NO. 1/1A ESS
TECHNICAL AIDS HANDBOOK

Western Electric

HANDBOOK USERS COMMENTS

Your comments and suggestions are welcome. They will help us in our effort to improve the quality and usefulness of our documentation.

- | 1. How would you rate this handbook for: | good | fair | poor |
|--|--------------------------|--------------------------|--------------------------|
| completeness of information | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| accuracy of information | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| accessibility of information | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

2. Did you find any errors in this handbook? _____

3. What suggestions do you have for additional No. 1/1A ESS coverage in this handbooks? _____

4. What elements of this handbook (charts, diagrams, tables) were especially good at helping you with your tasks? _____

5. What other sources do you have for the information in this handbook and how does this handbook compare to these sources? _____

6. What suggestions do you have for handbooks of this type to cover other Western Electric products or services? _____

LOCATION AND TYPE OF PUAB CIRCUIT PACKS IN CPD FRAME (NO. 1A ESS)

LOCATING UNIPOLAR CPD POINTS

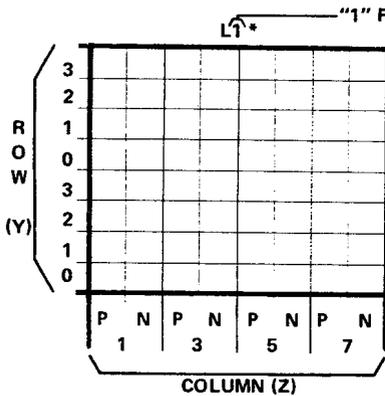

EVEN COLUMN NUMBER—LEFT T. S.

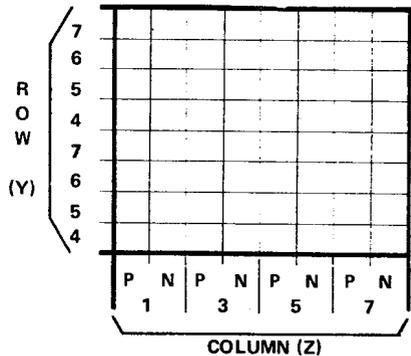

ODD COLUMN NUMBER—RIGHT T. S.

LOCATING BIPOLAR CPD POINTS

ROWS 0 TO 3—LEFT T. S.

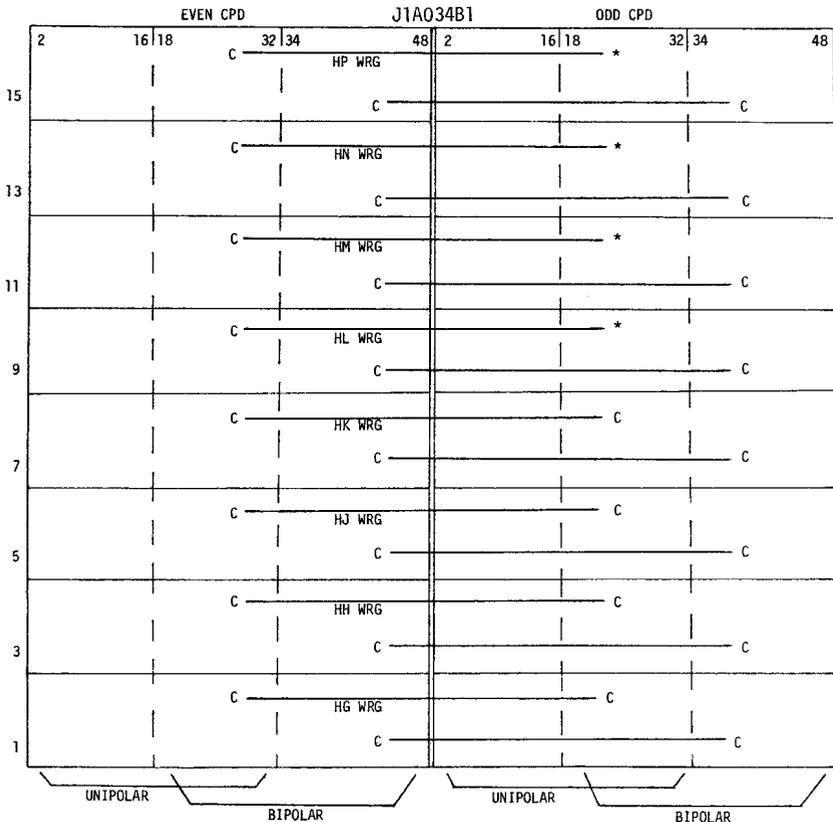

ROWS 4 TO 7—RIGHT T. S.

* THE LAST DIGIT OF THE T. S. NUMBER IS THE GROUP (X) NUMBER.

UNIPOLAR AND BIPOLAR CPD OPTIONS

SEVERAL SERVICE INTERRUPTIONS HAVE BEEN CAUSED WHEN CHANGING THE TYPES OF ASSIGNMENTS ON CPD FRAMES. THE ATTACHED SKETCH AND ASSOCIATED NOTES SHOULD HELP CLARIFY ENGINEERING NOTES 57A THRU 57D, MANUFACTURING NOTES 5 & 14, AND TABLE C ON J1A034B-1.

PARTICULAR ATTENTION SHOULD BE PAID TO NOTE 7 ON THE ATTACHED SKETCH. THE BULK OF THE SERVICE INTERRUPTIONS HAVE BEEN CAUSED BY INSERTING PACKS (BIPOLAR-UNIPOLAR) IN PACK POSITIONS 2-32 OF THE EVEN OR ODD CPD WHICH ARE NOT COMPATIBLE WITH THE WIRING (HG-HP) ON THE ASSOCIATED MOUNTING PLATE.

1. C - CONNECTED BY SHOP
2. * - NOT CONNECTED BY SHOP
3. HG THRU HP WRG (LOCAL CABLES) FURNISHED SEPARATELY ON OLDER FRM PER L-A.
4. CKT PACK POSITIONS 34-48 CAN ONLY BE BIPOLAR (L-2).
5. A GIVEN MTG PLATE MUST BE ALL UNIPOLAR IN CKT PACK POSITIONS 2-32 OR ALL BIPOLAR IN CKT PACK POSITIONS 18-32 (2-16 VACANT).
6. HG-HP WRG (LOCAL CABLES) SHOULD NOT BE REMOVED. THEY SHOULD ONLY BE CONNECTED (BIPOLAR) OR DISCONNECTED (UNIPOLAR) IN THE ODD CPD.
7. HG-HP WRG SHOULD BE CONNECTED OR DISCONNECTED BEFORE ASSIGNMENTS ARE WIRED AND WITH NO CKT PACKS INSERTED ON THE ASSOCIATED MTG PLATE (CKT PACK POSITIONS 2-32 MUST BE VACANT). DO NOT REMOVE PACKS FROM POS 34-48.

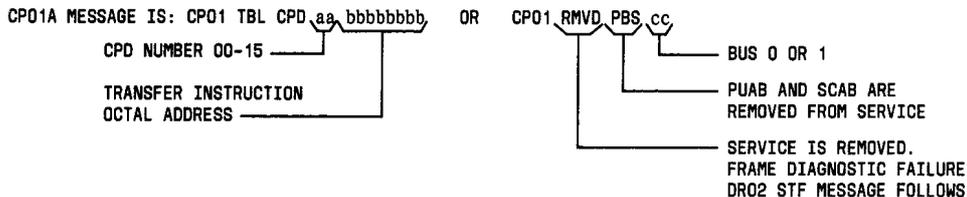

BIPOLAR MULTIPLE FURNISHED PER L-D (J1A034B-1)

CP01/CP01A FAILURE MESSAGE WITH DATA FIELDS IDENTIFIED

Failing circuit pack(s), CPs, relate to raw data as follows:

- Last failing words
- Common circuit function
- Error pattern may have numerous failures in previous words

FAILURE PATTERN SENSITIVITY

• FAILURE/CHARACTERISTICS	POSSIBLE CAUSE OF FAILURE
Multiple test phases failed: Phase 1 and 2 - STF	CPD circuits failure: <ul style="list-style-type: none"> • Decoder X and Y address • Parity detection for group (X), row (X) and column (Z) enable address • Output gate matrix current excessive • Z-register parity checks • Control and decoder gates or timing
Single test phase <ul style="list-style-type: none"> • Phase 1 - STF (bus 0) • Phase 2 - STF (bus 1) 	Cable driver/receiver or gate in CC to CPD bus system failed: <ul style="list-style-type: none"> • Enable address • Verify answer • CPD execute • CPD execute reply • CPD diagnostic echo
* Single test phase failure may result in F-level interrupt	

CPD DIAGNOSTIC TEST EVALUATION

* GRC address is group, row, and column address of output gate terminal strip located in 0 or 1 CPD			

PROBABLE FAILURE PATTERNS – TEST PHASES 1 AND 2

WORD, BIT	FAILURE OF FUNCTION OR TROUBLE CONDITION	PATTERN NO.
Words 1-8 Bits 8-15	ASWCPD for test (T) – lead in conjunction with all 64 X- and Y-decoder addresses: 1. Single failure-any word: Decoder XY-address 2. All bits failing-any word: Y-address 3. Single bit failing -all words: X-address 4. All words and bits: control operations, input gate at decoder and Z-register or output gate	1
Words 9,10 Bits 16-21	1. Parity checks for X- and Y-registers in decoder and Z-register: control, decoder or output gate 2. Maintenance input and output data transfers	2
Words 11-18 Bits 0-15	Matrix current of output gates and ASWCPD for all X- and Y-addresses during control inhibit mode: checks for shorted diodes in output gates	3
Words 19,20 Bits 3-18	Matrix current of output gates and parity check of Z-register for each Z-register driver using 16 valid addresses during the inhibited state	4
Words 21,24 Bits 0-22	Z-register test lead in inhibit mode – (word 20) and normal terminated CPD address – (word 23) indicate failure of encoder or verify answer bus	5
Word 22 Bits 17,19 & 21	Matrix current and parity check PCC indicate Z-register and encoder failures	6
Word 23 Bits 17,19 & 21	Shorted CPD address has matrix current and ASWCPD checked. CPD operates in normal mode. Failure indicates control error	6
Word 25 Bits 2-17	Parity checks for X- and Y-addresses detect failure of control and detector	6

FAILURE PATTERN SENSITIVITY

CMT FRAME, J1A088C

TYPE A CMT FRAME

†FOURTH FRAME

EACH CMT FRAME CAN CONTAIN 256 PIMTS:

- (A) 16 VF(S) X 8 TIC(S) = 128 PIMTS PER BAY
 (B) 128 X 2 BAYS = 256 PIMTS PER CMT FRAME

"A" TYPE CMT FRAME (J1A088A)

THIS FRAME ACCEPTS ONLY TWO TYPES OF PLUG IN MISCELLANEOUS TRUNKS PIMTS.

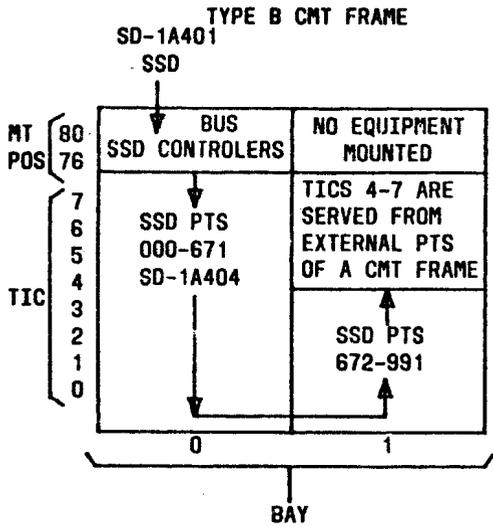

- A. 2-WAY TRK MF4-W (TOLL) SD-1A236-05
 B. 2-WAY TRK DP4-W (TOLL) SD-1A237-05

ALL TRUNK INTERCONNECT CIRCUITS WILL BE J1A088EC PER SD-1A404.

*SD-1A404 CONTAINS THE MATRIX CPS MG7

†SD-1A403 CONTAINS THE MATRIX CPS (MG7) FOR THE SD-1A402 SSD AND CABLED TO FOURTH FRAME

‡FOURTH FRAME TICS ARE IN SD-1A404 (OPTION W; NO MATRIX CPS)

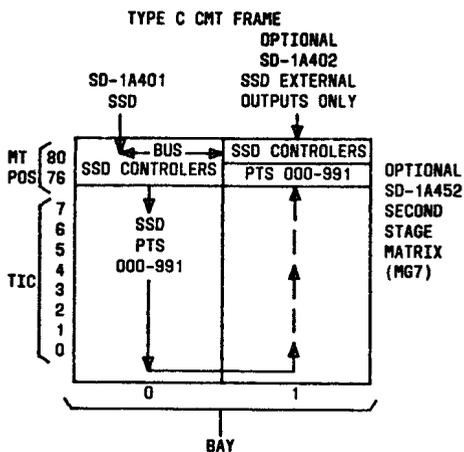

TYPE "B" CMT FRAME (J1A0888)

THIS FRAME ACCEPTS ONLY 5 TYPES OF PIMTS.

- A. 2-WAY TRK MF4-W (LOCAL) SD-1A236-05
- B. 2-WAY TRK DP4-W (LOCAL) SD-1A237-05
- C. LONG HAUL FX TRK SD-1A415-05

TEST MLR PTS

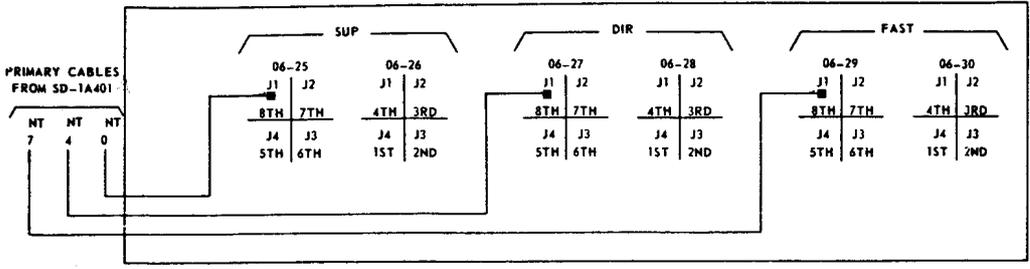

PRIMARY INTERROGATE CABLES TO PRIMARY TICs (FACTORY CABLED)

- CABLES
- NT 0 - ROWS 00-07
 - NT 1 - ROWS 08-15
 - NT 2 - ROWS 16-23
 - NT 3 - ROWS 24-31
 - NT 4 - ROWS 32-39
 - NT 5 - ROWS 40-47
 - NT 6 - ROWS 48-55
 - NT 7 - ROWS 56-63

For a group of 8 unassigned scanner rows,
942E connector replaces "NT x" cable.

- ① ② SD location given as unit location (e.g., 02-12, 02-35).
- ③ Primary cable plugged into TIC assigned highest row number for that cable (e.g., 7, 15, 23, etc.).

CONTROLLER INTERROGATE WIRING

CONNECTORS FOR PARTIALLY UNASSIGNED ROWS

942AH	1 UNASGND ROW(S)
AJ	2
AK	3
AL	4
AM	5
AN	6
AP	7

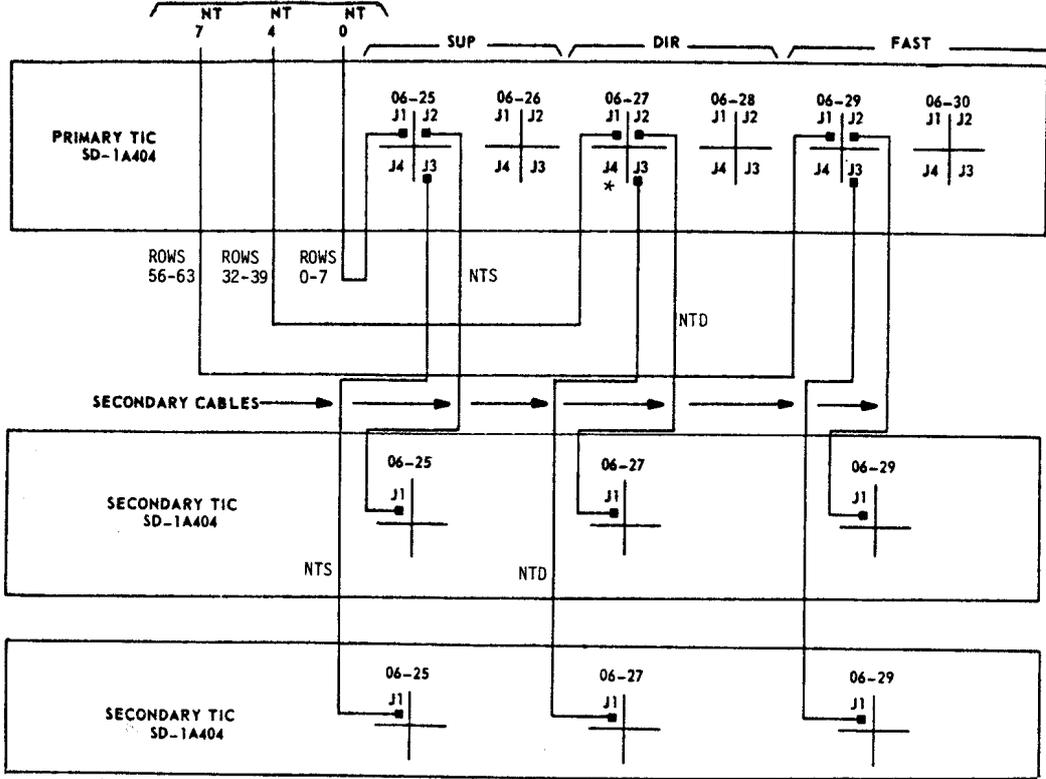

The primary TIC shows the NT 4 cable plugged into connector 06-27, J1. Since NT 4 cable is Rows 32-39, the connectors would be as follows:

Quadrant to row number is as follows:

8TH ROW	7TH ROW	4TH ROW	3RD ROW	ROW 39	ROW 38	ROW 35	ROW 34
7TH	6TH	3RD	2ND	38	37	34	33
6TH	5TH	2ND	1ST	37	36	33	32
5TH	4TH	1ST		36	35	32	
4TH	3RD			35	34		
3RD	2ND			34	33		
J1 2ND	1ST	J2	J1	33	32		
310 1ST	110	310	110	32			
5TH ROW	6TH ROW	1ST ROW	2ND ROW	ROW 36	ROW 37	ROW 32	ROW 33
4TH	5TH		1ST	35	36		32
3RD	4TH			34	35		
2ND	3RD			33	34		
1ST	2ND			32	33		
J4	1ST	J3	J4		32		
300	100	300	100

 SD 1A402 - Optional SSD

READOUT LOOP CABLE RULES

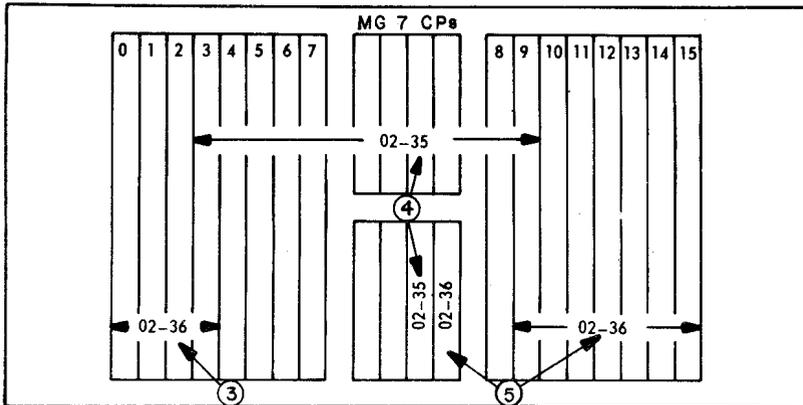

1. If the number of rows (MG CP's) is even on a TIC, the paddleboard is plugged into the other quadrant from where the cable is started.
2. If there is an odd number of rows (MG CP's) on a TIC, the paddleboard is plugged into the same quadrant from where the cable is started.

EXAMPLE OF READOUT LOOP CABLING

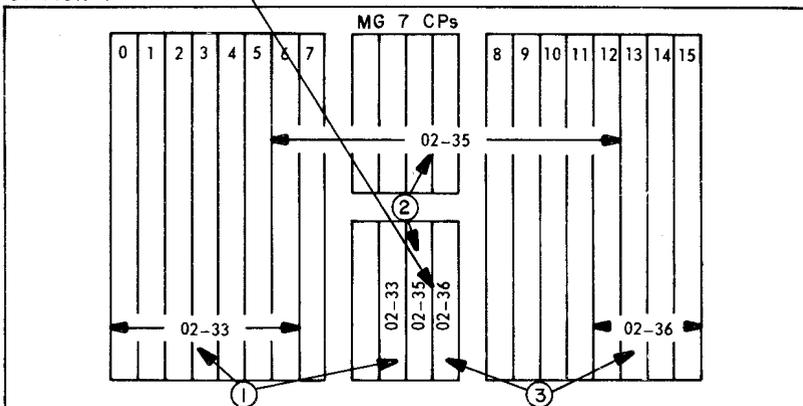

TIC VERTICAL FILES

OPTION X

OPTION Y

Each VF requires 5 points (5 MLRs).

16 VFs in TIC = 80 pts.

Each MG7 CP provides 32 pts.

Examples of VF to MG7 CP association:

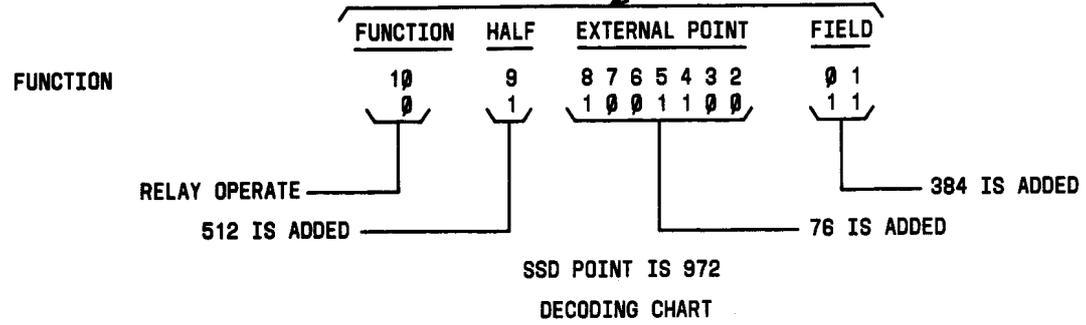

Option Y

1. 02-33 (32 pts.) services VF00-05 plus 2 pts. in VF06.
2. 02-35 (32 pts.) services 3 pts. in VF06, VF07-11, 4 pts. in VF 12.
3. 02-36 (32 pts.) services 1 pt. in VF 12, VF 13-15, and donates 16 pts. to next TIC-VF00-02 and 1 pt. in VF03.

Option X

3. Preceding TIC MG7 at 02-36 services VF00-02 plus 1 pt. in VF03.
4. 02-35 (32 pts.) services 4 pts. in VF03, VF04-08, plus 3 pts. in VF09.
5. 02-06 (32 pts.) services 2 pts. in VF09 and VF 10-15.

ERROR PATTERN IN CCINT F-LEVEL MESSAGE
COMPONENTS OF MAIS AND PUMS REGISTERS

CCINT TTY MESSAGE - INDICATOR FLIP-FLOP(S), PU FAILURE SOURCE, AND TROUBLE CONDITION INDICATED

REGISTER	FLIP-FLOP / BIT	PU FAILURE SOURCE	TROUBLE CONDITION INDICATED
PUMS	ASWCPD/16 MCE/17, PCA/18, PCB/19 or PCC/20	All-seems-well (ASW) CPD	Maintenance circuits in CPD detect incorrect enable address or amplitude of access current. ASW-CPD signal is not returned to CC when bit 16 is reset to 0
PUMS	ASWS/22	ASW - scanner (S)	Maintenance circuits in scanner detect more than one row of ferrod selected and interrogate current exceeds nominal value. Failure is indicated when bit 22 is reset to 0
MAIS	CPDEM/21	CPD execute reply match	CPD returns execute pulse to CC in PUMS register bits 0 through 15. CC then compares CPD selection made by translation of F register bits 10 through 13 to CPD echo in PUMS. Failure is indicated when bit 21 is reset to 0
MAIS	CPDRM/22	CPD verify answer match	CPD enable sent to PU does not match address on verify answer bus as received by CC. Y register contents is compared to translation F register bits 14 through 22. Failure is indicated when bit 22 is reset to 0
MAIS	PERF/20	Peripheral sequencer	Peripheral sequencer enters an invalid state when internal CC checks are made. Failure is indicated when bit 20 is reset to 0
MAIS	PIT/8	Processor interface (PI)	In office equipped with PI features - generic 1E5 or later: failure of internal PT checks and source error in 3ACC processor produce report of trouble condition. When it is determined at fault by program, PIINT/PISNAP TTY message is printed; otherwise, CCINT FP TTY message contains data reporting failure
MAIS	PURMM/15 or PURPF/16	Peripheral unit parity (PUP) reply	In office equipped with peripheral unit controller (PUC) - generic 1E6 or later: Failure develops as short in scanner control to readout winding. Failure is reported that undetected false ones are received in L register on peripheral orders where scanner response is expected. Peripheral unit parity (PUP) and PUP check (PUPCHK) responses from PUC are also detected by CC for proper match on all PU responses. PUP, PUPCK, RAWPCK and IPURPF flip-flops are located in PBCF register

Scanner answer reply AN00-15 or scanner ASW, AN16*	<ul style="list-style-type: none"> • Cable driver - -output circuit • Open ferrod readout loop • Ferrod matrix circuit
Multiple failures in AN00-15 & ASW-S*	<ul style="list-style-type: none"> • Scanner answer bus register circuits • Controller, register, and translator circuits • Scanner timing circuits • Interrogate current driver circuits • Interrogate matrix circuits • Scanner detector
* This failure may be reported by F-level interrupt TTY message	

TROUBLE SHOOTING THE TRIAC SIGNAL DISTRIBUTOR

- I. USE DIAGNOSTICS AND REPLACE PACKS INDICATED.
- II. USE METHOD OF "SUCCESSIVE CIRCUIT DIVISION" TO ISOLATE FAULTS.
 1. CHECK MAJOR "PIVOT" POINTS.
 - A. PULSE AND DETECTOR CIRCUIT PACK, FB 593, TERMINAL 218 LEAD PUL (PULSE).
 - B. INTERFACE CIRCUIT PACK, FC 300, INPUTS AND OUTPUTS.
 2. OBSERVE CIRCUIT PACK INPUT AND OUTPUT WAVEFORMS.
 - A. INPUT WAVEFORM INCORRECT - PROCEED TOWARDS BUS CIRCUITRY.
 - B. OUTPUT WAVEFORM CORRECT - PROCEED TOWARDS TRUNK CIRCUITRY.
 - C. INPUT CORRECT, OUTPUT INCORRECT - REPLACE CIRCUIT PACK OR FIND FAULT IN LINE TO SUCCEEDING CIRCUIT PACK OR PACKS.
- III. STUDY WAVEFORMS
 1. COMPARE GOOD AND FAULTY SELECTIONS.
 2. WAVEFORMS TO EXPECT
 - A. INPUTS FROM BUS
 - a. SELECT - NEGATIVE GOING ABOUT .5 us PULSE FROM ABOUT 1.2v.
 - b. NO SEL - CONSTANT ABOUT 1.2v.
 - B. OUTPUT OF +3v LOGIC (CDI) SEE NOTE.
 - a. LO - \leq .2v
 - b. HI - \geq .6v - NEXT STAGE IS A TRANSISTOR BASE.
 \geq 1.0v- NEXT STAGE IS A CDI INPUT BUFFER.
 - c. TIMING WAVEFORMS FROM FB592 (TD), TIMING AND DIFFERENTIATOR, ARE ALL CDI LOGIC LEVEL.
 - d. INTERFACE PACK WAVEFORMS (FC300)
 - a) INPUT LO \leq .2v
 HI \geq .6v
 - b) OUTPUT
 - e. PULSER
 - a) OPERATE
 - b) RELEASE
 - c) DETECTOR ACTIVATED
 - f. WAVEFORMS ALONG ML RELAY PULSE PATH.
 - a) FIRST STAGE
 - b) SECOND STAGE
 - g. VOLTAGE WAVEFORM ALONG TRIAC GATE SELECTION CIRCUIT.
 - H. CURRENT WAVEFORMS
 - a) ML RELAY PULSE PATH
 - b) TRIAC GATE CURRENT PATH

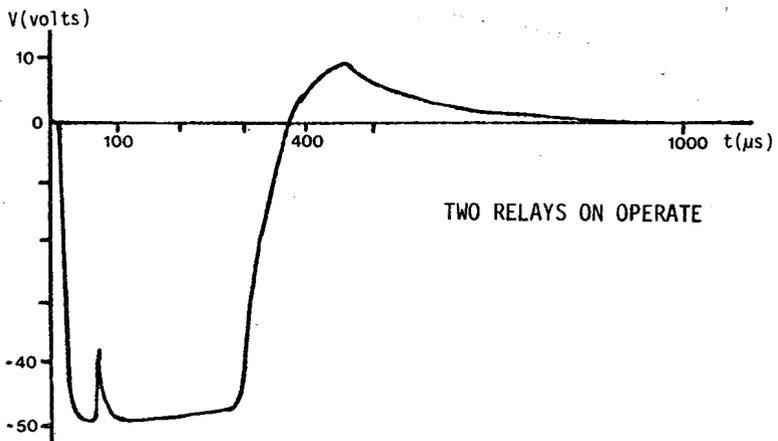

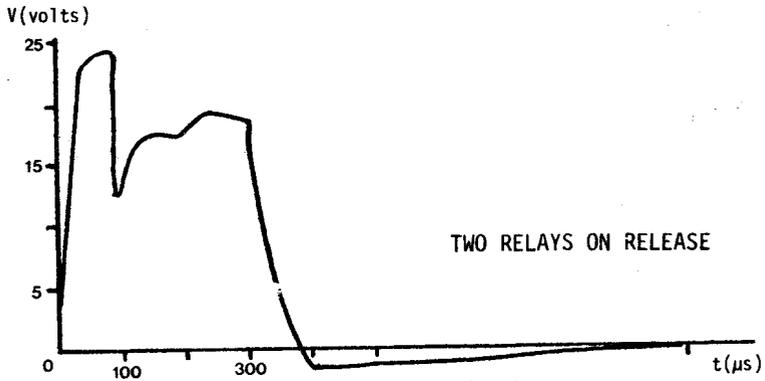

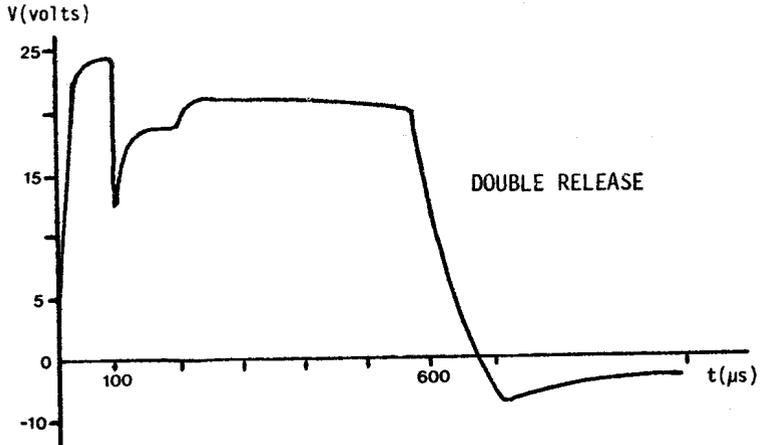

LAST RESORT!

TRIAC SIGNAL DISTRIBUTOR TIMING SEQUENCE

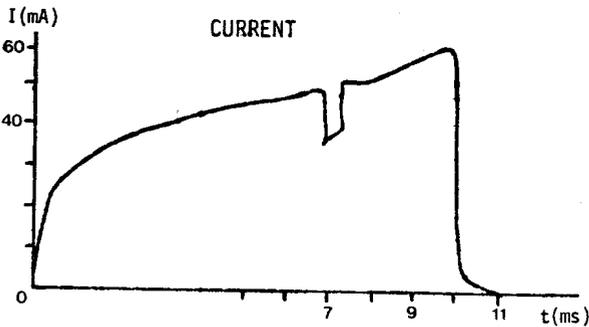

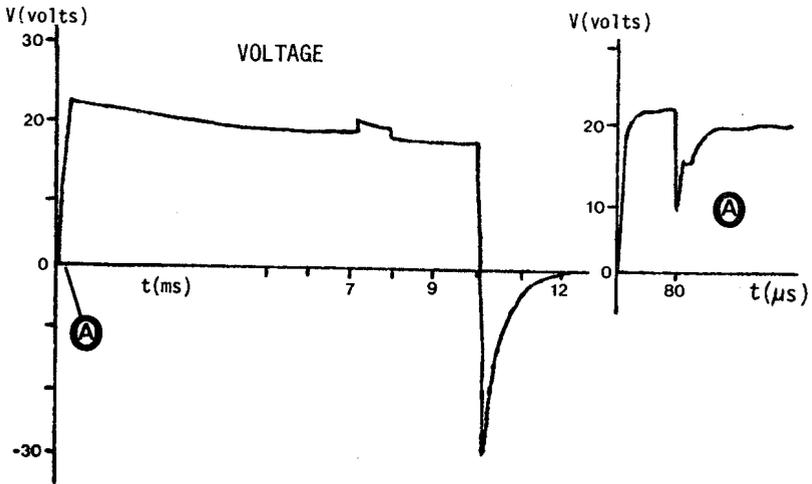

PULSER WAVE FORMS, FB593 (TERM 218)

FAULT CONDITIONS

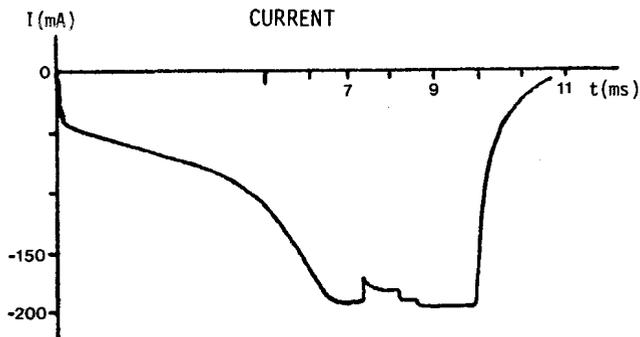

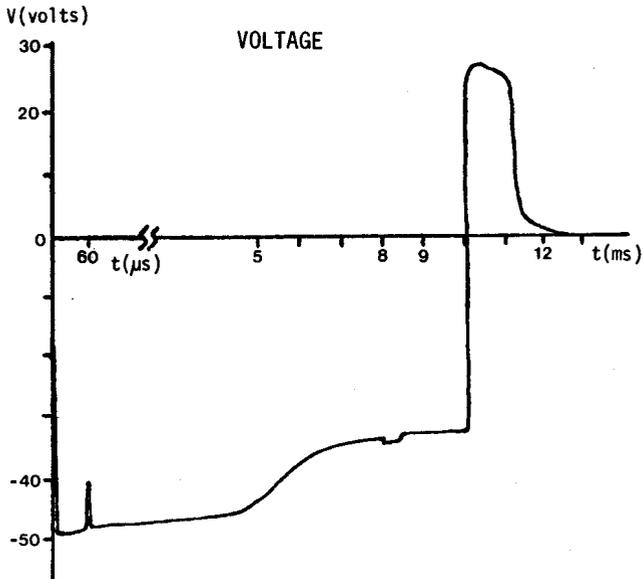

PULSER WAVE FORMS, FB593 (TERM 213)

RELEASE +V = 26.25V, -V = -52.5V (AM RELAY)

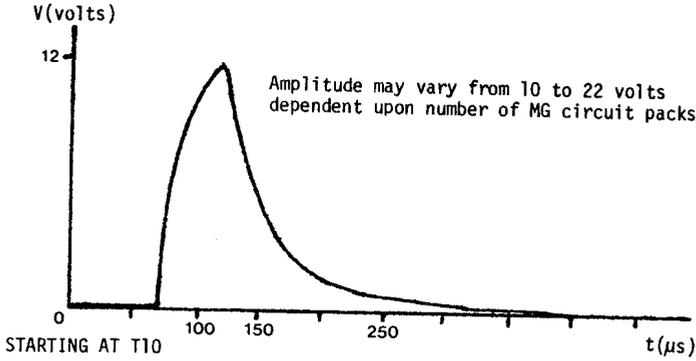

PULSER WAVE FORMS, FB593 (TERM 213)

OPERATE +V = 26.25V, -V = -52.5V (AM RELAY)

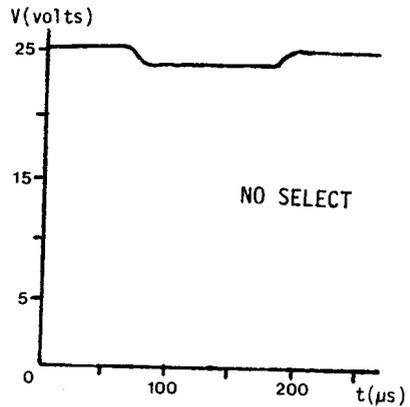

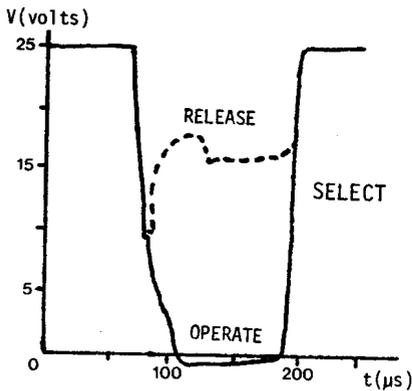

TRIAC GATE SELECTION WAVEFORMS

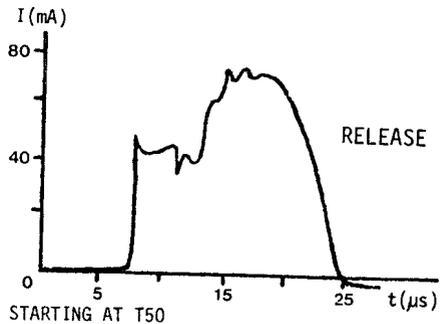

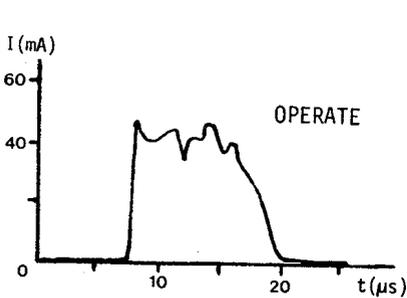

VERTICAL, HORIZONTAL BITS 18-20 OUTPUT OF FC300 OR
INPUT FROM FC324 OR FB591 CURRENT SOURCE TO FC300

VOLTAGE AT ISOLATION DIODE OF TRIAC GATE CURRENT

PERIPHERAL UNIT CONTROLLER -- DATA LINK

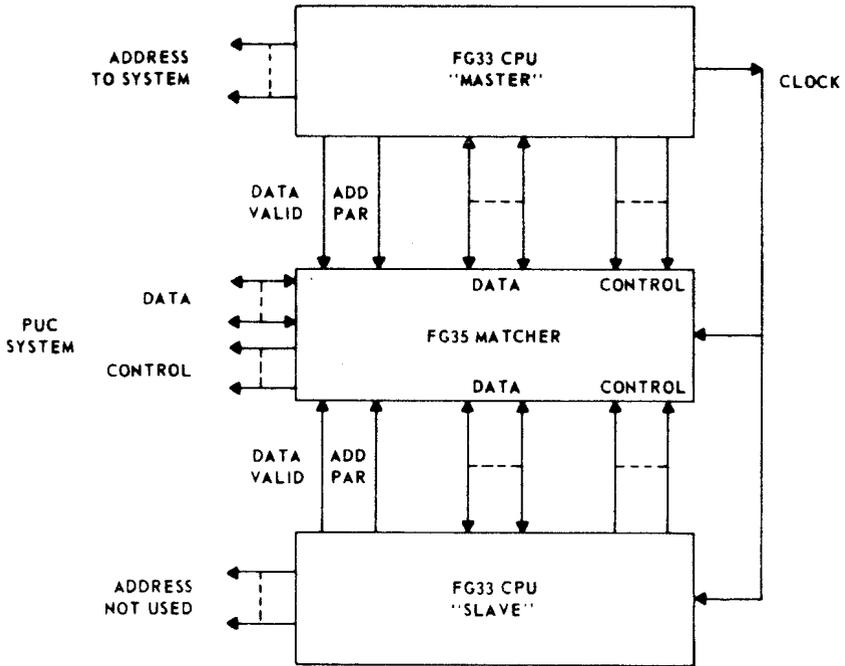

**PERIPHERAL UNIT CONTROLLER
 CIRCUIT PACK DIVISION**

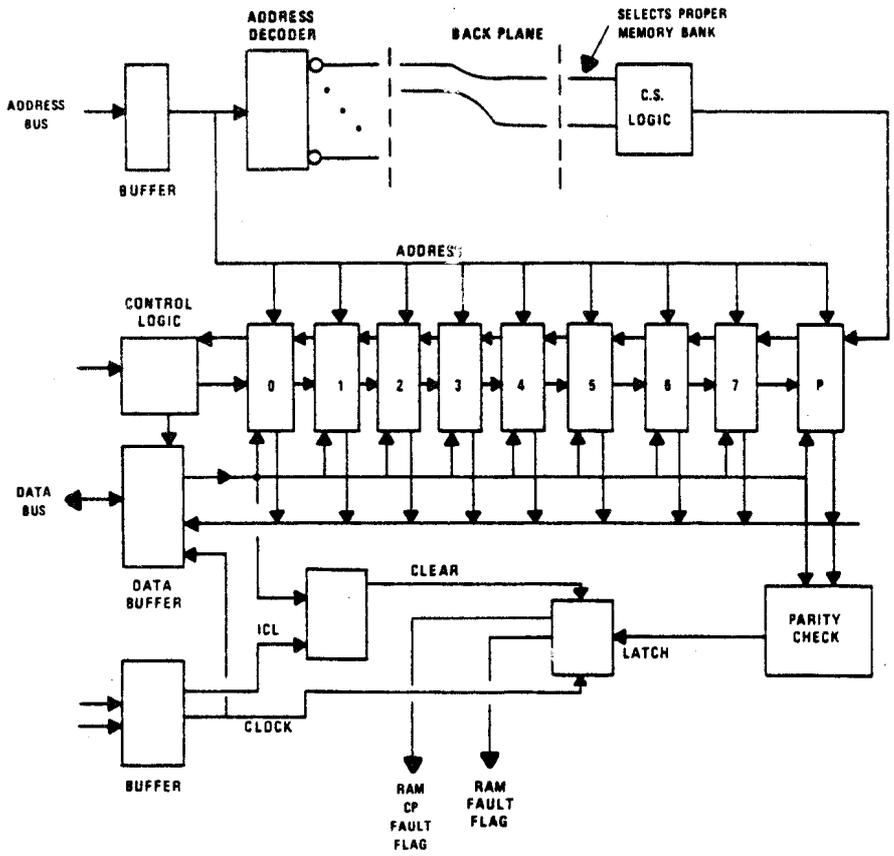

PIC - PROGRAMMABLE INTERRUPT CHIP

HARDCORE BLOCKS

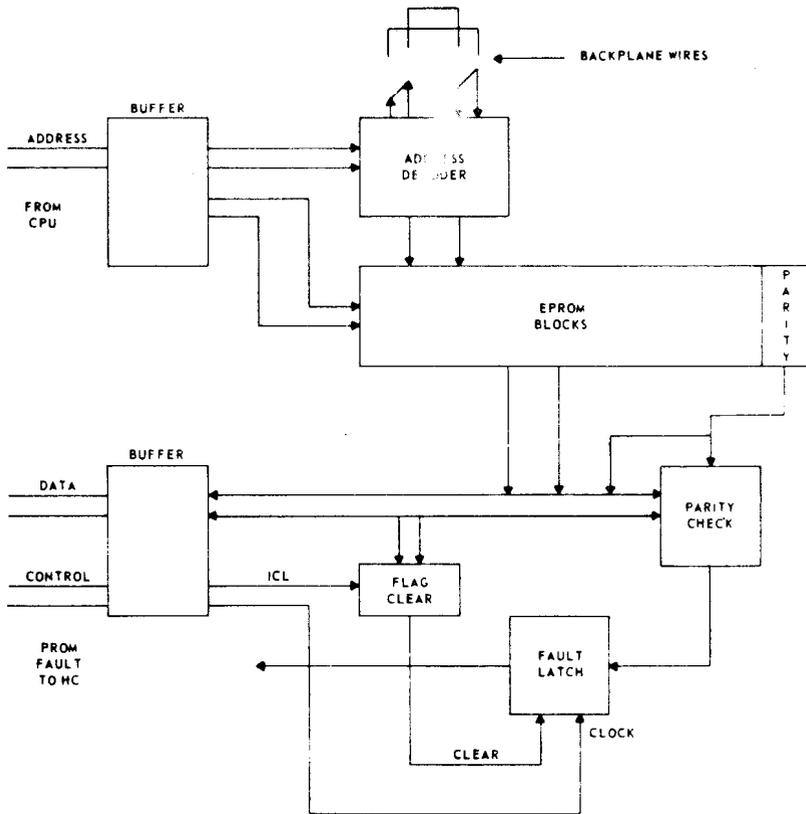

MATCHING OF THE CPU BOARDS IS DONE ON THE FG35. THE MASTER PROVIDES THE CLOCK FOR ALL BOARDS. THE DATA VALID SIGNALS WHEN THE COMPARISON SHOULD BE MADE.

HC BLOCK DIAGRAM FG33, FG35, FG33

NOTE: FG29 CONTAINS TWO BANKS OF RAM CHIPS, WHILE FG32 CONTAINS ONLY ONE BANK

RAM BOARD DESIGN FG 29-32

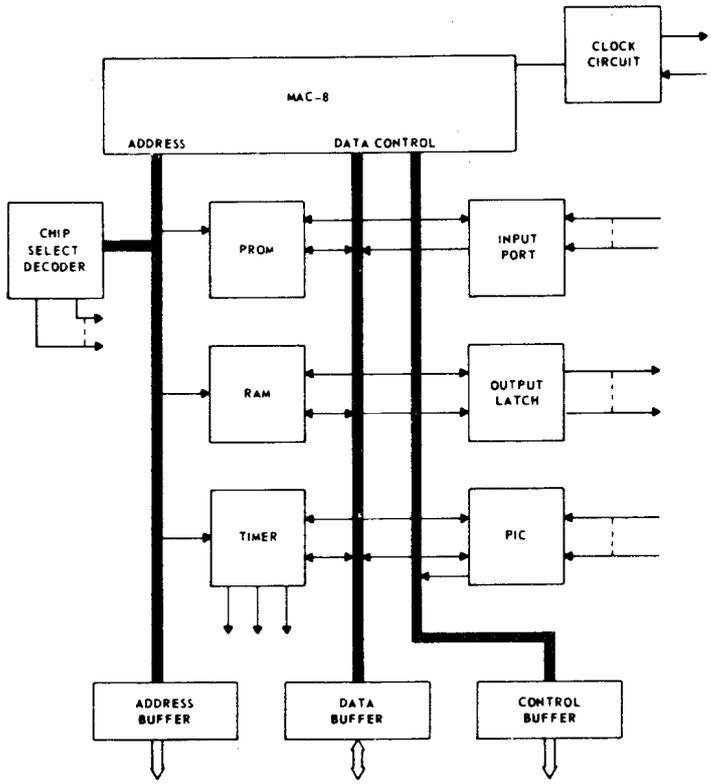

THE PROM BOARD FG 31 DECODES THE UPPER ADDRESS BITS AS A FUNCTION OF BACKPLANE WIRES. PARITY IS CHECKED ON ALL READS. IF BAD PARITY IS DETECTED A FAULT IS LATCHED.

CAUTION: FG 31 BOARDS ARE NOT INTERCHANGEABLE DUE TO UNIQUE PROGRAM DATA ENCODED ON EPROM CHIPS.

FG31 PROM BOARD

ADDRESS SPACE (HEXADECIMAL)	BACKPLANE WIRE		BACKPLANE WIRE	
	SELECT LEAD	PROM PIN	ENABLE LEAD	CHIP SELECT
1st 16K	2XXX	PROM — SEL 00	EN 0	CS 0
	3XXX	SEL 01	EN 1	CS 1
	4XXX	SEL 02	EN 2	CS 2

RELATIONSHIP BETWEEN AVAILABLE ADDRESS SPACE ON AN FG 31
AND THE RESPECTIVE CHIP SELECT LEADS FOR UP TO THREE FG 31
CIRCUIT PACKS

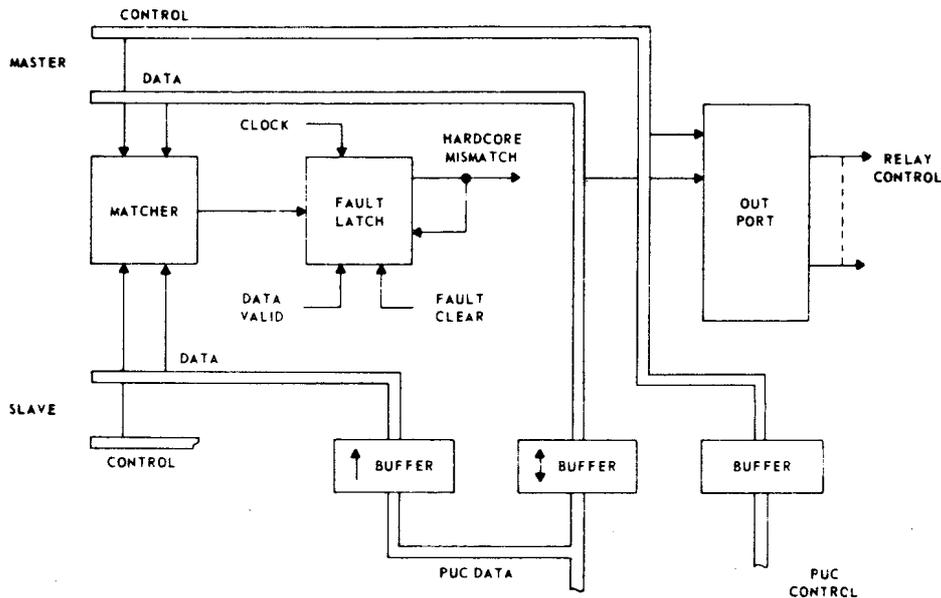

THE FG 33 HAS ALL THE FUNCTIONAL PARTS FOR A COMPLETE PROCESSING UNIT.

- CPU
- PROM
- RAM
- TIMER
- INPUT PORT
- OUTPUT LATCH
- INTERRUPT PROCESSOR
- CHIP SELECT DECODER

**CPU BLOCK DIAGRAM
FG 33**

SCANNER ANSWER MEMORY CONTROLLER FG 34

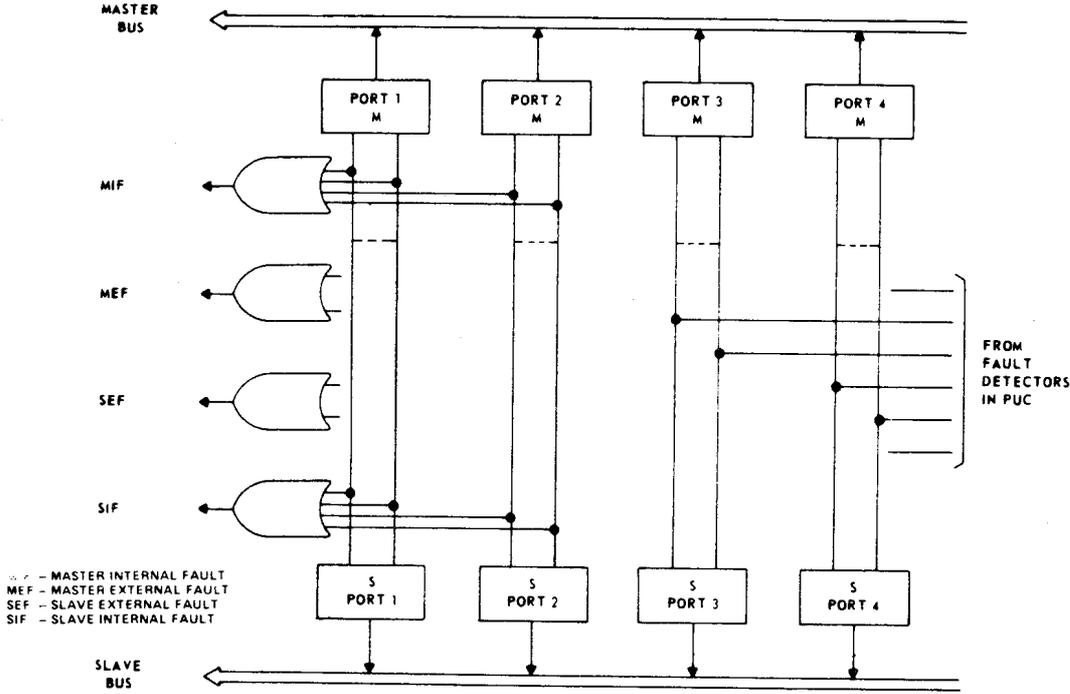

THE FG 35 MATCHING LOGIC DETECTS ANY DIFFERENCES BETWEEN MASTER AND SLAVE CPU'S.

THE DATA BUFFERS ALLOW THE MASTER CPU TO TRANSMIT AND RECEIVE DATA. THE SLAVE CAN RECEIVE DATA ONLY.

THE MASTER CONTROL SIGNALS ARE BUFFERED AND SENT TO PUC BOARDS.

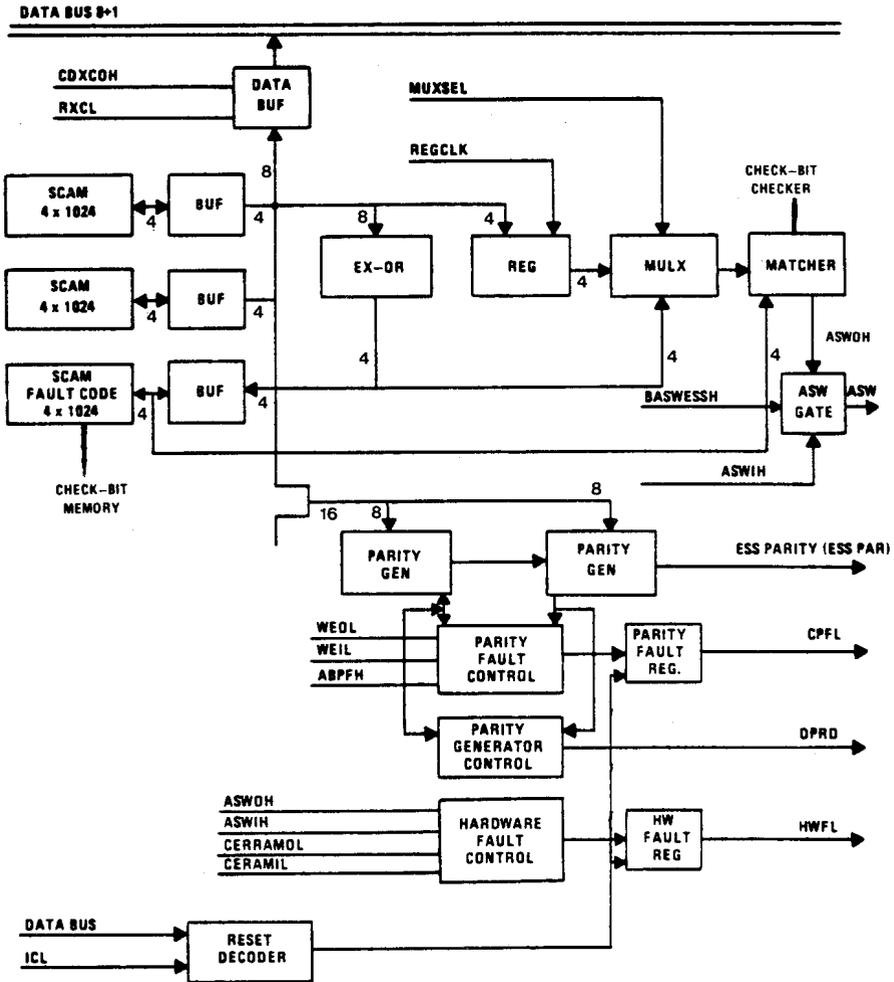

FG35 MATCHER AND BUFFERS

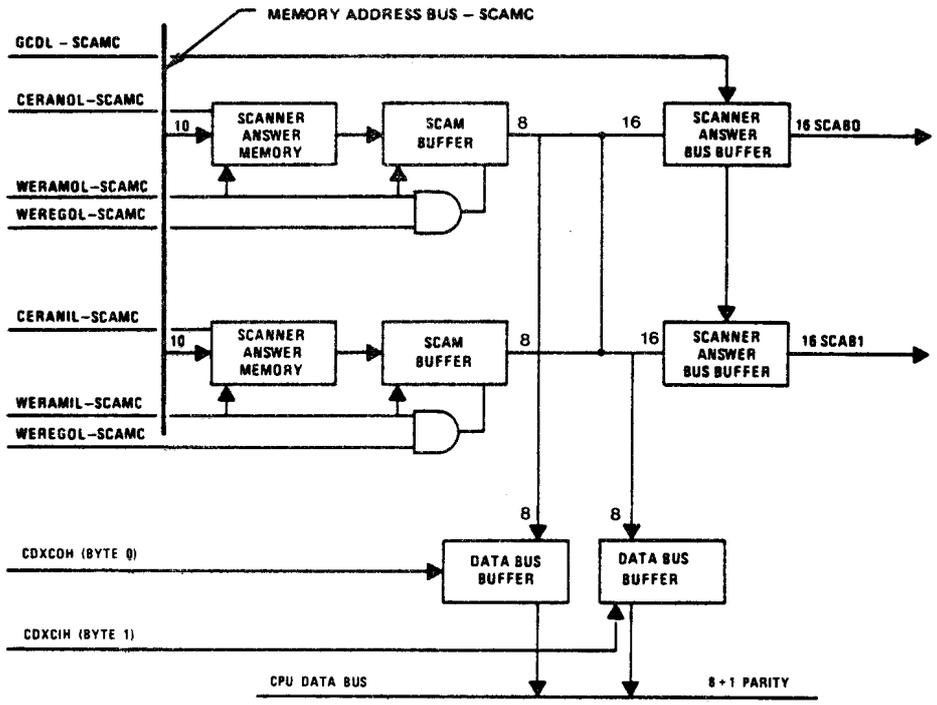

MIF - MASTER INTERNAL FAULT
 MEF - MASTER EXTERNAL FAULT
 SEF - SLAVE EXTERNAL FAULT
 SIF - SLAVE INTERNAL FAULT

TEST PORTS ON THE FG 35
 ALLOW THE MAINTENANCE
 FIRMWARE TO LOCATE FAULTS.
 DUPLICATION OF THE PORTS
 AND 'OR' GATES ALLOWS
 DETECTION OF FAILURES
 IN THIS CIRCUIT.

CIRCUIT PACK	NAME	FUNCTION	LOCATION
FC137	Input Line Selector	Selects the input level (0-15) with the OP10-OP13 or 1P18-1P111 P-leads on all orders that close the cut-offs in concentrators 0-3; orders 5 or 7 (normal from controller 0) and orders 13 or 15 (crossfire from controller 1).	02-23 FS7
FC137		Selects the input level (0-15) with the OP20-OP23 or 1P28-1P211 P-leads on all orders that close the cut-offs in concentrators 4-7; orders 5 or 7 (normal from controller 0) and orders 13 or 15 (crossfire from controller 1).	02-25 FS7
FC137		Selects the input level (0-15) with the OP10-OP13 or 1P18-1P111 P-leads on all orders that open the cut-offs in concentrators 0-3; orders 1 or 4 (normal from controller 0) and orders 9 or 12 (crossfire from controller 1).	02-27 FS7
FC137		Selects the input level (0-15) with the OP20-OP23 or 1P28-1P211 P-leads on all orders that open the cut-offs in concentrators 4-7; orders 1 or 4 (normal from controller 0) and orders 9 or 12 (crossfire from controller 1).	02-29 FS7
FC137		Selects the input level (0-15) with the 1P10-1P13 or OP18-OP111 P-leads on all orders that close the cut-offs in concentrators 8-11; orders 5 or 7 (normal from controller 1) and orders 13 or 15 (crossfire from controller 0).	06-40 FS7
FC137		Selects the input level (0-15) with the 1P20-1P23 or OP28-OP211 P-leads on all orders that close the cut-offs in concentrators 12-15; orders 5 or 7 (normal from controller 1) and orders 13 or 15 (crossfire from controller 0).	06-42 FS7
FC137		Selects the input level (0-15) with the 1P10-1P13 or OP18-OP111 P-leads on all orders that open the cut-offs in concentrators 8-11; orders 1 or 4 (normal from controller 1) and orders 9 or 12 (crossfire from controller 0).	06-44 FS7
FC137		Selects the input level (0-15) with the 1P20-1P23 or OP28-OP211 P-leads on all orders that open the cut-offs in concentrators 12-15; orders 1 or 4 (normal from controller 1) and orders 9 or 12 (crossfire from controller 0).	06-46 FS7
FC134	Diagnostic Control Circuit	Provides certain inhibit and mode control functions to controllers during diagnostics. Works in conjunction with other packs. Uses power supply from both controllers.	02-59 FS10
FC133	Test Point Access Circuit	Contains test point and quarantine relays; reflects F, S, and T points to master scanner for both controllers. Uses power supply from both controllers.	02-63 FS10

4:1 LSC CONTROLLER PACKS

CIRCUIT PACK	NAME	FUNCTION	CONTROLLER LOCATION	
			0	1
FB292	+3v DC-DC Converter	Converts +24v to +3v to supply CP's FA774, FA772, FA773, FC130, and FB497 or FB297.	02-03 FS12	02-13
FA774	Three 4-bit Registers	Converts P.U. address bits 0-11 from bus 0 or 1 to the group 1 and half of the group 2 P-leads.	02-04 FS2	02-14
FA774		Converts P.U. address bits 12-23 from bus 0 or 1 to the group 3 and half of the group 2 P-leads.	02-05 FS2	02-16
FA772	Two 6-bit Registers and Translation Circuits	Converts P.U. address bits 24-35 from bus 0 or 1 to the (0 or 1)H or (0 or 1)M leads, the group 4 P-leads and the order group leads.	02-06 FS2	02-17
FA773	Controller Logic and Group Check Circuit	Processes enable, enable verify, controller reset (bit 36), group check and other functions.	02-07 FS4	02-18
FB290	Cut-Through and Gate Driver Ckt.	Used primarily in group check functions. Generates the A, B, and C leads for the six translator lead groups. Prevents the associated controller from accessing the mate concentrators unless the other controller is quarantined. Provides gate driving for the lead groups in the FA774's and FA772.	02-08 FS3	02-19
FC130	Diagnostic Bus Driver Circuit	Converts the low voltage leads from the IC's to the +24v levels required on the diagnostic bus. Has a few other functions.	02-09 FS5	02-20
FB297 or FB497	Enable Timer and Pulser Sequence Ckt.	Provides timing for enabling translators and generating enable verify; generates the group check window; controls timing and reset signals for pulser circuit; drives pulser circuit.	02-10 FS6	02-21
FB296	Pulser Circuit	Generates the 4.0 amp pulse through the concentrator grid to open or close remanent reed contacts.	02-51 FS6	02-55
FB287	Order Group Node Selector	Selects the order nodes with the OR1-OR7 leads and the P14-P17 P-leads for concentrators 0-3 (in controller 0) or concentrators 8-11 (in controller 1). Used on home orders.	02-42 FS7	06-59
FB287		Selects the order nodes with the OR1-OR7 leads and the P24-P27 P-leads for concentrators 4-7 (in controller 0) or concentrators 12-15 (in controller 1). Used on home orders.	02-43 FS7	06-60
FB287		Selects the order nodes with the OR9-OR15 leads and the P112-P115 P-leads for concentrators 8-11 (in controller 0) or concentrators 0-3 (in controller 1). Used on cross-fire orders.	02-44 FS7	06-61
FB287		Selects the order nodes with the OR9-OR15 leads and the P212-P215 P-leads for concentrators 12-15 (in controller 0) or concentrators 4-7 (in controller 1). Used on cross-fire orders.	02-45 FS7	06-62

4:1 LSC CONTROLLER PACKS (CONT'D)

CIRCUIT PACK	NAME	FUNCTION	CONTROLLER LOCATION	
			0	1
FB286	Concentrator Node Selector	Develops the nodes for the stage 0 and 1 switches in the home concentrators with the P34-P37 P-leads and the A40-A43 concentrator pair leads from the FC139 pack. Used on home orders.	02-40	06-57
FB286		Develops the nodes for the stage 0 and 1 switches in the mate concentrators with the P312-P315 P-leads and the A48-A411 concentrator pair leads from the FC139 pack. Used on crossfire orders.	02-41	06-58
FC438	Mate Access and Release Path Selector	Selects the output level with the OP20-OP23 P-leads and provides pulse steering with the OOR1-OOR7 order group leads for concentrators 0 to 3. Used on home orders to controller 0.	02-32 FS7	
FC438		Selects the output level with the OP10-OP13 P-leads and provides pulse steering with the OOR1-OOR7 order group leads for concentrators 4 to 7. Used on home orders to controller 0.	02-34 FS7	
FC438		Selects the output level with the OP28-OP211 P-leads and provides pulse steering with the OOR9-OOR15 order group leads for concentrators 8-11 on controller 0 crossfire orders.	02-36 FS7	
FC438		Selects the output level with the OP18-OP111 P-leads and provides pulse steering with the OOR9-OOR15 order group leads for concentrators 12-15 on controller 0 crossfire orders.	02-38 FS7	
FC438		Selects the output level with the 1P20-1P23 P-leads and provides pulse steering with the 1OR1-1OR7 order group leads for concentrators 8-11 on controller 1 home orders.		06-48 FS7
FC438		Selects the output level with the 1P10-1P13 P-leads and provides pulse steering with the 1OR1-1OR7 order group leads for concentrators 12-15 on controller 1 home orders.		06-51 FS7
FC438		Selects the output level with the 1P28-1P211 P-leads and provides pulse steering with the 1OR9-1OR15 order group leads for concentrators 0-3 on controller 1 crossfire orders.		06-53 FS7
FC438		Selects the output level with the 1P18-1P111 P-leads and provides pulse steering with the 1OR9-1OR15 order group leads for concentrators 4-7 on controller 1 crossfire orders.		06-55 FS7
FC139	Concentrator Pair and Group Selector	Selects the concentrator group (0-3) with the P34-P37 or P312-P315 P-leads; selects the concentrator pair (0-3) home or 0-3 mate) with the P40-P43 or P44-P48 P-leads; selects on of the test leads (P31A-P34A) with the P30-P33 P-leads and the OR3 order group lead on test orders.	02-39 FS7	06-56

LINE SCANNER CONTROLLER PACKS (2:1 AND 4:1)

CIRCUIT PACK	NAME	FUNCTION	CONTROLLER LOCATION	
			0	1
FB292	+3v DC-DC Converter	Converts +24 to +3v to supply CP's FA777 or FA775, FB288, FB289, FC330 and FC135.	0*-03 FS6 FS18	0*-20 2:1 4:1
FC135	Scanner Detection Circuit	Accepts the readout matrix bits 0-15 from the even rows (associated with the even LSC in 2:1) in concentrators 0 to 15.	0*-05 FS5 FS17	0*-22 2:1 4:1
FC135	Scanner Detection Circuit	Accepts the readout matrix bits 0-15 from the odd rows (associated with the odd LSC in 2:1) in concentrators 0 to 15.	0*-07 FS5 FS17	0*-24 2:1 4:1
FA777 (2:1) FA775 (4:1)	Scanner Controller Register and Translator	Translates P.U. bus bits 0-15 to select the row to be interrogated; Accepts the enable; generates the enable verify; Generates the ASWS; Accepts bit 16 to generate the test order functions.	0*-08 FS3 FS15	0*-25 2:1 4:1
FC330	Interrogate Matrix	Selects one of the 16 scanner rows to be interrogated in concentrators 0 to 3.	0*-09 FS3 FS15	0*-26 2:1 4:1
FC330		Selects one of the 16 scanner rows to be interrogated in concentrators 4 to 7.	0*-10 FS3 FS15	0*-27 2:1 4:1
FC330		Selects one of the 16 scanner rows to be interrogated in concentrators 8 to 11.	0*-14 FS3 FS15	0*-31 2:1 4:1
FC330		Selects one of the 16 scanner rows to be interrogated in concentrators 12 to 15.	0*-15 FS3 FS15	0*-32 2:1 4:1
FB288	Interrogate Current Drivers	Drives the interrogate current for 1 out of 4 rows selected in a concentrator; Checks that exactly one of these four are selected to help generate the ASWS.	0*-12 FS3 FS15	0*-29 2:1 4:1
FB289	Scanner Timing	Provides enable timing and scanner sequencing functions; Accepts bit 36 (controller reset); Buffers the maintenance test functions from the +3v to the +24v level.	0*-16 FS3 FS15	0*-33 2:1 4:1

TSC SHARED or CRITICAL CIRCUIT PACKS

CIRCUIT PACK	NAME	FUNCTION	LOCATION
FB294	trunk grid node selector	Selects stage 0 and 1 node leads for grids 0 and 1 with the order group and group 5 P-leads from the controller 0 or 1 FA772 packs.	15-31 FS7
FB294		Selects stage 0 and 1 node leads for grids 2 and 3 with the order group and group 5 P-leads from the controller 0 or 1 FA772 packs.	15-40 FS7
FC131	input level selector	Selects 1 of 4 test order functions with OP31-OP34 and OOR3 leads (This portion not shared). Also selects input levels for grids 0-1 with group 1 P-leads from controller 0 or 1 FA772's.	15-33 FS7
FC131		Selects 1 of 4 test order functions with IP31-IP34 and IOR3 leads (this portion not shared). Also selects input levels for grids 2-3 with group 1 P-leads from controller 0 or 1 FA772's.	15-42 FS7
FC132	output level selector	Selects output levels (from stage 1) for grids 0-1 with the group 2 and 4 P-leads from controller 0 or 1 FA772's.	15-35 FS7
FC132		Selects output levels (from stage 1) for grids 2-3 with the group 2 and 4 P-leads from controller 0 or 1 FA772's.	15-44 FS7
FC134	diagnostic control circuit	Provides certain inhibit and mode control functions to controllers during diagnostics. Works in conjunction with several other packs. Uses power supply from both controllers.	15-59 FS11
FC133	test point access circuit	Contains test point and quarantine relays; reflects F, S, and T points to master scanner for both controllers. Uses power supply from both controllers.	15-63 FS11

REFERENCE - SD1A327

TSC and JSC CONTROLLER PACKS

CIRCUIT PACK	NAME	FUNCTION	CONTROLLER LOCATION	
			0	1
FB292	+3v DC-DC Converter	Converts +24v to +3v to supply CP's FA772, FA773, FC130 and FB295.	15-03 FS12 FS15	15-18 TSC JSC
FA772	Two 6-bit register and translator circuits	Translates P.U. bus bits 0-7 and 16-19 to group 1 and 2 "P-leads".	15-04 FS2	15-19 TSC, JSC
FA772		Translates P.U. bus bits 8-15, 20-21, and 24-25 to group 3 and 4 "P-leads".	15-05 FS2	15-20 TSC, JSC
FA772		Translates P.U. bus bits 26-35 to group 5 "P-leads", order group leads, and H or M leads.	15-06 FS2	15-21 TSC, JSC
FA773	Controller logic and group check circuit	Processes the enable, enable verify, controller reset (bit 36), group check, and other controller functions. Also controls the FCG interrogate action (from bit 37) and the NT vertical functions in JSC's only.	15-07 FS4	15-22 TSC, JSC
FC130	Diagnostic bus driver circuit	Converts the low voltage leads from the IC's to the +24v levels required on the diagnostic bus. Has a few other functions.	15-08 FS5	15-23 TSC, JSC
FB290	Cut-through and gate driver circuit	Generates the A and B group check leads, and the C and CT (H/M) gate driver leads for the six lead groups in the translators.	15-09 FS3	15-24 TSC, JSC
FB295	Enable timer and pulse driver circuit	Timing for enabling translators, timing for generating enable verify, and drives the pulser circuit. Generates group check window.	15-12 FS6	15-27 TSC, JSC
FB296	Pulser circuit	Generates the 4.0 amp pulse through the grid to open or close remanent reed contacts.	15-51 FS6	15-55 TSC, JSC
298 FB291 JSC only	FCG detector and test vertical circuit	Connects FCG detector or test vertical to the FA773 according to the order leads from the FA772's.	15-11 FS13	15-26 JSC

JSC SHARED or CRITICAL CIRCUIT PACKS

CIRCUIT PACK	NAME	FUNCTION	LOCATION
FB293	juncator grid node selector	Selects stage 0 and 1 node leads for grids 0 and 1 with the order group and group 5 P-leads from the FA772 packs in controller 0 or 1.	15-31 FS7
FB293		Selects stage 0 and 1 node leads for grids 2 and 3 with the order group and group 5 P-leads from the FA772 packs in controllers 0 or 1.	15-40 FS7
FC131	input level selector	Selects 1 of 4 test order functions with OP31-OP34 and OOR3 leads (this portion not shared). Also selects input levels for grids 0-1 with group 1 P-leads from controller 0 or 1 FA772's.	15-33 FS7
FC131		Selects 1 of 4 test order functions with 1P31-1P34 and 1OR3 leads (this portion not shared). Also selects input levels for grids 2-3 with group 1 P-leads from controller 0 or 1 FA772's.	15-42 FS7
FC132	output level selector	Selects output levels for grid 0 with the group 2 P-leads from the FA772's in controllers 0 or 1.	15-35 FS7
FC132		Selects output levels for grid 1 with the group 4 P-leads from the FA772's in controllers 0 or 1.	15-37 FS7
FC132		Selects output levels for grid 2 with the group 2 P-leads from the FA772's in controllers 0 or 1.	15-44 FS7
FC132		Selects output levels for grid 3 with the group 4 P-leads from the FA772's in controllers 0 or 1.	15-46 FS7
FC134	diagnostic control circuit	Provides certain inhibit and mode control functions to controllers during diagnostics. Works in conjunction with several other packs. Uses power supply from both controllers	15-59 FS14
FC133	test point access circuit	Contains test point and quarantine relays; reflects F, S, and T points to master scanner for both controllers. Uses power supply from both controllers.	15-63 FS14

RELATED INPUT MESSAGES - NETWORK FRAMES

FAB-MB- aa b cc d e f g h i.

REMOVES SPECIFIED LINKS FROM SERVICE.

FAB-RESTORE- aa b cc d e f g h i.

RETURNS SPECIFIED LINKS TO SERVICE.

FAB-SET- aa bb c d e f gg h i.

SETS A PARTIAL PATH IN ANY NETWORK FRAME. LINKS IN PATH MUST HAVE BEEN BUSIED USING FAB-MB MESSAGES.

FAB-STATUS- aa b cc d e f g h i.

DETERMINES PRESENT CONDITION OF LINK OR SWITCH SPECIFIED.

NET-DGN- aaa bb c d e.

REQUESTS DIAGNOSTIC, QUARANTINING, OR RESTORAL OF THE SIGNAL DISTRIBUTOR OR NETWORK CONTROLLER SPECIFIED.

NET-ONE- aaa bb c d e fffffff ggggggg hhhhhhh.

ALLOWS SINGLE ORDER TO BE SENT REPEATEDLY TO A NETWORK OR SIGNAL DISTRIBUTOR FRAME.

NET-LINE- aaa aaaa bbbb.

IDENTIFIES OTHER NETWORK TERMINATION (LINE OR TRUNK) IF LINE IS IN USE ON A CALL

T-SCAN- a b cc d ee ff.

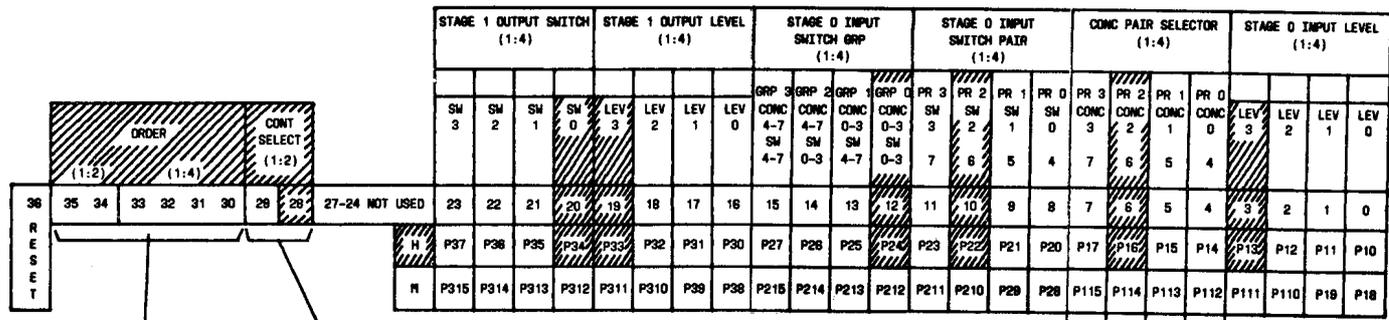

READS ONE SCAN POINT OR A ROW OF POINTS IN THE SCANNER SPECIFIED.

VFY-TNN- aa bb c d e f.

VERIFIES A TRUNK NETWORK NUMBER ON A TSF

VFY-UNTY-15 aaa bbbb.

PRINTS CONTENTS OF AUX BLOCK ASSOCIATED WITH UNIT TYPE AND MEMBER NUMBER

SUPF

CALL PROGRAM

PIDENT NMFL

*ESTABLISH NTKW PATH (REMOVE LINE FERROD) *CLOSE TRUNK CUT THROUGHES *SCAN TRUNK FERROD	=0 (CLOSED PATH)	OK
=1 (OPEN PATH)		
*OPEN TRUNK CUT THROUGHES *CONNECT LINE FERROD *SCAN LINE FERROD	=1 (ON HOOK)	OK
=0 (OFF HOOK)		
*PRINT NT02 SUPP *SCORE NTKW SWITCH FAILURE COUNTERS *REQUEST TRK MTCE		

METHOD OF PERFORMING TEST

Whenever a network connection is completed in the ESS office, a supervisory check is made to verify the continuity of the newly established path. In theory this test should detect opens in the trunks or switching network. In fact, many of the failure messages are a result of line or trunk problems external to the ESS machine.

SUPF (cont'd)

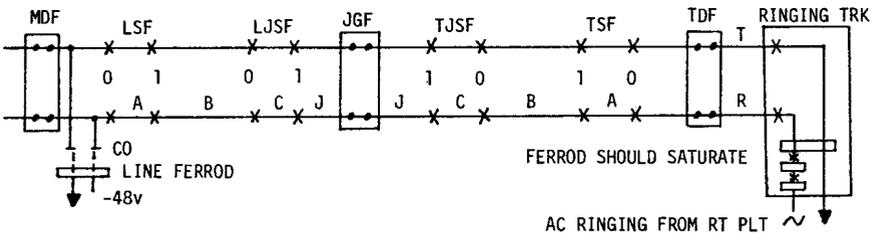

POSSIBLE CAUSES OF TROUBLE

1. Broken cross-connect on trunk frame.
2. Defective trunk units or switches (trk ckt to line path).
3. Split pulse paths in the ESS network.
4. Crossed lines on the MDF or in the cable. Tip of one line crossed to the ring of another causes excessive supervisory failures.
5. Application of breakdown tone to a line. Voltmeter tests of such lines will not show a DC trouble, and the line must be monitored to detect the tone.
6. JGF plug or jack troubles.
7. Crosses or grounds on lines which fall between the saturation point of the line ferrod ($\sim 4800-5200\Omega$) and a CDPR or RA trunk ($\sim 2700\Omega$). LEN to CDPR path.

MEANS OF REDUCING FAILURES

1. Application of cable tone to a line only with the coils removed.
2. Close surveillance of T-T supervision failures to identify bad trunks.
3. Repeated failures to one switch frame could indicate either a split pulse path of a deteriorating pulser.

RC

METHOD OF PERFORMING TEST

While ringing current is being applied to a line, an AC continuity check is made to assure that sufficient current is flowing in the circuit. This test will detect open lines or keysets with insufficient capacitance.

In this test the failure will not be printed out until after the originating party abandons the connection. If the ringing is tripped, for any reason, the failure message will not be printed.

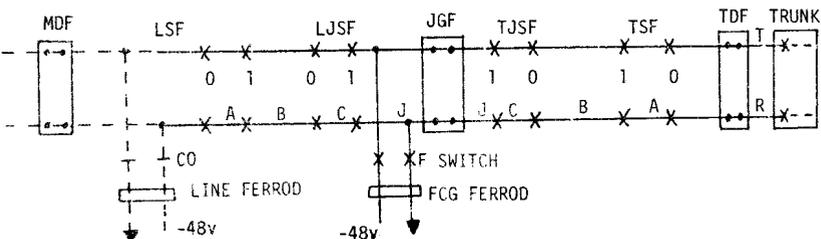

POSSIBLE CAUSES OF TROUBLE

1. Defective switches or ringing trunks.
2. Open cross connect on MDF.
3. Lines put into translations too soon or not removed properly when service has been discontinued.
4. 400B keyset unit is the primary cause. Due to its design, causes false failures.

MEANS OF REDUCING FAILURES

1. Analyze printouts for repeated failures to the MLHG.
2. Periodically check the RC failures for repeated ringing trunk failures.
3. Coordinate cross connect work with service order TTY entries.

FCG

METHOD OF PERFORMING TEST

When a network connection is established, it is checked for the presence of a false cross or ground on the tip and ring connection. This test is performed with stage 0 of the LSF open to remove the line. However, the trunk unit is associated with the test since the crosspoints of the TSF are closed. Generally failures of this type indicate a problem within the ESS trunk or network.

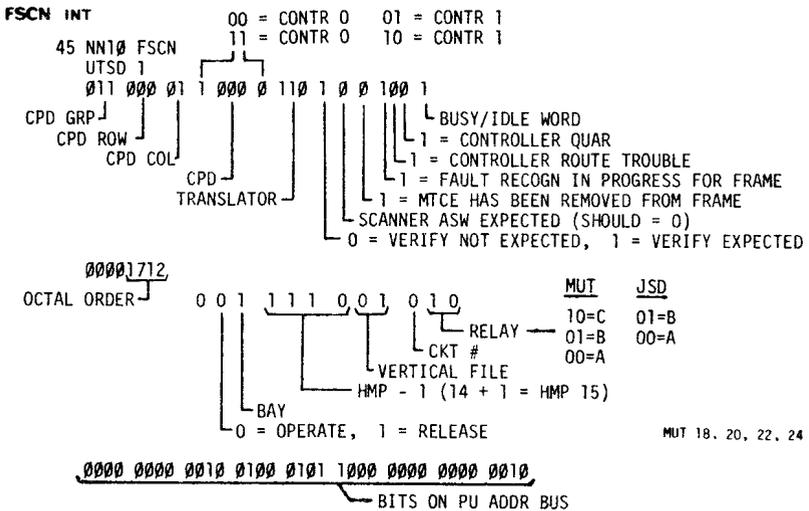

The FCG test is made from the No Test Vertical associated with the JSF. When attempting to isolate a failure in the combined mode, one controller cannot test for FCG in the grids normally controlled by the other controller. By removing a JSF controller, half of the FCG testing in that frame is eliminated.

POSSIBLE CAUSES OF TROUBLE

1. Cross connect touching on TDF.
2. JGF crosses in plugs or jacks.
3. Defective switches (closed trunk cutoff).
4. Stuck "F" switches.
5. Defective trunk units

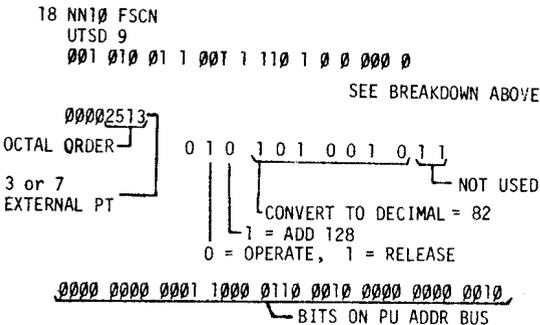

MEANS OF REDUCING FAILURES

1. Logging all failures to identify patterns early.
2. Use "MNO2 MISC" messages on mtce TTY to identify trunks associated with transient FCG failures.

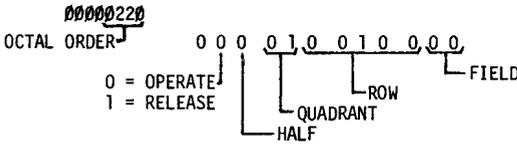

FSCN failures indicate that the signal distributor either failed to see a MLR (magnetic latching relay) operate or release.

or MJ

METHOD OF PERFORMING TEST

When an ESS line disconnects, a test is made to verify that the line equipment restores properly and thus will be able to detect a new origination. To perform the test, a resistance loop or ground is connected from the junctor switch frame to the line ferrod. This resistance simulates an origination and the line ferrod is scanned to see if it is saturated. Failure to saturate the line ferrod results in the error printout.

POSSIBLE CAUSES OF TROUBLE

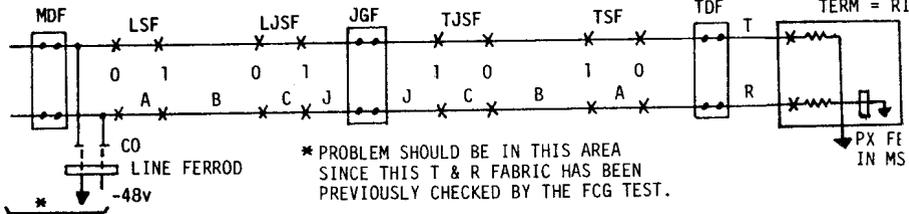

1. Defective cutoff switch not closing through to line ferrod.
2. Translations incorrect or line ferrod wiring incorrect.
3. Tip ground from a blown coil on MDF or T-T cross.
4. Open "F" switch contacts or troubles in the restore verify circuit.

MEANS OF REDUCING FAILURES

1. Check ALIT printout every morning to pick up failures from previous night's automatic line insulation tests.
2. Periodically check the RVFY printouts for failure patterns to one particular JSF.

PX

TRK, ORIG = CDPR

CONTINUOUSLY CLOSED CROSSPOINT ON THE RING SIDE OF THE LINE.

METHOD OF PERFORMING TEST

Prior to applying either dial tone or ringing current to a line, a power cross test is made. This test looks for the presence of a positive foreign potential in excess of 50 volts.

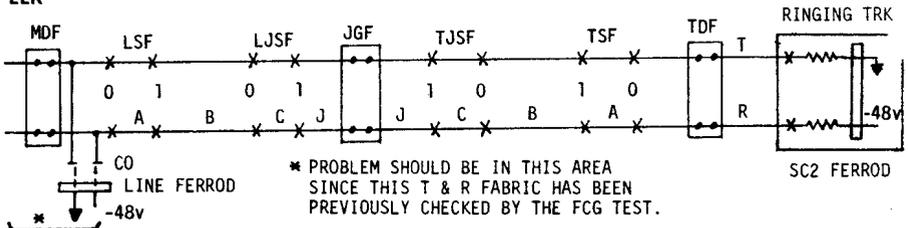

POSSIBLE CAUSES OF TROUBLE

1. Crosses with power lines.
2. CDPR trunk low sensitivity.
3. Positive DC on subscriber line.
4. Incorrect use of cable breakdown set.

MEANS OF REDUCING FAILURES

1. Adherence to standard practices when using breakdown sets.
2. Investigating each PX that is received.

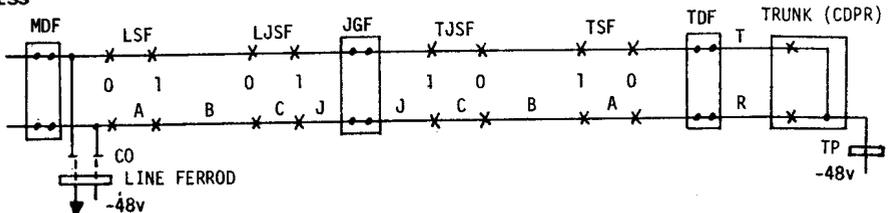

LLR

PRIOR TO RINGING THE CALLED SUBSCRIBER, A PRE-TRIP TEST IS MADE TO INSURE THAT A FALSE TRIP OF RINGING WILL NOT OCCUR CAUSING A FALSE AMA OR COIN CHARGE TO BE MADE AGAINST THE ORIGINATING CUSTOMER.

TIP AND RING REVERSAL IN THE PATH WILL CAUSE AN LLR.
 LOW T-R RESISTANCE IN CALLED SUBSCRIBER LINE OR RINGING TRUNK CIRCUIT.

LSS

TIP PARTY HAS 1000Ω GROUND (OFF HOOK)
 RING PARTY HAS NONE.
 THIS CAN BE TESTED VIA LTTP OR STATION RINGER TEST CODE.

TWO PARTY TESTS ARE MADE ON ORIGINATING SUBSCRIBER LINE - ONE IS MADE PRIOR TO DIAL TONE (PT1) AND ANOTHER IS MADE AFTER ALL DIGITS ARE DIALED (PT2).

IF ONE TEST SHOWS RING PARTY AND SECOND TEST SHOWS TIP PARTY OR VICE VERSA, A LINE SECURITY SCAN FAILURE EXISTS. THE POSSIBILITY OF CHARGING THE WRONG CUSTOMER CAN OCCUR.

SUPPORTING DOCUMENTATION

BSP 820-502-150

TLTP, STT, OR MTT* TESTING ORDER FORMAT

LAMP INDICATIONS

EQUIPMENT STATE

Steady - TNN is idle
60 IPM - Locked out
120 IPM - Disabled

REG LAMP

Steady - Traffic idle
60 IPM - Traffic busy

PROGRESS AND ERROR

5 second steady - Success
60 IPM - System failure
120 IPM - Translation or human error

* Status lamps indicate status of TNN

TRUNK TESTING

PRIOR TO 1E6, 1AE6

DIAGNOSE A TNN

Keys: TRK, TST, OP
TT Dial: TNN, XX, START

DIAGNOSE A TRK GRP

Keys: TRK, TST
TT Dial: TGN, XX, START

1E6, 1AE6 AND LATER OR MTT*

DIAGNOSE A TNN

Keys: TRUNK/TNN, TST
TT Dial: TNN, *, XX, #

DIAGNOSE A TRK GRP

Keys: TST
TT Dial: TGN, *, XX, #

TEST CODES XX

	<u>First Digit</u>	<u>Second Digit</u>
0	No substitute trunk	Normal automatic trunk prog. TST
1	Use substitute trunk	Permanent busy TST
2	Repeat test 32 times	Synchronous TST
3	Repeat with sub. trunk	Non-synchronous TST
4	Raw data print	Not used
5	Raw data with sub. trunk	Continuity and polarity TST
6	Raw data - repeat	Same as "0" but remove all failing trunks from service on a T.G. DGN
7	Raw - repeat with sub. trunk	

OPERATION OF CPD POINTS

TNN ON ACCESS TRUNK (1 - 3)

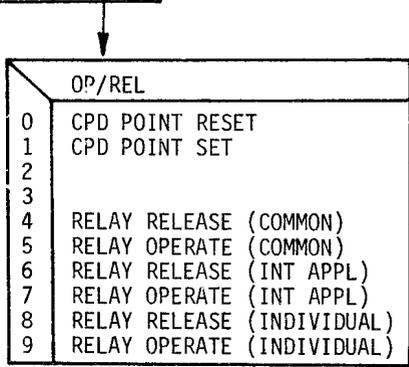

PRIOR TO 1E6, 1AE6

Keys: TST, OP
 TT Dial: A, B, C, D, START

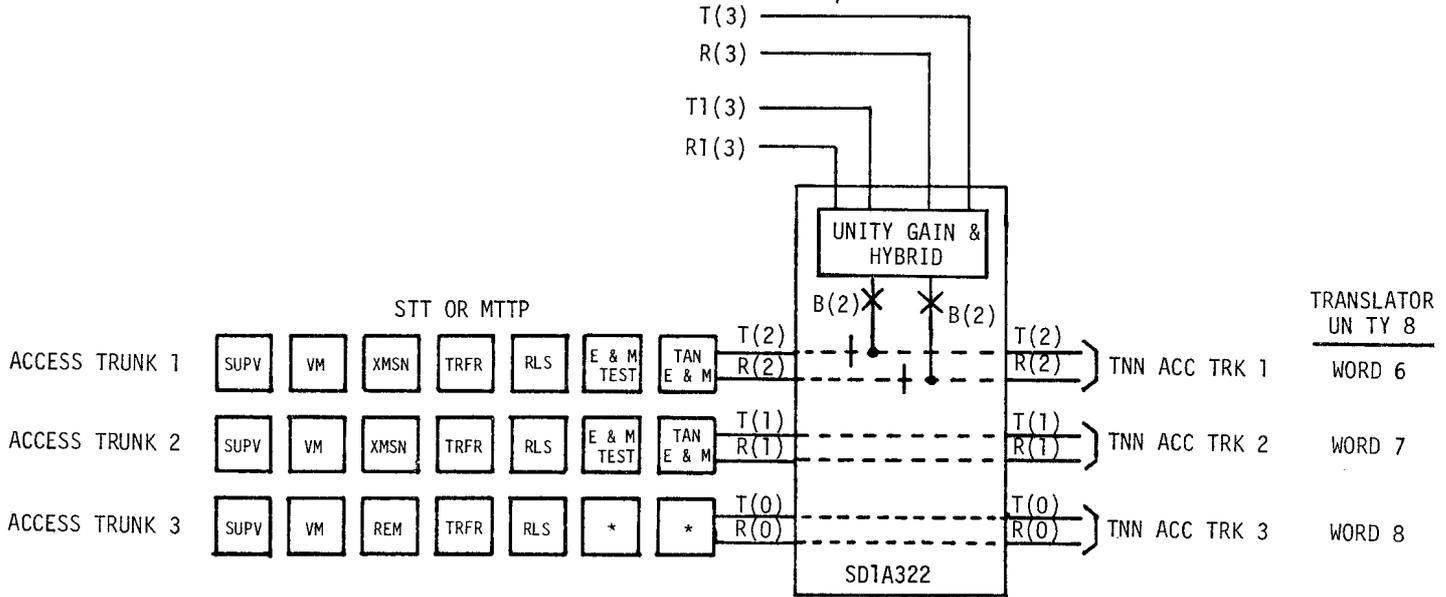

1E6, 1AE6 AND LATER

Keys: TST, TRK/TNN
 TT Dial: *, A, B, C, D, #

CPD POINT	RELAY	(A)	(B)	(C)	(D)
		ACCESS TRUNK	GROUP	CKT SD PT	OP/REL
0	A	1 - 3	9	0	0 - 9
1	B	1 - 3	9	1	0 - 9
2	C	1 - 3	9	2	0 - 9
3	D	1 - 3	9	3	0 - 9

ASSOCIATION OF STT/MTTP ACCESS TRUNK NUMBER TO SD1A322-01 PORT (2-WIRE ONLY) AND TNN CONTAINED IN WORDS 6, 7, AND 8 OF UNIT TYPE 8 TRANSLATION (SECT 30, PA 591003) NO. 1 ESS (SECT 256, PA6A002) NO. 1A ESS.

REPEATEDLY OPERATE RELAY OR CPD POINT ON TRUNKS HELD ON ACCESS TRUNKS

BASIC FOUR DIGIT CODES

0100 SIEZE POB
 03ab TIME DELAY
 a = Quantity of 250 msec delays
 b = Quantity of 25 msec delays (0-9)
 0600 IGNORE RELAY FAILURES
 0200 ACTIVATE POB
 0500 TERMINATE TEST (Zero the POB)

EXAMPLE OF REPEATEDLY OPERATING THE A, B, AND C RELAYS OF A TNN ON ACCESS 1

0100	SIEZE POB	
0600	IGNORE RELAY FAILURES	
1909	OPERATE A RELAY	PROCEDURE
0302	DELAY 50 msec	(1E5, 1AE5 AND EARLIER)
1919	OPERATE B RELAY	
0320	DELAY 500 msec	1. BRING TRUNK UP ON ACCESS
1929	OPERATE C RELAY	2. OPERATE "TEST", "OP"
0310	DELAY 250 msec	3. DIAL FOUR DIGITS, THEN "ST" FOR EACH STEP
1908	RELEASE A RELAY	4. TO TERMINATE TEST, DIAL 0500, "ST"
0310	DELAY 250 msec	
1918	RELEASE B RELAY	(1E6, 1AE6 AND LATER OR MTPP)
0310	DELAY 250 msec	
1928	RELEASE C RELAY	F. BRING TRUNK UP ON ACCESS
0310	DELAY 250 msec	2. OPERATE "TEST"
0200	ACTIVATE POB	3. RELEASE "TRUNK/TNN" AND "OP"
		4. DIAL *, FOUR DIGITS AND "ST/#" FOR EACH STEP
		5. TO TERMINATE TEST, DIAL 0500, "ST/#"

PROGRAM STORE AND CALL STORE BUS SELECTION IN CC

Ten flip-flops are required to determine which central control is working with which program store and call store bus. They are the AU, PBO, PBA, PBT, CBO, CBA, CBT, OL3, and MRP. These flip-flops have the following significance:

AU - central control status. 0 = CC0 active, 1 = CC1 active

PBO, CBO - 1 = active CC sends on both busses

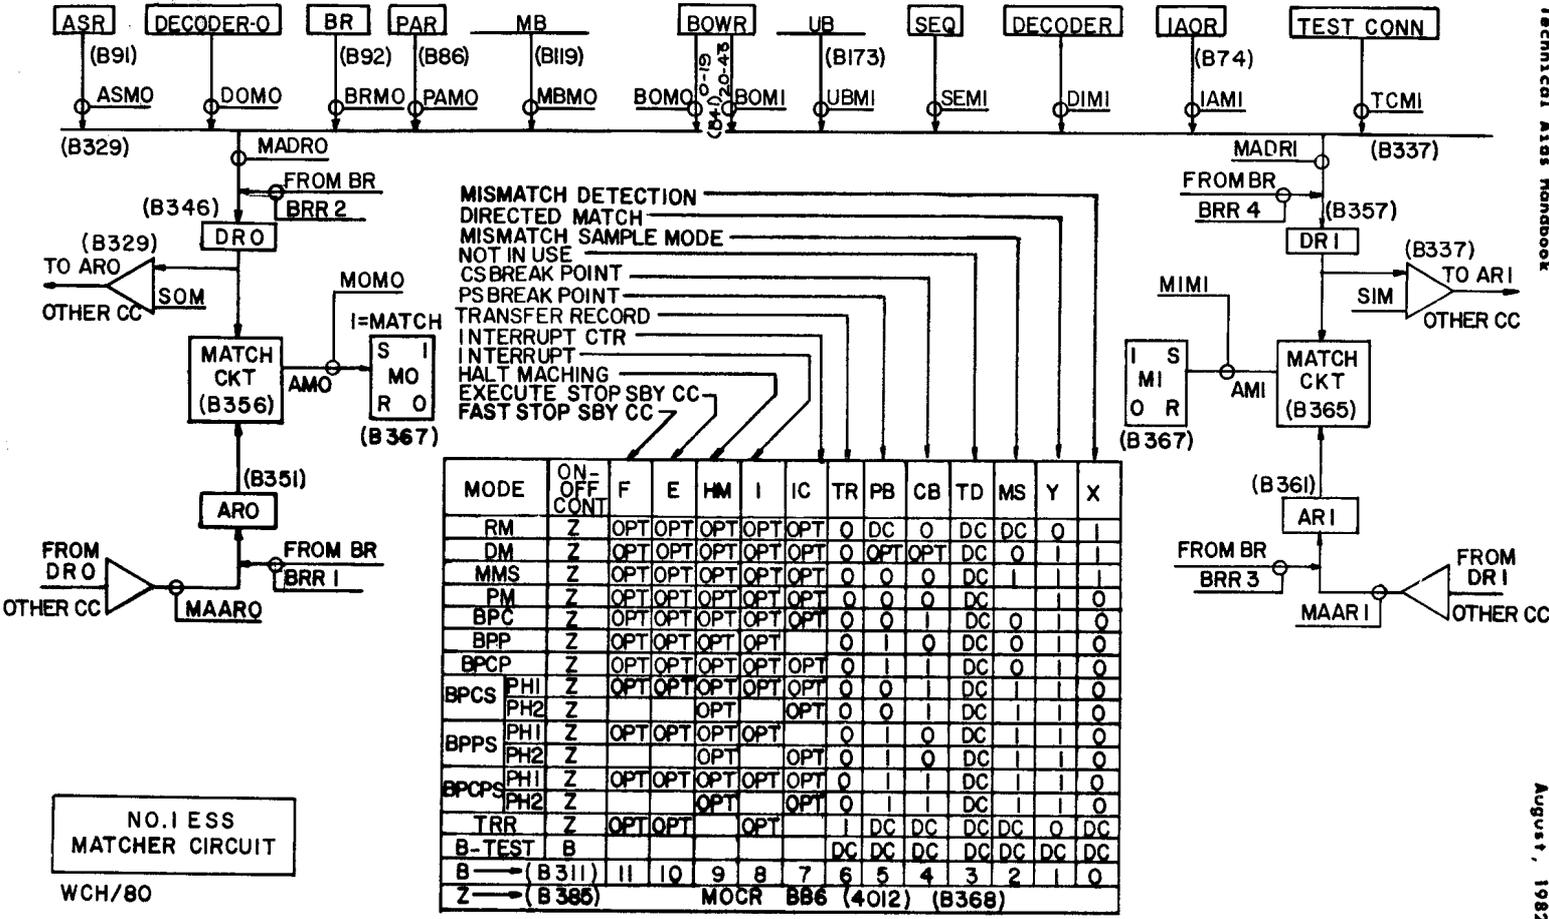

PBA, CBA - this flip-flop defines the active bus, ie, which bus is to be used by the active CC

PBT, CBT - 1 = standby bus is not used

OL3 - offline operation. 1 = bus selection for maintenance and control instructions is handled the same as for normal instructions (controlled by PBO, PBA, PBT, CBO, CBA, and CBT). 0 = active CC sends addresses on both busses and each CC will receive from the bus specified by the MRP, MRC flip-flop

MRP, MRC - maintenance and control instructions. 1 = receive from bus 1, 0 = receive from bus 0

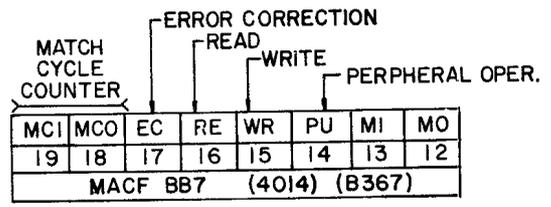

PS bus	PBT	PBA	PBO	Active CC		Standby CC	
CS bus	CBT	CBA	CBO	Send	Rec	Send	Rec
	0	0	0	0	0	1	1
	0	1	0	1	1	0	0
	1	0	0	0	0	X	0
	1	1	0	1	1	X	1
	0	0	1	0&1	0	X	1
	0	1	1	0&1	1	X	0
	1	0	1	0&1	0	X	0
	1	1	1	0&1	1	X	1
0 = F/F reset 1 = F/F set				0 = bus 0 1 = bus 1 X = neither bus

PS ADDRESS AND MEMORY BLOCK LAYOUT

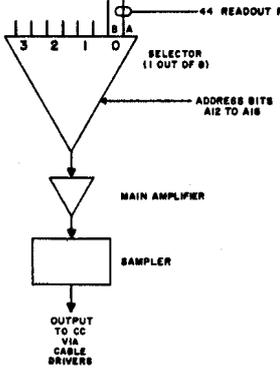

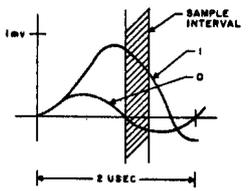

* SAME AS LAST MEMORY BLOCK IN OFFICE

#1 ESS PS MEMORY MODULE

TWISTOR MODULE ARRAY

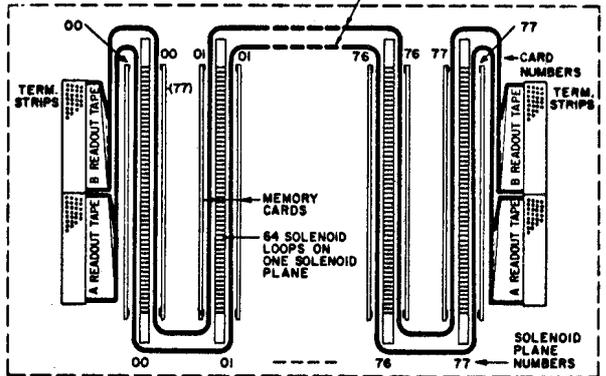

TYPICAL SIGNAL AT SELECTOR INPUT

- NOTES:
1. 44-BIT A READOUT AND 44-BIT B READOUT ARE EACH CONNECTED IN PARALLEL WITH SIMILAR READOUTS FROM SIMILARLY NUMBERED MODULES. FOUR MODULES ARE CONNECTED TO SAME OUTPUT PAIRS IN EACH WIRING PATTERN.
 2. G0, G1, G2, AND G3 REFER TO READOUT GROUPS.

Program Store Readout Connections

A AND B TAPES INTERLACE ALL INTERMEDIATE CARD POSITIONS IN A SIMILAR MANNER

MEMORY MODULE (FRONT VIEW)

NOTES:

1. ALL NUMBERING IS OCTAL.
2. WORDS ON EACH CARD ARE NUMBERED 00 THROUGH 77.
3. CARDS TO RIGHT OF SOLENOID PLANES ARE CALLED PASS 0 CARDS; CARDS TO LEFT OF SOLENOID PLANES ARE CALLED PASS 1 CARDS.
4. INFORMATION IS CONTAINED ON ONLY ONE SIDE OF EACH CARD. PASS 0 CARDS AND PASS 1 CARDS HAVE INFORMATION ON OPPOSITE SIDES.
5. PASS 0 AND PASS 1 REFER TO WRITING SEQUENCE WHEN CARDS ARE IN MEMORY CARD WRITER.

"B" TAPE

- PASS 0 - EVEN CARDS
- PASS 1 - ODD CARDS

"A" TAPE

- PASS 0 - ODD CARDS
- PASS 1 - EVEN CARDS

Program Store Answer Bus Testing in No. 1 ESS Offices Where PS-0 and PS-1 are in the Same PS Bus Community

Due to the physical location of Program Store Frames in many No. 1 ESS Offices both PS-0 and PS-1 have been engineered and installed on the same PS Bus Community (A or B). This presents a problem when adding a PS Frame to the other Bus Community.

The present "MOD-5" Bus Test Programs require that either PS-0 or PS-1 be in the PS-Bus Community to be tested in order to test the PS Answer Bus. The following is a method by which the A or B Community PS Answer Bus can be tested when PS-0 or PS-1 are not in the Community to be tested. This method utilizes normal Offline procedures and one (possibly two) PS Memory Card(s) from a "MOD-5" Bus Test Program.

1. Utilizing the Program MAP for the "MOD-5" Program Test Set Locate the PS Memory Card(s) containing the seven (7) Test Words starting at symbolic address "ROTP". This (These) cards will be referred to as "TEST CARD(S)".
2. Select a Program Store in the PS Bus Community(A or B) to be tested. This will be referred to as the "TEST PS". * The "TEST PS" must have one or two consecutive Memory Cards (depending on no. of TEST CARDS), containing FILL (either Generic FILL or Xlation FILL). These FILL Cards must be of the same "PASS" No. as the "TEST CARDS". The location of these memory cards will be referred to as "TEST CARD LOCATION(S)".
3. T-READ the FILL CARD(S) to verify that the entire card(s) are in fact FILL (ie: All addresses on the Card(s) are either Generic or Xlation FILL).
4. Determine the address of symbolic "ROTP" when the "TEST CARD(S)" are placed in the "TEST CARD LOCATION(S)" of the "TEST PS". This is the "START ADDRESS OF TEST WORDS".
5. Initiate Bus Testing by input messages as follows:

PS ANSWER BUS TEST
Offline Program

OFL-CONFIG- _ _ _ _ 00 0 99 0.

Mem. No. of "TEST PS" (00 - 11)*

No. of BUS to be tested (0 or 1)

3777737777777.

*If it is necessary to use an untested (added) PS as the "TEST PS" use Mem. No. 00 in the OFL-CONFIG- message. It should be noted that under this condition the problems encountered in performing the Bus Test may be caused by the untested "TEST PS" and may not be bus problems.

6. After OFL messages have been successfully completed remove the Original Translation or Generic FILL Card(s) from "TEST CARD LOCATION(S)" and insert the "TEST CARDS".
7. If an untested (added) PS is being used as the "TEST PS" it will have to be configured on the Offline Bus (0 or 1) by setting the Send and Receive FF on the PS with PS Bus Control Card (ITE: 4742). Care should be taken to be sure that this PS does not Send on the Active PS Bus (ie: Set TBL FF associated with the ACTIVE PS Bus and reset SEND FF's FOR THE HALF (H or G) not being used for Test).

If the system for any reason should attempt to reconfigure PS's and/or PS Buses be prepared to Set TBL FF for the bus being Tested on the untested (added) PS.

The above FF controls can all be accomplished with the ITE 4742 Bus Control Card.

8. Utilizing on oscilloscope perform Bus Test using scope patterns in the Program Listing for the PS Answer Bus Test.
9. When Bus Test is completed Set both Bus TBL FF's with switches on Bus Control Card if an added PS was used as "TEST PS".
10. Remove "TEST CARD(S)" and insert Original FILL Cards in "TEST CARD LOCATION(S)".

RETURN TEST CARD(S) TO PROPER
LOCATION(S) IN MOD 5 TEST SET

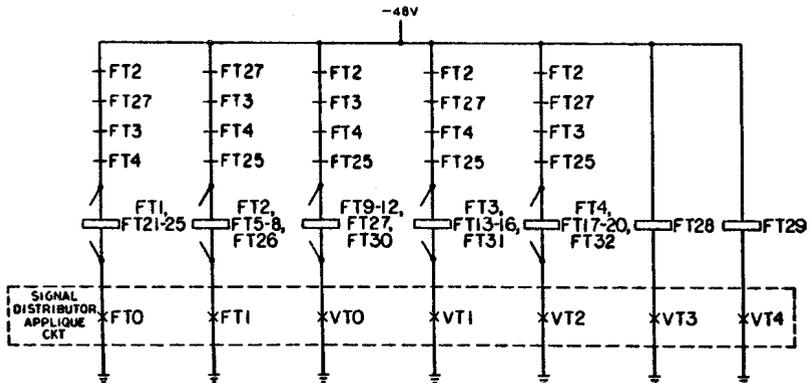

11. Input message OFL-MODE-03.

ACCESS NOTES

- R = READABLE VIA READ MEMORY ORDERS.
- W = WRITABLE VIA WRITE MEMORY ORDERS.
- C = WRITABLE VIA CONTROL WRITE OPERATIONS.
- *
- = INDICATES BITS WHICH HAVE WRITE CONTROL (W AND OR C) THAT DIFFERS FROM THE STANDARD METHODS EMPLOYED. THE BITS INVOLVED ARE: ARO-23, DRO-23, ARI-23 & DRI-23 --- THE LEAST SIGNIFICANT BIT OF THE ADDRESS IS USED AS THE DATA SOURCE.
- RCSEC, RPS2EC & RPSIEC --- WHEN ZERO IS WRITTEN, THE ASSOCIATED COUNTER IS RESET. WRITING A ONE HAS NO EFFECT.
- ALL WRITABLE BITS OF MAIS, MWIS & ILAF --- WHEN A ONE IS WRITTEN, THE FLIP FLOP IS RESET. WRITING A ZERO HAS NO EFFECT.

- = FOR W AND C ACCESS, MACR IS ACTUALLY SPLIT INTO TWO PARTS. ADDRESS 4013 GATES INTO BITS 0 - 9 AND ADDRESS 4011 GATES INTO BITS 10 - 21. R ACCESS IS NORMAL. ALL BITS ARE WRITABLE BY A SINGLE EMMS ORDER.
- ** = R ACCESS TO MO & MI READS THE ZERO SIDE OF THESE FF'S.
- *** = WRITABLE VIA EMMS ORDERS.
- EMMS = CONTROLLED IN BOTH CC'S, BUT SIMULTANEOUSLY VIA TWO UNIPOLAR POINTS.
- CPDUN = CONTROLLED SEPARATELY IN EACH CC BY 1 BIPOLAR CPD POINT PER CC.
- WY = WRITABLE VIA WY ORDERS.

EQUIPMENT NOTES

- (W) = EXISTS ONLY IN CC'S WHICH HAVE THE W OPTION.
- (R) = EXISTS ONLY IN CC'S WHICH HAVE THE R OPTION.
- (Z6) = EXISTS ONLY IN CC'S WHICH HAVE THE Z6 OPTION.
- (Z1) = EXISTS ONLY IN CC'S WHICH HAVE OPTIONS Z1, 42, AND 44.
- (305) = ONLY EXISTS IN SOME CC'S, AND IN SUCH CASES, ONLY ON A TEMPORARY BASIS. SEE SD-1A105-O1 NOTE 305.

MISCELLANEOUS NOTES

- (X...X) = ACTUAL NAME OF FUNCTION USED IN THE CC SD (SUPPLIED ONLY WHEN IT DIFFERS SIGNIFICANTLY FROM THE BIT NAMES USED IN THIS FIGURE).

NOTES:

1. THE MATCH CONTROL CIRCUIT INCORPORATES SINGLE-TO-DOUBLE RAIL CONVERSION.
2. A CC REQUEST FOR A WRITE OPERATION IN THIS GROUP WILL RESET THE COUNTER AND THE OVERFLOW F/F. THIS IS DONE INDEPENDENTLY OF THE CC DR DATA FIELD.
3. THE OPERATIONAL REGISTERS ARE WRITTEN INTO BY CC VIA THE MASKEE BUS. THE CC DR AND THE REGISTERS HAVE A BIT-BY-BIT CORRESPONDENCE.

MASTER CONTROL CENTER SCAN POINT DISPLAY

MCC data insert key assignment for using the MCC Binary Display to display a Scanner Row, MCC Matrix Row, CC Buffer Bus Register, or Scan Points associated with a TNN.

Step 1. Indicate type of display using data insert keys.

	KEY	20	19	18
A. Master Scanner Row		0	0	0
B. Universal Trunk Scanner Row		0	0	1
C. Junctor Scanner Row		0	1	0
D. Line Scanner Row		0	1	1
E. MCC Matrix Row		1	0	0
F. CC Buffer Bus Register		1	0	1
G. Scan Points Associated with TNN (Supervisory points right-adjusted, directed next, then fast)		1	1	0

Step 2. Identify row, register, or TNN on DATA INSERT keys 0 - 17.

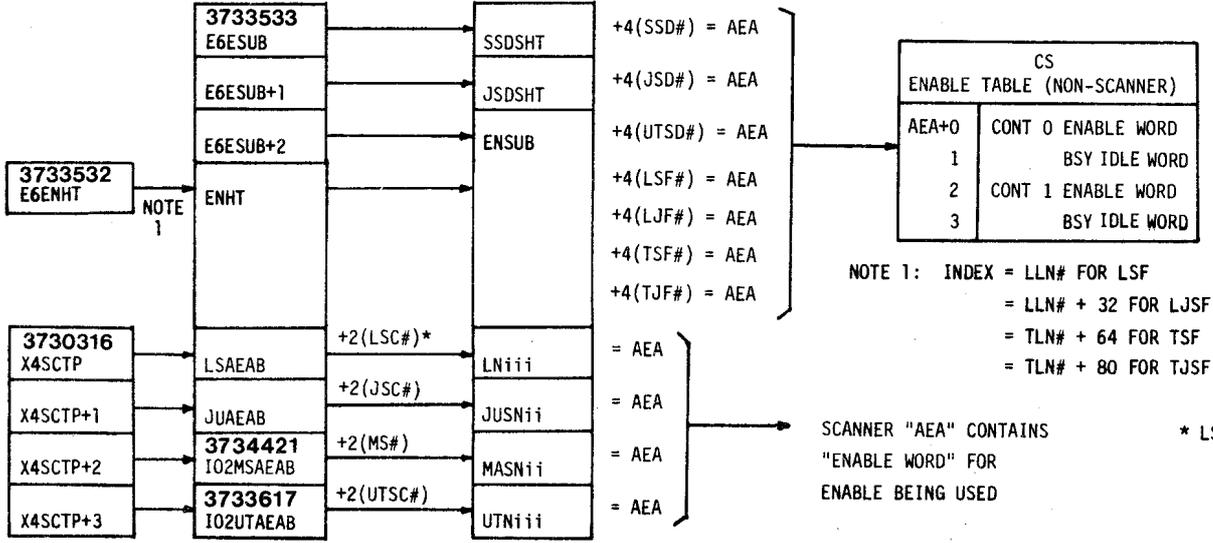

Step 3. Operate the Scan Point key for display. Program MCMP updates the display at a 1 second rate. If any of the data checks made by MCMP fails, the display and the Scan Point key are extinguished. For some failures, the CD01 message is also printed

TYPES OF SCANNERS USING TYPE 1 THROUGH 5 FERRODS

TYPE OF SCANNER	FERROD SENSOR ASSEMBLY	MATRIX SIZE	LOCATION	FUNCTION
Line (4 to 1)	1B	16 by 32 (512)	Line Switching Frame (4 to 1), home and mate	Detection of call origination by customer (off-hook)
Line (2 to 1)		16 by 32 (512)	*Line Switching Frame (2 to 1)	
Junctor	1C	16 by 32 (512)	*Junctor Frame	Supervision of intraoffice calls
Universal Trunk	1C and 1D	16 by 32 (512)	*Universal Trunk Frame	Supervision of interoffice calls
Master	1D	16 by 32 (512)	Master Scanner Frame	Monitoring of points within the electronic central office for various purposes such as routine tests, trouble diagnosis, administration, and other requirements.
	1E	16 by 64 (1024)		

* For each pair of mate and home frames, the control for both 512-point matrixes are located on the home frame.

OPERATING CHARACTERISTICS OF TYPE 1 THROUGH 5 FERRODS

TYPE OF FERROD	TYPE OF FERROD ASSY	USED IN	MAX RES† EXT TO FERROD	MIN EXT LEAK-AGE RES†	RES† PER CONTROL WINDING ± 10%	NON-OPERATE CURRENT (1 READOUT)	OPERATE CURRENT (0 READOUT)
						(ma)	(ma)
Type 1	1B*	Line Scanners (Loop-Start)	2800	10,000	660	5.5	10.0
Type 2		Line Scanners (Loop-Start, Ground Start, or No-Test Vertical)	1800**	10,000	660	5.5	10.0
Type 3	1C	Junctur and Universal Trunk Scanners	1900	10,000	19	9.0	18.0
Type 4	1D	Universal Trunk and Master Scanners	10,700	30,000	35	1.8	3.9
Type 5	1E	Master Scanners	10,700	30,000	35	1.8	3.9

* Each 1B ferrod sensor assembly holds one type 1 and one type 2 ferrod. Both ferrods are arranged for loop-start use. The type 2 ferrod can be converted to ground-start use by changing wire straps on the equipment side of the assembly.

** The ground-start ferrod operates with a ground potential of ± 10 volts.

† All resistances are in ohms.

OPERATING CHARACTERISTICS OF MINIATURE TYPE FERRODS

TYPE OF FERROD	USED IN	MAX REST EXT TO FERROD	MIN EXT LEAKAGE REST	REST PER CONTROL WINDING $\pm 10\%$	NON-OPERATE CURRENT (1 READOUT)	OPERATE CURRENT (0 READOUT)
