## Notice

Every effort was made to ensure that the information in this book was complete and accurate at the time of printing. However, information is subject to change.

## Your Responsibility for Your System's Security

Toll fraud is the unauthorized use of your telecommunications system by an unauthorized party, for example, persons other than your company's employees, agents, subcontractors, or persons working on your company's behalf. Note that there may be a risk of toll fraud associated with your telecommunications system and, if toll fraud occurs, it can result in substantial additional charges for your telecommunications services.

You and your system manager are responsible for the security of your system, such as programming and configuring your equipment to prevent unauthorized use. The system manager is also responsible for reading all installation, instruction, and system administration documents provided with this product in order to fully understand the features that can introduce risk of toll fraud and the steps that can be taken to reduce that risk. Lucent Technologies does not warrant that this product is immune from or will prevent unauthorized use of common-carrier telecommunication services or facilities accessed through or connected to it. Lucent Technologies will not be responsible for any charges that result from such unauthorized use.

## Lucent Technologies Fraud Intervention

If you *suspect that you are being victimized* by toll fraud and you need technical support or assistance, call Technical Service Center Toll Fraud Intervention Hotline at 1 800 643-2353.

## Federal Communications Commission Statement

**Part 15: Class A Statement.** This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

**Part 68: Network Registration Number.** This equipment is registered with the FCC in accordance with Part 68 of the FCC Rules. It is identified by FCC registration number AS593M-13283-MF-E.

**Part 68: Answer-Supervision Signaling.** Allowing this equipment to be operated in a manner that does not provide proper answer-supervision signaling is in violation of Part 68 Rules. This equipment returns answer-supervision signals to the public switched network when:

- Answered by the called station
- Answered by the attendant
- Routed to a recorded announcement that can be administered by the CPE user

This equipment returns answer-supervision signals on all DID calls forwarded back to the public switched telephone network. Permissible exceptions are:

- A call is unanswered
- A busy tone is received
- A reorder tone is received

## Canadian Department of Communications (DOC)

### Interference Information

This digital apparatus does not exceed the Class A limits for radio noise emissions set out in the radio interference regulations of the Canadian Department of Communications.

Le Présent Appareil Numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la class A prescrites dans le reglement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

## Ordering Information

**Call:** Lucent Technologies Publications Center  
Voice 1 800 457-1235 International Voice 317 361-5353  
Fax 1 800 457-1764 International Fax 317 361-5355

**Write:** Lucent Technologies Publications Center  
P.O. Box 4100  
Crawfordsville, IN 47933

**Order:** Document No. 555-230-123  
Comcode 107959140  
Issue 1, April 1997

For additional documents, refer to the section in "About This Document" entitled "Related Resources."

You can be placed on a standing order list for this and other documents you may need. Standing order will enable you to automatically receive updated versions of individual documents or document sets, billed to account information that you provide. For more information on standing orders, or to be put on a list to receive future issues of this document, contact the Lucent Technologies Publications Center.

## European Union Declaration of Conformity

The "CE" mark affixed to the DEFINITY® equipment described in this book indicates that the equipment conforms to the following European Union (EU) Directives:

- Electromagnetic Compatibility (89/336/EEC)
- Low Voltage (73/23/EEC)
- Telecommunications Terminal Equipment (TTE) i-CTR3 BRI and i-CTR4 PRI

For more information on standards compliance, contact your local distributor.

# About This Book

---

## General

---

This book has the information needed to monitor, test, and maintain DEFINITY® Enterprise Communications Server Release 5 Systems and covers many of the faults and troubles that can occur in the system. Most maintenance requirements are simple procedures due to the modular, self-testing nature of the system.

This document covers information related to DEFINITY ECS Release 5, and includes all incremental releases up to and including Release 5.4. For details about changes for Release 5.4, refer to *DEFINITY Enterprise Communications Server Release 5.4.0, Change Description*, 555-230-471.

Simple, traditional troubleshooting methods are sometimes sufficient to locate and clear faults. The traditional methods include terminal substitution, visual inspections, continuity checks, and clarification of operating procedures with users.

The information in this book is intended for use by:

- A maintenance technician dispatched to a DEFINITY System site in response to a trouble alarm or a user trouble report,
- A maintenance technician located at a remote maintenance facility, or
- The user's assigned maintenance technician. The technician is expected to have a knowledge of telecommunications fundamentals and of the DEFINITY Enterprise Communications Server Release 5 Systems to the extent that the procedures in this book can be performed, in most cases, without assistance.

Each DEFINITY System has a user-designated System Manager who is responsible for administration of the system. This person's duties and capabilities are covered in the following books:

- *DEFINITY Communications System Generic 1 and Generic 3 System Management*, 555-230-500
- *DEFINITY Communications System Release 5 Traffic Reports*
- *DEFINITY Enterprise Communications Server Release 5.4 Administration and Feature Description*

The maintenance technician should work closely with the user's System Manager.

This book is not intended to solve all levels of troubles. It is limited to troubles that can be solved by using the Alarm Log, Error Log, trouble-clearing procedures, maintenance tests, and traditional troubleshooting methods. If the trouble still has not been resolved, it the responsibility of the maintenance technician to escalate the problem to a higher level of technical support. Escalation should conform to the procedures in the *Technical and Administration Escalation Plan*.

When features, screen displays, equipment, or operations differ between system types, for example, Generic 3 V4, Release 5si, or Release 5si + memory, these differences are clearly identified by use of the following indicators: "[G3V4]", "[R5si]", or "[R5 si + memory]."

## **Conventions Used in This Document**

The following conventions are used in this document:

- DEFINITY Systems are called G3V4, Release 5; Release 5vs, Release 5si, and Release 5si + memory.
- All occurrences of G3siV4, G3siV4+m, Release 5si, and Release 5 si + memory are called Release 5si unless a specific configuration is required to differentiate among product offerings.
- All occurrences of R5 without a suffix following the "5" refer to Release 5si, and Release 5si + memory.
- A component of a DEFINITY System, such as a circuit pack, occurring without a reference to any specific system, is part of G3V4 or Release 5.
- The term "ASAI" is synonymous with the newer CallVisor ASAI.
- All physical dimensions in this book are in English (Foot Pound Second) (FPS) followed by the metric Centimeter Grams Second (CGS) in parenthesis. Wire gauge measurements are in AWG followed by the diameter in millimeters in parenthesis.
- Admonishments used in this book are as follows:

**CAUTION:**

*This sign is used to indicate possible harm to software, possible loss of data, or possible service interruptions.*

**WARNING:**

*This sign is used where there is possible harm to hardware or equipment.*

**DANGER:**

*This sign is used to indicate possible harm or injury to people.*

## Organization

---

This book is organized into two volumes: volume 1 contains Chapters 1 through 9, and volume 2 contains Chapter 10.

- [Chapter 1, “Maintenance Architecture”](#) describes the system’s design and maintenance strategy.
- [Chapter 2, “Circuit Packs and Power”](#) describes DEFINITY circuit packs. It also explains how power is supplied to the system.
- [Chapter 3, “Management Terminals”](#) describes the various management terminals that can be used on the system and how to set up the terminals.
- [Chapter 4, “Initialization and Recovery”](#) describes the various reset and reboot processes, and discusses how these processes are used to perform maintenance and to recover systems or subsystems that are out of service.
- [Chapter 5, “Routine Maintenance Procedures”](#) discusses common maintenance tasks, including: removing and installing circuit packs, removing and restoring power, performing system backups, upgrading software, and various testing and troubleshooting procedures.
- [Chapter 6, “Reliability Systems: A Maintenance Aid”](#) provides detailed hardware and functional descriptions as well as additional repair strategy (in addition to the procedures provided in this document) for Standard, High, and Critical Reliability systems.
- [Chapter 7, “LED Interpretation”](#) is a quick reference to interpreting circuit pack LEDs.
- [Chapter 8, “Maintenance Commands and Trouble-Clearing Aids”](#) has the maintenance commands, and explains how to use these commands using the management terminal. Specific command syntax plus typical forms and display output are also given in the chapter.

- **Chapter 9, “Packet Bus Fault Isolation and Correction”** describes Pack Bus maintenance and the interactions of the bus with Packet circuit packs. The chapter also discusses how Packet Bus faults are isolated and corrected.
- **Chapter 10, “Maintenance Object Repair Procedures”** has specific troubleshooting and repair instructions for every component in the system. The chapter contains repair procedures for system-alarmed and user-reported troubles. For each MO, a table lists the alarm level, hardware error associated with the MO, and the associated test that caused the error. The test sequences and the specific command line entry required to run the tests are given and a brief description of each test. Explanations of error codes associated with each test are given, as are specific maintenance procedures to be used to resolve each problem.

Each MO is described in a separate section of [Chapter 10, “Maintenance Object Repair Procedures”](#). The individual sections are labeled with the name of the MO exactly as the name appears in the Alarm Log; for example, MAINT (for Maintenance circuit pack). The only exception is the MO name for Common Port Circuit Pack maintenance which is XXX-BD. The XXX-BD section contains a set of common tests used by certain circuit packs listed in the section. The common portion of these circuit packs is the generic hardware that interfaces with the Time Division Multiplex (TDM) Bus.

Lucent Technologies listens carefully to its readers. The organization of this book is a direct result of user feedback. Your feedback is important. Use the feedback form at the back of this book to send your comments to Lucent Technologies.

## Safety Precautions

---

When performing maintenance or translation procedures on the system, users must observe certain precautions. Observe all caution, warning, and danger statements to prevent loss of service, possible equipment damage, and possible personal injury. In addition, the following precautions regarding electromagnetic interference (EMI) and static electricity must be observed:

**Electromagnetic Interference:** This equipment generates, uses, and can radiate radio frequency energy. Electromagnetic fields radiating from the switch may cause noise in the customer's equipment. If the equipment is not installed and used in accordance with the instruction book, radio interference may result.

### WARNING:

*To maintain the EMI integrity of the system, maintenance personnel must ensure that all cabinet panels, covers, and so forth, are firmly secured before leaving the customer's premises.*

**Static Electricity:** To prevent or reduce electrostatic discharge (ESD), maintenance personnel must always attach wrist grounding straps before working on switch components or handling circuit packs.

**CAUTION:**

*Electrostatic discharge can damage or destroy circuit packs containing integrated circuits (ICs).*

The ESD wrist strap, cable assembly, and spare fuses are packed in a plastic bag and placed in the top of the system cabinet. Use the ESD wrist strap when troubleshooting, performing maintenance, or handling any circuit packs associated with the system.

## Class 1 Laser Device

The DEFINITY ECS contains a Class 1 Laser device if single-mode fiber optic cable is connected to a remote Expansion Port Network (EPN). The LASER device operates within the following parameters:

Power Output: -5 dBm

Wavelength: 1310 nm

Mode Field Diameter: 8.8 microns

**DANGER:**

*Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.*

Contact your Lucent Technologies representative for more information.

## Security Issues

---

A number of matters concerning maintenance are affected by security issues. For details, be sure to consult the *GBCS Products Security Handbook*, 555-025-600.

**CAUTION:**

*Login security is an attribute of the DEFINITY® Enterprise Communications Server (ECS) Release 5 software.*

## Standards Compliance

---

The equipment presented in this document complies with the following (as appropriate):

- ITU-T (Formerly CCITT)

- ECMA
- ETSI
- IPNS
- DPNSS
- National ISDN-1
- National ISDN-2
- ISO-9000
- ANSI
- FCC Part 15 and Part 68
- EN55022
- EN50081
- EN50082
- CISPR22
- Australia AS3548 (AS/NZ3548)
- Australia AS3260
- IEC 825
- IEC950
- UL 1459
- UL1950
- CSA C222 Number 225
- TS001

## Electromagnetic Compatibility Standards

This product complies with and conforms to the following:

- Limits and Methods of Measurements of Radio Interference Characteristics of Information Technology Equipment, EN55022 (CISPR22), 1993
- EN50082-1, European Generic Immunity Standard
- FCC Parts 15 and 68
- Australia AS3548

**NOTE:**

The system conforms to Class A (industrial) equipment. Voice terminals meet Class B requirements.

- Electrostatic Discharge (ESD) IEC 1000-4-2
- Radiated radio frequency field IEC 1000-4-3
- Electrical Fast Transient IEC 1000-4-4
- Lightning effects IEC 1000-4-5
- Conducted radio frequency IEC 1000-4-6
- Mains frequency magnetic field IEC 1000-4-8
- Low frequency mains disturbance

The system conforms to the following:

- Electromagnetic compatibility General Immunity Standard, part 1; residential, commercial, light industry, EN50082-1, CENELEC, 1991
- Issue 1 (1984) and Issue 2 (1992), Electrostatic discharge immunity requirements (EN55024, Part 2) IEC 1000-4-2
- Radiated radio frequency field immunity requirements IEC 1000-4-3
- Electrical fast transient/burst immunity requirements IEC 1000-4-4

## **European Union Standards**

---

Lucent Technologies Business Communications Systems declares that the DEFINITY equipment specified in this document bearing the “CE” mark conforms to the European Union Electromagnetic Compatibility Directives.

The “CE” (Conformité Européenne) mark indicates conformance to the European Union Electromagnetic Compatibility Directive (89/336/EEC) Low Voltage Directive (73/23/EEC) and Telecommunication Terminal Equipment (TTE) Directive (91/263/EEC) and with i-CTR3 Basic Rate Interface (BRI) and i-CTR4 Primary Rate Interface (PRI) as applicable.

The “CE” mark is applied to the following Release 5 products:

- Global AC powered Multi-Carrier Cabinet (MCC)
- DC powered Multi-Carrier Cabinet (MCC) with 25-Hz ring generator
- AC powered Single-Carrier Cabinet (SCC) with 25-Hz ring generator
- AC powered Compact Single-Carrier Cabinet (CSCC) with 25-Hz ring generator
- Enhanced DC Power System

# Federal Communications Commission Statement

---

## Part 68: Statement

---

Part 68: Answer-Supervision Signaling. Allowing this equipment to be operated in a manner that does not provide proper answer-supervision signaling is in violation of Part 68 rules. This equipment returns answer-supervision signals to the public switched network when:

- Answered by the called station
- Answered by the attendant
- Routed to a recorded announcement that can be administered by the CPE user

This equipment returns answer-supervision signals on all DID calls forwarded back to the public switched telephone network. Permissible exceptions are:

- A call is unanswered
- A busy tone is received
- A reorder tone is received

This equipment is capable of providing users access to interstate providers of operator services through the use of access codes. Modification of this equipment by call aggregators to block access dialing codes is a violation of the Telephone Operator Consumers Act of 1990.

This equipment complies with Part 68 of the FCC Rules. On the rear of this equipment is a label that contains, among other information, the FCC registration number and ringer equivalence number (REN) for this equipment. If requested, this information must be provided to the telephone company.

The REN is used to determine the quantity of devices which may be connected to the telephone line. Excessive RENs on the telephone line may result in devices not ringing in response to an incoming call. In most, but not all areas, the sum of RENs should not exceed 5.0. To be certain of the number of devices that may be connected to a line, as determined by the total RENs, contact the local telephone company.

 **NOTE:**  
REN is not required for some types of analog or digital facilities.

Means of Connection

Connection of this equipment to the telephone network is shown in the following table.

| Manufacturer's Port Identifier | FIC Code    | SOC/REN/<br>A.S. Code | Network Jacks          |
|--------------------------------|-------------|-----------------------|------------------------|
| Off/On Premises Station        | OL13C       | 9.0F                  | RJ2GX, RJ21X,<br>RJ11C |
| DID Trunk                      | 02RV2-T     | 0.0B                  | RJ2GX, RJ21X           |
| CO Trunk                       | 02GS2       | 0.3A                  | RJ21X                  |

If the terminal equipment (DEFINITY® System) causes harm to the telephone network, the telephone company will notify you in advance that temporary discontinuance of service may be required. But if advance notice is not practical, the telephone company will notify the customer as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe it is necessary.

The telephone company may make changes in its facilities, equipment, operations or procedures that could affect the operation of the equipment. If this happens, the telephone company will provide advance notice in order for you to make necessary modifications to maintain uninterrupted service.

If trouble is experienced with this equipment, for repair or warranty information, please contact the Technical Service Center at 1-800-248-1234. If the equipment is causing harm to the telephone network, the telephone company may request that you disconnect the equipment until the problem is resolved.

It is recommended that repairs be performed by Lucent Technologies certified technicians.

The equipment cannot be used on public coin phone service provided by the telephone company. Connection to party line service is subject to state tariffs. Contact the state public utility commission, public service commission or corporation commission for information.

This equipment, if it uses a telephone receiver, is hearing aid compatible.

# Maintenance Architecture

# 1

---

The maintenance subsystem is a part of the software that initializes and maintains the system. The software continuously monitors system health, and keeps a record of errors detected in the system. The maintenance subsystem also provides a user interface for on-demand testing.

This chapter provides a brief description of the Release 5 maintenance strategy and the background information on the system's overall functions. For detailed descriptions of components and subsystems, refer to related topics in [Chapter 10, "Maintenance Object Repair Procedures"](#).

## Maintenance Objects

---

The system is partitioned into separate entities called Maintenance Objects (MOs). Each MO is referred to by an upper-case, mnemonic-like name that serves as an abbreviation for the MO. For example, "CO-TRK" stands for "Central Office TRUnK". Each MO is monitored by the system and has its own maintenance strategy. Most MOs are individual circuit packs. Some MOs are hardware components that reside on part of a circuit pack. For example, the TDM bus Clock circuits reside on the Tone/Clock circuit pack. Other MOs, such as cabinet environmental sensors, represent larger subsystems or sets of monitors. Finally, some MOs, such as SYNChronization, represent processes or a combination of processes and hardware.

"Maintenance names" are recorded in the error and alarm logs. Individual copies of an MO are assigned an address that defines the MO's physical location in the system. These locations display as the "PORT" field in the alarm and error logs and as output of various commands such as **test board**, **busy tdm-bus**, and so forth.

## Alarm and Error Reporting

---

During normal operations, software or firmware may detect error conditions relevant to specific MOs. The system attempts to fix or circumvent these problems automatically. However, if a hardware component incurs too many errors, an alarm is raised. Errors are detected in two ways:

- For “in-line” errors, firmware on the component detects the occurrence of an error during ongoing operations.
- For other types of errors, a “periodic test” or a “scheduled test” started by the software detects the error. The technician can run these tests on demand by using the maintenance commands described in [Chapter 8, “busyout journal-printer”](#), and [Chapter 10, “Maintenance Object Repair Procedures”](#).

Software puts the error in the error log, and increments the error counter for that error. When an error counter is “active,” (greater than zero), there is a maintenance record for the MO.

Alarms are classified as MAJOR, MINOR, or WARNING, depending on the effect on system operation. They are also classified as ON-BOARD or OFF-BOARD.

- MAJOR alarms identify failures that cause a critical degradation of service. These alarms require immediate attention.
- MINOR alarms identify failures that cause some service degradation but that do not render a crucial portion of the system inoperable. MINOR alarms require attention. However, typically a MINOR alarm affects only a few trunks or stations or a single feature.
- WARNING alarms identify failures that cause no significant degradation of service or equipment failures external to the switch. These failures are not reported to INADS or to the attendant console.
- ON-BOARD problems originate in the circuitry on the alarmed circuit pack.
- OFF-BOARD problems originate in a process or component that is external to the circuit pack.

Alarms are discussed further in [Chapter 10, “Maintenance Object Repair Procedures”](#).

## Maintenance Testing

---

Most troubles are reduced to the circuit pack level and can be identified by LEDs on the circuit packs and software reports generated by the system. The maintenance tests in the system are divided into three groups:

- Periodic

Background tests are performed by software maintenance, usually on an hourly basis. These tests are nondestructive and can be run during high traffic periods without interfering with calls.

- **Scheduled**  
Background tests performed by software maintenance, usually on a daily basis, are generally more thorough than periodic testing. The tests are considered destructive and are run only during off-hours so as not to interfere with calls.
- **Fixed interval**  
Background tests performed by software maintenance at regular time intervals (these intervals cannot be administered). These tests run concurrently with periodic maintenance. The following table lists the MOs that run fixed interval testing.

| Maintenance Object | Interval (minutes) |
|--------------------|--------------------|
| POWER              | 60                 |
| SPE-SELEC          | 60                 |
| STBY-SPE           | 120                |
| TDM-BUS            | 10                 |
| TONE-PT            | 10                 |

Demand tests are also run by the system when it detects a need or by maintenance personnel in trouble-clearing activities. Demand tests include periodic tests plus other tests required only when trouble occurs. Some nonperiodic demand tests may disrupt system operation. In this book, destructive (service-disrupting) tests are identified in boldface type.

Maintenance personnel can use the management terminal to initiate the same tests that the system initiates. The terminal screen displays the test results.

## Protocols

This section describes the protocols handled by the system and the points where these protocols change. [Figure 1-1](#) is a pictorial guide through data-transmission state changes. [Figure 1-1](#) illustrates the flow of data from DTE equipment, like a terminal or host, through DCE equipment, like a modem or data module, into a communications port on the system. The data flow is shown by solid lines. Below these lines are the protocols used at particular points in the data stream.

Not shown in the [Figure 1-1](#) is the treatment of D-channels in ISDN-PRI and ISDN-BRI transmissions. PRI and BRI D-channels transport information elements

that contain call-signaling and caller information. These elements conform to ISDN level-3 protocol. In the case of BRI, the elements are created by the terminal or data module; for the PRI, the elements are created by the system, which inserts them into the D-channel at the DS1 port.

For ISDN transmissions, therefore, BRI terminals and data modules, and DS1 ports insert, interpret, and strip both layer-2 DCE information and layer-3 elements. Also, the DS1 port passes layer-3 elements to the system for processing.

## Layers

---

The Open System Interconnect (OSI) model for data communications contains seven layers, each with a specific function. Communications to and through the system concern themselves only with layers 1 and 2 of the model.

Layer 1, or the *physical layer*, covers the physical interface between devices and the rules by which bits are passed. Among the physical layer protocols are RS-232, RS-449, X.21, DCP, DS1, and others.

Layer 2, or the *data-link layer*, refers to code created and interpreted by the DCE. The originating equipment can send blocks of data with the necessary codes for synchronization, error control, or flow control. With these codes, the destination equipment checks the physical-link reliability, corrects any transmission errors, and maintains the link. When a transmission reaches the destination equipment, it strips any layer-2 information the originating equipment may have inserted. The destination equipment only passes to the destination DTE equipment the information sent by the originating DTE equipment. The originating DTE equipment can also add layer-2 code to be analyzed by the destination DTE equipment. The DCE equipment treats this layer as data and passes it along to the destination DTE equipment as it would any other binary bits.

Layers 3 to 7 (and the DTE-created layer 2) are embedded in the transmission stream and are meaningful only at the destination DTE equipment. Therefore, they are shown in the figure as "user-defined," with no state changes until the transmission stream reaches its destination.

Figure 1-1. Data Transmission States

## Usage

---

The following is a list of the protocols when data is transmitted to and through the system. The list is organized by protocol layers. Refer to [Figure 1-1](#).

### Layer-1 Protocols

Layer-1 protocols are used between the terminal or host DTE and the DCE, used between the DCE equipment and the system port, and used inside the system.

The following layer-1 protocols are used between the DTE equipment and the DCE equipment. DCE equipment can be data modules, modems, or Data Service Units (DSUs). A DSU is a device that transmits digital data to a particular digital endpoint over the public network without processing the data through any intervening private network switches.

- *RS-232* — A common physical interface used to connect DTE to DCE. This protocol is typically used for communicating up to 19.2 kbps
- *RS-449* — Designed to overcome the RS-232 distance and speed restrictions and lack of modem control
- *V.35* — A physical interface used to connect DTE to a DCE. This protocol is typically used for transmissions at 56 or 64 kbps

The following protocols are used at layer 1 to govern communication between the DCE equipment and the port. These protocols consist of codes inserted at the originating DCE and stripped at the port. The DS1 protocol can be inserted at the originating, outgoing trunk port and stripped at the destination port.

- *Digital Communications Protocol (DCP)* — A standard for a 3-channel link. This protocol sends digitized voice and digital data in frames at 160 kbps. The channel structure consists of two information (I) channels and one signaling (S) channel. Each I-channel provides 64 kbps of voice and/or data communication and the S-channel provides 8 kbps of signaling communication between the system and DTE equipment. DCP is similar to ISDN-BRI
- *Basic Rate Interface (BRI)* — An ISDN standard for a 3-channel link, consisting of two 64-kbps bearer (B) channels and one 16-kbps signaling (D) channel. For the implementation of this standard, see *DEFINITY Communications System and System 75 and System 85 ISDN BRI Reference*, 555-025-103
- *Primary Rate Interface (PRI)* — An ISDN standard that sends digitized voice and digital data in T1 frames at 1.544-Mbps or, for countries outside the United States, in E1 frames at 2.048-Mbps. Layer 1 (physical), layer 2 (link), and layer 3 (network) ISDN PRI protocols are defined in *AT&T System 75 and 85 — DS1/DMI/ISDN-PRI — Reference Manual*, 555-025-101. At 1.544 Mbps, each frame consists of 24 64-kbps channels plus 8 kbps for framing. This represents 23 B-channels plus 1 D-channel.

The maximum user rate is 64 kbps for voice and data. The maximum distances are based on T1 limitations. At 2.048 Mbps, each E1 frame consists of 32 64-kbps channels

- *Analog* — A modulated voice-frequency carrier signal
- *ADU Proprietary* — A signal generated by an ADU. The signal is for communication over limited distances and can be understood only by a destination ADU or destination system port with a built-in ADU
- *Digital Signal Level 1 (DS1)* — A protocol defining the line coding, signaling, and framing used on a 24-channel line. Many types of trunk protocols (for example, PRI and 24th-channel signaling) use DS1 protocol at layer 1
- *European Conference of Postal and Telecommunications rate 1 (CEPT)* — A protocol defining the line coding, signaling, and framing used on a 32-channel line. Countries outside the United States use CEPT1 protocol

Inside the system, data transmission appears in one of two forms:

1. Raw digital data, where the physical layer protocols, like DCP, are stripped at the incoming port and reinserted at the outgoing port.
2. Pulse Code Modulation (PCM)-encoded analog signals (analog transmission by a modem), the signal having been digitized by an analog-to-digital coder/decoder (CODEC) at the incoming port.

## Layer-2 Protocols

Layer-2 protocols are given below:

- *8-bit character code* — Between the DTE equipment and the DCE equipment. Depending on the type of equipment used, the code can be any proprietary code set.
- *Digital multiplexed interface* proprietary — Family of protocols between the originating DCE and the destination DCE for digital transmission. See *DEFINITY Communications System and System 75 and System 85 DS1/DMI/ISDN PRI Reference*, 555-025-101; and *Digital Multiplexed Interface [DMI] Technical Specification*, 555-025-204
- *Voice-grade data* — Between the originating DCE and the destination DCE for analog transmission

Protocol States

[Table 1-1](#) summarizes the protocols used at various points in the data transmission stream. See [Figure 1-1](#).

Table 1-1. Protocol States for Data Communication

| Transmiss-<br>ion Type | Incoming<br>DTE to<br>DCE             | OSI<br>Layer | Protocols DTE to<br>DCE    | DCE to System<br>Port       | Inside System               |
|------------------------|---------------------------------------|--------------|----------------------------|-----------------------------|-----------------------------|
| Analog                 | Modem                                 | 1            | RS-232, RS-449,<br>or V.35 | analog                      | PCM                         |
|                        |                                       | 2            | 8- or 10-bit code          | voice-grade data            | voice-grade data            |
|                        | ADU                                   | 1            | RS-232                     | ADU proprietary             | raw bits                    |
|                        |                                       | 2            | asynchronous<br>8-bit code | asynchronous<br>8-bit code  | DMI                         |
| Digital                | Data<br>Module                        | 1            | RS-232, RS-449,<br>or V.35 | DCP or BRI                  | raw bits                    |
|                        |                                       | 2            | 8-bit code                 | DMI                         | DMI                         |
|                        | Digital<br>Signal<br>Level 1<br>(DS1) | 1            | any                        | DS1                         | PCM or raw bits             |
|                        |                                       | 2            | 8-bit code                 | DMI or voice-<br>grade data | DMI or voice- grade<br>data |

 **NOTE:**  
OSI means Open Systems Interconnect  
PCM means Pulse Code Modulated  
DMI means Digital Multiplexed Interface

Both the physical-layer protocol and the Digital Multiplexed Interface (DMI) mode used in the connection are dependent upon the type of 8-bit code used at layer 2 between the DTE equipment and DCE equipment, as listed in [Table 1-2](#) and [Table 1-3](#).

Table 1-2. Physical-Layer Protocol Versus Character Code

| Protocol | Code                                      |
|----------|-------------------------------------------|
| RS-232   | Asynchronous 8-bit ASCII, and synchronous |
| RS-449   | Asynchronous 8-bit ASCII, and synchronous |
| V.35     | Synchronous                               |

**Table 1-3. Digital Multiplexed Interface (DMI) Mode Versus Character Code**

| DMI Mode | Code                                                        |
|----------|-------------------------------------------------------------|
| 0        | Synchronous (64 kbps)                                       |
| 1        | Synchronous (56 kbps)                                       |
| 2        | Asynchronous 8-bit ASCII (up to 19.2 kbps), and synchronous |
| 3        | Asynchronous 8-bit ASCII, and private proprietary           |

**Connectivity Rules**

[Figure 1-1](#) implies the following connectivity rules:

- Only the DS1 port and the analog trunk port are trunking facilities (all other ports are line ports). For communication over these facilities, the destination DCE equipment can be a hemisphere away from the system, and the signal can traverse any number of intervening switching systems before reaching the destination equipment.
- Data originating at any type of digital device, whether DCP or BRI, can exit the system at any type of digital port — BRI, digital-line, PRI, DS1, and others; as long as the call destination is equipped with a data module using the same DMI mode used at the call origin. This is because once the data enters the system through a digital port, its representation is uniform (raw bits at layer 1, and DMI at level 2), regardless of where it originated.
- Although data entering the system through an EIA port has not been processed through a data module, the port itself has a built-in data module. Inside the system, port data is identical to digital line data. Data entering the system at a DCP line port can exit at an EIA port. Conversely, data entering the system at an EIA port can exit at any DCP line port. The destination data module must be set for Mode-2 DMI communication.
- Voice-grade data can be carried over a DS1 facility as long as the destination equipment is a modem compatible with the originating modem
- If a mismatch exists between the types of signals used by the endpoints in a connection (for example, the equipment at one end is an analog modem, and the equipment at the other end is a digital data module), a modem-pool member must be inserted in the circuit. When the endpoints are on different switches, it is recommended that the modem-pool member be put on the origination or destination system. A modem-pool

member is always inserted automatically for calls to off-premises sites via analog or voice-grade trunking. For internal calls, however, the systems are capable of automatically inserting a modem-pool member.

- Data cannot be carried over analog facilities unless inside the system it is represented as a Pulse Code Modulation (PCM)-encoded analog signal. To do this for data originating at a digital terminal, the signal enters the system at a digital port and exits the system at a digital port. The signal then reenters the system through a modem-pool connection (data-module to modem to analog-port) and exits the system again at an analog port.
- Although DS1 is commonly called a trunk speed, here it names the protocol used at layer 1 for digital trunks. Some trunks use different signaling methods but use DS1 protocol at layer 1 (for example, PRI and 24th-channel signaling trunks).

## **Disconnect Supervision**

---

Disconnect supervision means the CO has the ability to release a trunk when the party at the CO disconnects, and the system is able to recognize the release signal. In general, a CO in the United States provides disconnect supervision for incoming calls but not for outgoing calls. Many other countries do not provide disconnect supervision on either incoming or outgoing calls.

The system must provide the assurance that at least one party on the call can control the dropping of the call. This avoids locking up circuits on a call where no party is able to send a disconnect signal to the system. Internal operations must check to be sure one party can provide disconnect supervision. An incoming trunk that does not provide disconnect supervision is not allowed to terminate to an outgoing trunk that does not provide disconnect supervision.

In a DCS environment, an incoming trunk without disconnect supervision can terminate to an outgoing DCS trunk connecting two nodes. The incoming trunk is restricted from being transferred to a party without disconnect supervision on the terminating node.

This is because, through messaging, the terminating node knows the originating node cannot provide disconnect supervision. This messaging is not possible with non-DCS tie trunks, and the direct call is denied.

Some two-wire loop start trunks outside the United States provide busy tone disconnect in place of line signals. For these trunks, an adjunct can be attached to the trunk to listen for busy or other disconnect tone. When a tone is detected, the adjunct sends line signals for disconnect to the system.

Administration is provided for each trunk group to indicate whether it provides disconnect supervision for incoming calls and for outgoing calls.

Transfer on Ringing

A station or attendant may conference in a ringing station or transfer a party to a ringing station. When a station conferences in a ringing station and then drops the call, the ringing station is treated like a party without disconnect supervision. However, when a station transfers a party to a ringing station, the ringing station party is treated like a party with disconnect supervision. Two timers (Attendant Return Call Timer and Wait Answer Supervision Timer) are provided to ensure the call is not locked to a ringing station.

Conference, Transfer, and Call-Forwarding Denial

If a station or attendant attempts to connect parties without disconnect supervision together, the following is possible:

- *Digital Station or Local Attendant Transfer:* if a digital station attempts to transfer the two parties together, the call appearance lamp flutters, indicating a denial. If transferring to a DCS trunk, the denial may drop the call since the transfer is allowed and the other system is queried for disconnect supervision.
- *Analog Station Transfer:* if an analog station attempts to transfer two parties together by going on-hook, the analog station is no longer on the call and the transfer cannot be denied.
- *Centralized Attendant Service (CAS) Attendant Transfer:* if a CAS attempts to transfer two parties together by pressing the release key, the release link trunk is released and the branch attempts a transfer by going on-hook
- *Station Conference/Dropout:* if a station conferences all parties, the conference is allowed since the station has disconnect supervision. When the station is dropped from the call, the call is dropped since the other parties do not have disconnect supervision.
- *Station Call Forwarding:* if a station is call forwarded off-premise to a trunk without disconnect supervision, the calling party without disconnect supervision is routed to the attendant

[Table 1-4](#) lists the various protocols, with applications and maximum limitations.

Table 1-4. Protocols Used in DEFINITY

| Protocol | Applications                                                                           | Maximum Data Rate                | Maximum Distance                                           |
|----------|----------------------------------------------------------------------------------------|----------------------------------|------------------------------------------------------------|
| DCP      | Digital switch to data endpoints                                                       | 64 kbps                          | 5000 feet (1524 m) for data<br>3000 feet (915 m) for voice |
| RS-232   | System to administration terminal. Data module to host computer                        | 19.2 kbps                        | 50 feet (15.2 m)                                           |
|          | Data module to printer                                                                 | 64 kbps                          | 17 feet (5.9 m)                                            |
|          | Data module for downloading and high-speed data transfer                               | 64 kbps                          | 17 feet (5.9 m)                                            |
|          | EIA interface (Data line to ADU)                                                       | 19.2 kbps                        | 2000 feet (610 m)                                          |
|          |                                                                                        | 9.6 kbps                         | 5000 feet (1524 m)                                         |

Table 1-4. Protocols Used in DEFINITY — Continued

| Protocol   | Applications                                    | Maximum Data Rate | Maximum Distance                                                                            |
|------------|-------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------|
| Category A | Data modules to terminals or cluster controller | 64 kbps           | 500 feet (152 m)                                                                            |
|            | Data module in ASCII emulation mode             | 9.6 kbps          |                                                                                             |
| ISDN-BRI   | Communication interface to ISDN-BRI S/T         | 64 kbps           | 655 feet (199.3 m) to network interface or repeater<br>1310 feet (399.3 m) system to system |
|            | ISDN-BRI U                                      | 160 kbps          | 18,000 feet (5486.4 m) from system to network interface, and then ~2000 feet to phone       |
| ISDN-PRI   | Communication interface to ISDN-PRI             | 64 kbps           | 655 feet (199.3 m) to network interface or repeater<br>1310 feet (399.3 m) system to system |

 **NOTE:**  
ADU means Asynchronous Data Unit  
BCS means Business Communications System  
MSA means Message Servicing Adjunct  
ACU means Automatic Call Unit

Transmission Characteristics

The system transmission characteristics comply with the American National Standards Institute/Electronic Industries Association (ANSI/EIA) standard RS-464A (SP-1378A). The following tables list some general switch transmission characteristics.

Frequency Response

Table 1-5 lists the analog-to-analog frequency response for station-to-station or station-to-CO trunk, relative to loss at 1 kHz for the United States.

Table 1-5. Analog-to-Analog Frequency Response

| Frequency (Hz) | Maximum Loss (dB) | Minimum Loss (dB) |
|----------------|-------------------|-------------------|
| 60             | —                 | 20                |
| 200            | 5                 | 0                 |
| 300 to 3000    | 1                 | -0.5              |
| 3200           | 1.5               | -0.5              |
| 3400           | 3                 | 0                 |

Table 1-6 lists the analog-to-digital frequency response of the system for station or CO-trunk-to-digital interface (DS0), relative to loss at 1 kHz for the United States.

Table 1-6. Analog-to-Digital Frequency Response

| Frequency (Hz) | Maximum Loss (dB) | Minimum Loss (dB) |
|----------------|-------------------|-------------------|
| 60             | —                 | 20                |
| 200            | 3                 | 0                 |
| 300 to 3000    | 0.5               | -0.25             |
| 3200           | 0.75              | -0.25             |
| 3400           | 1.5               | 0                 |

Insertion Loss for Port-to-Port; Analog or Digital

Table 1-7 lists the insertion loss in the system for different connection types for the United States. Table 1-8 shows the overload and cross-talk characteristics.

Table 1-7. Insertion Loss for the United States

| Typical Connections                  | Nominal Loss (dB) at 1 kHz |
|--------------------------------------|----------------------------|
| On-premises to on-premises station   | 6                          |
| On-premises to off-premises station  | 3                          |
| Off-premises to off-premises station | 0                          |
| On-premises station to 4-wire trunk  | 3                          |
| Off-premises station to 4-wire trunk | 2                          |
| Station-to-trunk                     | 0                          |
| Trunk-to-trunk                       | 0                          |

Table 1-8. Overload and Crosstalk

|                |         |
|----------------|---------|
| Overload level | +3 dBm0 |
| Crosstalk loss | >70 dB  |

Intermodulation Distortion

Table 1-9 lists the intermodulation distortion in the system for analog-to-analog and analog-to-digital, up to 9.6 kbps data

Table 1-9. Intermodulation Distortion

| Four-Tone Method           | Distortion |
|----------------------------|------------|
| Second-order tone products | >46 dB     |
| Third-order tone products  | >56 dB     |

## Quantization Distortion Loss

[Table 1-10](#) lists the quantization distortion loss in the system for analog port to analog port.

**Table 1-10. Quantization Distortion Loss**

| Analog Port-to-Analog Port |                 |
|----------------------------|-----------------|
| Signal Level               | Distortion Loss |
| 0 to -30 dBm0              | >33 dB          |
| -40 dBm0                   | >27 dB          |
| -45 dBm0                   | >22 dB          |

[Table 1-11](#) lists the quantization distortion loss in the system for analog port to digital port and digital port to analog port.

**Table 1-11. Quantization Distortion Loss**

| Analog Port-to-Digital Port or<br>Digital Port-to-Analog Port |                 |
|---------------------------------------------------------------|-----------------|
| Signal Level                                                  | Distortion Loss |
| 0 to -30 dBm0                                                 | >35 dB          |
| -40 dBm0                                                      | >29 dB          |
| -45 dBm0                                                      | >25 dB          |

Terminating Impedance: 600 Ohms nominal  
Trunk balance impedance (selectable): 600 Ohms nominal or complex Z [350 Ohms + (1 k Ohms in parallel with 0.215uF)]

## Impulse Noise

On 95% or more of all connections, the impulse noise is 0 count (hits) in five minutes at +55 dBmC (decibels above reference noise with C-filter) during the busy hour.

## ERL and SFRL Talking State

Echo-Return Loss (ERL) and Single-Frequency Return Loss (SFRL) performance is usually dominated by termination and/or loop input impedances. The system provides an acceptable level of echo performance if the ERL and SFRL are met.

|                                    |                                                                     |
|------------------------------------|---------------------------------------------------------------------|
| Station-to-station                 | ERL should meet or exceed 18 dB<br>SFRL should meet or exceed 12 dB |
| Station to 4-wire trunk connection | ERL should meet or exceed 24 dB<br>SFRL should meet or exceed 14 dB |
| Station to 2-wire trunk connection | ERL should meet or exceed 18 dB<br>SFRL should meet or exceed 12 dB |
| 4-wire to 4-wire trunk connection  | ERL should meet or exceed 27 dB<br>SFRL should meet or exceed 20 dB |

## Peak Noise Level

Analog to analog — 20 dBrnC (decibels above reference noise with C-filter)

Analog to digital — 19 dBrnC

Digital to analog — 13 dBrnC

## Echo Path Delay

Analog port to analog port —  $\leq 3$  ms

Digital interface port to digital interface port —  $\leq 2$  ms

## Service Codes

Service codes (for the United States only) are issued by the Federal Communications Commission (FCC) to equipment manufacturers and registrants. These codes denote the type of registered terminal equipment and the protective characteristics of the premises wiring of the terminal equipment ports.

Private line service codes are as follows:

- 7.0Y — Totally protected private communications (microwave) systems
- 7.0Z — Partially protected private communications (microwave) systems
- 8.0X — Port for ancillary equipment
- 9.0F — Fully protected terminal equipment

- 9.0P — Partially protected terminal equipment
- 9.0N — Unprotected terminal equipment
- 9.0Y — Totally protected terminal equipment

The product line service code is 9.0F indicating it is terminal equipment with fully protected premises wire at the private line ports.

## **Facility Interface Codes**

---

A Facility Interface Code (FIC) is a five-character code (United States only) that provides the technical information needed to order a specific port circuit pack for analog private lines, digital lines, MTS lines, and WATS lines.

Table 1-12 through Table 1-14 list the FICs. Included are service order codes, Ringer Equivalency Numbers (RENS), and types of network jacks that connect a line to a rear panel connector on a carrier.

Table 1-12. Analog Private Line and Trunk Port Circuit Packs

| Circuit Pack                                                                                                 | FIC   | Service Order Code | Network Jack |
|--------------------------------------------------------------------------------------------------------------|-------|--------------------|--------------|
| TN742 and TN747B Off-Premises Station Port, and TN746B Off-Premises Station Port or On-Premises Station port | 0L13C | 9.0F               | RJ21X        |
| TN760/B/C/D Tie Trunk                                                                                        | TL31M | 9.0F               | RJ2GX        |

Table 1-13. Digital Trunk Port Circuit Packs

| Circuit Pack                                                                            | FIC      | Service Order Code | Network Jack    |
|-----------------------------------------------------------------------------------------|----------|--------------------|-----------------|
| TN1654 and TN574 DS1 Converter; TN722B DS1 Tie trunk; and TN767 and TN464 DS1 Interface | 04DU9B,C | 6.0P               | RJ48C and RJ48M |

Table 1-14. MTS and WATS Port Circuit Packs

| Circuit Pack                         | FIC     | Ringer Equivalency Number (REN) | Network Jack   |
|--------------------------------------|---------|---------------------------------|----------------|
| TN742 and TN746B Analog Line         | 02LS2   | None                            | RJ21 and RJ11C |
| TN747B Central Office Trunk          | 02GS2   | 1.0A                            | RJ21X          |
| TN753 DID Trunk                      | 02RV2-T | 0,0B                            | RJ21X          |
| TN790 Processor                      | 02LS2   | 1.0A                            | RJ21X          |
| TN1648 System Access and Maintenance | 02LS2   | 0.5A                            | RJ21X          |

## Multimedia Interface (MMI)

The Multimedia Interface handles the following protocols:

- International Telecommunications Union (ITU) H.221 — Includes H.230, H.242, H.231, and H.243 protocol
- American National Standards Institute (ANSI) H.221 — Includes H.230, H.242, H.231, and H.243 protocol
- BONDING (Bandwidth On Demand INoperability Group) Mode 1
- ESM HLP HDLC Rate Adaptation

The Vistium Personal Conferencing System is supported either through the 8510T BRI terminal or directly through the Vistium TMBRI PC board.

Using the World Class Core (WCC) BRI interface, most desktop multimedia applications are supported through the Personal Computer's BRI interface.

# Circuit Packs and Power

# 2

This chapter discusses the hardware configurations contained within and supported by the DEFINITY Systems. Where appropriate, detailed information down to the circuit pack level is provided. This chapter also discusses the power sources required to enable the various components within the system.

## Circuit Packs

The following table list all circuit packs supported by DEFINITY Release 5 systems. For information concerning vintages and current versions, see *Reference Guide for Circuit Pack Vintages and Change Notices* which is published periodically as a special edition of the *AT&T Technical Monthly*.

For more information concerning which circuit packs are needed for different environments and locales, see the Application Notes section of *DEFINITY Enterprise Communications Server Release 5.4 Administration and Feature Description*.

[Table 2-1](#) lists circuit packs by Apparatus Code, Name, and Type. See the *Reference Guide for Circuit Pack Vintages and Change Notices* for circuit packs that pertain to your system.

Table 2-1. Circuit packs and modules supported by DEFINITY

| Apparatus Code                                         | Name                                               | Type          |
|--------------------------------------------------------|----------------------------------------------------|---------------|
| 631DA1                                                 | AC Power Unit                                      | Power         |

| WP-90510       | AC Power Supply (Compact Single-Carrier Cabinet) | Power   |
| WP-91153       | AC Power Supply (Single-Carrier Cabinet)         | Power   |

## Power

There are two basic powering options available with the Release 5si systems. These options include AC and DC. The cabinets and their associated power supplies can be powered by 120/208 volts AC either directly or from a Universal Power Supply (UPS) system. Alternatively, the cabinets and their power supplies may be powered by -48 volts DC from a battery power plant.

The Release 5vs system requires between 80 and 264 or between 90 and 132 volts AC. The system can be powered directly or from the WP-90510 power supply. The DC power option is not available with this system.

Except for the Release 5vs system, each control cabinet in an AC-powered system has an internal battery that provides a short term holdover to protect the system against short power interruptions. This method is known as the Nominal Power Holdover Strategy. The battery is connected so that it automatically provides power if the AC service fails. The time and extent of the holdover varies according to the type of cabinet and to whether or not the system has a duplicated control complex.

[Table 2-2](#) summarizes the response to the interruption of power service in systems without an internal holdover battery.

**Table 2-2. Response to Power Service Interruption (without Internal Holdover Battery)**

| Cabinet Power Interruption                                                        | Less Than Power Supply Decay                             | Greater Than Power Supply Decay    |
|-----------------------------------------------------------------------------------|----------------------------------------------------------|------------------------------------|
| -48 volt DC external power or multicarrier cabinet with UPS, no internal battery. | None on system, some impact on 48-volt powered circuits. | All calls dropped, system reloads. |

The next two tables indicate various responses to the interruption of power service in DEFINITY Systems equipped with an internal holdover battery.

[Table 2-3](#) provides a summary of holdover times. [Table 2-4](#) indicates the types of cabinet power interruption based on power holdover durations.

Table 2-3. Response to Power Service Interruption with an Internal Holdover Battery

| System and Configuration             | Cabinet      | Holdover for Entire Cabinet (in seconds) | Holdover for Entire Control Carrier (in minutes) |
|--------------------------------------|--------------|------------------------------------------|--------------------------------------------------|
| Standard                             | PPNMCC       | 10                                       | 10                                               |
| High, Critical                       | PPNMCC       | 10                                       | 5                                                |
| Standard/High, Critical              | PPN SCC/ESCC | 1/4                                      | 2                                                |
| Standard/High, Critical <sup>1</sup> | EPN MCC      | 15                                       | none                                             |
| Standard/High, Critical              | EPN SCC/ESCC | 1/4                                      | none                                             |

1. The holdover times listed are in effect if the EPN contains a TN775 maintenance circuit pack. However, if the EPN contains a TN775B maintenance circuit pack, the holdover time for the entire cabinet is 10 seconds, and the holdover time for the control carrier is 10 minutes.

Table 2-4. Types of Cabinet Power Interruption

| System and Cabinet | Shorter Holdover Than Entire Cabinet | Longer Holdover than Entire Cabinet, Shorter Holdover than Control Carrier | Longer Holdover Than Control Carrier |
|--------------------|--------------------------------------|----------------------------------------------------------------------------|--------------------------------------|
| PPN SCC            | No calls dropped                     | All calls dropped                                                          | System reloads                       |
| EPN SCC            | No calls dropped                     | All calls dropped                                                          | System reloads                       |

**NOTE:**  
When EPN power is interrupted for greater than the cabinet holdover but less than the control carrier holdover, calls in the control carrier are held for the duration of the interruption but are dropped when power is restored.

Single-Carrier Cabinets

In single-carrier cabinets, there is no internal AC wiring or distribution and no software interaction with the power system. The power supplies themselves take about 250 milliseconds for the voltages to drop below limits.

The control cabinet that houses the Switch Processing Element (SPE) is the only cabinet that has an internal battery reserve. All other control cabinets and port cabinets have the 250 millisecond power supply decay delay, after which all connections and links associated with the cabinets are dropped.

The SPE control cabinet has a battery that furnishes power to the processor memory complex for a minimum of two minutes if the battery is fully charged. This battery is recharged after power is restored, but the charging process is not monitored by the system. The cabinet is not able to detect AC power loss, and it notices only a DC power output failure as the power supply output decays.

The memory contents are preserved, and the processor continues operating during the two minute period. However, the tone-clock circuit pack is not held over, and as a result, no connections are possible. The battery does not supply all the voltages necessary for the internal modem circuit on the processor circuit pack. As a result, no call is originated to INADS, and the switch cannot answer any calls. Thus, the switch cannot report any internal or external alarms during this period. After two minutes (depending on the condition of the battery), the processor and memory are lost, and the system is totally inactive.

If power is restored in less than 250 milliseconds, no calls are dropped. If power is restored between 250 milliseconds and two minutes, all calls are dropped, and memory is maintained. However, since the tone-clock was lost, the system undergoes a reset once the AC restoral process clears all calls and the alarm log (in which errors are retained). The switch keeps a record of the restart in the error log, but it might not detect a power error if the outage is between 1/4 of a second and one minute, during which time only a loss of clock and not a loss of the power failure that caused the loss of clock is logged. After one minute, a power error is logged. If the outage exceeds the battery holdover interval, the error logs and alarm logs are lost (since they cannot be saved to tape). Depending on the size of the system, it can take up to one minute to restore service to the ports. After a power outage of two minutes following the restoral of AC power, the system re-initializes from the tape. It takes about 10 minutes to restore service. Again, if the customer has frequent power outages or critical service needs, an external UPS or DC power system should be considered.

 **NOTE:**

For more power control information, refer to AC-POWER, DC-POWER, and POWER maintenance objects.

# Management Terminals

# 3

## General

---

Maintenance personnel can use the management terminal to initiate the same tests that the system initiates. Test results display on the terminal screen. This chapter illustrates these terminals, explains how to use them, and identifies the typical maintenance tasks that can be performed from them.

## Management Terminals

---

The maintenance interface for the system technician is the management terminal. These terminals may be referred to as an *administration terminal*.

The following terminals are supported as administration terminals:

- 715 BCS
- 2900/715 BCS
- 715 BCS-2

In a standard reliability system, the terminal connects to the Processor circuit pack. In the PPN of a high or critical reliability system, the administration terminal connects to the Duplication Interface circuit pack in the PPN. In the EPN of a standard reliability system or of a high or critical reliability system, the administration terminal connects to the Maintenance circuit pack in the EPN.

Duplication Interface circuit pack A controls and monitors the same environment leads as the Maintenance/Tape Processor in a PPN system without high or critical reliability. Duplication Interface circuit pack A also supports the serial channel to the terminal in a PPN for a high or critical reliability system. The terminal connects to Duplication Interface circuit pack A via a connector, labeled

**DOT** (Duplication Option Terminal), on the back of cabinet A. At any time, the terminal may be disconnected from the Duplication Interface circuit pack A and connected directly to the active processor circuit pack by attaching the terminal to the connector labeled **TERM**. This connection should be made only if the terminal fails to function, since a problem with the Duplication Interface circuit pack A may be present.

Typical tasks that can be performed at the terminal are shown below.

- Display Error and Alarm logs
- Test circuit packs
- Test system functions
- Busyout and release system equipment
- Reset the system
- Monitor the system
- Check status of maintenance objects
- Check system translations

Most maintenance functions performed at the local administration terminal can also be done remotely at the INADS (Initialization and Administration System).

## **Terminal Keyboard**

---

The keyboard is equipped with cursor keys, editing keys, and transaction keys. The three types of keys are described here.

**Cursor Keys:** Cursor keys are used to move the cursor between fields and pages on a screen form. The cursor must be positioned on a field before the user can add or change information in that field.

**Editing Keys:** Two editing keys, BACKSPACE and Clear, are provided. BACKSPACE is used to erase the character at the current cursor position. The cursor moves one position to the left each time the key is pressed. If the cursor is at the first position of the data entry field, it erases the character at the first position. Clear when pressed simultaneously with the Shift is used to clear all data in a field on a screen form. The cursor must be positioned at the field the user wants to clear before Clear is pressed.

**Transaction Keys:** Three transaction keys, Cancel, Enter, and Help, are provided. CANCEL is used to erase a form or command. Once the key is pressed, the system returns the user to the command (tasks request) level and asks for a new command. Enter is used to store the data entered on a screen form in the system's memory. Help displays information on the type of data that can be entered into the field associated with the current cursor position. The system displays all the permissible entries the user can input for that field. This key can be pressed at the "enter command" level to obtain a list of all commands.

## System Login Procedure

---

### Forced Password Aging and Administrable Logins

---

Release 5 and later releases provide enhanced login/password security by adding a security feature that allows users to define their own logins/passwords and to specify a set of commands for each login. The system allows up to 11 customer logins. Each login name can be customized and must be made up of from 3 to 6 alphabetic/numeric characters, or a combination of both. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Password aging is an optional feature that the super-user administering the logins can activate.

#### NOTE:

If several users are logging in and out at the same time, a user may see the message "Transient command conflict detected; please try later". After the "users" have completed logging in or out, the terminal is available for use.

The password for each login can be aged starting with the date the password was created, or changed, and continuing for a specified number of days (1 to 99). The user is notified at the login prompt, 7 days before the password expiration date, that the password is about to expire. When the password expires the user is required to enter a new password into the system before logging in. If a login is added or removed, the "Security Measurement" reports are not updated until the next hourly poll, or a **clear measurements security-violations** command is entered. Once a non-super-user has changed the password, the user must wait 24 hours to change the password again.

Security is enhanced by providing a logoff notification screen to a system administrator at log off while either the facility test call or remote access features are still administered. The administrator can be required to acknowledge the notification before completing the logoff process. Logoff notification is administered on the Login Administration screen.

Release 5 and later releases are delivered to the customer with one customer "super-user" login/password defined. The customer is required to administer additional login/passwords as needed. The super-user login has full customer permissions and can customize any login created.

Login permissions for a specified login can be set by the super-user to block any object that may compromise switch security. Up to 40 administration or maintenance objects commands can be blocked for a specified login in.

Release 5 and later releases commands are grouped into three command categories. Each of the three command categories has a group of command subcategories listed under them, and each command subcategory has a list of command objects that the commands acts on. A super-user can set a users

permissions to restrict or block access to any command in these categories. The three main categories are:

- Common Commands
  - Display Admin. and Maint. Data
  - System Measurements
- Administration Commands
  - Administer Stations
  - Administer Trunks
  - Additional Restrictions
  - Administer Features
  - Administer Permissions
- Maintenance Commands
  - Maintain Stations
  - Maintain Trunks
  - Maintain Systems
  - Maintain Switch Circuit Packs
  - Maintain Process Circuit Packs

These categories are displayed on the Command Permissions Categories form.

## **To Log In**

1. Enter your login name and password on the login and password screen.  
If your password has expired, you see the message:  
Your password has expired, enter a new one.  
Reenter current password:

Login: telmgr

Password:

Your Password has expired, enter a new one.

Reenter Current Password:

New Password:

Reenter New Password:

**Figure 3-1. Password Expiration Screen**

The Password Expiration screen displays when you log in. See [Figure 3-1](#). If your password is expired, you are prompted to enter a new password. If your password is within 7 days of the expiration date, you see:

*WARNING: Your password will expire in X days*

## To Logoff

To logoff, enter “logoff” at the command prompt. You will receive a logoff screen if any of the following is true. If either a or b (see below) is true and an acknowledgment is required, or if any of c, d, or e is true, you need to respond to the “Proceed with Logoff?” prompt on the logoff screen. See [Figure 3-2](#). The response is defaulted to “n”; you will need to enter “y” to override the default.

- a. If Facility Test Call Notification has been enabled for your login (see Adding Customer Logins and Assigning Initial Passwords).
- b. If Remote Access Notification has been enabled for your login (see Adding Customer Logins and Assigning Initial Passwords).
- c. If Alarm Origination is disabled.
- d. If any active major or minor alarm is active.
- e. If any resource is busied out.

### CAUTION:

*To leave the Facility Test Call administered after you logoff poses a significant security risk.*

 **CAUTION:**  
*To leave the Remote Access feature administered after logging off poses a significant security risk if you are using the feature in conjunction with the Facility Test Call feature.*

 **CAUTION:**  
*No alarms report through the INADS interface if Alarm Origination is disabled.*

 **CAUTION:**  
*A busied out resource is one that is out of service. Be sure to verify if a busied resource needs to be released or if the resource should remain busied out.*

Facility Test Call Administered  
Remote Access Administered  
Alarm Origination is currently disabled.  
Active major or minor alarm detected; be sure to resolve it.  
\*\*\* Busied out resource detected; verify if release is needed! \*\*\*\*  
  
Proceed With Logoff: [n]

**Figure 3-2. Logoff Screen**

**To Display a Login**

1. Enter the command **display login [login name]** and press Enter.

The system displays the requested login's:

- Name

- Login type
- Service level
- Disable following a security violation value
- Access to Inads Port value
- Password aging cycle length
- Facility test call notification and acknowledgment
- Remote access notification and acknowledgment

## To List Logins

1. Enter the command **list logins**.

The system displays the following information for all current logins:

- Name
- Service level
- Status (active, inactive, disabled, svn-disabled, void)
- Password aging cycle length

The system displays only those logins with the same, or lower, service level as the requestor.

## To Remove a Login

1. Enter the command **remove login [login name]**.

The system displays the Login Administration form.

2. Press the ENTER key to remove the login, or press Cancel to exit the remove login procedure without making a change.

## To Test a Login

1. Enter your login name at the login prompt.
2. After the user enters the correct login name and password and the login is administered correctly, the system displays the command line interface.

## Administering Customer Logins and Forced Password Aging

---

## Adding Customer Logins and Assigning Initial Password

To add a customer login you must be a super-user, have administrative permissions, and:

1. Enter the **add login [name]** command to access the Login Administration form.
2. Enter your super-user password in the Password of Login Making Change field on the Login Administration form.

The 3- to 6-character login name (characters 0-9, a-z, A-Z) entered with the **add login [name]** command is displayed in the Login's Name field.

3. Enter "customer" in the Login Type field. The system default for the Login Type field is "customer." The maximum number of customer logins of all types is 11.
4. Enter super-user or non-super-user in the Service Level field. Default is none-super-user.
  - "super-user" gives access to the **add, change, display, list, and remove** commands for all customer logins and passwords. The super-user can administer any mix of super-user/non-super-user logins up to a total of ten additional system logins.
  - "non-super-user" permissions are limited by restrictions specified by the super-user when administering the non-super-user login. A non-super-user can change his/her password with permission set by the super-user, however once a password has been changed the non-super-user must wait 24 hours before changing the password again. A non-super-user cannot change other user passwords, login characteristics, or permissions.
5. Enter "y" in the Disable Following a Security Violation field to disable a login following a login security threshold violation,. This field is a dynamic field and only appears on the Login Administration form when the SVN Login Violation Notification feature is enabled. The system default for the Disable Following a Security Violation field is "y."
6. Enter "y" in the Access to INADS Port? field to allow access to the remote administration port,. This field only displays if Acct. has first enabled customer super-user access to the INADS Remote Administration Port. Default is "n".
7. Enter a password for the new login in the Login's Password field. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Valid characters include numbers, and !&\*?;'^(),.- (the system will not echo the password to the screen as you type).
8. Re-enter the password in the Login's Password field. The system will not echo the password to the screen as you type.
9. Enter the number of days (1 to 99) from the current day, that you want the password to expire, in the Password Aging Cycle Length field. If a you enter a blank in this field, password aging does not apply to the login.

10. Decide whether or not to leave the default of yes ("y") in the Facility Test Call Notification? field. If "y" is selected, the user receives notification at logoff that the facility test call feature access code is administered. If you do not want the notification to appear, set the field to "n".

**CAUTION:**

*Leaving The facility Test Call administered after logging off poses a significant security risk.*

11. Decide whether or not to leave the default of yes ("y") in the Facility Test Call Notification Acknowledgment Required field. If "y" is selected, the user is required to acknowledge that they wish to logoff while Facility Test Call is still administered. If you do not want to force the user to acknowledge, set the field to "n". This field appears only if the Facility Test Call Notification field is set to 'y'
12. Decide whether or not to leave the default of yes ("y") in the Remote Access Notification? field. If "y" is selected, the user receives notification at logoff that remote access is still administered. If you do not want the notification to appear, set the field to "n".

**CAUTION:**

*To Leave Remote Access feature administered after logging off poses a significant security risk if you are using the feature in conjunction with the Facility Test Call feature.*

13. Decide whether or not to leave the default of yes ("y") in the Remote Access Acknowledgment Required? field. If "y" is selected, the user is required to acknowledge that they wish to logoff while remote access is still administered. If you do not want to force the user to acknowledge, set the field to "n". This field appears only if the Facility Test Call Notification field is set to 'y'.

## Changing a Login's Attributes

To change a customer login's attributes you must be a super-user, have administrative permissions (specifically, the Administration Permission field must be set to "y" for the super-user), and:

1. Enter the **change login [name]** command to access the Login Administration form.
2. Enter your super-user password in the Password of Login Making Change field on the Login Administration form. The 3- to 6-character login name (characters 0-9, a-z, A-Z) entered with the **change login [name]** command is displayed in the Login's Name field.
3. Enter "customer" in the Login Type field.
4. Enter "super-user" or "non-super-user" in the Service Level field.

### NOTE:

You cannot change your own service level.

5. To disable a login following a login security threshold violation, enter "y" in the Disable Following a Security Violation field. This field is a dynamic field and only appears on the Login Administration form when the SVN Login Violation Notification feature is enabled.
6. To allow access to the remote administration port, enter "y" in the Access to INADS Port? field. This field will only display if Lucent Technologies has first enabled customer super-user access to the INADS Remote Administration Port.
7. Enter a password for the new login in the Login's Password field. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Valid characters include numbers, and !&\*?;'^(),.- (the system will not echo the password to the screen as you type).
8. Re-enter the password in the Login's Password field. The system will not echo the password to the screen as you type.
9. Enter the number of days (1 to 99) from the current day, when you wish the password to expire, in the Password Aging Cycle Length field. If a blank is entered in this field, password aging does not apply to the login.

## Administering Login Command Permissions

Users with super-user permissions can set the permissions of the logins they create. The Command Permissions Categories form displays fields to which a user with super-user permissions can give or limit access. These commands are divided into three categories:

- Common Command
- Administration Commands
- Optional Maintenance Commands

Each of the three main categories have subcategories listed under them that when set to a "y" give permission to use the command sets associated with that category. When the Command Permissions Categories form is displayed for a login, the subcategories fields appear with the fields set to give the login full permissions for that login type. The super-user administering login permissions can set any of these field to deny access to a command category for the specified login. If the super-user making the assignments has full super-user permissions and would like to limit permissions for a category, the super-user can do so by entering "y" in the Additional Restrictions field located under the Administration Category section of the Command Permissions Categories form.

Refer to the Command Permissions Form Entries Tables at the end of this section for a list of command Objects and Actions by:

- Display Administration and Maintenance
- Administer Features
- Administer Permissions
- Administer Stations
- Administer Trunks

The information in the tables will help you to establish command permissions for user logins.

To administer command permissions, log in as super-user and:

1. Access the Command Permissions Categories form by entering **change permissions login [login name]**. When the form is displayed for a login, the default permissions for that "login type" are shown. The super-user administering the login can change a "y" to "n" for each subcategory field.
2. Select a category for the login and enter "y" in each field where permission to perform an administrative or maintenance action is needed. The command object you select must be within the permissions for the login type you are administering.

If the Maintenance option is set to "y" on the Customer Options form, the super-user can enter "y" in the Maintain Switch Circuit Packs? or Maintain Process Circuit Packs fields.

3. A super-user with full super-user permissions (super-user administering the login cannot have the Additional Restrictions field set to “y” for his/her own login) can restrict additional administrative or maintenance actions for a specified login by entering “y” in the Additional Restrictions field on the Command Permission Categories form. Enter the additional restrictions for a login in the Restricted object list fields on the Command Permission Categories Restricted Object List form. You can enter up to 40 command names (object names) to block actions associated with a command category for a specified login.

| toll                              |        | X      |         |           |        |
| trunk-group                       | X      | X      |         |           | X      |

Testing a Login

- 1. Enter your login name at the login prompt.

Login: telmgr

Password:

Screen 3-5. Login Prompt Form

After the user enters the correct login name and password and the login is administered correctly, the system displays the command line interface.

To log into the system, do the following:

1. Turn on the administration terminal. Verify that the screen displays:  
login:
2. Enter your login name, then press Enter. Verify that the screen displays:  
password:
3. Enter your password, then press Enter.

For security reasons, the password is not displayed as you type it. The system verifies that a valid login and password name were entered. If an invalid login or password name was entered, the screen displays:

login incorrect:, and you must repeat the procedure.

If the system recognizes the login and password name, verify that the screen displays the software version.

4. For your terminal type, complete one of the following:

*Terminal Type (Enter 513, 715, VT220, 4410, or 4425): [513]*

- a. If the terminal is a 513 BCT, press Enter. The 513 in brackets [513] is the system default terminal.
  - b. If the terminal is a 610 BCT or a 615 MT that has a 513 emulation cartridge, press Enter.
  - c. If the terminal is a 610 BCT or a 615 MT that does not have a 513 emulation cartridge, enter 4410 and press Enter.
  - d. If the terminal is any other of the types listed, enter the terminal type and press Enter.
5. You can deactivate INADS alarm origination whenever you log in as craft. After you supply the terminal type information requested, the system displays the following if alarm origination is activated on the Maintenance System-Parameters screen:

 **NOTE:**

Unless you are in a special situation, please reduce unnecessary trouble tickets by always answering “y” to the following prompt to suppress Alarm Origination.

Suppress Alarm Origination: [y]

The default answer is yes. If you do NOT wish to suppress alarm origination, enter no. Any other entry defaults to yes. The **test inads-link** command works regardless of whether you have overridden INADS alarm origination.

6. Verify that the screen displays: *enter command:*

You may enter the desired command, such as **display station xxxx** or press Help to obtain the list of permissible commands.

## Command Line Details

---

After a successful login, the administration terminal displays `enter` command : and waits for entry of a command.

A command is made up of multiple words that are typed on the keyboard and that instruct the system to perform a particular task. The system's command structure follows the format: Action, Object, and Qualifier.

The first word entered is the *Action*. It specifies the operation to be done (for example, test, display, or reset).

The second word entered is the *Object*. It specifies the object to receive the action (for example, station, trunk group, or hunt group).

The third word(s) entered is/are the *Qualifier*. The Qualifier is one or more words or digits used to further identify or complete the Object. Depending on the Object used, a Qualifier may or may not be used.

An example of a command line used to do a short test twice on a station with the extension number 1212 is: *test station 1212 short r 2*. In this example, *test* is the Action, *station* is the Object, and *1212 short r 2* is the Qualifier.

Spaces separate the Action, Object, and Qualifier on the command line.

### NOTE:

Command line words do not have to be completely spelled out. All that is required is to type enough letters to make the word unique.

## Screen Forms

---

After the user completes a command line, the terminal displays the appropriate screen form(s). Screen forms are system-generated forms that are formatted to allow easy entry of translation data.

Screen forms enable the user to change the translations of the system by typing parameters on the keyboard. Screen forms also allow system technician to display errors and alarms. Each screen form consists of a title, page number, body area, and a help and error message line. Specific screen forms exist for each type of administrable function.

*DEFINITY Enterprise Communications Server Release 5.4 Administration and Feature Description* contains detailed information and examples of the screen forms generated by the system.

## Switch-Based Bulletin Board

---

This feature will allow a user to leave messages in the system in order to communicate with other system users.

### NOTE:

This feature is not intended as a substitute for the existing procedures for escalating problems, but only as an aid to the existing process.

### Description

The bulletin board service provides an easy interface for the customer and Lucent Technologies to leave messages on the system.

The bulletin board feature makes it easy for the customer to communicate with Lucent Technologies (and vice-versa). For example, when a new load is installed on a switch in the customer's system, Lucent Technologies can leave the customer messages which describe new functionality. This feature also allows Lucent Technologies to keep the customer informed on the progress of trouble items. In addition, the feature can be used by the customer to provide additional information concerning problems that have already been escalated.

### Accessing the Bulletin Board

Any user with the appropriate permissions can log into the system and have access to the bulletin board. User's who have "Maintain System" or "Administer Features" permissions can enter, change, display, print, or schedule to print a message. Users who have "Display Admen" and "Maintain Data" permission can display the bulletin board. Any user who has "Display" permission can display, print, and schedule to print the contents of the bulletin board.

When logging onto the system, users will be notified of any messages on the bulletin board. The notification message will indicate the last time the bulletin board was updated, if any "High-Priority" message exists, and if the bulletin board is 80% or more full. If a "High-Priority" message exists, the command prompt will change to the following message:

- High-Priority Bulletin Board Messages Entered:

After the next command is entered, the default command prompt returns to the screen.

### User Considerations

- Only one user at a time may edit a message on the bulletin board.
- The user must have the proper permissions to access the bulletin board.

- The user must maintain the information stored on the bulletin board. It is the user's responsibility to delete old messages. If the bulletin board is full, any new messages overwrite old messages.

## System Considerations

The Bulletin Board feature provides up to 3 pages of text for each message. Each page is limited to 20 lines of text, and each line of text is limited to 40 characters per line. The first 10 lines of text on page 1 is reserved for Lucent Technologies Service's High-Priority messages.

## System Bulletin Board Commands

---

The system commands "**change bulletin board**," "**display bulletin board**," and existing commands in the user interface are provided for use in the Switch Based Bulletin Board.

### Editing a Bulletin Board Message

1. Log into the system with "Maintain System" or "Administer Features" permissions.
2. Enter the command "**change bulletin-board**."
3. Follow system prompts.

To display messages on the Switch Based Bulletin Board the user must:

1. Log into the system with "Maintain System", "Display Admin", or "Maint Data" permissions.
2. Enter the command "**display bulletin board**."
3. Follow system prompts.

### Editing a Switch-Based Bulletin Board Message

A message may contain up to three pages of information. Message lines 1 through 10 on page 1 are reserved for Lucent Technologies Services *High-Priority* messages (the "init" and "inads" logins can edit the first 10 lines on page one). Pages 2 and 3 will allow up to 20 lines of text, and each line of text may be up to 40 characters per line. Each line of text has an associated date field that is populated automatically by the system each time the line is modified.

The control keys used to edit existing feature forms must be used to edit a message in the Switch Based Bulletin Board. The following characters are allowed for use in the text field:

- Uppercase/Lowercase letters, spaces, numerals, and !@#\$%^&\*()\_-+=[{};'"<>./?.

**NOTE:**  
Tab characters are not allowed. The existing command line interface will cause the cursor to move to the next field if a Tab character is entered.

If a user changes any lines that cause two or more consecutive blank lines, then the bulletin board will be automatically reorganized (upon submittal). Two or more blank lines will be consolidated into a single blank line. If a blank line is at the top of a form, it will also be deleted. This function will help prevent holes in the bulletin board screens as old entries are deleted.

To save a message entered into the bulletin board text field, the user must execute the **save translation** command.

G3V3 software is required for the bulletin board feature. The bulletin board feature, as described in this document is available in G3V4. The G3V3/G3V4 feature on the systems-parameters customers-options form need not be enabled.

The following screen is an example of bulletin board messages between Lucent Technologies and a customer who is having trouble with trunk group translations:

```
display bulletin-board           Page 1 of 3

      Messages (* indicates high-priority)      Date

* AT&T is in the process of                    02/02/95
* investigating your trunk lockup problem.     02/02/95
* The Bulletin Board will be updated as        02/02/95
* information is found.                        02/02/95
* We have identified the problem.               02/02/95
* The trunk you added does not provide          02/02/95
* disconnect supervision, however your trunk   02/02/95
* group was administered as such.               02/02/95
* Please call for details.                     02/02/95
*
We recently added a new trunk group (14)        02/03/95
and have had trunk group members locking up.   02/03/95
We see the error - Thanks for checking.         02/03/95
```

## System Logoff Procedure

The system logoff procedure should be done any time the terminal is not being used. This assures that system translations are not accidentally corrupted. The **monitor system** command, when canceled, automatically causes a terminal user to be logged off and, thus, prevents unauthorized use of the terminal. Use the following procedure to log off the system:

1. Verify that the screen displays: enter command:

2. Enter **logoff** and press Enter. The screen displays: *login*:

If after either logging on as system technician or issuing a system technician command no additional command is issued for 30 minutes, an automatic time-out and logoff occurs. At that time, any alarms in the system previously unreported to INADS are reported. If you are logged in at two separate administration terminals, the system waits until the second terminal times out or until you log off before reporting such alarms to INADS.

**Logoff Notification** alerts system administrators if features that present a significant security risk are enabled. A message displays on the system administration/maintenance interface. Additionally, the user can be required to acknowledge the notification before the logoff is completed.

## DEC VT220 Terminal

The system supports use of the DEC VT220 connected to the system and used in the same way as the other terminals. When logging in, at the terminal-type prompt the user should enter "VT220" to initialize the correct parameters. Keyboard definitions shown in [Table 3-5](#) are in effect:

**Table 3-5. Keyboard Definitions for the DEC VT220 Terminal**

| FUNCTION       | VT220 KEY       | ESCAPE SEQUENCE |
|----------------|-----------------|-----------------|
| Help           | Help            | ESC[28~         |
| Previous Page  | Previous Screen | ESC[5~          |
| Next Page      | Next Screen     | ESC[6~          |
| Cancel         | Remove          | ESC[3~          |
| Execute        | Do              | ESC[29~         |
| Previous Field | F17             | ESC[31~         |
| Next Field     | F18             | ESC[32~         |
| Clear Field    | F19             | ESC[33~         |
| Refresh        | F20             | ESC[34~         |

| Left Arrow     | Left_Arrow      | ESC[D           |
| Update Form    | Find            | ESC[1~          |

## Initialization and Recovery

# 4

When the system is powered up, or when it experiences a catastrophic fault that interrupts its basic functions, the system undergoes a reboot. Besides “reboot,” there are several less severe resets available to the system that allow it to recover from disrupting errors. The user can initiate these resets by using the reset system commands. These commands are used to manually restart the system at various levels, depending on the required test activity. The reset system commands are discussed in [Chapter 8, “Maintenance Commands and Trouble-Clearing Aids”](#).

A system is reset due to a loss of power, or via one of the following:

- Reset commands at the administration terminal.
- Maintenance software, from which the system can reset itself. (This process starts when certain software and hardware errors are detected by the software.)
- “Interchange,” which is a type of reset that can be scheduled as part of daily maintenance in High or Critical Reliability systems.

### **WARNING:**

*When the system is rebooted or reset at level 2, 3, 4, or 5, all voice terminal and attendant console features are adversely affected. Users should be advised of services that are lost and that, as a result, must be reactivated. See “Removing Power” in [Chapter 5, “Routine Maintenance Procedures”](#).*

The administration terminal display and circuit pack LEDs indicate the progress of the recovery process. LEDs are discussed in [Chapter 7, “LED Interpretation”](#).

The sections that follow discuss successful system resets. For each level of reset, a typical administration terminal display is provided. Note that any hexadecimal numbers shown in parentheses, such as "(=8B89)," are only examples and are subject to change. Subsequent sections discuss the recovery process following an SPE-Down Mode and for "duplication interface-processing element communication down."

**⇒ NOTE:**

If any of the diagnostic tests fail, the system may or may not function properly, and the LMM may or may not proceed with the restart. If the LMM does not proceed with the restart, the system goes into SPE-Down Mode. In failure cases, the appropriate part (for example, the Processor circuit pack) should be replaced.

**⇒ NOTE:**

Use and check the results of the **set/get vector** command found in the "Set Commands" section in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#), to determine how much time should be added for the recovery levels. Also, if an update file is applied on a system reset, add from 30 seconds to one minute to the recovery time for that reset.

## **Reset System 1 (System Warm Start)**

This recovery takes about 30 seconds. All stable phone calls remain up. In-progress calls are dropped. No new calls can be made during this time.

In this restart, all software (Oryx/Pecos, drivers, maintenance, and so forth.) is reset.

**Typical Display**

```
RESET 1 (WARM) PERFORMED
```

## **Reset System 2 (System Cold Start Without Translations Loading)**

All Port circuit packs are reset. All telephone sessions are dropped. Telephones begin to reconnect to the switch within 30 seconds. In a large system, reconnection of all telephones may take up to five minutes.

In this restart, all software (Oryx/Pecos, drivers, maintenance, and so forth) is reset. In addition, the TDM Bus and all port circuit packs are reset. Typical displays in a Release 5vs/si system follow:

Typical Display Release 5vs/si and Later Systems

|                            |        |
|----------------------------|--------|
| INTERNAL REGISTER TEST     | PASSED |
| LOCAL BUS TEST             | PASSED |
| ROM CHECKSUM TEST          | PASSED |
| CONTROL STATUS TEST        | PASSED |
| DCACHE TEST                | PASSED |
| ICACHE TEST                | PASSED |
| WRITE BUFFER TEST          | PASSED |
| BTO TEST                   | PASSED |
| TIMER TEST                 | PASSED |
| RESET 2 (COLD_2) PERFORMED |        |

Reset System 3 (System Cold Start With Translations Loading)

Emergency Transfer is invoked. Translations reload from translation card. Depending on the translations, the reloading process could take from five to 30 seconds. Thereafter, all port circuit packs are reset, and all telephone sessions drop. Telephones begin to reconnect to the switch within 30 seconds. In a large system, reconnection of all telephones may take up to five minutes.

In this restart, all software (Oryx/Pecos, drivers, maintenance, and so forth) is reset. After the software is reset, all translations load from translation card. In addition, the TDM Bus and all port circuit packs are reset. Typical displays in a Release 5 vs/si system follow:

Typical Display (TN790 Release 5vs/si and Later Systems)

|                            |        |
|----------------------------|--------|
| INTERNAL REGISTER TEST     | PASSED |
| LOCAL BUS TEST             | PASSED |
| ROM CHECKSUM TEST          | PASSED |
| CONTROL STATUS TEST        | PASSED |
| DCACHE TEST                | PASSED |
| ICACHE TEST                | PASSED |
| WRITE BUFFER TEST          | PASSED |
| BTO TEST                   | PASSED |
| TIMER TEST                 | PASSED |
| RESET 3 (COLD_1) PERFORMED |        |

Reset System 4 (System Reboot)

Emergency Transfer is invoked. The boot image is already in the flash ROM memory. The system reboots immediately after the LMM performs a series of diagnostics on the processor and memory. Translations reload from the translation card. Depending on the translation, the reloading process takes from five to 30 seconds.

Thereafter, all port circuit packs are reset, and all telephone sessions drop. Telephones begin to reconnect to the switch within 30 seconds. In a large system, reconnection of all telephones may take up to five minutes. Typical displays in a Release 5 system follow:

Typical Display (TN790 Release 5 and Later)

|                        |        |
|------------------------|--------|
| INTERNAL REGISTER TEST | PASSED |
| LOCAL BUS TEST         | PASSED |
| ROM CHECKSUM TEST      | PASSED |
| CONTROL STATUS TEST    | PASSED |
| DCACHE TEST            | PASSED |
| ICACHE TEST            | PASSED |

|                                |                                       |
|--------------------------------|---------------------------------------|
| WRITE BUFFER TEST              | PASSED                                |
| BTO TEST                       | PASSED                                |
| MEM CONFIG TEST                | PASSED                                |
| MEMORY FUNCTIONAL TEST         | PASSED                                |
| MEMORY MODULE A STUCK BIT TEST | PASSED                                |
| MEMORY MODULE A PARITY TEST    | PASSED                                |
| MEMORY MODULE A BURST TEST     | PASSED                                |
| MEMORY MODULE B STUCK BIT TEST | PASSED                                |
| MEMORY MODULE B PARITY TEST    | PASSED                                |
| MEMORY MODULE B BURST TEST     | PASSED                                |
| MEMORY MODULE C STUCK BIT TEST | PASSED                                |
| MEMORY MODULE C PARITY TEST    | PASSED                                |
| MEMORY MODULE C BURST TEST     | PASSED                                |
| VIRTUAL MEMORY TEST            | PASSED                                |
| EXCEPTION TEST                 | PASSED                                |
| TIMER TEST                     | PASSED                                |
| MTP TEST                       | PASSED                                |
| SANITY TIMER TEST              | PASSED                                |

## Reset System 5 (System Reboot and Run All 24-Hour Tests)

Emergency Transfer is invoked. The LMM performs a series of diagnostics on the processor, on memory, and on memory card. Some diagnostics perform twice. This takes less than three minutes.

The boot image is already in the flash ROM memory. The system reboots immediately after the LMM performs a series of diagnostics on the processor and memory. Translations reload from the translation card. Depending on the translation, the reloading process takes from five to 30 seconds. Thereafter, all port circuit packs are reset, and all telephone sessions drop. Telephones begin to reconnect to the switch within 30 seconds. In a large system, reconnection of all telephones may take up to five minutes. Finally, scheduled maintenance is initiated. Typical displays in a Release 5vs/si system follow:

**Typical Display (TN790 Release 5 and Later)**

|                                |        |

---

## Reset System Interchange (High or Critical Reliability Systems Only)

SPE-interchange (system hot start) is denoted by an "i" in the initcauses log. This restart is used to transfer control from the Active SPE to the Standby SPE in the least disruptive manner. Interchange (i) is the most transparent of all levels of restart and causes no disruption of service to telephone users. This restart takes fewer than two seconds.

**⇒ NOTE:**  
The administration terminal is logged off. No diagnostics are performed, and only the login prompt displays.

An interchange (i) can be performed in one of the following three ways:

- a. System Technician-Demanded: using the **reset system interchange** command
- b. Scheduled Maintenance
- c. Software-Requested: The software requests the interchange when it determines that the Standby SPE is healthier than the current Active SPE

**⇒ NOTE:**  
For most SPE alarms, interchange to the standby SPE is achieved using the hot restart (i). However, there may be other alarms for which another restart level (1 through 4) must be used to achieve a transition to the Standby SPE. See [Table 6-1, "Software-Requested Interchanges Caused by Alarm Conditions"](#) in [Chapter 6, "Reliability Systems: A Maintenance Aid"](#), for a complete list of alarms and restart levels.

## Procedure for SPE-Down Mode

Due to fatal hardware and software problems, it is possible for a system to go into SPE-Down Mode. In this mode, the system invokes emergency transfer and does not provide any other service. Moreover, while in this mode, the software does not (or cannot) run at all. In a high or critical reliability system the system goes into SPE-Down mode **only when both SPEs go into SPE-Down mode**.

There is an interface to the system by maintenance. The Processor circuit pack, is responsible for maintenance in a standard reliability system. In a high or critical reliability system, the maintenance is provided by the A-carrier Duplication Interface (DUPINT-A) TN772 circuit pack with help from the processor.

The administration terminal, which connects directly to the processor in a standard reliability system and to DUPINT-A in a high or critical reliability system, provides a very limited interface to the system. Technicians can display alarms or restart the system. Only a subset of control complex alarms displays.

The following are sample displays for SPE-Down mode and the alarms displayed.

*Display for SPE-Down in a Standard Reliability system:*

```
*****SPE DOWN MODE*****
You can display alarms and reset system(4).
SPE_DOWN->
```

[Screen 4-1](#) and [Screen 4-2](#) show all possible SPE-Down alarms in a standard reliability system and in a high or critical reliability system, respectively.

| DISPLAY ALARMS: |              |           |                |            |              |               |
|-----------------|--------------|-----------|----------------|------------|--------------|---------------|
| Physical Name   | Logical Name | On Board? | Alternate Name | Alarm Type | Date Alarmed | Date Resolved |
| -----           | PROC_BD      | y         | -----          | MAJOR      | -----        | -----         |
| -----           | MEM_BD_0     | y         | -----          | MAJOR      | -----        | -----         |
| -----           | M_BUS        | y         | -----          | MAJOR      | -----        | -----         |
| -----           | MAINT*       | y         | -----          | MAJOR      | -----        | -----         |
| -----           | NETCON_BD    | y         | -----          | MAJOR      | -----        | -----         |
| -----           | TAPE_UNIT    | -----     | -----          | MAJOR      | -----        | -----         |
| -----           | NO_TAPE      | -----     | -----          | MAJOR      | -----        | -----         |

Screen 4-1. Display Alarms Command

\* The “MAINT” designation is used for PR-MAINT.

*Display for SPE-Down in a High or Critical Reliability System:*

\*\*\*\*\*SPE DOWN MODE\*\*\*\*\*  
You can display alarms [a|b] and reset system(4) [a|b].  
SPE\_DOWN->

[Screen 4-2](#) shows only one SPE-Down alarm in a high or critical reliability system after entering the **display b** command:

|                   |              |           |                |            |              |               |
|-------------------|--------------|-----------|----------------|------------|--------------|---------------|
| DISPLAY ALARMS B: |              |           |                |            |              |               |
| Physical Name     | Logical Name | On Board? | Alternate Name | Alarm Type | Date Alarmed | Date Resolved |
| -----             | PROC_BD      | y         | -----          | MAJOR      | -----        | -----         |

Screen 4-2. Display Alarms (one SPE-Down)

 **NOTE:**  
A standard reliability system tries to restart itself every 20 minutes. A high or critical system tries to restart itself every 10 minutes.

The first step is to determine the location of the problem. It is possible for two or more circuit packs to have failed. It is also possible for a fatal problem with one circuit pack to affect another circuit pack. This is especially true for the Processor and Memory circuit packs, where a failure in one affects the other. All three of the following methods should be employed to determine where the fatal fault lies.

1. Use **display alarms** command:  
  
Issuing the **display alarms [a | b]** command at the administration terminal shows where maintenance thinks the problem lies. The alarms are a good indication of why the system went down. They should be used with the following two methods.
2. Observe red LEDs:  
  
Observe the red LEDs on the circuit pack to determine where software or processor firmware (LMM) had a problem.
3. Use the **reset** command:  
  
In 286 system, issuing the **reset** command (Standard Reliability system) or the **reset [a | b]** command (High or Critical Reliability system) causes the system to attempt a **reset system 4**. Observe all the diagnostics on the screen, and note if the LMM has a problem with any of the diagnostics, as this information should give a good indication of where the problem lies.

The procedure to get a system out of SPE-Down mode follows.

 **NOTE:**

**This is important!** If you cannot complete the first step or have problems with the maintenance interface, then the first step should be to replace the Processor circuit pack. In a high or critical reliability system the DUPINT-A circuit pack can also cause SPE-Down.

1. If the alarms indicate a tape failure, replace the tape or tape drive and go to Step 3. Otherwise, verify that there is a good tape in the tape drive. If a tape is not present or if either the tape or tape drive is defective, then restarting the system using the **reset** command causes the system to go down again.
2. In a High or Critical Reliability system, select a carrier to repair first.

When it is possible to accurately determine the location of the problem, use the **display alarms [a | b ]** command to display alarms for both SPEs and check the red LEDs on the processor complex circuit packs. Select the carrier where the red LEDs indicate the circuit pack alarmed. Bring up the system on that carrier and then refer to Standby SPE Maintenance documentation to repair the Standby SPE.

In a Standard Reliability system or after a carrier is chosen in a High or Critical Reliability system, determine which circuit pack is defective by displaying alarms and observing the red LEDs (as discussed previously). Depending on the alarms, use [Table 4-1](#) to replace the circuit packs indicated, one by one, in the order shown.

Table 4-1. Order of Circuit Pack Replacement

| Alarm         | Suggested Circuit Packs<br>To Replace                |
|---------------|------------------------------------------------------|
| PROC_BD       | 1) Processor<br>2) Network Control                   |
| MEM_BUS       | 1) Processor<br>2) Network Control                   |
| PROC_MEM      | 1) Processor                                         |
| OFFBD_MEM     | 1) Processor<br>2) Network Control                   |
| INVALID_ERR   | 1) Processor<br>2) Network Control                   |
| MAINT_BD      | 1) Processor<br>2) Network Control                   |
| NETCON_ABSENT | 1) Network Control<br>2) Processor                   |
| NO_CARTRIDGE  | 1) Memory Card<br>2) Network Control<br>3) Processor |

Procedure for Duplication Interface —  
Processing Element Communication  
Down

In a High or Critical Reliability system, it is possible for both SPEs to stop communicating with the A-carrier TN772 Duplication Interface (DUPINT-A) circuit pack. Thus, the DUPINT-A, which is in charge of maintenance, prints the following message on the administration terminal:

Duplication Interface-Processing Element Communication down

The system may continue to function on one of the SPEs. However, the system is not able to provide any interface to the administration terminal.

If the system is still providing service, connect the administration terminal to the Active SPE (check the amber LED on the Processor circuit pack). Then, if

4 Initialization and Recovery

*Procedure for Duplication Interface — Processing Element Communication Down*

Page 4-12

software provides a login on the administration terminal, you can determine the problems via the **display alarms** command.

If the system is not providing service, there is a problem with the Processor circuit packs and/or DUPINT-A. Replace these circuit packs, one by one, until the system starts functioning normally.

# Routine Maintenance Procedures

# 5

The following general purpose maintenance procedures may be used with other repair strategies to clear system-alarmed and user-reported troubles.

## Suppress Alarm Origination [y]

When logged in as “craft”, no alarms are reported to INADS. After logging off, INADS automatically reactivates, and any unresolved alarms are reported to INADS.

Also, when logged in as “craft,” an automatic logoff of the terminal occurs after 30 minutes of non-use. At that time, any unresolved alarms are reported to INADS. If you are logged in as “craft” at 2 different terminals, the logoff occurs when the second terminal remains unused for 30 minutes.

 **NOTE:**  
The **test inads-link** command functions even if INADS Alarm Origination is overridden.

## Handling Control Circuit Packs

### PPN Control Circuit Packs

 **WARNING:**  
*It is NOT recommended that you reseal circuit packs unless the documentation specifically instructs you to do so. If it is required to reseal a*

*circuit pack, follow the instructions below which explain how to unseat, reseal, and replace circuit packs.*

The procedures for unseating, reseating, and replacing control circuit packs vary depending on the system configuration. Therefore, before performing these maintenance activities, refer to the appropriate procedure below.

## Procedure for a Standard Reliability Cabinet

To unseat a control circuit pack:

1. Remove power from the PPN using the procedure provided in [“Removing Power”](#).
2. Slide the latch pin upward to unlock the locking lever.
3. Pull down on the locking lever until the circuit pack disconnects from its socket.
4. Pull the circuit pack just enough to break contact with the backplane connector, but do not remove it from the cabinet.

To reseal a circuit pack:

1. Push the unseated circuit pack back into the backplane connector.
2. Lift the locking lever until the pin engages.
3. Restore power to the PPN using the procedure provided in [“Restoring Power”](#)

To replace Control circuit packs:

1. Remove power from the PPN using the procedure in the [“Removing Power”](#)
1. Unseat the circuit pack.
2. Slide the circuit pack out of the slot.
3. Replace the circuit pack as per the following procedure:

**NOTE:**

If a new circuit pack does not correct the problem, install the original circuit pack.

**NOTE:**

If you are replacing a TN790 circuit pack, refer to [“TN790 Processor Circuit Pack \(Memory\)”](#) in this chapter.

To install a new circuit pack or return the original one to service:

1. Carefully insert the circuit pack and push it all the way into its mounting slot.

2. Lift the locking lever until the latch pin engages.
3. Restore power to the PPN using the procedure in ["Restoring Power"](#).
4. Verify that the circuit pack LED indications are correct.
5. Test the replaced control circuit pack by issuing the system technician commands after power has been restored.

## Network Control Circuit Pack

---

### WARNING:

*When a TN777B Network Control circuit pack is reseated or replaced, the correct date and time setting must be manually entered and verified.*

The TN777B Network Control Pack holds a translation card. Before this circuit pack is handled, remove the translation card.

1. Check that the "card in use" LED is not lighted. Otherwise, removing the memory card may damage the data recorded on it.
2. Carefully pull the translation card from the card slot.

To insert the card into the slot:

1. Take the translation card and hold it in front of you so that the card's label is facing to your left.
2. With the card in this position, insert the shorter edge of the card into the mounting slot. Then, gently push the card forward until you feel some resistance at the opposite edge of the card. Once you feel this resistance, the card is inserted. About 3/4 of an inch of a fully inserted card should appear outside of the card slot.

### WARNING:

*Remember, assuming you are directly facing the circuit pack, the card label should be facing to your left. If this is not the case, remove the card and start again.*

3. Test the inserted card by issuing the **test card-mem** system technician command.

## EPN Control Circuit Packs

---

Control circuit packs are unseated, reseated, replaced, and tested in the same way as Port circuit packs. Refer to the ["Handling Control Circuit Packs"](#) section in this chapter. Note the special precautions required when handling the TN776 and TN570 Expansion Interface (EXP-INTF) circuit packs and the EPN TN768 and TN780 Tone-Clock circuit packs.

## EPN Expansion Interface Circuit Packs

If the system has high or critical reliability, verify that the Expansion Interface to be unseated or replaced is NOT a part of the Active Expansion Interface Link. Issue the **status system** command. If the Expansion Interface circuit pack is shown to be a part of the Active Expansion Interface Link, use the **set expansion-link PCSS** command to make the current Standby link the Active one.

## EPN Tone-Clock Circuit Packs

If the EPN has redundant Tone-Clock circuit packs, make sure the Tone-Clock to be unseated or replaced is the Standby circuit pack. Issue the **status system** command. If the Tone-Clock is shown as Active, use the **set tone-clock PC** command to make the current Standby Tone-Clock the Active one.

## TN790 Processor Circuit Pack (Memory)

---

Unless upgrading memory, the TN790 must have the same number of SIMMs as the replaced circuit pack.

### CAUTION:

*Be sure to use a Lucent Technologies-provided SIMM. Other brands may have incompatible edge connectors and could produce unpredictable results.*

## Removing Power

---

When power is removed, the following features deactivate:

- Attendant Trunk Group Control
- Automatic Callback
- Call Park
- Make Busy for Direct Department Calling (DDC) and Uniform Call Distribution (UCD)

The procedures for removing power vary depending on the system configuration. Before performing these activities, refer to the following appropriate procedure.

### WARNING:

*Before powering down a cabinet or carrier that contains DEFINITY AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging the AUDIX software. Instructions for powering down this unit are in the*

["DEFINITY AUDIX System Power Procedures"](#) below, on the circuit pack, and in DEFINITY AUDIX documentation.

## **DEFINITY AUDIX System Power Procedures**

---

### **Manually Power Down AUDIX System**

A yellow caution sticker on the system's power unit notifies technicians to shut down the DEFINITY AUDIX System prior to powering down the system.

1. Using a pointed object, such as a paper clip or pen (do not use a pencil), press the Boot/shutdown button. The button is located at the top right portion of the front panel.
2. Hold the boot/Shutdown button in until the LCD display flashes the message MSHUT .
3. Release the Boot/Shutdown button.

#### **NOTE:**

The DEFINITY AUDIX System takes about five minutes to shut down. The "heartbeat" indication on the display continues to flash.

### **Procedure for a Single-Carrier Cabinet PPN**

---

This procedure applies to a single-carrier cabinet PPN with or with high or critical reliability, where the cabinet is powered by either an AC or a DC power source.

#### **WARNING:**

*If a translation card alarm is present, or if a translation card problem is suspected, do not save translations of the translation card that is provided with the system.*

#### **CAUTION:**

Check that the *translation card is present in the system or check that the translation card is in the TN777B Network Control circuit pack.*

4. At the administration terminal, enter the **save translation** command.
5. In a standard reliability system on the Processor circuit pack in the PPN, and on the Maintenance circuit pack in the EPN, set the Emergency Transfer switch to "ON."

#### **CAUTION:**

*When removing power, Error Log information is lost. If the data is to be retained, enter the **reset system 4** command. This command*

*restarts the system and may take several minutes. Wait for the login prompt before proceeding.*

6. To remove power from the cabinet:

- In an AC-Powered system, turn off the power in each cabinet individually. The ON/OFF switch is located at the rear of the carrier behind the WP-91153 Power Unit.
- In a DC-Powered system, turn off the power in each cabinet individually. The ON/OFF switch is located at the rear of the cabinet, behind the 676B Power Unit.

## **Procedure for a Single-Carrier Cabinet EPN**

---

This procedure applies to a single-carrier EPN with or without high or critical reliability, where the cabinet is powered by either an AC or a DC power source.

**Power may be removed from the EPN without affecting the PPN.**

**⇒ NOTE:**

In a high or critical reliability system, if power is to be removed from an individual cabinet only, make sure that the affected cabinet does not contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. To remove power from the cabinet:

- In an AC-Powered system, turn off the power in each cabinet individually. The ON/OFF switch is located at the rear of the cabinet behind the WP-91153 Power Unit.
- In a DC-Powered system, turn off the power in each cabinet individually. The ON/OFF switch is located at the rear of the cabinet behind the 676B Power Unit.

## **Restoring Power**

---

The procedures you need to restore power depend on the system configuration. Before performing these activities, refer to the following appropriate procedure.

**⇒ NOTE:**

If the AUDIX unit has been powered down, refer to [“Power Up the AUDIX System” on page 5-8](#).

## Procedure for Single Carrier Cabinet PPN

---

This procedure applies to single-carrier cabinet PPNs with or without high or critical reliability, where the cabinet is powered by either AC or DC power.

### ⇒ NOTE:

In a high or critical reliability system, if power is to be removed from an individual cabinet only, make sure that the affected cabinet does not contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. Restore power as follows:

### ⇒ NOTE:

If the cabinet is powered by a 676B Power Unit, the 676B must have been powered off for at least 10 seconds before being powered on. If not, the 676B Power Unit does not restart.

- In an AC-Powered system, turn on the power in each cabinet individually. The ON/OFF switch is located at the back of the cabinet behind the WP-91153 Power Unit.
  - In a DC-Powered system, turn on the power in each cabinet individually. The ON/OFF switch is located at the back of the cabinet behind the 676B Power Unit.
2. Make sure that the translation card is properly inserted into the slot.
  3. The system now goes through the rebooting process. The translations are loaded from the translation card, and rebooting takes about three minutes.
  4. When system power is restored, the appropriate display is shown on the administration terminal.

The display is the same as a **reset system 4** that is described in [“Reset System 4 \(System Reboot\)”](#) in [Chapter 4, “Initialization and Recovery”](#).
  5. After the system reboot is finished and all trouble is cleared, return the EMER XFER (Emergency Transfer) switch(es) to AUTO. This restores the system to the normal operating mode.
  6. Reset the time using the **set time** command. Use **display time** command to verify.

## Procedure for Single-Carrier Cabinet EPN

---

Power may be restored to the EPN without affecting the PPN.

This procedure applies to single-carrier cabinet EPNs with or without high or critical reliability, where the cabinet is powered by either AC or DC power.

 **NOTE:**

In a high or critical reliability system, if power is to be removed from an individual cabinet only, make sure that the affected cabinet does not contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. To restore power to the cabinet:

 **NOTE:**

If the cabinet is powered by a 676B Power Unit, the 676B must have been powered off for at least 10 seconds before being powered on. If not, the 676B Power Unit does not restart.

- In an AC-Powered single-carrier cabinet system, turn on the power in each cabinet individually. The ON/OFF switch is located at the back of the cabinet behind the WP-91153 Power Unit.
  - In a DC-Powered single-carrier cabinet system, turn on the power in each cabinet individually. The ON/OFF switch is located at the back of the cabinet behind the 676B Power Unit.
2. The EPN circuit packs is inserted and the EPN is available for call processing.
  3. After the system reboot is finished and all trouble is cleared, return the Emergency Transfer switch to AUTO. This restores the system to the normal operating mode.

## Power Up the AUDIX System

1. Using a pointed object such as a paper clip or a pen (do not use a pencil), press the Boot/Shutdown button.
2. Hold the boot/Shutdown button in until the display indicates the message, BTEST, steady on.
3. Release the Boot/Shutdown button. the DEFINITY AUDIX system takes approximately 5 minutes to power up.
  - The display has the following sequence of steady on messages:
    - OSINIT
    - OS
    - AINIT
    - ADX

- The DEFINITY AUDIX System is now powered up. When the system is in the active state, the display indicates ADX, and the red LED is off.

**NOTE:**

When powering up, the DEFINITY ADUXI System automatically reboots. This sequence may show an MD or MJ ADX alarm in the display until the system has powered up. When the system has completed its power up sequence, the display reads: ADX.

## Troubleshooting Control Cabinet Power Units

---

1. Check that the translation card is in the TN777B circuit pack and enter the **save translation** command.
2. On the Processor circuit pack in the PPN, set the EMER XFER (Emergency Transfer) switch to ON. This locks the system in the Transfer Mode until the trouble is cleared.

**WARNING:**

*Electrostatic discharge can destroy or severely damage integrated circuits or circuit packs. Always wear the electrostatic discharge (ESD) wrist grounding strap when handling circuit packs. Connect the wrist strap to one of the metal tabs located on the lower left or right side of one of the carriers.*

3. Unlatch the locking lever and unseat the power unit.
4. Unseat all the *control* circuit packs.
5. Reseat the power unit. If the yellow LED on the suspect power unit lights immediately, the control circuit packs can be presumed to be healthy. If the yellow LED on the suspect power unit does **not** light immediately, continue with the next step.
6. Reseat the circuit packs one at a time while observing the LED on the power unit.
  - a. If the yellow LED on the power unit lights when a specific circuit pack is reseated, unseat and reseat the same circuit pack again to rule out a transient problem. If the yellow LED lights again, the problem is with the circuit pack, and the power unit is functioning properly. Replace the defective circuit pack.
  - b. If the yellow LED on the suspect power unit does **not** light during the reseating of the control circuit packs, continue with the next step.
7. Unseat all *port* circuit packs.

8. Reseat the port circuit packs one at a time following the same steps outlined above for control circuit packs.
9. If none of the control or port circuit packs appears to be defective, replace the power unit.
10. When the system reboot has completed, return the EMER XFER (Emergency Transfer) switch to AUTO. This restores the system to the normal operating mode.

## Replacing Components (Release 5vs or Later)

---

Components within the Release 5vs can be replaced while the unit is attached to the wall. Also, if the wires and cables at the back of the cabinet are neatly bundled, these wires and cables need not be disconnected.

[Figure 5-1](#) and [Figure 5-2](#) provide views of the power supply sub-assembly. [Figure 5-3](#) provides a view of the fan sub-assembly. The sections following the figures discuss how to disassemble the unit and then replace the power supply or fans within the unit.

### CAUTION:

*When replacing either the power supply or the fans within a Release 5vs unit that is already attached to the wall, you should disconnect the entire fan panel from the unit. Otherwise, if the fan panel is left to dangle, the cable assemblies leading out from the fans (which are connected to the fan panel) and into the backplane might become damaged or disconnected from the backplane.*

**Figure 5-1. Power Supply Sub-Assembly (Outside View)**

## **Power Supply**

1. Remove the four screws on the top of the cabinet.
2. Remove the four screws from the fan panel at the rear of the unit. Then remove the fan panel.
3. If the unit is attached to the wall, disconnect the entire fan panel.
4. Extending out from the power supply is a cord consisting of numerous individual wires. This cord plugs into the backplane. A Burndy connector is at the end of the cord. Squeeze the sides of the connector to release the latch. Then pull the connector off of the backplane.
5. Remove the power supply from the unit. Once the power supply is removed, disconnect the AC power cord.
6. Reconnect the AC power cord, insert the new power supply, reconnect the Burndy connector and the cord, reinsert (if removed) the reconnected fan panel, screw the fan panel back onto the unit, and reinsert the screws on the top of the unit.

**Figure 5-2. Power Supply Sub-Assembly (Inside View)**

**Figure 5-3. Fan Sub-Assembly**

## Fans

1. At the back of the unit, remove the four screws from the fan panel. Then remove the panel.
2. If the unit is attached to the wall, disconnect the entire fan panel.

### CAUTION:

*The power cord for each fan extends from a plug on the backplane. Do not tug on any of these cords. Otherwise, the corresponding plug on the backplane might come off.*

3. Each fan has a power cord. At the end of each power cord is a plug and receptacle. Disconnect the plug for each fan that is to be replaced. Then remove the appropriate fan(s).
4. Install the new fan(s), reconnect the fan plug(s), reconnect the fan panel (if disconnected), and screw the fan panel back onto the back of the unit.

## System Backup

System translations can be restored by using the data on the system or on the backup translation card if the length of power failure is appropriate for the corresponding system. [Table 5-1](#) lists the requirements:

**Table 5-1. Requirements for System Backup**

| Minimum Length<br>of Power Failure<br>(in Minutes) | System                                                     |
|----------------------------------------------------|------------------------------------------------------------|
| 2                                                  | Single-Carrier Cabinet Standard System                     |
| 2                                                  | Single-Carrier Cabinet High or Critical Reliability System |

## Save Translation

To ensure that the translation card contains the most recent copy of the translation data, the system can automatically save the translation data onto the translation card every 24 hours. Automatic daily backup of the system translation data is controlled by an entry in the system parameters that defaults to "daily".

If many translation data changes are made, it is recommended that you save the translation data using the **save translation** command. This action saves the new changes to the translation card without having to wait for the next automatic daily translation backup.

 **NOTE:**  
The **save translation** command blocks all maintenance commands except some **list**, **display**, **monitor**, and **status** commands.

The system blocks the execution of any commands that change translations or trigger a maintenance action (for example, **test board**, **busyout port**, and so forth). The **status card-mem** command is blocked during the save translation operation.

In a high or critical reliability system, if the **save translation** command is entered without a qualifier, an attempt is made to save the translations on *both* the Active and Standby SPE. If the command is qualified with either "spe-active" or "spe-standby," the translations are saved only on the specified SPE. For example, if, when the **save translation** command was issued, the translations were successfully saved on the active SPE's translation card, but were not successfully saved on the standby SPE's translation card, issue the **save translation spe-standby** command to save the translations on the standby SPE as well.

The system blocks the execution of any commands that change the translation, access a translation card, or trigger a maintenance action.

**CAUTION:**

*It is recommended that "save translation" be performed after business hours so that dial tone delays are not encountered.*

**CAUTION:**

*Do not issue the "save translation" command when alarm conditions are present.*

## Save Recorded Announcements

---

In a high or critical reliability system, if the **save announcements** command is entered without a qualifier, an attempt is made to save the integrated announcements on *both* the Active and Standby SPE. If the command is qualified with either "spe-active" or "spe-standby," the integrated announcements are saved only on the specified SPE. For example, if, when the **save announcements** command was issued, the integrated announcements were successfully saved on the Active SPE's translation card, but were not successfully saved on the Standby SPE's translation card, then you would issue the **save announcements spe-standby** command to save the announcements on the Standby SPE as well.

**WARNING:**

*The "save announcements" commands should only be used after business hours or when the system is operating during a low usage period. The system takes about 45 minutes to one hour to transfer the recorded announcements from the Announcement circuit pack to the system tape. During this interval, use of the administration terminal is blocked for other activities until the command completes.*

## Translation Card Backup

---

In case of a power failure, the system translations can be restored using the translation card. Translation data can be saved during the daily scheduled maintenance. However, if the translation data changes frequently, translations should be saved frequently to ensure that the most up-to-date information is kept.

Note that only one translation card is provided with the system. It is recommended that the customer purchase additional translation cards to serve as backup or replacement. Translation cards should be alternated periodically.

It is also recommended that backup copies of the translation data be made weekly, or after many changes have been made to the translation data. This

minimizes the loss of recent translation data changes if the translation card in the system becomes damaged.

Enter the **save announcements** command to save the recorded announcements in the system on the translation card.

 **NOTE:**  
A 10 MByte or larger translation card is required to save and restore announcements.

The system takes about 10 minutes to complete this task. Because the terminal is unavailable during this time, it is recommended that this command be used after business hours. During this time period, the terminal cannot be used to administer the system until the transfer is complete; however, all other terminals (if provided) are allowed to perform administration procedures.

Enter the **restore announcements** command to restore the recorded announcements from the translation card back into system memory. The system takes about 22 minutes to complete this task. After completing the task, the system performs an audit to make sure that the announcements on the announcement circuit pack match the announcements administered in the system.

The working copy of the announcements is stored on the announcement circuit pack. A backup copy should be made on a 10 Mb or larger translation card. The following procedure is used to make a backup Memory Card:

1. Remove the translation card from the Netcon circuit pack.
2. Insert the backup translation card into the Netcon circuit pack.
3. Enter the **save translation** command and press Enter. This instructs the system to take all translation information in memory and transfer it into the translation card. The following display appears:

```
save translation                                SPE A

                                SAVE TRANSLATION

Processor                Command Completion Status        Error Code
SPE_A                    Success                            0

Command successfully completely

enter command:
```

Screen 5-1. Save Translation — SPEA

- 4. Verify that the command successfully completes. If not, an error message appears. In such a case, refer to the “Translation Card Errors” section.
- 5. If the system is equipped with a TN750 Announcement circuit pack, the recorded announcements can be saved using the **save announcement** commands. Enter the command and press Enter. The following display appears:

save announcements

SAVE ANNOUNCEMENTS

| Processor | Command Completion Status | Error Code |
|-----------|---------------------------|------------|
| SPE_A     | Success                   | 0          |

Command successfully completely

enter command:

Screen 5-2. Save Announcements Screen — SPEA

- 6. Verify that the command successfully completes. If not, an error message appears. In such a case, refer to the “Translation Card Errors” section.
- 7. Remove the backup translation card and insert the original translation card.
- 8. Label the backup translation card with the date and time it was updated. A special notation on the card clearly distinguishes it from other cards.
- 9. Store the backup translation card in a secure place.

Translation Card Errors

Translation card-related failures may occur for two reasons: the card is at fault, or the Netcon circuit pack is at fault. The following is a list of the error messages and recommended responses to each.

- 1. Cannot access file storage area—Implies that the wrong translation card may be installed.  
*Response:* Check to see which translation card is installed. If the correct one is installed, test it.
- 2. Cannot turn on 12 volt power supply—Implies that something may be wrong with the Netcon circuit pack, which contains the power supply.

*Response:* Test the 12-volt power supply by entering the **test card-mem** command from the terminal. Executing this command causes the system to run Test 701 (12 Volt Power Supply Test). If the power supply test fails, replace the Netcon circuit pack. Then repeat whichever command failed.

3. Invalid directory on Card-Mem — The translation card needs refreshing. Run **test card-mem** and be sure all tests pass.
4. Card-Mem is unusable — Something is wrong with the translation card. Replace the translation card.
5. Could not write to Card-Mem — Something is wrong with the translation card. Test the translation card.
6. Cannot access mass storage system now; try again later — The storage system is in use. Try again later.
7. Request is incompatible with currently running operations — The storage system is in use. Try again later.
8. Card-Mem is not inserted in the system — Insert the translation card.
9. Cannot access file; wrong type of Card-Mem is inserted — The correct translation card for the desired operation has not been inserted. Load the appropriate translation card.
10. File size exceeded — There is no more file space. Call your Lucent Technologies representative.
11. Upgrade Memory Card inserted — The system upgrade translation card may have been inserted instead of the translations card. Insert the translation card.
12. Card-Mem is write-protected — The switch on the top side of the translation card is incorrectly set. Move the switch to the down position.
13. Transmission problem; please try later — There is a problem communicating with the announcement circuit pack. Check to see that the announcement circuit pack has been correctly administered. Use the **change data <extension\_number>** command. Verify that the announcement circuit pack is in the correct slot in the processor. If so, wait and retry.
14. Command has been aborted; please try later — The command was pre-empted. Try again later.
15. Saved copy of translations is unusable — The copy of the translations on your translation card is faulty. Re-enter the **save translation** command.

## Software Upgrade

---

The software upgrade feature permits a DEFINITY System to upgrade its software to include new features and to fix software problems. Performing an upgrade on a system without high or critical reliability requires a **reset system 4** (reboot) and thus causes a service disruption. Performing an upgrade on a system equipped with high or critical reliability requires only a **reset system 2** (Cold-2) restart that is less disruptive.

### **WARNING:**

*No administration changes should be entered during the following software upgrade procedure. There can be substantial time gaps between steps and, since the system cannot prevent administration changes, it is up to the system technician to make sure that none are attempted during the entire software upgrade process.*

### **NOTE:**

This section does not apply to processor hardware upgrades such as upgrading a 386 system to a Release 5vs/si or later system. See “Upgrades and Additions/Software Upgrades”.

## Procedure on a System using Translation Cards

---

The software in a Release 5vs/si or later system can be upgraded to include new features and to fix software problems. Performing an upgrade on a standard reliability system requires a Reset System 4 (reboot) and thus causes a service disruption. Performing an upgrade on a high or critical reliability system requires only a Reset System 2 (Cold-2) restart, which is less disruptive.

### **CAUTION:**

*Do not enter any administration changes during the following software upgrade procedure. There can be substantial time gaps between steps and, since the system cannot prevent administration changes, it is up to the system technician to make sure that none are attempted during the entire software upgrade process. This includes making sure that no one (including the customer) is making administration changes through connections other than through the local administration terminal.*

## Standard Reliability (Simplex) Systems

---

The software upgrade for a standard reliability system can take up to 130 minutes, during which time service is interrupted for about 15 minutes. Upgrade software cannot be done remotely, and it must be performed at the local terminal. Ensure that the following items are available before proceeding:

- Generic program card with the software release running currently in the system

- Generic program card containing the new software to which the upgrade is to be done
- Translation card on which the system translations are to be saved (the card should already be in the system)
- Software patch (if it exists) that is currently applied to the system (this patch is downloaded if a software backout is required)
- Software release label to be applied to the processor circuit pack after a successful upgrade.

The following table indicates the processes and their corresponding time allotment for the upgrade procedure.

| Process            | Time<br>(minutes) |
|--------------------|-------------------|
| save translation   | 10                |
| save announcement  | 45                |
| upgrade software   | 10                |
| save translation   | 10                |
| save announcements | 45                |
| miscellaneous      | 10                |
| Total Time         | 130               |

[Figure 5-4](#) illustrates the output that appears on the terminal during the upgrade procedure.

**Figure 5-4. Typical Start-up Messages (TN790)**

**Save Current Translations to Original Translation Card**

- 1. Set the write switch on the original translation card down to record. Insert the card into the slot on the TN777B faceplate.
- 2. Enter **save translation** and press **Enter** to get translations onto the translation card. This takes about 10 minutes. The yellow LED on the TN777B is on. If the translations were corrupted, the following error message displays when logging in:

 **WARNING:**  
*Translation corruption detected; call Lucent Technologies distributor immediately.*

**NOTE:**

The **save translation** command cannot function if the translation corruption message appears.

## Disable TTI

Enter **change system-parameters features** and press Enter. Use Page 2 of the form to disable Terminal Translation Initialization (TTI) by changing the value to **n**.

## List Configuration Software Version

Issue the **list configuration software-versions** command to determine if any patches have been applied.

**NOTE:**

If the system must be restored to the old software, download the correct patches.

## Disable Scheduled Maintenance

Enter **change system-parameters maintenance**, and press Enter. Use this form to prevent scheduled daily maintenance from interfering with the update or upgrade.

**NOTE:**

If scheduled maintenance has begun, set the value of the "Stop Time" field to 1 minute after the current time. If scheduled maintenance has not yet begun, change the value of the "Start Time" field to a time after the upgrade is finished.

## Disable Alarm Origination to INADS

1. Enter **change system-parameters maintenance** and press Enter.
2. Enter **n** in the *Alarm Origination* field and press Enter.
3. For some releases of system software, disable *Cleared Alarm Notification* and *Restart Notification* before submitting the form.

**CAUTION:**

*Disabling alarm origination prevents the system from generating alarms, thus preventing unnecessary trouble tickets.*

## Save Announcements

1. If the system is equipped with a TN750/B Announcement circuit pack, enter **display announcements**, and press Enter. If administered recorded announcements are listed, enter **save announcements** [from PCSS] and

press Enter. Where P is the port network number (1 for PPN, and 2-4 for EPN), C is the carrier designation (A, B, C, or D), and SS is the number of the slot in which the circuit pack resides (01 to 21).

 **NOTE:**

If multiple TN750/B circuit packs are present, you *must* specify the slot location for the save announcements command. If there is only one announcement circuit pack, the system defaults to the proper location.

 **NOTE:**

The TN750C Announcement circuit pack has on-board non-volatile storage and does not need to be saved to the translation card.

## Shut Down DEFINITY LAN Gateway System

If a DEFINITY LAN Gateway system resides in the control cabinet to be upgraded, prepare to shut down the DEFINITY LAN Gateway assembly and allow the disk to completely spin down.

 **CAUTION:**

*Save the system parameters if you plan to reuse the current system.*

 **CAUTION:**

*Neglecting to shut down a DEFINITY LAN Gateway assembly before powering down the system cabinet where it resides can damage the LAN Gateway disk.*

1. Log onto the DEFINITY LAN Gateway. *See the DEFINITY Communications System Generic 3 Installation, Administration and Maintenance of CallVisor ASAI over the DEFINITY LAN Gateway, 555-230-223, for the procedure to log on.*
2. When the main menu appears, select *Maintenance*.
3. Select *Reset System* from the *Maintenance* menu.
4. Select *Shutdown* from the *Reset System* menu.
5. Unseat the LAN Gateway assembly from its backplane connectors.

## Shut Down DEFINITY AUDIX System

1. If a DEFINITY AUDIX System resides in the control cabinet to be upgraded, shut down the AUDIX assembly and allow the disk to completely spin down.

**WARNING:**

*Neglecting to shut down AUDIX before powering down the system cabinet where it resides can damage the AUDIX disk.*

2. Unseat the AUDIX assembly from its backplane connectors in the carrier.

## Power Down Basic Control Cabinet

**CAUTION:**

*Powering down the PPN cabinet causes important system data, such as BCMS data, records of queued ACD calls, Automatic Wakeup request, and Do Not Disturb requests to be lost. Refer to DEFINITY Enterprise Communications Server Release 5.4 Maintenance for R5vs/si for information about preparing the system for a power down.*

1. Set the basic control cabinet power supply circuit breaker to OFF.

## Replace Circuit Packs

1. At the basic control cabinet, remove the combined TN786B/CPP1 Processor/Memory circuit pack.
2. Install the TN790 Processor circuit pack into the control cabinet slot labeled "PROCR."

## Reseat DEFINITY LAN Gateway System

Reseat the LAN Gateway assembly into its backplane connectors.

## Reseat DEFINITY AUDIX System

Reseat the AUDIX assembly into its backplane connectors.

## Reboot the System

1. Set the basic control cabinet power supply circuit breaker to ON.
2. The system performs the reset level 4 rebooting process by loading translations from the translation card. This takes 8 to 11 minutes.
3. Peel the paper backing from the TN790 Processor circuit pack position label (designation strip) and affix it to the front of the control cabinet.
4. Install a circuit pack blank into the slot previously occupied by the CPP1.
5. Log in as "craft" at the login: prompt on the terminal.
6. Enter **set time**, and press Enter to set the time and ensure that the system is booted properly.

7. Enter **list configuration software-version**, and press Enter to compare the version number of the Release 5.4 software program (displayed on the terminal) with the TN790 version number (written on a label on the TN790's faceplate). If the version numbers are not the same, change the version number on the TN790 label so that they agree.
8. Perform a sanity check on the system running the new software by executing the following commands in this order:
  - a. **status system 1** (to check out unusual status in the system)
  - b. **list station** (to ensure that the translation is read in properly)
  - c. **display alarm** (to ensure no alarm is raised in the system)
  - d. **list trunk-group** (to ensure the translation is read in properly)
  - e. **list hunt-group** (to ensure the translation is read in properly)

This ensures there is no translation corruption and the translations can be saved with the new software.

 **NOTE:**

If the new load must be returned to the previous software load, re-install the TN786B/CPP1 circuit packs and reboot with the previous version's translation card.

9. Get the DOSS order number of the upgrade, and call the regional CSA to request an "init" login. Once logged in as "init," the CSA should assign the Release 5.4 option, which automatically sets the 24-hour password aging for the upgraded system's customer logins.

 **NOTE:**

Certain forms have changed for DEFINITY ECS R5. Upgraded translations may appear on a different form, fields may shift within a form, and the name assignments to particular fields may change.

10. Notify the switch administrator that any previous login names and passwords still exist, but that the passwords expire in 24 hours. The new login names and passwords must conform to the requirements below.

 **NOTE:**

A password must have from 4 to 11 alphanumeric characters including at least 1 alphabetic character and 1 numeric character. A login name must have from 3 to 6 alphanumeric characters.

11. Since an R1V3.0 G3-MA cannot notify users about expiring passwords, disable password aging for any login name used with an R1V3.0 G3-MA.

## Restart DEFINITY LAN Gateway System

1. Log onto the DEFINITY LAN Gateway.
2. When the main menu appears, select *Maintenance*.

3. Select *Reset System* from the *Maintenance* menu.
4. Select *Restart System* from the *Reset System* menu.

## Save Upgraded Translations onto New Translation Card

1. Enter **status system 1**, and press Enter to verify the system is in “active” mode.
2. If the system contains a TN750/B Announcement circuit pack, check for completion of an automatic restore of announcements before removing the original translation card. If the system has been running for at least 45 minutes since power on, this operation should be complete. Check the yellow LED on the TN750/B which is lit during the download. If the restore did not start within 15 minutes of power on, enter **restore announcements**, and press Enter.
3. At this point, all telephones should be working properly.
4. Insert the new Release 5.4 translation card. Verify the write switch is down.
5. The original translation card can be reformatted and reused. Enter **format card-mem announcements** and press Enter. This formats the original translation card into Release 5.4 format (even if no announcement circuit packs are installed).
6. Enter **save translation**, and press Enter. This instructs the system to write all translation information from memory onto the translation card.
7. If the system is equipped with a TN750/B Announcement circuit pack and announcements were restored in the above step, enter **save announcements [‘from’ cabinet(1-X). carrier (A-D), slot (0-20)]** and press Enter. Where cabinet/carrier/slot is the location of the TN750/B.

### NOTE:

If multiple TN750/B circuit packs are present, you *must* specify the slot location for the save announcements command. If there is only one announcement circuit pack, the system defaults to the proper location.

## Enable TTI

If TTI was optioned prior to the software upgrade:

1. Enter **change system-parameters features** and press Enter.
2. Use page 2 of the form to change the TTI field back to y.

## Enable Scheduled Maintenance

Enter **change system-parameters maintenance**, and press Enter. Enable the scheduled daily maintenance.

## Enable Customer Options

1. Enter **change system-parameters customer-options**.
2. Use these forms to verify the customer options are properly set.

### NOTE:

In the Basic Call Setup field, if ISDN-PRI? was set to y before the upgrade, be sure to set the field back to y.

## Resolve Alarms

Examine the alarm log. Resolve any alarms that may exist using *DEFINITY Enterprise Communications Server Release 5.4 Maintenance for R5vs/si*.

## Verify Alarm Origination to INADS

Be sure the system is part of the existing INADS database by calling the INADS Database Administrator at the Technical Service Center (TSC). Verify that INADS can dial into the system and that the system can dial out to INADS. As part of the system registration process, the INADS Database Administrator enables Alarm Origination.

## Return Equipment

Return the replaced equipment (including the old Translation Card) to Lucent Technologies according to the requirements outlined in the following documents:

*BCS/Material Logistics, MSL/Attended Stocking Locations  
Methods and Procedures for Basic Material Returns*

## High and Critical Reliability (Duplex) Systems

The upgrade procedure for high and critical reliability systems takes up to two hours. Service is interrupted for about five minutes. The procedure cannot be done remotely, and it must be performed at the PPN (local) terminal.

Ensure that the following items are available before proceeding:

1. Generic software card with the software release currently running in the system
2. Generic software card containing the new software to which upgrades are to be made
3. Translation cards on which to save system translations (these cards should already be in the system)
4. Software patch (if it exists) that is currently applied to the system (this patch is downloaded if a software backout is required)

5. Software release label to be applied to the processor circuit pack after a successful upgrade

The following table indicates the processes and their corresponding time allotment for the upgrade procedure.

| Process           | Time<br>(minutes) |
|-------------------|-------------------|
| save translation  | 9                 |
| save announcement | 45                |
| upgrade software  | 15                |
| save translation  | 9                 |
| miscellaneous     | 11                |
| Total Time        | 90                |

[Figure 5-5](#) presents output that appears on the terminal during this procedure.

**Figure 5-5. Terminal Display for a Duplex System Software Upgrade**

## Save Current Translations to Original Translation Card

1. Set the write switch on the original translation card down to record. Insert the card into the slot on the TN777B faceplate.
2. Enter **save translation** and press **Enter** to get translations onto the translation card. This takes about 5 minutes. The yellow LED on the TN777B is on. If the translations were corrupted, the following error message displays when logging in:

### WARNING:

*Translation corruption detected; call Lucent Technologies distributor immediately.*

### NOTE:

The **save translation** command cannot function if the translation corruption message appears.

## Disable TTI

Enter **change system-parameters features** and press **Enter**. Use Page 2 of the form to disable Terminal Translation Initialization (TTI) by changing the value to n.

## List Configuration Software Version

Issue the **list configuration software-versions** command to determine whether any patches have been applied.

### NOTE:

If the system must be restored to the old software, download the correct patches back onto the system.

## Disable Scheduled Maintenance

1. Enter **change system-parameters maintenance**, and press **Enter**. Use this form to prevent scheduled daily maintenance from interfering with the update or upgrade.

### NOTE:

If scheduled maintenance has begun, set the value of the "Stop Time" field to one minute after the current time. If scheduled maintenance has not yet begun, change the value of the "Start Time" field to a time after the upgrade is finished.

## Disable Alarm Origination to INADS

1. Enter **change system-parameters maintenance** and press **Enter**.

2. Enter **n** in the *Alarm Origination* field and press Enter.
3. For some releases of system software, disable *Cleared Alarm Notification* and *Restart Notification* before submitting the form.

**CAUTION:**

*Disabling alarm origination prevents the system from generating alarms, thus preventing unnecessary trouble tickets.*

## Save Announcements

1. If the system is equipped with a TN750/B Announcement circuit pack, enter **display announcements**, and press Enter. If administered recorded announcements are listed, enter **save announcements** [from PCSS] and press Enter. Where P is the port network number (1 for PPN, and 2-4 for EPN), C is the carrier designation (A, B, C, or D), and SS is the number of the slot in which the circuit pack resides (01 to 21).

**NOTE:**

If multiple TN750/B circuit packs are present, you *must* specify the slot location for the save announcements command. If there is only one announcement circuit pack, the system defaults to the proper location.

**NOTE:**

The TN750C Announcement circuit pack contains on-board non-volatile memory. It is not necessary to back up a TN750C.

## Shut Down DEFINITY LAN Gateway System

If a DEFINITY LAN Gateway system resides in the control cabinet to be upgraded, prepare to shut down the DEFINITY LAN Gateway assembly and allow the disk to completely spin down.

**CAUTION:**

*Save the system parameters if you plan to reuse the current system.*

**WARNING:**

*Neglecting to shut down a DEFINITY LAN Gateway assembly before powering down the system cabinet where it resides can damage the LAN Gateway disk.*

1. Log onto the DEFINITY LAN Gateway. See the *DEFINITY Communications System Generic 3 Installation, Administration and Maintenance of CallVisor ASAI over the DEFINITY LAN Gateway*, 555-230-223, for the procedure to log on.

2. When the main menu appears, select *Maintenance*.
3. Select *Reset System* from the *Maintenance* menu.
4. Select *Shutdown* from the *Reset System* menu.
5. Unseat the LAN Gateway assembly from its backplane connectors.

## Shut Down DEFINITY AUDIX System

1. If a DEFINITY AUDIX System resides in the control cabinet to be upgraded, shut down the AUDIX assembly and allow the disk to completely spin down.

### WARNING:

*Neglecting to shut down AUDIX before powering down the system cabinet where it resides can damage the AUDIX disk.*

2. Manually Power Down AUDIX System

A yellow caution sticker on the system's power unit notifies technicians to shut down the DEFINITY AUDIX System prior to powering down the system.

- a. Using a pointed object, such as a paper clip or pen (do not use a pencil), press the Boot/shutdown button. The button is located at the top right portion of the front panel.
- b. Hold the boot/Shutdown button in until the LCD display flashes the message MSHUT .
- c. Release the Boot/Shutdown button.

### NOTE:

The DEFINITY AUDIX System takes about five minutes to shut down. The "heartbeat" indication on the display continues to flash.

3. Unseat the AUDIX assembly from its backplane connectors in the carrier.

## Power Down Basic Control Cabinet

### CAUTION:

*Do not power down the entire system. This defeats the purpose of high or critical reliability configurations.*

### CAUTION:

*Powering down the control cabinet causes important system data, such as BCMS data, records of queued ACD calls, Automatic Wakeup request, and Do Not Disturb requests to be lost. Refer to DEFINITY Enterprise*

*Communications Server Release 5.4 Maintenance for R5vs/si for information about preparing the system for a power down.*

Set the basic control cabinet power supply circuit breaker to OFF.

## Replace Circuit Packs

1. Remove the combined TN786B/CPP1 Processor/Memory circuit pack from the basic control cabinet.
2. Install the TN790 Processor circuit pack into the control cabinet slot labeled "PROCR."

## Reboot the System

1. Set the basic control cabinet power supply circuit breaker to ON.
2. The system performs the reset level 4 rebooting process by loading translations from the translation card. This takes 10 to 15 minutes.
3. Peel the paper backing from the new circuit pack position label (designation strip) and affix it to the front of the basic control cabinet.
4. Install a circuit pack blank into the slot previously occupied by the CPP1.

## Power Down Duplicated Control Cabinet

### CAUTION:

*Do not power down the entire system. This defeats the purpose of high or critical reliability configurations.*

Set the duplicated control cabinet power supply circuit breaker to OFF.

## Replace Circuit Packs

1. Remove the combined TN786B/CPP1 Processor/Memory circuit pack from the duplicated control cabinet.
2. Install the TN790 Processor circuit pack into the control cabinet slot labeled "PROCR."

## Reseat DEFINITY LAN Gateway System

Reseat the LAN Gateway assembly into its backplane connectors in the carrier.

## Reseat DEFINITY AUDIX System

Reseat the AUDIX assembly into its backplane connectors.

## Reboot the System

1. Set the duplicated control cabinet power supply circuit breaker to ON.
2. The system performs the reset level 4 rebooting process by loading translations from the translation card. This takes 10 to 15 minutes.
3. Peel the paper backing from the new circuit pack position label (designation strip) and affix it to the front of the duplicated control cabinet.
4. Install a circuit pack blank into the slot previously occupied by the CPP1.
5. Log in as "craft" at the login: prompt on the management terminal.
6. Enter **set time**, and press Enter to set the time and ensure that the system is booted properly.
7. Enter **list configuration software-version**, and press Enter to compare the version number of the Release 5.4 software program (displayed on the terminal) with the TN790 version number (written on a label on the TN790's faceplate). If the version numbers are not the same, change the version number on the TN790 label so that they agree.
8. Perform a sanity check on the system running the new software by executing the following commands in this order:
  - a. **status system 1** (to check out unusual status in the system)
  - b. **list station** (to ensure that the translation is read in properly)
  - c. **display alarm** (to ensure no alarm is raised in the system)
  - d. **list trunk-group** (to ensure the translation is read in properly)
  - e. **list hunt-group** (to ensure the translation is read in properly)

This ensures there is no translation corruption and the translations can be saved with the new software.

### ⇒ NOTE:

If the new load must be returned to the previous software load, re-install the TN786B/CPP1 circuit packs and reboot with the previous version's translation card.

9. Get the DOSS order number of the upgrade, and call the regional CSA to request an "init" login. Once logged in as "init," the CSA should assign the DEFINITY ECS R5 option, which automatically sets the 24-hour password aging for the upgraded system's customer logins.

### ⇒ NOTE:

Certain forms have changed for DEFINITY ECS R5. Upgraded translations may appear on a different form, fields may shift within a form, and the name assignments to particular fields may change.

10. Notify the switch administrator that any previous login names and passwords still exist, but that the passwords expire in 24 hours. The new login names and passwords must conform to the requirements below.

 **NOTE:**

A password must have from 4 to 11 alphanumeric characters including at least 1 alphabetic character and 1 numeric character. A login name must have from 3 to 6 alphanumeric characters.

11. Since an R1V3.0 G3-MA cannot notify users about expiring passwords, disable password aging for any login name used with an R1V3.0 G3-MA.

## Restart DEFINITY LAN Gateway System

1. Log onto the DEFINITY LAN Gateway.
2. When the main menu appears, select *Maintenance*.
3. Select *Reset System* from the *Maintenance* menu.
4. Select *Restart System* from the *Reset System* menu.

## Save Upgraded Translations onto New Translation Card

1. Enter **status system 1**, and press Enter to verify that the system is in the "active/standby" mode.

 **NOTE:**

At this point, all telephones should be working properly.

2. Insert the new Release 5.4 translation card. Verify the write switch is down.
3. The original translation card can be reformatted and reused. Enter **format card-mem announcements** and press Enter. This formats the original translation card into Release 5.4 format (even if no announcement circuit packs are installed).
4. Enter **save translation**, and press Enter. This instructs the system to write all translation information from memory onto both translation cards.
5. If the system is equipped with a TN750/B Announcement circuit pack and announcements were saved above, enter **restore announcements**, and press Enter. Once the administered recorded announcements are restored, enter **save announcements** [from PCSS] and press Enter. Where P is the port network number (1 for PPN, and 2-4 for EPN), C is the carrier designation (A, B, C, or D), and SS is the number of the slot in which the circuit pack resides (01 to 21).

 **NOTE:**

If multiple TN750/B circuit packs are present, you *must* specify the slot location for the save announcements command. If there is only one announcement circuit pack, the system defaults to the proper location.

**NOTE:**

The TN750C Announcement circuit pack has on-board non-volatile storage and does not need to be saved to the translation card.

## Enable TTI

If TTI was enabled prior to the software upgrade:

1. Enter **change system-parameters features** and press Enter.
2. Use page 2 of the form to change the TTI field back to y (if necessary).

## Enable Scheduled Maintenance

Enter **change system-parameters maintenance**, and press Enter. Use this form to enable scheduled daily maintenance.

## Enable Customer Options

1. Enter **change system-parameters customer-options** and press Enter.
2. Use these forms to verify the customer options are properly set.

**NOTE:**

In the Basic Call Setup field, if ISDN-PRI? was set to y before the upgrade, be sure to set the field back to y.

## Resolve Alarms

Examine the alarm log. Resolve any alarms that may exist using *DEFINITY Enterprise Communications Server Release 5.4 Maintenance for R5vs/si*.

## Verify Alarm Origination to INADS

Be sure the system is part of the existing INADS database by calling the INADS Database Administrator at the Technical Service Center (TSC). Verify that INADS can dial into the system and that the system can dial out to INADS.

As part of the system registration process, the INADS Database Administrator enables Alarm Origination.

## Return Equipment

Return the replaced equipment (including the old Translation Card) to Lucent Technologies according to the requirements outlined in the following documents:

*BCS/Material Logistics, MSL/Attended Stocking Locations*

*Methods and Procedures for Basic Material Returns*

## **Preventive Maintenance Procedures**

---

The following preventive maintenance procedures should be followed when you are visiting customer sites:

### **Air Filters**

Air filters should be inspected annually. If a filter is dirty or clogged, first tap it on the ground. If the filter is still dirty or clogged, then wash it with warm water and a mild detergent. A vacuum cleaner can be used if one is available. If there is no facility for washing or vacuuming the air filter, then replace the filter. Refer to "CABINET" maintenance object for more information on air filters and fans.

### **Tape Head/Capstan**

The tape drive head (also called the tape head) should be cleaned at least once a year. Moreover, it should be cleaned as part of the preventive maintenance strategy. It is recommended that you inspect the tape head during each maintenance visit and that you clean the tape head several times a year. In addition, a dated label should be placed on the tape drive unit after the tape head is cleaned. New tapes leave more abrasive particles on the tape head.

The tape head can be accessed for cleaning from the front of the drive by opening the tape access door with your finger. Refer to TAPE Maintenance documentation for more details on cleaning the tape head.

### **Batteries**

The batteries should be replaced every four years or whenever a POWER alarm occurs in the system.

## **Preventive Maintenance Log**

---

[Figure 5-6](#) shows a sample of the AT&T Preventive Maintenance Log. Whenever you complete any of the preventive maintenance procedures described in this section, be sure to fill in the requested information on the log form before you leave the customer's premises.

## System Features

In addition to the various maintenance and test commands (described in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#)) that are available, the following system features may also be useful in troubleshooting certain system resources:

- Automatic Circuit Assurance (ACA)
- Busy Verification of Terminals and Trunks
- Trunk Group Busy/Warning Indicators to Attendant
- Trunk Identification by Attendant
- Facility Test Calls

- Analog Tie Trunk Back-to-Back Testing
- Terminating Trunk Transmission Testing
- Troubleshooting ISDN-PRI Problems
- Troubleshooting PRI Endpoint Problems
- Troubleshooting ISDN-PRI Test Calls

Complete descriptions of each feature are provided in the *DEFINITY Enterprise Communications Server Release 5.4 Administration and Feature Description*.

Refer to *DEFINITY Communications System Generic 1 and Generic 3 — Console Operations*, 555-230-700, and *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations* as required for detailed operating procedures (does not include Facility Test Calls, Analog Tie Trunk Back-to-Back Testing, Terminating Trunk Transmission Testing, Troubleshooting ISDN-PRI Problems, Troubleshooting ISDN-PRI Test Calls, or Troubleshooting ISDN-BRI Problems described in this chapter.)

## **Automatic Circuit Assurance**

---

Requires the use of a display-equipped voice terminal (may be nondisplay type if the Voice Message Retrieval feature is provided) or an attendant console. An "ACA activate/deactivate" button (one per system) is required on the voice terminal or attendant console.

Automatic Circuit Assurance (ACA) assists users in identifying possible trunk malfunctions. The system maintains a record of the performance of individual trunks relative to short and long holding time calls. The system automatically initiates a referral call to an attendant console or display-equipped voice terminal when a possible failure is detected.

Holding time is the elapsed time from when a trunk is accessed to the time a trunk is released. When ACA is enabled via administration, the system measures the holding time of each call.

A short holding time limit and a long holding time limit are preset by the System Manager for each trunk group. The short holding time limit can be from 0 to 160 seconds. The long holding time limit can be from 0 to 10 hours. The measured holding time for each call is compared to the preset limits for the trunk group being used.

Measurements are not made on personal CO lines, out-of-service trunks, or trunks undergoing maintenance testing.

## **Busy Verification of Terminals and Trunks**

---

Requires the use of a multi-appearance voice terminal or attendant console equipped with a "verify" button.

Busy Verification of Terminals and Trunks allows a user at a voice terminal or attendant console to make test calls to trunks, voice terminals, and hunt groups (DDC/UCD). These test calls check the status of an apparently busy resource. This provides an easy method to distinguish between a voice terminal or resource that is truly busy and one that only appears busy because of a trouble condition.

## **Trunk Group Busy/Warning Indicators to Attendant**

---

Requires the use of an attendant console.

Trunk Group Busy/Warning Indicators to Attendant provides the console user with a visual indication of the trunk group status for each trunk group associated with the 12 Trunk Group Select buttons located on the console. Trunk groups with busy indications during nonbusy periods should be checked to ensure that the trunks are busy and not out-of-service. Use the Busy Verification of Terminals and Trunks feature to test the suspected faulty trunks.

## **Trunk Identification by Attendant**

---

Requires the use of a display-equipped voice terminal or an attendant console equipped with a "trunk id" button.

Trunk Identification by Attendant allows a voice terminal or attendant console user to identify a specific trunk being used on a call. This is useful when a user experiences noise or poor transmission on a trunk call. The trunk identification (access code and group number) is displayed when the "trunk id" button is pressed while on a trunk call. Use of this feature is denied if there are more than two trunks on a call. If the call is trunk-to-trunk, the identification displayed is of the last trunk added to the call.

## **Facility Test Calls**

---

The Facility Test Calls feature provides a voice terminal user the capability of placing test calls to access specific trunks, touch-tone (DTMF) receivers, time slots, and system tones. The test call can be made by a local voice terminal user by dialing an access code.

### **NOTE:**

For the ISDN-PRI Test Call feature, see "[Troubleshooting ISDN-PRI Test Call Problems](#)" later in this chapter.

**NOTE:**

The following test call descriptions are for voice terminal users:

## Trunk Test Call

The trunk test call accesses specific Tie or CO trunks. DID trunks cannot be accessed.

To place a call:

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

**NOTE:**

The Facility Test Call Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example. For more information on FAC, refer to *DEFINITY Communications System Generic 3 Implementation*, 555-230-653.

2. Dial the 6-digit port number "PCSSpp"

P = Port network number (1 for PPN or 2 or 3 for EPN)  
C = Carrier number (A=1, B=2, C=3, D=4, E=5)  
SS = Slot number (01—20)  
pp = Port number

The channels on a DS1 trunk are addressed by using the channel number for the port number.

3. Listen for one of the following tones:
  - Dial Tone or Silence—trunk is connected. Go to Step 4. If you hear a dial tone, it is coming from the far end. If the far end has been disabled, you do not hear dial tone. However, depending on far-end administration, you may still be able to dial digits. All digits dialed after the port number are transmitted using end-to-end DTMF signaling; therefore, if the trunk being tested is a rotary trunk, it is not possible to break dial tone.
  - Reorder Tone—trunk is busy or maintenance busy.
  - Intercept Tone— a trunk or touch-tone (DTMF) receiver has not been accessed.
4. Place a call. Even if you do not hear a dial tone, you may still be able to dial digits, depending on the administration of the far-end switch.

All digits dialed after the port number are transmitted using end-to-end DTMF signaling; therefore, if the trunk being tested is a rotary trunk, it will not be possible to break dial tone.

If the call does not go through (that is, no ringing), determine if the trunk circuit pack has been removed.

## Touch-tone (DTMF) Receiver Test Call

The touch-tone (DTMF) receiver call accesses and tests the four touch-tone (DTMF) receivers located on the Tone Detector circuit pack. **To place the call:**

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

### NOTE:

The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial the 6-digit port number "PCSSpp":

P = Part network number (1 for PPN or 2 or 3 for EPN)

C = Carrier number (A=1, B=2, C=3, D=4, E=5)

SS = Slot number (01—20)

pp = Touch-tone (DTMF) Receiver Port number (01, 02, 05, or 06))

3. Listen for one of the following tones:

- Confirmation Tone—touch-tone (DTMF) receiver is connected. Go to Step 4.
- Reorder Tone—touch-tone (DTMF) receiver is busy.
- Intercept Tone—a touch-tone (DTMF) receiver or trunk has not been accessed.

4. Dial **1234567890\*#** and listen for Confirmation tone (test passed) or intercept tone (test failed). The test fails if the touch-tone (DTMF) receiver does not recognize all the touch-tone (DTMF) signals.
5. To test another touch-tone (DTMF) receiver, repeat Steps 2 through 4.
6. To terminate the test call, hang up the station set used for testing.

## Time Slot Test Call

The time slot test call connects the voice terminal user to a specific time slot located on the TDM Buses (A or B) or out-of-service time slots. **Specific Time Slots To place the call:**

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

**NOTE:**

The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial port network number (1 for PPN or 2 or 3 for EPN), then press # and the 3-digit time slot number "xxx," where:

xxx      =      Time slot number (000 through 255 on Bus A and 256 through 511 on Bus B)

3. Listen for one of the following tones:
  - Confirmation Tone—time slot is idle or maintenance busy
  - Reorder Tone—time slot is busy
  - Dedicated Tone—One of the following tones is heard (see [Table 5-2](#))

Table 5-2. TDM Bus Time Slot Numbers

| TDM Bus A<br>time slot | TDM Bus B<br>time slot | Tone Heard                    |
|------------------------|------------------------|-------------------------------|
| 000                    | 256                    | Reorder                       |
| 001                    | 257                    | Reorder                       |
| 002                    | 258                    | Reorder                       |
| 003                    | 259                    | Reorder                       |
| 004                    | 260                    | Reorder                       |
| 005                    | 261                    | Touch Tone 1 - 697Hz          |
| 006                    | 262                    | Touch Tone 2 - 770 Hz         |
| 007                    | 263                    | Touch Tone 3 - 852Hz          |
| 008                    | 264                    | Touch Tone 4 - 941 Hz         |
| 009                    | 265                    | Touch Tone 5 - 1209 Hz        |
| 010                    | 266                    | Touch Tone 6 - 1336Hz         |
| 011                    | 267                    | Touch Tone 7 - 1447 Hz        |
| 012                    | 268                    | Touch Tone 8 - 1633 Hz        |
| 013                    | 269                    | Dial Tone                     |
| 014                    | 270                    | Reorder Tone                  |
| 015                    | 271                    | Alert Tone                    |
| 016                    | 272                    | Busy Tone                     |
| 017                    | 273                    | Ringback Tone                 |
| 018                    | 274                    | Special Ringback Tone         |
| 019                    | 275                    | 2225 Hz Tone                  |
| 020                    | 276                    | Music                         |
| 021                    | 277                    | Tone on Hold                  |
| 022-253                | 278-509                | Confirmation (used for calls) |
| 254                    | 510                    | Reorder                       |
| 255                    | 511                    | Confirmation                  |

Out-of-Service Time Slots To place the call:

1. Dial the Facility Test Call Feature Access Code (for instance, 197, see Note), and listen for dial tone.

**⇒ NOTE:**  
The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

- 2. Dial port network number (1 for PPN or 2 or 3 for EPN), then dial \*\* and listen for the following tones:
  - Confirmation Tone—Connection is made. Go to Step 3.
  - Reorder Tone—No time slots are out-of-service.
- 3. Repeat from Step 1 to alternate between out-of-service time slots on TDM Bus A and B.

System Tone Test Call

The system tone test call connects the voice terminal user to a specific system tone. **To place the call:**

- 1. Dial the Facility Test Call Feature Access Code (for instance, 197, see Note), and listen for dial tone.

**⇒ NOTE:**  
The Facility Test Call Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

- 2. Dial port network number (1 for PPN or 2 or 3 for EPN), then dial \* followed by the two-digit tone identification number listed in [Table 5-3](#).
- 3. Listen for the tone that was specified.

**⇒ NOTE:**  
For a definition of Call Progress Tones see *DEFINITY Enterprise Communications Server Release 5.4 System Descriptions and Specifications*.

Table 5-3. System Tone Identification Numbers

| Number | Description  |
|--------|--------------|
| 00     | Null tone    |
| 01     | Dial tone    |
| 02     | Reorder tone |
| 03     | Alert tone   |
| 04     | Busy tone    |

Continued on next page

**Table 5-3. System Tone Identification Numbers — Continued**

| Number | Description                       |
|--------|-----------------------------------|
| 05     | Recall dial tone                  |

| 68     | Conference/bridging tone           |

**Analog Tie Trunk Back-to-Back Testing**

The TN760B circuit pack can be configured for back-to-back testing (also known as connectivity testing) by making translation and cross-connect changes. This testing configuration allows for the connection of Tie Trunks back-to-back in the same switch to verify the operation of Tie Trunk ports. The tests can be performed in either the E & M or simplex modes.

**E & M Mode Test Procedure**

The procedures to perform the Analog Tie Trunk port test in the E & M mode are as follows:

1. At the administration terminal, enter **list configuration trunks** command to determine which ports are assigned on the Tie Trunk circuit pack.
2. Enter **display dialplan** command to determine the Trunk Access Code (TAC) format.
3. Enter **display port xx** command for all ports defined in Step 1. This action displays the trunk groups to which the ports belong (that is, of which the ports are members).

 **NOTE:**  
See the [“Handling Control Circuit Packs”](#) section in this chapter for details on how to remove and replace port circuit packs.

4. Insert the circuit pack back into the slot.

5. Enter **display trunk xx p** command for each trunk group identified in Step 3. This command displays the specified trunk group on the administration terminal screen and prints a hard copy on the printer. Save this data for later use.
6. Remove all members defined by these ports from the trunk group(s) using the **ch trunk xx** command.
7. Remove the Tie Trunk circuit pack from the carrier slot.
8. Set the dip (option) switches for each of the two ports to be tested on the Tie Trunk circuit pack to "E & M mode" and "unprotected."
9. Enter **add trunk n** command to add a new (test) trunk group. Then enter the following information:

■ Group Type — tie

■ TAC — (use trunk access code obtained from dial plan)

■ Trunk Type (in/out) — wink/wink

■ Port — assign two of the ports from the tie trunk

■ Mode — E & M

■ Type — specify one port as t1 standard and other port as t1 compatible

Examples of the Trunk Group forms are shown in [Screen 5-3](#) and [Screen 5-4](#)..

| 15: |       |      |       |         |              |

Screen 5-4. Trunk Group Form — E & M Mode (Page 2 of 2)

10. Locate the Tie Trunk port terminal connections at the cross-connect field.  
See [Table 5-4](#).
11. At the cross-connect field, disconnect outside trunk facilities from the Tie Trunk ports and mark the disconnected wires for later reconnecting the Tie Trunk ports back to normal operation. The D Impact Tool (AT-8762) is required to perform this step.
12. Use jumper wires (DT 24M-Y/BL/R/G and DT 24P-W/BRN) and the D Impact Tool to connect wiring between the two ports assigned in Step 9 at the cross-connect field. For example, if the two ports on the Analog Tie Trunk circuit pack are port 1 and 2, connect the wirings as shown below:

13. Check all wirings to verify good connections between the two test ports.
14. Place a call from one voice terminal to another voice terminal using the Tie Trunk ports assigned. Dial TAC and extension. For example, if TAC of Tie Trunk group is 110 and station number is 5012, then dial 110 5012. If the call cannot be made, either one of these ports could be defective. There are four ports on TN760B (port 1, 2, 3, and 4), try different combinations to determine defective ports.
15. If there is a defective port on the circuit pack, try to switch to an unused port. However, if all ports are normally used, then replace the circuit pack.
16. Disconnect the jumpers between two ports. Then use administration terminal and trunk printouts to restore all trunk group changes to normal values.

**Table 5-4. Carrier Lead Appearances at 110 Cross-Connect Field**

| 110 Connecting Block Terminals | CO Trunk TN747B | Tie Trunk TN760B |

**Simplex Mode Test Procedure**

The procedures to perform the Analog Tie Trunk Port Test in the simplex mode are as follows:

1. Repeat Steps 1 through 7 of the E & M Mode Test Procedure.
2. Set the dip (option) switches for each of the two ports to be tested on the Tie Trunk circuit pack to simplex mode.
3. Enter **add trunk n** command to add a new (test) trunk group. Then enter the following information:
  - Group Type — tie
  - TAC — (use trunk access code obtained from dial plan)
  - Trunk Type (in/out) — wink/wink
  - Port — assign two of the ports from the tie trunk
  - Mode — simplex
  - Type — type 5

An example of the Trunk Group Form Page 2 is shown in [Screen 5-5](#).

Page 2 of 5

TRUNK GROUP

GROUP MEMBER ASSIGNMENTS

| Port     | Name | Mode    | Type   | Answer Delay |
|----------|------|---------|--------|--------------|
| 1: B1901 |      | simplex | type 5 |              |
| 2: B1902 |      | simplex | type 5 |              |
| 3:       |      |         |        |              |
| 4:       |      |         |        |              |
| 5:       |      |         |        |              |
| 6:       |      |         |        |              |
| 7:       |      |         |        |              |
| 8:       |      |         |        |              |
| 9:       |      |         |        |              |
| 10:      |      |         |        |              |
| 11:      |      |         |        |              |
| 12:      |      |         |        |              |
| 13:      |      |         |        |              |
| 14:      |      |         |        |              |
| 15:      |      |         |        |              |

Screen 5-5. Trunk Group Form — Simplex Mode (Page 2 of 5)

- 4. Locate the Tie Trunk port terminal connections at the cross-connect field. See [Table 5-4](#).
- 5. At the cross-connect field, disconnect outside trunk facilities from the Analog Tie Trunk ports and mark the disconnected wires for later when the Tie Trunk ports are placed back into normal operation. The D Impact Tool (AT-8762) is required to perform this step.
- 6. Use jumper wires (DT 24M-Y/BL/R/G) and the D Impact Tool to connect wiring between the two ports assigned in Step 4 at the cross-connect field. For example, if the two ports on the Analog Tie Trunk circuit pack are ports 1 and 2, connect the wirings as shown below:

- 7. Repeat Steps 13 through 16 of the E & M Mode Test Procedure.

## **Terminating Trunk Transmission Testing**

---

The Terminating Trunk Transmission (TTT) (noninteractive) feature provides for extension number access to three tone sequences that can be used for trunk transmission testing from the far end of the trunks.

The three test types should have extension numbers assigned on the Maintenance-Related System Parameters Form.

Test Type 100:\_\_\_\_\_ Test Type 102:\_\_\_\_\_ Test Type 105:\_\_\_\_\_

Test Type 100 provides:

1. 5.5 seconds of 1004 Hz tone at 0dB
2. Quiet until disconnect; disconnect is forced after one minute

Test Type 102 provides:

1. 9 seconds of 1004 Hz tone at 0dB
2. 1 second of quiet
3. This cycle is repeated until disconnect; disconnect is forced after 24 hours.

Test Type 105 provides:

1. nine seconds of 1004 Hz at -16dB
2. one second of quiet
3. nine seconds of 404 Hz at -16dB
4. one second of quiet
5. nine seconds of 2804 Hz at -16dB
6. 30 seconds of quiet
7. one half second of Test Progress Tone (2225 Hz)
8. approximately five seconds of quiet
9. forced disconnect

## **Troubleshooting ISDN-PRI Problems**

---

The following flowchart, [Figure 5-7](#) and [Figure 5-8](#), defines a layered approach when troubleshooting ISDN-PRI problems. Since a problem at a lower layer affects upper layers, layers are investigated from low to high. In the flowchart, the DS1 facility is layer 1, the TN765 Processor Interface is layer 2, and the ISDN trunks are layer 3. Transient problems are diagnosed on Page 2 of the flowchart, [Figure 5-8](#).

Figure 5-7. Processing of ISDN-PRI Problems (Page 1 of 2)

Figure 5-8. Processing of ISDN-PRI Problems (Page 2 of 2)

Troubleshooting PRI Endpoint Problems

The following flowchart, [Figure 5-9](#) and [Figure 5-10](#), defines a layered approach when troubleshooting PRI endpoint problems. Since a problem at a lower layer affects upper layers, layers are investigated from low to high. In the flowchart, the DS1 facility is layer 1, the TN765 Processor Interface is layer 2, and the ISDN trunks are layer 3.

The troubleshooting procedure described here diagnoses faults between the switch and the line-side PRI terminal adapter/ISDN-PRI endpoint equipment. Problems encountered on the network-side of a wideband connection or problems with end-to-end equipment compatibility are out of the scope of this section.

Figure 5-9. Processing of PRI Endpoint Problems (Page 1 of 2)

**Figure 5-10. Processing of PRI Endpoint Problems (Page 2 of 2)**

**Troubleshooting ISDN-PRI Test Call Problems**

An ISDN-PRI test call is a call of a diagnostic nature that is placed across an ISDN-PRI user-network interface to a previously designated number. An ISDN-PRI test call is also a maintenance procedure concerned with the identification and verification ISDN-PRI user-network interface problems. The ISDN-PRI test call can access ISDN-PRI trunks only.

**Placing an Outgoing ISDN-PRI Test Call**

**NOTE:**  
An ISDN-PRI test call can be placed only if the circuit translates to an ISDN-PRI trunk.

An ISDN-PRI test call can be originated via either the *synchronous* or the *asynchronous* method. Each method is described below.

### Synchronous Method

One command is used in this method to start, stop and query an ISDN-PRI test call. In the synchronous method, an outgoing ISDN-PRI test call may be part of a system technician-demanded long test sequence to test a circuit pack, port, or trunk. Therefore, the command line entry can be any of the following:

**test trunk <grp>/<mbr> long [repeat #]**

**test port PCSSpp long [repeat #]**

**test board PCSS long [repeat #]**

The "long" qualifier must be entered in the above commands in order for the ISDN test call to run. The repeat number (#) can be any number from 1 through 99 (default = 1).

The following information is displayed in response to the above commands:

- **Port:** The port address (PCSSpp) is the port network number, carrier designation, slot, and circuit of the maintenance object under test.
- **Maintenance Name:** The type of maintenance object tested.
- **Test Number:** The actual test that was run.
- **Test Results:** Indicates whether the test passes, fails, or aborts.
- **Error Code:** Additional information about the results of the test. (See the ISDN Trunk Maintenance documentation for details.)

### Asynchronous Method

#### ⇒ NOTE:

The asynchronous method requires a Maintenance/Test circuit pack to be physically present in the system.

In this method, four commands are used to start, stop, query, and list an outgoing ISDN-PRI test call. These commands are as follows:

**clear isdn-testcall <grp>/<mbr> (stop)**

**list isdn-testcall (list)**

**status isdn-testcall <grp>/<mbr> (query)**

**test isdn-testcall <grp>/<mbr> [minutes] (start)**

#### ⇒ NOTE:

Before placing an outgoing ISDN-PRI test call, verify that the FAC on the System Features Form has been administered as well as the Far End Test Line No and TestCall Bearer Capability Class (BCC) on the Trunk Group Administration Form. Furthermore, if the ISDN-PRI trunk is of the "cbc" (call

by call) service type, then the Testcall Service field on Trunk Group Administration Form must have been administered also.

To initiate an outgoing ISDN-PRI test call in the asynchronous method, issue the following command:

**test isdn-testcall <grp>/<mbr> [minutes]**

This command enables you to specify a specific the trunk on which to originate the ISDN-PRI test call.

 **NOTE:**  
The optional qualifier can also be used that specifies in minutes the duration of the test call. If no duration is specified, the default duration is used which is 8.4 or 9.6 seconds. The qualifier "minutes" accepts the numeric values one through 120 (that is, two hours = 120 minutes).

[Screen 5-6](#) shows a typical response to the **test isdn-testcall** command:

```
test isdn-testcall
```

| Port   | Maintenance Name | Test Number | Test Result | Error Code |
|--------|------------------|-------------|-------------|------------|
| 1B1501 | ISDN-TRK         | 258         | PASS        |            |

**Screen 5-6. Typical Response to Test ISDN-Testcall Command**

The meaning of the information displayed in response to the above command is described in the following list.

- **Port:** The port address (PCSSpp) is the port network number, carrier designation, slot, and circuit of the maintenance object under test.
- **Maintenance Name:** The type of maintenance object tested.
- **Test Number:** The actual test that was run.
- **Test Results:** Indicates whether the test passes, fails, or aborts.
- **Error Code:** Additional information about the results of the test. (See the ISDN Trunk Maintenance documentation for details.)

The functions of the **clear**, **list**, and **status** commands associated with the ISDN Testcall are summarized in the following list. For more detailed information, refer to the appropriate sections as directed.

- **Clear isdn-testcall <grp>/<mbr>** enables you to cancel an in-progress ISDN-PRI test call and allow another test call to start. For details on this command, refer to the **clear isdn-testcall** command description in the "Clear Commands" section of [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).
- **List isdn-testcall <grp>/<mbr>** enables you to list all the ISDN-PRI trunks in use for an ISDN-PRI test call in the system. For details on this command, refer to the **list isdn-testcall** command description in the "List Commands" section of [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).
- **Status isdn-testcall <grp>/<mbr no> [minutes]** enables you to check on the progress of an outgoing test call. When an outgoing ISDN-PRI test call completes in a specific port network, another ISDN-PRI trunk from the same port network is available for testing (regardless of whether the **status** information has been displayed). For details on this command, refer to the **status isdn-testcall** command description in the "Status Commands" section of [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

## Troubleshooting the Outgoing ISDN-Testcall Command

---

If the TestCall BCC field appears on the Trunk Group Administration Form, make sure the TestCall BCC field indicates the correct BCC for the service provisioned on the ISDN-PRI trunk. The TestCall BCC values are defined as follows:

- 0—Voice
- 1—Digital Communications Protocol Mode 1
- 2—Mode 2 Asynchronous
- 3—Mode 3 Circuit
- 4—Digital Communications Protocol Mode 0 (which is usually the default).

### ⇒ NOTE:

If the ISDN-PRI trunk is of type "cbc," make sure the TestCall Service field on the Trunk Group Administration Form indicates the correct service so that a network facility message can be sent across the ISDN-PRI network

If the outgoing ISDN-PRI test call keeps aborting, please make sure that the far-end device can handle DCP Mode 0 or DCP Mode 1.

### ⇒ NOTE:

Before attempting to make an ISDN-PRI test call to the public network (that is, the network is the far-end), make sure that test call service is provisioned by the network. The user must subscribe to Test Type 108 service and have the correct far-end test call number administered on the trunk group form for the call to be allowed.

## Troubleshooting Backplane Voltage Problems

---

The TN2036 Voltage Range circuit pack is a test tool that allows easy access to the backplane pins that provide various voltages to control and port slots. Probes from a voltmeter can be plugged into the access point for the desired voltage and a ground access point to measure the voltage. This circuit pack itself has instructions for use printed on the side as well as a listing of the voltage tolerance range for each voltage on the front panel. The voltages and tolerances are as follows:

ringing voltage: 75 -> 115 VAC

+12 VDC: 11.4 -> 12.6 VDC

+5 VDC: 4.95 -> 5.35 VDC

-5 VDC: -4.95 -> -5.35 VDC

-48 VDC: -43 -> -53 VDC

neon message waiting voltage: -80 VDC -> -165 VDC

The type of cabinet determines where the circuit is placed to measure the voltages. For single-carrier cabinets, all voltages except +12 VDC and +5 VDC can be measured from any port slot. However, the neon message waiting voltage requires that the system have a TN752 or TN755 Power Unit circuit pack. The Tape Drive slot is used to measure +12 VDC.

### NOTE:

All control circuit packs should be removed from the backplane before this measurement is made.

The +5 VDC measurement must be made in two separate cabinet locations since the power unit has two independent +5 VDC outputs [+5 VDC and +5(B) VDC]. Each output supplies a different section of the cabinet with power. For the control cabinet, make one measurement in the processor slot and another in any port slot. For an EPN control cabinet, make one measurement in any port slot from 1 to 4 and another in any port slot from 5 to 16. For a port cabinet, make 1 measurement in any port slot from 1 to 6 and another in any port slot from 7 to 18.

## Troubleshooting Multimedia Call Handling (MMCH)

---

Before troubleshooting any problems associated with the DEFINITY MMCH, always be sure that the endpoint is operating correctly (audio, video, and data) by making point-to-point test calls. If possible, make the test calls over the

network to test the connectivity and routing of network calls from the endpoint. This eliminates problems such as disconnected audio or video cables and network troubles.

## **64 Kbps Calls Terminate but Far End Receives 56 Kbps Indication**

---

### **Description**

Some 2x64 Kbps conferences on the DEFINITY MMCH do not establish because of framing, audio, or video problems.

For calls that are routed in the network through a Lucent Technologies/LEC interface, the originating equipment may launch a 64 Kbps call attempt, and the far end receives either a 56 Kbps or 64 Kbps indication. If the far end receives a 64 Kbps indication, the call may have used 56 Kbps facilities. If so, the call may exhibit any of the following conditions:

- No handshaking in one direction or both (call disconnects after timeouts)
- Call connects, but audio or video is corrupted (audio noise or no video)
- Call succeeds without disruption (this is the least likely since one endpoint must be aware that the call is really 56 Kbps to connect)

If any of the above conditions occur, then 64 Kbps calls from the site are blocked.

### **Solution**

Administer the conference for connection at 56 Kbps.

## **Calls Terminate with No Audio**

---

### **Description**

To support endpoints that do not support Multipoint Command Conference (MCC), the DEFINITY MMCH changes its capability set and initiates a capability set exchange with the endpoint when the Selected Communications Mode (SCM) changes. If the endpoint does not follow the SCM audio mode, the MCU may include the endpoint as a secondary (audio only) endpoint. If the endpoint sends an unknown or unsupported audio mode, then the TN788B decoder port mutes the endpoint from the conference. The user may hear the conference but may not be heard by other parties in the conference.

### **Solution**

1. Use the Status Conference x form and check the Audio Mode field for the current operating mode of the conference.

2. Another indication of the audio modes is in the "Incoming Mode Commands from Endpoint and Outgoing Commands from MMI" on page 3 of the Status Conference x Endpoint y form. Check the Audio fields under the Mode Commands/Communication Modes section of the form.

## **Some Parties Cannot Be Heard by Others (Audio Subsetting)**

---

### **Description**

Problems where varying subsets of the conference hear different things may have problems with the various summing resources/groups that are in use. Traditionally these faults are caused by the SPE not cleaning up the connections properly. Isolation and diagnosis should focus on the VC resources in use by that conference.

### **Solution**

1. Use the **status conference** command to list the VC resources in use by this conference. Try a hot replacement of any VC boards in use, which refreshes the VC translations and move all of the audio connections to different VC ports.
2. If the problem still exists, try dropping the conference and then bringing the conference back up again. Not only does this refresh VC translations, but uses different timeslots as well.
3. If the problem still exists, suspect a hardware problem. If practical, wait for the DEFINITY MMCH to be idle (no active conferences), and then check the circuit packs for active (yellow) LEDs. If any of these are unexpected, such as on a VC board, try replacing the board and then bringing the conference up again.

## **Calls Terminate with No Video**

---

### **Description**

Generally, loss of video can be divided into 2 types. The first occurs when the DEFINITY MMCH switches to the endpoint, but nobody sees them. The receivers see either "black" video or a frozen image of the previous speaker depending on the codec of the manufacturer. The type occurs when the DEFINITY MMCH does not switch to an endpoint.

### **Solution**

In the first type described above, wiring problems, power to the camera, or video encoder circuit pack problems in the codec are typical causes.

In the second type, no video from an endpoint typically occurs because it is not a valid video source. This can be checked by looking at page 1 of the Status

Conference x Endpoint y Vid form under the Capability section. In this section, a “y” or “c” suggests that the endpoint has video. An “e” means ept has not declared any video capability in cap set, “n” is audio only, and “blank” means audio add-on.

Also check page 1 of the Status Conference x Endpoint y Vs form for indication of the video state for the endpoint values.

## **Calls Terminate Correctly but Are Unstable**

### **Description**

A number of conditions will lead to some or all endpoints having stability problems during the course of a conference. A lack of stability from an endpoint is noticeable by a lack of a video switching while the party is the only talker or excessive disconnects from that endpoint.

### **Synchronization**

Generally, the most common problem is a mismatch in synchronization sources between the endpoint and the DEFINITY MMCH. This typically causes low-level (Px64) handshake problems that can trigger the endpoint/MMCH to disconnect the call. The MCCH's timers are set to sufficiently high values so that, normally, the endpoint will timeout and disconnect first. If installed in a customer network, it is a good idea to perform an audit of the path synchronization is being supplied. If there are different clock sources between endpoints and the DEFINITY MMCH, some problems are sure to occur. The severity of these problems can range from a handshake failure every few seconds to one per day. Depending on the type of endpoint, this can cause the endpoint to disconnect or just freeze video until the main problem is resolved.

Specifically, PictureTel System 4000 endpoints seem to be the most sensitive to instability. The Lucent Technologies Vistium also disconnects fairly infrequently. Last, the CLI Rembrandt II VP freezes video and waits for framing to be recovered.

### **Network Configuration Concerns with Synchronization**

When auditing a network for synchronization, avoid unnecessary hops. Thus, a switch providing star-configuration synchronization is preferred over a daisy-chain configuration. Additionally, if there are DEFINITY PBXs that have EPNs, synchronization should be provided to sub nodes from the same port network through which the PBX receives its synchronization. Passing synchronization through the PBX Expansion Interface adds an unnecessary hop to the path and creates another potential point of failure.

## Expansion Interface Duplication

If a customer's network uses PBX EPNs with duplicated Expansion Interfaces, scheduled switching of the Expansion Interface links should be disabled on the PBX via **change system-parameters maintenance**. When scheduled maintenance runs and switches the links, there is a brief corruption of the data path. If endpoints have active calls when the switch occurs, this corruption of the data path causes Px64 handshake problems, which lead to the endpoints losing video source status, and sometimes disconnecting as described above. Disabling the EI switching is in the customer's best interest to prevent the disruption of the Px64 data stream. The customer will get the same level of alarm indications and maintenance on the EI links, regardless of the status of scheduled switching.

## PRI D-Channel Backup

A somewhat unlikely source of call stability problems occur where the translations for PRI D-channel Backup between two non-MCU switches were incorrect. As an example, on switch A, DS1 1A10 was designated as the primary source, and on switch B, the corresponding DS1 was designated as the secondary source. When scheduled maintenance was run on the switch that had an active standby D-channel, an audit disconnected some calls using the link. The problem was corrected when the the D-channel primary/secondary assignments matched.

## Processor Duplication on the PBX

Do not enable the PI link switch on scheduled maintenance. This can cause link stability problems on the Accunet Bandwidth Controller (ABC).

## Voice-Activated Switching Problems

---

Voice-activated switching on the DEFINITY MMCH does not follow the loudest talker. The MMCH queues all speaking parties and selects a new video broadcaster (the second-oldest speaking party) when the oldest speaking party has stopped talking. The new broadcaster will see the last speaker as its video. The system can also "learn" about the noise coming from an endpoint to help prevent false switches, adapting both to noise level and repetitive sounds such as a fan. This adaptation occurs over approximately 10 seconds.

## No Switching, Full Motion Video

---

If a room is excessively noisy, the DEFINITY MMCH may receive sufficient audio signal to conclude that there is a speaker present. Use the Status Conference x form to determine if the MMCH thinks an endpoint is talking. The MMCH sets the Ts field to t for each endpoint if there is voice energy detected. This endpoint may have to mute when nobody at the site is speaking to allow the conference to proceed normally. Remind the customer that it may be necessary to mute if a side conversation is going on in the background, just as one would do in an

audio conference. If the system does not switch broadcasters even after the current broadcaster has muted, check the conference administration using the **display conference X** command to ensure that the conference is in voice-activated mode. Also verify that parties who were speaking are valid video sources as described in the "[Calls Terminate with No Video](#)" section above.

The See-Me feature (MCV) can also cause VAS to "lock-up." An endpoint can activate MCV to force their site to become the broadcaster. If they do not disable the feature when finished, the system remains in this mode indefinitely. Beginning with Release 3.0, the **status conference X** command shows that MCV is in effect by displaying av in the Video Status (Vs) column. Page 3 of the Status Conference X Endpoint Y form also has a Broadcaster field that indicates MCV is in effect with (SEE-ME) as the broadcaster. The same scenario can occur in a CHAIR or UCC-controlled conference with a designated broadcaster. In this situation the CHAIR/UCC has not released the designated broadcaster and returned to VAS mode. If there is a UCC-designated broadcaster, **status conference X** indicates a Video Status of u. Also, for UCC rollcall the return video may appear to be stuck. Check the Video Status for an "R," indicating rollcall.

If none of the examples above appears to be the cause, and if the room was quiet, all speakers are valid video sources, the conference is voice-activated, and the speaker can be heard, then escalate the problem.

## **Video Never Switches to a Particular Party**

### **Description**

Verify that the endpoint is a valid video source as described in the "[Calls Terminate with No Video](#)" section above. If it is, then the audio from the endpoint may not have sufficient voice signal for the hardware to determine the parties at the endpoint are speaking. Check the Talk field on page three of the Status Conference X Endpoint Y form to see if the `talking` bit is y. Next, check the audio by standing adjacent to the microphone and speaking at a normal level.

### **Solution**

If the audio is not muffled:

1. Use the **status conference** command to determine which port on the TN788B (VC board) is connected to this endpoint.
2. Check the VC (TN788B) board using the **test board xxyy long** command.
3. Drop the call.
4. Find another available port, then:
  - a. Busayout the port to which the endpoint was connected.

- b. Make another call to the same conference. If the problem corrects itself, then the previous port may be bad. If there are other VC boards with sufficient available ports to replace calls on the current VC, then pull the board that has the bad endpoint on it (the **status conference** command displays the encoder port associated with the call). The system will automatically reestablish the VC connections without dropping the call. If this fixes the problem, then replace the board, as it has at least one bad port. Reseating the board may temporarily fix the problem due to the hard reset done to the board.

## Audio Echo

---

Echo in conference calls, particularly those with large delay characteristics, is totally disruptive. When Voice Activated Switching is taken into account, the effects are disastrous. Various arrangements of the microphone(s) and room speaker(s) may be needed.

For some Lucent Technologies Vistium endpoints, if an external speaker is attached or was attached when the system was last rebooted, this endpoint will cause audio echo throughout the conference. First, isolate the offending endpoint by asking each endpoint to mute, one at a time, until the echo disappears.

If the input from an endpoint is located too close to the speakers of an endpoint, then acoustic echo is created. The microphone must be moved away from the speakers.

Normally, if any microphone in the room is moved relative to the speakers, that site will cause echo until the echo canceller in the codec retrains itself, some will require a manual reset. If a PictureTel keypad is configured with external microphones connected to the keypad, then the internal microphone and external microphone(s) "sing" to each other if the "ext mic" bat switch is set to "int mic" on the back of the keypad. In this configuration, VAS locked on that site, and the acoustic "singing" was inaudible.

## Rate Adaptation

---

Because of a lack of a clear explanation in standards, sometimes endpoints do not work well with each other and the DEFINITY MMCH. The MMCH will only allow a conference to downgrade from 64kbps to 56 kbps operation on conferences that have the Rate Adaptation flag set to y.

When a downgrade does occur, information on the Status Conference form indicates the success or failure of the 64kbps-endpoints that are participants to properly rate adapt to 56kbps. As a general indication that the conference has rate adapted, the Conference Transfer Rate and Effective Transfer Rate fields show initial and current transfer rates, respectively. For each 64-kbps

5 Routine Maintenance Procedures

Install DS1 CPE Loopback Jack (T1 Only)

Page 5-69

endpoint the column that indicates Rate Adapt shows an n if the endpoint did not follow the procedures as specified by the H.221. If an endpoint shows y, it did successfully rate adapt. If an endpoint shows c, it joined the conference at 56kbps.

Once the conference rate adapts, the endpoints that do not properly follow suit, will become audio-only endpoints. A conference will not rate adapt from 56 kbps back to 64 kbps until all endpoints disconnect from the conference and it idles.

The PictureTel 1000 Release 1.1C, PictureTel 6.01 software, and the Vistium 2.0 software successfully rate adapt with the MCU. External rate adaptation techniques used by VTEL and CLI are known to cause problems with the endpoint when used with this feature.

## Endpoint or I-MUX in Loopback Mode

---

Some endpoints have a loopback enable feature. This makes DEFINITY MMCH data loopback at the MMCH when a connection is in progress. The loopback can be enabled prior to or during a connection.

The MMCH does not detect the loop and continues to VAS. In most scenarios, the switch occurs, but within a few seconds, the broadcaster's return video becomes its own image. Once the broadcaster stops speaking, the system "false" switches to an apparently random port that was not speaking.

## Install DS1 CPE Loopback Jack (T1 Only)

---

Using the DS1 CPE Loopback Jack (apparatus code 700A, comcode 107988867), a technician can test the DS1 span between the system and the network interface point. The loopback jack is required when DC power appears at the interface to the ICSU. *The loopback jack isolates the ICSU from the DC power and properly loops the DC span power.*

### NOTE:

The loopback jack operates with any vintage of TN767E (or later) or TN464F (or later) DS1 circuit packs and with G3V3 EDI release 3 (or later) software. The loopback jack operates with the 120A2 (or later) Integrated Channel Service Unit (ICSU) only; *not* the 31xx series of Channel Service Units or other external CSUs or earlier ICSUs.

## Loopback Jack Installation

---

### Configurations Using a Smart Jack

The preferred location of the loopback jack is at the interface to the Smart Jack. This provides maximum coverage of CPE wiring when remote tests are run using the loopback jack. If the Smart Jack is not accessible, install the loopback jack at the extended demarcation point.

1. If there is no extended demarcation point, install the loopback jack directly at the network interface point as shown in [Figure 5-11](#).
2. If there is an extended demarcation point and the Smart Jack is not accessible, install the loopback jack as shown in [Figure 5-12](#).
3. If there is an extended demarcation point, but the Smart Jack is accessible, install the loopback jack as shown in [Figure 5-13](#).

### Configurations Without a Smart Jack

1. Install the loopback jack at the point where the cabling from the ICSU plugs into the “dumb” block. If there is more than one “dumb” block, choose the one that is closest to the Interface Termination feed or the fiber MUX. This provides maximum coverage for loopback jack tests. Refer to [Figure 5-14](#) and [Figure 5-15](#).

### Installation

1. To install the loopback jack, simply disconnect the RJ-48 (8-wide) connector (typically an H600-383 cable) at the appropriate interface point and connect the loopback jack in series with the DS1 span. See [Figure 5-11](#) through [Figure 5-15](#).
2. Plug the H600-383 cable from the ICSU into the female connector on the loopback jack.
3. Plug the male connector on the loopback jack cable into the network interface point.

#### NOTE:

Do not remove the loopback jack after installation. This is not a test tool and should always be available to remotely test a DS1 span.

### Administration

---

1. At the management terminal, enter **change ds1 <location>**. The “location” is the DS1 interface circuit pack for which the loopback jack was installed.
2. Be sure the “near-end CSU type” is set to integrated.

3. On page 2 of the form, change the supply CPE loopback jack power field to y.

**NOTE:**

Setting this field to y informs the technician that a loopback jack is present on the facility. This allows a technician to determine that the facility is available for remote testing.

4. Enter **save translation** to save the new information.

## **DS1 Span Test**

---

This test should only be performed after the DS1 circuit pack and the 120A2 (or later) ICSU have been successfully tested using appropriate maintenance procedures. The DS1 span test consists of 2 sequential parts. Each part provides a result indicating if there is a problem in the CPE wiring. CPE wiring may be considered problem-free only if the results of both parts are successful.

The first part of the span test powers-up the loopback jack and attempts to send a simple code from the DS1 board, through the wiring and loopback jack, and back to the DS1 board. Maintenance software waits about 10 seconds for the loopback jack to loop, sends the indication of the test results to the management terminal, and proceeds to the second part of the test.

The second part of the test sends the standard DS1 3-in-24 stress testing pattern from the DS1 board, through the loopback jack, and back to a bit error detector and counter on the DS1 board. The bit error rate counter may be examined at will via the management terminal, and provides the results of the second part of the test. The test remains in this state until it is terminated so that the CPE wiring may be bit error rate tested for as long as desired.

1. Busy out the DS1 circuit pack by entering **busyout board UUCCSS** (where UUCCSS is the cabinet, carrier, and slot number of the DS1 board).
2. At the management terminal, enter **change ds1 <location>** and verify the near-end csu type is set to integrated.
3. Change to page 2 of the DS1 administration form and confirm that the TX LBO field is 0dB. If not, record the current value and change it to 0dB for testing. Press Enter to implement the changes or press Cancel to change nothing.
4. Enter **test ds1-loop <location> cpe-loopback-jack**. This turns on simplex power to the loopback jack and waits about 20 seconds for any active DS1 facility alarms to clear. A "PASS" or "FAIL" displays on the terminal. This is the first of the 2 results. A "FAIL" indicates a fault is present in the wiring between the ICSU and the loopback jack. The loopback jack may also be faulty. A "PASS" only indicates that the loopback jack looped successfully, not that the test data contains no errors. If a "PASS" is obtained, continue with the following steps.

**⇒ NOTE:**  
The loss of signal (LOS) alarm (demand test #138) is not processed during this test while the 3-in-24 pattern is active.

- 5. Enter **clear meas ds1 loop <location>** to clear the bit error count.
- 6. Enter **clear meas ds1 log <location>** to clear the performance measurement counts.
- 7. Enter **clear meas ds1 esf <location>** to clear the ESF error count.
- 8. Enter **list meas ds1 sum <location>** to display the bit error count. Refer to [Table 5-5](#) for troubleshooting information.

**Table 5-5. DS1 Span Troubleshooting**

| Displayed Field         | Function                            | Indication                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test: cpe-loopback-jack | Pattern 3-in-24                     | The loopback jack test is active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Synchronized            | Y or N                              | If “y” displays, the DS1 circuit pack has synchronized to the looped 3-in-24 pattern and is accumulating a count of the bit errors detected in the pattern until the test has ended. If “n” displays, retry the test 5 times by ending the test per Step 11 and re-starting the test per Step 4. If the circuit pack never synchronizes, substantial bit errors in the 3-in-24 pattern are likely. This could be intermittent connections or a broken wire in a receive or transmit pair in the CPE wiring.                                                                                                                                                                                                                                       |
| Bit Error Count         | Cumulative count of detected errors | <p>If there are no wiring problems, the counter remains at 0.</p> <p>A count that pegs at 65535 or continues to increment by several hundred to several thousand on each <b>list meas</b> command execution indicates intermittent or corroded connections, severe crosstalk, or impedance imbalances between the two conductors of the receive pair or the transmit pair. Wiring may need replacement.</p> <p>Note that “ESF error events” counter and the ESF performance counter summaries (“errored seconds”, “bursty errored seconds”, and so forth) will also increment. These counters are not used with the loopback jack tests. However, they will increment if errors are occurring. Counters should be cleared following the test.</p> |

5 Routine Maintenance Procedures

*Install DS1 CPE Loopback Jack (T1 Only)*

Page 5-73

9. Repeat Steps 5 through 8 as desired to observe bit error rate characteristics. Also, wait 1 to 10 minutes between Steps 5 through 7. One minute without errors translates to better than a 1 in 10 to the eighth error rate. Ten minutes without errors translates to better than a 1 in 10 to the ninth error rate.
10. If the test runs for 1 minute with an error count of 0, confirm that the 3-in-24 pattern error detector is operating properly by entering **test ds1-loop <location> inject-single-bit-error**. This causes the 3-in-24 pattern generator on the DS1 circuit pack to inject a single-bit error into the transmit pattern. A subsequent **list meas ds1 summary <location>** command displays the bit error count. If a count greater than 1 is displayed, replace the ICSU and retest. If the problem continues, replace the DS1 circuit pack.
11. Terminate the test by entering **test ds1-loop <location> end cpe-loopback-jack-test**. Wait about 30 seconds for the DS1 to re-frame on the incoming signal and clear DS1 facility alarms.

Loopback termination fails under the following conditions:

- a. The span is still looped somewhere. This could be at the loopback jack, at the ICSU, or somewhere in the network. This state is indicated by a fail code of 1313. If the red LED on the loopback jack is on, replace the ICSU. Re-run the test and verify that the loopback test terminates properly. If not, replace the DS1 circuit pack and repeat the test.
  - b. The DS1 cannot frame on the incoming span's signal after the loopback jack is powered down. This means that there is something wrong with the receive signal into the loopback jack from the "dumb" block or the Smart Jack. If the service provider successfully looped and tested the span, up to the Smart Jack, this condition isolates the problem to the wiring between the loopback jack and the Smart Jack. Refer to "Loopback Jack Fault Isolation Procedures" for information on how to proceed in this case. The test cannot be successfully terminated until a good signal is received. To properly terminate the test before a good receive signal is available, enter **reset board <location>**.
12. Restore the "TX LBO" field to the original value recorded in Step 2.
  13. Release the DS1 circuit pack using the **release board UUCSSpp** command.
  14. Leave the loopback jack connected to the DS1 span.

## Loopback Jack Fault Isolation Procedures

---

This section describes the possible DS1 configurations in which the loopback jack may be used. These configurations are: when the DS1 provider includes a Smart Jack, when no Smart Jack is provided at all, and when sites use fiber multiplexers. These configurations are separated into "Configurations Using a Smart Jack" and "Configurations Without a Smart Jack."

### Configurations Using a Smart Jack

The addition of the loopback jack and the presence of a Smart Jack divides the DS1 span into 3 separate sections for fault isolation. These sections are shown in [Figure 5-11](#) through [Figure 5-13](#) for the different span configurations. They are:

- Section 1: Between the 120A2 (or later) ICSU and the loopback jack.
- Section 2: Between the loopback jack and the Smart Jack (network interface point).
- Section 3: From the Smart Jack to the CO. It is necessary to contact the DS1 provider to run this test.

A problem can exist in 1 or more of the 3 sections. The field technician is responsible for finding and correcting problems in the first 2 sections. The DS1 service provider is responsible for finding and correcting problems in the third section. Testing is divided into 3 steps.

- Test customer premises wiring (section 1 in the following 3 figures) from the ICSU to the loopback jack as described in "DS1 Span Test."
- Test the CO-to-network interface wiring (section 3 in [Figure 5-11](#)) using the Smart Jack loopback (CO responsibility). Coordinate this test with the DS1 provider.
- Test the short length of customer premises wiring (section 2 in the following 3 figures) between the loopback jack and the Smart Jack. This can be done using a loopback that "overlaps" section 2 of the cable. Any of the following loopbacks can do this:
  - a. The local ICSUs line loopback, which is typically activated, tested, and then deactivated by the DS1 service provider at the CO end.
  - b. The local DS1 interface's payload loopback, activated and tested by the DS1 service provider at the CO end.
  - c. The far-end ICSU's line loopback. This test is activated at the management terminal by entering **test ds1-loop <location> far-csu-loopback-test-begin**. The test is terminated by entering **test ds1-loop <location> end-loopback/span-test**. Bit error counts are examined as described in "DS1 Span Test." This test method is the least preferable because it covers wiring that is not in the local portion of the span. This test only isolates problems to

**5** Routine Maintenance Procedures

*Install DS1 CPE Loopback Jack (T1 Only)*

*Page 5-75*

section 2 wiring if there are no problems in the wiring between the far-end CO and the far-end ICSU. Coordinate this test with the DS1 service provider.

If any of the above tests (a, b, or c) fail, a problem is indicated in section 2 as long as the tests for section 1 and section 3 pass. Since section 2 includes the network interface point, it is necessary to work with the service provider to isolate the fault to the loopback jack cable, the “dumb” block, or the Smart Jack.

Figure 5-15. Network Interface at "Dumb" Block with Repeater Line to Fiber MUX

Section 2 includes the short cable from the loopback jack to the "dumb" block demarcation point (part of the loopback jack). This is the only portion of section 2 that is part of customer premises wiring but is not covered in the loopback jack's loopback path.

A problem can exist in 1 or both of the 2 sections. The field technician is responsible for finding and correcting problems in section 1 and the loopback cable portion of section 2. The DS1 service provider is responsible for finding

and correcting problems in the majority of section 2. Testing is divided into 2 steps.

1. Test customer premises wiring (section 1 in [Figure 5-14](#)) from the ICSU to the loopback jack as described in the “DS1 Span Test” section.
2. Test the loopback jack-to-“dumb” block and “dumb” block-to-CO wiring (section 2 in [Figure 5-14](#)). This can be done using a loopback that “overlaps” the section of the span. Any of the following loopbacks can do this:
  - a. The local ICSUs line loopback, which is typically activated, tested, and then deactivated by the DS1 service provider at the CO end.
  - b. The local DS1 interface’s payload loopback, activated and tested by the DS1 service provider at the CO end.
  - c. The far-end ICSU’s line loopback. This test is activated at the management terminal by entering **test ds1-loop <location> far-csu-loopback-test-begin**. The test is terminated by entering **test ds1-loop <location> end-loopback/span-test**. Bit error counts are examined as described in the “DS1 Span Test” section. This test only isolates problems to section 2 wiring if there are no problems in the wiring between the far-end CO and the far-end ICSU. Coordinate this test with the DS1 service provider.

If any of the above tests (a, b, or c) fail, a problem is indicated in section 2. This could mean bad loopback jack -to-“dumb” block cabling, but is more likely to indicate a problem somewhere between the “dumb” block and the CO. This is the responsibility of the DS1 service provider. If the DS1 Span Test confirms that there are no problems in section 1, the technician should proceed as follows to avoid unnecessary dispatch.

- Identify and contact the DS1 service provider
- Inform the DS1 provider that loopback tests of the CPE wiring to the “dumb” block (section 1) showed no problems
- If the far-end ICSU line loopback test failed, inform the DS1 provider
- Request that the DS1 provider perform a loopback test of their portion of the section 2 wiring by sending someone out to loop section 2 back to the CO at the “dumb” block.

If this test fails, the problem is in the service provider’s wiring.

If the test passes, the problem is in the cable between the loopback jack and the “dumb” block. Replace the loopback jack.

## Configurations Using Fiber Multiplexers

---

Use the loopback jack when customer premises DS1 wiring connects to an on-site fiber multiplexer (MUX) and allows wiring to the network interface point on the MUX to be remotely tested. This requires that ICSUs be used on DS1 wiring to the MUX.

Fiber MUXes can take the place of Interface termination feeds as shown in [Figure 5-11](#) , [Figure 5-12](#), [Figure 5-13](#), and [Figure 5-14](#). Test these spans using the same procedures as metallic spans. Note the following points:

1. Fiber MUXes may have loopback capabilities that can be activated by the service provider from the CO end. These may loop the signal back to the CO or back to the DS1 board. If the MUX provides the equivalent of a line loopback on the "problem" DS1 facility, this may be activated following a successful loopback jack test and used to isolate problems to the wiring between the loopback jack and the MUX.
2. Be aware that there are installations that use repeatered metallic lines between the MUX and the "dumb" block. Theses lines require DC power for the repeaters and this DC power is present at the "dumb" block interface to the CPE equipment. *A loopback jack is required in this configuration to properly isolate and terminate the DC power.*

To check for the presence of DC, make the following 4 measurements at the network interface jack:

1. From Transmit Tip (T, Pin 5) to Receive Tip (T1, Pin 2)
2. From Transmit Ring (R, Pin 4) to Receive Ring (R1, Pin 4)
3. From Transmit Tip (T, Pin 5) to Transmit Ring (R, Pin 4)
4. From Receive Tip (T1, Pin 2) to Receive Ring (R1, Pin 4)

All measurements should read 0 (zero) volts DC. For pin numbers and pin designations, refer to *Integrated Channel Service Unit (ICSU) Installation and Operation*, 555-230-193.

## Operating Charasteristics

---

If a TN464F or TN767E and a 120A2 were installed in a system running pre-G3V3 software and the software is later upgraded to G3V3 Release 3 or later, reseal the DS1 circuit pack so that the ICSU administration fields will appear on the DS1 administration form.

# Reliability Systems: A Maintenance Aid

# 6

## General

---

A high or critical reliability system provides highly-available call processing because single points-of-failure in the system that result in loss of call processing are minimized. Such a system uses the existing duplicated TDM buses, provides the SPE, translation card, and Tone-Clock circuit pack duplication, and it uses packet bus redundancy. These components are each single points of failure in a standard reliability system.

The SPE is fully duplicated. The two SPEs are mounted in separate carriers and powered by different carrier power supplies. As a result, a high or critical reliability system has two control carriers: the A control cabinet and the B control cabinet.

Since the circuit packs in the two SPEs are the same, the SPEs have identical capabilities. Either SPE can act as the active SPE. However, only one of the SPEs can be the active SPE at any given time. The active SPE performs the same operations that the single SPE performs in a standard system; that is, all call processing, administration, and maintenance activities being performed by the switch. All memory writes performed on the active SPE are copied to the other SPE. The other SPE is known as the standby SPE. Its role is to take over as the active SPE if the current active SPE fails. If the active SPE (or a component of the active SPE) fails, the system automatically switches to the standby SPE.

Under normal conditions, the system operates using both TDM Buses. If the system detects transmission problems on one of the buses, it takes that bus out-of-service and operates with only one bus. This action results in a reduction in capacity. However, if the system detects a problem with one of the Tone-Clock circuit packs, it is able to take that circuit pack out-of-service without any impact on system capacity or performance.

The Packet Bus is NOT duplicated in the same way that the TDM Bus is duplicated (that is, there is one Packet Bus, while there are two TDM Buses). However, there are several spare leads on the Packet Bus itself that are not normally used. In a High or Critical Reliability system, the TN771 Maintenance/Test circuit pack is provided. This circuit pack has ability to detect faulty Packet Bus leads and to instruct all Packet circuit packs (for example ISDN-BRI, Packet Control, TN570 Expansion Interface circuit packs) to use up to three spare leads in place of defective ones.

The rest of this chapter provides a detailed description of the High and Critical Reliability systems that are available in as well as of the Standard system that is available across the board. The chapter explains the duplicated hardware and includes a description of the TN772 Duplication Interface circuit pack. It provides a look at the following concepts relevant to high and critical reliability systems: memory shadowing, SPE modes, and SPE-interchanges.

In addition, this chapter contains technical descriptions important to the general maintenance of High and Critical Reliability systems, such as a list of the appropriate system technician commands, SPE circuit pack LED strategies, installation and replacement procedures for SPE Control Carrier circuit packs, and for the Inter-Carrier Cable (ICC).

This chapter uses the term "Standard Reliability system" or "Standard system" to denote a system without duplication.

## **Reliability Options**

---

The Release 5 systems are available in three different reliability options: standard, high and critical reliability. An increased level of reliability is implemented by duplicating various components so that standby components can take over (interchange) when a failure occurs on an active component. Most interchanges take place with no disruption of current service, and they allow for repairs to be made without disruption. Furthermore, duplication allows for the upgrading and maintenance of duplicated components and software without service disruption. The following sections describe which components are duplicated with each option.

### **Standard Reliability**

---

On standard reliability systems, the 512-time-slot TDM bus is divided into two duplicate 256-time-slot buses, A and B. Call traffic is shared between the two buses. The first five time slots on each bus are reserved for the control channel, which is active on only one of the two buses at a time. Likewise, the next 17 time slots are reserved for carrying system tones. The tone time slots are not necessarily on the same bus (A or B) as the control channel. If any failure that affects the ability of the active control channel or the tone time slots to function takes place, the other bus becomes active for those time slots. For more

information, see TDM-BUS Maintenance section in [Chapter 10, "Maintenance Object Repair Procedures"](#), and the **set tdm** command in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

## High Reliability

---

High reliability systems duplicate components that are critical to the viability of the system as a whole to prevent a single failure from dropping all service. These components include the following:

- PPN control carrier and carrier power units (OLSSs)
- All SPE circuit packs, including the Processor, Memory, Network Controller, Processor Interface, Packet Controller, and Duplication Interface circuit packs
- PPN Tone Clock circuit pack (EPN Tone-Clocks are not duplicated)
- TDM buses (described in the previous section)

The duplicated SPEs operate in active/standby fashion. Operation of this duplication is described in the STBY-SPE and DUPINT MO sections in [Chapter 10, "Maintenance Object Repair Procedures"](#). Interchanges of the SPE and of PPN Tone-Clocks operate independently unless induced by use of the SPE-select switches.

## Critical Reliability

---

Critical reliability systems include all of the features of the High Reliability option described in the previous section. Additionally, these systems duplicate components of Port Network Connectivity (PNC) and of other components that are critical to the viability of each EPN. These components include the following:

- PPN and EPN Tone-Clock circuit packs
- PPN and EPN Expansion Interface circuit packs
- Inter-PN cabling

The entire direct-connected fiber connectivity is duplicated between each pair of port networks. Each duplicated fiber pair operates in an active/standby manner with all inter-PN calls set up on both fibers so that the active SPE can assume control without disruption of service. Each fiber pair between a pair of port networks operates independently of the other fiber pairs with respect to the active/standby operation (that is, the A-carrier fiber can be active between the PPN and EPN 1, and the B-carrier fiber can be active between the PPN and EPN 2).

The Tone-Clocks in each EPN operate in an active/standby manner independently from other duplication strategies.

## Duplicated Hardware

---

A description of the hardware components used in a high or critical reliability system follows.

### SPE Duplication

---

Each SPE in a high or critical reliability system consists of the following circuit packs:

- Processor Circuit Pack (TN790)
- Network Control Circuit Pack (TN777B)
- Packet Control Circuit Pack (TN778)

**NOTE:**

There may be zero or one Packet Control circuit pack. However, both SPEs must have an equal number of circuit packs.

- Processor Interface Circuit Pack(s) (TN765)

**NOTE:**

There may be zero, one, or two Processor Interface circuit pack. However, both SPEs must have an equal number of Processor Interface circuit packs.

- Duplication Interface Circuit Pack (TN772)

### Duplication Interface Circuit Pack

---

The Duplication Interface circuit pack is required to support SPE duplication. Duplication Interface A is part of the SPE in the A control carrier, and Duplication Interface B is part of the SPE in the B control carrier.

The Duplication Interface circuit packs provide a broad range of functionality. Alone, Duplication Interface A provides control of the following components: the duplicated Processor circuit packs, the duplicated Tone-Clock circuit packs, the environmental maintenance monitoring and control, and G3MT terminal connection. Together, Duplication Interface A and Duplication Interface B provide memory shadowing from Active SPE Memory to Standby SPE Memory and communication between software on the Active SPE and the Standby SPE.

Duplication Interface A controls a lead that indicates to the duplicated Processor and Network Control circuit packs, respectively, which SPE is currently the Active SPE. This lead is known as the SPE Select lead. Duplication Interface A controls another set of leads that indicate to the duplicated TN768 and TN780 8

Tone-Clock circuit packs which of the two is currently the active one. These leads are known as the Tone-Clock Select leads. System software can request that the SPE Select lead and/or the Tone-Clock Select leads be changed. Duplication Interface A controls and monitors in the PPN of a High or Critical Reliability system the same set of environmental leads that the EPN TN775 or TN775B Maintenance circuit pack controls and monitors in an EPN.

The Duplication Interface circuit packs communicate with one another over the Inter-Carrier Cable (ICC). In a multicarrier cabinet, the ICC physically consists of two 25-pin connector cables known as ICC-A and ICC-B. In a single-carrier cabinet, the ICC physically consists of three 25-pin connector cables known as ICC-A, ICC-B, and ICC-C. The ICC connects the Duplication Interface circuit packs via pin fields on the backplane. The pin fields where ICC-A and ICC-B (and ICC-C in a single-carrier cabinet) are connected are labeled on the backplane near the pin fields for the Duplication Interface circuit packs. The ICC carries leads related to maintaining a High or Critical Reliability system. Furthermore, without the ICC properly attached, the system cannot function as either a High or Critical Reliability system or as a Standard system.

The Duplication Interface circuit packs support serial links that provide for G3 MT connection, memory shadowing from Active SPE Memory to Standby SPE Memory, and communication between software on the Active SPE and the Standby SPE. Four serial links are supported:

1. The serial link from Duplication Interface A to the G3 MT.
2. The serial link from Duplication Interface A to the Maintenance/Tape Processor in carrier A.
3. The serial link from Duplication Interface A to the Maintenance/Tape Processor in carrier B.
4. The serial link from Duplication Interface A to Duplication Interface B.

 **NOTE:**

The Duplication Interface B circuit pack does not communicate directly with either Maintenance/Tape Processor or with the G3MT.

Duplication Interface A supports the serial channel to the G3MT that is connected to the Duplication Interface A circuit pack by a connector on the back of carrier A labeled "DOT" (Duplication Option Terminal). If the Duplication Interface A circuit pack becomes defective, and the B carrier becomes the Active SPE, the terminal can be connected to the Maintenance/Tape Processor in carrier B by connecting the terminal to the connector labeled "TERM" on the back of carrier B. If the Duplication Interface A circuit pack becomes defective and carrier A becomes the Active SPE, the terminal can be connected to the Maintenance/Tape Processor in carrier A by connecting the terminal to the connector labeled "TERM" on the back of carrier A.

Communication between software on the Active SPE and the Standby SPE is conducted via a message flow between the two Processors. The flow of messages from the Processor in carrier A to the Processor in carrier B is as

follows: Processor A to Maintenance/Tape Processor A over the serial link to Duplication Interface A over the serial link to Maintenance/Tape Processor B to Processor B. The flow in the reverse direction is exactly opposite.

The serial link between Duplication Interface A and Duplication Interface B is involved only in memory shadowing from the Active SPE to the Standby SPE as described in the [“Memory Shadowing”](#) section.

## **SPE Select Switches**

---

The SPE-SELEC (SPE Select) switches are located on the TN772 Duplication Interface circuit packs and are used to hard-select the Active SPE in a high or critical reliability system. “Hard-select” means that the SPE Select switches can be moved from the AUTO position to force the current Active SPE to remain the Active SPE or to force the current Standby SPE to become the Active SPE. Hard selection of the Active SPE using the SPE Select switches overrides any attempts by the system software to switch to the Standby SPE to make it become the Active SPE.

Each switch has three positions:

- SPE-A (the left position)
- AUTO (the middle position)
- SPE-B (the right position)

To hard-select SPE A as the Active SPE, *both* SPE Select switches must be moved **one at a time** to the SPE-A position. To hard-select SPE-B as the Active SPE, *both* SPE Select switches must be moved to the SPE-B position. Any other combination of SPE Select switches leave control of the Active SPE to the system software.

## **Inter-Cabinet Cable**

---

As described previously, the ICC connects the two TN772 Duplication Interface circuit packs and is a basis of support for the Duplication Interface circuit pack functionality described previously.

The ICC carries leads related to maintaining a High or Critical Reliability system. The SPE Select lead indicates which SPE is the Active SPE. The Tone-Clock Select leads indicate which Tone-Clock circuit pack is active. SPE Select switch state leads indicate the position of the SPE Select switches. Emergency Transfer leads indicate whether Emergency Transfer is on or off in the PPN cabinet. Other leads “combine” the INADS, CDR, and the Customer-Provided Alarming device channels from the two Maintenance/Tape Processors.

The ICC also carries an indication of whether memory shadowing is enabled or disabled. Information to be shadowed is sent over the serial link between

Duplication Interface B and Duplication Interface A; this serial link is carried over the ICC.

Communication between software on the Active SPE and the Standby SPE is sent over the serial link between Duplication Interface A and the Maintenance/Tape Processor in carrier B. This serial link is also carried over the ICC.

The presence of the ICC also causes ID pins on the backplane to indicate that the system is a high or critical reliability system rather than a standard reliability system.

The ICC is difficult to connect, and its proper connection is critical to the operation of the system. Refer to the [“Procedure for Installing/Replacing the Inter-Cabinet Cable”](#) section for details on how to properly connect the ICC.

## **Tone-Clock Circuit Pack Duplication**

For more information about the Tone-Clock circuit packs see TONE-BD Maintenance Object in [Chapter 10, “Maintenance Object Repair Procedures”](#).

The TONE-BD (Tone-Clock) MO functionality is made up of the TONE-PT (Tone Generator) and the TDM-CLK (TDM Bus Clock). The Tone Generator provides all tones required by the system; the TDM Bus Clock provides synchronization for the TDM Bus and aids in monitoring and selection of SYNC (Synchronization) references.

Each High or Critical Reliability system provides two Tone-Clock circuit packs. In this configuration, a failed Tone-Clock circuit pack is switched off-line and an operational circuit pack is put on-line. Duplication Interface A selects the Active Tone-Clock circuit pack by driving the Tone-Clock Select lead. The selection of the Active Tone-Clock circuit pack is independent of the selection of the Active SPE.

## **Time Division Multiplexing Bus Duplication**

The TDM Bus is composed of two separate, independent buses called bus A and bus B. The first five time slots of both buses are reserved for communication between the SPE and port circuit packs. These time slots are known as the control channel. The control channel is a vital component and must be operational for the system to provide meaningful customer voice and data services. In addition to the control channel time slots, several other time slots are reserved for system use. These additional time slots are for the standard tones. The standard tones include the dial tone and the touch tones.

The ability to move the control channel and tones from a defective TDM Bus to an operational TDM Bus is a key component of a highly-available system. The system can detect transmission errors on the control channel, errors can be diagnosed, and corrective actions can be taken when necessary. If a bus is found to be defective, it is taken out-of-service. All existing calls on the

out-of-service bus are maintained, but no new calls are assigned to the out-of-service bus.

In addition to the system software's ability to detect a defective bus and perform a TDM Bus switch, the user also has the ability to specify if and when a scheduled control channel switch is to be performed.

## **Packet Bus Redundancy**

---

The Packet Bus is used to provide ISDN-BRI signaling via the TN778 Packet Control circuit pack. The Packet Bus is not physically duplicated in the same way that the TDM Bus is duplicated. However, there are several spare leads on the Packet Bus itself that are not normally used. In a High or Critical Reliability system that is using the Packet Bus, a TN771 Maintenance/Test circuit pack is provided for each port network. The Maintenance/Test circuit pack has the ability to test the Packet Bus and discover shorted or open leads on the Packet Bus. When such a fault is discovered, the Maintenance/Test circuit pack sends a message to each circuit pack that uses the Packet Bus, instructing that circuit pack to use one of the spare leads in place of the defective lead.

The Maintenance/Test circuit pack can recover up to three Packet Bus lead failures by this mechanism. This provides high availability by decreasing the chance of a blocking Packet Bus fault by two orders of magnitude.

The Maintenance/Test circuit pack has other capabilities, primarily with respect to ISDN-PRI Test Call features. Because of these other capabilities, the Maintenance/Test circuit pack is available as an option in Standard Reliability systems or in High and Critical Reliability systems that are not using the Packet Bus. In such systems, the Packet Bus redundancy capabilities of the Maintenance/Test circuit pack are NOT enabled.

## **Duplication Concepts**

---

High and critical reliability systems employ several concepts of duplication. These are described in the following sections.

### **Memory Shadowing**

---

Most of the time the Standby SPE is in a mode known as Standby Mode (see ["SPE Modes"](#) section) in which it is ready to assume the role of the Active SPE. To be ready to assume the role of the Active SPE, PR-MEM Release 5vs/si and later must be an up-to-date reflection of Active SPE Memory. This is accomplished by the memory shadowing mechanism.

The SHDW-CIR (Common Shadow Circuitry) on the Active SPE TN772 DUPINT (Duplication Interface) detects all memory writes that the Active SPE PROCR (Processor) makes to Active SPE Memory. The Active SPE Common Shadow

Circuitry sends this information to the Common Shadow Circuitry on the Standby SPE Duplication Interface via the ICC. The Common Shadow Circuitry on the Standby SPE Duplication Interface then writes the data to Standby SPE Memory. This logical connection between Active SPE Memory and Standby SPE Memory is known as the SHDW-LNK (Memory Shadowing Link).

Although most of the components making up the Memory Shadowing Link (that is, Active SPE Memory, both sets of Common Shadow Circuitry, and Standby SPE Memory) are tested and maintained individually, the integrity of the entire logical connection is also tested and maintained to make sure that the shadowing mechanism is functional and that Standby SPE Memory is the same as Active SPE Memory. Therefore, this testing is done under the guise of the Memory Shadowing Link.

## **SPE Modes**

---

As described earlier, the Active SPE is the SPE that is currently responsible for all call processing, administration, and maintenance activities being performed by the switch. The Active SPE is always in Active Mode.

The role of the Standby SPE is to be ready to take over as the Active SPE in the event that the current Active SPE fails. The Standby SPE does not perform Call Processing or Administration activities. It does perform Maintenance activity, but this is carried out completely under the direction of the Active SPE in order to monitor and maintain the health of the Standby SPE.

The Standby SPE is always in one of three modes: Standby, Maintenance, Busout, or Down. Usually the Standby SPE is in Standby Mode. In this mode, the SW-CTL (Switch Control) on the Standby SPE Network Control circuit pack is isolated from the TDM Bus so that it does not attempt to control the bus and interfere with the Switch Control on the Active SPE Network Control circuit pack. Similarly, the Standby SPE Packet Control circuit pack is isolated from the Packet Bus so that it does not attempt to control the Packet bus, and thus interfere with the Active SPE Packet Control circuit pack. The Standby SPE PROCR (Processor) is held in a reset state so that it does not run software. Finally, Standby SPE is being shadowed into from Active SPE Memory—meaning that Standby SPE Memory is updated to reflect every change in Active SPE Memory (for example, calls and administration changes). In Standby Mode, the Standby SPE is available to assume the role of the Active SPE.

In certain circumstances, the Standby SPE is put into Maintenance Mode by the Active SPE. In this mode, the Standby SPE is still isolated from the TDM and Packet Buses, but is no longer having its Memory shadowed into; its Processor is no longer held in a reset state. In Maintenance Mode, the Standby SPE accepts maintenance activity requests from the Active SPE to perform testing on Standby SPE components. For many of the requested activities, system software on the Standby SPE is brought up to conduct the activity. Translation saves and announcement saves may be performed on the Standby SPE when it is in Maintenance Mode. While in Maintenance Mode, the Standby SPE is not as

readily available to assume the role of the Active SPE, but may do so depending on the severity of the Active SPE fault(s).

In Busyout Mode, the Standby SPE is busied out by the *busyout SPE-standby* command. Only system technician-requested activities are carried out on the Standby SPE until a *release SPE-standby* command is executed. Refer to the **status system** command in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#) for information concerning Standby Modes. Whenever the Standby SPE is returned to Standby Mode from Maintenance Mode, its Memory is refreshed.

 **NOTE:**

Verify that the Standby SPE is functional (no duplication alarms exist and the SPE has returned to the Standby Mode) by running the **status system 1** command. If the standby SPE is in the maint/idle mode with no standby alarms, use the **standby refresh** command to put the standby SPE into the standby mode. Verify the results by using the **status system 1** command. For more information about the **status system** command see [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

 **NOTE:**

The system software automatically returns the Standby SPE from Maintenance Mode to Standby Mode at the completion of any maintenance activity. However, it is also possible to force the Standby SPE to return to Standby Mode by issuing the **refresh spe-standby** command from the G3MT terminal. The **refresh spe-standby** command preempts Standby SPE Maintenance Mode except that of entering maintenance mode. See the ["System Technician Commands for High and Critical Reliability Systems"](#) section for a description of the **refresh spe-standby** command.

This means that all of Active SPE DRAM Memory is shadowed over into Standby SPE Memory. The refresh is necessary because, while in Maintenance Mode, memory shadowing to the Standby SPE is disabled, and Standby SPE Memory is not updated to reflect changes in Active SPE Memory. After the refresh, Standby SPE Memory is again an up-to-date reflection of Active SPE Memory.

The Standby SPE goes into Down Mode when certain error conditions are detected. These error conditions are described in detail in the "Hardware Error Log Entries and Test to Clear Values" section of STBY-SPE (Standby SPE) Maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#). Once the error condition(s) that caused the Standby SPE to go into Down Mode is (are) corrected, the Standby SPE is first put into Maintenance Mode to conduct testing on Standby SPE components and is then returned to Standby Mode.

The current mode of the Standby SPE can be determined by issuing the **status system** command.

## SPE-Interchanges

---

The process by which the Standby SPE takes over for the Active SPE is referred to as an SPE-interchange. There are six conditions under which an SPE-interchange is initiated:

- Upgrade Software

Issuing the **upgrade software** command to upgrade the software on a High or Critical Reliability system reboots the Standby SPE from the standby translation card and then invokes an SPE-interchange so that the system is now running on the new software.

- System Technician Command

Issuing the **reset system interchange** command on the G3MT terminal causes an SPE-interchange to be initiated.

- Alarm Condition

If a Major or Minor alarm is activated on any circuit pack, an SPE-interchange is initiated, provided the health of the Standby SPE is better than that of the Active SPE. [Table 6-1](#) lists the MOs, the alarm levels, the level of SPE-interchange initiated, and the severity given to the alarm for all MOs that can cause software requested SPE-interchanges. The health of an SPE is based upon the single most severe alarm active within that SPE. The higher the severity level, the more severe the problem. The restart level of the interchange also depends on the single most severe alarm within the active SPE. Hot Restarts occur only when the Standby SPE is in standby mode. For example, the active SPE has a MAJOR SHDW-CIR and a MINOR DATA-BD alarm, and the standby SPE has a MAJOR TAPE alarm. In this case, the severity level of the active is 60, the severity level of the standby is 65, and no SPE-interchange would occur.

- SPE Select Switches

An SPE-interchange can be initiated by moving both SPE Select Switches, **one at a time**, to the position that selects the Standby SPE for Active Mode. The SPE Select Switches were described earlier in this chapter.

- Scheduled Maintenance

An SPE-interchange can be requested as a part of scheduled maintenance. This mechanism is used to exercise both SPEs. An SPE-interchange can be requested as part of scheduled maintenance by issuing the **change system-parameters maintenance** command and updating the form.

- Processor Insanity

Duplication Interface A (DUPINT, TN772) periodically audits the sanity of each of the Processor circuit packs. If the Active SPE does not respond to the sanity audit, Duplication Interface A initiates an SPE-interchange.

Table 6-1. Software-Requested Interchanges Caused by Alarm Conditions

| Maintenance Object | Alarm Level    | On/Off Board | Fault Severity Level | Restart Level            |
|--------------------|----------------|--------------|----------------------|--------------------------|
| STBY-SPE           | WARNING        | OFF          | 120                  | None                     |
| MEM-BD             | MAJOR or MINOR | ON           | 110                  | Hot or Warm <sup>1</sup> |
| MEMORY             | MAJOR or MINOR | ON           | 110                  | Hot or Warm <sup>1</sup> |
| STBY-SPE           | MAJOR          | ON           | 100                  | None                     |
| PROCR              | MAJOR          | ON           | 70                   | Hot or Warm <sup>1</sup> |
| SW-CTL             | MAJOR          | ON           | 65                   | Cold 2                   |
| MEM-CARD           | MAJOR          | OFF          | 65                   | Cold 1                   |
| 12V-PWR            | MINOR          | ON           | 65                   | Hot                      |
| DUPINT             | MAJOR          | ON           | 61                   | Hot                      |
| CARR-POW           | MAJOR          | ON           | 61                   | Cold 2                   |
| SHDW-CIR           | MAJOR          | ON or OFF    | 60                   | Warm                     |
| SHDW-LINK          | MAJOR          | ON           | 60                   | Warm                     |
| SW-CTL             | MINOR          | ON           | 40                   | Hot                      |
| PR-MAINT           | MINOR          | ON           | 30                   | Hot                      |
| PI-BD              | MAJOR or MINOR | ON           | 20                   | Hot                      |
| PKT-CTRL           | MAJOR          | ON or OFF    | 20                   | Hot                      |
| PKT-CTRL           | MINOR          | ON or OFF    | 15                   | Hot                      |
| PI-PT              | MAJOR          | ON           | 15                   | Hot                      |
| DATA-CHL           | MINOR          | ON           | 15                   | Hot                      |
| DATA-CON           | MINOR          | ON           | 15                   | Hot                      |
| DATA-BD            | MINOR          | ON           | 15                   | Hot                      |
| CARD-MEM           | MINOR          | ON or OFF    | 10                   | Hot                      |
| PR-MAINT           | MINOR          | OFF          | 8                    | Hot                      |

1.
- If the Standby SPE is in Standby mode when the alarm occurs, a Hot SPE-Interchange occurs. If the Standby is in Maintenance mode when the alarm occurs, however, a Warm SPE-Interchange rather than a Hot SPE-Interchange occurs.

Regardless of the condition that initiates an SPE-interchange, the G3MT is always logged off as a result of the SPE-interchange. The G3MT is available to log into after the SPE-interchange is complete and the “login” prompt is displayed.

## System Technician Commands for High and Critical Reliability Systems

The following system technician commands support high and critical reliability systems. Complete descriptions of these commands are found in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

### Commands for SPE Duplication

- The **busyout SPE-standby** command stops all background maintenance activities on the Standby SPE, and it doubles memory shadowing.
- The **release SPE-standby** command refreshes the Standby SPE, and it allows all background standby maintenance activities to continue.
- The **status system** command displays the status of the Active SPE and the Standby SPE (among other information).

#### ⇒ NOTE:

Verify that the Standby SPE is functional (no duplication alarms exist and the SPE has returned to the Standby Mode) by running the **status system 1** command. If the standby SPE is in the maint/idle mode with no standby alarms, use the **standby refresh** command to put the standby SPE into the standby mode. Verify the results by using the **status system 1** command. For more information about the **status system** command see [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

- The **status mem-card [1] a|b** command displays the status of the Active SPE Memory Card or the status of the Standby SPE Memory Card.
- The **test processor [1] a | b [short | long]** command tests the specified Processor circuit pack.
- The **test memory [1] a | b [short | long]** command tests the specified on-circuit pack memory with an optional Memory Expansion circuit pack.
- The **test card-mem [1] a | b [short | long]** command tests either the Active SPE Memory Card or the Standby SPE Memory Card.
- The **test network-control [1] a | b [short | long]** command tests the specified TN777B Network Control circuit pack and the Memory Card.
- The **test packet-control [1] a | b [short | long]** command tests the specified TN778 Packet Control circuit pack.
- The **test interface [1] a1 | b1 [short | long]** command tests the specified first TN765 Processor Interface circuit pack.
- The **test interface [1] a2 | b2 [short | long]** command tests the specified second TN765 Processor Interface circuit pack.

- The **test duplication-interface [1] a | b [short | long]** command tests the specified TN772 Duplication Interface circuit pack.
- The **test shadow-link** command tests the SHDW-LINK (Memory Shadowing Link). Refer to "MEM-BD" in [Chapter 10, "Maintenance Object Repair Procedures"](#) for a detailed description of this command.
- The **set vector <level> [spe-active | spe-standby | spe-maint]** command requests that a core dump be taken when a system restart of level <level> occurs.
- The **reset system interchange** command requests an SPE-interchange.
- The **test spe-standby [short | long]** command tests the Processor, Memory, Network Control, Processor Interface, Duplication Interface, and translation card circuit packs in the control carrier containing the Standby SPE. Refer to "STBY-SPE" in [Chapter 10, "Maintenance Object Repair Procedures"](#) for a detailed description of this command.
- The **refresh spe-standby** puts the Standby SPE into Standby mode.

**CAUTION:**

*Because of the power of the "refresh spe-standby" command, its full impact is described here so that it is clearly understood.*

The **refresh spe-standby** command is used to immediately put the Standby SPE into Standby Mode. The command conducts the same activities regardless of whether the Standby SPE is already in Standby Mode or whether it is in Maintenance Mode. When this command is issued, most Standby SPE maintenance activity that is currently in progress is preempted, the Standby SPE Processor is held reset, and the Standby SPE Memory is refreshed (that is, all of Active SPE DRAM Memory is shadowed to Standby SPE Memory). Recall that the refresh is necessary because, while the Standby SPE is in Maintenance Mode, memory shadowing is disabled. When the Standby SPE is returned to Standby Mode, its Memory must be brought up-to-date with Active SPE Memory. If the system was trying to enter Maintenance Mode, the **refresh spe-standby** command aborts with the message, "Cannot interrupt Standby SPE while entering maintenance mode; please try later."

**WARNING:**

*Because of its power to preempt Standby SPE maintenance activities, the "refresh spe-standby" command should be used judiciously. If the Standby SPE is in Maintenance Mode when the "refresh spe-standby" command is issued, the maintenance activity that is being conducted by the Standby SPE is immediately terminated.*

The following side-effects may occur:

- Testing of the Standby SPE components that are the target of the maintenance activity may not have completed. Depending on the maintenance activity and the point at which it is terminated, tests that

detect faults and/or lack of faults on those Standby SPE components may not have had the opportunity to run. Accordingly, alarms are not raised or retired on the components.

- If the maintenance activity is scheduled maintenance, and if the **refresh spe-standby** command is issued before a scheduled translation save is performed, the translation save is not done, and the translation data on both the Active SPE and Standby SPE tapes or memory cards do not reflect changes made since the last translation save.

In general, after a **refresh spe-standby** command has been used and the user has finished working with the system, the **test spe-standby long** command should be issued if the **refresh spe-standby** command preempted a Standby SPE maintenance activity.

Additionally, if the **refresh spe-standby** command was used in the time frame in which scheduled maintenance with a translation save was to have been conducted, the **save translation** command should be issued to ensure that the current translation data has been written to the Active SPE and Standby SPE tapes or Memory Cards. When using the **refresh spe-standby** command to preempt Standby SPE maintenance activities, it may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled “standby” on the status system form, wait 20 minutes. This does not include cases where the command completes with the G3MT terminal message “Refresh not successful; use ‘display errors’ to check for STBY-SPE errors” or “Cannot interrupt Standby SPE while entering maintenance mode; please try later.” Issue the **refresh spe-standby** command once more.

## Commands for TDM Bus Duplication

- The **status system** command displays the bus on which the control channel and tones currently reside (among other information).
- The **test tdm port-network [1 | 2 | 3] [short | long]** command tests both TDM Buses.
- The **set tdm port-network [1 | 2 | 3] a | b [override]** command moves the control channel and dedicated tones to the specified TDM Bus.
- The **busyout tdm port-network [1 | 2 | 3] bus a | b** command places the specified bus in a maintenance busy state.
- The **release tdm port-network [1 | 2 | 3] bus a | b** command places a busied-out bus back in service.

### Commands for Packet Bus Redundancy

- The **status system** command displays the status of the Packet Bus, and the number of faulty and open leads that the Maintenance/Test circuit pack has found.
- The **test pkt port-network [1 | 2 | 3]** command tests the Packet Bus.

### Commands for Tone-Clock Circuit Pack Duplication

- The **status system** command displays the Tone-Clock circuit pack that is currently supplying tones and clocks (among other information).
- The **test tone-clock [1 | 2 | 3] a | b [short | long]** command tests the specified TN768 Tone-Clock circuit pack.
- The **set tone-clock [1 | 2 | 3] a | b [override]** command makes the specified Tone-Clock circuit pack active.
- The **busyout tone-clock [1 | 2 | 3] a | b** command places the specified Tone-Clock circuit pack in the maintenance busy state.

 **NOTE:**  
This cannot be the one that is currently active.

- The **release tone-clock [1 | 2 | 3] a | b** command removes the specified Tone-Clock circuit pack from the maintenance busy state.

## Processor Complex Circuit Pack LED Strategies

The LEDs on the circuit packs in the two SPEs have the following meanings:

- Processor Circuit Pack

| Yellow | Green | Red | Meaning                                |
|--------|-------|-----|----------------------------------------|
| On     | Off   | -   | Active mode                            |
| On     | On    | -   | Active mode: Maintenance running       |
| Off    | On    | -   | Maintenance mode; Memory not refreshed |
| Off    | Off   | -   | Maintenance mode; Memory refreshed     |
| -      | -     | On  | Fault on Processor circuit pack        |

**NOTE:**

In addition to the standard LEDs, the Processor circuit pack has the red major and minor alarm LEDs, an amber warning LED, a green ack LED, and a red Emergency Transfer LED.

- Duplication Interface Circuit Pack (PICP)(B carrier) (TN772)::

| Yellow | Green | Red | Meaning                     |
|--------|-------|-----|-----------------------------|
| On     | -     | -   | SPC in active mode          |
|        | On    | -   | Maintenance running on PICP |
| -      | -     | On  | Fault on PICP               |

- Duplication Interface Circuit Pack (DICP)(A carrier) (TN772):

| Yellow | Green | Red | Meaning                                                         |
|--------|-------|-----|-----------------------------------------------------------------|
| On     | -     | -   | SPC in active mode, or A carrier Tone-Clock circuit pack active |
|        | On    | -   | Maintenance running on DICP                                     |
| -      | -     | On  | Fault on DICP                                                   |

Each Duplication Interface circuit pack has another red LED associated with the SPE Select Switch. The purpose of the red switch LED is to serve as a reminder that an SPE is being forced to be the Active SPE and, therefore, the system is not duplicated. Both SPE Select Switch LEDs (one on each Duplication Interface circuit pack) are on when an SPE is being forced to be the Active SPE by the consistent positions of the two SPE Select Switches. Both LEDs are extinguished when the SPE Select Switch positions are inconsistent or when both SPE Select Switches are in the position. In the latter two cases, the Active SPE is automatically selected by the system software.

- Processor Interface Circuit Pack (TN765):

| Yellow | Green | Red | Meaning                     |
|--------|-------|-----|-----------------------------|
| On     | -     | -   | Link terminated at PICP     |
|        | On    | -   | Maintenance running on PICP |
| -      | -     | On  | Fault on PICP               |

- Network Control Circuit Pack (TN777B):

| Yellow | Green | Red | Meaning                     |
|--------|-------|-----|-----------------------------|
| On     | -     | -   | Link terminated at NCCP     |
|        | On    | -   | Maintenance running on NCCP |
| -      | -     | On  | Fault on NCCP               |

There is also an yellow LED (below Memory Card slot). When ON, the Memory Card is in use.

- Packet Control Circuit Pack(PCCP)(TN778)

| Yellow | Green | Red | Meaning                     |
|--------|-------|-----|-----------------------------|
| On     | -     | -   | Link terminated at PCCP     |
|        | On    | -   | Maintenance running on PCCP |
| -      | -     | On  | Fault on PCCP               |

- Tone-Clock Circuit Pack:

**NOTE:**

For information on the standard amber/green/red LEDs see TONE-BD Maintenance Object in [Chapter 10, "Maintenance Object Repair Procedures"](#).

## Repair Procedures for High and Critical Reliability

This section describes the procedure for installing or replacing Standby SPE circuit packs. These circuit packs are:

- Processor Circuit Pack (TN790)
- Memory Expansion Board (CPP1)
- Network Control Circuit Pack (TN777[B])
- Packet Control circuit pack (TN778)
- Processor Interface circuit pack(s) (TN765)
- Duplication Interface circuit pack (TN772).

This procedure does **not apply** to the TN768 or TN780 Tone-Clock circuit pack. Refer to 'TONE-BD", "TONE-PT", or "TDM-CLK" in [Chapter 10, "Maintenance](#)

[Object Repair Procedures](#)" for the procedure to replace the Tone-Clock circuit pack.

**CAUTION:**

*When circuit packs in the Active SPE are to be replaced, this section provides procedures for performing an SPE-interchange to place the circuit packs in the Standby SPE mode. SPE circuit packs should never be replaced while they are located in the Active SPE.*

Use this section when:

1. Defective (that is, alarmed) Active or Standby SPE circuit packs are to be replaced. The procedure begins at the ["Replacing Defective SPE Circuit Packs"](#) section. Ignore the ["Upgrading SPE Circuit Packs"](#) section, as it does **not apply** to replacing defective Standby SPE circuit packs.
2. Healthy Standby SPE circuit packs are to be upgraded. The procedure begins at the ["Upgrading SPE Circuit Packs"](#) section. Ignore the ["Replacing Defective SPE Circuit Packs"](#) as it does **not apply** to upgrading Standby SPE circuit packs.

The ["Circuit Pack Replacement Procedure"](#) and ["Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs"](#) sections apply to both situations but should be referred to only **after** reading the appropriate sections as instructed previously.

## **Replacing Defective SPE Circuit Packs**

---

Determine that software is running by looking at the G3MT and verifying that it does not have either the "SPE DOWN MODE" or the "Duplication Interface - Processing Element Communication Down" message displayed.

### **Software Not Running**

If system software is not running or if it stops running at any point during this procedure, the suggested order of Processor Complex circuit packs to replace in an attempt to fix the SPE down problem is:

- Processor Circuit Pack (TN790)
- Network Control Circuit Pack (TN777[B])
- Packet Control circuit pack (TN778)
- Duplication Interface circuit pack (TN772)
- Processor Interface circuit pack (TN765)

## Software Running

If system software is running, determine which SPE is the Standby SPE by issuing the **status system** command from the G3MT terminal. Look at the SPE and MODE fields in the upper left corner of the form to determine which SPE (A or B) is the Active SPE; it is labeled as "active." The other SPE is the Standby SPE and is labeled as either "standby," "maint," or "down."

Follow the "Circuit Pack Replacement Procedure" described later for each Standby SPE circuit pack to be replaced. Continue with this procedure as follows.

1. If alarms are against the Active SHDW-CIR, Active DUPINT, or SHDW-LNK, replace the Duplication Interface circuit pack. Proceed to the ["Handling SHDW-CIR and SHDW-LNK Alarms in the Active SPE"](#) or ["Handling DUPINT Alarms in the Active SPE"](#) sections as applicable.
2. If these sections do not need to be referenced, proceed to the ["Circuit Pack Replacement Procedure"](#) section.

The rest of this section describes how the system behaves when there are faulty circuit packs in the SPEs and is meant to be informative rather than part of the general procedure of replacing SPE circuit packs.

### NOTE:

When circuit packs **other than the Duplication Interface circuit pack in the Active SPE** are defective, the SPE containing the more severely defective circuit packs is usually in the Standby SPE.

## Handling SHDW-CIR and SHDW-LNK Alarms in the Active SPE

Check for the existence of SHDW-CIR alarms against the Active SPE Duplication Interface circuit pack or SHDW-LNK alarms. If there are Active SPE SHDW-CIR or SHDW-LNK alarms, inform the customer that a COLD 2 restart of the system is needed and determine a time at which to restart may be. At that time, complete the following steps:

1. Make sure that the tape (memory card) in the Active SPE tape unit (memory card slot) has the most current translations. If it does not, issue the **save translations spe-active** command to put the most current translations on it.
2. Exchange the tapes (memory cards) in the Active SPE and Standby SPE so that the Standby SPE tape unit (memory card slot) contains the tape (memory card) from the previous step.
3. For a 386 system, if the Standby SPE is not in standby mode, issue the **refresh spe-standby** command to put it into standby mode if possible (see the previous Note). If the Standby SPE was successfully put into standby mode, then issue the **reset system interchange** command to

cause a PEI. If the refresh or system interchange are unsuccessful, then use the SPE select switches to hard select the Standby SPE (this will result in a COLD 2 restart of the system).

4. If the **upgrade software (reset system interchange)** command is successful, an SPE-interchange results in the new Active SPE performing a COLD 2 (HOT) restart. Follow the "Circuit Pack Replacement Procedure" described later. If the **upgrade software** command failed, determine why the failure occurred, resolve the problem, and repeat this entire procedure.

## **Handling DUPINT Alarms in the Active SPE**

---

Check for the existence of DUPINT alarms against the Active SPE Duplication Interface circuit pack. If there are Active SPE DUPINT alarms, inform the customer that a reboot of the system may be required and determine a time at which a reboot may be done. At that time, complete the following steps:

1. Make sure that the translation card in the Active SPE has the most current translations. If it does not, issue **save translations spe-active** to put the most current translations on it.
2. Exchange the translation cards in the Active SPE and Standby SPE so that the Standby SPE contains the card with the most current translations.
3. Throw the SPE Select Switches on the TN772 Duplication Interface circuit packs to force an SPE-interchange so that the current Standby SPE becomes the new Active SPE. If SPE B is currently the Standby SPE, throw both SPE Select Switches to the right. If SPE A is currently the Standby SPE, throw both SPE Select Switches to the left.

If the Duplication Interface circuit pack actually severed the Memory Shadowing Link resulting in corruption of Standby SPE Memory, the SPE-interchange results in the new Active SPE performing a Reboot. However, if the defect in the Duplication Interface circuit pack did not sever the Memory Shadowing Link, the SPE-interchange results in the new Active SPE performing a Warm Start instead.

4. After the SPE-interchange is complete, log into the terminal. Follow the "Circuit Pack Replacement Procedure" described later **for each circuit pack to be replaced in the new Standby SPE.**

## **Upgrading SPE Circuit Packs**

---

Determine which SPE is the Standby SPE by issuing the **status system** command. Look at the SPE and MODE fields in the upper left corner of the form. The Active SPE; it is labeled as "active." The other SPE is the Standby SPE and is labeled as either "standby," "maint," or "down."

Follow the "[Circuit Pack Replacement Procedure](#)" described later *for each Standby SPE circuit pack to be upgraded.*

When all Standby SPE circuit packs have been upgraded, force the Active SPE to become the Standby SPE as follows:

1. Issue the **status system** command from the terminal. Look at the SPE and MODE fields in the upper left corner of the form to determine the status of the Standby SPE. Recall that the Standby SPE is labeled as either “standby,” “maint,” or “down.”
2. If the Standby SPE is labeled as “maint,” continue issuing the **refresh spe-standby** command followed by the **status system** command until the Standby SPE is labeled “standby.”

**⇒ NOTE:**

It may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled “standby” on the status system form, wait 20 minutes. Issue the **refresh spe-standby** command once more.

3. If the Standby SPE is labeled “standby,” issue the **reset system interchange** command from the G3MT. After the SPE-interchange is complete, log into the terminal, issue the **status system** command, and verify that the SPEs have reversed roles.
4. Then, follow the “Circuit Pack Replacement Procedure” **for each circuit pack to be upgraded in the new Standby SPE.**

## Circuit Pack Replacement Procedure

This procedure **does not** apply to the TN768 Tone-Clock circuit pack. Please refer to “TONE-BD”, “TONE-PT”, or “TDM-CLK” in [Chapter 10, “Maintenance Object Repair Procedures”](#) for the procedure to replace the Tone-Clock circuit pack.

**⇒ NOTE:**

See the flowchart of the procedure for installing or replacing Standby SPE Circuit Packs In Duplication Option Systems at the end of this section, for use as a circuit pack replacement maintenance aid.

The following procedure involves throwing the SPE Select Switches to hard-select the current Active SPE. After completing the circuit pack replacement procedure, verify that the SPE Select Switches have been returned to the AUTO position both by noting their position and by noting that the SPE Select Switch LEDs on the TN772 Duplication Interface circuit packs are not on.

1. Throw the SPE Select Switches, **one at a time**, to force selection of the current Active SPE. If SPE B is currently the Active SPE, throw both SPE Select Switches, **one at a time**, to the right. If SPE A is currently the Active SPE, throw both SPE Select Switches, **one at a time**, to the left. Throwing the SPE Select Switches automatically disables shadowing.

⇒ **NOTE:**

Do not remove power before proceeding with step 2. All PPN Control Carriers used in High or Critical Reliability Systems (A slot for the Duplication Interface circuit pack identifies these carriers.) have staggered pins to support the hot plug-in of circuit packs.

2. Unseat the Standby SPE Processor circuit pack. (It is not necessary to entirely remove the Standby SPE Processor circuit pack from its slot.)
3. If the circuit pack to be replaced is the TN772 Duplication Interface in the A carrier, continue with this step. Otherwise, proceed to Step 4.

Issue the **status system** command from the terminal, and check the status of the Tone-Clock in the 1B carrier:

- a. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is "in" (that is, in service) and the SYSTEM CLOCK and SYSTEM TONES fields indicate that it is "active," proceed to Step 4.
- b. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is "in" (that is, in service) but the SYSTEM CLOCK and SYSTEM TONES fields indicate that it is "standby," then check the Error Log for an active Error Type 3329 against the 1B TONE-BD by issuing the **display error** command. If this error exists, proceed to Step 4.

⇒ **NOTE:**

Error Type 3329 implies that the Tone-Clock circuit pack probably cannot provide system clocks and an attempt to set the system clocks to this circuit pack would result in a **reset system 2** of the system. When the 1A Duplication Interface circuit pack is replaced, however, the system experiences a loss of clock, and a **reset system 2** occurs.

If an active Error Type 3329 is not logged against the 1B TONE-BD, issue the **set tone-clock 1B** command from the G3MT terminal to make the 1B carrier Tone-Clock active. Verify that the switch occurs by issuing the **status system** command and checking that the SERVICE STATE, SYSTEM CLOCK and SYSTEM TONES fields are now "in" and "active." Proceed to Step 4.

⇒ **NOTE:**

If the 1B Tone-Clock circuit pack is defective the switch may have failed and a **reset system 2** may have occurred. In this case, proceed to Step 4. However, the system experiences a loss of clock and another **reset system 2** when the 1A Duplication Interface circuit pack is replaced.

- c. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is "out" (that is, out-of-service), refer to the TONE-BD (Tone-Clock circuit pack), TONE-PT (Tone Generator), and TDM-CLK (TDM Bus Clock) Maintenance documentation in [Chapter 10, "Maintenance](#)

[Object Repair Procedures](#)", to restore it to service. Proceed to Step 4 regardless of whether or not the attempt to restore the 1B Tone-Clock to service was successful.

 **NOTE:**

If the 1B Tone-Clock was not successfully restored to service, the system experiences a loss of clock, and a **reset system 2** when the 1A Duplication Interface circuit pack is replaced.

4. If the circuit pack to be replaced is the TN772 Duplication Interface, throw the SPE Select Switch of the replacement Duplication Interface circuit pack to the same position as the SPE Select Switch on the Duplication Interface circuit pack that was removed.

If the Standby Processor is not being replaced Install the replacement circuit pack and reinsert the Standby SPE Processor circuit pack.

- a. If the circuit pack that was replaced was the TN772 Duplication Interface in the A carrier, the G3MT terminal is logged off. Log in to the Manager I terminal and proceed to Step 7.
5. If the circuit pack to be replaced is a TN790 Standby SPE Processor circuit pack loaded with the same software as loaded in the Active Processor or is a TN770 Standby SPE Processor circuit pack, install the circuit pack and proceed to Step 7.
6. If the circuit pack to be replaced is a TN790 Standby SPE Processor circuit pack and the software is being loaded from the generic program card, continue with the following steps:

 **NOTE:**

The TN790 must have the same number of SIMMs as the replaced circuit pack.

- a. Insert the generic program card into the Active SPE. Issue the **list configuration software-versions** command. If the software matches and the UPDATE FILE Identifier displays **none**, continue with this procedure. *Replace the translation card in the Active SPE.*
  - b. Insert the generic program card into the Standby SPE.
  - c. Install the TN790 Standby Processor circuit pack. When the Standby Processor starts to initialize and detects the program card, it does a software upgrade and displays the progress of this upgrade on the terminal.
  - d. When prompted, replace the program card in the Standby SPE with the translation card. The Standby SPE boots up with the translation.

 **NOTE:**

Perform this operation within two minutes. Otherwise the Standby SPE will boot up without translations. However, it will

recover the translations when the Active SPE enables memory shadowing to the Standby SPE.

- e. At the prompt **REPLACE TRANSLATION MEM-CARD ON <ACTIVE SPE> WITH SOFTWARE MEM-CARD**, wait 3 minutes for the Standby SPE to initialize before proceeding to next step.
  - f. Issue the **list configuration software-versions long** command to ensure that both SPEs are running identical software. Use the next step if the this command does not display the software versions, otherwise skip the next step.
  - g. Issue the **busyout spe-standby** command followed by the **release spe-standby** command to force the Standby SPE into a mode to accept the **list configuration software-versions long** command. Wait 5 minutes for the Standby SPE to initialize and issue the **status system 1st-cabinet** command. The Standby SPE failed to initialize if the Standby SPE Mode is **down**. If the Standby SPE Mode is **maint/init** or **maint/entering**, execute the **busyout spe-standby** and **release spe-standby** command up to 2 more times. If this step does not succeed, try this procedure again.
7. Issue the **status system 1st-cabinet** command. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If SPE alarm counts are displayed, run component tests to resolve these alarms. Allowed tests include **test spe-standby**, **test duplication-interface**, and **test shadow-link**. Use the next step if the allowed test commands are not accepted, otherwise skip the next step.

**CAUTION:**

*If the Duplication Interface circuit pack is being tested, Test #278 fails because the SPE Select Switches are thrown.*

8. Issue the **busyout spe-standby** command followed by the **release spe-standby** command to force the Standby SPE into a mode to accept the **test commands** attempted in the previous step. Wait 5 minutes for the Standby SPE to initialize and issue the **status system 1st-cabinet** command. If the Standby SPE failed to initialize if the Standby SPE Mode is **down**. If the Standby SPE Mode is **maint/init** or **maint/entering**, execute the **busyout spe-standby** and **release spe-standby** command up to 2 more times. If this step does not succeed, try this procedure again.
9. If other Standby SPE circuit packs are to be replaced, return to Step 2.
10. Move each SPE Select Switch back to the AUTO position. If any of the TN777B Network Control or the Processor circuit packs were replaced, please refer to the ["Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs"](#) section.

**WARNING:**

*Move only one SPE Select Switch at a time. DO NOT move both switches at the same time.*

**WARNING:**

*If the Active SPE has alarms in it, an SPE-interchange may occur after moving each SPE Select Switch back to the AUTO position.*

Maintenance activity is performed automatically on the Standby SPE after the SPE Select Switches are returned to their AUTO positions in Step 10. This can be verified by issuing the **status system** command and noting that the Standby SPE is labeled as "maint." It may take up to 5 minutes for this activity to begin. The maintenance activity itself takes from 10 to 30 minutes to complete.

**NOTE:**

The time required for the maintenance activity to finish depends on the number of TN765 Processor Interface circuit packs, the number of administered ports on the Processor Interface circuit packs, the number of administered data channels on the TN777B Network Control circuit pack, and the current load on the system.

Verify the completion of the maintenance activity by issuing the **status system 1** command and noting whether the Standby SPE is labeled as "standby."

**Although not recommended at this stage of the procedure**, the maintenance activity on the Standby SPE can be preempted using the **refresh spe-standby** command. To preempt the maintenance activity, continue issuing the **refresh spe-standby** command followed by **status system 1** command until the status system form shows that the Standby SPE is labeled "standby."

It may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. Issue the **refresh spe-standby** command once more.

If the **status system 1** command continues to show SPE alarms, issue the appropriate command(s) from the G3MT terminal to test these alarmed MOs.

After Step 10, if the Active SPE contains more severely defective circuit packs than the Standby SPE, an SPE-interchange may occur. The presence of alarms in the Active and Standby SPE can be verified by issuing the **status system** command. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If the Active SPE has alarms in it, an SPE-interchange may occur. The occurrence of the SPE-interchange can be verified by issuing the **status system** command to determine which SPE is now the Active SPE.

## **Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs**

---

After **all** affected circuit packs have been replaced, if the replaced circuit packs include the TN777B Network Control circuit pack(s), the TN778 Packet Control circuit pack(s), or the Processor circuit pack(s), additional testing is required to ensure that the new circuit packs are healthy. This testing must be done on these circuit packs when they are located in the Active SPE. Issue the **status system** command to determine which SPE is currently the Active SPE and determine the SPE, Active or Standby, in which each replaced Network Control, Packet Control, and/or Processor circuit pack resides.

If any of the replaced circuit packs are located in the Active SPE, test it by issuing the **test network-control [a | b]**, **test packet-control [a | b]**, or **test processor [a | b]** command, as appropriate. If any tests fail or abort, refer to the SW-CTL (Switch Control), DATA-CHL (Network Control Data Channel), PKT-CTRL (Packet Control Circuit Pack, DATA-BD (Network Control Circuit Pack), or PROCR, and PR-MAINT (Maintenance/Tape Processor) Maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#), as appropriate.

If any of these circuit packs are located in the Standby SPE, force the Standby SPE to become the Active SPE as described in "Upgrading SPE Circuit Packs." However, before the Standby SPE is made to become the Active SPE, the replaced circuit pack should first be tested while on the Standby SPE. Then, test these circuit packs (that are now located in the Active SPE) by issuing the **test network-control [a | b]**, **test packet-control [a | b]**, or **test processor [a | b]** command, as appropriate. If any tests fail or abort, refer to the SW-CTL (Switch Control), DATA-CHL (Network Control Data Channel), DATA-BD (Network Control Circuit Pack), PKT-CTRL (Packet Control Circuit Pack), or PROCR, and PR-MAINT (Maintenance/Tape Processor) Maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#), as appropriate.

### **WARNING:**

*Before leaving the system, verify that the SPE Select Switches have been returned to their proper position. The switches should be in the AUTO position and the SPE Select Switch LEDs should be off on both the TN772 Duplication Interface circuit packs.*

See the following flowchart, [Figure 6-1](#), [Figure 6-2](#) and [Figure 6-3](#), for the procedure for installing or replacing Standby SPE Circuit Packs in Duplication Option System.

Figure 6-1. Page 1 Procedure for Replacing Standby SPE Circuit Packs

Figure 6-2. Page 2 Procedure for Replacing Standby SPE Circuit Packs

Figure 6-3. Page 3 Procedure for Replacing Standby SPE Circuit Packs

## Procedure for Installing/Replacing the Inter-Cabinet Cable

---

The Inter-Cabinet Cables (ICCs) are physically located on the back of the cabinet behind the panels and between the A control cabinet and the B control cabinet. The panels must first be opened to see the ICCs.

### **WARNING:**

*Damage can be done to the Inter-Cabinet Cables during removal or installation. Follow the guidelines listed below to minimize the possibility of damage to the cables and later need of replacement.*

To remove ICC-A, ICC-B, or ICC-C:

1. Remove power from the system. Refer to the [“Removing Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
2. Grasp the cable connector, not the cable itself. Attempting to remove a cable by pulling on the cable itself can damage the cable-to-connector interface.
3. Pull the cable straight out. Pulling the connector from the backplane at an angle can bend the backplane pins.
4. Push the ICC connector onto the insulated sleeves.

### **CAUTION:**

*The pins should not show through the back of this connector. If they do, they ICC may be shorted out.*

The only way to check the connector-cable-connector integrity is with a continuity test.

To re-install ICC-A, ICC-B, or ICC-C:

1. Verify that the backplane pins are not bent. If any are bent, they must be straightened or replaced before continuing.
2. Align the ICC connector with the backplane pins and push partially into place.
3. Use a dental mirror and light to view the back sides of the connector. Determine that all 50 backplane pins are seated correctly in the ICC connector.
4. Push the ICC connectors fully onto the insulated sleeves. The pins should not show through the back of the connectors. If the pins show through, the ICC may be shorted out.

## Blocking Standby SPE Maintenance Activities for System Testing

Sometimes it is necessary to block Standby SPE maintenance activities so that system technician commands that test Standby SPE components can be conducted without being blocked with the G3MT terminal message line "Standby SPE busy with another task; for information use 'status system'." To block Standby SPE maintenance activities, perform the steps listed below.

### WARNING:

*The following procedure involves throwing the SPE Select Switches to hard-select the current Active SPE. After completing the circuit pack replacement procedure, verify that the SPE Select Switches have been returned to the AUTO position both by noting their position and by noting that the SPE Select Switch LEDs on the TN772 Duplication Interface circuit packs are not on.*

1. Throw the SPE Select Switches (on the TN772 Duplication Interface circuit packs) to force selection of the current Active SPE. If SPE-B is currently the Active SPE, throw both SPE Select Switches to the right. If SPE-A is currently the Active SPE, throw both SPE Select Switches to the left.
2. Issue the **status system 1st-cabinet** command from the G3MT terminal. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If SPE alarm counts are displayed, run component tests to resolve these alarms. Allowed tests include test spe-standby, test duplication-interface, and test shadow-link. Use the next step if the allowed test commands are not accepted, otherwise skip the next step.

### CAUTION:

*If the Duplication Interface circuit pack is being tested, Test #278 fails because the SPE Select Switches are thrown.*

3. Issue the busyout spe-standby command followed by the release spe-standby command to force the Standby SPE into a mode to accept the **test commands** attempted in the previous step. Wait 5 minutes for the Standby SPE to initialize and issue the status system 1st-cabinet command. If the Standby SPE failed to initialize if the Standby SPE Mode is down. If the Standby SPE Mode is **maint/init** or maint/entering, execute the busyout spe-standby and release spe-standby command up to 2 more times. If this step does not succeed, try this procedure again.
4. Move each SPE Select Switch back to the AUTO position.

### WARNING:

*Move only one SPE Select Switch at a time. DO NOT move both switches at the same time.*

Maintenance activity is performed automatically on the Standby SPE after the SPE Select Switches are returned to their AUTO positions in Step 4. This can be verified by issuing the **status system** command and noting that the Standby SPE is labeled as "maint." The maintenance activity takes from 10 to 30 minutes to complete. (The time required for the maintenance activity to complete depends upon the number of TN765 Processor Interface circuit packs, the number of administered ports on the Processor Interface circuit packs, the number of administered data channels on the TN777B Network Control circuit pack, and the current load on the system.) The completion of the maintenance activity can be verified by issuing the **status system** command and noting whether the Standby SPE is labeled as "standby."

**Although not recommended at this stage of the procedure**, the maintenance activity on the Standby SPE can be preempted using the **refresh spe-standby** command. To preempt the maintenance activity, continue issuing the **refresh spe-standby** command followed by **status system** command until the status system form shows that the Standby SPE is labeled "standby."

It **may** be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. This **does not include** cases where the command completes with the G3MT terminal message line errors "Refresh not successful; use 'display errors' to check for STBY-SPE errors" or "Cannot interrupt Standby SPE while entering maintenance mode; please try later."

Issue the **refresh spe-standby** command once more.

# LED Interpretation

# 7

## General

---

The lighting and unlighting of LEDs indicates to the system user the status of various maintenance components in the system. LEDS are located on the attendant console, on all circuit packs in the switch cabinets and, optionally, on customer-designated voice terminals. The following LEDS are included in the system:

- Processor circuit pack and maintenance circuit pack LEDs
- Duplication interface circuit pack LEDs
- Attendant console LEDs
- Carrier power unit LEDs
- Power distribution unit LEDs
- Control and port circuit pack status LEDs

## Processor and Maintenance Circuit Pack LEDs

---

The front panels of the Processor circuit pack and the Maintenance circuit pack are identical. Each has two groups of LEDs. One group indicates the status of the pack, and the other group (which includes the Major, Minor, and Warning alarms described previously) reflects maintenance conditions in the entire system (that is, the PPN and EPN cabinets). See [Figure 7-1](#).

- Red (alarm)—the system has detected a fault in this circuit pack.

**⇒ NOTE:**

Alarms on the PROCR, PR-MAINT, MEMORY, and PR-MEM MOs are indicated by the red LED on the Processor circuit pack.

- Green (test)—the system is running tests on this circuit pack.

**⇒ NOTE:**

On the Standby Processor circuit pack, green means that the Standby Switch Processing Element (SPE) is not refreshed (that is, it is in Maintenance or Down Mode).

**⇒ NOTE:**

On the Maintenance circuit pack, the green LED may blink very faintly once per second. This is the normal operating state of the Maintenance circuit pack. The faint blink is due to a once-per-second self-test executed by the Maintenance circuit pack.

- Yellow (busy)—this circuit pack is in use. In a high or critical reliability system, the yellow LED is always off for the Standby Processor and Memory circuit packs even when in Maint mode.
- MAJOR ALARMS (red)
- MINOR ALARMS (red)
- WRNG (warning) ALARMS (yellow)
- ACK (acknowledgment) (green)—indicates Major or Minor alarms have been reported to INADS
- EMERGENCY TRANSFER (red)—indicates emergency transfer has been invoked

**⇒ NOTE:**

If the AC power cord is unplugged from the control cabinet, the emergency transfer feature invokes, however the EMERGENCY TRANSFER LED (red) is not lit due to loss of AC power.

Figure 7-1. Indicators on Maintenance and Processor Circuit Packs

## Duplication Interface Circuit Pack LEDs

In a High or Critical Reliability system, there are two Duplication Interface circuit packs. One is located in carrier A and one in carrier B of the PPN. Each circuit pack has two groups of LEDs. The top three have the traditional function of indicating the status of the pack. The LED located at the bottom of the faceplate directly beneath the SPE AUTO switch is labeled OVERRIDE. Under normal operating conditions, the SPE AUTO switch is in the AUTO (center) position (see [Figure 7-2](#)). This means that the system controls which SPE is active. However, there will be times (during maintenance activity, for example) when you, the technician, may choose to manually override the SPE selection function. To override system selection of the Active processor, move the SPE Select switches one at a time on *both* Duplication Interface circuit packs from the AUTO position

to either the “A” position or the “B” position. Thus, when both SPE Select switches have been moved to either “A” or “B,” the OVERRIDE LED turns red and lights steadily.

**NOTE:**  
Failure to move both SPE Select switches to the same position causes the system to retain control of processor selection.

To return control of the SPE selection to the system, return the SPE Select switches on both Duplication Interface circuit packs to the AUTO position (one at a time to avoid accidentally selecting the other SPE). The OVERRIDE LED goes dark.

Figure 7-2. Duplication Interface Circuit Pack Indicators

## Attendant Console LEDs

---

The console has two red LEDs, labeled ALM and ACK, on the left side of the dial. The left LED lights steadily when there is a Major or Minor alarm at the switch cabinet. The right LED lights steadily if the alarm has been successfully reported to INADS. If the system is unable to report the alarm to INADS, the LED flashes; signaling the attendant to call INADS and report the alarm.

## Cabinet Power Unit LEDs

---

For a description of Cabinet Power Unit LEDs, refer to “AC-POWER” for AC-Powered Systems and “DC-POWER” for DC-Powered Systems in [Chapter 10, “Maintenance Object Repair Procedures”](#).

## Power Distribution Unit LEDs

---

For a description of Power Distribution LEDs, refer to “AC-POWER” for AC-Powered Systems and “DC-POWER” for DC-Powered Systems in [Chapter 10, “Maintenance Object Repair Procedures”](#).

## Control and Port Circuit Pack Status LEDs

---

Each circuit pack has three LEDs on the front panel visible at the front of the carrier. On all circuit packs, except the TN736 Power Unit, the LEDs indicate:

1. Red (alarm) — If the circuit pack is communicating with the system, the system has detected a fault in this circuit pack. An on-board alarm for this circuit pack is displayed in the Alarm Log.

The circuit pack also lights this LED when either the circuit pack has not yet initialized communication with the system or when the circuit pack loses contact with the system and stops functioning (circuit pack is said to be “in reset”). In these cases, there may not be an alarm in the Alarm Log. To determine if the red LED is lit because the circuit pack is not in contact with the system, issue the **list configuration board PCSS** command, where PCSS refers to the slot containing this circuit pack. If the system does not detect the circuit pack, this command returns “Identifier not assigned” or “no board.”

If the circuit pack has just been inserted, the system may still be initializing the circuit pack. If, after 5 minutes, the circuit pack still has not initialized communications with the system, check the MO for any special instructions (for example, EPN Maintenance circuit pack can stop EXP-INTF circuit pack from initializing). If the MO does not provide the needed information, perform the following steps:

- Check the Error Log for TONE-BD and TDM-BUS errors. Enter **test tdm P** where P is the port network containing the relevant slot. Refer to "Restarting Nonfunctioning Port Circuit Packs" in [Chapter 10, "Maintenance Object Repair Procedures"](#) in the general description of the "TDM-BUS". Enter **test tone-clock PC**, where P is the network containing the relevant slot, and C is the carrier containing the relevant slot. Follow appropriate sections for any "TONE-BD" and "TDM-BUS" errors.
- Reseat the suspect circuit pack.

**WARNING:**

*Reseating some circuit packs may be very destructive (for example, Control Carrier circuit packs.)*

Wait 5 minutes. Then issue the **list configuration board PCSS** command. If the result indicates that the system still has not registered the circuit pack, go to next step.

- Try to insert the circuit pack into a different slot and try to insert a different circuit pack into the suspect slot (provided the maintenance documentation for this circuit pack does not warn against either of these actions).
  - If the system seems to be functioning correctly, but the circuit pack does not start communicating with the system, replace the circuit pack.
2. Green (test)—the system is running tests on this circuit pack.
  3. Yellow (busy)—indicates that the circuit pack is in use.

**NOTE:**

A port circuit pack also lights its red LED when it performs initialization tests (for example, when the circuit pack is initially inserted into the system). If all initialization tests pass, the red LED is turned off. If any initialization tests fail, the red LED remains lighted and the circuit pack is not placed into service.

Packet circuit packs such as the TN556 ISDN BRI-Line and TN570 Expansion Interface perform extensive initialization tests and light both the red and green LEDs during that testing.

During the various states of operation (start-up testing, normal operation, circuit failure, and so forth) circuit pack status LED indications appear as shown in [Table 7-1](#).

Table 7-1. Circuit Pack Status LEDs

| Equipment Type                    | LED    | Description                                                                                                                                                                                                                                    |
|-----------------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Circuit Packs                | Red    | On briefly during power up, circuit pack reseating, resetting, and system reset. Steadily on if circuit pack fails start-up test or fails while in use. Off during normal operation.                                                           |
|                                   | Green  | Briefly on during circuit pack testing following power up, circuit pack reseating, and system reset. On during periodic, scheduled, and system technician demanded testing. Off during normal operation.                                       |
|                                   | Yellow | On when any port in the circuit pack is in use, otherwise, off.<br><br>The yellow LED on the TN771 Maintenance/Test circuit pack may blink. This has special meaning for systems using Packet Bus. Refer to "Packet Bus" for more information. |
| Control Circuit Packs             | Red    | On briefly during power up and system reset. Steadily on if circuit pack fails start-up test or fails while in use. Off during normal operation.                                                                                               |
| Control Circuit Packs (continued) | Green  | On briefly during board testing following power up and system reset. Also on during periodic, scheduled, and system technician-demanded testing. Off during normal operation.                                                                  |

Continued on next page

Table 7-1. Circuit Pack Status LEDs — *Continued*

| Equipment Type | LED    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# Maintenance Commands and Trouble-Clearing Aids

# 8

For Maintenance Objects and Maintenance Commands for the DEFINITY Wireless Business System (DWBS), refer to the appropriate maintenance documentation that accompanies the DWBS.

This chapter provides additional trouble-clearing information for resolving both system-alarmed and user-reported troubles. This chapter supplements the information found in [Chapter 10, "Maintenance Object Repair Procedures"](#). The information consists of using the maintenance commands as trouble-clearing aids. The maintenance commands are used to control, test, and obtain information associated with maintenance objects (MOs). The commands require the use of the administration terminal or remote Initialization and Administration System (INADS) interface (a valid login and password to perform maintenance are required).

In this chapter, the commands are first identified and organized into categories. Thereafter, each command is described individually.

## **busyout access-endpoint**

This command will busyout a specified access endpoint.

### **Synopsis**

busyout access-endpoint extension

### **Permissions**

The following default logins may execute this command: system technician, inads, init, nms.

**Examples**

---

**busyout access-endpoint 25012**  
**busyout access-endpoint 77868**

**Description**

---

The busyout access-endpoint command will put all the ports associated with the specified access endpoint in a maintenance busy (system technician busy) state. There will be no periodic or scheduled tests performed on the busied out access endpoint ports until they are released. When the access endpoint ports are maintenance busy (system technician busy) then the access endpoint is removed from active service on the switch (i.e., no call processing activity may include the busied objects). Warning alarms are generated on each busied out port in the access endpoint. The release access-endpoint command will return all the ports associated with the specified access endpoint to operation.

**Defaults**

No defaults.

**Parameters**

|           |                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| Extension | An extension number associated with the desired access endpoint. The number of digits in an extension is determined by the dial-plan. |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the user presses HELP after entering "busyout access-endpoint," the following message is displayed:

```
Enter assigned extension
```

## Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the access endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not an access endpoint, the following message will be displayed:

```
Extension assigned to object other than access-endpoint
```

If the board that contains the access endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                  |                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.                                                                                                        |
| Maintenance Name | The type of maintenance object that is being busied out. For wideband access endpoint the maintenance name for each port is "WAE-PORT." For single port access endpoint the maintenance name is "TIE-DS1." |
| Alt. Name        | The alternate way of identifying the maintenance object. This field contains the extension number of the access endpoint.                                                                                  |
| Result           | An indicator as to whether the object is successfully busied out. The possible values are: PASS, FAIL and ABORT.                                                                                           |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.                                  |

For the following output example, the command "busyout access-endpoint 22502" was entered. Assume that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6.

busyout access-endpoint 22502

SPE A

COMMAND RESULTS

| Port    | Maintenance Name | Alt. Name | Result | Error Code |
|---------|------------------|-----------|--------|------------|
| 01C1101 | WAE-PORT         | 22502     | PASS   |            |

| 01C1106 | WAE-PORT         | 22502     | PASS   |            |

Command Successfully Completed

## Feature Interactions

If there is an active call on the specified access endpoint, the busyout command will cause the call to drop. This command is destructive.

## busyout board

This command will busyout each maintenance object on the specified board.

Synopsis

---

busyout board location

Permissions

---

The following default logins may execute this command: system technician, inads, init.

Examples

---

**busyout board 01c11**  
**busyout board 02c15**

Description

---

The busyout board command will put every administered maintenance object on the circuit pack at the specified location in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out objects until they are released. The ports on the board may not be used for call processing (i.e., terminals on the administered ports will not receive dial-tone, etc.). Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release board command will return every administered maintenance object on the circuit pack at the specified location to operation.

 **WARNING:**  
*This command is service disrupting and may cause extraneous alarms.*

Defaults

No defaults.

## Parameters

**location** A "location" represents the physical position of the board to be busied out and is entered as "UUcSS" where "UU" represents the cabinet number (1-3), "c" represents the carrier, and "SS" represents the slot position.

A "location" represents the physical position of the port to be marked and is entered as "PCSSpp" where P is the port network number (1 for PPN, 2 for EPN, and 3 for the second EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.), and "pp" represents the circuit (port). A single digit cabinet (1 - 3) may be entered with or without a leading zero (0).

## Help Messages

If the system technician presses HELP after entering "busyout board," the following message will be displayed:

```
Enter 5 character board number
```

## Error Messages

If the format of the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the board resides is not available, the following message will be displayed:

```
EPN is not available
```

If a board is not inserted in the specified location, the following message will be displayed:

```
Board not assigned
```

If the specified board does not have any maintenance objects associated with it, the following message will be displayed:

```
No MO in this board
```

If the specified board is part of the DCS link, the board cannot be busied out unless the link itself is busied out first. If the DCS link is not busied out, the following message will be displayed:

```
Must first busyout SCI link
```

If the specified board is an EI board and it is part of the active link, the following message will be displayed:

```
Illegal Command for active object; use 'set' to switch to standby
```

If a busyout is attempted on an invalid board in the service slot, the following message is displayed:

Board invalid

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.                                                                                                                                                                                                                                                     |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                                                                                                                                                                                                                                |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | An indicator as to whether the object was successfully busied out. The result of the busyout -"PASS," "ABORT," "FAIL."                                                                                                                                                                                                                                  |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.                                                                                                                                                                               |

For the following output example, assume that the board in cabinet 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered is "busyout board 1c07."

busyout board 01C07

Command successfully completed

### Feature Interactions

---

None.

## busyout cdr-link

---

This command will busyout a maintenance object associated with the specified call detail recording (cdr)-link.

### Synopsis

---

busyout cdr-link link-id

### Permissions

---

The following default logins may execute this command: system technician, inads, init, nms.

### Examples

---

busyout cdr-link primary  
busyout cdr-link secondary

### Description

---

The busyout cdr-link command will put the maintenance object associated with a specified call detail recording (cdr)-link in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out maintenance object until it is released. When the object is maintenance busy then the object is removed from active service on the switch (no call processing activity may include the busied out object) and the link will be dropped. Warning alarms are

generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release cdr-link command will return the object to operation.

A link is made up of several components. It involves a far end data module, a simulated data channel on a PKTINT board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For information on what a CDR link is and does, see the second paragraph in the Description section of the "status cdr-link" manual pages.

Defaults

Primary.

Parameters

link-id                   The link identifier is either "primary" or "secondary."

Help Messages

If the system technician presses HELP after entering "busyout cdr-link," the following message will be displayed:

primary                   secondary

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. With this maintenance object a port address of 1 represents the primary link, while a 2 port address is associated with the secondary link.                                                                                                         |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                                                                                                                                                                                                                                |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | An indicator as to whether the object was successfully busied out.                                                                                                                                                                                                                                                                                      |
| Error Code       | A numerical description of why the command failed.                                                                                                                                                                                                                                                                                                      |

For the following output example, assume that the command that was entered is "busyout cdr-link primary."

busyout cdr-link primary

## busyout data-module

This command will busyout a system technician specified data module or data channel.

## Synopsis

busyout data-module extension

Permissions

---

The following default logins may execute this command: system technician, inads, cust, init, nms.

Examples

---

**busyout data-module 31300**

Description

---

The busyout data module command will put the specified data module in a maintenance busy state, even those data modules that are not installed. There will be no periodic or scheduled tests performed on the busied out data module or data channel until it is released. Also no call processing may be executed on the data modules or over the data channels. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release data module command will return the specified data module (or data channel) to operation.

On a system with the duplication option, a busyout of a Network Control Data Channel, DATA-CHL, or a Processor Interface Port Data Channels, PI-PT, will be preserved across SPE interchanges. The data channel extension must be released before the data channel can be brought back into service.

Defaults

No defaults.

Parameters

|           |                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| extension | An extension number associated with the desired data module or data channel. The number of digits in an extension is determined by a dial-plan. |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses HELP after entering "busyout data-module," the following message will be displayed:

Enter assigned extension

Error Messages

If the length or format of the extension is incorrect, the following error message will be displayed:

Extension invalid

If the specified extension is not administered, then the following message will be displayed:

Extension not assigned

If the specified extension is not a data module or a data channel, then the following message will be displayed:

Extension exists but assigned to a different object

If the EPN that contains the data module port is not available, the following message will be displayed:

EPN is not available

If the board containing the data module port is part of the SCI link, the following message will be displayed:

Cannot busyout/release part of SCI link

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out, or the number of the data channel.                                                                                                                                                                                                                  |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                                                                                                                                                                                                                                |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | An indicator as to whether the object was successfully busied out.                                                                                                                                                                                                                                                                                      |
| Error Code       | A numerical description of why the command failed.                                                                                                                                                                                                                                                                                                      |

For the following output example, assume that the command that was entered is "busyout data-module 300."

## busyout journal-printer

This command will busyout a maintenance object associated with the system technician specified pms-log or wakeup-log.

## Synopsis

busyout journal-printer [ pms-log | wakeup-log ]

### Permissions

---

The following default logins may execute this command: system technician, inads, init, nms.

### Examples

---

**busyout journal-printer pms-log**  
**busyout journal-printer wakeup-log**

### Description

---

The busyout journal-printer command will put the maintenance object associated with a specified pms-log or wakeup-log link in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out maintenance object until it is released. Also, no activity will occur over the links (i.e. no data will be transferred to the printer) and the link will be dropped. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release journal-printer command will return the object to operation.

A link is comprised of several components. It involves a far end data module, a simulated data channel on a PKTINT board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For general information on journal printer links, see the second paragraph in the Description section of the ["busyout pms-link"](#) manual pages.

For information on what a journal printer is and does, see the second paragraph in the Description section of the "status journal-link" manual pages.

### Defaults

None.

Parameters

|            |                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------|
| pms-log    | This will busyout the link to the pms printer. In the output the port name for the pms link is 1.            |
| wakeup-log | This will busyout the link to the wakeup logging facility. In the output the port name for this object is 0. |

Help Messages

If the system technician presses HELP after entering "busyout journal-printer," the following object command word choices will be displayed:

pms - log                      wakeup - log

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Error Message

Link not administered not enabled

Output

|                  |                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. In this case, the physical object port address will be a 0 for wakeup log and a 1 for the pms log. |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                                                                               |
| Alt. Name        | Not applicable.                                                                                                                                                                                        |
| Result           | An indicator as to whether the object was successfully busied out.                                                                                                                                     |
| Error Code       | A numerical description of why the command failed.                                                                                                                                                     |

For the following output example, assume that the command that was entered is "busyout journal-printer wakeup-log."

Command successfully completed

### Feature Interactions

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will not cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup trys on the link.

## busyout link

This command will busyout the system technician specified link.

### Synopsis

busyout link link-id

### Permissions

The following default logins may execute this command: system technician, inads, init.

### Examples

busyout link 1

### Description

The busyout link command will put the maintenance objects associated with a specified link in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out maintenance objects until they are

released. Also the link will be marked out of service and inaccessible to call processing for use. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release link command will return the objects to operation.

## Defaults

None.

## Parameters

**link-id** The link-id is a number associated with each link between 1-8. Link 1 through 4 reside on Processor Interface circuit pack "1a1" or "1b1" and 5 through 8 reside on Processor Interface circuit pack "1a2" or "1b2."

## Help Messages

If the system technician presses HELP after entering "busyout link," the following message will be displayed:

```
Enter 1 character link number
```

## Error Messages

If the link identifier is not valid, the following error message is displayed:

```
Link out of range, please press HELP
```

If the link is not administered, the following error message is displayed:

```
Link not administered or not enabled
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

## Output

|                  |                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. With this command the Port address represents the link-id.                  |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                                                        |
| Alt. Name        | Not applicable.                                                                                                                                                                 |
| Result           | "PASS," "ABORT," "FAIL."                                                                                                                                                        |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Error Codes" section of this chapter. |

For the following output example, assume that the command that was entered is "busyout link 1."

busyout link 1

## busyout modem-pool

This command will allow all members of a modem pool group to be busied out.

## Synopsis

busyout modem-pool group/*member*

## Permissions

The following default logins may execute this command: init, inads, system technician.

Examples

busyout modem-pool 1  
busyout modem-pool 4/3

Description

The "busyout modem-pool" command will put the specified modem pool group or group member in the maintenance busy state, even those groups that are not installed. There will be no periodic or scheduled tests performed on the busied out modem pool groups or group members until they are released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). A single group member can be busied out by specifying the group number, a "/", and the member number. All members in a modem pool group can be busied out by specifying the modem pool group number only. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The "release modem-pool" command will return the specified modem pool group or group member to operation.

Defaults

None.

Parameters

- group number      The group number is assigned from administration. The group number may be any administered group from 1-5.
- member number    The member number is assigned from administration. A member is a pair of analog and digital line ports (or two pair for the Integrated modem-pool case). The member number may be any administered group member from 1-32.

Help Messages

If the system technician presses HELP after entering "busyout modem-pool" the following message will be displayed:

Enter assigned group number between 1-5  
Or press CANCEL to cancel the command

Error Messages

If the "busyout modem-pool" command is entered from a login for which the command is not valid, then the following message will be displayed:

"busyout" is an invalid entry; please press HELP

If the group or member numbers entered are not in a valid format, the following message will be displayed:

Identifier invalid

If the group number entered is not within the range of groups or the member number is not within the member range, then the following message will be displayed:

Boards not assigned

If the specific group or member are not administered, then the following message will be displayed:

Group not assigned, or group assigned but with no member

If a software fault is encountered while the command is executing, the following message will be displayed:

Error encountered, can't complete request

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

When each modem pool member has been busied out, the following information will be displayed:

|                  |                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object which is being busied out.                                                                      |
| Maintenance Name | The type of maintenance object that is being busied out. This is always MODEM-PT.                                                                                         |
| Alt. Name        | This field is not applicable to this command.                                                                                                                             |
| Result           | The result of the busyout -"PASS," "ABORT," "FAIL,"                                                                                                                       |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter. |

In the following output example, the command "busyout modem-pool 1" was entered.

```
busyout modem-pool 1                                SPE B

                                COMMAND RESULTS

Feature Interactions

None.

busyout packet-control

This command will busyout the specified packet-control.

Synopsis

busyout packet-control *location*

Permissions

The following default logins may execute this command: system technician, inads, init

Examples

busyout packet-control 1A  
busyout packet-control 1B

Description

The busyout packet-control command will put the packet-control circuit pack in a maintenance busy state, and tear-down each point-to-point signaling link that is terminated on this packet-control. There will be no periodic or scheduled test performed on the busied out packet-control until it is released. A warning alarm is generated (error type 18) on the busied out packet-control so that INADS can

access the state of the object. The release packet-control command will return the board to a normal operation state and initiate recovery on all point-to-point signaling links terminated on this packet-control.

## Defaults

For simplex systems, the location is optional and defaults to cabinet 1, carrier A. For duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | The location only applies to duplicated configurations. If the configuration is a simplex, the location parameter is not used and thus is not valid. For duplicated configurations, a "location" represents the carrier that the packet-control resides on in the system. Valid locations are either 1A or 1B. |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses HELP after entering "busyout packet-control," the following message is displayed:

```
Enter Packet Control location: [cabinet(1)];carrier(A-B)
```

## Error Messages

If this command is entered for a packet-control that resides on the stand-by control complex of a duplicated system, the following message is displayed:

```
Command only applies to the active Packet Control
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                  |                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | This field represents the Cabinet-Carrier in which the Packet-Control resides.                                                                                                |
| Maintenance Name | The type of maintenance object that is being busied out ( which in this case is always PKT-CTRL).                                                                             |
| Alt. Name        | This field is not used in this output display.                                                                                                                                |
| Result           | An indicator as to whether the object was successfully busied out ( "PASS," "ABORT," or "FAIL").                                                                              |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes is present in the "Busyout/Release Error Codes" section of this chapter. |

For the following output example, the command busyout packet-control 1A was entered.

```
busyout packet-control 1A                               SPE A

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result      Error Code

1A        PKT-CTRL                PASS

Command successfully completed
```

## Feature Interactions

In a duplicated system, an attempt to busyout the packet-control that resides in the standby processor complex will be disallowed.

When the packet-control in the active control complex is busied out, all connectivity across the Packet Bus will be severed. Thus, all ISDN-BRI point-to-point signaling links that have been established via the active packet-control will be torn down by the busyout packet-control command. The release packet-control command will reestablish all Packet Bus connectivity.

## busyout pms-link

This command will busyout a specified property management system link.

## Synopsis

---

busyout pms-link

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**busyout pms-link**

## Description

---

The busyout pms-link command will put all maintenance objects associated with a property management system link in the maintenance busy state. There will be no periodic or scheduled maintenance performed on the busied out maintenance objects until they are released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object) and the link will be dropped. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release pms link command will return the busied out objects on the link to operation.

A link is made up of several components. It involves a far end data module, a simulated data channel on a NETCON board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For information on what a PMS is and does, see the second paragraph in the Description section of the "status pms-link" manual pages.

## Defaults

None.

## Parameters

None.

Help Messages

If the system technician presses HELP after entering "busyout pms-link" the following message will be displayed:

Entry is not required

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | With this maintenance object the port field is left blank.                                                                                                                |
| Maintenance Name | The type of maintenance object that is being busied out (always PMS-LINK).                                                                                                |
| Alt. Name        | Not applicable.                                                                                                                                                           |
| Result           | The result of the busyout -"PASS", "ABORT", "FAIL".                                                                                                                       |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter. |

For the following output example, assume that the command that was entered is "busyout pms-link."

busyout pms-link

## Feature Interactions

---

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will not cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup tries on the link.

## busyout port

---

This command will busyout a specified port on a circuit pack.

### Synopsis

---

busyout port location

### Permissions

---

The following default logins may execute this command: system technician, inads, init.

### Examples

---

**busyout port 01c1101**  
**busyout port 02c1501**

### Description

---

The busyout port command will put the specified port on a circuit pack in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out port until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release port command will return the administered port on a circuit pack at a specified location to operation.

### Defaults

No defaults.

## Parameters

**location** A "location" represents the physical position of the port to be busied out and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit (port).

A "location" represents the physical position of the port to be marked and is entered as "PCSSpp" where P is the port network number (1 for PPN, 2 for EPN, and 3 for the second EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.), and "pp" represents the circuit (port). A single digit cabinet (1 - 3) may be entered with or without a leading zero (0).

## Help Messages

If the system technician presses HELP after entering "busyout port," the following message will be displayed:

Enter 7 character port number

## Error Messages

If the format of the port location is incorrect, the following error message will be displayed:

Port/Board invalid

If the EPN on which the port resides is unavailable, the following message will be displayed:

EPN is not available

If the board on which the port resides is not administered, the following error message will be displayed:

Port not assigned

If the board on which the port resides is part of the SCI link, the following error message will be displayed:

Cannot busyout/release part of SCI link

If the port is translated within a Wideband Access Endpoint, the following error message will be displayed:

Port within wideband access endpt; Use busyout access-endpoint <ext> instead

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.                                                                                                                                                                                                                                                     |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                                                                                                                                                                                                                                |
| Result           | The result of the busyout -"PASS," "ABORT," "FAIL,"                                                                                                                                                                                                                                                                                                     |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.                                                                                                                                                                               |

For the following output example, assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port. The command that was entered is "busyout port 1c0701."

busyout port 01C0701

# busyout pri-endpoint

This command will busyout a specified PRI endpoint.

## Synopsis

busyout pri-endpoint extension

## Permissions

The following default logins may execute this command: system technician, inads, init, nms.

## Examples

busyout pri-endpoint 25012  
busyout pri-endpoint 77868

## Description

The busyout pri-endpoint command will put all PRI endpoint ports (B-channels) associated with the specified PRI endpoint in a maintenance busy (system technician busy) state. There will be no periodic or scheduled tests performed on the busied out PRI endpoint ports until they are released. When the PRI endpoint port is maintenance busy (system technician busy) then the port is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated on each busied out port. The release pri-endpoint command will return all ports (B-channels) associated with the specified PRI endpoint extension to operation. When released, the switch will attempt to negotiate with the far-end PRI terminal adapter to put each PRI endpoint port (B-channel) into in-service state.

## Defaults

No defaults.

## Parameters

|           |                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| extension | An extension number associated with the desired PRI endpoint. The number of digits in an extension is determined by the dial-plan. |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the user presses HELP after entering "busyout pri-endpoint," the following message is displayed:

Enter assigned extension

## Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

Extension invalid

If the EPN on which the PRI endpoint resides is not accessible, the following message will be displayed:

EPN is not available

If the extension is not administered, the following message will be displayed:

Extension not assigned

If the object associated with the specified extension is not a PRI endpoint, the following message will be displayed:

Extension assigned to object other than pri-endpoint

If the board that contains the PRI endpoint is not inserted in the system, the following message will be displayed:

Board not inserted

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

|                  |                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.                                                                       |
| Maintenance Name | The type of maintenance object that is being busied out. The name for PRI endpoint port is "PE-BCHL."                                                                     |
| Alt. Name        | The alternate way of identifying the maintenance object. This field contains the extension number of the PRI endpoint.                                                    |
| Result           | An indicator as to whether the object is successfully busied out. The possible values are: PASS, FAIL or ABORT.                                                           |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter. |

For the following output example, the command "busyout pri-endpoint 22501" was entered. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 6.

busyout pri-endpoint 22501

| 01B2005 | PE-BCHL          | 22501     | PASS   |            |
| 01B2006 | PE-BCHL          | 22501     | PASS   |            |

Command Successfully Completed

## Feature Interactions

- If there is an active call on the specified PRI endpoint, the busyout command will cause the call to drop. This command is destructive.
- Once the PRI endpoint is in the maintenance busy (system technician busy) state, all call attempts from the far-end PRI terminal adapter will be denied with a cause value 17 (User Busy).

## busyout sp-link

This command will busyout the system printer link.

## Synopsis

---

busyout sp-link

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**busyout sp-link**

## Description

---

The busyout sp-link command will put the system printer link into a maintenance busy state. There will be no periodic or scheduled maintenance performed on the busied out system printer link until it is released. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the object. Placing the system printer link in a busyout state will prevent access to the system printer. The release sp-link command will return the system printer link to operation.

The system printer link is a link from the switch to an external printer over which jobs can be printed. This link is created by administering the system printer extension and setting up a call to the system printer.

## Defaults

No defaults.

## Parameters

None.

## Help Messages

If the system technician presses HELP after entering "busyout sp-link," the following is displayed:

Entry is not required

## Error Messages

If the system printer link is not administered, the following message is displayed:

Link not administered or not enabled

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | Not applicable. Will always be blank.                                                                                                                                           |
| Maintenance Name | The type of maintenance object that is being busied out will always be SYS-PRNT.                                                                                                |
| Alt. Name        | Not applicable. Will always be blank.                                                                                                                                           |
| Result           | The result of the busyout - "PASS," "ABORT," "FAIL".                                                                                                                            |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Error Codes" section of this chapter. |

For the following output example the command entered was "busyout sp-link."

busyout sp-linkSPE A

busyout spe-standby

This command allows the technician to busyout the standby Switch Processing Element (SPE)

## Synopsis

---

busyout spe-standby

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**busyout spe-standby**

## Description

---

The busyout spe-standby command raises the Fault Severity Level of the Standby SPE (see reference 5) of the standby Switch Processing Element (SPE) by raising a Warning Off-board alarm against STBY-SPE. Because a Warning Off-board STBY-SPE alarm is defined to have the highest Fault Severity of all alarms the affect the health of an SPE (refer to the Reset System MUS), the chance that an SPE interchange will occur is diminished, but does not guarantee that an SPE interchange will not occur. Once the standby SPE is busied out, an SPE interchange will only occur if the standby SPE is hard selected via the SPE Select switches or the active SPE goes into SPE down mode. This command will also stop any activity currently executing on the standby SPE and will disable memory shadowing to the standby SPE. Periodic and scheduled testing **will** be prevented from starting on the standby SPE while it is busied out. The busyout state of the standby SPE and the STBY-SPE Warning alarm will be maintained across a reset system 1 (Warm restart) and a reset system 2 (Cold 2 restart) but will be removed after all other levels of restart.

## Defaults

No defaults.

## Parameters

None.

## Help Messages

If the system technician presses `HELP` after entering "busyout spe-standby" the following message will be displayed:

Entry is not required

### Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If this command is issued while an **upgrade software** command is active the following message will be displayed:

```
Standby SPE upgrade in progress, command denied
```

### Output

|                  |                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address displays the cabinet and carrier location of the standby SPE. The standby SPE port address is always 01A or 01B.                                         |
| Maintenance Name | "STBY-SPE" for the standby SPE maintenance object.                                                                                                                        |
| Alt. Name        | Always blank for this command.                                                                                                                                            |
| Result           | The result of the busyout -"PASS," "ABORT," "FAIL,"                                                                                                                       |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter. |

For the following output example, assume that the standby SPE is located in carrier "B." The command that was entered is "busyout spe-standby."

busyout spe-standby

SPE A

| COMMAND RESULTS |                  |           |        |            |
|-----------------|------------------|-----------|--------|------------|
| Port            | Maintenance Name | Alt. Name | Result | Error Code |
| 01B             | STBY-SPE         |           | PASS   |            |

Command successfully completed

### Feature Interactions

When a busyout of the standby SPE is performed, the fault severity level of the standby SPE is set to the highest possible value and memory shadowing is turned off. This is done to lessen the probability that the system will switch to the standby SPE. However, in some cases a "spontaneous" (hard) interchange of the SPEs may still occur.

This command can be used as a mechanism to turn off memory shadowing of the standby SPE.

If the standby SPE is in poor health (less than optimum), memory shadowing can not be disabled, or communication to the standby is impossible a busyout of the standby SPE will still be successful.

## busyout station

---

This command will busyout a specified station.

### Synopsis

---

busyout station extension

### Permissions

---

The following default logins may execute this command: system technician, inads, init.

### Examples

---

**busyout station 10020**  
**busyout station 32770**

### Description

---

The busyout station command will put the specified administered voice terminal extension (station) in a maintenance busy state, even those stations that are not installed. There will be no periodic or scheduled tests performed on the busied out station until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release station command will return the specified voice terminal extension to operation.

### Defaults

No defaults.

## Parameters

**extension** An extension number associated with the desired voice terminal. The number of digits in an extension is determined by a dial-plan.

## Help Messages

If the system technician presses **HELP** after entering "busyout station," the following message will be displayed:

```
Enter extension for an assigned station
```

## Error Messages

If the format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the specified extension is not administered, then the following message will be displayed:

```
Extension not assigned
```

If the specified extension does not belong to a station or attendant console, the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the station port resides on an EPN that is unavailable, the following message will be displayed:

```
EPN is not available
```

If the station port resides on a board that is not inserted in the system, the following message will be displayed:

```
Board not assigned
```

If the station port resides on a board that is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. |
| Maintenance Name | The type of maintenance object that is being busied out.                                            |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension.       |
| Result           | The results of trying to busyout the station - "PASS," "FAIL," "ABORT."                             |
| Error Code       | A numerical description of why the command aborted or failed.                                       |

For the following output example, assume that the command that was entered is "busyout station 1002."

busyout station 1002SPE A

COMMAND RESULTS

Command successfully completed

Feature Interactions

None.

busyout tdm

This command will busyout a TDM bus on the PPN or any EPN. The TDM bus with system tones can not be busied out.

Synopsis

busyout tdm pn number bus

## Permissions

The following default logins may execute this command: system technician, inads, init.

## Examples

**busyout tdm 1a**

## Description

The busyout tdm command will put the specified tdm bus in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out bus until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated (error type 18) on each tdm bus busied out, so that INADS can access the state of the objects. The release tdm command will return the specified tdm bus to operation.

## Defaults

No defaults.

## Parameters

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pn number | The PN number specifies the Port Network number of the TDM bus to be busied out.                                                                                                                                                                                                                                                                                                                                                                                              |
| bus       | The TDM bus ("a" or "b") specifies which half of the TDM bus is desired. Each 512 time slot TDM bus is configured as two duplicate 256 time slot buses. This division allows for duplication of control channels and dedicated tone time slots. The default control bus (carrying the control channel) is the "a" bus, while the default tone bus (carrying dedicated tones) is the "b" bus. A port-network number (1 - 3) may be entered with or without a leading zero (0). |

## Help Messages

If the system technician presses HELP after entering "busyout tdm," the following message will be displayed:

Enter TDM bus location: [network(1-3)];carrier(A-B)

## Error Messages

If the technician does not enter a port network number followed by bus, the following message will be displayed:

Identifier invalid

If the port network on which the desired TDM bus resides is unavailable, the following message will be displayed:

EPN is not available

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address is displayed as PN followed by the port network number and bus (A or B) associated with the TDM bus.                                                     |
| Alt. Name        | Not applicable.                                                                                                                                                           |
| Maintenance Name | The type of maintenance object that is being busied out. In this case it is always TDM-BUS.                                                                               |
| Result           | The result of the busyout -"PASS," "ABORT," "FAIL".                                                                                                                       |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter. |

For the following output example, assume that the command that was entered is "busyout tdm port-network 1 bus a."

busyout tdm port-network 1 bus a

SPE A

COMMAND RESULTS

|        |                  |           |        |            |
|--------|------------------|-----------|--------|------------|
| Port   | Maintenance Name | Alt. Name | Result | Error Code |
| PN 01A | TDM-BUS          |           | PASS   |            |

Command successfully completed

## Feature Interactions

---

If a bus is busied out, no calls will be torn down. However, no new calls will be set up on the busied out bus.

Dedicated tone time slots must be moved to another bus (the other half of the duplicated bus) before a busyout of a particular bus will be allowed.

## busyout tone-clock

---

This command will busyout a tone/clock circuit pack.

## Synopsis

---

busyout tone-clock location

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**busyout tone-clock 01c**  
**busyout tone-clock 03d**

## Description

---

The busyout tone-clock command will put the specified tone/clock in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out object until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated (error type 18) on each tone clock circuit pack busied out, so that INADS can access the state of the objects. The release tone-clock command will return the specified tone/clock to operation.

## Defaults

The cabinet number will default to 1 (one).

## Parameters

**location** A "location" represents the physical position of the tone/clock to be busied out and is entered as "UUc" where "UU" represents the cabinet number, and "c" represents the carrier. A cabinet number (1 - 3) may be entered with or without a leading zero (0).

## Help Messages

If the system technician presses HELP after entering "busyout tone-clock," the following message will be displayed:

```
Enter tone/clock location: [cabinet(1-3);(carrier(A-E))
```

## Error Messages

If an identifier greater than 3 (three) characters is entered, or the cabinet entered is not a digit (number), the following message will be displayed:

```
Identifier invalid
```

If the carrier entered is invalid, the following message will be displayed:

```
Invalid carrier specified
```

If the cabinet entered is not within the valid range of cabinets or the cabinet is not administered, the following message will be displayed:

```
Cabinet number not assigned
```

If there is no tone/clock board at the specified location, one of the following messages will be displayed:

```
Board not inserted  
Board not assigned
```

If the specified cabinet carrier location is that of a switch node, the following message will be displayed:

```
Switch Node carrier specified; invalid command for SN carrier
```

If the cabinet carrier location entered is that of an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If the tone/clock is active and the specified action is busyout, the following message will be displayed:

```
Illegal Command for active object; use 'set' to switch to standby
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The tone clock maintenance object will only display the cabinet and carrier of the desired tone/clock board.                                                              |
| Maintenance Name | The type of tone clock circuit pack that is being busied out which is TONE-PT, TDM-CLK and TONE-BD.                                                                       |
| Alt. name        | Not applicable.                                                                                                                                                           |
| Result           | The result of the busyout -"PASS," "ABORT," "FAIL".                                                                                                                       |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter. |

For the following output example, assume that the command that was entered is "busyout tone-clock 1a."

```
busyout tone-clock 1a                                SPE A

                                COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01A    TONE-PT           PASS
01A    TDM-CLK          PASS
01A    TONE-BD          PASS

Command successfully completed
```

Feature Interactions

None.

busyout trunk

This command will busyout a specified trunk group or trunk group member.

## Synopsis

---

busyout trunk group/*member*

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**busyout trunk 78**  
**busyout trunk 78/1**

## Description

---

The busyout trunk command will put the specified trunk group or trunk group member in a maintenance busy state, even trunk groups that are not installed. There will be no periodic or scheduled tests performed on the busied out trunk groups or trunk group members until they are released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). A single group member can be busied out by specifying the group number, a "/", and the member number. All members in a trunk group can be busied out by specifying the trunk group number only. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release trunk command will return the specified trunk group or group member to operation.

 **NOTE:**  
While not recommended, if the user enters "busyout trunk <group number>/," the lowest port-location in the group will be busied out.

## Defaults

No defaults.

## Parameters

|        |                                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------------------------------|
| group  | The group number is an administered number associated with each trunk group. The valid range is 1 - 99.                     |
| member | The member number is an administered number identifying a particular trunk within a trunk group. The valid range is 1 - 99. |

## Help Messages

If the system technician presses HELP after entering "busyout trunk," the following message will be displayed:

```
Enter assigned trunk group number [or group/member]
```

## Error Messages

If the format of the identifier is invalid, the following message will be displayed:

```
Format invalid
```

If the range of the trunk group is incorrect, the following error message will be displayed:

```
Trunk or trunk group invalid
```

If the specified trunk group is not administered or has no members, the following message will be displayed:

```
Group not assigned, or group assigned but with no member
```

If the specified member is not administered, the following message will be displayed:

```
Group member not assigned
```

If the specified trunk group is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.                                                                                                                                                                                                                                                     |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                                                                                                                                                                                                                                |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | The result of the busyout - "PASS", "ABORT", "FAIL".                                                                                                                                                                                                                                                                                                    |
| Error Code       | A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Error Codes" section of this chapter.                                                                                                                                                                         |

For the following output example, assume that the command that was entered is "busyout trunk 78/1."

busyout trunk 78/1

SPE A

COMMAND RESULTS

|         |                  |           |        |            |

Command successfully completed

## Feature Interactions

None.

## cancel hardware-group

This command allows a user to cancel an active "test hardware-group" command executing in the background or foreground mode.

## Synopsis

cancel hardware-group

Permissions

The following logins may execute this command: inads, init.

Examples

cancel hardware-group

Description

A system technician, in the course of the execution of a "test hardware-group" command may find the need to stop the testing either temporarily or permanently. This can be accomplished by entering the "cancel hardware-group" command on the SAT. This command may be restarted where it left off with the "resume hardware-group" command or another "test hardware-group" may be entered.

In addition to the "cancel hardware-group" command, the 'cancel' key on the SAT cancels a hardware-group command executing in the foreground.

The status of a canceled "test hardware-group" command will show up as 'canceled' on the "status hardware-group" screen.

When a "test hardware-group" command is executing in the foreground with the 'continuously' option and the 'cancel' key on the SAT is pressed or the "cancel hardware-group" command is entered, then the hardware-group command is canceled and for security reasons, the SAT running the "test hardware-group" command will be logged off. However, after logging back on the system, the user still maintains the capability to restart the canceled "test hardware-group" command with the "resume hardware-group" command.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses help after entering "cancel hardware-group" the following message will be displayed:

Entry is not required

## Error Messages

If there is no "test hardware-group" command currently active to be canceled, the following message will be displayed:

```
Command aborted - no hardware-group test in progress
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

## Output

---

If a "test hardware-group" command executing in the background is successfully canceled with the "cancel hardware-group" command, the following response will be displayed:

```
Hardware-group command successfully canceled
```

If a "test hardware-group" command executing in the foreground is successfully canceled with a "cancel hardware-group" command from another SAT terminal, the following response will be displayed on the SAT terminal where the hardware-group command was executing:

```
Hardware-group command aborted with cancel command entered from another SAT
```

## Feature Interactions

---

### Scheduled and Periodic Maintenance

When a "test hardware-group" is entered, all activity related to scheduled background maintenance, periodic background maintenance, and data audits is suspended for the duration of the execution of the "test hardware-group" command. All activity related to scheduled background maintenance, periodic background maintenance, and data audits will restart if the "test hardware-group" command is canceled.

### Status Hardware-group

The state of a canceled "test hardware-group" command can be displayed by means of the "status hardware-group" command and the state will show up as 'canceled'.

## change circuit-packs

This command allows the user to add, change, or remove circuit packs which are administered.

## Synopsis

---

change circuit-packs cabinet number

## Permissions

---

The following default logins may execute this command: system technician, cust, inads, init, nms.

## Examples

---

**change circuit-packs 1**  
**change circuit-packs 2**

## Description

---

This command allows the user to administer the circuit packs that are to be inserted into the system port, expansion control, and switch node carriers. It is used to configure the system when the circuit packs have not yet been physically inserted.

## Defaults

If no cabinet number is entered, this value defaults to "1."

## Parameters

cabinet number     The number of the cabinet containing the circuit packs that the user wishes to modify.

## Help Messages

If the system technician presses **HELP** after entering "change circuit-packs" the following message is displayed:

Enter number between [1-3]

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If an invalid cabinet number is entered on the command line the following message will be displayed:

```
"n" Identifier not assigned
```

Output

|                |                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cabinet        | The administered number of the cabinet.                                                                                                                                 |
| Cabinet Layout | Type of cabinet (single-carrier).                                                                                                                                       |
| Carrier        | Each page of this form reports the information for a specific carrier, this field tells the user which carrier of the cabinet that this page refers to.                 |
| Carrier Type   | For each carrier - A, B, C, or D, what its function is (port, processor, or expansion control).                                                                         |
| Slot           | Lists the slot numbers from 0 - 21 depending on the type of carrier.                                                                                                    |
| Code           | The circuit pack code (TN number). This number identifies the circuit pack type to the system. The proper format are the letters "TN" followed by a three digit number. |
| Sfx            | For suffix, lists the suffix if the particular circuit pack has one.                                                                                                    |
| Name           | This field contains the alphanumeric name for the circuit pack. It is provided to aid the user in entering the circuit pack codes.                                      |

For the following output example, the command entered is "change circuit-packs 1" which is a n single-carrier cabinet. All five pages are shown here.

change circuit-packs 1 Page 1 of 5

'#' indicates circuit pack conflict.

Feature Interactions

None.

change synchronization

This command changes/updates the translation data associated with the existing synchronization hierarchy.

Synopsis

change synchronization

Permissions

The following logins may execute this command: system technician, cust, inads, init, rcust, bcms.

Examples

change synchronization  
change synch

**Description**

---

A hierarchy of sources exists within each system that are used for timing synchronization. For stratum 3 synchronization, this hierarchy is reflected by the DS1 inputs to the external stratum 3 clock. For stratum 4 synchronization, this hierarchy is reflected in the primary and secondary fields. If all fields are blank, then the tone clock board within each PN provides timing for that PN.

**Defaults**

None.

**Parameters**

None.

**Help Messages**

If the user presses `HELP` after entering "change synchronization" the following message is displayed:

Entry is not required

**Error Messages**

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict.

Output/INPUT

---

- Stratum:

This field specifies the synchronization stratum that will be used. The only entries that are acceptable are "3" and "4." If "4" is entered in this field, the message
- Primary:

This field designates the first choice system synchronization source. A blank entry means no synchronization. This field is valid only if stratum 4 synchronization is specified.

— FIELD HELP:

Enter 5 character board number;  
cabinet(1-3):carrier(A-E):slot(0-21)

— FIELD ERROR(S):

— "entry" Board location invalid

— "entry" Circuit Pack must be a DS1 or a UDS1 board

— "entry" Circuit pack must be installed first

— Cannot administer synchronization sources on a port network  
remoted via DS1C

Secondary:

This field designates the second choice system synchronization source. A blank entry means no synchronization. This field is valid only if stratum 4 synchronization is specified.

— FIELD HELP:

Enter 5 character board number; cabinet(1-3):carrier(A-E):  
slot(0-21)

— FIELD ERROR(S):

— "entry" Board location invalid

— "entry" Circuit Pack must be a DS1 or a UDS1 board

— "entry" Circuit pack must be installed first

— Secondary source requires primary synchronization source

— Duplicate entry

— Synchronization sources must be in same port network

Location:

The circuit pack location (port network, carrier and board slot) of all administered DS1 circuit packs are listed here.

- Name: If a user defined name is administered for the DS1 circuit pack, it will be displayed here. Blank means no user defined name was given to this DS1 circuit pack.
- Slip: If the DS1 circuit pack has slip alarm, this field will show 'y'. Otherwise it will show 'n'.
- Port Network: This field is only valid for stratum 3 synchronization. The field is a display only field and specifies the port network that supplies synchronization via the tone clock circuit pack.

For the following example, the command that was entered is "change synchronization" and "4" was entered in the stratum field.

```
change synchronization                                Page 1 of 1

      SYNCHRONIZATION PLAN

      SYNCHRONIZATION SOURCE (DS1 circuit pack location)
        Stratum: 4
        Primary: _____ Secondary: _____
Location  Name      Slip      Location  Name      Slip
NOTE: TN722B DS1 source will result in stratum 4, type II synchronization
```

For the following example, the command that was entered is "change synchronization" and "3" was entered in the stratum field.

```
change synchronization                                Page 1 of 1

      SYNCHRONIZATION PLAN

      SYNCHRONIZATION SOURCE (DS1 circuit pack location)
        Stratum: 3
        Port Network: 1
```

**Feature Interactions**

A DS1 interface or a UDS1 board that has been selected as either a primary or secondary synchronization source cannot be removed on the DS1 circuit pack administration form or the regular circuit pack administration form.

## change system-parameters maintenance

---

### change system-parameters maintenance

The maintenance-related system parameters form specifies and displays scheduled maintenance operations and maintenance support functions.

This form activates and deactivates INADS alarm origination when performing repairs. To deactivate alarm origination:

1. Make a note of the current entries in the Alarm Origination and CPE Alarm fields so you can restore them when you are done.
2. Change the Alarm Origination to OSS Numbers field to "neither."
3. Change the CPE Alarm Activation Level field to "none."
4. If daily scheduled maintenance must be prevented from starting during a maintenance procedure, set the Start Time field to a time after the session will end. If daily Scheduled Maintenance is already running and needs to be shut off, set the Stop Time field to one minute after the current time.
5. Press **Enter** and verify that the screen displays the message:

Command successfully completed

#### **NOTE:**

For earlier releases of system software, disable Cleared Alarm Notification and Restart Notification before submitting the form.

#### **NOTE:**

When finished working on the switch be sure to return all fields to their original settings.

## Examples

### change system-parameters maintenance

## Output

An input form displays with the following fields. Defaults for data entry fields are listed in parentheses.

Operations Support Parameters

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Product Identification           | This is a 10-digit number starting with 1 that identifies the switch to an Operations Support System (OSS), for example, INADS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| First OSS Telephone Number       | The first telephone number that the switch uses to report alarms to, for example, INADS or Trouble Tracker. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. # and * are not allowed in the telephone number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Abbrev Alarm Report              | Enables the Abbreviated Alarm Report feature for the first OSS. (yes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Second OSS Telephone Number      | The second telephone number that the switch uses to report alarms to, for example, INADS or DEFINITY SNMP. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. # and * are not allowed in the telephone number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Abbrev Alarm Report              | Enables the Abbreviated Alarm Report feature for the second OSS. (no)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Alarm Origination to OSS Numbers | <p>Indicates one of four options for alarm origination (neither):</p> <ul style="list-style-type: none"><li>■ If this field is set to “both,” all Major and Minor alarms result in an automatic call to both OSS telephone numbers. Both OSS telephone numbers must be administered.</li><li>■ If this field is set to “first-only,” all Major and Minor alarms result in an automatic call to the first OSS number only. The switch does not call the second OSS telephone number even if the number is administered. The first OSS telephone number must be administered</li><li>■ If this field is set to “neither,” alarm origination does not take place. Warning alarms are not reported to either numbers.</li><li>■ If this field is set to “second-as-backup,” all Major and Minor alarms result in an automatic call to the first OSS telephone number. If calling the first OSS telephone number fails four attempts, the switch starts to call the second OSS telephone number as a backup until calling the first OSS telephone number becomes successful. Both OSS telephone numbers must be administered.</li></ul> <p>Before Release 5, the name of this field is “Alarm Origination Activated.” If Alarm Origination is deactivated, both Cleared Alarm Notification and Restart Notification are disabled, even though they may still be activated in the administration.</p> |
| Cleared Alarm Notification       | Enables the switch to originate a call to the OSS and send an alarm resolution message whenever all previously reported Major and Minor alarms are resolved. Alarm Origination must be activated in order for Cleared Alarm Notification to work. (no)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Restart Notification             | Enables the switch to originate a call to the OSS and report any system restarts caused by problems with the switch. Activate Alarm Origination for Restart Notification to operate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Suspension Threshold**      The threshold for suspending Cleared Alarm Notification. Some problems may cause alarms to be generated and then resolved repeatedly. To detect these problems (by not sending additional Cleared Alarm notifications to indicate a problem-free system), the switch suspends Cleared Alarm Notification when it has reported this administrable number of Cleared Alarm notifications in a 24 hour period. A suspended Cleared Alarm Notification is only enabled again with a successfully completed "logoff" command, a system reset, or when the threshold is changed. This field is irrelevant if Cleared Alarm Notification or Alarm Origination is disabled. The possible range of threshold values is between one and fifteen.

**Test Remote Access Port**      Specifies whether testing of the remote access port on the SYSAM circuit pack is enabled. This field should be set to "yes" whenever there is an INADS line connected to the switch and there is a maintenance contract in effect so that alarm origination capability is maintained.

If no equipment is connected to the remote access port, or if a trunk for remote access and alarm origination is not provided, running tests on the remote access port on the SYSAM results in test failures. This causes unnecessary maintenance alarms and allows potentially destructive tests to be run. Setting this field to "no" prevents this.

**CPE Alarm Activation Level**      Indicates the minimum level (Major, Minor or Warning) at which the Customer-Provided Equipment (CPE) alarm is activated. If the level is "none," the CPE does is not activated for any alarm. (none)

 **NOTE:**  
The CPE alarm is always activated when the switch goes into Emergency Transfer, regardless of the CPE Alarm Activation Level setting.

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Packet Bus<br>Activated             | <p>Enables the system Packet Bus.</p> <p>If this field is set to "yes", then maintenance software assumes that there is a Packet Control circuit pack installed in the system. The packet endpoints (for example, ASAI, and/or BRI) may be administered, and maintenance testing runs on both the Packet Control circuit pack and on the Packet Bus (This field should be set to "yes" after a packet control circuit pack is installed.). If a Packet Control circuit pack is not installed in the system, then a major alarm is raised against the PKT-CTRL MO.</p> <p>This field can only be changed from "yes" to "no" if there are no packet endpoints administered, thus ensuring that there can be no packet endpoints administered if the packet bus is not activated.</p> <p>This field should be set to "yes" after a Packet Control circuit pack is installed.</p> <p>If a Packet Control circuit pack is not installed, then this field should be set to "no" (the only exception is when setting up translations for a system for which not all of the required hardware is available). (no)</p> |
| Customer<br>Access to<br>INADS Port | <p>Provides the capability to prohibit access to system administration and maintenance interface, via the INADS port when using customer login ID's. This field can only be activated by Lucent Technologies services through system-parameters maintenance administration.(no)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Repeat Dial<br>Interval<br>(MMS)    | <p>Indicates the number of minutes that the system must wait before attempting another call origination to an OSS. This timer is triggered by the lack of a far-end acknowledgment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Scheduled Maintenance

A series of maintenance tests and operations runs automatically every day according to the schedule and settings specified in the following fields

Table 8-1. Scheduled Maintenance Settings

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Start Time                  | The hour and minute in 24-hour notation at which daily scheduled maintenance will begin running. (22:00)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Stop Time                   | The hour and minute when scheduled daily maintenance will stop running. If any daily maintenance operations are not completed by this time, the system will note where in the sequence it stopped and perform those operations during the next scheduled daily maintenance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Daily Maintenance           | This display-only field simply represents the series of tests that are always run by maintenance software as part of daily maintenance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Save Translation            | This field indicates on which days translation data in memory will automatically be saved to the Mass Storage System disk and/or tape devices during scheduled maintenance. The save operation is first made to disk, followed by a disk backup to tape. On systems with duplicated SPEs, translation data is saved on both SPEs. Valid entries are <b>daily</b> , days of the week, or <b>no</b> . "No" specifies that no automatic saves are to be executed.                                                                                                                                                                                                                                                                                                                                       |
| Control Channel Interchange | Each port network has a pair of TDM busses called A and B, each of which has a set of time slots dedicated to use by the control channel. At any one time, the control channel in each PN is carried on only one of the two busses. This field indicates on which days the control channel in each port network will be switched from one of the paired TDM busses to the other. Valid entries are <b>daily</b> , days of the week, or <b>no</b> . "No" specifies that no interchange be executed. (no)                                                                                                                                                                                                                                                                                              |
| System Clocks Interchange   | <p>On High and Critical Reliability systems, this option causes a Tone-Clock interchange in each port network with duplicated Tone-Clock circuit packs. Each port network interchanges into the standby Tone-Clock for 20 seconds and then back to the Tone-Clock that was originally active. This field indicates on which days the interchanges are to take place. Valid entries are daily, days of the week, or no. "No" specifies that interchanges be executed. (no)</p> <p>The system performs a Tone-Clock interchange, making the stand by Tone-Clock active. The newly active Tone-Clock circuit pack is tested and, while active, provides system clocks for the port network in which it resides. The system then interchanges back to the originally active Tone-Clock circuit pack.</p> |

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPE Interchange                             | On systems with duplicated SPEs, this field indicates on which days an SPE interchange will be executed during scheduled maintenance. Valid entries are <b>daily</b> , days of the week, or <b>no</b> . "No" specifies no scheduled interchanges. (no)                                                                                                                                                                                                                                                                                                                                                                                          |
| EXP-LINK Interchange                        | This field indicates whether or not the expansion links between port-networks are interchanged as part of scheduled maintenance. The value "daily" means that EXP-LINK interchange occurs automatically everyday. The value "no" means that EXP-LINK interchange is not done automatically as part of scheduled maintenance. Values represented by the days of the week mean that EXP-LINK interchange occurs automatically on the specified day only. Since EXP-LINK interchange only applies to duplicated systems, simplex systems do not display this field. (no)                                                                           |
| Minimum Threshold for TTRs                  | When the number of touch tone receivers (TTRs) in service falls below this number (4 to 200), a WARNING alarm is raised against TTR-LEV. These are also known as dual-tone multifrequency receivers (DTMRs). There are 4 TTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a TTR being taken out of service, set this field to 4 times the number of TN748s. If this number is set to more than three less than the total number of TTRs, a port network with only one TN748 could lose all of its TTRs before this alarm is raised.                                             |
| Minimum Threshold for CPTRs                 | When the number of call progress tone receivers in service falls below this number (2 to 100), a WARNING alarm is raised against TTR-LEV. These are also known as general purpose tone detectors (GPTDs). There are 2 CPTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a CPTR being taken out of service, set this field to 2 times the number of TN748s. If this number is set to more than one less than the total number of TTRs, a port network with only one TN748 could lose all of its CPTRs before this alarm is raised.                                               |
| Minimum Threshold for Call Classifier Ports | When the number of call classifier ports (CLSFY-PTs) in service falls below this number, a WARNING alarm is raised against TTR-LEV. Valid entries are 1 to 200. There are 8 ports on each TN744 Call Classifier circuit pack, and up to 25 TN744s in a system. To alarm the first occurrence of a CLSFY-PT being taken out of service, set this field to 8 times the number of TN744s. If this number is set to more than 7 less than the total number of CSLFY-PTs in the system, a port network with only one TN744 could lose all of its CLSFY-PTS before the alarm is raised. If there are no TN744s in the system, leave this field blank. |

Table 8-1. Scheduled Maintenance Settings — Continued

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISDN-BRI<br>Service SPID                     | This field shows whether or not the link is associated with the Service SPID. If the link is associated with the Service SPID, the field contains a number from “0 to 99999” this number is the test spid (under BRI-SET MO) otherwise, this field is blank. Service SPID is a feature used by the system technician to check building wiring between the switch and the BRI endpoint.                                                                                                                                                                            |
| DSO<br>Loop-Around<br>Test Call<br>Extension | <p>The extension used by the network service provider to set up a DSO loop around connection for testing non-ISDN DS1 trunks</p> <p>The DSO Loop-Around Test Call feature is used primarily for testing DSO channels associated with non ISDN-PRI trunks. The loop-around is activated by dialing the test extension number. Multiple DSO Loop-Around connections can be set up by placing multiple calls to the loop-around extension.</p> <p>For more information see "Facility Test Calls" in <a href="#">Chapter 5, “Routine Maintenance Procedures”</a>.</p> |
| Loss Plan                                    | Use only when extra loss is required to maintain quality of transmission on conference calls. Leave this field blank if no extra loss is required. If extra loss is required, enter digits as shown below.                                                                                                                                                                                                                                                                                                                                                        |

| No. Of Parties To<br>Be Conferenced | Enter Digit |
|-------------------------------------|-------------|
| 3                                   | 2           |
| 4                                   | 3           |
| 5                                   | 4           |
| 6                                   | 5           |
| 7                                   | 6           |

SPE Optional Boards: These fields indicate whether a Disk circuit pack is present in the system, and which Packet Interface slots are administered. If a Packet Interface circuit pack is physically present, the corresponding Packet Interface field is set to y when the system boots, and no change to that field is allowed. If the system is equipped with duplicated SPEs, a Packet Interface field is set to y when either SPE carrier contains a Packet Interface circuit pack in the corresponding position. If a Packet Interface circuit pack is not present, then the value for the Packet Interface field is read from translation data stored on disk or tape. If the field is set to n, a Packet Interface circuit pack may be administered by changing the corresponding Packet Interface field to y.

Modem Connection

On page 3 of the example forms shown below, there are 11 fields that are hidden when the “Modem Connection?” field is set to internal. In this example the “Modem Connection” field is set to “external” and these additional 11 fields are visible.

The first 2 fields on page 3 help setup the data format for the serial data from the switch to the modem. The field names are, “Data Bits:”, and “Parity?”. There are only two valid combinations for these 2 fields:

- Data Bits = 8, Parity = None
- Data Bits = 7, Parity =(odd, even, mark, or space)

The remaining fields are listed below:

|                  |                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modem Connection | The only valid entries for this field are “internal” or “external”. The default is set to internal. (internal)                                                                                                                                                      |
| Modem Name       | This field is 20 characters long and will permit alpha-numeric characters to provide a unique qualifier for a given modem. The field is called “Modem Name: ”. ( )                                                                                                  |
| RTS/CTS Enabled  | This field will inform the modem that communication with the data source UART will be driven with RTS/CTS flow control. This field is 6 characters long with a default of “\Q3”. This field is case in-sensitive; however, the default will be in upper case. (\Q3) |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Asynchronous Data Mode   | <p>This field will configure the modem as an asynchronous communications device. This field is 8 characters long with a default of "&amp;M0&amp;Q0".</p> <p>This field is case in-sensitive; however, the default will be in upper case. (&amp;M0&amp;Q0)</p>                                                                                                                                                                                                                                                                                                                 |
| DTE Auto-Data Speed      | <p>This option will adjust the speed of the data source (DTE) UART to the outgoing (modem-to-modem) data rate. So, at maximum this speed would be 9600 baud.</p> <p>This field is 6 characters long with a blank as default.</p> <p>This field is case in-sensitive. ( )</p>                                                                                                                                                                                                                                                                                                  |
| Disable Data Compression | <p>This field will turn off the default data compression algorithms that are in use by most consumer modems. This field is 6 characters long with blank as the default. The AT commands that control this capability are supported by similar commands; however, these commands do not operate in the same manner. The Intel modems require the use of "H%C0" to disable V.42bis &amp; MNP Class 5 data compression algorithms; however, the Paradyne products only use "%C0" to disable both algorithms. This field is case in-sensitive; with blank as the default. ( )</p> |
| Enable Error Control     | <p>This field will turn on the V.42 LAPM and MNP error control protocols, if available on the modem. This field is 6 characters long with "blank" as the default.</p> <p>This V.42/MNP/Buffer mode first attempts to negotiate V.42 error control with the remote modem. If this fails, then the modem transitions to MNP, and if this fails then no error control is used.</p> <p>This field is case in-sensitive. ( )</p>                                                                                                                                                   |
| Misc. Init. Param        | <p>This field is 20 characters long with blank as the default. This field supports any initialization parameters that are not already specified. The AT commands specified in this free-form field will be always the last initialization parameters to be sent to the external modem.</p> <p>This field is case in-sensitive; however, the default will be in upper case. ( )</p>                                                                                                                                                                                            |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto-Answer Ring<br>Count | <p>This field controls the number of rings required before the modem will automatically answer an incoming call. This field is 6 characters long with "S0=10" as the default. Typically, the maximum permissible value for this register is 255. The values 1-255 denote the number of incoming ring cycles.</p> <p>This field is case in-sensitive; however, the default will be in upper case. (S0=10)</p>               |
| Dial Type                 | <p>This field controls the type of inter-register signaling to be used between the modem and the Central Office. The field name is "Dial Type: " with a default of "T " for tone dialing. Pulse dialing is indicated by "P". The field length should be 3 characters long. This field will be concatenated with the dial string. This field will be case in-sensitive; however, the default will be in upper case. (T)</p> |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adjustable<br>Make/Break Ratio | <p>This field can be of particular importance when using a modem that may be transferable from country to country. The intent of this field is to control the make/break ratios of pulses and DTMF dialing. The Intel product information has support for the different make/break options for pulse dialing only.</p> <p>Intel uses the option "&amp;P0" to select a ratio of 39% make and 61% break for communication within the U.S. and Canada. The option "&amp;P1" sets a ration of 33% make and 67% break for the U.K. and Hong Kong.</p> <p>This field is 5 characters long with blank as the default.</p> <p>This field will be case in-sensitive. ( )</p>                                                                                                                                                                                                                                                                                                          |
| Dial Command                   | <p>This field is 3 characters long with "D" as the default.. This field simply denotes the dialing command of the modem. This is a fairly standard command.</p> <p>This field will be case in-sensitive; however, the default will be in upper case. (D)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| No Answer Time-Out             | <p>Most off-the-shelf external modems provide a timer that abandons any outbound data call after a predetermined interval. Some modems provide for this timer to be disabled, thus allowing an outbound call to ring indefinitely. AT&amp;T Paradyne does not provide this capability with their modem line, because it is generally undesirable to have an outbound call attempt ring indefinitely.</p> <p>The internal modem must have this parameter disabled or set to at least 255 seconds.</p> <p>This is a non-administrable parameter. For the external modem connection, this parameter will be the first initialization string to be transmitted to the external modem. This field will be visible on the administration form in display mode only.</p> <p>This hardcoded constant can be overridden for type approval applications, specifically in the U.K and other Western European nations, by the use of the "Misc. Init. Param:" field.</p> <p>(S7=255)</p> |

## clear audits

This command is used to clear the cumulative and/or peak hour's data that has been collected about the status of each data relation audit.

### Synopsis

clear audits [cumulative | peak-hour]

### Permissions

The following default logins may execute this command: inads, init.

### Examples

clear audits cumulative  
clear audits peak-hour

## Description

---

This command is used to clear the cumulative and/or peak hour's data that has been collected for each data relation audit. The purpose of this command is to clear old data so that when the "status audits" command is used only data collected since the last "clear audits" command is displayed. With this command, the user can clear the peak hour's data that has been collected or both the peak hour and cumulative data (refer to the "status audits" manual page for more information).

## Defaults

None

## Parameters

- |            |                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cumulative | This option will cause the data collected since the last reboot or "clear audits cumulative" command and the data collected about the peak hour to be cleared. |
| peak-hour  | This option will cause the data collected about the peak hour to be cleared.                                                                                   |

## Help Messages

If the technician presses HELP after entering "clear audits" the following message will be displayed:

peak-hour cumulative

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

---

If the clear audits command is successful, the following message will be displayed on the SAT:

Command successfully completed

If the clear audits command is unsuccessful, the following message will be displayed on the SAT:

Error encountered, can't complete request

Feature Interactions

---

The data cleared by the "clear audits" command is displayed using the "status audits" command. After the "clear audits" command is executed successfully the "display audits cumulative" and/or "display audits peak-hour" commands will only display information collected since the "clear audits" command was executed. The start date displayed on the status audits screen will reflect the time that the "clear audits" command was executed.

clear errors

---

This command moves errors and resolved alarms to the cleared-error list. alarms from the error log.

Synopsis

---

clear errors

Permissions

---

The following default logins may execute this command: system technician, inads, init.

Examples

---

clear errors

Description

---

The clear errors command moves all errors and resolved alarms to the cleared-error list, thereby making room for new incoming error messages which might otherwise be dropped. This command will not clear active alarms from the alarm log. This command should be used with care because the information cleared may be lost if these entries are overwritten.

Cleared error entries will be the first entries overwritten when additional entries are needed to log new errors.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "clear errors," the following message will be displayed:

Entry is not required

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

If the clear errors command is successful, the following message will be displayed on the SAT:

Command successfully completed

If the clear errors command is unsuccessful, the following message will be displayed on the SAT:

Error encountered, can't complete request

Feature Interactions

Cleared errors can be displayed using the "display errors" command.

clear interface

This command clears all values of counters maintained by the processor interface.

## Synopsis

---

clear interface location

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**clear interface 01a1**  
**clear interface 01a2**  
**clear interface a2**

## Description

---

The clear interface command causes all counter values maintained by the Processor Interface (PI) circuit pack to be reinitialized. These counters display via the status interface command which is for use in the development environment only. The PI circuit pack is a front end processor implementing the packet layer and link layer of the BX.25 protocol, and the ISDN procedure-D protocol.

## Defaults

None

## Parameters

|          |                                                                                                                                                                                                                                                                                              |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | The location (cabinet-carrier-position) of the processor interface. The position determines which processor interface circuit pack will be cleared. A position of 1 is the first processor interface in the carrier, while a position of 2 is the second processor interface in the carrier. |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If HELP is pressed after entering "clear interface," the following message is displayed:

Enter location: [cabinet(1)], carrier(A-B), pos(1-2)

## Error Messages

If the specified carrier is not the active PE, the following message is displayed:

Command must be executed from active SPE

If the cabinet and carrier is invalid for a PPN, the following message is displayed:

```
Invalid port-network specified
```

If the carrier is not a valid carrier, the following message is displayed:

```
Invalid carrier specified
```

If the technician-entered carrier is not active, the following message is displayed:

```
Board invalid
```

If there is not a PI circuit pack administered for the specified position, but the specified carrier is active, the following error message is displayed:

```
Processor Interface (TN765) not started or is being started
```

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If, during the execution of a command, a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

## Output

---

If the clear interface command is successful, the following message is displayed on the SAT:

```
Command successfully completed
```

If the clear interface command is unsuccessful, the following message is displayed on the SAT:

```
Error encountered, can't complete request
```

## Feature Interactions

---

None.

## **clear isdn-testcall**

---

This command cancels a ISDN-PRI test call already in progress.

## Synopsis

---

clear isdn-testcall group number/member number

## Permissions

---

The following default logins may execute this command: system technician, inads, init

## Examples

---

**clear isdn-testcall 80/1**  
**clear isdn-testcall 78/2**

## Description

---

The clear isdn-testcall command cancels an ISDN-PRI test call if one is currently in progress. Once a running test call is cleared, another test call is allowed to run.

## Defaults

None.

## Parameters

- |               |                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------|
| group number  | The group number is an administered number associated with each trunk group.                     |
| member number | The member number is an administered number identifying a particular trunk within a trunk group. |

## Help Messages

If the system technician presses HELP after entering "clear isdn-testcall," the following is displayed:

Enter group #/member #

## Error Messages

If the specified format of the trunk location is incorrect, this message displays:

Format invalid

If the specified trunk group or member range is invalid, this message displays:

Trunk or trunk group invalid

If a trunk group and member is not specified, this message displays:

Must specify group/member pair

If the specified trunk group is not administered or has no members administered, this message displays:

Group not assigned, or group assigned but with no member

If the specified trunk group member is not administered, this message displays:

Group member not assigned

If the board on which the port resides is not administered, this message displays:

Port not assigned

If a test call is currently not in progress when the command is entered, this message displays:

Test Call not in progress

If the specified trunk is not an ISDN-PRI trunk, this message displays:

Invalid non ISDN-PRI trunk specified

If the test call has already completed, the following message is displayed:

Test Call already terminated

If, during the execution of a command, a resource problem occurs that requires the user to restart the command, this message displays:

Command resources busy; Press CANCEL to clear, and then resubmit

If all available maintenance resources are in use, this message displays:

All maintenance resources busy; try again later

## Output

---

If the `clear isdn-testcall` command is successful, this message displays:

Command successfully completed

If the `clear isdn-testcall` command is unsuccessful, this message displays:

Error encountered, can't complete request

## Feature Interactions

---

None.

## clear link

---

This command will clear a link by performing a reset.

### Synopsis

---

clear link link-id

### Permissions

---

The following default logins may execute this command: system technician, inads, init.

### Examples

---

clear link 1  
clear link 8

### Description

---

The clear link command will clear the hardware error counters associated with the ports on the Processor Interface circuit pack (displayed via the status link command).

### Defaults

None.

### Parameters

link-id            The link-id is a number associated with each link (1-8). The link number is assigned via the communication-interface links form.

### Help Messages

If the system technician presses HELP after entering "clear link," the following message will be displayed:

Enter 1 character link number

### Error Messages

If the link identifier is not within the valid range, the following error message is displayed:

Link out of range, please press HELP

If the link is not administered, the following error message is displayed:

```
Link not administered or not enabled
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

**Output**

---

If the clear link command is successful, the following message is displayed on the SAT:

```
Command successfully completed
```

If the clear link command is unsuccessful, the following message is displayed on the SAT:

```
Error encountered, can't complete request
```

**Feature Interactions**

---

None.

**clear mst**

---

This command will clear the trace buffer.

**Synopsis**

---

clear mst

**Permissions**

---

The following default logins may execute this command: inads, init.

## Examples

---

clear mst

## Description

---

This command is usually used before enabling the trace. It may be used while the trace is enabled to clear unwanted data.

## Defaults

None.

## Parameters

None.

## Help Messages

If HELP is pressed after entering "clear mst," the following message is displayed:

Entry is not required

## Error Messages

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. A conflict could occur if another user was executing an enable, disable or clear message sequence trace command at the same time. The message is as follows:

'login id':'command' has a command conflict

## Output

---

After the user has entered the command the following message appears at the bottom of the screen:

Command successfully completed

## Feature Interactions

---

None.

## clear pkt

---

This command forces a packet bus 'clear stimuli' to be sent over the packet bus.

## Synopsis

---

clear pkt port-network location

## Permissions

---

The following default logins may execute this command: cust, inads, init.

## Examples

---

clear pkt port-network 1

## Description

---

This command helps resolve problems with the packet bus.

## Parameters

location     A "location" represents the physical position of the packet bus that is forced to send a 'clear stimuli' to all boards connected to it. Enter a digit (1 - 3).

## Help Messages

If the technician presses HELP after entering "clear pkt," this message displays:

Enter port-network; port network number (1-3)

## Error Messages

If the packet bus is not administered, this message displays:

Packet Bus is not activated, check system-parameters maintenance form

If all available maintenance resources are in use, this message displays:

All maintenance resources busy; try again later

## Output

If the clear pkt command is successful, this message displays:

Command successfully completed

## Feature Interactions

None. For additional information, refer to EDD document 23154.

# clear port

This command removes the maintenance mark from a port.

## Synopsis

clear port location

## Permissions

The following default logins may execute this command: cust, inads, init, nms.

## Examples

clear port 01c1102

## Description

This command is used in conjunction with the "mark port" command. This command will remove the mark from the port and allow it to be usable.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                                           |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | A "location" represents the physical position of the port to be busied out and is entered as "UUcSSrr" where "UU" represents the cabinet number, "c" represents the carrier, "SS" represents the slot position, and "rr" represents the circuit (port). A single digit cabinet (1 - 9) may be entered with or without a leading zero (0). |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses HELP after entering "clear port," the following message will be displayed:

Enter 7 character port number

## Error Messages

If the port is not administered, the following error message will be displayed:

Port not marked

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

**Output**

---

If the clear port command is successful, the following message will be displayed on the SAT:

Command successfully completed

If the clear port command is unsuccessful, the following message will be displayed on the SAT:

Error encountered, cannot complete request

**Feature Interactions**

---

None.

**copy update-file**

---

This command provides a mechanism for copying a field update file from the active SPE to the standby SPE.

**Synopsis**

---

copy update-file *override*

**Permissions**

---

The following default logins may execute this command: inads and init.

**Examples**

---

copy update-file  
copy update-file override

## Description

In a Duplex system only, the copy update-file will copy a field update file from the active SPE to the standby SPE. This command is intended to permit the user to recover from situations whereby the standby SPE was not available when a field update ("patch") file was downloaded to the switch. All validation checks are made on the standby as it receives the file. If there is a newer, valid update file on the standby, the override option must be used to force the copy.

## Parameters

**override**      The override parameter allows the user to copy the update file from the active SPE to the standby SPE regardless of the dates.

## Help Messages

If the system technician presses HELP after entering "copy update-file" on a duplex SPE system the following message is displayed:

[ 'override' ]

## Error Messages

If the standby SPE contains a newer patch file than the active SPE and the override option was NOT used, the following message is displayed:

Active SPE's update file is older than standby's

If the vintage of the standby SPE doesn't match the vintage of the active SPE, the following message is displayed:

Update file vintage does not match standby SPE core vintage

If there is no update file on active processor, the following message is displayed:

No update file on tape

If the standby SPE is NOT in standby mode, the following message is displayed: is displayed:

Cannot access the standby SPE at this time

If the active SPE cannot establish a communication path to the standby SPE, the following message is displayed:

Could not establish netcon data call between SPE's

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If the update file is too large to fit on device, the following message is displayed:

Update file is too large to fit on device

If the checksum of the files is not correct, the following message is displayed:

Update file checksum failed

If the update is successful the following message is displayed:

Command completed successfully

## Output

---

None.

## Feature Interactions

---

The form displayed for the list configuration software-vintage command has been modified to reflect the changes imposed by the flash architecture. The "list configuration software" command should allow INADS to determine, with one query, the hardware configuration, software vintage and patch identifier.

There is no interaction with routine periodic or scheduled maintenance because patches are only applied on restarts before the system is in normal operation.

The flash checksum test acts as a backup check to make sure the entire field update file was applied correctly. It can fail because of a bad checksum update from a poorly constructed update file or because the patching operation has aborted. When the flash Checksum Test fails, a MAJOR on-board alarm is raised on the processor/memory circuit pack. Maintenance runs a data consistency test on a daily basis to check that copies of translations, announcements and software files are consistent across both processors in a High or Critical Reliability System. If the test detects a difference, a minor, off-board alarm is generated.

When checking the software, the test compares the memory resident software version and patch identifier. It also checks for the presence of a field update file and, if found, compares the old and new patch identifiers to make sure the same patch file id loaded on each processor. If the software or update files are inconsistent, the "list configuration software" command can be used to display the status of the patch file.

## **disable administered-connection**

---

This command stops periodic and scheduled maintenance from being performed on a single administered connection or all administered connections.

## Synopsis

disable administered-connection [ac number | all]

## Permissions

The following default logins may execute this command: inads, init, system technician, cust, rcust, mis.

## Examples

disable administered-connection all  
disable administered-connection 1  
disable administered-connection 128

## Description

The disable administered connection command inhibits scheduled and periodic testing from being performed on all or a single administered connection(s). This command stops the processing of in-line errors for all or the selected administered connection(s).

## Defaults

None.

## Parameters

- ac number      The number of the administered connection being disabled.
- all             If "all" is entered then all administered connections are disabled.

## Help Messages

If the user presses HELP after entering "disable administered-connection," the following message will be displayed:

Enter assigned administered connection number(1-128) or 'all'

## Error Messages

If the administered connection number entered is not "all" and is non numeric, the following message is displayed:

Identifier invalid

If the administered connection number entered is not within the valid range of connections, the following message is displayed:

Entry out of range

If the connection number entered is not administered, the following message is displayed:

Identifier not assigned

If the administered connection number entered is already disabled, the following message is displayed:

Administered connection already disabled

If the software data cannot be sent to the SAT, the following message will be displayed:

Error encountered, can't complete request

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

Output

After the user has entered the command and the command is successful, the following message appears at the bottom of the screen:

Command successfully completed

Feature Interactions

None.

disable mst

This command will allow the user to disable the mst.

Synopsis

disable mst

Permissions

The following default logins may execute this command: inads, init.

## Examples

---

**disable mst**

## Description

---

The disable mst command will disable the message trace. If the trace was not already disabled for some other reason, a GAP marker will be inserted into the trace. The contents are then frozen, and can be viewed via the "list mst" command.

The command should be executed when done using the trace facility. If left enabled, the trace will continue to use CPU time until the run time limit expires.

Executing a disable mst command when the trace is already disabled will have no effect, and will indicate that it worked.

## Defaults

None.

## Parameters

None.

## Help Messages

If the user presses HELP after entering "disable mst," the following message displays:

Entry is not required

## Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

## Output

---

After the user has entered the command the following message appears at the bottom of the screen:

Command successfully completed

### Feature Interactions

None.

## disable suspend-alm-orig

This command disables one or more active Suspend Alarm Origination entries.

### Synopsis

disable suspend-alm-orig (board location).

### Examples

disable suspend-alm-orig 1C03  
disable suspend-alm-orig 1E07

### Description

This command disables one or more active Suspend Alarm Origination entries from the Suspend Alarm Origination table. This command disables all entries (boards and ports) matching the specified physical board location.

**NOTE:**

A port entry cannot be disabled with this command. Allowing for different ways to disable one or more entries greatly increases the complexity of updating and displaying the Suspend Alarm Origination table.

### Defaults

None.

### Parameter

|                |                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| board location | This parameter specifies the physical board location of the hardware component that has been replaced or corrected. A port location is not supported because of it complexities. |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Help Messages

N is the maximum number of cabinets in the switch:

```
Enter board location:[cabinet(1-N)];  
carrier(A-E);slot(0-20)
```

## Output

---

- The command returns one of the following messages:
1. If the board specifier is not valid:

Board invalid
  2. If no entries can be disabled in the Suspend Alarm Origination table:

Entry not found; no entries disabled

## Feature Interactions

---

None.

## disable synchronization-switch

---

This command disables automatic clock switching.

## Synopsis

---

disable synchronization-switch

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

disable synchronization-switch

## Description

---

The disable synchronization command stops the automatic clock switching capability of the maintenance subsystem. Clock refers to the oscillator on a tone/clock or DS1 interface.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

**Defaults**

No defaults.

**Parameters**

None.

**Help Messages**

If the system technician presses help after entering "disable synchronization" the following message will be displayed:

Entry is not required

**Error Messages**

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

**Output**

---

If the disable synchronization command is successful, the following message will be displayed on the SAT:

Command successfully completed

If the disable synchronization command is unsuccessful, the following message will be displayed on the SAT:

Error encountered, can't complete request

If the disable command is run and synchronization is currently disabled, the following message will be displayed on the SAT:

Synchronization-switch already disabled

**Feature Interactions**

---

None.

# disable test-number

This command stops a specified test number from being performed during demand and periodic or scheduled maintenance.

## Synopsis

disable test-number number [ print | schedule ]

## Permissions

The following default logins may execute this command: inads, init.

## Examples

disable test-number 710  
disable test-number 710 print  
disable test-number 510 schedule

## Description

The disable test-number command makes the user specified test number unavailable for any maintenance testing. An enable test-number must be issued to make the test number available.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| number   | The number of the test that is to be maintenance disabled.                                                                                                                                                                                                                                                                                                                                                                                                |
| print    | If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.                                                                                                                                                                                                                                                                                            |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

## Help Messages

If the system technician presses HELP after entering "disable test-number," the following message will be displayed:

Enter test number

### Error Messages

If the test-number entered is not a valid system test number, the following error message will be displayed:

Test number invalid

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

### Output

---

If the disable test-number command is successful, the following message is displayed:

Command successfully completed

If the disable test-number command is unsuccessful, the following message is displayed:

Error encountered, can't complete request

### Feature Interactions

---

None.

### display alarms

---

This command will display an options form which allows the technician to choose which alarms are to be displayed.

### Synopsis

---

display alarms [ print | schedule ]

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

## Examples

---

**display alarms**  
**display alarms print**  
**display alarms schedule**

## Description

---

The display alarms command brings up a hardware alarm report. This screen allows the technician various different options to select which alarms will be displayed on the alarm report. There are no parameters entered on the command line, parameters are selected on the hardware alarm report form instead.

An alarm can occur for any hardware object when it has been determined by the maintenance subsystem that a problem definitely exists. The impact of the problem is indicated by the alarm type:

Warning alarm—A problem which has been deemed important enough to log, or may be external to the system, but not severe enough to cause a noticeable degradation of service.

Minor alarm—A problem which could disable a local area of the system and so noticeably degrade the system.

Major alarm—A problem which widely degrades the system and seriously impairs service. This would cause a call to be placed to INADS.

A resolved alarm is a problem which has been corrected, and the alarmed component of the system is functioning correctly again. The alarm will be stamped with a resolved date and time, indicating that it is no longer a concern (any errors associated with the alarms will also be considered "resolved").

## System Reboots and the Error and Alarm Logs

The system attempts to save the error and alarm logs to the memory card, on the *active* SPE when any of the following events take place:

- The **save translation** command is executed.
- Translations are saved as part of scheduled maintenance (as administered on the maintenance-related system parameters form).
- A demand or software-escalated system reboot takes place.
- The PPN is about to lose all power after having been on battery backup.

Conditions such as unavailability of the MSS can prevent this attempt from succeeding.

Whenever the system reboots, the error log is restored from the disk on the SPE that becomes active with the reboot. Since the logs are saved to the disk on the SPE that was active before the reboot, the versions restored at reboot time may not be current. This occurs when either:

- The attempt to save at reboot did not succeed.
- The SPE that is active coming out of the reboot is not the same one to which the logs were last saved.

In such a case, the logs will not show the errors and alarms that have been logged since the last time a save was made to the SPE that became active with the reboot. When looking at errors that precede the last reboot, look for indications preceding the reboot to determine whether the logs restored at reboot are complete.

System resets less severe than a reboot rarely affect the error and alarm logs.

### NOTE:

If there are SYSTEM errors in the Error Log, use **display initcauses** to obtain additional information. Information that could not be logged during a system reset may be found here.

## Defaults

All alarms will be displayed.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| print    | This will cause the report to be printed if a printer is linked to the SAT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [4] for more details.<br><br>There are no parameters entered on the command line, parameters are selected on the hardware alarm report form instead. |

## Backward Paging of the Alarm/Error Log

The user can display the next and previous pages of the alarm/error log. When the user executes the **display alarm/error** command to view the alarm/error log. If more than one page of alarms/errors is stored by the system, the user may use the NEXT PAGE key or the PREV PAGE key (513 or 715 terminals only use F8 or F7 for all other terminals) to toggle between pages (up to a maximum of two pages). If the system has stored one or less than one page of alarms/errors the command will display the alarms/errors and echo *Command successfully completed* and exit. Help messages/Key actions:

*Next Page*—The command will display the next page. If the user is not viewing the first page of alarms/errors, is not viewing a page as a result of depressing the *Prev Page* key, and there are more entries to display, the help message will be:

*press CANCEL to abort, NEXT PAGE to complete, or PREV PAGE for previous page.*

*Prev Page*—Press previous page key to return to the previous page. The system will display the help message:

*press CANCEL to abort or NEXT PAGE for next page* If the user is not viewing the first page of alarms/errors, is not currently viewing a page as a result of pressing the *prev Page* key, and there are no remaining entries to display, the help message will be:

*press CANCEL to abort, NEXT PAGE to complete, or PREV PAGE for previous page.*

## Help Messages

If the technician presses HELP after entering "display alarms" the following message will be displayed:

[ 'print' or 'schedule' ]

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

FORM INPUT

---

After entering the command "display alarms," the system technician will be presented with an options form.

|             |                                                                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alarm Types | The type of alarm to be displayed is specified by placing a 'y' or 'n' in the alarm type fields. The technician can choose a combination of active alarms, major, minor, warning, or resolved alarms. |
| Interval    | Display alarm records for the last (m)onth, last (h)our, last (d)ay, last (w)EEK, or (a)ll. The default is all.                                                                                       |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| From           | Display alarm records from the time specified by mm/dd/hh/mm, where mm is the month, dd is the day, hh is the hour and mm is the minute. If no "from" date is entered, then no checking is done. This will give the user all the alarms active since a month prior to the current time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| To             | Display alarm record to the time specified by mm/dd/hh/mm, where mm is the month, dd is the day, hh is the hour and mm is the minute. If no "to" date is entered, any alarm which is active after the from date will be selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Equipment Type | <p>The technician can choose between seven different equipment types. If there is no input to any of these fields, the system will default to all the equipment. The user can select one of the following fields:</p> <ul style="list-style-type: none"><li>■ Cabinet: This allows the technician to display all alarms associated with a particular cabinet. Alarms for a cabinet are referenced by a number ranging from 1 to 3 which is assigned during cabinet administration.</li><li>■ Port Network: This allows the technician to display all alarms associated with a particular port network. Alarms for a port network are referenced by a number ranging from 1 to 3.</li><li>■ Board Number: This allows the technician to choose all alarms associated with a particular circuit pack for display. Alarms for a (cabinet-carrier-slot). If the cabinet number is omitted, the system will default to 1.</li><li>■ Port: This allows the technician to choose all alarms associated with a particular port on a circuit pack for display. Alarms for a port circuit are referenced by port location (cabinet-carrier-slot-circuit). If the cabinet number is omitted, the system will default to 1.</li><li>■ Category: Alarms for a particular equipment category.</li><li>■ Extension: Alarms associated with an extension number.</li><li>■ Trunk (group/member): The technician can choose to view all alarms associated with a particular trunk group or trunk group member. The group identifier should be entered to view all alarms associated with a trunk group XXX/__. The group identifier and member identifier should both be entered to view all alarms associated with a specific trunk group member XXX/XXX.</li></ul> |

ALARM REPORTS

The following options control which alarms will be displayed.

ALARM TYPES

Active? y\_ Resolved? n\_  
Major? y\_ Minor? y\_ Warning? y\_

REPORT PERIOD

Interval: m\_ From: \_\_/\_\_/\_\_:\_\_ To: \_\_/\_\_/\_\_:\_\_

EQUIPMENT TYPE ( Choose only one, if any, of the following )

Cabinet: \_\_\_\_  
Port Network: \_\_\_\_  
Board Number: \_\_\_\_  
Port: \_\_\_\_  
Category: \_\_\_\_  
Extension: \_\_\_\_  
Trunk ( group/member ) : \_\_/\_\_\_\_

Field Help

Following are the help messages that the system technician will see upon tabbing to the specified field and pressing the HELP key.

- Active?"n(o) y(es)"
- Resolved?"n(o) y(es)"
- Major?"n(o) y(es)"
- Minor?"n(o) y(es)"
- Warning?"n(o) y(es)"
- Interval:The interval field help is a list of objects. This list includes m(onth), h(our), d(ay), w(eek), a(ll).  
"From (month) "Enter month between 1-12"
- From (day)"Enter day between 0-31"
- From (hour)"Enter hour between 0-23"
- From (minute)"Enter minute between 0-59"
- To (month)"Enter month between 1-12"
- To (day)"Enter day between 0-31"
- To (hour)"Enter hour between 0-23"
- To (minute)"Enter minute between 0-59"
- Cabinet:"Enter cabinet number (1-3)"
- Port Network:"Enter port network number (1-3)"
- Board Number:"Enter 5 character board number;  
cabinet(01-3):carrier(A-E):slot(00-20)"

- Port: "Enter port number;  
[cabinet(1-3)]:carrier(A-E):slot(0-20):circuit(01-31)"
- Category: The category field help is a list of objects. This list includes the following: adm-conn, announce, bri/asai, card-mem, cdr, data-mod, detector, dup-spe, environ, exp-intf, ext-dev, generatr, inads-link, infc, maint, mbus, memory, misc, mnt-test, modem, netcon, pkt, pkt-ctrl pms/jrnl, procr, quick-st s-syn, stabd, stacrk, stations, sys-prnt, tape, tdm, tone, trkbd, trkcrk, trunk, wideband. For a table describing the category entries in greater detail, see the ["display errors"](#) command.
- Extension: "Enter assigned extension"
- Trunk (group) "Enter group number between 1-99"

Field Error Messages

Following are the error messages that will be displayed on the screen. The messages are displayed when the system technician tabs out of a field and the validation routines are executed. In the following messages, an "x" represents the character that was entered by the user.

- Active? ""x" is an invalid entry; please press HELP"
- Resolved? ""x" is an invalid entry; please press HELP"
- Major? ""x" is an invalid entry; please press HELP"
- Minor? ""x" is an invalid entry; please press HELP"
- Warning? ""x" is an invalid entry; please press HELP"
- Interval: ""x" is an invalid entry; please press HELP"
- From (month) "Entry must be all digits"
- From (day) "Entry must be all digits"
- From (hour) "Entry must be all digits"
- From (minute) "Entry must be all digits"
- To (month) "Entry must be all digits"
- To (day) "Entry must be all digits"
- To (hour) "Entry must be all digits"
- To (minute) "Entry must be all digits"
- Cabinet: "Entry invalid"
- Port Network: "Entry invalid"
- Board Number: "Board invalid"

**FORM Output**

---

After valid options are entered by the technician, an alarm report is displayed. The data displayed on this form will be:

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The location of the alarmed object. For installed circuit packs, the location is displayed as "cabinet-carrier-[slot]-[circuit]." For Port Network-related objects, the location is displayed as "PN UUB," where "UU" is the Port Network number and B is the bus (A or B). For Fiber Link-related objects, the location is displayed as "x a-PNC" where "x" is the Fiber Link number and "a" is the PNC side (A or B). This is the same identifier as used by the alarm log. |
| Maintenance Name | The logical name of the maintenance object which has been alarmed.                                                                                                                                                                                                                                                                                                                                                                                                            |
| On Brd           | Whether the fault detected is on the associated circuit pack, or an off board element connected to the circuit pack.                                                                                                                                                                                                                                                                                                                                                          |
| Alt Name         | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.                                                                                                                       |
| Alarm Type       | "MAJOR," "MINOR," or "WARNING." This is an indicator to the seriousness of the alarm raised.                                                                                                                                                                                                                                                                                                                                                                                  |
| Service State    | "RDY" (ready for service), "OUT" (out of service), or "IN" (in service). This is the current service state of the station and trunk ports shown. If a blank is displayed in this field it means that no service state is associated with the MO.                                                                                                                                                                                                                              |

Ack?

The columns under the "1" and "2" headings denote if the alarm has been acknowledged by the first and second OSS telephone numbers, respectively. A "y" in this field means that the alarm has been acknowledged. A "n" means that the alarm has not been acknowledged. A "c" means that the alarm resolved and cleared and the alarm notification was acknowledged. A blank means that there will be no attempt to report the alarm.

Date Alarmed

Day, hour, and minute of alarm.

Date Resolved

Day, hour, and minute of resolution. For active alarms this field will be zero (0).

For the following output example, the ENTER key was pressed immediately after entering the display alarms command.

display alarms

ALARM REPORT

| Port    | Maintenance Name | On Brd? | Alt Name | Alarm Type | Svc State | Ack? 1 2 | Date Alarmed | Date Resolved |

Command successfully completed

Feature Interactions

If the alarm origination is disabled via "change system-parameters maintenance," the "Ack?" field displays blanks no matter what the true acknowledge state is for the alarm.

# display cabinet

display cabinet UU [print | schedule]

The display cabinet command displays the port network number, type, layout, room, floor, building, and carriers for the specified cabinet.Output

## CABINET Description

|                         |                                                                          |
|-------------------------|--------------------------------------------------------------------------|
| Cabinet                 | The administered number of the cabinet.                                  |
| Cabinet Layout          | Type of cabinet (five-carrier or single-carrier-stack).                  |
| Cabinet Type            | The type of port network housed in the cabinet (processor or expansion). |
| Number of Port networks | The number of port networks in the cabinet (1 or 2).                     |
| Room                    | Room where cabinet is located, if administered on the cabinet form.      |
| Floor                   | Floor where cabinet is located, if administered on the cabinet form.     |
| Building                | Building where cabinet is located, if administered on the cabinet form.  |

## CARRIER Description

|              |                                                             |
|--------------|-------------------------------------------------------------|
| Carrier      | Letter designation of the carrier.                          |
| Carrier Type | Port, processor, switch-node, fan or not-used.              |
| Number       | The administered port network number or switch node number. |

The following display shows a typical result when **display cabinet 1** is entered.

```
display cabinet 1

                                CABINET

```

## display communication-interface

---

**display communication-interface**  
**hop-channels | links | processor-channels**  
**[print | schedule]**

The **display communication-interface** command displays three different forms depending on the object specified by the user. See also **status link** for more details.

The **hop-channels** object displays translation data for hop channels. A hop channel is a bi-directional network channel between two interface links for DCS message hopping. A hop channel is used to tandem DCS messages from one interface link to another interface link.

The **processor-channels** object displays translation information for each of the local processor channels. A processor channel is one several data streams which are multiplexed by the X.25 protocol onto a single data link. The system has 128 total processor channels; up to 64 can be assigned to a single link.

The **links** object displays translation information for each communication interface link. A link is an electronic communication channel transmitted over the Packet Bus for carrying packet-switched data. There are 16 links which terminate at one end on the Packet Interface circuit pack in the SPE. At the physical and link layers, the link terminates at the other end on a port on the PBX's switching matrix. At a higher level, the link continues over a transmission facility to another endpoint, such as a DCS node or AUDIX. The link carries application messages between the SPE and other switches or adjuncts.

### Output for Hop-channels qualifier

|                |                                                                                                                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link/Channel A | Identifies the first of the two link/channels joined by the hop channel. Links range from 1 to 16, channels from 1 to 64. The link/channel must not be assigned to a local processor channel, and the link must not be assigned to a PRI local processor channel.       |
| Link/Channel B | Identifies the second of the two link/channels joined by the hop channel. Links range from 1 to 16, channels from 1 to 64. The link/channel pair must not be assigned to a local processor channel, and the link must not be assigned to a PRI local processor channel. |

The number of the local processor channel used to hop the interface link channels is not shown. The following display shows a typical result when **display comm hop** is entered.

display communication-interface hop-channelsPage 1 of 4

HOP CHANNEL ASSIGNMENT

| Link/Channel A | Link/Channel B | Link/Channel A | Link/Channel B |
|----------------|----------------|----------------|----------------|
| 31             | 412            |                |                |

### Output for Links Object

|                    |                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link               | The physical link number.                                                                                                                                                                                                  |
| Enabled            | "Yes" indicates the link is enabled for normal operation. "No," the default, indicates that message flow over the link is suppressed. The link can only be enabled if the corresponding data module has been administered. |
| X.25 Extension     | The extension of the TN577 Packet Gateway port through which the link is routed.                                                                                                                                           |
| Destination Number | "External" indicates the link goes to equipment connected locally to an external port on a Packet Gateway circuit pack. Such ports must show a "y" in the Establish Connection field.                                      |

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Establish Connection  | This field indicates whether the local switch is responsible for any part of call set-up with the far-end data module. If the physical link is through a pair of data modules, each switch terminating the link must set up a connection to its PDM/TDM. If the physical link is over a DS-1 interface, it is possible for one switch to set up the entire connection without any initiation by the other end. However, ISDN signaling links must be set to "y" at both ends of the interface. |
| Connected Data Module | The extension of a PDM/MPDM directly connected to a PGATE port cable or to a cable to an adjunct in an administered connection arrangement.                                                                                                                                                                                                                                                                                                                                                    |
| Identification        | This field records the type and identification number of the machine connected to this link. This field is for informational purposes only.                                                                                                                                                                                                                                                                                                                                                    |

|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proc Chan      | The Processor Channel denotes one of the processor channels on the processor link. With this link/logical channel pair and the one specified in the interface link and interface channel field, a network channel to a remote machine is specified. The valid range for link is 1 to 16, specifying one of the 16 interface links. Each interface link corresponds to a port on a PGATE board. The Processor channel is not administrable. |
| Application    | This field specifies the type of application that connects to this processor channel. The following lists the valid entries:                                                                                                                                                                                                                                                                                                               |
| Interface Link | The interface link to which the processor channel is connected.                                                                                                                                                                                                                                                                                                                                                                            |
| Interface Chan | The channel on the interface link to which the processor channel is connected.                                                                                                                                                                                                                                                                                                                                                             |
| Local Port     | The switch application port used by the local session.                                                                                                                                                                                                                                                                                                                                                                                     |
| Remote Port    | The application port used by the remote session.                                                                                                                                                                                                                                                                                                                                                                                           |
| Adjunct Name   | The name of the adjunct connected to this processor channel. These are defined in the Adjunct Name Form. Only AUDIX and MSA channels (AUDIX, MSAAMWL, MSAHLWC, MSALLWC, and MSAMCS) require entries in this field.                                                                                                                                                                                                                         |
| Machine-ID     | This is the network machine ID for the remote machine. Machine IDs are required only for the AUDIX adjunct and DCS connections.                                                                                                                                                                                                                                                                                                            |

The following display shows a typical result for **display comm proc**.

display communication-interface processor-channels

## display disabled-tests

**display disabled-tests [print | schedule]**

The display disabled-tests command displays the numbers off all maintenance tests that have been disabled by INADS. These tests will not be available for background or demand testing.

### Output

Test Number    The numbers of the disabled tests

The following display shows a typical result when **display disabled-tests** is entered.

```
display disabled-tests                                SPE A

                                     DISABLED TEST INFORMATION

Test Number

710

Command successfully completed
```

## display errors

This command will display an options form that allows the technician to choose which errors are to be displayed.

### Synopsis

display errors *high-resolution [ print | schedule ]*

### Permissions

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

## Examples

---

**display errors**  
**display errors print**  
**display errors schedule**  
**display errors high-resolution print**

## Description

---

The **display errors** command brings up an error report. This screen allows the technician various different options to select which errors will be displayed on the hardware error report. There are no query parameters entered on the command line. Those type of parameters are selected on the error report form instead.

Errors can result from in-line firmware errors, periodic tests, failures detected while executing a test command, software inconsistency, or a data audit discrepancy.

## System Reboots and the Error and Alarm Logs

The system attempts to save the error and alarm logs to the memory card, on the *active* SPE when any of the following events take place:

- The **save translation** command is executed.
- Translations are saved as part of scheduled maintenance (as administered on the maintenance-related system parameters form).
- A demand or software-escalated system reboot takes place.
- The PPN is about to lose all power after having been on battery backup.

Conditions such as unavailability of the MSS can prevent this attempt from succeeding.

Whenever the system reboots, the error log is restored from the disk on the SPE that becomes active with the reboot. Since the logs are saved to the disk on the SPE that was active before the reboot, the versions restored at reboot time may not be current. This occurs when either:

- The attempt to save at reboot did not succeed.
- The SPE that is active coming out of the reboot is not the same one to which the logs were last saved.

In such a case, the logs will not show the errors and alarms that have been logged since the last time a save was made to the SPE that became active with the reboot. When looking at errors that precede the last reboot, look for indications preceding the reboot to determine whether the logs restored at reboot are complete.

System resets less severe than a reboot rarely affect the error and alarm logs.

 **NOTE:**  
If there are SYSTEM errors in the Error Log, use **display initcauses** to obtain additional information. Information that could not be logged during a system reset may be found here.

**Defaults**

All errors will be displayed.

**Parameters**

- high-resolution
- This option specifies that the error report should be displayed with high resolution time stamps for the first occurrence and last occurrence of the error. This high resolution time stamp includes seconds and a sequence count within a second. The sequence count starts over for each second.
- print
- This will cause the report to be printed if a printer is linked to the SAT.
- schedule
- When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

**Backward Paging of the Alarm/Error Log**

The user can display the next and previous pages of the alarm/error log. When the user executes the **display alarm/error** command to view the alarm/error log. If more than one page of alarms/errors is stored by the system, the user may use the NEXT PAGE key or the PREV KEY key (513 or 715 terminals only use F8 or F7 for all other terminals) to toggle between pages (up to a maximum of two pages). If the system has stored one or less than one page of alarms/errors the command will display the alarms/errors and echo *Command successfully completed* and exit. Help messages/Key actions:

*Next Page*—The command will display the next page. If the user is not viewing the first page of alarms/errors, is not viewing a page as a result of depressing the PREV PAGE key, and there are more entries to display, the help message will be:

*press CANCEL to abort, NEXT PAGE to complete, or PREV PAGE for previous page.*

*Prev Page*—Press previous page key to return to the previous page. The system will display the help message:

*press CANCEL to abort or NEXT PAGE for next page* If the user is not viewing the first page of alarms/errors, is not currently viewing a page as a result of pressing the PREV PAGE key, and there are no remaining entries to display, the help message will be:

*press CANCEL to abort, NEXT PAGE to complete, or PREV PAGE for previous page.*

Help Messages

If the technician presses HELP after entering "display errors" the following message will be displayed:

`['high-resolution'], ['print' or 'schedule']`

Error Messages

If the software data cannot be sent to the SAT, the following message will be displayed:

`Error encountered, can't complete request`

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

`Command resources busy; Press CANCEL to clear, and then resubmit`

If all of the available maintenance resources are currently in use, then the following message will be displayed:

`All maintenance resources busy; try again later`

FORM INPUT

After entering the command "display errors," the system technician will be presented with an options form.

|               |                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error Type    | The type of error to be displayed is specified by choosing an error type. This field defaults to display all errors.                                                                                                                                                     |
| Error List    | The user may select which error list the error entries will be selected from by entering 'active-alarms', 'errors', or 'cleared-errors'. This field defaults to the 'active-alarms' error list. The error list selected will affect the Report Title on the output form. |
| Report Period | The technician can specify a starting and stopping time from which errors should be reported.                                                                                                                                                                            |
| Interval      | Display only error records for the last hour, last day, last week or all. The default is the last day.                                                                                                                                                                   |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| From           | Display only error records from the time specified by dd/hh/mm, where dd is the day, hh is the hour and mm is the minute. The default is the earliest time of the existing error records in the log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| To             | Display only error records to the time specified by dd/hh/mm, where dd is the day, hh is the hour and mm is the minute. The default is the current time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Equipment Type | <p>The technician can choose between seven different equipment types:</p> <p>Cabinet: This allows the technician to display all errors associated with a particular cabinet. Errors for a cabinet are referenced by a number ranging from 1 to 3 which is assigned during cabinet administration.</p> <p>Port Network Number: This allows the technician to display all errors associated with a particular port network number. Errors for a port network are referenced by a number ranging from 1 to 3.</p> <p>Board Number: This allows the technician to choose all errors associated with a particular circuit pack for display. Errors for a circuit pack are referenced by circuit pack location (cabinet-carrier-slot).</p> <p>Port: This allows the technician to choose all errors associated with a particular port on a circuit pack for display. Errors for a port circuit are referenced by port location (cabinet-carrier-slot-circuit).</p> <p>Category: Errors for a particular equipment category.</p> <p>Extension: Errors associated with an extension number.</p> <p>Trunk (group/member): The technician can choose to view all errors associated with a particular trunk group or trunk group member. The group identifier should be entered to view all errors associated with a trunk group XXX/__. The group identifier and member identifier should both be entered to view all errors associated with a specific trunk group member XXX/XXX.</p> |

ERROR REPORT

The following options control which errors will be displayed.

ERROR TYPES

Error Type: \_\_\_\_\_ Error List: active-alarms

REPORT PERIOD

Interval: \_ From: \_\_/\_\_/\_\_:\_\_ To: \_\_/\_\_/\_\_:\_\_

EQUIPMENT TYPE ( Choose only one, if any, of the following )

Cabinet: \_\_\_\_\_

Port Network: \_\_\_\_\_

Board Number: \_\_\_\_\_

Port: \_\_\_\_\_

Category: \_\_\_\_\_

Extension: \_\_\_\_\_

Trunk ( group/member ): \_\_\_\_/\_\_\_\_

Field Help

Following are the help messages that the system technician will see upon tabbing to the specified field and pressing the HELP key.

- Error Type: "Enter error type"
- Error List: The Error List field help provides the following help list: active-alarms, errors, cleared-errors.
- Interval: The interval field help provides the following help list: h(our), d(ay), w(eek), m(onth), a(ll).
- From (month) "Enter month between 1-12"
- From (day) "Enter day between 0-31"
- From (hour) "Enter hour between 0-23"
- From (minute) "Enter minute between 0-59"
- To (month) "Enter month between 1-12"
- To (day) "Enter day between 0-31"
- To (hour) "Enter hour between 0-23"
- To (minute) "Enter minute between 0-59"
- Cabinet: "Enter cabinet number (1-3)"
- Port Network: "Enter port network number (1-3)"

Board Number: "Enter 5 character board number; cabinet(1-3):carrier(A-E):slot(0-20)"

Port: "Enter port number; [cabinet(1-3)]:carrier(A-E):slot(0-20):circuit(01-31)"

Category: The category field help is a list of objects. This list includes the following: adm-conn, announce, bri/asai, cdr, data-mod, detector, dup-spe, environ, exp-intf, ext-dev, generatr, inads-link, infc, maint, mbus, memory, misc, mnt-test, modem, netcon, pkt, pkt-ctrl pms/jrnl, procr, quick-st s-syn, stabd, stacrk, stations, sys-prnt, tape, tdm, tone, trkbd, trckrk, trunks. This list pertains only to help messages.

| Category   | Maintenance Objects                                                                                                                                             |

- Extension: "Enter assigned extension"
- Trunk (group) "Enter group number between 1-99"
- Trunk (member) "Enter group member between 1-99, or blank"

Field Error Messages

Following are the error messages that will be displayed on the screen. The messages are displayed when the system technician tabs out of a field and the validation routines are executed. In the following messages, an "x" or "xxxxxxx" represents the characters that were entered by the user.

- Interval: ""x" is an invalid entry; please press HELP key"
- Error Type: "Entry must be all digits"
- From (month) "Entry must be all digits"
- From (day) "Entry must be all digits"
- From (hour) "Entry must be all digits"
- From (minute) "Entry must be all digits"
- To (month) "Entry must be all digits"
- To (day) "Entry must be all digits"
- To (hour) "Entry must be all digits"
- To (minute) "Entry must be all digits"
- Cabinet "Cabinet invalid"
- Port Network Number: "Port Network invalid"
- Board Number: "Board invalid"
- Port: "Port invalid"
- Category: ""xxxxxxx" is an invalid entry; please press HELP"
- Extension: "Entry must be all digits"
- Trunk (group) "Entry must be all digits"
- Trunk (member) "Entry must be all digits"

FORM Output

---

After valid options are entered by the technician, a hardware error report is displayed. The data displayed on this form will be:

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The location of the maintenance object. For installed circuit packs, the location is displayed as "cabinet-carrier-[slot]-[circuit]." For Port Network-related objects, the location is displayed as "PN xx," where "xx" is the Port Network number.                                                                                                                                                                                                                                                                                                                          |
| Maintenance Name | The logical name of the maintenance object which has had an error logged against it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Alt Name         | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xx when the object is a private CO line, where xx is the private CO line group number.                                                                                                                                                                                                                         |
| Error Type       | A code identifying the type of problem encountered for this maintenance object. Because the error code is generally specific to the individual maintenance object and the total number of error codes may be extensive, only the error number is displayed. The technician must use this error number in conjunction with the logical name information to determine the exact nature of the error.                                                                                                                                                                            |
| Aux Data         | Additional information concerning the maintenance object error condition which may be useful to the technician. Like the error type, this data will be specific to the maintenance object type. However, unlike the error code, only the most recent value of the auxiliary data will be retained for each error record.                                                                                                                                                                                                                                                      |
| First Occur      | The month, day, hour, and minute (and second if the high-resolution command line option is used) that the error was first recorded.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Seq Cnt          | Sequence Count - This number indicates the order of errors logged within a second for the time stamps associated with the first occurrence and last occurrence of an error. This information is displayed only if the "high-resolution" command line option is entered. There may be gaps for the sequence numbers within a given second since the last occurrence of an error may replace an existing entry that had been assigned the missing sequence number, and since sequence counts are also used with software event information not shown in the hardware error log. |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Occur | The month, day, hour, and minute (and second if the high-resolution command line option is used) of the most recent error. Note: if the system is unable to retrieve the time of day when the error occurred, a 'dummy' date will be stamped in the log so as to distinguish it from reliable data. It would appear as "00/00/01:07".                                                                                                                                                                                                                   |
| Err Cnt    | Error Count - The total number of times that the error type has occurred for this maintenance object. Should this field exceed the display space allowed on the terminal screen (three characters), the numbers will be replaced by '256' This should inform the technician that a larger number was encountered, but could not be displayed correctly.                                                                                                                                                                                                 |
| Err Rt     | Error Rate - The average rate at which the errors have occurred from the first occurrence to the present. Should this field exceed the display space allowed on the terminal screen (three characters), the numbers will be replaced by '256' This should inform the technician that a larger number was encountered, but could not be displayed correctly.                                                                                                                                                                                             |
| Rt/Hr      | Rate per Hour - An approximation of the rate that this error occurred in the last hour. Should this field exceed the display space allowed on the terminal screen (three characters), the numbers will be replaced by '256' This should inform the technician that a larger number was encountered, but could not be displayed correctly.                                                                                                                                                                                                               |
| Al St      | <p>Alarm Status - A character indicating the status of this MO in the error and alarm logs. The allowed values are:</p> <ul style="list-style-type: none"><li>■ a — Active alarm entry</li><li>■ r — Resolved alarm entry</li><li>■ c — Resolved alarm entry as a result of the long "clear" option of the test command.</li><li>■ s — Resolved alarm entry as a result of a software requested (non-demand) system restart.</li><li>■ t — Resolved alarm entry as a result of a technician requested system restart.</li></ul> <p>n — Not alarmed.</p> |
| Ac         | Active? - A flag indicating whether or not the maintenance object is still under active consideration by the maintenance subsystem. If set to 'no', maintenance no longer considers that this error report indicates a problem.                                                                                                                                                                                                                                                                                                                         |

Example of Error Log Display without the High-Resolution Command Line Option

For the following output example, the Enter key was pressed immediately after entering the display errors command without the "high-resolution" command line option. Only those errors associated with alarms display since the "Error List" field on the options form defaults to 'active\_alarms'.

None.

display events

display events [print]

A vector event is the occurrence of something unexpected during a vector-routed call due to resource exhaustion or faulty vector programming. (For example, route-step failures are typically due to the programming of an invalid extension.) These types of failures are not due to faulty hardware or system software error and do not constitute incorrect feature operation. This command allows you to diagnose and correct vectoring problems due to the above-mentioned causes. See *DEFINITY Communications System Generic 3 Call Vectoring and Expert Agent Selection (EAS) Guide*, 555-230-520, for information on how to interpret this report.

Input Form

The following entry form is displayed to allow limiting the report to events of a certain type or from a certain time period. Enter the desired parameters and press ENTER.

|                 |                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category        | “Vector” specifies the type of event report to display and is the only valid entry.                                                                                                                                                         |
| Report Period   | The fields in this section allow you to view only those vector events that occurred within a specific time period. If these are left blank, all vector events recorded are displayed.                                                       |
| Interval:       | This field specifies a display of all events within the last time period of the type Enter the first letter of one of the following selections: all, month, day, hour, minute.                                                              |
| Start/Stop Time | The starting and ending times, in 24-hour notation, of the interval to be reported.                                                                                                                                                         |
| Vector Number   | The number of the vector (1-256) for which events will be reported. If this field is left blank, events for all vectors will be reported.                                                                                                   |
| Event Type      | Specific types of vector events are associated with numbers from 50000 to 50999. Entering one of these numbers will limit the report to events of this type. If this field is left blank, events for all types of vectors will be reported. |

## Output

See *DEFINITY Communications System Generic 3 Call Vectoring and Expert Agent Selection (EAS) Guide*, 555-230-520, for more information on how to interpret this report. In particular, the Event Data 2 field will be associated with possible causes and repair strategies for the event.

|                   |                                                                                                                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event Type        | A number from 50000 to 50999 that identifies what type of vector event occurred.                                                                                                                                                |
| Event Description | A text string describing the event.                                                                                                                                                                                             |
| Event Data 1      | If in the format <i>number/number</i> such as “200/10”, this indicates the vector number and step number associated with the event. If in the format “Split <i>number</i> ” such as “Split 2”, this indicates the split number. |
| Event Data 2      | Additional data concerning the event encoded as a hex number.                                                                                                                                                                   |
| First Occur       | The date and time when the vector event first occurred.                                                                                                                                                                         |
| Last Occur        | The date and time when the vector event last occurred.                                                                                                                                                                          |
| Evnt Cnt          | The total number of times, up to 255, that vector events of this type have occurred.                                                                                                                                            |

## display initcauses

This command records and displays a history of restarts performed by the system.

### Synopsis

display initcauses [ print | schedule ]

### Permissions

The following default logins may execute this command: system technician, inads, init, nms.

### Examples

display initcauses  
display initcauses print  
display initcauses schedule

### Description

The display initcauses command displays a history of recovery steps taken by the system. *This command displays information for restarts of the active processor only.* Each time the system performs some type of recovery (due to user request or a hardware or software problem), the recovery information is stored. The software error log also contains information pertaining to restarts. If a reset 4 (reboot) occurs, the software error log will also be stored on tape. Information in the software error log should be used in conjunction with information in the initcauses log.

**8** Maintenance Commands and Trouble-Clearing Aids  
*display initcauses*

Page 8-127

The history of the last 16 restarts performed by the system will be recorded to the initcauses buffer in chronological order. This buffer will fill an entire screen with information if it is completely full. Power failures in the processor complex wipe out the entire initcauses buffer which is stored by the software. In duplex systems, both processors have to lose power before the information will be lost.

## Defaults

No defaults.

## Parameters

**print** This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "display initcauses" the following message will be displayed:

```
['print' or 'schedule']
```

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

---

Cause                      The cause field indicates the reason for the restart.

- **Active Down:** (high or critical reliability system only) The Active SPE went into SPE Down mode. The Duplication Interface initiated an SPE-interchange to the Standby SPE. If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a high or critical reliability system does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Bad Handshake:** (High or Critical Reliability system only) The Duplication Interface received inconsistent handshakes from the Active SPE. Thus, the Duplication Interface initiated an SPE-interchange to the Standby SPE. If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a COLD 2 restart to recover properly only minutes after the warm start has occurred.
- **Bad Memory:** A defective memory circuit pack generating too many errors caused a restart.
- **System Technician Request:** The restart was performed because of system technician demand. A system technician-requested **reset system 4** command entry should always precede an **upgrade software** command entry.
- **Failed Interchange:** A "hot-start" interchange (system technician-demanded, scheduled, or software-requested) failed because shadowing was disabled.
- **From Monitor (mon):** (For Development Environment only)
- **Initialized:** This is always the first entry in the history and is present until more than 15 restarts have been performed. It indicates power-up and also occurs if the Maintenance/Tape Processor is reset during initialization.

- **LMM Request:** A sanity time-out was requested by the LMM firmware. The three processor circuit pack LEDs blink until the sanity timer goes off. The LMM requests a restart like this when it gets into trouble, usually with memory.
- **Maintenance Reset:** The Maintenance/Tape Processor or Duplication Interface reset the system. This refers to resets of the SPE by maintenance in SPE Down mode in which maintenance periodically tries to awaken the SPE.
- **No Handshake:** (High or Critical Reliability System only) The Duplication Interface lost handshaking with the active SPE. Thus, the Duplication Interface initiated an SPE-interchange to the Standby SPE. A defective tape drive may cause the Active SPE to miss handshakes with the Duplication Interface which, in turn, could result in an initialization cause of "No Handshake." Check the Hardware Error Log for TAPE-related error types and alarms and follow the recommended repair procedures in the TAPE Maintenance documentation. If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Oryx Request:** A sanity time-out was requested by the Oryx operating system. The three processor circuit pack LEDs blink until the sanity timer goes off. Oryx requests a restart like this when it gets into trouble, usually with software.
- **Sanity Timer Reset:** The sanity timer on the processor timed out and reset the system. This event usually indicates a software fault.
- **Scheduled Interchange:** A scheduled SPE-interchange occurred.
- **Software Request:** Software requested the system restart. In a system equipped with High or Critical Reliability, software can also request SPE-interchanges when it detects problems. See the Software Requested Interchanges Caused by Alarm Conditions table ([Table 6-1](#)) in the "SPE-Interchanges" section of [Chapter 6, "Reliability Systems: A Maintenance Aid"](#). If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation.

- **SPE-Select Lead Change:** (High or Critical Reliability System only) The system could not determine why the SPE changed its status from Active or Standby. However, this change usually indicates a transition from Active to Standby. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **SPE-Select Switch:** (High or Critical Reliability System only) The SPE-Select switches on the Duplication Interface circuit packs were thrown to select the Standby SPE, which became the Active SPE, using the restart level shown. It is also possible to get an initialization cause of SPE-Select Switch when SPE B is active and power to carrier B is lost. In this case, an SPE switch to SPE A occurs and the initialization cause can show either SPE-Select Switch or SPE Down. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation.
- **Stby-SPE Core Dump:** (High or Critical Reliability System only) The Standby SPE had finished a core dump when an interchange took place that made the Standby SPE the Active SPE. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Stby-SPE Tests:** (high or critical reliability system only) The Standby SPE was in the process of running tests at the request of the Active SPE when an interchange occurred. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Unknown:** A restart that could not be classified. The Software Error Log may contain more information about the restart.
- **Upgrade Software:** (High or Critical Reliability System only) This indicates that the system was upgraded to a new software generic using the Standby SPE to load the new software via the **upgrade software** command. A system technician-requested **reset system 4** command should be the previous entry.

- **LMM Put Fail:** This initcause occurs when the LMM has failed to place the request for initcause message in the DPR. This could occur if the MTP does not respond to the DPR handshake. Level of Restart: Warm (escalation turned on).
- **LMM Get Fail:** This initcause occurs when the LMM does not receive a response to the request for initcause message from the MTP. This could occur if the MTP is not taking messages out of the DPR. Level of Restart: Warm (escalation turned on).
- **Dupint Unknown:** This initcause occurs when the LMM receives an UNKNOWN initcause from the Dupint. This could occur in a High or Critical Reliability System where the MTP thinks a PEI has occurred but the dupint disagrees. Level of Restart: Warm (escalation turned on).
- **MTP Reset Unknown:** This initcause occurs when the LMM has reset the MTP during the process of trying to get initcause from the MTP. Level of Restart: Warm (escalation turned on).
- **S-vintage Mismatch:** This initcause occurs when a mismatch in the duplication super vintage is detected by the LMM. Level of Restart: Reboot (no escalation).
- **Monitor Reset:** (For Development Environment Only) This initcause occurs when "ini 1" is executed from the Flash Monitor. This initcause can occur only in systems with SBB. Level of Restart: Reboot (no escalation).
- **Bad GDT:** (For Development Environment Only) This initcause occurs when the LMM fails to transfer control to Oryx/Pecos because of absence of entry in GDT to point at O/P. This usually occurs in a system with no ldata. Again, this should only occur in systems with SBB.

Action                   The level of recovery performed by the system. The recovery levels follow:

- Reset system 1 (Warm)
- Reset system 2 (Cold-2)
- Reset system 3 (Cold-1)
- Reset system 4 (Reboot)
- Reset system 5 (Extended Reboot)
- Reset system interchange (High or Critical Reliability System only - hot restart interchange)

Escalated               Whether the restart was escalated to a higher level to clear the problem. There is a software escalation strategy which can cause a higher level of restart than the one previously performed to be executed if the need arises.

**Carrier** The "carrier" statement indicates the carrier on which the recovery was performed (possible values are **1A** and **1B**). In most cases, this "carrier" is the Active SPE carrier when the restart occurs. However, it is possible in a High or Critical Reliability System that this carrier was the Standby carrier. See the preceding description of **display initcauses** for a complete explanation.

**Time** The date (month and day) and time of the restart.

For the following output example, the command **display initcauses** was entered.

display initcauses

INITIALIZATION CAUSES

| Cause                     | Action | Escalated | Carrier | Time  |      |
|---------------------------|--------|-----------|---------|-------|------|
| Initialized               | 4      | no        | 1B      | 08/01 | 1:14 |
| System Technician Request | i      | no        | 1A      | 08/01 | 2:14 |
| System Technician Request | i      | no        | 1B      | 08/01 | 2:18 |
| Sanity Timer Reset        | 1      | no        | 1B      | 08/02 | 6:03 |
| Sanity Timer Reset        | 1      | no        | 1B      | 08/02 | 6:08 |
| Sanity Timer Reset        | 2      | yes       | 1B      | 08/02 | 6:14 |
| Scheduled Interchange     | i      | no        | 1A      | 08/03 | 2:33 |
| Bad Handshake             | 1      | no        | 1B      | 08/04 | 2:34 |
| Software Request          | 2      | no        | 1B      | 08/05 | 8:22 |
| System Technician Request | 1      | no        | 1B      | 08/05 | 8:23 |
| System Technician Request | 4      | no        | 1A      | 08/05 | 9:15 |
| Upgrade Software          | 2      | no        | 1A      | 08/05 | 9:29 |
| Software Request          | i      | no        | 1B      | 08/06 | 7:00 |
| System Technician Request | 2      | no        | 1B      | 08/06 | 7:09 |
| Software Request          | 1      | no        | 1A      | 08/09 | 2:34 |
| No Handshake              | 1      | no        | 1A      | 08/09 | 2:36 |

Command successfully completed

Feature Interactions

None.

display memory-configuration

This command displays the active and standby processor Flash Read-Only Memory and Dynamic Random Access Memory configurations.

Synopsis

display memory-configuration [ long]

Permissions

The following default logins may execute this command: browse, system technician, cust, inads, init.

Examples

display memory-configuration  
display memory-configuration long

Description

The maintenance command, display memory-configuration, will indicate the total memory available for the active, and if present the standby, processor(s). This command is a single page display with hidden fields for the standby-processor; these hidden fields will only be visible if a standby processor is available in the system.

Defaults

No defaults.

Parameters

|          |                                                                                                                                                                                                                                                                                                                                                              |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| long     | The "long" command parameter is required to display the standby SPE Flash ROM and DRAM configuration.                                                                                                                                                                                                                                                        |
| print    | If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.                                                                                                                                                                                               |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. |

Help Messages

If the system technician presses help after entering "display memory-configuration" the following message will be displayed:

Enter ['long'] ['print' or 'schedule']

Error Messages

If “display memory-configuration” is executed, the following error message will appear on the SAT status line:

“memory-configuration” is an invalid entry; please press HELP

If ““display memory-configuration long” is executed on a simplex system, the following error message will appear on the SAT status line:

“long” is an invalid identifier; please press HELP

If “display memory-configuration long” is executed when the standby processor is not available, the following message will appear on the SAT status line:

Cannot access the standby SPE at this time

Output

The following output example is for the **display memory long** command.

display memory-configuration longSP\_A  
PROCESSOR MEMORY-CONFIGURATION  
(M bytes)

|             | SPE_A | SPE_B |

display port

This command displays information for a specified port.

Synopsis

display port location [ print | schedule ]

Permissions

The following default logins may execute this command: browse, system technician, cust, inads, init.

### Examples

```
display port 1c0801
display port 1c0802 print
display port 2c1504 schedule
```

### Description

The display port command displays the port location, the equipment connected to the port, and the means by which the port can be identified (e.g. an extension number, the trunk group and member, etc.).

### Defaults

No defaults.

### Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | the location represents the physical position of the port to be displayed and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit. A single digit cabinet (1 - 9) may be entered with or without a leading zero (0).                                                                                                                   |
| print    | If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.                                                                                                                                                                                                                                                                                            |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

### Help Messages

If the system technician presses help after entering "display port" the following message will be displayed:

```
Enter assigned port, ['print' or 'schedule']
```

### Error Messages

If the format for the port location is incorrect, the following message is displayed:

```
Identifier invalid
```

If the port location is not administered, the following message is displayed:

Identifier not assigned

If the specified port location is out of range, the following message is displayed:

Port/Board location invalid

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

Output

- Port: The port address (cabinet-carrier-slot-circuit) of the specified user specified port.
- Equipment Type: The hardware that is physically connected to the user specified port.
- Identification: This depends on the hardware that is physically connected to the port. If a station is connected to the port the station extension is displayed, if a trunk is connected to the port a trunk group and member is displayed, If a modem pool is connected to the port, the modem pool group is displayed, etc.

For the following output example the command "display port 1c0801" was entered.

```
display port 1c0801                                SPE A

                                PORT INFORMATION

                                Port: 01C0801
                                Equipment Type: Station
                                Identification: 1021
```

Feature Interactions

None

display synchronization

This command displays the system synchronization administration such as stratum level (3,4), primary and secondary synchronization reference sources and DS1 boards.

## Synopsis

display synchronization [ print | schedule ]

## Permissions

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

## Examples

display synchronization  
display synchronization print  
display synchronization schedule

## Description

The display synchronization command will bring up the synchronization form. The administered synchronization stratum and reference sources will be displayed on this form. This command does not allow for any changes to be made to the system synchronization.

## Defaults

No defaults.

## Parameters

- print
- This will cause the report to be printed if a printer is linked to the SAT.
- schedule
- When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen.

## Help Messages

If the system technician presses HELP after entering "display time" the following message will be displayed:

[ 'print' or 'schedule' ]

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

---

- Stratum: This field specifies the synchronization stratum that is used. The only possible entries are "3" and "4."
- Primary: This field designate the first choice system synchronization source. A blank entry means no synchronization. This field is valid only if stratum 4 synchronization is specified.
- Secondary: This field designate the second choice system synchronization source. A blank entry means no synchronization. This field is valid only if stratum 4 synchronization is specified.
- Location: The circuit pack location (cabinet-carrier-slot) of all administered DS1 circuit packs are listed here.
- Name: If a user defined name is administered for the DS1 circuit pack, it will be displayed here. Blank means no user defined name was given to this DS1 circuit pack.
- Slip: If the DS1 circuit pack has slip alarm, this field will show 'y'. Otherwise it will show 'n'.
- Port Network: This field is only valid for stratum 3 synchronization. The field specifies the port network that supplies synchronization via the tone clock circuit pack.

For the following output example, the command display synchronization was entered.

display synchronization

Page 1 of 2

SYNCHRONIZATION SOURCE (DS1 circuit pack location)

Stratum: 4  
Primary:           Secondary:

DS1 CIRCUIT PACKS

| Location | Name  | Slip     | Location | Name | Slip |
|----------|-------|----------|----------|------|------|
| 02B10    | D92D1 | ds1 2b10 | n        |      |      |
| 02B11    | d92D1 | ds1 2b11 | n        |      |      |
| 01C10    | D92D1 | ds1 1c10 | n        |      |      |
| 01C11    | D92D1 | ds1 1c11 | n        |      |      |

NOTE: TN722B DS1 sources result in stratum 4, type II synchronization

SYNCHRONIZATION PLAN  
DS1 CIRCUIT PACKS

| Location | Name | Slip | Location | Name | Slip |
|----------|------|------|----------|------|------|
|----------|------|------|----------|------|------|

### Feature Interactions

A DS1 interface or a UDS1 board that has been selected as either a primary or secondary synchronization source cannot be removed on the DS1 circuit pack administration form or the regular circuit pack administration form.

## display system-parameters maintenance

This command displays existing maintenance-related system parameters.

### Synopsis

display system-parameters maintenance [print | schedule]

Permissions

Logins with the following service levels may execute this command: craft, inads, init, super-user, or logins with Maintain Switch Circuit Packs permissions enabled.

Examples

display system-parameters maintenance  
display system-parameters maintenance print  
display system-parameters maintenance schedule

Description

The “display system-parameters maintenance” command displays the translation data for maintenance related system parameters.

Parameters

- Print

This option will cause the report to be printed if a printer is linked to the SAT.
- Schedule

When the schedule option is specified, the command is validated and a schedule form is displayed to allow the technician to schedule execution of the command at a specified time. The information displayed by the command will be sent to the system printer instead of the screen.

For more information see "Command Groups" at the beginning of this chapter.

Help Messages

The following help message will be displayed when the system technician presses the help key after entering the **display system-parameters maintenance** command:

[ 'Print' or 'schedule' ]

## Output

---

An input form is displayed with the following fields. Defaults for data entry fields are listed in parentheses.

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Identification           | This is a 10-digit number starting with 1 that identifies the switch to an Operations Support System (OSS), for example, INADS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| First OSS Telephone Number       | The first telephone number that the switch uses to report alarms to, for example, INADS or Trouble Tracker. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. # and * are not allowed in the telephone number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Abbrev Alarm Report              | Enables the Abbreviated Alarm Report feature for the first OSS. (yes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Second OSS Telephone Number      | The second telephone number that the switch uses to report alarms to, for example, INADS or Definity SNMP. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. # and * are not allowed in the telephone number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Abbrev Alarm Report              | Enables the Abbreviated Alarm Report feature for the second OSS. (no)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Alarm Origination to OSS Numbers | <div>Indicates one of four options for alarm origination (neither):<ul style="list-style-type: none"><li>■ If “both,” all Major and Minor alarms result in an automatic call to both OSS telephone numbers. Both OSS telephone numbers must be administered.</li><li>■ If “first-only,” all Major and Minor alarms result in an automatic call to the first OSS number only. The switch does not call the second OSS telephone number even if the number is administered. The first OSS telephone number must be administered</li><li>■ If “neither,” alarm origination does not take place. Warning alarms are not reported to either numbers.</li><li>■ If “second-as-backup,” all Major and Minor alarms result in an automatic call to the first OSS telephone number. If calling the first OSS telephone number fails four attempts, the switch starts to call the second OSS telephone number as a backup until calling the first OSS telephone number becomes successful. Both OSS telephone numbers must be administered.</li></ul></div> |

Before Release 5, the name of this field is “Alarm Origination Activated.” If Alarm Origination is deactivated, both Cleared Alarm Notification and Restart Notification are disabled, even though they may still be activated in the administration.

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cleared Alarm Notification | Enables the switch to originate a call to the OSS and send an alarm resolution message whenever all previously reported Major and Minor alarms are resolved. Alarm Origination must be activated in order for Cleared Alarm Notification to work. (no)                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Restart Notification       | Enables the switch to originate a call to the OSS and report any system restarts caused by problems with the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Suspension Threshold       | The threshold for suspending Cleared Alarm Notification. Some problems may cause alarms to be generated and then resolved repeatedly. To detect these problems (by not sending additional Cleared Alarm notifications to indicate a problem-free system), the switch suspends Cleared Alarm Notification when it has reported this administrable number of Cleared Alarm notifications in a 24 hour period. A suspended Cleared Alarm Notification is only enabled again with a successfully completed "logoff" command, a system reset, or when the threshold is changed. This field is irrelevant if Cleared Alarm Notification or Alarm Origination is disabled. The possible range of threshold values is between 1 and 15. |
| Test Remote Access Port    | Specifies whether testing of the remote access port on the SYSAM circuit pack is enabled. This field should be set to "yes" whenever there is an INADS line connected to the switch and there is a maintenance contract in effect so that alarm origination capability is maintained.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CPE Alarm Activation Level | Indicates the minimum level (Major, Minor or Warning) at which the Customer-Provided Equipment (CPE) alarm is activated. If the level is "none," the CPE does is not activated for any alarm. (none)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

 **NOTE:**  
The CPE alarm is always activated when the switch goes into Emergency Transfer, regardless of the CPE Alarm Activation Level setting.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Packet Bus Activated          | <p>Enables the system Packet Bus.</p> <p>If this field is set to "yes", then maintenance software assumes that there is a Packet Control circuit pack installed in the system. The packet endpoints (for example, ASAI, and/or BRI) may be administered, and maintenance testing runs on both the Packet Control circuit pack and on the Packet Bus (This field should be set to "yes" after a packet control circuit pack is installed.). If a Packet Control circuit pack is not installed in the system, then a major alarm is raised against the PKT-CTRL MO. This field can only be changed from "yes" to "no" if there are no packet endpoints administered, thus ensuring that there can be no packet endpoints administered if the packet bus is not activated.</p> <p>This field should be set to "yes" after a Packet Control circuit pack is installed.</p> <p>If a Packet Control circuit pack is not installed, then this field should be set to "no" (the only exception is when setting up translations for a system for which not all of the required hardware is available). (no)</p> |
| Customer Access to INADS Port | <p>Provides the capability to prohibit access to system administration and maintenance interface, via the INADS port when using customer login ID's. This field can only be activated by Lucent services through system-parameters maintenance administration.(no)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Repeat Dial Interval (MMS)    | <p>Indicates the number of minutes that the system must wait before attempting another call origination to an OSS. This timer is triggered by the lack of a far-end acknowledgment. (7)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Scheduled Maintenance

A series of maintenance tests and operations runs automatically every day according to the schedule and settings specified in the following fields.

|                   |                                                                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Start Time        | The hour and minute in 24-hour notation at which daily scheduled maintenance will begin running. (22:00)                                                                                                                                                                    |
| Stop Time         | The hour and minute when scheduled daily maintenance will stop running. If any daily maintenance operations are not completed by this time, the system will note where in the sequence it stopped and perform those operations during the next scheduled daily maintenance. |
| Daily Maintenance | This display-only field simply represents the series of tests that are always run by maintenance software as part of daily maintenance.                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Save Translation            | This field indicates on which days translation data in memory will automatically be saved to the Mass Storage System disk and/or tape devices during scheduled maintenance. The save operation is first made to disk, followed by a disk backup to tape. On systems with duplicated SPEs, translation data is saved on both SPEs. Valid entries are <b>daily</b> , days of the week, or <b>no</b> . "No" specifies that no automatic saves are to be executed. (daily)                                                                                                                              |
| Control Channel Interchange | Each port network has a pair of TDM busses called A and B, each of which has a set of time slots dedicated to use by the control channel. At any one time, the control channel in each PN is carried on only one of the two busses. This field indicates on which days the control channel in each port network will be switched from one of the paired TDM busses to the other. Valid entries are <b>daily</b> , days of the week, or <b>no</b> . "No" specifies that no interchange be executed. (no)                                                                                             |
| System Clocks Interchange   | On High and Critical Reliability systems, this option causes a Tone-Clock interchange in each port network with duplicated Tone-Clock circuit packs. Each port network interchanges into the standby Tone-Clock for 20 seconds and then back to the Tone-Clock that was originally active. This field indicates on which days the interchanges are to take place. Valid entries are <b>daily</b> , days of the week, or <b>no</b> . "No" specifies that interchanges be executed. (no)                                                                                                              |
| SPE Interchange             | On systems with duplicated SPEs, this field indicates on which days an SPE interchange will be executed during scheduled maintenance. Valid entries are <b>daily</b> , days of the week, or <b>no</b> . "No" specifies no scheduled interchanges. (no)                                                                                                                                                                                                                                                                                                                                              |
| EXP-LINK Interchange        | This field indicates whether or not the expansion links between port-networks are interchanged as part of scheduled maintenance. The value "daily" means that EXP-LINK interchange occurs automatically everyday. The value "no" means that EXP-LINK interchange is not done automatically as part of scheduled maintenance. Values represented by the days of the week mean that EXP-LINK interchange occurs automatically on the specified day only. Since EXP-LINK interchange only applies to duplicated systems, simplex systems do not display this field. (no)                               |
| Minimum Threshold for TTRs  | When the number of touch tone receivers (TTRs) in service falls below this number (4 to 200), a WARNING alarm is raised against TTR-LEV. These are also known as dual-tone multifrequency receivers (DTMRs). There are 4 TTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a TTR being taken out of service, set this field to 4 times the number of TN748s. If this number is set to more than three less than the total number of TTRs, a port network with only one TN748 could lose all of its TTRs before this alarm is raised. |

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Minimum Threshold for CPTRs                 | When the number of call progress tone receivers in service falls below this number (2 to 100), a WARNING alarm is raised against TTR-LEV. These are also known as general purpose tone detectors (GPTDs). There are 2 CPTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a CPTR being taken out of service, set this field to 2 times the number of TN748s. If this number is set to more than one less than the total number of TTRs, a port network with only one TN748 could lose all of its CPTRs before this alarm is raised.                                               |
| Minimum Threshold for Call Classifier Ports | When the number of call classifier ports (CLSFY-PTs) in service falls below this number, a WARNING alarm is raised against TTR-LEV. Valid entries are 1 to 200. There are 8 ports on each TN744 Call Classifier circuit pack, and up to 25 TN744s in a system. To alarm the first occurrence of a CLSFY-PT being taken out of service, set this field to 8 times the number of TN744s. If this number is set to more than 7 less than the total number of CSLFY-PTs in the system, a port network with only one TN744 could lose all of its CLSFY-PTS before the alarm is raised. If there are no TN744s in the system, leave this field blank. |
| Test Type 100, Test Type 102, Test Type 105 | <p>An extension assigned to receive tie-trunk calls from other switches with test line origination capability. The system responds by sending a sequence of test tones. Test Type 100 tests far-end to near-end loss and C-message by sending:</p> <ul style="list-style-type: none"><li>■ 5.5 seconds of 1004 Hz tone at 0dB</li><li>■ Quiet until disconnect; disconnect is forced after one minute</li></ul>                                                                                                                                                                                                                                 |
| ISDN-PRI Test Call Extension                | The extension used by a far-end ISDN node to place a call to the system to test the ISDN-PRI trunks between the far-end and the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ISDN-BRI Service SPID                       | This field shows whether or not the link is associated with the Service SPID. If the link is associated with the Service SPID, this field contains a "yes" and the extension field is blank; otherwise, this field is blank. Service SPID is a feature used by the system technician to check building wiring between the switch and the BRI endpoint.                                                                                                                                                                                                                                                                                          |

DSO  
Loop-Around  
Test Call  
Extension

This field contains the extension number for the test call extension number. This test extension number will be used to establish a loop-around connection on the selected trunk.

The DSO Loop-Around Test Call feature is used primarily for testing DSO channels associated with non-ISDN-PRI trunks. The loop-around is activated by dialing the test extension number. Multiple DSO Loop-Around connections can be set up by placing multiple calls to the loop-around extension.

The DS0 Loop Around feature provides a loop around connection for incoming non-ISDN DS1 trunk data calls. This feature is similar to the far-end loop around connection provided for the ISDN Test Call feature. This DS0 loop around is provided primarily to allow a network service provider to perform facility testing at the DS0 level before video teleconferencing terminals are installed at the PBX.

The feature is activated on a call-by-call basis by dialing a test call extension specified on the second page of the System Parameters Maintenance form. No special hardware is required. When the test call extension is received by the PBX, a non-inverting, 64 kbps connection is set up on the PBX's Time Division Multiplexed bus. More than one loop around call can be active at the same time.

For calls routed over the public network using the ACCUNET Switched Digital Service (SDS) or Software Defined Data Network (SDDN), the data transmission rate is 56 Kbps, since robbed bit signaling is used. For calls established over a private network using common channel signaling, the full 64 kbps data rate is available.

When the incoming trunk group is used only for data calls (SDS), the Communications Type on the associated Trunk Group form should be set to "data." When the incoming trunk group is used for robbed bit alternate voice and/or data (SDN/SDDN), the Communications Type on the Trunk Group form should be set to "rbavd" (robbed bit alternate voice data). For private network trunks using common channel signaling, the Communications Type on the associated Trunk Group form can be set to "avd."

Loss Plan

Use only when extra loss is required to maintain quality of transmission on conference calls. Leave this field blank if no extra loss is required. If extra loss is required, enter digits as shown below.

| No. of Parties to Be Conferred | Enter Digit |
|--------------------------------|-------------|
| 3                              | 2           |
| 4                              | 3           |
| 5                              | 4           |
| 6                              | 5           |
| 7                              | 6           |

SPE Optional Boards:

These fields indicate whether a Disk circuit pack is present in the system, and which Packet Interface slots are administered. If a Packet Interface circuit pack is physically present, the corresponding Packet Interface field is set to y when the system boots, and no change to that field is allowed. If the system is equipped with duplicated SPEs, a Packet Interface field is set to y when either SPE carrier contains a Packet Interface circuit pack in the corresponding position. If a Packet Interface circuit pack is not present, then the value for the Packet Interface field is read from translation data stored on disk or tape. If the field is set to n, a Packet Interface circuit pack may be administered by changing the corresponding Packet Interface field to y.

Modem Connection

On page 3 of the example forms shown below, there are 11 fields that are hidden when the “Modem Connection?” field is set to internal. In this example the “Modem Connection” field is set to “external” and these additional 11 fields are visible.

The first 2 fields on page 3 help setup the data format for the serial data from the switch to the modem. The field names are, “Data Bits:”, and “Parity?”. There are only two valid combinations for these 2 fields:

- Data Bits = 8, Parity = None
- Data Bits = 7, Parity =(odd , even, mark, or space)

The remaining fields are listed below:

|                  |                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modem Connection | The only valid entries for this field are “internal” or “external”. The default is set to internal. (internal)                                                     |
| Modem Name       | This field is 20 characters long and will permit alpha-numeric characters to provide a unique qualifier for a given modem. The field is called “Modem Name: ”. ( ) |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RTS/CTS Enabled          | <p>This field will inform the modem that communication with the data source UART will be driven with RTS/CTS flow control. This field is 6 characters long with a default of “\Q3”. This field is case in-sensitive; however, the default will be in upper case. (\Q3)</p>                                                                                                                                                                                                                                                                                                                  |
| Asynchronous Data Mode   | <p>This field will configure the modem as an asynchronous communications device. This field is 8 characters long with a default of “&amp;M0&amp;Q0”.</p> <p>This field is case in-sensitive; however, the default will be in upper case. (&amp;M0&amp;Q0)</p>                                                                                                                                                                                                                                                                                                                               |
| DTE Auto-Data Speed      | <p>This option will adjust the speed of the data source (DTE) UART to the outgoing (modem-to-modem) data rate. So, at maximum this speed would be 9600 baud.</p> <p>This field is 6 characters long with a blank as default .</p> <p>This field is case in-sensitive. ( )</p>                                                                                                                                                                                                                                                                                                               |
| Disable Data Compression | <p>This field will turn off the default data compression algorithms that are in use by most consumer modems. This field is 6 characters long with blank as the default. The AT commands that control this capability are supported by similar commands; however, these commands do not operate in the same manner.</p> <p>The Intel modems require the use of “H%C0” to disable V.42bis &amp; MNP Class 5 data compression algorithms; however, the Paradyne products only use “%C0” to disable both algorithms.</p> <p>This field is case in-sensitive; with blank as the default. ( )</p> |
| Enable Error Control     | <p>This field will turn on the V.42 LAPM and MNP error control protocols, if available on the modem. This field is 6 characters long with blank as the default.</p> <p>This V.42/MNP/Buffer mode first attempts to negotiate V.42 error control with the remote modem. If this fails, then the modem transitions to MNP, and if this fails then no error control is used.</p> <p>This field is case in-sensitive. ( )</p>                                                                                                                                                                   |
| Misc. Init. Param        | <p>This field is 20 characters long with blank as the default. This field supports any initialization parameters that are not already specified. The AT commands specified in this free-form field will be always the last initialization parameters to be sent to the external modem.</p> <p>This field is case in-sensitive; however, the default will be in upper case. ( )</p>                                                                                                                                                                                                          |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto-Answer<br>Ring Count      | <p>This field controls the number of rings required before the modem will automatically answer an incoming call. This field is 6 characters long with "S0=10" as the default. Typically, the maximum permissible value for this register is 255. The values 1-255 denote the number of incoming ring cycles.</p> <p>This field is case in-sensitive; however, the default will be in upper case. (S0=10)</p>                                                                                                                                                                                                                                                    |
| Dial Type                      | <p>This field controls the type of inter-register signaling to be used between the modem and the Central Office. The field name is "Dial Type: " with a default of "T" for tone dialing. Pulse dialing is indicated by "P". The field length should be 3 characters long. This field will be concatenated with the dial string. This field will be case in-sensitive; however, the default will be in upper case. (T)</p>                                                                                                                                                                                                                                       |
| Adjustable<br>Make/Break Ratio | <p>This field can be of particular importance when using a modem that may be transferable from country to country. The intent of this field is to control the make/break ratios of pulses and DTMF dialing. The Intel product information has support for the different make/break options for pulse dialing only.</p> <p>Intel uses the option "&amp;P0" to select a ratio of 39% make and 61% break for communication within the U.S. and Canada. The option "&amp;P1" sets a ration of 33% make and 67% break for the U.K. and Hong Kong.</p> <p>This field is 5 characters long with blank as the default.</p> <p>This field will be case in-sensitive.</p> |
| Dial Command                   | <p>This field is 3 characters long with "D" as the default.. This field simply denotes the dialing command of the modem. This is a fairly standard command.</p> <p>This field will be case in-sensitive; however, the default will be in upper case. (D)</p>                                                                                                                                                                                                                                                                                                                                                                                                    |

No Answer  
Time-Out

Most off-the-shelf external modems provide a timer that abandons any outbound data call after a predetermined interval. Some modems provide for this timer to be disabled, thus allowing an outbound call to ring indefinitely. AT&T Paradyne does not provide this capability with their modem line, because it is generally undesirable to have an outbound call attempt ring indefinitely.

The internal modem must have this parameter disabled or set to at least 255 seconds.

This is a non-administrable parameter. For the external modem connection, this parameter will be the first initialization string to be transmitted to the external modem. This field will be visible on the administration form in display mode only.

This hardcoded constant can be overridden for type approval applications, specifically in the U.K and other Western European nations, by the use of the "Misc. Init. Param:" field. (S7=255)

Help/Error Message Line  
Command Line

**display time**

---

This command displays the system time.

## Synopsis

display time [ print | schedule ]

## Permissions

The following default logins may execute this command: system technician, inads, cust, init, browse.

## Examples

display time  
display time print  
display time schedule

## Description

The display time command will bring up the time form. The system time will be displayed on this form. This command does not allow for any changes to be made to the system time.

## Defaults

No defaults.

## Parameters

- print
- This will cause the report to be printed if a printer is linked to the SAT.
- schedule
- When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [2] for more details.

## Help Messages

If the system technician presses HELP after entering "display time" the following message will be displayed:

[ 'print' or 'schedule' ]

### Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

### Output

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| Day of the Week  | The day of the week that the system has stored.             |
| Day of the Month | The numerical day of the month.                             |
| Month            | The month of the year stored by the system.                 |
| Year             | The current year stored by the system.                      |
| Hour             | The hour of the current day.                                |
| Minute           | The number of minutes into the hour.                        |
| Second           | The number of seconds into the minute stored by the system. |

For the following output example, the command display time was entered.

```
display time

                        DATE AND TIME

DATE
  Day of the Week:  Sunday      Month:  January
  Day of the Month:   1         Year:   1990

TIME
      Hour:  6      Second:  20
      Minute: 8
```

### Feature Interactions

The date and time are generally used by the switch.

### download update-file

This command provides a mechanism for downloading a field update file from INADS or a personal computer using the XMODEM protocol.

## Synopsis

---

download update-file

## Permissions

---

The following default logins may execute this command: inads and init.

## Examples

---

**download update-file**

## Description

---

The update file is transferred to the switch asynchronously from either an INADS host or a personnel computer (PC) using the XMODEM protocol. The switch is called asynchronously (either using the "call" command from an INADS host, or by dialing the switch directly with a modem. Once the connection has been established, the user logs into the switch as a remote system access terminal (SAT), using the inads login.

**Only the INADS and INIT logins have the necessary permission to send an update file to the switch.**

The command "download update-file" is entered at the SAT to initiate the download of the update file and, when this command is entered, the switch will respond with "Please wait ...". After some initialization at the switch has completed, the command displays: "Please start file transmission now...". At this point, an XMODEM session should be started up on the remote end and the update file should be sent. If an INADS host is being used, enter ~dload <file\_name> to start the file transmission. If a PC is being used, follow the instructions in the emulator's manual for invoking an XMODEM session to send the update file.

As each block is received by the switch, it is written to tape or flash. Error detection and retransmission are provided by the link level of XMODEM. Additional protection is provided within the application level. After the entire file has been written to tape or flash it is read back and each update file block is validated. The file checksum is also checked. If the file appears to be sound, the status word in the header block is then changed to indicate that there is a valid update file.

There may be a delay (of up to 5 minutes on a duplex system) between the end of the file transmission and command completion. This delay is caused by the patch application of any immediate sub-patches and, if on a duplex system, the automatic copy of the update file to the standby SPE which take place as a result of the reception of a valid update file.

In a High or Critical Reliability System, the connection to the INADS host computer may be dropped (by the INADS side) but the process of copying the patch file to the standby processor continues. The standby is placed in maintenance mode and a call placed between active and standby via the data channels. The file is transmitted in the same way for both tape and flash based systems. The same checks are made on the receiving side as were made during and after the original download. If no errors are found, the file is marked valid.

There is no feedback to the user on the status of the standby copy. If an error is encountered during the copy or validation process on the standby, an error is logged in the software error log. The data consistency audit will discover that the two patch files are inconsistent and the user must manually copy the valid file on the active processor to the standby processor.

The software does not indicate when the copy has completed, so scripts run by the TSC must not issue an immediate reset on High or Critical Reliability Systems. This will interrupt the copy and guarantee that the field update files on the two processors are inconsistent. This problem can be avoided by using one of the following techniques:

- Use two scripts: the first to apply the patch and a second, to be run later, to issue the reset that applies the patch. This requires two calls to each duplicated switch.
- Put a delay into the scripts which causes the scripts to wait a period of time after downloading the file and before issuing the reset. This requires only one call, but the amount of delay time required is not well defined as it depends on system load.
- Use a manual means of detecting when the copy has completed: either a "PASS" on the data consistency audit or a match on the *"list configuration software"* form. This requires only one call and introduces less delay in requesting the reset.

## Help Messages

There is no associated help message as the command has no options.

## Error Messages

If the vintage of the standby SPE doesn't match the vintage of the active SPE, the following message is displayed:

```
Update file vintage does not match standby SPE core vintage
```

If the patch identifier in the update file does not match the patch identifier in memory, the following message is displayed:

```
Update file patch identifier does not match SPE patch identifier
```

If an update file which is created for a different system (i.e., a patch file is created for a tape system and downloaded to a flash system), the following message is displayed:

Update file designed for a different configuration, file will not be used

If the update file is too large to fit in the remaining space, the following message is displayed:

Update file is too large to fit on device

If the calculated file checksum is incorrect, the following message will be displayed:

File checksum failed; file will not be used

If an invalid update file block was found, the following message will be displayed:

Found a bad file block; file will not be used

If the total number of blocks listed in the header block of the update file did not match the number of blocks received by the SPE, the following message is displayed:

Received an invalid number of blocks; file will be ignored

The total number of subpatches listed in the header of the update file did not match the number of subpatches received by the switch

Received wrong number of subpatches for update file

Output

---

None

Feature Interactions

---

The form displayed for the list configuration software-vintage command has been modified to reflect the changes imposed by the flash architecture. The **list configuration software** command should allow INADS to determine, with one query, the hardware configuration, software vintage and patch identifier.

There is no interaction with routine periodic or scheduled maintenance because patches are only applied on restarts before the system is in normal operation.

The flash checksum test acts as a backup check to make sure the entire field update file was applied correctly. It can fail because of a bad checksum update from a poorly constructed update file or because the patching operation has aborted. When the flash Checksum Test fails, a MAJOR on-board alarm is raised on the processor/memory circuit pack. Maintenance runs a data consistency test on a daily basis to check that copies of translations, announcements and software files are consistent across both processors in a High or Critical

Reliability System. If the test detects a difference, a minor, off-board alarm is generated.

When checking the software, the test compares the memory resident software version and patch identifier. It also checks for the presence of a field update file and, if found, compares the old and new patch identifiers to make sure the same patch file id loaded on each processor. If the software or update files are inconsistent, the "list configuration software" command can be used to display the status of the patch file.

## **RECOVERY PROCEDURES**

---

This sections describes the procedures to be followed to recover from failures encountered during the download and application of the update file. The instructions apply to both simplex and duplex switches; additional detail is given when needed.

### **Error on the Transmission of the Download**

If the error displayed on the terminal indicates that the download step in the process failed, there are several culprits:

1. The transmission line could have been noisy. Retry after making all the following checks. Failed attempts take up room in the hard patch file and may require a warm start to clear the file.
2. The user may have downloaded the tape/MIPS version of the patch instead of the flash version.
3. The vintage of the update file may not match the vintage of software currently running in the system. Check the customer's vintage using "list config software" and patch vintage provided in the documentation.
4. The switch may have had difficulty in writing to the hard patch file. Check the hardware error log for processor/memory board failures.
5. The hard patch file may be full. Issue a "reset system 1". This should cause valid files to be applied and invalid ones to be erased.

## Error on Application of the Patch

A patch may not have been applied for the following reasons:

1. The memory card was write-protected. Remove this protection and issue a **reset system x** command
2. The patch identifiers were inconsistent. Run **list configuration software** and compare the old\_patch identifier with the values in the update file.
3. The LMM encountered a problem with the patch file. This is unlikely because the same checks, and more, were performed when the file was downloaded, prior to marking the file valid. This implies that the memory which stored the update file was corrupted. Apply the back out file immediately to back out the changes. Run the flash checksum test to make sure the system is back to its prepatch state. Check the validity of the file again with the development community and then try redownloading and applying the patch immediately.
4. The LMM reports a hard error. The symptoms of this is an entry in the hardware error log for the processor/memory board, if you're lucky, or extremely odd switch behavior followed by SPE down mode if you're not. The problem is that the LMM couldn't complete the programming of memory with the result that memory is in a corrupted state. The only recovery is to visit the site armed with new software and processor/memory circuit packs.

In a High or Critical Reliability System, the failure causes a switch to the standby processor. The hardware on the standby must be repaired and the patch redownloaded. (There was nothing wrong with the patch)

## Good Application - Bad Patch

This error is caused, not by a failure in the download or application, but by a fault in the patch file itself. To recover from this type of problem, the back out file which backs out the patch should be downloaded and applied. Clearly, this requires that the system be sane enough to receive the file correctly and be able to apply it.

In a High or Critical Reliability System, the user has about eight minutes to recognize that a problem exists and force an interchange to the standby processor. If this can be done, the file on the newly active processor can be invalidated using a file containing a destroy tuple or the *wp byte* command. The standby can be restored to a normal state using the back out file.

## Inconsistent Software Versions on a Duplicated Switch

Inconsistent software, as indicated by a failure in the data consistency test, can be caused by problems copying the update file to the standby or validation test failures on the standby. Unlike the tape or MIPS systems which revert to the same version of software as a result of a refresh, a flash system remains inconsistent

until manually initiated steps are taken. Use the *list config software* command to determine the status of the vintages, patch identifiers and patch file data on both the active and standby processor.

1. If one processor looks as if it has been patched (updated patch identifier and no update file) and the other looks as if the patch file is still present (no patch identifier and valid update file), the application of the patch can be forced by making that processor active and requesting the system restart indicated in the accompanying documentation.
2. If one processor has a copy of the update file and the other doesn't (neither has been patched), the file can be copied using the command *copy update-file*.
3. If patch identifiers disagree but neither side has a valid update file, the missing patch should be redownloaded to the system. During the download process the file will pass the vintage test and be copied to the standby processor. Validation tests will then be run on both machines. On the next restart, the patch will be applied to memory. This procedure is less disruptive to the customer if the unpatched processor is the standby at the time of the restart.

## **enable administered-connection**

---

This command restarts scheduled and periodic maintenance for a single administered connection or all administered connections.

### **Synopsis**

---

`enable administered-connection [ ac number | all ]`

### **Permissions**

---

The following default logins may execute this command: inads, init, system technician, cust, rcust, mis.

### **Examples**

---

**enable administered-connection all**  
**enable administered-connection 1**  
**enable administered-connection 128**

### **Description**

---

The `enable administered connection` command causes scheduled and periodic maintenance to function normally for all or single administered connection(s). This command can be used to track the maintenance processing of

administered connections without interference from other maintenance processing. This commands restarts the processing of in-line errors for all or the selected administered connection.

## Defaults

None.

## Parameters

ac number     The number of the administered connection being enabled.

all            IF "all" is entered then all administered connections are enabled.

## Help Messages

If the user presses HELP after entering "enable administered-connection", the following message will be displayed:

Enter assigned administered connection number(1-128) or 'all'

## Error Messages

If the administered connection number entered is not "all" and is non numeric, the following message is displayed:

Identifier invalid

If the administered connection number entered is not within the valid range of connections, the following message is displayed:

Entry out of range

If the connection number entered is not administered, the following message is displayed:

Identifier not assigned

If the administered connection number entered is already enabled, the following message is displayed:

Administered connection already enabled

If the software data cannot be sent to the SAT, the following message will be displayed:

Error encountered, can't complete request

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear and then resubmit

Output

---

After the user has entered the command and the command is successful, the following message appears at the bottom of the screen:

Command successfully completed

Feature Interactions

---

None.

enable mst

---

This command allows the user to enable the trace buffer.

Synopsis

enable mst

Permissions

The following default logins may execute this command: inads, init.

Examples

enable mst

Description

Enables the message trace. The trace is controlled according to the parameters on the "change mst" screen. If executed while the trace is enabled, it has no effect and indicates that it worked.

Defaults

None.

Parameters

None.

## Help Messages

If you press Help after entering "enable mst", the following message displays:

Entry is not required

## Error Messages

If the command conflicts with another currently executing command, a message displays the login ID of the conflicting user and the conflicting command.

'login id': 'command' has a command conflict

## Output

After you enter the command the following message displays:

Command successfully completed

## Feature Interactions

None.

# enable suspend-alm-orig

This command suspends Alarm Origination for alarms generated from a specified hardware component over a time-out duration.

## Synopsis

enable suspend-alm-orig (board or port location) [off-board-only]  
expires-in-hrs(1-72).

## Examples

enable suspend-alm-orig 1C03 expires-in-hrs 3  
enable suspend-alm-orig 1E0701 expires-in-hrs 72  
enable suspend-alm-orig 1E07 off-board-only expires-in-hrs 24

## Description

This command enables Suspend Alarm Origination for a board (which also includes all ports and endpoints on the board) or for a port (which includes all endpoints on the port), and either for both on- and off-board alarms or for off-board alarms only. Many control circuit packs do not have a board location, so this command cannot support all circuit packs.

On the command line, specify a time-out duration between one and 72 hours. The “off-board-only” keyword is optional; if the keyword is not specified, the entry suspends Alarm Origination for both on-and off-board alarms. Each enable command becomes a new entry or replaces an existing entry in the Suspend Alarm Origination table. A new entry that matches both the physical location and off-only/on- and off-board specifications of an active entry replaces the active entry in the Suspend Alarm Origination table.

This command may be particularly useful for improving control over situations such as the following:

- Improved control over customer requests. For example, to suspend off-board DS1 alarms temporarily for customers that periodically disconnect DS1 trunks for testing or other business related purposes.
- Improved control over external (non-Lucent) problems. For example, to suspend off-board DS1 alarms before a customer resolves facility problems (such as working with the vendor of a T1 trunk that has developed an off-board condition).
- Improved control over internal (Lucent) problems that we cannot resolve right away. For example, to suspend Alarm Origination for a bad circuit pack detected late Friday night and we cannot dispatch personnel to replace the circuit pack until well into Monday.
- Improved control over chronic problems that we have not yet found a solution to.

 **NOTE:**  
Also see other Suspend Alarm Origination related commands, including “disable suspend-alm-orig” and “list suspend-alm-orig”.

**Defaults**

This command enables Suspend Alarm Origination for both on- and off-board alarms if the “off-board-only” keyword is not specified.

**Parameter**

|                        |                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| board or port location | This parameter specifies the physical location of the hardware component for suspending Alarm Origination.                       |
| off-board-only         | This option enables Suspend Alarm Origination for off-board alarms only.                                                         |
| expires-in-hrs         | This parameter specifies the time-out duration for a Suspend Alarm Origination entry. Expired entries are removed automatically. |

**Help Messages**

Enter board or port location,  
[ 'off-board-only' ], expires-in-hrs(1-72)

Output

The command returns one of the following messages:

1. If the time-out duration is not between one and 72:  
XX is an invalid identifier; please press HELP
2. If the port or board specifier is not valid:  
Port/Board invalid
3. If the Suspend Alarm Origination table is full:  
Table full; cannot enable a new entry

Feature Interactions

None.

enable synchronization-switch

This command re-enables automatic clock switching.

Synopsis

enable synchronization-switch

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

enable synchronization-switch

Description

The enable synchronization-switch command puts the automatic clock switching capability of the maintenance subsystem back into a normal state. Clock refers to the oscillator on a tone/clock or DS1 interface.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses help after entering "enable synchronization-switch" the following message will be displayed:

Entry is not required

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

---

If the enable synchronization-switch command is successful, the following message will be displayed on the SAT:

Command successfully completed

If the enable synchronization-switch command is unsuccessful, the following message will be displayed on the SAT:

Error encountered, can't complete request

If the enable command is run and synchronization-switch is currently enabled, the following message will be displayed on the SAT:

Synchronization-switch already enabled

Feature Interactions

---

None.

# enable test-number

---

This command enables a previously disabled test number.

## Synopsis

---

enable test-number number

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**enable test-number 102**

## Description

---

This command will re-enable the specified test number that was previously disabled. This will cause that the test number be allowed to run on the next request by maintenance or the technician.

## Defaults

No defaults.

## Parameters

number This is the specific test number to re-enable.

## Help Messages

If the system technician presses help after entering "enable test-number" the following message will be displayed:

Enter test number

## Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy

### Output

---

If the enable test-number command is successful, the following message will be displayed on the SAT:

Command successfully completed

If the enable test-number command is unsuccessful, the following message will be displayed on the SAT:

Error encountered, cannot complete request

### Feature Interactions

---

The display disabled-tests command gives a list of all disabled tests.

## format card-mem

---

This command formats the active processor Flash Read-Only Memory.

### Synopsis

---

**format card-mem [translation] [announcements] [coredump] [firmware]**

### Permissions

---

The following default logins may execute this command: browse, system technician, cust, inads, init.

### Examples

---

**format card-mem translation**  
**format card-mem announcements**  
**format card-mem coredump**  
**format card-mem firmware**

## Description

The maintenance command, "format card-mem" will erase and format the memory card for translations announcements, coredump, and firmware.

## Defaults

No defaults.

## Parameters

|               |                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------|
| translation   | If specified, this parameter will erase and format the memory card for translations only.                       |
| announcements | If specified, this parameter erase and format the memory card for translations and announcements.               |
| coredump      | If specified, this parameter will erase and format the memory card for translations, announcements and coredump |
| firmware      | If specified, this parameter erase and format the memory card for translations, announcements and firmware      |

## Help Messages

If the system technician presses help after entering "format card-mem" the following message will be displayed:

```
Enter 'translation' or 'announcements' or 'coredump' or 'firmware'
'translation' option formats for translation only
'announcements' option formats for translation and announcements
'coredump' option formats for translation, announcements, and code-dump
'firmware' option formats for translation, announcements, and firmware
Or press CANCEL to cancel the command
```

## Error Messages

If the **format memory [translation] [announcements] [coredump] [firmware] maintenance** command is executed and errors occur, one of the following error messages will be displayed:

```
Memory card is not inserted in the system
Cannot turn on 12 volt power supply
Memory card is write-protected
Unknown type of memory card
Could not write to memory card
Could not erase memory card
Memory card too large for operation requested
Memory card too small for operation requested
Error encountered, memory card unusable
```

## Output

The following output example is for the **format card-mem** command.

```

                                FORMAT FLASH MEMORY CARD

Processor  Command Completion Status

SPE-A     SUCCESS

-----
Command successfully completed
-----
Command: format card-mem translation
```

## Feature Interactions

None

## get vector

This command displays the conditions and the Switch Processing Element (SPE) associated with a core dump of memory to tape or memory card.

## Synopsis

**get vector long print**

## Permissions

The following default logins may execute this command: system technician, inads, init.

### Examples

---

get vector  
get vector print  
get vector long  
get vector long print

### Description

---

The get vector command displays the vector and the Switch Processing Element (SPE) used for a core dump of memory to tape or memory card. The dump occurs on the tape or disk of the previously active SPE (or the SPE previously specified using the "set vector" command in systems with duplicated SPEs).

**The vector is cleared when a system restart of the proper level is performed regardless of whether the core is actually dumped.**

### Defaults

No defaults.

### Parameters

- long This causes timestamps for the core dump to be printed. If SPEs are duplicated, timestamps are printed for both SPEs (or a message stating why the timestamp cannot be printed is displayed).
- print This causes the report to be printed if a printer is linked to the SAT.

### Help Messages

If the system technician presses help after entering "get vector" the following message will be displayed:

[ 'long', [ 'print' ]

### Error Messages

If a list configuration command is still executing while the "get vector" command is entered, the following message will be displayed:

Still clearing previously canceled command; please try later

If during the execution of a command a resource problem occurs that requires the user to restart the command, the following message is displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, the following message is displayed:

All maintenance resources busy; try again later

Output

Core Dump Vector      The condition(s) which cause(s) a core dump to a tape drive or memory card are represented by a hexadecimal value. The hexadecimal value is a bit map of the four reset conditions which cause the dump. These conditions from least to most significant bit are: warm start, cold 2 restart, cold 1 restart, and reboot. A core dump vector of 0 signifies that the vector is cleared or not set.

| Vector-Condition Mapping |            |        |        |        |
|--------------------------|------------|--------|--------|--------|
| value                    | warm-start | cold-2 | cold-1 | reboot |
| 0                        | n          | n      | n      | n      |
| 1                        | y          | n      | n      | n      |
| 2                        | n          | y      | n      | n      |
| 3                        | y          | y      | n      | n      |
| 4                        | n          | n      | y      | n      |
| 5                        | y          | n      | y      | n      |
| 6                        | n          | y      | y      | n      |
| 7                        | y          | y      | y      | n      |
| 8                        | n          | n      | n      | y      |
| 9                        | y          | n      | n      | y      |
| a                        | n          | y      | n      | y      |
| b                        | y          | y      | n      | y      |
| c                        | n          | n      | y      | y      |
| d                        | y          | n      | y      | y      |
| e                        | n          | y      | y      | y      |
| f                        | y          | y      | y      | y      |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Set Vector Command Option | The user specified SPE prior to the core dump. For simplex SPE systems this field will always be "spe-active" unless the vector is cleared or not set. For duplex SPE systems the field will be either "spe-active" or "spe-standby" unless the vector is cleared or not set. If the vector is cleared or not set in either a duplex or simplex SPE system, this field will display blanks.                                                                                                                                                                                                                                 |
| Core Dump Time            | The time that the core dump was taken. This field displays timestamps for both "SPE_A" and "SPE_B." If the system has a simplex SPE, a timestamp will be displayed for "SPE_A" (or the active SPE) and "non duplicated SPE" will be displayed for "SPE_B." If the core dump cannot be accessed a message of "can't access" will be displayed for the corresponding SPE (e.g. in a High or Critical Reliability System where SPE B is not refreshed, "SPE_B" displays "can't access" instead of a timestamp). If the MSS device storing the core dump timestamp is busy for any reason a "device busy" message is displayed. |

For the following output example, the command get vector was entered on a duplex SPE system after a core dump occurred when the vector bit was set. Assume SPE B was the active processor prior to the core dump, but SPE A is the current active processor.

get vector

**Feature Interactions**

None.

**list configuration**

list configuration hardware-group [print | schedule]

### NOTE:

The **list configuration software-version** command is discussed separately under its own heading.

Hardware configuration reports list, for each circuit pack in the group specified, the type, code, suffix, and vintage of the requested circuit packs as installed in the switch, and all ports assigned to the circuit pack.

## Parameters

Enter one of the following hardware groups.

- **carriers all**— Specifies the display of all circuit packs administered and/or physically inserted in port, switch node and control carriers on the entire system.
- **board PCSS**— Specifies the display of all assigned ports on the circuit pack specified by cabinet, carrier and slot.
- **carrier c**— Specifies the display of all circuit packs and assigned ports on a specified carrier.
- **control**— Specifies the display of all circuit packs located in the control complex.
- **ds1**— Specifies the display of all the DS1 (TN722, TN767 and TN464) circuit packs administered and/or physically inserted in port carriers on the entire system.
- **port-network pn#**— Specifies the display of all circuit packs located in a specified port network. **List cabinet** gives the port network number(s) associated with a particular cabinet. Circuit packs on switch node carriers are not displayed when the port-network qualifier is entered. To display SN circuit packs, use the **all**, **carrier** or **board** qualifiers.
- **stations**— Specifies the display of all circuit packs that can be assigned stations (including DS1 circuit packs for remote stations). All assigned ports are displayed.
- **trunks**— Specifies the display of all circuit packs that can be used for administering trunks. All assigned ports are displayed.

## Examples

```
list configuration carrier 2c schedule
list configuration port-network 5
list configuration stations print
```

## Output

Assigned Ports:

- **Board Number**— The functional name of the circuit pack.

- **Code** — The TN or UN code and suffix of the circuit packs are displayed.
- **Vintage 00000000-065535 KKKKKK**— The vintage number of the circuit pack.
- **no board** — The circuit pack is administered but not physically installed.
- **conflict** — The circuit pack administered to the slot differs from the circuit pack that is physically installed.
- **no link** — The T1 link is down to a DS1 circuit pack.

Field definitions:

- **Signaling** —This field is displayed only when "list configuration ds1" option is selected. The contents of the field are the same as the signaling mode administered for the ds1 circuit pack (via add/change ds1 command) or "none" if the circuit pack is not administered.
- **Name** — This field is displayed only when "list configuration ds1" option is selected. The contents of the field are the same as the name administered for the ds1 circuit pack (via add/change ds1 command) or "blank" if the circuit pack is not administered.
- **CSU MOD** — This field is displayed only when "list configuration ds1" option is selected. The field contains the identification number of the Integrated CSU module present on the ds1 circuit pack (TN767E or later / TN464F or later) or "none". If the circuit pack is a TN464E or TN767D, "unknown" will be displayed. If the circuit pack is a TN464D or TN767C or earlier suffix DS1 board, then "n/a" will be displayed.

## Assigned Ports

Each port on the circuit pack is represented by a position corresponding to its circuit number in ascending order from left to right. The assigned ports are not displayed for "list configuration ds1". Two rows are required for circuit packs with more than 8 ports. The position displays one of the following values depending on its administered status:

- **01-16** — The circuit number of an assigned port.
- **u** — The port corresponding to this position exists but is unassigned.
- **t** — The port is not currently assigned and is supported by the Terminal Translation Initialization feature. Ports in this state can be activated by the TTI association sequence.

Each port on a TN556 ISDN-BRI circuit pack can have two BRI endpoints. BRI ports are displayed once when assigned only one endpoint and twice when fully configured with two endpoints.

The following display shows a typical result when **list configuration all** is entered.

```
list configuration all                                     Page 1

**list config software-version**

**list configuration software-version** [memory-resident | long]  
[print | schedule]

This command displays

- Software version numbers and compatibility indexes of the software load modules stored in system memory (RAM) and on the Mass Storage System devices (tape).
- The dates and times when translation and announcement data were last saved to the MSS.
- Information about any software update files that have been applied to the system. See "Software Upgrade" in [Chapter 5, "Routine Maintenance Procedures"](#) for an explanation of software versions and compatibility indexes.

Parameters

|                 |                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------|
| long            | Specifies display of data for both SPEs in a high or critical reliability<br>If not used, only data for the active SPE is shown. |
| memory-resident | Specifies display of RAM-resident files only. Fields for tape data will<br>contain n/a                                           |

Output

If the tape or memory card contains a core dump file, fields for tape or memory card data display coredump. When a core dump is present, all other files on the device are marked invalid.

If the memory card cannot be read at the time the command is entered, the relevant fields display no tape or memory card. (This does not indicate that the system does not recognize the presence of the device.)

Fields in the SPE-B column are blank for standard reliability systems. On high and critical reliability systems, only fields for the active SPE are displayed unless the **long** option is specified.

UPDATE FILE Section

The top half of page 1 of the form displays information pertaining to software field-update files ("patches").

|                                          |                                                                                                                                                                                |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Creation (GMT)<br>Tape and<br>(GMT) Disk | When the update file was originally created, in Greenwich Mean<br>Time (GMT). Note that this is <i>not</i> the time at which the update file<br>was written to the MSS device. |
| Old-Version<br>Tape and Disk             | The software version for which the update was created.                                                                                                                         |
| Old-Identifier<br>Tape and Disk          | Which previous update file this update file expected to find stored in<br>the MSS when it was applied.                                                                         |
| New-Identifier<br>Tape and Disk          | Uniquely identifies the current update file.                                                                                                                                   |

SOFTWARE VERSION Section

This section at the bottom of page 1 of the output form displays information related to the current software-load module stored in memory and in the MSS.

|                                      |                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Memory Resident                      | Version number of the RAM-resident load module.                                                                    |
| Mem Card Resident                    | Version of memory card resident load module. If a memory card is not installed, this field will display “no card”. |
| Update-identifier (Patch Identifier) | This uniquely identifies the update file, if any, that has been applied to memory.                                 |
| Update-state (Patch State)           | The status of the software field-update (“patch”) file id is displayed.                                            |

TRANSLATION DATE Section

This section displays information related to the translation files as stored in memory and the MSS.

|                   |                                                                                                                                                                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Memory Resident   | Date and time marked on the tape or disk when translation data was last read from the MSS into memory. This is stored in SPE memory and is not modified by changes to translation data. A save translation will update this date. If "Date invalid" is displayed, the timestamp does not contain the expected information. |
| Mem Card Resident | The last date and time that translation data was saved to the memory card. This date is read from the memory card at command execution. If a memory card is not installed, this field will display “no card”.                                                                                                              |

PI FW VERSION Section

This section displays information related to the Processor Interface (PI) circuit pack firmware. Information is displayed for the PI circuit pack resident copy as well as the corresponding tape file..

|                |                                                                               |
|----------------|-------------------------------------------------------------------------------|
| PI 1 Resident  | The version of firmware in the first PI circuit pack in the control carrier.  |
| PI 2 Resident  | The version of firmware in the second PI circuit pack in the control carrier. |
| Flash Resident | The version of PI firmware residing on the system flash memory.               |

ANNOUNCEMENT DATE Section

This section displays information related to the announcement files. Information is displayed for the memory resident copy as well as the corresponding MSS file.

|                   |                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mem Card Resident | The last date and time that announcement data was saved to the memory card. If the memory card is not installed, this field will display "no card".. |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|

PKT-CTRL FW VERSION Section

This section displays information related to the Packet Control firmware. Information is displayed for the Packet Control circuit pack resident copy as well as the corresponding tape file..

|                   |                                                                                     |
|-------------------|-------------------------------------------------------------------------------------|
| Pkt-ctrl Resident | The version of firmware in the Packet Control circuit pack.                         |
| Flash Resident    | The version of the Packet Control circuit pack residing on the system flash memory. |

Some things to note when using the **list configuration software-version** command are:

- 1. For simplex systems, the fields under column "SPE\_B are always blank and the optional **Long** qualifier is not part of the command line.
- 2. For a High or Critical Reliability System, the fields under the column of the standby SPE are blank if the optional **long** modifier is not given.
- 3. If the tape or memory card contains a core dump file system, fields for the tape or memory card will contain **coredump**. This is because in a coredump file system all files other than the **coredump** file are marked as invalid.
- 4. If for any reason, MSS can not be read when the command is issued the string **no tape** or **none** for no memory card will be placed in the appropriate fields on the screen. This does not mean that the system thinks there is no tape, only that the software was unable to read the appropriate information when requested.
- 5. If the command is issued using the **memory-resident** option, the fields on the form associated with the tape will contain the string **n/a**.
- 6. When the status of the update field is displayed, the following strings will be used (For more information refer to step 3 of this list):

|                                           |                                                                                                                                                                                                                                                                          |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. none in memory                         | No update has been applied to memory.                                                                                                                                                                                                                                    |
| 2. immediate partially applied            | An error condition that is valid only when an update that is in the process of being applied fails. Check the validity of the update file that was sent, and then check the hardware error log for tape errors, and follow standard maintenance procedures.              |
| 3. all immediate applied deferred pending | A valid update file was received by the switch, and all the immediate sub-patches were applied. This state indicates that there are deferred sub-patches in the update file, and a system reset of the proper level has not occurred since the update file was received. |
| 4. deferred partially applied             | An error condition that is valid only when a update that is in the process of being applied fails. Check the validity of the update file that was sent, and then check the hardware error log for tape errors, and follow standard maintenance procedures.               |
| 5. entirely applied to memory             | The update associated with the memory-resident identifier has been completely applied to memory.                                                                                                                                                                         |

## list disabled-mos

| SOFTWARE VERSIONS   |         |         |
|---------------------|---------|---------|
| COMPATIBILITY INDEX | SPE - A | SPE - B |
| Memory Resident:    | 8.3     |         |
| Tape Resident:      | 8.3     |         |
| Disk Resident:      | 8.3     |         |

This command displays all the MOs that have been maintenance disabled in the system.

### Synopsis

list disabled-MOs [ print | schedule ]

### Permissions

The following default logins may execute this command: inads, init.

### Examples

list disabled-MOs  
list disabled-MOs print  
list disabled-MOs schedule

### Description

This command will display a list of the specific MOs that have been disabled with the disable MO, disable MO-all, or disable all commands.

### Defaults

No defaults.

Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| print    | This will cause the report to be printed if a printer is linked to the SAT.                                                                                                                                                                                                                                                                                                                                                                               |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

Help Messages

If the system technician presses help after entering "list disabled-MOs" the following message will be displayed:

[ 'print' or 'schedule' ]

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy, try again later

Output

---

|                  |                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maintenance Name | The type of maintenance object or group of maintenance objects that have been disabled. "ALL" is also valid.                                                                                                                      |
| Location         | The physical location of the maintenance object that has been disabled. This field displays blanks if all maintenance objects have been disabled (disable all) or all MOs of a specific type have been disabled (disable MO-all). |
| Status           | Whether the maintenance object or group of maintenance objects is "Enabled" or "Disabled."                                                                                                                                        |

Command successfully completed
```

### Feature Interactions

---

None.

### list history

---

This command generates a log listing of the most recent "data affecting" administration and maintenance commands.

### Synopsis

---

list history [ print | schedule ]

### Permissions

---

The following logins may execute this command: browse, system technician, cust, inads, init, nms.

### Examples

---

list history  
list history print  
list history schedule

### Description

---

The list history command generates a log listing of the most recent "data affecting" administration and maintenance commands successfully completed.

Data commands are those administration and maintenance commands that change the data state associated with any object and qualifier in the system. Administration data commands affect translation data while maintenance data

commands affect state information. For example, "change station" would be classed as a data command, whereas "display station" would not.

All information in the transaction log is saved on tape as translation data when the "save translation" command is performed (LIFO order). When the switch COLD I starts or reboots, the saved translation, and thus the transaction log, will be loaded from tape. In this way, the translation data and the data in the transaction log will remain compatible.

Defaults

None.

Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| print    | This will cause the report to be printed if a printer is linked to the SAT.                                                                                                                                                                                                                                                                                                                                                                               |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [2] for more details. |

Help Messages

If the system technician presses HELP after entering "list history", the following message is displayed:

```
[ 'print' or 'schedule' ]
```

Error Messages

None.

Output

---

|      |                                                                                                     |
|------|-----------------------------------------------------------------------------------------------------|
| Date | The date the command was issued. Format "mm/dd" where "mm" is the month and "dd" is the day.        |
| Time | The time the command was issued. Format "hh:mm" where "hh" is the hour and "mm" is the minute.      |
| Port | The port field indicates the port type to which the user was connected when the command was issued. |

| Port Number | Board                         | List History Display |
|-------------|-------------------------------|----------------------|
| 0 - 30      | EPN Maintenance Board Port    | MAINT                |
| 31 - 40     | System Access Port            | SYS-PORT             |
| 41          | Maintenance Board Port        | SYSAM-LCL            |
| 42          | Remote Maintenance Board Port | SYSAM-RMT            |

- Login

The login of the user performing the data command; for example "system technician."
- Actn

The first word (verb) of the command, specifying the operation to be performed. This field is truncated after four characters to allow enough space for objects and qualifiers. Four characters is enough to uniquely identify each action.
- Object

The second phrase of the command specifying the particular thing being acted upon by the command. Note: Where the object is multiple words in length, only the first word will be displayed in the object field. All succeeding words will be treated as qualifiers. This field is truncated after twelve characters to allow enough space for qualifiers. Twelve characters is enough to uniquely identify each object.
- Qualifier

One or more qualifiers which specify the characteristics of the action/object pair. This field is truncated after 31 characters to keep information for a command on a single line.

The following output is for the **list history** command.

```
list history                               Page 1   SPE A

```

**Feature Interactions**

The translation log is written to the memory card as translation data when the **save translation** command is executed. The translation data is time stamped when saved. This time stamp is noted when translation is loaded from the memory card and included in all recent change history reports.

When a user requests a recent change history report, there could be other users concurrently issuing data commands and altering the contents of the transaction log. Therefore, if the user pages the entire way through the report, the oldest entries in the transaction log may have been overwritten by data commands issued by these other users. Should this occur, the final entries of the report will show the data commands which have been issued by these other users since the recent change history report was originally requested.

Use of the maintenance command "set time" to alter the system clock could make it look as if the recent change history report is not in true LIFO order.

A maximum of 250 commands are stored in the transaction log.

**list isdn-testcall**

This command displays the ISDN-PRI trunks in use for ISDN-PRI test calls.

## Synopsis

---

list isdn-testcall [ schedule | print ]

## Permissions

---

The following logins may execute this command: system technician, inads, init.

## Examples

---

list isdn-testcall  
list isdn-testcall print  
list isdn-testcall schedule

## Description

---

The list isdn-testcall command lists all of the ISDN-PRI trunks that are currently in use for ISDN-PRI test calls in the system. This command is useful to determine which trunk is in use for an outgoing ISDN-PRI test call.

## Defaults

No defaults.

## Parameters

- |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |
| print    | This parameter will cause the output to be printed by a printer at the SAT.                                                                                                                                                                                                                                                                                                                                                                               |

### Help Messages

If the system technician presses help after entering "list isdn-testcall" the following message will be displayed:

[ 'print' or 'schedule' ]

### Error Messages

If the software data cannot be sent to the SAT, the following message will be displayed:

Error encountered, can't complete request.

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy

### Output

|            |                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| B-Channel  | This field displays the trunk in use for the ISDN-PRI test call (trunk group number/ member number).                                                  |
| Start Time | The time the test call started (DD/HH:MM).                                                                                                            |
| Duration   | The expected duration of the test call.                                                                                                               |
| M/T Port   | The TN771 Maintenance/Test circuit pack's digital port address(cabinet/carrier/slot/circuit) in use for the outgoing asynchronous ISDN-PRI test call. |

```

```

### Feature Interactions

None.

## list marked-ports

This command lists all the ports that have been marked unusable.

### Synopsis

list marked-ports [ print | schedule ]

### Permissions

The following default logins may execute this command: bcms, browse, system technician, cust, inads, init, rcust.

### Examples

list marked-ports  
list marked-ports print  
list marked-ports schedule

### Description

The list marked-ports command displays all of the ports that have been marked unusable via the mark port command. For more information on the mark port command, refer to the ["mark port"](#) command description in this chapter.

A maximum of fifteen marked ports are displayed per page.

### Defaults

No defaults.

### Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| print    | If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.                                                                                                                                                                                                                                                                                            |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

Help Messages

If the system technician presses help after entering "list marked-ports" the following message will be displayed:

[ 'print' or 'schedule' ]

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy, try again later

Output

|            |                                                                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port       | The port address (cabinet-carrier-slot-circuit) of the marked port.                                                                                                                                              |
| Board-Type | The type of circuit pack containing the marked port. If this circuit pack information is no longer available because the circuit pack was removed after the port was marked, the Board-Type field will be blank. |

For the following output example, the command entered was "list marked-ports."

```
list marked-ports

      Port      MARKED-PORT INFORMATION
      Board-Type
1C0101      DIG-BD
1C0601
1C0702      DIG-BD

# list measurements

---

This command lists reports summarizing measurements associated with DS1 board. **The list measurements command has many more options than those that are documented here. Only those options dealing with DS1 board are documented below.**

## Synopsis

---

list measurements ds1 [ log | summary ] ds1\_location [ print | schedule ]

## Permissions

---

The following logins may execute this command: browse, system technician, cust, inads, init, nms, bcms, rcust.

## Examples

---

list measurements ds1 log 2a18  
list measurements ds1 summary 2a18 print  
list measurements ds1 summary 2a18 schedule

## Description

---

The "list measurements ds1" command provides performance measurements on a DS-1 link. The "ds1 summary" option provides a summary report while the "ds1 log" option provides a detailed report.

The performance measurements of a DS-1 link indicate the quality of the DS-1 physical interface between the system and a far end system.

## Defaults

None.

Parameters

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ds1_location | The physical location of a DS1 circuit pack entered as cabinet-carrier-slot.                                                                                                                                                                                                                                                                                                                                                                              |
| print        | This will cause the report to be printed if a printer is linked to the MGR1 terminal.                                                                                                                                                                                                                                                                                                                                                                     |
| schedule     | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [2] for more details. |

Help Messages

If the system technician presses HELP after entering "list measurements ds1", the following list of options is displayed:

log            summary

If the system technician presses HELP after entering "list measurements ds1 log" or "list measurements ds1 summary", the following message is displayed:

Enter board location: [cabinet(1-3)];carrier(A-E);slot(00-20),  
                          ['print' or 'schedule']

Error Messages

If the user enters an invalid format for a board location when entering a "list measurements ds1 log" or "list measurements ds1 summary" command, the following error message is displayed:

"entered value" Invalid slot address for DS1 board

If the user enters a board location that is not a DS1 board location or the location of an unadministered DS1 when entering a "list measurements ds1 log" or "list measurements ds1 summary" command, the following error message is displayed:

DS1 board has not been administered

If the user enters anything other than "log" or "summary" following "list measurements ds1", the following error message is displayed:

"entered value" is an invalid entry; please press HELP

If the system time has not been set correctly, after entering "list measurements ds1 log ds1\_location" or "list measurements ds1 summary ds1\_location" the following error message is displayed:

Cannot get time from system clock

Output

The following field descriptions pertain to the summary reports accessed by the "list measurements ds1 summary" command.

|                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Counted Since:                                          | The start time and date when the associated measurement counters were cleared or the DS1 circuit pack was administered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Number of Seconds Elapsed Into Current 15-min Interval: | The number of seconds from the beginning of the current 15-minute interval. This field has a value from 0 to 900.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Total of Valid 15-min Intervals in Past 24-hr Period:   | The total number of 15-minute intervals in the past 24-hour period that contain valid data. This field has a value from 0 to 96.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Category                                                | <p>The four categories correspond to four measurement error counters. The four categories are "Errored Seconds," "Bursty Err Secs," "Severely Err Secs," and "Failed Seconds". The meanings of each category follow:</p> <ul style="list-style-type: none"><li>■ The value of the errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.</li><li>■ The value of the bursty errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.</li><li>■ The value of the severely errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.</li><li>■ The value of the failed seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.</li></ul> |

|                            |                                                                                                                                                                                                                                                                                                                      |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Worst_15-Min_Interval      | The date(Date), end time(Time), and error count (Count; from 0 to 900 in increments of four) of the 15-minute interval in the previous 24-hour period that contains the maximum value for each of the four error categories (errored seconds, bursty errored seconds, severely errored seconds, and failed seconds). |
| Total of 24-Hour Count     | The sum of all valid 15-minute counts for the previous 24-hour period for each of the four error categories. This field has a value from 0 to 65535.                                                                                                                                                                 |
| Current 15-Minute Interval | The error count for the current (incomplete) 15-minute interval for each of the four error categories. This field has a value from 0 to 899 or N/A if the data for the current 15-minute interval is invalid.                                                                                                        |

The following field descriptions pertain to the detailed reports accessed by the "list measurements ds1 log" command.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Counted Since:    | The start time and date when the associated measurement counters were cleared or the DS1 circuit pack was administered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DATE              | The date of the 15-minute interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TIME              | The time of the 15-minute interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ERRORED SECONDS   | The value of the errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| BURSTY ERR SECS   | The value of the bursty errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SEVERELY ERR SECS | The value of the severely errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| FAILED SECONDS    | The value of the failed seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| VALID INTERVAL    | This field indicates whether the data for the specified 15-minute interval is valid. Data is considered valid when a count for that 15-minute interval. If the field has a value of "y", the data for the four error categories is valid; otherwise, the data is invalid. Data is considered valid when a count for that 15-minute interval is retrieved and none of the following invalid conditions occur. Data is invalid if a system warm start or a system cold start occurred during the interval, if the DS1 circuit pack was not inserted during the interval, if the system time was changed during the interval, or if the system was too busy to respond to a poll request for the interval. |

The following output examples show all of the four different DS1 reports.

Feature Interactions

None.

list mst

This command will allow the user to display messages in the MST buffer.

Synopsis

```
list mst from message number count number [ continuous | LIFO | FIFO ]
auto-page

[ schedule | print ]
```

Permissions

The following logins may execute this command: inads, init.

Examples

list mst continuous  
list mst continuous auto-page  
list mst LIFO  
list mst from 222 count 7

Description

This command is used to display the messages in the trace buffer. It can be used when the trace is disabled or active, but if active, older messages may be sporadically omitted if wraparound is selected and the message rate is high. This command can be used repeatedly without destroying the integrity of the buffer.

Defaults

The default for the command is to display all messages in FIFO order, i.e., until the displayed message momentarily catches up with the newest message, and not "auto-page".

Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| from message number | The message number to start the display may be entered. If the message number specified is not in the buffer, then that will be indicated on the display, and no additional messages will be displayed. If this clause is omitted, then the messages will be displayed starting with the oldest in the buffer for FIFO and for "continuous". For LIFO, the display will start with the newest message in the buffer. |
| continuous          | The display will be updated as new messages enter the trace buffer. The messages will be displayed in FIFO order. This option is most useful in conjunction with "auto-page". The list continuous command will terminate only when canceled by the user.                                                                                                                                                             |
| count               | The count of messages to display may be used to limit the trace                                                                                                                                                                                                                                                                                                                                                      |
| LIFO                | The messages will be displayed with the current newest message first.                                                                                                                                                                                                                                                                                                                                                |
| FIFO                | The messages will be displayed in the order received.                                                                                                                                                                                                                                                                                                                                                                |

|           |                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto-page | The screen will automatically page when full. When used in combination with "continuous" this provides a nice way to "watch" the trace as messages arrive. |
| schedule  | This parameter will allow access to the system printer feature. The "continuous" option may not be combined with this option.                              |
| print     | This parameter will cause the output to be printed by a printer at the SAT.                                                                                |

Help Messages

If the user presses HELP after entering "list mst" the following message will be displayed:

```
Enter [ 'from' 0-32767 ] [ 'count' 1-9998 ]  
      [ 'fifo' or 'lifo' or 'continuous' ]  
      [ 'auto-page' ] [ 'print' or 'schedule' ]
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Output

The responses will be displayed on a message by message basis with one or more lines of data displayed for each message traced.

|           |                                                                                             |
|-----------|---------------------------------------------------------------------------------------------|
| Number    | The sequence number for the message.                                                        |
| Date/Time | The Date/Time.                                                                              |
| Type      | MST message type, ex. 60 == ISDN uplink, 62 == ISDN downlink, 6C == ISDN level 2 primitive. |
| Message   | Message text in hexadecimal (ISDN or X.25).                                                 |

For the following output example, assume that the command that was entered was "list mst", and that timestamps were enabled via the "change mst" command.

```
list mst

                                MST DATA

Number  Date/Time    Type  Message
 1    12/21/90
    14:30:21.220  62   00 00 74 17 08 02 00 11 05 04 03 80 90 a2 18

Table 8-2. Summary of MST Message Types — Continued

| Message Type Encode | Description                                            |
|---------------------|--------------------------------------------------------|
| 0xA0                | X.25 Outgoing application data message                 |
| 0xA1                | X.25 Incoming application data message                 |
| 0xA2                | X.25 Application error message                         |
| 0xB0                | X.25 Outgoing session layer control message            |
| 0xB1                | X.25 Incoming session layer control message            |
| 0xCF                | X.25 Message confirmation                              |
| 0xD0                | X.25 Outgoing processor channel control message        |
| 0xD1                | X.25 Incoming processor channel control message        |
| 0xD2                | X.25 Link control message                              |
| 0xD3                | X.25 Link status message                               |
| 0xE2                | X.25 Session Timer Expirations                         |
| 0xF0                | X.25 Error Message (Outgoing Message Lost)             |
| 0xF1                | X.25 Unrecognized Messages                             |
| 0xF2                | X.25 Error Message (DIP ICOM Record Aborted) (R2 Only) |
| 0xF9                | Snapper instrumentation message                        |
| 0xFA                | Snapper continuation message (for large msgs)          |

Detailed description of Messages\*\*

Note that the X.25 messages discussed below really follow the BX.25 Message Protocol.

\*\* The R2 message set will be defined in the document, *OSS Interface Requirement for the Definity Generic 2.2 ISDN-PRI/DCIU Message Sequence Tracer*, COMPAS ID 7459DR.

The terminology Message[n] used below refers to the byte at offset n in the message being displayed.

MST message types contain a version number. Whenever the structure of the MST message changes, the version field in the MST buffer will be changed.

Version 1 ( default) displays a blank in the version field which is immediately after the MST message type field. Subsequent versions display the version number after the MST message type field and are connected with a '-'. For example: Version 2 of the X.25 Application error/notification message has added the text of the pm state table stimulus which was ignored.

Version 1 of MST message type 0xA2 would appear on the 'list mst' output:

| Number | Date/Time    | Type | Message |
|--------|--------------|------|---------|
| 1      | 11:41:22:425 | A2   | 17 10   |

Version 2 of MST message type 0xA2 would appear on the 'list mst' output:

| Number | Date/Time    | Type  | Message                 |
|--------|--------------|-------|-------------------------|
| 90     | 12:41:14:112 | A2-02 | 17 10 21 03 32 05 01 80 |

**Vector Trace**

---

Message type: 0x10

Message format:

- Message[1-4] = call identifier (CID) (defined in \$BASEPJ/hdrs/capro.h)
- Message[5-6] = vector number (defined in \$BASEPJ/hdrs/dpm\_calls.h)
- Message[7] = step number (defined in \$BASEPJ/hdrs/callr.h)
- Message[8] = step type (defined in \$BASEPJ/hdrs/dpm\_calls.h)
- Message[9] = step state (defined in \$BASEPJ/hdrs/dpm\_calls.h)
- Message[10-12] = VDN
- Message[13] = port network number
- Message[14] = endpoint number
- Message[15] = angel number
- Message[16] = circuit number
- Message[17-20] = trunk number
- Message[21+] = auxiliary data (based on step type)

**Vector Event Trace (D92 Only)**

---

Message type:

0x11

Message format:

Message[1-4] = cid (defined in \$BASEPJ/hdrs/capro.h)

Message[5-6] = event

Message[7+] = auxiliary data (based on event)

Events are defined in \$BASEPJ/hdrs/evnt\_defs.h. Events based on the call\_p will have the following auxiliary data:

Message[7-8] = vector number

Message[9-10] = step number

Events based on the grp\_m will have the following auxiliary data:

Message[7-10] = hunt group number

## **IMT (D92)**

---

The messages described in this section cannot be controlled directly through any of the MST screens. They are enabled/disabled through TCM but their output goes to the MST buffer. See [IMT] for details on these messages.

A read-only field in the "change mst" screen, "Other Tracing?", alerts the user that one or more of these types of messages is enabled.

### **0x21 - IMT proc\_errs**

Message format:

Message[1-4] = process number(lname)

Message[5-8] = sequence number (defined in \*.p/hdrs/main\_err.h, for example: \$BASEPJ/gmtce.ss/hmm.p/hdrs/main\_err.h)

Message[9-12] = data 1

Message[13-17] = data 2

### **0x22 - IMT crec**

Message format:

Message[1+] = call record (defined as CALLR typedef in \$BASEPJ/hdrs/callr.h)

## 0x23 - MT\_IMT (miscellaneous IMT hooks)

This message type is for miscellaneous IMT hooks. The only sub-type currently available is for a debug button (dbut). The button number is provided in the debug button MST message so that more than one button can be administered (through IMT) to convey different meanings. For example, depression of button N could signify the start of the problem symptoms, while depression of button N + X could signify the end of the problem symptoms. Note that the button number being logged represents the position of a button on a particular set type, and will be different depending on set type and module type (feature, coverage, display, ...), etc. The mapping of the button number stored in the IMT\_BUT\_DEBUG MST message to a position on the set is not trivial, however, the debug buttons can be administered through TCM, debug button filtering enabled through TCM and MST enabled using the 'enable mst' command and the resultant messages sent to MST when each button is depressed can be examined for the button data and noted.

Message format:

Message[1] = 0x01 (debug button sub-type, IMT\_BUT\_DEBUG)  
Message[2-3] = button number  
Message[4-7] = user id

## 0x40 - internal message tracing of call\_p, conn\_m, grp\_m, serv\_d, suser\_m

Message formats: conn\_m, grp\_m, and suser\_m:

Message[1-4] = user identifier  
Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)  
Message[7+] = standard message (depends on hook type)

serv\_d (map-type messages):

Message[1-4] = user identifier  
Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)  
Message[7] = STIM type  
Message[8-11] = service identifier  
Message[12] = port network number  
Message[13] = endpoint number  
Message[14] = angel number  
Message[15] = circuit number

- Message[3] = angel number
- Message[4] = circuit number
- Message[5-6] = hook identifier (defined in \$BASEPJ/hdrs/mstencode.h)
- Message[7-10] = link identifier
- Message[11+] = standard packet message

**ASAI**

---

ASAI messages listed on the MST screen consist of a 4 octet header and a variable length body. The header contains the ASAI port address encoded with 8 hexadecimal digits. This same encoding is also used for BRI and PRI.

In message types other than 50 and 51 (Level 2 Primitives), following the port address is a one octet field called the qualifier. The meaning of the qualifier varies according to the type (as specified by the MST encode) of ASAI message

traced. The body which is a real ASAI message (except for Level 2 Primitives) follows the qualifier.

When the display is administered for abbreviated format, the body contains only the initial part of the ASAI message (all information in beginning of message up to and including the Q.931 IE tag) plus the cause IE (if present).

## 0x50 - ASAI level 2 uplink primitive

Message[1] = Port Network Number of ASAI port

Message[2] = reserved

Message[3] = Carrier Address of ASAI port

Message[4] = Port number of ASAI port

Message[5] = SAPI

Message[6] = TEI

R1:

Message[7,8] = Link ID

Message[9] = Uplink encode  
0x01 - ASAI Link State  
0x02 - TEI Management Message  
0x03 - XID Message

Message[10] = R1/R3 Link States:  
0x00 - the link has gone down  
0x01 - the link has come up  
0x02 - the link id has changed  
0x03 - the link has gone hyperactive  
0x04 - the link has recovered  
0x05 - the audit recovery stim  
0x06 - the link has been reset  
0x07 - link state hyper (too many SABMEs) disconnect  
0x08 - broadcast link audit

= R1/R3 TEI Management Message  
0x01 - Identity request  
0x05 - Identity Check Response  
0x07 - Identity Verify Request

= R1/R3 XID Messages  
0x01 - XID Request  
0x02 - XID Response

R3:

Message[7-10] = Link ID

Message[11] = Uplink encode  
0x01 - ASAI Link State  
0x02 - TEI Management Message  
0x03 - XID Message

Message[12] = ASAI Link State:  
0x00 - the link has gone down  
0x01 - the link has come up

## 0x6C - ISDN PRI level 2 uplink primitive

- Message[1] = Port Network Number of D-channel port
- Message[2] = Reserved
- Message[3] = Carrier Address of D-channel port
- Message[4] = Port number of D-channel port
- Message[5] = change type

R1/R3 change types:

0x01 - session up notification

0x02 - Session down notification

0x6D - ISDN PRI level 2 downlink primitive (not implemented)

- Message[1] = Port Network Number of D-channel port
- Message[2] = Reserved

- Message[3] = Carrier Address of D-channel port
- Message[4] = Port number of D-channel port
- Message[5] = change type

R1/R3 change types:  
0x01 - link establish request  
0x02 - link release request

0x6E - ISDN PRI Unrecognized Messages

- Message[1] = Port Network Number of D-channel port
- Message[2] = Reserved
- Message[3] = Carrier Address of D-channel port
- Message[4] = Port number of D-channel port
- Message[5] = type of failure

Types of failure:  
0x01 - outgoing ISDNPRI  
0x02 - incoming ISDNPRI

- Message[6+] = standard ISDN format

0x6F - ISDN BRI Unrecognized Messages

- Message[1] = Port Network Number of BRI port
- Message[2] = Reserved
- Message[3] = Carrier Address of BRI port
- Message[4] = Port number of BRI port
- Message[5] = SAPI
- Message[6] = TEI

R1:

- Message[7,8] = Link ID
- Message[9] = type of failure

Types of failure:

0x01 - outgoing ISDN  
0x02 - incoming ISDN

Message[10+] = standard ISDNBRI format

R3:

Message[7-10] = Link ID

Message[11] = type of failure

Types of failure:

0x01 - outgoing ISDN  
0x02 - incoming ISDN

**NOTE:**

In abbreviated format, the header of the Q.931 message, the cause IE (if present) and the channel id IE (if present) are the only IEs present.

An additional cancel byte (0xCA) may be present after the standard ISDNBRI formatted message if the message was not sent. The cancel byte will not be appended if the abbreviated format is selected.

## **General**

---

### **0x71 - GAP marker**

Message[1] = GAP reason

Message[2] = GAP count (since last clear - high byte)

Message[3] = GAP count (since last clear - low byte)

GAP reasons:

0x01 - disabled, disable mst command executed  
0x02 - disabled, mst timer expired  
0x03 - disabled, buffer full on no-wrap  
0x04 - disabled, restart occurred  
0x05 - disabled, by stop trigger or count  
0x06 - disabled, audit error  
0x07 - not disabled, stopped by stop trigger or count

**0x72 - Time changed while trace enabled**

Message[1] = 0x00  
Message[2] = timestamp indication

timestamp indication:

0x00 - MST timestamp is old time  
0x01 - MST timestamp is new time

**X.25 Application Data**

---

The processor channel number is the R1/R3 term, and R2 calls it the port number. The processor channel number is equal to the Application port number in R1. In R3, the processor channel admin screen should be inspected to determine the mapping.

**0xA0 - X.25 outgoing application message**

Message[1] = processor channel number  
Message[2] = sequence number  
Message[3] = buffer id  
Message[4] = 0x00  
Message[5+] = application message<sup>1</sup>

---

1. Application messages will contain the session layer data headers and the data.

In abbreviated mode, the application message is not saved.

**0xA1 - X.25 incoming application message**

Message[1] = processor channel number  
Message[2] = sequence number  
Message[3+] = application message

In abbreviated mode, the application message is not saved.

## Application Control

---

### 0xA2 - X.25 application error or notification

**NOTE:**

The 'X.25 application error message' category contains notifications as well as errors.

0xA2, 0xF0 and 0xF2 messages will be turned on by responding 'y' to the 'Application Errors?' field.

Version 1:

Message[1] = processor channel number

Message[2] = application error/notification

Version 2:

Message[1] = processor channel number

Message[2] = application error/notification

Message[3+] = pm stimulus ignored (For message[2] == 0x10 only)

Errors/Notifications:

R1/R3:

- 0x01 - no outgoing buffer available
- 0x05 - pvc session down
- 0x06 - pvc session up
- 0x07 - pvc session connect
- 0x08 - pvc session restart
- 0x09 - message buffer overload uplink
- 0x0A - message buffer overload downlink
- 0x0B - message buffer exhaustion
- 0x0C - max # of outgoing msgs allowed
- 0x0D - bad msg type in message buffer routine
- 0x0E - no message buffers available
- 0x0F - message buffer pointer error
- 0x10 - pm state table stimulus ignored
- 0x11 - bad session connect message

## Session Layer Control

---

**NOTE:**

The session layer header is considered part of the session layer message.

## **0xB0 - X.25 outgoing session layer control message**

Message[1] = processor channel number  
Message[2] = session layer message type  
Message[3] = buffer id  
Message[4] = 0  
Message[5+] = session layer message

session layer message type:

0x00 - session connect  
0x01 - session accept  
0x02 - session reject  
0x03 - session disconnect  
0x04 - reserved  
0x05 - reserved  
0x06 - resynch  
0x07 - reserved  
0x08 - resynch acknowledge

In abbreviated mode, the session layer message is not saved.

## **0xB1 - X.25 incoming session layer control message**

Message[1] = processor channel number  
Message[2] = session message type  
Message[3+] = session message

session message type:

0x00 - session connect  
0x01 - session accept  
0x02 - session reject  
0x03 - session disconnect  
0x04 - reserved  
0x05 - reserved  
0x06 - resynch  
0x07 - reserved  
0x08 - reserved

In abbreviated mode, the session layer message is not saved.

**0xCF - message confirmation**

This confirmation is X.25 far end confirmation.

- Message[1] = processor channel number
- Message[2] = internal buffer id
- Message[3] = count of outgoing buffers confirmed

**Processor Channel Control**

---

**0xD0 - outgoing control message**

- Message[1] = processor channel number
- Message[2] = message event

Message events for R1:

- 0x00 - Request Reset of Logical Channel
- 0x05 - Ack. Reset of Logical Channel
- 0x06 - Flow Control Uplink
- 0x07 - Release Uplink Flow Control
- 0x0A - Flow Control Downlink
- 0x0B - Release Downlink Flow Control

Message events for R3:

- 0x00 - Request Reset of Logical Channel
- 0x08 - Connect Processor Channel
- 0x09 - Disconnect Processor Channel
- 0xD1 - X.25 incoming control message

- Message[1] = processor channel number
- Message[2] = message event

R1 Message events:

- 0x01 - Performed Requested Reset of Logical Channel
- 0x06 - Resetting Logical Channel
- 0x0A - Level 3 Restart<sup>1</sup>

R3 Message events:

---

1. If this event occurs, one restart for each logical channel will be written into the MST trace.

- 0x01 - Performed Requested Reset of Logical Channel
- 0x06 - Resetting Logical Channel
- 0x08 - processor channel connected
- 0x09 - processor channel disconnected

**Link Control**

---

**0xD2 - link control**

- Message[1] = interface link number
- Message[2] = message event

R1 Message events:

- 0x00 - Busy Out Link
- 0x01 - Release Busied Out Link
- 0x0A - Level 3 Restarting

R3 Message events:

- 0x00 - Stop Link
- 0x01 - Start Link
- 0x0A - Level 3 Restarting

**0xD3 - link status (R3 Only)**

- Message[1] = interface link number
- Message[2] = message event

R3 Message events:

- 0x02 - Session Down
- 0x03 - Session Up

**Session Sanity**

---

**0xE2 - X.25 Session Timer Expirations**

- Message[1] = processor channel number
- Message[2] = timer

Timers:

0x00 - ST2(session connect)  
0x01 - ST3(retransmission)

Message[3] = countdown from A1

0x02 - ST4(resynchronization)

No count

0x03 - ABT1(abort session 1)

Message[3] = protocol machine state where timeout occurred

0x04 - ABT2(abort session 2)

Message[3] = protocol machine state where timeout occurred

0x05 - State Timer

Message[3] = protocol machine state where timeout occurred

0x06 - Message Timer

Message[3] not used

Protocol Machine States:

|             |                                                     |

0xF0 - X.25 Error Message (Outgoing Message  
Lost)

Note that 0xA2, 0xF0 and 0xF2 messages will be turned on by responding 'y' to the 'Application Errors?' field.

Version 1:

- Message[1] = processor channel number
- Message[2] = sequence number
- Message[3+] = message

Version 2:

- Message[1] = processor channel number
- Message[2] = sequence number
- Message[3] = reason code
- Message[4+] = message

Reason Codes:

- 0x00 /\* message lost \*/  
/\* 1 reserved \*/
- 0x02 /\* message ignored, sequence number is within window but less  
\* than expected  
\*/
- 0x03 /\* message ignored, bad sequence number \*/
- 0x04 /\* message ignored, other port has sent a disconnect message \*/
- 0x05 /\* message ignored, send request is rejected\*/
- 0x06 /\* message ignored, from ig\_l3 \*/
- 0x07 /\* message ignored, from l3\_err \*/
- 0x08 /\* sequence number is within window but less  
\* than expected (resync)  
\*/
- 0x09 /\* bad sequence number (resync) \*/

In abbreviated mode, the application message is not saved.

0xF1 - Unrecognized X.25 Messages

- Message[1] = processor channel number
- Message[2] = Failure type
- Message[3+] = session message

- Failure types:
- 0x00 - Reserved
  - 0x01 - Unknown session layer message type
  - 0x02 - unrecognized control message

0xF2 - BX.25 Error Message (DIP ICOM Record Aborted)

R2 only

Feature Interactions

See documentation on the system printer feature.

list suspend-alm-orig

This command lists entries in the Suspend Alarm Origination table.

Synopsis

list suspend-alm-orig [print | schedule].

Examples

list suspend-alm-orig  
list suspend-alm-orig print  
list suspend-alm-orig schedule

Description

This command lists active entries in the Suspend Alarm Origination table. Even though this command only lists active entries, an entry that expires during the list process still appears in the output. If the Suspend Alarm Origination table is empty, the output would only contain the title and field headings.

Parameters

- Print

This option causes the report to be printed if a printer is linked to the SAT.
- Schedule

When the schedule option is specified, the command validates and a schedule form displays to allow the technician to schedule execution of the command at a specified time. The information displayed by the command is sent to the system printer instead of the screen.

Help Messages

[ 'print' or 'help' ]

Output

```
list suspend-alm-orig

                Suspend Alarm Origination Entries

Physical      Board      Expires At
01C03         off-only    06/11/15:06
01E0407       on-and-off  06/11/17:26
01E0406       on-and-off  06/12/45:34
```

Feature Interactions

None.

list testcalls

This command generates an Automatic Transmission Measurement System (ATMS) measurement report.

## Synopsis

---

*list testcalls detail [ grp group number to-grp group number mem member number to-mem member number | port location ] [ result result identifier | not-result result identifier ] count count number [ print | schedule ]*

*list testcalls summary grp group number to-grp group number count count number [ print | schedule ]*

## Permissions

---

The following logins may execute this command: browse, system technician, cust, inads, init, nms.

## Examples

---

**list testcalls detail**  
**list testcalls detail print**  
**list testcalls detail grp 78**

**list testcalls summary to-grp 78 count 7 schedule**

## Description

The list testcalls command is used to examine ATMS trunk measurements. The ATMS is a feature which allows the voice and data trunk facilities to be measured for satisfactory transmission performance. The performance of the trunks are evaluated according to measurements produced by a series of analog tests and are compared against user defined threshold values. The list testcalls command is a reporting mechanism designed to display the measurements produced by these tests.

The measurement report contains data on trunk signal loss, noise, singing return loss, and echo return loss. The purpose of the report is to provide measurement data to help determine the quality of trunk lines.

The measurements are produced by a set of analog trunk tests. The tests are initiated by a maintenance demand test or by a set of scheduled tests. The largest portion of these measurements are generated through scheduled testing during system quiet hours (hours where the traffic volume is low). Each trunk test performed by the system stores the results in a database. The trunk measurements in this database reflect the state of each trunk at the time of its last test.

## Defaults

None.

## Parameters

|                     |                                                                                                                                                                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| detail              | This option specifies that a detailed measurement report is displayed (See example of the screen).                                                                                                                                                  |
| summary             | This option specifies that a summary measurement report is displayed (See example of the screen).                                                                                                                                                   |
| grp group number    | This option is used to specify that measurements for a specific trunk group are displayed. When used with the "to-grp" option, this option is the starting trunk group in a range of user specified trunk groups.                                   |
| to-grp group number | This option is used to specify that measurements for all trunk groups from 1 to the specified "to-grp" trunk group are displayed. When used with the "grp" option, this option is the ending trunk group in a range of user specified trunk groups. |
| mem member number   | This option is used to specify that measurements for a specific trunk group member are displayed. When used with the "to-mem" option, this option is the starting trunk group member in a range of user specified trunk group members.              |

## Error Messages

If there are no records in the measurements database, the following message is displayed:

No data in the system to list

If an invalid identifier is entered, the following message is displayed:

"identifier" is an invalid entry; please press HELP

If an invalid count identifier is entered, the following message is displayed:

"identifier" is an invalid identifier; press RETURN to execute modified  
command

If an invalid port location or unadministered port location is entered, the following message is displayed:

"identifier" Identifier invalid

If the user entered trunk group number or the trunk group member number is not within a valid range, the following message is displayed:

Entry out of range

If the user entered trunk group number or the trunk group member number is not administered, or the user entered result is not found, the following message is displayed:

No records match the specified query options

| TTL Type           | The kind of test line for this trunk group.                                                                                                                                                                                                                                                                                   |
| Threshold Values   | <p>The list of marginal and unacceptable threshold values defined on the trunk group form.</p> <p>The following fields appear on the lower section of the form. Many of the column headings contain the abbreviations "FE" for far end and "NE" for near end. These abbreviations define which end took the measurements.</p> |
| Trk Mem            | The trunk member within the trunk group.                                                                                                                                                                                                                                                                                      |
| Test Date          | The month and day this trunk was tested.                                                                                                                                                                                                                                                                                      |
| Test Time          | The time of day this trunk was tested.                                                                                                                                                                                                                                                                                        |
| Tst Rslt           | This field describes the results of the trunk transmission test.                                                                                                                                                                                                                                                              |
| 1004Hz-loss Min    | Far-to-near and near-to-far measurements of 1004-Hz loss from low-level tone.                                                                                                                                                                                                                                                 |
| 1004Hz-loss Max    | Far-to-near and near-to-far measurements of 1004-Hz loss at 0 dBm.                                                                                                                                                                                                                                                            |
| Loss dev at 404Hz  | Transmission tests at low frequency. These tests measure a maximum positive and negative deviation of +9 and -9 dB from the 1004-Hz loss measurements.                                                                                                                                                                        |
| Loss dev at 2804Hz | Transmission tests at high frequency. These tests measure a maximum positive and negative deviation of +9 and -9 dB from the 1004-Hz loss measurements.                                                                                                                                                                       |
| C-msg Noise        | Maximum noise interference (in dBrnC: decibels above reference noise, which is B(EQ)10 sup -12E(EQ) watts) terminating on a voice terminal within the voice-band frequency range (500 to 2500 Hz) between 15 and 55 dBrnC.                                                                                                    |
| C-ntch Noise       | Maximum signal-dependent noise interference on a line between 34 and 74 dBrnC.                                                                                                                                                                                                                                                |

- SRL-LO

Singing return loss from 0 to 40 dB between the sum of the circuit (repeater) gains and the sum of the circuit losses. SRL-LO occurs most often in the frequency range of 200 to 500 Hz.
- SRL-HI

Singing return loss from 0 to 40 dB between the sum of the circuit (repeater) gains on a circuit and the sum of the circuit losses. SRL-HI occurs most often in the frequency range of 2500 to 3200 Hz.
- ERL

Echo return loss from 0 to 40 dB between the level of signal strength transmitted and the level of signal strength reflected. ERL occurs most often in the frequency range of 500 to 2500 Hz.

For the following example, the command that was entered is "list testcalls detail grp 80."

```
list testcalls detail grp 80                               Page 1   SPE A

SUMMARY REPORT Output

|                                 |                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trk Grp Num                     | The trunk group number which is being summarized. Only outgoing or two-way analog trunks will be listed.                                                    |
| Num Of Trks                     | The total number of members per trunk group.                                                                                                                |
| Last Test Date                  | The date of the oldest measurement in the trunk group.                                                                                                      |
| Last Test Time                  | The time of the oldest measurement in the trunk group.                                                                                                      |
| Trunks Passed Transm Test       | The number of trunks that have passed the trunk transmission tests.                                                                                         |
| Trunks Failed Marginal Threshld | The number of trunks that failed a marginal threshold, but not an unacceptable threshold according to the threshold values defined on the trunk group form. |
| Trunks Failed Unaccept Threshld | This is taken from the unacceptable threshold administered on the Trunk group form.                                                                         |
| Trks In-Use                     | The number of trunks that were in-use at the time of testing.                                                                                               |
| Trks Not Test                   | The number of trunks that were not tested due to error conditions.                                                                                          |
| Busied Out Trunks               | The number of trunks that were busied out at the time. This could be due to hardware problems, incorrect threshold values, etc.                             |

For the following example, the command that was entered is "list testcalls summary grp 80."

list testcalls summary grp 80

Command successfully completed

mark port

This command marks a port as unusable.

## Synopsis

---

mark port location

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

mark port 1c0208  
mark port 2a1001

## Description

---

The mark port command is used to mark a faulty port as defective to prevent the use of the port in other administrative operations (for example, adding a data-module or station). Ports on any type of circuit pack may be marked except for circuit packs that are administered automatically (for example, Tone Detector, Tone Generator, Announcement, Speech Synthesizer, Call Classifier and Maintenance/Test circuit packs) when the circuit pack is installed. When the mark port command is entered, the specified port is marked. If the port can be administered manually, and if the port is not assigned, then the port is marked as faulty. The port can be restored to service by using the clear port command. All marked ports can be displayed in a list format via the list marked-ports command. All marked port information is saved as part of translations.

## Defaults

No defaults.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                                       |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | A "location" represents the physical position of the port to be marked and is entered as "UUcSSpp" where "UU" represents the cabinet number, "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit (port). A single digit cabinet (1 - 3) may be entered with or without a leading zero (0). |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses help after entering "mark port" the following message will be displayed:

Enter 7 character port number

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy, try again later

Output

If the mark port command is successful the following message will be displayed on the SAT:

Command successfully completed

Feature Interactions

None.

monitor bcms

This command displays real-time status reports for agents and splits summarizing BCMS (basic call management systems).

Synopsis

monitor bcms [ split *split number* | system *system number* | skill *skill number* ]

Permissions

The following default logins may execute this command: init, inads, system technician, cust, rcust, bcms, browse.

Examples

monitor bcms split 1  
monitor bcms system 1 5 7 8 9  
monitor bcms system 1-15  
monitor bcms skill 1

## Description

The monitor bcms command displays output for agents and splits summarizing the bcms condition. This on-line status report is automatically updated every 30 seconds (or by pressing the UPDATE key) until the command is canceled by pressing the CANCEL key. Three display options are available: skill, split, and system.

## Defaults

No defaults.

## Parameters

|               |                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| split         | This specifies that the command display status information for a specified split number (an ACD hunt group).                                                |
| split number  | The split's identity to the switch and BCMS; an ACD hunt group number (split number). This parameter is entered only when the "split" parameter is entered. |
| system        | This specifies that the command display split queue status as well as cumulative split information for all the BCMS measured splits.                        |
| system number | ACD hunt group numbers (split numbers) separated by spaces and/or split number ranges separated by a hyphen ("-").                                          |
| skill         | This specifies that the command display status information for a specified skill number.                                                                    |
| skill number  | The skill's identity to the switch and BCMS; an ACD hunt group number (skill number). This parameter is entered only when the "skill" parameter is entered. |

## Help Messages

If the system technician presses HELP after entering "monitor bcms", the following object command word choices will be displayed:

Please enter one of the following object command words:  
skill                      split                      system  
Or press CANCEL to cancel the command

If the system technician presses HELP after entering "monitor bcms system" the following message will be displayed:

Enter [measured split numbers separated by one space  
and/or split range in the format xx-xx], ['print']  
Or press CANCEL to cancel the command

If the system technician presses HELP after entering command "monitor bcms split" or "monitor bcms skill" the following message will be displayed:

Enter a measured split or skill number(1-99), ['print']  
Or press CANCEL to cancel the command

Error Messages

If the split or skill number entered is non numeric, not administered, or invalid in any other way, the following message is displayed:

Invalid split number

If the split or skill number entered is not measured by BCMS or only measured externally, the following message is displayed:

Split is not measured by Basic Call Management System (BCMS)

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The following output fields are for the "monitor bcms system" command

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date:          | The current date and time which is updated every 30 seconds or when the UPDATE key is pressed.                                                                                                                                                                                                                                                                                                                                                                                             |
| SPLIT          | The name of the split being reported, if no name is administered then the split extension is displayed in the form "EXTxxxxx". Splits are displayed in split number order. This field is translation data.                                                                                                                                                                                                                                                                                 |
| CALLS WAIT     | The number of calls currently waiting in this split's queue. If any of these calls are Direct Agent Calls, the field will be preceded by an asterisk. This field is real-time status data.                                                                                                                                                                                                                                                                                                 |
| OLDEST CALL    | The amount of time that the oldest call has waited in queue. This field is real-time status data.                                                                                                                                                                                                                                                                                                                                                                                          |
| AVG ANSW SPEED | The average speed of answer for this split during the current period. This includes time in queue and time ringing at the agent's voice terminal. Calls that intraflow (calls that overflow from one ACD split to another split) will not have queue time from previous splits included in the average. The calculation is Total Answer Time/Total Automatic Call Distribution (ACD) Calls. This field is measurement data and includes only those calls that have completed (terminated). |

- AVAIL AGENTThe number of agents in this split currently available to receive an Automatic Call Distribution (ACD) call from this split. This field is real-time status data.
- # ABANDThe number of calls that have abandoned during the current period. This field is measurement data.
- AVG ABAND TIMEThe average time abandoned calls waited in queue before abandoning during the current period. The calculation is Total Abandon Time/Total Calls Abandoned. This field is measurement data and includes only those calls that have completed (terminated).
- # ACDThe number of Automatic Call Distribution (ACD) calls handled by this split during the current period. This includes calls that intraflow into the split. This field is measurement data.
- AVG TALKThe average talk time for Automatic Call Distribution (ACD) calls handled by this split during the current period. This does not include ring time at the agents' voice terminal. The calculation is Total ACD Talk Time/Number of ACD Calls. This field is measurement data and includes only those calls that have completed (terminated).
- AVG AFTER CALLThe average After Call Work (ACW) time for Automatic Call Distribution (ACD) calls handled by this split during the current period. ACD calls with no ACW time are included in the average. Time spent on direct incoming or outgoing calls while in ACW will not be included in the average. The calculation is (Total ACW Time - Total ACW Incoming Time - Total ACW Outgoing Time)/Total ACD Calls. This field is measurement data and includes only those calls that have completed (terminated).

The following display was produced by entering the "monitor bcms system" command.

monitor bcms system

Page 1 of 1

BCMS SYSTEM STATUS

Date: 14:02 THU OCT 17 1991

|         | CALLS | OLDEST | AVG  | AVAIL | #     | AVG   | #   | AVG  | AVG   |
|---------|-------|--------|------|-------|-------|-------|-----|------|-------|

| Service | 3     | 1:03   | :45  | 0     | 3     | :30   | 20  | 2:30 | 1:25  |
| Sales   | 5     | :33    | :15  | 0     | 11    | :45   | 36  | 1:32 | :35   |

The following output fields are for the "monitor bcms split" command:

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Split:         | The number of the split requested. This field is translation data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Split Name:    | The name of the split requested. If no name exists the split extension is displayed in the form "EXT xxxxx". This field is translation data.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Date:          | The current date and time which is updated every 30 seconds or when the UPDATE key is pressed.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Calls Waiting: | The number of calls currently waiting in this split's queue. If any of these calls are Direct Agent Calls, the field will be preceded by an asterisk. This field is real-time status data.                                                                                                                                                                                                                                                                                                                                                                |
| Oldest Call:   | The time in minutes:seconds that the current oldest call has waited in this split's queue. This field is real-time status data.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Staffed        | The number of agents currently logged into this split. This field is real-time status data.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Avail          | The number of agents currently available to receive an Automatic Call Distribution (ACD) call in this split. Agents are in either the Auto-in or Manual-in work modes and are not currently on a call. If the agent is on another split's call or in After Call Work (ACW) for another split, this agent is not considered available and will not be recorded here. This field is real-time status data.                                                                                                                                                  |
| ACD            | The number of agents in this split currently on an Automatic Call Distribution (ACD) call for this split. This includes ACD calls that are being handled by this split that arrive as coverage from another split. This field also includes outbound calls (Outgoing Call Manager) that are distributed through the ACD. Note that if an agent puts an ACD call on hold, but does not enter another state (for example, the agent does not enter the AVAIL state), the agent will still be seen as in the ACD state. This field is real-time status data. |
| ACW            | The number of agents in this split currently in After Call Work (ACW) for this split. This field is real-time status data.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| AUX            | The number of agents in this split currently in AUX work for this split. If an agent is on another split's call or in After Call Work (ACW) for another split, this agent is not considered in AUX work and will not be recorded here. This field is real-time status data.                                                                                                                                                                                                                                                                               |
| Extn           | The number of agents in this split currently on non-ACD (Automatic Call Distribution) calls, either incoming or outgoing directly to or from their extensions. If the agents are also in After Call Work (ACW) or AUX they will be recorded as Extn rather than ACW or AUX. This field is real-time status data.                                                                                                                                                                                                                                          |
| OtherSplit     | The number of agents in this split on another split's call or in After Call Work (ACW) for another split. Only used if agents belong to multiple splits. This field is real-time status data.                                                                                                                                                                                                                                                                                                                                                             |

|                |                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AGENT          | The name of the agent associated with the extension. If no name exists this field will be left blank. This field is translation data.                                                                                                                                                           |
| EXT            | The extension of the agent. This field is translation data.                                                                                                                                                                                                                                     |
| STATE          | The current state of the agent for this split. This possible states are Avail, ACD, ACW, AUX, Extn In, Extn Out, OtherSplit, and Unstaff. If an agent is staffed, the agent must also be in one of the above states. This field is real-time status data.                                       |
| TIME           | The clock time that the agent entered the current state in hours:minutes. This field is real-time status data.                                                                                                                                                                                  |
| ACD CALLS      | The number of Automatic Call Distribution (ACD) calls (inbound and outbound), that the agent has completed for this split during the current period (half hour or hour). The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data. |
| EXTN IN CALLS  | The number of non-ACD (Automatic Call Distribution) calls that the agent has received (incoming) and completed during the current period. The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data.                                |
| EXTN OUT CALLS | The number of non-ACD (Automatic Call Distribution) calls that the agent has made (outgoing) and completed during the current period. The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data.                                    |

The following display was produced by entering "monitor bcms split 1".

```
monitor bcms split 1                               Page 1 of 1   SPE A

None.

# monitor health

---

This command displays one screen page of output summarizing the overall condition of the system.

## Synopsis

---

monitor health

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

## Examples

---

monitor health

## Description

---

The monitor health command displays the current system alarm summary, maintenance busy summary, user summary, critical system status, and cabinet status, all of which is updated every minute.

The user is logged off of the system after this command is terminated.

## Defaults

No defaults.

## Parameters

None.

## Help Messages

If the system technician presses HELP after entering "monitor health" the following message will be displayed:

Entry is not required

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Major    | The number of logged major alarms is displayed as a number ranging from 0 to 200. Up to 200 major alarms can be reported in the alarm log; therefore, this is the maximum which can be displayed.                                                                                                                                                                                                                                                                                                       |
| Minor    | The number of logged minor alarms is displayed as a number ranging from 0 to 200. Up to 200 minor alarms can be reported in the alarm log; therefore, this is the maximum which can be displayed.                                                                                                                                                                                                                                                                                                       |
| Warning  | The number of warnings logged in the alarm file is displayed as a value between 0 and 200, which is the maximum number of warnings permitted.                                                                                                                                                                                                                                                                                                                                                           |
| Trunks   | The number of maintenance busied out trunks is shown.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Stations | The number of maintenance busied out stations is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Others   | The combined number of maintenance busied out objects excluding trunks and stations is displayed.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Static   | Static indicates the proportion of the CPU which is currently dedicated to high priority items (e.g. the operating system). This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (e.g. an occupancy of 89.6% would be displayed as 90%).                                                                                                                                                                          |
| SM       | SM indicates the proportion of the CPU which is currently dedicated to system management or periodic and scheduled maintenance. Therefore, if there is a large amount of periodic or scheduled maintenance testing being performed, this occupancy percentage can be high without affecting service. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (e.g. an occupancy of 89.6% would be displayed as 90%). |
| CP       | CP indicates the proportion of the CPU which is currently dedicated to call processing. This occupancy has priority over SM and IDLE occupancy categories and if needed, will take processor time away from these occupancy categories. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (e.g. an occupancy of 89.6% would be displayed as 90%).                                                              |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Idle        | Idle indicates the proportion of the CPU which is currently available for use. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (e.g. an occupancy of 89.6% would be displayed as 90%).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Active SPE  | A or B is displayed to indicate the currently active processor complex. When the active processor complex is locked on-line via lock switching on DUPINT, the "lock" option will be displayed; otherwise, "auto" will be shown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Duplicated? | The duplication status of the SPE component is indicated. "y" indicates duplication and "n" indicates no duplication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SPE Power   | The current source of power for the processor complex is indicated. The normal state is "commercial". When commercial power is not available, battery backup is in use and will be indicated by "backup".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Time Source | The current timing source is displayed. The display values for this field vary according to the timing source selected. If the site has administered the optional Stratum-3 hardware, "external" will be displayed under normal operating conditions and "internal" will be displayed when an internal source, such as a tone clock, is used. Primary and secondary timing sources must be administered when using the Stratum-4 option. "primary" is displayed when the primary administered source is in use, and "secondary" is displayed when the administered secondary source is in use. When neither the primary or secondary sources are in use, "local" will be displayed.                                                                                                                                                                                                                                                                                                                                                                 |
| # Logins    | The number of current users is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Cab         | The assigned cabinet number, ranging from 1 to the highest cabinet number in the system, is displayed on the screen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Emerg Trans | The current setting of the emergency transfer switch on the maintenance board is indicated for each cabinet. Five options are available: auto-on ("auto+" or "a+"), auto-off ("auto-" or "a-"), "on", "off", and "n.a.". Normally, the "auto+" or "auto-" option is enabled. In this state, emergency transfer will be activated automatically upon cabinet failure (The "+" indicates that emergency transfer is currently activated, while the "-" indicates that emergency transfer is currently not activated). When "on" is displayed, emergency transfer is automatically activated. The "off" option shows that the cabinet is prevented from activating emergency transfer. In a system equipped with duplicated SPEs, the switch settings for both processors of the PPN (cabinet 1) will be displayed. In this case, "auto+" will be abbreviated "a+", "auto-" will be abbreviated "a-", and "off" will be abbreviated as "of". "on" will not be changed. If "n.a." is displayed, the emergency transfer switch setting is not available. |
| Mj          | The individual number of major alarms associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

- Mn

The individual number of minor alarms associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.
- Wn

The individual number of associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.
- PNC

Current Port Network Connectivity (PNC) status for each of the port networks within a cabinet is displayed. When multiple port networks exist within a cabinet, Carriers A, B, and C are listed first and separated from Carriers D and E by a slash (e.g. up/up). PNC status of a port network is determined on the basis of availability of the Expansion Archangel Link (EAL). An "up" denotes that the EAL is available. When the EAL is not available, then a "dn" (down) is displayed.
- Time of Day

The current time of day acquired from the system is displayed.

The following display was produced by entering "monitor system health".

Feature Interactions

In a High or Critical Reliability System, if the standby SPE Emergency Transfer Select Switch is changed and handshake is down, the displayed Emerg Trans field will be incorrect until handshake comes up again.

The user is logged off of the system when the monitor health command is terminated.

# monitor security-violations

This command provides an audit trail of security infractions

## Synopsis

monitor security-violations *print*

## Permissions

The following default logins may execute this command: init, inads, system technician, cust, rcust, bcms, browse.

## Examples

**monitor security-violations**  
**monitor security-violations print**

## Description

The monitor security-violations command displays information about failed attempts to access the system. The time of the violation, the login entered, and the port accessed during the failed login attempt are logged. Also, the trunk group number, member, and extension will be logged for remote access violations. Remote and local invalid access attempts are logged with a total of 16 entries maintained for each access type. This on-line status report is automatically updated every 30 seconds until the command is canceled by pressing the CANCEL key.

## Defaults

No defaults.

## Parameters

**print** This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "monitor security-violations", the following message is displayed:

[ 'print' ]

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The following output fields are for the "monitor security-violations" command

SYSTEM MANAGEMENT VIOLATIONS

- Date: The current date and time.
- Date The date of the logged security violation given as MM/DD where MM is the month and DD is the day of the invalid access attempt.
- Time The time of the logged security violation given as HH:MM where HH is the hour and MM is the minute of the invalid access attempt.
- Login This is the login ID that was entered as part of the login violation attempt.
- Port This is the type of port from which the login violation was attempted. The following is a table of the valid port types:

| Port Type | Description                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| MGR1      | This represents a connection to one of the system SAT ports. This can be accomplished either by a hard-wired EIA connection or by a dial-up connection. |

- Ext The extension assigned to the data module the failed "logging in" session was attempted on. If a data module was not used as, for example, in the case of dedicated EIA connections, then this field will be blank.

REMOTE ACCESS VIOLATIONS

|        |                                                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| Date   | The date of the logged security violation given as MM/DD where MM is the month and DD is the day of the invalid access attempt.          |
| Time   | The time of the logged security violation given as HH:MM where HH is the hour and MM is the minute of the invalid access attempt.        |
| TG No. | The trunk group number associated with the trunk from which the remote access attempt terminated (remote access violations only).        |
| Mbr    | The trunk group member number associated with the trunk from which the remote access attempt terminated (remote access violations only). |
| Ext    | The extension used to interface with the remote access feature (remote access violations only).                                          |

The following display was produced by entering "monitor security-violations".

**Feature Interactions**

---

None.

**monitor system**

---

This command with the view1 or view2 option displays one screen page of output summarizing the overall condition of the system. With the connection option, the command displays the real-time status for time slots and buses. Additionally, there are other miscellaneous parameters displayed that show call rates, intervals, etc.

**Synopsis**

---

monitor system [ view1 | view2 | conn [ pnn pnn number 1 pnn number 2 pnn number 3 ] ]

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

## Examples

---

```
monitor system view1
monitor system view2
monitor system conn
monitor system conn pnn 1 5 7
```

## Description

---

The monitor system view1 and view2 commands display a page of output summarizing the condition of the system. This on-line status report is automatically updated until the command is canceled by pressing the CANCEL key. Two display options are available: view1 and view2.

The current overall system status is available with either of the view options. "View1" displays attendant, maintenance, and traffic status. Attendant and maintenance status are updated every minute and traffic status is updated on an hourly basis. When the command is canceled, the technician will be automatically logged off for security reasons. The "view2" report contains everything the "view1" report does, except the hunt group measurements are omitted from the traffic status portion of the "view2" report. These forms contain simplified high-level information from which a basic picture of the system's health can be drawn. The monitor system conn command displays output that shows the status of connections in the connection manager process. Data is collected frequently in the connection manager for certain key information items. It is from this database that this report is drawn. This on-line status report is automatically updated every minute (or by pressing the UPDATE key) until the command is canceled by pressing the CANCEL key. Pressing the CANCEL keys forces a logout of the current login id.

There is one option to the command line entry, monitor system conn. That parameter is *pnn*. On the *gaz target*, there are only 3 possible pnn's. The command line parameter *pnn* is used to indicate which 3 pnn's the user wishes to see.

## Defaults

No defaults.

Parameters

|                     |                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| view1               | This specifies a form that will include the attendant status, the maintenance status, the last hour's measurement of trunk groups, hunt groups, and the attendant group, and finally, the time of day. |
| view2               | This specifies a form that will display a subset of the view1 form entries. This form will include all of the view1 form except the last hour's hunt group measurements.                               |
| conn                | This option will bring up the connection monitor output for key information.                                                                                                                           |
| entering no options | Omitting the "pnn # # #" argument on the command line will cause the default configuration of Pnn's 1, 2 and 3 to be displayed.                                                                        |
| pnn # # #           | Entering "pnn # # #", where "#" is replaced by a pnn number from 1 to 3, will cause data for the specified pnn's to be displayed.                                                                      |

|                     |                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| entering no options | Omitting the "pnn # # #" argument on the command line will cause the default configuration of Pnn's 1, 2 and 3 to be displayed.   |
| pnn # # #           | Entering "pnn # # #", where "#" is replaced by a pnn number from 1 to 3, will cause data for the specified pnn's to be displayed. |

Help Messages

If the system technician presses HELP after entering "monitor system", the following object command word choices will be displayed:

connview1view2

scr

If the system technician presses HELP after entering "monitor system conn" the following message will be displayed:

Enter 3 port network numbers(xx-xx) ['pnn' x x x]

Error Messages

If the pnn number entered is non numeric, not administered, or invalid in any other way, one of following messages will be displayed:

Object command word omitted; please press HELP

"xx" is an invalid identifier; press RETURN to execute modified command

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The following output fields are for the "monitor system view1" and "monitor system view2" commands.

|                                     |                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Console #                           | A list of console numbers that are either activated or deactivated.                                                                                                                                                                                                                                                           |
| Activated:                          | The attendant console is in service. An attendant console is considered activated if its handset/headset is plugged in, it is not busied out, and the system is in day service and the console is a day or day/night or principle console, or the system is in night service and the console is a night or day/night console. |
| Deactivated:                        | The attendant console is not in service. The attendant console is considered deactivated if it does not meet the previous activated conditions.                                                                                                                                                                               |
| # of alarms for trunks              | The total number of existing minor and major alarms on trunk ports.                                                                                                                                                                                                                                                           |
| # of alarms for other resources     | The total number of existing minor and major alarms on all maintainable objects in the system except trunks and stations.                                                                                                                                                                                                     |
| First OSS number has been informed? | Have all the alarms been reported and acknowledged by the first OSS telephone number. If the "Alarm Origination" is not enable or there are no active alarm, the field will be "n".                                                                                                                                           |
| Measurement Hour                    | The starting time of the period for which the measurement was taken. For example, if the measurement hour is shown as 1800, it means the traffic status data displayed is for the time period from 6 PM to 7 PM (The measurement is taken on an hourly basis).                                                                |
| Grp no                              | A number between 1 and the maximum trunk group number or maximum hunt group number in the system.                                                                                                                                                                                                                             |
| Grp dir                             | Group direction: incoming, outgoing or two way.                                                                                                                                                                                                                                                                               |
| Calls qued                          | Total calls that arrived and were placed in the queue for trunk groups.                                                                                                                                                                                                                                                       |
| Calls aban                          | Total calls that were abandoned by the caller.                                                                                                                                                                                                                                                                                |

- %Out blkg:       The ratio of outgoing calls that are not carried (due to overload conditions) on a trunk group to the outgoing calls offered.
- % Time ATB:       The percentage of time within the polling interval that all trunks in the trunk group were unavailable for use.
- Time of day        The current time of day acquired from the system.

For the following output example, the command monitor system view1 was entered.

```
monitor system view1
      ATTENDANT STATUS                               MAINTENANCE STATUS
      Console no.                                     # of alarms for trunks: 4

Output

The following output fields are for the "monitor system conn" command.

|                  |                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time Slot Status | There are 4 numbers associated with the time slot status for each specified pnn; for each of the two buses (0 and 1) there is a maintenance and a normal state. The first row is the pnn, the second specifies the bus while the third specifies the bus's state while the last column represents the number of idle counts. These fields represent real-time status data. |
| Bus Status       | For the bus status fields, there are two numbers associated with each of the two buses for each pnn. Shown are the pnn number; the bus associated with it, i.e., 0 or 1; and the state of the bus, i.e., "avail" or "unavail". These fields represent real-time status data.                                                                                               |
| Callrate         | The callrate field represents the call rate being experienced currently on the switch. This is a counter which is bumped each time a call attempt is made. This field represents real-time status data.                                                                                                                                                                    |
| Interval         | This field is related to the above field in that it represents the interval being applied with which the call rate is applicable. It is normally set to a 36 second time period. This field represents a constant status data.                                                                                                                                             |

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max_callrate | This field represents the maximum call rate which has been hit during the time since the last hour has passed. If, for example, at 20 minutes past 12:00 this command is executed, this field will represent the maximum call rate obtained during the past 20 minutes. This field represents real-time status data.                                                                                                                                               |
| Next_hour    | This field will contain a value of 0 or 1 depending upon if the measurements being taken are for this hour or the next. It is related to the previous field in that the maximum call rate is reflected for this hour. When this flag is set, then statistics begin to accumulate for the next hour and shortly thereafter, the maximum call rate will become zero and accumulations will begin anew.                                                               |
| tot_ts_req   | This field holds the total time slots in use during the time period elapsed since the top of the last hour. Data is internally collected every 100 seconds. When the timer fires and the data collection occurs, a check is made as to how many time slots are currently in use. That's where the total comes from. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data. |
| ts_denied    | This field holds the total time slots requests that were denied during the time period elapsed since the top of the last hour. Data is internally collected every 100 seconds. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data.                                                                                                                                      |
| tot_fts_req  | This field represents the total fiber time slots that have been requested. This field is incremented each time a fiber time slots that have been allocated since the last top of the hour measurements polling. There are three values shown on the form; one for each of the requested pnns. This field represents real-time status data.                                                                                                                         |
| ts_count     | This field indicates how many time slots are in use during the last 100 second poling period. An internal timer causing polling to occur every 100 seconds. The value in this field represents the requests for time slots during that 100 second interim. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data.                                                          |
| ts_total     | This field gets it's value from the time slots count field discussed above every 100 seconds. It represents the total number of time slots requested since the top of the last hour and is real-time status data.                                                                                                                                                                                                                                                  |
| fts_count    | This field indicates how many fiber time slots are in use during the last 100 second poling period. An internal timer causing polling to occur every 100 seconds. The value in this field represents the requests for fiber time slots during that 100 second interim. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data.                                              |

|                          |                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fts_total                | This field indicates the total number of fiber time slots. This field gets it's value from the fiber time slots count field discussed above every 100 seconds. It represents the total number of fiber time slots requested since the top of the last hour and is real-time status data.                                                                 |
| Requests-TN7<br>48 TTRs  | The total number of touch tone receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a tone receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN748 board. This field represents real-time status data.                       |
| Requests-TN7<br>48 CPTRs | The total number of call progress tone receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a call progress tone receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN748 board. This field represents real-time status data. |
| Requests-TN7<br>44 CPTRs | The total number of call progress tone receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a call progress tone receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN744 board. This field represents real-time status data. |
| Requests-TN7<br>44 TTRs  | The total number of touch tone receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a tone receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN744 board. This field represents real-time status data.                       |
| Requests-TN7<br>44 MFC   | The total number of multi-frequency receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a multi-frequency receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN744 board. This field represents real-time status data.       |

The following display was produced by entering "monitor system conn".

| Time Slot Status |     |        |             | Bus Status |     |                  |
|------------------|-----|--------|-------------|------------|-----|------------------|
| Pnn              | Bus | State  | *Idle Count | Pnn        | Bus | State            |

Feature Interactions

None.

monitor traffic

This command monitors the traffic load for trunk or hunt groups.

Synopsis

monitor traffic [ trunk-groups *number* | hunt-groups ]

Permissions

The following default logins may execute this command: init, inads, system technician, cust, rcust, bcms, browse.

Examples

monitor traffic trunk-groups  
monitor traffic trunk-groups 4  
monitor traffic hunt-groups

## Description

The monitor traffic command gives an instant picture of the load on various trunk and hunt groups in terms of number of calls waiting to be serviced, and the time the oldest call in the group has been awaiting service.

## Defaults

No defaults.

## Parameters

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trunk-groups | The trunk group report displays the number of calls in the queue waiting to be serviced, for each trunk group. The number of the members in the group and the number of members which are active on calls in the group are also displayed for comparative analysis. Only the administered trunk groups are displayed, up to a maximum of 60 groups. The user may specify the starting trunk group. For example, if the user entered 5, then the trunks displayed would be from group 5 and up, 1-4 would not be displayed. |
| hunt-groups  | The hunt-group report has a similar format as the trunk-group report. In addition to the trunk-group information, this report displays the time the oldest call has been waiting in the queue for each hunt group. The data on the screen is updated every minute, only the fields whose values have changed are refreshed. All the hunt groups, whether administered or not, are displayed. The hunt groups that are not administered have blank values.                                                                  |

## Help Messages

If the system technician presses HELP after entering "monitor traffic", the following object command word choices will be displayed:

hunt-groups

trunk-groups

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

- # Group number for the trunk or hunt group.
- S The size (number of members administered) of each trunk or hunt group.
- A The number of members in a group that are active on a call. This does not include members which have been busied out.
- Q The length of the queue administered for a group.
- W The number of calls waiting in the group queue to be serviced.
- LCIQ The longest call in queue (LCIQ) indicates the time in seconds the oldest call in the hunt group queue has been waiting to be serviced.

For the following output example, the command "monitor traffic hunt-groups" was entered.

monitor traffic hunt-groups

| #  | S  | A  | HUNT GROUP | STATUS | 22:49 SAT DEC 31 1988 |    |    |   |   |   |      |
|----|----|----|------------|--------|-----------------------|----|----|---|---|---|------|
| #  | S  | A  | Q          | W      | LCIQ                  | #  | S  | A | Q | W | LCIQ |
| 1  | 15 | 10 | 10         | 0      | 20                    | 17 |    |   |   |   |      |
| 2  |    |    |            |        |                       | 18 |    |   |   |   |      |

| 13 |    |    |            |        |                       | 29 |    |   |   |   |      |
| 14 |    |    |            |        |                       | 30 |    |   |   |   |      |
| 15 |    |    |            |        |                       | 31 |    |   |   |   |      |
| 16 |    |    |            |        |                       | 32 |    |   |   |   |      |

(#: Group; S: Grp Size; A: Active Members; Q: Q Length; W: Calls Waiting)

(LCIQ: Longest Call In Queue in seconds)

For the following output example, the command monitor traffic trunk-groups was entered.

```
monitor traffic trunk-groups

      TRUNK GROUP STATUS      22:49 SAT DEC 311988
#  S  A  Q  W  #  S  A  Q  W  #  S  A  Q  W  #  S  A  Q  W
1  15 10 0  0
2  22 21 10 10
9  31 12 20 0
65 5  5  10 8
99 12 0  0  0

( #: Group;  S: Grp Size;  A: Active Members;  Q: Q Length;  W: Calls Waiting)
```

Feature Interactions

None.

monitor trunk

This command monitors the status of an individual trunk group member.

Synopsis

monitor trunk group/*member*

Permissions

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

Examples

```
monitor trunk 78
monitor trunk 80/
monitor trunk 78/1
monitor trunk 80/2
```

Description

The monitor trunk command displays internal software state information for diagnosis. This command can help locate facilities to which the trunk is communicating.

If a trunk group number is entered without a member number, with or without the "/", it is assumed to be the member 1. If a trunk group number and member number are both entered, status for the specified member is displayed.

## Defaults

The member number defaults to 1 if a group is specified without a member.

## Parameters

|        |                                                                                                                                                                                                  |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group  | The group number is an administered number associated with each trunk group. The valid range is 1 - 99. If a group number is entered without a member number, member number defaults to 1.       |
| member | The member number is an administered number identifying a particular member within a trunk group. The valid range is 1 - 99. If a member number is entered, status for that member is displayed. |

## Help Messages

If the system technician presses HELP after entering "monitor trunk", the following message is displayed:

```
Enter assigned trunk group(1-99) or [group/member(1-99)]
```

## Error Messages

If the format of the trunk identifier is incorrect, the following error message is displayed:

```
Format invalid
```

If the trunk identifier is not in the valid range, the following error message is displayed:

```
Trunk or trunk group invalid
```

If the trunk group member is not administered, the following message is displayed:

```
Group member not assigned
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

## Output

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trunk Group/Member | The trunk group number and group member number. Valid identifiers are 1-99/1-99.                                                                                                                                                                                                                                                                                                                                                                     |
| Port               | The port location (cabinet-carrier-slot-circuit) of the trunk.                                                                                                                                                                                                                                                                                                                                                                                       |
| Signaling Group ID | If the trunk is of type ISDN, then this field contains the number of the ISDN Signaling Group to which this group belongs. Otherwise, this field is blank.                                                                                                                                                                                                                                                                                           |
| Connected Ports    | Port locations (cabinet-carrier-slot-circuit) connected to the trunk.                                                                                                                                                                                                                                                                                                                                                                                |
| Service State      | Whether the trunk is in service or out of service. One of the following states is displayed: in-service/active, in-service/idle, out-of-service, out-of-service-NE (Near End), out-of-service-FE (Far End), maint-NE/active, maint-FE/active, maint-NE/idle, maint-FE/idle, pending-in-service, pending-maint, or disconnected. NE (Near End) and FE (Far End) refer to which "end" of the trunk has placed the facility in the state that it is in. |
| Maintenance Busy   | Whether there is any maintenance testing being performed upon the trunk.                                                                                                                                                                                                                                                                                                                                                                             |
| CA-TSC State       | The state of the temporary signaling connection. A temporary signaling connection is a connection set up to pass call information over PRI signaling links.                                                                                                                                                                                                                                                                                          |

For the following output example, the command that was entered is "monitor trunk 78/1".

```
monitor trunk 78/1

                                TRUNK STATUS

Trunk Group/Member: 078/001      Service State: in-service/idle
Port: 01C1505                    Maintenance Busy? no
Signaling Group ID:              CA-TSC State:
Connected Ports:
```

## Feature Interactions

None.

## recycle carrier

---

This command recycles power on a carrier.

### Synopsis

---

recycle carrier location

### Permissions

---

The following default logins may execute this command: system technician, inads, init.

### Examples

---

recycle carrier c  
recycle carrier 01c  
recycle carrier 2b  
recycle carrier 3d

### Description

---

The recycle carrier command recycles power on a specific carrier. When a power unit is replaced in a carrier, this command must be entered to recycle the power on that carrier. **The processor carrier and its duplicate if present as well as any EPN control carrier or an SCC carrier cannot be recycled. If a port carrier is recycled, service is interrupted for that port carrier. If a carrier containing an active EI is recycled, communications with that cabinet will be disrupted. If a carrier containing an active tone-clock board is recycled, all ports in port network will have service disrupted.** For more details on recycling and trouble shooting power units, refer to "Troubleshooting Control Carrier Power Units" in [Chapter 5, "Routine Maintenance Procedures"](#).

### Defaults

The default cabinet is cabinet 1. There is no default carrier.

### Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | The location designates the physical location of the desired carrier. The location consists of the cabinet number and a carrier letter. The cabinet number is one or two digits from 1 to 3 with leading zeros allowed. Cabinet 1 is the PPN with 2-3 referring to some optional EPN cabinet. The carrier letter may be "b" through "e". The "b" carrier may not be specified for SPE duplex PPNs. |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses HELP after entering "recycle carrier" on a simplex SPE system, the following message will be displayed:

```
Enter [cabinet(1-3)];carrier(B-E)
```

If the system technician presses HELP after entering "recycle carrier" on a duplex SPE system, the following message will be displayed:

```
For cabinet 1 enter [cabinet(1)];carrier(C-E)  
For cabinet 2-3 enter cabinet (2-3);carrier(B-E)
```

## Error Messages

If no location is entered, the following message will be displayed:

```
Identifier command word(s) omitted; please press help
```

If a location greater than three characters is entered, the following message will be displayed:

```
Entry invalid
```

If the location entered is longer than 3 characters or less than 1 character the following will be displayed:

```
Invalid carrier specified
```

If the cabinet and carrier specified are in an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If a cabinet number of "1" or "01" is entered and the carrier specified is "A" or "B" in an SPE duplex system, the carrier specified is "A" in a SPE simplex system or if the "A" carrier is specified with a cabinet other than "1" or "01, or an SCC carrier location is given," the following message will be displayed:

```
Cannot recycle control carriers or XE carriers
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
login id:'command' has a command conflict
```

## Output

---

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier) of the maintenance object that is being tested. For this maintenance object, only the cabinet and carrier values are displayed. |
| Maintenance Name | The maintenance name will always be CARR-POW.                                                                                                                      |
| Alt. Name        | Not applicable.                                                                                                                                                    |
| Test Number      | The test number will always be 126.                                                                                                                                |
| Test Result      | An indicator as to whether the test passed, failed, or was aborted.                                                                                                |
| Error Code       | Further detail about the results of the test.                                                                                                                      |

For the following output example, the command recycle carrier c was entered.

```
recycle carrier c

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01C       CARR-POW            
126       PASS

Command successfully completed
```

**Feature Interactions**

The 'a' carrier can never have its power recycled. When the 'b' carrier of the PPN contains SPE duplication hardware, the 'b' carrier similarly is not available for power recycling.

If a port carrier is recycled, service is interrupted for that port carrier. If a carrier containing an active EI is recycled, communications with that cabinet will be disrupted. If a carrier containing an active tone-clock board is recycled, all ports port network will have service disrupted.

Occasionally, circuit packs show red LEDs and "NO BOARD" when a list configuration command is issued after a carrier is recycled. The test tdm command can be used to accelerate retirement of these problems.

**refresh spe-standby**

This command refreshes the memory of the standby SPE in a High or Critical Reliability System.

## Synopsis

---

`refresh spe-standby`

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

`refresh spe-standby`

## Description

---

The `refresh spe-standby` command is used to immediately put the Standby SPE into Standby Mode. The command conducts the same activities regardless of whether the Standby SPE is already in Standby or Maintenance Mode. When this command is issued, any Standby SPE maintenance activity that is currently in progress is preempted, the Standby SPE Processor is held reset, and the Standby SPE's DRAM memory is refreshed (that is, all of Active SPE DRAM memory is shadowed to the Standby SPE memory). The refresh is necessary because while the Standby SPE is in Maintenance Mode, memory shadowing is disabled. When the Standby SPE is returned to Standby Mode, its memory must be brought up-to-date with Active SPE memory.

Because of its power to preempt Standby SPE maintenance activities, the `refresh spe-standby` command should be used judiciously. If the Standby SPE is in Maintenance Mode when the `refresh spe-standby` command is issued, the maintenance activity that is being conducted by the Standby SPE is immediately terminated with the following potential side-effects:

- Testing of the Standby SPE components that are the target of the maintenance activity may not have completed. Depending on the maintenance activity and the point at which it is terminated, tests that detect faults and/or lack of faults on those Standby SPE components may not have had the opportunity to run. Accordingly, alarms are not raised or retired on the components.
- If the maintenance activity is scheduled and if the `refresh spe-standby` command is issued before a scheduled translation save is performed, the translation save is not done and the translations data on the Active and Standby SPE mass storage devices do not reflect the changes made since the last translation save.

## Defaults

No defaults.

## Parameters

None.

## Help Messages

If the system technician presses `HELP` after entering "refresh spe-standby," the following message will be displayed:

```
Entry is not required
```

## Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

## Output

---

If the refresh command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the refresh command is unsuccessful, the following message will be displayed on the SAT:

```
Refresh not successful;  
use 'display errors' to check for STBY-SPE errors
```

If the active SPE is held reset via the SPE select switches, then the following will be displayed:

```
Could only hold Standby SPE reset because  
Active SPE is locked via SPE select switches
```

If the standby is currently entering maintenance mode, then the following will be displayed:

Cannot interrupt Standby SPE while entering  
maintenance mode; please try later

If the standby is busy with another task, then the following will be displayed:

Standby SPE not available; for information use "status  
system"

If the standby is in the process of doing a software upgrade, then the following will be displayed:

Standby SPE upgrade in progress, command denied

**Feature Interactions**

---

The refresh command is not allowed while the standby SPE is being brought out of standby mode into maintenance mode. Once fully in maintenance mode, however, the command can be executed.

**release access-endpoint**

---

This command will release a specified access endpoint.

**Synopsis**

---

release access-endpoint extension

**Permissions**

---

The following default logins may execute this command: system technician, inads, init, nms.

**Examples**

---

release access-endpoint 25012  
release access-endpoint 77868

**Description**

---

The release access endpoint command will remove all ports associated with the specified access endpoint from a maintenance busy state. Periodic and scheduled tests will resume on the released ports. Maintenance will do background initialization testing on the released ports. For details of the test sequence, refer to [3].

## Defaults

No defaults.

## Parameters

**extension**            An extension number associated with the desired access endpoint.  
                         The number of digits in an extension is determined by the dial-plan.

## Help Messages

If the user presses **HELP** after entering "release access-endpoint," the following message is displayed:

Enter assigned extension

## Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

Extension invalid

If the EPN on which the access endpoint resides is not accessible, the following message will be displayed:

EPN is not available

If the extension is not administered, the following message will be displayed:

Extension not assigned

If the object associated with the specified extension is not an access endpoint, the following message will be displayed:

Extension assigned to object other than access-endpoint

If the board that contains the access endpoint is not inserted in the system, the following message will be displayed:

Board not inserted

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.                                                                                                        |
| Maintenance Name | The type of maintenance object that is being released. For wideband access endpoint the maintenance name for each port is "WAE-PORT." For single port access endpoint the maintenance name is "TIE-DS1." |
| Alt. Name        | The alternate way of identifying the maintenance object. This field contains the extension number of the access endpoint.                                                                                |
| Result           | An indicator as to whether the object is successfully released. The possible values are: PASS, FAIL and ABORT.                                                                                           |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busout/Release Commands" section of this chapter.                                    |

For the following output example, the command "release access-endpoint 22502" was entered. Assume that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6.

```
release access-endpoint 22502           page 1 of 1

                                COMMAND RESULTS

Port Maintenance Name Alt. Name Result  Error Code
01C1101 WAE-PORT      22502    PASS
01C1102 WAE-PORT      22502    PASS
01C1103 WAE-PORT      22502    PASS
01C1104 WAE-PORT      22502    PASS
01C1105 WAE-PORT      22502    PASS
01C1106 WAE-PORT      22502    PASS

Command Successfully Completed
```

Feature Interactions

None.

# release board

---

This command will release each maintenance object on the specified board.

## Synopsis

---

release board location

## Permissions

---

The following default logins may execute this command: system technician, inads, init, nms.

## Examples

---

release board 01c11  
release board 02c15

## Description

---

The release board command will put every administered maintenance object on the circuit pack at the specified location into operation. Some tests are done on the object to make sure that it can be used.

## Defaults

No defaults.

## Parameters

|          |                                                                                                                                                                                                                                      |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | A "location" represents the physical position of the board to be busied out or released and is entered as "UUcSS" where "UU" represents the cabinet number (1-3), "c" represents the carrier, and "SS" represents the slot position. |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses HELP after entering "release board," the following message will be displayed:

Enter 5 character board number

## Error Messages

If the format of the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the board resides is not available, the following message will be displayed:

```
EPN is not available
```

If a board is not inserted in the specified location, the following message will be displayed:

```
Board not assigned
```

If the specified board does not have any maintenance objects associated with it, the following message will be displayed:

```
No MO in this board
```

If the specified board is a EI board and it is part of the active link, the following message will be displayed:

```
Illegal Command for active object; use 'set' to switch to  
standby
```

If a reset is attempted on an invalid board in the service slot, the following message is displayed:

```
Board invalid
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then  
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot) of the maintenance object that is being released.                                                                                                                                                                                                                                                               |
| Maintenance Name | The type of maintenance object that is being released.                                                                                                                                                                                                                                                                                                  |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | The result of the release -"PASS," "ABORT," "FAIL."                                                                                                                                                                                                                                                                                                     |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.                                                                                                                                                                                  |

For the following output example, assume that the board in cabinet 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered is "release board 1c07."

```
release board 01C07

                                COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01C07   ANL-BD              PASS
01C0702 ANL-LINE              PASS
01C0701 ANL-LINE              51001    PASS
01C0703 ANL-LINE              PASS

Command successfully completed
```

## Feature Interactions

None.

## release cdr-link

This command will release a maintenance object associated with the specified call detail recording (cdr)-link.

Synopsis

---

release cdr-link link-id

Permissions

---

The following default logins may execute this command: system technician, inads, init.

Examples

---

release cdr-link primary  
release cdr-link secondary

Description

---

The release cdr-link command will remove the maintenance object associated with a specified call detail recording (cdr)-link from a maintenance busy state.

A link is made up of several components. It involves a far end data module, a simulated data channel on a PKTINT board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For information on what a CDR link is and does, see the second paragraph in the "Description" section of the "status cdr-link" manual pages.

Defaults

No defaults.

Parameters

link-id                   The link identifier is either "primary" or "secondary."

Help Messages

If the system technician presses HELP after entering "release cdr-link," the following message will be displayed:

Enter 'primary' or 'secondary'

## Error Messages

If the cdr-link is not administered, then the following message will be displayed:

Link not administered

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

|                  |                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | Not applicable. Will always be blank.                                                                                                                                                                             |
| Maintenance Name | The type of maintenance object that is being released. If releasing the primary cdr-link the maintenance object will be PRI-CDR, else if releasing the secondary cdr-link the maintenance object will be SEC-CDR. |
| Alt. Name        | Not applicable. Will always be blank.                                                                                                                                                                             |
| Result           | The result of the release - "PASS," "ABORT," "FAIL."                                                                                                                                                              |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Commands" section of this chapter.                                      |

For the following output example, assume that the command that was entered is "release cdr-link primary."

```
release cdr-link primary
```

## COMMAND RESULTS

| Port | Maintenance Name | Alt. Name | Result | Error Code |
|------|------------------|-----------|--------|------------|
|      | PRI-CDR          |           | PASS   |            |

Command successfully completed

Feature Interactions

---

None.

release data-module

---

This command will release a system technician-specified data module or data channel.

Synopsis

---

release data-module extension

Permissions

---

The following default logins may execute this command: system technician, inads, cust, init, nms.

Examples

---

release data-module 310

Description

---

The release data module command will put the specified data module (or data channel) into service. Some tests are executed on the hardware to verify that the equipment is functioning.

Defaults

No defaults.

Parameters

|           |                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| extension | An extension number associated with the desired data module or data channel. The number of digits in an extension is determined by a dial-plan. |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses `HELP` after entering "release data-module," the following message will be displayed:

Enter assigned extension

## Error Messages

If the length or format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the specified extension is not administered, then the following message will be displayed:

```
Extension not assigned
```

If the specified extension is not a data module or a data channel, then the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the EPN that contains the data module port is not available, the following message will be displayed:

```
EPN is not available
```

If the board containing the data module port is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then  
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out or released, or the number of the data channel.                                                                                                                                                                                                      |
| Maintenance Name | The type of maintenance object that is being busied out or released.                                                                                                                                                                                                                                                                                    |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | An indicator as to whether the object was successfully busied out or released.                                                                                                                                                                                                                                                                          |
| Error Code       | A numerical description of why the command failed.                                                                                                                                                                                                                                                                                                      |

For the following output example, assume that the command that was entered is "release data-module 300."

```
release data-module 310
```

COMMAND RESULTS

|         |                  |           |        |            |
|---------|------------------|-----------|--------|------------|
| Port    | Maintenance Name | Alt. Name | Result | Error Code |
| 01C1103 | DIG-LINE         |           | PASS   |            |

Command successfully completed

## Feature Interactions

None.

## release journal-printer

This command will release a maintenance object associated with the system technician specified pms-log or wakeup-log.

## Synopsis

release journal-printer [ pms-log | wakeup-log ]

## Permissions

The following default logins may execute this command: system technician, inads, init, nms.

## Examples

```
release journal-printer pms-log
release journal-printer wakeup-log
```

## Description

The release journal-printer command will put the maintenance object associated with a specified pms-log or wakeup-log link into service. Some tests are executed on the hardware to verify that the equipment is functioning.

For general information on journal printer links, see the second paragraph in the "Description" section of the "busyout pms-link" manual pages.

For information on what a journal printer is and does, see the second paragraph in the "Description" section of the "status journal-link" manual pages.

## Defaults

None.

## Parameters

- |            |                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------|
| wakeup-log | This will release the link to the wakeup logging facility. In the output the port name for this object is 0. |
| pms-log    | This will release the link to the pms printer. In the output the port name for the pms link is 1.            |

## Help Messages

If the system technician presses `HELP` after entering "release journal-printer," the following object command word choices will be displayed:

```
pms - log      wakeup - log
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out or released. In this case, the physical object port address will be a 0 for wakeup log and a 1 for the pms log. |
| Maintenance Name | The type of maintenance object that is being busied out or released.                                                                                                                                               |
| Alt. Name        | Not applicable.                                                                                                                                                                                                    |
| Result           | An indicator as to whether the object was successfully busied out or released.                                                                                                                                     |
| Error Code       | A numerical description of why the command failed.                                                                                                                                                                 |

For the following output example, assume that the command that was entered is "release journal-printer wakeup-log."

```
release journal-printer wakeup-log

                                COMMAND RESULTS

Port      Maintenance Name  Alt. Name  Result  Error Code
0          JRNL-LINK                               PASS

Command successfully completed
```

Feature Interactions

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will not cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup attempts on the link.

# release link

---

This command will release the system technician specified link.

## Synopsis

---

release link link-id

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

release link 1  
release link 8

## Description

---

The release link command puts the MOs associated with a specified link into service. Some tests execute on the hardware to verify functioning equipment.

## Defaults

None.

## Parameters

link-id            The link-id is a number associated with each link between 1-8. Link 1 through 4 reside on Processor Interface circuit pack "1a1" or "1b1" and 5 through 8 reside on Processor Interface circuit pack "1a2" or "1b2."

## Help Messages

If the system technician presses HELP after entering "release link," the following message will be displayed:

Enter 1 character link number

## Error Messages

If the link identifier is not valid, the following error message is displayed:

Link out of range, please press HELP

If the link is not administered, the following error message is displayed:

Link not administered or not enabled

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out or released. With this command the Port address represents the link-id.   |
| Maintenance Name | The type of maintenance object that is being released.                                                                                                                       |
| Alt. Name        | Not applicable.                                                                                                                                                              |
| Result           | "PASS," "ABORT," "FAIL."                                                                                                                                                     |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Commands" section of this chapter. |

For the following output example, assume that the command that was entered is "release link 1."

release link 1

COMMAND RESULTS

|         |                  |           |        |            |
|---------|------------------|-----------|--------|------------|
| Port    | Maintenance Name | Alt. Name | Result | Error Code |
| 01C0301 | PI-LINK          |           | PASS   |            |

Command successfully completed

Feature Interactions

None.

# release mis

---

This command will release a specified management information system.

## Synopsis

---

release mis

## Permissions

---

The following default logins may execute this command: system technician, inads, init, cust, rcust.

## Examples

---

release mis

## Description

---

The release mis command will put a management information system into service. Some tests are executed on the hardware to verify that the equipment is functioning.

## Defaults

None.

## Parameters

None.

## Help Messages

If the system technician presses HELP after entering "release mis" the following message will be displayed:

Entry is not required

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Output

|                  |                                                                                           |
|------------------|-------------------------------------------------------------------------------------------|

release modem-pool

This command will allow all members of a modem pool group to be released.

## Synopsis

release modem-pool group/member

## Permissions

The following default logins may execute this command: init, inads, system technician.

## Examples

release modem-pool 1  
release modem-pool 4/3

## Description

The release modem-pool command will remove the specified modem pool group or group member from the maintenance busy state. A single group member can be released by specifying the group number, a "/", and the member number. All members in a modem pool group can be released by specifying the modem pool group number only.

## Defaults

None.

## Parameters

|               |                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group number  | The group number is assigned from administration. The group number may be any administered group from 1-5.                                                                                                                 |
| member number | The member number is assigned from administration. A member is a pair of analog and digital line ports (or two pair for the Integrated modem-pool case). The member number may be any administered group member from 1-32. |

## Help Messages

If the system technician presses HELP after entering "release modem-pool" the following message will be displayed:

Enter assigned group number between 1-5  
Or press CANCEL to cancel the command

## Error Messages

If the "release modem-pool" command is entered from a login for which the command is not valid, then the following message will be displayed:

"release" is an invalid entry; please press HELP

If the group or member numbers entered are not in a valid format, the following message will be displayed:

Identifier invalid

If the group number entered is not within the range of groups or the member number is not within the member range, then the following message will be displayed:

Boards not assigned

If the specific group or member are not administered, then the following message will be displayed:

Group not assigned, or group assigned but with no member

If a software fault is encountered while the command is executing, the following message will be displayed:

Error encountered, can't complete request

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

**Output**

---

When each modem pool member has been busied out, the following information will be displayed:

|                  |                                                                                                      |
|------------------|------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object which is being busied out. |
| Maintenance Name | The type of maintenance object that is being busied out or released. This is always MODEM-PT.        |

|            |                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alt. Name  | This field is not applicable to this command.                                                                                                                          |
| Result     | The result of the release -"PASS," "ABORT," "FAIL."                                                                                                                    |
| Error Code | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter. |

In the following output example, the command "release modem-pool 1" was entered.

```
release modem-pool 1          SPE B

                                COMMAND RESULTS

Port      Maintenance Name    Alt. Name  Result  Error Code
01C0701    MODEM-PT                   PASS
01C0703    MODEM-PT                   PASS

Command successfully completed
```

**Feature Interactions**

---

None.

**release packet-control**

---

This command will release the specified packet-control.

**Synopsis**

---

release packet-control *location*

**Permissions**

---

The following default logins may execute this command: system technician, inads, init

**Examples**

---

release packet-control 1A  
release packet-control 1B

## Description

---

The release packet-control command will put the packet-control circuit pack in-service, and reestablish each point-to-point signaling link that is terminated on this packet-control. This command is the complement to the busyout packet-control command which puts the packet-control in a out-of-service state and tears down all point-to-point signaling links terminated on this packet-control.

## Defaults

For simplex systems, the location is optional and defaults to cabinet 1, carrier A. For duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | The location only applies to duplicated configurations. If the configuration is a simplex, the location parameter is not used and thus is not valid. For duplicated configurations, a "location" represents the carrier that the packet-control resides on in the system. Valid locations are either 1A or 1B. |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses HELP after entering "release packet-control," the following message is displayed:

```
Enter Packet Control location: [cabinet(1)];carrier(A-B)
```

## Error Messages

If this command is entered for a packet-control that resides on the stand-by control complex of a High or Critical Reliability System, the following message is displayed:

```
Command only applies to the active Packet Control
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then  
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Output

---

|                  |                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | This field represents the Cabinet-Carrier in which the Packet-Control resides.                                                                                         |
| Maintenance Name | The type of maintenance object that is being released which is always PKT-CTRL.                                                                                        |
| Alt. Name        | This field is not used in this output display.                                                                                                                         |
| Result           | An indicator as to whether the object was successfully released ( "PASS," "FAIL," or "ABORT" ).                                                                        |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter. |

For the following output example, the command release packet-control 1A was entered.

```
release packet-control 1A

                                COMMAND RESULTS

Port   Maintenance Name   Alt. Name   Result   Error Code
-----
1A      PKT-CTRL              PASS

Command successfully completed
```

Feature Interactions

In a High or Critical Reliability System, an attempt to release the packet-control that resides in the standby control complex will be disallowed.

When the packet-control in the active control complex is released from a previously busied-out state, all connectivity across the Packet Bus will be reestablished. Thus, all ISDN-BRI point-to-point signaling links that had been established via the packet-control prior to the execution of a busyout packet-control command will be reestablished by the release packet-control command.

release pms-link

This command will release a specified property management system link.

Synopsis

release pms-link

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

release pms-link

## Description

---

The `release pms-link` command removes all MOs associated with a property management system link from the maintenance busy state. A link is made up of several components. It involves a far-end data module, a simulated data channel on a NETCON board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

## Defaults

None.

## Parameters

None.

## Help Messages

If you press `HELP` after entering "`release pms-link`" the following message displays:

```
Entry is not required
```

If the command entered is in conflict with another currently executing command, then a message displays showing the login ID of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then  
resubmit
```

If all of the available maintenance resources are currently in use, the following message displays:

```
All maintenance resources busy; try again later
```

## Output

|                  |                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | With this maintenance object the port field is left blank.                                                                                                             |
| Maintenance Name | The type of MO that is being released (always PMS-LINK).                                                                                                               |
| Alt. Name        | Not applicable.                                                                                                                                                        |
| Result           | The result of the release -"PASS," "ABORT," "FAIL."                                                                                                                    |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter. |

For the following output example, assume that the command that was entered is "release pms-link."

release pms-link

| COMMAND RESULTS                |                  |           |        |            |
|--------------------------------|------------------|-----------|--------|------------|
| Port                           | Maintenance Name | Alt. Name | Result | Error Code |
|                                | PMS-LINK         |           | PASS   |            |
| Command Successfully Completed |                  |           |        |            |

## Feature Interactions

The maintenance of a particular component on a link may interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. The technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will not cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup trys on the link.

## release port

This command will release a specified port on a circuit pack.

## Synopsis

release port location

Permissions

---

The following default logins may execute this command: system technician, inads, init.

Examples

---

release port 01c1101  
release port 02c1501

Description

---

The release port command will remove the specified port on a circuit pack from a maintenance busy state.

Defaults

No defaults.

Parameters

location            A "location" represents the physical position of the port to be released and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit (port).

Help Messages

If the system technician presses HELP after entering "release port," the following message will be displayed:

Enter 7 character port number

Error Messages

If the format of the port location is incorrect, the following error message will be displayed:

Port/Board invalid

If the EPN on which the port resides is unavailable, the following message will be displayed:

EPN is not available

If the board on which the port resides is not administered, the following error message will be displayed:

Port not assigned

If the board on which the port resides is part of the SCI link, the following error message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the port is translated within a Wideband Access Endpoint, the following error message will be displayed:

```
Port within wideband access endpt;  
Use busyout access-endpoint <ext> instead
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.                                                                                                                                                                                                                                                       |
| Maintenance Name | The type of maintenance object that is being released.                                                                                                                                                                                                                                                                                                  |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | The result of the release -"PASS," "ABORT," "FAIL,"                                                                                                                                                                                                                                                                                                     |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.                                                                                                                                                                                  |

For the following output example, assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port. The command that was entered is "release port 1c0701."

release port 01C0701

COMMAND RESULTS

| Port                           | Maintenance Name | Alt. Name | Result | Error Code |
|--------------------------------|------------------|-----------|--------|------------|
| 01C0701                        | ANL-LINE         |           | PASS   |            |
| Command successfully completed |                  |           |        |            |

Feature Interactions

None.

release pri-endpoint

This command will release a specified PRI endpoint.

Synopsis

release pri-endpoint extension

Permissions

The following default logins may execute this command: system technician, inads, init, nms.

Examples

release pri-endpoint 25012  
release pri-endpoint 77868

Description

The release PRI endpoint command will remove all PRI endpoint ports (B-channels) associated with the specified PRI endpoint from a maintenance busy state. Periodic and scheduled tests will resume on the released ports. The switch will attempt to negotiate with the far-end PRI terminal adapter to put each PRI endpoint port (B-channel) into in-service state. Maintenance will do background initialization testing on the released ports. For details of the test sequence, refer to [3].

## Defaults

No defaults.

## Parameters

|           |                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| extension | An extension number associated with the desired PRI endpoint. The number of digits in an extension is determined by the dial-plan. |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the user presses `HELP` after entering "release pri-endpoint," the following message is displayed:

```
Enter assigned extension
```

## Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the PRI endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not a PRI endpoint, the following message will be displayed:

```
Extension assigned to object other than pri-endpoint
```

If the board that contains the PRI endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.                                                                      |
| Maintenance Name | The type of maintenance object that is being released. The name for PRI endpoint port is "PE-BCHL."                                                                    |
| Alt. Name        | The alternate way of identifying the maintenance object. This field contains the extension number of the PRI endpoint.                                                 |
| Result           | An indicator as to whether the object is successfully released. The possible values are: PASS, FAIL and ABORT.                                                         |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter. |

For the following output example, the command "release pri-endpoint 22501" was entered. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 6.

```
release pri-endpoint 22501           page 1 of 1

                                COMMAND RESULTS

Port      Maintenance Name Alt. Name Result  Error Code
01B2001   PE-BCHL          22501   PASS
01B2002   PE-BCHL          22501   PASS
01B2003   PE-BCHL          22501   PASS
01B2004   PE-BCHL          22501   PASS
01B2005   PE-BCHL          22501   PASS
01B2006   PE-BCHL          22501   PASS

Command Successfully Completed
```

Feature Interactions

None.

release sp-link

This command will release the system printer link.

## Synopsis

---

release sp-link

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**release sp-link**

## Description

---

The release sp-link command will return the busied out system printer link to operation and resolve all active alarms for the system printer link.

The system printer link is a link from the switch to an external printer over which jobs can be printed. This link is created by administering the system printer extension and setting up a call to the system printer.

## Defaults

No defaults.

## Parameters

None.

## Help Messages

If the system technician presses HELP after entering "release sp-link," the following is displayed:

Entry is not required

## Error Messages

If the system printer link is not administered, the following message is displayed:

Link not administered or not enabled

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. For this maintenance object, blanks are displayed.                                                                                                                                                                                                  |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                                                                                                                                                                                                                                |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | An indicator as to whether the object was successfully busied out.                                                                                                                                                                                                                                                                                      |
| Error Code       | A numerical description of why the command failed.                                                                                                                                                                                                                                                                                                      |

For the following output example the command entered was "release sp-link."

```
release sp-link           SPE A

                        COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
      SYS-PRNT
Command Successfully Completed
```

Feature Interactions

None.

release spe-standby

This command allows the technician to release the standby Switch Processing Element (SPE).

Synopsis

release spe-standby

Permissions

---

The following default logins may execute this command: system technician, inads, init.

Examples

---

**release spe-standby**

Description

---

The release spe-standby command removes the busyout status of the standby SPE. Memory shadowing will be restored, a memory refresh of the standby SPE will occur and 1 minute later the equivalent of scheduled standby SPE maintenance will be performed which will return the standby SPE's Fault Severity Level to the appropriate value.

Release of the standby SPE will be allowed if communication to the standby is down.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "release spe-standby" the following message will be displayed:

Entry is not required

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

## Output

|                  |                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address will display the cabinet and carrier location of the standby SPE. The standby SPE port address will always be 01A or 01B.                            |
| Maintenance Name | "STBY-SPE" for the standby SPE maintenance object.                                                                                                                    |
| Alt. Name        | Always blank for this command.                                                                                                                                        |
| Result           | The result of the release -"PASS," "ABORT," "FAIL,"                                                                                                                   |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busout/Release Commands" section of this chapter. |

For the following output example, assume that the standby SPE is located in carrier "B." The command that was entered is "release spe-standby."

```
release spe-standby           SPE A

                                COMMAND RESULTS

Port  Maintenance Name  Alt. Name  Result  Error Code
01B      STBY-SPE

Command successfully completed
```

## Feature Interactions

When the standby SPE is released a memory refresh is performed which may take several minutes to complete. The standby Fault Severity Level will be lowered to its appropriate level when a release is requested. One minute later, the equivalent of scheduled standby SPE maintenance will be performed, after which a spontaneous SPE interchange could occur, depending of the Fault Severity Level of the two SPE's.

If the standby SPE is in poor health, memory shadowing can not be enabled or communication to the standby is impossible, a release of the standby SPE will still be successful.

## release station

This command will release a specified station.

## Synopsis

release station extension

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, init.

## Examples

---

```
release station 10020
release station 32770
```

## Description

---

The release station command will remove the specified administered voice terminal extension (station) from a maintenance busy state.

## Defaults

No defaults.

## Parameters

|           |                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| extension | An extension number associated with the desired voice terminal. The number of digits in an extension is determined by a dial-plan. |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses HELP after entering "release station," the following message will be displayed:

```
Enter extension for an assigned station
```

## Error Messages

If the format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the specified extension is not administered, then the following message will be displayed:

```
Extension not assigned
```

If the specified extension does not belong to a station or attendant console, the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the station port resides on an EPN that is unavailable, the following message will be displayed:

```
EPN is not available
```

If the station port resides on a board that is not inserted in the system, the following message will be displayed:

```
Board not assigned
```

If the station port resides on a board that is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Output

|                  |                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.                                                                      |
| Maintenance Name | The type of maintenance object that is being released.                                                                                                                 |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station.                                             |
| Result           | The result of the release -"PASS," "ABORT," "FAIL."                                                                                                                    |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter. |

For the following output example, assume that the command that was entered is "release station 1002."

release station 1002

COMMAND RESULTS

| Port    | Maintenance Name | Alt. Name | Result | Error Code |
|---------|------------------|-----------|--------|------------|
| 01C1102 | DIG-LINE         |           | PASS   |            |

Command successfully completed

Feature Interactions

None.

release tdm

This command will release a TDM bus on the PPN or any EPN.

Synopsis

release tdm port-network pn number bus bus

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

release tdm port-network 1 bus a  
release tdm port-network 1 bus b

Description

The release tdm command will remove the specified tdm bus from a maintenance busy state.

## Defaults

No defaults.

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pn number | The PN number specifies the Port Network number of the TDM bus to be released.                                                                                                                                                                                                                                                                                                                                                                                                |
| bus       | The TDM bus ("a" or "b") specifies which half of the TDM bus is desired. Each 512 time slot TDM bus is configured as two duplicate 256 time slot buses. This division allows for duplication of control channels and dedicated tone time slots. The default control bus (carrying the control channel) is the "a" bus, while the default tone bus (carrying dedicated tones) is the "b" bus. A port network number (1 - 3) may be entered with or without a leading zero (0). |

## Help Messages

If the system technician presses `HELP` after entering "release tdm," the following message will be displayed:

```
Enter 'port-network', port network number (1-3),  
'bus', bus ('a' or 'b')
```

## Error Messages

If the technician enters "bus" before "port-network," the following message will be displayed:

```
'bus' is an invalid identifier; please press HELP
```

If the technician does not enter all digits for the port-network number, the following message will be displayed:

```
Entry must be all digits
```

If the technician enters a bus other than A or B, the following message will be displayed:

```
Identifier invalid
```

If the technician enters a TDM bus identifier with a Port Network number that is not administered, the following message will be displayed:

```
Port Network number not assigned
```

If the port network on which the desired TDM bus resides is unavailable, the following message will be displayed:

```
EPN is not available
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port network number (preceded by "PN") and the bus ("A" or "B") associated with the TDM bus.                                                                       |
| Maintenance Name | TDM-BUS is the maintenance object being released.                                                                                                                      |
| Alt. Name        | Not applicable.                                                                                                                                                        |
| Result           | The result of the release -"PASS," "ABORT," "FAIL,"                                                                                                                    |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter. |

For the following output example, assume that the command that was entered is "release tdm port-network 1 bus a."

release tdm port-network 1 bus a

COMMAND RESULTS

| Port   | Maintenance Name | Alt. Name | Result | Error Code |
|--------|------------------|-----------|--------|------------|
| PN 01A | TDM-BUS          |           | PASS   |            |

Command successfully completed

Feature Interactions

If a bus is busied out, no calls will be torn down. However, no new calls will be set up on the busied out bus.

Dedicated tone time slots must be moved to another bus (the other half of the duplicated bus) before a busyout of a particular bus will be allowed.

# release tone-clock

This command will release a tone/clock circuit pack.

## Synopsis

release tone-clock location

## Permissions

The following default logins may execute this command: system technician, inads, init.

## Examples

release tone-clock c

## Description

The release tone-clock command will remove the specified tone/clock from a maintenance busy state.

## Defaults

The cabinet number will default to 1 (one).

## Parameters

|          |                                                                                                                                                                                                                                                                           |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | A "location" represents the physical position of the tone/clock to be released and is entered as "UUc" where "UU" represents the cabinet number, and "c" represents the carrier. A single digit cabinet number (1 - 3) may be entered with or without a leading zero (0). |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses HELP after entering "release tone-clock," the following message will be displayed:

```
Enter tone/clock location:  
[cabinet(1-3)];(carrier(A-E))
```

## Error Messages

If an identifier greater than 3 (three) characters is entered, or the cabinet entered is not a digit (number), the following message will be displayed:

```
Identifier invalid
```

If the carrier entered is invalid, the following message will be displayed:

```
Invalid carrier specified
```

If the cabinet entered is not within the valid range of cabinets or the cabinet is not administered, the following message will be displayed:

```
Cabinet number not assigned
```

If there is no tone/clock board at the specified location, one of the following messages will be displayed:

```
Board not inserted  
Board not assigned
```

If the specified cabinet carrier location is that of a switch node, the following message will be displayed:

```
Switch Node carrier specified;  
invalid command for SN carrier
```

If the cabinet carrier location entered is that of an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If the tone/clock is not busied out and the specified action is release, the following message will be displayed:

```
Object is not busied out; can't release
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                  |                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The tone clock circuit pack maintenance object will only display the cabinet and carrier of the desired tone/clock board.                                              |
| Maintenance Name | The type of maintenance object that is being released is TONE-PT, TDM-CLK and TONE-BD.                                                                                 |
| Alt. Name        | Not applicable.                                                                                                                                                        |
| Result           | The result of the release -"PASS," "ABORT," "FAIL."                                                                                                                    |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter. |

For the following output example, assume that the command that was entered is "release tone-clock 1a."

```
release tone-clock 1a

                                COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01A    TONE-PT             
01A    TDM-CLK             
01A    TONE-BD             

Command successfully completed
```

## Feature Interactions

None.

## release trunk

This command will release a specified trunk group or trunk group member.

## Synopsis

release trunk group/*member*

## Permissions

The following default logins may execute this command: system technician, inads, init.

### Examples

---

release trunk 78  
release trunk 78/1

### Description

---

The release trunk command will remove the specified trunk group or trunk group member from a maintenance busy state. A single group member can be released by specifying the group number, a "/", and the member number. All members in a trunk group can be released by specifying the trunk group number only.

### Defaults

No defaults.

### Parameters

- |        |                                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------------------------------|
| group  | The group number is an administered number associated with each trunk group. The valid range is 1 - 99.                     |
| member | The member number is an administered number identifying a particular trunk within a trunk group. The valid range is 1 - 99. |

### Help Messages

If the system technician presses HELP after entering "release trunk," the following message will be displayed:

Enter assigned trunk group number [or group/member]

### Error Messages

If the format of the identifier is invalid, the following message will be displayed:

Format invalid

If the range of the trunk group is incorrect, the following error message will be displayed:

Trunk or trunk group invalid

If the specified trunk group is not administered or has no members, the following message will be displayed:

Group not assigned,  
or group assigned but with no member

If the specified member is not administered, the following message will be displayed:

```
Group member not assigned
```

If the specified trunk group is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.                                                                                                                                                                                                                                                       |
| Maintenance Name | The type of maintenance object that is being released.                                                                                                                                                                                                                                                                                                  |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | The result of the release - "PASS," "ABORT," "FAIL."                                                                                                                                                                                                                                                                                                    |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Commands" section of this chapter.                                                                                                                                                                            |

For the following output example, assume that the command that was entered is "release trunk 78/1."

```
release trunk 78/1
```

COMMAND RESULTS

| Port                           | Maintenance Name | Alt. Name | Result | Error Code |
|--------------------------------|------------------|-----------|--------|------------|
| 01C1505                        | CO_TRK           | 78/01     | PASS   |            |
| Command successfully completed |                  |           |        |            |

Feature Interactions

None.

reset board

This command will reset the specified board.

Synopsis

reset board location *repeat number*

Permissions

The following default logins may execute this command: system technician, inads, init, nms.

Examples

reset board 01c11  
reset board c08  
reset board 03d12 r 3

Description

The reset board command will perform a soft (i.e. software) reset of every administered port on the port circuit pack at the specified location. All ports must be busied out before the port circuit pack is reset. The most efficient way of doing this is to perform a busyout of the board before resetting it.

 **WARNING:**  
This command is service disrupting and may cause extraneous alarms.

## Defaults

The carrier and repeat number default to 1.

## Parameters

|          |                                                                                                                                                                                                                             |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | A "location" represents the physical position of the port board to be reset and is entered as "UUcSS" where "UU" represents the cabinet number ( 1 - 3), "c" represents the carrier, and "SS" represents the slot position. |
| number   | The "number" specifies how many times each board reset is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                    |

## Help Messages

If the system technician presses HELP after entering "reset board," the following message will be displayed:

```
Enter board location, ['repeat' (1-100)]
```

## Error Messages

If the format of the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the specified board is not available, the following message will be displayed:

```
EPN is not available
```

If a board is not inserted in the specified location, then the following message will be displayed:

```
Board not assigned
```

If the specified board is active, the following message will be displayed:

```
Illegal command for active object;  
use 'set' to switch to standby
```

If a reset is attempted on an invalid board in the service slot, the following message is displayed:

```
Board invalid
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Output

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot) of the maintenance object that is being reset.                                                                                                                                                                                                                                                                  |
| Maintenance Name | The type of maintenance object being reset.                                                                                                                                                                                                                                                                                                             |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Result           | The result of the reset -"PASS," "ABORT," "FAIL."                                                                                                                                                                                                                                                                                                       |
| Error Code       | A system-generated number that tells why the reset failed or aborted. A detailed list of the codes can be in the "Reset Commands" section of this chapter.                                                                                                                                                                                              |

For the following output example, assume that the board in port network 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered is "reset board 1c07."

```
reset board 1c07  
  
TEST RESULTS  
  
Port      Maintenance Name  Alt. Name Test No. Result  Error Code  
01C07     ANL-BD              53      PASS  
  
Command Successfully Completed
```

Feature Interactions

None.

# reset interface

This command will reset the processor interface board (PI).

## Synopsis

reset interface location

## Permissions

The following default logins may execute this command: system technician, inads, init.

## Examples

reset interface 01a1  
reset interface a2  
reset interface 01b1  
reset interface 01b2

## Description

This command resets the Processor Interface circuit pack, causes its associated software to be read from tape, applications processes to be restarted, permanent switched calls to be re-established, and each enabled link to be setup. If the interface cannot be established, a Major alarm is raised on the interface and all enabled links are taken out-of-service. When the Message Server Adjunct (MSA), Distributed Communications System (DCS), Audio Information Exchange (AUDIX), or Call Management System (CMS) is first administered and the form submitted, the link for these applications and the submittal of the form restart the interface. Before the Processor Interface circuit pack is replaced, the switch must be powered down and then restarted (unless the system is equipped with High or Critical Reliability).

When resolving troubles, also see the **status interface**, **status link**, and **status processor-channel** commands to determine where the trouble is located before performing a **reset interfaces** because link traffic is interrupted.

**WARNING:**

*The interface command interrupts operation of the AP, DCS, AUDIX, CMS or ISDN-PRI.*

## Defaults

No defaults.

## Parameters

**location** The location (cabinet-carrier-position) of the processor interface (PI board). The position determines which processor interface circuit pack will be cleared. A position of 1 is the first processor interface in the carrier, while a position of 2 is the second processor interface in the carrier.

## Help Messages

If you press HELP after entering "reset interface," the following message displays:

```
Enter identifier: [cabinet(1)];carrier(A-B);position(1-2)
```

## Error Messages

If the specified carrier is not the active PE, the following message will be displayed:

```
Command must be executed from active SPE
```

If the technician-entered cabinet and carrier is invalid for a PPN, the following message will be displayed:

```
Invalid port-network specified
```

If the technician-entered carrier is not a valid carrier, the following message will be displayed:

```
Invalid carrier specified
```

If the technician-entered carrier is not active, the following message displays:

```
Board invalid
```

If the specified carrier/position processor interface circuit pack is not inserted, but the specified carrier is active, the following error message will be displayed:

```
Processor Interface (TN765)  
not started or is being started
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering  
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed; use the
"refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

---

If the reset interface command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the reset interface command is unsuccessful, the following message will be displayed:

```
Error encountered, can't complete request
```

## Feature Interactions

---

None.

# reset maintenance

---

This command will reset the EPN maintenance circuit pack in any Expansion Port Network cabinet.

## Synopsis

---

reset maintenance location

## Permissions

---

The following logins may execute this command: system technician, inads, init.

## Examples

---

reset maintenance 02  
reset maintenance 2  
reset maintenance 3a

## Description

---

The reset maintenance command performs a reset on a technician specified EPN maintenance circuit pack. Specifying cabinets 2 or 3 resets the EPN maintenance circuit pack in the 'a' carrier of the specified cabinet.

This command is destructive and will drop a SAT terminal session on the EPN maintenance circuit pack being reset. If this command is run from a EPN maintenance SAT terminal, the results of the reset will not be displayed.

## Defaults

None.

## Parameters

|          |                                                                                                                                                                                                                                                                          |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | The location designates the physical position of the desired EPN maintenance circuit pack. The location consists of a cabinet number and carrier letter. The cabinet number is one digit, 2 through 3 with a leading zero allowed. The carrier is always "a" if entered. |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses `HELP` after entering "reset maintenance" the following message will be displayed:

Enter cabinet([0]2-[0]3);[carrier(A)]

Error Messages

If the cabinet entered is non numeric or not within a valid range, the following message will be displayed:

Cabinet number out of range; Enter 2 - 3

If the length of the user entered parameter exceeds three (3), or is in any other way invalid, the following message will be displayed:

Entry invalid

If the command entered is in conflict with another currently executing command, then a message displays showing the login ID of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

Output

|                  |                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot) of the MO being reset.                                                                                             |
| Maintenance Name | "MAINT" for the EPN maintenance circuit pack.                                                                                                              |
| Alt. Name        | Always blank for this command.                                                                                                                             |
| Result           | The result of the reset -"PASS," "ABORT," "FAIL."                                                                                                          |
| Test No.         | The test number for this command will always be 306.                                                                                                       |
| Error Code       | A system-generated number that tells why the reset failed or aborted. A detailed list of the codes can be in the "Reset Commands" section of this chapter. |

For the following output example, assume that the command that was entered is "reset maintenance 02a."

reset maintenance 02A

TEST RESULTS

| Port | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|------|------------------|-----------|----------|--------|------------|
| 02A  | MAINT            |           | 306      | PASS   |            |

Command successfully completed

Feature Interactions

Running the command from the EPNSAT, will cause the SAT to be dropped before the reset results can be displayed. In this case, the user should examine the error and alarm logs for "MAINT" entries to determine if the reset failed.

# reset spe-standby

This command resets the standby SPE to a defined level.

## Synopsis

reset spe-standby level

## Permissions

The following default logins may execute this command: system technician, inads, init.

## Examples

reset spe-standby 1  
reset spe-standby 2  
reset spe-standby 3  
reset spe-standby 4  
reset spe-standby 5

## Description

Resetting the standby SPE means bringing that SPE out of standby mode into maintenance mode with the defined restart level. This command is only for a high or critical reliability system.

## Defaults

None.

## Parameters

level                    The reset levels are entered numerically with a range of 1 - 5, the levels are as follows:

| Level | Recovery     |
|-------|--------------|
| 1     | Warm Restart |
| 2     | Cold-2       |

| Level | Recovery        |
|-------|-----------------|
| 3     | Cold-1          |
| 4     | Reboot          |
| 5     | Extended Reboot |

Help Messages

If the system technician presses HELP after entering "reset spe-standby" on a duplex SPE system, the following message will be displayed:

Enter standby SPE recovery level '1'(WARM), '2'(COLDII),  
'3'(COLDI), '4'(REBOOT) or '5'(EXT REBOOT)

Error Messages

If the specified level is invalid (not 1-5), the following message will be displayed:

System reset level invalid

If the standby SPE is not refreshed and the SPE Select switches are selecting the active SPE, the following message will be displayed:

Active SPE locked via select switches;  
Standby SPE memory not refreshed

If the standby SPE is not refreshed; the following message will be displayed:

Standby SPE memory not refreshed; use the  
"refresh spe-standby" command

Output

If the reset command is successful, the following message displays:

Command successfully completed

If the reset command is unsuccessful, the following message displays:

Standby SPE failed to reset with requested level;  
check for STBY-SPE errors

If the standby is in the process of doing a software upgrade, then the following will be displayed:

Standby SPE upgrade in progress, command denied

## Feature Interactions

The reset spe-standby command will invoke standby SPE initialization as if low level maintenance had done it. This means that the reset level requested will never be escalated by software. The reset level requested by the technician will always be the level that is performed.

If the standby SPE contains a software memory card and the requested restart level is 4 or 5, then the standby SPE will reload system software before rebooting.

## reset system

This command resets the SPE to a defined level, or switch control to the standby SPE.

## Synopsis

reset system [ level | interchange ]*health-override*

## Permissions

The following default logins may execute this command: system technician, inads, init.

## Examples

reset system 1  
reset system 2  
reset system 3  
reset system 4  
reset system 5  
reset system interchange  
reset system interchange health-override

## Description

This command is increasingly destructive as the reset level increases.

The command can also be used to switch control from the currently active SPE to the standby SPE in a High or Critical Reliability System through a HOT (planned) restart interchange. **Once a planned interchange has been started it cannot be aborted by pressing the CANCEL key.** If a "reset system interchange" command is rejected because the Fault Severity Level of the standby SPE is higher than that of the active SPE, the "health-override" option can be specified to try to force a HOT interchange.

The reset system interchange command does not disrupt in-progress calls. However, it drops links to local and remote administration terminals and also drops and re-establishes connections on the Network Control Circuit Pack data channels. This includes CDR and PMS links. No new calls can be made during the interchange, but stable calls are not affected.

When a system restart occurs with the corresponding vector bit set, a core dump is written to memory card, only if the memory card is the special core dump card), the vector is cleared, and the requested restart is performed.

**All successful reset system commands will log the user off.**

**Defaults**

None.

**Parameters**

llevel                    The reset levels are entered numerically with a range of 1 - 5, the levels are as follows, and the approximate times are listed for each appropriate level and system configuration:

| Level | Recovery        | SMALL<br>Flash | MEDIUM<br>Flash |
|-------|-----------------|----------------|-----------------|
| 1     | Warm Restart    |                |                 |
| 2     | Cold-2          |                |                 |
| 3     | Cold-1          |                |                 |
| 4     | Reboot          |                |                 |
| 5     | Extended Reboot |                |                 |

interchange            Control of the system passes to the standby SPE as the active SPE becomes the standby SPE and the standby SPE becomes the active SPE. The optional "health-override" qualifier can be entered to force an interchange even if the Fault Severity Level of the standby SPE would normally cause the maintenance software to abort the interchange. The Fault Severity Level of an SPE is determined by the alarmed components in that SPE. Each component is given a severity level, and the single worst alarm (severity) for a SPE defines Fault Severity Level for the SPE. The table below lists the maintenance objects, their alarms, severities and the restart level of the interchange that affect a SPE's Fault Severity Level.

| Maintenance Object | Alarm Level    | On/Off Board | Fault Severity Level | Restart Level |
|--------------------|----------------|--------------|----------------------|---------------|
| STBY-SPE           | WARNING        | OFF          | 120                  | None          |
| MEM-BD             | MAJOR or MINOR | ON           | 110                  | Hot or Warm   |
| MEMORY             | MAJOR or MINOR | ON           | 110                  | Hot or Warm   |
| STBY-SPE           | MAJOR          | ON           | 100                  | None          |
| PROCR              | MAJOR          | ON           | 70                   | Hot or Warm   |
| SW-CTL             | MAJOR          | ON           | 65                   | Cold 2        |
| MEM-CARD           | MAJOR          | OFF          | 65                   | Cold 1        |
| 12V-PWR            | MIN            | ON           | 65                   | Hot           |
| DUPINT             | MAJOR          | ON           | 61                   | Hot           |
| CARR-POW           | MAJOR          | ON           | 61                   | Cold 2        |
| SHDW-CIR           | MAJOR          | ON or OFF    | 60                   | Warm          |
| SHDW-LINK          | MAJOR          | ON           | 60                   | Warm          |
| SW-CTL             | MINOR          | ON           | 40                   | Hot           |
| PR-MAINT           | MINOR          | ON           | 30                   | Hot           |
| PI-BD              | MAJOR or MINOR | ON           | 20                   | Hot           |
| PKT-CTRL           | MAJOR          | ON or OFF    | 20                   | Hot           |
| PKT-CTRL           | MINOR          | ON or OFF    | 15                   | Hot           |
| PI-PT              | MAJOR          | ON           | 15                   | Hot           |
| DATA-CHL           | MINOR          | ON           | 15                   | Hot           |
| DATA-CON           | MINOR          | ON           | 15                   | Hot           |
| DATA-BD            | MINOR          | ON           | 15                   | Hot           |
| MEM-CARD           | MINOR          | ON or OFF    | 10                   | Hot           |
| PR-MAINT           | MINOR          | OFF          | 8                    | Hot           |

A "reset system interchange" command will abort for the following reasons:

- If the standby SPE is down
- If the active SPE is locked active
- If communication to the standby SPE is not possible
- If memory shadowing to the standby SPE is not functioning
- If the standby SPE is not fully refreshed
- If the standby SPE is busied out

health-override If a HOT restart interchange fails because the Fault Severity Level of the standby SPE is higher than that of the active SPE, the "health-override" option can be specified to try to force a switch to occur. If the switch occurs, this option causes the new active SPE Fault Severity Level to be raised as much as possible in hopes that a software initiated HOT SPE interchange switch back to the original active SPE will not occur. This artificial raising of the active Fault Severity Level will last for one hour at which time the Fault Severity Level of both SPEs will return to their normal values based on the alarms listed in the table above.

## Help Messages

If the system technician presses HELP after entering "reset system" on a simplex SPE system, the following message will be displayed:

```
Enter system recovery level '1'(WARM), '2'(COLDII),  
'3'(COLDI), '4'(REBOOT), or '5'(EXT REBOOT)
```

If the system technician presses HELP after entering "reset system" on a duplex

SPE system, the following message will be displayed:

```
Enter system recovery level '1'(WARM), '2'(COLDII),  
'3'(COLDI), '4'(REBOOT), or '5'(EXT REBOOT)  
or 'interchange ['health-override']'
```

## Error Messages

If the CANCEL key is pressed after the command has been started, the following message is displayed:

```
This command may not be canceled
```

If the system reset level is not numeric or "interchange," the following message will be displayed:

```
System reset level invalid
```

If the "health-override" option is specified with any level of 1 - 5, the following message will be displayed:

```
The 'health-override' option is only used  
with the 'interchange' level
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If this command is issued while an **upgrade software** command is active the following message will be displayed:

```
Standby SPE upgrade in progress, command denied
```

## Output

---

If the reset command, including the "reset system interchange," is successful the user will be logged off.

If the "reset system interchange" command is not successful one of the following are displayed:

If the "interchange" option is specified and the active SPE is locked active, the following message will be displayed:

```
Unable to interchange because the  
active SPE is locked active
```

If the "interchange" option is specified and only the Fault Severity Level of the standby SPE is preventing the interchange, the following message will be displayed:

```
Unable to interchange due to alarms on the standby SPE;  
Use 'health-override' option
```

If the "interchange" option is specified and the standby SPE is busied out, the following message will be displayed:

```
Unable to interchange; standby SPE is busied out
```

If the reset interchange command cannot be performed for any other reason, the following message will be displayed on the SAT:

```
Cannot perform SPE interchange;  
for information use 'status system'
```

## Feature Interactions

---

The reset command will invoke system initialization as if low level maintenance had done it. This means that the reset level requested will never be escalated by software. The reset level requested by the technician will always be the level that is performed.

It should be noted that there are two hardware switches associated with the active and standby SPEs. These hardware switches override any demand maintenance activities that the system technician requests. If the active SPE is locked active with these hardware switches, an interchange will not take place until the active is unlocked using the same hardware switches.

A successful SPE interchange will always logoff the PPNSAT terminal.

Any level of restart will null out the effect of the health-override option.

## restore announcements

---

This command copies announcement data from the specified MSS device (tape or Card-Mem) to the announcement board.

## Synopsis

---

restore announcements [ *print* | *schedule* ]

## Permissions

---

The following default logins may execute this command: system technician, cust, rcust, inads, init.

## Examples

---

restore announcements

## Description

---

The restore announcements command copies announcement data from the active MSS device to the announcement board.

## Defaults

In a tape based system, the announcement data is copied from the active processor's tape to the announcement board. In a Card-Mem based system, the announcement data is copied from the active processor's Card-Mem to the announcement board.

## Parameters

|           |                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| print     | In addition to displaying the output of the restore announcement command on the Manager I terminal, print the result of the restore announcement command on the printer. |
| scheduled | Schedule the execution of the restore announcement command at a specific time.                                                                                           |

## Help Messages

If the system technician presses HELP after entering "restore announcements," the following message is displayed:

```
Enter ['print' or 'schedule']
```

## Error Messages

If the announcement data module cannot be accessed (upload/download port is active), the following message is displayed:

```
Announcement data module not available
```

If the announcement data module has been taken out of service, the following message is displayed:

```
Announcement data module out of service
```

If one or more of the announcement ports are in use, the following message is displayed:

```
Announcement port in use; please try later
```

If the announcement data module is not administered, the following message is displayed:

```
Required announcement data module not administered
```

If the announcement data module is not administered or is currently in use, the following message is displayed:

```
Required data module not administered or unavailable
```

If there is no announcement board in the system, the following message is displayed:

```
Integrated announcement board not present
```

If the NETCON data module is not administered or out of service the following message is displayed:

```
Required NETCON data module not  
administered or out-of-service
```

If the NETCON data module is busy the following message is displayed:

Required NETCON data module unavailable

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

Output

|                           |                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Processor                 | This field displays the processor on which the MSS device resides that was used to copy announcement data.                                                                                                                 |
| Command Completion Status | This field specifies whether the command completed successfully. Valid values are:                                                                                                                                         |
| Error Code                | This is a numerical description of whether the announcement file is successfully restored to the announcement board. A value of "0" means that the restore was successful. A value of "1" denotes that the restore failed. |

For the following output example, the command entered is "restore announcements" on a simplex SPE system.

restore announcements

Page 1 of 1 SPE A

RESTORE ANNOUNCEMENTS

|           |                           |            |
|-----------|---------------------------|------------|
| Processor | Command Completion Status | Error Code |
| SPE-A     | Success                   | 0          |

Feature Interactions

 **WARNING:**

Use of the manager I is blocked for other activities until the command completes, which can take up to 45 minutes

- The command is denied if no announcement data module and no NETCON data module has been administered.
- The command is denied if the announcement data module port is out of service or active (e.g. performing an announcement playback).
- The command is denied if a user is in an integrated announcements session.

The command is denied if the board is currently being uploaded or downloaded. A user cannot save or restore announcement after the restore announcements command has started.

The command aborts if copying from tape and no tape is in the tape drive.

The restore announcements command will not be allowed if the MSS is in use. The MSS may be in use by either another user or by maintenance.

In case of a failure, it is the user's responsibility to make sure the announcement file is completely copied to the announcement board. If an error is the result of a hardware or firmware failure, the MSS software will log a hardware error with maintenance.

The restore announcements command will not be allowed if no announcement file has been saved on the MSS or a corrupted announcement file is on the MSS.

In case of a failure, it is the user's responsibility to make sure the announcement file is completely copied to the announcement board, although the system will continually attempt to download the board in 10 minute intervals until a download is successful, announcements are recorded, or a download is initiated from the SAT. The user should take appropriate action based on the error message returned. If the error is the result of a hardware or firmware failure, the MSS software will log a hardware error with maintenance. Maintenance software will invoke tests to diagnose and attempt to correct the problem. If maintenance software fails to correct the problem, an alarm is raised and the system technician should take appropriate action.

In the case where the system crashes and/or there is a spontaneous processor interchange, the restore operation will fail. In this case, there will not be a valid announcement file on the announcement board. The command should be restarted on the newly active processor to copy the announcements from the active processor's MSS device to the announcement board. Until the announcements are successfully and completely copied to the announcement board, calls will not be connected to any announcements on the ANN board.

When the announcement board is plugged in or reset, maintenance will perform a series of tests, including a DRAM Checksum test. The test will fail due to the power loss to the board, resulting in automatic downloading of the announcement file.

## **resume hardware-group**

A "test hardware-group" command which had been canceled can be resumed by the user with this command. The reactivated hardware-group command will start testing where it previously left off.

Synopsis

---

resume hardware-group

Permissions

---

The following logins may execute this command: inads, init.

Examples

---

resume hardware-group

Description

---

A system technician, in the course of the execution of a "test hardware-group" command, may find the need to halt the testing, either temporarily or permanently. A "test hardware-group" command executing in the background can be canceled with the "cancel hardware-group" command. A "test hardware-group" command executing in the foreground can be canceled by pressing the 'cancel' key on the SAT or by entering the "cancel hardware-group" command from another SAT. The "resume hardware-group" command provides the technician the ability to resume the previous "test hardware-group" command from where it was canceled. This ability to resume a canceled "test hardware-group" command is lost if another "test hardware-group" command is entered.

The state of a canceled "test hardware-group" command will appear on the "status hardware-group" screen as 'canceled'. The state of a resumed "test hardware-group" command will appear on the "status hardware-group" screen as 'active'.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses `HELP` after entering "resume hardware-group," the following message will be displayed:

Entry is not required

## Error Messages

If there is no "test hardware-group" command to be resumed, i.e, no "test hardware-group" command was previously canceled, or some system recovery had occurred and no "test hardware-group" command had since been entered and subsequently canceled, then the following message will be displayed:

```
Command aborted - no hardware-group  
test available to resume
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If the previously entered hardware-group command used the "all-ports" option the following message will be displayed:

```
Resume disallowed with 'all-ports'  
option in original command
```

If the previously entered hardware-group command used the "SPE-interchange" option the following message will be displayed:

```
Resume disallowed with 'SPE-interchange'  
option in original command
```

## Output

---

If a "test hardware-group" command is successfully resumed as a consequence of the "resume hardware-group" command and the previous "test hardware-group" was executing in the background, then the following response will be displayed:

```
Hardware-group command successfully  
resumed in background
```

If a "test hardware-group" command is successfully resumed as a consequence of the "resume hardware-group" command and the previous "test hardware-group" was executing in the foreground, then the test results will start being displayed on the SAT.

## Feature Interactions

---

### Cancel hardware-group

When a "test hardware-group" command is canceled, the test command is put in an inactive state. This state can be displayed using the "status hardware-group" screen and will show up as 'canceled'.

When the "resume hardware-group" command is entered to resume a previously canceled "test hardware-group" command, the state of the test command will be changed to 'active' on the "status hardware-group" screen.

## save announcements

---

This command copies announcement data from the announcement board to the MSS. (tape or Card-Mem)

### Synopsis

---

save announcements [ *spe-active* | *spe-standby* ]

### Permissions

---

The following default logins may execute this command: system technician, cust, rcust, inads, init.

### Examples

---

save announcements  
save announcements spe-active  
save announcements spe-standby

### Description

---

The save announcements command copies announcement data from the announcement board to the MSS. The Card-Mem is the storage device for the system. By default, announcement data is written to the MSS device in a simplex processor (SPE) system, or to both MSS devices in a High or Critical Reliability System. Also, the save announcements command can be directed to write to the MSS device on either of the processors, in a High or Critical Reliability System.

This command is only allowed if there is an integrated announcement board in the system. The save announcement command is denied if no announcement data module has been administered and no NETCON data module has been administered.

### Simplex

There are no options for the save announcement in a simplex system. The save announcement command will save the announcement file to the MSS device.

## Duplex

If no options are specified, the system saves the announcement to both processors' MSS devices.

## Parameters

- |             |                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------|
| spe-active  | This option forces the system to write the announcement data to the specified device in the currently active processor. |
| spe-standby | This forces the system to write the announcement data to the specified device in the standby processor.                 |

## Help Messages

If the system technician presses `HELP` after entering "save announcements" on a simplex SPE system the following message is displayed:

```
Entry is not required
```

If the system technician presses `HELP` after entering "save announcements" on a duplex SPE system the following message is displayed:

```
Enter ['spe-active' or 'spe-standby']
```

## Error Messages

If the announcement data module cannot be accessed (upload/download port is active), the following message is displayed:

```
Announcement data module not available
```

If the announcement data module is out of service, the following message is displayed:

```
Announcement data module out of service
```

If one or more of the announcement ports are in use, the following message is displayed:

```
Announcement port in use; please try later
```

If there are no announcements on the announcement board, the following message is displayed:

```
No announcements on board
```

If the announcement data module is not administered, the following message is displayed:

```
Required announcement data module not administered
```

If the announcement data module is not administered or is currently in use, the following message is displayed:

```
Required data module not administered or unavailable
```

If there is no announcement board in the system, the following message is displayed:

```
Integrated announcement board not present
```

If the standby processor times out, the following message is displayed:

```
Command timed out on standby processor
```

If an inconsistency between the NETCON data module and the announcement data module exists (e.g. both data modules using the same COR) the following message is displayed:

```
System error, please try later
```

If the NETCON data module is not administered or out of service the following message is displayed:

```
Required NETCON data module not  
administered or out-of-service
```

If the NETCON data module is busy the following message is displayed:

```
Required NETCON data module unavailable
```

If the time of day is not set, the following message is displayed:

```
Please set the time of day before proceeding
```

If the standby SPE is inaccessible, the following message is displayed:

```
Cannot access the standby SPE at this time
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

## Output

|                           |                                                                                                                                           |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Processor                 | This field displays the processor(s) that had the announcement data written to its/their device(s). Valid values are "SPE-A" and "SPE-B." |
| Command Completion Status | This field specifies whether the command completed successfully. Valid values are:                                                        |
| Error Code                | A value of "0" specifies that the save was successful. A value of "2" specifies that the save failed.                                     |

For the following output example, the command entered is "save announcements" on a simplex SPE system.

```
save announcements           Page  1 of  1  SPE A

                        SAVE ANNOUNCEMENTS

Processor  Command Completion Status      Error Code
SPE-A      Success                        0
```

## Feature Interactions

 **WARNING:**  
*Use of the manager I is blocked for other activities until the command completes, which can take up to 45 minutes.*

- The command is denied if no announcement data module and no NETCON data module has been administered.
- The command is denied if the announcement data module port is out of service or active (e.g. performing an announcement playback).
- The command is denied if no announcements are on the board or a user is in an integrated announcements session.
- The command is denied if the board is currently being uploaded or downloaded. A user cannot record an integrated announcement after the save announcements command has started although 15 channels are still available for announcement playback (one is reserved for uploading and downloading).
- The command aborts if saving to the tape and no tape is in the tape drive or the tape is write-protected. The command also abort if no NETCON data module is available.

The save announcements command will not be allowed if the MSS is in use. The MSS may be in use by either another user or by maintenance.

If the user requests that announcements be saved to the standby processor, the standby processor must be in service and shadowing must be enabled.

When MSS devices on both processors in a High or Critical Reliability System are specified, the save announcements operation will save announcement data from the announcement board to the active MSS device, then to the standby MSS device. The status of each save operation is reported to the user separately. If one of the save operations fail, the save operation to the other device continues. The goal is to save the new announcement data on some MSS device so that it is not lost totally; this will cause the announcement data to be inconsistent between these MSS devices.

In case of a failure, it is the user's responsibility to make the announcement files on the two MSS devices consistent. The files may become inconsistent due to hardware failures or spontaneous processor interchanges. If announcement files are inconsistent due to failure on the hardware used during the save announcements command, the user should take appropriate action based on the error message returned. Maintenance software monitoring this hardware will log a hardware error with maintenance. Maintenance software will invoke tests to diagnose and attempt to correct the problem. If maintenance software fails to correct the problem, an alarm is raised and the system technician should take appropriate action.

The save announcements command writes two time-stamped identical copies of announcement data to the selected device(s). The time stamp for both copies will be the same, i.e. the time of writing to the first copy. Each copy contains a timestamp and the state of the copy (i.e., "good" or "bad").

If a good copy of the announcement file is not available, then the restore announcements operation can not be executed until the save announcements command is successfully completed. The announcements on the board are still accessible and usable.

## **save translation**

---

This command allows the user to save the in-memory translation data to the memory card device.

## **Synopsis**

---

`save translation [ spe-active | spe-standby ]`

## Permissions

---

The following default logins may execute this command: system technician, inads, init, cust.

## Examples

---

**save translation**  
**save translation spe-active**  
**save translation spe-standby**

## Description

---

All translation data is kept in memory during system operation. This means that all data would be lost if the switch went down. The save translation operation will allow the user to save to tape or memory card the in-memory translation data. This operation may be done as part of scheduled maintenance and/or on demand by the customer/system technician.

### Simplex

The default is to save translation to the tape/memory-card on SPE\_A.

### Duplex

The default is to save translation to the tape/memory-card on both SPE-A and SPE-B.

## Parameters

- |             |                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------|
| spe-active  | This identifies that the save translation should be done on the active processor's MSS device.  |
| spe-standby | This identifies that the save translation should be done on the standby processor's MSS device. |

## Help Messages

If the system technician presses HELP after entering "save translation" the following message will be displayed:

Enter ['spe-active' or 'spe-standby']

## Error Messages

If there is another tape activity currently running on the system, then the following message will be displayed:

A tape command is active;

this command is not allowed at this time

If the user chooses that save be done on the standby processor, and the standby processor is inaccessible, then the following message will be displayed:

Cannot access the standby SPE at this time

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

### Output

The responses will be displayed on an SPE basis with one line of data displayed for each SPE.

|                           |                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------|
| Processor                 | This identifies the processor carrier that was translation data was saved to. (i.e. SPE-A, or SPE-B).             |
| Command Completion Status | This may display a variety of messages, to identify the success or failure of the command on the given processor: |

For the following output example, assume that the command, save translation is done on a duplex system.

```
save translation

                                SAVE TRANSLATION

Processor  Command Completion Status  Error Code
SPE-A     Success                    0
SPE-B     Success                    0

Command Successfully Completed
```

### Feature Interactions

The save translation cannot be performed if translation data is being changed by an administration command.

# set expansion-link

This command sets the Expansion-Interface Link between the PPN and an EPN or between two EPNs to a specific Interface Link circuit pack between PPN and EPN.

## Synopsis

set expansion-link link-identifier

## Permissions

The following default logins may execute this command: system technician, inads, init.

## Examples

set expansion-link 02a01  
set expansion-link 3a02

## Description

This command sets the Expansion-Interface Link between the PPN and an EPN or between two EPNs to a specific Interface Link circuit pack between PPN and EPN.

Note: This command can corrupt any active data links between the PPN and an EPN or between two EPNs.

## Defaults

No defaults.

## Parameters

|                 |                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link-identifier | The circuit pack address of the designated Standby Expansion Interface circuit pack (identified as 1A01, 1A02, 1B01, 1B02, 2A01, 2A02, 2B03, 3A01, 3A02, 3AB02 or 3B03). |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Help Messages

If the system technician presses HELP after entering "set expansion-interface," the following message will be displayed:

Enter board location:  
[cabinet(1-3)];carrier(A-E);slot(0-20)

## Error Messages

If the format of the specified expansion interface circuit pack is invalid, the following message will be displayed:

```
Port/Board invalid
```

If the link associated with the entered EI location is already active, the following message will be displayed:

```
EXP-INTF is already on active link
```

If the specified expansion interface is not configured in the system, the following message will be displayed:

```
Board not assigned
```

If the specified expansion interface is already the active link, the following message will be displayed:

```
EXP-INTF is already on active link
```

If the specified expansion interface is unable to become active, the following message will be displayed:

```
Standby EXP-INTF Link is unable to take over
```

If there are no maintenance objects for the specified board, the following message will be displayed:

```
No MO in this board
```

If the specified board is not an expansion interface board, the following message will be displayed:

```
Address is not a valid Expansion Interface Board
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

---

The following message indicates that the command completed successfully:

Command successfully completed

The following message indicates that the command was aborted:

Command aborted; please try later

The following message indicates that the command failed:

Error encountered, can't complete request  
Command failed

## Feature Interactions

---

None.

## set options

---

This command allows the user to administer whether certain alarms are reported to INADS or whether they are downgraded to a minor alarm, warning alarm, or no alarm.

## Synopsis

---

set options

## Permissions

---

The following default logins may execute this command: inads, init.

## Examples

---

set options

## Description

---

This special command enables the technician (that is, remote user with INADS permission) to select which types of maintenance categories report alarms automatically and which types require the customer to call in. Judicious use of this command can reduce the number of ineffective alarms to the TSC. For the **set options** command to be effective, the default settings specified in this section should always be used. These settings are not intended to be changed on a per-system basis. Special circumstances (for example, special studies) may require temporary changes under the guidance of Tiers 3 and 4.

NOTE: Alarms can't be upgraded.

## Defaults

Initially, the alarm reporting options for On-board Trunk Alarms (Alarm Group 1), both Major and Minor, and Minor, and the Memory Card Capacity Alarm are set to "yes" (y); all others are set to "warning" (w). All trunk groups are associated with alarm severity group 1 by default.

## Parameters

None.

## Help Messages

If the user presses HELP after entering "set options," the following message is displayed:

```
Entry is not required
```

## Error Messages

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

## Form Input

---

After entering the command "set options," the user is presented with the following form.

ALARM REPORTING OPTIONS

|                                         | Major | Minor |
|-----------------------------------------|-------|-------|
| On-board Station Alarms:                | w     | w     |
| Off-board Station Alarms:               | w     | w     |
| On-board Trunk Alarms (Alarm Group 1):  | y     | y     |

| 10: 1 | 20: 1 | 30: 1 | 40: 1 | 50: 1 | 60: 1 | 70: 1 | 80: 1 | 90: 1 |       |

 **NOTE:**  
The remaining Trunk Group information is shown on the next 6 pages and is not documented in this Manual.

On the first page of the Alarm Reporting Options Form, the user selects the alarm severity options for station alarms, the four trunk alarm severity groups, the adjunct alarms, off-board DS1 alarms, and PI-LINK alarms, memory card translation capacity alarms, and other off-board alarms. On the second page, known as the Alarm Reporting Options Form, the user assigns an alarm severity group to each trunk group. This feature enables the technician to reduce the level of alarms reported for on-board or off-board trouble conditions.

The following alarm options are available:

- Minor

Alarms are raised as maintenance testing discovers them but the severity of the alarm is downgraded to a minor. Alarmed resources that would have normally been taken out of service are still taken out of service. LEDs on the port board and maintenance board follow the normal Minor alarm LED strategy and there is a call to the receiving OSS.

- **Warning**

Alarms are raised as maintenance testing discovers them, but the severity of the alarm is downgraded to a warning. The advantage to the technician here is that the Alarm Log can still be used to pinpoint trunk or station problems reported by the customer. Alarmed resources that would normally have been taken out-of-service are still taken out-of-service. Alarm LEDs light on the port circuit pack and Maintenance circuit pack as before, but no attendant LEDs or stations reporting alarms are affected. There is no call to INADS.

- **Report**

This option treats the alarms in the same way as the warning category with one exception: alarms are reported to INADS using a special WARNING category. When an alarm of this type is received, INADS logs the occurrence and either creates a trouble ticket or closes it immediately. The retry strategy for a call of this type is similar to normal Major or Minor alarm reports. However, the acknowledgment LED on the attendant console or alarm reporting station does not reflect the status of the call.

- **Yes**

Alarms are raised in the normal manner. There is no filtering of alarm data.

- **No**

Alarms raised on a trunk, station, or adjunct in this category are dropped. Error information is provided as before, but there is no trace of an alarm. There is no LED activity and no call to INADS. Because resources are taken out-of-service without any record, this option is recommended only when other options do not provide the desired result.

The alarm options can be administered only on a system-wide basis for the following alarm categories:

- Major on-board station alarms
- Minor on-board station alarms
- Major off-board station alarms
- Minor off-board station alarms

Four alarm severity groups are provided for trunk alarms. You can administer the alarm options for the categories listed below in each alarm severity group. However, in G1, the alarm options can be administered only on a system-wide basis for the following categories:

- Major on-board trunk alarms

- Minor on-board trunk alarms
- Major off-board trunk alarms
- Minor off-board trunk alarms

For Adjuncts, an alarm severity option is assigned to each of the following categories:

- Major on-board adjunct alarms
- Major off-board adjunct alarms
- Minor on-board adjunct alarms
- Minor of-board adjunct alarms

You can also administer the options on a system-wide basis for Minor off-board DS1 Interface circuit pack alarms and for the Minor off-board Memory Card Capacity Alarm.

Alarm reporting options information in the Alarm Reporting Options Form is considered translation data and, thus, is preserved through all levels of restart.

This feature affects the alarming of the MOs listed below. Neither the trunk nor the station category applies to alarms raised on the common portion of the circuit pack.

In all cases, if the option associated with the alarm type is set to "n," the alarm report is dropped. All error information about the alarm is intact, but there is no record of an alarm and no LEDs light on the port circuit pack, the Maintenance circuit pack, the attendant console, or alarm reporting station to indicate a problem.

If the option is set to "warning" or "report," port circuit pack LEDs and LEDs on the Maintenance circuit pack are affected the same as normal warning alarms.

The default parameters are as follows:

- Downgrade all station, trunk (except on-board trunk alarms), and Minor DS1-BD alarms to warning alarms.
- On-board Major and Minor trunk alarms, and the Memory Card Capacity alarm should continue to raise alarms and report to INADS.

#### *Station MOs Affected By This Command*

#### **NOTE:**

Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

- Analog Lines (ANL-LINE, ANL-NE-L, ANL-16-L)
- Digital Lines (DIG-LINE)

- Hybrid Lines (HYB-LINE)
- MET Lines (MET-LINE)
- ISDN-BRI Lines (BRI-PORT, BRI-SET)

Trunk maintenance is characterized by an escalation of a Minor alarm to a Major alarm if more than 75 percent of the members of the trunk group are alarmed. If the option for the trunk category is set to "warning," "minor," "report," or "no," this no longer happens. Maintenance removes an individual trunk member out-of-service according to the normal criteria used for Major and Minor alarms.

*Trunk MOs Affected By This Command:*

**⇒ NOTE:**

Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

- Auxiliary Trunks (AUX-TRK)
- Central Office Trunks (CO-TRK)
- Direct Inward Dialing Trunks (DID-TRK)
- Direct Inward and Outward Dial Trunks (DIOD-TRK)
- DS1 Central Office Trunks (CO-DS1)
- DS1 Direct Inward Dialing Trunks (DID-DS1)
- DS1 Tie Trunks (TIE-DS1)
- ISDN Trunks (ISDN-TRK)
- Tie Trunks (TIE-TRK)

*Circuit Pack MOs Affected By This Command*

**⇒ NOTE:**

Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

**⇒ NOTE:**

Trunks that are not members of Trunk Groups, (e.g. PCOLs) are downgraded according to the alarm severity of group one.

- DS1 Interface Circuit Pack (DS1-BD)

*Adjunct-Related MOs Affected By This Command*

**⇒ NOTE:**

Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

- ASAI Adjunct (ASAI-ADJ)
- AT&T Adjunct Port (ATT-PORT)
- Ethernet ASAI Port (LGATE-PT)
- Ethernet ASAI Adjunct (LGATE-AJ)
- Ethernet AT&T Port (ATTE-PT)
- Ethernet AT&T Adjunct (ATTE\_AJ)
- ISDN-BRI Ports connected to Adjuncts (ABRI-PORT)

Although adjuncts are administered as stations, the administration of alarm severity for the station alarm group does not affect the alarm severity levels of the adjuncts. Similarly, the administration of alarm severity for the adjunct alarm group does not affect the alarm severity levels for other types of stations.

*PI-Link and associated Link MOs affected by this Command:*

**⇒ NOTE:**

Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-related problems.

- See Processor Interface Link ["PI-LINK (Processor Interface Link)"] for other associated Link Maintenance Objects.

*Memory Card MOs Affected by This Command*

**⇒ NOTE:**

While this option does not downgrade the CAP-MEM alarm by default, changes to this options may result in alarms being downgraded to warning. This alarm is raised when the memory card translation capacity is over 98% full and is intended to alert Services to inform the customer of a possible need to upgrade to a larger flash card.

- Memory Card Capacity (CAP-MEM)

*Other MOs Affected by This Command*

**⇒ NOTE:**

Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-related problems.

- EPN Maintenance Circuit Pack (MAINT)
- Expansion Interface (EXP-INTF)
- ISDN-PRI Signaling Group (ISN-SGR)
- Journal Printer (JNL-PRNT)
- PMS Link (PMS-LINK)

- PMS log printer (PMS-LOG)
- Primary CDR Link (PRI-CDR)
- Secondary CDR Link (SEC-CDR)
- SPE Select Switches (SPE-SELEC)
- Synchronization (SYNC)
- System Communication Interface (PI-SCI)
- System Printer (SYS-PRNT)
- TDM Clock (TDM-CLK)
- Tone Generator Circuit Pack (TONE-BD)

Field Help

Since all fields on the first page may have the same values, then pressing HELP in any field on the first page presents the following field help message:

m(inor) n(o) r(eport) w(arning) y(es)

The following is a description of the values:

|           |                                                                                |
|-----------|--------------------------------------------------------------------------------|
| m(inor)   | Downgrade the major alarm to a minor alarm and report the alarm to INADS.      |
| n(o)      | Do not log the alarm or report it to INADS.                                    |
| r(eport)  | Downgrade the alarm to a warning and report the warning to INADS.              |
| w(arning) | Downgrade the alarm to a warning, log it but do not report the alarm to INADS. |
| y(es)     | Log and report the alarm to INADS.                                             |

All fields on page 2 may have the same values. Pressing HELP in any field on page 2 gives the following field help message:

Enter alarm group number: 1 to 4

The alarm group number is a way of distinguishing four different groups of alarms. These alarm groups allow the user to specify that alarms in different groups are handled differently from those in other groups.

Field Error Messages

All of the fields on the first page allow the same values. Only one error message is printed for all first page fields. If the value is not one of the listed characters (m,n,r,w,or y) then the following message is displayed:

"X" is an invalid entry; please press HELP key

All of the fields on page 2 allow the same values. If the value in one of these fields is not numeric, the following message is displayed:

Entry must be all digits

All of the fields on pages page 2 allow the same values. If the value in one of these fields is a digit other than 1, 2, 3, or 4, the following message is displayed:

Entry out of range

Output

---

After the user has entered in the changes to the options and pressed SUBMIT, the following message appears at the bottom of the screen:

Command successfully completed

Feature Interactions

---

None.

set signaling-group

---

This command sets the secondary D-channel within the specified group to be the primary D-channel.

Synopsis

---

set signaling-group group identifier

Permissions

---

The following default logins may execute this command: system technician, inads, init.

Examples

---

set signaling-group 1  
set signaling-group 2

Description

---

The set signaling-group command sets the secondary D-channel in the specified signaling group to be the primary D-channel. The primary D-channel then becomes the secondary D-channel.

A signaling group is a collection of B-channels signaled for by a designated single D-channel or set of D-channels over an ISDN-PRI.

## Defaults

None.

## Parameters

**group identifier** The signaling group identifier is an administered number associated with each signaling group.

## Help Messages

If the system technician presses HELP after entering "set signaling-group," the following is displayed:

```
Enter group identifier
```

## Error Messages

If the specified group identifier is non numeric or out of range, the following message is displayed:

```
Signaling group invalid
```

If the specified group identifier is not administered, the following message is displayed:

```
No signaling group assigned
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

## Output

---

If the set signaling-group command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the set signaling-group command is unsuccessful, the following message will be displayed:

Error encountered, can't complete request

**Feature Interactions**

---

None.

**set synchronization**

---

This command will set the DS1 trunk or tone/clock circuit pack that is to supply an on-line reference for synchronization.

**Synopsis**

---

set synchronization location

**Permissions**

---

The following default logins may execute this command: system technician, inads, init.

**Examples**

---

set synchronization 01c08  
set synchronization 02a01  
set synchronization 01a  
set synchronization 02c

**Description**

---

The set synchronization command will set the DS1 trunk or active tone/clock circuit pack that will supply a reference for synchronization. The set command will work only after synchronization has been disabled via the "disable synchronization" command. Any administered DS1 trunk or active tone/clock may be entered with the set command. The DS1 or tone/clock will remain as the synchronization reference until the set command is run with another board or until the "enable synchronization" command is run.

After the "enable synchronization" command is run, an administered primary or secondary synchronization source will be used as the synchronization reference. If no primary or secondary source is administered, then synchronization will use an active tone/clock board as the synchronization reference after synchronization has been enabled.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The

subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

## Defaults

No defaults.

## Parameters

location      A "location" represents the physical position of the board (DS1 trunk or active tone/clock) that will supply a reference for synchronization. The location of a DS1 trunk is entered as "UUcSS" where "UU" represents the cabinet number, "c" represents the carrier, and "SS" represents the slot position. The location of a tone/clock is entered as "UUc" where "UU" represents the cabinet number, and "c" represents the carrier. The location of a tone/clock may also be entered as "UUcSS" where "UU" represents the cabinet number, "c" represents the carrier, and "SS" represents the slot position. A cabinet number (1 - 3) may be entered with or without a leading zero (0).

## Help Messages

If the system technician presses HELP after entering "set synchronization," the following message will be displayed:

```
Enter DS1 board location or Tone-Clock location:
[(cabinet (1-3)); carrier (A-E)]
```

## Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Can not set synchronization to standby tone clock circuit pack.

```
Cannot set synchronization to standby tone/clock board.
```

## Output

---

The following message indicates that the command completed successfully:

```
Command successfully completed
```

The following message indicates that the command was unsuccessful, due to synchronization not being disabled:

```
Must disable synchronization-switch first
```

The following message indicates that the command was unsuccessful, due to the board not being inserted:

```
Board not inserted
```

The following message indicates that the command was unsuccessful, due to an invalid board being specified (not a DS1 trunk or tone/clock):

```
Port/Board invalid
```

The following message indicates that the command was unsuccessful, due to reasons other than the ones listed above:

```
Error encountered, can't complete request
```

## Feature Interactions

---

None.

## set tdm

---

This command will set which TDM bus has the control channel and dedicated tones on it.

## Synopsis

---

set tdm port-network pn number bus bus *override*

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

```
set tdm port-network 2 bus a  
set tdm port-network 2 bus b override
```

## Description

The set tdm command sets which TDM bus on a port network has the control channel and dedicated tones on it.

## Defaults

No defaults.

## Parameters

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pn number | The PN number specifies the Port Network number of the TDM bus to be set.                                                                                                                                                                                                                                                                                                                                                                                                     |
| bus       | The TDM bus ("a" or "b") specifies which half of the TDM bus is desired. Each 512 time slot TDM bus is configured as two duplicate 256 time slot buses. This division allows for duplication of control channels and dedicated tone time slots. The default control bus (carrying the control channel) is the "a" bus, while the default tone bus (carrying dedicated tones) is the "b" bus. A port network number (1 - 3) may be entered with or without a leading zero (0). |
| override  | This qualifier is optional, it will force the setting of a bus which is out of service or a bus whose dedicated tone time slots are in use.                                                                                                                                                                                                                                                                                                                                   |

## Help Messages

If the system technician presses HELP after entering "set tdm," the following message will be displayed:

```
Enter 'port-network', port network number (1-3),  
'bus', bus ('a' or 'b'); ['override']
```

## Error Messages

If the technician enters "bus" before "port-network," the following message will be displayed:

```
'bus' is an invalid identifier; please press HELP
```

If the technician does not enter all digits for the port-network number, the following message will be displayed:

```
Entry must be all digits
```

If the technician enters a bus other than A or B, the following message will be displayed:

```
Identifier invalid
```

If the technician enters a Port Network number that is not administered, the following message will be displayed:

```
Port Network number not assigned
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

---

The following message indicates that the command completed successfully:

```
Command successfully completed
```

The following message indicates that the command was unsuccessful, due to the tdm bus being busied out:

```
Must release tdm bus first
```

The following message indicates that the command was unsuccessful, due to the health of the tdm bus:

```
Tdm bus is out-of-service; use 'override'  
option to force 'set' command
```

The following message indicates that the command was unsuccessful, due to the dedicated tone time slots being used:

```
Dedicated tone time slots in use; use 'override'  
option to force 'set' command
```

The following message indicates that the command was unsuccessful, due to a tone/clock (TN768) board not being available:

```
Cannot set tdm bus or tone/clock boards;  
need a TN768 board
```

The following message indicates that the command was unsuccessful, due to the expansion port network (EPN) not being available:

```
EPN is not available
```

The following message indicates that the command was unsuccessful, due to the link to the expansion port network (EPN) not being available:

EXP-INTF not available; please try later

Feature Interactions

In the rare event that all time slots on a particular bus are being used, and the dedicated tone time slots are on the other half of the bus, the time slots reserved for tones on the bus that has no other time slots available will be used for new calls. If the technician then performs a "set" command to the bus that has calls up on the dedicated tone time slots, these calls will be dropped.

set time

This command will allow the system technician to set the time of day clock on the switch.

Synopsis

set time

Permissions

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

Examples

set time

Description

The set time command will present the system technician with a form that contains the current time of day on the switch. The system technician may then edit and submit the form in order to change the time of day. The set time command allows the system technician to change the day of the week, the day of the month, the month, year, hour, and minute. The second field will be reset to zero (0) whenever the time on the clock is altered, but cannot be modified by the technician. The day of the week will be entered as a text string and will be translated to an integer for internal storage.

If no change is made to any field when the command is entered, there will be no update of the clock when the form is submitted. If the command is entered and the form is unchanged, the time will not be reset to the time displayed on the screen, but will remain the same as the current system clock time.

**Defaults**

If the system clock has never been set, a default time is used.

**Parameters**

None.

Help Messages

If the system technician presses HELP after entering "set time," the following message will be displayed:

Entry is not required

Error Messages

If the system encounters an error in getting the current time of day, then the following message will be displayed:

Error encountered, cannot complete request

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

FORM INPUT

---

After entering the command "set time," the system technician will be presented with the following form. The current time, or default time will be placed in the fields.

- Day of the Week:     The day of the week that will be used by the time of day clock on the switch. Valid entries are Monday through Sunday. The timer will maintain the value of the day of the week, incrementing it every twenty-four (24) hours, and resetting it at the seventh day.
- Day of the Month:    The day of the month that will be used by the system time of day clock. 1-31 are valid entries. A check for leap year is also made, February can have 29 days in 1984, but only 28 in the year 1990.
- Month:                The month that will be used by the system time of day clock. Any of the twelve months are valid entries.

- Year: The year that will be used by the time of day clock on the switch. 1970-2999 are valid entries for the year field. The year must be saved as translation data and passed to the kernel whenever kernel memory is corrupted (system reboot or cold I restart) or the data is changed.
- Hour: The hour that will be used by the system for the time of day clock. 0-23 are valid hours that can be entered into this field.
- Minute: The minute that will be used by the time of day clock on the system. 0-59 are valid entries for the minute field.
- Second: The second that will be used by the time of day clock on the system. This field is restricted, and can't be set to a specific value by the technician. This field is set to zero when the time of day clock is set.

Field Help

Following are the help messages that the system technician will see upon tabbing to the specified field and pressing the HELP key.

- Day of the Week: A list of the days of the week will be presented on the bottom line. The help is longer than 80 characters, consequently, the "(MORE)" message will appear. In order to get the continuation of the list, the system technician needs to type another help key. The list of key words is: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday.
- Day of the Month: "Enter current day 1-31."
- Month: A list of the months of the year will be presented on the bottom line. The help is longer than 80 characters, consequently, the "(MORE)" message will appear. In order to get the continuation of the list, the system technician needs to select the HELP key. The list of key words is: January, February, March, April, May, June, July, August, September, October, November, December.
- Year: "Enter current year"

|         |                                                                                                     |
|---------|-----------------------------------------------------------------------------------------------------|
| Hour:   | "Enter number between 0-23"                                                                         |
| Minute: | "Enter number between 0-59"                                                                         |
| Second: | This field is restricted and consequently the system technician cannot tab to or change this value. |

**Field Error Messages**

Following are the error messages that will be displayed on the bottom of the screen. The messages are displayed when the system technician tabs out of a field and the validation routines are executed.

|                   |                                                   |
|-------------------|---------------------------------------------------|
| Day of the Week:  | ""xxxxxx" is an invalid entry; please press HELP" |
| Day of the Month: | "Day invalid"                                     |
| Month:            | ""xxxx" is an invalid entry; please press HELP"   |
| Year:             | "Year invalid"                                    |
| Hour:             | "Hour invalid"                                    |
| Minute:           | "Minute invalid"                                  |

**Output**

---

After the system technician has entered in the corrections to the time and pressed the submit key (ENTER), then the following message appears at the bottom of the screen:

Command successfully completed

**Feature Interactions**

---

The date and time are generally available to all software via a system primitive.

**set tone-clock**

---

This command sets which tone/clock is active in a port network.

**Synopsis**

---

set tone-clock location *override*

**Permissions**

---

The following default logins may execute this command: system technician, inads, init.

Examples

set tone-clock 01b  
set tone-clock 1b  
set tone-clock 01b override  
set tone-clock a

Description

The set tone-clock command sets which tone/clock is active in a PN. This command is only for use where the tone/clock circuit pack is duplicated in a PN. Set the default active tone clock in each PN back to active after any use of the "set tone-clock" command. If it is not in use, a single failure can result in unnecessary service outage. Schedule maintenance tone-clock switch option does not set the tone-clock back to the default active if it was not active at the beginning of the test.

Defaults

The cabinet number defaults to one (1) if it is not specified.

Parameters

- location A "location" represents the physical position of the tone/clock to be tested and is entered as "UUc" where "UU" represents the cabinet number (1-3), and "c" represents the carrier. The "b" carriers only contain tone-clock circuit packs when the system is equipped with High or Critical Reliability.
- override This qualifier is optional. If used, it will force the set command into effect regardless of the health of the tone/clock circuit pack.

Help Messages

If you press HELP after entering "set tone-clock," the following message displays:

Enter tone/clock location:  
[cabinet(1-3)];(carrier(A-E)) ['override']

Error Messages

If an identifier greater than 3 characters is entered, or the cabinet entered is not a digit (number), the following message will be displayed:

Identifier invalid

If the carrier entered is invalid, the following message will be displayed:

Invalid carrier specified

If the cabinet entered is not within the valid range of cabinets or the cabinet is not administered, the following message will be displayed:

```
Cabinet number not assigned
```

If there is no tone/clock board at the specified location, one of the following messages will be displayed:

```
Board not inserted  
Board not assigned
```

If the cabinet carrier location entered is that of an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If the board is not a TN768 tone/clock board, the following message displays:

```
Cannot set tdm bus or tone/clock boards;  
need a TN768 board
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, the following message displays:

```
All maintenance resources busy; try again later
```

## Output

If the tone/clock selected is out of service, the following message displays:

```
Tone/clock board is out-of-service;  
use 'override' option to force 'set' command
```

The following message indicates that the command was unsuccessful, due to the tone/clock being busied out:

```
Must release tone/clock board first
```

The following message indicates that the command was unsuccessful, due to the epn in which the tone/clock resides not being available:

```
EPN is not available
```

The following message indicates that the command was unsuccessful, due to the link to the EPN in which the tone/clock resides:

```
EXP-INTF not available; please try later
```

This message indicates the command was unsuccessful, due to the standby system clock:

```
Unable to activate the standby  
System Clocks; please try later
```

This message indicates the command was unsuccessful, due to the standby system tones:

```
Unable to activate the standby  
System Tones; please try later
```

Feature Interactions

None.

set vector

This command will set the conditions that cause a core dump of memory to a core dump memory card.

Synopsis

```
set vector condition [ spe-standby | spe-active | spe-maint ]
```

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

```
SIMPLEX SYSTEM Examples:  
set vector f  
set vector 9  
DUPLEX SYSTEM Examples:  
set vector f spe-standby  
set vector f spe-active  
set vector f spe-maint  
set vector 9
```

## Description

---

The set vector command specifies what level of restart must occur before a core dump occurs. The memory copy (core dump) is placed on the primary Mass Storage System (a tape in a tape system and a core dump memory card in a memory card system) device so that it may be examined at a later date. The set vector command allows the technician to tailor what level of restarts will cause memory to be copied to the primary Mass Storage System device.

### NOTE:

An extended reboot will never be requested by software.

To force a core dump to occur immediately by user demand in a simplex or duplex system, the appropriate bit should be set using this command, then a "reset system" should be done at a level that will force a core dump corresponding to the set vector bit.

When a system restart occurs in a simplex Switch Processing Element (SPE) system with the corresponding vector bit set, the core dump is written to secondary storage (the primary MSS device). Once the core dump is written, the vector is cleared and the restart is performed. **This command is always service disruptive in a simplex system.**

When a system restart occurs on the active SPE in a High or Critical Reliability System with the corresponding vector bit set, and the "spe-active" option was selected when the vector bit was set, the active SPE will perform a core dump. **Service will be disrupted while the active SPE is performing the requested core dump.**

When a system restart occurs on the active SPE in a High or Critical Reliability System with the corresponding vector bit set, and the "spe-standby" option was selected when the vector bit was set, the standby SPE will perform a core dump after the standby SPE has refreshed its memory.

When a system restart occurs on the active SPE in a High or Critical Reliability System with the corresponding vector bit set, and the "spe-maint" option was selected when the vector bit was set, the standby SPE will perform a core dump without refreshing its memory first.

In all cases after a core dump has been performed, the vector will be cleared.

## Defaults

In a High or Critical Reliability System, the default option is "spe-standby."

Parameters

condition      The condition(s) which cause(s) a core dump represented by a hexadecimal value. The hexadecimal value represents the bit map of the four reset conditions which cause the dump. These conditions from least to most significant bit are: WARM start, COLDII restart, COLDI restart, and REBOOT. To set more than one condition, the logical OR of the bits needed is used to determine the hexadecimal character. Setting a vector to a condition of 0 actually clears the vector, and the vector is not considered set.

Vector-Condition Mapping

| value | WARM | COLDII | COLDI | REBOOT |
|-------|------|--------|-------|--------|
| 0     | n    | n      | n     | n      |
| 1     | y    | n      | n     | n      |
| 2     | n    | y      | n     | n      |
| 3     | y    | y      | n     | n      |
| 4     | n    | n      | y     | n      |
| 5     | y    | n      | y     | n      |
| 6     | n    | y      | y     | n      |
| 7     | y    | y      | y     | n      |
| 8     | n    | n      | n     | y      |
| 9     | y    | n      | n     | y      |
| a     | n    | y      | n     | y      |
| b     | y    | y      | n     | y      |
| c     | n    | n      | y     | y      |
| d     | y    | n      | y     | y      |
| e     | n    | y      | y     | y      |
| f     | y    | y      | y     | y      |

- spe-standby

This option is only specified for a High or Critical Reliability System and is the default option. It specifies that if a restart occurs on the active SPE and the corresponding vector bit is set, a core dump will be taken on the standby SPE after the standby SPE has performed a refresh of memory.
- spe-active

This option is only specified for a High or Critical Reliability System. It specifies that if a restart occurs on the active SPE and the corresponding vector bit is set, a core dump will be taken on the active SPE. This option is the default in simplex SPE systems (no options are specified in a simplex SPE system, but spe-active is always assumed).  
**This option is service disrupting.**
- spe-maint

This option is only specified for a High or Critical Reliability System. It specifies that if a restart occurs on the active SPE and the corresponding vector bit is set, a core dump will be taken on the standby SPE without the standby SPE performing a refresh of memory.

## Help Messages

If the system technician presses HELP after entering "set vector" on a simplex system, the following message will be displayed:

Enter a memory dump vector value: (0-F)

The memory dump vector value is a hex value representing restart levels  
A hex value of '1' causes memory dumps to be taken on WARM restarts  
A hex value of '2' causes memory dumps to be taken on COLDII restarts  
A hex value of '4' causes memory dumps to be taken on COLDI restarts  
A hex value of '8' causes memory dumps to be taken on REBOOT restarts

All other hex values represent a combination of restart levels.  
The combination is determined by adding the hex values of the individual restarts together (e.g. a hex value of '3' causes memory dumps to be taken on WARM and COLDII restarts, a hex value of 'F' causes memory dumps to be taken on WARM, COLDII, COLDI, and REBOOT restarts, etc.)

If the system technician presses HELP after entering "set vector" on a duplex system, the following message will be displayed:

Enter a memory dump vector value: (0-F),  
['spe-active', 'spe-standby', 'spe-maint']

The memory dump vector value is a hex value representing restart levels  
A hex value of '1' causes memory dumps to be taken on WARM restarts  
A hex value of '2' causes memory dumps to be taken on COLDII restarts  
A hex value of '4' causes memory dumps to be taken on COLDI restarts  
A hex value of '8' causes memory dumps to be taken on REBOOT restarts

All other hex values represent a combination of restart levels.  
The combination is determined by adding the hex values of the individual restarts together (e.g. a hex value of '3' causes memory dumps to be taken on WARM and COLDII restarts, a hex value of 'F' causes memory dumps to be taken on WARM, COLDII, COLDI, and REBOOT restarts, etc.)

## Error Messages

If the format of the condition (dump vector value) is invalid, the following message will be displayed:

Entry invalid; please press HELP

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

---

The following message indicates that the command completed successfully:

Command successfully completed

The following message indicates that the command failed:

Command failed  
Error encountered, can't complete request Feature  
Interactions

In a simplex SPE system, service will be disrupted while a core dump is being written to the primary Mass Storage System device. In addition, service will continue to be disrupted until the software is restarted at an appropriate level. These "disruption" times will vary depending upon the particular switch configuration.

If a core dump already exists on the file system (tape or memory card) subsequent core dumps will overwrite the existing core dump.

If the Mass Storage System is not accessible, a core dump can not be executed.

**The vector will be cleared when a system restart of the proper level is performed regardless of whether the core is actually dumped.**

If handshake is down in a High or Critical Reliability System and one of the "spe-active," "spe-standby," or "spe-maint" options is selected, the active vector will be set, but the standby vector will not be cleared. This could lead to two different vectors on the active and standby SPEs. Therefore, the "set vector" command should be reissued after handshake is up on the standby SPE.

If handshake is up in a High or Critical Reliability System, the active vector will be set and the standby vector will be cleared, or vice versa depending on the option that is selected.

## **status access-endpoint**

---

This command displays the status of an access endpoint.

## Synopsis

---

status access-endpoint extension *print*

Permissions

The following default logins may execute this command: system technician, cust, inads, init, nms, browse.

Examples

status access-endpoint 25012  
status access-endpoint 77868  
status access-endpoint 66078 print

Description

The status access-endpoint command displays internal software state information for diagnosis. This command can help locate facilities with which an Access Endpoint is communicating.

Defaults

No defaults.

Parameters

- extension      The extension number of the access endpoint to be displayed. The number of digits in an extension is determined by the dial-plan.
- print            This will cause the report to be printed if a printer is connected to the SAT.

Help Messages

If the user presses `HELP` after entering "status access-endpoint," the following message is displayed:

Enter assigned extension, ['print']

Error Messages

If the format for the extension is incorrect, the following message displays:

Extension invalid

If the extension is not administered, the following message displays:

Extension not assigned

If the object associated with the specified extension is not an access endpoint, the following message will be displayed:

Extension assigned to object

other than access-endpoint

If the board that contains the access endpoint is not inserted in the system, the following message will be displayed:

Board not inserted

If the EPN on which the access endpoint resides is not accessible, the following message will be displayed:

EPN is not available

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                    |                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Extension          | The extension of the access endpoint to be displayed.                                                                                                                                                    |
| (Starting) Port    | Port locations of the access endpoint. For wideband access endpoint, the location shown is that of the starting port.                                                                                    |
| Communication Type | The valid voice and data communication type that the access endpoint is administered. The options are: 56k-data, 64k-data, voice-grade-data, and wideband.                                               |
| Width              | For communication types of 56k-data, 64k-data, and voice-grade data, the width value is 1. For communication type of wideband, this field displays the number of DS0s that makes up the access endpoint. |
| Service State      | Whether the access endpoint is in-service or out-of-service. One of the following states displays: in-service/active, in-service/idle, and out-of-service.                                               |
| Connected Ports    | Port location connected to the access endpoint for an active call. For wideband access endpoint connection, all ports connected to the wideband access endpoint are listed.                              |

For the following output example, the command "status access-endpoint 22502" was entered. Assume that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6. The access endpoint is connected on an active call to ports 7 to 12 of board in location 1B19 (cabinet 1, carrier B, slot 19). This means port 01C1101 is connected to 01B1907, port 01C1102 is connected to 01B1908, port 01C1103 is connected to 01B1909, and so on.

Feature Interactions

None.

status administered-connection

This commands displays the operational status of an administered connection.

Synopsis

status administered-connection ac number *print*

Permissions

The following default logins may execute this command: rcust, cust, inads, init, system technician, browse, bcms.

Examples

status administered-connection 1  
status administered-connection 50  
status administered-connection 128 print

Description

An administered connection provides the ability to automatically establish an end-to-end connection between two access/data endpoints.

## Parameters

|           |                                                                             |
|-----------|-----------------------------------------------------------------------------|
| ac number | The number assigned to an administered connection.                          |
| print     | This will cause the report to be printed if a printer is linked to the SAT. |

## Help Messages

If the system technician presses HELP after entering "status administered-connection," the following message will be displayed:

```
Enter assigned administered connection number(1-128),  
['print']
```

## Error Messages

If the user entered administered-connection number is in the wrong format, the following error message is displayed:

```
Identifier invalid
```

If the user entered administered-connection number is out of range (not between 1 and 128), the following error message is displayed:

```
Entry out of range
```

If the user entered administered-connection number is not administered, the following error message is displayed:

```
Identifier not assigned
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then  
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                    |                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Number: | The number assigned to the administered connection.                                                                                                                                                                                                                                                          |
| Enabled?           | Whether the administered connection is enabled ("y" or "n").                                                                                                                                                                                                                                                 |
| Originator:        | The extension of the originating access/data endpoint.                                                                                                                                                                                                                                                       |
| Destination:       | The destination address to be used in the routing of the administered connection.                                                                                                                                                                                                                            |
| Connection State:  | The current status of the administered connection. Valid values are "connected," "restored," "failed," "waiting to retry," "attempting to restore," "attempting to connect," "not scheduled," and "disabled."                                                                                                |
| Failure Cause:     | The cause of the state of the administered connection (that is, why the state is reported as attempting to connect, attempting to restore, or having failed to restore). If the administered connection was due to be active but is not connected, then this field shows the most recent reason for failure. |
| Number of Retries: | The number of consecutive failed establishment attempts.                                                                                                                                                                                                                                                     |
| Auto Restorable?   | When an administered connection is in the connected state, this field indicated whether or not auto restoration is attempted when failure occurs.                                                                                                                                                            |

For the following output example, the command status administered-connection 3 was entered.

```
status administered-connection 3                                page 1 of 1

## Feature Interactions

None.

# status attendant

---

This command displays the status of the attendant console.

## Synopsis

---

status attendant console number *print*

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, rcust, init, bcms, browse.

## Examples

---

status attendant 1  
status attendant 2  
status attendant 2 print

## Description

---

The status attendant command displays internal software state information for diagnosis. This command can help locate facilities to which the attendant console is communicating.

## Defaults

No defaults.

## Parameters

- console number      The console number is a unique number assigned to a specific attendant (i.e. 1 - 16).
- print                This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses `HELP` after entering "status attendant," the following message will be displayed:

Enter assigned console(1-16), [`'print'`]

## Error Messages

If the entered console number is not a valid number from 1 through 16 the following message will be displayed:

Console number invalid

If the console number is not administered, the following error message will be displayed:

Console number not assigned

If a software fault is encountered while the command is executing, the following message will be displayed:

Error encountered, can't complete request

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                        |                                                                                        |
|------------------------|----------------------------------------------------------------------------------------|
| Console Number         | The specific number assigned to the attendant (1-16).                                  |
| Port                   | The port location of the attendant (cabinet-carrier-slot-circuit).                     |
| Service State          | In-service/idle, in-service/active, out of service, or disconnected.                   |
| Usage State            | Idle or active.                                                                        |
| Maintenance Busy State | Whether maintenance is testing the object.                                             |
| Connected Ports        | Port locations to which the attendant is communicating (cabinet-carrier-slot-circuit). |

For the following output example, the command that was entered is "status attendant 1."

```
status attendant 1

ATTENDANT STATUS

Console Number: 1           Service State: in-service/night service
                Port: 01C1106 Maintenance Busy? no
Connected Ports:

Command successfully completed
```

**Feature Interactions**

---

None.

**status audits**

---

This command will display the status of all of the Data Relation Audits that have detected a problem or that have aborted.

**Synopsis**

---

status audits [ peak-hour | cumulative ] [ print | schedule ]

**Permissions**

---

The following default logins may execute this command: inads, init.

**Examples**

---

status audits cumulative  
status audits cumulative print  
status audits cumulative schedule  
status audits peak-hour  
status audits peak-hour print  
status audits peak-hour schedule

**Description**

---

This command is used to display the results of the execution of the Data Relation Audits that are built into the switch. Data Relation Audits are used to check for inconsistencies between selected data items in the switch, to report any inconsistencies found and to take corrective action if possible. Data Relation

Audits are useful during the development and testing phases of a project to help uncover software errors as well as in the field to help the switch recover from data corruption before that corruption causes an interruption in service.

This command displays the date and time of the beginning of the interval requested, the number of times that the full sequence of audits was executed (audit cycles), and status information about each audit that detected a problem or aborted during the specified interval. The status information contains the name of the audit, the number of times that the audit ran and corrected an error, the number of times that the audit ran and detected an error that it could not correct, the number of times that the audit ran and aborted for some reason, the date and time of the first problem detected by the audit (only for cumulative) and the time of the most recent error detected by the audit (only for cumulative).

The audit data is available since the last reboot or since the last execution of the "clear audits cumulative" command, and for the peak hour since the last reboot or since the last execution of the "clear audits peak-hour" or "clear audits cumulative" command. **Note: This data is not cleared on single process restarts, warm starts, cold 2 restarts, cold 1 restarts, or processor interchanges.**

Audits can be executed directly using the "test MO" command (e.g. *test MO / 8192 p 512 t 0* will execute the Station Connections Audit, the audit lnames and numbers (pnames) are included in the Table Of Audits at the end of this main page). When the "test MO" command is used to execute an audit, the results of the audit are displayed on the terminal screen. In general, errors discovered as the result of a demand test are not logged in the error logs. To be consistent with other error logging and to avoid confusion, errors that are discovered as the result of a demand test executing an audit are not included in the data displayed by this command.

The screen does not automatically update, and is a reflection of the system at the time the request was made. More audits may have been run while the information is being displayed. These updates will not be reflected until the next execution of the command.

## Defaults

None

## Parameters

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cumulative | This option will display the data collected since the last reboot or since the last execution of the "clear audits cumulative" command.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| peak-hour  | This option will display the data for the peak hour since the last reboot, or since the last execution of the "clear audits cumulative" or "clear audits peak-hour" command. The peak hour is determined by summing, for all audits, the number of times that the audit found and fixed a problem, the number of times that the audit found a problem that it could not fix and the number of times the audit aborted. The data for the hour with the highest number is displayed as the peak hour's data. If two peaks of the same size occur, the most recent is displayed. |
| print      | If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.                                                                                                                                                                                                                                                                                                                                                                                                                |
| schedule   | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [3] for more details.                                                                                                                     |

## Help Messages

If the technician presses HELP after entering "status audits," the following message will be displayed:

```
cumulative peak-hour
```

## Error Messages

If the "print" option is specified and there is no printer attached to the terminal or if the printer is off line, then the following message will be displayed:

```
Printer failed
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

The audit information will be displayed with one line of data displayed for each audit that has detected an error or aborted. The data for audits that have not detected any errors or aborted is not displayed since all of the numbers would be zero anyway. The output will be sorted in descending order based on the sum of the values in the "# Cycles Fixed Data," "# Cycles Could Not Fix Data" and "# Cycles Audit Aborted" fields for each audit.

Start Date

This field shows the date and time of the beginning of the interval being displayed. For "cumulative" it will be the date and time of the last reboot or of the last execution of the "clear audits cumulative" command. For "peak-hour" it will be the date and time of the beginning of the peak hour since the last reboot or since the last execution of a "clear audits cumulative" or "clear audits peak-hour" command.

# of Audit Cycles Completed

The switch executes the audits in a set order, one after another. When all of the audits have been executed, the switch starts over with the first one in the sequence. An audit cycle is one execution of all audits in the sequence of audits executed by the switch. This field shows how many audit cycles were completed in the specified interval. The number ranges from 0 to 999999, if it exceeds 999999 the string "\*\*\*\*\*" will be displayed to indicate overflow.

 **NOTE:**

Since this field shows the number of audit cycles completed, it is possible that the individual audit values, described below, could be larger than this value if the switch is part way through another audit cycle. Also, some audits are executed as part of scheduled maintenance instead of in the normal audit sequence, the Audit Cycles number does not apply to these audits.

Audit Name

This field shows the name of the audit that detected an error or aborted. There are a few audits that are not run in the normal sequence of audits. Instead, they are executed as part of scheduled maintenance. Those audits will be included in the reports but will be marked with "(SCH)" following the audit name.

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| # Cycles Fixed Data         | This field shows the number of times that the audit ran, in the specified interval, and found a problem that it was able to fix. The number ranges from 0 to 65534, if it exceeds 65534 the string "*****" will be displayed to indicate overflow.                                                                                                                                                                                                                                                                                                                      |
| # Cycles Could Not Fix Data | This field shows the number of times that the audit ran, in the specified interval, and found a problem that it was not able to fix. The switch data being audited is left in an inconsistent state when this happens. The number ranges from 0 to 65534, if it exceeds 65534 the string "*****" will be displayed to indicate overflow.                                                                                                                                                                                                                                |
| # Cycles Audit Aborted      | This field shows the number of times that the audit ran, in the specified interval, and aborted due to an internal error. The number ranges from 0 to 65534, if it exceeds 65534 the string "*****" will be displayed to indicate overflow.                                                                                                                                                                                                                                                                                                                             |
| First Error                 | This field shows the date and time that the audit first detected any of the three types of problems (i.e. fixed data, could not fix data, audit aborted) since the last execution of the "clear audits cumulative" command. The format used is: two digit month number followed by "/" followed by the two digit day of the month followed by "/" followed by the two digit hour in 24 hour time followed by ":" followed by the two digit minute (e.g. 03/27/14:31 for 2:31 pm, March 27th). <b>This field appears only on the "status audits cumulative" display.</b> |
| Most Recent Error           | This field shows the date and time that the audit last detected any of the three types of problems. The format used is: two digit month number followed by "/" followed by the two digit day of the month followed by "/" followed by the two digit hour in 24 hour time followed by ":" followed by the two digit minute (e.g. 03/27/14:31 for 2:31 pm, March 27th). <b>This field appears only on the "status audits cumulative" display.</b>                                                                                                                         |

The following are a sample outputs of the "status audits" command.

```

### Feature Interactions

The data displayed by "status audits cumulative" and "status audits peak-hour" can be affected by the "clear audits" command. The "clear audits cumulative" command clears the data collected to date and resets the start time kept for that data and also clears the peak hour's data. The "clear audits peak-hour" command clears the data kept for the peak hour so that a new peak hour can be established.

When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. Refer to the Report Scheduler and System Printer feature specification [3] for details about the scheduling form.

### TABLE OF AUDITS

The following table shows the names of the audits that are run as part of time available maintenance, the audit number (pname) and a short description of each audit. These audits are executed using lname MO\_DR\_AUDIT (8192). These audits may be executed using the *test MO* command with lname 8192, pname "audit number," and test number 0 (for example, *test MO / 8192 p 607 t 0* will execute the AC state audit).

| Audit Name | Audit Number | Description                             |
|------------|--------------|-----------------------------------------|
| AC-ISG     | 607          | AC state audit                          |
| ADJUSR     | 595          | Adjunct user record audit               |

The following table shows the names of the audits that are run as part of scheduled maintenance, the audit number (pname) and a short description of each audit. These audits are executed using lname MO\_SCH\_AUDIT (8193). These audits may be executed using the *test MO* command with lname 8193, pname "audit number," and test number 0 (for example, *test MO / 8193 p 556 t 0* will execute the Message Waiting Lamp Audit audit).

| Audit Name | Audit Number | Description                         |
|------------|--------------|-------------------------------------|

**status bri-port**

This command displays the current states of the specified ISDN-BRI port.

## Synopsis

---

status bri-port location *print*

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

## Examples

---

**status bri-port 1c0701**  
**status bri-port 1c0701 print**

## Description

---

The status bri-port command displays the service state, maintenance state and layer 1 state of an ISDN-BRI port. Also displayed on this form is information on the point-to-point signaling links transported over the port.

## Defaults

None.

## Parameters

- |          |                                                                                                                                                                                                                                                               |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | A "location" represents the physical position of the port to be busied out and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit (port). |
| print    | This will cause the report to be printed if a printer is linked to the SAT.                                                                                                                                                                                   |

## Help Messages

If the system technician presses HELP after entering "status bri," the following is displayed:

```
Enter an isdn-bri port location, ['print']
```

## Error Messages

- If the format of the port location is incorrect, the following message is displayed:
- ```
Port/Board invalid
```
- If the port location entered is not between 5 and 7 characters long, the following message is displayed:

Port invalid

If the port is not administered, the following message is displayed:

Port not assigned

If the board associated with the entered port location is not inserted, the following message is displayed:

Board not inserted

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

Output

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port:              | This field specifies the physical address of the ISDN-BRI port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Service State:     | This field specifies whether the ISDN-BRI port is "in-service" or "out-of-service."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Maintenance Busy?: | This field specifies whether there is any maintenance testing being performed upon the ISDN-BRI port ("yes" or "no").                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Layer 1 State:     | <p>This field contains the layer 1 (physical) state of the BRI on the port. Valid states are "activated," "pend-activation," and "deactivated."</p> <ul style="list-style-type: none"><li>■ The "activated" state means layer 1 frames are being passed between the port and BRI endpoints.</li><li>■ The "pend-activation" state specifies that the port has been placed in-service, the layer 1 interface device has been turned on, layer 1 frames are being sent to the BRI endpoints connected to this port, but the BRI endpoints are not responding.</li><li>■ The "deactivated" state means that the layer 1 interface device on the BRI has been turned off due to the port going out-of-service.</li></ul> |
| TEI Value          | The Terminal Endpoint Identifier(TEI) is a layer 2 addressing parameter used by the switch to pass information over the point-to-point signaling link to and from BRI endpoints. Each point-to-point signaling link has a TEI associated with it. This field displays the value of this addressing parameter. This value is in the range from 0 to 127.                                                                                                                                                                                                                                                                                                                                                              |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Layer2 State:   | <p>This field contains the point-to-point signaling link layer 2 state. Valid states are "un-assigned," "assigned," "established," "l3-established" or "hyperactive."</p> <ul style="list-style-type: none"><li>■ The states of "un-assigned" means the link is in the TEI-UNASSIGN state at Layer 2.</li><li>■ The "assigned" state specifies the link is currently in the AWAIT_EST (Await Establish) state at layer 2. If the BRI endpoint supports TEI allocation procedures, this state means that those procedures have been successfully executed and a TEI has been assigned to the endpoint by the switch.</li><li>■ The state of "established" signifies that the link is in the MF_EST_NORM (Multi-Frame Established Normal) state at layer 2. This state means that the switch has successfully started the link and is now capable of exchanging layer 3 frames with the endpoint. If the endpoint does not support SPID initialization procedures, the extension of the endpoint associated with the link is also displayed. This is the normal state for the link in the point-to-point wiring configuration.</li><li>■ A state of "l3-established" shows that the link is in the MF_EST_NORM state at layer 2 and SPID initialization procedures have been completed successfully. The extension of the endpoint associated with the link is also displayed. This is the normal state for the link in the multi-point wiring configuration.</li><li>■ The state of "hyperactive" means that traffic on this link has gone over threshold. The link has been suspended and deemed hyperactive.</li></ul> |
| Endpt Extension | <p>This field displays the extension of the voice/data endpoint associated with the link only if the link is in the "established" (point-to-point configuration) or "l3-established" (multipoint configuration) layer 2 states, otherwise this field is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Endpt SPID      | <p>This field displays the SPID administered on the voice/data endpoint associated with the link. Note that this information is displayed only if the link is in either the "established" (point-to-point configuration) or the "l3-established" (multipoint configuration) layer 2 state. Otherwise this field is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Service SPID    | <p>This field displays an indication as to whether the link is associated with the Service SPID. If the link is associated with the Service SPID this field contains a "yes" and the endpoint extension field is blank, otherwise this field is blank. Service SPID is a feature used by service technicians to check building wiring between the switch and the BRI endpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

For the following output example, the command status bri-port 1c1701 was entered.

```
status bri-port 1c1701                                Page 1 of 1  SPE A

## status card-mem

---

This command views the status of the memory card located at the specified SPE.

### Synopsis

---

`status card-mem location print`

### Permissions

---

The following default logins may execute this command: cust, init, inads, system technician, nms, rcust, browse, and bcms.

### Examples

---

```
status card-mem
status card-mem A
status card-mem b print
```

### Description

---

Memory card is a portable and compact memory card containing a bank of flash EPROM chips. The non-volatile memory card can be erased and randomly programmed with user's data. The system software is stored in the "flash" section of main memory and the memory card used for saving translations doesn't contain a copy of the system software as the tape does. During the system reboot or a system power down condition, the in-core system maintenance hardware error logs are temporarily saved in the memory card before the system goes down and then the error logs file is read back when the system is restarted. The Hard Patch feature also uses the memory card as a temporary storage when LMM applies a patched file to the system software.

The "status card-mem" command can show the following information of a memory card located at either active SPE or standby SPE:

- Is a valid memory card in place?
- Is the memory card write-protected?
- What is the capacity of the inserted memory card?
- What kind of system configuration - small or medium?
- What is the number of pulses counted in the last erase operation?
- What is the percentage of translation storage space used?
- What are the names of files stored in the memory card, and what is date and time (if available) when it was saved?

## Defaults

None.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                  |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | This parameter indicates the carrier location where the memory card resides in a High or Critical Reliability System. This field is not required in a simplex switch configuration. In a duplex switch configuration, this field is required and it can be either "A" for control carrier A in Processor Port Network (PPN) or "B" for control carrier B in PPN. |
| print    | Print the status on the printer attached to the SAT.                                                                                                                                                                                                                                                                                                             |

## Help Messages

If the system technician presses HELP after entering "status card-mem," the following message is displayed for a duplex system:

```
Enter [cabinet(1)];carrier(A-B), ['print']  
['print']
```

## Error Messages

If the carrier entered is invalid, the following message will be displayed:

```
"entered value" is an invalid identifier;  
press RETURN to execute modified command
```

If the NETCON board is not TN777B, then the following message will be displayed:

```
Must install TN777B circuit pack
```

If the system is insane, the following message will be displayed:

```
Error encountered, can't complete request
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering  
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;  
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;  
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;  
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;  
for information use "status system 1"
```

## Output

- Location

This field indicates the physical location (carrier) of the memory card. In a simplex system, the "Location" always has the value "01A" for carrier A of Processor Port Network. In a High or Critical Reliability System, either "01A" or "01B" can be displayed.
- System Size

The "System Size" field reflects the system configuration - **Small** or **Medium**. This information is useful for catching errors such as inserting wrong size of memory card into the system.
- Capacity

The "Capacity" field shows the capacity of the inserted memory card and the series number of the memory card. This field has a 3-digit format for the size of memory card and the 1-digit format for the series number. Three different capacities of memory cards are used in DEFINITY D92 system. The file contents of each type of memory card are described in the following table.

Capacity of Memory Card

| Card Size | User                                | Customer File Names                        |
|-----------|-------------------------------------|--------------------------------------------|
| 1 Mb      | Small w/o Announcements             | translation                                |
| 4 Mb      | Medium w/o Announcements            | translation                                |
| 4 Mb      | Small and Medium with Announcements | translation<br>announcements               |

| Write-Protection                   | <p>The "Write-Protection" field has a value <b>"on"</b> when the write-protection toggle on the memory card is turned on. Otherwise, the field is <b>"off."</b> If the "Write-Protection" field is <b>"on,"</b> then the switch can not store any file to the memory card.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Number of Erase Pulses             | <p>This field contains the number of pulses counted in the last erase operation on a Series 1 type of memory card. This field is blank for Series 2 type of memory card due to the different algorithm of erase operation between two series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Translation Storage Space Used (%) | <p>Indicates the percentage of reserved storage space for storing translation file in the memory card that has been used for saving the translation into the memory card.</p> <div> <b>NOTE:</b><br/>This percentage is valid only for the specific memory card used in the <i>most recent</i> save translation operation (which is implemented via the <b>save translation</b> command or via the scheduled maintenance with save translation enabled). If the memory card is replaced with another card, or if no save translation is performed on the new memory card, the percentage does <b>not</b> indicate the translation storage space used in the new card. Therefore, in such a case, the percentage can be ignored.</div> |
| File Name                          | <p>Each formatted memory card has reserved a fixed space in the card for each file. The starting address and size of each reserved slot is pre-determined according to the capacity of the memory card. The file name as defined in Table "Capacity of Memory Card" is shown in this field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Data Present                       | <p>The "Data Present" field is "y" when the file contains valid data. Otherwise, the "Data Present" field has a value of "n."</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Date Time                          | <p>This field shows the date and time when the file was saved into the memory card. For the "Software Upgrade" type of memory card, this field contains the system software release number instead of the time stamp. Due to the restriction of "core dump" file format, the year information is not available in the date/time string.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

For the following output example, the command "status card-mem" was entered.

```
status card-mem

                                MEMORY CARD STATUS

Location: 01A                    Write Protection: off
Status: inserted                 Capacity (MB): 4 Series 1
System Size: Medium             Number of Erase Pulses: 78
                                Translation Storage Space Used (%): 21

File Name      Data Present    Date      Time
translation    y              2/17/91   9:00
announcements  y              2/15/91   20:30

Command successfully completed
```

Feature Interactions

If the Announcement feature is not available in the system features configuration, then the "Data Present" field is always "n" for the "announcements" file. The Announcement feature requires a memory card with a minimum capacity of 4 MB. If the memory card is less than 4 MB, then the Announcements can not be saved in the memory card.

The Core Dump feature requires a 10 MB memory card for saving the core dump. If the memory card has a capacity less than 10 MB, then the core dump operation will fail.

status cdr-link

This command displays the status of the call detail recording (CDR) links.

Synopsis

```
status cdr-link print
```

Permissions

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, nms, browse.

Examples

```
status cdr-link
status cdr-link print
```

## Description

---

The `status cdr-link` command displays the status of call detail recording (CDR) links. Whether the link is up or down will be displayed. If a link is down, the number of times the switch has tried to set up the link will be shown.

The call detail recording (CDR) link is the physical link connecting the SPE to a recording device (for example, printer) for sending CDR call records. A CDR link is composed of a data channel on the NETCON board or EIA port on the processor circuit pack, a digital port and a data module. There can be up to two CDR links in the system.

## Defaults

No defaults.

## Parameters

`print` This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses `HELP` after entering "`status cdr-link`", the following message will be displayed:

```
['print']
```

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

- Link State

Up, down, or extension not administered will be displayed.  
  
*Up* means the link is up and the application can use the link. This is the normal state of operation.  
  
*Down* means the link is physically down.  
  
*Extension not administered* means you need to administer the *system cdr feature* form.
- Number of Retries

The number of times the switch has tried to set up the link.
- Maintenance Busy

Whether the maintenance object has been busied out or not. Will be set to either *yes* or *no*.

The following is an example of the fields contained on the output form.

```
status cdr-link

                                CDR LINK STATUS

      Primary                      Secondary
Link State: up                  extension not administered
Number of Retries: 0
Maintenance Busy? no
```

## Feature Interactions

None.

## status cleared-alarm-notif

This command returns the status of Cleared Alarm Notification.

## Synopsis

status cleared-alarm-notif [1 | 2]

## Examples

status cleared-alarm-notif  
status cleared-alarm-notif 1  
status cleared alarm-notif 2

## Description

---

This command is intended to be used by Expert System to detect a chronic alarming condition. If this command returns "Feature is suspended", Expert System can then identify an open trouble ticket as a chronic problem for special considerations.

## Defaults

The test defaults to return the status of Cleared Alarm Notification of the first OSS telephone number.

## Parameter

- |   |                                                                                                  |
|---|--------------------------------------------------------------------------------------------------|
| 1 | This option returns the status of Cleared Alarm Notification of the first OSS telephone number.  |
| 2 | This option returns the status of Cleared Alarm Notification of the second OSS telephone number. |

## Help Messages

[ '1' or '2' ]

## Output

---

- The command returns one of the following messages:
- If Cleared Alarm Notification is enabled and has not been suspended:  
Feature is enabled
  - If Cleared Alarm Notification is disabled:  
Feature is disabled
  - If Cleared Alarm Notification is enabled and has been suspended:  
Feature is suspended

## Feature Interactions

---

None.

## status conference

---

This command is a troubleshooting aid to help identify problems with a multimedia conference and can help solve more complex problems.

## Synopsis

---

The first screen appears when **status conference** is entered and at least 1 valid conference is found.

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**status conference**  
**status conference 2 print**  
**status conference [all \ conference-ID] [print \ schedule]**  
**status conference [all \ conference-ID] [endpoint \ endpoint id]**  
(see [“Field Descriptions \(status conference endpoint\)” on page 8-426](#))

## Description

---

Use the **status conference** command to solve the following multimedia problems:

1. A user unable to join or remain joined to a conference.
2. A conference having poor video quality due to it being downgraded because of the automatic algorithms - audio AUTO mode and the Px64 video picture specifications.
3. A user not receiving full service, such as being an audio-only endpoint (no video).
4. An audio add-on user unable to join or remain joined to a conference.
5. A conferee not being seen by other users due to interworking problems.
6. A user not able to participate in the Muiltpoint Communications Service conference.
7. A continuous conference not switching endpoints in or out of quadrants.

## Defaults

---

The default for the conference-ID is **all** (all stored data).

Parameters

---

|                           |                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------|
| status conference         | Displays all stored conference data.                                                        |
| status conference 2 print | Displays data on conference 2 (current or last completed), and sends it to the SAT printer. |

Feature Interactions

---

None.

Output

---

Depending on the command entered, it is possible to have many records display. Active conferences display first (in order of conference-ID), followed by completed conferences (most recently completed first). There is no data or information about conferences not yet begun.

The data for each conference displays in 2 parts: the first screen describes the status of the conference and indicates the modes and levels of the conference. It also shows certain endpoint information such as which endpoints are in use and which endpoint caused the conference operating mode to change. This screen is similar to the administration screens. The remainder of the screens display endpoint level data (up to 8 endpoints per screen), displaying the ports and drop reasons.

[Screen 8-1](#) shows page 1 of a typical administration screen. The first screen appears when **status conference** is entered and at least 1 valid conference is found.

| stop<br>time/date  | End of conference in 24-hour notation with month and day. It is the actual end time if Status is complete; otherwise it is blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| admin<br>bandwidth | The channel bandwidth as administered on the Conference Record form - 64k.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| no of<br>channels  | The number of channels (transfer rate) required for each Px64 endpoint - 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Chair              | Identifies the current chair token holder. This field is always blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| conf<br>bandwidth  | The current operating channel conference bandwidth. This can be different from the administered bandwidth because of Rate Adaptation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Rate<br>adaptation | Does this conference support Rate Adaptation? - n, y.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Format<br>(in/out) | For single-screen conference, the video format of the conference, CIF, QCIF, QCIF/CIF, H.CTS, H.CTX+, and SG4. For conferences other than H.261, the input and output formats are always symmetric and the mode is the same for input and output. These display as H.CTX, H.CTX+, and SG4. For H.261 mode non-continuous presence conferences, the format is always symmetric and displays as CIF and QCIF. The same is true for the non-presentation, continuous presence conference in single-screen. For presentation mode H.261 single screen continuous presence capable conferences, the input and output formats may be symmetric QCIF/CIF (displayed as CIF) or asymmetric QCIF/CIF, depending on if the format is administered as upgradeable. For quad-screen conferences, the format is QCIF/CIF to reflect the input of QCIF from all participants and output of CIF to all participants. For presentation mode quad-screen conference, the format is also QCIF/CIF to reflect the input/output of all participants except the presenter. In quad-screen mode, the input from the presenter is always CIF. |
| FPS                | The CIF frame rate (frames per second) - ' - ' , 30, 15, 10, 7.5. FPS indicates the rate that an endpoint is capable of receiving frames. Note that there is no indication of the maximum transmit frame rate nor the current frame rate that the MCU can detect. The frame rate changes as a function of the amount of motion in the input image.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| QFPS               | <p>The ACIF frame rate (frames per second) - ' - ', 30, 15, 10, 7.5. QFPS indicates the rate that an endpoint is capable of generating/receiving frames.</p> <p>For quad-screen VAS conferences, QFPS reflects the highest common QCIF frame rate of all endpoints and the rate of the video mixer board, which may be lower than the rest of the participants. Note that QCIF calculation takes into account the highest common CIF frame rate declared by all conference participants, since QCIF rate cannot be greater than that of the highest common CIF rate.</p> <p>For quad-screen presentation conferences, QFPS reflects the highest common QCIF frame rate of all participants and the rate of the video mixer board. Note that the QFPS cannot be greater than the CIF frame rate announced by the presenter.</p> <p>QFPS field is blank for proprietary modes.</p> |
| lo/hi interworking | <p>Does this conference support Low Speed/High Speed Interworking? - This field will always have a value of n.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Type               | <p>The type of conferee, either Audio/Video (P64), Audio Add-on (AUD), Cascade Link (CAS), BONDing Call (BOND), BONDing Cascade Link (BCAS), UCC Controller (UCC), or Dedicated Access (DA). BONDing calls use up to 12 channels to form a single multimedia pipe.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Ext                | <p>Endpoint extension chosen at administration. This field is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Meet-me number     | <p>The Meet-Me Number administered for the Meet-Me Extension. This field is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Dial Type          | <p>Indicates whether dial-in or dial-out is used to join the endpoint to the conference - in, out. The value in is for dial-in, and out is for dial-out.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In Use | <p>Is the endpoint currently participating in the conference or in process of connecting to the conference? - y, c, e, f, n, blank.</p> <p>y means that the endpoint is in use and is fully connected on all media in an active conference.</p> <p>c means that the endpoint is in use and is fully connected, however the endpoint has changed the conference audio or video capability or has changed the rate of the conference because of rate adaptation. This condition requires analysis of this endpoint's capabilities and mode fields to identify which capability was reduced.</p> <p>e means that the endpoint is in use but the endpoint had capability problems. The endpoint does not have one of the required capabilities (Vid, Bhl, MLP) to be a full participant. For MLP capabilities, see the "T120" field. This condition requires analysis of this endpoint's capabilities and mode field to identify the missing capability.</p> <p>f means that the endpoint is in use but is not connected to all media. This indicates that the endpoint has declared all the required capabilities (channel/video/ audio/data) but is not fully connected to all conference media at this time. This endpoint may be in the process of connecting, has failed to connect, or is not a valid video source. This condition requires analysis of this endpoint's capabilities and mode fields to identify the problem.</p> <p>n means that the endpoint was connected in a conference but has/was disconnected or attempted to connect to a conference but was unsuccessful.</p> <p>blank means the field is blank until the first call is made from/to the endpoint.</p> |
| Ch1    | <p>Data on the quantify and quality of channels (transfer rate)? - y, e, n, blank</p> <p>y the endpoint has the required number of channels.</p> <p>e means that the endpoint has not declared support for the correct number of channels and cannot participate fully in the conference.</p> <p>n means that the endpoint has declared the correct number of channels, but all the channels have not yet joined the conference, due to either a network or endpoint problem.</p> <p>blank Audio add-on endpoints always have the Ch1 field set to blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aud | <p>Does it have the required audio capability? - y, c, e, blank</p> <p>y the endpoint has the required audio capability. Audio add-on endpoint always have the Aud field set to y once the endpoint has joined the conference.</p> <p>c this endpoint is PCM only and it changed the video quality of the conference by changing the operating audio from G.728 to G.711. If the administered audio mode is auto and the administered bandwidth is 112 kbps (56 k/channel) or 128 kbps (64 k/channel), the system starts out with the highest common audio of G.728. When the administered bandwidth is greater than 128 kbps, the system starts out with the highest common bandwidth of 7 kHz.</p> <p>e A PCM-only endpoint that did not have the capability of supporting the administered audio mode of G.728 (such as a data conference), or G. 278/G.711 endpoint that did not have the capability of supporting the administered audio mode of 7 kHz. Such endpoints operate with PCM audio and interwork with the current operating audio mode.</p> <p>blank the field is blank until the first call is made from/to the endpoint.</p>                |
| Vid | <p>Does it have the required video capability and is receiving video? - y, c, e, n, blank</p> <p>y the endpoint has the required video capability and should be receiving video if the Chl, Aud, and Dat fields are y.</p> <p>c means it downgraded the conference's video quality - either from CIF to ACIF or by decreasing the frame rate. The conference video mode is set by default to CIF and if a QCIF-only endpoint joins the conference, then the entire conference is made to operate in QCIF, with the video clarity downgraded. Also, the conference frame rate is initially set to the highest frame rate that can then be reduced by any endpoint. If the conference video mode is not administered with upgrade capability, then if the video parameters for a conference have been "downgraded," they are not "upgraded" until all endpoints disconnect from the conference.</p> <p>e means that the endpoint has not declared any video capability in its cap-set.</p> <p>n means audio only, not receiving video, possibly due to an audio or data problem.</p> <p>blank Audio add-on endpoint always have the Vid field set to blank.</p> |
| MLp | <p>The state of the Control Link to the ESM (T.120 stack terminator), the endpoint MLP data capability, and the state of the data connection in the T.120 stack. This field value is always blank, indicating that the Data Mode for the conference is none, and therefore, the data does not apply, or the endpoint has never joined the conference.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Gx        | <p>Does it have the Still Frame Graphics capability? - y, e, blank</p> <p>y This endpoint has this capability.</p> <p>e This endpoint did not declare this capability. The conference retains the still frame graphics capability when a non-compliant endpoint joins the conference.</p> <p>blank This endpoint has never joined the conference.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Rate Adpt | <p>Rate adaptation/Interworking indicator - 5, 6, y, c, e, n, blank. Values of 5 and 6 apply only to Low Speed/High Speed Interworking. All other values apply only to Rate Adaptation.</p> <p>5 A 56-kbps (Low Speed) endpoint has joined a High Speed (128 kbps or above) conference. This endpoint is connected with audio only capability but is not a valid video source and destination.</p> <p>6 A 64-kbps (Low Speed) endpoint has joined a High Speed (128 kbps or above) conference. This endpoint is connected with audio only capability but is not a valid video source and destination.</p> <p>y This endpoint has joined the conference at the administered rate of 64 kbps, but because rate adaptation to 56 kbps was triggered by another endpoint, this endpoint has successfully rate adapted to 56 kbps.</p> <p>c The administered bandwidth of the conference is 64 kbps and this endpoint has joined the conference at 56 kbps. The first 56 kbps endpoint that joins 64 kbps rate adaptable conference triggers rate adaptation (see Join Time below).</p> <p>n A 64-kbps conference was triggered to rate adapt to 56 kbps by some other endpoint. This endpoint joined the conference at the bandwidth of 64 kbps, but encountered problems in rate adapting down to 56 kbps. This endpoint may have the audio and may be receiving video, but is not a valid video source.</p> <p>blank Rate adaptation was never triggered by any endpoint, and if this endpoint is in use and connected, then it has joined the conference at the administered bandwidth.</p> |
| Bond Mode | <p>BONDing Mode - blank. This field is blank for calls that are not related to bonding.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ts | <p>Indication of the talking state of the endpoint - t, m, M, S, blank.</p> <p>t At the time the command was invoked, voice energy (talking) was detected from the endpoint.</p> <p>m At the time the command was invoked, the endpoint indicated to the MCU that it was muted. It is possible that an endpoint may mute, but not send any indication to the MCU. In this situation the MCU does not display a mute indication.</p> <p>M At the time the command was invoked, the endpoint's audio was muted via UDD/CRCS Agent interface. M displays when both the endpoint and the UCC/CRCS Agent have muted the endpoint audio.</p> <p>S At the time the command was invoked, the endpoint's audio was muted because of solo-audio state set by UCC/CRCS Agent. While in solo-audio state, new endpoints joining the conference are automatically muted.</p> <p>blank At the time the command was invoked voice energy (talking) was not being detected from the endpoint.</p>           |
| Vs | <p>Indication of the MCU video state for this endpoint - a, b, B, c, i, r, R, s, S, u, U, v, blank.</p> <p>For quad-screen conferences an * is affixed before the value of Vs to indicate that an endpoint is currently part of the mixed image. A # may be affixed before the value of Vs to indicate that an endpoint was fixed to be in the mixed image (via administration or UCC/CRCS Agent), but instead, a Fill video is shown in its place. This occurs when the video of an endpoint that is fixed in a quadrant cannot be used as a video source because the endpoint is currently not joined to the conference, has suppressed its video, or has invalid video to be the video source. Notice that at most four endpoints have an * or # affixed before the Vs field value.</p> <p>For quad-screen conference in VAS mode, the mixed image is broadcast to all endpoints. For quad-screen conference in presentation mode, the mixed image is return video to the presenter.</p> |

Vs  
(cont'd.)

a This value applies only to quad-screen conferences. \*a indicates that an endpoint is part of the current mixed image and is fixed in one of the quadrants via administration. A value of \*a indicates that the endpoint is fixed in a quadrant but is not currently connected (Fill image displays).

b For full-screen conference it indicates that at the time the command was invoked, this endpoint's video was being broadcast to other sites. This conference was in VAS, broadcast, or presentation mode. For quad-screen VAS conference it is prefixed with an asterisk (\*) and indicates that this endpoint's video is part of the mixed image because of VAS. For quad-screen presentation conferences, b (without an asterisk) identifies the presenter as the broadcaster.

B At the time the command was invoked the endpoint's video was being broadcast to other sites because of the UCC roll call feature. UCC roll call feature can only be performed in full-screen mode.

c At the time the command was invoked this endpoint's video was being broadcast to other sites. The conference was in chair mode and the broadcaster was designated by the chair. Chair features can only be performed in full-screen mode.

i At the time the command was invoked the endpoint was not a valid video source. For continuous presence conference, if this endpoint is fixed in a particular quadrant, an asterisk (#) is affixed before i.

r For full-screen conferences, at the time the command was invoked the endpoint's video was the return video to the broadcaster. For continuous presence conference in presentation mode, \*r represents a VAS quadrant that is part of the mixed image.

R At the time the command was invoked, the endpoint's video was the return video to the broadcaster because of the UCC browse feature. UCC Browse feature can only be performed in full-screen mode.

s At the time the command was invoked this endpoint's video was suppressed at the request of the endpoint. For continuous presence conference with fixed quadrant participants, if this endpoint is fixed in a particular quadrant a # is affixed before s.

Vs  
(cont'd)

S At the time the command was invoked this endpoint's video was suppressed via UCC/CRCS Agent interface. For continuous presence conference with fixed quadrant participants, if this endpoint is fixed in a particular quadrant, # is affixed before S. S displays when both the endpoint and the UCC/CRCS Agent have suppressed the endpoint video.

u For full-screen conferences, at the time the command was invoked this endpoint's video was being broadcast to other sites. The conference was in VAS mode and the broadcaster was designated by the UCC/CRCS Agent interface. For quad-screen conferences, it indicates that UCC/CRCS Agent designated this endpoint as fixed in a quadrant. An asterisk (\*) is affixed before u if the endpoint is currently part of the quad image, and # is affixed if the endpoint is not currently joined.

U Applies only to quad-screen conference and indicates that UCC/CRCS Agent designated a quadrant as VAS. An asterisk (\*) is affixed before U to indicate that this endpoint is part of the current quad image.

v At the time the command was invoked this endpoint's video was being broadcast to other sites. The conference was in VAS mode but the endpoint has asked to be a broadcaster via "See-Me" request and was granted a MCV (Multipoint Command Visualize) token. The See-Me feature is only performed in full-screen mode.

b l a n k At the time of the request the endpoint's video was not broadcast, return, video, or part of the mixed-image, but it is a valid video source.

Field Descriptions (status conference, page 2)

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sum Grp   | The VD audio Level 1 (L1) and Level 2 (L2) summer group parts for each assigned group (1-4). Summer parts are assigned only for conferences with over 6 participants. When a conference operates at an audio mode of 7 kHz (administered audio mode is 7 kHz, or auto with the bandwidth greater than 128 kbps), the system allocates “primary” and “secondary” L1 and L2 summer parts. These primary and secondary parts are allocated as adjacent port slots on the same board. Status conference only displays the primary summer ports. The secondary summer ports are always one slot higher than the displayed primary summer port. |
| Join Time | Time (in 24-hour notation) when the channel joined the conference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Drop Time | Time (in 24-hour notation) when the channel disconnected. If the first channel has a drop time, then it means that the endpoint is not in use. If there is a drop time without a join time, it means that the call disconnected without being joined to the conference.                                                                                                                                                                                                                                                                                                                                                                   |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Drop Reason | <p>The reason for the channel's disconnect:</p> <p>2 - pri This drop reason occurs when an administration error causes a mismatch in primary-secondary designation for a cascade link. This mismatch shows that both MCUs are administered as primaries (see "Cascading" for a description of primary-secondary compatibility).</p> <p>2 - sec This drop reason occurs when an administration error causes a mismatch in primary-secondary designation for a cascade link. This mismatch shows that both MCUs are administered as secondaries (see "Cascading" for a description of primary-secondary compatibility).</p> <p>Agent The reservation agent has caused the call to disconnect (for example, the agent has changed a connected dial-out destination number).</p> <p>Bandwidth mismatch between a call and the conference it attempted to join. For example, a 56-kbps call attempted to join a 64-kbps conference that does not allow rate adaptation.</p> <p>BondHshake BONDing handshake drop reason can be caused due to the following reasons: information channel parameter not supported or invalid, parameter negotiation terminated out of sequence, timer expired because of the secondary channels did not establish, or BONDing framing was not detected for one of the other channels.</p> <p>Busy This dial-out drop reason occurs when the MCU detects that the conferee's terminal equipment is busy. This drop reason is detected by an ISDN cause value (for example h0). See "Dial-out" for a description of CPTR usage.</p> <p>Chair disconnected the endpoint, using either Chair Command Disconnect (CCD) or Chair Command Kill (CCK) signals.</p> <p>Conf End The conference was ended due to reaching stop time for a reserved conference or due to an active conference being converted to file.</p> |

Drop Reason

*(cont'd)*

Endpoint Clearing received from DS1 - the disconnect came from the endpoint. The endpoint notified the MCU that it intended to disconnect.

Far - end Clearing received from DS1 - the disconnect came from either the network or the endpoint.

Handshake Either framing was never found (the endpoint could not complete initialization - problems finding Frame Alignment Signal (FAS), Multi Frame Alignment (MFA) and getting a corrected coded cap-set) or framing was lost for some time (over 40 seconds) and the endpoint was disconnected.

IDtimeout The MCU has not received response to the UIN/password Query from the H.320 user after three attempts. Each attempt has a system administered timeout period.

Internal MCU has a problem allocating trunk resources necessary to route the dial-out call for the specified dial-numbers. This problem can be associated with routing pattern or trunk associated translation (for example, TAC specified in the dial-out number or routing pattern points to a trunk group without members), or it can indicate a lack of trunk resources (for example, all trunk members are maintenance busy or all in-service members are busy on a call).

Network Clearing received from DS1 - the disconnect came from the network. The endpoint that had the disconnect notification capability disconnected without notifying the MCU.

Not - MCU The dial-out destination number(s) of the "CAS" extension has terminated to a number that is not a dial-in cascade MCU extension.

No - ring This dial-out drop reason occurs when the call has been up for 30 seconds and no ringing is detected.

Reorder This dial-out drop reason occurs when the MCU detects that there are no available trunks in the network to place the call. This drop reason is detected by MCU CPTR resources. See "Dial-out" for a description of CPTR usage.

|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Drop Reason<br><i>(cont'd)</i> | <p>Pre-AnsDrop The call disconnected before answer by an endpoint. The cause of the disconnect may be the network, an endpoint, or a terminal adapter. This drop reason is different from 'No-answer,' which indicates that a 60-second timeout occurred while alerting. In this case, the call drops before the 60-second timer has expired. Some busy endpoints connected through terminal adapters display this behavior.</p> <p>Resource MCU could not provide resources (VC or MMI) when the call arrived or lost the resources during the call. This could be due to them being Out of Service, busied out by craft, or being used by system maintenance. This drop reason could also occur if the DS1/MMI cable is disconnected. If there was a resource problem when the call arrived, it would get reorder (fast busy) and not get disconnected by the MCU.</p> <p>Password Either the user entered the wrong password or the audio add-on user did not enter it within the specified time period. Note that the audio add-on user gets one attempt to enter a correct password and inter-digit timing for each digit (that is, about 10 seconds between digits).</p> <p>System An MCU restart (level 2) disconnected all calls.</p> <p>UIN-Inv The user entered an invalid User Identification Number.</p> <p>Unknown The system could not determine the cause of the disconnect.</p> <p>Wrong-num This dial-out drop reason occurs when the MCU detects the wrong destination number was dialed. This drop reason is detected by MCU CPTR resources SDN cause value. See "Dial-out" for details.</p> <p>UCC controller intentionally disconnected the endpoint.</p> |
| AC Num                         | Administered Connection Number - from 1 to 128. AC number can be used to further diagnose a problem by combining status conference information with the <b>status administered connection</b> command and data stored in the error and alarm logs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Ports Trunk                    | The data endpoint that the channel is using.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Ports Video                    | The MMI port for the channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Ports Aud                      | If the endpoint type is not "UCC," the VC audio encoder port (which is always paired to a decoder port) for the channel (only the first channel). Because only one audio encoder port is allocated per endpoint, it appears together with the ESM data port in the endpoint's channel 1 port slot position of the Port Aud/ESM column. For "UCC" endpoint type, the channel 1 port slot position displays the allocated Call Classifier resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Field Descriptions (status conference endpoint)

status conference x endpoint y

The first screen appears when **status conference x endpoint y** is entered and the specified conference is found. Data relevant for each endpoint displays in 6 pages. If the endpoint-ID of **all** is used, all possible endpoints associated with the specified conference display.

Screen 8-3. Page 1 of 6: status conference x endpoint y

|                          |                                                                                                                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Endpoint                 | Endpoint-ID is a slot number associated with the endpoint entered on the conference forms.                                                                                                             |
| Product                  | Product identification number obtained from the endpoint.                                                                                                                                              |
| Manufacturer/<br>Country | Manufacturer identification number and manufacturer's country code obtained from the endpoint.                                                                                                         |
| Terminal Name            | This field is always blank.                                                                                                                                                                            |
| Sum Grp                  | Summer group number to which this endpoint belongs and the VC Audio Level (L1) and Level 2 (L2) summer ports for this group. These fields have an entry only for conferences with over 6 participants. |
| Dial Out #1              | Blank                                                                                                                                                                                                  |
| Dial Out #2              | Blank                                                                                                                                                                                                  |

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In Use  | <p>Is the endpoint currently participating in the conference or in process of connecting to the conference? - y, c, e, f, n, blank.</p> <p>y means that the endpoint is in use and is fully connected on all media in an active conference.</p> <p>c means that the endpoint is in use and is fully connected, however the endpoint has changed the conference audio or video capability or has changed the rate of the conference because of rate adaptation. This condition requires analysis of this endpoint's capabilities and mode fields to identify which capability was reduced.</p> <p>e means that the endpoint is in use but the endpoint had capability problems. The endpoint does not have one of the required capabilities (Vid, Bhl, MLP) to be a full participant. For MLP capabilities, see the "T120" field. This condition requires analysis of this endpoint's capabilities and mode field to identify the missing capability.</p> <p>f means that the endpoint is in use but is not connected to all media. This indicates that the endpoint has declared all the required capabilities (channel/video/ audio/data) but is not fully connected to all conference media at this time. This endpoint may be in the process of connecting, has failed to connect, or is not a valid video source. This condition requires analysis of this endpoint's capabilities and mode fields to identify the problem.</p> <p>n means that the endpoint was connected in a conference but has/was disconnected or attempted to connect to a conference but was unsuccessful.</p> <p>blank means the field is blank until the first call is made from/to the endpoint.</p> |
| Enh BAS | <p>EnhancedBasic Service Flag - n, y</p> <p>y means that the endpoint supports the enhanced BAS commands/caps;</p> <p>n means that the endpoint only supports the basic BAS commands/caps.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Chl     | <p>Data on the quantify and quality of channels (transfer rate)? - y, e, n, blank</p> <p>y the endpoint has the required number of channels.</p> <p>e means that the endpoint has not declared support for the correct number of channels and cannot participate fully in the conference.</p> <p>n means that the endpoint has declared the correct number of channels, but all the channels have not yet joined the conference, due to either a network or endpoint problem.</p> <p>blank Audio add-on endpoints always have the Chl field set to blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aud | <p>Does it have the required audio capability? - y, c, e, blank</p> <p>y the endpoint has the required audio capability. Audio add-on endpoint always have the Aud field set to y once the endpoint has joined the conference.</p> <p>c this endpoint is PCM only and it changed the video quality of the conference by changing the operating audio from G.728 to G.711. If the administered audio mode is auto and the administered bandwidth is 112 kbps (56 k/channel) or 128 kbps (64 k/channel), the system starts out with the highest common audio of G.728. When the administered bandwidth is greater than 128 kbps, the system starts out with the highest common bandwidth of 7 kHz.</p> <p>e A PCM-only endpoint that did not have the capability of supporting the administered audio mode of G.728 (such as a data conference), or G. 278/G.711 endpoint that did not have the capability of supporting the administered audio mode of 7 kHz. Such endpoints operate with PCM audio and interwork with the current operating audio mode.</p> <p>blank the field is blank until the first call is made from/to the endpoint.</p>                |
| Vid | <p>Does it have the required video capability and is receiving video? - y, c, e, n, blank</p> <p>y the endpoint has the required video capability and should be receiving video if the Chl, Aud, and Dat fields are y.</p> <p>c means it downgraded the conference's video quality - either from CIF to ACIF or by decreasing the frame rate. The conference video mode is set by default to CIF and if a QCIF-only endpoint joins the conference, then the entire conference is made to operate in QCIF, with the video clarity downgraded. Also, the conference frame rate is initially set to the highest frame rate that can then be reduced by any endpoint. If the conference video mode is not administered with upgrade capability, then if the video parameters for a conference have been "downgraded," they are not "upgraded" until all endpoints disconnect from the conference.</p> <p>e means that the endpoint has not declared any video capability in its cap-set.</p> <p>n means audio only, not receiving video, possibly due to an audio or data problem.</p> <p>blank Audio add-on endpoint always have the Vid field set to blank.</p> |
| MLp | <p>The state of the Control Link to the ESM (T.120 stack terminator), the endpoint MLP data capability, and the state of the data connection in the T.120 stack. This field value is always blank, indicating that the Data Mode for the conference is none, and therefore, the data does not apply, or the endpoint has never joined the conference.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Gx        | <p>Does it have the Still Frame Graphics capability? - y, e, blank</p> <p>y This endpoint has this capability.</p> <p>e This endpoint did not declare this capability. The conference retains the still frame graphics capability when a non-compliant endpoint joins the conference.</p> <p>blank This endpoint has never joined the conference.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Rate Adpt | <p>Rate adaptation/Interworking indicator - 5, 6, y, c, e, n, blank.</p> <p>Values of 5 and 6 apply only to Low Speed/High Speed Interworking. All other values apply only to Rate Adaptation.</p> <p>5 A 56-kbps (Low Speed) endpoint has joined a High Speed (128 kbps or above) conference. This endpoint is connected with audio only capability but is not a valid video source and destination.</p> <p>6 A 64-kbps (Low Speed) endpoint has joined a High Speed (128 kbps or above) conference. This endpoint is connected with audio only capability but is not a valid video source and destination.</p> <p>y This endpoint has joined the conference at the administered rate of 64 kbps, but because rate adaptation to 56 kbps was triggered by another endpoint, this endpoint has successfully rate adapted to 56 kbps.</p> <p>c The administered bandwidth of the conference is 64 kbps and this endpoint has joined the conference at 56 kbps. The first 56 kbps endpoint that joins 64 kbps rate adaptable conference triggers rate adaptation (see Join Time below).</p> <p>n A 64-kbps conference was triggered to rate adapt to 56 kbps by some other endpoint. This endpoint joined the conference at the bandwidth of 64 kbps, but encountered problems in rate adapting down to 56 kbps. This endpoint may have the audio and may be receiving video, but is not a valid video source.</p> <p>blank Rate adaptation was never triggered by any endpoint, and if this endpoint is in use and connected, then it has joined the conference at the administered bandwidth.</p> |
| Bond Mode | <p>BONDing Mode - blank. This field is blank for calls that are not related to bonding.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Ts

Indication of the talking state of the endpoint - t, m, M, S, blank.

t At the time the command was invoked, voice energy (talking) was detected from the endpoint.

m At the time the command was invoked, the endpoint indicated to the MCU that it was muted. It is possible that an endpoint may mute, but not send any indication to the MCU. In this situation the MCU does not display a mute indication.

M At the time the command was invoked, the endpoint's audio was muted via UDD/CRCS Agent interface. M displays when both the endpoint and the UCC/CRCS Agent have muted the endpoint audio.

S At the time the command was invoked, the endpoint's audio was muted because of solo-audio state set by UCC/CRCS Agent. While in solo-audio state, new endpoints joining the conference are automatically muted.

blank At the time the command was invoked voice energy (talking) was not being detected from the endpoint.

Vs

Indication of the MCU video state for this endpoint - a, b, B, c, i, r, R, s, S, u, U, v, blank.

For quad-screen conferences an \* is affixed before the value of Vs to indicate that an endpoint is currently part of the mixed image. A # may be affixed before the value of Vs to indicate that an endpoint was fixed to be in the mixed image (via administration or UCC/CRCS Agent), but instead, a Fill video is shown in its place. This occurs when the video of an endpoint that is fixed in a quadrant cannot be used as a video source because the endpoint is currently not joined to the conference, has suppressed its video, or has invalid video to be the video source. Notice that at most four endpoints have an \* or # affixed before the Vs field value.

For quad-screen conference in VAS mode, the mixed image is broadcast to all endpoints. For quad-screen conference in presentation mode, the mixed image is return video to the presenter.

a This value applies only to quad-screen conferences. \*a indicates that an endpoint is part of the current mixed image and is fixed in one of the quadrants via administration. A value of \*a indicates that the endpoint is fixed in a quadrant but is not currently connected (Fill image displays).

b For full-screen conference it indicates that at the time the command was invoked, this endpoint's video was being broadcast to other sites. This conference was in VAS, broadcast, or presentation mode. For quad-screen VAS conference it is prefixed with an asterisk (\*) and indicates that this endpoint's video is part of the mixed image because of VAS. For quad-screen presentation conferences, b (without an asterisk) identifies the presenter as the broadcaster.

B At the time the command was invoked the endpoint's video was being broadcast to other sites because of the UCC roll call feature. UCC roll call feature can only be performed in full-screen mode.

c At the time the command was invoked this endpoint's video was being broadcast to other sites. The conference was in chair mode and the broadcaster was designated by the chair. Chair features can only be performed in full-screen mode.

- Vs  
(cont'd.)
- i At the time the command was invoked the endpoint was not a valid video source. For continuous presence conference, if this endpoint is fixed in a particular quadrant, an asterisk (#) is affixed before i.
- r For full-screen conferences, at the time the command was invoked the endpoint's video was the return video to the broadcaster. For continuous presence conference in presentation mode, \*r represents a VAS quadrant that is part of the mixed image.
- R At the time the command was invoked, the endpoint's video was the return video to the broadcaster because of the UCC browse feature. UCC Browse feature can only be performed in full-screen mode.
- s At the time the command was invoked this endpoint's video was suppressed at the request of the endpoint. For continuous presence conference with fixed quadrant participants, if this endpoint is fixed in a particular quadrant a # is affixed before s.
- S At the time the command was invoked this endpoint's video was suppressed via UCC/CRCS Agent interface. For continuous presence conference with fixed quadrant participants, if this endpoint is fixed in a particular quadrant, # is affixed before S. S displays when both the endpoint and the UCC/CRCS Agent have suppressed the endpoint video.
- u For full-screen conferences, at the time the command was invoked this endpoint's video was being broadcast to other sites. The conference was in VAS mode and the broadcaster was designated by the UCC/CRCS Agent interface. For quad-screen conferences, it indicates that UCC/CRCS Agent designated this endpoint as fixed in a quadrant. An asterisk (\*) is affixed before u if the endpoint is currently part of the quad image, and # is affixed if the endpoint is not currently joined.
- U Applies only to quad-screen conference and indicates that UCC/CRCS Agent designated a quadrant as VAS. An asterisk (\*) is affixed before U to indicate that this endpoint is part of the current quad image.
- v At the time the command was invoked this endpoint's video was being broadcast to other sites. The conference was in VAS mode but the endpoint has asked to be a broadcaster via "See-Me" request and was granted a MCV (Multipoint Command Visualize) token. The See-Me feature is only performed in full-screen mode.
- b lank At the time of the request the endpoint's video was not broadcast, return, video, or part of the mixed-image, but it is a valid video source.

## Page 2 - Endpoint Channel Information

This section only describes the fields that are specific to the endpoint-level command output.

status conference endpointpage 2 of 6

enter command:

Screen 8-4. Page 2 of 6: status conference x endpoint y

- Join TimeTime (in 24-hour notation) when the channel joined the conference.
- Drop TimeTime (in 24-hour notation) when the channel disconnected. If the first channel has a drop time, then it means that the endpoint is not in use. If there is a drop time without a join time, it means that the call disconnected without being joined to the conference.

## Drop Reason

The reason for the channel's disconnect:

**2-pri** This drop reason occurs when an administration error causes a mismatch in primary-secondary designation for a cascade link. This mismatch shows that both MCUs are administered as primaries (see "Cascading" for a description of primary-secondary compatibility).

**2-sec** This drop reason occurs when an administration error causes a mismatch in primary-secondary designation for a cascade link. This mismatch shows that both MCUs are administered as secondaries (see "Cascading" for a description of primary-secondary compatibility).

**Agent** The reservation agent has caused the call to disconnect (for example, the agent has changed a connected dial-out destination number).

**Bandwidth mismatch** between a call and the conference it attempted to join. For example, a 56-kbps call attempted to join a 64-kbps conference that does not allow rate adaptation.

**BondHshake** BONDing handshake drop reason can be caused due to the following reasons: information channel parameter not supported or invalid, parameter negotiation terminated out of sequence, timer expired because of the secondary channels did not establish, or BONDing framing was not detected for one of the other channels.

**Busy** This dial-out drop reason occurs when the MCU detects that the conferee's terminal equipment is busy. This drop reason is detected by an ISDN cause value (for example h0). See "Dial-out" for a description of CPTR usage.

**Chair** disconnected the endpoint, using either Chair Command Disconnect (CCD) or Chair Command Kill (CCK) signals.

**Conf End** The conference was ended due to reaching stop time for a reserved conference or due to an active conference being converted to file.

## Drop Reason

(cont'd)

Endpoint Clearing received from DS1 - the disconnect came from the endpoint. The endpoint notified the MCU that it intended to disconnect.

Far -end Clearing received from DS1 - the disconnect came from either the network or the endpoint.

Handshake Either framing was never found (the endpoint could not complete initialization - problems finding Frame Alignment Signal (FAS), Multi Frame Alignment (MFA) and getting a corrected coded cap-set) or framing was lost for some time (over 40 seconds) and the endpoint was disconnected.

IDtimeout The MCU has not received response to the UIN/password Query from the H.320 user after three attempts. Each attempt has a system administered timeout period.

Internal MCU has a problem allocating trunk resources necessary to route the dial-out call for the specified dial-numbers. This problem can be associated with routing pattern or trunk associated translation (for example, TAC specified in the dial-out number or routing pattern points to a trunk group without members), or it can indicate a lack of trunk resources (for example, all trunk members are maintenance busy or all in-service members are busy on a call).

Network Clearing received from DS1 - the disconnect came from the network. The endpoint that had the disconnect notification capability disconnected without notifying the MCU.

Not -MCU The dial-out destination number(s) of the "CAS" extension has terminated to a number that is not a dial-in cascade MCU extension.

No - ring This dial-out drop reason occurs when the call has been up for 30 seconds and no ringing is detected.

Reorder This dial-out drop reason occurs when the MCU detects that there are no available trunks in the network to place the call. This drop reason is detected by MCU CPTR resources. See "Dial-out" for a description of CPTR usage.

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Drop Reason<br><i>(cont'd)</i> | <p>Pre-AnsDrop The call disconnected before answer by an endpoint. The cause of the disconnect may be the network, an endpoint, or a terminal adapter. This drop reason is different from 'No-answer,' which indicates that a 60-second timeout occurred while alerting. In this case, the call drops before the 60-second timer has expired. Some busy endpoints connected through terminal adapters display this behavior.</p> <p>Resource MCU could not provide resources (VC or MMI) when the call arrived or lost the resources during the call. This could be due to them being Out of Service, busied out by craft, or being used by system maintenance. This drop reason could also occur if the DS1/MMI cable is disconnected. If there was a resource problem when the call arrived, it would get reorder (fast busy) and not get disconnected by the MCU.</p> <p>Password Either the user entered the wrong password or the audio add-on user did not enter it within the specified time period. Note that the audio add-on user gets one attempt to enter a correct password and inter-digit timing for each digit (that is, about 10 seconds between digits).</p> <p>System An MCU restart (level 2) disconnected all calls.</p> <p>UIN-Inv The user entered an invalid User Identification Number.</p> <p>Unknown The system could not determine the cause of the disconnect.</p> <p>Wrong-num This dial-out drop reason occurs when the MCU detects the wrong destination number was dialed. This drop reason is detected by MCU CPTR resources SDN cause value. See "Dial-out" for details.</p> <p>UCC controller intentionally disconnected the endpoint.</p> |
| Drop Code                      | <p>A detail code complementing the Drop Reason (see above). Additional bonding related information may be obtained from supplementary BONDing Drop Codes described above.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AC Num                         | <p>Administered Connection Number - from 1 to 128. AC number can be used to further diagnose a problem by combining status conference information with the <b>status administered connection</b> command and data stored in the error and alarm logs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

- Ports Aud

If the endpoint type is not “UCC,” the VC audio encoder port (which is always paired to a decoder port) for the channel (only the first channel). Because only one audio encoder port is allocated per endpoint, it appears together with the ESM data port in the endpoint’s channel 1 port slot position of the Port Aud/ESM column. For “UCC” endpoint type, the channel 1 port slot position displays the allocated Call Classifier resource.
- Ports ESM

The Expansion Service Module MMI data port. This field is always blank.
- Ports BONDng

The MMI port used for BONDing for the channel.
- Fr Err

Frame error counter. A circular hex counter (0-FF) to indicate the occurrence of framing errors.

Page 3 - Conference Information

This section only describes the fields that are specific to the endpoint-level command output.

| Broadcaster      | Indicates the endpoint number that is the current broadcaster. The Broadcaster can be qualified with the following keywords: <ol style="list-style-type: none"><li>1. Broadcast - indicates a broadcast mode broadcaster.</li><li>2. Chair - indicates that the broadcaster was designated by the chair.</li><li>3. See-Me - indicates that the broadcaster is a result of MCV request from an endpoint.</li><li>4. Presenter - indicates a presentation mode broadcaster.</li><li>5. Rollcall - indicates that the broadcaster was designated by the UCC via the Rollcall feature.</li><li>6. UCC - indicates that the broadcaster was designated by the UCC.</li><li>7. VAS - indicates a Voice Activated Switching broadcaster.</li></ol>                   |
| Next Broadcaster | Indicates the endpoint number that is selected to be the next broadcaster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Return Vid       | Indicates the endpoint number that is the current return video. The return video can be qualified with the following keywords: <ol style="list-style-type: none"><li>1. blank - indicates that the return video is the previous broadcaster forced to be return video because of VAS, action by Chair, action by UCC, or endpoint MCV request. The broadcaster qualifier identifies which action forced this endpoint to become return video.</li><li>2. Autoscan - indicates auto scan return video. This is true only when conference mode is broadcast with auto scan.</li><li>3. Browse - indicates that the return video was designated by the UCC via the Browse feature.</li><li>4. VAS - indicates a Voice Activated Switching return video.</li></ol> |
| Next Return Vid  | Indicates the endpoint number that is selected to be the next return video.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Mode Commands/Communication Modes.** This is a collection of both incoming and outgoing bandwidth allocations for the multiplex. The Incoming data is the rate at which the MCU thinks the endpoint is communicating based on the Bit-rate Allocation Signal (BAS) codes received from the endpoint/codec and the capabilities the MCU has declared. The Outgoing data is the rate from the MCU toward the endpoint. The following are column definitions for this section of page 3.

|      |                                                                                                                             |
|------|-----------------------------------------------------------------------------------------------------------------------------|
| CONF | The desired conference operating mode. This may be different from the endpoint in (EPT-IN) or endpoint out (EPT-OUT) modes. |
| CMD  | labels for the various types of mode commands                                                                               |

- STAT

indicates if the conference and the incoming modes are compatible. A value of y indicates mode compatibility; a value of n indicates that the modes are not compatible.
- EPT-IN

defines the communication modes coming in from an endpoint.
- EPT-OUT

defines the communication modes sent out to an endpoint based on the number of channels connected and the capabilities of the endpoint.

The following are field definitions for the Mode Commands/Communication Modes section of Page 3.

XRATE

One of the supported rates in [Table 8-4](#):

**Table 8-4. Supported Transfer Rates s**

| XRATE | Bandwidth of the Call |
|-------|-----------------------|
| 2x64  | 2B (2x56 or 2x64)     |
| 128   | 112kbps or 128kbps    |
| 196   | 168kbps or 196kbps    |
| 256   | 224kbps or 256kbps    |
| 320   | 280kbps or 320kbps    |
| 384   | 336kbps or 384kbps    |
| 512   | 512kbps               |
| 768   | 768kbps               |
| 1472  | 1472kbps              |
| 1536  | 1536kbps'             |
| 1920  | 1920kbps              |

XRATE  
(cont'd.)

XRATE may be 64 when the endpoint is just dialing in, or in the event of problems. It implies that only one B channel is being used.

AUDIO

Audio rate (kbps bandwidth) of the conference and the endpoint must be the same but not necessarily their mode. When the audio rate of the conference and the endpoint are different the endpoint's audio will interwork but the endpoint's video will be invalid. MCU may or may not send video to such an endpoint.

Table 8-5 summarizes expected endpoint audio mode with different configurations of transfer rate, facility bandwidth, conference mode, and whether or not all endpoints support the highest common audio mode (HC audio) when the administered mode is auto. The highest common conference mode is dependent on the administered bandwidth. A '-' in the table indicates 'does not apply.'

Table 8-5. Audio Mode Configurations

| Admin Mode<br>(HC Audio) | All<br>Support<br>HC Audio | Xfer<br>Rate | Facility<br>BW | Conf Mode   | Expected Endpoint Mode             |
|--------------------------|----------------------------|--------------|----------------|-------------|------------------------------------|
| auto (G.728)             | yes                        | <=128k       | -              | G.728       | G.728                              |
| auto (G.728)             | no                         | <=128k       | 64k            | G.711-A-56k | G.711-A-56k B.711-Mu-56k           |
| auto (G.728)             | no                         | <=128k       | 56k            | G.711-A-48k | G.711-A-48k G.711-MU-48k           |
| auto (G.722)             | -                          | >128k        | 64k            | G.722-56k   | G.722-56k G.711-A-56k G.711-Mu-56k |
| auto (G.722)             | -                          | >128k        | 56k            | G.722-48k   | G.722-48k G.711-A-48k G.711-Mu-48k |
| G.728                    | -                          | -            |                | G.728       | G.728                              |
| G.711                    | -                          | -            | 64k            | G.711-A-56k | G.711-A-56k G.711-Mu-56k           |
| G.711                    | -                          | -            | 56k            | G.711-A-48k | G.711-A-48k G.711-Mu-48k           |
| G.722                    | -                          | -            | 64k            | G.722-56k   | G.722-56k G.711-A-56k G.711-mu-56k |
| G.722                    | -                          | -            | 56k            | G.722-48k   | G.722-48k G.711-A-48k G.711-Mu-48k |

AUDIO  
(cont'd.)

Other possible AUDIO mode values include neutral (neutralized I-channel) and Au-off, Frm (no audio signal) which never match conference mode and are not supported by MCU.

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 56/64 | <p>The 65/64 field is derestrict when operating at per-channel speeds of 64kbps, 128kbps, 192kbps, 256kbps, 320kbps, 384kbps, 512kbps, 768 kbps, 1472kbps, 1536kbps, or 1920kbps; it is restrict when operating at 56kbps, 112kbps, 168kbps, 224kbps, 280kbps, 336kbps, 448kbps, and 672kbps.</p> <p>Note that if the conference is configured for Nx56kbs operation, the endpoint may signal either via capabilities or modes that is operating at the proper rate. In such a case, even when we receive derestrict command which does not match the conference communication mode of restrict, if the capability indicates restrict (MISC capability has restrict displayed on Page 4) the STAT 56/64 is set to y to indicate 56/64 compatibility between the conference and the endpoint.</p> |
| VIDEO | <p>The Video mode: H.261 (recommended), H.CTX (proprietary), H.CTX+ (proprietary), or SG4 (proprietary) indicate that video is on in the direction indicated; video-off when the video is off.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MLP   | <p>Multi Layer Protocol data mode. When Data Mode is administered as any-mlp or ww-pcs, the MLP mode should be var-MLP. Other values will affect video status.</p> <p>The MLP mode should be MLP-off when Data Mode is administered as none. Again, other values in this mode will affect video status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| H_MLP | <p>The High Speed MLP mode. The HMLP mode should be H-MLP-off. Other values in this mode will affect video status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LSD   | <p>Low Speed Data mode. The LSD mode should be LSD-off. Other values in this mode will affect video status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| HSD   | <p>High Speed Data mode. The HSD mode should be HSD-off. Other values in this mode will affect video status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CRYPT | <p>Encryption mode. The CRYPT mode should be encrypt-off. Other values in this mode will affect video status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| S/M   | <p>Single/Multi channel interoperability mode. 6B-H0-comp indicates that the sender is interoperating multiple channels and a single channel (for example, 6B and H0). Not-comp-6B-H0 indicates that the sender is not interoperating between 6B and H0. Normally this value is Not-comp-6B-H0. Other values in this mode will affect video status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Endpoint Miscellaneous (EPT MISC) Information.** EPT MISC contains miscellaneous states and counters for an endpoint. The flags can be a value of y or n. The counters start with initial value of 0x00, they increment to 0xff, and then

wrap around to 0x01. AIM and VIS are BAS commands which can be sent as input (I) to MCU from an endpoint or as output (O) from MCU to an endpoint.

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AIM  | Audio Indicate Muted. Value of y on input (I) indicates that this endpoint has muted its audio. MCU will not VAS to an endpoint displaying mute indicate. Value of n on input indicates that this endpoint has not muted (only if endpoint audio mode is turned on). Value of y on output (O) indicates that all other endpoints in the conference have muted their audio (have sent AIM to MCU). MCU in turn tells this endpoint (by sending it AIM) that there is no audio output from MCU. A value of n on output indicates that there is an audio path open across the bridge. |
| VIS  | Video Indicate Suppressed. Value of y on input (I) indicates that this endpoint has suppressed its video (indicated video is muted). Value of y on output (O) indicates that the MCU is not sending video to this endpoint because there is no video broadcaster (broadcaster has not joined or broadcaster's video is not valid).                                                                                                                                                                                                                                                 |
| MIS  | Multipoint Indicate Secondary-status. This command is only sent as output (O) to an endpoint. A value of n indicates that the endpoint is viewed as capable of being a valid source (although not necessarily at this moment). A value of n is the correct state to be in for video. A value of y indicates that MIS was sent to an endpoint and that this endpoint is viewed as a secondary endpoint. The endpoint is included in the audio portion of the conference but not the video portion. Video will not be sent.                                                          |
| MCV  | Multipoint Command Visualize. This command is only sent as input (I) from an endpoint. A value of y indicates that an endpoint has requested to become a broadcaster. This is used during Still Frame Graphics and to force "presentation" mode.                                                                                                                                                                                                                                                                                                                                   |
| TALK | A value of y indicates that the VC board is detecting voice energy from the endpoint. The TALK counter indicates the number of times a start/stop was detected.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VRCV | Value of y indicates if the endpoint is receiving video (MCU is sending video to the endpoint). The VRCV counter indicates the number of times video was sent/not sent to this endpoint.                                                                                                                                                                                                                                                                                                                                                                                           |
| BCTK | Applies to single screen and quad-screen presentation mode conferences. A value of y indicates that the endpoint is the video broadcast source. The BCTK counter indicates the number of times this endpoint was the video broadcast source.                                                                                                                                                                                                                                                                                                                                       |
| RTTK | Applies only to single screen conferences. A value of y indicates that the endpoint is the return video source. The RTTK counter indicates the number of times this endpoint was the return video source.                                                                                                                                                                                                                                                                                                                                                                          |
| BCLS | Applies to single screen and quad-screen presentation mode conferences. A value of y indicates that the endpoint is watching the video of the broadcast source.                                                                                                                                                                                                                                                                                                                                                                                                                    |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RTLS   | Applies only to single screen conferences. A value of y indicates that the endpoint is watching the video of the return source.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| HYPR   | A value of y indicates hyperactivity from an endpoint (MCU isolated endpoint from the MMCH conference due to “thrashing” behavior) and affects endpoint’s status as a video source (for 5 seconds of hyperactivity timer). The HYPR counter indicates the number of times this endpoint was hyperactive.                                                                                                                                                                                                                                                          |
| DMUTE  | A value of y indicates that the decoder was muted by the VC board or the software in the MCU. VC board mutes the decoder when it loses MMI or endpoint framing is lost, when it receives an invalid audio code word, and when endpoint is hyperactive. The only time that the MCU software mutes the decoder of an endpoint is to mute all endpoints, other than the broadcaster, when a mode of a conference is “broadcastw/scan” (broadcast with auto scan). The DMUTE counter indicates the number of times this endpoint’s decoder was muted by the VC board. |
| VFMT   | The video format applicable only to quad-screen conferences. This field always has a value of n, indicating QCIF format.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| H. 261 | A value of y indicates video framing loss. The H.261 counter indicates the number of times the framing was lost.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Frame Alignment Word (FAW) Information.** The FAW section of page 3 provides the channel Frame Alignment Word information for the communication paths labeled CHL 1 and 2. For 2B calls, both CHL 1 and 2 are used. For 1-channel calls (112, bps, 128kbps, 168kbps, 196kbps, 224kbps, 256kbps, 280kbps, 320kbps, 336kbps, 384kbps, 768kbps, 1472kbps, 1536kbps, and 1920kbps) only CHL 1 is used. A-OUT, A-IN, M-FRM, MFA, and MFN are flags with values of y or n.

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A-OUT  | MCU has endpoint framing.                                                                                                                                                                                                                                                                                                                                                                                                            |
| A-IN   | Endpoint has MCU framing                                                                                                                                                                                                                                                                                                                                                                                                             |
| M-FRM  | Multichannel frame alignment is present (alignment of both channels in 2B).                                                                                                                                                                                                                                                                                                                                                          |
| MFA    | Multiframe alignment word is present (required in 2B call).                                                                                                                                                                                                                                                                                                                                                                          |
| MFN    | Multiframe numbering is present (required in 2B call).                                                                                                                                                                                                                                                                                                                                                                               |
| FAS    | Frame Alignment Signal (FAS) channel number (1 or 2). This number should match the column header.                                                                                                                                                                                                                                                                                                                                    |
| MCUFAL | MCU Frame Alignment Loss (MCUFAL). A counter of the number of times the MCU indicates to the endpoint that it has lost endpoint FAW or multichannel synchronization (M-FRM). The MCU a-bit toggles when the MCU gains or loses endpoint multichannel synchronization. This counter starts with an initial value of 0x00, increments to 0xff, then wraps around to 0x01. The MCUFAL count is also shown in the Fr Err field on Page 2 |

FEFAL

Far End Frame Alignment Loss (FEFAL). A counter of the number of changes the MCU detects in the endpoint's a-bit (A-OUT). The endpoint a-bit toggles when an endpoint gains or loses MCU framing. This counter starts with an initial value of 0x00, increments to 0xff, then wraps around to 0x01.

Page 4 - Endpoint Capability Information

This section only describes the fields that are specific to the endpoint-level command output.

**Endpoint Capability Information.** Fields on this page will only be displayed if an endpoint declares the specific capability. For example, if an endpoint does not declare the VID H.CTX capability, the H.CTX field will not be displayed.

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VID  | <p>Provides information about the type of video and frame rate the endpoint supports.</p> <p>vfmt - does not display if the endpoint has no video capability. All values are blank if there is an active call or this is an audio-only endpoint. Otherwise, values for this field include:</p> <ul style="list-style-type: none"> <li>■ FCIF for full CIF</li> <li>■ QCIF for quarter CIF. Support of CIF implies support of QCIF. In general, for larger screens, CIF displays sharper resolution video, which ZCIF is blocked, but may run at higher frame rates and less clear. The differences are less observable on very small displays.</li> <li>■ cfps and qfps are the maximum frame rate (frames/second) at which the endpoint can receive video for CIF and QCIF operating modes. CIF frame rate values are 30fps, 15fps, 10fps, and 7.4fps. If the endpoint does not support CIF (that is, the vfmt field is QCIF), the cfps value should be blank.</li> <li>■ da_sfg indicates support for H.261 Still Frame Graphics transfers.</li> <li>■ H.CTX, H.CTX+ and SG4 are proprietary video format capabilities.</li> <li>■ SG4_sfg indicates support for SG4 Still Frame Graphics</li> </ul>                                 |
| MISC | <p>The restrict field is 1 way for an endpoint to indicate that it is operating at 56 kbps per channel, the other way is the 56/64 command mode with a value of restrict. An endpoint on a 56 kbps conference must send one or both of the 2 indications that they are operating at 56 kbps before they become a video source in a 56 kbps conference. If they signal either way that they are operating at 56 kbps in a 64 kbps or 384 kbps conference, they are an audio-only source, but the MCU continues to send Selected Communication Mode (SCM) toward them when possible.</p> <p>A MISC capability of derestrict and a 56/64 command of derestrict together indicate that an endpoint is operating at 64 kbps. If either is restrict, the conference operates at 56 kbps. Other field values include:</p> <ul style="list-style-type: none"> <li>■ dcomp indicates support for WorldWorx PCS data compliance.</li> <li>■ mbe indicates support for Multi Byte Extension. MBE capability is used for the exchange of passwords, terminal names, and other special capabilities, such as, support of WorldWorx PCS specific features.</li> <li>■ cic (Chair Indicate Capability) indicates chair control capability.</li> </ul> |

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XR   | <p>Transfer rate capabilities are statement about the speeds at which the endpoint can operate over the current connection and operate a Px64 Multiplex.</p> <p>For a 384 kbps (H0) call, the endpoint sends its capabilities to indicate 384 kbps support, which displays as 384. On a 336 kbps call, the endpoint must signal 384 kbps support. If an endpoint does not indicate support for 384 kbps on a 384/336 kbps conference, the MCU provides Audio Only Communications Mode (ACOM). For a 2B conference, the MCU sets the rate to 2x64, expecting the endpoints to do likewise (64x2 is displayed; if this is not displayed, there is no 64x2 capability). Endpoints may occasionally take 2x64 (or the current channel rate: 384, 768, 1472, 1536) out of their capability. This is Mode 0 forcing and is part of normal procedures. The MCU will provide AOCM if the endpoint does not signal support matching the configuration of the conference.</p> |
| AUD  | <p>The audio fields are statements of the audio protocols that the endpoint supports. 711m and 711a are PCM (G.711) and support Mu and A-law, respectively, and at least one is required of endpoints. The g728 field indicates whether G.728 is supported (LB_CELP). This value depends upon the type of the endpoint and how that endpoint is currently configured. The g722_48 field indicates endpoint support for G.722 (7 kHz) at both 48 kbps and 56 kbps. Therefore, g722_48 indicates that the endpoint supports G.722 audio at both rates. The g722_64 field indicates endpoint support for G.722 at 64 kbps in an unframed (not supported by the MCU) mode.</p>                                                                                                                                                                                                                                                                                          |
| LSD  | <p>The LSD fields indicate the capabilities for Low Speed Data conferencing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| HSD  | <p>The HSD fields indicate the capabilities for High speed Data conferencing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Page 5 - Endpoint Call Status Information**

This page summarizes such call-related status as per-channel join counts, join/drop time, drop reason, drop code, and auxiliary bonding drop code. In addition, it contains a drop code and software fields from the previous call. The data on the page is always retained. The Endpoint Call Status Information section groups together all call-related fields. The only new field in this section is Join Count; all other fields are described in [Screen 8-3](#) and [Screen 8-4](#).

Join Count

This field displays a count of the number of times this endpoint joined this conference during this conference session. This counter starts with an initial value of 0, can increment to 64, and wraps around back to 1.

Page 6 - Administered Connections

This page summarizes information on the administered connections associated with this endpoint. This data can only be viewed while the conference is active.

Screen 8-8. Page 6 of 6: status conference x endpoint y

Dial-out number

The actual numbers that are dialed out by the administered connections for each channel in the call. Note that the dial Out #1 and #2 on page 1 of the forms display the DCP endpoint number. This is particularly useful with bonding dial-out calls.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection State | <p>Indicates the current call state of the AC. The following are connection states associated with dial-out ACs:</p> <ul style="list-style-type: none"><li>■ <code>enabled</code> - is transient in nature and indicates that an AC is about to enter the attempting to connect state.</li><li>■ <code>disabled</code> - this may mean one of three things:<ul style="list-style-type: none"><li>— The AC has reached an administered retry threshold, and all retries are stopped. Verify this by checking the Error Log and checking whether an error type of 9 is logged against the AC.</li><li>— The AC was in a connected state and the far end disconnected.</li><li>— The initial channel call has not yet connected. No dial out call attempt is made for the additional channel(s) until the initial channel has reached a connected state.</li></ul></li><li>■ <code>not scheduled</code> - is transient in nature and indicates that an AC is about to enter the “attempting to connect” state.</li><li>■ <code>waiting to retry</code> - means that the AC is inactive (sleeping) and waiting for the retry timer to expire. Once the timer expires, the AC sends a dial out call and enters the “attempting to connect” state. ACs in this state indicate that the dial out call has failed at least once.</li><li>■ <code>attempting to connect</code> - means that the AC is active on a call, but the call has not yet connected.</li><li>■ <code>connected</code> - means that the call associated with the AC has been answered and join cut-thru to the conference.</li></ul> |
| Retry Count      | <p>This field indicates how many retries have been attempted for this AC during this join attempt. This field does not clear when the AC connects. However, it clears when a new join attempt is made via a Redial feature. Note that this is different from the Join Count which counts the number of times the channel joined the conference during this conference session.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Failure Cause    | <p>This field shows an ISDN or CPTR cause value (values lower than 0x7f) recorded when the last dial out call was dropped. Values above 0x7f are generated internally. <a href="#">Table 8-6</a> lists all possible failure cause values displayed by this field and its associated description. The Failure Cause value is logged in the Error Log and can be displayed via the display errors command. (Err Type is normally displayed as a decimal.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 8-6. Status AC - Failure Cause Values

| Failure Cause<br>(hexadecimal) | Description                         |
|--------------------------------|-------------------------------------|
| 0x00 (0t0)                     | N/A                                 |
| 0x01 (0t1)                     | Incorrect destination address       |
| 0x02 (0t2)                     | Reason unknown                      |
| 0x06 (0t6)                     | Reason unknown                      |
| 0x10 (0t16)                    | Normal call clearing                |
| 0x11 (0t17)                    | Endpoint not available              |
| 0x12 (0t18)                    | ISDN timer expired                  |
| 0x15 (0t21)                    | Reason unknown                      |
| 0x12 (0t22)                    | Destination address changed         |
| 0x1C (0t28)                    | Bad destination or access denied    |
| 0x1D (0t29)                    | Access denied                       |
| 0x1F (0t31)                    | Reason unknown                      |
| 0x22 (0t34)                    | Trunks unavailable                  |
| 0x26 (0t38)                    | Temporary or facility failure       |
| 0x29 (0t41)                    | Temporary or facility failure       |
| 0x2A (0t42)                    | Resources unavailable               |
| 0x2C (0t44)                    | Resources unavailable               |
| 0x32 (0t50)                    | Access denied                       |
| 0x34 (0t52)                    | Access denied                       |
| 0x36 (0t54)                    | Access denied                       |
| 0x3A (0t58)                    | Resources unavailable               |
| 0x41 (0t65)                    | Required capability not implemented |
| 0x42 (0t66)                    | Required capability not implemented |
| 0x45 (0t69)                    | Required capability not implemented |
| 0x51 (0t81)                    | ISDN protocol error                 |
| 0x52 (0t82)                    | Required capability not implemented |
| 0x58 (0t88)                    | Incorrect destination number        |
| 0x60 (0t96)                    | ISDN protocol error                 |
| 0x61 (0t97)                    | ISDN protocol error                 |
| 0x62 (0t98)                    | ISDN protocol error                 |

**Table 8-6. Status AC - Failure Cause Values — Continued**

| Failure Cause<br>(hexadecimal) | Description                          |
|--------------------------------|--------------------------------------|
| 0x64 (0t100)                   | ISDN protocol error                  |
| 0x66 (0t102)                   | ISDN timer expired                   |
| 0x7f (0t127)                   | Reason unknown                       |
| 0xC2 (0t194)                   | Ring no answer                       |
| 0xC8 (0t200)                   | Hi and dry - no feedback detected    |
| 0xC9 (0t201)                   | Cascade link administered wrong      |
| 0xCA (0t202)                   | CPTR not available to detect failure |

## status data-module

This command displays the status of a data-module.

### Synopsis

status data-module extension *print*

### Permissions

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

### Examples

status data-module 30000  
status data-module 32770  
status data-module 32770 print

### Description

The status data-module command displays internal software state information for diagnosis. This command can help locate facilities to which the data module is communicating.

## Defaults

No defaults.

## Parameters

- extension      The extension of the data module to be displayed. The number of digits in an extension is determined by a dial-plan.
- print          This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "status data-module", the following message will be displayed:

```
Enter assigned extension, ['print']
```

## Error Messages

If the format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the extension is not a data module, the following message will be displayed:

```
Extension exists but assigned to a different object
```

If software fails to complete the command, one of the following messages will be displayed:

```
No tests for this MO
EPN is not available
Board not assigned
Port not assigned
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data Ext/Sta Ext for Stn DM | The data module extension number. The DTDM is an exception: the connected station extension is shown.                                                                                                                                                                                                                                                                                                                                         |
| Port/Channel Number         | The port location of the data module (cabinet-carrier-slot-circuit). If the data module specified is a data channel, the channel number will be shown instead.                                                                                                                                                                                                                                                                                |
| Service State               | This entry displays the status of the data module; valid states are: <ul style="list-style-type: none"><li>— In-service/idle</li><li>— The data module is present but not in use.</li><li>— In-service/active</li><li>— The data module is present and is in use.</li><li>— Out-of-service</li><li>— The data module has been removed from service</li><li>— Disconnected</li><li>— The data module no longer appears to be present</li></ul> |
| CF Destination Ext          | This entry displays the call forwarding destination, if any, of the station.                                                                                                                                                                                                                                                                                                                                                                  |
| Maintenance Busy?           | Whether maintenance is testing the object, "yes" or "no".                                                                                                                                                                                                                                                                                                                                                                                     |
| Connected Ports             | Port locations to which the data module is connected (cabinet-carrier-slot-circuit).                                                                                                                                                                                                                                                                                                                                                          |

For the following output example, the command that was entered is "status data-module 301".

```
status data-module 301

DATA-MODULE STATUS

Data Ext/Stn Ext for Stn DM: 301      Service State: out-of-service
Port/Channel Number: 01C1103      Maintenance Busy? no

```

## Feature Interactions

None.

# status hardware-group

This command displays the status of the hardware group maintenance test.

## Synopsis

status hardware-group *print*

## Permissions

The following default logins may execute this command: bcms, browse, system technician, inads, cust, init, rcust.

## Examples

status hardware-group  
status hardware-group print

## Description

Summary information on the active or last hardware group tests will be displayed. This display includes the number and percentage of maintenance objects tested, the percentage of tests passed, failed, and aborted, the time elapsed since initiating the hardware group test, the specific hardware group test command (see ["test hardware-group"](#) command) initiated, and the state (active/canceled/complete) of the hardware-group test.

## Defaults

No defaults.

## Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "status hardware-group", the following message will be displayed:

[ 'print' ]

Output

|                                   |                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware Group Command State:     | The state of a hardware-group command: "active" - if testing is in progress, "canceled" - if testing has been canceled, "complete" - if the command has completed and there is no testing going on.                                                                                                                                        |
| Number of MOs Tested:             | The number of MOs in the specified group (refer to test hardware-group command) that have had been tested by the current hardware-group command. This includes all MOs that were either actually tested or were aborted due to resource contention.                                                                                        |
| Total Number of MOs to be Tested: | The total number of MOs in the group that was specified in the "test hardware-group" command.                                                                                                                                                                                                                                              |
| Percent Complete:                 | A ratio of the number of MOs completed and the total number of MOs to test in the command.                                                                                                                                                                                                                                                 |
| Elapsed Test Time:                | The duration of the hardware-group test. If a test was canceled and then restarted this time excludes the cancel period. If the hardware-group command has finished it will indicate the length of time it took to complete the command. The time is displayed in the HH:MM:SS format where HH is hours, MM is minutes, and SS is seconds. |
| Repetition Number                 | The number of iterations that have been completed corresponding to the 'repeat' or the 'continuously' option.                                                                                                                                                                                                                              |
| Percentage of Tests Passed:       | The percentage of tests that passed.                                                                                                                                                                                                                                                                                                       |
| Percentage of Tests Failed:       | The percentage of tests that failed.                                                                                                                                                                                                                                                                                                       |
| Percentage of Tests Aborted:      | The percentage of tests that were aborted.                                                                                                                                                                                                                                                                                                 |
| Command:                          | The hardware-group action object and qualifiers that were entered.                                                                                                                                                                                                                                                                         |
| Test sequence:                    | This will display either short or long.                                                                                                                                                                                                                                                                                                    |
| Test repetition:                  | This will display either continuously or the keyword repeat along with the repeat value entered.                                                                                                                                                                                                                                           |
| Output options:                   | This will display the selections that were chosen on the input form: auto-page, background, or failures.                                                                                                                                                                                                                                   |
| Hardware options:                 | This will display the selections that were chosen on the input form: all-ports, or SPE-interchange.                                                                                                                                                                                                                                        |

For the following output example, the command "status hardware-group" was entered.

```
status hardware-group                                page 1 of 1

                HARDWARE GROUP STATUS

Hardware Group Command State:    active
Number of MOs Tested:           11070
Total Number of MOs to be Tested: 12300
Percent Complete:                90%
Elapsed Test Time (hr:min:sec): 0:15:30
Repetition Number:               1
Percentage of Tests Passed:       82%
Percentage of Tests Failed:       11%
Percentage of Tests Aborted:      7%

                ENTERED HARDWARE GROUP COMMAND

Command: test hardware-group system
Test sequence: short
Test repetition: repeat 3
Output Options: failures
Hardware Options: SPE-interchange
```

**Feature Interactions**

---

None.

**status health**

---

This command displays the status of the overall health of the system.

**Synopsis**

---

status health *print*

**Permissions**

---

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

**Examples**

---

status health  
status health print

## Description

---

The status health command displays the current system alarm summary, maintenance busy summary, user summary, critical system status, and cabinet status. This is the same page that is displayed when "monitor health" is entered, except with the "status health" command the output page is not updated periodically.

## Defaults

None.

## Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "status health", the following object command word choices will be displayed:

[ 'print' ]

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

---

|         |                                                                                                                                                                                                   |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Major   | The number of logged major alarms is displayed as a number ranging from 0 to 200. Up to 200 major alarms can be reported in the alarm log; therefore, this is the maximum which can be displayed. |
| Minor   | The number of logged minor alarms is displayed as a number ranging from 0 to 200. Up to 200 minor alarms can be reported in the alarm log; therefore, this is the maximum which can be displayed. |
| Warning | The number of warnings logged in the alarm file is displayed as a value between 0 and 200, which is the maximum number of warnings permitted.                                                     |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trunks      | The number of maintenance busied out trunks is shown.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Stations    | The number of maintenance busied out stations is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Others      | The combined number of maintenance busied out objects excluding trunks and stations is displayed.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Static      | Static indicates the proportion of the CPU which is currently dedicated to high priority items (for example, the operating system). This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (for example, an occupancy of 89.6% would be displayed as 90%).                                                                                                                                                                  |
| SM          | SM indicates the proportion of the CPU which is currently dedicated to system management or periodic and scheduled maintenance. Therefore, if there is a large amount of periodic or scheduled maintenance testing being performed, this occupancy percentage can be high without affecting service. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (for example, an occupancy of 89.6% would be displayed as 90%). |
| CP          | CP indicates the proportion of the CPU which is currently dedicated to call processing. This occupancy has priority over SM and IDLE occupancy categories and if needed, will take processor time away from these occupancy categories. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (for example, an occupancy of 89.6% would be displayed as 90%).                                                              |
| Idle        | Idle indicates the proportion of the CPU which is currently available for use. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (for example, an occupancy of 89.6% would be displayed as 90%).                                                                                                                                                                                                                       |
| Active SPE  | A or B is displayed to indicate the currently active processor complex. When the active processor complex is locked on-line via lock switching on DUPINT, the "lock" option will be displayed; otherwise, "auto" will be shown.                                                                                                                                                                                                                                                                                 |
| Duplicated? | The duplication status of the SPE component is indicated. "y" indicates duplication and "n" indicates no duplication.                                                                                                                                                                                                                                                                                                                                                                                           |
| SPE Power   | The current source of power for the processor complex is indicated. The normal state is "commercial". When commercial power is not available, battery backup is in use and will be indicated by "backup".                                                                                                                                                                                                                                                                                                       |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time Source | The current timing source is displayed. The display values for this field vary according to the timing source selected. If the site has administered the optional Stratum-3 hardware, "external" will be displayed under normal operating conditions and "internal" will be displayed when an internal source, such as a tone clock, is used. Primary and secondary timing sources must be administered when using the Stratum-4 option. "primary" is displayed when the primary administered source is in use, and "secondary" is displayed when the administered secondary source is in use. When neither the primary or secondary sources are in use, "local" will be displayed.                                                                                                                                                                                                                                                                                                                                                                 |
| # Logins    | The number of current users is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Cab         | The assigned cabinet number, ranging from 1 to the highest cabinet number in the system, is displayed on the screen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Emerg Trans | The current setting of the emergency transfer switch on the maintenance board is indicated for each cabinet. Five options are available: auto-on ("auto+" or "a+"), auto-off ("auto-" or "a-"), "on", "off", and "n.a.". Normally, the "auto+" or "auto-" option is enabled. In this state, emergency transfer will be activated automatically upon cabinet failure (The "+" indicates that emergency transfer is currently activated, while the "-" indicates that emergency transfer is currently not activated). When "on" is displayed, emergency transfer is automatically activated. The "off" option shows that the cabinet is prevented from activating emergency transfer. In a system equipped with duplicated SPEs, the switch settings for both processors of the PPN (cabinet 1) will be displayed. In this case, "auto+" will be abbreviated "a+", "auto-" will be abbreviated "a-", and "off" will be abbreviated as "of". "on" will not be changed. If "n.a." is displayed, the emergency transfer switch setting is not available. |
| Mj          | The individual number of major alarms associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Mn          | The individual number of minor alarms associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Wn          | The individual number of associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| PNC         | Current Port Network Connectivity (PNC) status for each of the port networks within a cabinet is displayed. When multiple port networks exist within a cabinet, Carriers A, B, and C are listed first and separated from Carriers D and E by a slash (for example, up/up). PNC status of a port network is determined on the basis of availability of the Expansion Archangel Link (EAL). An "up" denotes that the EAL is available. When the EAL is not available, then a "dn" (down) is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Time of Day | The current time of day acquired from the system is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

For the following output example, the command "status health" was entered.

```
status health

```

Feature Interactions

In a High or Critical Reliability System, if the standby SPE Emergency Transfer Select Switch is changed and handshake is down, the displayed Emerg Trans field will be incorrect until handshake comes up again.

status interface

This command displays the current value of a number of counters maintained by the processor interface (PI). The information displayed by this command is only useful to development environment.

Synopsis

status interface location *print*

Permissions

The following default logins may execute this command: system technician, inads, cust, init, browse, bcms, rcust.

Examples

- status interface a1
- status interface 01a2
- status interface 01b1
- status interface b2
- status interface b2 print

## Description

The status interface command displays the current value of a number of counters maintained by the PI, which is a front end processor implementing the packet layer and link layer of the BX.25 protocol and the integrated services digital network (ISDN) procedure-D protocol.

## Defaults

The cabinet number defaults to one (1) if it is not specified.

## Parameters

- location    The location (cabinet-carrier-position) of the processor interface (PI board). A position of 1 is the first processor interface in the carrier, while a position of 2 is the second processor interface in the carrier.
- print        This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses `HELP` after entering "status interface", the following message will be displayed:

```
Enter location: [cabinet(1)], carrier (A-B),  
              position(1-2); ['print']
```

## Error Messages

If the specified carrier is not the active PE, the following message will be displayed:

```
Port invalid
```

If the technician-entered cabinet and carrier is invalid for a PPN, the following message will be displayed:

```
Entry is bad
```

If the technician-entered carrier is not a valid carrier, the following message will be displayed:

```
Invalid carrier specified
```

If the technician-entered carrier is not active, the following error message will be entered:

```
Board invalid
```

If the specified carrier/position processor interface circuit pack is not inserted, but the specified carrier is active, the following error message will be displayed:

Processor Interface (TN765) not  
started or is being started

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

Base Level Occupancy (Low)

Base Level Occupancy (High)

Primary Queue Audit Error

Secondary Queue Audit Error

Translation Audit Error

Protocol Timer Audit Error

Hardware Sanity Timeout

Hardware Resource Error

Hardware Overload Error

The following is an example of the fields contained on the output form.

```
status interface a1

PROCESSOR INTERFACE STATUS

Base Level Occupancy(low): 10
Base Level Occupancy(high): 25
Primary Queue Audit Error: 4
Secondary Queue Audit Error: 10
Translation Audit Error: 12
Protocol Timer Audit Error: 0
Hardware Sanity Timeout: 1
Hardware Resource Error: 12
Hardware Overload Error: 8
```

## Feature Interactions

---

None.

## status isdn-testcall

---

This command displays the operational status (progress) of an outgoing ISDN-PRI test call.

## Synopsis

---

status isdn-testcall group number/*member number print*

## Permissions

---

The following default logins may execute this command: system technician, inads, init

## Examples

---

**status isdn-testcall 80/1**  
**status isdn-testcall 78/1 print**

## Description

---

The status isdn-testcall command displays the progress of an outgoing ISDN-PRI test call. The tested ISDN-PRI B-channel port number, bit error rate, number of bits transmitted, block error rate, number of blocks transmitted, start time, duration specified, duration of test call and reason of termination are displayed on the status form.

## Defaults

None.

## Parameters

- |               |                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------|
| group number  | The group number is an administered number associated with each trunk group.                     |
| member number | The member number is an administered number identifying a particular trunk within a trunk group. |
| print         | This will cause the report to be printed if a printer is linked to the SAT.                      |

## Help Messages

If the system technician presses HELP after entering "status isdn-testcall", the following is displayed:

```
Enter group #/member # ['print']
```

## Error Messages

If the specified format of the trunk location is incorrect, the following message is displayed:

```
Format invalid
```

If the specified trunk group or member range is invalid, the following message is displayed:

```
Trunk or trunk group invalid
```

If a trunk group and member is not specified, the following message is displayed:

```
Must specify group/member pair
```

If the specified trunk group is not administered or has no members administered, the following message is displayed:

```
Group not assigned,  
or group assigned but with no member
```

If the specified trunk group member is not administered, the following message is displayed:

```
Group member not assigned
```

If a test call is currently not in progress when the command is entered, the following message is displayed:

```
Test Call not in progress
```

If the specified trunk is not an ISDN-PRI trunk, the following message is displayed:

```
Invalid non ISDN-PRI trunk specified
```

If software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

Output

---

|                  |                                                                                                                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | This field specifies the physical address (cabinet/carrier/slot/circuit) of the ISDN-PRI B-channel.                                                                                      |
| Bit Error Rate   | The measured bit error count according to the comparison of the sent and received bit pattern. The number is displayed in scientific notation (one significant digit and an exponent).   |
| Number of Bits   | The number of bits generated. The number is displayed in scientific notation (one significant digit and an exponent).                                                                    |
| Block error Rate | The measured block error count according to the comparison of the sent and received bit pattern. The number is displayed in scientific notation (one significant digit and an exponent). |
| Number of Blocks | The number of blocks generated. The number is displayed in scientific notation (one significant digit and an exponent).                                                                  |
| Start Time       | The time the test call started (dd/hh:mm).                                                                                                                                               |

- Duration Specified

The duration specified in minutes for how long the test call should run. Valid durations are 1-120 (minutes) or blank (to indicate the default amount of 10 seconds was used to run the test).
- Duration of Test

The duration specified in minutes for how long the test call has been running. A blank indicates that the default amount of time was used to run the test.
- Reason of Termination

The reason of termination indicates why the test call has terminated. Valid reasons of termination are "finished," "canceled," "overflow," "no bits," "transmission," "internal fail," "data corrupt," "call dropped," "call rejected," and "in progress." A termination reason of "finished" means the test finished in the specified time. A termination reason of "canceled" means the test call has been canceled with the "clear isdn-testcall" command. A reason of "overflow" denotes that the bits transmitted have overflowed buffer allocation. A reason of "no bits" means that no bits have been received because the ISDN-PRI test call circuit connection is bad. A reason of "transmission" means there has been a data transmission interruption, probably caused from a power hit. A termination reason of "call dropped" indicates that the call dropped due to abnormal termination, or it couldn't cut-through to the other side. A termination reason of "call rejected" means the originating call was not set up properly. A termination reason of "internal fail" specifies that there is an internal error on the Maintenance/Test circuit pack. A reason of "in progress" means the test is still running and a reason of "data corrupt" is used for any other error condition.

For the following output example, the command status isdn-testcall 80/1 was entered.

```
status isdn-testcall 80/1                               Page 1 of 1   SPE A

                                ISDN TESTCALL STATUS

Port      Bit Error Rate  Number Of Bits  Block Error Rate  Number Of Blocks  Start Time  Duration Specified  Duration Of Test  Reason Of Termination
1B1401    0EE0            4EE7            0EE0            6EE2            25/12:36 120              100              in progress
```

Feature Interactions

If the bit error rate or block error rate is greater than zero, the ISDN-PRI trunk "may" be in a troubled state. Based on the statistical information displayed on the terminal, it can be decided to take the ISDN trunk out of service. This is

subjective data because the ISDN trunk may be used for data or voice. If the trunk is used for data and the rates are high, the trunk should be taken out of service. If the trunk is used for voice, the trunk may not have to be taken out of service. Also, high rates may be due to some type of power hit on the line.

## status journal-link

---

This command displays the status of a wakeup-log or a pms-log printer link.

### Synopsis

---

`status journal-link [ wakeup-log | pms-log ] print`

### Permissions

---

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

### Examples

---

`status journal-link wakeup-log`  
`status journal-link pms-log`  
`status journal-link pms-log print`

### Description

---

Either command displays whether the link is up or down. If the link is down, the number of times the switch has tried to set up the link is shown. A journal printer documents the automatic wake-up events, emergency access to attendant events, and housekeeping events when the property management system is not functional. A journal printer may also generate reports of the automatic wake-up events and the emergency access events at a scheduled time. If system configuration includes two printers, one is for the housekeeping events only and the second is for automatic wake-up events and emergency access events only.

For general information on journal printer links, see the second paragraph in the "Description" section of the "busyout journal-printer" pages.

### Defaults

No defaults.

Parameters

|            |                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------|
| wakeup-log | The printer that handles the automatic wakeup and emergency access to attendant events and scheduled reports. |
| pms-log    | The printer which handles the pms down events.                                                                |
| print      | This will cause the report to be printed if a printer is linked to the SAT.                                   |

Help Messages

If the system technician presses HELP after entering "status journal-link", the following object command word choices will be displayed:

pms - log                  wakeup - log

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link State       | Up, down, or extension not administered displays. A wakeup-log or a pms-log link is considered administered only if an extension is given in the System Parameters Hospitality form. |
| Maintenance Busy | Whether there is any maintenance testing being performed upon the link.                                                                                                              |

The following is an example of the fields contained on the output form.

status journal-link wakeup-log

JOURNAL LINK STATUS

Link State: up

Maintenance Busy? no

Feature Interactions

None.

# status link

---

This command displays the status of an Processor Interface (PI) link.

## Synopsis

---

status link link number *print*

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, rcust, init, bcms, browse.

## Examples

---

status link 1  
status link 8  
status link 4 print

## Description

---

The status link command displays the operational status associated with a specified processor interface link.

## Defaults

No defaults.

## Parameters

- link number     A link number (1-8) associated with a specific link.
- print            This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "status link", the following message will be displayed:

Enter 1 character link number ['print']

Error Messages

If the specified link number is invalid, the following message is displayed:

Link out of range, please press HELP

If the specified link number is not administered, the following message is displayed:

Link not administered

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

DEFINITIONS

---

|         |                                                                                                                                                                                                                                                                                                 |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link    | A synchronous connection between the Definity system and an adjunct or another switch. The link consists of three protocol levels. The entire link is identified by a link number which is specified on the "change communications-interface links" form.                                       |
| Level 1 | Physical connection of a port on a Processor Interface board to hardware which serves the same purpose on the adjunct or switch (for example, a PI board or an SCP board on Audix). There can be several components between these two endpoints (modems, DS1 facilities, cables, and so forth). |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Level 2           | The logical protocol that allows data communication between these two endpoints. BX.25 specifies that this is the LAPB (Link Access Protocol on the B-channel) protocol. Frames are sent at level 2. Establishment of the protocol requires one end to send a SABM (Set Asynchronous Balanced Mode) frame and the other to respond with a UA (User Acknowledgment) frame. Both sides send SABMs until they receive a UA at which time level 2 is up and the Link Status field indicates "restarting". This should be a temporary condition, because the link is unusable until level 3 comes up, and that occurs immediately. |
| Level 3           | The logical protocol that allows multiplexing of many channels onto one level 2 link. BX.25 specifies that this will be the X.25 data phase protocol. Packets are sent at level 3 and are included in level 2 frames. This protocol is established after level 2 is established by one end sending a Restart packet, and the other end sending a Restart Confirm packet.                                                                                                                                                                                                                                                      |
| Processor channel | The connection of an application running inside the SPE to a particular channel on a particular link. Processor channels are identified by a number associated with an entry on the "change communication-interface processor-channel" form. There the link number and level channel number on that link are specified as well as the application (for example, dcs) that uses that processor channel are specified.                                                                                                                                                                                                          |

## Output

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link Number                   | The Processor Interface link number (1-8).                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Link Status                   | <div>The state of the link, valid states are:<ul style="list-style-type: none"><li>— in-service</li><li>— PI link is currently up and providing service.</li><li>— maintenance busy</li><li>— The PI link has been busied out by system technician.</li><li>— disconnected</li><li>— The PI link is currently down. Check the Hardware Error Log for more information on why the link is not in-service.</li></ul></div>                                                                                             |
| Destination                   | A character string identifying the link destination type. The valid types are: "ISDN-LNK", "ISDN-TRK", "TIE-DS1", "PDMODULE", "TDMODULE", and " EIA LINK".                                                                                                                                                                                                                                                                                                                                                           |
| Dest Status                   | <div>The status of the link destination. Valid states are: "in-service", "in-service/idle", "in-service/active", and "out-of-service", "manual OOS", "standby", "awaiting call", "disconnected", "out-of-service-NE", and "out-of-service-FE".</div>                                                                                                                                                                                                                                                                 |
| Port                          | The destination port, this port is logically connected to the Processor Interface.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Destination Information Field | <div>One of the following will be present depending on the type of link destination.<ul style="list-style-type: none"><li>— Sig Grp<ul style="list-style-type: none"><li>— The signaling group number, valid for "ISDN-LNK".</li></ul></li><li>— Trk/Mem<ul style="list-style-type: none"><li>— The trunk group/member, valid for "ISDN-TRK" and "TIE-DS1".</li></ul></li><li>— Ext<ul style="list-style-type: none"><li>— The data module extension, valid for "PDMODULE" and "TDMODULE".</li></ul></li></ul></div> |

The following fields represent values of counters read from the Packet Interface board. These counters are not initialized on board insertion. It is therefore recommended that "clear link" command be issued and the counters are read after a period of time (15 min) to get a reliable readout.

|                                  |                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware Device Check (receive)  | This timeout counter is incremented when there is a 40 to 80 second period during which no link traffic is received. This condition probably indicates that the link is down on the far end system. The SABM (Set Asynchronous Balance Mode) count is probably increasing also.                                                                                            |
| Hardware Device Check (transmit) | This timeout counter is incremented when there is a 40 to 80 second period during which no link traffic is transmitted. This condition indicates possible PI faults. The link is down and the SABM count is increasing. If the link is down at both the near end and the far end, then this counter will increment along with the Hardware Device Check (receive) counter. |
| Far-End MOOS Count               | The number of times that the switch tries to restart the link and the Far-End responds with the link status "manual-out- of-service." This condition only occurs on ISDN-PRI Nonfacility Associated Signaling (NFAS) with D-channel backup. When this occurs, contact the Network and ask them to release the link.                                                        |
| Far-End FRMR                     | This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the switch received an FRMR frame from the Far-End.                                                                                                  |
| Far-End DISC                     | This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the switch received a DISConnect frame from the Far-End.                                                                                             |
| Timeout                          | This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because of a Layer 2 timer expiration on the PI circuit pack.                                                                                                |
| Software Initiated Link Down     | This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the switch software restarted the link. Look at other PI-LINK errors to determine the cause.                                                                                    |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Level 2 I-frames retransmitted | This is a count of the number of frames that have been retransmitted in LAPD (Link Access Procedure D) or X.25 layer 2. In general, this is a measure of link quality. This count, which could indicate a very noisy link or synchronization problem, will increment normally if a Hot Start PEI is done locally.                                                                                                                                                              |
| Level 2 Reset (SABM)           | This is the number of X.25 SABMs or LAPD SABMs that have been transmitted. Since SABMs are used to establish links, every time this count is incremented a link establishment attempt has failed. If the link is currently in-service and the count is non-zero after having been previously cleared by the "clear link link-no" command, then this condition indicates that the link has gone down in that interval. Check the Hardware Error Log for additional information. |
| Invalid Frame Count            | This is the number of invalid frames that have been received. This count is a measure of the link quality and could indicate a very noisy link or a synchronization problem. This might increment normally if a Hot Start PEI is done locally. If an administration error exists, this counter could be incrementing along with the Level 2 Reset counter. This counter may be incremented by message retransmissions.                                                         |
| Far-End SABM(E)/DM             | This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the switch received a SABM from the Far-End.                                                                                                                                                                                                             |
| Protocol Error Detected        | This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the PI circuit pack detected a Layer 2 protocol error in its communications with the Far-End of the link.                                                                                                                                                |

Local Busy Out

This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the switch software made the link local busy. The link is made "maintenance busy" as part of the D-channel Back Up protocol or when the link is "busied out" via the System Access Terminal (SAT).

Firmware Initiated Link Down

This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the PI firmware initiated the link down. Please consult SCI-BD or PROTOCOL errors to determine the cause.

LOCAL/REMOTE  
PROCESSOR CHANNELS

Local/remote processor channel pairs. Each pair consists of a processor channel on the local machine and a processor channel on the remote machine that are connected in the communication session.

 **NOTE:**  
For "ISDN-LNK" links, this is no correlation between the local and remote processor channels. Therefore, only the local processor channel is shown (the remote processor channel is blank).

The following are examples of the fields contained on the output form. The command entered, for each example, was "status link 1." Each example shown is for a different type of link connection.

status link 1

PI LINK STATUS

|                         |                       |              |
|-------------------------|-----------------------|--------------|
| Link Number: 1          | Destination: ISDN-LNK | Port: 1B1624 |
| Link Status: in-service | Dest Status: standby  | Sig Grp: 8   |

**Feature Interactions**

---

None.

**status logins**

---

This command will list the status all of the users that are currently logged into the system.

**Synopsis**

---

status logins *print*

**Permissions**

---

The following default logins may execute this command: system technician, inads, init, rcust, bcms, browse, cust.

**Examples**

---

status logins  
status logins print

## Description

---

This command will display information about all of the users that are currently logged into the system. This information will contain their login names, location of physical access, and their currently executing command.

The screen does not automatically update, and is a reflection of the system at the time the request was made. Users may have logged off, or on, or the command may have finished executing while the information is being displayed. These updates will not be reflected until the next execution of the command.

## Defaults

None.

## Parameters

`print` This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the technician presses `HELP` after entering "status logins" the following message will be displayed:

[ 'print' ]

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

---

The login information will be displayed with one line of data displayed for each user.

- Login Id

This field shows the login id of the user that is currently logged into the system. The value of "LOGIN" means that the terminal is connected to that port and the login prompt is displayed, but no user is currently logged on. An asterisk in the login id field identifies your login.
- Type

This identifies the type of connection that is associated with the login session. Following are the values for this field:

| Login Type | Description                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NET        | This represents a dialed-in connection via a Netcon data channel.                                                                                                                                 |
| EPN        | This represents a connection to the SAT port of an EPN maintenance board. This is accomplished via a hard-wired connection to that port.                                                          |
| MGR1       | This signals a physical connection to the local SAT port on the active processor carrier. This port is accessed via a hard-wired connection.                                                      |
| INADS      | This represents a connection to the remote SAT port on the active processor carrier. This port is normally accessed via a dial-in connection.                                                     |
| SYS-PTR    | This identifies that the system printer is active in the system. The login will be the id of the user who requested the print job, and the active command will be the command used for the print. |

- Location

This identifies the physical location where the user or printer is connected into the switch.

For the types of MGR1 and INADS, this value will be the processor board location. For the EPN type, this will be the EPN maintenance board location. For the NET type this will be the physical location of the terminal port where the customer's SAT is connected. For a BRI NET connection the BRI endpoint is the last 3 digits, and for the SYS-PTR type this is the physical location of the printer port.
- Aux

This field give additional location information.

For the types of MGR1 and INADS, this field will contain the port network number of the processor board (that is, 1). For the EPN type, this field will contain the port network number of the EPN maintenance board. For the NET and SYS-PTR types, this field will contain the Netcon data channel number (1-4).
- Active Command

This field displays the currently executing command, entered by the user logged into the system at the specified location. If the user has no command currently executing, then the field is empty.

The following is a sample output of a "status logins" command.

```
status logins

                                USER LOGIN INFORMATION

Login      Type    Location  Aux  Active Command
*system technician MGR1     01A      1    stat logins
cust       NET     01c1101001 1    add station next
inads      INADS   01A      1
LOGIN      EPN     02A      3
system technician SYS-PTR  01c1102  2    list stations

Command Successfully Completed
```

Feature Interactions

The command will take a snapshot of the commands that the users on the system are currently executing. Because of timing, the command could be terminated by the time this command finishes displaying the list (i.e., the active command may not be accurate).

status mst

This command allows the user to display the trigger and buffer status of the mst.

Synopsis

status mst

Permissions

The following default logins may execute this command: inads, init.

Examples

status mst

Description

The status mst command will present the user with the form that contains the current status for the mst triggers and buffers.

Parameters

None.

Help Messages

If you press HELP after entering "status mst", the following message displays:

Entry is not required

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id':'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

FORM Output

After entering the command "status mst", the user will be presented with the following form. The current settings will be placed in the fields.

MST STATUS

Trace Status: enabled

Start Trigger Status: triggered

Stop Trigger Status: not triggered

Pending Stop Count: 5

Enable Trace Time: 1/21/90 10:30

Disable Trace Time : 3/31/90 10:30

Percent of Current Wrap: 100

Wraparound Count: 2

Oldest Message Number: 3345

Newest Message Number: 3923

Completed Snapshots: 0

|                         |                                                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trace status            | Can be "enabled", "disabled by command", "disabled by timer", "disabled by buffer full", "disabled by stop trigger or count" or "disabled by restart".           |
| trigger status          | Can be "none", "not triggered", "triggered".                                                                                                                     |
| Pending stop count      | This field will have a value in it whenever it is actually being used. The value will indicate the number of messages to be collected before stopping the trace. |
| Enable trace time       | The time the trace was enabled.                                                                                                                                  |
| Disable trace time      | The time the trace was disabled or will be disabled by the run time limit.                                                                                       |
| Percent of current wrap | The percentage of the buffer that has been written since the last wraparound.                                                                                    |
| Wraparound count        | The number of times that the buffer has wrapped around. This will initially be 0.                                                                                |
| Oldest message number   | The sequence number of the oldest message in the trace.                                                                                                          |
| Newest message number   | The sequence number of the newest message in the trace.                                                                                                          |
| Completed snapshots     | The number of complete snapshots that have been collected.                                                                                                       |

**Feature Interactions**

---

None.

**status packet-control**

---

This command displays the status of the specified packet-control.

**Synopsis**

---

status packet-control *location*

**Permissions**

---

The following default logins may execute this command: system technician, inads, init, nms

Examples

---

status packet-control 1A  
status packet-control 1B

Description

---

The status packet-control command will display the service state of the specified packet-control, and link statistics for links that are terminated on this packet-control. The service state can be either in-service or out-of-service. The link statistics describe the connectivity picture for links terminated by this packet-control. The total number of links is the number of links that have been administered or translated. The number of established links is the number of links that have transitioned from a translated (tie-assigned) state to a state of normal operation (Multi-Frame Established Normal state). Proper handshaking is required for links to be in the established state.

Defaults

For simplex systems, the location is optional and defaults to cabinet 1, carrier A. For duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier.

Parameters

location            The location only applies to duplicated configurations. If the configuration is a simplex, the location parameter is not used and thus is not valid. For duplicated configurations, a "location" represents the carrier that the packet-control resides on in the system. Valid locations are either 1A or 1B.

Help Messages

If the system technician presses HELP after entering "status packet-control", the following message is displayed:

Enter Packet Control location:  
[cabinet(1)];carrier(A-B)

Error Messages

If this command is entered for a packet-control that resides on the stand-by control complex of a High or Critical Reliability System, the following message is displayed:

Command only applies to the active Packet Control

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

Service State: This field describes the service state of the packet-control. Valid service states are "in-service" and "out-of-service". In-service means that the packet-control is providing service. Out-of-service means that the packet-control is not providing service. Typical reasons for the out-of-service state are:

- The packet-control is busied out.
- The packet-control has failed.

Total No. of links: The total number of links that require establishment for normal operation. Point-to-point signaling links are an example of links that require establishment. There is usually one point-to-point signaling link per endpoint with packet-bus connectivity (for example, ISDN-BRI endpoints).

No. of links that are established: The number of links that are established out of the total number of links. Ideally, all point-to-point signaling links are in the established state and thus, the number of established links will be equal to the total number of links.

For the following output example, the command status packet-control 1A was entered.

```
status packet-control 1A

      PACKET CONTROL STATUS

      Service State: in-service
      Total No. of links: 10
      No. of links that are established: 10

Command successfully completed
```

## STATUS INTERPRETATION SECTION

---

The "Total No. of Links" minus the "No. of links that are established" equals the number of links which are down. Links that are down do not necessarily imply that there is a Packet Control circuit pack failure. A link goes down if there is a failure on any of the components through which it passes. These components include the Packet Control circuit pack, the Packet Bus, the Expansion Interface circuit pack, the BRI circuit pack, and the endpoint itself. By knowing which components can cause a link terminating on the Packet Control circuit pack to go down, and by having an idea of how many links go through each component, it is possible to determine which components are the most likely to have failed.

For example, when all of the links are down (no links are established) it is likely that there is a failure with a component through which all of the links pass. All links always pass through the Packet Control circuit pack and the PPN Packet Bus. Thus, these two components are likely to have failed. If all of the packet endpoints are in one EPN, then that EPN's Packet Bus is also a likely to have failed. It is unlikely that the failure is with an individual BRI circuit pack, since that only affects links passing through that one circuit pack (unless there is only one BRI circuit pack in the system, in which case that circuit pack may have failed).

Conversely, if only a few links are down, then it is not likely that the fault is with the Packet Control circuit pack or the PPN Packet Bus, since a fault on either of these would normally affect all links equally. In this case, the fault is more likely to be on an individual BRI circuit pack or endpoint.

 **CAUTION:**

*The purpose of the information described above is to provide general information about the causes of link failures. This information should be used in conjunction with the procedures found throughout this manual, and not as a replacement for those procedures.*

## Feature Interactions

---

In a high or critical reliability system, an attempt to get the status of the packet-control that resides in the standby processor complex is not allowed.

## status periodic-scheduled

---

This command displays the status of periodic and scheduled maintenance testing performed by the system.

## Synopsis

---

status periodic-scheduled *print*

Permissions

---

The following default logins may execute this command: system technician, inads, init.

Examples

---

status periodic-scheduled  
status periodic-scheduled print

Description

---

The status periodic-scheduled command displays summary information on active scheduled and periodic testing. Periodic tests are run every hour, while scheduled tests are run every 24 hours. Scheduled tests can have their starting and stopping times administered. For periodic maintenance, the completion percentage for all resources will be displayed for the current cycle of testing as well as the previous cycle of testing. For scheduled maintenance, the completion percentage of all resources will be displayed for the last 24 hour testing cycle.

Defaults

No defaults.

Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status period-scheduled", the following message will be displayed:

[ 'print' ]

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit.

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later.

## Output

---

Pre - SCHEDULED MAINTENANCE

During scheduled maintenance, a delay of about 1 to 15 minutes can be observed prior to the testing of System Critical Resources. During this period maintenance is switching those duplicated resources administered on the **system-parameters maintenance** screen.

Pre-scheduled maintenance also includes the time the standby SPE is being tested in a system with the duplication option.

System Critical Percentage Complete:

The ratio of the number of System Critical MOs tested to the number of System Critical MOs left to test. This number is displayed for the current testing period as well as the previous testing period. System critical resources are considered imperative to test, and are tested first (for example, Processor).

Shared Percentage Complete:

The ratio of the number of Shared MOs tested to the number of Shared MOs left to test. This number is displayed for the current testing period as well as the previous testing period. Shared resources are resources that are used by more than one user, and are tested after system critical resources (for example, Trunks).

Single User Percentage Complete:

The ratio of the number of Single User MOs tested to the number of Single User MOs left to test. This number is displayed for the current testing period as well as the previous testing period. Single User resources are resources that are used by a single user only, and are tested after shared resources (for example, Voice Stations).

Start Time of Current or Previous Cycle:

For both periodic and scheduled maintenance if any of the three levels of MOs are active, then the time the System Critical MOs started for this current cycle is shown. If, however, none of the MO levels are currently being tested, then the start time for previous completed cycle is shown.

For the following output example, the command "status periodic-scheduled" was entered.

|                                                         |                 |  |          |         |                |           |

Feature Interactions

None.

status pms-link

This command displays the status of the property management system interface link.

Synopsis

status pms-link *print*

Permissions

The following default logins may execute this command: system technician, inads, cust, init, browse.

Examples

status pms-link  
status pms-link print

## Description

---

The `status pms-link` command displays the status of the property management system interface link. If the link is up, whether or not a data base swap is taking place between the switch and PMS, will be shown. If the link is down, the number of times the switch has tried to set up the link will be shown.

A property management system (PMS) is a stand alone computer system which can be integrated with the switch to enhance the service capability for a hotel/motel.

For general information on PMS links, see the second paragraph in the "Description" section of the "busyout pms-link" manual pages.

## Defaults

No defaults.

## Parameters

`print` This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses `HELP` after entering "`status pms-link`", the following message will be displayed:

```
['print']
```

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                     |                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical Link State | Up, down, or extension not administered will be displayed. The PMS link is considered administered only if an extension is given in the System Hospitality form. |
| Protocol State      | "up", "down", or blank if not administered.                                                                                                                      |
| Number of Retries   | Number of times the switch has tried to set up the link. Only displayed when the link is down. The Largest number that can be displayed is 999.                  |
| Maintenance Busy    | "yes", or "no" (that is, system technician has or has not busied out the link). Blank if PMS link not administered.                                              |

The following is an example of the fields contained on the output form.

```
status pms-link

                                PMS LINK STATUS

Physical Link State: down
    Protocol State: down
    Number of Retries: 3
    Maintenance Busy? no
```

## Feature Interactions

None.

## status pri-endpoint

This command displays the status of a PRI endpoint.

## Synopsis

status pri-endpoint extension *print*

## Permissions

The following default logins may execute this command: system technician, cust, inads, init, nms, browse.

Examples

---

status pri-endpoint 25012  
status pri-endpoint 77868  
status pri-endpoint 66078 print

Description

---

The status pri-endpoint command displays internal software state information for diagnosis. This command can help locate facilities with which a PRI endpoint is communicating. Status information for each of the B-channels making up the PRI endpoint are displayed in addition to some overall PRI endpoint information.

Defaults

No defaults.

Parameters

- extension      The extension number of the PRI endpoint to be displayed. The number of digits in an extension is determined by the dial-plan.
- print           This causes the report to be printed if a printer is connected to the SAT.

Help Messages

If the user presses HELP after entering "status pri-endpoint", the following message is displayed:

Enter assigned extension, ['print']

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

Extension invalid

If the extension is not administered, the following message will be displayed:

Extension not assigned

If the object associated with the specified extension is not a PRI endpoint, the following message will be displayed:

Extension assigned to object other than pri-endpoint

If the board that contains the PRI endpoint is not inserted in the system, the following message will be displayed:

Board not inserted

If the EPN on which the PRI endpoint resides is not accessible, the following message will be displayed:

EPN is not available

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

---

|                              |                                                                                                                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Extension                    | The extension of the PRI endpoint.                                                                                                                                                                                                                              |
| Width                        | Administered number of B-channels associated with the specified PRI endpoint.                                                                                                                                                                                   |
| Signaling Group ID           | The ID number of the signaling group which handles the signaling for the ports in the specified PRI endpoint.                                                                                                                                                   |
| Originating Auto Restoration | Administered option for the auto restore feature which restores calls originated from this PRI endpoint in the case of network failure. Displayed values for this field are "y" for the restoration option enabled and "n" for the restoration option disabled. |
| B-Channels Active            | The number of B-channels active on a call.                                                                                                                                                                                                                      |
| B-Channels Idle              | The number of B-channels that are in the in-service/idle state.                                                                                                                                                                                                 |
| Port                         | Port locations (cabinet-carrier-slot-circuit) for each of the B-channels that makes up the PRI endpoint.                                                                                                                                                        |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service State    | This field shows whether each of the B-channels is in-service or out-of-service. One of the following states is displayed: in-service/active, in-service/idle, out-of-service-NE, out-of-service-FE, maint-NE/active, maint-FE/active, maint-NE/idle, and maint-FE/idle. NE (Near End) and FE (Far End) refer to which "end" of the B-channel has placed the facility in the state that it is in. NE refers to the switch and FE refers to the PRI terminal adapter (or any device that terminates the D-channel signaling on the facility). |
| Test In Progress | Whether there is any maintenance testing being performed on the port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Connected Port   | This field lists the connected port location (cabinet-carrier-slot-circuit) for each of the B-channels active on a call.                                                                                                                                                                                                                                                                                                                                                                                                                     |

For the following output example, the command "status pri-endpoint 22501" was entered. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 6. The ports 1 to 3 of the specified PRI endpoint are connected on an active call to ports 13 to 15 of board in location 1B19 (cabinet 1, carrier B, slot 19). Ports 4 and 5 of the specified PRI endpoint are idle. Port 6 of the specified PRI endpoint is out of service and background maintenance testing is being performed on the port.

Note that a PRI endpoint can initiate and receive a call on any one or more of the B-channels making up the PRI endpoint.

```
status pri-endpoint 22501                                page 1 of 1

```

Note that the line listing of each B-channel's status may continue on to the next page. The user is prompted to hit <NxtPg> key to continue the display.

Feature Interactions

None.

status processor-channel

status processor-channel - This command displays the status of a processor channel.

Synopsis

status processor-channel channel number *print*

Permissions

The following default logins may execute this command: system technician, inads, cust, init, browse, bcms, rcust.

Examples

status processor-channel 1  
status processor-channel 10  
status processor-channel 64  
status processor-channel 64 print

Description

The status processor-channel command displays the status of the technician specified processor channel and the values of its various counters. A processor channel is one 64 logical channels associated with an SCI link. Each processor channel terminates in the switch processing element with a session.

Defaults

No defaults.

Parameters

- channel number      The processor channel number (1-64).
- print                This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "status processor-channel", the following message will be displayed:

```
Enter a processor-channel number 1-64 ['print']
```

## Error Messages

If the technician-entered channel number is invalid, the following message will be displayed:

```
Channel invalid
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

```

Feature Interactions

None.

status signaling-group

status signaling-group - This command displays the operational status of the specified ISDN-PRI signaling group.

Synopsis

```
status signaling-group group identifier print
```

Permissions

The following default logins may execute this command: system technician, inads, cust, init, browse.

Examples

```
status signaling-group 1
status signaling-group 2 print
```

Description

The status signaling-group command displays the state, type, port location, and state of the Primary and Secondary D-channels within the group.

A signaling group is a collection of B-channels signaled for by a designated single D-channel or set of D-channels over an ISDN-PRI.

Defaults

None.

Parameters

- group identifier
- The signaling group identifier is an administered number associated with each signaling group (1-8).
- print
- This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status signaling-group", the following is displayed:

Enter group identifier (1-8) ['print']

Error Messages

If the specified group identifier is non numeric or out of range, the following message is displayed:

Signaling group invalid

If the specified group identifier is not administered, the following message is displayed:

No signaling group assigned

If the software data cannot be sent to the SAT, the following message is displayed:

Error encountered, can't complete request

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

## Output

---

- Group ID: The numerical ID of the signaling group. Valid identifiers are 1-8.
- Type: The signaling group can be either "facility associated signaling" or "non-facility associated signaling." In the "facility associated signaling" type all members are on a single DS-1 facility. Facility associated signaling groups support only the simplex D-channel configuration. In the "non-facility associated signaling" type members can be carried by multiple DS-1 facilities. The DS-1 facility is identified across the ISDN-PRI using an explicit facility identifier. In a simplex configuration one D-channel is used to signal for B-channel members, while in a duplex configuration two D-channels are used to signal for B-channel members (one channel is active and the other is used as a backup to the active channel).
- Group State: The signaling group state can be either "in-service" or "out-of-service." The group is "in-service" when one of the D-channels signaling for the group is in service. The group is "out-of-service" when neither D-channel in the group is in service. NOTE: If there is no D-channel backup and the primary D-channel is out-of-service, then the signaling group is in an "out-of-service" state.
- Link: The link transporting the D-channel.

| Port:          | The physical address of the port transporting either the primary or secondary D-channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Level 3 State: | <p>The state of the primary or secondary D-channels. The state can be "in-service," "standby," "wait," "maintenance busy," "manual-out-of-service," "out-of-service," or "no-link."</p> <p><b>in-service:</b>A D-channel is "in-service" when it is in the multiple-frame-established state at layer 2 carrying normal call-control signaling at layer 3.</p> <p><b>standby:</b>A D-channel is "standby" when it is in the multiple-frame-established state at layer 2, and not carrying any layer 3 call-control messages on logical link 0,0.</p> <p><b>wait:</b>A D-channel is in a "wait" state when an attempt has been made by one side of the interface to establish layer 3 peer communications as part of the process of going to the "in-service" state. This state is transitional in nature. As ISDN SERVICE message is sent over the interface, When the far end of the interface responds with a SERVICE ACKnowledge message the D-channel is placed in the "in-service" state.</p> <p><b>maintenance-busy:</b>A D-channel is "maintenance-busy" when it is not in the multiple-frame-established state at layer 2. This state is entered automatically when an active D-channel is declared failed. A D-channel which has been placed in the "maintenance-busy" state may be place in the "out-of-service" state without system technician intervention.</p> <p><b>manual-out-of-service:</b>A D-channel is "manual-out-of-service" when system technician intervention has caused it to be placed in the TEI-assigned state at layer 2. System Technician intervention is required to retrieve a D-channel from this state.</p> <p><b>out-of-service:</b>A D-channel is "out-of-service" when it is in the TEI-assigned state at layer 2, but is periodically requested by layer 3 to attempt to establish the link.</p> <p><b>no-link:</b>No link is administered for the D-channel.</p> |

For the following output example, the command `status signaling-group 1` was entered.

status signaling-group 1

Page 1 of 1SPE A

STATUS SIGNALING-GROUP

Group ID: 1  
Type: facility associated signaling  
Group State: in-service

Primary D-Channel

Link: 1Port: 01C1924Level 3 State: in-service

Secondary D-Channel

Link:Port:Level 3 State:

**Feature Interactions**

---

None.

**status sp-link**

---

This command displays the operational attributes of the system printer link.

**Synopsis**

---

status sp-link *print*

**Permissions**

---

The following default logins may execute this command: system technician, cust, rcust, bcms, inads, init, browse.

**Examples**

---

status sp-link  
status sp-link print

**Description**

---

The status sp-link command displays a page of output summarizing the operational status of the system printer link. The link state, number of retries, and whether the link is maintenance busy is displayed.

## Defaults

None.

## Parameters

**print** This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses **HELP** after entering "status sp-link", the following message will be displayed:

```
['print']
```

## Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

- Link State:

This field displays the operational mode of the link. A state of "up," "down," or "extension not administered" is displayed. A state of "up" means that the link is administered and a call is setup between the switch and the system printer. A state of "down" means that the link is administered, but a call is not setup between the switch and the system printer. A state of "extension not administered" means that the link is not administered (no system printer extension has been administered).
- Number of Retries:

This field is displayed only if the "Link State:" is "down." The field displays the number of times the switch has tried to set up the link since a request to set up the link has been received. The largest number that can be displayed is "999". If more than "999" retries have occurred, "999" is still displayed.
- Maintenance Busy?

This field displays whether any maintenance testing is being performed on the system printer link. Values of "yes" and "no" are displayed if the system printer link is administered (the system printer extension is administered). Blanks are displayed if the system printer link is not administered.

For the following output example, the command status sp-link was entered.

```
status sp-link                               SPE A

                                SYSTEM PRINTER LINK STATUS

Link State: up
Number of Retries:
Maintenance Busy? no
```

## Feature Interactions

None.

## status station

status station - This command displays the status of a station.

## Synopsis

status station extension *print*

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, init, browse.

## Examples

---

status station 10020  
status station 83277  
status station 83277 print

## Description

---

The status station command displays internal software state information for diagnosis. This command can help locate facilities to which the station is communicating.

## Defaults

No defaults.

## Parameters

- |           |                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------|
| extension | The extension of the station to be displayed. The number of digits in an extension is determined by a dial-plan. |
| print     | This will cause the report to be printed if a printer is linked to the SAT.                                      |

## Help Messages

If the system technician presses HELP after entering "status station", the following message will be displayed:

Enter assigned extension, ['print']

## Error Messages

If the extension format is incorrect, the following message will be displayed:

Extension invalid

If the extension is not administered, the following message will be displayed:

Extension not assigned

If the object associated with the extension is not a station or an attendant console, the following message will be displayed:

Extension exists but assigned to a different object

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                        |                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------|
| Type                   | The administered station type.                                                                                    |
| Extension              | The extension of the station or attendant to be displayed.                                                        |
| Port                   | The port location of the station (cabinet-carrier-slot-circuit).                                                  |
| Call Park              | Whether the station has a call parked ("yes" or "no").                                                            |
| Ring Cut Off Activated | Whether ring cut off is activated ("yes" or "no").                                                                |
| CF Destination Ext     | The call forwarding destination extension, if any.                                                                |
| Message Waiting        | Whether there is a message waiting for the station. "AP-SPE", "AUDIX", "PMS" or blank if no messages are waiting. |
| Connected Ports        | Port locations of the facilities to which the station is connected (cabinet-carrier-slot-circuit).                |
| Agent Logged In        | Displays (underneath it) the hunt groups (up to 3) that the agent is logged into.                                 |
| On ACD Call?           | Whether the agent is on an ACD call currently ("yes" or "no").                                                    |
| Work Mode              | Work mode of each hunt group that an agent is logged into.                                                        |
| Service State          | In service/on-hook, in service/off-hook, out of service, or disconnected.                                         |
| Maintenance Busy State | Whether maintenance is testing the object ("yes" or "no").                                                        |
| SAC Activated          | Whether send all calls is activated ("yes" or "no").                                                              |
| User Cntrl Restr       | One or two of the following: "none", "total", "stat-stat", "outward" or "terminate".                              |
| Group Cntrl Restr      | One or two of the following: "none", "total", "stat-stat", "outward" or "terminate".                              |
| AWU Call at            | What time an automatic wakeup call is scheduled.                                                                  |

|             |                                                                               |
|-------------|-------------------------------------------------------------------------------|
| User DND    | Status of the do not disturb feature.                                         |
| Group DND   | Status of the group do not disturb feature.                                   |
| Room Status | Whether a room is occupied or not ("non-guest room", "vacant" or "occupied"). |

For the following output example, the command that was entered is "status station 1002".

```
status station 1002

                                GENERAL STATUS

**Feature Interactions**

---

None.

**status synchronization**

---

This command displays the current status of synchronization.

**Synopsis**

---

status synchronization *print*

**Permissions**

---

The following default logins may execute this command: system technician, inads, cust, init, browse.

## Examples

---

status synchronization  
status synchronization print

## Description

---

The status synchronization command displays the location of the DS1 or tone-clock circuit pack that is used for an on-line synchronization reference.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

## Defaults

No defaults.

## Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "status synchronization", the following message will be displayed:

```
['print']
```

## Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

|                               |                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stratum Level                 | This is the synchronization stratum level, either a "3" or "4."                                                                                                                                                                                         |
| Maintenance Name:             | Either "TONE-BD," "DS1-BD," or "STRAT-3."                                                                                                                                                                                                               |
| Physical Location             | The board location of the selected DS1 or tone-clock circuit pack. This includes the cabinet-carrier-slot for a DS1 or the cabinet-carrier for a tone-clock.                                                                                            |
| Switching Capability          | Whether the on-line reference for synchronization can be switched. "Enabled" and "Disabled" are used to describe the current capacity for reference switching.                                                                                          |
| Excessive Reference Switching | This field gives a high level description of how many times the synchronization reference has been switched. If excessive reference switching is taking place (sync error 1793 is at threshold) this field displays "Yes," otherwise "No" is displayed. |

For the following output example, the command that was entered is "status synchronization".

```
status synchronization

                                SYNCHRONIZATION STATUS

Stratum Level:4
Maintenance Name: TONE-BD   Physical Location: 01A
Switching Capability: Enabled
Excessive Reference Switching: No
```

## Feature Interactions

None.

## status system

This command displays the status, mode, and operational attributes of the SPE(s), TDM and Packet busses, tone-clock circuit pack(s), expansion interface links (exp-links), and emergency transfer switch of a single cabinets or all cabinets in the system.

## Synopsis

---

status system cabinet

## Permissions

---

The following logins may execute this command: bcms, browse, system technician, cust, inads, init, rcust.

## Examples

---

status system 1st-cabinet  
status system 2nd-cabinet  
status system 3rd-cabinet  
status system all-cabinets

## Description

---

status system - This command displays the status, mode, and operational attributes of the SPE(s), TDM and Packet busses, tone-clock circuit pack(s), expansion interface links (exp-links), and emergency transfer switch of a single cabinets or all cabinets in the system.

## Defaults

No defaults.

## Parameters

cabinet            The cabinet specifies for which cabinet to display status. "**1st-cabinet**" always refers to the PPN, "**2nd-cabinet**" refers to the 1st EPN, and "**3rd-cabinet**" refers to the 2nd EPN. The status for one cabinet is displayed on one page of output. If "**all-cabinets**" are specified, then the user gets a 3 page output, one for each cabinet in the system. The status displayed for a cabinet is always related to that cabinet except in the case of status for EPNs and the SPE attributes. SPE attributes always refer to PPN status regardless of which cabinet is being displayed.

## Help Messages

If the system technician presses HELP after entering "status system", the following message will be displayed:

                  Please enter one of the following object command words:  
                                  1st-cabinet  
                                  2nd-cabinet

3rd-cabinet  
all-cabinets

If the system technician presses `HELP` after entering "status system cabinet", where "cabinet" is one of the object described above, the following message will be displayed:

[ 'print' ]

Error Messages

None

Output

**CAUTION:**

*The purpose of this command is to provide general information about the cabinet status. This information may not display correctly when the cabinet is in a transient period. In this case, wait for 1 minute and enter the command again.*

**SPE** The identifier of the Switch Process Element (SPE). Valid identifiers are **1A** or **1B**.

**MODE** The modes of an SPE are different for simplex systems versus those for systems with the duplication option.

1. SIMPLEX SPE MODES

- **active** The **1ASPE** in a simplex system is always the **active** SPE.
- **<blank>** The **1BSPE** in a simplex system always displays **<blank>** indicating there is no 1B SPE.

2. DUPLEX SPE MODES

The modes for the active and standby SPE in a system with the duplication option are different.

3. DUPLEX ACTIVE SPE MODES

- **active** This SPE is performing its designed functions for the system as the active SPE.
- **active/override-on** This SPE is performing its designed functions for the system as the active SPE, however, this SPE is active because it was forced active via a **reset system interchange health-override** command.
- **selected** This SPE is the "active" SPE and is performing its designed functions for the system, however, the SPE select switches will **not** allow this SPE to become the standby SPE.

#### 4. DUPLEX STANDBY SPE MODES

The modes of the standby SPE can be classified into one of the following four areas: **Standby Mode**, **Busyout Modes**, **Maintenance Modes** and **Down Modes**.

#### 5. STANDBY MODE

- **standby** This SPE is held reset, its memory is being shadowed from the active SPE, and is ready to take over the functions being performed by the active SPE.

#### 6. BUSYOUT MODES

Busyout modes occur when the standby SPE has been busied out via the **busyout spe-standby** command. The active SPE could be either **active** or **selected** when the standby SPE is in one of the **Busyout** modes.

- **busyout/idle** This standby SPE has been busied out and no maintenance activity is currently taking place. The active SPE could be either **active** or **selected**.
- **busyout/entering** This standby SPE has been busied out and is currently in the process restarting the switch software on this SPE. As soon as the switch software on this SPE finishes its initialization, the standby SPE will be ready to perform SAT requested maintenance functions on the standby SPE and the mode will change.
- **busyout/testing** This standby SPE has been busied out, however the switch software on this SPE has been restarted and is currently in the process of executing a SAT demanded **test** command.
- **busyout/not-refreshed** This standby SPE has been busied out, however the **busyout spe-standby** command was executed at a time when the standby memory was not refreshed. The standby SPE will not be able to perform any maintenance or SAT requested activities until a successful **refresh spe-standby** command is executed.
- **busyout/list-config** This standby SPE has been busied out, however the switch software on this SPE has been restarted and is currently in the process of executing a SAT demanded **list configuration** command.
- **busyout/status** This standby SPE has been busied out, however the switch software on this SPE has been restarted and is currently in the process of executing a SAT demanded **status card-mem** command.

#### 7. MAINTENANCE MODES

Maintenance modes occur when the standby SPE is taken out of **standby** mode to perform a maintenance or SAT requested function. Unlike the **busyout** and **down** modes, being in **maintenance** mode implies this SPE can be returned to **standby** mode when the requested activity is

completed assuming there are no faults in the standby SPE complex. The active SPE could be either **active** or **selected** when the standby SPE is in one of the **Maintenance** modes.

- **maint/init** The standby SPE is in maintenance mode because the system has restarted within the last 10 minutes. During this 10 minute interval, the standby SPE is not placed into standby mode just in case a core dump is being written to the tape or memory card on the standby SPE.
- **maint/idle** This standby SPE is in maintenance mode, however no maintenance activity is currently taking place. The active SPE could be either **active** or **selected**.
- **maint/entering** This standby SPE is currently in the process of restarting the switch software on this SPE. As soon as the switch software on this SPE finishes its initialization, the standby SPE will be ready to perform SAT requested maintenance function and the mode will change.
- **maint/testing** This standby SPE is in maintenance mode executing a SAT demanded **test** command.
- **maint/not-refreshed** This standby SPE is in maintenance mode executing a destructive background maintenance test that has temporarily left the standby memory not refreshed. Once the current test has completed a refresh of the standby SPE will be performed by background maintenance and the mode will change.
- **maint/not-tested** This standby SPE is in maintenance mode because previously the active SPE had been selected with the SPE select switches and since the active was unselected the standby has not been tested to ensure the standby can enter standby mode. Once the standby is tested successfully, the standby will go back to standby mode.
- **maint/list-config** This standby SPE is in maintenance mode and is currently in the process of executing a SAT demanded **list configuration** command.
- **maint/save~trans** This standby SPE is in maintenance mode and is currently in the process of executing a SAT demanded **save translation** command.
- **maint/save~announce** This standby SPE is in maintenance mode and is currently in the process of executing a SAT demanded **save announcement** command.
- **maint/status** This standby SPE is in maintenance mode and is currently in the process of executing a SAT demanded **status card-mem** command.
- **maint/patching** This standby SPE is in maintenance mode and is currently in the process of applying a software patch to the standby SPE memory.

- **maint/periodic** This standby SPE is in maintenance mode and is currently in the process of performing periodic background maintenance. Periodic background maintenance is performed on the standby SPE every two hours if some component of the standby SPE is currently alarmed.
- **maint/scheduled** This standby SPE is in maintenance mode and is currently in the process of performing daily scheduled background maintenance.
- **maint/analysis** This standby SPE is in maintenance mode and is currently in the process of performing background maintenance testing in response to a reported trouble by some component in the active or standby SPE complex that relates to the standby SPE.
- **maint/upgrade** This standby SPE is in maintenance mode and is currently in the process of performing software upgrade.

## 8. DOWN MODES

The standby SPE is placed in **down** mode when a fault occurs in the standby SPE complex that would prevent that SPE from performing system functions. **Down** mode is always associated with **STBY-SPE** alarms and errors. The active SPE could be either **active** or **selected** when the standby SPE is in one of the **Down** modes.

- **down/bad\_upgrade** This standby SPE is in down mode because a software upgrade attempt failed. The standby SPE will stay in down mode until a successful software upgrade is performed.
- **down/idle** This standby SPE is in down mode, however, no maintenance activity is currently taking place. The active SPE could be either **active** or **selected**.
- **down/entering** This standby SPE is in down mode, but is currently in the process of trying to restart the switch software on this SPE. As soon as the switch software on this SPE finishes its initialization, the standby SPE will be ready to perform background or SAT requested maintenance activity.
- **down/mismatch\_soft** This standby SPE is in down mode because the vintage of software in flash memory of the standby SPE does not match the vintage of the software in the active SPE. The standby SPE will stay in down mode until a successful software upgrade is performed to fix the software mismatch.
- **down/testing** This standby SPE is in down mode attempting to execute a SAT demanded **test** command.
- **down/not-refreshed** This standby SPE is in down mode executing a destructive background maintenance test that has temporarily left the standby memory not refreshed. Once the current test has completed a refresh of the standby SPE will be attempted by background maintenance and the mode will change.

- **down/analysis** This standby SPE is in down mode and is currently in the process of performing background maintenance testing in an effort to determine if the problem has been corrected.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SELECT SWITCH      | <p>The position of the SPE select switch on the Duplication Interface circuit pack is displayed in the SPE related information section. The switch can be in one of three positions:</p> <ul style="list-style-type: none"><li>— <b>auto</b><br/>The switch is in the position.</li><li>— <b>spe-a</b><br/>The switch is in the left position.</li><li>— <b>spe-b</b><br/>The switch is in the right position.</li><li>— <b>&lt;blank&gt;</b><br/>Always appears for the 1A and 1B SPE in a simplex system. In a system with High or Critical Reliability, a "<b>blank</b>" implies a hardware problem with the Duplication Interface circuit pack.</li></ul> |
| PE ALARMS - MAJOR  | <p>The number of Major alarms associated with the SPE complex that affect the fault severity level of this SPE is shown. If the system is simplex system, then the 1B SPE always shows blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SPE ALARMS - MINOR | <p>The number of Minor alarms associated with the SPE complex that affect the fault severity level of this SPE is shown. If the system is simplex system, then the 1B SPE always shows blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TONE/CLOCK         | <p>The location of the tone-clock circuit pack. | SERVICE STATE   | <p>The operational state of the TDM Bus circuit pack. The possible states are as follows:</p> <ul style="list-style-type: none"><li>— <b>in</b><br/>The TDM Bus is installed in the system and is in-service.</li><li>— <b>out</b><br/>The TDM Bus has failed certain maintenance tests and has been removed from service.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CONTROL CHANNEL | <p>Indicates whether the control channel is on this TDM Bus. Either <b>y(es)</b> or <b>n(o)</b> is displayed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DEDICATED TONES | <p>Indicates whether the dedicated tones are on this TDM Bus. Either <b>y(es)</b>, <b>n(o)</b> is displayed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PKT             | <p>The Packet Bus identifier, which is the same as the cabinet number. Valid Packet Buses are <b>1</b>, <b>2</b> and <b>3</b>. If the system is running on a X75XE cabinet all the PKT fields will be blank and the following will be displayed instead:</p> <p><b>S75XE does not support Packet</b></p> <p>Refer to Packet Bus Maintenance descriptions for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SERVICE STATE   | <p>The operational state of the Packet Buses. Possible states are:</p> <ul style="list-style-type: none"><li>— <b>in</b><br/>The Packet Bus is in-service and operating normally.</li><li>— <b>out</b><br/>The Packet Bus has failed certain maintenance tests and has been removed from service.</li><li>— <b>reconfig</b><br/>The Maintenance/Test circuit pack has swapped one or more signal leads because of lead faults detected during testing (High or Critical Reliability System only).</li><li>— <b>open lds</b><br/>The Maintenance/Test circuit pack can not correct all of the Packet Bus faults. There are open leads, but the Packet Bus is still at least partly functional (on a High or Critical Reliability System only).</li><li>— <b>unavail</b><br/>If the system has an EPN that is currently down, then <b>unavail</b> is displayed for the Packet Bus.</li><li>— <b>&lt;blank&gt;</b><br/>If the system does not have the Packet Bus feature, a blank is displayed.</li></ul> |

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BUS<br>ALARMS-MAJOR   | This <b>y</b> (es) or <b>n</b> (o) field shows whether Major alarms exist for packet bus components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| BUS<br>ALARMS-MINOR   | This <b>y</b> (es) or <b>n</b> (o) field shows whether Minor alarms exist for packet bus components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| BUS FAULTS            | This field indicates the number of faulty bus leads, where a fault is defined as either shorted to another lead, stuck at some value or an open lead. This field may take on any integer between 0 and 24. The system displays a blank if the Maintenance/Test circuit pack is not present, if the Packet Bus port of the Maintenance/Test circuit pack has been taken out-of-service or if the system does not have the Packet Bus feature.                                                                                                                                                        |
| OPEN BUS<br>LEADS     | This field indicates the number of bus leads which tests indicate have an open circuit between the Maintenance/Test circuit pack and bus terminator. Bus leads test open as a result of physical damage to the backplane or its connectors OR because a bus terminator is missing. This field may contain values between 0 and 24. The system displays a blank if the Maintenance/Test circuit pack is not present or has been take out-of-service, if the Packet Bus port of the Maintenance/Test circuit pack has been take out-of-service or if the system does not have the Packet Bus feature. |
| EMERGENCY<br>TRANSFER | The location of the Processor or EPN Maintenance circuit pack containing the Emergency Transfer Select Switch is displayed. Valid locations are <b>1A</b> and <b>1B</b> for the PPN, and <b>2A</b> or <b>3A</b> for the EPNs.                                                                                                                                                                                                                                                                                                                                                                       |

**SELECT SWITCH** The position of the Emergency Transfer Switch on the Processor(s) or the EPN maintenance circuit pack and the state of Emergency Transfer in the cabinet are displayed as follows:

— **on**

The switch is in the right position. If this is a Simplex PPN or an EPN, then designated analog phones in this cabinet are cut through to CO trunk lines. The switch should only be in this state in an emergency situation. In a High or Critical Reliability System, the Emergency Transfer Switches on both SPEs in the PPN must be in the **on** position before Emergency Transfer is invoked for the PPN.

— **off**

The switch is in the left position and regardless of Simplex or Duplex, PPN or EPN, Emergency Transfer is off and can not be invoked by the system software. The switch should only be in this state when a service technician is on sight.

— **auto-on**

The switch is in the or auto position, however, because of a serious system fault, system software has invoked Emergency Transfer.

— **auto-off**

The switch is in the or auto position and because the system has no serious faults, system software has **not** invoked Emergency Transfer.

— **unavail**

If the system has an EPN that is currently down, then **unavail** is displayed for the Emergency Transfer.

— **<blank>**

If the system is Simplex, then the 1B Emergency Transfer indication for the PPN will display a blank. If the system does not have an EPN, then both the 1A and 1B Emergency Transfer indications for the EPN will display a blank.

## EXP-LINK

An identifier of the Expansion Links that originate from this cabinet showing the locations of the two Expansion Interface circuit packs that make up the link. If the Expansion Link does not exist in the system then a - is displayed.

The following are valid Expansion Link identifiers for the PPN or Cabinet 1:

**"1A01-2A01", "1B01-2B02", "1A02-3A01", "1B02-3B02"**

The following are valid Expansion Link identifiers for the first EPN or Cabinet 2:

**"1A01-2A01", "1B01-2B02", "2A02-3A02", "2B03-3B03"**

The following are valid Expansion Link identifiers for the second EPN or Cabinet 3:

**"1A02-3A01", "1B02-3B02", "2A02-3A02", "2B03-3B03"**

SERVICE STATE      The operational state of the Expansion Interface Link. The possible states are as follows:

- **in**  
The Expansion Interface Link is installed in the system and is in-service.
- **out**  
The Expansion Interface Link has failed certain maintenance tests and has been removed from service.
- **<blank>**  
The Expansion Interface Link does not exist in the system.

- MODE
- **active**  
The Expansion Interface Link is in-service and is providing the active connectivity between the two cabinets.
  - **standby**  
The Expansion Interface Link is in-service and is ready to provide connectivity between the two cabinets should the active link fail.
  - **down**  
The Expansion Interface Link is out-of-service and can not provide connectivity between the two cabinets.
  - **<blank>**  
The Expansion Interface Link does not exist in the system.

|                |                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CABINET TYPE   | Indicates the type of physical cabinet containing this cabinet.                                                                                                    |
| — <b>MCC-</b>  | A Medium Carrier Cabinet capable of supporting up to 5 carriers. An MCC can run as either simplex or duplex as a PPN.                                              |
| — <b>SCC</b>   | A Single Carrier Cabinet capable of supporting up to 4 carriers. An SCC can run as either simplex or duplex as a PPN.                                              |
| — <b>EMCC-</b> | A Enhanced Medium Carrier Cabinet capable of supporting up to 5 carriers. An EMCC can only be a PPN cabinet. An EMCC can run as either simplex or duplex as a PPN. |
| — <b>ESCC-</b> | A Enhanced Medium Carrier Cabinet capable of supporting up to 4 carriers. A ESCC can only be a PPN cabinet. An ESCC can run as either simplex or duplex as a PPN.  |
| — <b>MICRO</b> | A Mirco or Wall Mounted cabinet always exists alone as an A carrier in the PPN. A MICRO cabinet can be only used in simplex systems.                               |

The following is an example of the fields contained on the output form.

Feature Interactions

None.

status trunk

This command displays the status of an individual trunk group member or all of the members in a particular group.

Synopsis

status trunk group/member print

Permissions

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

## Examples

status trunk 78  
status trunk 80  
status trunk 78/1  
status trunk 80/2  
status trunk 80/2 print

## Description

The status trunk command displays internal software state information for diagnosis. This command can help locate facilities to which the trunk is communicating.

If a trunk group number is entered without a member number, a list showing the status for each member in the specified group is displayed. If a trunk group number and member number are both entered, only status for the specified member is displayed.

## Defaults

None.

## Parameters

|        |                                                                                                                                                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group  | The group number is an administered number associated with each trunk group. The valid range is 1 - 99. If a group number is entered without a member number, a list showing the status of each member in the group is displayed. |
| member | The member number is an administered number identifying a particular member within a trunk group. The valid range is 1 - 99. If a member number is entered, status for that member only is displayed.                             |
| print  | This will cause the report to be printed if a printer is linked to the SAT.                                                                                                                                                       |

## Help Messages

If the system technician presses HELP after entering "status trunk", the following message is displayed:

```
Enter assigned trunk group(1-99)
or [group/member(1-99)], ['print']
```

## Error Messages

If the format of the trunk identifier is incorrect, the following error message is displayed:

Format invalid

If the trunk identifier is not in the valid range, the following error message is displayed:

Trunk or trunk group invalid

If the trunk group is not administered or has no members, the following message is displayed:

Group not assigned, or group assigned  
but with no member

If the trunk group member is not administered, the following message is displayed:

Group member not assigned

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

**MEMBER Output**

---

The following is output when a user enters a trunk group and member:

|                    |                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trunk Group/Member | The trunk group number and group member number. Valid identifiers are 1-99/1-99.                                                                           |
| Port               | The port location (cabinet-carrier-slot-circuit) of the trunk.                                                                                             |
| Signaling Group ID | If the trunk is of type ISDN, then this field contains the number of the ISDN Signaling Group to which this group belongs. Otherwise, this field is blank. |
| Connected Ports    | Port locations (cabinet-carrier-slot-circuit) connected to the trunk.                                                                                      |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service State    | Whether the trunk is in service or out of service. One of the following states is displayed: in-service/active, in-service/idle, out-of-service, out-of-service-NE (Near End), out-of-service-FE (Far End), maint-NE/active, maint-FE/active, maint-NE/idle, maint-FE/idle, pending-in-service, pending-maint, or disconnected. NE (Near End) and FE (Far End) refer to which "end" of the trunk has placed the facility in the state that it is in. |
| Maintenance Busy | Whether there is any maintenance testing being performed upon the trunk.                                                                                                                                                                                                                                                                                                                                                                             |
| CA-TSC State     | The state of the temporary signaling connection. A temporary signaling connection is a connection set up to pass call information over PRI signaling links.                                                                                                                                                                                                                                                                                          |

For the following output example, the command that was entered is "status trunk 78/1".

status trunk 78/1

TRUNK STATUS

Trunk Group/Member: 078/001Service State: in-service/idle  
Port: 01C1505Maintenance Busy? no

Connected Ports:

GROUP Output

The following is output when a user enters only a trunk group:

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Member          | The trunk group number and group member number. Valid identifiers are 1-99/1-99.                                                                                                                                                                                                                                                                                                                                                                     |
| Port            | The port location (cabinet-carrier-slot-circuit) of the trunk.                                                                                                                                                                                                                                                                                                                                                                                       |
| Service State   | Whether the trunk is in service or out of service. One of the following states is displayed: in-service/active, in-service/idle, out-of-service, out-of-service-NE (Near End), out-of-service-FE (Far End), maint-NE/active, maint-FE/active, maint-NE/idle, maint-FE/idle, pending-in-service, pending-maint, or disconnected. NE (Near End) and FE (Far End) refer to which "end" of the trunk has placed the facility in the state that it is in. |
| Mtce Busy       | Whether there is any maintenance testing being performed upon the trunk.                                                                                                                                                                                                                                                                                                                                                                             |
| Connected Ports | Port locations (cabinet-carrier-slot-circuit) connected to the trunk.                                                                                                                                                                                                                                                                                                                                                                                |

For the following output example, the command that was entered is "status trunk 78".

```
status trunk 78
```

| TRUNK GROUP STATUS |         |                 |      |                 |
|--------------------|---------|-----------------|------|-----------------|
| Member             | Port    | Service State   | Mtce | Connected Ports |
|                    |         |                 | Busy |                 |
| 078/001            | 01C1505 | in-service/idle | no   |                 |
| 078/002            | 01C1506 | in-service/idle | no   |                 |

Feature Interactions

None.

status tsc-administered

This command displays the operational status of Temporary Signaling Connections (TSCs) for a signaling group.

Synopsis

status tsc-administered signaling group *#/tsc index print*

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

status tsc-administered 1  
status tsc-administered 1/1  
status tsc-administered 1/2 print

Description

The status tsc-administered command displays the operational status of TSC's administered for an administered signaling group. The status represents the state of the TSC according to switched services.

## Defaults

None.

## Parameters

|                   |                                                                         |
|-------------------|-------------------------------------------------------------------------|
| signaling group # | An administered number associated with each signaling group.            |
| tsc index         | A number associated with each TSC in a signaling group.                 |
| print             | This causes the report to be printed if a printer is linked to the SAT. |

## Help Messages

If the system technician presses **HELP** after entering "status tsc-administered" the following message will be displayed:

```
Enter sig group # (1-8) /tsc index # (1-64),  
['print']
```

## Error Messages

If the format for the specified signaling group or the signaling group and TSC is incorrect, the following message is displayed:

```
Format invalid
```

If the specified signaling group number is out of range, the following message is displayed:

```
Signaling group invalid
```

If the specified signaling group is not administered, the following message is displayed:

```
No signaling group assigned
```

If the specified signaling group has no TSC assigned or the specified TSC is unadministered, the following message is displayed:

```
No TSC assigned
```

If the specified TSC number is out of range, the following message is displayed:

```
Tsc index invalid
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|           |                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TSC Index | The administered TSC index (1-64).                                                                                                                                                                                                                                                                                                                                                                                      |
| TSC State | The state of the administered TSC. A state of "inactive" means that the administered TSC is not functioning (i.e. D-channel out-of-service, or disabled, etc.). A state of "active" indicates that the administered TSC is up and user information can be exchanged end-to-end. A state of "pending-inactive" shows that the TSC is being released. A state of "pending-active" means that the TSC is about to come up. |
| Establish | This field refers to the switch responsible for the origination of the administered TSC. A state of "as-needed" shows that the TSC is established on an as needed basis. A state of "permanent" shows that the TSC is permanently established.                                                                                                                                                                          |
| Enabled   | Indicates if the administered TSC's have been enabled ("yes" or "no").                                                                                                                                                                                                                                                                                                                                                  |
| Congested | This field indicates the administered TSC congestion history (i.e. whether the network can handle the receipt of USER INFORMATION messages for the administered TSC). A "yes" in this field indicates that the administered TSC is congested. A "no" indicates that the administered TSC is not congested. A "clear" in this field denotes the administered TSC congestion was cleared during its' active period.       |

For the following output example, the command that was entered was "status tsc-administered 1/1".

```
status tsc-administered 1/1
```

| ADMINISTERED NON-CALL-ASSOCIATED TSC STATUS |           |           |         |           |
|---------------------------------------------|-----------|-----------|---------|-----------|
| TSC Index                                   | TSC State | Establish | Enabled | Congested |
| 1                                           | inactive  | as-needed | yes     | no        |

# status tti

---

This command displays the status of the TTI (Terminal Translation Initialization) background maintenance task.

## Synopsis

---

status tti *print*

## Permissions

---

The following default logins may execute this command: system technician, inads, cust init, nms, browse.

## Examples

---

status tt  
status tti print

## Description

---

The status tti command displays the status (active/not active) of the tti background maintenance task and if it is active, then it will display whether tti ports are being generated or removed, the number of tti-supported boards that have processed, and the number of tti-supported boards that have not yet been processed. The display also includes the elapsed time since the background maintenance task started.

## Defaults

No defaults.

## Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

## Help Messages

If the system technician presses HELP after entering "status tti", the following message will be displayed:

[ 'print' ]

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit.

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later.

Output

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TTI Background Task State:       | The state of the tti background maintenance task: generating tti ports, removing tti ports, suspended, not active, completed - all ports translated, completed - some ports not translated. If the last execution of the background task completed normally, then "completed - all ports translated" is displayed here. If the task completed due to resource exhaustion with some ports left untranslated, then "completed - some ports not translated" is displayed in this field. |
| TTI State:                       | The tti state field contains "off" if the TTI feature is not enabled for the system or if it is enabled then it contains what kind of tti ports are being generated or removed: voice, data.                                                                                                                                                                                                                                                                                         |
| # of Boards Completed:           | The number of TTI-supported boards that have had been processed by the background maintenance task. A "completed" board has either had all its unadministered ports translated as TTI ports or its TTI ports have been removed and are now unadministered ports. This depends on whether the TTI background task is generating or removing tti ports.                                                                                                                                |
| # of Boards Left to Process:     | The number of TTI-supported boards that have not yet been processed by the background maintenance task.                                                                                                                                                                                                                                                                                                                                                                              |
| Percent Complete:                | A ratio of the of number of boards completed and the number of boards left to process.                                                                                                                                                                                                                                                                                                                                                                                               |
| Elapsed Time since Task Started: | The amount of time that has elapsed since the TTI background task was started. If the task is "not active", then this field will blank. If the task is "completed" it will indicate the length of time it took to complete the task. If the task is "suspended", then it will display the elapsed time at the point the task was suspended. The time is displayed in the HH:MM format where HH is hours and MM is minutes.                                                           |

For the following output example, the command "status tti" was entered.

status tti

Page 1 of 1

TTI STATUS

TTI Background Task State: generating tti ports

TTI State: voice

# of Boards Completed: 30

# of Boards Left to Process: 120

Percent Complete: 25

Elapsed Time since Task Started: 0:15

### Feature Interactions

The TTI Background maintenance task is activated by enabling the TTI system parameter on the system-parameters features administration form.

## test access-endpoint

This command will perform hardware diagnostic tests on all port circuits that are associated with the specified access endpoint extension.

### Synopsis

test access-endpoint extension [ short | long ] repeat number schedule

### Permissions

The following default logins may execute this command: system technician, inads, init, nms.

### Examples

- test access-endpoint 25012
- test access-endpoint 45002 sh
- test access-endpoint 45892 l
- test access-endpoint 24389 sh r 4
- test access-endpoint 34899 l r 6
- test access-endpoint 34912 l r 5 schedule
- test access-endpoint 93483 r 2
- test access-endpoint 10022 c
- test access-endpoint 92349 schedule

## Description

The test access-endpoint command performs hardware diagnostic tests on all port circuits that are associated with the specified access endpoint.

## Defaults

The default for the command is short with repeat number of 1.

## Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extension     | The extension of the access endpoint to be tested. The number of digits in an extension is determined by the dial-plan.                                                                                                                                                                                                                                                                                                                                   |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                       |
| long          | This will execute a more comprehensive and longer version of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                             |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                         |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

## Help Messages

If the user presses HELP after entering "test access-endpoint", the following message is displayed:

```
Enter extension number, ['long' or 'short'],
                        ['repeat' (1-100)], ['schedule']
```

## Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the access endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

Extension not assigned

If the object associated with the specified extension is not an access endpoint, the following message will be displayed:

Extension assigned to object  
other than access-endpoint

If the board that contains the access endpoint is not inserted in the system, the following message will be displayed:

Board not inserted

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a port-by-port and test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                                                                        |
| Maintenance Name | The type of maintenance object that is being tested. For wideband access endpoint the maintenance name for each port is "WAE-PORT". For single port access endpoint the maintenance name is "TIE-DS1". |
| Alt. Name        | The alternate way of identifying the maintenance object. This field contains the extension number of the access endpoint.                                                                              |
| Test No          | The actual test that is being executed.                                                                                                                                                                |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED."                                                                                                                    |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.                                                     |

For the following output example, the command "test access-endpoint 22502" was entered. Assume that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6.

test access-endpoint 22502 shortpage 1 of 1

| TEST RESULTS |                  |           |          |        |            |  |
|--------------|------------------|-----------|----------|--------|------------|--|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |  |
| 01C1101      | WAE-PORT         | 22502     | 36       | PASS   |            |  |
| 01C1102      | WAE-PORT         | 22502     | 36       | PASS   |            |  |
| 01C1103      | WAE-PORT         | 22502     | 36       | PASS   |            |  |
| 01C1104      | WAE-PORT         | 22502     | 36       | PASS   |            |  |
| 01C1105      | WAE-PORT         | 22502     | 36       | PASS   |            |  |
| 01C1106      | WAE-PORT         | 22502     | 36       | PASS   |            |  |

Command Successfully Completed

Feature Interactions

None.

test alarms

This command tests the hardware associated with selected alarms

Synopsis

test alarms auto-page failures step [ short | long ][ repeat number | clear ]

Permissions

The following default logins may execute this command: system technician, inads, init, nms.

Examples

- test alarms
- test alarms step failures
- test alarms long clear auto-page
- test alarms long failures

## Description

---

This command allows the technician to automatically test all of the hardware that is associated with the active alarms in the alarm log. This command provides a query form to help the user narrow the selection of alarmed objects. Once the form is filled out, the user presses "ENTER" and the hardware associated with the selected alarm log entries is tested. The results will be displayed in standard test output and status information will be displayed on the message line as the command progresses.

Several alarms may be logged against a single maintenance object, each alarm representing a different problem. Even if there are multiple entries in the alarm log for a single object, the test alarms command will only test each physical object once.

## Defaults

The default options for this command are: short, repeat of 1.

Parameters

auto-page      This option provides the ability to continue testing and displaying test results, by providing a new screen every time the SAT screen is filled with test results. The screen does not scroll to accommodate new results; instead a new screen is provided after the current screen fills up.

If the auto-page option is not specified, the SAT screen will not be refreshed once it is filled with test results and testing will stop until the user enters the "PAGE" key to continue or the "CANCEL" key to halt the testing.

failures      This requests that only the failures be displayed on the screen. All passes will not be displayed on the output screen. Hardware failures as well as aborts, conflicts and EPN-down failures will be displayed.

step      This option will allow the user to step to the next or previous alarm and not have the current alarm tested. When this option is specified, the user is presented with the alarm information and prompted for a keypress. The user may enter CANCEL to abort the command, ENTER to test the currently displayed alarm, NEXT ALARM (function key) to move to the next alarm, PREV ALARM (function key) to move to the previous alarm without testing the currently displayed alarm. If this option is given, then the NEXT ALARM (function key) or PREV ALARM (function key) may be pressed at any time during the command (even during test results). If the NEXT ALARM or PREV ALARM is pressed during a test, the test is aborted, testing of the current alarm stops, and the next alarm or previous alarm is displayed. If the first alarms is displayed, and the PREV ALARM is pressed, then the last alarm is displayed. Also, if the last alarm is currently displayed, and the NEXT ALARM is requested, then the first alarm will be shown.

 **NOTE:**  
When this option is given the only way to terminate this command is to press CANCEL.

short      This will cause the command to execute a series of nondestructive diagnostic tests.

- long

This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
- repeat number

The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
- clear

This option causes the test sequence (short or long) to repeat until the alarm is cleared or a single test in the sequence fails. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

 **WARNING:**  
*Executing a clear with short option, may not clear all alarms even if all tests pass.*

 **WARNING:**  
*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

## Help Messages

If the technician presses HELP after entering "test alarms" the following message will be displayed:

```
Enter ['auto-page'], ['failures'], ['step'],
['short' or 'long'], ['repeat' (1-100) or 'clear']
```

## Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

QUERY FORM INPUT

After entering the command "test alarms", the system technician will be presented with an options form for alarm selection.

```
test alarms repeat 1

      HARDWARE TEST ALARM QUERY

The following options control which alarms will be tested.

ALARM TYPES
  Major? y_      Minor? y_      Warning? y_

REPORT PERIOD
  Interval: m_   From: __/__/__:__   To: __/__/__:__

EQUIPMENT TYPE ( Choose only one, if any, of the following )
      Cabinet: __
      Port Network: __
      Board Number: ____
      Port: _____
      Category: _____
      Extension: _____
Trunk ( group/member ): __/__
```

- Alarm Types

The type of alarm to be tested is specified by placing a 'y' or 'n' in the alarm type fields. The technician can choose a combination of active alarms: major, minor, and/or warning.
- Interval

Test alarms for records for the last hour (h), last day (d), last week (w) or all (a). The default is all.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| From           | Test alarm associated with records from the time specified by mm/dd/hh/mm, where mm month, dd is the day, hh is the hour and mm is the minute. If no "from" date is entered, then no checking is done. This will give the user all the alarms active since a month prior to the current time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| To             | Test alarms associated with records to the time specified by mm/dd/hh/mm, where mm is the month, dd is the day, hh is the hour and mm is the minute. If no "to" date is entered, any alarm which is active after the from date will be selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Equipment Type | <p>The technician can choose between five different equipment types. If there is no input to any of these fields, the system will default to all the equipment. The user can select one of the following fields:</p> <ul style="list-style-type: none"><li>■ Cabinet: This allows the technician to test all alarms associated with a particular cabinet. Alarms for a cabinet are referenced by a number ranging from 1 to 3 which is assigned during cabinet administration.</li><li>■ Port Network: This allows the technician to test all alarms associated with a particular port network. Alarms for a port network are referenced by a number ranging from 1 to 3.</li><li>■ Board Number: This allows the technician to choose all alarms associated with a particular circuit pack for testing. Alarms for a circuit pack are referenced by circuit pack location (cabinet-carrier-slot). If the cabinet number is omitted, the system will default to 1.</li><li>■ Port: This allows the technician to choose all alarms associated with a particular port on a circuit pack for testing. Alarms for a port circuit are referenced by port location (cabinet-carrier-slot-circuit). If the cabinet number is omitted, the system will default to 1.</li><li>■ Category: Alarms for a particular equipment category.</li><li>■ Extension: Alarms associated with an extension number.</li><li>■ Trunk (group/member): The technician can choose to test all alarms associated with a particular trunk group or trunk group member. The group identifier should be entered to test all alarms associated with a trunk group (XX/__). The group identifier and member identifier should both be entered to test all alarms associated with a specific trunk group member (XX/XX).</li></ul> |

Field Help

Following are the help messages that the system technician will see upon tabbing to the specified field and pressing the HELP key.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Output

The responses, with normal output, will be displayed on a test-by-test basis with one line of data displayed for each test result. With the failures option only the tests that have failed will be displayed.

The following output fields are for the ALARM ENTRY section:

|                  |                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The location of the alarmed object (cabinet-carrier-slot-circuit). This is the same identifier as used by the alarm log.                          |
| Maintenance Name | The logical name of the maintenance object which has been alarmed.                                                                                |
| On Board         | Whether the fault detected is on the associated circuit pack, or an off board element connected to the circuit pack.                              |
| Alt Name         | Terminal extension numbers or trunk group numbers.                                                                                                |
| Alarm Type       | Major, Minor, or Warning. This is an indicator to the seriousness of the alarm raised.                                                            |
| Service State    | RDY (ready for service), OUT (out of service), or IN (in service). This is the current service state of the station and trunk ports shown.        |
| Ack              | The columns under the "1" and "2" headings denote if the alarm has been acknowledged by the first and second OSS telephone numbers, respectively. |
| Date Alarmed     | Day, hour, and minute of alarm.                                                                                                                   |
| Alarm Count      | This field contains the count of the current alarm entry verses the total number of alarms to be tested.                                          |

The following fields are displayed for the test results:

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                                                                                                                                                                                                                         |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                                                                                                                                                    |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Test No          | The actual test that is being executed.                                                                                                                                                                                                                                                                                                                 |
| Result           | An indicator as to whether the test failed, passed, aborted or no hardware was available (no board). If this field has conflict, this means that another user was testing this hardware. If this field has epn-down it means that the epn is inaccessible at this time.                                                                                 |
| Error Code       | A numerical description of why the test failed or was aborted.                                                                                                                                                                                                                                                                                          |

When errors are encountered preparing a particular object to be tested (not inserted, contention, etc.) the an error message will be displayed. This error message will be displayed in the TEST RESULTS data.

For the following output example, assume that only one alarm was in the alarm log and it is on the board in cabinet 1, carrier c, slot 7. The command that was entered was "test alarms" and the query form was left empty by just pressing "ENTER"

test alarms

Page1

ALARM ENTRY

| Port  | Maintenance Name | On Brd? | Alt Name | Alarm Type | Svc State | Ack? 1 2 | Date Alarmed | Alarm Count |
|-------|------------------|---------|----------|------------|-----------|----------|--------------|-------------|
| 01C03 | UDS1-BD          | n       |          | WARNING    |           |          | 03/06/16:48  | 1/4         |

TEST RESULTS

| Port  | Maintenance Name | Alt. Name | Test No. | Result   | Error Code |

| 01C03 | UDS1-BD          |           | 144      | NO BOARD |            |
| 01C03 | UDS1-BD          |           | 145      | NO BOARD |            |
| 01C03 | UDS1-BD          |           | 146      | NO BOARD |            |

Testing completed for this object.

press CANCEL to quit -- press NEXT PAGE to continue

## Feature Interactions

---

With the enhancement of multiple maintenance users, there may be a possibility of two users attempting to test the same physical hardware (for example, one via the test alarms command and another through the test board command). If this command should attempt to test a board that is currently being tested by another user, a error message is displayed.

## test analog-testcall

---

This command will place an analog test call on a trunk or a group of trunks.

### Synopsis

---

*test analog-testcall [ trunk group number/member number | port location | board location ] [ full | supervision | no-selftest | no-return-loss | no-st-or-rl ][ repeat number ] schedule*

### Permissions

---

The following logins may execute this command: system technician, inads, cust, init.

### Examples

---

```
test analog-testcall trunk 78 f
test analog-testcall trunk 78 f schedule
test analog-testcall trunk 80/1 s r 2
test analog-testcall trunk 80/1 s r 2 schedule
test analog-testcall trunk 78/2 no-selftest r 10
test analog-testcall trunk 78/2 no-selftest r 10 schedule
test analog-testcall trunk 78 r 4
test analog-testcall trunk 78 r 4 schedule
test analog-testcall port 2a1505 no-st-or-rl r 4
test analog-testcall port 2a1505 no-st-or-rl r 4 schedule
test analog-testcall board 2a15
test analog-testcall board 2a15 schedule
test analog-testcall port 2a1505 no-return-loss
test analog-testcall port 2a1505 no-return-loss schedule
te an t 80
te an t 80 schedule
```

## Description

The test analog-testcall command performs facility diagnostic tests on an entire trunk group, an individual trunk group member, an individual trunk port or on all trunks on a board, depending on the options entered by the technician. The type of test call, the far end test line number and the various other test call related parameters must be administered on the trunk group form before executing the command. Press HELP.

Normally the user should only invoke the full or supervision test. The other options are provided primarily for testing when setting up an ATMS schedule.

## Defaults

The default for the command is full with the repeat of 1.

## Parameters

|                |                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group number   | The group number is an administered number associated with each trunk group.                                                                                                                                                                                                                                                                    |
| member number  | The member number is an administered number identifying a particular trunk within a trunk group. If a group number is entered, and no member number is given, then all trunks in the group will be tested.                                                                                                                                      |
| location       | A "location" represents the physical position of the board or port to be tested and is entered as "UUcSSpp" where "UU" represents the cabinet number, "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit. A cabinet number (1 - 3) may be entered. The "pp" should be omitted for a board location. |
| full           | This will execute the most comprehensive test call available using the administered test set type.                                                                                                                                                                                                                                              |
| supervision    | This will cause the system to execute a supervision only test call. It will take about 10 seconds and will only confirm the presence of the test set at the far end.                                                                                                                                                                            |
| no-selftest    | This will execute the "full" test, but will skip any self test sequences. This saves about 20 seconds on the type 105 transmission test and will not have any effect on type 100 transmission tests or on type 102 transmission tests.                                                                                                          |
| no-return-loss | This will execute the "full" test, but will skip any return loss sequences. This saves about 20 seconds on the type 105 transmission test and will not have any effect on type 100 transmission tests or type 102 transmission tests.                                                                                                           |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no-st-or-rl   | This will execute the "full" test, but will skip all self test and return loss sequences. This saves about 40 seconds on the type 105 transmission test and will not have any effect on type 100 transmission tests or type 102 transmission tests.                                                                                                                                                                                                       |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                         |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

## Help Messages

If the system technician presses HELP after entering "test analog-testcall" a message showing the following keywords is displayed:

```
trunk board port
```

If the system technician presses HELP after entering "test analog-testcall trunk," the following message will be displayed:

```
Enter group number or group number/member number,
    ['full' or 'supervision' or 'no-selftest'
     or 'no-return-loss' or 'no-st-or-rl'],
    ['repeat 1-100'], ['schedule']
```

If the system technician presses HELP after entering "test analog-testcall port" the following message will be displayed:

```
Enter trunk port number ['full' or 'supervision'
    or 'no-selftest' or 'no-return-loss'
    or 'no-st-or-rl'], ['repeat 1-100'], ['schedule']
```

If the system technician presses HELP after entering "test analog-testcall board" the following message will be displayed:

```
Enter trunk board number, ['full' or 'supervision'
    or 'no-selftest' or 'no-return-loss'
    or 'no-st-or-rl'], ['repeat 1-100'], ['schedule']
```

## Error Messages

If the format for the trunk location is incorrect, the following message displays:

```
Format invalid
```

If the trunk group or member range is invalid, the following message displays:

```
Trunk or trunk group invalid
```

If the board is not inserted, the following message will be displayed:

Board not inserted

If the specified board does not have any maintenance objects associated with it, the following message will be displayed:

No MO in this board

If the EPN on which the board resides is not available, the following message will be displayed:

EPN is not available

If there is a software communication problem, the following message displays:

Error encountered, can't complete request

If the trunk group is not administered, the following message displays:

Group not assigned, or group  
assigned but with no member

If the trunk group member is not administered, the following message displays:

Group member not assigned

If no tests can be found for the associated MO, the following message is displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

If the format for the board or port location is incorrect, the following message displays:

Port/Board invalid

## Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                                                                       |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                  |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number.                  |
| Test No.         | The actual test that is being executed.                                                                                                                                                               |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                                                                       |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO (for example, CO_TRK Transmission Tests (#844-849). |

For the following output example, assume that the command that was entered was "test analog-testcall trunk 78".

```
test analog-testcall trunk 78
```

TEST RESULTS

| Port    | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|---------|------------------|-----------|----------|--------|------------|
| 01C1505 | CO-TRK           | 78/1      | 845      | PASS   |            |
| 01C1507 | CO-TRK           | 78/2      | 845      | PASS   |            |

Command Successfully Completed

## Feature Interactions

Additional data is available after running a test. See the list measurements test-calls command for details on how to access the additional data.

If the trunk is in use by call processing the test will abort.

If the trunk is in use by maintenance, the test will queue and will run when the current maintenance activity finishes.

# test board

---

This command will perform a set of hardware diagnostic tests on the specified circuit pack. The tests will vary according to the type of pack and short or long request.

## Synopsis

---

test board location [ short | long ][ repeat number | clear ] schedule

## Permissions

---

The following default logins may execute this command: system technician, inads, init, nms.

## Examples

---

test board 01c11 l  
test board 01c11 l schedule  
test board 02e15 sh r 2  
test board 01c08  
test board 02d12 r 4  
test board 02d12 c

## Description

---

The test board command will validate that the board exists at the specified location. Based on the logical type (e.g., Analog, Digital, Hybrid, etc.) of board a series of tests will be executed. Each individual test will exercise diagnostics on the board and then return results of the test along with any possible error codes.

Some of the tests can be disabled by administering forms on the administration terminal.

## Defaults

The default for the command is short with the repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | A "location" represents the physical position of the board to be tested. For R3 Standard cabinets a location is entered as "UUcSS" where "UU" represents the cabinet number, "c" represents the carrier, and "SS" represents the slot position. A single digit cabinet (1 - 9) may be entered with or without a leading zero (0).                                                                                                                                                   |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This executes a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                          |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |

 **WARNING:**

*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses HELP after entering "test board" the following message will be displayed:

```
Enter board location, ['long' or 'short'],  
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the format for the board location is incorrect, the following error message will be displayed:

Port/Board invalid

If the EPN in which the specified board resides is not available, the following message will be displayed:

EPN is not available

If the specified board is not configured in the system, the following message will be displayed:

Board not assigned

If the request for all maintenance objects associated with the board fails, the following message will be displayed:

No MO in this board

If no tests can be found for the associated MO, the following message displays:

No tests for this MO

If the specified board is a Switch Node Interface (SNI) board which resides on the active Port Network Connectivity (assuming PNC is duplicated) and a long test has been specified, the following message will be displayed:

Must busyout specified object first

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

The responses display on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                                                                                                                                                                                                                         |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                                                                                                                                                    |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |
| Test No          | The actual test that is being executed.                                                                                                                                                                                                                                                                                                                 |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                                                                                                                                                                                                                         |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.                                                                                                                                                                                                   |

For the following output example, the command entered was "test board 1c07".

```
test board 01C07 short

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01C07     ANL-BD              51         PASS
01C07     ANL-BD              52         PASS
01C0703   ANL-LINE                  35         PASS
01C0703   ANL-LINE                  48         PASS
01C0703   ANL-LINE                  36         PASS
01C0701   ANL-LINE                  35         PASS
01C0701   ANL-LINE                  48         PASS
01C0701   ANL-LINE                  36         PASS
01C0702   ANL-LINE                  35         PASS
01C0702   ANL-LINE                  48         PASS
01C0702   ANL-LINE                  36         PASS

Command Successfully Completed
```

## Feature Interactions

Destructive long tests on a Switch Node Interface (SNI) board are not allowed unless the board has been busied out.

## test card-mem

This command will initiate a test sequence on the specified memory card.

### Synopsis

test card-mem location [ short | long ] [ repeat number | clear ] schedule

### Permissions

The following default logins may execute this command: init, inads, system technician.

### Examples

test card-mem  
test card-mem a l  
test card-mem b sh r 2  
test card-mem a sch  
test card-mem a c

### Description

The "test card-mem" command executes a sequence of tests on the memory card in the specified switch processor element. The test sequences in order for both "long" and "short" versions are described in the following table:

| TEST                                               | Included<br>In Short? | Included<br>In Long? |
|----------------------------------------------------|-----------------------|----------------------|
| 12 Volt Power Supply Test (#701)                   | Yes                   | Yes                  |
| Memory Card Insertion Test (#695)                  | Yes                   | Yes                  |
| Memory Card Format and Read Test (#696)            | Yes                   | Yes                  |
| Memory Card Match Test (#697)                      | Yes                   | Yes                  |
| Memory Card Write-Protected Test (#698)            | Yes                   | Yes                  |
| Memory Card Directory Recovery Test (#699)         | Yes                   | Yes                  |
| Memory Card Translation Data Integrity Test (#694) | No                    | Yes                  |
| Memory Card Erase/Write/Read Test (#693)           | No                    | Yes                  |
| Memory Card Capacity Test (#1014)                  | No                    | Yes                  |
| Flash Data Consistency Test (#421)                 | No                    | Yes                  |

The tests in the sequence can verify the sanity of the memory card device, the basic read/erase/write operations to the memory card, the integrity of the translation data stored in the memory card, the function of 12 volt power supply in TN777B NETCON circuit pack used for memory card erase/write operations, the translation capacity of the memory card, and the consistency of data stored in both memory cards in a High or Critical Reliability System. This command can help system technician to trouble-shoot the hardware errors related to maintenance objects such as "CARD-MEM", "12V-PWR", CAP-MEM, and "FL-DATA" logged in the system hardware error log. The details of test results and the repair procedures for recovery are described in Maintenance Service Document associated with each maintenance object.

If the switch is a simplex system, then the "Flash Data Consistency Test" is not executed.

## Defaults

The defaults for this test command are "short" with a repeat number of "1". The location of carrier where the memory card resides must be specified in the command line for a High or Critical Reliability System.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | This parameter indicates the carrier location where the memory card resides in a High or Critical Reliability System (i.e. "a" or "b"). In a duplicated switch configuration, it can be either "a", "A", "b", or "B".                                                                                                                                                                                                                                                               |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |

 **WARNING:**

*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses HELP after entering "test card-mem", the following message is displayed for a simplex switch configuration:

```
Enter ['long' or 'short'], ['repeat' (1-100)
      or 'clear'], ['schedule']
```

For a duplex switch configuration, the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B), ['long' or 'short'],  
      ['repeat' (1-100) or 'clear'], ['schedule']
```

## Error Messages

If the SPE is not active, the following message will be displayed:

```
Command must be executed from active SPE
```

If the carrier entered is invalid, the following message will be displayed:

```
"entered value" is an invalid identifier;  
press RETURN to execute modified command
```

If the NETCON board is not TN777B, the following message is displayed:

```
Must install TN777B circuit pack
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering  
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;  
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;  
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed

```
Standby SPE busy with another task;  
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;  
for information use "status system 1"
```

## Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested. This object is always associated with cabinet 1. The carrier is "A" for the control carrier A in a simplex system, and it can be either "A" or "B" for the control carriers A and B in a duplex system. The slot and circuit fields of port address for the maintenance objects, 12V-PWR, CAP-MEM, and CARD-MEM, are always blank. The port address for maintenance object "FL-DATA" is blank. |
| Maintenance Name | The type of maintenance object that is being tested - "CARD-MEM" for the memory card; "12V-PWR" for 12 volt power supply in TN777B NETCON board; "CAP-MEM" for memory card capacity; and "FL-DATA" for the data consistency stored in memory cards in a duplicated switch.                                                                                                                                                                                                                     |
| Test No          | The actual test that is being executed.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Result           | An indicator such as PASS for test passed, FAIL for test failed, ABORT for test was aborted.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Error Code       | A system-generated number that tells why the individual test failed or was aborted. A detailed list of the codes according to "Test No." is provided for each maintenance object.                                                                                                                                                                                                                                                                                                              |

For the following output example, the command "test card-mem" was entered.

```
test card-mem a long                               SPE A

TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result    Error Code
01A       12V-PWR              701        PASS
01A       CARD-MEM               695        PASS
01A       CARD-MEM               696        PASS
01A       CARD-MEM               697        PASS
01A       CARD-MEM               698        PASS
01A       CARD-MEM               699        PASS
01A       CARD-MEM               694        PASS
01A       CARD-MEM               693        PASS
01A       CAP-MEM               1014       PASS
           FL-DATA          421        PASS

Command successfully completed
```

## Feature Interactions

---

The "test card-mem long" command will invoke the Memory Card Erase/Write/Read Test. This means that the "save translation" and "save announcement" commands will be rejected while a write-to-memory-card operation is active.

The "test card-mem long" command will also invoke the Memory Card Capacity Test which will check if the memory card is more than 98% full or not. This test will also be invoked after a "save translation" command.

In a High or Critical Reliability System, running "test card-mem" command for a memory card in the standby SPE means that the standby SPE is put into the maintenance mode and no SPE interchange is allowed through the "reset system interchange" command or scheduled SPE interchange.

## test cdr-link

---

This command will perform a set of tests on a call detail recording (cdr)-link.

## Synopsis

---

test cdr-link [ primary | secondary ][ *short* | *long* ][ *repeat number* | *clear* ]  
*schedule*

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

test cdr-link primary l  
test cdr-link secondary sh r 2  
test cdr-link primary  
test cdr-link secondary  
test cdr-link secondary c  
test cdr-link primary schedule

## Description

---

The test cdr-link command will validate that the call detail recording (cdr)-link has been administered and exists in the PBX. Each individual test will exercise diagnostics on the link and then return results of the test along with any possible error codes.

For information on what a CDR link is and does, see the second paragraph in the "Description" section of the "status cdr-link" manual pages.

**Defaults**

The default for the command is short with the repeat of 1.

**Parameters**

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link-id       | A "Link-id" is either "primary" or "secondary".                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

**Help Messages**

If the system technician presses HELP after entering "test cdr-link" the following message will be displayed:

Enter 'primary' or 'secondary'

If the system technician presses HELP after entering "test cdr-link primary" or "test cdr-link secondary" the following message will be displayed:

Enter ['long' or 'short'],  
['repeat' (1-100) or 'clear'], ['schedule']

**Error Messages**

If the link is not administered, the following error message will be displayed:

Link not administered or not enabled

If no tests can be found for the link, the following message will be displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | Not applicable. Will always be blank.                                                                                                              |
| Maintenance Name | The type of MO being tested. If testing primary cdr-link the MO is PRI-CDR, else if testing secondary cdr-link the MO is SEC-CDR.                  |
| Alt. Name        | Not applicable. Will always be blank.                                                                                                              |
| Test No          | The actual test that is being executed.                                                                                                            |
| Result           | The result of the individual test - "PASS", "ABORT", "FAIL", "DISABLED".                                                                           |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following example, the command entered was "test cdr-link primary".

test cdr-link primary short

## test customer-alarm

---

This command allows the technician to test the leads for a customer-provided alarming device on the Processor and EPN maintenance circuit packs.

### Synopsis

---

test customer-alarm location [ short | long ][ repeat number | clear ] schedule

### Permissions

---

The following default logins may execute this command: system technician, inads, init.

### Examples

---

test customer-alarm  
test customer-alarm schedule  
test customer-alarm 02 r 2  
test customer-alarm 01b r 25  
test customer-alarm 01b r 25 schedule  
test customer-alarm 2a  
test customer-alarm 2a sh  
test customer-alarm 01b l schedule  
test customer-alarm 3 c

### Description

---

The test customer-alarm command performs hardware diagnostic tests on the leads of the Processor and EPN maintenance circuit packs. These are used for customer provided alarms by closing the appropriate relay for one minute. Failure is verified by the technician checking the customer alarm attached to the circuit pack that was specified.

### Defaults

The default cabinet is cabinet 1. The default carrier is carrier "a" except for SPE duplex system PPNs. In this case the carrier has no default and either "a" or "b" must be entered. The default for the remaining parameter is a repeat of 1.

## Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | The location designates the physical position of the desired customer-alarm circuit pack. The location consists of a cabinet number and carrier letter. The cabinet number is one or two digits from 1 to 3 with leading zeros allowed. Cabinet 1 is the PPN with 2-3 referring to some optional EPN. The carrier is either "a" or "b" for cabinet 1 for SPE duplex systems. For SPE simplex systems, when selecting cabinet 1, the carrier must be "a" if entered. For cabinets 2-3, the carrier must be "a" if entered. |
| short         | This will cause test number 115 to run.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| long          | This will cause test number 115 to run and is the same as the short sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                                                         |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The clear option forces a clear of all alarms if no errors are encountered during testing.                                                                                                                                |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                                                                 |

## Help Messages

If the system technician presses HELP after entering "test customer-alarm" on a simplex SPE system, the following message will be displayed:

```
Enter [cabinet(1-3)], ['long' or 'short'],
['repeat'(1-100) or 'clear'], ['schedule']
```

If the system technician presses HELP after entering "test customer-alarm" on a duplex SPE system the following message will be displayed:

```
For cabinet 1 enter [cabinet(1)];
carrier (A-B), ['long' or 'short'],
['repeat'(1-100) or 'clear'], ['schedule']
For cabinet 2-3 enter cabinet(2-3), ['long' or 'short'],
['repeat'(1-100) or 'clear'], ['schedule']
```

Error Messages

If the location identifier entered is not valid, the following message will be displayed:

Command aborted; please try later

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

Output

|                  |                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot) of the maintenance object that is being reset.                                                             |
| Maintenance Name | The maintenance name will always be CUST-ALM.                                                                                                      |
| Alt. Name        | Not applicable.                                                                                                                                    |
| Test No.         | The test number will always be 115.                                                                                                                |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL."                                                                                        |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the command that was entered is "test customer-alarm 02a".

test customer-alarm 02A

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 02A          | CUST-ALM         |           | 115      | PASS   |            |

test data-module

This command allows the technician to test a data module or a data channel.

## Synopsis

---

test data-module extension [ short | long ][ repeat number | clear ] schedule

## Permissions

---

The following default logins may execute this command: system technician, inads, cust, init, nms.

## Examples

---

test data-module 30000 l  
test data-module 30000  
test data-module 32000 sh r 2  
test data-module 33000 l r 25  
test data-module 33000 l r 25 schedule  
test data-module 30000 c

## Description

---

The test data-module command performs hardware diagnostic tests on a data module or a data channel. Test results are determined by the interface to the digital switch-data line port, digital line port, or network control data channel.

## Defaults

The default for the command is short with the repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extension     | The extension associated with the data module or data channel to be tested. The number of digits in an extension is determined by a dial-plan.                                                                                                                                                                                                                                                                                                                                      |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |

 **WARNING:**  
*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses HELP after entering "test data-module" the following message will be displayed:

Enter extension, ['long' or 'short'],  
['repeat' (1-100) or 'clear'], ['schedule']

Error Messages

If the extension format is invalid, the following error message would be displayed:

Extension invalid

If the extension is not administered, the following message will be displayed:

Extension not assigned

If the object associated with the specified extension is not a data module or a data channel, the following message will be displayed:

Extension exists but assigned to a different object

If the EPN that contains the data module port is not accessible, the following message will be displayed:

EPN is not available

If the board that contains the data port is not configured in the system, the following message will be displayed:

Board not assigned

If no tests can be found for the current MO, the following message will be displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                                                                                                                                                                                                                         |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                                                                                                                                                    |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |

|            |                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------|
| Test No    | The actual test that is being executed.                                                              |
| Result     | An indicator as to whether the test failed, passed, aborted or no hardware was available (no board). |
| Error Code | A numerical description of why the test failed or was aborted.                                       |

For the following output example, the command entered was "test data-module 300".

```
test data-module 300

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01C1103   PDMODULE                17         PASS

Command successfully completed
```

Feature Interactions

None.

test ds1-loop

test ds1-loop - For TN464F or TN767E or later suffix DS1 Interface circuit packs, this command is used for loopback and one-way span testing of the DS1 span.

Synopsis

test ds1-loop location [ cpe-loopback-jack-test-begin [number-of-bits bit-pattern]  
/ far-csu-loopback-test-begin | one-way-span-test-begin |  
end-loopback/span-test | inject-single-bit-error | ds1/csu-loopback-tests]

Permissions

Logins with the following service levels may execute this command: system technician, inads, init, super-user, or logins with Maintain Switch Circuit Packs permissions enabled.

## Examples

---

```
test ds1-loop 01c08
test ds1-loop 1-3c03 cpe-loopback-jack
test ds1-loop 1-3c03 cpe
test ds1-loop 10c03 end
test ds1-loop 02d12 fa
test ds1-loop 02d12 inj
```

## Description

---

The test ds1-loop command will validate that the board exists at the specified location, that the board is a TN464F or TN767E or later suffix DS1 Interface board. Based on the command parameter, a long-duration loopback/span test or series of short-duration loopback tests will be executed.

Long-duration loopback tests execute for an extended period of time until the system technician terminates it. Short-duration loopback tests return the result of the test to the screen when finished executing. The "list measurements ds1 summary" command should be used to monitor the status of a long-duration loopback/span test.

## Defaults

The default for the command is ds1/csu-loopback-tests.

Parameters

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location                     | A "location" represents the physical position of the board to be tested. For standard cabinets, a location is entered as "UUcSS" where "UU" represents the cabinet number, "c" represents the carrier, and "SS" represents the slot position. A single digit cabinet (1-3) may be entered with or without a leading zero (0).                                                                                                                                                                                                        |
| cpe-loopback-jack-test-begin | For TN464F or TN767E or later suffix DS1 boards, this will cause a long-duration loopback test to be setup through the Customer Premises Equipment (CPE) Loopback Jack. The command allows the user to specify a loop-up code for the CPE loopback jack if it differs from the default of 0x47F. This loop-up code is entered by specifying the number of bits in the loop-up code as well as the actual bit-pattern (in hexadecimal). The test will abort if the board has not been taken out of service via the "busyout" command. |
| far-csu-loopback-test-begin  | For TN464F or TN767E or later suffix DS1 boards, this will cause a long-duration loopback test to be setup through the far-end Channel Service Unit (CSU). The test will abort if the board has not been taken out of service via the "busyout" command.                                                                                                                                                                                                                                                                             |
| one-way-span-test-begin      | For TN464F or TN767E or later suffix DS1 boards, this will begin execution of a long-duration one-way span test. The test will abort if the board has not been taken out of service via the "busyout" command.                                                                                                                                                                                                                                                                                                                       |
| end-loopback/span-test       | For TN464F or TN767E or later suffix DS1 boards, this parameter terminates long-duration one-way span and loopback testing.                                                                                                                                                                                                                                                                                                                                                                                                          |
| inject-single-bit-error      | For TN464F or TN767E or later suffix DS1 boards, this parameter causes a single bit error to be sent within an active framed 3-in-24 test pattern used in long-duration loopback and span testing.                                                                                                                                                                                                                                                                                                                                   |
| ds1/csu-loopback-tests       | For TN464F or TN767E or later suffix DS1 boards, this parameter will execute the following loopback tests: DS1 Board LoopBack, CSU Module Equipment LoopBack, and CSU Module Repeater LoopBack. These tests are performed sequentially for a short duration each, and individual PASS/FAIL/ABORT test results are reported following each test.                                                                                                                                                                                      |

## Help Messages

If the system technician presses HELP after entering "test ds1-loop" the following message will be displayed:

```
Enter DS1 board location,  
['cpe-loopback-jack-test-begin [number-of-bits bit-pattern]' or  
'far-csu-loopback-test-begin' or 'one-way-span-test-begin' or  
'end-loopback/span-test' or 'inject-single-bit-error' or  
'ds1/csu-loopback-tests']
```

## Error Messages

If the format for the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN in which the specified board resides is not available, the following message will be displayed:

```
EPN is not available
```

If the specified board is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

If the "test ds1-loop" command is executed and the "Version" field on the "system-parameters customer-options" form is not V5 or later, then the following message will be displayed:

```
G3 Version must be V5 or later
```

If the "test ds1-loop" command is executed on a circuit pack other than TN464F or TN767E or later DS1 board, then the following message will be displayed:

```
Command valid for TN464F or TN767E or  
later release DS1 circuit packs
```

If the "inject-single-bit-error" parameter is selected, but no CPE Loopback Jack, far-end CSU, or one-way span test is active on the DS1 circuit pack, then the following message will be displayed:

Parameter valid only if a loopback/span test is active on the DS1

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                       |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                  |
| Alt. Name        | The alternate means of identifying the maintenance object.                                                                                            |
| Test No          | The actual test that is being executed.                                                                                                               |
| Result           | The result of the individual test - "PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD".                                                      |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the board in cabinet 1, carrier c, slot 7 is a TN767E DS1 board. The command that was entered was "test ds1-loop 1c07."

```
test ds1-loop 01C07 ds1/csu-loopback-tests

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01C07     DS1-BD              1209      PASS
01C07     DS1-BD              1210      PASS
01C07     DS1-BD              1211      PASS

Command Successfully Completed
```

Feature Interactions

Loopback or span tests will not be allowed on DS1 boards unless the board has been busied out.

Only one of the CPE Loopback Jack, far-end CSU, one-way span, or DS1/CSU loopback tests may be active at any given time on a DS1 span.

# test duplication-interface

---

This command will test the indicated duplication-interface board.

## Synopsis

---

test duplication-interface location [ short | long ][ repeat number | clear ]  
schedule

## Permissions

---

The following default logins may execute this command: system technician,  
inads, init.

## Examples

---

test duplication-interface a  
test duplication-interface b sh  
test duplication-interface a l r 25  
test duplication-interface 1b l r 25 schedule  
test duplication-interface 1a l c

## Description

---

The test duplication-interface command performs hardware diagnostic tests on the indicated duplication interface circuit pack. Testing is under control of the active SPE. The SHDW-CIR, SPE-SELECT and DUPINT maintenance objects are tested using this command. The SHDW-CIR maintenance object is associated with that portion of the duplication interface circuit pack that handles memory shadowing from the active to the standby SPE. The SPE-SELECT maintenance objects is associated with the SPE Select switch located on the front of the circuit pack. The DUPINT maintenance object is associated with the duplication interface circuit packs other functions which include SPE to SPE communication, SAT connection and environmental maintenance leads.

## Defaults

Defaults for the parameters are short with a repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | The location designates the SPE location of the desired duplication interface circuit pack; either "1a", "1b" "a" or "b".                                                                                                                                                                                                                                                                                                                                 |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                       |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. The long version includes a destructive test for this command.                                                                                                                                                                                                                                                                                                         |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                         |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing.                                                           |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

Help Messages

If the system technician presses HELP after entering "test duplication-interface," the following message is displayed:

```
Enter [network(1);carrier(A-B) ['long' or 'short'],  
      ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

For any system, if a user entered parameter is not among those listed in the "Parameters" section, the following message is displayed:

```
Entry invalid
```

If an invalid port network is specified, the following message is displayed:

```
Invalid port-network specified
```

If an invalid carrier is specified, the following message is displayed:

```
Invalid carrier specified
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

Cannot interrupt Standby SPE while entering  
maintenance mode; please try later

If the standby SPE is not refreshed when this command is executed, then the  
following message is displayed:

Standby SPE memory not refreshed;  
use the "refresh spe-standby" command.

If the standby SPE is not refreshed and the active SPE is hard selected via the  
SPE select switches when this command is executed, then the following  
message is displayed:

Active SPE locked via select switches;  
Standby SPE memory not refreshed

If the standby SPE is busy with another task, then the following message is  
displayed:

Standby SPE busy with another task;  
for information use "status system 1"

If the standby SPE is not available when this command is executed, then the  
following message is displayed:

Standby SPE not available;  
for information use "status system 1"

If the command entered is in conflict with another currently executing command,  
then a message will be displayed showing the login id of the conflicting user and  
the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

Output

The responses will be displayed on a test-by-test basis with one line of data  
displayed for each test result.

|                  |                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier) will always be 01A or 01B.                                                                                      |
| Maintenance Name | The maintenance name will always be SHDW-CIR, SPE-SELE, or DUPINT.                                                                                 |
| Alt. Name        | Not applicable.                                                                                                                                    |
| Test No.         | The actual test that is being executed.                                                                                                            |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED."                                                                |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the command that was entered was "test duplication-interface 1A" while "A" was the active carrier in an SPE duplex system.

test duplication-interface a longSPE A

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 1A           | SHDW-CIR         |           | 285      | PASS   |            |
| 1A           | SHDW-CIR         |           | 283      | PASS   |            |
| 1A           | SHDW-CIR         |           | 284      | PASS   |            |
| 1A           | SPE-SELE         |           | 278      | PASS   |            |
| 1A           | DUPINT           |           | 315      | PASS   |            |
| 1A           | DUPINT           |           | 275      | PASS   |            |
| 1A           | DUPINT           |           | 276      | PASS   |            |
| 1A           | DUPINT           |           | 280      | PASS   |            |
| 1A           | DUPINT           |           | 271      | PASS   |            |
| 1A           | DUPINT           |           | 277      | PASS   |            |
| 1A           | DUPINT           |           | 272      | PASS   |            |
| 1A           | DUPINT           |           | 274      | PASS   |            |
| 1A           | DUPINT           |           | 273      | PASS   |            |

Command Successfully Completed

Feature Interactions

Failures of the duplication-interface may prevent SPE switching.

test eda-external-device-alm

test eda-external-device-alm all | physical location [ repeat number | clear ][ schedule ]

This test will perform hardware diagnostic tests on an individual external-device-alarm port or on all external-device-alarm ports.

The **test eda-external-device-alm** command performs a hardware diagnostic test on all administered external device alarms if all is entered. If an administered external device alarm port is entered, the test external-device-alarm command performs a hardware diagnostic test on that port. The test PASSES if the external device is not reporting an external device alarm and FAILS if the external device is reporting an external device alarm. If the technician specifies the port it must be administered as an external device alarm port on a maintenance board or on an analog line port carrier board.

**Defaults**

---

The default for this command is a repeat of 1.

Parameters

---

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| physical location | <p>In addition to entering the word "physical" the system technician must specify the physical location. For an administered external device alarm analog line port, a "physical location" represents the physical position of the port to be tested and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-MAX_CABS), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit.</p> <p>Since the "maintenance board" alarm connections connect to control carrier boards that are in unnumbered slots, the standard port format cannot be used to designate these alarm connections. The special ports <b>UUmajor</b> and <b>UUminor</b> are used designate the major or minor maintenance board alarm connection for cabinet <b>UU</b>.</p> <div> <b>NOTE:</b><br/>The major/minor designation specifies the pair of wires, not the alarm level associated with the connection (<i>i.e.</i> the "major" port can be administered as a major, minor or warning alarm and the "minor" port can be administered as a major, minor or warning alarm).</div> |
|                   | <p>The "all" location is used to test all administered external device alarm ports on analog line boards and maintenance boards.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| repeat number     | <p>The "number" specifies how many times the "test physical location" is to be repeated. "Number" may be any integer between 1 and 100.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| clear             | <p>This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| schedule          | <p>When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specifications [1] for more details.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Examples

---

```
test eda-external-device-alm all
test eda-external-device-alm all schedule
test eda-external-device-alm physical 1major r 10
test eda-external-device-alm physical 2c1101 c
```

Output

For the following output example the command that was entered was **"test external-device-alarm all"**:

```
test eda-external-device-alm all

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code

03major    EXT-DEV                CMS1       120       PASS
03A2102    EXT_DEV                CMS2       120       FAIL
01major    EXT-DEV                UPS1       120       PASS
01minor    EXT-DEV                UPS1       120       PASS
01c1201    EXT-DEV                UPS1       120       PASS
03A2101    EXT_DEV                CC temp    120       PASS
01c1202    EXT-DEV                Audix1     120       PASS
03minor    EXT-DEV                Audix2     120       FAIL
04major    EXT-DEV                unknown    120       FAIL

Command successfully completed
```

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Field definitions:

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                       |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                  |
| Alt. Name        | The alternate means of identifying the maintenance object. This is an administered more descriptive name of the external device alarm                 |
| Test No          | The actual test that is being executed.                                                                                                               |
| Result           | The result of the individual test -"PASS", "ABORT", "FAIL",<br>"NO BOARD", "DISABLED", "EXTRA BD".                                                    |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

## test environment

---

This command will test the environment monitoring and control capabilities including emergency transfer in any cabinet.

### Synopsis

---

test environment location [ short | long ][ repeat number | clear ] schedule

### Permissions

---

The following default logins may execute this command: system technician, inads, init.

### Examples

---

test environment  
test environment schedule  
test environment 1 sh  
test environment 1 l r 25  
test environment 01 l r 25  
test environment 01 l r 25 schedule  
test environment 2 l c  
test environment 3 c

### Description

---

The test environment command performs hardware diagnostic tests of the environment monitoring and control, and emergency transfer functions of a technician specified cabinet. This command will test both Processor Port Network (PPN) cabinets and Expansion Port Network (EPN) cabinets. Circuit packs involved are the Processor circuit pack (PPN simplex systems), the Duplication Interface circuit pack (PPN duplex systems) and EPN Maintenance circuit packs. The tone/clock circuit pack is involved in tests of the ring generator.

There are 8 Maintenance Objects involved in this testing. DC-POWER tests power availability, battery charging and temperature functions in SCC cabinets only. EMG-XFER tests emergency transfer status, and EXT-DEV tests external (i.e. AUDIX) alarm status for both the SCC and MCC cabinet systems. POWER tests battery backup, AC-POWER tests AC power availability, CARR\_POW tests carrier DC power availability, CABINET tests air flow and temperature, RING\_GEN tests ringing voltage are tested in MCC cabinets only.

Note that the long test of CARR\_POW includes a power recycle test for non-Processor Element (SPE) carriers and is destructive. There is one instance of CARR\_POW for each carrier in the cabinet.

**⇒ NOTE:**  
The processor carrier and its duplicate if present as well as any EPN control carrier or an SCC carrier will not be recycled. All port carriers are recycled, and service is interrupted for each port carrier. If a carrier containing an active EI is recycled, communications with that cabinet will be disrupted. If a carrier containing an active tone-clock board is recycled, all ports in the cabinet or port network will have service disrupted.

**Defaults**

The default cabinet is cabinet 1. Defaults for the remaining parameters are short with a repeat of 1.

**Parameters**

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | The location the cabinet number. The cabinet number is one or two digits from 1 to 3 with leading zeros allowed. Cabinet 1 is the PPN with 2-3 referring to some optional EPN.                                                                                                                                                                                                                                                                                                      |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This includes both destructive and nondestructive tests for this command.                                                                                                                                                                                                                                                                                                                        |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

**Help Messages**

If the system technician presses HELP after entering "test environment," the following message will be displayed:

Enter [cabinet(1-3)], ['long' or 'short'],  
['repeat'(1-100) or 'clear'], ['schedule']

Error Messages

If the entered cabinet location is greater than two characters or otherwise invalid, the following error message is displayed:

Identifier invalid

If the indicated EPN is not available, the following message is displayed:

EPN is not available

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier) of the maintenance object that is being tested. For all but the CARR-POW maintenance object, only the cabinet value is displayed. For the CARR-POW maintenance object, both the cabinet and carrier values are displayed. |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                                                         |
| Alt. Name        | Not applicable.                                                                                                                                                                                                                                              |
| Test No.         | The actual test that is being executed.                                                                                                                                                                                                                      |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "DISABLED."                                                                                                                                                                                      |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.                                                                                                           |

For the following output example, assume that the command that was entered was "test environment 1" to test a MCCPPN cabinet.

test environment 1

TEST RESULTS

| Port | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|------|------------------|-----------|----------|--------|------------|
| 01   | POWER            |           | 5        | PASS   |            |
| 01   | AC-POWER         |           | 79       | PASS   |            |
| 01A  | CARR-POW         |           | 127      | PASS   |            |
| 01B  | CARR-POW         |           | 127      | PASS   |            |
| 01C  | CARR-POW         |           | 127      | PASS   |            |
| 01D  | CARR-POW         |           | 127      | PASS   |            |
| 01E  | CARR-POW         |           | 127      | PASS   |            |
| 01   | EMG-XFER         |           | 124      | PASS   |            |
| 01   | CABINET          |           | 122      | PASS   |            |
| 01   | EXT-DEV          |           | 120      | PASS   |            |
| 01   | RING-GEN         |           | 118      | PASS   |            |

Command Successfully Completed

For the following output example, assume that the command that was entered was "test environment 2" where cabinet 2 is an SCC cabinet.

test environment 2

TEST RESULTS

| Port | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|------|------------------|-----------|----------|--------|------------|
| 02   | DC-POWER         |           | 5        | PASS   |            |
| 02   | EMG-XFER         |           | 124      | PASS   |            |
| 02   | EXT-DEV          |           | 120      | PASS   |            |
| 02   | RING-GEN         |           | 117      | PASS   |            |
| 02   | RING-GEN         |           | 118      | PASS   |            |

Command Successfully Completed

Feature Interactions

The long test will recycle power in some specified cabinet on non-SPE and maintenance board carriers and is destructive. Specifically, the 'a' carrier of PPNs and EPNs does not have power recycled. In PPNs containing duplicated SPEs the 'b' carrier also does not have power recycled.

All port carriers are recycled, and service is interrupted for each port carrier. If a carrier containing an active EI is recycled, communications with that cabinet will be disrupted. If a carrier containing an active tone-clock board is recycled, all ports in the cabinet or port network will have service disrupted.

## test hardware-group

---

This command allows a user to perform a set of hardware diagnostic tests on the whole system, a carrier, cabinet, spe, or board. The tests will vary according to the configuration of the system and the specified command options.

### Synopsis

---

test hardware-group [ system | carrier carrier location |  
cabinet cabinet location | board board location | spe ]  
  
[ print | schedule ]

### Permissions

---

The following logins may execute this command: inads, init.

### Examples

---

test hardware-group system  
test hardware-group system print  
test hardware-group carrier 1a  
test hardware-group carrier 1a schedule  
test hardware-group cabinet 2  
test hardware-group board 01c07  
test hardware-group board 01c07 schedule  
test hardware-group spe  
test hardware-group spe print  
test hardware-group spe schedule

### Description

---

The "test hardware-group" command will run a series of tests on all the hardware on the entire system, an individual carrier, cabinet, spe, or board. The tests will vary depending on options chosen and board types. Each individual test will exercise diagnostics on all the hardware in the specified hardware group and return results of the test along with any possible error codes. Concurrent testing is done to enhance performance, therefore, test results are displayed on the SAT in the order they are received. Consequently, test results of one maintenance object may be intermixed with test results of other maintenance objects.

Because the tests in the "test hardware-group" command are not destructive, the tests performed on a particular maintenance object with either the 'short' or the 'long' option of the "test hardware-group" command may not be the same as the corresponding demand tests.

A hardware-group command executing in the foreground may be aborted by either pressing the 'cancel' key on the SAT or by entering the "cancel hardware-group" command on a different SAT.

However, if the system technician wishes to cancel a "test hardware-group" command running in the background the "cancel hardware-group" command needs to be entered on any SAT.

A canceled "test hardware-group" command can be resumed at the point it left off by entering the "resume hardware-group" command on the SAT. Restarts are not allowed for "test hardware-group" commands entered with either the "all-ports" option or the "spe-interchange" option.

Defaults

The default for the command is short with a repeat of 1.

Parameters

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| carrier location | A 'carrier location' represents the carrier to be tested and is entered as UUC format where 'UU' is a valid cabinet number (1-3) and the 'C' represents any value between A-E. The type of carrier may be port, or processor. In the case of a port carrier, all universal port and tone-clock boards (see reference 4) and its affiliated MOs residing in the specified carrier are tested. For a processor carrier, all SPE complex and tone-clock boards and its affiliated MOs are tested. |
| cabinet location | A 'cabinet location' represents the cabinet to be tested. It can be any value between 1-3. All PN and PNC related MOs plus cabinet specific MOs, including maintenance boards and environment (ring generator, battery, power, emergency transfer, external alarms, fans, and temperature) will be tested if they reside in the specified 'cabinet location'.                                                                                                                                  |
| board location   | A 'board location' represents the physical location of the board and is entered as 'UUCSS' format, where 'UU' is a valid cabinet number (1-3), 'C' is a carrier number between A-E, and 'SS' is the slot position. All MOs on the specified 'board location' including ports will be tested.                                                                                                                                                                                                   |
| print            | This will cause the report to be printed if a printer is linked to the SAT.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| schedule         | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [5] for more details.                                      |

## Help Messages

If the system technician presses HELP after entering "test hardware-group" the following message will be displayed:

```
board cabinet carrier spe system
```

If the system technician presses HELP after entering "test hardware-group board" the following message will be displayed:

```
Enter board location: [cabinet (1-3);  
carrier (A-E);slot(00-20)]
```

If the system technician presses HELP after entering "test hardware-group cabinet" the following message will be displayed:

```
Enter cabinet (1-3)
```

If the system technician presses HELP after entering "test hardware-group carrier" the following message will be displayed:

```
Enter carrier location:  
['cabinet'(1-3)]; carrier (A-E)
```

If the system technician presses HELP after entering "test hardware-group system" the following message will be displayed:

```
Entry is not required
```

If the system technician presses HELP after entering "test hardware-group spe" the following message will be displayed:

```
Entry is not required
```

## Error Messages

If there is another "test hardware-group" active the following message will be displayed:

```
Command aborted - another hardware-group  
test already in progress
```

If an "add station" command is entered for a non-customer translated port at the same time as it is being tested because of the "test hardware-group" command with the 'all-ports' option the request to "add station" will fail and the following message will be displayed:

```
Object in use; please try later
```

If an invalid physical location is specified with the "test hardware-group board" command the following message will be displayed:

```
Board invalid
```

If an unassigned board is specified with the "test hardware-group board" command the following message will be displayed:

Board not assigned

If an invalid carrier is specified with the "test hardware-group carrier" command the following message will be displayed:

Invalid carrier specified

If an invalid cabinet is specified with the "test hardware-group cabinet" command the following message will be displayed:

Invalid cabinet specified

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

FORM INPUT

Once the user has entered the desired action (test hardware-group) and the object (board, carrier, etc.), then the user is presented with an options form.

- Test sequenceThis allows the user to specify whether the short (nondestructive) or the long (more comprehensive and still nondestructive) test sequence should be exercised.
- Test RepetitionThis allows the user to enter either 'repeat' with a corresponding repeat value (between 1 and 99) or 'continuously'. The repeat option will cause each test to be executed the number of times specified on each physical object. The continuously option, on the other hand, will cause all tests on all the hardware specified to be executed until the CANCEL key is hit or the 'cancel hardware-group' command is run.
- count:This field allows the technician to enter a repeat value between 1 and 99. If the 'test sequence' field is set to continuously, then this field is removed from the screen. When the 'test sequence' field is set to repeat, then this field is added to the screen.
- Auto-page?This option provides the ability to continue testing and display of test results by providing a new screen every time the SAT screen is filled with test results. The screen does not scroll to accommodate new results; instead a new screen is provided after the current screen fills up.  
  
This option is not allowed if the 'background' option has been chosen.  
  
If the 'auto-page' option is not specified, the SAT screen will not be refreshed once it is filled with test results and testing will stop until the user enters the 'page' key to continue or 'cancel' key to halt the testing.

- Background?

This option provides the ability to run the command in the background thus freeing up the SAT. The error results will be tabulated in the error log but no results will be displayed on the terminal.

This option may not be used if the 'continuously' option or the 'auto-page' option is specified.
- Failures?

This option will select only failing test results to be displayed on the test results screen. Test results which pass or abort are not displayed. The 'failures' option has no effect if entered with the 'background' option.
- All-ports?

The 'all-ports' option will allow testing of all customer translated line and trunk ports and also a set of line and trunk ports without customer translations. Untranslated ports for the following board types will be tested:

**Table 8-7. Test of 'all ports' option for the following boards:**

| Board Number | Description                         |
|--------------|-------------------------------------|
| TN413        | Digital Line                        |
| TN417        | Auxiliary Trunk                     |

TEST HARDWARE-GROUP SELECTIONS

Select the desired options for the specified test.

Test sequence: short

Test repetition: repeat\_\_\_\_\_ count: 1

Output OPTIONS:

Auto-page? n

Background? n

Failures? n

HARDWARE OPTIONS:

All-ports? n

SPE-interchange? n

Field Help

Following are the help message that the system technician will see upon tabbing to the specified field and pressing the HELP key.

- |                  |                                  |
|------------------|----------------------------------|
| Test sequence    | Enter short or long              |
| Test Repetition  | Enter repeat or continuously     |
| count:           | Enter repeat number between 1-99 |
| Auto-page?       | n(o) y(es)                       |
| Background?      | n(o) y(es)                       |
| Failures?        | n(o) y(es)                       |
| All-ports?       | n(o) y(es)                       |
| SPE-interchange? | n(o) y(es)                       |

Field Error Message

Following are the error message that will be displayed on the screen. The message are displayed when the system technician tabs out of a field and the validation routines are executed. In the following messages, an "x" represents what was entered by the user.

|                  |                                                                    |
|------------------|--------------------------------------------------------------------|
| Test sequence    | "x" is an invalid entry, please press HELP                         |
| Test Repetition  | "x" is an invalid entry, please press HELP                         |
|                  | "x" The background option cannot be chosen with continuous testing |
| count:           | Entry must be all digits                                           |
|                  | Entry out of range                                                 |
| Auto-page?       | "x" is an invalid entry, please press HELP                         |
|                  | "x" The auto-page and background options may not both be activated |
| Background?      | "x" is an invalid entry, please press HELP                         |
|                  | "x" The background option cannot be chosen with continuous testing |
|                  | "x" The auto-page and background options may not both be activated |
| Failures?        | "x" is an invalid entry, please press HELP                         |
| All-ports?       | "x" is an invalid entry, please press HELP                         |
| SPE-interchange? | "x" is an invalid entry, please press HELP                         |

Output

If the 'background' option was chosen then the following message is displayed:

Command started in background mode

Progress information will be displayed on the SAT screen for a "test hardware-group" command run in the foreground. While testing is in progress, a running count of MOs tested, the total number of MOs to be tested, and the current pass number will be displayed on the screen.

If the all-ports option is entered the following message will be displayed before testing has begun:

Preparing unadministered ports for testing

If the "failures" option was selected and no tests fail the following message will be displayed:

No failing test results available

If no tests are available for the MOs in the specified hardware group the following message is displayed:

No tests available for MOs in the  
specified hardware group

If the spe-interchange option was selected and the command was run from a non-PPNSAT the following message is displayed while the interchange takes place:

SPE interchange in progress, please wait

If the spe-interchange option was selected and the command was run from the PPNSAT, the interchange will be the last operation to run and then the SAT will be logged off as part of the interchange.

If an interchange cannot be performed the following message is displayed:

Cannot perform SPE interchange,  
for information use 'status spe'

The responses to a "test hardware-group" command run in the foreground will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that has been tested.                                                                                                                                                                                                                                                         |
| Maintenance Name | The type of maintenance object that has been tested.                                                                                                                                                                                                                                                                                                    |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test No.   | The actual test that has been executed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Result     | <p>An indicator as to whether the test failed, passed or was aborted. Sometimes a maintenance object cannot be tested and one of the following test results will be displayed:</p> <p>NO BOARD</p> <p>The board is administered but not inserted.</p> <p>EXTRA BD</p> <p>The wrong type of board is inserted in this slot.</p> <p>DISABLED</p> <p>This maintenance object has been disabled, either through a demand maintenance command ("disable MO") or by an internal maintenance action.</p> <p>SKIPPED</p> <p>This maintenance object is busy with other maintenance activity. Hardware-group maintenance will <b>not</b> preempt other types of testing, not even background maintenance.</p> |
| Error Code | A numerical description of why the test failed or was aborted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

For the following output example, assume that the board in port network 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered was "test hardware-group system" and a repeat with count of 3 was chosen.

test hardware-group system

TEST RESULTS

| Port    | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|---------|------------------|-----------|----------|--------|------------|
| 01C07   | ANL-BD           |           | 51       | PASS   |            |
| 01C07   | ANL-BD           |           | 52       | PASS   |            |
| 01C0703 | ANL-LINE         |           | 35       | PASS   |            |

| 01C0701 | ANL-LINE         |           | 36       | PASS   |            |

Testing system, 11070 of 12300 (90%) MOs tested for repetition 1

For the following output example, the command that was entered was "test hardware-group system" and the background option was chosen.

test hardware-group system

Command started in background mode

## Feature Interactions

### Test hardware-group

Only one "test hardware-group" command can be active at any given time.

### TTI

If the "test hardware-group" command is issued with the 'all-ports' option when the TTI background task is active, some unadministered ports may not be tested. In addition, active alarms on line ports may be cleared by this task. The "status tti" command may be used to determine the state of the TTI background task.

### Add Station

If a "add station" command is entered for an untranslated port at the same time as it is being tested because of the "test hardware-group" command with the 'all-ports' option, the request to "add station" will fail and the following message will be displayed:

Object in use; please try later

### Trunk Administration

If an attempt is made to add an unadministered trunk port to a trunk group at the same time as it is being tested because of the "test hardware-group" command with the 'all-ports' option, the request will fail and the following message will be displayed:

Object in use; please try later

### Save Translation

If the "test hardware-group" command is issued with the 'all-ports' option when a translation save operation is active, some unadministered ports may not be tested. All other hardware will be tested normally.

### Hardware Alarms

When a hardware error is detected by the "test hardware-group" command the hardware goes through the standard escalation strategy. Alarms are raised on hardware that manifest 'hard' errors. This alarming strategy is the same, regardless of whether the ports are translated or not.

System Interaction

The performance of "test hardware-group" is affected by call processing traffic, administration activity, choice of the 'short' or 'long' option, whether the 'all-ports' option was chosen, whether the 'spe-interchange' option was chosen, and other demand maintenance activity.

Scheduled and Periodic maintenance

When a "test hardware-group" command is entered, all activity related to scheduled background maintenance, periodic background maintenance, and data audits is suspended for the duration of the execution of the "test hardware-group" command. When a "test hardware-group" command is canceled or when the "test hardware-group" command completes, all suspended periodic, scheduled, and data audits background maintenance activity will be restarted where it left off.

test inads-link

This command will perform hardware diagnostic tests from the inads port that is accessible through the maintenance board to an OSS telephone number.

Synopsis

test inads-link [1 | 2]

Permissions

The following default logins may execute this command: system technician, inads, init, nms.

Examples

test inads-link  
test inads-link 1  
test inads-link 2

Description

The test inads-link command attempts to make a call over the inads port on the maintenance board to verify the INADS alarm notification process. By default, the link to the first OSS telephone number is tested. If there is an alarm pending to be reported or the call is in progress or up, then the test will be aborted. If the alarm origination to the OSS telephone number to be tested is disabled, the test generates an informative error and the test continues. The test will wait 2 minutes before executing to allow the remote maintenance technician to logoff freeing the

line. The line must be free so the system can place a call to INADS. A local SAT user entering the "test inads-link" command need not log off for the system to place a call to INADS, but the two minute delay still exists.

Once the call is answered by INADS, the system will send a message with a test alarm type. INADS acknowledges receipt of the message and creates a trouble ticket. The trouble ticket will be closed immediately and have a "INADS LINK TEST" message entered in the description field. If an alarm is raised while the test call is up, the system will not send an alarm message over the existing link. The normal retry mechanism will be followed, which means an attempt to make a call to INADS to report the error will take place seven (7) minutes later. An INADS trouble ticket will be created only if the connection is successfully established, and a message is sent to the system acknowledging that INADS received the system message.

The "Maintain Process Circuit Packs" field must be set to yes on the inads and technician permission forms. This will provide permissions to execute the "test inads-link" command. The field can be changed by executing a "change permission login" command.

There will be no alarms raised on the system as a result of the "test inads-link" command. Attendant alarm and acknowledgment lamp states will not be changed as a result of the command. The test will not be run during periodic or scheduled maintenance.

## Defaults

The test will default to test the link to the first OSS telephone number.

## Parameter

- 1 This option causes testing of the link to the first OSS telephone number.
- 2 This option causes testing of the link to the second OSS telephone number.

## Help Messages

If the system technician presses HELP after entering "test inads-link" the following message will be displayed:

[ '1' or '2' ]

Or press CANCEL to cancel the command

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

---

If the test passed then the following message will be displayed:

Command successfully completed

If the test failed, because the link was up or because there was an active alarm that the switch needs to report or there was a problem with the call, the following message will be displayed:

Command failed

NOTE: An entry is made in the error log describing why the inads-link test failed.

Feature Interactions

---

None.

test interface

---

This command will test a processor interface board.

Synopsis

---

test interface location [ short | long ][ repeat number | clear ] schedule

Permissions

---

The following default logins may execute this command: system technician, inads, init, nms.

Examples

```
test interface 01a1 l
test interface 01b2 s r 2
test interface 01b2 s r 2 schedule
test interface b1 l r 25
test interface a2
```

Description

The test interface command performs hardware diagnostic tests on the technician specified processor interface circuit pack. In addition to testing the PI board, the tests will examine the protocol and link interface that is transmitted over the board.

Defaults

The default for the command is short with the repeat of 1.

Parameters

|          |                                                                                                                                                                                                                                                                                              |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | The location (cabinet-carrier-position) of the processor interface. The position determines which processor interface circuit pack will be cleared. A position of 1 is the first processor interface in the carrier, while a position of 2 is the second processor interface in the carrier. |
| short    | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                          |
| long     | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                               |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                  |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence |

### WARNING:

*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

## Help Messages

If the system technician presses HELP after entering "test interface" the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B), pos(1-2),  
    ['long' or 'short'], ['repeat' (1-100)  
    or 'clear'], ['schedule']
```

## Error Messages

If the specified carrier is not the active PE, the following message will be displayed:

```
Command must be executed from active SPE
```

If the technician-entered cabinet and carrier is invalid for a PPN, the following message will be displayed:

```
Invalid port-network specified
```

If the technician-entered carrier is not a valid carrier, the following message will be displayed:

```
Invalid carrier specified
```

If the technician-entered carrier is not active, the following error message will be entered:

```
Board invalid
```

If the specified carrier/position processor interface circuit pack is not inserted, but the specified carrier is active, the following error message will be displayed:

```
No such MO's lname/pname
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering  
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;  
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;  
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;  
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;  
for information use "status system 1"
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot) of the maintenance object that is being tested. With this particular maintenance object, the port address represents the carrier associated with the particular processor interface board. |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                               |
| Alt. Name        | Not applicable.                                                                                                                                                                                                                    |
| Test No          | The actual test that is being executed.                                                                                                                                                                                            |
| Result           | The result of the individual test - "PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                                                                                                   |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.                                                                              |

For the following output example, assume that the command that was entered was "test interface a1".

test interface a1

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 01A1         | PI-SCI           |           | 231      | PASS   |            |
| 01A1         | PI-BD            |           | 52       | PASS   |            |

## Feature Interactions

None.

## test isdn-testcall

This command starts an outgoing ISDN-PRI test call.

## Synopsis

test isdn-testcall group number/member number minutes minute number schedule

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

```
test isdn-testcall 80/1
test isdn-testcall 80/1 schedule
test isdn-testcall 78/2 minutes 10
test isdn-testcall 78/3 minutes 100 schedule
```

Description

The test isdn-testcall command starts an outgoing ISDN-PRI test call in the asynchronous method. The trunk to originate the ISDN-PRI test call from is specified. If the test results are "PASS" the test call is started. A test result of "ABORT" means that a resource wasn't available (i.e. B-channel, Maintenance/Test circuit pack). A test result of "FAIL" denotes that the outgoing ISDN-PRI test call was not established.

Defaults

The duration of the test call defaults to 8.4 or 9.6 seconds.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group number  | The group number is an administered number associated with each trunk group.                                                                                                                                                                                                                                                                                                                                                                              |
| member number | The member number is an administered number identifying a particular trunk within a trunk group.                                                                                                                                                                                                                                                                                                                                                          |
| minute number | The duration of the test call specified in minutes (1-120).                                                                                                                                                                                                                                                                                                                                                                                               |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

Help Messages

If the system technician presses HELP after entering "test isdn-testcall" the following message will be displayed:

```
Enter group #/member # ['minutes' (1-120)],
                        ['schedule']
```

## Error Messages

If the specified format of the trunk location is incorrect, the following message is displayed:

Format invalid

If the specified trunk group or member range is invalid, the following message is displayed:

Trunk or trunk group invalid

If a trunk group and member is not specified, the following message is displayed:

Must specify group/member pair

If the specified trunk group is not administered or has no members administered, the following message is displayed:

Group not assigned, or group assigned  
but with no member

If the specified trunk group member is not administered, the following message is displayed:

Group member not assigned

If the specified trunk is not an ISDN-PRI trunk, the following message is displayed:

Invalid non ISDN-PRI trunk specified

If no tests can be found for the associated MO, the following message is displayed:

No tests for this MO

If an ISDN-PRI test call has already been started, the following message is displayed:

There is a test call already in progress

If the software data cannot be sent to the SAT, the following message is displayed:

Error encountered, can't complete request

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;

Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                                                                                                                  |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                                             |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the trunk object xxx/yyy, where xxx is the trunk group number and yyy is the member number.                                                                       |
| Test No          | The actual test that is being executed.                                                                                                                                                                                                          |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                                                                                                                  |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO [for example, see "ISDN-TRK (DS1 ISDN Trunk)" section error code description Test Number 258]. |

For the following output example the command entered was "test isdn-testcall 80/1".

```
test isdn-testcall 77/1                                SPE A

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01B1501   ISDN-TRK                077/001    258       PASS

Command Successfully Completed
```

Feature Interactions

Additional data is available after running the test. See the status isdn-testcall command for details on how to access the additional data.

Only one ISDN trunk can be tested per port network at a time. Once testing is completed, another ISDN trunk can be tested in that port network.

The maximum number of asynchronous outgoing test calls running, depends on the number of Maintenance/Test circuit packs in the system.

## test journal-printer

---

This command will perform tests on the journal printer links.

### Synopsis

---

```
test journal-printer [ pms-log | wakeup-log ] [ short | long ][ repeat number | clear  
] schedule
```

### Permissions

---

The following default logins may execute this command: system technician, inads, init.

### Examples

---

```
test journal-printer pms-log l  
test journal-printer pms-log l schedule  
test journal-printer wakeup-log r 2  
test journal-printer wakeup-log r 2 schedule  
test journ pm r 3  
test journ pm r 3 schedule
```

### Description

---

The test journal-printer command will perform hardware diagnostics on the link between the switch and one of the technician specified journal printer links. There are two types of journal printer links (pms-log wakeup-log).

For general information on journal printer links, see the second paragraph in the "Description" section of the "busyout pms-link" manual pages.

For information on what a journal printer is and does, see the second paragraph in the "[Description](#)" section of the "[status journal-link](#)" manual pages.

### Defaults

The default for the command is short with the repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pms-log       | This will test the link to the pms logging printer. The maintenance name for the pms-log printer, displayed on the test results form on output, is PMS-PRNT.                                                                                                                                                                                                                                                                                                                        |
| wakeup-log    | This will test the link to the wakeup logging printer. The maintenance name for the wakeup-log printer, displayed on the test results form on output, is JNL-PRNT.                                                                                                                                                                                                                                                                                                                  |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

Help Messages

If the system technician presses `HELP` after entering "test journal-printer", the following object command word choices will be displayed:

pms-log      wakeup-log

Error Messages

If the link is not administered, the following error message will be displayed:

Link not administered or not enabled

If no tests can be found for the link, the following message will be displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | Not applicable. Will always be blank.                                                                                                                                                                              |
| Maintenance Name | The type of maintenance object that is being tested. If testing the pms-log printer link the maintenance name will be PMS-PRNT, else if testing the wakeup-log printer link the maintenance name will be JNL-PRNT. |
| Alt. Name        | Not applicable. Will always be blank.                                                                                                                                                                              |
| Test No          | The actual test that is being executed.                                                                                                                                                                            |
| Result           | The result of the individual test - "PASS", "ABORT", "FAIL", "DISABLED".                                                                                                                                           |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.                                                                 |

For the following output example, assume that the command that was entered was "test journal-printer pms-log".

test journal-printer pms-log short

TEST RESULTS

|      |                  |           |          |        |            |
|------|------------------|-----------|----------|--------|------------|
| Port | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|      | JRNL-LINK        |           | 215      | PASS   |            |

Command Successfully Completed

## Feature Interactions

---

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recovery of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup tries on the link.

## test led

---

This command will perform a test on all the LEDs in a specified cabinet. The test consists of turning all the LEDs on all circuit packs on and then off.

## Synopsis

---

*test led [ all | cabinet number ] [ short | long ] repeat number*

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

```
test led
test led all r 2
test led cabinet 1
test led c 1
test led 1 long
```

## Description

---

The test led command will validate that the specified cabinet exists. Once the range of circuit packs is determined, the test LED command will turn on all LEDs on the circuit packs contained in each carrier until all affected carriers are lit. Once all the LEDs are on there will be a 2 second pause and then all the LEDs will be turned off in the same order as they were lit. Once all of the repeat cycles are completed, all affected LEDs will be restored to the current status.

On a duplex PPN, only the long option will test the leds in the standby SPE. When executing the test led long command, the standby Processor, Memory and Packet Control circuit pack LEDs can take up to 20 seconds to light.

The following LEDs are NOT lighted by the test led command:

- SPE Select LEDs on the Duplication Interface Circuit Packs.
- Power Unit LEDs.
- The yellow (amber) LED on the tape drive.

Defaults

The default for the command is "all" with a repeat of 1 and short in a duplex system.

Parameters

|                |                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all            | All LEDs in all carriers will be tested.                                                                                                                                                                                          |
| cabinet number | The number of the cabinet that will be tested. Each carrier in the cabinet will complete testing before the next carrier is started.                                                                                              |
| short          | In a simplex system the short and long option are identical and will turn on and off all leds in the specified port network. In a duplex system, the short option will NOT affect the leds in the standby SPE carrier in the PPN. |
| long           | In a simplex system the short and long option are identical and will turn on and off all leds in the specified port network. In a duplex system, the long option will affect the leds in the standby SPE carrier in the PPN.      |
| repeat number  | The "number" specifies how many times each test is repeated. "Number" may be any integer between 1 and 100.                                                                                                                       |

Help Messages

If the system technician presses HELP after entering "test led" the following message will be displayed:

```
Enter ['all' or 'cabinet' (1-3)],  
['long' or 'short' ], ['repeat' (1-100)]
```

Error Messages

If there is an error in the input to the command, where "x" is the invalid input, the following message will be displayed:

```
"x" is an invalid identifier;  
press RETURN to execute modified command
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

## Output

---

If the command is successful, the following message will be displayed:

Command successfully completed

## Feature Interactions

---

None.

## test link

---

This command will perform a set of hardware diagnostic tests on the specified link.

## Synopsis

---

test link link-id [ short | long ][ repeat number | clear ] schedule

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

test link 1  
test link 1 schedule  
test link 3 l  
test link 2 sh  
test link 2 r 2  
test link 2 l c

## Description

---

The test link command will validate that the link specified is administered. Then the tests for a link will be executed on the specified link. The results of the test along with any possible error codes are displayed.

## Defaults

The default for the command is short with the repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link-id       | A link number between 1-8 that identifies the link to be tested. The link number is assigned via the communication-interface links form.                                                                                                                                                                                                                                                                                                                                            |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |

 **WARNING:**  
*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses HELP after entering "test link" the following message will be displayed:

Enter link number(1-8), ['long' or 'short'],  
['repeat' (1-100) or 'clear'], ['schedule']

Error Messages

If the link number is not within the valid range, then the following error message is displayed:

Link out of range, please press HELP

If the link has not been administered, then the following message is displayed:

Link not administered or not enabled

If there are no tests for the current MO, the following message is displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | Port address on the Processor Interface board associated with the link-id being tested.                                                            |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                               |
| Alt. Name        | Not applicable.                                                                                                                                    |
| Test No          | The actual test that is being executed.                                                                                                            |
| Result           | The result of the individual test - "PASS", "ABORT", "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                   |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

Following is an sample output for the command "test link 1 long".

test link 1 long

TEST RESULTS

| Port    | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|---------|------------------|-----------|----------|--------|------------|
| 01AXX01 | PI-LINK          |           | 182      | PASS   |            |
| 01AXX01 | PI-LINK          |           | 183      | PASS   |            |
| 01AXX01 | PI-LINK          |           | 234      | PASS   |            |
| 01AXX01 | PI-LINK          |           | 233      | PASS   |            |

Command Successfully Completed

Feature Interactions

None.

test maintenance

This command will test the EPN maintenance circuit pack in any Expansion Port Network control carrier.

Synopsis

test maintenance location [ short | long ][ repeat number | clear ] schedule

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

test maintenance 2  
test maintenance 3 schedule  
test maintenance 2 sh  
test maintenance 2 l c

Description

The test maintenance command performs hardware diagnostic tests on a technician specified maintenance circuit pack. Specifying cabinets 2 through 3 will allow testing of any connected EPN maintenance circuit packs.

For the EPN maintenance circuit pack, the SAT interface, EI link, reset and sanity functions are tested. The long test resets the EPN maintenance circuit pack causing the EPNSAT link to be dropped and is destructive.

Defaults

The default for the parameters are short with a repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | The location designates the physical position of the desired maintenance circuit pack. The location consists of a cabinet number and carrier letter. The cabinet number is one or two digits from 2 to 3 with leading zeros allowed.                                                                                                                                                                                                                                                |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This includes both destructive and nondestructive tests for this command.                                                                                                                                                                                                                                                                                                                        |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

Help Messages

If the system technician presses HELP after entering "test maintenance", the following message will be displayed:

```
Enter [cabinet(2-3)];carrier(A)],
['long' or 'short'], ['repeat'(1-100)
or 'clear'], ['schedule']
```

Error Messages

For any system, if the entered value is invalid, the following message will be displayed:

Identifier invalid

If the port network specified is not available, the following message will be displayed:

EPN is not available

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier) of the maintenance object that is being tested. For this maintenance object, only the cabinet and carrier values are displayed. |
| Maintenance Name | The maintenance name will always be MAINT.                                                                                                                         |
| Alt. Name        | Not applicable.                                                                                                                                                    |
| Test No.         | The actual test that is being executed.                                                                                                                            |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "DISABLED."                                                                                            |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.                 |
