For the following output example, assume that the command that was entered was "test maintenance 2".

```
test maintenance 2
```

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 02A          | MAINT            |           | 106      | PASS   |            |
| 02A          | MAINT            |           | 229      | PASS   |            |
| 02A          | MAINT            |           | 303      | PASS   |            |
| 02A          | MAINT            |           | 337      | PASS   |            |

```
Command Successfully Completed
```

Feature Interactions

The long test on EPN maintenance circuit packs will cause the EPNSAT link to be dropped. The reset test is the last test and drops this link.

test memory

This command will test memory circuit packs.

Synopsis

test memory location [ short | long ][ repeat number | clear ] schedule

Permissions

The following default logins may execute this command: system technician, inads, init, nms.

Examples

- test memory
- test memory a
- test memory a schedule
- test memory 1a2
- test memory b1 sh
- test memory b l r 25
- test memory a l c

## Description

This command performs hardware diagnostic tests on any one memory circuit packs or on all memory circuit packs in the technician specified carrier. Neither the short nor the long test is destructive when testing memory.

## Defaults

The cabinet default is always cabinet 1. For SPE simplex systems, the default carrier is the "a" carrier. For SPE duplex systems, there is no default carrier. The defaults for the remaining parameters are short with a repeat of 1.

## Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | The location designates the physical position of the desired memory circuit pack. The location consists of a cabinet number and carrier letter. The cabinet number is always optional and must be a "1" or a "01" if entered. The carrier must be either "a" or "b" for SPE duplex systems. For SPE simplex systems, the carrier must be "a" if entered.                                                                                                                            |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. The long version does not include any destructive tests for this command.                                                                                                                                                                                                                                                                                                                        |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

## Help Messages

If the system technician presses HELP after entering "test memory" on a simplex SPE system the following message will be displayed:

Enter [cabinet(1)];carrier(A),

['long' or 'short'], ['repeat' (1-100)  
or 'clear'], ['schedule']

If the system technician presses **HELP** after entering "test disk" on a duplex SPE system the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B),  
['long' or 'short'], ['repeat' (1-100)  
or 'clear'], ['schedule']
```

## Error Messages

For SPE duplex systems, if no carrier is entered on the command line, the following message will be displayed:

```
A carrier must be specified for duplex systems
```

For any system, if the length of the user entered parameter exceeds five (5), the following message will be displayed:

```
Entry invalid
```

On any system, if any cabinet other than "1" or "01" is specified, the following message will be displayed:

```
Only cabinet '1' may be specified for this command
```

If a carrier is entered which is not valid for the current system configuration (for example, anything other than "A" or "B" for SPE duplex and anything other than the 'a' carrier for SPE simplex), the following message will be displayed:

```
Carrier out of range;  
Enter 'a' if SPE simplex, 'a' or 'b' if SPE duplex
```

If the standby SPE was specified, and it does not respond, the following message will be displayed:

```
Standby SPE not available;  
for information use 'status system'
```

If an invalid position number is entered, the following message will be displayed:

```
Board position is invalid
```

If a non administered circuit pack location is entered, the following message will be displayed:

```
Memory Board not assigned
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier) of the maintenance object that is being tested.                                                                    |
| Maintenance Name | The type of maintenance object that is being tested will be MEMORY.                                                                                   |
| Alt. Name        | Not applicable.                                                                                                                                       |
| Test No.         | The actual test that is being executed.                                                                                                               |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL".                                                                                           |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the command that was entered was "test memory 1b".

test memory 1b

TEST RESULTS

| Port | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|------|------------------|-----------|----------|--------|------------|
| 01B  | MEM-BD           |           | 87       | PASS   |            |
| 01B  | MEM-BD           |           | 631      | PASS   |            |

## test modem-pool

---

This command will perform hardware diagnostic tests on the specified modem pool group or an individual member of a specified group.

### Synopsis

---

*test modem-pool group/member [ short | long ] repeat number schedule*

### Permissions

---

The following default logins may execute this command: init, inads, system technician.

### Examples

---

```
test modem-pool 1
test modem-pool 1 schedule
test modem-pool 1/3 l r 2
test modem-pool 1/3 l r 2 schedule
test modem-pool 2 r 2
test modem-pool 2 l
```

### Description

---

The "test modem-pool" command performs hardware diagnostic tests on all of the members that are in a modem-pool group or, on a single member if the optional member number is supplied.

If the member number is supplied, what is tested depends on the type of modem-pool group, Combined or Integrated. A Combined modem-pool group consists of pairs of Analog and Digital Line ports. One pair of Analog and Digital Line ports used for modem-pooling is called a conversion resource. An Integrated group, on the other hand, consists of modem-pool circuit packs each of which contains two conversion resources. Therefore, when a member number is specified for a Combined modem-pool group, one conversion resource is tested and when a member number is specified for an Integrated modem-pool group, two conversion resources are tested.

### Defaults

The default for the command is short with a repeat number of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group number  | The group number is assigned from administration. The group number may be any administered group from 1-5.                                                                                                                                                                                                                                                                                                                                                |
| member number | The member number is assigned from administration. A member is a pair of analog and digital line ports (or two pair for the Integrated modem-pool case). The member number may be any administered group member from 1-32.                                                                                                                                                                                                                                |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                       |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                            |
| repeat number | This number specifies how many times each test in the sequence is to be repeated. The number may be any integer between 1 and 100. For example, if number = 2, then each test in the sequence is executed twice.                                                                                                                                                                                                                                          |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

Help Messages

If the system technician presses HELP after entering "test modem-pool" the following message will be displayed:

```
Enter group #(1-5) or group #/member #,  
['long' or 'short'], ['repeat' (1-100)],  
['schedule'] or press CANCEL to cancel the command
```

Error Messages

If the "test modem-pool" command is entered from a login for which the command is not valid, then the following message will be displayed:

```
"test" is an invalid entry; please press HELP
```

If the group or member numbers entered are not digits, then the following message will be displayed:

```
Identifier invalid
```

If the group number or member number entered is not within the valid range of groups or members, the following message will be displayed:

```
Boards not assigned
```

If the group is not administered or is administered but with no members, the following message will be displayed:

Group not assigned, or group  
assigned but with no member

If the a member is assigned, but the port is does not exist in the system, then the following message is displayed:

Port not assigned

If there are no tests found for the maintenance object, the following message will be displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                       |
| Maintenance Name | The type of maintenance object that is being tested. This is always MODEM-PT.                                                                         |
| Alt. Name        | This field is not applicable to this command.                                                                                                         |
| Test No          | The actual test that is being executed.                                                                                                               |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                       |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

In the following output example, the command "test modem-pool 1/3" was entered.

```
test modem-pool 1/3 short                                SPE B

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
01C0701   MODEM-PT              98         PASS
01C0701   MODEM-PT              99         PASS

Feature Interactions

None.

test network-control

This command will test a network control board.

Synopsis

test network-control location [ short | long ][ repeat number | clear ] schedule

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

```
test network-control
test network-control a l
test network-control b sh r 2
test network-control b l r 25
test network-control a
test network-control a c
```

Description

The test network-control command performs hardware diagnostic tests on a technician specified network control circuit pack.

Defaults

The default for the command is cabinet 1, carrier a, short with a repeat of 1.

Parameters

- location
- The location designates the desired network control board carrier in a High or Critical Reliability System (i.e. "a" or "b").
- short
- This will cause the command to execute a series of nondestructive diagnostic tests.
- long
- This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
- repeat number
- The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
- clear
- This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

**WARNING:**  
*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

- schedule
- When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test network-control" the following message will be displayed for a simplex switch configuration:

```
Enter ['long' or 'short'], ['repeat' (1-100)
      or 'clear'], ['schedule']
```

For a duplex switch configuration, the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B),  
['long' or 'short'], ['repeat' (1-100)  
or 'clear'], ['schedule']
```

## Error Messages

If the SPE is not active, the following message will be displayed:

```
Command must be executed from active SPE
```

If the carrier entered is invalid, the following message will be displayed:

```
"entered value" is an invalid identifier;  
press RETURN to execute modified command
```

If the NETCON board is not TN777B, the following message will be displayed:

```
Must install TN777B circuit pack
```

If the entered standby carrier cannot be retrieved, the following message will be displayed:

```
Error encountered, can't complete request
```

If there aren't any tests found for this MO, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering  
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;
```

use the "refresh spe-standby" command.

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

Active SPE locked via select switches;  
Standby SPE memory not refreshed

If the standby SPE is busy with another task, then the following message is displayed:

Standby SPE busy with another task;  
for information use "status system 1"

If the standby SPE is not available when this command is executed, then the following message is displayed:

Standby SPE not available;  
for information use "status system 1"

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested. This object is always associated with cabinet 1. For maintenance objects: DATA-BD, SW-CTL, 12V-PWR, CARD-MEM, the slot and circuit fields of port address are blank. The administered data channel maintenance object, DATA-CHL, uses the "XX" as the slot address and has a circuit number between 01 and 04. The carrier field has a value "A" for the control carrier A in a simplex system, and "A" or "B" for control carriers A and B in a duplex system. |
| Maintenance Name | The type of maintenance object that is being tested. The maintenance objects are: DATA-BD for Network Control board, SW-CTL for Switch Control Arch-angel, DATA-CHL for administered data channel, 12V-PWR for 12 volt power supply unit on Network Control board, CARD-MEM for flash memory card on Network Control board. 12V-PWR and CARD-MEM are shown only when the Network Control board is TN777B.                                                                                                                                                       |
| Alt. Name        | This field contains the extension number of the DATA-CHL if administered. For other maintenance objects, this field is not applicable and left empty.                                                                                                                                                                                                                                                                                                                                                                                                           |

|            |                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test No    | The actual test that is being executed.                                                                                                                                           |
| Result     | An indicator such as "PASS" for test passed, "FAIL" for test failed, "ABORT" for test was aborted, "NO BOARD" for no Network Control Board was inserted.                          |
| Error Code | A system-generated number that tells why the individual test failed or was aborted. A detailed list of the codes according to "Test No." is provided for each maintenance object. |

For the following output example, assume that the entered command was "test network-control a".

```
test network-control a
```

| TEST RESULTS |                  |           |          |        |            |  |
|--------------|------------------|-----------|----------|--------|------------|--|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |  |
| 01A          | DATA-BD          |           | 52       | PASS   |            |  |
| 01AXX01      | DATA-CHL         | 4001      | 109      | PASS   |            |  |
| 01AXX01      | DATA-CHL         | 4001      | 110      | PASS   |            |  |
| 01AXX01      | DATA-CHL         | 4001      | 111      | PASS   |            |  |
| 01A          | SW-CTL           |           | 95       | PASS   |            |  |
| 01A          | SW-CTL           |           | 92       | PASS   |            |  |
| 01A          | SW-CTL           |           | 94       | PASS   |            |  |
| 01A          | SW-CTL           |           | 324      | PASS   |            |  |
| 01A          | 12V-PWR          |           | 701      | PASS   |            |  |
| 01A          | CARD-MEM         |           | 695      | PASS   |            |  |
| 01A          | CARD-MEM         |           | 696      | PASS   |            |  |
| 01A          | CARD-MEM         |           | 697      | PASS   |            |  |
| 01A          | CARD-MEM         |           | 698      | PASS   |            |  |
| 01A          | CARD-MEM         |           | 699      | PASS   |            |  |

test packet-control

This command will test the specified packet-control.

Synopsis

test packet-control location [ short | long ][ repeat (1-100) | clear ] [ schedule ]

## Permissions

---

The following default logins may execute this command: system technician, inads, init, nms

## Examples

---

```
test packet-control
test packet-control A
test packet-control B
test packet-control 1A
test packet-control 1B
test packet-control a short
test packet-control a s repeat 5
test packet-control b s r 5
test packet-control b long clear
test packet-control b l r 25
```

## Description

---

The test packet-control command performs hardware diagnostic tests on a technician specified packet-control circuit pack.

## Defaults

For simplex systems, the location is optional and defaults to cabinet 1, carrier A. For duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | The location only applies to duplicated configurations. If the configuration is a simplex, the location parameter is not used and thus is not valid. For duplicated configurations, a "location" represents the carrier that the packet-control resides on in the system. Valid locations are either 1A or 1B.                                                                                                                                                |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                           |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. The long version does not include any destructive tests for this command.                                                                                                                                                                                                                                                                                                  |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                             |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if on exists against the packet-control) is cleared or a single test in the sequence fails. If no alarms are registered against the packet-control the test sequence will be run only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms related to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.     |

Help Messages

If the system technician presses HELP after entering "test packet-control", the following message is displayed:

```
Enter [cabinet(1)]; carrier (A-B),  
['long' or 'short'], ['repeat' (1-100)  
or 'clear'], ['schedule']
```

Error Messages

If this command is executed on the standby SPE and this SPE is busy at the moment, the following will be displayed:

```
Standby SPE busy;  
See status system for more details
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | This field represents the Cabinet-Carrier in which the Packet-Control resides.                                                                        |
| Maintenance Name | The type of maintenance object that is being busied out.                                                                                              |
| Alt. Name        | This field is not used in this output display.                                                                                                        |
| Test No.         | This field lists the test run on the packet-control.                                                                                                  |
| Result           | An indicator as to whether the object was successfully busied out ("PASS", "FAIL", "ABORT", "NO BOARD", "DISABLED", "EXTRA BD").                      |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the coeds according to "Test No." is provided for each MO. |

For the following output example, the command test packet-control 1B long was entered. Note that carrier B is the active carrier in these example outputs.

test packet-control 1B l

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 01B          | PKT-CTRL         |           | 583      | PASS   |            |
| 01B          | PKT-CTRL         |           | 584      | PASS   |            |
| 01B          | PKT-CTRL         |           | 585      | PASS   |            |

Command successfully completed

For the following output example, the command test packet-control 1B was entered. Note that carrier B is the active carrier in these example outputs.

test packet-control 1B

TEST RESULTS

| Port | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|------|------------------|-----------|----------|--------|------------|
| 01B  | PKT-CTRL         |           | 585      | PASS   |            |

Command successfully completed

For the following output example, the command test packet-control 1A was entered. Note that carrier A is the standby carrier in these example outputs.

test packet-control 1A

TEST RESULTS

| Port | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|------|------------------|-----------|----------|--------|------------|
| 01A  | PKT-CTRL         |           | 586      | PASS   |            |
| 01A  | PKT-CTRL         |           | 583      | PASS   |            |
| 01A  | PKT-CTRL         |           | 585      | PASS   |            |

Command successfully completed

Feature Interactions

The reset packet-control test (586) does not run on the active packet-control. This test is part of the standby packet-control test sequence as illustrated in the Output section of this manual page.

test pkt

This command will test the Packet bus on the specified PPN or EPN.

Synopsis

test pkt port-network pn number [ short | long ][ repeat number | clear ] schedule

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

```
test pkt port-network 1 l
test pkt port-network 2 sh r 2
test pkt port-network 2 sh schedule
test pkt port-network 1 l r 25
test pkt port-network 2
test pkt port-network 1 c
```

## Description

---

The test pkt runs a series of diagnostic packet bus tests that return results of the test along with possible error codes to the user.

## Defaults

The default for this command is short with a repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pn number     | The individual Packet bus to be tested is entered as "NN" where "NN" represents the port network number of the port network to have its Packet bus tested. A port network number (1-3) may be entered.                                                                                                                                                                                                                                                                              |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |

 **WARNING:**  
*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses HELP after entering "test pkt" the following message will be displayed:

```
Enter 'port-network', port network number (1-3),  
    ['long' or 'short'], ['repeat' (1-100)  
    or 'clear'], ['schedule']
```

Error Messages

If the technician does not enter all digits for the port-network number, the following message will be displayed:

Entry must be all digits

If the port network on which the desired Packet bus resides is unavailable, the following message will be displayed:

EPN is not available

For any system, if the length of the user entered parameter "port network" exceeds 3 the following message will be displayed:

Entry invalid

If the packet bus is not activated the following message will be displayed:

Packet Bus is not activated,  
check system-parameters maintenance form

If no tests can be found for the associated MO, the following message is displayed:

No tests for this MO

If the software data cannot be sent to the SAT, the following message is displayed:

Error encountered, can't complete request

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                      |
|------------------|------------------------------------------------------|
| Port             | A port network number is displayed (1-3).            |
| Maintenance Name | The type of maintenance object that is being tested. |
| Alt. Name        | Not applicable.                                      |

|            |                                                                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test No    | The actual test that is being executed.                                                                                                                                                                    |
| Result     | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                                                                            |
| Error Code | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO [for example, see MO section on "PKT-BUS (Packet Bus)"]. |

For the following output example, assume that the command that was entered was "test pkt port-network 1".

```
test pkt port-network 1

                                TEST RESULTS

Port   Maintenance Name  Alt. Name  Test No.  Result      Error Code
PN 01  PKT-BUS              571       PASS
PN 01  PKT-BUS              572       PASS
PN 01  PKT-BUS              573       PASS

Command successfully completed
```

Feature Interactions

None.

test pms-link

This command will test a property management system link.

Synopsis

test pms-link [ short | long ][ repeat number | clear ] schedule

Permissions

The following default logins may execute this command: system technician, inads, init.

## Examples

---

```
test pms-link sh r 5
test pms-link l
test pms-link
test pms-link c
test pms-link c sch
```

## Description

---

The test pms-link command will perform the specified property management system link tests on the specified pms link, by checking to see if the link is accessible and then performing a reset on the link. The above scenario is for the long test only.

For general information on PMS links, see the second paragraph in the "Description" section of the "busyout pms-link" manual pages.

For information on what a PMS is and does, see the second paragraph in the ["Description"](#) section of the ["status pms-link"](#) manual pages.

## Defaults

The default for the command is short with the repeat of 1.

## Parameters

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| short            | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long             | This executes a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                          |
| repeat<br>number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear            | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule         | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

## Help Messages

If the system technician presses HELP after entering "test pms-link" the following message will be displayed:

```
Enter ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

## Error Messages

If the link is not administered, the following error message will be displayed:

```
Link not administered or not enabled
```

If no tests can be found for the link, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
```

Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | With this object the port field is blank.                                                                                                             |
| Maintenance Name | The type of MO that is being tested (always PMS-LINK).                                                                                                |
| Alt. Name        | Not applicable.                                                                                                                                       |
| Test No          | The actual test that is being executed.                                                                                                               |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                       |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following example, the command entered was "test pms-link l".

test pms-link long

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|              | PMS-LINK         |           | 214      | PASS   |            |

Command Successfully Completed

Feature Interactions

The maintenance of a particular component on a link may interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recovery of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and causes the link to be torn down. If the link is already down, the busyout command stops periodic re-setup tries on the link.

# test port

---

This command performs hardware diagnostic tests on an individual port circuit.

## Synopsis

---

*test port location [ short | long ][ repeat number | clear ] schedule*

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

**test port 01c1101 l**  
**test port 01c1101 l schedule**  
**test port 02e1502 sh r 2**  
**test port 02d1201 r 4**  
**test port 01c1101 c**

## Description

---

The test port command performs hardware diagnostic tests on an individual port circuit. In most cases, tests will be performed on hardware that is connected to the port. The technician must specify the port on the port carrier board which the tests are to be performed on.

## Defaults

The default for the command is short with the repeat of 1.

Parameters

- location

A "location" represents the physical position of the port to be tested and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit.
- short

This will cause the command to execute a series of nondestructive diagnostic tests.
- long

This executes a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
- repeat number

The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
- clear

This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

 **WARNING:**

*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

- schedule

When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test port" the following message will be displayed:

```
Enter port location, ['long' or 'short'],  
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the format for the port location is incorrect, the following error message will be displayed:

Port/Board invalid

If the EPN on which the port resides is not accessible, the following message will be displayed:

EPN is not available

If the board on which the port resides is not configured in the system, the following message will be displayed:

Port not assigned

If there are no tests found for this maintenance object, the following message will be displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                                                                                                                                                                                                                         |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                                                                                                                                                    |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |

|            |                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test No    | The actual test that is being executed.                                                                                                               |
| Result     | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                       |
| Error Code | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port. The command that was entered was "test port 1c0701".

test port 01c0701 short

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 01C0701      | ANL-LINE         |           | 35       | PASS   |            |
| 01C0701      | ANL-LINE         |           | 48       | PASS   |            |
| 01C0701      | ANL-LINE         |           | 36       | PASS   |            |

test pri-endpoint

This command will perform hardware diagnostic tests on all port circuits (B-channels) that are associated with the PRI endpoint extension.

Synopsis

test pri-endpoint extension [ short | long ] repeat number schedule

Permissions

The following default logins may execute this command: system technician, inads, init, nms.

### Examples

```
test pri-endpoint 25012
test pri-endpoint 45002 sh
test pri-endpoint 45892 l
test pri-endpoint 24389 sh r 4
test pri-endpoint 34899 l r 6
test pri-endpoint 34912 l r 5 schedule
test pri-endpoint 93483 r 2
test pri-endpoint 10022 c
test pri-endpoint 92349 schedule
```

### Description

The test pri-endpoint command performs hardware diagnostic tests on all port circuits (B-channels) that are associated with the specified PRI endpoint.

### Defaults

The default for the command is short with repeat number of 1.

### Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extension     | The extension of the PRI endpoint to be tested. The number of digits in an extension is determined by the dial-plan.                                                                                                                                                                                                                                                                                                                                      |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                       |
| long          | This will execute a more comprehensive and longer version of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                             |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                         |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

### Help Messages

If the user presses HELP after entering "test pri-endpoint", the following message is displayed:

```
Enter extension number, ['long' or 'short'],
['repeat' (1-100)], ['schedule']
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

Extension invalid

If the EPN on which the PRI endpoint resides is not accessible, the following message will be displayed:

EPN is not available

If the extension is not administered, the following message will be displayed:

Extension not assigned

If the object associated with the specified extension is not a PRI endpoint, the following message will be displayed:

Extension assigned to object other than pri-endpoint

If the board that contains the PRI endpoint is not inserted in the system, the following message will be displayed:

Board not inserted

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a port-by-port and test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                  |
| Maintenance Name | The type of maintenance object that is being tested. The name for PRI endpoint port is "PE-BCHL".                                |
| Alt. Name        | The alternate way of identifying the maintenance object. This field contains the specified extension number of the PRI endpoint. |

|            |                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Test No    | The actual test that is being executed.                                                                                                            |
| Result     | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED."                                                                |
| Error Code | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, the command "test pri-endpoint 22501" was entered. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 3.

test pri-endpoint 22501 short

page 1 of 1

TEST RESULTS

| Port    | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|---------|------------------|-----------|----------|--------|------------|
| 01B2001 | PE-BCHL          | 22501     | 36       | PASS   |            |
| 01B2001 | PE-BCHL          | 22501     | 255      | PASS   |            |
| 01B2001 | PE-BCHL          | 22501     | 256      | PASS   |            |
| 01B2001 | PE-BCHL          | 22501     | 257      | PASS   |            |
| 01B2002 | PE-BCHL          | 22501     | 36       | PASS   |            |
| 01B2002 | PE-BCHL          | 22501     | 255      | PASS   |            |
| 01B2002 | PE-BCHL          | 22501     | 256      | PASS   |            |
| 01B2002 | PE-BCHL          | 22501     | 257      | PASS   |            |
| 01B2003 | PE-BCHL          | 22501     | 36       | PASS   |            |
| 01B2003 | PE-BCHL          | 22501     | 255      | PASS   |            |
| 01B2003 | PE-BCHL          | 22501     | 256      | PASS   |            |
| 01B2003 | PE-BCHL          | 22501     | 257      | PASS   |            |

test processor

This command will test the processor circuit pack.

Synopsis

test processor location [ short | long ] clear schedule

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

```
test processor
test processor schedule
test processor a
test processor 1a
test processor b sh
test processor a l c
```

## Description

---

The test processor command performs hardware diagnostic tests on a technician specified processor circuit pack.

## Defaults

For SPE simplex systems, the location is optional and defaults to cabinet 1, carrier "a". For SPE duplex systems, the cabinet default is again cabinet 1 but there is no default for the carrier. Defaults for the remaining parameters are short with a repeat of 1.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location | The location designates the physical position of the desired processor. The location consists of a cabinet number and carrier letter. The cabinet number is always optional and must be a "1" or a "01" if entered. The carrier is an optional "a" for SPE simplex systems but is required for SPE duplex systems and must be either "a" or "b" in this case.                                                                                                                       |
| short    | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long     | This will execute a more comprehensive and longer version of the diagnostic tests. The long version does not include any destructive tests for this command.                                                                                                                                                                                                                                                                                                                        |
| clear    | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

## Help Messages

If the system technician presses HELP after entering "test processor" on a simplex SPE system the following message will be displayed:

```
Enter ['long' or 'short'],  
['repeat'(1-100) or 'clear'], ['schedule']
```

If the system technician presses **HELP** after entering "test processor" on a duplex SPE system the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B),  
      ['long' or 'short'],  
      ['repeat'(1-100) or 'clear'], ['schedule']
```

## Error Messages

For SPE duplex systems, if no carrier is entered on the command line, the following message will be displayed:

```
A carrier must be specified for duplex systems
```

For any system, if the length of the user entered parameter exceeds three (3), the following message will be displayed:

```
Entry invalid
```

On any system, if any cabinet other than "1" or "01" is specified, the following message will be displayed:

```
Only cabinet '1' may be specified for this command
```

If a carrier is entered which is not valid for the current system configuration (for example, anything other than "A" or "B" for SPE duplex and anything other than the 'a' carrier for SPE simplex), the following message will be displayed:

```
Carrier out of range;  
Enter 'a' if SPE simplex, 'a' or 'b' if SPE duplex
```

If the standby SPE was specified, and it does not respond, the following message will be displayed:

```
Standby SPE not available;  
for information use 'status system'
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;  
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

## Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier) of the maintenance object that is being tested.                                                                    |
| Maintenance Name | The type of maintenance object that is being tested is MEMORY.                                                                                        |
| Alt. Name        | Not applicable.                                                                                                                                       |
| Test No.         | The actual test that is being executed.                                                                                                               |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD".                                                       |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the command that was entered was "test processor a".

test processor a

SPE B

TEST RESULTS

| Port | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|------|------------------|-----------|----------|--------|------------|
| 01A  | PROCR            |           | 77       | PASS   |            |
| 01A  | PROCR            |           | 80       | PASS   |            |
| 01A  | PROCR            |           | 82       | PASS   |            |
| 01A  | PR-MAINT         |           | 102      | ABORT  | 1018       |
| 01A  | PR-MAINT         |           | 103      | ABORT  | 1018       |
| 01A  | PR-MAINT         |           | 106      | PASS   |            |
| 01A  | PR-MAINT         |           | 228      | PASS   |            |
| 01A  | PR-MAINT         |           | 229      | ABORT  | 1018       |
| 01A  | MEMORY           |           | 87       | PASS   |            |
| 01A  | MEMORY           |           | 631      | PASS   |            |

None.

## test shadow-link

This command allows the technician to test the shadow link.

## Synopsis

---

test shadow-link [ short | long ][ repeat number | clear ] schedule

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

```
test shadow-link l
test shadow-link sh r 2
test shadow-link sh r 2 schedule
test shadow-link c
```

## Description

---

The test shadow-link command performs hardware diagnostics for the shadow link between the two duplication-interface circuit packs. This command works only with a High or Critical Reliability System. Refer to [Chapter 6, “Reliability Systems: A Maintenance Aid”](#) for more details.

## Defaults

The default for the command is short with the repeat of 1.

## Parameters

- |       |                                                               |
|-------|---------------------------------------------------------------|
| short | The short and long test sequence both execute only test #318. |
| long  | The short and long test sequence both execute only test #318. |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

## Help Messages

If the system technician presses HELP after entering "test shadow-link" the following message will be displayed:

```
Enter ['long' or 'short'],  
['repeat' (1-100) or 'clear'], ['schedule']
```

## Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering  
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;  
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;  
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed

Standby SPE busy with another task;  
for information use "status system 1"

If the standby SPE is not available when this command is executed, then the following message is displayed:

Standby SPE not available;  
for information use "status system 1"

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address will always be blank for this command.                                                                                            |
| Maintenance Name | The maintenance name will always be SHDW-LNK for this command.                                                                                     |
| Alt. Name        | Not applicable.                                                                                                                                    |
| Test No          | The test number will always be 318 for this command.                                                                                               |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "DISABLED,".                                                                           |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the command that was entered was "test shadow-link"

test shadow-link

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|              | SHDW-LNK         |           | 318      | PASS   |            |

## test signaling-group

---

This command performs a set of hardware diagnostic tests on the specified signaling group. The tests vary according to whether a short or long option is specified.

### Synopsis

---

*test signaling-group group identifier [ short | long ][ repeat number | clear ]  
schedule*

### Permissions

---

The following default logins may execute this command: system technician, inads, init.

### Examples

---

**test signaling-group 1**  
**test signaling-group 1 repeat 10**  
**test signaling-group 2 short**  
**test signaling-group 4 long**  
**test signaling-group 4 long clear**  
**test signaling-group 2 schedule**

### Description

---

The test signaling-group validates that the specified signaling group is administered and runs a series of diagnostic tests that return results of the test along with possible error codes to the user.

A signaling group is a collection of B-channels signaled for by a designated single D-channel or set of D-channels over an ISDN-PRI.

### Defaults

The default for the command is short with the repeat of 1.

Parameters

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group identifier | The signaling group identifier is an administered number associated with each signaling group (1-8).                                                                                                                                                                                                                                                                                                                                                                                |
| short            | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long             | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number    | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear            | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |

 **WARNING:**

*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses HELP after entering "test signaling-group", the following is displayed:

```
Enter group identifier (1-8), ['long' or 'short'],  
      ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the specified group identifier is non numeric or out of range, the following message is displayed:

Signaling group invalid

If the specified group identifier is not administered, the following message is displayed:

No signaling group assigned

If no tests can be found for the associated MO, the following message is displayed:

No tests for this MO

If the software data cannot be sent to the SAT, the following message is displayed:

Error encountered, can't complete request

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The signaling group number (1-8) of the signaling group that is being tested.                                                                                                                                             |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                      |
| Alt. Name        | Not Applicable.                                                                                                                                                                                                           |
| Test No          | The actual test that is being executed.                                                                                                                                                                                   |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                                                                                           |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO [for example, see MO section on "ISDN-SGR (ISDN-PRI Signaling Group)"]. |

For the following output example, assume that the command "test signaling-group 1" was entered.

test signaling-group 1

SPE A

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 1            | ISDN-SGR         |           | 636      | PASS   |            |
| 1            | ISDN-SGR         |           | 639      | PASS   |            |
| 1            | ISDN-SGR         |           | 637      | PASS   |            |

Command Successfully Completed

### Feature Interactions

Additional data is available after running a test. See the status signaling-group command for details on how to access the additional data.

## test sp-link

This command performs a set of hardware diagnostic tests on the system printer link (if one exists). The tests vary according to whether a short or long option is specified.

### Synopsis

test sp-link [ short | long ] schedule

### Permissions

The following default logins may execute this command: system technician, inads, init.

### Examples

test sp-link  
test sp-link sh  
test sp-link l  
test sp-link schedule  
test sp-link sh sch

## Description

The test sp-link command validates that the system printer link is administered and runs a series of diagnostic tests that return results of the test along with possible error codes to the user.

The system printer link is a link from the switch to an external printer over which jobs can be printed. This link is created by administering the system printer extension and setting up a call to the system printer.

## Defaults

The default for the command is short.

## Parameters

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| short    | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                       |
| long     | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                            |
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

## Help Messages

If the system technician presses HELP after entering "test sp-link", the following is displayed:

Enter ['long' or 'short'], ['schedule']

## Error Messages

If the system printer link is not administered, the following message is displayed:

Link not administered or not enabled

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message is displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | Not applicable. Will always be blank.                                                                                                              |
| Maintenance Name | The type of maintenance object that is being tested. This will always be "SYS-PRNT".                                                               |
| Alt. Name        | Not applicable. Will always be blank.                                                                                                              |
| Test No          | The actual test that is being executed.                                                                                                            |
| Result           | The result of the individual test - "PASS", "ABORT", "FAIL", "NO BOARD", "DISABLED", "EXTRA BD".                                                   |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example the command entered was "test sp-link".

test sp-linkSPE A

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|              | SYS-PRNT         |           | 215      | PASS   |            |
|              | SYS-PRNT         |           | 213      | PASS   |            |

Feature Interactions

None.

test spe-standby

This command allows the technician to test the standby Switch Processing Element.

Synopsis

test spe-standby [ short | long ][ repeat number | clear ]

## Permissions

---

The following default logins may execute this command: system technician, inads, init.

## Examples

---

```
test spe-standby long
test spe-standby l
test spe-standby s r 2
test spe-standby c
```

## Description

---

The test spe-standby command performs hardware diagnostic tests on the standby Switch Processing Element (SPE) in a duplex SPE system. This command tests all MOs in the standby MO. The STBY-SPE MO itself does not have any defined tests. Instead tests are run on the following MOs when the **test spe-standby** command is run. Refer to the sections for these MOs for more details. This command is only for a High or Critical Reliability System. This command will run the following tests on the standby SPE:

9. MEMORY
10. SHDW-LNK
11. SHDW-CIR
12. SPE\_SELEC
13. DUPINT
14. DATA-BD
15. DATA-CHL
16. SW-CTL
17. PROCR
18. PR-MAINT
19. 12V-PWR
20. CARD-MEM
21. FL-DATA
22. PI-BD
23. PI-PT
24. PKT-CTRL

Defaults

The defaults for this command are short with a repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |

Help Messages

If the system technician presses HELP after entering "test spe-standby" the following message will be displayed:

```
Enter ['long' or 'short'],  
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering  
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;  
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;  
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;  
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;  
for information use "status system 1"
```

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested. This maintenance object will display the cabinet and carrier location of the standby SPE only. |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                           |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a data module.                                                                 |
| Test No          | The actual test that is being executed.                                                                                                                                                        |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED,".                                                                                                           |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.                                             |

For the following output example, assume that the standby SPE is located in carrier B and the command entered is "test spe-standby".

```
test spe-standby                                SPE A

                                TEST RESULTS

Port      Maintenance Name Alt. Name Test No. Result      Error Code
01B       SHDW-CIR                285              PASS
01B       SHDW-CIR                284              PASS
01B       SPE-SELECT              278              PASS
01B       DUPINT                  315              PASS
.         .                      .                  .
.         .                      .                  .
.         .                      .                  .

Command Successfully Completed
```

Feature Interactions

The testing of the standby SPE maintenance object makes the standby SPE unavailable to take over for the active SPE.

test station

This command performs hardware diagnostic tests on an individual port circuit that is associated with the extension.

Synopsis

test station extension [ short | long ][ repeat number | clear ] schedule

Permissions

The following default logins may execute this command: system technician, inads, cust, init, nms.

Examples

test station 81709 l  
test station 85136 s r 2  
test station 85036 l r 25  
test station 85036 l r 25 schedule  
test station 84297 r 4  
test station 81709 c

**Description**

---

The test station command performs hardware diagnostic tests on an individual port circuit assigned to that extension. Tests will be performed on the hardware that is connected to the port. The technician must specify the extension and a translation is automatically done to the physical port location.

**Defaults**

The default for the command is short with the repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extension     | The extension of the station to test. The number of digits in an extension is determined by a dial-plan.                                                                                                                                                                                                                                                                                                                                                                            |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |

 **WARNING:**  
*Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Help Messages

If the system technician presses HELP after entering "test station" the following message will be displayed:

Enter extension, ['long' or 'short'],  
['repeat' (1-100) or 'clear'], ['schedule']

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

Extension invalid

If the EPN on which the port resides is not accessible, the following message will be displayed:

EPN is not available

If the extension is not administered, the following message will be displayed:

Extension not assigned

If the object associated with the specified extension is not a station, the following message will be displayed:

Extension exists but assigned to a different object

If the board that contains the port is not inserted in the system, the following message will be displayed:

Board not assigned

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

**Output**

---

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                            |
| Maintenance Name | The type of maintenance object that is being tested.                                                                       |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains the extension when the object is a station. |

|            |                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test No    | The actual test that is being executed.                                                                                                               |
| Result     | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                       |
| Error Code | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port and extension 81902 is connected to that port. The command that was entered was "test station 81902".

test station 81902 short

TEST RESULTS

| Port    | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|---------|------------------|-----------|----------|--------|------------|
| 01C0701 | ANL -LINE        |           | 35       | PASS   |            |
| 01C0701 | ANL -LINE        |           | 48       | PASS   |            |

test synchronization

This command updates all the boards involved with synchronization.

Synopsis

test synchronization [ short | long ][ repeat number | clear ] schedule

Permissions

The following default logins may execute this command: system technician, inads, init.

## Examples

---

```
test synchronization r 3
test synchronization sh r 1
test synchronization sh r 1 schedule
test synchronization l
```

## Description

---

The test synchronization command makes sure that the proper sources are being used for timing synchronization and update the boards with the correct synchronization parameters. The tone-clocks, DS1s, and EIs are all sent down-link messages to place them in the correct synchronization configuration given the current on-line synchronization reference.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of: TDM bus clock, DS1 trunk board, and maintenance and administration software resident in the SPE.

## Defaults

The default for this command is short with a repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| short         | This causes the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| long          | This executes a more comprehensive and longer version of the diagnostic tests. This involves both destructive and nondestructive tests. For the synchronization MO, the same nondestructive test is run for both the short and long tests: test 417. If stratum-3 synchronization is administered, an additional nondestructive test (649) is also run.                                                                                                                                                     |
| repeat number | The "number" specifies how many times each test in the sequence is repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                                                 |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against synchronization maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against synchronization maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                                                   |

Help Messages

If the system technician presses HELP after entering "test synchronization", the following message will be displayed:

```
Enter ['long' or 'short'], ['repeat' (1-100)
      or 'clear'], ['schedule']
```

Error Messages

If there are no tests found for synchronization maintenance object, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id': 'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                       |

test tdm

This command tests all the time slots on a bus associated with a PPN or an EPN.

Synopsis

---

test tdm port-network pn number [ short | long ][ repeat number | clear ][  
schedule ]

Permissions

---

The following default logins may execute this command: system technician,  
inads, init.

Examples

---

test tdm port-network 1 l  
test tdm port-network 2 sh r 2  
test tdm port-network 2 sh sch  
test tdm port-network 1 l r 25  
test tdm port-network 2  
test tdm port-network 1 c

Description

---

The test tdm command performs hardware diagnostic tests on the time slots of  
the desired bus.

Defaults

The default for this command is short with a repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pn number     | The individual TDM bus to be tested is entered as "NN" where "NN" represents the port network number of the port network to have its TDM bus tested. Both halves ("a" and "b") of the TDM bus will be tested. A port network number (1 - 3) may be entered with or without a leading zero (0).                                                                                                                                                                                                      |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the TDM-BUS maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the TDM-BUS maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                                           |

Help Messages

If the system technician presses HELP after entering "test tdm" the following message will be displayed:

```
Enter 'port-network', port network number (1-3),  
['long' or 'short'], ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the technician does not enter all digits for the port-network number, the following message will be displayed:

```
Entry must be all digits
```

If the technician enters a Port Network number that is not administered, the following message will be displayed:

```
Port Network number not assigned
```

If the port network on which the desired TDM bus resides is unavailable, the following message will be displayed:

EPN is not available

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | For TDM-BUS maintenance object the port network number and the bus (A or B) is displayed.                                                             |
| Maintenance Name | The maintenance object being tested is TDM-BUS.                                                                                                       |
| Alt. Name        | Not applicable.                                                                                                                                       |
| Test No          | The actual test that is being executed.                                                                                                               |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                       |
| Error Code       | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the command that was entered was "test tdm port-network 1".

```
test tdm port-network 1
```

TEST RESULTS

| Port   | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
|--------|------------------|-----------|----------|--------|------------|
| PN 01A | TDM-BUS          |           | 294      | PASS   |            |
| PN 01A | TDM-BUS          |           | 296      | PASS   |            |
| PN 01A | TDM-BUS          |           | 297      | PASS   |            |
| PN 01B | TDM-BUS          |           | 294      | PASS   |            |
| PN 01B | TDM-BUS          |           | 296      | PASS   |            |
| PN 01B | TDM-BUS          |           | 297      | PASS   |            |

test tone-clock

This command will test a tone/clock board.

Synopsis

test tone-clock location [ short | long ][ repeat number | clear ] schedule

Permissions

The following default logins may execute this command: system technician, inads, init.

Examples

test tone-clock 01a I  
test tone-clock 01b I schedule

Description

The test tone/clock command performs hardware diagnostic tests on a technician specified tone/clock circuit pack.

Defaults

The default for the command is short with a repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location      | A "location" represents the physical position of the tone/clock to be tested and is entered as "UUc" where "UU" represents the cabinet number, and "c" represents the carrier. A cabinet number (1 - 3) may be entered with or without a leading zero (0).                                                                                                                                                                                                                                    |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                           |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                                |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                             |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the tone clock circuit pack) is cleared or a single test in the sequence fails. If no alarms are registered against the tone clock circuit pack then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                                     |

Help Messages

If the system technician presses HELP after entering "test tone-clock" the following message will be displayed:

```
Enter [[cabinet(1-3)];carr(A-B)],['long' or 'short'],
      ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If an identifier greater than 3 (three) characters is entered, or the cabinet entered is not a digit (number), the following message will be displayed:

```
Identifier invalid
```

If the carrier entered is invalid, the following message will be displayed:

Invalid carrier specified

If the cabinet entered is not within the valid range of cabinets or the cabinet is not administered, the following message will be displayed:

Cabinet number not assigned

If there is no tone/clock board at the specified location, one of the following messages will be displayed:

Board not inserted  
Board not assigned

If the specified cabinet carrier location is that of a switch node, the following message will be displayed:

Switch Node carrier specified; invalid command for SN carrier

If the cabinet carrier location entered is that of an EPN that is not available, the following message will be displayed:

EPN is not available

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy; Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                |
|------------------|------------------------------------------------------------------------------------------------|
| Port             | The tone clock circuit pack maintenance object will only display the cabinet-carrier location. |
| Maintenance Name | The maintenance objects being tested is TONE-BD, TONE-PT and TDM-CLK.                          |
| Alt. Name        | Not applicable.                                                                                |

|            |                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test No    | The actual test that is being executed.                                                                                                               |
| Result     | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                       |
| Error Code | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the command that was entered was "test tone-clock 1a".

test tone-clock 1a

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 01A          | TONE-BD          |           | 46       | PASS   |            |
| 01A          | TONE-BD          |           | 52       | PASS   |            |
| 01A          | TONE-PT          |           | 40       | PASS   |            |
| 01A          | TONE-PT          |           | 41       | PASS   |            |
| 01A          | TDM-CLK          |           | 148      | PASS   |            |
| 01A          | TDM-CLK          |           | 149      | PASS   |            |
| 01A          | TDM-CLK          |           | 150      | PASS   |            |
| 01A          | TDM-CLK          |           | 151      | PASS   |            |
| 01A          | TDM-CLK          |           | 574      | PASS   |            |

Command Successfully Completed

Feature Interactions

None.

test trunk

This command will test an entire trunk group or a specific trunk group member.

Synopsis

test trunk group number/member number [ short | long ][ repeat number | clear ] schedule

Permissions

The following default logins may execute this command: system technician, inads, cust, init.

## Examples

---

```
test trunk 78 l
test trunk 80/1 sh r 2
test trunk 78/2 l r 25
test trunk 78/2 l r 25 schedule
test trunk 80
test trunk 80 schedule
test trunk 78 r 4
test trunk 78 c
```

## Description

---

The test trunk command performs hardware diagnostic tests on an entire trunk group or an individual trunk group member, depending on the options entered by the technician.

## Defaults

The default for the command is short with the repeat of 1.

Parameters

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group number  | The group number is an administered number associated with each trunk group (1-99).                                                                                                                                                                                                                                                                                                                                                                                                 |
| member number | The member number is an administered number identifying a particular trunk within a trunk group (1-99).                                                                                                                                                                                                                                                                                                                                                                             |
| short         | This will cause the command to execute a series of nondestructive diagnostic tests.                                                                                                                                                                                                                                                                                                                                                                                                 |
| long          | This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.                                                                                                                                                                                                                                                                                                                                      |
| repeat number | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                   |
| clear         | This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. |
| schedule      | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.                           |

Help Messages

If the system technician presses HELP after entering "test trunk" the following message will be displayed:

```
Enter group # or group #/member #, ['long' or 'short'],  
      ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the format for the trunk location is incorrect, the following error message would be displayed:

```
Format invalid
```

If the trunk group or member range is invalid, the following message will be displayed:

```
Trunk or trunk group invalid
```

If a software fault is encountered while the command is executing, the following message will be displayed:

Error encountered, can't complete request

If the trunk group is not administered, the following message will be displayed:

Group not assigned, or group assigned but with no member

If the trunk group member is not administered, the following message will be displayed:

Group member not assigned

If there are no tests found for this maintenance object, the following message will be displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.                                                                                                                                                                                             |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                                                                                        |
| Alt. Name        | The alternate means of identifying the maintenance object. This field contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number. |

|            |                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test No    | The actual test that is being executed.                                                                                                               |
| Result     | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED."                                                                   |
| Error Code | A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO. |

For the following output example, assume that the command that was entered was "test trunk 78".

test trunk 78

| TEST RESULTS |                  |           |          |        |            |
|--------------|------------------|-----------|----------|--------|------------|
| Port         | Maintenance Name | Alt. Name | Test No. | Result | Error Code |
| 01C1505      | CO-TRK           | 078/001   | 3        | PASS   |            |
| 01C1505      | CO-TRK           | 078/001   | 36       | PASS   |            |

Command Successfully Completed

**Feature Interactions**

None.

**test tsc-administered**

This command performs switched services request to run a heartbeat test on any type of administered Temporary Signaling Connection (TSC).

**Synopsis**

test tsc-administered signaling group number/*tsc index repeat number schedule*

**Permissions**

The following default logins may execute this command: system technician, inads, init.

Examples

test tsc-administered 1  
test tsc-administered 1/1 repeat 2  
test tsc-administered 1/2 schedule

Description

The test tsc-administered command runs a switched services request to run the TSC heartbeat test is for administered Temporary Signaling Connection's (TSCs) on a signaling group.

Defaults

The default for the command is a repeat of 1.

Parameters

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| signaling group number | An administered number associated with each signaling group (1-8).                                                                                                                                                                                                                                                                                                                                                                                        |
| tsc index              | A number associated with each TSC in a signaling group.                                                                                                                                                                                                                                                                                                                                                                                                   |
| repeat number          | The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.                                                                                                                                                                                                                                                                                                                         |
| schedule               | When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details. |

Help Messages

If the system technician presses HELP after entering "test tsc-administered" the following message will be displayed:

Enter group # (1-8) or group #, [/tsc index (1-64)],  
['repeat' (1-100)], ['schedule']

Error Messages

If the format for the specified signaling group or the signaling group and TSC is incorrect, the following message is displayed:

Format invalid

If the specified signaling group number is out of range, the following message is displayed:

Signaling group invalid

If the specified signaling group is not administered, the following message is displayed:

No signaling group assigned

If the specified signaling group has no TSC assigned or the specified TSC is unadministered, the following message is displayed:

No TSC assigned

If the specified TSC number is out of range, the following message is displayed:

Tsc index invalid

If the software data cannot be sent to the SAT, the following message is displayed:

Error encountered, can't complete request

If no tests can be found for the associated MO, the following message is displayed:

No tests for this MO

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

Command resources busy;  
Press CANCEL to clear, and then resubmit

If all of the available maintenance resources are currently in use, then the following message will be displayed:

All maintenance resources busy; try again later

## Output

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

|                  |                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The port address of the administered temporary signaling connection that is being tested (signaling group no/tsc index).                                                                                                                  |
| Maintenance Name | The type of maintenance object that is being tested.                                                                                                                                                                                      |
| Alt. Name        | Not applicable.                                                                                                                                                                                                                           |
| Test No          | The actual test that is being executed.                                                                                                                                                                                                   |
| Result           | The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."                                                                                                                                           |
| Error Code       | A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO (for example, see MO section "TSC-ADM (Administered Temporary Signaling Connections)"). |

For the following output example, the command that was entered was "test tsc-administered 1/1".

```
test tsc-administered 1/1

                                TEST RESULTS

Port      Maintenance Name  Alt. Name  Test No.  Result      Error Code
1/1       TSC-ADM             604        PASS

Command Successfully Completed
```

## Feature Interactions

Additional data is available after running the test. See the status tsc-administered command for details on how to access the additional data.

## upgrade software

This command allows the software text image, the flash component of the LMM firmware, the MTP firmware, the Packet Control (PACCON) and the Processor Interface (PI) firmwares to be upgraded. Save translation must be done before this command.

## Synopsis

---

**Simplex/Duplex<sup>2</sup>**  
**upgrade software**

## Permissions

---

The following logins may execute this command: system technician, inads, init.

## Examples

---

**Simplex/Duplex**  
**upgrade software**

## Description

---

### Simplex

The command verifies that a software card-mem is present and then, if present, proceeds to reprogram the flash memory and perform a level-4 restart. During the restart of the system, the system technician is prompted to replace the software card-mem with the translation card-mem. Service is provided upon completion of the system restart. Service down time is between 5 to 12 minutes.

### Duplex

The command verifies that a software card-mem is present in the standby SPE, programs the flash memory, resets the standby SPE, and prompt the system technician to replace the software card-mem with the translation card-mem as in the simplex case. An interchange of SPE's is performed upon completion of a successful standby upgrade. At the same time, the old active SPE is upgraded automatically with the new software through similar swapping of card-mems. The service disruption is between 1 to 4 minutes, which is less disruptive than the simplex case.

## Defaults

None.

---

2. In this context, *simplex* is equivalent to the *stand reliability option*  
In this context, *duplex* is equivalent to the high reliability option or *critical reliability option*.

## Parameters

None.

## Help Messages

If the system technician presses HELP after entering "upgrade software," the following message is displayed:

Entry is not required

If no card-mem is loaded into the system, the following message will be displayed:

Software card-mem is not inserted in the system

If a wrong card-mem is loaded into the system, the following message will be displayed:

Incorrect card-mem loaded; insert software card-mem

If the directory information on the software card-mem is corrupted or the card-mem is not formatted properly, the following message will be displayed:

Software card-mem not readable; try another card-mem

If this command is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

'login id': 'command' has a command conflict

If the checksum on the software card-mem is bad, the following message will be displayed:

Bad checksum on software card-mem; try another card-mem

If the software upgrade failed in the standby SPE, the following message will be displayed:

No response on upgrade status from standby SPE, command failed

If the software card-mem in the standby SPE is not replaced with a translation card-mem within 2 minutes, the following message will be displayed:

No translation card-mem inserted  
in the standby SPE, command aborted

If the flash text checksum failed after the standby upgrade, the following message will be displayed:

Standby SPE text checksum failed, command aborted

If the software card-mem is not inserted in the active SPE within 2 minutes after the prompting string: "REPLACE TRANSLATION CARD-MEM ON <active carrier> WITH SOFTWARE CARD-MEM," the command has to be retried again and the following message will be displayed:

No software card-mem inserted in active SPE; command aborted

If the SPE-select switches are thrown to prevent the SPE-interchange during a software upgrade, the following message is displayed:

```
SPE select switches thrown; upgrade complete only on standby
```

If the standby SPE is not in the standby mode and is busy running tests, the following message will be displayed:

```
Standby SPE busy with another task;  
for information use 'status system'
```

If the standby SPE has not completed initialization, the following message will be displayed:

```
Standby SPE memory not refreshed; Use 'refresh spe-standby'
```

If the active SPE cannot communicate with the standby SPE after the standby SPE is properly upgraded, the following message will be displayed:

```
Upgrade failed; no communication with  
standby after new software booted
```

If the SPE-interchange failed and the new software cannot be run in the active SPE, the following message is displayed:

```
Software upgrade failed, could not perform an interchange
```

## Output

---

The following is the output of a successful simplex upgrade upon entering the "upgrade software" command:

```
INITIATING SOFTWARE UPGRADE  
MEM-CARD CHECKSUMPASSED  
REPROGRAMMING MTPPASSED  
ERASING MEMORYPASSED  
REPROGRAMMING SPEPASSED  
FLASH TEXT CHECKSUM      PASSED  
UPGRADE COMPLETE  
<beep>  
REPLACE SOFTWARE MEM-CARD WITH TRANSLATION MEM-CARD  
<beep>
```

Explanations and error recoveries to the above steps are as follows:

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INITIATING SOFTWARE UPGRADE:                         | This indicates that the system is proceeding to do a software upgrade.                                                                                                                                                                                                                                                                                                                                          |
| MEM-CARD CHECKSUM:                                   | If the card-mem checksum fails, the system will reboot without performing an upgrade. Retry the command with another software card-mem.                                                                                                                                                                                                                                                                         |
| REPROGRAMMING MTP:                                   | If the MTP programming fails, the Manager I will not be functional anymore. So the rest of the upgrade (if it occurs) will not be visible. Nor will the MTP be present to monitor the health of the processor. The only recovery procedure is to power down and power up the system since the presence of a software card-mem will cause a software upgrade.                                                    |
| ERASING MEMORY:                                      | The rest of the memory is being erased.                                                                                                                                                                                                                                                                                                                                                                         |
| REPROGRAMMING SPE:                                   | This shows the status of the reprogramming. A total of 7 Mbytes has to be reprogrammed. If the reprogramming fails in the midst of upgrade, it will take the system into <i>SPE-down</i> mode. In this mode, the system technician can only reset the system or display alarms. The system should be reset, and another upgrade attempt will be done due to the detection of a software card-mem in the system. |
| FLASH TEXT CHECKSUM:                                 | If the checksum fails, the software may or may not be healthy. But it will try to run for as long as it can until further system reset due to system technician intervention.                                                                                                                                                                                                                                   |
| REPLACE SOFTWARE MEM-CARD WITH TRANSLATION MEM-CARD: | The system technician is prompted by a beep and this text string on the Manager I to replace the software card-mem with the translation card-mem. The system boots without translation if the replacement is not done within 2 minutes. The only way to recover from this is to replace the card-mem and issue a <i>reset system 3</i> to read in the translations again.                                       |
| UPGRADE COMPLETE:                                    | This indicates that the software upgrade is completed.                                                                                                                                                                                                                                                                                                                                                          |

**Feature Interactions**

---

**System Restarts**

An upgrade will cause a system restart. Simplex systems will result in a level-4 restart. Duplex system will undergo a level-2 SPE-interchange after the standby is upgraded through a level-4 restart.

## Initcauses

Executing "display initcauses" shows that software upgrade and the level of system reset being done.

## Multi-user Contention

When this command is executing, all other maintenance commands will be blocked. Exceptions to these are most of the status or display type commands. All administrations commands are not blocked. It is the user's responsibility to make sure that no new translations are added between the last save translation operation and the completion of the *upgrade software* command.

## Recent Change History Log

The *upgrade software* command will not be logged for both simplex and duplex systems. This is due to the clearing of memory during the level 4 reset.

## Periodic and Scheduled Maintenance

Periodic and scheduled maintenance will be suspended while the upgrade command is executing.

## Error and Alarm Log

Error and alarm logs before the software upgrade will be lost.

## Demand Busyout Objects

Maintenance objects that have been demand busyout will be released when the processor reboots or interchanges during the software upgrade. If the command is cancelled before the actual reboot or interchange starts, then all demand busyout objects status will be preserved.

## Standby SPE Maintenance

Data consistency alarms will be generated if the software in the active and standby are not consistent.

## Disabled Objects

All disabled objects retain their "disabled" status after a software upgrade according to status recorded in the last successful *save translation* command.

# Packet Bus Fault Isolation and Correction

# 9

## General

---

This chapter describes the fault isolation/correction procedures for the Packet Bus and for the various MOs that use the Packet Bus. Because the Packet Bus is shared by all circuit packs that must communicate on it, a faulty circuit pack can disrupt communication over the Packet Bus. In addition, a circuit pack that does not use the Packet Bus can cause service disruptions if the physical configuration of the switch is being modified (this is discussed in more detail later). For these reasons, isolating the cause of Packet Bus failure can be complicated. In this chapter, a flowchart is provided to aid in this isolation effort, as are detailed discussions of the tools and procedures used in the fault isolation and correction.

This chapter is organized into several sections that provide introductory information, as well as packet bus fault isolation and correction procedures. The sections of the chapter are as follows:

- [“Remote Maintenance versus On-Site Maintenance”](#) discusses the strategy and the requirements for performing remote maintenance and on-site maintenance for the Packet Bus.
- [“Tools for Packet Bus Fault Isolation and Correction”](#) discusses the tools that are needed to isolate and correct Packet Bus faults.
- [“Packet Bus”](#) describes the Packet Bus, its use, and the types of faults that can occur on the Packet Bus. A diagram that shows the physical and logical connections between circuit packs connected to the Packet Bus is also included.

- [“Circuit Packs That Use the Packet Bus”](#) describes the various circuit packs, ports, and endpoints that use the Packet Bus. The section discusses how these maintenance objects interact, how a failure of one maintenance object can affect another, and also the failure symptoms of these maintenance objects.
- [“Maintenance of the Packet Bus”](#) describes the Packet Bus maintenance software strategy. Similarities and differences between the Packet Bus and the TDM Bus are discussed. An overview of the Fault Isolation and Correction Procedures is also presented.
- [“The Maintenance/Test Circuit Pack \(TN771D\)”](#) discusses the use of the Maintenance/Test circuit pack in normal switch maintenance, as well as its role in Packet Bus fault isolation. The standalone mode of the Maintenance/Test (which is used to perform the Packet Bus Fault Isolation and Correction procedures on-site) is discussed in detail.
- [“Packet Bus Fault Isolation Flowchart”](#) presents a flowchart that is used to isolate a Packet Bus problem. This flowchart is the starting point for this process, and it is used to determine if a failure of service is caused by the Packet Bus itself or by another maintenance object on the Packet Bus.
- [“Packet Bus Fault Correction”](#) presents the procedures required to correct either a problem with the Packet Bus itself or one that is caused by a circuit pack connected to the Packet Bus.

The Packet Bus Fault Isolation Flowchart is intended to be the normal starting point for isolating and resolving Packet Bus problems. However, anyone who is unfamiliar with Packet Bus maintenance should read the introductory sections to gain a good understanding of the Packet Bus maintenance and the procedures involved.

## Remote Maintenance versus On-Site Maintenance

---

Most packet bus fault isolation and repair procedures require a technician to be on-site. This is true because a packet bus failure is caused by a hardware failure of the packet bus itself or by a circuit pack that is connected to it. However, initial diagnoses can be made via use of the flowchart presented in the [“Packet Bus Fault Isolation Flowchart”](#) section of this chapter. However, before implementing the Maintenance/Test Standalone Mode Procedure (described later) and the Packet Bus Fault Correction Procedure, a technician must be on-site.

The flowchart as presented refers to the repair procedures in [Chapter 10, “Maintenance Object Repair Procedures”](#), for various MOs. When one of the decision points is reached, a remote technician can refer to the appropriate section and attempt to resolve any fault conditions. In addition, the remote technician can examine some of the other MOs on the flowchart. Keep in mind that if an MO that appears early on the flowchart fails, this failure can cause alarms with MOs that appear later in the flowchart.

The Maintenance/Test Packet Bus port (described in detail later in this chapter) can give the remote technician information about the state of the packet bus. This information can be obtained via the **status system** command and via the PKT-BUS test sequence. As described later, the Maintenance/Test circuit pack may or may not be present at a customer site, depending on system configuration. If a Maintenance/Test circuit pack is not present, one must be taken to the customer site.

In a high or critical reliability system, a Processor Interchange may resolve the packet bus problem. This operation can be done remotely, and is discussed in the [“Packet Bus Fault Correction”](#) section in this chapter.

## Tools for Packet Bus Fault Isolation and Correction

---

The following list discusses several tools that are (or may be) required to perform Packet Bus Fault Isolation and Correction. The technician should be provided with these tools at the customer site:

- TN771 Maintenance/Test circuit pack for use in standalone mode, as well as the required connectors and cables. (Refer to the [“The Maintenance/Test Circuit Pack \(TN771D\)”](#) section in this chapter.)
- Replacement TN771 Maintenance/Test circuit pack may be needed. Conditions for requirement, and the relevant implementation steps are documented in the [“Special Precaution Concerning the TN771”](#) section in this chapter.
- Backplane pin-replacement kit may be required in the procedures described in the [“Packet Bus Fault Correction”](#) section of this chapter. If the kit is not available, replacement of a carrier may be required.

## Packet Bus

---

Each port network has its own packet bus, and, accordingly, there is one packet bus MO in each port network. The packet bus is not duplicated, as is the TDM Bus. However, there are several spare leads on the packet bus and, in high and critical reliability systems, these spare leads are used to recover from some failures on the packet bus.

## Packet Bus Usage

---

The packet bus carries ISDN-BRI signaling information for ISDN-BRI stations and data modules and for ASAI adjunct connections. The TN556 ISDN-BRI circuit pack is used for these connections. The SPE interface to the packet bus is the TN778 Packet Control (in high and critical reliability systems, there is one TN778 in each SPE). For systems with multiple port networks, the TN570 Expansion Interface is used to pass messages from the packet bus in one port network to

the packet bus in its neighbor. The TN771 Maintenance/Test Circuit Pack (discussed in detail later) provides packet bus maintenance testing and reconfiguration capabilities.

## Packet Bus Faults

---

Two types of packet bus failures can occur:

- **Shorts.** A short occurs when leads on the packet bus become connected together. Such a connection can occur due to component failures on the packet bus interface of a circuit pack, a failure of the cables between carriers or the TDM/LAN terminators, or by pins being bent together on the backplane. Usually, a failure that occurs during normal operation is caused by a circuit pack failure. However, if the system configuration is being modified (for example, circuit packs are being moved), the cause of a subsequent packet bus failure is probably bent pins.
- **Opens.** An open occurs when there is a break on the packet bus such that the electrical path to the termination resistors is broken. Usually, this break is caused by a failed TDM/LAN cable or by a failed TDM/LAN terminator. The break can also be caused by a failure in the backplane of a carrier, although this is unlikely.

Shorts on the packet bus occur much more often than do opens. This is because the incorrect insertion of a circuit pack can cause leads to be shorted together. It is possible for a circuit pack to be the cause of a packet bus fault but still exhibit trouble-free operation. For example, the insertion of a TDM-only circuit pack (TN754B Digital Line) could bend the packet bus pins on the backplane. However, since the circuit pack does not communicate on the packet bus, the pack is not affected by the problem.

Packet bus faults do not necessarily cause service interruptions. However, most packet bus shorts do cause these interruptions. Depending on what leads are defective, the system may be able to recover and continue to communicate. This can be detrimental because it makes isolating the fault difficult. The Maintenance/Test circuit pack provides the capability to detect, and, in some cases, correct packet bus faults.

## Packet Bus Connectivity

---

Various circuit packs communicate on the packet bus (see next section).

For details on ISDN-BRI and ASAI connectivity, refer to “BRI-PORT” and “BRI-SET/ASAI-ADJ” in [Chapter 10, “Maintenance Object Repair Procedures”](#). For details on Expansion Interface connectivity, refer to “EXP-INTF”.

## Circuit Packs That Use the Packet Bus

Four circuit packs can use the packet bus. The following list identifies and discusses each circuit pack. An explanation of how each circuit pack assists in packet bus maintenance is also included.

### ⇒ NOTE:

The MOs involved with each circuit pack are listed in brackets. Documentation for each maintenance object is provided in [Chapter 10, "Maintenance Object Repair Procedures"](#).

- **TN778 Packet Control** [PKT-CTRL] provides the SPE interface to the packet bus, just as the TN777 Network Control does to the TDM Bus. All traffic on the packet bus passes through the packet control.  
  
The packet control can detect failures of certain control leads on the bus. Such failures are indicated by an inability to transmit data. The packet control can also detect data errors on the packet bus.
- **TN570 Expansion Interface** [EXP-INTF] is used to connect the PNs in the system. For systems that use the packet bus, all Port Network connections must be made with TN570 circuit packs. All packet traffic between PNs passes through a pair of TN570s (one in each port network).  
  
The Expansion Interface can detect a subset of control lead failures (though not as many as the packet control), and it can detect many data lead failures via parity errors on received data.
- **TN556, TN2198 and TN2208 ISDN-BRI circuit packs** [BRI-BD, BRI-PORT, ABRI-PORT, BRI-SET, BRI-DAT, ASAI-ADJ] provides connections for ISDN-BRI station sets and data modules and for ASAI adjuncts. The Packet Bus is used to carry signaling information for sets and data modules. The Packet Bus passes signaling information and ASAI messages between the SPE and the ASAI adjunct. The ISDN-BRI circuit pack has the same fault detection capabilities as the TN570 Expansion Interface.
- **TN771D (or later) Maintenance/Test circuit pack** is the workhorse of packet bus maintenance. This circuit pack can detect all packet bus failures for the PN in which it resides. In High and Critical Reliability systems, the circuit pack enables the reconfiguring of the packet bus around a small number of failed leads. The TN771D circuit pack provides a standalone mode (that is, one that does not involve communication with the SPE) for inspecting the packet bus for faults. This is a critical tool for the packet bus fault correction procedures, which are described later.

## **Effect of Circuit Pack Failures on the Packet Bus**

A failure of any of the circuit packs described in the previous section can disrupt traffic on the Packet Bus. Some failures cause actual Packet Bus failures with corresponding alarms, while others cause service outages without alarming the Packet Bus (although the failed circuit pack(s) should be alarmed).

The following list discusses the effects on the Packet Bus of a failure on each circuit pack that uses the Packet Bus.

- **TN778 Packet Control.** A failure of the Packet Control typically causes all Packet traffic in the system to fail. As a result, ISDN-BRI sets are not able to make or receive calls, and communication with an ASAI adjunct fails. A failure of the Packet Control may also cause a failure of the Packet Bus itself if the failure is on the interface circuitry. Otherwise, only the Packet Control is alarmed.

In a High or Critical Reliability system, there is one TN778 Packet Control in each SPE. If a Packet Control failure in the active SPE causes a Packet Bus disruption, performing an SPE interchange may restore service. In some cases, circuit pack failures may require that the circuit pack be replaced before service is restored.

- **TN570 Expansion Interface.** A failure of the Expansion Interface typically causes all Packet traffic in the connected EPN to fail. If the failure is on the Packet Bus interface, the Packet Bus may be alarmed as well.

In a High or Critical Reliability system, there is one EPN link in each control carrier for each EPN. If an active Expansion Interface failure causes a Packet Bus disruption, performing an Expansion Link switch may restore service. In some cases, circuit pack failures may require that the circuit pack be replaced before service is restored.

- **TN556 ISDN-BRI Circuit Pack.** A failure of the ISDN-BRI circuit pack typically causes some or all ISDN-BRI sets and data modules and/or an ASAI adjunct connected to the circuit pack to fail to function. If the failure is on the Packet Bus interface, the Packet Bus may be alarmed as well.
- **TN771 Maintenance/Test.** A failure of the Maintenance/Test may cause an incorrect indication of a packet bus failure or the inability to detect such a failure. A failure of the packet bus interface of the circuit pack may cause the packet bus to be alarmed.

A failure of the packet bus interface on any of the circuit packs discussed can cause the packet bus to be alarmed. This is true because such a failure may result in shorting packet bus leads together. This typically disrupts ALL packet bus traffic in the affected port network. A failure of the packet bus in the PPN affects packet traffic in the EPNs as well. Also, packet bus failures that do not affect all endpoints on that packet bus may occur. Therefore, a packet bus failure should not be ruled out even if some packet service is still present.

A circuit pack can fail in a manner such that it transmits bad data on the Packet Bus. If the Packet Control fails in such a fashion, all Packet traffic is disrupted (because all traffic requires the Packet Control). Likewise, such a failure on the Expansion Interface may disrupt all Packet traffic in that port network.

However, if an ISDN-BRI circuit pack fails such that it transmits bad data, all devices connected to the circuit pack fail to function. This failure may also disrupt the entire Packet Bus whenever the circuit pack tries to transmit data. Such a disruption may be indicated by Packet Bus alarms that occur and go away, intermittent failures of other Packet circuit packs, and/or interference with other connected endpoints. The failures mentioned are difficult to isolate because of their intermittent nature. In most cases, the failed circuit pack is usually alarmed, and all connected endpoints on the circuit pack are out of service until the circuit pack is replaced. These symptoms help in isolating the fault.

## **Maintenance of the Packet Bus**

---

The following topics are discussed:

- Comparison between the Packet Bus and the TDM Bus
- Packet Bus Maintenance Software
- Overview of Fault Correction Procedures

### **Packet Bus and TDM Bus: a Comparison**

---

Although the Packet Bus is similar to the TDM Bus in many ways, there are some important differences. For example, there are two physical TDM Busses in the switch (refer to the TDM-BUS section in [Chapter 10, "Maintenance Object Repair Procedures"](#), for more information), and one of these busses can fail without affecting the other (although half of the call-carrying capacity is lost in this case). On the other hand, there is only a single Packet Bus in the switch, and a failure of that bus can disrupt all traffic on the Packet Bus.

In High or Critical Reliability systems, the Maintenance/Test circuit pack provides Packet Bus reconfiguration capabilities. This allows the Packet Bus to remain in service with up to three lead failures. There is no corresponding facility on the TDM Bus, where the second physical TDM Bus continues to carry traffic until repairs are completed.

In addition, the system response varies according to the type of bus failure. Specifically, a catastrophic TDM Bus failure (one that affects both TDM Buses) disables ALL traffic in the system, while a catastrophic Packet Bus failure affects only Packet traffic. This means that all TDM traffic is unaffected, while all BRI and ASAI traffic does not work. The significance of this distinction depends on the customer's application. (For example, a customer whose primary application requires ASAI would consider the switch to be out of service, while a customer

with a large number of Digital/Analog/Hybrid sets and a small number of ISDN-BRI sets would probably not consider the Packet Bus failure a catastrophic problem.) The only way a Packet Bus failure can affect TDM traffic is via possible impact on system response time in a large switch due to ISDN-BRI endpoint maintenance running. This should rarely happen because the Packet Bus maintenance software is able to prevent this impact for most Packet Bus faults (see the next section).

**CAUTION:**

*Since the correction procedures and some of the fault isolation procedures for the Packet Bus are highly destructive to service throughout the system (inasmuch as the procedures primarily involve removing circuit packs), particular attention must be paid to nondestructive fault isolation. Also, for the same reason, the time taken with destructive procedures must be minimized. This is the major reason that maintenance of the Packet Bus and of the Packet maintenance objects is described in such detail.*

## **Packet Bus Maintenance Software**

---

Packet Bus maintenance software involves the traditional set of error conditions, tests, and alarms relevant to Packet Bus faults. These are described in the PKT-BUS section in [Chapter 10, "Maintenance Object Repair Procedures"](#), and they are similar in design to the maintenance strategy for most maintenance objects.

In addition, because a Packet Bus failure can cause all BRI/ASAI endpoints in the affected Port Network (and their associated ports and circuit packs) to report failures, special care must be taken to ensure that the flood of error messages from the affected maintenance objects does not overload the system and interfere with TDM Bus traffic. When such a failure occurs, maintenance of Packet circuit packs is affected in the following manner:

- ISDN-BRI circuit pack (BRI-BD) in-line errors indicating possible Packet Bus failures are placed into the error log, but are not acted upon.
- ISDN-BRI port (BRI-PORT, ABRI-PORT) in-line errors indicating possible Packet Bus failures **are neither placed into the error log nor acted upon.**
- ISDN-BRI endpoint (BRI-SET, BRI-DAT, ASAI-ADJ) in-line error **are neither placed into the error log nor acted upon.**
- Circuit pack and port in-line errors that are not related to the Packet Bus, or that indicate a circuit pack failure, are acted upon in the normal fashion.
- Normal background maintenance (periodic and scheduled) is not affected.
- Foreground maintenance (for example, commands executed on the Manager I terminal) are not affected.

These interactions allow normal, non-Packet, system traffic to continue unaffected, and they reduce the number of extraneous entries into the Error/Alarm Logs. If the Packet Bus failure is caused by a failed circuit pack, the circuit pack should appear in the Error/Alarm Logs, which aids in fault isolation.

The following events indicate a Packet Bus failure that requires the actions in the previous paragraph to occur:

- In-line errors that indicate a possible Packet Bus failure reported by two or more Packet circuit packs
- Packet Bus Uncorrectable report from the Maintenance/Test Packet Bus port (M/T-PKT)
- Packet Bus Interface Failure from the Packet Control (PKT-CTRL)

If such a failure occurs, this information will be available in an Error Log entry for PKT-BUS. Refer to the PKT-BUS section in [Chapter 10, "Maintenance Object Repair Procedures"](#), for more detailed information.

## **Overview of Fault Correction Procedures**

---

This section gives an overview of the procedures used to (1) isolate the cause of Packet Bus faults and to (2) correct the Packet Bus faults. These procedures are applicable to High and Critical Reliability systems, and they are detailed fully later in this chapter:

1. The first procedure attempts to determine if a circuit pack that interfaces to the Packet Bus is the cause of the Packet Bus problem. The error and alarm logs are examined for entries for these circuit packs, and the normal maintenance procedures for those circuit packs are attempted.
2. If the Packet Bus problem still exists, port circuit packs (those in the purple slots) are removed to look for circuit pack(s) that have failed and/or have damaged the Packet Bus pins (a diagram of the backplane pins is provided later).
3. If the Packet Bus problem is still not resolved, the same procedure is attempted for the control complex circuit packs.
4. If the problem is still not resolved, or if the Packet Bus faults are known to have open leads, a procedure is undertaken in which the bus terminators and cables are replaced. If this does not resolve the problem, the carrier connectivity of the port network is reconfigured to attempt to isolate a faulty carrier.

## The Maintenance/Test Circuit Pack (TN771D)

---

### Description

---

Packet bus reconfiguration is available only in high and critical reliability systems. In such systems that use the packet bus, a Maintenance/Test is required in each port network. In other configurations (for example, Standard Systems, no packet bus use), the circuit pack is optional.

#### CAUTION:

*All TN771 circuit packs must be of TN771D vintage or later.*

### Normal Packet Functionality

---

The Maintenance/Test Packet Bus Port provides the packet bus testing and reconfiguration capabilities. When the port is in service, the port continuously monitors the packet bus for faults (or recovery from faults), and it reports this information to packet bus maintenance.

The yellow LED on the TN771D Maintenance/Test circuit pack provides a visual indication of the state of the packet bus, as follows:

- **Blinking** at a rate of 1 per sec — the Maintenance/Test Packet Bus port cannot swap leads to correct a Packet Bus fault (that is, there are too many faults). **The Packet Bus may be unusable.** If the failures detected by the Maintenance/Test Packet Bus port are open lead failures, the Packet Bus may still be operating.
- **On steady** — the Maintenance/Test Packet Bus port has swapped leads on the Packet Bus. **The Packet Bus is still operating.**

#### NOTE:

Because the yellow LED on the Maintenance/Test circuit pack can also be on steady when the other ports on the circuit pack are in use, the ports on the Maintenance/Test circuit pack used for ISDN-PRI trunk testing must be busied out before the Maintenance/Test circuit pack is used to help resolve Packet Bus faults. This is done via the **busyout port PCSS02** and **busyout port PCSS03** commands. Also, be sure to release these ports when the process is completed.

- **Off** — there is no Packet Bus fault present.

#### NOTE:

It takes 5 to 10 seconds for the LED to respond to a change in the state of the Packet Bus.

In normal switch operation, the Maintenance/Test provides the visual feedback of the Packet Bus state. When standalone mode (described in the next section) is in effect, these visual indications are still provided; however, the Packet Bus is never reconfigured, and, as a result, the yellow LED either blinks or is off.

## Standalone Mode

---

The TN771D Maintenance/Test provides a standalone mode for detecting Packet Bus faults. In the standalone mode, a terminal is connected to the Maintenance/Test circuit pack via the Amphenol™ connector on the back of the cabinet. This setup allows the System Technician to determine the state of the Packet Bus without having to access the Manager I terminal to provide these functions, even if the switch is not in service. Note that the Maintenance/Test does not reconfigure the Packet Bus when it is operating in standalone mode.

Standalone mode is used in the Packet Bus Fault Correction procedures. As a result, **a TN771 and a corresponding terminal must be available to the technician who is to perform such procedures.** A High or Critical Reliability system has a TN771 in each port network. However, the customer of a system that does not have High or Critical Reliability may have purchased a TN771 for ISDN-PRI trunk testing, or to increase the system's ability to detect Packet Bus failures.

The **list configuration** command is used to check for the presence of a circuit pack in the system. If a circuit pack is not present in the system, one must be taken to the customer site. The [“Special Precaution Concerning the TN771”](#) section in this chapter discusses the special cases when a spare TN771 must be taken to the customer site.

### NOTE:

When in standalone mode, the yellow LED on the TN771 blinks if there is a Packet Bus fault. If there is no such fault, the yellow LED is off. This is true because Packet Bus reconfiguration cannot occur in standalone mode.

## Required Hardware for Standalone Mode

In addition to the TN771, the following equipment is required to use the standalone mode:

1. Terminal or PC with terminal-emulation software. The EIA-232 (RS-232) port should be configured at 1200 baud, no parity, 8 data bits, and one stop bit. This is **not** the same configuration as for the Manager I terminal. Therefore, if the Manager I can be used for this operation (and this depends on the switch configuration and on customer requirements), remember to restore the original communication parameters before returning the Manager I to service.
2. 355A EIA-232 Adapter (COMCODE 105 012 637).
3. 258B Six-Port Male Amphenol Adapter (COMCODE 103 923 025).

4. D8W 8-wire modular cable of an appropriate length to connect the 258A on the back of the cabinet to the 355A adapter. The relevant COMCODE is determined by the length of the cable, as follows:
  - 103 786 786 (7 feet)
  - 103 786 802 (14 feet)
  - 103 786 828 (25 feet)
  - 103 866 109 (50 feet)

## Slot Selection for Standalone Mode

When selecting a carrier slot to use for standalone mode in a port network that does not already contain a TN771, keep the following points in mind:

- A port circuit slot (indicated by a purple label) should be used.
- -5 volt power supply must be available in the carrier. This section describes the power supply configurations that provide this power supply.
- It is preferable that the slot chosen is in the A carrier if a free slot that matches the criteria presented in the first two items of information in this list is available.

## Entering and Exiting Standalone Mode

### NOTE:

When in standalone mode, the red LED on the TN771 is lit. This function is correct, and it serves as a reminder to remove the TN771 from standalone mode.

### CAUTION:

*The TN771 in standalone must be the ONLY TN771 in the port network. If a TN771 is already in the port network, place that TN771 in standalone mode. Do not insert a second TN771 into standalone mode. System behavior is rendered as undefined if this is done. In addition, the system is not able to detect the extra circuit pack in this case because a TN771 in standalone mode is invisible to the SPE.*

### CAUTION:

*If the TN771 Packet Bus port has reconfigured the Packet Bus in a switch with a High or Critical Reliability system, (indicated by error type 2049 against PKT-BUS), placing the Maintenance/Test in standalone mode causes a loss of service to the Packet Bus. This is true because reconfiguration is not performed in standalone mode. Therefore, this procedure should be considered a service-disrupting procedure.*

If the system has a TN771 installed in the Port Network to be examined, use the following steps to enter the standalone mode:

1. Ensure that Alarm Origination is suppressed either at login time or via the Maintenance-Related System Parameters form.
2. Attach the 258B Six-Port Male Amphenol Adapter to the Amphenol connector for the TN771's slot. Connect one end of a D8W 8-wire modular cable to port 1 of the 258B. Connect the other end of the cable to a 355A EIA-232 Adapter. Plug the EIA-232 Adapter into the terminal to be used, and turn the terminal on.
3. Reseat the TN771 circuit pack.

 **NOTE:**

In a High or Critical Reliability system, this causes a Minor, Off-board alarm to be raised against the Packet Bus. This alarm is not resolved until the TN771 (in particular, the Packet Bus port is returned to service. To ensure that Packet Bus alarms have been cleared, it may be necessary to restore the TN771 to normal mode.

If there is no TN771 in the Port Network, use the following steps to enter the standalone mode:

1. Attach the 258A Six-Port Male Amphenol Adapter to the Amphenol connector for the slot into which the TN771 is to be inserted. Connect one end of a D8W 8-wire modular cable to port 1 of the 258A. Connect the other end of the cable to a 355A EIA-232 Adapter. Plug the EIA-232 Adapter into the terminal to be used, and turn the terminal on.
2. Insert the TN771 circuit pack into the slot. The system does not recognize the presence of the circuit pack.

If the standalone mode is entered successfully, the following is displayed on the connected terminal:

**Figure 9-1. Normal Standalone Mode Display**

**! CAUTION:**

*If the display in [Figure 9-1](#) does not appear, be sure to check the wiring between the terminal and the TN771, and also the terminal parameters. If these are correct, the TN771 may be defective. In such a case, follow the procedures to exit standalone mode (described in the next paragraph). Then test the Maintenance/Test circuit pack.*

**⇒ NOTE:**

If the TN771 fails while in standalone mode, the message TN771 circuit pack failed is displayed, and no further input is accepted on the terminal. The circuit pack must be replaced.

Use the following procedures to exit standalone mode:

1. Remove the 258A Adapter from the Amphenol connector.
2. If the TN771 was installed for this procedure, remove it. Otherwise, reseal the TN771.
3. Be sure that alarm origination is re-enabled on the Maintenance-Related System Parameters form if it was disabled there (if it was disabled at login, it is automatically re-enabled at logoff).

## Using Standalone Mode in Packet Bus Fault Isolation and Correction

When the TN771 is in standalone mode, three commands can be used at the terminal:

- **ds** displays the current state of the Packet Bus leads.
- **dsa** toggles auto-report mode on and off. In auto-report mode, the state of the Packet Bus leads are displayed and the terminal beeps whenever a change occurs.
- **?** displays the available commands.

[Figure 9-2](#) presents an example of a standalone mode display. In the display, an 'S' indicates a shorted lead, an 'O' indicates an open lead, and a blank indicates no fault.

---

```
L L L L L L L L L L H H H H H H H H S S S L
P 0 1 2 3 4 5 6 7 8 P 0 1 2 3 4 5 6 7 8 S F B F
S S                                     O
Command:
```

---

**Figure 9-2. Example Standalone Mode Display**

The information within a standalone mode display is used in the Packet Bus Fault Correction procedures that follow. The TN771 display indicates the specific leads on the backplane to examine for bent or damaged pins. [Figure 9-3](#) shows the location of the packet bus leads on the backplane as viewed from the front of the carrier, while [Figure 9-4](#) shows the same slot as viewed from the back of the carrier.

**➤ NOTE:**  
This information is available only from the standalone mode and with an on-site connected terminal. This information is not available from the Manager I, and, thus, it is not available remotely. This is not a concern, inasmuch as this information cannot be used effectively if testing is not on site.

Figure 9-3. Packet Bus Leads on the Backplane - Front View

Figure 9-4. Packet Bus Leads on the Backplane - Back View

## Special Precaution Concerning the TN771

---

### ⇒ NOTE:

A new TN771 Maintenance/Test circuit pack must be taken to the customer site whenever the following is true:

- Maintenance/Test Packet Bus port indicates that a Packet Bus fault is present.

### ⇒ NOTE:

Such a fault is indicated by a Major or Minor alarm against the Packet Bus. A Major alarm is indicated in the error log by Error Type 513, while a Minor alarm is indicated by Error Type 2049.

- Test #572 of the PKT-BUS test sequence is the only test that fails.

This precaution is taken because certain failures of the Maintenance/Test circuit pack can appear as Packet Bus failures. To ensure that the problem is indeed with the Packet Bus, implement the following steps:

1. Refer to the M/T-PKT Maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#). Correct any problems with the TN771 Maintenance/Test Packet Bus port as described in that section. If the TN771 Maintenance/Test circuit pack is replaced during the correction process, enter the **test pkt P long** command to determine if the Packet Bus faults have been resolved. If there are still Packet Bus problems, correct them by using the procedures in the sections that follow.
2. If the Maintenance/Test circuit pack was not replaced, enter the **test pkt P** command. Record the results (PASS/FAIL/ABORT) and error codes for Test #572.
3. Enter the **status system P** command. Record the information listed for the Packet Bus.
4. Busyout the Maintenance/Test circuit pack by entering the **busyout board PCSS** command.
5. Replace the Maintenance/Test circuit pack with the new circuit pack.
6. Release the Maintenance/Test circuit pack by entering the **release board PCSS** command.
7. Enter the **test pkt P** and **status system P** commands as described in Steps 2 and 3.

8. If the data matches the previously recorded data, a Packet Bus problem exists. The original TN771 Maintenance/Test circuit pack is not defective, and it does not need to be returned to the factory. Replace the original TN771, then correct the Packet Bus problem by using the procedures in the sections that follow.
9. If the data does *not* match the previously recorded data, *the original TN771 Maintenance/Test circuit pack is defective*. If there are still indications of Packet Bus problems, correct them by using the procedures in the sections that follow.

## **Packet Bus Fault Isolation Flowchart**

---

The flowchart in this section presents the steps to be taken for isolating and resolving Packet Bus problems. The order in which the maintenance objects should be examined can be determined by assessing how wide-spread the failure is. For example, since all ISDN-BRI devices communicate with the TN778 Packet Control circuit pack, this MO should be examined early in the sequence. On the other hand, a failure of a TN570 circuit pack in an EPN may cause ISDN-BRI failure in an EPN, but it could not be the cause of a failure in the PPN.

Whenever the flowchart refers to the Maintenance documentation for a specific MO, keep in mind that the repair procedure for that MO may in turn refer to another MO's repair procedure. The flowchart tries to coordinate these procedures so that a logical flow is maintained if the Packet Bus problems are not resolved via the first set of repair procedures. However, a Packet Bus failure can lead to a somewhat haphazard referencing of various MO procedures that may result in your implementing steps that either have already been completed or are not necessary. If this occurs, return to the flowchart at the step that follows the reference to [Chapter 10, "Maintenance Object Repair Procedures"](#), and then continue.

### **NOTE:**

The following **status** commands can also help diagnose Packet Bus problems:

- **status system**
- **status packet-control**
- **status bri-port**
- **status station**
- **status data-module**

For a description of these commands, refer to the "Status Commands" section in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#). The commands provide information about the service state of various Packet maintenance objects. This information can be useful for remote maintenance, inasmuch it can explain the impact of the failure(s) on the system.

The Packet Bus Fault Isolation Flowchart appears on the following two pages.

**NOTE:**  
See the “[Flowchart Description and Supplement](#)” section following the flowchart for a description of the flowchart as well as for supplementary information, the availability of which is indicated by the uppercase letters that appear in the flowchart.

Figure 9-5. Processing of Packet Bus Problems (Page 1 of 2)

Figure 9-6. Processing of Packet Bus Problems (Page 2 of 2)

## Flowchart Description and Supplement

An uppercase letter in bold (for example, **A**, **B**, **C**, etc.) indicates that there is supplemental information with details about the relevant process that could not fit into the appropriate box or diamond.

### ⇒ NOTE:

Due to space restrictions, individual error codes and alarms are not detailed on the flowchart. The maintenance object descriptions in [Chapter 10, "Maintenance Object Repair Procedures"](#), discuss which errors and alarms could cause or be indicative of Packet Bus problems. In general, unless an error, alarm, or test refers explicitly to the TDM Bus, the error, alarm, or test should be considered a possible cause of Packet Bus problems.

The following paragraphs supplement the corresponding letter in the flowchart.

- a. Problems with the system clock (TDM-CLK) can cause service disruptions on the Packet Bus as well as on the TDM Bus. Therefore, if there are alarms active against TDM-CLK, these alarms should be resolved before any other Packet Bus fault isolation is attempted.

### ⇒ NOTE:

All TDM-CLK problems should be resolved before the process is continued, even if the problems refer only to the TDM Bus. (This is an exception to the previous note.) This is recommended because a Packet Bus problem cannot cause a TDM-CLK problem, while a TDM-CLK problem can cause a Packet Bus problem.

- b. The question "Are the Packet Bus problems resolved?" appears several times on the flowchart. This is a general question that can involve several checks. The basic question is "Are the problems that caused you to use this flowchart resolved?" Some of the more specific questions might be:

- Are all Packet Bus alarms resolved?
- Are all Packet circuit pack (port, endpoint) alarms resolved?

### ⇒ NOTE:

If all alarms are resolved, issue the **clear pkt** command. This command attempts to put the switch back into the service state by resolving any BRI problems that exist. Refer to [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#), for more information.

- Are all ISDN-BRI stations/data modules and/or ASAI adjuncts in service?
- Does the Maintenance/Test Packet Bus port (in normal or standalone mode) still indicate a Packet Bus fault?

- c. If only a single EPN is affected, the Packet Control is probably not the source of the problem. However, if all of the ISDN-BRI circuit packs are located in a single EPN, assume that the answer to this question is "No," and check the Packet Control.
- d. A Packet problem that affects more than one port network is probably caused by either a Packet Control failure or a PPN Packet Bus failure. The Packet Control is checked before the Packet Bus Fault Correction procedures are implemented.
- e. Because the Packet Bus in each port network is physically separate, each affected port network must be checked individually. The PPN should be checked first, however, since any EPN Packet problems are usually resolved once the PPN Packet problem is resolved. After resolving the problem in one port network, be sure to check if the problems in other port networks have also been resolved.
- f. This step applies only when an attempt to resolve an EPN Packet Bus problem is made. When checking the Expansion Interfaces in an EPN, be sure to check the corresponding ones in the PPN. Also, recall that all Expansion Interfaces in 286 systems, 386 systems, or later systems that are using the Packet Bus must be TN570s. Using TN776s results in an EPN where TDM traffic works but Packet traffic does not work.
- g. If a TN771 is not present, one must be installed to accommodate the standalone mode, which is discussed earlier in this chapter.
- h. If a TN771 is present, it can fail in such a fashion that it eventually disrupts the Packet Bus or misinterprets a Packet Bus problem.
- i. If work is being done on-site, follow the procedures described earlier in this chapter for placing the TN771 into standalone mode. If work is not being done on-site, go to the next step.
- j. The answer is "Yes" if the TN771 in standalone mode indicates any faulty leads. The answer is also "Yes" if Test #572 in the PKT-BUS test sequence fails, and/or if the **status system** display indicates that faulty leads are present and the TN771 in the port network is known to be functioning correctly.
- k. If the non-functional endpoints are isolated to a single circuit pack, the circuit pack is probably the cause of the problem.
- l. The procedures that must be executed are determined by which maintenance objects on the circuit packs are alarmed. Start with the procedures for the circuit pack errors/alarms, then continue with those for the port. Finally, execute the procedures for the endpoint.
- m. Follow the procedures outlined later in this chapter.

## Packet Bus Fault Correction

---

### Using and Interpreting Results from the Status System Command

---

The **status system** command can be issued to retrieve information about the Packet Bus. This command is described fully in the "Status Commands" section in [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

The **status system** command provides the service state, alarm status, and (if the Maintenance/Test Packet Bus port is activated) the number of faulty and open leads. This information can be used to determine the urgency of the repair. In general, a service state of "out" indicates extreme urgency, while a service state of "reconfig" indicates moderate urgency.

#### CAUTION:

*Ultimately, the urgency of a repair is determined by the customer's requirements. A customer who uses ISDN-BRI for station sets probably considers a Packet Bus failure critical. However, a customer with only a small percentage of ISDN-BRI service may consider even an uncorrectable Packet Bus fault to be of minor importance and may prefer to delay performing repairs, due to their destructive nature.*

#### NOTE:

If maintenance is actively running on the Packet Bus at the time the **status system** command is issued, the data reported for the Packet Bus may be inconsistent. The reason is that this data is updated by the maintenance tests that are running. If the data seems inconsistent, enter the command again.

If test results or the results of the **status system** command indicate that there are 24 faults on the Packet Bus, the problem is probably caused by faulty cables between carriers, or by defective bus terminators. However, before proceeding, make sure that the report is not being falsely given by the Maintenance/Test Packet Bus port. Accordingly, look for an M/T-PKT error in the error log. Then test the Maintenance/Test Packet Bus port by entering the **test port** command. Refer to the ["Special Precaution Concerning the TN771"](#) section earlier in this chapter if any problems are suspected.

If the carrier into which a TN771 Maintenance/Test circuit pack is installed does not have a -5 volt power supply, the Maintenance/Test Packet Bus port reports 24 open leads on the Packet Bus (via the **status system** command and via Test #572 of the PKT-BUS test sequence). No failure of the TN771 is indicated in this case because the TN771 is not defective. Refer to CARR-POW maintenance in [Chapter 10, "Maintenance Object Repair Procedures"](#), and ensure that a -5 volt power supply is available.

## Considerations for High and Critical Reliability Systems

---

If a High or Critical Reliability system is involved, special considerations involving the features of this type of system must be kept in mind. In particular, if a Packet Bus problem is caused by a duplicated component, switching to the standby component may both alleviate the problem and isolate the faulty circuit pack. Therefore, the commands in the following list should be executed first in a High or Critical reliability system. For more information on these commands, refer to [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#).

- **reset system interchange** If this command resolves the Packet Bus problem, the problem is with the Packet Control in the (new) standby SPE. Refer to PKT-CTRL maintenance in [Chapter 10, "Maintenance Object Repair Procedures"](#).
- **set exp-link** If this command resolves the Packet Bus problem, the problem is with either the (new) standby EI Link or the EIs at either end. Refer to EXP-INTF maintenance in [Chapter 10, "Maintenance Object Repair Procedures"](#).
- **set tone-clock** If this command resolves the Packet Bus problem, the problem is with the (new) standby Tone-Clock. Refer to TDM-CLK maintenance in [Chapter 10, "Maintenance Object Repair Procedures"](#).

### ⇒ NOTE:

Keep in mind that, even though the steps discussed in the previous list may fail to resolve the problem, the steps are not necessarily fault-proof. Continue with the procedures in the next section.

## Troubleshooting Procedures

---

As we discussed earlier in this chapter, Packet Bus faults are usually caused by a defective circuit pack connected to the backplane, by bent pins on the backplane, or by defective cables/terminators that make up the Packet Bus. The first two faults cause shorts, while the third fault causes either shorts or opens.

There are four procedures for correcting Packet Bus faults. The number of procedures that are to be used to correct faults depends upon a number of factors relevant to system performance and to the content of the procedures themselves. For example, if the Maintenance/Test Packet Bus port is activated, and if there is an indication of open leads on the Packet Bus (either via the **status system** command or via Test #572 failure), **go directly to Procedure 4**. The reason for this is that Procedures 1 through 3 try to locate faulty circuit packs or bent pins behind circuit packs. Since these types of failures can never cause open faults, Procedures 1 through 3 need not be implemented in this case. However, if there are both shorts and opens, execute Procedure 4, then return to Procedure 1 if there are still shorts after the open lead problems are resolved.

### CAUTION:

*Since Packet Bus fault isolation procedures involve removing circuit packs and possibly disconnecting entire carriers, these procedure have a profound effect on service. Therefore, if possible, implement these procedures after hours or during hours of minimum system use.*

### NOTE:

Each of these procedures contains one or more steps that require a determination as to whether the Packet Bus problem has been resolved. Accordingly, several condition checks must be performed. We can present each such check in the form of a question, as follows:

- Did the Maintenance/Test circuit pack standalone mode initially indicate the existence of faulty leads, and are these leads no longer indicated?
- Have all alarms against the Packet Bus and Packet circuit packs been resolved?

### NOTE:

If all alarms are resolved, issue the **clear pkt** command. This command attempts to put the switch back into the service state by resolving any BRI problems that exist. Refer to [Chapter 8, "Maintenance Commands and Trouble-Clearing Aids"](#), for more information.

- Are all ISDN-BRI stations and data modules as well as any relevant ASAI adjuncts in service?

Note that if one of these conditions is not yet met, the others need not be checked.

The following sections discuss the four procedures for correcting Packet Bus faults.

## Procedure 1

Procedure 1 determines if any circuit packs that use the Packet Bus have faults. For each circuit pack type (see [Table 9-1](#)), perform the following steps:

### NOTE:

The circuit packs need not be checked in the order presented *if the flowchart in this chapter has been followed*. However, if newly added circuit packs are involved, check these packs first, inasmuch as the packs are most likely to have caused a problem.

1. Display the Error and Alarm Logs for the circuit pack via the **display errors** and **display alarms** commands.

2. If there are errors for the circuit pack, refer to the appropriate maintenance documentation in [Chapter 10, "Maintenance Object Repair Procedures"](#), and follow the recommended maintenance procedure to resolve the errors. Note that some of these procedures may refer to PKT-BUS maintenance as the cause of the fault; if so, implement these Packet Bus Fault Correction procedures at that point.
3. After implementing the repair procedure for the circuit pack (and regardless of whether this procedure succeeds or fails), determine if the Packet Bus fault is still present.
4. If the Packet Bus fault is still present, implement Procedure 1 for the next circuit pack.
5. If there are no more circuit packs in the list, go to Procedure 2.
6. If the Packet Bus fault has been resolved, the procedures are completed.

**Table 9-1. Packet Circuit Packs**

| Circuit Pack Name   | Circuit Pack Code | Associated Maintenance Objects                          |
|---------------------|-------------------|---------------------------------------------------------|
| ISDN-BRI            | TN556             | BRI-BD, BRI-PORT, ABRI-PORT, BRI-SET, BRI-DAT, ASAI-ADJ |
| Maintenance/Test    | TN771             | M/T-BD, M/T-PKT                                         |
| Packet Control      | TN778             | PKT-CTRL                                                |
| Expansion Interface | TN570             | EXP-INTF                                                |

**Procedure 2**

Procedure 2 removes and reinserts port circuit packs (those in the purple slots) one or several at a time. Use Procedure 2 for each port circuit pack in the port network until either (1) the problem is resolved or (2) there are no more circuit packs in the port network.

 **NOTE:**  
This procedure should also be used for the TN570 Expansion Interface circuit pack in a standard system. For a High or Critical Reliability system, refer to Procedure 3 for the Expansion Interface circuit pack. Also, refer to Procedure 3 for the TN768 or TN780 Tone-Clock circuit pack in a switch with a High or Critical Reliability system.

 **CAUTION:**  
*The Expansion Interface circuit pack should be the last one checked in this procedure, since removing this circuit pack disconnects its EPN. The Tone-Clock circuit pack should be the next-to-last one checked. In addition, the TN771 must be reseated after the Tone-Clock is reinstalled.*

If the Packet Bus problem is present when the circuit pack is inserted, but is resolved when the circuit pack is removed, either the circuit pack or the backplane pins in that slot caused the problem. If the backplane pins are intact, replace the circuit pack.

**NOTE:**

In a multiple failure situation, the circuit pack could be one cause of the Packet Bus problem. However, there could also be other failures that are causing Packet Bus faults.

In Procedure 2, an option of working either with one circuit pack at a time or with multiple circuit packs simultaneously is available. In view of this, determine the level of service interruption to be allowed during this procedure. If causing a disruption to all users in the port network is deemed permissible, large groups of circuit packs should be worked with. This option allows faster job completion. *However, if large service disruptions are to be avoided, work with one circuit pack at a time.* This option is slower, but it disrupts only the users of a single circuit pack.

**CAUTION:**

*If the TN771 Standalone mode does NOT indicate Packet Bus faults, perform Procedure 2 for ONLY the port (purple) slot Packet circuit packs listed in [Table 9-1](#). Also, problems with the backplane pins need not be checked for. Determining if the problem is resolved by removing circuit packs is sufficient.*

## Steps for Procedure 2:

1. Remove one or several circuit packs as appropriate, according to the considerations presented in the previous paragraphs. Any circuit pack(s) (whether Packet or non-Packet) that have been recently inserted should be checked first. It is likely that such a circuit pack caused a new problem. Keep in mind that Packet circuit packs should be checked before non-Packet circuit packs.

If the decision is made to remove multiple circuit packs, consider working with an entire carrier at a time to ensure a good granularity.

2. Determine if the Packet Bus fault is still present.
3. If the Packet Bus fault is still present:
  - Determine if the backplane pins in the removed circuit pack's slot are bent. Use the output from the Maintenance/Test standalone mode and [Figure 9-3](#) and [Figure 9-4](#).
  - If the backplane pins are bent, power down the carrier (refer to the "Removing Power" section in [Chapter 5, "Routine Maintenance Procedures"](#), straighten or replace the pins, reinsert the circuit pack, restore power (refer to the ["Restoring Power"](#) section in [Chapter 5](#), and repeat Procedure 2, beginning with Step 2, for the same circuit pack.

**WARNING:**

*If this is a High or Critical Reliability system, and if the slot is in the Active control carrier, perform an SPE interchange before changing the circuit pack. Follow the procedures presented in [Chapter 6, "Reliability Systems: A Maintenance Aid"](#).*

- If the backplane pins are not bent, reinsert the circuit pack(s), and perform Procedure 2 for the next set of circuit packs.
4. If the Packet Bus fault is not present, do the following:
- Reinsert a circuit pack. If multiple circuit packs have been removed, reinsert the circuit packs **one at a time**, and repeat the following substeps until all of the circuit packs have been reinserted.
  - Determine if the Packet Bus fault has returned.
  - If the Packet Bus fault has returned, the reinserted circuit pack is defective. Replace the circuit pack and then continue.
  - If the Packet Bus fault does not return when all of the circuit packs have been reinserted, the procedure is completed.

Continue with Procedure 3 if all the port circuit packs have been checked, but the Packet Bus fault is still not resolved.

### Procedure 3

Procedure 3 removes and reinserts control carrier circuit packs one at a time. The Packet Control, Tone-Clock, and Expansion Interface circuit packs are the only processor complex circuit packs that communicate on the Packet Bus. In addition, the Memory 1 and EPN Maintenance Board circuit packs are connected to the Packet Bus in the backplane (while the Memory 2 circuit pack is not). Therefore, these are the only processor complex circuit packs that are likely to cause a Packet Bus problem in a stable system. As a result, Procedure 3 should be performed only on the Packet Control, Memory 1, and EPN Maintenance Board circuit packs in all systems, and on the Expansion Interface and Tone-Clock circuit packs in High and Critical Reliability systems.

**CAUTION:**

*If the TN771 Standalone mode does NOT indicate Packet Bus faults, perform Procedure 3 for ONLY the Packet Control, Expansion Interface, and Tone-Clock circuit packs. Also, problems with the backplane pins need not be checked for. Determining if the problem is resolved by removing circuit packs is sufficient.*

*In a system without High or Critical Reliability, do the following:*

1. Power down the control carrier. Refer to the [“Removing Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
2. Remove the suspect circuit pack.
3. As in Procedure 2, determine if the backplane pins in the removed circuit pack’s slot are bent.
4. If the backplane pins are bent, do the following:
  - a. Straighten or replace the pins
  - b. Insert the same circuit pack
5. If the backplane pins are not bent, replace the circuit pack (reinsert the circuit pack if a replacement is not available).
6. Turn the power back on to reboot the system. Refer to the [“Restoring Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
7. Determine if the Packet Bus fault is still present.
8. If the Packet Bus fault is still present, do the following:
  - a. If the circuit pack was reinserted in Step 5, replace the circuit pack, and repeat Procedure 3.
  - b. If the circuit pack was replaced in Step 5, repeat Procedure 3 for the next processor complex circuit pack.
9. If the Packet Bus fault does not recur, the procedure is completed.

If Procedure 3 fails to identify the cause of the problem, go to Procedure 4.

*In a High or Critical Reliability System, do the following:*

1. If the circuit pack to be replaced is in the SPE, perform an SPE interchange by entering the **reset system interchange** command. For an Expansion Interface circuit pack, enter the **set exp-link** command to switch to the standby expansion link. For a Tone-Clock circuit pack, enter the **set tone-clock** command to switch to the standby Tone-Clock circuit pack.
2. Remove the newly-inactive suspect circuit pack. For a circuit pack in the processor complex, use the procedures in [Chapter 6, “Reliability Systems: A Maintenance Aid”](#).
3. As in Procedure 2, determine if the backplane pins in the removed circuit pack’s slot are bent.
4. If the pins are bent, do the following:
  - a. Power down the carrier. Refer to the [“Removing Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
  - b. Straighten or replace the pins.
  - c. Insert the same circuit pack.

- d. Restore power to the carrier. Refer to the [“Restoring Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
5. If the backplane pins are not bent, insert or replace the circuit pack.
6. Determine if the Packet Bus fault is still present.
7. If the Packet Bus fault is still present, do the following:
  - a. If the circuit pack was reinserted in Step 5, replace the circuit pack. Then repeat Procedure 3, starting at Step 2.
  - b. If the circuit pack was replaced in Step 5, continue with Step 9.
8. If the Packet Bus fault does not recur, then the procedure is completed.
9. If the suspect circuit pack has been tested in the other control carrier, go to Step 10. Otherwise, implement Step 1, then Steps 2 through 8.
10. Repeat the procedure in the previous step for the next suspect circuit pack.

If all processor complex circuit packs have been checked and the problem is not resolved, continue with Procedure 4.

## Procedure 4

Procedure 4 tries to isolate the failure to a particular set of carriers. Only the circuit packs in those carriers are checked. Procedure 4 is used if the preceding procedures fail, because it can help locate multiple circuit pack failures as well as failures of the carrier hardware. The procedure is also used if there are open leads on the Packet Bus. (The faults detected by Procedures 1 through 3 cannot cause open leads.)

In Procedure 4, the TDM/LAN Cable Assemblies and TDM/LAN termination resistor packs are replaced. If this action does not resolve the Packet Bus fault, the carriers are reconfigured by moving the termination resistor packs in such a manner that certain carriers are disconnected from the bus. This is done by moving the termination resistors on the carrier backplanes. To terminate the Packet Bus at the end of a particular carrier, first unplug the cable that connects the carrier to the next carrier and then replace the cable with a termination resistor (see [Figure 9-6](#)). When the length of the Packet Bus is modified via this procedure, circuit packs that are essential to system operation (for example, Processor Complex, Tone-Clock) must still be connected to the new “shortened” Packet (and TDM) Bus. In addition, the Maintenance/Test circuit pack (in standalone mode) must be connected to the “shortened” bus.

### WARNING:

*Power must be removed from the entire port network before any cables or terminators are removed. Failure to do so can cause damage to circuit packs and power supplies and can be hazardous to the technician. After cabling changes are made and verified, power must be restored to the port*

*network. Use the TN771 Standalone mode to determine if the Packet Bus fault is resolved.*

**CAUTION:**

*Circuit packs in carriers that are not part of the shortened bus are not inserted. As a result, these circuit packs are not alarmed. Ignore these alarms for now. All alarms should be resolved when the cabinet is restored to its original configuration.*

---

---

**Figure 9-7. Carrier Rewiring Example**

Procedure 4 is organized into two parts, as follows:

**Part 1:**

1. Power down the PN. See [“Removing Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
2. Replace all of the TDM/LAN cables and both TDM/LAN terminators.
3. Restore power to the PN. See [“Restoring Power”](#) section in [Chapter 5, “Routine Maintenance Procedures”](#).
4. Determine if the packet bus fault is still present.
5. If the fault is present, go to Part 2.

## Part 2:

### Processor Port Network:

1. Terminate the Packet Bus so that it extends only from the Active control carrier (that is, the carrier that contains the Active SPE) to the carrier that contains the Maintenance/Test circuit pack. To allow this procedure to isolate the failure to the smallest possible number of carriers, place the Maintenance/Test circuit pack into a carrier that contains a processor complex, if possible.
2. Determine if the Packet Bus fault is still present. If so, and if there are shorts on the Packet Bus, perform Procedure 2 and/or Procedure 3 for only the circuit packs in those carriers that are connected to the "shortened" Packet Bus. (Procedure 2 is performed for port circuit packs, and Procedure 3 is performed for processor complex circuit packs.)
3. If the Packet Bus fault is not present, extend the Packet Bus to another carrier, and repeat the procedure in the previous step. When a carrier that causes the fault to recur is added, and if there are shorts, perform Procedure 2 and/or Procedure 3 for only the circuit packs in that carrier.
4. If the Packet Bus fault recurs as the Packet Bus is extended, and if Procedures 2 and 3 (if performed) do not resolve the problem, the added carrier(s) that caused the problem to recur are defective and must be replaced.

### Other Port Networks:

1. Terminate the Packet Bus so that it extends only from the carrier that contains the Active Expansion Interface to the nearest carrier that contains the Maintenance/Test circuit pack. Place the Maintenance/Test circuit pack into a carrier that contains an Expansion Interface circuit pack in order to allow the procedure to isolate the failure to the smallest possible number of carriers.
2. Determine if the Packet Bus fault is still present. If so, and if there are shorts on the Packet Bus, perform Procedure 2 and/or Procedure 3 for only the circuit packs in those carriers that are connected to the "shortened" Packet Bus.
3. If the Packet Bus fault is not present, extend the Packet Bus to another carrier, and repeat the procedure in the previous step. When a carrier that causes the fault to recur is added, and if there are shorts, perform Procedure 2 and/or Procedure 3 for only the circuit packs in that carrier.
4. If the packet bus fault recurs as the packet bus is extended, and if Procedures 2 and 3 (if performed) do not resolve the problem, the added carrier(s) that caused the problem to recur are defective and must be replaced.

## Maintenance Object Repair Procedures

# 10

---

For Maintenance Objects on the DEFINITY Wireless Business System (DWBS), refer to the appropriate documentation that accompanies the DWBS.

Trouble-clearing is based on the type of indication received, system-alarmed troubles, or user-reported troubles. When viewing the Alarm Log, all major alarms display first, followed by minor alarms, and warning alarms. Resolve the first alarmed entry first because it may affect the rest of the alarmed entries. System-alarmed and user-reported troubles may exist at the same time. Always clear the alarmed troubles first. This often clears the user-reported faults without additional maintenance.

### Escalation Procedures

---

This document is not intended to solve all troubles. When the limits of these procedures are reached and the problem is not resolved, it is the technician's responsibility to escalate to a higher level of technical support. Escalation must conform to the procedures in the *Technical and Administration Plan*.

### Cabling Precautions

---

**CAUTION:**

*Do not cut or bend fiber optic cables. Doing so may adversely affect communication between the EPN and the PPN cabinets.*

**CAUTION:**

*To avoid damaging the cable-to-connector interface when removing any Inter-Carrier Cable, grasp the cable connector, not the cable itself.*

## 12V-PWR (12 Volt Power Supply)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run | Full Name of MO      |
|------------------------|-------------|------------------------|----------------------|
| 12V-PWR                | MINOR       | test card-mem sh       | 12 Volt Power Supply |
| 12V-PWR                | WARNING     | test card-mem sh       | 12 Volt Power Supply |

The 12 Volt Power Supply unit in the TN777B NETCON circuit pack is required for programming flash memory devices in circuit packs such as the TN786B or TN790 Processor circuit pack and the removable translation card. During the erase and write operations of a flash memory or translation card, the 12 volt power supply must be turned on under the instruction of software. For the read-only operation, the 12 volt power supply is not required.

If the 12-volt power supply cannot be turned on, all the erase and write operations to a flash device fail. Features such as "save translation," "save announcements," "system upgrade," "hard patching," and "core dump" always fail in this case.

### Error Log Entries and Test to Clear Values

Table 10-1. 12 Volt Power Supply Error Log Entries

| Error Type       | Aux Data | Associated Test                  | Alarm Level | On/Off Board | Test to Clear Value |
|------------------|----------|----------------------------------|-------------|--------------|---------------------|
| 0 <sup>1</sup>   | 0        | Any                              | Any         | Any          | test card-mem       |
| 1 <sup>2</sup>   | Any      | 12 Volt Power Supply Test (#701) | MINOR       | ON           | test card-mem       |
| 257 <sup>3</sup> | Any      | 12 Volt Power Supply Test (#701) | WARNING     | ON           | test card-mem       |

- Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- Software cannot turn on the 12 volt power supply to provide 12 volt power to the flash memory or to the translation card.
- Software can turn on the 12 volt power supply, and 12 volt power is available. However, the software cannot turn the power supply off after operations are completed. The 12 volt power remains on. This error does not affect the normal operations involved in accessing the memory or the translation card.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the *12 Volt Power Supply Test* for example, you may also clear errors generated from other tests in the testing sequence. The 12 Volt Power Supply Test can be initiated via either the **test card-mem** command or the **test network-control** command.

| Order of Investigation                                          | Short Test Sequence | Long Test Sequence | ResetBoard Sequence | D/ND <sup>1</sup> |
|-----------------------------------------------------------------|---------------------|--------------------|---------------------|-------------------|
| 12 Volt Power Supply Test (#701)                                | X                   | X                  |                     | ND                |
| Memory Card Insertion Test (#695) <sup>2</sup>                  | X                   | X                  |                     | ND                |
| Memory Card Format and Read Test (#696) (a)                     | X                   | X                  |                     | ND                |
| Memory Card Match Test (#697) <sup>2</sup>                      | X                   | X                  |                     | ND                |
| Memory Card Write-Protected Test (#698) <sup>2</sup>            | X                   | X                  |                     | ND                |
| Memory Card Directory Recovery Test (#699) <sup>2</sup>         | X                   | X                  |                     | ND                |
| Memory Card Translation Data Integrity Test (#694) <sup>2</sup> |                     | X                  |                     | ND                |
| Memory Card Erase/Write/Read Test (#693) <sup>2</sup>           |                     | X                  |                     | ND                |

1. D = Destructive; ND = Nondestructive
2. Refer to “CARD-MEM (Memory Card)” information for a description of this test.

12 Volt Power Supply Test (#701)

**This test is nondestructive.**

The purpose of the test is to diagnose the 12 volt power supply unit in the TN777B NETCON circuit pack. No erase and write-to-memory operations are started or verified during the test. The contents of flash memory and of the memory card should not be changed.

The test turns on the power supply, and it verifies that 12 volt power appears by reading the control register in the TN777B NETCON circuit pack. After the power supply is turned on, the maintenance software waits for three seconds before verifying the appearance of 12 volt power. After the 12 volt power supply can be turned on and verified, the test turns the power supply off and then verifies that

the power is off. The control register in the TN777B NETCON circuit pack is read again for the verification.

If, while this test is running, an application attempts to erase or write a flash memory or a memory card, this test remains active, and the application is barred.

Table 10-2. 12 Volt Power Supply Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1192       | ABORT       | 12 volt power supply is being used by other applications or by maintenance.<br><br>1. The 12 volt power supply is in use. Retry the <b>test card-mem</b> command after the maintenance operation application is completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2106       | ABORT       | Internal system error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2114       |             | 1. | 2108       | ABORT       | The NETCON circuit pack is not a TN777B circuit pack.<br><br>1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack.<br><br>2. Re-enter the <b>test card-mem</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 109        | FAIL        | The 12 volt power supply unit in the TN777B NETCON circuit pack cannot be turned on by the software.<br><br>1. Retry the <b>test card-mem</b> command one more time to verify the operation of the 12 volt power supply in the TN777B NETCON circuit pack.<br><br>2. If the failure indicated by Error Code 109 persists, the TN777B NETCON circuit pack must be replaced with a new circuit pack. Follow the standard procedure for replacing the NETCON circuit pack from the SPE control carrier.<br><br>3. After the new TN777B circuit pack is inserted, enter the <b>test card-mem</b> command to verify the operations of the 12 volt power supply in the TN777B NETCON circuit pack. The alarm is resolved after the test passes twice. |
| 110        | FAIL        | The 12 volt power supply unit in the TN777B NETCON circuit pack cannot be turned off by the software.<br><br>1. Retry the <b>test card-mem</b> command one more time to verify the operation of the 12 volt power supply in the TN777B NETCON circuit pack.<br><br>2. If the failure indicated by Error Code 110 persists, the TN777B NETCON circuit pack should be scheduled for replacement during the next regular maintenance visit. This failure does not cause any service disruption.                                                                                                                                                                                                                                                    |

Table 10-2. 12 Volt Power Supply Test — Continued

| Error Code | Test Result | Description/Recommendation                                                                |
|------------|-------------|-------------------------------------------------------------------------------------------|
|            | PASS        | The 12 volt power supply unit in the TN777B NETCON circuit pack is functioning correctly. |

## ABRI-PORT (ASAI ISDN-BRI Port)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO    |
|------------------------|-------------|-------------------------------------|--------------------|
| ABRI-PORT <sup>2</sup> | MAJOR(b)    | test port PCSSpp l                  | ASAI ISDN-BRI Port |
| ABRI-PORT              | MINOR       | test port PCSSpp l                  | ASAI ISDN-BRI Port |

- 
- Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., and so forth); and pp is the 2-digit port number (for example, 01).
  - The alarm level for ABRI ports may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to MAJOR for all ABRI ports in the system.

 **NOTE:**

Refer to "BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)" for repair procedures.

# AC-POWER

## AC Power for AC-Powered Systems

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO |
|------------------------|-------------|-------------------------------------|-----------------|
| AC-POWER               | WARNING     | test environment P                  | AC Power        |

1. Where P is an appropriate port network number determined via the PORT field from the Alarm or Error Log.

**NOTE:**

For environment maintenance, PPN or EPN cabinet configuration aspects in a high or critical reliabilty system are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Also refer to the DC-POWER (DC Power) for environment maintenance strategy.

The AC Power MO represents the AC power provided to the system from a wall outlet. The AC power comes from the wall outlet, through the Power Distribution Unit (PDU), if installed, and is then distributed to the various cabinets. The battery charger monitors AC power via fuse F3. See Figure 10-1. If no PDU is installed, the power is supplied directly to each cabinet from each individual wall outlets.

When the system loses power (for example, a power outage in the building), a Major alarm is logged against AC Power and the system goes on battery backup, which is known as Nominal Power Holdover (NPH). If power is restored before the NPH time expires, the alarm is resolved. Each basic control cabinet has separate batteries for NPH. The nominal power holdover provided is as follows:

- The batteries power the system for 10 seconds in a PPN cabinet, for 15 seconds in an EPN cabinet, and for 10 minutes in the control carrier in a standard reliability system.
- The batteries also provide system power for five minutes in the control carrier in high and critical reliability systems.

**WARNING:**

*Before powering down a cabinet or carrier that contains DEFINITY AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging the AUDIX software. Instructions for powering down this unit are in the "DEFINITY AUDIX System Power Procedures" in Chapter 5, "Routine*

Maintenance Procedures", on the circuit pack, and in DEFINITY AUDIX documentation.

Error Log Entries and Test to Clear Values

Table 10-3. AC Power Error Log Entries

| Error Type     | Aux Data | Associated Test           | Alarm Level | On/Off Board | Test to Clear Value       |
|----------------|----------|---------------------------|-------------|--------------|---------------------------|
| 0 <sup>1</sup> | 0        | Any                       | Any         | Any          | test environment P sh r 1 |
| 513            | Any      | AC Power Query Test (#78) | WARNING     | OFF          | test environment P sh r 1 |

- 
1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence.

Refer to the appropriate test description and follow the recommended procedures.

AC Power Query Test (#78)

Table 10-4. TEST #78 AC Power Query Test

| Error Code | Test Result | Description / Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Error Code     | Test Result       | Description / Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1<br>(cont'd.) | FAIL<br>(cont'd.) | 2. Procedures for a Global MCC (J58890CH):<br><br>a. For a nominal holdover system if there is no AC power at the wall outlet, then the problem is not with the system itself. Power must be restored to the wall outlet.<br><br>b. If there is AC power at the wall outlet, then there could be a problem with the Rectifiers (RM850), Battery Interface Unit, or battery. Resolve all alarms logged against the POWER Maintenance Object, and rerun the test. If the test still fails, the BIU may be defective. Check to see if the BOD alarm LED is “on”, on the BIU. If the BOD LED is “on” replace the Battery Interface Unit (BIU). If the BOD LED is “off” and the BOK LED is “on” then the SYSAM or the EPN Maintenance circuit pack may be incorrectly reporting the problem. Resolve all alarms against these Maintenance Objects and rerun the test. |
| 100            | FAIL              | The switch is currently without AC power, and AC Power maintenance is in the middle of timing the NPH interval.<br><br>1. Follow the repair steps outlined above for Error Code 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                | PASS              | The PR-MAINT (Maintenance/Tape Processor) in a PPN in a system without High or Critical Reliability, the DUPINT (Duplication Interface) circuit pack in a High or Critical Reliability system PPN, or the EPN MAINT (Maintenance) circuit pack in an EPN multicarrier cabinet system has reported that the switch has AC power. If there is no AC power at the wall outlet, then look for and resolve all alarms against the appropriate MO listed.                                                                                                                                                                                                                                                                                                                                                                                                              |

AC Power for DC-Powered Systems

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO |
|------------------------|-------------|-------------------------------------|-----------------|
| AC-POWER               | WARNING     | test environment P                  | AC Power        |

1. Where P is an appropriate port network number determined via the PORT field from the Alarm or Error Log.

 **NOTE:**  
For environment maintenance, the PPN or EPN cabinet configuration aspects in a High or Critical Reliability system are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Refer to the "DC-POWER (Single-Carrier Cabinet Power)" information for environment maintenance strategy.

In a DC-powered multicarrier cabinet system, the AC-POWER maintenance object still exists, but serves no functional purpose. Because the system cannot determine the type of powering provided, all AC-POWER tests should always either pass or abort.

Error Log Entries and Test to Clear Values

Table 10-5. AC Power Error Log Entries

| Error Type     | Aux Data | Associated Test           | Alarm Level | On/Off Board | Test to Clear Value       |
|----------------|----------|---------------------------|-------------|--------------|---------------------------|
| 0 <sup>1</sup> | 0        | Any                       | Any         | Any          | test environment P sh r 1 |
| 513            | Any      | AC Power Query Test (#78) | WARNING     | OFF          | test environment P sh r 1 |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the *AC Power Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 10-6. System Technician-Demanded Tests: AC-Power

| Order of Investigation                        | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-----------------------------------------------|---------------------|--------------------|-------------------|
| Battery & Battery Charger Query Test (#5) (a) | X                   | X                  | ND                |

Notes:

- a. Refer to "POWER" for a description of this test.
- b. Refer to "CARR-POW" for a description of this test.
- c. Refer to "EMG-XFER" for a description of this test.
- d. Refer to "CABINET" for a description of this test.
- e. Refer to "EXT-DEV ADMIN? N" or "EXT-DEV ADMIN? Y" for a description of this test.
- f. Refer to "RING-GEN" for a description of this test.

AC Power Query Test (#78)

This test queries the Maintenance/Tape Processor in a PPN in a system without High or Critical Reliability, the Duplication Interface circuit pack in a High or Critical Reliability system PPN, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of AC power to the switch. In a DC-powered system, this test should never fail.

Table 10-7. TEST #78 AC Power Query Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 2029       | ABORT       | Internal system error<br><br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                                                                                                                                                                                                                                                                                                      |
| any        | FAIL        | The Maintenance/Tape Processor in a PPN in a system without High or Critical Reliability, the Duplication Interface circuit pack in a High or Critical Reliability system PPN, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system is incorrectly reporting a problem with AC power. If this test fails, the problem is with the circuit pack and not with AC-POWER. The suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. |
|            | PASS        | All that can be inferred is that the PR-MAINT (Maintenance/Tape Processor) in a PPN in a system without High or Critical Reliability, the DUPINT (Duplication Interface) circuit pack in a High or Critical Reliability system PPN, or the EPN MAINT (Maintenance) circuit pack in an EPN multicarrier cabinet system is working properly.                                                                                                                                                         |

## ADM-CONN (Administered Connection)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO         |
|------------------------|-------------|-------------------------------------|-------------------------|
| ADM-CONN               | MAJOR       | status administered-connection N    | Administered Connection |
| ADM-CONN               | MINOR       | status administered-connection N    | Administered Connection |
| ADM-CONN               | WARNING     | status administered-connection N    | Administered Connection |

1. Where N is an appropriate Administered Connection number determined via the PORT field from the Alarm or Error Log.

An Administered Connection provides an end-to-end connection between two access endpoints or data modules. This connection is automatically established when the administered connection is administered and is due to be active. An error is logged when an administered connection cannot be established or when an established administered connection fails. An alarm is logged when a connection cannot initially be established or fails and cannot be reestablished. An alarming strategy is supported on a per administered connection basis. An alarm is raised for a connection when either the number of consecutive failed attempts to establish the connection reaches the alarm threshold or it can be determined that a failed attempt to establish was due to an administered error. The alarm raised ("major," "minor," "warning," or "none") is specified in the "Alarm Type" field of the Administered Connection Administration Form.

Table 10-8. Administered Connection Error Log Entries — Continued

| Error Type       | Aux Data | Associated Test | Alarm Level | On/Off Board | Test to Clear Value |
|------------------|----------|-----------------|-------------|--------------|---------------------|
| 111 (a)(b)(c)(q) | Any      | None            | Any         | OFF          | None                |
| 127 (a)(b)(c)(g) | Any      | None            | Any         | OFF          | None                |

Notes:

- a. These errors have no specific test associated with them. Refer to Notes b through p for an explanation and appropriate action.
- b. These errors are valid only for administered connection established over ISDN facilities; only error 127 is valid for administered connection established over non-ISDN facilities (or between two endpoints on the same switch).
  - Aux Data 1—Administered connection establishment failed
  - Aux Data 2—Active administered connection failed; attempting reestablishment via auto restoration
  - Aux Data 3—Auto restoration failed
  - Aux Data 4—Active administered connection failed; attempting reestablishment via fast retry
  - Aux Data 5—Fast retry failed
- c. These errors are typically associated with administrative problems and are not expected to be of a temporary nature. Therefore, the administered connection is not retried and the failure is alarmed immediately (the alarm threshold specified by the customer is ignored).
- d. The address of the destination endpoint is: an unassigned number (1); has an invalid number format (28); or is restricted form terminating calls ("Access Denied") [due to COR (Class of Restriction)]. Verify that the destination address is correct and that the destination endpoint is administered. The destination endpoint is not administered on the switch where this error is logged.
- e. A request has been made to use a transit network or common carrier that cannot be accessed. Check the routing pattern used by this Administered Connection and verify that the inter-exchange carrier specified is correct.
- f. The exact failure cause is unknown or has been mapped to one of these values. If this is not a temporary condition, try reversing the direction of the Administered Connection (that is, originate the Administered Connection from the destination switch). This may yield another failure cause.

- g. The destination endpoint is not available. Check the status of the destination endpoint (using **status access-endpoint** or **status data-module**) and verify that the endpoint is not busy or otherwise unavailable (for example, out-of-service). The status for the destination endpoint is not available on the switch where this error is logged.
  - h. This switch sent an ISDN message to another switch, which either did not respond (18) or did not respond within the allotted time (102). This could be due to link failure or congestion or outage at the other switch.
  - i. The address of the destination endpoint has changed. Verify that the new address is correct and change the Administered Connection accordingly. The destination endpoint is not administered on the switch logging this error.
  - j. Indicate that a resource (for example, a circuit or bearer capability) required by the administered cConnection is not presently available.
  - k. A network failure (38) or temporary failure (41) has occurred. Error Log entries for other maintenance objects (for example, DS1-BD or ISDN-LNK) may indicate a local problem.
  - l. A request to use a network service has been denied because the service has not been purchased. Check the routing pattern used by this Administered Connection and verify that the service type is correct. If the service type appears correct, check with the customer or network provider or both to determine what services have been purchased by the customer.
  - m. Indicate that outgoing calls may be barred on the originating switch (52) or that incoming calls may be barred on the destination switch (54). To restore an administered connection failure, issue the **status administered connection** command for current administered connection state (observe the retry count). If the administered connection state is "failed," then verify and correct the Administered Connection Administration Form.
  - n. The requested bearer capability (65), channel type (66), or facility (69) is not implemented or is unknown to the network. Check the address of the destination endpoint and the routing pattern used by this Administered Connection, and verify that they are correct and available.
  - o. These errors indicate that an ISDN protocol error has occurred.
  - p. The destination endpoint (or some intermediate facility) is not compatible with the originating endpoint. Check the BCC fields of the routing pattern used by this Administered Connection. Also, check if the originating and destination endpoints are compatible (for example, the originating access endpoint is voice-grade data, and the destination access endpoint is 64k data).
-

|------------------------|-------------------|-------------------------------------|--------------------|
| ADX8D-BD               | MINOR or WARNINGS | test board PCSS sh                  | AUDIX Circuit Pack |

1. *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21).

The ADX8D-BD maintenance object represents a TN566/TN2169 DEFINITY AUDIX circuit pack (sometimes called Embedded AUDIX) operating in digital-port (DP) mode. For circuit pack problems, see “XXX-BD (Common Port Circuit Pack)”. Port level problems are covered by ADX8D-PT.

DEFINITY AUDIX consists of two circuit s that occupy 5 slots on a port cabinet. The tests described in this manual apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

## ADX8D-PT (AUDIX Digital Port)

| MO Name (in Alarm Log) | Alarm Level | Initial Command To Run <sup>1</sup> | Full Name of MO    |
|------------------------|-------------|-------------------------------------|--------------------|
| ADX8D-PT               | MINOR       | test port PCSSpp l                  | AUDIX Digital Port |
| ADX8D-PT               | WARNING     | test port PCSSpp sh                 | AUDIX Digital Port |

1. *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21). *pp* is the two digit port number (01, 02, ...).

The ADX8D-PT maintenance object represents a port on a TN566/TN2169 DEFINITY AUDIX circuit pack (sometimes called Embedded AUDIX) operating in digital-port (DP) mode. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

The tests described in this section apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction Board (MFB) and the TN2169 Alarm Board (ALB). Because of its size this combination occupies 5 slots, but only 1 slot is functional as far as the switch is concerned. The other 4 slots are seen by the switch as “AUDIX-reserved” slots (or ADXDP-RS/ADX8D-RS.)

In DP mode the TN566 pack supports up to 8 voice ports, each with a primary information channel and a secondary information channel. Ports are administered in increments of two. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, DEFINITY AUDIX is not an adjunct.

 **CAUTION:**

*Never do any of the following without first shutting down AUDIX. Follow instructions on the TN566/TN2169 faceplate:*

- *Remove DEFINITY AUDIX circuit packs*
- *Cycle power to a carrier containing DEFINITY AUDIX circuit packs*
- *Remove power to a carrier containing DEFINITY AUDIX circuit packs*

Error Log Entries and Test to Clear Values

Table 10-9. DEFINITY AUDIX Digital Port Error Log Entries

| Error Type     | Aux Data | Associated Test                     | Alarm Level          | On/Off Board | Test to Clear Value     |
|----------------|----------|-------------------------------------|----------------------|--------------|-------------------------|
| 0 <sup>1</sup> | 0        | Any                                 | Any                  | Any          | test port PCSSpp sh r 1 |
| 1(a)           | 40987    | None                                | WARNING              | OFF          |                         |
| 1(b)           | 1 to 20  | None                                | WARNING              | OFF          |                         |
| 15(c)          | Any      | None                                |                      |              |                         |
| 18(d)          | 0        | busyout port PCSSpp                 | WARNING              | OFF          | release port PCSSpp     |
| 23(e)          | 0        | None                                | WARNING              | OFF          |                         |
| 130(f)         |          | None                                | WARNING              | ON           | test port PCSSpp sh     |
| 257(g)         | 40971    | None                                |                      |              |                         |
| 513(h)         | Any      | None                                |                      |              |                         |

| 2305(j)        | 40967    | None                                |                      |              |                         |
| 3840(k)        | 40965    | None                                |                      |              |                         |
| 3840(l)        | 41029    | None                                |                      |              |                         |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- a. The user may experience a noisy port or link. This is an off-board problem that is detected by the port circuit. If this problem exists, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined time.
- b. At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented. Also see Note (a).
- c. This is an internal type error that occurs when an audit request fails.
- d. The port is busied-out by command. You can release the port via the **release port PCSSpp** command.

- e. The circuit pack is administered but not physically installed. The alarm will clear when a circuit pack is inserted.
- f. The circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the AUDIX circuit pack (see precaution at the beginning of this section).
- g. Something is interfering with transmitting to the voice port. This is usually an on-board problem and can be ignored if no user complaints are received.
- h. AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. Check out the AUDIX system referring *DEFINITY AUDIX System Maintenance*, 585-300-110, if necessary.
- i. An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if no user complaints are received. If the problem persists, replace the circuit pack (see precaution at the beginning of this section). Once the problem is resolved, the alarm is retired after a certain period of time.
- j. The link between the circuit pack and the voice port is successfully reset. No craft action is necessary.
- k. No voice ports are connected to the DEFINITY AUDIX circuit pack. No maintenance action is required.
- l. The message buffer in the circuit pack is full.

**System Technician-Demanded Tests:**  
**Descriptions and Error Codes**

Always investigate tests in the order presented in the table below when you are inspecting errors in the system. By clearing error codes associated with the *Voice and Control Channel Local Loop Around Test* for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                                 | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------|---------------------|--------------------|-------------------|
| Voice and Control Channel Local Loop Around Test (#13) |                     | X                  | ND                |
| NPE Crosstalk Test (#9)                                |                     | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for DEFINITY AUDIX emulates the one for DIG-LINE. The tests listed below apply only to DIG-LINE and not to DEFINITY AUDIX. These are referred to as *NO-OP* tests, and they always return PASS.

- Electronic Power Feed Test (#11)
- Station Lamp Updates Test (#16)
- Station (Digital) Audits Test (#17)

NPE Crosstalk Test (#9)

This test verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence, and it takes about 20 to 30 seconds to complete.

Crosstalk testing is performed on both the primary information channel (voice) and on the secondary information channel (data) associated with each DEFINITY AUDIX port. If this test fails on either channel, the voice port is taken out-of-service.

Table 10-10. TEST #9 NPE Crosstalk Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | ABORT       | During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test.<br><br>1. Check the port status. Use the <b>display port PCSSpp</b> command to determine the voice port extension of the port. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, you must wait until the port is idle. When the port is idle, try (a). |
| 2          | ABORT       | System resources may not have been available, or the port may have been busy during the test. Try (a).                                                                                                                                                                                                                                                                                                                                                                                             |
| 1000       | ABORT       | System resources required to run this test are not available. The port may be in use. Use the <b>display port PCSSpp</b> command to determine the voice port extension of the port. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, you must wait until the port is idle before retesting. Try (a).                                                                                                      |
| 1001       | ABORT       | System resources required to run this test are not available. Try (a).                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                      |
|------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1002       | ABORT       | The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out-of-service due to TDM-BUS errors. Refer to “TDM-BUS” to diagnose any active TDM-BUS errors.<br><br>1. If system has no TDM-BUS errors, and if it is not handling heavy traffic, try (a). |
| 1003       | ABORT       | The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out-of-service.<br><br>1. Resolve any “TTR-LEV” errors.<br>2. Resolve any “TONE-PT” errors. Try (a).                                                            |
| 1004       | ABORT       | The port was put in use during the test. The test has been aborted. Use the <b>display port PCSSpp</b> command to determine the voice port extension of the port. Use the <b>status station</b> command to determine the service state of the port. If the port is in use, wait until the port is idle before testing.          |
| 1020       | ABORT       | Test disabled by background testing. Use the <b>status station</b> command to determine when the voice port is available for testing.                                                                                                                                                                                           |
| 2000       | ABORT       | Response to the test request was not received within the allowable time period. Try (a).                                                                                                                                                                                                                                        |
| 1<br>2     | FAIL        | The NPE of the tested port is transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel.<br><br>1. Replace the circuit pack .                       |
|            | PASS        | The port is using its allocated time slots correctly.<br><br>1. To be sure that this is not an intermittent problem, repeat this test up to a maximum of 10 times to make sure it continues to pass.<br><br>2. If complaints still exist, examine the connections.                                                              |

Note:

a. Retry the command at 1-minute intervals a maximum of 5 times.

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between the Switch Processing Element (SPE) and the DEFINITY AUDIX port circuit. First, the primary information (voice) channel loop back test is run.

While the primary information channel is still looped around, the Control Channel Loop Around Test is performed. The Loop Around Test for the secondary information (data) channel is then performed. This test is the same as the primary information channel loop around test.

Next, a Conference Test is implemented for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any test fails or aborts, the sequence is stopped.

Table 10-11. TEST #13 Voice and Control Channel Local Loop Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                    |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT       | Internal System Error. Try (a).                                                                                                                                                                                                                                                                                                                                                               |
| 1000       | ABORT       | System resources required to run this test are not available. The port may be in use. Use the <b>display port PCSSpp</b> command to determine the voice port extension of the port. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, you must wait until the port is idle before retesting. Try (a). |
| 1001       | ABORT       | System resources required for this test are not available. Try (a).                                                                                                                                                                                                                                                                                                                           |
| 1002       | ABORT       | The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or may have time slots that are out-of-service due to TDM-BUS errors. Refer to "TDM-BUS" to diagnose TDM-BUS errors.<br><br>1. If the system has no TDM-BUS errors, and is not handling heavy traffic, try (a).                                                                      |
| 1003       | ABORT       | The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out-of-service.<br><br>1. Resolve any "TTR-LEV" errors.<br>2. Resolve any "TONE-PT" errors.<br>3. If neither condition exists, try (a).                                                                                       |
| 1004       | ABORT       | The port was put in use during the test. Use the <b>display port PCSSpp</b> to determine the voice port extension of the port. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, you must wait until the port is idle before retesting. Try (a).                                                      |
| 2000       | ABORT       | Response to the test was not received within the allowable time period. If complaints still exist, examine the connections.</li></ol>                                                                                                                                                                                                                                                                           |

## ADX16D-B (16 Port AUDIX Circuit Pack)

| MO Name (in Alarm Log) | Alarm Level | Initial Command To Run <sup>1</sup> | Full Name of MO    |
|------------------------|-------------|-------------------------------------|--------------------|
| ADX16D-B               | MINOR       | test board PCSS sh                  | AUDIX Circuit Pack |
| ADX16D-B               | WARNING     | test board PCSS sh                  | AUDIX Circuit Pack |

1. *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21).

The ADX16D-BD maintenance object represents a TN566/TN2169 DEFINITY AUDIX circuit pack combination operating in 16 port mode digital (DP). For circuit-pack-level problems, see “XXX-BD (Common Port Circuit Pack)”. Port-level maintenance is covered by ADX16D-BD-PT.

DEFINITY AUDIX consists of 2 circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy of its own that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

## ADX16A-BD (AUDIX Circuit Pack)

| MO Name (in Alarm Log) | Alarm Level        | Initial Command To Run <sup>1</sup> | Full Name of MO    |
|------------------------|--------------------|-------------------------------------|--------------------|
| ADXCL-BD or VADX16A-BD | MINOR, or WARNINGS | test board PCSS sh                  | AUDIX Circuit Pack |

1. *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21).

The ADX16A-BD maintenance object represents a TN566/TN2169 DEFINITY AUDIX circuit pack combination operating in control-link (CL) mode. For circuit-pack-level problems, see “XXX-BD (Common Port Circuit Pack)”. Port-level maintenance is covered by ADX16A-PT.

DEFINITY AUDIX consists of 2 circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

# ADX16D-P (16-Port AUDIX Digital Port)

| MO Name (in Alarm Log) | Alarm Level       | Initial Command To Run <sup>1</sup> | Full Name of MO    |
|------------------------|-------------------|-------------------------------------|--------------------|
| ADX16D-P               | MINOR or WARNINGS | test port PCSSpp I                  | AUDIX Digital Port |

1. *UU* is the universal cabinet number (1 for PPN, 2-44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21). *pp* is the two digit port number (01, 02, ...).

 **CAUTION:**

*Never do any of the following without first shutting down AUDIX. Follow the instructions on the TN566/TN2169 faceplate:*

- *Remove DEFINITY AUDIX circuit packs*
- *Cycle power to a carrier containing DEFINITY AUDIX circuit packs*
- *Remove power to a carrier or cabinet containing DEFINITY AUDIX circuit pack.*

The ADX16D-P maintenance object represents a port on a TN566/TN2169 DEFINITY AUDIX circuit pack operating in digital-port (DP) mode. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADX16A-PT.

The tests described in this section apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction Board (MFB) and the TN2169 Alarm Board (ALB). Because of its size this combination occupies 5 slots, but only 1 slot is functional as far as the system is concerned. The other 4 slots are seen by the switch as “AUDIX-reserved” slots (or ADX16-RES/ADX16D-RS).

In 16 Port DP mode, the TN566 pack supports up to 16 voice ports, each with a primary information channel and a secondary information channel. Ports are administered in increments of two. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, DEFINITY AUDIX is not an adjunct.

Error Log Entries and Test to Clear Values

Table 10-12. DEFINITY AUDIX Digital Port Error Log Entries

| Error Type     | Aux Data | Associated Test                         | Alarm Level           | On/Off Board | Test to Clear Value     |
|----------------|----------|-----------------------------------------|-----------------------|--------------|-------------------------|
| 0 <sup>1</sup> | 0        | Any                                     | Any                   | Any          | test port PCSSpp sh r 1 |

| 3840(l)        | 41029    | None                                    |                       |              |                         |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. Minor alarms may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- a. The user may experience a noisy port or link. This is an off-board problem that is detected by the port circuit. If this problem exists, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined time.
- b. At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented. Also see Note a, above.
- c. This is an internal type error that occurs when an audit request fails.
- d. The port is busied-out by command. Release the port with the **release port PCSSpp** command.

- e. The circuit pack is administered but not physically installed. The alarm will clear when a circuit pack is inserted.
- f. The circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reseal or replace the AUDIX circuit pack (see caution at the beginning of this section).
- g. Something is interfering with transmitting to the voice port. This is usually an on-board problem and can be ignored if no user complaints are received.
- h. AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. Refer to *DEFINITY AUDIX System Maintenance*, 585-300-110, if necessary.
- i. An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if no user complaints are received. If the problem persists, replace the circuit pack (see caution at the beginning of this section). Once the problem is resolved, the alarm is retired after a certain period of time.
- j. The link between the circuit pack and the voice port is successfully reset. No craft action is necessary.
- k. No voice ports are connected to the DEFINITY AUDIX circuit pack. No maintenance action is required.
- l. The message buffer in the circuit pack is full.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the *Voice and Control Channel Local Loop Around Test* for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                                 | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------|---------------------|--------------------|-------------------|
| Voice and Control Channel Local Loop Around Test (#13) |                     | X                  | ND                |
| NPE Crosstalk Test (#9)                                |                     | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for DEFINITY AUDIX emulates the one for DIG-LINE. The tests listed below apply only to DIG-LINE and not to DEFINITY AUDIX. These tests always return PASS.

- Electronic Power Feed Test (#11)
- Station Lamp Updates Test (#16)
- Station (Digital) Audits Test (#17)
- Digital Terminal Remote Loop Around Test (1201)

NPE Crosstalk Test (#9)

This test verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence, and it takes about 20 to 30 seconds to complete.

Crosstalk testing is performed on both the primary information channel (voice) and on the secondary information channel (data) associated with each DEFINITY AUDIX port. If this test fails on either channel, the voice port is taken out-of-service.

Table 10-13. TEST #9 NPE Crosstalk Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1002       | ABORT       | <p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out-of-service due to TDM-BUS errors. Refer to “TDM-BUS” to diagnose TDM-BUS errors.</p> <p>1. If system has no TDM-BUS errors, and if it is not handling heavy traffic, try (a)</p>                                                                                                                          |
| 1003       | ABORT       | <p>The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present, or some tone detectors may be out-of-service.</p> <p>1. Resolve any “TTR-LEV” errors in the Error Log.</p> <p>2. Resolve any “TONE-PT” errors in the Error Log.</p>                                                                                                                                            |
| 1004       | ABORT       | <p>The port was put in use during the test. The test has been aborted. Use the <b>display port PCSSpp</b> command to determine the voice port extension of the port. Use the <b>status station</b> command to determine the service state of the port. If the port is in use, it is unavailable for certain tests. Refer to “Status” commands in Chapter 8 for explanations of all possible states. Wait until the port is idle before testing.</p> |
| 1020       | ABORT       | <p>Test disabled via background testing. Use the <b>status station</b> command to determine when the voice port is available for testing.</p>                                                                                                                                                                                                                                                                                                       |
| 2000       | ABORT       | <p>Response to the test request was not received within the allowable time period (a).</p>                                                                                                                                                                                                                                                                                                                                                          |
| 1<br>2     | FAIL        | <p>The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel.</p> <p>1. Replace the circuit pack (see caution at the beginning of this section).</p>                                                                         |
|            | PASS        | <p>The port is using its allocated time slots correctly.</p> <p>1. To be sure that this is not an intermittent problem, repeat this test up to a maximum of 10 times to make sure it continues to pass.</p> <p>2. If complaints still exist, examine the connections.</p>                                                                                                                                                                           |

Note:

a. Retry the command at 1-minute intervals a maximum of 5 times.

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between the Switch Processing Element (SPE) and the DEFINITY AUDIX port circuit. The SPE sends a message to loop around both the information and control channels for the port. First, the primary information (voice) channel loop back test is run.

While the primary information channel is still looped around, the Control Channel Loop Around Test is performed. The Loop Around Test for the secondary information (data) channel is then performed. This test is the same as the primary information channel loop around test.

Next, a Conference Test is implemented for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any test fails or aborts, the sequence is stopped.

Table 10-14. TEST #13 Voice and Control Channel Local Loop Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

If the tone generator and tone detector circuit packs are functioning properly, and if the test still fails, replace the AUDIX (see caution at the beginning of this section).</li></ol> |
|            | PASS        | <p>Voice and Control Channel Local Loop test passed. All channels are transmitting properly.</p> <ol style="list-style-type: none"><li>1. To be sure that this is not an intermittent problem, repeat this test up to 10 times and see if it continues to pass.</li><li>2. If complaints still exist, examine the connections.</li></ol>                                                                                                                                                                                                                            |

- Notes:
- a. Retry the command at 1-minute intervals a maximum of 5 times.

# ADX16A-PT (AUDIX Analog Line/Control Link)

| MO Name (in Alarm Log) | Alarm Level | Initial Command To Run <sup>1</sup> | Full Name of MO                 |
|------------------------|-------------|-------------------------------------|---------------------------------|
| ADXCL-PT or ADX16A-PT  | MINOR       | test port PCSSpp l                  | AUDIX Analog Line/ Control Link |
| ADXCL-PT or ADX16A-PT  | WARNING     | test port PCSSpp sh                 | AUDIX Analog Line/ Control Link |

1. *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21). *pp* is the two digit port number (01, 02, ...).

**CAUTION:**

*Never do any of the following without first shutting down AUDIX. Follow the instructions on the TN566/TN2169 faceplate:*

- *Remove DEFINITY AUDIX circuit packs*
- *Cycle power to a carrier containing DEFINITY AUDIX circuit packs*
- *Remove power to a carrier containing DEFINITY AUDIX circuit packs*

The ADX16A-PT maintenance object represents a port on a TN566/TN2169 DEFINITY AUDIX circuit pack that is operating in control-link (CL) mode. For circuit-pack-level problems (ADX16A-BD or ANL-16-BD), see “XXX-BD (Common Port Circuit Pack)”. For port-level problems with AUDIX operating in digital-port mode, see ADXDP-PT/ADX8D-PT.

The tests described in this section apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

AUDIX resides on a combined pair of circuit packs: the TN566 Multifunction Board (MFB) and the TN2169 Alarm Board (ALB). Because of its size this combination occupies 5 slots, but only 1 slot is functional as far as the switch is concerned. The other 4 slots are seen by the switch as “AUDIX-reserved” slots.

In CL mode the TN566 pack supports up to 16 voice ports. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

Unlike other AUDIX systems, DEFINITY AUDIX is not an adjunct.

Error Log Entries and Test to Clear Values

Table 10-15. DEFINITY AUDIX Analog Line/Control Link Error Log Entries

| Error Type     | Aux Data | Associated Test                | Alarm Level              | On/Off Board | Test to Clear Value       |

| 1281           |          | Conference Test (#7)           | MIN/<br>WRN <sup>2</sup> | ON           | test port PCSSpp l r 2    |
| 1537           |          | NPE Crosstalk Test (#6)        | MIN/<br>WRN <sup>2</sup> | ON           | test port PCSSpp l r 2    |

- Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
- Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- This is an in-line error and can only be resolved over time. This indicates that no terminal equipment was present when ringing was attempted. Execute the short **test port PCSSpp** command.
- The circuit pack has been logically administered but not physically installed. The alarm will be cleared when the circuit pack is installed.
- The circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reseal or replace the circuit pack.
- This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only one analog circuit pack in the system has this problem, then replace the circuit pack. If only analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If analog circuit packs on many carriers have this error, check the ringing generator.
- AUDIX is not available to the switch. Check the AUDIX system, referring to *DEFINITY AUDIX System Maintenance*, 585-300-110.

f. The TDM bus is out of service. See the “TDM-BUS” section.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the *Loop Around Test #161* for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation  | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-------------------------|---------------------|--------------------|-------------------|
| Loop Around Test (#161) |                     | X                  | ND                |
| Conference Test (#7)    |                     | X                  | ND                |
| NPE Crosstalk Test (#6) |                     | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NO-OP Tests

The maintenance strategy for DEFINITY AUDIX emulates the one for ANL-16-L. The tests listed below apply only to ANL-16-L and not to DEFINITY AUDIX. These tests always return PASS.

- Battery Feed Test (#35)
- Audits and Updates Test (#36)
- Station Present Test (#48)

Tests 36 and 48 ABORT when AUDIX is not running.

NPE Crosstalk Test (#6)

This test verifies that this port’s NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of the long test sequence and takes about 25 seconds to complete.

Table 10-16. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                               |
|------------|-------------|---------------------------------------------------------------------------|
|            | ABORT       | Could not allocate the necessary system resources for this test. Try (a). |

- Note:
- a. Retry the command at 1-minute intervals a maximum of 5 times.

## ALARM-PT (ALARM PORT)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO |
|------------------------|-------------|-------------------------------------|-----------------|
| ALARM-PT               | MIN         | test port PCSSpp l                  | Alarm-Port      |
| ALARM-PT               | WRN         | test port PCSSpp sh                 | Alarm-Port      |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The Alarm Port Maintenance Object provides on-board maintenance for an analog line port that is administered as an external device alarm port. Tests are provided to verify the analog line port's ability to detect an external device alarm. The External Device Alarm (EXT-DEV) Maintenance Object is used for the off-board external device alarm.

## ANL-16-L (16-Port Neon Analog Line)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup>       | Full Name of MO          |
|------------------------|-------------|-------------------------------------------|--------------------------|
| ANL-16-L               | MIN         | test port PCSSpp l                        | 16-Port Neon Analog Line |
| ANL-16-L               | WRN         | test port PCSSpp sh release station <ext> | 16-Port Neon Analog Line |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The following are 16-Port Analog Line circuit packs:

|                    |                    |
|--------------------|--------------------|
| TN746              | TN746B             |
| TN468 [G3iV2-386]  | TN749 [G3iV2-386]  |
| TN468B [G3iV2-386] | TN2135 [G3iV2-386] |
| TN2144 [G3iV2-386] | TN2149 [G3iV2-386] |

These circuit packs provide 16 ports for analog voice terminals. The TN746, TN468, and TN749 support only single-line, on-premises/in-building, analog voice terminals, and not off-premises stations, since these circuit packs are not equipped with lightning protection. The TN746B, TN2144, TN2149, and TN468B support both on-premises and off-premises (that is, out-of-building) analog voice terminals. The TN468, TN468B, TN479, TN2135, TN2144, and TN2149 do NOT support the neon message waiting feature.

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled via the **change station <extension>** command. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

No maintenance of the terminal connected to the 16-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power and the common ringing application circuitry are reported as part of the Common Port Circuit Pack errors (see errors 1281 and 1793 in the XXX-BD (Common Port Circuit Pack) Maintenance documentation).

Hardware Error Log Entries and Test to Clear Values

Table 10-19. 16-Port Neon Analog Line Error Log Entries

| Error Type     | Aux Data       | Associated Test               | Alarm Level          | On/Off Board | Test to Clear Value         |
|----------------|----------------|-------------------------------|----------------------|--------------|-----------------------------|
| 0 <sup>1</sup> | 0              | Any                           | Any                  | Any          | test port PCSSpp sh r 1     |
| 1 (a)          | 40960<br>40977 | none                          |                      |              |                             |
| 15 (b)         | Any            | Audits and Updates Test (#36) |                      |              |                             |
| 18             | 0              | busyout station <extension>   | WRN                  | ON           | release station <extension> |
| 130 (c)        |                | None                          | WRN                  | ON           | test port PCSSpp sh         |
| 257 (d)        | 40973          | none                          |                      |              |                             |
| 513 (e)        |                | Station Present Test (#48)    | WRN                  | OFF          | test port PCSSpp sh r 2     |
| 769            |                | Battery Feed Test (#35)       | MIN/WRN <sup>2</sup> | ON           | test port PCSSpp sh r 2     |
| 1025           |                | Loop Around Test (#161)       | MIN/WRN <sup>2</sup> | ON           | test port PCSSpp l r 2      |
| 1281           |                | Conference Test (#7)          | MIN/WRN <sup>2</sup> | ON           | test port PCSSpp l r 2      |
| 1537           |                | NPE Crosstalk Test (#6)       | MIN/WRN <sup>2</sup> | ON           | test port PCSSpp l r 2      |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

- Notes:
- a. This is an in-line error and can only be resolved over time. This indicates that no terminal equipment was present when ringing was attempted. Execute the short **test port PCSSpp** command, and follow the procedure for the results of Test #48.

■ 40960—indicates that too many simultaneous incoming ringing attempts were made on this board. Only four ports on a board may be ringing simultaneously. A fifth incoming call will cause an inline error from the board.

- 40977—indicates that no terminal equipment was connected when ringing was attempted. Run the short Test via the **test port PCSSpp** command, and follow the procedure for the results of Test #48.
- b. This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors (if any).
- c. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- d. This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only one Analog circuit pack in the system has this problem, then replace the circuit pack. If only Analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If Analog circuit packs on many carriers have this error, then it is probably a problem with the ringing generator.
- e. Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the **change station <extension>** command. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                                       | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------------|---------------------|--------------------|-------------------|
| Battery Feed Test (#35)                                      | X                   | X                  | ND                |
| Station Present Test (#48)                                   | X                   | X                  | ND                |
| Loop Around Test (#161)                                      |                     | X                  | ND                |
| Conference Test (#7)                                         |                     | X                  | ND                |
| NPE Crosstalk Test (#6)                                      |                     | X                  | ND                |
| Station Status and Translation Audits and Updates Test (#36) | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-20. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT       | Could not allocate the necessary system resources to run this test.<br>1. Retry the command at one-minute intervals a maximum of five times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1000       | ABORT       | System resources required to run this test are not available. The port may be busy with a valid call. Use the <b>display port PCSSpp</b> command to determine the station extension. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting.<br>1. If the port status is idle, retry the command at one-minute intervals a maximum of five times. |
| 1001       | ABORT       | System resources required to run this test are not available. This could be due to a failure to seize the port.<br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1002       | ABORT       | The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors.<br>1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times.                                                                                                                                                                                                                                                                                   |

|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Any        | FAIL        | <p>This test can fail due to on-board or off-board problems. Off-board problems of concern include EXP-INTF faults, TDM-BUS faults, and faults associated with the tone detectors/tone generators. Clear all off-board problems before replacing the board. Keep in mind that a TDM-BUS problem is usually the result of a faulty board connected to the backplane or bent pins on the backplane.</p> <ol style="list-style-type: none"><li>1. Look for EXP-INTF errors in the error log. If present, refer to the EXP-INTF Maintenance documentation.</li><li>2. Look for TDM-BUS errors in the error log. If present, refer to the TDM-BUS Maintenance documentation.</li><li>3. Look for TONE-BD and/or TONE-PT errors in the error log. If present, refer to the TONE-BD Maintenance documentation and the TONE-PT Maintenance documentation.</li><li>4. Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.</li></ol> |
|            | PASS        | <p>The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</li></ol>                                                                                                                              |

Conference Circuit Test (#7)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is

instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

| 2000       | ABORT       | Response to the test request was not received within the allowable time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2100       | ABORT       | System resources required to run this test are not available.<br><br>1. Look for TONE-PT errors in the error log. If present, refer to the TONE-PT Maintenance documentation.<br><br>2. If there are no TONE-PT errors in the error log, retry the test at 1-minute intervals for a maximum of 5 times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Any        | FAIL        | The NPE of the tested port did not conference the tones correctly. This will cause noisy and unreliable connections.<br><br>1. Issue the <b>display port</b> and the <b>status station</b> commands to determine if the station is idle. If the station is found to be idle, issue the <b>test port</b> command for this port.<br><br>2. If the test continues to fail, issue the <b>busyout port</b> and the <b>release port</b> commands, and then retest the port.<br><br>3. If the test still fails, replace the board.                                                                                                                                                                                                                                                                        |
|            | PASS        | The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 0          | NO BOARD    | The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.<br><br>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.<br><br>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.<br><br>3. Issue the <b>reset board</b> command.<br><br>4. Issue the <b>release busy board</b> command.<br><br>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted. |

**Battery Feed Test (also called Port Diagnostic Test) (#35)**

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and by trying to detect a current.

**⇒ NOTE:**  
For the TN746B 16-Port Neon Analog Line circuit pack, Test #35 always "passes." No actual testing is performed on the TN746B while the test is running. Test #35 operates in the normal manner for TN746.

**Table 10-22. TEST #35 Battery Feed Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Retry the command at one-minute intervals a maximum of five times.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|            | FAIL        | <p>The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This could be a marginal test, and the terminal equipment may be operating satisfactorily.</p> <p>1. Retry the test at 1-minute intervals for a maximum of 5 times.</p> <p>2. If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack only if the customer is experiencing problems.</p>                                                                                                                                                                                                                                                                                                                                            |
|            | PASS        | <p>The port's battery feed chip is able to provide power to the station equipment to detect on-/off-hook, but may not be able to supply power for touch-tones. If touch-tones are inoperative on this station, then replace the circuit pack because this port is inoperative. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.</p>                                                                                                                                                                                                                                                                                                                                                                        |
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <p>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</p> <p>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</p> <p>3. Issue the <b>reset board</b> command.</p> <p>4. Issue the <b>release busy board</b> command.</p> <p>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</p> |

Station Status and Translation Audits and Updates Test (#36)

This test updates the Analog port's message lamp state (if it has one) and translations (such as station type, dial type, network connection) with information kept in the software. The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

|            | PASS        | <p>The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <p>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</p> <p>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</p> <p>3. Issue the <b>reset board</b> command.</p> <p>4. Issue the <b>release busy board</b> command.</p> <p>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</p> |

Station Present Test (also called Ringing Application Test) (#48)

This test provides a burst of ringing current to the terminal equipment and detects that current flows. This test ascertains whether terminal equipment is connected to the port.

This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen form. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

Table 10-24. TEST #48 Station Present Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|            | ABORT       | Could not allocate the necessary system resources to run this test.<br><br>1. Retry the command at one-minute intervals a maximum of five times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 1000       | ABORT       | System resources required to run this test are not available. The port may be busy with a valid call. Use the <b>display port PCSSpp</b> command to determine the station extension. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting.<br><br>1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times.                                     |
| 1004       | ABORT       | The port was seized by a valid call during the test. The test has been aborted. Use the <b>display port PCSSpp</b> command to determine the station extension. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort and the port is not in use, escalate the problem. |
| 1005       | ABORT       | The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1008       | ABORT       | Could not allocate a ringing circuit. Either all the ringing circuits are in use or the ringing generator is defective or it is not wired correctly.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or is not wired correctly (see errors for RING-GEN). If it doesn't occur on other ports, then all four ring phases are in use.                                                                                                                                                                         |

| 1018       | ABORT       | <p>The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the brief ringing disturbance that this test may cause).</p> <p>1. To enable the test for the particular analog station being tested, enter <b>change station extension</b> and set the 'Test?' field on the station from 'n' to 'y.'</p>                                                                                                                                                                                                                                                                                                                                                                                                   |
| 2000       | ABORT       | <p>Response to the test request was not received within the allowable time period.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2100       | ABORT       | <p>Could not allocate necessary system resources to run this test.</p> <p>1. Retry the command at one-minute intervals a maximum of five times.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|            | FAIL        | <p>The terminal equipment is not connected to the circuit pack. Some terminal equipment such as modems may fail even when connected properly.</p> <p>1. Remotely test the equipment.</p> <p>2. If the test fails again, look for RING-GEN errors in the error log. If present, refer to the RING-GEN (analog ring generator) Maintenance documentation.</p> <p>3. Check all of the wiring between the station equipment and the switch. Then, run the test again.</p> <p>4. If the test still fails, the set may be defective. Check the set, and replace it, if necessary.</p> <p>5. Some terminal equipment could fail even when it is connected properly. If this is the case, disable the test using the <b>change station extension</b> command (enter 'n' into the Test field). Note that this action also disables tests 6, 7, 161, and 35 on this port.</p> |
|            | PASS        | <p>The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</li></ol> |

Loop Around Test (#161)

Each Analog port consists of:

- an NPE for port connectivity and gain, and conferencing functionality
- a code that converts the digital signals of the TDM Bus to analog signals
- a battery feed chip that provides power to the telephone set for signaling, dial pulsing, transmission, and balance

This test is designed to check the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the analog port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog Port. The Analog Port is then instructed to go into loop around mode (see the following below). The test passes if the signal measured by the Tone Detector is within acceptable limits.

**Figure 10-2. Analog Loop Around Test**

Table 10-25. TEST #161 Loop Around Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</li></ol> |

## ANL-BD (Analog Line Circuit Pack)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO                       |
|------------------------|-------------|-------------------------------------|---------------------------------------|
| ANL-BD                 | MIN         | test board PCSS sh                  | 8-Port Analog Line Circuit Pack       |
| ANL-BD                 | WRN         | test board PCSS sh                  | 8-Port Analog Line Circuit Pack       |
| ANL-BD                 | MIN         | test board PCSS sh                  | 8-Port Neon Analog Line Circuit Pack  |
| ANL-BD                 | WRN         | test board PCSS sh                  | 8-Port Neon Analog Line Circuit Pack  |
| ANL-BD                 | MIN         | test board PCSS sh                  | 16-Port Neon Analog Line Circuit Pack |
| ANL-BD                 | WRN         | test board PCSS sh                  | 16-Port Neon Analog Line Circuit Pack |

- 
1. Where P is the port network number (1 for PPN and 2 or [G.1] 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to "XXX-BD (Common Port Circuit Pack)" Maintenance documentation for circuit pack level errors. See also "ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line)", and "ANL-16-L (16-Port Neon Analog Line)" Maintenance documentation for related line information.

## ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO         |
|------------------------|-------------|-------------------------------------|-------------------------|
| ANL-LINE               | MIN         | test port PCSSpp l                  | 8-Port Analog Line      |
| ANL-LINE               | WRN         | test port PCSSpp sh                 | 8-Port Analog Line      |
| ANL-NE-L               | MIN         | test port PCSSpp l                  | 8-Port Neon Analog Line |
| ANL-NE-L               | WRN         | test port PCSSpp sh                 | 8-Port Neon Analog Line |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The 8-Port Analog Line circuit packs are:

- TN742      TN431 [G3iV2-386]
- TN769      TN443 [G3iV2-386]
- TN712      TN467 [G3iV2-386]
- TN411 [G3iV2-386]

These circuit packs provide eight ports for single line on-premises or off-premises analog endpoints such as analog voice terminals, queue warning level lamps, recorded announcements, dictation machines, PagePac™ paging equipment, external alerting devices, modems, facsimile machines, and AUDIX voice ports. The TN769 supports a neon message waiting lamp. The other eight-port analog lines do not support the lamp.

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen. However, on some releases of the software, this action disables Tests #6, #47, and #35 as well as Test #48. Test #47 may cause a false alarm when the port is connected to off-premises equipment, some non-voice terminal equipment, and some loop equipment. If this is the case, then the test should be disabled using the Tests field of the **change station <extension>** command.

No maintenance of the terminal connected to the 8-Port Analog Line circuit pack or 8-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power (for ANL-NE-L only) and the common ringing application circuitry are

reported as part of the Common Port Circuit Pack errors (see errors 1281 and 1793 in the XXX-BD (Common Port Circuit Pack) Maintenance documentation).

Hardware Error Log Entries and Test to Clear Values

Table 10-26. 8-Port Analog Line Error Log Entries

| Error Type     | Aux Data                | Associated Test                      | Alarm Level              | On/Off Board | Test to Clear Value         |

| 1025           |                         | NPE Crosstalk Test (#6)              | MIN/WR<br>N <sup>2</sup> | ON           | test port PCSSpp l r 3      |
| 1281 (f)       |                         |                                      |                          |              |                             |
| 1793 (f)       |                         |                                      |                          |              |                             |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. Major or Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

- a. These are in-line errors and can only be resolved over time.
- 40960—indicates that too many simultaneous incoming ringing attempts were made on this board. Only four ports on a board may be ringing simultaneously. A fifth incoming call will cause an inline error from the board.

- 40975—indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal rings. If the terminal doesn't ring, then replace it. Otherwise, issue the **test port PCSSpp** command, and follow the procedure for Test #48.
  - 40977—indicates that no terminal equipment was connected when ringing was attempted. Run the Short Test via the **test port PCSSpp** command, and follow the procedure for the results of Test #48.
- b. This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate errors (if any).
  - c. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
  - d. Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled via the **change station <extension>** command. However, on some releases of the software, this disables Tests #6, #47, and #35 as well as Test #48.
  - e. Test #47 may cause a false alarm when the port is connected to off-premises equipment, some non-voice terminal equipment, and some loop equipment. If this causes a false alarm, then disable the test by changing the Tests field of the **change station** command to "no."
  - f. Refer to "XXX-BD (Common Port Circuit Pack)" Maintenance documentation.

**System Technician-Demanded Tests:**  
**Descriptions and Error Codes**

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation     | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|----------------------------|---------------------|--------------------|-------------------|
| Battery Feed Test (#35)    | X                   | X                  | ND                |
| Station Present Test (#48) | X                   | X                  | ND                |

| Order of Investigation                                       | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------------|---------------------|--------------------|-------------------|
| NPE Crosstalk Test (#6)                                      |                     | X                  | ND                |
| Loop Around and Conference Test (#47)                        |                     | X                  | ND                |
| Station Status and Translation Audits and Updates Test (#36) | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-27. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | System resources required to run this test are not available. The port may be busy with a valid call. Use the <b>display port PCSSpp</b> command to determine the station extension. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting.<br><br>1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. |
| 1001       | ABORT       | Could not allocate the necessary system resources to run this test.<br><br>1. Retry the command at one-minute intervals a maximum of five times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1002       | ABORT       | The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors.<br><br>1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times.                                                                                                                                                                                                                                                                                             |

**Battery Feed Test (also called Port Diagnostic Test) (#35)**

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and trying to detect a current.

**Table 10-28. TEST #35 Battery Feed Test**

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations (such as station type, dial type, network connection) with information kept in the software. The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

| 1004       | ABORT       | Could not allocate the necessary system resources to run this test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|            | ABORT       | <p>System resources required to run this test are not available. The port may be busy with a valid call. Use the <b>display port PCSSpp</b> command to determine the station extension. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort and the port is not in use, escalate the problem.</li></ol> |
| 1005       | ABORT       | <p>The test was aborted due to a configuration problem. This code will result under either of the following conditions:</p> <ol style="list-style-type: none"><li>1. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).</li><li>2. The circuit pack is one of the following:<ul style="list-style-type: none"><li>— TN742 vintages 13,14 and 15</li><li>— TN769 vintages 3,4 and 5</li></ul></li></ol>                                                                                                                                                                                                                                                                                                  |
| 1006       | ABORT       | <p>This port has been busied out by command or taken out-of-service by the failure of the NPE Crosstalk Test.</p> <ol style="list-style-type: none"><li>1. Look in the Error Log for Error Type 18 (port busied out) for this port. If this error is present, then release the port with the <b>release station extension</b> command and run the test again.</li><li>2. Look in the Error Log for Error Type 1025 (NPE Crosstalk Test failed) for this port. If this error is present, then investigate the errors associated with the NPE Crosstalk Test (#6) first.</li><li>3. Make sure that the terminal is connected and in service, and then retest.</li></ol>                                                                                                                                                  |
| 2000       | ABORT       | Could not allocate the necessary system resources to run this test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|            | ABORT       | Response to the test request was not received within the allowable time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 10-29. TEST #36 Station Status and Translation Audits and Updates Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | FAIL        | <p>This does not indicate a hardware problem. The switchhook audit failed, and the other updates were not performed because of this failure. This condition may occur when the audit is performed at the same time that the terminal equipment goes off-hook. Use the <b>status station</b> command to determine when the port is available for testing.</p> <p>1. When the port becomes available for testing, retry the command at one-minute intervals a maximum of five times.</p>                                                                                                                                                                                                                                                                                                                    |
| 5          | FAIL        | <p>This does not indicate a hardware problem but may indicate an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 7          | FAIL        | <p>The translation update failed. The ringer update was not performed because of this failure. This does not indicate a hardware problem but may be an internal software error.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 8          | FAIL        | <p>This does not indicate a hardware problem but may be an internal software error. The ringer update failed.</p> <p>1. Retry the command at one-minute intervals a maximum of five times.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|            | PASS        | <p>The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises.</p> <p> <b>NOTE:</b><br/>This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 circuit packs prior to Vintage 6.</p>                                                                                                                                                                                                                                                                |
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <p>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</p> <p>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</p> <p>3. Issue the <b>reset board</b> command.</p> <p>4. Issue the <b>release busy board</b> command.</p> <p>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</p> |

## **Loop Around and Conference Test (#47)**

---

Each Analog Port consists of:

- an NPE for port connectivity and gain, and conferencing functionality
- a code that converts the digital signals of the TDM Bus to analog signals
- a battery feed chip that provides power to the telephone set for signaling, dial pulsing, transmission, and balance.

This test is designed to check the on-board transmission capabilities of the NPE, the code, and the battery feed chip of the Analog Port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog Port. The Analog Port is then instructed to go into loop around mode (see Figure 10-2). The test passes if the signal measured by the Tone Detector is within acceptable limits.

The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. As part of Test #47, the operation of the port conference circuits in the NPE for three and four parties is also tested. In addition, a test is run to measure noise. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

The noise test is performed by filtering out the tone, and then measuring inherent port noise.

### **NOTE:**

This Loop Around Test is sensitive to the length of the loop, the equipment in the loop, or the equipment terminating the loop, such as off-premises stations. If this test is causing a false alarm, then disable the test by changing the Tests field to "no" using the **change station** command for this station.

| Error Code                       | Test Result       | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7<br>13<br>14<br>15<br>(cont'd.) | FAIL<br>(cont'd.) | <div><div><div>1. Disconnect the terminal equipment from the circuit pack at the cross-connect and run the test again.</div><div>2. If the test fails again, replace the circuit pack and reconnect the terminal equipment. If the test passes the second time, then the test results were affected by the terminal equipment connected to the port; in this case, ignore the results of this test if all other tests pass or abort and the station is operating properly. Failure of test 47 does not cause an alarm. If there are failures of other tests, then investigate those errors. User reported troubles with this port should be investigated by using other port tests, by examining station wiring, and by examining the station to ensure that it is correctly translated as off-premises or on-premises.</div></div><div><div>⇒ NOTE:</div><div>If the loop around and conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test.</div></div></div> |
|                                  | PASS              | <div>The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises.</div> <div><div>⇒ NOTE:</div><div>This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 circuit packs prior to Vintage 6.</div></div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</li></ol> |

Station Present Test (also called Ringing Application Test) (#48)

This test provides a burst of ringing current to the terminal equipment and detects that current flows. This test is to ascertain whether or not terminal equipment is connected to the port.

This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen. However, on some releases of the software, this action disables Tests #6, #47, and #35 as well as Test #48.

Table 10-31. TEST #48 Station Present Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                      |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | <p>System resources required to run this test were not available. The port may be busy with a valid call.</p> <p>Use the <b>display port PCSSpp</b> to determine the station's extension. Enter <b>status station</b> extension to determine the service state of the port. If the port is in use, it will be unavailable for certain tests. Wait until the port is idle before retesting.</p> <ol style="list-style-type: none"><li>1. If the port is idle, retry the command at 1-minute intervals up to 5 times.</li><li>2. Check for phone left off-hook or for wiring problems.</li></ol>                                                                                                                                                                                                                         |
| 1004       | ABORT       | <p>System resources required to run this test are not available. The port may be busy with a valid call. Use the <b>display port PCSSpp</b> command to determine the station extension. Use the <b>status station</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort and the port is not in use, escalate the problem.</li></ol> |
| 1005       | ABORT       | <p>The test was aborted due to a configuration problem. This code will result under either of the following conditions:</p> <ol style="list-style-type: none"><li>1. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).</li><li>2. The circuit pack is one of the following:<ul style="list-style-type: none"><li>— TN742 vintages 13,14 and 15</li><li>— TN769 vintages 3,4 and 5</li></ul></li></ol>                                                                                                                                                                                                                                                                                                  |
| 1008       | ABORT       | <p>Could not allocate a ringing circuit for one of the following reasons:</p> <ul style="list-style-type: none"><li>■ All the ringing circuits are in use, or</li><li>■ The ringing generator is defective, or</li><li>■ It is not wired correctly.</li></ul> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for Test #48 on other circuit packs as well, then the ringing generator may be defective or not wired correctly. If it does not occur on other ports, then that circuit pack is currently using all four ringing phases.</li></ol>                                                                                             |

Table 10-31. TEST #48 Station Present Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1018       | ABORT       | <p>The test was disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing).</p> <p>1. To enable the test for a particular station, enter <b>change station extension</b> and set the 'Test?' field on the 'Station Form' to 'y.'</p>                                                                                                                                                                                                                                                                                                                                                                                        |
| 2000       | ABORT       | <p>Response to the test request was not received within the allowable time period.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2100       | ABORT       | <p>System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a tone-clock problem). The tone-clock and tone detectors could be having a communication problem, for example, the companding modes could be out of synchronization.</p> <p>1. Retry the command at 1-minute intervals a maximum of 5 times.</p>                                                                                                                                                                                                                                                                                                                                |
|            | FAIL        | <p>The terminal equipment is not connected to the circuit pack or the ringing generator may have failed.</p> <p>1. Remotely test the equipment.</p> <p>2. If the test fails again, look for RING-GEN errors in the error log. If present, refer to the RING-GEN (analog ring generator) Maintenance documentation.</p> <p>3. Check all of the wiring between the station equipment and the switch. Then, run the test again.</p> <p>4. If the test still fails, the set may be defective. Check the set, and replace it, if necessary.</p> <p>5. Some terminal equipment (such as a modem) could fail even when it is connected properly. If this is the case, disable the test using the <b>change station extension</b> command (enter 'n' into the 'Test' field). Note that this action also disables tests 6, 7, 161, and 35 on this port.</p> |
|            | PASS        | <p>The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located far from the switch (that is, it is off-premises). User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises.</p> <p> <b>NOTE:</b></p> <p>This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 circuit packs prior to Vintage 6.</p>                                                                                                                                                                  |

Table 10-31. TEST #48 Station Present Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</li></ol> |

# ANN-BD (Announcement Circuit Pack)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO           |
|------------------------|-------------|-------------------------------------|---------------------------|
| ANN-BD                 | MINOR       | test board PCSS I                   | Announcement Circuit Pack |
| ANN-BD                 | WRN         | test board PCSS I                   | Announcement Circuit Pack |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

The TN750 Announcement circuit pack is a service circuit which provides a DEFINITY Generic 3 customer with an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (for example, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. In addition to the 16 Announcement Ports, the Announcement circuit pack also has one Data Line Circuit Port (port 17). The Data Line Circuit Port is used for uploading/downloading the announcement memory to/from the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2]. If there are any errors associated with port 17, refer to "DAT-LINE (Data Line)" Maintenance documentation. If there are any errors associated with any other port, refer to "ANN-PT (Announcement Port)" Maintenance documentation.

 **NOTE:**

TN750C is required if your system will have multiple announcement boards. To use multiple announcement boards, you must have G3V4 software, and at least one TN750C (up to ten are allowed). Only one TN750A/B may be present in the system when a TN750C is used. The announcements from a TN750A/B can be saved and restored to a TN750C — but once the announcements are recorded onto a TN750C, they are not backward compatible with the TN750A/B.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack and communicates with the switch via the control channel on the TDM Bus. The second processor, or Speech Processor (SP), controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

## General Notes

---

Here are a few **very important** general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, **especially if the circuit pack needs to be replaced.**

1. The Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power*. For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always best to try to reset the circuit pack via the **reset board PCSS** command first. If that does not work, replace the circuit pack. **Announcements are preserved through a software reset, but they are lost when the circuit pack is reseated.**
2. If a customer has announcements on the Announcement circuit pack  cannot be rerecorded easily, then announcements must be saved to the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] to ensure that they are not lost. This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the circuit pack is in proper working order (see Note).

### NOTE:

Unlike translations, announcements are NEVER automatically saved to the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2].

3. The administration terminal **save announcements** command replaces the announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] the Announcement circuit pack speech memory. Care must be taken not to mistakenly enter this command and, as a result, destroy a valid file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2].
4. The **restore announcements** command replaces the Announcement circuit pack speech memory with the announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2]. Care must be taken not to mistakenly enter this command, destroying valid speech memory (especially if the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] does not have a valid announcement file on it).
5. Whenever the Announcement circuit pack is replaced, announcements must always be rerecorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the pack.
6. If announcement speech memory is corrupted, announcements should not be saved [that is, if the Announcement Checksum Test (#209) fails, or if the speech sounds corrupted on playback]. This can ruin a good announcement file on the system tape [G3iV1.1-286] or memory card

[G3sV2, G3iV2-386, G3vsV2] and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2], announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).

7. Due to a hardware fault in the TN750 announcement board, the following sequence of events may cause the announcement file to become corrupted and unusable:
  - Fill the board with recorded announcements.
  - Delete the last few announcements recorded.
  - Re-record the announcements deleted.

If the announcement file becomes corrupted, the only solution is to re-record all announcements. To do this, follow these steps:

- a. Remove the announcement board.
- b. Remove the tape cartridge from the tape drive. Do this so that announcements are not automatically restored from tape.
- c. Re-insert the announcement board.
- d. Re-record all announcements.
- e. Insert the tape cartridge in the tape drive.
- f. Issue the save announcements command to save all the announcements on the tape.

This hardware fault is fixed in the TN750B announcement board. However, the TN750B board will not automatically correct an announcement file which has previously been corrupted by a TN750 board. The only way to correct an announcement file corrupted by the TN750 board is to follow the steps above.

## **Announcement Administration**

---

A brief description of the integrated announcement administration is given here to aid in troubleshooting the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to the following manuals:

1. *DEFINITY Communications System Generic 3 Implementation*, 555-230-653
2. *DEFINITY Communications System Generic 1 and Generic 3 System Management*, 555-230-500

3. *DEFINITY Communications System Generic 3 V2 Traffic Reports*, 555-230-511
4. *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations*, 555-230-701

## **Announcement Session**

---

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate Feature Access Code (FAC), administered as Announcement access code on the FACs form. Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted, or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press 2. To delete an announcement, press 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

## **Uploading/Downloading Announcements**

---

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] with the administration terminal **save announcements** command. Likewise, integrated announcements can be downloaded to the Announcement circuit pack with the **restore announcements** command. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a tape cartridge to be in the system's tape drive (must not be write-protected) or a memory card (must not be write-protected). These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads and/or downloads take between 30 and 45 minutes.

The system **automatically** tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

1. An announcement is recorded within 10 minutes of circuit pack insertion.
2. An announcement download is invoked sooner with the administration terminal **restore announcements** command.
3. No announcement and/or NETCON data module is administered.
4. Either the announcement data module is busy or all the administered NETCON data modules are busy.

5. No tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] is in the system.
6. The tape or memory card in the system does not have a valid announcement file saved on it.

 **NOTE:**

Unlike translations, there is no provision in the Generic 3 system for automatically saving announcements to the system tape or memory card.

Hardware Error Log Entries and Test to Clear Values

Table 10-32. Announcement Circuit Pack Error Log Entries

| Error Type     | Aux Data | Associated Test                         | Alarm Level (See WARNING message below) | On/Off Board | Test to Clear Value    |
|----------------|----------|-----------------------------------------|-----------------------------------------|--------------|------------------------|
| 0 <sup>1</sup> | 0        | Any                                     | Any                                     | Any          | test board PCSS sh r 1 |
| 1(a)           | 0        | Circuit pack removed or SAKI Test (#53) | MINOR                                   | ON           |                        |
| 2(p)           |          | None                                    |                                         |              |                        |
| 14(b)          | 1 to 64  | Announcement Checksum Test (#209)       |                                         |              |                        |
| 18             | 0        | busyout board PCSS                      | WARNING                                 | OFF          | release board PCSS     |

Table 32-1. Announcement Circuit Pack Error Log Entries — Continued

| Error Type  | Aux Data  | Associated Test                       | Alarm Level (See WARNING message below) | On/Off Board | Test to Clear Value    |
|-------------|-----------|---------------------------------------|-----------------------------------------|--------------|------------------------|
| 1538(k)     | Any       | None                                  | MINOR                                   | ON           |                        |
| 1793        |           | Angel-SP Handshake Test (#208)        | MINOR                                   | ON           | test board PCSS l r 3  |
|             | 17680     | In-line Error                         |                                         |              |                        |
| 2049(l) (m) |           | Clock Match Inquiry Test (#212)       | MINOR                                   | ON           | test board PCSS sh r 3 |
|             | 17674     | In-line Error                         |                                         |              |                        |
| 2305        |           | 140AY Loop Around Test (#210)         | MINOR                                   | ON           | test board PCSS sh r 3 |
| 2561        |           | Super Frame Match Inquiry Test (#211) | MINOR                                   | ON           | test board PCSS sh r 3 |
|             | 17676     | In-line Error                         |                                         |              |                        |
| 2817(l)     |           | Announcement Checksum Test (#209)     | MINOR                                   | ON           | test board PCSS sh r 3 |
|             | 17682     | In-line Error                         |                                         |              |                        |
|             | 17699 (m) | In-line Error                         |                                         |              |                        |
| 3840(n)     | Any       | None                                  |                                         |              |                        |
| 3999(o)     | Any       | None                                  |                                         |              |                        |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

 **WARNING:**

All alarms are upgraded to MAJOR when the BASE Tone Generator is set to 12. (France).

Notes:

- a. Error Type 1— This error indicates the circuit pack totally stopped functioning or it was physically removed from the system.

 **NOTE:**

The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, follow the instructions for "Red (alarm)" in the "Control and Port Circuit Pack Status LEDs" section in Chapter 7, "LED Interpretation".

 **NOTE:**

The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

 **WARNING:**

*Reseating and/or replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.*

- b. Error Type 14—Whenever the Announcement Checksum Test (#209) fails, this error is logged. The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by the **display announcement** command. This error only appears in the Error Log in conjunction with Error Type 2817. Follow the procedures for Error Type 2817 to troubleshoot Error Type 14.
- c. Error Type 23—The circuit pack has been logically administered but not physically installed. The alarm is cleared when the circuit pack is installed.
- d. Error Type 125—A wrong circuit pack is inserted in the slot where this circuit pack is logically administered. To resolve this problem, either remove the wrong circuit pack and insert the logically administered circuit pack OR use the **change circuit-pack** command to readminister this slot to match the circuit pack inserted.
-  Error Type 170—Announcement board is not allowed in slot A03 for a system with Enhanced SCC cabinet. The red led of announcement board is turned on and the error message "Announcement board is not allowed in slot A03" is shown on SAT when **test/busyout/release board A03** commands are entered. The announcement board must be removed and inserted into a different slot.
- f. Error Type 217 and 267—Indicate that there is more than one TN750 Announcement circuit pack inserted in the system. Remove the alarmed circuit pack..
- g. Error Type 257—This error indicates transient communication problems with this circuit pack. This error is not service-affecting and no action is required.

- h. Error Type 513—This error, when reported with Aux Data in the range of 4352 to 4358, indicates the circuit pack has reported a hardware failure on the circuit pack. The circuit pack should be replaced.

**WARNING:**

*Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.*

- i. Error Type 1025—This error is not service-affecting and no action is required.
- j. Error Type 1281—The SP found a fault in the speech main memory (SMM) (that is, it found one or more faulty memory locations). Whenever this error is logged, error 2817 is also logged [see Note (k)], which causes the maintenance system to run the Announcement Checksum Test (#209) to determine if the bad memory location was being used by an announcement.
- k. Error Type 1538—The hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:
  - 1. The tests run on the ports of this circuit pack are returning with a NO-BOARD.
  - 2. A busyout/release of the circuit pack has no effect on test results.
  - 3. A **list configuration** command shows that the circuit pack and ports are properly installed.

The system tries to restore the circuit pack within 15 minutes. If the error recurs after 15 minutes, replace the circuit pack. (Refer to Chapter 5, "Routine Maintenance Procedures".)

- l. Error Type 2049 and 2817—These errors are logged in conjunction with Error Type 1281, Aux Data 17699. Since that error [see Note (j)] means that a defective speech memory location was found, the announcement checksum error is also logged. This causes the Announcement Checksum Test (#209) to run, which determines if the defective memory location has corrupted any recorded announcements. If the Checksum Test passes, the faulty memory location is currently not being used, and the SP marks the location as faulty to ensure that future announcements do not attempt to use it.

**NOTE:**

As memory locations are marked faulty, the amount of available memory decreases, which decreases the total amount of announcement time available on the circuit pack.

- m. Error Type 2049—A transient error that does not cause an alarm can occasionally occur during a SPE, TDM BUS, or Tone Clock interchange. It is possible for a marginal Tone-Clock circuit pack to cause this error

against the ANN-BD without alarming the TONE-BD. If this error occurs again, replacing the Tone-Clock circuit pack may clear up this error. See the FAIL case in the Clock Match Inquiry Test (#212).

- n. Error Type 3840— This error is not service-affecting and no action is required.
- o. Error type 3999— Indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.
- p. Error Type 2—Check the Class of Restriction (COR) administered for the Data Line extension assigned to the TN750 for uploading and downloading announcements. The extension can be found by using **list data-module**.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in [Table 10-33](#) when inspecting errors in the system. By clearing error codes associated with the *Control Channel Loop Around Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Table 10-33. System Technician-Demanded Tests: ANN-BD

| Order of Investigation                               | Short Test Sequence | Long Test Sequence | Reset Board Sequence | D/ND <sup>1</sup> |
|------------------------------------------------------|---------------------|--------------------|----------------------|-------------------|
| Control Channel Loop Around Test (#52) (a)           |                     | X                  |                      | ND                |
| Angel-Speech Processor (SP) Handshake Test (#208)    |                     | X                  |                      | ND                |
| Clock Match Inquiry (#212)                           | X                   | X                  |                      | ND                |
| Super Frame Match Inquiry (#211)                     | X                   | X                  |                      | ND                |
| 140AY Loop Around Test (#210)                        | X                   | X                  |                      | ND                |
| Announcement Checksum Test (#209)                    | X                   | X                  |                      | ND                |
| Network Processor Element (NPE) Audit Test (#50) (a) |                     | X                  |                      | ND                |

Table 10-33. System Technician-Demanded Tests: ANN-BD — Continued

| Order of Investigation | Short Test Sequence | Long Test Sequence | Reset Board Sequence | D/ND <sup>1</sup> |
|------------------------|---------------------|--------------------|----------------------|-------------------|
| SAKI Test (#53) (a)    |                     |                    | X                    | D                 |

1. D = Destructive, ND = Non-destructive

- Note:
- a. For a complete description of these tests, refer to the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation.

Angel-Speech Processor (SP) Handshake Test (#208)

This test checks the integrity of the communication link between the two processors on the Announcement circuit pack. Failure of this test indicates that the Speech Processor is insane and **results in the loss of all integrated announcements on the circuit pack.**

Table 10-34. TEST #208 Angel-Speech Processor (SP) Handshake Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                      |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2000       | ABORT       | Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type. |
| 2100       | ABORT       | Could not allocate the necessary system resources to run this test.                                                                                                                              |
|            | ABORT       | Internal System Error.<br>1. Retry the command at one-minute intervals a maximum of five times.                                                                                                  |

Table 10-34. TEST #208 Angel-Speech Processor (SP) Handshake Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL        | <p>Test failed. Circuit pack cannot be used. <b>Announcement speech memory is cleared when this test fails. Therefore, when the problem has been resolved, announcements must be rerecorded or downloaded to the circuit pack.</b> Refer to "General Notes" near the beginning of this Maintenance documentation.</p> <ol style="list-style-type: none"><li>1. Reset the circuit pack via the <b>reset board PCSS</b> command and then run this test again. If the test continues to fail, replace the circuit pack and then run this test again.</li><li>2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack <b>even if Step 1 works</b>.</li></ol> <p> <b>WARNING:</b><br/><i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance documentation.</i></p> |
|            | PASS        | <p>The communications link between the two processors on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Announcement Checksum Test (#209)

Associated with every recorded announcement is a checksum. In this test, the SP checks a stored global checksum covering all recorded announcements against a calculated one and returns the results to the maintenance system. If the global checksum failed, maintenance requests the SP to check each individual announcement's checksum.

If the test fails, then it returns the total number of defective announcements found. In addition, associated with each failure is an error in the Error Log (Error Type 14). The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by the **display announcement** command.

Table 10-35. TEST #209 Announcement Checksum Test

| Error Code | Test Result    | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 10-35. TEST #209 Announcement Checksum Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0-256      | FAIL        | <p>Test failed. The error code indicates the total number of defective announcements that were found.</p> <p>When TEST #209 fails with error code 0, the Global Checksum failed on the board, but no individual Checksum failed.</p> <p> <b>NOTE:</b></p> <p>Since the announcements are recorded digitally, it is possible for the Announcement Checksum Test to <i>fail</i> but still have all the announcements sound uncorrupted. When an individual announcement fails the Checksum Test, always listen to the announcement first before taking any action (an announcement can be played back by dialing the announcement extension associated with the announcement number). If the announcement sounds corrupted, then rerecord it or delete it.</p> <p></p> <ol style="list-style-type: none"><li>1. Look in the Error Log to determine the number of the first defective announcement. Play back the announcement. If the announcement sounds defective, rerecord it or delete it. If the error code was greater than one (indicating that there is more than one defective announcement), run this test again and repeat this step.</li><li>2. If after deleting and rerecording all defective announcements, the checksum test still fails, reset the circuit pack using the <b>reset board PCSS</b> command and run this test again.</li><li>3. If the test still continues to fail, reseal the circuit pack and restore all announcements with an appropriate time estimate (for example, 40 minutes.) Then rerecord the lost announcements (that is, those recorded since the last save operation) and run this test again.</li><li>4. If the test still continues to fail, replace the circuit pack, and run this test again.</li></ol> <p> <b>WARNING:</b></p> <p><i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.</i></p> |
|            | PASS        | <p>All recorded announcements checksum correctly, indicating that the speech main memory is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement do not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yield the following abort codes:
  - Ports 1 AND 9 abort Test #206 with code 1024
  - Ports 1 AND 9 abort Test #205 with code 2000
  - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:  
Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

### 140AY Loop Around Test (#210)

This test checks the integrity of the record channel on the Announcement circuit pack (Announcement Port 1). The main function of the 140AY device is to accept Pulse Code Modulation (PCM)/Adaptive Differential Pulse Code Modulation (ADPCM) samples and compress/expand the samples using ADPCM. This test connects a Tone Generator to one port (Announcement Port 1, the recording port), and a Tone Detector to another port (Announcement Port 9). A tone is generated by the Tone Generator on the first port and looped through the 140AY device to the second port. The Tone Detector then responds with a tone present/absent message. The 140AY Loop Around Test is repeated at three different speech compression rates.

Since this test involves sending a tone through two different ports, the Playback Speech Memory Array (PSMA) Test (#206) [see ANN-PT (Announcement Port) Maintenance documentation for a description of this test] is run on the two ports first to make sure that they are working properly.

Table 10-36. TEST #210 140AY Loop Around Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-3        | ABORT       | Response to the test request was not received within the allowable time period. The error code indicates at which speech compression rate the test aborted (one being the first rate tested, three being the last).<br><br>1. Retry the command at one-minute intervals a maximum of five times.                                                                                                                                                                                                                                                       |
| 10         | ABORT       | The PSMA Test (#206) failed on Announcement Port 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 90         | ABORT       | The PSMA Test (#206) failed on Announcement Port 9.<br><br>1. Refer to"ANN-PT (Announcement Port)" Maintenance documentation, Test #206.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 1000       | ABORT       | System resources required to run this test are not available. This test needs Announcement Ports 1 and 9 to run. One of the ports may be in use on a valid call.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort and Ports 1 and 9 are not in use, escalate the problem.                                                                                                                                                                                                         |
| 1002       | ABORT       | The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors.<br><br>1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times.                                                                                                                                        |
| 1003       | ABORT       | The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service.<br><br>1. Look for TTR-LEV errors in the Error Log. If present, refer to the "TTR-LEV (TTR Level)" Maintenance documentation.<br><br>2. Look for TONE-PT errors in the Error Log. If present, refer to the "TONE-PT (Tone Generator)" Maintenance documentation.<br><br>3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. |

Table 10-36. TEST #210 140AY Loop Around Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-3        | FAIL        | <p>Test failed. The error code indicates at which speech compression rate the test actually failed (one being the first rate tested, three being the last).</p> <ol style="list-style-type: none"><li>1. Reset the circuit pack via the <b>reset board PCSS</b> command and then run this test again. If the test still fails, replace the circuit pack (see Warning) and run this test again.</li><li>2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning).</li></ol> <p> <b>WARNING:</b><br/><i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.</i></p> |
|            | PASS        | <p>The record channel on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.
- If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.
- If the circuit pack is locked into this state, the following symptoms are observed:
1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
  2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
    - Ports 1 AND 9 abort Test #206 with code 1024
    - Ports 1 AND 9 abort Test #205 with code 2000
    - Board level Tests #209 and #210 abort with code 1024

3. The **save/restore announcements** command times out with:
- Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

**Super Frame Match Inquiry Test (#211)**

The super frame is a means by which the SP synchronizes with the 140AY device on the Announcement circuit pack. If the super frame is not synchronized, the SP is not able to properly process record/playback requests. Both the SP and the hardware generate a super frame pulse. When these two pulses are out of synch, the SP sets a flag to indicate the mismatch. When this test is run, the state of this flag is returned.

**Table 10-37. TEST #211 Super Frame Match Inquiry**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                      |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2000       | ABORT       | Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type. |
| 2100       | ABORT       | Could not allocate the necessary system resources to run this test.                                                                                                                              |
|            | ABORT       | Internal System Error.<br><br>1. Retry the command at one-minute intervals a maximum of five times.                                                                                              |

If the test continues to fail, replace the circuit pack (see Warning).</li><li>If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning).</li></ol> <p> <b>WARNING:</b><br/><i>Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.</i></p> |
|            | PASS        | <p>The SP can properly process record/playback requests. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Clock Match Inquiry Test (#212)

This test is supported to determine the state of the clock generation circuitry on the Announcement circuit pack. This circuitry is used for controlling various pieces of the hardware, like the 140AY device. It is also used to synchronize the Announcement circuit pack with the clock that is on the backplane.

See "General Notes" near the beginning of this Maintenance procedure.</i></p> <p>4. If there are recurring alarms on this circuit pack caused by this test failing, replace the ANN-BD even if the previous steps were successful.</p> <p> <b>WARNING:</b><br/><i>Replacing the TONE-BD causes a standard system PPN to perform a COLD 2 reset or an EPN to reset. Replacing the ANN-BD results in loss of integrated announcements. See the "General Notes" section near the beginning of this Maintenance procedure.</i></p> |
|            | PASS              | <p>Announcement record/playbacks should have clear sound quality. User-reported troubles on this circuit pack should be investigated using other circuit packs and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## ANN-PT (Announcement Port)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO   |
|------------------------|-------------|-------------------------------------|-------------------|
| ANN-PT                 | MINOR       | test port PCSSpp I                  | Announcement Port |
| ANN-PT                 | WRN         | test port PCSSpp I                  | Announcement Port |

- 
1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

The TN750 Announcement circuit pack is a service circuit pack that provides a customer with an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (that is, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. In addition to the 16 Announcement Ports, the Announcement circuit pack also has one Data Line Circuit Port (Port 17). The Data Line Circuit Port is used for uploading/downloading the announcement memory to/from the system tape. If there are any errors associated with Port 17, refer to "DAT-LINE (Data Line)" Maintenance documentation. If there are any errors associated with the circuit pack, refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack, and communicates with the switch via the control channel on the TDM Bus. The second processor, or SP, controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

### General Notes

Here are a few **very important** general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, **especially if the circuit pack needs to be replaced**.

- 
1. The Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power*. For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always better to try to reset the circuit pack via the **reset board PCSS** command first and, if that

does not work, then try to reseat it. **Announcements are preserved through a software reset, but they are lost when the circuit pack is resealed.**

2. **If a customer has announcements on the Announcement circuit pack that cannot be re-recorded easily, then announcements must be saved on the system tape to ensure that they are not lost.** This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the pack is in proper working order (see Note).

This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the pack is in proper working order (see Note).

 **NOTE:**

Unlike translations, announcements are NEVER automatically saved to the system tape.

3. The administration terminal **save announcements** command replaces the announcement file on tape with the Announcement circuit pack speech memory. Care must be taken not to mistakenly enter this command, thereby destroying a valid file on tape.
4. The terminal **restore announcements** command replaces the Announcement circuit pack speech memory with the announcement file on the system tape. Care must be taken not to mistakenly enter this command, thereby destroying valid speech memory (especially if the system tape does not have a valid announcement file on it).
5. Whenever the Announcement circuit pack is replaced, announcements must always be re-recorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the circuit pack.
6. If announcement speech memory is corrupted, **announcements should not be saved**, that is, if the Announcement Checksum Test (#209) fails or if the speech sounds corrupted on playback. This can ruin a good announcement file on tape and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file on tape, then announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).
7. Although Announcement Port 5 and Data Line Circuit Port 17 on the Announcement circuit pack are logically two separate ports, they are physically the same port. Therefore, if one of the ports is in use, the other one will be busy. Also, if Announcement Port 5 is out-of-service, the Data Line Circuit Port is taken out-of-service. However, if the Data Line Circuit Port is out-of-service, the Announcement Port remains in-service.

## **Announcement Administration**

---

A brief description of the integrated announcement administration is given here to aid in the troubleshooting of the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to the following manuals:

1. *DEFINITY Communications System Generic 3 Implementation*, 555-230-653
2. *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations*, 555-230-701
3. *DEFINITY Communications System Generic 1 and Generic 3 System Management*, 555-230-500
4. *DEFINITY Communications System Generic 3 V2 Traffic Reports*, 555-230-511

## **Announcement Session**

---

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate FAC (administered as Announcement access code on the FACs form). Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press station keypad digit 2. To delete an announcement, press station keypad digit 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

## **Uploading/Downloading Announcements**

---

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the system tape with the administration terminal **save announcements** commands. Similarly, integrated announcements can be downloaded to the Announcement circuit pack with the administration terminal **restore announcements** command. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a tape cartridge to be in the system's tape drive (must not be write-protected).

These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads/downloads take between 30 and 45 minutes.

The system **automatically** tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

1. An announcement is recorded within 10 minutes of circuit pack insertion.
2. An announcement download is invoked sooner with the administration terminal **restore announcements** command.
3. There is no announcement and/or NETCON data module administered.
4. Either the announcement data module is busy or all the administered NETCON data modules are busy.
5. There is no tape in the system.
6. The tape in the system does not have a valid announcement file saved on it.

**NOTE:**

Unlike translations, there is no provision in the system for automatically saving announcements to the system tape.

Hardware Error Log Entries and Test to Clear Values

| Announcement Port Error Log Entries |          |                                                        |             |              |                         |
|-------------------------------------|----------|--------------------------------------------------------|-------------|--------------|-------------------------|

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- b. This error is logged and the port is alarmed when an alarm is raised on the Announcement circuit pack because of a faulty condition with a common circuit pack resource. Any one of the following alarmed errors on the Announcement circuit pack causes this error to be logged against the Announcement Port: 1793, 2049, 2305, 2561. Follow the ANN-BD (Announcement Circuit Pack) Maintenance documentation to resolve these alarms. When the corresponding circuit pack alarm is cleared, this alarm clears.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Channel Administration Memory Array (CAMA) Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                                 | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------|---------------------|--------------------|-------------------|
| Channel Administration Memory Array (CAMA) Test (#205) |                     | X                  | ND                |
| Playback Speech Memory Array (PSMA) Test (#206)        | X                   | X                  | ND                |
| 140AY Channel Sanity Inquiry Test (#222)               | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Channel Administration Memory Array (CAMA)  
Test (#205)

This test is a memory device that stores information used to control the 140AY device. The Angel asynchronously feeds the CAMA with the control information. During the CAMA test, the Angel writes patterns into the CAMA, reads them back, and verifies that they match. If the patterns do not match, the test fails. This test is run periodically by the switch maintenance and by the Announcement circuit pack in the background.

|            | FAIL        | <p>Test failed. Announcements played back on this port may sound corrupted.</p> <ol style="list-style-type: none"><li>1. Reset the circuit pack via the <b>reset board PCSS</b> command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning).</li><li>2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning).</li></ol> <p> <b>WARNING:</b><br/><i>Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.</i></p> |
|            | PASS        | <p>This test verifies that the Angel processor can properly set up this port for playbacks. User-reported troubles on this circuit pack should be investigated using other port and circuit pack tests. (Refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation for a description of the circuit pack tests.)</p>                                                                                                                                                                                                                                                                                                                                                                                            |

Notes:

a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
  - Ports 1 AND 9 abort Test #206 with code 1024
  - Ports 1 AND 9 abort Test #205 with code 2000
  - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

**Error encountered, can't complete request**

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

## **Playback Speech Memory Array (PSMA) Test (#206)**

---

The PSMA test checks the integrity of a playback channel's interface to the speech memory and the TDM Bus. The SP has an internal buffer that contains a specific 256-byte sequence. During this test, the byte sequence is "played" through the 140AY device onto the TDM Bus. A General Purpose Tone Detector is used to confirm that the proper sequence was played. **This test is very important.** It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

Table 10-40. TEST #206 Playback Speech Memory Array  
(PSMA) Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                        |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | This port can cleanly play announcements. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation for a description of the circuit pack tests. |

Notes:

- a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

- 1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
- 2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
  - Ports 1 and 9 abort Test #206 with code 1024
  - Ports 1 and 9 abort Test #205 with code 2000
  - Board level Tests #209 and #210 abort with code 1024
- 3. The **save/restore announcements** command times out with:

**Error encountered, can't complete request**

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command

- release circuit pack using the **release board PCSS** command

140AY Channel Sanity Inquiry Test (#222)

The Angel keeps a sanity status bit for each of the 16 channels on the 140AY device. This test queries the Angel to determine the status for a particular channel. If a channel is insane, that implies that announcements cannot be played back on that channel.

Table 10-41. TEST #222 140AY Channel Sanity Inquiry Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|            | PASS        | Announcements can be played back over this port. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to the "ANN-BD (Announcement Circuit Pack)" Maintenance documentation for a description of the circuit pack tests. |

## ANNOUNCE (Announce)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run | Full Name of MO |
|------------------------|-------------|------------------------|-----------------|
| ANNOUNCE               | none        | none                   | ANNOUNCEMENT    |

The ANNOUNCE MO logs an error in the hardware error log if at least one of the following is true:

- The **save announcements** or **restore announcements** command does not complete successfully, or the
- System fails to restore announcements from the memory card [386 system] or tape [286 system] at boot time.

Figure 10-4 shows the connection of the Announcement Circuit Pack to the system. To save or restore announcements, an ANNOUNCEMENT Data Extension must be administered, and at least one DATA-CHL (Network Control Data Channel) must be in the in-service/idle state.

**Figure 10-4. Connection of Announcement Circuit Pack to the System**

- Notes:
- a. Error occurred while saving announcements. (See Table 10-42 in the next section for an explanation of Aux Data and for recommended repair actions.)
  - b. Error occurred while saving announcements to the standby SPE. (See Table 10-42 in the next section for an explanation of Aux Data and for recommended repair actions.)
  - c. User pressed cancel while announcements were being saved by the active PE.
  - d. User pressed cancel while announcements were being saved by the standby PE.
  - e. Error occurred while restoring announcements. (See Table 10-42 in the next section for an explanation of Aux Data and for recommended repair actions.)
  - f. The port field for this error contained the active PE complex when the error occurred.

# ASAI-BD (Multi-Application Platform Board)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO |
|------------------------|-------------|-------------------------------------|-----------------|
| ASAI-BD                | MIN         | test board PCSS sh                  | ASAI-BD         |
| ASAI-BD                | WRN         | test board PCSS sh                  | ASAI-BD         |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, or D); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., and so forth).

Maintenance testing of the common circuit pack is handled by on-board firmware and SPE-controlled tests. Maintenance software queries the firmware for error and alarm information, status, and test results. Firmware automatically reports error conditions that result in SPE-controlled testing.

For MAPD board insertion, the switch makes an additional board query if any of the following circuit packs are inserted:

| Circuit Pack | Vintage              |
|--------------|----------------------|
| TN754        | 49                   |
| TN556        | 49,<br>80 or greater |
| TN800        | any                  |

For any of the above initial board uplinks, the switch queries the board for administration data, as well as reporting the switch software release and the system type.

For the native mode, the response to the board query downlink messages consists of several CCMS uplink messages that identify the true board code, vintage, suffix, emulation type, and number of reserved slots needed.

-  **NOTE:**
- Refer to LAN-BD Maintenance documentation for circuit pack level errors. See also ASAI-PT/ASAI-EPT (BRI Line) maintenance documentation for related line information. See the following exceptions listed below:
- **Hyperactivity:** currently, the common circuit pack is considered "hyperactive" if the Service Dispatcher receives 200 uplink messages from the circuit pack in a 10-second period. Since MAPD has 32 ports, the hyperactivity limit increases to 500 uplink

messages per 10 seconds. The switch issues an alarm when the limit reaches 400; when it reaches 500 up-link messages in 10 seconds, the board is taken out of service.

- LED use: the LED Control Message 038x requests the Angel to drive the red, yellow, and green LEDs on the face plate of a typical port board on or off. On the MAPD, only the red LED is controlled by this message. Yellow and green change requests received from the switch by the MAPD drive LCD behavior rather than LED behavior. The DEFINITY switch continues to send the same LED control messages to the MAPD that the DEFINITY switch currently sends to all other port boards. The MAPD handles proper interpretation of these messages. You should note that the PC on the MAPD and the switch itself control the LEDs and the LCD on the MAPD.
- Port Administration: in Administration Without Hardware (AWOH), the switch allows administration of up to 8 ports in any of the first 12 ports. If the port type later reported by the board does not match the existing type, the switch assumes it to be a MAPD board with a different configuration and rejects the board.

**NOTE:**

Refer to the LAN-BD documentation for circuit pack level errors. For related information, see ASAI-PT and ASAI-EPT maintenance documentation.

# ASAI-EPT

| MO Name (in Alarm Log) | Alarm Level        | Initial Command to Run | Full Name of MO |
|------------------------|--------------------|------------------------|-----------------|
| ASAI-EPT               | MAJOR <sup>1</sup> | test station extension | ASAI-Adjunct    |

1. The alarm level for ASAI adjuncts is administered using the **set options** command. The alarm level can be set independently for off-board and on-board alarms to WARNING, MINOR, or MAJOR for all ASAI adjuncts in the system.

The maintenance strategy for this endpoint MO is built on maintenance facilities offered in the Lucent ISDN-BRI protocol and in the ASAI adjuncts. Currently there are no facilities in the protocol that provide for maintenance of set data features.

The TN800 is a PC-based platform that allows interaction of multiple applications with DEFINITY at any time. DEFINITY Release 5 software (Native mode) supports emulation of three types of port MOs on this board. The type of ports to be emulated is defined by the applications running on the TN800.

⇒ **NOTE:**

If the TN800 is emulating BRI, the software/firmware supports a maximum of 12 ports, but only 8 of the 12 ports can be administered at any one time.

## Error Log Entries and Test to Clear Values

- 
- Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
  - Major alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

- 
- a. Errors of this type indicate violations of the ISDN-BRI signaling protocol. Timers associated with certain Layer 3 messages have expired before a required response was received. In the following table, the aux data column indicates which timer has just expired. For more information, refer to the Lucent ISDN-BRI Specification.

| Aux Data | Timer Type                                     |
|----------|------------------------------------------------|
| 2        | First T303 (SETUP timer)                       |
| 3        | Second T303 (SETUP timer)                      |
| 4        | T305 (DISConnect timer)                        |
| 5        | First T308 (RELease timer)                     |
| 6        | Second T308 (RELease timer)                    |
| 10       | T316 (REStart timer)                           |
| 12       | T309 (Layer 2 Failure timer)                   |
| 16       | TM100 (Management Information Message timer 1) |
| 17       | TM200 (Management Information Message timer 2) |
| 102      | TASAI (ASAI Routing Timer)                     |

The switch sent a message to an endpoint that did not respond in the allotted time. This may be due to failure of the point-to-point signaling link or because of a problem in the ASAI adjunct. To repair:

- Execute the **test station extension** command and perform the associated repair procedures for those tests.
- b. An endpoint is not responding to the service state query message sent to the adjunct or to the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or to the adjunct.

When this error occurs for an ASAI adjunct, the Aux Data field indicates the state of the ASAI link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

| Aux Data | ASAI Link State | Error                               |
|----------|-----------------|-------------------------------------|
| 102      | 13-restarting   | No response to RESTART message      |
| 104      | 13-restarting   | Invalid response to RESTART message |
| 152      | 13-restarted    | No response to Layer 3 query        |
| 154      | 13-restarted    | Invalid response to Layer 3 query   |
| 202      | 13-established  | No response to Layer 3 query        |
| 204      | 13-established  | Invalid response to Layer 3 query   |

See "status bri-port" in Chapter 8 for an explanation of the ASAI link states.

For ASAI or Lucent adjuncts, the switch queries the adjunct every two minutes. The Layer 3 Query Test is not executed for ASAI or Lucent adjuncts through a command issued from the management terminal. While alarmed for this error, the switch takes the associated port out-of-service for five seconds every 15 minutes. This action attempts to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or Lucent adjunct, the service technician should:

1. Execute the **test station extension** command and perform the associated repair procedures for those tests.
  2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.
- c. This error and associated warning alarm are logged against an ASAI endpoint when the adjunct has asked the switch to suspend maintenance on the ASAI endpoint. Busying out and releasing the ASAI station clears this alarm.
  - d. This error occurs when the endpoint sends more messages than the switch can handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.
  - e. This error occurs when the signaling link associated with the ASAI endpoint has too much link-establishment related traffic. This occurs if the signaling link is alternating between assigned and established states. If this problem persists, replace the endpoint.

- f. This error occurs when the ASAI-EPT message is not transmitted because the PKT-CTRL (packet control circuit pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI adjunct. Resolve the problem by following the repair procedures for the PKT-CTRL. If these attempts fail, re-engineering the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- g. The ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow-controlled. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI adjunct. Resolve the problem by following the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- h. This version of ASAI is not supported. Check the software version that is running on the ASAI adjunct.
- i. The adjunct identification is invalid. Check the vendor ID or software running on the ASAI adjunct.
- j. This occurs when the point-to-point signaling link to the endpoint goes down, except when the link goes down because either a system technician has busied out the PKT-CTRL or the PKT-BUS, or they have failed. This error raises an alarm against the endpoint or adjunct. Execute the **test station extension short** command and note the results of the Signaling Link Status Test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is re-established to the endpoint or adjunct.
- k. The switch software logs certain ASAI cause values. The cause value is determined from the following formulas:
  - If the error type is greater than 3712, then the ASAI cause value is equal to the error type minus 3712. The switch sent this value to the adjunct.
  - If the error type is less than 3712, then the ASAI cause value is equal to the error type minus 3584. The switch sent this value to the adjunct.

Table 10-44 contains a description of the various ASAI cause values and recommended system technician actions associated with the cause value. The ISDN-BRI Specification (AT&T PUB 801-802-100) contains further information. In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

- l. The switch software logs certain ASAI cause values. The cause value is determined from the following formula:
  - If the error type is greater than 3968, then the ASAI cause value is equal to the error type minus 3968. The switch sent this value to the endpoint.

- If the error type is less than 3968, then the ASAI cause code is equal to the error type minus 3840. The switch sent this value to the endpoint.

Table 10-44. ASAI Cause Values

| Code | Explanation                           | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | Unrecognized ASAI Protocol Operation. | <p>Requested ASAI protocol is not implemented by switch or adjunct. Aux data field of error log entry contains protocol identifier for unrecognized operation.</p> <ol style="list-style-type: none"><li>1. Consult switch and adjunct documentation to determine which set of operations is supported by switch and the adjunct. Adjunct administration turning off operations not implemented by the switch may resolve the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 34   | No circuit or channel available       | <p>A resource on the switch is unavailable for a call. For BRI endpoints, this cause value is not logged. For ASAI, this condition means that there are no available trunks for an outgoing call request.</p> <ol style="list-style-type: none"><li>1. Verify that the adjunct is administered to support the trunk capabilities of the switch.</li><li>2. Investigate trunk group status by issuing the <b>status trunk</b> command from the SAT or by requesting trunk group query(ies) from the adjunct.</li><li>3. Perform trunk diagnostic procedures outlined in this manual.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 40   | Resources not available.              | <p>No available internal resources to service switch or adjunct request. Exceeds system transaction capacity for adjunct or switch.</p> <ol style="list-style-type: none"><li>1. May require re-engineering of adjunct services.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 50   | Requested facility not subscribed     | <p>Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct.</p> <p>For BRI endpoints:</p> <ol style="list-style-type: none"><li>1. Verify the switch administration of endpoint using either the <b>display station</b> or <b>display data-module</b> commands.</li><li>2. If Step 1 does not resolve the problem, refer to the endpoint's service manual and verify administration on the endpoint.</li></ol> <p>For ASAI adjuncts:</p> <ol style="list-style-type: none"><li>1. Display the Customer Optional Features Form (administration screen) on the switch to determine which ASAI capabilities are turned on in the switch.</li><li>2. Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administered capabilities, then readminister the switch and/or the adjunct to establish a consistent set of desired capabilities on both the switch and the adjunct.</li></ol> |

Table 10-44. ASAI Cause Values — Continued

| Code | Explanation                               | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 58   | Bearer capability not presently available | Requested bearer capability is implemented, but not administered. No B-channel administered. See code 50 above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 63   | Service or option not available           | <p>Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resource. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct.</p> <p>1. Verify that no overlapping administration of switch resources (for example, requesting notifications on a single domain by multiple adjuncts attempting to control a single call) exists across all adjuncts connected to the switch. If overlaps exist, then re-administer the adjuncts to ensure that each adjunct is associated with a unique set of switch resources.</p> |
| 65   | Bearer service not implemented            | Requested service not implemented in switch or endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 69   | Requested facility not implemented        | <p>Requested service not supported in switch or endpoint.</p> <p>1. Consult switch and endpoint documentation to determine service support.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 79   | Service or option not implemented         | <p>Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct.</p> <p>1. Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Re-administration of the switch-administered capabilities (see Customer Optional Feature Form) or those of the adjunct may be necessary to correct the problem.</p>                                                                                                                                                                                                                                                    |
| 81   | Invalid CRV                               | <p>An invalid CRV was sent by the adjunct.</p> <p>1. This may indicate a CRV inconsistency between the switch and the adjunct. See the CallVisor protocol reference manual.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 87   | Internal switch audit                     | <p>There is an inconsistency in switch data records.</p> <p>1. There is no action needed, since the switch has corrected the data inconsistency.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

System Technician-Demanded Tests:  
Descriptions and Error Codes

When inspecting errors in the system, always investigate errors associated with the circuit pack and port first. Clearing these error codes first may also clear errors generated against the endpoint. When all circuit pack and port errors have been cleared, but errors still exist against the endpoint, investigate errors in the table below. By clearing error codes associated with the Signaling Link Status Test, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation            | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-----------------------------------|---------------------|--------------------|-------------------|
| Signaling Link Status Test (#626) | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

BRI Layer 3 Query Test (#629)

This test is not used by the ASAI-ADJ maintenance object. For information about this test, see BRI-SET in the maintenance documentation.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is "bound" to an endpoint and fails if the link is "not bound."

The definition of the term "bound" for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of "bound" for ASAI type of endpoint is:

- ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):

For endpoints of this type, the signaling link is "bound" when the link is connected at Layer 2 (L2 established).

Table 10-45. TEST #626 Signaling Link Status Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1139       | ABORT       | The Packet Bus in the port network is out-of-service.<br><br>1. Follow the repair procedures for the Packet Bus.<br><br>2. After completing Step 1, execute the <b>test port long PCSSpp</b> command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.                                                                                                                                                        |
| 1141       | ABORT       | The PKT-CTRL is out-of-service.<br><br>1. Refer to PKT-CTRL maintenance documentation.                                                                                                                                                                                                                                                                                                                                                             |
| 1144       | ABORT       | The PPN Packet Bus is out-of-service.<br><br>1. Follow the repair procedures for the Packet Bus in the PPN.<br><br>2. Execute the <b>test port long PCSSpp</b> command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.                                                                                                                                                                                      |
| 2012       | ABORT       | Internal system error                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2100       | ABORT       | Could not allocate the necessary system resources to run this test.<br><br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                                                                                                                                                                                                        |
| 1113       | FAIL        | The signaling link is not "bound" to the adjunct. For ASAI adjuncts this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified by administration, the link is only "unbound" from the endpoint when it is disconnected.<br><br>1. Execute the <b>status bri-port PCSSpp</b> command and refer to the associated procedures for this command contained in "BRI-PORT". |
|            | PASS        | The signaling link is connected at Layer 2 and "bound" to the ASAI adjunct.                                                                                                                                                                                                                                                                                                                                                                        |

# ASAI-PT

| MO Name (in Alarm Log) | Alarm Level          | Initial Command to Run <sup>1</sup> | Full Name of MO    |
|------------------------|----------------------|-------------------------------------|--------------------|
| ASAI-PT                | MAJOR <sup>2,3</sup> | test port PCSSpp I                  | ASAI ISDN BRI Port |
| ASAI-PT                | WARNING              | test port PCSSpp I                  | ASAI ISDN BRI Port |

- Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, or D); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., and so forth).
- The alarm level for ASAI adjunct ports may be administered using the **set options** command. The alarm level can be set independently for off-board and on-board alarms to WARNING, MINOR, or MAJOR for all ASAI adjunct ports in the system.
- All alarming for an ASAI adjunct and off-board alarming for an ASAI port is disabled if the ASAI adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI adjunct. Check the Hardware Error and Alarm Logs to see if the adjunct has disabled alarming.

Unless otherwise stated, all maintenance actions contained in this section apply to ASAI-PT and ISDN-BRI ports connected to ASAI adjuncts. This port type is administered as an ASAI-BD on the TN800 circuit pack.

The TN800 circuit pack is a PC-based platform that allows interaction of multiple applications with DEFINITY at any time. DEFINITY Release 5 software (Native mode) will support emulation of three types of port MOs on this board. The type of ports to be emulated are defined by the applications running on the TN800. The TN800 can support a maximum of 32 ports (time slots) at a time.

The TN800 connects to the switch through a single slot in the backplane, however its width is not limited to one slot. The number of slots occupied by the TN800 is supplied by the board during its insertion. The TN800 in Release 5 is 3 slots wide. The blank (reserve) slots are to the left of the functional slot.

In non-native mode the TN800 is recognized as TN556, TN2181, TN754, or TN746 based on the switch software and the application running on the TN800. In non-native mode only one type of port MOs will run at any time, and the port type depends on the application running on the TN800. If the TN800 fails diagnostics in non-native mode, the system's alarm and error logs would show a failure for the board type the TN800 is emulating.

Error Log Entries and Test to Clear Values

Table 10-46. ASAI-PT Port Error Log Entries

| Error Type     | Aux Data | Associated Test               | Alarm Level ASAI-PORT | On/Off Board | Test to Clear Value     |
|----------------|----------|-------------------------------|-----------------------|--------------|-------------------------|
| 0 <sup>1</sup> | 0        | Any                           | Any                   | Any          | test port PCSSpp sh r 1 |
| 1 (a)          | (a)      | Level 1 Status Inquiry (#621) | MAJ <sup>2</sup>      | OFF          | test port PCSSpp sh r 2 |
| 513 (b)        | 0        | none                          | (b)                   | ON           |                         |
| 1537 (c)       | 46210    | CRC Error Counter (#623)      | MAJ <sup>2</sup>      | OFF          |                         |
| 3841 (d)       | 46208    | None                          |                       |              |                         |
| 3844 (e)       | 46223    | None                          |                       |              |                         |
| 3845 (f)       |          | None                          |                       |              |                         |
| 3846 (g)       | TEI      | None                          |                       |              |                         |

Continued on next page

1.

Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2.

Major and Minor alarms may be downgraded to warning alarms based on the value used in the **set options** command.

Notes:

- a.

This error occurs when the Level 1 Status Inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. The aux data field contains one of the following values:

- Blank

This indicates that the Level 1 Status Inquiry failed.
- 32773

This is a message from the ASAI-Line circuit pack indicating Level 1 has been deactivated.

Refer to the repair procedures for Test #621.

- b.

The circuit pack is having problems transmitting data to the Packet Bus, thus affecting the conveyance of signalling information over D-channel. This error occurs when the Packet Bus transmit FIFO buffer overflows. This condition probably indicates a hardware problem as well. The ASAI-PORT alarm level is MAJOR with aux data 0. Use troubleshooting procedures for both on-board hardware problems and potential off-board Packet Bus problems.

- c. The port received an invalid frame over the D-channel. When the Cyclical Redundancy Check (CRC) errors exceed 5 within 15 minutes, the port is taken out of service for 5 seconds. If 5 more CRC errors are received within 15 minutes of the first set of 5 errors, the port is taken out of service for one minute. If 5 more CRC errors are received within 15 minutes of the last 5, the port is taken out of service for 15 minutes.
- This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source, or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.
- Check the wiring to the endpoints or the adjunct.
  - If the problem persists, replace the endpoints or adjuncts.
- d. This error occurs when a Layer 1 Transmission error is detected for the port. Run the Long Test Sequence and note the results of the Layer 1 Transmission Error Counter Test (#624).
- e. This error occurs when the circuit pack detects an overflow of its receive buffers. Run the Long Test Sequence and note the results of the Receive FIFO Overflow Counter Test (#625).
- f. This error occurs when the BRI Port Local LAN Looparound Test (#618) fails. Run the Long Test Sequence and note the results of Test (#618).
- g. The Terminal Endpoint Identifier (TEI) administered for the ASAI endpoint most likely does not match the TEI administered in the ASAI adjunct. Check the switch administration of the TEI against that of the adjunct, and make sure that both are using the same TEI.

**System Technician-Demanded Tests:**  
**Descriptions and Error Codes**

Always investigate tests in the order presented in the following tables when inspecting errors in the system. For example, by clearing error codes associated with the NPE Crosstalk Test, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                          | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-------------------------------------------------|---------------------|--------------------|-------------------|
| ASAI Port Local LAN Looparound Test (#618)      |                     | X                  | D                 |
| Level 1 Status Inquiry Test (#621)              | X                   | X                  | ND                |
| CRC Error Counter Test (#623)                   |                     | X                  | ND                |
| Layer 1 Transmission Error Counter Test (#624)  |                     | X                  | ND                |
| Receive FIFO Overflow Error Counter Test (#625) |                     | X                  | ND                |
| Clear Error Counters (#270)                     | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

**BRI Port Local LAN Looparound Test (#618)**

**This test is destructive.**

This test verifies the connectivity of a BRI port across the LAN Bus and executes only if the port is out-of-service. The test aborts if calls associated with the port are in-progress. Failures of this test indicate either on-board faults associated with the ASAI-PT hardware on the circuit pack or problems with the LAN Bus, which is used to form connectivity between the switch and the ASAI-PT.

The dotted lines in Figure 10-5 show how a Looparound Test is performed across the Packet Bus for the D-channel.

Level 1 Status Inquiry Test (#621)

This test determines the state of the transmission facility of a BRI port at the Level 1 (L1) or physical layer. L1 can be in one of two possible states: Activated or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI adjunct administered on this port. This test passes if the state of L1 is activated. This test also passes if software has taken this port out of service.

The Deactivated state indicates a problem with the ASAI circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ASAI port is placed in the out-of-service state, Level 1 is also put into the deactivated state. This could be due either to the system detecting a fault with the port or in response to a **busyout port PCSSpp** request.

Table 10-48. TEST #621 Level 1 Status Inquiry

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port's Layer 1 Transmission error counter maintained on the ASAI circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY Communications System Generic 1 and Generic 3i Wiring*, 555-204-111). It does not indicate a problem with the TN800 circuit pack. This test is useful for verifying the repair of the problem

|            | PASS        | The Layer 1 Transmission error counter was read correctly and has a value of 0.                                                                                                                                                                                                                                                                                                                                                                                                                         |

Receive FIFO Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO error counter maintained on the TN800 circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from a Packet Bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port or if hardware fault is causing the receive buffers not to be emptied properly. This test is useful for verifying the repair of the problem.

Table 10-50. TEST #625 Receive FIFO Error Counter Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 2100       | ABORT       | Could not allocate necessary system resources to run test.<br><br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Any        | FAIL        | The TN800 circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter.<br><br>1. Retry the command at 1-minute intervals a maximum of 5 times.<br><br>2. If the test continues to fail, review the results of other tests in the Long Test Sequence. Note the results of the Level 1 Status Inquiry test. Follow repair procedures for any of the tests that fail. Otherwise, go to the next step.<br><br>3. If the tests for the endpoints or adjunct pass and the Layer 1 Transmission Error Counter Test continues to fail, check the wiring to the endpoints or adjunct. |
|            | PASS        | The Layer 1 Transmission error counter was read correctly and has a value of 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Clear Error Counters Test (#270)

There are various error counters associated with each ASAI-PT. This test clears those counters and triggers the auditing of Layer 3 reinitialization. This test is used only to send messages to the ASAI-PT and, therefore, should neither abort nor fail. ASAI uses a fixed TEI value of 1.

Table 10-51. TEST #270 Clear Error Counters

| Error Code | Test Result | Description/Recommendation                                                                       |
|------------|-------------|--------------------------------------------------------------------------------------------------|
| Any        | ABORT       | This test should never abort.                                                                    |
| Any        | FAIL        | This test should never fail.<br>1. Retry the command at 1-minute intervals a maximum of 5 times. |
|            | PASS        | The message to clear the error counters of the ASAI-PT has been sent.                            |

## ASAI-RES/E-DIG-RES (TN800 reserve slot)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run | Full Name of MO         |
|------------------------|-------------|------------------------|-------------------------|
| ASAI-RES               | NONE        | NONE                   | TN800 ASAI reserve slot |
| E-DIG-RES              | NONE        | NONE                   | TN800 DIG reserve slot  |

There are no tests associated with these MOs. Both the **test board** and **busy out board** commands abort when either is attempted on a reserved slot. An error message indicates the slot is associated with the circuit pack that the TN800 is emulating, but the requested operation is not valid.

The TN800 MAPD (Multi-Application Platform for DEFINITY) circuit pack connects to the switch through a single slot in the backplane. The number of slots occupied by the MAPD pack is supplied by the board when inserted. The TN800 in R5EM is 3 slots wide. The TN800 requires 2 reserve slots to its left. The reserve (blank) slots are to left of the functional slot and are place holders on the switch, and do not have any interaction with the switch.

Each instance of these MOs represents a reserve slot associated with respective circuit pack mode in which the MAPD is working.

# BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack)

| MO Name As It Appears in Alarm Log | Alarm Level | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO            |
|------------------------------------|-------------|-------------------------------------------------------|----------------------------|
| BRI-BD                             | MAJOR       | test board PCSS l                                     | ISDN-BRI Line Circuit Pack |
| BRI-BD                             | MINOR       | test board PCSS l                                     | ISDN-BRI Line Circuit Pack |
| BRI-BD                             | WARNING     | test board PCSS sh                                    | ISDN-BRI Line Circuit Pack |

| LGATE-BD                           | MINOR       | test board PCSS l                                     | DEFINITY Lan Gateway       |
| LGATE-BD                           | WARNING     | test board PCSS sh                                    | DEFINITY Lan Gateway       |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.).

 **NOTE:**

Some of the information in this section is reserved for future use.

 **CAUTION:**

*A detailed flowchart for isolating and resolving Packet Bus faults is included in Chapter 9, "Packet Bus Fault Isolation and Correction". This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction", in addition to the relevant MO documentation.*

ISDN-BRI Line is a packet port circuit pack that provides access to ISDN-BRI endpoints. The ISDN-BRI Line circuit pack supports 12 ports, each of which provides access to ISDN stations. Voice and circuit-switched data from the ISDN stations are carried on the Time Division Multiplex (TDM) Bus. Signaling is carried over the Packet Bus.

## **LEDS**

---

The ISDN-BRI Line circuit pack performs extensive initialization tests and lights both the red and green LEDS during the initialization testing. See Chapter 7, "LED Interpretation", for more details on circuit pack status LEDs.

Hardware Error Log Entries and Test to Clear Values

| BRI-BD Error Log Entries |                |                                                 |             |              |                        |
|--------------------------|----------------|-------------------------------------------------|-------------|--------------|------------------------|
| Error Type               | Aux Data       | Associated Test                                 | Alarm Level | On/Off Board | Test to Clear Value    |
| 0 <sup>1</sup>           | 0              | Any                                             | Any         | Any          | test board PCSS sh r 1 |

| 3330 (k)                 | 46083          |                                                 | MINOR       | OFF          |                        |
| 3840 (l)                 | 4096 to 4101   |                                                 |             |              |                        |
| 3843 (m)                 | 46097          |                                                 |             |              |                        |
| 3999 (n)                 | Any            | None                                            |             |              |                        |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. This error indicates the circuit pack totally stopped functioning or it was physically removed from the system.

**NOTE:**

The alarm is logged approximately 11 minutes after the circuit pack has been removed and/or SAKI Sanity Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, then follow the instructions for "Red (alarm)" in the "Control and Port Circuit Pack Status LEDs" section in Chapter 7, "LED Interpretation". (Also, refer to the "Handling Control Circuit Packs" section in Chapter 5, "Routine Maintenance Procedures".

- b. This circuit pack has been busied out via the **busyout board PCSS** command.
- c. Port(s) has(have) been administered on this circuit pack but the circuit pack is not physically present.
- d. This error indicates transient communication problems between the switch and this circuit pack. Execute the **test board PCSS** command and refer to the repair procedures for the Control Channel Loop Around Test (#52).
- e. An on-board hardware failure has been detected by the circuit pack.

The reported aux data values correspond to the following detected errors:

|      |                       |
|------|-----------------------|
| 4352 | External RAM error    |
| 4353 | Internal RAM error    |
| 4355 | ROM Checksum error    |
| 4357 | Instruction set error |

Reset the circuit pack by executing the **busyout board PCSS** and **reset board PCSS** commands. When it is reset, the circuit pack executes a set of tests to detect the presence of any of the above faults. The detection of one of these errors during initialization causes the circuit pack to lock-up and appear insane to the system. See the repair procedure in footnote (a) for error type 1.

- f. This error is reported by the circuit pack when it detects a program logic error. While no action is required, this error may lead to errors of other types being reported against this circuit pack.
- g. This error is reported by the circuit pack when it cannot update NPE memory and read it back. This error type can be ignored, but may lead to errors of other types being reported against this circuit pack.

- h. A critical hardware failure has been detected on the circuit pack. Reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via the **test board PCSS long clear** command. If the Circuit Pack Restart Test (#594) fails, replace the circuit pack.

The reported error types correspond to the following detected errors:

- 1293      On-board auxiliary processor insane
- 1294      Internal memory access error

- i. These error types are reported when the following errors are detected:

- 1537      Frame overrun at Packet Bus interface. This condition may be caused by an on-board fault or by faulty data received on one of the circuit pack's external ports. If any of the ports on this circuit pack are alarmed, refer to the repair procedures for those maintenance objects.
- 1538      Circuit packet is hyperactive; that is, it is flooding the switch with messages sent over the control channel. The circuit pack is taken out-of-service when a threshold number of these errors is reported to the switch. Clear the alarm via the following commands: **busyout board PCSS**, **reset board PCSS**, **test board PCSS long clear**, **release board PCSS**. If the error recurs within 10 minutes, then replace the circuit pack.

- j. These errors indicate that the circuit pack is having problems transmitting data to the Packet Bus.

- 1793      Parity errors are detected when transmitting data to the Packet Bus.

- 1794      Overflow of Packet Bus transmit buffers has occurred.
- 1795      Circuit pack cannot find end of frame when transmitting to Packet Bus. Clear the alarm via the following commands:  
**busyout board PCSS, reset board PCSS, test board PCSS long clear, release board PCSS.** If the error recurs within 10 minutes, then replace the circuit pack.
- 2306      This error occurs when the circuit pack detects an error in a received frame from the packet bus. These errors are most likely caused by a packet bus problem, but may be due to a circuit pack fault. An invalid Link Access Procedure Data (LAPD) frame error occurs if the frame contains a bad Cyclical Redundancy Checking (CRC), is greater than the maximum length, or violates the link level protocol. When bus parity errors are reported, the LANBIC Receive Parity Error Counter Test (#595) should be performed to determine if the condition had cleared. Refer to the "PKT-BUS (Packet Bus)" Maintenance documentation to determine if the problem is isolated to this circuit pack or if the problem is caused by Packet Bus faults.

k. A critical failure has been detected in the Packet Bus interface of the circuit pack. This failure may be due to either a Packet Bus fault or an on-board fault. If the Packet Bus is alarmed, refer to the "PKT-BUS (Packet Bus)" section and Chapter 9, "Packet Bus Fault Isolation and Correction" for recommended repair procedures. The probability of this error being related to Packet bus problems increases with the number of ISDN-BRI circuit packs displaying this error.

If the Packet Bus is not alarmed, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via the **test board PCSS long clear** command. If the Circuit Pack Restart Test (#594) fails, replace the circuit pack. If the problem persists after complying with the above instructions, then follow normal escalation procedures.

l. These errors are not service-affecting. No action is required. These errors are reported by the circuit pack when it receives a bad control channel message from the switch. The auxiliary data identifies the following error events:

- 4096      Bad major heading
- 4097      Bad port number
- 4098      Bad data

- 4099 Bad sub-qualifier
- 4100 State inconsistency
- 4101 Inconsistent downlink message

m. This error is not service-affecting. No action is required.

- 3843 Bad translation RAM detected, but call continues by using another translation location.

n. Error type 3999— Indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *Control Channel Loop Around Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                          | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-------------------------------------------------|---------------------|--------------------|-------------------|
| Control Channel Loop-Around Test (#52)          | X                   | X                  | ND                |
| NPE Audit Test (#50)                            |                     | X                  | ND                |
| LANBIC Receive Parity Error Counter Test (#595) |                     | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NPE Audit Test (#50)

Refer to the repair procedure described in the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation as NPE Audit Test (#50).

Control Channel Loop Around Test (#52)

Refer to the repair procedure described in the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation as Control Channel Loop Around Test (#52).

SAKI Sanity Test (#53)

Refer to the repair procedure described in the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation as SAKI Sanity Test (#53).

LANBIC Receive Parity Error Counter Test (#595)

This test is destructive.

The test reads and clears the LANBIC Receive Parity Error Counter on the circuit pack. This counter is incremented by the circuit pack when it detects a parity error in data received from the Packet Bus.

These errors may be indicative of a circuit pack problem, Packet Bus problem, or a problem with another circuit pack on the bus. This test is useful for verifying the repair of the problem.

Table 10-52. TEST #595 LANBIC Receive Parity Error Counter Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                 |

| ATT-PORT                           | WARNING <sup>2, 3</sup> | test port PCSSpp l                                    | AT&T Adjunct ISDN-BRI Port |
| LGATE-PORT                         | MAJOR <sup>2, 3</sup>   | test port PCSSpp l                                    | Ethernet ASAI Port         |
| LGATE-PORT                         | WARNING <sup>2, 3</sup> | test port PCSSpp l                                    | Ethernet ASAI Port         |
| ATTE-PT                            | MAJOR <sup>2, 3</sup>   | test port PCSSpp l                                    | Ethernet AT&T Adjunct Port |
| ATTE-PT                            | WARNING <sup>2, 3</sup> | test port PCSSpp l                                    | Ethernet AT&T Adjunct Port |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).
2. The alarm level for ASAI and AT&T adjunct ports may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI and AT&T adjunct ports in the system.
3. All alarming for an ASAI and AT&T adjunct and OFF-BOARD alarming for an ASAI or AT&T port is disabled if the ASAI or AT&T adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI or AT&T adjunct. The Hardware Error and Alarm Logs should be checked to see if the adjunct has disabled alarming.

 **NOTE:**  
Some of the information in this section is reserved for future use.

 **CAUTION:**  
*A detailed flowchart for isolating and resolving Packet Bus faults is included in Chapter 9, "Packet Bus Fault Isolation and Correction". This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to*

**10** Maintenance Object Repair Procedures

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

Page 10-159

*Packet Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction" in addition to the relevant MO documentation.*

**WARNING:**

*If a significant Packet Bus failure occurs, errors and alarms may not be logged as expected for BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT. Conditions under which this occurs are detailed in the "Maintenance of the Packet Bus" section of Chapter 9, "Packet Bus Fault Isolation and Correction".*

The TN2208 LGATE MFB provides DEFINITY with the interface to Adjunct-Switch Application Interface (ASAI) and AT&T adjuncts (for example, CONVERSANT®. Voice System). The circuit pack contains 12 ports of line circuit interface (although only 8 are usable by the switch), each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the AT&T ISDN-BRI Specification. In this context, the term "ISDN-BRI port" is used to refer collectively to ports on the TN2208 circuit pack which are connected to ASAI or AT&T adjuncts.

The TN556 and TN2198 ISDN-BRI Line circuit packs provide DEFINITY with the interface to ISDN-BRI end points, Adjunct-Switch Application Interface (ASAI) and AT&T adjuncts (for example, CONVERSANT®. Voice System). The circuit packs contain 12 ports of line circuit interface, each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the AT&T ISDN-BRI Specification. In this context, the term "ISDN-BRI port" is used to refer collectively to ports on the TN556 and TN2198 circuit packs which are connected to either BRI endpoints or ASAI or AT&T adjuncts.

For BRI endpoints, each B-channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B-channels are not used on ports connected to ASAI or AT&T adjuncts. The D-channel is used for conveying signaling between the switch and a BRI endpoint(s) or ASAI or AT&T adjunct. Each ISDN-BRI D-channel is connected to the switch processor and the ISDN-BRI port through the Packet Control circuit pack and the Packet Bus.

ISDN-BRI endpoints are available in various configurations. All endpoints require the D-channel to convey signaling information to the switch. Only one B-channel is required for a voice-only set or a stand-alone data module (BRI-DAT). A voice and data-capable set requires both B-channels (one for voice and one for data). Therefore, each TN556 or TN2198 port can support either two voice-only sets, two stand-alone data modules (BRI-DAT), or one voice and data-capable set. Only a single ASAI or AT&T adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

Figure 10-6 illustrates the physical connection (solid line) between an ISDN-BRI Port and its associated ISDN-BRI set(s). Each physical connection allows for two

B-channels and one D-channel. Each ISDN-BRI circuit pack can support up to 12 of these *physical* connections to different voice and voice/data sets or ASAI or AT&T adjuncts. On a TN2198 each ISDN-BRI circuit pack can support up to 12 *physical* connections to a NT1, which, in turn, connects to 2 terminals.

This section covers the maintenance documentation for ISDN-BRI ports. Some of the results of maintenance testing of ISDN-BRI ports may be affected by the health of the ISDN-BRI Line circuit pack (BRI-BD), BRI endpoint (BRI-SET), or ASAI adjunct (ASAI-AJ/LGATE-AJ) or AT&T adjunct (ATT\_AJ/ATTE-AJ). These interactions should be kept in mind when investigating the cause of ISDN-BRI port problems. For more information on the circuit pack and endpoints, refer to the BRI-BD (ISDN-BRI Line Circuit Pack) Maintenance documentation, the BRI-SET (ISDN-BRI Endpoint) Maintenance documentation, and ASAI-AJ (Adjunct-Switch Application Interface) Maintenance documentation, ATT-AJ (AT&T Adjunct) Maintenance documentation, LGATE-AJ (Ethernet Adjunct-Switch Application Interface) Maintenance documentation, and ATTE-AJ (Ethernet AT&T Adjunct) Maintenance documentation.

**10** Maintenance Object Repair Procedures

*BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)*

Page 10-162

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description, and follow the recommended procedures.
2. Major and Minor alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

- a. This error occurs when the Level 1 Status Inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. The aux data field contains one of the following values:
  - blank - this indicates that the Level 1 Status Inquiry failed.
  - 32773 - this is a message from the BRI-LINE circuit pack indicating Level 1 has been deactivated.

Refer to the repair procedures for Test #621.

- b. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.
- c. This error occurs when the EPF Status Inquiry fails due to an overcurrent condition or when the BRI-LINE circuit pack detects that the EPF is in an over current condition. The aux data field contains one of the following values:
  - blank - this indicates that the EPF Status Inquiry failed due to an overcurrent condition.
  - 40988 - this indicates that the BRI-LINE circuit pack has detected an overcurrent condition and has turned the EPF off.

Execute the Short Test Sequence and see the repair procedures for Test #622.

- d. This error indicates that the circuit pack is having problems transmitting data to the Packet Bus, thus affecting the conveyance of signaling information over the D-channel. With Aux Data 46222, this error occurs when the Packet Bus transmit buffers overflow. This condition probably indicates a hardware problem. The BRI-PORT Alarm Level for the error with Aux Data 46222 is "MIN/WRN," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJ/MIN/WNR." With Aux Data 0, this error occurs whenever the Packet Bus transmit FIFO buffers overflow. This condition can be caused by an on-board hardware problem as well as by problems on the Packet Bus that disrupt the BRI circuit pack's ability to transmit data onto the Packet Bus. Use troubleshooting procedures for both on-board hardware problems and potential off-board Packet Bus problems. See the "PKT-BUS (Packet Bus)" Maintenance section in this chapter as well as Chapter 9, "Packet Bus Fault Isolation and Correction" for more details on Packet Bus

**10** Maintenance Object Repair Procedures

*BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)*

*Page 10-163*

troubleshooting procedures. The BRI-PORT Alarm Level for the error with Aux Data 0 is "MINOR," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJOR."

- e. This error occurs when the NPE Crosstalk Test (#617) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #617.
- f. This error occurs when broadcast signaling links associated with this port have too much link establishment related traffic. This could occur if an endpoint on this port is sending link establishment traffic on a port level broadcast link, or if there are Level 1 problems on the port. Check the error logs for Level 1 errors. If Level 1 problems exist, follow the repair procedures listed for test #621. Software will suspend activity to this port for 75 minutes when the port is alarmed due to this error (note that service suspension does not occur if the port is an ABRI-PORT/LGATE-PT/ATTE-PT/ATT-PORT). If this problem persists, replace the endpoint or endpoints associated with this port. If replacing the endpoints does not fix the problem, follow normal escalation procedures.
- g. This error occurs when the port receives an invalid frame over the D-channel. When CRC errors exceed five within 15 minutes, the port is taken out of service for five seconds. If five more CRC errors are received within 15 minutes of the first set of five errors, the port is taken out of service for one minute. If five more CRC errors are received within 15 minutes of the last five, the port is taken out of service for 15 minutes.

This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

- Check the wiring to the endpoints or the adjunct.
  - If the problem persists, replace the endpoints or adjuncts, or escalate the problem.
- h. This error occurs when the BRI Port Local TDM Loop Around Test (#619) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #619.

There are no Test to Clear Values for the following error types. The error types are simply provided as additional data that may prove useful while troubleshooting.

- i. This error occurs when a Layer 1 Transmission error is detected for the port. Run the Long Test Sequence, and pay particular attention to the results of the Layer 1 Transmission Error Counter Test (#624).
- j. A BRI port supports up to three Terminal Endpoint Identifiers (TEIs). This error occurs when the switch receives a request for a fourth TEI on a port. Check the number of endpoints administered for this port.

- k. This error occurs when an SPID initialization request is made from an endpoint and the switch determines that the SPID value is invalid or is a duplicate of another SPID that is already initialized at Layer 3 on the port. Check the administration of the endpoints.
- l. This error occurs when the circuit pack detects an overflow of its receive buffers. Run the Long Test Sequence, and pay particular attention to the results of the Receive First In First Out (FIFO) Overflow Error Counter Test (#625).
- m. This error occurs when the BRI Port Local LAN Loop Around Test (#618) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #618.
- n. This error most likely occurs when the Terminal Endpoint Identifier (TEI) administered for the ASAI or AT&T endpoint does not match the TEI administered in the ASAI or AT&T adjunct. Check the switch administration of the TEI against that of the adjunct, and make sure that both are using the same TEI.
- o. Indicates that sets on the port do not support Layer 3 initialization. Consult the Service Set documentation.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                     | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------|---------------------|--------------------|-------------------|
| NPE Crosstalk Test (#617)                  |                     | X                  | D                 |
| BRI Port Local LAN Loop Around Test (#618) |                     | X                  | D                 |
| BRI Port Local TDM Loop Around Test (#619) |                     | X                  | D                 |
| Electronic Power Feed Restoral Test (#620) | X                   | X                  | ND                |
| Level 1 Status Inquiry Test (#621)         | X                   | X                  | ND                |
| Electronic Power Feed Inquiry Test (#622)  | X                   | X                  | ND                |
| CRC Error Counter Test (#623)              |                     | X                  | ND                |

| Order of Investigation                          | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-------------------------------------------------|---------------------|--------------------|-------------------|
| Layer 1 Transmission Error Counter Test (#624)  |                     | X                  | ND                |
| Receive FIFO Overflow Error Counter Test (#625) |                     | X                  | ND                |
| Clear Error Counters (#270)                     | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

 **NOTE:**  
The NPE Crosstalk Test and the BRI Port Local TDM Loop Around Test are not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT.

**NPE Crosstalk Test (#617)**

**This test is destructive.**

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence and takes approximately 20 to 30 seconds to complete. Crosstalk testing is performed on both B-channels (B1 and B2) associated with a BRI port. If this test fails on either channel, any endpoints connected to the port are taken out-of-service.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B-channels associated with the port are not used by ASAI or AT&T adjuncts.

Table 10-54. TEST #161 Loop Around Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | <p>System resources required to run this test are not available. The port may be busy with a valid call. Use the <b>display port PCSSpp</b> command to determine the station extension or trunk group/member number of the port. Use the <b>status bri-port PCSSpp</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) Wait until the port is idle before retesting.</p> <ol style="list-style-type: none"><li>1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol> |
| 1004       | ABORT       | <p>The port has been seized by a user for a valid call. Use the <b>status station</b> command for the station associated with this port and determine when the port is available for testing.</p> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort and the port is not in use, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1005       | ABORT       | <p>This test is not valid for this type of translation. Ports administered as "ASAI" or "ADJK" can not run this test, because the B channels associated with the port are not used by ASAI or AT&amp;T Adjunct Links. This is a normal condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 1, 2       | FAIL        | <p>The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Error code 1 indicates that the NPE Crosstalk Test failed on Channel B1. Error code 2 indicates that the NPE Crosstalk Test failed on Channel B1.</p> <p>1. Replace circuit pack.</p> |
|            | PASS        | <p>The port is correctly using its allocated time slots.</p> <p>1. To be sure that this is not an intermittent problem, repeat this test a maximum of 10 times to make sure it continues to pass.</p> <p>2. If complaints still exist, examine the station, connections, and wiring.</p>                 |

BRI Port Local LAN Loop Around Test (#618)

This test is destructive.

This test, which verifies the connectivity of a BRI port across the LAN Bus, executes only if the port is out-of-service. The test aborts if calls associated with the port are in-progress. Failures of this test indicate either on-board faults associated with the BRI-PORT hardware on the circuit pack or problems with the LAN Bus, which is used to form connectivity between the switch and the BRI-PORT.

The dotted lines in Figure 10-7 show how a Loop Around Test is performed across the Packet Bus for the D-channel.

**Figure 10-7. Path of the BRI Port Local LAN Loop Around**

|            | PASS        | The BRI Port Local LAN Loop Around Test has passed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

BRI Port Local TDM Loop Around Test (#619)

This test is destructive.

This test verifies the connectivity of a BRI port across the TDM Bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack.

This Loop Around Test runs a series of individual tests on the two B-channels (B1 and B2) associated with the port. It is a collection of the following:

- A Loop Around Test across the TDM Bus for B1.
- A Conference Circuit Test for B1.
- A Loop Around Test across the TDM Bus for B2.
- A Conference Circuit Test for B2.

The tests are run in the above order. If one fails, the remaining tests in the sequence are not executed. An error code is returned at that point.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B-channels associated with the port are not used by ASAI or AT&T adjuncts.

The dotted lines in Figure 10-8 show how a Loop Around Test is performed for the B-channels. The figure shows a terminal connected to a BRI line board using a TN556. If a TN2198 is used, the terminal would be connected to a NT1, and the NT1 to the BRI board.

| 1, 2       | FAIL        | As stated previously, this test runs a TDM Loop Around Test on each B-channel. This indicates that the loop around failed on one of the channels. Error Code 1 indicates that the TDM Loop Around Test failed on B1. Error Code 2 indicates that the TDM Loop Around Test failed on B2.                                                                                                                                                                                                                                                                     |
| 7, 8       | FAIL        | As stated previously, this test runs a Conference Circuit Test on each B-channel. A failure here indicates that one of these conference tests failed; Error Code 7 means that the test failed on B1; Error Code 8 means that the test failed on B2.<br><br>1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the circuit pack are not in use. Reset the circuit pack by issuing the <b>busyout board PCSS</b> and the <b>reset board PCSS</b> commands.<br><br>2. If the test fails again, replace the circuit pack. |
|            | PASS        | The BRI Port Local TDM Loop Around Test has passed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Electronic Power Feed Restoral Test (#620)

This test attempts to restore the Electronic Power Feed (EPF) on an ISDN-BRI port twice. In this test, the processor requests that the EPF be turned on for a given port. An attempt is made to turn on the power unit to the station or adjunct.

If no current is being drawn by a station, this probably indicates that the station is not connected. No current being drawn by an adjunct is the normal condition. If an overcurrent condition is sensed (that is, too much current is being drawn), this condition may indicate a short in the wiring to the endpoint or adjunct. Depending on what condition is sensed, a message is returned stating that either the EPF was turned on successfully with no problems or that an overcurrent condition is sensed. This response is reported by the Electronic Power Feed Inquiry (#622), which follows in the testing sequence. EPF Restoral is attempted again by this test five seconds later. This test always passes for the TN2198 because it has no EPF. This test will always abort when run on the TN2208.

## **Level 1 Status Inquiry Test (#621)**

This test determines the state of the transmission facility of a BRI port at the physical layer (that is, Level 1). Level 1 can be in one of three possible states: Activated, Pending Activation, or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI or AT&T adjunct administered on this port. This test passes if the state of Level 1 (L1) is Activated. This test also passes if software has taken this port out of service. See the description of the Level 1 "Deactivated State" below for more details.

The Pending Activation state indicates a problem with the endpoints or adjunct, the wiring to the sets or adjunct, or the BRI-LINE circuit pack. When in this state, the Level 1 interface is either not receiving any L1 framing from the endpoint or adjunct (Endpoint Idle), or it is communicating with the endpoint or adjunct but cannot transition to the Activated state (Endpoint Active).

The Deactivated state indicates a problem with the BRI-LINE circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ISDN-BRI port is placed in the out-of-service state, Level 1 is also put into the Deactivated state. This could be due either to the system detecting a fault with the port or to a **busyout port PCSSpp** request.

Electronic Power Feed Inquiry (#622)

This test queries the BRI-LINE circuit pack for the status of the Electronic Power Feed (EPF) supplied to a BRI endpoint or an ASAI or AT&T adjunct. If the EPF is on and no overcurrent condition exists, this test passes. All other states are not normal and indicate a problem with the endpoint or adjunct, the wiring to the endpoint or adjunct, or the BRI-LINE circuit pack. This test is not run on the TN2208 circuit pack or the TN2198 and will always return a pass for a TN2198. The TN2208 has no power feeds.

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port's Layer 1 Transmission error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or the endpoint or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY Communications System Generic 1 and Generic 3i Wiring*, 555-204-111). It does

not indicate a problem with the ISDN-BRI circuit pack. This test is useful for verifying the repair of the problem.

Receive FIFO Overflow Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO Overflow error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is non-zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from the Packet Bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port OR if a hardware fault is causing the receive buffers not to be emptied properly by the circuit pack. This test is useful for verifying the repair of the problem.

Table 10-61. TEST #625 Receive FIFO Overflow Error Counter Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

If the test continues to fail, escalate the problem.                                                                                                                                                                                                                                                                     |
| value      | FAIL        | The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to fail, run the Long Test Sequence and pay particular attention to the Loop Around Tests (#618 and #619). See the repair procedures for the executed test if it fails. Otherwise, go to the next step.<br><br>3. Replace the circuit pack. |

**Table 10-61. TEST #625 Receive FIFO Overflow Error Counter Test — Continued**

| Error Code | Test Result | Description/ Recommendation                                                      |
|------------|-------------|----------------------------------------------------------------------------------|
|            | PASS        | The Receive FIFO Overflow error counter was read correctly and has a value of 0. |

**Clear Error Counters Test (#270)**

This test is not an actual test in the strict sense of the word. There are various error counters associated with each BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT. This test clears those counters and triggers the auditing of Terminal Endpoint Identifier (TEI) values and layer 3 reinitialization. This test is used only to send messages to the BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT and, therefore, should neither abort nor fail.

**Table 10-62. TEST #270 Clear Error Counters**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                              |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01). The alternate name field contains the extension of the endpoint. This field is used to distinguish between endpoints on the same port.
2. The alarm level for ASAI and AT&T adjuncts may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI and AT&T adjuncts in the system.
3. Alarming for an ASAI and AT&T adjuncts is disabled if the adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm are logged against the endpoint. Busying out and releasing the ASAI station or ADJLK station will clear the alarm.

 **CAUTION:**

A detailed flowchart for isolating and resolving Packet Bus faults is included

*in Chapter 9, "Packet Bus Fault Isolation and Correction". this flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction" in addition to the relevant MO documentation.*

**WARNING:**

*If a significant Packet Bus failure occurs, errors and alarms may not be logged as expected for*

*BRI-SET/BRI-DAT/ASAI-ADJ/ATT-ADJ/LGATE-AJ/ATTE-AJ. Conditions under which this occurs are detailed in the "Maintenance of the Packet Bus" section of Chapter 9, "Packet Bus Fault Isolation and Correction".*

The TN2208 ESAI MFB provides DEFINITY with an Ethernet interface to Adjunct-Switch Application Interface (ASAI) and AT&T adjuncts (for example, CONVERSANT<sup>®</sup> Voice System). This circuit pack contains 8 ports of line circuit interface, each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the AT&T ISDN-BRI Specification. In this context, the term "ISDN-BRI port" is used to refer collectively to ports on the TN2208 MFB circuit pack which is connected to ASAI or AT&T adjuncts. The TN2208 ESAI MFB is handled by switch software as it is an ISDN BRI compatible board and all maintenance actions referring to ASAI and AT&T Adjunct Links in this section apply.

In G3iV1.1-286 and G3iV2-386, two types of ISDN-BRI endpoints may be connected to ISDN-BRI (ISDN Basic Rate Interface Line) TN556 and TN2198 circuit packs: ISDN-BRI station endpoints, ASAI (Adjunct-Switch Application Interface) and AT&T adjuncts (for example CONVERSANT<sup>®</sup> Voice System). These circuit packs contain 12 ports of line circuit interfaces, each of which operates at 192 kilobits per second (kbps) with two B-channels and one D-channel as specified in the AT&T ISDN-BRI specification (PUB 801-802-100). For BRI endpoints, each B-channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B-channels are not used by ASAI or AT&T adjuncts. The D-channel is used for conveying signaling between the switch and a BRI endpoint(s) or ASAI or AT&T adjuncts. Each ISDN-BRI D-channel is connected to the switch processor and the ISDN-BRI port through the PKT-CTRL (Packet Control) and the PKT-BUS (Packet Bus).

ISDN-BRI endpoints come in a number of configurations. All endpoints require the D-channel to convey signaling information to the switch. A voice-only set requires only one B-channel. A voice and data-capable set requires both B-channels (one for voice and one for data). Therefore, each TN556 port can support either two voice-only sets or one voice and data-capable set. Only a single ASAI or AT&T adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

Figure 10-9 illustrates the physical connection (solid line) between an ISDN-BRI Circuit Pack and a voice or voice/data set. Each physical connection allows for two B-channels, as stated above, plus one D-channel. Each ISDN-BRI circuit pack can support up to 12 of these PHYSICAL connections to different voice and voice/data sets or ASAI and AT&T adjuncts.

**Figure 10-9. ISDN-BRI Set Interactions**

This section contains the ISDN-BRI Set, ASAI Adjunct, and AT&T Adjunct Maintenance documentation. Some of the results of maintenance testing of the ISDN-BRI Set or the ASAI and AT&T Adjunct may be affected by the health of the ISDN-BRI circuit pack and Port. These interactions should be kept in mind when investigating the cause of ISDN-BRI Set problems.

Continued on next page

- 
- Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
  - Major alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

- 
- a. Errors of this type indicate violations of the ISDN-BRI signaling protocol; timers associated with certain Layer 3 messages have expired before a required response was received. In the following table, the aux data field indicates which timer has just expired. (For more information, refer to the AT&T ISDN-BRI Specification.)

| Aux Data | Timer Type                 |
|----------|----------------------------|
| 2        | First T303 (SETUP timer)   |
| 3        | Second T303 (SETUP timer)  |
| 4        | T305 (DISConnect timer)    |
| 5        | First T308 (RELease timer) |

| Aux Data | Timer Type                                     |
|----------|------------------------------------------------|
| 6        | Second T308 (RELease timer)                    |
| 10       | T316 (REStart timer)                           |
| 12       | T309 (Layer 2 Failure timer)                   |
| 16       | TM100 (Management Information Message timer 1) |
| 17       | TM200 (Management Information Message timer 2) |
| 102      | TASAI (ASAI Routing Timer)                     |

The switch sent a message to the endpoint which did not respond in the allotted time. This can happen occasionally due to failure of the point-to-point signaling link or because of a problem in the BRI endpoint or ASAI adjunct or AT&T adjunct. Execute the **test station extension sh** command and pay particular attention to the results of the BRI Layer 3 Query Test (#629). If this test fails, follow the repair procedure for Test #629.

- b. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.
- c. This error occurs when the endpoint does not respond to the service state query message sent to the adjunct or the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or the adjunct.

For BRI endpoints, the Aux Data field for this error contains "0." When it occurs, execute the **test station extension sh** command and pay particular attention to the results of the BRI Layer 3 Query Test (#629). If this test fails, follow the repair procedure for Test #629.

When this error occurs for an ASAI or AT&T adjunct, the Aux Data field indicates the state of the ASAI link or AT&T link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

| Aux Data | ASAI Link State | Error                               |
|----------|-----------------|-------------------------------------|
| 102      | 13-restarting   | No response to RESTART message      |
| 104      | 13-restarting   | Invalid response to RESTART message |
| 152      | 13-restarted    | No response to Layer 3 query        |
| 154      | 13-restarted    | Invalid response to Layer 3 query   |
| 202      | 13-established  | No response to Layer 3 query        |
| 204      | 13-established  | Invalid response to Layer 3 query   |

(See "Status BRI-Port" in Chapter 8, "Maintenance Commands and Trouble-Clearing Aids" for an explanation of the ASAI link states.)

For ASAI or AT&T adjuncts, the switch automatically queries the adjunct every two minutes (and therefore the Layer 3 Query Test is not executed for ASAI or AT&T adjuncts via a command issued from the G3MT terminal). While alarmed for this error, the switch momentarily (for five seconds) takes the associated port out-of-service every 15 minutes. This action is taken in an attempt to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or AT&T adjunct, the service technician should:

1. Execute the **test station extension** command, paying particular attention to any tests which fail, and perform the associated repair procedures for those tests.
  2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.
  3. The alarm condition persists and, if the above steps do not resolve the problem, follow normal escalation procedures.
- d. This error and associated WARNING alarm are logged against an ASAI or AT&T endpoint when the adjunct has asked the switch to suspend Maintenance on the ASAI or AT&T endpoint. Busying out and releasing the ASAI station or ADJLK station will clear this alarm.
- e. This error occurs when the endpoint sends more messages than the switch can handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.
- f. This error occurs when the signaling link associated with a BRI endpoint has too much link establishment related traffic. This could occur if the signaling link is bouncing between assigned and established states. Software will suspend activity to this endpoint for 75 minutes when the endpoint is alarmed due to this problem (note that service suspension does not occur if the endpoint is an ASAI or AT&T adjunct). If this problem persists, replace the endpoint. If replacing the endpoint does not fix the problem, follow normal escalation procedures.
- g. This error occurs when the ASAI-ADJ or ATT-ADJ or LGATE-AJ or ATTE-AJ message is not transmitted because the PKT-CTRL (Packet Control Circuit Pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or AT&T adjunct. Attempt to resolve the problem by following the repair procedures for the PKT-CTRL. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.
- h. This error occurs when the ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow controlled. Frequent or persistent occurrence of these events may

indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or AT&T adjunct. Attempt to resolve the problem by following the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

- i. This error indicates a problem with Layer 2 over the D-channel between the switch and the endpoint. When this error occurs, an alarm is raised against the station or adjunct. Execute the **test station extension short** command and pay particular attention to the results of the BRI XID Test (#628). If this test fails, follow the repair procedure for Test #628.
- j. This error indicates a problem with the B-channel connection between the switch and the endpoint. When this error occurs, a warning alarm is raised against the endpoint. Execute the **test station extension I** command, and pay particular attention to the results of the BRI Remote Loop Back Test (#627). If this test fails, follow the repair procedure for Test #627.
- k. This error occurs whenever the point-to-point signaling link to the endpoint goes down (except when it goes down because either the PKT-CTRL or the PKT-BUS has failed or has been busied out by system technician). When this error occurs, an alarm is raised against the endpoint or adjunct. Execute the **test station extension short** command and pay particular attention to the results of the Signaling Link Status Test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is reestablished to the endpoint or adjunct.
- l. Certain ASAI protocol-specific cause codes are logged by switch software. The cause code can be determined from the following formula:

If the error type is greater than 3712, then the ASAI cause code is equal to the error type minus 3712. This code was sent to the adjunct by the switch.

If the error type is less than 3712, then the ASAI cause code is equal to the error type minus 3584. This code was sent to the switch by the adjunct.

A description of the various ASAI cause values is contained in the Table 10-64. This table also contains recommended system technician actions associated with the cause value. Further information can also be found in the AT&T ASAI Specification (AT&T PUB 288-500-03). In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

Table 10-64. ASAI Cause Values

| Code | Explanation                         | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | SERVICE OR OPTION NOT AVAILABLE     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 0    | Unrecognized ASAIProtocol Operation | <p>Requested ASAI protocol operation is not implemented by the switch or adjunct. Aux Data field of Error Log entry contains protocol identifier for unrecognized operation.</p> <ol style="list-style-type: none"><li>1. Consult switch and adjunct documentation to determine which set of operations is supported by the switch and the adjunct. Adjunct administration turning off operations not implemented by the switch may resolve the problem.</li><li>2. If Step 1 does not resolve the problem, escalate to the next tier.</li></ol>                                                                                                                                                                                                                                                                           |
| 40   | Resources not available             | <p>No available internal resources to service switch or adjunct request. System transaction capacity for adjunct or switch is exceeded.</p> <ol style="list-style-type: none"><li>1. Re-engineering of adjunct services my be required. If problem persists, escalate problem to the next tier.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 63   | SERVICE OR OPTION NOT AVAILABLE     | <p>Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resources. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct.</p> <ol style="list-style-type: none"><li>1. Verify that no overlapping administration of switch resources (e.g., requesting notifications on a single domain by multiple adjuncts or multiple adjuncts attempting to control a single call) exists across all adjuncts connected to the switch. If overlaps exist, then readminister the adjuncts to guarantee that each adjunct is associated with a unique set of switch resources.</li><li>2. If Step 1 does not resolve the problem, escalate to the next tier.</li></ol> |

Table 10-64. ASAI Cause Values — *Continued*

| Code | Explanation                             | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | SERVICE OR<br>OPTION NOT<br>IMPLEMENTED |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 79   | SERVICE OR<br>OPTION NOT<br>IMPLEMENTED | <p>Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct.</p> <ol style="list-style-type: none"><li>1. Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Readministration of the switch-administered capabilities (see Customer Optional Feature Form) or those of the adjunct may be necessary to correct the problem.</li><li>2. If Step 1 does not provide the set of desired services due to deficient implementation, escalate the problem to the next tier.</li></ol> |

If a number of these errors continue to occur, then escalate to next tier.</li></ol>                                                                                                                                                                                                                                                                                                                                |

m. Certain ISDN-BRI cause codes are logged by switch software. The cause code can be determined from the following formula:

If the error type is greater than 3968, then the ISDN-BRI cause code is equal to the error type minus 3968. This code was sent to the endpoint by the switch.

If the error type is less than 3968, then the ISDN-BRI cause code is equal to the error type minus 3840. This code was sent to the switch by the endpoint.

A description of the various ISDN-BRI cause values is contained in Table 10-65. This table also contains recommended system technician actions associated with the cause value. Further information can also be found in

the AT&T ISDN-BRI Specification (AT&T PUB 801-802-100). In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

- n. Error 3847 indicates that sets on the port do not support level 3 initialization. Consult the Set Service documentation
- o. For the Error 2567 indicates that the version of ASAI is not supported, check version of the software running on the ASAI or AT&T adjunct.
- p. For Error 2568 indicates that the adjunct id is invalid, check the vender id or software running on the AT&T adjunct.

System Technician-Demanded Tests:  
Descriptions and Error Codes

When inspecting errors in the system and deciding which ones to address, always investigate errors associated with the circuit pack and port first. Clearing these error codes first may also clear errors generated against the endpoint. When all circuit pack and port errors have been cleared, and errors still exist against the endpoint, always investigate errors in the order they are presented in

the table below. By clearing error codes associated with the *Signaling Link Status Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation            | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-----------------------------------|---------------------|--------------------|-------------------|
| Signaling Link Status Test (#626) | X                   | X                  | ND                |
| BRI XID Test (#628)               | X                   | X                  | ND                |
| BRI Layer 3 Query (#629)          | X (a)               | X (a)              | ND                |
| BRI Remote Loop Back (#627)       |                     | X (a)              | ND                |
| BRI Set Audits (#630)             | X (a)               | X (a)              | ND                |

| BRI Model/Vintage ID Test (#632)  |                     | X (a)              | ND                |

1. D = Destructive; ND = Nondestructive

Note:

- a. Will execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is "bound" to an endpoint and fails if the link is "not bound."

The definition of the term "bound" for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of "bound" for each type of endpoint is as follows:

- **BRI endpoints administered for MIM (management information messages) initialization (multipoint):**

NOTE:

An MIM is a level 3 message that conveys management and maintenance information between a communications system and a BRI terminal.

For endpoints of this type, the signaling link is "bound" when the link is connected at Layer 2 and the link has been associated with an endpoint, [that is, the endpoint has completed SPID initialization (L3 established)].

■ **ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):**

For endpoints of this type, the signaling link is "bound" when the link is connected at Layer 2 (L2 established).

For all endpoint types, a signaling link becomes "unbound" when it is disconnected at Layer 2. For BRI endpoints supporting MIM initialization, a signaling link may also become "unbound" if a subsequent attempt to perform SPID initialization on a "bound" link fails, (that is, wrong SPID is entered into the endpoint by the user).

| 1113       | FAIL        | <p>The signaling link is not "bound" to the adjunct or endpoint. For BRI endpoints supporting MIM initialization, this error indicates that the endpoint has not been bound to a signaling link (that is, SPID initialization has not been completed). Since the signaling link associated with the endpoint is not identified until SPID initialization completes, this error does not imply that the signaling link is connected or disconnected at Layer 2 nor does it provide the status of TEI assignment for the endpoint. For ASAI adjuncts and BRI endpoints not supporting MIM initialization, this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified via administration, the link is only "unbound" from the endpoint when it is disconnected.</p> <ol style="list-style-type: none"><li>1. Execute the <b>status bri-port PCSSpp</b> command and refer to the associated procedures for this command contained in the BRI-PORT (ISDN-BRI Port) Maintenance documentation.</li><li>2. If the test continues to fail, escalate the problem.</li></ol> |

BRI Remote Loop Back Test (#627)

This test checks the integrity of a circuit switched B-channel connection between the switch and the endpoint.

In this test, the endpoint is put in the "maintenance busy" state to prevent the switch from issuing calls to the endpoint during the test. An application message containing a loop back activate request for the appropriate B-channel is sent to the endpoint. The endpoint responds with a loop back activated response. Maintenance then sends data to the endpoint over the B-channel under test. Since the B-channel is looped back at the endpoint, maintenance should receive the data that it sent. If no data is detected, the test fails. An application message containing a loop back deactivate request is then sent to the endpoint to terminate the remote loop back test. The endpoint responds with an MIM message containing a loop back deactivate response. Maintenance then releases the endpoint so that it is available to terminate calls.

This test is not executed for ASAI adjuncts because adjuncts do not support MIMs upon which this test is based.

Table 10-67. TEST #627 BRI Remote Loop Back — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                       |
|------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | The endpoint has responded to the switch activate and deactivate loop back application messages. Data has been detected on the looped back channels.                                              |
| 1000       | ABORT       | Could not seize the endpoint or B-channels for test.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem. |

BRI XID Test (#628)

This test checks the D-channel connection between the SPE and the endpoint or adjunct.

In this test, a D-channel XID frame is sent to the endpoint or adjunct over the point-to-point signaling link. The test passes if the endpoint or adjunct responds with a Layer 2 XID-RESPONSE frame.

This test must be administered to not run in the station administration form for ports on a TN2208.

Table 10-68. TEST #628 BRI XID

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 2000       | FAIL        | <p>The XID-RESPONSE message was not received from the endpoint.</p> <ol style="list-style-type: none"><li>1. Consult the endpoint documentation to determine if the Layer 2 XID and XID-RESPONSE messages are supported. If the documentation reflects no support for these messages, change XID Testing? field to "no" using the <b>change station extension</b> command.</li><li>2. If the endpoint supports these Layer 2 messages and the test continues to fail, assume the endpoint is defective and replace it.</li><li>3. If the test continues to fail, escalate the problem.</li></ol> |
|            | PASS        | <p>The switch can successfully pass messages over the D-channel to the BRI endpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

BRI Layer 3 Query Test (#629)

This test is used to check the application layer communications between the switch and the endpoint or adjunct.

For BRI endpoints, an application message containing the appropriate endpoint service state is sent by the switch to the endpoint. The endpoint responds with an acknowledgment to the application message.

For ASAI and AT&T adjuncts, this test is not executed from the administration terminal. Rather, a query message is automatically sent by the switch every two minutes. Failure of the switch to receive a response to a query from the adjunct is logged in the Hardware Error Log.

BRI Set Audits Test (#630)

This is a series of two tests which are classified as audits. The switch sends messages to the BRI endpoint to perform the following tests:

- Ringer Audit - This audit ensures that both the switch and the endpoint agree as to the current state of the endpoint's ringer.
- Lamps Audit - This audit ensures that both the switch and the endpoint agree as to the current state of the endpoint's lamps.
- Call Activity Audit - This audit ensures that the state of calls is consistent between the switch and the endpoint.

This test is not executed for ASAI or AT&T adjunct because adjuncts do not employ ringers or lamps, or establish calls on the B-channels associated with the BRI interface.

Table 10-70. TEST #630 BRI Set Audits

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1113       | ABORT       | <p>The signaling link between the switch and the endpoint is down.</p> <ol style="list-style-type: none"><li>1. Use the <b>test port PCSSpp long</b> command to clear any errors which prevent establishment of the signaling link.</li><li>2. ## SPID Facility Test

This test is used to verify the wiring and operation of the signaling link between the switch and a endpoint or adjunct on a BRI interface. **This test is not executed from the administration terminal, but rather is executed by using a BRI test set equipped with a display.** The test set may replace the BRI set, ASAI or AT&T adjunct under test by plugging it into the same jack or by bridging it onto the wiring at some point between the switch and the endpoint (or adjunct), thereby creating a pseudo-BRI multipoint configuration.

When plugged into the port in this manner, the test set establishes a signaling link connection with the switch and attempts to complete SPID initialization by using the Service SPID administered for the system (see the System Maintenance Administration Form). If the test set displays the correct administered port address for the endpoint or adjunct under test, the test passes (see Service SPID Display which follows). If after one-minute nothing is displayed on the test set, the test fails.

| SPID Facility Test |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## CABINET (Cabinet Sensors)

| MO Name As It Appears in Alarm Log | Alarm Level        | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO |
|------------------------------------|--------------------|-------------------------------------------------------|-----------------|
| CABINET                            | MAJOR              | test environment P                                    | Cabinet Sensors |
| CABINET                            | MINOR <sup>2</sup> | test environment P                                    | Cabinet Sensors |

1. Where P is an appropriate port network number determined via the Port field from the Alarm or Error Log.
2. If a minor alarm occurs for a variable speed fan, the fan should be checked for a dirty filter. If the filter is not dirty, the fan should be replaced.

**⇒ NOTE:**  
CABINET is valid only in a multicarrier cabinet system. For information concerning single-carrier cabinet systems, refer to the DC-POWER (Single-Carrier Cabinet Power) Maintenance documentation.

Each multicarrier cabinet is equipped either with six non-variable speed fans or with six variable speed fans.

**Non-Variable Speed (Standard) Fan Option.** A non-variable speed (standard) fan is indicated by one of the following Product Codes: "ED67077 G1," "ED67077 G2," or "ED67077 G3." Multicarrier cabinets with non-variable speed fans contain a fan speed control unit known as the AHD1 circuit pack. This circuit pack is designed to keep the temperature within the cabinet below 65<sup>0</sup> C (149<sup>0</sup> F). Air is drawn in by the three fans located in the front of the cabinet. The air is channeled upwards through a filter, then through carriers A, B, and C and out the top of the cabinet. Air is drawn in by the three fans located in the back of the cabinet as well. The air is channeled down through a filter, then through carriers D and E and out the bottom of the cabinet. The AHD1 circuit pack monitors five of the six temperature sensors located throughout the multicarrier cabinet, and it uses the output of these sensors to adjust fan speed and to report air flow problems. The Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack, a PPN for a High or Critical Reliability system, and the EPN Maintenance circuit pack in an EPN multicarrier cabinet system directly monitor the sixth sensor (S1) to report temperature problems. The Cabinet Sensors maintenance object represents the air flow and temperature problems reported by the AHD1 circuit pack and by the Maintenance/Tape Processor, the Duplication Interface circuit pack, or the EPN Maintenance circuit pack in the multicarrier cabinet systems.

The fans and the AHD1 circuit pack obtain their power from the -48 volt DC power supply of the 631 DB DC power unit in the A carrier. In a PPN cabinet for a High or Critical Reliability system, the 631 DB DC power unit in the B carrier can also provide power to the fans. The power goes from the power unit(s) to the

current limiter card (982LS), over a wiring harness from the A carrier to the back of the fan unit, through the AHD1 circuit pack, and then to the fans. The front fans are wired in parallel with a rear fan. The repair scenarios that follow rely on the technician's ability to distinguish between high fan speed and low fan speed. The only way to distinguish between the fan speeds is by the sound of the fans. When operating at high speed, the fans make a higher pitched sound than when they run at low speed. The technician probably knows from prior experience what the fans sound like at low speed as well as at high speed.

Figure 10-10 shows a multicarrier cabinet system and the location of the temperature sensors S1 through S4 (there are actually two S3 sensors and two S4 sensors) as well as the location of the fans, the AHD1 circuit pack, and the filters. The figure also shows other environment-related components of a multicarrier cabinet system and can be ignored for this section on Cabinet Sensors.

**Figure 10-10. Multicarrier Cabinet Environment Components (CABINET) [Non-Variable Speed Fan Option]**

Sensor S1 informs the Maintenance/Tape Processor, the Duplication Interface circuit pack, or the EPN Maintenance circuit pack when the temperature at the top of the cabinet reaches 65° C (149° F). Sensor S2 is not monitored by any circuit pack. However, when the temperature at the top of the cabinet reaches 70° C (158° F), this sensor causes the Power Distribution Unit to shut down power to the entire cabinet. At this point, Emergency Transfer is invoked, and no other system functions are provided.

The S3 and S4 sensors constantly report the temperature at the air exhaust in the cabinet (top and bottom S3 sensors) and at the air intake (S4 sensors). The AHD1 circuit pack uses this information to determine fan speed and air flow

alarm state. If there is at least a 15 °C (27 °F) air temperature difference between the air exhaust and air intake, **and** if the air exhaust temperature is greater than 50 °C (122 °F), all the fans are turned up to high speed. If this condition exists, the AHD1 circuit pack reports an air flow problem which results in a Minor alarm against the Cabinet Sensors.

**Variable Speed Fan Option.** A variable speed fan is indicated by the Product Code "ED67077 G'x,'" where 'x' is '4' or a number greater than '4.' A variable speed fan contains Thermal Speed Control and an alarm circuit. As a result, the AHD1 circuit pack is not required in this type of fan.

A variable speed fan has two connectors: a two pin connector for the -48 volt input power for backward compatibility, and the five pin Molex connector for speed control and alarm circuitry. The -48 volt power circuitry is isolated from the speed control and the alarm circuitry.

An alarm lead from all six variable speed fans is tied to a single lead leading to the processor circuit pack. Three fans on the front of the system are connected to an S3 sensor, which monitors the exhaust air temperature above carrier position "C." Three fans on the back of the system are connected to another S3 sensor, which monitors the exhaust air in the power distribution unit. The speed of the variable speed fans is determined by the temperature detected by the S3 sensors. Thus, the fans' speed changes continuously according to the temperature of the exhaust air. If the fan speed drops below the preset limit, or if the fan fails, the fan alarm circuit reports an air flow problem, which results in a minor alarm.

A multicarrier cabinet containing variable speed fans is presented in Figure 10-11. Note that the two S4 sensors that are included with non-variable speed fans are not required with variable speed fans.

 **NOTE:**

The new variable speed fans are backward compatible to the carriers for the non-variable speed fans. However, the carriers for the variable speed fans are not backward compatible to cabinets configured for the carriers for the non-variable speed fans. Finally, the carriers for the non-variable speed fans are not forward compatible to cabinets configured for the carriers for variable speed fans.

**Figure 10-11. Multicarrier Cabinet Environment Components (CABINET) [Variable Speed Fan Option]**

**Replacement Procedures for AHD1 Fan Speed Controller Circuit Packs and Fans**

**AHD1 Fan Speed Controller Circuit Pack Replacement Procedure**

**NOTE:**  
The procedures in this section pertain only to non-variable speed (standard) fans.

1. Refer to Chapter 5, "Routine Maintenance Procedures", for details on removing power from the system.
2. Remove the fan assembly cover by pulling the cover outward.
3. Loosen and remove the retaining screw nearest the power plug on the front fan located to the extreme left.
4. Disconnect the power plug from the fan.
5. Loosen and remove the other retaining screw on the fan.
6. Remove the fan from the fan assembly.

**CAUTION:**

***DO NOT TOUCH! Resistors on the circuit pack are hot.***

7. Lift the latch on the AHD1 fan speed controller circuit pack.
8. Using the latch as a handle, pull the circuit pack up and out of its holder.
9. Insert a replacement AHD1 circuit pack, and push down on the latch until the latch snaps in place.
10. Position the fan, and reconnect the fan power plug.
11. Insert and tighten the retaining screws.
12. Replace the fan assembly cover.
13. Refer to Chapter 5, "Routine Maintenance Procedures", for details on restoring power to the switch.

## Fan Replacement Procedure

**NOTE:**

The procedures in this section pertain to both non-variable speed (standard) fans and variable speed fans.

First, determine which fans are defective:

**NOTE:**

The following instructions are for servicing a Medium Cabinet. For a Small Cabinet (only two fans in the rear), follow Step 2A below, but start from the rear of the cabinet.

1. If any fan is **not** rotating, a more detailed inspection is required to determine why the fan has stopped operating. The fact that a fan is not spinning is not always proof that it is damaged. Since each front fan is electrically in parallel with a rear fan, an internal short circuit in a front fan prevents power from reaching the rear fan (and vice versa).

Remove the fan assembly cover by pulling the cover outward. Remove the power connector from each inoperative front fan.

2. The following must be done to determine if the front fan or the rear fan has failed:

a. Test the front fan:

Measure the input impedance between the (+) and (-) input terminals of the front fan with an ohmmeter. **IMPORTANT: Attach the "common" lead of the ohmmeter to the fan's (-) input terminal and the "ohms" or "+" lead of the ohmmeter to the fan's (+) input terminal.**

Follow the guidelines in the table below:

| Input Impedance   | Fan Analysis  | Action  | Next Step     |
|-------------------|---------------|---------|---------------|
| 2.0M < ohms < 20M | Good          | None    | Go to Step 2B |
| ohms < 2.0M       | Short Circuit | Replace | Go to Step 3  |
| ohms > 20M        | Open Circuit  | Replace | Go to Step 3  |

b. Test the "paired" rear fan:

From the front of the cabinet, use a voltmeter to measure the DC voltage across the two female contact pins in the connector housing of the fan wire harness removed from the inoperative front fan in Step 1. (This voltage is the same voltage seen across the input terminals of the paired fan in the rear of the assembly.)

Follow the guidelines in the table below:

| Input Impedance | Fan Analysis  | Action                     | Next Step    |
|-----------------|---------------|----------------------------|--------------|
| VDC > 25V       | Good          | (AHD1 or Front Fan failed) |              |
| VDC < 25V       | Short Circuit | Replace                    | Go to Step 3 |

3. To replace a fan located at the front of the switch cabinet, remove the fan assembly cover by pulling the cover outward. To replace a fan located at the rear of the switch cabinet, use a No. 10 slot screwdriver or 5/16-inch (8mm) wrench and remove the panel covering the fan assembly.
4. Loosen and remove the retaining screw nearest the power plug on the defective fan.

 **DANGER:**  
*48-volt power is present on the fan plug.*

5. Disconnect the power plug from the defective fan.
6. Loosen and remove the other retaining screw on the fan.

- 7. Remove the fan from the fan assembly.
- 8. Position the replacement fan and reconnect the fan power plug.
- 9. Insert and tighten the retaining screws.
- 10. Replace the fan assembly cover or panel.

Hardware Error Log Entries and Test to Clear Values

| Cabinet Sensors Error Log Entries |          |                                       |             |              |                           |
|-----------------------------------|----------|---------------------------------------|-------------|--------------|---------------------------|
| Error Type                        | Aux Data | Associated Test                       | Alarm Level | On/Off Board | Test to Clear Value       |
| 0 <sup>1</sup>                    | 0        | Any                                   | Any         | Any          | test environment P sh r 1 |
| 1                                 | Any      | Cabinet Temperature Query Test (#122) | MINOR       | ON           | test environment P sh r 3 |
| 257                               | Any      | Cabinet Temperature Query Test (#122) | MAJOR       | ON           | test environment P sh r 3 |

- 1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery & Battery Charger Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                               | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|------------------------------------------------------|---------------------|--------------------|-------------------|
| Battery & Battery Charger Query Test (#5) (a)        | X                   | X                  | ND                |
| AC Power Query Test (#78) (b)                        | X                   | X                  | ND                |
| Power Unit Query Test (carrier E) (#127) (c)         | X                   | X                  | ND                |
| Power Unit Query Test (carrier D) (#127) (c)         | X                   | X                  | ND                |
| Power Unit Query Test (carrier A) (#127) (c)         | X                   | X                  | ND                |
| Power Unit Query Test (carrier B) (#127) (c)         | X                   | X                  | ND                |
| Power Unit Query Test (carrier C) (#127) (c)         | X                   | X                  | ND                |
| Emergency Transfer Query Test (#124) (d)             | X                   | X                  | ND                |
| Cabinet Temperature Query Test (#122)                | X                   | X                  | ND                |
| External Alarm Lead Query Test (#120) (e)            | X                   | X                  | ND                |
| Analog Ring Generator Initialization Test (#117) (f) | X                   | X                  | ND                |
| Analog Ring Generator Query Test (#118) (f)          | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Notes:

- a. Refer to POWER (Battery & Battery Charger) Maintenance documentation for a description of this test.

- b. Refer to AC-POWER (AC-Power) Maintenance documentation for a description of this test.
- c. Refer to CARR-POW (Carrier Port Power Unit for AC- and DC-Powered Systems) Maintenance documentation for a description of this test.
- d. Refer to EMG-XFER (Emergency Transfer) Maintenance documentation for a description of this test.
- e. Refer to EXT-DEV (External Alarm) Maintenance documentation for a description of this test.
- f. Refer to RING-GEN (Analog Ring Generator) Maintenance documentation for a description of this test. This test shows up in the test sequence only if there is a TN768 Tone-Clock circuit pack in the port network being tested.

**Cabinet Temperature Query Test [for Non-Variable Speed Fans] (#122)**

This test queries the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN for the status of the cabinet sensors in the cabinet that contains non-variable speed fans.

**⇒ NOTE:**  
The descriptions for Error Codes 1 and 2 (FAIL) in the following table are reversed for Generic 1 systems that use a TN731B maintenance circuit pack . That is, Error Code 1 indicates an "over temperature" problem while Error Code 2 indicates and "air flow" problem. If you are servicing a Generic 1 system, be sure to follow the proper service strategy.

**Table 10-71. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans]**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                |

|------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | FAIL<br>(cont'd.) | <div>4. If the fans are not at high speed, measure the cabinet temperature at the air intake and the air exhaust at the top of the cabinet.<div>a. If the 15<sup>0</sup> C/50<sup>0</sup> C criteria is met, there is a problem with either the AHD1 circuit pack or the fans that is preventing the fans from operating at high speed. Replace the AHD1 circuit pack and/or the fans. If this succeeds in getting the fans to run at high speed, wait five minutes to give the cabinet time to cool down and, rerun the test. If the problem persists, go to step 5.<div>b. If the 15<sup>0</sup> C/50<sup>0</sup> C criteria is not met, the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack is incorrectly reporting this condition. Look for and resolve all errors on these maintenance objects first, then rerun the test. If the test still fails, escalate the problem.</div></div></div> <div>5. If the fans are running at the high speed, check the items on list that follows. Any on of the items could be restricting or redirecting the flow of air within the cabinet.<div>a. Check both filters. If a filter is dirty or clogged it should be cleaned or replaced. The filters can either be washed with soap and water or vacuumed.<div>b. Make sure there is nothing (other than circuit packs) in the carrier slots that could be restricting the air flow.<div>c. Make sure there are no missing (blank) circuit pack or carrier faceplates. Install and/or replace them as necessary.<div>d. Make sure the cabinet door is properly closed. The door must be closed for the fans to be able to properly cool the cabinet. Wait five minutes to give the fans a chance to cool the cabinet. Rerun the test. If the tests still fails, proceed to Step 6.</div></div></div></div></div> |

Table 10-71. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans] — Continued

| Error Code | Test Result       | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | FAIL<br>(cont'd.) | <p>6. At this point, there should be nothing impeding the air flow, and the fans should be running at high speed. Check the temperatures for the 15<sup>0</sup> C/50<sup>0</sup> C criteria.</p> <p>a. If the 15<sup>0</sup> C/50<sup>0</sup> C criteria exists, a temperature problem exists, and the fans (at high speed) should cool down the switch. Wait five minutes and rerun the test. If the test still fails, the ambient room temperature is probably too high, and the room should be cooled.</p> <p>b. If the 15<sup>0</sup> C/50<sup>0</sup> C criteria does not exist, the AHD1 circuit pack, the fans, or the S3 or S4 sensors are defective. Replace these items one at a time (in the order listed). Rerun the test between each replacement. Failures can occur on the Maintenance/Tape Processor, the Duplication Interface, and the EPN Maintenance circuit pack that <b>are not</b> detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If this does not clear the problem, follow normal escalation procedures.</p> |

Table 10-71. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans] — Continued

| Error Code | Test Result       | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2          | FAIL<br>(cont'd.) | <p>4. Check the temperature at the top of the cabinet. If the temperature is at least 65<sup>0</sup> C (149<sup>0</sup> F), the ambient room temperature is too high, and the fans cannot cool the system. Unless the room temperature is reduced, the system is going to shut down soon. If the temperature is less than 65<sup>0</sup> C, then:</p> <p>a. The PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may be incorrectly reporting this condition. First, look for and resolve all errors on these MOs, then rerun the test. If this test fails again, return to Step 1. If there are no errors, continue.</p> <p>b. The sensor S1 may be incorrectly reporting the temperature at the top of the cabinet. Replace sensor S1, and rerun the test. If the test still fails, escalate the problem.</p> |
| 3          | FAIL              | The AHD1 circuit pack has reported both air flow and temperature problems. Resolve the airflow error first, then, correct the temperature error as described previously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | PASS              | The AHD1 circuit pack has not reported any temperature or air flow problems. The temperatures at the air exhaust at the top of the cabinet and the air intake at the bottom of the cabinet can be measured and the results compared against the criteria described previously. If a problem has been reported, troubleshoot this problem by using the procedures for the "FAIL" cases described previously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## CAP-MEM (Memory Card Capacity)

| MO Name (in Alarm Log) | Alarm Level                    | Initial Command to Run | Full Name of MO      |
|------------------------|--------------------------------|------------------------|----------------------|
| CAP-MEM                | MINOR/<br>WARNING <sup>1</sup> | test card-mem long     | Memory Card Capacity |

1. The WARNING alarm is generated when the alarm is downgraded by using the **set option** command.

Memory Card Capacity tracks the percentage of used translation storage space on the memory card. Whenever translation space usage on the memory card reaches 98% of capacity, an alarm is generated. This alarm serves to inform the user that a larger flash card may be required for the system.

### Error Log Entries and Test to Clear Values

Table 10-72. Memory Card Capacity Error Log Entries

| Error Type | Aux Data | Associated Test                   | Alarm Level           | On/Off Board | Test to Clear Value |
|------------|----------|-----------------------------------|-----------------------|--------------|---------------------|
| 1 (a)      | 112      | Memory Card Capacity Test (#1014) | MINOR/<br>WARNING (b) | OFF          | test card-mem long  |

Notes:

- a. The memory card translation storage space is at least or more than 98% full.
- b. This alarm has been downgraded by the **set option** command.

### System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table that follows when you are inspecting errors in the system. By clearing error codes associated with the "Memory Card Capacity Test," for example, you may also clear errors generated from other tests in the testing sequence. The "Memory Card Capacity Test" can be initiated via either the **test card-mem long** command or after a **save translation** command.

| Order of Investigation                                 | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------|---------------------|--------------------|-------------------|
| 12 Volt Power Supply Test (#701) (a)                   | X                   | X                  | ND                |
| Memory Card Insertion Test (#695) (b)                  | X                   | X                  | ND                |
| Memory Card Format and Read Test (#696) (b)            | X                   | X                  | ND                |
| Memory Card Match Test (#697) (b)                      | X                   | X                  | ND                |
| Memory Card Write-Protected Test (#698) (b)            | X                   | X                  | ND                |
| Memory Card Directory Recovery Test (#699) (b)         | X                   | X                  | ND                |
| Memory Card Translation Data Integrity Test (#694) (b) |                     | X                  | ND                |
| Memory Card Erase/Write/Read Test (#693) (b)           |                     | X                  | ND                |
| Memory Card Capacity Test (#1014)                      |                     | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Notes:

- a. Refer to 12V-PWR (12 Volt Power Supply) Maintenance documentation for a description of this test.
- b. Refer to CARD-MEM (Memory Card) Maintenance documentation for a description of this test.

Memory Card Capacity Test (#1014)

This test is a nondestructive test. The purpose of the test is to verify that the percentage of translation storage space used in the memory card is less than 98%.

This test can be initiated through a system technician demanded **test card-mem long** command, or it can be executed as part of a maintenance test sequence after the **save translation** operation.

Table 10-73. TEST #1014 Memory Card Capacity Test

| Error Code           | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                              |

## CARD-MEM (Memory Card)

| MO Name (in Alarm Log) | Alarm Level        | Initial Command to Run | Full Name of MO |
|------------------------|--------------------|------------------------|-----------------|
| CARD-MEM               | MAJOR <sup>1</sup> |                        | Memory Card     |
| CARD-MEM               | MINOR              | test card-mem long     | Memory Card     |
| CARD-MEM               | WARNING            | test card-mem sh       | Memory Card     |

1. The "MAJOR" alarm occurs only at power-up time or on a Reset System 3, 4, or 5 when the switch cannot load all translations from the memory card.

A memory card contains a set of flash EPROM memory devices. The data can be stored in a memory card and can remain nonvolatile, even when the power is off. The memory card is installed into the TN777B NETCON circuit pack to save the translations, announcements, and core dumps. During the system reboot or a system power down condition, the in-core system maintenance hardware error logs are temporarily saved in the memory card before the system goes down. When the system is restarted, the error logs file is read back from the memory card.

The Hard Patch feature also uses the memory card as temporary storage when LMM applies an update file to the in-core system software. The system software is stored in the "flash" section of main memory. The memory card used for saving translations doesn't contain a copy of the system software.

The recommended size of a memory card for each configuration is described in the following table.

| Memory Card Size | Usage                 | File Names                          |
|------------------|-----------------------|-------------------------------------|
| 1 Megabyte       | Without Announcements | translation                         |
| 4 Megabyte       | With Announcements    | translation announcements           |
| 10 Megabyte      | With Announcements    | translation announcements           |
| 10 Megabyte      | Maintenance           | translation announcements core_dump |
| 10 Megabyte      | System Upgrade        | system_software                     |

Customers can have either 1 MB, 4 MB, or 10 MB memory cards for the normal operations. 10 MB memory cards are also used for maintenance and software upgrades. The software upgrade memory card cannot be used for saving translations.

Always use 4 MB memory Cards, 10 MB memory cards should only be used when a 4MB card gives an error in the CAP-MEM Maintenance Object Test #1014 (Memory Card Capacity Test).

A memory card has a write-protection switch along its edge. If the write-protection switch is enabled, the memory card cannot be written to.

The 12 volt power supply unit located in TN777B NETCON circuit pack supports the erase and write operations of flash memory devices in the TN786B or TN790 Processor circuit pack. The unit also supports the memory card inserted in the TN777B NETCON circuit pack. If the 12 volt power supply unit cannot be turned on to supply 12 volts, all erase and write operations fail. Refer to 12V-PWR (12 volt power supply) Maintenance documentation for a detailed description.

To write data (for example, translations) onto a memory card, the system software first erases the memory card and then writes the data. An erased bit can be written again, but a written bit cannot be changed or written again until after the next erasure. Software erase and write operations on a memory card take longer as the card usage increases. A memory card that cannot be erased or written to by software should be replaced.

## **Removing A Memory Card From The Slot**

---

A memory card can be removed from the slot at the TN777B NETCON circuit pack only when the fourth yellow LED with a label "card-in-use" is not glowing. Otherwise, the memory card operation might be interrupted abnormally, and the files stored in the memory card may become corrupted.

## **Resolving an Alarm Raised Against a Memory Card**

---

The list that follows discusses the procedures for resolving an alarm that is raised against a memory card:

1. Remove the inserted memory card from the slot at the TN777B NETCON circuit pack while the "card-in-use" amber LED on TN777B is not glowing.
2. Insert the new formatted memory card firmly into the slot at the TN777B NETCON circuit pack.
3. Enter the **test card-mem** command to verify the new memory card.
4. If the alarm cannot be resolved by replacing the memory card, do the following:
  - a. Remove the memory card from the TN777B NETCON circuit pack.
  - b. Replace the TN777B NETCON circuit pack in the appropriate control carrier. Since the TN777B is in the SPE control complex, follow the standard procedures for replacing an SPE circuit pack.
  - c. Insert the memory card back into the slot at the TN777B circuit pack.
  - d. Enter the **test network-control [long]** command to verify the new TN777B and the memory card.

5. Once the alarm is resolved, enter the **save translation** command to store the current system translations to the memory card.
6. If applicable, enter the **save announcements** command to store the current announcements to the memory card.

Error Log Entries and Test to Clear Values

Table 10-74. Mrmory Card Error Log Entries

| Error Type     | Aux Data                        | Associated Test                                    | Alarm Level     | On/Off Board | Test to Clear Value |
|----------------|---------------------------------|----------------------------------------------------|-----------------|--------------|---------------------|
| 0 <sup>1</sup> | 0                               | Any                                                | Any             | Any          | test card-mem       |
| 1(a)           |                                 | Memory Card Insertion Test (#695)                  | MINOR           | OFF          | test card-mem       |
| 257(b)         |                                 | Memory Card Format and Read Test (#696)            | MINOR           | OFF          | test card-mem       |
| 513(c)         | Any                             | Memory Card Match and Read Test (#697)             | WARNING         | OFF          | test card-mem       |
| 769(d)         |                                 | Memory Card Write-Protected Test (#698)            | WARNING         | OFF          | test card-mem       |
| 1025(e)        | 104<br>105<br>106<br>107<br>108 | Memory Card Dir. Recovery Test (#699)              | MINOR           | OFF          | test card-mem       |
| 1281(f)        | Any                             | Memory Card Translation Data Integrity Test (#694) | MINOR           | OFF          | test card-mem long  |
| 1537(g)        | 104<br>105<br>106<br>107<br>108 | Memory Card Erase/Write/Read Test (#693)           | MINOR           | OFF          | test card-mem long  |
| 3329(h)        | any                             | None                                               | MINOR/<br>MAJOR | OFF          |                     |
| 3841(i)        | Any                             | Save Translation                                   | MINOR           | OFF          | save translation    |
| 3843(j)        | Any                             | Save Translation                                   | MINOR           | OFF          | save translation    |

1. Run the Short Test sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. System detects that no memory card is inserted in the slot at the TN777B NETCON circuit pack. If a memory card is in place, the memory card may have a bad physical connection.
- b. System software cannot recognize the inserted memory card because the inserted memory card is not formatted or the directories in the memory card are corrupted. The system cannot use this memory card. The memory card must be replaced with a good memory card.
- c. The inserted memory card does not have enough storage space to support system operations, such as saving translations and, if applicable, announcements; or, the memory card is a system-upgrade memory card that cannot be used for saving translations. This hardware error raises a WARNING/OFF\_BOARD alarm. The memory card should be replaced with one of the recommended size.

The "Aux Data" field contains the following error codes:

- 101: Inserted memory card is a system-upgrade memory card
  - 102: While the announcement feature is in use, no announcement file is available in the memory card
  - 103: The inserted memory card is a system-upgrade memory card, and, while the announcement feature is in use, no announcement file is available in the memory card.
  - 116: The capacity of the inserted memory card doesn't match the system configuration.
  - 118: While the announcement feature is in use, no announcement file is available in the memory card, and the capacity of the inserted memory card doesn't match the system configuration.
  - 132: System translation reaches a 98% capacity of the memory card reserved storage space.
  - 134: While the announcement feature is in use, no announcement file is available in the memory card, and system translation reaches a 98% capacity of the memory card reserved storage space.
  - 148: The capacity of the inserted memory card doesn't match the system configuration, and system translation reaches a 98% capacity of the memory card reserved storage space.
  - 150: While the announcement feature is in use, no announcement file is available in the memory card, and the capacity of the inserted memory card doesn't match the system configuration. Also, the system translation reaches a 98% capacity of the memory card reserved storage space.
- d. The write-protection switch of the memory card is in the "protected" position. A write-protected memory card can not be erased or written. Before entering the **test** command to resolve the alarm, follow the

standard procedure for taking the memory card out of the slot. Then, change the "write-protection" switch to the "not-protected" position. Finally, insert the memory card back into the slot.

- e. The memory card has been detected with a broken directory. A MINOR/OFF\_BOARD alarm is raised when maintenance cannot restore the broken directory. The memory card must be replaced before the test to resolve the alarm is run.

The "Aux Data" field contains the following error codes:

- 104: Directories on the memory card are corrupted and cannot be recovered.
  - 105: "0" cannot be written into the memory card before an erase operation.
  - 106: Memory card cannot be erased.
  - 107: Data cannot be written into a memory card after an erasure.
  - 108: 12 volt power supply for directory recovery can't be turned on. The 12 volt power supply on TN777B NETCON circuit pack may be defective. Follow the standard procedure to replace the TN777B NETCON circuit pack.
- f. The translations file stored in the memory card is corrupted with a checksum error during the read operation. The memory card can no longer hold the written data. Enter the **save translation** command to restore the translations. Then, run the **test** command to clear the alarm. If the error occurs repeatedly, replace the memory card.
  - g. The maintenance test "Memory Card Erase/Write/Read Test" failed. Enter the **status card-mem** command to verify that a user's memory card is inserted and that the write-protection switch of the memory card is off. Rerun the **test card-mem** command to verify that the 12 volt power supply is functional.

Enter the **test card-mem long** command again to verify the test result of the "Memory Card Erase/Write/Read Test." If the test still fails, the memory card should be replaced. After the new memory card is inserted, enter the **test card-mem long** command again to resolve the alarm.

The "Aux Data" field contains the same error codes as for Error Type "1025." See Note (e).

- h. There was an error while translations were being loaded. The relevant alarm occurs at power-up or on a Reset System 3, 4, or 5 if the switch cannot load translations.

In a standard system, the alarm invokes Emergency Transfer. The repair procedure for a standard system is provided in the list that follows:

**⇒ NOTE:**  
Follow this procedure **only** if there are no other memory card errors or alarms. If such errors or alarms exist, resolve them before trying to resolve this alarm.

1. After you resolve all other memory card problems, issue the **reset system 3** command.
2. After the system is restarted, issue the **status card-mem** command.
3. If the "translation" is not present, insert a backup memory card and then issue the **reset system 3** command.

**⇒ NOTE:**  
In a High or Critical Reliability System where the problem is in the Standby SPE, use the procedure above substituting **reset spe-standby 3** and **status card-mem a/b** for the Standby SPE.

- i. The "save translation" operation failed. The reasons for failure are described in the "Aux Data" field and include the following:

| Aux Data | Description                                                           |
|----------|-----------------------------------------------------------------------|
| 1        | Directory file on the memory card failed the checksum test            |
| 2        | NETCON is not a TN777B circuit pack                                   |
| 3        | Too many commands are running                                         |
| 4        | Command has been aborted                                              |
| 5        | Command has collided with a current command                           |
| 6        | Software controller is idle                                           |
| 7        | Memory card has been erased                                           |
| 8        | Only one good directory is on the card                                |
| 9        | All directories are corrupted, and the memory card needs reformatting |
| 10       | Hard patch file is full                                               |
| 11       | Hardware fault: data can't be written into the memory card            |
| 12       | Software error: passed parameters were out of range                   |
| 13       | Command has been aborted                                              |
| 14       | Magic number is illegal                                               |
| 15       | Driver was trapped when reading the memory card                       |
| 16       | No memory card is inserted                                            |

|     |                                                                 |
|-----|-----------------------------------------------------------------|
| 17  | Second directory in the memory card could not be found          |
| 18  | File in the memory card is not available                        |
| 19  | Memory card does not match the system usage                     |
| 20  | Memory card is too small for the system usage                   |
| 21  | Broken directory couldn't be recovered                          |
| 22  | System upgrade card is inserted                                 |
| 23  | Illegal write is requested                                      |
| 24  | Generic software failure                                        |
| 25  | Driver timed out                                                |
| 26  | Driver is unable to program "O's" in the memory card            |
| 27  | Memory card can't be erased                                     |
| 28  | Memory card is write-protected                                  |
| 29  | 12 volt power supply could not be turned on                     |
| 109 | Standby SPE does not respond to the request from the Active SPE |
| 124 | Can't access Standby SPE for saving translation                 |

---

A MINOR/OFF\_BOARD alarm is raised when two consecutive "save translation" operations fail. The alarm is resolved only when the translation is saved onto the memory card successfully.

- j. The save translations failure is due to other hardware failures. Enter the **test card-mem long** command and resolve other card-mem failures first. After the all test card-mem pass message is received, use the **save translation** command to resolve this error.
-

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the *Memory Card Insertion Test* for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                             | Short Test Sequence | Long Test Sequence | Reset Board Sequence | D/ND <sup>1</sup> |
|----------------------------------------------------|---------------------|--------------------|----------------------|-------------------|
| 12 Volt Power Supply Test (#701) (a)               | X                   | X                  |                      | ND                |
| Memory Card Insertion Test (#695)                  | X                   | X                  |                      | ND                |
| Memory Card Format and Read Test (#696)            | X                   | X                  |                      | ND                |
| Memory Card Match Test (#697)                      | X                   | X                  |                      | ND                |
| Memory Card Write-Protected Test (#698)            | X                   | X                  |                      | ND                |
| Memory Card Directory Recovery Test (#699)         | X                   | X                  |                      | ND                |
| Memory Card Translation Data Integrity Test (#694) |                     | X                  |                      | ND                |
| Memory Card Erase/Write/Read Test (#693)           |                     | X                  |                      | ND                |

1. D = Destructive; ND = Nondestructive

- Note:
- a. Refer to 12V-PWR (12 Volt Power Supply) Maintenance documentation for a description of this test.

Memory Card Erase/Write/Read Test (#693)

The purpose of this test, which is nondestructive, is to verify the erase, write, and read operations. The test erases the backup copy of the translation file stored in the memory card, and it verifies that the erase operation works. The test then writes the primary copy of the translation file from the same memory card to the erased flash segment, and it verifies that the translation file is written successfully.

This test can be initiated through a system technician demanded **test card-mem long** command, or it can be executed as part of a maintenance test sequence when the **save translation** and **save announcements** operations fail. The test and relevant applications (for example, saving translations, saving announcements) cannot be executed at the same time.

Table 10-75. TEST #693 Memory Card Erase/Write/Read Test

| Error Code           | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                       |

Memory Card Translation Data Integrity Test  
(#694)

This test, which is nondestructive, verifies the integrity of the translation file stored in the memory card by reading (without any PREC updates) the translation file from the memory card and by then performing a checksum error checking. The calculated checksum value is compared with the recorded checksum value in the translation file. If these two values are different, this indicates that the translation file is corrupted.

Table 10-76. TEST #694 Memory Card Translation Data Integrity Test

Memory Card Insertion Test (#695)

This test, which is nondestructive, verifies whether a memory card is inserted into the memory card slot at the TN777B NETCON circuit pack and also whether the system can detect its existence.

Table 10-77. TEST #695 Memory Card Insertion Test

| Error Code           | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                      | FAIL        | No memory card is inserted in the TN777B NETCON circuit pack, or the inserted memory card has a bad connection.<br><br>1. Insert a memory card into the slot at the TN777B NETCON circuit pack.<br><br>2. If a memory card is already inserted, take the memory card out and examine the connectors of the memory card and the TN777B NETCON circuit pack. Insert the memory card into the slot again.<br><br>3. When a memory card is pushed into the slot, make sure that the memory card is inserted firmly into the slot.<br><br>4. Re-enter the <b>test card-mem</b> command. If the test still fails, replace the memory card, and then repeat this step one more time.<br><br>5. If the test still fails after you replace the memory card, replace the TN777B NETCON circuit pack. Follow the Standard Repair Procedures for a memory card. |
|                      | PASS        | A memory card is inserted into the TN777B NETCON circuit pack, and the system can recognize its existence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Memory Card Format and Read Test (#696)

This test is a nondestructive test. The memory card must be formatted before an application. The test reads the directory file from the memory card, and it verifies the integrity of the directory file.

Table 10-78. TEST #696 Memory Card Format and Read Test

| Error Code           | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                   |

|                      | PASS        | System recognizes the inserted memory card, and it can read the directories from the memory card.                                                                                                                                                                                             |

Memory Card Match Test (#697)

This test is a nondestructive test. The test verifies the inserted memory card for consistency with the system configuration. The test helps answer the following questions:

- Is the inserted memory card a system software upgrade card?
- Does the size of the inserted memory card match the capacity of the system configuration?

- Does the inserted memory card contain the Announcement file for a system with an Announcement circuit pack?
- Does the size of the translations in the system reach 98% of the reserved storage space on the memory card?

If the answer to any of these questions is "yes," maintenance raises a WARNING alarm for service attention. A new memory card is usually required.

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 150        | FAIL        | While the announcement feature is in use, no announcement file is available in the memory card, and the capacity of the inserted memory card doesn't match the system configuration. Also, system translation reaches a 98% capacity of the memory card reserved storage space.<br><br>1. Replace the memory card with one of a larger size. See the system configuration guidelines.<br><br>2. Retry the command at 1-minute intervals a maximum of 5 times. |
|            | PASS        | The inserted memory card matches the system configuration, and the card has enough space for saving translations and (if applicable) announcements.                                                                                                                                                                                                                                                                                                           |

Memory Card Write-Protection Test (#698)

This test, which is nondestructive, verifies whether the write-protected switch on the memory card is turned on. The memory card cannot be erased or written to when the write-protected switch is on.

Table 10-80. TEST #698 Memory Card Write-Protected Test

| Error Code           | Test Result | Description/ Recommendation                                                                                                                                                                                                    |

|            | PASS        | The inserted memory card is not write-protected.                                                                                                                                                                                                                                                                         |

Memory Card Directory Recovery Test (#699)

This test is a nondestructive test. All memory cards, except the memory card for system software upgrade, have two copies of both directory files and translation files to ensure that there is at least a good translation file in the memory card at any time, especially during the "save translation" operation.

If one of the two directory files (for example, the directory file) is missing or broken (for example, the directory file has a bad checksum), maintenance can build the directory file. The Memory Card Directory Recovery Test

- Verifies the integrity of both active and backup directory files in a memory card, and
- Requests a rebuilding of the directory file if the file is missing or corrupted.

When the test passes, both directories are sane. If the memory card is a system-upgrade memory card, the test is aborted. If the test fails, the broken or missing directory cannot be rebuilt. As a result, all subsequent "write-to-memory card" operations are blocked. When an alarm is raised and Error Type 1025 for "CARD-MEM" is active, replace the memory card.

If Test 701 fails, follow the Standard Repair Procedure to replace the TN777B NETCON circuit pack with a new TN777B circuit pack.<br><br>3. Retry the command at 1-minute intervals a maximum of 5 times. |
|            | PASS        | Both directory files in the inserted memory card are sane.                                                                                                                                                                                                                                                                    |

## CARR-POW (Carrier Port Power Unit) for AC-Powered Systems

| MO Name As It Appears in Alarm Log | Alarm Level | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO         |
|------------------------------------|-------------|-------------------------------------------------------|-------------------------|
| CARR-POW                           | MAJOR       | recycle carrier PC                                    | Carrier Port Power Unit |

1. Recycle the carrier indicated by the PORT field in the Alarm Log.

DEFINITY Generic 1 offers two basic cabinet type configurations: (1) the multicarrier cabinet system and (2) the single-carrier cabinet system. Both cabinet system configurations may be powered by either an external AC or DC power source.

**NOTE:**  
For environment maintenance, the aspects of a PPN configuration for a High or Critical Reliability system or of an EPN cabinet configuration are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Therefore, refer to the following list to find the appropriate MO section(s).

- For a single-carrier cabinet system, refer to the "DC-POWER" Maintenance documentation for environment maintenance strategy.
- For a multicarrier cabinet system using an external AC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER", "CUST-ALM (Customer-Provided Alarming Device)", or "POWER (Battery & Battery Charger) for AC-Powered Systems".
- For a multicarrier cabinet system using an external DC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for DC-Powered Systems", "CUST-ALM (Customer-Provided Alarming Device)", or "POWER (Battery & Battery Charger) for DC-Powered Systems".

Every carrier in the system must be supplied with +5 volt, -48 volt, and -5 volt DC power for the various circuit packs to operate properly. This power is supplied to the carriers as follows: AC from a wall outlet comes into the PDU, which distributes the power via a set of fuses (F1 to F7) to the power units. Each carrier in the system is equipped with two power units: the 631 DA AC power unit and the 631 DB AC power unit, which together supply the required voltages to the carrier. Figure 10-12 illustrates the position of the power unit and the power distribution unit (PDU) and shows which power unit each fuse controls (Figure 10-12 also shows other Environment maintenance-related items that can be

**10** Maintenance Object Repair Procedures*CARR-POW (Carrier Port Power Unit) for AC-Powered Systems*

Page 10-263

ignored for this section on Carrier Port Power Unit). Figure 10-13 illustrates the position of the power unit and the PDU and shows which power unit each fuse controls in a small cabinet (from a System 75 R1V3 upgrade). Figure 10-14 shows the position of the fuses on the PDU and describes how to replace a fuse. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages on the backplane pins. For more information, refer to the "Troubleshooting Backplane Voltage Problems" section found in Chapter 5, "Routine Maintenance Procedures".

The power unit has two LEDs: if the yellow LED is lit it means the power unit is operating as normal; if the red LED is lit it means the power unit has a fault; and if neither is lit it LED means no external power is being supplied. The CARR-POW (Carrier Port Power Unit) MO represents the pair of power units that power each carrier in a multicarrier cabinet system. If a problem is reported by hardware for a power unit on a port carrier, the system can recycle the pair of power units in a port carrier; however, if the problem is reported on a control carrier, the system cannot recycle the pair of power units in a control carrier. In a standard multicarrier cabinet (PPN or EPN) carrier A is the control carrier, and carriers B, C, D, and E are the port carriers. In a High or Critical Reliability system multicarrier cabinet (PPN or EPN), carriers A and B are the control carriers, and carriers C, D, and E are the port carriers. However, carrier B can be recycled only if the Active Expansion Interface Link and Active Tone-Clock circuit pack are in the A carrier.

Loss of the 631 DB Carrier Port DC Power Unit in the active control carrier (the A carrier for a standard system and either the A or B carrier for a High or Critical Reliability system) causes loss of the administration terminal. In a High or Critical Reliability system, the Active SPE should switch to the Standby SPE if there is a CARR-POW alarm.

Recycling a carrier turns off the pair of power units, and turns them back on two seconds later.

**WARNING:**

*Recycling carriers disrupts service for all circuit packs on the carrier.*

The DEFINITY Generic 1 can also support neon message waiting lamps on analog telephones. If this is required, then the carrier(s) that contains the TN769 Analog Neon circuit packs must also be supplied with 165 volt to power the neon lights. The 165 volt can only be supplied by a TN752 or a TN755B power unit circuit pack. The following table lists all power unit and power-related circuit packs for the system and indicates the voltages they can supply. Figure 10-12 through Figure 10-17 show a schematic of each power unit type. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages

on the backplane pins. Refer to Chapter 2 in *DEFINITY Communications System Generic 1 and Generic 3 Installation and Test*, 555-230-104.

| Power Supply | +5  | -48V | -5V | 165V | Cabinet Position |
|--------------|-----|------|-----|------|------------------|

Figure 10-13. Small Cabinet Environment Components (CARR-POW)

BACK OF POWER DISTRIBUTION UNIT

FRONT OF POWER DISTRIBUTION UNIT

FUSE F8 (5A AC) IS LOCATED ON THE  
BACK OF THE PDU ABOVE THE  
CONVENIENCE OUTLET AND IS NOT SHOWN

FUSES F1-F7 ARE ILLUSTRATED AT THE LEFT.  
WHEN REPLACING ONE OF THESE FUSES, CARE  
MUST BE TAKEN TO INSTALL THEM FUSE TIP  
FIRST.  
FUSES F8-F9 ARE SYMMETRICAL AND CAN BE  
INSERTED EITHER WAY.

## **Power Unit Replacement Procedures**

The procedures for replacing the various power units are given below:

### **Replacing a 631AR or 631BR AC Power Unit**

If the power unit to be replaced is in a control carrier of a PPN system, refer to "Removing Power" and "Restoring Power" in Chapter 5, "Routine Maintenance Procedures", before replacing the power unit. To replace the power unit, implement the following steps:

1. Set the power switch to OFF, and unplug the power cord.
2. Move the locking slide on the power unit to its leftmost position and unlatch the locking lever.
3. Remove the power unit from the carrier.

4. Before installing the replacement power unit in the carrier, turn the power unit on its side and operate rocker switches 1 through 4 on the dip switch as follows:

| Switch | 631AR Position | 631BR Position |
|--------|----------------|----------------|
| 1      | open           | open           |
| 2      | closed         | closed         |
| 3      | open           | open           |
| 4      | closed         | open           |

 **NOTE:**  
In the open position, the rocker is down on the side opposite the number. In the closed position, the rocker is down on the side adjacent to the number.

5. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
6. Insert the power unit into the carrier until some resistance is felt.
7. Lift the locking lever upward until it latches.
8. Move the locking lever slide on the power unit to the extreme right position.
9. Connect the power cord and set the power switch to ON.

**Replacing a 631DA or 631DB AC Power Unit**

If the power unit to be replaced is in a control carrier of a PPN system, refer to "Removing Power" and "Restoring Power" in Chapter 5, "Routine Maintenance Procedures" before replacing the power unit. To replace the power unit, follow the procedure below:

1. Unplug the power cord.
2. Move the locking slide on the power unit to the extreme left position and unlatch the locking lever.
3. Remove the power unit from the carrier.
4. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
5. Insert the power unit into the carrier until some resistance is felt.
6. Lift the locking lever upward until it latches.
7. Move the locking lever slide on the power unit to the extreme right position.
8. Connect the power cord and set the power switch to ON.

Replacing a TN736 or TN752 Power Unit Circuit Pack

If the TN736 or TN752 power unit circuit pack is in a control carrier of a PPN system, then refer to the "Handling Control Circuit Packs" section in Chapter 5, "Routine Maintenance Procedures". Replacing either power unit interrupts the -5 volt supply to the carrier. This causes all the analog circuit packs in the carrier to fail their Loop Around Tests and may cause failures in circuit packs in the control complex. After the power unit has been replaced, look for alarms against these maintenance objects. If ANL-LINE alarms exist, refer to Test #47 (Loop Around and Conference Test) in ANL-LINE Maintenance documentation. For CO-TRK alarms, refer to Test #33 (Loop Around and Conference Test) in CO-TRK Maintenance documentation.

Hardware Error Log Entries and Test to Clear Values

Carrier Port Power Unit Error Log Entries

| Error Type     | Aux Data | Associated Test              | Alarm Level | On/Off Board | Test to Clear Value       |
|----------------|----------|------------------------------|-------------|--------------|---------------------------|
| 0 <sup>1</sup> | 0        | Any                          | Any         | Any          | test environment P sh r 1 |
| 1(a)(b)        | 0 or 1   | Power Unit Query Test (#127) | MAJOR       | ON           | test environment P r 2    |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. Where P is an appropriate port network number taken for the PORT field of the Error Log.
- b. Run the Power Unit Query Test (#127) first using the **test environment P r 2** command. Then, if a carrier must be recycled to clear the CARR-POW alarm, use the **recycle carrier PC** command to run the Power Unit Recycle Test (#126). The Power Unit Recycle Test (#126) is not included in either the long or Short Test Sequences.

WARNING:

The Power Unit Recycle Test (#126) is destructive. For more information, refer to the description of this test.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery & Battery Charger Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                               | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|------------------------------------------------------|---------------------|--------------------|-------------------|
| Battery & Battery Charger Query Test (#5) (a)        | X                   | X                  | ND                |
| AC Power Query Test (#78) (b)                        | X                   | X                  | ND                |
| Power Unit Query Test (carrier E) (#127)             | X                   | X                  | ND                |
| Power Unit Query Test (carrier D) (#127)             | X                   | X                  | ND                |
| Power Unit Query Test (carrier A) (#127)             | X                   | X                  | ND                |
| Power Unit Query Test (carrier B) (#127)             | X                   | X                  | ND                |
| Power Unit Query Test (carrier C) (#127)             | X                   | X                  | ND                |
| Emergency Transfer Query Test (#124) (c)             | X                   | X                  | ND                |
| Cabinet Temperature Query Test (#122) (d)            | X                   | X                  | ND                |
| External Alarm Lead Query Test (#120) (e)            | X                   | X                  | ND                |
| Analog Ring Generator Initialization Test (#117) (f) | X                   | X                  | ND                |
| Analog Ring Generator Query Test (#118) (f)          | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Notes:

- a. Refer to POWER (Battery & Battery Charger) Maintenance documentation for a description of this test.

- b. Refer to AC-POWER (AC Power) Maintenance documentation for a description of this test.
- c. Refer to EMG-XFER (Emergency Transfer) Maintenance documentation for a description of this test.
- d. Refer to CABINET (Cabinet Sensors) Maintenance documentation for a description of this test.
- e. Refer to EXT-DEV (External Alarm) Maintenance documentation for a description of this test.
- f. Refer to RING-GEN (Analog Ring Generator) Maintenance documentation for a description of this test. This test only shows up in the test sequence if there is a TN768 Tone-Clock circuit pack in the port network being tested.

Power Unit Recycle Test (#126)

This test is destructive.

This test is destructive because it requires all circuit packs in the recycled carrier to be removed and inserted. These actions cause all calls originating or terminating on circuit packs in this carrier to be dropped. The pair of power units in the specified carrier is recycled. Both power units in the carrier are turned off for two seconds and then back on again. After the power units have been turned back on, the test queries the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of pair of power units in the specified carrier. If both power units are on and functioning, then the test passes. If both power units are not on and functioning, the test fails, and BOTH power units are turned off.

Table 10-82. TEST #126 Power Unit Recycle Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                 |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | <p>System resources required to run this test are not available.</p> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol> |

|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | Both power units in the recycled carrier were found to be healthy by the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system after the power units were powered down and back up. If the status LEDs on both power units are not showing green, then the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the power units. Look for and resolve any alarms on these MOs. |

**Power Unit Query Test (#127)**

This test queries the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of pair of power units in the specified carrier. If both power units are on and functioning, then the test passes. If both are not on and functioning, it fails.

|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL        | <p>There is a problem with one or both power units on the tested carrier.</p> <ol style="list-style-type: none"><li>For each power unit that has all status LEDs OFF, check the AC input to the power unit at the power unit outlet (see Figure 10-12 and Figure 10-13). If there is no AC, then check the appropriate fuses (see Figure 10-14) for the affected power unit. If the fuses are blown out, replace the fuses (see ). If the fuses blow out again or AC does not show up at the power unit outlet, then there is probably a power wiring problem in the cabinet. Follow normal escalation procedures.</li><li>At this point AC should be present at the power unit outlet. If the carrier being tested is the 1A or 2A carrier or the 1B carrier in a High or Critical Reliability system, refer to "Troubleshooting Control Carrier Power Units" in Chapter 5, "Routine Maintenance Procedures". Otherwise, use the <b>recycle carrier PC</b> command (where PC is the appropriate port network and carrier) in an attempt to bring back the power units for this carrier.</li></ol> <p>If the test passes, the trouble is cleared. If the test does not pass, one power unit, or both, in the tested carrier is defective.</p> <p>If only one power unit is defective, the status LEDs on the healthy power unit light green for a moment. When the recycle test determines that both power units are defective, the software turns off power to both the good and defective power units. This causes the status LED(s) on the good power unit to light red.</p> <ol style="list-style-type: none"><li>Unplug both power units, and wait about one minute to allow the power units to cool down. Plug in the power units. If either power unit is operating properly (that is, the status LEDs show green), then replace the defective power unit(s). See "Power Unit Replacement Procedures" in this section.</li></ol> |

| Error Code | Test Result       | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL<br>(cont'd.) | <p>4. If the replaced power unit still does not operate properly, then a circuit pack or a defective telephone connected to a circuit pack in the affected carrier may be causing an electrical load which is preventing the power unit from operating properly. Unseat all the circuit packs in the carrier and reissue the <b>recycle carrier</b> command.</p> <p>a. If the recycle passes, then the power units are healthy, and the problem is with one of the circuit packs. Reinsert the circuit packs one at a time. If the status LED shows red after reinserting a circuit pack, replace the defective circuit pack. If the status LED still shows red, remove the Amphenol. connector on the back of the slot containing this circuit pack and reissue the <b>recycle carrier</b> command. If the status LED shows green, the problem is with one of the telephones or the wiring to one of the telephones on this slot. If the status LED still shows red, escalate the problem.</p> <p>b. If either power unit still shows a red status LED, check for bent pins and cable placement in the affected carrier. There are failures that can occur on the Maintenance/Tape Processor, Duplication Interface, and EPN Maintenance circuit pack that <b>are not</b> detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If no other problems can be found, escalate the problem.</p> |

**Table 10-83. TEST #127 Power Unit Query Test — Continued**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | Both power units in the tested carrier were found to be healthy by the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system. If the status LEDs on both power units are not showing green, the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the power units. Look for and resolve any alarms on these MOs. |

# CARR-POW (Carrier Port Power Unit) for DC-Powered Systems

| MO Name As It Appears in Alarm Log | Alarm Level | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO         |
|------------------------------------|-------------|-------------------------------------------------------|-------------------------|
| CARR-POW                           | MAJOR       | recycle carrier PC                                    | Carrier Port Power Unit |

1. Recycle the carrier indicated by the Port field in the Alarm Log.

Generic 1 offers two basic cabinet type configurations: (1) the multicarrier cabinet system and (2) the single-carrier cabinet system. Both cabinet system configurations may be powered by either an external AC or DC power source.

**NOTE:**  
For environment maintenance, the PPN or EPN cabinet configuration aspects for a High or Critical Reliability system are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Therefore, refer to the following list to find the appropriate MO section(s).

- For a single-carrier cabinet system, refer to the "DC-POWER (Single-Carrier Cabinet Power)" Maintenance documentation for environment maintenance strategy.
- For a multicarrier cabinet system using an external AC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for AC-Powered Systems", "CUST-ALM (Customer-Provided Alarming Device)", or "POWER (Battery & Battery Charger) for AC-Powered Systems".
- For a multicarrier cabinet system using an external DC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for DC-Powered Systems", "CUST-ALM (Customer-Provided Alarming Device)", or "POWER (Battery & Battery Charger) for DC-Powered Systems".

Every carrier in the system must be supplied with +5 volt, -48 volt, and -5 volt DC power for the various circuit packs to operate properly. A multicarrier system can be supplied by an external AC power source or an external DC power source.

In a DC-powered system, power is supplied to the carriers as follows: DC power from an external device comes into Power Distribution Units (PDU J58890CF and PDU J58890CF-1), which distribute the power via circuit breakers (CB1-CB12 for PDU J58890CF, CB1-CB6 for J58890Cf-1) to the carrier power units. Each carrier in the system is equipped with two power units, the 644A and the 645B, which

together supply the required voltages to the carrier. Figure 10-17 illustrates the position of the carrier power units and PDU J58890CF and shows which power unit each circuit breaker controls (Figure 10-17 also shows other Environment maintenance-related items that can be ignored for this section on Carrier Port Power Unit). Figure 10-18 shows the position of the circuit breakers on the PDU J58890CF. Figure 10-19 illustrates the position of the carrier power units and PDU J58890CF-1 and shows which power unit each circuit breaker controls (Figure 10-19 also shows other Environment maintenance-related items that can be ignored for this section on Carrier Port Power Unit). Figure 10-20 shows the position of the circuit breakers on the PDU J58890CF-1. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages on the backplane pins. Refer to Chapter 2 in *DEFINITY Communications System Generic 1 and Generic 3 Installation and Test*, 555-230-104. The CARR-POW (Carrier Port Power Unit) MO represents the pair of power units for each carrier in a multicarrier cabinet system. If a problem is reported by hardware for a power unit on a port carrier, the system can recycle the pair of power units in a port carrier; however, if the problem is reported on a control carrier, the system cannot recycle the pair of power units in a control carrier. In a standard multicarrier cabinet (PPN or EPN), carrier A is the control carrier, and carriers B, C, D, and E are the port carriers. In a High or Critical Reliability system multicarrier cabinet (PPN or EPN), carriers A and B are the control carriers, and carriers C, D, and E are the port carriers. However, carrier B in the EPN can be recycled only if the Active Expansion Interface Link and Active Tone-Clock circuit pack are in the A carrier.

The carrier port power unit has one LED: the yellow LED on means operating as normal and the LED off means no external power is being supplied or that the power unit has a fault.

Loss of the 645B Carrier Port Power Unit in the active control carrier (the A carrier for a standard system and either the A or B carrier for a High or Critical Reliability system) causes loss of the administration terminal. In a High or Critical Reliability system, the Active SPE should switch to the Standby SPE if there is a CARR-POW alarm.

Recycling a carrier turns off the pair of carrier power units and turns them back on two seconds later.

 **WARNING:**  
*Recycling carriers disrupts service for all circuit packs on the carrier.*

Generic 1 can also support neon message waiting lamps on analog telephones. If this is required, then the carrier(s) that contains the TN769 Analog Neon circuit packs must also be supplied with 165 volt DC power to power the neon lights. The 165 volt DC power can only be supplied by a TN752 or a TN755B power unit circuit pack. The following table lists the power units and power-related circuit packs that can be used in a DC-powered system and indicates the voltages they can supply. Figure 10-21 and Figure 10-22 show a schematic of the 644A and 645B power supplies, respectively. The TN2036 Voltage Range circuit pack

provides easy access for testing the various voltages on the backplane pins.  
Refer to Chapter 2 in *DEFINITY Communications System Generic 1 and Generic 3 Installation and Test*, 555-230-104.

| Power Supply | +5V | -48V | -5V | 165V | Cabinet Position |
|--------------|-----|------|-----|------|------------------|
| 644A         | yes | no   | no  | no   | Left Side        |
| 645B         | no  | yes  | yes | no   | Right Side       |
| TN736        | no  | no   | yes | no   | -                |
| TN752        | no  | no   | yes | yes  | -                |
| TN755B       | no  | no   | no  | yes  | -                |

### **Port Carrier Power Unit Replacement Procedures**

The procedures for replacing a 644A or 645B carrier DC power unit are given below.

If the port carrier power unit to be replaced is in a control carrier of a PPN system, refer to the "Removing Power" and "Restoring Power" sections in Chapter 5, "Routine Maintenance Procedures" before replacing the port carrier power unit. To replace the port carrier power unit, follow the procedure below:

1. If this is a 645B power unit, set the power switch to OFF.
2. Unplug the power cord.
3. Move the locking slide on the power unit to the extreme left position, and unlatch the locking lever.
4. Remove the power unit from the carrier.

- 5. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
- 6. Insert the power unit into the carrier until some resistance is felt.
- 7. Lift the locking lever upward until it latches.
- 8. Move the locking lever slide on the power unit to the extreme right position.
- 9. Connect the power cord.
- 10. If this is a 645B power unit, set the power switch to ON.

Hardware Error Log Entries and Test to Clear Values

Carrier Port Power Unit Error Log Entries

| Error Type     | Aux Data | Associated Test              | Alarm Level | On/Off Board | Test to Clear Value       |
|----------------|----------|------------------------------|-------------|--------------|---------------------------|
| 0 <sup>1</sup> | 0        | Any                          | Any         | Any          | test environment P sh r 1 |
| 1(a)(b)        | 0 or 1   | Power Unit Query Test (#127) | MAJOR       | ON           | test environment P r 2    |

- 1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
  - a. Where P is an appropriate port network number taken for the Port field of the Error Log.
  - b. Run the Power Unit Query Test (#127) first using the **test environment P r 2** command. Then, if a carrier must be recycled to clear the CARR-POW alarm, use the **recycle carrier PC** command to run the Power Unit Recycle Test (#126). The Power Unit Recycle Test (#126) is not included in either the long or Short Test Sequences.

 **WARNING:**  
The Power Unit Recycle Test (#126) is destructive. For more information, refer to the description of this test.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery & Battery Charger Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                               | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|------------------------------------------------------|---------------------|--------------------|-------------------|
| Battery & Battery Charger Query Test (#5) (a)        | X                   | X                  | ND                |
| AC Power Query Test (#78) (b)                        | X                   | X                  | ND                |
| Power Unit Query Test (carrier E) (#127)             | X                   | X                  | ND                |
| Power Unit Query Test (carrier D) (#127)             | X                   | X                  | ND                |
| Power Unit Query Test (carrier A) (#127)             | X                   | X                  | ND                |
| Power Unit Query Test (carrier B) (#127)             | X                   | X                  | ND                |
| Power Unit Query Test (carrier C) (#127)             | X                   | X                  | ND                |
| Emergency Transfer Query Test (#124) (c)             | X                   | X                  | ND                |
| Cabinet Temperature Query Test (#122) (d)            | X                   | X                  | ND                |
| External Alarm Lead Query Test (#120) (e)            | X                   | X                  | ND                |
| Analog Ring Generator Initialization Test (#117) (f) | X                   | X                  | ND                |
| Analog Ring Generator Query Test (#118) (f)          | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive
- a. Refer to POWER (Battery & Battery Charger) Maintenance documentation for a description of this test.

b. Refer to AC-POWER (AC Power) Maintenance documentation for a description of this test.

c. Refer to EMG-XFER (Emergency Transfer) Maintenance documentation for a description of this test.

d. Refer to CABINET (Cabinet Sensors) Maintenance documentation for a description of this test.

e. Refer to EXT-DEV (External Alarm) Maintenance documentation for a description of this test.

- f. Refer to RING-GEN (Analog Ring Generator) Maintenance documentation for a description of this test.

 **NOTE:**  
This test only shows up in the test sequence if there is a TN768 Tone-Clock circuit pack in the port network being tested.

**Power Unit Recycle Test (#126)**

**This test is destructive.**

This test is destructive because it requires all circuit packs in the recycled carrier to be removed and inserted. These actions cause all calls originating or terminating on circuit packs in this carrier to be dropped. The pair of port carrier power units in the specified carrier is recycled. Both port carrier power units in the carrier are turned off for two seconds and then back on. After the port carrier power units have been turned back on, the test queries the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of the pair of port carrier power units in the specified carrier. If both port carrier power units are on and functioning, then the test passes. If both port carrier power units are not on and functioning, the test fails, and BOTH port carrier power units are turned off.

**Table 10-84. TEST #126 Power Unit Recycle Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | System resources required to run this test are not available.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem. |
| 1129       | ABORT       | Only occurs when recycling carrier 2B. Indicates that the Active Tone-Clock for the EPN is in carrier 2B.<br><br>1. Issue the <b>set tone-clock 2A</b> command.<br><br>2. Rerun the test.                  |

If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1 (Carrier E)<br>2 (Carrier D)<br>4 (Carrier A)<br>8 (Carrier B)<br>16 (Carrier C) | FAIL        | There is a problem with one or both port carrier power units on the recycled carrier.<br><br>1. Since the Power Unit Recycle Test failed, both port carrier power supplies in the recycled carrier should have been powered off by the system software. Both port carrier power units should be showing a red status LED, instead of a green one. Since the Power Unit Query Test is a subset of the Power Unit Recycle Test, the Power Unit Query Test (#127) should also fail. Run the Power Unit Query Test by using the <b>test environment P</b> command where P is the appropriate port network number.<br>2. If the test fails, follow the repair procedures described for Test #127. If the problem persists, follow normal escalation procedures. |

|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | Both port carrier power units in the recycled carrier were found to be healthy by the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system after the port carrier power units were powered-down and powered up again. If the status LEDs on both port carrier power units are not showing green, then the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the port carrier power units. Look for and resolve any alarms on these MOs. |

**Power Unit Query Test (#127)**

This test queries the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of the pair of port carrier power units in the specified carrier. If both port carrier units are on and functioning, the test passes. If both are not on and functioning, the test fails.

|            | FAIL        | <p>There is a problem with one or both port carrier power units on the tested carrier.</p> <ol style="list-style-type: none"><li>1. For each port carrier power unit that has all status LEDs OFF, check the DC input to the port carrier power unit at the port carrier power unit outlet (see Figures 11-19 through 11-22). If there is no DC, then check the appropriate circuit breakers for the affected port carrier power unit. If the circuit breaker has tripped (that is, it is in the down position), reset the circuit breaker. If the circuit breaker trips again or DC is not present at the port carrier power unit outlet, there is probably a power wiring problem in the cabinet. Follow normal escalation procedures.</li><li>2. At this point, DC should be present at the port carrier power supply outlet. If the carrier being tested is the 1A or 2A carrier, or the 1B carrier in a High or Critical Reliability system, refer to "Troubleshooting Control Carrier Power Units" in Chapter 5, "Routine Maintenance Procedures". Otherwise, use the <b>recycle carrier PC</b> command (where PC is the appropriate port network and carrier) in an attempt to bring back the power units for this carrier. If the test passes, the trouble is cleared. If the test does not pass, one port carrier power unit, or both, in the tested carrier is defective.</li></ol> <p>If only one port carrier power unit is defective, the status LEDs on the healthy port carrier power unit light green for a moment. When the recycle test determines that both port carrier power units are defective, the software turns off power to both the good and defective port carrier power units. This causes the status LED(s) on the good port carrier power unit to light red.</p> |

| Error Code | Test Result       | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL<br>(cont'd.) | <p>3. Unplug both port carrier power units, and wait about one-minute to allow the port carrier power units to cool down. Plug in the port carrier power units. If either port carrier power unit is operating properly (that is, the status LEDs show green), then replace the defective port carrier power unit(s). See "Port Carrier Power Unit Replacement Procedures" in this section.</p> <p>4. If the replaced port carrier power unit(s) still does (do) not operate properly, then a circuit pack or a defective telephone connected to a circuit pack in the affected carrier could be causing an electrical load which is preventing the port carrier power unit from operating properly. Unseat all the circuit packs in the carrier, and reissue the <b>recycle carrier</b> command.</p> <p>a. If the recycle passes, then the port carrier power units are healthy, and the problem is with one of the circuit packs. Reinsert the circuit packs one at a time. If the status LED shows red after reinserting a circuit pack, replace the defective circuit pack. If the status LED still shows red, remove the Amphenol connector on the back of the slot containing this circuit pack and reissue the <b>recycle carrier</b> command. If the status LED shows green, the problem is with one of the telephones or the wiring to one of the telephones on this slot. If the status LED still shows red, escalate the problem.</p> <p>b. If either port carrier power unit still shows a red status LED, check for bent pins and cable placement in the affected carrier. There are failures that can occur on the Maintenance/Tape Processor, Duplication Interface, and EPN Maintenance circuit pack that <b>are not</b> detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If no other problems can be found, escalate the problem.</p> |

**Table 10-85. TEST #127 Power Unit Query Test — Continued**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | Both port carrier power units in the tested carrier were found to be healthy by the Maintenance/Tape Processor in a PPN for a High or Critical Reliability system, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system. If the status LEDs on both port carrier power units are not showing green, the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the port carrier power units. Look for and resolve any alarms on these MOs. |

## CLSFY-BD (Call Classifier Circuit Pack)

| MO Name As It<br>Appears in<br>Alarm Log | Alarm<br>Level | Initial System<br>Technician<br>Command to Run <sup>1</sup> | Full Name of MO              |
|------------------------------------------|----------------|-------------------------------------------------------------|------------------------------|
| CLSFY-BD                                 | MIN            | test board PCSS sh                                          | Call Classifier Circuit Pack |
| CLSFY-BD                                 | WRN            | test board PCSS sh                                          | Call Classifier Circuit Pack |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for circuit pack level errors. See also Call Classifier Port (CLSFY-PT) Maintenance documentation for related port information.

CLSFY-PT (Call Classifier Port)

| MO Name As It<br>Appears in<br>Alarm Log | Alarm Level | Initial System<br>Technician<br>Command to Run <sup>1</sup> | Full Name of MO                     |
|------------------------------------------|-------------|-------------------------------------------------------------|-------------------------------------|
| CLSFY-PT(a)                              | MAJOR       | test port PCSSpp sh                                         | Call Classifier Port<br>Maintenance |
| CLSFY-PT                                 | MINOR       | test port PCSSpp sh                                         | Call Classifier Port<br>Maintenance |
| CLSFY-PT                                 | WARNING     | release port PCSSpp                                         | Call Classifier Port<br>Maintenance |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (e.g., A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (e.g., 01, 02, ..., etc.); and pp is the 2-digit port number (e.g., 01).

The TN744 Call Classifier (CLSFY-BD) circuit pack is a service circuit pack that enables usage of the Outbound Call Management (OCM) and the Inbound Call Management (ICM) features. On a G3iV2-386 system, the TN744 also enables usage of R2-MFC signaling for incoming and outgoing feature operation. There are eight ports (CLSFY-PTs) on the Call Classifier circuit pack. Each port can handle call classification, touch-tone reception, or, for G3iV2-386 systems, MFC tone generation and detection or touch-tone reception.

The CLSFY-PT maintenance feature defines a set of tests to ensure that the Call Classifier circuit pack ports are capable of detecting tones for call classification, and detecting and generating necessary tones for correct MFC feature operation.

Hardware Error Log Entries and Test to Clear Values

Call Classifier Port (CLSFY-PT) Error Log Entries

| Error Type | Aux Data | Associated Test                               | Alarm Level         | On/Off Board | Test to Clear Value  |
|------------|----------|-----------------------------------------------|---------------------|--------------|----------------------|
| 1          | any      | Tone Detector Audit/Update Test (#43)         | MAJOR/<br>MINOR (a) | ON           | test port PCSSpp r 2 |
| 18         |          | Port has been busied out by system technician | WARNING             | OFF          | release port PCSSpp  |
| 257 (b)    | 17666    | Test (#43)                                    | MAJOR/<br>MINOR(a)  | ON           | test port PCSSpp r 3 |
| 513 (c)    | any      | Tone Detection Verification Test (#42)        | MAJOR/<br>MINOR (a) | ON           | test port PCSSpp r 3 |

Notes:

- a. There are two possible alarm levels for this error type: major alarm and minor alarm. A major alarm is raised if the total number of call classifier ports currently in-service is less than or equal to 1/2 of the administered threshold number. Otherwise, a minor alarm is raised. In either case, run the short test sequence against the port and follow the error code procedures for the individual tests.

The threshold number of call classifier ports for service is administered using the **change system-parameters maintenance** command. For details, refer to Chapter 5, "Routine Maintenance Procedures".

- b. The call classifier port lost its translation. Testing the call classifier port is sufficient to reload its translation. If testing the call classifier port does not clear the error, then the call classifier circuit pack containing the defective call classifier port should be replaced.
- c. This error indicates the call classifier port is having problems detecting system tones (DTMF, etc.) or detecting and generating necessary R2-MFC tones. This error should accompany some percentage of failed calls. If this error type is persistently logged, then the call classifier circuit pack containing the defective call classifier port should be replaced.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *Tone Detection Verification Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                 | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|----------------------------------------|---------------------|--------------------|-------------------|
| Tone Detection Verification Test (#42) | X                   | X                  | ND                |
| Tone Detection Audit/Update Test (#43) | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Tone Detection Verification Test (#42)

This test checks out each port in both the touch-tone receiver mode and in the R2-MFC tone detection/generation mode. During the first half of the test, the touch-tone receiver mode is tested. In the second half of the test, each port is put into the R2-MFC mode. During this portion of the test, each port's ability to accurately detect and generate all forward and backward MFC tones is verified.

Table 10-86. TEST #42 Tone Detection Verification Test

| Error Code | Test Result | Description/ Recommendation                                                                                       |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------|
| none       | ABORT       | The system was not able to allocate all the resources needed for this test OR there was an Internal System Error. |
| 1          | ABORT       | The system could not allocate all the resources needed to test the tones.                                         |
| 1001       | ABORT       | The system was unable to put the Call Classifier port in the appropriate mode to test it.                         |

Table 10-86. TEST #42 Tone Detection Verification Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2006       | ABORT       | <p>This abort code indicates that the active Tone-Clock circuit pack might not be functioning properly. If there is more than one Tone Detector circuit pack in the system, then the problem can be either with the Tone-Clock circuit pack or the Tone Detector circuit pack. This could also be caused by the companding mode administered for the system not matching that of the Tone Detector circuit pack [G3iV2-386].</p> <ol style="list-style-type: none"><li>[G3iV2-386] Make sure that the companding mode of the system matches that of the Tone Detector (TN748 for Mu-law systems and TN420 for A-law systems).</li><li>Test the active Tone-Clock circuit pack in the port network. This test is being executed via the <b>test tone-clock qualifier</b> system technician command. ("qualifier" is the carrier of the active Tone-Clock circuit pack to be tested. Valid qualifiers are: a, b, 1a, 1b, 2a, and 2b.) Refer to the TONE-BD (Tone-Clock Circuit Pack) Maintenance documentation for details.</li><li>Retry the command at one-minute intervals a maximum of five times.</li><li>If the test continues to abort, escalate the problem.</li></ol> |
| 2000       | ABORT       | <p>Response to the test request was not received within the allowable time period.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2100       | ABORT       | <p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"><li>Retry the command at one-minute intervals a maximum of five times.</li><li>If the test continues to abort, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

If the test continues to abort, escalate the problem.                                                                                                                                                                            |
|            | FAIL        | Hardware audit failed.<br><br>1. Run the short test sequence via the <b>test port PCSSpp sh r 1</b> command.<br><br>2. If the problem persists, the system is still operating properly but system capacity will be reduced. In order to restore system performance to normal, replace the CLSFY-BD (Call Classifier circuit pack) containing the defective CLSFY-PT (Call Classifier Port). |
|            | PASS        | The (CLSFY-PT) Call Classifier Port has passed the sanity inquiry.                                                                                                                                                                                                                                                                                                                          |

## CO-BD (Central Office Trunk Circuit Pack)

| MO Name As It Appears in Alarm Log | Alarm Level | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO                   |
|------------------------------------|-------------|-------------------------------------------------------|-----------------------------------|
| CO-BD                              | MIN         | test board PCSS sh                                    | Central Office Trunk Circuit Pack |
| CO-BD                              | WRN         | test board PCSS sh                                    | Central Office Trunk Circuit Pack |

- 
1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for circuit pack level errors. See also CO-TRK (CO Trunk) Maintenance documentation for related trunk information.

## CO-DS1 (DS1 CO Trunk)

| MO Name As It Appears in Alarm Log | Alarm Level        | Initial System Technician Command to Run | Full Name of MO |
|------------------------------------|--------------------|------------------------------------------|-----------------|
| CO-DS1                             | MAJOR <sup>1</sup> | test trunk <grp/mbr> l                   | DS1CO Trunk     |
| CO-DS1                             | MINOR              | test trunk <grp/mbr> l                   | DS1CO Trunk     |
| CO-DS1                             | WARNING            | test trunk <grp/mbr>                     | DS1CO Trunk     |

- 
1. A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

A DS1CO (central office) trunk provides a communications channel between the system and a central office switch through either a 1.544 Mbps or a 2.048 Mbps [G3iV2-386] DS1 link. A 24 channel DS1 link consists of 24 digital DS1CO trunks. A 32 channel DS1 link [G3iV2-386] consists of 30 digital DS1CO trunks. A DS1CO trunk can be used for both voice and data communication.

The DS1CO Trunk Maintenance provides a strategy in the system to maintain a CO trunk via a port on the DS1 Interface circuit pack. The TN767 and TN464 [G3iV2-386] DS1 Interface circuit packs support the low level CO trunk signaling interfaces, ground-start and loop-start. This strategy covers the in-line errors log, initialization tests, periodic tests, system technician-demanded tests, and alarm resolution and escalation.

Three trunk service states are specified in the DS1CO trunk maintenance. They are: *out-of-service* in which the trunk is in a deactivated state and cannot be used for either incoming or outgoing calls; *in-service* in which the trunk is in an activated state and can be used for both incoming and outgoing calls; *disconnect* (ready-for-service) in which the trunk is in an activated state but can only be used for an incoming call. If the DS1 Interface circuit pack is out-of-service, then all trunks on the DS1 Interface circuit pack are also in the out-of-service state, and a Warning alarm is raised for each trunk.

Hardware Error Log Entries and Test to Clear Values

| DS1CO Trunk Error Log Entries |          |                                      |                          |              |                            |
|-------------------------------|----------|--------------------------------------|--------------------------|--------------|----------------------------|
| Error Type                    | Aux Data | Associated Test                      | Alarm Level              | On/Off Board | Test to Clear Value        |

- 
1.

Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2.

This alarm will only be raised when the System-Parameter Country form has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.

3. Minor alarms on this maintenance object (MO) may be downgraded to Warning alarms based on the values used in the **set options** command. If the Minor alarm is not downgraded by the **set options** values, the Minor alarm is upgraded to a Major alarm if 75 percent of the trunks in this group are alarmed.

**Notes:**

- a. Error Type 1—Aux Data 57408—No tip ground is detected on an outgoing call.

Aux Data 57487—PBX could not get "loop close" signal (TN767).

The DS1 Interface circuit pack detected a hardware fault. These errors cause the Dial Tone Test (#314) to run and are only considered a problem if the Dial Tone Test fails (in which case Error Type 1025 also shows up). In this case, the trunk may be put in ready-for-service state (shown as "disconnected" by status command), which allows only incoming calls. Run the Dial Tone Test (#314) and follow its outlined procedures.

- b. Error Type 15—This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors (if any).
- c. Error Type 18—System Technician has busied-out the trunk to the out-of-service state. No calls can be made on this trunk except the Facility Access Test Call. For details on this feature, refer to "Facility Test Calls" section in Chapter 5, "Routine Maintenance Procedures".
- d. Error Type 130—This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- e. Error Type 257—The DS1 Interface circuit pack detects a hardware fault. The Aux Data field contains the following error type: 57392—no external release on PBX disconnect [E030]. Escalate the problem.
- f. Error Type 513—The DS1 Interface circuit pack detects a hardware fault. The Aux Data field contains the following error type: 57393—belated external release on PBX disconnect [E031]. Escalate the problem.
- g. Error Type 769—The DS1 Interface circuit pack detects a hardware fault. The Aux Data field contains the following error type:—57484, fault is detected on tip/ring [E08C]. Escalate the error.
- h. Error Type 1793—DS1 Interface circuit pack is out-of-service. Look for DS1-BD errors in the Hardware Error Log. Refer to the DS1-BD (DS1 Trunk Circuit Pack) Maintenance documentation for details.
- i. Error Type 2562—Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from call processing and is generated when a second attempt (retry) to seize an outgoing trunk fails.
- j. Error Type 2817—Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a two-way trunk

from both the near-end and the far-end. Attempt to place the call again. If the error persists, execute the Dial Tone Seizure Test (#314) and follow those procedures.

- k. Error Type 3840—Port Audit and Update Test (#36) failed due to an internal system error. Enter the **status trunk** command to verify the status of the trunk. If the trunk is out-of-service, then enter the **release trunk** command to put it back into in-service. Retry the test command. If the test continues to abort, then escalate the problem.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

For example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation           | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|----------------------------------|---------------------|--------------------|-------------------|
| NPE Crosstalk Test (#6)          |                     | X                  | ND                |
| Conference Circuit Test (#7)     |                     | X                  | ND                |
| DS1CO Trunk Seizure Test (#314)  | X                   | X                  | ND                |
| Port Audit and Update Test (#36) | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) resides on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-88. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive (see note below).</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</li></ol> <p> <b>NOTE:</b><br/>Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing the <b>list config</b> command but the 'Vintage' field reports that there is no board (when there really is a board), then the <b>busyout board</b> and the <b>release busy board</b> commands will not work (even though the <b>reset board</b> command will work). The software will put the hyperactive board back in service after the hyperactivityclears.</p> |

Conference Circuit Test (#7)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones

and conference the tones together. The resulting signal is then measured by a tone detector port. If the level of the tone is within a certain range, the test passes.

**Table 10-89. TEST #7 Conference Circuit Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT       | System resources required for this test are not available.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1000       | ABORT       | The test was aborted. System resources required to run this test were not available. The port may be busy with a valid call. Use the <b>display port PCSSpp</b> command to determine the trunk group/member number of the port. Use the <b>status trunk</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.<br><br>1. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up.<br><br>2. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.<br><br>3. If the test continues to abort, escalate the problem. |
| 1002       | ABORT       | The test was aborted. The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out of service due to TDM-BUS errors. Refer to the TDM-BUS (TDM bus) maintenance documentation to diagnose any active TDM-BUS errors.<br><br>1. If the system has no TDM-BUS errors and is not handling heavy traffic and the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.<br><br>2. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                           |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL        | <div><div>1. Enter the 'list configuration board UUCSS' command. If the circuit pack is a TN767B vintage 8 or 9, replace the circuit pack with a TN767C V3 or later.The error log may have error type 1281 entries.</div><div>2. Test all administered trunks on the board. If one fails, this could be an off-board problem (such as an incoming seizure or an off-hook port seizure during the test). Retest the board.</div><div>3. If all of the ports fail, check the CARR-POW (see Note below).</div><div>4. If several ports fail, check the error log for TONE-BD or TONE-PT errors. If there are such errors, take the appropriate action. When the TONE errors have cleared, rerun the test.</div><div>5. If the retry passes and troubles have been reported, coordinate isolation with the CO. Make sure that the switch, the CO, and any NTCE equipment (the CSU's) have the correct administration.</div><div>6. Replace the circuit pack.</div><div><div>⇒ NOTE:</div><div>If the conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance Documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance Documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack.</div></div></div> |

|            | PASS        | The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board).</p> <p>This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive (see note below).</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command.</li></ol> <p>This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</p> <p> <b>NOTE:</b></p> <p>Hyperactivity causes some special problems with the sequence suggested above.If the ports are translated after issuing the <b>list config</b> command but the 'Vintage' field reports that there is no board (when there really is a board), then the <b>busyout board</b> and the <b>release busy board</b> commands will not work (even though the <b>reset board</b> command will work). The software will put the hyperactive board back in service after the hyperactivity clears.</p> |

Port Audit and Update Test (#36)

This test sends port level translation data from switch processor to the DS1 Interface circuit pack to assure that the trunk's translation is correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of trunk kept in the DS1 Interface circuit pack and in the switch software.

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This result could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive (see note below).</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command.</li></ol> <p>This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</p> <p>Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing the <b>list config</b> command but the 'Vintage' field reports that there is no board (when there really is a board), then the <b>busyout board</b> and the <b>release busy board</b> commands will not work (even though the <b>reset board</b> command will work). The software will put the hyperactive board back in service after the hyperactivity clears.</p> |

DS1 CO Dial Tone Seizure Test (#314)

DS1CO Dial Tone Seizure Test checks the trunk's signaling capability provided by the DS1 Interface circuit pack. The maintenance software initiates the test by sending a "seizure" message to the DS1 Interface circuit pack and expects an "active" reply from the DS1 interface circuit pack. If the "active" message is received, then the test passes. If no message is received and the timer expires, the test is aborted. If the DS1 Interface circuit pack sends a "reorder" message back to maintenance software, then the test fails.

The test **CANNOT** be run on a trunk if one of the following cases is true:

- a. The trunk direction is administered as an incoming only trunk.
- b. The trunk has been seized by a normal trunk call.
- c. The trunk is administered with maintenance test disabled.

Table 10-91. TEST #314 DS1CO Dial Tone Seizure Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, an insane board is inserted, or the board is hyperactive (see Note below).</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.</li></ol> <p> <b>NOTE:</b></p> <p>Hyperactivity causes some special problems with the sequence suggested above. If the ports are translated after issuing the <b>list config</b> command but the 'Vintage' field reports that there is no board (when there really is a board), then the <b>busyout board</b> and the <b>release busy board</b> commands will not work (even though the <b>reset board</b> command will work). The software will put the hyperactive board back in service after the hyperactivity clears.</p> |

# CO-TRK (CO Trunk)

| MO Name As It Appears in Alarm Log | Alarm Level        | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO |
|------------------------------------|--------------------|-------------------------------------------------------|-----------------|
| CO-TRK                             | MAJOR <sup>2</sup> | test port PCSSpp l                                    | CO Trunk        |
| CO-TRK                             | MINOR              | test port PCSSpp l                                    | CO Trunk        |
| CO-TRK                             | WARNING            | test port PCSSpp l                                    | CO Trunk        |

1.

Where P is the port network number (1 for PPN and 2 or 3 for EPN); c is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.).
2.

A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

 **NOTE:**

If ATMS testing is enabled, check the error log for ATMS Errors #3840 and #3841. If the error log indicates that measurements exceeded acceptable thresholds, and if no other trouble is found with the **test trunk** command, run the ATMS test call with the **test analog-testcall port UCCSSpp full** command.

Central Office (CO) trunks are 2-wire analog lines to the CO which support both incoming and outgoing calls. A CO trunk circuit pack provides an interface between the 2-wire analog line from the CO and the system's (4-wire) Time Division Multiplex (TDM) Bus. The CO Trunk circuit packs include:

- TN747B (United States), 8 port loop start or ground start CO, foreign exchange (FX), or Wide Area Telecommunications (WATS) trunks.
- TN438B (Australia), 8 port loop start.
- TN447 (United Kingdom), 8 port ground start.
- TN465 (multiple countries), 8 port loop start.
- TN2138 (Italy), 8 port loop start.
- TN2147 (multiple countries), 8 port loop start and United Kingdom Earth Calling or Loop Calling Guarded Clearing.

## LOOP START AND UK LOOP CALLING GUARDED CLEARING OPERATION

Idle State - Tip \_ ground, Ring = CO Battery

### A. Outgoing Call

1. PBX Off-Hook (Seize Message): Closes the Tip-Ring Loop

- a. CO Response: DC loop current + Dial tone
2. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current
  - a. CO Response: CO goes to idle state (see Note)

#### *B. Incoming Call*

1. CO Applies Ringing Voltage
  - a. PBX Response: Detect ringing current
2. PBX Off-Hook (Answer Message): Close loop
  - a. CO Response: Trip ringing, provide loop current
3. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current
  - a. CO Response: CO goes to idle state (see Note)

#### **NOTE:**

Except for the Netherlands Loop Start and UK Loop Calling Guarded Clearing trunks, CO does not normally provide an On-Hook (Disconnect) signal.

### **GROUND START AND UK EARTH CALLING OPERATION**

Idle state - Tip \_ open, Ring = CO Battery

#### *A. Outgoing Call*

1. PBX Off-Hook (Seize Message): Places ground on Ring
  - a. CO Response: Places ground on Tip
  - b. PBX Response: close the loop
  - c. CO Response: provide loop current
  - d. PBX response: dial out digits
2. PBX On-Hook first (Drop Message): Open the Tip-Ring Loop, no loop current
  - a. CO Response: Open circuit on Tip
3. CO On-Hook first (Disconnect): Open circuit on Tip, no loop current.
  - a. PBX Response: Open Tip-Ring loop

#### *B. Incoming Call*

1. CO Off-Hook (Seizure): CO applies ground on Tip, CO applies ringing voltage
  - a. PBX Response: Detect ringing, ring destination
2. PBX Off-Hook (Answer Message): Close loop
  - a. CO Response: Trip ringing, provide loop current

3. PBX On-Hook first (Drop Message): Open the Tip-Ring Loop, no loop current
- a. CO Response: Open circuit on Tip
4. CO On-Hook first (Disconnect): Open circuit on Tip, no loop current

Hardware Error Log Entries and Test to Clear Values

Table 10-92. CO Trunk Error Log Entries

| Error Type     | Aux Data | Associated Test                       | Alarm Level              | On/Off Board | Test to Clear Value       |
|----------------|----------|---------------------------------------|--------------------------|--------------|---------------------------|
| 0 <sup>1</sup> | 0        | Any                                   | Any                      | Any          | test port PCSSpp sh r 1   |
| 1 (a)          | 57347    | None                                  |                          |              |                           |
| 15 (b)         | any      | Port Audit Update Test (#36)          |                          |              |                           |

| 1793           |          | Loop Around and Conference Test (#33) | MAJ/MIN/WRN <sup>2</sup> | ON           | test port PCSS l r 3      |
| 2049           |          | NPE Cross Talk Test (#6)              | MAJ/MIN/WRN <sup>2</sup> | ON           | test port PCSS l r 3      |

- d. Aux data 57345 -- Single polarity ringing current  
Aux data 57376 -- No loop current on incoming call  
Aux data 57408 -- No tip ground detected on outgoing call  
Aux data 57424 -- No loop current on outgoing call  
Aux data 57484 -- No dial tone on outgoing call

These errors cause the Dial Tone Test (#0) to run and are only considered a problem if the Dial Tone Test fails (in which case Error Type 1537 also shows up). In this case, the trunk may be put in "Ready-for-Service" state (shown as "disconnected" by status command), which allows only incoming calls. Run the Dial Tone Test (#0) and follow its outlined procedures.

If error count associated with this error type is very high (that is, 255) and if Alarm Status on the Hardware Error Report is "n" (not alarmed), then the existence of this error type indicates that, despite the fact that many in-line error messages have been received, all Call Seizure Tests have passed. Problems at the CO may cause this condition rather than problems with the PBX.

- e. These errors are logged for all versions of the CO-TRK/CO-BD. However, no MINOR alarms are generated for Central Office Trunks [TN747B] with vintages V8 or greater. Any failures received by this test are still logged as Error type 1025/1281 as additional information for the system technician person.

The system technician person should check for the use of MFT/Range extenders. If there are extenders present, and there are no other complaints or maintenance errors against this trunk, then there is a good chance that Test #3 failed due to excessive loop current and may be ignored.

- f. Test calls made by the Automatic Transmission Measurement System (ATMS) returned measurements that were outside the acceptable limits. Use the **list testcall detail** command to examine specific transmission parameters that are out of spec, and investigate the trunk for that kind of noise. If the noise is acceptable, the limits administered on the "change trunk" screen should be changed.

Table 10-93. CO Trunk Errors with NO Tests

| Error Type | Aux Data | Description and System Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | System Technician Action                                                                                                                                                                                                                       |
|------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | 57347    | Port error. Ringing without ground. This error is detected on an incoming call on a ground-start CO trunk. The CO trunk circuit pack has not detected a Tip ground before ringing current is detected. This may indicate that the ground detector is not working. However, the call is accepted.                                                                                                                                                                                                                   | See Note 1 at end of table.                                                                                                                                                                                                                    |
| 257        | 50176    | Battery reversal detected. This is usually caused by the CO (often seen with step-by-step and cross-bar offices in connection with outgoing calls). This is detected if the direction of the loop current changes from normal to reverse for at least 40 msec. Could occur if the trunk was just installed and for some reason the Tip and Ring wires were reversed at the PBX. If battery reversals occur during dialing, wrong numbers may result. The CO should be asked to remove the battery reversal option. | Refer problem to CO.                                                                                                                                                                                                                           |
| 513        | 57364    | Ground detector stuck active. After several occurrences, an on-board minor alarm is generated.                                                                                                                                                                                                                                                                                                                                                                                                                     | Run short test. If test aborts with Error Code 1000, disconnect Tip and Ring and repeat short test. If test still aborts, replace circuit pack. If test passes, refer problem to CO. If any other error code is received, pursue that problem. |
| 769        | 57392    | CO not releasing after call is dropped from PBX end (off-board alarm after several occurrences), or the loop is not open after a disconnect (on-board alarm after several occurrences).                                                                                                                                                                                                                                                                                                                            | For off-board alarm, refer problem to CO. For on-board alarm, the circuit pack has an on-board problem (for example, stuck relay) and should be replaced.                                                                                      |

**Table 10-93. CO Trunk Errors with NO Tests — Continued**

| Error Type | Aux Data | Description and System Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | System Technician Action                                          |
|------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| 2561       | 57345    | Single polarity ringing current. This error results from abnormal ringing current, but does not prevent the incoming call from being accepted. One cause could be that the reverse current detector associated with the port is failing. (Will not be detected by any tests.) Another cause could be that normal current is not detected. In this case, neither incoming nor outgoing calls can be completed, and the dial tone test also fails. The last cause could be that certain types of noise are present on the CO line during the silent period of ringing. | Check for other errors first and then see Note 4 at end of table. |
| 2817       | 57360    | Ground but no ringing. This error occurs on an incoming call on a ground-start trunk. If ringing is not detected within 5 seconds of the Tip being grounded, the call is still accepted. If the CO is of the No. 5ESS. switch type, ringing delays of more than 5 seconds during heavy traffic are fairly common.                                                                                                                                                                                                                                                    | Check for other errors.                                           |
| 2817       | 57393    | On the TN465, the loop is opening too slowly after a disconnect. This error indicates an on-board problem, although the trunk may be functional. On the TN2138, CO released the trunk at least 4 minutes after the PBX dropped the call. This error code is log-only and causes no other testing to occur. No alarm is generated.                                                                                                                                                                                                                                    | Check for other errors.                                           |
| 3073       | 57376    | No loop current on incoming call. The incoming destination has already answered and no loop current has been detected. If this is a hard fault, the dial tone test and all outgoing calls should also fail.                                                                                                                                                                                                                                                                                                                                                          | Check for other errors.                                           |

*Continued on next page*

Table 10-93. CO Trunk Errors with NO Tests — Continued

| Error Type | Aux Data | Description and System Action                                                                                                                                                                                                              | System Technician Action           |
|------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| 3329       | 57408    | Trunk error. No Tip ground detected on outgoing call. This error occurs when an attempt is made to seize a ground-start CO trunk for an outgoing call and Tip ground is not detected or the caller hangs up before Tip ground is detected. | See Notes 1 and 2 at end of table. |
| 3585       | 57424    | No loop current on outgoing call. This error occurs on attempt to seize a loop or ground-start trunk for an outgoing call. An error occurs if loop current is not detected or the caller hangs up before it is detected.                   | See Note 3 at end of table.        |

Notes:

1. At the administration terminal, busyout the affected port, and run a Long Test Sequence. Observe the test results. If any tests fail, refer to the description of the tests and the associated error codes. Release the port. If users continue to report troubles, check for other errors and make test calls to determine whether the problem should be escalated or referred to the CO.
2. At the administration terminal, busyout the affected port, and run a Long Test Sequence. If Dial Tone Test #0 passes, ignore this error. Release the port.
3. At the administration terminal, busyout the affected port, and run a Long Test Sequence. If CO Demand Diagnostic Test #3 passes and this error keeps occurring, refer problems to CO. Release the port.
4. If the error count associated with this error type is very high (that is, 255) and all tests pass, then either the reverse current detector is defective or the CO line is noisy. If the CO line is suspected, Tip and Ring observations should be made. If the line is determined to be noisy, the problem should be referred to the CO. If the reverse current detector is defective, ignore this error.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

For example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                                             | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------------------|---------------------|--------------------|-------------------|
| NPE Crosstalk Test (#6)                                            |                     | X                  | ND                |
| Dial Tone Test (#0)                                                |                     | X                  | ND                |
| CO Demand Diagnostic Test (#3) (a)                                 | X                   | X                  | ND                |
| Loop Around and Conference Test (#33)                              |                     | X                  | ND                |
| Audit Update Test (#36)<br>Analog Transmission Test (#844-848) (b) | X<br>(c)            | X<br>(c)           | ND                |

1. D = Destructive; ND = Nondestructive

Notes:

- a. A demand test of Diagnostic Test (#3) always returns a PASS indication for CO-TRK/CO-BD [TN747B] version 8 or greater. However, any errors produced as a result of this test are logged and produce no alarms.  
  
If errors logged by Test #3 are the only complaints against this trunk, then the system technician person should check if MFT/Range Extenders are being used. If extenders are present, then there is a good chance that there is excessive loop current, which causes Test #3 to log errors.  
  
However, all else being normal, these errors should not affect the customer.
- b. Refer to TIE-TRK (Tie Trunk) Maintenance documentation for a description of this test.
- c. ATMS test are not part of either sequence. They are run either on demand with the **test analog-testcall** command or via the ATMS schedule.

Dial Tone Test (#0)

This test attempts to seize a port and checks for the return of a dial tone.

**Table 10-94. TEST #0 Dial Tone Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL        | <p>Trunk was seized, but dial tone could not be detected.</p> <ol style="list-style-type: none"><li>1. Test all administered outgoing ports on the board. Failure of 1 indicates a problem toward the CO.</li><li>2. If all fail, see note below.</li><li>3. Check for errors on the TONE-BD or TONE-PT. Clear any errors found, and repeat the test.</li><li>4. If the error has still not cleared, refer the problem to the CO.</li><li>5. If no service problems exist on the port, continue to use the port until the circuit pack can be replaced (as a last resort). Perform a trunk test call to see if the trunk is operable.</li></ol> <p><b>⇒ NOTE:</b></p> <p>If the dial tone test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation.</p> |

| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board).</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Translate the board, if necessary.</li><li>2. Issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board</b> command. This should re-establish the linkage between the internal ID and the port.</li></ol> |

CO Demand Diagnostic Test (#3)

For ground start trunks only, port circuit pack relays are operated and checks are made to see if the port can detect and apply ground on the Tip lead. This test also verifies that there is no external ground on the Ring lead. In the absence of other failures, the circuit pack should be replaced only if this test fails with the CO line disconnected.

For the TN2147 World Class Central Office circuit pack, this test also checks the on-board programmable transmission circuitry that allows the circuit pack to support the transmission characteristics of several countries.

| 2000       | ABORT       | <p>Response to the request was not received within the allowable time period.</p> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|            | FAIL        | <p>Failure to detect ground or faulty ground detected on Ring lead. Display the hardware errors for this trunk, to determine if the fault was on- or off-board. Look for Error Type 1025 or 1281 (if both appear in the Hardware Error Log, pick the most recent error). Error Type 1025 indicates a faulty ground detected on Ring lead (an off-board fault) and Error Type 1281 indicates failure to detect (internally generated) ground (an on-board fault). Faulty ground detected on Ring lead (Error Type 1025):</p> <p><b>⇒ NOTE:</b><br/>On TN747B vintage 8 and greater circuit packs, an incoming seizure during this test may cause it to fail with an off-board fault.</p> <ol style="list-style-type: none"><li>1. Repeat test. If test passes, ignore the original failure. If test aborts, follow the recommended procedures.</li><li>2. Repeat test with CO line removed.</li><li>3. If test fails, replace the circuit pack.</li><li>4. If test passes, refer problem to CO.</li></ol> <p>Failure to detect ground (Error Type 1281):</p> <ol style="list-style-type: none"><li>1. Run the long test sequence. If the CO Demand Diagnostic Test fails, the Dial Tone Test (#0) fails with Error Code 2002, AND Error Type 3329 or 3585 appears in the Hardware Error Log (with the same last occurred time as Error Type 1281 and 1537), replace the circuit pack.</li><li>2. Repeat test with CO line removed.</li><li>3. If test fails, replace the circuit pack.</li><li>4. If test passes, the CO may be drawing too much current. Refer problem to CO.</li></ol> |

Table 10-95. TEST #3 CO Demand Diagnostic Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 57481      | FAIL        | On-board test of programmable transmission circuitry failed.<br><br>1. Replace the circuit pack.                                                                                                                                                                                                                                                                                                                                                           |
|            | PASS        | This test verifies that the port is able to apply ground for outgoing calls and detect ground for incoming calls; however, it does not provide information on whether a CO line is actually connected. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.                                                                                                                     |
| 0          | NO BOARD    | The test could not relate the internal ID to the port (no board).<br><br>1. Check to ensure that the board translations are correct. Translate the board, if necessary.<br><br>2. Issue the <b>busyout board</b> command.<br><br>3. Issue the <b>reset board</b> command.<br><br>4. Issue the <b>release busy board</b> command.<br><br>5. Issue the <b>test board</b> command. This should re-establish the linkage between the internal ID and the port. |

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one way and noisy connections may be observed. This test is usually only part of a port's long test sequence and takes approximately 20 to 30 seconds to complete.

Table 10-96. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT       | <p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 1000       | ABORT       | <p>The port was seized by a user for a valid call. Use the <b>display port UUCSSpp</b> command to determine the trunk group/member number of the port. Use the <b>status trunk</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"><li>1. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the Error Log table for a description of this error and required actions). The port may be locked up. Check the CO wiring, check for excessive loop current, and check the trunk translations. (If the trunk is translated incorrectly, this test will abort.)</li><li>2. If the port status is idle, busyout and release the trunk, and then retry the command at 1 minute intervals for a maximum of 5 times.</li><li>3. If the test still aborts, replace the circuit pack.</li><li>4. If the test continues to abort, escalate the problem.</li></ol> |
| 1001       | ABORT       | <p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1004       | ABORT       | The port was seized by a valid call during the test. The test has been aborted. Use the <b>display port PCSSpp</b> command to determine the trunk group/member number of the port. Use the <b>status trunk</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. |
| 2000       | ABORT       | Response to the test request was not received within the allowable time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2100       | ABORT       | Could not allocate the necessary system resources to run this test.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                           |
| Any        | FAIL        | The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections.<br><br>1. Replace the circuit pack.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|            | PASS        | The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.                                                                                                                                                                                                                                                                                                                                                                                                      |
| 0          | NO BOARD    | The test could not relate the internal ID to the port (no board).<br><br>1. Check to ensure that the board translations are correct. Translate the board, if necessary.<br><br>2. Issue the <b>busyout board</b> command.<br><br>3. Issue the <b>reset board</b> command.<br><br>4. Issue the <b>release busy board</b> command.<br><br>5. Issue the <b>test board</b> command. This should re-establish the linkage between the internal ID and the port.                                                                                                                                 |

Loop Around and Conference Circuit Test (#33)

This test checks the reflective loop around and conference capabilities of a CO port circuit. The test uses 404-Hz, 1004-Hz, and 2804-Hz tones. Each tone is transmitted separately through the loop and checked.

Table 10-97. TEST #33 Loop Around and Conference Circuit Test

| Error Code             | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|----------------------------------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7,<br>129,<br>131,<br>or<br>133<br>(cont'd.) | FAIL<br>(cont'd.) |  <b>NOTE:</b><br>If the loop around and conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test. If the test fails again, see FAULT ISOLATION above. |
|                                              | PASS              | CO Trunk Loop Around and Conference Test is successful. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Port Audit Update Test (#36)

This test sends updates of the CO port translation for all ports on the circuit pack that have been translated. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack. No response message is expected from the circuit pack once it receives translation updates. The port translation data includes: ground or loop start trunk, tone or rotary dialing trunk, rotary dialing inter-digit timing, network balance R/RC, and disconnect timing.

This should re-establish the linkage between the internal ID and the port.</li></ol>                                                                                                                                                                                         |

Transmission Test (#844-848)

This test is non-destructive.

 **NOTE:**  
Tests #844-848 are not supported on a International switch.

These tests are run by the Automatic Transmission Measurement System (ATMS). They are not part of the long or short trunk test sequences. Instead, they are run on demand with the **test analog-testcall** command or as part of ATMS scheduled testing.

The test call is run from an analog port on a TN771 Maintenance/Test circuit pack. It attempts to seize a port and make a call to a terminating test line (TTL) on the trunk's far end. Transmission performance measurements are made and compared to administered thresholds. Errors are generated when results fall outside of "marginal" or "unacceptable" thresholds. Detail and summary measurement reports are obtainable via the **list testcalls** command.

**Table 10-99. TEST #844-848 Transmission Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | <p>System resources required to run this test are not available. The port may be busy with a valid call. Use <b>display port PCSSpp</b> to determine the trunk group/member number of the port. Use the "status trunk" command to determine the service state of the port. If the service state indicates that the port is in use, then the port unavailable for this test. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids" for a full description all possible states). You must wait until the port is idle before retesting.</p> <ol style="list-style-type: none"><li>1. If the port status is idle, then retry the command at 1 minute intervals for a maximum of 5 retries.</li><li>2. If the test continues to abort escalate the problem.</li></ol> |
| 1001       | ABORT       | <p>Could not allocate the necessary system resources to run this test.</p> <ol style="list-style-type: none"><li>1. Retry the command at 1 minute intervals for a maximum of 5 retries.</li><li>2. If the test continues to abort escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1002       | ABORT       | <p>The system could not allocate timeslots for the test. The system may be under heavy traffic conditions or it may have timeslots out of service due to TDM bus errors. Refer to TDM Bus Maintenance to diagnose any active TDM bus errors.</p> <ol style="list-style-type: none"><li>1. If system has no TDM bus errors and is not handling heavy traffic, repeat test at 1 minute intervals for a maximum of 5 retries.</li><li>2. If the test continues to abort escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                |

Table 10-99. TEST #844-848 Transmission Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL        | Measured transmission performance was in the unacceptable range as administered on the trunk group form. Retrieve a measurement report via the <b>list testcalls</b> command. Make sure that ATMS thresholds are set properly on page 4 of the trunk group form. Besides the facility, test failures can be caused by faulty test lines or switch paths. If the measurements point to a facility problem, report the results to the trunk vendor.        |
| 8000       | FAIL        | Measured transmission performance was in the marginal range as administered on the trunk group form. This generally means that the trunk is usable but has an undesirable amount of noise or loss. If the user does not report unacceptable effects, it may not be necessary to take any action. Retrieve a measurement report via the <b>list testcalls</b> command. Make sure that ATMS thresholds are set properly on page 4 of the trunk group form. |

## CONFIG (System Configuration)

| MO Name As It Appears in Alarm Log | Alarm Level | Initial System Technician Command to Run | Full Name of MO      |
|------------------------------------|-------------|------------------------------------------|----------------------|
| CONFIG                             | none        | none                                     | System Configuration |

The System Configuration maintenance object (MO) oversees logical insertion and removal of circuit packs in the system. When Switch Control detects that a circuit pack is present in a port slot, it informs System Configuration and System Configuration queries the circuit pack to determine the type and vintage of the circuit pack. Similarly, when Switch Control detects that a circuit pack has been removed from a port slot, it informs System Configuration.

There are no alarms or tests for System Configuration, but three types of errors are logged to the Hardware Error Log (see below).

### Hardware Error Log Entries and Test to Clear Values

System Configuration Error Log Entries

| Error Type     | Aux Data | Associated Test | Alarm Level | On/Off Board | Test to Clear Value |
|----------------|----------|-----------------|-------------|--------------|---------------------|
| 0 <sup>1</sup> | 0        | Any             | Any         | Any          | none                |
| 2-117(a)       | 0-2      | none            |             |              |                     |
| 257(b)         |          | none            |             |              |                     |
| 1002-1117(c)   | 0-2      | none            |             |              |                     |

1.
- Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a.
- This error indicates that a Port circuit pack in the system did not respond to a circuit pack type inquiry. Follow the procedures outlined in (b) to determine if there is an error.
- b.
- This error indicates that less than 25% of Trunk Group is available.
- c.
- This error indicates that a Port circuit pack in the system did not respond to a vintage inquiry.

As a result of either of these errors, a Port circuit pack may be physically inserted in a Port slot, but the system may not recognize its existence. The Error Type and Aux Data fields specify the location of the port circuit pack that caused the error as indicated in Table 10-100. If the Error Type field is greater than 1000, subtract 1000 from the Error Type field before consulting the table.

If more than one CONFIG error is logged with an Aux Data of 1 at the same time, investigate any EXP-INTF (Expansion Interface) errors before proceeding.

Once the Port circuit pack location has been determined from Table 10-100, use the **list configuration all** command to determine if the circuit pack is inserted. If not, insert the pack. If the circuit pack has already been inserted but the error persists, replace the circuit pack.

**Table 10-100. System Configuration Error Log Entries**

| Error Type | Aux Data | Port Circuit Pack Location      |
|------------|----------|---------------------------------|
| 1          | 0        | GAMUT Circuit Pack <sup>1</sup> |
| 1          | 1        | GAMUT Circuit Pack <sup>1</sup> |
| 2          | 0        | 1E01                            |

## CUST-ALM (Customer-Provided Alarming Device)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO                   |
|------------------------|-------------|-------------------------------------|-----------------------------------|
| CUST-ALM               | none        | test customer-alarm PC              | Customer-Provided Alarming Device |

1. Where PC is an appropriate port network number and carrier (for a High or Critical Reliability system, specify 1a or 1b).

The system provides customers a way to connect their own alarm indication device to a switch. The CUST-ALM maintenance object represents this Customer-Provided Alarming Device (CPAD). When an alarm occurs at least to the level to which the CPAD is administered, the CPAD in the Processor Port Network (PPN) and in the Expansion Port Network (EPN) are activated. The CPAD is administered by the Maintenance-Related System Parameters Form (CPE Alarm Activation Level field). The CPAD is connected to the Maintenance/Tape Processor in the PPN (in a High or Critical Reliability system, the CPAD is connected to both Maintenance/Tape Processors) and to the EPN Maintenance circuit pack in the EPN. The valid levels to which to set the CPE Alarm Activation Level are: *none*, *warning*, *minor*, or *major*. The CPAD is also activated within a cabinet whenever Emergency Transfer is invoked within that cabinet. The CUST-ALM MO is not maintained by the system, and does not generate any alarms. If a problem is suspected with the CPAD, it may be tested using the **test customer-alarm** command, which activates the device by closing the relay on either the Maintenance/Tape Processor or the EPN Maintenance circuit pack (whichever is specified) for 1 minute. In a High or Critical Reliability system, the CPAD on the PPN is connected to the Maintenance/Tape Processor on both carrier A and carrier B, and the **test customer-alarm** command can specify which Maintenance/Tape Processor should close its relay. The repeat parameter may be used to close the relay for a longer length of time (5 minutes is the suggested repeat value).

The CPAD is also activated within a cabinet whenever Emergency Transfer is invoked within that cabinet. The CUST-ALM MO is not maintained by the system, and does not generate any alarms. If a problem is suspected with the CPAD, it may be tested using the **test customer-alarm** command, which activates the device by closing the relay on either the Maintenance/Tape Processor or the EPN Maintenance circuit pack (whichever is specified) for 1 minute. In a High or Critical Reliability system, the CPAD on the PPN is connected to the Maintenance/Tape Processor on both carrier A and carrier B, and the **test customer-alarm** command can specify which Maintenance/Tape Processor should close its relay. The repeat parameter may be used to close the relay for a longer length of time (5 minutes is the suggested repeat value).

| Error Type | Aux Data | Associated Test | Alarm Level | On/Off Board | Test to Clear Value |
|------------|----------|-----------------|-------------|--------------|---------------------|
| none       | none     | none            |             |              |                     |

System Technician-Demanded Tests:  
Descriptions and Error Codes

There are no errors associated with the CPAD CUST-ALM MO. The **test customer-alarm PC** command is provided to allow a technician to check that the customer-provided alarming device is correctly installed and functional. It is recommended that this test be run at least once after both the switch and the customer alarm have been installed.

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Customer-Provided Alarming Device Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                        | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-----------------------------------------------|---------------------|--------------------|-------------------|
| Customer-Provided Alarming Device Test (#115) | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Customer-Provided Alarming Device Test (#115)

This test closes the relay that activates the CPAD for 1 minute only within the port network specified. If it takes longer than 1 minute to check that the CPAD has been activated, the Repeat field on the **test customer-alarm PC** command can be used to close the relay for up to 99 minutes. Note that when the repeat option is used, the results for Test #115 come back immediately and, for each test that passed, the CPAD is kept on for that many minutes. The CPAD does not go off after 1 minute and then come back on. Instead, the CPAD is kept on continuously for the entire time. If the CPAD is being activated and deactivated in a flickering fashion, there is a problem with either the CPAD, or the Maintenance/Tape Processor, or the EPN Maintenance circuit pack.

Table 10-102. TEST #115 Customer-Provided Alarming Device Test

| Error Code              | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                         | PASS        | The switch software successfully sent the request to the Maintenance/Tape Processor or EPN Maintenance circuit pack to turn on the CPAD. The CPAD must be physically inspected to verify that it is working. If the CPAD is working and the customer has complained that the CPAD did not indicate a system alarm when it occurred, then check the administered levels for turning on the CPAD via the Display System-Parameter Maintenance screen form. Compare these levels with the customer's specifications. If Test #115 passes, and the CPAD is not being activated, check the connection of the CPAD to the Maintenance/Tape Processor or EPN Maintenance circuit pack. If the CPAD can be activated but cannot be deactivated, first check to make sure Emergency Transfer is not activated in the affected port network via the <b>status system</b> command. Emergency Transfer can be forced to manual OFF by the Emergency Transfer switch on the Maintenance/Tape Processor or EPN Maintenance circuit pack. If Emergency Transfer is OFF and the CPAD still cannot be deactivated, check the administered levels for the CPAD via the Display System-Parameter Maintenance screen form and compare against the alarm levels currently present in the system ( <b>display alarms</b> command). |

## DATA-BD (Network Control Circuit Pack)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run | Full Name of MO              |
|------------------------|-------------|------------------------|------------------------------|
| DATA-BD                | WARNING     | test network-control   | Network Control Circuit Pack |
| DATA-BD                | MINOR       | test network-control   | Network Control Circuit Pack |
| DATA-BD                | WARNING     | test network-control   | Network Control Circuit Pack |

The TN777 or TN777B Network Control circuit pack contains the following objects: the SW-CTL (Switch Control), four DATA-CHLs (Network Control Data Channels), the DATA-CON (Network Control Driver), and the generic hardware that interfaces with the TDM Bus (that is, DATA-BD). The generic hardware DATA-BD is described here.

All circuit packs that have an interface with the TDM Bus have a common set of generic hardware that provides the TDM Bus interface. Consequently, these circuit packs share a common set of tests that verify the integrity of the generic hardware. The circuit packs and common set of tests that they share are described in XXX-BD (Common Port Circuit Pack) Maintenance documentation. Because the Network Control circuit pack has this common set of hardware, it is classified in the XXX-BD Maintenance documentation as a service port circuit pack.

A DEFINITY system with a single SPE has a single Network Control circuit pack. A High or Critical Reliability system has two Network Control circuit packs: one that resides in the Active SPE control carrier, and one that resides in the Standby SPE control carrier. Refer to Chapter 6, "Reliability Systems: A Maintenance Aid", and the STBY-SPE (Standby SPE) Maintenance documentation for a description of High and Critical Reliability systems.

Because the Network Control circuit pack is a SPE circuit pack, it has two important characteristics that make maintenance on the DATA-BD MO different from the maintenance on other XXX-BD (Common Port Circuit Pack) MOs. First, because the Network Control circuit pack has the SW-CTL (Switch Control) on it, it must always be physically installed in the system. Therefore, the DATA-BD MO is always logically administered. Second, because the Network Control circuit pack is a SPE circuit pack, it has no PCSS designation. Therefore, the DATA-BD MO **cannot** be accessed by system technician via the **test board PCSS**, **reset board PCSS**, **busyout board PCSS**, or **release board PCSS** commands. The only system technician access to the DATA-BD MO is via the **test network-control [a | b] [short | long]** command.

Error Log Entries and Test to Clear Values

Table 10-103. Network Control Circuit Pack Error Log Entries

| Error Type     | Aux Data | Associated Test                | Alarm Level | On/Off Board | Test to Clear Value                     |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. This error indicates the DATA-BD portion of the Network Control circuit pack stopped functioning. Since the Network Control circuit pack cannot be reset via the **reset board PCSS** command, the Data Channel Reset Test (#107) in the Long Test Sequence for the DATA-CHLs and DATA-CON must be used to reset it as follows:
1. Issue the **list data** command to determine if one, or more, Network Control Data Channels (DATA-CHLs) is administered.

 **NOTE:**  
A Network Control Data Channel (DATA-CHL) is identified by a "type" value of "netcon."

2. If a Network Control Data Channel (DATA-CHL) is not administered, use the **add data-module** [<ext> | next] command to administer a DATA-CHL.

3. From the form resulting from the **list data** command, choose a Network Control Data Channel (DATA-CHL) whose port field value indicates that it is on the same carrier (A or B) as the Network Control circuit pack to be reset.
4. Issue the **test data-module <ext> long** command using the extension for the DATA-CHL chosen in Step 3.

**WARNING:**

*Issuing this command drops all data channel extensions. See DATA-CHL (Network Control Data Channel) Maintenance documentation first.*

If the red LED stays on, then replace the circuit pack.

- b. The circuit pack has been logically administered but not physically installed. The alarm is cleared when the circuit pack is installed.
- c. This error indicates transient communications problems with this circuit pack. This error is not service-affecting and no action is required.
- d. This error indicates the circuit pack has reported a hardware failure on the circuit pack. The circuit pack should be replaced.
- e. This error can be ignored, but look for other errors on this circuit pack.
- f. This error is not service-affecting and no action is required.
- g. This error indicates the DATA-BD portion of the Network Control circuit pack is out-of-service. Since the Network Control circuit pack cannot be reset via the **reset board PCSS** command, the Data Channel Reset Test (#107) in the Long Test Sequence for the DATA-CHL and DATA-CON must be used to reset it as follows:

1. Issue the **list data** command to determine if one or more Network Control Data Channels (DATA-CHLs) are administered.

**NOTE:**

A Network Control Data Channel (DATA-CHL) is identified by a "type" value of "netcon."

2. If a Network Control Data Channel (DATA-CHL) is not administered, use the **add data-module [<ext> | next]** command to administer a DATA-CHL.
3. From the form resulting from the **list data** command, choose a Network Control Data Channel (DATA-CHL) whose port field value indicates that it is on the same carrier (A or B) as the Network Control circuit pack to be reset.

- Refer to “DATA-CHL” before issuing the **test network-control [a | b] long** command to determine if CDR, System Printer, Journal Printer, and/or PMS Links are using the DATA-CHLs and how to busyout these links prior to running destructive tests on the DATA-CHLs.
  - Refer to “SW-CTL” before issuing the **test network-control [a | b] long** command to determine the consequences of running the Switch Control Reset Test (Test #93).
4. Issue the **test data-module <ext> long** command using the extension for the DATA-CHL chosen in Step 3.

If the error happens again within 15 minutes, then replace the circuit pack.

- h. This error is not service-affecting and no action is required.
- i. In a High Critical Reliability system, the vintage number of the TN777B Network Control circuit pack must be greater than or equal to 17. The aux value for error 3841 indicates the vintage of the current TN777B installed.
- j. Error type 3999— Indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the *NPE Audit Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                 | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|----------------------------------------|---------------------|--------------------|-------------------|
| NPE Audit Test (#50) (a)               |                     | X                  | ND                |
| Control Channel Loop Around Test (#52) | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

- Note:
- a. Refer to “DATA-CHL” and “SW-CTL” for other tests associated with DATA-BD maintenance.

NPE Audit Test (#50)

The system sends a message to the on-board microprocessor to update the network connectivity information for all the NPEs on the circuit pack.

Table 10-104. TEST #50 NPE Audit Test

| Error Code   | Test Result | Description/Recommendation                                                                |
|--------------|-------------|-------------------------------------------------------------------------------------------|
| 2100<br>1019 | ABORT       | Could not allocate the necessary system resources to run this test.                       |
|              | ABORT       | Could not allocate the necessary system resources to run this test.                       |
|              | ABORT       | Test already in progress.                                                                 |
|              | FAIL        | Internal system error<br>1. Retry the command at 1-minute intervals a maximum of 5 times. |
|              | PASS        | The circuit pack’s NPEs have been updated with their translation.                         |

Control Channel Loop Around Test (#52)

This test queries the circuit pack for its circuit pack code and vintage and verifies its records.

Table 10-105. TEST #52 Control Channel Loop Around Test

| Error Code | Test Result | Description/Recommendation                                                                |
|------------|-------------|-------------------------------------------------------------------------------------------|
|            | ABORT       | Could not allocate the necessary system resources to run this test.                       |
|            | FAIL        | Internal system error<br>1. Retry the command at 1-minute intervals a maximum of 5 times. |
|            | PASS        | Communication with this circuit pack is successful.                                       |

# DATA-CHL (Network Control Data Channel)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run                 | Full Name of MO              |
|------------------------|-------------|----------------------------------------|------------------------------|
| DATA-CHL <sup>1</sup>  | MINOR       | test data-module l <ext>               | Network Control Data Channel |
| DATA-CHL <sup>2</sup>  | WARNING     | test data-module sh <ext> <sup>3</sup> | Network Control Data Channel |

1. The **test data-module <ext> long** command drops all sessions on all of the Network Control ports. Refer to Data Channel Reset Test (#107).
2. <ext> is the extension of the Data Channel to be tested. The extension can be determined by issuing the **list data-module** command from the administration terminal. The resulting form provides a mapping from the 1CXXpp designation of the Data Channel to its corresponding extension, where pp indicates which one of the four Data Channels is alarmed (01, 02, 03, or 04) and C indicates the carrier on which the alarmed Data Channel resides (A for carrier A or B for carrier B).
3. The **test data-module <ext> long** command drops all sessions on all of the Network Control ports. Refer to Data Channel Reset Test (#107).

The TN777 or TN777B Network Control circuit pack contains the following objects: the SW-CTL (Switch Control), four Data Channels, the Driver, and the generic hardware that interfaces with the TDM Bus (that is, DATA-BD). The Data Channels are the subject of this section. The Driver is also described.

Together, the four DATA-CHLs and the DATA-CON provide a data communications interface that allows data terminal equipment connected to port circuit packs to communicate with software applications running on the system. The DATA-CON represents the interface to the control channel of the TDM Bus. Each DATA-CHL represents a dial-up/dial-out asynchronous communications port that interfaces to the TDM Bus. The DATA-CON supports the signaling required to establish and tear down a connection between the terminal equipment and a software application. Data is transported between the terminal equipment and the software application over the connection established over the DATA-CHL.

A system with a single SPE has a single Network Control circuit pack (DATA-BD). Thus, there is single set of four DATA-CHLs. A High or Critical Reliability system has two Network Control circuit packs: one that resides in the Active SPE control carrier, and one that resides in the Standby SPE control carrier. Refer to Chapter 6, "Reliability Systems: A Maintenance Aid", and the STBY-SPE (Standby SPE) Maintenance documentation for descriptions of High and Critical Reliability systems.

Network Control Data Channels (DATA-CHLs) may be used to support the following features and functions:

## 10 Maintenance Object Repair Procedures

## DATA-CHL (Network Control Data Channel)

Page 10-383

- Establishment of a connection over which to log CDR data to a printer or other storage unit. This connection is called PRI-CDR/SEC-CDR (PRI-CDR Link).
- Establishment of connection(s) over which to log PMS, Automatic Wakeup, and Emergency Access to Attendant data to a Journal printer. This connection is called PMS-PRINT/JRNL-PRNT (PMS Printer Link).
- Establishment of a connection to a customer-owned PMS. This connection is called the PMS-LINK.
- Establishment of a connection to system printer. This connection is called the System Printer Link (SYS-PRNT).
- Establishment of connection(s) for up to two secondary administration terminals.
- Saving announcements from the ANN-BD (Announcement Circuit Pack) to tape.
- Restoring announcements from tape to the ANN-BD (Announcement Circuit Pack).
- Maintenance testing of the DATA-CHLs and DATA-CON.

From the viewpoint of administration, the four DATA-CHLs on a Network Control circuit pack are numbered 01 through 04. In a system with a single SPE or in the Active SPE of a system with High or Critical Reliability, each DATA-CHL may be assigned a unique extension using the **add data-module [ <ext> | next ]** command. These extensions are called *active* extensions. When assigning an active extension to a DATA-CHL XX (where XX is 01, 02, 03, or 04) the Add Data-Module form also requires the user to assign a unique *maintenance* extension to the corresponding Standby SPE DATA-CHL XX. The maintenance extension is required even when the system does not High or Critical Reliability; that is, even when there are no Standby SPE DATA-CHLs. In a High or Critical Reliability system, a Standby SPE DATA-CHL is tested by using its maintenance extension to identify it.

**NOTE:**

If a DATA-CHL or the DATA-CON becomes defective on the Network Control in a system with a single SPE, the Network Control circuit pack cannot be replaced without powering down the system.

Figure 10-24 illustrates the logical decomposition of DATA-CHL (Network Control Channel) and the DATA-CON (Network Control Driver) into software and hardware components. The figure also shows the interface to the switch software via the memory bus and to terminal equipment via the TDM Bus and port circuit packs.

As indicated in the figure, DATA-CHLs 1 and 2 share a common Dual Port RAM (DPR) and TDM Bus interface hardware, and DATA-CHLs 3 and 4 share a common DPR and TDM Bus interface hardware. Thus, if DATA-CHL 1 is defective, then DATA-CHL 2 is likely to be defective and vice versa. Similarly, if

DATA-CHL 3 is defective, then DATA-CHL 4 is likely to be defective and vice versa.

1. Determine if CDR, System Printer, Journal Printer, and/or PMS Links are using the DATA-CHLs and busyout these links if it is necessary to use the **test network-control [a | b] long** command.
2. Refer to SW-CTL (Switch Control) Maintenance documentation before executing the **test network-control [a | b] long** command to determine the consequences of running the Switch Control Reset Test (Test #93).

Figure 10-24. DATA-CON (Network Control Driver)

## Status of Network Control Data Channels

---

In order to perform maintenance testing on the Network Control DATA-CHLs, the DATA-CHLs cannot be busy with one of the functions described previously. A series of system technician commands can be used to determine if the DATA-CHLs are busy and, if so, to determine the function for which they are being used. This series of system technician commands is described below and should be done before testing the DATA-CHLs.

Issue the **list data-module** command to determine the extensions for the administered Network Control Data Channels (DATA-CHLs).

### ⇒ NOTE:

A Network Control Data Channel (DATA-CHL) is identified by a "type" value of "netcon."

For each Network Control Data Channel (DATA-CHL) on the Active SPE, determine if the DATA-CHL is busy by issuing the **status data-module <ext>** command using the DATA-CHL's extension. If the DATA-CHL is busy, the Service State field in the resulting form will be in service/active. However, the form does not indicate the reason the DATA-CHL is busy. This must be determined using other system technician commands.

Use the procedures below to determine whether busy Network Control Data Channels (DATA-CHLs) are being used for CDR, Journal Printer, or PMS Links. If a DATA-CHL is busy with one of these links then, in order to test the DATA-CHL, the link must be busied out using **busyout smdr-link**, **busyout journal-printer wakeup-log**, **busyout journal-printer pms-log**, or **busyout pms-link** command, respectively. Do not issue any of these busyout commands unless instructed to do so while investigating Error Codes according to the "System Technician-Demanded Tests: Descriptions and Error Codes" subsection. If one of these links must be busied out to perform maintenance testing, restore the link to service according to PRI-CDR/SEC-CDR (PRI-CDR Link), PMS-PRNT/JNL-PRNT (PMS Printer Link), and PMS-LINK Maintenance documentation, respectively.

If a DATA-CHL is busy but is not being used for one of these links, then it is being used for a secondary administration terminal connection or for maintenance testing. If it is being used for a secondary administration terminal connection, then in order to test the DATA-CHL that the connection is using, the DATA-CHL must be busied out using the **busyout data-module <ext>** command.

### ⇒ NOTE:

The **busyout data-module <ext>** command causes the connection over the associated DATA-CHL to be dropped. Do not issue this command unless instructed to do so.

If the DATA-CHL must be busied out in order to perform maintenance testing, the secondary administration terminal connection must be re-established by redialing the DATA-CHL.

## CDR Links

1. Issue the **status smdr-link** command to see if an CDR Link has been established. If the Link State field is "Up," then the CDR Link may be using one of the Network Control Data Channels (DATA-CHLs).
2. Issue the **display system features** command and go to the CDR subsection on Page 2 of the resulting form. Note the values in the Primary Output Extension and Secondary Output Extension fields. If the values are extensions, then the CDR Link is using one of the Network Control Data Channels (DATA-CHLs).
3. For each of the extensions in the Primary Output Extension and Secondary Output Extension fields, issue the **status data-module <ext>** command using the extension. Note the value in the Connected Ports field of the resulting form. If there is a port value in the field, then the indicated port is a Network Control Data Channel (DATA-CHL).
4. Issue the **list data-module** command, locate each port indicated in the Connected Ports fields, and determine if that port has a "type" value of "netcon." If so, then there is an CDR Link over that DATA-CHL.

## System Printer Links

1. Issue the **status sp-link** command to see if a System Printer Link has been established. If the Link State field is "Up," then the System Printer Link may be using one of the Network Control Data Channels (DATA-CHLs).
2. Issue the **display system features** command and go to the System Printer subsection on Page 2 of the resulting form. Note the values in the Primary Output Extension and Secondary Output Extension fields. If the values are extensions, then the System Printer Link is using one of the Network Control Data Channels (DATA-CHLs).
3. For each of the extensions in the Primary Output Extension and Secondary Output Extension fields, issue the **status data-module <ext>** command using the extension. Note the value in the Connected Ports field of the resulting form. If there is a port value in the field, then the indicated port is a Network Control Data Channel (DATA-CHL).
4. Issue the **list data-module** command, locate each port indicated in the Connected Ports fields, and determine if that port has a "type" value of "netcon." If so, then there is a System Printer Link over that DATA-CHL.

## Journal Printer Links

1. Issue the **status journal-link wakeup-log** and **status journal-link pms-log** commands to see if one or both of these Journal Printer Links have been established. If the Link State field is "Up" for either of these, then that Journal Printer Link may be using one of the Network Control Data Channels (DATA-CHLs).
2. Issue the **display system hospitality** command and note the values in the Extension of Journal/System Printer and Extension of PMS Log Printer fields. If either of these values are extensions, then that Journal Printer Link is using one of the Network Control Data Channels (DATA-CHLs).
3. For each of the extensions in the Extension of Journal/Schedule Printer and Extension of PMS Log Printer fields, issue the **status data-module <ext>** command using the extension. Note the value in the Connected Ports field of the resulting form. If there is a port value in the field, then the indicated port is a Network Control Data Channel (DATA-CHL).
4. Issue the **list data-module** command, locate each port indicated in the Connected Ports fields, and determine if that port has a "type" value of "netcon." If so, then there is a Journal Printer Link over that DATA-CHL.

## PMS Link

1. Issue the **status pms-link** command to see if a PMS Link has been established. If the Link State field is "Up," the PMS Link may be using one of the Network Control Data Channels (DATA-CHLs).
2. Issue the **display system hospitality** command and note the value in the Extension of the PMS field. If this value is an extension, the PMS Link is using one of the Network Control Data Channels (DATA-CHLs).
3. For the extension in the Extension of PMS field, issue the **status data-module <ext>** command using the extension. Note the value in the Connected Ports field of the resulting form. If there is a port value in the field, the indicated port is a Network Control Data Channel (DATA-CHL).
4. Issue the **list data-module** command, locate the port indicated in the Connected Ports field, and determine if that port has a "type" value of "netcon." If so, there is a PMS Link over that DATA-CHL.

Error Log Entries and Test to Clear Values

Table 10-106. Network Control Data Channel Error Log Entries

| Error Type         | Aux Data | Associated Test                            | Alarm Level | On/Off Board | Test to Clear Value           |
|--------------------|----------|--------------------------------------------|-------------|--------------|-------------------------------|
| 0 <sup>1</sup> (a) | 0        | Any                                        | Any         | Any          | test data-module <ext> sh r 1 |
| 1                  | Any      | Local Loop Back Test (#111)                | MINOR       | ON           | test data-module <ext> sh r 3 |
| 18 (b)             | 0        | busyout data-module <ext>                  | WARNING     | OFF          | release data-module <ext>     |
| 130                |          | None                                       | WARNING     | ON           | test data-module <ext> sh     |
| 257                | Any      | Remote Maintenance Loop Around Test (#109) | MINOR       | ON           | test data-module <ext> sh r 5 |
| 513                | Any      | Crosstalk Test (#110)                      | MINOR       | ON           | test data-module <ext> sh r 3 |
| 769                | Any      | Dual Port RAM Test (#108)                  | MINOR       | ON           | test data-module <ext> l r 3  |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- b. In a system with the duplication option, a busyout of the DATA-CHL is preserved across an SPE interchange. When an SPE interchange occurs, and the DATA-CHL is busied out, the busyout state is transferred to the corresponding DATA-CHL on the new active SPE while the DATA-CHL on the former active SPE is released.

System Technician-Demanded Tests:  
Descriptions and Error Codes

There are two system technician test commands that include the Network Control Data Channels (DATA-CHLs). The **test data-module <ext> [short | long]** command tests the single DATA-CHL that has the extension specified by <ext>. The **test network-control [a | b] [short | long]** command tests each administered DATA-CHL that resides on the Network Control circuit pack in the specified carrier.

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *Data Channel Reset Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                                  | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|---------------------------------------------------------|---------------------|--------------------|-------------------|
| Data Channel Reset Test (#107) (a)                      |                     | X                  | D                 |
| Data Channel Dual Port Ram Test (#108) (a)              |                     | X                  | D                 |
| Data Channel Remote Maintenance Loop Around Test (#109) | X                   | X                  | ND                |
| Data Channel Local Loop Back Test (#111)                | X                   | X                  | ND                |
| Data Channel Crosstalk Test (#110)                      | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

- Note:
- a. Determine if CDR, System Printer, Journal Printer, and/or PMS Links are using the DATA-CHLs and busyout these links if it is necessary to use the **test network-control [a | b] long** command.

**Table 10-107. System Technician-Demanded Tests: DATA-CHL**

| Order of Investigation                                    | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-----------------------------------------------------------|---------------------|--------------------|-------------------|
| Control Channel Test (Common Port Circuit Pack) (#52) (a) |                     | X                  | ND                |
| NPE Audit Test (Common Port Circuit Pack) (#50) (a)       | X                   | X                  | ND                |
| Data Channel Reset Test (#107)                            |                     | X                  | D                 |
| Data Channel DPR Test (#108)                              |                     | X                  | D                 |
| Data Channel Maintenance Loop Around Test (#109)          | X                   | X                  | ND                |
| Data Channel Crosstalk Test (#110)                        | X                   | X                  | ND                |
| Data Channel Local Loop Back Test (#111)                  | X                   | X                  | ND                |
| Switch Control Reset Test (#93) (b)                       |                     | X                  | D                 |
| EPN Maintenance Board Interface Test (#325) (b)           |                     | X                  | D                 |
| Time-of-Day Clock Test (#95) (b)                          | X                   | X                  | ND                |
| Control Channel Interface Test (#92) (b)                  | X                   | X                  | ND                |
| Control Channel Transmission Test (#94) (b)               | X                   | X                  | ND                |

Table 10-107. System Technician-Demanded Tests: DATA-CHL — Continued

| Order of Investigation                                 | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------|---------------------|--------------------|-------------------|
| EPN Maintenance Board Interface Test (#324) (b)        | X                   | X                  | ND                |

Notes:

- a. Refer to DATA-BD (Network Control Circuit Pack) Maintenance documentation for a description of these tests.
- b. Refer to SW-CTL (Switch Control) Maintenance documentation for a description of these tests.
- c. Refer to the CARD-MEM MO section for information on this test.

Data Channel Reset Test (#107)

This test is destructive.

This test resets the entire data communications interface provided by the DATA-CON and the four DATA-CHLs. All existing connections over the DATA-CHLs are dropped.

Table 10-108. TEST #107 Data Channel Reset Test

| Error Code                                                   | Test Result        | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Data Channel Dual Port RAM Test (#108)

This test is destructive.

This is a coordinated test of the dual port RAM that is shared between the hardware and software composing the DATA-CON. Control messages and data are passed through this dual port RAM to establish and tear down connections over the DATA-CHLs. This test requests each side to read and write the dual port RAM, first one at a time and then simultaneously in alternate locations.

This test prevents any control stimuli from being received from or sent to the TDM Bus control channel preventing the establishment of new connections over the DATA-CHLs. However, existing connections are not (and cannot) be dropped.

Table 10-109. TEST #108 Data Channel Dual Port RAM Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

After the Network Control circuit pack has been replaced, its Time-of-Day clock must be set using the <b>set time</b> command. |
|            | PASS        | The DATA-CON dual port RAM is functioning. Connections can be established over the DATA-CHLs.                                                                                                                                                                                                                                                                                                                                                                                                        |

Data Channel Remote Maintenance Loop Around  
Test (#109)

This test verifies the integrity of the entire DATA-CHL (that is, the software, dual port RAM, and hardware that compose it). It verifies that a connection can be established over the DATA-CHL and that the DATA-CHL can correctly send and receive data over the connection (that is, over the TDM Bus). The test actually involves two DATA-CHLs: the DATA-CHL that is the target of the test and a second, arbitrary, unbusy DATA-CHL. A connection is set up by placing a call out from the arbitrary DATA-CHL and into the target DATA-CHL. Data is looped over the connection in each direction (that is, the target DATA-CHL is tested as both a sender of data and a receiver of data). The test checks that the data received by one DATA-CHL is the same as the data that was sent by the other DATA-CHL.

Because it establishes a connection between two Network Control Data Channels (DATA-CHLs) across the TDM Bus, this test does more than just verify the integrity of the target DATA-CHL. It also verifies the integrity of the DATA-CON (by establishing the connection) and of the TDM Bus and Tone-Clock circuit pack (by sending and receiving data).

If this test aborts or fails, it is impossible to determine from this test alone whether the defective DATA-CHL is the target DATA-CHL or the arbitrarily chosen DATA-CHL, or if the problem lies with the DATA-CON, TDM Bus, or Tone-Clock circuit pack. The results of running Tests #107, #108, #110, and #111 on the DATA-CHL can be used to determine whether the target DATA-CHL is defective.

Finally, recall from the description of that DATA-CHLs 1 and 2 share a common Dual Port RAM (DPR) and TDM Bus interface hardware and DATA-CHLs 3 and 4 share a common DPR and TDM Bus interface hardware. Thus, if this test finds that DATA-CHL 1 is defective, then DATA-CHL 2 is likely to be defective and vice versa. Similarly, if this test finds that DATA-CHL 3 is defective, then DATA-CHL 4 is likely to be defective and vice versa.

 **NOTE:**

If an Error Code is encountered recommending that an CDR, System Printer, Journal Printer, and/or PMS Link be busied out, restore each busied out link to service according to PRI-CDR/SEC-CDR (PRI-CDR Link), SYS-PRNT (System Printer Link), JNL-PRNT (Journal Printer Link), or PMS-PRNT/JNL-PRNT (PMS Printer Link) Maintenance documentation, respectively, before concluding work on the problem.

| 1006<br>(cont'd.) |             | <div><div>1. Issue the <b>list data-module</b> command to determine if other DATA-CHLs are administered. If no other CATA-CHLs are administered, administer at least one at this time.</div><div>2. Determine if the target DATA-CHL is in use for some other function (that is, CDR Link, System Printer Link, Journal Printer Link, PMS Link, or secondary administration terminal connection) as described previously in the "Status of network Control Data Channels" section. If so, check for errors on the function that is using the DATA-CHL. If there are no errors, there is a high probability that the DATA-CHL is not defective. Proceed with the remaining steps <b>only if it is necessary to completely test the target DATA-CHL.</b><div><div>a. If a DATA-CHL is being used for a secondary administration terminal connection, busyout that DATA-CHL.</div><div>b. Otherwise, if a DATA-CHL is being used for a PMS Link, busyout the PMS Link.</div><div>c. Otherwise, if a DATA-CHL is being used for a Journal Printer Link, busyout the Journal Printer Link.</div><div>d. Otherwise, if a DATA-CHL is being used for an CDR Link, busyout the CDR Link.</div><div>e. Otherwise, if a DATA-CHL is being used for a System Printer Link, busyout the System Printer Link.</div></div></div><div>3. Retry the command at 1-minute intervals a maximum of 5 times.</div><div>4. Restore any busied out CDR, System Printer, Journal Printer, or PMS Link to service before moving on to another activity.</div></div> |

Table 10-110. TEST #109 Data Channel Remote Maintenance Loop Around Test — Continued

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                        |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | The target DATA-CHL, DATA-CON, TN777 Network Control circuit pack, TDM Bus (TDM-BUS), and Tone-Clock circuit pack (TONE-BD, TONE-PT, TDM-CLK) are functioning. Connections can be established over the DATA-CHLs. |

Data Channel Crosstalk Test (#110)

This test verifies the integrity of the entire DATA-CHL, that is, the software, dual port RAM, and hardware that composes it. However, unlike the Remote Maintenance Loop Around Test (#109), this test only involves the single DATA-CHL that is the target of the test. A loop around connection is established over the TDM Bus from the DATA-CHL back to itself. Data is looped over the connection in each direction, that is, the DATA-CHL is tested as both a sender of data and a receiver of data. The test checks that the data received by the DATA-CHL is the same as the data that was sent by the DATA-CHL.

Because it establishes a loop around connection from the Network Control DATA-CHL back to itself across the TDM Bus, this test does more than just verify the integrity of the target DATA-CHL. It also verifies the integrity of the DATA-CON (by establishing the connection) and of the TDM Bus and Tone-Clock circuit pack (by sending and receiving data).

If this test aborts or fails, it is impossible to determine from this test alone whether the target DATA-CHL is defective or if the problem lies with the DATA-CON, TDM Bus, or Tone-Clock circuit pack. The results of running Tests #107, #108, and #111 on the DATA-CHL can be used to determine whether the target DATA-CHL is defective.

Finally, recall from the description of that DATA-CHLs 1 and 2 share a common DPR and TDM Bus interface hardware and DATA-CHLs 3 and 4 share a common DPR and TDM Bus interface hardware. Thus, if this test finds that DATA-CHL 1 is defective, then DATA-CHL 2 is likely to be defective and vice versa. Similarly, if this test finds that DATA-CHL 3 is defective, then DATA-CHL 4 is likely to be defective and vice versa.

**➤ NOTE:**  
If an Error Code is encountered that recommends that an CDR Link, System Printer Link, PMS Log Printer, Wakeup-Log Printer Link, and/or PMS Link be busied out, restore each busied-out link to service according to the PRI-CDR/SEC-CDR (PRI-CDR Link), SYS-PRNT, or PMS-LINK Maintenance documentation, respectively, before concluding work on the problem.

Table 10-111. TEST #110 Data Channel Crosstalk Test

| Error Code     | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4              | ABORT       | <p>For this test, an Error Code of 4 can have one of two different meanings:</p> <ul style="list-style-type: none"><li>a. The target DATA-CHL is busy and, therefore, not available for use.</li><li>b. Internal system error</li></ul> <p>Determine if the target DATA-CHL is in use for some other function (that is, CDR Link, System Printer Link, Journal Printer Link, PMS Link, or secondary administration terminal connection) as described previously in the "Status of network Control Data Channels" section. If so, check for errors on the function that is using the DATA-CHL. If there are no errors, there is a high probability that the DATA-CHL is not defective.</p> <p>Proceed with the remaining steps <b>only if it is necessary to completely test the target DATA-CHL:</b></p> <ul style="list-style-type: none"><li>1. If the target DATA-CHL is in use for some other function, busyout the function (CDR Link, System Printer Link, Journal Printer Link, PMS Link) or the DATA-CHL (secondary administration terminal connection <b>only&lt;EMPH&gt;</b>).</li><li>2. Retry the command at 1-minute intervals a maximum of 5 times.</li><li>3. Restore any busied out CDR, System Printer, Journal Printer, or PMS Link to service before moving on to another activity.</li></ul> |
| 40<br>70<br>75 | ABORT       | <p>Internal system error</p> <ul style="list-style-type: none"><li>1. Retry the command at 1-minute intervals a maximum of 5 times.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 10-111. TEST #110 Data Channel Crosstalk Test — Continued

| Error Code                                          | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14<br>16<br>40<br>2000<br>2003<br>2004<br>(cont'd.) |             | <p>4. If the result of Test #111 is FAIL, then the most likely problem is that the target DATA-CHL is defective, the DATA-CON is defective, or the TN777 Network Control circuit pack is defective. Busyout <b>all</b> functions that are using the Network Control Data Channels (DATA-CHLs).</p> <p> <b>CAUTION:</b><br/><i>All functions must be busied out because Test #107 is destructive and terminates all established connections over the DATA-CHLs.</i></p> <p>a. Issue the <b>test data-module &lt;ext&gt; long</b> command for the target DATA-CHL. Note the test results for Tests #107 and #108.</p> <p>1. If the result of Test #107 is FAIL, then the TN777 Network Control circuit pack is defective.</p> <p>(a). Replace the Network Control circuit pack immediately. After the Network Control circuit pack has been replaced, its Time-of-Day clock must be set using the <b>set time</b> command.</p> <p>(b). Repeat the test.</p> <p>2. If the result of Test #107 is PASS and the result of Test #108 is FAIL, then the DATA-CON is defective.</p> <p>(a). Although all DATA-CHLs are unusable, the SW-CTL is still operational. Based on the customer's use of DATA-CHLs, replace the Network Control circuit pack at the customer's convenience. After the Network Control circuit pack has been replaced, its Time-of-Day clock must be set using the <b>set time</b> command.</p> <p>(b). Repeat the test.</p> <p>3. If the result of Test #107 is PASS and the result of Test #108 is PASS, then the target DATA-CHL is defective.</p> <p>(a). Issue the <b>remove data-module &lt;ext&gt;</b> command for the target DATA-CHL to remove it from operation.</p> <p>(b). Replace the Network Control circuit pack at your earliest convenience. After the Network Control circuit pack has been replaced, its Time-of-Day clock must be set using the <b>set time</b> command.</p> <p>5. Restore any busied out function (PRI-CDR/SEC-CDR, SYS-PRNT, PMS-PRNT/JNL-PRNT, PMS-LINK) to service before moving on to another activity.</p> |

Table 10-111. TEST #110 Data Channel Crosstalk Test — Continued

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                              |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | The target DATA-CHL, DATA-CON, TN777 Network Control circuit pack, TDM Bus (TDM-BUS), and Tone-Clock circuit pack (TONE-BD, TONE-PT, TDM-CLK) are functioning. Connections can be established over the target DATA-CHL. |

Data Channel Local Loop Back Test (#111)

This test verifies the integrity of the dual port RAM that is shared between the software and hardware that composes the DATA-CHL. The dual port RAM is placed in local loop back mode such that data to be sent by the DATA-CHL is instead looped back to be received by the DATA-CHL. The loop back is done within the dual port RAM, that is, the data is never sent over the TDM Bus. The test checks that the data received by the DATA-CHL is the same as the data that was sent by the DATA-CHL.

This test actually does more than just verify the integrity of the target DATA-CHL. Because it is the DATA-CON that actually puts the Dual Port RAM in local loop back mode and loops the data from the Dual Port RAM back into the Dual Port RAM, the test also verifies the integrity of the DATA-CON.

If this test aborts or fails, it is impossible to determine from this test alone whether the target DATA-CHL is defective or if the problem lies with the DATA-CON. The results of running Tests #107 and #108 on the DATA-CHL can be used to determine whether the target DATA-CHL is defective.

Finally, recall from the description of that DATA-CHLs 1 and 2 share a common Dual Port RAM (DPR) and TDM Bus interface hardware and DATA-CHLs 3 and 4 share a common DPR and TDM Bus interface hardware. Thus, if this test finds that DATA-CHL 1 is defective, then DATA-CHL 2 is likely to be defective and vice versa. Similarly, if this test finds that DATA-CHL 3 is defective, then DATA-CHL 4 is likely to be defective and vice versa.

 **NOTE:**  
If an Error Code is encountered that recommends that an CDR Link, System Printer Link, PMS Log Printer, Wakeup-Log Printer, and/or PMS Link be busied out, restore each busied-out link to service according to the PRI-CDR/SEC-CDR (PRI-CDR Link), SYS-PRNT (System Printer Link), PMS-PRNT/JNL-PRNT (PMS Printer Link), or PMS-LINK (Property Management System Link) Maintenance documentation, respectively, before concluding work on the problem.

Table 10-112. TEST #111 Data Channel Local Loop Back Test

| Error Code     | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4              | ABORT       | <p>For this test, an Error Code of 4 can have one of two different meanings:</p> <ul style="list-style-type: none"><li>a. The target DATA-CHL is busy and, therefore, not available for use.</li><li>b. Internal system error</li></ul> <p>Determine if the target DATA-CHL is in use for some other function (that is, CDR Link, System Printer Link, Journal Printer Link, PMS Link, or secondary administration terminal connection) as described previously in the "Status of network Control Data Channels" section. If so, check for errors on the function that is using the DATA-CHL. If there are no errors, there is a high probability that the DATA-CHL is not defective. Proceed with the remaining steps <b>only if it is necessary to completely test the target DATA-CHL.</b></p> <ul style="list-style-type: none"><li>1. If the target DATA-CHL is in use for some other function, busyout the function (PRI-CDR/SEC-CDR, SYS-PRNT, PMS-PRNT/JNL-PRNT, PMS-LINK) or the DATA-CHL (secondary administration terminal connection <b>only</b>).</li><li>2. Retry the command at 1-minute intervals a maximum of 5 times.</li><li>3. Restore any busied out PRI-CDR/SEC-CDR, SYS-PRNT, PMS-PRNT/JNL-PRNT, PMS-LINK MOs to service before moving on to another activity.</li></ul> |
| 40<br>70<br>75 | ABORT       | <p>Internal system error</p> <ul style="list-style-type: none"><li>1. Retry the command at 1-minute intervals a maximum of 5 times.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                                         | PASS        | <p>The target DATA-CHL and DATA-CON are functioning. Connections can be established over the target DATA-CHL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## DATA-CON (Network Control Driver)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run | Full Name of MO        |
|------------------------|-------------|------------------------|------------------------|
| DATA-CON               | MINOR       | none                   | Network Control Driver |

The TN777B Network Control circuit pack contains the following objects: the SW-CTL (Switch Control), four DATA-CHLs (Data Channels), the DATA-CON (Network Control Driver), and the generic hardware that interfaces with the TDM Bus (DATA-BD). The DATA-CON (Network Control Driver) is the subject of this section. The DATA-CHLs (Network Control Channels) are also described.

Together the four DATA-CHLs and the DATA-CON provide a data communications interface that allows DTE equipment connected to port circuit packs to communicate with software applications running on the system. The DATA-CON represents the interface to the control channel of the TDM Bus. Each DATA-CHL represents a dial-up/dial-out asynchronous communication port that interfaces to the TDM Bus. The DATA-CON supports the signaling required to establish and tear down a connection between the terminal equipment and a software application. Data is transported between the terminal equipment and the software over the connection established over the DATA-CHL.

A system with a single SPE has a single Network Control circuit pack. Thus, there is a single DATA-CON. A High or Critical Reliability system has two Network Control circuit packs, one in each of the two SPEs. Thus, there is a DATA-CON on the Network Control circuit pack that resides in the Active SPE control carrier and a DATA-CON on the Network Control circuit pack that resides in the Standby SPE control carrier. Refer to Chapter 6, "Reliability Systems: A Maintenance Aid", and the STBY-SPE (Standby SPE) Maintenance documentation for discussions of High and Critical Reliability systems.

From an external (user) point of view, the DATA-CON is not directly accessible via a system technician command; that is, there is no object command word that represents it. Instead, the DATA-CON is tested under the guise of the DATA-CHLs that it controls. The **test data-module <ext> [short | long]** command tests the DATA-CON along with the DATA-CHL designated by <ext> but all Test Results are associated with the DATA-CHL Maintenance Name.

From an internal (system software) point of view, the DATA-CON uses the same set of tests as the DATA-CHLs. Therefore, the DATA-CON assumes the same Error Type and Aux Data values as the DATA-CHLs in the Hardware Error Log. It is also alarmed at the same Alarm Level (that is, MINOR, ON BOARD) in the Alarm Log. In both logs, the Maintenance Name is DATA-CON.

Error Log Entries and Test to Clear Values

Table 10-113. Network Control Driver Error Log Entries

| Error Type     | Aux Data | Associated Test                            | Alarm Level | On/Off Board | Test to Clear Value (a) |
|----------------|----------|--------------------------------------------|-------------|--------------|-------------------------|
| 0 <sup>1</sup> | 0        | Any                                        | Any         | Any          | none                    |
| 1              |          | Local Loop Back Test (#111)                | MINOR       | ON           | none                    |
| 257            | Any      | Remote Maintenance Loop Around Test (#109) | MINOR       | ON           | none                    |
| 513            |          | Crosstalk Test (#110)                      | MINOR       | ON           | none                    |
| 769            | Any      | Dual Port RAM Test (#108)                  | MINOR       | ON           | none                    |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Note:

- a. As previously described, the DATA-CON is not directly accessible via a system technician command so there is no Test to Clear value that can be used to directly clear errors and alarms raised against the DATA-CON. However, since the DATA-CON and the DATA-CHLs share the same set of tests (that is, test the same set of hardware, firmware, and software), DATA-CON errors and alarms are accompanied by DATA-CHL errors and alarms.

Therefore, the strategy to clear DATA-CON errors and alarms is to first clear all DATA-CHL errors and alarms. After DATA-CHL errors and alarms have been cleared, allow about 60 minutes for maintenance software to run internally and to automatically clear the DATA-CON errors and alarms.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Because the DATA-CON uses the same set of tests as the DATA-CHLs, refer to the "System Technician-Demanded Tests: Descriptions and Error Codes" in the DATA-CHL (Network Control Data Channel) Maintenance documentation for a description of the tests and their associated error codes.

## DAT-LINE (Data Line)

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO |
|------------------------|-------------|-------------------------------------|-----------------|
| DAT-LINE               | MINOR       | test port PCSSpp l                  | Data Line       |
| DAT-LINE               | WARNING     | test port PCSSpp sh                 | Data Line       |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

The TN726 Data Line circuit pack is a port circuit that provides connectivity from the system to asynchronous CPE having RS232-compatible serial interfaces. There are eight data lines (DAT-LINES) on the Data Line circuit pack. If there are errors associated with the DT-LN-BD (Data Line Circuit Pack), refer to the XXX-BD (Common Port Circuit Pack) Maintenance documentation.

Data Lines are administered via the administration terminal **add data-module** command. The data module type is *data-line*. The **list data-module** command lists all administered data modules in the system.

The TN750 Announcement circuit pack has one Data Line on it. The Data Line is used for saving and restoring announcements. For a description of this feature, refer to ANN-BD (Announcement Circuit Pack) Maintenance documentation. Also, if there are errors associated with the Announcement circuit pack, refer to the ANN-BD Maintenance documentation.

 **NOTE:**

If the tests for the Data Line in question pass and there are still user-reported problems, there is probably an external problem. Test the ADU, following the procedures outlined in *User Manual Z3A Asynchronous Data Unit*, 555-401-701. If the ADU appears to be working properly, check the external wiring and, finally, check the customer equipment.

Error Log Entries and Test to Clear Value

Table 10-114. Data Line Error Log Entries

| Error Type     | Aux Data | Associated Test                 | Alarm Level | On/Off Board | Test to Clear Value     |
|----------------|----------|---------------------------------|-------------|--------------|-------------------------|
| 0 <sup>1</sup> | 0        | Any                             | Any         | Any          | test port PCSSpp sh r 1 |
| 1              |          | Digital Loop Around Test (#171) | MINOR       | ON           | test port PCSSpp sh r 2 |
| 15(a)          | Any      | Audit Update Test (#36)         |             |              |                         |
| 18             | 0        | busyout port PCSSpp             | WARNING     | OFF          | release port PCSSpp     |
| 130 (b)        |          | None                            | WARNING     | ON           | test port PCSSpp sh     |
| 257            |          | Conference Circuit Test (#7)    | MINOR       | ON           | test port PCSSpp l r 2  |
| 513            |          | NPE Crosstalk Test (#6)         | MINOR       | ON           | test port PCSSpp l r 2  |
| 769(a)         | Any (c)  | None                            |             |              |                         |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

- a. This is a software audit error that does not indicate any hardware malfunction. Run the Short Test Sequence and investigate errors (if any).
- b. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- c. This error is logged when the Data Line circuit pack finds an error with the transmit/receive circuitry of an administered Data Line on circuit pack insertion. Perform the following procedure:
  - 1. Issue the **busyout board PCSS** command to busyout the Data Line circuit pack on which this port resides.
  - 2. Issue the **reset board PCSS** command. Check the Hardware Error Log to determine if Error Type 769 is logged again for the DAT-LINE MO.

 **NOTE:**  
When displaying errors, set the Active Alarms Only field to "n."

If Error Type 769 reappears, replace the DAT-LINE circuit pack. If Error Type 769 does not reappear, proceed to Step 3.

3. Issue the **release board PCSS** command to release the Data Line circuit pack on which this port resides.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Digital Loop Around Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation          | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|---------------------------------|---------------------|--------------------|-------------------|
| Digital Loop Around Test (#171) | X                   | X                  | ND                |
| NPE Crosstalk Test (#6)         |                     | X                  | ND                |
| Conference Circuit Test (#7)    |                     | X                  | ND                |
| Audit Update Test (#36)         | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-115. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                   |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT       | Could not allocate the necessary system resources to run this test.<br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                      |
| 1000       | ABORT       | System resources required to run this test are not available. The port may be in use on a valid call. Use <b>status data-module</b> to determine when the port is available for testing.<br>1. Retry the command at 1-minute intervals a maximum of 5 times. |

Table 10-115. TEST #6 NPE Crosstalk Test — Continued

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                       |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1001       | ABORT       | Could not allocate the necessary system resources to run this test.<br><br>1. Retry the command at 1minute intervals a maximum of 5 times.                                                                                                                                                                                                                       |
| 1002       | ABORT       | The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS" to diagnose TDM-BUS errors.<br><br>1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.      |
| 1003       | ABORT       | The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service.<br><br>1. Resolve any "TTR-LEV" errors.<br><br>2. Resolve any "TONE-PT" errors.<br><br>3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times. |
| 1004       | ABORT       | The port has been seized by a user for a valid call. Use <b>status data-module</b> to determine when the port is available for testing.<br><br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                                                  |
| 1020       | ABORT       | The test did not run due to an already existing error on this port (Error Type 769).<br><br>1. Refer to the procedure for Error Type 769. If Error Type 769 still occurs on this port, replace the circuit pack.                                                                                                                                                 |
| 2000       | ABORT       | Response to the test request was not received within the allowable time period.                                                                                                                                                                                                                                                                                  |
| 2100       | ABORT       | Could not allocate the necessary system resources to run this test.<br><br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                                                                                                                      |
| Any        | FAIL        | The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections.<br><br>1. Replace the circuit pack.                                                                                                                                                                                                              |
|            | PASS        | The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests, examining the ADU, external wiring, and customer equipment.                                                                                                                                                             |

Conference Circuit Test (#7)

The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

Table 10-116. TEST #7 Conference Circuit Test

| Error Code | Test Result | Description/Recommendation                                                                                                                                                                                   |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT       | Could not allocate the necessary system resources to run this test.<br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                      |
| 1000       | ABORT       | System resources required to run this test are not available. The port may be in use on a valid call. Use <b>status data-module</b> to determine when the port is available for testing.                     |
| 1004       | ABORT       | The port has been seized by a user for a valid call. Use <b>status data-module</b> to determine when the port is available for testing.<br>1. Retry the command at 1-minute intervals a maximum of 5 times.  |
| 1020       | ABORT       | The test did not run due to an already existing error on this port (Error Type 769).<br>1. Refer to the procedure for Error Type 769. If Error Type 769 still occurs on this port, replace the circuit pack. |
| 2000       | ABORT       | Response to the test request was not received within the allowable time period.                                                                                                                              |
| 2100       | ABORT       | Could not allocate the necessary system resources to run this test.<br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                      |
| Any        | FAIL        | The conference circuit test failed (possible off-board problem).<br>1. Busyout and release the port (data line), and then retest.<br>2. Replace the circuit pack if the test continues to fail.              |
|            | PASS        | The port can correctly conference multiple connections. User-reported troubles on this port should be investigated using other port tests, examining the ADU, external wiring, and customer equipment.       |

Audit Update Test (#36)

This audit makes sure that the hardware state of the Data Line is consistent with the system translations. When this audit is run, the port is queried for the switchhook state, and the software state is updated according to the returned value. Also, the data line options are sent down to the port.

Table 10-117. TEST #36 Audit Update Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                      |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1006       | ABORT       | The test did not run due to an already existing error on this port (Error Type 769).<br><br>1. Refer to the procedure for Error Type 769. If Error Type 769 still occurs on this port, replace the circuit pack. |
| 2000       | ABORT       | Response to the test request was not received within the allowable time period.                                                                                                                                  |
| 2100       | ABORT       | Could not allocate the necessary system resources to run this test.<br><br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                      |
| 7          | FAIL        | Internal system error<br><br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                    |
|            | PASS        | The hardware port state is consistent with the software state. User-reported troubles on this port should be investigated using other port tests, examining the ADU, external wiring, and customer equipment.    |

Digital Loop Around Test (#171)

The Digital Loop Around Test checks the Data Line’s ability to transmit and receive data on the TDM Bus. Data is sent through Network Control Data Channel 3 (data channel port 3) over the TDM Bus, internally looped through the Data Line back onto the TDM Bus, and received again by Network Control Data Channel 3.

If data channel 3 is in use or not administered, this test aborts. This test may fail if Network Control Data Channel 3 is not functioning properly. If there are any DATA-CHL errors in the Error Log, refer to the DATA-BD (Network Control Circuit Pack) Maintenance documentation to clear them up first. This test passes regardless of any customer equipment that may be connected to the port, as long as the port is not in use by the equipment.

Table 10-118. TEST #171 Digital Loop Around Test

| Error Code   | Test Result    | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                          |

|            | PASS        | <p>The port can correctly transmit/receive data. User-reported troubles on this port should be investigated by examining the ADU, external wiring, and customer equipment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# DC-POWER

## Single-Carrier Cabinet Power

| MO Name (in Alarm Log) | Alarm Level | Initial Command to Run <sup>1</sup> | Full Name of MO              |
|------------------------|-------------|-------------------------------------|------------------------------|
| DC-POWER               | MAJOR       | test environment P                  | Single-Carrier Cabinet Power |

1. Where P is an appropriate port network number determined from the PORT field of the alarm log.

**NOTE:**  
For environment maintenance, the high or critical reliability system, PPN, or EPN cabinet configuration aspects are irrelevant.

The DC-POWER MO represents all the environmental maintenance for a single-carrier cabinet system. It includes an external power unit and all the port power units in the Port Network. The external power unit can be either a DC or an AC power source. If the external power unit is AC, then the Carrier Port Power Units must be WP-91153 power units. If the external power unit is DC, then the Carrier Port Power Units must be 676B power units. If the hardware detects a problem with any one of these elements, it reports the information to the system software through a single lead. The system software cannot differentiate between different environmental failures. All environmental alarms on a single-carrier cabinet system are logged as a major DC-POWER alarm. Therefore, it is possible to get a DC-POWER alarm when there is still power to the system. The yellow LED on the power unit means operating as normal. If the LED is off, no external power is being supplied or that the power unit has a fault.

**NOTE:**  
Physically removing a Carrier Port Power Unit from a single-carrier cabinet system does not raise a DC-POWER alarm. The removal of the power unit is equivalent to the carrier being physically absent since DC-POWER maintenance cannot distinguish between these two situations.

A single-carrier cabinet system powered by an AC external power source with WP-91153 Carrier Port Power Units has a minimal Nominal Power Holdover (NPH) for the PPN only in standard, high, and critical reliability systems. There is no NPH for a DC- powered PPN or for an AC- or DC-powered EPN. NPH in the PPN of an AC-powered system without high or critical reliability provides full powering for 0.25 seconds, and power to the control complex for an additional two minutes.

**WARNING:**  
*Before powering down a cabinet or carrier that contains DEFINITY AUDIX circuit packs (TN566), first power down the AUDIX unit to avoid damaging*

the AUDIX software. Instructions for powering down this unit are in the "DEFINITY AUDIX System Power Procedures" in Chapter 5, "Routine Maintenance Procedures", on the circuit pack, and in DEFINITY AUDIX documentation.

Error Log Entries and Test to Clear Values

Table 10-119. Single-Carrier Cabinet Power Error Log Entries

| Error Type     | Aux Data | Associated Test        | Alarm Level | On/Off Board | Test to Clear Value       |
|----------------|----------|------------------------|-------------|--------------|---------------------------|
| 0 <sup>1</sup> | 0        | Any                    | Any         | Any          | test environment P sh r 1 |
| 513            | 0        | Single-Carrier Cabinet | MAJOR       | ON           | test environment P r 2    |
|                |          | Power Query Test (#79) |             |              |                           |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the following table. By clearing error codes associated with the *Single-Carrier Cabinet Power Query Test*, for example, you may also clear errors generated from other tests in the testing sequence. Test descriptions and recommended maintenance procedures follow for all errors that can occur during system technician-demanded testing.

| Order of Investigation                               | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|------------------------------------------------------|---------------------|--------------------|-------------------|
| Single-Carrier Cabinet Power Query Test (#79)        | X                   | X                  | ND                |
| Emergency Transfer Query Test (#124) (a)             | X                   | X                  | ND                |
| External Alarm Lead Query Test (#120) (b)            | X                   | X                  | ND                |
| Analog Ring Generator Initialization Test (#117) (c) | X                   | X                  | ND                |
| Analog Ring Generator Query Test (#118) (c)          | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Notes:

- a. Refer to "EMG-XFER" for a description of this test.
- b. Refer to "EXT-DEV" for a description of this test.

c. Refer to “RING-GEN” for a description of this test.

 **NOTE:**  
Tests #117 and #118 only show up in the test sequence if there is a TN768 Tone-Clock circuit pack in the port network being tested.

**Single-Carrier Cabinet Power Query Test (#79)**

This test queries the Maintenance/Tape Processor (in a PPN) or the EPN Maintenance circuit pack (in an EPN) about the status of the power in a single-carrier cabinet system. This test can only detect power problems in carriers in the Port Network for which the Carrier Port Power Unit is physically present.

**Table 10-120. TEST #79 Single-Carrier Cabinet Power Query Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | System resources required to run this test are not available.<br>1. Retry the command at 1minute intervals a maximum of 5 times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2000       | ABORT       | Response to the test request was not received within the allowable time period.<br>1. Retry the command at 1minute intervals a maximum of 5 times.<br>2. If the test continues to ABORT with Error Code 2000, check for system powering problems with the A cabinet (PPN or EPN). Resolve all DC-POWER alarms. Then, repeat the test. If the test continues to ABORT with a 2000 Error Code, resolve all DUPINT (Duplication Interface Circuit Pack) errors in a PPN for a high or critical reliability system, or MAINT (EPN Maintenance circuit pack) errors in an EPN. Then, repeat the test. |
| 2029       | ABORT       | Internal system error<br>1. Retry the command at 1-minute intervals a maximum of 5 times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 10-120. TEST #79 Single-Carrier Cabinet Power Query Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | FAIL        | <p>There is a problem with the environment of the power system.</p> <ol style="list-style-type: none"><li>The power unit for any one of the cabinets may have been lost.<ol style="list-style-type: none"><li>Verify and, if necessary, restore power units for each cabinet.</li><li>Rerun the test. If the test still fails, proceed to Step 2.</li></ol></li><li>Either the WP-91153 AC power unit or the 676B DC power unit for one of the cabinets could be defective. Refer to the "Removing Power" and "Restoring Power" sections in Chapter 5, "Routine Maintenance Procedures".<ol style="list-style-type: none"><li>If the yellow LED on the WP-91153 AC power unit or the 676B DC power unit is off, replace the power unit.</li><li>If the Active Tone-Clock circuit pack loses power, the system performs a Cold-2 restart to finish (the login prompt appears at the administration terminal).</li><li>Rerun the test. If the test still fails, proceed with Step 3.</li></ol></li><li>The DUPINT (Duplication Interface Circuit Pack), or the MAINT (EPN Maintenance Circuit Pack) could be incorrectly reporting this error. Resolve all alarms on these MOs, and rerun the test. There are failures that can occur on the Duplication Interface and EPN Maintenance circuit pack that <b>are not</b> detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun.</li></ol> |
|            | PASS        | <p>The DUPINT (Duplication Interface Circuit Pack), or the MAINT (EPN Maintenance Circuit Pack) has reported no problem with the power.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

DETR-BD

| MO Name As It<br>Appears in<br>Alarm Log | Alarm Level | Initial System<br>Technician Command<br>to Run <sup>1</sup> | Full Name of MO            |
|------------------------------------------|-------------|-------------------------------------------------------------|----------------------------|
| DETR-BD                                  | MINOR       | test board PCSS                                             | Tone Detector Circuit Pack |
| DETR-BD                                  | WARNING     | test board PCSS                                             | Tone Detector Circuit Pack |

1. Where P is the port network number (1 for PPN, 2 for EPN, and 3 for EPN2); C is the carrier number (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

G1, G3iV1.1-286, and those G3iV2-386 systems that use the Mu-law companding mode use TN748 Tone Detector circuit packs or TN756 combination Tone Detector-Tone-Clock circuit packs. G3iV2-386 systems that use the A-Law companding mode use TN420B (and higher suffixes) Tone Detector circuit packs. The companding mode of the DETR-BD circuit pack must match that administered for the system for proper tone detection. The companding mode is administered on the System-Parameters Country-Options form. Refer to *DEFINITY Communications System Generic 3 Implementation*, 555-230-653.

For all DETR-BD circuit pack level errors, refer to XXX-BD (Common Port Board) Maintenance documentation.

## DID-BD (Direct Inward Dial Trunk Circuit Pack)

| MO Name As It Appears in Alarm Log | Alarm Level | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO                       |
|------------------------------------|-------------|-------------------------------------------------------|---------------------------------------|
| DID-BD                             | MIN         | test board PCSS sh                                    | Direct Inward Dial Trunk Circuit Pack |
| DID-BD                             | WRN         | test board PCSS sh                                    | Direct Inward Dial Trunk Circuit Pack |

1. Where P is the port network number (1 for PPN and 2 or; C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for circuit pack level errors. See also DID-TRK (DID Trunk) Maintenance documentation for related trunk information.

## DID-DS1 (DS1 DID Trunk)

| MO Name As It Appears in Alarm Log | Alarm Level        | Initial System Technician Command to Run | Full Name of MO          |
|------------------------------------|--------------------|------------------------------------------|--------------------------|
| DID-DS1                            | MAJOR <sup>1</sup> | test trunk<br><grp>/<mbr> l              | Direct Inward Dial Trunk |
| DID-DS1                            | MINOR              | test trunk<br><grp>/<mbr> l              | Direct Inward Dial Trunk |
| DID-DS1                            | WARNING            | test trunk<br><grp>/<mbr>                | Direct Inward Dial Trunk |

- 
1. A major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

The DID-DS1 trunk provides a digital DID trunk from a CO switch into the system through a DS1 link. A 24 channel DS1 link can support up to 24 DID-DS1 trunk calls simultaneously. A 32 channel DS1 link [G3iV2-386] can support up to 30 DID-DS1 trunk calls simultaneously. A DID-DS1 trunk can be used for both voice and data communications with appropriate DS1 signaling mode (for example, common channel signaling). Only the TN767 and TN464 [G3iV2-386] DS1 Interface circuit packs support the DID-DS1 trunk call processing signalings, wink-start, and immediate-start.

DID-DS1 trunk maintenance provides a means to maintain a DID trunk on a port of DS1 Interface circuit pack. Information included covers the in-line errors log, initialization tests, periodic tests, system technician demand tests, and alarms escalation and elimination. Two trunk service states are specified in the DID-DS1 trunk maintenance. They are: *out-of-service*, the trunk is in a deactivated state and can't be used for incoming calls; *in-service*, the trunk is in an activated state and can be used for incoming calls. If the DS1 Interface circuit pack is out-of-service, then all trunks on the DS1 Interface circuit pack are put into out-of-service state and a Warning alarm is raised.

Hardware Error Log Entries and Test to Clear Values

Direct Inward Dial Trunk Maintenance Error Log Entries

| Error Type     | Aux Data       | Associated Test                  | Alarm Level                  | On/Off Board | Test to Clear Value           |
|----------------|----------------|----------------------------------|------------------------------|--------------|-------------------------------|
| 0 <sup>1</sup> | 0              | Any                              | Any                          | Any          | test trunk <grp>/<mbr> sh r 1 |
| 1 (a)          | Any            |                                  |                              |              |                               |

| 1793 (h)       |                |                                  |                              | ON           | test board PCSS I             |
| 2305(i)        | 50944          | None                             | MIN/MAJ <sup>2</sup>         | OFF          |                               |
| 3840 (j)       |                | Port Audit and Update Test (#36) |                              |              |                               |

- 
- Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
  - This alarm will only be raised when the System-Parameter Country form has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.
  - Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command. If the Minor alarm is not downgraded by the **set options** values, the Minor alarm is upgraded to a Major alarm if 75 percent of the trunks in this trunk group are alarmed.

Notes:

- 
- a.

DS1 Interface circuit pack detects a hardware error. The Aux Data field contains the Error Type: 57476, on-hook before wink; 57477, on-hook before ready to receive digits; 57485, wink too short for valid signal. Escalate the error.

- b. This is a software audit error that does not indicate any hardware malfunction. Run the Short Test Sequence and investigate errors (if any).
- c. System Technician has busied out the trunk to out-of-service state. No calls can be made on this trunk.
- d. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- e. DS1 Interface circuit pack detects a hardware error. The Aux Data field contains the Error Type: 57474, rotary dial rate above 12 pulses per second; 57473, rotary dial rate below eight pulses per second. Escalate the error.
- f. DS1 Interface circuit pack detects a hardware error. The Aux Data field contains the Error Type: 57392, no external release on PBX disconnect. Escalate the error.
- g. DS1 Interface circuit pack detects a hardware error. The Aux Data field contains the Error Type: 57393, belated external release on PBX disconnect. Escalate the error.
- h. DS1 Interface circuit pack is out-of-service. Look for DS1-BD errors in Hardware Error Log. Refer to the DS1-BD (DS1 Trunk Circuit Pack) Maintenance documentation for details.
- i. Error Type 2305—This error indicates that a signaling change was detected by the PBX trunk circuit pack which is inconsistent with the present state of the trunk.
- j. Port Audit and Update Test (#36) failed due to an internal system error. Enter **status trunk** command to verify the status of the trunk. If the trunk is out-of-service, then enter the **release trunk** command to put it back to in-service. Retry the test command. If the test continues to abort, then escalate the problem.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence..

| Order of Investigation           | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|----------------------------------|---------------------|--------------------|-------------------|
| NPE Crosstalk Test (#6)          |                     | X                  | ND                |
| Conference Circuit Test (#7)     |                     | X                  | ND                |
| Port Audit and Update Test (#36) |                     | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-121. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                             |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.</li></ol> |

Conference Circuit Test (#7)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passed.

Table 10-122. TEST #7 Conference Circuit Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL        | <p>The NPE of the tested port did not conference the tones correctly. This can cause noisy and unreliable connections.</p> <ol style="list-style-type: none"><li>1. Enter the <b>list configuration board UUCSS</b> command. If the circuit pack is a TN767B vintage 8 or 9, replace the circuit pack with a TN767C V3 or later. The error log may have error type 1281.</li><li>2. Test all administered trunks on the board. If one fails, this could be an off-board problem (such as an incoming seizure or an off-hook port seizure during the test). Retest the board.</li><li>3. If all of the ports fail, check the CARR-POW (see note below).</li><li>4. If several ports fail, check the error log for TONE-BD or TONE-PT errors. If there are such errors, take the appropriate action. When the TONE errors have cleared, rerun the test.</li><li>5. If the retry passes and troubles have been reported, coordinate isolation with the CO. Make sure that the switch, the CO, and any NTCE equipment (the CSUs) have the correct administration.</li><li>6. Replace the circuit pack.</li></ol> <p><b>⇒ NOTE:</b></p> <p>If the conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the 'CARR-POW (carrier port power unit for AC-powered systems) Maintenance Documentation'. To investigate problems with a 645B DC power unit, refer to the 'CARR-POW (carrier port power unit for DC-powered systems) Maintenance Documentation'. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack.</p> |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | <p>The port can correctly conference multiple connections. User-reported troubles on this port should be investigated using other port tests and by examining station, trunk, or external wiring.</p> <p> <b>NOTE:</b><br/>This test always passes for TN712 Analog circuit packs prior to Vintage 14 and for TN742 prior to Vintage 4.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>lst config</b> command and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.</li></ol> |

Port Audit and Update Test (#36)

This test sends port level translation data from the switch processor to the DS1 Interface circuit pack to assure that the trunk's translation is correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of the trunk as kept in the DS1 Interface circuit pack and in the switch software.

Table 10-123. TEST #36 Port Audit and Update Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT       | Internal System Error.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1000       | ABORT       | The port may be busy with a valid call. Issue the <b>display port UUCSSpp</b> command to determine the trunk group/member number of the port. Use the <b>status trunk</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.<br><br>1. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the Error Log table for a description of this error and required actions). The port may be locked up.<br><br>2. If the port status is idle, retry the command at 1 minute intervals for a maximum of 5 times.<br><br>3. If the test continues to abort, escalate the problem. |
| 1006       | ABORT       | The test was aborted because the trunk is out of service.<br><br>1. Use the <b>status trunk</b> command to verify that the trunk is out of service.<br><br>2. If the trunk is out of service, determine why.<br><br>3. If it is OK to put the trunk back in service, issue the <b>release trunk</b> command to put the trunk back in service, and then retry the test.<br><br>4. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                |
| 2000       | ABORT       | Response to the test was not received within the allowable time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 2100       | ABORT       | Could not allocate resources to run this test.<br><br>1. Retry the command at 1 minute intervals for a maximum of 5 times.<br><br>If the test continues to abort, escalate the problem                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 10-123. TEST #36 Port Audit and Update Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL        | <p>Test failed due to Internal System Error.</p> <ol style="list-style-type: none"><li>1. Retry the command at one-minute intervals a maximum of five times.</li><li>2. If test continues to fail, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|            | PASS        | <p>Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack and switch software are consistent. If the trunk is busied out, the test does not run, but returns PASS. To verify that the trunk is in-service:</p> <ol style="list-style-type: none"><li>1. Enter <b>status-command</b> to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to Step 2.</li><li>2. Enter <b>release-trunk</b> command to put trunk back into in-service.</li><li>3. Retry the test command.</li></ol>                                                                                                                                                                                                     |
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted.</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Use the <b>list config</b> command, and resolve any problems that are found.</li><li>2. If the board was found to be correctly inserted in step 1, issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board long</b> command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.</li></ol> |

DID-TRK (DID Trunk)

| MO Name As It Appears in Alarm Log | Alarm Level        | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO |
|------------------------------------|--------------------|-------------------------------------------------------|-----------------|
| DID-TRK                            | MAJOR <sup>2</sup> | test port PCSSpp l                                    | DID Trunk       |
| DID-TRK                            | MINOR              | test port PCSSpp l                                    | DID Trunk       |
| DID-TRK                            | WARNING            | test port PCSSpp l                                    | DID Trunk       |

1.

Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).
2.

A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

Direct Inward Dial (DID) trunks, coming from the Central Office (CO), allow outside parties to call directly to an extension in the system. DID Trunk circuit packs include:

|                                    |                             |
|------------------------------------|-----------------------------|
| TN753 [G1, G3iV1.1-286, G3iV2-386] | United States               |
| TN2146 [G3iV2-386]                 | Belgium and the Netherlands |
| TN2139 [G3iV2-386]                 | Italy                       |
| TN 436 [G3iV2-386]                 | Australia                   |
| TN459 [G3iV2-386]                  | United Kingdom              |

The DID Trunk circuit packs support eight, incoming-only, ports. Each port provides an interface between the 2-wire analog line from the CO and the DEFINITY system. The DID port receives 3 to 5 digits from the CO that is used to directly connect an outside caller to the called station without assistance from an attendant. See Figure 10-25.

**Figure 10-25. DID Trunk Interactions**

For each call, the CO switch signals the system by opening and closing individual DID loops (one of the eight ports) and causing the starting or stopping of loop current.

A DID trunk operation involves three significant aspects:

1. **Transmission**—deals with the interface requirements regarding all AC signals. Transmission includes gain, analog to digital encoding, and digital to analog decoding.
2. **Signaling**—involves interpretation of DC signals appearing on Tip and Ring to and from the CO. These signals include off-hook, on-hook, and dial pulse detection.
3. **Switch Connection**—involves the connection between the trunk circuitry and the TDM Bus of the system. It operates the switchhook connection to the TDM Bus.

Four tests are implemented to diagnose the health of a DID trunk. All of them test on-board circuitry only. They are:

1. **Loop Around and Conference Circuit Test**—verifies the transmission operation of the circuit pack (loop around within the port), and checks the conference capabilities of all ports.

This test may fail due to noise induced by adjacent electric power lines. Customers having this problem should resolve it with their local power company. To temporarily alleviate the alarm caused by the failure of this test, the test may be disabled from trunk administration Test field. (This also disables the port diagnostic test).

2. **NPE Crosstalk Test**—verifies the switch connection operation of the circuit pack. The test also verifies that the trunk circuitry only talks on the selected time slot on the TDM Bus and never crosses over to time slots reserved for other connections.

3. Port Diagnostic Test—the battery feed circuitry is tested for hook detection.
4. Port Audit Update Test—updates the DID translation information on individual ports of the DID trunk. The port translation data consists of signaling parameters whose values depend on the CO switch connected to the trunk. These parameters include:
  - wink (signal indicating PBX is ready to receive digits) or immediate start
  - dial tone or rotary dialing trunk
  - rotary dialing inter-digit timing
  - network balance R/RC
  - disconnect timing

Additional in-line testing is performed while a call is in progress. Thus, in-line errors may occur during operation. See Error Log table for a description of these errors. These errors may be reproduced by using the trunk (that is, placing a call) and checking their occurrence in the Hardware Error Log.

Problems detected during signaling may be caused by faults off-board (in the CO switch or connections) for which a Warning alarm is raised.

Before a maintenance test can be run on a port, the port must be idle. If an incoming call seizes the port which is being tested by maintenance, the test is aborted, and the incoming call proceeds.

For transmission and signaling standard specification, refer to Digital PBX Standards document RS4648.

Hardware Error Log Entries and Test to Clear Values

DID Trunk Error Log Entries

| Error Type     | Aux Data | Associated Test                  | Alarm Level              | On/Off Board | Test to Clear Value     |
|----------------|----------|----------------------------------|--------------------------|--------------|-------------------------|
| 0 <sup>1</sup> | 0        | Any                              | Any                      | Any          | test port PCSSpp sh r 1 |
| 1 (a)          | Any      | None                             | WRN                      | OFF          |                         |
| 1 (b)          | 57476    | None                             | WRN                      | OFF          |                         |

| 510 (l)        | 57393    | None                             |                          |              |                         |
| 769            | Any      | Port Diagnostic (#35)            | MAJ/MIN/WRN <sup>2</sup> | ON           | test port PCSSpp r 3    |
| 1025           |          | Loop Around and Conference (#33) | MAJ/MIN/WRN <sup>2</sup> | ON           | test port PCSSpp r 3    |
| 1281           |          | NPE Crosstalk (#6)               | MAJ/MIN/WRN <sup>2</sup> | ON           | test port PCSSpp r 3    |
| 1537           | Any      | Port Diagnostic (#35)            | MAJ/MIN/WRN <sup>2</sup> | OFF          | test port PCSSpp r 3    |
| 1793 (m)       | 57489    | None                             | None                     |              |                         |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command. If the Minor alarm is not downgraded by the **set-options** values, the Minor alarm is upgraded to a Major alarm if 75 percent of the trunks in this trunk group are alarmed.

## Notes:

A common trouble on DID trunks, which reports no errors or alarms, occurs when the CO busies out the port (disconnects port). This situation occurs when the CO thinks there are problems with the DID port. In this case, no incoming calls are possible through this port. In addition to complaints received from outside callers trying unsuccessfully to call in, this problem can be diagnosed by listing measurements on lightly used trunks. If a particular port is detected as not in use, a call to the CO is necessary to get the connection back in service.

- a. This condition occurs when the tone detector times out waiting for digits.
  - 1 – Verify trunk administered wink/immediate-start parameter.
  - 2 – Verify the dial type.
  - 3 – Refer problem to the CO.
- b. Rotary dial before wink – This condition occurs when the CO starts dialing before the PBX sends wink on a wink-start trunk.
  - 1 – Verify trunk administered wink/immediate-start parameter.
  - 2 – Refer problem to CO.
- c. Rotary dial too early – This condition occurs when the CO starts dialing too soon after seizure on an immediate-start trunk.
  - 1 – Verify trunk administered wink/immediate-start parameter.
  - 2 – Refer problem to CO.
- d. Rotary dial pulse during wink – This condition occurs when the CO sends rotary dial digits too soon after seizure on a wink-start trunk.
  - 1 – Verify trunk administered wink/immediate-start parameter.
  - 2 – Refer problem to CO.
- e. This is a software audit error that does not indicate any hardware malfunction. Run the Short Test Sequence and investigate associated errors (if any).
- f. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- g. Rotary dial pulse on-hook longer than 105 msec – Break between rotary pulses is too long.
  - 1 – Test trunk by performing an incoming test call.
  - 2 – Refer problem to CO.
- h. Rotary dial rate below eight pulses/sec – More than 135 msec between two successive breaks.
  - 1 – Verify trunk administered interdigit-timing parameters.
  - 2 – Refer problem to CO.

- i. Rotary dial rate above 12 pulses/sec – Less than 75 msec between two successive breaks.
  - 1 – Verify trunk administered interdigit-timing parameters.
  - 2 – Refer problem to CO.
- j. Digit detection – Co is starting new rotary dial digit within 150 msec of previous digit.
  - 1 – Verify trunk administered interdigit timing parameters.
  - 2 – Refer problem to CO.
- k. Loop current active – CO not releasing trunk after PBX disconnect. Occurs when the PBX end drops first and the CO does not release the trunk within four minutes.
  - 1 – Verify the interface to the network with a hand telephone set. If calls are placed correctly, then refer problem to the CO.
  - 2 – If unable to place calls or this equipment is not available, check the status on port using the **status trunk** command. If active but not connected, disconnect bridging clips at the network interface. Check status on the trunk. If trunk went idle, then replace clips. If trunk is still active but unable to place calls, refer problem to the CO.
- l. Late CO trunk release – This event only happens after the occurrence of Error Type 513. The CO released the trunk four minutes after the PBX dropped the call. This event decrements the severity (error count) of Error Type 513, or may mean the problem related to Error Type 513 has been fixed.
  - 1 – Verify that Error Type 513 does not occur again. Refer to Error 513.
- m. Incomplete Dial timer expired. This error applies only to the TN459. Problem with incoming dialing stream. Refer problem to the CO.

**System Technician-Demanded Tests:**  
**Descriptions and Error Codes**

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *DID-TRK Loop Around and Conference Circuit Test*, for example, you may also clear errors generated from subsequent tests in the testing sequence.

| Order of Investigation  | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-------------------------|---------------------|--------------------|-------------------|
| NPE Crosstalk Test (#6) |                     | X                  | ND                |

| Order of Investigation                        | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|-----------------------------------------------|---------------------|--------------------|-------------------|
| Port Diagnostic Test (#35)                    | X                   | X                  | ND                |
| Loop Around and Conference Circuit Test (#33) |                     | X                  | ND                |
| Port Audit Update Test (#36)                  | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-124. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                      |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT       | Could not allocate the necessary system resources to run this test.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem. |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | <p>System resources required to run this test are not available. The port may be busy with a valid call. Use the <b>display port PCSSpp</b> command to determine the station extension, attendant number, or trunk group/member number of the port. Use the <b>status station</b>, <b>status attendant</b>, or <b>status trunk</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out.</p> <ol style="list-style-type: none"><li>1. If the port status is active but the port is not in use (no calls), then check the Error Log for Error Type 513 (see Error Log table for description of this error and required actions). The port may be locked up.</li><li>2. If the port status is idle, then retry the command at one-minute intervals a maximum of five times.</li><li>3. If the test continues to abort, escalate the problem.</li></ol> |
| 1001       | ABORT       | <p>Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port.</p> <ol style="list-style-type: none"><li>1. Retry the command at 1-minute intervals a maximum of 5 times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1002       | ABORT       | <p>The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM Bus) Maintenance documentation to diagnose any active TDM-BUS errors.</p> <ol style="list-style-type: none"><li>1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board).</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Translate the board, if necessary.</li><li>2. Issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board</b> command. This should re-establish the linkage between the internal ID and the port.</li></ol> |

Loop Around and Conference Circuit Test (#33)

This test checks the reflective and non-reflective loop around and conference capabilities of a DID port circuit. The test that uses 404-Hz, 1004-Hz, and 2804-Hz tones is an on-board test only. Each tone is separately transmitted to and from the port (loop around within the port) and verified.

This test may fail due to noise induced by adjacent electric power lines. Customers having this problem should resolve it with their local power company. To temporarily alleviate the alarm caused by the failure of this test, the test may be disabled from trunk administration Test field. (This also disables the port diagnostic test.

| 3          | FAIL        | The nonreflective 1004 Hz tone test of the port failed. An echo was detected from the port. Poor quality transmission was detected to or from the port. The problem may be off-board.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 7          |             | The conference capabilities of the port failed. Poor quality transmission was detected to or from the port. The problem may be off-board.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 129        |             | The reflective 404-Hz tone test failed. Poor quality transmission was detected to or from the port. The problem may be off-board.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 131        |             | The reflective 1004-Hz tone test failed. Poor quality transmission was detected to or from the port. The problem may be off-board.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 133        |             | <p>The reflective 2804-Hz tone test failed. Poor quality transmission was detected to or from the port. The problem may be off-board.</p> <p> <b>CAUTION:</b><br/><i>The port may still be operational, or the fault may be off-board (connections or CO). Off-board problems also include incoming seizures or off-hook port seizures during the test and, perhaps somewhat unlikely, noise induced by adjacent electric power lines. Customers having this problem should resolve it with their local power company to temporarily alleviate the alarm caused by the failure of this test. The test may be disabled from trunk administration 'Test' field. This turns off all testing for that trunk group except for tests 6 and 36.</i></p> <p><i>More information continues on the next page.</i></p> |

|------------------------------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3<br>7<br>129<br>131<br>133<br>(cont'd.) | FAIL<br>(cont'd.) | <p>FAULT ISOLATION: Proceed as follows unless power or tone problems are suspected (see note below).</p> <ol style="list-style-type: none"><li>1. To make sure the problem is on-board, disconnect the port from the far-end and retry the test. Coordinate this with the CO, or do it after busy hours.</li><li>2. If the retry fails, replace the circuit pack.</li><li>3. If the retry passes and no troubles have been reported, disable the test in the trunk group administration. If the retry passes and troubles have been reported, coordinate isolation with the CO.</li></ol> <p><b>⇒ NOTE:</b></p> <p>If the loop around and conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test. If the test fails again, see 'FAULT ISOLATION' above.</p> |

|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | DID Trunk Loop Around and Conference Test is successful. This port is functioning properly.<br><br>1. If users are reporting troubles, examine loop connections to the port and refer problem to the CO.                                                                                                                                                                                                                                                   |
| 0          | NO BOARD    | The test could not relate the internal ID to the port (no board).<br><br>1. Check to ensure that the board translations are correct. Translate the board, if necessary.<br><br>2. Issue the <b>busyout board</b> command.<br><br>3. Issue the <b>reset board</b> command.<br><br>4. Issue the <b>release busy board</b> command.<br><br>5. Issue the <b>test board</b> command. This should re-establish the linkage between the internal ID and the port. |

Port Diagnostic Test (#35)

This test checks a port's battery feed circuitry. The battery feed circuitry is tested for on-/off-hook detection, battery shutdown, and battery reversal (WINK) capabilities.

Table 10-126. TEST #35 Port Diagnostic Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                            |

Translate the board, if necessary.<br><br>2. Issue the <b>busyout board</b> command.<br><br>3. Issue the <b>reset board</b> command.<br><br>4. Issue the <b>release busy board</b> command.<br><br>5. Issue the <b>test board</b> command. This should re-establish the linkage between the internal ID and the port. |

Port Audit Update Test (#36)

This test sends updates of the DID port translation for all ports on the circuit pack that have been translated. The update is non-disruptive and guards against possible corruption of translation data contained on the circuit pack. No response message is expected from the circuit pack once it receives translation updates. The port translation data includes: wink or immediate start trunk, dial tone or rotary dialing trunk, rotary dialing inter-digit timing, Network balance R/RC, and disconnect timing.

Table 10-127. TEST #36 Port Audit Update Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 10-127. TEST #36 Port Audit Update Test — Continued

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | <p>This test passed. Translation information was successfully updated on the circuit pack.</p> <ol style="list-style-type: none"><li>1. If signaling troubles are reported (Error Types 1, 257, or 513 in Error Log table), verify translation information for this port.</li><li>2. Refer problem to the CO. If the trunk is busied out, the test does not run, but returns PASS.</li></ol> <p>To verify that the trunk is in-service:</p> <ol style="list-style-type: none"><li>1. Enter <b>status-command</b> to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to Step 2.</li><li>2. Enter <b>release-trunk</b> command to put trunk back into in-service.</li><li>3. Retry the test command.</li></ol> |
| 0          | NO BOARD    | <p>The test could not relate the internal ID to the port (no board).</p> <ol style="list-style-type: none"><li>1. Check to ensure that the board translations are correct. Translate the board, if necessary.</li><li>2. Issue the <b>busyout board</b> command.</li><li>3. Issue the <b>reset board</b> command.</li><li>4. Issue the <b>release busy board</b> command.</li><li>5. Issue the <b>test board</b> command. This should re-establish the linkage between the internal ID and the port.</li></ol>                                                                                                                                                                                                                                                                                         |

## DIG-BD (Digital Line Circuit Pack)

| MO Name As It Appears in Alarm Log | Alarm Level | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO           |
|------------------------------------|-------------|-------------------------------------------------------|---------------------------|
| DIG-BD                             | MIN         | test board PCSS sh                                    | Digital Line Circuit Pack |
| DIG-BD                             | WRN         | test board PCSS sh                                    | Digital Line Circuit Pack |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for circuit pack level errors. See also DIG-LINE (Digital Line) Maintenance documentation for related line information.

## DIG-LINE (Digital Line)

| MO Name As It Appears in Alarm Log | Alarm Level | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO |
|------------------------------------|-------------|-------------------------------------------------------|-----------------|
| DIG-LINE                           | MINOR       | test port PCSSpp l                                    | Digital Line    |
| DIG-LINE                           | WARNING     | test port PCSSpp sh                                   | Digital Line    |

1. Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

DIG-LINE maintenance monitors and tests ports on Digital Line circuit packs and the hardware connected to those ports for lines administered as a digital station. These include stations with just a digital voice terminal and stations with a digital voice terminal and a linked data module. Stand-alone data modules, and data adaptors in stand-alone mode, are covered by the PDMODULE and TDMODULE maintenance objects. Circuit pack-level maintenance is covered by DIG-BD whose strategy is described in the XXX-BD section of this chapter. The following circuit packs support digital lines:

| Digital Line Circuit Packs |       |             |              |                                                                                                                |
|----------------------------|-------|-------------|--------------|----------------------------------------------------------------------------------------------------------------|
| Code                       | Ports | Type        | Companding   | Endpoints                                                                                                      |
| TN413                      | 8     | 4-wire DCP  | A-law        | 7400 series digital voice terminals, attendant consoles, 510D personal terminals, MT515 BCTs, DCP data modules |
| TN754                      | 8     | 4-wire DCP  | mu-law       |                                                                                                                |
| TN754B                     | 8     | 4-wire DCP  | A-law/mu-law |                                                                                                                |
| TN2181                     | 16    | 2-wire IDCP | A-law/mu-law |                                                                                                                |
| TN2224                     | 24    | 2-wire IDCP | A-law/mu-law |                                                                                                                |
| TN2136                     | 8     | 2-Wire IDCP | A-law/mu-law | Data Adaptors (DA), Italtel Digital Telephone Models 1 and 2 (IDT1/2).                                         |
| TN2177                     | 16    | 2-wire IDCP | A-law/mu-law |                                                                                                                |
| TN2181                     | 16    | 2-wire IDCP | A-law/mu-law |                                                                                                                |
| TN2224                     | 24    | 2-wire IDCP | A-law/mu-law |                                                                                                                |

G3r V1 systems support only TN754 and TN754B. TN413 and TN754 are found only in upgraded cabinets.

Each digital line port supports two 64 kbps information channels (primary and secondary) and one 8kbps signaling channel. Digital voice terminals always use the primary information channel. Thus only one voice terminal can be connected to each port. The secondary information channel can be used to connect a data

terminal via a Digital Terminal Data Module (DTDM) or a Data Adaptor (DA). All other devices currently supported by Digital Line circuit packs communicate on the primary information channel. Figure 10-26 shows examples of digital line connectivity.

Only the TN754B or TN2136 should be used in out-of-building applications. For important information pertaining to protection required for out-of-building digital voice terminals, see *DEFINITY Communications System Generic 1 and Generic 3 Installation and Test*, 555-230-104.

It should be noted that TN2181 and TN2224 supports both modes as shown in Figure 10-26 and Figure 10-27.

**Figure 10-26. Digital Line Connectivity**

Figure 10-27. Digital Line Connectivity

Only 2-wire Italtel Digital Telephone Models 1 and 2 (IDT1/2) or DAs can be directly connected to a TN2136. AT&T DCP (4-wire) digital voice terminals and data modules can be connected to these circuit packs via Italtel's 2/4-wire adapter. DAs can operate in either of two modes which are covered by different maintenance objects:

| DA Mode     | Administered as: | Endpoint                          | Maintenance Object |
|-------------|------------------|-----------------------------------|--------------------|
| Stand-alone | PDM              | Data endpoint only                | PDMODULE           |
| Linked      | DTDM             | IDT1/2 and optional data terminal | DIG-LINE           |

Digital Line maintenance interacts with Digital Line circuit pack (DIG-BD) maintenance, and results of DIG-LINE testing can be affected by the health of the Digital Line circuit pack. Keep this in mind when investigating reported Digital Line problems.

There are instances where the service state of a station is mentioned. It is helpful to understand what is meant by the different service states that may exist. The

different service states which apply to digital line station are explained as follows.:

|                   |                                                                                                                                                                                                                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Out-of-Service    | The port, and thus the station, have been removed from service. Busyouts put the port in the out-of-service state.                                                                                                                                                                                                              |
| Ready-for-Service | The port on the circuit pack has been put into service, but the voice terminal has not yet established signaling communications with the port.                                                                                                                                                                                  |
| In-Service        | The voice terminal has established signaling communications with the port, and the system is ready to process calls to and from that station. A terminal in the ready-for-service state will progress to the in-service state if it is functioning normally. It can also be forced into the in-service state by going off-hook. |

Downloading of Terminal Parameters

Programmable Terminals

The following information is presented as background information to help understand how maintenance software interacts with terminal parameter downloading.

Terminal Types:

The following terminals can be downloaded for Definity G3V3 and later versions:

- a. 84xx multibutton digital voice terminals (8403D01A, 8410B, 8410D02A, 8434D01A) with optional expansion module.
- b. 603A1 and 603D1 Callmaster terminals for telemarketing applications.
- c. 302B1 attendant console.

Circuit Packs:

- 1. 8400x, 302B1 Terminals
  - a. TN754 (4-wire, Mu-law)  
**Minimum usable vintage for 8410D and 8434D terminals - V11**
  - b. TN413 (4-wire, A-law)
  - c. TN754B (4-wire, A-law/Mu-law selectable)
  - d. TN2177 (2-wire, 16-port, A-law/Mu-law selectable)
  - e. TN2181 (2-wire, 16-port, A-law/Mu-law selectable)
  - f. TN2224 (2-wire, 24-port, A-law/mu-law selectable)

- 2. 603A1/D1 Terminals
  - a. TN754 (4-wire, Mu-law),
  - b. TN413 (4-wire, A-law)
  - c. TN754B (4-wire, A-law/Mu-law selectable)

Downloadable Terminal Parameters

The following parameters are downloaded to programmable terminals:

| DOWNLOADABLE PARAMETERS                                                   |                               |                   |
|---------------------------------------------------------------------------|-------------------------------|-------------------|
| Parameter                                                                 | Scope                         | Terminal          |
| International Flags<br>(A-law/Mu-law, Display Mode,<br>DLI Voltage level) | System level                  | 84xx, 603x, 302B1 |
| Primary Levels<br>(Transmission & Sidetone)                               | System level                  | 84xx, 603x, 302B1 |
| Adjunct Levels<br>(Transmission & Sidetone)                               | System level                  | 84xx              |
| Handset Expander Option                                                   | System level                  | 84xx              |
| Administrable Options<br>(Speakerphone & Mute Button)                     | Per-terminal                  | 84xx              |
| Administrable Softkeys                                                    | Per-terminal,<br>System level | 8410D, 8434D      |

Nonvolatile Memory

Nonvolatile memory is used to store downloadable parameters in programmable terminals. Therefore, once the terminal has been downloaded, it is not be necessary to download it again, even if power is removed from the terminal.

If the nonvolatile memory fails with power still present, the terminal will revert to its default factory settings except for its A-law/Mu-law companding settings which are stored in RAM. If power is removed after the nonvolatile memory fails, the terminal will revert to its factory default settings.

Mu-law companding is assigned as a default setting at the factory, so, for domestic use, a programmable terminal can place calls even though it has not been downloaded from the PBX.

## Download Actions

There are several different scenarios which will cause a terminal to be downloaded. As described below, these can occur as part of background maintenance activity or on demand from the System Access Terminal or from a station.

For the background actions described below, the terminal will be downloaded automatically if a download retry flag for the terminal is set in software. This flag is set at the time translation is loaded at boot time, when translation which affects the parameters of a terminal is changed as part of system administration actions, and when a port is inserted in software as a result of board insertion or translation change.

### Automatic Download Actions

#### 1. System Reboot/Restart

A global download action is started when periodic maintenance tests start after a system reboot/restart regardless of whether the parameters have been downloaded previously.

#### 2. Periodic Tests

If the download flag is still set when periodic tests are run on a terminal, a download action will occur. This operation is required in case a terminal could not be downloaded previously because it was off-hook at the time the system first booted or because the terminal was off-hook at the time translation associated with downloadable parameters was changed.

Note that it may take more than an hour for periodic tests to reach the terminal that needs to be downloaded.

#### 3. Terminal Administration

A downloadable terminal is automatically downloaded when translation changes associated with downloadable parameters are made as part of system administration. As shown in Table 10-128, these changes can be for a specified terminal or may be system-wide. If the change is for system-level parameter, a background global update request is made to download all programmable terminals.

This global update may take more than an hour for a system with several thousand programmable terminals.

#### 4. Port Insertion

Whenever maintenance software initiates a request to place a port into service, a terminal download action is started on that terminal if that terminal is programmable. This port insertion action occurs under the following circumstances:

- a. A digital line circuit pack that is physically inserted into the system has ports currently administered for programmable terminals.

If more than 20 port insertion requests are received within a few seconds, a global download request is started up as a background task. This action updates all programmable terminals instead of just those being inserted. This is done to avoid system overload for situations where there is massive board insertion. This could occur when connectivity to an EPN is reestablished after that EPN was down.

- b. A station port is added to the system by a **"add station"** or **"change station"** command.
  - c. A TTI port is activated.
5. Audits

As part of periodic maintenance, the hardware status audit test queries programmable terminals to determine which levels and/or options are being used. If the reported values are not equal to the administered values, the system will initiate a terminal download action. This audit does NOT check the parameters used for softkeys.

6. Activation of TTI

A terminal is downloaded automatically when it is activated using the Terminal Translation Initialization feature. Therefore, no special user actions are required for TTI.

 **NOTE:**

Plugging the station cord into a terminal does not automatically cause the terminal to be downloaded. If this terminal has factory defaults or if the terminal has been previously downloaded with parameters different than those desired, use one of the demand download actions described below to download the terminal.

## Demand Download Actions

1. Busyout/Release Command

A maintenance demand busyout/release request for a station will cause the terminal to be downloaded regardless of its previous download status.

2. Feature Access Code

A Refresh Terminal Parameters Feature Access Code can be used to request a terminal download action. When this code is followed by a "#", the programmable parameters for the current terminal are downloaded when the terminal goes on hook. When this code is followed by an extension, the programmable parameters for the specified station are downloaded.

This Refresh Terminal Parameters Feature Access Code is assigned on the second page of the "feature-access-codes" screen.

A confirmation is returned if the download request is accepted. A busy tone is returned if the request is made from a different station when the target station is off-hook.

The first three green call appearance LEDs on the 84xx 603x terminal will be turned on for three seconds if the station was successfully downloaded as a result of an entry of a Refresh Terminal Parameters Facility Access Code. This is not true for the 302B1 terminal.

There is no visible display on a station for the other background or demand download actions. As described below, the "status station" and "status attendant" screens can be used to check the download status of a specified terminal.

Status of Parameter Downloads

The "status station" and "status attendant" screens display the current download status of individual 84xx, 603, and 301B1 terminals in the Download Status field. The possible download states are:

Table 10-128. Terminal Download Status

| Status         | Terminal Down Load State                                                                                                                                                                                                           |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Complete       | Terminal successfully downloaded sometime in the past.                                                                                                                                                                             |
| Pending        | System waiting to download the terminal. This may require the execution of a background periodic test which could take more than an hour. A demand download as described above may also be used to initiate an immediate download. |
| Not Applicable | Not a programmable terminal.                                                                                                                                                                                                       |

Possible reasons for terminal being not downloaded include:

- Terminal is off-hook.
- Terminal detected a bad checksum.
- Terminal detected a bad or missing EEPROM (refer to hardware error log).
- Terminal is busy programming data from a previous PROGRAM message.
- Terminal is in the Programming Disabled state.
- Terminal is in the Local Program Options Mode.
- Terminal is disconnected or out of service (use **status station** command).

Hardware Error Log Entries and Test to Clear Values

| Digital Line Error Log Entries |                |                                     |                                |              |                          |

- 
- Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
  - Major alarms on this MO may be downgraded to Warning alarms based on the value used in the set options command.

3. Major alarms on this MO may be downgraded to Warning alarms based on the value used in the set options command.

Notes:

- a. Could experience a noisy port or link. This is an off-board problem detected by the port circuit. Check for defective wiring, a defective voice terminal, or move voice terminal closer to the switch (in terms of feet of wire from the jack to the switch). If the problem still exists, replace the circuit pack. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.
- b. This Error Type and Aux Data will occur when at least 15 off-board problems have been detected with the link to the terminal. When an error with the link is detected, an on-board counter is incremented.

The user could experience a noisy port or link. This is an off-board problem detected by the port circuit. Check for defective wiring, a defective voice terminal, or move voice terminal closer to the switch (in terms of feet of wire from the jack to the switch). If the problem still exists, replace the circuit pack. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.

- c. This error type is logged when the port in question is busied out by maintenance personnel. Make sure port is released from busyout via the **release port UUCSS pp/PCSSpp** command.
- d. This error type indicates that the circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the circuit pack.
- e. Problems transmitting to the voice terminal. This problem can be caused by defective wiring. Defective wiring can cause varying degrees of problems on different types of sets. Sets such as the 7410 appear to be more susceptible to wiring problems than other sets. This is usually an on-board problem and can be ignored if no user complaints are received.
- f. This is an in-line event that produces this error type when a favorable response is received from running the Digital Line Electronic Power Feed Test (#11). No craft action is necessary. This alarm will be resolved with the passing of time.
- g. With Aux Data 40963, this error type is a result of an unfavorable response to the Electronic Power Feed/ Positive Temperature Coefficient Test (#11). With Aux Data 40988, this error type indicates that the EPF/PTC circuit has been turned off due to an overcurrent condition.

For TN754 vintage 13 or earlier and TN413, the EPF circuit senses an overcurrent condition at the voice terminal. Check for a short in the wiring, a damaged jack, an incorrect type of voice terminal, or a defective voice terminal.

For TN754 vintage 14 or later, TN754B and TN2136, the PTC will open if there is a short on the power line for 1/2 second or longer. The voice terminal is probably not operating properly. Unplug the voice terminal for

30 seconds and then plug it back in. If the voice terminal still does not operate, then check for a short in the wiring, a damaged jack, an incorrect type of voice terminal, or a defective voice terminal.

Once the problem has been resolved, it may take up to 1 hour for the alarm to clear due to "leaky bucket" strategy. If the problem cannot be resolved by one of the steps above, then replace the circuit pack.

- h. An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice terminal. This can be ignored if no user complaints are received. Otherwise, make sure the voice terminal is connected, check for defective wiring, check for a defective voice terminal, and move voice terminal to a jack that is closer to the switch (in terms of feet of wiring between the jack and the switch). If the problem still exists, replace the circuit pack. Once the problem has been resolved, the alarm will be retired after a predetermined amount of time.
  - i. This indicates that the station went off-hook while it was in the ready-for-service state. Use the **status station** command to determine the state of the station. The off-hook should have moved the station to ready-for-service. No craft action is necessary.
  - j. This is the code that is generated when the link between the circuit pack and the voice terminal is successfully reset. No craft action is necessary.
  - k. No terminal is connected to the Digital Line board. No maintenance action is required.
  - l. An uplink message has been logged indicating that the Electric Power Feed (EPF) is on with no load on it. No action is necessary.
  - m. The circuit pack's message buffer is full. This may be caused by having many display phones with heavy traffic connected to the circuit pack. No action is necessary.
  - n. Internal system error. No action is necessary.
  - o. There is a problem with the voice terminal EEPROM. When the voice terminal is repaired the alarm will be resolved with the passing of time.
-

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Voice and Control Channel Local Loop Around Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                                 | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|--------------------------------------------------------|---------------------|--------------------|-------------------|
| Digital Terminal Remote Loop Around Test (#1201)       |                     | X                  | D                 |
| Voice and Control Channel Local Loop Around Test (#13) |                     | X                  | ND                |
| Digital Line NPE Crosstalk Test (#9)                   |                     | X                  | ND                |
| Digital Line Electronic Power Feed Test (#11)          |                     | X                  | ND                |
| DIG-LINE Station Lamp Updates Test (#16)               | X                   | X                  | ND                |
| Station (Digital) Audits Test (#17)                    | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Digital Terminal Remote Loop Around Test  
(#1201)

This test checks the integrity of the connection between the SPE and the attached Digital Terminal and the ability of the terminal and the associated port to send and receive data. This test is based, in principal, on procedure 622 used in system 85 to help isolate digital terminal problems.

A request is presented to the terminal to go into loop back mode. Then data is sent to the terminal and when received back, checked for consistency. This test is run as a part of the craft command "test long" procedure. It is not included in any error recovery strategy and generates no Error Log entries or alarms. To begin the test, Maintenance will ask Call Processing to make the associated end point and port "Maintenance Busy". This test will succeed if the endpoint is "idle". If the reserve request fails then the test will abort. If the request succeeds then the SPE sends a message to loop around both information channels for the digital terminal. First the primary information (voice, Information Channel 1 or I1) channel loop back test is run. The test is performed by sending a digital count from the Tone/Clock circuit pack on the primary information channel time slot and receiving the same digital count with a general purpose tone detector.

If the primary information channel test is successful, the loop around test for the secondary information (data, Information Channel 2 or I2) channel is then performed. This test is the same as the primary information channel loop around test and is performed only if a DTDM is administered, which is also the case for a linked DA.

Only one value (Pass, Fail, or Abort) is generated as a result of the two tests run. If any test fails aborts, the sequence is stopped. Upon completion of this test the associated endpoint and port are moved back into the previous service state.

**Table 10-129. TEST #1201 Digital Terminal Remote Loop Around Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1015       | ABORT       | The system will not allow this test to be run because the station is/has not been busied out. Busy out the station with the /E3busyout station/E1 command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16         | FAIL        | <p>The secondary channel (data Information Channel 2 or I2 is not operating properly. User impact may range from noticing nothing to not being able to use this terminal. Check the results of "Voice and Control Channel Local Loop Test (#13). If that test fails, suspect the Digital Line circuit pack. If that test passes then replace the terminal. If both test fail, and component replacement does not change the results, then:</p> <ol style="list-style-type: none"><li>1. Run circuit pack tests to check the tone generator circuit pack and the Tone Detector circuit pack using the <b>test board</b> UUCSS s command.</li><li>2. Resolve any problems that are detected on the Tone Generator circuit pack or Tone Detector circuit pack.</li><li>3. If the Tone Generator and Tone Detector circuit pack are functioning properly, and the tests still fail, escalate the problem.</li></ol> |
|            | PASS        | <p>Voice and Control Channel Local Loop test passed. All channels are transmitting properly.</p> <ol style="list-style-type: none"><li>1. To be sure that this is not an intermittent problem, repeat this test up to a maximum of ten times to make sure it continues to pass.</li><li>2. If complaints persist (noisy connections for voice. corrupted data transfer for data), examine the station, connections, and wiring.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Digital Line NPE Crosstalk Test (#9)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence and takes about 20 to 30 seconds to

complete. Crosstalk testing is performed on both the primary information channel (voice) and the secondary information channel (data) associated with each digital station port. If this test fails on either channel, the station and the DTDM are taken out-of-service.

Table 10-130. TEST #9 Digital Line NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Digital Line Electronic Power Feed/Positive Temperature Coefficient/PPF Test(#11)**

For TN413, and TN754 vintage 13 or earlier, this is an Electronic Power Feed (EPF) restoral test. In this test, the processor requests that the EPF be turned on for a given port, and an attempt is made to turn on the power supply to the station. If no current is drawn, the station is probably not connected. If an overcurrent condition is sensed, there may be a short in the loop. A message is returned reporting that either the EPF was successfully turned on, or that an overcurrent condition was sensed. This test is repeated again 5 seconds later.

For TN754 vintage 14 or later, TN754B and TN2136 this is a Positive Temperature Coefficient (PTC) restoral test. In this test, the processor requests that the PTC be turned on for a given port, and an attempt is made to turn on the power supply to the station. If an overcurrent condition is sensed, there is probably a short on the power line that causing the PTC to open and disconnect the voice terminal. Since the PTC does not have self-restoral capability, the voice terminal must be manually unplugged for 30 seconds and then plugged back in to restore the PTC. A message is returned reporting that either the PTC was successfully turned on successfully with no problem or an overcurrent condition was sensed. This test is repeated again 5 seconds later.

TN2181 and TN2224 boards carry a Protected Power Feed (PPF) relays, one for each port. Therefore this will be a Protected Power Feed restoral test. The test procedure and its response is same as that of EPF. One of differences between

EFP and PPF is that, if the port goes into a overcurrent state, PPF does not report this change of state because it is a transient state which will not last more than 50ms. If the over current persists the power will be shut off automatically and an EPF\_off\_overcurrent message is sent uplink.

|            | PASS        | <p>Electronic Power Feed Test passed. The message to turn on the power to the station was successfully sent to the port.</p> <ol style="list-style-type: none"><li>1. Although this test will never actually return a FAIL result except for the <b>Internal System Error</b> described above, it will log an error indicating the real results of the test. Check the Error Log for any entries with Error Types 767 or 769 after the test completes.</li><li>2. If Error Type 767 appears in the Error Log, this should indicate that the test sensed no problems with the power to the station. To verify that the station is powered up correctly, run a self-test on the station, if available, and check that all the feature buttons are operating.</li><li>3. If Error Type 769 appears in the Error Log, this indicates some problem with the power to the station. Check for a short in the wiring, a damaged jack, a defective voice terminal, or an incorrect type of terminal.</li></ol> |

Voice and Control Channel Local Loop Test (#13)

These tests check the information and control channels between the Switch Processing Element (SPE) and the Digital Line port circuit. The SPE sends a message to loop around both the information and control channels for the port. First, the primary information (voice) channel loop back test is run. The test is performed by sending a digital count from the Tone-Clock circuit pack on the primary information channel time slot and receiving the same digital count with a general purpose Tone Detector.

While the primary information channel is still looped around, the Control Channel Loop Around Test is performed. This test consists of sending four different transparent patterns to the on-board microprocessor, receiving them back, and comparing them.

The Loop Around Test for the secondary information (data) channel is then performed. This test is the same as the primary information channel loop around test and is performed only if a DTDM is administered.

A Conference Test is done next for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of four tests run. If any test fails or aborts, the sequence is stopped.

**Table 10-132. TEST #13 Voice and Control Channel Local Loop Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

If complaints persist (noisy connections for voice, corrupted data for data transfer), examine the station, connections, and wiring.</li></ol>                                                                                                                                                                                                   |

DIG-LINE Station Lamp Updates Test (#16)

This test lights all lamps on the terminal as specified. The lamp updates will run only if the station is in-service. The status of the station is checked and the lamp updates are blocked from taking place if the station is not in the in-service state. This test does not affect the status of the Message Waiting lamp.

|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000       | ABORT       | <p>System resources required to run this test are not available. The port may be busy with a valid call. Use <b>display port</b> UUCSSpp/PCSSpp to determine the station extension or attendant number of the port. Use <b>status station</b> or <b>status attendant</b> to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (See Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. Attendants are always in use (off-hook) if the handset is plugged in and the port is not busied out.</p> <ol style="list-style-type: none"><li>1. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol> |
| 1392       | ABORT       | <p>This port is currently a TTI port and the test will not execute on it.</p> <ol style="list-style-type: none"><li>1. Verify that the port is a TTI port using either the <b>display port</b> command (the display shows that the port is a TTI port) or the <b>list config</b> command (the display shows a t for the port).</li><li>2. If either <b>list config</b> or <b>display port</b> indicates that the port is <i>not</i> a TTI port, escalate the problem. If both commands indicate that the port is a TTI port, the abort is correct, and no action is necessary.</li></ol>                                                                                                                                                                                                                                                                                                                                           |
|            | FAIL        | <p>Internal System Error</p> <ol style="list-style-type: none"><li>1. Retry the command at 1-minute intervals a maximum of 5 times.</li><li>2. If the test continues to abort, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | PASS        | <p>The message to light all of the station lamps was sent successfully to the port.</p> <ol style="list-style-type: none"><li>1. Observe the station lamps being lit when running the test. If all lamps do not light successfully, the other Digital Line test results may indicate related problems that will not allow the lamps to light.</li><li>2. Investigate by using other Digital Line port tests, and by examining the station, wiring, and connections.</li></ol> |

**Digital Station Audits Test (#17)**

This is a series of six tests which are classified as audits. The SPE sends messages to the on-board microprocessor to perform the following tests. These audits run only if the station is in-service.

- Switchhook Inquiry Test — This is an update of the SPE records according to the circuit pack's records. This inquiry is sent all the way to the voice terminal.
- Bad Scan Inquiry Test — A message is sent uplink which contains a count that is generated due to certain events relating to the link conditions. This can be an indication of communications problems between the Processor and Digital Port circuit pack.
- EPF/PTC Inquiry Test — For a TN413 or a TN754 vintage 13 or earlier, the status of the Electronic Power Feed (EPF) is sent uplink. Possible conditions are: EPF-on-ok, EPF-off, and EPF-no-load. For TN754 vintage 14 or later, TN754B or TN2136, TN2181, TN2224, the status of the Positive Temperature Coefficient (PTC) is sent uplink. Possible conditions are: PTC-on-ok, PTC-off, and PTC-no-load.
- ID Request Test — A request is made to the station for its status. The station sends its configuration information and health information back. This information is checked and a pass/fail result is provided.
- Ringer Update Test — This updates the digital telephone ringer state according to the processor records.
- DTMF Administration Update Test — This is a message to the digital station to refresh the default value which causes the station to send touch-tones only in the primary information channel. This value is set initially when the station is put in-service and every time the station's state changes from other states to in-service.

**Table 10-134. TEST #17 Station (Digital) Audits Test**

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | ABORT       | Switchhook audit timed out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 2          | ABORT       | ID request fails, health bit returned from voice terminal is bad.<br><br>1. Make sure voice terminal is connected and repeat test.<br><br>2. If test fails, replace voice terminal and repeat test.<br><br>3. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                                  |
| 3          | ABORT       | The EPF/PTC has detected an overcurrent condition.<br><br>1. For a TN754 vintage 13 or earlier Digital Line circuit pack, issue the <b>test</b> UUCSSpp/PCSSpp <b>long</b> command. If Test #11 passes, then the EPF/PTC condition has been cleared. Rerun the Short Test Sequence. If Test #11 does not pass, follow the repair procedures described for Test #11.<br><br>2. Look for Error Type 769 logged against DIG-LINE and follow the procedures in the associated footnote. If any additional problems are found after completion of maintenance procedures, rerun the test.<br><br>3. If the test continues to abort, escalate the problem. |
| 4          | ABORT       | Internal System Error<br><br>1. Resolve any outstanding circuit pack maintenance problems.<br><br>2. Retry the command at 1-minute intervals a maximum of 5 times.<br><br>3. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 5          | ABORT       | Ringer update aborted due to station being in ready-for-service or out-of-service state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

If the test continues to fail, escalate the problem.</li></ol>                                                                                                                                                                                                                                                                                                                                                                           |
|            | PASS        | <p>Station Audits passed. This Digital Port circuit pack is functioning properly.</p> <ol style="list-style-type: none"><li>1. If complaints persist, investigate by using other port tests, and by examining the station, wiring, and connections.</li></ol>                                                                                                                                                                                                                                                                                                                           |

## DIOD-DS1 (DS1 DIOD Trunk)

| MO Name As It Appears In Alarm Log | Alarm Level        | Initial System Technician Command To Run | Full Name of MO |
|------------------------------------|--------------------|------------------------------------------|-----------------|
| DIOD-DS1                           | MAJOR <sup>1</sup> | test trunk <i>group# member#</i> l       | DS1 DIOD Trunk  |
| DIOD-DS1                           | MINOR              | test trunk <i>group# member#</i> l       | DS1 DIOD Trunk  |
| DIOD-DS1                           | WARNING            | test trunk <i>group# member#</i>         | DS1 DIOD Trunk  |

1. A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed. For more information on the **set options** command, see Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

**NOTE:**

Many trunk problems are caused by incorrect settings of parameters on the trunk group administration form. Settings must be compatible with the local environment and with parameter settings on the far-end. Refer to *DEFINITY Communications System Generic 3 V2 Implementation*, 555-230-653, for information on how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

A DS1 DIOD trunk provides a link for digitized voice or data communications between the system and a central office switch. There are two types of DS1 interfaces:

- 24 DS0 channels on a 1.544 Mbps link
- 31 DS0 channels + 1 framing channel on a 2.048 Mbps link
- 32-channel mode is supported only on TN464 circuit packs and on G3r V2 systems.

The DS1-DIOD maintenance object monitors and maintains a DIOD trunk port on a TN464 UDS1 Interface circuit pack. See UDS1-BD in this chapter for more information about this circuit pack. The DS1 circuit pack supports low level CO trunk signaling interfaces for both ground-start and loop-start trunks. This maintenance strategy covers the in-line errors log, initialization tests, periodic tests, scheduled tests, demand tests, and alarm resolution and escalation.

Three trunk service states are specified by DS1 DIOD trunk maintenance:

- out-of-service

The trunk is in a deactivated state and cannot be used for either incoming or outgoing calls.
- in-service

The trunk is in an activated state and can be used for both incoming and outgoing calls.
- disconnect (ready-for-service)

The trunk is in an activated state but can only be used for an incoming call.

Hardware Error Log Entries and Test to Clear Values

| DS1 DIOD Trunk Error Log Entries |                                  |                                      |                          |              |                               |

| 3840(n)    |                         | Port Audit and Update Test (#36) |                          |              |                                 |

- 
- Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
  - This alarm will only be raised when the System-Parameter Country form has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.
  - Major alarms on this MO may be downgraded to Warning alarms based on the value used in the set options command.

Notes:

- a. Error Type 1—Aux Data 57408—No tip ground is detected on an outgoing call.  
Aux Data 57476—Rotary Dial before Wink.  
Aux Data 57477—Rotary Dial pulse too early.  
Aux Data 57485—Wink too short for a valid signal.  
Aux Data 57487—PBX could not get “loop close” signal.

The DS1 Interface circuit pack detected a hardware fault. These errors will cause the Dial Tone Test (#314) to run and are only considered a problem if the Dial Tone Test fails (in which case Error Type 1025 will also show up). In this case, the trunk may be put in the ready-for-service state (shown as “disconnected” by the status command), which allows only incoming calls. Run the Dial Tone Test (#314) and follow the procedures.

- b. Error Type 15—This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors (if any).
- c. Error Type 18—System Technician has busied out the trunk to the out-of-service state. No calls can be made on this trunk except the Facility Access Test Call. For details on this feature, refer to "Facility Test Calls" section in Chapter 5, "Routine Maintenance Procedures".
- d. Error Type 130—This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.
- e. Error Type 257—The DS1 Interface circuit pack detects a hardware fault. Aux Data 57392 indicates no external release on PBX disconnect. Escalate the problem.
- f. Error Type 513—The DS1 Interface circuit pack detects a hardware fault. Aux Data 57393 indicates belated external release on PBX disconnect. Escalate the problem.
- g. Error Type 769—The DS1 Interface circuit pack detects a hardware fault. The Aux Data field contains the following error type:—57484, fault is detected on tip/ring. Escalate the error.
- h. The DS1Interface circuit pack detects a hardware fault, and the Aux Data field contains the following error type: 51200, port is unavailable. Run the Dial Tone Test (#314) and follow procedures.
- i. Error Type 1793—DS1 Interface circuit pack is out-of-service. Look for UDS1-BD errors in the Hardware Error Log if the port is on a TN464 UDS1 board. Refer to the UDS1-BD (DS1 Trunk Circuit Pack) Maintenance documentation for details
- j. Error Type 2049—With the following Aux Data:
  - Aux Data 57473—Rotary dial rate below 8 pulses per second.
  - Aux Data 57474—Rotary dial rate above 12 pulses per second.
  - Aux Data 57475—Rotary Dial interdigit time is too short.

The DS1 interface circuit pack detects a hardware error on the DS1 DIOD trunk. The trunk can not communicate with the far-end because it is unable to interpret digits sent from the far-end switch. Check with the far-end switch or Operating Company for proper trunk connection.
- k. Error Type 2305—Recorder message, trunk could not be seized (Aux Data 50944). Run Test #314 and follow the outlined procedures.
- l. Error Type 2562—Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from call processing and is generated when a second attempt (retry) to seize an outgoing trunk fails.

- m. Error Type 2817—Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a two-way trunk from both the near-end and the far-end. Attempt to place the call again. If the error persists, execute the Dial Tone Seizure Test (#314) and follow those procedures.
- n. Error Type 3840—Port Audit and Update Test (#36) failed due to an internal system error. Enter the **status trunk** command to verify the status of the trunk. If the trunk is out-of-service, then enter the **release trunk** command to put it back into in-service. Retry the test command. If the test continues to abort, then escalate the problem.

System Technician-Demanded Tests:  
Descriptions and Error Codes

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation           | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|----------------------------------|---------------------|--------------------|-------------------|
| NPE Crosstalk Test (#6)          |                     | X                  | ND                |
| Conference Circuit Test (#7)     |                     | X                  | ND                |
| DS1 Dial Tone Test (#314)        | X                   | X                  | ND                |
| Port Audit and Update Test (#36) | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) resides on each circuit pack with a TDM Bus interface. (The TN464 UDS1 circuit pack has one SCOTCH-NPE chip instead of several NPE chips.) The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 10-135. TEST #6 NPE Crosstalk Test

Conference Circuit Test (#7)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. (The TN464 UDS1 circuit pack has one SCOTCH-NPE chip instead of several NPE chips). The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a tone detector port. If the level of the tone is within a certain range, the test passes.

Port Audit and Update Test (#36)

This test sends port level translation data from switch processor to the DS1 Interface circuit pack to assure that the trunk's translation is correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of trunk kept in the DS1 Interface circuit pack and in the switch software.

|            | PASS        | Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack and switch software are consistent. If the trunk is busied out, the test will not run but will return PASS. To verify that the trunk is in-service:<br><br>1. Enter the <b>status trunk</b> command to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to step 2.<br><br>2. Enter the <b>release trunk</b> command to put the trunk back into in-service.<br><br>3. Retry the test command. |

DS1 CO Dial Tone Seizure Test (#314)

DS1 CO Dial Tone Seizure Test checks the trunk’s signaling capability provided by the DS1 Interface circuit pack. The maintenance software initiates the test by sending a “seizure” message to the DS1 Interface circuit pack and expects an “active” reply from the DS1 interface circuit pack. If the “active” message is received, then the test passes. If no message is received and the timer expires, the test is aborted. If the DS1 Interface circuit pack sends a “reorder” message back to maintenance software, then the test fails.

This test cannot be run on a trunk in any of the following conditions:

- a. The trunk direction is administered as an incoming only trunk.
- b. The trunk has been seized by a normal trunk call.
- c. The trunk is administered with maintenance test disabled.

Table 10-138. TEST #314 DS1 CO Dial Tone Seizure Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                |
|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | FAIL        | <p>The trunk cannot be seized for an outgoing call.</p> <ol style="list-style-type: none"><li>1. Verify that the Trunk Type field on the trunk administration screen form matches the trunk type administered on far end switch.</li><li>2. Look for UDS1-BD errors in Hardware Error Log. If present, refer to the UDS1-BD (DS1/UDS1 Trunk Circuit Pack) Maintenance documentation.</li><li>3. Retry the test at 1-minute intervals for a maximum of 5 times.</li><li>4. If the test continues to fail, escalate the problem.</li></ol> |
|            | PASS        | <p>The trunk can be seized for an outgoing call.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## DIOD-TRK (DIOD Trunk), DIOD-BD (DIOD Circuit Pack) [G1.2SE]

| MO Name As It<br>Appears in<br>Alarm Log | Alarm<br>Level | Initial System<br>Technician<br>Command to Run <sup>1</sup> | Full Name of MO   |
|------------------------------------------|----------------|-------------------------------------------------------------|-------------------|
| DIOD-BD <sup>2</sup>                     | MINOR          | test port PCSS s                                            | DIOD Circuit Pack |

- 
- Where P is the port network number (1 for PPN, 2 for EPN, and 3 for the second EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.)
  - Where **1** is Long, **s** is Short, and **r** is repeat. Refer to the XXX-BD (Common Port Board) Maintenance Documentation.

DIOD-TRK (DIOD Trunk) [G1.2SE]

| MO Name As It Appears in Alarm Log | Alarm Level        | Initial System Technician Command to Run <sup>1</sup> | Full Name of MO |
|------------------------------------|--------------------|-------------------------------------------------------|-----------------|
| DIOD-TRK                           | MAJOR <sup>2</sup> | test port PCSSpp l                                    | DIOD Trunk      |
| DIOD-TRK                           | MINOR              | test port PCSSpp l                                    | DIOD Trunk      |
| DIOD-TRK                           | WARNING            | test port PCSSpp l                                    | DIOD Trunk      |

1.

Where P is the port network number (1 for PPN, 2 for EPN, and 3 for the second EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.).
2.

A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

Direct Inward and Outward Dial (TN429 DIOD) trunks are 2-wire analog lines to the CO which support the following services:

- both incoming and outgoing CO calls
- DID trunk
- DID Trunk and 1-way Outgoing DIOD

The DIOD Trunk circuit pack provides eight ports for loop-start CO. The circuit pack is an interface between the 2-wire analog line from the CO and the system's (4-wire) TDM Bus.

LOOP START OPERATION

Idle State - Tip = ground, Ring = CO Battery

A. Outgoing Call

1.

PBX Off-Hook (Seize Message): Closes the Tip-Ring Loop
  - a. CO Response: DC loop current + Dial tone
2.

PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current
  - a. CO Response: CO goes to idle state (see Note)

B. Incoming Call

1.

CO Applies Ringing Voltage
  - a. PBX Response: Detect ringing current

2. PBX Off-Hook (Answer Message): Close loop
  - a. CO Response: Trip ringing, provide loop current
3. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current
  - a. CO Response: CO goes to idle state (see Note)

*C. Direct Inward Dialing (DID)*

1. CO Applies Ringing Voltage
  - a. PBX Response: Detect ringing current and close loop
  - b. CO Response: Send DTMF digits
  - c. PBX Response: Acknowledge of Number dialed and open loop
2. PBX Off-Hook (Answer Message): Close loop
  - a. CO Response: Trip ringing, provide loop current
3. PBX On-Hook (Drop Message): Open Tip-Ring loop, no loop current
  - a. CO Response: CO goes to idle state (see Note)

**NOTE:**

CO does not normally provide an On-Hook (Disconnect) signal.

Hardware Error Log Entries and Test to Clear Values

| DIOD Trunk Error Log Entries |          |                                       |                          |              |                         |
|------------------------------|----------|---------------------------------------|--------------------------|--------------|-------------------------|
| Error Type                   | Aux Data | Associated Test                       | Alarm Level              | On/Off Board | Test to Clear Value     |
| 0 <sup>1</sup>               | 0        | Any                                   | Any                      | Any          | test port PCSSpp sh r 1 |

| 2049                         |          | NPE Cross Talk Test (#6)              | MAJ/MIN/WRN <sup>2</sup> | ON           | test port PCSS l r 3    |
| 2561 (a,d)                   | 57345    | None                                  |                          |              |                         |
| 2817 (a,e)                   | 57393    | None                                  |                          |              |                         |
| 3073 (a,c)                   | 57376    | None                                  |                          |              |                         |
| 3073 (a,c)                   | 57424    | None                                  |                          |              |                         |
| 3585 (a,c)                   | 57424    | None                                  |                          |              |                         |

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. Minor alarms on this MO may be downgraded to warning alarms based on the values used in the **set options** command. If the Minor alarm is not downgraded by the **set-options** values, the Minor alarm is upgraded to a Major alarm if 75 percent of the trunks in this trunk group are alarmed.

- Notes:
- a. These are in-line errors that have no specific test associated with them. Refer to the following table for an explanation and appropriate action.
- b. This is a software audit error that does not indicate any hardware malfunction. Run the Short Test Sequence and investigate associated errors (if any).

- c. Aux data 57376 - No loop current on incoming call  
Aux data 57424 - No loop current on outgoing call  

These errors cause the Dial Tone Test (#0) to run and are only considered a problem if the Dial Tone Test fails (in which case Error Type 1537 also shows up). In this case, the trunk may be put in "Ready-for-Service" state (shown as "disconnected" by status command), which allows only incoming calls. Run the Dial Tone Test (#0) and follow its outlined procedures.
- d. Single polarity ringing current - This error results from abnormal ringing current, but does not prevent the incoming call from being accepted. This error code is only logged as an informational event and causes no other testing to occur.
- e. Late CO Trunk release - This error indicates that the CO releases the trunk at least four minutes after the PBX dropped the call. This error code is only logged as an informational event and causes no other testing to occur.

Table 10-139. DIOD Trunk Errors with NO Tests

| Error Type | Aux Data | Description and System Action                                                                                                                                                                                                                                                                                                                                                                                                                      | System Technician Action |
|------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| 769        | 57392    | CO not releasing after call is dropped from PBX end (TN747B), or the loop is not open after a disconnect (TN765). After several occurrences, an off-board (TN747B) or on-board (TN465) warning alarm is generated.                                                                                                                                                                                                                                 | Refer problem to CO.     |
| 2561       | 57345    | Single polarity ringing current. This error results from abnormal ringing current, but does not prevent the incoming call from being accepted. One cause could be that the reverse current detector associated with the port is failing. (Will not be detected by any tests.) The other cause could be that normal current is not detected. In this case, neither incoming nor outgoing calls can be completed, and the dial tone test also fails. | Check for other errors.  |

Table 10-139. DIOD Trunk Errors with NO Tests — Continued

| Error Type | Aux Data | Description and System Action                                                                                                                                                                                            | System Technician Action  |
|------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| 2817       | 57393    | CO released the trunk at least four minutes after the PBX dropped the call. This error code is log only and causes no other testing to occur. No alarm is generated.                                                     | Check for other errors.   |
| 3073       | 57376    | No loop current on incoming call. The incoming destination has already answered and no loop current has been detected. If this is a hard fault, the dial tone test and all outgoing calls should also fail.              | Check for other errors.   |
| 3585       | 57424    | No loop current on outgoing call. This error occurs on attempt to seize a loop or ground-start trunk for an outgoing call. An error occurs if loop current is not detected or the caller hangs up before it is detected. | See Note at end of table. |

 **NOTE:**

At the administration terminal, busyout the affected port, and run a Long test. If Dial Tone Test #0 passes, ignore this error. Release the port.

**System Technician-Demanded Tests:  
Descriptions and Error Codes**

Always investigate tests in the order they are presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

For example, you may also clear errors generated from other tests in the testing sequence.

| Order of Investigation                | Short Test Sequence | Long Test Sequence | D/ND <sup>1</sup> |
|---------------------------------------|---------------------|--------------------|-------------------|
| NPE Crosstalk Test (#6)               |                     | X                  | ND                |
| Dial Tone Test (#0)                   |                     | X                  | ND                |
| Loop Around and Conference Test (#33) |                     | X                  | ND                |
| Audit Update Test (#36)               | X                   | X                  | ND                |

1. D = Destructive; ND = Nondestructive

Dial Tone Test (#0)

This test attempts to seize a port and checks for the return of a dial tone.

Table 10-140. TEST #0 Dial Tone Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|            | ABORT       | Could not allocate system resources to run this test.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1000       | ABORT       | System resources required to run this test are not available. The port may be busy with a valid call. Use the command <b>display port PCSSpp</b> to determine the trunk group/member number of the port. Use the <b>status trunk</b> command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids" for a full description of all possible states.) You must wait until the port is idle before retesting.<br><br>1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem. |

|------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2000       | ABORT       | Response to the test was not received within the allowable time period.<br><br>1. Retry the command at one-minute intervals a maximum of five times.<br><br>2. If the test continues to abort, escalate the problem.                                                                                                                                                                                                                                                                                                                                                                           |
|            | FAIL        | Trunk was seized, but dial tone could not be detected.<br><br>1. Check for errors on TONE-BD or TONE-PT. Clear any errors found and repeat test.<br><br>2. If error has still not cleared, refer problem to CO.                                                                                                                                                                                                                                                                                                                                                                                |
| 2002       | FAIL        | Seizure portion of test failed due to hardware problem. Fault is usually caused by a disconnected trunk.<br><br>1. Check trunk wiring to ensure good connection; repeat test if wiring correction made.<br><br>2. Locate another identical CO trunk and swap its wiring with one under test. Repeat test on both trunks and determine if problem follows trunk or remains at original port. If problem follows trunk, refer problem to CO. If problem remains at port, replace circuit pack and repeat test.<br><br>3. If replacing circuit pack does not clear failure, escalate the problem. |
| 1009       | PASS        | Detected tone was not pure dial tone. No action required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|            | PASS        | Trunk was seized, and dial tone was detected. User-reported troubles on this port should be investigated by using other port tests and by examining trunk or external wiring.                                                                                                                                                                                                                                                                                                                                                                                                                  |

NPE Crosstalk Test (#6)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per port basis. The NPE Crosstalk Test verifies that this port’s NPE channel talks on the selected time slot and never crosses over to time slots reserved for

other connections. If the NPE is not working correctly, one way and noisy connections may be observed. This test is usually only part of a port's long test sequence and takes approximately 20 to 30 seconds to complete.

Table 10-141. TEST #6 NPE Crosstalk Test

| Error Code | Test Result | Description/ Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
