The active SNC communicates with each circuit pack in the switch node carrier over the serial channel bus on the backplane. In addition, the active SNC provides timing to the circuit packs in the switch node carrier via the clock busses. The active SNC uses Timing Priority Number (TPN) links with each Switch Node Interface (SNI) and the other SNC to receive and distribute TPNs. TPNs are used for setting up the correct timing distribution for the switch node carrier. The active SNC receives timing for the switch node carrier from each SNI circuit pack in the carrier and chooses the SNI with the best timing reference for the switch node carrier timing signal the SNC puts out on the clock busses. The timing reference for each SNI is derived from the fiber signal to each SNI. The active SNC chooses the SNI to receive timing from by choosing the SNI with the lowest numbered TPN which means that the SNI is closest to the system timing source. The active SNC also verifies that the SNI reference signal is good before using that SNI as the timing reference for the switch node carrier. The active SNC then supplies this timing over the clock busses on the backplane to all the SNI and SNC circuit packs in the carrier. For more information on timing synchronization including how the SNC fits into the overall synchronization configuration, see the SYNC section.

The SNC circuit packs are associated with three maintenance objects:

- The SNC-BD MO covers general SNC board errors and errors with the serial communication channel between the active and standby SNCs.
- The SNC-LINK MO covers errors between the active SNC and SNIs over the serial channel (aux data is 1). Also, the SNC-LINK MO covers TPN Link errors between the active SNC and SNIs (aux data is 2).
- The SNC-REF MO covers errors the active SNC detects with SNI reference signals.

SNC circuit packs are part of port network connectivity (PNC). For background information about PNC, refer to the Maintenance Architecture and Hardware Configurations chapters.

* = An EI or a DS1C circuit pack may reside in this slot
** = A DS1C circuit pack may reside in this slot

Switch Node Clock (SNC) TN572
Switch Node Interface (SNI) TN573
Expansion Interface (EI) TN570
DS1 Converter (DS1C) TN574
Online Switcher (OLS) power supply

Figure 9-86. A Center Stage Switch Configuration

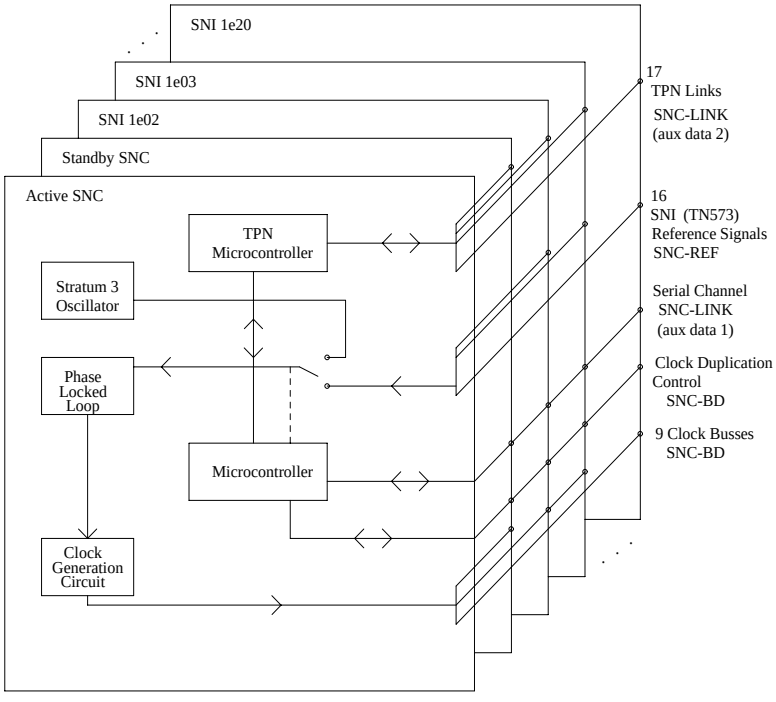

Figure 9-87. SNC Functions

SNC LEDs

SNC circuit packs have the standard red, green and yellow LEDs. The red and green LEDs operate as usual: red means an alarm condition and green indicates maintenance testing in progress. If the yellow LED is lit this indicates that the SNC is the active circuit pack, supplying timing to the carrier. In a high reliability system (duplicated SPE, simplex PNC), the standby SNC on a carrier will be unlit. In a critical reliability system (duplicated PNC), an SNC on a standby switch node carrier will be lit since it is providing timing for the standby carrier.

Clear Firmware-Counters Command

SNC firmware generates error reports independently of technician-demanded tests. Therefore, the **test board** UUCSS clear command will not affect the error status reported by firmware. The **clear firmware-counters** command will clear all firmware-generated errors unconditionally.

The **clear firmware-counters** UUCSS command sends a downlink message to the SNC circuit pack, causing it to clear out its firmware error counters and failure database. Once the firmware failure database is cleared, the failure audit test (#777) will pass. If problems still exist, the firmware will increment its error counters and the failure audit test will begin failing again.

This command should not be used as a replacement for the repair procedures associated with the hardware error log entries. This command may be useful if a problem has been fixed and off-board alarms associated with the problem are still active.

Replacing SNC Circuit Packs

WARNING:
Do not power down a Switch Node carrier to replace a circuit pack. Replacing an SNC on a system with unduplicated SNCs disrupts service.

Standard Reliability System (Simplex SPE, PNC and SNCs)

This procedure is destructive. Any links through the switch node carrier will go down.

1. Pull out the SNC circuit pack to be replaced.
2. Insert a new SNC circuit pack.
3. Wait for the SNC to reset. (The red and green LEDs light and then go out. The yellow LED should be on solid.)
4. **Test alarm long clear** category **exp-intf**. **Do not busyout the Expansion Interface circuit packs.**
5. Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK, and DS1 CONV-BD alarms to clear, or enter **clear firmware-counters**.

High Reliability System (Duplicated SPE and SNCs, Simplex PNC)

This procedure is non-destructive.

1. If the SNC circuit pack to be replaced is the active SNC in the switch node carrier (yellow LED is on solid), first set the standby SNC to active via the **set switch-node-clock** command.
2. When the SNC circuit pack is in standby mode (yellow LED is off), pull out the SNC circuit pack to be replaced.

3. Insert a new SNC circuit pack.
4. Wait for the SNC to reset. (The red and green LEDs light and then go out.) The yellow LED should be off since the SNC circuit pack is in standby mode.

Critical Reliability System (Duplicated SPE and PNC)

WARNING:

On a system with duplicated PNC, synchronization may be provided over a combination of active and standby components. This condition is indicated by an OFF-BOARD WARNING alarm against TDM-CLK with error type 2305. Repairs to standby PNC in this state may disrupt service. Otherwise, if the active PNC is functional, replacement of a standby component will not disrupt service.

STEPS:

Enter **status pnc**	Verify that the component to be replaced is on the standby PNC.
Enter **busyout pnc**	
Enter **busyout board UUCSS**	UUCSS represents the cabinet-carrier-slot address of the circuit pack to be replaced.
Replace the circuit pack	
Enter **release board UUCSS**	**CAUTION:** *Do not busyout any Expansion Interface circuit pack after this point.*
Enter **test alarms long clear** for category **exp-intf**	
Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK, and DS1C alarms to clear, or enter **clear firmware counters <a-pnc or b-pnc>**	Use the letter designation of the pnc which holds the replaced component (the standby pnc).
Enter **status pnc**	If either PNC state-of-health is not "functional", consult the ''PNC-DUP (PNC Duplication)'' section.
Enter **release pnc**	

Error Log Entries and Test to Clear Values

Table 9-622. SNC Board Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test board UUCSS r 1
1(a)	Any	Failure Audit (#777)	MAJOR	ON	test board UUCSS r 1
18(b)	0	busyout board UCSS	WARNING	OFF	release board UCSS
257(c)	Any	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
513(d)	Any	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1
769(e)	Any	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1
1025(f)	Any	Failure Audit (#777)	MAJOR	ON	test board UUCSS r 1
1281(g)	Any	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1
1537(h)	Any	Failure Audit (#777)	MINOR	ON	test board UUCSS r 1
1793(i)	Any	Failure Audit (#777)	MAJOR	ON	test board UUCSS r 1
2049(j)	Any	Failure Audit (#777)	MAJOR	ON	test board UUCSS r 1

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. Error type 1 indicates SNC on-board microcontroller error. (This occurs whenever the microcontroller sanity test fails, the ROM has problems, the processor internal or external RAM is faulty, or the firmware instruction test fails. In addition, this error indicates problems with the interrupt capabilities, the dual port RAM and the RTM (Real Time Monitor) interface on the faceplate of the SNC.)

   Replace the SNC circuit pack.

b. This error indicates that the SNC circuit pack has been busied out via the **busyout board UCSS** command. To resolve this error, release the SNC circuit pack via the **release board UCSS** command.

c. These errors occur whenever firmware detects failure of the phase-locked loop, inability to lock, or failure of the clock drivers and the problem is off-board.

   1. Enter **display errors** and if SNC-BD error type 1793 exists in the hardware error log, follow the associated repair procedures for SNC-BD error 1793.

2. Enter **display errors** and if no SNI-BD 1025 errors exist in the error log, replace the active SNC.
3. Enter **display errors** and if any SNI-BD 1025 errors exist in the error log, follow the associated repair procedure in the SNI-BD section for these errors.

d. This error occurs whenever the active SNC determines that there is a problem communicating with the standby SNC via the connecting serial channel.

If the switch node carrier is administered with duplicate SNCs:

1. If the standby SNC (the one with its yellow LED off) has this error, escalate the problem. (**Status switch-node** will also display the active and standby SNCs.)
2. If the system originally had duplicate SNCs and the standby SNC was removed and never replaced and the active SNC has not been reset after the standby SNC was removed, this error will occur.

   If you do not intend to replace the SNC:

   a. Remove the standby SNC from circuit pack administration via **change circuit-pack**.

   b. If the problem persists, replace the active SNC circuit pack.

   Otherwise:

   a. Insert an SNC circuit pack.

3. Check the error log via **display errors**. If SNIs in the switch node carrier also have problems communicating with the active SNC, i.e. error code 257 is logged against SNI-BD, then replace the active SNC.
4. Replace the standby SNC circuit pack.
5. Retry the **test board** command. Check the error log via **display errors**. If this error is still in the error log, replace the active SNC.

If the switch node carrier is administered with only one SNC:

1. If step 2 above does not apply, replace the SNC.

e. This error occurs whenever the standby SNC determines that there is a problem communicating with the active SNC via the connecting serial channel.

1. If the active SNC (the one with its yellow LED on) has this error, escalate the problem. (**Status switch-node** will also display the active and standby SNCs.)
2. Check the error log via **display errors**. If more than one SNI in the switch node carrier has problems communicating with the active SNC, i.e. error code 257 is logged against SNI-BD, then replace the active SNC.

3. If a single SNI has SNI-BD error 257, replace the SNI circuit pack.
4. Replace the standby SNC circuit pack.
5. Retry the **test board** command. Check the error log via **display errors**. If this error is still in the error log, replace the active SNC.

f. This error occurs when the firmware detects problems with the various hardware circuit monitors (e.g. loss of reference monitor) that verify correct operation of the reference links.

Replace the SNC circuit pack.

g. This error occurs when the firmware detects problems with the interface used to track the status of both SNCs when there are duplicated SNCs in a switch node carrier. When this error occurs, software may have incorrect information from SNC firmware for which SNC is active. Therefore, the yellow LEDs on the SNCs must be checked in the following repair procedure and the **status switch-node** command should not be used when this error type occurs.

If the switch node carrier has duplicate SNCs:

1. Replace the SNC that does not have its yellow LED lit.
2. Retry the **test board** command. Check the error log via **display errors**. If this error is still in the error log, replace the SNC that has its yellow LED lit.

If the switch node carrier has only one SNC, replace the SNC.

h. This error occurs whenever a loss of signal from the SNC on-board Stratum 3 oscillator is detected by the firmware.

Replace the SNC circuit pack.

i. These errors occur whenever firmware detects failure of the phase-locked loop, inability to lock, or failure of the clock drivers and the problem is on-board.

Replace the SNC circuit pack.

If the error persists, follow normal escalation procedures.

j. This error occurs when the firmware detects problems with the microcontroller used for Timing Priority Number processing.

Replace the SNC circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *configuration audit* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Configuration Audit (#759)	X	X		ND
Failure Audit(#777)	X	X		ND
Processor Route Audit(#760)		X		ND
SNC On-Board Test(#778)	X	X		ND
TPN Test(#779)	X	X		ND
Switch Node Clock Reset Test(#780)			X	D

1. D = Destructive, ND = Non-destructive

NOTE:
Test #983 is not an actual demand maintenance test. This test number is used to report results of executing of the **clear firmware-counters** command. Refer to error codes for Test #777.

Configuration Audit (#759)

This test is non-destructive.

This test is run via the **test board short** or **test board long** command for SNC circuit packs.

For SNC circuit packs, this test queries the SNC for SNCs and SNIs in the same switch node carrier that the SNC can communicate with and compares this data to the administered data.

Failures of this test cause entries in the error and alarm logs against Switch Node Configuration (SN-CONF) with the board location of the SNC.

Table 9-623. TEST #759 Configuration Audit

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2306	ABORT	The SNC circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that this board resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNC may be service interrupting. Refer to the SNC-BD section for the procedure for replacing an SNC. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Check **list fibers** to determine the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
2500	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.

Table 9-623. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
102	FAIL	The SNC circuit pack cannot communicate with the SNI in slot 2. 1. If a standby SNC (one with its yellow LED off) was tested and resulted in this error code, follow normal escalation procedures. (**status switch-node** will also display the active and standby SNCs.) 2. Use **list configuration carrier** to determine whether an SNI is physically present in slot 2. If the `Vintage` field indicates that a circuit pack is present, proceed to step 3. If the `Vintage` field reports `no board`, do one of the following: ■ If an SNI is not supposed to be installed in slot 2: a. This failure will not affect service. The missing SNI can be removed from administration with **change circuit-pack**. b. If the error persists, reset the active SNC circuit pack with **reset board** UUCSS. If the error still persists, replace the active SNC circuit pack. ■ If an SNI is supposed to be installed in slot 2, insert one. 3. **Display errors** for category **pnc**. If the SNC has SNC-BD error 513, or SNC-LINK errors with aux data 1 pointing to other SNIs besides the one in slot 2, replace the active SNC circuit pack. 4. If SNIs in the same carrier have SNI-BD error 257 logged, (indicating they are having trouble communicating with the SNC), replace the active SNC circuit pack. 5. If the SNC being tested has SNC-LINK error type 1, replace the SNI in slot 2. Replacing an SNI may interrupt service. Refer to the SNI-BD section for the procedure for replacing an SNI. 6. If the SNC being tested still has SNC-LINK error type 1, replace the SNC circuit pack.

Table 9-623. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
109	FAIL	The SNC circuit pack cannot communicate with the SNI in slot 9. 1. If a standby SNC (one with its yellow LED off) was tested and resulted in this error code, follow normal escalation procedures. (**status switch-node** will also display the active and standby SNCs.) 2. Use **list configuration carrier** to determine whether an SNI is physically present in slot 9. If the `Vintage` field indicates that a circuit pack is present, proceed to step 3. If the `Vintage` field reports `no board`, do one of the following: ■ If an SNI is not supposed to be installed in slot 9: a. This failure will not affect service. The missing SNI can be removed from administration with **change circuit-pack**. b. If the error persists, reset the active SNC circuit pack with **reset board UUCSS**. If the error still persists, replace the active SNC circuit pack. ■ If an SNI is supposed to be installed in slot 9, insert one. 3. **Display errors** for category **pnc**. If the SNC has SNC-BD error 513, or SNC-LINK errors with aux data 1 pointing to other SNIs besides the one in slot 9, replace the active SNC circuit pack. 4. If SNIs in the same carrier have SNI-BD error 257 logged, (indicating they are having trouble communicating with the SNC), replace the active SNC circuit pack. 5. If the SNC being tested has SNC-LINK error type 1793, replace the SNI in slot 9. Replacing an SNI may interrupt service. Refer to the SNI-BD section for the procedure for replacing an SNI. 6. If the SNC being tested still has SNC-LINK error type 1793, replace the SNC circuit pack.

Continued on next page

Table 9-623. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
112	FAIL	The SNC circuit pack cannot communicate with the other SNC. **If this test was run on the active SNC and if the switch node carrier is administered with duplicate SNCs:** 1. If the system originally had duplicate SNCs and the standby SNC was removed and never replaced, this error will occur. *If you do not intend to replace the SNC:* a. Remove the standby SNC from circuit pack administration via **change circuit-pack**. b. If the problem persists, reset the active SNC circuit pack via **reset board UUCSS**. If the problem persists after the reset, replace the active SNC circuit pack. 2. Check the error log via **display errors**. If SNIs in the switch node carrier also have problems communicating with the active SNC, i.e. error code 257 is logged against SNI-BD, then replace the active SNC. 3. Replace the standby SNC circuit pack. 4. Retry the **test board** command. If this test continues to fail, replace the active SNC. **If this test was run on the active SNC and if the switch node carrier is administered with only one SNC:** 1. Replace the SNC.
112	FAIL *(cont'd.)*	**If this test was run on the standby SNC:** 1. Check the error log via **display errors**. If more than one SNI in the switch node carrier has problems communicating with the active SNC, i.e. error code 257 is logged against SNI-BD, then replace the active SNC. 2. Replace the standby SNC circuit pack. 3. Retry the **test board** command. Check the error log via **display errors**. If this error is still in the error log, replace the active SNC.

Table 9-623. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
113	FAIL	The SNC circuit pack cannot communicate with the SNI in slot 13. 1. If a standby SNC (one with its yellow LED off) was tested and resulted in this error code, follow normal escalation procedures. (**status switch-node** will also display the active and standby SNCs.) 2. Use **list configuration carrier** to determine whether an SNI is physically present in slot 13. If the `Vintage` field indicates that a circuit pack is present, proceed to step 3. If the `Vintage` field reports `no board`, do one of the following: If an SNI is not supposed to be installed in slot 13: a. This failure will not affect service. The missing SNI can be removed from administration with **change circuit-pack**. b. If the error persists, reset the active SNC circuit pack with **reset board** UUCSS. If the error still persists, replace the active SNC circuit pack. If an SNI is supposed to be installed in slot 13, insert one. 3. **Display errors** for category **pnc**. If the SNC has SNC-BD error 513, or SNC-LINK errors with aux data 1 pointing to other SNIs besides the one in slot 13, replace the active SNC circuit pack. 4. If SNIs in the same carrier have SNI-BD error 257 logged, (indicating they are having trouble communicating with the SNC), replace the active SNC circuit pack. 5. If the SNC being tested has SNC-LINK error type 2049, replace the SNI in slot 13. Replacing an SNI may interrupt service. Refer to the SNI-BD section for the procedure for replacing an SNI. 6. If the SNC being tested still has SNC-LINK error type 2049, replace the SNC circuit pack.

If the SNC being tested has SNC-LINK error type 3841, replace the SNI in slot 20. Replacing an SNI may interrupt service. Refer to the SNI-BD section for the procedure for replacing an SNI. 6. If the SNC being tested still has SNC-LINK error type 3841, replace the SNC circuit pack.
	PASS	The administered data and the circuit packs the SNC can communicate with match.

Continued on next page

Table 9-623. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	No board was detected by the test. 1. Check that SNC board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNC should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNC. It may be necessary to use the **reset board** command if the SNC circuit pack gets into a mode where it cannot communicate with software. If an SNC with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Processor Route Audit Test (#760)

This test is non-destructive.

This test sends processor routes to all SNIs and SNCs in the same carrier as the SNC that the **test board UCSS** command was run for. The processor route is used for the boards to send uplink messages to the SPE and gives a sequence of boards for the message to get routed through so that the message ends up at the SPE. If the SNI and SNC boards do not have processor routes, they will not be able to send any in-line errors to the SPE.

When each individual board receives the processor routes, it sends a board insertion message uplink and software inserts that board if it has not already been inserted. Each board is sent either one or two processor routes depending on the configuration.

Use **test led** or **list config carrier** to see whether boards are inserted.

Table 9-624. TEST #760 Processor Route Audit Test

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2306	ABORT	None of the circuit packs in this switch node carrier are responding to the processor route messages sent by software. 1. Run the **test led switch-node** for the switch node that this switch node carrier resides in to verify whether the LEDs on any of the boards light. 2. If none of the LEDs light for the boards in this carrier, fix any problems associated with the connectivity of this carrier to the SPE. Use the **list fiber link** command to obtain a list of the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
2500	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.
	FAIL	If this test fails, not all of the administered circuit packs in this switch node carrier responded with an up-link board insertion message. Check to see that administered SNI and SNC boards match the physically installed SNI and SNC boards by entering **list config carrier** UUC. The command output will show "NO BOARD" for every board that is administered, but not inserted. ■ If all administered boards are inserted, run this test again. ■ If administration does not match the physical configuration, and is correct, insert the missing circuit packs in this switch node carrier. ■ If *none* of the administered boards in this switch node carrier were inserted, fix any other SN-CONF errors by following the associated repair procedures for SN-CONF. Use **display errors** with category **pnc** to view SN-CONF errors. Next check if any INLs, LNLs, or RNLs are down, refer to the SYS-LINK section for fixing link problems.

Continued on next page

Table 9-624. TEST #760 Processor Route Audit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	If this test passes, all of the administered circuit packs in this switch node carrier were inserted.
0	NO BOARD	No board was detected by the test. 1. Check that SNC board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNC should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNC. It may be necessary to use the **reset board** command if the SNC circuit pack gets into a mode where it cannot communicate with software. If an SNC with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Failure Audit (#777)

This test is non-destructive.

This test queries the SNC for any existing failures and any unacknowledged cleared failure messages. Each failure generates an error and alarm entry against SNC-BD, SNC-LINK, or SNC-REF. An unacknowledged cleared failure message is a message the SNC circuit pack sent to software indicating a previous failure is now gone and the SNC circuit pack did not receive a message from software indicating that the failure message was received by software.

If no failures are detected by the SNC circuit pack, this test will pass.

If this test reports failures, the results screen for the **test board** command will show **FAIL** with no FAIL code. The error log must then be displayed via **display errors** with category PNC to view all SNC related errors: SNC-BD, SNC-LINK, and SNC-REF.

Table 9-625. TEST #777 Failure Audit

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2306	ABORT	The SNC circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that this board resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNC may be service interrupting. Refer to the SNC-BD section for the procedure for replacing an SNC. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Use the **list fiber link** command to obtain a list of the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.

Continued on next page

Table 9-625. TEST #777 Failure Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	The SNC circuit pack reported failures or retransmitted a cleared failure message. 1. Check the error and alarm logs for SNC-BD, SNC-LINK, or SNC-REF entries. Use the **display errors** and **display alarms** commands with category PNC. Fix any problems found by referring to the SNC Board, SNC Link, or SNC Reference Error Log Entries tables in this section and follow the associated repair procedures. 2. If no SNC-BD, SNC-LINK, or SNC-REF errors exist in the error and alarm logs, retry the command.
	PASS	No problems are detected on the board.
0	NO BOARD	No board was detected by the test. 1. Check that SNC board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNC should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNC. It may be necessary to use the **reset board** command if the SNC circuit pack gets into a mode where it cannot communicate with software. If an SNC with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

SNC On-Board Test (#778)

This test is non-destructive.

This test queries the SNC circuit pack for status of the background tests run on-board. These background tests include an SNC on-board microcontroller test, clock test, an SNC on-board Stratum 3 oscillator test, and TPN microcontroller test.

Table 9-626. TEST #778 SNC On-Board Test

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2303	ABORT	The SNC circuit pack responded that the software test requested is not valid. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2304	ABORT	SNC firmware is not able to run the test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2306	ABORT	The SNC circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that this board resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNC may be service interrupting. Refer to the SNC-BD section for the procedure for replacing an SNC. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Use the **list fiber link** command to obtain a list of the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.

Table 9-626. TEST #778 SNC On-Board Test — *Continued*

Error Code	Test Result	Description/ Recommendation
101	FAIL	The SNC circuit pack has on-board microcontroller failure.
128	FAIL	The SNC circuit pack has a problem with its clock; firmware has detected a phase-locked loop failure, an inability to lock, or a failure of the clock drivers.
129	FAIL	The SNC circuit pack has a problem with the SNC on-board Stratum 3 oscillator.
130	FAIL	The SNC circuit pack has a problem with the TPN microcontroller. 1. Replace the SNC circuit pack.
	PASS	No problems exist with the on-board functions verified by this test.
0	NO BOARD	No board was detected by the test. 1. Check that SNC board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNC should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNC. It may be necessary to use the **reset board** command if the SNC circuit pack gets into a mode where it cannot communicate with software. If an SNC with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

TPN Test (#779)

This test is non-destructive.

This test queries the SNC circuit pack for status of the ROM and internal RAM background tests for the TPN microcontroller.

Table 9-627. TEST #779 TPN Test

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2302	ABORT	Software received unexpected message data from the SNC circuit pack. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2303	ABORT	The SNC circuit pack responded that the software test requested is not valid. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2304	ABORT	SNC circuit pack responded that it is not able to run the test requested by software. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2306	ABORT	The SNC circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that this board resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNC may be service interrupting. Refer to the SNC-BD section for the procedure for replacing an SNC. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Use the **list fiber link** command to obtain a list of the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
	FAIL	The test failed. Replace the SNC circuit pack.

Table 9-627. TEST #779 TPN Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	No problems exist with the TPN microcontroller.
0	NO BOARD	No board was detected by the test. 1. Check that SNC board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNC should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNC. It may be necessary to use the **reset board** command if the SNC circuit pack gets into a mode where it cannot communicate with software. If an SNC with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Switch Node Clock Reset Test (#780)

This test is destructive.

This test resets the SNC circuit pack via the **reset board UUCSS** command when an SNC circuit pack location is entered. If the system has PNC duplication, the active SNC on the active PNC cannot be reset.

If the SNC is active and the **reset board** command is executed, an SNI in the same carrier as the SNC will be told by software to reset the SNC via the TPN link. If no inserted SNIs in the same carrier as the SNC can successfully reset the SNC, software will send a reset message directly to the SNC. Software first tries to reset the SNC via an SNI in case the SNC is insane because the latter method (sending the reset message directly to the SNC) will not work if the SNC is insane.

If an active SNC is reset and a standby SNC exists in the same switch node carrier, the standby SNC will become active. The **reset board** command should not be used to make a standby SNC active. Instead, the **set switch-node-clock UUCSS** command should be used.

If the SNC is standby and the **reset board** command is executed, the active SNC is told by software to reset the standby SNC via the TPN link.

An SNC should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNC. It may be necessary to use the **reset board** command if the SNC circuit pack gets into a mode where it cannot communicate with software.

Table 9-628. TEST #780 Switch Node Clock Reset Test

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2302	ABORT	Software received unexpected message data from the SNC circuit pack. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2303	ABORT	The SNC circuit pack responded that the software test requested is not valid. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2304	ABORT	SNC circuit pack reponded that it is not able to run the test requested by software. 1. Retry the command at 1-minute intervals a maximum of 3 times.

Continued on next page

Table 9-628. TEST #780 Switch Node Clock Reset Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2306	ABORT	The SNC circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that the SNC resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNC may be service interrupting. Refer to the SNC-BD section for the procedure for replacing an SNC. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Use the **list fiber link** command to obtain a list of the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries.
2500	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.
	PASS	The reset message was sent out successfully to the active SNC or to an SNI. A PASS does not necessarily mean the SNC circuit pack was successfully reset. The reset can be verified by checking that the red and green LEDs turn on and then turn off. If an SNC circuit pack fails one of the firmware tests run during its reset sequence, the red LED will stay on and the circuit pack should be replaced.

Table 9-628. TEST #780 Switch Node Clock Reset Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	No board was detected by the test. 1. Check that SNC board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNC should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNC. It may be necessary to use the **reset board** command if the SNC circuit pack gets into a mode where it cannot communicate with software. If an SNC with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Clear Firmware Counters (#983)

This test number is used to report unsuccessful results of the **clear firmware-counters** command. This is not an actual demand maintenance test. If the command aborts, refer to the error codes listed for Test #777.

SNC-LINK (Switch Node Clock Link)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
SNC-LINK	MINOR	test board UUCSS s	SNC Link

1. UU is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (10 or 12).

The SNC-LINK maintenance object reports errors in communications between the active Switch Node Clock and Switch Node Interfaces over the serial channel (aux data 1) and the TPN link (aux data 2). SNC-LINK errors are described on the following pages. For a complete description of SNCs and SNIs, including circuit pack replacement instructions, see maintenance objects SNI-BD and SNC-BD.

Error Log Entries and Test to Clear Values

Table 9-629. SNC-LINK Hardware Error Log Entries

Error Type	Aux Data	SNI Slot[1]	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[2]	0		Any	Any	Any	test board UUCSS r 1
1	1 (a)	2	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1
1	2 (b)	2	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1

3329	2 (b)	18	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1
3585	1 (a)	19	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1
3585	2 (b)	19	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1
3841	1 (a)	20	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1
3841	2 (b)	20	Failure Audit (#777)	MINOR	OFF	test board UUCSS r 1

1. The location of the SNI with which the SNC cannot communicate.
2. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. This error occurs whenever the active SNC determines that there is a problem communicating with an SNI circuit pack in the same carrier via the connecting multiprocessor serial channel used for transmitting CSCN messages. The slot location of the SNI with which the SNC cannot communicate is given in Table 9-629.

   1. Check the error log via **display errors**.
   2. If any SNI-PEER errors exist in the hardware error log, follow the associated repair procedures for SNI-PEER errors.

3. If the SNC has SNC-LINK errors with aux data of 1 against other SNIs and/or has SNC-BD error 513, replace the SNC circuit pack.
4. If SNIs in the same carrier have SNI-BD error 257 logged indicating they are having trouble communicating with the SNC, replace the SNC circuit pack.
5. Use **list configuration carrier** to determine whether an SNI is physically present in the slot pointed to by the SNC-LINK error. If the `Vintage` field indicates that a circuit pack is present, proceed to step 6. If the `Vintage` field reports `no board`, do one of the following:
   - If an SNI is not supposed to be installed in this slot:
   - Remove the SNI from circuit pack administration with **change circuit-pack**.
   - If the error remains, readminister the SNI circuit pack and then remove it from administration again.
   - If the error still remains, replace the active SNC circuit pack.
   - If an SNI should be installed in this slot, but is missing, insert an SNI circuit pack.
6. Replace the SNI that the SNC is complaining about.
7. Retry the command. If this error is still in the error log, continue with the following steps.
8. Replace the SNC circuit pack.
9. If a standby SNC (the one with its yellow LED off) has this error, escalate the problem. (**Status switch-node** will also display the active and standby SNCs.)

b. This error occurs whenever the active SNC determines that there is a problem communicating with an SNI circuit pack in the same carrier via the TPN communication channel. The slot location of the SNI with which the SNC cannot communicate is given in Table 9-629 on page 9-1634.

1. Check the error log via **display errors**. If more than one SNI in the same carrier have SNI-BD errors with error type 769, replace the SNC.
2. Check the error log via **display errors**. If the SNC has more than one SNC-LINK error with aux data of 2, replace the SNC.
3. Verify that the SNI the SNC is complaining about exists in the slot indicated by the error code. If the SNI does not exist:

   If you do not intend to replace the SNI:

   a. Remove the SNI from circuit pack administration via **change circuit-pack**.
   b. If the error remains, readminister the SNI circuit pack and then remove it from administration again.
   c. If the problem persists, replace the active SNC circuit pack.

Otherwise:

a. Insert an SNI circuit pack.

If this step does not apply, continue with the following steps.

4. Replace the SNI circuit pack that the SNC is complaining about.
5. Retry the command. If this error is still in the error log, continue with the following steps.
6. Replace the SNC circuit pack.
7. If a standby SNC (the one with its yellow LED off) has this error, escalate the problem. (**Status switch-node** will also display the active and standby SNCs.)
8. Retry the command. If this error is still in the error log, escalate the problem.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *configuration audit* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Configuration Audit (#759)	X	X		ND
Failure Audit(#777)	X	X		ND
Processor Route Audit(#760)		X		ND
SNC On-Board Test(#778)	X	X		ND
TPN test(#779)	X	X		ND
Switch Node Clock Reset Test(#780)			X	D

1. D = Destructive, ND = Non-destructive

Refer to maintenance object SNC-BD for descriptions of tests and results.

SNC-REF (Switch Node Clock Reference)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
SNC-REF	MAJOR	test board UUCSS s	SNC Reference

1. UU is the universal cabinet number (1 for PPN, 2 -44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (10 or 12).

The SNC-REF maintenance object reports errors in SNI reference signals detected by the active Switch Node Clock. Descriptions of SNC-REF errors are described on the following pages. For a complete description of SNCs and SNIs, including circuit pack replacement instructions, see maintenance objects SNI-BD and SNC-BD.

Error Log Entries and Test to Clear Value

Table 9-630. SNC Reference Error Log Entries

Error Type	Aux Data	SNI Slot[1]	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[2]	0		Any	Any	Any	test board UUCSS r 1
1(a)	Any	2	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
257(a)	Any	3	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
513(a)	Any	4	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
769(a)	Any	5	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
1025(a)	Any	6	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
1281(a)	Any	7	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
1537(a)	Any	8	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
1793(a)	Any	9	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
2049(a)	Any	13	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
2305(a)	Any	14	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
2561(a)	Any	15	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
2817(a)	Any	16	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
3073(a)	Any	17	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
3329(a)	Any	18	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
3585(a)	Any	19	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1
3841(a)	Any	20	Failure Audit (#777)	MAJOR	OFF	test board UUCSS r 1

1. The slot location of the SNI with which the SNC cannot communicate.
2. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. This error occurs whenever the active or standby SNC detects problems in its timing reference with an SNI circuit pack in the same carrier. The slot location of the SNI with which the SNC cannot communicate is given in the error table above.

If duplicated SNCs exist in the carrier:

1. If the SNCs are duplicated in the carrier, check the error log via **display errors**. If both SNCs have this error, replace the SNI that the SNCs are complaining about.
2. If the error occurred only on the standby SNC and the active SNC in the carrier does not have this error, reset the standby SNC via the **reset board** command. (The active and standby SNCs are displayed via **status switch-node**.) If this error comes back after the standby has been reset, replace the standby SNC.
3. Retry the command. If this error is still in the error log, continue with the following steps.
4. If the active SNC has this error, use the **set switch-node-clock** command to set the standby SNC to active. If the new active SNC had this error, replace the SNI that the SNC is complaining about. Otherwise, replace the SNC that originally had this error.

If only one SNC exists in the carrier:

1. Replace the SNI that the SNC is complaining about.
2. Retry the command. If this error is still in the error log, continue with the following step.
3. Replace the SNC.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *configuration audit* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Configuration Audit (#759)	X	X		ND
Failure Audit(#777)	X	X		ND
Processor Route Audit(#760)		X		ND
SNC On-Board Test(#778)	X	X		ND
TPN test(#779)	X	X		ND
Switch Node Clock Reset Test (#780)			X	D

1. D = Destructive, ND = Non-destructive

Refer to maintenance object SNC-BD for descriptions of tests and results.

SNI-BD (SNI Circuit Pack)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
SNI-BD	MAJOR	test board UUCSS s	SNI Circuit Pack
SNI-BD	MINOR	test board UUCSS s	SNI Circuit Pack
SNI-BD	WARNING	test board UUCSS s	SNI Circuit Pack

1. UU is the universal cabinet number (1 for PPN, 2 -44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21).

The TN573 Switch Node Interface (SNI)circuit pack is part of the Center Stage Switch (CSS)configuration. It resides in a switch note carrier that alone or with other switch nodes make up a CSS. SNIs connect to other SNIs or Expansion Interface (EI) circuit packs via fiber links. SNI to EI fiber links are used to connect port networks to a switch node carrier and SNI to SNI fiber links are used as inter-switch node fibers. In critical reliability systems, the fiber link connections are duplicated as part of Port Network Connectivity (PNC) duplication. In standard reliability and high reliability systems, the PNC is not duplicated.

There may be up to 16 SNIs in a switch node carrier. They are located in slots 2 through 9 and slots 13 through 20. Slot 11 in a switch node carrier is not used. One or two TN572 boards (SNCs) must reside in switch node carrier positions 10 and 12. The SNIs connect to other SNIs in the same carrier via the backplane; these connections within the same carrier are referred to as peer-links. Each SNI also connects via an optical fiber or metallic connection to another SNI in another carrier or to an EI in the Processor Port Network (PPN) or in an Expansion Port Network (EPN). These connections are referred to as fiber-links.

The Switch Node Clock (SNC) provides timing for the SNIs in the entire carrier. When two SNCs reside in the same switch node carrier, one is in active mode and one is in standby mode. The yellow LED on the active SNC will be on solid. The yellow LED on the standby SNC will be off. See the SYNC section for an explanation of how SNIs are involved in timing synchronization.

Figure 9-88 on page 9-1642 shows an unduplicated CSS with one switch node. A single switch node can accommodate up to 16 port networks, including the PPN. A system with two switch nodes can accommodate up to 22 port networks. Figure 9-89 on page 9-1643 shows a two-switch node CSS with duplicated PNC (four switch node carriers). In this configuration, each PNC (A and B) contains two switch nodes. The cabinet numbers for the switch node carriers are typical cabinet numbers. The EPNs and PPN on the top half of the figure (PNC A) are the same as the EPNs and PPN on the bottom half of the figure (PNC B).

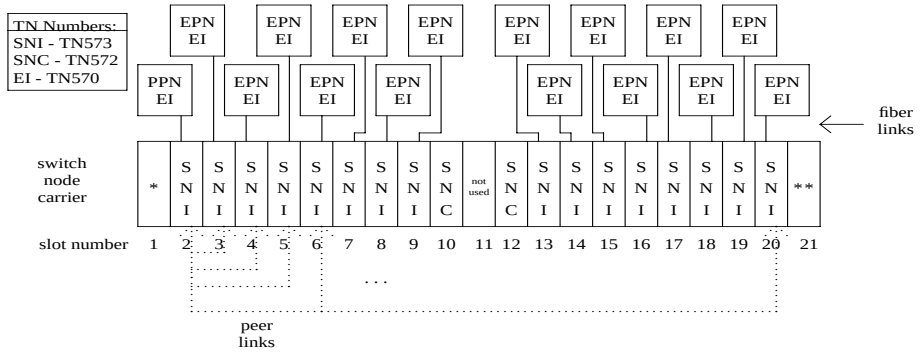

Figure 9-88. CSS Configuration with Simplex PNC and 1 Switch Node Carrier

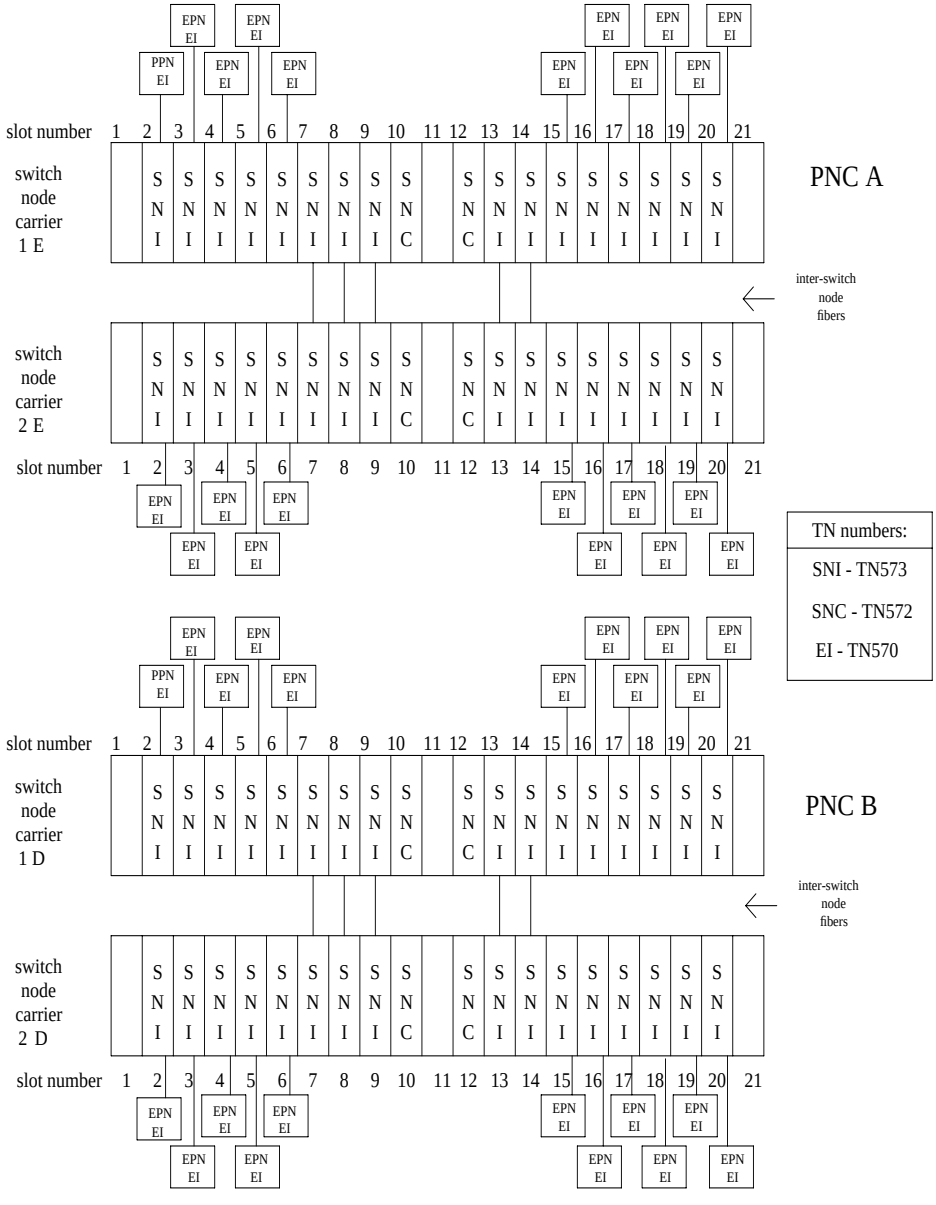

Figure 9-89. CSS Configuration with Duplicated PNC and 4 Switch Node Carriers

Remote EPNs

A DS1 converter complex can used to provide connectivity to a remotely located port network. The DS1 converter complex consists of two TN574 DS1 converter (DS1C) circuit packs connected by 1 to 4 DS1 facilities. The DS1C complex is administered as a fiber link.

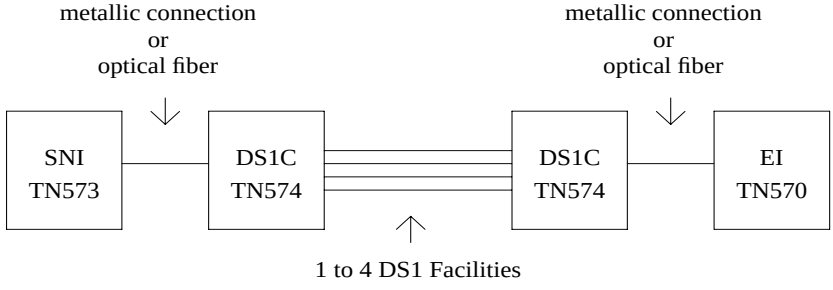

Figure 9-90. Fiber Link over a DS1 Converter Complex

SNI LEDs

The SNI circuit pack has red, green and yellow LEDs. The red and green LEDs have the usual meaning, with red signifying an on-board alarm, and green signifying maintenance testing in progress. The red and green LEDs will come on and then turn off when the circuit pack is reset.

NOTE:
If the red LED is on without any alarms active against the circuit pack, replace the SNI circuit pack. This indicates that SNI firmware has detected a fault and is unable to notify software.

The yellow LED indicates status information as follows:

SNI Yellow LED states

Condition	LED on	LED off
Fiber out of Frame	0.1 second	0.1 second
In frame, No Neighbor [1]	0.5 second	0.5 second
SNI active	solid on	never off
SNI standby	never on	solid off

1. The fiber is in frame but a communication problem exists to the neighbor.

SNI Administration and SNI Board Insertion

The circuit packs in the switch node carrier will not function properly unless administration is performed first. For example, without fiber link administration, phone calls cannot be made through the CSS, CSS circuit packs will not be inserted, and maintenance software cannot test the CSS circuit packs.

For simplex PNC configurations, administration must be done in the following order before SNIs will be inserted:

1. Cabinet Administration: The switch node carriers must be administered into the proper cabinets. When this form is submitted by pressing ENTER, these carriers will be assigned switch node numbers. The **list cabinet** command can then be used to determine the numbers for the carriers of interest.
2. Circuit Pack Administration: All of the boards in the switch node carriers must be administered.
3. Fiber-link Administration: The fibers between the TN570s and the TN573 (or TN573 to TN573) must be administered via the **add fiber-link** command. A DS1C converter complex is added to a fiber link via the **add fiber-link** command also.

For duplicated PNC configurations, administration must be done in the following order before SNIs will be inserted:

1. Activate PNC duplication administration via the **change system-parameters customer-options** command.
2. Cabinet Administration: The switch node carriers and duplicate switch node carriers must be administered into the proper cabinets. When this form is submitted by depressing the "enter" key, these carriers will be assigned switch node numbers. The **list cabinet** command can then be used to determine the numbers for the carriers of interest.
3. Circuit Pack Administration: All of the boards in the switch node carriers must be administered.
4. Fiber-link Administration: The fibers between the TN570s and the TN573 (or TN573 to TN573) must be administered via the **add fiber-link** command. If the system is being changed from a simplex PNC configuration to a duplicate PNC configuration, the **change fiber-link command** can be used to administer the b-pnc fiber link endpoints on the existing fiber links. A DS1C converter complex is added to a fiber link via the **add fiber-link** command also.
5. PNC duplication is enabled via the **change system-parameters duplication** command.

Clear Firmware-Counters Command

SNI firmware generates error reports autonomously. This takes place independently of technician-demanded tests. Therefore, the **test board UUCSS** clear command will not affect the error status reported by firmware. The clear firmware-counters command will clear all firmware-generated errors unconditionally.

The **clear firmware-counters UUCSS** command sends a downlink message to the SNI circuit packs, causing them to clear out their firmware error counters and failure databases. Once the firmware failure database is cleared, the failure audit test (#777) will pass. If problems still exist, the firmware will increment its error counters and the failure audit test will begin failing again.

This command should not be used as a replacement for the repair procedures associated with the hardware error log entries. This command may be useful if a problem has been fixed and off-board alarms associated with the problem are still active.

Replacing an SNI Circuit Pack—Simplex PNC

WARNING:
Do not power down a Switch Node carrier to replace a circuit pack.

WARNING:
Replacing a Switch Node Interface, Switch Node Clock, Expansion Interface or DS1 Converter circuit pack on a simplex system disrupts service. The service effect can range from outage of a single EPN to outage of the entire system.

1.	Enter **busyout board UUCSS**	UUCSS represents the cabinet-carrier-slot address of the circuit pack to be replaced.
2.	Replace the circuit pack	
3.	Wait for the circuit pack to reset	Red and green LEDs will light and then go out.
4.	Enter **release board UUCSS**	**CAUTION:** *Do not busyout any Expansion Interface circuit pack after this point.*
5.	Enter **test alarms long clear** for category **exp-intf**.	
6.	Wait 5 minutes for SNI-BD, FIBER-LK AND DS1C-BD alarms to clear, or enter **clear firmware counters a-pnc**.	

Replacing an SNI Circuit Pack— Duplicated PNC

WARNING:
On a system with duplicated PNC, synchronization may be provided over a combination of active and standby components. This condition is indicated by an OFF-BOARD WARNING alarm against TDM-CLK with error type 2305. Repairs to standby PNC in this state may disrupt service. Otherwise, if the active PNC is functional, replacement of a standby component will not disrupt service.

1.	Enter **status pnc**	Verify that the component to be replaced is on the standby PNC.
2.	Enter **busyout pnc**	
3.	Enter **busyout board UUCSS**	UUCSS represents the cabinet-carrier-slot address of the circuit pack to be replaced.

4. Replace the circuit pack
5. Enter **release board UUCSS**

⚠ CAUTION:
Do not busyout any Expansion Interface circuit pack after this point.

6. Enter **test alarms long clear** for category **exp-intf**.
7. Wait 5 minutes for SNI-BD, SNI-PEER, FIBER-LK, and DS1C alarms to clear, or enter **clear firmware counterssp 0 <a-pnc or b-pnc>**.

Use the letter designation of the pnc which holds the replaced component (the standby pnc).

8. Enter **status pnc**.

If either PNC state-of-health is not "functional", consult the ''PNC-DUP (PNC Duplication)'' section.

9. Enter **release pnc**.

Switch Node Interface Manual Loop Back Procedure

This procedure is destructive.

This procedure is to be used when an SNI circuit pack cannot be tested by software. This can occur when communication between the switch node carrier and the SPE is down. Before using this procedure, the configuration audit test (#759) should be run on SNI circuit packs where possible via **test board UUCSS s**. Also, the processor route audit test (#760) should be run via the **test board UUCSS long** command for the active SNC in the switch node carrier. If the active SNC is not inserted, test 760 can be run via **test hardware-group pnc P**, where P is **a-pnc** or **b-pnc**.

Before using this procedure, first determine whether more than one SNI is unable to communicate with software. Verify SNI and SNC circuit pack insertion via the **list configuration carrier UUC** command, where UUC is the cabinet and carrier location of a switch node carrier. Check for SNI and SNC insertion for every administered switch node carrier.

If all of the SNIs and SNCs are not inserted ("NO BOARD" is displayed for each board) in the entire PNC (either the a-pnc or the b-pnc), then the link between the PPN EI (on the PNC where SNI and SNC circuit packs did not insert) and the connected SNI is not functioning properly. If this case applies, perform the following steps:

1. Run the **test board UUCSS** command on the PPN EI and fix any problems found.
2. Perform the manual loopback procedure for the PPN EI.

3. Perform the manual loopback procedure for the SNI connected to the PPN EI.
4. Replace the active SNC.

If the system has a two level switch node carrier configuration, i.e. SNI-SNI fiber links exist, and the SNIs and SNCs in the second switch node carrier only (the switch node carrier that has no SNI connected to the PPN EI) are not inserted and at least two SNI-SNI fiber links exist, perform the following steps:

1. Run the **test board UUCSS long** command on the SNIs in the first switch node carrier that are connected to SNIs in the second switch node carrier and fix any problems found.
2. Replace the active SNC.
3. Perform the manual loopback procedure for the SNIs in the second switch node carrier that are connected to SNIs in the first switch node carrier.

If software is unable to communicate with an EPN EI but can communicate with the connected SNI:

1. Run the **test board UUCSS long** command on the connected SNI and fix any problems found.
2. Perform the manual loopback procedure for the EPN EI.

   When the connection to the SNI circuit pack is via fiber, a short length of optical fiber is required for this procedure. If a metallic cable is used in the connection, the metallic connector must be removed from the back of the carrier, and a lightwave transceiver connected in its place. The short length of optical fiber can then be used.

   If this procedure is run on both endpoints on a fiber link (Expansion Interface circuit packs or Switch Node Interface circuit packs), and both check out fine, then the failure is most likely in the connection (fiber or metallic) itself if neither endpoint circuit pack is busied out, but the link remains inactive.

   1. Busyout the circuit pack (Expansion Interface or SNI) using the **busyout board UUCSS** command.
   2. Disconnect the transmit and receive fiber pair from the lightwave transceiver on the back of the circuit pack (Expansion Interface or Switch Node Interface) slot.

      NOTE:
      Note which is the transmit fiber and which is the receive fiber for proper re-connection at the end of this procedure. The fiber connected to the transmit side of the lightwave transceiver on one circuit pack should be connected to the receive side of the lightwave transceiver on the circuit pack on the opposite end of the fiber.

3. Using a spare fiber jumper cable, interconnect the transmit and receive jacks of the lightwave transceiver as shown in Figure 9-91 on page 9-1651.

   NOTE:
   Make sure that the total length of the fiber jumper cable does not exceed the maximum length recommended for the fiber link connections between cabinets. This is necessary so that the testing of the Expansion Interface or SNI circuit pack is done within connectivity guidelines so that test results are not influenced due to the cable length not meeting requirements.

4. Go to the front of the cabinet and inspect the yellow LED.

   - If the yellow LED flashes on at a rate of once per second, the (Expansion Interface or Switch Node Interface) circuit pack or transceiver should be replaced.
   - If the yellow LED flashes on at a rate of five times per second, the circuit pack (Expansion Interface or Switch Node Interface) or the lightwave transceiver may need replacement. This condition may also be due to a faulty system clock on the network containing the Expansion Interface circuit pack or in the switch node carrier containing the SNI.
   - If the yellow LED was blinking before starting this procedure and the yellow LED is not blinking now, this circuit pack (Expansion Interface or Switch Node Interface) and the lightwave transceiver are functioning properly.

5. Replace faulty component(s) and reconnect the original fiber. Be sure to reconnect the fibers properly as noted in Step 2.
6. Release Expansion Interface circuit pack or Switch Node Interface circuit pack with the **release board UUCSS** command.

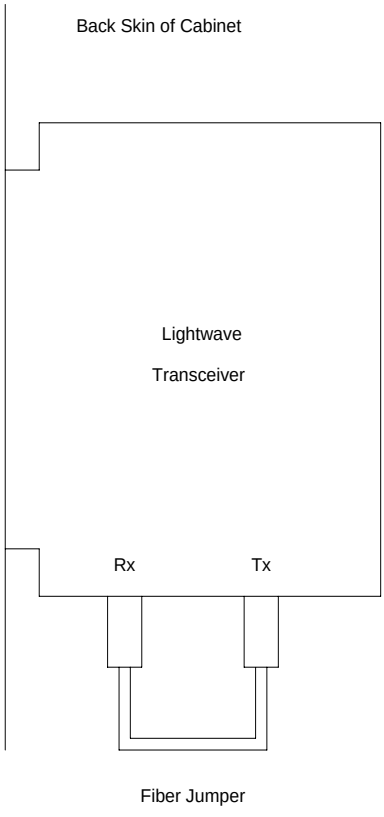

Figure 9-91. Interconnection of Lightwave Transceiver Transmit/Receive Jacks

Error Log Entries and Test to Clear Values

Table 9-631. SNI Board Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test board UUCSS r 1
1(b)	any	failure audit (#777) (a)	MAJ/MIN/WAR	ON	test board UUCSS r 1
18(c)	0	busyout board UUCSS	WARNING	OFF	release board UUCSS
125(d)		None	MINOR	ON	
257(e)	any	failure audit (#777) (a)	MAJ/MIN/WAR	OFF	test board UUCSS r 1
513(f)	any	failure audit (#777) (a)	MAJ/MIN/WAR	OFF	test board UUCSS r 1
769(g)	any	failure audit (#777) (a)	MAJ/MIN/WAR	OFF	test board UUCSS r 1
1025(h)	any	failure audit (#777) (a)	MAJ/MIN/WAR	ON/OFF	test board UUCSS r 1
1281(i)	any	failure audit (#777) (a)	MAJ/MIN/WAR	ON	test board UUCSS r 1
1537(j)	any	failure audit (#777) (a)	MAJ/MIN/WAR	OFF	test board UUCSS r 1
2561(k)	any	failure audit (#777) (a)	MAJ/MIN/WAR	ON	test board UUCSS r 1
2817(l)	any	failure audit (#777) (a)	MAJ/MIN/WAR	ON	test board UUCSS r 1

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. The first time you see an SNI-BD error in the error log, run the **test board UUCSS** command. If the failure audit test (#777) fails, enter **display errors** for this SNI circuit pack and continue with the associated repair procedures for SNI-BD errors.

b. This error indicates a problem that the SNI may have trouble communicating with all of the other SNI and SNC circuit packs in the switch node carrier.

    1. Replace the SNI circuit pack.

c. This error indicates that the SNI circuit pack has been busied out via the **busyout board UUCSS** command. To resolve this error, release the SNI circuit pack via the **release board UUCSS** command.

d. The SNI circuit pack is incompatible with the TN1654 DS1 Converter board. A TN573B or later suffix SNI board must be used when connecting to a TN1654 DS1 Converter board. Replace with a newer suffix.

e. This error indicates that the SNI cannot communicate with the active SNC.

   1. Check the error log via **display errors** for other SNI circuit packs with the 257 SNI-BD error. If other SNI circuit packs in the same switch node carrier have error 257, then replace the active SNC.
   2. Replace this SNI.
   3. Replace the active SNC in the same switch node carrier.
   4. Enter **display errors** and if this error is still in the error log, follow normal escalation procedures.

f. This error indicates that the SNI cannot communicate with the DS1C.

   1. Perform the Fiber Fault Isolation Procedure described in Chapter 5.

g. This error indicates a failure communicating synchronization control data with the active SNC.

   Look at all of the SNI-BD errors in the log via **display errors** and **display alarms** to determine whether to follow procedure 1 or procedure 2. See the table below which lists pairs of SNIs that are considered to be adjacent. Use Procedure 2 if either of the following two conditions is present:

   — At least one pair of adjacent SNIs in this carrier has Error 769 with an off-board alarm logged against both SNIs in the pair.

   — The active SNC in this carrier has error 257.

   If neither of the above is true, follow Procedure 1.

Adjacent SNI Slot Numbers

2 & 3
4 & 5
6 & 7
8 & 9
13 & 14
15 & 16
17 & 18
19 & 20

Procedure 1 (suspect TPN link or clock generation out of lock problem):

1. Enter **display alarms** and **display errors** and follow the procedures for any on-board SNI-BD error and alarm entries.
2. If more than one SNI circuit pack in the same switch node carrier has SNI-BD error 769 with an off board alarm, replace the active SNC in the same carrier.
3. Replace this SNI.
4. Replace the active SNC in the same carrier.

Procedure 2 (suspect clock generation out of lock problem):

1. If only one SNC exists in this switch node carrier, replace the SNC. If two SNCs exist in this switch node carrier, perform the following steps:
    a. Set the standby SNC to active by running the **set switch-node-clock UUCSS** command with the standby SNC's location.
    b. If the problem goes away, replace the SNC that was previously active. Then set the SNC that was just replaced to active via the **set switch-node-clock UUCSS** command. If the problem returns, assume that the SNC that was just replaced was not at fault and go to step 2 below.
    c. If the problem persists, switch back to the previously active SNC via the **set switch-node-clock** command and go to step 2 below.
2. Replace the leftmost SNI from the pair of adjacent SNIs.
3. Replace the rightmost SNI from the pair of adjacent SNIs.
4. If none of the above steps cleared this error, this could be a switch node carrier backplane problem.

h. This error indicates a failure communicating synchronization control data over the fiber-link.

    If the error is logged as an on-board error:

    1. Replace the SNI circuit pack.

    If the error is logged as an off-board error:

    1. Enter **display errors** and follow the associated repair procedures for FIBER-LK errors.
    2. Replace the SNI with this error.

3. Replace the other endpoint of the fiber-link if no DS1C complex is administered on the fiber-link (use **list fiber-link** to determine whether a DS1C complex is administered). If a DS1C complex is administered on the fiber-link, replace the circuit packs in this order:

   i . Replace the DS1C circuit pack connected to this SNI.

   ii.. Replace the other DS1C circuit pack.

   iii.. Replace the other endpoint of the fiber-link.

i. This error indicates a processor complex failure.

   1. Replace the SNI circuit pack.

j. This error indicates that excessive slips have occurred.

   Follow the steps for diagnosing synchronization problems when slips have occurred in the SYNC section.

k. This error indicates that the SNI cannot communicate with its neighbor. The SNI is at fault.

   1. Replace the SNI circuit pack.

l. This error indicates that the SNI cannot communicate with one of its peers. The SNI is at fault.

   1. Replace the SNI circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Configuration Audit* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Configuration Audit (#759)	X	X		ND
Failure Audit(#777)	X	X		ND
Fiber Out of Frame Query(#989)	X	X		ND
Packet Neighbor Test(#767)	X	X		ND
Circuit Path Test(#755)	X	X		ND
Destructive Facility Test(#757)		X		D
Off-board Destructive Facility Test(#756)		X		D
Switch Node Interface Reset Test(#761)			X	D

1. D = Destructive, ND = Non-destructive

NOTE:
Test #982 is not an actual demand maintenance test. This test number is used to report results of executing of the **clear firmware-counters** command. Refer to error codes for Test #777.

SNI Circuit Path Test (#755)

This test is non-destructive. This test performs a non-destructive test of the circuit path.

Table 9-632. TEST #755 SNI Circuit Path Test

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2302	ABORT	Software received incorrect message data from the SNI circuit pack. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2303	ABORT	The SNI circuit pack responded that software test requested is not valid. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2304	ABORT	SNI circuit pack responded that it is not able to run the test requested by software. 1. Retry the command at 1-minute intervals a maximum of 3 times.

Continued on next page

Table 9-632. TEST #755 SNI Circuit Path Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2306	ABORT	The SNI circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that the SNI resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Check **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries. 4. Follow the procedure described above, SNI Manual Loopback to determine whether the circuit pack or the fiber connection is faulty.

Table 9-632. TEST #755 SNI Circuit Path Test — *Continued*

Error Code	Test Result	Description/ Recommendation
102	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 2 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 2. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 1. If other SNI circuit packs have SNI-PEER error type 1, then replace the SNI in slot 2. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 1 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 2.
103	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 3 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 3. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 257. If other SNI circuit packs have SNI-PEER error type 257, then replace the SNI in slot 3. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 257 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 3.

Table 9-632. TEST #755 SNI Circuit Path Test — *Continued*

Error Code	Test Result	Description/ Recommendation
104	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 4 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 4. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 513. If other SNI circuit packs have SNI-PEER error type 513, then replace the SNI in slot 4. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 513 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 4.
105	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 5 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 5. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 769. If other SNI circuit packs have SNI-PEER error type 769, then replace the SNI in slot 5. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 769 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 5.

Table 9-632. TEST #755 SNI Circuit Path Test — *Continued*

Error Code	Test Result	Description/ Recommendation
106	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 6 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 6. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 1025. If other SNI circuit packs have SNI-PEER error type 1025, then replace the SNI in slot 6. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 1025 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 6.
107	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 7 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 7. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 1281. If other SNI circuit packs have SNI-PEER error type 1281, then replace the SNI in slot 7. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 1281 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 1. Replace this SNI. 2. Replace the SNI in slot 7.

Continued on next page

Table 9-632. TEST #755 SNI Circuit Path Test — *Continued*

Error Code	Test Result	Description/ Recommendation
108	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 8 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 8. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 1537. If other SNI circuit packs have SNI-PEER error type 1537, then replace the SNI in slot 8. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 1537 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 8.
109	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 9 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 9. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 1793. If other SNI circuit packs have SNI-PEER error type 1793, then replace the SNI in slot 9. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 1793 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 9.

Table 9-632. TEST #755 SNI Circuit Path Test — *Continued*

Error Code	Test Result	Description/ Recommendation
117	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 17 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 17. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 3073. If other SNI circuit packs have SNI-PEER error type 3073, then replace the SNI in slot 17. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 3073 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 17.
118	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 18 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 18. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 3329. If other SNI circuit packs have SNI-PEER error type 3329, then replace the SNI in slot 18. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 3329 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 18.

Continued on next page

Table 9-632. TEST #755 SNI Circuit Path Test — *Continued*

Error Code	Test Result	Description/ Recommendation
119	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 19 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 19. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 3585. If other SNI circuit packs have SNI-PEER error type 3585, then replace the SNI in slot 19. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 3385 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 19.
120	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 20 over the circuit path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 20. Use **display errors** to find any SNI-BD errors and check **display alarms** to see whether the errors have on-board alarms. Then follow the associated repair procedures for SNI-BD. 2. Check the error log via **display errors** for other SNI circuit packs with SNI-PEER error type 3841. If other SNI circuit packs have SNI-PEER error type 3841, then replace the SNI in slot 20. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 3841 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. Proceed as follows: 3. Replace this SNI. 4. Replace the SNI in slot 20.

Continued on next page

Table 9-632. TEST #755 SNI Circuit Path Test — *Continued*

Error Code	Test Result	Description/ Recommendation
122	FAIL	The SNI circuit pack cannot communicate with its neighbor via the circuit path. 1. Fix any on-board errors (SNI-BD, EXP-INTF, and/or DS1C-BD) against the components of this fiber link by using **display errors** and **display alarms** and following the associated repair procedures. (Use the **list fiber-link** command to find the fiber link associated with this SNI. The **display fiber-link** command can then be used to find the endpoints of the fiber link and the DS1C circuit pack locations if this fiber link has a DS1 Converter Complex administered.) 2. Enter **display errors** and follow the associated repair procedures for any FIBER-LK entries for the fiber this SNI is administered on. Check **list fiber-link** to determine the administered fiber. 3. If this fiber link has a DS1 converter complex administered, enter **display errors** and **display alarms** and follow the associated repair procedures for any off-board DS1C-BD or DS1-FAC entries for either of the DS1C boards administered or for the DS1 facilities associated with either of the DS1C boards administered. 4. Replace this SNI.
	PASS	The SNI passed the sni circuit path test.
0	NO BOARD	No board was detected by the test. 1. Check that board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software. If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

SNI Off-board Destructive Facility Test (#756)

This test is destructive.

The SNI runs a destructive looparound of the off-board and on-board loparounds. This test returns the result of the off-board looparound, while test 757 returns the result of the on-board looparound.

Table 9-633. TEST #756 SNI Off-Board Destructive Facility Test

Error Code	Test Result	Description/ Recommendation
1015	ABORT	The system will not allow this test to be run because the SNI circuit pack has not been busied out. Busy out the SNI circuit pack with **busyout board**. Repeat the **test board UUCSS long** command.
1415	ABORT	The lightwave transceiver is not present. 1. If a lightwave transceiver is not supposed to be present, do nothing. For example, an SNI connected to a DS1C circuit pack or an SNI with a metallic connection does not have a lightwave transceiver. This test can only be run when a lightwave transceiver exists. 2. Otherwise, check the lightwave transceiver connections. 3. If OK, replace the lightwave transceiver. If a fiber out of frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type, that is, both are 9823a or both are 9823b. If they are not the same type, replace one of the lightwave transceivers: ■ 9823a is used for distances up to 4900 feet. ■ 9823b is used for distances up to 25,000 feet. 4. If the test continues to abort, replace the SNI circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2304	ABORT	SNI circuit pack responded that it is not able to run the test requested by software. 1. Retry the command at 1-minute intervals a maximum of 3 times.

Continued on next page

Table 9-633. TEST #756 SNI Off-Board Destructive Facility Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2306	ABORT	The SNI circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that the SNI resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Check **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries. 4. Follow the procedure described above, SNI Manual Loopback to determine whether the circuit pack or the fiber connection is faulty.
127	FAIL	The data is not correctly looped around. 1. Check the lightwave transceiver or metallic physical connections. 2. If connections OK, replace the lightwave transceiver or the metallic interconnect. 3. If the test still fails, replace the SNI circuit pack.

Continued on next page

Table 9-633. TEST #756 SNI Off-Board Destructive Facility Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	No problems associated with this test are detected on the SNI.
0	NO BOARD	No board was detected by the test. 1. Check that board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software. If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

SNI Destructive Facility Test (#757)

This test is destructive.

The SNI runs a destructive looparound of the off-board and on-board looparounds. This test returns the result of the on-board looparound, while test 756 returns the result of the off-board looparound.

Table 9-634. TEST #757 SNI Destructive Facility Test

Error Code	Test Result	Description/ Recommendation
1015	ABORT	The system will not allow this test to be run because the SNI circuit pack has not been busied out. Busy out the SNI circuit pack with **busyout board**. Repeat the **test board UUCSS long** command.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.

Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries. 4. Follow the procedure described above, SNI Manual Loopback to determine whether the circuit pack or the fiber connection is faulty.
127	FAIL	The data is not correctly looped around. 1. Replace the SNI circuit pack.
	PASS	No problems associated with this test are detected on the SNI.

Continued on next page

Table 9-634. TEST #757 SNI Destructive Facility Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	No board was detected by the test. 1. Check that board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software. If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Configuration Audit (#759)

This test is non-destructive.

NOTE:
For descriptions of result codes for this test refer to:

- SNC-BD when the circuit pack tested is a Switch Node Clock (circuit pack slots 10 or 12).
- SNI-BD when the circuit pack tested is a Switch Node Interface (circuit pack slots 2-9 or 13-20).

This test is run via the **test board short** or **test board long** command for SNI circuit packs or SNC circuit packs.

For SNI circuit packs, this test queries the SNI for SNCs in the same switch node carrier, SNI peers, DS1Cs, and EI or SNI neighbors that the SNI can communicate with and compares this data to the administered data.

For SNC circuit packs, this test queries the SNC for SNCs and SNIs in the same switch node carrier that the SNC can communicate with and compares this data to the administered data.

Failures of this test cause entries in the error and alarm logs against Switch Node Configuration (SN-CONF) with the board location of the SNI or SNC.

Incorrectly Connected Administered Fibers

Some physically connected fibers that do not match fiber administration can cause port network problems that are not detected and alarmed by PNC tests. The symptoms will usually be many phone calls not working correctly, and port network component alarms because of translation mismatches.

This test is unable to detect the case where an SNI is connected to the same type of board (EI or SNI) as administered but located in a different cabinet but the same carrier and same slot as the administered fiber endpoint. The administered fiber endpoint can be viewed with the **list fiber-link** command. This test can only detect if the fiber endpoint connected to the SNI is in a different carrier, slot location than the administered fiber endpoint.

Incorrectly Connected Administered SNI-EI Fibers

If the SNI is connected to the same type of fiber endpoint as the administered fiber endpoint, but the location is the same as administered except for the cabinet, many phone calls will not work correctly; some phone calls will not go through and some phone calls will ring the wrong phone.

The **test led** command can be used in this case to check connectivity.

1. Run the **test led port-network** command on each administered port network and verify that the LEDs on the correct port network are lit.
2. If they are not lit, check that the fiber connections to the port network are consistent with the administered fibers (**list fiber-link**) that does not light the LEDs as expected.
3. Run **test led switch-node** on each administered switch node carrier and verify that the LEDs on the correct carrier are lit.
4. If they are not, check the connectivity to the switch node carrier that does not light the LEDs as expected.

Incorrectly Connected Administered SNI-SNI Fibers between 3 Switch Nodes

If the system has more than 2 switch nodes, SNI-SNI fibers administered between 2 switch nodes could be incorrectly connected to a third switch node. This is a problem that could occur during installation or when inter-switch node fibers are changed. For multiple fibers to a distant switch node (not the PPN switch node), an incorrect connection would not appear as a problem unless this fiber is used for a system-link to a port network connected to the distant switch node. The **status system-link** command can be used to determine the boards and fiber-links in the path from the PPN to a specific port network. A specific SNI-SNI fiber connection must be in the system-link path to be checked with the port network LED test.

One method to force an SNI-SNI fiber connection to be used as a system-link is to physically remove all SNI-SNI connections except the fiber-link being tested at the distant switch node by physical removing SNI boards in the distant SWItch node.

1. Use the **status system-link** command to verify that this fiber selected for test is in the path to the EPN connected to the distant switch node that will be used for the LED test.
2. Run the **test led** sequence to a port network as described above to verify this fiber connection.
3. Repeat this procedure for each of the other SNI-SNI fibers terminating on this distant switch node.

Another method for testing multiple fiber connections to a distant switch node is described below.

1. Use the **list fiber-link** command to determine the number of SNI-SNI fibers that are administered and terminating on this switch node.
2. Run the **test led port-network** command on a port network connected to this distant switch node and verify that the LEDs on the correct port network are lit.
3. Use the **status system-link** command and select the active EI in the port network connected to the distant switch node being tested. This display will show the path from the PPN and the SNI-SNI fiber being used in this path.
4. If they are not lit, check that the fiber connections to the port network are consistent with the administered fibers (**list fiber-link**) that does not light the LEDs as expected.
5. If the port network LEDs are lit and we have multiple SNI-SNI fibers to this distant switch node, physically remove the SNI that is listed in this path.
6. Use the **status system-link** command to determine the new path from the PPN to the this distant switch.
7. Run the **test led port-network** command on a port network connected to the distant switch node and verify that the LEDs on the correct port network are lit.
8. Continue with steps 5 — 7 above until the last SNI-SNI fiber to this distant switch node has been tested.

Table 9-635. TEST #759 Configuration Audit

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2306	ABORT	The SNI circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that this board resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Check **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries. 4. Follow the procedure described above, SNI Manual Loopback to determine whether the circuit pack or the fiber connection is faulty.
2500	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.

Table 9-635. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
117	FAIL	The SNI circuit pack cannot communicate with the equipped SNI in slot 17. 1. Perform the Fiber Fault Isolation Procedure described in Chapter 5. This will resolve multiple SNI-PEER errors. 2. If the SNI being tested has SNI-PEER error type 3073, replace the SNI being tested. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. 3. If the SNI being tested has SNI-PEER error type 3073, replace the SNI in slot 17. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. Retry the command.
118	FAIL	The SNI circuit pack cannot communicate with the equipped SNI in slot 18. 1. Perform the Fiber Fault Isolation Procedure described in Chapter 5. This will resolve multiple SNI-PEER errors. 2. If the SNI being tested has SNI-PEER error type 3329, replace the SNI being tested. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. 3. If the SNI being tested has SNI-PEER error type 3329, replace the SNI in slot 18. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. Retry the command.
119	FAIL	The SNI circuit pack cannot communicate with the equipped SNI in slot 19. 1. Perform the Fiber Fault Isolation Procedure described in Chapter 5. This will resolve multiple SNI-PEER errors. 2. If the SNI being tested has SNI-PEER error type 3585, replace the SNI being tested. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. 3. If the SNI being tested has SNI-PEER error type 3585, replace the SNI in slot 19. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. Retry the command.

Table 9-635. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
120	FAIL	The SNI circuit pack cannot communicate with the equipped SNI in slot 20. 1. Perform the Fiber Fault Isolation Procedure described in Chapter 5. This will resolve multiple SNI-PEER errors. 2. If the SNI being tested has SNI-PEER error type 3841, replace the SNI being tested. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. To view SNI-PEER errors, use the **display errors** command with category PNC-PEER. Retry the command. 3. If the SNI being tested has SNI-PEER error type 3841, replace the SNI in slot 20. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. Retry the command.
133	FAIL	No neighbor link is administered, but the SNI has an EI neighbor. 1. Administer the SNI on a fiber link to the EI neighbor it is connected to via the **add fiber-link next** command. Or remove both fiber endpoints (i.e., this SNI and its EI neighbor) and remove the fiber endpoints from circuit pack administration via **change circuit-pack**.
134	FAIL	No neighbor link is administered, but the SNI has an SNI neighbor. 1. Administer the SNI on a fiber link to the SNI neighbor it is connected to via the **add fiber-link next** command. Or remove both fiber endpoints (i.e., this SNI and its SNI neighbor) and remove the fiber endpoints from circuit pack administration via **change circuit-pack**.
135	FAIL	The SNI circuit pack cannot communicate with its neighbor. The SNI has an administered neighbor, but cannot communicate with its neighbor. 1. Check if the administered neighbor is inserted. If not, insert the neighbor circuit pack. 2. Perform the Fiber Fault Isolation Procedure described in Chapter 5.
136	FAIL	The SNI's administered neighbor does not match the physical neighbor connected. The type of neighbor administered is an SNI and the type of neighbor physically connected is an EI. Enter **list fiber-link** and verify that the fiber optic cable and metallic cable connections are installed as administered.
137	FAIL	The SNI's administered neighbor does not match the physical neighbor connected. The type of neighbor administered is an EI and the type of neighbor physically connected is an SNI. Enter **list fiber-link** and verify that the fiber optic cable and metallic cable connections are installed as administered.

Continued on next page

Table 9-635. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
138	FAIL	The physical neighbor location does not match administered neighbor location. The carrier and slot of the administered neighbor do not match the carrier and slot of the physical neighbor. Enter **list fiber-link** and verify that the fiber optic cable and metallic cable connections are installed as administered. If the problem does not seem to be caused by a physical connection problem or an administration problem, replace the neighbor circuit pack. It is possible for the neighbor circuit pack to have a hardware problem that causes it to report a wrong angel address (physical carrier/slot address) to software.
139	FAIL	The SNI is administered to be connected to a DS1C but is not physically connected to a DS1C. *If a DS1C is not supposed to be connected to this SNI*, change administration to remove the DS1 converter complex from the fiber link associated with this SNI by: 1. Determine which fiber that this SNI is an endpoint of by checking **list fiber-link**. 2. Remove this fiber with the **remove fiber-link** command. 3. Add the fiber back via **add fiber-link**, and do not administer the DS1 converter complex at this time.
140	FAIL	The SNI is physically connected to a DS1C but is not administered to be connected to a DS1C. **Either** add the DS1 converter complex to the fiber that this SNI is associated with by: 1. Determine which fiber that this SNI is an endpoint of by checking **list fiber-link**. 2. Remove this fiber with the **remove fiber-link** command. 3. Add the fiber back via **add fiber-link**, and at this time also administer the DS1 converter complex. **Or**: 1. Remove the DS1C connection and connect the SNI directly to its administered fiber endpoint. 2. Verify that the fiber optic cable and metallic cable connections are installed as administered by entering **list fiber-link**.
	PASS	The administered data and the circuit packs the SNI can communicate with match.

Table 9-635. TEST #759 Configuration Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	No board was detected by the test. 1. Check that board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software. If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Switch Node Interface Reset Test (#761)

This test is destructive.

This test resets the SNI circuit pack via the **reset board UUCSS** command when an SNI circuit pack location is entered. The SNI is reset via the active SNC circuit pack in the carrier. If the SNI is connected to the PPN EI, the SNI is reset via its PPN EI neighbor. If an SNI with an EPN EI or another SNI as its neighbor cannot be reset via the active SNC, i.e., if no software communication exists between the active SNC and the SPE, an attempt will be made to reset the SNI via its neighbor.

An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software.

If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems.

Table 9-636. TEST #761 Switch Node Interface Reset Test

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2302	ABORT	Software received incorrect message data from the SNI circuit pack. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2303	ABORT	The SNI circuit pack responded that the software test requested is invalid. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2304	ABORT	SNI circuit pack responded that it is not able to run the test requested by software. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2306	ABORT	The SNI circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that the SNI resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Check **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries. 4. Follow the procedure described above, SNI Manual Loopback to determine whether the circuit pack or the fiber connection is faulty.

Continued on next page

Table 9-636. TEST #761 Switch Node Interface Reset Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2316	ABORT	The reset of the SNI circuit pack was attempted via the connected DS1C circuit pack. This ABORT code indicates that the fiber is not administered, but in this particular case it also indicates a software problem. 1. Retry the command at 1-minute intervals a maximum of 1 time.
2500	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.
	PASS	The reset message was sent out successfully to the active SNC or to the SNI's neighbor. A PASS does not necessarily mean the SNI circuit pack was successfully reset. The reset can be verified by checking that the red and green LEDs turn on and then turn off. If an SNI circuit pack fails one of the firmware tests run during its reset sequence, the red LED will stay on and the circuit pack should be replaced.
0	NO BOARD	No board was detected by the test. 1. Check that board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software. If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Packet Neighbor Link Test (#767)

This test is non-destructive.

This test checks the packet path of the neighbor circuit pack and the peer circuit packs. A packet is sent from the SNI being tested to the peer SNIs and to the neighbor EI or SNI. If the other EI or SNI sends the same data back in the packet, this test passes. Otherwise, this test fails.

Table 9-637. TEST #767 Packet Neighbor Link Test

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2302	ABORT	Software received incorrect message data from the SNI circuit pack. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2303	ABORT	The SNI circuit pack responded that the software test requested is invalid. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2304	ABORT	SNI firmware is not able to run the test. For this particular test, the SNI circuit pack must be able to communicate with its neighbor. 1. Verify that the SNI can communicate with its neighbor by checking the yellow LED of the SNI to make sure the SNI is in frame or by running the **test board** command for the SNI and checking test 989 for fiber out-of-frame. If the results of Test 989 indicate that the fiber is out-of-frame, follow the recommendation associated with the test failure. If a DS1 converter complex exists on the fiber link, enter **display errors** and follow the associated repair procedures for any DS1C-BD and DS1-FAC entries. 2. Retry the command at 1-minute intervals a maximum of 3 times.

Error Code	Test Result	Description/ Recommendation
117	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 17 over the packet path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 17. Use the **display errors** command to find any SNI-BD errors and use the display alarms command to determine whether the errors have on-board alarms. Then, follow the associated repair procedures for the SNI-BD as described in the Maintenance manual. 2. Using the **display errors** command, check the error log for other SNI circuit packs with SNI-PEER error type 3073. If other SNI circuit packs have SNI-PEER error type 3073 errors, replace the SNI in slot 17. Replacing an SNI may be service interrupting. Refer to the SNI-BD Maintenance documentation for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 3073 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. 3. Replace the SNI being tested. 4. Replace the SNI in slot 17.

Continued on next page

Table 9-637. TEST #767 Packet Neighbor Link Test — *Continued*

Error Code	Test Result	Description/ Recommendation
118	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 18 over the packet path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 18. Use the **display errors** command to find any SNI-BD errors and use the display alarms command to determine whether the errors have on-board alarms. Then, follow the associated repair procedures for the SNI-BD as described in the Maintenance manual. 2. Using the **display errors** command, check the error log for other SNI circuit packs with SNI-PEER error type 3329. If other SNI circuit packs have SNI-PEER error type 3329 errors, replace the SNI in slot 18. Replacing an SNI may be service interrupting. Refer to the SNI-BD Maintenance documentation for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 3329 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. 3. Replace the SNI being tested. 4. Replace the SNI in slot 18.

Continued on next page

Table 9-637. TEST #767 Packet Neighbor Link Test — *Continued*

Error Code	Test Result	Description/ Recommendation
119	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 19 over the packet path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 19. Use the **display errors** command to find any SNI-BD errors and use the display alarms command to determine whether the errors have on-board alarms. Then follow the associated repair procedures for the SNI-BD as described in the Maintenance manual. 2. Using the **display errors** command, check the error log for other SNI circuit packs with SNI-PEER error type 3585. If other SNI circuit packs have SNI-PEER error type 3585 errors, replace the SNI in slot 19. Replacing an SNI may be service interrupting. Refer to the SNI-BD Maintenance documentation for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 3585 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. 3. Replace the SNI being tested. 4. Replace the SNI in slot 19.

Continued on next page

Table 9-637. TEST #767 Packet Neighbor Link Test — *Continued*

Error Code	Test Result	Description/ Recommendation
120	FAIL	The SNI circuit pack cannot communicate with the SNI in slot 20 over the packet path. 1. Fix any on-board SNI-BD errors against this SNI and the SNI in slot 20. Use the **display errors** command to find any SNI-BD errors and use the display alarms command to determine whether the errors have on-board alarms. Then, follow the associated repair procedures for the SNI-BD as described in the Maintenance manual. 2. Using the **display errors** command, check the error log for other SNI circuit packs with SNI-PEER error type 3841. If other SNI circuit packs have SNI-PEER error type 3841 errors, replace the SNI in slot 20. Replacing an SNI may be service interrupting. Refer to the SNI-BD Maintenance documentation for the procedure for replacing an SNI. **NOTE:** If other SNI circuit packs do not have SNI-PEER error type 3841 errors, the problem could be at either of the peer SNI boards. It is arbitrary as to which SNI is replaced first. 3. Replace the SNI being tested. 4. Replace the SNI in slot 20.

Continued on next page

Table 9-637. TEST #767 Packet Neighbor Link Test — *Continued*

Error Code	Test Result	Description/ Recommendation
123	FAIL	The SNI circuit pack cannot communicate with its neighbor via the packet path. 1. Fix any on-board errors (SNI-BD, EXP-INTF, and/or DS1C-BD) against the components of this fiber link by using **display errors** and **display alarms** and following the associated repair procedures. (Use the **list fiber-link** command to find the fiber link associated with this SNI. The **display fiber-link** command can then be used to find the endpoints of the fiber link and the DS1C circuit pack locations if this fiber link has a DS1 Converter Complex administered.) 2. Enter **display errors** and **display alarms** and follow the associated repair procedures for any SNC-BD error entries with corresponding on-board alarm entries. 3. Enter **display errors** and follow the associated repair procedures for any SYNC entries. 4. If this FIBER-LK has circuit, packet, and control path errors, check the lightwave transceiver connections or metallic connections. Use the LED states to verify whether the connections are correct. Also, a test fiber-link s command can be run to determine whether a fiber out of frame condition exists on the fiber link; the SNI Fiber Out-of-Frame Query (#989) reports whether a fiber out of frame condition exists for an SNI endpoint and the Expansion Interface Fiber Out-of-Frame Query test (#238) reports whether a fiber out of frame condition exists for an Expansion Interface endpoint. 5. Replace the lightwave transceivers if present. 6. Replace one of the endpoint boards. 7. Replace the other endpoint board. 8. Replace the DS1 CONV circuit packs if a DS1 CONV converter complex is administered on this fiber.
	PASS	The SNI can communicate with the peer SNIs and the neighbor over the packet path.

Continued on next page

Table 9-637. TEST #767 Packet Neighbor Link Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	No board was detected by the test. 1. Check that board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software. If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Failure Audit (#777)

This test is non-destructive.

This test queries the SNI for any existing failures and any unacknowledged cleared failure messages. Each failure generates an error and alarm entry against SNI-BD, SNI-PEER, or FIBER-LK. An unacknowledged cleared failure message is a message the SNI circuit pack sent to software indicating a previous failure is now gone and the SNI circuit pack did not receive a message from software indicating that the failure message was received by software.

If no failures are detected by the SNI circuit pack, this test will pass.

If this test reports failures, the results screen for the **test board** command will show **FAIL** with no FAIL code. The error log must then be displayed via **display errors** with category PNC to view all SNI-BD and FIBER-LK errors and category PNC-PEER to view all SNI-PEER errors.

Table 9-638. TEST #777 Failure Audit

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2306	ABORT	The SNI circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that the SNI resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Check **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries. 4. Follow the procedure described above, SNI Manual Loopback to determine whether the circuit pack or the fiber connection is faulty.

Continued on next page

Table 9-638. TEST #777 Failure Audit — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	The SNI circuit pack reported failures or retransmitted a cleared failure message. 1. If this is the first time this test was run, run the test again. If there were any previous failure messages that software did not acknowledge, this test will FAIL even if the failure messages indicate a FAIL to PASS transition, i.e., a problem has gone away. If this test is run twice and FAILs both times, then at least one problem still exists. 2. Fix any SNI-BD, SNI-PEER, and FIBER-LK errors by following the associated repair procedures. Use the **display errors** and **display alarms** commands with category PNC for SNI-BD and FIBER-LK and category PNC-PEER for SNI-PEER. Fix any problems found by referring to the SNI Board or SNI Peer Error Log Entries tables in this section or Fiber Link Error Log Entries tables in the ''FIBER-LK (Fiber Link)'' section. 3. If no SNI-BD, SNI-PEER, or FIBER-LK entries exist in the error and alarm logs, retry the command.
	PASS	No problems are detected on the board.
0	NO BOARD	No board was detected by the test. 1. Check that board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software. If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

Clear Firmware Counters (#982)

This test number is used to report unsuccessful results of the **clear firmware-counters** command. This is not an actual demand maintenance test. If the command aborts, refer to the error codes listed for Test #777.

SNI Fiber Out of Frame Query (#989)

This test is non-destructive.

The SNI circuit pack reports whether a fiber out of frame condition exists, whether a loss of signal condition exists, and whether the lightwave transceiver is present.

Table 9-639. TEST #989 SNI Fiber Out of Frame Query

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
1415	ABORT	The lightwave transceiver is not present. 1. If a lightwave transceiver is not supposed to be present, do nothing. For example, an SNI connected to a DS1C circuit pack or an SNI with a metallic connection does not have a lightwave transceiver. 2. Otherwise, check the lightwave transceiver connections. 3. If OK, replace the lightwave transceiver. If a fiber out of frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type, that is, both are 9823a or both are 9823b. If they are not the same type, replace one of the lightwave transceivers: ■ 9823a is used for distances up to 4900 feet. ■ 9823b is used for distances up to 25,000 feet. 4. If the test continues to abort, replace the SNI circuit pack.
2300	ABORT	The downlink message necessary to run this test could not be sent. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2301	ABORT	The software timer could not be set before sending the downlink message necessary to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2304	ABORT	SNI circuit pack responded that it is not able to run the test requested by software. 1. Retry the command at 1-minute intervals a maximum of 3 times.

Continued on next page

Table 9-639. TEST #989 SNI Fiber Out of Frame Query — *Continued*

Error Code	Test Result	Description/ Recommendation
2306	ABORT	The SNI circuit pack is not responding to test requests sent by software. 1. Run the **test led switch-node** for the switch node that the SNI resides in to verify whether the LEDs on the board light. 2. If the LEDs on the other boards in the carrier light, but the LEDs on this board do not light, run test 760 via **test board UUCSS l** for the active SNC in this carrier. Wait 5 minutes and then try step 1 one more time. If the LEDs on this board still do not light, replace this board. Replacing an SNI may be service interrupting. Refer to the SNI-BD section for the procedure for replacing an SNI. 3. If none of the LEDs light for the boards in the same carrier as this board, fix any problems associated with the connectivity of this carrier to the SPE. Check **list fiber-link** to determine the fiber connections to this carrier. Check the LEDs on all SNIs and EIs and fix any fiber problems. Enter **display errors** and follow the associated repair procedures for any EXP-INTF error entries associated with the PPN. Also, follow the associated repair procedures for any SYNC, SNI-BD, SNC-BD, FIBER-LK, or SNI-PEER error entries. 4. Follow the procedure described above, SNI Manual Loopback to determine whether the circuit pack or the fiber connection is faulty.
2500	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.
141	FAIL	The SNI circuit pack has a fiber out of frame condition, but no loss of signal condition. Also, a lightwave transceiver is connected to the SNI circuit pack. 1. Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber-link if no DS1C complex is administered (check via **list fiber-link**). Otherwise, if a DS1C complex is administered, the connected circuit pack is the DS1C circuit pack connected to the SNI circuit pack. 2. Perform the Fiber Fault Isolation Procedure described in Chapter 5. 3. Replace this SNI circuit pack. 4. Replace the connected circuit pack.

Continued on next page

Table 9-639. TEST #989 SNI Fiber Out of Frame Query — *Continued*

Error Code	Test Result	Description/ Recommendation
142	FAIL	The SNI circuit pack has a fiber out-of-frame condition, but no loss of signal condition. Also, no lightwave transceiver is connected to the SNI circuit pack. 1. Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber-link if no DS1C complex is administered (check via **list fiber-link**). Otherwise, if a DS1C complex is administered, the connected circuit pack is the DS1C circuit pack connected to the SNI circuit pack. 2. If a lightwave transceiver is not supposed to be present, go to step 2. For example, an SNI connected to a DS1C circuit pack or an SNI with a metallic connection does not have a lightwave transceiver. Otherwise, check the lightwave transceiver connections. If OK, replace the lightwave transceiver. If a fiber out-of-frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type, that is, both are 9823a or both are 9823b. If they are not the same type, replace one of the lightwave transceivers: ■ 9823a is used for distances up to 4900 feet. ■ 9823b is used for distances up to 25,000 feet. 3. Perform the Fiber Fault Isolation Procedure described in Chapter 5. 4. Replace this SNI circuit pack. 5. Replace the connected circuit pack.
143	FAIL	The SNI circuit pack has a loss of signal condition, but no fiber out of frame condition. Also, a lightwave transceiver is connected to the SNI circuit pack. 1. Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber-link if no DS1C complex is administered (check via **list fiber-link**). Otherwise, if a DS1C complex is administered, the connected circuit pack is the DS1C circuit pack connected to the SNI circuit pack. 2. Perform the Fiber Fault Isolation Procedure described in Chapter 5. 3. Replace this SNI circuit pack. 4. Replace the connected circuit pack.

Continued on next page

Table 9-639. TEST #989 SNI Fiber Out of Frame Query — *Continued*

Error Code	Test Result	Description/ Recommendation
144	FAIL	The SNI circuit pack has a loss of signal condition, but no fiber out of frame condition. Also, no lightwave transceiver is connected to the SNI circuit pack. 1. Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber-link if no DS1C complex is administered (check via **list fiber-link**). Otherwise, if a DS1C complex is administered, the connected circuit pack is the DS1C circuit pack connected to the SNI circuit pack. 2. If a lightwave transceiver is not supposed to be present, go to step 2. For example, an SNI connected to a DS1C circuit pack or an SNI with a metallic connection does not have a lightwave transceiver. Otherwise, check the lightwave transceiver connections. If OK, replace the lightwave transceiver. If a fiber out-of-frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type, that is, both are 9823a or both are 9823b. If they are not the same type, replace one of the lightwave transceivers: ■ 9823a is used for distances up to 4900 feet. ■ 9823b is used for distances up to 25,000 feet. 3. Perform the Fiber Fault Isolation Procedure described in Chapter 5. 4. Replace this SNI circuit pack. 5. Replace the connected circuit pack.
145	FAIL	The SNI circuit pack has a fiber out of frame condition and a loss of signal condition. Also, a lightwave transceiver is connected to the SNI circuit pack. 1. Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber-link if no DS1C complex is administered (check via **list fiber-link**). Otherwise, if a DS1C complex is administered, the connected circuit pack is the DS1C circuit pack connected to the SNI circuit pack. 2. Perform the Fiber Fault Isolation Procedure described in Chapter 5. 3. Replace this SNI circuit pack. 4. Replace the connected circuit pack.

Continued on next page

Table 9-639. TEST #989 SNI Fiber Out of Frame Query — *Continued*

Error Code	Test Result	Description/ Recommendation
146	FAIL	The SNI circuit pack has a fiber out of frame condition, and a loss of signal condition. Also, no lightwave transceiver is connected to the SNI circuit pack. 1. Check that the connected circuit pack is physically installed. The connected circuit pack is the other endpoint of the fiber-link if no DS1C complex is administered (check via **list fiber-link**). Otherwise, if a DS1C complex is administered, the connected circuit pack is the DS1C circuit pack connected to the SNI circuit pack. 2. If a lightwave transceiver is not supposed to be present, go to step 2. For example, an SNI connected to a DS1C circuit pack or an SNI with a metallic connection does not have a lightwave transceiver. Otherwise, check the lightwave transceiver connections. If OK, replace the lightwave transceiver. If a fiber out-of-frame condition exists and lightwave transceivers are used, check that the lightwave transceivers are of the same type, that is, both are 9823a or both are 9823b. If they are not the same type, replace one of the lightwave transceivers: ■ 9823a is used for distances up to 4900 feet. ■ 9823b is used for distances up to 25,000 feet. 3. Perform the Fiber Fault Isolation Procedure described in Chapter 5. 4. Replace this SNI circuit pack. 5. Replace the connected circuit pack.
	PASS	No problems associated with this test are detected on the SNI.
0	NO BOARD	No board was detected by the test. 1. Check that board is properly translated and inserted. 2. Run the test again. If it fails, reset the board. An SNI should be reset instead of reseating the circuit pack. The **reset board** command should almost never be used on an SNI. It may be necessary to use the **reset board** command if the SNI circuit pack gets into a mode where it cannot communicate with software. If an SNI with active errors and alarms is reset, the errors and alarms may take a while to come back, therefore the **reset board** command can mask real problems. 3. Run the test again. If it fails, the ID chip on board may be bad. Replace the board and retest.

SNI-PEER (SNI Peer Link)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
SNI-PEER	MAJOR	test board UUCSS s	SNI Peer Link
SNI-PEER	MINOR	test board UUCSS s	SNI Peer Link
SNI-PEER	WARNING	test board UUCSS s	SNI Peer Link

1. UU is the universal cabinet number (1 for PPN, 2 -44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21).

SNI Peers are Switch Node Interfaces residing on the same Switch Node Carrier. SNI-PEER maintenance involves testing of the links between SNI Peers. SNI-PEER errors are described on the following pages. For a full description of SNIs, including circuit pack replacement, see SNI-BD.

Error Log Entries andTest to Clear Values

Table 9-640. SNI-PEER Hardware Error Log Entries

Error Type	Aux Data	SNI Slot[1]	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[2]	0		Any	Any	Any	test board UUCSS r 1
1	any	2	Failure Audit (#777)	MAJ/MIN/ WAR	OFF	test board UUCSS r 1
257	any	3	Failure Audit (#777)	MAJ/MIN/ WAR	OFF	test board UUCSS r 1
513	any	4	Failure Audit (#777)	MAJ/MIN/ WAR	OFF	test board UUCSS r 1
769	any	5	Failure Audit (#777)	MAJ/MIN/ WAR	OFF	test board UUCSS r 1
1025	any	6	Failure Audit (#777)	MAJ/MIN/ WAR	OFF	test board UUCSS r 1
1281	any	7	Failure Audit (#777)	MAJ/MIN/ WAR	OFF	test board UUCSS r 1
1537	any	8	Failure Audit (#777)	MAJ/MIN/ WAR	OFF	test board UUCSS r 1
1793	any	9	Failure Audit (#777)	MAJ/MIN/ WAR	OFF	test board UUCSS r 1

Continued on next page

Table 9-640. SNI-PEER Hardware Error Log Entries — *Continued*

Error Type	Aux Data	SNI Slot[1]	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3329	any	18	Failure Audit (#777)	MAJ/MIN/WAR	OFF	test board UUCSS r 1
3585	any	19	Failure Audit (#777)	MAJ/MIN/WAR	OFF	test board UUCSS r 1
3841	any	20	Failure Audit (#777)	MAJ/MIN/WAR	OFF	test board UUCSS r 1

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. The slot location of the SNI at the other end of the peer link indicted by the SNI reporting the error.

Notes:

For **all** errors in Table 9-640, the SNI circuit pack reporting the error is indicating that it has a problem with the control path, circuit path, or packet path to the SNI peer in the slot indicated on the error table.

First, the Failure Audit test (#777) should be run to confirm whether the error still exists.

If the SNI is reporting an SNI-PEER error against a slot that does not contain an SNI, either change circuit pack administration via **change circuit-pack** to unadminister the SNI, or insert an SNI into the indicated slot. **List configuration carrier** can be used to determine whether an SNI circuit pack is inserted. Otherwise, **display errors** and look at *all* of the SNI-PEER errors in the log. If either of the following two conditions are present, follow Procedure 2 below.

- Do many SNIs have SNI-PEER errors pointing to the same 2 adjacent SNIs?
- Do 2 adjacent SNIs have SNI-PEER errors pointing to many other SNIs?

If neither condition is present, follow Procedure 1 below. When using either procedure, refer to SNI-BD or SNC-BD for circuit pack replacement instructions.

Slot Numbers of Adjacent SNIs	Point to This SNI Pair
2, 3	1, 257
4, 5	513, 769
6, 7	1025, 1281
8, 9	1537, 1793
13, 14	2049, 2305
15, 16	2561, 2817
17, 18	3073, 3329
19, 20	3585, 3841

Procedure 1: Proceed through the following steps *until* the problem is resolved:

1. Perform the Fiber Fault Isolation Procedure described in Chapter 5.
2. Replace the SNI pointed to by the SNI-PEER error type (see the SNI Slot column in the preceding table, *SNI-PEER Error Log Entries*).
3. Replace the SNI reporting the SNI-PEER error.
4. Replace the active SNC.

Procedure 2: If either of the two patterns described before are present, then the clock signal between active SNC and 2 Adjacent SNIs is suspect. Proceed through the following steps *until* the problem is resolved:

1. If only one SNC exists in this switch node carrier, replace the SNC. If two SNCs exist in this switch node carrier, perform the following steps:
    a. Set the standby SNC to active by executing **set switch-node-clock** UUCSS with the standby SNC's location.
    b. If the problem persists, switch back to the previously active SNC via the **set switch-node-clock** command and go to step 2 below.
    c. If the problem went away, replace the SNC that was previously active. Then set the newly replaced SNC to active. If the problem returns, assume that the SNC that was just replaced was not at fault and go to step 2 below.
2. Replace the leftmost SNI from the pair of adjacent SNIs.
3. Replace the rightmost SNI from the pair of adjacent SNIs.
4. This could indicate a problem with the switch-node-carrier backplane.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Configuration Audit* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Configuration Audit (#759)	X	X		ND
Failure Audit (#777)	X	X		ND
Fiber Out of Frame Query (#989)	X	X		ND
Packet Neighbor Test (#767)	X	X		ND
Circuit Path Test (#755)	X	X		ND
Destructive Facility Test (#757)		X		D
Off-board Destructive Facility Test (#756)		X		D
Switch Node Interface Reset Test (#761)			X	D

1. D = Destructive, ND = Non-destructive

For descriptions of these tests, refer to the SNI-BD section of this chapter.

SPE-SELE (SPE Select Switch)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
SPE-SELE	MAJOR	none	SPE Select Switch
SPE-SELE	WARNING	none	SPE Select Switch

The SPE Select Switch MO monitors the position of the SPE Select switches located on the front of each UN330B Duplication Interface board. Each switch may be in one of three possible positions: Auto, A selected, B selected. Both switches, one on the active Duplication Interface board and one on the standby, should be set to the same designation. The switches control selection of the active SPE and cause alarms as follows:

- If both switches are in the AUTO position, the SPE that is the healthiest, as determined by the state-of-health bits on the boards, is selected as active. No alarm is raised.
- If one SPE Select switch is in the AUTO position and one selecting either A or B carrier as active, or one switch selects A and the other selects B, the boards default to handling the selection of which carrier is active as if both switches were in the AUTO position. A WARNING alarm appears after one hour. The alarm is resolved 5 minutes after the switches are returned to identical positions.
- If both switches select either A carrier or B carrier active, then the Duplication Interface boards will force that carrier active (irrespective of state-of-health) and the red Override LED is lit. A MAJOR alarm is raised by SPE-SELE if the switches remain in these positions for more than 6 hours. The alarm is resolved within 5 minutes of the switches being returned to AUTO.

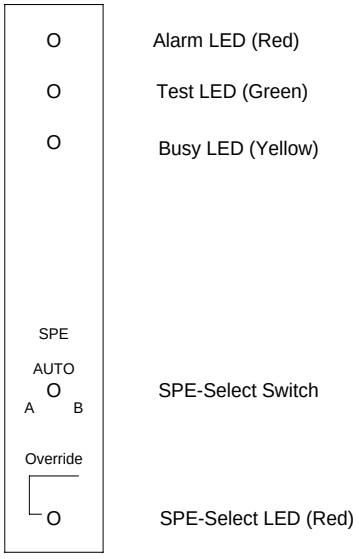

Figure 9-92. Duplication Interface Circuit Pack

Error Log Entries and Test to Clear Values

Table 9-641. SPE Select Switch Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	
1(a)	0	none	WARNING	OFF	
257(b)	0	none	MAJOR	OFF	

1. Check the position of the SPE-Select switches.

Notes:

a. Error 1 appears when one SPE Select Switch is in the AUTO position and the other is in the select A or select B position. Placing both switches in the AUTO position will retire the alarm immediately.

b. Error 257 appears when both SPE Select Switches are in the select A or select B position for more that 6 hours. Placing both switches in the AUTO position will retire the alarm immediately.

SRP-EPN

MO Name in Alarm Log	Alarm Level	Full Name of MO
SRP-EPN	MAJOR	SRP-EPN

The Survivable Remote Expansion Port Network (SREPN) provides EPN service to the customer when the link to the main processor fails or is broken, or when the processor or center stage fails. SREPN is a disaster recovery operation rather than an additional reliability option.

Due to the hardware solution for Survivable Remote Processor (SRP), maintenance tests to make sure the SRP can go into “survive” mode are not possible.

When the `Survivable Remote Processor` field on the **system-parameters customer-options** form is set to y, then the following alarming strategy is used:

1. When the SRP is not in control of the SREPN (which is the normal state), then all alarms associated with the SREPN are downgraded to WARNING alarms. These include the EXP-INTF in the SRP, the EXP-LINK between the SRP and the SREPN, and all maintenance components in the SREPN.
2. When the SRP is in control of the the SREPN (the EXP-LINK is up between the SRP and SREPN), the disaster recovery state is in effect. A MAJOR alarm is raised against the SRP-EPN maintenance object. All other maintenance objects use their normal alarm strategies.

If the G3r PPN loses control (connectivity) to a SREPN, and the SRP associated with the SREPN does not raise a MAJOR alarm against the SRP-EPN maintenance object, then the disaster recovery mechanism is **NOT** working.

There are no tests associated with the SRP-EPN maintenance object. The only way to resolve the SRP-EPN alarm is to fix the connectivity problem(s) between the G3r PPN and the SREPN.

STBY-SPE (Standby SPE Maintenance)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
STBY-SPE	MAJOR	test spe-standby l	Standby SPE Maintenance
STBY-SPE	MINOR	test spe-standby l	Standby SPE Maintenance
STBY-SPE	WARNING	test spe-standby l	Standby SPE Maintenance

The general principles of SPE duplication, including the following topics, are discussed in Chapter 1:

- Standby Maintenance Architecture
- Standby State-of-Health and Availability
- Handshake Communication
- Memory Shadowing and Refresh
- Maintenance Software
- Standby Initialization

Troubleshooting a duplicated SPE, and replacing SPE components, are discussed in Chapter 5. The SPE-Down or SPE-Locked interface is discussed in Chapter 4.

Maintenance of the standby SPE is organized around the STBY-SPE maintenance object. It relies on documentation of the other SPE maintenance objects:

PROCR	SYSAM	MEM-BD
SW-CTL	H-ADAPTR	R-MEDIA
DISK	DUPINT	DUP-CHL

Once a general SPE problem has been isolated to the level of one of these individual packs, the service documentation for that MO should be consulted. It is the responsibility of standby SPE maintenance described here to keep the standby SPE fully available for an interchange.

Standby Availability

Various factors affect the availability of the standby SPE:

- The condition of the individual hardware components of the standby SPE
- Standby memory content
- Standby State-of-Health (SOH)
- Standby SPE-Down
- System Time-of-Day

The health of both the active and standby is tracked as a State-of-Health (SOH) value. State-of-Health is discussed fully in Chapter 1.

The SOH of the standby SPE can be determined with the "status spe" command. A complete description of this command and its output appears in Chapter 8. For the standby to be fully available, the fields (for the SPE with mode *standby*, where applicable) should read as follows:

Duplicated?	yes
SPE Selected?	auto (otherwise, the SPE-Select switches will prevent any interchange)
Standby Busied	no
Standby Refreshed?	yes
Standby Shadowing	on
Standby Handshake?	up
Recent Spontaneous Interchange?	no
State-of-Health	functional

Any divergence from these conditions, except during system recovery or technician-initiated maintenance, requires immediate investigation.

Locking the Active SPE

Duplication Interface hardware supports the ability to lock the active SPE into active mode. On each Duplication Interface circuit pack is an SPE-SELECT switch which can be set in three positions: A, B, Auto. These are normally set with both switches on AUTO, allowing system software to govern which SPE is active. When the SPE-SELECT switches on both SPE's Duplication Interface circuit packs are set to the position A, then the SPE in carrier A is locked active and the B-carrier SPE is locked standby. Setting both to B locks the B carrier active. Any other combination of settings results in AUTO mode. *In locked mode, the system operates as if it is simplex:*

- The standby SPE is inaccessible to the active SPE and active G3-MT login.
- No SPE-interchange is possible.
- Handshake is down and memory shadowing is off.

WARNING:

Transition the system into the lock mode with extreme care. Always move the switches into the position designating the ***active*** *SPE carrier. Switching to a faulted standby can cause a total service outage.*

The locked state is intended for temporary use to prevent interchanges during maintenance sessions. Alarms are raised if the switches are left out of the AUTO position for an extended length of time (SPE-SEL).

To lock the SPEs, first determine which is active:

- The active Duplication Interface's yellow LED will be lit.
- **status spe** reports active/standby status of each SPE.

Making sure you are grounded, move the switches one at a time to the letter designating the active carrier. Wait a few seconds, then verify that the lock took effect:

- The red LED labeled OVERRIDE on both Duplication Interface circuit packs should be lit.
- **status spe** displays `spe-a locked` in the `SPE SELECTED` field if the A SPE is locked active. This verifies that internal software is aware of the lock state. The screen will also indicate that handshake is down, memory shadowing is off and the standby is not refreshed. The standby SPE is technically not in service while locked, and its SOH can vary.

To unlock the active SPE, move both SPE-SELECT switches back to AUTO. System software will automatically try to bring the standby SPE into full service, by establishing handshake, refreshing memory, and raising the standby's SOH if appropriate.

CAUTION:

When exiting the locked state, a spontaneous SPE interchange is possible if active SPE SOH is not functional. Always check first with ***status spe*** *(unless the interchange is desired).*

After exiting the locked state, make sure the standby returns fully to service (SOH functional). When the system is in the locked state, all alarms against the standby SPE (STBY-SPE), (except the WARNING alarm raised in the busyout state), are automatically cleared by the system.

Replacing SPE Circuit Packs

To replace any SPE circuit pack on a duplicated system, always use the "lock-and-power-down" procedure described fully in Chapter 5. This procedure allows replacements without service disruption, and guarantees that the system is returned to full normal operation.

Memory Shadowing

Memory shadowing is used to keep the standby SPE's memory content up-to-date relative to the active SPE's memory. A standby SPE that has just rebooted, exited lock mode or just been released from busyout must undergo this full re-initialization. System software tracks the operation and raises a major alarm when refresh failure occurs. If shadowing stays on, system software automatically tries to refresh again 5 minutes later.

Generally, memory shadowing should always remain on unless:

- The standby SPE is undergoing any restart.
- The active SPE is undergoing a restart level of 2 or greater.
- The active SPE is locked.
- The standby SPE is busied out.

In any other situation, it is an error condition for shadowing to be off. The first two situations are transitory and shadowing should automatically be restored within 10 minutes. If shadowing has been on for several minutes, it is an error condition for the standby not to be refreshed. A standby SPE with no critical component alarms that is either not refreshed or does not have shadowing on should have SOH level *not refreshed.*

Busyout of the Standby SPE

The standby SPE can be placed in the state of maintenance busyout with the command **busyout spe-standby**. This creates the following conditions:

- The SOH of the standby SPE is kept artificially at level *partially-functional* regardless of the actual state of its components.
- Memory shadowing is turned off. Standby memory content is not in agreement with that of the active SPE
- A Warning alarm is raised against STBY-SPE with error type 18. This Warning alarm supersedes all other alarms against STBY-SPE.
- The **status spe** field `Standby Busied?` will display `yes`.

release spe-standby causes the following:

- The standby SPE's SOH returns to the appropriate level based on its component alarms.
- After verifications, software turns on shadowing and refreshes the standby's memory.

Busyout is used to discourage the likelihood of interchange and prevent side effects of memory shadowing. For example:

- When it is necessary to run the long demand test sequence for the duplication-interface hardware or to reset the standby SPE's Packet-interface circuit packs
- To allow destructive testing of components relevant to shadowing (packet-interface, memory, or duplication interface packs).

When the standby SPE is busied out, handshake communication is maintained if possible. The standby SPE can be busied-out at any time the G3-MT interface is available, including when the system is initializing or when the active SPE is locked. Busyout applies to only one instance of the SPEs. If SPE B is busied out and an SPE interchange occurs A-carrier SPE is not busied out.

When releasing a standby SPE from the busyout state, make sure that the standby SPE is brought fully back to service. Wait until the standby is refreshed and its SOH returns to level *functional* to make sure repair actions did not disable the standby SPE.

Initialization: Bringing the Standby SPE Up

When the standby SPE has been out of service or is first coming up, SPE software executes the following steps:

1. Establishes handshake communication
2. Raises the standby SPE's SOH to *not refreshed* if it has no critical component alarms, or *partially functional* if it does have critical component alarms
3. Tests for component mismatch (test number 920)
4. Turns on memory shadowing
5. Refreshes standby memory
6. If there are no critical-component major alarms, raises the standby SPE's SOH to *functional*

This normally takes about 5 minutes. Should a step of this initialization sequence fail, the step is retried until it succeeds. The failed condition is alarmed so that it can be diagnosed and corrected.

Other Mechanisms: Status Command and SPE-Down Interface

There are certain maintenance tools available for dealing with the standby SPE which can be used regardless of the state of handshake communication or memory shadowing.

Always start with and continue to use **status spe** to determine completely the status of the standby SPE.

When handshake communication is down, there is no access from the usual G3-MT connection to test the standby. In this case, locking the active SPE with the switches has no harmful effect on switch service and allows terminal access into the standby SPE via the SPE-Down or SPE-Locked Interface. With this interface, you can run low level tests on individual components and request reboots of the standby SPE. Whenever the SPEs are locked and the SPE-Locked Interface is in use. Instructions on how to bring up and use this interface are described in Chapter 4. When using this tool, do not unlock the SPE until all tests of standby SPE components have passed.

Recent Interchange Mode

The event of a spontaneous SPE interchange is intended to be a rare event and reflects a serious hardware failure on the formerly active SPE. Generally, when such an interchange has occurred, that SPE (now standby) requires diagnosis and repair action. There should be information in the error and alarm logs to indicate the specific problem. System software will attempt to establish handshake communication with the SPE, refresh its memory, bring it into service as a standby SPE, and diagnose its problems.

Regardless of any success in bringing that standby SPE into service, software will not improve the SOH of that SPE until either:

- Technician-demanded testing addresses the problem
- One hour has passed since the interchange

This mode, called Recent Interchange Mode, is reported on the **status spe** screen and serves to prevent further interchanges from occurring too quickly. Additionally, a minor alarm with error 103 is logged against STBY-SPE and the SOH of that SPE is allowed to get no better than *partially functional*. *Troubleshooting a Duplicated SPE* in Chapter 5 describes an approach to diagnosing problems under this condition.

There are two ways in which the standby SPE can exit recent interchange mode.

a. You can run **test spe-standby long clear** and wait until all the tests of STBY-SPE have completed. (this runs tests of *all* components of the standby SPE in addition to those for STBY-SPE). The first test of the sequence (#855) fails, because the standby SOH is at level *partially functional*. The execution of this sequence clears the minor alarm against STBY-SPE and allows normal treatment of the standby SPE. If the standby is refreshed and has no major alarms against critical components, its SOH will be allowed to improve to *functional*.

b. Alternately, when one hour has passed since the last spontaneous interchange, system software automatically transitions the standby SPE out of recent interchange mode. The minor alarm clears and the standby SPE's SOH level is allowed to go to its appropriate value (typically *functional* if there are no major component alarms and it is refreshed).

Resolving Error Conditions on the Standby SPE

Divergence of the standby SPE from the state of full availability involves one of the following events:

- Handshake communication is down
- Memory shadowing is off
- The standby SPE is not refreshed
- The standby SOH is not *functional*

A hierarchical approach is recommended in the above order. Follow the steps presented in the following diagram.

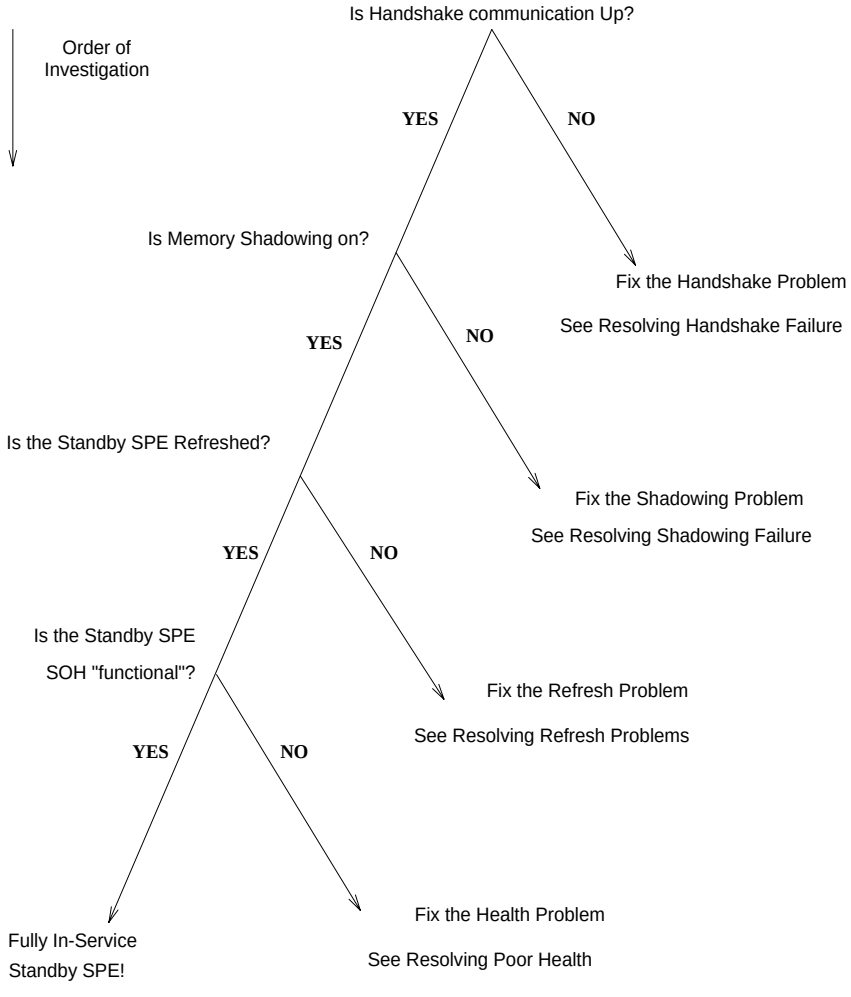

Figure 9-93. Resolving Standby-SPE Errors

Resolving Handshake Failure

When handshake fails, a major alarm with error 1 is repeatedly logged against STBY-SPE reflecting the fact that over a 2-minute period, no successful communication has occurred with the standby SPE. When the system is in lock mode, handshake is taken down with no alarm or error logged. When the standby SPE is busied out, handshake communication is kept up. If handshake should fail during busyout, the major alarm will not appear, but error 1 and the usual busyout warning alarm with error 18 will be logged. You can always determine if handshake is up with **status spe**.

To restore handshake, proceed through the following steps.

1. Make sure that the SPE is not locked, and that it has power. Resolve any CARR-POW alarms on the standby SPE carrier. (If the standby SOH is partially functional or better, you can assume that the standby SPE has power.)
2. Busyout the standby SPE and run **test dup long**. Some DUP-CHL tests may abort due to the absence of handshake. If any tests *fail*, follow procedures in DUPINT and then DUP-CHL to resolve the problem. If you replace any DUPINT hardware, wait to see if the standby SPE can be fully restored to service.
3. If the above tests did not fail, lock the SPEs with the SPE-select switches and use the SPE-down interface to test the standby components as described in Chapter 4. If all tests pass, proceed to the next step. Replace any component that fails testing. (Use the lock-and-power-down technique.) Bring the SPE back up as described in Chapter 4.
4. With the standby still busied out, issue the command **r** to reboot the standby SPE and immediately unplug the STANDBY terminal connector. The standby should still be busied out. Wait for the yellow LED on the standby Processor to begin flashing, unlock the SPEs, and monitor the standby with **status spe**.
5. If handshake is established, release the standby SPE from busyout and monitor its recovery with **status spe**. If the onset of memory shadowing or refresh causes handshake to fail, then suspicion is cast on these standby circuit packs:

   - DUPINT
   - PKT-INT
   - MEMORY
   - MSSNET

   Replace each of these in the standby in the above order, using lock-and-power-down. For each one, bring up the standby SPE and wait to see if handshake and memory refresh succeed.

Resolving Shadowing Failure

This section addresses the situation in which handshake communication is up, but memory shadowing is not on after reasonable initialization time, or is repeatedly turning on and off. If the onset of memory shadowing is causing handshake failure, see the preceding section.

The following conditions prevent memory shadowing:

- Busyout of the standby SPE
- Locking of the SPEs by means of the SPE-select switches
- Alarms against components relevant to shadowing
- A mismatch between the hardware configurations of the active and standby SPEs
- Incomplete initialization of the standby after a restart

When memory shadowing is not on, system software checks every 30 seconds to see if the above conditions are gone, allowing it to restore shadowing. Examine the Hardware Error Log for any of the following indications.

STBY-SPE Error 257

This usually represents inhibiting of memory shadowing by the standby SPE. This can occur if the standby SPE is undergoing any level of restart or if the standby PKT-INT circuit pack is being reset. Typically this condition clears quickly. In the case that the standby SPE has restarted, there should be an STBY-SPE error 514 logged. If the 257 error persists with handshake staying up, look for problems with the standby PKT-INT board (red LED). It may be necessary to reset the standby PKT-INT board (**reset packet-interface**) to clear the inhibiting of shadowing. See “PKT-INT”.

STBY-SPE Error 260

This indicates that the mechanism in the active SPE’s Duplication Interface circuit pack to turn on shadowing has somehow failed. When this occurs, busyout the standby SPE and run **test dup long**. Follow instructions for DUPINT.

STBY-SPE Error 1537

This error indicates a component mismatch between the active and standby SPEs. Use **list config control** to determine what components are in the PPN carriers A and B. Correct any mismatches. Use the lock-and-power-down method described in Chapter 5 to replace circuit packs.

DUPINT or DUP-CHL Alarms

As long as any alarms against either of these MOs persist, memory shadowing will not be turned on.

Standby PKT-INT Major Alarms

These prevent memory shadowing. See “PKT-INT”. It may be necessary to reset the board (**reset packet-interface**).

Standby MEM-BD Major Alarms

These prevent memory shadowing. See “MEM-BD”.

When you observe any of the above problems, first busyout the standby SPE, then fix the given problem (usually with a lock-and-power-down replacement), then release the standby SPE.

If any of the above problems persist, or if none of them appears but shadowing remains off in the presence of good handshake, escalate the problem.

Resolving Refresh Problems

It can happen that handshake communication and memory shadowing can both be maintained to a standby SPE, but for some reason that SPE cannot be completely refreshed. In this case, one must distinguish between delays in refresh completion and outright failure. This section addresses the situation in which shadowing remains on, handshake remains up, but refresh will not complete.

Delays in Refresh

Under extremely heavy occupancy loads, standby refresh can be delayed but it is still expected to complete within 10 minutes of the time when memory shadowing was turned on. You should not see delays greater than this without some STBY-SPE alarm.

Failure of Refresh

The refresh operation occurs in two steps:

- Refresh of Packet Interface dual port RAM (very quick execution)
- Refresh of all memory on all memory boards

A failure can occur in either of these steps. When refresh fails, STBY-SPE error code 1281 is logged. The auxiliary data indicates which aspect of refresh failed. Aux code 1383 indicates that the memory board part has failed. This typically indicates a problem with *active* SPE memory circuit packs. Execute the long test sequence against both active SPE memory circuit packs and see “MEM-BD”. If no problems are revealed in the memory long test sequence, but memory refresh persists in failing with error 1281 error aux 1383, escalate the problem.

Error code 1281 with auxiliary data 1381 indicates that refresh of the packet-interface dual port RAM has failed. If this persists, one should look for problems with either active SPE or standby SPE packet-interface boards. Follow the procedures outlined in PKT-INT to fully test the active SPE’s Packet-interface. Note that, since the standby SPE is not refreshed, one cannot execute the long demand test sequence on the standby Packet Interface. One can however trigger a reset of that circuit pack. If the active PKT-INT passes all tests of the long sequence and if the standby PKT-INT successfully resets, the problem should clear. If error 1281 aux 1381 persists, escalate the problem.

Error code 1281 with auxiliary data 1380 indicates that memory shadowing was turned off during refresh and the refresh has therefore terminated in failure. This situation should be treated as a shadowing failure and approached as described in the section *Resolving Shadowing Failure*. If memory shadowing is restored, but refresh again fails with code 1380, escalate attention to the problem.

One particular way memory or PKT-INT refresh can be led to fail is by inserting one of these circuit packs into its slot without powering down the carrier. If this happens, it may be necessary to cycle power on the given carrier and let the LMM run all tests of components on the carrier to clear the problem. If such an SPE is in standby mode, **reset spe-standby 4** would also cause the appropriate initialization to occur. Always follow the lock-and-power-down approach to replace circuit packs on the standby SPE.

Resolving Poor Health

It can happen that a standby SPE is properly maintaining handshake communication, shadowing is on and the standby is fully refreshed, but for some reason the SOH of that standby SPE remains at a level other than *functional*.

For example, in a heavily loaded system, the standby SOH may temporarily stay at *not refreshed*, but eventually it should clear. Once refresh completes, system software begins an effort to improve the standby SOH from *not refreshed* to *functional*. This effort can be delayed, but within a few minutes one should see the change. If one sees an indefinite persistence of this health level, in an otherwise perfect standby SPE, escalate the problem. This should be an extremely rare event.

If the standby SOH Stays at *partially functional*, either the standby SPE is in *recent interchange mode* or there is a major alarm against some critical standby component (see the table above). For the first case, verify the situation with **status spe** and then clear the recent interchange mode by executing **test spe-standby long**. Wait until at least the first four tests of the sequence complete, then cancel out of the command. The standby SOH should eventually be raised to *functional.* In the second case, check the alarm log to see if there is any major alarm against any component of the standby SPE. If you find one, fix that problem, (usually by replacing the circuit pack). Then the SOH problem should eventually clear. If you lock-and-power-down the standby SPE to replace the given pack, you'll need to test it while in locked mode until all tests pass and then unlock and wait for system software to re-initialize the standby SPE. Only then should you expect standby SOH to be improved to level *functional.*

If neither the recent interchange mode nor a standby component alarm exist, but standby SOH persists at level *partially functional*, escalate the problem.

Error Log Entries and Test to Clear Values

Table 9-642. STBY-SPE Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test spe-standby l
1(a)		Standby SPE Handshake Test (#919)	MAJOR	OFF	
18(b)		busyout spe-standby	WARNING	OFF	rel spe-standby
103(c)		None	MINOR	OFF	test spe-standby l
257(d)		standby SPE status query (#855)	MAJOR	OFF	
260(e)		standby SPE status query (#855)	MAJOR	OFF	
514(f)		None	MAJOR	OFF	
770(g)		standby SPE TOD Comparison Test (#858)	MINOR	OFF	test spe-standby l
1025(h)		standby SPE status query (#855)	MAJOR	OFF	test spe-standby l
1281(i)	any	standby SPE status query (#855)	MAJOR	OFF	
1537(j)	any	standby SPE configuration Matchup test (#920)	MAJOR	OFF	test spe-standby l

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. Indicates that a single handshake attempt has failed. Use "status spe" to see if handshake is down. If "status spe" indicates that handshake is up, ignore this error. If handshake is down, see *Resolving Handshake Failure*.

b. Presence of this error indicates that the standby SPE has is busied out. When busied out, standby SPE's health is kept at the level *partially functional* and memory shadowing is kept off.

c. Error 103 indicates that a spontaneous interchange has taken place. This lowers the now standby SPE's state-of-health to *partially functional*, raises a MINOR alarm against the standby SPE, and invokes recent interchange mode (anti-thrashing). After one hour, or entering **Test spe-standby long** or **busyout spe-standby**, the alarm clears, recent interchange mode is lifted, and the standby's state of health assumes the appropriate value (usually *functional*).

   After a spontaneous SPE interchange has occurred, the Alarm Log retains a record of any MAJOR ON-BOARD alarm against an SPE component that took place before the interchange. This record is retained for three hours and may indicate the cause of the interchange when testing is not possible or conclusive. If handshake has not been restored (check with **status spe**), replace the alarmed circuit pack on the standby SPE. If handshake is up, and such an alarm is logged against SW-CTL, replace the standby MSSNET circuit pack. If handshake is up, and such an alarm is logged against one of the other SPE components, execute a **test long clear** of the alarmed standby component and follow repair instructions for that maintenance object.

d. This error represents inhibiting of memory shadowing by the standby SPE. If this error occurs accompanied by error 514, then the standby SPE has reset, so wait 5 minutes for this condition to clear. If the 257 error persists, or did not occur with a 514, then how you proceed depends on whether handshake is up. If handshake is not up, deal with the handshake failure problem (see the section *Resolving Handshake Failure*). If handshake is up, look for errors or red LEDs indicting the standby packet-interface circuit pack or either of the duplication-interface circuit packs. If such problems exist consult the appropriate MO documentation. When no PKTINT errors or alarms are present, the PKTINT may still be the cause of the problem. Try **reset packet-interface [a|b]** to reset the standby PKTINT and wait two minutes, after which shadowing should be turned on. If 257 continues to persist, with handshake up, and no associated packet-interface or duplication-interface problems, escalate the problem.

e. This error indicates that shadowing could not be turned on due to a problem with the duplication-interface hardware. **Busyout spe-standby**, run **test duplication-interface long**, and consult the DUPINT section. Once all tests of duplication-interface have passed, and all alarms against it have cleared, **release spe-standby** and wait 10 minutes for normal initialization to complete. If error 260 recurs, escalate the problem.

f. This error indicates that the standby SPE has been reset. Wait 5 minutes and then use "status spe" to see if the standby SPE is refreshed. If so, ignore the 514 error. If not, or if 514 recurs frequently, then lock the standby SPE and proceed to trouble-shoot it with the SPE-Down Interface. If all SPE-Down Interface tests pass, and error 514 recurs, then there is probably a software problem in the standby SPE: follow normal escalation procedures.

g. Indicates that the two Time-of-Day (TOD) clocks of the active and standby SPEs were detected to be more than 30 seconds apart. Run the short test sequence on each of the two SPEs' SYSAM circuit packs (see service documentation for TN1648). If any of these tests fail, fix the problem with that SYSAM pack (as described in TN1648 service documentation). If no SYSAM tests fail, and if the 770 persists, then replace the standby SYSAM pack (via the lock-and-power-down approach) and wait for the repaired standby SPE to initialize again (after unlocking). If, after all this, the 770 persists, then, once the standby SPE is fully refreshed and of *functional* health, perform a planned SPE interchange ("reset system interchange") and replace the now-standby (other) SYSAM pack (again: use lock-and-power-down). Now let the standby re-initialize. If the 770 error persists, escalate the problem.

h. This indicates that the standby SPE is down (has a power or sanity problem) and is associated with a *non-functional* SOH level (as revealed by "status spe"). Check for any power alarms (CARR-POW) and deal with them. If none, trouble-shoot the standby SPE by locking and using the SMT. Do not unlock the standby SPE until all SMT tests of it have passed.

i. Represents an instance of refresh failure. Look at the auxiliary data associated with the error. There are the following possibilities:

   - Aux data 1380

     This indicates that memory shadowing was turned off during refresh. Proceed as you would to solve a shadowing problem (see the section *Resolving Shadowing Failure*). If shadowing returns, wait 10 minutes for the system to automatically retry refresh. Also, problems with the standby PKT-INT might lead standby software to turn off shadowing during refresh. So look for a red LED on the standby PKT-INT. If you find this, follow PKT-INT service documentation to repair. Then wait for the automatic retry of refresh.

   - Aux data 1381

     This indicates a failure of PKT-INT refresh. Consult PKT-INT service documentation to test and repair both active and standby PKT-INTs while the standby is not refreshed. Then wait for the automatic retry of refresh.

- Aux data 1383

  This indicates that refresh of one of the memory packs has failed. Typically this indicates a problem with one of the active SPE MEM-BDs. Consult MEM-BD service documentation of execute the long test sequence on these packs. Fix any problems you encounter. Then wait for the automatic retry of refresh.

- any other value

  System software problem; escalate the problem.

If all memory and packet-interface packs pass all test and refresh failure persists, escalate the problem.

j. This error indicates a possible mismatch in hardware configuration between active and standby SPEs for other than disk and removable media components. Auxiliary data indicates the general area of the mismatch:

- Aux data 1374

  Indicates a mismatch of PKT-INT circuit packs

- Aux data 1375

  Indicates a mismatch of MEM-BD circuit packs

- Aux data 1376

  Indicates a mismatch of Processor, SYSAM, DUPINT or MSSNET circuit packs

If handshake is up, use the "list config control" command to compare components of the two SPEs; then verify and correct the discrepancy. If no discrepancies are revealed, escalate the problem. If handshake is down, fix that problem (see *Resolving Handshake Failure*).

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Standby SPE Status Query Test (#855)	X	X	ND
Standby SPE Handshake Test (#919)	X	X	ND
Standby SPE Time-of-Day Comparison Test (#858)	X	X	ND
Standby SPE Configuration Matchup Test (#920)		X	ND

1. D = Destructive, ND = Non-destructive

The **reset spe-standby [1|2|3|4]** command executes a restart of the specified level on the standby SPE. It can be used to attempt to clear certain apparent software problems. Handshake must be up. Any standby restart causes memory shadowing to be turned off, requiring several minutes for refresh to complete.

Standby SPE Status Query Test (#855)

This test *does not require handshake communication.* It reads the active SPE's duplication interface circuit pack hardware register to determine standby SOH, status of the lock switches, and whether shadowing is currently turned on. It updates all internal status data kept about the standby SPE (which can be read via the "status spe" command). This test is considered to pass if standby SOH is *functional*, memory shadowing is turned on and the standby memory is fully refreshed. It returns different failure codes depending of which of these conditions is not met. Abort codes reflect that the status data could not be read.

Table 9-643. TEST #855 Standby SPE Status Query Test

Error Code	Test Result	Description/ Recommendation
1330	ABORT	Test cannot run due to duplication-interface hardware failure. 1. **busyout spe-standby** 2. **test duplication-interface long** 3. Proceed according to the DUPINT and DUP-CHL service documentation in this chapter. 4. If all DUPINT tests pass, rerun command.
1338	ABORT	Test cannot run because a planned SPE interchange is in progress 1. Wait for the planned SPE interchange to complete (this might have been stimulated by a craft request or by scheduled maintenance).
1321	FAIL	Test failed because the SPEs are in locked mode. 1. Check that the SPE-SELECT switches on the two DUPINT packs agree with this. This failure will clear once the SPEs are unlocked.

Continued on next page

Table 9-643. TEST #855 Standby SPE Status Query Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1322	FAIL	Test failed because memory shadowing is off (but not inhibited). When not inhibited by the standby SPE, memory shadowing can be off for the following reasons: 1. Shadowing has not been turned on yet (temporary condition). To allow for this, the test again (or **status spe**) after 5 minutes to see if shadowing is then on. 2. There is a failure in the duplication-interface hardware: to allow for this, look for errors or alarms against the duplication-interface hardware (DUPINT and DUP-CHL): address these according to duplication-interface documentation. Then re-run the test. 3. Handshake has not been established between the two SPEs: use "status spe" to see if handshake is up. If it is not, address that problem according to the section *Resolving Handshake Failure*. 4. There is a hardware configuration mismatch between components of the two SPEs. Look for error 1537 in the hardware error log and use "list config control" to identify the hardware discrepancy between SPEs. Fix this. 5. There is a major alarm against the memory (MEM-BD), packet-interface (PKT-INT) or switch-control (SW-CTL) circuit packs of the standby SPE. Look for alarms against these and correct the problem.

Continued on next page

Table 9-643. TEST #855 Standby SPE Status Query Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1324	FAIL	Test failed because standby SPE has *partially functional* SOH; 1. Use "display alarms" to see alarms against standby SPE components. 2. If a MINOR alarm is active against the current carrier of STBY-SPE, associated with an error 103, then clear this condition with "test spe-standby long". If a WARNING alarm exists against STBY-SPE, use "status spe" to see if the standby is busied out. If so, "release spe-standby" will clear the health problem. 3. Use "status spe" to see if handshake is up. If it is not, deal with that problem according to the section *Resolving Handshake Failure*. 4. Otherwise look for a MAJOR, ON-BOARD alarm against the processor (PROCR), memory (MEM-BD), switch-control (SW-CTL), packet-interface (PKT-INT), or SYSAM circuit packs of the standby SPE. Using the lock-and-power-down approach, replace the offending circuit pack on the standby SPE. Consult the documentation for that component to clear its alarms. Once the alarm against the offending component clears, the SOH of the standby SPE will automatically improve from the *partially functional* level. If error 1324 persists and either none of the above cases is true or you have fixed all of these particular problems, escalate the problem.
1325	FAIL	Test failed because memory shadowing is off due to its being inhibited from the standby SPE 1. This can be a temporary condition, wait 5 minutes and run the test again. 2. If handshake is not established (use **status spe** to see this), deal with that problem according to the preceding section ‘‘Resolving Handshake Failure’’ 3. Rerun the test; if the same 1325 failure recurs, look for problems with the duplication-interface circuit packs (both SPEs) or with the standby SPE’s packet-interface pack (look for red LEDs on these). Fix these problems according to the service documentation for these packs.
1326	FAIL	Test failed because standby memory is not refreshed. 1. Retry the test (or "status spe") after 10 minutes, to see if standby is then refreshed.

Continued on next page

Table 9-643. TEST #855 Standby SPE Status Query Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1329	FAIL	Test failed because standby SPE has *non-functional* SOH; this means that the standby SPE is down. 1. Look for power alarms (CARR-POW) against the standby SPE carrier; address these. 2. Otherwise, lock the standby SPE and trouble-shoot it with the SMT (as you'd diagnose any down SPE. If you cannot revive the standby SPE or if, upon getting it out of the SPE-down state, error 1339 persists for this test, follow normal escalation procedures.
	PASS	Standby SPE is fully in service (SOH functional, memory content refreshed).

Standby SPE Time-of-Day Comparison Test (#858)

This test, available only when handshake communication is up, compares the SYSAM board's Time-of-Day clock values in the two SPEs. The test passes if the two clocks differ by less than 20 seconds. Failure of this test means that the two clocks have drifted apart but that each clock appears to be moving forward. Having the two TOD clocks more than 20 seconds apart can make spontaneous SPE interchanges disruptive to the point of dropping calls. Repeated failure of this test indicates that one or both of the two SYSAM packs will have to be replaced.

Table 9-644. TEST #858 Standby SPE Time-of-Day Comparison Test

Error Code	Test Result	Description/ Recommendation
1000 2029	ABORT	Either of these codes indicates that the test cannot run because internal resources cannot be allocated to read active clock. 1. Consult SYSAM service documentation for time-of-day clock tests.
1338	ABORT	Test cannot run because a planned SPE interchange is pending. 1. Wait for the planned interchange to complete, then for handshake to come up, then re-run test on newly standby SPE.

Continued on next page

Table 9-644. TEST #858 Standby SPE Time-of-Day Comparison Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1339	ABORT	Test cannot run because handshake communication is not up. 1. Wait 5 minutes and try test again. If handshake is still not up (you get a 1339), solve the handshake problem as described in *Resolving Handshake Failure*
1346	ABORT	Test could not read standby SPE's TOD clock. 1. Test standby SPE's SYSAM and consult that section in this chapter.
1377	ABORT	A-carrier SPE's clock is not moving forward. 1. Test A-carrier SYSAM's time-of-day clock according to SYSAM service documentation.
1378	ABORT	B-carrier SPE's clock is not moving forward. 1. Test B-carrier SYSAM's time-of-day clock according to SYSAM service documentation.
2000	ABORT	Effort to read the clock timed out. 1. Test each of the two SPE's SYSAMs (test maint {1a|1b}) as described in SYSAM service documentation. Once these all pass, repeat this test.
	FAIL	Standby TOD clock differs from active's by more than 20 seconds. 1. Wait 1-minute; repeat the test. If test passes, there is no problem. 2. If test fails, use the lock-power-down approach to replace the TN1648 SYSAM circuit pack on the standby SPE. After the repaired standby SPE is fully initialized (handshake has been re-established), repeat the test. 3. If the test fails again, run it again it 1-minute later. If it fails again, perform a planned SPE interchange and wait for it to complete, Replace the standby SYSAM pack with another new replacement pack. Note that this repair procedure requires two extra SYSAM circuit packs.
	PASS	The two SPE's TOD clocks are within tolerable limits of one another.

Standby SPE Handshake Test (#919)

This test causes software to send a handshake request message to the standby SPE (this is the same handshake request message sent every 30 seconds automatically by the software). For this test to pass, standby software must respond to this message in less than 3 seconds. Persistent failure of this test indicates that handshake communication is down (as can be discerned from the "status spe" command). This should be dealt with as described in the preceding section ‘‘Resolving Handshake Failure.’’

Table 9-645. Test #919 Standby SPE Handshake Test

Error Code	Test Result	Description/ Recommendation
1321	ABORT	Test cannot run due to SPEs being locked. 1. Inter-SPE communication is not possible while in locked mode. Verify that SPEs are locked with lock switches. Handshake communication may resume once the SPEs are unlocked.
1330	ABORT	Test cannot run due to problem in DUPINT hardware. 1. Test the duplication-interface hardware according to the service documentation for DUPINT and DUP-CHL.
1338	ABORT	Test cannot run due to planned SPE interchange pending. 1. Wait for the planned SPE interchange to complete, then retry the test.
	FAIL	Standby SPE did not respond to handshake request within 3 seconds. 1. Wait 2 minutes and try the test again. 2. If test fails again, use "status spe" to see if handshake communication is up. If it is not and there is a STBY-SPE MAJOR alarm, then deal with the problem according to the preceding section Resolving Handshake Failure.’’
	PASS	Handshake request was responded to within 3 seconds; handshake communication is up.

Standby SPE Configuration Matchup Test (#920)

This test requires that handshake be up. It checks to see if the hardware configuration of the standby SPE is in agreement with that of the active SPE, *ignoring removable media and disk components.* Active SPE software sends a message to the standby requesting a list of the latter's components. This list is compared to the list of known components on the active SPE.

This match is necessary for memory shadowing to operate correctly, and for the standby SPE to be able to take on active SPE status correctly. Failure indicates that, for some SPE component other than disk or removable media, the two SPE configurations disagree. This is a serious problem. Memory shadowing is automatically turned off as long as a configuration mismatch exists. As long as this condition holds, any spontaneous SPE interchange which might occur results in all calls being dropped and a COLD-1 restart on the newly active SPE.

Table 9-646. TEST #920 Standby SPE Configuration Matchup Test

Error Code	Test Result	Description/ Recommendation
1338	ABORT	Test cannot run because a planned SPE interchange is pending. 1. Wait for the planned interchange to complete, then for handshake to come up, then re-run test on newly standby SPE.
1339	ABORT	Test cannot run because handshake communication is not up. 1. Wait 5 minutes and try test again. If handshake is still not up (you get a 1339), solve the handshake problem as described in ''Resolving Handshake Failure''.
2000	ABORT	Communication with Standby SPE timed out. 1. Retry the test once after 2 minutes.
1374	FAIL	Test failed due to mismatch in packet-interface circuit packs. 1. Use **list config control** to verify discrepancy. 2. Fix the indicated discrepancy in packet-interface packs. 3. Re-run test. This mismatch test is not sensitive to firmware differences between the two packet-interface circuit packs. See the PKT-INT section for dealing with firmware variations.
1375	FAIL	Test failed due to mismatch in memory circuit packs. 1. Use "list config control" to verify discrepancy. 2. Fix the indicated discrepancy in memory packs. 3. Re-run test.

Continued on next page

Table 9-646. TEST #920 Standby SPE Configuration Matchup Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1376	FAIL	Test failed due to mismatch in either PROCR, SYSAM, DUPINT, or MSSNET circuit packs. 1. Use **list config control** to verify this highly unlikely discrepancy. 2. Fix the indicated discrepancy. 3. Re-run test.
	PASS	Active and standby SPEs' hardware configurations agree in all critical components.

STO-DATA (Stored Data)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
STO-DATA	MINOR	test stored-data [long]*	Stored Data
STO-DATA	WARNING	test stored-data	Stored Data

NOTE:
STO-DATA problems can be caused by faulty MSS hardware or hardware used to provide communication between active and standby SPEs. If hardware errors are present for H-ADAPTER, R-MEDIA, DISK, or DUPINT, investigate those first and then run **test stored-data** to address file inconsistencies.

The Mass Storage System (MSS) consists of the following components which are part of the system's SPE:

- TN1657 Disk circuit pack
- TN1656 Tape circuit pack or TN2211 Optical Disk circuit pack (Removable media drive)
- Host Adapter circuit located on the UN332 MSS/Network Control circuit pack

Each disk and removable media drive stores 2 copies of each of the following:

- The software that the system runs (the ''boot image'')
- Translation data
- Software update data (also known as program updates or patches)
- Announcement files from the TN750 Announcement circuit pack
- File directory
- Error log
- In special circumstances, a core dump of all system memory (single copy)

The disk is the primary storage device. Files on disk are generally used to reboot the system or to restore files that are lost or corrupted during a malfunction. The removable media is used to backup the disk and as a portable medium for data, such as is used for introduction of a new software load.

In High and Critical Reliability systems (duplicated SPE) the removable media and disk drives are duplicated as part of the PPN control carrier, resulting in a total of 4 devices, each storing 2 copies of the aforementioned files. Ideally, the files on all of the devices are identical, but malfunctions or even normal operations can lead to inconsistencies.

Data Inconsistencies and STO_DATA Tests

The STO-DATA maintenance object is not a hardware component, but a strategy used to test for consistency between corresponding files on the different storage devices. When inconsistencies are found, STO-DATA errors and alarms are generated. The translation, announcement, and software update files are checked by comparing timestamps created when the files were saved from system memory. The boot image files are checked by comparing vintage numbers. The other files are not checked.

On systems with simplex SPE, a STO-DATA test compares the files on removable media to those on the disk. On systems with duplicated SPEs, the following comparisons of corresponding files are made:

1. Disk to removable media (active SPE)
2. Disk to removable media (standby SPE)
3. Disk (active SPE) to disk (standby SPE)
4. Removable Media (active SPE) to removable media (standby SPE)

The data consistency tests are run as part of the short and long demand test sequences and automatically during daily scheduled maintenance. Test results point to which files, if any, are out of date.

In addition to the data consistency tests, checksum tests are run during the long demand test sequence to verify that the checksums of both copies of the boot image on each storage device are the same. This capability is useful when the system has booted using a boot image other than the first copy on disk. (An alarm and unique error code identify this situation). In addition to test results, you can use the **list configuration software** command to retrieve detailed information about the files on each storage device.

Backing Up Data: MSS Commands

Several commands are available for copying files from system memory to the MSS, and for copying files from one MSS device to another. They are summarized in the following table. Refer to Chapter 8, for complete descriptions and additional options for these commands.

Table 9-647. Mass Storage System Commands

Command	Execution Time *	Action/Remarks
save translation [disk][1]	2 minutes	Copy translation from system memory to disk. File is timestamped at time of command.
save announcement	40 minutes	Copy announcement file from TN750 to disk. File is timestamped at time of command. Use after recording announcements.
restore announcement	40 minutes	Copy announcement file from disk back to TN750. Use after a TN750 or announcement administration error.
backup disk [incremental]	20-50 minutes	Copy from disk to removable media all files on disk that are newer. Done to both SPEs if duplicated
backup disk full	50 minutes	Copy all disk files to removable media. Done to both SPEs if duplicated. Use after replacing removable media cartridge.
restore disk [full]	50 minutes	Copy all removable media files to disk. Use after disk is replaced. Done to both SPEs if duplicated.
copy announcement removable-media	2 minutes	Copy announcement file from disk to removable media. Keeps timestamps consistent.
copy update-file removable-media	2 minutes	Copy update file from disk to removable media. Keeps timestamps consistent.

1. Execution times vary; those shown are expected maximums. Entries in brackets ([]) are defaults and need not be entered. Pipes (|) indicate a choice between options.

The following commands are not used in normal backup or maintenance procedures. They are sometimes useful in special situations such as software updates or resolving specific file inconsistencies between devices.

Table 9-648. Special Purpose MSS Commands

Command	Execution Time[1]	Action/Remarks
save translation removable-media	10 minutes	Copy translation from memory to removable media. Use only for special situations. Causes STO-DATA tests to fail since removable media timestamp is newer than disk.
copy announcement spe-a|spe-b disk	2 minutes	Copy announcement data from removable media to disk. Useful for restoring announcement file on disk
copy update-file spe-a|spe-b disk	2 minutes	Copy update (patch) data from removable media to disk. Useful for restoring update data on disk
copy bootimage [spe-a|spe-b|both] removable-media	2 minutes	Copy boot image from disk to removable media. Useful for restoring boot image on removable media.
copy bootimage [spe-a|spe-b|both] disk	2 minutes	Copy boot image from removable media to disk. Useful for restoring boot image on disk

1. Execution times vary; those shown are expected maximums. Entries in brackets ([]) are defaults and need not be entered. Pipes (|) indicate a choice between options.

Automatic Backups

During normal operations, files in system memory, on disk, and on removable media can become inconsistent (for example, when translations are changed, when announcements are saved). During daily scheduled maintenance, several actions are take to keep data files consistent:

1. At the start of scheduled maintenance, translations and error logs are saved. This step must be enabled by the ‘‘Save Translation’’ field on the **change system-parameters maintenance** form.
2. Disk files are backed up to removable media.
3. STO-DATA tests are run along with other daily maintenance tests.

At the end of this sequence, disk and removable media files should all be identical, and translations and error logs files should be current with system memory. Announcement files are not saved automatically, and should be manually saved after recording or altering announcements. The automatic backup will however transfer these from disk to removable media.

File Inconsistencies: Causes

A number of things can cause files to become inconsistent between devices. **Test stored data** and **list configuration software** can be used to identify which files are affected. Described below are some of the causes of inconsistencies.

Save commands

Whenever a **save translation** or **announcements** is executed, the files on disk are newer than the files on removable media until a **backup disk** is performed either by command or by daily scheduled maintenance. If **test stored-data** is run before a backup, Tests #833 and #834 will fail with error code 1 or 8, generating a warning alarm against STO-DATA. Once a disk backup is performed, running the stored data tests will clear the alarm. A copy command can be used instead of backup to save time; take extra care to enter the right options so good files are not lost.

When **save translation removable-media** or **save announcements removable-media** is executed, timestamps on the removable media files will be newer than those on the disk files. (This is the opposite of normal operational sequences.) These commands should not be used as part of standard administration or repair procedures. When the files are in this state, automatic or demand incremental backups from disk will be prevented from overwriting the removable media files, and subsequent STO-DATA tests will fail, generating warning alarms.

Save to removable media commands may be useful when the disk has failed and the removable media is being used temporarily for primary storage. Once the disk is replaced, **restore disk** can be used to recoordinate the files.

Dirty Files

Two copies of each file are stored on each MSS device. This protects against data loss in case a failure occurs while data is being written. If such a failure occurs, or if a removable media cartridge is pulled out of the drive while data is being written to it, the incomplete file is marked as a ‘‘dirty’’ file. The system will then use the other copy for reading data and will generate a minor alarm against R-MEDIA or DISK. As long as one of the copies is clean, STO-DATA tests will test the clean copy and not report any errors.

Removable Media Replacement

If the removable media is a tape, the tape cartridges are periodically replaced (for example, after a R-MEDIA warning alarm with error type 2305, indicating that 90% of its useful life has been exceeded). Until a full disk backup is performed, the new removable media will be inconsistent with the disk.

Inconsistent Files: Solutions

The best way to clear STO-DATA alarms is to perform a **save translation** or **announcements** (if those files are affected), followed by a **backup disk**. Daily scheduled maintenance also performs this sequence. There are unusual situations in which other actions are required. If problems exist on the TN750 Announcement circuit pack, avoid saving announcements until resolving those problems. Otherwise, good copies of the files could be overwritten by bad ones.

The default for the backup command is ‘‘incremental,’’ meaning that files on removable media with newer timestamps than those on disk are not overwritten. This can occur when a save is made to removable media. Save followed by backup will still work, but time can be saved by **restore disk**.

Inconsistency across SPEs

When the SPE is duplicated, disruptions to inter-SPE communication, or MSS writes on one SPE but not on the other, can cause files to be inconsistent between devices on the different SPEs. You can detect this situation by running **list configuration software long** and inspecting the timestamps and software version numbers. Correct procedure depends on which device has the correct boot image.

Disk on Active SPE Has Correct Boot Image:

1. **save translation active** (2 min)
2. **backup disk active** (40 min)
3. Put the removable media cartridge from the active SPE into the removable media drive on the standby SPE. Put the removable media cartridge from the standby SPE into the removable media drive on the active SPE.
4. **backup disk active** (40 min)
5. **restore disk standby** (40 min)
6. **test stored data**

Removable Media on Active SPE Has Correct Boot Image:

1. **save translation removable-media active** (2 min)
2. **restore disk active** (40 min)
3. Put the removable media cartridge from the active SPE into the removable media drive on the standby SPE. Put the removable media cartridge from the standby SPE into the removable media drive on the active SPE.
4. **backup disk active** (40 min)
5. **restore disk standby** (40 min)
6. **test stored data**

Error Log Entries and Test to Clear Values

Table 9-649. STORED-DATA Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	1 to 6	Carrier A Removable Media-Disk Consistency Test (#833)	WARNING	OFF	test stored-data
257 (b)	1	Carrier A Removable Media-Disk Consistency Test (#833	WARNING	OFF	test stored-data
513 (a)	1 to 6	Carrier B Removable Media-Disk Consistency Test (#834)	WARNING	OFF	test stored-data
542 (c)	0	Scheduled translation save	-	-	
543 (d)	0	Scheduled disk backup	-	-	
769 (b)	1	Carrier B Removable Media-Disk Consistency Test (#834)	WARNING	OFF	test stored-data
1025 (e)	1 to 6	Removable Media-Removable Media Consistency Test (#835)	MINOR	OFF	test stored-data
1281 (f)	1	Removable Media-Removable Media Consistency Test (#835)	MINOR	OFF	test stored-data
1537 (e)	1 to 6	Disk-Disk Consistency Test (#836)	MINOR	OFF	test stored-data
1793 (f)	1	Disk-Disk Consistency Test (#836)	MINOR	OFF	test stored-data
2049 (g)	1 to 3	Carrier A Boot Image Test (#837) (Runs at system boot time only)	MINOR	OFF	test stored-data long
2305 (g)	1 to 3	Carrier B Boot Image Test (#837) (Runs at system boot time only)	MINOR	OFF	test stored-data long

Continued on next page

Table 9-649. STORED-DATA Error Log Entries — *Continued*

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3073 (h)	30004 30014 30201	Carrier B Removable Media Checksum Test (#831)	MINOR	OFF	test stored-data long
3329 (h)	30004 30014 30201	Carrier B Disk Checksum Test (#832)	MINOR	OFF	test stored-data long
3585 (i)	Any		WARNING	OFF	test stored-data
3586 (j)	Any		WARNING	OFF	test stored-data
3587 (k)	Any		WARNING	OFF	test stored-data
3841 (i)	Any		WARNING	OFF	test stored-data
3842 (j)	Any		WARNING	OFF	test stored-data
3843 (k)	Any		WARNING	OFF	test stored-data

Notes:

a. Error types 1 and 513 indicate that one or more of the following conditions has occurred on Carrier A or Carrier B respectively: the timestamps of the translation files on the two storage devices are inconsistent, the timestamps of the announcement files on the two storage devices are inconsistent, or the timestamps of the program update files on the two storage devices are inconsistent.

   The auxiliary data for the error type can be used to determine which files are inconsistent. That information is presented in the table below. More than one data inconsistency may exist, but only the fault with the highest auxiliary data number will appear in the error log. Enter the **test stored-data** command to obtain more information about the failure and follow the associated repair procedures.

Table 9-650. Auxiliary Data for Error Types 1 and 513

Aux Data	Data File Inconsistency
1	Disk translation data is newer than the removable media translation data
2	Removable Media translation data is newer than the disk translation data
3	Disk announcement data is newer than the removable media announcement data
4	Removable Media announcement data is newer than the disk announcement data
5	Disk program update data is newer than the removable media program update data
6	Removable Media program update data is newer than the disk program update data

b. Error types 257 and 769 indicate that the vintages of the boot images on the two storage devices on Carrier A or Carrier B respectively, are inconsistent.

   1. Use the **list configuration software-vintage** command to get the vintage numbers and install the correct vintage.
   2. Run the data storage tests by entering **test stored-data** to retire the alarm.
   3. If the STORED-DATA tests fail, refer to the repair procedures for those tests for further information.

c. Error type 542 indicates that the scheduled daily save-translation operation failed. If a STORED-DATA alarm is active, it is due to a data inconsistency.

   1. Refer to the alarm log and clear any failures associated with the HOST ADAPTER, R-MEDIA, or DUPINT circuit and clear those problems first.
   2. Then save translation manually by entering **save translation** and backup the disk manually by entering **backup disk**. Note: this operation may take up to an hour.
   3. Run the data storage tests by entering **test stored-data** to retire the alarm.
   4. If the STORED-DATA tests fail, refer to the repair procedures for those tests for further information.

d. Error type 543 indicates that the scheduled daily disk backup operation failed. If a STORED-DATA alarm is active, it is due to a data inconsistency.

   1. Refer to the alarm log and clear any failures associated with the H ADAPTR, DISK, or DUPINT circuit and clear those problems first.
   2. Then backup translation manually by entering **backup disk**. Note: this operation may take up to an hour.
   3. Run the data storage tests by entering **test stored-data** to retire the alarm.
   4. If the STORED-DATA tests fail, refer to the repair procedures for those tests for further information.

e. Error types 1025 and 1537 indicate that one or more of the following conditions has occurred between the removable media cartridges or between the disks respectively, in each carrier: the timestamps of the translation files on the two storage devices are inconsistent, the timestamps of the announcement files on the two storage devices are inconsistent, or the timestamps of the program update files on the two storage devices are inconsistent.

   This auxiliary data for the error type can be used to determine which files are inconsistent. That information is presented in the table below. More than one data inconsistency may exist, but only the fault with the highest auxiliary data number will appear in the error log. Enter the **test stored-data** command to obtain more information about the failure and follow the associated repair procedures.

Auxiliary Data for Error Types 1025 and 1537

Aux Data	Data File Inconsistency
1	Translation data on the carrier A device is newer than the translation data on the carrier B device
2	Translation data on the carrier B device is newer than the translation data on the carrier A device
3	Announcement data on the carrier A device is newer than the announcement data on the carrier B device
4	Announcement data on the carrier B device is newer than the announcement data on the carrier A device
5	Program update data on the carrier A device is newer than the program update data on the carrier B device
6	Program update data on the carrier B device is newer than the program update data on the carrier A device

f. Error types 1281 and 1793 indicate that the vintages of the boot images on two the storage devices on Carrier A or Carrier B respectively, are inconsistent. Use the **list configuration software-vintage** command to get the vintage numbers and install the correct vintage.

g. Error types 2049 and 2305 indicate that a copy of the boot image other than the primary copy on the primary device on Carrier A or Carrier B, respectively, was used to boot the system. The check of which copy of the boot image was used is made only at boot time. Use the following procedures based on the Auxiliary Data to clear the problem on Carrier A or Carrier B.

Table 9-651. Auxiliary Data for Error Types 2049 and 2305

Aux Data	Description / Recommendation
1	The secondary boot image on the disk was used to boot the system. 1. Run **test stored-data long** to verify that the primary copy of the boot image is invalid. 2. Restore the bad copy from the removable media by issuing a **restore disk** command. 3. Run **test stored-data long** to retire the alarm.
2	The primary boot image on the removable media was used to boot the system. 1. Run **test disk long** for the disk on the SPE carrier which reports the failure. If any tests fail, refer to DISK repair procedures for further action. 2.) Run **test stored-data long** to verify that the primary and secondary copies of the boot image on the disk are invalid. 3. Restore the copies on the primary device from the copies on the secondary device by issuing a **restore disk** command. 4. Run **test stored-data long** to retire the alarm.
3	The secondary boot image on the removable media was used to boot the system. 1. Run **test stored-data long** to verify that the primary and secondary copies of the boot image on the disk and the primary copy of the boot image on the removable media are all invalid. 2. Insert a backup removable media cartridge of the correct vintage. 3. Run **save translation removable-media** to get the latest translation on the backup removable media. 4. Run **copy announcement removable-media** to get the latest announcements on the backup removable media. 5. Run **restore disk** to copy the good boot images, translations, announcements and software update files to the disk. 6. Run **test stored-data long** to retire the alarm.

h. Error types 2561, 2817, 3073, and 3329 indicate that the checksum test for the two copies of the boot image on the Carrier A removable media, Carrier A disk, Carrier B removable media, or Carrier B disk, respectively, are inconsistent. (Auxiliary data 30004 indicates that the device could not be read, auxiliary data 30014 indicates that the file type is invalid, and auxiliary data 30201 indicates the checksum is bad).

i. Error types 3585 and 3841 indicate that a save translation to disk failed on carrier A or B, respectively.

   1. Refer to the alarm log and clear any H-ADAPTR, DISK, R-MEDIA, or DUPINT alarms first.
   2. Enter **save translation**. This operation may take up to an hour.
   3. Run **test stored-data** to retire the alarm.
   4. If the Stored Data tests fail, refer to the repair procedures for those tests.

j. Error types 3586 and 3842 indicate that an attempt to restore the disk from removable media failed on carrier A or B, respectively.

   1. Refer to the alarm log and clear any H-ADAPTR, DISK, R-MEDIA, or DUPINT alarms first.
   2. Enter **restore disk**. This operation may take up to an hour.
   3. Run **test stored-data** to retire the alarm.
   4. If the Stored Data tests fail, refer to the repair procedures for those tests.

k. Error types 3587 and 3843 indicate that an attempt to backup the disk to the removable media failed on carrier A or B, respectively.

   1. Refer to the alarm log and clear any H-ADAPTR, DISK, R-MEDIA, or DUPINT alarms first.
   2. Enter **backup disk**. This operation may take up to an hour.
   3. Run **test stored-data** to retire the alarm.
   4. If the Stored Data tests fail, refer to the repair procedures for those tests.

System Technician-Demanded Tests

The sequence of tests performed depends on whether the SPE is duplicated.

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *A Carrier R-Media Checksum Test*, for example, you may also clear errors generated from other tests in the testing sequence.

	Short Sequence				Long Sequence			
SPE:	**Simplex**		**Duplex**		**Simplex**		**Duplex**	
MSS (D:disk/r-media, R:r-media only)	**D**	**R**	**D**	**R**	**D**	**R**	**D**	**R**
A Carrier Removable Media Checksum Test (#829)					X	X	X	X
B Carrier Removable Media Checksum Test (#830)							X	X
A Carrier Disk Checksum Test (#831)					X		X	
B Carrier Disk Checksum Test (#832)							X	
A Carrier Removable Media to Disk Consistency Test (#833)	X		X		X		X	
B Carrier Removable Media to Disk Consistency Test (#834)			X		X		X	
A to B Carrier Removable Media Consistency Test (#835)			X	X			X	X
A to B Carrier Disk Consistency Test (#836)			X				X	

The A/B Carrier Boot Image Test (#837) runs only at system boot time.

A Carrier and B Carrier Removable Media Checksum Tests (#829/#830)

A checksum is done on the primary copy of the boot image on the removable media and also on the secondary copy of the boot image on the removable media. A comparison is made to verify that these two checksums are the same. This test is run as part of the **test stored-data long** demand test.

Table 9-652. TESTS #829 and #830 Removable Media Checksum Tests

Error Code	Test Result	Description/ Recommendation
1303	ABORT	Could not run the test—internal MSS error 1. Retry the command
1304	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (Use the **display system-parameters maintenance** command to display the start time for scheduled maintenance and the "y/n" option for saving translation daily).
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby SPE is restored to service (use **status spe** to determine state of standby SPE) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby SPE is restored to service (use **status spe** to determine state of standby SPE) retry the command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals a maximum of 5 retries.
30004	FAIL	The removable media cartridge could not be read. 1. Verify a removable media cartridge is in the removable media drive. 2. Retry the command at 1-minute intervals for a maximum of 5 retries.

Continued on next page

Table 9-652. TESTS #829 and #830 Removable Media Checksum Tests — *Continued*

Error Code	Test Result	Description/ Recommendation
30014	FAIL	An invalid file system was found. 1. Verify the correct removable media cartridge is in the removable media drive. 2. Otherwise, insert the correct removable media cartridge and re-run **test stored-data long**.
30201	FAIL	The checksums of the boot images for the removable media are inconsistent. 1. If a removable media-only system, replace the removable media. Follow the procedures presented in the Section **XXX** of this manual. 2. If a disk/removable media system, run **backup disk full** on the carrier containing the bad removable media (this could take up to an hour to complete). 3. Run **test stored-data long** to resolve the alarms.
	PASS	The checksums are consistent between the two boot images on the removable media. 1. If other mss errors are present, refer to the maintenance information for the H ADAPTR, R-MEDIA, and DISK maintenance objects to clear those errors.

A and B Carrier Disk Checksum Tests (#831/#832)

A checksum is done on the primary copy of the boot image on the disk and also on the secondary copy of the boot image on the disk. A comparison is made to verify that these two checksums are the same. This test is run as part of the **test stored-data long** demand test.

Table 9-653. TESTS #831 and #832 Disk Checksum Tests

Error Code	Test Result	Description/ Recommendation
1303	ABORT	Could not run the test—internal MSS error.
1304	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.

Continued on next page

Table 9-653. TESTS #831 and #832 Disk Checksum Tests — *Continued*

Error Code	Test Result	Description/ Recommendation
30201	FAIL	The checksums of the boot images for the disk were inconsistent. 1. Run **restore disk full** on the carrier containing the bad disk (this could take up to an hour to complete). 2. Run **test stored-data long** to resolve the alarms.
	PASS	The checksums are consistent between the two boot images on the disk. 1. If other mss errors are present, refer to the maintenance information for the H ADAPTR, R-MEDIA, and DISK maintenance objects to clear those errors.

Test #833 (A Carrier) and #834 (B Carrier) Removable Media to Disk Consistency Tests

There are two copies of the boot image, translation data, announcement data, and program update date on each storage device. In each of the checks performed by these tests, the system chooses one copy of each that it deems "best." These tests then perform four checks. First, the vintage of one of the boot images on removable media is compared to the vintage of one of the boot images on disk. The test verifies that the two chosen copies are consistent. Second, the time stamp of one of the copies of the translation file on the removable media is compared to the time stamp of one of the translation files on the disk. If the files are inconsistent, the test reports which one is newer. Next, the time stamp of one of the copies of the announcements file on the removable media is compared to the time stamp of one of the announcements files on the disk. Finally, the time stamp of one of the copies of the program update file on the removable media is compared to the time stamp of one of the program update files on the disk. If the files are inconsistent, the test again reports which one is newer.

This test is run as part of the **test stored-data** demand test and during daily scheduled maintenance. The following table is used in diagnosing fail results.

Table 9-654. TESTS #833 and #834 Failure Numbers

Failure Number	File Inconsistency
1	The translation file on the disk is newer than the translation file on the removable media.
2	The translation file on the removable media is newer than the translation file on the disk.
4	The vintages of the boot images on the removable media and disk are inconsistent.
8	The announcement file on the disk is newer than the announcement file on the removable media.
16	The announcement file on the removable media is newer than the announcement file on the disk.
32	The program update file on the disk is newer than the program update file on the removable media.
64	The program update file on the removable media is newer than the program update file on the disk.

Table 9-655. TESTS #833 (A Carrier) and #834 (B Carrier) Removable Media to Disk Consistency Tests

Error Code	Test Result	Description/ Recommendation
1304	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1333	ABORT	Could not run the test—internal MSS error.
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.

Continued on next page

Table 9-655. TESTS #833 (A Carrier) and #834 (B Carrier) Removable Media to Disk Consistency Tests — *Continued*

Error Code	Test Result	Description/ Recommendation
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
2000	ABORT	Response to the test was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.

Continued on next page

Table 9-655. TESTS #833 (A Carrier) and #834 (B Carrier) Removable Media to Disk Consistency Tests — *Continued*

Error Code	Test Result	Description/ Recommendation
Any	FAIL	One or more of the 4 files checked was inconsistent with the file on the other device. 1. Enter **list configuration software** to determine the inconsistent file. If a file on removable media is the older file, use **backup disk** to copy the disk file to the removable media. If a file on disk is older file, use **restore disk** to copy the removable media file to the disk. 2. If for some reason the **list configuration software** command does not provide the necessary data: a. Convert the error code to a set of failure numbers. The error code returned by the test is the sum of one or more failure numbers listed in the table at the beginning of this test description, *Tests 833 and 834 Failure Numbers.* Using that table, subtract the largest failure number possible (so as to leave a positive remainder) from the error code and note the associated inconsistency from the table. Continue subtracting failure numbers from the remainder until the remainder is 0. The numbers subtracted represent the inconsistencies found. b. Use the results of the four consistency tests (#833, #834, #835 and #836) to determine the device with the incorrect files. If the files on the removable media are newer than the files on the disk, restore the disk from the removable media (**restore disk**). If the files on the disk are newer than the files on the removable media, backup the removable media from its disk (**backup disk**).
	PASS	The files are consistent between the disk and the removable media. 1. If other MSS errors are present, refer to the H-ADAPTR, R- MEDIA, and DISK sections.

Removable Media to Removable Media and Disk to Disk Consistency Tests (#835/#836)

There are two copies of the boot image, translation data, announcement data and program update data on each storage device. In each of the checks performed by these tests, the system chooses one copy of each that it deems "best." These tests then perform four checks. First, the vintage of one boot image on the Carrier A device is compared to the vintage of one boot image on the Carrier B device. The test verifies that the two chosen copies are consistent. Second, the time stamp of one copy of the translation file on the Carrier A device is compared to the time stamp of one copy of the translation file on the Carrier B device. If the files are inconsistent, the test reports which one is newer. Next, the time stamp of one copy of the announcement file on the Carrier A device is compared to the time stamp of one copy of the announcement file on the Carrier B device. Finally, the time stamp of one copy of the program update file on the Carrier A device is compared to the time stamp of one copy of the program update files on the Carrier B device. If the files are inconsistent, the test again reports which one is newer.

This test is run as part of the **test stored-data** demand test and during daily scheduled maintenance. The following table is used in diagnosing fail results.

Table 9-656. TEST #835 and #836 Failure Numbers

Failure Number	File Inconsistency
1	The translation file on the Carrier A device is newer than the translation file on the Carrier B device.
2	The translation file on the Carrier B device is newer than the translation file on the Carrier A device.
4	The vintages of the boot images on the two devices are inconsistent.
8	The announcement file on the Carrier A device is newer than the announcement file on the Carrier B device.
16	The announcement file on the Carrier B device is newer than the announcement file on the Carrier A device.
32	The program update file on the Carrier A device is newer than the program update file on the Carrier B device.
64	The program update file on the Carrier B device is newer than the program update file on the Carrier A device.

Table 9-657. TESTS #835 and #836 Removable Media to Removable Media and Disk to Disk Consistency Tests

Error Code	Test Result	Description/ Recommendation
1304	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1333	ABORT	Could not run the test—internal MSS error.
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.

Table 9-657. TESTS #835 and #836 Removable Media to Removable Media and Disk to Disk Consistency Tests — *Continued*

Error Code	Test Result	Description/ Recommendation
Any	FAIL	One or more of the 4 files checked was inconsistent with the file on the other device. 1. Enter **list configuration software** to determine the inconsistent file. If a file on removable media is the older file, use **backup disk** to copy the disk file to the removable media. If a file on disk is older file, use **restore disk** to copy the removable media file to the disk. 2. If for some reason the **list configuration software** command does not provide the necessary data: a. Convert the error code to a set of failure numbers. The error code returned by the test is the sum of one or more failure numbers listed in the table at the beginning of this test description, *Tests 835 and 836 Failure Numbers*. Using that table, subtract the largest failure number possible (so as to leave a positive remainder) from the error code and note the associated inconsistency from the table. Continue subtracting failure numbers from the remainder until the remainder is 0. The numbers subtracted represent the inconsistencies found. b. Use the results of the four consistency tests (#833, #834, #835 and #836) to determine the device with the incorrect files. If the files on the removable media are newer than the files on the disk, restore the disk from the removable media (**restore disk**). If the files on the disk are newer than the files on the removable media, backup the removable media from its disk (**backup disk**).
	PASS	The files are consistent between the compared devices. 1. If other MSS errors are present, refer to the H-ADAPTR, R-MEDIA, and DISK sections.

STRAT-3 (Stratum 3 Clock)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
STRAT-3	MAJOR	test synchronization	Stratum 3 Clock
STRAT-3	MINOR	test synchronization	Stratum 3 Clock

The *Digital Synchronization Network Plan (PUB 60110)* specifies a hierarchy of synchronization nodes consisting of strata 1 to 4, where the sole Stratum 1 clock in the network is the most accurate. The Release 5r system supports both Stratum 3 and Stratum 4 operations. Refer to “SYNC (Synchronization)” for details on Stratum 4 operation.

A Stratum 3 clock derives its timing from two DS1 references connected to a Stratum 3 or better source. The Stratum 3 clock provides a holdover of at least 24 hours should both DS1 references fail. (After 24 hours, the Stratum 3 clock still provides service but its accuracy may be degraded). The *Digital Synchronization Network Plan (PUB 60110)* requires that the Stratum 3 clock have duplicated components.

The Stratum 3 clock can be configured with only one DS1 input if one of the Clock Input cards is removed. Also, the Stratum 3 clock can free run (use its internal clock without using DS1 inputs, if both Clock Input cards are removed).

The recognition of the Stratum 3 clock itself as well as its alarm signals, is supported only by the TN780 Tone-Clock circuit pack. The TN780 Tone-Clock circuit pack is also backwards-compatible with the TN768 Tone-Clock circuit pack. The Stratum 3 clock may be connected to the PPN if the TN780 Tone-Clock circuit pack(s) is present in that port network. The Stratum 3 clock should never be connected to an EPN.

The only operation that software can perform is a query of the alarm leads. The only recovery action that can be performed on a catastrophic failure of the Stratum 3 clock is using the local oscillator on the active TN780 Tone-Clock circuit pack. Neither software nor the TN780 Tone-Clock circuit pack can request additional information about the health of the Stratum 3 clock other than the information provided by the alarm leads. Furthermore, neither the software nor the TN780 Tone-Clock circuit pack can request that the external clock switch references, change configuration, disable/enable, initialize, and so forth.

In the system, the Stratum 3 clock has been implemented as an external which follows the specification in PUB 60110 for Stratum 3. The only external Stratum 3 clock that is supported is the Telecom Solutions Digital Clock Distributor™ for Customer Premise Timing (DCD-CPT) Stratum 3 clock. Figure 9-94 on page 9-1769 shows how the Stratum 3 hardware configuration provides clock and alarm signals to the TN780 Tone-Clock circuit pack(s). The reference DS1

facilities connect directly to the Stratum 3 clock for timing purposes, but the DS1 data may be routed into the switch by using a Y connector (H-600-274 G1 for the 50 pin DS1 end or H-600-274 G2 for the 15 pin DS1 end).

For more information on the installation of the Stratum 3 clock, see the *DEFINITY Enterprise Communications Server Release 5.4 Installation and Test for Multi-Carrier Cabinets*.

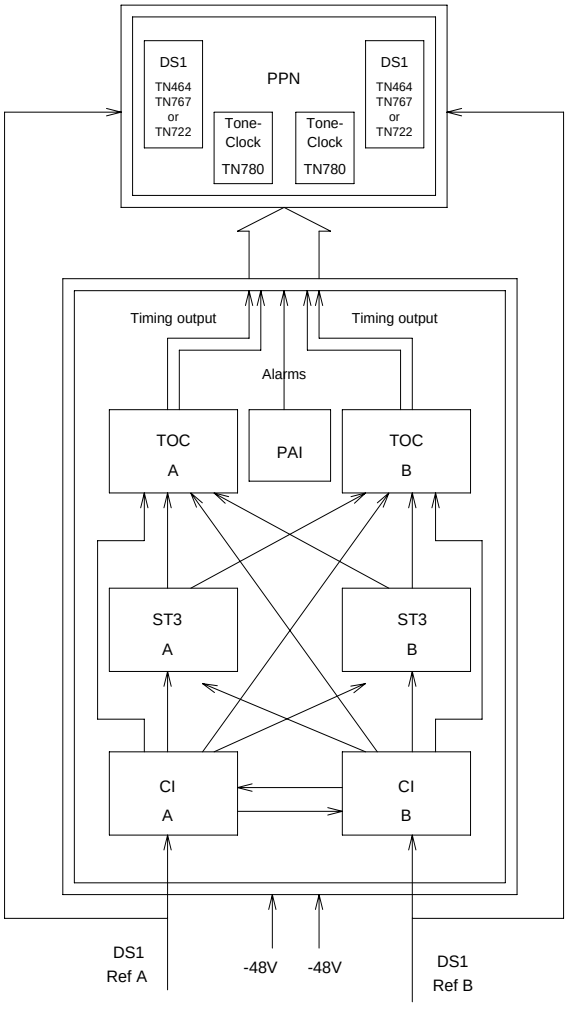

Figure 9-94. Stratum 3 Clock Hardware Configuration

Stratum 3 Clock LED Strategy

NOTE:
When looking in the Stratum 3 cabinet, ‘‘A’’ card is on the left and ‘‘B’’ card is on the right.

NOTE:
The normal LED scheme is not followed for this device. Green LEDs do not indicate maintenance activity. There are no yellow LEDs, and there are more than three LEDs per circuit pack.

NOTE:
Removal of a card in the Stratum 3 clock may cause alarm(s) to be resolved and the query test to pass. However, the removed cards should still be replaced to restore the Stratum 3 clock to full service.

The Stratum 3 clock has the following components:

- 2 Clock Input cards (CI)

  Provides the logic to select the better DS1 reference or Clock Input card. The red FAIL LED on this card indicates a failure with the card or the DS1 reference connected to it.

- 2 Stratum 3 Cards (ST3)

  Provides 24-hour holdover. The red FAIL LED on this card indicates a failure with the card. Replace the card.

- 2 Timing Output Cards (TOC)

  Provides cable length compensation, multiple output ports, selection of the ST3, and CI outputs. This type of card has two red failure LEDs: one indicates a failure of the card; the other indicates a failure in one or more output ports. In either case, replace the card.

- 1 PBX (Private Branch Exchange) Alarm Interface (PAI)

  Filters power supplied to the clock, provides fuse protection, and provides alarm indications based on inputs supplied by other cards. The six LEDs on this card provide indications for the six alarm or status conditions as follows:

  — Loss of DS1 reference A

  — Loss of DS1 reference B

  — Loss of one clock unit

  — Loss of both clock units

  — Loss of one power supply

  — Loss of both power supplies

The output of the CI and PAI cards go directly to the TN780 Tone-Clock circuit pack via two 25-pair amphenol-terminated cables. All of the cards have red and/or green LEDs for providing status or alarm indications. The abbreviations used in the table are defined above except for SRC (source) and PLL (Phase Locked Loop).

Table 9-658. Stratum 3 Clock LED Indications

Card	Name	Color	Indication
PAI	REF A	Red	Loss of input reference A or CI A failed
	REF B	Red	Loss of input reference B or CI A failed
	ST A	Red	Failed Stratum 3 clock A
	ST B	Red	Failed Stratum 3 clock B
	PWR A	Green	-48VDC A present
	PWR B	Green	-48VDC B present
CI	FAIL	Red	Card failure
	DS1	Green	DS1 source present
	CC	Green	Composite clock source[1] present
	SRC ACTIVE	Green	Card is currently on-line
ST3	FAIL	Red	Card failure
	LOCK	Red	PLL lost sync with reference or holdover mode
	REF A	Red	Timing Reference from CI A
	REF B	Red	Timing Reference from CI B
TOC	FAIL	Red	Card failure
	PORT ALM	Red	Output port alarm (one or more)
	ST	Green	Reference present from ST clock
	INPUT	Green	Reference present from CI
	500’	Green	500 feet phase advance
	1000’	Green	1000 feet phase advance

1. Composite Clock (CC) source refers to the protocol used to electrically transfer timing from the Stratum 3 clock to the switch. The Composite Clock source is not relevant to the system.

Error Log Entries and Test to Clear Values

Table 9-659. Stratum 3 Clock Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test synchronization r 4
1(a)	Any	Stratum 3 Clock Alarm Query (#649	MINOR	OFF	test synchronization r 4
18(b)	0	disable sync	WARNING	OFF	enable sync
257(c)	Any	Stratum 3 Clock Alarm Query (#649)	MINOR	OFF	test synchronization r 4
513(d)	Any	Stratum 3 Clock Alarm Query (#649	MINOR	ON	test synchronization r 4
769(e)	Any	Stratum 3 Clock Alarm Query (#649)	MINOR	ON	test synchronization r 4
1025(f)	Any	Stratum 3 Clock Alarm Query (#649)	MINOR/ MAJOR(h)	ON	test synchronization r 4
1281(g)	Any	Stratum 3 Clock Alarm Query (#649)	MINOR /MAJOR(h)	ON	test synchronization r 4
1537(i)		none	MINOR/ MAJOR(h)	ON	
1793(j)		none	MINOR/ MAJOR(h)	ON	

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. This error type corresponds to FAIL code 1 of the Stratum 3 Clock Alarm Query (test #649): either reference A failed or the CI card A failed.

b. This error indicates that Synchronization Maintenance has been disabled via the **disable synchronization-switch** command. Execute the **enable synchronization-switch** command to enable Synchronization Maintenance reference switching and to resolve this alarm.

c. This error type corresponds to FAIL code 2 of the Stratum 3 Clock Alarm Query (test #649): one power supply failed.

d. This error type corresponds to FAIL code 4 of the Stratum 3 Clock Alarm Query (test #649): one clock unit failed.

e. This error type corresponds to FAIL code 8 of the Stratum 3 Clock Alarm Query (test #649): either reference B failed or the CI card B failed.

f. This error type corresponds to FAIL code 16 of the Stratum 3 Clock Alarm Query (test #649): all power supplies failed.

g. This error type corresponds to FAIL code 32 of the Stratum 3 Clock Alarm Query (test #649): all clock unit(s) failed.

h. An OFF-BOARD alarm on the Stratum 3 clock, indicates a DS1 facility problem; an ON-BOARD alarm indicates a fault in either the Stratum 3 clock or the connection between the Stratum 3 clock and the switch. If the Stratum 3 clock cannot be referenced and the local oscillator on the TN780 Tone-Clock circuit pack must serve as the reference, a Major alarm is raised. Otherwise, a Minor alarm is raised.

i. This error can be caused by one of the following conditions:

   - One or both TOCs (Timing Output Cards) has failed.
   - The connection between the Stratum 3 clock and the TN780 Tone-Clock circuit pack is faulty.
   - The TN780 Tone-Clock circuit pack is defective.

   A Minor alarm results if the Stratum 3 clock can still provide timing to the switch; otherwise, a Major alarm will be raised because the Stratum 3 clock is not providing timing and the switch is referencing the local oscillator on the TN780 Tone-Clock circuit pack. If only the Active TN780 Tone-Clock circuit pack is faulty, the Standby TN780 Tone-Clock circuit pack becomes active and remains synchronized to the Stratum 3 clock. When the system switches to the Standby Tone-Clock circuit pack, the alarm is resolved, and a TDM-CLK alarm is raised to indicate a possible problem on the TN780 Tone-Clock.

   If the alarm is minor:

   Look for a red LED on either or both TOC cards. If there is a red LED, then replace the card. If there is no red LED, then, using the *Stratum 3 Wiring Guide*, check that the wiring installation is correct. After replacing the card or correctly rewiring the installation, clear the alarm by first issuing the **disable synchronization-switch** command followed by the **enable synchronization-switch** command. The latter procedure will cause synchronization software to switch back to using the Stratum 3 clock again. Wait 2 minutes and then execute the **status synchronization** command. If Maintenance Name on the status screen shows ‘‘STRAT-3,’’ then the problem is resolved.

⚠ CAUTION:

*The **disable synchronization-switch** command followed by the **enable synchronization-switch** command may cause slip alarms. The circuit packs that can experience slips and the associated error log entry for slips are as follows.*

Table 9-660. Timing Slip Error Types

Circuit Pack Name	Error Log Name	Error Log Entry for Slips
DS1 Interface	DS1-BD	3073 to 3160
Expansion Interface	EXP-INTF	2305
Switch Node Interface	SNI-BD	1537
Tone-Clock	TDM-CLK	1025
UDS1 Interface	UDS1-BD	3073 to 3160

If the alarm is major:

Check connections between the Stratum 3 clock and the switch. If there are no loose connections, then, using the *Stratum 3 Wiring Guide*, check that the wiring installation is correct. After reconnecting the loose connection or correctly rewiring it, clear the alarm by first issuing the **disable synchronization-switch** command followed by the **enable synchronization-switch** command. Wait 1-minute, and then execute the **status synchronization** command. If Maintenance Name on the status screen shows ‘‘STRAT-3,’’ then the problem is resolved.

If the Standby Tone-Clock circuit pack became active:

Check the connection between the Stratum 3 clock and the TN780 Tone-Clock circuit pack from which the system has just switched. If there are no loose connections, then, replace the TN780 Tone-Clock circuit pack. Refer to the ‘‘How to Replace the Tone-Clock circuit pack’’ section in the TDM-CLK (TDM Bus Clock) Maintenance documentation. Before switching back to the new TN780 Tone-Clock circuit pack, use the **test tone-clock UC long** command to check that the Tone-Clock is receiving a signal from the Stratum 3 clock. If all tests pass, switch to the new Tone-Clock circuit pack via the **set tone-clock UC override** command. If Test #651 fails, then the original TN780 Tone-Clock should be reinserted, and the cable between the Stratum 3 clock and the TN780 Tone-Clock circuit pack should be replaced. If Test #651 continues to fail, then escalate the problem.

For all of the above cases if slip alarms exist after following the repair procedures, clear the slip alarms by running the **test board** command with the **clear** option. See the table on the previous page for a list of circuit packs and associated slip error log entries.

This error indicates that the Tone-Clock circuit pack in the master port network is not a TN780. If duplicate Tone-Clock circuit packs exist in the master port network, this error may mean that one or both Tone-Clock circuit packs are not TN780s. Verify that the Tone-Clock(s) in the master port network are TN780s.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *Stratum 3 Clock Alarm Query Test,* for example, you may also clear errors generated from other tests in the testing sequence.

The **test synchronization** commands also runs the Test Synchronization test (test #417). Test 417 is described in the SYNC section.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Stratum 3 Clock Alarm Query (#649)	X	X	ND

1. D = Destructive, ND = Non-destructive

Stratum 3 Clock Alarm Query (#649)

This test queries the Stratum 3 clock for its alarm status and reports the results of the query. The Stratum 3 clock provides the system with the following six alarm indications via the TN780 Tone-Clock circuit pack:

- Reference A failed or CI card A failed.
- Reference B failed or CI card B failed.
- One power supply failed.
- All power supplies failed.
- One clock unit failed.
- All clock unit(s) failed.

CAUTION:

The removal of a card in the Stratum 3 clock may cause alarm(s) to be resolved and the query test to pass. However, the removed cards should still be replaced to restore the Stratum 3 clock to full service.

Table 9-661. TEST #161 Looparound Test

Error Code	Test Result	Description/ Recommendation
1001	ABORT	The system could not allocate the necessary resources to run this test. 1. Retry the command at 1-minute intervals up to a maximum of 3 times.
1005	ABORT	This test aborts when it is run on a Stratum 4 system. Do not change synchronization to Stratum 3 without consulting the synchronization plan administrator for this switch.
2500	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.
1	FAIL	Either Reference A failed or CI card A failed. This condition usually indicates a failure of the DS1 reference; however, there may also be a failure of the CI card to which the reference is connected. The system technician dispatched to investigate this problem should take a spare CI card in case the CI card caused the failure. If you are NOT ON-SITE, use the following procedure: 1. Look for DS1-BD (DS1 Interface Circuit Pack) errors using the **display error** command. Refer to the DS1-BD Maintenance documentation for recommended strategy to resolve any DS1-BD errors found. 2. If there are no DS1-BD errors OR after resolving all DS1-BD errors, issue the **test synchronization r 4** command to determine if the alarm is still present. If all repetitions of the tests pass, then the alarm no longer exists. Otherwise, the system technician should be dispatched with a spare CI card to use the following instructions on-site. (*continued*)

Continued on next page

Table 9-661. TEST #161 Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	(*continued*) If you are ON-SITE, use the following procedure: 1. Look for a red LED on CI card A (i.e., the left CI card). If there is a red LED, then replace the CI card, if a spare is available. If no spare CI is available on-site, proceed to Step 3. If after replacing the CI card, the red LED on the new CI card lights also, then proceed to Step 3. 2. If a spare CI card is available, replace the suspect CI card. Otherwise, issue the **test synchronization r 4** command to clear the alarm. If any test repetitions fail, then follow the procedure for those failures. 3. Look for DS1-BD (DS1 Interface Circuit Pack) errors using the **display error** command. Refer to the DS1-BD Maintenance documentation for recommended strategy to resolve any DS1-BD errors found. If there are no DS1-BD errors, then proceed to Step 5. 4. After all DS1-BD errors have been resolved, then determine if the alarm still exists by issuing the **test synchronization r 4** command to clear the alarm. If any test repetitions fail, then follow the procedure for those failures. 5. Check the DS1 reference A connections to the Stratum 3 clock. 6. Determine if the alarm still exists by issuing the **test synchronization r 4** command to clear the alarm. If any test repetitions fail, then follow the procedure for those failures.
2	FAIL	One power supply failed. This error only occurs when the Stratum 3 clock has two power supplies, and one of them has failed. However, the clock can function with one power supply. 1. Locate the failed power supply by looking for a power supply with a red LED and replace it. The power supply is located under the Stratum 3 clock carrier. 2. Determine if the alarm still exists by issuing the **test synchronization r 4** command to clear the alarm. If any test repetitions fail, then follow the procedures for those test failures.

Continued on next page

Table 9-661. TEST #161 Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
4	FAIL	One clock unit failed. 1. Look at the Stratum 3 cabinet for a red LED on a circuit card marked ‘‘ST3.’’ Replace the card. 2. Determine if the alarm still exists by issuing the **test synchronization r 4** to clear the alarm. If any test repetitions fail, then follow the procedures for those failures.
8	FAIL	Reference B failed or CI card B failed. This condition usually indicates a failure of the DS1 reference; however, there may also be a failure of the CI card to which the reference is connected. The system technician dispatched to investigate this problem should take a spare CI card in case the CI card caused the failure. If you are NOT ON-SITE, use the following procedure: 1. If there were no DS1-BD errors, OR if all DS1-BD errors have been resolved, enter **test synchronization r 4** to determine if the alarm is still present. If all repetitions of the tests pass, the alarm no longer exists. Otherwise, the system technician should be dispatched with a spare CI card to perform the following instructions on-site.
8	FAIL *(cont’d.)*	If you are ON-SITE, use the following procedure: 1. Look for a red LED on a CI card B (the CI card on the right). If there is a red LED, then replace the CI card, if a spare is available. If no spare CI is available on-site, proceed to Step 3. If, after replacing the CI card, the red LED on the new CI card lights, proceed to Step 3. 2. Otherwise, enter **test synchronization r 4** to clear the alarm. If any test repetitions fail, follow the procedure for those failures. 3. Enter **display errors** and look for DS1-BD errors. If there are any, refer to “DS1-BD”. If there are no DS1-BD errors, proceed to Step 5. 4. After all DS1-BD errors have been resolved, determine if the alarm still exists with **test synchronization r 4**. If any test repetitions fail, follow procedures for those failures. 5. Check the DS1 reference A connections to the Stratum 3 clock. 6. Determine if the alarm still exists with **test synchronization r 4** to clear the alarm. If any test repetitions fail, then follow procedures for those failures.

Continued on next page

Table 9-661. TEST #161 Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
16	FAIL	All power supplies failed. 1. Replace the failed power supplies. 2. If battery backup for the Stratum 3 clock is not supplied or if the battery backup holdover time has been exceeded, then the system will be referencing the local oscillator on the Active TN780 Tone-Clock circuit pack until software detects that one or both power supplies has(have) been restored (approximately 40 minutes). To speed up this restoration, issue the **test synchronization r 4** command. All tests should pass. If any repetitions should fail, then follow the procedures for those failures. The battery backup is located under the Stratum 3 clock carrier.
32	FAIL	All clock unit(s) failed. 1. Look at the Stratum 3 cabinet for red LEDs on circuit cards marked ‘‘ST3.’’ Replace the card(s). 2. Determine if the alarm still exists by issuing the **test synchronization r 4** command to clear the alarm. If any test repetitions fail, then follow the procedure for those failures.
2101	FAIL	The TN780 Tone-Clock circuit pack detects loss of signal. Refer to note h of the STRAT-3 Hardware Error Log Entries table in the STRAT-3 (Stratum 3 Clock) Maintenance documentation for replacement procedures.
	PASS	The Stratum 3 clock has reported that it has no alarm conditions. If synchronization problems have been reported, look for SYNC errors and refer to SYNC (Synchronization) Maintenance documentation for recommended strategy for those errors.

SVC-SLOT (Service Slot)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
SVC-SLOT	MINOR	none	Service Slot

The Service Slot maintenance object detects the insertion of an invalid circuit pack a dedicated SERVICE slot. The SERVICE slot is the leftmost slot in the J58890BB Port Carrier, and is identified as slot location "00" in all commands, field entries, and displays on the management terminal.

Since this slot does not provide tip and ring connectivity to the wall field, only the following circuit packs are allowed:

- TN744 Call Classifier
- TN750 Integrated Announcement
- TN771 Maintenance/Test
- TN725 Speech Synthesizer
- TN433 Speech Synthesizer
- TN457 Speech Synthesizer
- TN748 Tone Detector
- TN420 Tone Detector
- TN755 Neon Power Unit

A MINOR alarm is generated against the Service Slot maintenance object when a circuit pack with a type other than that listed above is inserted in a SERVICE slot.

The Service Slot maintenance object name is used instead of the maintenance object name for the illegal circuit pack to prevent any attempt to assign a port to an illegal circuit pack physically inserted in the SERVICE slot.

Error Log Entries and Test to Clear Values

Table 9-662. Service Slot Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
600(a)		None	MINOR	ON	

Note:

a. Error type 600 indicates that a non-permitted circuit pack was inserted in slot 00, the SERVICE slot, of a J58890BB port carrier. See the preceding list of valid circuit packs for this slot.

   The code of the invalid circuit pack can be displayed by using the **list configuration board UUCSS** command where UU is the cabinet number, C is the carrier letter, and SS is the slot number (always 00) of the alarmed circuit pack.

   To retire the alarm, remove the invalid circuit pack.

SW-CTL (Switch Control)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
SW-CTL	MAJOR[2]	test switch-control [a|b] short	Switch Control
SW-CTL	WARNING	test switch-control [a|b] short	Switch Control

1. In a system with simplex SPE, the carrier location, a need not be specified. In a system with duplicated SPEs, carrier a or b must be specified.
2. After a spontaneous SPE interchange has occurred, the Alarm Log retains for three hours a record of any MAJOR ON-BOARD alarm against an SPE component that took place before the interchange. If a spontaneous interchange has occurred (as indicated by STBY-SPE error type 103 or the **display initcauses** screen), and such an alarm is logged against SW-CTL, then replace the standby MSSNET circuit pack using the "lock-and-power-down" procedure described in Chapter 5.

The Switch Control resides on the MSSNET (Mass Storage System and Network Control) circuit pack (UN332). The Mass Storage System Host Adapter (HA) also resides on the MSSNET circuit pack. Systems equipped with the Standard Reliability configuration have a single MSSNET circuit pack and systems equipped with the High Reliability or Critical Reliability configuration have two MSSNET circuit packs, one in each Switch Processing Element (SPE) complex. The MSSNET cannot be replaced in a system with one SPE complex without bringing the system down. The MSSNET in the standby SPE of a system equipped with the High Reliability or Critical Reliability option can be replaced without affecting normal system operation.

The Switch Control sends control information between the SPE and port circuit packs on the Processor Port Network (PPN) as shown in Figure 9-95 on page 9-1783. This control information is sent via the PPN cabinet's TDM (Time Division Multiplexed) bus. The portion of the TDM bus used to transmit control messages is called the control channel. The control channel can be on either TDM bus A or TDM bus B, but only one of the two buses is used for the control channel at any give time.

The Switch Control is involved in sending control channel messages for the setup and takedown of all calls involving endpoints connected to the PPN, but is not involved in the voice or data transmission that takes place during established calls. The Switch Control is also involved in setting up system links used for control of calls involving endpoints connected to Expansion Port Networks (EPNs). Once those links are set up at system boot time, a failure of the Switch Control will not affect existing calls or new calls involving those EPN endpoints.

One of the functions of the Switch Control is to detect when port circuit packs are plugged into or removed from the PPN cabinet. The Switch Control also monitors the health of the control channel on the PPN cabinet TDM bus and informs the SPE when errors occur.

The Switch Control also contains hardware to monitor critical system timing signals and informs the SPE when these signals fail. For example, if the timing signals from a Tone/Clock circuit pack fail, the Switch Control will inform the SPE and the SPE can then switch to a standby Tone/Clock circuit pack, (if Tone-Clocks are duplicated).

On High and Critical Reliability systems (duplicated SPE), a MAJOR alarm failure of the Switch Control circuit on the active SPE results in an SPE interchange, if the health of the standby SPE permits. (Refer to Chapter 1 for more information about duplicated SPEs.) The following sections assume that if the SPEs are duplicated, and if a Switch Control circuit has a MAJOR alarm, the MSSNET circuit pack associated with that Switch Control circuit is located in the standby SPE.

As mentioned above, the MSSNET circuit pack contains both the Switch Control circuit and the MSS Host Adapter circuit. A failure of either circuit will light the red LED on the MSSNET circuit pack.

The **test mssnet** command tests both the Switch Control circuit and the MSS Host Adapter circuit on the MSSNET circuit pack. Whenever the MSSNET circuit pack is replaced, **test mssnet** should be used to verify that both circuits are operating correctly.

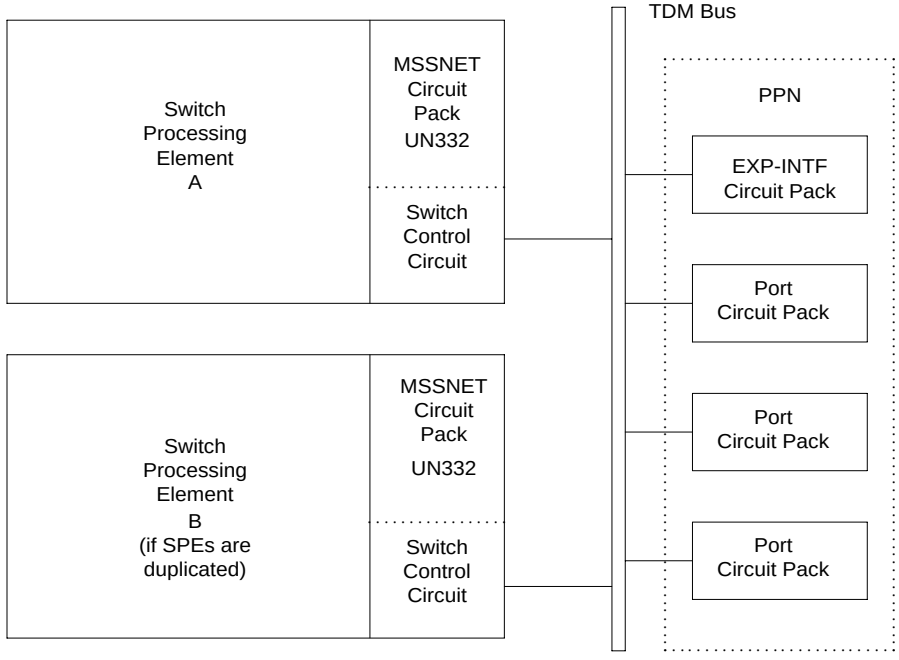

Figure 9-95. Switch Control Connectivity

Error Log Entries and Test to Clear Values

Table 9-663. Switch Control Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test switch-control [a|b] r 3
1(a)		Control Transmission Test (#94)Channel	MAJOR[2]	ON	test switch-control [a|b] r 3
2(b)		Control Channel Transmission Test (#94)	MAJOR[2]	ON	test switch-control [a|b] r 3
150(c)	Any	None	MAJOR[2]	ON	test switch-control [a|b] l c
257(d)	Any	None			
769(e)		None			
1025(f)		Control Channel Interface Test (#92)	MAJOR[2]	ON	test switch-control [a|b] r 2
1281(g)		None			
1537(h)		Switch Control Reset Test (#93)	MAJOR[2]	ON	test switch-control [a|b] l r 2
1793(i)		None			
2561(j)		None	WARNING	OFF	

1. Indicates that an alarm was raised but the associated error could not be entered into the hardware error log due to a momentary overload condition. Run the short test sequence and refer to the appropriate test description for tests that fail.
2. After a spontaneous SPE interchange has occurred, the Alarm Log retains for three hours a record of any MAJOR ON-BOARD alarm against an SPE component that took place before the interchange. If a spontaneous interchange has occurred (as indicated by STBY-SPE error type 103 or the **display initcauses** screen), and such an alarm is logged against SW-CTL, then replace the standby MSSNET circuit pack using the "lock-and-power-down" procedure described in Chapter 5.

Notes:

a. A 1 error indicates that there has been 8 or more Processor Port Network circuit pack removals in less than 15 minutes. This action may be forced manually by removing power to a port carrier or pulling out at least 8 port circuit packs within 15 minutes. The generation of this error may indicate that there is a problem with the Switch Control circuit on the MSSNET circuit pack or that there is a problem with the TDM bus. Three successful completions of the Control Channel test (#94) will resolve the MAJOR alarm caused by this error.

b. A 2 error indicates that the Switch Control Channel Transmission test (#94) failed. This error may not cause a Switch Control alarm if Error Type 769 is also present since this error may actually be caused by the loss of clock signals and not by a Switch Control failure. If the system is not equipped with the High Reliability or Critical Reliability option, or if the Switch control circuit is on the active processor, use the **test switch-control** command to test the Switch Control.

   In a system is equipped with duplicated SPEs and the hardware error is reported against the Switch Control on the standby processor, use the following procedures. The Control Channel Transmission test which detected this error cannot run on the Switch Control circuit on the standby SPE since the Switch Control circuit on the standby SPE is not allowed access to the TDM bus. Therefore if the system is equipped with duplicated SPEs and if this error is associated with the Switch Control circuit on the standby SPE, the error was detected while the Switch Control circuit was running on an active SPE.

   To allow the Control Channel test to run on this circuit, it will be necessary to initiate an SPE interchange, using the procedures described below. This action should only be taken during a time that would cause the least service disruption since exiting calls may disconnect if a failure detected on the newly active Switch Control circuit causes a spontaneous switch back to the other SPE. If this possible action is *not* acceptable, first verify that no TDM bus problems are detected when the **test TDM 1** command is entered and then replace the MSSNET circuit pack on the standby SPE. If TDM problems are detected, refer to the TDM-BUS maintenance documentation to clear those problems.

   1. Initiate a test of the Switch Control circuit on the standby SPE using the **test switch-control C long** command (where C represents the carrier location of the standby SPE) to make sure no other failure conditions can be detected. If failures are detected, use the diagnostic information associated with those tests to clear the failure before proceeding.

   2. Initiate an SPE interchange using the **reset system interchange** command. This should be done at a time that would cause the least service disruption since a fault may still exist on the MSSNET circuit pack. If the system reset command fails, refer to *Failure of Planned Interchange* in Chapter 5 for further actions.

   3. Enter the **test switch-control** command for the Switch Control now on the active SPE and verify that the Control Channel Transmission test (#94) passes. If a failure occurs, an automatic SPE interchange may occur. If an interchange back to the original SPE occurs, replace the MSSNET board on the standby SPE and go back to step 1 above. If other failures are detected, use the repair procedures associated with those tests to clear the failure.

c. A 150 error indicates that a SPE interchange occurred and that the Switch Control circuit on the MSSNET circuit pack was the cause of the spontaneous interchange.

    1. If other SW-CTL errors are present, investigate those errors
    2. If no other SW-CTL errors are present, run the **test switch-control a|b long clear** command and investigate those failures.

d. A 257 error is logged when the Switch Control circuit reports that tests of its internal memory (RAM or ROM) have failed. The receipt of this error causes Switch Control maintenance to run specific Switch Control tests. If there is a problem, the Switch Control tests will normally cause other errors to be logged. In the rare case where no other errors are logged but 257 errors are occurring at a high rate (more than 10 in the last hour) the MSSNET circuit pack should be replaced during a time that would cause the least service disruption. If the system is equipped with the High Reliability or Critical Reliability Configuration this can be done immediately since a MSSNET circuit pack on the standby SPE can be replaced without affecting service.

e. A 769 error occurs when the Switch Control reports a loss of timing signals to the SPE. When this error is present, the Switch Control will not normally be alarmed since any Switch Control test failures are really the result of faulty signals from the Tone/Clock circuit pack. See “TDM-CLK” for the procedures needed to diagnose Tone/Clock circuit pack troubles.

f. A 1025 error indicates that there has been a failure of the Control Channel Interface Test (#92). Refer to the diagnostics for that test to clear the problem.

g. A 1281 error is called a Switch Control handshake error. It is an in-line error not produced by any test. The Aux Data for this error is not meaningful. This error can be ignored.

    The receipt of this errors causes Switch Control maintenance to run specific Switch Control tests. If there is a problem, the Switch Control tests would cause other errors to be logged. 1281 errors do not cause alarms so there is no specific action that can be taken when these errors are observed.

h. A 1537 error indicates that the Switch Control Reset test (#92) failed. A MAJOR alarm is raised if this test fails. Refer to the repair procedures for the Switch Control Reset test (#93).

i. A 1793 error is an in-line error that indicates a possible problem with the interface between the Switch Control and the SPE. The Aux Data for this error is not meaningful. The receipt of this error causes Switch Control maintenance to run specific Switch Control tests. If there is a problem, the Switch Control tests will normally cause other errors to be logged. In the rare case where no other errors are logged but 1793 errors are occurring at a high rate (more than 10 in the last hour) the MSSNET circuit pack should be replaced during a time that would cause the least service disruption. If the system is equipped with the High Reliability or Critical Reliability Configuration this can be done immediately since a MSSNET circuit pack on the standby SPE can be replaced without affecting service.

j. A 2561 error indicates that a software message buffer for downlink port board messages has overflowed and those messages were thrown away. The Aux Data for this error is not meaningful. The SPE is sending more downlink port board messages to the Switch Control than the Switch Control is able to process. A WARNING alarm for this condition will automatically be resolved if no errors of this type are detected within a 15 minute period. If no other errors are logged but 2561 errors are occurring at a high rate (more than 10 in the last hour), follow normal escalation procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Switch Control Reset Test* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Switch Control Reset Test (#93)		X		D
Control Channel Interface Test (#92)	X	X		ND
Control Channel Transmission Test (#94)[2]	X	X		ND

1. D = Destructive, ND = Non-destructive
2. When the SPE is duplicated, this test runs only on the Switch Control circuit on the active SPE. An interchange must be performed to test the other one.

Switch Control Channel Interface Test (#92)

Loop-back messages are sent to the Switch Control via the interface used for control channel messages. The messages are returned to the SPE for verification via the same interface. The TDM bus is not involved in this test since the messages are looped back on the MSSNET circuit pack.

Table 9-664. TEST #92 Control Channel Interface Test

Error Code	Test Result	Description/ Recommendation
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.
1339	ABORT	The test could not run on the standby Switch Control on the MSSNET circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The *SPE Selected* field on the **status spe** screen will display *spe a* or *spe b* if both SPE-SELECT switches are in the a or b positions, respectively.
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is equipped with the High Reliability or Critical Reliability Configuration and if the MSSNET circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code will then change to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2012 2500	ABORT	Internal System Error 1. Retry the command.
2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 retries.
2334	ABORT	The hardware mailbox in the standby Duplication Interface circuit pack is not ready to receive messages. 1. Retry the command at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-664. TEST #92 Control Channel Interface Test — *Continued*

Error Code	Test Result	Description/ Recommendation
Any	FAIL	Messages could not be looped back through the control channel interface. If the system is equipped with the Standard Reliability configuration, you will probably not be able to make or receive calls involving telephones connected to the Processor Port Network. 1. This failure could be due to either a MSSNET circuit pack hardware failure or the loss of system timing signals. If the Switch Control is alarmed, then a MSSNET circuit pack failure should be suspected. If the Switch Control is not alarmed, then investigate the possibility of the loss of system timing signals before attempting to replace the MSSNET circuit pack. See “TDM-CLK”. A TDM Bus Clock problem may cause many port circuit pack red LEDs to light. If only the MSSNET circuit pack LED is lit, suspect the MSSNET circuit pack. If many port circuit pack red LEDs are lit, suspect a TDM Bus Clock problem. Test #92 and Test #94 run as part of the test sequence for the **test switch-control C** command (where C represents the carrier location of the circuit under test). Both tests will fail if the system timing signals are lost. If test #94 passes, then do not suspect the loss of timing signals.
Any *(cont'd.)*	FAIL	2. Run the short test sequence several times to make sure that this failure is occurring consistently. Then run the long test sequence to reset the Switch Control. Sometimes running the long test sequence may clear the problem. If the test is still failing, proceed to step 3 or 4. 3. If the system is still able to process calls, replace the MSSNET circuit pack during a time that would cause the least service disruption. If the system is equipped with the High Reliability or Critical Reliability Configuration this can be done immediately since a MSSNET circuit pack on the standby SPE can be replaced without affecting service. The procedure for replacing the MSSNET circuit pack is described in ‘‘Replacing SPE Circuit Packs’’ in Chapter 5. 4. If calls cannot be made, then replace the MSSNET circuit pack immediately. The procedure for replacing the MSSNET circuit pack is described in ‘‘Replacing SPE Circuit Packs’’ in Chapter 5.
	PASS	The control channel interface between the SPE and the Switch Control is working correctly

Switch Control Reset Test (#93)

This test is destructive if the Switch Control is on the active SPE.

This test resets the Switch Control and determines if it can successfully go through its initialization sequence. The test is destructive if the Switch Control circuit is on an active SPE since there is the possibility of losing some control messages to or from port circuit packs. This test will not affect established calls but call setup may be affected for several seconds.

Table 9-665. TEST #93 Switch Control Reset Test

Error Code	Test Result	Description/ Recommendation
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.
1339	ABORT	The test could not run on the standby Switch Control on the MSSNET circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The *SPE Selected* field on the **status spe** screen will display *spe a* or *spe b* if the SPE-SELECT switches are in the a or b positions, respectively.
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is equipped with the High Reliability or Critical Reliability Configuration and if the MSSNET circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code will then change to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2012	ABORT	Request for results timed out.
2500	ABORT	Internal System Error 1. Retry the command two times.

Continued on next page

Table 9-665. TEST #93 Switch Control Reset Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 retries.
2334	ABORT	The hardware mailbox in the standby Duplication Interface circuit pack is not ready to receive messages. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	The Switch Control could not be successfully reset. If the system is equipped with the Standard Reliability configuration, you will probably not be able to make or receive calls involving telephones connected to the Processor Port Network. 1. This failure could be due to either a MSSNET circuit pack hardware failure or the loss of system timing signals. If the Switch Control is alarmed, then a MSSNET circuit pack failure should be suspected. If the Switch Control is not alarmed, then investigate the possibility of the loss of system timing signals. See “TDM-CLK”. A TDM Bus Clock problem may cause many port circuit pack red LEDs to light. If only the MSSNET circuit pack LED is lit, suspect the MSSNET circuit pack. If many port circuit pack red LEDs are lit, suspect a TDM Bus Clock problem. Test #92 and Test #94 run as part of the test sequence for the **test switch-control C** command (where C represents the carrier location of the circuit under test). Both tests will fail if the system timing signals are lost. If test #94 passes, then do not suspect the loss of timing signals. If the MSSNET circuit pack is determined to be at fault, proceed to step 2. 2. If the system is still able to process calls, replace the MSSNET circuit pack during a time that would cause the least service disruption. If the system is equipped with the High Reliability or Critical Reliability Configuration this can be done immediately since a MSSNET circuit pack on the standby SPE can be replaced without affecting service. The procedure for replacing the MSSNET circuit pack is described in ‘‘Replacing SPE Circuit Packs’’ in Chapter 5. 3. If calls cannot be made, then replace the MSSNET circuit pack immediately. The procedure for replacing the MSSNET circuit pack is described in ‘‘Replacing SPE Circuit Packs’’ in Chapter 5.
	PASS	The Switch Control has initialized correctly. Look at results of the other tests to see if it is operating correctly.

Switch Control-Channel Transmission Test (#94)

Control channel messages are sent from the SPE to selected port circuit packs and the response from the port circuit packs is checked. This tests the ability of the Switch Control to send and receive messages on the control channel of the TDM bus.

For the case when the system is equipped with the High Reliability or Critical Reliability configuration, this test cannot run on the Switch Control in a standby SPE. However, this test may have run and failed while the Switch Control was on the active SPE which will alarm the Switch Control and cause an SPE interchange. In that case, Error Types 2 and 150 will be entered in the error log for the Switch Control on the standby SPE, indicating that a failure of the Switch Control Transmission Test caused a spontaneous SPE interchange. Refer to the Error Log information presented earlier in this repair document for the procedures to clear problems associated with a SW-CTL error log entry of 2.

Table 9-666. TEST #94 Control Channel Transmission Test

Error Code	Test Result	Description/ Recommendation
0	ABORT	The port circuit packs necessary for this test are not available. For this test to pass, it must receive a successful response to a circuit pack query message from at least one of the following circuit pack types in the PPN cabinet: Tone/Clock circuit pack (TN768 or TN780) Tone Detector circuit pack (TN599) 1. Retry the command at 1-minute intervals a maximum of 5 retries. 2. If the test keeps aborting with this abort code, replace the MSSNET circuit pack. 3. If the test keeps aborting with this abort code, verify that the PPN has at least one of the circuit packs listed above.
1335	ABORT	Internal System Error. The MSSNET circuit pack is on the standby SPE and this test is not allowed to execute on a MSSNET circuit pack on the standby SPE. 1. If this abort code is received for a Switch Control on a standby SPE in a system equipped with the High Reliability or Critical Reliability configuration, there must be a software error. Test #94 is not allowed to run on a standby Switch Control. 2. Retry the command at 1-minute intervals, a maximum of 5 times.
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.

Continued on next page

Table 9-666. TEST #94 Control Channel Transmission Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2012 2500	ABORT	Internal System Error 1. Retry the command.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 retries.
0	FAIL	The Switch Control cannot communicate on the TDM bus control channel. If the system is equipped with the Standard Reliability configuration, you will probably not be able to make or receive calls involving telephones connected to the Processor Port Network. 1. Run the short test sequence several times to make sure that this failure is occurring consistently. Then run the long test sequence to reset the Switch Control. Sometimes, running the long test sequence may clear the problem. Remember that the long test sequence is *destructive*. Placing and receiving of calls will be affected for several seconds. 2. If there are no TDM Bus alarms against the standby TDM bus, switch the control channel from its current bus to the standby bus using the **set tdm** command. Refer to the TDM-BUS maintenance documentation for information on how to use this command. If this test passes on the new bus, then investigate the possibility of TDM Bus failures. If the test fails even after the control channel is switched to the standby TDM bus, then proceed to Step 3 or 4. 3. If the system is still able to process calls, replace the MSSNET circuit pack during a time that would cause the least service disruption. If the system is equipped with the High Reliability or Critical Reliability Configuration this can be done immediately since a MSSNET circuit pack on the standby SPE can be replaced without affecting service. The procedure for replacing the MSSNET circuit pack is described in ‘‘Replacing SPE Circuit Packs’’ in Chapter 5. 4. If calls cannot be made, then replace the MSSNET circuit pack immediately. The procedure for replacing the MSSNET circuit pack is described in ‘‘Replacing SPE Circuit Packs’’ in Chapter 5.
	PASS	The Switch Control can communicate with selected port circuit packs over the TDM bus.

SYNC (Synchronization)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
SYNC	MINOR	display errors	Synchronization
SYNC	WARNING	test synchronization	Synchronization

This section discusses synchronization problems local to the switch. For further information about synchronization including network synchronization, see the *AT&T Network and Data Connectivity*.

Synchronization Maintenance is composed of both hardware and software components and its purpose is to provide a common reference frequency for reliable digital communication between the G3r system and other PBXs, Central Offices(COs) or Customer-Premises Equipment (CPE). Synchronization is implemented using several system components including:

- TN768 or TN780 Tone-Clock
- TN722, TN767 and TN 464 DS1 Interfaces (all suffixes)
- TN572 Switch Node Clock
- TN573 Switch Node Interface
- TN570 Expansion Interface

Synchronization is achieved between the Processor Port Network (PPN) and the Expansion Port Networks (EPNs) via the port network connectivity (PNC) between the networks. Depending on the network synchronization plan and the status of synchronization sources, the system timing reference may be a Tone-Clock circuit pack, DS1 interface or UDS1 circuit packs, or an external Stratum 3 clock. Stratum 4 synchronization extracts timing information directly from a DS1 reference, UDS1 reference, or a Tone-Clock. Stratum 3 synchronization requires the use of a Stratum 3 clock that provides a timing signal derived from DS1 references to the Tone-Clock circuit pack. The external Stratum 3 clock is a more stable timing source than the Stratum 4 clock and provides 24-hour holdover in case of reference failures and redundant components.

If both a primary and a secondary reference are administered for Stratum 4 synchronization, both references must reside in the same port network.

Stratum 4 Synchronization

The system can be configured with primary and secondary synchronization references (DS1 or UDS1 interface circuit packs) when using Stratum 4 synchronization. If this is the master synchronization source for the network, then its local oscillator is used and no DS1s are used as references. If this system is a slave in the network, a primary reference must be used as the synchronization reference and the secondary reference is optional:

- If the primary synchronization reference is not providing a valid timing signal, the system automatically switches to the secondary synchronization reference.
- If the primary synchronization reference is invalid and secondary reference does not provide a valid timing signal or is not administered as a synchronization reference, a Tone-Clock circuit pack provides the system timing source.
- If the system is using the local oscillator as the timing source (both the primary and secondary references are providing invalid timing signals), should either the primary or secondary reference becomes valid again, the system switches back to the primary or secondary source.
- When both the primary and secondary source become valid, the system switches to the primary source, since the primary source is always preferred over the secondary source when both sources are equally healthy.

If the primary synchronization reference is providing a valid timing signal, then the flow of system synchronization would travel from the DS1 interface circuit pack in the PPN across the active PPN to EPN fiber links to the two EPNs. The PPN DS1 interface circuit pack provides a timing signal for the PPN Tone-Clock circuit pack and the PPN Tone-Clock circuit pack provides timing for all circuit packs in the PPN. Each PPN Expansion Interface circuit pack uses the timing generated by the Tone-Clock circuit pack to clock data from the fiber links to the Expansion Interface circuit packs in the two EPNs. The active EPN Expansion Interface circuit pack uses the received data stream to generate a timing signal. The Tone-Clock circuit packs in the EPNs use this signal to generate timing for all the circuit packs in their respective EPNs. The PPN, in the above mentioned scenario, is designated the *master* port network and the EPNs are called *slave* port networks. The *master* port network is defined as the port network that contains the system synchronization source. If the primary synchronization reference does not provide a valid timing signal, Synchronization Maintenance will switch to the secondary reference. *Both the primary and secondary references must reside in the same port network, which may be any port network. The PPN is the recommended location.*

If TDM-CLK error 2305 is in the error log, then a slave Tone-Clock loss of signal condition exists on the slave Tone-Clock circuit pack that has this error. If only one loss of signal occurred, the slave Tone-Clock circuit pack is receiving the timing signal from the standby EI circuit pack (in this example, the timing is coming from the PPN to the EPN over the standby fiber link). If another loss of signal occurred after the Tone-clock circuit pack switched to receive timing from the standby EI, the Tone-clock circuit pack will run on its local oscillator. The yellow LED on the Tone-clock circuit pack flashes at the 2.7 seconds on and .3 seconds off rate (mostly on) if timing is received from an external source (an EI in this example). Otherwise, if the Tone-clock circuit pack is running on its local oscillator, the yellow LED flashes at the .3 seconds on and 2.7 seconds off rate (mostly off).

The TN722 DS1 Interface circuit pack does not provide a synchronization reference as reliable as the TN767 or TN464C circuit packs. Therefore, it is recommended that the TN767 or TN464C circuit packs are used as primary or secondary sources instead of the TN722 type DS1 circuit packs.

Stratum 3 Synchronization

Figure 9-96 illustrates one possible configuration of Stratum 3 synchronization.

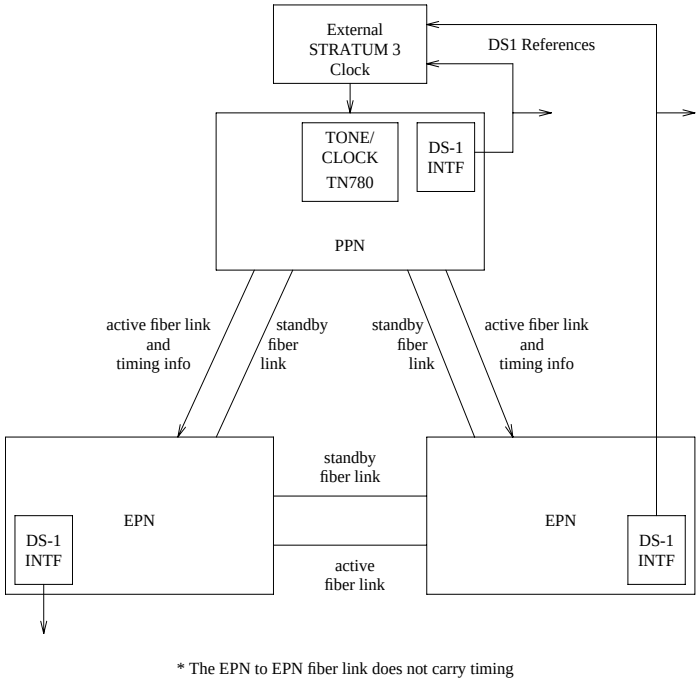

Figure 9-96. Typical Duplicated Direct-Connect Stratum 3 Synchronization Configuration

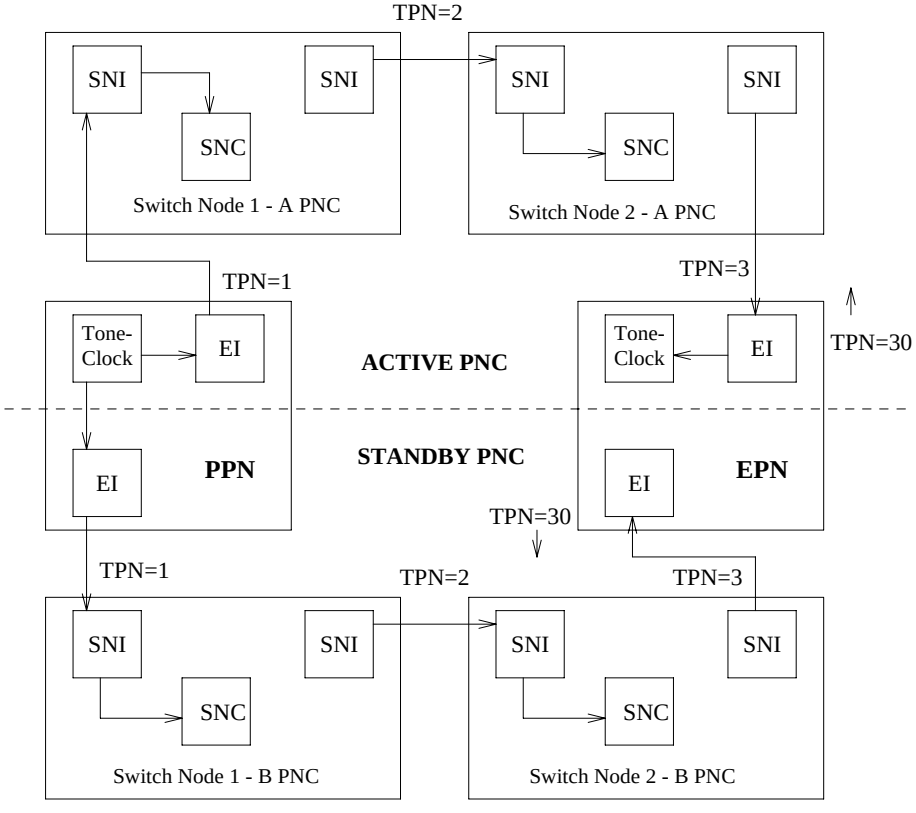

For Stratum 3 synchronization, an external clock provides a timing signal to a TN780 Tone-Clock circuit pack, and the TN780 provides timing to all circuit packs in the PPN in which the TN780 resides (the external stratum 3 clock is only allowed in the PPN). Each PPN Expansion Interface circuit pack uses the timing generated by the TN780 to clock data from the active PPN to EPN fiber links. The active EPN Expansion Interface circuit packs use the received data stream to generate a timing signal which is used by the Tone-Clock circuit packs in the EPNs to provide timing for all circuit packs in their respective EPNs. (The EPN Tone-Clock circuit packs can be either TN780s or TN768s; only the Tone-Clock circuit pack(s) connected to the external Stratum 3 clock must be TN780s.) The PPN, in the above mentioned scenario, is designated the *master* port network and the EPNs are called *slave* port networks. The *master* port network is defined as the port network that contains the system synchronization source, the Stratum 3 clock in this case. The Stratum 4 equipment (usually a PBX) should never provide timing to a Stratum 3 PBX.

If TDM-CLK error 2305 is in the error log, then a slave Tone-Clock loss of signal condition exists on the slave Tone-Clock circuit pack that has this error. If only one loss of signal occurred, the slave Tone-Clock circuit pack is receiving the timing signal from the standby EI circuit pack (in this example, the timing is coming from the PPN to the EPN over the standby fiber link). If another loss of signal occurred after the Tone-clock circuit pack switched to receive timing from the standby EI, the Tone-clock circuit pack will run on its local oscillator. The yellow LED on the Tone-clock circuit pack flashes at the 2.7 seconds on and .3 seconds off rate (mostly on) if timing is received from an external source (an EI in this example). Otherwise, if the Tone-clock circuit pack is running on its local oscillator, the yellow LED flashes at the .3 seconds on and 2.7 seconds off rate (mostly off).

Synchronization in a Center Stage Switch Configuration

In the following typical duplicated Center Stage Switch (CSS) configuration, the timing signal from the *master* port network, the PPN in this diagram, is sent to all circuit packs in its network. The timing signal is sent from the Expansion Interface (EI) circuit packs in the PPN to the Switch Node Interface (SNI) circuit packs in the switch node carriers. The EIs in the *master* port network also sends out a timing priority number (TPN) of 1. Every *slave* port network EI sends out a TPN of 30. The active Switch Node Clock (SNC) circuit pack in each switch node carrier decides which SNI is providing the timing signal that the switch node carrier should synchronize to by looking at each SNI's incoming TPN. The SNC chooses the SNI with the lowest numbered TPN to synchronize to. The SNC then sends the timing signal to all SNIs and the standby SNC, if a standby SNC is present, in the switch node carrier. The SNC also sends out a TPN equal to 1 plus the lowest incoming TPN. Each SNI in the switch node sends the timing signal received from the SNC and the TPN from the SNC out on its associated fiber.

If TDM-CLK error 2305 is in the error log, then a slave Tone-Clock loss of signal condition exists on the slave Tone-Clock circuit pack that has this error. In this case, the slave Tone-Clock circuit pack is receiving the timing signal from the standby EI circuit pack in the port network that has the TDM-CLK 2305 error or from its local oscillator. The yellow LED on the Tone-clock circuit pack flashes at the 2.7 seconds on and .3 seconds off rate (mostly on) if timing is received from an external source (for example, an EI circuit pack). Otherwise, if the Tone-clock circuit pack is running on its local oscillator, the yellow LED flashes at the .3 seconds on and 2.7 seconds off rate (mostly off).

Timing information is sent through both the active and standby PNCs, but the EPNs normally derive timing from the EIs on the active PC.

Figure 9-97. Typical Center Stage Switch Synchronization Configuration -Two Switch Nodes, Duplicated PNC

Synchronization Troubleshooting

For both Stratum 3 and 4 operation, major and minor alarms indicate that there is a problem with the system synchronization references. These alarms will be resolved when the alarmed synchronization reference is restored.

The **change synchronization** command is used to administer whether Stratum 3 or Stratum 4 synchronization is being used. The **change synchronization** command allows primary and secondary references to be administered for the Stratum 4 option.

The **status synchronization** command shows the current synchronization reference. The **display synchronization** command shows the synchronization references (e.g. primary, secondary, stratum 3) that are administered.

The **list timing-source** command displays all DS1 and UDS1 locations that are allowed to be administered as primary or secondary references with the **change synchronization** command.

Other commands associated with Synchronization Maintenance are **disable synchronization-switch** and **enable synchronization-switch.** These commands are used to disable the ability of Synchronization Maintenance to switch between synchronization references and to enable this switching ability, respectively. The **set synchronization** command is executed only after synchronization has been disabled and is used to manually switch to a specific synchronization reference. This command is useful to diagnose synchronization problems by forcing a specific reference (DS1, UDS1, or Tone-Clock) to be the system synchronization reference to determine if a specific reference is providing a valid timing signal. To switch synchronization to the Stratum 3 clock, use the **enable synchronization-switch** command after verifying that the Stratum 3 clock is wired correctly.

Approach to Troubleshooting

Slip errors are the primary symptom associated with being unsynchronized.

A correct Synchronization plan for the network keeps the systems within the network transmitting data at approximately the same rate to avoid situations where:

- One system transmits data at a rate faster than another system can receive the data (in which case data is lost).
- One system transmits data at a rate slower than another system expects to receive data (in which case data is repeated).

Either of these situations, data being lost or repeated, is a slip.

When troubleshooting synchronization problems when slips are the primary error log entry indications of a synchronization problem, requires that the problem be isolated to:

- A problem outside of the switch, i.e., the switch is not properly synchronized to the rest of the network.
- A problem internal to the switch.

DS1 and UDS1 circuit packs can be administered with slip detection enabled via the **Slip Detection?** field set to a **y** (see the **add ds1**, **change ds1**, and **display ds1** commands). All DS1 and UDS1 circuit packs administered as slip enabled will be counted in the following algorithm:

When over half of the DS1 and UDS1 circuit packs administered as slip enabled are experiencing slips, and the primary or secondary synchronization reference is the current synchronization reference, synchronization will try the other administered synchronization reference.

In situations where one or many circuit packs in the system are experiencing slips, the problem could be with the synchronization reference, with individual circuit packs, or with phase modulation of the transmitted digital bit streams due to environmental variations of the transmission facilities (such as temperature variations that affect the electrical length of a transmission line). The circuit packs that can experience slips and the associated error log entry for slips are as follows.

Table 9-667. Error Log Entries for Slip Errors

Circuit Pack	Error Log Name	Error Log Entry for Slips
DS1 Interface	DS1-BD	3073 to 3160
Expansion Interface	EXP-INTF	2305
Switch Node Interface	SNI-BD	1537
Tone-Clock	TDM-CLK	1025
UDS1 Interface	UDS1-BD	3073 to 3160

When slips occur on the circuit packs mentioned above, first consult the individual circuit pack section in the manual for each circuit pack that has slips. If slips occur in low numbers, they may be due to environmental conditions as described above. If no service degradation is occurring, no action is necessary. Whenever the system switches synchronization sources, slips can be expected from DS1-BD, UDS1-BD, and EXP-INTF circuit packs. If service degradation occurs, after following the repair steps in the individual section, use the following trouble shooting techniques.

The following table lists circuit packs that can report slips and related circuit packs whose hardware problems that cause those slips.

Table 9-668. Slips and Related Circuit Packs

Circuit Pack Reporting Slips	Associated Circuit Packs That Can Cause Slips
DS1 Interface	Active Tone-Clock in same port network
Expansion Interface	Active Tone-Clock in same port network or circuit pack at opposite end of fiber or metallic connection
Switch Node Interface	Circuit pack at opposite end of fiber or metallic connection, or active Switch Node Clock circuit pack in same switch node carrier
Tone-Clock	Current DS1 reference
UDS1 Interface	Active Tone-Clock in same port network

Troubleshooting Synchronization Problems

The following flow chart presents a logical approach to troubleshooting synchronization problems in conjunction with the background information presented above. Explanatory notes follow the charts.

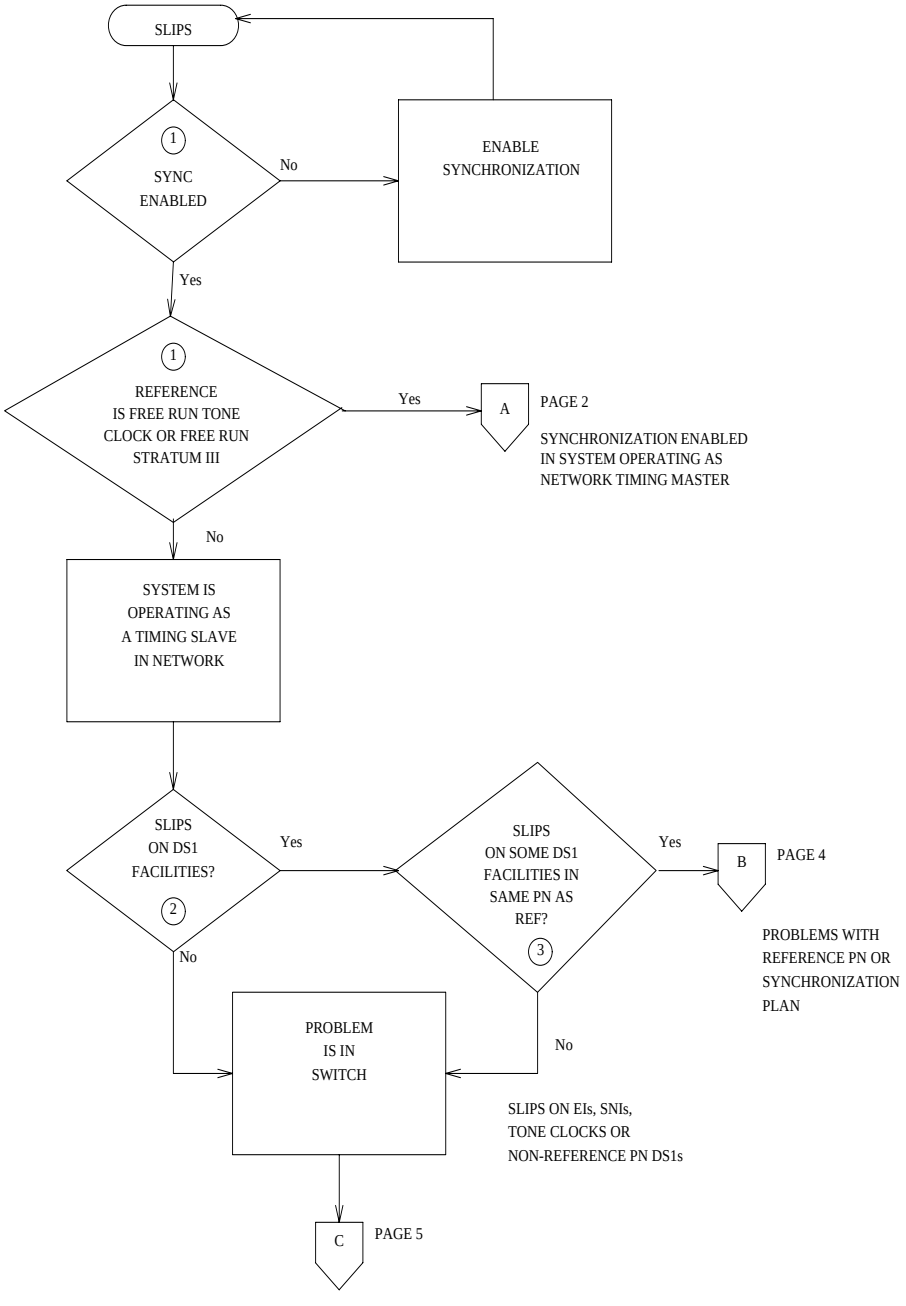

Figure 9-98. Synchronization Troubleshooting, Page 1 of 6

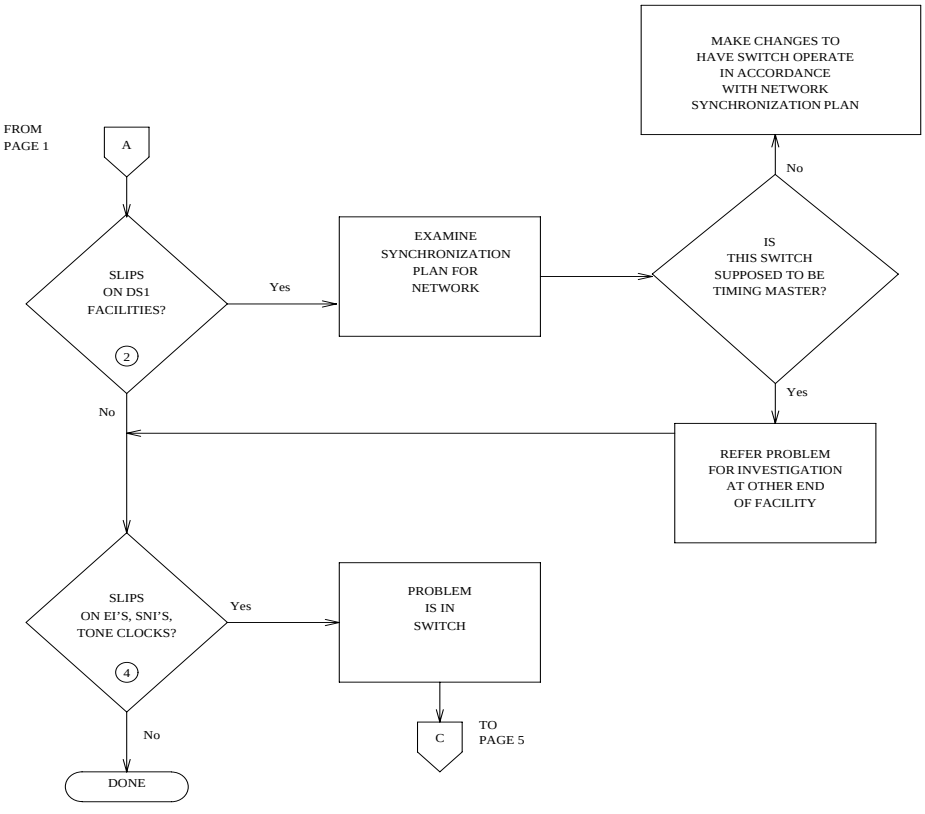

Figure 9-99. Synchronization Troubleshooting, Page 2 of 6

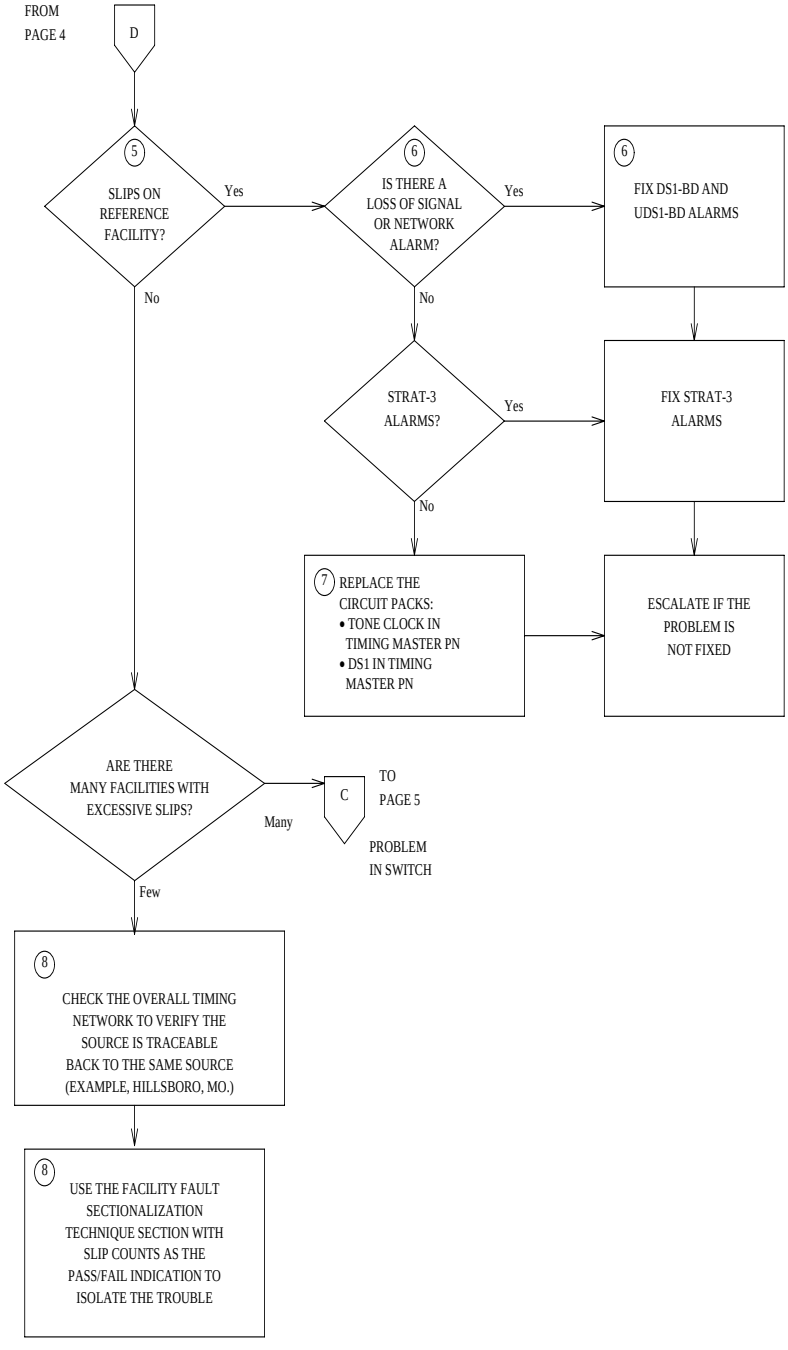

Figure 9-100. Synchronization Troubleshooting, Page 3 of 6

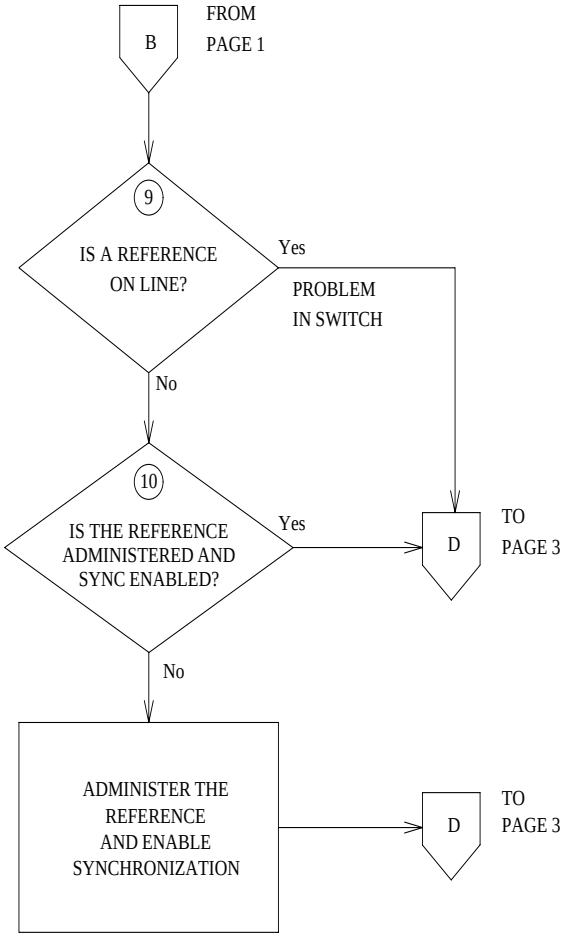

Figure 9-101. Synchronization Troubleshooting, Page 4 of 6

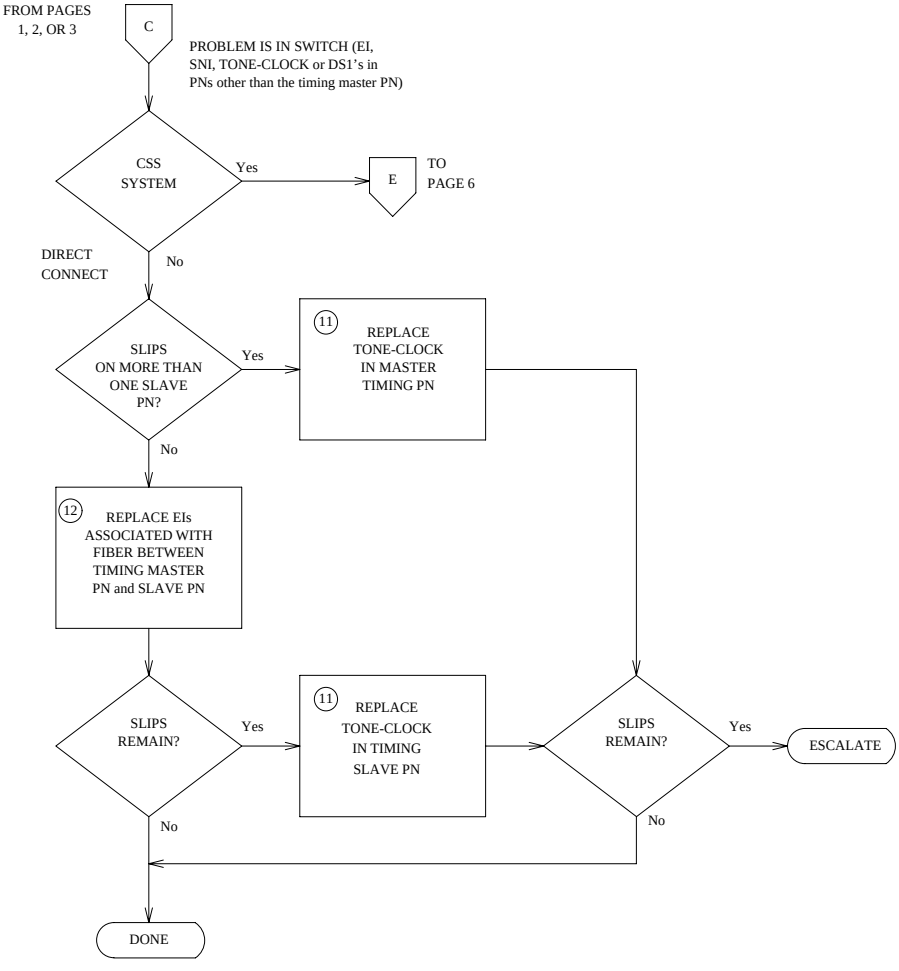

Figure 9-102. Synchronization Troubleshooting, Page 5 of 6

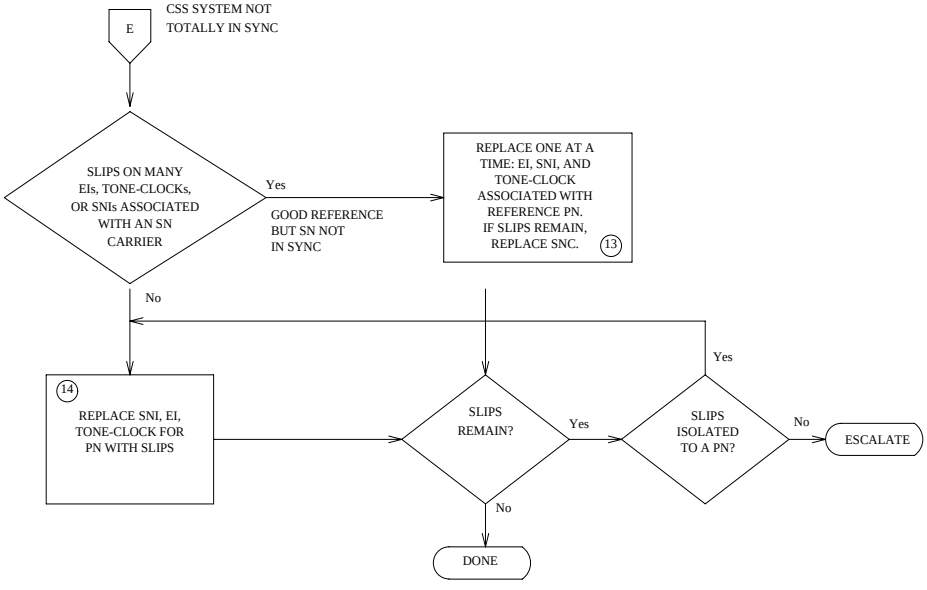

Figure 9-103. Synchronization Troubleshooting, Page 6 of 6

Notes for Sheet 1 through Sheet 6 flowcharts (when checking for slip errors, use the table above, *Error Log Entries for Slip Errors*):

1. Use the **status synchronization** command to determine whether synchronization is enabled and to determine the on-line reference. If the on-line reference is a tone-clock board, the switch is operating in free run mode. If the Stratum 3 is displayed, and no DS1s are connected to the Stratum 3 clock or no DS1 connection existed to the Stratum 3 clock for over 24 hours, then the Stratum 3 clock is in free run mode.
2. Check for slip errors against DS1-BD and UDS1-BD.
3. If Stratum 3 is administered (**display synchronization**) and on-line (**status synchronization**), check for DS1-BD or UDS1-BD slip errors for the DS1(s) or UDS1(s) used as input to the Stratum 3 clock. Check the LED indications on the Stratum 3 clock to determine which DS1 is providing input to the Stratum 3 and examine the cross connect information for that DS1.
4. Check for slips errors against EXP-INTF, SNI-BD, and TDM-CLK.

5. Check **status synchronization** for the current DS1 reference. If a DS1 or UDS1 is on-line, check for slips on that DS1 or UDS1. If Stratum 3 synchronization is administered and the Stratum 3 clock is used as the reference (i.e. the tone-clock local oscillator is not on-line), follow the procedure in step 3 to determine the DS1 reference used as input to the Stratum 3 clock and check for slips on that reference.

6. Check for LOS, Blue, Yellow, and Red Alarms on the on-line reference facility and fix those problems first. See the DS1-BD and/or UDS1-BD for the error log entries associated with the above mentioned alarms. Replace the circuit packs one at a time and wait at least one hour to determine if the problem has gone away. This procedure is disruptive and should be done after hours if possible. An alternative to replacing the tone-clock circuit pack in systems where the tone-clocks are duplicated, is to run the **set tone-clock** command to switch tone-clocks. If the problem goes away, the previously active tone-clock should be replaced.

7. If a few facilities are experiencing slips or are unusable references, the clock source for facilities with slips or that are unusable is not traceable to the same ultimate source as the clock source for the on-line reference facility.

   Examine the overall timing network for the interconnected DS-1 to determine if the clock can be traced back to a single source and if the reference designations for each location in the distribution of timing is supplied in accordance with the *synchronization plan* for the customer. Examine the capability of the external transmission equipment to pass or provide timing.

   Verify the integrity of the on-site hardware by using the *Facility Fault Sectionalization* section, which loops the transmit signal to the receive signal and verifies that the excessive slips or the unusable reference are no longer observed.

   This is a time consuming process that disrupts service. You should perform it after hours if the service being provided by the system is acceptable as determined by checking with the customer.

8. Use **status synchronization** to determine the on-line reference. If a DS1 or Stratum 3 reference is not on-line and the local oscillator of a tone-clock board is on-line, then the answer to this question is "no".

9. Use **display synchronization** to find out what references, if any, are administered. Use **status synchronization** to find out whether synchronization is enabled.

10. If tone-clocks are duplicated, the **set tone-clock** command can be used to switch tone-clocks. If slips go away, then replace the tone-clock that was just switched away from.

11. Use **status pnc** to determine which PNC is active. Then use **list fiber-links** to determine the EIs on the active PNC and the EIs associated with the slave PN. If the switch does not have PNC duplication, the EIs are all on the active PNC, A-PNC. A PNC interchange can be done via **reset pnc interchange** before replacing EIs if the system has PNC duplication. If the slips go away after the PNC interchange, replace the EIs that were previously active.

12. Replace the circuit packs one at a time and wait at least one hour to determine if the problem has gone away. This procedure is disruptive and should be done after hours if possible.

    An alternative to replacing the EI and SNI in systems where the PNC is duplicated, is to perform a PNC interchange via **reset pnc interchange**. If the problem goes away, either the EI or the SNI on the previously active PNC should be replaced. Replace one at a time and make that PNC active again to determine whether the problem is fixed.

    An alternative to replacing the tone-clock circuit pack in systems where the tone-clocks are duplicated, is to run the **set tone-clock** command to switch tone-clocks. If the problem goes away, the previously active tone-clock should be replaced.

    Also, before replacing an SNC circuit pack, the **set switch-node-clock** command can be used if SNCs are duplicated in the carrier. If the problem goes away, the previously active SNC should be replaced.

13. Replace the circuit packs one at a time and wait at least one hour to determine if the problem has gone away. This procedure is disruptive and should be done after hours if possible.

    An alternative to replacing the EI and SNI in systems where the PNC is duplicated, is to perform a PNC interchange via **reset pnc interchange**. If the problem goes away, either the EI or the SNI on the previously active PNC should be replaced. Replace one at a time and make that PNC active again to determine whether the problem is fixed.

    An alternative to replacing the tone-clock circuit pack in systems where the tone-clocks are duplicated, is to run the **set tone-clock** command to switch tone-clocks. If the problem goes away, the previously active tone-clock should be replaced.

    Also, before replacing an SNC circuit pack, the **set switch-node-clock** command can be used if SNCs are duplicated in the carrier. If the problem goes away, the previously active SNC should be replaced.

Facility Fault Sectionalization

DS-1 facility fault sectionalization involves looping around the DS-1 signal at on-site access points to localize the source of the problem to equipment and wiring on either the near side or far side of the loop-around point.

WARNING:

The facility fault sectionalization technique disrupts service. When you perform the looparound on a facility, make sure it is not the on-line synchronization reference or a system outage will occur.

When you use this technique to investigate problems on facilities with multiplex or DACS equipment, the technique becomes cumbersome because all of the 64 Kbps (B-channels) or subrate channels corresponding to the DS-1 facility need to be looped around.

Figure 9-104 shows a sequence of units (1 though n) that may be connected as the on-site equipment. A typical example is the case where the only on-site equipment is channel-terminating equipment designated Unit #1. A more complex, less typical example might have a DACS as Unit #1, a protection switch as Unit #2, and a DS-1-level microwave radio system as Unit #3.

The flowchart in Figure 9-105 on page 9-1811 gives an overview of the facility fault sectionalization technique. It is important that you know the configuration and wiring of the equipment for the problem facility in order to support this technique.

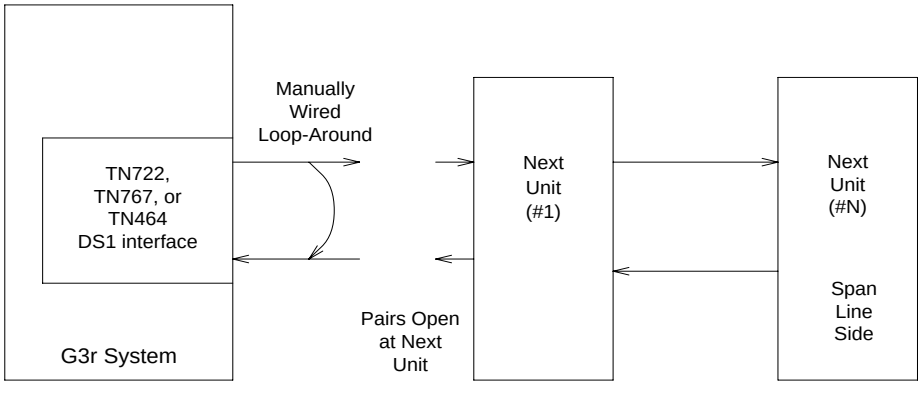

Figure 9-104. Manual Looparound for Facility Fault Sectionalization

Since the technique is time consuming, fix any DS1-BD, UDS1-BD, STRAT-3, or SYNC errors first that are not slip errors.

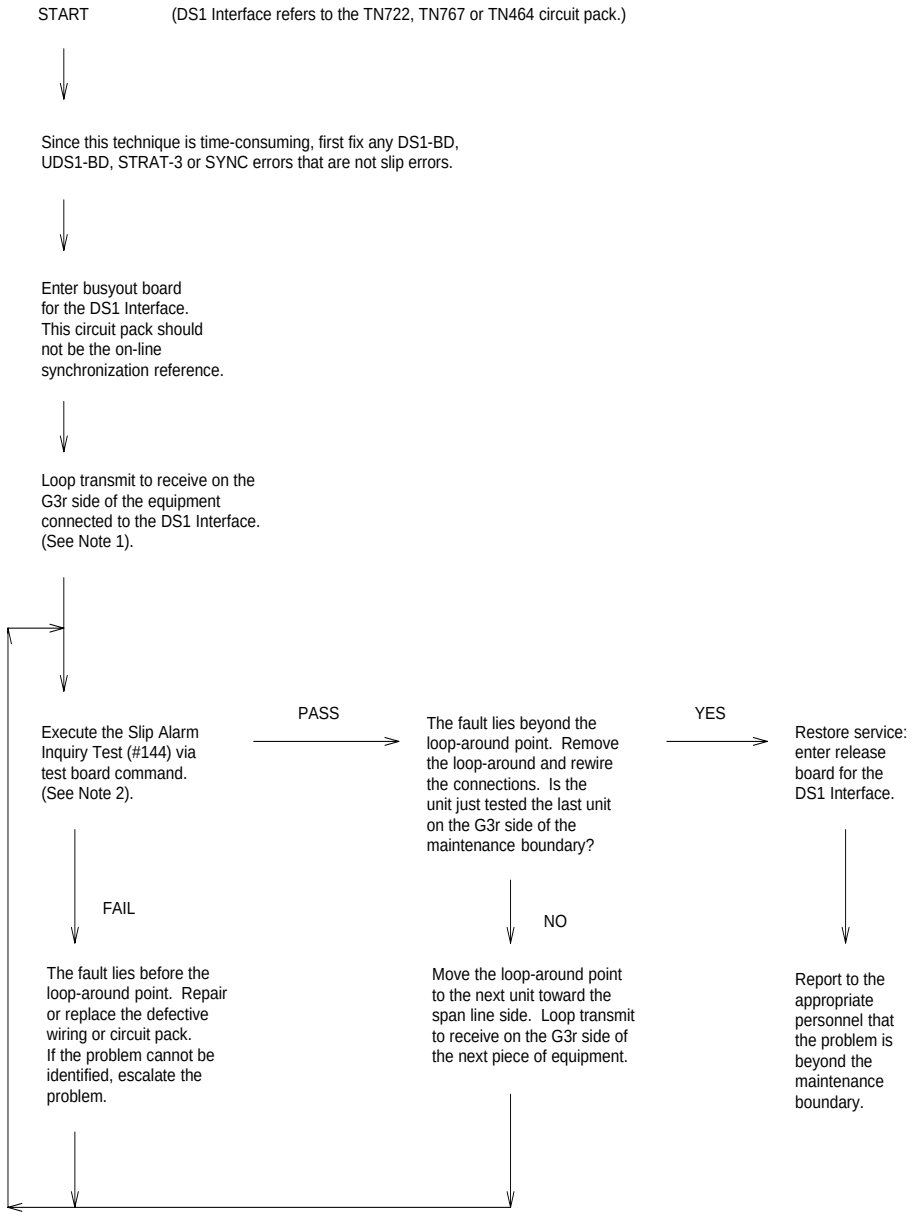

Figure 9-105. Facility Fault Sectionalization

Notes to Facility Fault Sectionalization Flowchart

1. Loop transmit to receive on the system side.

   Remove the transmit signal from the TN722, TN767, or TN464 circuit pack inputs and outputs and loop it around to the receive signal going toward the TN722, TN767, or TN464 circuit pack at the first unit wired to the TN722, TN767, or TN464 circuit pack. (See Figure 9-104 on page 9-1810).

   The looparound signal may take different forms depending on the installation.

   - In some cases, the unit connected to the system may provide a switch or a terminal interface to control the desired looparound. Make sure that the signal is looped toward the system and that the timing signal is looped.
   - In most cases, it may be necessary to temporarily rewire connections at the cross-connect fields to loop the signal back toward the switch.

   The point at which the signal is looped should be one at which physical access is easy and where the signal level is within the line compensation (i.e. equalization) range of the hardware connected. A few cases exist where access to the looparound cannot be easily provided at locations where the signal level is within the line compensation range of the hardware. The line compensation can be changed via the **change ds1 UUCSS** command.

2. Execute the **test board UUCSS** command for the TN722, TN767 or TN464. Look at results of Test #144, the Slip Alarm Inquiry Test. When this test fails, the error code gives the number of slips detected since the last Slip Inquiry Test was run. If the test fails, run it at least one more time to ensure that slips have occurred since the looparound was installed.

Timing Loops

A timing loop exists whenever a system receives timing from another system whose timing reference is directly or indirectly derived from itself. The system synchronization planner *must avoid creating a timing loop* when administering the synchronization references in a system. Timing loops can lead to loss of digital data between systems that are exchanging data with any system within the loop. An invalid timing signal will also be generated by any system within the loop, thus propagating the invalid timing signal to any system(s) using a system within the loop as a synchronization reference.

A correctly designed network has no loops and each piece of equipment in the network is supplied by a clock of equal or lower stratum (i.e.,: the inputs to a Stratum 3 clock should NEVER be from a Stratum 4 device). *Synchronization administration changes should never be done without consulting the overall synchronization plan for the network. If you suspect that synchronization administration changes are needed, follow normal escalation procedures.*

Synchronization Switches Away from the Current Timing Reference

Synchronization will switch away from a DS1 reference (primary or secondary) if the current DS1 reference is not providing a valid timing signal. The other DS1 reference will be used if one is administered and providing a valid timing signal. Otherwise, the local oscillator of the Tone-Clock circuit pack in the same port network as the DS1 reference will be used. The following conditions will cause a synchronization switch:

- The current DS1 reference is not inserted (i.e. **list configuration board UUCSS** shows "no board").
- The current DS1 reference has a loss of signal error (DS1-BD and UDS1-BD error type 1281), a blue alarm error (DS1-BD and UDS1-BD error type 1793), a red alarm error (DS1-BD and UDS1-BD error type 2049), or a hyperactive angel error (DS1-BD and UDS1-BD error type 1538). A corresponding alarm log entry is not required.
- DS1 and UDS1 circuit packs can be administered with slips detection enabled via the **Slip Detection?** field set to a **y** (see the **add ds1**, **change ds1**, and **display ds1** commands). When over half of the DS1 and UDS1 circuit packs administered as slip enabled are experiencing slips, and the primary or secondary synchronization reference is the current synchronization reference, synchronization will try the other administered synchronization reference if the other administered reference does not have the above two conditions. The **list measurements ds1-log** command can be used to get an historical perspective of DS1 facility operation.

The following conditions will cause a switch to the other DS1 reference if one exists and the other DS1 reference is more healthy:

- The current DS1 reference has a misframe error (DS1-BD error type 3329 to 3345 or UDS1-BD error type 3585-3601). A corresponding alarm log entry is not required.
- The current DS1 reference has a slip alarm (DS1-BD and UDS1-BD error type 3073 to 3160). A corresponding alarm log entry is required.

If the above conditions are repaired and no longer apply, synchronization will switch back to the primary reference.

Tone-Clock Circuit Pack LEDs

The yellow and green LEDs of the TN768 and TN780 Tone-Clock circuit packs flash in a specific pattern to indicate the status of the circuit pack. For example, these flashing LED patterns are used to indicate if a Tone-Clock circuit pack is deriving timing from an external source or whether the Tone-Clock circuit pack is providing the timing signal for the port network.

The yellow and green LED patterns for the TN768 and TN780 Tone-Clock circuit pack are as follows:

Table 9-669. Tone-Clock Yellow/Green LED Flashing Codes

Circuit Pack Condition	Tone-Clock State	Explanation
[1]flashing yellow 2.7 seconds on .3 seconds off	active	This light pattern indicates that an external timing source is being used as a synchronization reference.
flashing yellow .3 seconds on 2.7 seconds off	active	This light pattern indicates that the circuit pack is being used as a synchronization reference.
steady yellow on	active	This light pattern indicates that the light has been reset but has not been told which synchronization reference source to use.
steady yellow off	standby	This light pattern indicates that the circuit pack is in standby mode (neither generating tones nor supplying clocks).
"jingle bells" green and yellow .1 seconds on, .2 seconds off, .1 seconds on, .4 seconds off, .4 seconds on, .4 seconds off,	standby	The system is running maintenance tests on the standby circuit pack. (the standby Tone-Clock circuit pack is providing tones.)
other green and yellow	active	The system is running maintenance tests on the active circuit pack

1. The external synchronization reference being used is a primary reference, a secondary reference, or the external stratum 3 clock when the Tone-Clock is in the master port network. The external synchronization reference used in a slave port network is the Expansion Interface circuit pack.

Error Log Entries and Test to Clear Values

Table 9-670. Synchronization Maintenance Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test synchronization
1(a)*		None	WARNING/MINOR(h)	OFF	None
18(b)	0	disable sync	WARNING	OFF	enable sync
257(c)*		None	WARNING/MINOR(h)	OFF	None
513(d)*		None	WARNING/MAJOR(h)	OFF	None
769(e)		None	MAJOR	OFF	None
1793(f)[2]	0-50	None	MAJOR	OFF	None
2049(g)[2]	0	None	WARNING	OFF	None

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. It may take up to 1 hour for these alarms to clear via the ‘‘leaky bucket’’ strategy.

Notes:

a. This error indicates a problem with the primary DS1 reference. It will be cleared when the primary reference is restored. The following steps should give an indication of the source of the problem:

1. Check if the primary DS1 interface circuit pack is inserted in the carrier via the **list configuration board UUCSS** command.
2. Verify that the administered primary reference matches the DS1 reference from the network synchronization plan.
3. Test the primary DS1 interface circuit pack via the **test board UUCSS long** command. Check the Error Log for DS1-BD or UDS1-BD errors and refer to the DS1-BD or UDS1-BD (DS1 Interface Circuit Pack or UDS1 Interface Circuit Pack) Maintenance documentation to resolve any errors associated with the primary DS1 (DS1 or UDS1) interface circuit pack. If the only errors against DS1-BD or UDS1-BD are slip errors, then follow the procedures described in the troubleshooting section above. If no errors are listed in the Error Log for the primary DS1 interface circuit pack, continue with the following steps.

4. Test the active Tone-Clock circuit pack in the master port network via the **test tone-clock UUC long** command. Check the Error Log for TDM-CLK errors and verify that TDM Bus Clock Test #148 (TDM Bus Clock Circuit Status Inquiry test) passes successfully. If Test #148 fails with an Error Code 2 through 32, refer to the TDM-CLK (TDM Bus Clock) Maintenance documentation to resolve the problem. If not, continue with the following steps.

5. Execute the **disable synchronization-switch** and then the **enable synchronization-switch** commands. These two commands (when executed together) will switch the system synchronization reference to the primary DS1 interface circuit pack. Check the Error Log and execute the **status synchronization** command to verify that the primary DS1 interface circuit pack is still the system synchronization reference. If the primary DS1 interface circuit pack is not the system synchronization reference, and the master port network does not have duplicate Tone-Clock circuit packs, escalate the problem. If not, continue with the following step.

6. *Duplicated Tone-Clock circuit packs in the master port network:* Switch Tone-Clock circuit packs on the master port network via the **set tone-clock UUC** command, and repeat the disable/enable commands described in the previous step.

   Switch Tone-Clock circuit packs on the master port network via the **set tone-clock UUC** command, and repeat the disable/enable commands described in the previous step.

b. This error indicates that Synchronization Maintenance has been disabled via the **disable synchronization-switch** command. Execute the **enable synchronization-switch** command to enable Synchronization Maintenance reference switching and to resolve this alarm.

c. This error indicates a problem with the secondary DS1 reference. It will be cleared when the secondary reference is restored. Refer to note (a) to resolve this error substituting **secondary** for **primary** in the preceding resolution steps.

d. This error indicates that the Tone-Clock circuit pack is providing the timing source for the system. The primary and secondary (if administered) are not providing a valid timing signal. Investigate errors 1 and 257 to resolve this error.

e. This error indicates that the external Stratum 3 Clock fails to provide the system timing reference. Refer to Stratum 3 Clock Maintenance document to resolve the defective synchronization reference.

f. This error indicates excessive switching of system synchronization references has occurred. When this error occurs, synchronization is disabled and the Tone-Clock circuit pack (in the master port network) becomes the synchronization reference for the system. Execute the following steps to resolve this error:

1. Check for timing loops and resolve any loops that exist.
2. Test the active Tone-Clock circuit pack in the master port network via the **test tone-clock UUC long** command. Check the Error Log for TDM-CLK errors and verify that TDM Bus Clock Test #148 (TDM Bus Clock Circuit Status Inquiry test) passes successfully. If Test #148 fails with an Error Code 2 through 32, refer to “TDM-CLK” to resolve the problem. If not, continue with the following steps.
3. *Duplicated Tone-Clock circuit packs in the master port network:* Switch Tone-Clock circuit packs on the master port network via the **set tone-clock UUC** command.

   Switch Tone-Clock circuit packs on the master port network via the **set tone-clock UUC** command.

   For simplex Tone-Clock circuit packs in the master port network: If this is not a Stratum 3 system, replace the primary and secondary (if administered) DS1 Interface circuit packs.
4. Investigate any other SYNC or STRAT-3 errors.

g. This error indicates that the Expansion Interface circuit packs are experiencing timing slips. This error will increase the bit error rates for data transmission between port networks. The Expansion Interface circuit packs with timing slips have EXP-INTF error 2305.

1. Check the LEDs on the active Tone-Clock circuit packs in the system and verify that the system is properly synchronized.
2. Verify that all the TDM/LAN Bus cables on the backplane are marked WP-91716. Also for a Multi-Carrier Cabinet (MCC), check that the bus terminator type is a ZAHF4 TDM/LAN.

   For a Single Carrier Cabinet verify that the bus terminator type is a AHF110 TDM/LAN.
3. Check for timing loops, and resolve any loops that exist.
4. Check the Error Log for any active as well as resolved Expansion Interface circuit pack errors and refer to EXP-INTF (Expansion Interface Circuit Pack) Maintenance documentation to resolve any errors found.

5. *Duplicated Tone-Clock circuit packs in the slave port networks:*

   - Switch Tone-Clock circuit packs in the slave port networks where EXP-INTF error 2305 also occurs via the **set tone-clock UUC** system technician command. The error count for this particular error should start decrementing once the problem is solved—if the count does not decrease in 15 minutes the problem still persists.
   - If the problem still persists, switch the Tone-Clock in the slave port network back to the previous configuration. Then, perform a PNC interchange via the **reset pnc interchange** command.
   - If the problem still persists, switch the PNC back to the previous configuration via the **reset pnc interchange** command. Then, switch the Tone-Clock circuit packs in the master port network via **set tone-clock UUC**.
   - If the problem still persists, switch the Tone-Clock circuit packs in the master port network back to the previous configuration via **set tone-clock UUC**.
   - Replace the active Expansion Interface circuit pack in the master port network.
   - In a CSS configuration, replace the Switch Node Interface circuit pack connected to the active Expansion Interface circuit pack in the master port network. The **list fiber-link** command can be used to determine the Switch Node Interface circuit pack that is connected to the active Expansion Interface circuit pack in the master port network.
   - If the system synchronization reference is a Tone-Clock circuit pack or the Stratum 3 Clock, follow normal escalation procedures. If the system synchronization reference is a DS1 interface circuit pack, administer a different DS1 interface circuit pack as the primary synchronization reference. If the problem still is not resolved and any slip errors remain, follow the procedures described in the troubleshooting section above.

6. *Simplex Tone-Clock circuit packs in the slave port networks:*

   - Switch the Tone-Clock circuit packs in the master port network via **set tone-clock UUC**.
   - If the problem still persists, switch the Tone-Clock circuit packs in the master port network back to the previous configuration via **set tone-clock UUC**. Test the Tone-Clock circuit packs in the master and slave port networks via the **test tone-clock UUC long** command. Check the Error Log for TDM-CLK errors and verify that TDM Bus Clock Test #148 (TDM Bus Clock Circuit Status Inquiry test) passes successfully. If Test #148 fails with an Error Code 2 through 32, refer to “TDM-CLK” to resolve the problem. If not, continue with the following steps.
   - If the master and slave Tone-Clock circuit packs *do not* fail TDM Bus Clock Test #150 (TDM Bus Clock PPM Inquiry test), replace the Expansion Interface circuit packs that have EXP-INTF error 2305.
   - If the system synchronization reference is a Tone-Clock circuit pack and the master Tone-Clock circuit pack fails TDM Bus Clock Test #150, follow the steps listed in “TDM-CLK” to replace the master Tone-Clock circuit pack.
   - If the system synchronization reference is a DS1 interface circuit pack and the master Tone-Clock circuit pack fails TDM Bus Clock Test #150, the primary or secondary (if administered) synchronization references are not providing valid timing signals for the system. Check the system synchronization references administered, and follow the steps outlined in note (a) if the primary synchronization reference is providing timing for the system or note (c) if the secondary synchronization reference is providing timing for the system.
   - If the slave Tone-Clock circuit pack fails TDM Bus Clock Test #150 but the master Tone-Clock *does not* fail this test, the master Tone-Clock circuit pack must be replaced. Follow the Tone-Clock replacement steps listed in “TDM-CLK”.
   - Replace the active Expansion Interface circuit pack in the master port network.

- In a CSS configuration, replace the Switch Node Interface circuit pack connected to the active Expansion Interface circuit pack in the master port network. The **list fiber-link** command can be used to determine the Switch Node Interface circuit pack that is connected to the active Expansion Interface circuit pack in the master port network.
- If the problem still is not resolved and any slip errors remain, follow the procedures described in the troubleshooting section above.

This error is cleared by a leaky bucket strategy and takes one hour to clear (leak away) the error counter once it is alarmed. Therefore, it may take up to one hour to clear the alarm after the problem is cleared.

h. Noise on the DS1 line can cause transient alarms on synchronization. Therefore, when a sync problem occurs on error types 1, 257, or 513, a WARNING alarm is first raised for 15 to 20 minutes before the alarm is upgraded to a MINOR or MAJOR alarm.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system.

If Stratum 3 is administered via **change synchronization**, the Stratum 3 Clock Alarm Query test (test #649) will also execute when the **test synchronization** command is run. Test 649 is described in the STRAT-3 section.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Test Synchronization Test (#417)	X	X	ND

1. D = Destructive, ND = Non-destructive

Test Synchronization Test (#417)

This test updates all the Synchronization Maintenance component circuit packs with the correct information regarding their role in providing synchronization for the system. All the Tone-Clock, Expansion Interface, DS1 Interface and UDS1 Interface circuit packs in the system are updated via this test. This test will either pass or abort.

Table 9-671. TEST #417 Test Synchronization Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 3 times.
1115	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 3 times.
2500	ABORT	Internal System Error 1. Retry the command at 1-minute intervals a maximum of 3 times.
	PASS	The Synchronization Maintenance component circuit pack parameters have been successfully updated. The system should be synchronized after successful execution of this test. If synchronization problems still exist, refer to the Error Log to obtain information regarding the source of the problem.

SYS-LINK (System Links)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
SYS-LINK	MINOR	test sys-link UUCSSpp	SYSTEM LINKS
SYS-LINK	WARNING	test sys-link UUCSSpp	SYSTEM LINKS

System Links are packet links that originate at the Packet Interface board and traverse various hardware components to specific endpoints. The hardware components involved on the forward and reverse routes can be different, depending upon the configuration and switch administration. Various types of links are defined by their endpoints:

EAL	Expansion Archangel Link terminating at an Expansion Interface board. This link carries CCMS messages.
INL	Indirect Neighbor Link terminating at a Switch Node Interface board
PACL	PNC ATM Control Link terminating at a PNC ATM EI board. This link carries ATM signaling commands from CaPro to the remote TN2238 (ATM-EI) boards.
PGC	Packet Gateway Call-Control Link terminating at a Packet Gateway board
PRI	ISDN PRI D-Channel Link terminating at a Universal DS1 board
RSCL	Remote Socket Control Link terminating at a C-LAN board
RSL	Remote Socket Link teminating at a C-LAN board
SAP	System (Access) Port Link terminating at a Packet Data port
X.25	BX.25 Link terminating at a Packet Gateway port

Recording System Link Events

The system links maintenance object records all errors encountered on the links. Most of these events are not extraordinary unless they occur with an alarming frequency. The events are logged as they occur, leaving a “trail” to help analyze abnormal behavior exhibited by the endpoints attached to the links or the links themselves.

When a link goes down, an alarm is raised immediately. For EAL, INL, and PACL link types a MINOR alarm is raised; for all other link types a WARNING alarm is raised. Other alarming conditions that do not cause the link to go down get a WARNING alarm, regardless of the link type.

Identifying a System Link

In order to trace problems associated with a system link, it is necessary to find its location. The following methods can be used to find the location of the system link:

Display Errors/Alarms

The output of the **display errors** or **display alarm** commands shows the location of the system link for entries with a Maintenance Name of SYS-LINK. You can restrict the scope of the output of these commands by specifying **sys-link** in the `Category` field on the input form. The link type and channel number, if any, are listed under the `Alt Name` field of the report.

List sys-link

The **list sys-link** command lists all system links (location, link type, and channel number) present in the system.

NOTE:
In case of the X.25 link type, a single endpoint carries multiple links. A combination of the endpoint and channel number is used to uniquely identify the link. All other links can be uniquely identified by their endpoints.

Common Procedure for Repairing Link Problems

The state of a system link is dependent on the state of the various hardware components that it travels over. To resolve any problems associated with a system link, use the following procedure.

The switch maintains a list of hardware components over which the link travels, called the hardware path. There are two hardware paths: the current hardware path and the faulted hardware path for each of the system links. The current hardware path is present only for those links that are currently up. When a link is down, the current hardware path is empty. The faulted hardware path is always present once the link has gone down and is *not cleared when the link subsequently recovers.* The faulted path preserves the path that the link traversed when it last went down. The time at which the faulted path was last recorded is preserved and is accessible through the **status sys-link *location*** and **list sys-link** commands. Therefore, the focus of attention for problems which do not involve a link that is down is the current hardware path. If the link is down, faulted hardware path is the focus of attention.

The **status sys-link *location*** command shows the state of both the hardware paths (current and faulted) along with the state of each of the components in the hardware path. When analyzing any system link problem

1. Look for alarms on the components listed under desired hardware path.
2. If any alarms are present, then follow the maintenance procedures for the alarmed components to clear those alarms first.

   NOTE:
   For systems using ATM-EI (TN2305/6 circuit packs) and where link alarms are present, refer to ''ATM-BCH (ATM B-Channel Trunk)'' and the ''ATM Tips'' section in Chapter 5.

3. When all the components are alarm free, wait for 3 minutes to allow the links to recover.
4. Test the system link (**test sys-link PCSSpp long clear**) and notice any tests that fail.
5. If there are any failures, fix the problems indicated by the tests and repeat the procedure.

Error Log Entries and Test to Clear Values

Table 9-672. Maintenance Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
13 (a)		System Link Status (985)	MINOR/ WARNING	OFF	
257 (b)			WARNING	OFF	test sys-link UUCSSpp l cl
513 (c)			WARNING	OFF	test sys-link UUCSSpp l cl
772 (d)			WARNING	OFF	test sys-link UUCSSpp l cl
1025 (e)			WARNING	OFF	test sys-link UUCSSpp l cl
1281 (f)			WARNING	OFF	test sys-link UUCSSpp l cl
1537 (g)			WARNING	OFF	test sys-link UUCSSpp l cl
1793 (h)			WARNING	OFF	test sys-link UUCSSpp l cl

Notes:

a. This error indicates that the link went down. The link may have gone down or never come up. Enter command **status sys-link location** and check the value of the `Faulted Path` field. If the value is `default`, then the link never came up. If the value is `present`, then the link came up and then went down.

   1. Follow the information in the ‘‘Common Procedure for Repairing Link Problems’’ section above.
   2. Wait for 3-5 min. before checking the link state.
   3. Repeat the procedure until there are no problems with the components.

b. This error indicates that the link has experienced uplink flow control. Manifest effect of this error is that the end-point may be hyperactive. The system link is alarmed if 4 or more errors of this type are detected within 10 min.

   1. Follow the information in the ‘‘Common Procedure for Repairing Link Problems’’ section above.
   2. Clear errors and wait for 10 min.

c. This error indicates that the link has experienced downlink flow control, meaning that some information packets from the packet interface board have been lost. The link is reset on first occurrence, hence, Error 1025 is also logged. The system link is alarmed if 2 or more errors of this type are detected within 10 min.

   1. Follow the information in the ‘‘Common Procedure for Repairing Link Problems’’ section above.
   2. Clear errors and wait for 10 min.

d. This error indicates that the link experienced a temporary disconnect due to excessive resets or state transitions, meaning that the link is taken down and then brought up again. The system link is alarmed if 2 or more errors of this type are detected within 10 min.

   1. Follow the information in the ‘‘Common Procedure for Repairing Link Problems’’ section above.
   2. Clear errors and wait for 10 min.

e. This error indicates that the link has been reset, meaning that information packets queued at the time of reset are lost. The system link is alarmed if 20 or more errors of this type are detected within 10 min.

   1. Follow the information in the ‘‘Common Procedure for Repairing Link Problems’’ section above.
   2. Clear errors and wait for 10 min.

f. This error indicates that the link has experienced slow transmit rate because the remote endpoint is busy. The effect of this error is that the endpoint location may experience slower throughput rate and/or noisy transmission. The system link is alarmed if 4 or more errors of this type are detected within 10 min.

   1. Ensure that the remote endpoint is functioning properly.
   2. If the problem persists, follow the information in the ‘‘Common Procedure for Repairing Link Problems’’ section above.
   3. Clear errors and wait for 10 min.

g. This error indicates that the link has experienced slow transmit rate due to excessive retransmission. Possible causes for this error may be that the switch is overrunning the endpoint or that the endpoint is sick. The effect of this error is that the endpoint location may experience slower throughput rate. The system link is alarmed if 4 or more errors of this type are detected within 10 min.

   1. Follow the information in the ‘‘Common Procedure for Repairing Link Problems’’ section above.
   2. Clear errors and wait for 10 min.

h. This error indicates that the link has experienced slow transmit rate due to unknown causes, meaning that the endpoint location may experience slower throughput rate and the Packet Interface may experience backup or congestion. The system link is alarmed if 4 or more errors of this type are detected within 10 min.

   1. Follow the information in the ‘‘Common Procedure for Repairing Link Problems’’ section above.
   2. Clear errors and wait for 10 min.

System Technician-Demanded Tests: Descriptions and Error Codes

Testing for system links is different from the standard test procedures for Maintenance Objects. In addition to testing the system link maintenance object, the user is allowed to test all the components in the path of the system link. There are two paths preserved for the link. The current path, if present, represents the path traversed by the link currently. This path is not present when the link is down. The other path, the faulted path, is present if the link has ever gone down or never come up. If the link came up and went down, then the faulted path is marked `present`. If the link never came up, the faulted path is marked `Default`. In either case, it represents the path on which the link was attempted or established unsuccessfully.

Test command for the system links, **test sys-link UUCSSpp** can be specified with current or faulted as an optional argument if the user wishes to test all the components in the specified path. The tests executed will be the same if the user were to test each component manually. In the event that the user does not specify any path, then only the tests specified for the system links are executed.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
System Link Status (#985)	X	X	N

1. D = Destructive, ND = Non-destructive

System Link Status (#985)

This test is non-destructive. This test queries the switch for the status of the system link and verifies that all switch components have the same view of the link state.

Table 9-673. TEST #985 System Link Status

Error Code	Test Result	Description/ Recommendation
1007	ABORT	Could not locate the system link associated with this location 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2500	ABORT	Internal system error 1. Retry the command at 1-minute intervals for a maximum of 5 times.
6	FAIL	The system link is down. 1. Follow the procedure for Error Type 13.
	PASS	The system link is up.

SYS-PRNT (System Printer)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run	Full Name of MO
SYS-PRNT	MINOR	test sp-link l	System Printer
SYS-PRNT	WARNING	release sp-link	System Printer

The Report Scheduler feature provides the capability to schedule printing of output form selected administration commands on an asynchronous System Printer (SYS-PRNT) or a Personal Computer (PC). The System Printer device connects to the system via a data module (PDM, MPDM, DTDM) connected to a port on a TN754 Digital Line circuit pack which is administered as a data extension. A System Printer device can also be connected through an ADU to a port on TN726B Data Line circuit pack. The System Printer link to the processor is via a system port. A system port is comprised of a port on the TN726B Data Line circuit pack and a port on the TN553 Packet Data circuit pack connected to each other in a null-modem fashion. Refer to the PDATA-PT section for information on the system port connectivity.

System Printer Link Maintenance provides a strategy for maintaining the link between the system and an external SYS-PRNT output device. The strategy includes a set of tests for detection of errors during normal operation, troubleshooting actions, and alarms for serious problems. System Printer Link Maintenance uses a try-and-wait mechanism for maintaining the SYS-PRNT link. A minor alarm is raised when the link set-up fails. A warning alarm is raised when the SPE has been busied out. A maximum of two link retry attempts is made. After the second attempt, set-up attempts are only made by the application software. (The 15-minute timer fires and jobs are printed unless an immediate job was entered.) After two unsuccessful attempts to establish the link, a MINOR alarm is raised. If the System Printer Link is torn down due to an error, System Printer Link Maintenance will raise a MINOR alarm but will not attempt to bring up the System Printer Link.

System Printer Link Maintenance does not cover the elements comprising the SYS-PRNT physical link: the external SYS-PRNT output device, the Data Module (PDM/MPDM/DTDM) and TN754 Digital Line, or the ADU and TN726B Data Line. If System Printer Link Maintenance cannot restore the System Printer Link, the maintenance tests of these individual components of the System Printer Link must be executed to diagnose faults.

Procedures for Restoring the System Printer Link

1. Determine the status of the System Printer Link via the **status sp-link** command. Verify that the System Printer Link is not busied out for maintenance. This is indicated by a `no` in the `Maintenance Busy?` field. If the System Printer Link has been busied out, issue the **release sp-link** command. If the link is `down`, proceed to Step 2.
2. Issue the **display system feature** command to determine the location of the System Printer Link.

   Enter the **status data-module <extension>** command and verify that the data extension is in-service/idle. If the data extension is *not* available, refer to the `Port` field. Look for errors and/or alarms on the circuit pack with which this extension is associated. Follow repair instructions for the appropriate MO. Continue with Step 3.
3. Verify the availability of the external SYS-PRNT output device. Make sure that the output device is *on-line* and ready-for-service. Check the physical connectivity between the Data Module and the SYS-PRNT output device.
4. Verify that there is at least one system port available. The System Printer Link can not be established unless there is a system port available. Refer to “PDATA-PT” for more information on system ports.
5. If the problem is not found in the above steps, check the system port for any problems. Refer to “PDATA-PT” for description about system port and its connectivity.

It should be noted that when restoring the System Printer link it is necessary to execute tests on different maintenance objects that comprise the System Printer link. It is recommended that you busy out the System Printer link before trying to restore the link. When the System Printer Link is busied out, all System Printer Link maintenance actions are deactivated, and interference with tests of other MOs is prevented.

Error Log Entries and Test to Clear Values

Table 9-674. SYS-PRNT Maintenance Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any	Any	test sp-link
18 (a)	0	busyout sp-link	WARNING	OFF	release sp-link
257(b)	1, 3 4, 5, 6	Link Retry Test (#215)	MINOR/[1] WARNING	OFF	test sp-link l
513 (c)	0	None	MINOR	OFF	test sp-link

1. Minor alarms may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

a. The System Printer Link has been busied out.

b. A failure was encountered while attempting to set up the System Printer Link. This attempt could have been initiated by either Report Scheduler software or by link maintenance during automatic link retry or as a result of a Link Retry Test (#215) request. The Aux Data field indicates the following:

1	No system port available. Refer to PDATA-PT for explanation.
3, 4	Time-out during setup attempt. Most likely due to problem with physical link or printer status.
5	Internal system error. Most likely temporary/sporadic failure.
2, 6	The data module the printer is trying to use is busy with another call. Use the **Status data module** command to determine when the port is available for testing.

Refer to the preceding section ‘‘Procedures for Restoring the System Printer Link for recommended maintenance strategy.

c. The SYS-PRNT was interrupted for one of the following reasons:

- The cable to the SYS-PRNT output device is disconnected
- The SYS-PRNT output device is powered off
- The data extension to which the SYS-PRNT output device connects has been busied out
- Internal software error

Check the connectivity of the wires and cables among the wall jacket, data module, and SYS-PRNT output device. Follow the instructions provided in *Procedures for Restoring the System Printer Link* above.

System-Technician-Demanded Tests: Descriptions And Error Codes

When inspecting errors in the system and deciding which ones to address, always investigate errors in the order they are presented in the table below. By clearing error codes associated with the *Link Retry Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Link Tear Down Test (#213)		X	D
Link Retry Test (#215)	X	X	ND

1. D = Destructive, ND = Non-destructive

Link Tear Down Test (#213)

This test is destructive.

The Link Tear Down Test disconnects the existing link between DEFINITY Generic 3 and the external SYS-PRNT output device. If the link has been disconnected already, this test just returns PASS. All resources allocated for a System Printer Link are released after this test.

Table 9-675. TEST #213 Link Tear Down Test

Error Code	Test Result	Description/ Recommendation
40, 50	ABORT	Internal System Error. 1. Retry the command at 1 -minute intervals a maximum of two times.
1010	ABORT	The System Printer Link has been busied out. 1. Enter the **release sp-link** command to release the System Printer Link from the busyout state. 2. Reissue the **test sp-link long** command to execute the test.
2012	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of five times.
	FAIL	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of two times.
	PASS	The System Printer Link is torn down or a Short Test Sequence was executed and the link was not torn down.

Link Retry Test (#215)

This test sends a message to the System Printer management software process instructing it to make a data call to the extension connected to the printer. If the System Printer link is already up, this test passes without making any data call.

Table 9-676. TEST #215 Link Retry Test

Error Code	Test Result	Description/ Recommendation
10, 20	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of two times.
30	ABORT	Internal System Error. 1. Refer to the ‘‘Procedures for Restoring the System Printer Link’’ section for recommended maintenance strategy.
1010	ABORT	The System Printer Link has been busied out. 1. Enter the **release sp-link** command to release the System Printer Link from the busyout state. 2. Reissue the **test sp-link long** command to execute the test.
2012	ABORT	Internal System Error. 1. Retry the command at 1-minute intervals a maximum of five times.
	FAIL	The System Printer Link CANNOT be established. 1. Refer to the ‘‘Procedures for Restoring the System Printer Link’’ section for recommended maintenance strategy.
	PASS	The System Printer Link is up.

SYSAM (Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
SYSAM	MAJOR[2]	test maintenance UUC l	System Access and Maintenance circuit pack
SYSAM	MINOR	test maintenance UUC s	System Access and Maintenance circuit pack
SYSAM	WARNING	test maintenance UUC s	System Access and Maintenance circuit pack

1. UU is the cabinet number (always 1, not required). C is the carrier designation (a or b). With simplex SPE the carrier location is not required. With duplicated SPEs, carrier a or b must be specified.
2. After a spontaneous SPE interchange has occurred, the Alarm Log retains for three hours a record of any MAJOR ON-BOARD alarm against an SPE component that took place before the interchange. If a spontaneous interchange has occurred (as indicated by STBY-SPE error type 103 or the **display initcauses** screen), and handshake is down, (check with **status spe**), replace the alarmed circuit pack on the standby SPE. If handshake is up, execute a **test long clear** of the alarmed circuit pack and follow recommended procedures.

The System Access and Maintenance (SYSAM) circuit pack, TN1648:

- Is a required component of the SPE Complex
- Monitors the sanity of the RISC Processor circuit pack and environmental conditions
- Provides the serial interface for the G3-MT terminal and the communication interface to INADS or other service locations for alarm reporting and remote maintenance capability
- Provides the Time-Of-Day Clock for the system.

In addition to the usual red, green, and yellow LEDs, the SYSAM circuit pack has alarm, acknowledgment and emergency transfer LEDs whose meanings are explained in the ''SYSAM and Maintenance Circuit Pack LEDs'' in Chapter 7.

NOTE:
Pay attention to the extra LEDs on the *active* SYSAM only. Indications given by these extra LEDs on a *standby* SYSAM (duplicated SPE) are not meaningful.

Error Log Entries and Test to Clear Values

Table 9-677. SYSAM Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test processor UUC s r 1
1		SYSAM Reset Test	MAJOR[2]	ON	test maintenance UUC l r 1
150 (a)	Any	None	MAJOR[2]	ON	test maintenance UUC l c
257		Analog Looparound Test (#917)	MINOR	ON	test maintenance UUC l r 3
513 (b)		G3-MT Looparound Test (#915)	MINOR	ON	test maintenance UUC s r 3
769(c)	Any	Sanity Handshake Test	WARNING	OFF	test maintenance UUC s r 3
1025		Out-Pulse Relay Test (#916)	MINOR	OFF	test maintenance UUC l r 5
1281		Time of Day Clock Test	MAJOR[2]	ON	test maintenance UUC s r 3
1537		Sanity Handshake Test	MINOR	ON	test maintenance UUC s r 3
1793(d)	None		WARNING	ON	
2049		SYSAM Dual Port Ram Test	MAJOR[2]	ON	test maintenance UUC l r 1
2561 (e)		G3-MT Looparound Test(#915)	MINOR	ON	test maintenance UUC s r 3
2817 (f)	Any	External Modem Present Test (#912)	MINOR	OFF	test maintenance UUC s r 3

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. After a spontaneous SPE interchange has occurred, the Alarm Log retains for three hours a record of any MAJOR ON-BOARD alarm against an SPE component that took place before the interchange. If a spontaneous interchange has occurred (as indicated by STBY-SPE error type 103 or the **display initcauses** screen), and handshake is down, (check with **status spe**), replace the alarmed circuit pack on the standby SPE. If handshake is up, execute a **test long clear** of the alarmed circuit pack and follow recommended procedures.

Notes:

a. Error 150 indicates that a SPE interchange has occurred and that the SYSAM circuit pack was the cause of the spontaneous interchange.

   1. If other SYSAM errors are present, investigate these errors.
   2. If no other SYSAM errors are present, run the **test maintenance a|b long clear** command and investigate any test failures.

b. Error 513 indicates that the circuitry associated with active port on the SYSAM circuit pack is not functioning properly. This circuitry can only be tested when the SYSAM is in the active SPE.

c. Error 769 indicates that one of the following in-line errors has occurred:

   1. The "No Case" error indicates that the SYSAM firmware received a message that does not match any known message format.
   2. The "Background Fault" error indicates that one of the following SYSAM firmware background test failed: CPU Test, EPROM Checksum Test, RAM Test, or NVRAM Checksum Test.
   3. The "Logical Inconsistency" error indicates that the SYSAM firmware has determined that the SYSAM circuit pack is in a logically inconsistent state.

   These errors indicate that the SYSAM's sanity may be questionable. SYSAM software will run the Sanity Handshake Test in response to these errors. If these errors are reported repeatedly, SYSAM software will reset the SYSAM circuit pack via the SYSAM Reset Test.

d. Error 1793 indicates that the Sanity Timer Test initialization test failed on the last time the system rebooted. (Refer to "Routine Maintenance Procedures"). Replace the SYSAM circuit pack and verify that the Sanity Timer Test passes after replacing the circuit pack. To replace the SYSAM circuit pack, refer to ''Replacing SPE Circuit Packs'' in Chapter 5.

e. Error 2561 indicates that the standby G3-MT port on the standby SYSAM circuit pack is not functioning properly. Standby port circuitry on the active SYSAM is not tested.

f. Error 2817 with aux 2060 indicates that external modem is administered on a switch with an active TN1648 suffix A. The external modem capability requires a TN1648 suffix B or later. Set the `Modem Connection:` field on the System-parameters Maintenance screen to **internal**.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *SYSAM Reset Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
SYSAM Reset Test (#909)(a)		X	X	D
SYSAM Dual Port Ram Test (#910)(a)		X	X	D
Sanity Handshake Test (#911)	X	X		ND
Time of Day Clock Test (#913)	X	X		ND
G3-MT Looparound Test (#915)	X	X		ND
Outpulse Relay Test (#916) (b)	X	X		ND
Analog Looparound Test (#917) (b)	X	X		ND
External Modem Present Test (#912) (b)(c)	X	X		ND

1. D = Destructive, ND = Non-destructive

Notes:

a. If you are invoking the long test sequence from the PPN G3-MT, the SYSAM Reset Test and SYSAM DPR Test will cause the PPN G3-MT to logoff and tear down any SYSAM Remote Access connection. After the test sequence runs, the Error Log should be examined for SYSAM errors of type 1 and 2049 to determine if either SYSAM Reset Test or SYSAM DPR Test have failed. If you are invoking the long demand test sequence from an EPN G3-MT, all tests listed above will run and the results will display on the EPN G3-MT. The PPN G3-MT will still be logged off and any SYSAM Remote Access connection will be torn down.

b. These tests can be run only on the active SYSAM circuit pack. If you are invoking the long test sequence on the standby SYSAM circuit pack, these tests (Outpulse Relay Test, Analog Looparound Test, and External Modem Present Test) do not run.

c. This test aborts if an external modem is not administered.

SYSAM Reset Test (#909)

This test is destructive.

This test resets the SYSAM circuit pack. The destructive nature of this test causes the PPN G3-MT to logoff and any SYSAM Remote Access connection (for example, INADS connection) to be torn down.

The reset test causes terminals connected to the SYSAM either directly or through the remote access port to logoff prior to the test results being displayed. To determine a test result from one of these locations, log back in and examine the Error Log for SYSAM error type 1 with no Aux Data. This error entry indicates that the SYSAM Reset Test failed and that the SYSAM circuit pack should be replaced.

If the test is being run from somewhere other than the SYSAM ports, (for example, a G3-MT connected to an EPN Maintenance circuit pack), test results are displayed on the screen without a logoff taking place.

Table 9-678. Test #909 SYSAM Reset Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1318 1335 2029 2033 2500	ABORT	Internal System Error 1. Retry the command.
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.

Continued on next page

Table 9-678. Test #909 SYSAM Reset Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs set as the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The `SPE Selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is a High or Critical Reliability configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code then changes to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2334	ABORT	The hardware mailbox on the standby Duplication Interface board is not ready to receive messages. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
	FAIL	The circuit pack was reset, but responded with a NOT PASS status indicating it did not pass initialization correctly. The SYSAM is not functioning correctly. The system should continue to operate but will not have the ability to perform alarm origination, if needed. Environmental monitoring, the PPN G3-MT, and the System Sanity Timer are lost. 1. Retry the command. 2. If test continues to fail, replace the SYSAM circuit pack. To replace the SYSAM circuit pack, refer to ''Replacing SPE Circuit Packs'' in Chapter 5.
	PASS	The circuit pack was reset, it did pass initialization correctly. The other SYSAM tests should be examined to verify that the SYSAM is functioning normally. 1. Execute **test maintenance a|b short** and verify that the SYSAM is operating correctly.

SYSAM Dual Port RAM Test (#910)

This test is destructive.

This test terminates any PPN G3-MT or SYSAM Remote Access session. This is a coordinated test of the Processor circuit pack's and SYSAM circuit pack's on-board microprocessor ability to access the SYSAM's Dual Port RAM (DPR). Control messages and data are passed through the DPR. The test forces both the Processor and the on-board microprocessor to read and write the DPR simultaneously in alternate locations.

The DPR test causes the PPN G3-MT and SYSAM Remote Access sessions to logoff prior to the test result being displayed. To determine the test result, log back in and examine the Error Log for an error against SYSAM, Error Code 2049, no Aux Data. This error entry indicates that the SYSAM DPR Test failed and that the SYSAM circuit pack should be replaced.

If the test is being run from somewhere other than the PPN G3-MT or SYSAM Remote Access connection (for example, EPN G3-MT), the test results will be displayed on the screen.

Table 9-679. Test #910 SYSAM Dual Port RAM Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1318 1335 2029 2033 2500	ABORT	Internal system error 1. Retry the command.
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.

Continued on next page

Table 9-679. Test #910 SYSAM Dual Port RAM Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The SPE `selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is a High or Critical Reliability configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code then changes to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2334	ABORT	The hardware mailbox on the standby Duplication Interface board is not ready to receive messages. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
	FAIL	The DPR is not functioning correctly. Communication between the Processor and SYSAM is lost. The system is not able to report environmental alarms, use the PPN G3-MT, or use the SYSAM Remote Access connection if the need should arise. 1. Retry the command. 2. If the test continues to fail, replace the SYSAM circuit pack. 3. Retry the command. 4. If the test continues to fail, replace the Processor circuit pack. 5. Retry the command. 6. Replace the SPE circuit packs. See ‘‘Replacing SPE Circuit Packs’’ in Chapter 5.
	PASS	Dual Port RAM is functioning. Communication does exist between the Processor and SYSAM circuit packs.

Sanity Handshake Test (#911)

This test checks the SYSAM circuit pack's ability to respond to queries. A message is sent to the SYSAM circuit pack, which then returns a message. The SYSAM must reply for this test to pass. If this test fails, the SYSAM circuit pack should be considered insane, the circuit pack should be reset with the **reset maintenance a | b** command.

Table 9-680. Test #911 Sanity Handshake Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1318 1335 2029 2033 2500	ABORT	Internal system error 1. Retry the command.
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The SPE `selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.

Continued on next page

Table 9-680. Test #911 Sanity Handshake Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is equipped with the High Reliability or Critical Reliability Configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code then changes to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2318	ABORT	The standby SYSAM was not responding within the allowable time period. 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2334	ABORT	The hardware mailbox on the standby Duplication Interface board is not ready to receive messages. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
	FAIL	The SYSAM did not respond to the sanity handshake query. 1. Run the **test maintenance 1a|b long** command. The terminal login drops, and you must login again. 2. If test continues to fail, replace the SYSAM circuit pack at the earliest convenience. 3. Retry the command. 4. Replace the SYSAM circuit pack. To replace the SYSAM circuit pack, refer to ‘‘Replacing SPE Circuit Packs’’ in Chapter 5.
	PASS	The SYSAM did respond to the sanity handshake query. 1. Examine other SYSAM tests for errors.

SYSAM Refresh Test (#912)

This test checks the current state of the Alarm Panel LEDs on the SYSAM circuit pack and attempts to resynchronize them to reflect the current alarm levels in the system. Any discrepancies are resolved by changing the Alarm Panel LEDs to what maintenance believes the alarm levels should be. The SYSAM Refresh Test runs only in G3r V1 software loads preceding Release 6.0. Newer software has replaced the SYSAM Refresh Test with the External Modem Present Test (*both* use the Test #912 number).

Table 9-681. Test #912 SYSAM Refresh Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1318 1335 2029 2033 2500	ABORT	Internal system error 1. Retry the command.
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The `SPE selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.

Continued on next page

Table 9-681. Test #912 SYSAM Refresh Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is a High or Critical Reliability configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code then changes to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2005	FAIL	Could not handshake with the SYSAM circuit pack. The SYSAM circuit pack did not respond to a query message sent to it. Run the **test maintenance a|b short**, and refer to the repair procedures outlined for the Sanity Handshake Test.
2318	ABORT	The standby SYSAM was not responding within the allowable time period. 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2334	ABORT	The hardware mailbox on the standby Duplication Interface board is not ready to receive messages. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
	FAIL	Internal System Error 1. Retry the command
	PASS	The SYSAM circuit pack has been sent the correct state for the system LEDs. If the LEDs do not reflect the system alarms shown in the alarm log, the SYSAM circuit pack may have problems. 1. Verify the LEDs on the SYSAM circuit pack can be changed by issuing the **test led port-network 1** command. All the SYSAM circuit pack LEDs should go on and then off, and then be refreshed. 2. After the **test led port-network 1** command finishes, if the SYSAM circuit pack LEDs do not reflect the alarm log, follow normal escalation procedures.

Time-Of-Day Clock Test (#913)

The short term accuracy of the time-of-day clock is tested. The test reads the clock once, waits 10 seconds, and then reads the clock again. The second reading of the clock must be within certain limits (10 seconds) relative to the first reading for the test to pass. The **display time** command can be used to display the current setting of the time-of-day clock.

If the time-of-day clock is not functioning correctly, the software time-of-day clock is used (this clock is not as accurate as the hardware clock).

Table 9-682. Test #913 Time-Of-Day Clock Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1318 1335 2029 2033 2500	ABORT	Internal system error 1. Retry the command.
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The `SPE selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.

Continued on next page

Table 9-682. Test #913 Time-Of-Day Clock Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is a High or Critical Reliability configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code then changes to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2318	ABORT	The standby SYSAM was not responding within the allowable time period. 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2334	ABORT	The hardware mailbox on the standby Duplication Interface board is not ready to receive messages. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
any	FAIL	The short term accuracy of the time-of-day clock is not within limits (10 seconds >= difference <= 20 seconds). **NOTE:** Error Code *any* indicates the difference between the two reads. A zero (0) indicates that the time-of-day clock is not running. 1. Run the short test sequence several times to make sure the error is occurring consistently. 2. If test continues to fail consistently, replace the SYSAM circuit pack at the earliest convenience. 3. After replacing the SYSAM, you must set the time-of-day clock via the **set time** command. To replace the SYSAM circuit pack, refer to ''Replacing SPE Circuit Packs'' in Chapter 5.
	PASS	The short term accuracy of the time-of-day clock on the SYSAM circuit pack is within limits.

SYSAM G3-MT Looparound Test (#915)

This test places the G3-MT port on the SYSAM circuit pack into loop-around mode and verifies the data integrity of the channel. The test is non-destructive but may cause a momentary loss of keyboard input from the G3-MT while the test is running (about 1 second).

On High and Critical Reliability systems, there are two G3-MT ports on each of the two SYSAM circuit packs: one is labeled ACTIVE and the other STANDBY. On the current active SYSAM circuit pack, only the ACTIVE port is tested. On the current standby SYSAM circuit pack, only the STANDBY port is tested.

Table 9-683. TEST #915 SYSAM G3-MT Looparound Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1318 1335 2029 2033 2500	ABORT	Internal system error 1. Retry the command.
1338	ABORT	The test is not allowed to run with a planned SPE interchange in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable, and related repair actions. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The `SPE selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.

Continued on next page

Table 9-683. TEST #915 SYSAM G3-MT Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is equipped with the High Reliability or Critical Reliability Configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code then changes to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2334	ABORT	The hardware mailbox on the standby Duplication Interface board is not ready to receive messages. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
2318	FAIL	The STANDBY port on the SYSAM circuit pack on the standby SPE did not respond to the test in time. If this test fails at least 3 times in a row, the STANDBY port is probably unusable for diagnostics through the SPE-Down or SPE-Standby Interfaces. Other than this unavailability, this failure should cause no service effects. 1. Try the test again at 1-minute intervals up to a maximum of 3 times. 2. If the test fails all 3 attempts, replace the standby SYSAM circuit pack at the earliest convenience. To replace the SYSAM circuit pack, refer to ''Replacing SPE Circuit Packs'' in Chapter 5.
	FAIL	The SYSAM G3-MT channel failed the loop around test. The G3-MT will probably be unusable for administration or maintenance. The EPN G3-MT, if available, or remote access can still be used. 1. Retry the command. 2. If test continues to fail, replace the SYSAM circuit pack at the earliest convenience. To replace the SYSAM circuit pack, refer to ''Replacing SPE Circuit Packs'' in Chapter 5.
	PASS	The G3-MT channel passed the loop around test. 1. If the PPN G3-MT is not usable, check the G3-MT and associated cabling.

SYSAM Outpulse Relay Test (#916)

This test validates the operation of the SYSAM Remote Access CO trunk used for Alarm Origination and remote access. The SYSAM goes off-hook and then on-hook on this trunk. If loop current is detected then the test passes. If the external modem is administered, the SYSAM sends an AT command sequence that causes the external modem to go off-hook and wait for dial-tone. If the modem detects dial-tone, the test passes.

This test is not allowed if the remote access line is in use or if the SYSAM is on the Standby SPE in SPE Duplication Option systems. Also, this test must be administered for testing through the **change system-parameters maintenance** form.

NOTE:
When using an active TN1648 (prior to suffix B), and even though the modem is administered as “external,” this only tests the internal modem.

Table 9-684. TEST #916 SYSAM Outpulse Relay Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1018	ABORT	The test has been disabled via administration. 1. To enable test, set the `Test Remote Access Port` field to **y** on the system-parameters maintenance screen. 2. Retry the command.
1318 1335 2029 2033 2500	ABORT	Internal system error 1. Retry the command.
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.

Continued on next page

Table 9-684. TEST #916 SYSAM Outpulse Relay Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The `SPE selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.
1364	ABORT	The component on which the test was to be run is on the Standby SPE. This test may only be run on this component when it resides on the Active SPE. 1. To verify the remote access line is working (connected), run this on the Active SYSAM.
1379	ABORT	System could not determine if testing of remote access port is administered. 1. Check system-parameters maintenance screen for a **y** in the `Test Remote Access Port` field. 2. Retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is s High or Critical Reliability configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code then changes to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2034	ABORT	The remote access port is busy. A remote user is probably dialed into the switch. 1. If a remote user is dialed in, remote access line is working. No need to run test. Use the **status logins** command to verify that the SYSAM-RMT port is in use.

Continued on next page

Table 9-684. TEST #916 SYSAM Outpulse Relay Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	SYSAM reported test failure. No loop current detected. 1. Retry the command. 2. For an external modem, if the test continues to fail: a. If the External Modem Present Test (#912) failed, use the external modem recommendations listed in Test #912. b. If the External Modem Present Test (#912) passes, the SYSAM most likely received a `NO DIALTONE` response to the ATD command sent from the SYSAM. This problem is between the modem and the INADS trunk. 3. If test continues to fail, examine SYSAM remote access line for connectivity, manually check line for loop current. 4. If SYSAM remote access line checks out fine, but test still fails, check backplane connector cabling. Also, check the cabling from the wall field to the backplane. 5. If backplane cabling checks out fine, replace SYSAM circuit pack at earliest convenience. To replace the SYSAM circuit pack, refer to "Replacing SPE Circuit Packs" in Chapter 5.
	PASS	SYSAM detected loop current on remote access port. 1. If system cannot call remote maintenance facility or remote maintenance facility cannot contact system, check with local Central Office for problems with SYSAM remote access line.

SYSAM Analog Looparound Test (#917)

This test checks the on-board modem circuitry of the SYSAM circuit pack associated with the SYSAM remote access port. Test data is looped through the on-board modem and verified for integrity. If the external modem is administered, the test loops data in the MTP DUART ahead of the connection to the external modem. This test also causes the MTP DUART to verify that Clear-To-Send (CTS) is being supplied by the modem.

This test is not allowed if the remote access port is in use or if the SYSAM is on the Standby SPE in SPE Duplication Option systems. Also, this test must be administered for testing through the **change system-parameters maintenance** screen.

NOTE:
This test does not send any data onto the SYSAM remote access line, but the test does require the line to be present to pass reliably.

NOTE:
When using an active TN1648 (prior to suffix B), and even though the modem is administered as “external,” this only tests the internal modem.

Table 9-685. TEST #917 SYSAM Analog Looparound Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1018	ABORT	The test has been disabled by administration. 1. To enable test, set the `Test Remote Access Port` field to **y** on the system-parameters maintenance screen. 2. Retry the command.
1318 1335 2029 2033 2500	ABORT	Internal System Error 1. Retry the command.

Continued on next page

Table 9-685. TEST #917 SYSAM Analog Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the STBY-SPE maintenance documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The `SPE selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.
1364	ABORT	The component on which the test was to be run is on the Standby SPE. This test may only be run on this component when it resides on the Active SPE. 1. To verify the remote access line is working (connected), run this on the Active SYSAM.
1379	ABORT	System could not determine if testing of remote access port is administered. 1. Check system-parameters maintenance screen for a **y** in the `Test Remote Access Port` field. 2. Retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is a High or Critical Reliability configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code then changes to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2034	ABORT	The remote access port is busy. A remote user is probably dialed into the switch. 1. Wait until the remote user session is terminated, retry the command.

Continued on next page

Table 9-685. TEST #917 SYSAM Analog Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2317	ABORT	Test #916 SYSAM Outpulse Relay Test failed. 1. Follow instructions for FAIL result for SYSAM Outpulse Relay Test (#916).
	FAIL	SYSAM reported test failure. The system is not able to reliably contact any remote maintenance facility with alarm data or dialed into through the SYSAM remote access port. The system continues to provide reliable service. 1. For an internal modem: a. If SYSAM Outpulse Relay test (#916) is also failing, check for presence of SYSAM remote access line and resolve SYSAM remote access line problems. b. If test #916 passes, the fault is on the SYSAM circuit pack, replace at the earliest convenience. To replace the SYSAM circuit pack, refer to "Replacing SPE Circuit Packs" in Chapter 5. 2. For an external modem: a. Check the power to the modem. b. Check the RS-232 connection from the external modem connector to the modem. Transmit, Receive, RTS, and CTS signals must be communicating between the MTP DUART hardware and the modem hardware. c. The SYSAM DUART or related circuitry on the processor circuit pack may have failed. The circuit pack should be changed at your convenience.
	PASS	SYSAM detected correct data through loop around connection. 1. If system cannot call remote maintenance facility or remote maintenance facility cannot contact system, check with local Central Office for problems with SYSAM remote access line.

SYSAM External Modem Present Test (#912)

This test is a nondestructive test on the remote access line, and will run only if the channel is idle. The test validates the presence of an external modem with a firmware invoked AT command. The test passes if the modem responds with “OK” to the AT command. This test also validates external modem administration. This test will fail if an external modem is administered on a switch with an active TN1648 suffix A.

This test is not allowed if the remote access line is in use or if the SYSAM is on the Standby SPE in SPE Duplication Option systems. Also, this test must be administered for testing through the **change system-parameters maintenance** screen.

Table 9-686. TEST #912 SYSAM External Modem Present Test

Error Code	Test Result	Description/ Recommendation
100	ABORT	The requested test did not complete within the allowable time period. 1. Retry the command.
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals, a maximum of 5 times.
1018	ABORT	The test has been disabled by administration. 1. To enable test, set the `Test Remote Access Port` field to **y** on the system-parameters maintenance screen. 2. Retry the command.
1049	ABORT	External modem is not administered. When using an active TN1648 (prior to suffix B), this abort code is normal, because only this test only applies to external modems.
1318 1335 2029 2033 2500	ABORT	Internal system error 1. Retry the command.
1338	ABORT	The test is not allowed to run since a planned SPE interchange is in progress. This may be caused by a planned interchange initiated automatically during 24 hour scheduled testing. 1. Wait 3 minutes and retry the command.

Continued on next page

Table 9-686. TEST #912 SYSAM External Modem Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1339	ABORT	The test could not run on the standby SYSAM circuit pack in the standby SPE carrier because the standby SPE is unavailable. 1. Refer to the "STBY-SPE (Standby SPE Maintenance)" documentation for information on why a standby SPE may be unavailable and what repair actions should be taken. The screen for the **status spe** command should indicate that handshake is down. This may be caused by a variety of reasons such as the SPE-SELECT switches on the DUPINT circuit packs being set to the position of the active SPE, a failure of the DUPINT circuit pack, or loss of power on the standby SPE. The SPE `selected` field on the **status spe** screen displays `spe a` or `spe b` if both SPE-SELECT switches are in the a or b positions, respectively.
1364	ABORT	The component on which the test was to be run is on the Standby SPE. This test may only be run on this component when it resides on the Active SPE. 1. To verify the remote access line is working (connected), run this on the Active SYSAM.
1379	ABORT	System could not determine if testing of remote access port is administered. 1. Check system-parameters maintenance screen for a **y** in the `Test Remote Access Port` field. 2. Retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. If the system is a High or Critical Reliability configuration and if the SYSAM circuit pack is on the standby SPE, this abort code may indicate that the standby SPE is not responding to the handshake message. If this is the case, the standby SPE maintenance software may take up to two minutes to indicate that handshake communication with the standby SPE is down. The ABORT code will then change to 1339 (standby SPE unavailable). 1. Retry the command at 1-minute intervals, a maximum of 3 times.
2034	ABORT	The remote access port is busy. A remote user has probably dialed into the switch. 1. If a remote user is dialed in, remote access line is working. No need to run test. Use the **status logins** command to verify that the SYSAM-RMT port is in use.

Continued on next page

Table 9-686. TEST #912 SYSAM External Modem Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2080	FAIL	An external modem is administered on a switch with an active TN1648 (prior to suffix B.) 1. Set the `Modem Connection:` field on the system-parameters maintenance screen to **internal**. (The external modem capability requires a TN1648 suffix B or later.) 2. Retry the command.
	FAIL	SYSAM reported test failure. The SYSAM did not receive an “OK” response after sending the “AT” command to the modem. 1. If the Analog Looparound Test (#917) failed, follow the external modem recommendations for that failure. 2. If the Analog Looparound Test (#917) passes: a. Check the RS-232 connection from the external modem connector to the modem. RTS and CTS signal are being communicated between the SYSAM DUART hardware and the modem hardware. Transmit and receive signals may not be communicated correctly. b. Check the modem administration using the change system-parameters maintenance command, especially changes from default parameters. c. Check the modem settings, especially changes from factory defaults. **NOTE:** The fault may be on the SYSAM circuit pack. The circuit pack may need to be replaced.
	PASS	Modem administration matches SYSAM capability and SYSAM detected loop current on remote access port. 1. If system cannot call remote maintenance facility or remote maintenance facility cannot contact system, check with local Central Office for problems with SYSAM remote access line.

SYSTEM (System)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
SYSTEM	None	None	System

1. SYSTEM has no associated alarms and thus appears only in the Error Log. There are no tests that run on SYSTEM.

The SYSTEM maintenance object is used to log information about system resets, including interchanges. When software encounters a problem with hardware, or with its own processes, and requests a restart to clear the problem, an error is logged under SYSTEM. For example, if there is a loss of clock in the Processor Port Network (PPN) in a system with duplicated SPEs, the system switches to the other clock and then executes a level 2 system reset to recover from hardware problems caused by the loss of clock. Errors logged under SYSTEM can help to determine the cause of a reset. The **display initcauses** screen should also contain information about the reset. See "Troubleshooting a Duplicated SPE" in Chapter 5 for more information about interchanges.

Error Log Entries and Test to Clear Values

Table 9-687. System Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
8 (a)	0	None			
9 (b)	Any	None			
10 (c)	Any	None			
601 (d)	Any	None			
602 (e)	Any	None			
605 (f)	(p)	None			
606 (g)	Any	None			
607 (h)	Any	None			
6001 (i)	Any	None			
6002 (j)	(o)	None			
6003 (k)	(o)	None			
6101 (l)	Any	None			
6102 (m)	(o)	None			
6103 (n)	(o)	None			

Notes:

a. Software requested a System Restart Level 3.

b. Software requested a System Restart Level 2.

c. Software requested a System Restart Level 1.

d. An error occurred during initialization.

e. Translation data was corrupted, so the system requested a Restart Level 3 to reload translation data from the Mass Storage System (MSS).

f. A **reset system interchange** or a scheduled SPE interchange failed. The AUX Data indicates the cause of the failure. Consult the table in note p. Use **status spe** to determine the current SPE status and follow the Standby SPE Maintenance procedures to resolve the problems that are preventing the SPE interchange.

g. A **reset system interchange health-override** command has failed. The standby SPE state-of-health (SOH) would not allow a spontaneous SPE interchange. Use **status spe** to determine the current SPE status and follow the Standby SPE Maintenance procedures to resolve the problems that are preventing the SPE interchange.

h. A requested SPE interchange has failed because the SPEs are locked by means of the SPE-Select switches on the duplication interface circuit packs. with the SYSAM lock switches.

i. Error 6001 indicates that an operating system error occurred on the active SPE. The aux data gives the source of the error:

Aux-Data Value	Operating System Error Type
5	Software Abort
6	SPE Bus Error

j. Error 6002 indicates that an application error occurred on the active SPE. See note (o) to diagnose the error using the aux data.

k. Error 6003 indicates that an application alarm occurred on the active SPE. See note (o) to diagnose the error using the aux data.

l. Error 6100 indicates that an operating system error occurred on the standby SPE. See error 6001 (i) to interpret the aux data.

m. Error 6102 indicates that an application error occurred on the standby SPE. See note (o) to diagnose the error using the aux data.

n. Error 6103 indicates that an application alarm occurred on the standby SPE. See note (o) to diagnose the error using the aux data.

o. For error types 6002, 6003, 6102, and 6103, the aux-data value points to the MO that the error or alarm is logged against. The following table lists possible aux-data values and their associated MOs. Locate the Error Log entry for the indicated MO and follow the instructions for that error.

AUX Data	Implicated Maintenance Object
4137	PKT-INT
16384	PROCR
16385	MEM-BD
16386	SYSAM
16389	DUPINT
16391	SW-CTL
16392	H-ADAPTR
16397	R-MEDIA
16398	DISK

p. The following table and notes give causes and recommendations for each AUX data value for error 605.

Table 9-688. SYSTEM Error 605 AUX Data, Failure of Planned Interchange

Aux Data	See Note	Explanation
1352	1	Standby SOH "non-functional"
1353	1	Standby SOH not "functional"
1355	1	Handshake Communication with Standby SPE is down
1356	1	Memory Shadowing not enabled
1357	1	Standby memory not refreshed
1358	2	Mass Storage System was in use
1359	3	PKT-INT link migration failed
1360	1	Interchange failed *
1361	4	SW-CTL failure
1369	7	Could not suspend G3-MT connectivity *
1370	4	Could not freeze active SW-CTL *
1371	5	Internal Error associated with processor interrupts *
1372	6	Minor alarm on standby SYSAM or PKT-INT
1395		SPE Duplication not administered
1396	3	PKT-INT Link Migration failure in Begin Step *
1397	3	PKT-INT Link Migration denied, (peer test in progress)
1398	3	PKT-INT Link Migration failure in Completion Step *
1399	3	PKT-INT Link Migration failure in Finish Step *
1400	4	Could Not Idle SW-CTL dual port RAM *
1401	4	Could Not Refresh SW-CTL dual port RAM *
1402	5	Internal Error (could not get duplication status)
1403	5	Unable to inhibit Standby Maintenance Monitor
1404	5	Failure to determine Standby SPE alarm status
1406	3	Active SPE's PKT-INT in held-reset state
1418	8	Active Duplication Interface circuit pack is in a bad state and needs to be reset.
2500	5	Internal Software failure (* sometimes)

Notes for SYSTEM Error 605 AUX Data:

1. Follow repair instructions in “STBY-SPE” for the particular standby SPE problem. After fixing that problem, try the interchange again.
2. Mass Storage System is in use. Check Disk and Removable Media LEDs for activity. Wait until all MSS activity completes, then retry the interchange again. If the problem persists, check for alarms and errors against MSS components and follow the repair procedures for the “MSS” maintenance object.
3. Test the PKT-INT on both carriers with the long test sequence. Follow procedures for “PKT-INT”. Once *all* tests of both PKT-INTs pass, try the interchange again.
4. Consult SW-CTL service documentation. Test SW-CTL on both carriers with the long test sequence. Follow repair instructions for any failures. Once *all* tests of both SW-CTLs pass, try the interchange again.
5. Make sure the standby SPE is refreshed, then try the interchange again.
6. Examine alarm log to determine which of the PKT-INT or SYSAM circuit packs has a minor alarm against it. Consult the section in this chapter for that circuit pack.
7. Check for errors or alarms against active SPE’s SYSAM. If you find any, consult SYSAM service documentation. If you find none, and if all tests of the SYSAM long sequence pass, try the interchange again.
8. Run **test duplication-interface long** and follow instructions for any test that does not pass.

TAPE

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
TAPE	WARNING	test tape a|b long	MSS Tape circuit pack
TAPE	MINOR	test tape a|b long	MSS Tape circuit pack
TAPE	MAJOR[2]	test tape a|b long	MSS Tape circuit pack

1. In a system with a simplex SPE, the carrier need not be specified. In a system with duplicated SPEs, carrier a or b must be specified.
2. This alarm occurs when the system undergoes a reset of level 3, 4, or 5, and the switch cannot load translation from tape; it also occurs when a program update cannot be applied. See the Error Log Table, error type 3585.

Description

The TN1656 Tape circuit pack is part of the Mass Storage System (MSS). The MSS provides non-volatile storage for system software, translation data, announcement data and program update data. As shown in Figure 9-106 on page 9-1864, the MSS consists of a Host Adapter circuit on the UN332 MSS-Network Control circuit pack (MSSNET), a Small Computer System Interface (SCSI) bus, a TN1656 Tape circuit pack and the TN1657 Disk Drive circuit pack. The Disk Drive acts as the primary storage device. The Tape Drive serves as a backup device and as a removable medium for system data.

The system is usually booted from the bootimage stored on disk. The **save translation** and **save announcements** commands save to disk the memory-resident translation data and TN750-resident announcement data, respectively. The **backup disk** command copies data from the disk to the tape for backup storage. The **restore disk** command copies data from the tape back to disk. All MSS components reside in the SPE, or PPN control carrier (carrier A for a simplex SPE, carriers A and B for a duplicated SPE).

The Tape circuit pack contains SCSI bus terminators, a -48V to +12V power converter, an industry standard SCSI based Tape Drive, and interface circuitry to the private bus to control the LEDs, detect the presence of the circuit pack, and identify the vintage of the hardware.

A -48V to +12V converter circuit on the Tape circuit pack provides power for both the Tape Drive and the Disk Drive. The presence of +12V on these circuit packs is monitored separately by maintenance software so that a failure of the +12V converter on the Tape circuit pack can be identified or ruled out as the source of the problem when the Disk Drive loses +12V power.

The Host Adapter Circuit, Tape circuit pack, and Disk circuit pack are treated as separate, but related, maintenance objects (H-ADAPTER,TAPE, and DISK).

Since the Disk circuit pack is controlled by SCSI commands which are generated by the Host Adapter, problems with the Host Adapter can prevent communications with the Disk. Whenever the Host Adapter is taken out of service by the **busy-out host-adapter** command, or due to failure of a critical Host Adapter test, the Tape and Disk maintenance objects are also placed in a maintenance busyout state.

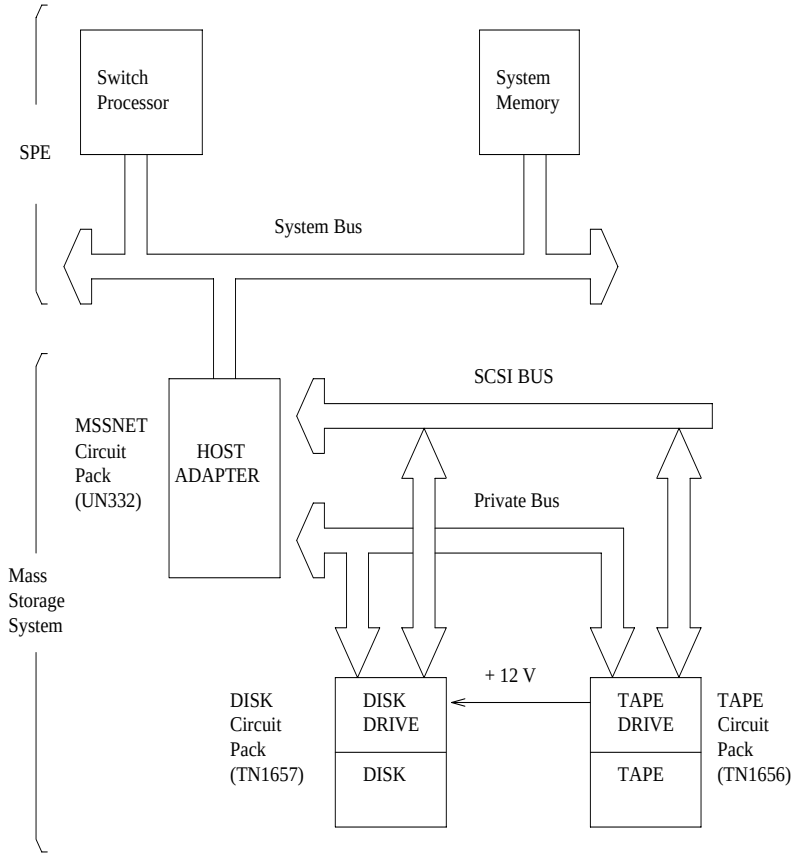

Figure 9-106. Mass Storage System Interactions

General Repair Procedures for TAPE

The following guidelines should be followed when troubleshooting and resolving tape problems.

1. Cleaning the tape drive head is very important. Dirty tape drive heads may cause problems that appear to be hardware related.

   A tape drive head with abrasive particles can permanently damage a new tape. A worn tape may leave abrasive particles in the tape drive head. Follow the tape head cleaning instructions that appear at the end of the test descriptions for TAPE.

2. *Avoid saving translations or announcements* on the backup tape cartridge if all other Tape Drive and Host Adapter problems have not been resolved.

   If there is something wrong with the Mass Storage System, an attempt to save translations or announcements could destroy a good copy of the files on the tape cartridge.

3. In a system configured with duplicated SPEs, the tests run on the standby Tape circuit pack are identical to those run on the active Tape circuit pack. Communications between the active and standby SPEs is provided by the DUPINT circuit pack for both the control channel and memory shadowing. Therefore, problems with the DUPINT circuit pack may affect maintenance tests of the standby Tape circuit pack.

4. Check the error log for power related problems and refer to the maintenance documentation on power.

5. The *data on the tape cartridge will likely be destroyed* if:

   - The tape cartridge is removed when the amber LED on the Tape circuit pack is on.
   - The Tape circuit pack is removed while the amber LED on the Tape Circuit is on.
   - Power is removed from the Tape Drive while the amber LED on the Tape circuit pack is on.

6. The *data on the disk will likely be destroyed* if the Tape circuit pack is removed while the amber LED on the Disk Drive is on.

7. Dirty Tape Drive heads may cause problems that appear to be hardware related. To clean the tape heads in the Tape Drive, follow the tape head cleaning procedure at the end of this section.

8. Since maintenance software cannot always distinguish between errors caused by the tape cartridge and those caused by the Tape Drive or Host Adapter, check for tape cartridge errors first.

   - Make sure there is a tape cartridge in the Tape Drive.
   - Make sure that the write protect lock is not active. To deactivate write protect, slide the *RECORD* switch on the tape cartridge in the direction of the arrow on the switch.

Tape cartridge in record position

Tape cartridge in write-protect position

Figure 9-107. Mass Storage System Interactions

Replacing a TAPE Cartridge

If the tape cartridge needs to be replaced, follow the procedure given below:

1. Resolve all other Tape circuit pack alarms/problems.
2. Install a new tape cartridge which has the same release number or, if that is not practical, install a tape cartridge with the same file layout as the original tape cartridge. Generally the file layouts are the same for tapes formatted for same product (G3r V1 or G3r V2). However, for G3r V1, a new file was added to the tape starting with the 6.1 release to support the **restore disk install** command. Therefore depending on the release number of the existing tape, a tape earlier than 6.1 or later than 6.0 should be used for G3r V1.

   When a tape cartridge is first inserted, there should be a spinning noise indicating that the Tape Drive is performing a retension pass (moving the tape forward and then back to the tape mark several times). This may take several minutes.
3. Verify that the tape cartridge has an acceptable release number by checking the Software Version via the **list configuration software-vintage** command.
4. If a new tape cartridge is not available, but all other tape alarms/problems have been resolved, then replace the damaged tape cartridge with the backup tape cartridge. Wait for the retension pass to complete.
5. Verify that the tape cartridge has the latest translations by issuing the **list configuration software-vintage** command. If the tape cartridge does not have the latest translation or announcement files, then perform a **backup disk**.

Replacing the TAPE Circuit Pack

For a Simplex SPE:

a. Enter **busyout host-adapter**. The Host Adapter should be "busied out" to prevent other applications from trying to access the tape or the disk. The Tape circuit pack supplies +12V to the Disk circuit pack so when it is removed, the Disk circuit pack will also go out of service.

b. Replace the Tape circuit pack and insert the tape cartridge into the new Tape circuit pack.

c. Issue the **reset host-adapter** command. This may take up to 3 minutes to complete since it waits for the tape to retension.

d. Issue the **release host-adapter** command.

e. Issue the **status spe** command and check that the status screen indicates that the tape and disk are now in service.

For a Duplicated SPE:

a. See ''Replacing SPE Circuit Packs'' in Chapter 5.

b. After the standby SPE is powered up and fully refreshed, test the standby tape using the **test tape long** command.

Error Log Entries and Test to Clear Values

Table 9-689. TAPE Error Log Entries

Error Type	Aux Data[1]	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	any	Tape Reset (#894)	MINOR	OFF	reset tape a|b[2]

3585 (u)	409		MAJOR/ MINOR	OFF	
3841 (v)	[3]	Miscellaneous	MINOR	OFF	test tape a|b* long rep 1

1. The number of times the tape has been accessed. This number is at least 90% of the manufacturer's recommended limit.
2. In a system with a simplex SPE, the carrier does not have to be specified. In a system with duplicated SPE, the carrier (a or b) must be specified.
3. If error type 1 with aux data of 123 is present, this field will have the out of service cause data. See the *MSS Error Actions* table at the end of the section on TAPE.

The "service state" field in the Alarm Log refers to the accessibility of the device. IN (in service) means that users can access the device and all maintenance tests will run. MTC (maintenance busy) means that the device is "busied out" and users cannot access it although all demand maintenance tests will run. OUT (out of service) means that users cannot access the device but background and demand testing can run.

Notes:

a. Error type 1 means that the device is out of service as a result of maintenance tests detecting a critical failure of the tape drive.

b. Error type 18 means that the Tape was busied out on demand from the System Access Terminal.

c. Error type 250 means that the Reset Test (#809 or #894) failed.

d. Error type 257 means that the device could not be accessed.

e. Error type 513 means that on-board tape drive diagnostics tests requested by the Tape Diagnostic Test (#813) failed.

f. Error type 526 means that the Host Adapter was busied out. This also causes the Tape to be busied out.

g. Error type 529 means that there was a failure to put the tape in service or to take it out of service.

h. Error type 769 means that the tape Loop-around Test (#814) failed.

i. Error type 1025 means that a tape medium error was detected when the tape was read or written. The tape cartridge should be replaced if this error continues to be reported.

j. Error type 1281 indicates that a hardware failure condition was detected by the Firmware Error Counters Read and Clear Test (#812). See the *MSS Error Actions* table at the end of the section on TAPE.

k. Error type 1537 indicates that the tape cartridge is write protected. Check the RECORD switch on the tape cartridge. It should be pushed forward in the direction shown by the arrow on the switch.

l. Error type 1793 is an in-line error from the tape control software that indicates there was a problem with the SCSI Bus Access Failure or Memory Access Failure between the Host Adapter circuit pack and the Tape circuit pack. See the *MSS Error Actions* table at the end of the section on TAPE.

m. Error type 2049 indicates that a bad command was sent to the tape drive. This may be caused by a software error or a hardware failure. Execute the **test tape long** command and fix any failures associated with those tests.

n. Error type 2305 means that the tape has exceeded 90% of the manufacturer’s recommended limit of accesses. The tape should be replaced as soon as practical. This alarm can be retired by issuing the **reset tape** command but it will reappear each time the Tape Firmware Counter Test (#812) is run.

o. Error type 2306 means that a block has been reassigned on the tape or an attempt to reassign a block has failed. The tape should be replaced as soon as practical.

p. Error type 2561 indicates that the Data Write-Read Test (#810) failed.

q. Error 2817 indicates that the Tape Status Test (#815) detected a fault. See the *MSS Error Actions* table at the end of the section on TAPE.

r. Error type 3073 indicates in-line errors reported by the tape control software. See the *MSS Error Actions* table at the end of the section on TAPE.

s. Error type 3329 indicates that the Tape Audit Test (#811) detected a corrupted directory file. Execute the **test tape long** command and fix any failures associated with those tests. The Auxiliary Code for this Error Log entry and the failure code for the Tape Audit test indicate the directory file that is corrupted. If Test 811 does not fail, follow normal escalation procedures.

t. Error type 3585 with auxiliary data 408 indicates that there was an error in reading translation data from the tape and/or disk.

   This error only occurs on a system reset 3,4, or 5 (Cold 1, system reboot, or extended system reboot). If a disk is present, the system first tries to read translation from the first and second copies of translation on the disk and, if that fails, it tries to read translation from the first and second copies of translation on the tape.

   If an error was detected with reading translation from the disk and then the tape, a 408 error will be logged. This error will invoke *Emergency Transfer* on a system with simplex SPE. It will cause an SPE interchange if the system is equipped with duplicated SPEs. To clear this alarm, correct all other tape errors.

   If the SPE is not duplicated, it may be necessary to use a backup tape to first restore translation data to the disk. A new backup tape should be obtained as soon as possible.

   If the system is equipped with duplicated SPEs and if the alarm is associated with the tape on the standby SPE the active SPE should be running with the most current translation. Therefore after correcting any hardware failures associated with the tape and disk on the standby SPE, a **save translation** command should be used to save translations to the disk and tape on the standby SPE.

u. Error type 3585 with auxiliary data 409 means that there was an error in reading the program update file from both the disk and tape or there was an error in applying the program update file once it was successfully read from the disk or tape.

This error only occurs during a system reset 4 or 5 (system reboot or extended system reboot). If a disk is present, the system will try to read the program update file from the disk first and, if that fails, it will try to read the program update file from the tape. After it succeeds in reading a copy of the program update file, it will check to see if the program update information is appropriate for the software version in memory before it applies it to the software boot image.

If an error is detected with any part of the process of reading the program update file from the disk or tape and applying the program update to memory, a hardware error 409 will be generated. This error will invoke a MAJOR alarm and *Emergency Transfer* on a system with simplex SPE. It will initiate an SPE interchange followed by a MINOR alarm on a system with duplicated SPEs. When this error occurs, the copies of the program update files on the disk and tape are invalidated so that those files no longer appear when a **list configuration software** command is entered from the System Access terminal.

To clear this alarm, first correct any other tape and disk alarms. Then restore the two copies of the program update files on the disk and tapes and apply those upgrades using ''Software updates'' in Chapter 6.

v. Error type 3841 is used to record miscellaneous data when an out-of-service condition occurs. See the *MSS Error Actions* table at the end of the section on TAPE.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Reset Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Tape Reset Test (#809)	X	X		ND
Tape Diagnostic Test (#813)	X	X		ND
Tape Looparound Test (#814)	X	X		ND
Tape Status Test (#815)	X	X		ND
Tape Firmware Error				
Counters Read and Clear Test (#812)	X	X		ND
Tape Write-Read Test (#810)		X		ND
Tape Audit Test (#811)		X		ND
Tape Reset (#894)			X	ND

1. D = Destructive; ND = Nondestructive

Tape Reset Test (#809 and #894)

The Tape Reset Test consists of the following steps controlled by firmware on the Host Adapter Circuit (located on the MSSNET CIRCUIT PACK):

- Tape Drive reset

  An SCSI ‘‘BUS DEVICE RESET’’ message is transmitted to the Tape Drive to reset it.

- Presence test

  An SCSI ‘‘INQUIRY’’ command is sent to the Tape Drive to attempt to query with it. If the Tape Drive is present, it will return information about the device type, whether or not its medium is removable, compatibility with established standards, vendor and product IDs, and other miscellaneous information.

- Capacity test

  An SCSI ‘‘READ CAPACITY’’ command is sent to the Tape Drive. It returns with the logical block address and the block length of the last logic block on the medium.

  An SCSI ‘‘READ DATA BUFFERS’’ command is sent to the Tape Drive. This returns the size of the controller memory data buffers.

  An SCSI ‘‘READ DEFECT DATA’’ command is sent to the Tape Drive. This returns the addresses of bad blocks on the tape that must be mapped around.

- Device Diagnostic Tests

  An SCSI ‘‘SEND DIAGNOSTICS’’ command is sent to the Tape Drive to initiate a set of device-dependent self-tests that are run as a unit. Failures can be for multiple reasons and the return code which indicates the cause of failure is vendor unique. A failure condition will be reported as single failure type since the only repair action is to replace the Tape circuit pack.

Table 9-690. TEST #809/#894 Tape Reset Test

Error Code	Test Result	Description/ Recommendation
526	ABORT	The Host Adapter has been busied out. 1. Issue the **release host-adapter** command.
1316	ABORT	Could not get access to the Mass Storage System. Other application software may be using it or background maintenance tests may be running. 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1335	ABORT	Could not run the test on the Standby SPE—Duplication not administered. 1. Refer to the documentation for STBY-SPE maintenance. 2. Administer standby present.
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1350	ABORT	Could not run test on Standby SPE—Shadowing not enabled. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.

Continued on next page

Table 9-690. TEST #809/#894 Tape Reset Test — *Continued*

Error Code	Test Result	Description/ Recommendation
5102	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
	NO BOARD	The tape has been placed in the "uninstalled" state. 1. Verify that a tape cartridge is installed and not write-protected and that the tape drive is fully inserted and powered up. 2. Attempt a demand reset of the tape.
201	FAIL	The Tape Drive is not responding or it may not be present. 1. Verify that the Tape circuit pack is present and powered. 2. Replace the Tape circuit pack. 3. If the reset continues to fail with this error code, replace the Host Adapter circuit pack.
5124	FAIL	It has been detected that no tape cartridge is installed. 1. Verify that a tape cartridge is installed and not write-protected. 2. If the reset continues to fail with this error code, continue with the steps below for the general reset failure case.
1	FAIL	The Tape could not be reset successfully. 1. Verify that a tape cartridge is installed and not write-protected. 2. If the test continues to fail, replace the Tape cartridge. Wait for the retension pass to complete. If the test succeeds, issue the **backup disk** command. 3. If the test continues to fail, replace the Tape circuit pack. 4. If the test continues to fail, replace the MSSNET circuit pack.
	PASS	The Tape was reset correctly. Check other test results to see if it is operating correctly.

1. See the MSS Error Actions table at the end of the section on TAPE.

Tape Write-Read Test (#810)

The Tape Write-Read Test verifies that data can be written to a specific file on the tape and read back successfully. It does not test the integrity of other files on the tape. This test consists of the following steps:

1. Maintenance software in the SPE issues a request to the Host Adapter for a transfer of data between SPE memory and a specified block on the tape.

   The Host Adapter firmware issues an SCSI **WRITE** command to the Tape Drive which results in a transfer of data between the SPE memory and the tape.

2. Maintenance software in the SPE issues a request to the Host Adapter to run a checksum on the data previously written to the tape.

   The Host Adapter reads the data off the tape and computes a checksum which is returned to the SPE maintenance software.

3. Maintenance software compares the value of the checksum from the Host Adapter with the checksum it previously calculated on the data it stored on the tape.

Multiple failure conditions can occur during this test since it uses both the software and hardware functions used during normal operations.

Table 9-691. TEST #810 Tape Write-Read Test

Error Code	Test Result	Description/ Recommendation
1301 1302	ABORT	Could not run the test—internal MSS error 1. Retry the command
1304	ABORT	Could not allocate the Mass Storage System to run this test. Other application software may be using it or background maintenance tests may be running. 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (Use the **display system-parameters maintenance** command to display the start time for scheduled maintenance and the "y/n" option for saving translation daily).
1316	ABORT	Could not get access to the Mass Storage System. Other application software may be using it or background maintenance tests may be running. 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).

Continued on next page

Table 9-691. TEST #810 Tape Write-Read Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1335	ABORT	Could not run the test on the Standby SPE—Duplication not administered. 1. Refer to the documentation for STBY-SPE maintenance. 2. Administer standby present.
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe**), retry the command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When standby is restored to service (use **status spe**), retry command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
5102	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
	NO BOARD	The tape has been placed in the "uninstalled" state. 1. Verify that a tape cartridge is installed and not write-protected and that the tape drive is fully inserted and powered up. 2. Attempt a demand reset of the tape.

Continued on next page

Table 9-691. TEST #810 Tape Write-Read Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	The tape could not be accessed, the checksum on the data written did not match the checksum in memory or the data read did not match the data written. 1. Verify that a tape cartridge is installed and not write-protected. 2. If a non-write-protected tape was inserted, remove it and clean the Tape Heads. 3. If the test continues to fail, replace the Tape Cartridge. Wait for the retension pass to complete. If the test succeeds, issue the **backup disk** command. 4. If the test continues to fail, replace the Tape circuit pack. 5. If the test continues to fail, replace the MSSNET circuit pack.
	PASS	The Tape write-read test succeeded. Check other test results to see if it is operating correctly.

1. See the MSS Error Actions table at the end of the section on TAPE.

Tape Audit Test (#811)

The Tape Audit Test verifies the following Tape Medium conditions.

- The directory can be read.
- There are no "dirty" files. A file is said to be "dirty" if the data in the file is not complete or if the directory entry for that file was not updated after the data was written to the device.
- The tape has not exceeded the number of passes recommended by the manufacturer. If the tape has exceeded 90% of the manufacturer's recommended limit of accesses, the tape should be replaced. An alarm indicating this will appear nightly after scheduled maintenance is executed. This alarm can be retired by issuing the **reset tape** command.

Table 9-692. TEST #811 Tape Audit Test

Error Code	Test Result	Description/ Recommendation
1316	ABORT	Could not get access to the Mass Storage System. Other application software may be using it or background maintenance tests may be running. 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1335	ABORT	Could not run the test on the Standby SPE—Duplication not administered. 1. Refer to the documentation for STBY-SPE maintenance. 2. Administer standby present.
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
5102	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals for a maximum of 5 retries. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).

Continued on next page

Table 9-692. TEST #811 Tape Audit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	NO BOARD	The tape has been placed in the "uninstalled" state. 1. Verify that a tape cartridge is installed and not write-protected and that the tape drive is fully inserted and powered up. 2. Attempt a demand reset of the tape.
1	FAIL	The audit of the tape directory failed. 1. Verify that a tape cartridge is installed. 2. Perform a **backup disk**. This may take up to an hour to complete. 3. If the test continues to fail, replace the Tape Cartridge. Wait for the retension pass to complete and rerun the test. If the test succeeds, issue the **backup disk** command. 4. If the test continues to fail, replace the Tape circuit pack. 5. If the test continues to fail, determine if other Tape, Disk, or Host Adapter tests fail, and if they do, follow the repair procedures for those failures.
	PASS	The tape directory audit succeeded. Check other results to see if it is operating correctly.

1. See the MSS Error Actions table at the end of the section on TAPE.

Tape Firmware Error Counters Read and Clear Test (#812)

The Host Adapter firmware is constantly running background tests on each of its devices. When an error is detected by one of these background tests, the appropriate counter in the host adapter dual port RAM is incremented. The Tape Firmware Error Counters Read and Clear Test requests that the firmware return these errors to the software and clear the area in dual port RAM. If any counter is non-zero, the software then increments the appropriate software counter. The 16 errors reported by the firmware are:

- Unexpected interrupt from the SCSI Bus Interface Controller Chip (SBICC)
- SBICC timed out during SCSI command
- Error interrupt from the Direct Memory Access Controller (DMAC)
- DMAC timeout without issuing interrupt
- Tape self-test failed

- Tape external looparound test failed
- Command failed with bad sense key
- Tape could not be accessed
- Flaw detected in tape medium
- Unrecoverable hardware error on tape
- Invalid parameter in SCSI command
- Media removed or device reset
- Tape is write protected
- Tape reached end of medium
- Block reassigned on tape
- Block reassignment on tape failed

Also this test checks for two other conditions: the presence of grown defects on the tape medium, and whether the tape has been accessed in excess of 90% of the manufacturer's suggested maximum.

Table 9-693. TEST #812 Tape Firmware Error Counters Read and Clear Test

Error Code	Test Result	Description/ Recommendation
1305	ABORT	Could not read firmware error counters. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1306	ABORT	Could not read configuration area for defect information. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1316	ABORT	Could not get access to the Mass Storage System. Other application software may be using it or background maintenance tests may be running. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1335	ABORT	Could not run the test on the Standby SPE—Duplication not administered. 1. Refer to the documentation for STBY-SPE maintenance. 2. Administer standby present.

Continued on next page

Table 9-693. TEST #812 Tape Firmware Error Counters Read and Clear Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When standby is restored to service (use **status spe** to determine state of standby) retry command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When standby is restored to service (use **status spe** to determine state of standby) retry command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When standby is restored to service (use **status spe** to determine state of standby) retry command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
5102	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
	NO BOARD	The tape has been placed in the "uninstalled" state. 1. Verify that a tape cartridge is installed and not write-protected and that the tape drive is fully inserted and powered up. 2. Attempt a demand reset of the tape.

Continued on next page

Table 9-693. TEST #812 Tape Firmware Error Counters Read and Clear Test — *Continued*

Error Code	Test Result	Description/ Recommendation
7	FAIL	Background tests run by the Host Adapter detected that the tape could not be accessed at some time previous to executing the read-and-clear test. This error may have been caused by removing and reinserting the tape cartridge. The read-and-clear test or reset test must be run at least once before this error is cleared. 1. Try **test tape** again to see if the error has cleared. 2. Verify that the Tape Cartridge is present. 3. If the test continues to fail, replace the Tape circuit pack.
11	FAIL	Background tests run by the Host Adapter detected that the Tape drive was reset at some time previous to executing the read-and-clear test. This error may have been caused by removing and reinserting the tape cartridge. The read-and-clear test or reset test must be run at least once before this error is cleared. 1. Try **test tape** again to see if the error has cleared. 2. If the test continues to fail, replace the Tape circuit pack.
5504	FAIL	A tape block has been reassigned to a different location on the tape as a result of a medium error. This is referred to as a "grown defect." Tape performance will be affected since the tape drive must search ahead to read or write this block and then return to where it left off. Continued testing will not correct the problem. The tape should be replaced as soon as practicable. 1. Run the STO-DATA tests to verify that the boot images, translations, announcements, etc., are valid. 2. If errors are detected, run **backup disk full** to restore good copies to the tape. 3. If the STO-DATA tests continue to fail, replace the tape.
5512	FAIL	Ninety per cent of the manufacturer's recommended limit for tape accesses has been exceeded. Continued testing will not correct the problem and the tape will need to be replaced as soon as practicable.

Continued on next page

Table 9-693. TEST #812 Tape Firmware Error Counters Read and Clear Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	At least one of the firmware error counters was non-zero. 1. Run the **test tape** command again to verify that this failure was not from a failure condition which has been cleared as a result of this test clearing the firmware counters. 2. Verify that a tape cartridge is installed and not write-protected. 3. If a non-write-protected tape was inserted, retry the command at 1-minute intervals a maximum of 5 times. 4. If the test continues to fail, remove the tape cartridge and clean the Tape Heads. 5. If the test continues to fail, replace the Tape Cartridge. Wait for the retension pass to complete. If the test succeeds, issue the **backup disk full** command. 6. If the test continues to fail, replace the Tape circuit pack. 7. If the test continues to fail, replace the MSSNET circuit pack.
	PASS	The firmware error counters were zero. Check other test results to see if it is operating correctly.

1. See the MSS Error Actions table at the end of the section on TAPE.

Tape Diagnostic Test (#813)

The Tape Diagnostic test causes the Host Adapter to send an SCSI **SEND DIAGNOSTICS** command to the TAPE circuit pack. This initiates a set of device-dependent self-tests that are run as a unit. Failures can be for multiple reasons. The return code which indicates the cause of failure is vendor unique. A failure condition will be reported as single failure type since the only repair action is to replace the Tape circuit pack.

Table 9-694. TEST #813 Tape Diagnostic Test

Error Code	Test Result	Description/ Recommendation
1316	ABORT	Could not get access to the Mass Storage System Other application software may be using it or background maintenance tests may be running. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1335	ABORT	Could not run the test on the Standby SPE—Duplication not administered. 1. Refer to the documentation for STBY-SPE maintenance. 2. Administer standby present.
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-694. TEST #813 Tape Diagnostic Test — *Continued*

Error Code	Test Result	Description/ Recommendation
5102	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
	NO BOARD	The tape has been placed in the "uninstalled" state. 1. Verify that a tape cartridge is installed and not write-protected and that the tape drive is fully inserted and powered up. 2. Attempt a demand reset of the tape.
1	FAIL	A Tape diagnostic test failed. 1. Verify that a tape cartridge is installed and not write-protected. 2. If a tape was inserted, remove it and clean the Tape Heads. 3. If the test continues to fail, replace the Tape Cartridge. Wait for the retension pass to complete. If the test succeeds, issue the **backup disk** command. 4. If the test continues to fail, replace the Tape circuit pack. 5. If the test continues to fail, replace the MSSNET circuit pack.
	PASS	The Tape passed all diagnostic tests. Check other test results to see if it is operating correctly.

1. See the MSS Error Actions table at the end of the section on TAPE.

Tape Loop-around Tests (#814)

This test extends the Host Adapter Loop-Around test to send data from the Host Adapter to buffers on the Tape circuit pack and back to the Host Adapter. It may detect errors related to the Host Adapter, SCSI bus, and the Tape circuit pack. It is intended to functionally test the Tape Drive circuit pack to the extent possible without actually writing data to the tape.

This test consists of two sets of tests:

- Tape Internal Loop-around

  Data is generated in the RAM of the Host Adapter and transferred to its SCSI Data Memory. An SCSI **WRITE DATA BUFFERS** command is sent to the Tape circuit pack which causes the Tape Drive circuit pack to copy the data to its buffers. An SCSI **READ DATA BUFFERS** command is then sent by the Host Adapter to the Tape Drive circuit pack which causes the Tape circuit pack to transfer the data from its buffers back to the Host Adapter's SCSI Data Memory. The Host Adapter then copies the data back to its private RAM where it compares it with the original test data.

- Tape External Loop-around

  This test is similar to the Internal Loop-around test except that the data originates in the Host Adapter's Dual Port RAM and it is transferred to and from the SCSI Data Memory using SPE system bus accesses. Only a small amount of data is sent to the Tape Drive circuit pack in order to keep system bus access to a minimum.

Table 9-695. TEST #814 Tape Loop-around Test

Error Code	Test Result	Description/ Recommendation
1316	ABORT	Could not get access to the Mass Storage System. Other application software may be using it or background maintenance tests may be running. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1335	ABORT	Could not run the test on the Standby SPE—Duplication not administered. 1. Refer to the documentation for STBY-SPE maintenance. 2. Administer standby present.
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.

Continued on next page

Table 9-695. TEST #814 Tape Loop-around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
5102	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
	NO BOARD	The tape has been placed in the "uninstalled" state. 1. Verify that a tape cartridge is installed and not write-protected and that the tape drive is fully inserted and powered up. 2. Attempt a demand reset of the tape.
[1]	FAIL	The Tape loop-around test failed. 1. Verify that a tape cartridge is installed and not write-protected. 2. If a tape was inserted, remove it and clean the Tape Heads. 3. If the test continues to fail, replace the Tape Cartridge. Wait for the retension pass to complete. If the test succeeds, issue the **backup disk** command. 4. If the test continues to fail, replace the Tape circuit pack. 5. If the test continues to fail, replace the MSSNET circuit pack.
	PASS	The Tape loop-around test passed. Look at the results of other tests to see if it is operating correctly.

1. See the MSS Error Actions table at the end of the section on TAPE.

Tape Status Test (#815)

The Tape Status Test verifies the following:

- The Host Adapter knows about the existence of the Tape Drive circuit pack.
- The LEDs on the faceplate can be turned on and off correctly.

  Note that this only verifies that the control and status logic for the LEDs is operating correctly. The operation of the LEDs may also be tested visually by using the **test led** command.
- +12V from on-board DC-to-DC converters are present.

Table 9-696. TEST #815 Tape Status Test

Error Code	Test Result	Description/ Recommendation
1306 1307 1308	ABORT	Internal software error between maintenance software and MSS driver. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1316	ABORT	Could not get access to the Mass Storage System. Other application software may be using it or background maintenance tests may be running. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
1335	ABORT	Could not run the test on the Standby SPE—Duplication not administered. 1. Refer to the documentation for STBY-SPE maintenance. 2. Administer standby present.
1338	ABORT	Could not run the test on the Standby SPE—Interchange pending. 1. Refer to the documentation for STBY-SPE maintenance. 2. After interchange occurs, run test on new active SPE.
1339	ABORT	Could not run the test on the Standby SPE—Handshake down. 1. Refer to the documentation for STBY-SPE maintenance. 2. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
1347	ABORT	Could not run the test on the Standby SPE—Refresh not complete. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.

Continued on next page

Table 9-696. TEST #815 Tape Status Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1350	ABORT	Could not run the test on the Standby SPE—Shadowing not enabled. 1. When the standby is restored to service (use **status spe** to determine state of standby) retry the command.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2500	ABORT	Could not run the test on the Standby SPE—Internal software error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
5102	ABORT	Could not allocate the Mass Storage System to run this test 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, verify that the daily translation-save operation is not in progress (issue the **display system-parameters maintenance** command to display the time for scheduled maintenance and the "y/n" option for saving translation daily).
	NO BOARD	The tape has been placed in the "uninstalled" state. 1. Verify that a tape cartridge is installed and not write-protected and that the tape drive is fully inserted and powered up. 2. Attempt a demand reset of the tape.
[1]	FAIL	The tape configuration information shows the tape circuit pack is missing or the tape LED test failed. 1. Verify that a tape cartridge is installed and not write-protected. 2. If a tape was inserted, remove it and clean the tape heads. 3. If the test continues to fail, replace the Tape Cartridge. Wait for the retension pass to complete. If the test succeeds, issue the **backup disk** command. 4. If the test continues to fail, replace the Tape circuit pack. 5. If the test continues to fail, replace the MSSNET circuit pack.
	PASS	The Tape status test passed successfully. Check other test results to see if it is operating correctly.

1. See the MSS Error Actions table at the end of the section on TAPE.

Tape Reset Test (#894)

The Tape Reset Test is run on as part of the **reset tape** command. The test results for Test 894 are the same as those for Test 809, which is run as part of the **test tape** sequence. All tape alarms are cleared when Test 894 passes, while only some tape alarms may clear when Test 809 passes. Refer to results for Test 809 for repair procedures.

Tape Drive Head Cleaning Procedure

The following procedures should be used to clean the PBX Tape Drive(s). **A Tape Drive should be cleaned once every three months** to reduce the risk of losing information and to prevent unexpected service calls. An entry should be made in the Lucent Preventive Maintenance Log when this is done (see Chapter 6).

A DC2000 Series Data Cartridge Tape Drive Cleaning Kit from 3M is used to clean the tape head and the tape capstan. This kit consists of a Cleaning Positioning Cartridge and 20 cleaning wands (Comcode 406622464 or 3M Reorder number DC051111-12947). A refill kit of 20 cleaning wands is also available (Comcode 406622472 or 3M Reorder Number DC051111-12948).

NOTE:
The cleaning wands are flammable. Dispose of properly.

1. Busy out the Tape circuit pack using the **busyout tape c** command where *c* is the carrier number (a or b). This prevents background maintenance tests and other application software from trying to access the tape.
2. Eject the Tape Cartridge from the Tape circuit pack (TN1656). Insert the Cleaning Position Cartridge into the Tape Drive with the **label side to the left** (see Picture 1).
3. Prepare the cleaning wand for use as follows: Hold the bristle end down, crush the wand at the "x" area and squeeze to release fluid and saturate the bristles.
4. Insert the wand into **R/W Head Slot** (top of cartridge, see Picture 2) with gentle twisting motion. Stop when solid resistance is felt. Rotate the wand 6 turns while raising and lowering end of wand.
5. Remove the used wand and discard.
6. Prepare a second wand as described in step 3 above.
7. Eject the Cleaning Position Cartridge out of the Tape circuit pack and reinsert it. This will condition the tape drive to move the capstan when the cleaning wand is inserted in the next step.
8. Insert the wand into the **Capstan Slot** (middle of cartridge, see Picture 2) within 10 seconds after the Cleaning Position Cartridge was reinserted.
9. Apply a gentle forward pressure to the wand for about 15 seconds. You should be able to feel the capstan moving.

10. Remove the used wand and discard.
11. Eject the Cleaning Positioning Cartridge and insert the PBX Tape Cartridge back into the Tape Drive.

    NOTE:
    After the Tape Cartridge is inserted back into the Tape Drive, it will run through a retension pass which will take up to two minutes to complete. During that time, the **reset tape** command entered in the next step causes a "please wait" message to flash on the terminal screen while the tape is retensioning, but the command will complete after the retension pass completes.

12. Reset the Tape circuit pack using the **reset tape c** command where *c* is the carrier number (a or b). This will clear out a tape error that indicates the tape cartridge had been removed and reinserted.
13. Release the Tape from its maintenance busy-out state using the **release tape c** command where *c* is the carrier number (a or b).

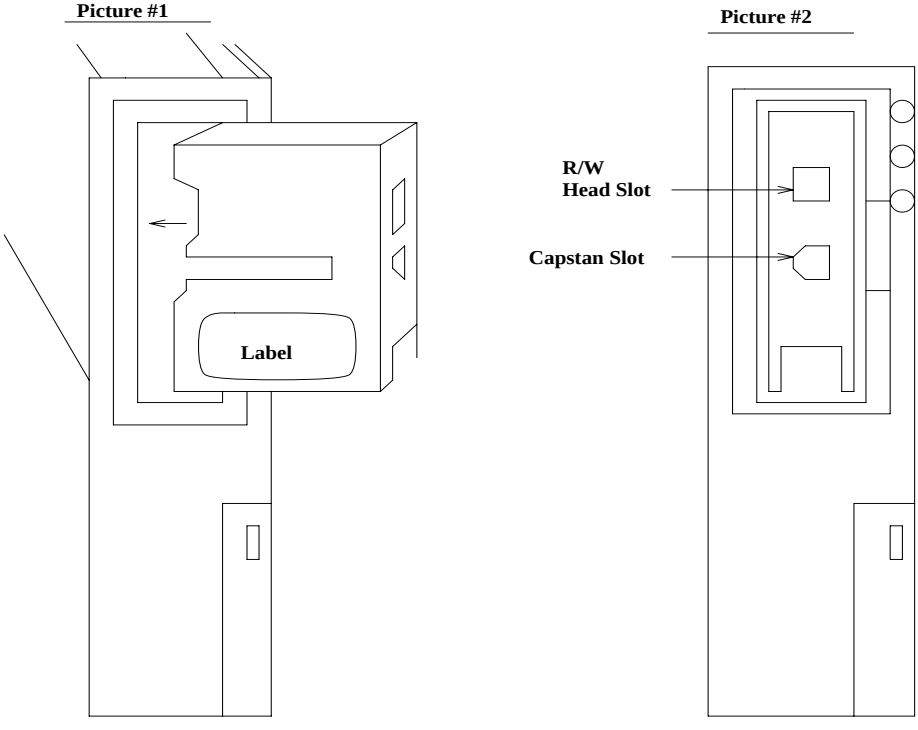

Figure 9-108. Mass Storage System Interactions

Table 9-697. MSS Error Actions

Code	Description
0	Unexpected interrupt from SBICC.
1	SBICC timed out during SCSI command.
2	DMAC generated error interrupt.
3	DMAC timed out without interrupt.
4	Tape self-test failed.
5	Tape external looparound test failed.
6	Command failed with bad SENSE key.
7	Tape could not be accessed.
8	Flaw detected in tape medium.
9	Unrecoverable hardware failure on tape.
10	Invalid parameter in SCSI command.
11	Media removed or tape reset.
12	Tape is write protected.
13	Tape reached end of medium.
14	Block reassigned on tape.
15	Block reassignment failed on tape.
16	Inconsistent capacity data
17	Device busy
18	Device reservation conflict
19	Request sense failed
101	Unrecognized *opcode*.
102	Unrecognized *modifier*.
103	*xlist_length* too long.
104	Invalid transfer address.
105	Intra-device copy ranges overlap.
121	Device invalid for *opcode* requested.
122	Device non-existent.
123	Device is out of service.
124	*to_byte* or *from_byte* is out of range.
125	*to_byte* + *numbytes* is invalid or *from_byte* + *numbytes* is invalid.

Continued on next page

Table 9-697. MSS Error Actions — *Continued*

Code	Description
126	Type of device is invalid for *opcode* requested.
201	An unexpected interrupt code was returned from the SBICC. This represents a protocol error that could be the result of the HA or the target device. The device may not be present.
251	SBICC timed out. This could be the fault of the HA or target device. The HA will attempt to reset the SBICC.
301	DMAC error. This could be the fault of the HA or the SCSI target device.
351	DMAC timed out. This could be the fault of the HA or the SCSI target device. The HA will attempt to reset the SBICC.
401	Could not save announcements or program update file.
408	Could not read translation from the Disk and Tape as part of system initialization.
409	Could not apply program update file.
422	Could not save translations.
501	A non-critical diagnostic test failed on the Host Adapter. This includes the USART chip test and the LED tests.
511	A diagnostic test requiring bus mastership failed. This happens only as the result of an MSS_DIAG command. This could be the fault of the HA or the system. Therefore the board does not put itself in held reset state. Rather, the error is reported and counters are incremented.
521	The HA looparound test requiring bus mastership failed. This happens only as the result of an MSS_LOOPAROUND command. This could be the fault of the HA or the system. Therefore the board does not put itself in held reset state. Rather, the error is reported and counters are incremented.
531	Target device **SEND DIAGNOSTICS** self-test indicated a hardware error. This indicates that there are problems with the controller or the device, and it should be taken out of service. This error will not occur if other errors (e.g. SBICC) prevent the **SEND DIAGNOSTICS** command from running.
551	The target device internal looparound failed due to data corruption. Other errors (SBICC, SCSI check condition) would cause a different error code to be reported. This failure demonstrates that the target may potentially corrupt data and it should be taken out of service.
552	The target device external looparound failed due to data corruption. Other errors (SBICC, SCSI check condition) cause a different error code to be reported. This failure demonstrates that the target may potentially corrupt data. However, the HA does not take the device out of service as a result of this error. This test is only run following the target device internal looparound which detects actual problems with the target device. This failure implicates the HA bus interface or a system problem.
561	When the MSS_RESET command was issued for a device, it was found not to be present.
562	When the MSS_RESET command was issued for a device, the NQUIRY command failed.

Continued on next page

Table 9-697. MSS Error Actions — *Continued*

Code	Description
563	When the MSS_RESET command was issued for a device, the TEST UNIT READY command failed
564	When the MSS_RESET command was issued for a device, the READ CAPACITY command failed
565	The device reset failed.
566	Device type not supported.
567	Capacity data is inconsistent.
568	Block size doesn't divide into 8K.
601	**REQUEST SENSE** failed.
700	Indicates that there is no specific sense key information for a SCSI target on which a **REQUEST SENSE** was issued. This should never happen because firmware only asks for sense information if errors occurred.
701	SCSI sense information reported a recovered error on a SCSI target where it didn't make sense. Normally recovered errors are filtered by the HA firmware for reads and writes. However, for other commands, this is reported to software.
702	SCSI sense information indicates that the target device cannot be accessed. This will occur if the tape cartridge is not present.
703	SCSI sense information indicates that a SCSI command terminated with a nonrecovered error condition probably caused by a flaw in the medium or an error in the recorded data.
704	SCSI sense information indicates a nonrecoverable hardware failure occurred. The tape may be broken.
705	SCSI sense information indicates that there was an illegal parameter in the command descriptor block or in additional parameters supplied. This could be caused by a HA firmware failure or a problem with the target device.
706	SCSI sense information indicates that the target device's removable medium may have been changed or the target controller has been reset.
707	SCSI sense information indicates that reads or writes were attempted for a medium that was protected from this operation.
708	SCSI sense information indicates that a write-once read-multiple device or a sequential-access device encountered a blank block while reading or a write-once read-multiple device encountered a nonblank block while writing. This should never happen; the HA only supports direct access devices.
709	SCSI sense information indicates a vendor-unique sense key.
710	SCSI sense information indicates a **COPY**, **COMPARE**, or **COPY AND VERIFY** command was aborted due to an error condition on the source device, the destination device, or both. This shouldn't happen since these commands aren't issued by the HA.
711	SCSI sense information indicates that the target controller aborted the command.

Continued on next page

Table 9-697. MSS Error Actions — *Continued*

Code	Description
712	SCSI sense information indicates that a **SEARCH DATA** command has satisfied an equal comparison. This should not happen since this command is not issued by the HA.
713	This indicates that a buffered peripheral device has reached the end-of-medium and data remains in the buffer that has not been written to the medium.
714	This indicates that the source data did not match the data read from the medium. This should not happen since the HA does not issue any commands involving comparisons.
715	SCSI sense information returned a reserved sense key. This should not happen.
758	Device returned busy.
764	Device returned reservation conflict status.
801	HA firmware was attempting to process a command requiring system bus access and the NOGOINT interrupt occurred. This probably indicates that system software failed to enable bus access before issuing an MSS command requiring it. It also could indicate a system problem or a HA problem.
802	HA firmware was accessing the system bus and it timed out. This could be a result of MSS command argument errors, system problems, or a HA problem.
803	HA firmware was accessing the system bus and received a data-parity interrupt. This could indicate a system or HA problem.
804	HA firmware was accessing the system bus and received a error detection and correction interrupt. This could indicate a system or HA problem.
805	System bus error test failed.
1001	Firmware error
1002	Cheetah/Pecos error
1003	Both the 68020 and the DMAC tried to access the same location in the SDM concurrently.
1004	HA firmware couldn't put a response in the response queue because it was full. This could be the fault of the HA, or system software. However, there is no way to recover, therefore the HA places itself in held reset.
2001	A critical diagnostic test on the Host Adapter failed making it dangerous to continue service.
2002	The Host Adapter internal looparound test failed because of data corruption.
3001	An exception occurred indicating a serious hardware or firmware problem. Additional information will be placed in HA DPRAM about which exception occurred and the address at which it occurred.
3002	An interrupt occurred when it should not have. This includes interrupts that are a normal part of command processing but that occurred unexpectedly.
4001	The checksum of the firmware image in memory prior to FLASH PROM programming failed.
4002	Flash PROM programming failed.

Continued on next page

Table 9-697. MSS Error Actions — *Continued*

Code	Description
5000	The tape cartridge has been changed or the tape drive has been reset by firmware.
5001	Alternate copy of file used—primary could not be accessed.
5113	Device out of service
5124	No tape cartridge in tape drive.
5126	Handshake not up
5127	Memory refresh not complete
5200	Kernel call received a notification.
5201	Spurious interrupt from MSSNET.
5202	Message received on an unexpected class.
5203	File system on the device is corrupt.
5204	Driver failed to get parity error interrupt.
5205	Driver failed to get EDC error interrupt.
5206	Driver failed to get timeout interrupt.
5207	Alternate file could not be accessed.
5208	Bad path index on software call.
5209	Driver failed to get bus error interrupt.
5210	MSS client died.
5212	File 0 (directory) corrupt.
5213	File 1 (alternate directory) corrupt.
5214	File 2 (small boot image) corrupt.
5215	File 3 (alternate small boot image) corrupt.
5216	File 4 (program update file) corrupt.
5217	File 5 (alternate program update file) corrupt.
5218	File 6 (translation file) corrupt.
5219	File 7 (alternate translation file) corrupt.
5220	File 8 (error log) corrupt.
5221	File 9 (alternate error log) corrupt.
5222	File 10 (downloadable firmware) corrupt.
5223	File 11 (alternate downloadable firmware) corrupt.
5224	File 12 (announcement file) corrupt.

Table 9-697. MSS Error Actions — *Continued*

Code	Description
5225	File 13 (alternate announcement file) corrupt.
5226	File 14 (maintenance scratch file) corrupt.
5227	File 15 (small config core dump) corrupt.
5228	File 16 (large boot image) corrupt.
5229	File 17 (alternate boot image) corrupt.
5230	File 18 (large core dump on disk) corrupt.
5231	File 19 (large core dump on tape) corrupt.
5300	Command timed out.
5301	Driver ran out of resources.
5302	Device or host adapter is not ready.
5303	State information is invalid.
5304	Firmware returned unexpected tag.
5305	MSSNET board is not inserted.
5400	Initialization error.
5401	Kernel call failed.
5402	Timer call failed.
5403	DUPINT call failed.
5404	DRIP call failed.
5405	Critical path destroyed.
5406	Internal error.
5504	Block reassigned on tape as a result of a medium error
5505	While running status test, configuration test failed.
5506	While running status test, LED test failed.
5507	Status test found host adapter in "held reset" state.
5508	Unable to obtain path to PAM.
5509	Translations were not locked.
5510	+5V not present
5511	+12V not present
5512	Exceeded 90% of manufacturer’s recommended tape access limit.
5513	Disk capacity not sufficient for memory size.

Continued on next page

Table 9-697. MSS Error Actions — *Continued*

Code	Description
5514	Disk not configured for larger memory size.
30003	Cannot write to tape, cartridge or device error.
30004	Cannot read from tape, cartridge or device error.
30017	Checksum error in block.
30203	Write-read mismatch error.

TBRI-BD (TN2185 ISDN Trunk-Side BRI)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
TBRI-BD	MINOR	test board UUCSS l r#	TBRI-BD

1. Where UU is the universal cabinet number (1 for PPN, 2 -44 for EPN), C is the carrier designation (A, B, C, D, or E), SS is the carrier slot address where the circuit pack is located (1, 2, and so forth), and pp is the two-digit port number (1, 2, 3, and so forth).

The TN2185 circuit pack contains eight, 4-wire ports that interface to the network at the ISDN S/T reference point over two 64 Kb/s channels (B1 and B2) and over a 16Kb/s signaling (D) channel. The B1 and B2 channels can be simultaneously circuit switched or individually packet switched. Only one channel per trunk can be packet switched due to Packet Processing Element (PPE) limitations. The D channel is either circuit switched or packet switched. Packet switching uses the PPE to combine all D channels into a single physical channel, which is then routed via the concentration highway to the Network Control Element (NCE) and then to the TDM bus. The circuit-switched connections have a Mu-law or A-law option for voice and operate as 64Kb/s clear data channels. The packet-switched channels support the LAPD protocol and conform with the CCITT Q.920 Recommendations for D-channel signaling.

LEDs

The three LEDs on the circuit pack's faceplate indicate board status. When illuminated, the red LED indicates a board failure or a major or minor on-board alarm, the green LED indicates that testing is in progress, and the amber LED indicates that the board is in use.

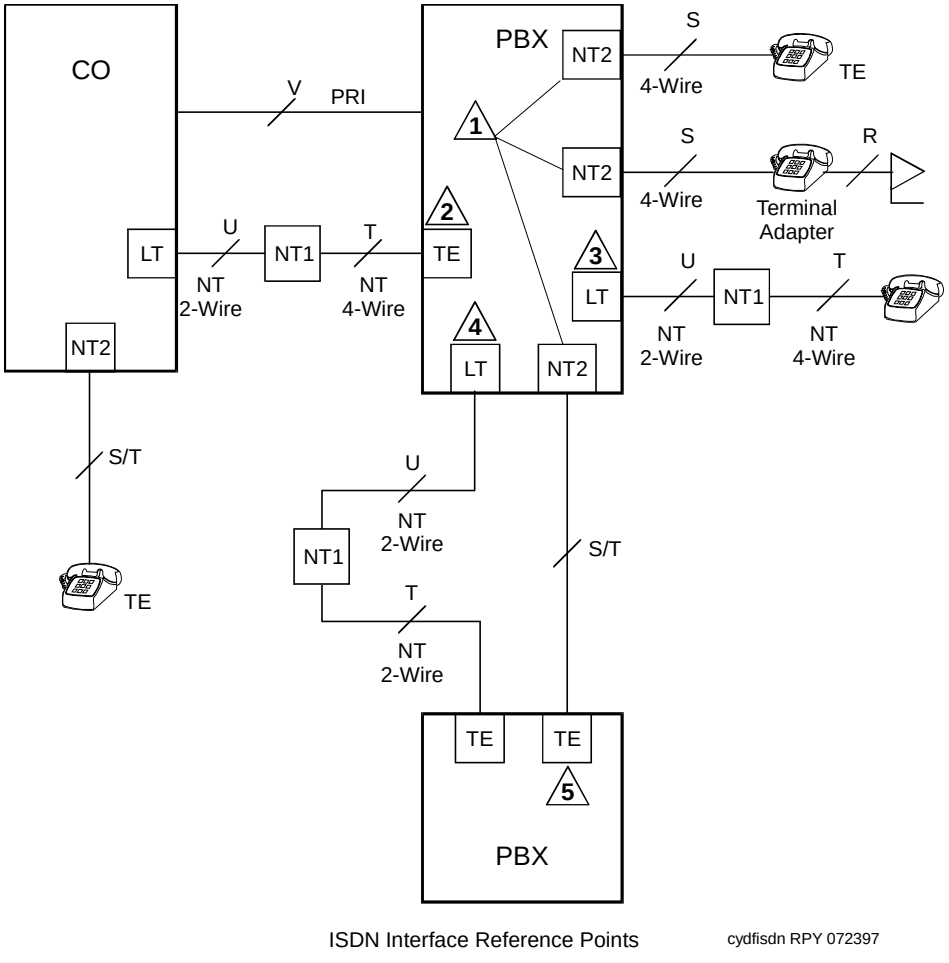

Figure 9-109. Integrated Trunk-Side BRI, ISDN Interface Reference Points

ISDN Interface Reference Point definitions:

LT	Logical Terminal
V	Primary Rate user/network (asymmetrical) trunk interface. The ECS is capable of acting as the user or as the network side of this 1.544 - or 2.048-Mbps interface.
R	Interface between Terminal Equipment and Network Termination
S	Basic Rate network-side 4-wire line interface
S/T	4-wire Basic Rate connection to a Network Termination[1].
T	4-wire Basic Rate interface to a Network Termination.[2]

TE	Terminal Equipment
U	Basic Rate network-side 2-wire line interface.
1	TN556B ISDN-BRI 4-Wire S/T-NT Line (A-law)
2	TN 2185 ISDN-BRI 4-Wire S Interface (Trunk Side)
3	TN2198 ISDN-BRI 2-Wire U Interface
4	TN2198 ISDN-BRI 2-Wire U Interface
5	TN 2185 ISDN-BRI 4-Wire S Interface (Trunk Side)

1. Network Termination 2 (NT2), that terminates Layer 1 and higher layers. PBXs, LANs, and terminal controllers typically provide NT2 functionality including protocol handling and multiplexing for Layers 2 and 3.
2. Network Termination 1 (NT1), that terminates Layer 1 and monitors maintenance, performance, timing, power transfer, multiplexing, and multi-drop termination with contention resolution.

Hardware Error Log Entries and Test to Clear Values

1537 (h)	46082		MINOR	ON	
1793 (i)	46080		MINOR	ON	
1794 (i)	46094		MINOR	ON	
1795 (i)	46085		MINOR	ON	

Continued on next page

Table 9-698. TBRI-BD Error Log Entries — *Continued*

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
2305 (j)	46104		None	ON	
2306 (i)	46081		None	ON	
3330 (j)	46083		MINOR	OFF	
3586 (k)			MINOR	OFF	
3840(l)	4096 to 4101				
3842 (m)	46095				
3843 (n)	46097				

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. The circuit pack stopped functioning or is physically removed from the system.

NOTE:
This alarm logs approximately 11 minutes after removing the circuit pack and/or the SAKI Sanity Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack in the same slot as the error indicates. See note (g).

b. Transient communication problems between the switch and this circuit pack. Execute the **test board UUCSS** command and refer to the repair procedures for the Control Channel Loop Around Test (#52).

c. On-board hardware failure. Aux data values correspond to the following detected errors:

4352	External RAM error
4353	Internal RAM error
4355	ROM Checksum error
4357	Instruction set error

Reset the circuit pack with the **busyout board UUCSS** and **reset board UUCSS** commands. When reset, the circuit pack executes a set of tests to detect the presence of any of the faults listed above. Detection of one of these errors during initialization causes the circuit pack to lock-up and appear insane to the system. See the repair procedure in Note (a).

d. The circuit pack detects a program logic error. While no action is required, this error can lead to other errors against this circuit pack.

e. The circuit pack cannot update and read back NPE/NCE memory. This error can be ignored, but may lead to other errors against this circuit pack.

f. The TN2185 board notifies maintenance software that it has detected a parity error while accessing its dynamic RAM (that stores the board's translation information and downloadable application firmware). Maintenance software resets the circuit pack.

g. Unable to write LAN Translation RAM Error (internal memory access error). Translation RAM locations for the call connection attempt are not available, and one or more RAM locations are bad due to a translation RAM read-back error. Reset the circuit pack with the **busyout board UUCSS** and **reset board UUCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm with the **test board UUCSS long clear** command. If the Circuit Pack Restart Test (#594) fails, replace the circuit pack.

h. Frame overrun at Packet Bus interface. Due to an on-board fault or by faulty data received on one of the circuit pack's external ports. If any of the ports on this circuit pack is alarmed, refer to the repair procedures for those maintenance objects. If this error persists, maintenance software removes the board from service; replace the circuit pack.

i. The circuit pack is has problems transmitting/receiving data to/from the Packet Bus.

1793	Parity errors are detected when transmitting data to the Packet Bus.
1794	Packet Bus transmit buffers overflow.
1795	Circuit pack cannot find end of frame when transmitting to Packet Bus. Clear the alarm with: **busyout board UUCSS**, **reset board UUCSS**, **test board UUCSS long clear**, **release board UUCSS**. If the error recurs within 10 minutes, replace the circuit pack.
2306	Error in a received frame from the Packet Bus, most likely caused by a packet bus problem, but may be due to a circuit pack fault. An invalid Link Access Procedure Data (LAPD) frame error occurs if the frame contains a bad Cyclical Redundancy Check (CRC). If bus parity errors occur, run the LAN Receive Parity Error Counter Test (#595) to determine if the condition has cleared. Refer to the maintenance documentation to determine if the problem is isolated to this circuit pack or is caused by Packet Bus faults.

j. Error Type (2305, 3330): A critical failure in the Circuit Pack's Packet Bus interface. Possible causes include either a Packet Bus fault or an on-board fault, for example, the board received a bad CRC or invalid DLCI. If the Packet Bus is alarmed, refer to the "*Maintenance Manual*" section for Packet Bus fault location and recommended repair procedures. The number of ISDN circuit packs displaying this error increases the probability of errors due to Packet Bus problems.

   If there are no Packet Bus alarms, reset the circuit pack with the **busyout board UUCSS** and **reset board UUCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm with the **test board UUCSS long clear** command. If the Circuit Pack Restart Test (#594) fails, replace the circuit pack.

k. The SPE software detects an excessive number of up-link messages from the TN2185 board within a certain time period. To prevent the faulty board from flooding the switch with data, the switch software takes the board out of service and alarms it. The switch software also tells the Archangel to ignore up-link messages from the board.

   When the board is alarmed due to this error, the switch software periodically puts the board back in service and tells the Archangel to process up-link messages from the board. If the problem still exists, the software takes the circuit pack out of service again. If the circuit pack does not exhibit the problem for a certain time period, then maintenance software resolves the alarm and the circuit pack is left in service.

l. The circuit pack received an inconsistent down-link message (a bad header, port number, data, subqualifier, or logical link) over the Control Channel.

m. The board is receiving data from the bus faster than it can distribute the data to its endpoints, causing the FIFO RAM buffer to overflow. This error can occur occasionally due to the statistical sizing of the buffers. If it occurs frequently, it may indicate a LAPD parameter mismatch. LAPD should recover from this problem, but it may degrade the performance of the LAN bus.

   When this error is reported, maintenance reads and clears the board counter and logs the problem in the maintenance error log.

n. Bad translation RAM detected, but the call continues by using another translation location. The circuit pack reports this error when it cannot update NPE/NCE memory and read it back. This error is not service-affecting and can be ignored, but can lead to other types of errors against this circuit pack.

System Technician-Demanded Tests: Descriptions and Error Codes

When inspecting errors in the system, always investigate tests in the order listed below. By clearing error codes associated with the *Control Channel Loop Around Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Control Channel Loop-Around Test (#52)	X	X	ND
NPE/NCE Audit Test (#50)		X	ND
LAN Receive Parity Error Counter Test (#595)		X	ND

1. D = Destructive; ND = Nondestructive

Control Channel Loop Around Test (#52)

Refer to the repair procedure described in the "XXX-BD (Common Port Circuit Pack)" section.

NPE /NCE Audit Test (#50)

Refer to the repair procedure described in the "XXX-BD (Common Port Circuit Pack)" section.

SAKI Sanity Test (#53)

This is a destructive test.

Refer to the repair procedure described in the "XXX-BD (Common Port Circuit Pack)" section. This test is only run as a part of a reset board procedure.

LAN Receive Parity Error Counter Test (#595)

This test is nondestructive. The test reads and clears the circuit pack's LAN Receive Parity Error Counter. This counter increments when it detects a parity error from the Packet Bus. These errors may indicate problems with a circuit pack, Packet Bus, or with another circuit pack on the bus. Use this test to verify the repair.

Table 9-699. TEST #595 LAN Receive Parity Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of 5 times, reset the circuit pack via the **busyout board UUCSS** and **reset board UUCSS** commands. 2. If the test aborts again, replace the circuit pack.
2100 2012	ABORT ABORT	Could not allocate the necessary system resources to run this test. Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1-10	FAIL	The circuit pack is still detecting errors of this type. The error code indicates the value of the on-board error counter. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to fail, verify the validity of the Packet Bus. Run the Packet Bus maintenance test with the **test pkt P long** command. If any Packet Bus tests fail, refer to the "PKT-BUS (Packet Bus)" section for recommended repair procedures. 3. If the Packet Bus test passes, check the validity of the circuit pack. Execute a test that involves data transmission onto the Packet Bus. For example, the **test port UUCSSpp** command may use the connectivity tests of the BRI-PORT maintenance object. If the test fails, refer to the repair procedures; otherwise, proceed to the next step. 4. Other circuit packs on the Packet Bus may be causing of the parity error. Use the **display errors** command to check the Error Log for alarmed other circuit packs. Resolve any alarms for other circuit packs as well. Rerun the LAN Receive Parity Error Counter Test (#595).
	PASS	No errors detected.

TBRI-PT (ISDN Trunk-Side BRI Port)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
TBRI-PT	MAJOR	test port UUCSS l r#	TBRI-PT
TBRI-PT	MINOR	test port UUCSS l r#	TBRI-PT
TBRI-PT	WARNING	test port UUCSS s r#	TBRI-PT

1. Where UU is the universal cabinet number (1 for PPN, 2 -44 for EPN), C is the carrier designation (A, B, C, D, or E), SS is the carrier slot address where the circuit pack is located (1, 2, and so forth), and pp is the two-digit port number (1, 2, 3, and so forth).

This document describes the port maintenance features of the DEFINITY® ISDN Trunk-side BRI board (TN2185). The circuit pack provides 8 S/T ISDN 2B+D ports that interface to either the central office or another PBX.

The TN2185 circuit pack contains eight, 4-wire ports that interface to the network at the ISDN S/T reference point over two 64 Kb/s channels (B1 and B2) and over a 16Kb/s signaling (D) channel. The B1 and B2 channels can be simultaneously circuit switched, or individually packet switched. Only one channel per trunk can be packet switched due to Packet Processing Element (PPE) limitations. The D channel is either circuit switched or packet switched. Packet switching uses the PPE to combine all D channels into a single physical channel, which is then routed via the concentration highway to the Network Control Element (NCE) and then to the TDM bus. The circuit-switched connections have a Mu-law or A-law option for voice and operate as 64Kb/s clear data channels. The packet-switched channels support the LAPD protocol and conform with the CCITT Q.920 Recommendations for D-channel signaling.

LEDs

The three LEDs on the circuit pack's faceplate indicate board status. When illuminated, the red LED indicates a board failure or a major or minor on-board alarm, the green LED indicates that testing is in progress, and the amber LED indicates that the board is in use.

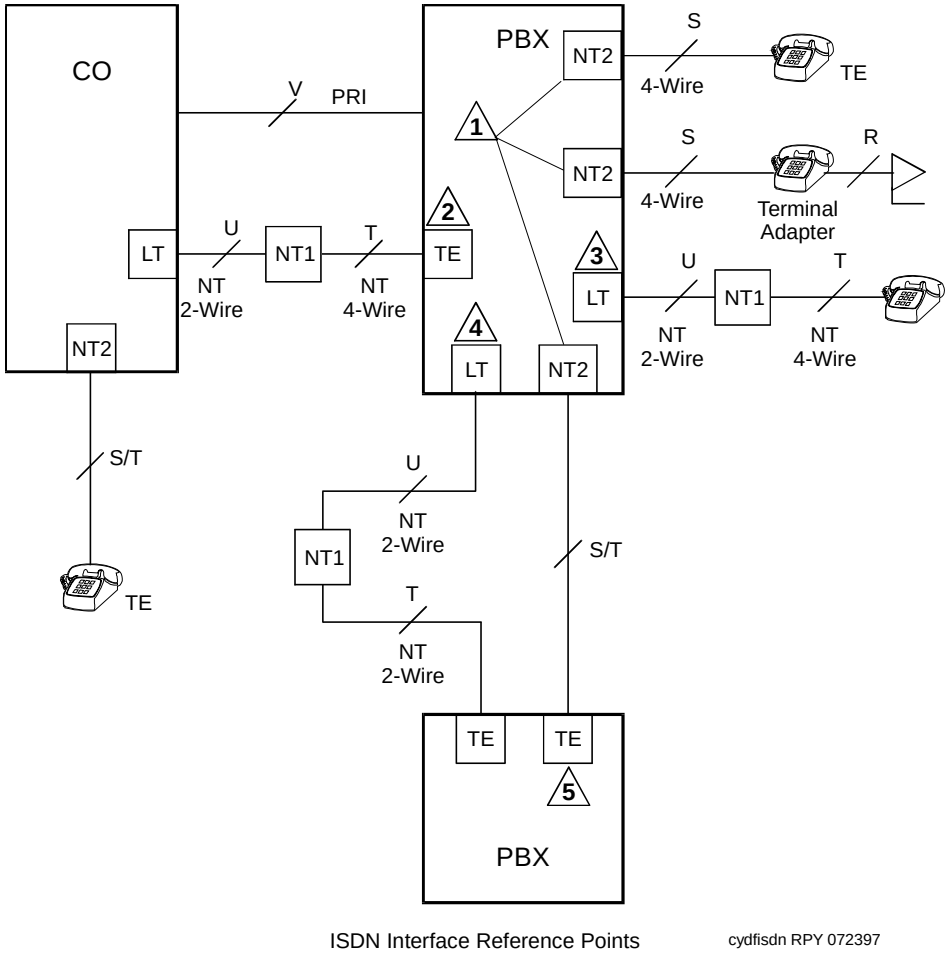

Figure 9-110. Integrated Trunk-Side BRI, ISDN Interface Reference points

ISDN Interface Reference Point definitions:

LT	Logical Terminal
V	Primary Rate user/network (asymmetrical) trunk interface. The ECS is capable of acting as the user or as the network side of this 1.544 - or 2.048-Mbps interface.
R	Interface between Terminal Equipment and Network Termination

1538 (i)		CRC error (TDM D-Channel)	MINOR	OFF	

Continued on next page

Table 9-700. TBRI-PT Error Log Entries — *Continued*

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1793 (j)		BRI Port Local TDM Looparound Test (#619)	MINOR	ON	
2049 (k)			MINOR	OFF	
2305 (l)		Layer 3 Query (#1243)	MINOR	OFF	
3073 (m)		Slip Query Test (#1244)	MINOR	OFF	
3585 (n)		Receive FIFO Overflow (TDM D-Channel)	Log Only	ON	
3586 (o)					
3587 (p)					
3588 (q)	46223				
3589 (r)					
3590 (s)	46211				
3591 (t)					
3592 (u)					
3841 to 3942 (v)					

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. The far-end switch changed the ISDN service state. This may be a temporary condition.

Notes:

a. Loss of continuity of Layer 1 to the far-end. It is assumed that Layer 1 remains active, even when both B-Channels are idle.

   This test determines whether Layer 1 is active or not. If Layer 1 is not active, the test attempts to activate it. If Layer 1 cannot be activated, the port is taken out of service, and the test fails.

b. The D-Channel failed at Layer 2. Expiration of this timer indicates that attempts to bring the failed link back into service have not succeeded and some recovery actions should be taken on the associated B-Channels. Upon expiration, associated in-service B-channels are put in the out-of-service/far end state.

c. Error Type (513): On-board hardware failure. The FIFO RAM buffers have overflowed, indicating a hardware problem.

d. Error Type (514): Transmit FIFO Overflow - This error indicates that the circuit pack is having problems transmitting data to the TDM D-Channel. This error only occurs only a system that switches the packet implementation of the D-channel over the TDM Bus. This error indicates an on board problem related to the packet implementation of the D-Channel (R6.2 and higher).

e. Error Type (769): The port is generating too many uplinks. The link is being suspended.

f. Error Type (1025): An expired timer has created an unexpected event. The timer could be any of the following:

Timer	Event
T3031	ISDN T3031 timeout
T3032	ISDN T3032 timeout
T305	ISDN T305 timeout
T3081	ISDN T3081 timeout
T3082	ISDN T3082 timeout
TL3	Status Inquiry
T304	Setup ACK
T310	Call Proceeding Receive
T313	Connect SEND

g. Error Type (1281): This error occurs when the NPE Crosstalk Test (#617) has failed. The test will be repeated every 15 minutes until it passes. Follow normal trouble shooting procedures for NPE Crosstalk Test (#617). If this does not fix the problem, follow normal escalation procedures.

h. Error Type (1537): The board received a bad Cyclical Redundancy Check (CRC) over the D-Channel. This error is reported on a per-port basis. When the CRC errors exceed 5 within 15 minutes, the port is taken out of service for 5 seconds. If 5 more CRC errors are received within 15 minutes of the first set of 5 errors, the port is taken out of service for 1 minute. If 5 more CRC errors are received within 15 minutes of the previous 5, the port is taken out of service for 15 minutes.

   This error is most likely due to a problem with backplane wiring, a noise source, or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

   1. Check the backplane wiring.
   2. If the problem persists escalate the problem.

i. Error Type (1538): This error occurs when a frame with a bad CRC is received by the BRI trunk board. This error only occurs on a system that switches the packet implementation of the D-channel over the TDM bus. This error indicates an off board problem related to the packet implementation of the TDM D-Channel (R6.2 and later).

j. Error Type (1793): The BRI Port Local TDM Loop Around Test (#619) failed. Run the Long Test Sequence paying particular attention to the results of the BRI TDM Port Loop Test (#619).

k. Error Type (2049): The Layer 2 Link Query failed. The test is repeated every 15 minutes until it passes.

l. Error Type (2305): The Remote Layer 3 Query failed. The test is repeated every 15 minutes until it passes.

m. Error Type (3073): A frame of information had to be repeated or deleted. Slips usually occur when the received bit rate is not synchronized with the TDM Bus clock.

n. Error Type (3585): The circuit pack detected an overflow of its receive buffers. This error occurs only a system that switches the packet implementation of the D-Channel over the TDM bus. This error indicates an on board problem related to the packet implementation of the TDM D-Channel (R6.2 and higher).

o. Error Type (3586): Each port can support up to three Terminal Endpoint Identifiers (TEIs). Each channel on the port can request a TEI assignment from the switch if it supports ISDN-BRI TEI assignment procedures. If switch services gets a request for a fourth TEI on a port, it reports this event to maintenance software and initiates TEI check procedures on the port. Check to see if the correct number of channels are administered for this port.

   The user side supports automatic TEI assignment by the network. Both fixed and automatic TEI assignment are supported on the network side.

p. Error Type (3587)Service Profiler IDentifier (SPID) value is invalid or is a duplicate of another SPID that is already initialized at Layer 3 on the port. SPIDs are not used on the TN2185 circuit pack. However there will be related events.

q. Error Type (3588): The board receives D-Channel data from the bus faster than it can process the data. The FIFO RAM buffers overflowed. This error occurs occasionally due to the statistical sizing of the buffers; however, frequent occurrences may indicate a LAPD parameter mismatch between the two endpoints of a packet-switched connection. Run the Long Test Sequence paying particular attention to the results of the Receive FIFO Overflow Test (#625).

r. Error Type (3589): The BRI Port Local LAN Loop Around Test (#618) failed. Run the Long Test Sequence and pay particular attention to the results of Test #618.

s. Error Type (3590): An activated BRI port receives a frame containing a DLCI over a D-Channel for which it does not have a translation. This error normally indicates an off-board problem related to a state mismatch between the far-end and the switch. This error is logged only.

t. Error Type (3591): The port is generating too many uplinks and is taken out of service.

u. Error Types (3841-3942): Table 9-701 contains the received ISDN cause values for Errors 3841-3942 that are recorded in the hardware error logs. Unless otherwise stated, the cause values are D-Channel events. The aux data field shows which port caused the error.

Table 9-701. Cause Values for Error 3841-3942

Value	Type of Problem	Meaning
2	admin	No route to specific transit network
3	admin	No route to destination (or Germany bcap not imp)
6	admin	Channel unacceptable
18	switch problems	No user responding
38	switch problems	Network failure
50	subscription	Requested facility not subscribed
52	admin	Outgoing calls barred
54	admin	Incoming calls barred
62	subscription	Service not authorized
63	admin/sub	Service/option not available
65	admin/sub	Bearer capability not implemented
66	admin/sub	Channel type not implemented
69	admin/sub	Requested facility not implemented
70	admin/sub	Only restricted digital BC available
79	admin	Service/option not implemented
88	admin	Incompatible destination
102	switch problems	Recovery on timer expired

System Technician-Demanded Tests: Descriptions and Error Codes

When inspecting errors in the system, always investigate tests in the order listed below. By clearing error codes associated with the *Control Channel Loop Around Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
BRI Local LAN Port Loop Around Test (#618)		X	D
BRI TDM Port Loop Around Test (#619)		X	D
L1 State Query Test (#1242)	X	X	D
CRC Error Counter Test (#623)		X	ND
Receive FIFO Overflow Test (#625)		X	ND
Layer 3 Query Test (#1243)		X	ND
Slip Query Test (#1244)	X	X	ND
Clear Error Counters Test (#270)	X	X	ND
NPE Crosstalk Test (#617)		X	D

1. D = Destructive; ND = Nondestructive

Clear Error Counters Test (#270)

This test is nondestructive.

This test clears the various error counters associated with each TBRI-PT. This test passes if maintenance software is able to successfully send the downlink messages; the test aborts otherwise.

Table 9-702. TEST #270 Clear Error Counters

Error Code	Test Result	Description/ Recommendation
Any	ABORT	Maintenance could not send the downlink message.
	PASS	The message to clear the error counters of the TBRI-PT maintenance object has been sent.

NPE Crosstalk Test (#617)

This test is conditionally destructive.

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence and takes approximately 20 to 30 seconds to complete. Crosstalk testing is performed on both B-channels (B1 and B2) associated with a BRI port. If this test fails on either channel, any channel connected to the port is taken out-of-service. This test aborts if the port and its associated channels are not in the idle state.

Table 9-703. TEST #617 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use the **display port UUCSSpp** command to determine the station extension or trunk group/member number of the port. Use the **status bri-port UUCSSpp** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. Wait until the port is idle before retesting. 2. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use the **status bri-port** command to determine when the port is available for testing. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	This test is not valid for this type of translation. Ports administered as "ASAI" or "ADJK" can not run this test, because the B channels associated with the port are not used by ASAI or Lucent Adjunct Links. This is a normal condition.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-703. TEST #617 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1, 2	FAIL	The NPE of the tested port was found to be transmitting in error, causing noisy and unreliable connections. Error code 1 indicates that the NPE Crosstalk Test failed on Channel B1. Error code 2 indicates that the NPE Crosstalk Test failed on Channel B2. 1. Replace circuit pack.
	PASS	The port is correctly using its allocated time slots. 1. To be sure that this is not an intermittent problem, repeat this test a maximum of 10 times to ensure it continues to pass. 2. If complaints still exist, examine the connections and wiring.

BRI Port Local LAN Looparound Test (#618)

This test is destructive.

This test checks the connectivity of the BRI port across the LAN bus. Because this test is destructive, run this test only if the port is out-of-service.

Failures of this test indicate either on-board faults associated with the TBRI-PT hardware on the circuit pack or problems with the LAN Bus, which is used to form connectivity between the switch and the TBRI-PT.

If the port is in a state other than out-of-service, the BRI Port Local LAN Looparound Test will abort. If the port is out-of-service, then the port is put into a local looparound mode and the following test is executed.

A looparound test is performed across the Packet Bus for the D-Channel. The switch sends data over a packet connection, which is looped back by the BRI port (D-Channel) and received back by the switch. The test passes if the packet connection can be established and the transmitted data is received unaltered. The test aborts if the Packet Bus is alarmed in the Processor Port Network (or the port network in which that circuit pack resides) or if the Packet Interface board is out-of-service. The test fails due to either on-board faults associated with the BRI port hardware on the circuit pack or problems with the LAN bus.

Table 9-704. TEST #618 BRI Port Local LAN Looparound

Error Code	Test Result	Description/ Recommendation
1015	ABORT	The port is not out-of-service. 1. Use the **status bri-port UUCSSpp** command to determine the status of the port. 2. If it is in use, wait until it is idle, and then use the **busyout port UUCSSpp** command to place it in the out-of-service state and repeat this test. **CAUTION:** *Since the busyout command is destructive, execution of this command prior to the port being idle causes all calls associated with the BRI port to be torn down.*
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. Run the **test port long UUCSSpp** command and verify the repair by viewing the results of the BRI Port Local LAN Looparound Test (#618).
1141	ABORT	The PKT-CTRL is out-of-service. 1. Follow the repair procedures for the PKT-CTRL. 2. Run the **test port long UUCSSpp** command and verify the repair by viewing the results of the BRI Port Local LAN Looparound Test (#618).
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. Run the **test port long UUCSSpp** command and verify the repair by viewing the results of the BRI Port Local LAN Looparound Test (#618).
2012 2100	ABORT	Internal system error Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The Looparound Test has failed. 1. If the test fails repeatedly, attempt to reset the circuit pack with the **busyout board UUCSS** and the **reset board UUCSS** commands if the other ports on the board are not in use. 2. If the test fails again, execute **test pkt P**. If this fails, follow failure procedures in the PKT-BUS section. 3. If the tests in Step 2 pass, the problem is local to the BRI board. Replace the trunk circuit pack.
	PASS	The BRI Port Local LAN Looparound Test passed.

BRI Port Local TDM Looparound Test (#619)

This test is conditionally destructive.

This test verifies the connectivity of a BRI port across the TDM Bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack.

This Looparound Test runs the following individual tests on the two B-channels (B1 and B2) associated with the port:

- A Looparound Test across the TDM Bus for B1.
- A Conference Circuit Test for B1.
- A Looparound Test across the TDM Bus for B2.
- A Conference Circuit Test for B2.

The tests are run in the above order. If one fails, the remaining tests in the sequence are not executed, and maintenance software returns an error code.

Table 9-705. TEST #619 BRI Port Local TDM Loop Around

Error Code	Test Result	Description/ Recommendation
1000	ABORT	The system resources required to run this test are not available. The port may be busy with a valid call. 1. Use the **display port UUCSSpp** command to determine the trunk group/member number of the port. Use the **status bri-port UUCSSpp** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. Wait until the port is idle before retesting. 2. If the port is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-705. TEST #619 BRI Port Local TDM Loop Around — *Continued*

Error Code	Test Result	Description/ Recommendation
1004	ABORT	The port has been seized by a user for a valid call. Use the **status trunk** command for the trunks associated with this port and determine when the port is available for testing. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	This test is not valid for this type of translation. Ports administered as **ASAI** or **ADJK** cannot run this test because the B channels associated with the port are not used by ASAI or Lucent Adjunct Links. This is a normal condition.
2000	ABORT	Response to the test was not received from the BRI-LINE circuit pack within the allowable time period. 1. If this result occurs repeatedly, attempt to reset the circuit pack with the **busyout board UUCSS** and the **reset board UUCSS** commands if the other ports on the board are not in use. 2. If this result occurs again, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2103	ABORT	The system could not make the conference connection for the test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1, 2	FAIL	The TDM Looparound failed on one of the channels. ■ Error Code 1 — TDM Loop Around Test failed on B1. ■ Error Code 2 — TDM Loop Around Test failed on B2.
7, 8	FAIL	The Conference Circuit Tests failed on a B-channel. ■ Error Code 7 — test failed on B1 ■ Error Code 8 — test failed on B2. 1. If the test fails repeatedly, attempt to reset the circuit pack with the **busyout board UUCSS**, the **reset board UUCSS**, and then the **release board UUCSS** commands (if the other ports on the board are not in use). 2. If the test fails again, replace the circuit pack.
	PASS	The BRI Port Local TDM Loop Around Test passed.

CRC Error Counter Test (#623)

This test is nondestructive.

This test reads the BRI port's CRC error counters that are maintained on the BRI circuit pack. The Cyclic Redundancy Check (CRC) is a means of error detection used to determine the integrity of data frame contents. The CRC error counter is incremented by the circuit pack when it detects a CRC error. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is non-zero, the test fails, and the value of the counter is displayed in the `Error Code` field.

Table 9-706. TEST #623 CRC Error Counter Test

Error Code	Test Result	Description/ Recommendation
ANY	FAIL	This error occurs when a frame with a bad CRC is received over the D-Channel by the BRI board. This error is reported on a per-port basis when the counter goes over the threshold. This error is most likely due to a problem with the wiring or interference on the wiring caused by a noise source or no termination. It usually does not indicate a problem with the circuit pack.
	PASS	The CRC error counter was read correctly and has a value of 0.

Receive FIFO Overflow Error Counter Test (#625)

This test is nondestructive.

This test reads and clears the BRI port's Receive FIFO Overflow error counter maintained on the TBRI-BD circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is non-zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from the Packet Bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port OR if a hardware fault is causing the receive buffers not to be emptied properly by the circuit pack. This test is useful for verifying the repair of the problem.

Table 9-707. TEST #625 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of 5 times, reset the circuit pack with the **busyout board UUCSS** and **reset board UUCSS** commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
value	FAIL	The TBRI-BD circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to fail, run the Long Test Sequence and pay particular attention to the Looparound Tests (#618 and #619). See the repair procedures for the executed test if it fails. Otherwise, go to the next step. 3. Replace the circuit pack.
	PASS	The Receive FIFO Overflow error counter was read correctly and has a value of 0.

Level 1 Status Inquiry Test (#1242)

This test is nondestructive.

This test determines the state of the transmission facility of a BRI port at the Level 1 (L1) physical layer: Activated, Pending Activation, or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the L1 interface can send and receive synchronized signals. This test passes if the state of L1 is Activated. This test also passes if software has taken this port out of service. See the description of the L1 “Deactivated State” below for more details.

The Pending Activation state indicates a problem with the channels, the wiring, or the TBRI-BD circuit pack. When in this state, the Level 1 interface is either not receiving any L1 framing from the channel, or it is communicating with the channel but cannot transition to the Activated state.

The Deactivated state indicates a problem with the TBRI-BD circuit pack. When in this state, the Level 1 interface is not active, and an idle signal is transmitted to the channels or that Layer 1 was deactivated by the switch. When an TBRI-PT port is placed in the out-of-service state, Level 1 is also put into the Deactivated state. This could be due either to the system detecting a fault with the port or to a **busyout port UUCSSpp** request.

Table 9-708. TEST #1242 Level 1 Status Inquiry

Error Code	Test Result	Description/ Recommendation
1187	ABORT	The board or port may be busied out. 1. Look in the Error Log for Error Type 18 (port busied out) for this port and TBRI-BD (board busied out). If this error type is present for TBRI-PT only, then release the port with the **release port pp** command and run the test again. If the error is present for both TBRI-BD and TBRI-PT, then release the board with the **release board UUCSS** command and run the test again. **NOTE:** When you release a board, you release all ports associated with it. If certain ports still need to be busied out, use the **busyout port UUCSSpp** command to busy them out. 2. Make sure the endpoint is connected. 3. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of 5 times, reset the circuit pack with the **busyout board UUCSS**, **reset board UUCSS**, and **release board UUCSS** commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-708. TEST #1242 Level 1 Status Inquiry — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	Received a status of Level 1 Pending Activation. U interface down indicating a problem with a connection between the switch and the NT1, a 2- to 4-wire converter that is used to connect 4-wire terminals to a 2-wire TN2198 or TN2185 circuit pack. 1. Verify that the connections between the switch and the NT1 are good. Verify that the NT1 has power. 2. Execute the **test port UUCSSpp** command and review the results of the Level 1 Status Inquiry Test to verify the repair. If this test still fails, proceed to Step 3. 3. Follow the manufacturers repair procedures for the NT1. Then execute the **test port UUCSSpp** command and review the results of the Level 1 Status Inquiry Test to verify repair.
2	FAIL	Received a status of Level 1 Pending Activation. U interface up, S/T interface down, which indicates a problem with the NT1 or the wiring between the NT1 and the BRI endpoint (S/T interface). 1. Execute the **test port UUCSSpp** command and review the results of the Level 1 Status Inquiry test to verify the repair. If this test still fails, proceed to Step 2. 2. Follow the manufacturer-recommended repair procedures for the NT1. Then execute the **test port UUCSSpp** command and review the results of the Level 1 Status Inquiry test to verify repair.
3	FAIL	Received a status of Level 1 Deactivated; the port is out-of-service. 1. Issue the **status bri-port UUCSSpp** command to verify that the service state of the port is out-of-service. If the service state of the port is not out-of-service, escalate the problem to the next tier. Otherwise, proceed to Step 2. 2. If the port has been placed out-of-service with the **busyout port UUCSSpp** command, try releasing the port by executing the **release port UUCSSpp** command. Then issue the **test port long UUCSSpp** command and review the results of Level 1 Status Inquiry test. If this test still fails, proceed to Step 3. 3. After executing the **test port long UUCSSpp** command, review the results of all the tests. Follow the repair procedures for any tests that fail. Verify repair of the problem by executing the **test port UUCSSpp** command and by determining that the Level 1 Status test passes. If the test continues to fail for this reason, escalate the problem to the next tier.

Continued on next page

Table 9-708. TEST #1242 Level 1 Status Inquiry — *Continued*

Error Code	Test Result	Description/ Recommendation
4	FAIL	Received a status of Level 1 Pending Activation, the NT1 has a loss of power indicating a problem with the NT1. 1. Follow the manufacturer-recommended repair procedures for the NT1. 2. Execute the **test port UUCSSpp** command and review the results of the Level 1 Status Inquiry test to verify the repair.
	PASS	This test indicates that Level 1 is activated or that software has taken the port out of service.

Layer 3 Query Test (#1243)

This test is nondestructive.

This test is used to check the application layer communications across the in-service ISDN D-Channel. The test passes if a status enquiry message is successfully sent, fails if the signaling link is down, and aborts if a query is already running or there is an internal error.

Table 9-709. TEST #1243 Layer 3 Query

Error Code	Test Result	Description/ Recommendation
1005	ABORT	The test aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, a modem pool member or Music on Hold). This error can be ignored.
1019	ABORT	Test is already running.
1113	ABORT	The signaling link is down. 1. Use the **test port UUCSSpp long** command to clear any errors which prevent establishment of the signaling link. 2. Examine the results of Test #626, which is executed with the command. If this test aborts or fails, follow the repair procedure for the Signaling Link Status Test. 3. Escalate problem if BRI Layer 3 Query Test continues to abort.

Continued on next page

Table 9-709. TEST #1243 Layer 3 Query — *Continued*

Error Code	Test Result	Description/ Recommendation
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the **test port long UUCSSpp** command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. 1. Consult the repair procedure for PKT-CTRL. 2. If Step 1 does not resolve the problem, escalate to the next tier.
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus in the PPN. 2. After completing Step 1, execute the **test port long UUCSSpp** command and review the results of the BRI Port Local LAN Looparound Test to verify the repair.
1187	ABORT	The circuit pack or port may have been busied out by a technician. 1. Look in the Error Log for Error Type 18 (busied out) for TBRI-BD or TBRI-PT. a. If this error type is present for TBRI-PT, then release the port with the **release port UUCSSpp** command and run the test again. b. If the error is present for both TBRI-BD and TBRI-PT, then release the circuit pack with the **release board PUUCSS** command and run the test again. **NOTE:** When you release the circuit pack, you release all ports associated with it. If certain ports still need to be busied out, use the **busyout port UUCSSpp** command to busy them out. 2. Make sure the terminal is connected. 3. Retry the command at 1-minute intervals a maximum of 5 times.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The switch has successfully sent a Status Enquiry message.

Slip Query Test (#1244)

This test is nondestructive.

Slips occur when the transmitter and receiver are not running at precisely the same clock rate. The Slip Alarm Inquiry Test polls the total number of slips that have occurred on a link.

When the TN2185 circuit pack detects a slip condition, maintenance software initiates the Slip Alarm Inquiry Test to query the slip counters on the TN2185 circuit pack and total the slip counts in the maintenance software.

If the slip count is over the threshold, a Minor alarm is raised against the TN2185 circuit pack, leaving all ports of the TN2185 circuit pack in the in-service state. If the TN2185 circuit pack is used to supply the system synchronization source, the MINOR alarm will initiate a synchronization source switch. See TDM-BUS and SYNC for additional information.

Table 9-710. TEST #1244 Slip Alarm Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this error type.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
1 to 88	FAIL	The circuit pack and the remote endpoint are not synchronized to the same clock rate, which has generated the Slip alarm. The error code equals the number of slips detected by the TN2185 circuit pack since the last Slip Alarm Inquiry Test. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the circuit pack is a TN2185, enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 3. Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. 4. Check the physical connections of DS1 Interface circuit packs and cable. 5. Replace the local DS1 Interface circuit pack and repeat the test. 6. Contact T1 Network Service to diagnose the remote DS1 endpoint.

Continued on next page

Table 9-710. TEST #1244 Slip Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	No Slip alarm is detected on the DS1 Interface circuit pack.
0	NO BOARD	The DS1 Interface circuit pack is not administered. 1. Administer the DS1 Interface circuit pack by issuing the **add ds1 UUCSS** command. 2. Run the test again. 3. If the test continues to return NO BOARD, escalate the problem.

TBRI-TRK (ISDN Trunk-Side BRI)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
TBRI-TRK[2]	MAJOR[3]	test trunk UUCSSpp l	MO_TBRI_TRK
TBRI-TRK	MINOR	test trunk UUCSSpp l	MO_TBRI_TRK
TBRI-TRK	WARNING	test trunk UUCSSpp sh	MO_TBRI_TRK

1. Where UU is the universal cabinet number (1 for PPN, 2 -44 for EPN), C is the carrier designation (A, B, C, D, or E), SS is the carrier slot address where the circuit pack is located (1, 2, and so forth), and pp is the two-digit port number (1, 2, 3, and so forth).
2. For additional repair information, also see TBRI-BD and TBRI-PT Maintenance documentation.
3. A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

The TN2185 circuit pack contains eight, 4-wire ports that interface to the network at the ISDN S/T reference point over two 64 Kb/s channels (B1 and B2) and over a 16Kb/s signaling (D) channel. The B1 and B2 channels can be simultaneously circuit switched, or individually packet switched. Only one channel per trunk can be packet switched due to Packet Processing Element (PPE) limitations. The D channel is either circuit switched or packet switched. Packet switching uses the PPE to combine all D channels into a single physical channel, which is then routed via the concentration highway to the Network Control Element (NCE) and then to the TDM bus. The circuit-switched connections have a Mu-law or A-law option for voice and operate as 64Kb/s clear data channels. The packet-switched channels support the LAPD protocol and conform with the CCITT Q.920 Recommendations for D-channel signaling.

LEDs

The three LEDs on the circuit pack's faceplate indicate board status. When illuminated, the red LED indicates a board failure or a major or minor on-board alarm, the green LED indicates that testing is in progress, and the amber LED indicates that the board is in use.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Services State Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Signaling Link State Check Test (#1251)	X	X	ND
Service State Audit Test (#256)	X	X	ND
Call State Audit Test (#257)	X	X	ND
ISDN Test Call Test (#258)		X	ND

1. Destructive; ND = Nondestructive

Signaling Link State (#1251)

This test is non-destructive.

This test checks the current state of the signaling link. The test looks at the board-level translations, checks that the board is physically inserted, gets the state of the D-Channel and service state of the port.

The test passes if the signaling link (D-Channel) is connected and operating normally. The test fails if the board is not installed, the signaling link is disconnected, or if the port is out of service. The test aborts otherwise.

Table 9-711. TEST #1251 Signaling Link State Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
1018	ABORT	The test is disabled. 1. Enable the test by entering **enable test #1251**.
1114	ABORT	The signaling link is in a transitional state. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
8	FAIL	The signaling link is down. 1. Consult the procedures for the TBRI-PT maintenance object.
9	FAIL	The port is out of service. 1. Return the port to an in-service state.
	PASS	The signaling link is connected and operating normally.

Service State Audit (#256)

This test is nondestructive.

This test performs a service state audit on an ISDN B-Channel. The test passes if Call Processing informs Maintenance that the Restart message was transmitted successfully, or if the B-Channel was busy and could not send the message.

The test fails if the board is not inserted or translated properly, or if a reply is not received within a certain amount of time.

The test aborts if the signaling link is disconnected, if a message is already outstanding, or if the necessary resources could not be allocated.

To investigate the service state of the TN2185 ISDN Trunk-Side BRI Channel, issue the **status trunk trunk-group/trunk-member** command.

Table 9-712. TEST #256 Service State Audit Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be on a valid call. Use **status trunk** to determine when trunk is available for testing. 1. Check the results of Test #1251 (Signaling Link State Check).
1005	ABORT	The test aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, a modem pool member or Music on Hold). This error can be ignored.
1018	ABORT	The test is disabled. 1. Enable maintenance by entering **y** in the `Maintenance Tests?` field on page 2 of the **change trunk-group** form.
1113	ABORT	The signaling link has failed, so the system cannot send any messages on behalf of this trunk. 1. Check the results of Test #1251 (Signaling Link State Test).
1114	ABORT	The signaling link is in a transitional state. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1116	ABORT	The trunk is not in a service state which is appropriate for running the test. This test is only performed in the OOS/FE state.
1117	ABORT	A service state audit message is outstanding. 1. Wait two minutes and then try again.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	Wait 4 minutes and then check the Error Log for any new errors of type 3073. If there are none, then both sides of the ISDN connection agree on the service state; the negotiation succeeded. If there is a new 3073 error, then the negotiation failed (the far-end switch twice failed to respond within 2 minutes). The switch automatically retries every 15 minutes. If the trunk was initially in-service, it is now placed in the maintenance/far-end state. Incoming calls are accepted, but no outgoing calls can be originated. If an incoming call is presented, another Service State Audit is immediately performed in an attempt to put the TN2185 ISDN Trunk-Side BRI Channel in the proper state.

Call State Audit Test (#257)

This test is nondestructive.

This test performs a call state audit on an ISDN B-Channel, and upon successful completion, guarantees that both sides of the interface are in a consistent call state for connections using the B-Channel. The test can be helpful when trying to clear a hung call. If the internal call state data to the near-end switch is different from that of the far-end switch, the call will be torn down.

The test passes if the audit is successful.

The test fails if the board is not inserted, if there is an internal system error, or if a reply was not received within the prescribed amount of time.

The test aborts if the signaling link is disconnected, the request is already active, or if the B-Channel is in an Out-Of-Service state.

Table 9-713. TEST #257 Call State Audit Test

Error Code	Test Result	Description/ Recommendation
1018	ABORT	The test is disabled. 1. Enable the test by entering **y** in the `Maintenance Tests?` field on page 2 of the **change trunk-group** form.
1019	ABORT	An audit is already in progress. 1. Wait two minutes and try again.
1113	ABORT	The signaling link has failed, so the system cannot send any messages on behalf of this trunk. 1. Check the results of Test #1251 (Signaling Link State Check).
1114	ABORT	The signaling link is in a transitional state. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1116	ABORT	The trunk is in an out-of-service ISDN service state. 1. A call cannot be present if the trunk is in an ISDN out-of-service state, so a call state audit would be inappropriate. No action necessary. (Use the **status trunk** command.)
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The audit passed successfully.

ISDN Test Call Test (#258)

This test performs a far-end loop around to a far-end switch over an ISDN trunk. The trunk's service state must be in-service, maint-NE, or out-of-service/NE, and no call can be active on the trunk.

A test call connection is established to a far-end switch over the ISDN trunk to be tested. The digital port on a TN711D Maintenance/Test circuit pack generates a test-pattern bit stream that is sent to the far-end switch and echoed back. The received pattern is then compared to the sent pattern and checked for errors that indicate a loss of integrity on the communications path.

If a test call is running when scheduled maintenance starts, the green LED is turned off. To determine if a test call is still running, use the **list isdn-testcall** and **status isdn-testcall** commands. A lit yellow LED on the Maintenance/Test circuit pack also indicates that a test call is running.

There are two methods available to place an outgoing ISDN Trunk-side BRI trunk test call:

1. The test call connection is established over the TDM Bus of the transmit and receive sides of the ISDN Trunk-side BRI trunk to a data channel. This method is selected when no Maintenance/Test circuit pack resides in the system.
2. The test call connection is established over the TDM Bus of the transmit and receive sides of the ISDN Trunk-side BRI trunk to a digital trunk testing port on the Maintenance/Test circuit pack. The Maintenance/Test Digital Port generates a pseudo bit stream.

A test is run periodically to check if the call is hung. If so, it gracefully tears down the call to release the resources.

Synchronous Commands

You can demand a synchronous outgoing test call by using the following maintenance commands:

- **test trunk trunk-group-no/member-no long [repeat number]**
- **test board UUCsspp long [repeat number]**
- **test port port-location long [repeat number]**

Whenever a circuit translates to an ISDN Trunk-side BRI trunk during a Long Test Sequence, an outgoing test call is invoked, and the duration of the test call is 8.6 seconds. Once the test call completes, the bit error rate is retrieved from the Maintenance/Test Digital Port. A bit error rate greater than zero is reported as a failure to the Manager I terminal (MGRI). A failure indicates the need to run further diagnostics.

If no Maintenance/Test circuit pack exists, the outgoing ISDN Trunk-side BRI trunk test call is established over a high-speed data channel on the Network Control (NETCON) circuit pack (DATA-BD).

Asynchronous Commands

NOTE:
Only one trunk can be tested in a given port network, until the test call is canceled or completes.

Table 9-714. TEST #258 ISDN TEST Call

Error Code	Test Result	Description/ Recommendation
4	ABORT	There is a problem with the Processor Interface Link. 1. Refer to the PI-LINK (Processor Interface Link) Maintenance documentation.
1004	ABORT	B channel in use. 1. Determine if a call is active on this ISDN Trunk-side BRI trunk via the **status trunk** command. 2. When the service state indicates in-service/idle, retry the test.
1005	ABORT	Bad Configuration (that is, no Maintenance/Test circuit pack) Issue the **test trunk <trunk Group/trunk member>** command and make sure there is a DATA-CHL (NETCON channel) administered.
1018	ABORT	Test call is disabled. 1. Enable Maintenance on the Trunk Group form.
1024	ABORT	(M/T-DIG) Maintenance/Test Digital Port in use. 1. Wait until yellow and green LEDs are turned off on the M/T-BD (Maintenance/Test circuit pack). 2. Retry the test. If problem persists, refer to M/T-DIG (Maintenance/Test Digital Port) documentation.
1113	ABORT	The signaling link has failed; the system cannot send any messages on behalf of this trunk. 1. Check the results of Test #1251 (Signaling Link State Check Test).
1114	ABORT	The signaling link is in a transitional state. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Table 9-714. TEST #258 ISDN TEST Call — *Continued*

Error Code	Test Result	Description/ Recommendation
1116	ABORT	The switch could not appropriately change the ISDN service state. 1. Determine if a call is active on this ISDN Trunk-side BRI trunk (use the **status trunk** command). 2. If not, check the Error and Alarm Logs for problems with this TBRI-TRK MO.
1117	ABORT	ISDN B-channel maintenance message is already outstanding. 1. Wait two minutes, then try again.
1118	ABORT	Far-end of ISDN trunk is not administered. 1. Check the administration of the far-end ISDN trunk. 2. Issue the **status trunk** command and try the test again.
1119	ABORT	The test call was aborted due to a normal call attempt on this trunk. The test call is performed only if the trunk is idle. 1. Either wait for the normal call to terminate normally, or force it to be dropped by using the **busyout trunk** command**.**
1120	ABORT	The ISDN Trunk-side BRI trunk is in the ISDN out-of-service/far-end state. 1. Try to change the service state via Test #256 (Service State Audit Test). Then retry this test. **However, the trunk may be in the out-of-service/far-end state due to problems at the far-end switch. If that is the case, no remedial action can be taken at this end.**
1122	ABORT	There is no test line number for the far-end switch. 1. Check the Trunk Group Administration form.
1123	ABORT	There is no Feature Access Code administration for this Facility Test. 1. Check the Dial Plan and Feature Administration forms.
2012 None 2000	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2035	ABORT	The call has timed out, perhaps because of a lack of system resources. 1. Wait 1 minute and try again.
2036 2037	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 9-714. TEST #258 ISDN TEST Call — *Continued*

Error Code	Test Result	Description/ Recommendation
2038 2039	ABORT	A problem occurred while trying to read the test data. 1. Wait one minute and then try again. 2. If the test aborts again in the same manner, there is a serious internal problem. If so, escalate the problem.
2040	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2041	ABORT	The call has timed out, perhaps because of a lack of system resources. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2066	ABORT	Could not establish test call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2067	ABORT	The call has timed out, perhaps because of a lack of system resources. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2074	ABORT	Bit and Block Error query failed. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, there may be a serious internal problem with M/T-DIG (Maintenance/Test Digital Port). If this is the case, refer to the M/T-DIG (Maintenance/Test Digital Port) Maintenance documentation.
2075	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2104	ABORT	Call dropped or could not be originated. 1. Make sure service is provisioned by the network. 2. Check the administration of the far-end test line extension on the trunk group administration form. 3. Check the administration of the test call BCC (Bearer Capability Class) on the trunk group administration form. 4. Try the test again.

Table 9-714. TEST #258 ISDN TEST Call — *Continued*

Error Code	Test Result	Description/ Recommendation
2201 2202 2203 2204 2205	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2206	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2208	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2209 2210	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2211	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2212	ABORT	Call terminated by unexpected disconnect. 1. Wait one minute and then try again.
2213	ABORT	The call has timed-out, perhaps because of a lack of system resources. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2214	ABORT	Call terminated by unexpected disconnect. 1. Wait one minute and then try again.
2215 2216 2217 2218 2219	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2220	ABORT	Call terminated prematurely. 1. Wait one minute and try again.

Continued on next page

Table 9-714. TEST #258 ISDN TEST Call — *Continued*

Error Code	Test Result	Description/ Recommendation
2221 2222 2223 2224 2225 2226	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2227	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2042	FAIL	**This is the main purpose of the test.** The comparison of the data sent with the data received indicates a loss of integrity on the communications path. 1. The trunk should be taken out-of-service and the quality of the ISDN Trunk-side BRI line should be investigated. The investigation should include an in-depth analysis of the facility including the transmission facility and any external equipment such as DACs, CSUs, etc.
	PASS	The call worked. A test pattern was sent and received properly; the communications path is OK if the synchronous test call command was issued. An in-depth analysis of the ISDN Trunk-side BRI trunk facility including the transmission facility and any external equipment such as DACs, CSUs, and others should take place if the bit and block error rates are not acceptable.

TDM-BUS (TDM Bus)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
TDM-BUS	MAJOR	test tdm P	TDM Bus
TDM-BUS	MINOR	test tdm P	TDM Bus
TDM-BUS	WARNING	test tdm P	TDM Bus

1. P is the Port Network number. Use **list cabinet** to find the port network(s) contained in a given cabinet.

Each port network has a pair of TDM busses, designated TDM Bus A and TDM Bus B, each with 256 time slots. This division allows for duplication of control channels and dedicated tone time slots. The first five time slots on each bus are reserved for the control channel, which is active on only one bus at a time in each Port Network. The next 17 time slots are reserved for system tones such as dial tone, busy tone and so on. As with the control channel, these time slots are active on only one bus, A or B, at a time. The rest of the time slots on each bus are for general system use such as carrying call-associated voice data. The 17 dedicated tone time slots that are inactive can also be used for call processing when all other available time slots are in use.

When the system initializes, the control channel is on TDM Bus A and the dedicated tones on TDM Bus B in each Port Network. If a failure occurs on one of the two busses, the system will switch any control, tone and traffic channels to the other bus. Service will still be provided, though at a reduced capacity.

The **set tdm** PC command has the effect of putting both the control channel and tone time slots on a specified bus, A or B. P specifies the port network number, and C specifies the TDM bus, A or B. Throughout this discussion, PC refers to a specific TDM Bus. References to *port circuit packs* include all circuit packs that terminate on the TDM bus, including the Expansion Interface TN570, and the following service circuit port boards: Call Classifier (TN744), Integrated Announcement (TN750), Maintenance/Test (TN771), Speech Synthesizer (TN725B), Tone Detector (TN748 or TN420). Other terms used are:

- Control Channel Bus: the TDM Bus carrying the active control channel.
- Non-Control Channel Bus: the tdm bus with the inactive control channel.
- Tone Bus: the TDM bus carrying the active tone time slots
- Non-Tone Bus: the TDM Bus with the inactive tone time slots

TDM Bus Fault Detection and Isolation

TDM Bus are usually caused by one of the following:

- A defective circuit pack connected to the backplane
- Bent pins on the backplane
- Defective bus cables or terminators

It is possible that a circuit pack can cause a TDM Bus fault and still exhibit trouble-free operation. For example, insertions of any circuit pack into a slot with TDM Bus terminations may bend the backplane pins and short two leads together. Since the TDM Bus is a shared resource, identification of the cause of a TDM Bus fault can be difficult. If a TDM Bus problem is suspected, run the **test tdm P** command. If any of the resulting tests fail, you must perform a manual TDM Bus isolation procedure to identify the cause of the problem.

WARNING:

Since the TDM Bus fault isolation procedure involves removing circuit packs and possibly disconnecting entire carriers, the procedure is extremely destructive to the port network that contains the TDM Bus being tested. If possible, arrange to perform this procedure at a time when traffic is minimal.

As circuit packs are removed or entire carriers are disconnected, any active calls terminating on those circuit packs or carriers will be dropped. If you have any hints about a particular circuit pack that may be causing the TDM Bus problem investigate those before performing this procedure (for example, look at any circuit packs that were inserted into the PN just before the TDM bus problem appeared.

When straightening or replacing backplane pins in a carrier that contains a CFY1B Current Limiter, power to the *cabinet* must be removed. When straightening or replacing backplane pins in a carrier that does NOT contain a CFY1B Current Limiter, power to that *carrier* must be shut off. Failure to follow this procedure may result in damage to circuit packs and power supplies, and can be hazardous to the technician.

NOTE:

Maintenance software requires TN748 or TN420 Tone Detector circuit pack to test the TDM Bus. Before starting these procedures, make sure that one of these is installed in the port network being investigated.

Procedure 1

This procedure is an attempt to isolate the TDM Bus fault to circuit packs that are essential to the system operation. For each of the following circuit packs in the port network where the TDM Bus fault appears, perform Procedure 1.

Circuit Pack	Error Log Names
Tone-Clock	TONE-BD, TONE-PT, and TDM-CLK
MSS/Network Control*	SW-CTL and H-ADAPTER
Tone Detector	DETR-BD, GPTD-PT, and DTMR-PT
Expansion Interface	EXP-INTF
Packet Interface*	PKT-INT

1. Display the Alarm Log for the circuit pack via the **display alarms** command.
2. If there are alarms for the circuit pack, refer to that section and try to resolve the alarms.
3. Whether or not all the alarms can be cleared, test the TDM Bus again via the **test tdm P** command.
4. If some TDM Bus tests fail, implement Procedure 1 for the next circuit pack.
5. If all the TDM Bus tests pass, the problem has been fixed.
6. If all circuit packs in the list have been investigated, go to Procedure 2.

Procedure 2

Procedure 2 removes and reinserts port circuit packs (those in the purple slots) one or more at a time. Use this procedure for each port circuit pack in the port network until the problem is resolved or until all circuit packs in the port network have been tried. To execute diagnostic procedures on the Expansion Interface and Tone/Clock circuit packs, refer to Procedure 3. Although these circuit packs reside in purple slots, procedure 2 does not apply. This procedure *does* apply to the Tone Detector circuit pack.

If the TDM Bus problem is present when the circuit pack is inserted, but is resolved when the circuit pack is removed, either the circuit pack or the backplane pins in that slot are causing the problem. If the backplane pins are intact, replace the circuit pack. If some of the tests fail regardless of whether the circuit pack is inserted or removed, and the backplane pins are intact, the circuit pack is not the cause of the problem. In a multiple failure situation, the circuit pack could be one cause of the TDM Bus problem. However, other simultaneous failures might also be responsible for TDM Bus faults. In Procedure 2, an option of working either with one circuit pack at a time or with multiple circuit packs simultaneously is available. In view of this capability, determine the level of service interruption that will be acceptable during the procedure. If causing a disruption to all users in the port network is deemed permissible, large groups of circuit packs should be worked with in order to get the job done quickly. However, *if large service disruptions are to be avoided*, work with one circuit pack at a time. This option is slower, but it disrupts only the users of a single circuit pack.

1. Remove one or several circuit packs as appropriate. Any circuit packs that reside on the TDM Bus that have been recently inserted should be checked first.

   If you decide to remove multiple circuit packs, consider working with an entire carrier at a time to more quickly and reliably determine which circuit packs are *not* the source of trouble.

2. Run *test tdm P* to determine if the TDM Bus fault is still present.

3. If any of the TDM Bus tests fail:

   - Determine if the backplane pins in the removed circuit pack's slot appear to be bent.
   - If the backplane pins are not bent, reinsert the circuit pack(s), and perform Procedure 2 for the next set of circuit packs.
   - If the backplane pins are bent, remove power to this carrier in the manner described previously.
   - Straighten or replace the pins and reinsert the circuit pack.
   - Restore power and repeat Procedure 2, beginning with Step 2, for the same circuit pack(s).

4. If none of the TDM Bus tests fail:

   - Reinsert the circuit pack(s) *one at a time,* and repeat the following substeps until all of the circuit packs have been reinserted.
   - Run **test tdm P** to determine if the TDM Bus fault has returned.
   - If any of the TDM Bus tests fail, the reinserted circuit pack is defective. Replace this circuit pack and repeat this procedure for the next circuit pack.
   - If none of the TDM Bus tests fail when all of the circuit packs have been reinserted, the problem has been fixed and the procedure is completed.

Continue with Procedure 3 if all the port circuit packs have been checked, but the TDM Bus fault is still not resolved.

Procedure 3

This procedure removes and reinserts SPE and EPN control circuit packs, as listed in the table at the beginning of this section. In the PPN processor carrier (SPE), the TDM Bus terminates on slots 11-15. When running diagnostics in the PPN, the following circuit packs should be tested:

- TN1655 Packet Interface (three slots available per carrier)
- TN768/TN780 Tone/Clock
- UN332 MSSNET
- TN570 Expansion Interface

Although the Packet Interface circuit pack does not communicate over the TDM bus, the bus does terminate at those slots. TDM Bus failures could be caused by bent backplane pins.

When running TDM Bus diagnostics in an EPN, the following circuit packs should be tested with this procedure:

- TN570 Expansion Interface
- TN768/TN780 Tone/Clock

When using this procedure on an EPN, the Tone/Clock circuit pack should be the next-to-last one checked. The Expansion Interface circuit pack (TN570) should be the last one checked, since removing this circuit pack disconnects its EPN. In a system with duplicated PNC, disruption of traffic can be minimized by following the procedure for the standby TN570 Expansion Interface circuit pack, then entering a **reset pnc interchange**. The formerly active Expansion Interface will now be standby and can be checked without affecting service to the EPN.

At steps in the procedure that require the removal and/or replacement of circuit packs, refer to the Maintenance Object documentation for the given circuit pack for instructions. SPE and/or PNC interchanges may be required to complete these steps with the least amount of service disruption.

Procedure for PPN with Simplex SPE or EPN with Simplex PNC

1. Remove the suspect circuit pack.
2. As in Procedure 2, determine if the backplane pins in the removed circuit pack's slot are bent.
3. If the backplane pins are bent, do the following:
    a. Power down the control carrier as described in the previous warning statement.
    b. Straighten or replace the pins.
    c. Insert the same circuit pack.

d. Turn the power back on to reboot the system or to restart the EPN.

e. Run **test tdm P** to determine if the TDM Bus fault still exists.

f. If none of the TDM Bus test fail, the procedure is complete.

g. If some of the TDM Bus tests fail, replace the suspect circuit pack and go to step 6.

4. If the backplane pins are not bent, replace the circuit pack.
5. Turn the power back on to reboot the system.
6. Run **test tdm P** to determine if the TDM Bus fault is still present. If none of the TDM Bus tests fail, the procedure is completed.
7. If the TDM Bus fault is still present, the suspect circuit pack was not the cause of the TDM Bus failure. Do the following:

   a. Remove the replacement circuit pack that was just inserted and replace it with the previously suspected circuit pack.

   b. Repeat Procedure 3 for the next circuit pack on the list for this procedure.

If Procedure 3 fails to identify the cause of the problem, go to Procedure 4.

Procedure for PPN with Duplicated SPE or EPN with Duplicated PNC

In this type of configuration, the test procedure is made up of several independent parts. In a duplicated system it is desirable to investigate whether or not circuit packs are causing problems on the TDM Bus when they are in active mode or when they are in standby mode or both. The procedure utilizes SPE interchange in the PPN, or a PNC interchange in the EPN. If the TDM Bus fault disappears after the interchange takes place, the newly standby MSSNET (PPN), or Expansion Interface (EPN), is suspect and should be replaced. If the problem still exists, the Tone/Clocks are then interchanged. If the TDM Bus failure then disappears, the newly standby Tone/Clock is suspect and should be replaced. If the TDM Bus problem still exists, then the procedure begins diagnostics on individual circuit packs and backplane pins.

Part 1 (PPN Procedure)

1. If performing this procedure for a PPN carrier, execute **status port-network** to determine which SPE is currently active. Run **reset system interchange** to make the currently active SPE standby.
2. Run **test tdm P** to determine if the TDM Bus fault is still present.
3. If the TDM Bus fault is gone, replace the formerly active MSSNET circuit pack.
4. Run **reset system interchange** again to get the new MSSNET circuit pack on the active SPE.

5. Run **test tdm P** to determine if the TDM Bus fault is still present.
6. If the TDM Bus fault is still present, replace the new MSSNET circuit pack with the original suspect circuit pack, and continue on to Part 3.
7. If the TDM Bus fault has disappeared, the procedure is complete.

Part 2 (EPN Procedure)

1. If doing this procedure for an EPN carrier, execute the **status pnc** command to determine which PNC is currently active. Run **reset pnc interchange** to make the currently active PNC standby.
2. Run **test tdm P** to determine if the TDM Bus fault is still present.
3. If the TDM Bus fault is gone, replace the formerly active Expansion Interface circuit pack.
4. Run **reset pnc interchange** again to make get the new Expansion Interface circuit pack on the active SPE.
5. Run **test tdm P** to determine if the TDM Bus fault is still present.
6. If the TDM Bus fault is still present, replace the new Expansion Interface circuit pack with the original suspect circuit pack, and continue on to Part 3.
7. If the TDM Bus fault has disappeared, the procedure is complete.

Part 3

1. Run **set tone-clock** to make the currently active Tone/Clock standby.
2. Run **test tdm P** to determine if the TDM Bus fault is still present.
3. If the TDM Bus fault is gone, replace the formerly active Tone/Clock circuit pack.
4. Run **set tone-clock** again to make the new Tone/Clock circuit pack active.
5. Run **test tdm P** to determine if the TDM Bus fault is still present.
6. If the TDM Bus fault is still present, replace the new Tone/Clock circuit pack with the original suspect circuit pack, and continue on to Part 4.

Part 4

Part 4 should be used for each individual circuit pack as listed in the previous table. Run this procedure on all circuit packs on the standby SPE or standby PNC. If the TDM Bus failure still exists once the standby circuit packs have all been tested, execute either **reset system interchange** (PPN) or **reset pnc interchange** (EPN), followed by **set tone-clock** to get the currently active circuit packs into standby mode so that this procedure can be run on each of them.

1. Remove the inactive suspect circuit pack.
2. As in Procedure 2, determine if the backplane pins in the removed circuit pack's slot are bent.
3. If the pins are bent, do the following:
    a. Remove power as described in the previous warning statement.
    b. Straighten or replace the pins.
    c. Restore power.
    d. Run **test tdm P** to determine if the TDM Bus fault is still present.
    e. If the TDM Bus failure is still present, the problem is with another circuit pack. Reinsert the original suspect circuit pack and continue with Part 4 for the next circuit pack.
    f. If the TDM Bus failure has disappeared, reinsert the circuit pack and run the **test tdm P** command to see if the TDM Bus failure is still present.

       If any of the TDM Bus tests fail, replace the suspect circuit pack. The procedure is complete.

       If none of the TDM Bus test fail, the procedure is complete.
4. If the backplane pins are not bent, run the **test tdm P** command to determine if the TDM Bus fault is still present.

   command to determine if the TDM Bus fault is still present.
    a. If any of the TDM Bus tests fail, the problem is with another circuit pack. Reinsert the original suspect circuit pack and continue with Part 4 for the next circuit pack.
    b. If none of the TDM Bus tests fail, replace the suspect circuit pack. The procedure is complete.
5. If all standby circuit packs have been tested, and the TDM Bus failure still exists, execute the **reset system interchange** (PPN) or the **reset pnc interchange** commands (EPN), and the **set tone-clock** command to get the currently active circuit packs into standby mode. Continue with Part 4 of this procedure for each of the newly active circuit packs.

Procedure 4

Procedure 4 attempts to isolate the TDM Bus failure to a particular set of carriers. Only the circuit packs in selected carriers are checked. Procedure 4 is used if the preceding procedures fail, because it can help locate multiple circuit pack failures and failures of the carrier hardware itself.

In this procedure, the TDM/LAN Cable Assemblies and TDM/LAN Bus terminators are replaced. If this action does not resolve the TDM Bus fault, the carriers are reconfigured so that certain carriers are disconnected from the TDM Bus. This is done by moving the TDM/LAN Bus terminators (ZAHF4) on the carrier backplane. To terminate a TDM Bus at the end of a particular carrier, the TDM Bus cable that connects the carrier to the next carrier should be unplugged and replaced with the TDM/LAN Bus terminator (see tFigure 9-111). When the length of the TDM Bus is modified the circuit packs that are essential to the system operation and TDM Bus maintenance (for example, MSSNET and Tone/Clock), must still be connected to the new *shortened* TDM Bus.

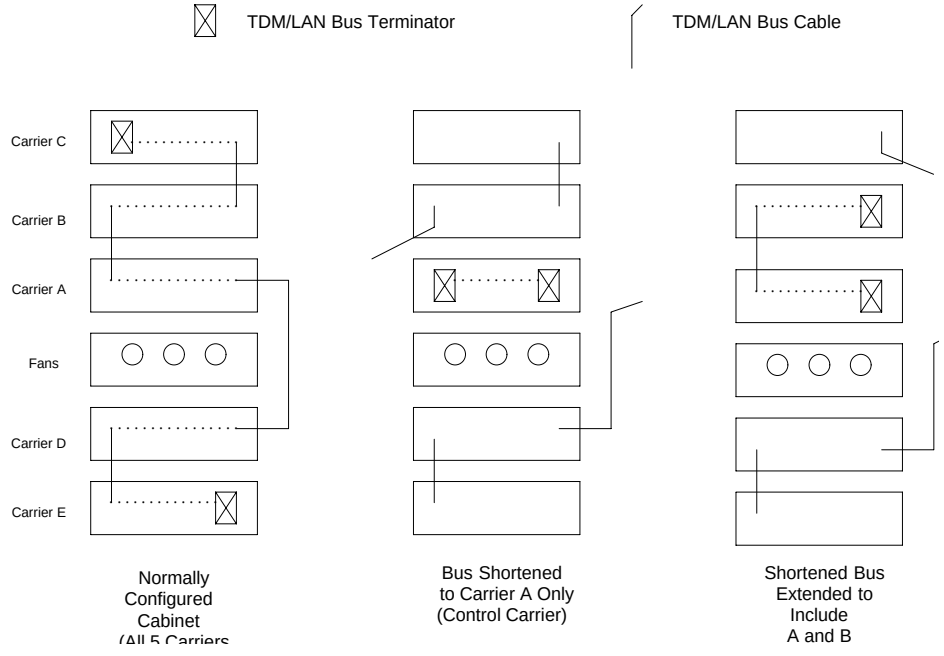

Figure 9-111. Carrier Rewiring Example—Rear View of Five-Carrier Cabinet

After cabling changes are made and verified, power must be restored to the port network. Circuit packs in carriers that are not part of the shortened bus are not inserted. As a result, these circuit packs are alarmed. Ignore these alarms for now. All alarms should be resolved when the cabinet is restored to its original configuration.

Procedure 4 is organized into two parts. Part 1 attempts to clear the TDM Bus fault by replacing all the bus cabling and terminators within a port-network. Part 2 attempts to isolate the fault to a particular carrier by extending the TDM Bus from the control carrier to additional carriers one at a time.

WARNING:

Power must be removed from the entire port network before any cables or terminators are removed. Failure to follow this procedure can cause damage to circuit packs and power supplies, and can be hazardous to the technician.

Part 1

1. If spare TDM/LAN Cable assemblies and TDM/LAN Bus Terminators are not available, go to Part 2 of this procedure.
2. Power down the port network.
3. Replace all of the TDM/LAN Cable Assemblies and both TDM/LAN Bus Terminators.
4. Restore power to the port network.
5. Run the **test tdm P** command to determine if the TDM Bus fault is still present.

   command to determine if the TDM Bus fault is still present.
6. If the TDM Bus fault is resolved, the procedure is completed. Otherwise, go to Part 2.

Processor Port Network:

1. Terminate the TDM Bus so that it extends only across the Active SPE control carrier.
2. Determine if the TDM Bus fault is still present by running the **test tdm P** command. While the TDM bus is extended only across SPE control carriers the non-control channel test (#297) will not run on the non-control channel because of the absence of a Tone Detector on the shortened bus. After the TDM Bus tests are run once, run the **set tdm PC** command to move the control channel to the non-active bus (the **status port-network P** command will show which bus is currently active). After the bus switch has occurred, run the

   command will show which bus is currently active). After the bus switch has occurred, run the **test tdm P** command again to determine if the newly active bus is faulted.

3. If none of the TDM Bus tests fail, extend the TDM Bus to another carrier. If that carrier is an SPE control carrier, repeat this procedure beginning at step 2. If the carrier is not an SPE control carrier, the **test tdm P** command only needs to be executed once since there is now a Tone Detector present on the bus and both the control and non-control channels will be tested in one test sequence.
4. If some of the TDM Bus tests fail, and since Procedures 2 and 3 have not resolved the problem, the added carrier(s) are defective and must be replaced.

Expansion Port Networks:

1. Terminate the TDM Bus so that it extends only across the carrier that contains the Active Expansion Interface.
2. Determine if the TDM Bus fault is still present by running the **test tdm P** command.

   If the *shortened* TDM Bus does not extend to a carrier that contains the Tone Detector circuit pack, the non-control channel test (#297) will not be able to run and the bus that the non-control channel was on will not be tested. If this is the case, run the **set TDM PC** command to move the control channel to the non-active Bus. The **status port-network P** command will show which Bus is currently active. After the Bus switch has occurred, run the **test tdm P** command again to determine if the newly active Bus is faulted.

   Another option in an EPN is to move a Tone Detector circuit pack to an empty slot (if one is available) in the carrier where the TDM bus is terminated. This would allow both the control channel and non-control channel tests to run and would not require that the **set tdm P** command be run.
3. If none of the TDM Bus tests fail, extend the TDM Bus to another carrier, and repeat the procedure in the previous step. When a carrier that causes the fault to recur is added, perform Procedure 2 for only the circuit packs in that carrier.
4. If any of the TDM Bus test fail, and Procedures 2 and 3 have not resolved the problem, the added carrier(s) are defective and must be replaced.

Restarting Non-functioning Port Circuit Packs

A defective TDM Bus Control Channel or system timing reference on one of the networks can result in port circuit packs (those not on a control carrier) on this port network entering the reset state. When this situation occurs, the circuit pack will stop functioning and its red LED will light. The system will not detect the presence of a circuit pack when the circuit pack is in the reset state. Hence, executing the **list config board** command will indicate that the circuit pack is not present.

If a circuit pack enters the reset state it will remain out of service until it receives a restart message form the control channel on the same TDM Bus, A or B, that was active when it reset, or until it is powered up again.

To force the system to send a restart message to all circuit packs on a network, try one of the following methods, depending on the circumstances. A circuit pack that is functioning normally (is not in the reset state) will ignore the restart message.

Procedure 1 (Non-destructive)

Execute the Idle Time Slot Test (#294) by issuing the command **test tdm P** when the control channel is on the same TDM Bus as it was when the circuit pack entered the reset state.

Procedure 2 (Non-Destructive)

If you are at the site, reseat the circuit pack. This action will cause the circuit pack that was in the reset state to begin functioning on the *current* Control Channel bus.

Procedure 3 (Destructive)

Reset the port network that contains the circuit pack that is in the reset state. When a network is reset, two restart messages, one on the control channel of each TDM Bus, are sent to each circuit pack on the network. *To reset an EPN only*, execute the **reset port-network** *P* **level 2** command. *Resetting the EPN will disrupt all calls going to and originating from the EPN.*

Procedure 4 (Destructive)

Execute the **recycle carrier** *PC* command. *This command will remove and return power to the designated port carrier. Thus, any other circuit packs on this carrier will also be temporarily taken out-of-service.*

Error Log Entries and Test to Clear Values

Table 9-715. TDM Bus Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any	Any	test tdm P
1	0	Control Channel Test (#296)	MINOR	ON	test tdm P r 3
18(a)	0	busyout tdm PC	WARNING	ON	release tdm PC
35(b)	0-1	TDM Bus Corruption	MINOR	ON	set tdm PC
257(c)	0	None	MAJOR	ON	
513(d)	Any	Idle Time Slot Test (#294)	MINOR	ON	test tdm P r 3
769(e)	Any	Idle Time Slot Test (#294)	WARNING	ON	test tdm P r 3
769(f)	Any	Idle Time Slot Test (#294)			(see Notes)
1025(g)	Any	None			
3872(h)	Any	None			
3873(h)	Any	None			
3874(h)	Any	None			
3877(h)	Any	None			

Notes:

a. The TDM Bus has been busied out by the technician. The error will retire when the technician releases the TDM Bus.

b. This error indicates the TDM Bus is corrupted. If the corruption was on the Control Channel bus, TDM Bus maintenance will automatically switch the control channel and/or tones to the other bus. The same strategy applies if the corruption was on the bus carrying the tones.

   An aux data value of 0 indicates the last reported TDM Bus corruption was on the Control channel bus.

   An aux data value of 1 indicates the last reported TDM Bus corruption was on the Non-Control channel bus.

If this error is logged on both TDM Buses (A and B) on the PPN within two or three minutes, the red LED of several circuit packs may or may not be lit and there could be Switch Control (SW-CTL) errors. Under these circumstances do the following:

- Display the Hardware Error Log via the **display errors** command and look for SW-CTL (Switch Control) errors.
- If there are any errors logged against the Switch Control, try to resolve them.
- Test the TDM Bus via the **test tdm P** command.
- If all the TDM Bus tests pass, the problem has been fixed.

c. This error indicates the TDM Bus was switched to the other bus due to TDM Bus corruption. The aux data value is not meaningful and no action is required. Look for other TDM-BUS errors to determine the cause of this error.

d. This error indicates that some time slots are corrupted in the specified TDM Bus. The Minor alarm is raised when there are more than 50 bad time slots in the bus. The aux data indicates the number of bad time slots found by the test.

e. This error indicates that some time slots are corrupted in the specified TDM Bus. The Warning alarm is raised when there are more than 10 bad time slots but less than or up to 50 bad ones in the bus. The aux data value indicates the number of bad time slots found by the test.

f. This error indicates the idle time slot test found less than 10 bad time slots in the TDM Bus. The aux data value indicates the number of bad time slots found by the test. There is no alarm associated with this error.

g. This error indicates that the daily TDM Bus switch was not successful. The Switch Control (PPN) or Active Expansion Interface (EPN) cannot talk on the bus that software was trying to switch into. There is no alarm associated with this error.

h. These errors indicate communication problems which may be causing message loss. TDM Bus maintenance may switch the Control Channel bus and/or Tone bus to the other bus. Test the TDM Bus via the **test tdm P** command and follow the procedures according to the error codes reported from the test. The aux data value shows the Angel id number for which a downlink message was lost.

Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the *Control Channel Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Control Channel Test on the Control			
Channel Bus (#296)	X	X	ND
Digit Detection Test on the Non-Control Channel Bus (#297)	X	X	ND
Idle Time Slot Test (#294)	X	X	ND

1. D = Destructive; ND = Nondestructive

Idle Time Slot Test on TDM Bus A or B (#294)

The Idle Time Slot Test detects noisy time slots on the bus and takes them out-of-service. The Tone Detector circuit pack is told to listen to idle time slots and if it detects any noise on a time slot, it returns a failure. At the end of the test, any out-of-service time slots are retested to see if they are still noisy and restored to service if they are idle. After all the time slots have been tested, maintenance counts the number of bad time slots and reports the number to the technician in the error code field. No more than 220 time slots will be taken out-of-service on one bus and no more than 300 will be taken out-of-service on both buses at one time.

Table 9-716. TEST #294 Idle Time Slot Test on TDM Bus A or TDM Bus B

Error Code	Test Result	Description/ Recommendation
None	ABORT	Could not allocate the necessary system resources to run this test. For example, maintenance could be running on the Tone Detector circuit pack and it is using the CPTRs.
1115	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 3 times.
Any	FAIL	The error code indicates the number of bad time slots that were detected. The cause of this failure is most likely due to a bad port circuit pack and not the TDM Bus itself. 1. Execute the command again. 2. If the error persists, check the Error and Alarm Logs for alarms, on the port network where the faulted TDM Bus resides, on port circuit packs from the NPE Crosstalk Test. Also check for EXP-INTF alarms associated with error type 1537. 3. Refer to the appropriate circuit pack's documentation to clear the circuit pack's problem. 4. Test the TDM Bus again. If the error continues, refer to the ''TDM Bus Fault Detection and Isolation Procedure'' described earlier.
	PASS	The success of this test indicates all the idle time slots that are supposed to be idle are indeed idle. There is no noise on any of the idle time slots.

Control Channel Test (#296)

This tests the integrity of the Control Channel bus by ensuring that communication through the TDM Bus is operational. The test attempts to query a circuit pack whose presence is required in each port network for proper operation (Tone/Clock or Tone Detector). If a reply from the queried circuit pack is received, the TDM Bus is considered operational and the test passes. If no reply is received, the Bus is not operational and the test fails.

Table 9-717. TEST #296 Control Channel Test

Error Code	Test Result	Description/ Recommendation
Any other than 1005	ABORT	Internal system error. 1. Retry the command at one-minute intervals for a maximum of three times.
1005	ABORT	Since this test is valid only on the control channel bus, it aborts execution when run on the non-control channel bus. This is a valid response. Use the **status port-network** command to verify which bus is the control channel bus.
None	FAIL	Communication through the Control Channel is not working. The problem is not necessarily the TDM Bus itself. 1. Display the hardware error and alarm log for the Tone-Clock circuit pack and for the Tone Detector circuit pack in the port network where the faulted TDM Bus resides. Refer to Maintenance documentation for TONE-BD (Tone-Clock Circuit Pack), TONE-PT (Tone Generator), GPTD-PT (General Purpose Tone Detector Port), and DTMR-PT (Dual Tone Multi-Frequency Port). 2. Resolve the errors and alarms for the Tone-Clock and Tone Detector circuit packs. 3. If the faulted TDM Bus is in the PPN, display the hardware error and alarm log and look for SW-CTL errors and alarms. 4. If the faulted TDM Bus is on the EPN, display the hardware error and alarm log and look for errors and alarms for the active Expansion Interface circuit pack. Refer to EXP-INTF (Expansion Interface Circuit Pack) Maintenance documentation and resolve its errors. 5. Execute the **test tdm P** command again. 6. If the test still fails, refer to the ‘‘TDM Bus Fault Detection and Isolation Procedure’’ described earlier.
	PASS	Communication through the control channel bus is operational.

Digit Detection Test (#297)

This test is executed on the Non-Control Channel bus. The Tone-Clock circuit pack is told to put a tone on the Non-Control Channel bus and the Tone Detector circuit pack is told to listen to it. The test passes if the tone is successfully transmitted on the Non-Control Channel bus.

Table 9-718. TEST #297 Digit Detection Test

Error Code	Test Result	Description/ Recommendation
None 1001 2100	ABORT	Could not allocate the necessary system resources to run this test.
1005	ABORT	Since this test is valid only on the non-control channel bus, it aborts execution when run on the control channel bus. This is a valid response. Use the **status port-network** command to verify which bus is the control channel bus.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at one-minute intervals a maximum of three times.
None	FAIL	This failure indicates that communication on the Non-Control Channel is not reliable. 1. Execute the command again. 2. If the problem persists, test the active Tone-Clock circuit pack and Tone Detector circuit pack in the port network where the faulted TDM Bus resides, to make sure they are healthy. Refer to TONE-BD (Tone-Clock Circuit Pack), TONE-PT (Tone Generator), GPTD-PT (General Purpose Tone Detector Port), and DTMR-PT (Dual Tone Multi-Frequency Port). 3. Execute the command again. 4. If the problems persists, refer to the ‘‘TDM Bus Fault Detection and Isolation Procedure’’ described earlier.
	PASS	The non-control channel bus is operational.

TDM-CLK (TDM Bus Clock)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
TDM-CLK	MAJOR	test tone-clock UUC short	TDM Bus Clock
TDM-CLK	MINOR	test tone-clock UUC short	TDM Bus Clock
TDM-CLK	WARNING	release tone-clock UUC	TDM Bus Clock

1. UU is the universal cabinet number (1 for PPN, 2 -44 for EPNs). C is the carrier designation (A, B, C, D, or E).

NOTE:
Replacing the tone/clock circuit pack requires a special procedure described in the documentation for TONE-BD. That section also describes the LED displays for this board.

The Time Division Multiplex (TDM) Bus Clock resides on the Tone-Clock circuit pack, providing clocking signals both for the TDM Bus and the LAN Bus. The Tone-Clock circuit pack is a critical component in the system and is necessary to ensure the operation of all port circuit packs in the system. The TDM buses of the PPN and any EPNs are synchronized together. The system timing reference can be derived internally from the Tone-Clock circuit pack in any PN, or from an external (off-board) timing reference. Currently, the TDM Bus Clock supports synchronizing the TDM Bus with interface rates from Digital Signal 1 (DS1) facilities as primary or primary and secondary references, and from Stratum 3 Clock (STRAT-3) facilities. Only the TN780 tone-clock supports a Stratum 3 clock.

Moreover, the Tone-Clock circuit pack aids in monitoring and selecting synchronization references. The Tone-Clock circuit pack, after detecting that the external source of timing is not valid, will automatically begin its escalation procedure, according to the facilities administered. In the following table, successive losses of signal cause escalation from left to right.

NOTE:
Switching back to a DS1 source is handled by synchronization maintenance, once any problems with it have been corrected and tested. However, once synchronization has been switched to the internal timing source of the master Tone-Clock circuit pack, *switching back to a Stratum 3 Clock must be initiated by a technician* after the external reference has been repaired.

Tone-Clock Role	Synchronization Facilities	Initial External Synchronization Source	Backup External Synchronization Source	Internal Source
MASTER	Stratum 3 Clock	Source "A"	Source "B"	Local oscillator
	DS1 Primary and Secondary	DS1 Primary	DS1 Secondary	
	DS1 Primary Only	DS1 Primary	None	
	No External Source	None	None	
SLAVE	PNC Duplication	Active EI	Standby EI	
	No PNC Duplication	Active EI	None	

See “Synchronization” for more details of the escalation plan. *There exists a strong interdependency among the DS1 Interface circuit pack Maintenance, Synchronization Maintenance, and TDM Bus Clock Maintenance MOs*.

See the section on “TONE-BD” for a discussion of the relationship of Tone-Clock circuit packs with the various Reliability Options.

Error Log Entries and Test to Clear Values

Table 9-719. TDM Bus Clock Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board[1]	Test to Clear Value
0[2]	0	Any	Any	Any	test tone-clock UUC sh r 1
1(a)	0	None	MINOR	OFF	
18(b)	0	busyout tone-clock UUC	WARNING	OFF	release tone-clock UUC
130(c)		None			
257(d)		None	WARNING	OFF	
513(e)	Any	Clock Circuit Status Inquiry (#148)	MINOR[3]	OFF	test tone-clock UUC
769(f)	Any	Clock Circuit Status Inquiry (#148)	MAJOR‡	ON	test tone-clock UUC sh r 10
1025(g)	Any	Clock Slip Inquiry(#149)			test tone-clock UUC sh
1281(h) 1282(h)	Any	None	MINOR	OFF	
1537	Any	Clock PPM Inquiry(#150)			test tone-clock UUC sh
2049(i)	Any	Standby Reference Health Check Test(#651)	MAJOR[3]	ON	test tone-clock UUC
2305(j)	0	None	WARNING	OFF	

1. As a general rule, any *on board* errors against the TDM Bus Clock should be resolved before pursuing any other errors against SPE or PNC components. *Off board* clock errors may be caused by other board errors, and should usually be addressed once any on board errors have been resolved.
2. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
3. Major or Minor alarms on this MO may have been downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a. The Tone-Clock circuit pack may have a clock at the edge of its specified frequency. This can cause Expansion Interface circuit packs and SNI circuit packs to go out-of-frame or report no-neighbor conditions. This can is turn cause EPNs, Expansion Archangel Links (EALs), Remote Neighbor Links (RNLs), and/or Local Neighbor Links LNLs) to go down. When this error is alarmed, Clock Health Inquiry Test (#46) will fail with an error code of 1.

   1. Replace the Tone-Clock circuit pack identified in the error log. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.

b. The indicated Tone-Clock circuit pack has been made unavailable via the **busyout tone-clock UUC** command. It only applies to systems which have the High or Critical Reliability Option administered, because only a standby Tone-Clock circuit pack may be made busy by that command. To resolve this error, execute the **release tone-clock UUC** command for the alarmed circuit pack.

c. This error type indicates that the circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, reinsert or replace the circuit pack.

d. The Tone-Clock circuit pack in the PPN is not a TN780 while a Stratum 3 synchronization is administered. Replace the Tone-Clock in the PPN with a TN780, or change synchronization administration to Stratum 4 if a Stratum 3 clock is not being used.

e. The tone-clock has reported an out-of-lock condition. A aux value of 1 indicates this error is an out-of-lock with the primary reference. A aux value of 2 indicates this error is an out-of-lock with the secondary reference. It could not lock onto the frequency of that synchronization reference. This will lead to a change in the synchronization reference if the condition continues.

f. The Tone-Clock circuit pack may be defective, however it may be a software failure that can be corrected by testing.

    1. Check to see if the board is duplicated (**list cabinet** and **status port-network**) on the affected port network.
    2. If the board is not duplicated, use test tone UUCSS long to resolve the errors. The long test resets the board and is required to reload on-board RAM associated with the TN2182's DSPs. The effect is that tone detectors are taken out of service momentarily and tones are removed from the TDM bus for about 10 seconds, meaning that no dial tone or touch tones are available during this interval. This will probably not affect calls in progress, but could cause a call origination to abort or a user not to get dial tone when going off hook.
    3. If all tests pass and the alarm does not resolve, retest with **test tone UUCSS long clear**.
    4. If the test passes, terminate the repair process. If the test fails, replace the circuit pack at the customer's convenience.
    5. If this error was logged against the standby Tone-Clock, and if the Aux Data value was 18369, SYNC (Synchronization) maintenance acts on this error. No corrective action is required. For any other Aux Data, go to the next step.
    6. If the board is duplicated, switch to the standby side (**set tone**).
    7. Test the alarmed board (test tone UUCSS long). This resets the board and is required to reload on-board RAM associated with the TN2182's DSPs.

8. If all tests pass and the alarm does not resolve, retest (**test tone UUCSS long clear**).
9. If the test passes, terminate the repair process. If the test fails, replace the circuit pack at the customer's convenience.

g. Tone-Clock circuit pack on-board maintenance has detected one or more *clock slips*, timing differences between its internal reference source and the synchronization signal provided by the master Tone-Clock. Although no clock slip errors are expected during normal operation, both manual and automatic interchanges of Tone-Clock circuit packs, synchronization references, and PNCs, may result in clock slip counts.

If error 1281 also is logged for the same Tone-Clock circuit pack, it is related to this problem, and should be corrected first. Otherwise, continue with the procedure below.

1. Use **test tone-clock UUC**, and examine the results of test #149 to see if slip errors are still occurring. If no new slip errors are reported, and if these errors are not causing a TDM-CLK alarm, they may be ignored. Use **test tone-clock UUC long clear** to clear the errors.
2. Otherwise, enter the **display errors** command, and follow corrective procedures for any other TDM-CLK, TONE-BD, SYNC, DS1C-BD, EXP-INTF, SNC-BD, and SNI-BD errors logged, except for those in Table 9-720.

Table 9-720. Error Log Entries for Slip Errors

Circuit Pack Name	Error Log Name	Error Log Entry for Slips
DS1 Interface	DS1-BD	3073 to 3160
Expansion Interface	EXP-INTF	2305
Switch Node Interface	SNI-BD	1537
Tone-Clock	TDM-CLK	1025
UDS1 Interface	UDS1-BD	3073 to 3160
DS1C Circuit Pack	DS1C-BD	3329

3. If 1025 errors persist, refer to SYNC Maintenance in this manual and follow the procedures in the "Approach to Troubleshooting" section.

h. Error Type 1281—This error is an indication that the Tone-Clock circuit pack has detected a loss of timing signal from the system synchronization reference. The Tone-Clock circuit pack has switched synchronization references.

   1. Resolve any errors logged against the SYNC or STRAT-13 maintenance objects.
   2. Refer to SYNC maintenance, in the “Approach to Troubleshooting” section, if the error is not resolved by step 1

   Error Type 1282—Indicates that the TN2182 tone-clock was synchronized to a DS1 facility and that the reference frequency provided by the DS1 drifted beyond a range that could be tracked by the TN2182. Therefore the TN2182 is no longer synchronized to that DS1 reference. If a second DS1 is available, the tone-clock may be synchronized to that reference. If no secondary DS1 reference is available, the tone-clock will run off of its internal clock. This may result in slips being reported by the tone-clock and all DS1 facilities.

i. The tone-clock circuit pack in the master port network was unable to detect the incoming synchronization signal, but the other tone-clock was able to detect the references. If the aux data is 0, the problem is with the signal on the primary. If the aux data is 1, the problem is with the signal on the secondary. The system should switch clocks in this situation.

   1. If this error is against a PPN clock board and the system is using a Stratum 3 clock, check the cabling that brings the stratum 3 signal to this clock board.
   2. Replace the current standby Tone-Clock circuit pack. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.

j. The indicated active Tone-Clock circuit pack, which is on a port network that does not contain the system synchronization reference (a **slave** Tone-Clock), has detected a loss of timing signal from its EXP-INTF synchronization source.

   1. Enter **display errors** and **display alarms**, and follow the associated repair procedures for EXP-INTF, TDM-CLK, and TONE-BD error log entries that have on-board alarms.
   2. If the 2305 errors persist, follow the repair procedures for EXP-INTF error log entries 257, 769, or 770, or any errors logged against SNI-BD, SNC-BD, or FIBER-LK.

3. If the 2305 errors persist:

   a. *For Port Networks with more than one Tone-Clock circuit pack*, execute the command test synchronization r 10, and check to see if new 2305 errors against TDM-CLK were reported. If not, execute reset PNC interchange and then test synchronization r 10 again, and recheck for new 2305 errors against TDM-CLK

   b. *For Port Networks with a single Tone-Clock circuit pack*, execute the command test synchronization r 10, and check to see if new 2305 errors were reported.

   If no new instances of the 2305 errors were logged for either test, then enter **test tone-clock UUC long clear** to clear the TDM-CLK errors and the procedure is complete.

4. For Port Networks with more than one Tone-Clock circuit pack, interchange Tone-Clocks with the **set tone-clock UUC**, then run **test synchronization r 10**, and check to see if new 2305 errors are reported against the new active Tone-Clock circuit pack. If not, replace the standby Tone-Clock circuit pack. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section. If this clears the error, the problem has been resolved.

5. Replace the EI circuit pack for the active PNC. In the direct-connect case, use the **list fibers** command to identify which active EI connects with the PPN.

6. If the problem is still not cleared, and the Tone-Clock circuit pack reported in the error log has not been replaced up to now, replace it. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *SAKI Reset Test* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
SAKI Reset Test (#53) (a)		X		D
Clock Health Test (#46) (b)	X	X		ND
Control Channel Looparound Test (#52) (a)	X	X		ND
Tone Generator Crosstalk Test (#90) (c)		X		ND
Tone Generator Transmission Test (#40) (c)	X	X		ND
Tone Generator Audit/Update Test (#41) (c)	X	X		ND
TDM Bus Clock Circuit Status Inquiry Test (#148)	X	X		ND
TDM Bus Clock Slip Inquiry Test (#149)(e)	X	X		ND
TDM Bus Clock PPM Inquiry Test (#150)	X	X		ND
TDM Bus Clock Parameter Update Test (#151)	X	X		ND
Board Type Check Test (#574)	X	X		ND
Standby Reference Health Check Test (#651) (d)		X		ND

1. D = Destructive; ND = Nondestructive

Notes:

a. Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for descriptions of these tests.

b. Refer to TONE-BD (Tone-Clock Circuit Pack) documentation for a description of this test.

c. Refer to TONE-PT (Tone Generator) documentation for descriptions of these tests.

d. This test only runs on the Standby Tone-Clock circuit pack in a Port Network with more than one Tone-Clock circuit pack (High or Critical Reliability Option). The circuit pack must be a TN780 code with firmware revision 2 or above, or be a TN2182.

e. Test #149 is not run on the TN2182.

TDM Bus Clock Circuit Status Inquiry Test (#148)

The TDM Bus Clock circuitry is checked for sanity. Any problems that are found are reported via error codes

Table 9-721. TEST #148 TDM Bus Clock Circuit Status Inquiry Test

Error Code	Test Result	Description/ Recommendation
None 1001	ABORT	The system could not allocate the necessary resources for the test. 1. Wait 1-minute, and retry the test.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1	FAIL	This error means the Tone-Clock circuit pack framing verification firmware reports an error in the clock synchronization signal coming into this Port Network. 1. If the Tone-Clock circuit pack reporting the problem is a master clock, then the system synchronization reference is providing a bad timing source. Refer to SYNC (Synchronization) or STRAT-3 (Stratum 3 Clock) Maintenance documentation to change the system synchronization reference. 2. If the Tone-Clock circuit pack is a slave clock, then the EI to which it is listening is providing a bad timing source. Follow the diagnostic procedures specified for TDM-CLK Error Code 2305. 3. If no problem can be found with the incoming synchronization signal, replace the Tone-Clock circuit pack. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.
2	FAIL	This error indicates that Tone-Clock circuit pack has inaccurately detected loss of signal on the incoming synchronization timing source.
4 or 8	FAIL	The local oscillator on the Tone-Clock circuit pack has failed.
16 or 32	FAIL	The circuitry on the Tone-Clock circuit pack used to detect synchronization timing errors has failed. 1. Errors 2, 4, 8, 16, and 32 indicate that there is poor synchronization between port networks and external facilities. It may be noticeable to the customer in the form of errors in data communications. The Tone-Clock circuit pack is defective. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.
64	FAIL	This message is only sent when an uplink message has reported the loss of valid synchronization timing information coming into this Port Network. It has been reported in TDM-CLK Error Log entries; one or more of 1025, 1281, 1537, 2049 and 2305. 1. Resolve the errors indicated. No separate corrective action is required.

Continued on next page

Table 9-721. TEST #148 TDM Bus Clock Circuit Status Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
65	FAIL	The tone-clock is currently not able to lock on to the current synchronization reference. If this tone-clock is in the master port networK: 1. Examine the error log for any DS1-BD, SYNC or other TDM-CLK errors and resolve as applicable. 2. Run this test again via the test tone-clock UUC command. 3. Examine the DS1 measurements to determine if the facility is healthy. 4. Administer a new synchronization reference. 5. Replace the DS1 board currently supplying the reference. If this tone-clock is in the slave port networK: 1. Examine the error log for any SYNC, EXP-INTF or other TDM-CLK errors. 2. Run this test again via the test tone-clock UUC command.
66	FAIL	There is an on-board failure of TDM clock hardware. 1. Use **test tone UUCSS long** to resolve the problem. The long test resets the board and is required to reload on-board RAM associated with the TN2182"s DSPs. The effect is that tone detectors are taken out of service momentarily and tones are removed from the TDM bus for about 10 seconds. This means that no dial tone or touch tones are available during this interval. It probably will not affect calls in progress, but could cause a call origination to abort or a user will not get dial tone when going off hook. 2. If the test passes and the alarm does not resolve, retest (**test tone UUCSS long clear**). 3. If the test passes, terminate the repair process. If it fails, replace the circuit pack at the customer's convenience.
	PASS	TDM Bus Clock Circuit Status is sane. There are no clock-detection circuit problems on the Tone-Clock circuit pack.

TDM Bus Clock Slip Inquiry Test (#149)

This test evaluates the quality of the synchronization source for the Tone-Clock circuit pack.

NOTE:
This test does not apply to the TN2182

Table 9-722. TEST #149 TDM Bus Clock Slip Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	The system could not allocate the necessary resources for the test.
1001	ABORT	The system could not allocate the necessary resources for the test. 1. Wait 1-minute, and retry the test.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	The error code represents the number of timing slips detected on the incoming synchronization source since the last slip inquiry was sent to the Tone-Clock circuit pack. The incoming synchronization signal can be from one of four sources: 1. A Stratum 3 Clock, if that option is administered and the circuit pack tested was the active Tone-Clock in the PPN. 2. A DS1 Interface circuit pack, if DS1 Synchronization is administered, and associated with the circuit pack tested. 3. The local oscillator on the master Tone-Clock circuit pack, if it is providing the system clocking signals. 4. An EXP-INTF circuit pack, if the port network on which the test was executed does not contain the current system synchronization reference. The error code is a variable amount ranging from 1 to 255. 1. Small numbers of slips should not result in service degradation. If the error code is small (1 or 2), rerun the test. If the error only occurs infrequently, it may be ignored. 2. Otherwise, refer to the “Approach to Troubleshooting” section in the Synchronization (SYNC) Maintenance section of this manual.
	PASS	The Tone-Clock circuit pack does not detect any timing slips. This indicates that the incoming synchronization timing source is valid or that the system synchronization reference is a Tone-Clock circuit pack. The **status synchronization** command should be used to verify that the desired synchronization reference is providing timing for the system.

TDM Bus Clock PPM Inquiry Test (#150)

This test evaluates the quality of the synchronization source for the Tone-Clock circuit pack.

Table 9-723. TEST #150 TDM Bus Clock PPM Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	The system could not allocate the necessary resources for the test.
1001	ABORT	The system could not allocate the necessary resources for the test. 1. Wait 1-minute, and retry the test.
255	ABORT	The test was not executed because the Tone-Clock circuit pack was using its local oscillator rather than synchronizing to an external source. 1. Verify that this Tone-Clock circuit pack is expected to be the synchronization source. If not, correct the synchronization information and re-execute the test.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	The error code represents the rate (in Parts Per Million, or PPM) at which clock slip errors have been detected on the incoming synchronization source since the last PPM inquiry was sent to the Tone-Clock circuit pack. A failure of this test indicates that we are outside of Stratum 4 or Stratum 3 timing specifications on the incoming timing source. The error code is a variable amount ranging from 1 to 254. 1. If error 1537 is entered in the hardware error log against TDM-CLK, then the board has switched timing sources. Follow the procedures associated with hardware log error code 1537. 2. Otherwise, refer to "Approach to Troubleshooting" in the Synchronization (SYNC) Maintenance section of this manual.
	PASS	The Tone-Clock circuit pack does not detect timing any PPM errors. This indicates that the external synchronization timing source is valid or that the system synchronization reference is a Tone-Clock circuit pack. Use the **status synchronization** command to verify that the desired synchronization reference is providing timing for the system.

TDM Bus Clock Parameter Update Test (#151)

This test updates the following internal parameters on the Tone-Clock circuit pack:

- Disable in-line duplication status messages.
- Disable in-line subrate frame maintenance messages (TN768, TN780 only).
- Set the PPM threshold at 60 PPM for TN768 and TN780. Set the PPM threshold at 85 PPM for TN2182.
- Enable PPM threshold switching
- Set the number of slips to trigger *loss of signal* - currently 30 per 5 millisecond period
- Enable the on-board synchronization switching algorithm (see above)
- Enable holdover operation (TN2182 only).

This is not a test and will always pass without identifying or reporting any Tone-Clock circuit pack errors

Table 9-724. TEST #151 TDM Bus Clock Parameter Update Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error
	FAIL	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The Tone-Clock circuit pack parameters have been successfully updated.

Board Type Check Test (#574)

This test verifies that a Tone-Clock circuit pack administered with a Stratum 3 Clock source has code TN780.

Table 9-725. TEST #574 Board Type Check Test

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
ANY	FAIL	Stratum 3 Clock Synchronization is administered for the carrier in which this Tone-Clock circuit pack resides, but the Tone-Clock does not have code TN780. 1. If the Stratum 3 Clock option is incorrectly administered, remove it. 2. Otherwise, replace the circuit pack. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.
	PASS	The proper (TN780) Tone-Clock circuit pack code is present for Stratum 3 Clock synchronization.

Standby Reference Health Check Test (#651)

This test evaluates the quality of the external synchronization timing source for a standby Tone-Clock circuit pack. All administered synchronization timing sources must be valid for this test to pass. If the tone-clock circuit pack and the synchronization timing sources are in different port networks, the EI circuit packs transport the timing sources to the tone-clock.

Table 9-726. TEST #651 Standby Reference Health Check Test

Error Code	Test Result	Description/ Recommendation
	ABORT	This test may already be running due to a tone-clock installation, scheduled maintenance, alarm activity, or a technician-demand test from another terminal. This abort can also occur due to an internal system error. 1. Try the command again at 1-minute intervals up to five times.
1184	ABORT	This test requires an external synchronization source to be administered (DS1 primary, DS1 primary and secondary, or Stratum 3 Clock). 1. Administer the external synchronization source and retry the test.
2500	ABORT	Internal system error 1. Try the command again at 1-minute intervals up to 5 times.
0	FAIL	The external synchronization timing source for side A of the Stratum 3 clock, or for the primary DS1 reference is either absent or invalid. The external synchronization timing source for side B of the Stratum 3 clock, or for the secondary DS1 reference is not yet tested.
1	FAIL	The external synchronization timing source for side B of the Stratum 3 clock, or for the secondary DS1 reference is either absent or invalid. 1. Correct the synchronization source problem. Refer to the Synchronization (SYNC) maintenance section of this manual. 2. If the error still exists, replace the Tone-Clock circuit pack reported in the error log. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.
	PASS	The external synchronization timing source is valid.

TDMODULE (Trunk Data Module)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
TDMODULE	MIN	test port UUCSSpp |	Trunk Data Module
TDMODULE	WRN	test port UUCSSpp |	Trunk Data Module

1. UU is the universal cabinet number (1 for PPN, 2 -44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21). pp is the two digit port number (01, 02, and so forth).

The TDMODULE (Trunk Data Module) is covered in the PDMODULE (Data Module).

TIE-BD (Tie Trunk Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run[1]	Full Name of MO
TIE-BD	MIN	test board UUCSS sh	Tie Trunk Circuit Pack
TIE-BD	WRN	test board UUCSS sh	Tie Trunk Circuit Pack

1. UU is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21). pp is the two digit port number (01, 02, ...).

Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for circuit pack level errors. See also TIE-TRK (Tie Trunk) Maintenance documentation for related trunk information.

TIE-DS1 (DS1 Tie Trunk)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
TIE-DS1[1]	MAJOR[2]	test trunk *grp/mbr* l[3]	DS1 Tie Trunk
TIE-DS1	MINOR	test trunk *grp/mbr* l[3]	DS1 Tie Trunk
TIE-DS1	WARNING	test trunk *grp/mbr*	DS1 Tie Trunk

1. For additional repair information, see DS1-BD documentation if the tie trunk is on a TN722 or TN767 DS1 circuit pack. See UDS1-BD documentation if the tie trunk is on a TN464C/D UDS1 circuit pack.
2. A MAJOR alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75% of the trunks in this trunk group are alarmed. For more information on the **set options** command, see Chapter 8, "Maintenance Commands"
3. For TN767B vintage 8 or 9 circuit packs, a failure of Test #136 causes a subsequent failure of Test #7. Test #136 is part of the short sequence and generates off-board alarms Test #7 is part of the long sequence and generates on-board alarms. Before entering **busyout**, **release**, **reset** or **test board long** commands, check the vintage number of the circuit pack with **list configuration board** UUCSS. If it is TN767B vintage 8 or 9, do not use the above commands until first making sure that Test #136 passes via **test board short**. Otherwise, extraneous on-board alarms may be generated.

NOTE:
Many trunk problems are caused by incorrect settings of parameters on the trunk group administration form. Settings must be compatible with the local environment and with parameter settings on the far-end. Refer to *DEFINITY Enterprise Communications Server Release 5.4 Administration and Feature Description*, for information on how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

The DS1 tie trunk provides both voice and data communications between two PBX switches. There are two types of DS1 interfaces:

- 24 DS0 channels on a 1.544 Mbps link
- 31 DS0 channels + 1 framing channel on a 2.048 Mbps link

  32-channel mode is supported only on TN464 circuit packs and on G3r V2 systems.

DS1 Tie Trunks are used widely in the Distributed Communications System (DCS) and Central Attendant Service (CAS) system features.

A DS1 tie trunk can also be used as an access endpoint which is a non-signaling channel with bandwidth for voice-grade data, 56 Kbps data or 64 Kbps data.

DS1 tie trunk maintenance provides a strategy to maintain a DS1 tie trunk via a port on either the TN722 or TN767 DS1 Interface circuit pack or the TN464C/D UDS1 Interface circuit pack. Throughout this TIE-DS1 section, the term DS1 Interface applies to DS1 and UDS1 circuit packs.

The DS1 tie trunk maintenance strategy covers logging DS1 tie trunk hardware errors, running tests for trunk initialization, periodic and scheduled maintenance, system technician-demanded tests, and alarm escalation and resolution. Three different trunk service states are specified in DS1 tie trunk maintenance:

Out-of-service	The trunk is deactivated and cannot be used for incoming or outgoing calls.
In-service	The trunk is activated and can be used for both incoming and outgoing calls.
Disconnect (ready-for-service)	The trunk is in an activated state but can only be used for an incoming call.

If the DS1 Interface circuit pack is out of service, then all trunks on the DS1 Interface circuit pack are also placed into the out-of-service state and a Warning alarm is raised.

Hardware Error Log Entries and Test to Clear Values

Table 9-727. DS1 Tie Trunk Maintenance Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test trunk *grp*/*mbr*
1(a)	57476 57477 57485 57487				
15(b)	Any	Port Audit and Update Test (#36)			
18(c)	0	busyout trunk *grp*/*mbr*	WARNING	OFF	release trunk *grp*/*mbr*[2]
19(d)	0	None			
130(e)		None	WARNING	ON	test trunk *grp*/*mbr*
257(f)	57473 57474				
513(g)	57392	DS1 Tie Trunk Seizure Test (#136)	MIN/MAJ[3]		

Continued on next page

Table 9-727. DS1 Tie Trunk Maintenance Error Log Entries — *Continued*

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
769(h)	57393	DS1 Tie Trunk Seizure Test (#136)	MIN/MAJ[3]		
1025		DS1 Tie Trunk Seizure (Test #136)	MIN/ WRN[4]	OFF	test trunk *grp*/*mbr* r 2
1281		Conference Circuit (Test #7)	MIN/ WRN[4]	ON	test trunk *grp*/*mbr* l r 4 [2]
1537		NPE Crosstalk Test (#6)	MIN/ WRN[4]	ON	test trunk *grp*/*mbr* l r 3 [2]
1793(i)					test board UUCSS long [2]
2305(j)	50944	DS1 Tie Trunk Seizure Test (#136)	MIN/MAJ[3]	OFF	
2562(k)	16665				
2817(l)	52992				
3840(m)	Any	Port Audit and Update (Test #36)			

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. For TN767B vintage 8 or 9 circuit packs, a failure of Test #136 causes a subsequent failure of Test #7. Test #136 is part of the short sequence and generates off-board alarms. Test #7 is part of the long sequence and generates on-board alarms. Before entering **busyout**, **release**, **reset** or **test board long** commands, check the vintage number of the circuit pack with **list configuration board** UUCSS. If it is TN767B vintage 8 or 9, do not use the above commands until first making sure that Test #136 passes via **test board short**. Otherwise, extraneous on-board alarms may be generated.
3. This alarm will only be raised when the System-Parameter Country form has the Base Tone Generator field set to 4 (Italy). This alarm will be a MINOR alarm unless 75% or more trunks in this trunk group are out of service, then the alarm will be upgraded to a MAJOR alarm.
4. Major or Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a. Error Type 1—The DS1 Interface circuit pack detects a hardware error on the DS1 tie trunk. This error can be caused by incompatible translations. Make sure the parameters administered on the DS1 circuit pack form match those administered on the far-end switch. See *DEFINITY Communications System Generic 3 V2 Implementation,* 555-230-653, and *DEFINITY Communications System Generic 2.2 and Generic 3 V2 DS1/CEPT/ISDN-PRI Reference*, 555-025-107, for details.

The Aux Data field indicates the following hardware error types:

57476	On-hook before wink
57477	On-hook before ready to receive digits
57485	Wink too short for valid signal
57487	The timer expired while waiting for an off-hook signal from the far end as a response at end of digits dialing. Check the far-end switch for related problems.

If all administration errors between the switch and the far-end match, and these errors continue to recur, follow normal escalation procedures.

b. Error Type 15—This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors (if any).

c. Error Type 18—The DS1 tie trunk has been busied out by a **busyout trunk** grp/mbr command. No calls can be made on this trunk except for the Facility Access Test Call. Facility Access Test Calls are described in Chapter 6 and in *DEFINITY Enterprise Communications Server Release 5.4 Administration and Feature Description*.

d. Error Type 19—This error type indicates that the far-end may be out-of-service, or the Electronic Tandem Network may be busied out.

e. Error Type 130—This error type indicates that the circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, reinsert or replace the circuit pack.

f. Error Type 257—The DS1 Interface circuit pack detects a hardware error on the DS1 tie trunk. The trunk cannot communicate with the far end because it is unable to interpret digits sent from the far-end switch. The Aux Data field indicates the following:

57473	The rotary dial rate is below 8 pulses per second.
57474	The rotary dial rate is above 12 pulses per second.

Check with the far-end switch or operating company for proper trunk connection.

g. Error Type 513—DS1 Interface circuit pack detects a hardware error on the DS1 tie trunk. The trunk is in-service/active and waiting for an ‘‘on-hook’’ from the far-end switch. No calls can be routed over the trunk while it is in this state. Aux Data 57392 indicates no external release on PBX disconnect. Check with the far-end switch or operating company for proper trunk connection.

h. Error Type 769—The DS1 Interface circuit pack detects a hardware error on the DS1 tie trunk. This error usually occurs after an occurrence of error type 513. The trunk has received the belated ‘‘on-hook’’ that it has been waiting for from the far-end switch. The trunk is restored to in-service/idle and can be used for calls. Aux Data 57393 indicates delayed external release on PBX disconnect. This error can be ignored.

i. Error Type 1793—The DS1 Interface circuit pack is out-of-service. See the appropriate DS1-BD/UDS1-BD (DS1/UDS1 Interface Circuit Pack) Maintenance documentation for details.

j. Error Type 2305—Reorder message. The trunk could not be seized. This error causes the Trunk Seizure Test (#136) to run and is only a problem if the Seizure Test fails (in which case Error Type 1025 also appears). In this case, the trunk may be put in ‘‘Ready-for-Service’’ state (shown as ‘‘disconnected’’ by the status command), which allows only incoming calls. Run the Trunk Seizure Test (#136) and follow its procedures.

k. Error Type 2562—Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from call processing and is generated when a second attempt (retry) to seize an outgoing trunk fails.

l. Error Type 2817—Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a two-way trunk from both the near-end and the far-end. Attempt to place the call again. If the error persists, execute the DS1 Tie Trunk Seizure Test (#136) and follow its outlined procedures.

m. Error Type 3840—Port Audit and Update Test (#36) failed due to an internal system error. Enter **status trunk** command and verify the status of the trunk. If the trunk is out-of-service, then enter **release trunk** command to put it back to in-service. Retry the test command.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk Test (#6)		X	ND
Conference Circuit Test (#7)		X	ND
DS1 Tie Trunk Seizure Test (#136)	X	X	ND
Port Audit and Update Test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

For TN767B vintage 8 or 9 circuit packs, a failure of Test #136 causes a subsequent failure of Test #7. Test #136 is part of the short sequence and generates off-board alarms Test #7 is part of the long sequence and generates on-board alarms. Before entering **busyout**, **release**, **reset** or **test board long** commands, check the vintage number of the circuit pack with **list configuration board** UUCSS. If it is TN767B vintage 8 or 9, do not use the above commands until first making sure that Test #136 passes via **test board short**. Otherwise, extraneous on-board alarms may be generated.

NPE Crosstalk Test (#6)

The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes on the order of 20 to 30 seconds to complete.

Table 9-728. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. 1. Use the **display port UUCSSpp** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 2. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1001	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out of service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic and the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-728. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some of the tone detectors may be out of service. Issue the **list measurements tone-receiver** command to display basic information about the system's tone receivers. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the test at 1-minute intervals for a maximum of 5 times.
1004	ABORT	The port was seized by a user for a valid call. 1. Use the **display port UUCSSpp** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 2. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1020	ABORT	The test did not run because of a previously existing error on the specific port or a more general circuit pack error. 1. Examine the Error Log for existing errors against this port or the circuit pack and attempt to diagnose the already existing error.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2053	ABORT	At least one of the following errors is found on the DS1 circuit pack: ■ 1281—Loss of signal ■ 1793—Blue Alarm ■ 2049—Red Alarm ■ 2305—Yellow Alarm ■ 1537—Hyperactivity Look for the above error types in the Hardware Error Log and follow the procedures given in the appropriate DS1-BD or UDS1-BD maintenance documentation for the listed error types.

Continued on next page

Table 9-728. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	This can be due to on-board or off-board problems. Off-board problems of concern include EXP-PN and EXP-INTF faults, TDM-BUS faults, and faults associated with the tone detectors/tone generators. Clear all off-board problems before replacing the board. Keep in mind that a TDM-BUS problem is usually the result of a faulty board connected to the backplane or bent pins on the backplane. 1. Resolve any EXP-PN and/or EXP-INTF errors. 2. Resolve any TDM-BUS errors. 3. Resolve any TONE-BD and/or TONE-PT errors. 4. Retest when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and by examining station, trunk, or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.

Conference Circuit Test (#7)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. (The TN464C/D UDS1 circuit pack has one SCOTCH-NPE chip instead of several NPE chips). The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

Table 9-729. TEST #7 Conference Circuit Test

Error Code	Test Result	Description/ Recommendation
	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. 1. Use the **display port UUCSSpp** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 2. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out of service due to TDM-BUS errors. The **status health** command can be used to determine if the system is experiencing heavy traffic. 1. If the system has no TDM-BUS errors and is not handling heavy traffic and the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-729. TEST #7 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of tone detectors present or some of the tone detectors may be out of service. Issue the **list measurements tone-receiver** command to display basic information about the system's tone receivers. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the test at 1-minute intervals for a maximum of 5 times.
1004	ABORT	The port was seized by a user for a valid call. 1. Use the **display port UUCSSpp** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 2. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1018	ABORT	Test disabled via administration. This only applies to analog stations. 1. To enable test, set the Test field on the station administration screen for the particular analog station being tested to ''y.'' Use the **change station** *extension* command.
1020	ABORT	The test did not run due to a previously existing error on the specific port or because of a more general circuit pack error. 1. Examine the Error Log for existing errors against this port or circuit pack, and attempt to diagnose the previously existing error.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2053	ABORT	At least one of the following errors is found on the DS1 circuit pack: 1281—Loss of signal,1793—Blue Alarm, 2049—Red Alarm, 2305—Yellow Alarm, or 1537—Hyperactivity. Look for the above error types in the Hardware Error Log and follow the procedures given in the appropriate DS1-BD or UDS1-BD maintenance documentation for the listed error types.

Continued on next page

Table 9-729. TEST #7 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	The NPE of the tested port did not conference the tones correctly. This can cause noisy and unreliable connections. 1. Enter the **list configuration board UUCSS** command. If the circuit pack is a TN767B vintage 8 or 9, replace the circuit pack with a TN767C V3 or later. The error log may have error type 1281 entries. 2. Test all administered trunks on the board. If one fails, this could be an off-board problem (such as an incoming seizure or an off-hook port seizure during the test). Retest the board. 3. If all of the ports fail, check the CARR-POW (see note below). 4. If several ports fail, check the error log for TONE-BD or TONE-PT errors. If there are such errors, take the appropriate action. When the TONE errors have cleared, rerun the test. 5. If the retry passes and troubles have been reported, coordinate isolation with the far-end PBX. Make sure that the near-end and far-end switches and any NTCE equipment (the CSUs) have the correct administration. 6. Replace the circuit pack. **NOTE:** If the conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated using other port tests and by examining station, trunk, or external wiring.

Table 9-729. TEST #7 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.

Port Audit and Update Test (#36)

This test sends port level translation data from switch processor to the DS1 Interface circuit pack to ensure that the trunk's translation is correct. Translation updates include the following data: trunk type (in/out), dial type, timing parameters, and signaling bits enabled. The port audit operation verifies the consistency of the current state of the trunk kept by the DS1 Interface circuit pack and the switch software.

Table 9-730. TEST #36 Audit and Update Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-730. TEST #36 Audit and Update Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. 1. Use the **display port UUCSSpp** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 2. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1006	ABORT	The test was aborted because the trunk is out of service. 1. Use the **status trunk** command to verify that the trunk is out of service. 2. If the trunk is out of service, determine why. 3. If it is OK to put the trunk back in service, issue the **release trunk** command to put the trunk back in service, and then retry the test.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Internal system error. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	Trunk translation has been updated successfully. The current trunk states kept in the DS1 Interface circuit pack and switch software are consistent. If the trunk is busied out, the test will not run but will return PASS. To verify that the trunk is in-service: 1. Enter the **status trunk** command to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to step 2. 2. Enter the **release trunk** command to put the trunk back into in-service. 3. Retry the test command.

Continued on next page

Table 9-730. TEST #36 Audit and Update Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.

DS1 Tie Trunk Seizure Test (#136)

The DS1 Tie Trunk Seizure Test is run to verify the trunk's signaling capability. The test is composed of two parts. The first part queries the circuit pack for the following errors: Loss of Signal, Red Alarm, Blue Alarm, Yellow Alarm, and Hyperactivity Alarm. The second part of the test is performed by sending a seizure message to the DS1 Interface circuit pack and expecting an active reply by the DS1 Interface circuit pack. If maintenance software does not receive any reply and the timer expires, the test fails. Once the active message is received, a dial pause message is sent to the DS1 Interface circuit pack. If the DS1 Interface circuit pack replies with a dial pulse tone message when the far end responds to the seizure, then the DS1 tie trunk Seizure Test passes. If the far end does not respond to the seizure and the timer expires, and the DS1 Interface circuit pack sends a reorder message back to the maintenance software, then the test fails.

This second part of this test *cannot* be run on a trunk if one of the following cases is true:

1. The trunk direction is administered as an incoming only trunk.
2. The trunk is the 24th port on a DS1 Interface circuit pack which is administered using 24th Common Channel Signaling.
3. The trunk has been seized by a normal trunk call.
4. The trunk is administered with maintenance test disabled.
5. The outgoing signal type of the trunk is either automatic or immediate-start.
6. This test always passes if the associated board is the TN802 IP trunk circuit pack.

Table 9-731. TEST #136 DS1 Tie Trunk Seizure Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. 1. Use the **display port UUCSSpp** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the port is in use, wait until the port is idle before testing. 2. If the port status is active but the port is not in use (no calls), check the error log for error type 1025 (see the error log table for a description of this error and required actions). The port may be locked up. 3. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1004	ABORT	Far end is seizing the trunk while the test is ongoing. A glare situation is detected. Current test is designed to be aborted. 1. Use the **display port UUCSSpp** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the port is in use, wait until the port is idle before testing. 2. If the port status is idle, retry the command at 1-minute intervals for a maximum of 5 times.
1005	ABORT	Test failed due to incompatible configuration administered in trunk group form. 1. Verify the following fields on the trunk group administration screen: a. Is trunk direction incoming only? b. Is trunk outgoing type either automatic or immediate-start? c. Is trunk the 24th port of the DS1 Interface circuit pack while common control channel signaling is specified? 2. If the trunk has been administered using the above information, then this test should abort.
1018	ABORT	The test was disabled via translation. You may want to determine why the test has been disabled before you enable it. 1. Verify that the 'Maintenance Test' field on the 'Trunk Administration' screen is set to 'n.' To enable the test, change the trunk administration and enter 'y' into the 'Maintenance Test' field. 2. Repeat the test.

Continued on next page

Table 9-731. TEST #136 DS1 Tie Trunk Seizure Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1020	ABORT	The test did not run due to an already existing error on the specific port or due to a more general circuit pack error. 1. Examine the error log for existing errors against this port or the circuit pack and attempt to diagnose the already existing error. 2. Retry the test.
1040	ABORT	The test is invalid for this trunk port because it is administered as an access endpoint. 1. Use **display port** to verify that this port is administered as an access endpoint. In this case the test should abort.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2053	ABORT/ FAIL[1]	At least one of the following errors is found on the DS1 circuit pack: 1281: Loss of Signal 1793: Blue Alarm 2049: Red Alarm 2305: Yellow Alarm 1537: Hyperactivity 1. Look for the above error types in the Hardware Error Log and follow the procedures given in the appropriate DS1-BD/UDS1-BD Maintenance documentation for the listed error types.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	The far-end trunk did not respond to the seizure of the near-end trunk within the allowable time period. This test could have associated in-line errors in the error log. 1. Enter the **list configuration board UUCSS** command. If the circuit pack is a TN767B vintage 8 or 9, a failure of test 136 causes a subsequent failure of test 7 due to a firmware bug. Eventually, the board and all of its ports will be taken out of service and extraneous on-board alarms will be generated. Replace the circuit pack with a TN767C V3 or later. 2. Verify that the 'Trunk Type' field on the 'Trunk Administration' screen matches the trunk type administered on far-end switch. 3. Look for DS1-BD or UDS1-BD errors in the hardware error log. If present, refer to the DS1-BD (DS1 trunk circuit pack) Maintenance documentation or to the UDS1-BD (UDS1 trunk circuit pack) Maintenance documentation. 4. Retry the test at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-731. TEST #136 DS1 Tie Trunk Seizure Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	FAIL	Response to the seizure message was not received within the allowable time period. 1. Enter the **list configuration board UUCSS** command. If the circuit pack is a TN767B vintage 8 or 9, a failure of test 136 causes a subsequent failure of test 7 due to a firmware bug. Eventually, the board and all of its ports will be taken out of service and extraneous on-board alarms will be generated. Replace the circuit pack with a TN767C V3 or later. 2. Verify that the 'Trunk Type' field on the 'Trunk Administration' screen matches the trunk type administered on far-end switch. 3. Look for DS1-BD or UDS1-BD errors in the hardware error log. If present, refer to the DS1-BD (DS1 trunk circuit pack) Maintenance documentation or to the UDS1-BD (UDS1 trunk circuit pack) Maintenance documentation. 4. Retry the test at 1-minute intervals for a maximum of 5 times.
	PASS	The trunk can be seized for an outgoing call.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, check to see that there is a valid board inserted.

1. Earlier G1 Software Versions reported Error Code 2053 as a FAIL

TIE-TRK (Analog Tie Trunk)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1][2]	Full Name of MO
TIE-TRK	MAJOR[3]	test port UUCSSpp l	Tie Trunk
TIE-TRK	MINOR	test port UUCSSpp l	Tie Trunk
TIE-TRK	WARNING	test port UUCSSpp sh	Tie Trunk

1. *UU* is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). *C* is the carrier designation (A, B, C, D, or E). *SS* is the number of the slot in which the circuit pack resides (01 to 21). *pp* is the two digit port number (01, 02, ...).
2. If ATMS testing is enabled, check the error log for ATMS errors 3840 and 3841. If the error log indicates that measurements exceeded acceptable thresholds, and no other trouble is found with **test trunk**, run the ATMS test call with **test analog-testcall port UUCSSpp full**.
3. A Major alarm on a trunk indicates that alarms on these trunks are not downgraded by the **set options** command and that at least 75 percent of the trunks in this trunk group are alarmed.

   This alarm does not apply to TN497.

NOTE:
Many trunk problems are caused by incorrect settings of parameters on the trunk group administration form. Settings must be compatible with the local environment and with parameter settings on the far-end. Refer to *DEFINITY Communications System Generic 3 V2 Implementation*, 555-230-653, for information on how to administer trunks. The Application Notes section of that book shows the correct settings for administrable timers and other parameters on a country-by-country basis.

The following circuit packs, including all suffixes such as TN760D, support analog tie trunks:

Table 9-732. Analog Tie Trunk Circuit Packs

Code	Trunk Type	Signaling Leads
TN760	4-wire	E&M
TN437	4-wire	E&M
TN439	2-wire	A&B (two-way circuits only)
TN458	4-wire	E&M
TN497	2-wire	A&B
TN2140	4-wire	E&M

Each tie trunk circuit pack occupies a port circuit pack slot and contains 4 port circuits. Each port circuit supports 1 analog tie trunk used to connect the switch to another PBX across one-way or two-way dedicated circuits (see preceding list).

A tie trunk port can also be administered as an access endpoint which is a non-signaling channel with a voice-grade data bandwidth. Tie trunk maintenance employs up to 6 tests, depending on the hardware involved, to monitor the operating condition of the trunk and its connections. These are described in the following sections on each test. The port must be idle for these tests to run. If an incoming call seizes the port while a test is in progress, the test aborts and the call proceeds (except for TN497).

Additional in-line testing is performed whenever a call is in progress, logging errors that occur during operation. You can reproduce these types of errors by making a call over the trunk and then checking the Hardware Error Log.

By making translation and cross-connect changes, circuit packs (except for TN497) can be configured for back-to-back testing, also known as connectivity testing. Port operation is tested by connecting two tie trunk ports together in either E&M or simplex modes. See the section *Analog Tie Trunk Back-to-Back Testing*.

Error Log Entries and Test to Clear Values

Table 9-733. TIE Trunk Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value

3840(r)	8000	Transmission Tests (ATMS)(#844-848)		OFF	test analog-testcall
3841(r)		Transmission Tests (ATMS)(#844-848)	MINOR	OFF	test analog-testcall UUCSSpp r 2

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command. If the MINOR alarm is not downgraded by the **set options** values, then the MINOR alarm will be upgraded to a MAJOR alarm if 75% of the trunks in this trunk group are alarmed. These errors, if applicable, always log a MINOR alarm for TN439 and TN497.

Notes:

a. Digit time-out. This occurs when the far-end PBX began transmitting digits too late (10 seconds) after receiving the signal indicating ready to receive digits (if any). This can occur on an incoming immediate, wink, or delay dial line. Check the far-end PBX to ensure a translation match at both ends. This error does not apply to TN497.

b. Rotary dial before wink. This occurs when the far-end PBX starts dialing before the PBX sends the wink on a wink-start or delay-dial trunk. Check the far-end PBX to ensure a translation match at both ends. This error does not apply to TN497.

c. Rotary dial too early. This occurs when the far-end PBX starts dialing too soon (about 50ms) after seizure on a wink start or delay dial line. Check the far-end PBX to ensure a translation match at both ends. This error does not apply to TN497.

d. On hook before wink. This occurs when the far end goes on hook before a wink. Check the far-end PBX to ensure a translation match at both ends. This error applies only to TN439.

e. On an outgoing wink-start or delay-dial trunk, the wink time was too short (less than 80ms) for a valid signal. Check the far-end PBX to ensure a translation match at both ends. This error does not apply to TN497.

f. This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors (if any).

g. This indicates that the trunk in question has been busied-out by maintenance personnel.

h. The circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, reinsert or replace the circuit pack. TN439 does not alarm this error. This error does not apply to TN497.

i. The rotary dial rate was too slow — less than 8 pulses per second. Check the far-end PBX to ensure a translation match at both ends.

j. The rotary dial rate was too fast — above 12 pulses per second. Check the far-end PBX to ensure a translation match at both ends.

k. The time between digits was too short (less than 300ms). Check the far-end PBX to ensure a translation match at both ends.

l. These errors do not apply to TN439 and TN497.

m. This indicates that the trunk is still seized with an incoming call. The far-end PBX is not releasing the trunk after the call was dropped. Check the far-end PBX for problems.

   Once the trunk is released from the call, the severity of this problem is decreased. If Error Type 1025 does not appear again, this means that the problem has been corrected. Verify that Error Type 1025 does not reappear in the Error Log.

n. Reorder message. The trunk could not be seized. This error causes the Tie Trunk Seizure Test (#73) to run and is considered a problem only if that test fails, logging error 1793. In this case, the trunk may be placed in the ready-for-service state, allowing only incoming calls. This service state shows up as `disconnected` on the trunk status screen. Run the Tie Trunk Seizure Test and follow recommended procedures.

   TN439 logs aux data 57424 or 50944. Other circuit packs log 50944. This error is associated with Test #747 for TN439, Test #73 for TN497, and no test for the others.

o. These errors apply only to TN497.

p. Retry Failure error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error comes from call processing and is generated when a second attempt (retry) to seize an outgoing trunk fails.

q. Glare error. This error is logged only. It is not a hardware failure and hence does not start any testing or generate any alarms. This error is the result of a simultaneous seizure of a two-way trunk from both the near-end and the far-end. Attempt to place the call again. If the error persists, execute the Tie Trunk Seizure Test (#73) and follow its outlined procedures.

r. Error 3841 indicates that test calls made by the Automatic Transmission Measurement System (ATMS) returned measurements in the unacceptable range. Error 3840 indicates measurements were in the marginal range. Use **list testcall detail** to examine the specific transmission parameters which are out of spec, and investigate the trunk for that kind of noise. If the noise is acceptable, then the AMTS thresholds administered on page 4 of the trunk group form should be changed.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in Table 9-734 when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test* for example, you may also clear errors generated from other tests in the testing sequence.

Table 9-734. System Technician-Demanded Tests: TIE-TRK

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk Test (#6)		X	ND
Looparound and Conference Circuit Test (#33)		X	ND
Tie Trunk Seizure Test (#73)	X	X	ND
Dial Test #747	X	X	ND
Tie Trunk EPF Test (#74)	X	X	ND
Port Audit and Update Test (#36)	X	X	ND
Transmission Test - ATMS (#844-848)	[2]	†	ND

1. D = Destructive, ND = Non-destructive
2. ATMS tests are not part of either sequence. They are run either on demand with **test analog-testcall**, or by the ATMS schedule.

NPE Crosstalk Test (#6)

The NPE Crosstalk Test verifies that a port's NPE channel talks on the time slot assigned to it and does not cross over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. The test takes 20 to 30 seconds to complete.

Table 9-735. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The trunk may be busy with a valid call. Use the **display trunk xx** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is active, but the port is not in use (no connected ports), then check the Error Log for Error Type 1025 (see Error Log table for description of this error and required actions). The port may be locked up. 2. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	System resources required to run this test are not available. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the test at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-735. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display trunk xx** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.
Any	FAIL	This test can fail due to on-board or off-board problems. Off-board problems of concern include EXP-PN and EXP-INTF faults, TDM-BUS faults, and faults associated with the tone detectors/tone generators. Clear all off-board problems before replacing the board. Keep in mind that a TDM-BUS problem is usually the result of a faulty board connected to the backplane or bent pins on the backplane. 1. Resolve any EXP-PN and/or EXP-INTF errors. i 2. Resolve any TDM-BUS errors. 3. Resolve any TONE-BD and/or TONE-PT errors. 4. Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated using other port tests and examining station, trunk or external wiring.
0	NO BOARD	The test could not relate the internal ID to the port (no board). 1. Check to ensure that the board translations are correct. Translate the board, if necessary. 2. Issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board** command. This should re-establish the linkage between the internal ID and the port.

Looparound and Conference Circuit Test (#33)

This test verifies signal transmission and conferencing capabilities of a port using 404-Hz, 1004-Hz, and 2804-Hz tones. This is an on-board test only: each tone is transmitted to and looped around within the port and then returned.

This test can fail due to noise induced by adjacent electric power lines. If this is the case, the customer must resolve it with their local power company. To temporarily alleviate an alarm caused by failure of this test, you can disable it via the `Test` field on the trunk administration form.

Table 9-736. TEST #33 Looparound and Conference Circuit Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.
7	ABORT	The conference circuit test was aborted. 1. Retry the command at 1-minute intervals a maximum of 5 times.
129	ABORT	The 404-Hz reflective loop around test aborted. Response to the test request was not received within the allowable time period.
131		The 1004-Hz reflective loop around test aborted. Response to the test request was not received within the allowable time period.
133		The 2804-Hz reflective loop around test aborted. Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The trunk may be busy with a valid call. Use the **display trunk xx** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is active, but the port is not in use (no calls), then check the Error Log for Error Type 1025 (see Error Log table for description of this error and required actions). The port may be locked up. 2. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-736. TEST #33 Looparound and Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized force. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display trunk xx** command to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting.
1018	ABORT	The test has been disabled via administration. Verify that the 'Maintenance Test' field on the 'Trunk Group' form is set to 'n.' To enable the test, issue the 'change trunk-group x' command (x equals the number of the trunk group to be tested). Then, change the entry in the 'Maintenance Test' field on the form to 'y.'
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.
7,	FAIL	The conference capabilities of the port failed (Error Code 7).
129,		The reflective 404-Hz Tone Test failed. No transmission was detected to or from the port (Error Code 129).
131, or		The reflective 1004-Hz Tone Test failed. No transmission was detected to or from the port (Error Code 131).

Continued on next page

Table 9-736. TEST #33 Looparound and Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
133		The reflective 2804-Hz Tone Test failed. No transmission was detected to or from the port (Error Code 133). FAULT ISOLATION: Proceed as follows unless power or tone problems are suspected (see notes on the next page). 1. To make sure the problem is on-board, disconnect the port from the CO and retry the test. Coordinate this with the CO, or do it after busy hours; otherwise, the CO may put the connection out of service. 2. If the retry fails, replace the circuit pack. 3. If the retry passes and no troubles have been reported, disable the test. If the retry passes and troubles have been reported, refer the problem to the CO. *More information continues on the next page.*
7, 129, 131, or 133 *(cont'd.)*	FAIL *(cont'd.)*	**NOTE:** If the loop around and conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test. If the test fails again, see FAULT ISOLATION above.
	PASS	Tie trunk Looparound and Conference Test is successful. This port is functioning properly. 1. If users are reporting troubles, examine loop connections to the port.

Continued on next page

Table 9-736. TEST #33 Looparound and Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). 1. Check to ensure that the board translations are correct. Translate the board, if necessary. 2. Issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board** command. This should re-establish the linkage between the internal ID and the port.

Audit Update Test (#36)

This test sends to the circuit pack updates of translations for all administered ports on the circuit pack. It is non-disruptive and guards against possible corruption of translation data contained on the circuit pack. No response is expected from the circuit pack. Port translation data includes:

- Start type: immediate, automatic, wink-start, or delay dial
- Rotary or DTMF senderization in or out
- Disconnect timing: 10 to 2550ms in 10ms increments
- DMTF time slot
- Continuous-seize-ack? (TN2140

Table 9-737. TEST #36 Audit Update Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABORT	Could not allocate the necessary system resources to run the test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-737. TEST #36 Audit Update Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	This test passed. Translation information was successfully updated on the circuit pack. If the trunk is busied out, the test will not run, but will return PASS (except on TN439 and TN497). 1. If signaling troubles are reported, verify translation information for this port. 2. To verify that the trunk is in-service, enter **status trunk** command to verify that the trunk is in-service. If the trunk is in-service, no further action is necessary. If the trunk is out-of-service, continue to Step 2. 3. Enter **release trunk** command to put trunk back into in-service. 4. Retry the test command.
0	NO BOARD	The test could not relate the internal ID to the port (no board). 1. Check to ensure that the board translations are correct. Translate the board, if necessary. 2. Issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board** command. This should re-establish the linkage between the internal ID and the port.

Tie Trunk Seizure Test (#73) and Tie Trunk Dial Test (#747)

For wink-start, delay-dial and TN2140 (cont-seize-ack or discont-seize-ack) trunks, this test activates the M lead and checks for a response from the far end within 10 seconds.

For TN497, the test seizes a trunk and outpulses a pause. The port reports uplink the result of the seizure. This test can be disabled via the `Test` field on the trunk group administration form.

For TN439, Test #747 is run instead of #73. This test seizes a trunk and outpulses a pause digit. This test aborts on ports administered as access endpoints.

Table 9-738. TEST #73,#747 Tie Trunk Seizure Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The trunk may be busy with a valid call. Use the **display trunk xx** to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is active, but the port is not in use (no calls), then check the Error Log for Error Type 1025 (see Error Log table for description of this error and required actions). The port may be locked up. The far-end PBX may not be releasing. 2. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display trunk xx** to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1005	ABORT	This test is not valid for this trunk translation. Must be a wink-start or delay dial trunk and must be outgoing or two-way for this test to run. For the TN2140, the trunk must also be continuous-seize-ack or discontinuous-seize-ack. 1. Check trunk translation. If it is not a wink-start or delay dial trunk, this abort message should be ignored.
1018	ABORT	Test disabled via administration. 1. Verify that the ‘‘Maintenance Tests?’’ field on the Trunk Group Form is set to "n". To enable the test, issue the **change trunk-group x** command where ‘‘x’’ equals the number of the trunk group to be tested. Then change the entry in the ‘‘Maintenance Tests?’’ field on the form to ‘‘y.’’
1040	ABORT	This test is not performed for trunk ports administered as access endpoints. 1. Verify this port is an access endpoint by using the **display port** command. 2. If the port has been administered as an access endpoint, then this test should abort.
2100	ABORT	Could not allocate the necessary system resources to run the test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-738. TEST #73,#747 Tie Trunk Seizure Test — *Continued*

Error Code	Test Result	Description/ Recommendation
3	FAIL	No dial tone detected from the other end. (TN439 circuit packs only.) 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to fail, check the far-end PBX to ensure a translation match at both ends. 3. Check the facility.
2000	FAIL	Seizure message is not received back within 10 seconds. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to fail, check the far-end PBX to ensure a translation match at both ends. 3. Check the facility.
	PASS	The Tie Trunk Seizure Test passes. This port is functioning properly. 1. If users are reporting troubles, examine loop connections to the port, wiring, and stations.
0	NO BOARD	The test could not relate the internal ID to the port (no board). 1. Check to ensure that the board translations are correct. Translate the board, if necessary. 2. Issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board** command. This should re-establish the linkage between the internal ID and the port.

Tie Trunk EPF Test (#74)

The first part of this test checks for proper activation and deactivation of the port's E lead. The second part checks the M lead electronic power feed current flow.

Table 9-739. TEST #74 Tie Trunk EPF Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run the test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The trunk may be busy with a valid call. Use the **display trunk xx** to determine trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. If the port status is active, but the port is not in use (no calls), then check the Error Log for Error Type 1025 (see Error Log table for description of this error and required actions). The port may be locked up. The far-end PBX may not be releasing. 2. If the port status is idle, then retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display trunk xx** to determine the trunk group/member number of the port. Use the **status trunk** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. You must wait until the port is idle before retesting. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1005	ABORT	This test is not valid for this trunk translation. Must be a type-1 standard trunk for this test to run. 1. Check trunk configuration. If it is not a type-1 standard trunk, this abort message should be ignored.
1014	ABORT	The test was aborted because the circuit pack has not been inserted into the system. 1. Use the **list configuration board** command to make sure the circuit pack is inserted in the carrier. 2. If the board is not inserted, make sure the circuit pack is inserted in the carrier and fully seated.

Continued on next page

Table 9-739. TEST #74 Tie Trunk EPF Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1040	ABORT	This test is not performed for trunk ports administered as access endpoints. 1. Verify this port is an access endpoint by using the **display port** command. 2. If the port has been administered as an access endpoint, then this test should abort.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run the test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1	FAIL	The E lead test failed due to an on-board port problem. 1. Replace the circuit pack.
2	FAIL	The M lead test failed. The EPF has experienced an overcurrent condition, perhaps due to the external M lead. 1. To make sure the problem is on-board, disconnect the facility from the pack and retry the test. 2. If the test fails, replace the circuit pack. Otherwise, check the external wiring toward the far-end PBX.
	PASS	Tie Trunk EPF test is successful. This port is functioning properly. 1. If users are reporting troubles, examine loop connections to the port.
0	NO BOARD	The test could not relate the internal ID to the port (no board). 1. Check to ensure that the board translations are correct. Translate the board, if necessary. 2. Issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board** command. This should re-establish the linkage between the internal ID and the port.

Transmission Test (#844-848)

This test is non-destructive.

NOTE:
Tests #844-848 are not supported on a International switch.

These tests are run by the Automatic Transmission Measurement System (ATMS). They are not part of the long or short trunk test sequences. Instead, they are run on demand with the **test analog-testcall** command or as part of ATMS scheduled testing. For more information, see ''Automatic Transmission Measurement System (ATMS)'' in Chapter 6.

The test call is run from an analog port on a TN771 Maintenance/Test circuit pack. It attempts to seize a port and make a call to a terminating test line (TTL) on the trunk's far end. Transmission performance measurements are made and compared to administered thresholds. Errors are generated when results fall outside of ''marginal'' or ''unacceptable'' thresholds. Detail and summary measurement reports are obtainable via the **list testcalls** command.

Table 9-740. TEST #844-848 Transmission Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Use **display port UUCSSpp** to determine the trunk group/member number of the port. Use the "status trunk" command to determine the service state of the port. If the service state indicates that the port is in use, then the port unavailable for this test. (Refer to section on "status" commands for a full description all possible states). You must wait until the port is idle before retesting. 2. If the port status is idle, then retry the command at 1-minute intervals for a maximum of 5 retries.
1001	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
1002	ABORT	The system could not allocate timeslots for the test. The system may be under heavy traffic conditions or it may have timeslots out of service due to TDM bus errors. 1. If system has no TDM bus errors and is not handling heavy traffic, repeat test at 1-minute intervals for a maximum of 5 retries.
1004	ABORT	The port has been seized by a user for a valid call. Use status trunk to determine when the port is available for testing. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.

Continued on next page

Table 9-740. TEST #844-848 Transmission Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1005	ABORT	Trunk has been administered as incoming-only; transmission tests can only be run on outgoing trunks.
1115	ABORT	The near end test line on the TN771 circuit pack could not be allocated. 1. Verify that the TN771 circuit pack is in service and that port 1 is administered and in service with the **status port** command. 2. Retry the command at 1-minute intervals for a maximum of 5 retries.
1900	ABORT	The test completion message was not received from the TN771 circuit pack. 1. Test the TN771 circuit packs.
1901	ABORT	This error occurs when the TN771 circuit pack uplinks a message that is not the proper response for this test. The anticipated uplink messages are seize, ring or answer. 1. Verify that the Trunk is administered properly.
1905	ABORT	Intercept tone detected from far end. 1. Get the test line data and verify it with the far end. Dial the test number manually to see if the TTL is reached. If it is not, then either the number is wrong, or the far end is administered incorrectly.
1906	ABORT	Reorder tone detected from far end. 1. See actions for error code 1905.
1907	ABORT	Other unexpected tone detected from far end. 1. See actions for error code 1905.
1913	ABORT	Audible Ring detected from far end. 1. See actions for error code 1905.
1914	ABORT	Unidentified interrupted tone detected from far end. 1. See actions for error code 1905
1915	ABORT	Busy tone detected from far end. 1. Since the test line at the far end was busy. Try the test again. 2. If the test continues to abort, the problem is with the far end system.
1918	ABORT	Test progress tone not removed from far end (type 105 test line only). 1. The problem is with the far end system; a technician at the far end should test the test line (TN771 or ADFTC).
1919	ABORT	Unexpected far end release 1. The problem is with the far end system; a technician at the far end should test the test line (TN771 or ADFTC).

Continued on next page

Table 9-740. TEST #844-848 Transmission Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1920	ABORT	No response from far end. 1. The problem is with the far end system; a technician at the far end should test the test line (TN771 or ADFTC).
1921	ABORT	No data returned from far end. 1. The problem is with the far end system; a technician at the far end should test the test line (TN771 or ADFTC).
1922	ABORT	Steady, unidentifiable tone from far end 1. See actions for error code 1905.
1923	ABORT	Broadband energy detected from far end (such as voice or announcement). 1. See actions for error code 1905.
1924	ABORT	No test tone from far end 1. See actions for error code 1905.
1938	ABORT	Near-end self test failed. 1. Test the TN771 circuit packs.
1939	ABORT	Loss self check at 0dBm at 1004 Hz failed. 1. Test the TN771 circuit packs.
1940	ABORT	Far end noise self check failed. 1. The problem is with the far end system; a technician at the far end should test the test line (TN771 or ADFTC).
1941	ABORT	High frequency singing return loss self check failed. 1. Test the TN771 circuit packs.
1942	ABORT	Echo return loss self check failed. 1. Test the TN771 circuit packs.
1943	ABORT	Singing return loss self check failed. 1. Test the TN771 circuit packs.
1944	ABORT	Loss self check at -16 dBm at 1004 Hz failed. 1. Test the TN771 circuit packs
1945	ABORT	Loss self check at -16 dBm at 404 Hz failed. 1. Test the TN771 circuit packs.
1946	ABORT	Loss self check at -16 dBm at 2804 Hz failed. 1. Test the TN771 circuit packs.

Continued on next page

Table 9-740. TEST #844-848 Transmission Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1947	ABORT	Noise with tone self check failed. 1. Test the TN771 circuit packs.
2000	ABORT	The test timed out while waiting for a response from the TN771 circuit pack. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2012	ABORT	An internal software error occurred. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2053	ABORT	The test call could not be established, but no information on why is available. 1. Retry the command at 1-minute intervals for a maximum of 5 retries.
2056	ABORT	An error occurred while trying to obtain results from the TN771 circuit pack. 1. Test the TN771 circuit packs.
	FAIL	Measured transmission performance was in the unacceptable range as administered on the trunk group form. Retrieve a measurement report via the **list testcalls** command. Make sure that ATMS thresholds are set properly on page 4 of the trunk group form. Besides the facility, test failures can be caused by faulty test lines or switch paths. If the measurements point to a facility problem, report the results to the trunk vendor.
8000	FAIL	Measured transmission performance was in the marginal range as administered on the trunk group form. This generally means that the trunk is usable but has an undesirable amount of noise or loss. If the user does not report unacceptable effects, it may not be necessary to take any action. Retrieve a measurement report via the **list testcalls** command. Make sure that ATMS thresholds are set properly on page 4 of the trunk group form.

TIME-DAY (Time of Day)

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run	Full Name of MO
TIME-DAY	MINOR	set time	Time of Day

The time of day contains the current year, month, day of the week, day of the month, hour, minute, and second. The Time of Day maintenance object is responsible for monitoring the time-of-day clock and raising an alarm if the time-of-day clock is not set or cannot be read by the software. If the time-of-day clock is not set or cannot be read by the software, many features such as Time-of-Day Routing, CDR, ISDN Call-by-Call, Duplication, and so on will be either inoperative or incorrect. The time-of-day clock should be set using the **set time** command whenever the system is initially powered up or the TN1648 SYSAM circuit pack is replaced.

The time-of-day clock can be read with the **display time** command and set via the **set time** command. The time-of-day clock resides on the TN1648 SYSAM circuit pack and has a backup battery to save the time of day during power failures. If the TN1648 SYSAM circuit pack is physically removed from the carrier, the contents of the time-of-day clock is lost and the time of day must be set when the TN1648 SYSAM circuit pack is re-inserted.

Error Log Entries and Test to Clear Values

Table 9-741. Time of Day Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0	0	Any	Any	Any	display time
247[1]	0	none	MINOR	OFF	set time

1. This error indicates that software cannot read the time-of-day clock on the TN1648 SYSAM circuit pack. During this condition, all time stamps on Alarm Log entries, Hardware Error Log entries, and Software Error Log entries are potentially inaccurate. In addition, any features that are sensitive to the time of day (such as SMDR, Time-of-Day Routing, ISDN Call-by-Call) will not function correctly.

To resolve the alarm, do the following:

1. Use the **set time** command to set the time of day.
2. Use the **display time** command to display the time of day. If the time of day is displayed correctly, wait 15 minutes and verify that the alarm is retired. If the alarm has not been retired, continue with Step 3.
3. Test the active TN1648 SYSAM circuit pack using the **test maintenance [a | b] sh** command. If any tests fail, refer to the repair procedures for the SYSAM circuit pack before further investigating time-of-day problems. If all tests PASS and the alarm has not been retired, proceed to Step 4.
4. Replace the active TN1648 SYSAM circuit pack must be replaced. See "Replacing SPE Circuit Packs" in Chapter 5. The alarm should be resolved within 15 minutes of replacing the SYSAM and resetting the time with **set time**.

TONE-BD (Tone-Clock Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
TONE-BD	MAJOR	test tone-clock UUC short	Tone-Clock Circuit Pack
TONE-BD	MINOR	test tone-clock UUC short	Tone-Clock Circuit Pack
TONE-BD	WARNING	release tone-clock UUC	Tone-Clock Circuit Pack

1. UU is the universal cabinet number (1 for PPN, 2 -44 for EPNs). C is the carrier designation (A, B, C, D, or E).

The Tone-Clock circuit packs house two independent components. The tone generator provides all the tones needed by the system, and the clock generates the system clocks for the Time Division Multiplex (TDM) Bus and the LAN Bus, and aids in monitoring and selecting internal synchronization references.

When resolving errors/alarms on the Tone-Clock circuit pack, the following sections should also be consulted:

- Use the **set tone-clock PC** command to establish the tone and synchronization resources for the system.
- TONE-PT (Tone Generator)
- TDM-CLK (TDM Bus Clock)
- SYNC (Synchronization)

The TN2182 is a combined Tone-Clock-Detector circuit pack which contains a third independent function not available on the TN768 or TN780. The TN2182 contains 8 ports used for all-purpose tone detection. These ports are called Enhanced Tone Receiver ports (ETR-PT) and are described in the documentation for ETR-PT.

Tone-Clock Circuit Packs and System Reliability Options

The following sections describe the relationship between the various System Reliability Options and Tone-Clock circuit pack configurations.

Standard Reliability Option

Systems with the Standard Reliability Option (no duplication options) have one Tone-Clock circuit pack in each port network (PPN and EPN). For the PPN or the first EPN of a cabinet this is in the A carrier. Cabinets containing a second EPN will also have a Tone-Clock circuit pack in the E carrier. This Tone-Clock circuit pack generates clocks and provides system tones for all carriers of the port network it resides on.

High Reliability Option

Systems with the High Reliability Option (duplicated SPE, simplex PNC) have one Tone-Clock circuit pack in each PPN control carrier, A and B. One Tone-Clock circuit pack will be actively generating system clock signals for PPN components, while the other will be in standby mode, ready to take over in the event of a Tone-Clock interchange. Similarly, one Tone-Clock circuit pack will be actively providing system tones for the PPN, while the other will be in standby mode. Normally, the same Tone-Clock circuit pack will be active for both tones and clock signals, but these responsibilities may be divided if neither circuit pack is able to perform both functions. The **status port-network** PN# command will indicate which Tone-Clock circuit pack is actively performing each function.

For systems using the TN2182 Tone-Clock-Detector circuit pack, tone generation and clock generation behaves the same as other clock boards with one being active and one being standby. But the tone detector ports (ETR-PTs) of the TN2182 are always considered available and in-service regardless of the active/standby state of the tones or clock for a specific circuit pack.

EPN Tone-Clock circuit pack configuration is the same as for the Standard Reliability Option. Each EPN Tone-Clock circuit pack will be active for both tones and clock signals for its port network.

Critical Reliability Option

Systems with the Critical Reliability Option (SPE duplication and PNC duplication) have two Tone-Clock circuit packs associated with the PPN, as in the High Reliability Option case, and two more Tone-Clock circuit packs for each EPN. For the first EPN in a cabinet, these are in carriers A and B; for the second EPN, where configured, they are in carriers D and E. As in the previous case, one Tone-Clock in each Port Network is active, supplying system clocks and tones, and the other is in standby mode.

Tone-Clock Interchange Strategy

Tone-Clock circuit pack interchanges are controlled both by manual intervention and by maintenance software strategies.

The manual interchange strategy for Tone-Clock circuit packs differs slightly between the PPN and any EPNs on a system.

Manual PPN Tone-Clock Interchange

In a PPN with more than one Tone-Clock circuit pack, the intention is to assure that the one considered most healthy is active at any given time. *This is independent of the SPE Duplication strategy*, in the sense that the active Tone-Clock circuit pack need not change with an interchange of SPE carriers. Rather, except for the effect of the manual intervention discussed earlier, Tone-Clock interchanges occur only as a result of changes in the health of Tone-Clock circuit packs, as perceived by maintenance software. When both Tone-Clock circuit packs are equally healthy, no preference is given to one over the other, regardless of which SPE carrier is active.

It is possible to manually control Tone-Clock interchanges in three ways.

1. The **standby** Tone-Clock circuit pack may be made unavailable for most purposes by using the **busyout tone-clock UUC** command. Such a Tone-Clock may not be selected with console commands, nor with normal maintenance software activities, until it has been made available again with the **restore tone-clock UUC** command.

   NOTE:
   busyout tone-clock is not allowed for active Tone-Clock circuit packs.

2. The SPE processor lock switches may be used to force a particular SPE to be active. *This method overrides all other Tone-Clock interchange controls*. If there is a Tone-Clock circuit pack in the same carrier as the active SPE, it will become active, regardless of its health. If the Tone-Clock circuit pack in the selected SPE was in the *busyout* state (see item 1 above), it will automatically be released and made active. While the lock switches are set for a particular carrier, *no manual intervention or software error detection* will cause an interchange of Tone-Clocks; the Tone-Clock circuit pack in the standby SPE carrier can never become active. If there is no Tone-Clock circuit pack in the selected SPE at the time the switches are set, but one is later installed, the system will interchange to it regardless of its health. If the Tone-Clock circuit pack is removed from an SPE while the switches are set, *no interchange will occur*; the system will have no active tone-clock. When the lock switches are restored to the neutral position, a tone clock interchange will occur only if the standby Tone-Clock circuit pack is healthier than the active one.

3. A particular Tone-Clock circuit pack can be made active by issuing the **set tone-clock UUC [override]** command. If the Tone-Clock to be made active is less healthy than the currently active one, no interchange will occur unless the **override** option is specified; without it a message will inform the user that it is required.

   Once a Tone-Clock circuit pack is made active by the **set tone-clock UUC** command, it will stay active until either the **set tone-clock UUC** command is issued again to make the other circuit pack active, or until a fault occurs in the active Tone-Clock circuit pack, which causes the system to interchange Tone-Clocks.

Manual EPN Tone-Clock Interchange

In an EPN with duplicated Tone-Clock circuit packs, one circuit pack is always *preferred* over the other. For the first Port Network in a cabinet, this is the Tone-Clock circuit pack in carrier **A**. If a second Port Network is configured in a cabinet, its preferred Tone-Clock is the one in carrier **E**. The intention is that the preferred circuit pack be active whenever it is healthy. Once a failing preferred Tone-Clock circuit pack has been replaced or repaired, the system will make it active as soon as possible.

Control over interchanges for an EPN is accomplished in essentially the same ways as items 1 and 3 in the PPN case above. In addition, when the non-preferred Tone-Clock circuit pack in an EPN is active, and the preferred circuit pack is repaired and proven capable of filling its roles, the system will automatically interchange back to it as soon as possible.

Software Maintenance Interchange

Interchanges may be instigated by software Tone-Clock maintenance in two ways.

1. A scheduled Tone-Clock circuit pack interchange occurs according to the parameters set by the **change system-parameters maintenance** command. This can be disabled or set to run weekly, but the standard (default) situation is for it to occur daily, at the time specified in the system-parameters list for scheduled maintenance to begin. This interchange will be blocked if the lock switches are set, if the non-preferred Tone-Clock circuit pack in an EPN has been selected with the **set tone-clock** command, if the standby Tone-Clock has been set to the busyout state, or if the clock generation capability of the standby Tone-Clock circuit pack is known to be impaired. When this scheduled interchange occurs, the standby Tone-Clock circuit pack becomes active for a period of 20 seconds to test its ability to generate clock signals, and then is returned to standby mode.
2. Unscheduled interchanges occur when on-board Tone-Clock circuit pack maintenance, or ongoing switch maintenance tests of **TONE-BD, TONE-PT**, or **TDM-CLK** uncover failures serious enough to raise any MAJOR or MINOR alarm against the active Tone-Clock circuit pack.

International Settings [G3r V2]

The TN780 Tone-Clock circuit pack uses three firmware configuration parameters for international support [G3r V2]. The following two are automatically set by the software load for the targeted country:

- The circuit pack's country-code (USA, ITALY, AUSTRALIA, etc.)
- The circuit pack's companding mode (mu-Law or A-Law)

The third configuration parameter is used only for Italy (country code: ITALY), and selects whether *new* versus *old* ISPT (Istituto Superiore Poste Telegrafi) tones will be used for dial and confirmation tones. Values for dial confirmation tone can be set independently on the **change system-parameters miscellaneous** form. Whenever such changes are made, the effects are immediately enforced on all TN780 Tone-Clock circuit packs without disrupting tone or timing services.

Tone	New ISPT Value(default)	Old ISPT Value
Dial	continuous	cadenced
Confirmation	cadenced	continuous

In addition the TN780 allows customization of up to six system tones in order to meet specific country needs. These changes are made via the **change system-parameters country-options** form.

The TN2182 allows the same internation changes as the TN780 but allows the customization of up to 24 system tones in order to meet specific country needs. These changes are made via the **change system-parameters country-options** form.

How to Replace the Tone-Clock Circuit Pack

Replacing the Tone-Clock circuit pack is a service-disrupting procedure on Port Networks with a single Tone-Clock, because the Tone-Clock circuit pack is always needed to generate clocks for its network. For EPN Tone-Clock replacement where no second Tone-Clock circuit pack exists, only that EPN is affected. When the circuit pack is removed, all calls are dropped immediately, the EPN enters emergency transfer within one minute, and no calls can be set up from or to that EPN. However, if the PPN Tone-Clock is removed for replacement in a Standard Reliability Option system, the System Emergency Transfer feature is activated within milliseconds, and the entire system is disrupted; no calls can be placed, and existing calls are dropped.

When replacing the Tone-Clock circuit pack, always make sure to replace it with the appropriate Tone-Clock circuit pack for the system. Three circuit pack codes are supported by G3r systems:

TN768	This is the general purpose Tone-Clock circuit pack for port networks on a G3r switch. It can be used in every situation except as the Master Tone-Clock circuit pack when a Stratum 3 Clock is administered.
TN780	The Stratum 3 Clock feature requires the use of this circuit pack code for the PPN (in both carriers of High and Critical Reliability systems). The Stratum 3 Clock will operate only with this code as the Master Tone-Clock circuit pack. The TN780 circuit pack is upward compatible with the TN768 code, and can be used in any place a TN768 would be allowed. The TN780 is used in many countries outside the U.S. where the TN768 does not provide local tones.
TN2182	This Tone-Clock-Detector may be used anywhere a TN768 or TN780 is used with the exception of configurations requiring Stratum 3 Clock. The TN2182 may be used in all country configurations.

Port Networks with a Single Tone-Clock Circuit Pack:

This procedure is destructive.

1. Pull out the defective Tone-Clock circuit pack. This will remove the clocks and cause the system to activate emergency measures:
   - For the PPN Tone-Clock, the system will immediately go into the Emergency Transfer state.
   - For an EPN Tone-Clock, all calls to and from the EPN will drop and the EPN will activate Emergency Transfer within about one minute, but the rest of the system should operate normally.
2. Insert a new Tone-Clock circuit pack. The system will detect the return of the clocks and will automatically recover as follows:
   - If the Tone-Clock circuit pack being replaced is in the Processor Port Network, the system will perform a **reset system 2 (system cold 2 restart)** automatically. First, all red LEDs of the PPN will come on and off within 30 seconds. Then, all red LEDs of any Expansion Port Networks will come on and go off within the next 30 seconds.
   - If the Tone-Clock circuit pack being replaced is in an Expansion Port Network, the system will reset the EPN **(EPN cold restart)** and all the red LEDs of the EPN will come on and go off within 30 seconds.
3. If the red LEDs come on but do not go off within 30 seconds, pull the circuit pack out and reseat it. If the LEDs perform as expected this time, continue with step 6. Otherwise, there may be a problem with the TDM Bus; possibly a bent pin in the Tone-Clock circuit pack slot. Follow the directions in the TDM-BUS maintenance section.
4. If the red LEDs did light, as explained above, then go to Step 6. If the red LEDs do NOT light, as explained above, then go on to Step 5.

5. Restart the affected Port Network:
   - In the PPN, restart the system via the **reset system 2** command.
   - In an EPN, restart the EPN by resetting its Expansion Interface circuit pack via the **reset port-network PN# 2** command, using the Port Network number of the affected EPN. (Use the **list cabinet** UU command to determine the Port Network number for a given cabinet and carrier.)
6. Test the new Tone-Clock circuit pack to verify that it is functioning properly, using the **test tone-clock UUC long** command, and verify that the system is operational by placing several phone calls. Where possible, try calls into, out from, and within the affected Port Network.

Port Networks with Two Tone-Clock Circuit Packs:

Table 9-742. LED Condition/Tone-Clock Circuit States (Two Tone-Clock Pack)

Condition	Tone-Clock Circuit State	Explanation
flashing yellow 2.7 seconds on .3 seconds off	active	An external timing source is being used as a synchronization reference[1].
flashing yellow .3 seconds on 2.7 seconds off	active	The local oscillator on the Tone-Clock circuit pack is being used as a synchronization reference.
yellow on continuously	active	The circuit pack has been reset but has not been told which synchronization source to use.
yellow LED off	standby	The circuit pack is in standby mode, (neither generating tones nor supplying clocks).
"jingle bells" green and yellow .1 sec on, .2 sec off, .1 sec on, .4 sec off, .4 sec on, .4 sec off	standby	Maintenance software is testing the standby circuit pack (the standby Tone-Clock is providing tones).

Continued on next page

Table 9-742. LED Condition/Tone-Clock Circuit States (Two Tone-Clock Pack) — *Continued*

Condition	Tone-Clock Circuit State	Explanation
"double blink" yellow .3 sec on, .3 sec off, .3 sec on, 2.4 sec off,	active	TN2182 has lost all external references and is in holdover mode.
other green and yellow patterns	active	Maintenance software is testing the active circuit pack.
random yellow	standby	If the circuit pack is a TN2182, the yellow LED may come on and off intermittently as ETR-PTs on the board are used for tone detection services.

1. For a Tone-Clock in the master port network, the external source is the primary or secondary DS1 source, or a Stratum 3 clock. For a Tone-Clock in a slave port network, the external source is the Expansion Interface circuit pack.

Notes:

1. Use the **list cabinet** command to determine the Port Network number of the cabinet and carrier containing the Tone-Clock circuit pack to be replaced. If both Tone-Clock circuit packs in a Port Network need to be replaced, first replace and test the one that is in standby mode. Make sure that it is healthy and active before replacing the second one. Make sure the Tone-Clock circuit pack to be replaced is in Standby Mode by displaying its status via the **status port-network** command or making sure its yellow LED is off.

   The active/standby state of a Tone-Clock circuit pack may also be determined by looking at its LED. A continuously lit red LED on the Tone-Clock circuit pack indicates a reported fault on one or more of the maintenance objects on the circuit pack. Flashing patterns of the yellow and green LEDs correspond to the following service states:

2. If the Tone-Clock circuit pack to be replaced is active, then switch to the other Tone-Clock circuit pack by doing the following:

   - **set tone-clock UUC**—Where UUC is the Standby Tone-Clock circuit pack.

     NOTE:
     When Port Network Connectivity Duplication is active, the system generally expects an EPN to have its "preferred" Tone-Clock circuit pack active. For the first Port Network in a given cabinet, this is carrier A. For a second PN in a given cabinet this is carrier E. There is no "preferred" tone clock for the PPN, regardless of reliability options.

   - **status system**—Verify the Tone-Clock circuit pack switched to the other Tone-Clock circuit pack or check the LEDs. The yellow LED of the new Standby Tone-Clock circuit pack should be off (provided maintenance is not running on it) and the yellow LED of the active Tone-Clock circuit pack should be blinking.
   - If the interchange was not successful, the standby Tone-Clock circuit pack may be defective. In particular, if the error message "must use override" is displayed, fix the standby Tone-Clock circuit pack before attempting to replace the active one.

3. If the Tone-Clock circuit pack to be replaced is in the PPN, it is recommended, but not required, that the SPE carrier containing it be locked in standby mode by executing an interchange if necessary, and locking the SPE-Select switches. This protects you from disrupting service in case of inadvertent errors in replacing the circuit pack. See "Repairing SPE Components" in Chapter 5, ‘‘Alarms, Errors, and Troubleshooting’’.

   NOTE:
   If the SPE-Select switches are locked, be sure to release them at the conclusion of the replacement procedure.

4. Pull out the defective Tone-Clock circuit pack. No calls should be affected. If this is a TN2182 circuit pack, some ETR-PTs may be in use and removal of the pack will affect some individual users. It may be less disruptive to busyout the standby TN2182 before removing it.
5. Insert a new Tone-Clock circuit pack of the appropriate code in the same slot where the defective Tone-Clock circuit pack was removed.
6. Test the new Tone-Clock circuit pack via the **test tone-clock UUC long** command to make sure it is functioning properly. If the Tone-Clock circuit pack is being replaced due to loss of c locks, the Clock Health Inquiry (#46) will still report a failure, proceed with the next step.

7. To verify that the new Tone-Clock circuit pack can generate clocks for the system, switch to the new Tone-Clock with **set tone-clock UUC override**, and execute **test tone-clock UUC**. (In a PPN, the SPE-Select switches must be in the auto position.)

   CAUTION:
   If the new Tone-Clock circuit pack is not able to generate system clocks, this procedure becomes destructive. The system will detect a loss of clock and recover accordingly.

   In this case if the Tone-Clock circuit pack being replaced is in the PPN the system will perform a reset system 2 (cold 2 restart) automatically. If the Tone-Clock circuit pack being replaced is in an EPN, the system will reset the EPN (EPN cold restart). After either type of restart, the faulty Tone-Clock circuit pack will be in standby mode.

   If the new Tone-Clock circuit pack is able to generate system clocks, there will be no system disruption.

8. Place several phone calls.

9. After replacing a Tone-Clock circuit pack in an SPE, if the SPE lock switches were set during the procedure, they should be released. Additionally, after repairs in an EPN, the **set tone-clock UUC** command should be used if required to make the preferred Tone-Clock circuit pack active.

Error Log Entries and Test to Clear Values

Table 9-743. Tone-Clock Circuit Pack Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test tone-clock PC sh
1(a)	0	Circuit pack removed or SAKI Sanity Test (#53)	MINOR	ON	
18(b)	0	busyout tone-clock PC	WARNING	OFF	release tone-clock PC
23(c)	0	None	WARNING	OFF	
125(d)		None	MINOR	ON	
126(e)		None	MINOR	ON	
257	65535	Control Channel Test (#52)	MINOR	ON	test tone-clock PC r 20
257(f)	Any	None			
513(g)	Any	None			
769(h)	4358	None			
1025(i)	4363	NPE Audit Test (50)			test tone-clock PC sh
1538(j)	Any	None	MINOR	ON	
2049(k)	0	Clock Health Inquiry Test (#46)	MAJOR	ON	set tone-clock PC override
2305(k)	0	Clock Health Inquiry Test (#46)	MAJOR	ON	set tone-clock PC override
2561(l)	Any	None	MAJOR	ON	
3329(m)	0	None	MINOR/ WARNING[2]	OFF	set tone-clock PC
3840(n)	Any	None			
3848(o)	0	Clock Health Inquiry Test (#46)			set tone-clock PC override
3872(p)	0	None			set tone-clock PC override
3999 (q)	Any	None			

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. Minor alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

a. Error Type 1—This error indicates the circuit pack totally stopped functioning or it was physically removed from the system.

NOTE:
The alarm is logged approximately 11-minutes after the circuit pack is removed/SAKI Sanity Test (#53) fails.

If the circuit pack is not present in the system, insert a circuit pack in the slot indicated by the error to resolve the error.

If the circuit pack is present in the system, it is faulty and must be replaced. See the preceding section, *How to Replace the Tone-Clock Circuit Pack*.

If the faulty circuit pack is in standby mode, a MINOR alarm is raised, but no other system action is taken. If the circuit pack is the active Tone-Clock, further effects of this error depend on the Reliability Option for the switch.

Table 9-744. Location of Tone-Clock Circuit Pack

Reliability Option	PPN	EPN
Standard	System Emergency Transfer (entire system affected)	Emergency Transfer in the affected EPN
High	Interchange to standby Tone-Clock in the PPN	Emergency Transfer in the affected EPN
Critical	Interchange to standby Tone-Clock in the PPN	Interchange to standby Tone-Clock in the affected EPN

If an interchange is attempted and the system is unable to activate the standby Tone-Clock, Emergency Transfer is activated. If the problem is in the PPN the entire system is affected. Otherwise only the EPN in question is affected. When this happens, both circuit packs are faulty and must be replaced. See the preceding section, *How to Replace the Tone-Clock Circuit Pack*.

If a successful interchange occurs in response to a failure of the active Tone-Clock, or if a standby Tone-Clock fails, the faulty Tone-Clock should be replaced.

b. Error Type 18—The indicated Tone-Clock circuit pack has been made unavailable via the **busyout tone-clock PC** command. This error applies only to High or Critical Reliability systems (an active Tone-Clock may not be busied out). To resolve this error, execute **release tone-clock PC**.

c. Error Type 23—The circuit pack has been logically administered but not physically installed. Installing the circuit pack will resolve the alarm.

d. Error Type 125—A wrong circuit pack is inserted in the slot where this circuit pack is logically administered. To resolve this problem, either remove the wrong circuit pack and insert the logically administered circuit pack OR use the **change circuit-pack** command to readminister this slot to match the circuit pack inserted.

e. Error Type 126—The port network specified in the PORT field of the error log entry booted up without a Tone-Clock circuit pack, or with a one that cannot communicate at all with the system. The error is logged five minutes after the port network is restarted. If no circuit pack is present, install one of the proper code. If there is a circuit pack present, replace it. See the preceding section, *How to Replace the Tone-Clock Circuit Pack*.

f. Error Type 257—This error indicates transient communication problems with this circuit pack. This error is not service-affecting and no action is required.

g. Error Type 513—This circuit pack has an on-board hardware failure. Replace the circuit pack using the procedure described in preceding section, *How to Replace the Tone-Clock Circuit Pack*.

h. Error Type 769—This error can be ignored, but look for other errors on this circuit pack.

i. Error Type 1025—This error is not service-affecting and no action is required.

j. Error Type 1538—The circuit pack was taken out of service because of an excessive rate of uplink messages. Use **test tone-clock PC long** to reset the circuit pack and put it back into service. If the command is not successful, replace the circuit pack using the procedure described in the preceding section, *How to Replace the Tone-Clock Circuit Pack*. If the alarmed circuit pack is the active Tone-Clock of a duplicated pair, first interchange Tone-Clocks via the **set tone-clock PC** command to avoid a service outage. If the error occurs again within 15 minutes, follow normal escalation procedures.

k. Error Type 2049 or 2305—These errors indicate the loss of one or more clock signals from the reported Tone-Clock circuit pack, which was active at the time of the error. The effect of any of these errors is described in the table for error type 1. Diagnosis of the problem is the same for all four error types, with the exception noted below.

    1. Examine the Hardware Error Log for errors reported against circuit packs in the same Port Network, especially TDM-CLK, TONE-BD, DUPINT, SW-CTL, and EXP-INTF. Follow the repair or replacement procedures indicated for any such errors found.

2. If the error is not corrected by resolving errors found in step 1, the Tone-Clock circuit pack should be replaced. See the preceding section, *How to Replace the Tone-Clock Circuit Pack*.

   NOTE:
   Replacing the circuit pack and retesting it with the **test tone-clock** command is not adequate to retire this alarm and return the Tone-Clock Circuit Pack to full service; the Clock Health Inquiry test (#46) will continue to fail. Because the ability to generate clocks was considered lost, once any repairs have been made it is necessary to execute the **set tone-clock PC override** command, forcing the circuit pack to become active. If the problem has not actually been corrected, this action may cause a disruption in service for active digital facilities users.

3. If error 2305 or 3848 persists, all clock signals from the indicated board were lost. If the reported Tone-Clock circuit pack is in a Port Network with duplicated Tone-Clocks, the problem may lie with the circuit pack responsible for selecting the active Tone-Clock circuit pack (the *t/c selector*).

   - For a PPN, the t/c selector is the DUPINT circuit pack on carrier A.
   - For an EPN, the t/c selector is the active EXP-INTF circuit pack that is connected to the PPN. This is EXP-INTF 2A01 or 2B02 for EPN1 and 3A01 or 3B02 for EPN2.

   The t/c selector circuit pack of interest is the one which was active at the time the error was logged. This is the currently active t/c selector unless there has been an SPE interchange for PPN problem, or an EXP-INTF link switch for EPN problem, In order to determine whether an interchange has occurred since the TONE-BD error, examine the **display initcauses** log for SPE interchanges, and EXP-LNK entries in the hardware error log for expansion link interchanges.

   If the t/c selector circuit pack was not replaced as part of the previous step, replace it now. Follow procedures described in "Replacing SPE Circuit Packs" in Chapter 5; Chapter 7, ‘‘LED Interpretation’’, for the DUPINT circuit pack, or in the EXP-INTF section of this chapter for the Expansion Interface.

4. If the error has not been corrected at this point, there is a problem with the TDM Bus within the Port Network containing the reported Tone-Clock circuit pack. This may include TDM Bus intercarrier cables, Bus terminators, bent pins on the backplane, and errors on any circuit pack plugged into the same Port Network. Refer to the TDM-BUS section.

l. Error Type 2561—This error indicates that a Tone-Clock circuit pack, with a different circuit pack code as required for this system, has been inserted in the port slot as shown in the Hardware Error Log. To resolve this error, refer to the "How to Replace the Tone-Clock Circuit Pack" section for an appropriate circuit pack code and replace the Tone-Clock circuit pack according to the procedures indicated for this system. The meanings of the aux data values are as follows:

1001	A TN756 Tone-Clock circuit pack is in the PPN of a one port network system without High or Critical Reliability (Multicarrier Cabinet).
1002	A TN756 Tone-Clock circuit pack is in the EPN of a one port network system without High or Critical Reliability (Multicarrier Cabinet).
1003	Either a TN741 or TN714 Tone-Clock circuit pack (instead of a TN768, TN780 or TN2182) is in a one port network system without High or Critical Reliability (Multicarrier Cabinet).
1004	Either a TN741 or TN714 Tone-Clock circuit pack (instead of a TN768, TN780 or TN2182) is in a High or Critical Reliability system.
1005	Same as for aux value 1004.

m. Error Type 3329—The system attempted but failed to interchange Tone-Clock circuit packs. (This error occurs only in Port Networks with duplicated Tone-Clocks.) The fault may lie in the standby Tone-Clock or in the circuit pack that controls selection of the active Tone-Clock (the *t/c selector*). The goal of the following procedure is to ensure that both Tone-Clocks can be interchanged into while either t/c-selector circuit pack is active.

1. Examine the Error Log for errors reported against circuit packs in the same Port Network, paying special attention to TDM-CLK, TONE-BD, DUPINT, SW-CTL, and EXP-INTF. Follow the procedures indicated for any such errors found. After eliminating the above potential problem sources, proceed with the following steps.
2. Determine which circuit pack was controlling the choice of Tone-Clock at the time the error occurred.
   - For a PPN, the t/c selector is the DUPINT circuit pack on the A-carrier.
   - For an EPN, the t/c selector is the active EXP-INTF circuit pack that is connected to the PPN. This is EXP-INTF 2A01 or 2B02 for EPN1 and 3A01 or 3B02 for EPN2.

   The t/c-selector circuit pack of interest is the one which was active at the time the error was logged. An EXP-LNK interchange since the time of the error may have made that circuit pack the current standby. Determine whether an interchange affecting the t/c selector has occurred since the TONE-BD error. When investigation an EPN Tone-Clock, look for EXP-LNK entries in the hardware error log for PNC interchanges, which would affect the EXP-INTF.

3. If the t/c selector has not undergone an interchange since the error occurred, go to the next step. If such an interchange has taken place, interchange back to the formerly active t/c selector. Use the **set expansion-interface** command when investigating an EPN Tone-Clock.) If the interchange attempt fails due to other errors, resolve those problems first.
4. Interchange the Tone-Clock circuit packs using the **set tone-clock PC** command. If the command succeeds, the interchange which previously failed has been accomplished and the problem has been satisfactorily resolved. If it fails, proceed to the next step. (You may want to proceed in any case to definitively test all relevant components.)
5. Interchange the t/c selector using **set expansion-interface** if investigating an EPN. If errors prevent this interchange, resolve them first.
6. Attempt again to interchange Tone-Clocks with the **set tone-clock PC** command.

— If the Tone-Clock interchange failed for both t/c selectors:

Replace the standby Tone-Clock circuit pack which could not be interchanged into and return to this step. (See *How to Replace the Tone-Clock Circuit Pack*.) Test the new circuit pack as follows:

a. Execute the set tone-clock PC command.
b. Execute a set expansion-interface, if this is an EPN Tone-Clock.
c. Execute the set tone-clock PC command again.

If these commands successfully complete, the problem has been resolved.

— If these commands successfully complete, the problem has been resolved.

— If the Tone-Clock circuit packs successfully interchange when one EXP-INTF is active, but not when the other one is:

The t/c-selector circuit pack on the failing side is suspect.

a. Replace the A carrier DUPINT or EXP-INTF board that is active when the Tone-Clock interchange fails. (Follow procedures in "Replacing SPE Circuit Packs" in Chapter 5 for the DUPINT circuit pack; for the Expansion Interface, see ‘‘EXP-INTF (Expansion Interface Circuit Pack)’’.)
b. Make sure the new t/c selector is active and execute the set tone-clock PC command.

— If both Tone-Clocks can be interchanged into, and interchanges succeed when either t/c selector is active, the problem has been resolved.

n. Error Type 3840—This error is not service-affecting and can be ignored. It indicates that the circuit pack has received a bad control message from the switch.

o. Error Type 3848—This error indicates that the Tone/Clock circuit pack had a loss of clock. If error 2305 is also logged, see note (j).

p. Error Type 3872—These errors indicate this Tone/Clock circuit pack had a loss of Data Clocks. This error will impact mainly users on station connected to Digital circuit packs. These users could be with out service. If error 2049 is also logged see note (i).

q. Error type 3999 indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *SAKI Reset Test* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
SAKI Reset Test (#53) (a)		X		D
Clock Health Test (#46)	X	X		ND
Control Channel Looparound Test (#52)(a)	X	X		ND
Tone Generator Crosstalk Test (#90) (b)		X		ND
Tone Generator Transmission Test (#40)(b)	X	X		ND
Tone Generator Audit/Update Test (#41)(b)	X	X		ND
TDM Bus Clock Circuit Status Inquiry Test (#148) (c)	X	X		ND
TDM Bus Clock Slip Inquiry Test (#149)(c)(e)	X	X		ND
TDM Bus Clock PPM Inquiry Test (#150)(c)	X	X		ND
TDM Bus Clock Parameter Update Test (#151) (c)	X	X		ND
Board Type Check Test (#574) (c)	X	X		ND
Standby Reference Health Check Test (#651) (c,d)		X		ND

1. D = Destructive; ND = Nondestructive

Notes:

a. Refer to XXX-BD for descriptions of these tests.

b. Refer to TONE-PT for descriptions of these tests.

c. Refer to TDM-CLK for descriptions of these tests.

d. This test runs only on the standby Tone-Clock circuit pack in a Port Network with duplicated Tone-Clocks (High or Critical Reliability systems). The circuit pack must be a TN780 with firmware version 2 or above.

Clock Health Inquiry Test (#46)

This inquiry reads special data stored in memory to determine if this Tone-Clock circuit pack had a loss of any of three clock types:

- SYSCLK
- SYSFM
- SYSDCLK

If this data indicates this Tone-Clock circuit pack had a loss of any of these clocks, the inquiry reports FAIL. In addition, if TDM-CLK error 1 is at threshold, this test will FAIL. TDM-CLK error 1 indicates a suspect clock is at the edge of its specified frequency. If the circuit pack did not have a loss of clock or TDM-CLK error 1 at threshold, the inquiry reports PASS.

This is not really a test, in the sense that it simply reports status held by the system, and does not generate new information or raise alarms. If this test fails with no error code, there is at least one Major alarm against a Tone-Clock circuit pack. If this test fails with an error code of 1, there is at least one Minor off-board alarm against a TDM-CLK.

Table 9-745. TEST #46 Clock Health Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error. 1. Retry the command at 11-minute intervals for a maximum of 5 times.
none	FAIL	This Tone-Clock circuit pack had an apparent loss of clock. One or more of error types 2049, 2305, 3834, and 3872 will appear in the error log. Correct the problem according to the appropriate error log entries. Once this test fails, the only way to make it pass, and to retire the associated alarm, is to repair the problem and to execute the **set tone-clock UUC override** command against the indicated Tone-Clock circuit pack.
1	FAIL	This Tone-Clock circuit pack is suspect of having a clock at the edge of its specified frequency. A Tone-Clock circuit pack with this problem can cause Expansion Interface circuit packs and SNI circuit packs to go out-of-frame or report no neighbor conditions, thus causing EPNs, Expansion Archangel Links (EALs), Remote Neighbor Links (RNLs), and/or Local Neighbor Links LNLs) to go down. 1. Replace the Tone-Clock circuit pack identified in the error log. Refer to the ''How to Replace the Tone-Clock Circuit Pack'' section.
	PASS	This Tone-Clock circuit pack has not reported a loss of clock.

TONE-PT (Tone Generator)

MO Name (in Alarm Log)	Alarm Level	Initial Command To Run[1]	Full Name of MO
TONE-PT	MAJOR	test tone-clock UUC short	Tone Generator
TONE-PT	MINOR	test tone-clock UUC short	Tone Generator
TONE-PT	WARNING	release tone-clock UUC	Tone Generator

1. UU is the universal cabinet number (1 for PPN, 2 -44 for EPNs). C is the carrier designation (A, B, C, D, or E).

NOTE:
Replacing the tone/clock circuit pack requires a special procedure which is described in the documentation for TONE-BD. That section also describes the LED display for this board.

The tone generator resides on the Tone/Clock circuit pack and provides all system tones such as dial tone, busy tone, and so on. If an active tone generator fails, its port network may not have tones (see the Tone Generator Transmission Test #40). For instance, a user may go off-hook and hear no dial tone. This problem will affect only users on the same port network in which the faulty Tone-Clock circuit pack resides. The system will be able to process certain type of calls (that is, internal calls will succeed while outgoing calls will not).

The Tone-Clock circuit pack also provides the clocks for the system and can serve as the synchronization reference. Therefore, when resolving alarms on the Tone-Clock circuit pack, the TDM-CLK (TDM Bus Clock) and SYNC (Synchronization) Maintenance documentation should be utilized as well as the TONE-BD (Tone-Clock Circuit Pack) Maintenance documentation.

See the section on TONE-BD Maintenance in this manual for a discussion of the relationship of Tone-Clock circuit packs with the various Reliability Options.

Error Log Entries and Test to Clear Values

Table 9-746. Tone Generator Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test tone-clock UUC r 1
1(a)	17664	Tone Generator Audit/	MAJOR/	ON	test tone-clock UUC r 2
		Update Test (#41)	MINOR[2]		
18(b)	0	busyout tone-clock UUC	WARNING	OFF	release tone-clock UUC
130(c)		None	MINOR	ON	test tone-clock UUC Sh
257(d,f)	17667	None	MINOR	ON	
513(e,f)	17666	Tone Generator Audit/ Update Test (#41)	MINOR	ON	test tone-clock UUC r 3
769	Any	Transmission Test (#40)	MAJOR/ MINOR[2]	ON	test tone-clock UUC r 3
1025		Crosstalk Test (#90)	MAJOR/ MINOR[2]	ON	test tone-clock UUC l r 2
1281(g)	Any	Tone Generator Audit/ Update Test (#41)	MINOR	ON	test tone-clock UUC r 3

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. MAJOR alarm if the alarmed Tone-Clock circuit pack is not duplicated; MINOR if it duplicated within the same Port Network.

Notes:

a. A failure in the tone generation facility on the indicated circuit pack has been detected. Replace the circuit pack. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.

b. The indicated Tone-Clock circuit pack has been made unavailable via the **busyout tone-clock UUC** command. It only applies to systems which have the High or Critical Reliability Option administered, because only a standby Tone-Clock circuit pack may be made busy by that command. To resolve this error, execute the **release tone-clock UUC** command for the alarmed circuit pack.

c. This error type indicates that the circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, reinsert or replace the circuit pack.

d. The tone generation facility is having problems verifying that tones have been connected as requested.

e. The tone generation facility may or may not be able to generate tones.

f. Infrequent errors, at a rate which does not bring up an alarm, probably do not affect service, unless there are customer complaints of no tones, or incorrect tones which can not be explained in any other way. However, if an alarm is raised because this error is being repeatedly logged, then the circuit pack should be replaced. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.

g. The system-parameters country-options administration are setup such that a TN780 or TN2182 are required and the existing tone-clock circuit pack will not provide the needed functionality. The Base Tone Generation Set on page 1 or the custom tones beginning on page 2 of the system-parameters country options form may have values not supported by the existing tone-clock.

   This error (1281) indicates that the system parameters country-options form has custom tones translated and that the alarmed tone board does not support the customized tones. TN768 tone boards do not support any customized tones. TN780 tone boards support up to 6 customized tones using the following frequencies/levels only:

   Silence

   350Hz at 17.25 dB

   425Hz at 4.0 dB

   425Hz at 11.0 dB

   425Hz at 17.25 dB

   440Hz at 17.25 dB

   350Hz+425Hz at 4.0 dB

   350Hz+440Hz at 13.75 dB

   480Hz at 17.25 dB

   620Hz at 17.25 dB

   440Hz+480Hz at 19.0 dB

   404Hz at 11.0 dB

   404Hz at 16.0 dB

   480Hz+620Hz at 24.0 dB

   404Hz+425Hz at 11.0 dB

   375Hz+425Hz at 15.0 dB

   404Hz+450Hz at 11.0 dB

   1000Hz at 0.0 dB

   1000Hz at +3.0 dB

   525Hz at 11.0 dB

   1400Hz at 11.0 dB

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *SAKI Reset Test* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
SAKI Reset Test (#53) (a)		X		D
Clock Health Test (#46) (b)	X	X		ND
Control Channel Looparound Test (#52) (a)	X	X		ND
Tone Generator Crosstalk Test (#90)		X		ND
Tone Generator Transmission Test (#40)	X	X		ND
Tone Generator Audit/Update Test (#41)	X	X		ND
TDM Bus Clock Circuit Status Inquiry Test (#148) (c)	X	X		ND
TDM Bus Clock Slip Inquiry Test (#149)(c)(e)	X	X		ND
TDM Bus Clock PPM Inquiry Test (#150) (c)	X	X		ND
TDM Bus Clock Parameter Update Test (#151) (c)	X	X		ND
Board Type Check Test (#574) (c)	X	X		ND
Standby Reference Health Check Test (#651) (c,d)		X		ND

1. D = Destructive; ND = Nondestructive

Notes:

a. Refer to XXX-BD (Common Port Circuit Pack) section for descriptions of these tests.

b. Refer to TONE-BD (Tone-Clock Circuit Pack) section for descriptions of these tests.

c. Refer to TDM-CLK (TDM Bus Clock) section for descriptions of these tests.

d. This test only runs on the Standby Tone-Clock circuit pack in a Port Network with more than one Tone-Clock circuit pack (High or Critical Reliability Option). The circuit pack must be a TN780 code with firmware revision 2 or above.

e. Test #149 does not run on the TN2182.

Tone Generator Transmission Test (#40)

The purpose of this test is to verify that the tone generation hardware on the tone-clock circuit pack is capable of generating a subset of system tones and a set of test tones. This test does not verify all system tones the tone generator produces during normal system operation.

The test is performed in two parts. For the first part, the Tone Generator is told to generate the touch-tone digits. The digits are received and checked by a Tone Detector touch-tone detector. If any of the digits fail, the test is repeated using a touch-tone detector in another Tone Detector circuit pack.

For the second part, the Tone Generator is told to generate call progress tones that are detected and identified by a tone detector. These tones are:

- 440 Hz
- 2225 Hz
- Digital Count

The tone generator is then told to generate a sequence of test tones whose output levels are measured by a tone detector. These tones are:

- 404 Hz at 0 dB
- 1004 Hz at -16 dB
- 1004 Hz at 0 dB
- 2804 Hz at 0 dB

A Tone Detector general purpose tone detector listens for the tones and measures the quality of the tone. If any of the measured values are not within limits, the test is repeated using a general purpose tone detector in a different Tone Detector circuit pack. If the values are still out of the limits, the test will fail.

For all the failure cases of Test #40, do the following:

1. Check that all Tone Detector circuit packs have the same companding mode as that administered for the system. Correct the situation if there is a mismatch.
2. Run the long test sequence: **test tone-clock PC long repeat 1**.
3. If the problem persists, replace the Tone-Clock circuit pack by following the steps outlined in the ‘‘How to Replace the Tone-Clock Circuit Pack’’ section

Table 9-747. TEST #40 Tone Generator Transmission Test

Error Code	Test Result	Description/ Recommendation
None	ABORT	The system was not able to allocate all the resources needed for this test or there was an Internal system error.
1	ABORT	The system could not allocate all the resources needed to test the DTMF tones.
1001	ABORT	The system was not able to put the tone generation facility in the appropriate mode to test it.
1002	ABORT	The system could not allocate time slots for the test connection. This can happen when the system is heavily loaded. If the system is not heavily loaded, then test the TDM Bus via the **test tdm port-network PN#** command. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test connection. This can happen when the system is heavily loaded or there is not a Tone Detector circuit pack in the port network where this test is being executed. 1. Make sure there is a Tone Detector circuit pack in the same port network. 2. If a Tone Detector circuit pack is missing, install one in the same port network. 3. Allow approximately 1-minute for Tone Detector maintenance to run on the newly inserted Tone Detector circuit pack. 4. Retry the command at 1-minute intervals a maximum of 5 times.
1022	ABORT	[G3r V2] Tone detection for the system is administered as wide broadband (tone detection mode 5), and the Tone Detector used for this test was not a TN420C. (the only circuit packs with this capability). GPTD ports on other types of Tone Detector circuit packs are taken out of service since they cannot provide the administered function. 1. Change the tone-detection mode administered on the system-parameters country-options form (see *DEFINITY Communications System Generic 3 V2 Implementation,* 555-230-653, Or 2. Remove all non-TN420C circuit packs from the system.
2000	ABORT	Response to the test request was not received within the allowable time period. System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1 (a)	FAIL	DTMF generation failed for the active tone generator.

Continued on next page

Table 9-747. TEST #40 Tone Generator Transmission Test — *Continued*

Error Code	Test Result	Description/ Recommendation
105 (a)	FAIL	Generation of 440-Hz failed.
109 (a)	FAIL	Generation of 2225-Hz failed.
110 (b)	FAIL	Generation of 404-Hz level invalid.
111 (b)	FAIL	Generation of 1004-Hz low level invalid.
112 (b)	FAIL	Generation of 1004-Hz high level invalid.
113 (b)	FAIL	Generation of 2804-Hz level invalid.
115 (b,c)	FAIL	Generation of digital count sequence invalid.
120 (a)	FAIL	Generation of quiet tone failed.
1044 (a)	FAIL	DTMF generation failed to generate Digit 1 for the standby tone generator.
1045 (a)	FAIL	DTMF generation failed to generate Digit 5 for the standby tone generator.
1046 (a)	FAIL	DTMF generation failed to generate Digit 9 for the standby tone generator.
1047 (a)	FAIL	DTMF generation failed to generate Digit D for the standby tone generator.
	PASS	The tone generation facility is able to generate and transmit all the tones.

Notes:

Except in Port Networks containing more than one Tone-Clock circuit pack, replacing the circuit pack is a service disrupting procedure. The test should be run several times with more than one failure before the replacement policy specified in the following notes is executed. Use the procedure described in *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.

a. All the failure error codes marked with (a) may affect users if the failure is on the active tone generator. When this type failure is detected, the system will attempt to move the tone generation function to the alternate Tone-Clock circuit pack, if one is present in the affected Port Network. When the tone generation facility fails in this way, especially in a Port Network without duplicated Tone-Clock circuit packs, the faulty Tone-Clock should be replaced promptly.

b. All the failure error codes marked with (b) are almost transparent to the user. Again, when this type failure is detected, the system will attempt to move the tone generation function to the alternate Tone-Clock circuit pack, if one is present in the affected Port Network. Users may or may not hear any noisy tones. This type of failure affects maintenance on other objects. Maintenance may not be able to run on other objects which use the tone generation facility (that is, Tone Detector Circuit Pack maintenance). In this case, the Tone-Clock circuit pack can be replaced as suitable to the customer.

c. Error code 115 may also be caused by TDM Bus corruption. This normally means a physical problem with bent backplane pins, TDM/LAN Bus cabling, or TDM/LAN Bus terminators. Such physical problems should especially be suspected if board replacement or other physical activity has occurred just before this error is observed.

   Use **display errors** to look for errors on other circuit packs in the carriers of the same Port Network as the indicated Tone-Clock. If any are found, they should be resolved if possible, and the Tone-Clock circuit pack retested. If this does not clear the problem, the Tone-Clock circuit pack should be replaced and the new one tested. If the problem persists, follow instructions for TDM Bus maintenance in this manual.

Tone Generator Update/Audit Test (#41)

The active tone generation facility is refreshed with all the time slot tone information. This test also triggers in-line error messages the Tone-Clock circuit pack generates when it detects problems by itself.

A check is also made between the type of tone-clock being tested and the type of tone-clock needed based on system administration. The administration on the system-parameters country-options form may imply that a TN780 is required.

Table 9-748. TEST #41 Tone Generator Update/Audit Test

Error Code	Test Result	Description/ Recommendation
none	ABORT	The system was not able to allocate all the resources needed for this test.
2100	ABORT	System resources required for this test are not available.
1	FAIL	The system requires a TN780 tone-clock to support the administered country-options tone generation parameters. 1. Check the administration on the system-parameters country-option form. Specifically, the Base Tone Generation Set on page 1 and any custom tone administration beginning on page 2. 2. Replace existing tone-clock circuit packs with TN780.
	PASS	The tone generation facility has been successfully refreshed with its time-slot translation and system administration is consistent with this type of tone-clock. 1. Display the Hardware Error Log via the **display errors** command to make sure this circuit pack did not generate new errors.

Tone Generator Crosstalk Test (#90)

This test checks the ability of the Tone Generator to talk on a specific time slot. The tone generator is told to talk on a specific time slot. The other idle time slots are checked to make sure the Tone Generator put the tone on only the specified time slot.

Table 9-749. TEST #90 Tone Generator Crosstalk Test

Error Code	Test Result	Description/ Recommendation
None	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	The system was not able to put the tone generation facility in the appropriate mode to test it.
1002	ABORT	The system could not allocate time slots for the test connection. This can happen when the system is heavily loaded. If the system is not heavily loaded, then test the TDM-BUS via the **test tdm port-network PN#** command.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The Tone Generator could be defective. In a Port Network with more than one Tone-Clock circuit pack, the system will attempt to move the tone generation function to the alternate one. 1. Test the Tone-Clock circuit pack again via the **test tone-clock UUC** command. 2. If the test fails again, look at the Hardware Error Log for Tone Detector circuit pack errors. 3. If there are Tone Detector circuit pack errors, refer to Tone Detector Maintenance documentation (DTMR-PT, GPTD-PT, CLAS-PT, ETR-PT) to resolve these errors first. 4. If there are no Tone Detector circuit pack errors, then the Tone-Clock circuit pack should be replaced. See *How to Replace the Tone-Clock Circuit Pack* in the TONE-BD section.
	PASS	The tone generation facility is able to put tones out.

TR-LN-BD (Trunk Line Board)

The TN797 Analog Trunk and Line circuit pack provides 8 ports, any of which may be administered as one of the folowing:

Table 9-750. TN797 Analog Trunk and Line circuit pack – port administration

Function	Group Type	Trunk Type	LED MWI
Central Office trunk (CO)	co fx wats	loop start ground start	
CAMA/E911 trunk	cama		
Direct Inward Dialing (DID) trunk	did	wink start immed start	
Analog Line on-or-off premises	n/a	n/a	with/ without MWI

In the U.S., Canada, and like countries, all CO trunk ports of TN797 Analog Trunk and Line circuit pack should be administered as ground start (GS) trunks rather than as loop start trunks, because GS signaling provides disconnect supervision, and loop start does not. If for some reason, a port on the TN797 must be administered as loop start, it must be administered as one-way only – either incoming or outgoing – not only at the DEFINITY switch, but also at the CO switch. This is necessary to avoid collisions, i.e., “glare”, and other highly undesirable conditions.

The TN797 Analog Trunk and Line circuit pack does not support Neon Lamp Message Waiting Indication (MWI). No maintenance of the terminal connected to the Neon Analog Line circuit pack is performed.

For circuit pack problems, refer to the “XXX-BD (common port circuit pack)” maintenance documentation.

TSC-ADM (Administered Temporary Signaling Connections)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
TSC-ADM	none	none	Administered Temporary Signaling Connections

No alarms are generated for Administered Temporary Signaling Connections (TSC-ADM, also called ADM TSCs).

Administered temporary signaling connections provide a path through ISDN-PRI networks for supplementary D-channel messages. ISDN-PRI applications such as the Distributed Communications System (DCS) use temporary signaling connections to exchange user information across an ISDN-PRI network. What makes Administered TSCs unique is that these particular TSCs stay active for an extended period of time, similar to a permanent data connection. These ADM TSCs are used for DCS features that require Non-Call Associated (NCA) TSCs, and the ADM TSC provides the logical channel function in a DCS network.

An NCA TSC is a virtual connection established within a D-channel without associating any B-channel connections. The connection provides user-to-user service by exchanging USER INFORMATION messages without associated B-channel connections.

An Administered TSC is a special NCA TSC defined for the DCS over the ISDN-PRI D-channel. The ADM TSC has an administratively defined endpoint and is established for an extended period of time.

There are two types of ADM TSCs:

- Permanent

  These are established by the originating PBX (Near-end ADM TSC) or by the terminating PBX (Far-end ADM TSC). Once these ADM TSCs are established, they remain active.

- As-Needed

  These are established only when needed.

ADM TSC maintenance provides a strategy to verify that a far-end can respond to an ISDN-PRI USER INFORMATION TSC heartbeat message, thereby indicating that user-user signaling is functioning. In addition, maintenance can retrieve the status of the ADM TSC's connection state.

Since ADM TSCs are administered on a per signaling group basis, the health of an ADM TSC also depends on the state of the D-channel or D-channel pair administered per signaling group. Refer to ISDN-SGR documentation for details on ISDN-PRI NFAS and D-channel Backup maintenance.

The two administration commands for ADM TSCs are as follows:

- **add signaling group** number
- **change signaling group** number

The two maintenance commands for ADM TSCs are as follows:

- **test tsc-administered signaling group** number [/tsc index]
- **status tsc-administered signaling group** number [/tsc index]

Error Log Entries and Test to Clear Values

Table 9-751. ADM TSC Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3840-3967 (a)	tsc index #	test tsc-administered			

Note:

a. There is no Test to Clear Value for error types 3840-3967. These error types provide the following additional data that may prove useful when tracking down problems.

   Any of these errors indicates that a TSC Heartbeat Inquiry Test was run on an active far-end Administered TSC from the switch. Upon receiving the heartbeat message, the network communicated that the call was unable to complete. As a result, the error was logged. Check the signaling group status of the D-channel or D-channel pair via the **status signaling-group <group>** command for the Administered TSC. Check the status of the Administered TSC via the **status tsc-administered** command. Also check the administration of the Administered TSC on the switch.

   This error may only be affecting service for some DCS customers. Upon receipt of this error condition, the switch will tear down and re-establish the ADM TSC within 20 minutes.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *TSC Heartbeat Inquiry Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
TSC Heartbeat Inquiry Test (#604)			ND

1. D = Destructive; ND = Nondestructive

TSC Heartbeat Inquiry Test (#604)

This test can be invoked by system technician personnel for any ADM TSC administered in the switch. Most of the error conditions on the following table will not log an error, but switched services may take some type of recovery action in certain instances.

This test sends a USER INFORMATION TSC heartbeat message inquiry across an ADM TSC to determine if the far-end can respond to a USER INFORMATION TSC heartbeat message.

Table 9-752. TEST #604 TSC Heartbeat Inquiry Test

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Reissue the **test tsc-administered** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	The Administered TSC does not exist. 1. Display the administration for the Administered TSC. 2. If an Administered TSC exists, reissue the **test tsc-administered** command.
1113	ABORT	The D-channel is out-of-service. 1. Refer to the “ISDN-LNK”.

Continued on next page

Table 9-752. TEST #604 TSC Heartbeat Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1145	ABORT	There is congestion in the network. 1. Issue the **status tsc-administered** command at 1-minute intervals a maximum of 5 times. 2. If the congestion does not clear, disable and enable the Administered TSC via the **change sig-group <group>** command. **NOTE:** To disable the Administered TSC, display the (administration) Signaling Group Form via the **change sig-group <group>** command where <group> refers to the number of the signaling group under which the suspect TSC is administered. Change the Enable field to ''n.'' To enable the ADM TSC, change the ''Enable'' field to ''y.'' 3. If the congestion still does not clear, check other nodes in the network.
1146	ABORT	The congestion just occurred in the network. 1. Issue the **status tsc-administered** command at 1-minute intervals a maximum of 3 times. 2. If congestion does not clear, disable and enable the Administered TSC via the **change sig-group <group>** command. **NOTE:** To disable the Administered TSC, display the (administration) Signaling Group Form via the **change sig-group <group>** command where <group> refers to the number of the signaling group under which the suspect TSC is administered. Change the Enable field to ''n.'' To enable the ADM TSC, change the ''Enable'' field to ''y.'' 3. If congestion still does not clear, check the other nodes in the network.
1147	ABORT	The ADM TSC is being torn down. 1. Issue the **status tsc-administered** command at 1-minute intervals a maximum of 3 times. 2. If ADM TSC is still down, disable and enable the ADM TSC via the **change sig-group <group>** command. **NOTE:** To disable the ADM TSC, display the (administration) Signaling Group Form via the **change sig-group <group>** command where <group> refers to the number of the signaling group under which the suspect TSC is administered. Change the Enable field to ''n.'' To enable the ADM TSC, change the ''Enable'' field to ''y.'' 3. If the ADM TSC is still down, check the other nodes in the network.

Continued on next page

Table 9-752. TEST #604 TSC Heartbeat Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1148	ABORT	The ADM TSC is enabled, but inactive (near-end). 1. Disable and enable the ADM TSC. 2. Reissue the **test tsc-administered** command. 3. If the ADM TSC is still inactive, check the other nodes in the network.
1149	ABORT	The ADM TSC is disabled. 1. Enable the TSC, and see if the status indicates ‘‘active.’’ 2. Reissue the **test tsc-administered** command. 3. If the TSC still disabled, remove the ADM TSC from the system.
1181	ABORT	Ran out of ADM TSC resources. 1. Reissue the **test tsc-administered** command at 1-minute intervals a maximum of 3 times.
1182	ABORT	The BX.25 link is down at the gateway. 1. Disable the ADM TSC. 2. Check the status of the gateway link via the **status link link-no** command. 3. Once the gateway link indicates an ‘‘in-service’’ state, enable the Administered TSC. 4. Reissue the **test tsc-administered** command.
2000	ABORT	The Administered TSC is not responding to a TSC heartbeat inquiry. 1. Retry the **test tsc-administered** command at 1-minute intervals a maximum of 3 times. 2. If the problem continues to fail, obtain the status of the D-channel or D-channel pair associated with the ADM TSC via the **status sig-group <group>** command. If the D-channel is INS (i.e., in-service) and the status of the ADM TSC appears to be active, then disable and enable the ADM TSC through administration. **NOTE:** To disable the ADM TSC, display the (administration) Signaling Group Form via the **change sig-group <group>** command where <group> refers to the number of the signaling group under which the suspect TSC is administered. Change the ‘‘Enable’’ field to ‘‘n.’’ To enable the ADM TSC, change the ‘‘Enable’’ field to ‘‘y.’’ 3. Reissue the **test tsc-administered** command. 4. If the test fails, check the ADM TSC node on the other side of the network to verify that the ADM TSC is indeed active.

Continued on next page

Table 9-752. TEST #604 TSC Heartbeat Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Internal system error. 1. Reissue the **test tsc-administered** command at 1-minute intervals a maximum of 5 times.
1	FAIL	The Administered TSC is not active (far-end). 1. Reissue the **test tsc-administered** command. 2. Verify that the Administered TSC node on the other side of the network is active. 3. Disable and enable the Administered TSC. 4. Retry the **test tsc-administered** command.
2	FAIL	Facility IE (Information Element) reject. 1. Check all other nodes in the network, and make sure Administered TSC is active.
	PASS	The Administered TSC responded to a heartbeat.

TTR-LEV (TTR Level)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
TTR-LEV	WARNING	1	TTR Level
TTR-LEV	MINOR	1	TTR Level
TTR-LEV	MAJOR	1	TTR Level

1. See Repair Procedure for the TTR-LEV below.

TN748 and TN420 Tone Detector circuit packs and TN744 Call Classifier circuit packs provide tone receivers for detecting various types of signaling tones. These circuit packs are shared resources that serve all users of the PBX. This discussion uses the following terms and abbreviations (note that the maintenance-related system parameters form uses different names than the alarm and error logs):

Type of Tone Receiver	Maintenance Object	Also Known As	Alternate Abbreviation	Location
Dual-tone Multifrequency Tone Receiver	DTMR-PT	Touch Tone Receiver	TTR	4 per TN420/TN748
General Purpose Tone Detector	GPTD-PT	Call Progress Tone Receiver	CPTR	2 per TN420/TN748
Call Classifier	CLSFY-PT		CCTR	8 per TN744

TN748s and TN420s each have 4 DTMR-PTs and 2 GPTD-PTs. DTMR-PTs interpret dual-tone multifrequency (DTMF) calling signals and translate them into logical digits 0 through 9, *, and #. GPTD-PTs detect call progress tones, modem answer tones, and transmission test tones.

TN744 Call Classifier circuit packs have 8 CLSFY-PTs. These ports detect DTMF tones and classify network and MFC (multifrequency compelled) signaling tones. (That is, CLSFY-PTs can function as DTMR-PTs or GPTD-PTs, and have other additional capacities).

When a user goes off-hook to place a call, dial tone is returned to the user, indicating that a tone detector is connected and ready to receive and interpret tones. The tone detector is in use until the total number of digits needed is collected or until a time-out occurs. If all tone detectors in the system are being used simultaneously, the next user to go off-hook will not receive dial tone until a tone detector becomes available. It is therefore necessary to have a sufficient number of tone detectors in the system to prevent delays in receiving dial tone. The **list measurements tone-receiver** command shows the level of tone detector usage. For more information on this command, refer to the following documents:

- *DEFINITY Enterprise Communications Server Release 5.4 Administration and Feature Description*
- *DEFINITY Communications System Generic 3 V2 Traffic Reports,* 555-230-511

In order to prevent dial-tone delays and other shortcomings in system performance, threshold levels for the 3 types of tone receivers are administered on the **change system-parameters maintenance** form. Whenever the number of tone receivers in service falls below the administered threshold for that type of tone receiver, an alarm is logged against the TTR Level maintenance object. At this point, the system is operating properly, but call processing capacity is reduced. Another alarm is logged if the number falls to zero. At this point, system operation is severely compromised.

Typical causes of these events are:

1. The threshold for GPTD-PTs or DTMR-PTs is administered incorrectly on the maintenance-related system parameters form.
2. Too many GPTD-PTs, DTMR-PTs, or CLSFY-PTs have been taken out of service, possibly by maintenance software or a demand busyout.
3. A tone detector circuit pack has been removed or suffered a fatal failure, resulting in the loss of all its ports.
4. The system has an insufficient number of TN748/TN744/TN420 circuit packs.

Repair Procedure for TTR-LEV

To resolve a TTR-LEV alarm:

1. **Display errors** and use the TTR-LEV Error Log Table to determine which type of tone receiver has fallen below its threshold.
2. Enter **change system-parameters maintenance**, and check the administered value. On the form, TTR represents DTMR-PTs, CPTR represents GPTD-PTs, and Call Classifier represents CLSFY-PTs. If the threshold value is set too high, change it to a lower value and wait a minute for the alarm to clear.

   To determine the correct thresholds, first find the total number of TN478/TN420 Tone Detector and TN744 Call Classifier circuit packs in the system using the **list configuration** command. Then calculate the total number of tone receiver ports of each type. Each Tone Detector circuit pack has 4 TTR (DTMR) ports and 2 CPTR (GPTD) ports. Each TN744 Call Classifier circuit pack has 8 Call Classifier (CLSFY-PT) ports.

   For each type of tone receiver, if the total number of ports installed in the system is less than the administered threshold, then either add more circuit packs to the system or reduce the threshold to match the number already in the system. If the TTR Level alarm is still present, then proceed to Step 3.
3. **Display errors** for error type 18 and look for GPTD-PTs, DTMR-PTs, or CLSFY-PTs that have been busied out.

   For each of the busied-out ports:

   - Determine why the port was busied out.
   - If the port can be placed back into service, then test the port via the **test port UUCSSpp** command.
   - If all tests pass, **release port** and wait 1-minute for the TTR Level alarm to clear.

   If this does not clear the TTR Level alarm, proceed to Step 4.
4. **Display alarms** and determine the location of the circuit pack with the alarmed GPTD-PT, DTMR-PT, or GPTD-PT.

   Test board UUCSS long rep 3 for that circuit pack.

   If this does not clear the TTR Level alarm, replace the Tone Detector or Call Classifier circuit pack with the alarmed GPTD-PT, DTMR-PT or CLSFY-PT.

Error Log Entries and Test to Clear Values

Table 9-753. TTR Level Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	1	None			
2 (b)	2		WARNING (See WARNING message below)	OFF	
3 (c)	3	None			
4 (d)	4		WARNING	OFF	
5 (e)	5	None			
6 (f)	6		WARNING	OFF	
7 (g)	7		MAJOR	OFF	
8 (h)	8		MINOR	OFF	
9 (i)	9		MINOR	OFF	

WARNING:
The Alarm is upgraded to MAJOR if the Base Tone Generator is set to 12 (France).

Notes:

a. Error code 1 does not indicate a current error condition. It indicates that the number of DTMR ports in service was below the administered threshold, but is now equal to or greater than the threshold. These errors are typically generated during boot time or other transitional states when the ports are being brought into service.

b. The total number of DTMR ports currently in service is below the administered threshold. To clear the alarm, refer to the repair procedure described above.

c. Error code 3 does not indicate a current error condition. It indicates that the number of GPTD ports in service was below the administered threshold, but is now equal to or greater than the threshold. These errors are typically generated during boot time or other transitional states when the ports are being brought into service.

d. The total number of GPTD ports currently in service is below the administered threshold. To clear the alarm, refer to the repair procedure describe above.

e. Error code 5 does not indicate a current error condition. It indicates that the number of Call Classifier ports (CLSFY-PT) service was below the administered threshold, but is now equal to or greater than the threshold. These errors are typically generated during boot time or other transitional states when the ports are being brought into service.

f. The total number of Call Classifier ports (CLSFY-PT) currently in service is below the administered threshold. To clear the alarm, refer to the repair procedure described above.

g. There are currently no DTMR ports in service. To clear the alarm, refer to the repair procedure described above.

h. There are currently no GPTD ports in service. To clear the alarm, refer to the repair procedure described above.

i. There are currently no Call Classifier ports (CLSFY-PT) in service. To clear the alarm, refer to the repair procedure described above.

UDS1-BD (UDS1 Interface Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
UDS1-BD	MAJOR	test board UUCSS sh	UDS1 Interface Circuit Pack
UDS1-BD	MINOR	test board UUCSS l	UDS1 Interface Circuit Pack
UDS1-BD	WARNING	test board UUCSS sh	UDS1 Interface Circuit Pack

1. UU is the universal cabinet number (1 for PPN, 2 - 44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21).

2Mbit Japan trunk (TN2242)

The TN2242 2Mbit, 30-port trunk circuit pack supports Japanese TTC private networking environments. This circuit pack interfaces only with network equipment or other circuit packs of the same model and is incompatible with all other digital trunk circuit packs.

The maintenance strategy for the TN2242 is similar to that of the TN464F or later suffix DS1 interface circuit pack. The TN2242 circuit pack is functionally the same as the TN464F (without ICSU) with the following exceptions:

- The Blue Alarm Inquiry Test (#139) always passes for the TN2242
- The **test ds1-loop** command is not executed for the TN2242
- When **reset board** is run on a TN2242, a different initialization message is sent for the local looparound test (Test #135) is executed
- Since an Integrated Channel Service Unit (ICSU) is not supported on this circuit pack, tests associated with an ICSU are not executed,
- Tests associated with new functionality available with the video-enabled TN464F are not executed for the TN2242
- Cyclical Redundancy Check (CRC) is not defined for this circuit pack
- The D-Channel can be user-assigned to any port 1 - 30, when the signaling mode is ISDN-PRI
- Wideband is not supported
- Stations (OPS) are not supported

The TN2242 circuit pack also supports specialized versions of CAS (Channel Associated Signaling) and ISDN-PRI signaling that pertain to the TTC private networking environment in Japan.

Upgrading to TN2242

Figure 9-112 shows the hardware connections for public network access in Japan. The upgrade procedure requires removing the JRC (Japan Radio Corporation) external converter.

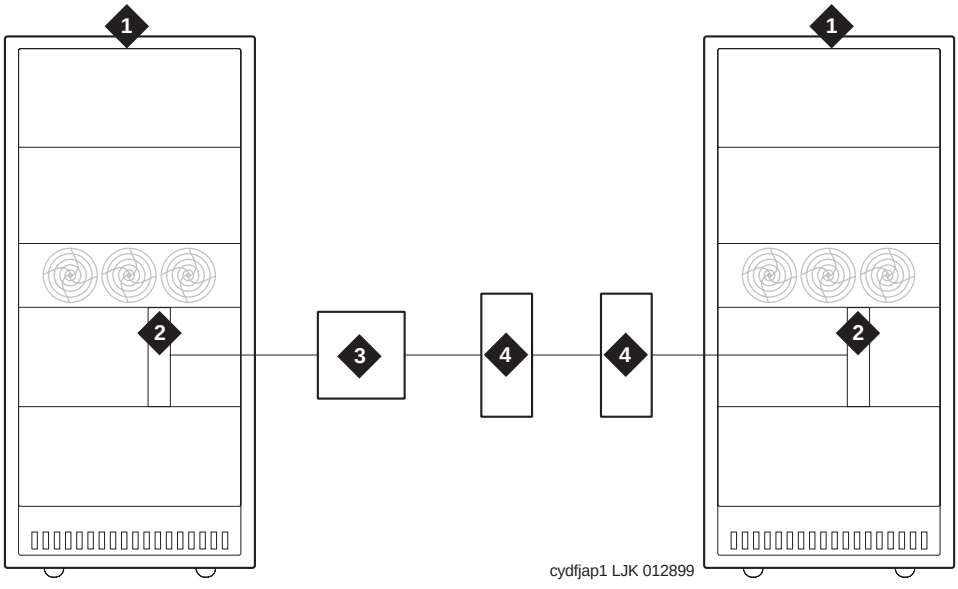

Figure Notes:

1. DEFINITY Release 7
2. UDS1-BD DS1-CONV circuit pack (24-trunk digital tie-trunk)
3. JRC (Japan Radio Corporation) external converter
4. TDM facilities

Figure 9-112. Japanese TTC public network connections

Figure 9-113 shows the hardware connections for private network access using the TN2242 circuit pack.

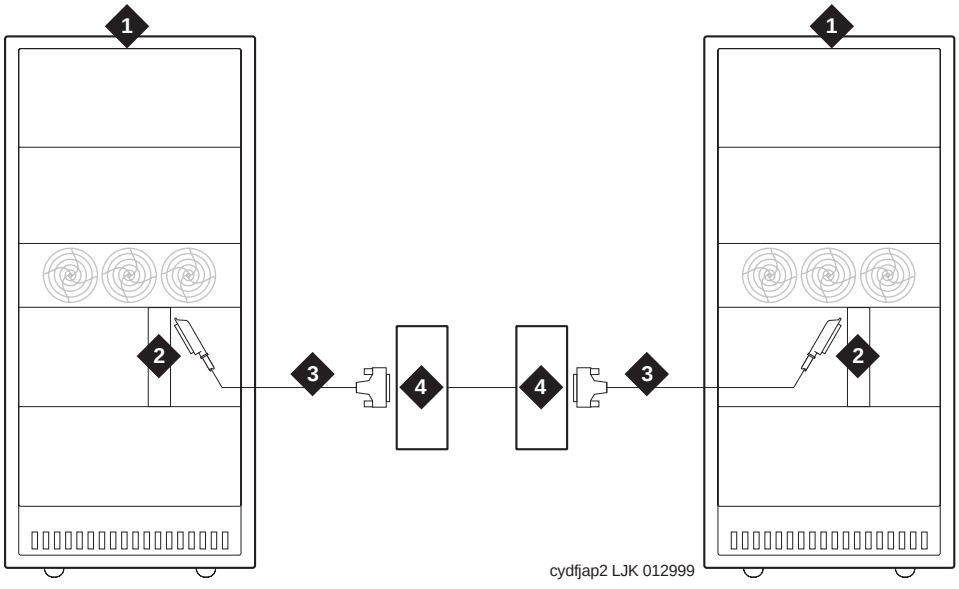

Figure Notes:

1. DEFINITY Release 7
2. TN2242 2Mbit Japan trunk circuit pack
3. H600-513 cable assembly cable. (See ‘‘H600-513 cable pinout’’).
4. TDM facilities

Figure 9-113. TN2242 Japan trunk TTC private network connections

To upgrade a system to the TN2242 circuit pack:

1. Busyout the UDS1-BD DS1-CONV circuit pack (**busyout board UUCSS**).
2. Remove the TN464 administration (**change circuit pack, change ds1**, and **change trunk group *n***).
3. Remove the UDS1-BD circuit packs.
4. Remove the JRC (Japan Radio Corporation) external converter and cable.
5. Insert the TN2242 circuit packs.
6. Connect the TN2242 to the TDM with the H600-513 cable assembly.
7. Administer the TN2242 circuit pack (see ‘‘Administration’’).

H600-513 cable pinout

Table 9-754 shows the pinout for the H600-513 cable assembly:

Table 9-754. H600-513 cable assembly pinout

TN2242			TDM	
50-pin connection pin number	**Color**	**Lead Designation**	**Color**	**15-pin connection pin number**
22	W-BL	Line in +	W-BL	4
23	W-O	Line out -	W-O	9
47	Bl-W	Line in -	Bl-W	11
48	O-W	Line out +	O-W	2

Administration

The TN2242 circuit pack requires board-level translation data. Before administering any ports on the circuit pack, administer the following forms:

- Circuit pack (**change circuit pack**)
- DS1 (**add ds1**)
- Trunk group (**add trunk group *n***)

  Table 9-755 outlines the trunk group administration parameters that are required for this interface to operate successfully in Japan.

Table 9-755. TN2242 administration

Field	Value
Trunk Group form, Page 1	
Trunk Type (in/out)	wink, delay, immed (all permutations)
Trunk Signaling Type	blank
Answer Supervision Timeout	0
Receive Answer Supervision	y
Disconnect Supervision - In?	y
Disconnect Supervision - Out?	y

Continued on next page

Table 9-755. TN2242 administration — *Continued*

Field	Value
Incoming Dial Type	tone rotary mf (to other DEFINITYs only)
Wink Timer for wink type	300
Wink Timer for delay type	4500
Trunk Group form, Page 3 (Administrable Timers)	
Incoming Disconnect	100
Incoming Glare Guard	800ms or higher
Incoming Dial Guard	10
Incoming Incomplete Dial Alarm	25 or higher
Incoming Partial Dial	18
PPS	10 or 20
Make (for PPS 10)	35
Break (for PPS 10)	65
Make (for PPS 20)	15
Break (for PPS 20)	35
Outgoing Disconnect	100
Outgoing Glare Guard	800 or higher
Outgoing Rotary Dial Interdigit	800
Outgoing Seizure Response	5

LEDs

The LEDs on the faceplate of the TN2242 circuit pack indicate its status as described in Table 9-756.

Table 9-756. TN2242 LED interpretation

LED	Meaning
Red	■ MAJOR alarm ■ MINOR alarm ■ Firmware initialization during circuit pack insertion
Yellow	A port on the circuit pack is in use.
Green	Maintenance testing is in progress on the circuit pack or its ports.

Interactions with other MOs

The TN2242 maintenance object directly interacts with these maintenance objects:

- ‘‘Synchronization’’
- ‘‘TN2242 trunk ports’’
- ‘‘Call processing’’

Synchronization

The DS1 facility plays a vital role in the synchronization subsystem. The Tone/Clock circuit pack uses either the primary or secondary timing reference, whether internal (local -- Tone/Clock circuit pack) or external. TN2242 circuit packs can be administered as “primary” or “secondary” synchronization references.

The TN2242 circuit pack sends DS1 link status information to the synchronization reference switching algorithm. This algorithm determines whether timing references should be switched due to failure or restore conditions.

TN2242 trunk ports

The TN2242 circuit pack MO is responsible for monitoring the health of the DS1 facility. If a DS1 facility goes down, then that facility’s DS1 circuit pack instructs all DS1 port MOs associated with the facility to place their trunks (or ISDN-PRI signaling link) in an out-of-service state.

Call processing

The **busyout board** command tears down all calls and signaling links associated with a TN2242 circuit pack.

TN2242 serviceability

Hardware connections

This circuit pack can be

- Mated to another circuit pack of the same type when interconnecting two DEFINITY systems
- Directly connected to the TDM network device
- Directly connected to another vendor PBX using ISDN PRI signaling

Loopbacks

There is no automatic process to signal the remote end to provide loopbacks for testing purposes. All loopbacks to be tested with a single circuit pack must be local loopbacks on the circuit pack.

Remote loopbacks may be possible with the TDM network equipment with appropriate coordination between BCS Services Technicians and the service technicians of the TDM equipment (considered a CPE device).

TN464GP/TN2464BP UDS1 Circuit Packs With Echo Cancellation

The TN464GP and TN2464BP UDS1 circuit packs feature an integrated echo canceller. Echo cancellation is a Software Right-To-Use feature that can be turned as needed. Echo cancellation supports channels carrying voice and is not intended for channels that support data. The TN464GP/TN2464BP will have the capability to detect modem tone and turn off echo cancellation accordingly for the duration of a data call. Echo cancellation on the TN464GP/TN2464BP will be administrable per channel. The echo cancellation circuitry on a given TN464GP/TN2464BP is driven by administrable parameters.

The TN464GP/TN2464BP circuit packs are intended for use with ATM, IP, wideband, or other complex services which are likely to have problems with echo.

The echo cancellation circuitry on a given TN464GP/TN2464BP is a right-to-use feature activated on the System-Parameters Customer-Options form. Also on this form is a field `Maximum Number of DS1 Boards with Echo Cancellation` that indicates the number of DS1 boards on which echo cancellation is activated for a specific customer.

The DS1 CIRCUIT PACK form for the TN464GP/TN2464BP circuit packs has fields to support echo cancellation: `Echo Cancellation?`, `EC Direction`, and `EC Configuration`. The `Echo Cancellation?` field displays only if the Echo Cancellation feature has been activated on the **System-Parameters Customer Options** form by entering a y in the `DS1 Echo Cancellation?` field. The `EC Direction` and `EC Configuration` fields do not display unless the user has entered y in the `DS1 Echo Cancellation?` field.

- EC Direction determines the direction from which echo will be eliminated, ether inward or outward.
- EC Configuration is the set of parameters that will be used when cancelling echo. This information is stored in firmware on the UDS1 circuit pack.

Echo cancellation is turned on or off on a trunk group basis using the **change trunk-group** command. If the TRUNK GROUP field, `DS1 Echo Cancellation?` is set to y, echo cancellation will be applied to every TN464GP/TN2464BP trunk member in that trunk group. The echo cancellation parameters used for a given trunk member are determined by the Echo Cancellation Configuration Number administered on the **DS1 Circuit Pack** form for that specific trunk's board.

Echo cancellation on the TN464GP/TN2464BP is selectable per channel, even though it is administrable on a trunk group basis. For example, if all but two ports on a TN464GP/TN2464BP need to have echo cancellation applied, those two ports must be put in a trunk group where the `DS1 Echo Cancellation` field is set to n. The remaining ports will be in a trunk group(s) where the `DS1 Echo Cancellation` field is set to y. A user will have the ability to cancel echo coming from the network (far-end echo) or coming from the switch (near-end echo).

The TN464 UDS1 Circuit Pack

The TN464C, D, E, F, and GP Universal DS1 Interface circuit packs provide an interface to the DS1 facility, and are designed to support 24 DS0 channels on a 1.544 Mbps DS1 link, or 32 DS0 channels on a 2.048 Mbps link. (The 32-channel interface is not supported on G3r V1 systems.) The DS0 channels can be administered as trunks to other switches, lines to off-premises stations, ports to line-side PRI terminating devices, or ports to other line-side non-PRI terminating devices. (DS0 channels on TN464/Bs can only be administered as trunks to other switches.) For more information on how TN464 ports can be used, see the maintenance objects (MOs): ISDN-SGR, ISDN-TRK, ISDN-LNK, PE-BCHL, TIE-DS1, CO-DS1, DID-DS1, OPS-LINE and WAE-PT.

NOTE:
For information on other DS1 circuit packs, see DS1-BD.

NOTE:
The TN464GP provides Echo Cancellation, and in addition, the TN464GP firmware may be updated using the firmware download feature.

Throughout this MO on the UDS1-BD, the term TN464 will mean any TN464C or later suffix UDS1 circuit pack. If part of this section refers to a specific suffix TN464 board, it will be noted as such.

The UDS1 maintenance strategy includes logging in-line errors reported by the UDS1 circuit pack, running tests for error diagnosis and recovery, and raising or clearing maintenance alarms.

TN464 circuit packs support the following:

- Digital Tie, CO, and DID trunks
- DS1 off-premises (OPS) lines
- Narrowband and wideband access endpoint ports
- ISDN-PRI trunks and accompanying signaling channel
- PRI endpoint ports (PE-BCHL) and accompanying signaling channel

The TN464 supports digital Tie, CO, and DID trunks, and OPS lines. On-board firmware performs call control signaling for the Tie, CO and DID trunks and OPS lines. ISDN-PRI trunk and PRI endpoint signaling (Q.921, Q.931) is received and generated by system software and is transmitted on a system link through the TN1655 Packet Interface and packet bus to the UDS1 where it is placed on the D-channel. Signaling over the DS1 link has to be synchronized between the transmitting and receiving ends to ensure error-free communication. Refer to ''SYNC (Synchronization)'' in this MO for details.

Each trunk, line, or endpoint has its own maintenance strategy, but all depend on the health of the UDS1 Interface circuit pack. Refer to the following MOs for details: TIE-DS1, CO-DS1, DID-DS1, OPS-LINE, ISDN-TRK, ISDN-LNK, ISDN-SGR, WAE-PT and PE-BCHL. The maintenance strategy for the TN464 UDS1 Interface circuit pack (UDS1-BD) is very similar to the maintenance strategy for the TN767 DS1 Interface circuit pack (DS1-BD). The same commands are used for administering and testing the boards. The differences in maintenance strategy between the boards result from the UDS1 circuit pack's direct interface to the Packet Bus used for ISDN-PRI signaling (ISDN-LNK). While both the TN464 and TN767 can support ISDN-PRI B-channels, ISDN-PRI D-channel signaling applications require a TN464 UDS1 circuit pack.

The UDS1 circuit pack, combined with the 120A1 CSU Module forms an Enhanced Integrated CSU. The 120A1 CSU Module, when combined with the functionality provided by the TN464F hardware and firmware, and switch software, provides functionality equivalent to an external stand-alone Lucent ESF T1 CSU. The 120A1 CSU Module connects to the UDS1 circuit pack on the I/O connector panel on the back of the port carrier. The new CSU Module thus becomes an integrated part of the DEFINITY system. Throughout this MO, the term 120A1 will mean a 120A1 or later suffix CSU Module.

The Enhanced Integrated CSU is for use in the United States of America with 1.544 Mbps DS1 service. For further details on the 120A1 CSU Module refer to *DEFINITY Communications System Generic 1, Generic 2, and Generic 3 V1 and V2 - Integrated CSU Module Installation and Operation*.

The UDS1-BD and 120A1 CSU Module support on-demand loopback tests that assist in the detection of faults between the UDS1-BD circuit pack and the CSU Module, between the Integrated CSU and the optional Customer Premises Loopback Jack, or between the Integrated CSU and remote CSU. These loopback tests are explained in detail later in this UDS1-BD MO, but Figure 9-114 gives a high level overview of the loopback points.

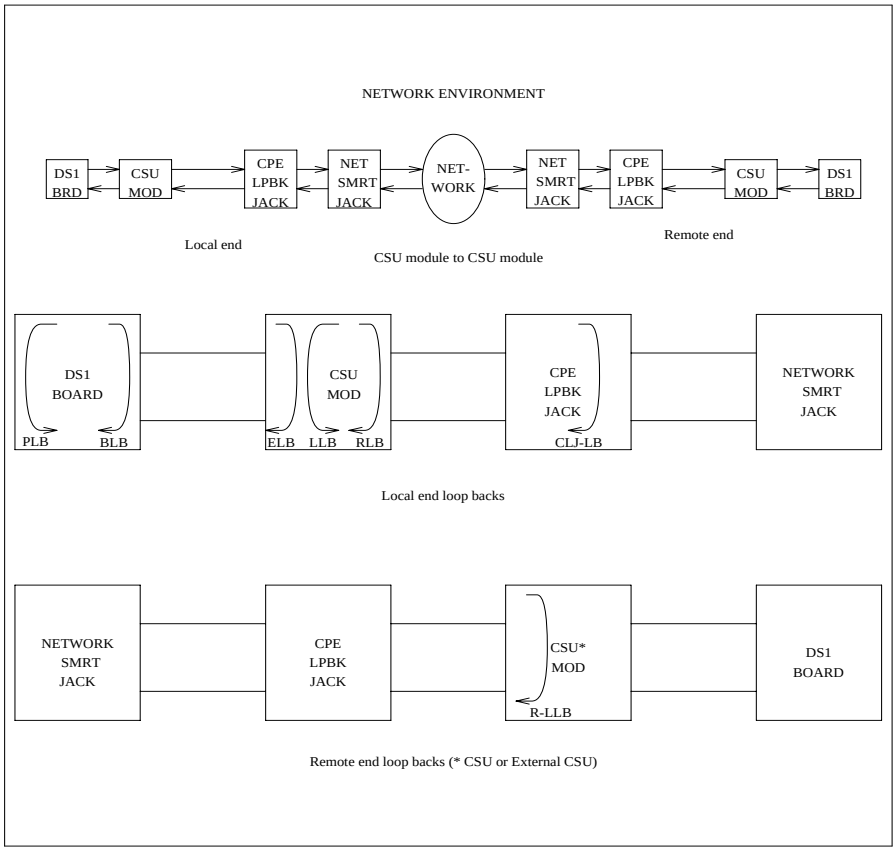

Figure 9-114. High Level Overview Of Loopback Points

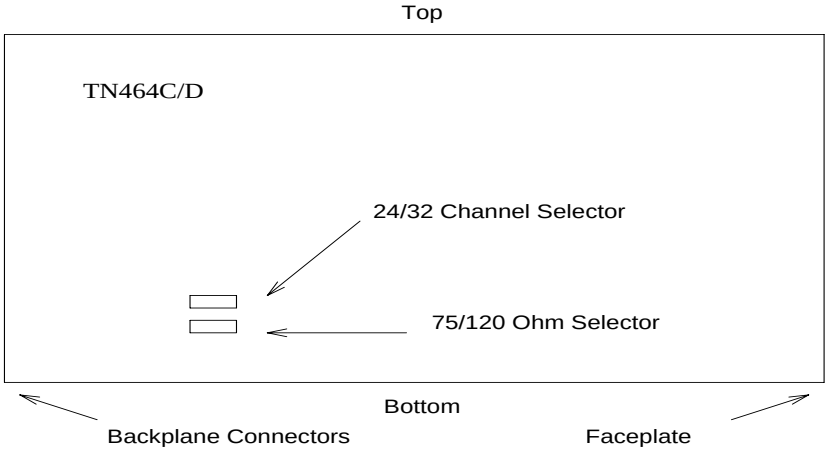
The following list of acronym definitions are for the Figure 9-114 on page 9-2063:

- PLB = Payload Loopback
- BLB = Board Loopback
- ELB = Equipment Loopback
- LLB = Line Loopback
- RLB = Repeater Loopback
- CLJ = Loopback Jack Loopback
- R-LLB = Remote Line Loopback
- SMRT = Smart Jack
- LPBK = Loopback

Circuit Pack Administration and Options

The DS1 configuration for each circuit pack is administered on the **DS1 Circuit Pack** form. `Bit Rate` is set to 1.544 Mbps for 24-channel systems, and 2.048 Mbps for 32-channel systems. `Country Protocol` is used to drive layer 3 protocol decisions based on PRI specifications specific to a given country (not those related to specific features). This Country Protocol is independent of the `Country` parameter administered on the **country-options system-parameters** form. Different UDS1 circuit packs may be administered with different Country Protocols, allowing the switch to act as a gateway between two incompatible ISDN-PRI implementations (for example, between two different countries). US systems use country protocol 1. `Near-End CSU Type` is set to `other` for no CSU installed or for an external CSU such as an Lucent ESF T1 CSU, or set to `integrated` for the 120A1 CSU Module or the 401A T1 Sync Splitter. Answering `integrated` will cause additional fields to be displayed for administering the Enhanced Integrated CSU Module. `E1 Sync-Splitter?` is set to y if a 402A or 403A E1 Sync splitter is used to provide timing to an ATM switch. `Echo Cancellation?` is set to y if the echo cancellation right-to-use feature has been activated and this TN464GP/TN2464BP or later suffix board is to supply echo cancellation. In addition to the above there are numerous other fields defining such parameters as framing modes, line coding, companding mode and so on. For details, refer to *DEFINITY Communications System Generic 3 V2 Implementation,* 555-230-653, and *DEFINITY Communications System Generic 2.2 and Generic 3 V2 DS1/CEPT/ISDN-PRI Reference*, 555-025-107.

Two option jumpers located on the side of the TN464C/D circuit pack must be installed correctly. The figures on the following page show how to configure the circuit pack for 24-channel or 32-channel DS1, and for 75*W (coaxial) or 120*W trunk connections. The channel selection must match the parameters administered on the corresponding **DS1 Circuit Pack** Form. (US applications use 24 Channels.)



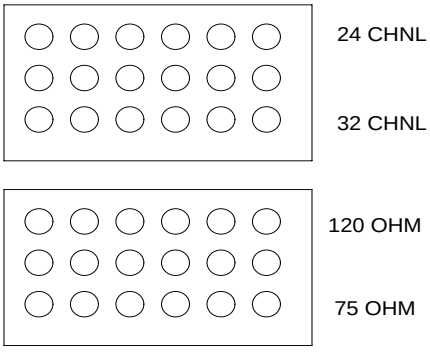


Figure 9-115. TN464C/D DS1 Option Jumpers

Insert the jumpers into the blocks so as to join the center row of pins and the row designating the desired options.

Figure 9-116. TN464C/D DS1 Option Jumpers (Continued)

The option switch located on the component side of the TN464E/F circuit pack must be set correctly. Figure 9-117 on page 9-2066 shows how to configure the circuit pack for 24-channel or 32-channel DS1. The channel selection must match the parameters administered on the corresponding **DS1 Circuit Pack** Form. (US applications use 24 Channels.)

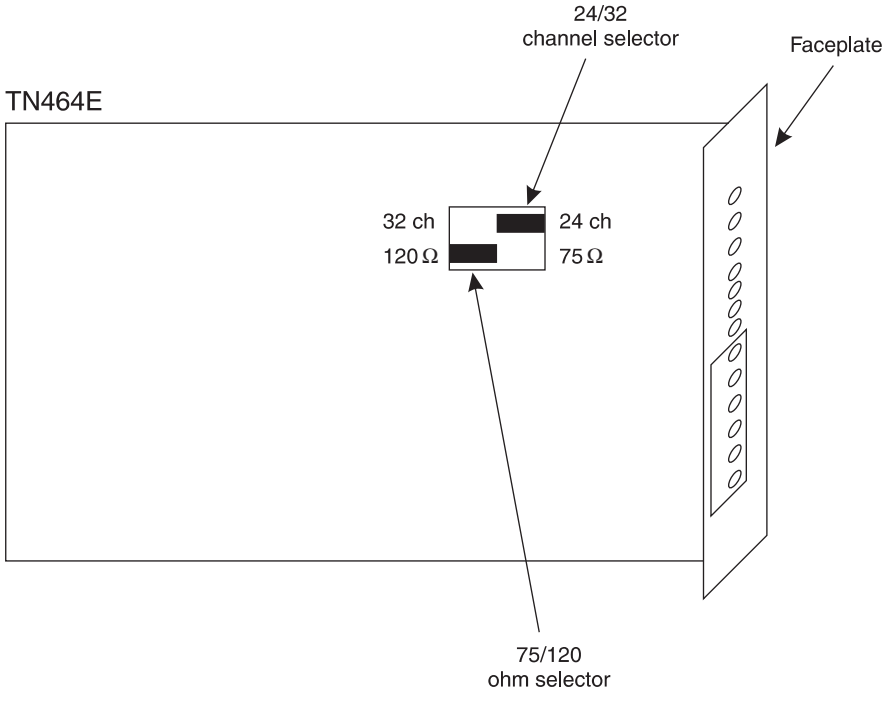

Figure 9-117. TN464E/F DS1 Option switches

Firmware Download Feature

The Firmware Download feature provides DEFINITY ECS the ability to download new firmware to one or more UDS1 circuit boards residing in its system. The download image is copied onto a source (C-LAN) board, using FTP. The image is then copied to the target boards Flash over the TDM bus. The transfer of the download image from the source board to the target board is done under switch software's control. This process is initiated using the DEFINITY SAT interface.

If the firmware download fails for this circuit pack, an error is logged, and a alarm raised (See Error Type 174 for this MO). Also see the FW-DWNLD MO for more information on trouble shooting firmware download problems.

Error Log Entries and Test to Clear Values

Table 9-757. DS1 Interface Circuit Pack Maintenance Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test board UUCSS
1(a)	0	Circuit pack removed or SAKI Test (#53)	MIN/WRN[2]	ON	
18(b)	0	busyout board UUCSS	WARNING	OFF	release board UUCSS
23(c)	0		WARNING	OFF	add ds1 UUCSS
125(d)	none 3	None	MIN/WRN[3]	ON	
257	65535	Control Channel Loop Test (#52)	MINOR	ON	test board UUCSS l r 20
257(e)	Any	None			
513(f)	Any		MIN/WRN[3]	ON	
514(g)	46086		MIN/WRN[3]	ON	
769(h)	46085		MIN/WRN[3]	ON

Table 9-757. DS1 Interface Circuit Pack Maintenance Error Log Entries — *Continued*

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
3330(w)	46083		MIN/WRN[3]	ON	
3585 to 3601 (x)	Any	Misframe Alarm Inquiry Test (#145)	MIN/WRN[3]	OFF	test board UUCSS r 6
3840(y)	Any	None			
3841(z)	4358				
3842(aa)	46097				
3843(ab)	46081				
3900(ac)	Any	CPE Loopback Jack Test (#1212)			
3901(ad)	Any	Far CSU Loopback Test (#1213)			
3902(ae)	Any	One-Way Span Test (#1214)			
3999(af)	Any	None			

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.
2. If ports are assigned to the circuit pack, then a minor alarm is raised. If no ports are assigned to the circuit pack, then a warning alarm is raised. The alarm is raised after the circuit pack has been missing for a period of 15 minutes. Warning alarms are also raised against any ports administered on the circuit pack.
3. Minor alarms on this MO may be downgraded to warning alarms based on values set in the **set options** command.
4. Major alarms on this MO may be downgraded to minor or warning alarms based on values set in the **set options** command.

Notes:

a. **Error Type 1** — indicates that the circuit pack has totally stopped functioning or is not fully administered. The alarm is logged about 15 minutes after the circuit pack has been removed or 11-minutes after the SAKI Test (#53) fails.

   To be fully administered, a UDS1 circuit pack must meet all three of the following conditions:

   1. Have an entry in the circuit plan using the **change circuit pack** command
   2. Be administered using the **add ds1 UUCSS** command
   3. Be physically inserted into the correct slot

If the circuit pack has an entry in the circuit plan and either of the other two conditions are *not* met, a MINOR alarm is logged. To resolve the error either:

1. Make sure that all conditions for administration are met and that a functioning UDS1 circuit pack is inserted in the correct slot, or
2. Completely remove the UDS1-BD from the system using the following steps:
    a. Remove any administered DS1 trunks, access endpoints or PRI endpoints associated with the circuit pack from their trunk groups.
    b. Execute the **remove ds1 UUCSS** and **change circuit pack UUCSS** commands.

If all the administration conditions are met for this circuit pack and the red LED is still on, follow the instructions for *LED Alarms with Error Type 1* in Chapter 7.

b. **Error Type 18** — The UDS1 Interface circuit pack has been busied out by a **busyout board UUCSS** command.

c. **Error Type 23** — The UDS1-BD circuit pack is not completely administered. To be fully administered, the UDS1 circuit pack must:

    1. Have an entry in the circuit plan using the **change circuit pack** command,
    2. Be administered using the **add ds1 UUCSS** command, and
    3. Be physically inserted into the correct slot.

    A DS1 (UDS1-BD and DS1-BD) differs from most circuit packs in that inserting the circuit pack into the switch is not enough to make the board usable. It must also be administered with the **add ds1** command.

d. **Error Type 125: No Aux Data** — An incorrect circuit pack is inserted in the slot where the USD1 circuit pack is logically administered. To resolve this problem, either remove the incorrect circuit pack and insert the logically administered circuit pack, OR use the **change circuit-pack** command to re-administer this slot to match the circuit pack inserted.

    Aux Data 3 — The 24/32-channel option jumper setting on the circuit pack does not match the option set on the **DS1 Circuit Pack** administration form. The circuit pack must be physically removed to see the setting of the jumper.

e. **Error Type 257** — is associated with the Common Port Circuit Pack Maintenance Test. Refer to XXX-BD (Common Port Circuit Pack) Maintenance documentation for details.

f. **Error Type 513** — The UDS1 Interface circuit pack has detected a transient hardware problem. The value in the Aux Data field indicates the type of hardware problem:

Aux Data	Problem
4352	External RAM failure
4353	Internal RAM failure
4355	Internal ROM failure

If the UDS1 board detects only one of these hardware problems, then the error will disappear when none of these faults are detected for 10 minutes. If the same Aux Data value is logged more than once in a 24 hour period, the circuit pack should be replaced.

g. **Error Type 514** — LAN External RAM Error. This error occurs when there is a hardware fault in the PPE external RAM. The RAM is used for message buffering to and from the Packet Bus. This error should not occur frequently. If it does (10 times within 30 minutes), the circuit pack should be replaced.

h. **Error Type 769** —Transmit FIFO Underflow Error. This error occurs when the circuit pack cannot find the "end of frame" bit when transmitting a frame to the Packet Bus. An alarm is raised if this error occurs three times within 10 minutes. Clear the alarm using the following commands: **busyout board UUCSS**, **reset board UUCSS**, **test board UUCSS long**, **release board UUCSS**. If the error recurs within 10 minutes, replace the circuit pack.

i. **Error Type 770** — Unable to Write LAN Translation RAM Error. This error occurs when a call is aborted because there are no available translation RAM locations for the call connection attempt. An alarm is raised if this error occurs two times within 10 minutes. Clear the alarm using the following commands: **busyout board UUCSS**, **reset board UUCSS**, **test board UUCSS long**, **release board UUCSS**. If the error recurs within 10 minutes, replace the circuit pack.

j. **Error Type 1300** — CSU Module/T1 Sync Splitter missing or E1 Synchronization Splitter (E1SS) missing.

CSU Module/T1 Sync Splitter missing: The `Near-End CSU Type` field on the **add ds1** form has been administered as `integrated` but the 120A1 CSU Module or the 401A T1 Sync Splitter is not physically connected (or is improperly connected) to the UDS1 board on the back of the port carrier.

If using the 120A1 CSU Module or the 401A T1 Sync Splitter, plug (or replug) the CSU Module/T1 Sync Splitter into the UDS1 circuit pack's connector on the I/O connector panel on back of the carrier. Otherwise, change the `Near-End CSU Type` field using the **change ds1** form to `other`.

If this error remains after plugging the CSU Module/T1 Sync Splitter into the board's connector, there could be a problem with the I/O connector panel.

E1 Synchronization Splitter missing: The `E1 Sync-Splitter?` field on the **add ds1** form has been administered as `y`, but the 402A or 403A E1 Synchronization Splitter is not physically connected (or is improperly connected) to the UDS1 board on the back of the port carrier.

If using the 402A or 403A E1 Synchronization Splitter, plug (or replug) the E1SS into the UDS1 circuit pack's connector on the I/O connector panel on back of the carrier. Otherwise, change the `E1 Sync-Splitter?` field using the **change ds1** form to `n`.

If this error remains after plugging the E1SS into the board's connector, there could be a problem with the I/O connector panel.

k. **Error Type 1301** — CSU Module/T1 Sync Splitter not expected or E1 Synchronization Splitter not expected.

CSU Module/T1 Sync Splitter not expected: The 120A1 CSU Module or the 401A T1 Sync Splitter is physically connected to the UDS1 board on the back of the port carrier but the `Near-End CSU Type` field on the **add ds1** form has not been administered as `integrated`.

If the 120A1 CSU Module or the 401A T1 Sync Splitter is to be used, use the **change ds1** command to change the `Near-End CSU Type` field to `integrated`. Otherwise, physically remove the 120A1 CSU Module or the 401A T1 Sync Splitter from the back of the port carrier.

E1 Synchronization Splitter not expected: The 402A or 403A E1 Synchronization Splitter is physically connected to the UDS1 board on the back of the port carrier but the `E1 Sync-Splitter?` field on the **add ds1** form has not been administered as `y`.

If the 402A or 403A E1 Synchronization Splitter is to be used, use the **change ds1** command to change the `E1 Sync-Splitter?` field to `y`. Otherwise, physically remove the 402A or 403A E1 Synchronization Splitter from the back of the port carrier.

l. **Error Type 1302** — DS1 configuration error. Attempting to use the 120A1 CSU Module with a UDS1 circuit pack that is configured for 32-channel (2.048 Mbps) operation. The CSU Module only works with a DS1 board configured for 24-channel (1.544 Mbps) operation in the United States of America.

m. **Error Type 1303** — DS1 circuit pack suffix incorrect for CSU Module/T1 Sync Splitter or for E1 Synchronization Splitter.

DS1 circuit pack suffix incorrect for CSU Module/T1 Sync Splitter: The `Near-End CSU Type` field on the **add ds1** form has been administered as `integrated` but the DS1 circuit pack is not a TN464F or later suffix UDS1 board.

If the 120A1 CSU Module or the 401A T1 Sync Splitter is to be used, remove the circuit pack and replace it with a TN464F or later suffix board. Otherwise, use the **change ds1** command to change the `Near-End CSU Type` field to `other`.

DS1 circuit pack suffix incorrect for E1 Synchronization Splitter: The `E1 Sync-Splitter?` field on the **add ds1** form has been administered as y but the DS1 circuit pack is not a TN464F or later suffix UDS1 board.

If the 402A or 403A E1 Synchronization Splitter is to be used, remove the circuit pack and replace it with a TN464F or later suffix board. Otherwise, use the **change ds1** command to change the `E1 Sync-Splitter?` field to n.

n. **Error Type 1310** — BLB failure. This error occurs when the DS1 Board Loopback (BLB) demand test fails. Repeat the test using the commands **busyout board UUCSS, test ds1-loop UUCSS ds1/csu-loopback-tests, release board UUCSS**. If the BLB test continues to fail, then the TN464F circuit pack needs to be replaced.

o. **Error Type 1311** — ELB failure. This error occurs when the Equipment Loopback (ELB) test fails for the Integrated CSU (I-CSU) Module/T1 Sync Splitter or for the 402A or 403A E1 Synchronization Splitter. This test is executed by the I-CSU/E1SS during I-CSU/E1SS power-up/reset (i.e.- UDS1 board physically inserted and 120A1 CSU Module or the 401A T1 Sync Splitter, or the 402A or 403A E1SS is already installed) or when the 120A1 CSU Module or the 401A T1 Sync Splitter, or the 402A or 403A E1SS is plugged on to an already initialized UDS1 DS1 board.

NOTE:
For the **I-CSU/T1 Sync Splitter only**, the ELB test is also executed as part of the command **test ds1-loop UUCSS ds1/csu-loopback-tests**. Attempt to clear the alarm using the commands **busyout board UUCSS, test ds1-loop UUCSS ds1/csu-loopback-tests, release board UUCSS**. If the ELB test continues to fail, then either the UDS1 board, the CSU Module, or the I/O cable between the backplane and the CSU module (or any combination thereof) has failed. Attempt to isolate where the failure is occurring by re-executing the test and by replacing one piece of hardware at a time.

p. **Error Type 1312** — RLB failure. This error occurs when the Repeater Loopback (RLB) test fails for the Integrated CSU (I-CSU) Module/T1 Sync Splitter or for the 402A or 403A E1 Synchronization Splitter. This test is executed by the I-CSU/E1SS during I-CSU/E1SS power-up/reset (i.e.- UDS1 board physically inserted and 120A1 CSU Module or the 401A T1 Sync Splitter, or the 402A or 403A E1SS is already installed) or when the 120A1 CSU Module or the 401A T1 Sync Splitter, or the 402A or 403A E1SS is plugged on to an already initialized DS1 board.

NOTE:
For the **I-CSU/T1 Sync Splitter only**, the RLB test is also executed as part of the command **test ds1-loop UUCSS ds1/csu-loopback-tests**. Attempt to clear the alarm using the commands **busyout board UUCSS, test ds1-loop UUCSS ds1/csu-loopback-tests, release board UUCSS**. If the RLB test continues to fail, then the CSU Module needs to be replaced.

q. **Error Type 1313** — CPE Loopback Jack deactivation error. This error occurs when the UDS1 circuit pack could not deactivate a CPE Loopback Jack on power-up/reset or upon software request.

Attempt to clear the alarm using the commands **busyout board UUCSS, test ds1-loopback UUCSS end-loopback/span-test, release board UUCSS**. If the attempt to deactivate the CPE Loopback Jack continues to fail, other steps must be taken to deactivate the loopback.

r. **Error Type 1314** — Far CSU Loopback deactivation error. This error occurs when the UDS1 circuit pack could not deactivate a far-end CSU loopback on power-up/reset or upon software request.

Attempt to clear the alarm using the commands **busyout board UUCSS, test ds1-loop UUCSS end-loopback/span-test, release board UUCSS**. If the attempt to deactivate the Far CSU loopback continues to fail, then escalate the problem.

s. **Error Types 1400, 1401** — Echo Cancellation errors are logged when:

- Error 1400 - Echo canceller function failed. The Echo Canceller Function Test, which is executed by firmware, failed.
- Error 1401 - Echo canceller memory failed. The Echo Canceller Memory Test, which is executed by firmware, failed.

Echo Cancellation is no longer being supplied by the board. Clear the alarm using the following commands: **busyout board UUCSS**, **test board UUCSS long**, **release board UUCSS**. If Test #1420 (Echo Canceler Test) fails, replace the circuit pack.

t. **Error type 1537** — LAN Bus Timeout Error. This error occurs when the circuit pack transmits too many bytes on the LAN bus for a single frame. This condition may be caused by an on-board fault or by faulty data received on one of the circuit pack's external ports. If any of the ports on this circuit pack are alarmed, refer to the repair procedures for those maintenance objects.

   If the error occurs three times within 10 minutes, the board is isolated from the Packet Bus and the board alarmed. To clear the alarm and restore the board to the Packet Bus, use the commands **busyout board UUCSS**, **reset board UUCSS**, **test board UUCSS long**, **release board UUCSS**.

   If the problem persists, and there are no PKT-BUS alarms or port alarms, then replace the circuit pack.

u. **Error Type 1538** — The hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:

   - The common circuit pack level tests such as Test #50 and/or Test #52 abort with error code 2000
   - The tests run on the ports of this circuit pack return a NO-BOARD result
   - A busyout/release of the circuit pack has no affect on test results
   - A **list configuration** command shows that the circuit pack and ports are properly installed

   The circuit pack is isolated from the system and all trunks or ports on this circuit pack are placed into the out-of-service state. The system will try to restore the circuit pack within 20-30 minutes. When no faults are detected for 20-30 minutes, the UDS1 Interface circuit pack is restored to normal operation. All trunks or ports of the UDS1 Interface circuit pack are then returned to the in-service state.

   If the board is not restored to normal operation, or the error recurs after the board was restored to normal operation, escalate the problem.

v. **Error Types 3073 to 3160** — For later releases of G3V4 and beyond, only Error Type 3073 shows that this board is receiving slips and the AUX data shows the last slip count reported.

w. **Error Type 3330** — LAN Critical Error. A critical failure has been detected in the Packet Bus interface of the circuit pack. This failure may be due to an on-board fault or a Packet Bus fault. If the Packet Bus is alarmed, refer to the PKT-BUS Maintenance documentation for recommended repair procedures.

   This error isolates the board from the Packet Bus and raises an alarm. If the Packet Bus is not alarmed, enter the commands **busyout board UUCSS**, **reset board UUCSS**, **test board UUCSS**, **release board UUCSS**. This should clear the alarm and restore the board to the Packet Bus.

   If the problem persists, and there are no PKT-BUS alarms, then replace the circuit pack.

x. **Error Types 3585 to 3601** — For later releases of G3V4 and beyond, only Error Type 3585 shows that this board is receiving misframes, and the AUX Data shows the last misframe count reported.

y. **Error Type 3840** — is not service-affecting. No action is required. These errors are reported by the circuit pack when it receives a bad control channel message from the switch. The auxiliary data identifies the following error events:

Aux Data	Event
4096	Bad major heading
4097	Bad port number
4098	Bad data
4099	Bad sub-qualifier
4100	State inconsistency
4101	Bad logical link

z. **Error Type 3841** — The UDS1 Interface circuit pack has detected a transient hardware logic error (for example, program logic inconsistency). This error will disappear when no faults are detected for 100 minutes. The value in Aux Data indicates the type of hardware problem.

aa. **Error Type 3842** — Bad Translation RAM Location Found Error. This error is not service-affecting. No action is required. A Bad Translation RAM is detected, but the call continues by using another translation location.

ab. **Error Type 3843** — LAN Receive Parity Error. This error occurs when the circuit pack detects an error in a received frame from the Packet Bus. These errors are most likely caused by a Packet Bus problem, but may be due to a circuit pack fault.

Refer to the PKT-BUS Maintenance documentation to determine if the problem is isolated to this circuit pack or if the problem is caused by Packet Bus faults.

ac. **Error Type 3900** — is used to give status information on a CPE Loopback Jack Test. The value in the Aux Data field indicates the status of the loopback test.

Aux Data	Test Status
1	Currently running
2	Failed because loopback could not be activated
3	Failed because test pattern could not be detected
4	Terminated

ad. **Error Type 3901** — is used to give status information on a Far CSU Loopback Test. The value in the Aux Data field indicates the status of the loopback test.

Aux Data	Test Status
1	Currently running
2	Failed because loopback could not be activated
3	Failed because test pattern could not be detected
4	Terminated

ae. **Error Type 3902** — is used to give status information on a One-Way Span Test. The value in the Aux Data field indicates the status of the span test.

Aux Data	Test Status
1	Currently running
2	Failed because test could not be activated
3	Test pattern was not received from the far end
4	Terminated

af. **Error Type 3999** — indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If Error Type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If Error Type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Investigate tests in the order they are presented in Table 9-758. By clearing error codes associated with the *Echo Cancellation Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Table 9-758. System Technician-Demanded Tests

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	test ds1-loop	D/ND[1]
Echo Cancellation Test (#1420)		X			D
NPE Connection Audit Test (#50)		X			ND
Control Channel Loop Test (#52)		X			ND
Loss of Signal Alarm Inquiry Test (#138)	X	X			ND
Blue Alarm Inquiry Test (#139)	X	X			ND
Red Alarm Inquiry Test (#140)	X	X			ND
Yellow Alarm Inquiry Test (#141)	X	X			ND
Major Alarm Inquiry Test (#142)	X	X			ND
Minor Alarm Inquiry Test (#143)	X	X			ND
Slip Alarm Inquiry Test (#144)	X	X			ND
Misframe Alarm Inquiry Test (#145)	X	X			ND
Translation Update Test (#146)	X	X			ND
ICSU Status LEDs Test (#1227)	X	X			ND
SAKI Sanity Test (#53)			X		D
Internal Looparound Test (#135)			X		D

1. D = Destructive; ND = Nondestructive

NPE Connection Audit Test (#50)

The system sends a message to the on-board microprocessor to update the network connectivity translation for the SCOTCH-NPE chip on the circuit pack.

Table 9-759. TEST #50 NPE Connection Audit Test

Error Code	Test Result	Description/ Recommendation
None 2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1019	ABORT	The test aborted because a test was already running on the port. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The circuit pack's SCOTCH-NPE chip has been updated with its translation.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Control Channel Looparound Test (#52)

This test queries the circuit pack for its circuit pack code and vintage and verifies its records.

Table 9-760. TEST #52 Control Channel Looparound Test

Error Code	Test Result	Description/ Recommendation
None 2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The circuit pack failed to return the circuit pack code or vintage. 1. Retry the command a maximum of 5 times. 2. If the problem continues, and if the circuit pack is one of the Port circuit packs, replace the circuit pack. Otherwise, if the circuit pack is part of the SPE, use the procedure described in *Replacing SPE Circuit Packs* in Chapter 5. 3. Retry the command a few times a maximum of 5 times.
	PASS	Communication with this circuit pack is successful.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

SAKI Sanity Test (#53)

This test is destructive.

This test resets the circuit pack. The test is highly destructive and can only be initiated by a system technician-demanded **reset board UUCSS** command.

Table 9-761. TEST #53 SAKI Sanity Test

Error Code	Test Result	Description/ Recommendation
None	ABORT	System resources required for this test are not available. 1. Retry the **reset board** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	Wrong circuit pack configuration to run this test. This error applies only to DS1 Interface circuit packs. It means the DS1 Interface circuit pack is providing timing for the system, and therefore, it cannot be reset without major system disruptions. 1. If the circuit pack needs to be reset, then set synchronization to another DS1 Interface circuit pack or to the Tone-Clock circuit pack and try again. Refer to ''SYNC (Synchronization)'' Maintenance documentation.
1015	ABORT	Port is not out-of-service. 1. Busyout the circuit pack. 2. Execute the **reset board** command again.
2100	ABORT	System resources required for this test are not available. 1. Retry the **reset board** command at 1-minute intervals a maximum of 5 times.
1 2	FAIL FAIL	The circuit pack failed to reset. The circuit pack failed to restart. 1. Execute the **reset board** command again. 2. If the problem persists, replace the circuit pack.
	PASS	The circuit pack initializes correctly. 1. Run the Short Test Sequence.

Table 9-761. TEST #53 SAKI Sanity Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Internal Looparound Test (#135)

This test is destructive.

The Internal Looparound Test is run by looping the transmitted DS1 bit stream back into the UDS1's board receiver. The loop occurs just before the DS1 facility interface. The test is highly destructive and can only be initiated by a system technician-demanded **reset board UUCSS** command.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running the Internal Looparound Test. When the Internal Looparound Test is initiated, maintenance software sends appropriate messages to the UDS1 Interface circuit pack to start the test. The test uses the Tone Generator and Tone Detector to exercise a bit pattern consistency test for all ports. If the transmitted and received bit patterns on a trunk or port are different, the test fails.

When the test completes, the maintenance software sends a stop loop around message to the UDS1 Interface circuit pack to put the circuit pack back into the normal operation mode. All trunks or ports of the UDS1 Interface circuit pack are restored to the in-service state after the **release board** command is entered.

Table 9-762. TEST #135 Internal Looparound Test

Error Code	Test Result	Description/ Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the **reset board** command at 1-minute intervals a maximum of 5 times.
1004	ABORT	Received an incoming call on a port of the UDS1 circuit pack during the test. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack to out-of-service state. 2. Retry the **reset board** command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-762. TEST #135 Internal Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the **reset board** command.
1039	ABORT	The UDS1 Interface circuit pack is providing timing for the system. Therefore, it cannot be reset without major system disruption. If the UDS1 Interface circuit pack needs to be tested, set the synchronization reference to another UDS1 Interface circuit pack or to the Tone-Clock circuit pack via the following command sequence: 1. Issue the **disable synchronization-switch** command. 2. Next, issue the **set synchronization UUCSS** command. 3. Lastly, issue the **enable synchronization-switch** command.
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this error type.
2012	ABORT	Internal system error 1. Retry the **reset board** command at 1-minute intervals a maximum of 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the **reset board** command at 1-minute intervals for a maximum of 5 times.
	FAIL	The UDS1 Interface circuit pack failed in the Internal Looparound Test. If the UDS1 connects to a T1 network facility or another switch: 1. Retry the **reset board** command at 1-minute intervals a maximum of 5 times. 2. Enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 3. Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. 4. Check the physical connectivity of DS1 Interface circuit packs and cable. 5. Replace the local UDS1 Interface circuit pack and repeat the test. 6. Contact T1 Network Service to diagnose the remote DS1 endpoint.

Continued on next page

Table 9-762. TEST #135 Internal Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL *(cont'd.)*	If the UDS1 connects to a line-side terminating device such as a PRI terminal adapter: 1. Retry the **reset board** command at 1-minute intervals a maximum of 5 times. 2. Enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 3. Verify that the switch DS1 and the line-side terminating device are administered using the same signaling mode, framing mode, and line coding. 4. Investigate the maintenance status of the line-side terminating device. Obtain the error seconds measurement on the terminating device (if possible). Refer to the line-side terminating device operating manual for information. 5. Check the physical connection of the UDS1 Interface circuit pack to the terminating device. Check premise distribution system (or intra-premise wiring) for physical connection failures. If the error seconds measurement is severe, investigate premise distribution system wiring for noise and distance limitation. 6. Replace the local UDS1 Interface circuit pack and repeat the test. 7. Contact the vendor of the line-side terminating device to diagnose the equipment.
	PASS	All administered trunks or ports of the UDS1 Interface circuit pack pass the Internal Looparound Test. The bit pattern consistency test is executed successfully over the path that covers a DS1 port, cable, and the external NCTE device.

Continued on next page

Table 9-762. TEST #135 Internal Looparound Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Loss of Signal Alarm Inquiry Test (#138)

This test verifies the synchronization status, echo cancellation, and continuity of the DS1 link. The Loss of Signal alarm indicates that the UDS1 Interface circuit pack is unable to derive the synchronization clock from the DS1 facility. When the UDS1 Interface circuit pack detects a Loss of Signal alarm, it stops providing the synchronization clock for the system, if it is administered as a timing source, and transmits a Yellow alarm to the remote DS1 endpoint.

When the Loss of Signal alarm is confirmed, maintenance software places all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. The inquiry test will run every 10 minutes until the loss of signal has been restored.

The UDS1 Interface circuit pack raises a Loss of Signal alarm after the signal has been lost for about 1 second. It will not retire the alarm until the signal has returned for about 10 seconds.

120A1 CSU Module/Sync Splitter

This test is also used to maintain the Lucent 120A1 CSU Module or the 401A T1 Sync Splitter, and the 402A or 403A E1 Synchronization Splitter. The CSU Module, when combined with the functionality provided by the UDS1 circuit pack, provides functionality equivalent to an external stand-alone Lucent ESF T1 CSU. The combination of the UDS1 and 120A1 CSU Module is known as an Enhanced Integrated CSU (I-CSU).

The 401A T1 Synchronization Splitter, when combined with the functionality provided by the UDS1 circuit pack, allows an ATM switch to derive its timing from a T1 connected to the UDS1 in the DEFINITY.

The 402A or 403A E1 Synchronization Splitter, when combined with the functionality provided by the UDS1 circuit pack, allows an ATM switch to derive its timing from an E1 connected to the UDS1 in the DEFINITY.

If a UDS1 circuit pack detects certain I-CSU/Sync Splitter hardware errors, it notifies maintenance. When the maintenance subsystem receives notification of the I-CSU/Sync Splitter error, it executes this Loss of Signal Alarm Inquiry, Test #138. The test, in addition to querying for a Loss Of Signal alarm condition, also queries the UDS1 board to confirm the I-CSU/Sync Splitter error. A Minor or Warning alarm is raised depending on the severity of the I-CSU/Sync Splitter error. The trunks on the board may be taken out of service if the I-CSU/Sync Splitter error is deemed serious.

If a Loss Of Signal alarm and an I-CSU/Sync Splitter error co-exist, the Loss Of Signal alarm condition takes priority, and the board and all trunks on the board are put in the out-of-service state. Errors are logged, however, for both.

When the maintenance subsystem receives notification that the I-CSU/Sync Splitter hardware error condition no longer exists, maintenance will restore the board and all trunks to their previous service state, if the alarm can be cleared (no other I-CSU/Sync Splitter errors or Loss Of Signal alarm exist).

Echo Cancellation

If the TN464GP/TN2464BP or later suffix UDS1 firmware detects a serious echo canceller hardware error, it notifies maintenance software. When the maintenance subsystem receives notification of the echo cancellation error, it executes this *Loss Of Signal Alarm Inquiry* test.

This test, in addition to querying for a loss of signal condition and ICSU errors, also queries the TN464GP/TN2464BP to confirm the echo canceller error. A minor alarm is raised if the error is confirmed. The trunks of the board remain in-service since the board is still functional except for the echo cancellation capability.

If a loss of signal condition co-exists with ICSU and/or echo canceller errors, the loss of signal condition takes priority, and the board and all trunks on the board are put in the out-of-service state. Errors are logged, however, for each error type.

When the maintenance subsystem receives notification that the echo canceller hardware error condition no longer exists, the maintenance subsystem restores the board and all trunks to their previous service state, if the alarm can be cleared (no other ICSU errors or loss of signal conditions exist).

Table 9-763. TEST #138 Loss of Signal Alarm Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-763. TEST #138 Loss of Signal Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	UDS1 Interface circuit pack detects a Loss of Signal alarm. The physical link is broken or the remote DS1 endpoint is down. All trunks or ports of this UDS1 interface circuit pack are out-of-service. If the UDS1 Interface circuit pack is designated as the supplier of the system synchronization source, then the system synchronization maintenance will adopt a source elsewhere. Refer to the ''SYNC (Synchronization)'' section in this chapter for details. If the UDS1 connects to a T1 network facility: 1. Check the physical connection of the UDS1 Interface circuit pack and the cable. If a CSU Module or a Sync Splitter is physically connected to a UDS1-BD board on the back of the port carrier, check the physical connection of the CSU Module/Sync Splitter and make sure the Network Interface cable is plugged into the CSU Module's/Sync Splitter's NETWORK jack. 2. If the UDS1 Interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the UDS1 Interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. If the UDS1 connects to a line-side terminating device such as a PRI terminal adapter: 1. Check the physical connection of the UDS1 Interface circuit pack to the terminating device. Check premise distribution system (or intra-premise wiring) for physical connection failures. If a CSU Module or Sync Splitter is physically connected to a UDS1-BD board on the back of the port carrier, check the physical connection of the CSU Module/Sync Splitter and make sure the Network Interface cable is plugged into the CSU Module's/Sync Splitter's NETWORK jack. 2. Contact the vendor of the line-side terminating device to diagnose the equipment.

Continued on next page

Table 9-763. TEST #138 Loss of Signal Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1300	FAIL	The CSU Module/T1 Sync Splitter or the E1 Sync Splitter is missing. The CSU Module/T1 Sync Splitter is missing: The `Near-End CSU Type` field on the **add ds1** form has been administered as `integrated` but the 120A1 CSU Module or the 401A T1 Sync Splitter is not physically connected to the UDS1 board on the back of the port carrier. 1. If using the 120A1 CSU Module or the 401A T1 Sync Splitter, plug the CSU Module/T1 Sync Splitter into the UDS1 circuit pack's connector on the I/O connector panel on back of the carrier. Otherwise, change the `Near-End CSU Type` field using the **change ds1** form to `other`. 2. Run the test again. The E1 Sync Splitter is missing: The `E1 Sync-Splitter?` field on the **add ds1** form has been administered as `y` but the 402A or 403A E1 Sync Splitter is not physically connected to the UDS1 board on the back of the port carrier. 1. If using the 402A or 403A E1 Synchronization Splitter, plug the E1SS into the UDS1 circuit pack's connector on the I/O connector panel on back of the carrier. Otherwise, change the `E1 Sync-Splitter?` field using the **change ds1** form to `n`. 2. Run the test again.
1301	FAIL	The 120A1 CSU Module or the 401A T1 Sync Splitter, or the 402A or 403A E1 Synchronization Splitter is not expected. The 120A1 CSU Module or the 401A T1 Sync Splitter is not expected: The 120A1 CSU Module/T1 Sync Splitter is physically connected to the UDS1 board on the back of the port carrier but the `Near-End CSU Type` field on the **add ds1** form has not been administered as `integrated`. 1. If the 120A1 CSU Module/T1 Sync Splitter is to be used, use the **change ds1** command to change the `Near-End CSU Type` field to `integrated`. Otherwise, physically remove the 120A1 CSU Module/T1 Sync Splitter from the back of the port carrier. 2. Run the test again. The 402A or 403A E1 Synchronization Splitter is not expected: The 402A or 403A E1 Synchronization Splitter is physically connected to the UDS1 board on the back of the port carrier but the `E1 Sync-Splitter?` field on the **add ds1** form has not been administered as `y`. 1. If the 402A or 403A E1 Synchronization Splitter is to be used, use the **change ds1** command to change the `E1 Sync-Splitter?` field to `y`. Otherwise, physically remove the 402A or 403A E1 Synchronization Splitter from the back of the port carrier. 2. Run the test again.

Continued on next page

Table 9-763. TEST #138 Loss of Signal Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1302	FAIL	Attempting to use the 120A1 CSU Module with a UDS1 circuit pack that is configured for 32-channel (2.048 Mbps) operation. The CSU Module only works with a DS1 board configured for 24-channel (1.544 Mbps) operation in the United States of America. 1. If the 120A1 CSU Module is to be used, physically remove the UDS1 circuit pack and reconfigure for 24-channel (1.544 Mbps) operation. 2. Reinsert the circuit pack and run the test again.
1303	FAIL	The DS1 circuit pack Suffix is incorrect for CSU Module/T1 Sync Splitter or E1 Sync Splitter administration. The DS1 circuit pack Suffix is incorrect for CSU Module/T1 Sync Splitter administration. The `Near-End CSU Type` field on the **add ds1** form has been administered as `integrated` but the DS1 circuit pack is not a TN464F or later suffix UDS1 board. 1. If the CSU Module/T1 Sync Splitter is to be used, and the `Near-End CSU Type` field is set to `integrated` to allow for CSU Module/T1 Sync Splitter administration, remove the circuit pack and replace it with a TN464F or later suffix board. Otherwise use the **change ds1** command to change the `Near-End CSU Type` field to `other`. The DS1 circuit pack Suffix is incorrect for E1 Sync Splitter administration. The `E1 Sync-Splitter?` field on the **add ds1** form has been administered as `y` but the DS1 circuit pack is not a TN464F or later suffix UDS1 board. 1. If the E1 Sync Splitter is to be used, and the `E1 Sync-Splitter?` field is set to `y` to allow for E1SS administration, remove the circuit pack and replace it with a TN464F or later suffix board. Otherwise use the **change ds1** command to change the `E1 Sync-Splitter?` field to `n`.
1310	FAIL	The DS1 Board Loopback (BLB) demand test (#1209) failed. 1. Repeat the test using the **test ds1-loop UUCSS ds1/csu-loopback-tests** command. 2. If the BLB test continues to fail, then replace the UDS1-BD circuit pack. 3. Run this test again.

Continued on next page

Table 9-763. TEST #138 Loss of Signal Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1311	FAIL	The Integrated CSU (I-CSU) Module Equipment Loopback (ELB) test (#1210) failed. This test is executed by the I-CSU during I-CSU power-up/reset (i.e., the UDS1 board is physically inserted and a CSU Module or a Sync Splitter is already installed) or when the CSU Module/Sync Splitter is plugged on to an already initialized DS1 board. The ELB test is also executed as part of the command **test ds1-loop UUCSS ds1/csu-loopback-tests** for the CSU Module and T1 Sync Splitter. 1. Execute the **test ds1-loop UUCSS ds1/csu-loopback-tests** command. 2. If the ELB test continues to fail, then either the UDS1 board, the CSU Module/T1 Sync Splitter, or the I/O cable between the backplane and the CSU module/T1 Sync Splitter (or any combination thereof) has failed. Attempt to isolate the problem to one of these areas. Begin by replacing the CSU Module/T1 Sync Splitter and running the **test ds1-loop UUCSS ds1/csu-loopback-tests** command again. 3. If the ELB test continues to fail, then replace the UDS1 board and run the **test ds1-loop UUCSS ds1/csu-loopback-tests** command again. 4. If the ELB test continues to fail, the problem could be in the I/O cable between the backplane and the CSU module/T1 Sync Splitter.
1312	FAIL	The Integrated CSU (I-CSU) Module Repeater Loopback (RLB) test (#1211) failed. This test is executed during I-CSU/Sync Splitter power-up/reset (i.e., the UDS1 board is physically inserted and the CSU Module or the Sync Splitter is already installed) or when the CSU Module/Sync Splitter is plugged on to an already initialized DS1 board. The RLB test is also executed as part of the command ***test ds1-loop UUCSS ds1/csu-loopback-tests*** for the CSU Module/T1 Sync Splitter. 1. Execute the ***test ds1-loop UUCSS ds1/csu-loopback-tests*** command. 2. If the RLB test continues to fail, then replace the CSU Module/T1 Sync Splitter. 3. Run this test again.
1313	FAIL	The UDS1 circuit pack could not deactivate a CPE Loopback Jack loopback. 1. Execute the ***test ds1-loop UUCSS end-loopback/span-test*** command. 2. If the attempt to deactivate the CPE Loopback Jack is not successful, check the cabling and investigate the problem at the CPE Loopback Jack. 3. Run the test again.
1314	FAIL	The UDS1 circuit pack could not deactivate a far-end CSU loopback. 1. Execute the ***test ds1-loop UUCSS end-loopback/span-test*** command.

Continued on next page

Table 9-763. TEST #138 Loss of Signal Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1320	FAIL	A CSU Module/Sync Splitter hardware failure, or an ICSU/Sync Splitter serial interface audit failure was detected by the UDS1 circuit pack. 1. Replace the CSU module/Sync Splitter, and then run the test again. 2. If the test continues to fail with this error code, replace the UDS1-BD circuit pack and run the test again. 3. If the test continues to fail with this error code, then the problem could be in the I/O cable between the backplane and the CSU module/Sync Splitter.
1321	FAIL	DTE LOS (loss of signal) was detected between the UDS1 board and the CSU Module or the Sync Splitter. Either the UDS1 board, the CSU Module/Sync Splitter, or the I/O cable between the backplane and the CSU module/Sync Splitter (or any combination thereof) has failed. Attempt to isolate the problem to one of these areas. 1. Replace the CSU Module/Sync Splitter and run the test again. 2. If the test continues to fail with this error code, then replace the UDS1-BD board and run the test again. 3. If the test continues to fail with this error code, the problem could be in the I/O cable between the backplane and the CSU module/Sync Splitter.
1322	FAIL	No 5 volts power detected from the UDS1 circuit pack to the CSU Module or the Sync Splitter. Problem is probably due to an open fuse on the DS1 board or a faulty ICSU/Sync Splitter. **NOTE:** Do not immediately swap DS1 boards as this may blow the fuse on the new board. 1. If the test continues to fail with this error code, then replace the CSU Module/Sync Splitter and run the test again. 2. Remove the UDS1 from the system and reinsert. 3. Run the test again once the board has finished its reset. 4. If the test continues to fail with this error code, then replace the UDS1-BD board and run the test again. 5. If the test continues to fail with this error code, the problem could be in the I/O cable between the backplane and the CSU module/Sync Splitter.
1323	FAIL	A service-affecting CSU Module/Sync Splitter audit failure was detected by the UDS1 circuit pack. All administered ports on the UDS1 circuit pack are affected and maintenance software will place the ports into the out-of-service state. 1. Replace the CSU Module or the Sync Splitter.

Continued on next page

Table 9-763. TEST #138 Loss of Signal Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1324	FAIL	A non-service-affecting CSU Module/Sync Splitter audit failure was detected by the UDS1 circuit pack. No ports should be affected. No immediate action is required. These errors indicate that the CSU Module/Sync Splitter hardware may have a problem, and that it should be replaced when practical to avoid further deterioration.
1400	FAIL	Echo Canceller Function failed, this could be a hardware problem on the TN464GP/TN2464BP: 1. Issue the **busyout board** command. 2. Issue the **test board long** command. 3. Issue the **release board** command. 4. If Test 1420 still fails, replace the TN464GP/TN2464BP.
1401	FAIL	Echo Canceller Function failed, this could be a hardware problem on the TN464GP/TN2464BP: 1. Issue the **busyout board** command. 2. Issue the **reset board** command. 3. Issue the **test board long** command. 4. Issue the **release busy board** command. 5. If the test still fails replace the TN464GP/TN2464BP.
	PASS	DS1 signal is present and the physical link is healthy. In addition, no Integrated CSU/Sync Splitter errors or echo cancellation errors are detected.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Blue Alarm Inquiry Test (#139)

The Blue Alarm is a signal sent by the remote DS1 endpoint when it is out-of-service. The Blue Alarm Inquiry Test checks the blue alarm status of the remote DS1 endpoint.

When the UDS1 Interface circuit pack detects a Blue Alarm signal from the remote DS1 endpoint, the circuit pack transmits a Yellow alarm to the remote DS1 endpoint and sends a BLUE ALARM message to the maintenance software. When the Blue alarm is confirmed, the maintenance software places all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. The inquiry test runs every 10 minutes until the Blue alarm is cleared.

The UDS1 Interface circuit pack takes one second to recognize and report a Blue alarm and 16 seconds to recognize and report the resolution of a Blue alarm. When the Blue alarm is cleared, the UDS1 Interface circuit pack stops transmitting the Yellow alarm and places the trunks or ports back into the service state before the Blue alarm occurs.

Line Loopback Alarm

The Line Loopback (LLB) is used by the remote DS1 endpoint to put the ICSU or DS1 board into a loopback mode. When the ICSU or DS1 board is in the LLB mode, the arriving bit pattern is regenerated and sent back. The Line Loopback (LLB) Alarm activates when the in-band activate LLB bit pattern arrives continuously for 5 seconds on the DS1 line. The LLB deactivates when the in-band deactivate LLB bit pattern arrives continuously for 5 seconds on the DS1 line.

Since LLB is a maintenance condition rendering all DS0 channels unavailable for signaling or bearer traffic, maintenance software treats this the same as a Blue Alarm.

Payload Loopback Alarm

The Payload Loopback (PLB) is used by the remote DS1 endpoint to put the switch DS1 into a loopback mode. The PLB Alarm activates when a network protocol activate bit pattern arrives over the 4Kbps ESF data link on the DS1 line. The PLB deactivates when a network protocol deactivate bit pattern arrives over the 4Kbps ESF data link on the DS1 line.

Since PLB is a maintenance condition rendering all DS0 channels unavailable for signaling or bearer traffic, maintenance software treats this the same as a Blue Alarm

Table 9-764. TEST #139 Blue Alarm Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	The remote DS1 endpoint is out-of-service.
1 1794	FAIL	The UDS1 Interface circuit pack detects a Line Loopback Alarm (LLB). If the UDS1 interface circuit pack connects to a T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the UDS1 interface circuit pack connects directly to a switch, call the system technician of the remote switch to diagnose the DS1 endpoint. If the UDS1 interface circuit pack connects directly to a line-side terminating device (for example, a PRI terminal adapter), call the vendor of the terminating device to diagnose the equipment.

Continued on next page

Table 9-764. TEST #139 Blue Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1795	FAIL	The UDS1 Interface circuit pack detects a Payload Loopback Alarm (PLB). If the UDS1 Interface circuit pack connects to a leased T1 facility, call the vendor of the T1 carrier to diagnose the remote DS1 endpoint. If the UDS1 Interface circuit pack connects directly to another DS1 board, call the system technician of the remote switch to diagnose the DS1 endpoint. If the UDS1 Interface circuit pack connects directly to a line-side terminating device such as a PRI terminal adapter contact the vendor of the terminating device to diagnose the equipment.
	PASS	Remote DS1 endpoint is in-service. Neither a Blue alarm nor a Line Loopback alarm nor a Payload Loopback Alarm is detected by the UDS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Red Alarm Inquiry Test (#140)

A UDS1 Interface circuit pack raises a Red alarm when the framing pattern of the incoming DS1 bit stream has been lost. The Red Alarm Inquiry Test checks the framing status of a UDS1 Interface circuit pack. A UDS1 Interface circuit pack takes 3 seconds to recognize and report a Red alarm and 10 seconds to recognize and report the resolution of a Red alarm.

When the UDS1 Interface circuit pack detects a Red alarm, the circuit pack transmits a Yellow alarm to the remote DS1 endpoint and sends a RED ALARM message to the maintenance software. After the Red alarm is confirmed, the maintenance software places all trunks or ports of the circuit pack into the out-of-service state. The inquiry test runs every 10 minutes until the Red alarm is cleared.

When the Red alarm is cleared, the UDS1 Interface circuit pack stops transmitting the Yellow alarm to the remote DS1 endpoint. The maintenance software restores all trunks or ports of the UDS1 Interface circuit pack to the service state before the Red alarm occurs.

Loss of Multiframe Alarm

If the UDS1 Interface circuit pack is administered using DMI-BOS signaling, the UDS1 Interface circuit pack raises a Loss of Multiframe Alarm (LMA) when it cannot interpret the incoming signaling bits to synchronize to the multiframe pattern received in the 24th channel. Once the UDS1 Interface circuit pack detects an LMA, the circuit pack transmits a Remote Multiframe Alarm (RMA) to the remote DS1 endpoint. Maintenance software handles both Red alarm and LMA alarm(s) using the same mechanism.

Table 9-765. TEST #140 Red Alarm Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.

Table 9-765. TEST #140 Red Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	The UDS1 interface circuit pack detected a red alarm. An out of frame condition occurred on the UDS1 interface circuit pack. The UDS1 interface circuit pack will transmit a yellow alarm to the remote UDS1 endpoint until the red alarm is retired. If the UDS1 connects to a T1 network facility or to another switch, do the following. 1. Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. 2. Contact T1 Network Service or a technician at the far-end switch to diagnose the remote DS1 endpoint. 3. Check the physical connectivity of the UDS1 packs and of the cable. 4. Replace the local UDS1 interface circuit pack, and repeat the test. If the UDS1 connects to a line-side terminating device (for example, a PRI terminal adapter), do the following. 1. Verify that the switch DS1 and the line-side terminating device are administered using the same signaling mode, framing mode, and line coding. 2. Investigate the maintenance status of the line-side terminating device. Refer to the 'Line-Side Terminating Device Operating Manual' for information. 3. Contact the vendor of the line-side terminating device to diagnose the equipment. 4. Check the physical connection of the UDS1 interface circuit pack to the terminating device, and check the premise distribution system (or the intra-premise wiring) for physical connection failures. 5. Replace the local UDS1 interface circuit pack and repeat the test.

Continued on next page

Table 9-765. TEST #140 Red Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	The test failed. The UDS1 interface circuit pack detected a loss of multiframe alarm (LMA). An out of frame condition occurred on the UDS1 interface circuit pack. The UDS1 interface circuit pack will transmit a remote multiframe alarm (RMA) to the remote UDS1 endpoint until the LMA is retired. If the UDS1 connects to a T1 network facility or to another switch, do the following: 1. Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. 2. Contact T1 Network Service or a technician at the far-end switch to diagnose the remote DS1 endpoint. 3. Check the physical connectivity of the UDS1 packs and of the cable. 4. Replace the local UDS1 interface circuit pack, and repeat the test. If the UDS1 connects to a line-side terminating device (for example, a PRI terminal adapter), do the following. 1. Verify that the switch DS1 and the line-side terminating device are administered using the same signaling mode, framing mode, and line coding. 2. Investigate the maintenance status of the line-side terminating device. Refer to the 'Line-Side Terminating Device Operating Manual' for information. 3. Contact the vendor of the line-side terminating device to diagnose the equipment. 4. Check the physical connection of the UDS1 interface circuit pack to the terminating device, and check the premise distribution system (or the intra-premise wiring) for physical connection failures. 5. Replace the local UDS1 interface circuit pack and repeat the test.

Continued on next page

Table 9-765. TEST #140 Red Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	No Red alarm is detected on the UDS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Yellow Alarm Inquiry Test (#141)

Receiving a Yellow alarm from a remote DS1 endpoint indicates that the remote DS1 endpoint has an out-of-frame condition. The Yellow Alarm Inquiry Test is used to determine whether the remote DS1 endpoint is transmitting a Yellow alarm. The UDS1 Interface circuit pack takes 500 msec to recognize and report a Yellow alarm and 500 msec to recognize and report that a Yellow alarm condition is cleared.

When the UDS1 Interface circuit pack detects a Yellow alarm from the remote DS1 endpoint, it sends a YELLOW-ALARM uplink message to the maintenance software. After the maintenance software receives the YELLOW-ALARM message, the Yellow Alarm Inquiry Test is run to confirm the Yellow alarm. Once the Yellow alarm is confirmed, the maintenance software places all trunks or ports on the circuit pack into the out-of-service state. The Inquiry Test runs every 10 minutes until the Yellow alarm is cleared.

When the Yellow alarm is cleared, the maintenance software restores all trunks or ports on the UDS1 Interface circuit pack back to their previous service state before the Yellow alarm was raised.

This Yellow alarm corresponds to the yellow F2 state documented in CCITT Recommendation I.431.

Remote Multiframe Alarm

Remote Multiframe Alarm (RMA) indicates that the remote DS1 endpoint is in a Loss of Multiframe Alarm condition while the UDS1 Interface circuit pack is administered using the DMI-BOS common channel signaling. The RMA is handled as a Yellow alarm.

Yellow F5 Fault Alarm

For 32-channel E1 operation with CRC4 on, the F5 fault state is defined as a fault in the user-network interface, specifically in the direction from the user (PBX) to the network. Refer to CCITT recommendation I.431.

Table 9-766. TEST #141 Yellow Alarm Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.

Table 9-766. TEST #141 Yellow Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	Neither a Yellow alarm nor a Remote Multiframe Alarm nor a F5 state alarm is being received from the remote DS1 endpoint.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Major Alarm Inquiry Test (#142)

The Major alarm raised by a UDS1 Interface circuit pack indicates that the average bit error rate on the DS1 facility is greater than 1/1000. The Major Alarm Inquiry Test is used to determine that the received DS1 bit error rate is greater than 1/1000. The UDS1 Interface circuit pack takes 10 seconds to recognize and report a Major alarm and 10 seconds to recognize and report that a Major alarm condition is cleared.

When the UDS1 Interface circuit pack detects a Major alarm, it sends a MAJOR-ALARM message to the maintenance software. (32-channel interfaces send a YELLOW alarm to the far end). After the maintenance software receives a MAJOR-ALARM message, the Major Alarm Inquiry Test is initiated to confirm the Major alarm on the UDS1 Interface circuit pack. The Inquiry Test runs every 10 minutes until the Major alarm is cleared. The maintenance software places all trunks or ports on the circuit pack in the out-of-service state if the Major alarm persists for more than 20 minutes.

When the Major alarm is cleared, the maintenance software restores all trunks or ports on the circuit pack to their previous service state before a Major alarm occurs.

Table 9-767. TEST #142 Major Alarm Inquiry Test

Replace the local UDS1 interface circuit pack and repeat the test.

Continued on next page

Table 9-767. TEST #142 Major Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	No Major alarm is detected in the UDS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Minor Alarm Inquiry Test (#143)

The Minor alarm raised by a UDS1 Interface circuit pack indicates that the average bit error rate on the DS1 facility is greater than 1/1,000,000, but less than 1/1000. The Minor Alarm Inquiry Test is used to determine that the received DS1 bit error rate is greater than 1/1,000,000 and less than 1/1000. When D4 framing mode is selected, the UDS1 Interface circuit pack takes 41-minutes to recognize and report a Minor alarm and 41-minutes to recognize and report that a Minor alarm condition has cleared. If ESF framing mode is selected, the UDS1 Interface circuit pack takes 10 minutes to recognize and report a Minor alarm and 10 minutes to recognize and report that a Minor alarm condition has cleared.

When the UDS1 Interface circuit pack detects a Minor alarm condition, it sends a MINOR-ALARM message to the maintenance software. After the maintenance software receives a MINOR-ALARM message, the Minor Alarm Inquiry Test is initiated to confirm the Minor alarm. All trunks or ports on the circuit pack are kept in the in-service state after the Minor alarm is confirmed. The Minor Alarm Inquiry Test runs every 10 minutes until the Minor alarm is cleared.

Table 9-768. TEST #143 Minor Alarm Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.

Table 9-768. TEST #143 Minor Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	Minor alarms are often accompanied by slip and misframe alarms against the board. Trunk alarms and hardware error logs may occur on the associated trunks. If the UDS1 connects to a T1 network facility or to another switch, do the following: 1. The performance of the DS1 link between the UDS1 interface circuit pack and the remote DS1 endpoint is poor. Enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 2. Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. 3. Contact T1 Network Service or the technician at the remote switch to diagnose the equipment. 4. Check the physical connectivity of the UDS1 interface circuit packs and the cable. 5. Replace the local UDS1 interface circuit pack, and repeat the test.
	FAIL *(cont'd.)*	If the UDS1 connects to a line-side terminating device (for example, a PRI terminal adapter), do the following: 1. The performance of the DS1 link between the UDS1 interface circuit pack and the line-side terminating device is very poor. Enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 2. Verify that the switch DS1 and the line-side terminating device are administered using the same signaling mode, framing mode, and line coding. 3. Investigate the maintenance status of the line-side terminating device. Obtain the error seconds measurement on the terminating device (if possible). Refer to the 'Line-Side Terminating Device Operating Manual' for information. 4. Contact the vendor of the line-side terminating device to diagnose the equipment. 5. Check the physical connection of the UDS1 interface circuit pack to the terminating device, and check the premise distribution system (or the intra-premise wiring) for physical connection failures. 6. Replace the local UDS1 interface circuit pack and repeat the test.

Continued on next page

Table 9-768. TEST #143 Minor Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	No Minor alarm is detected in the UDS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Slip Alarm Inquiry Test (#144)

Slips occur when transmitter and receiver are not running at precisely the same clock rate. The UDS1 Interface circuit pack can detect both positive and negative slips on the DS1 facility. The Slip Alarm Inquiry Test is used to acquire the total number of slips that have occurred on a DS1 link.

When the UDS1 Interface circuit pack detects a slip condition, the circuit pack increments the on-board slip counter by one. A SLIP-COUNT message is spontaneously sent to the system software after the counter reaches a threshold (for example, 88). When the maintenance software receives the SLIP-COUNT message, the Slip Alarm Inquiry Test is initiated to query the slip counters on a UDS1 Interface circuit pack and total the slip counts in the maintenance software.

If the count of slips is over the threshold, a Minor alarm is raised against the UDS1 Interface circuit pack. All trunks or ports of the UDS1 Interface circuit pack remain in the in-service state. If the UDS1 Interface circuit pack is used to supply the system synchronization source, the MINOR alarm will initiate a synchronization source switch. See “TDM-BUS” and ‘‘SYNC (Synchronization)’’ for details.

Table 9-769. TEST #144 Slip Alarm Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.

Table 9-769. TEST #144 Slip Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1 to 88	FAIL	The test failed because the UDS1 interface circuit pack and the remote DS1 endpoint are not synchronized to the same clock rate. The UDS1 interface circuit pack detected a slip alarm. The error code equals the number of slips detected by the UDS1 interface circuit pack since the last slip alarm inquiry test. If the UDS1 connects to a T1 network facility or to another switch, do the following: 1. Retry the command at 1-minute intervals for a maximum of 5 times. 2. If the DS1 interface circuit pack is a TN464C, enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 3. Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. 4. Check the active alarm and error logs for recent alarms and errors against the synchronization (SYNC). Follow the suggested repair procedure for these errors. 5. Contact T1 Network Service or the technician at the remote switch to diagnose the remote DS1 endpoint. 6. Check the physical connectivity of the UDS1 interface circuit packs and the cable. 7. Replace the local UDS1 interface circuit pack, and repeat the test.
1 to 88 *(cont.)*	FAIL *(cont'd.)*	If the UDS1 connects to a line-side terminating device (for example, a PRI terminal adapter), do the following: 1. Retry the command at 1-minute intervals for a maximum of 5 times. 2. Enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 3. Verify that the switch DS1 and the line-side terminating device are administered using the same signaling mode, framing mode, and line coding. 4. Investigate the maintenance status of the line-side terminating device. Refer to the 'Line-Side Terminating Device Operating Manual' for information. 5. Contact the vendor of the line-side terminating device to diagnose the equipment. 6. Check the physical connection of the UDS1 interface circuit pack to the terminating device, and check the premise distribution system (or the intra-premise wiring) for physical connection failures. 7) Replace the local UDS1 interface circuit pack and repeat the test.

Table 9-769. TEST #144 Slip Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	No Slip alarm is detected on the UDS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Misframe Alarm Inquiry Test (#145)

Misframe Alarm indicates that framing bits observed on a UDS1 Interface circuit pack are in error. The Misframe Alarm Inquiry Test queries the total number of misframes that have occurred on a DS1 Interface circuit pack since the last inquiry.

When the DS1 Interface circuit pack detects a misframe error, it increments its misframe counter by one. If the counter reaches a specified threshold (i.e., 17), a MISFRAME-COUNT message is automatically sent to the switch maintenance software. After the maintenance software receives the MISFRAME-COUNT message, the Misframe Alarm Inquiry Test is initiated to collect the misframe counts from the UDS1 Interface circuit pack.

When the threshold of misframes is reached, if the UDS1 Interface circuit pack is supplying the system synchronization source, then a switching synchronization source message is sent to the TDM Bus Clock. See TDM-BUS (TDM Bus) Maintenance documentation for details. A Minor alarm against the UDS1 Interface circuit pack is raised, but all trunks or ports of the UDS1 Interface circuit pack remain in the in-service state.

Table 9-770. TEST #145 Misframe Alarm Inquiry Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-770. TEST #145 Misframe Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1 to 17	FAIL	The test failed because the UDS1 interface circuit pack detected errors in the received framing bits pattern. The error code equals the number of misframes detected by the UDS1 interface circuit pack since the last misframe alarm inquiry test. Major bit and minor bit error rate (error types 2561 and 2817) error logs often accompany misframe alarms. Clearing the cause of these error logs may clear the misframes which are occurring. If the UDS1 connects to a T1 network facility or to another switch, do the following: 1. Retry the command at 1-minute intervals for a maximum of 5 times. 2. If the DS1 interface circuit pack is a TN464C, enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 3. Verify that both endpoints of the DS1 link are administered using the same signaling mode, framing mode, and line coding. 4. Check the active alarm and error logs for recent alarms and errors against the synchronization (SYNC). Follow the suggested repair procedure for these errors. 5. Contact T1 Network Service or the technician at the remote switch to diagnose the remote DS1 endpoint. 6. Check the physical connectivity of the UDS1 interface circuit packs and the cable. 7. Replace the local UDS1 interface circuit pack, and repeat the test. *More information continues on the next page.*
1 to 17 *(cont.)*	FAIL *(cont'd.)*	If the UDS1 connects to a line-side terminating device such as a PRI terminal adapter: 1. Retry the command at 1-minute intervals for a maximum of 5 times. 2. Enter the **list measurement ds1-log UUCSS** command to read the error seconds measurement. 3. Verify that the switch DS1 and the line-side terminating device are administered using the same signaling mode, framing mode, and line coding. 4. Investigate the maintenance status of the line-side terminating device. Refer to the 'Line-Side Terminating Device Operating Manual' for information. 5. Contact the vendor of the line-side terminating device to diagnose the equipment. 6. Check the physical connection of the UDS1 interface circuit pack to the terminating device, and check the premise distribution system (or the intra-premise wiring) for physical connection failures. 7. Replace the local UDS1 interface circuit pack and repeat the test.

Table 9-770. TEST #145 Misframe Alarm Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	No Misframe alarm is detected on the UDS1 Interface circuit pack.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Translation Update Test (#146)

The Translation Update Test sends the circuit-pack-level information specified by System Administration to the UDS1 Interface circuit pack. Translation includes the following data administered for a UDS1 Interface circuit pack (see output of **display ds1 UUCSS** command): DS1 Link Length between two DS1 endpoints, Synchronization Source Control, All Zero Suppression, Framing Mode, Signaling Mode, Time Slot Number of 697-Hz Tone, Time Slot Number of 700-Hz Tone, etc.

In G3V3, if a TN464F or later UDS1 circuit pack is combined with a Lucent 120A1 CSU Module or the 401A T1 Sync Splitter to form an Integrated CSU Module/T1 Sync Splitter, this test will also send the administration for this Integrated CSU to the circuit pack to assure the board's translations are correct. The administration of the CSU Module/T1 Sync Splitter is done using the **DS1 Circuit Pack** administration form. Translation for the CSU Module/T1 Sync Splitter includes the following data: Transmit LBO, Receive ALBO, Supply CPE Loopback Jack Power?, etc.

Table 9-771. TEST #146 Translation Update Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute interval s a maximum of 5 times.
	FAIL	Internal system software error. 1. Enter the **display ds1 UUCSS** command to verify the UDS1 Interface circuit pack translation.
	PASS	Translation data has been downloaded to the UDS1 Interface circuit pack successfully.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

DS1 Board Loopback Test (#1209)

This test is destructive.

The DS1 Board Loopback (BLB) Test causes a loopback at the DS1 board edge and tests DS1 board internal circuitry.

The test is destructive and can only be initiated by a system technician demanded **test ds1-loop UUCSS ds1/csu-loopback-tests** command.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running the BLB Test.

When the BLB Test is initiated, maintenance software sends an appropriate message to the UDS1 Interface circuit pack to start the test. The board sets up the BLB loopback, transmits a test pattern, and verifies that the pattern is received unaltered through the loopback. If the transmitted and received pattern is different, the test fails.

When the test is complete, all trunks or ports on the TN464GP/TN2464BPTN UDS1 Interface circuit pack are restored to the in-service state after the **release board** command is entered.

Table 9-772. TEST #1209 DS1 Board Loopback Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the **test ds1-loop UUCSS ds1/csu-loopback-tests** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	DS1 Board Loopback Test cannot be executed in the current configuration. To run this, the TN464F or later suffix UDS1 must be administered for 24-channel operation. The "Bit Rate" field on the DS1 circuit pack administration form must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the command.

Continued on next page

Table 9-772. TEST #1209 DS1 Board Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1039	ABORT	The UDS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the UDS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit pack via the following command sequence: 1. Issue the **disable synchronization-switch** command. 2. Next, issue the **set synchronization UUCSS** command. 3. Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loopback/span test is already executing on the DS1 board or the board is in a network requested loopback mode (Line loopback or Payload loopback). The hardware error log will indicate whether a Customer Loopback Jack Test, Far CSU Loopback Test, or the One-Way Span Test is executing or if the board is in line loopback or payload loopback mode. Only one long-duration loopback/span test can be active at a given time. Thus, if a loopback/span test is already active, that test must be terminated via the **test ds1-loop UUCSS end-loopback/span-test** command in order to execute this test.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.

Table 9-772. TEST #1209 DS1 Board Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	UDS1 Interface circuit pack failed the DS1 Board Loopback Test. 1. Retry the **test ds1-loop UUCSS ds1/csu-loopback-tests** command. 2. If the BLB test continues to fail, then replace the UDS1 circuit pack.
	PASS	The BLB test executed successfully. The test pattern was transmitted and received successfully up to the DS1 board edge.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

CSU Equipment Loopback Test (#1210)

This test is destructive.

The CSU Equipment Loopback (ELB) Test causes a loopback at the near-edge of the local Lucent 120A1 CSU Module or the 401A T1 Sync Splitter and tests the connection from the DS1 board to the CSU Module/T1 Sync Splitter (DS1 board edge interconnecting cable, and CSU Module/T1 Sync Splitter edge). This test is only performed if the Lucent 120A1 CSU Module or the 401A T1 Sync Splitter is present, administered, and connected to a 1.544 Mbps DS1 circuit pack on the back of the port carrier.

The test is destructive and can only be initiated by a system technician demanded **test ds1-loop UUCSS ds1/csu-loopback-tests** command.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running the ELB Test.

When the ELB Test is initiated, maintenance software sends an appropriate message to the UDS1 Interface circuit pack to start the test. The board sets up the ELB loopback, transmits a test pattern, and verifies that the pattern is received unaltered through the loopback. If the transmitted and received pattern is different, the test fails.

When the test is complete, all trunks or ports on the UDS1 Interface circuit pack are restored to the in-service state after the **release board** command is entered.

Table 9-773. TEST #1210 CSU Equipment Loopback Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the **test ds1-loop UUCSS ds1/csu-loopback-tests** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	CSU Equipment Loopback Test cannot be executed in the current configuration. To run this test, the *Near-End CSU Type* field on the DS1circuit pack administration form must be set to *integrated* and the "Bit Rate" field on the DS1 circuit pack administration form must be set to "1.544" (24-channel configuration). 1. Use the **change ds1 UUCSS** command to set the *Near-End CSU Type* field on the DS1 circuit pack administration form to *integrated*, and/or change the "Bit Rate" field to "1.544" if the board is to be used in 24-channel configuration. 2. Retry the ***test ds1-loop UUCSS ds1/csu-loopback-tests*** command.

Table 9-773. TEST #1210 CSU Equipment Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
1039	ABORT	The UDS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the UDS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit pack via the following command sequence: 1. Issue the **disable synchronization-switch** command. 2. Next, issue the **set synchronization UUCSS** command. 3. Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loopback/span test is already executing on the DS1 board or the board is in a network requested loopback mode (Line loopback or Payload loopback). The hardware error log will indicate whether a Customer Loopback Jack Test, Far CSU Loopback Test, or the One-Way Span Test is executing or if the board is in line loopback or payload loopback mode. Only one long-duration loopback/span test can be active at a given time. Thus, if a loopback/span test is already active, that test must be terminated using the **test ds1-loop UUCSS end-loopback/span-test** command in order to execute this test.
1951	ABORT	The CSU Equipment Loopback Test could not be executed because the 120A1 CSU Module or the 401A T1 Sync Splitter was not physically installed. Physically connect the 120A1 CSU Module or the 401A T1 Sync Splitter to the UDS1-BD board on the back of the port carrier.

Continued on next page

Table 9-773. TEST #1210 CSU Equipment Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	UDS1 Interface circuit pack failed the CSU Equipment Loopback Test. 1. Retry the **test ds1-loop UUCSS ds1/csu-loopback-tests** command. 2. If the ELB test continues to fail, then either the UDS1-BD board, the CSU Module/T1 Sync Splitter, or the I/O cable between the backplane and the CSU module/T1 Sync Splitter (or any combination thereof) has failed. Attempt to isolate the problem to one of these areas. Begin by replacing the CSU Module/T1 Sync Splitter and running the **test ds1-loop UUCSS ds1/csu-loopback-tests** command again. 3. If the ELB test continues to fail, then replace the UDS1-BD board and run the **test ds1-loop UUCSS ds1/csu-loopback-tests** command again. 4. If the ELB test continues to fail, the problem could be in the I/O cable between the backplane and the CSU module/T1 Sync Splitter.

Continued on next page

Table 9-773. TEST #1210 CSU Equipment Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The ELB test executed successfully. The test pattern was transmitted and received successfully over the connection from the DS1 board to the near-edge of the 120A1 CSU Module or the 401A T1 Sync Splitter.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

CSU Repeater Loopback Test (#1211)

This test is destructive.

The CSU Repeater Loopback (RLB) Test causes a loopback at the far-edge of the local Lucent 120A1 CSU Module or the 401A T1 Sync Splitter and tests the connection from the DS1 board to and including the CSU Module/T1 Sync Splitter circuitry. This test is only performed if the Lucent 120A1 CSU Module or the 401A T1 Sync Splitter is present, administered, and connected to a 1.544 Mbps DS1 circuit pack on the back of the port carrier.

The test is destructive and can only be initiated by a system technician demanded **test ds1-loop UUCSS ds1/csu-loopback-tests** command.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running the RLB Test.

When the RLB Test is initiated, maintenance software sends an appropriate message to the UDS1 Interface circuit pack to start the test. The board sets up the RLB loopback, transmits a test pattern, and verifies that the pattern is received unaltered through the loopback. If the transmitted and received pattern is different, the test fails.

When the test is complete, all trunks or ports on the UDS1 Interface circuit pack are restored to the in-service state after the **release board** command is entered.

Table 9-774. TEST #1211 CSU Repeater Loopback Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the **test ds1-loop UUCSS ds1/csu-loopback-tests** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	CSU Repeater Loopback Test cannot be executed in the current configuration. To run this test, the `Near-End CSU Type` field on the **DS1Circuit Pack** administration form must be set to `integrated` and the `Bit Rate` field on the **DS1 Circuit Pack** administration form must be set to `1.544` (24-channel configuration). 1. Use the **change ds1 UUCSS** command to set the `Near-End CSU Type` field on the **DS1 Circuit Pack** administration form to `integrated`, and/or change the `Bit Rate` field to `1.544` if the board is to be used in 24-channel configuration. 2. Retry the **test ds1-loop UUCSS ds1/csu-loopback-tests** command.

Table 9-774. TEST #1211 CSU Repeater Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
1039	ABORT	The UDS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the UDS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit pack via the following command sequence: 1. Issue the **disable synchronization-switch** command. 2. Next, issue the **set synchronization UUCSS** command. 3. Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loopback/span test is already executing on the DS1 board or the board is in a network requested loopback mode (Line loopback or Payload loopback). The hardware error log will indicate whether a Customer Loopback Jack Test, Far CSU Loopback Test, or the One-Way Span Test is executing or if the board is in line loopback or payload loopback mode. Only one long-duration loopback/span tests can be active at a given time. Thus, if a loopback/span test is already active, that test must be terminated using the **test ds1-loop UUCSS end-loopback/span-test** command in order to execute this test.
1951	ABORT	The CSU Repeater Loopback Test could not be executed because the 120A1 CSU Module or the 401A T1 Sync Splitter was not physically installed. Physically connect the 120A1 CSU Module or the 401A T1 Sync Splitter to the UDS1 board on the back of the port carrier.

Table 9-774. TEST #1211 CSU Repeater Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
	FAIL	UDS1 Interface circuit pack failed the CSU Repeater Loopback Test. 1. Retry the **test ds1-loop UUCSS ds1/csu-loopback-tests** command. 2. If the RLB test continues to fail, and the CSU Equipment Loopback Test (#1210) passed, then replace the CSU Module/T1 Sync Splitter.

Table 9-774. TEST #1211 CSU Repeater Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The RLB test executed successfully. The test pattern was transmitted and received successfully over the connection from the UDS1 board to the far-edge of the 120A1 CSU Module or the 401A T1 Sync Splitter.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

CPE Loopback Jack Test (#1212)

This test is destructive.

The CPE Loopback Jack (CLJ-LB) Test causes a loopback at the CPE Loopback Jack and tests the building wiring connection between the UDS1-BD DS1 board and the CPE Loopback Jack.

The test is highly destructive and can only be initiated by a system technician demanded ***test ds1-loop UUCSS cpe-loopback-jack-test-begin [number-of-bits bit-pattern]*** command. The System technician has the choice of entering a loopback activation code on the command line or using the default code *0x47F*.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running the CPE Loopback Jack Test.

The CPE Loopback Jack Test has the UDS1 Interface circuit pack transmit a loopback activation code to the CPE Loopback Jack, waits up to 10 seconds for return of the code to verify the loopback has been established, transmits a framed 3-in-24 test pattern, begins counting bit errors in the received test pattern, and returns a PASS result to indicate that the pattern was successfully sent. If the loopback is not established within the 10 seconds, the test returns FAIL or abort.

The status of the CPE Loopback Jack test is available in the hardware error log via Error Type 3900. Several distinct Aux values give the user information on the status of the test.

The **list measurements ds1 summary** command will display the length of time the test has been running (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). If the test pattern is being passed through the loopback cleanly, the number of bit errors should be very low. The command will also display the type of Loopback/Span test executing (`Test` field), the type of pattern generated for the Loopback/Span test (`Pattern` field), and whether the pattern (i.e. 3-in-24 Pattern) is synchronized (`Synchronized` field).

To terminate the test, enter the **test ds1-loop UUCSS end-loopback/span-test** command or the **release board** command. Using the **release board** command will restore all trunks or ports on the UDS1 Interface circuit pack to the in-service state.

Table 9-775. TEST #1212 CPE Loopback Jack Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the **test ds1-loop UUCSS cpe-loopback-jack-test-begin** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	CPE Loopback Jack Test cannot be executed in the current configuration. To run this test, the TN464F or later suffix UDS1 must be administered for 24-channel operation. The "Bit Rate" field on the DS1 circuit pack administration form must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
1039	ABORT	The UDS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the UDS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit pack via the following command sequence: 1. Issue the **disable synchronization-switch** command. 2. Next, issue the **set synchronization UUCSS** command. 3. Lastly, issue the **enable synchronization-switch** command.

Table 9-775. TEST #1212 CPE Loopback Jack Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2	FAIL	The CLJ-LB test failed because it was not set up properly. The UDS1 interface pack could not successfully put the CPE loopback jack into loopback mode. 1. Rerun the **test ds1-loop UUCSS cpe-loopback-jack-test-begin** command. 2. If the test continues to fail, the problem could be with the UDS1-BD board, the CPE loopback jack equipment, or somewhere between. Run the **test ds1-loop UUCSS ds1/csu-loopback-tests** command to determine if the loopback tests that are closer to the UDS1-BD board are successful. If any of these tests fail, follow the maintenance strategy that is associated with the test that fails.
3	FAIL	The CPE Loopback Jack Test was not set up properly. The framed 3-in-24 test pattern, generated by the UDS1 Interface circuit pack and looped back through the CPE Loopback Jack, could not be detected properly by the UDS1 circuit pack. 1. Retry the **test ds1-loop UUCSS cpe-loopback-jack-test-begin** command. 2. If the CPE Loopback Jack test continues to fail, the problem could be with the UDS1-BD board, the CPE Loopback Jack equipment, or somewhere in between. Run the **test ds1-loop UUCSS ds1/csu-loopback-tests** command to see if the loopback tests closer to the UDS1-BD board are successful. If any of those loopback tests fail, follow the maintenance strategy associated with those loopbacks.

Continued on next page

Table 9-775. TEST #1212 CPE Loopback Jack Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The CPE Loopback Jack test has successfully began executing. The test will continue to run until the system technician enters the **test ds1-loop UUCSS end-loopback/span-test** command or the **release board UUCSS** command.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Far CSU Loopback Test (#1213)

This test is destructive.

The Far CSU Loopback (R-LLB) Test causes a loopback at the far-end CSU and tests all circuitry and facilities from the local DS1 board to the far-end CSU.

The test is destructive and can only be initiated by a system technician demanded **test ds1-loop UUCSS far-csu-loopback-test-begin** command.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running the Far CSU Loopback Test.

If the far-end CSU is not a Lucent 120A1 CSU Module or the 401A T1 Sync Splitter, and the DS1 is administered for ami-zcs line coding, density protection must be disabled on the CSU/T1SS during the test due to the large number of zero's in the 3-in-24 test pattern.

The Far CSU Loopback Test has the UDS1 Interface circuit pack transmit a loopback activation code to the remote CSU, waits up to 15 seconds for return of the code to verify the loopback has been established, transmits a framed 3-in-24 test pattern, begins counting bit errors in the received test pattern, and returns a PASS result. If the loopback is not established within the 15 seconds, the test fails.

The status of the Far CSU Loopback test is available in the hardware error log via Error Type 3901. Several distinct Aux values give the user information of the status of the test.

The **list measurements ds1 summary** command will display the length of time the test has been running (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). If the test pattern is being passed through the loopback cleanly, the number of bit errors should be very low. The command will also display the type of Loopback/Span test executing (`Test` field), the type of pattern generated for the type of Loopback/Span test (`Pattern` field), and whether the pattern (i.e. 3-in-24 Pattern) is synchronized (`Synchronized` field).

To terminate the test, enter the **test ds1-loop UUCSS end-loopback/span-test** command or the **release board** command. Using the **release board** command will restore all trunks or ports on the UDS1 Interface circuit pack to the in-service state.

Table 9-776. TEST #1213 Far CSU Loopback Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the **test ds1-loop UUCSS far-csu-loopback-test-begin** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	Far CSU Loopback Test cannot be executed in the current configuration. To run this, the TN464F or later suffix UDS1 must be administered for 24-channel operation. The "Bit Rate" field on the DS1 circuit pack administration form must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
1039	ABORT	The UDS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the UDS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit pack via the following command sequence: 1. Issue the **disable synchronization-switch** command. 2. Next, issue the **set synchronization UUCSS** command. 3. Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loopback/span test is already executing on the DS1 board or the board is in a network requested loopback mode (Line loopback or Payload loopback). The hardware error log will indicate whether a Customer Loopback Jack Test, Far CSU Loopback Test, or the One-Way Span Test is executing or if the board is in line loopback or payload loopback mode. Only one long-duration loopback/span test can be active at a given time. Thus, if a loopback/span test is already active, that test must be terminated using the **test ds1-loop UUCSS end-loopback/span-test** command in order to execute this test.

All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2	FAIL	The test failed because it was not set up properly. The UDS1 pack could not successfully put the far-end CSU into loopback mode. 1. Rerun the **test ds1-loop UUCSS far-csu-loopback-test-begin** command. 2. If the test continues to fail, the problem could be with the UDS1-BD board, the CPE loopback jack equipment, or somewhere between. Run the **test ds1-loop UUCSS cpe-loopback-jack-test-begin** command to determine if the CPE loopback jack loopback test is successful. If a CPE loopback jack device is not being used, issue the **test ds1-loop UUCSS ds1/csu-loopback-tests** command instead. If the closer loopback test fails, follow the maintenance strategy associated with that test.

Continued on next page

Table 9-776. TEST #1213 Far CSU Loopback Test — *Continued*

Error Code	Test Result	Description/ Recommendation
3	FAIL	The Far CSU Loopback Test was not set up properly. The framed 3-in-24 test pattern, generated by the UDS1 Interface circuit pack and looped back through the far-end CSU, could not be detected properly by the UDS1 circuit pack. 1. Retry the **test ds1-loop UUCSS far-csu-loopback-test-begin** command. 2. If the Far CSU Loopback test continues to fail with this error code, the problem could be with the UDS1-BD board, the far-end CSU equipment, or somewhere in between. Run the **test ds1-loop UUCSS cpe-loopback-jack-test-begin** command to see if the CPE Loopback Jack test which is closer to the UDS1-BD board is successful. (If a CPE Loopback Jack device is not being used, then run the **test ds1-loop UUCSS ds1/csu-loopback-tests** command to see if these even closer loopback tests succeed). If the closer loopback test fails, follow the maintenance strategy associated with that loopback.
	PASS	The Far CSU Loopback test has successfully began executing. The test will continue to run until the system technician enters the **test ds1-loop UUCSS end-loopback/span-test** command or the **release board UUCSS** command.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

One-Way Span Test (#1214)

This test is destructive.

The One-Way Span Test allows one-way span testing to and from remote test equipment or another DEFINITY communications system. This tests all circuitry and facilities from the local DS1 board to the remote test equipment or other DEFINITY communications system.

The test is destructive and can only be initiated by a system technician demanded **test ds1-loop UUCSS one-way-span-test-begin** command.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running the One-Way Span Test.

The One-Way Span Test has the UDS1 Interface circuit pack transmit a framed 3-in-24 test pattern and attempt to receive and verify the pattern. If the UDS1-BD board receives a framed 3-in-24 test pattern sent from another DEFINITY G3V3 or test equipment at the far-end of the DS1, it begins counting bit errors within the received pattern.

The status of the One-Way Span test is available in the hardware error log via Error Type 3902. Several distinct Aux values give the user information of the status of the test.

The **list measurements ds1 summary** command will display the length of time the test has been running (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). If the test pattern is being sent cleanly over the span from the far-end, the number of bit errors should be very low. The `Test Duration` field will show `0` until the test pattern is received from the far-end. Upon receiving the test pattern, the board will begin calculating the test duration and number of bit errors. The command will also display the Loopback/Span test executing (`Test` field), the type of pattern generated for the Loopback/Span test (`Pattern` field), and whether the pattern (i.e. 3-in-24 Pattern) is synchronized (`Synchronized` field).

To terminate the test, enter the **test ds1-loop UUCSS end-loopback/span-test** command or the **release board** command. Using the **release board** command will restore all trunks or ports on the UDS1 Interface circuit pack to the in-service state.

Table 9-777. TEST #1214 One-Way Span Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the **test ds1-loop UUCSS one-way-span-test-begin** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	One-Way Span Test cannot be executed in the current configuration. To run this, the TN464F or later suffix UDS1 must be administered for 24-channel operation. The "Bit Rate" field on the DS1 circuit pack administration form must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the command.
1039	ABORT	The UDS1 Interface circuit pack is providing timing for the system. Executing this test could cause major system disruption. If the UDS1 Interface circuit pack needs to be tested, set the synchronization reference to another DS1 Interface circuit pack or to the Tone-Clock circuit pack via the following command sequence: 1. Issue the **disable synchronization-switch** command. 2. Next, issue the **set synchronization UUCSS** command. 3. Lastly, issue the **enable synchronization-switch** command.
1950	ABORT	Another loopback/span test is already executing on the DS1 board or the board is in a network requested loopback mode (Line loopback or Payload loopback). The hardware error log will indicate whether a Customer Loopback Jack Test, Far CSU Loopback Test, or the One-Way Span Test is executing or if the board is in line loopback or payload loopback mode. Only one long-duration loopback/span test can be active at a given time. Thus, if a loopback/span test is already active, that test must be terminated using the **test ds1-loop UUCSS end-loopback/span-test** command in order to execute this test.

Table 9-777. TEST #1214 One-Way Span Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-777. TEST #1214 One-Way Span Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The One-Way Span test has successfully began transmitting a framed 3-in-24 test pattern. The test will continue to run until the system technician enters the **test ds1-loop UUCSS end-loopback/span-test** command or the **release board UUCSS** command.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Inject Single Bit Error Test (#1215). This test is destructive.

The Inject Single Bit Error Test causes a single bit error to be sent within an active framed 3-in-24 test pattern.

The test is highly destructive and can only be initiated by a system technician demanded **test ds1-loop UUCSS inject-single-bit-error** command. An attempt to use this command will be rejected if none of the three long-duration DS1 loopback/span tests (CPE Loopback Jack Test, Far CSU Loopback Test, One-Way Span Test) are active on a UDS1-BD circuit pack.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running the Inject Single Bit Error Test.

The **list measurements ds1 summary** command displays the number of bit errors detected (`Loopback/Span Test Bit-Error Count` field). Injecting this single bit error should increment the bit error count of the loopback/span test by one.

Table 9-778. TEST #1215 Inject Single Bit Error Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the **test ds1-loop UUCSS inject-single-bit-error** command at 1-minute intervals a maximum of 5 times.
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the command.

Continued on next page

Table 9-778. TEST #1215 Inject Single Bit Error Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-778. TEST #1215 Inject Single Bit Error Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	A single bit error has been successfully injected into an active framed 3-in-24 test pattern.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

End Loopback/Span Test (#1216)

This test is destructive.

The End Loopback/Span Test terminates an active loopback or span test on a UDS1 circuit pack. Bit error counting against the received test pattern stream is terminated and sending of the framed 3-in-24 test pattern is halted. If either the CPE Loopback Jack or the far-end CSU is looped, the appropriate loopback deactivate code is sent. If the loopback cannot be deactivated, then the test returns FAIL, and a MINOR alarm is noted in the alarm log until the loopback is cleared.

The test is highly destructive and can only be initiated by a system technician demanded **test ds1-loop UUCSS end-loopback/span-test** command. Since only one of these three different long-duration loopback/span tests can be active at a time, the UDS1-BD circuit pack knows which loopback/span test to terminate.

All trunks or ports on the UDS1 Interface circuit pack must be busied out using the system technician **busyout board** command before running this End Loopback/Span Test.

The **list measurements ds1 summary** command will display the length of time the test ran (`Test Duration` field) and number of bit errors detected (`Loopback/Span Test Bit-Error Count` field).

To restore the trunks or ports on the UDS1 Interface circuit pack to the in-service state, execute the **release board** command.

Table 9-779. TEST #1216 End Loopback/Span Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the **test ds1-loop UUCSS end-loopback/span-test** command at 1-minute intervals a maximum of 5 times.
1005	ABORT	End Loopback/Span Test cannot be executed in the current configuration. To run this test, the TN464F or later suffix DS1 board must be administered for 24-channel operation. The "Bit Rate" field on the DS1 circuit pack administration form must be set to "1.544" for 24-channel operation.
1015	ABORT	Ports on the UDS1 Interface circuit pack have not been busied out to out-of-service. 1. Enter the **busyout board UUCSS** command to put all trunks or ports of the UDS1 Interface circuit pack into the out-of-service state. 2. Retry the command.

Table 9-779. TEST #1216 End Loopback/Span Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. **NOTE:** When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
1313	FAIL	The UDS1 circuit pack could not deactivate the loopback through the Customer Loopback Jack. 1. Retry the **test ds1-loop UUCSS end-loopback/span-test** command at 1-minute intervals for a maximum of 5 times.
1314	FAIL	The UDS1 circuit pack could not deactivate the loopback through the far-end CSU. 1. Make sure that the far-end DS1 is installed if the far-end CSU is a 120A1 Lucent CSU Module/T1 Sync Splitter. 2. Retry the ***test ds1-loop UUCSS end-loopback/span-test*** command at 1-minute intervals for a maximum of 5 times.

Continued on next page

Table 9-779. TEST #1216 End Loopback/Span Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The active long-duration loopback or span test on the UDS1-BD circuit pack was successfully terminated.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

ICSU Status LEDs Test (#1227)

The UDS1 circuit pack has four status LEDs on the faceplate in addition to the three standard faceplate LEDs. These four status LEDs are associated with the 120A1 Channel Service Unit (CSU) Module that can be connected to the UDS1-BD board through the I/O connector panel on the back of the port carrier. The UDS1-BD circuit pack, combined with the 120A1 CSU Module or the 401A T1 Sync Splitter, forms an Integrated CSU (I-CSU).

This test is a visual test. It lights the four status LEDs red for 5 seconds, then lights them green for 5 seconds, then lights them yellow for 5 seconds, then turns the LEDs off and returns control of the status LEDs to the circuit pack.

This test is only be executed on TN464F or later suffix UDS1 circuit packs administered for 24-channel operation (1.544 bit rate).

If the 120A1 CSU Module or the 401A T1 Sync Splitter is not physically installed, the status LEDs are always off and this test aborts.

Table 9-780. TEST #1227 ICSU Status LEDs Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
1005	ABORT	The ICSU Status LEDs test can not be executed for the current configuration. The test applies only to TN464F or later UDS1 circuit packs administered for 24-channel operation (1.544 bit rate). 1. If the circuit pack is a TN464F or later suffix UDS1 circuit pack, then retry the command.
1951	ABORT	The ICSU Status LEDs Test can not be executed because a 120A1 or later suffix CSU Module or a 401A or later suffix T1 Sync Splitter is not physically installed. If using a 120A1 CSU Module or the 401A T1 Sync Splitter, physically connect it to the UDS1-BD board on the back of the port carrier. Otherwise, ignore this abort.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2500	ABORT	Internal system error. 1. Retry the command.

Continued on next page

Table 9-780. TEST #1227 ICSU Status LEDs Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The ICSU Status LEDs test executed successfully. A PASS result, however, does not necessarily mean that the status LEDs behaved properly. It only means that the software successfully attempted to light the status LEDs. This is a visual test. The service technician must visually exam the behavior of the LEDs while the test is running. The LEDs are functioning properly if the four status LEDs are lit red for 5 seconds, then lit green for 5 seconds, then lit yellow for 5 seconds. If the LEDs behave differently, the board should be replaced at the customer's convenience.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

Echo Canceller Test (#1420)

This test is destructive.

NOTE:
This test is executed only for TN464GP/TN2464BP circuit packs that have been administered on the DS1 circuit pack form to provide echo cancellation. The TN464GP/TN2464BP must be busied out before this demand test is run.

This test is for the TN464GP and TN2464BP circuit packs. The test originates from a manually initiated **test board long** demand test of a TN464GP/TN2464BP circuit pack. The test instructs firmware to test the echo cancellation circuity. The TN464GP/TN2464BP firmware tests echo cancellation on a subset of channels. If any channel fails twice, or if any two channels fail once, the test fails, and echo cancellation is bypassed on all channels of the board. Otherwise the test passes, and echo cancellation is configured to the administered parameters.

Table 9-781. TEST #1420 Echo Canceller Test

Error Code	Test Result	Description/ Recommendation
1015	ABORT	The board is not busied out. This test will abort if the UDS1 circuit pack under test is in service.
2000	ABORT	Response to the test was not received within the allowable time period. This may be due to hyperactivity. Error Type 1538 in the error log indicates hyperactivity. The hyperactive circuit pack is out of service and one or more of the following symptoms may be exhibited. 1. The UDS1-BD tests (such as Test #138 and Test #139) are aborting with error code 2000. 2. The tests run on the ports of this circuit pack are returning a no board result. 3. A **busyout** or a **release** command has no affect on the test results. 4. A **list config** command shows that the circuit pack and the ports are properly installed. When hyperactivity occurs, the circuit pack is isolated from the system, and all of the trunks for this circuit pack are placed into the out of service state. The system will try to restore the circuit pack within 15 minutes. When no faults are detected for 15 minutes, the UDS1 interface circuit pack is restored to normal operation. All of the trunks for the UDS1 interface circuit pack are then returned to the in service state. Hyperactivity is often caused by the associated facility. In such a case, faults (such as slips, misframes, or blue alarms) would be entered in the error log. In addition, many hardware errors would be logged against the associated trunk circuits. If the facility is OK and the error occurs again after 15 minutes, replace the circuit pack.

Continued on next page

Table 9-781. TEST #1420 Echo Canceller Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Internal system error. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
2500	ABORT	Internal system error. 1. Retry the command at 1-minute intervals for a maximum of 5 times.
1400, 1401	FAIL	The Echo Cancellation Test has failed: ■ Error 1400 - Echo canceller function failed. The Echo Canceller Function Test, which is executed by firmware, failed. ■ Error 1401 - Echo canceller memory failed. The Echo Canceller Memory Test, which is executed by firmware, failed. Echo Cancellation is no longer being supplied by the board. Clear the alarm using the following commands: **busyout board UUCSS**, **test board UUCSS long**, **release board UUCSS**. If the test still fails, replace the circuit pack. **NOTE:** When this test fails, echo cancellation will be bypassed on all channels on the board. The circuit pack can still be used for a T1/E1 line interface without echo cancellation. This capability provides limited service for the customer until the circuit pack can be changed out.
	PASS	The Echo Cancellation feature is functioning properly.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Ensure that the board translations are correct. Execute the **add ds1 UUCSS** command to administer the UDS1 interface if it is not already administered. 2. If the board was already administered correctly, check the error log to determine whether the board is hyperactive. If this is the case, the board is shut down. Reseating the board will re-initialize the board. 3. If the board was found to be correctly inserted in step 1, then issue the **busyout board** command. 4. Issue the **reset board** command. 5. Issue the **release busy board** command. 6. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port.

VC-BD

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
VC-BD	MAJOR	test board UUCSS l r#	Voice Conditioner Circuit Pack
VC-BD	MINOR	test board UUCSS l r#	Voice Conditioner Circuit Pack
VC-BD	WARNING[2]	test board UUCSS s r#	Voice Conditioner Circuit Pack

1. Where UU is the universal cabinet number (1 for PPN and 2-44 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...); and pp is the two digit port number (01, 02, 03, ...).
2. Refer to XXX-BD (Common Port Board) Maintenance documentation.

CAUTION:
If the TN788 Voice Conditioner Circuit Pack (VC-BD) is not Vintage 2 or later, it must be replaced.

The TN788 Voice Conditioner Circuit Pack (VC-BD) is a service circuit pack that provides conditioning for the audio signals from multimedia equipment based on the CCITT H.221 standard. The TN788 transcodes, gain adjusts, and bridges the audio bit streams demultiplexed by the TN787 (MMI) circuit pack and transmits encoded, exclusive audio conference sums onto the TDM bus so that the MMI can multiplex the audio, video, and data streams for the H.221 endpoints.

Error Log Entries and Test to Clear Values

Table 9-782. VC-BD Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test board UUCSS sh r 1

769 (e)	4358				
1025 (f)	4363	NPE Audit Test (#50)			

Continued on next page

Table 9-782. VC-BD Error Log Entries — *Continued*

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1281 (g)	Any	SAKI Sanity Test (#53)	MAJ	On	
1293 to 1294 (h)	46088 to 46096	SAKI Sanity Test (#53)	MIN	ON	
1538 (i)	46082		MIN	ON	

1. Run the short test sequence first. If all tests pass, run the long test sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. The circuit pack stopped functioning or it was removed from the system. This alarm is logged approximately 11-minutes after the circuit pack is removed and/or the SAKI Sanity Test (#53) fails.

   To resolve this error, insert a circuit pack in the same slot as the error indicates, if the circuit pack is not already in the system. Or, if the circuit pack is in the system and the red LED is on, then follow instructions for Red alarms.

   CAUTION:
   If the TN788 Voice Conditioner Circuit Pack (VC-BD) is not Vintage 2 or later, it must be replaced.

b. This circuit pack is busied out by the **busyout board UUCSS** command.

c. Transient communication problems exist between the switch and this circuit pack. Execute the **test board UUCSS** command and refer to the repair procedures for the Control Channel Looparound Test (#52).

d. The circuit pack detected an on-board hardware failure. The reported aux data values correspond to the following detected errors:

Error	Description
4352	External RAM error
4353	Internal RAM error
4355	ROM Checksum error
4357	Instruction set error

Reset the circuit pack by executing the **busyout board UUCSS**, **reset board UUCSS**, and **release board UUCSS** commands. When it is reset, the circuit pack executes a set of tests to detect the presence of any of the above faults. The detection of one these errors during initialization causes the circuit pack to lock-up and appear insane to the system. See the repair procedures in footnote (a) for error type 1.

e. The circuit pack detects a program logic error. While no action is required, this error may lead to errors of other types being reported against this circuit pack.

f. The circuit pack cannot update NPE memory and read it back. This error type can be ignored, but it may lead to other error types being reported against this circuit pack.

g. A critical hardware failure has been detected on the circuit pack. Use **busyout board UUCSS, reset board UUCSS**, followed by **release board UUCSS**. If test #53 passes, the on-board circuitry is healthy. Use **test board UUCSS long clear** to retire the alarm. If test #53 fails, replace the circuit pack.

h. The circuit pack detected a critical hardware failure. Reset the circuit pack by issuing the **busyout board UUCSS**, **reset board UUCSS**, and **release board UUCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm by issuing the **test board UUCSS long clear** command. If the Circuit Pack Restart Rest (#594) fails, replace the circuit pack.

The reported error types correspond to the following detected errors:

Error	Description
1293	On-board auxiliary processor insane
1294	Internal memory access error

i. The circuit pack is hyperactive — it is flooding the switch with messages sent over the control channel. The circuit pack is taken out of service when a threshold number of these errors is reported to the switch. Clear the alarm by using **busyout board UUCSS**, **reset board UUCSS**, **test board UUCSS long clear**, and **release board UUCSS**. If the error recurs within 10 minutes, then replace the circuit pack.

System Technician-Demanded Tests: Descriptions and Error Code

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Control Channel Loop-Around Test (#52)[2]	X	X	ND

1. D = Destructive; ND = Nondestructive
2. Refer to the repair procedure described in the XXX-BD (Common Port Circuit Pack) maintenance documentation for a description of this test.

CAUTION:
If the TN788 Voice Conditioner Circuit Pack (VC-BD) is not Vintage 2 or later, it must be replaced.

Control Channel Looparound Test (#52)

Refer to the repair procedure described in the XXX-BD (Common Port Circuit Pack) maintenance documentation as Control Channel Looparound Test (#52).

VC-DSPPT

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
VC-DSPPT	MAJOR	test port UUCSSpp	Voice Conditioner DSP Port
VC-DSPPT	MINOR	test port UUCSSpp	Voice Conditioner DSP Port
VC-DSPPT	WARNING	test port UUCSSpp	Voice Conditioner DSP Port

1. Where UU is the universal cabinet number (1 for PPN and 2-44 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...); and pp is the two digit port number (01, 02, 03, ...).

Each Voice Conditioner Circuit Pack (VC-BD) provides two types of resources:

1. Transcoder Resources used for encoding and decoding audio formats
2. Summer Resources used for summing audio from different sources

The eight Voice Conditioner DSP ports are the transcoder resources on the VC-BD.

Error Log Entries and Test to Clear Values

Table 9-783. VC-DSPPT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/ Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test port UUCSSpp sh r 1
18 (a)	0	busyout port UUCSSpp	WNG	OFF	release port UUCSSpp
257 (b)	Any	NPE Crosstalk Test (#6)	MIN	ON	test port UUCSSpp 1 r 3
513 (c)	Any	VC DSP Port Local TDM Loopback Test (#1104)	MIN	ON	test port UUCSSpp sh r 3
778 to 781 (d)	Any	VC Port Reset DSP Test (#1106)	MAJ	ON	See note (d)
1025 (e)			WNG	ON	
1281 (f)	Any	VC DSP Port DSP Loopback Test #(1105)	MIN	ON	test port UUCSSpp sh r 3
3840 (g)					

1. Run the short test sequence first. If all test pass, run the long test sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. This port has been busied out by the **busyout port UUCSSpp** command.

b. The VC DSP Port NPE Crosstalk Test(#1103) failed.

c. The VC DSP Port Local TDM Loopback Test(#1104) failed. Run the Long Test Sequence.

d. A critical hardware failure has been detected on the circuit pack. Reset the port by the **busyout port UUCSSpp** and **reset port UUCSSpp** commands. If the VC Reset DSP Test (#1106) passes, then the on-board circuitry is healthy. Retire the alarm with the **test port UUCSSpp long clear** command.

e. The VC DSP port reported loss of framing on the Service Channel between the VC and MMI circuit packs.

f. The VC DSP Port DSP Loopback Test (#1105) failed.

g. The DSP corresponding to this port on the VC circuit pack reported a firmware error. No action is required.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the DSP NPE Crosstalk Test, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
DSP NPE Crosstalk Test (#1103)		X	D
TDM Loopback Test (#1104)	X	X	D
DSP Loopback Test (#1105)	X	X	D

1. D = Destructive; ND = Nondestructive

DSP NPE Crosstalk Test (#1103)

This test is destructive.

The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of the port's long test sequence and takes approximately 20 to 30 seconds to complete.

Table 9-784. TEST #1103 NPE Crosstalk Test

Error Code	Test Result	Description/Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2012	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABORT	Could not allocate the necessary resources for this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The NPE of the tested port was transmitting in error, causing noisy and unreliable connections. 1. Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. 1. To be sure that this is not an intermittent problem, repeat this test a maximum of 10 times. 2. If complaints still persist, examine the station, connections, and wiring.

VC DSP Port Local TDM Loopback Test (#1104)

This test is destructive.

This test verifies the connectivity of a VC DSP Port across the TDM bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack. The Loopback Test runs the following tests:

1. A Looparound test across the TDM bus.
2. A conference Circuit Test.

The tests are run in the above order; if one test fails, an error code is returned and the remaining tests in the sequence are not executed.

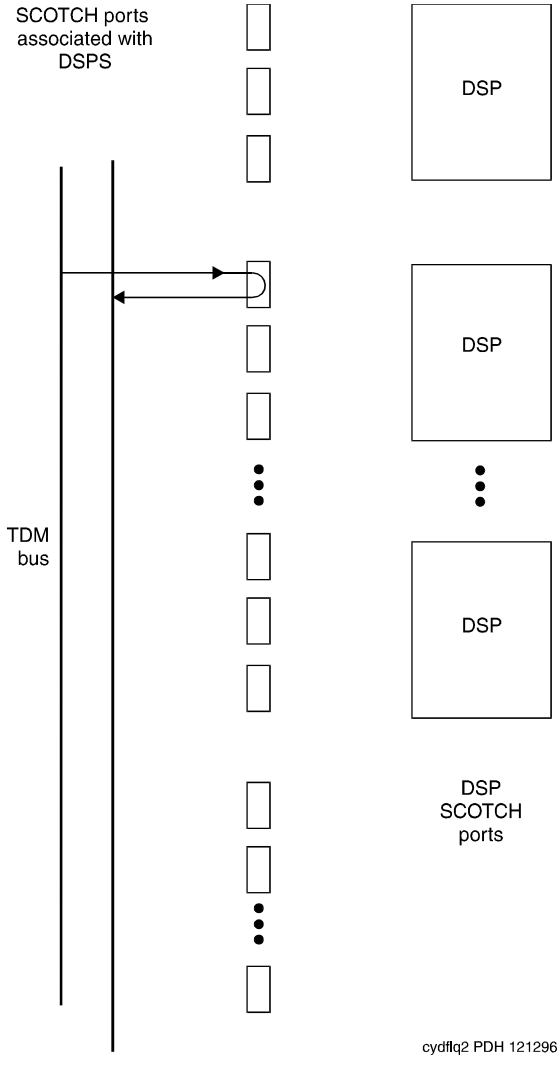

Figure 9-118. VC Circuit Pack DSP Port Local TDM Loopback Test

Table 9-785. TEST #1104 VC DSPPT Local TDM Loopback Test

Error Code	Test Result	Description/Recommendation
1000 1001	ABORT	System resources required to run this test are not available, or the port is busy with a valid call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The traffic load on the system is very high, or time slots may be out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat the test at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a Tone Detector for the test. The system is oversized for the number of Tone Detectors present, or some Tone Detectors are out-of-service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port is seized by a user for a valid call. Use the **status station** command for the station associated with this port and determine if the port is available for testing. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test was not received from the VC-BD circuit pack within the allowable time period. 1. If this result occurs repeatedly, attempt to reset the port by using the **busyout port UUCSSpp** and **reset port UUCSSpp** commands. 2. If this result occurs again, replace the circuit pack.
2012	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABORT	Could not allocate the necessary resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2103	ABORT	The system could not make the conference connection for the test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
0-3	FAIL	The TDM Looparound Test failed. 1. Replace circuit pack.
4-7	FAIL	The Conference Circuit Test failed. 1. Replace circuit pack.
	PASS	The VC DSP Port Local TDM Looparound Test passed.

VC-DSP Port DSP Loopback Test (#1105)

This test is destructive.

This test verifies the connectivity of a VC-DSPPT across the TDM bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack.

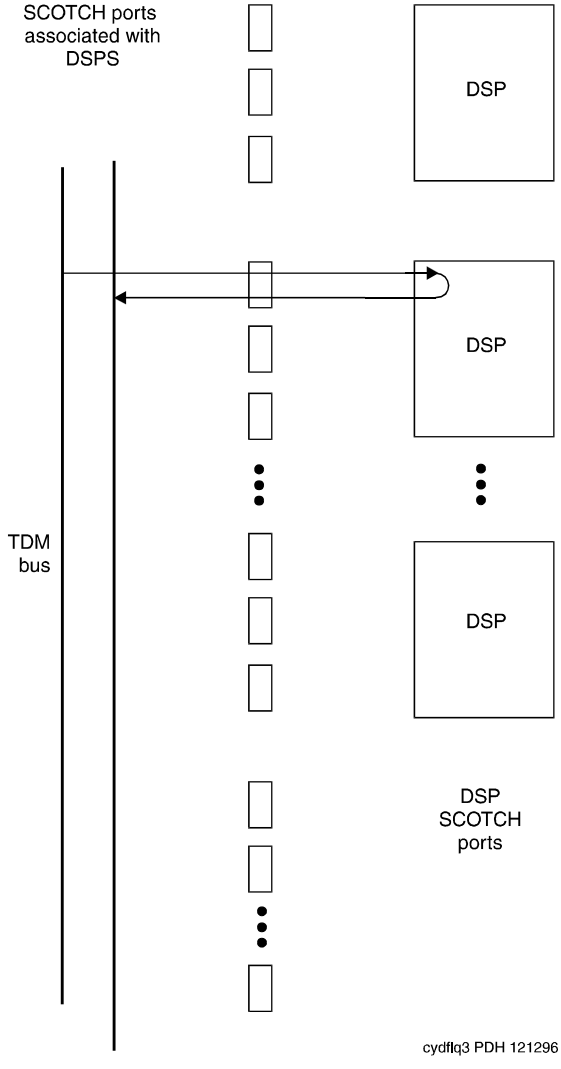

Figure 9-119. VC Circuit pack DSP Port DSP Looparound Test

Table 9-786. TEST #1105 VC-DSP Port DSP Loopback Test

Error Code	Test Result	Description/Recommendation
1000	ABORT	System resources required to run this test are not available, or the port is busy with a valid call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test, the traffic load on the system is very high, or time slots are out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a Tone Detector for the test, the system is oversized for the number of Tone Detectors present, or some Tone Detectors are out-of-service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use the **status station** command for the station associated with this port and determine if the port is available for testing 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received from the VC-BD circuit pack within the allowable time period. 1. If this result occurs repeatedly, reset the circuit pack if the other ports are not in use by using the **busyout port UUCSSpp** and **reset port UUCSSpp** commands. 2. If this result occurs again, replace the circuit pack.
2012	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
0, 1	FAIL	The VC-DSPPT DSP Loopback Test failed. 1. Replace the circuit pack.
	PASS	The VC DSPPT DSP Loopback Test passed

VC Port Reset DSP Test (#1106)

This test is destructive.

This test resets the VC-DSPPT and the DSP associated with it. As part of the reset procedure, the VC-DSPPT will execute a series of self- tests on the hardware. If these self- tests fail, the test will fail; otherwise the test will pass.

Before executing the test, the VC-DSPPT must be busied out by executing the **busy port UUCSSpp** command. After the completion of the test, the VC-DSPPT must be released by executing the **release port UUCSSpp** command.

Table 9-787. TEST #1106 VC Port Reset DSP Test

Error Code	Test Result	Description/Recommendation
1000	ABORT	System resources required to run this test are not available, or the port may be busy with a call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1015	ABORT	The VC-DSPPT is not busied out. 1. Busy out the VC-DSPPT by executing the **busy port UUCSSpp** command and then retry the test.
2000	ABORT	Response to the test was not received from the VC-DSPPT within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If this result occurs again, replace the circuit pack.
2012	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABORT	Could not allocate the necessary resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The reset of the VC-DSPPT was unsuccessful. 1. Replace circuit pack.
	PASS	The VC-DSPPT was successfully reset. 1. Release the VC-DSPPT by executing the **reset port UUCSSpp** command.

VC-LEV (Voice Conditioner DSP Port Level)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run	Full Name of MO
VC-LEV	MAJOR	See "Resolving VC-LEV Errors/Alarms"	VC-LEV

Enable the MMCH feature on the *system-parameters customer-options* form before changing the fields.

The Voice Conditioner (VC) Port Level MO monitors VC efficiency by tracking the number of VC ports that are in-service, and then comparing that number with the value entered in the VC field on the System-Parameters Maintenance form. This VCs field is located under the Minimum Maintenance Thresholds section. The VCs field contains the minimum number of VC ports needed for the Multimedia Call Handling (MMCH) feature, and is an administrable field. The VCs field must contain a number between 0 and 126, and is entered by the system administrator. The MMCH feature must be enabled on the System-Parameters Customer-Options form before the VCs field can be changed to a number greater than 0. For example, administering 8 in that field means 1 circuit pack. The algorithm for determining that a low level of VC resources exists uses the number entered in the VCs field, and the number of VCs that are in-service in the system.

Each VC circuit pack contains 16 physical ports: 8 ports are reserved for VC-DSPPT ports, and the remaining 8 ports are designated as VC-SUMPT ports. The 8 DSP ports are made up of 4 encoder and 4 decoder resources that encode and decode audio formats. Thus, *one VC circuit pack is required for every 8 ports of MMCH port capacity*. If the number of in-service VC ports falls below the MMCH port capacity (value entered on the System-Parameters Maintenance form under the Minimum Maintenance Thresholds section and in the VCs field), a VEC-LEV error is logged. If this outage continues for 15 minutes a MAJOR alarm is raised.

Resolving VC-LEV Errors/Alarms

VC ports are a key part of the MMCH feature, any loss in the number of ports available for use degrades the MMCH customer defined service level.

If a VC circuit pack or port is busied out using the **busyout board** or **busyout port** command, these out-of-service ports are not included in the VC level calculation, thus allowing a technician to busy out a VC circuit pack for maintenance reasons without causing a MAJOR alarm to be raised.

NOTE:
When diagnosing a VC-LEV problem, resolve any alarms raised against VC-BD or VC-DSPPT maintenance objects. Clearing VC-BD or VC-DSPPT alarms may clear the VC-LEV alarm.

The VC circuit pack is maintained by the software similarly to the Tone Detector circuit pack. Tone Detector circuit packs may be removed and reinserted in any port board slot without administration. The same rule applies to VC circuit packs. If a VC circuit pack is removed from service logically (by failing the Archangel sanity scan test) or is removed from service physically (by physically removing the circuit pack from the carrier), no error/alarm is raised against VC-BD or VC-DSPPT maintenance objects. Therefore, if a VC-LEV error/alarm exists, and none has been raised against VC-BD or VC-DSPPT maintenance objects, a VC circuit pack may have been removed from service causing the VC-LEV error/alarm. To resolve a VC-LEV MAJOR alarm, restore the number of VC ports available for service to be equal to or more than the calculated port capacity (value entered in the VCs field).

To determine how many VC circuit packs are needed for the MMCH feature:

1. Display the System-Parameters Maintenance form by executing the command **display system-parameters maintenance**.
2. Locate the number listed in the Minimum Maintenance Threshold (VCs) field. The MMCH feature requires one VC circuit pack for each four ports listed in the Minimum Maintenance Threshold (VCs) field.
3. Divide the Minimum Maintenance Threshold value by 8 to determine the number of VC circuit packs needed. For example, a port capacity of 12 listed in the Minimum Maintenance Threshold (VCs) field would require 2 VC circuit packs.
4. Use the **list configuration** command to verify that the number of VC circuit packs listed agrees with the required number of VC circuit packs (determined in step 3). If the number of VC circuit packs listed in the step 3 differs from the calculated number, restore the number of VC circuit packs to the correct value, in order to resolve the VC-LEV alarm.

Error Log Entries and Test to Clear Values

Table 9-788. VC-LEV Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/ Off Board	Test to Clear Value
1 (a)	Any	None	MAJOR	OFF	

Notes:

a. The number of VC resources in the system that are in service has fallen below the calculated minimum value. If the number of in-service VC ports falls below the MMCH port capacity (value entered in the Minimum Maintenance Threshold VCs field on the system parameters maintenance form), a VEC-LEV error is logged. If this outage continues for 15 minutes a MAJOR alarm is raised. To resolve this alarm, correct the out-of-service problem by following the procedures below:

   1. See “VC-DSPPT” and “VC-BD” and resolve any associated alarms.
   2. If a VC-LEV error/alarm exist and none has been raised against VC-BD or VC-DSPPT maintenance objects, a VC circuit pack may have been removed from service causing the VC-LEV error/alarm. To resolve a VC-LEV MAJOR alarm, restore the number of VC ports available for service to be equal to or more than the calculated port capacity. See “Resolving VC-LEV ERRORS/ALARMS” for details.

System Technician-Demanded Tests: Descriptions and Error Code

There are no System Technician-Demanded test for VC-LEV.

VC-SUMPT

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
VC-SUMPT	MAJOR	test port UUCSSpp	Voice Conditioner Summer Port
VC-SUMPT	MINOR	test port UUCSSpp	Voice Conditioner Summer Port
VC-SUMPT	WARNING	test port UUCSSpp	Voice Conditioner Summer Port

1. Where UU is the universal cabinet number (1 for PPN and 2-44 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...); and pp is the two digit port number (01, 02, 03, ...).

Each Voice Conditioner Circuit Pack (VC-BD) provides two types of resources:

1. Transcoder Resources that are used for encoding and decoding audio formats
2. Summer Resources that are used for summing audio formats from different sources.

The Voice Conditioner Summer ports (VC-SUMPT) are the summer resources on the VC-BD. There are 8 such ports on a VC-BD.

Error Log Entries and Test to Clear Values

Table 9-789. VC-SUMPT Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test port UUCSSpp sh r 1
18 (a)	0	busyout port UUCSS	WNG	OFF	release port UUCSSpp
130 (b)			WNG	ON	test port UUCSSpp sh
257 (c)	Any	Control Channel Loop Test (#52)	MIN	ON	test board UUCSSpp 1 r 3
513 (d)	Any	VC Summer Port Local Loopback Test #(1100)	MIN	ON	test board UUCSSpp sh r 3

1. Run the short test sequence first. If all test pass, run the long test sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. This port has been busied out with the **busyout port UUCSSpp** command.

b. The circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, replace or reinsert the circuit pack.

c. The NPE Crosstalk Test(#1103) failed.

d. The VC Summer Port Local TDM Loopback Test(#1100) failed.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below. By clearing error codes associated with the NPE Crosstalk Test, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk Test (#6) (a)		X	D
TDM Loopback Test (#1100)	X	X	D

1. D = Destructive; ND = Nondestructive

VC-SUMPT Port NPE Crosstalk Test (#6)

This test is destructive.

The NPE controls port connectivity and gain and provides conferencing functions. The NPE Crosstalk test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of the port's long test sequence and takes approximately 20 to 30 seconds to complete.

Table 9-790. TEST #6 VC-SUMPT Port NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
1000 1001	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2012	ABORT	Internal system error
2100	ABORT	Could not allocate the necessary resources for this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
0-3	FAIL	The NPE of the tested port was transmitting in error. This causes noisy and unreliable connections. 1. Replace circuit pack.
	PASS	The port is correctly using its allocated time slots. 1. Verify that this is not an intermittent problem by repeating this test a maximum of 10 times. 2. If complaints continue, examine the station, connections, and wiring.

VC Summer Port Local TDM Loopback Test (#1100)

This test is destructive.

This test verifies the connectivity of a VC Summer Port across the TDM bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack. The Loopback Test runs the following tests:

- A Looparound test across the TDM bus.
- A conference circuit test.

The tests are run in the above order. If the first test fails, the switch returns an error code, and the second test is not executed.

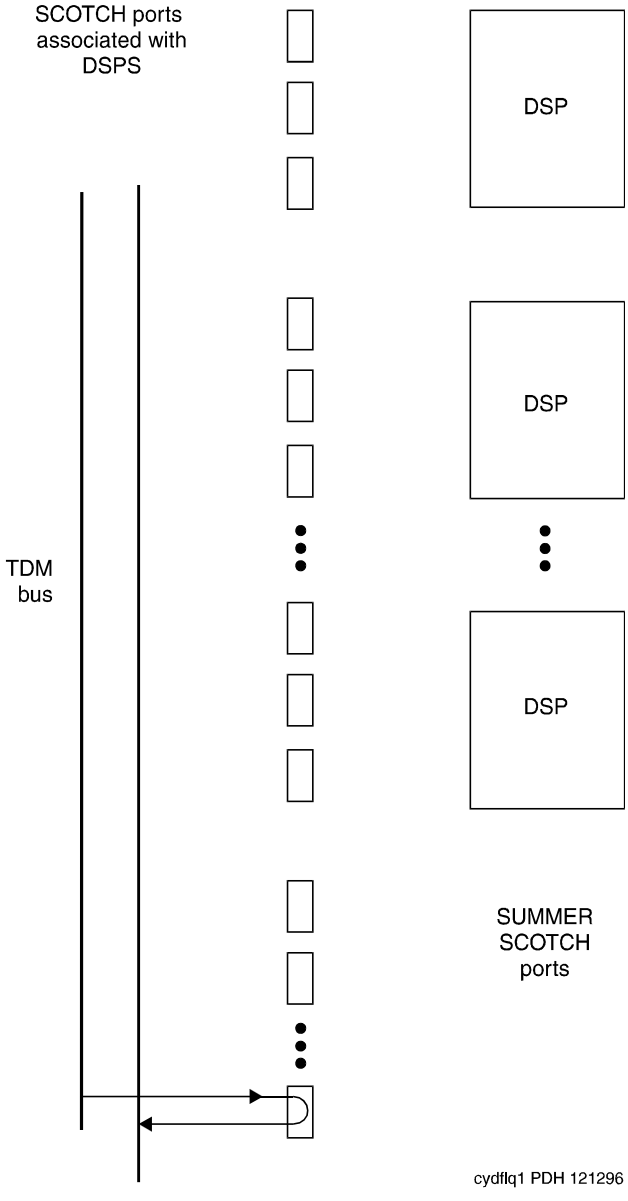

Figure 9-120. VC Circuit Pack Summer Port Loopback Test

Table 9-791. TEST #1100 VC Summer Port Local TDM Loopback Test

Error Code	Test Result	Description/Recommendation
1000	ABORT	System resources required to run this test are not available, or the port may be busy with a valid call. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1002	ABORT	The system could not allocate time slots for the test. The traffic load on the system is very high or time slots are out-of-service due to TDM-BUS errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a Tone Detector for the test, the system is oversized for the number of Tone Detectors present, or some Tone Detectors are out-of-service. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use the **status station** command for the station associated with this port to determine whether the port is available for testing. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2000	ABORT	Response to the test request was not received from the VC-BD circuit pack within the allowable time period. 1. If this result occurs repeatedly, reset the circuit pack if the other ports are not in use. Reset the circuit pack by issuing the **busyout board UUCSS** and the **reset board UUCSS** commands. 2. If this result occurs again, replace the circuit pack.
2012	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
2103	ABORT	The system could not make the conference connection for the test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
0	FAIL	The TDM Looparound Test failed.
1	FAIL	The Conference Circuit Test failed. 1. Replace circuit pack.
	PASS	The VC Summer Port Local TDM Loopback Test passed.

WAE-PORT (Wideband Access Endpoint Port)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run[1]	Full Name of MO
WAE-PORT (a)	MINOR	test access-endpoint *extension* l	Wideband Access
WAE-PORT	WARNING	test access-endpoint *extension*	Endpoint Port

1. For additional repair information, see also DS1-BD (DS1 Interface Circuit Pack).

Wideband Switching supports end-to-end connectivity between customer endpoints at data rates from 128 to 1536 kbps over T1 facilities and to 1984 kbps over E1 facilities. DEFINITY switching capabilities are extended to support wideband calls comprised of multiple DS0s that are switched end-to-end as a single entity.

Wideband Switching extends the Administered Connections feature to include non-signaling wideband access endpoints. Endpoint application equipment with direct T1 or E1 interfaces may connect directly to the switch's line-side facilities; application equipment without T1 or E1 interfaces requires a terminal adapter such as a DSU/CSU. The terminal adapter or endpoint application equipment is connected to the TN464C Universal DS1 circuit pack.

These endpoints are administered as wideband access endpoints and have no signaling interface to switch; they simply transmit and receive data. (Some applications detect and respond to the presence or absence of data). Calls are initiated from these endpoints using the Administered Connections feature.

Multiple access endpoints on one line-side UDS1 circuit pack facility are separate and distinct within the facility. Endpoint application equipment must be administered to send and receive the correct data rate over the correct DS0s. All Administered Connections originating from wideband access endpoints use the entire bandwidth administered for the endpoint. An incoming call of a different data rate then that administered of the endpoint cannot be routed to the endpoint.

Although Wideband Access Endpoints are used primarily for line-side facilities, these endpoints can also be administered on network DS1 facilities to connect DEFINITY to non-switched network services, such as the Lucent fractional T-1 service. An example of this is the Lucent Static Integrated Network Access, where a trunk group to AT&T 4ESS Switched Services shares an access T-1 facility with a Wideband Access Endpoint. In this case, the Wideband Access Endpoint is connected to the AT&T fractional T-1 service, and it does not terminate on local endpoint equipment but is connected to a far-end CPE (for example, another DEFINITY PBX) via the dedicated fractional T-1. All Wideband Access Endpoint functionality and operation is identical on both line-side and network facilities. However, because maintenance capabilities are limited to the Wideband Access Endpoint interface, and because faults can occur end-to-end, troubleshooting procedures based on an end-to-end view of the network is required.

Wideband access endpoint port maintenance provides a strategy to maintain a wideband access endpoint port via a port on the Universal DS1 interface circuit pack hardware. The maintenance strategy covers logging wideband access endpoint port hardware errors, running tests for port initialization, periodic and scheduled maintenance, demand tests, and alarm escalation and resolution. Two different port service states are specified in the wideband access endpoint port maintenance:

- *out-of-service*: the port is in a deactivated state and cannot be used for calls
- *in-service*: the port is in an activated state and can be used for calls

  If the UDS1 Interface circuit pack is out of service, all ports on it are taken out of service and a Warning alarm is raised.

Error Log Entries and Test to Clear Values

Table 9-792. Wideband Access Endpoint Maintenance Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test access-endpoint *extension* sh r 1
18(a)	0	busyout access-endpoint	WARNING	OFF	release access-endpoint *extension*
130(b)		None	WARNING	ON	test access-endpoint *extension*
1281(c)		Conference Circuit (Test #7)	MINOR	ON	test access-endpoint *extension* l r 4
1537(d)		NPE Crosstalk Test (#6)	MINOR	ON	test access-endpoint *extension* l r 3
1793(e)		None			test board *UUCSS* long
3840(f)	Any	Port Audit and Update (Test #36)			

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. The wideband access endpoint has been busied out by a **busyout access-endpoint** extension command. No calls can be made to this extension.

b. The circuit pack has been removed or has been insane for more than 11-minutes. To clear the error, reinsert or replace the circuit pack.

c. The Conference Circuit Test (#7) failed on this port. See Test #7 for repair procedures.

d. The NPE Crosstalk Test (#6) failed on this port. See Test #6 for repair procedures.

e. The TN464C UDS1 Interface circuit pack has failed. See UDS1-BD.

f. The Port Audit and Update Test (#36) failed due to an internal system error. Enter **status access-endpoint** extension and verify the status of the port. If the wideband access endpoint port is out of service, enter **release access-endpoint** extension to put it back into service. Retry the test command.

Technician-Demand Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk Test (#6)		X	ND
Conference Circuit Test (#7)		X	ND
Port Audit and Update Test (#36)	X	X	ND

1. D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot, and does not cross over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually part of a port's long test sequence and takes 20 to 30 seconds to complete

Table 9-793. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. Use the **status access-endpoint** extension or command to determine when the port is available for testing. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1001	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-793. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Use **status health** to determine if the system is experiencing heavy traffic. 1. If system has no TDM-BUS errors and is not handling heavy traffic, retry the command at 1-minute intervals a maximum of 5 times.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be too big for the number of Tone Detectors present, or some Tone Detectors may be out of service. **List measurement tone-receiver** displays information on the system's tone receivers. 1. Resolve any TTR-LEV errors. 2. Resolve any TONE-PT errors. 3. If neither condition exists, retry the command at 1-minute intervals a maximum of 5 times.
1004	ABORT	The port has been seized by a user for a valid call. Use **status access-endpoint** extension to determine when the port is available for testing. The port is available when it is in the **in-service/idle** state. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1020	ABORT	The test did not run because of a previously existing error on the specific port or a more general circuit pack error. 1. Examine the Error Log for existing errors against this port or the circuit pack and attempt to diagnose the already existing error.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. 1. Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. 1. Investigate user-reported troubles on this port using other port tests and by examining the terminal adapter or external wiring.

Conference Circuit Test (#7)

The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

Table 9-794. TEST #7 Conference Circuit Test

Error Code	Test Result	Description/ Recommendation
	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. Use the **status access-endpoint** extension command to determine when the port is available for testing.
1004	ABORT	The port has been seized by a user for a valid call. Use the **status access-endpoint** extension command to determine when the port is available for testing. The port is available when it is in the **in-service/idle** state. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1020	ABORT	The test did not run due to a previously existing error on the specific port or because of a more general circuit pack error. 1. Examine the Error Log for existing errors against this port or circuit pack, and attempt to diagnose the previously existing error.
2000	ABORT	Response to the test was not received within the allowable time period.
2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The NPE of the tested port did not conference the tones correctly. This causes noisy and unreliable connections. Even though wideband calls do not use the conferencing feature on the NPE, this failure indicates problems with the circuit pack hardware. 1. Replace the circuit pack.
	PASS	The port can correctly conference multiple connections. 1. Investigate user-reported troubles on this port using other port tests and by examining the terminal adapter or external wiring.

Port Audit and Update Test (#36)

This test sends port level translation data from switch processor to the UDS1 Interface circuit pack to ensure that the wideband access endpoint port's translation is correct.

Table 9-795. TEST #36 Audit and Update Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
1006	ABORT	The port is out-of-service. If the port is busied out: 1. Issue **release access-endpoint <extension>** command to put the port back into in-service. 2. Retry the test command. If the port is not busied out: a. Check the error and alarm logs for WAE-PORT and UDS1-BD errors and alarms and follow the recommended repair procedures.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	Port translation has been updated successfully.

XXX-BD (Common Port Circuit Pack)

MO Name (in Alarm Log)	Alarm Level	Initial Command to Run [1]	Full Name of MO
XXX-BD[2]	MAJOR	test board UUCSS	Common Port Circuit Pack Maintenance
XXX-BD[2]	MINOR	test board UUCSS	Common Port Circuit Pack Maintenance
XXX-BD[2]	WARNING	test board UUCSS	Common Port Circuit Pack Maintenance

1. UU is the universal cabinet number (1 for PPN, 2-44 for EPNs). C is the carrier designation (A, B, C, D, or E). SS is the number of the slot in which the circuit pack resides (01 to 21).
2. Refer to the appropriate circuit pack documentation for the correct MO name displayed in this field. It usually ends with BD.

Common Port Circuit Pack Maintenance is a set of common tests used by all the circuit packs listed in the tables below. The common portion of these circuit packs is the generic hardware that interfaces with the TDM Bus. The XXX-BD designation is also used on G3-MT displays when **reset board** is entered with an empty circuit pack slot, or with a circuit pack type that is in conflict with the actual board type administered for that slot. All circuit pack suffixes (B,C, D, and so forth) are supported by “XXX-BD.”

When any of the Common Port Circuit Packs are physically removed from the backplane, no alarm will be logged for approximately 11-minutes. (In the case of the TN754 Digital Line,TN566 DEFINITY AUDIX, and TN758 Pooled Modem circuit packs, Digital Line and Pooled Modem circuit packs, approximately 21-minutes will elapse before an alarm is logged.) When a circuit pack that has been removed is alarmed, the alarm type is minor and is classified as an on-board alarm. The time delay permits maintenance activity to be performed without triggering an additional alarm.

Alarms are logged against only those common port circuit packs on which ports have been administered. In a heavily loaded system, the interval between the removal of a Common Port Circuit Pack and the logging of the alarm may be several minutes longer. The circuit packs in the following list contain ports on the TDM bus. Suffixes are not shown; for a list of all circuit packs supported, see the table in Chapter 2. Those that appear in **bold** type are documented separately under their own maintenance object name. Only those with an asterisk are supported by G3r V1 systems.

XXX-BD Common Circuit Packs

The following list of circuit packs are listed by apparatus code.

Table 9-796. XXX-BD Common Circuit Packs

Apparatus Code	Name	Type
CPP1	Memory Expansion	Control
ED-1E546 (TN2169) (TN2170) (TN566) (TN567)	DEFINITY AUDIX R3 System	Port Assembly
ED-1E546 (TN2208) (TN2170)	Call Visor ASAI over the DEFINITY (LAN) Gateway R1	Port Assembly

Error Log Entries and Test to Clear Values

Table 9-797. Common Port Circuit Pack Maintenance Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test board UUCSS sh r 1
1(a)	0	Circuit pack removed or SAKI Sanity Test (#53)	MINOR	ON	
18(b)	0	busy-out board UUCSS	WARNING	OFF	release board UUCSS
23(c)	0	None	WARNING	OFF	
36 (d)	4368	none			
125 (e)		None	MINOR	ON	
217 (f)	0	None	WARNING	ON	
257	65535	Control Channel Test (#52)	MINOR	ON	test board UUCSS sh r 20
257 (g)	Any	None			
267 (f)	0	None	WARNING	ON	
513 (h)	Any	None	MINOR	ON	test board UUCSS sh
769 (i)	4358	None			
1025 (j)	4363	NPE Audit Test (#50)			test board UUCSS l r 20
1281 (k)		Ringing Application Test (#51)	MINOR	ON	test board UUCSS r 2
1538 (l)	Any	None	WARNING/ MINOR	ON	
1793 (m)		Neon Test (#220)	MINOR	ON	test board UUCSS r 2
3840 (n)	Any	None			
3999 (o)	Any	None			

1. Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. Error type 1 indicates the circuit pack has stopped functioning or has been physically removed from the system. This error type does not apply to ANN-BD, DETR-BD, S-SYN-BD, M/T-BD, or CLSFY-BD. The alarm is logged approximately 11 minutes after removal of the circuit pack or failure of the SAKI Sanity Test (#53).

   Check for the physical presence of the circuit pack in the slot indicated by the alarm. If the circuit pack is not present, insert one of the proper type. If the circuit pack is present and its red LED is lit, see *LED Alarm Without Alarm Log Entry* in Chapter 7.

b. This error indicates the circuit pack has been busied out. Release the circuit pack via **release board UUCSS**.

c. The circuit pack has been logically administered but not physically installed. The alarm should clear when the circuit pact is installed.

   If the circuit pack is already installed:

   1. Run **test board UUCSS long** and look at any test failures or error codes generated.
   2. If the test does not clear error 23, then execute **reset board UUCSS** and run the long test again.
   3. If the reset/test does not clear error 23, replace the circuit pack.

d. This error applies only to the Maintenance/Test circuit pack (TN771B or TN771C). The error indicates that the hardware associated with the Analog Trunk Testing port of the circuit pack failed to initialize. Note that when this error occurs, the Maintenance/Test circuit pack may report an invalid vintage. Although this error is not service-affecting, the Maintenance/Test circuit pack should be replaced.

e. The circuit pack physically installed in the slot does not match the type that is administered for that slot. Do one of the following:

   - Remove the incorrect circuit pack and replace it with one of the type that is administered for that slot.
   - Use **change circuit pack** to readminister the slot so that it matches the board that is installed, and follow with **reset board**.

f. This error applies to the Maintenance/Test circuit pack TN771D), Tone Detector (TN748B, TN748C, or TN748D), and Call Classifier (TN748) circuit packs. For the Maintenance/Test circuit pack, the error indicates that there is more than one Maintenance/Test circuit pack in the port network. For the Tone Detector or Call Classifier packs, the error indicates that there are more than 10 circuit packs in the system. Remove the circuit pack against which the error is logged.

g. This error indicates transient communication problems with this circuit pack. This error is not service-affecting and no action is required.

h. This error, when reported with Aux data in the range of 4352 to 4358, indicates that the circuit pack has reported an on-board hardware failure. The circuit pack will continuously test the hardware and report the results approximately every 10 minutes. If the hardware problem is resolved, the ‘‘leaky bucket’’ strategy should clear the alarm in approximately 30 minutes. However, if the alarm does NOT clear in 30 minutes, then the circuit pack should be replaced.

i. This error can be ignored, but look for other errors on this circuit pack.

j. This error is not service-affecting and no action is required.

k. This error indicates that no ringing current is detected. Run Test #51, Ringing Application Test, and follow the procedures for Test #51. This error is only applicable to Analog Line circuit packs.

l. The hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:

    1. The common circuit pack level tests such as Test #51 and/or Test #220 are aborting with error code 2000.
    2. The tests run on the ports of this circuit pack are returning with a NO-BOARD.
    3. A busy-out/release of the circuit pack has no affect on test results.
    4. A **list configuration** command shows that the circuit pack and ports are properly installed.

    If the XXX-BD is not a TN754 Digital Line Circuit Pack (DIG-BD), and if this error happens again within 15 minutes, then replace the circuit pack. If the XXX-BD is a TN754 Digital Line Circuit Pack (DIG-BD), then check the alarm level. If the alarm level is a WARNING, this indicates that users are probably causing the hyperactivity by playing with their digital stations. If the circuit pack is really hyperactive then this alarm will be upgrade to a MINOR alarm within 1 hour. If the alarm level is a MINOR alarm, then replace the circuit pack. To replace the circuit pack, refer to Replacing Circuit Packs in Chapter 5.

m. This error indicates that no neon current is detected. Run **test board UUCSS short** and follow the procedures for Test #220. This error is only applicable to TN769 and TN746 Analog Line circuit packs.

n. This error is not service-affecting and no action is required.

o. Error type 3999 indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

Technician-Demand Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *NPE Audit*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
NPE Audit Test (#50)		X		ND
Ringing Application Test (#51) (a)	X	X		ND
Control Channel Looparound Test (#52)	X	X		ND
SAKI Sanity Test (#53) (b)		X	D	
Neon Test (#220) (c)	X	X		ND

1. D = Destructive; ND = Nondestructive

Notes;

a. Only applicable to Analog Line circuit packs.

b. The SAKI Sanity Test is run in the Long Test Sequence for the Tone/Clock circuit packs (TN768, TN780) **only**. The test is run on other circuit packs only when they are reset via the **reset board** command.

c. Only applicable to TN746 and TN769 Analog Line circuit packs.

NPE Audit Test (#50)

The system sends a message to the on-board microprocessor to update the network connectivity translation for all the Network Processing Elements (NPEs) on the circuit pack.

Table 9-798. TEST #50 NPE Audit Test

Error Code	Test Result	Description/ Recommendation
None 2100	ABORT	System resources required for this test are not available.
1019	ABORT	Test already in progress.
	FAIL	Internal system error 1. Retry the command at 1-minute intervals a maximum of 5 times.
	PASS	The circuit pack's NPEs have been updated with their translation.
	EXTRA BD	Certain circuit packs have limitations on how many circuit packs can be in the system or port network such as the Maintenance/Test circuit pack (TN771B or TN771C), the Tone Detector circuit pack (TN748B, TN748C or TN748D) and the Call Classifier (TN744). The Maintenance/Test circuit pack allows only one circuit pack per port network. The Tone Detector and Call Classifier allow only 10 circuit packs in each system. All additional circuit packs will return EXTRA-BD and should be removed.
Any	NO BOARD	This is normal if the test is being done when (a) the board is not physically in the system or (b) the system is booting up. Otherwise, there is some inconsistency between the physical configuration and the data kept in the system. 1. Verify that the board is physically in the system. 2. Verify that the system is not in a stage of booting up. 3. Retry the command at 1-minute intervals for a maximum of 5 times.

Ringing Application Test (#51)

This test checks the ringing application circuitry common to all ports on an Analog Line circuit pack.

Table 9-799. TEST #51 Ringing Application Circuit Test

Error Code	Test Result	Description/ Recommendation
1000 2100	ABORT	Could not allocate the necessary system resources to run test.
	ABORT	Could not allocate the necessary system resources to run test. The circuit pack is not installed. Internal system error
2000	ABORT	There was no response from the board. 1. If error type 1538 (hyperactivity) is present in the error log, follow the maintenance strategy that is recommended for this error type. 2. Run the **busyout board**, **reset board**, and **release busy board** commands,and then retest. 3. If the test still aborts, dispatch with the circuit pack. 4. Check the off-board wiring and the terminal, and, if there are no problems found, replace the circuit pack.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. 1. Use the **display port UUCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to Chapter 8, for a full description of all possible states). You must wait until the port is idle before retesting. 2. Retry the command at 1-minute intervals a maximum of 5 times.

Continued on next page

Table 9-799. TEST #51 Ringing Application Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1008	ABORT	Could not allocate a ringing circuit for one of the following reasons: all the ringing circuits are in use; the ringing generator is defective; ringing generator is not wired correctly. 1. If the test continues to abort, look for RING-GEN error in Error Log. a. If there are RING-GEN errors, refer to RING-GEN Maintenance documentation and try to resolve any problem(s). Then, go to Step 2. b. If there are no RING-GEN errors, and the test continues to abort, issue the **test board UUCSS** command on other TN742, TN769, or TN746 Analog circuit packs. If an ABORT with error code 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or may not be wired properly. Refer to RING-GEN Maintenance documentation for details. If an ABORT with error code 1008 does NOT occur on the other ports, then all four ring generators are in use. Exit from this documentation. 2. Retry the command.
	FAIL	No ringing current is detected. The ringing application circuitry on this circuit pack probably is not healthy. 1. Retry the command again. 2. If the test continues to fail, look for RING-GEN error in Error Log. a. If there are RING-GEN errors, refer to the RING-GEN Maintenance documentation and try to resolve any problem(s). b. If there are no RING-GEN errors, then replace the circuit pack. 3. Retry the command again.
	PASS	Ringing current is detected or this vintage of the Analog Line circuit pack does not support the Ringing Application Circuit Test. Analog Line circuit packs that DO NOT support Test #51 include TN712 Vintage 13 and earlier and TN742 Vintage 3 and earlier.
Any	NO BOARD	This is normal if the test is being done when (a) the board is not physically in the system or (b) the system is booting up. Otherwise, there is some inconsistency between the physical configuration and the data kept in the system. 1. Verify that the board is physically in the system. 2. Verify that the system is not in a stage of booting up. 3. Retry the command at 1-minute intervals for a maximum of 5 times.

Control Channel Looparound Test (#52)

This test queries the circuit pack for its circuit pack code and vintage and verifies its records.

Table 9-800. TEST #52 Control Channel Looparound Test

Error Code	Test Result	Description/ Recommendation
None 2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
	FAIL	The test failed because the circuit pack failed to return the circuit pack code or vintage. 1. Retry the command for a maximum of 5 times. 2. If the test still fails, issue the **busyout board**, **reset board**, and **release busy board** commands, and then retest. 3. If the problem continues, replace the circuit pack. 4. Run the test again.
	PASS	Communication with this circuit pack is successful.
	EXTRA BD	This result should only appear when more than one TN771D Maintenance/Test circuit pack has been installed in this port network. Remove this circuit pack.
Any	NO BOARD	This is normal if the test is being done when (a) the board is not physically in the system or (b) the system is booting up. Otherwise, there is some inconsistency between the physical configuration and the data kept in the system. 1. Verify that the board is physically in the system. 2. Verify that the system is not in a stage of booting up. 3. Retry the command at 1-minute intervals for a maximum of 5 times.

SAKI Sanity Test (#53)

This test is destructive.

This test resets the circuit pack. It is executed as part of the long test sequence only for the Tone-Clock circuit pack and DS1 interface circuit packs. Other common circuit packs can be reset with the **reset board UUCSS** command which also executes this test.

Table 9-801. TEST #53 SAKI Sanity Test

Error Code	Test Result	Description/ Recommendation
None	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1005	ABORT	Wrong circuit pack configuration to run this test. This error applies only to DS1 interface circuit packs. It means the DS1 interface circuit pack is providing timing for the system and, therefore, it cannot be reset without major system disruptions. 1. If the circuit pack needs to be reset, then set synchronization to another DS1 interface circuit pack or the Tone-Clock circuit pack and try again. Refer to SYNC (Synchronization) Maintenance documentation.
1015	ABORT	Port is not out-of-service. 1. Busy out the circuit pack. 2. Execute command again.
2100	ABORT	System resources required for this test are not available. 1. Retry the command at 1-minute intervals a maximum of 5 times.
1	FAIL	The circuit pack failed to reset.
2	FAIL	The circuit pack failed to restart. 1. Execute command again. 2. If the problem persists, replace the circuit pack.
	PASS	The circuit pack initializes correctly. 1. Run the short test sequence.
Any	NO BOARD	This is normal if the test is being done when (a) the board is not physically in the system or (b) the system is booting up. Otherwise, there is some inconsistency between the physical configuration and the data kept in the system. 1. Verify that the board is physically in the system. 2. Verify that the system is not in a stage of booting up. 3. Retry the command at 1-minute intervals for a maximum of 5 times.

Neon Test (#220)

This test checks the voltage required to light the neon lamp on an analog terminal. A relay connects a 150V DC source from the backplane of the circuit pack onto the voltage bus, and another relay connects a 2K shunt from the bus to ground. Current in the line is then monitored to determine if the voltage is present. The neon test runs only for TN746 and TN769 Analog circuit packs. If the circuit pack is not a TN746 or TN769, the test will return PASS, but the test is not actually run.

Table 9-802. TEST #220 Neon Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Cannot get the list of translated ports on the circuit pack.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. 1. Use the **display port UUCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. Refer to the status commands described in Chapter 8 for a full description of all possible states.) You must wait until the port is idle before retesting. 2. Retry the command at 1-minute intervals a maximum of 5 times.
1008	ABORT	Could not allocate a ringing circuit. Either all the ringing circuits are in use, or the ringing generator is defective or is not wired correctly. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or is not wired correctly (see errors for RING-GEN). If it does not occur on port test 48 for ANL-16-L, then all four ring phases are in use.
2000	ABORT	Response to the request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Could not allocate the necessary system resources to run this test. Internal system error. 1. If Error Type 1538 is present in the Error Log, follow the recommended maintenance strategy.

Continued on next page

Table 9-802. TEST #220 Neon Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	The test failed because no neon current was detected. 1. Determine if there is a TN755 or TN752 power unit circuit pack installed in the same carrier as the TN746 or TN769 analog line circuit pack that failed the test. Look for the failure of test 220 on other TN746 or TN769 circuit packs in the carrier. If test 220 fails on the other circuit packs, replace the TN755 or TN752 power unit circuit pack. 2. Retry the command again. 3. If the test continues to fail, replace the circuit pack. 4. Retry the command again.
	PASS	This circuit pack is a TN746 or TN769 Analog Line circuit pack and the neon current is detected. If this test passes, it can also mean that this circuit pack is not a TN746 or TN769 Analog Line circuit pack.
Any	NO BOARD	This is normal if the test is being done when (a) the board is not physically in the system or (b) the system is booting up. Otherwise, there is some inconsistency between the physical configuration and the data kept in the system. 1. Verify that the board is physically in the system. 2. Verify that the system is not in a stage of booting up. 3. Retry the command at 1-minute intervals for a maximum of 5 times.

TN799B, 8-430
TN802B, 1-6, 8-430, 9-1010, 9-1123, 9-1136
tone clocks, circuit packs, 9-845
tone detectors, enhanced tone receiver ports, 9-826
tone generators, 9-2014, 9-2033
tone-clock circuit packs
duplication, 9-2014
interchanges, 9-2015
international settings, 9-2018
LEDs, 7-13
replacing, 9-2018
time division multiplex (TDM) bus clocks, 9-1957
TN2182, 9-2014
tone generators, 9-2033
tones, Italian, 9-2018
traceroute, 8-430
Transfer on Ringing, 1-41
transmission
characteristics, 1-43 to 1-47
errors, 1-34
stream, 1-34
TR-LN-BD, 9-2042
troubleshooting
duplicated switch processing element (SPE), 5-10
ISDN-BRI/ASAI problems, 5-70
ISDN-PRI endpoints (wideband), 5-69
ISDN-PRI problems, 5-67
ISDN-PRI test call problems, 5-74
outgoing ISDN-testcall command, 5-76
packet bus, 5-96, 5-101
trunk data module (TDMODULE), 9-1972
trunk speed, 1-40
Trunk Test Call, 6-24
trunking facilities, 1-39
trunks, DS1, 9-943, 9-1010, 9-1092, 9-1123, 9-2054
TTC privante networking (Japan), 9-2054
TTT. See Terminating Trunk Transmission

U

UDS1 Interface Circuit Pack, 9-2054
UN330B circuit packs, 5-6
UN331B circuit packs, 5-6
UN332 circuit packs, 5-6
uninterruptible power supply (UPS), 1-31
uninterruptible power supply, see UPS
universal DS1 (UDS1) interface circuit packs, 9-606, 9-943, 9-1010, 9-1092, 9-1123, 9-2054, 9-2064
updates, software, 6-1
UPS, 9-407

V

V.35, 1-36
voice-grade
data, 1-37

W

warm restarts, reset level 1, 4-4
warning alarms, 7-1
wideband access endpoints, 9-2181
wiring
premises, 1-48
terminal equipment ports, 1-48

We'd like your opinion.

Lucent Technologies welcomes your feedback on this document. Your comments can be of great value in helping us improve our documentation.

DEFINITY® Enterprise Communications Server Release 9 Maintenance for R9r
555-233-117, Issue 2, November 2000

1. Please rate the effectiveness of this document in the following areas:

	Excellent	Good	Fair	Poor
Ease of Finding Information				
Clarity				
Completeness				
Accuracy				
Organization				
Appearance				
Examples				
Illustrations				
Overall Satisfaction				

2. Please check the ways you feel we could improve this document:

- ❒ Improve the overview/introduction
- ❒ Improve the table of contents
- ❒ Improve the organization
- ❒ Add more figures
- ❒ Add more examples
- ❒ Add more detail
- ❒ Make it more concise
- ❒ Add more step-by-step procedures/tutorials
- ❒ Add more troubleshooting information
- ❒ Make it less technical
- ❒ Add more/better quick reference aids
- ❒ Improve the index

Please add details about your concern._____
