NORTEL NETWORKS CONFIDENTIAL: The information contained herein is the property of Nortel Networks and is strictly confidential. Except as expressly authorized in writing by Nortel Networks, the holder shall keep all information contained herein confidential, shall disclose the information only to its employees with a need to know, and shall protect the information, in whole or in part, from disclosure and dissemination to third parties with the same degree of care it uses to protect its own confidential information, but with no less than reasonable care. Except as expressly authorized in writing by Nortel Networks, the holder is granted no rights to use the information contained herein.

Information subject to change without notice. Nortel Networks reserves the right to make changes in design or components as progress in engineering and manufacturing may warrant.

NORTEL NETWORKS, DMS, and TOPS are trademarks of Nortel Networks Corporation. Microsoft Windows is a trademark of Microsoft Corporation.

Limitation of liability: Neither Nortel Networks nor any of its agents or suppliers shall be liable for any indirect, consequential, incidental, or exemplary damages, or economic losses (including damages for loss of business profits, business interruption, loss of business information and the like), arising from the use, inability to use, or performance of the software or this license agreement, even if Nortel Networks or such agent or supplier has been advised of the possibility of such damages and/or losses, and whether any such damage and/or loss arises out of contract (including fundamental breach), tort (including negligence), or otherwise. The entire liability of Nortel Networks for any claim or loss, damage or expense from any cause whatsoever, whether arising out of contract (including fundamental breach), tort (including negligence), or otherwise shall in no event exceed the price paid by you under this license agreement. In some jurisdictions you may have additional rights, in which case some of the above may not apply to you.

RelDoc Introduction

DMS* - FAMILY SOFTWARE

PRODUCT COMPUTING MODULE LOAD RELEASE DOCUMENT

(PCL) Release Document

The DMS-250 Family Software release document is supplied for each Software Stream. This release document provides software feature information pertinent to the new software load.

A status of DRAFT or PRELIMINARY means the final feature content of the software release has not been finalized and features may be added or deleted without notice. A status of STANDARD indicates that the feature content of the software release is firm.

The release document consists of the following sections:

FEATURE CONTENT
This section provides information concerning DMS-250 Family System features associated with software releases. Each office configuration is customized to meet Telco/Carrier requirements. The following subsections include information necessary to determine that system software changes have occurred since the last software release.

> ***Note:*** Only features NEW or CHANGED in the release(s) covered by the document are included

CROSS REFERENCE TABLES
This section contains tables to make it more efficient to find information. A description of the tables precedes them.

The following sections provide information necessary to support changes applicable to the new software release. Only features that impact a section category are included; therefore, some sections may be left out of this NTP because none of the features for this release had an impact to that section.

- Functional Descriptions (FN) -summarizes the functions of the feature

- Fault Management (FM)
  - — Logs (LG) -indicates major additions/changes to the LOGs
- Configuration (CN)
  - — Data Schema (DS) -indicates major additions/changes to the Data Schema table
  - — Service Orders (SO) -indicates major additions/changes to the Service Orders
  - — User Interface (UI) - indicates major additions/changes to the User Interface
- Accounting (ACC)
  - — Automatic Message Accounting (AM) -indicates major additions/ changes to the AMA
- Performance (PF)
  - — Operational Measurements (OM) -indicates major additions/changes to the OM groups

How To Use the Feature Content Section

The feature content software section contains the documentation for the features new or changed in the release. There are tables included to help in the reading of the feature content section.

The items in the tables are feature numbers and feature functional groups. Features are designed by NT against an NT featid.

A functional group is made up of several features.

- Table1: Feature to Functional Group Cross Reference

  These tables list all features new to the release that may be included in the release document. The functional group is indicated along with the Nortel Technologies featid and its title against which the documentation has been written.

- Table 2: Functional Groups to Feature Impacts Cross Reference

  These tables list all documentation listed in the feature content section. As stated above, the documentation is sorted first by feature functional group, and then by featid within the functional group. This table indicates which sections (for example, FM, CN, PF, or ACC) are included in the release document.

SN07 Feature Subset Cross Reference Tables: North American Features

Feature to Functional Group Cross Reference

Table 1 shows feature IDs, feature titles, and the corresponding functional group (under Stream and release).

For details on specific features, refer to the FN sections starting on page 43.

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release

A00003279.AB35	Refer to A00003933 (Session Server project)	Core20, NGSS07, GWC10
A00003280.AA12	SIP on NGSS Tracing/Debug Framework	NGSS07, GWC10
A00003371	Common Inventory and Data Consolidation	PNM07
A00003452.AA05	Intelligent Portal Insertion for Low Portal Density Networks	GWC10
A00003454	Secure_and_Firewall_Compatible_CS2M_and_UE9KEM_ Client_GUI_Communication	PNM07
A00003459.AA18	SSC re-architecture: SYSB Line alarm/log and LGRP alarm/ pm map support	Core20, GWC10
A00003485.AA12	ISUP 200,000 Ports Trunk Support.	Core20
A00003486.AA13	Gateway location information	Core20
A00003487.AA32	SN07 Trimodal Call Server Features	Core20
A00003490.AA22	Support for ABI XPM Tuple Change - XA-Core	Core20
A00003495.AA15	APG integration with MP for NAT traversal.	GWC10
A00003496.AA10	Control of Shasta Media Proxy	GWC10
A00003506.AA17	H.248 Per Trunk Signalling (PTS) Development	Core20, GWC10
A00003531	MG9K EM – Frame location enhancements	PNM07

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release
Note: Core is comprised of CCM, CNA, CSP, MSH, SHR, and UCS streams.		
A00003560	Patching SSPFS, CBM, and IEMS via the NPM	PNM07
A00003562	SAM21 Element Manager (EM) support for CICM	PNM07
A00003567	MG9000 Element Manager support for ABI ESA	PNM07
A00003568.AA02	CICM ECS Location Identification	CICM07, GWC10, PNM07
A00003571	MG9000 Cards Support A00003571 (ITP, ITX, ABI, SCO)	PNM07
A00003576.AA10	Trunk Security	PNM07, GWC10
A00003591	MG9000 OC3 Channelization support from EM	PNM07
A00003604	OC3 Channelized Support	MG9K07
A00003613	SSPFS: CBM Configuration Parameters	PNM07
A00003615	SSPFS packaging/patch enhancements	PNM07
A00003617	AlarmD Integration	PNM07
A00003618	Succession Solaris Platform Foundation Service (SSPFS) - High Availability Enhancement	PNM07
A00003630.AA18	TGCP for the Cable Market	Core20, GWC10, PNM07
A00003649.AA07	SCTP (Stream Control Transmission Protocol) Enhancements on XA-Core	Core20
A00003650.AA08	MG4K-IP Logs Core Component	Core20
A00003651.AA10	MG4K-IP XA-Core Support for IPCCM (IP Control Connection Management) & OAM (Operations Administration & Maintenance)	Core20
A00003662.AA09	Trimodal Call Server Bridge Maintenance	Core20
A00003667	SESM NB Alarm Interface Changes required for OSS	PNM07
A00003669.AA08	Media Gateway 4000 - Internet Protocol (MG4K-IP) Prep Feature	Core20, SPM20
A00003672.AA02	NTLZ20CA Core Definition	Core20
A00003687.AA07	TOPS Wireless Intelligent Network Integration	TOPS20

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release
Note: Core is comprised of CCM, CNA, CSP, MSH, SHR, and UCS streams.		
A00003693.AA02	MG9K ESA for SMSI subtending ABI	MG9K07, XPM20
A00003698.AB01	Razor Gateway Requirements For Trunking	GWC10, Core20, NGSS07
A00003704.AA10	OSSAIN Enhancements for SN07	TOPS20
A00003711.AA24	CS2000 SUPPPORT FOR GateWay Inter Machine Trunk (GWIMT) ON Passport Voice Gateway	GWC10, Core20
A00003717	CICM Flow Through Provisioning, CICM Component	CICM07, PNM07
A00003718-3719	Alarms, Logs & Performance for Centrex IP Client Manager	CICM07
A00003720.AA04	Compact Call Server Hybrid Asynchronous Transfer Mode Processor Mezzanine Card Replacement	Core20
A00003737	LCI Remote Access, Enhancements and MG9000 Security	MG9K07
A00003767.AA29	IP ABI PPVM Robustness & Msg Loss Alarms	GWC10, Core20, MG9K07
A00003773.AA08	Trunk Group Based Quality of Service (QOS) Operational Measurement (OM) support for MG4K-IP	Core20, SPM20
A00003789.AA14	INTRA IMT CAUSE Enhancements	Core20
A00003905.AA07	DIRP Enhancements for Billing	Core20
A00003923.AA13	CTX / RES SCAI Redirection	Core20
A00003933.AA14	Succession Communication Server (SCS) 2000 - Session Server Manager: SCS 2000 - SIP Gateway application	Core20
A00003947.AA16	Trimodal LOGs and Operational Measurements (OM)	Core20, TOPS20, Core20
A00003948	Tri-modal provisioning	PNM07
A00003951	i2001 Internet Telephone and a common User Interface for the i2001, i2002 and i2004	CICM07
A00003952.AA09	Centrex IP Client Manager 3069 termination capacity	CICM07
A00003971.AA10	SPM Log Robustness	Core20, SPM20
A00003995	SN07 H.323 Gateway Change Capability	PNM07

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release
Note: Core is comprised of CCM, CNA, CSP, MSH, SHR, and UCS streams.		
A00004005.AA18	Nortel Carrier Grade Linux (NCGL) platform “Session Server”	Core20
A00004020	USP Java GUI Introduction to Succession	USP09
A00004036.AA42	Off-Board Service Control	Core20
A00004037.AA08	USNBD - FSK CDC Over Trunks	Core20
A00004045.AA06	Calling Line Identification Directory Number (CLIDN) for DMS-250	Core20
A00004046.AA10	Echo Cancellation Support for TriModal Call Server 2000	Core20
A00004096.AA11	North America (NA) H.323 Support for Networked Meridian Customer Defined Network (MCDN) Services	GWC10
A00004109	MG9K Hardware Upgrade and Call Processing Changes	MG9K07
A00004126.AA13	SPM ECAN Control Enhancement	Core20
A00004131.AA16	UCS PRI B-Channel Negotiation	Core20
A00004137.AA12	ANI Billing	Core20
A00004260.AA24	XPKT301 Alarm Banner for MG4K/IW/DPT	Core20
A00004271.AA08	SIP App Server SOC	Core20
A00004391	ACD Agent Expansion from 9,999 to 30,000 Agents	Core20
A00004414.AA03	SIP Call Server SOC	Core20
A00004422.AA12	Enhanced 911 Dynamic Packet Trunks Session Initiation Protocol-Telephony Call Trace	GWC10, Core20
A00004430.AA08	SVC Failure OMs	Core20
A00004449.AA08	OP_E911-Trunk Support	Core20
A00004500.AA15	IN TCAP Messaging on IP	Core20
A00004554.AA04	SDM FX System Backup Enhancements	SDM20
A00004568.AA06	H.323 NA Network CAS Tunneling	Core20
A00004713.AA04	1+1 Speedometer Support	Core20

Table 1 Feature to Functional Group Cross Reference

Functional Group to Feature Impacts Cross Reference

Table 2 is organized alphabetically by functional group. Within each group, the features are listed numerically. The table also indicates which sections are

included for a given feature (for example, FN, FM, CN, PF, or ACC) in the release document.

Table 2 Functional Group to Feature Impacts Cross Reference

Functional Group	Featid	FN	FM (Logs)	CN (DS, SOC)	ACC (AMA)	PF (OMS)

Functional Descriptions

Introduction

This chapter describes new and changed features that are planned for this release.

Featid	Title
A00001319.AA10	Device activity & RMID-PWID restoration tool & Panther enhancements
A00001649	SBA Robustness: End-to-end Integrity
A00001650.AA09	SBA Patch Size Reduction
A00001742.AA05	OMDD Capacity Enhancements
A00001743.AA04	Syslog Consolidation for Succession
A00001847.AA31	ABI Expansion Datafill
A00001888.AC02	CS2000 Line Test for MG9000 Lines
A00001890.AA31	Refer to A00001888
A00001893	MG9K Imaging (includes A00001894)
A00001895.AC09	H323 Base Application
A00001898.AA29	ABI RMM Support
A00001935	Provisioning Support for Centrex-IP Nodes and Lines
A00001990.AA02	CAIN via CICROUTE PEP Sourcing
A00002008.AA08	SBA:CBM Introduction
A00002009.AA04	Enhance Display on PSET

A00002011.AA08	DMS-100: Virtual Office Worker
A00002012.AA13	XA-Core CMIC/RTIF HIOP Maintenance Software
A00002013.AA06	Intelligent Network T1 Timer Expiry Message Suppression
A00002016.AA02	AINDENY Enhancements
A00002020.AB10	ESA Translation Download
A00002047.AA13	Double Density Spectrum Backplane
A00002133.AA05	CBM HA Installation, Patching and SW Delivery
A00002137.AA01	DS512 Link Mtc Robustness - CM
A00002146.AA09	MAPCI ABI Link Test & Legacy Comparison
A00002155.AA11	SSH Core File Transfer (SCFT) for CBM and SDM
A00002164.AA10	Application Manager for High Availability (HA)
A00002186.AA08	IOM DDU Capacity Enhancement
A00002196.AA15	Enhanced Do Not Disturb
A00002251.AA13	192M Shared Memory Extension
A00002281.AA02	Table AMAPRT Expansion
A00002340.AA07	Add Extension Registers for Billing OM's
A00002380.AA21	MG9K ABI ESA
A00002431.AA16	LX82BA Capacity Delivery
A00002432.AA24	Enhanced Spectrum Overload Operational Measurements (OMs) and Logs
A00002433.AA08	XA-Core Baseline Control
A00002499.AA05	Store Audit for XA-Core
A00002505	Universal Signaling Point Interface Client - GUI
A00002510.AA11	LANCOMM IP over IRM
A00002538.AA19	Performance Measurements Tools

A00002549.AA04	CSP20 Callp Robustness
A00002555.AA03	SERVORD Manipulation of the GND Option
A00002558.AA07	LDI display for Class phone
A00002585	TMM Support For PTS Trunk, POST by Carrier
A00002607.AA11	ABI XPM SITE and MG9K Location support
A00002739.AA15	Virtual Call Admissions Control (VCAC) on Communication Server 2000
A00002740.AA03	International Directory Assistance Call Completion (IDACC)
A00002741	Supernode Billing Application Base Real Time Billing Robustness
A00002744.AA05	SBA: Automatic Recovery File Closure
A00002746.AB01	ABI XPM Fault Isolation & QueryPM
A00002756.AA23	Japan Trunk Services
A00002757.AA08	CBM Fault Management (HA)
A00002760.AA11	Panther Enhancements For Hybrid Office Support
A00002765.AA06	XLAGRP Refinements for Coin Station-Paid Routing
A00002766.AA05	Add Extension Registers for Billing OM's
A00002822.AA07	User Interface Manager for CBM
A00002823.AA08	SDM Core HA Maintenance (HA OAMMTCE)
A00002858.AA26	Node ISTB for SPM Carrier Outage
A00002900.AA09	China INAP Compliance Enhancement Part 2
A00002901.AA08	Enhanced Meet-Me Conference (EMMC)
A00002960.AA12	Originator Identification Screening
A00002966.AA07	Base Re-architecture Phase 2
A00002970.AA11	SMG4 Remote Site Provisioning
A00002979.AA08	Panther Electronic Software Delivery

A00003073.AA30	SimRing Deny Redirection (SRDR)
A00003074	MG9000 Manager Capacity Increase
A00003154.AA09	SN07 Take Back and Transfer Enhancements
A00003233.AA01	LANComm Tool Enhancements
A00003273.AA15	Refer to A00003933 (Session Server project)
A00003277.AA15	Refer to A00003933 (Session Server project)
A00003279.AB35	Refer to A00003933 (Session Server project)
A00003280.AA12	SIP on NGSS Tracing/Debug Framework
A00003371	Common Inventory and Data Consolidation
A00003452.AA05	Intelligent Portal insertion for low portal density networks.
A00003454	Secure_and_Firewall_Compatible_CS2M_and_UE9KEM_Client_GUI_Communication
A00003459.AA18	SSC re-architecture: SYSB Line alarm/log and LGRP alarm/pm map support
A00003485.AA12	ISUP 200,000 Ports Trunk Support.
A00003486.AA13	Gateway location information
A00003487.AA32	SN07 Trimodal Call Server Features
A00003489.AA09	ABI SMS Support
A00003490.AA22	Support for ABI XPM Tuple Change - XA-Core
A00003495.AA15	APG integration with MP for NAT traversal.
A00003496.AA10	Control of Shasta Media Proxy
A00003506.AA17	H.248 Per Trunk Signalling (PTS) Development
A00003531	MG9K EM – Frame location enhancements
A00003560	Patching SSPFS, CBM, and IEMS via the NPM
A00003562	SAM21 Element Manager (EM) support for CICM

A00003567	MG9000 Element Manager support for ABI ESA
A00003568.AA02	CICM ECS Location Identification
A00003571	MG9000 Cards Support A00003571 (ITP, ITX, ABI, SCO)
A00003576.AA10	Trunk Security
A00003591	MG9000 OC3 Channelization support from EM
A00003604	OC3 Channelized Support
A00003613	SSPFS: CBM Configuration Parameters
A00003615	SSPFS packaging/patch enhancements
A00003617	AlarmD Integration
A00003618	Succession Solaris Platform Foundation Service (SSPFS) - High Availability Enhancement
A00003630.AA18	TGCP for the Cable Market
A00003649.AA07	SCTP (Stream Control Transmission Protocol) Enhancements on XA-Core
A00003650.AA08	MG4K-IP Logs Core Component
A00003651.AA10	MG4K-IP XA-Core Support for IPCCM (IP Control Connection Management) & OAM (Operations Administration & Maintenance)
A00003662.AA09	Trimodal Call Server Bridge Maintenance
A00003667	SESM NB Alarm Interface Changes required for OSS
A00003669.AA08	Media Gateway 4000 - Internet Protocol (MG4K-IP) Prep Feature
A00003672.AA02	NTLZ20CA Core Definition
A00003687.AA07	TOPS Wireless Intelligent Network Integration
A00003693.AA02	MG9K ESA for SMSI subtending ABI
A00003698.AB01	Razor Gateway Requirements For Trunking
A00003704.AA10	OSSAIN Enhancements for SN07

A00003711.AA24	CS2000 SUPPPORT FOR GateWay Inter Machine Trunk (GWIMT) ON Passport Voice Gateway
A00003717	CICM Flow Through Provisioning, CICM Component
A00003718-3719	Alarms, Logs & Performance for Centrex IP Client Manager
A00003720.AA04	Compact Call Server Hybrid Asynchronous Transfer Mode Processor Mezzanine Card Replacement
A00003737	LCI Remote Access, Enhancements and MG9000 Security
A00003767.AA29	IP ABI PPVM Robustness & Msg Loss Alarms
A00003773.AA08	Trunk Group Based Quality of Service (QOS) Operational Measurement (OM) support for MG4K-IP
A00003789.AA14	INTRA IMT CAUSE Enhancements
A00003905.AA07	DIRP Enhancements for Billing
A00003923.AA13	CTX / RES SCAI Redirection
A00003933.AA14	Succession Communication Server (SCS) 2000 - Session Server Manager: SCS 2000 - SIP Gateway application
A00003947.AA16	Trimodal LOGs and Operational Measurements (OM)
A00003948	Tri-modal provisioning
A00003951	Covers the work required to support the i2001 Internet Telephone and a common User Interface for the i2001, i2002and i2004
A00003952.AA09	Centrex IP Client Manager 3069 termination capacity
A00003971.AA10	SPM Log Robustness
A00003995	SN07 H.323 Gateway Change Capability
A00004005.AA18	Nortel Carrier Grade Linux (NCGL) platform “Session Server”
A00004020	USP Java GUI Introduction to Succession
A00004036.AA42	Off-Board Service Control
A00004037.AA08	USNBD - FSK CDC Over Trunks

A00004045.AA06	Calling Line Identification Directory Number (CLIDN) for DMS-250
A00004046.AA10	Echo Cancellation Support for TriModal Call Server 2000
A00004096.AA11	North America (NA) H.323 Support for Networked Meridian Customer Defined Network (MCDN) Services
A00004109	MG9K Hardware Upgrade and Call Processing Changes
A00004126.AA13	SPM ECAN Control Enhancement
A00004131.AA16	UCS PRI B-Channel Negotiation
A00004137.AA12	ANI Billing
A00004260.AA24	XPKT301 Alarm Banner for MG4K/IW/DPT
A00004271.AA08	SIP App Server SOC
A00004391	ACD Agent Expansion from 9,999 to 30,000 Agents
A00004414.AA03	SIP Call Server SOC
A00004422.AA12	Enhanced 911 Dynamic Packet Trunks Session Initiation Protocol-Telephony Call Trace
A00004430.AA08	SVC Failure OMs
A00004449.AA08	OP_E911-Trunk Support
A00004500.AA15	IN TCAP Messaging on IP
A00004554.AA04	SDM FX System Backup Enhancements
A00004568.AA06	H.323 NA Network CAS Tunneling
A00004713.AA04	1+1 Speedometer Support
A00004772. AA10	Destination ACD DN MIS Reporting
A00004859	T1400 to N240 migration procedure
A00004860	SSPFSHA Cluster & Application Upgrade Procedures
A00004872.AA25	Services Support for the UA-IP Solution
A00004873	MS2000 CLUI Enhancements

A00004922.AA10	DMS-250 N449 PRI Enhancements - GWC
A00004923.AA12	Refer to A00004922
A00005007.AA11	Cause Indicators parameter support for DTAG AMA Enhancement
A00005016	VMG Out of Service Alarms
A00005073.AA19	SBA Outbound Connection Security
A00005074.AA07	OMDD: Outbound Connection Security
A00005089.AA04	NOA Routing for IC Agency - TRAVER Enhancement
A00005123	CS2M Configuration Install Script Enhancements
A00005124.AA01	Compact Hybrid China Cutover Tools - Production Software
A00005160.AA12	OSSAIN XA-Core Data Messaging Capacity Enhancements
A00005190.AA09	CBM 800 OC3 Core Node and Link Maintenance
A00005192.AA28	CBM 800 OC3 BRISC connectivity and OC3 node and link maintenance
A00005193.AA04	9+1 Performance Measurements Tools Support
A00005268.AA05	SBA: Multi-volume Support for Core Backup
A00005317	WanBuilder Heartbeat Ping
A00005322.AA08	Spectrum Common Equipment Module (CEM) Overload Enhancement: Asynchronous Transfer Mode Resource Module (ATMRM) Status
A00005337.AA04	CBM 800 OC3 BRISC Connectivity
A00005363.AA16	CAIN FlexCDR Enhancements
A00005375	New Shelf Discovery Alarms
A00005391.AA04	SBA: Support for Verizon GNS personal Toll Free Service
A00005485	SAM21 Platform Installation on SSPFS
A00005538.AA14	Preset Conference on Succession
A00005734.AA05	Multiple Time Zone (MTZ) support for CICM lines

A00005758.AA03	ESUP over TELNET Support
A00005986	EM integration with PAM+ proxy
A00006032.AA07	Loop Reversal On Answer (LROA), Loop Reversal on Seizure (LRS) and Insert Tone on Coin Phone Termination (NOCOLL) SN07 Support for Cable & Wireless Caribbean
A00006483.AA02	Audio Server Node Announcement Capacity Increase to 1280
A00006495	H.323 Flexible Carriers
A00006496	H.323 Multiple D Channels
A00006639.AA02	MG9K Overload OM pegs
A00006693	XA-Core IO Capacity Monitoring Toolset
A00006741.AA08	H.323 Gatekeeper to CS2K Gatekeeper Interworking
A00007063	H.323 Gateway Profile Changes
A00007211	H.323 GWC600 Log Changes
Q00681924	AIN Response Simplification

1: Functional Description (FN): A00001319

1.1 Feature name

ACT.A00001319: Device activity & RMID-PWID restoration tool & Panther enhancements

1.2 Description

This activity provides two new functionalities:

- A new CI tool ‘SPMRESALIGN’ which ensures the following:
  a. The RMID-PWID values of the Resource RMs (DSP & VSP RMs) are aligned.
  b. The activity of DSP & VSP RMs are aligned as per the table MNCKTPAK datafill.
- A new automated task as a part of Panther Upgrade. When this new task is executed, it will align the RMID-PWID values of all the resource RMs of all the SPMs in the office.

1.2.1 New CI tool SPMRESALIGN

A new CI tool ‘SPMRESALIGN’ is introduced as a part of this feature. This tool aligns the RMID-PWID values of the DSP/VSP RMs of the all the SPMs in the office. Once the RMID-PWID values of a particular RM is aligned, the activity of that particular RM is aligned as per the table MNCKTPAK datafill. The tool is implemented as a new CI directory.The tool can be directly accessed from the CI prompt.The tool has the following commands:

- Align the RMID-PWID values of the resource RMs of all the SPMs in the office.

  CI:
  >SPMRESALIGN
  SPMRESALIGN:
  >align all

- Align the RMID-PWID values of the resource RMs based on the variant of SPMs

  CI:
  >SPMRESALIGN
  SPMRESALIGN:
  >align <variant>

  where the variant can be DMSCP, SMG4 or IW-DPT.

- Align the RMID-PWID values of the resource RMs of a single SPM.

  CI:
  >SPMRESALIGN
  SPMRESALIGN:
  >align spm <no>
  This command is applicable for all variants of SPMs.

- Align the RMID-PWID values of the resource RMs for a range of SPMs.

  CI:
  >SPMRESALIGN
  SPMRESALIGN:
  >align spm <from_no> <to_no>
  This command is applicable for all variants of SPMs.

This tool is a single user tool. i.e. only one user can use the tool at a time. Also all the command in this tool are privclassed. For this, the command 'SPMRESALIGN; & 'align' will be added to the table CMDS.

Please refer to section 13.9 of Configuration Document for more details on the CI tool.

1.2.2 Panther Enhancements

This feature enhances the planning phase of PMUPGRADE to create a default task. This new task is to align the RMID-PWID values of all the SPMs present in the entire office. The new task is appended to the upgrade plan and will be passed to the SWUPGRADE tool. The new task will be created only if there is atleast one SPM is available in the upgrade plan.

In SWUPGRADE, the craft person can view this new task by issuing the command 'display steps'. An example is as shown in Figure 1, "SWUPGRADE steps"

Figure 1 SWUPGRADE steps

```
>swupgrade pm
SWUPGRADE:

>display steps

SWUPGRADE steps for target PM:

1_A_SPM                 Needed    Perm  Act    Proc
ALIGN_RMS               Needed    Perm  Act    Proc
UPGRADE_COMPLETE Needed    Perm Act      Proc
```

The default task created is ALIGN_RMS. This task is an automated task. i.e. it is automatically executed as soon as all the upgrade tasks are completed. As this step starts executing, it halts for a user confirmation to proceed or abort this step. The following warning message will be displayed on the Panther screen

****WARNING: This step ALIGN_RMS will align the RMID-PWID values of all the Resource RMs of the SPMs in the office. Do you wish to continue?**
Please confirm ("YES", "Y", "NO", or "N"):

Once the craft person enters “YES”, Panther will start aligning the RMID-PWID values of the all the resource RMs in the office. If the craft person enters “NO”, it aborts this task.

Panther automatically triggers this alignment task only if all the other task in the plan is successfully completed without any failure. Also the user confirmation has to be turned off in the Panther planning phase. Otherwise Panther waits for a manual intervention after each task is completed, to trigger the next task.

On the other hand, the craft person can manually execute this alignment task by overriding all the other upgrade tasks. The craft person has to issue the following command:

>runstep ALIGN_RMS.

All the progress message that are part of the new CI tool will be printed on the Panther screen also. Please refer to section 13.9 in Configuration document to get more information on the progress messages.

1.2.3 Log generation

A new SPM log is introduced to make the craftperson aware that a particular resource RM protection group is excluded by the SPMRESALIGN tool, without align RMID-PWID values. A particular RM group will be excluded from the alignment due to three reasons:

- PWID duplication
- Any RM in invalid state.
- Sparing failure.

Under all these circumstances the new SPM log '**SPM605**' will be generated giving necessary information to the craftperson and what action to be taken. This is only an info log and there is no alarm associated with it. The fields of the SPM605 log is as shown in Figure 2, "SPM605 Log Format"

Figure 2 SPM605 Log Format

a) PWID Duplication

```
SPM605  MAR25 05:06:48 3004 INFO RMID-PWID Alignment
        Prot group  : SPM 3 VSP
        Prot grp id  : 1
        Result       : Not Aligned
        Reason       : PWID duplication.
        Action       : Rectify the duplication and execute SPMRESALIGN
```

b) Any RM in invalid state

```
SPM605  MAR25 05:06:48 3004 INFO RMID-PWID Alignment
        Prot group  : SPM 3 VSP
        Prot grp id  :1
        Result       : Not Aligned
        Reason       : VSP 1 not in ISV/ISTB.
        Action       : Bring this RM to INSV and execute SPMRESALIGN
```

c) Sparing failure

```
SPM605  MAR25 05:06:48 3004 INFO RMID-PWID Alignment
        Prot group  :  SPM 3 VSP
        Prot grp id  :  1
        Result       :  Not Aligned
        Reason       :  Unsuccessfull sparing
        Action       :  Review the logs related to sparing
```

Please refer to the fault management document for more information on this log.

1.3 Hardware Requirements or Dependencies

None.

1.4 Software Requirements or Dependencies

None.

1.5 Limitations and restrictions

Following RM groups are excluded from the alignment process.

- If any RM in the group is having a PWID duplication.
- If there is no inactive RM in the group.
- If any RM in the group is in invalid state (offl, sysb, cbsy, manb).

No action is taken on these RM groups to align the RMID-PWID values. However, proper warning messages will be displayed. Please refer to section 13.9 in Configuration document to get more information on the warning messages.

1.6 Interactions

When the office upgrade using Panther is in progress, the craftperson is restricted from executing the commands in the ‘SPMRESALIGN’ tool. Proper message will be displayed to the craftperson.

a) In a multiple window upgrade shift, after each days shift the craft can run the CI tool on the SPMs which finished the upgrade or.

b) The craftperson can run the automated task from panther . This will be run automatically after all the steps. Proper message will be displayed that it will align the RMID-PWID values of all the Reousrce RMs in the office.

2: Functional Description (FN): A00001649

2.1 Feature name

SBA Robustness: End-to-end Integrity[A00001649]
This feature has two parts:
1. SBA Backup Alarms Precedence

2. Add "clli" command to BILLMTC Interface.

2.2 Description

Section 2.2.1 below gives a brief description on SBA Backup Alarms Precedence and section 2.2.2 below gives a brief description of Add “clli” command to BILLMTC interface.

2.2.1 SBA Backup Alarms Precedence

All the SBA alarms on the DMS are reported on the MAP under the SDMBIL sub-level available under the APPL banner and the severity is set to match the highest {Critical, Major, Minor} in case of multiple alarms.

NOCOM alarm appears on the MAP at the SDMBIL level when the communication to SDM cannot be established.

This feature is to provide a change in the priority for the backup alarms: BAK50, BAK70, BAK90, NOBAK, NOSTOR so that these alarms take precedence over NOCOM alarm.

The severity of the alarms BAK50,BAK70 will all be changed from major to critical.

If the stream is in backup for more than 10 minutes, a SDMB320 log will be generated every 2 minutes indicating the same.This is an existing log.

The backup alarms BAK50, BAK70, BAK90, NOBAK and NOSTOR alarm will take precedence over the following critical alarms:

DSKWR, LODSK, NOFL, NOVOL, FTPW, SBAIFT.

This enhancement prevents loss of billing by ensuring that appropriate alarms are generated which will inform the operational personnel well in advance so that preventive maintenance action can be performed.

2.2.2 Add "clli" command to BILLMTC Interface

The SDM/SBA “BILLMTC” refers to Billing Maintenance Interface. This interface is similar to CM MAPCI interface. BILLMTC is available through a telnet session to SDM or from an SDM terminal. Also BILLMTC will be accessible from the ETA and ATA connected to SDM.

CLLI(Common Language Location Identifier) is a string with a maximum of eleven characters which uniquely identifies the switch. The switch name is available in OFCENG table under the field OFFICE_CLLI_NAME and is datafilled when the switch is being provisioned.

This feature is an enhancement for Supernode Billing Application RMI to introduce a new command which retrieves and displays CLLI (Common Language Location Identifier, in the context of this feature the CLLI will refer to the Telco “name” of the switch) at BILLMTC level. This command will display the name of the CLLI connected to SDM.

2.3 Requirements.

2.3.1 Requirements for SBA Backup Alarms Precedence

Modify BAK50, BAK70 alarms to critical.

Modify BAK50,BAK70,BAK90 NOBAK & NOSTOR to take higher precedence than NOCOM at SDMBIL level.

2.3.2 Requirements for Add "clli" command to BILLMTC Interface

1. "clli" command will be available from BILLMTC Interface.

2. "clli" command will be available at all levels of BILLMTC.

3. The command will not appear on BILLMTC menu(non-menu command).

4. The command will not be a numbered command at BILLMTC menu.

5. The help command, without any parameter at BILLMTC will display help for "clli" along with help for other commands.

6. “Help clli” will not display any help.

7. The command returns core CLLI name and "clli" command does not have any parameters.

2.4 Target Audience

This document is intended for:

— SDM Architecture Team

— SDM GPS

— SDM Verification

— SDM Documentation

2.5 Functional overview

Section 2.5.1 below gives a functional overview of “SBA Backup Alarms Precedence” and section 2.5.2 below gives a brief functional overview of “Add “clli” command to BILLMTC interface.”

2.5.1 “SBA Backup Alarms Precedence”

This feature is to change the priority of the backup alarms so that these alarms take precedence over NOCOM alarm.

When the NOCOM alarm appears on the MAP at the SDMBIL level, the streams on the CM go to backup mode. The billing records then generated will be written to backup files on backup volumes configured for the stream.

Eventually the backup space on core will start getting used up and backup alarms will start appearing on the SDMBIL banner depending upon the amount of used space. When 50% of backup space has been used up, the BAK50 alarm will appear on the SDMBIL banner on the MAP indicating that only 50% of the configured backup space is available for the stream.

Once 70% of the backup space is used, the BAK50 alarm will be changed to BAK70 alarm. Again when a situation is reached wherein only 10% of the free space is available, BAK70 alarm will be replaced by the BAK90 alarm. Eventually when the system runs out of backup space, NOBAK alarm will appear under the SDMBIL banner replacing the BAK90 alarm.

Once the NOBAK alarm comes up for a stream, any further records generated would still persist in the buffer pool {buffer allocated to the stream}.Eventually if the situation continues the buffers would get depleted and a NOSTOR{Critical} alarm will appear under SDMBIL level.

2.5.2 “Add "clli" command to BILLMTC Interface”

This feature will add a new functionality whereby a new command ("clli") will be introduced under the SBA RMI subsystem to retrieve the CLLI name from BILLMTC Interface.

This command is hidden and does not appear on the BILLMTC level. The command is available from all BILLMTC level as a non menu command. The user can run the "clli" command from any level of BILLMTC interface to get the CLLI name.

"clli" command is not available either as a numbered command or as a menu command, unlike other commands in BILLMTC interface. The user has to directly enter the command “"clli"” at the BILLMTC interface from any level to retrieve the CLLI name.

2.5.2.1 "clli" command

Command name: "clli"

Command description:

"clli" command displays the current information about the CLLI connected with the sdm. The command should be used at BILLMTC level. The command is case in-sensitive.

The "clli" command response will be,

<Core CLLI Name>

Command Format:
clli

Parameters
None

Response :
<Core CLLI Name>

2.6 Hardware requirements

None

2.7 Limitations and restrictions

2.7.1 “SBA Backup Alarms Precedence“ will put the following limitations.

Any critical alarm raised by SBA under the SDMBIL banner will be masked by the backup alarm if any. To see all the alarms (critical, major, minor) raised by SBA, the user will have to invoke the DispAl command to see the list of all SBA alarms.

2.7.2 “Add "clli" command to BILLMTC Interface“ will put the following limitations

The command is available only at BILLMTC level. The command can not be used at SDMRLOGIN level.

2.8 Interaction.

3: Functional Description (FN): A00001650

3.1 Feature name

SBA Patch Size Reduction

3.2 Description

SDM SBA application is delivered to Nortel's customers as SDM_SBA.DMS500 and SDM_AFT.DMS500 filesets in the previous releases. The total size of the two filesets are greater than 160[1] MB (40MB + 120MB). When there is a change in SBA base code to fix issues, the whole 120 MB fileset must be packaged and delivered. In an extreme case, if a change is in base MIB functional component, the two filesets of 160MB will also be required if AFT is installed. In most of the cases, SBA base fix does not require the AFT fileset to be delivered to the customers.

In the past releases, SBA fix filesets were stored into 4Gg DAT tape and shipped to customer sites. However, Nortel's SDM fix delivery method have been migrating from shipping MNCL tape(s) to downloading the filesets (or packages) into the customer networks via IP protocols (i.e. electronic delivery).

In cases where customer only has 28.8K modem in the networks, the total download time would be more than 9 hours (120MB / 211Kbytes per minute[2]) for SBA SDM_SBA.DMS500 fileset and more than 3 hours for AFT fileset. If the customers has high speed cable connection, then the time for SBA and AFT would be 3 hours and 48 minutes; and 55 minutes respectively. Therefore, the "fix filesets" would not be downloaded completely before maintenance window had expired even though the customer has high speed connection.

This feature reduces SBA/AFT deliverable(s)[3] size by de-coupling ACE and eighteen SBA base libraries code from SBA/AFT executable(s). The SBA base shared libraries will be packaged into the SBA fileset/package. The ACE library code will be packaged separately. The fileset/package for ACE is named as SDM_ACE.dist in AIX platform and SDM_ACE_5.3.0.0.pkg in Solaris platform.

3.3 Hardware Requirements or Dependencies

No new hardware required

[1]The size information are taken from 19.72.0.0 NCL load. The SDM_SBA.DMS500-19.69.0.0.tape file is 120,287,232 bytes and the SDM_AFT.DMS500-19.69.0.0.tape file 40,079,360 bytes.
[2]Data taken from "SDM Wellness Patching 3.1" presentation.
[3]The deliverable(s) could be the whole SBA in a single fileset or a number of filesets of different sizes.

3.4 Software Requirements or Dependencies

SBA and AFT requires ACE fileset and package in AIX and Solaris platforms respectively. The ACE fileset/package contains ACE shared libraries. This is the only copy of ACE library code. The filesets/packages must be installed in the following orders[1]:

1. ACE
2. SDM_SBA.DMS500
3. SDM_AFT.DMS500

Similarly, the packages/filesets must be removed in the following orders.

1. SDM_AFT.DMS500
2. SDM_SBA.DMS500
3. ACE

In case ACE fileset is upgraded/patched, SBA and AFT fileset must be BSY/RTS after the new ACE fileset is installed otherwise SBA and AFT software will be running with the order version of ACE. This might lead to run time problems.

3.5 Limitations and restrictions

- SBA/AFT cannot be installed before ACE is installed.
- ACE cannot be removed before SBA/AFT are un-installed from the system. In CBM, the Solaris “pkgrm” command does not prevent user from removing lower layer package that are needed by other upper layer package. In other words, there is nothing stopping user from removing ACE fileset even if SBA/AFT have not been un-installed. It is important to note that if a user removes ACE package from the system, SBA/AFT will not function.
- SBA/AFT must be BSY/RTS if ACE is upgraded on the system.

3.6 Interactions

None

[1]The installations follows the standard CBM and nSDM procedure

4: Functional Description (FN): A00001742

4.1 Feature name

OMDD Capacity Enhancements

4.2 Description

Currently, the SDM OMMD application can handle, in 2.5 minutes, 6000 tuples for five minute transfer period and 8000 tuples for office transfer period, each tuple containing a maximum of 32 registers.

This activity enhances the capacity of the present OMDD application so that a transfer of 12000 OM tuples (containing a maximum of 32 registers each) from the core to the downstream OSS can be done in less than 2.5 minutes for the office transfer period. This activity also addresses any storage issues on the SDM that may arise while handling the transfer of 12000 OM tuples.

4.2.1 Improving OMDD performance

In real time, the OMDD application performs the following operations :

1. Receives OM data from the CM (through OM access).
2. Converts it into CSV files based on the Report Registration configurations.
3. Sends out the CSV files to the downstream OSS using FTP.

This activity addresses the performance issues of OMDD in the above steps.

The following are achieved by this activity.

1) Improved OMDD performance in terms of the overall latency time from the core to the OSS, which is reduced from the current >3.5 minutes to less than 2.5 minutes for 12000 tuples with 32 registers each.

2) Improved OMDD performance in terms of CPU utilization.

4.2.2 Improving OMDD storage handling

File Transfer schedules are used by the report registrations to schedule the transfer of OM report files downstream. Once a file transfer schedule event occurs, the report files associated with the event, as defined in the report registration, are FTP'd downstream. They are then moved from the */omdata/closedNotSent* directory to the */omdata/closedSent* directory.

The OM files progress through the following states:

- Open — OM files continue to be written to the file.
- ClosedNotSent — No more OM's are being written to the file. The file has not been transferred to any OSS.
- ClosedSent — The ftp event which transfers the file to the downstream OSS is completed.

The OM files in closedSent and closedNotSent are currently audited every midnight. At that time, a check is made for the File Retention period.Those files in */omdata/closedSent* which have reached the the File Retention Period for */omdata/closedSent* are deleted. Also, those files in */omdata/closedNotSen*t which have reached the File Retention Period for */omdata/closedNotSent* are deleted. If */omdata* is 100% full before the midnight,then OMDD cannot open any new files.

This activity increases the frequency of auditing */omdata* from once in 24 hours to once in 12 hours. During that time, in addition to checking for files with expired retention period, a check is made to see if */omdata* usage exceeds the threshold value of 60 %. If the usage is above 60 % a custlog is generated to make the customer aware of the low storage available. In the next audit, if */omdata* usage is above 70%, files in */omdata/closedSent* will get deleted. If even after deleting all files in */omdta/closedSent*, the usage is above 50%, the files */omdata/closedNotSent* are deleted one by one (the oldest file first), until the usage falls below 50%. A custlog is generated for each closedNotSent file that gets deleted.

The following is the custlog that is generated when audit finds that /omdata usage exceeds 60 %:

SDM330 MAJOR TBL SDM OM FILE RETENTION
ODM:Audit finds /omdata usage exceeds 60 percent. OM files will be deleted in the next audit if the usage exceeds 70 percent.

The following is the custlog that is generated when a file in */omdata/closedNotsent* is deleted by audit to make more than 50 % available space in */omdata.*

SDM331 MAJOR INFO SDM OM FILE RETENTION
ODM: The file <filename> from closeNotSent direcory deleted by audit to free up space in /omdata.

- Where <filename> is the name of the file deleted from */omdata/closedNotSent.*

4.3 Hardware Requirements or Dependencies

- SDM with SDM20 load.
- CM with SDM connectivity.

4.4 Software Requirements or Dependencies

- Table Access Service and OM Access Service application on the SDM should be present and should be in INSV state.
- CM - SDM connectivity should be up.

4.5 Limitations and restrictions

This activity does not introduce any new limitation or restriction on the OMDD application. The performance of the application can degrade if either the SDM or the core is heavily loaded.

5: Functional Description (FN): A00001743

5.1 Feature name

Syslog Consolidation for Succession.

5.2 Feature Synopsis

This activity uses the Log Delivery application to

- Provide a single consolidated northbound log feed for all the components in a succession node.
- Implement the initial phase of Lost Log detection for Non-CM logs.
- Enhance the Lost Log indication mechanism for CM logs.
- Enhance the Log Delivery application's capacity to handle bursty traffic of logs.
- Enhance Logroute tool to make it more user friendly and to remove redundant processing.

5.3 Functional Overview

5.3.1 Introduction

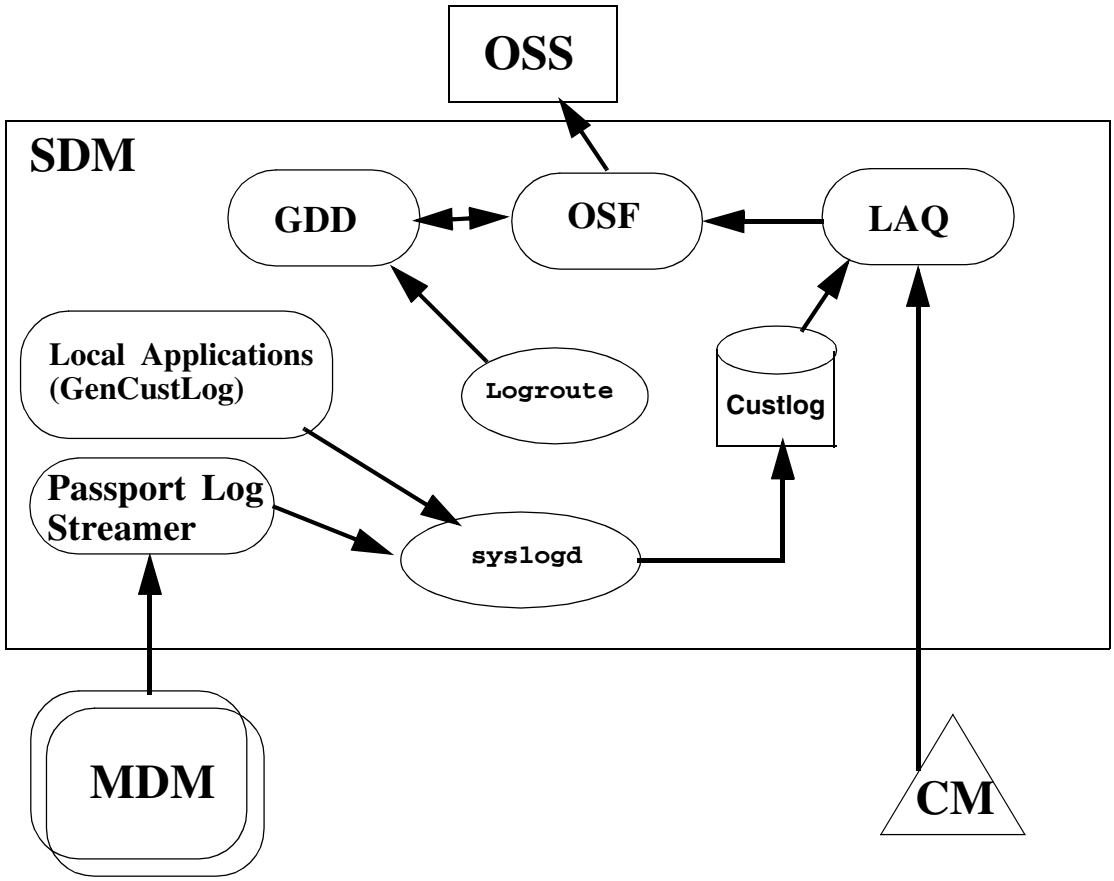
The Log Delivery Application is used to collect CM logs and Customer logs, format them in either STD or SCC2 format and route them to remote (Telco) hosts, printers and/or UNIX files.

Log Delivery application has two components - **LAQ** and **OSF**. LAQ is the component which is used to receive the logs from the CM and custlog file, parse the logs and send them to OSF.

OSF receives these logs, formats the logs (into STD or SCC2 depending on the format configured for that device in Logroute) and sends the logs to the configured destination (that is, whether these logs need to be written to an UNIX file or sent to some remote destination).

Figure 1 shows the current design of the Log Delivery Application.

Figure 1 Interaction Between Component



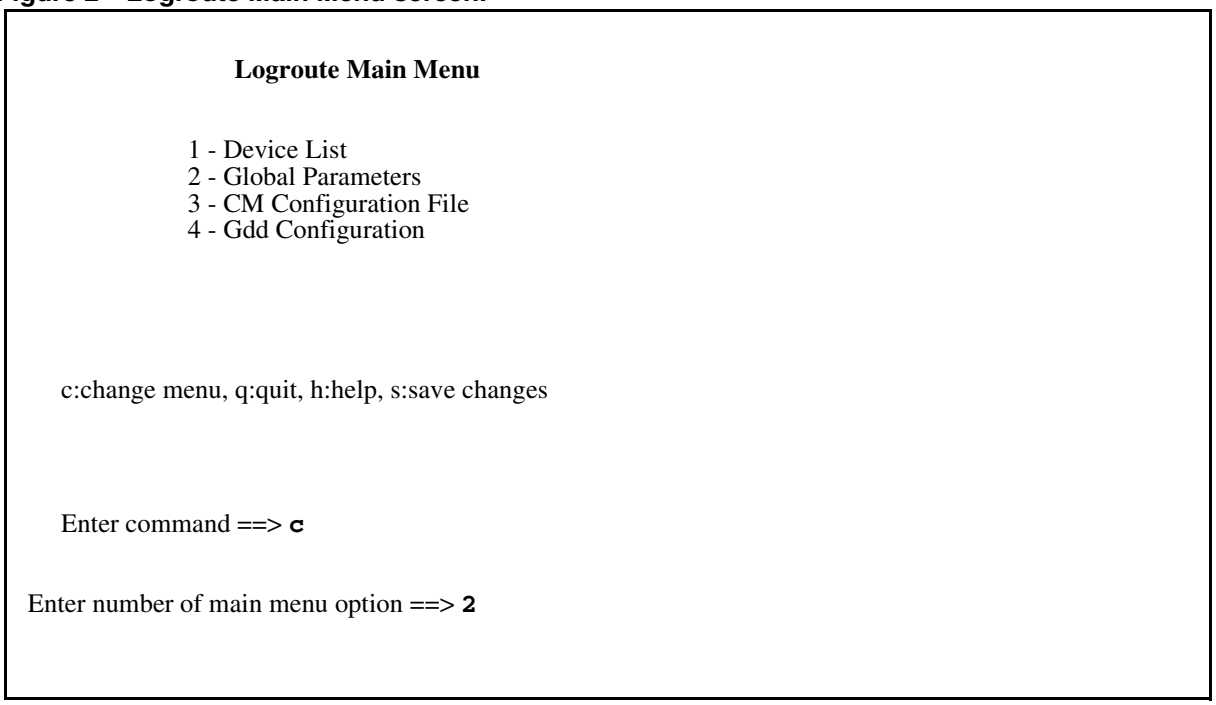
5.3.2 Current Problem scenarios

The Current Log Delivery application contains the following problem scenarios.

5.3.2.1 Logroute Command Line User Interface

The User Interface of Logroute is not very user-friendly currently. For example, consider the Main menu screen as shown in figure 2.

Figure 2 Logroute Main Menu screen.



The user has to first enter “c” and then the number of the main menu option to access any sub-menu. The same is the case for all sub-menu screens. This is a strenuous way to access the sub-menus and information in the logroute tool.

5.3.2.2 Lost Log Detection

The Log Delivery application, currently does not have a mechanism to detect stoppage or any gap in the delivery of logs from a given Element Manager or a Network Element Application. Hence, the client is not notified regarding the loss of logs.

5.3.2.3 Conforming to Standards Specified

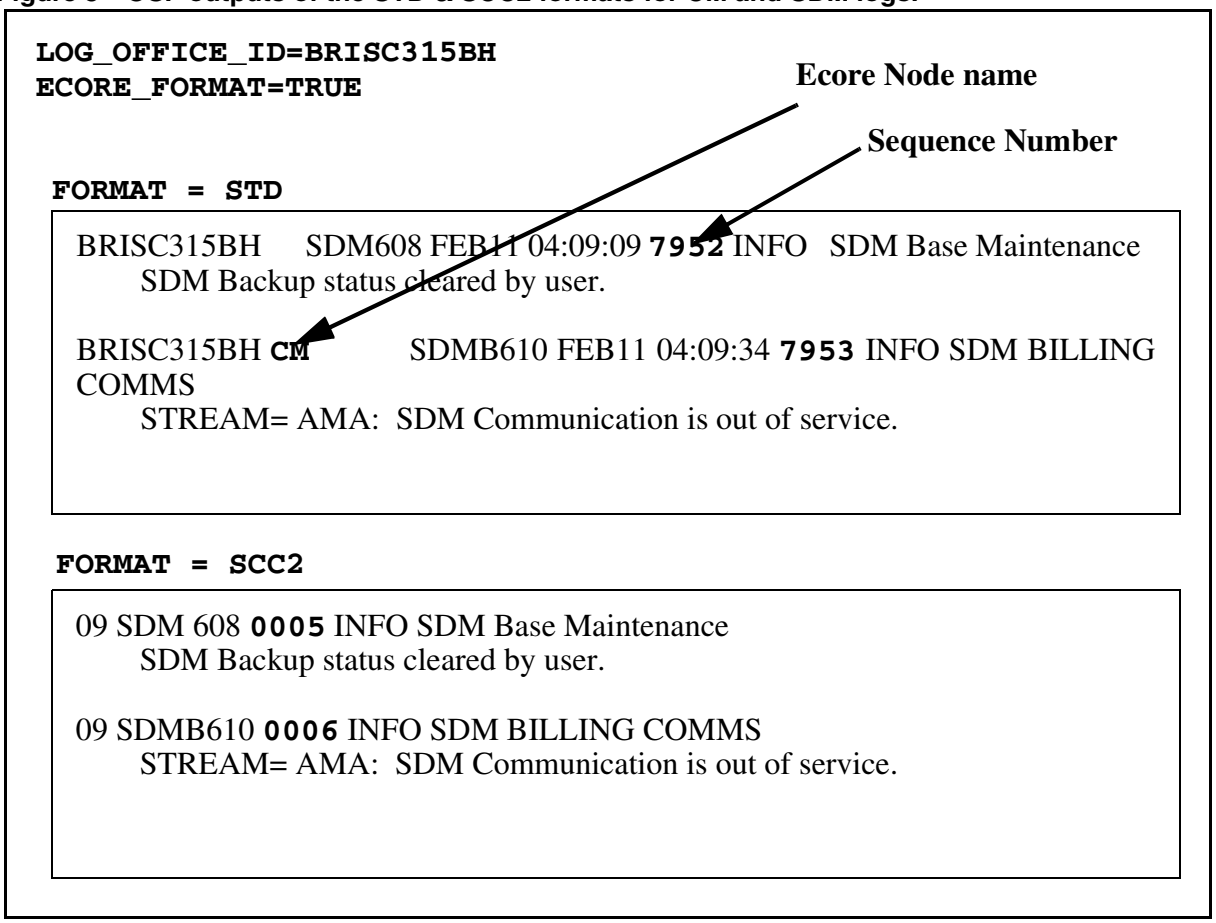
The Logroute tool is used to define the parameters of each individual OSS feed.

- Format : STD or SCC2
- Who originates connection : OSS (TCP), OSS (TCPIN)
- Port number used : <xxxxx>
- Filtering rules (by log name and number) :

OSF retrieves this information and based on the configured format, converts them into STD or SCC2 logs. The inconsistency of the OSF output for different formats can be noticed in Figure 3.

Assuming that the LOG_OFFICE_ID (that identifies the switch generating the log) and ECORE_FORMAT (flag used to decided the display of the node name) in the DMS table OFCVAR have been set.

Figure 3 OSF outputs of the STD & SCC2 formats for CM and SDM logs.



From the above figure it can be clearly seen that the application does not follow the same format for all logs.

- The Node name (ECORE Node name) is not displayed for logs generated on Non-CM node.
- Logs generated in SCC2 format do not display the originator of the log (Example :- CM or SDM).
- The generated Sequence number does not conform to the Dual Sequence Number (Global and Device Sequence Number) format specified in the log standards. Currently the Global and Device Sequence number format is not implemented. The number is implemented as a single four digit Sequence Number.

- The logs generated in the configured format (STD or SCC2) by the Log Delivery Application do not conform to the customer document.

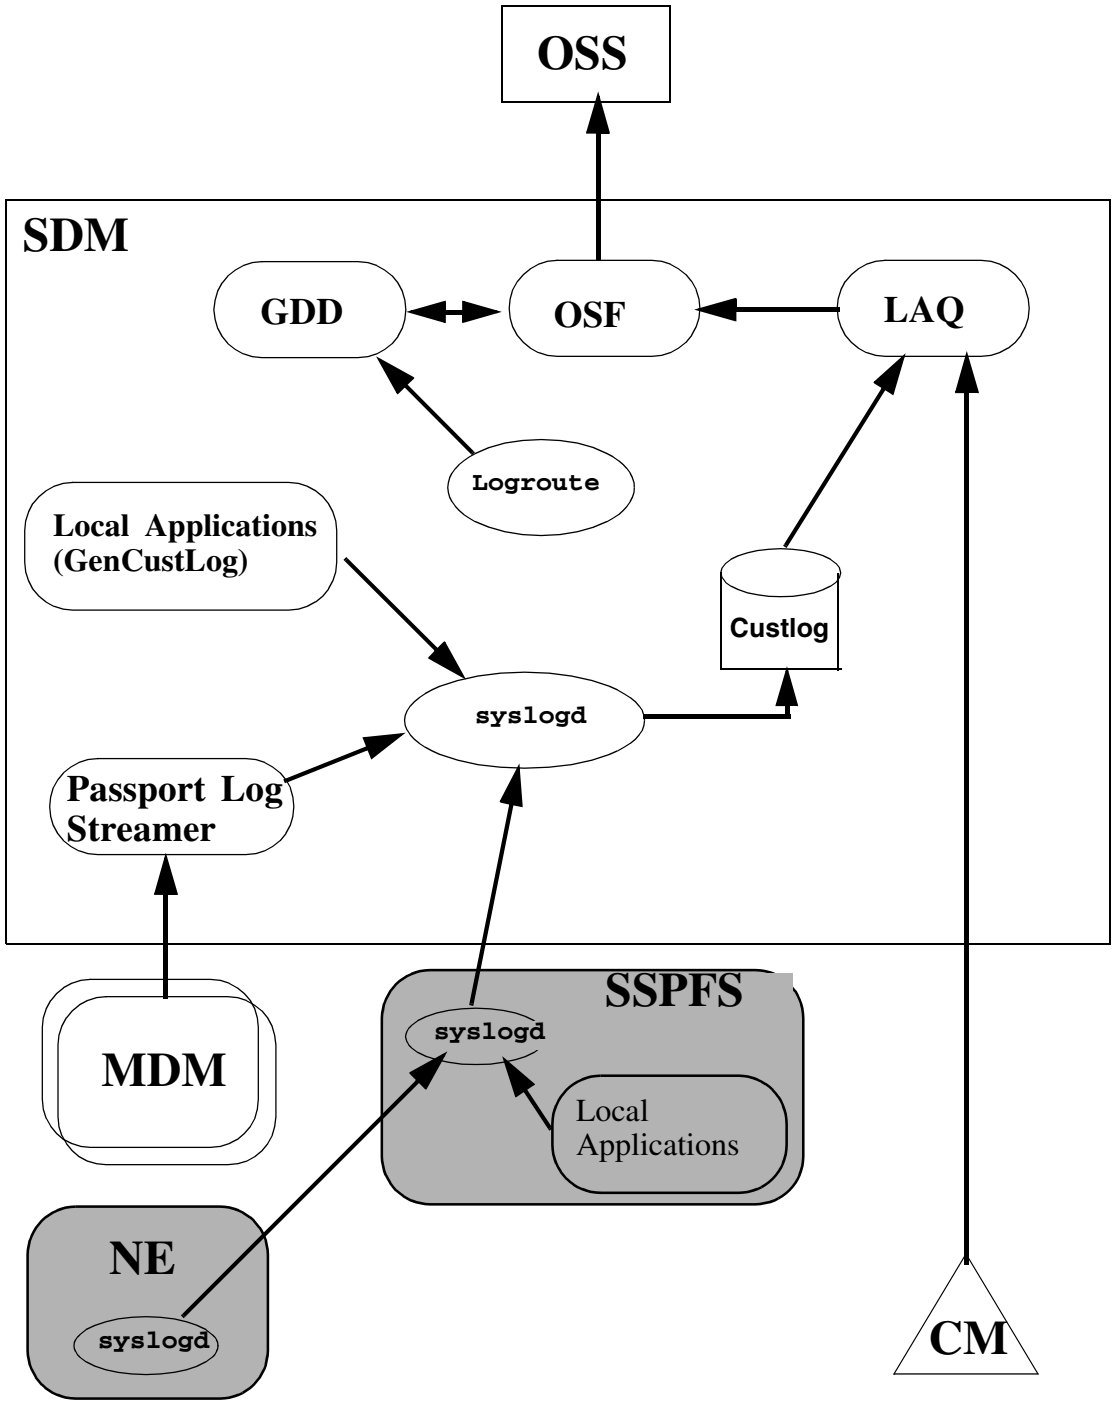
The OSF needs to be upgraded to support the standard log format (either STD or SCC2).

The purpose of the feature is to resolve the current problem scenarios mentioned above.

5.3.3 Functional Components.

The proposed architecture to support customer logs being fed into the syslogd daemon from remote syslogd daemons is as below.

Figure 4 Interaction Between Components



The implementation of this feature can be broken down into the following main components.

5.3.3.1 Logroute Command Line User Interface (Logroute CLUI).

- Modify the existing screens to enable the user to access and modify the existing information more easily.
- Add new menus and screens to make the Logroute CLUI more user-friendly.

5.3.3.2 Upgrade all SDM applications to use GENCustLog API Version 2 to generate custlogs.

- Enhance the current custlog to contain information required for lost log detection.
- Upgrade SDM applications to reflect the new custlog format.

5.3.3.3 Implement initial phase of lost log detection in Log Delivery for Non-CM logs.

- Poll logs from custlog file.
- Detect whether any logs have been lost.
- If lost logs detected, generate log to indicate lost log detection.

5.3.3.4 Enhance lost log indication mechanism for CM logs.

- Enhance Log Delivery so that an internal log is generated when a lost log scenario is detected for CM logs.

5.3.3.5 Enhance Log Delivery to support STD, SCC2, STD-OLD and SCC2-OLD formats with ECORE node id enabling and Dual Sequence numbering.

- Enhance Log Delivery to support LOG_OFFICE_ID enabling from SDM.
- Enhance Log Delivery to support ECORE Node Id enabling from SDM.
- Enhance Log Delivery to support Dual Sequence Numbering for logs.
- Enhance STD and SCC2 formats to incorporate the above enhancements (LOG_OFFICE_ID, ECORE Node ID, Dual Sequence Numbering).
- Retain the Pre-SDM20 behaviour of Log Delivery with respect to formats.

5.3.3.6 Handle bursty generation of logs.

- Ensure that the new functionality does not adversely impact the Log Delivery performance and also ensure that the application stays in conformance to the specified limits.

5.4 Feature Description

5.4.1 Introduction

As mentioned above, the main task of this feature consists of

- Implementing code changes to make Logroute CLUI more user-friendly.
- Upgrading all SDM applications to use GenCustLog API version 2 to generate custlogs.
- Implementing initial phase of lost log detection in Log Delivery for Non-CM logs.
- Enhancing the lost log indication mechanism for CM logs.
- Enhancing Log Delivery to support STD, SCC2, STD-OLD and SCC2-OLD formats with ECORE node id enabling and dual sequence numbering.
- Handling bursty generation of logs.

5.4.2 Enhancing Logroute CLUI

Logroute tool used for configuration of device and log routing information. This information is used to collect the data in the desired format (STD or SCC2) and send the collected logs to the configured destination. The tool can also be used for configuring the device such that, it receives only the desired logs.

Currently the Logroute tool is not very user-friendly (as described in section 2.3.2.1). This feature seeks to enhance the Logroute tool, so that the user is able to obtain or modify the information more easily.

The enhanced user interface is explained in more detail in the configuration document (optcn.fm) of this feature.

5.4.3 Upgrading SDM applications to use GenCustLog API version 2 to generate custlogs.

5.4.3.1 Enhancement to SDM log generation API

On the SDM, the SDM Log Generation (SLG) API will be upgraded to generate the new custlog format GenCustLog version 2. This new custlog format will enhance the content of the logs flowing through syslogd and stored in custlog to include the following data.

- Node Id :- Identifies where the log originated.
- Host Name :- Identifies the machine which generated the log.
- Application Name :- The application which generated the log.
- Sequence Number :- The number of the log which the application has generated.

To initialize and generate the above data, the following options are provided.

- init_cust_log :- This function is used to set/reset the sequence number and application name of a particular application.
- gen_cust_log_v2 :- This function is used by the applications to generate custlogs in the new GENCustLog Version 2 format.
- gen_foreign_cust_log_v2 :- This function is used by applications that generate a custlog on behalf of a remote system.

5.4.3.2 Updation of all SDM applications

The SDM applications will be updated so that they will call the GenCustLog Version 2 function to generate a custlog.

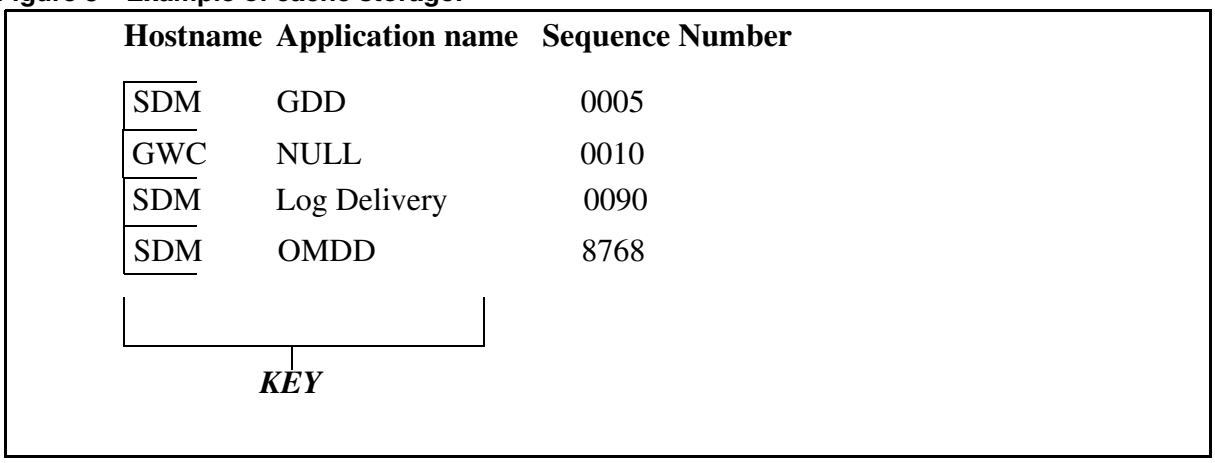
As part of this updation, the application will provide the application name as one of the parameters of the new CustLog version. The application name must be unique.

5.4.4 Implementing initial phase of lost log detection for Non-CM logs

This requirement is achieved by implementing a new lost log detection functionality.

- Create a cache (data structure) to store the latest Hostname, Application name and Sequence number of the custlog generated by each application.

Figure 5 Example of cache storage.



- Log Delivery polls for logs in the custlog file and retrieves the logs.
- While formatting the logs, retrieve the Host name, Application name and Sequence number of the log.
- If the Sequence number of the log has been set to zero abruptly, the LAQ recognizes it as a reset log for that application. accordingly it re-initializes the application details in the cache.
- Validate the sequence number retrieved from the log to the sequence number stored in the cache.
- If the sequence number is found to be breaking the flow (i.e it has skipped by more than one number). Then it is assumed that the following events could have happened.
  a. The logs missing could have been lost.
  b. The logs have arrived out of sequence and the missing logs can be expected to arrive immediately.

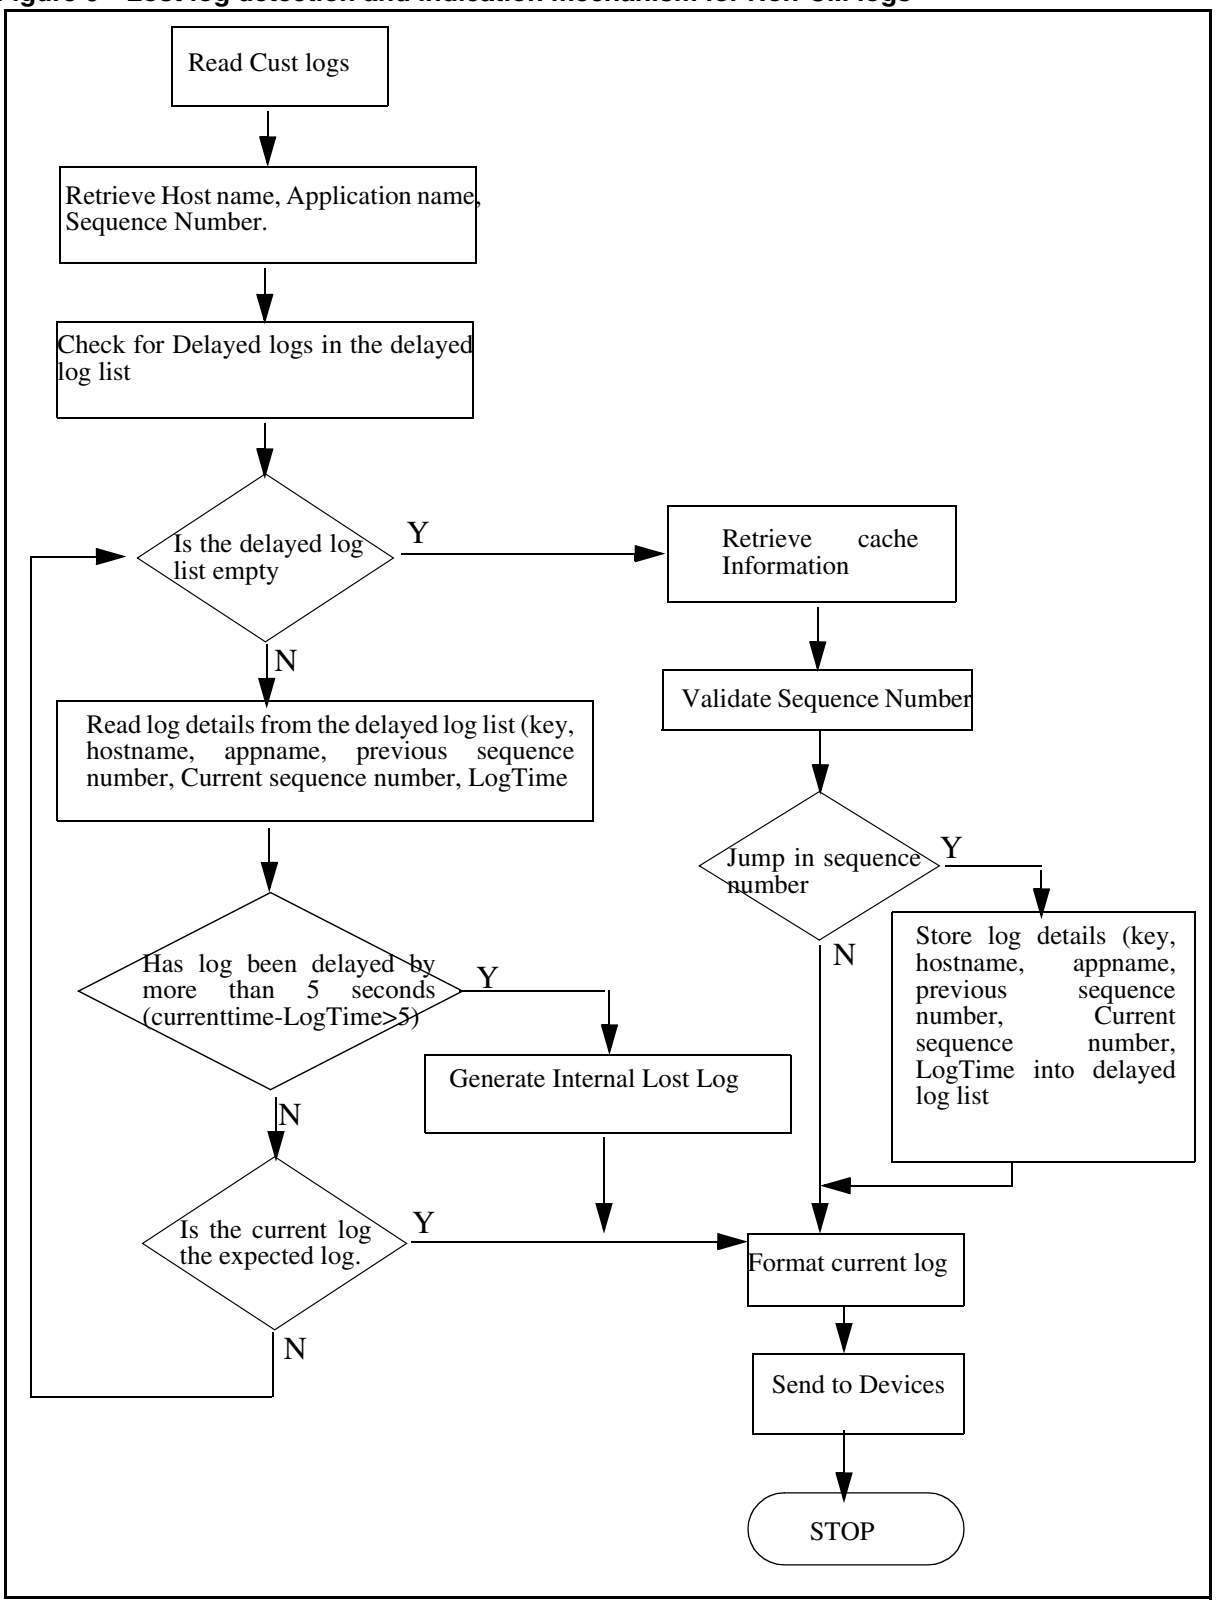
In order to take the above scenario into consideration, the details of the latest log (Key, hostName, appName, previous sequence number, current sequence number) received are stored as a list in a RWSlistCollectables structure “RWDelayedLogCheckList” along with the time when the log was received. When the next log is received, the following steps are followed.

i. The list is checked to see if the log is an expected log or not.
ii. If the log is expected then it is generated.
iii. If the LAQ does not receive the log in less than 5 seconds, an internal log is generated to indicate that a log has been lost.

If LAQ detects that a lost log scenario exists, it will generate a “<number> Logs lost for application <application name> on host <hostname>” log, else it will increment the sequence number.

If the search is not successful, LAQ assumes that log is the first log from that application and accordingly inserts the log details into the RogueWave structure.

Figure 6 Lost log detection and indication mechanism for Non-CM logs



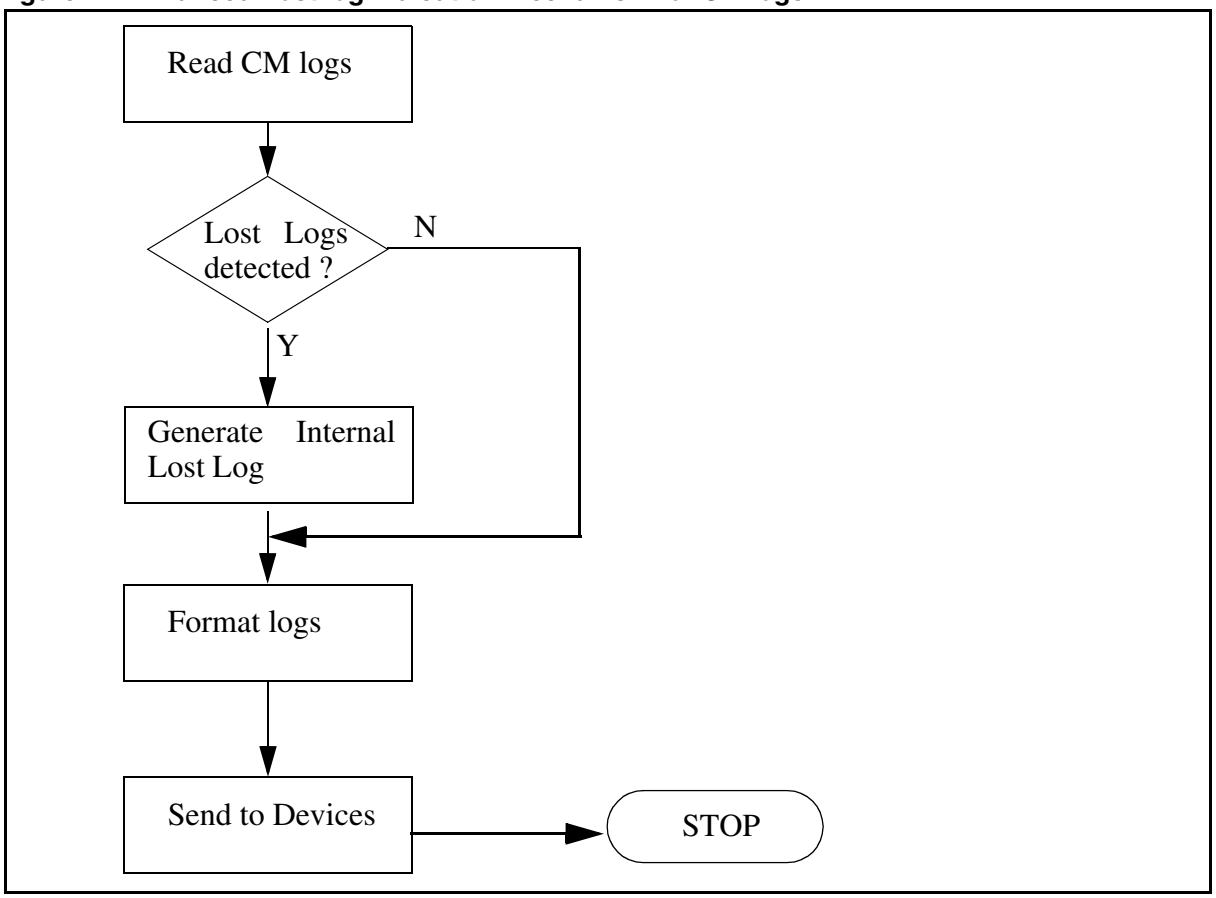
5.4.5 Enhancing the lost log indication mechanism for CM logs.

The current lost log indication mechanism existing for CM logs is enhanced as below.

- Log Delivery application detects a lost log scenario.
- The application generates an internal log indicating the number of logs lost.
- The internal log is passed to the OSF to be sent to all the devices.

This will ensure that the user will be intimated regarding lost logs immediately.

Figure 7 Enhanced Lost log indication mechanism for CM logs



5.4.6 Enhancing Log Delivery to support STD, SCC2, STD-OLD and SCC2-OLD format with ECORE node id enabling and Dual Sequence numbering.

5.4.6.1 LOG_OFFICE_ID enabling

The `LOG_OFFICE_ID` parameter currently existing on the core will henceforth be configured from the "`Global Parameters`" level of the logroute tool. This parameter will be the same for all logs and streams. The LOG_OFFICE_ID will be configured as shown in the following figure.

Figure 8 Logroute tool for configuring LOG_OFFICE_ID option.

```
                    Global Parameters

 1 - LOG_OFFICE_ID                : BRISC315BH
 2 - Buffer size (number of logs)   : 150
 3 - Reconnect timeout value (secs)  : 15
 4 - Lost logs threshold (NT only)   : 100
 5 - Incoming end of line character  : 10
 6 - Outgoing end of line characters  : 10 13
 7 - Start of log characters         : 10 13
 8 - End of logs characters          :  10 13
 9 - Number of days to keep log files  : 5
10 - Maximum size of a log file (Meg)  : 40
11 - Maximum size action             : STOPDEV
12 - Help
13 - Return to Main Menu

        Select Option ==> 1

Enter Log_office_Id [CORE-COMPAT]==> BRISC315BH
```

5.4.6.2 Ecore node id enabling

In order to provide the Ecore Node Name for all the logs, the option shall be provided on the SDM through the Logroute tool.

The option to set the **`Ecore`** ON/OFF is to be on a per stream (device) basis and will be provided through the logroute tool. For example, if the user is configuring a TCP-IN device, the device parameters needed for configuring are as shown in the following figure.

Figure 9 Logroute tool for configuring Ecore option.

```
                    TCP-IN Device

                1 -  REMOTE IP      : any
                2 -  PORT           : 8550
                3 -  FORMAT         : STD
                4 -  ECORE          : ON
                5 -  Log Routing
                6 -  Help
                7 -  Return to Main Menu.

          Select Option :- 4

Enter Ecore option (ON or OFF) ==> ON
```

5.4.6.3 Dual Sequence Numbering

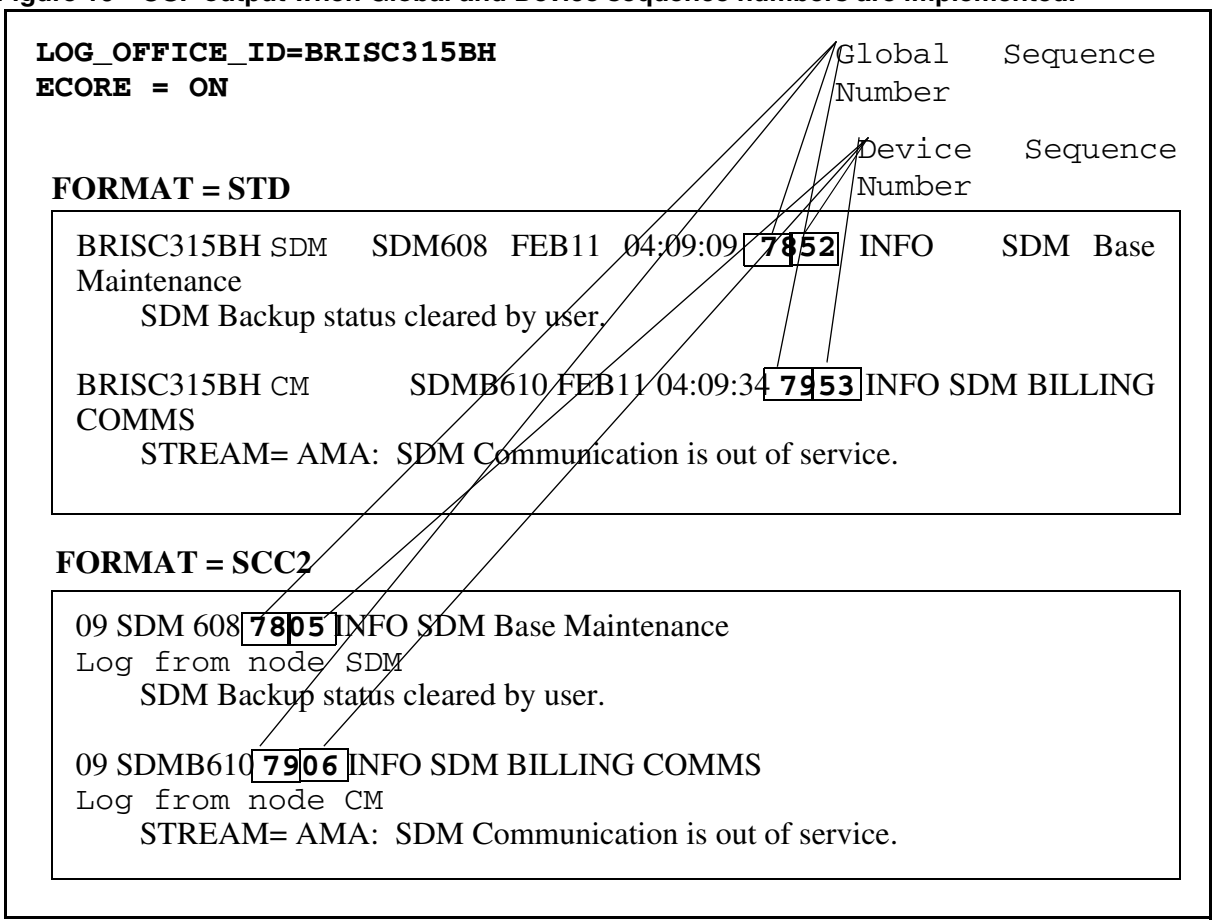
The sequence number field will be implemented as two distinct fields that will be incremented from 0 to 99.

Global Sequence number as a field of 2 digits (from 0 to 99) and
Device Sequence number as a field of 2 digits (from 0 to 99).

The Global Sequence number of the log will be the same for all the devices and the device sequence number varies based on the device. The LAQ will generate the Global Sequence number and the OSF will generate the Device Sequence number for all logs. These number have a maximum value of 99 after which they are reset to 0.

The diagram below illustrates the usage of the Global Sequence number and the Device Sequence number

Figure 10 OSF output when Global and Device sequence numbers are implemented.

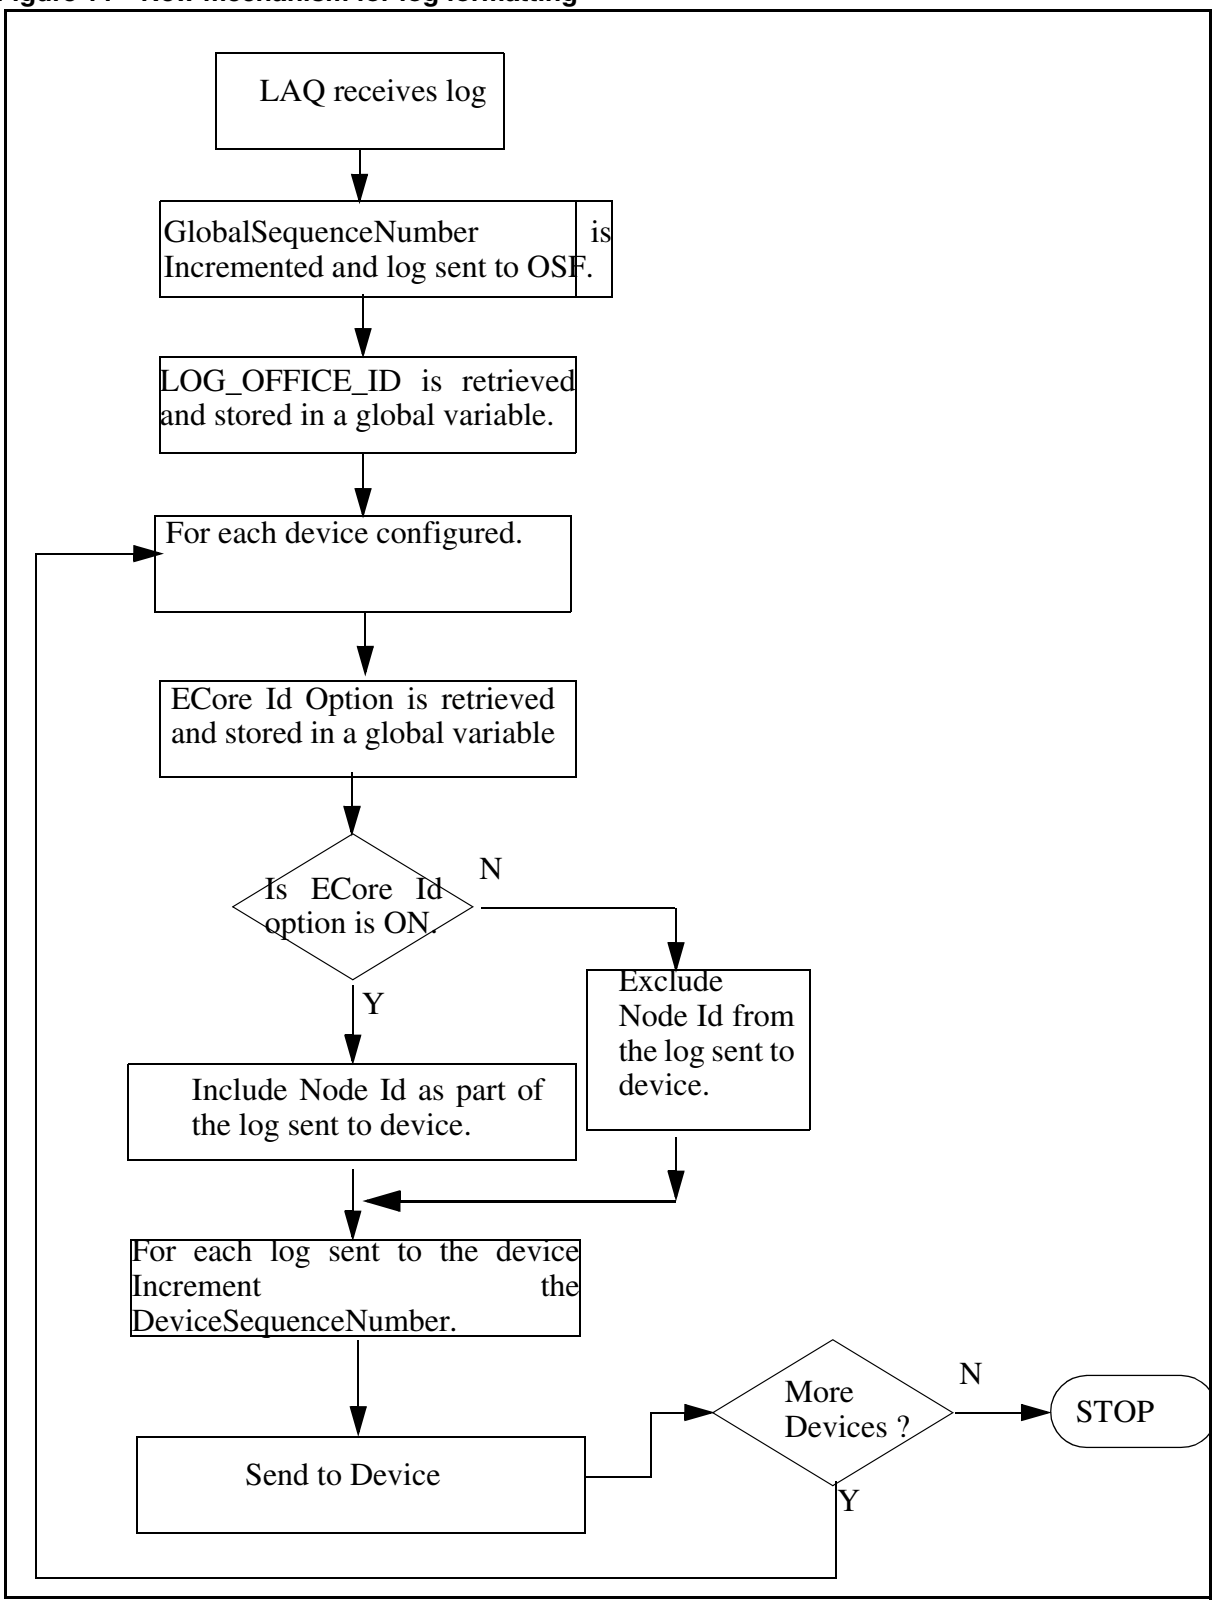


5.4.6.4 Update current formats to support proposed changes

The following changes will be made to Log Delivery to support the ECore Node Id and Dual Sequence numbering.

- When the LAQ receives a new log, the Global Sequence number will be retrieved, incremented and stored.
- After formatting the log, LAQ will send the log to the OSF. Upon receival of the log the OSF will retrieve LOG_OFFICE_ID and ECORE node id option.
- If the Ecore option is ON, then the node name which is part of the log information received by OSF will be included in the log sent to the device.
- If the Ecore option is OFF, then the node name is ignored.
- For each log which is to be sent to the particular device, the corresponding device sequence number is retrieved and incremented.
- The data is then updated into the log information and sent to the device.

Figure 11 New mechanism for log formatting



5.4.6.5 Retain the Pre SDM20 behaviour of Log Delivery.

The Pre SDM20 behaviour of Log Delivery will be retained in the new formats STD_OLD and SCC2-OLD. User who wish to receive logs without the above changes can select the format to be either STD-OLD or SCC2-OLD.

5.4.7 Handling bursty generation of logs.

This feature ensures that the new functionality does not adversely impact the Log Delivery performance and also ensure that the application stays in conformance to the specified limits

5.5 Hardware Requirements or Dependencies

- Fault tolerant SDM with SDM20/CS2E07 load.
- CM (XACORE / BRISC / 3PC)
- Succession Network Elements like GWC, MDM.
- NSDM

5.6 Software Requirements or Dependencies

- Connectivity between various Network Elements and SDM should be up.
- Connectivity between SDM and CM should be up.

6: Functional Description (FN): A00001847

Note: The FN/CN sections for activity A00001847 include the related information for a number of activities due to the close association of all these activities. The activities that are included in this group are:

- A00001847 - ABI Expansion Datafill
- A00001909 - ABI Trunk Support for RCC
- A00001936 - MG9K ABI Expansion - Node and Link Mtc

Note: Within this document the terms LTC and LGC are used, which the terms LTCI and LGCI are not used. The use of the term LGC or LTC implies both the ISDN and non-ISDN capable versions of these peripherals unless otherwise stated. This is done to avoid confusion as the LGCI and LTCI do not actually exist from a datafill perspective, they are simply LGCs and LTCs with an ISDN capability.

6.1 Feature name

A00001847 - ABI Expansion Datafill

6.2 Description

This activity expands the set of supported Peripheral types that can be provisioned off an ABI card in a MG9000 gateway. In SN05 the initial ABI work provided support for the LGC (ISDN only) and SMA2 peripheral types. With this activity we will provide the capability for customers to provision not only SMA2 and LGC (ISDN only) peripherals off the ABI card, but also LTC and LGC (non-ISDN) peripherals on the ABI.

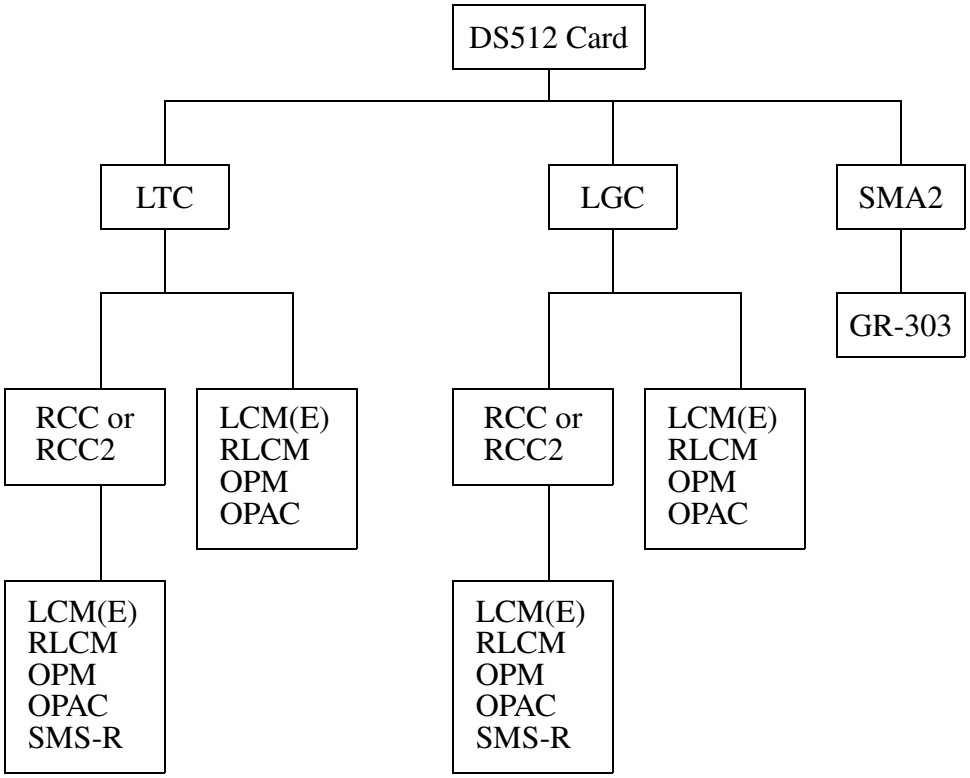
Also, as part of this activity the set of line concentrating devices (LCDs) supported off the above list of host peripherals has been expanded. When this activity is complete the set of supported LCDs will include:

1. LCM
2. RLCM
3. OPM
4. OPAC
5. RSC
6. RSCS

Also, the remotes (RSC/RSCS) will support the SMS-R (Mode I or II) as a subtending device, along with the LCM, RLCM, OPM, and OPAC. It should also be noted that whenever the RSC and RSCS are mentioned both the single and dual configurations are implied. The following figure shows the allowed

configurations for SN06.2. Note that this is a logical not a physical representation, and that it is not possible to host all these devices on a single DS512 card in the MG9000.

Figure 1 Supported SN06.2 Configurations



The main customer visible changes for this activity will be the ability to provision the EXTDS512 optional field as part of the tuple in table LTCINV for the LTC Peripheral Type (the LGC was already supported in SN05 although only for ISDN lines). This optional field is used to identify the IP Address of the ABI Card and the Gateway Controller that the peripheral is "hosted" off (the GWC must be datafilled in table SERVRINV prior to entering this information). Prior to this release if this optional field was added to an LTC tuple an error would result.

Note: Although only ISDN lines were supported on the ABI-based LGC in SN05, the EXTDS512 attribute could be added to any LGC (including normal LGCs without ISDN lines) without an error resulting. Thus this is unchanged in SN06.2 except that we have added official support for the other LCCs on the LGC.

A full description of the table control changes is available in the Data Schema section of this document (part of the Configuration chapter).

6.2.1 Supported Line Class Codes and Features

The following tables lay out the supported Line Class Codes (LCCs) and features that are supported on the new ABI XPMs as well as what is currently supported. This table includes the terms LTCI and LGCI, but it should be noted that the LCCs supported are the same as for the LTC/LGC with the exception of the ISDNKSET.

Note: Although the subtending devices are not listed in the following list, they will support all the LCCs applicable for their host peripheral. For example, an RCC subtending an ABI based LTC will be able to support all the LCCs listed for the LTC in the table below, assuming that the RCC supports that LCC in a legacy environment.

Table 7 LCC Support

	MG9000	MG9000 ABI Supported Peripherals

ZMD	S	SN05	SN06.2	SN06.2	SN06.2
ZMZPA	S	SN05	SN06.2	SN06.2	SN06.2

Note: An “S” under the MG9000 Lines column means that this LCC was supported on the MG9000 prior to SN05 (SN05 was the first release for ABI XPMs).

Note: A “-” in any cell of the above table means that the LCC is not supported for that XPM type. For example, ISDNKSET is not supported on LGC/LTC XPMs as these XPMs are not ISDN capable.

The following LCCs are only supported on legacy, not on the MG9000 or ABI based XPMs:

1. 10FR - Ten-party flat rate, residence and business
2. 2FR - Two-party flat rate, residence and business
3. 4FR - Four-party flat rate, residence and business
4. 8FR - Eight-party flat rate, residence and business
5. ATA - Coin, coin first (prepay)
6. CSD - Circuit-switched digital service
7. CSP - Coin, semi-postpay
8. DATA - Data unit
9. PDATA - POTS data unit

Here is the list of supported services on ABI peripherals.

Stop Hunt	SHU	
Subscriber Loop Carrier	SLC	Identifies coin lines resident on a SLC-96 remote
Terminal Management Environment	TME	Support for Nortel P-Phone Power Feature test tools
Uniform Call Distribution Signal Distributor	UCDSD	

2.2.2 Support of ABI RCC Trunks

Also, as part of this activity, trunks will be supported off of RCC/RCC2s subtending any of

- LGC
- LTC

The following trunk types will be supported off of an RCC/RCC2:

- TI
- TO
- T2
- IBNTI
- IBNTO
- IBNT2
- PBX
- PX
- ES

As well, intra-switching will be supported on these RCC trunks.

Note: Trunks are not supported directly on the LTC. Trunking is only supported on RCCs hosted on ABI XPMs. Please see the documentation for activity A00001909 for more information on ABI RCC Trunk support.

2.2.2.1 Trunk Services Support

All Trunk services that are currently supported on the listed trunk types in section 2.2.2, such as ANI outpulsing and operator signals on ES trunks (rering, etc.), will continue to be supported when those trunk are hosted off of an ABI RCC.

2.3 Hardware Requirements or Dependencies

There is no hardware impact associated with this activity.

2.4 Software Requirements or Dependencies

This activity will be implemented in the SN07 stream in the CM, but due to customer requirements will be patched back into the SN06 CM release (officially this is called the SN06.2 release).

There are several other acetifies that are required to complete the support of the additional peripheral types. They include A00001979 - ABI Expansion GWC,

A00001909 - ABI Trunk Support for RCC, and A00001936 - MG9K ABI Expansion - Node & Link Mtc.

2.5 Limitations and restrictions

The following restrictions exist on the new External XPM types added by this activity (it should be noted that all of these restrictions apply to the existing External XPMs as well as the new XPMs and are not new in SN06.2):

- Special Connections are not supported on any External XPM.
- External XPMs do not support broadcast loading or patching, although they do support parallel loading. Broadcast loading and patching are not supported due to the lack of support for IPMLs between the External XPMs.
- The MONTALK LINK command of the Trunk Test Position (TTP) is NOT supported on ABI RCC Trunks. When the MONTALK level is entered with an ABI RCC Trunk posted at the TTP, the MONTALK LISTEN mode is immediately entered. A conference resource is acquired, a two-way connection between the ABI RCC Trunk and conference circuit is made, a two-way connection between the other party in the call and the conference circuit is made, and a one-way listen-only connection is made between the HSET and the conference circuit (i.e. normal MONTALK LISTEN operations). MONTALK TALK is supported on ABI RCC Trunks.
- The T108 and BERT tests of the TTP level of the MAP are supported for ABI RCC Trunks. When the trunk posted at the TTP connects to an ABI RCC Trunk (incoming or two-way), then the loop-back connection will be made at the ABI card of the MG9K Gateway.
- Trunking is not supported directly on an ABI LTC. Trunks should not be provisioned directly on an ABI LTC as they are not supported at this time. Trunks can be provisioned off an RCC hosted on an ABI XPM.

2.6 Interactions

- An MG9000 entering ESA will cause an RCC subtending an ABI-base XPM off the MG9000 to enter into ESA as well. When the MG9000 exits ESA and the C-side links come back into service, then the RCC will also exit ESA.

7: Functional Description (FN): A00001888

7.1 Feature name

CS2000 Line Test for MG9000 Lines

7.2 Description

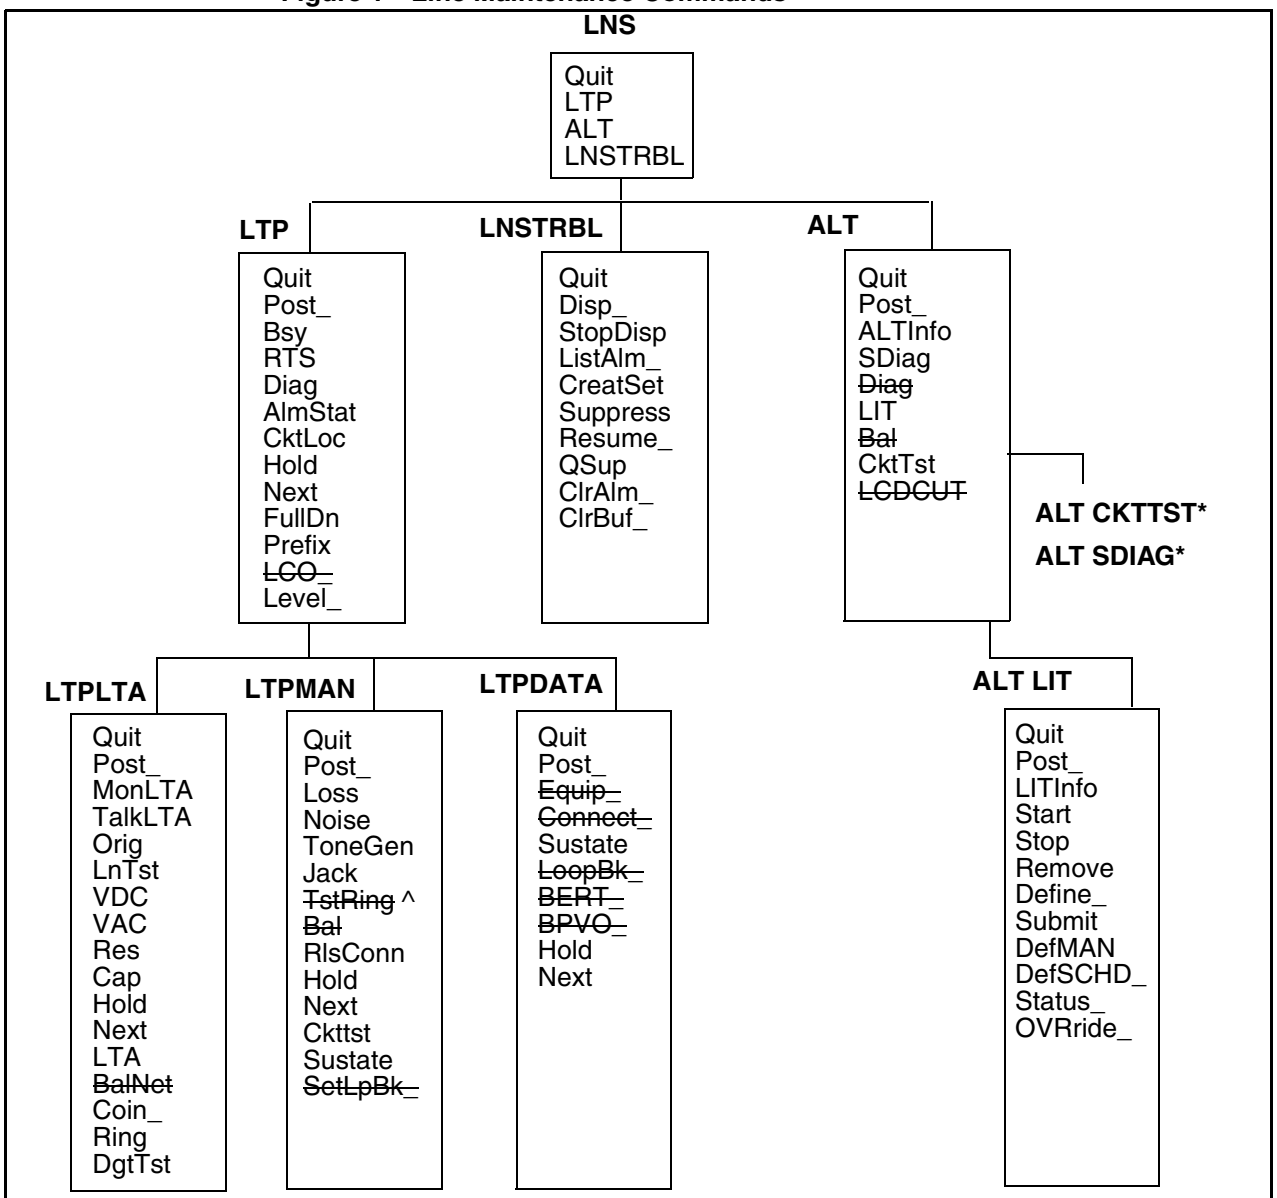
Testing and troubleshooting of line faults are traditionally done using a Maintenance and Administration Position (MAP) user interface at the levels below the LNS MAP level. The LNS MAP level contains the lines test position (LTP) menu commands, the automatic line testing (ALT) menu commands and the lines service trouble (LNSTRBL) commands. Prior to this feature, only a few MAP commands, such as BSY, RTS, and FRLS, were supported for Succession lines off of LGRPs from the MAP. As the primary component of this feature, the majority of the MAP commands in the LTP, ALT and LNSTRBL level for Succession MG9000 POTS, Ground Start, Coin and EBS lines are provided for the Universal Access solution which are available for legacy RDT lines. In addition to the MAP commands, ShowerQ support and Subscriber Premise Test support are provided for these types of Succession lines. Support of No Test Trunk (NTT) is already provided. This feature is for the SN06.2 release and is for the Maintenance Trunk Module (MTM) and Remote Maintenance Module (RMM) configurations.

7.2.1 Overview of Line Maintenance Commands

Figure 1 contains a list of the line maintenance commands shown at their respective levels which are supported for native MG9000 lines. Figure 1 does not include commands which are or are not supported for MG9000 Access Bridge Interface (ABI). To get to the LNS MAP level on a DMS MAP window which is at the top of the hierarchy in the figure, enter the mapci;mtc;lns level.

Most commands shown in the figure are supported for native MG9000 lines. The unsupported commands are indicated by a strike through. Check the legend for additional clarification.

Figure 1 Line Maintenance Commands



Legend:

*** :**The menu of commands for the other ALT levels are the same as the commands for the ALT LIT level.
^ : Indicates that a message is displayed referring the user to use the DIAG command.
A strike through indicates that the command is not supported.

Note 1: The LTP levels IBNCON and DCTLTP are not shown since they do not apply to Succession MG9K.
Note 2: The ALT LCDCUT and ALT SDIAG sub-levels are not shown since it is not applicable to Succession MG9K.
Note 3: The ALT BAL sub-level is not shown since it is not valid for RDTLSG, RDTCON, or RDTEBS lines.
Note 4: The LTP level LTPISDN is not shown since it only applies to ISDN lines and does not apply to native MG9K.

The following sections highlight the basic functionality provided by this activity. For more information, please refer to the DMS-100 Family Lines Maintenance Guide.

7.2.2 LTP Menu Commands

Following are the valid commands at the LTP level for native MG9000 lines:

- **Quit**: The QUIT command is used to leave the current level and return to a higher level.
- **Post**: Posts a line or set of lines to the LTP.
- **Bsy**: The BSY command changes the state of the line in the control position, or optionally all lines that are posted, to a specific state.
- **RTS**: The RTS command changes the state of the line in the control position, or optionally the complete set of posted lines, from MB to IDL.
- **Diag**: The DIAG command performs an extended diagnostic on a line in the control position that is in the MB or IDL state, and displays the results on the LTP screen.
- **AlmStat**: The ALMSTAT command triggers the alarm system of the LNS subsystem and displays the status of alarms in the full switch by type of alarm, when used without parameters. The command is used with parameters to display all or selected alarms at specified units in the host or remote sites, or to change the thresholds of the alarm classes in the full switch.
- **CktLoc**: The CKTLOC command locates and identifies the circuit card used for the line circuit in the control position, and displays circuit characteristics. Some of the displayed information for the Floor and Row Position, which consists of both the row and frame position, is dependent on the datafill of the SN06.2 LGRPLOC option in table LGRPINV. See SN06.2 activity A00002607. If this option is not provided, this information is displayed with default values of “00” for the Floor and “A00” for the Row Position. The Bay ID consists of the frame type, which is displayed as “MG9F”, and the frame number. LEN information that is stored in table LNINV is also displayed.
- **Hold**: The HOLD command moves the line in the control position to a spare hold position, and the next line from the posted set, if any, to the control position.
- **Next**: The NEXT command moves the line in a specified HOLD position to the control position, or replaces the line in the control position with the line in a specified hold position; and exchanges, saves, or drops the replaced line from LTP control.
- **FullDn**: The FULLDN command displays the full National Number.
- **Prefix**: The PREFIX command clears the LTP of prefix digits. Optionally it sets or changes prefix digits.
- **Level_** : The Level command gives the user access to the sublevels LTPLTA, LTPMAN, LTPDATA, IBNCON, and DCTLTP at the MAP.

7.2.2.1 LTPLTA Menu Commands

Following are the valid commands at the LTPLTA sub-level for native MG9000 lines:

- **Quit**: The QUIT command is used at the LTPLTA sublevel in the same way as it is described at the LTP level.
- **Post_**: The POST command is used in the LTPLTA sublevel in the same way as it is described at the LTP level.
- **MonLTA**: The MONLTA command connects a headset circuit to the MG9000 line in the control position for listening purposes.
- **TalkLTA**: The TALKLTA command connects a talk circuit to a subscriber on a MG9000 line, and optionally connects a talk battery so that the tester can converse with the subscriber when the CO relay is operated.
- **Orig**: The ORIG command configures the loop side of a line circuit in either the off-hook mode or the on-hook mode, or alternates between modes.
- **LnTst**: The LNTST command performs resistance, capacitance, and voltage tests on a MG9000 line.
- **VDC**: The VDC command performs a dc voltage measurement on a subscriber loop.
- **VAC**: The VAC command performs an ac voltage measurement on a subscriber loop.
- **RES**: The RES command performs resistance measurements on a subscriber loop.
- **CAP**: The CAP command performs a capacitance measurement on a subscriber loop.
- **Hold**: The HOLD command is used at the LTPLTA sublevel in the same way that it is described at the LTP level.
- **Next**: The NEXT command is used at the LTPLTA sublevel in the same way that it is described at the LTP level.
- **LTA**: The LTA command connects the LTA to a line card, or releases the LTA from a line card.
- **Coin_**: The COIN command sends a +130 V pulse on the subscriber loop to operate the coin collect mechanism in the coin station, or a -130 V pulse to operate the coin return mechanism.
- **Ring**: The RING command places ringing voltage on the loop of a MG9000 line.

- **DgtTst**: The DGTTST command tests the DIGITONE pad or dial on the subscriber station.

7.2.2.2 LTPMAN Menu Commands

Following are the valid commands at the LTPMAN sub-level for native MG9000 lines:

- **Quit**: The QUIT command is used at the LTPMAN sublevel in the same way as described in the LTP level.
- **Post_**: The POST command is used at the LTPMAN sublevel in the same way as described in the LTP level.
- **Loss**: The LOSS command measures the insertion loss of a test tone sent from the subscriber end of a loop to its line circuit.
- **Noise**: The NOISE command measures the C-message weighted circuit noise on a subscriber loop.
- **ToneGen**: The TONEGEN command transmits a tone on a subscriber loop.
- **Jack**: The JACK command connects a jack-ended trunk to a subscriber line, or a jack to a subscriber loop while bypassing the line card.
- **TstRing**: The TSTRING command tests the ringing relay in the line card for proper functioning. Since this functionality is performed during the Diag command, a message referring the craftsperson to run the Diag command is displayed.
- **RlsConn**: The RLSCONN command releases test equipment that is connected to a line.
- **Hold**: The HOLD command is used at the LTPMAN sublevel in the same way that it is described at the LTP level.
- **Next**: The NEXT command is used at the LTPMAN sublevel in the same way that it is described at the LTP level.
- **Ckttst**: The CKTTST command sends test messages to test the posted line.
- **Sustate**: The SUSTATE command determines the status of the MBS that is connected to the Business Set line in the control position.

7.2.2.3 LTPDATA Menu Commands

Following are the valid commands at the LTPDATA sub-level for native MG9000 lines:

- **Quit_**: The QUIT command is used at the LTPDATA sublevel in the same way as it is described in the LTP level.
- **Post_** : The POST command is used at the LTPDATA sublevel in the same way as it is described in the LTP level.

- **Sustate**: The SUSTATE command reports on the loop status of the subscriber data line.
- **Hold**: The HOLD command is used at the LTPDATA level in the same way as it is described in the LTP level.
- **Next**: The NEXT command is used at the LTPDATA sublevel in the same way as it is described in the LTP level.

7.2.3 LNSTRBL Menu Commands

Following are the valid commands at the LNSTRBL level for native MG9000 lines:

- **Quit**: The QUIT command is used at the LNSTRBL level in the same way as it is described in the LTP level.
- **Disp_**: The DISP command displays call processing trouble entries in the upper buffer that is allocated to a LCD.
- **StopDisp**: The STOPDISP command discontinues the periodic updating of the call processing trouble displays that were initiated by the command DISP.
- **ListAlm_**: The LISTALM command displays a list of LCD that have call processing fault alarms, and the class of alarm that exists in each LCD.
- **CreatSet**: The CREATSET command posts a set of call processing trouble upper buffer entries.
- **Suppress**: The SUPPRESS command causes specified trouble types to be ignored by the buffering process and by alarm generation
- **Resume_**: The RESUME command discontinues the suppression of specified types of call processing troubles.
- **QSup**: The QSUP command lists the code number and description of the types of troubles which are currently suppressed.
- **ClrAlm_**: The CLRALM command clears the call processing alarms in a specified LCD and resets attempt and failure counters to zero.
- **ClrBuf_**: The CLRBUF command deletes part or all of the contents of the upper buffer that is allocated to a specified LCD.

7.2.4 ALT Menu Commands

Following are the valid commands at the ALT level for native MG9000 lines:

- **Quit**: The QUIT command causes the system to leave the current level and return to a higher level of the MAP.
- **Post_**: The POST command posts the scheduled ALT TESTID that is stored in memory (in Table ALTSCHED)
- **ALTInfo**: The ALTINFO command checks test data stored in memory (Table ALTSCHED)
- **SDiag**: The SDIAG command accesses the SDIAG sublevel of ALT. If a TESTID is not entered as a parameter, a new TESTID must be defined with the DEFSCHD or DEFMAN command.
- **LIT**: The LIT command accesses the LIT sublevel of ALT. If a TESTID is not entered as a parameter, a new TESTID must be defined with the DEFSCHD or DEFMAN command.
- **CktTst**: The CKTTST command accesses the CKTTST sublevel of ALT. If a TESTID is not entered as a parameter, a new TESTID must be defined with the DEFSCHD or DEFMAN command.

The following ALT commands are not supported for native MG9000 lines:

- **DIAG**
- **BAL**
- **LCDCUT**

All MG9000 linecard types are support by ALT in the SN06.2 release.

7.2.4.1 ALT Sublevel Commands

Following are the valid commands at the ALT sub-levels for native MG9000 lines:

- **Quit**: The QUIT command causes the system to leave the current level and return to a higher level of the MAP.
- **Post_** : The POST command posts the scheduled ALT TESTID that is stored in memory and corresponds to the current sublevel.
- **LITInfo**: The LITINFO command displays the system default values for the LIT parameters. Note: This command only applies to the ALTLIT menu level.
- **Start**: The START command sets the posted scheduled ALT test in a state such that it is ready to run at the next scheduled time.
- **Stop**: The STOP command stops a test and changes the status of the TESTID.
- **Remove**: The REMOVE command removes the data associated with the posted TESTID from memory (table ALTSCHED). If the TESTID is for a scheduled test, the system prompts for a YES or NO confirmation.

- **Define_**: The DEFINE command defines test data for the specified TESTID.
- **Submit**: The SUBMIT command submits the defined test data for the posted TESTID into memory (table ALTSCHED).
- **DefMAN**: The DEFMAN command is used to assign a TESTID to the test that corresponds to the current ALT sublevel. For example, the DEFMAN command entered at the LIT level of MAP device number 7, will be assigned a TESTID of MANUAL07.
- **DefSCHD_**: The DEFSCHD command is used to assign a TESTID to the scheduled test that corresponds to the current ALT sublevel.
- **Status_**: The STATUS command checks the status of the posted TESTID.
- **OVRride_**: The OVERRIDE command overrides a scheduled test so that testing will not start until a specified day and time has passed.

7.2.5 ShowerQ

Failure of some conditions, such as line card not in place, test register not functioning, and message signaling not successful, causes the MG9000 line to be registered in the shower queue (a CS2000 originated diagnostic schedule) and released for a second call attempt. If any of the tests fail a second time, the MG9000 line is subjected to diagnostic tests for fault identification. Shower queue results are reported to the log system.

All MG9000 linecards are supported by the ShowerQ in the SN06.2 release.

For more information on the shower queue process, please refer to the DMS-100 Family Lines Maintenance Guide.

7.2.6 Subscriber Premise Tests

The silent switchman test (SSMAN), station ringer test, and the dialable short circuit test are usually conducted on subscriber premises by installation or repair personnel.

The **SSMAN test** checks the subscriber loop for facility faults. The test circuit is accessed by dialing a service code or a seven digit number. After a confirmation tone is returned, the MG9000 line is disconnected from office battery and ground for a defined interval as datafilled in table OFCENG as SILENT_SWITCHMAN_TIMEOUT, allowing facility faults to be checked.

The **station ringer test** is used to verify that a subscriber's station set is functioning correctly. The station ringer test is initiated by dialing a customer defined access code. When the station ringer test is initiated, it allows the user to verify the following set functions:

POTS, Coin or Groundstart

- DP or DTMF Digits
- Flash Key or Flash Hook
- RLS Key or Onhook
- Talk Key or Offhook
- Set Ringer

PPhone

- Meridian Set Function Keys
- Meridian Set Lamps
- Meridian Set Display

The circuit test part of Station Ringer test for KSET lines is not supported in this release. The result for circuit test are shown by LED displays 1, 2 and 8 turning on. The number of messages is not displayed also. The test can be exited during circuit test by pressing the "Hold" key.

The **dialable short circuit test** involves placing a short circuit to the loop of the MG9000 line when a code is dialed to access the short circuit. The short circuit persists on the line under test for a period of time as established by the operating company via OFCENG office parameter CABLE_SHORT_TIMEOUT, or for the default period of 3 min. When the short circuit ends its established duration, the subscriber's line is returned to regular service.

For more information on the sequence of tasks for these type of tests, please refer to the NTP 297-1001-594, DMS-100 Family Lines Maintenance Guide. This document contains additional details on the subscriber premise tests and translations required to support these tests.

7.2.6.1 Note on Digit Maps

In H.248, gateways can use digit maps when collecting digits. When the collected digits match an applied digit map, the gateway will report the collected digits to the call server. The subscriber premise tests are typically provisioned with a three digit access code in translations.

When the user dials a three digit access code to initiate a subscriber premise test, it may not match the standard digits maps used with MG9000 lines. The

MG9000 has a 10 second timeout and will report collected digits to the CS2000 even if the dialed digits do not match an applied digit map.

When a craftsperson is initiating the subscriber premise tests on MG9000 lines, this may cause a 10 second delay between the dialing of the access code and the application of the confirmation tone to indicate that the test is starting. For KSET lines, there is no delay between the dialing of the access code and the application of the confirmation tone since KSET lines do not use digit maps.

7.2.7 Line Diagnostics

The CS2000 line diagnostics are intended to verify that a line is capable of providing service. The CS2000 line diagnostics are integrated with the embedded MG9000 circuit diagnostics. When an MG9000 circuit is diagnosed from the CS2000, the embedded MG9000 line diagnostics are executed and additional network tests are performed to ensure that the circuit is providing service. The following shows the tests the CS2000 line diagnostics will perform for MG9000 lines, and compares the MG9000 line diagnostics to the diagnostics supported for HOST lines and GR-303 lines.

CS2000 Line Diagnostics

Test	HOST	TR-303	LGRP
Provisioning Data	Note 1	x	x
Missing Card Test	x	x	Note 2
Trans Hybrid Loss	x	x	x

Coin Return	x	x	x

CS2000 Line Diagnostics

Test	HOST	TR-303	LGRP
PPhone Opcode Signalling	x	x	x
PPhone Provisioning Audit	x	x	x
Battery Feed	x	Note 5	Note 5
Cutoff Relay	x	Note 5	Note 5
Test Access Relay	x	Note 5	Note 5
Facility Check	x	Note 5	Note 5

X - denotes tests that are supported

1. GR-303 digital loop carriers and H.248 gateways have provisioning that must match the provisioning in the CS2000 to provide service. HOST lines do not have remote provisioning data and the provisioning data test is not required.
2. The MG9000 does not support a missing card tests. MG9000 lines can affect the CS2000 line state. If the linecard is missing or disabled, the CS2000 line state will be set to SB to indicate that the line is in a trouble condition.
3. The CS2000 does to support analog pad control for GR-303 lines; therefore, the analog padding test is not supported for GR-303 lines.
4. The MG9000 has echo cancellers for all line types; therefore, a echo return test is not performed at this time.
5. GR-303 and MG9000 line diagnostics do not include facility and linecard relay tests.

7.3 Configuration Requirements

7.3.1 Hardware Requirements

7.3.1.1 CS2000 Hardware

The following hardware is required to provide the CS2000 line test support:

7.3.1.1.1 Trunk Modules

The CS2000 supports an array of test heads and supporting hardware. These circuit packs are contained in trunk modules. Examples of the supported trunk modules are the TM8, ISM, MTM and RMM.

7.3.1.1.2 Test Circuits

The following CS2000 test heads and supporting hardware are required to support MG9000 line testing:

- NT4X45AA EDTU (or NT1x90/NT2x96 TTT, NT2x47/NT2x56 TTU, NT4x23 DTU)
- NT2X10/NT2X11 MTU
- NT2X90AD MONTALK Circuit
- NT5X30AA 101 Communication Test Line (HSET)
- NT1X54AA Jack Ended Trunk (JACK)
- NT2X90AD INC/OC Test Trunk (Analog Test Trunk Interface)

The CS2000 also requires the following supporting equipment for MLT test trunks:

- NT2X57 SD Card

Additional details on the circuit packs listed above are provided in TAM-1001-018 DMS-100 Family Quick Reference Guide. This is available through Helmsman.

7.3.1.1.3 MTA Matrix

The CS2000 supports two types of test heads: transmission test heads and metallic test heads. The transmission test heads connect to the line under test through the bearer network. The metallic test heads connect to the line under test through a metallic test access matrix.

The metallic test access matrix is a matrix with the metallic test heads connected to the horizontal leads on the matrix and the line concentrating devices connected to the vertical leads on the matrix. This matrix allows any test head to be cross connected to any line, thus allowing the test heads to be shared across all line access devices.

The CS2000 supports the following cards for implementing the MTA matrix:

- NT3X09BA 8x8 Matrix Card

The trunk modules also contain the MTA matrix cards.

7.3.1.1.4 Horizontal Connectivity

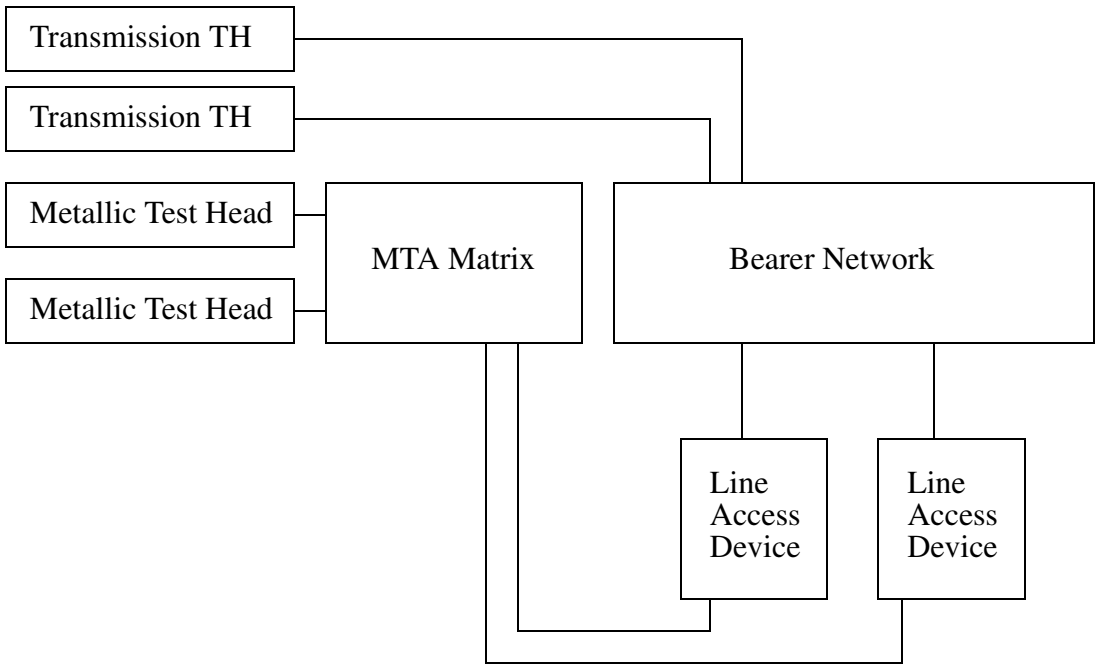
As noted above, the metallic test heads must be wired to the horizontal leads on the MTA matrix.

7.3.1.1.5 Vertical Connectivity

As notes above, the test access ports on the line concentrating devices must be wired to the vertical leads on the MTA matrix.

7.3.1.1.6 Test Configuration Diagram

The following diagrams illustrate the hardware configuration required to support CS2000 based line testing for MG9000 lines.



The above diagram is a logical view of the test equipment.

- The transmission test heads have access to the bearer network. These test heads are connected to the line access devices through the bearer network.
- The metallic test heads are connected to the horizontal leads on the MTA matrix. The line access devices are connected to the vertical leads on the MTA matrix. In this configuration, any metallic test head can be cross connected to any line on any line access device.

The following figure gives a more detailed view of the physical implementation.

7.3.1.1.7 References

NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides a more complete description of the test equipment and the provisioning of the test equipment.

NTP 297-8991-805 DMS-100 Family Hardware Description Manual provides additional details on the hardware described above.

NTP 50041.08 DMS-100/200 Hardware Planning Guide

7.3.1.2 MG9000 Hardware

The MG9000 requires the following hardware to support the SN06.2 line test content provided by activities A00001888 and A00001890:

- MTA-TRC pack per node per frame
- SIC card per shelf.

7.3.1.3 3rd Party Gateways

The CS2000 line test functionality will support any 3rd party gateway that supports the H.248 extension added by activities A00001890 and A00001888. However, this document does not provide specific information on the hardware requirements for 3rd party gateways.

7.3.2 Software Requirements

There are 5 types of equipment/connectivity datafilled required to support the CS2000 line test functionality provided by activities A00001888 and A00001890.

- First the trunk modules that contain the CS2000 test equipment are provisioned.
- Second, the CS2000 test heads and supporting hardware are provisioned.
- Third, the MTA (Metallic Test Access) matrix for the CS2000 is provisioned.
- Fourth, the metallic test head connectivity to the horizontals on the MTA matrix are provisioned.
- Fifth, the line concentrating device connectivity to the verticals on the MTA matrix are provisioned.

Note that additional datafill is required for individual line test applications. For example, the subscriber premise tests are supported for MG9000 lines in the SN06.2 release (DSCKT, SSMAN, Station Ringer). The subscriber premise tests require translations in the CS2000 to function correctly.

This document does not provide details on the provisioning and translations required for the individual line test applications. The provisioning and translations for individual line test applications are already documented in NTP 297-1001-594 DMS-100 Family Line Maintenance Guide, and the existing provisioning and translations methods apply to LGRP lines on the CS2000.

7.3.2.1 Trunk Module Provisioning

The trunk modules are provisioned in table TMINV and RMMINV. The CS2000 uses the same trunk module provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provide details on trunk module provisioning for the CS2000.

7.3.2.2 Test Head and Supporting Hardware Provisioning

The test heads and supporting hardware are provisioned in tables TRKGRP and TRKMEM. The CS2000 uses the same test head provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on test head provisioning for the CS2000.

7.3.2.3 MTA Matrix Provisioning

The MTA matrix is provisioned in table MTAMDRVE. The CS2000 uses the same MTA matrix provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on MTA matrix provisioning for the CS2000.

7.3.2.4 Horizontal Connectivity Provisioning

The horizontal connectivity is provisioned in table MTAHORIZ. The CS2000 uses the same horizontal connectivity provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on the horizontal connectivity provisioning for the CS2000.

7.3.2.5 Vertical Connectivity Provisioning

Vertical connectivity provisioning for LGRPs differs from the vertical connectivity provisioning for existing DMS-100 peripherals. Additional details on LGRP vertical connectivity are provided below.

Table LGRPINV and MTAVERT are used to provision the metallic connections from MG9000 shelves to verticals on the MTA matrix. The following figure shows examples of provisioning these tables for MG9000 to MTA matrix connectivity.

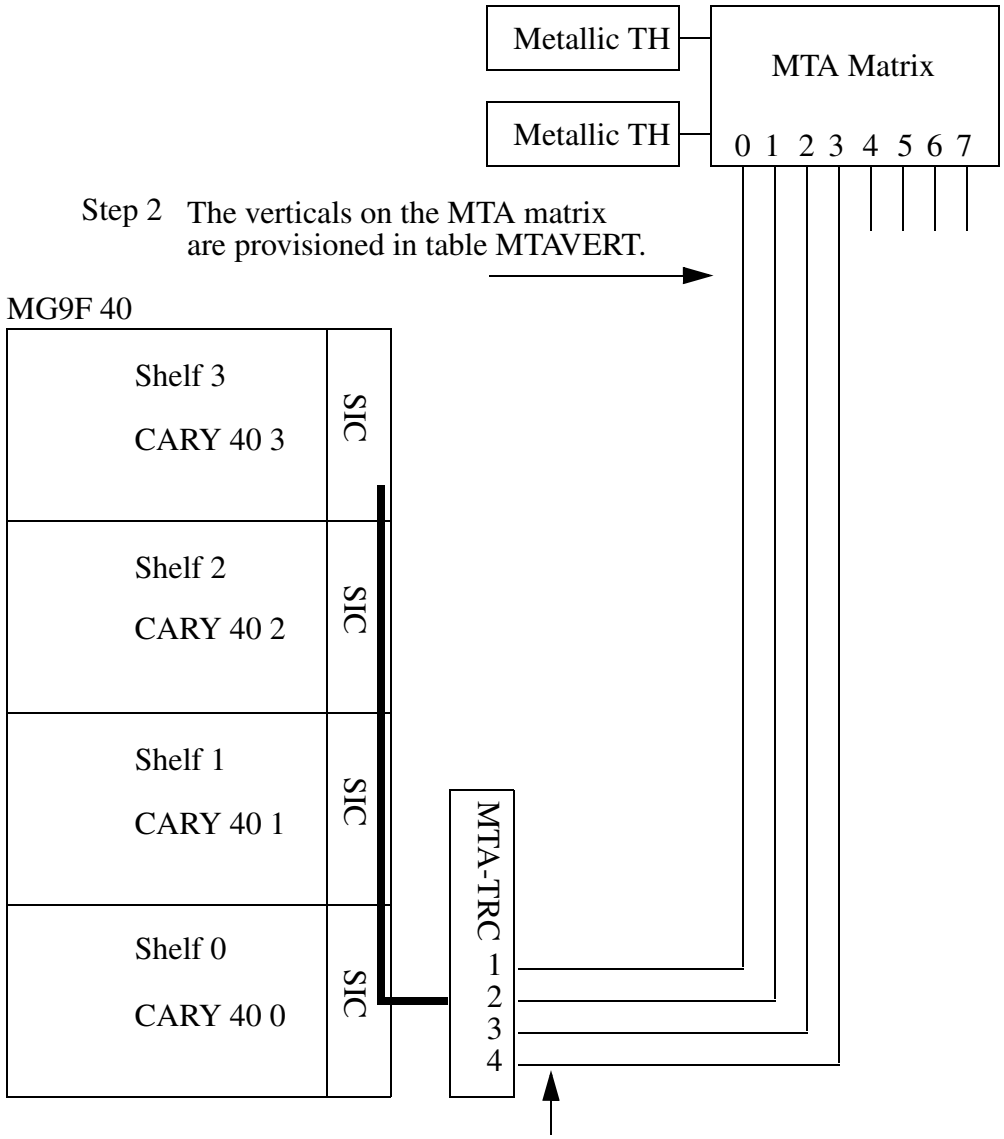

Table LGRPINV

```
CARY 40 0  GWC 0  S  MTSTAPT  CARY  (0  1) $
CARY 40 1  GWC 0  S  MTSTAPT  CARY  (1  2) $
CARY 40 2  GWC 0  S  MTSTAPT  CARY  (2  3) $
CARY 40 3  GWC 0  S  MTSTAPT  CARY  (3  4) $
```

Table MTAVERT

```
0  G  (O  CARY  40  0) $
1  G  (O  CARY  40  1) $
2  G  (O  CARY  40  2) $
3  G  (O  CARY  40  3) $
```

Vertical
Metallic Test Access Point

Provisioning Rules for MG9000 Verticals

1. The metallic test access connections for the MG9000s are provisioned in table LGRPINV first, and then in table MTAVERT.
2. Table LGRPINV allows up to 8 metallic test access points (with verticals) to be provisioned per LGRP. This is for future flexibility to increase the number of simultaneous tests per MG9000. **At this time, the user should only provision a single metallic test access point per LGRP in table LGRPINV (each LGRP being a single MG9000 shelf**).
3. LGRPs are assigned to verticals in table MTAVERT. Before an LGRP is assigned to a vertical in table MTAVERT, the tuple for the LGRP in table LGRPINV must have a metallic test access point associated to the vertical.

As noted in the rules, only a one metallic test access point and vertical should be assigned to an LGRP in the SN06.2 release. A single physical MG9000 can support up to 16 shelves; however, a single physical MG9000 can only support 8 metallic test access points. When an MG9000 grows beyond 8 shelves, verticals must be shared across multiple shelves. The provisioning recommendations for SN06.2 are as follows:

a. For MG9000 nodes that have 8 or less shelves, each shelf on the MG9000 should be assigned to a unique metallic test access point and vertical.

b. As an MG9000 grows beyond 8 shelves, the metallic test access points and verticals used on shelves 0-7 should be reused on shelves 8-15 in sequential fashion.

c. If wideband testing is required on the MG9000 to support DSL lines, then one (or more) of the metallic test access points should be reserved for the wideband test head.

Example 1 : All 8 metallic test access points assigned to verticals.

The following shows example provisioning for table LGRPINV and MTAVERT for a 16 shelf MG9000. In the example given, the MG9000 node is in the CARY site and it occupies frame 40 41 42 and 43. This example shows all 8 metallic test access points wired to verticals on the MTA matrix.

TABLE: LGRPINV

```

In this configuration, a single vertical will be shared across as many as 1024 lines.

Example 2 : Two metallic test access points reserved for wideband testing

The following shows example provisioning for table LGRPINV and MTAVERT for a 16 shelf MG9000. In the example given, the MG9000 node is in the CARY site and it occupies frame 40 41 42 and 43. This example shows only 6 metallic test access points wired to verticals on the MTA matrix.

```

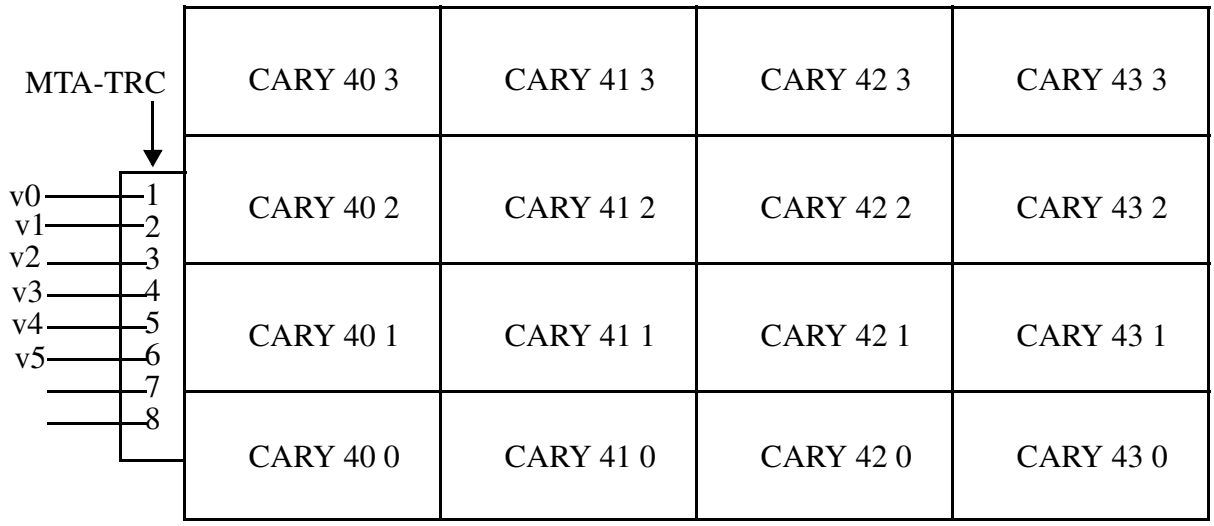
In this example, a single vertical can be shared by up to 1536 lines.



7.3.2.6 Provisioning Example

7.3.2.6.1 Trunk Module Provisioning

First, the trunk modules must be provisioned. This includes shelves such as the TM8, MTMs and RMMs. In the example given, RMMs are not shown. However, RMMs can be used in the remote sites for MG9000 line testing. The sample datafill given shows a single MTM and TM8 shelf for this CS2000.

Note: all tables are shown in packeted format.

TABLE: TMINV

7.3.2.6.2 Test Head and Supporting Hardware Provisioning

The test heads and supporting hardware are provisioned next. These circuits are provisioned through tables TRKGRP and TRKMEM. The following test heads and interface circuits are required to support MG9000 line testing:

- NT4X45AA EDTU (or NT1x90/NT2x96 TTT, NT2x47/NT2x56 TTU, NT4x23 DTU)
- NT2X10/NT2X11 MTU
- NT2X90AD MONTALK Circuit
- NT5X30AA 101 Communication Test Line (HSET)
- NT1X54AA Jack Ended Trunk (JACK)
- NT2X90AD INC/OC Test Trunk (Analog Test Trunk Interface)

7.3.2.6.3 MTA Matrix Provisioning

After the test heads and supporting circuits are provisioned, the MTA (Metallic Test Access) matrix is provisioned for the CS2000. The MTA matrix is provisioned through table MTAMDRVE. This example shows an MTA matrix with a single MTA matrix card. The CS2000 supports an MTA matrix that is

significantly larger. The MTA matrix for a CS2000 is created by linking together multiple MTA cards in both the vertical and horizontal directions.

TABLE: MTAMDRVE

```
MTAMEM VERT HORIZ TMTYPE TMNO TMCKTNO MTACARD
-------------------------------------------
0 0 0 MTM 0 6 3X09BA
```

7.3.2.6.4 Horizontal Connectivity Provisioning

After provisioning the MTA matrix for the office, the test heads are assigned to horizontals on the MTA matrix. The example shows a pair of MTU (Metallic Test Units) connected to the first two horizontals on the MTA matrix along with a single analog test trunk for supporting external test systems such as: Access Care, 4TEL and Loop Care.

TABLE: MTAHORIZ

```
HORIZ HORIZGRP HORIZAGT MTAGRP
-----------------------------
0 0 L MTU 0 Y (0 0) $
1 0 L MTU 1 N (0 1) $
3 0 T LTDESK 0 (0 3) $
```

7.3.2.6.5 Vertical Connectivity Provisioning

After provisioning the test head connectivity to the horizontals on the MTA matrix, the line concentrating devices are assigned to verticals on the MTA matrix. For LGRPs, verticals are assigned to specific MG9000 metallic test access points and shelves through tables LGRPINV and MTAVERT.

The following example shows two separate LGRPs. For CARY 77 1, the entry in LGRPINV associates vertical 0 with metallic test access point 1 on the gateway. For CARY 40 2, the entry in LGRPINV associates vertical 1 with metallic test access point 1 on the gateway.

7.4 Line States

This section provide information on the MG9000 lines states. This includes the interfaces for checking the line states and what they represent.

7.4.1 CS2000 Line States

The following is a list of CS2000 line states and their meaning. This is the complete list of CS2000 line states. Not all states are currently used for MG9000 lines. The states that are not used for MG9000 lines are in italic.

- CPB (Call processing busy)
  - — The line is in use by a subscriber (call processing is taking place).
- CPD (Call processing deload)
  - — The line is in use by a subscriber, and a maintenance request to place the line in the deloaded (DEL) state is pending. The state changes momentarily to DEL when call processing ends, and then to state MB.
- *CUT (Cutoff)*
  - — *The cutoff relay in the line circuit is operated, disconnecting the subscriber loop from the line circuit.*
  - — *Not used for MG9000 lines.*
- DEL (Deloaded)
  - — The line is removed from availability for call processing by a maintenance order, in preparation for testing activity. This is a temporary state after the state CPD and before the state MB.
- *DMB (Applicable to ISDN lines. See Integrated Services Digital Network)*
  - — *Basic Rate Interface Maintenance Guide, 297-2401-501.*
  - — *Not used for MG9000 lines.*
- *HAZ (Hazard)*
  - — *A line hazard condition (foreign line voltage, leakage resistance) has been detected; the line's cutoff relay is operated.*
  - — *Not used for MG9000 lines.*
- IDL (Idle)

— The line is in service and available to process calls.

- INB (Installation busy)

  — The line is not available for call processing for one or more of the following reasons:

  – some required data has not been assigned

  – a data change has been made

  – a LTP operator has entered an instruction

  During this state tests can be conducted.

- LMB (Line module busy)

  — Call processing cannot take place because the LGRP that represent the MG9000 shelf for the posted line is out of service.

- LO (Lock-out)

  — The line has been removed from service by the CS2000, preventing call processing. Manual action is required to change the state.

- MB (Maintenance busy)

  — The line has been removed from service by maintenance personnel or by the CS2000. Call processing cannot take place.

- NEQ (Not equipped)

  — The LEN has not been datafilled. Call processing cannot take place.

- PLO (PSPD lock-out)

  — This is a particular variety of the state LO. The line has been removed from service by the CS2000 because of a PSPD condition. Call processing cannot take place until the condition no longer exists and the CS2000 restores the line state to IDL.

- SB

  — The line has been removed from service by the CS2000. There are a range of error conditions that can cause an MG9000 line to be set to the SB state in the CS2000. If the CS2000 can set the line to the SB state if it detects an error condition for the line. The CS2000 can also set the line to the SB state if it receive an indication from the GWC that the line is not capable of providing service. This could represent a data error in the GWC or MG9000, or it could represent a fault condition for the line at the MG9000 such as an overcurrent protection condition. For lines in the SB state, the craftsperson should check the state of the circuit at the MG9000 EM.

- *SZ*

  — *Future line state*

— *Not used for MG9000 lines.*

7.4.2 MG9000 Line States

The state of the MG9000 circuits are checked at the MG9000 EM. The MG9000 EM shows the status of the physical line circuit and it shows the status of the H.248 line termination.

7.4.2.1 Line Circuit

The state of the physical line circuit is checked by opening the line card at the MG9000 EM and then opening the port on the line card. The following state information is shown for the MG9000 physical line circuit.

- Administrative Status
  - — The administrative status shows the requested user state. The values can be locked and unlocked.
    - – Locked indicates that the circuit has been manually taken out of service.
    - – Unlocked indicates that the circuit has not been manually taken out of service.
- Operational Status
  - — The operational status shows the current service state. The values can be enabled, disabled.
    - – Enabled indicates that the circuit is in the working state.
    - – Disabled indicates that the circuit is not in the working state.
- Fault State
  - — This state indicates that the line maintenance subsystem on the MG9000 has determined that the selected circuit is in a fault condition and is not providing service. The CS2000 state will be set to SB.
- Protection State
  - — This state indicates that excess voltage/current was detected for the selected circuit. MG9000 line maintenance has placed the circuit in the protect state. Lines in this state will not provide subscriber service. When MG9000 lines are in the protection state, the CS2000 line state is set to SB.
- Babble State
  - — This state indicates that the line maintenance subsystem on the MG9000 has determined that the selected circuit is a babbler. The circuit is generating excessive circuit state indications. Line maintenance will disable babbling circuits to protect the MG9000.

Lines in this state will not provide subscriber service. When line maintenance takes the circuit to the disabled state, the CS2000 line state will be set to SB.

- Cut Off Relay
  - — This state indicates that the cut off relay has been operated for the selected circuit. The user will not have service when the cutoff relay is operated to disconnect the loop for the circuit.

7.4.2.2 H.248 Line Termination

The state of the H.248 line termination is shown at the Switched Lines Services Manager on the MG9000 EM. The H.248 line termination represent the logical call processing service for the subscriber circuit. The state of the H.248 line termination is tied to the CS2000 line state.

If the service is turned down on the CS2000, the CS2000 will set the H.248 line to the disabled state. When service is restored for a line at the CS2000, the CS2000 will set the H.248 line termination to the enabled state.

The H.248 line termination state is also dependent on the physical line circuit. If the physical line circuit is in the disabled state (not able to provide service), the gateway will move the H.248 line termination to disabled state. This will inturn set the CS2000 line state to the SB state.

The Switched Lines Services Manager shows the following state information for the H.248 line terminations:

- Operational Status
  - — The operational status shows the current service state of the H.248 line termination. The values can be enabled, disabled and test.
    - – Enabled indicates that the H.248 line termination is in the working state and providing service.
    - – Disabled indicates that the H.248 line termination is not in the working state and is not providing service.
    - – Test indicates that the line is currently under test.
- Termination Test Status
  - — For terminations that are under test, the termination test status provides additional information. The value can be Not Testing, Testing via Call Server, Testing via EM.
    - – Not Testing indicates that the line is not currently under test.
    - – Testing via Call Server indicates that the line is currently under test from the Call Server.

– Testing via EM indicates that the line is currently under test from the MG9000 Element Manger.

7.5 Line Options Support

The following line options affect the CS2000 line test subsystem are supported for MG9000 lines:

- No Double Connect (NDC)

  The No Double Connect (NDC) option prevents a line from being connected to a verification or test circuit when the line is off-hook.

- No Hazard Test (NHT)

  The No Hazard Test (NHT) option does not allow the user to test the line for a line hazard condition. Line hazard conditions are low resistance or high voltage on the subscriber loop.

- No Line Insulation Test (NLT)

  The No Line Insulation Test (NLT) option allows the automatic line insulation test to skip a line.

7.6 Diagnostic Users Guide

7.6.1 Diagnostic Results

The line diagnostic results are delivered through a combination of the following:

- Printing results at the MAP
- Generating the appropriate logs
- Setting or clearing alarm flags for the line

7.6.1.1 Line Log

The MG9000 line diagnostic uses the following existing logs:

The LINE100 log indicates a line diagnostic has passed.

```
RTP206BH ***+LINE100 MAR21 08:06:49 3600 PASS LN_DIAG
        CARY 05 0 02 21    DN 6195200000
        DIAGNOSTIC RESULT   Card Diagnostic OK
        ACTION REQUIRED  None
        CARD TYPE  RDTLSG
```

The LINE101 indicates that a line diagnostic has failed.

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test failed:  Single-party ringing
    ACTION REQUIRED    Replace card
    CARD TYPE   RDTLSG
```

7.6.1.2 Alarm Flags

Various errors and actions in the CS2000 can mark failure flags against an MG9000 line. These failure flags provide information to the craftsperson on lines that are in trouble and need corrective action. The alarm flags supported for MG9000 lines are listed below.

- D - Long diagnostic has failed
- S - Short diagnostic has failed
- N - Needs long diagnostic
- Q - Line is in the ShowerQ
- L - Line has failed loop signaling at the linecard
- l - Line has failed loop signalling at the terminal

7.6.2 Line State Supported for the Line Diagnostics

7.6.2.1 For LTP Diags

The LTP diagnostic is supported on MG9000 lines in the following state:

- INB
- DMB
- MB
- LO
- IDL
- HAZ

7.6.2.2 ALT SDIAG

ALT SDIAG will test lines in the following states:

- INB
- MB
- IDL

7.6.2.3 ShowerQ

The ShowerQ tests lines in the following states:

- INB
- MB
- SB
- IDL
- LO
- DMB
- CUT
- PLO
- HAZ

7.6.3 Diagnostic Results

This section shows the most common diagnostic result indications and the actions the user should take for each result.

7.6.3.1 Diagnostic Passed

Display / Log

```
RTP206BH ***+LINE100 MAR21 08:06:49 3600 PASS LN_DIAG
        CARY 05 0 02 21    DN 6195200000
        DIAGNOSTIC RESULT   Card Diagnostic OK
        ACTION REQUIRED  None
        CARD TYPE  RDTLSG
```

Description

- The line tested is functioning correctly.

Alarm

- When a circuit diagnostic passes for a given line, all diagnostic failure flags for the line will be cleared.

Users Action

- No user action is required.

7.6.3.2 CS2000 Software Errors

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
CARY 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT Call server software error
ACTION REQUIRED Check Logs
CARD TYPE RDTEBS

Description

- A CS2000 software error has occurred.

Alarm

- The line failure flag is not affected.

Users Action

- Capture the CS2000 SWERR log and try the test again.

7.6.3.3 GWC Processing Errors

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
CARY 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT GWC processing error
ACTION REQUIRED Chk GWC logs
CARD TYPE RDTLSG

Description

- A gateway controller software error has occurred.

Alarm

- The line failure flag is not affected.

Users Action

- Capture the GWC logs and try the test again.

7.6.3.4 GWC Provisioning Faults Detected

7.6.3.4.1 Missing Node Data

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
CARY 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT Node data missing in GWC
ACTION REQUIRED Chk GWC data
CARD TYPE RDTLSG

Description

- In H.248, a node is represented by a termination called the root termination. The Gateway Controllers can support many MG9000 shelves. Each MG9000 shelf is provisioned in the GWC and represented as a root termination. This logical node is also referred to as the VMG (Virtual Media Gateway) in the MG9000 documentation. This diagnostic result indicates that there is a provisioning problem in the GWC. The GWC is missing the node provisioning data for the MG9000 shelf. This will prevent the entire MG9000 shelf from providing service.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- Check the node provisioning data for the GWC.

7.6.3.4.2 Missing Line Data

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Line data missing in GWC
    ACTION REQUIRED   Chk GWC data
    CARD TYPE   RDTLSG
```

Description

- The line termination for the line under test does not exist in the GWC. In H.248, each line is represented by a line termination. For MG9000 lines to provide service, the line termination must be provisioned in the GWC and it must be provisioned at the MG9000. This diagnostic failure indicates that the provisioning data for the line under test is missing in the GWC. The line will not provide service with this error condition.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- Check the line provisioning data in the GWC.

7.6.3.5 Node State Faults Detected in the GWC

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21                DN   6195200000
    DIAGNOSTIC RESULT   Gateway is out of service in GWC
    ACTION REQUIRED   Chk GW state
    CARD TYPE   RDTLSG
```

Description.

- A Gateway Controller can support many MG9000 shelves. Each MG9000 shelf is represented as a unique node in the Gateway Controller. This node is referred to as the root termination in H.248, and it also referred to at the VMG in the MG9000 documentation. The fault indicates that the node that represents the MG9000 shelf state is Out of Service in the Gateway Controller. When this occurs, the lines should be transitioned to the LMB state in the CS2000. If the line is not in the LMB state, this indicates that a node state mismatch exists between the C2000 and the Gateway Controller.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The user should check the line state in the CS2000. If the line state is not LMB and this diagnostic error persists, the user should attempt to correct

the MG9000 shelf state mismatch between the CS2000 and the Gateway Controller.

7.6.3.6 Line Termination is Out of Service in the GWC

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
CARY 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT Line out of service in GWC
ACTION REQUIRED Chk ln state
CARD TYPE RDTLSG

Description

- The H.248 line termination for the line under test is in an out of service state in the GWC.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The user should check the state of the line circuit at the MG9000 element manager to ensure that the line circuit is in the enabled state.
- If the line circuit is in the enabled stated at the MG9000 EM, the user should BSY and RTS the line to attempt to bring the line termination back to a working state. After the BSY and RTS, repeat the diagnostic. If the problem persists, contact the next level of support.

7.6.3.7 Gateway Controller to Gateway Messaging Error

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
CARY 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT No response from gateway
ACTION REQUIRED Try again
CARD TYPE RDTLSG

Description

- This indicates that the Gateway Controller timed out waiting on a response from a test request sent to the gateway.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The users should try the diagnostic again. If this problem persists, it indicates a messaging problem between the Gateway Controller and the Gateway that could affect call processing.

7.6.3.8 Gateway Processing Error

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Gateway processing error
    ACTION REQUIRED   Chk GW logs
    CARD TYPE   RDTLSG
```

Description

- This indicates that the gateway failed to process a line test request.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The users should check the MG9000 logs for SWERRs and try the test again. If this problem persists, contact the next level of support.

7.6.3.9 Gateway Test Resources Unavailable

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test resources unavailable at gateway
    ACTION REQUIRED   Chk Gateway
    CARD TYPE   RDTLSG
```

Description

- This indicates that the MG9000 line test resources are out of service.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The user should check the state of the line test hardware at the gateway. For the MG9000, the users should check the state of the MTA-TRC pack

and the SIC cards. Those cards provide the line test functions within the MG9000.

7.6.3.10 Gateway Test Resource Busy

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test resources busy at gateway
    ACTION REQUIRED   Try Again
    CARD TYPE   RDTLSG
```

Description

- This indicates that the MG9000 line test resources are currently in use.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- This does not indicate any type of equipment fault. The line test resources in the gateway are all currently in use. The user should attempt the test again.

7.6.3.11 Line Provisioning Mismatch in the Gateway

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Line data mismatch in gateway
    ACTION REQUIRED   Chk GW data
    CARD TYPE   RDTLSG
```

Description

- The H.248 line terminations in the MG9000 can be provisioned as POTS, coin and PPhone services. This error indicates that the diagnostic detected a mismatch between the line termination provisioning data in the MG9000 and the provisioning data in table LNINV.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.

- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The users should correct the line data mismatch at the MG9000.

7.6.3.12 Line Provisioning Missing in the Gateway

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Line data missing in gateway
    ACTION REQUIRED   Chk GW data
    CARD TYPE   RDTLSG
```

Description

This Indicates that there is a line data missing in the gateway and the user should check the provisioning data in the gateway.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.

- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The users should check the line provisioning data in the gateway.

7.6.3.13 Line Card Diagnostic Failures

7.6.3.13.1 Offhook Detection Failure

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test failed:  Off-hook
    ACTION REQUIRED    Replace card
    CARD TYPE   RDTLSG
```

Description

- Indicates that the linecard does not detect and report subscriber offhook condition correctly.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The line circuit should be replaced or the subscriber should be moved to another circuit.

7.6.3.13.2 Onhook Detection Failure

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test failed:  On-hook
    ACTION REQUIRED    Replace card
    CARD TYPE   RDTLSG
```

Description

- Indicates that the linecard does not detect and report subscriber onhook condition correctly.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The line circuit should be replaced or the subscriber should be moved to another circuit.

7.6.3.13.3 Single Party Ringing Failure

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test failed:  Single-party ringing
    ACTION REQUIRED    Replace card
    CARD TYPE   RDTLSG
```

Description

- Indicates that the linecard does generate the correct ringing voltage and frequency.

Alarm

- The line failure flag for the line is set D to indicated that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The line circuit should be replaced or the subscriber should be moved to another circuit.

7.6.3.13.4 Tip Ring Reversal Failure

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test failed:  Reverse battery
    ACTION REQUIRED    Replace card
    CARD TYPE   RDTCON
```

Description

- Indicates that the linecard does not provide tip ring reversal correctly. Note: tip/ring reversal signaling is used by coin lines only.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The line circuit should be replaced or the subscriber should be moved to another circuit.

7.6.3.13.5 Coin Collect or Coin Return Failure

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test failed:  Coin collect/return
    ACTION REQUIRED    Replace card
    CARD TYPE   RDTCON
```

Description

- Indicates that the linecard does not generate coin collect or coin return voltages correctly.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The line circuit should be replaced or the subscriber should be moved to another circuit.

7.6.3.13.6 Transhybrid Loss Failure

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:40:48 6900 FAIL LN_DIAG
     CARY 05 0 02 21    DN 2145201001
     DIAGNOSTIC RESULT  -11.6-10.7  0.6  1.4 THL Test
     ACTION REQUIRED  Replace Card
     CARD TYPE  RDTLSG
```

Description

- The transhybrid loss test passes a series of tones through a linecard in both directions to verify that the linecard will encode and decode speech correctly for voice frequencies. This test also verifies the hybrid circuit in the linecard is not defective. The transhybrid loss tests uses the following frequencies: 304, 704, 1504 and 4305 Hz. The above display/log indicates that the transhybrid loss test has failed. The measured transhybrid loss at each test frequency is displayed in the diagnostic failure log.

- The transhybrid loss test will fail if too much loss or gain is detected when the tones are passed through the line under test. Different linecard have different transmission characteristics. The following shows the ranges that are considered a test pass for the MG9000 linecards.

POTS-32 and 8x8 DSL

	304 Hz	704 Hz	1504 Hz	3204 Hz
Minimum (Loaded)	Not Supported	Not Supported	Not Supported	Not Supported
Maximum (Loaded)	Not Supported	Not Supported	Not Supported	Not Supported
Minimum (Non-Loaded)	-5.0 dB	-4.5 dB	-4.5 dB	-5.0 dB
Maximum (Non-Loaded)	1.0 dB	1.5 dB	1.5 dB	1.0 dB

SAA-12

	304 Hz	704 Hz	1504 Hz	3204 Hz
Minimum (Loaded)	Not Supported	Not Supported	Not Supported	Not Supported
Maximum (Loaded)	Not Supported	Not Supported	Not Supported	Not Supported
Minimum (Non-Loaded)	-8.0 dB	-7.5 dB	-7.0 dB	-7.5 dB
Maximum (Non-Loaded)	-2.0 dB	-1.5 dB	-1.0 dB	-1.5 dB

- The example log shows a linecard that does not pass low frequency tones correctly.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- If the diagnostic failure shows excess loss or gain in the linecard, the linecard should be replaced or the subscriber should be moved to another circuit.

User Notes

- The MG9000 does not supported loaded lines. If a MG9000 line is provisioned as a loaded line in table LNINV, the transhybrid loss test will fail. If this occurs, the user should correct the provisioning error in table LNINV.

7.6.3.13.7 Continuity Failure

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    CARY 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Bearer continuity not detected
    ACTION REQUIRED   Try Again
    CARD TYPE   RDTLSG
```

Description

- When the transhybrid loss test indicate -88.8 for all frequencies, then it may not be the linecard. It is more likely a bearer path problem.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The user should attempt the test again. If multiple lines show the same behavior, the user should troubleshoot the bearer network connection faults.

7.6.3.13.8 Weighted or Notched Noise Failure

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:50:13 6200 FAIL LN_DIAG
     CARY 00 0 00 14    DN 2145201001
     DIAGNOSTIC RESULT  Noise Level 44.1DB Notch Noise
```

ACTION REQUIRED Replace Card
CARD TYPE RDTLSG

RTPU07BC ***+LINE101 OCT26 09:53:55 7100 FAIL LN_DIAG
CARY 00 0 00 14 DN 2145201001
DIAGNOSTIC RESULT Noise Level 36.5DB Weight Noise
ACTION REQUIRED Replace Card
CARD TYPE RDTLSG

Description

- The weighted or notched noise tests have failed for the linecard. The noise limits for the MG9000 linecards are as follows:

  Notched Noise must be less than 42.0 dB

  Weighted Noise must be less than 30.0 dB

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The linecard should be replaced or the subscriber should be moved to another circuit.

7.6.3.13.9 Linecard Pads Failure

Display / Log

RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG
CARY 00 0 00 14 DN 2145201001
DIAGNOSTIC RESULT -.7 -2.2 -.4 -.4 Pad 1DB Test
ACTION REQUIRED Replace Card
CARD TYPE RDTLSG

Description

- Indicates that linecard pad test failed. The CS2000 supports per call gain control, referred to as padding. This linecard pad test will verify that the CS2000 can adjust the pads in an MG9000 linecard. The linecard pad test measures the gain applied by a linecard when a 1, 3, 5, and 7 dB pad are applied to the line under test. The linecard pad test verifies that the correct gain in applied at 304, 704, 1504 and 4305 Hz.
- The example log given shows a diagnostic that failed the 1dB pad test. The diagnostic will allow a 1 dB variance from the requested gain. In the example given, the 704 Hz frequency had a loss of -2.2 dB when a -1.0 dB pad was requested.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The linecard should be replaced or the subscriber should be moved to another circuit.

7.6.3.13.10 Linecard Messaging Failure

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG
     CARY 00 0 00 14    DN 2145201001
     DIAGNOSTIC RESULT  No Signalling to Card 5/10
     ACTION REQUIRED  Replace Card
     CARD TYPE  RDTEBS
```

Description

- PPhones, also referred to as EBS (Electronic Business Sets) lines, use out of band signaling. This signalling is called OPCODE signalling. The linecard diagnostic for an MG9000 PPhone line will verify the OPCODE signaling to the linecard and to the PPhone set itself. The given diagnostic

error log indicates that the OPCODE signaling test to the linecard has failed.

- The diagnostic failure log also contains the number of OPCODE message sent to the of message received back from the linecard.

Alarm

- The line failure flag for the line is set to L to indicate that the linecard diagnostic has failed the OPCODE signaling test to the linecard itself. Lines marked with the L failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a L failure flag:

  mapci nodisp;mtc;lns;ltp;post df lcard print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The user can use the CKTTST command to perform additional manual OPCODE signaling tests on the suspect line.
- The linecard should be replaced or the subscriber should be moved to another circuit.

7.6.3.13.11 Mainset Messaging Failure

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG
    CARY 00 0 00 14    DN 2145201001
    DIAGNOSTIC RESULT  No Signalling to Set 5/10
    ACTION REQUIRED  Chk Card&Set
    CARD TYPE  RDTEBS
```

Description

- PPhones, also referred to as EBS (Electronic Business Sets) lines, use out of band signaling instead of analog signaling. This signalling is called OPCODE signalling. The linecard diagnostic for an MG9000 PPhone line will verify the OPCODE signaling to the linecard and to the PPhone set itself. The given diagnostic error log indicates that the OPCODE signaling test to the set has failed.

- The diagnostic failure log also contains the number of OPCODE message sent to and received back from the set.

Alarm

- The line failure flag for the line is set to l to indicate that the linecard diagnostic has failed the OPCODE signaling test to the phone set. Lines marked with the l failure flag have been identified by the CS2000 as lines that are not providing service. For this failure flag, there is a working PPhone assigned to the line under test, and the CS2000 can not successfully exchange OPCODE messages with a set on the loop.
- The following command line will print a report containing all the lines served by the CS2000 with a l failure flag:

  mapci nodisp;mtc;lns;ltp;post df lset print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The user should verify that the set is connected to the loop.
- The user can use the CKTTST command to perform additional manual OPCODE signaling tests.
- If the CKTTST command verifies that the signaling to the mainset is not working and the set is connected to the loop, the user should replace the linecard. If the problem persists, the set should be replaced.
- The user can use the Station Ringer test to verify that the new set is fully functional from the subscriber premise.

7.6.3.13.12 Addon / Extension Provisioning Mismatch

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG

```
RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG
     CARY 00 0 00 14    DN 2145201001
     DIAGNOSTIC RESULT  Ext. Not Datafilled
     ACTION REQUIRED   Sustate
     CARD TYPE  RDTEBS

RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG
     CARY 00 0 00 14    DN 2145201001
     DIAGNOSTIC RESULT  Addon Not Datafilled
     ACTION REQUIRED   Sustate
     CARD TYPE  RDTEBS
```

Description

- The linecard diagnostic on an MG9000 PPhone line will audit the hardware on the loop and compare the hardware to the provisioning in the CS2000. The CS2000 can support up to 3 addons and 3 extensions per PPhone line. If the line diagnostic finds a mismatch between the hardware and the provisioning in the CS2000, the diagnostic will fail.
- The first example log shows a line that has an extension provisioned in the CS2000 but can not be detected on the loop.
- The second example log shows a line that has an addon provisioned in the CS2000 but can not be detected on the loop.
- The third example log shows a line where the diagnostic has detected an extension on the loop being testing, which is not provisioned in the CS2000.
- The fourth example log shows a line where the diagnostic has detected an addon on teh looop being testing, which is not provisioned in the CS2000.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The user should use the SUSTATE command to evaluate the CS2000 provisioning versus the hardware connected to the line. Once the mismatch is identified, the provisioning or hardware error should be corrected.

7.6.4 Multicircuit Linecards

7.6.4.1 Managing Faulty Circuits

When the diagnostics detect a fault that requires intervention by a craftsperson, the CS2000 will raise a failure flag against the line. See the list of supported diagnostic failure flags listed in section "3.6.1.2 Alarm Flags" on page 209.

The diagnostic failure flag can be cleared by replacing the linecard and reexecuting the diagnostic. When the diagnostic passes, the CS2000 will automatically clear the failure flag. For multicircuit linecards, the user may not replace the entire pack if only one a few circuit on the linecard are defective. In this scenario, the user will not be able to clear the diagnostic failure flag by reexecuting the diagnostic.

The following procedure should be used to manage individual defective circuits on a multicircuit linecard.

- If a subscriber is assigned to the defective circuit, move the subscriber off the defective circuit to a working circuit.
- Select the circuit at the gateway element manager.
- Lock the individual defective circuit. If a circuit is in the locked state, the CS2000 will not attempt to test the line. The CS2000 will also not be able to return the line to the IDL state if service is reassigned to the defective circuit by mistake.
- Enter the LGLTT (LGRP Line Test Tool). Type LGLTT at the CI prompt. Use the ClrFlag command to clear the failure flag against the line. See section "3.13.2 LGLTT" on page 241.
- Post the line at the LTP level of the map. Verify that the failure flag has been cleared for the circuit. Verify that the DIAG command is not allowed for the line.

Note: the user must track the defective circuits to ensure that they are not unlocked at the gateway element manager. The user must also manage the defective circuits in their inventory system to ensure that service is not assigned to the defective circuit again.

7.7 Routine Maintenance

The following NTPs provide extensive information on the recommended routing maintenance and trouble shooting procedures for CS2000 lines:

297-1001-594	DMS-100 Family Lines Maintenance Guide
297-8991-500	Maintenance and Operations Manual
297-1421-503	Subscriber Services Maintenance Guide

This section provides some specific recommendations for MG9000 lines.

7.7.1 Subscriber Service

ALT SDIAG should schedule and executed on MG9000 lines. ALT SDIAG will routinely run the line diagnostics to detect functional, state or provisioning errors that would prevent subscriber service.

7.7.2 Facility Tests

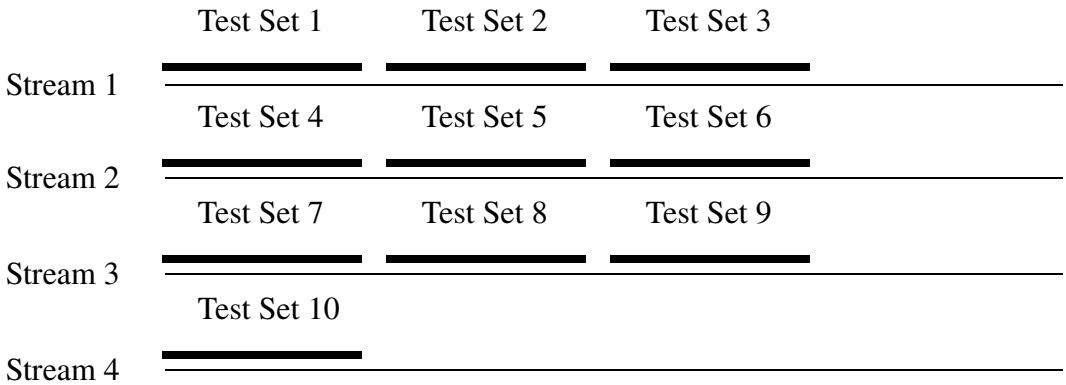
ALT LIT or a loop testing system should be scheduled to routinely test subscriber loops.

7.7.3 ALT Provisioning Recommendations for MG9000 Lines

7.7.3.0.1 MG90000 Tests Sets

ALT is designed to provide as much testing concurrency as possible. The user enters into ALT the range of LENs to test, which can span multiple nodes. ALT will run through the range of LENs to determine the “test sets” for the range of LENs.

ALT then creates a set of “test streams”. The test streams represent the resources that can be used to perform ALT tests. ALT will attempt to create as many streams a possible and divide the test sets up among the streams for maximum testing concurrency. This is illustrated in the diagram below. The diagram shows a configuration where ALT calculates 10 possible test sets for a range of LENs and divides the test sets over 4 test streams.



ALT SDIAG

Each MG9000 shelf is represented as an LGRP in the call server. As stated above, ALT test sets are calculated on a per node basis. A single MG9000 frame is represented in the call server as four distinct nodes. Therefore, a single MG9000 frame will be divided into 4 separate ALT test sets (one for each shelf).

ALT SDIAG, is dependent on the TTU resources in the MTM and the MTA-TRC resources in the MG9000. The TTU resources are required to perform transmission tests on the MG9000 linecards, and the MTA-TRC pack provides the supervision and ringing test resources. When ALT SDIAG is calculating the test streams for MG9000 lines, it will calculate the test streams based on the available TTUs. Specifically, ALT will create a single test stream for each TTU available for ALT SDIAG testing.

The combination of the way ALT test sets and ALT test streams are calculated can create a resource contention in the MG9000. A given MG9000 frame has a single MTA-TRC pack. Each MTA-TRC pack only provides two TRC circuits. Therefore, for a single MG9000 frame, only two MG9000 linecard diagnostics can be executed simultaneously.

The following example illustrates the issue:

- A craftsperson requests ALT to perform diagnostics for all the MG9000 lines in a single frame.
- Each MG9000 shelf is represented in the core as an LGRP. As stated above, each node in the CS2000 is assigned to a unique test set. Therefore, each MG9000 shelf will be assigned to a unique test set.

- As the linecard diagnostic only requires a TTU in the CS2000, ALT will attempt to create 4 test streams, one for each test set, and assign a TTU to each stream.
- ALT will then assign each test set, one for each shelf, to the 4 test streams.
- Once the test sets are assigned to test streams, ALT will begin processing the ALT test streams in parallel. This will create a scenario where ALT is attempting linecard diagnostic on all 4 shelves in a MG9000 frame concurrently. As the MG9000 can only support 2 simultaneous linecard diagnostics, there will be resources contention in the MG9000. Two of the ALT test streams will execute correctly, and two of the ALT test streams will fail due to unavailable resources at the MG9000.

To avoid the resource contention, the user should create tests on a per MG9000 shelf basis and ensure that ALT SDIAG is not scheduled on more than shelves shelf per frame concurrently.

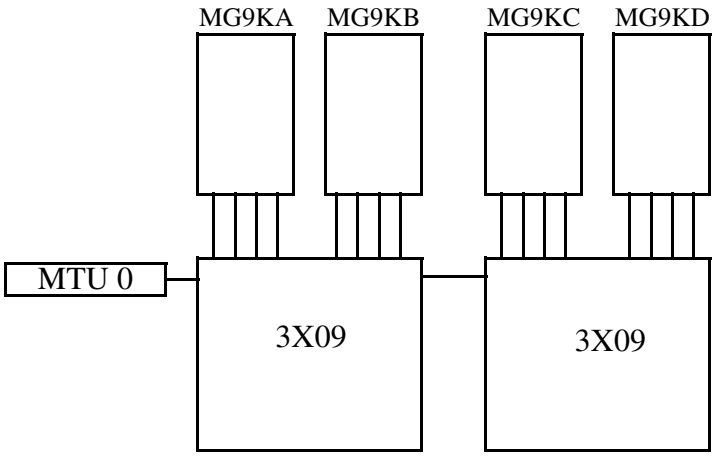
ALT LIT

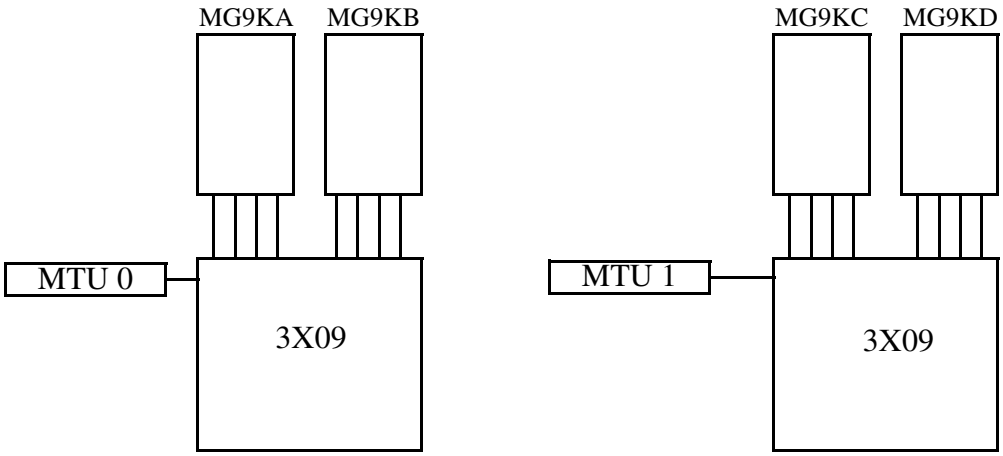
ALT LIT requires an MTU to test the subscriber's loop. ALT uses the "dedicated" MTUs in the switch. There are two test configuration options which are supported for MG9000 lines. If the customer uses the WTA (Wideband Test Access) panel, there will be a single dedicated MTU for a pair of 3X09s. If the customer wires the test equipment together through the MDF (Main Distribution Frame) a dedicated MTU can be assigned to each 3X09. These configurations are shown in the following diagrams.

As documented in the engineering rules, a MG9000 node should not span across multiple 3X09 circuit packs. Therefore, in either configuration shown, a given MG9000 can only use one possible dedicated MTU for performing ALT LIT tests.

When ALT LIT creates its test streams, it will create a test stream for each MTU in the switch that has the ALT option set to Y. As ALT LIT is assigning MG9000 test sets to the test streams, the engineering rules will ensure that the MG9000 test sets for a single MG9000 (one for each shelf) will go into the same test stream, because all the shelves for a given MG9000 must use the same MTU. Therefore, all the shelves in a MG9000 physical node will be tested in a serial fashion. This will ensure that there is no contention for MG9000 resources while ALT LIT is testing MG9000 lines.

Note: the option the customer chooses to deploy for the 3X09 configurations will be dependent on the maintenance window that is allowed for ALT LIT testing.





ALT CKTTST

ALT CKTTST performs messaging to the MG9000 to check the ability to loopback PPhone messages at the linecard or phone set. For the MG9000, each shelf is represented as a node in the core. Each MG9000 LGRP will be considered a single test set. There is no test equipment required to perform a

CKTTST, therefore, ALT can create a unique test stream for each test set up to the maximum number of ALT test streams allowed.

ALT CKTTST can run concurrently across all MG9000 shelves in the office

7.8 Trouble Shooting

The following NTPs provide extensive information on the recommended routing maintenance and trouble shooting procedures for CS2000 lines:

297-1001-594	DMS-100 Family Lines Maintenance Guide
297-8991-500	Maintenance and Operations Manual
297-1421-503	Subscriber Services Maintenance Guide

This section provides some specific recommendations for MG9000 lines.

7.8.1 No Dial Tone

- Determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- If the fault is not outside plant, post the line at the CS2000 and check the CS2000 line state.
- If the line is an manually busy state, stop trouble shooting.
- If the line is in the SB state, that can indicated that the CS2000 has taken the line to the SB state, or it could indicated that the Gateway has taken the line to the SB state.
  - — The user can attempt to BSY and RTS the line. If the line returns to the IDL state, verify that dial tone is restored.
  - — If the line remains SB, check the line at the MG9000 EM. Check the line circuit for faults. The line circuit must be in the enabled state before the CS2000 line state will return to IDL. If there is a circuit fault at the MG9000, resolve the MG9000 circuit fault. Once resolved and the line circuit is restored to the enabled state, verify that the line has returned to the IDL state in the CS2000. Verify that dial tone is restored.
- If the CS2000 line state is IDL and there is not dial tone, execute the DIAG command on the line. The DIAG command will verify the line provisioning date in the CS2000, GWC and the MG9000. Once the provisioning data is verified, the DIAG will request the MG9000 to execute the embedded circuit diagnostics. This will execute the following tests:

- — Offhook detection
- — Onhook detection
- — Ringing
- — Coin Collect / Coin Return / Reverse Battery (for coin lines)
- — For PPhone lines, OPCODE signaling is verified instead of analog signaling.

- If the line diagnostic fails, resolve the issue reported in the diagnostic.
- If the line diagnostic passes check for dial tone at T/R pair coming off the face place on the linecard. If dial tone does not exist and the line diagnostic passes for the line, escalate to the next level of support. The TALKLTA and ORIG commands can be used to remotely pull dial tone from the T/R of the linecard.

7.8.2 Poor Speech Quality

- Determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- Post the line at the CS2000 MAP position and execute the DIAG command. This will verify the transmission characteristics of the line.
- If the DIAG fails, move the subscriber to a different circuit.
- If the DIAG passes, the TONGEN, LOSS and NOISE commands can be used to perform manual transmission tests on the subscribers linecard and loop.
- If the problem can not be isolated, escalate to the next level of support.

7.8.3 Line Does Not Ring

- Determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- If the fault is not outside plant, post the line at the CS2000 and check the CS2000 line state.
- If the line is an manually busy state, stop trouble shooting.
- If the line is in the SB state, that can indicated that the CS2000 has taken the line to the SB state, or it could indicated that the Gateway has taken the line to the SB state.
  - — The user can attempt to BSY and RTS the line. If the line returns to the IDL state, verify that dial tone is restored.

— If the line remains SB, check the line at the MG9000 EM. Check the line circuit for faults. The line circuit must be in the enabled state before the CS2000 line state will return to IDL. If there is a circuit fault at the MG9000, resolve the MG9000 circuit fault. Once resolved and the line circuit is restore to the enabled state, verify that the line has returned to the IDL state in the CS2000. Verify that dial tone is restored.

- If the CS2000 line state is IDL terminating calls will not RING the line, execute the DIAG command on the line. The DIAG command will verify the line provisioning date in the CS2000, GWC and the MG9000. Once the provisioning data is verified, the DIAG will request the MG9000 to execute the embedded circuit diagnostics. This will execute the following tests:
  - — Offhook detection
  - — Onhook detection
  - — Ringing
  - — Coin Collect / Coin Return / Reverse Battery (for coin lines)
  - — For PPhone lines, OPCODE signaling is verified instead of analog signaling.
- If the line diagnostic fails, resolve the issue reported in the diagnostic.
- If the line diagnostic passes check for ringing voltage at T/R pair coming off the face place on the linecard. If ringing voltage does not exist and the line diagnostic passes for the line, escalate to the next level of support.

7.8.4 Call Not Completed Correctly

- Use TRAVER to verify that translations will correctly route the dialed digits for the line being tested.
- If the translations are verified to be good, determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- Post the line at the CS2000 MAPCI. Execute the DIAG command on the line. This will execute the following tests:
  - — Offhook detection
  - — Onhook detection
  - — Ringing
  - — Coin Collect / Coin Return / Reverse Battery (for coin lines)
  - — For PPhone lines, OPCODE signaling is verified instead of analog signaling.

— Transhybrid Loss

— Weighed and Notched Noise

— Padding

The diagnostic will verify the transmission characteristics of the linecard.

- If the line diagnostic fails, resolve the issue reported in the diagnostic.
- If the diagnostic passes, test the lines ability to collect and report digits to the CS2000. The TALKLTA, ORIG commands be used to simulate a test call. The TALKLTA, DGTTST commands can be used to capture and observe any digits actually collected for the line under test.
- If the diagnostic passes for the line under test, and manual trouble shooting can not isolate the problem, escalate to the next level of support.

7.8.5 PPhone Lines Not Functioning Correctly

- Determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- Post the line at the CS2000 MAPCI. Execute the DIAG command on the line. This will execute the following tests:

  — Offhook detection (analog lines)

  — Onhook detection (analog lines)

  — Ringing (analog lines)

  — Coin Collect / Coin Return / Reverse Battery (for coin lines)

  — OPCODE signaling (for PPhone lines)

  — Transhybrid Loss (for analog lines)

  — Weighed and Notched Noise (for analog lines)

  — Padding (for analog lines)

  The line diagnostic on a PPhone line will verify the provisioning in the CS2000 matches the set hardware, and it will verify the signaling between the CS2000, the linecard and the PPhone set.
- The Station Ringer test can be executed on site to verify the PPhone set itself.
- If the issue can not be isolated, escalate to the next level of support.

7.9 Logs

7.9.1 Existing Logs Applicable to CS2000 Line Test

NTP 297-1001-594 DMS-100 Family Lines Maintenance Guides, section 3 contains the line maintenance related logs for the CS2000.

7.9.2 Modified Logs

7.9.2.1 ALT SDIAG

There are two types of diagnostics supported by the ALT (Automatic Line Test) subsystem: long diagnostics and short diagnostics. The long diagnostics use external metallic test resources to test the line, and traditionally have provided more coverage than the short diagnostics which do not use external metallic test equipment.

For LGRP lines, the linecard diagnostics are not dependent on external metallic test equipment; therefore, only short diagnostics are supported. Note, the short diagnostics do not provide a reduced fault coverage for LGRP lines. They have been designed to provide the same fault coverage as the manual linecard diagnostics without the use of external metallic test equipment.

ALT SDIAG has been modified to use the ALT101 log for LGRP lines. As stated above, ALT SDIAG provides full fault coverage for LGRP lines so it has been modified to give a more detailed report on the diagnostic failures for LGRP lines. The following shows an example ALT101 log for an LGRP line that has failed diagnostics.

```
RTPU07BC      ALT101 NOV18 11:35:35 7900 FAIL ALT
       SLOA 77 1 19 18          NO DIRN    1st CYCLE
       TEST TYPE SDIAG DIAGNOSTIC RESULT Test failed: Off-hook
       ACTION REQUIRED  Replace card  CARD TYPE  RDTLSG
```

7.10 OMs

7.10.1 Line Troubles

NTP 297-1001-594 DMS-100 Family Lines Maintenance Guides provides recommendations for CS2000 OMs the users should monitor for lines troubles.

7.10.2 Equipment Troubles

NTP 297-1001-595 DMS-100 Family Trunks Maintenance Guide provides information on CS2000 OMs for the CS2000 test equipment.

7.11 Alarms

MG9000 lines support the CS2000 line failure flags in the SN06.2 release. This enables the ALMSTAT command for MG9000 lines. The ALMSTAT command allows the user to query the line alarms for an office. The user can also set thresholds for updating office alarms for excessive line failures.

7.11.1 ALMSTAT QUERY

The following shows sample output of an almstat query.

```
                OFFICE LINE FAILURE TOTALS

                          OFFICE   OFFICE OFFICE OFFICE

7.11.2 ALMSTAT SET

The user can also use the ALMSTAT command to set the thresholds for the MINOR, MAJOR and CRITICAL office alarms.

7.12 User Error Responses

The complete list of user error responses are located in the configuration section under activity A00001890. Following are some of the more common error responses.

7.12.1 Line State Errors

When testing an MG9000 line, the line terminations is set to the TEST state. If the CS2000 fails to set to the termination to the TEST state, the user will get one of the following error responses.

Failed to determine the termination state

The CS2000 failed to determine the current state of the line at the gateway. The user should attempt the test again. If the problem persists, the users should contact the next level of support.

Failed to put the termination in the test state

The CS2000 requested the gateway to place the line in the TEST state and the request was not successful. The user should check the state of the line termination in the gateway.

The line is an ESA call

The CS2000 has determined that the line is involved in ESA call.

The line is out of service at the gateway

The CS2000 has determined that the line is in an out of service state at the gateway. The users should check the state of the line at the element manager for the gateway to isolate the fault on the gateway.

7.12.2 Line Test Provisioning Errors

Unable to determine metallic test equipment provisioned
Verify the MTSTAPT option exists for the entry in table LGRPINV

When a line test was attempted on an MG9000 line, the CS2000 failed to access the metallic test point provisioning data for the MG9000 in table LGRPINV. Check the provisioning in table LGRPINV.

Unable to get the test point index from LGRPINV
Test cannot be performed

When a line test was attempted on an MG9000 line, the CS2000 failed to access the metallic test point provisioning data for the MG9000 in table LGRPINV. Check the provisioning in table LGRPINV.

Vertical is not datafilled in MTAVERT
Test cannot be performed

When a line test was attempted on an MG9000 line, the CS2000 failed to access the vertical provisioning data for the MG9000 in table MTAVERT. Check the provisioning in table MTAVERT.

7.13 Tools

7.13.1 NFF

The No Fault Found utility allows the user to capture and query results from individual tests performed during the line diagnostics. The NFF utility is entered by typing NFF at the CS2000 CI prompt. The following shows the command help reference.

```
No Fault Diagnostic (NFF) utility.

This allows the intermediate results of the line
diagnostics to be sent to a file.

Valid commands are:

NFF START (fd) (fn) - Start recording NFF tst result onto
                      specified device and file name.
NFF STOP            - Stop NFF recording and close file
NFF QUERY           - Query the NFF recording status,
                      device and file name.
NFF PRINT           - Print the closed NFF file.

Parms: <Function> {START <device_name> DEVICE name
                   <file_name  > STRING,
                  STOP,
                  QUERY,
                  PRINT}
```

7.13.1.1 NFF Results for an MG9000 line

The following shows the data provided by the NFF utility for an MG9000 line.

```

-
     Noise test result:  56   db*10 noise level
-
     Noise test result:  282   db*10 noise level
```

7.13.2 LGLTT

The LGRP Line Test Tool (LGLTT) can be used to clear the failure flag against a defective MG9000 circuit. To do so, enter the ClrFlag command at the CS2000 CI prompt, followed by the DN or LEN of the defective circuit. Below is an example of the use of the command:

```
CI:
>
>lgltt
LGRP Line Test Tool (LGLTT):
>help
LGRP Line Test Tool (LGLTT)
Commands:
  Help     - Display summary
  ClrFlag  - Clear failure flag for a given MG9000 DN/LEN
  Quit     - To return to CI
>clrflag sloa 77 1 19 10
>clrflag 5202090
>quit
```

7.14 Restart Behavior

All CS2000 line test activities are terminated by element restarts.

- After a CORE restart, any line test in progress is aborted and the line is returned to the IDLE state.
- After a Gateway Controller restart, any line test in progress times out and a failure message is displayed at the MAP. If the line test requires manual action at the CORE, the line test will remain in the test state until that action is complete.
- After a Gateway restart, any line test in progress is aborted and a failure message is displayed at the MAP.

7.15 MG9000 ESA Entry

All CS2000 line test activities are terminated by the MG9000 when a shelf enters ESA.

7.16 Limitations and restrictions

- The CS2000 line test functionality is only supported for MG9000 lines.
- The CS2000 line test functionality is only supported for MG9000 lines when using the following cardcodes:: RDTLSG, RDTCON, RDTEBS.
- Some of the SN06.2 CS2000 line test functionality delivered for MG9000 lines requires the collocation of DMS metallic test equipment with the MG9000. The functions that require collocated metallic test equipment are not supported in remote sites that do not contain ABI peripherals.

7.17 Interactions

Not applicable.

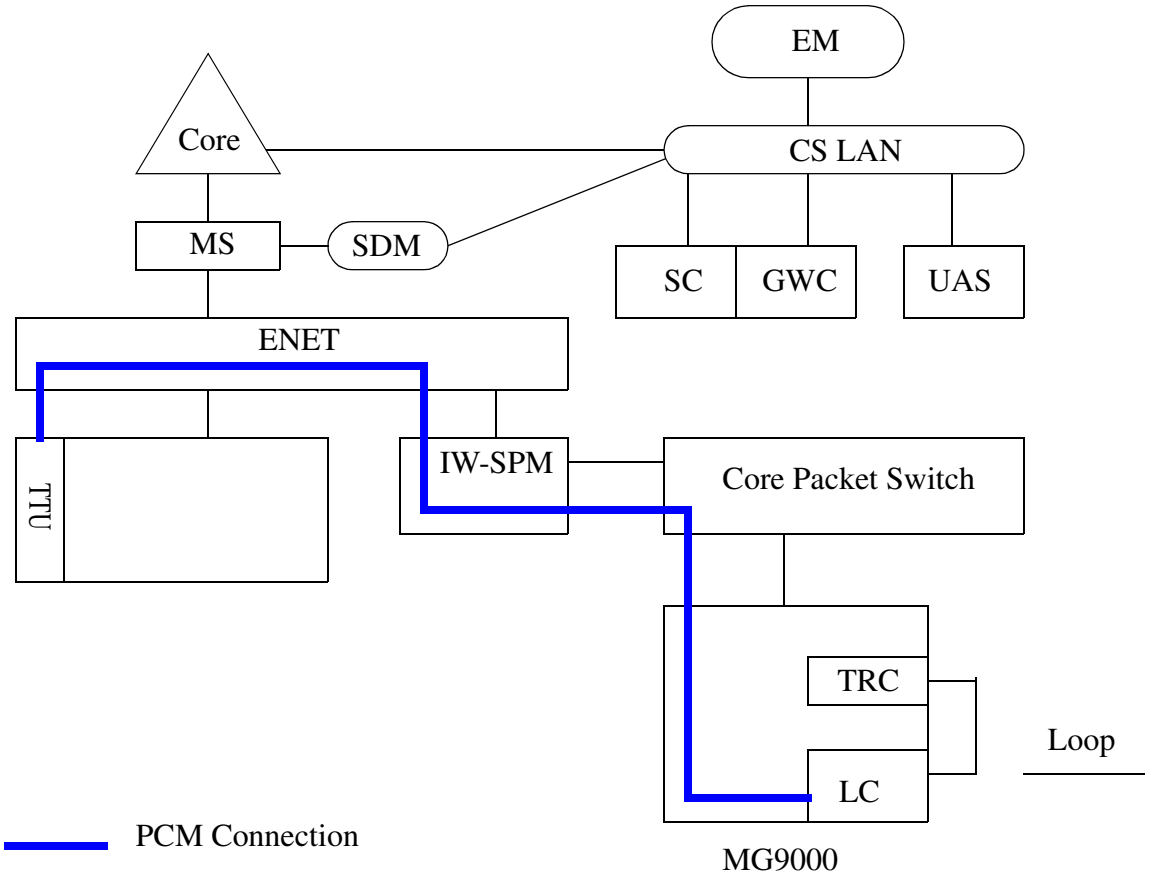
Appendix 1: Test Configuration Diagrams

This appendix contains configuration diagrams for the various CS2000 line test functions. This information is intended to aid in trouble shooting testing issues. The commands that are not listed do not require any test equipment. For example the SUSTATE command does not require line test equipment so a configuration diagram is not shown.

DIAG

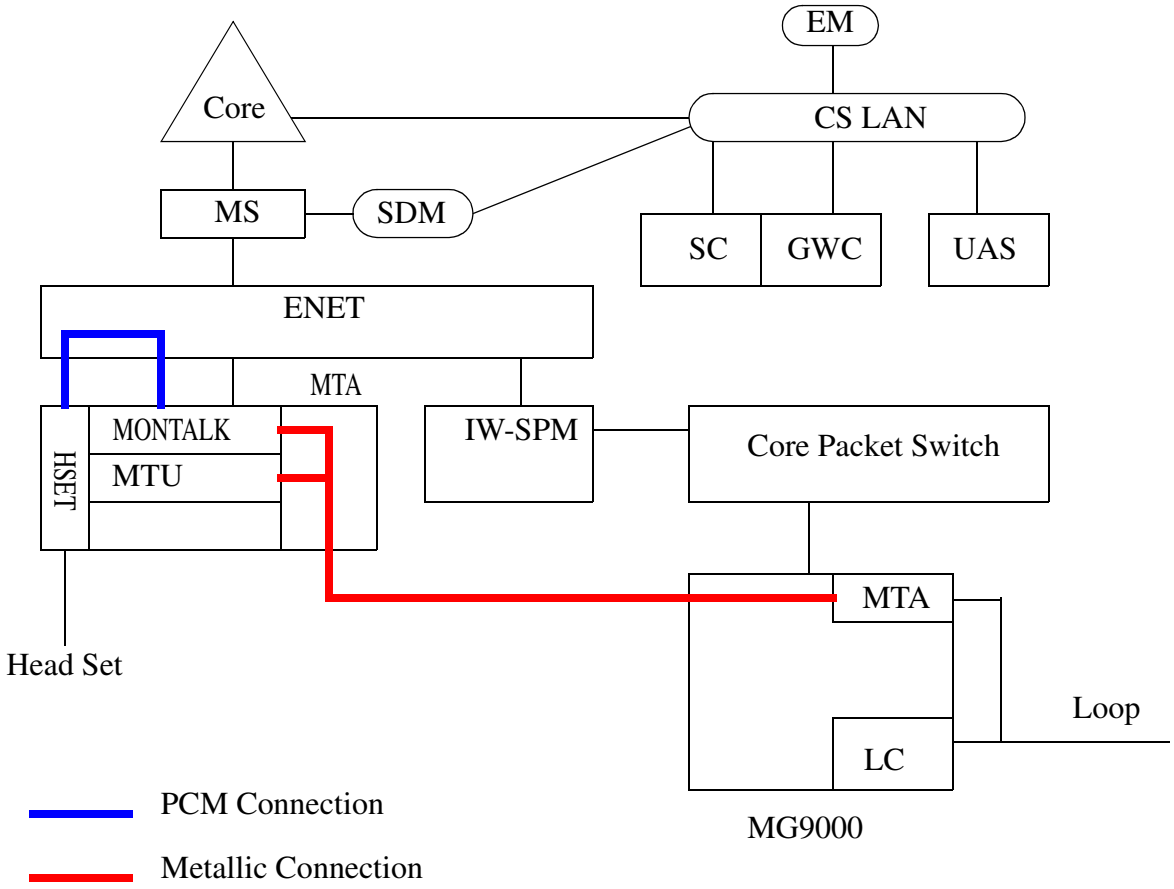
For POTS, Coin and groundstart lines, a TTU located in an ISM/MTM shelf is used during the linecard diagnostic.



The transmission tests are not supported for PPhone lines in the SN06.2 release. Therefore, no external test equipment is required when executing a diagnostic on a MG9000 PPhone line.

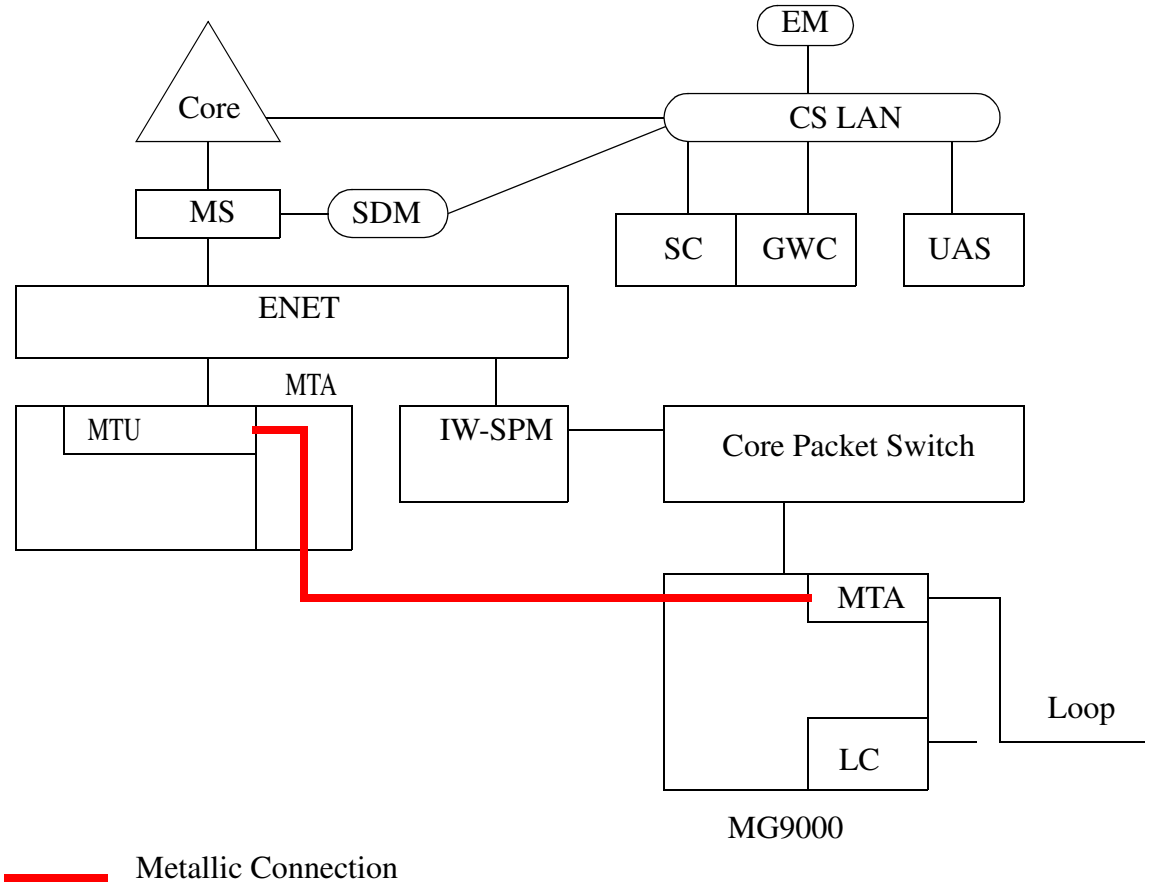
MONLTA, TALKLTA, ORIG, COIN, RING, DGTTST

The following diagram shows the configuration used when the above listed commands are performed on an MG9000 line.



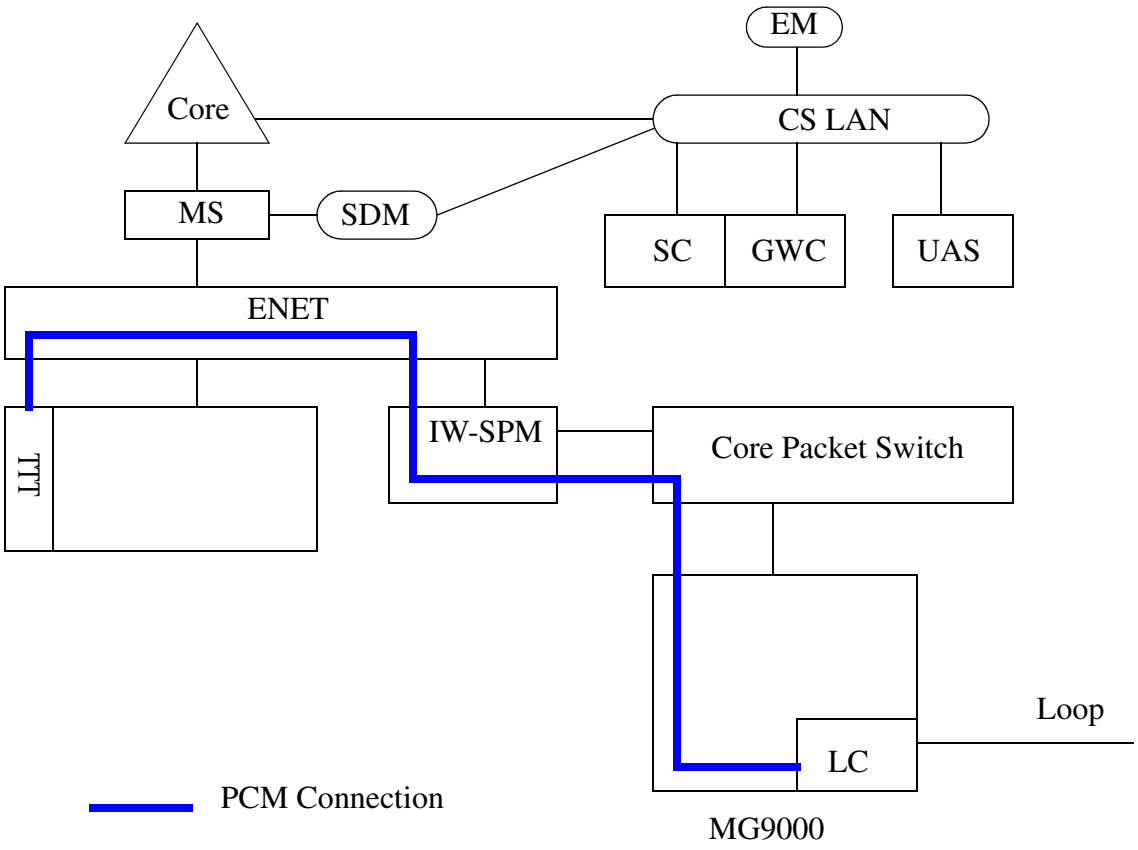
LNTST, VDC, VAC, RES, CAP, LTA

The following diagram shows the configuration used when the above listed commands are performed on an MG9000 line.



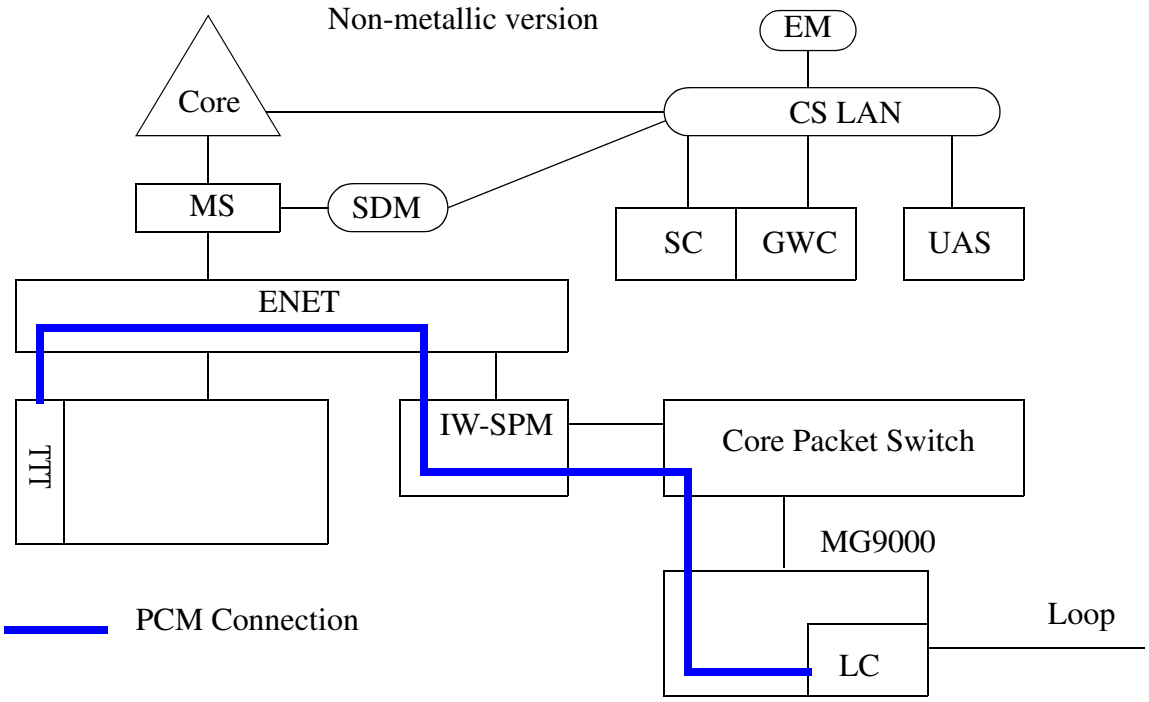
LOSS, NOISE

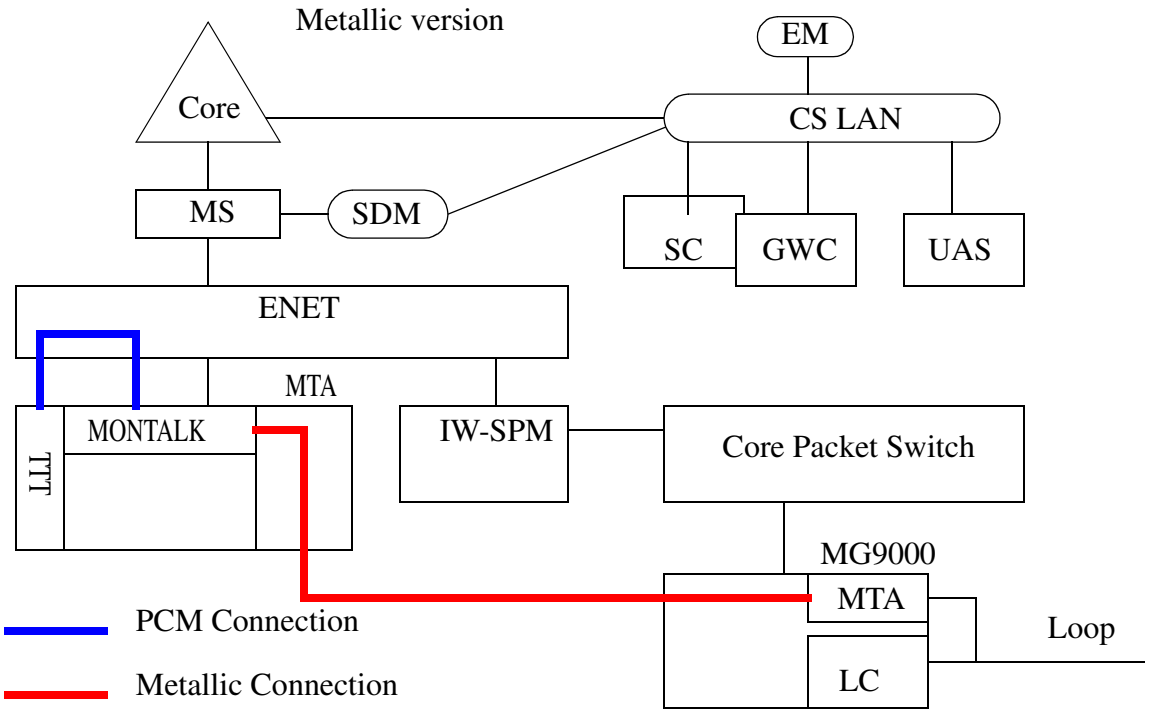
The following diagram shows the configuration used when the above listed commands are performed on an MG9000 line.



TONEGEN

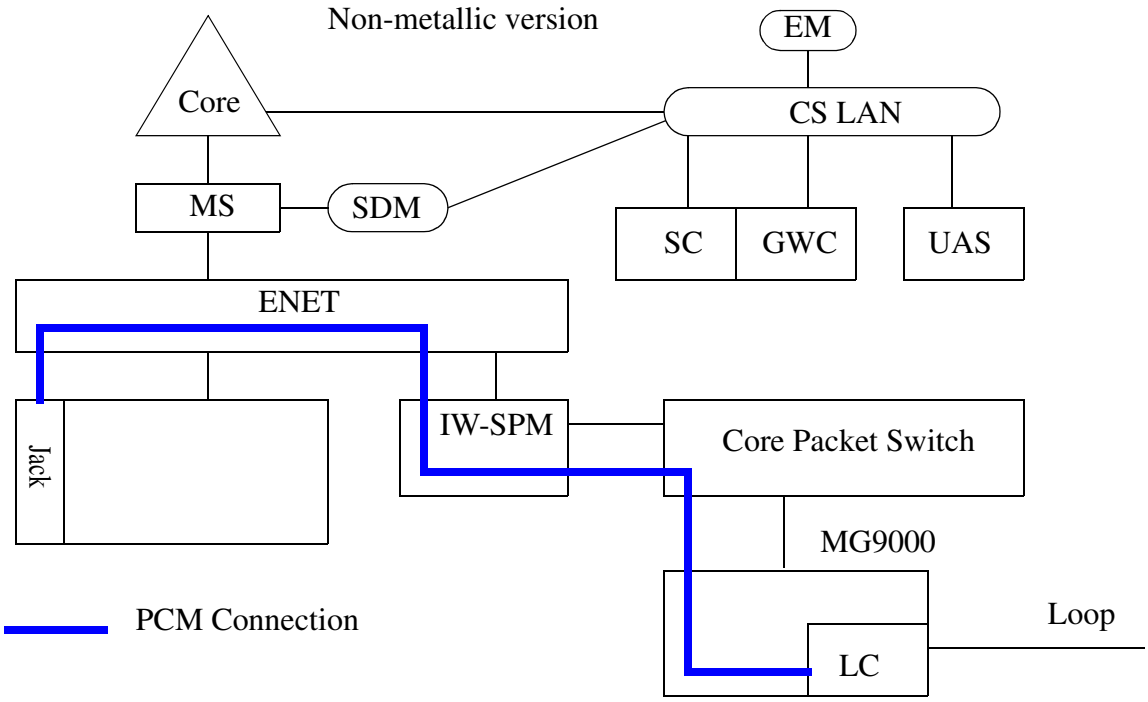
There are two versions of the TONEGEN command, the metallic and non-metallic version.

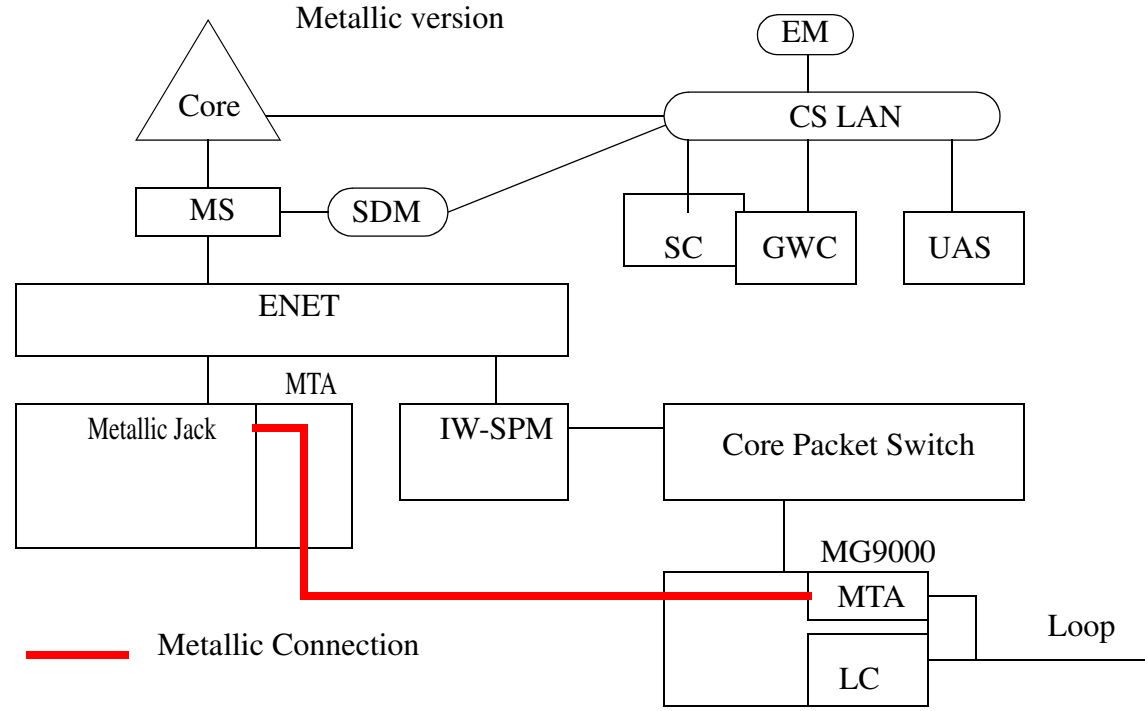




JACK

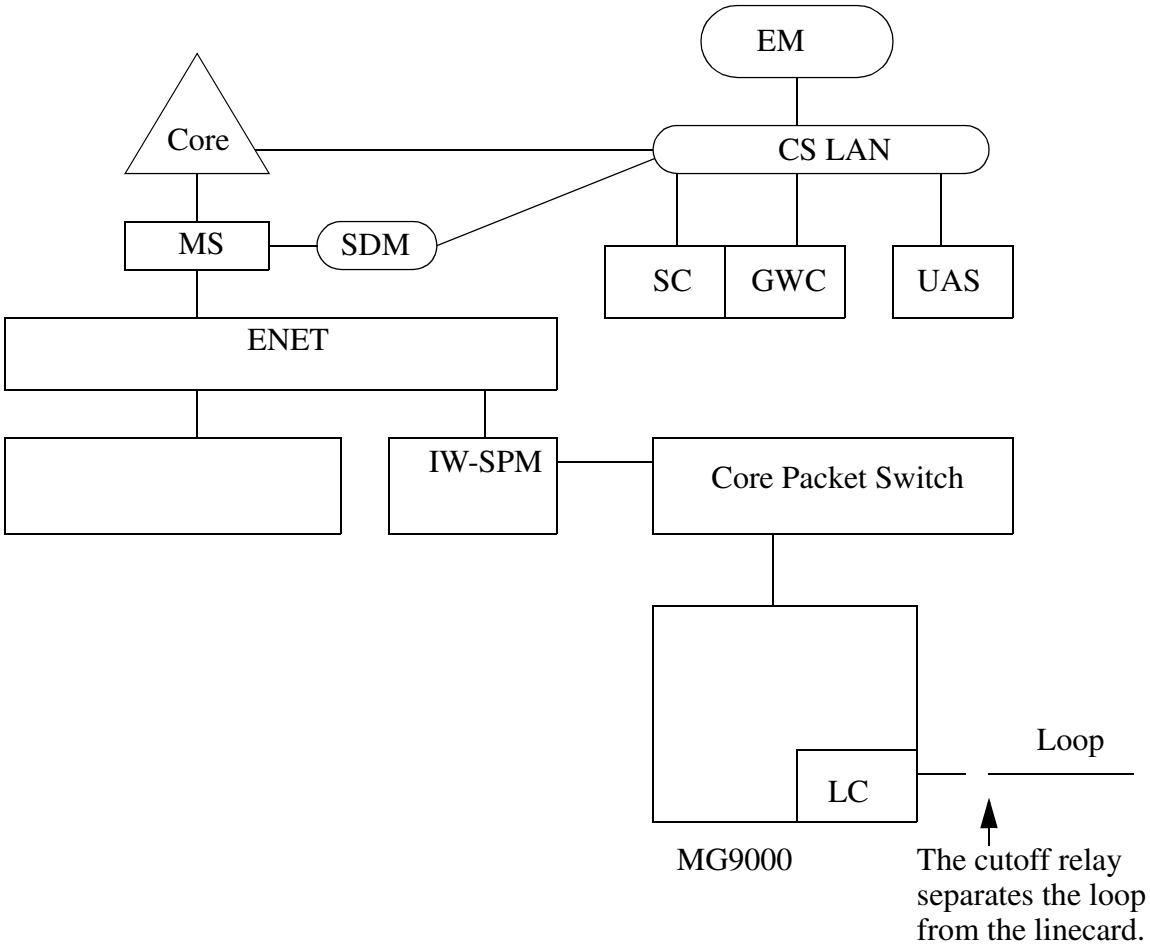
There are two versions of the JACK command, the metallic and non-metallic version





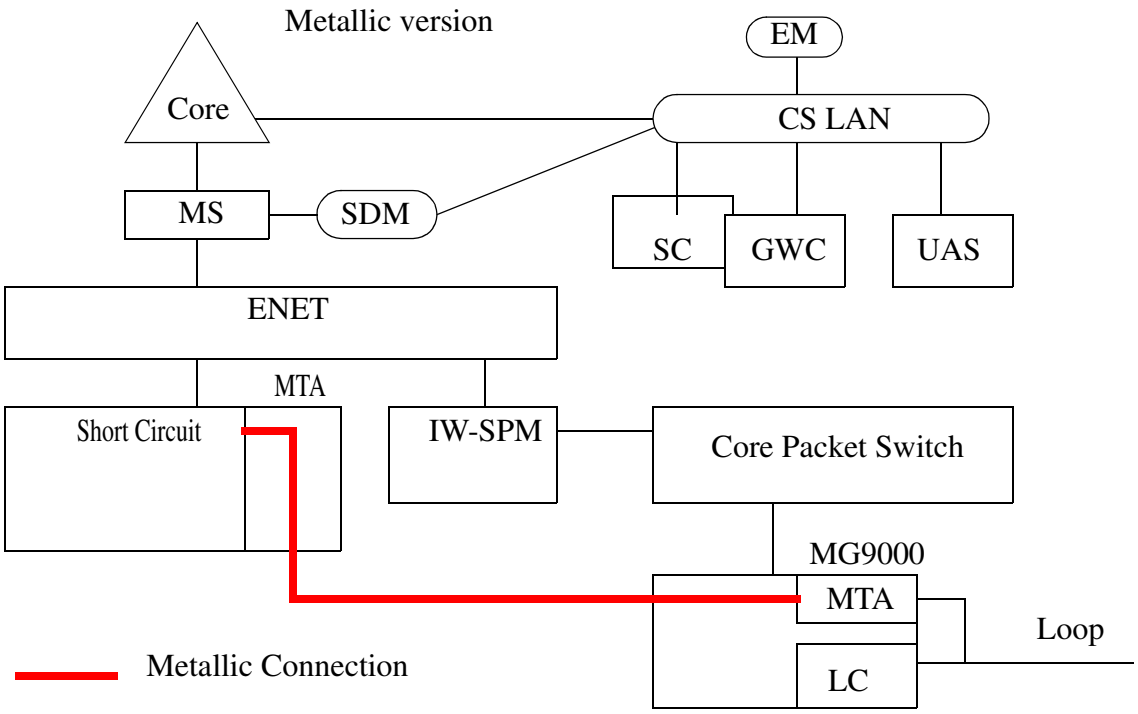
SSMAN

The silent switchman test allows a craftsperson to dial an access code and have the switch automatically apply an open condition to the subscriber loop for a provisioned period of time. No external test equipment is used. However, the metallic test resources in the MG9000 are used. Therefore the SSMAN test can be blocked if the metallic test resources in the MG9000 are already in use.



DSCKT

The dialable short circuit allows a craftsperson to dial an access code and have the switch automatically apply a short to the subscriber loop for a provisioned period of time.



ALT SDIAG

ALT SDIAG for MG9000 lines use the same equipment as LTP DIAG. Refer to the DIAG section for the test equipment configuration diagram.

ALT LIT

ALT LIT use the same equipment as the LNTST, VDC, VAC, RES, CAP commands. Refer to the test configuration diagrams for those commands.

ShowerQ

The ShowerQ diagnostic runs the same diagnostic as the LTP and ALT diagnostics; therefore, the same equipment is used. Refer to the DIAG section for the test equipment configuration diagram.

9: Functional Description (FN): A00001893 and A00001894

9.1 Feature name

The name of this feature is MG9K Imaging, A00001893 and A00001894.

9.2 Document version

/main/pnmdoc/4

9.3 Description

Currently, there is not a concept of imaging a Media Gateway 9000 (MG9K) device load from the Media Gateway 9000 Element Manager (MG9K EM) or any other application. This means that after a new load is loaded into a Supercore OC3, ITX, ITP, DS1, or ABI device, each device must then be patched up to date. This process can take hours, days and some times months depending on the size of the office, the number of patches and the maintenance window.

This feature will provide a means for the customer to upgrade an MG9K Device, patch the device up to date, image the MG9K Device load with the patches applied and then upgrade the rest of the devices in the office with the imaged load.

This feature will also provide a means for imaging to occur automatically so that after the upgrade, if more patches arrive to the site, the customer can continuously keep a stored, up to date, imaged load.

This feature introduces MG9K device imaging from the following Succession applications:

- MG9K Element Manager (MG9K EM)
- Network Patch Manager (NPM)

The MG9K EM will provide an interface for the user to image one MG9K Device at a time. The NPM will provide a mechanism for the user to image a device via a maintenance command through the NPM user interfaces as well as schedule an imaging task through the NPM scheduler.

Note: the NPM will provide a mechanism for the user to request images of multiple device loads, but the MG9K EM will only be able to image one device at time per Network Element.

9.3.1 Media Gateway 9000 Element Manager

This feature will change the MG9K Element Manager Graphical User Interface (GUI) at the card level as well as asking the user to provide additional information at start up time for the MG9K EM Server.

9.3.1.1 Security

This feature does not change any of the login procedures or security level access for the MG9K EM, however, this feature does require that the user have emsadm or emsrw level of security in order to execute the Software Image command.Otherwise the command will be greyed out indicating that the user does not have access to execute the command.

9.3.1.2 Logs

This feature will introduce a new Information log that will indicate a success or failure of an image as well a a new Audit log that will indicate user access of the image command.

However, it is not the responsibility of this document to discuss the log information as it will be provided in a separate log document for this feature. This information is being provided here so the reader of this document can be aware of the new logs.

9.3.1.3 MG9K EM Server Configuration

Configuration for the MG9K EM will change when a user executes the mg9kconfig.sh script from the /opt/nortel/mg9ksrv_xx/bin directory on the SSPFS platform.

When a user executes the mg9kconfig.sh script before start up of the MG9K Server, the user will be asked to provide the following information:

- Image Server - the load server where the load images will be stored
- Image Server User ID - the user id for the load server that has ftp access
- Image Server password - the password for the load server user id
- Supercore IMA Image Directory - directory where the image for this load type will be stored.
- SuperCore OC2 Image Directory - directory where the image for this load type will be stored.
- ITP Image Directory - directory where the image for this load type will be stored.
- ITX Image Directory - directory where the image for this load type will be stored.

- DS1 Image Directory - directory where the image for this load type will be stored.
- ABI Image Directory -directory where the image for this load type will be stored.

The mg9kconfig.sh script will provide a default Image Directory for the user that will be located at: /swd/mg9k.

The user can change this information by executing the ./mg9kserver config script located in /opt/nortel/mg9ksrv_xx/bin. This command can be executed after the MG9K server is running. This feature will provide a "*Change Imaging Server Settings*" Menu in this script so that the default software imaging parameters can be changed without executing the entire mg9kconfig.sh script again.

9.3.1.4 MG9K EM GUI

This feature changes the MG9K EM GUI at the card level only. An additional item named *Software Image* will be added to the *Actions* menu. The Software Image function is performed on a **per card basis** and is only available for the SuperCore OC3, SuperCore IMA, ITP, ITX, DS1 and ABI cards.

As part of manual imaging, the MG9K EM will obtain patch information from the Network Patch Manager. This information will help the user to determine if there is any reason the device load should not be imaged. If the NPM determines any of the following conditions, a *Warning* message will be sent to the user:

- the device load contains obsolete patches
- the device load contains patches that are on hold
- the device itself is on hold
- the device load is at a lower patch level then the previously image load.

A *Failure* message will be sent to the user if communication with the NPM cannot be obtained. However, in all of these instances, the user will have the ability to override these conditions and continue with the image.

9.3.1.5 Image File

The name of the image file created by imaging is pre-determined and **CANNOT** be configured. The imaged file name will be based on the name of the load file with a ".tar" extension. For example, if the file name of the load is SCOA07AA_GZ, the imaged load file name will be SCOA07AA_GZ.tar. This is the name of the load file that should be used when the user is ready to upgrade or re-load devices from disk.

9.3.1.6 FTP Configuration

This feature requires that the FTP server that is used for images have an FTP user configured that has read AND overwrite access to the server. After an image file is created once, every subsequent image of that load will be overwritten. NOTE: only the image file will be overwritten, not the original load file.

9.3.2 Network Patch Manager

The NPM will offer the ability to image an MG9K Device via a new maintenance command; *SmartImage*. This new maintenance command will "look and feel" like the other maintenance commands in the NPM.

Unlike manual imaging from the MG9K EM, the *SmartImage* command utilizes a patching criteria that will determine if the devices that the user wishes to image *should* be imaged.

9.3.2.1 NPM PreDefined Device Sets

This feature will introduce two new predefined device sets to the NPM:

- MG9KDEVICES
- GWCDEVICES

Each of these sets will include all of the devices of the device type they reference. For example, MG9K Devices will include all of the MG9K type devices; OC3, ITP, ITX, DS1, and ABI. It will be recommended that the user utilize these sets when executing the *SmartImage* command.

9.3.2.2 NPM Patching Criteria

Basically, the criteria for the SmartImage command boils down to which device(s) contains the highest patch content.

Because this is the "focus" of the criteria, it is essential that the user be aware of what they are doing when they image a device from the NPM. It is **highly** recommended that the user only use the "device sets" that will be provided as part of this feature. Otherwise, an image of a device could be taken that does not contain the highest patch content.

This criteria is the same criteria that is used today for auto imaging ISN and Gateway controller devices.

9.3.2.3 NPM GUI/CLUI

This feature will add a new command called *SmartImage* to the NPM GUI and CLUI. The new SmartImage command will appear under maintenance commands in the Task window for the GUI and will be part of the maintenance group of commands listed in the CLUI.

9.3.2.4 Scheduling

The *SmartImage* command can be saved as a task and can be scheduled as part of the NPM System Plan via the NPM GUI or CLUI for auto imaging. It is recommended that when scheduling the SmartImage task, auto apply be scheduled and executed before the *SmartImage* task.

9.3.2.5 Security

This feature requires the user to have a security level of emsadm in order to execute the *SmartImage* command.

9.3.2.6 Logs

This feature will not add new log numbers for the SmartImage command. This feature will utilized the NPM maintenance log numbers that are currently available for maintenance commands.

9.4 Hardware Requirements or Dependencies

None

9.5 Software Requirements or Dependencies

This feature requires the SN07 MG9K EM, NPM and MG9K Device Software.

9.6 Limitations and restrictions

The following items are listed here as limitations from this feature:

- **SmartImage is dependant on the default information that is input at configuration time of the MG9K EM Server. If this information is not available, the user will not be able to SmartImage or auto image.**
- **SmartImage or auto imaging for the customer who does not *specialize* his office. It is for the customer who patches all devices with the same patches.**
- **The patching criteria looks at the levels of patches in a device load. Therefore is a user patches a device with 4 patches, images the device, then removes the patches and then applies 4 different patches; the level of patches since the last image has not changed and the device will not be imaged.**
- **Due to the fact that two MG9K EM Servers execute on the same SSPFS box at one time during upgrades; the customer must be aware that when the mg9kconfig.sh script asks for the image user id and image server password, they must be the same for both MG9K EM Servers executing. This is due to the fact that there will only be one secure password file for the imaging server per SSPFS platform. However, the additional information the user provides via the**

mg9kconfig.sh script can be different, including the image server IP and load image directories.

9.9 Glossary

MG9K EM - Media Gateway 9000 Element Manager

NPM - Network Patch Manager

GUI - Graphical User Interface

CLUI - Command Line User Interface

10: Functional Description (FN): A00001895

10.1 Feature name

H323 Base Application

10.2 Description

Please refer to FN sections of feature A00001913 and A00002225.

10.3 GWC Logs

Log report GWC600 is an information log for an H.323 failure. The log entry identifies the H.323 failure condition and describes the specific reason for the failure. Please refer to FM section of feature A00001895.

10.4 Hardware Requirements or Dependencies

None

10.5 Software Requirements or Dependencies

None

10.6 Limitations and restrictions

10.6.1 CS2K H.323 limitations

1 CS2K H323 system does not support silence suppression codecs (e.g. G.729b or G.729ab, G.723).

2 Comfort noise on CS2K-H.323 is not supported.

3 ~~CS2K H323 system cannot currently support T.38. Any support for FAX or Modem operations SHOULD be provided via Mediatrix 1104/1124.~~

4 ~~The capacity of an H323 GW cannot be changed after initial installation without taking the GW OOS. Bsy/INB the trunks in order to change capacity or ip address.~~

5 The NAT dynamic mapping timeout in the router should be set high enough in order to keep those long duration calls active - where user tries to invoke a feature after talking for a long period of time. See Config notes.

6 DISA Services :

- For CS2K H.323, DISA DN hosted off of BCM is NOT supported.
- When a Carrier Based Line (CICM, MediaTrix, etc) dials a DISA DN hosted on the CS2K, the DISA DN grants access to a Hosted IPPBX Enterprise (e.g. S1000) without any workaround.

- DISA is NOT supported when a Carrier Based Line (CICM, MediaTrix, etc) dials a DISA DN hosted on the S1000/S1000M/BCM.
- When an H.323 IPPBX Line (BCM, S1000, S1000M etc) dial a DISA DN hosted on the S1000/S1000M DISA call works without any work around.
- When an H.323 IPPBX Line (BCM, S1000, S1000M etc) dial a DISA DN hosted on the CS2K, the call should route to ISUP looparounds (on a PVG) before terminating to DISA.

7 To preserve DPNSS VPN network capabilities calls between the Westell H323-DPNSS trunks and other agents (line or PVG) must be routed via SIP-T IBN7(DFT) looparound trunks to preserve DPNSS VPN network capabilities. Also trunks and lines should be in the same network (i.e. the customer groups of the line and trunk have the same NETNAME value) and the CLID option for the line's customer group set to ONNET to get CLI display for all VPN calls (or OFFNET if you want CLI display for all calls).

8 Currently CS2K H.323 use H.450 for DPNSS tunneling only and it does not support any H.450 based supplementary features.

9 The TCP keepalive is disabled by default to prevent the active calls after the warm swact from dropping (except when the call involves Cisco GW, in which case call drops after the warm swact).

10 Inter-working between H.323 and the IW SPM is not supported. Loop around trunk should be used instead.

11 Slow start calls will be supported with G.711 only.

12 Any call which involves both APG and Media portal is not supported.

13 CNDB (Calling Number Delivery Blocking) and CNNB (Calling Name and Number Delivery Blocking) Features work with following datafill:

Table LTDATA should have the following datafill for the H.323 PRI Trunk:

"Serv Serv Y N Screened Always PRI_IP_PROT H.323"

14 In order to prevent Glare on the H.323 trunk, trunk selection order should be set as ASEQ and NOT MIDL.

15 When a call originates from either Cisco GW, BCM or M1/ S1000, where originator has blocked his calling party number and name then those fields are NOT delivered to the CS2K marked as 'private' instead those field are sent to the CS2K marked as 'unavailable'. This causes feature e.g. ACRJ not to work, where a terminator had chosen to reject all incoming private calls.

16 When a BCM is configured to route calls to lines (MG9K, Mediatrix, or native) using the Private route type on the BCM, the calling number will be delivered as 'unknown' number. To allow the calling number to be presented to lines when calling from a BCM a route type other than Private should be used.

10.6.2 H.323 Gateway limitations

1 For the calls terminating on the S1000M1 and S1000 NET_RINGBACK_ON option must be provisioned in the TABLE LTDATA for all S1000M1 and S1000 trunk CLLIs in order to get the audiable ringback tone during the Call Setup (at the time of ALERTing).

2 ~~S1000M and S1000 do not support Calling Name Delivery to Non-MCDN endpoints.~~

3 ~~S1000M and S1000 do not support Calling Name Display on S1000M/ S1000 phones from Non-MCDN endpoints either.~~

4 The BCM GW does not support SlowStart signalling on origination.

5 The CS2K H323 System currently interoperates with Cisco's H323 IOS-version 12.2(13b) GWs , however there are a number of restrictions to be addressed in a future load release from Cisco:

a. Cisco calls are terminated by the GW 1 minute after a GWC warm SWACT.

b. Cisco GWs must be configured in a 1:1 static bind NAT configuration

c. For call scenarios where the Cisco GW is to connect to the UAS, and the Media Portal is present in the call topology due to NAT/FW traversal, the Cisco GW must be configured to transmit/receive immediately.

~~d. Slow start termination on Cisco GW is not supported with H245 tunneling enabled~~

6 For Core Cold and Reload restarts and for GWC Cold SWACT H.323 calls may not get dropped in the H.323 GWs and will be dropped in the Core. After a warm SWACT on the GWC, any attempted tcp messaging caused by a feature activation or dtmf key press (if it is conveyed by out of bandmsgs) will cause a warm swacted call to drop.

7 The following are few features which are not currently supported on the CS2K H.323 IPPBX

- Executive Busy Override (EBO)
- Automatic Call Back (ACB), however Network Ring Again is supported for calls within the same customer group
- Release Link Trunk (RLT)
- Malicious Call Hold (MCH), however MCH is supported on the Carrier Based Lines (CICM, MediaTrix, etc)
- Network ACD

8 Codec Provisioning: If a H.323 GW can support both G.711 and G.729 then G.711 should be provisioned as a defualt codec and G.729 should be provisioned as a preferred codec. No GW should be configured as have only G.729 codec. Configure BCM3.5 to have no preferred codec & to have G711 as the default codec. For the BCM3.5 Unified Manager, there is a need to set G711 as the default codec for Nortel IP terminal. **Configure BCM 3.6 gateways to have G.711 as default & G.729 preferred.**

9 H.323 calls with only Symmetric codec and ptime are supported (H.323 GW must receive what send - i.e. if send G711 must receive G711, if send 20ms must receive 20ms).

10 ~~When the ethernet cable at the back of the Westell GW is disconnected (for longer than 3 time-to-live periods, each of which is 30 secs) the Westell GW fails to automatically re-register with the CS2K upon reconnection of the cable. In these cases, manual recovery action is required to bring the Westell GW back into service.~~

11 M1 Conference Keys only works after the conference party answers the call.

12 S1000M do not send any packets till the CONNECT. So we need to change to the loss timer on the PVG to 0 - see config notes #3.

13 There are three different ways to carry DTMF digits:

— DTMF digits are carried as inband DTMF tone. But low bit-rate voice codecs such as G.729 cannot be guaranteed to reproduce these tone signals accurately enough for automatic recognition

— Out of band DTMF digits in signaling

— Using RTP payload to carry DTMF digits, Telephony Tones and Telephony Signals as specified in RFC2833.

As listed above, inband DTMF tone is not sufficient for certain codecs such as G.729. RFC 2833 solves the problem by carrying DTMF digits in the RTP Payload with special encoded RTP packets, but currently certain H.323 GWs such as BCM, S1000M/S1000 do not support RFC 2833.

Following is a list of ways to carry DTMF digits between different GWs:

Table 1 Method Used to carry DTMF digits between different GWs:

Termination Origination	**To H.323 GWs which Supports RFC 2833**	**H.323 GWs which do Not supports RFC 2833**
From H.323 GWs which Supports RFC 2833	RFC 2833	Out of Band DTMF Signaling
From H.323 GWs which do Not Support RFC 2833	Out of Band DTMF Signaling	Out of Band DTMF Signaling

Table 1 Method Used to carry DTMF digits between different GWs:

Termination Origination	**To H.323 GWs which Supports RFC 2833**	**H.323 GWs which do Not supports RFC 2833**
From PVG Supports (PVG RFC 2833)	RFC 2833	DTMF digits pressed on the phone off H.323 GW are delivered to PVG in out of band dtmf signaling, PVG will play out the tone DTMF digits pressed on the phone off PVG: - G.711 Codec H.323 does not request to collect DTMF digits, so DTMF from PVG will be delivered as in band tone - G.729 Codec H.323 does request PVG to collect DTMF digits, so DTMF from PVG will be delivered as out of band signaling
Mediatrix Supports (Mediatrix supports RFC 2833)	RFC 2833	DTMF digits pressed on the phone off H.323 GW are delivered to mediatrix GWC in out of band dtmf signaling, but Mediatrix side will NOT play out the tone H.323 does not request mediatrix to collect DTMF digits, so DTMF pressed on mediatrix will be delivered as in band tone

10.6.3 H.323 Protocol limitations

1 H.323 protocol does not support providing audible ringback tones to the H.323 subscriber after a call has been answered. Due to this, the H.323 subscriber will hear silence in certain feature interaction scenarios instead of audible ringback. These scenarios include:

- a line gateway (such as Mediatrix) invokes call park on a call that it received from an H.323 subscriber. In this scenario, the H.323 subscriber will hear silence until the call is retrieved.
- a line gateway (such as Mediatrix) is involved in a call with an H.323 subscriber, followed by the line gateway initiating a conference to another party. If the third party is conferenced into the call while still alerting, the H.323 subscriber will not receive audible ringback. (Note: If the third party is connected via a TDM ISUP trunk, then audible ringback will be provided by the terminating office and will be heard.)

- a line gateway (such as Mediatrix) performs a call transfer of an answered call from an H.323 subscriber to an alerting party.
- certain ACD/UCD scenarios where the call is queued after answer.

In these scenarios, the service interaction will function as normal, except for the fact the H.323 subscriber will hear silence as opposed to audible ringback. Since all of these scenarios involve answered calls, the H.323 subscriber will most likely know that they're on hold and waiting for some action to complete.

10.7 Configuration Notes

1 Add the NET_RINGBACK_ON in the table ltdata to the get the network ringback for the S1000M terminating call.

```
Examples:
```

ISDN 13 SERV

SERV Y Y ALWAYS ALWAYS (NET_RINGBACK_ON) (PRI_IP_PROT H323) $

ISDN 14 SERV

SERV Y Y ALWAYS ALWAYS (NET_RINGBACK_ON) (PRI_IP_PROT H323) $

2 Media proxy (RTP Portal) must be associated in SESM -> GWC# ->Provisioning -> Media Proxies -> for all GWCs (line, trunk, UAS and H.323 GWCs).

3 S1000M do not send any packets till the CONNECT. So we need to change to the loss timer on the PVG to 0.

Telnet to your PVG

and check the card slot you are using on the PVG :

St prov

set nsta/13 vgs brag/1 loss 0

set nsta/13 vgs brag/2 loss 0

…..

set nsta/13 vgs brag/16 loss 0

act prov

confirm prov

4 Make sure that the RFC 2833 is clicked in the SESM ‘Configure Network’ GUI, if the RFC 2833 support is required for the In-band DTMF tones.

5 Make sure that the appropriate DEFAULT CODEC is selected for a particular market (e.g. G.711 u-Law is selected for North America and G.711 a-Law is selected for International). Also make sure that G.729 is selected in the SESM ‘Configure Network-> Compression Codec’ GUI, if the G.729 codec support is required.

6 The two configuration rules must be setup for each H.323 GW which in the Enterprise IP-VPN on the NAT router. The first rule maps the RAS port of the GW (UDP transport) to NATed IP(of the NAT router) + port (X open on the NAT router). The second rule maps the Call signalling port of the GW (TCP transport) to the NATed IP(of the NAT router) + port (X+1open on the NAT router).

Example:
10.19.199.195(NAT Router IPAddress):7000(port on the NAT router)<-> 10.88.88.55(H.323 GW IP address):1719(RAS port on the GW)

10.19.199.195(NAT Router IPAddress):7001(port on the NAT router)<-> 10.88.88.55(H.323 GW IP address):1720(Call Sig. port on the GW)

7 For gateways -e.g. Cisco GWs- that do not provide a static RAS port, N:1 addressing is not an option as mapping the port must be done dynamically. This is a NAT 1:1 configuration and although supported in a limited fashion, devices requiring this configuration may require code changes, which is already supported for Cisco GWs, in the CS2K to support registration and call processing.

8 If a H323 gateway in International market does not support overlap signaling for termination, then the translation in the core should be set to do en-bloc signaling by using the TABLE PXCODE and minmax mm option to control for the en-bloc sending.

9 The “INTER DOMAIN" bool is in the TABLE TRKOPTS for the SIP-T Trunks should be set as follows

- "INTER DOMAIN" bool should be set to Y (i.e. inter-domain) for all SIP-T trunks except loop-around trunks.
- "INTER DOMAIN" bool should be set to N (i.e. intra-domain) for SIP-T loop-around trunks.

10 To hear the busy tone when calling from S1000M/S1000 phone to a A Busied Line. Apply the BHC19 patch and ensure AUDTRMT is set to "Y" on the TABLE LTID for S1000M/S1000 trunks.

11 Do not enable e.164 registration in the H.323 GW as this kind of registration is not supported by GWC.

12 For NATs with per-protocol timeouts, recommend timer values are

- For TCP (for Call Signaling) bind timeout of 35 minutes.
- For UDP (for RAS) bind timeout of 3 minutes.

For NATs that have a single global timeout value, a bind timeout value of 35 minutes is recommended.

11: Functional description (FN): A00001898

11.1 Feature name

A00001898 - ABI RMM Support

11.2 Description

This activity adds support for hosting a Remote Maintenance Module (RMM) off of ABI-based XPMs, specifically the LTC, LTCI, LGC, LGCI, and SMA2. The need for an RMM hosted off peripherals other than the RCC/RCC2 type peripheral has come about due to the office collapse scenarios in which central office based XPMs such as LTCs, LGCs, and SMA2s are no longer co-resident with the Call Server. In these collapsed office sites there is a need to perform metallic line testing on these peripherals, but the existing MTM test resources are no longer available (MTMs must be hosted off of the ENET and hence cannot be present in the collapsed sites as there is no longer an ENET in these sites).

To fill this gap the RMM will be used for test access, but it needs to be reconfigured to be properly supported in the new environment where it is not part of the RSC/RSCS setup. The RMM uses DS30A links to connect to it's host peripheral, which is perfectly fine for the LTC/LGC type XPMs, but is a problem for the SMA2. The SMA2, prior to this activity, did not support a DS30A type interface on it's P-side. With this activity we will add the capability for the SMA2 to host DS30A based subtending RMMs. This means that core provisioning, core maintenance, and the SMA2 load itself need to be altered to support the new DS30A interface.

Another issue with the RMM involves the hardware configuration. Specifically, the RMM has in the past always been sold by Nortel as a component of the RSC/RSCS, not as a stand-alone piece of hardware. For this activity the RMM needs to be supported in a new frame, and new cabling needs to be configured to allow it to be connected to the new host peripherals. This new hardware setup needs to be documented and made available to the customer to be installed in the collapsed office sites.

11.3 Hardware Requirements or Dependencies

There are two new hardware requirements for this project, the RMM frame and the DS30A card and cable to the RMM.

11.3.1 RMM Frames

The RMM will be housed in a MIS frame. This is an existing frametype, but prior to this feature, was not used to house RMM shelves. This frame type will be used regardless of whether the RMM subtends the SMA2 or LTC/LGC.

11.3.2 RMM Circuit Packs

The following circuits packs will be supported in an RMM in the ABI configuration. . The pack are:

- 0X10: Scan Detector
- 2X11: MTU, (Mult-Line Test Unit)
- 2X57: Signal Distribution Card
- 2X90: Datafilled as a Montalk or NTT (No Test Trunk)
- 3Z09: MTA (Metallic Test Access)

11.3.3 DS30A Cards and Cables

See the Engineering Information section of this feature for more details than the summary below.

An RMM requires a DS30A interface to its host XPM. The SMA2 requires a MX74 DS30A card to interface the RMM. Prior to this feature, a DS30A card could not be provisioned on an SMA2 in LTCPSINV.

In addition a new cable is required to interface from the MX74 on the SMA2 to the RMM.

The LGC/LTC XPMs already supported a DS30A interface (6X48 card) prior to this feature. This card will be used for interfacing the RMM, but a new cable is required to connect from the LTC/LGC to the RMM.

11.4 Software Requirements or Dependencies

This activity will be implemented in the SN07 stream in the CM, but due to customer requirements will be patched back into the SN06 CM release (officially this is called the SN06.2 release).

There are several other acitivies that are required to complete the support of the RMM. They include A00001847 - ABI Expansion, and A00001936 - MG9K ABI Expansion - Node & Link Mtc.

11.5 Limitations and restrictions

The following limitations and restrictions exist for this activity:

- The RMM will only be supported on the LGC/LTC , and SMA2. The RMM will not be supported on the SMS in SN06.2.
- Only a single RMM will be supported hosted off an SMA2. This is due to the provisioning restriction whereby only a single DS30A link is allowed on the P-side of the SMA2.

- Only the circuits listed in section “11.3.2 RMM Circuit Packs” on page 204 are supported on an ABI RMM. No effort has been made to prevent the datafill of other circuits packs, but they will not be supported.
- The RMM Selector field in table RMMINV will be set to RMMLTC for both LTCs and LGCs. This is done because the two types of peripherals are treated exactly the same (and are essentially alike from a hardware perspective) in their handling.

12: Functional description (FN): A00001935

12.1 Feature name

Provisioning Support for Centrex-IP Nodes and Lines

12.2 Description

Feature A0001935 will deliver the lines flow through and pre-provisioning functionality in the Succession Element and Sub-element Manager (SESM) required for the Centrex IP Client Manager (CICM) integration with Succession. The design will be split into Nodes provisioning for CICM Gateways (GWs), and lines provisioning for CICM terminations.
The Nodes provisioning feature component will provide for the provisioning of CICM GWs. Nodes provisioning will also provide functionality to pre-provision the CICM terminations in the GWC-EM and to pre-provision LENs (Line Equipment Numbers) in XACore table LNINV. The Lines Provisioning component will provide flow through of service information entered at OSSGate (SERVORD+ commands). New line provisioning functionality will be delivered to allow line data to be transmitted to the CICM Element Manager (CICM-EM).

12.3 Hardware Requirements or Dependencies

Not applicable.

12.4 Software Requirements or Dependencies

Not applicable.

12.5 Limitations and restrictions

None.

12.6 Interactions

This feature will integrate the Centrex-IP client provisioning with the existing Succession SERVORD+ system. Centrex-IP client ommands/data will distributed to the CICM-EM from the SERVORD+ system within the SESM. The following commands will trigger data distribution to the CICM-EM from SESM SERVORD+:

- NEW, EST, ADD, OUT, DEL, CDN, CHDN, CLN/CTP, CKLN/CKTP, ADO, DEO, CHF

This list is subject to change until final DSUM approval.

12.8 Glossary

Term	Description
New term	Definition

13: Functional Description (FN): A00001990

13.1 Feature name

CAIN via CICROUTE PEP Sourcing

13.2 Description

13.2.1 Background

Currently, CAIN subscriptions can be achieved through tables TRKGRP, AINSCUSP, UNIPROF, AUTHCODU, AUTHCDX and STDPRTCT. The sourcing of this patch will allow CAIN subscriptions to be added to table CICROUTE enabling subscription on a per CIC (Carrier Identification Code) basis. This new subscription point will allow carriers to use the SCP to route calls based on their CIC.

This functionality was originally patched into the UCS12 load. That patch has been propogated to more recent UCS loads. This activity will source the patching into the SN07 load and put it under SOC (Software Optionality Control) control.

13.2.2 Functional Description

The new subscription point will be created by adding the CAINGRP option to tuples of table CICROUTE, just as in other CAIN subscription tables. The CAINGRP option takes one argument, the service name, as defined in table CAINGRP. In the example below, CIC 333 is subscribed service SRVC1.

Table 1 CICROUTE Example with CAIN Subscription

KEY	NATLSTS	INTLSTS	MLTCOSID	OPCHIDX	PRTNM	IDPRTNM	ADIN	CICDELV	OPTIONS
333 1	611	212	0	2	CIC	EAPT	3	ALWAYS	**CAINGRP SRVC1**

CAIN precedence levels determine the order in which specific subscription types are checked for applicability at a particular TDP. The new CICROUTE subscription point will have a new precedence level of CARRIER which will fit in the current order as below:

Table 2 Precedence Level Between Subscription Types

Order	Subscription Type	Subscription Tables
1	SCP	Requested by SCP
2	Address	subtable STDPRT of STDPRTCT
3	Authorization Code	AUTHCODU, AUTHCDU*

Table 2 Precedence Level Between Subscription Types

Order	Subscription Type	Subscription Tables
4	ANI	ANICUSP, ANIVAL, UNIPROF
5	TR533_CIC	
6	Agent	TRKGRP, CALLATTR, TRKFEAT
7	**Carrier**	CICROUTE
8	Office-wide	CAINPARM

13.2.2.1 Subscribing to CAIN via table CICROUTE

The originating agent types supported by this feature are PTS FGD, SS7 FGD, and SS7 Inter IMT.

All originating trunks wishing to use the CAIN functions must have the CAIN option defined in table TRKGRP, CALLATTR, or TRKFEAT. The CICRTE option also needs to be included in TRKGRP so translations will use table CICROUTE and encounter the new subscription point.

A service and its associated triggers must be added to table CAINGRP and the triggers must have their criteria defined in the relevant subscription tables.

Once the above datafill is in place, the CAINGRP option can be added to individual tuples in table CICROUTE. The CAINGRP option takes the name of a service defined in table CAINGRP.

More general information on CAIN datafill can be found in NTPs 297-2621-370*, the UCS DMS-250 NetworkBuilder Application Guides.

13.2.2.2 CallP Behavior

When a specific TDP (Trigger Detection Point) is encountered during call processing (see NTP 297-261-370 Network Builder Application Guide, Vol. 2), each subscription method is checked in the precedence order defined above. If a subscription to a CAIN service is defined via the CAINGRP option, and the service includes a trigger of this TDP, and the trigger's criteria is met, then the trigger will have its action performed.

Adding a new subscription point to CAIN does not affect the procedure described above. A service subscribed via table CICROUTE will have its triggers evaluated at the proper TDPs.

13.2.2.3 Traver

The traver tool simulates a call from the user specified originating trunk to the user specified address. Traver displays the following CAIN-specific information at each TDP encountered:

1 The name of the TDP encountered (e.g. ORIGATT)

2 The CAIN subscription method, if any (e.g. CARRIER)

3 The tuple from table CAINGRP detailing the subscribed to service

4 The tuple from the trigger table detailing the criteria being evaluated

5 The action, if any, taken if the trigger's criteria is met

Traver will be enhanced to display the subscription method of CARRIER, the CAINGRP data and the trigger table data if a call subscribes to CAIN via CICROUTE.

The following traver snippet shows the SCP being queried when it is determined that the call is subscribed to the SPECGRP service via table CICROUTE. This example was run via

> UVTSTS 611; traver tr dal221twdtls 2201234 t

Table 3 Example Traver Output

TriggerCriteriaType: CUST_INT
CallingPartyID: 619
+++ TRAVER: SUCCESSFUL CALL TRACE +++

13.2.2.4 Log Changes

Logs that indicate the subscription method will be updated to display the CIC information.

13.2.2.4.1 CAIN902 Logs

CAIN902 logs show the subscription method and other relevant details when a call subscribes to CAIN (not when the query is sent to the SCP). The

METHOD field of the log indicates the subscription type (e.g. ANI, OFFICE) and the precedence level. CAIN902 logs will indicate a METHOD of CICROUTE and a precedence level of 7 when appropriate.

13.2.2.4.2 VAMP902 Logs

VAMP902 logs are output when the VPTrace CI tool is enabled and an outbound message is sent through the VAMP framework to the SCP.

The VAMP902 log may display the subscription type via the SUBINFO field. The SUBINFO field will be enhanced by this activity to include CARRIER as a possible value.

13.2.2.5 SOC Control

This feature will be controlled by a State SOC (State is either IDLE or ON). The SOC id will be CAIN0612. Using the SOC CI command to activate or deactivate a order code is covered in NTP 297-8991-901.

Datafilling a CAINGRP option will be allowed regardless of the state of SOC CAIN0612. However, if the SOC is IDLE, the CAIN software will not recognize subscriptions via CICROUTE either during CallP or in the Traver Tool.

13.2.2.6 ONP

Reformat procs will be written as part of this feature to garauntee the validity of CICROUTE tuples whether the swtich has patch HIJ00 activated or not.

13.3 Hardware Requirements or Dependencies

N/A.

13.4 Software Requirements or Dependencies

No new dependencies are introduced by this work beyod the new SOC order code detail above. However, using the functinality of this activity depends on a number of basic CAIN SOCs detailed below.

Table 4 CAIN SOC Codes of Note

Order Code	Function
CAIN0100	Usage Option for all CAIN msgs to SCP
CAIN0200	Extenstion Paramaters
CAIN050*	SOCs to enable Specific Trigger
CAIN0600	Conversational Digit Collection
CAIN0601	SCP Trigger Subscription
CAIN0602	EDPs Enabled

Table 4 CAIN SOC Codes of Note

Order Code	Function
CAIN604	Inter IMT Support

13.5 Limitations and restrictions

Originating trunk types supported by this feature are PTS-FGD, SS7-FGD and SS7 Inter IMT. Other trunk types are incapable of passing the CIC information.

13.6 Interactions

13.6.1 Normal CIC Routing Suspended

13.6.2 If a CAINGRP is datafilled against a CICROUTE CIC, normal CIC routing will be suspended and CAIN processing will begin. For example, if the DEFCIC option is datafilled against a trunk in table TRKGRP that is supported by table CICROUTE with the DFCICRTE sub-option set (when this field is Y, the DEFCIC can be used as an index into table CICROUTE), call processing will exit and the CIC routing feature will begin CAIN processing. If a CAIN “no action” or continue response is encoutered, normal CICROUTE call processing will continue.**CAINCIC Not Affected**

The functionality of table TRKGRP option DEFCIC, sub-option CAINCIC will not be affected by this activity.

13.6.3 No Affect on CAIN Standard Routing

Standard routing paramaters CARRIER, ALTERNATECARRIER and SECONDALTERNATECARRIER will continue to be used to identify a route by obtaining an STS value through table CICROUTE.

However, if the following scenario occurs, an extra CAIN902 log will be generated.

An Analyze_Route message containing CARRIER and ALTERNATECARRIER is recieved. Table CICROUTE is accessed for the CARRIER and a CAINGRP is picked up. The subsequent route selection results in a busy condition and the call route advances to the ALTERNATECARRIER. Table CICROUTE does not have a CAINGRP option for the ATLERNATECARRIER. Carrier subscription is undone and a CAIN902 log will be output to indicate this.

14: Functional description (FN): A00002008

14.1 Feature name

SBA:CBM Introduction[A00002008]

14.2 Description

This document will be broken into two sub sections for each section. The first sub section will describe **Adding a Logical volume for SBA**. The sub section second will describe the procedure for **DVD Billing record backup**.

14.2.1 Adding a Logical volume for SBA

For AIX:

- The instructions have not changed and can be found in Accounting module, chapter, “Adding a logical volume for SBA“
- Alternatively, the “makelv” command described below for CBM can also be used on AIX to create a Logical Volume for SBA billing files
- The recommended "logical_volume_name" remains the same on AIX: "/sba/<stream name>".
  - i.e. /sba/ama;

For CBM:

- the "makelv" command can also be used on CBM to create a Logical Volume for SBA billing files. Consult the configuration section for the actual instructions on how to do this.

14.2.2 DVD Billing record backup

The purpose of this subsection is to describe a manual procedure for backing up billing data from the CBM to a DVD. Three procedures will be described. The First procedure will be how to blank a DVD-RW disk. The Second procedure will be what the customer will do to back up the closed sent and closed not sent billing directories using a script that is provided to them. The third procedure will document how to create a DVD without the aid of the script. This could be of use in emergency scenarios or when only specific files are to be backed up.

Note: These actions should be performed only during non-peak hours unless a DVD backup is an urgent in special case.

Note: It is worth pointing out that the tape functionality has been removed for the CBM(Solaris) system. Only DVD functionality is supported. And DVD functionality has not been added to SDM (FX) systems. Users of this system should continue to use the current tape backup procedure.

Note: It is necessary to be a root user to execute these procedures

Note: These are best effort procedures. No locking is done on the files being copied

Note: On a CBM850, if a swact occurs during any of the following procedures the action will fail and must be started again on the newly active side.

14.2.2.1 Blanking a DVD-RW

Blanking the DVD-RW erases the contents of the DVD. It is a necessary step before a DVD-RW can be written to if it has previously been written to. It is unnecessary and not possible to do this to DVD-R type DVD's.

Note: This procedure is not specific to billing. It is an sspfs general procedure.

- You first must insert the DVD-RW which you intend to blank into the DVD drive.
- First, issue the UNIX command "cdrw -l" (as shown below). If it returns a message indicating that there are no devices or media then use the eject button on the front of the DVD drive to open the tray. If the cdrw -l command lists a device then use the UNIX eject command to open the tray as explained in the next point

  #> /usr/bin/cdrw -l
- To open the a drive unit that has media already inserted in it use the UNIX eject command (as shown bellow). If the eject command does not work it may be the case that someone is in the DVD directory or another backup procedure is running.

  #> /usr/bin/eject cdrom
- After successfully inserting your DVD, list the contents of the DVD-RW with the following UNIX command to ensure that it is the DVD you intend to blank.

  #> /usr/bin/ls /cdrom/cdrom0
- If you are satisfied that this is the disc you intend to blank, then enter the following UNIX command. This step can take a significant amount of time to complete. possibly more than one hour.

  #> /usr/bin/cdrw -b all
- To confirm the DVD is now blanked. Ensure the DVD is inserted. Then enter the UNIX command below. It should return some device information and the statement "Media is blank"

  #> /usr/bin/cdrw -M

14.2.2.2 Using script to back up billing records

This is the procedure the craft person would most likely use to back up the closed sent and closed not sent directories. This method is non selective in the files that it chooses to back up. It backs up the entire contents of the selected directories. It writes the files to the DVD in the following directory format "/<Stream name>/<Directory name>/files".

> **Note:** This procedure does not move the files from closed not sent to closed sent

- The craft person should ensure that he/she has a large enough supply of blank DVD's at least one for each stream they intend to back up. possibly more if the streams are larger than 2GB. The script will alert the craft person as to the number of disks that are required for each stream before proceeding to write the records to the DVD. Note that the DVDs should be blank. Consult the blanking procedure if the DVD's are not blanked.
- You first must insert the DVD-RW which you intend to write into the DVD drive.
- First, issue the UNIX command "cdrw -l" (as shown below). If it returns a message indicating that there are no devices or media then use the eject button on the front of the DVD drive to open the tray. If the cdrw -l command lists a device then use the UNIX eject command to open the tray as explained in the next point

  #> /usr/bin/cdrw -l

- To open the a drive unit that has media already inserted in it use the UNIX eject command (as shown bellow). If the eject command does not work it may be the case that someone is in the DVD directory or another backup procedure is running.

  #> /usr/bin/eject cdrom

- The next step is to enter sbadvdwrite at a UNIX prompt to start the script. you will get the following result

```
#> sbadvdwrite
Billing Data DVD Backup
--------------------------------------------------------------------------------
This is a utility to back up closed sent and closed not sent billing records.
A blank DVD should be in inserted in the DVDRW drive.

Press Enter to proceed, or type Abort to abort:
```

- Then press enter to proceed or abort to stop the scripts execution

- Next you will be asked to select the stream you would like to back up as is shown in the following result. If no streams are configured the script will print out and error message stating so and exit.

```
Billing Data DVD Backup Stream Display
--------------------------------------------------------------------------------
The following streams are available to be backed up.

AMA
OCC
SMDR

Billing Data DVD Backup Stream Selection
--------------------------------------------------------------------------------

>AMA

Enter the stream that you would like to back up and hit return.
```

- Now enter the stream that you would like to back up or abort to stop the scripts execution.
- Then press enter to proceed or abort to stop the scripts execution

```
Press Enter to proceed, or type Abort to abort:
```

- Next you will be prompted for which directories you would like to back up. Make your selection.

```
Billing Data DVD Backup Directory Selection
--------------------------------------------------------------------------------

enter the number corresponding to the directory(s) that you want backed up
and hit return:

1    - Closed Sent
2    - Closed Not Sent
3    - Both Closed Sent and Closed Not Sent

>3
Closed sent and Closed Not Sent have been
selected for backup.
```

Press Enter to proceed, or type Abort to abort:

- Then press enter to proceed or abort to stop the scripts execution
- Then you will advised of the number of DVD's that will be required to back

'1' blank DVD(s) will be required.

Press Enter to proceed, or type Abort to abort:

- Then press enter to proceed or abort to stop the scripts execution
- Next the DVD(s) are written to. Follow the on screen instructions with regards to when to insert DVDs into the DVD tray if more than 1 DVD is required. The DVD tray will eject automatically when the DVD is finished being written to.

Billing Data DVD Backup Finished
--------------------------------------------------------------------------------
you have now completed the DVD backup operation. Please ensure all requested
files have been written to the DVD(s)
```

- You have now completed the script based backup procedure.Label the DVD(s) with a CD/DVD safe pen and repeat until all of the required streams are backed up. When finished writing all disks use the ls command to confirm that all of the desired files have been copied and are of the correct size.

14.2.3 Manual procedure for writing to DVD

This is a procedure intended mainly for GNPS when they have been contacted by a customer to purge billing files. Probably due to down stream network connectivity problems. Or for a customer who wishes to back up specific files. The sbadvdwrite script is the preferred method for customers who intend to do general back ups

Note: This is not a billing specific procedure it is a general sspfs procedure

Note: This procedure does not move the files from closed not sent to closed sent

Note:

- You first must insert the DVD-RW which you intend to write into the DVD drive.
- First, issue the UNIX command “cdrw -l” (as shown below). If it returns a message indicating that there are no devices or media then use the eject button on the front of the DVD drive to open the tray. If the cdrw -l command lists a device then use the UNIX eject command to open the tray as explained in the next point

#> /usr/bin/cdrw -l

- To open the a drive unit that has media already inserted in it use the UNIX eject command (as shown bellow). If the eject command does not work it may be the case that someone is in the DVD directory or another backup procedure is running.

  #> /usr/bin/eject cdrom

- Next you want to confirm that all of the data which you want to put on the DVD will fit. You will need to use the cd and ls UNIX commands as follows. First use the cd command to set the current directory to the directory which contains the files you want to back up. In this case the files are in the /export/tmatt/closedsent directory. so the following command is issued.

  #> cd /export/tmatt/closedsent

  Next use the ls command as follows. This command lists all of the files in the current directory. The size of the files in bytes is listed in the fifth column of the output (in bold bellow). Add the size of each file you intend to back up together and ensure that the total size of all files does not exceed 2000000000 bytes. If it does you will need to use more than one DVD. Divide the files up to make the most efficient use of each DVD.

  #> /usr/bin/ls -l
  total 270524
  -rw-r--r-- 1 maint maint **7034800** Feb 3 16:56 data1
  -rw-r--r-- 1 maint maint **4915002** Jan 26 18:55 data2
  -rw-r--r-- 1 maint maint **10000000** Feb 2 15:21 data3
  -rw-r--r-- 1 maint maint **57590000** Jan 23 11:59 data5

- Next you need to create a ISO9660 file system from the files you intend to back up. To do this you use the UNIX command mkisofs. Use it as folllows.Where <destination file> is the name of the binary file that contains the ISO9660 file system. This is selected by the crafts person. <pathspec> represents the full path of the files that are to be backed up. It is very important to ensure that the directory in which you are creating the ISO9660 binary file has at least 2000000000 bytes of free space or the mkisofs command will fail.

  #> /usr/bin/mkisofs -o <destination file> -a -J -L -R <pathspec>

  For example if you wanted to create the <destination file> /export/home/maint/tmatt/tempiso out of the two files data1 and data2 from above you would issue the following UNIX command

  #> /usr/bin/mkisofs -o export/home/maint/tmatt/tempiso -a -J -L -R /export/tmatt/closedsent/data1 /export/tmatt/closedsent/data2

  Note: this command will fail if the files in the path spec total more than 2000000000 bytes in size

- Next you will write the binary that you have created to the DVD. For this you will use the UNIX command cdrw as follows.

  #> /usr/bin/cdrw -C -i <iso9660 file>

  Where <iso9660 file> is the binary you just created above. So for example you would use the following command to write the Binary to the DVD.

  #> /usr/bin/cdrw -C -i export/home/maint/tmatt/tempiso

- Now delete the iso9660 file which was created previously with the rm UNIX command as follows. This is an important step which allows you the regain disk space.

  #> /usr/bin/rm export/home/maint/tmatt/tempiso

15: Functional Description (FN): A00002009

15.1 Feature name

Enhance Display on PSET

15.2 Description

This feature activity is to migrate an existing line option, NAME24, from the MSL layer to the CCM layer.

NAME24 was created in the MSL layer under feature “Name Display Character Extension”. The documentation about the option creation are located in PLS DOC under names of AX1228 (CCM) and AX1240 (MSL).

The NAME24 line option enables subscribers to provide a name up to 24 characters for their private network. This NAME will be displayed on a MBS that supports 24 character display at the other end of the call. The display format will be following:

NAME24 --- Top line

DN --- Bottom line.

A SOC will be associated with this feature in CCM. After the migration, NAME24 will be a SOCed line option in the CCM layer and a non-SOCed line option in the MSL layer.

The SOC will have two functionalities. It controls the NAME24 line option processing and the display when NAME24 doesn’t apply to the originator. See section 2.6, 2.7 and 2.8 for details.

The SOC_FTR_ ID for this activity is “00002009” with OrderCode “MDC00075”

This feature activity involves changes to the MSL layer as well as the CCM layer. But the changes will not affect the behavior of the existing Name Display Character Extension (NAME24) feature in the MSL layer.

15.3 Hardware Requirements or Dependencies

There is no hardware requirement.

15.4 Software Requirements or Dependencies

CCM20

15.5 Limitations and restrictions

- This display feature will only be applied to MBS sets with 24 character display.
- IVD sets will be supported in MSL as well.
- NAME24 is limited to inter-custgrp or intera-custgrp calls in the same switch.

15.6 Servord

15.6.1 Assignment

The NAME24 line option can be assigned to a MBS via the SERVORD ADO, NEW, and COPYSET commands. Since the NAME24 options depends upon the NAME option, it must be assigned to a MBS that already has the NAME option on it or when NAME is being added to the set.

15.6.2 SO prompt

Here shows a simple assignment of this option in SERVORD. see Surveyor section for more examples.

```
>ado

SHOULD ORDER BE DONE ANYWAY? (Y OR N)
>y
```

15.7 Interactions

15.7.1 Interaction with REASON

Since NAME24 provides a name up to 24 characters it preserves all of the spaces on the top line of the display phone for the name and moves DN to the bottom line.

When a REASON display is delivered to a set the NAME24 feature will simply quit processing because of the limited display space. The display will be the same as if NAME24 is not on the originating line.

15.7.2 Interaction with NAME feature

NAME24 works on top of NAME option. It overrides the private network name provided by NAME option.

With NAME option two names can be datafilled for two different networks, private and public. T

With the NAME24 option, a name up to 24 characters can be datafilled. It is intended to be used as a “private” name for people with long surnames.

In the original design, NAME24 overrode either of the two names datafilled by NAME option.

This activity will limit NAME24 only to override “private name” if it is datafilled by NAME option. This change will not affect MSL customers.

The following two tables summarizes the interactions with NAME option before and after this activity.

Table 1 Example Datafill

	Party A	**Party B**	**Party C**	**Party D**
CUSTGRP	IBNTST	IBNTST	BNR	CLASSDSP
CSUTNTWK	PRIVATE	PRIVATE	PUBLIC	--
NAME option	private: Nice public: Nortel	private: Kevin public: Nortel	public: JCPenny	public: JCPenny
NAME24 option	Nice_PictureFrames	Kevin_Alex_ Blazejewski	JCPenny_CaryTown	JCPenny_Crabtree

Table 2 NAME Display Two Names (without NAME24)

Calls	**Network ID of the Call**	**Display on A**	**Display on B**	**Display on C**	**Display on D**
A <-> B	private	Kevin	**Nice**	n/a	n/a
A <-> C	public	JCPENNY	n/a	**Nortel**	n/a
A <-> D	public	JCPENNY	n/a	n/a	**Nortel**
C<-> D	public	n/a	n/a	JCPENNY	JCPENNY

Table 3 MSL Implementation: NAME24 Overrides Two Names

Calls	Network ID Of the Call	Display on A	Display on B	Display on C	Display on D
A <-> B	private	Kevin Alex Blazejewski	*Nice PictureFrames*	n/a	n/a
A <-> C	public	JCPenny CaryTown	n/a	*Nice PictureFrames*	n/a
A <-> D	public	JCPenny Crabtree	n/a	n/a	*Nice PictureFrames*
C<-> D	public	n/a	n/a	JCPenny Crabtree	JCPenny CaryTown

Table 4 CCM Implementation: NAME24 only Overrides Private Name

Calls	Network ID of the Call	Display on A	Display on B	Display on C	Display on D
A <-> B	private	Kevin Alex Blazejewski	*Nice PrictrueFrames*	n/a	n/a
A <-> C	public	JCPenny	n/a	*Nortel*	n/a
A <-> D	public	JCPenny	n/a	n/a	*Nortel*
C<-> D	public	n/a	n/a	JCPenny	JCPenny

15.7.3 Interaction with TCAPNM

NAME24 will not override TCAPNM but will display the TCAPNM and the DN on two separated lines.

NAME24 interacts with TCAPNM in the same way as NAME option. When it detects that TCAPNM applies to the line it will not check if the TCAPNM is retrieved successfully. If no TCAPNM is retrieved no name will be displayed.

15.7.4 Interaction with AUTODISP

NAME24 will display KEY# with DN on the bottom line of the display for incoming calls.

ALEXANDER BLAZEJEWSKI
KEY -1 6841000

15.7.5 Interaction with other features

The NAME24 will not work with features that require extra messages being displayed because of the limited display space. Also, NAME24 will not work with features that have their own specific name to be displayed.

When any one of following features is applied to the line NAME24 will quit its processing. The display will be the same as if NAME24 is not on the line.

a. An E911 call.

b. Attendant is attached to the call.

c. Call is forwarded/redirected/transferred/picked-up

d. The agent is an ACD agent

e. Originating agent is a MADN with the NAME24 assigned.

f. NAME24 will not function when the INSPECT feature is used on the terminating MBS.

15.8 Move DN to the bottom line - Controlled by NAME24 SOC

15.8.1 Background -- DN being dropped from display

When only the Name and DN are going to be displayed and NAME24 does not apply to the originator, the Name and DN will be displayed on the same top line of the terminator's display, and the bottom line will be left empty.

There are some cases that DN will be dropped from display and the bottom line will be left empty on the terminator's display.

Without NAME24 option / SOC MDC00075 = IDLE

- DN will not be displayed on the terminator if originator's Name + DN is over 15 characters long and terminator has a 2x16 display window
- DN will not be displayed on the terminator if originator's Name + DN is over 24 characters long and the terminator has a display window of 2x16 or 2x24.

With NAME24 option / SOC MDC00075 = ON

Since the NAME24 works only NAME and DN are going to be displayed (except AUTODISP), it will display the DN on the bottom line on the terminator's display if NAME24 SOC is ON, and the NAME24 doesn't apply to the originator because of the following reason(s):

- The originator doesn't have the NAME24 line option on it.
- The originator has NAME24 option on it but the terminator has a display window of 2x16.
- The originator has the NAME24 line option on it but it is not to be displayed (possibly, the call is on the public network).
- TCAPNM applies to the originator

Example:

- Party A (6137234532) has the NAME line option with a name of "abcdefghijklmno".
- Party B has a 2x16 display KSET,
- Party A calls party B
- Display on B:
  - — NAME24 SOC Idle

  - — NAME24 SOC On

16: Functional Description (FN): A00002011

16.1 Feature name

DMS-100: Virtual Office Worker

16.2 Description

The intent of this activity is to migrate the Virtual Office Worker (VOW) software from the MSL DRU into the CCM DRU.

The function of the VOW software is not changing as a result of this feature with the exception that it will now be available to all DMS-100 customers instead of limited to MSL-100 PBXs. The function of the VOW feature will be controlled by SOC for those customer who are not using MSL-100 loads.

For a functional description of the VOW feature, please refer to the FN of the original feature. It can be found in the PLS DOC library under AX1236FN.AA20.

16.3 Hardware Requirements or Dependencies

Not Applicable. See section 1.5.1 of AX1236FN.AA20 in PLS DOC library.

16.4 Software Requirements or Dependencies

None.

16.5 Limitations and restrictions

See section 1.7.2 of AX1236FN.AA20 in PLS DOC library.

16.6 Interactions

See section 1.7.1 of AX1236FN.AA20 in PLS DOC library.

16.8 Software Optionality Control (SOC)

For non-MSL customers, this feature will be regulated by standard SOC control. VOWs and VOWDNs can be datafilled, but will not be permitted to log-in unless the feature is activated in SOC. If the SOC is turned off, attempts to log-in by a VOW user will be routed to FNAL treatment.

Table 1 SOC

SOC option name:	TBD
SOC option title:	TBD

17: Functional Description (FN): A00002012

17.1 Feature name

XA-Core CMIC/RTIF HIOP Maintenance Software.

17.2 Description

17.2.1 Overview

This document provides an overview of the functionality provided by the Operations, Administration, and Maintenance (OAM) software for the High Performance Input Output Processor card (HIOP) with CMIC, RTIF, TOD, and ETHR functionality (CMIC/RTIF HIOP).

This HIOP card supports the following functionalities:

- Core to Message Switch (MS) InterConnect (CMIC), providing high speed access to the DMS Message Switch via OC3 links,
- Reset Terminal InterFace (RTIF). The RTIF local ports support XA-Core connectivity to Video Display Terminals (VDT) (EIA RS232 standard). The RTIF remote ports provide connection to remote terminals via modem (EIA RS422 standard).
- Time Of Day (TOD) support, and
- Ethernet, providing high speed access to the Succession Network via 100Mb/s full duplex ethernet links.

  Note: the OAM changes related to the Ethernet functionality were delivered by the XA-Core Ethernet Maintenance feature and are described in document AT.59019176 in fmdoc.

  Note: this feature does not introduce any changes to the Reset Terminal Interface (RTIF) behavior. The RTIF components are backwards compatible to the packlet.

This software provides the maintenance interface to the craft person for monitoring and manipulating the state of the HIOP common equipment, the CMIC, RTIF, ETHR ports and links, and TOD. For more information on the HIOP circuit pack, please refer to document ‘HIOP Maintenance Software’ (AT.59029980).

The components of the interface to the XA-Core are consistent with the XA-Core OAM interface. These include the maintenance administration position (MAP), logs, alarms, and operational measurements (OMs). All maintenance, fault handling, redundancy checking, and event reporting functionalities provided by this feature are consistent with established XA-Core maintenance procedures and guidelines.

The software associated with XA-Core CMIC/RTIF HIOP OAM Software provides the following functionality:

- changes the existing CMIC MAP level and MAP commands in order to maintain the new CMIC ports,
- changes the existing RTIF MAP level and MAP commands in order to maintain the new RTIF links (local and remote),
- changes the existing alarms, logs, and operational measurements that report on the maintenance status of the CMIC and RTIF ports and links.

17.2.2 HIOP card description

The CMIC/RTIF HIOP card is similar to the NTLX04CA HIOP card that supports AMDI, ETHR, and RTIF functionality. The main hardware difference between the two is the transmitter used in the OC3 hardware:

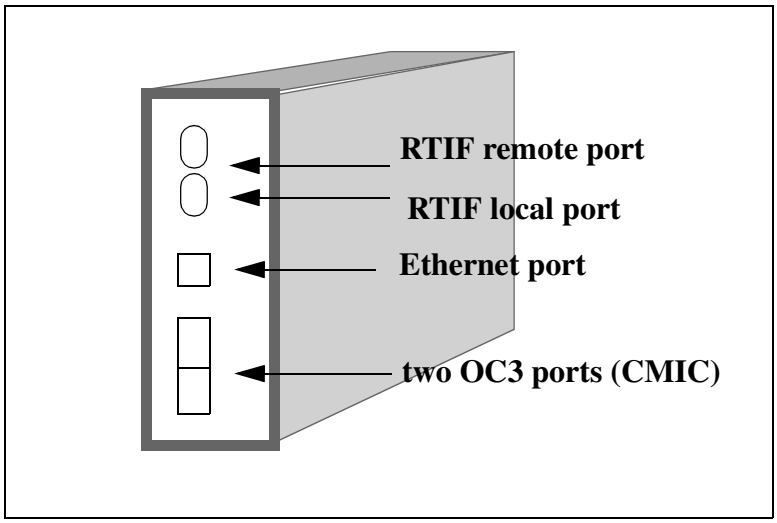
- the NTLX04CA HIOP card has single-mode transmitter (OC3 used for AMDI),
- the CMIC/RTIF HIOP card has multi-mode transmitter (OC3 used for CMIC).

The XA-Core CMIC/RTIF HIOP circuit pack is equipped with:

- two OC3 ports,
- one ethernet port, and
- two RTIF ports: one RS232 RTIF local port and one RTIF remote port.

Unlike circuit pack NTLX03 (IOP), the HIOP card does not support packlets. Please refer to “Figure 1 HIOP card” on page 238.

Figure 1 HIOP card



The HIOP LED strategy follows established XA-Core guidelines: the card is equipped with one red and one green LED which show the status of the card. Three additional amber LEDs represent presence or loss of signal on RTIF, ETHR, and CMIC links respectively.

The XA-Core Visual Indicator (LED) Strategy is described in XA0015FN.

17.3 Interactions

- XA-Core HIOP Maintenance Software: AT.59029980,
- XA-Core Ethernet Maintenance feature: AT.59019176,
- XA-Core Visual Indicator (LED) Strategy: XA0015,
- XA-Core provisioning feature: AT.59009527.

18: Functional Description (FN): A00002013

18.1 Feature name

Intelligent Network T1 Timer Expiry Message Suppression

18.2 Description

The T1 Timer specifies a length of time, in seconds, the SSP waits for response from an off-board processor after sending it a query message before the call is routed to treatment. When routing the call to treatment, a ‘T1 Timer Expiry’ message is generated by the SSP.

This feature, when enabled, will suppress ‘T1 Timer Expiry’ messages from being generated. Suppressing the ‘T1 Timer Expiry’ messages from being generated will prevent the messages from flooding the network should an SCP go down.

However, suppressing the ‘T1 Timer Expiry’ messages violates the standard procedure for this situation and is therefore adding optional functionality.

This feature depends on SOC INW00001 to switch the functionality ON/OFF and uses office parameter T1_TIMER_EXPIRY_MSG_SUPPRESS to provide feature optionality control.

The office parameter contains four fields, the first of which allows the user to switch the ‘T1 Timer Expiry’ message generation ON/OFF. When the feature is on, the remaining three fields allow the user to switch log generation ON/OFF, alarm generation ON/OFF and specify a threshold value. The threshold value is related with the alarm generation and is explained later on.

If the suppress option is switch on, no “T1 Timer Expiry” messages will be generated.

If the log option is switched on, then a GAME101 log will be created when the RSPTMOUT OM count is greater than zero. The RSPTMOUT is an OM peg that is incremented everytime the SSP generates a ‘T1 Timer Expiry’ message.

If the alarm option is switched on, then a GAME102 log will be created when the RSPTMOUT OM count is greater than or equal to the threshold value specified in the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS. This log generates an external minor alarm. It will stay activated while the RSPTMOUT OM count is greater than or equal to the threshold value, as previously described. Or, until an operator clears the minor alarm from the banner. The RSPTMOUT OM count will be checked against the threshold value everytime the RSPTMOUT OM transfer period expires. If the

RSPTMOUT OM count drops below the threshold value and the minor alarm was generated in the previous RSPTMOUT OM transfer period, then this feature will clear the minor alarm.

For more details on the log or alarm, please refer to the relevant documentation.

18.3 Hardware Requirements or Dependencies

None.

18.4 Software Requirements or Dependencies

None.

18.5 Limitations and restrictions

This feature will impact DMS-100 (including TDM, Succession, MSL), MMP and SSR. All other markets are not affected by this feature.

18.6 Interactions

None.

19: Functional Description (FN): A00002016

19.1 Feature name

A00002016: AINDENY Enhancements

19.2 Description

19.2.1 Background

AINDENY currently exists as both a line and customer group option. Its purpose is to block the triggering of Vertical Service Code (VSC) triggers to lines and customer groups. The VSC triggers are Specific Feature Code (SFC), Public Feature Code (PFC) and Office-Wide PFC (OFCPFC). These triggers are all hit by the originator dialing a digit string starting with a * or #. The AINDENY line option blocks SFC, PFC and OFCPFC triggers. The CUSTSTN option only blocks OFCPFC triggers.

AINDENY options are lists of {ACTION, SCOPE} pairs where ACTION is either DENY or RESTORE and SCOPE specifies a specific tuple in table TRIGITM or a whole trigger-type. An AINDENY option of “AINDENY DENY TIID 4 OPFC3, DENY TIID 4 SFC2” will deny triggering to the triggers defined in table TRIGITM as “4 OPFC3” and “4 SFC2”. The option can block entire triggers types, e.g. “AINDENY DENY ALL SFC”. Furthermore, the option can specifically allow triggers that have been blocked by AINDENY. “AINDENY DENY ALL OFCPFC, RESTORE TIID 4 OFCPFC2” denies all Office-Wide PFC triggers except the “4 OFCPFC2” trigger.

19.2.2 Functional Description

Verizon has requested the ability to deny AIN Prefix triggers (Specified_Carrier, One_Plus_Prefix, International, Operator_Services) on a per trunk group basis. This can be accomplished by enhancing table TRKAIN to store AINDENY information. In addition, this activity will expand the CUSTSTN AINDENY option to hold 15 triggers to bring it in line with the AINDENY line option.

19.2.3 Enlarging the CUSTSTN AINDENY Option

Currently the AINDENY option of table CUSTSTN can only hold 10 elements; that is, only 10 DENY or RESTORE actions can be taken per customer group. The AINDENY line option can hold 15 elements. This activity will enlarge the storage capacity of the CUSTSTN AINDENY option to 15 elements.

19.2.4 Denying Prefix Triggers

The four Prefix triggers (Specified_Carrier, One_Plus_Prefix, International, Operator_Services) are all detected at the Info_Analyzed TDP. The AINDENY line and customer group options cannot currently block these trigger types. This activity will allow the CUSTSTN, line and the newly created TRKAIN AINDENY options to hold the four Prefix triggers and block their triggering at the Info_Analyzed TDP.

19.2.4.1 Datafill for blocking Prefix triggers

The Prefix triggers are detected at the Info_Analyzed TDP (TDP 4). One or more Prefix triggers need to be added to table TRIGITM as below.

Table 1 Example Datafill for the Prefix triggers in table TRIGITM

TDP	Name	Trigger	Criteria	State	Action	MSGSET	TRANSPRT	GTT
4	PRFXEX1	*SPECARR*	$	ULK	EVENT	R02	SS7	AINPOP
4	PRFXEX2	*ONEPLUS*	$	ULK	EVENT	R02	SS7	AINPOP
4	PRFXEX3	*INTERNTL*	$	ULK	EVENT	R02	SS7	AINPOP
4	PRFXEX4	*OPERSRV*	$	ULK	EVENT	R02	SS7	AINPOP

Secondly, individual agents need to subscribe to the Prefix triggers. This can be accomplished in tables OFCTIID, CUSTIID, TRKAIN or through Servord.

Table 2 Subscribing Agents to AIN Prefix Triggers

Agent	Datafill
Office	table OFCTIID; add 4 PRFXEX1 ON
Customer Group	table CUSTTIID; add RESGRP 4 PRFXEX1 ON
Line	servord; ado $ 6213519 ain tiid 4 PRFXEX1 ON $
Trunk	table TRKAIN; add CLLI3 AIN TIID 4 PRFXEX1 ON $

Next, the AINDENY option can be added to the line, table CUSTSTN or table TRKAIN.

Table 3 Adding the AINDENY option

Agent	Datafill
Customer Group	table CUSTSTN; add RESGRP AINDENY AINDENY DENY TIID 4 PRFXEX1 $

Table 3 Adding the AINDENY option

Agent	Datafill
Line	servord; ado $ 6213519 AINDENY DENY TIID 4 PRFXEX1 $
Trunk	table TRKAIN; add CLLI3 AINDENY DENY TIID 4 PRFXEX1 $

Finally, the SOCs relevant to the trigger being detected need to turned on. Table 4 details the SOC Codes for PFC, SFC, OFCPFC, and the Prefix triggers.

Table 4 SOC Order Codes for VSC and Prefix Triggers

Trigger	SOC
SFC	AIN00294
PFC	AIN00294
OFCPFC	AIN00309
SPECARR	AIN00252
ONEPLUS	AIN00251
INTERNTL	AIN00253
OPERSRV	AIN00254

19.2.5 Blocking Prefix Triggers for Trunks

Trunks can be subscribed to AIN triggers through table TRKAIN or through office-wide subscriptions. However, there is currently no way to block the triggering for specific trunk groups.

Currently, table TRKAIN is keyed by CLLI. This activity will reformat the TRKAIN table to be keyed by a combination of CLLI and option name. This new format will allow a new AINDENY option to be added against CLLIs. The existing subscription information will be keyed by CLLI and the option name ‘AIN’.

The new AINDENY option will be functionally similar to the line and customer group options except that it will only block Prefix triggers. It will not be capable of holding SFC, PFC, or Office-Wide PFC triggers. It will allow 15 DENYs or RESTOREs just as the line and customer group options.

19.2.5.1 Datafilling AINDENY option in table TRKAIN

Table TRKAIN will be indexed by a combination of trunk group and option name. To deny all Operator Services triggers, except trigger “4 OPSRV1” for trunk group ISUP2WITEA, add the tuple seen below.

Table 5 Example Datafill for an AINDENY Option in table TRKAIN

OPTKEY	OPTINFO
ISUP2WITEA AINDENY	AINDENY (DENY ALL OPSERV) (RESTORE TIID 4 OPSRV1) $

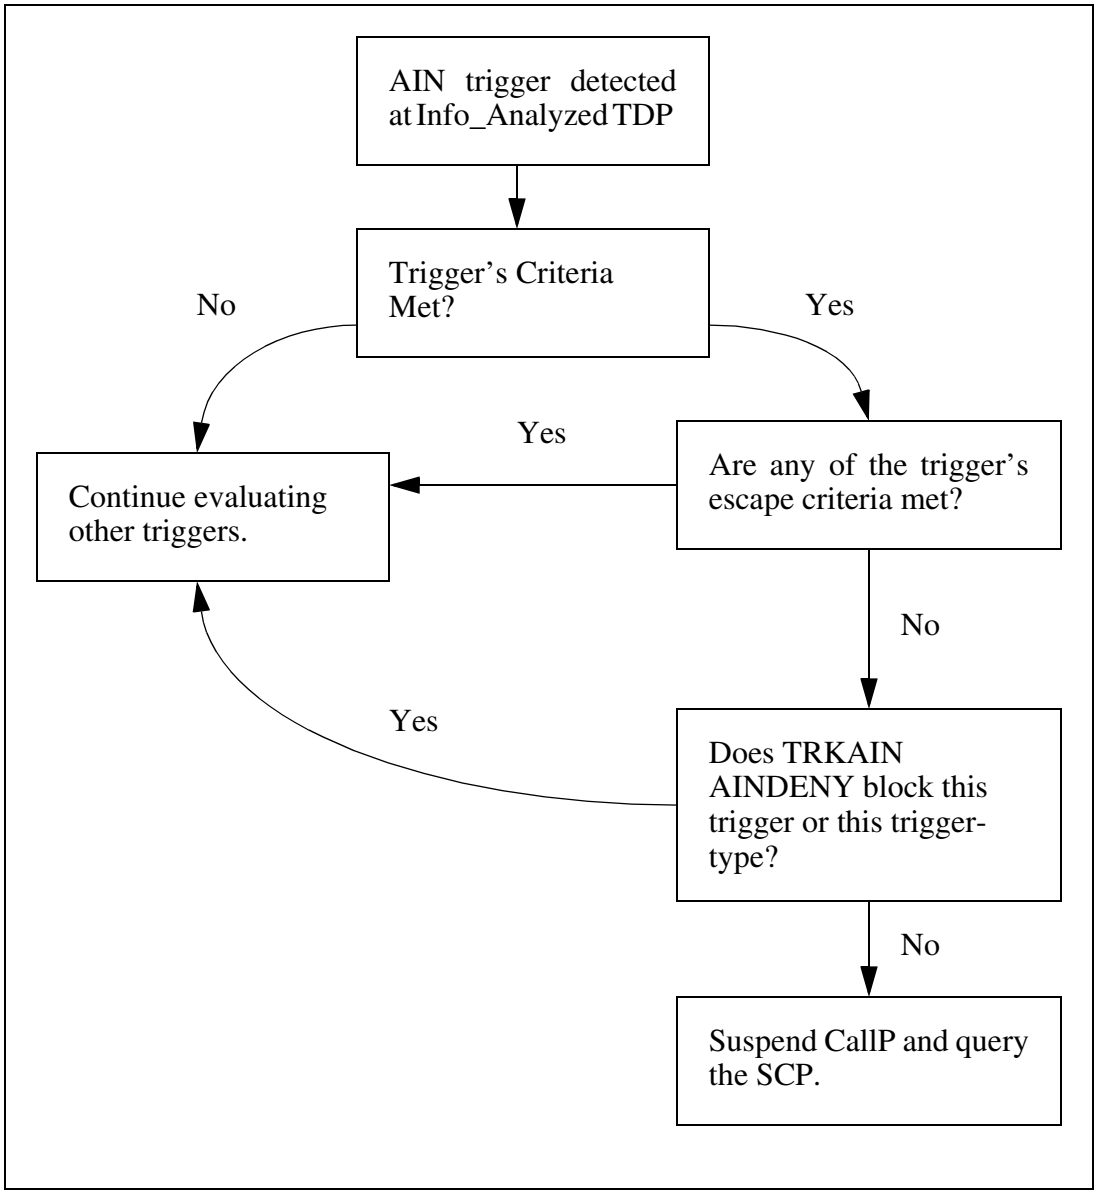
The existing AIN subscription information will be reformated to add an option name of 'AIN'. See table 6 for an example.

Table 6 Example Datafill for AIN Option in table TRKAIN

OPTKEY	OPTINFO
ISUP2WITEA AIN	AIN TIID (4 INTRL1 ON) (4 OPSRV3 ON) $

19.2.5.2 TRKAIN AINDENY CallP Behavior

When an originating trunk encounters the INFO_ANALYZED TDP and is subscribed to any AIN triggers at this TDP, it will evaluate the criteria for each subscribed trigger. If all the trigger criteria are met (including escape criteria), call processing will be suspended while the SCP is queried. If there is a TRKAIN AINDENY option datafilled against the originating trunk and the option specifies that the specific trigger or trigger-type is denied, the SCP will not be queried and AIN will continue evaluating any other subscribed triggers at this TDP. This behavior is summarized in the flowchart below.



19.2.6 Traver

The Traver tool simulates a call from the user specified originator with the user specified digits. Traver will display information regarding subscriptions to AIN triggers and will display the criteria associated with those triggers. The tool also respects the AINDENY line and customer group options and will tell the user if the SCP query was blocked due to AINDENY. Traver code will be enhanced to consider AINDENY for Prefix triggers and trunk origination.

Example of line being denied a One_Plus trigger by AINDENY line option:

```

19.3 Hardware Requirements or Dependencies

No new hardware requirements are introduced by this feature.

19.4 Software Requirements or Dependencies

The basic AIN SOC options need to be in state ON for the AINDENY option to be encountered during CallP. However, no new software dependencies are introduced by this feature.

19.5 Limitations and restrictions

Only AIN-capable trunks will be allowed AINDENY options in table TRKAIN.

20: Functional Description (FN): A00002020

20.1 Feature name

ESA Translation Download

20.2 Description

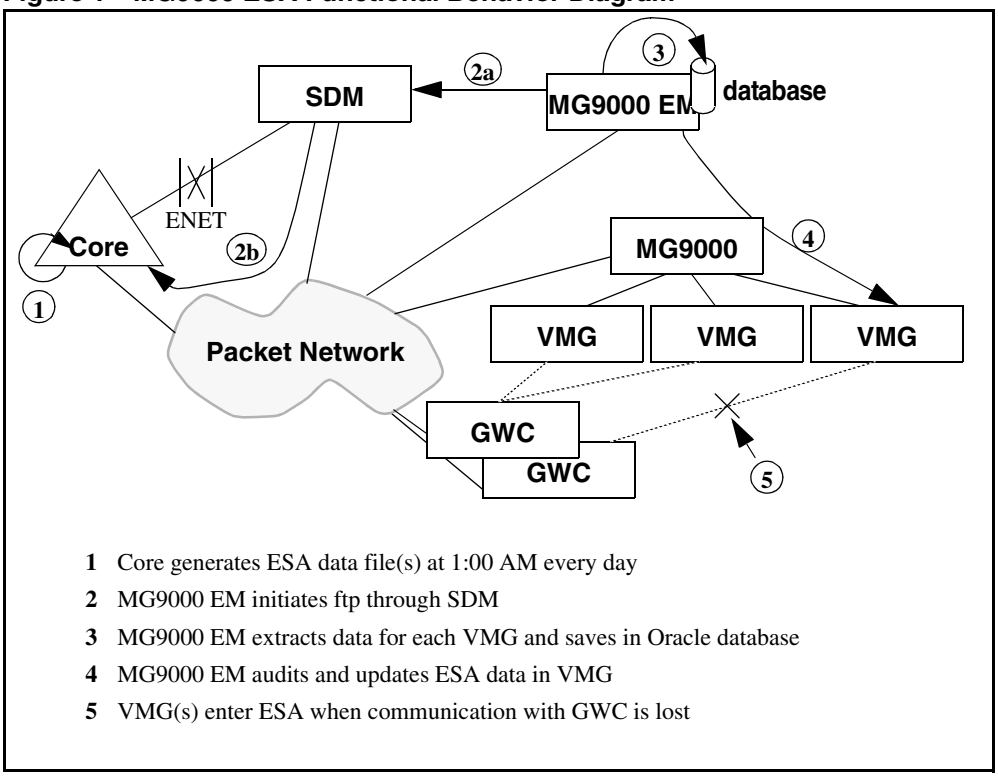
This activity allows the download of information necessary to support Emergency Stand Alone (ESA) call processing across all native (non ABI) lines served by a single MG9000.

The download takes place from the CS2000 core to an MG9000 element manager. The data is generated by the core at 1:00 AM and stored in a file called ESA_SYSTEM_SD$XML on a device specified by OFCENG parameter ESA_GWDATA_DEVICE. It is then downloaded by the MG9000 EM through the SDM.

Prior to this activity, ESA was supported for the MG9000 but all ESA data was provisioned through the MG9000 element manager. This method will continue to be used for VMGs not marked as North American in the MG9000 EM.

Note: Activity “A00002380 - MG9K ABI ESA” is implemented in CCM20 and enhances MG9K ESA to support ABI as well as non native lines. The documentation for that activity affects many of the same areas as this activity but in most cases does not invalidate the documentation found here. One exception is the ESATRAVER command described in the CN section of this document.

Figure 1 MG9000 ESA Functional Behavior Diagram



1 Core generates ESA data file(s) at 1:00 AM every day

2 MG9000 EM initiates ftp through SDM

3 MG9000 EM extracts data for each VMG and saves in Oracle database

4 MG9000 EM audits and updates ESA data in VMG

5 VMG(s) enter ESA when communication with GWC is lost

20.2.1 Related Activities

This activity is one of three activities to enhance ESA for the MG9000 in the SN06.2 time frame. The activity addresses the core code and will be sourced into the SN07 stream and patched back to SN06.2

The other features are

- A00001982 - ESA Enhancements [MG9000]
- A00002019 - ESA EM Enhancements (MG9000 EM]

This activity assumes that deterministic LENs are being used for MG9000 lines. Please refer to

- “A89009298 - MG9000 Lines Preprovisioning” (SN06)

20.3 Hardware Requirements or Dependencies

This activity requires CS2000 with SDM and EIOP.

The maximum size of SFDEV is 5 million words (10 million bytes) so a disk device must be available for large offices. Please see the engineering section of this document.

20.4 Software Requirements or Dependencies

Office must convert to using deterministic LENs for MG9000 as described in SN06 activity “A89009298 - MG9000 Lines Preprovisioning”.

20.5 Limitations and restrictions

ESA data will be built by the core every 24 hours at 1:00 AM or as the result of a manual command. Changes to CS2000 line data will not be reflected in the MG9000 until the data has been

- built by the core
- downloaded by the MG9000 Element Manager (EM)
- downloaded to the MG9000

Individual MG9000 VMGs can drop into ESA independently of other VMGs on the same MG9000. Emergency 911 lines should be provisioned on each VMG with table ESAPXLA provisioned to route 911 calls to these lines.

The ESA_SYSTEM_SD$XML file is not normally viewed by the telco. The DMS PRINT and EDIT commands will only partially display the file. The file must be transferred, using FTP, to a PC or UNIX, to be viewed completely.

20.6 Interactions

The MG9000 EM downloads the ESA data file from the core daily. The time for this download should be set so the data has been freshly built. The default values in the core and MG9000 EM are set to ensure the data is downloaded soon after being built.

21: Functional Description (FN): A00002047

21.1 Feature name

Double Density Spectrum Backplane

21.2 Feature Synopsis

This feature is being implemented in release SN07, under the following activities:

- A00002047 for DMSSHR(20)
- A00002057 for SP(20)

The feature entails the implementation of a new double density backplane for the Spectrum family of products.

The intent of this feature is to enable space efficiency by collapsing today's two-shelf Spectrum node configuration into a single double density card shelf. This can be accomplished in several ways. One example would be an IW SPM that does not use ECAN, provisioned with two CEMs, two ATM RMs, three DSP RMs, and a Sync RM. This has a straightforward conversion to a single-shelf configuration using the double density backplane. A second example would be a densely configured MG4K node, provisioned with two CEMs, two ATM RMs, two OC3 RMs, four DSP RMs, seven COH RMs, two Sync RMs, two DLC RMs, and an Alarm RM. In this case, when taken together with the new Spectrum resource module, the NTLX45AA Telephony Services Processor (TSP), customers will be able to fit four such Spectrum nodes into a single frame, one node per shelf.

The Double Density SPM program will significantly improve the trunk port density of the Spectrum-based product portfolio. Program benefits are a 50% density increase, achieved by a 50% footprint reduction, and a small yearly operating cost reduction (power and floor-space savings) which lowers the customer cost of ownership. The Double Density SPM program introduces new Spectrum back plane hardware, the NTLX51CA. The new back plane will provide backwards compatibility with the existing Resource Modules. Due to slot limitations, products that use the three-slot LSA complexes will experience slot exhaustion in the Double Density Spectrum-these products currently include MG4K LSA/STS1 and GSM e3 TCU/BSC-and, thus, will not be able to exploit the new backplane.

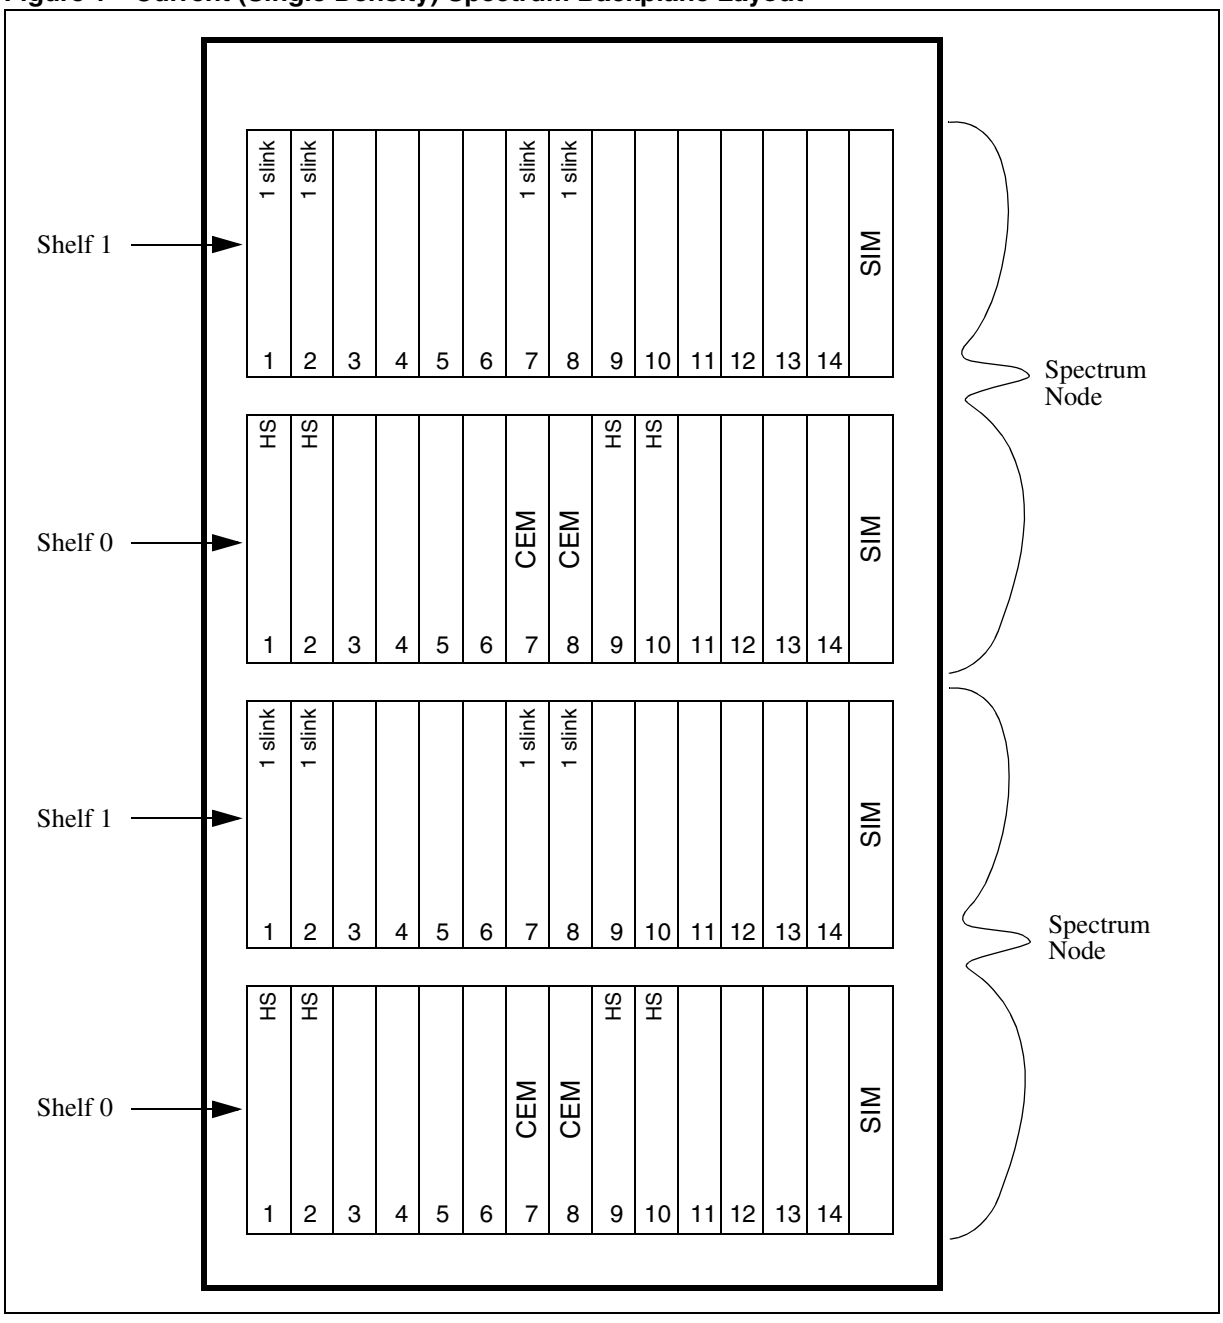
There are two distinct phases to the Double Density Spectrum Program. The first phase (A00002047, covered in this FN) modifies the existing Spectrum backplane hardware, NTLX51BA, to support four 15-slot Spectrum nodes per frame; currently two 30-slot nodes are supported per frame. The second phase, A00002386, constructs a new high-density DSP/ECAN card (the Telephony Services Processor, or TSP card) creating a new ECAN and DSP applications. This second phase also modifies the Spectrum software to support the concept of dynamic resource re-assignment within a single call and allows DSP and ECAN applications to co-exist on a single card.

21.3 Background Information

Today's Spectrum hardware includes a frame with PEC NTLX91BA that houses a backplane with PEC NTLX51BA which in turn supports **two** Spectrum nodes, each spanning two contiguous card shelves. (Please refer to "Figure 1 Current (Single Density) Spectrum Backplane Layout" on page 259.)

As illustrated, each Spectrum node occupies two shelves within the frame, each shelf housing 15 slots. Slot 15 on each shelf is dedicated for the Shelf Interface Modules (SIMs). Slots 7 and 8 of shelf 0 for each Spectrum node are dedicated for the Common Equipment Modules (CEMs).

Figure 1 Current (Single Density) Spectrum Backplane Layout



The remaining slots support various Spectrum resource modules (RMs), each having varying serial link (slink) requirements, depending upon the inter-module communication needs. Four high-speed slots are each serviced by 9 slinks and can be used for RM types such as OC3 or ATM. Low-speed slots are serviced by 3 slinks and can be used for RM types such as DSP or VSP. There are also four slots (1, 2, 7, and 8 on shelf 1) with single slinks which can accommodate DLC, DLC2, and ALM cards.

21.4 Feature Description

The new hardware layout for Double Density Spectrum includes a frame with PEC NTLX91CA (identical to the NTLX91BA frame[1]) that houses a backplane with PEC NTLX51CA which in turn supports **four** Spectrum nodes, each spanning only a single card shelf. (Please refer to “Figure 2 New Double Density Spectrum Backplane Layout” on page 261.)

Slot 15 on each shelf is still dedicated for the SIMs. Also, since each shelf is a “shelf 0”, slots 7 and 8 on each shelf are dedicated for CEMs. Of the remaining slots, ten of them are high-speed (9 slink) slots, slots 5 and 6 are single slink slots.

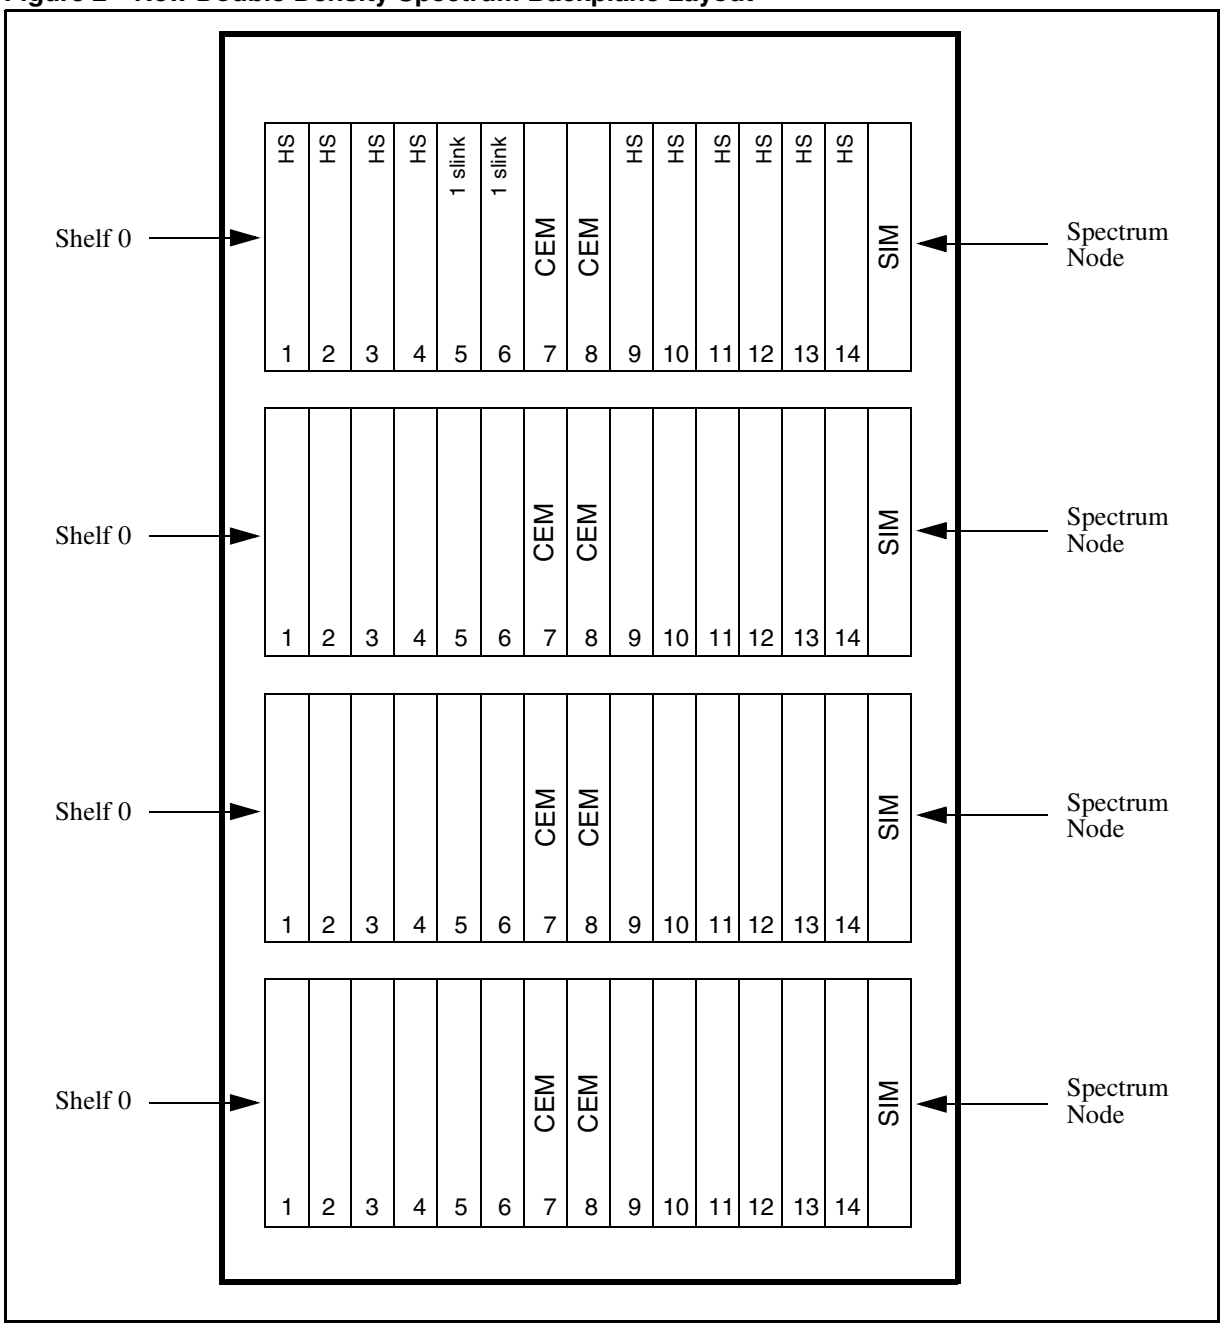
Clock synchronization traces are present in slots 1 and 2 (for use by ATM RMs), slots 9 and 10 (for use by OC3 or ATM RMs), and slots 5 and 6 (for use by Sync RMs, and also suitable for DLC and DLC2 RMs).

The addition of high-speed slots (and consequent reduction in low-speed slots) enable the single-shelf Spectrum layout through compression of DSP and ECAN functionality into a very small number of the new Telephony Services Processor (TSP) RMs.

> ***Note:*** To provide a future migration path for the Spectrum product (e.g., for OC-12 support), a set of Differential Link (D-Link) signals have been added to the double density backplane assembly. These D-link signals route between slots 5 & 6 and the ten high-speed slots; slots 5 & 6 form the hub of the D-link signals which emanate in a star configuration to the high-speed slots.

[1]The new frame PEC code is needed to facilitate ordering, since the frame and backplanes are ordered as a unit.

Figure 2 New Double Density Spectrum Backplane Layout



21.5 Limitations and restrictions

Though high-speed and double density Spectrum backplanes may co-reside in the same office, the two backplanes cannot be mixed within the same Spectrum frame.

21.6 Logs (LG)

N/A

21.7 Data schema (DS)

21.7.1 New/modified tables

Table 1 New or modified tables

Table name	NEW, CHANGED or DELETED	Table Control (NEW/OLD/UNCHANGED)
MNSHELF	changed	unchanged
MNCKTPAK	changed	unchanged

There are no new fields for tables MNSHELF or MNCKTPAK. Rather, the verification rules have changed in support of the double density Spectrum backplane. Tables MNSHELF and MNCKTPAK will be modified to enforce the following restrictions with respect to the double density Spectrum backplane:

- a single frame cannot contain both a traditional (high speed) Spectrum shelf assembly (NTLX51BA) and a new double density shelf assembly (NTLX51CA)
- a single NTLX91CA frame can be provisioned with no more than four Spectrum nodes, using only double density Spectrum shelf assemblies (NTLX51CA)
- frames older than NTLX91CA with backplanes older than NTLX51CA cannot be datafilled with more than two Spectrum nodes
- circuit packs cannot be datafilled on shelf 1 of a Spectrum node that resides on a double density backplane (since shelf 1 cannot exist)
- prevent higher speed cards from being datafilled in slots 5 and 6 (the SRM slots) of a double density Spectrum node
- ATM RMs can be datafilled in slots 1 and 2, or 9 and 10 only
- OC3 RMs can be datafilled in slots 9 and 10 only
- Sync RMs can be datafilled in slots 5 and 6 only

21.8 Office parameters (OP)

21.11 Command interface (CI)

21.11.1 MAP Display Changes

Since a double density Spectrum node will only use up one card shelf, rather than the two shelves used up by a traditional Spectrum node, corresponding changes are necessitated to some of the SPM MAP displays. Specifically, the SPM shelf level and CEM/RM protection level MAP displays will be truncated to display only the one card shelf. The following subsections illustrate the changes.

21.11.1.1 SPM Shelf Level MAP Changes

The SPM shelf level MAP summarizes the states of all of the SPM's cards. (Refer to Figure 3 on page 263and Figure 4 on page 264.)

> mapci;mtc;pm;post spm 34

Figure 3 Old Single Density Spectrum Node Display

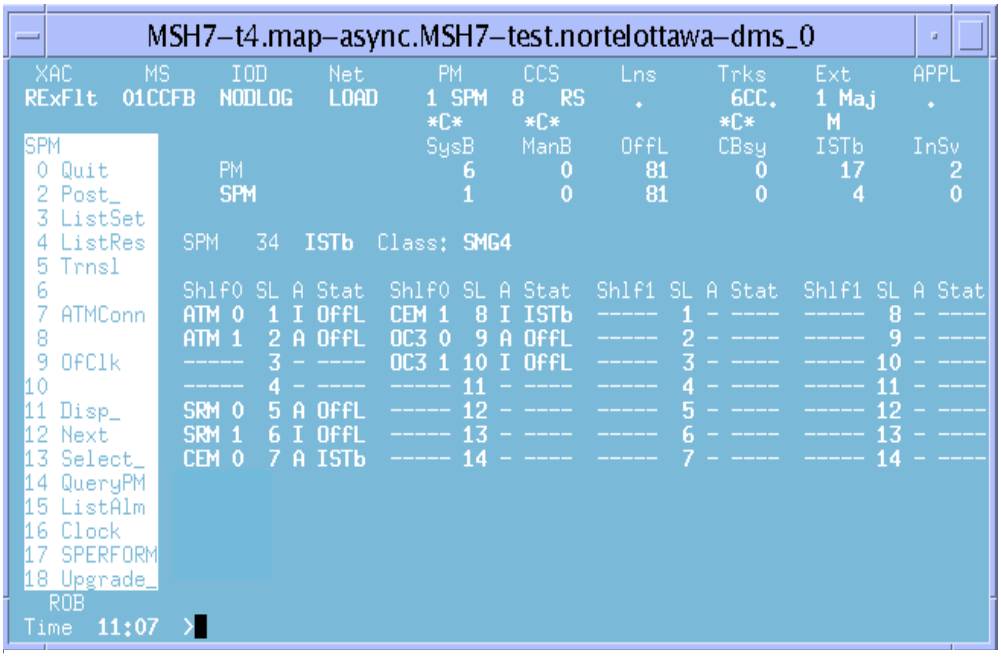

Figure 4 New Double Density Spectrum Node Display

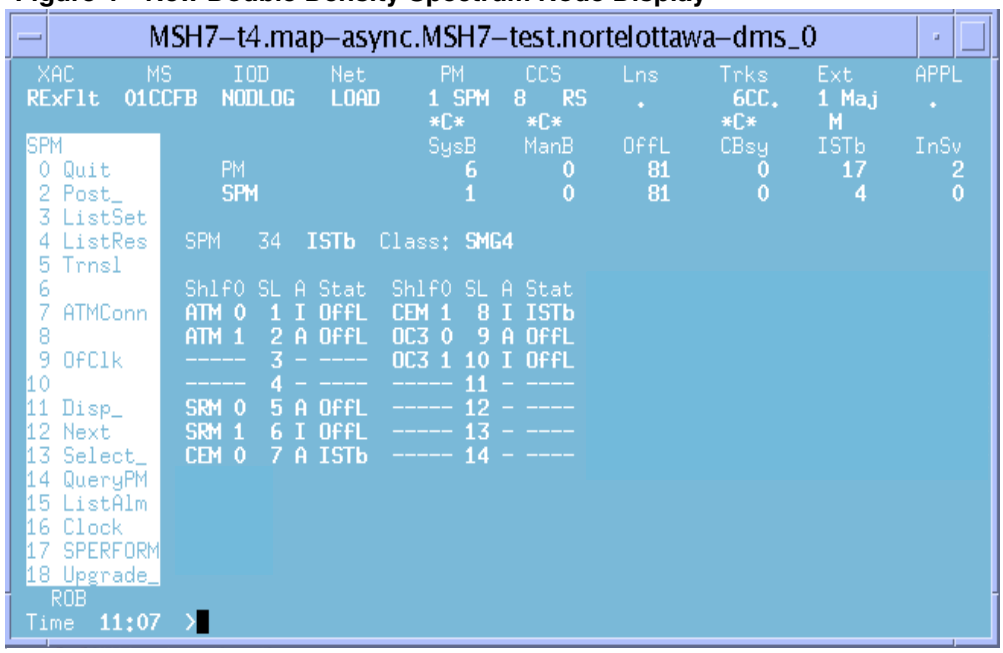

21.11.1.2 SPM Module Protection Level MAP Changes

The CEM (or RM) protection level MAPs are used for manually switching CEM (or RM) activity between units in the same Protection Group. (Refer to Figure 5 on page 264 and Figure 6 on page 265.)

> mapci;mtc;pm;post spm 34;select cem 0; prot

Figure 5 Old Single Density Spectrum Node Display

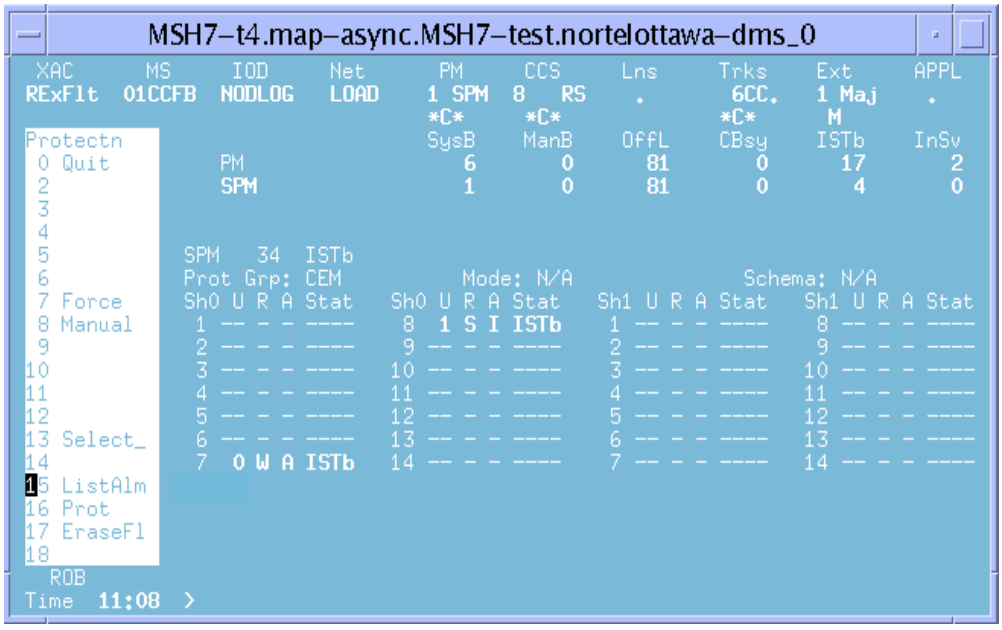

Figure 6 New Double Density Spectrum Node Display

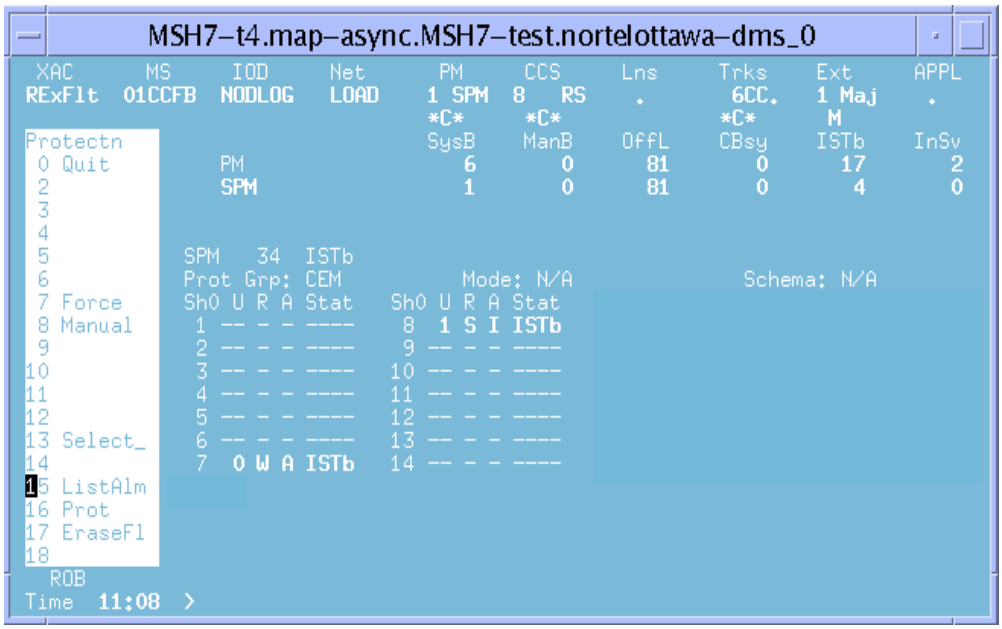


21.12 Glossary

Term	Description
TSP	Telephony Services Processor - a new, high-density Spectrum resource module that can be used to replace multiple VSP, DSP, and COH resource modules.

22: Functional Description (FN): A00002133

22.1 Features name

A00002133:

CBM HA Installation, Patching and SW Delivery

22.2 Description

This feature provides the following functionality:

CBM product functionality:

- Software delivery processes for the CBM product
- Installation for the CBM product in both single and dual server high availability configuration
- Preparation work required in SN07 for CBM upgrades in SN08

Product generic functionality:

- A platform for patching for products based on the Solaris operating system
- An easy to use interface for installing and removing software

Software Delivery

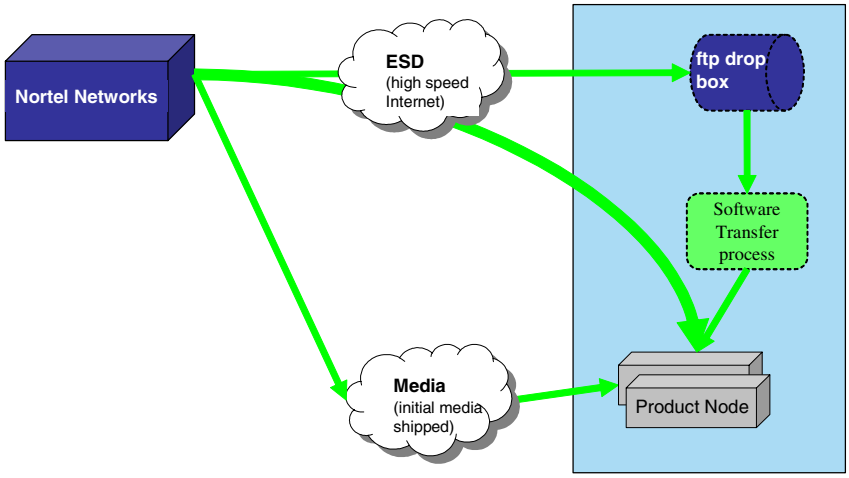
Electronic software delivery (ESD) is the supported method of software delivery for the CBM product. To support ESD, customers will require a high speed internet connection.

ESD provides greater responsiveness than media delivery. ESD provides business value by enabling automatic application of software reducing support costs.

CDROM media will be included with the initial product installation. Patches and maintenance load images will be delivered through ESD

ESD deliveries can be deposited on an intermediary machine, or directly onto the product node if access is provided. The direct access method is preferred as it is simpler.

The following diagram depicts an overview of software delivery.



The CDROM media will contain the final load image for the product and all available packages at the time the CDROM image was mastered. From that point on, the product will be patched using electronic patch delivery.

Installation

Installation procedures will support system preparation prior to shipment to the customer site to add business value. Preparation work includes installation of the SSPFS platform and CBM common software. Value is created by reducing installation technician labour costs as a single technician can perform the common parts of the installation process on many machines at the same time at the factory. This saves installation time and complexity during the install procedure at the customer site.

For two node clusters, the following steps are performed on the active node. Either node can be arbitrarily selected to be the active node for installation.

Installations for a single node cluster are very similar to installations for a two node cluster. Simply skip the last step where the inactive node is cloned.

Installation steps:

1) Install Solaris and the SSPFS platform and the CBM common components

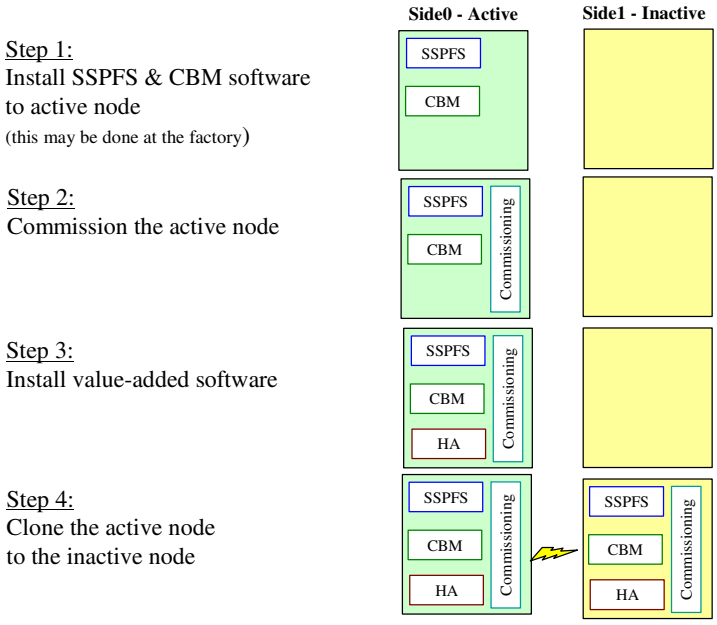
<these steps will be performed at the factory prior to shipment to site>

2) Perform system commissioning

3) Install value added software such as Billing, OM Delivery, or any other purchased software.

If this is a two node cluster, then

4) Clone the inactive node from the active node using the sync mechanism provide with the SSPFS HA framework



CBM Common software installation:

The installation interface is command line driven and common to all CBM based products. The “cbm_setup” installation tool provides a simple interface to initiate, complete, and provide status feedback for the installation.

Verification completed.
```

<End screen capture>

Upgrade preparation work:

cbm_setup will be used to provide a simple command line interface for upgrades. This adds business value by reducing training costs that would be required to learn multiple interfaces.

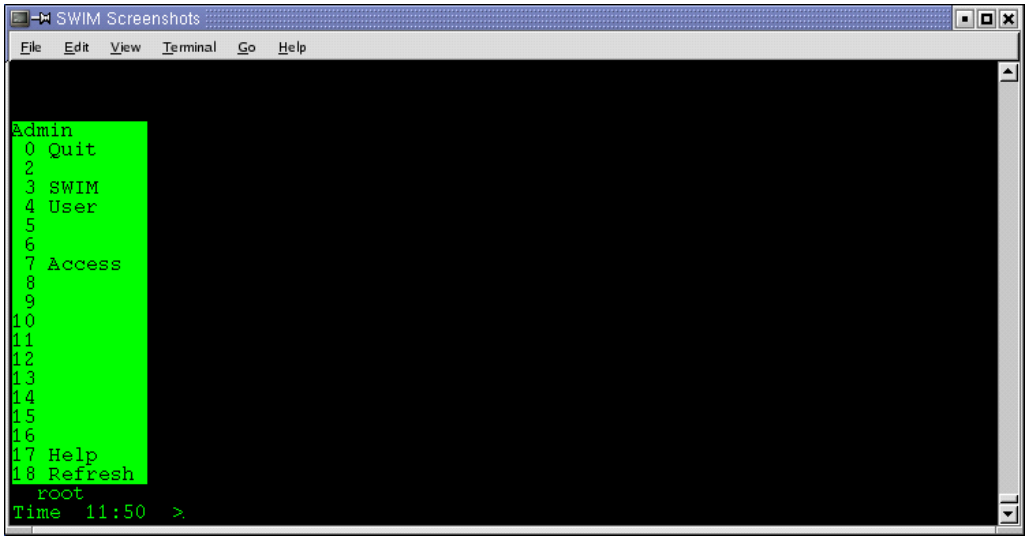
cbm_setup was designed to minimize user interaction prompts which adds business value by preventing user error and reducing labour and training costs.

CBM Upgrades were not completed as part of this activity.

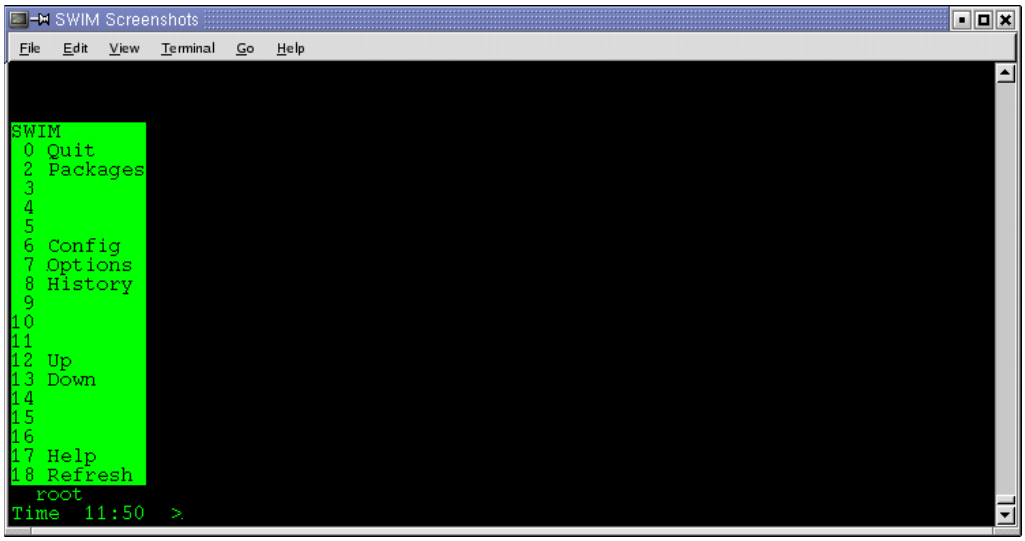
Software management:

Value added applications are installed via the SWIM level of the cbmmtce interface. Applications can be installed or removed at any time after initial installation. Applications must only be installed from the active node cbmmtce interface. This interface provides business value by providing a common interface across products for package removal and installation.

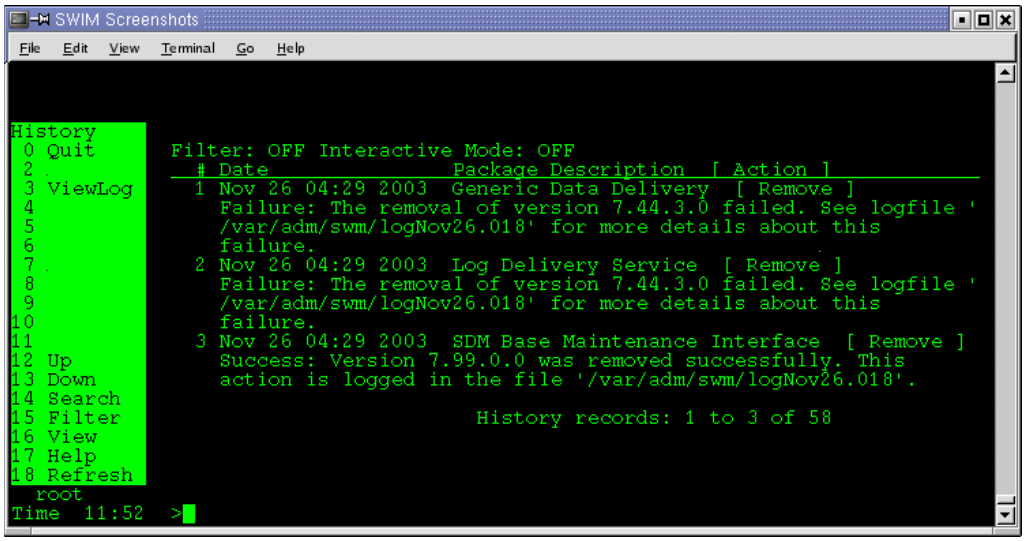
The SWIM level is accessible directly by typing SWIM and then enter in the cbmmtce interface, or through the admin level of the cbmmtce interface as detailed in the following graphic:



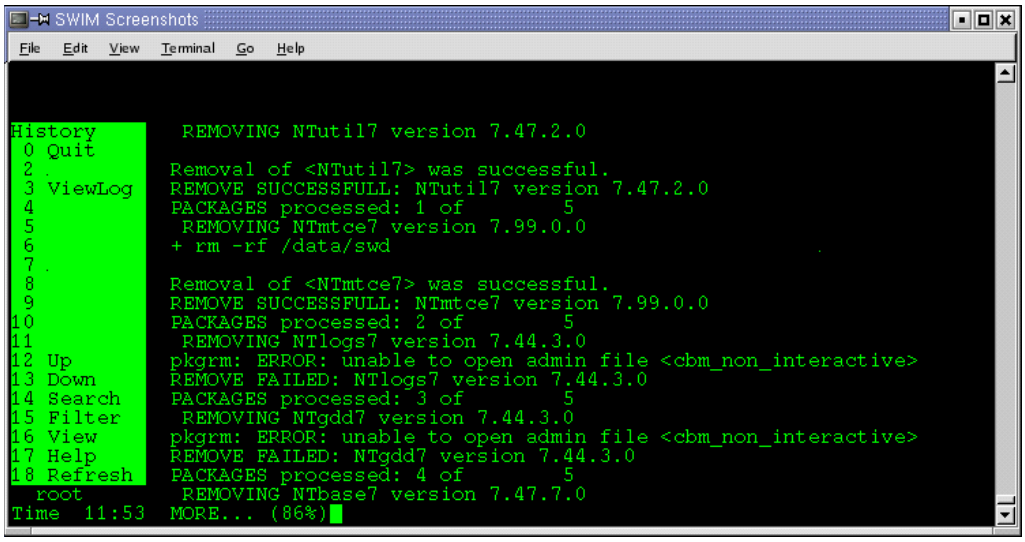
The options provided by the SWIM level are shown in the following graphic:



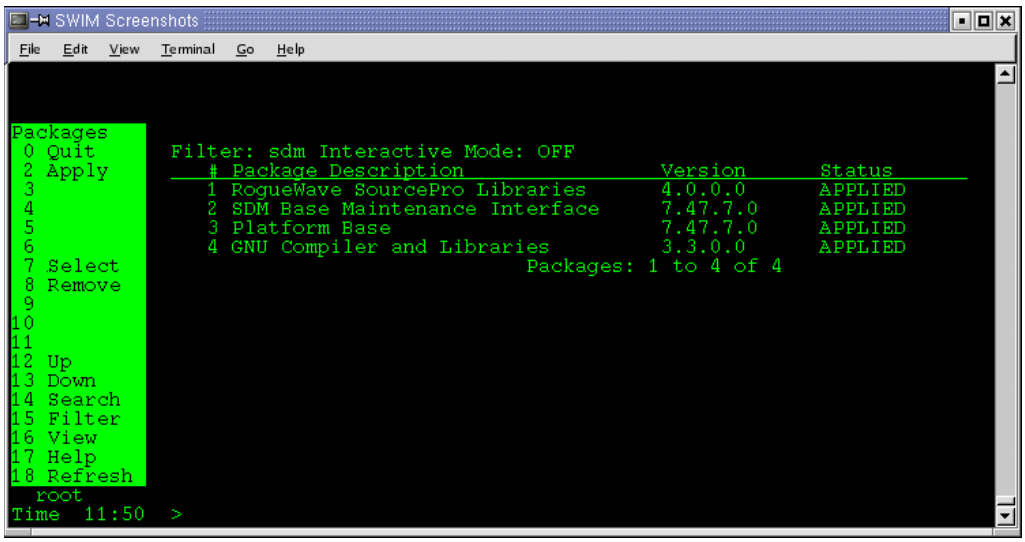
The SWIM -> History level provides a transaction history of packages that were applied using SWIM. These logs are maintained on the system and rotated every week or as disk space requires them to be rotated.



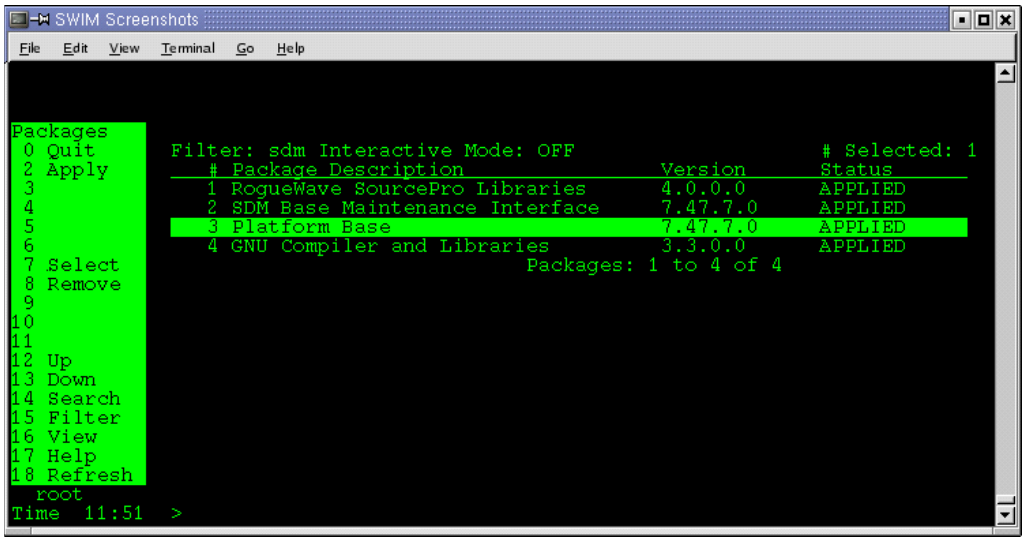
The SWIM -> History -> ViewLog level can be used to view the details from the application of a package using SWIM.



The SWIM -> Packages level shows software that is installed. The SWIM -> Packages -> Apply level should be used to apply software. It will provide a listing of available software Packages in a specified or default directory. The default directory is /swd/.



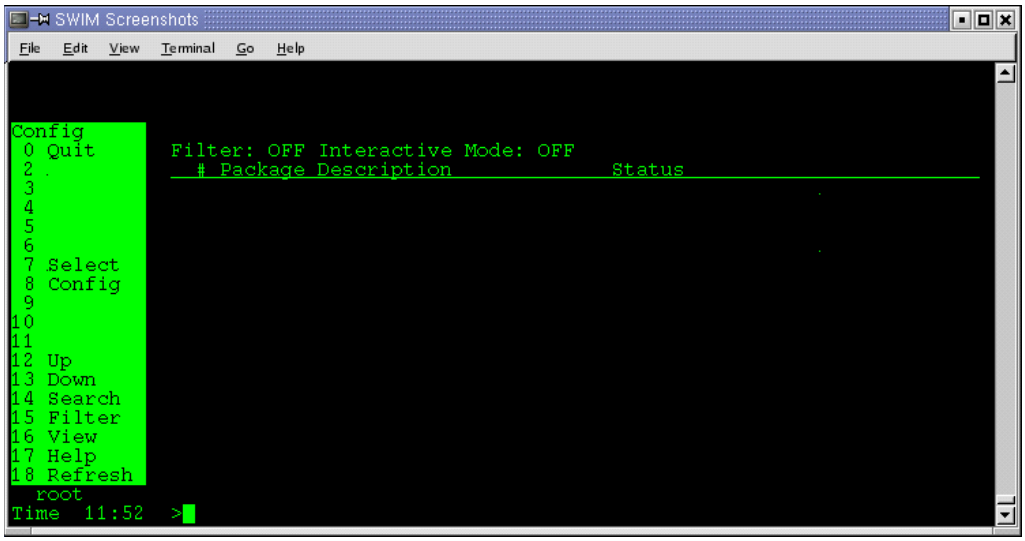
SWIM -> Packages, with an installed package selected



Application configuration:

Applications that require manual configuration will be configured via a command line interface initiated from the cbmmtce interface's config level. This provides business value as the interface and approach are the same across products preventing re-learning to reduce training costs and user error.

The following graphic depicts the config level:



Applications not requiring manual configuration will automatically be configured during installation or as they are brought into service depending on the scenario. The process of configuring these applications will be transparent to the system user.

Applications requiring manual configuration can be configured in two ways:

1) During installation, SWIM will notice the application requires manual configuration and at the end of the installation it will automatically prompt the user for the configuration steps and information.

Multiple installations requiring configuration will be batch queued such that the manual configuration steps are all executed at the end of the software installation cycle.

2) Should the user decide not the configure the application at installation time.They can configure, or reconfigure the application from the config level of the cbmmtce interface.

Patching:

A suite of tools to control patching are built into the SSPFS product. The tools are available to any products built on top of the SSPFS product, including the CBM product.

The patching suite tools create business value by reducing patching & support costs. They provide simple and product generic user interfaces to apply and remove patches as well as query and audit software.

Corrective content will be made available to the customers as individual patches. These will be provided in Solaris patch format contained within a tar and gzipped archive.The patching tools automatically handle processing and applying the patches.

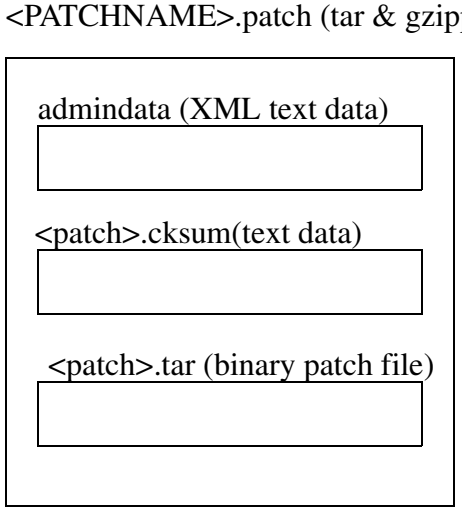
New for the CBM is a mechanism to guarantee the integrity of patches as they are received. The checksum delivered with the patch is used to verify the integrity of the patch archive. Any patch that is damaged in any way on its way to the CBM will be rejected as damaged.The customer will be informed of any such rejection.

Patches will be compressed and transported as a single file. The compression adds value by reducing disk space requirements and ESD transfer times for patches.

The patch archive will contain checksum data to verify the patches integrity. Should the patch file become corrupt in any way, the system will be able to detect, avoid applying, and alarm the corrupt patch.

An administrative file is provided with all patches to provide status information, release notes for the patch, and handling instructions for the patching tools.

The following diagram denotes the structure of patches provided by Nortel:



Patches are designated as one of three types: active node apply, inactive node apply, and manual apply. The patch type is used to trigger the appropriate handling of the patch while being applied in highly available cluster configuration. For single node configurations, inactive apply patches automatically become manual apply patches.

Both active node apply and inactive node apply patches can be applied automatically by setting a schedule with the patchconfig tool.There are separate schedules for each. Manual patches are never automatically applied, and cannot be scheduled. For non-clustered systems, the inactive apply schedule does not exist as patches are either active apply or manual apply.

Patches have an attribute embedded within them to determine whether they require a system reboot to be applied. If they require a reboot, the patching suite software will initiate the reboot. Depending on the scenario triggered by the patch type, the reboot may be handled either automatically, or manually with user prompts.

Patches applied on the active node will only affect service for specific applications modified or updated by the patch. Patches applied on the inactive side will not be enabled until after a SWACT (which involves a loss of service for all applications). However, applying the patch on the inactive side allows a continuation of service on the active side while the patch is being applied on the inactive.

Patches are only applied to the mate node once the patch has successfully been applied to the first node. Patches that fail to apply successfully will be automatically removed and an alarm will notify the user of the unsuccessful apply attempt.

Patch Handling	Applied Automatically	Can be scheduled	Node applied on	Description
Active Apply	Yes	Yes	Active	This handling is ideal for non disruptive or patches for less sensitive applications.
Inactive Apply	Yes	Yes	Inactive	This handling is ideal for disruptive or sensitive application patches.
Manual Apply	No	No – manually initiated	Inactive node with prompts	This handling is ideal for disruptive patches, patches that require manual interaction, or highly sensitive applications.

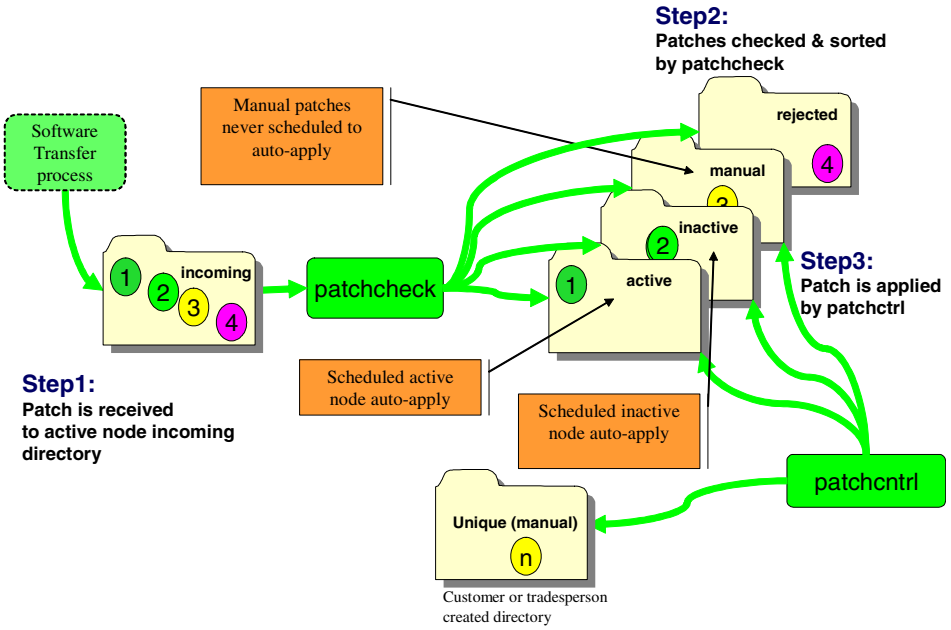
Additional Patch Attributes:

Reboot required: Yes/No Patch Status: S/V/R/Z

RPS States:
Submitted
Verification
Released
Zapped

These attributes trigger special handling. VO patches = manual apply.

The following diagram details how patches will be received in the incoming directory and processed by patchcheck to be sorted into directories according to required apply handling: Multiple patches will be applied in sequence.



Also new for the CBM is the capability to override embedded patching handling with a more cautious handling procedure. This feature is enabled by setting patch filters. Patch filters allow declaration of patches matching criteria to be always inactive apply, or always manual apply. The filters are set, updated, or removed using the patchfilter command. The filtering mechanism is based on the filter pattern matching the patch name, or the name of the package the patch updates, or the category of the patch.

Patch filters always add more conservative handling to patches. For example, making an active apply application such as Billing a strictly manual apply application. Patches requiring special handling cannot be filtered to remove that special handling. For example, a manual patch cannot be filtered to make it active apply.

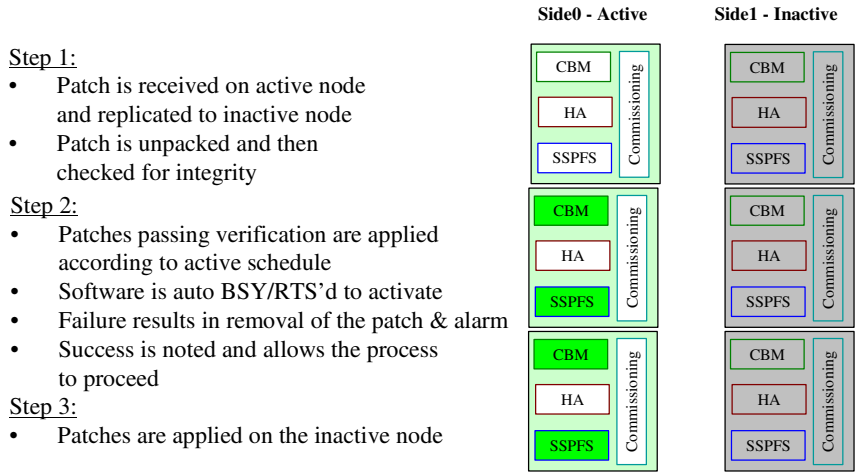
A status field is embedded within the patch to track the deployment state of the patch. This state is referenced to determine the appropriate behaviour for patch application. Verification (V) patches will be automatically classed as manual apply patches only. Release (R) status patches will follow their appropriate handling based on the patch type field, or any defined patch filters.

The configurable patch application schedules provide business value by allowing automatic patch application during less busy periods and reducing support costs as that would have been incurred if manual interaction was required.

The patch format used by the patching suite provides automatic patch application and automatic application restart once the patch has been applied (if required). CBM patches will restart applications autmatically by default.

The patching tools provide high availability cluster support. This feature enables value by automatically handling sensitive or disruptive patches requiring reboots or restart of important applications. These patches are handled automatically by applying them on the inactive node of the cluster and then SWACT'ing. These inactive apply patches will be applied on the inactive node to minimize service disruption.

The following diagram depicts how active apply patches are handled:

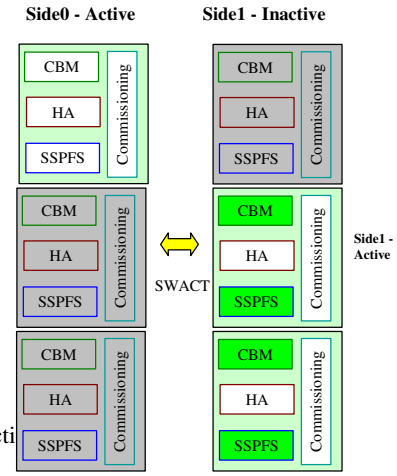


The following diagram depicts how inactive apply patches will be handled:

Step 1:
- Patch is received on active node and replicated to inactive node
- Patch is unpacked and then checked for integrity

Step 2:
- Patches passing verification are applied according to inactive schedule
- Failure results in removal of the patch & alarm
- SWACT and RTS is initiated to activate
- Success is noted and allows the process to proceed

Step 3:
- Patches are applied on the inactive (formerly acti node)



Patching security & robustness features:

The patching suite provides several important security features to enable a high level of security for customer networks.

The patching suite includes automatic integrity checking to screen and alarm corrupt patches & prevent their application. The patching suite supports encrypted file transfers & inter node communication.

The manual patch application type is supported to provide complete control over sensitive patches. Patch filters provide the ability to define more sensitive handling for defined applications to minimize service disruption

Important design considerations were factored to ensure a high level of robustness for the patching suite. No application level software required to apply patches. Patches are applied using low level operating system commands to ensure application of patches will not be blocked by a daemon or service being unavailable.

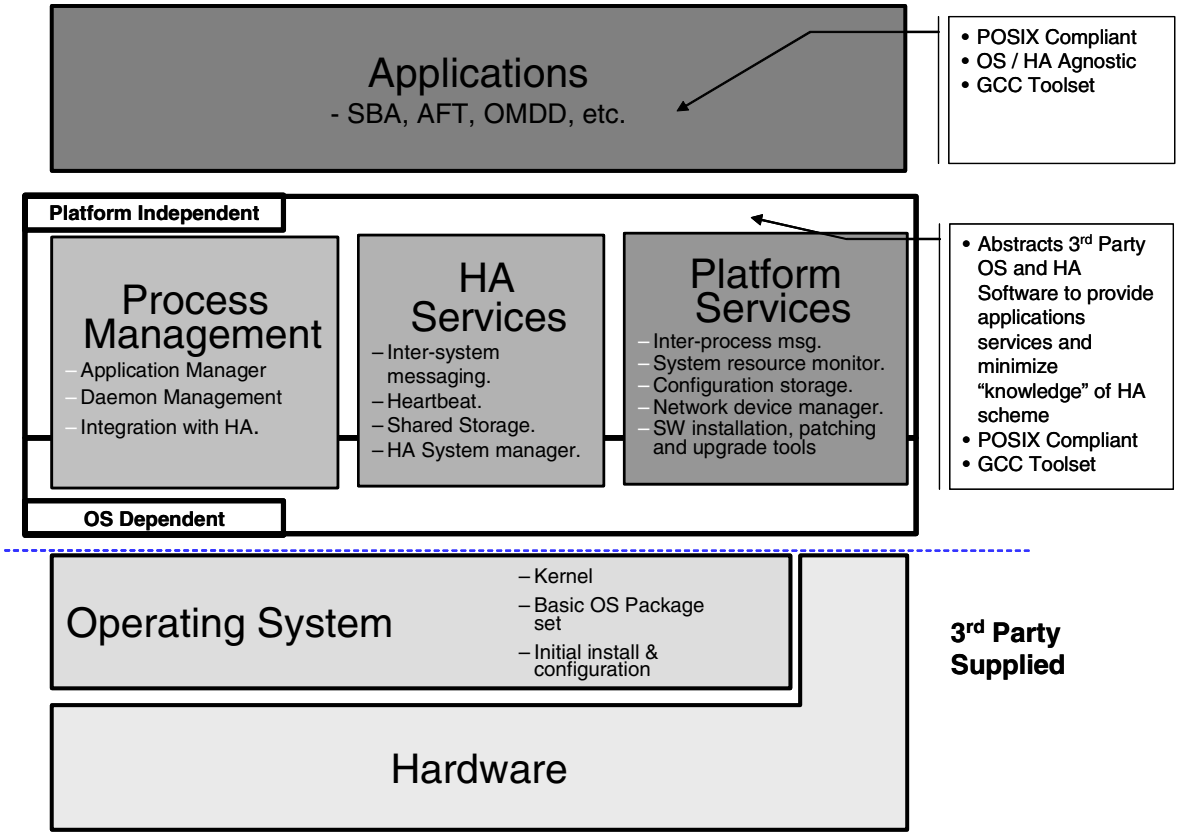
No special daemons required to support patching. For the automatic scheduling functions to work, the cron server must be functioning.

New for this release, the root password not required to control patching. Maintenance users (maint group, or emsadm group) will have access to run patchctrl. This enables them to apply patches without accessing the root password.

Please see the patching limitations section of this document for information regarding a possible security exploit.

22.3 Hardware and Software Requirements or Dependencies

The CBM product requires the Sun Microsystems N240 hardware platform that is provided by the SSPFS platform. The CBM product utilizes the Solaris operating system also provided by the SSPFS platform.



Dependencies for Patching include:

- Solaris patchadd and patchrm tools

- High available software
- Alarming facilities

Dependencies for Installation include:

- SSPFS installation script and commissioning interfaces
- Solaris pkgadd and pkgrm tools
- CDROM or ESD Image (ISO) of CDROM
- HA Cloning tool
- Alarming facilities
- Application registration interfaces
- Application set up automation

Upgrade preparation dependencies:

- HA Cloning tool
- Alarming facilities
- Application registration interfaces

22.4 Limitations and restrictions

General Limitations:

- There are differences between SDM's legacy patching processes and interfaces and the patching suite interfaces developed in A0002133. These differences are not likely to be accepted by customers creating a requirement to enhance the patching suite tools to understand and support SDM patching.The patching suite tools were designed with this goal in mind.

The following limitations are noted for the following components.

Patching limitations:

- Patches must be provided in Sun patch format
- Patch integrity checking requires a checksum to be include with the patch

- For the patch handling mechanisms (active apply, inactive apply, manual apply) to work, an amindata file containing information defining the intended handling must be included with the patch
- Solaris patches must follow a Solaris patch manager supported naming convention.
- Patches are cumulative until completion of a design activity to create incremental patching tools
- Patches must handle restart of dependent applications until a more sophisticated shared library & dependency handing tool is developed
- Z status patches will never be delivered, but are not automatically removed from products installed in the field.
- **Important:** Patches can not be verified to have originated from Nortel Networks without the development of a patch authenticity checking mechanism. Lack of this mechanism provides a significant security hole.

Installation limitations:

- Packages need to be supplied in Sun package format

22.5 Interactions

Installation Interactions:

Installation of CBM core software is completed through using the cbm_setup interface. This tool will automatically install the CBM core (also known as “base”) software. The core software packages will be installed and their installation verified automatically without any prompts.

Value added software such as Billing, OM Deliivery, and other applications that are sold seperately from the code platform software can be installed at any time after the initial installation using the SWIM interface. For two node cluster configurations, the SWIM interface will automatically install the software packages selected onto both nodes.

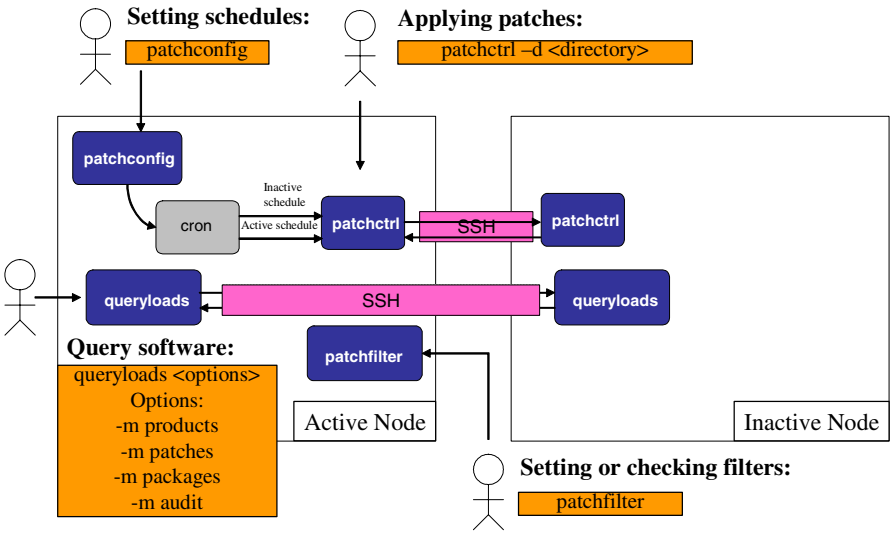
Upgrade Interactions:

The planned interface for CBM ugprades will be cbm_setup.

This work will be completed in a new activity.

Patching Interactions:

There are 4 interfaces for patching. They are depicted in the following graphic:



1) patchconfig

The patchconfig tool is used to set, or reset the patching schedules.

The user will be prompted for two schedules, one for the active apply schedule and one for the inactive apply schedule.These schedules will be used to trigger application of patches for the respective node and patch handling type.

<TODO: Add screen capture for patchconfig>

2) patchctrl

The patchctrl tool provides a single interface for patch application. It automatically handles active patch apply, inactive patch apply, or manual apply scenarios. If patches require a reboot, it will automatically initiate the reboot or prompt when patching manually.

patchctrl will automatically handle triggering a SWACT for patches that require it when the system is a two node cluster. During manual patch application, a SWACT will be preceeded by a prompt.

3) queryloads

queryloads provides an easy to use interface to gather software information about the system. queryloads reports information in one of two formats, a human friendly report, or raw XML data.

queryloads reports information on the Nortel products installed on the system, the software packages installed, and the software patches installed. If provided with a product name, queryloads will automatically filter output to report information for that product rather than all software installed on the system.

4) patchfilter

patchfilter provides an interface to set or remove filter instructions. Patch filters allow customers to define more conservative handling for patches. This enables making patches for designated applications either inactive or manual apply even though the patch itself may be an active apply patch. Filters only allow more conservative handling. For example, a manual patch could not be made an active apply patch.

5) Alarms

A minor alarm (Istb) will be raised on the node when a patch has failed to apply. A command line tool will be provided to manually clear this alarm.

A minor alarm (Istb) will be raised and automatically cleared on the node when a patch fails the integrity check

24: Functional Description (FN): A00002146

24.1 Feature name

A00002146: MAPCI ABI Link Test & Legacy Comparison

24.2 Description

Our existing customer base has a large number of legacy XPM peripherals in existing TDM networks. Migrating to a total packet network will be a large undertaking for our customers. Providing a means to gradually migrate will help our customers make the transition to total packet switching.

This feature is part of a larger project goal to subtend legacy XPM peripherals from an MG9000 using the Access Bridge Interface (ABI, pec code NTNY43AA). The XPM peripherals will connect to the MG9000 via DS-512 links instead of connecting to the ENET via DS-512 links. Most of the link mtc. needed to support ABI XPMs was developed in SN05 and SN06 via activities 59038678 and 59039633.

There are 4 parts to this design activity.

- **ABI Link Mtc. Enhancements**

  One purpose of this feature is to enhance the existing link maintenance software for the MG9000-ABI peripheral by filling in some inconsistencies found during testing and by adding the capability to perform single link maintenance on message-capable links.

- **ABI Card Activity Status**

  Unlike the ENET, the ABI cards in an MG9000 have a Master/Slave status. This feature enables the MG9K and the CS2K to report and handle ABI card activity status so that it can be displayed on the Map and (if desired) used by the speech aspect in CS2K software to align the preferred plane selection on the “Master” ABI card for call setup. (See also activity A00002045: ABI Loadsharing.)

- **Manual Link Mtc.**

  In order to facilitate commissioning and testing of ABI XPMs, there is a need to perform manual mtc. actions on the cside links of the XPM from the XA-Core MAP interface. This feature adds a new Map sublevel to the posted LGC map level from which an ABI XPM’s cside links can be Bsyed, RTSed and TSTed. See Figure 1, "ABILink Map level".

  Note: Only message links are supported at this time.

- **Resync capability**

When an XPM is being rehomed from the ENET network to an MG9K/ ABI, there is a need to tell the ABI interface to adjust its frame sync reference to sync to the inactive XPM unit. This capability is provided via new command ADJUST_FRAME_SYNC (AFS for short) from within the ABI Rehome CI tool (ABIREHOME).

24.3 Hardware Requirements or Dependencies

No new hardware requirements or dependencies are introduced due to this feature.

24.4 Software Requirements or Dependencies

This feature requires the following loads to function properly:

- MG9000 - SN06.2
- GWC - SN06.2
- XACore - SN06.2 (SN06 with 6.2 patches applied)

Feature A00002746: “ABI XPM Fault Isolation & QueryPM” is dependent upon this one for it’s functionality.

24.5 Limitations and restrictions

In SN06.2, the ABI interface on MG9000 supports the following XPM pm_types only:

- LGC
- LTC
- SMA2

Manual mtc. actions from the ABILink map level are not supported on individual speech-only links in SN06.2.

24.6 Interactions

Not applicable.

25: Functional description (FN): A00002155

25.1 Feature name

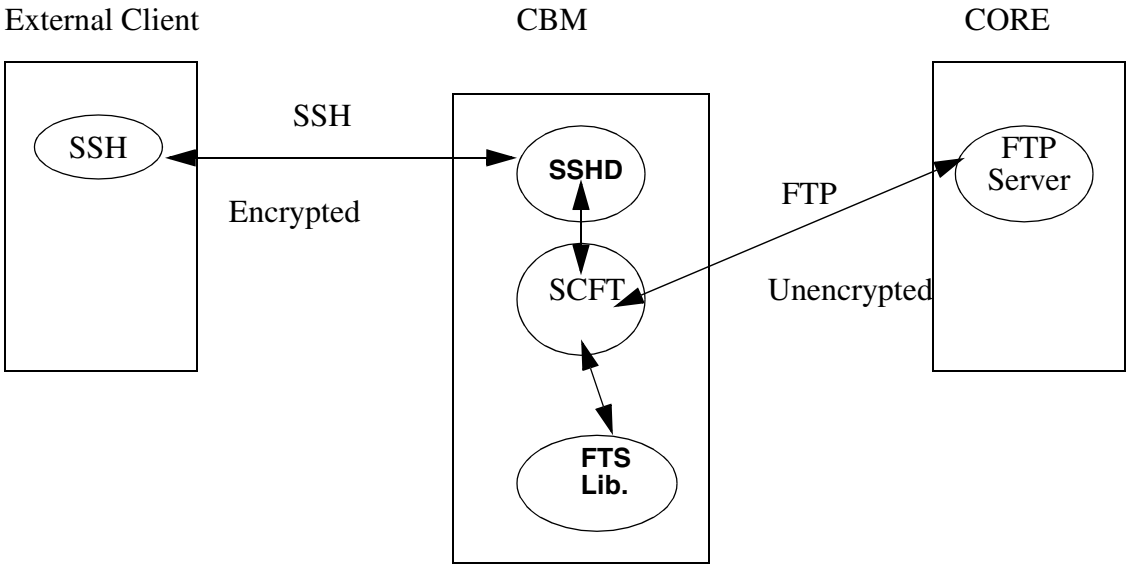
SSH Core File Transfer (SCFT) for CBM and SDM.

25.2 Description

This feature is intended to provide a non-DCE option for secure FTP that will allow secure FTP access to the CORE. through the CBM or SDM.The feature can be used to retrieve files from the core and transfer files to the core from an external workstation through the CBM or SDM. The feature provides the security supplied by the SSH (version 2) so that the core will not be compromised by illegal users. The SCTP code that runs on the CBM or SDM provides much of the standard FTP functionality, enabling the remote client to perform all the FTP operation that may be needed to maintain the CORE through the CBM or SDM.

This feature provides the dynamic creation of the CM FTP users. This is accomplished by the SSH core file transfer authorizing the user executing the command based on their group memberships.

Figure 1 SSH Core File Transfer



25.3 Hardware Requirements or Dependencies

This feature will run both on the CBM platform as well as the SDM.

25.4 Software Requirements or Dependencies

The external client must have standard SSH (version 2) running on his machine. He must also have the SCFT code running on the CBM or SDM. It would also be useful but not necessary to have the Korn shell script created by Nortel for running the SCFT code through SSH loaded on the external client's machine. The SCFT code as well as the Korn Shell script will be delivered to the client as a packaged SDM/CBM load.

25.4.1 Handling SSH authorized_keys file over SWACTs.

If you are using a CBM-850 system that has two CBM clustered together, special care must be take that the SSH authorized_keys file are kept current on both sides. This is particularly important if you do a swact as you may no longer be able to connect password free if the authorized_keys file is different. The authorized_keys file can be copied over to the cbm on the other side by using the syncFile.ksh command.

> /opt/servman/shell/syncFile.ksh /.ssh/authorized_keys

25.5 Limitations and restrictions

Only a restricted subset of FTP commands are supported with the SSH Core File Transfer. However, it should be noted that one of the commands supported is the "command" feature which allows any FTP command to entered as a string that will be performed on the FTP server on the core. With this command virtually any FTP command can be entered.

Core image files can not be transferred from an outside client at this time. There is code within the Core that prohibits this.

It should also be noted that all commands must fit onto one line and must be passed to the SCFT code intact.This is necessary because the FTP connection to the core is created and removed after each command. So you can not, for instance, set the output type to Binary in one command then do a put in the next and expect the type to be binary. The binary command will not be remembered for the put and the type will default back to the standard FTP type of ASCII.

25.6 Interactions

This feature will use the previously existing FTS code to perform the FTP commands that are requested through the SSH Core File Transfer code. Some changes have been made to allow the output to be returned to the external client. The external client will also be required to have a standard SSH installed on their system.

26: Functional description (FN): A00002164

26.1 Feature name

A00002164 - APPLICATION MANAGER FOR HIGH AVAILABILITY (HA)

26.2 Description

This feature provides a framework for running Core and Billing Manager (CBM) applications in a High Availability (HA) computing environment, based on having programs run on distinct computers rather than on a fault tolerant hardware base.

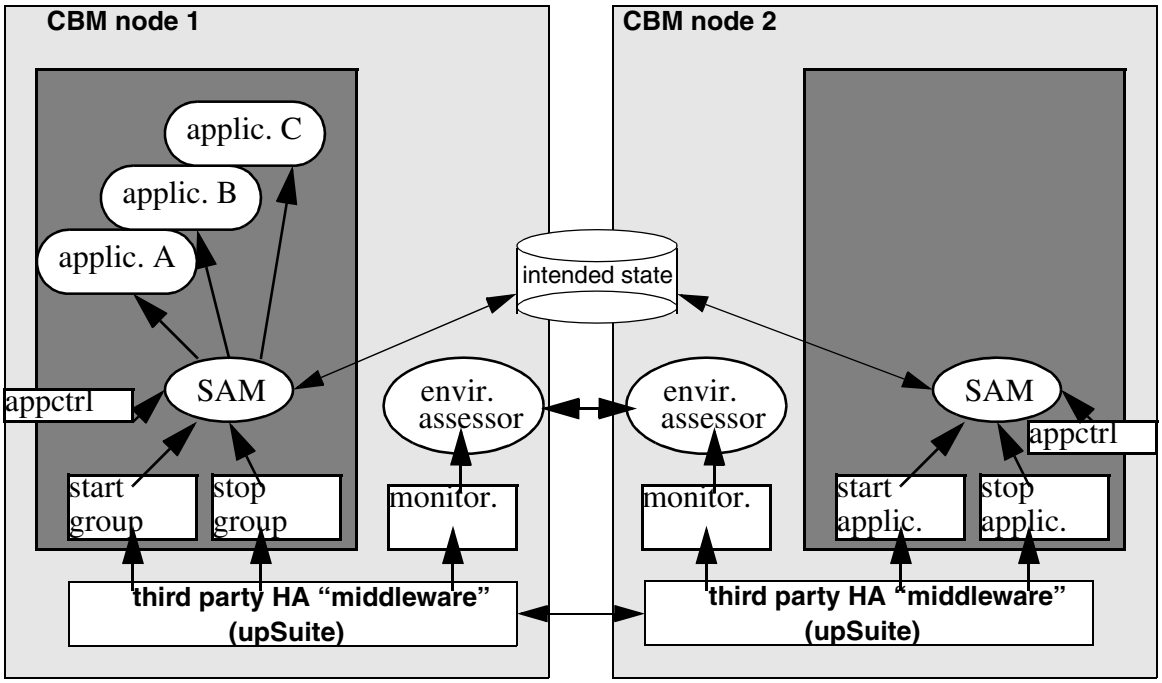
The feature deals with application management. An application is one or more programs that perform an OAM&P functions. Managing applications means starting and stopping them; restarting them automatically if they crash; and in the context of a HA environment switching them between the computers (nodes) in a CBM cluster as required.

In a CBM system applications are managed by a dedicated process the SDM/CBM Application Manager (SAM). The main purpose of this feature is to adapt the proven SAM manager, developed for the synch-matched fault tolerant SDM product, to work in a HA solution made up of two independently running computers.

26.2.1 Major components

Figure 1 depicts the major components involved in managing application on the High Availability CBM product. This feature implements the components that are in the dark gray boxes. The figure depicts the situation where node 1 is the “active” computer in the cluster, where the applications are running.

Figure 1 Application management components in HA CBM



These components and their primary functions are:

Application One or more programs that are performing a CBM Operation, Administration, Management or Provisioning (OAM&P) function. Applications are generally installed by a package, and can be individually managed by a user. Applications are organized in **groups** for the purpose of combined management and HA switchover. In the initial release of this product, only one group is supported: the "active side applications" group. This group will encompass all the CBM applications, and will run on the "active" CBM node.

SAM The management program that is responsible for starting, restarting and stopping applications as appropriate. SAM maintains information about an application and its group. This information contains amongst other things:

Intended state - The state that the user/administrator desires the application or group to be in. SAM will attempt to bring the application to that state, but may not be able to achieve it if there are problems. The intended state of groups and applications is stored on disk, thus it will be remembered if the SAM program dies, or the system restarts. Furthermore, the intended state file is deposited in a **replicated** file

system. This means that the up-to-date intended state information is available to the SAM program of both nodes, which enables SAM to bring the applications up to the same state they were in after an HA activity switch over.

Effective state - This is the real state of the application or group. It reflects degradation or failures of the application and group caused by faults on the system or network. The effective state is the one that is reported to the user via the management tools.

APPCTRL This is a command line user interface (CLUI) program that an administrator uses to control applications individually or as a group. It actually interfaces with SAM. The APPCTRL command supports sub-commands like: offline to set the intended state of a component to Offl; return to service (RTS) to set the intended state to in service (InSv); and busy (BSY) to set the intended state to manual busy (ManB). The cbmmtc page mode interactive management program also offers the same sub-commands in the APPL “level”.

HA middleware The software that controls the operation of the CBM cluster. It is responsible for deciding which node in a CBM cluster is to run a service (application group). It does this by exchanging messages between nodes and running diagnostics on the key hardware components of the computers. When the HA middleware decides to run a service on a node, it will also ensure that the resources that the service needs, like the “floating” CBM IP address, is activated on that node. When the HA framework determines that service must be moved to the other node, then it goes through a procedure known as a “HA switch over”. This involves stopping the services on the active system, transferring the resources to the other system, and starting the services on the other system. The HA framework used on CBM is a third party commercial software product, it uses “scripts” to interface with the software that it is managing. The HA framework is capable of spreading the load by having services active on multiple different nodes. However, in the initial release of this product, we will limit ourselves to two nodes per cluster, and one service: the “active side applications” group. Thus, in practice, for the first release, one of the two nodes will be the active computer, and the other one the inactive computer.

Start group script Run by the HA framework when a node has just become active, indicating that it is time to start the applications. The script passes the request to SAM who will launch the applications.

Stop group script Run by the HA framework when a node is about to become inactive, requesting an orderly shut down of the applications. The script passes the request to SAM who will terminate the applications.

Monitor script The HA framework will call this script regularly to verify the sanity of the application run-time environment. The script will interface with the environment assessor program. The script will return “NOT OK” if the environment assessor has determined that the local system or its network connections have a critical fault that prevents the applications from performing their job. In that case the HA framework will initiate a HA switch over to the other system. The environment assessor performs sanity checks that go beyond the basic hardware checks provided by the HA framework; it also communicates with its peer on the other system to ensure that it doesn’t cause a switch over unless it has determined that the other system is in a better situation. The environment assessor is not part of this feature, it is covered by feature A00002757 CBM FAULT MANAGEMENT.

26.2.2 Group and Application States

Figure 2 shows a flowchart describing the **effective** states that groups and applications can be in on the CBM, it also depicts all the changes between states and the triggers that cause them.

The big encompassing rounded rectangles represent the **group** states, the smaller rounded rectangles represent the **application** states. As mentioned earlier, in the initial release of CBM all the applications will be contained in one group called the “active side applications” group.

The group state and the applications **intended** state are controlled independently by a maintenance operator issuing **appctrl** or **cbmmtc** graphical user interface APPL level commands. However, it is apparent in the picture that the application **effective** state is greatly influenced by the **intended** state of the group that contains it. The general rule is that **SAM will try to bring an application’s effective state to the “lesser” of the group intended state or the application intended state**. However, there are factors that prevent the effective state from reaching the InSv state if that is the goal: like failures, which result in one of the faulty states; or being on the inactive side node, which causes the effective state to be Stby.

For example, if the group intended state is set by the administrator to offline (Offl), then all the applications are forced to go to the offline state regardless of their individual intended state setting. However, if the group state is set to ManB, then the application effective states can only be Offl or ManB. In the later case, an application that had been previously set to Offl (intended state) by the administrator would remain Offl even if the encompassing group was moved to the ManB state by the operator.

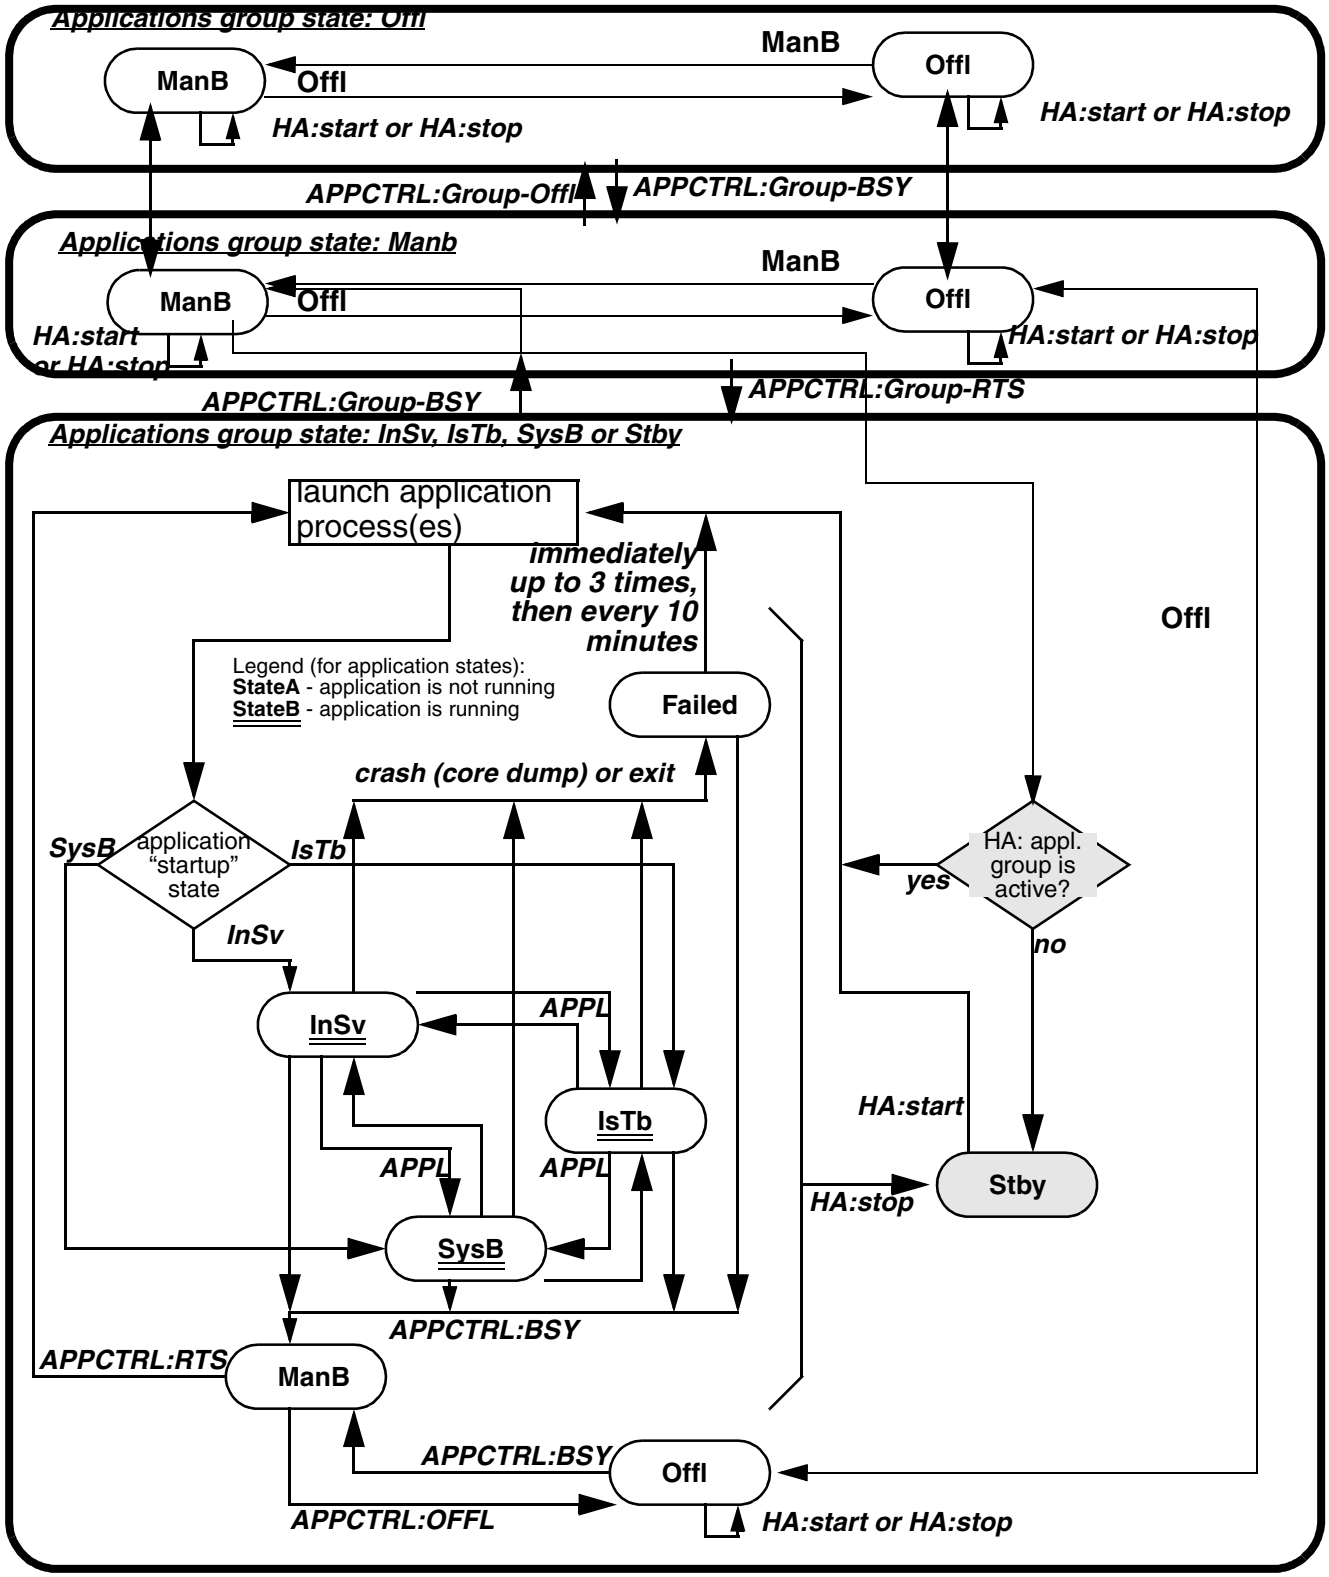
When the administrator issues a Ready to Service (RTS) operation on the group the applications are enabled to start, which ideally means they go to in service (InSv) state; unless they have been explicitly offlined. After the application process(es) is started, it will spontaneously move between the in

service (InSv), in service trouble (IsTb) and system busy (SysB) based on status reports issued by the running application. These states describe whether the application is respectively fully operational, partially operational, severely degraded. If the application fails to start and exits, then it is put in the failed state. SAM will attempt to restart applications in the failed state on a regular basis.

The CBM application state paradigm follows the exact same behavior that prevails on the SDM fault tolerant product from which it is derived. The major difference is the introduction of the standby state (Stby), which is required to support the High Availability (HA) configuration. The additions to the state machine flowchart introduced by the HA paradigm are depicted in gray in the figure. In essence, if an application is administratively enabled to start, but cannot do so on the local system because the HA framework has determined that the local system is inactive, then the application will be put in the Stby state. As soon as the HA framework invokes the start script, then all the applications that were in Stby state, will be launched and will go to one of the active states.

It is worthwhile to note that if an application is put by the administrator to the manual busy (ManB) state via a busy (BSY) command; the application would not remain in ManB state after a HA switch over. This is consistent with the behavior of the SDM product where an application that was in ManB state would be returned to service in the event of a system reboot. The rational for this behavior is that the ManB state is a temporary state, only used to do punctual maintenance. If an application needs to be permanently disabled, then it needs to be put in the Offl state.

Figure 2 Application effective states in the HA CBM product



26.2.3 User interfaces

The ‘appctrl’ command that is used by an administrator to change the group and application states is documented in the “User Interface Manager for CBM” feature A00002822.

The “User Interface Manager for CBM” will also group and application management and viewing from the APPL level of the cbmmtc page mode interactive tool.

Commands will also be available to force an HA switch over in order to perform maintenance on a CBM node. These commands are described in the Succession (SSPFS) platform documentation, they do not interface directly into SAM.

26.3 Hardware Requirements or Dependencies

As defined by SSPFS platform documentation

26.4 Software Requirements or Dependencies

SSPFS platform

CBM Fault management (A00002757)

26.5 Limitations and restrictions

In the initial release the software will only support:

- Two nodes per CBM cluster
- One group, the “active side applications” group
- All applications must be contained in the above group; thus, can only run on the active system.

26.8 Glossary

Term	Description
New term	Definition

27: Functional Description (FN): A00002186

27.1 Feature name

A00002186: IOM DDU Capacity Enhancement

27.2 Description

For more information, please refer to TURKPFN in FMDOC library.

27.2.1 Introduction

In 1999, Nortel committed to Netas to deliver sufficient storage for their switches for 25M billing records.

The feature patch was implemented for SN04/CSP17, and this is the source implementation of the enhanced functionality. The FN for the original feature patch can be found in FMDOC library as TURKPFN.

The IOM DDU disk capacity is currently limited to 1G. This feature provides increase in the capacity to 4G by utilizing the additional capacity supported by the new IOM load, IOMEXXXX.

27.2.2 Functional Overview

This feature increases the IOM DDU capacity from 1G to 4G. The maximum number of volumes per DDU increases from 32 to 63. The maximum volume size remains unchanged at 65,536 KBytes. By allocating 63 volumes at maximum volume size, the entire 4G can be used.

There are no HMI changes introduced in this feature. All the maintenance tools, such as DISKDBG, DSKALLOC, and DSKUT will continue to function with no visible changes to their interface.

27.2.3 Soc BASE0015

The ability to use the additional disk capacity is controlled by SOC BASE0015. The status of this SOC must be set to YES before the additional capacity is visible. If the status is set to IDLE after additional volumes have been allocated, further volume allocation maintenance may not be possible, however all volumes and files will continue to be accessible.

27.3 Hardware Requirements or Dependencies

- The capacity enhancement is applicable only to the IOM DDU

- The IOM disk drive, NTFX32BA must be Release 7 or later

27.4 Software Requirements or Dependencies

- SOC BASE0015 needs to be activated for this functionality.
- The IOM load with version IOMEXXXX must be used in conjuction with this feature

27.5 Limitations and restrictions

- Once the IOM has been upgraded to the new load, do not revert back to the old load, as this may cause the DDU to no longer function correctly and potentially require the disk to be reformatted.
- The IOM disk drive, NTFX32BA must be Release 7 or later.
- Setting the SOC BASE0015 to IDLE may prevent further volume allocation maintenance, however the volumes which have already been allocated will continue to be accessible.

28: Functional Description (FN): A00002196

28.1 Feature name

Enhanced Do Not Disturb

28.2 Description

28.2.1 Background

Do Not Disturb (DND) is an existing DMS feature that makes an MDC station appear busy to incoming calls when the station is idle. DND is scheduled via table DNDSCHED and allows pre-programmed times to be datafilled which specify a begin time to activate DND and an end time to deactivate it. DND is not currently supported on RES lines but will be as a result of this activity.

Selective Call Acceptance (SCA) feature allows a subscriber to selectively accept calls arriving from a limited set of previously identified directory numbers.

There is currently no mechanism to allow a subscriber to create a list of callers that would by-pass DND when it is active. This activity will change the current interaction between SCA and DND so that a subscriber can selectively accept calls while DND is active.

28.2.2 Enhanced Do Not Disturb

Currently there is no combination of features that allows a subscriber to activate a Do Not Disturb feature at a predetermined time each day, for example from 6 p.m. until 7 p.m. each evening (dinner hour), and at the same time maintain a list of DNs that are optionally allowed to bypass DND when it is active.

The Enhanced DND feature will be available to RES & MDC lines and provides the following capabilities:

- Via Table DNDSCHED, calls can be blocked at a predetermined time period each day. Table DNDSCHED allows up to 63 different time periods to be datafilled per customer group.
- A subscriber can dial DND feature access codes to activate or deactivate Do Not Disturb. The DNDACT feature access code will activate Do Not Disturb and the DNDDEACT feature access code will deactivate Do Not Disturb.

- Table DNDSCHED begin and end times will interact with DNDACT and DNDDEACT feature access codes. If a subscriber's line has Do Not Disturb active as a result of a begin time in table DNDSCHED, the subscriber can dial the DNDDEACT feature access code to deactivate DND. Likewise, an end-time deactivation of DND via Table DNDSCHED will turn off Do Not Disturb, whether it was activated via the DND feature access code or a begin time in table DNDSCHED.
- SCA will be enhanced to allow callers on the SCA screening list to bypass DND when it is active. This functionality will be controlled by the new parameter DND_ONLY, which will be visible when provisioning SCA.
- The new field DND_ONLY will default to N during provisioning and is visible during NEW, ADO (Add Option), and CHF (Change Feature) commands.
- Enhanced DND is defined as a line with both the DND and SCA options with SCA field DND_ONLY = Y.
- When Enhanced DND is active (DND and SCA with DND_ONLY=Y are both active), callers not on the SCA screening list will be routed to SCA treatment while callers on the SCA screening list will bypass DND and terminate to the line.
- If DND is active and SCA with DND_ONLY=Y is inactive, then all callers receive DND treatment as defined by Tables DNDSCHED and IBNTREAT.
- If DND is inactive and SCA is active (DND_ONLY=Y) then SCA screening will not be attempted on any termination. With DND_ONLY = Y, SCA screening is only done when DND is active. Under this condition, no SCA OMs will be pegged.
- Enhanced Do Not Disturb will be controlled by SOC RES00102.

28.2.3 New Activation Code for Table IBNXLA

Current implementation of DND does not allow a MDC or RES line to mark its DN busy by dialing an access code that interworks with scheduled Do Not Disturb times. This will be changed by this activity so that an access code can be datafilled in Table IBNXLA that MDC or RES lines can dial to activate and deactivate DND and that interworks with Table DNDSCHED.

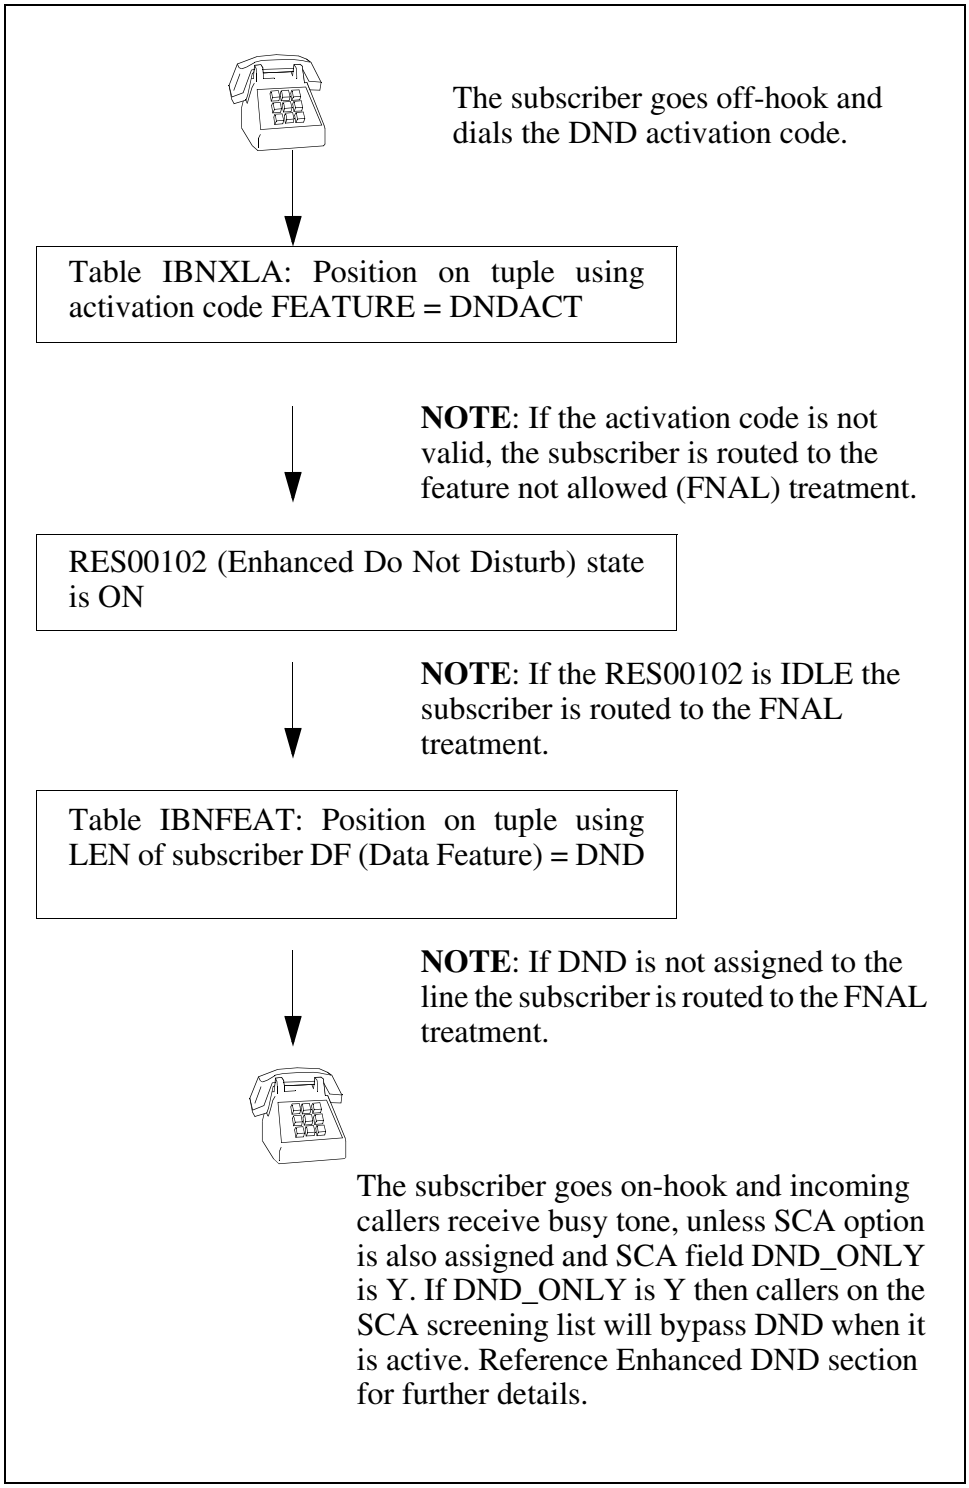
If DND is active on a line as a result of a begin time in table DNDSCHED it is currently not possible to deactivate it by dialling an access code. This activity will enhance DND so a Table DNDSCHED activation of DND can be deactivated by MDC and RES lines by dialing the DND deactivation access code.

The DND Activation and Deactivation access codes will be available when the TRSEL (TRanslation SELector) is set to FEAT in Table IBNXLA. The new

Features added are DNDACT (DND Activate) and DNDDEACT (DND Deactivate).

A Table DNDSCHED activation of DND will create an entry in Table DNDMSB with STATUS set to DNDGA. DNDACT and DNDDEACT will interwork with Table DNDSCHED, therefore a subscriber who dials DNDACT to activate DND will also create an entry in Table DNDMSB of DNDGA.

Figure 1 DND Activation



Refer to the configuration section (section optcn) for further details.

28.2.4 Selective Call Acceptance

28.2.4.1 Background

Currently, the SCA feature allows a subscriber to selectively accept calls arriving from a limited set of previously identified directory numbers.

In its current implementation SCA will not override DND when DND is active. If DND and SCA are active on a subscriber's line, callers on the SCA list will not terminate but will receive busy treatment due to DND. With this activity the interaction between DND & SCA will be modified when the new field DND_ONLY is Y so that callers on the SCA list can bypass DND when DND is active. If DND_ONLY is N then existing behavior remains unchanged.

28.2.4.2 Enhancement

The SCA enhancement being provided by this activity will change the conditions under which SCA screening can be applied so that SCA screening is only considered if DND is active. This functionality will be provided by a new field DND_ONLY (Y/N) that will be included at SCA servord provisioning. Current SCA subscribers will have the new field DND_ONLY initialized to FALSE over an ONP to preserve existing functionality. Refer to the configuration section (section optcn) for further details.

When DND is active and SCA is active with the DND_ONLY field set to Y on a subscriber's line then only callers on the SCA list will be allowed to terminate to the line. All callers not on the SCA list will be routed to SCA treatment.

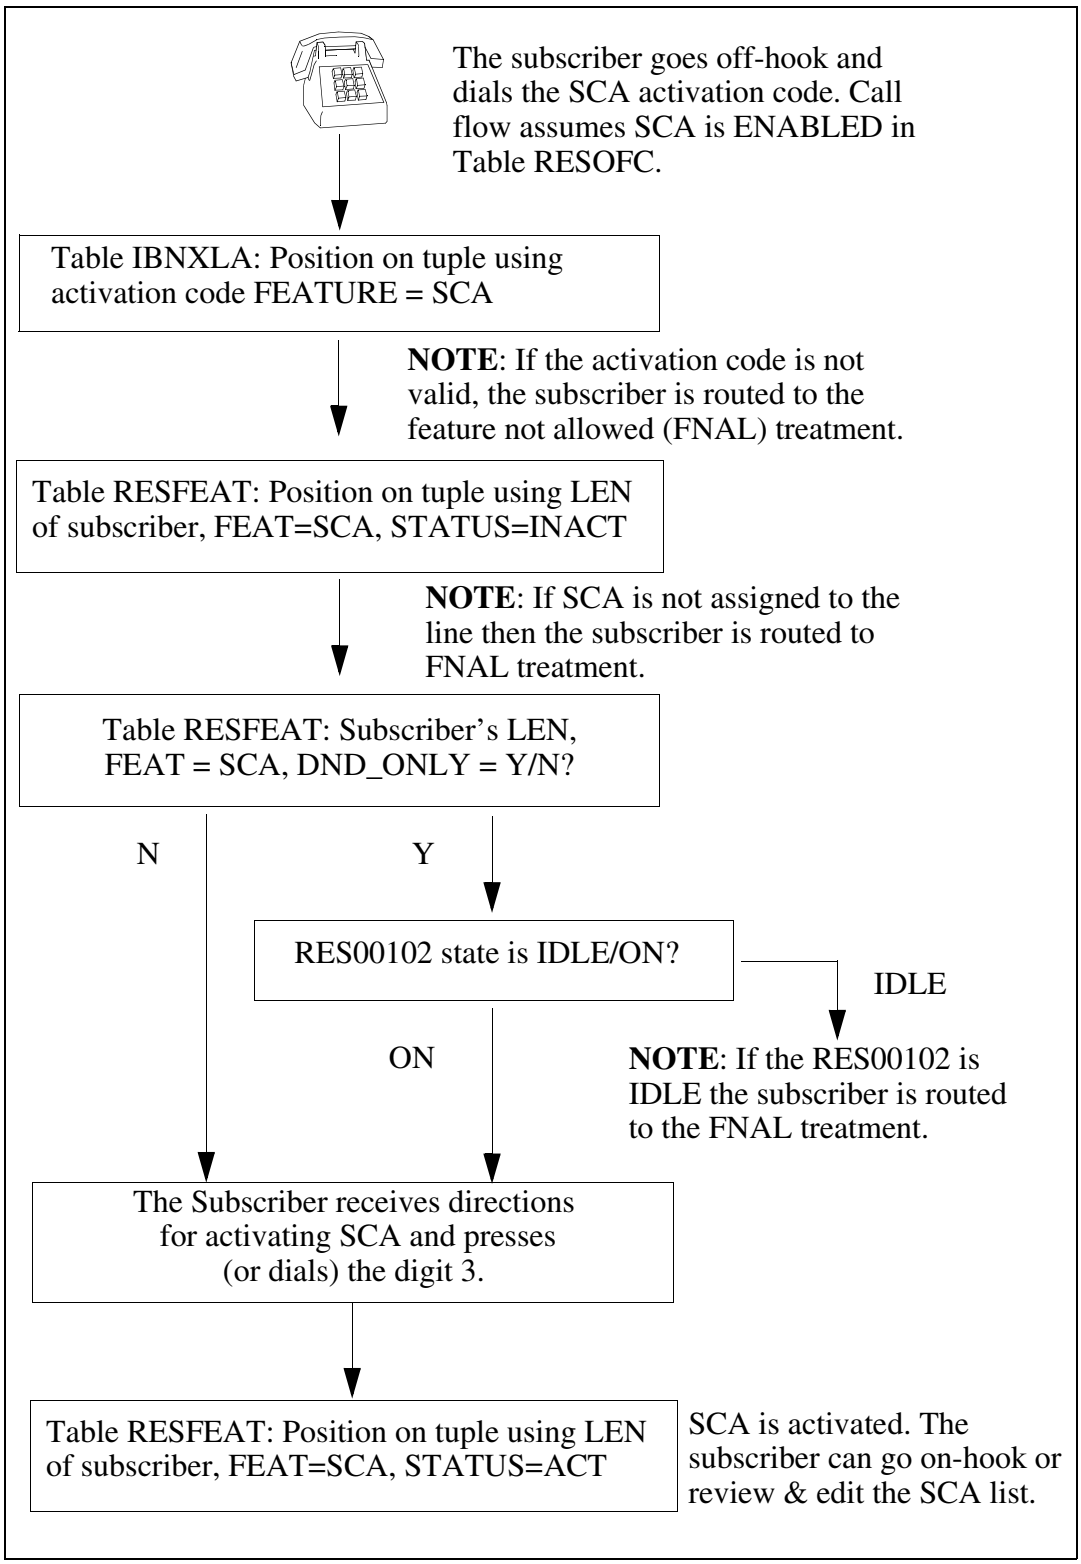
If DND is not active and the SCA field DND_ONLY is set to Y, then SCA screening will not apply to any incoming calls and all callers terminate to the line. The purpose of SCA screening when DND_ONLY is set to Y is to allow a list of callers to bypass the Do Not Disturb feature. If DND is not active then the SCA screening list will not apply to any incoming calls.

If DND_ONLY bool is set to N then the SCA feature (when ACTIVE) will screen callers to the subscriber's line regardless of whether DND is active or not. This preserves existing functionality.

An SCA subscriber with DND_ONLY set to Y can only dial the SCA access code when RES00102 is ON. If RES00102 is IDLE, then the SCA subscriber with DND_ONLY set to Y will receive FNAL (Feature Not Allowed) treatment if the SCA access code is dialed.

The following figure shows the SCA activation call flow:

Figure 2 SCA Activation



28.2.5 Description of Enhanced DND

The following paragraphs and figures show table datafill, servord and a description of call scenarios for Enhanced DND.

Prior to datafilling Table DNDSCHED, Table CUSTSTN should be datafilled to indicate the number of DND groups supported for the customer group. In the example shown, "63" represents the number of Do Not Disturb groups supported by the customer group. Its range is from 1 to 63.

Figure 3 Example datafill for Table CUSTSTN

```
TABLE: CUSTSTN

CUSTNAME OPTNAME OPTION
    RESGRP          DND  DND 63
```

The following figure shows example datafill for Table DNDSCHED.

Figure 4 Example datafill for Table DNDSCHED

```
TABLE: DNDSCHED

DNDSCKEY     DIVERSN          SCHED
RESGRP   1         1              $
RESGRP   2         1      (18 0 19 0)$
```

Using the above datafill as an example, if a RES subscriber who resides in the RESGRP customer group is assigned the DND option and DNDGRP is set to 2, then DND will be active each evening from 6 p.m. until 7 p.m. for this line. If DND is active and the call will not complete due to SCA overriding DND (SCA with DND_ONLY = Y), then the caller will be diverted to IBN treatment number 1 as defined by the DIVERSN field.

The following figure shows an example datafill for Table IBNTREAT. The DIVERSN field in table DNDSCHED should be datafilled in table IBNTREAT so callers who receive DND treatment are routed appropriately.

Figure 5 Example datafill for Table IBNTREAT

```
TABLE: IBNTREAT

CUSTGRP      IBNTRTMT          ITDATA
RESGRP              1    Y TRMT BUSY
```

NOTE: A default tuple should be datafilled in Table IBNTREAT with IBNTRTMT set to 0. This should be done for each customer group. An IBNTRTMT of 0 is used as the default treatment for any line with DND that does not have a corresponding entry in Table DNDSCHED to derive a diversion. An example for the RESGRP customer group is shown in Figure 6.

Figure 6 Example datafill for Table IBNTREAT

```
TABLE: IBNTREAT

CUSTGRP      IBNTRTMT          ITDATA
RESGRP              0     Y TRMT BUSY
```

Referring to Figures 4 & 5, a caller who calls a DND active RESGRP 2 line would be routed to BUSY treatment, provided SCA with DND_ONLY=Y was not active and either allowed the termination or routed the call to SCA treatment.

Figure 7 Example DND ADO with DNDGRP assigned as RESGRP 2

```
ADO $ 6210040
OPTION:
>DND
DNDGRP:
>2
```

If a subscriber in the RESGRP customer group does not want DND to become active at a preset time each day, then they can be assigned to RESGRP 1. This is done by assigning the RESGRP subscriber to DNDGRP 1 at servord time.

Figure 8 Example DND ADO with DNDGRP assigned as RESGRP 1

```
ADO $ 6210042
OPTION:
>DND
DNDGRP:
>1
```

The following ADO example assigns SCA with DND_ONLY set to Y

Figure 9 Example SCA ADO with DND_ONLY = Y

```
ADO $ 6210040
OPTION:
>SCA
BILLING_OPTION: NOAMA
>
STATUS:
>ACT
DNS:
>6136213500
VBCOUNT:
>7
DNS:
>$
DND_ONLY: N
>Y
```

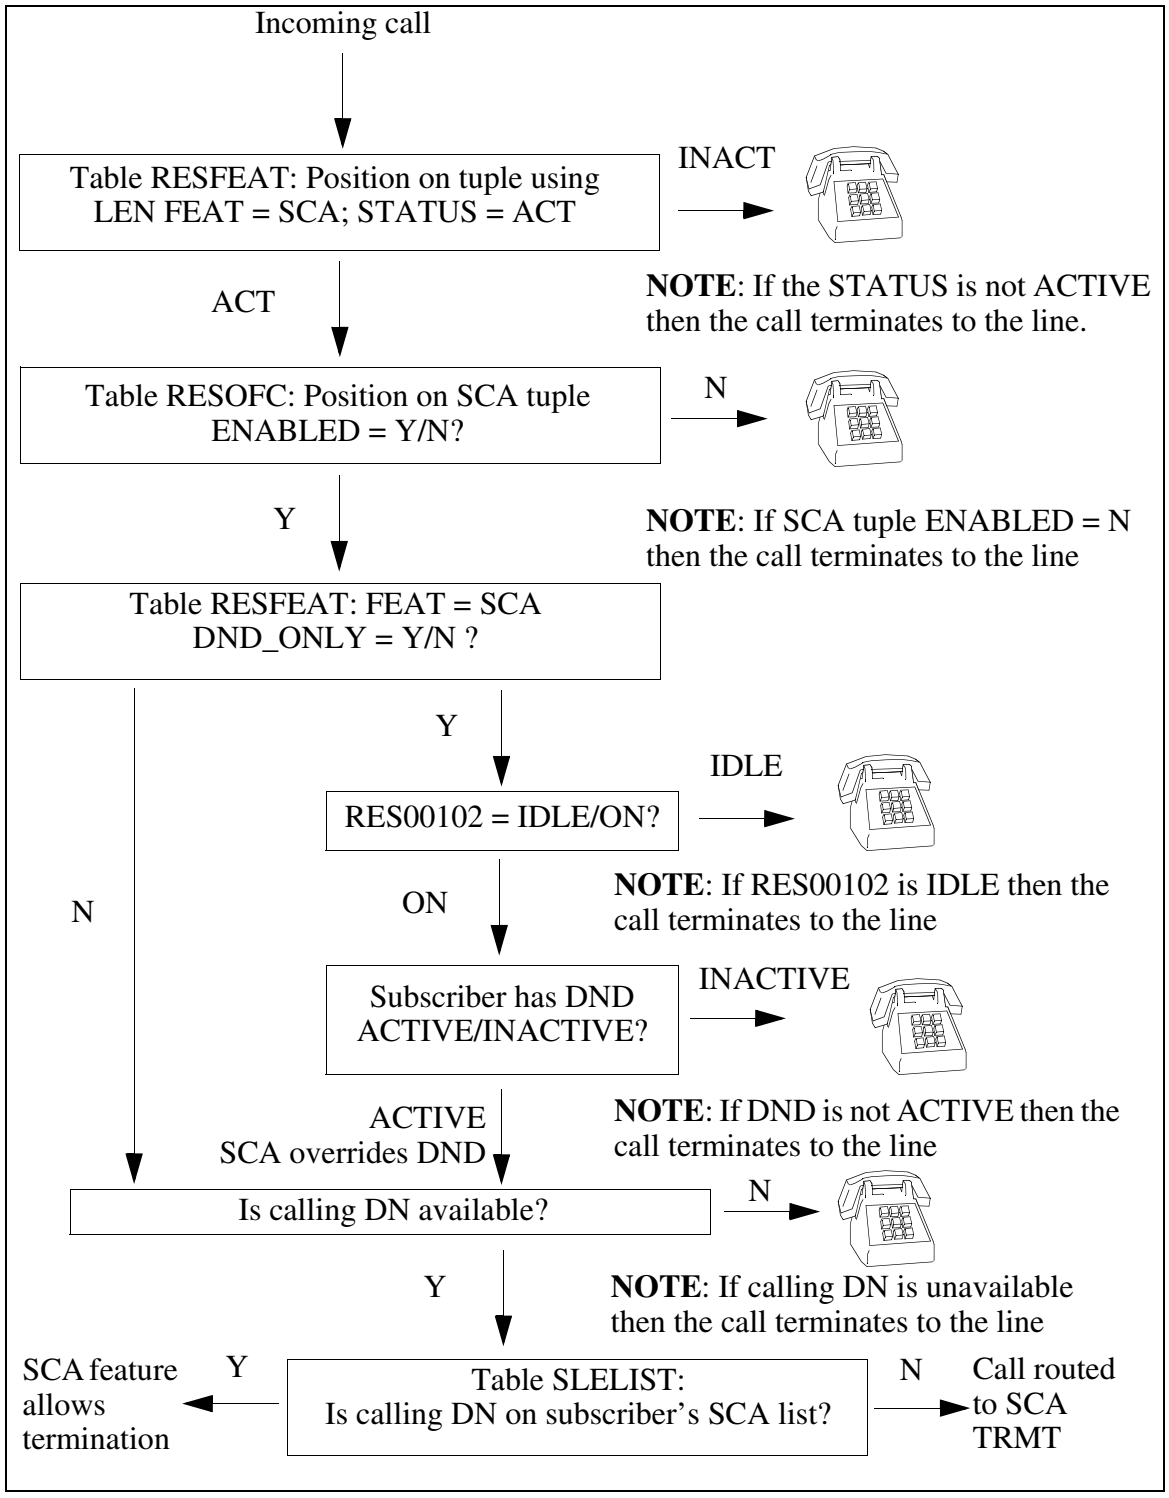
As described in the section 2.2.2, if DND is active on a subscriber's line and it also has subscribed to SCA with DND_ONLY set to "Y" and SCA is active, then callers on the SCA screening list will terminate to a line with DND active, whether DND was activated via Table DNDSCHED or by dialing the DNDACT (DND Activate) access code from Table IBNXLA.

If DND is assigned but not active on a line, and the line has SCA with DND_ONLY bool set to "Y" then SCA screening will not apply to any call termination attempt. Lines with SCA and the DND_Only bool set Y will only apply SCA screening when DND is active.

If the DND subscriber wishes to block all callers when DND is active, then the SCA feature enhancement can be turned off or not subscribed to, or DND_ONLY can be set to "N."

The following diagram shows the Enhanced DND call flow:

Figure 10 Enhanced DND Call Flow



Refer to Table 3 in section 2.6 for a description of DND & SCA interactions provided by this activity.

Refer to Table 4 in section 2.6 for a description of DND and SCA interactions as they existed prior to this activity. This funtionality will be preserved by this activity by setting the SCA DND_ONLY bool to “N” at provisioning time.

No new OMs or billing records are created as a result of this activity. AMA record generation will be not be impacted by Enhanced DND functionality.

28.2.6 Software Optionality Control

Enhanced DND functionality provided by this activity will be under SOC control. The SOC code is RES00102. If SOC is ON then the functionality will be provided:

- MDC & RES subscribers can dial the DNDACT and DNDDEACT access codes.
- MDC & RES SCA subscribers with DND_ONLY set to Y can dial the SCA access code.
- MDC & RES subscribers with DND active and SCA active with DND_ONLY bool set to Y receive Enhanced DND functionality.

If SOC is IDLE then the enhancements just described will not be provided, although datafill will be allowed.

Refer to the Configuration section (optcn) for further details.

If RES00102 is IDLE and the SCA option is added to a line with DND_ONLY set to Y, then DND_ONLY functionality will not be provided. In this scenario a message will be output to the servord user stating that functionality will not be provided until RES00102 is turned ON. An example is provided below:

Figure 11 Assigning DND_ONLY = Y when RES00102 is IDLE

```
>ADO $ 7234500
OPTION:
>SCA
BILLING_OPTION: NOAMA
>
STATUS:
>ACT
DNS:
>$
DND_ONLY: N
>Y
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 10 9 PM 7234500 ( SCA NOAMA INACT $ Y ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>Y
DND_ONLY functionality requires RES00102 to be turned ON
```

28.2.7 QSL changes

Query Screening List (QSL) command will not change as a result of this activity, but the display for SCA out will be changed to reflect the status of the new field DND_ONLY. A new line titled “Do Not Disturb Only” will be displayed and will show the status of DND_ONLY field. Refer to the optcn section for details.

28.3 Hardware Requirements or Dependencies

None

28.4 Software Requirements or Dependencies

RES00035: Selective Call Acceptance

28.5 Limitations and restrictions

Enhanced DND is not available on a pay-per-use (PPU) basis.

Existing limitations and restrictions regarding DND will remain unchanged as a result of this activity.

Existing limitations and restrictions regarding SCA will remain unchanged as a result of this activity.

28.6 Interactions

With this activity there is a new interaction between DND and SCA. The following tables summarizes these interactions:

Note: Enhanced DND subscriber is defined as a subscriber with DND and SCA with DND_ONLY = Y assigned.

Table 1 DND & SCA (DND_ONLY = Y) Provisioned (RES00102 SOC=ON)

IF DND_ONLY = Y	THEN
DND Inactive SCA Inactive	All callers terminate to the Enhanced DND subscriber
DND Inactive SCA Active	All callers terminate to the Enhanced DND subscriber
DND Active SCA Active	Callers on SCA List terminate to the Enhanced DND subscriber Callers not on SCA List receive SCA treatment
DND Active SCA Inactive	No callers terminate to the Enhanced DND subscriber

Table 2 DND & SCA (DND_ONLY = Y) Provisioned (RES00102 SOC=IDLE)

IF DND_ONLY = Y	THEN
DND Inactive SCA Inactive	All callers terminate to the Enhanced DND subscriber
DND Inactive SCA Active	All callers terminate to the Enhanced DND subscriber
DND Active SCA Active	No callers terminate to the Enhanced DND subscriber
DND Active SCA Inactive	No callers terminate to the Enhanced DND subscriber

Table 3 DND & SCA (DND_ONLY = N) Provisioned (RES00102 SOC=IDLE or SOC=ON)

IF DND_ONLY = N	THEN
DND Inactive SCA Inactive	All callers terminate to DND/SCA subscriber
DND Inactive SCA Active	Callers on SCA List terminate to DND/SCA subscriber Callers not on SCA List receive SCA treatment
DND Active SCA Active	Callers on SCA List pass SCA screening but are denied termination by DND Callers not on SCA List receive SCA treatment
DND Active SCA Inactive	Callers denied termination by DND

Note: Inactive assumes that the option is assigned but inactive.

SCA	Selective Call Acceptance

29: Functional Description (FN): A00002251

29.1 Feature name

192M Shared Memory Extension

29.2 Description

This feature increases addressable memory by 192M for selected 10 shared memory card XA-Core systems. This functionality is built into certain loads such as GSM for CSP20. This feature cannot be deactivated.

The 192M feature only has an effect in systems with 10 shared memory cards. This feature is able to entend memory by eliminating triplex memory from the system.

The addressable memory of a 10 shared memory card system without this feature is 1728M and the addressable memory of a 10 card system with this feature is 1920M. The addressable memory of a system sets the maximum load size that a switch can accomodate. Addressable memory can be viewed using the xsmemlim CI. The xsmemlim CI outputs the addressable memory in kilobytes (to convert to megabytes divide by 1024).

Output of xsmemlim for a 10 card system without feature built-in load

```
>xsmemlim

Memory Limits Statistics

Total addressable memory: 1769472 Kbytes

Spare memory:             1146880 Kbytes

 ...

MEMLIM Alarm Status: no alarm

>
```

Therefore the addressable memory for this system is 1769472/1024 = 1728M.

Output of xsmemlim for a 10 card system with feature built-info load

```
>xsmemlim

Memory Limits Statistics

Total addressable memory: 1966080 Kbytes

Spare memory:             1343488 Kbytes

...

MEMLIM Alarm Status: no alarm
```

Therefore the addressable memory for this system is 1966080/1024 = 1920M.

Any configuration with less then 10 cards will behave exactly the same with or without the feature. If a load with the feature built-in is booted with less then 10 cards no change will be noticed until enough cards are provisioned.

29.3 Hardware Requirements or Dependencies

The only hardware requirement is that a system has 10 shared memory cards. This feature will not extend memory by 192M unless there are 10 shared memory cards.

Please Note: This document discusses this feature in the context of 384M shared memory cards (NTLX14CA). This feature is applicable to newer larger shared memory cards. With larger shared memory cards the addressable memory gained by eliminating triplex addresses would be more than 192M.

29.4 Software Requirements or Dependencies

There are no software requirements or dependances. The load that is delivered must have the feature built into it.

29.5 Limitations and restrictions

The feature cannot be deactivated.

29.6 Interactions

Not applicable.

30.1 Feature name

Table AMAPRT Expansion

30.2 Description

Table STDPRTCT, subtable AMAPRT is a table that allows customers to add AMA specific options that are triggered by translations. The present limit of 8191 tuples in table AMAPRT limits the customer's ability to assign AMA options based on translations. This feature will expand the maximum value of this table to allow for 32000 entries, thus allowing the customer to datafill many more AMA options.

Term	Description
New term	Definition

31: Functional Description (FN): A00002340

31.1 Feature name

Add Extension Registers for Billing OM's

31.2 Description

31.2.1 CDR Oms

Two new OM groups FCDRTM1E and FCDRTM2E will be provided for the overflows from the groups FCDRTMP1 and FCDRTMP2. One new group FCDRALG2 will provided for the overflow from the group FCDRALGR.

The OM groups FCDRTMP1 and FCDRTMP2 each contains 32 registers to peg the usage of up to 32 different CDR templates. The OM group FCDRALGR contains eight registers to count the method used to choose the CDR template. The maximum size of a register is 65535 or #FFFF. The maximum size is controlled by the OM sub-system. With the addition of an extension register, every rollover will be pegged This allows up to a maximum value of 4,294,901,760 before the extension register overflows. This value is calculated by (65535 * 65535) + 65535.

The OM subsystem limits the maximum registers per OM group at 32 so new OM extension groups must be defined for the FCDRTMP1 and RFCDRTMP2 groups.

The new extension functionality will be implemented under SOC control. This will allow for controlled customer implementation and also provide the ability to disable the new extension if required.

The following displays the current OM group FCDRTMP1 along with the new OM extension group FCDRTM1E. The group FCDRTMP2 will be expanded in the same fashion for templates 32-63 using the new group FCDRTM2E.

The FCDRALGR group will have its extension registers in the new group FCDRALG2 as shown below.

```

31.8 Glossary

Term	Description

32: Functional Description (FN): A00002380

32.1 Feature name

MG9K ABI ESA

Emergency Stand Alone (ESA) service for lines off the Access Bridge Interface (ABI) cards of an MG9K Media Gateway 9000 (MG9K).

32.2 Description

This activity provides the ability for the Succession Call Server 2000 (CS2000) to support Emergency Stand Alone calling on the following DMS-100 Legacy Extended Peripheral Modules (XPM) subtending a Media Gateway 9000 (MG9K):

- LGC, LGCI
- LTC, LTCI
- SMA2

32.3 Hardware Requirements or Dependencies

There are no hardware requirements or dependencies for this feature.

32.4 Software Requirements or Dependencies

This ESA activity on the MG9000 is dependent upon the following activity for successful completion.

A00003567: MG 9000 Element Mgr Support for ABI ESA

The primary function of this component is to pull ESA data from the Core, organize this information in the EM in a meaningful way for the MG9K, and put it into the ESA subsystem on the ABI in a usable format.

The following activities support ITP ESA. ABI ESA and ITP ESA have a common design and the ITP documents should be considered as preliminary reading. The ABI ESA documentation supersedes the ITP ESA documentation.

A00002020: ESA Translation Download [ITP - CM]

A00002019: ESA EM Enhancements [ITP - MG9000 EM]

A00001982: ESA Enhancements [ITP - MG9000]

The following activities are related to this activity.

A00003486: Gateway Location Information [CM]

A00003693: ESA for ABI ON SMS

32.5 Limitations and restrictions

32.5.1 ABI VMG Naming convention

In order for the ESA data download to function properly, the VMG name for the ABI must contain the XPM node number of the XPM directly connected to the ABI pair. The typical name of an ABI is “EXPM168” where 168 is the node number of the ABI subtending XPM. The node number of the XPM can be obtained by posting it and the PM MAP level in the CM and using the querypm command. If the node number in the VMG name does not match the node number of the XPM, either no ESA data or incorrect ESA data will be downloaded to the ABI card.

32.5.2 Entering ESA

- Only calls that are in an active state (i.e. talking state) will survive warm entry into ESA mode.
- Calls that are intraswitched on RLCMs, OPMs, or OPACs can survive warm entry (not just network switched calls).
- Calls that won’t survive entry into ESA mode may be released over a period of time (not immediately).
- Only an Active Call on the PDN key of a P-phone is capable of surviving warm entry.
- Active Calls on non-PDN keys of a P-phone are dropped.
- The message waiting lamp is not extinguished during warm entry should an analog or P-phone terminal be so equipped.
- The lamp associated with the members of an SCA MADN group is not extinguished during warm entry should one member be in an active state (i.e. talking state).

32.5.3 During ESA

- Coin loop-start lines will be supported in ESA; however, ESA will supervise coin return upon call completion. The MG9K only supports CDF (Coin Dial First) and Coinless Coin phones.
- ESA between physical MG9000 master shelves (separate MGs) is not allowed.
- All members of a MADN group will be allowed to originate calls.

- Dialing a MADN member will result in a termination to the first idle MADN member and only this member. Not all MADN members will receive ringing.
- ESA is unavailable when DCC packs are out of service.
- ESA call processing is only supported between VMGs (ABIs or ITPs) currently in ESA on the same MG9000. Partial ESA (one VMG in ESA and another VMG not in ESA but on the same MG9000--commonly called *one up, one down*) is not supported.
- Emergency service (i.e. 911) translations are supported, but not emergency service features.
- No maintenance actions (whether from LCI, EMs, card-pulls, etc.) are recommended while in an ESA operational mode.
- Hunting is linear to those DNs physically residing on a VMG. Hunting on a hunt group that is divided across several VMGs does not guarantee true linear hunting for the entire group.
- Dialing directly to a DNH hunt member will cause a termination to that member. If the member is not available, hunting will be done only on the group members local to that VMG.
- If the "H" selector is used in table ESAPXLA then a call dialed with those digits will hunt through all hunt group members on the VMG. The Sequence Number, which normally causes hunting to start from a specific member, is not supported.
- The ESAPXLA table in the Core should be provisioned with the emergency service numbers (i.e. 911) needed while in ESA. Each VMG (as represented by an ABI XPM or LGRP) must be provided with its own emergency service line as well as table ESAPXLA translations terminating to the DN of that line.
- Basic call processing is supported on P-phone lines in ESA only for the primary DN.
- The PDN, Hold, RLS and digit keys are the only recognized keys supported for P-phones while in ESA.
- Hand-set and hands-free operation is supported for P-phones in ESA.
- Basic call processing during ESA is supported for analog and P-phone lines on RLCMs, OPMs, and OPACs. Intraswitching is not supported.

32.5.4 Exiting ESA

- Warm exit from ESA is not supported. Any call attempts or stable calls that coincide with exit from ESA will be torn down by the controlling MGC.

- Service codes are only supported on a limited basis for ESA. Emergency service 911 calls (or any other call using a service code) will not be preserved over ESA exit.

32.6 Interactions

While ABI ESA will be supported for the Legacy XPMs noted in section 32.2, it will not supersede Legacy ESA for Remote Switching Center (RSC) XPMs. RSCs that subtend an ABI XPM will enter existing Legacy ESA when an isolation occurs. They will not be controlled by ABI ESA. All existing RSC ESA functionality will remain intact.

33: Functional Description (FN): A00002431

33.1 Feature name

A00002431 - LX82BA CAPACITY DELIVERY

33.2 Description

This activity provides a mechanism for NORTEL to sell incremental call processing capacity for the NTLX82BA CEM card to its DMSCP SPM customers. The various levels of capacities for DMSCP class of SPMs are

1. Standard capacity - Call processing capacity equal to that of the NTLX82AA CEM card.
2. Enhanced capacity - Call processing capacity approximately equal to that of 2 times that of the NTLX82AA.
3. Premium capacity - Call processing capacity approximately equal to that of 3 times that of the NTLX82AA.

For Non-DMSCP class of SPMs, only two levels of capacities, Standard and Premium are provided based on the CEM PEC (NTLX82BA) that are datafilled in table MNCKTPAK. If both the CEMs are datafilled with NTLX82BA PEC, then the capacity is Premium else the capacity is Standard.

Currently, NTLX82BA CEMs running CST and CEM loads (DMSCP SPM) have their CALLP capacity reduced to that of the NTLX82AA whereas NTLX82BA CEMs running IWS (IW SPM) or MG4 (MG4K SPM) load have their CALLP capacity equivalent to that of NTLX82BA.

33.2.1 DMSCP class of SPMs:

This activity provides the ability to control the call processing capacity at the node level for DMSCP class of SPMs provisioned with NTLX82BA cards, using core SOC options. The customer can provision the desired capacity in table MNNODE if appropriate SOC keys are available.

The various functionalities provided as part of this activity are :

- Two usage SOCs, one for Enhanced and the other for Premium capacity.
- Table control changes in table MNNODE and table MNCKTPAK.

- New CI tool to display the capacity provisioned on the SPMs present in the office

33.2.1.1 Two Usage SOCs to provide Enhanced and Premium Capacity

Two new USAGE SOCs are created under the existing SPMS group for DMSCP class of SPMs. The SOC option SPMS0020 corresponds to the SPMs with Enhanced capacity and the SOC option SPMS0028 corresponds to the SPMs with Premium capacity. When the SOC keys are not available, the limit and the usage are zero and no DMSCP class of SPMs are capable of running at Enhanced or Premium capacity. Refer Figure 1 for the format of the two SOCs. Both the SOC options have hard usage limit. RTU is 'Y' for usage limit >0 and RTU is 'N' for usage limit = 0. For each value of the hard limit a separate SOC key is available for the customer. The threshold value for these SOC options are set to 100%.

The hard limit value of SPMS0020 denotes the maximum number of DMSCP class of SPMs in the office that can be provisioned with Enhanced capacity and the hard limit value of SPMS0028 denotes the maximum number of DMSCP class of SPMs in the office that can be provisioned with Premium capacity.

The value of the USAGE of SPMS0020 and SPMS0028 denotes the number of DMSCP class of SPMs currently running with the Enhanced and Premium capacity respectively from Core's perspective.

Please refer to section 13.7 of Configuration Document for more details on the Usage SOCs.

Figure 1 SPMS group options as listed in SOC framework

```
>select option SPMS0020 verbose

GROUP:SPMS
OPTION    NAME                 RTU STATE   USAGE   LIMIT    UNITS  LAST_CHG
------    ----                 --- -----   -----   -----    -----  --------
SPMS0020  Enhanced Call cap      Y     -       0       0      1SM  03/06/13
          replaces options:      NONE
          threshold:     100%    high water mark:       0

          FEATURE   STATE  USAGE     UNITS
          -------   -----  -----     -----
          00002431      -  0            1SM
             NAME:  SPMS Enhanced Call cap

>select option SPMS0028 verbose

GROUP:SPMS
OPTION    NAME                 RTU STATE   USAGE   LIMIT    UNITS  LAST_CHG
------    ----                 --- -----   -----   -----    -----  --------
SPMS0028  Premium Call cap       Y     -       0       0      1SM  03/06/13
          replaces options:      NONE
          threshold:     100%    high water mark:       0

          FEATURE   STATE  USAGE     UNITS
          -------   -----  -----     -----
          00002432      -  0            1SM
             NAME:  SPMS Premium Call cap
```

Note: SOC option SPMS0028 uses the feature id 00002432.

33.2.1.2 Table control support to provision the desired capacity in table MNNODE

For DMSCP class of SPMs, table control changes are made to provision the desired capacity per node in table MNNODE. A new field ‘capindx’ is added in table MNNODE, only for DMSCP class of SPMs to provision this capacity. This new field can take the values ‘Standard’, ‘Enhanced’ or ‘Premium’, ‘Standard’ being the default value.

During an ONP from an earlier release where the capindx field is not present to a release where the capindx field is introduced in table MNNODE, this field is set to ‘Standard’. For using ‘Enhanced’ or ‘Premium’ values during tuple addition, the respective SOC options must have its RTU set to Y and Usage count must be less than its Limit. Also for using ‘Enhanced’ capacity, number of DMSCP SPMs provisioned with Enhanced capacity must be less than the limit of SPMS0020 SOC option and for using ‘Premium’ capacity, number of DMSCP SPMs provisioned with Premium capacity must be less than the limit of SPMS0028 SOC option.

SOC 504 is an existing log that gets generated when the RTU is set for any SOC option.

While changing the capindx field to ‘Enhanced’ or ‘Premium’ values, the PEC codes of the CEM units provisioned in table MNCKTPAK for this node are also verified for NTLX82BA, in addition to the SOC check. If all the check passes, the appropriate SOC usage value is incremented. For capindx field changes from ‘Enhanced’ or ‘Premium’ values to ‘Standard’, appropriate SOC usage counts are decremented only if both the CEM tuples are present in table MNCKTPAK. Tuple change without any change to the ‘capindx’ field is not validated. For tuple deletion, there are no restrictions enforced on this field.

In table MNCKTPAK, the CEM tuples of DMSCP variant of SPM are allowed to be provisioned only with the PECs - NTLX82AA, NTLX82AB and NTLX82BA. The provisioning of the PEC is dependent on the capindx field present in table MNNODE. Incase the capindx in table MNNODE is ‘Standard’, the PEC shall be allowed to be datafilled as NTLX82AA, NTLX82AB or NTLX82BA. In case of ‘Enhanced’ or ‘Premium’ capindx, the PEC must be datafilled as NTLX82BA.

The provisioned capacity in table MNNODE, is downloaded to the local using DDM framework. Local throttles the callp capacity based on the capacity index downloaded.

Please refer to section 13.5 of Configuration Document for more details on the error, warning and success messages introduced by this activity during table control operations in table MNNODE and table MNCKTPAK.

33.2.1.3 CI tool to display capacity information

A new CI tool, SPMCPCAP, is introduced to display the capacity information of SPM. This tool enables to list the SPM and their capacities based on the variant type or list the SPMs based on the capacities. There is also a provision to find out capacity for a given SPM number. Remarks field in this tool displays if CEM(s) are not datafilled in table MNCKTPAK.

Please refer to section 13.9 of Configuration Document for more details on the CI tool.

33.2.2 Non-DMSCP class of SPMs

Table MNNODE is not modified for Non-DMSCP class of SPMs. Also in table MNCKTPAK no validations for CEM PEC are introduced by this activity.

The CI tool, SPMCPCAP, is used to display the capacity information of Non-DMSCP class of SPMs also. Only two capacities, ‘Standard’ and ‘Premium’ are displayed in this case. For Non-DMSCP variants, MG4K and IW, the capacity information is derived based on the table MNCKTPAK datafill. If both the CEM are datafilled with NTLX82BA PEC cards, then capacity is set

to ‘Premium’. For other combinations of PEC cards, the capacity is set to ‘Standard’. Remarks field in this tool displays if CEM(s) are not datafilled in table MNCKTPAK.

Please refer to section 13.9 of Configuration Document for more details on the CI tool.

33.3 Hardware Requirements or Dependencies

None.

33.4 Software Requirements or Dependencies

None.

33.5 Limitations and restrictions

- SOC limit can be decremented to a value less than the usage count.
- The CI tool displays the callp capacities for SPMs from core’s perspective only. The capacity will be enforced if there is a PEC mismatch at the local.

33.6 Interactions

None.

33.8 Glossary

Term	Description
CEM	Common Equipment Module
CI	Command Interpreter
PEC	Product Engineering Code
RTU	Right to Use
SOC	Software Optionality Control
SPM	Spectrum Peripheral Module

34: Functional Description (FN): A00002432

34.1 Feature name

ACT.A00002432 - Enhanced Spectrum Overload Operational Measurements (OMs) and Logs

34.2 Description

In the SP20 release, two new software optionality control (SOC) keys will be available that provides enhanced and premium call processing capability on the NTLX82BA CEM card. These keys are being added in feature A00002431. This capacity increase will allow the NTLX82BA card's performance to be approximately 2x that of an NTLX82AA card for 'enhanced' capability and approximately 3x for 'premium'. This additional capacity capability requires improvements to the SPM engineering information available to our customers.

This feature is also being used as a reference for the CAP00002 SOC key. That functionality is documented under feature ID A00002431.

This feature implements new operational measurements (OMs, or 'pegs') that will allow a craftsperson to monitor the performance of SPMs when the SPM is experiencing peak traffic levels that are in excess of the SPM engineering limit. It also augments an existing OM group, SPMACT, to include the capacity level.

There are two components that control the number of calls that can be handled by a given SPM. The first is the System Overload Control subsystem, which is controlled by the core and is dependent on core resources. The second is the SPM flow control system, which is controlled by the SPM and is influenced by SPM resource levels. The OMs and logs that are presented in this section will include data from both components.

34.3 Hardware requirements

None, the OMs and logs described in this section apply to all CEM platforms.

34.4 Limitations and restrictions

Core and local loads must both support the new functionality.

34.5 Interactions

The OMs and logs are driven by call processing on the SPM.

A new OM group will be added (SPMOVLD), and one new OM will be added to an existing group (SPMACT). For logs, a new log type (SPM399) will be introduced that indicates transitions in and out of the SPM overload conditions.

34.6 Logs (LG)

A new log will be introduced (SPM399) for flagging overload conditions in SPMs. This log is generated whenever an SPM enters/leaves an overload condition. The reason and the action for the craft are displayed in the log so that some action can be taken to rectify the condition. In addition, some diagnostic information for the designer is also printed in the log.

34.6.1 New/modified logs

Table 1 New or modified logs

Log name	Log number	NEW/MOD/ DELETED	System (SOS/UNIX)
SPM	399	New	SOS
SPM	313	Mod	SOS

The format/field-details and examples of the new log SPM 399 are given in detail in the ‘Fault Management’ section of this document.

34.7 Data schema (DS)

34.7.1 New/modified tables

Table MNNODE will be modified in a related feature:A00002431. Please refer to that design document for more details.

Table 2 New or modified tables

Table name	NEW, CHANGED or DELETED	Table Control (NEW/OLD/UNCHANGED)

34.8 Office parameters (OP)

34.11.1 New/modified commands

Table 5 New or modified commands

Command name	NEW, CHANGED OR DELETED	New name (if renamed)	Directory/MAP level name	MENU/NON-MENU /HIDDEN

34.12 Operational measurements (OM)

34.12.1 New/modified OM groups

Table 6 New or modified OM groups

Group name (acronym)	Group name (expanded)	NEW, CHANGED or DELETED	Reason
SPMACT	Spectrum Activity	Changed	One register added
SPMOVLD	Spectrum Overload	New	

One new register will be added to the SPMACT OM group - CAPLEVEL, which indicates what the SPM's capacity index is. The capacity index is a numeric value, with possible values of 0, 1, or 2, corresponding to regular, enhanced and premium capacity, respectively.

The new SPMOVLD group will have 18 OM registers that give metrics on the SPM flow control system and the system overload control component. All OM registers that apply to the system overload control component start with an 'S', all others apply to the flow control system:

Table 1

Flow Control Peg	SOC Peg	Description
OVLDNUM	SOVLDNUM	Number of times the system entered overload. For SOC (system overload control), this means the CM is in beyond_capacity state.
OVLDPNUM	not applicable	Number of times the SPM entered 'overload pending'.
OVLDUSG	SOVLDUSG	For Flow control, OVLDUSG represents the number of seconds the system was in overload. For SOC, SOVLDUSG represents the number of messages that were processed by SOC while the CM was in a beyond_capacity state.
OVLDPUSG	not applicable	Number of seconds the SPM was in 'overload pending'.
CLSDLYD	SCLSDLYD	The number of calls delayed by the two systems. When flow control and SOC are active, this will be equal to the number of new originations.
CLSDND CLSPTQ	SCLSDND	In flow control, CLSDND represents calls that were denied due to there being too many calls in the flow control system, while CLSPTQ represents calls denied because of too many messages on a PTQ. In SOC, these two registers are combined into a single 'Calls Denied' register that counts calls that were tossed regardless of the reason. This register in SOC includes origination messages that were counted in SMSGPTQ and SHDROVFL (see below).
CLSABDN	SCLSABDN	Calls in either system that were abandoned by the client. Normally the abandon message comes from call processing on the Core.

Table 1

Flow Control Peg	SOC Peg	Description
CLSMSC	not applicable	Calls lost to miscellaneous resource failures.
not applicable	SNUMORIG	Total number of originations passing through SOC (delayed or not).
not applicable	SMSGLOST	Number of messages lost because of SOC system limits (includes SMSGPTQ and SHDROVFL)
not applicable	SMSGPTQ	Number of messages of any type that were lost due to PTQ overflow.
not applicable	SHDROVFL	Number of messages of any type that were lost due to SOC header array overflow.

All of the above OMs will be presented in OMSHOW on a per-node basis. The 'Performance' section of this book gives details about the new and the changed OM groups.

34.13 AMA/Billing information (AM)

34.13.1 New/changed AMA/billing information

Table 7 New or modified AMA/billing information

Billing format	NEW/CHANGED	Application	Standards

34.14 Glossary

Term	Description
PTQ	Per Terminal Queue - in SOC (System Overload Control) and Spectrum flow control, this is a queue that stores messages that are to be delivered to a given terminal ID.
SOC	An overloaded acronym that can mean either System Overload Control or Software Optionality Control, depending on the context.

35: Functional Description (FN): A00002433

35.1 Feature name

XA-Core Baseline Control

35.2 Description

35.2.1 Purpose

This activity seeks to address reliability issues related to XA-Core Hardware (HW) and Firmware (FW) not being at field baseline.

35.2.2 Baseline Definition

Field baseline implies the minimum HW/FW release/version that Nortel Networks requires for reliable XA-Core operation. The HW field baseline is updated due to a class 'A' HW change. The FW field baseline is updated due to a severe FW bug.

1. HW baseline compatibility is based on PEC presence in table PECINV and meeting Release constraints.
2. FW baseline compatibility is based on PEC presence in table FWINV and FW/DLL meeting Version constraints.

See *"35.2.5 Activity Behaviour" on page 353* for detailed info.

35.2.3 Activation

The activity is activated by default, in all XA-Core loads.

35.2.4 Baseline Defaults

XA-Core **hardware** baselines are stored in table **PECINV**.
XA-Core **firmware** baselines are stored in **New table FWINV**.
These tables are provisioned in the loadbuild stage of software delivery.

Tables PECINV and FWINV are user modifiable, but caution must be exercised in making any changes, since the changes can impact the system, as further described below. Both tables are NOT restored over an ONP.
CSP20 defaults are shown in: *Table 1, "CSP20 Baseline HW Releases, FW Versions," on page 352*. HW/FW exceptions can be provisioned to indicate a HW release or FW version which **must** not be allowed. Any release/version greater than or equal to the baseline release/version is OK to use, as long as it is NOT listed as an exception. There are currently no exception values.

Table 1 CSP20 Baseline HW Releases, FW Versions

Grp	Type	PEC	PECINV HW Release	FWINV FW Version[a][s]:	
			Baseline	FW Baseline	DLL Baseline
Cards	PE	NTLX02AA	n/a	Not supported	
		NTLX02CA	01	XAPE01AG	Not user modifiable
		NTLX02DA		XAPE02AB	
	IOP	NTLX03AA	28	XAIO01AK	N/A
		NTLX03AB	03		
		NTLX03BA	28		
		NTLX03BB	03		
	HIOP	NTLX04AA	01	XHIO02AA	XHIO02AH
		NTLX04BA			
		NTLX04CA		XHIO02AH	
		NTLX17AA		XHIO03AA	
PkIt	CMIC	NTLX05AA	n/a	Not supported	
		NTLX05AB	01	PK12CE12	N/A
	AMDI	NTLX05BA			
	ETHR	NTLX09AA		EP14D003	
No FW	SM	NTLX14CA		N/A	
		NTLX14FA			
	DISK	NTLX06AA			
		NTLX06AB			
		NTLX06AC			
	TAPE	NTLX07AA			
		NTLX07BA			
	RTIF	NTLX08AA			
		NTLX08AB			

a. There are currently no hardware or firmware exceptions.

35.2.5 Activity Behaviour

HW and FW baseline behaviour is summarized below for Hardware (PECINV) and Firmware (FWINV) respectively.
Details follow in subsequent sections.

Table 2 Baseline Behaviour - PECINV vs. Hardware

Input Conditions		Behaviour		
PEC	**Hardware Rel vs. PECINV Rel**	**RTS**	**Baseln Alarm**	**SREx**
Not in PECINV	n/a	Fail	Raise	No SREx for X if X non-baseline. X=PE&SM | IO
IN PECINV	= exception Rel OR < baseline Rel			
	>= baseline Rel	Pass	Lower	OK

Table 3 Baseline Behaviour - FWINV vs. Firmware

Input Conditions		Behaviour		
PEC	**Firmware Ver vs. FWINV Ver**	**RTS**	**Baseln Alarm**	**SREx**
NOT in FWINV: pe, iop, hiop cards cmic, amdi, ethr pklts	n/a	Fail	Raise	No SREx for X if X non-baseline. X=PE&SM | IO
IN FWINV pe, iop, hiop[a] card, cmic, amdi, ethr pklts	= exception Ver			
	< baseline Ver	Pass[b]		OK
	>= baseline Ver	Pass	Lower	
NOT in FWINV: sm, disk, tape, rtif	don't care. FRU have no FW			

a. HIOP: Both FW & DLL must pass baseline checks.
b. FW/DLL updated AFTER unsplit, so we must RTS, since later SREx/ManB/Reload would leave a previously working FRU OOS.

35.2.5.1 Baseln Alarm

New Baseln Major alarm is used to indicate that at least one non-baseline (Hardware or Firmware) FRU is present in the system.
Baseln alarm raising or lowering is triggered by:

1. Manual "MAPCI;MTC;XAC;QUERY CARD" of a below baseline FRU
2. Manual "MAPCI;MTC;XAC;QUERY SHELF"
3. System initiated query - occur periodically and after certain events
4. Manual "MAPCI;MTC;XAC;<level>;UNEQ" after FRU BSY, then pull

The alarm is lowered when all FRU have baseline compatible HW and FW[1].

[1]Or any restart occurs. See *"35.5 Limitations and restrictions" on page 356*

To get a list of the non-baseline FRU responsible for the alarm, type, from MAPCI;MTC;XAC level:

1. ALARM Baseln - lists the problem FRU, but no baseline specific info
2. QUERY SHELF - ALL FRU info in the XA-Core shelf.
   Look for "*" in Hardware and Firmware "OK" columns.

35.2.5.2 Related Logs

1. **New XAC337** (FLT) - generated when the Baseln alarm is first raised, and whenever the list of non-baseline items changes, and is non-empty.
   The log lists the non-baseline FRU with related baseline information.
2. **New XAC637** (INFO)- generated when the Baseln alarm is lowered, indicating all FRU are now baseline compatible. The log is NOT generated due to a restart clearing the alarm, as discussed in *"35.5 Limitations and restrictions"*.
3. XAC415 - generated when SREx Baseline precheck determines that a PE or SM card is non-baseline, so no SREx is permitted.
   New reason added: "XACore Hardware or Firmware is not at baseline".

35.2.5.3 SREx Impact

SREx is **bypassed** and an XAC415 log generated if a PE or SM card is not at baseline. Subsequent AutoDump is disallowed, since no image test was run.

OOS IO tests are bypassed if ONLY IO related FRU are non-baseline.

35.2.5.4 Table Control

Table PECINV - **new warning** is displayed if the user attempts a change or delete operation on a tuple with a subsystem of XACHW.
Warn that FRU WILL NOT RTS if the tuple is deleted or if the baseline or exception list change is not compatible with existing/newly inserted hardware.

New table FWINV - contains firmware (and DLL) baseline(s) indexed by PEC. Also provides the ability to indicate a FW release which should not be allowed if declared an "exception" version(s).

Table XAFWLOAD - **new warning** is displayed if the user attempts to provision a non-baseline firmware loadname.
Warn that Baseln alarm will be raised after the FRU is RTS'd, if a non-baseline loadname is used.

35.2.5.5 OAM

From MAPCI;MTC;XAC level (or sublevels), QUERY SHELF output **adds** Hardware and Firmware baseline[s] and FRU status indicator ("OK").
Any "*" in the OK column requires investigation.
The OK column entry is of the form "x" where x is:

1. **P*** = PEC not in table **P**ECINV
2. **F*** = PEC not in table **F**WINV, and FRU has FW (and DLL - HIOP only)
3. **N*** = **N**ot baseline compatible. I.e. Below baseline.
4. **X*** = Release/Version is an e**X**ception Rel/Ver in table PECINV/FWINV
5. **I*** = Could not read MIM **I**DPROM, to get PEC/Rel.
   This occurs during some maintenance activities.
   Baseln alarm/log will NOT be generated solely from this info.
6. **Y** = **Y**es, this FRU is baseline compatible.

"HW-SW vintage" column is **removed** from QUERY SHELF output, to allow for new baseline information. Vintage is still visible from the QUERY CARD command.

CI "POLL SHORT <dev1> <dev2>" is **enhanced** to show the output from a "QUERY SHELF" command. On a Supernode, it currently displays the output from MAPCI;MTC;CM;QUERYCM NOEMPTY.
XAC;QUERY SHELF is the XA-Core logical equivalent.

35.2.5.6 ONP Prechecks

The following **ONP precheck steps are enhanced** to detect non-baseline FRU on the active image. The steps fail if the equivalent of a QUERY SHELF displays "P*, F*, X* or N*", as previously described in *"35.2.5.5 OAM"*.

1. "ONPREADY", step "DISPLAY_PEC_INFO"
2. "SWUPGRADE READY; START", step "VERIFY_SN_PECS_INFO"
3. "BCSUPDATE; PRECHECK", step "DISPLAY_PEC_INFO"

35.2.5.7 ONP Pre-SWACT

While split, a **new pre-SWACT check** requests/receives the new-side PECINV (hardware baseline) data, to see if existing HW meets new-side baseline requirements. Alert the user if it does not.

FW checks are NOT done, since FW is currently updated in the first available Mtc window AFTER the unsplit succeeds. The Baseln Major alarm WILL be raised shortly after the unsplit, if the FWINV baselines have changed from one CSP release to another - this is a reminder to do the suggested FW/DLL upgrades.

35.3 Hardware Requirements or Dependencies

This activity applies only to XA-Core.

The XA-Core must be at hardware baseline for new ONP prechecks to pass. Hardware baselines are detailed in "XA-Core Maintenance Manual" (NTP 297-8991-510).

A patch will be developed for each of CSP17-CSP19, in order to determine the switch's current hardware baseline status. The intent is to avoid any ONP baseline issues when upgrading to CSP20-CSP22.

35.4 Software Requirements or Dependencies

No new software dependencies.

Since XA-Core firmware is upgraded after the ONP, below baseline firmware must be permitted to RTS; however, it will cause the Baseln alarm to be raised. Firmware baselines are detailed in the "DMS-100 Family NA100 Peripheral Module Software Release Document" (NTP 297-9081-599).

35.5 Limitations and restrictions

New Baseln alarm is cleared over all restarts. The alarm is re-raised when the non-baseline item is queried manually or by the system (within 10 minutes).

Since XA-Core firmware is upgraded after the ONP, below baseline firmware must be permitted to RTS; however, it will cause the Baseln alarm to be raised.

No incompatibilities with other features.

35.6 Interactions

Table XAFWLOAD - a new warning is displayed if the user attempts to provision a non-baseline firmware loadname.
Warn that Baseln alarm will be raised after the FRU is RTS'd.

Table PECINV - a new warning is displayed if the user attempts a change or delete operation on a tuple with a subsystem of XACHW.
Warn that FRU **WILL NOT** RTS if the tuple is deleted.
Warn that FRU **MAY NOT** RTS if the baseline or exception list change is not compatible with existing/newly inserted hardware.

35.8 Glossary

Term	Description
Baseline	The minimum HW/FW release/version that Nortel Networks requires for reliable XA-Core operation.
DLL	DownLoadable Loader
Exception	A HW release/FW version greaterthan or equal to the baseline release/version is OK to use, as long as it is NOT listed explicitly as an exception. I.e. an exception indicates HW/FW which must not be used.
FRU	Field Replaceable Unit - card or IOP packlet
FW	FirmWare
HW	HardWare
IOP	Input Output Processor Card
ManB	Manual Busy
MIM	Module Information Memory
ONP	One Night Process
OOS	Out Of Service
PE	Processor Element Card
RTS	Return To Service
SM	Shared Memory Card
SREx	System Routine Exercise

36: Functional Description (FN): A00002499

36.1 Feature name

XA-Core Baseline Control

36.2 Description

36.2.1 Purpose

This activity seeks to address reliability issues related to XA-Core Hardware (HW) and Firmware (FW) not being at field baseline.

36.2.2 Baseline Definition

Field baseline implies the minimum HW/FW release/version that Nortel Networks requires for reliable XA-Core operation. The HW field baseline is updated due to a class 'A' HW change. The FW field baseline is updated due to a severe FW bug.

1. HW baseline compatibility is based on PEC presence in table PECINV and meeting Release constraints.
2. FW baseline compatibility is based on PEC presence in table FWINV and FW/DLL meeting Version constraints.

See *"35.2.5 Activity Behaviour" on page 353* for detailed info.

36.2.3 Activation

The activity is activated by default, in all XA-Core loads.

36.2.4 Baseline Defaults

XA-Core **hardware** baselines are stored in table **PECINV**.
XA-Core **firmware** baselines are stored in **New table FWINV**.
These tables are provisioned in the loadbuild stage of software delivery.

Tables PECINV and FWINV are user modifiable, but caution must be exercised in making any changes, since the changes can impact the system, as further described below. Both tables are NOT restored over an ONP.
CSP20 defaults are shown in: *Table 1, "CSP20 Baseline HW Releases, FW Versions," on page 352*. HW/FW exceptions can be provisioned to indicate a HW release or FW version which **must** not be allowed. Any release/version greater than or equal to the baseline release/version is OK to use, as long as it is NOT listed as an exception. There are currently no exception values.

Table 1 CSP20 Baseline HW Releases, FW Versions

a. There are currently no hardware or firmware exceptions.

36.2.5 Activity Behaviour

HW and FW baseline behaviour is summarized below for Hardware (PECINV) and Firmware (FWINV) respectively.
Details follow in subsequent sections.

Table 2 Baseline Behaviour - PECINV vs. Hardware

Input Conditions		Behaviour		
PEC	**Hardware Rel vs. PECINV Rel**	**RTS**	**Baseln Alarm**	**SREx**
Not in PECINV	n/a	Fail	Raise	No SREx for X if X non-baseline. X=PE&SM | IO
IN PECINV	= exception Rel OR < baseline Rel			
	>= baseline Rel	Pass	Lower	OK

Table 3 Baseline Behaviour - FWINV vs. Firmware

Input Conditions		Behaviour		
PEC	**Firmware Ver vs. FWINV Ver**	**RTS**	**Baseln Alarm**	**SREx**
NOT in FWINV: pe, iop, hiop cards cmic, amdi, ethr pklts	n/a	Fail	Raise	No SREx for X if X non-baseline. X=PE&SM | IO
IN FWINV pe, iop, hiop[a] card, cmic, amdi, ethr pklts	= exception Ver			
	< baseline Ver	Pass[b]		OK
	>= baseline Ver	Pass	Lower	
NOT in FWINV: sm, disk, tape, rtif	don't care. FRU have no FW			

a. HIOP: Both FW & DLL must pass baseline checks.
b. FW/DLL updated AFTER unsplit, so we must RTS, since later SREx/ManB/Reload would leave a previously working FRU OOS.

36.2.5.1 Baseln Alarm

New Baseln Major alarm is used to indicate that at least one non-baseline (Hardware or Firmware) FRU is present in the system.
Baseln alarm raising or lowering is triggered by:

1. Manual "MAPCI;MTC;XAC;QUERY CARD" of a below baseline FRU
2. Manual "MAPCI;MTC;XAC;QUERY SHELF"
3. System initiated query - occur periodically and after certain events
4. Manual "MAPCI;MTC;XAC;<level>;UNEQ" after FRU BSY, then pull

The alarm is lowered when all FRU have baseline compatible HW and FW[1].

[1]Or any restart occurs. See *"35.5 Limitations and restrictions" on page 356*

To get a list of the non-baseline FRU responsible for the alarm, type, from MAPCI;MTC;XAC level:

1. ALARM Baseln - lists the problem FRU, but no baseline specific info
2. QUERY SHELF - ALL FRU info in the XA-Core shelf.
   Look for "*" in Hardware and Firmware "OK" columns.

36.2.5.2 Related Logs

1. **New XAC337** (FLT) - generated when the Baseln alarm is first raised, and whenever the list of non-baseline items changes, and is non-empty.
   The log lists the non-baseline FRU with related baseline information.
2. **New XAC637** (INFO)- generated when the Baseln alarm is lowered, indicating all FRU are now baseline compatible. The log is NOT generated due to a restart clearing the alarm, as discussed in *"35.5 Limitations and restrictions"*.
3. XAC415 - generated when SREx Baseline precheck determines that a PE or SM card is non-baseline, so no SREx is permitted.
   New reason added: "XACore Hardware or Firmware is not at baseline".

36.2.5.3 SREx Impact

SREx is **bypassed** and an XAC415 log generated if a PE or SM card is not at baseline. Subsequent AutoDump is disallowed, since no image test was run.

OOS IO tests are bypassed if ONLY IO related FRU are non-baseline.

36.2.5.4 Table Control

Table PECINV - **new warning** is displayed if the user attempts a change or delete operation on a tuple with a subsystem of XACHW.
Warn that FRU WILL NOT RTS if the tuple is deleted or if the baseline or exception list change is not compatible with existing/newly inserted hardware.

New table FWINV - contains firmware (and DLL) baseline(s) indexed by PEC. Also provides the ability to indicate a FW release which should not be allowed if declared an "exception" version(s).

Table XAFWLOAD - **new warning** is displayed if the user attempts to provision a non-baseline firmware loadname.
Warn that Baseln alarm will be raised after the FRU is RTS'd, if a non-baseline loadname is used.

36.2.5.5 OAM

From MAPCI;MTC;XAC level (or sublevels), QUERY SHELF output **adds** Hardware and Firmware baseline[s] and FRU status indicator ("OK").
Any "*" in the OK column requires investigation.
The OK column entry is of the form "x" where x is:

1. **P*** = PEC not in table **P**ECINV
2. **F*** = PEC not in table **F**WINV, and FRU has FW (and DLL - HIOP only)
3. **N*** = **N**ot baseline compatible. I.e. Below baseline.
4. **X*** = Release/Version is an e**X**ception Rel/Ver in table PECINV/FWINV
5. **I*** = Could not read MIM **I**DPROM, to get PEC/Rel.
   This occurs during some maintenance activities.
   Baseln alarm/log will NOT be generated solely from this info.
6. **Y** = **Y**es, this FRU is baseline compatible.

"HW-SW vintage" column is **removed** from QUERY SHELF output, to allow for new baseline information. Vintage is still visible from the QUERY CARD command.

CI "POLL SHORT <dev1> <dev2>" is **enhanced** to show the output from a "QUERY SHELF" command. On a Supernode, it currently displays the output from MAPCI;MTC;CM;QUERYCM NOEMPTY.
XAC;QUERY SHELF is the XA-Core logical equivalent.

36.2.5.6 ONP Prechecks

The following **ONP precheck steps are enhanced** to detect non-baseline FRU on the active image. The steps fail if the equivalent of a QUERY SHELF displays "P*, F*, X* or N*", as previously described in *"35.2.5.5 OAM"*.

1. "ONPREADY", step "DISPLAY_PEC_INFO"
2. "SWUPGRADE READY; START", step "VERIFY_SN_PECS_INFO"
3. "BCSUPDATE; PRECHECK", step "DISPLAY_PEC_INFO"

36.2.5.7 ONP Pre-SWACT

While split, a **new pre-SWACT check** requests/receives the new-side PECINV (hardware baseline) data, to see if existing HW meets new-side baseline requirements. Alert the user if it does not.

FW checks are NOT done, since FW is currently updated in the first available Mtc window AFTER the unsplit succeeds. The Baseln Major alarm WILL be raised shortly after the unsplit, if the FWINV baselines have changed from one CSP release to another - this is a reminder to do the suggested FW/DLL upgrades.

36.3 Hardware Requirements or Dependencies

This activity applies only to XA-Core.

The XA-Core must be at hardware baseline for new ONP prechecks to pass. Hardware baselines are detailed in "XA-Core Maintenance Manual" (NTP 297-8991-510).

A patch will be developed for each of CSP17-CSP19, in order to determine the switch's current hardware baseline status. The intent is to avoid any ONP baseline issues when upgrading to CSP20-CSP22.

36.4 Software Requirements or Dependencies

No new software dependencies.

Since XA-Core firmware is upgraded after the ONP, below baseline firmware must be permitted to RTS; however, it will cause the Baseln alarm to be raised. Firmware baselines are detailed in the "DMS-100 Family NA100 Peripheral Module Software Release Document" (NTP 297-9081-599).

36.5 Limitations and restrictions

New Baseln alarm is cleared over all restarts. The alarm is re-raised when the non-baseline item is queried manually or by the system (within 10 minutes).

Since XA-Core firmware is upgraded after the ONP, below baseline firmware must be permitted to RTS; however, it will cause the Baseln alarm to be raised.

No incompatibilities with other features.

36.6 Interactions

Table XAFWLOAD - a new warning is displayed if the user attempts to provision a non-baseline firmware loadname.
Warn that Baseln alarm will be raised after the FRU is RTS'd.

Table PECINV - a new warning is displayed if the user attempts a change or delete operation on a tuple with a subsystem of XACHW.
Warn that FRU **WILL NOT** RTS if the tuple is deleted.
Warn that FRU **MAY NOT** RTS if the baseline or exception list change is not compatible with existing/newly inserted hardware.

37: Functional Description (FN): A00002505

37.1 Feature name

Universal Signaling Point Interface Client - GUI

37.2 Description

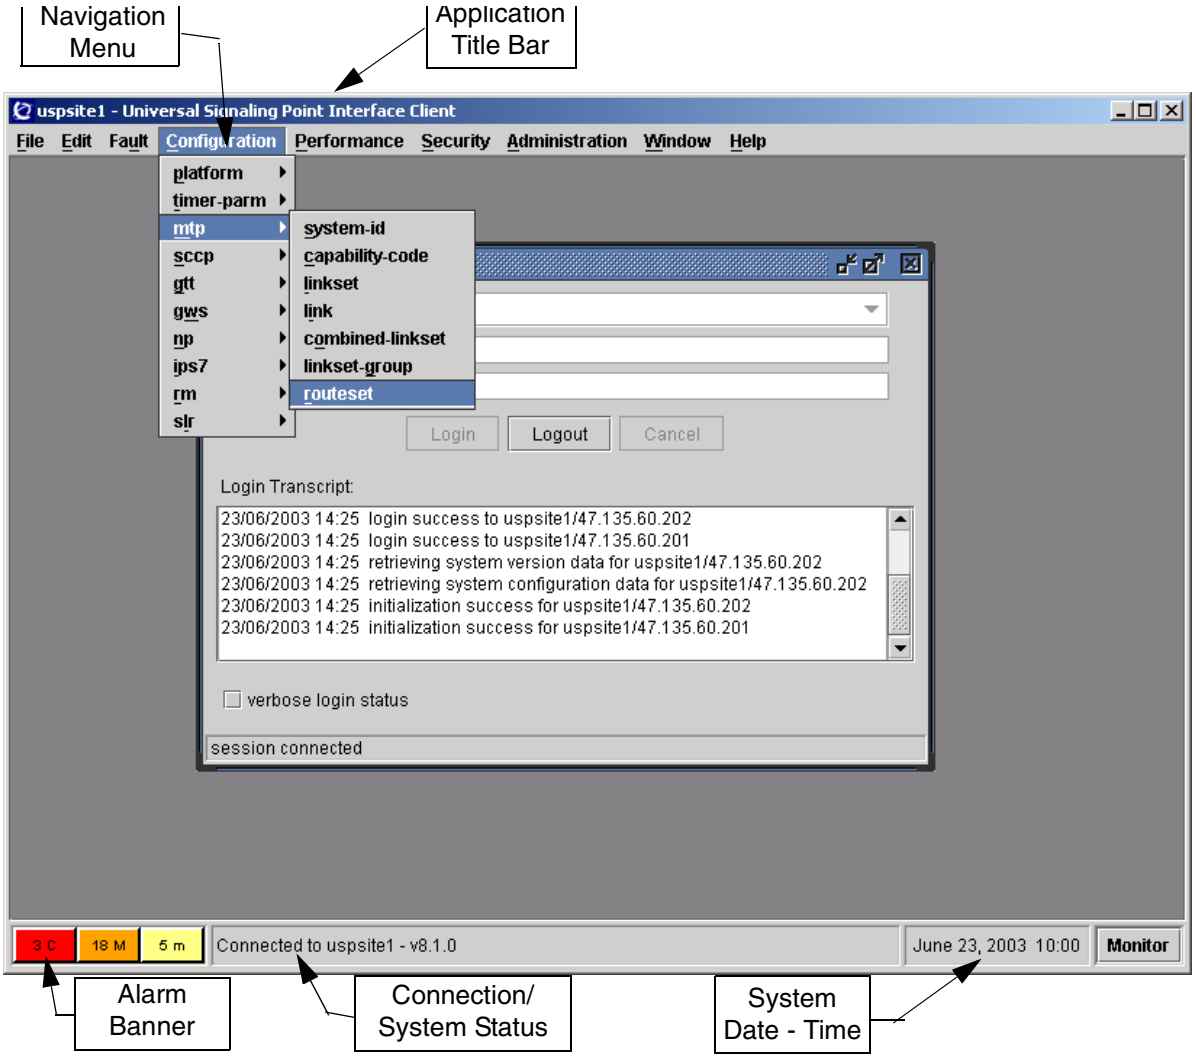
The purpose of this feature is to provide a graphical user interface (GUI) capable of running on multiple operating system platforms in a windows based environment. The GUI will have provisions for administering, monitoring and reporting on the Universal Signaling Point (USP). The GUI delivered by this feature is a replacement for the GUI provided with previous software releases (pre USP8.1.0) and will include and expand upon the functionality and usability provided by the previous GUI version.

The GUI provides a complete multi-platform solution for managing the operation of the USP by providing an intuitive user interface client to perform administration, system monitoring and reporting. The GUI client implements a consistent interface model to present all USP data to ensure ease-of-use and quick navigation of the data retrieved from the USP.

All communication with the USP is accomplished by establishing a standard TELNET connection to the USP Command Line Interface (CLI) and will maintain that connection, reestablishing the connection if necessary. There are no custom protocols or ports to configure which simplifies interoperability and allows for all existing security restrictions and firewalls to be enforced. Local security is also enhanced by initiating idle session lockout and re-authentication if a session is left unattended for an extended period of time. Interoperability is enhanced through context-sensitive launching, using command line arguments, which allows external applications to control the launch sequence of the GUI to have it automatically navigate to the desired table and records using the supplied retrieval criteria.

The GUI is designed as a single encapsulating window manager to help organize and manage the layout of the large number of tables offered by the USP. Access to each table is achieved by a hierarchical menu structure. This structure provides fast and simple navigation to the desired table by simply clicking on the desired table from the pull down menus. See the following figure for an example of the main window of the GUI application.

GUI Main Window



For monitoring purposes, the bottom panel of the main window has connection and status information related to the currently connected site. The alarm banner presents a summary of the current alarmed components of the USP. The status panels provide further overall site information about the current connected site; including, connection information, running software versions and the current system date-time.

The GUI is built on a proven transaction based multi-threaded framework to ensure it will remain responsive even under heavy operation. This permits multiple tasks to be performed simultaneously and assures that progress and status information can always be relayed to the user for the current operation. The cross-platform support of the GUI is accomplished by exploiting the multi-platform support of the Java 2 technology.

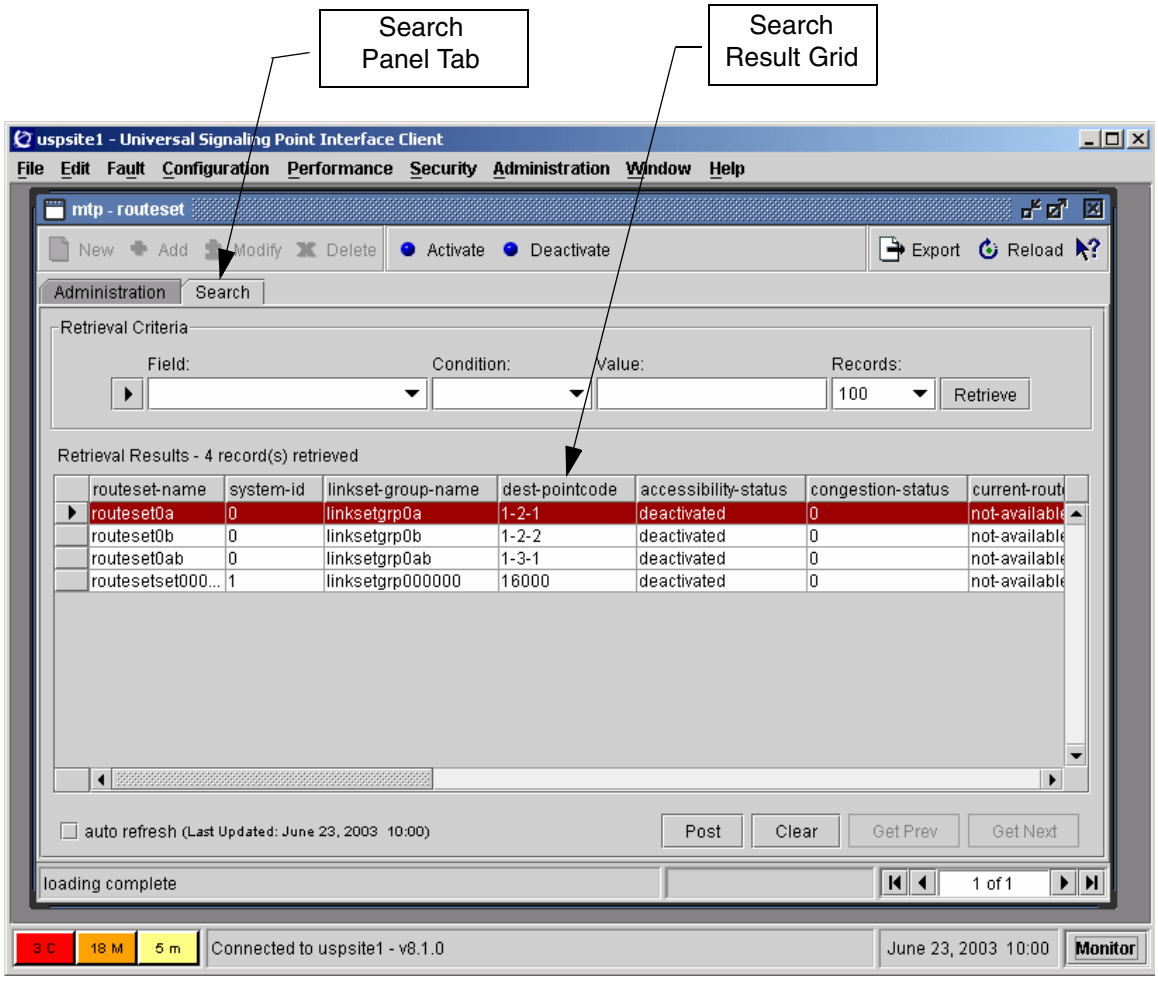
Management of all system operations and provisioning data is achieved through a common table interface. This common interface simplifies usability and reduces learning times by providing consistent presentation formats and navigation controls. The common table interface consists of an Administration and Search panel for each table accessible from the USP.

The Administration panel provides the provisioning and maintenance operations for that table. All record manipulation can be performed by the Administration screen for a particular table, including the addition, modification and deletion of records. To enhance usability, all table fields are linked to context-sensitive help to provide a complete field description; including field type, data type, minimum and maximum values, input restrictions, allowed value lists and optional descriptive text for field explanation or special notes. See the following figure for an example of a table Administration panel.

Table Administration Panel

The Search panel provides record retrieval and navigation, with the added capability of supplying search criteria for most table fields. All tables support both basic and advanced data retrieval and search capabilities to allow for quick navigation to the data of concern. See the following figure for an example of a table Search panel.

Table Search Panel

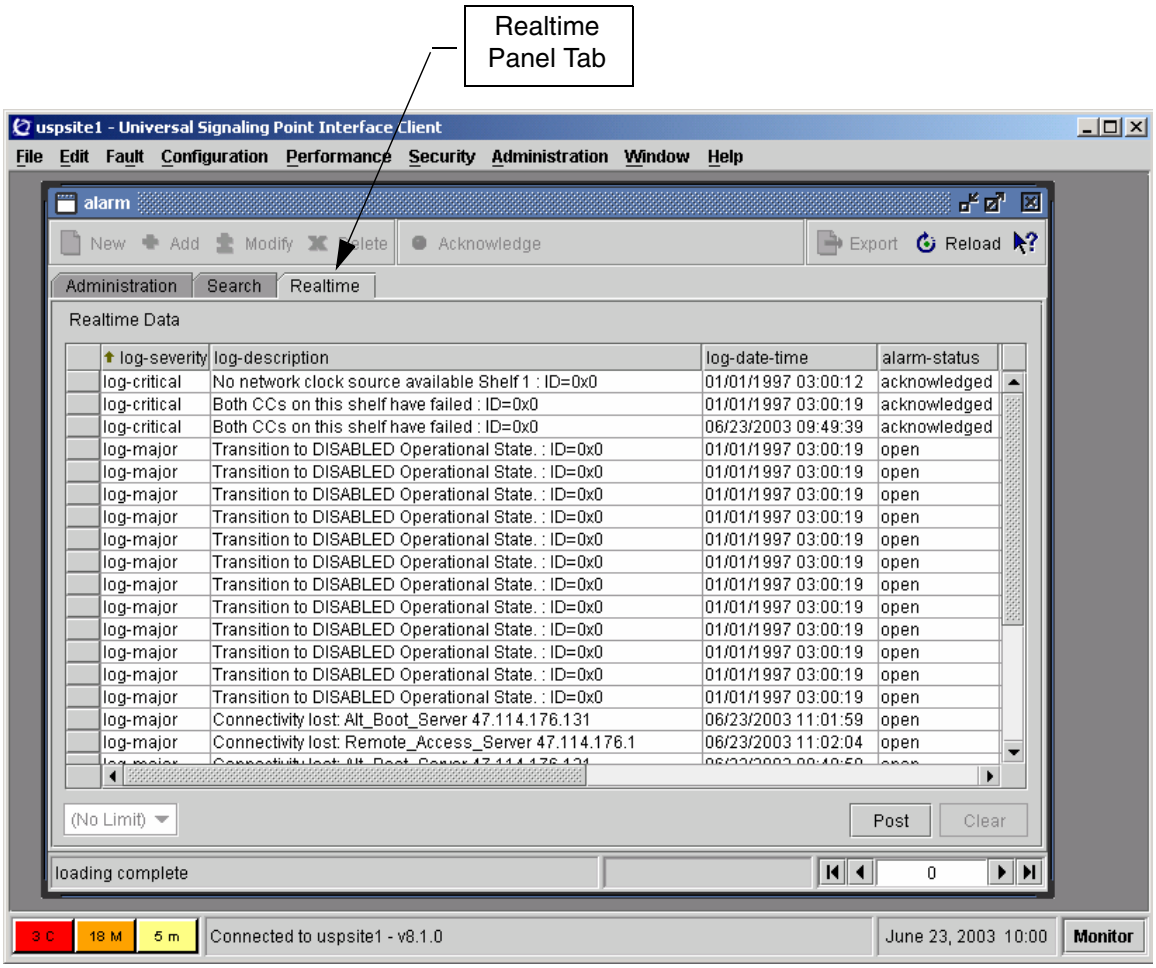


All data retrieved from the USP can be formatted and exported to an external file for the purpose of capturing the data in static form. Data can be exported in HTML, CSV and plain text formats. The Search panel facilitates the data capture and customized reporting through the search result grid containing the retrieved table records. Customization is accomplished by adjusting the appearance, presence and location of table fields of a table grid to help organize and report on the critical data.

Fault monitoring of a specific site can be performed in real-time by viewing the summary information from the status bar of the main window, or by accessing the specific fault information from the alarm and log tables. In addition to Administration and Search panels, the fault management tables have a Realtime panel which allows for real-time monitoring and viewing of USP events (i.e. logs and alarms). Similar to search screens, the data presented

by the Realtime panel can be customized and navigated using the same common interface. See the following figure for an example of a table Realtime panel.

Table Realtime Panel



37.3 Hardware Information

The GUI has been verified on the following platforms running JRE1.4.1_02:

- Windows (NT4.0+SP5/2000 prof+SP2/XP)
- Solaris OS + patches (http://sunsolve.sun.com/pub-cgi/show.pl?target=patches/J2SE)

The following system requirements must be met to run the GUI application:

- minimum of 64 megabytes of RAM, recommended 128 megabytes

- minimum of 100 megabytes of disk space to install JRE and to store site configuration, preferences and local logs required by GUI application
- graphical window environment running at least 16-bit color depth

37.3.1.1 GUI/CLI Information

The summary of the changes have been outlined in the "Description" section. For a complete and detailed description of the changes and the usage of the GUI, please refer to the document titled *Universal Signaling Point GUI - User Guide*.

37.3.1.2 CLI changes

All communication (data exchange) with the USP will be performed through a TELNET connection to the USP using the CLI. The GUI will make use of the CLI-API machine interface of the USP and will therefore require no additional functionality.

37.3.2 GUI changes

Refer to the "Description" section for details of GUI changes. The new GUI is a replacement for the GUI distributed with the previous software releases (pre USP8.1.0).

37.3.3 OMs

Not Applicable.

37.3.4 Logs, and Alarms

Not Applicable.

37.4 Interactions

The GUI facilitates administration, monitoring and reporting of all existing functions of the USP. The functionality provided by the USP will continue to operate as normal and will not be affected by the interface changes introduced by the GUI.

37.5 Restrictions and Limitations

None.

37.6 Definitions and Terms

CLI - Command Line Interface

CPU- Central Processing Unit

GUI - Graphical User Interface

J2SE- Java 2 Standard Edition

JRE - Java Runtime Engine

MDI- Multiple Document Interface

USP - Universal Signaling Point

38: Functional Description (FN): A00002510

38.1 Feature name

LANCOMM IP over IRM.

38.2 Description

This document provides the design intent for the feature to provide LANCOMM IP over the IRM on XA-CORE. The purpose of this feature is to provide LANCOMM TCP and UDP availability when communicating over the XACORE Ethernet messaging system. This feature does not address LANCOMM issues of performance or robustness.

At present the IRM IP is used to transmit and receive packets to and from the XACORE IO hardware. The IRM implementation of IP is very minimal with some of the features such as ARP routing being performed by the firmware. The IRM IP implementation does not support TCP or features like IP fragmentation and extra options. The LANCOMM version of IP supports IP more completely. This feature will use the IRM IP to receive packets from the IO cards, however the IRM will then will use callback routines that will be registered with the IRM for packets intended for LANCOMM to pass the packets to LANCOMM UDP or TCP. The LANCOMM IP will be used to process the packets. A TCP or UDP packet coming from the LANCOMM intended for the IRM will be injected in to the IRM IP after it has passed through the LANCOMM IP to be transmitted to Ethernet.

The specific purpose of this feature is to support the Next generation Supernode Data Manager (nSDM) that is being developed on a Solaris platform to replace the existing SDM FX which uses a DS512 to connect to the CORE. The nSDM will not have a DS512. It will connect to the CORE via Ethernet. This feature will also support FTP or TELNET over IRM from another source other than the SDM like for instance an workstation. [1]This will not be a EIU replacement but will exist in the same load as EIU.This Feature will support the following SDM applications with LANCOMM IP over IRM.

- RPC (UDP)
- NTP -Network Time Protocol (UDP)
- FTP (TCP)
- Telnet (TCP)
- SBA -Billing (RFC TCP)

[1]Telnet and FTP over IRM will be enabled for all devices connected to a CORE that is in lab mode. In field mode the only recognised device allowed to access the CORE through the Ethernet will be SDM.

38.3 Hardware Requirements or Dependencies

A nSDM and a SDM FX which are connected to the Core by HIOP are required to fully test the feature. We also need a nSDM system that is connected to a core that has both EIU and HIOPs.

38.4 Software Requirements or Dependencies

There should be no software dependencies as this feature will work with both the existing SDM FX and NSDM.

38.5 Limitations and restrictions

Only one SDM will be connected to the CORE at a time.

Any application that wants to use LANCOMM IP over IRM is required to bind to the NIL IP address. All present SDM applications are compliant.

Any applications that are using the EIU will continue to function.

Under this CSP20 release only, the SDM will be the only application node making use of the LANCOMM IP over IRM feature. The number of SDM nodes are limited to four.

The EIU and the XA-Core Ethernet (IRM) interface subnets should be isolated, and they should not be connected, directly or indirectly.

38.6 Interactions

All applications using LANCOMM IP over IRM on the nSDM will function as they did before on the SDM fx without any impact to the user.

- ***Design Component 4: Increase Cpwakeup Accuracy.***

40.1.1 Design Component 2: OM threshold alarms for call processing resources - table ALARMTAB

This feature component adds datafill to the system table ALARMTAB. The table is datafilled prior to the release of the nodata load to the field. This adds an alarm to the existing EXT alarm banner component and the existing log OM2200 to be triggered upon depletion of the base call processing resource ECCB (Extended Call Condense Blocks). This alarm is based on the existing Operational Measurement register defined in CP2 - ECCBOVFL (ECCB Overflow). The table ALARMTAB currently exists for several base call processing resources. This addition is an enhancement to this set of alarms.

All actions and explanations are already documented for the existing base call processing resources and are identical for the ECCB resource depletion. Documentation for the logs and the alarm already exist and can be found in the following NTPs:

- ***297-8991-500 04.02 Maintenance and Operations Manual***

40.1.2 Extension Block Format Code expansion

Currently, there are only a total of 256 extension format codes in the system. We are quickly approaching this limit thereby limiting the number of available extension format codes for new users. Design Component 3 of this feature -

EXT Format Code Expansion - addresses this issue. In particular, the total number of extension format codes in the system will be increased from 256 to 511.

Increasing the total number of extension format codes from 256 to 511 causes the size of the extension format codes to increase from 8-bits to 9-bits. The extension format code is a field within the extension block header (the first structure/field in every extension block). This may affect downstream processors if they extract the format code from the extension blocks hex dump. The total size of the extension block header is not being increased; however, two of its fields were re-arranged so that the new size of the format code could be accommadated. Specific details of this change are presented in the FM (Fault Management) section of this feature.

For each extension format code, there is a corresponding (unique) AUD and XAUD log. The XAUD logs are output whenever an extension block is reclaimed by the XA-Core audit process and the AUD logs are used to dump extension block contents for all other processes (ie. non-audit reclaims such as call deaths).

Currently the AUD logs assume the values 400 through 431, and 500 through 723. The XAUD logs assume values 600 through 610 (for standard call processing resources) and 700 through 955 (for extension blocks).

This feature will require that the ranges for the before mentioned AUD logs be extended beyond 723 to accommodate the new extension format codes. The XAUD logs will also be extended and the numbering convention (numeric range) will be changed to match that for the AUD logs for simplicity. That is, each extension format code will now have the same AUD and XAUD number (ie. the associated logs for extfc 109 will be AUD577 and XAUD577).

Please note that as each new extension format code is defined/added in the system, it is the responsiblity of the user to define and document it. Therefore, the only changes visible to the customer will be for the existing XAUD log numbers (those currently defined at the time of this feature). Furthermore, the contents of these logs (apart from the location and number of bits of the extfc in the extension block head) are in no way being changed.

40.1.3 Increase Cpwakeup Accuracy

This component of the feature will affect the real-time of the switch. This real-time increase will be minimal.

40.2 Hardware Requirements or Dependencies

40.7 Glossary

Term	Description

41: Functional Description (FN): A00002555

41.1 Feature name

SERVORD MANIPULATION OF THE GND OPTION

41.2 Description

This SN07 activity allows Servord commands ADO, DEO and CLN to manipulation the GND option. The GND option for lines resides in table LNINV. Table LNINV contains the hardware information about the line including the Line Equipment Number (LEN) card code and GND. If GND is set to Y, the line will be a ground start line if the line card is supportive. The list of line cards supported are:

- 3A06BA
- 7A25AA
- RDTCON
- RDTLSG
- SCD271

The GND option appears as a line option when a query is performed on the DN or LEN but it is currently not an option than can be manipulated via Servord. This activity will allow Servord to manipulate the GND option on the above line cards, including

- ADO and DEO of the GND option
- CLN will propagate the GND information of the OLD_LEN to the NEW_LEN

Lines that currently auto populate table LNINV on NEW, EST and ADD such as Succession and lines off of RDT peripherals will continue to function as before.

The redundant feature which is turned on by table OFCVAR parm SO_ALLOW_REDUNDANT_FEATURE is now supported for the GND option for the ADO, DEO and CLN Servord commands.

CLN will set the value of GND to that of the OLD_LEN if the NEW_LEN is one of the supported line cards. A warning message will be output that GND being set to the OLD_LEN value. The below example shows the warning message if GND will be set to TRUE on the NEW_LEN

WARNING: GND will be changed to TRUE in Table LNINV
on the NEW LEN, same setting as the OLD LEN

Also for CLN, if the NEW_LEN is not a supported line card and the value of GND is different

than the OLD_LEN GND value, the below warning message will be output

**WARNING: GND is FALSE in Table LNINV on the NEW LEN
the setting was TRUE on the OLD LEN**

If the value of GND is the same on the OLD_LEN and the NEW_LEN, no warning message is output.

There are additional line cards that support GND but also require some manual intervention such as a strap or a switch to be toggled in order for the GND to take effect. Attempts to manipulate GND on these type line cards will result in an error message as in releases prior to this feature.

It may be necessary to BSY and RTS the line at the MAP in order for the change in GND value to effect.

41.3 Hardware Requirements or Dependencies

There is no new hardware introduced by this feature. It is limited to the servord commands and linecards aforementioned

41.4 Software Requirements or Dependencies

This is a. SN07 deliverable

41.5 Limitations and restrictions

Servord GND manipulation is limited to the ADO, DEO and CLN commands and to the supported line card types

- 3A06BA
- 7A25AA
- RDTCON
- RDTLSG
- SCD271

Currently, GND can be added via NEW, NEWACD, EST, ADD, EXBEST and EXBADD for lines that can be autopopulated into table LNINV This is not changed by this feature.

41.6 Interactions

If the Servord Redundant feature which is activated by table OFCVAR parameter SO_ALLOW_REDUNDANT_FEATURE is turned off, attempts to manipulate GND on commands or line cards not supported will be rejected. If If this office parameter is turned on, then a warning message will be output that GND will be ignored for non-supported commands and line cards.

42: Functional Description (FN): A00002558

42.1 Feature name

LDI display for Class phone

42.2 Description

42.2.1 Overview

The Long Distance Indicator (LDI) feature identifies long distance calls and provides the LDI indicator information to the subscriber. The feature works with CND, CNAMD, DDN features that use the Multiple Data Message (MDM) format.

Figure 1 Functional Behavior Diagram

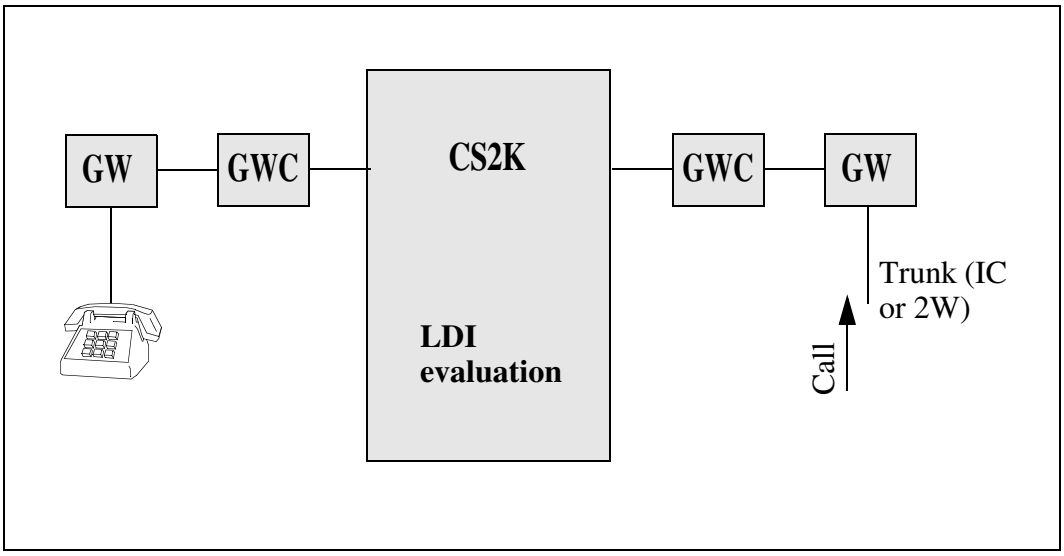

Figure 1 shows an example of an ISN07 office which is a terminating exchange. When a long distance call reaches the subscriber set, LDI evaluates the call. A call is deemed long distance when any of the following condition is satisfied:

- Reverse translation - The dialable DN's first digit is 1 and it has a total of 8 or 11 digits; or
- Table TOLLTRKS - The incoming trunk group CLLI present in table TOLLTRKS.

If a call is deemed long distance, the system delivers the LDI to the line through MGCP. The LDI is delivered as the character L. Following is the message which captured by tool CALLTRAK.

```

43: Functional Description (FN): A00002585

Purpose:This FN described the new feature added to TMM by ACTID00002585 which includes the following new components:

1. Post by Carrier . This component allows TMM to post and perform maintenance actions on trunks based ona specific carriers.
2. Show trunk type. This component enhance the operation "PostByGatewayName" to add trunk type in result.
3. Add online help. This component provide online help for TMM.

Reference: Design Intent DOC (DID) A00002585 (TMM Support PTS Trunk, Post By Carr iers)

43.1 Introduction

This document details the OAM&P functionality being delivered by the feature "TMM Support PTS Trunk, Post By Carrier" (Activity ID is A00002585 and Feature ID is 24651) in SN07. This document will describe the changes being made to the web based GUI and interface via OSSGate.

43.2 Feature name

TMM PTS Trunk Support, Post By Carrier - Activity ID A00002585.

43.3 Description

In SN07, the activity A00002585 will deliver the changes required to extend TMM functionality to support the following:

PTS Trunk maintenance:

1• PTS trunk maintenance will be supported by TMM. All maintenance commands related to ISUP trunk and PRI trunk will be supported for PTS trunk.

Post By Carriers name:

1• In addition to selecting a trunk gateway, user can select a specific carrier name, post trunks and perform all maintenance operations supported by "Maintenance by Gateway Name" today for ISUP, PRI and PTS trunks from GUI and OSSGate.

General TMM Robustness Enhancements:

1• Show trunk types (ISUP, PRI. PTS) in post result sets.

2• Return codes will be kept compliance with OSSGate NTP documents.
3• TMM Help page.

For “PTS Trunk maintenance”, no changes are made on either web based GUI or the interface via OSSGate.

43.4 Web GUI Modifications

This section describes all the changes being made on web based GUI by activity A00002585 in SN07. This section is not meant to be a complete description of the web based GUI. The TMM NTP document will be updated to provide detailes of the changes.

43.4.1 Post By Carrier

A new link “Mtc By Carrer” will be added on TMM main web page. (See Figure 1)

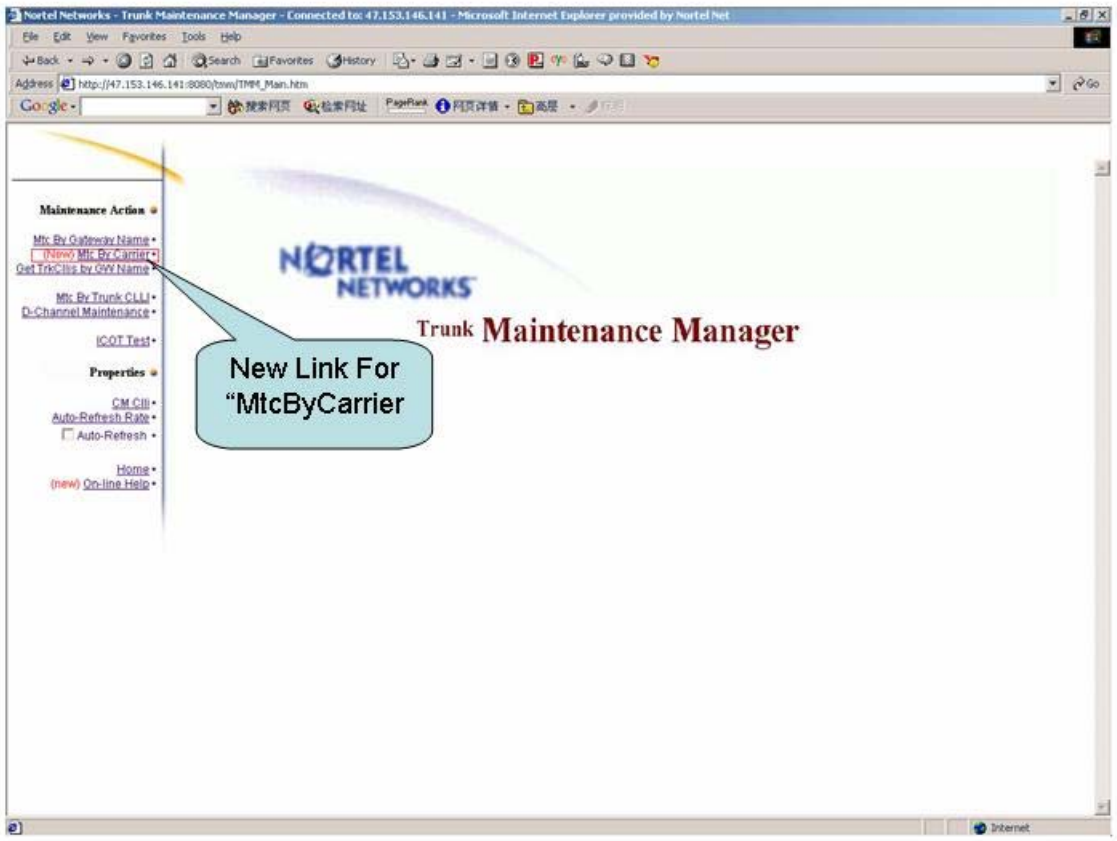

Figure 1

After the link “Mtc By Carrier” is clicked, a web page as Figure 2 will be displayed.

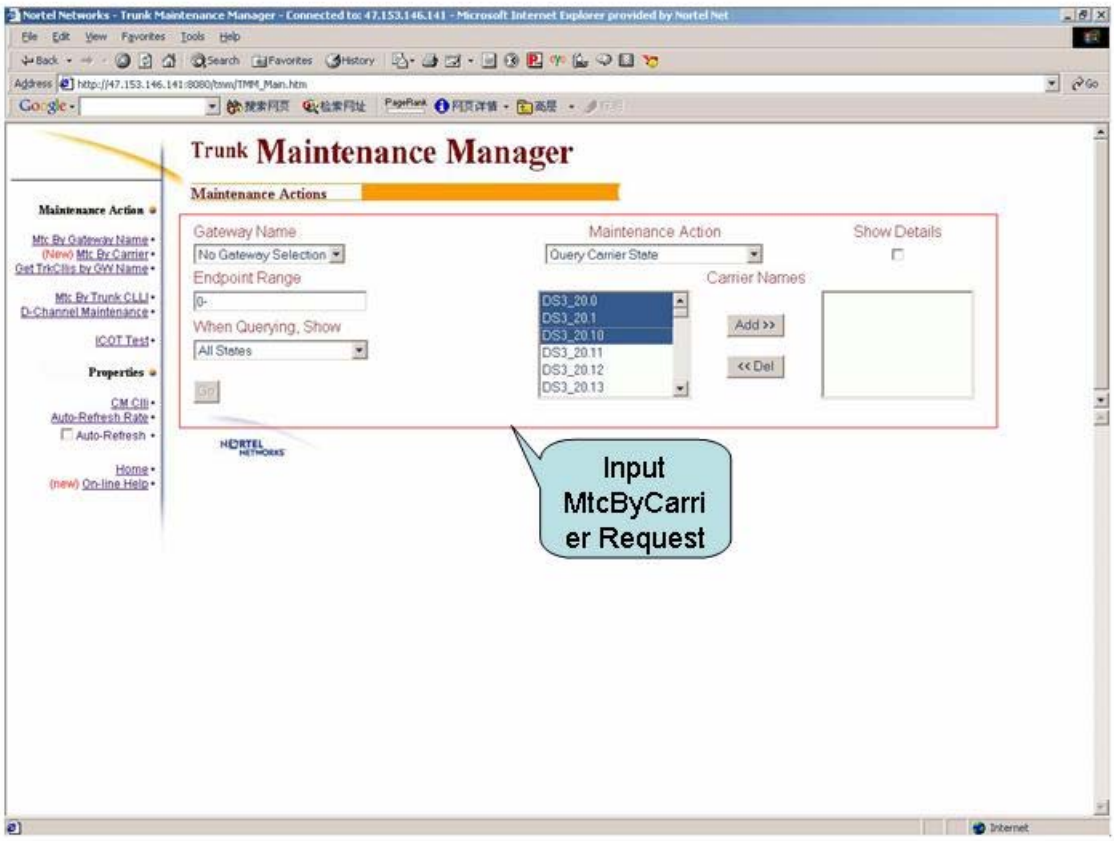

Figure 2

For a valid request “MtcByCarrier”, one and only one gateway should be defined, one and only one action should be defined and at **least** one carrier should be selected.

if no carrier is selected it will post all the carriers.

The gateway will be selected from drop list named “Gateway Names”. the action will be selected from drop list named “Maintenance Action”. The carrier will be selected from list box. After one item in the list box is highlighed, please click button “Add” or “Del” to add or remove carriers from request input. Multiple selection with normal Windowns style is supported. (For example, shift+mouse button, or ctrl+mouse button) (See Figure 3, 4, 5)

There are serveral options for the request “MtcByCarrier”.

- “Endpoint Range”, its default is “0-”.
- “States Filter” which can be selected from the drop list “When Querying, Show”, its default is “All States”.
- “Show Details” which can be set by setting check box “Show Details”, its default is “false”.

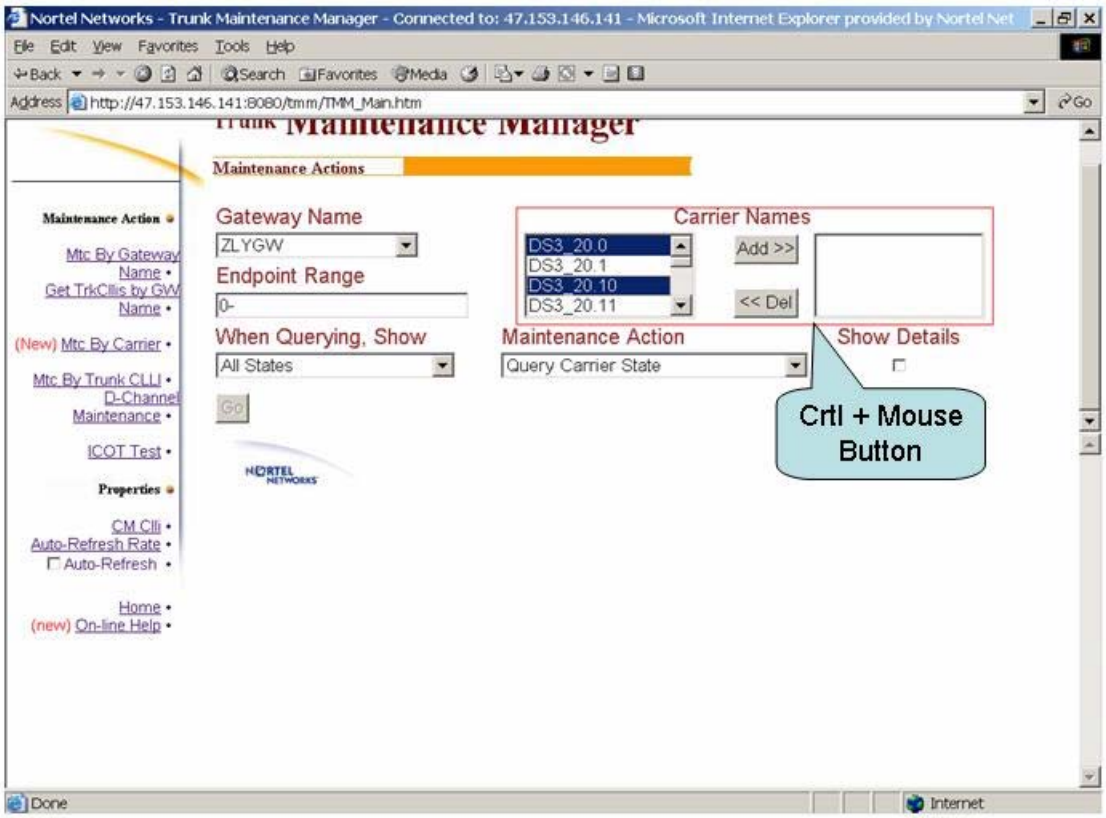

Figure 5

After gateway and carriers are defined, the button “go” will be activated. (See Figure 6). After the button “go” is clicked, the corresponding response will be displayed.

Currently, six commands are supported by “MtcByCarrier”.

- The response for the command “Query Carrier State” is as Figure 7.
- The response for the command “Post Carrier” is as Figure 8.
- The response for the command “Busy Carrier ” is as Figure 9.
- The response for the command “Return Carrier to Services ” is as Figure 10.
- The response for the command “Force Release Carrier” is as Figure 11.
- The response for the command “Installation Busy Carrier” is as Figure 12.

If the command failed, the error messages will be displayed. Please see an example as Figure 13.

44: Functional Description (FN): A00002607

44.1 Feature name

A00002607 - ABI XPM SITE and MG9K Location support

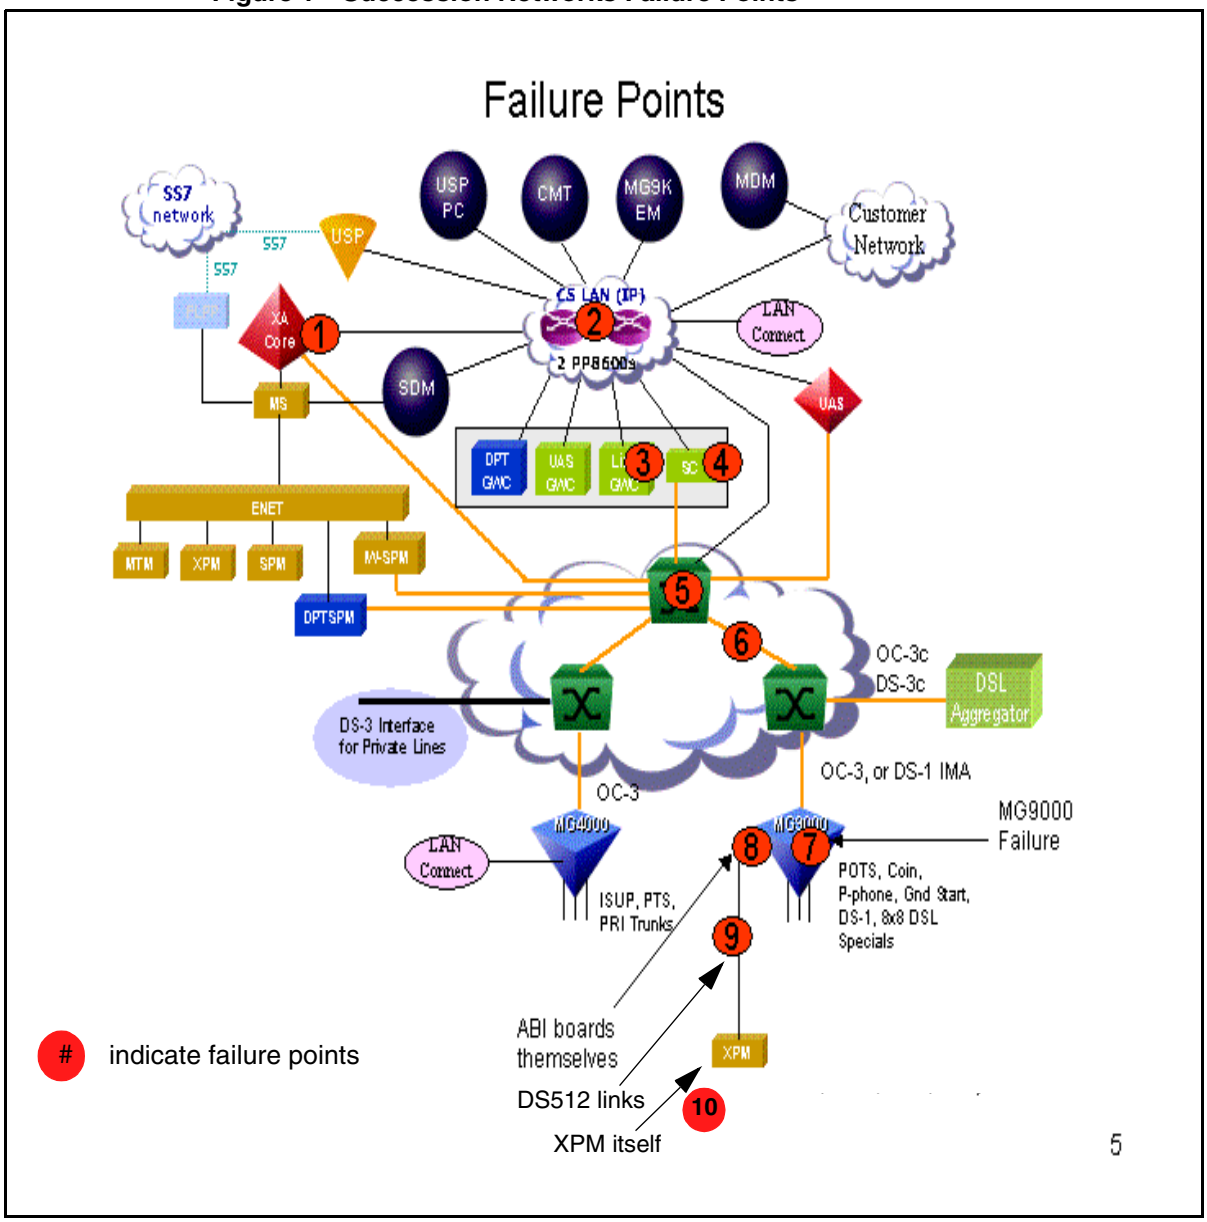
This is a Core feature available in both the SN07 release and in the SN06.2 release via patches.

44.2 Description

The purpose of this feature is to provide physical location data to aid in the determination and ultimately the resolution of ABI XPMs out of service conditions and native MG9K line troubles on the Core where applicable.

Currently, these service impacting failures can occur in many different points in the Succession networks. Please refer to Figure 1 on page 408.

Figure 1 Succession Networks Failure Points



The ability to identify MG9Ks involved in the ABI configurations and MG9K frames hosting native H.248 lines and their physical location was not easily determined.

This feature will aid in identifying the failure points detectable by the Core by providing necessary and accurate location data. Then using this newly provisioned data to correctly report and identify problem areas in the form of Logs, OMs, and Mapci commands.

In order to provide these new functionalities, the customer will see changes in the following areas:

- operation of Table LTCINV
- operation of Table LGRPINV

44.2.1 Table LTCINV Impacts

The identification of MG9K Gateways and ABI cards involved in ABI configurations is accomplished by provisioning this data in the modified ABI optional field in table LTCINV. For details on what/how this is provisioned, refer to Table LTCINV Database Schema information in the configuration section of this feature. No other changes have been made to the table.

44.2.2 Table LGRPINV Impacts

The identification of MG9K Frame and its physical location is accomplished by provisioning this data in the new Location optional field in table LGRPINV. Physical location information is maintained on a SITE/FRAME/SHELF granularity. For details on what/how this is provisioned, refer to Table LGRPINV Database Schema information in the configuration section of this feature. No other changes have been made to the table.

44.3 Hardware Requirements or Dependencies

There is no hardware dependencies required to execute this feature.

44.4 Software Requirements or Dependencies

This feature requires the Core load to be a Succession load. Specifically Succession release SN07 or later. Also, Succession release SN06.2 with this feature patches applied is also a valid configuration.

44.5 Limitations and restrictions

The ABI XPM location data is only be applicable to the XPMs which are datafilled in table LTCINV with the ABI (i.e. EXTDS512) option. Because of this restriction, the ABI XPM location data can only be datafilled after Legacy XPMs have been Upgraded to the ABI configurations.

For MG9K native lines, the SESM provisioning of this MG9K Frame location data will not auto populate the same data in LGRPINV. Therefore manual datafilled of this data in table LGRPINV via the Core is required. There are plans to have this flow through in a future release.

The Gateway Frame location data is optional however, there must be a Logical Group defined on the Core in table LGRPINV to have the possibility to

provision this physical location data. MG9K's which have no native lines, MG9Ks configured with ABI XPMs only, have no Logical Group representation in table LGRPINV and therefore have no physical location data available on the Core. The location data for these MG9K's are available on the MG9K-EM via the Network Element number, part of the newly provided ABI XPM location data, datafilled in table LTCINV. To obtain the location data of the ABI MG9K given the Network Element Number, the craftsperson would take the following steps:

1. Post the peripheral at the PM level of the map and execute the Querypm command. This provides the Network Element number for the MG9000 that host the peripheral.
2. Launch the MG9000 Element Manager.

   The MG9000 Element Manger will open with the Subnet View. This view shows all the MG9000 elements that have been configured for this Call Server. Each MG9000 has a unique Element Number per Call Server. This number is displayed below the Network Element icons in brackets ([ ]).
3. Find the MG9000 with the Network Element number that matches the Network Element number provide by the Querypm command from step 1.
4. Double click on the element to pull up the Element Frame View.
5. From the Element Frame View, under the "Actions" pull-down menu, select "Provision Frame Location Information". This will display the Frame Location View window that contains the desired information.

   Note: The Frame Location information for the MG9K is data that must be entered by the craftsperson manually. It is usually recommended that this information be datafilled when the element is commissioned/discovered in the element manager.

44.6 Interactions

The following are the feature interactions for this feature:

- Features which this feature is dependant on:
  - — none
- Features which are dependent on this feature:
  - — A00002746 - ABI XPM Fault Isolation / QueryPM
    This feature will use the ABI XPM MG9K hosting data provisioned by this feature.
- Features which have an interaction with this feature:
  - — A00002704 - MG9K EM Frame Location (Site and Frame Number)
    This interaction is not functional (i.e. the data is not feed to the Core from the 9K) but takes the form of common location data between the two components.

44.7 Applicable customer facing sections

Indicate with an X if you are completing the sections of the DDOC listed below. Indicate with "N/A" if these sections do not apply to this functionality.

Fault Management

- Logs ___X___
- Alarms ___n/a___

Configuration

44.8 Glossary

Term	Description
ABI XPM	An XPM which is provisioned in table LTCINV with the optional attribute EXTDS512. These XPMs are physically connected to MG9K Gateways via a DS512 interface.
Upgraded	A process where existing DMS ENET/JNET based XPMs have been converted to the ABI networks on the same DMS.
Core MG9K Gateways	These MG9K Gateways are represented in Core as Logical Groups with a GRPTYPE of "S". MG9K Logical Groups are auto-datafilled in Table LGRPINV from SESM Gateway provisioning.

45: Functional description (FN): A00002739

45.1 Feature name

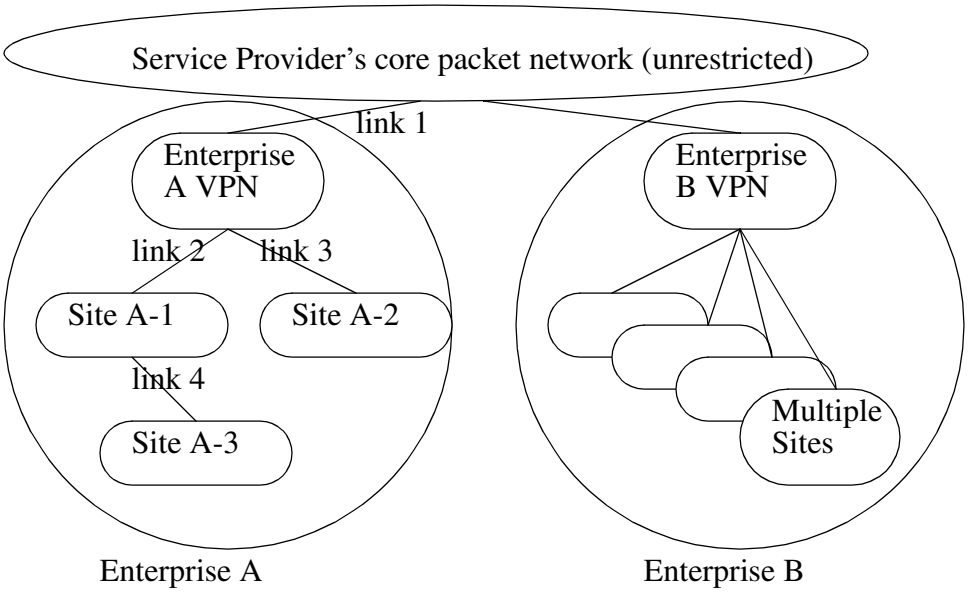
Virtual Call Admissions Control (VCAC) on Communication Server 2000.

45.2 Description

Virtual Call Admissions Control (VCAC) is a Quality of Service (QoS) mechanism that allows the Communication Server 2000 (CS 2000) to cancel post-dial, pre-ringing calls that would overload a segment of the packet network. A very high level description follows:

VCAC depends on a logical model of the packet network. This starts with the Service Provider's core packet network and points of bandwidth concentration. These could, for example, be customer enterprises that are made up of a collection of sites or a regional broadband agreggation point. These sites are connected by a mix of Limited Bandwidth Links (LBLs) and NATs. The VoIP GWs and hence the lines are located within the sites in each enterprise.

Figure 1, High level view of a sample VCAC topology



The logical model that VCAC uses is based on the links between the sites. The GWs are described as being behind or below a particular link. So, in Enterprise A in Figure 1, A GW in Site A-3 is behind link4, which is behind link2, which in turn is behind link 1.

Each of these links will be either a Limited Bandwidth Link (LBL) or a NAT. The LBLs have a provisioned level of resources available and know how many resources each call type consumes. NAT traversal was handled in Feature ACT.89007980 in SN06.

Once a call is made, the CS 2000 identifies the LBLs and NATs along the speech path between the two endpoints, and calculates if there are sufficient resources available on all the LBLs not to exceed the provisioned limits. If all the LBLs can handle the new call, then the call progresses as normal. If one or more LBLs cannot handle the call the originator receives a treatment provisioned by the carrier. The terminator has not reached a ringing stage so is unaware of the call attempt.

An example would be a call between a GW in Site A-3 and Site A-2. This call will use resources on links, 2, 3 and 4, but not on link 1 as the call doesn't leave the enterprise. An insufficient resources failure on any of the links will result in the call going to treatment.

The provisioning of this activity is described in Activity ACT.A00002512, GWC-EM Internet Transparency VCAC Provisioning.

Detailed description

The Logical Network Model
VCAC requires an operator to create a logical model of their network, made up of Limited Bandwidth links (LBL) and NATs. NAT traversal was added in ACT.89007980 in SN06, so the remainder of this description will focus on LBLs.

A LBL can represent a physical part of the network that has a bandwidth restriction (e.g. an ADSL line running at 600kbs) or a logical 'QoS point' (e.g. a customer has purchased a maximum of 1Mb/s of simultaneous VoIP calls). Each LBL has the following set of properties:

- Resource Usage Factor (RU Factor)- This is a provisioned look-up that turns the codec (G711A, G729, etc.) and packetisation rate (ptime) (10/20 ms) into how much resources that call will use on that middlebox.

Note: The term 'resource', rather that bandwidth is used because the value may be normalised, or an engineering factor may be applied to increase/ decrease the value away from the real 'bits on the wire' value. This also allows a customer to simply count calls on a LBL (all codec/ptime pairs use 1 unit of resource).
Note: The resource usage is per LBL not common across the whole network because is can relate to a real network element. E.g. for VoIP, a layer 3 value for a codec/ptime pair will be consistent across the network, but the layer 2 values will vary - i.e. ethernet vs. ADSL (which is ATM based).

- Maximum Count - This is the maximin amount of resources on the LBL in the same units the RU Factor is in.

The logical network model is a tree structure made up of LBLs and NATs according to the following rules (a generic term used to represent a LBL or NAT is middlebox (MB)):

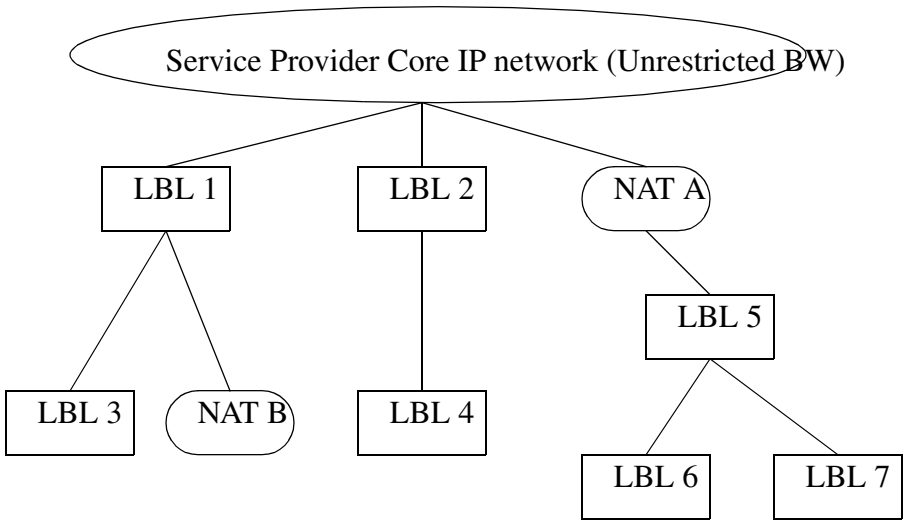
- A MB can be either a LBL or NAT.
- A top level MB must be connected to a non-bandwidth constrained ‘core network’.
- A MB can have only one parent MB (closer to the core network) or the core network.
- A MB can have any number of children (subject to the maximum number of MBs that may be datafilled per GWC).

These rules mean that:

- There can be no circular network paths.
- There can only be one route from a particular MB back to the core network

This logical model of the network must contain the key connectivity routes in the modeled network. E.g. If a set of duplicate routes exist between 2 MBs they must be modelled as one link, not two as otherwise the VCAC capacity counting will not be accurate.

Figure 2, Sample VCAC network model



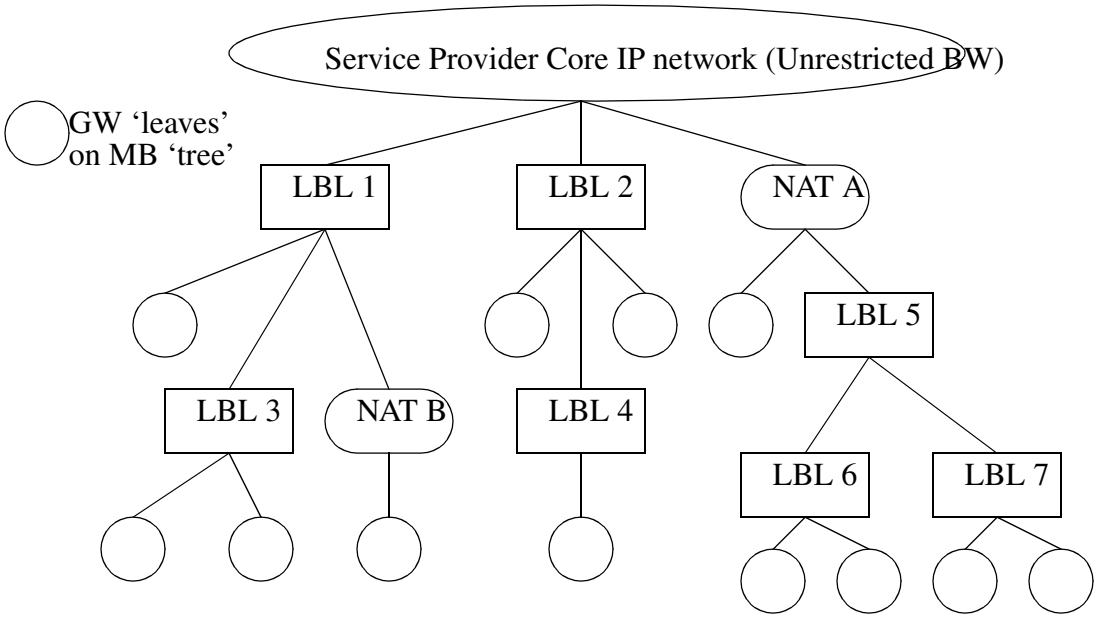
Adding GWs to the Model

GWs can be added to any MB in the logical model. A MB can have any number of GWs hanging off it. This is usually described as having GW 'leaves' on the MB 'tree'.

Note: PVG and UAS/AMS GWs are assumed to be within the core network. Similarly, SIP-T trunks are assumed to start/finish in the core network

This means that any GW will have a single path through the model to the core network, and to any other GW that is within the model.

Figure 3, GWs attached to the MB network model



VCAC

VCAC works by calculating the path between the originating and terminating GWs, looking at the negotiated codec and ptime for the call and checking that each LBL in the path has sufficient resources for the call to be set up. If so, the call proceeds as normal, if not the call is released and a user provisionable treatment (which must be a tone) is applied to the originator. The terminator has not reached a ringing stage.

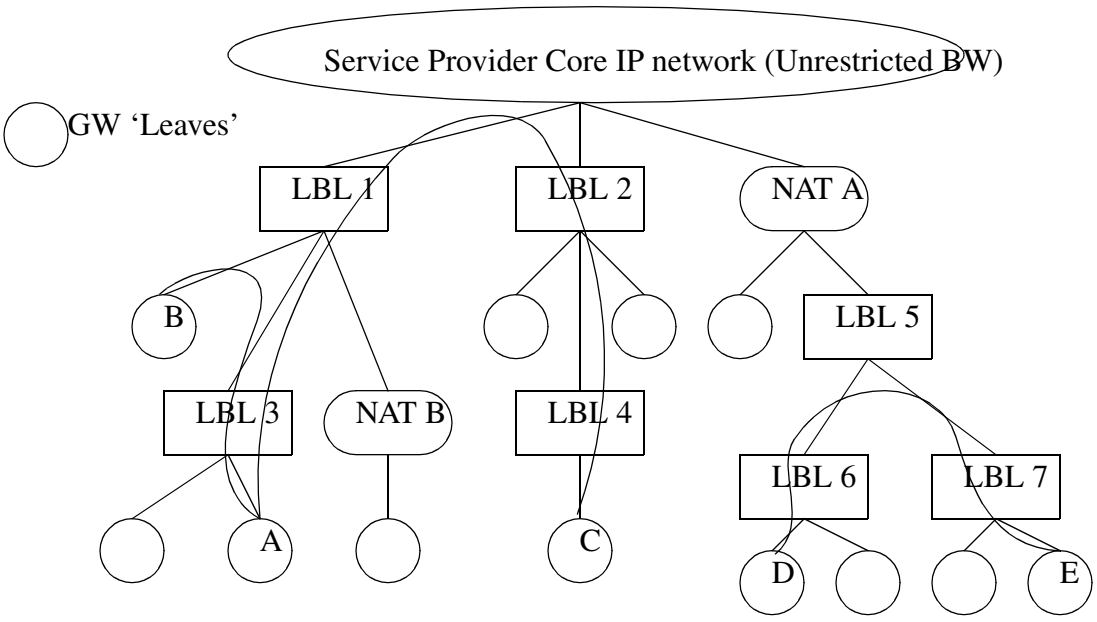
Note: VCAC uses the real, negotiated codec for the call. There are exception for certain call types (e.g. fax, modem) that are detailed below.

Note: Only the MBs on the path are used - resources are not always used all the way to the core network if there is a shorter route through the network.

For example in Figure 4 below:

- An A-to-B call uses resources on LBL 3. LBL 1 is not used event though it a part of the MB chain as the path between the GWs does not use it.
- An A-to-C call uses resources on LBL 3, LBL 1, LBL 2 and LBL 4. All the MBs in the originator and terminator chains are on the GW path.
- A D-to-E call uses resources on LBL 6 and LBL 7. They are both behind the same NAT so no Media proxy is required.

Figure 4, VCAC path finding

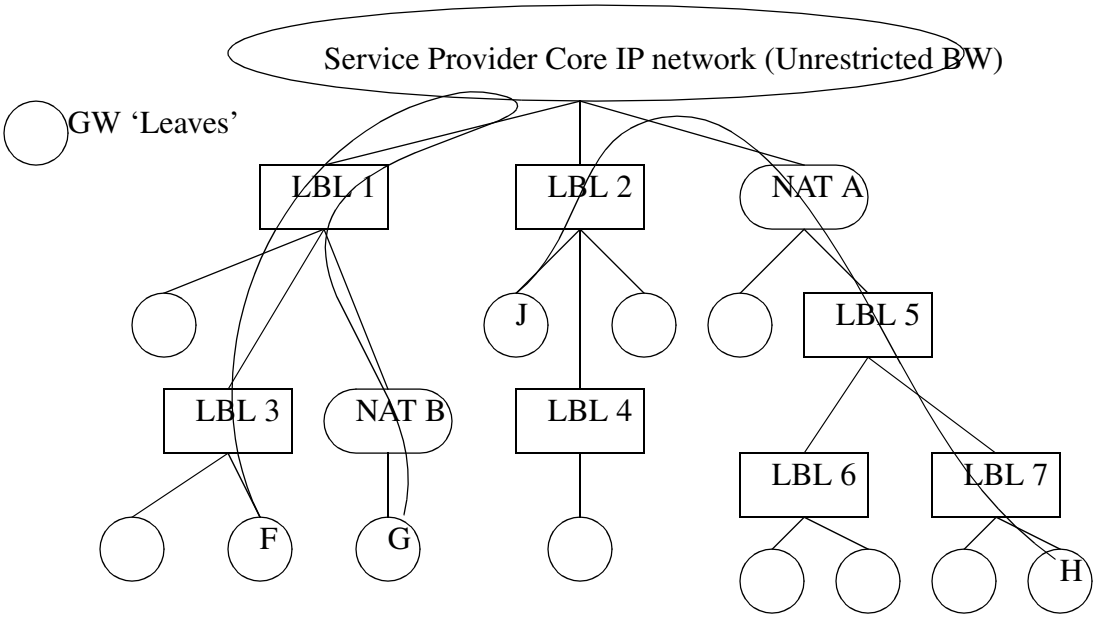


If there is a NAT MB on the call path then the call must extend as far as a Media Proxy (MP) (as described in ACT.89007980). These are located in the core network, so both the originator and terminator must use resources up to the core network, even if there is a shorter path between them.

Figure 5 below has examples of path finding when there is a NAT on the path between the GWs.

- An F-to G call uses resources on LBL 3 and LBL 1. LBL 1 has two call flows on it as both the originator and terminator need to use it to reach the Media Proxy (MP) in the Core network
- A H-to-J call uses resources on LBL 7, LBL 5 and LBL 2. This call will require a MP but the path between the GWs already traverses all the MBs in the chain so there is no need to change this.

Figure 5, VCAC path finding though NATs



This Feature is controlled by state SOC order code CS2Q0002. This has two states:

- ON, which will display ON and have VCAC enabled.
- OFF, which will display IDLE and will disable VCAC.

Further detail on all aspects of this feature can be found in the FNs for the provisioning Features (see dependencies below), and the Performance, Fault management and configuration sections within this book.

45.3 Hardware Requirements or Dependencies

No new hardware requirements.

45.4 Software Requirements or Dependencies

This feature is dependant on:

- A00002512 VCAC provisioning for the GWCEM.
- A00004981 VCAC support for CICM GW
- A00003568 E911 location support for CICM.
- SOC option CS2Q0002 controls the use of this feature

45.5 Limitations and restrictions

The VCAC architecture has some provisioning limits that are enforced by the the provisioning system. These are:

1. A LBL can only be used on one GWC. This means that all the GWs or endpoints behind a single LBL must be on the same GWC.
2. There is a maximum of 2000 LBLs per GWC.
3. There is a maximum of 5 LBLs and NATs between a GW and the Service Provider's core network.
4. VCAC only uses the negotiated values for a call. This means that fax and modem upspeeding to G711 from G729 will not be modelled. Similarly T.38 fax calls will not change the modelled bandwidth for the call.
5. VCAC does not model voice and data traffic on the same LBL. This can be done by careful modeling of the logical network, as a part of the system engineering, or by physical separation of the voice and data traffic (e.g. on different VPNs). There is a requirement that voice traffic is prioritised over the data traffic.

45.6 Interactions

VCAC potentially affects any call. If there is insufficient resources for a call or call leg to complete then the call will be released, and the user directed to a treatment.

VCAC can deny call admission whenever the speech path changes, so the main scenarios are:

1. Call Origination. After the digits have been dialed and the CS 2000 attempts to establish a speech path prior to ringing/ringback VCAC can deny admission to the call. This is the main VCAC scenario.
2. Call Hold. The bearer path is dropped for a call placed on hold, whether as a call hold service or as a step in another service such as 3WC or consultation transfer. If other calls have consumed the available resources then an attempt to retrieve the held call will fail.
3. Call Transfer. The bearer path is changed after it has been set up. This can be caused by services such as call transfer, CFNA, 3WC. IN services use this functionality by connecting a call to announcements before routing to other destinations. This fails if there is a LBL in the new path without resources for the new call leg.

On call denial VCAC will clear down the call that would overload the LBL. **Service handling will be on a best effort basis, i.e. there is no attempt to retry or changes to a less demanding codec**.

45.8 =Glossary

Term	Description
codec	Voice encoding for the call - G711a, G711u, or G729
LBL	Limited Bandwidth Link
MB	Middlebox, either a NAT or LBL
MP	Media Proxy, used for NAT traversal
ptime	Packetisation time, usually 10ms or 20ms
VCAC	Virtual Call Admissions Control

46: Functional Description (FN): A00002740

46.1 Feature name

International Directory Assistance Call Completion (IDACC)

46.2 Description

This feature allows DA calls with an international requested number to be completed using manual DA Call Completion (DACC) or Automated DACC (ADACC).

46.2.1 Overview

TOPS needs an international indicator to process a called number as international/overseas. When a call is signalled with an international called number, there is either a prefix or parameter to indicate international. When an international called number is entered by an operator at position, a functions key is first entered to indicate the number is international. Currently, when TOPS receives a requested number from the DA Service provider (DAS), it is assumed to be domestic (or local). This feature requires the DAS to provide a predetermined international indicator along with an international requested number. Thus, the **DAS must be upgraded** prior to activating this feature.

This feature enhances TOPS to look for the international prefix on requested numbers from the DAS. When found, TOPS will translate the requested number as international for call completion.

Since this feature is dependent upon DAS changes, there are a variety a scenarios which can or cannot be supported based on the level of DAS support. For full IDACC support, ensure the vendor supports the international prefix in all messages which contain the requested number.

The initial release of this feature only supported the ADACC scenario as documented in a00002740.aa01; these limitations have been reproduced in an appendix of this document. A second release (a00002740.aa02) added the ability to restrict overseas ADACC by adding it to table TDBDAOPT. This version captures the full functionality TOPS can provide for IDACC calls.

46.2.2 IDACC Callflow using ADACC

International listing numbers are supported via an international indicator prepended to the listing number. This international prefix indicator is datafillable via a new parameter in TOPSPARM, as described later in this document.

When TOPS receives a listing number from the DAS with the pre-determined international prefix, the listing is treated as an international number. The following callflow illustrates the ADACC scenario, and notes the IDACC specifics below.

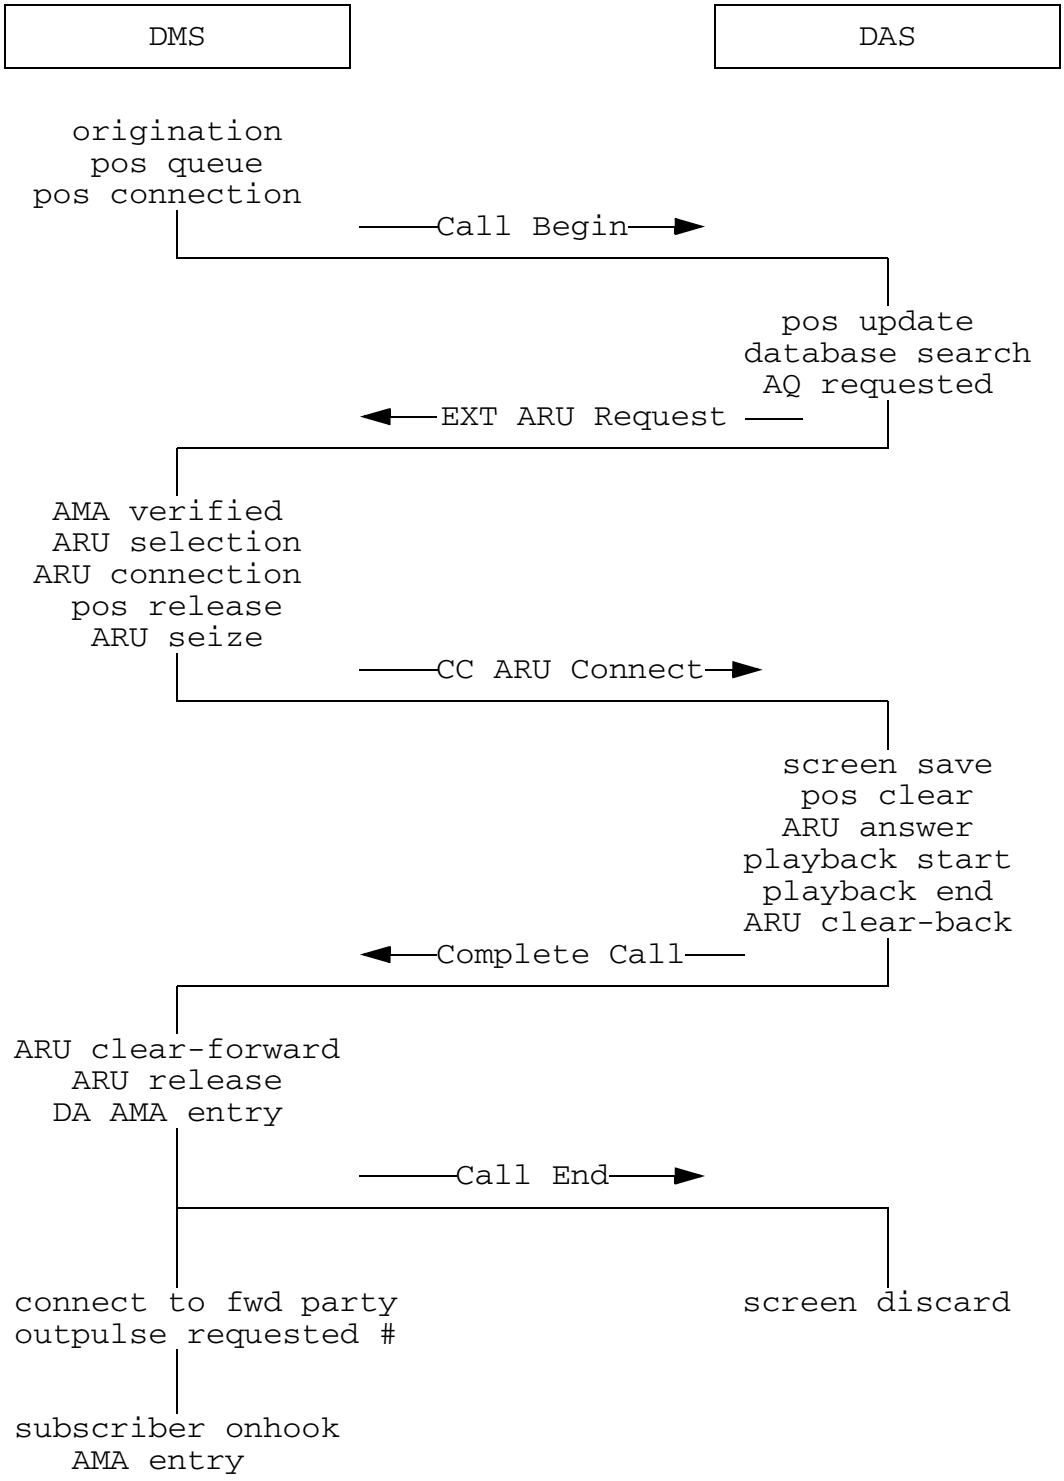

Figure 1 Auto-quote with Call Completion, DA Call

In the EXT ARU Request message, the DAS sends the international indicator, the country code, and the listing number (prefix+CC+listing). TOPS recognizes the international prefix and records the listing number as international. The prefix is then removed from the listing to enable existing translations to be used.

When the Complete Call message is received, TOPS will generate a DA AMA record[1] with the requested number showing the country code and listing number. It will also contain an international indicator.

TOPS can then utilize ADACC to complete the call if all ADACC checks pass.

In addition to existing ADACC checks in tables DABILL, DATRKOPT, ADACCOPT and ICNTRY (for direct routes to country), table TDBDAOPT includes a new option for International/Overseas calls. Thus, for IDACC calls to complete using ADACC, the ADACCSRV field of TDBDAOPT must include the new option, OVERSEAS, or be set to ALL.

> ***Note:*** Please ensure existing datafill for table TDBDAOPT field ADACCSRV which is set to 'ALL' should be completing International/ Overseas calls.

Table DOMBILL still enforces billing restrictions for domestic calls and table OVSBILL is now used for billing restrictions for international calls.

Table VROPT has a parameter, DACC_LOCAL_TOLL_ACTIVATION, in which international/overseas calls are now part of the TOLL and ALL options for this parameter.

[1]This AMA structure is not changed by this feature; however, DA AMA records can now include the international indicator and country code. Although the country code is included with the listing number in the 'TERM OPEN DIGITS' fields, the number of country code digits is not specified for open numbering dialling plans for this 'new' DA record (194) nor for the existing call completion record (192).

Auto-collect as sent from the DAS also includes a TOLL/ALL option in which now include international/overseas calls.

When ADACC processing can be applied to the IDACC call, existing translations are performed using the operator FOREIGN entry in table IOPRTRAN.

If outpulsing to a SS7 ISUP trunk (ANSI or ETSI), the NOA of the IAM will contain ‘international’ as shown below.

46.2.3 Enabling International DACC

In ISN07 and above loads, this feature is controlled by a SOC option and a TOPSFTR parameter. The intent is to only turn SOC on once and then use TOPSFTR to activate/deactivate the functionality.

Table 1 SOC Option

SOC Option	
ENSV0108	DA Intl Call Compltn

ENSV0108 requires ENSV0101, OSB00101, OSDA0101, and OSDA0102.

Table 2 Table TOPSFTR

FTRNAME	FTRENABL
International_DA_Call_Comp	Y

Table TOPSFTR can be set to Y to activate or N to deactivate.

The SOC option and TOPSFTR parameter can be set regardless of the other; however, a warning message will be generated if the other is not set as needed.

TOPSFTR parameter, cellular_automatic_da_call_comp, must also be set to Y to utilize table TDBDAOPT field ADACCSRV.

46.2.4 Defining the International_DACC_Prefix

The international DACC prefix is datafillable in table TOPSPARM. It contains the actual prefix digits (0-999). It can be 1, 2, or 3 digits.

Table 3 Table TOPSPARM

PARMNAME	PARMVAL
INTERNATIONAL_DACC_PREFIX	00

This example datafill will mark requested numbers arriving with a ‘00’ prefix as international. Thus, a requested number of 123456789 sent from DAS as 00123456789 will be translated as international. The 00 prefix will be removed, the 123 will be checked for a country code and the rest stored as the called number. International translations will be called using the country code and called number; the prefix is not used for translations.

46.2.5 Restricting ADACC Overseas calls

Table TDBDAOPT includes a field, ADACCSRV, which indicates the types of calls that can be completed via ADACC. It includes INTER, INTRATOLL, INTRALCL, ALL, and NONE. A new option, OVERSEAS, is added to the range. Thus, IDACC calls can be eligible for ADACC service if the datafill includes either OVERSEAS or ALL.

Table 4 Table TDBDAOPT

TDBDAIDX	ADACCSRV	BILLOPT	ADASERV
0	ALL	ALL	N
1	INTRALCL	ALL	N
2	NONE	ALL	N
3	OVERSEAS	ALL	N
4	INTER, INTRATOLL, OVERSEAS	ALL	N

In the example, calls which index tuples 0, 3, or 4 are eligible for IADACC service.

Table TDBDAOPT is indexed by table TOPSDB, which can be indexed by tables DNSCRN, TOPEACAR, and COANISCR.

Note: ADACCSRV is only used for carrier calls. Thus, the call must be either an EA call (north american) or GCA call (international).

46.2.6 Manual DA Call Completion and Operator Functions

IDACC is supported for manual DA call completion at an TOPS operator position or OSSAIN Service Node (SN).

The international requested number can be obtained from either a DAS message or the operator/SN entering the requested number. For all cases, the international requested number must arrive to TOPS with the datafilled international prefix indicator.

Thus, the international prefix indicator must be prepended to the international requesting number in all DAS messages, when the operator enters the requested DN at position, or when the SN sends in a DN request. In all cases, TOPS will scan the requested number for the international prefix.

Note: This means TOPS operators and SN applications will need to be able to recoginize an international listing and prepend the prefix for TOPS to treat the number as interational. An operator must enter prefix+cc+number when entering an international requested number. SNs must send prefix+cc+number in the called DN update message.

When the international prefix is found, TOPS will treat the requested number as international/overseas and will utilize overseas tables such as OVSBILL instead of DOMBILL.

Note: The DA forward function available at some operator positions currently only supports domestic numbers. Since this function is intended for emergency calls only, there is currently no need to enhance this function to include international numbers. In addition, the DA forward function uses a called number for outpulsing; the IDACC feature is for requested numbers. If a requested number is entered prior to the DA forward function, then the requested number is overwritten.

46.3 Interactions

The following note the interactions with the existing DA system.

46.3.1 Local-Toll Activation

Table VROPT has a parameter, DACC_LOCAL_TOLL_ACTIVATION, which is used for activating call completion for local and/or toll calls. Currently, the parameter can be set to NONE, LOCAL, TOLL, ALL. NONE

and LOCAL are not affected; however, the TOLL and ALL settings will now included International requested numbers.

46.3.2 Auto-Collect

Auto-collect is for business numbers which allow the subscriber to automatically bill collect. No verification is required for these collect calls. This option can be applied to the requested number in the DAS and sent to TOPS with the requested number. This functionality is currently provided with the following options: none, local, toll, all, and surcharge. All options remain the same except for the toll and all options. International requested numbers are now included in the toll and all auto-collect options.

46.3.3 Billing Restrictions

All existing DA and TA billing restrictions will be maintained with the addition of utilizing table OVSBILL for international requested numbers in comparision to table DOMBILL for domestic calls.

46.3.4 Invalid Country Code

Country codes must be datafilled in table CCTR to be valid. International requested numbers with invalid country codes can still be announced and generate an AMA record but cannot be completed. Calls with invalid country codes are not allowed to utilize ADACC and will be presented to an operator.

46.3.5 Direct and Alternate Routes

ADACC requires a direct route to complete international calls. If a direct route is not available, the call will be presented to an operator to select an alternate route, if available.

46.4 Software Requirements or Dependencies

This feature is dependent upon base TOPS and DA functionality being present and activated. It also requires the ADACC functionality.

ENSV0108 is the SOC option for this functionality. It requires ENSV0101, OSB00101, OSDA0101 and OSDA0102.

46.5 Limitations and restrictions

- Table TDBDAOPT field ADACCSRV is only for carrier calls.
- DA forward key function supports domestic/local numbers only. It has not been enhanced to support international numbers.
- This feature will remove the international prefix from the requested number so that existing translations can be used. It is not outpulsed nor included in any log or AMA record. The prefix is intended to only mark the call as international for translations and thus is removed for all other purposes. External listing announcements controlled by the DAS vendor

may include the prefix in the announcement according to the vendor implementation. Contact DAS vendor for specifics.

- International Requested numbers will be treated as toll (same as Domestic numbers) for activation and auto-collect.
- ADACC requires direct routes to the country. If a direct route is not available, this feature is not supported.
- LNP is not supported in Global loads.

46.6 Glossary

Term	Description
IADACC	International Automated Directory Assistance Call Completion
ADACC	Automated Directory Assistance Call Completion

46.7 Appendix A: International ADACC (IADACC) Limitations

IADACC is described as the functionality and limitations provided by TOPS when the DAS vendor only supports the EXT ARU Request message for International DA Call Completion (IDACC).

For IADACC, TOPS **can** support the following:

- International Indicator recognition
- International DA AMA record generation
- Call completion to the international number based on TDBDAOPT

TOPS **cannot** support the following with IADACC:

- Manual DA call completion (DACC) - DA call which receives an international listing then the operator switches service to Toll to complete the call. This is not supported.
- Multiple Requests - DA call at position with international listing; GEN AMA for first listing; obtain second listing. This is not supported.
- Verbal quotes - Operator verbally quotes listing to subscriber and releases call. This is not supported.
- Recalls / Reconnects - DA call obtains listing and is released to announcement; call recalls back to position; if a GEN AMA, service switch or position release is performed then the call is not supported. (If a

second listing is obtained, without gen ama for first listing, and is then released to announcement, the call can be supported.)

- Transfer with context scenarios are not supported.
- Alternate Routes are not supported since they require manual call completion which is not supported. Automated DA Call Completion (ADACC) requires direct routes.
- IADACC Error handling is limited since manual call completion is not available. Any scenario in which ADACC cannot service the international call is not supported.
- Any scenario utilizing DAS protocol messages - AMA transfer, Service Request, Position Request, and Position Release are not supported.

Supernode Billing Application Base Real Time Billing Robustness

47.2 Purpose

This activity robustifies SBA Base RTB to auto recover from downstream and network connectivity problems once the issues are resolved. This functionality will be optionalized. As well, the activity addresses many other deficiencies tracked by CRs and other means.

47.3 Problem Symptoms

Each item of functionality to be considered by this activity is grouped below, along with a summary explanation for the item.

1. Deletion/modification of underlying schedule tuple:

Problem Description: The billing stream Schedule tuple configuration is shared by both Outbound file transfer and the RTB Destination configuration. If the schedule tuple is removed or certain fields are modified while the corresponding RTB Destination is InSv, the RTB Destination would fail ungracefully.

Solution Description:

i. This activity displays a message to the user asking him to OffL and delete the any possible corresponding RTB Destination before modifying/deleting the associated Schedule tuple if the protocol of the tuple is RFTPW.

ii. Also, RTB will now check for the current schedule tuple every transfer event irrespective of whether failure has occured or not. If an active file is being transferred by RTB, and the schedule tuple is deleted or the protocol changed, the current active file will continue to transfer until it is closed as is the case currently. If another active file is opened, RTB will move to SYSB state as is the behaviour now.

2. Auto Recovery: “Test File transfer” and “Temp File renaming on DPMS”:

Problem Description: In order for RTB to recover from a user defined maximum number of consecutive outages in connectivity between the SDM and the DPMS, manual intervention was required (i.e. have to BSY/RTS RTB Destination in billmtc) in order to resume real time transfer of future open billing files to the DPMS.

Also, a Temporary open file (with suffix .tmp) exists on the DPMS to collect the billing data sent by RTB. Whenever there was a LAN failure or when SDM/ Downstream processor reboots, this open file was not complete nor properly named. Its corresponding file on the SDM is moved from Open to ClosedNotSent (CNS) directory, and renamed. Thus, when RTB resumed service, a new open file was transferred and thus a new .tmp file was created on the DPMS. Thus there would be two .tmp files at the DPMS.

Solution Description:

i. Enhancements are made to RTB such that after the maximum consecutive number of failures for a Destination, it will move to ISTB state to denote that RTB will initiate an autorecovery process.

When the above is encountered, it then starts a monitoring operation consisting of FTPing a test file (of size 10MB, named as NetworkTest) to the DPMS test file directory, and analysing the response to figure out if the test transfer was successful, or in case of error, if it was due to a network issue or a non-network issue. . Below are the 2 resulting scenarios:

–If it is a non-network issue, RTB will sleep until a new file is open on the the SDM and then resume its INSV state.

–If it is a network issue, RTB will try the operation again until it succeeds 3 consecutive times or until a non-network issue is detected, in which case the previous stated behaviour above for this case is followed.

The location of the test files on the downstream can be configured through RMI (BILLMTC).

ii. Enhancements are made such that whenever RTB resumes operation after an outage, the <filename>.tmp file on the downstream (for the associated stream/destination configuration) will be renamed to <filename>.partial before opening a new .tmp file. The location of this partial file is configurable through RMI (BILLMTC).

Both the test file transfer and partial file renaming functionality are one combined auto-recovery option (which applies to any/all configured RTB Destinations), which can be turned ON of OFF.

If the user sets the option to OFF,-manual intervention will be required to return to service the RTB Destination after the configured maximum # of consecutive network failures occurs**.** In this case, RTB will go to SYSB state, and manual intervention is required to ever get out of this state, as is the behaviour now.

3. Interoperability between RTB and base SBA status:

Problem Description: RTB behaviour is heavily dependant on the status of base SBA resources such as the stream state, and the application status of SBA. RTB fails ungracefully when base SBA stream or application states change.

Solution Description:

i. The RTB Destination will check the underlying stream status before executing the transfer event. If it is not INSV, a designlog and custlog will be raised, and the transfer will not be executed.

ii. Whenever SBA is restarted, RTB will check the previous state for each RTB Destination and will bring the Destination INSV if it was previously INSV or ISTB or SYSB at the time of SBA application shutdown.

47.4 Limitations and restrictions

- There already exists a limitation on SBA, which is the following: Multiple schedule tuples must not be configured (across OR within SDMs) sharing the same 'remote destination IP', 'remote directory', 'file format' (DIRP), and 'File_Extension.' If this is not respected, collisions between billing filenames may result. This feature adds more of a limitiation based on the above, which is the following: Multiple schedule tuples must not be configured (across OR within SDMs) sharing the same 'remote destination IP' and 'remote directory', and where there exists at least 1 RTB Destination configuration (on any SDM) based upon one of these underlying schedule tuple configurations. If this is not respected, and the Auto-recovery option is turned ON, then one transfer may remove files owned by another transfer.
- A new limitation exists if the Auto-recovery option is turned ON. Multiple RTB Destinations must not be configured (across OR within SDMs) with the same 'partial file location' OR the same 'test file location' on the DPMS. If this is not respected, collisions between files may result.

Definitions & Abbreviations

Acronym	Expansion
CNS	Closed Not Sent
FTP	File Transfer Protocol
MIB	Management Information Base
RMI	Remote Maintenance Interface
RTB	Real Time Billing
SBA	SuperNode Billing Application
DPMS	Data Processing and ManagementSystem
CM	Computing Module
SDM	SuperNode Data Manager

47: Functional Description (FN): A00002744

47.1 Feature name

SBA: Automatic Recovery File Closure.

47.2 Description

If the core SBA application is unable to send billing data to the SDM SBA applications, core SBA changes its state to backup mode. In backup mode, the core stores billing data in backup storage. Once communication resumes between the core SBA and SDM SBA, the core SBA will transition from backup mode to recovery mode. During recovery, the core SBA will send the current billing data and the stored backup billing data to the SDM SBA. SDM SBA will open separate files to store the current data and the billing data recovered from backup storage. Once all billing data has been recovered from backup storage, core SBA will transition from recovery mode to normal mode.

For each billing stream configured in SBA, its corresponding billing files can be configured to be rotated based on elapsed time since the file was opened. The crafts person must specify a maximum file size and a maximum number of records for each billing file. In addition to these facilities for file closure, this feature brings in a mechanism to close the recovery file as soon as the SBA core transitions from recovery mode to normal mode, irrespective of the file closure criteria.

47.3 Hardware Requirements or Dependencies

None.

47.4 Software Requirements or Dependencies

- SuperNode Billing Application (SBA) is installed and InSv.
- Billing configured on the CM.

47.5 Limitations and restrictions

None

47.6 Interactions

None

47.7 Applicable customer facing sections

Existing logs will be retained. No new logs are introduced as part of the feature.

47.8 Glossary

Term	Description
Automatic Message Accounting	Telcordia specification for accounting records.
Automatic Message Accounting Data Networking System (AMADNS).	System for transferring accounting records from a generating system to application systems. Comprises a Data Server component and a Data Processing and Management System (DPMS) component.
CDR	Call Detail Record
Data Processing and Management System (DPMS)	System for receiving accounting records from Data Servers and processing the records as required for transfer to application systems.
data server	Component that collects accounting records from a generating system.
Digital Multiplex System (DMS)	DMS core Digital telephone switch
Device-Independent Recording Package (DIRP)	file format file format used by SBA to store billing records, based on the DIRP billing file format on the DMS core

Term	Description
File Transfer Protocol (FTP)	application protocol for transferring files via Internet Protocol (IP)
generating system	Component that generates accounting records, such as the DMS core.
Generic Requirements (GR)	Telcordia specification document
Management Information Base (MIB).	In the context of this document, refers to the persistent data repository where SBA configuration information is kept. Individual values stored within the MIB are referred to as MIB values
Non-Computing module Load (NCL)	software load for components other than the DMS core; in the context of this document, software load for the SDM
outbound file transfer	SBA file transfer mode where SBA initiates the transfer of billing files to a downstream FTP server.
recovery file	A file on the SDM in which the SDM SBA saves the billing data recovered from the core SBA backup storage.
Supernode Billing Application (SBA)	Accounting collection data server that resides on the SDM. Implements the Data Server function of an AMADNS environment.
Supernode Data Manager (SDM)	Motorola FX computing node upon which resides Operations, Administration, Maintenance, and Provisioning applications / Fault, Configuration, Accounting, Performance, and Security management applications. SDM xxrefers to a given SDM NCL release, where xx is a two-digit number.
Reset EOS	Message from CM Indicating the end of a session.

48: Functional Description (FN): A00002746

48.1 Feature name

A00002746 - ABI XPM FAULT ISOLATION / QUERYPM

This is a Call Server CM feature which is being released in SN07 and in SN06.2 via patches.

48.2 Description

This feature provides new functionality which will assist the craftsperson with maintaining XPMs which subtend the MG9K. This new functionality consists of changes to the existing QUERYPM command which is part of the PM level of the MAP.

The QUERYPM command changes consist of:

- Provide SITE name and ABI location information.
- Provide an interface to assist in isolating communication issues between the CM and the ABI XPM over the Succession network.

48.3 Hardware Requirements or Dependencies

There are no hardware dependancies for this feature.

48.4 Software Requirements or Dependencies

This feature is dependant upon the following features:

- A00002607 - ABI XPM SITE and MG9K Location support.
- A00002146 - MAPCI ABI Link Test & Legacy Comparison.

This feature is not subject to any requirements other than the requirements of the features listed above.

48.5 Limitations and restrictions

There are no known limitations nor restrictions as of this writing.

48.6 Interactions

This feature directly interacts with the following features:

- A00002607 - ABI XPM SITE and MG9K Location support.
- A00002146 - MAPCI ABI Link Test & Legacy Comparison.

48.7 Applicable customer facing sections

Fault Management

Accounting (includes AMA billing) __N/A____

Performance (includes operational measurements) __N/A____

48.8 Glossary

Term	Description
ABI XPM	An XPM which is provisioned in table LTCINV with the optional attribute EXTDS512. These XPMs are physically connected to MG9K Gateways via a DS512 interface.

49: Functional Description (FN): A00002756

49.1 Feature name

A00002756 JAPAN TRUNK SERVICES

49.2 Description

49.2.1 Introduction

This activity migrates Japan trunk services “Notification of Time and Charge” (NTC), “Carrier Name Notification” (CNN) and “Account Code” (ACCT) from the legacy MMP product to CS2K Hybrid product IP side in ISN07. It transparently ports the functionality implemented under these MMP features onto the CS2K Hybrid IP side. “Hybrid” always means “CS2K Hybrid” within this document.

If these services are triggered by incoming IP side in hybrid, they are provided by IP side directly. On the contrary, if triggered by incoming TDM side, they are provided by legacy MMP features.

About the services provided by TDM side in hybrid, it is not the scope of this activity and please read the original MMP activities listed below.

The existing MMP NTC service was implemented by following activities:

- AR0480 Notification Of Time & Charge
- AR1344 NTC
- AR1599 Enhancement to NTC
- AR1816 Multilingual NTC
- A59017299 Japan Interconnect ISUP

The service of “Carrier Name Notification for Japan” has been provided on MMP under following activities:

- A59027517 Equal Access Carrier Name Notification
- A59034248 Carrier Name Notification for Carrier Designation Service

The “Account Code” service on MMP was originally done under following activities:

- AR2028 Account Code
- A59017299 Japan Interconnect ISUP

49.2.2 Notification of Time and Charge (NTC)

49.2.2.1 Functional Overview

Notification of Time and Charge is a service provided over JI-ISUP trunks to the Japanese domestic market.

The subscriber activates this service by using the NTC service code prior to the destination address digits. A call is registered as requesting NTC service when traversing a tuple in universal translation that has the NTC feature assigned to it. The NTC service contains two calls: original NTC call and NTC callback.

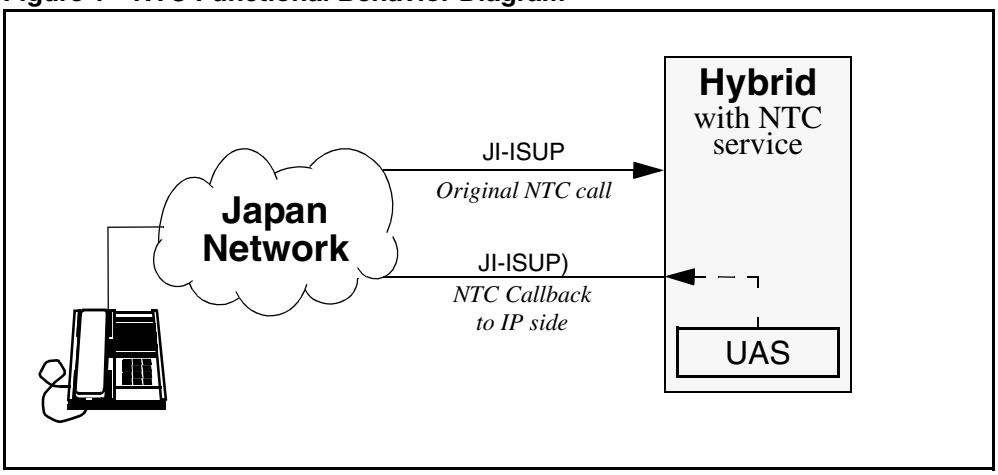
The original NTC call proceeds normally. After a successful call is answered, released and an AMA billing record is produced, NTC service calls the subscriber back using the Calling Line IDentifier (CLID) and provides an announcement indicating such information as the destination address digits, the duration of the original call and the charge amount for this service. The NTC announcement is delivered from EDRAM hardware on Hybrid TDM side. As a Hybrid switch IP side is unlikely to use EDRAM hardware, this activity will rework the feature to use the newer UAS hardware in IP side.

The NTC announcement is a custom announcement that consists of a number of simple and compound phrases. Each simple phrase has a corresponding recording on UAS. Each compound phrase is composed of 1 or simpler phrases.

NTC service is not affected by the out going agent of the original NTC call. The service works providing the interworking from JI-ISUP to the outgoing agent is available and AMA record is used for the call.

Please refer to Figure 1 ”NTC Functional Behavior Diagram”.

Figure 1 NTC Functional Behavior Diagram



49.2.2.2 Linguistic Logic

In this feature, the linguistic logic supports all of the nine languages, Japanese, English, Tagalog, Portuguese, Chinese, Korean, Thai, Spanish and Malay, supported by legacy MMP features.

Following shows the English version NTC announcement.

*This is IDC. The international call you have just made to **A** the number **B** was **C** hours **D** minutes **E** seconds long and cost **F** yen. Repeat, **C** hours, **D** minutes, **E** seconds long and cost **F** yen. Thank you for using IDC. This is a recording.*

Here:

A = Area Name

B = the number recorded by hybrid during the original call.

C = Hours quantity, range is from 1 to 277.

D = Minutes quantity, range is from 0 to 59.

E = Seconds quantity, range is from 0 to 59.

F = Yen quantity, range is from 1 to 10 065 533 yen.

49.2.2.3 Repeating/Skipping a Language during Cyclic Announcement

NTC service provides announcement in a cyclic fashion. In order to provide the subscriber with some control over NTC announcement playing, this feature

supports ‘*’ key for repeating a language in the same cycle and ‘#’ key for skipping to the next language.

— *skipping:* the received ‘#’ keys are used for skipping.

Skipping does not change the playing sequence of the selected languages. This means that a ‘#’ key stops the language currently being played immediately and starts the *next language* right after. The next language here may be the next one on the current cycle, or the first language of the next cycle if the stopped language is the last one of this cycle.

If a ‘#’ key is received while the last language is being played during the last cycle, skipping is ignored. This is so for providing an explicit ending of the NTC service, i.e. either by a complete announcement in the last language or by subscriber disconnect.

— *repeating:* the received ‘*’ keys are used for repeating.

A received ‘*’ key stops the language currently being played immediately and starts to repeat the *same* language on the current cycle.

The maximal number of repeats allowed per cycle of NTC announcement is datafillable via an office parameter. If ‘*’ keys are received beyond the maximum datafilled, the ‘*’ keys are ignored.

Office parameter NTC_ANNC_CONTROL in table OFCVAR has two fields.

1. The first field sets the total number of cycles for NTC service. This field has a range from 1 to 8 with a default value of 2.
2. The second field sets the maximal number of repeats (i.e. ‘*’ keys) allowed per cycle of the announcement. This field has a range from 0 to 7 with a default value of 2.

Let’s say there are three languages: A, B and C. One cycle is defined as (A B C) and NTC_ANNC_CONTROL is set to (4 2), i.e. four cycles and maximum of two repeats per cycle. The entire announcement without repeating (note, skipping may be happening) is:

```
(A B C) (A B C) (A B C) (A B C)
```

If skipping occurs during the above announcement, the language sequence would still be the same. The only difference is the skipped language would be stopped (except for *C* in the last cycle above) once the ‘#’ key is received by hybrid and the next language, which may be the next language on the current cycle or the first language on the next cycle, starts playing right after. Without skipping, each language would be played completely.

With repeating, the actual announcement may be:

```
(A A A B C) (A B B C C) (A B C) (A B B C)
```

Note that during the first cycle above, language B or C cannot be repeated any more since the only two repeats allowed per cycle is used up for language A. This means that all the '*' keys received during the playing time of B and C in this cycle are ignored.

49.2.3 Carrier Name Notification (CNN)

49.2.3.1 Functional Overview

When a JI-ISUP IAM reaches hybrid IP side, the IAM is analyzed for a number of parameters as to whether the announcement is to be played. Once hybrid decides to provide Carrier Name Notification announcement (The conditions please refer to A59034248 FN section 3.2.2 "Conditions for Feature activation"), an early ACM is sent to the calling party that serves to open a backward speech path and then the announcement is played.

Please refer to Figure 2 "CNN Call Flow for Interworking with ISUP" and Figure 3 "CNN Call Flow for interworking with SIP-T".

This service is supported in the following interworking scenarios by this activity:

- JI-ISUP -> JI-ISUP
- JI-ISUP -> IBN7 ISUP
- JI-ISUP -> ETSI ISUP V1
- JI-ISUP -> ETSI ISUP V2
- JI-ISUP -> SIP-T (JI-ISUP)
- JI-ISUP -> SIP-T (No ISUP to IMS)

Figure 2 CNN Call Flow for Interworking with ISUP

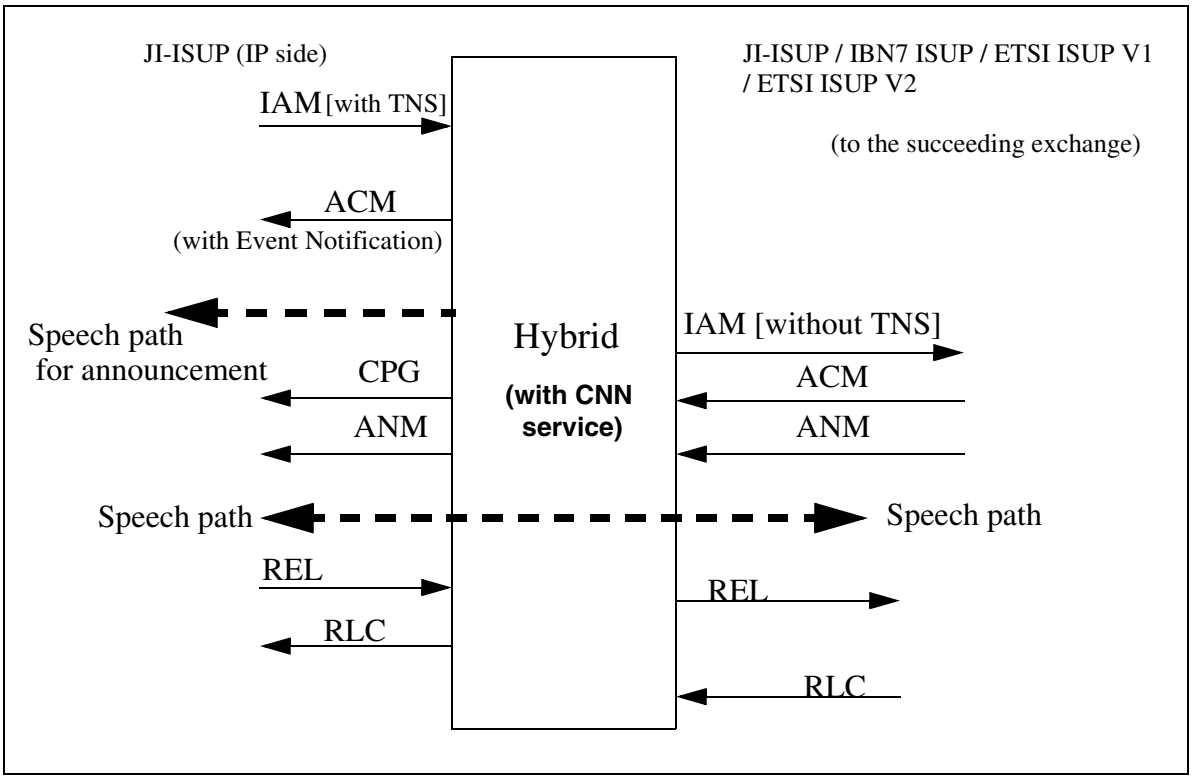


Figure 3 CNN Call Flow for interworking with SIP-T

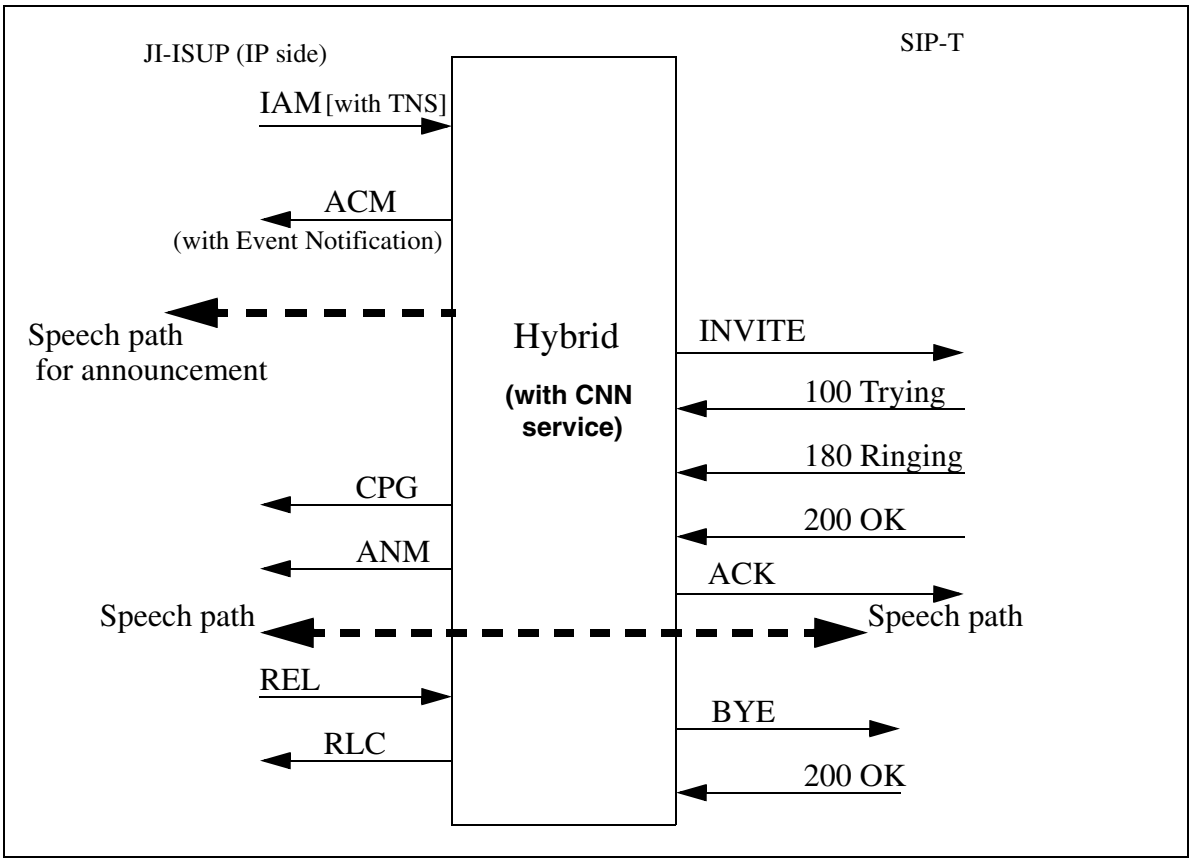


49.2.3.2 Announcement Handling

If all conditions for feature activation are satisfied and the Network Identification Code in the TNS parameter matches with the CARRID datafill in table CARRNAME, then the announcement recorded corresponding to the announcement CLLI is played. Samples for CNN announcement datafill in ANNS & CARRNAME are shown in Figure 4 "Example datafill in table ANNS" and Figure 5 "Example datafill in table CARRNAME". In this sample, the announcement CLLI is “ANNCLLI1” and CARRID is “111111”.

Figure 4 Example datafill in table ANNS

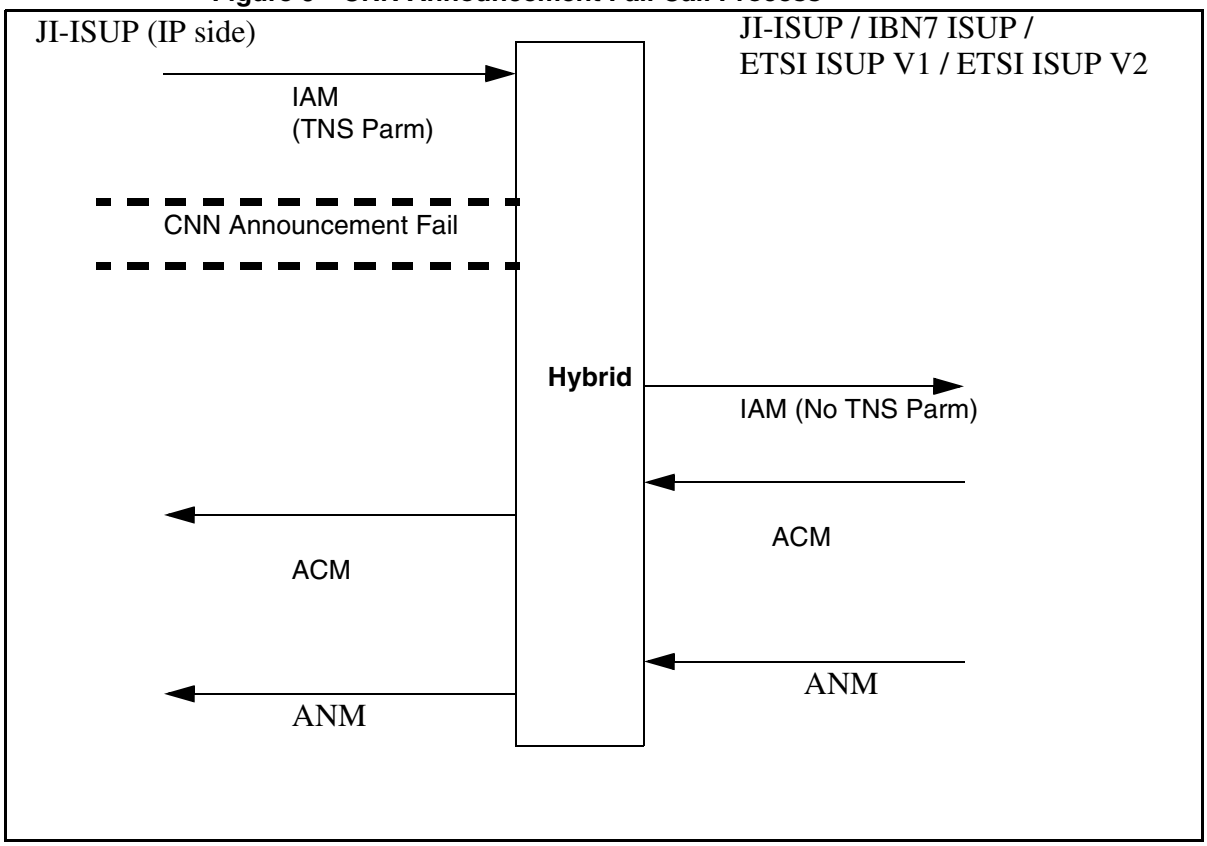
```
ANNCLLI1 NETWK 0 0 1 STND Y 10
```

Figure 5 Example datafill in table CARRNAME

```
111111 ANNCLLLI1
```

If CNN announces fail, e.g. all ANNCLLI1 trunks are busy, the call is tandemed as a normal tandem call and the outgoing IAM doesn't contain TNS parameter. At the same time, CNN101 log is generated. For more information about CNN log, please refer to activity A59034248 FN section 3.7 "Logs". The call process of this case please refer to Figure 6 "CNN Announcement Fail Call Process".

Figure 6 CNN Announcement Fail Call Process



49.2.3.3 Handling of Charge Indicator in BCI of CPG

When CNN feature is triggered, the charge indicator in the CPG is modified according to the CHGIND datafill or the CPGCGIND datafill in table XXCODE / XXHEAD.

The rule of it is shown in Table 1 ”Handling of CPGCGIND in CPG”

Table 1 Handling of CPGCGIND in CPG

CHGIND datafilled	Freedial (NOCHARGE) datafilled	CPGCGIND datafilled	Charge Indicator in CPG
Y / N	N	Y	datafilled value of CPGCGIND
Y	N	N	Datafilled value of CHGIND

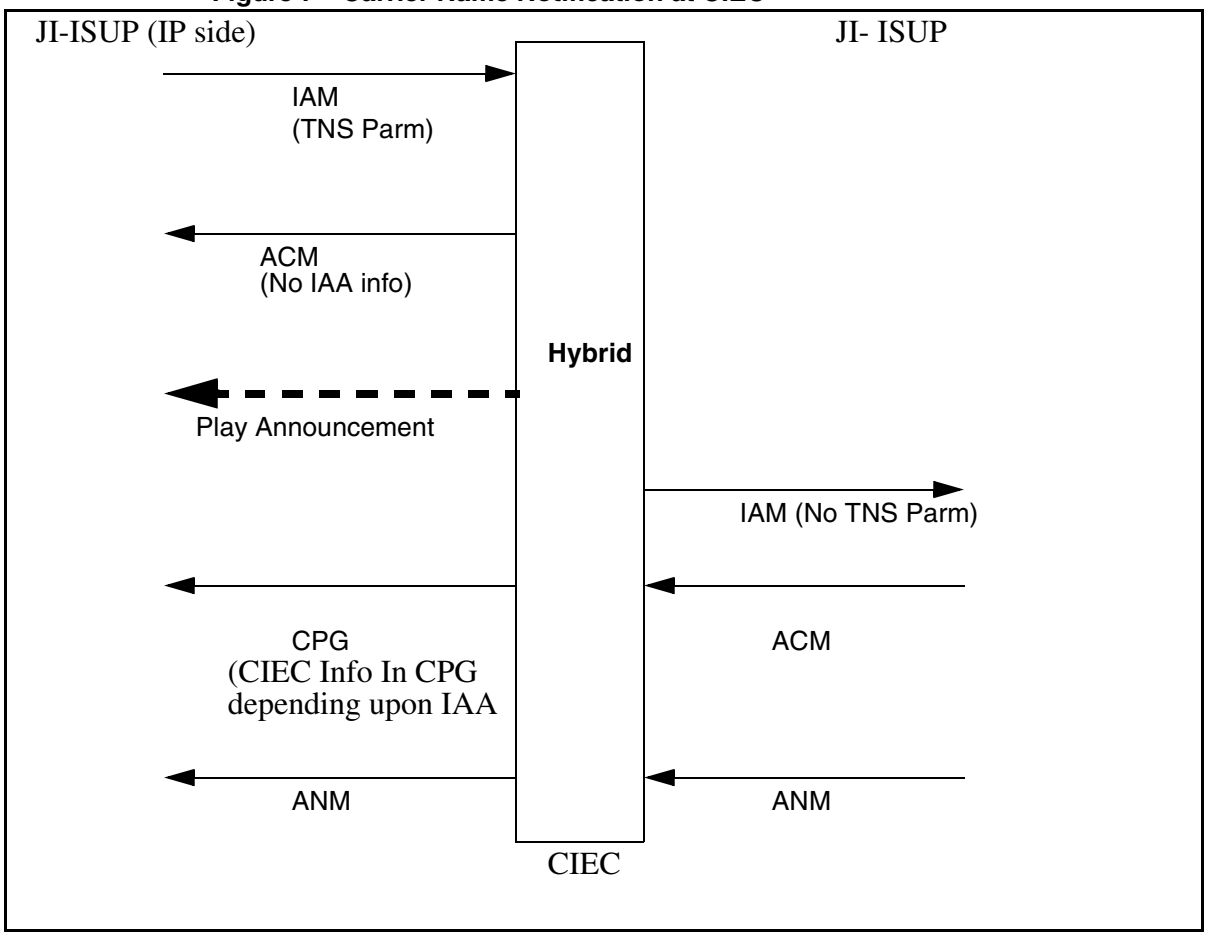
CHGIND datafilled	Freedial (NOCHARGE) datafilled	CPGCGIND datafilled	Charge Indicator in CPG
Y/N	N/Y	Y	Datafilled value of CPGCGIND
Y	N/Y	N	Datafilled value of CHGIND

49.2.3.4 Handling of IAA parameters

IAA is the abbreviation of Inter-Administration Accounting. For more information about IAA, please refer to AU2343 FN section APPENDIX A.

49.2.3.4.1 Carrier Name Notification at CIEC

Figure 7 Carrier Name Notification at CIEC



Please refer to Figure 7 ”Carrier Name Notification at CIEC”.

At hybrid that behaves as a CIEC, if an early ACM for the feature is generated, it will not contain the IAA parameters.

The IAA parameters in the incoming ACM are mapped to the CPG. The IAA parameters of the CIEC are appended to the CPG depending on the IAA logic.

The hybrid will append the CIEC info to the CPG only if all the following conditions are met: -

- the interworking is JI-ISUP to JI-ISUP,
- CIEC datafill in table IAACTRL is encountered during translation;
- all conditions for generating CIEC in IAM are met;
- the incoming ACM must contain the Carrier Info parm (#F1).
- the received TCIT indicator in the incoming IAM must be Backwards (10) or Bothways (11)

If all the above conditions are met, then the behavior depends on which of the following two conditions are met:

(1) if the last sub-block inside the received Carrier Info Parameter in the ACM is CIEC, and the received CIEC Carrier ID is NOT the same as the datafill in ofcparm TELCO_ID or the SUB_TELCO_ID datafill in table IAACTRL, then CIEC is not updated by hybrid. On the contrary, if it is the same as TELCO_ID or SUB_TELCO_ID, then the behavior is like: -

Table 2

CarrierID sub-parm	no change
POI-CA sub-parm	no change (even if EXIT_POI_CA is datafilled)
POI-CAT sub-parm	if received, the ENTRY_POI_CAT overwrites the received one when EXIT_POI_CAT is datafilled. And the received EXIT_POI_CAT is not changed; if not received, this sub-parm is added if EXIT_POI_CAT is datafilled;

(2) if the last sub-block inside the received Carrier Info parameter in the ACM is not CIEC, then the Carrier ID in it is not be the same as the datafill in ofcparm TELCO_ID or the SUB_TELCO_ID datafill in table IAACTRL, then the behavior is like: -

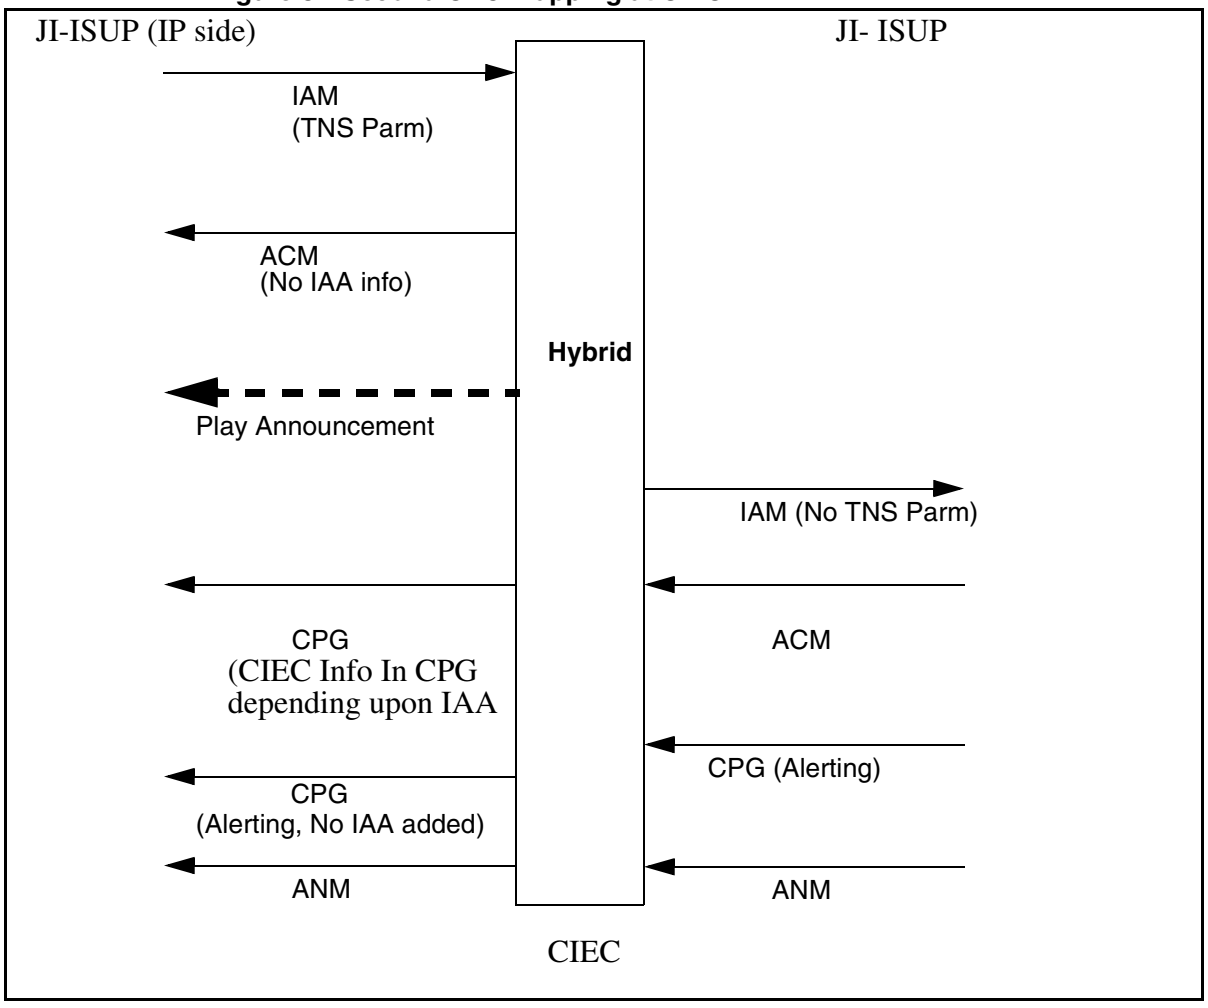
Table 3

CarrierID sub-parm	taken from ofcparm TELCO_ID or SUB_TELCO_ID datafill in table IAACTRL

POI-CA sub-parm	added only if EXIT_POI_CA is datafilled
POI-CAT sub-parm	added if (EXIT_POI_CAT) OR (EXIT_POI_CAT and ENTRY_POI_CAT) is datafilled

After the CPG with IAA is sent out, if there is an alerting CPG coming from outgoing JI-ISUP side, it is just tandemed out to incoming JI-ISUP side and no IAA is added. Please refer to Figure 8 "Second CPG mapping at CIEC".

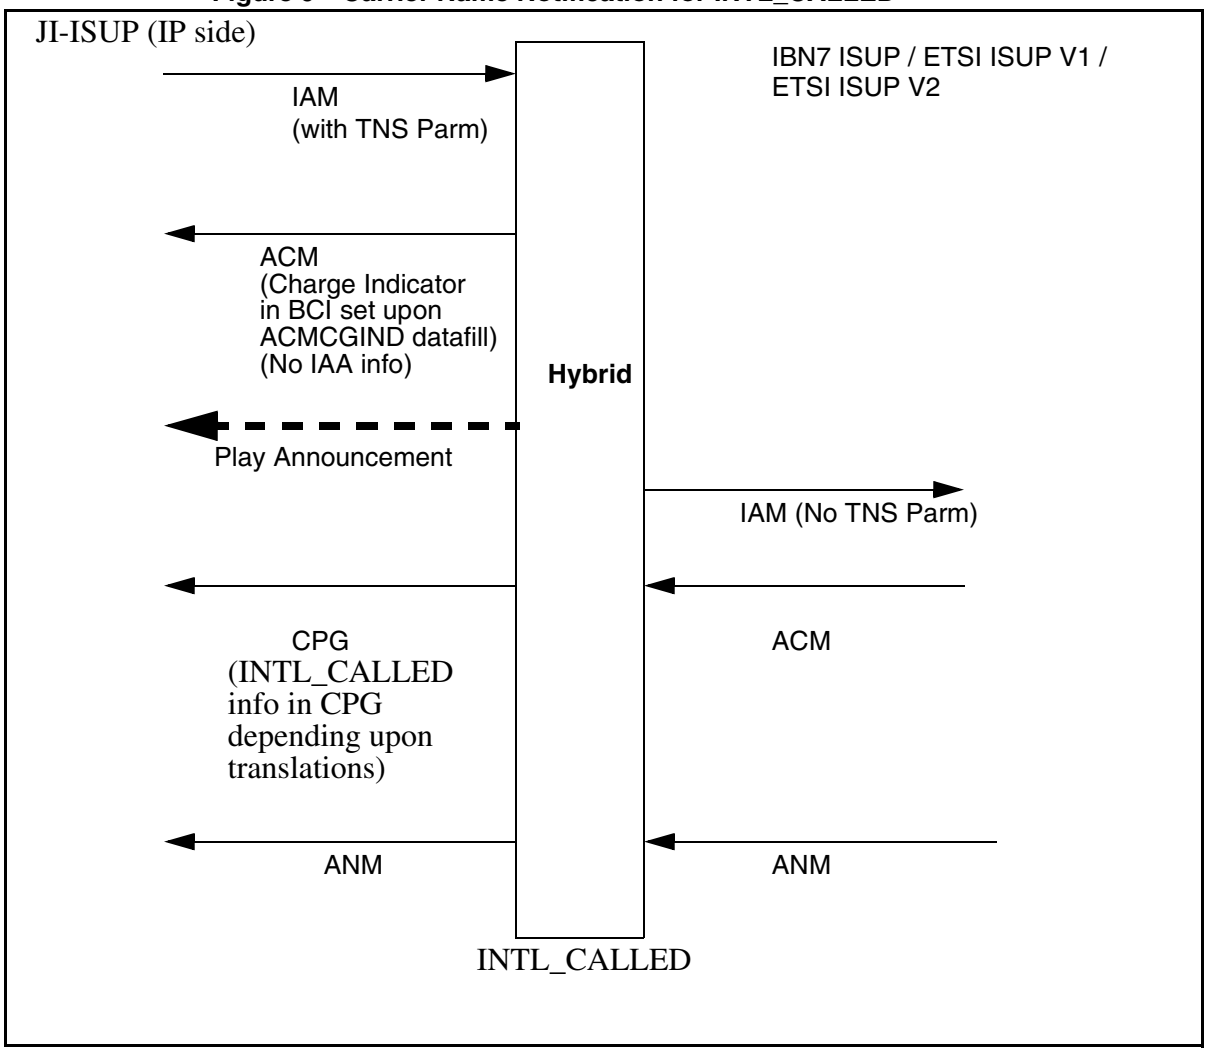
Figure 8 Second CPG mapping at CIEC



49.2.3.4.2 Carrier Name Notification at INTL_CALLED (Outbound International Calls)

Please refer to Figure 9 ”Carrier Name Notification for INTL_CALLED”.

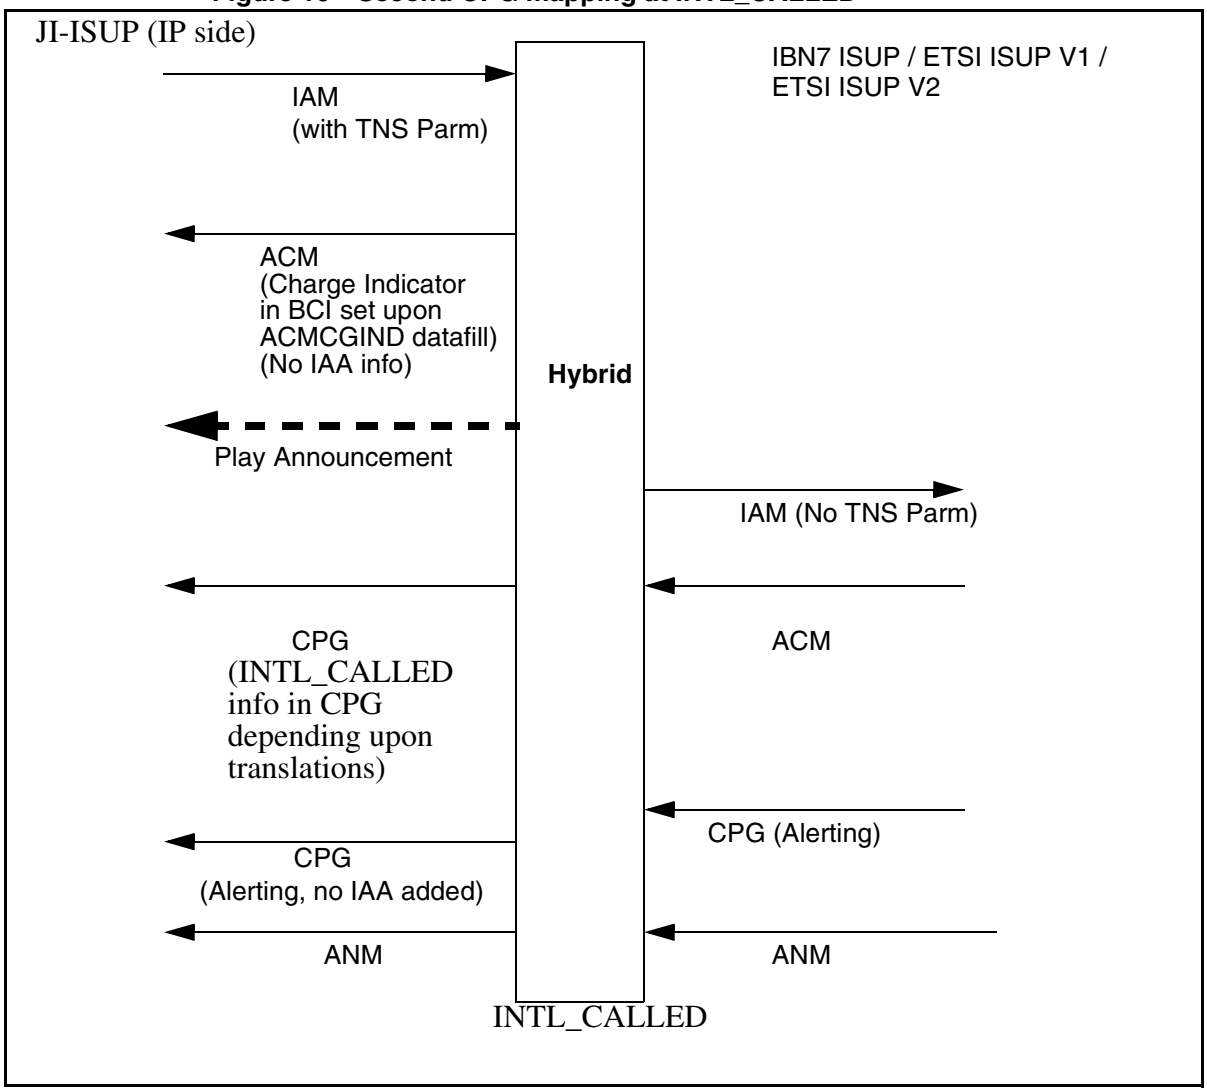
Figure 9 Carrier Name Notification for INTL_CALLED



At hybrid that behaves as an INTL_CALLED (for an international outbound call), if an early ACM for the feature is generated, it will not contain the IAA parameters. So the IAA parameters of the INTL_CALLED will be added to the CPG, i.e. the Carrier Information Parameter containing the Carrier ID.

After the CPG with IAA is sent out, if there is an alerting CPG coming from outgoing IBN7 ISUP side, it is just tandemed out to incoming JI-ISUP side and no IAA is added. Please refer to Figure 10 "Second CPG mapping at INTL_CALLED".

Figure 10 Second CPG mapping at INTL_CALLED



49.2.3.4.3 Carrier Name Notification at IEC

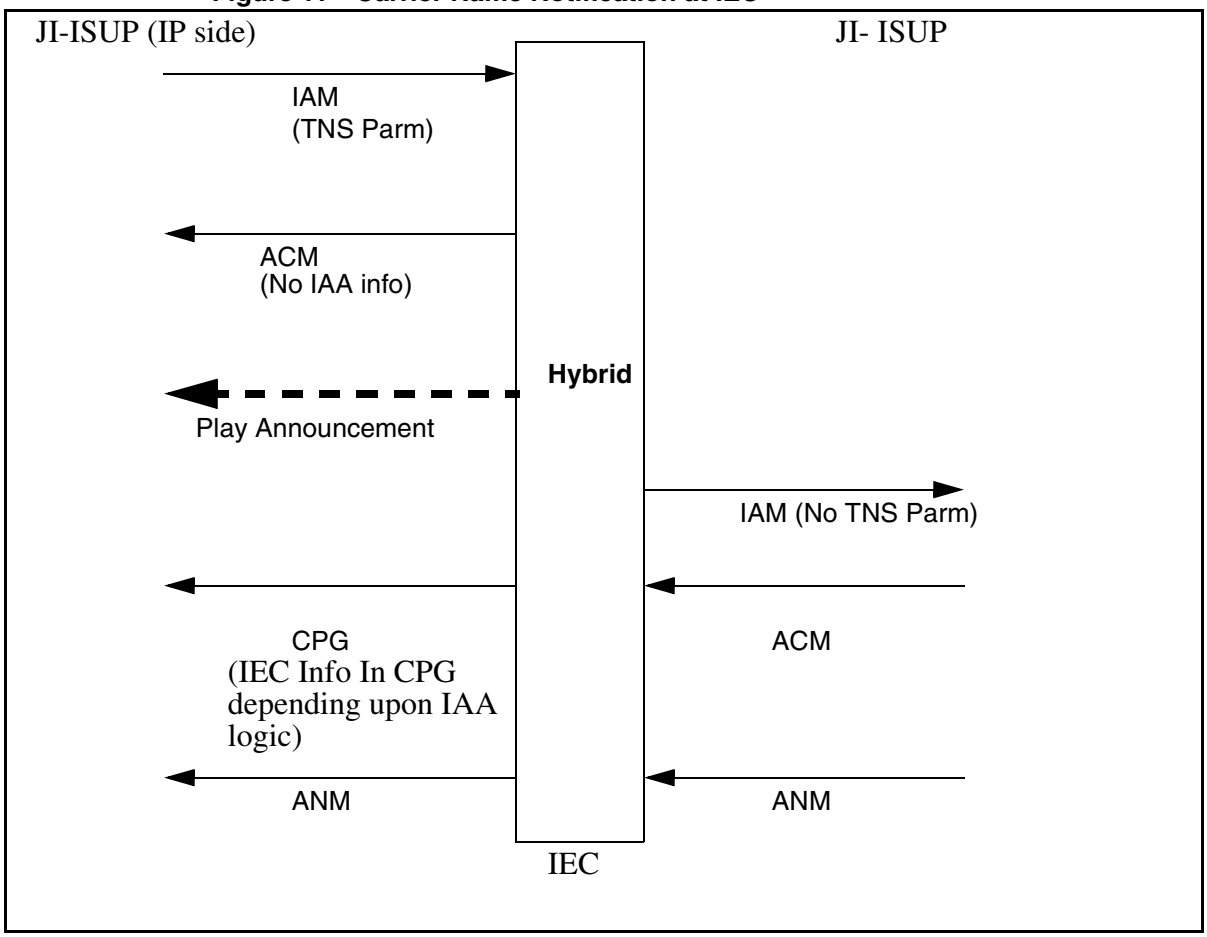
The activation of Carrier Name Notification announcement doesn't differentiate between IEC, CIEC or INTL_CALLED.

If the announcement is played at an IEC, the early ACM generated will not contain the IAA parameters.

The IAA parameters in the incoming ACM are mapped to the CPG. The IAA parameters of the IEC are appended to the CPG depending on the IAA logic.

Please refer to Figure 11 "Carrier Name Notification at IEC".

Figure 11 Carrier Name Notification at IEC



The hybrid updates the IEC carrier info parm to the CPG only if all the following conditions are met:

- the interworking is JI-ISUP to JI-ISUP;
- IEC datafill in table IAACTRL is encountered during translation;
- all conditions for generating IEC in IAM, except the condition regarding the received TCIT value, are met;
- the incoming ACM must contain the Carrier Info parm (#F1);
- the received TCIT indicator in the incoming IAM must be Backward (10) or Bothways (11);

If all the above conditions are met, then the behavior depends on which of the following two conditions are met: -

(1) if the last sub-block of the received #F1 parm is IEC, and this received IEC Carrier ID is NOT the same as the datafill in ofcparm TELCO_ID or the SUB_TELCO_ID datafill in table IAACTRL, then IEC is not updated by hybrid. On the contrary, if it is the same as TELCO_ID or SUB_TELCO_ID, then the behavior is like:

Table 4

CarrierID sub-parm	No Change
POI-CA sub-parm	no change (even if EXIT_POI_CA is datafilled)
POI-CAT sub-parm	if received, the ENTRY_POI_CAT overwrites the received one when EXIT_POI_CAT is datafilled. And the received EXIT_POI_CAT is not changed; if not received, this sub-parm is added if EXIT_POI_CAT is datafilled;

(2) if the Carrier ID in the last sub-block of the received #F1 parm is not the same as the datafill in ofcparm TELCO_ID or the SUB_TELCO_ID datafill in table IAACTRL, then the behavior is like: -

Table 5

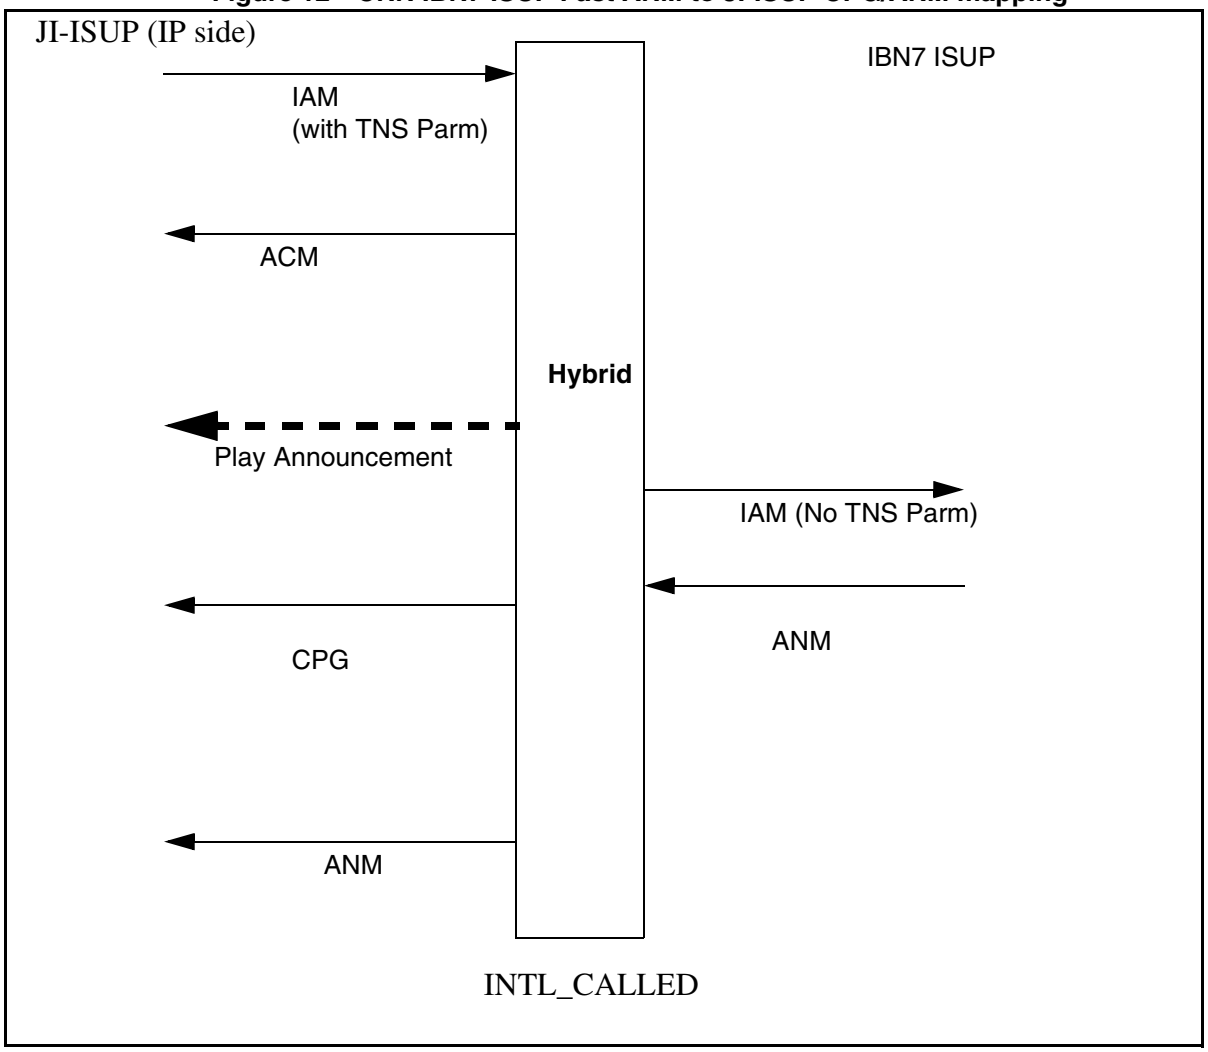
CarrierID sub-parm	taken from ofcparm TELCO_ID or SUB_TELCO_ID datafill in table IAACTRL
POI-CA sub-parm	added only if EXIT_POI_CA is datafilled
POI-CAT sub-parm	added if (EXIT_POI_CAT) OR (EXIT_POI_CAT and ENTRY_POI_CAT) is datafilled

49.2.3.5 Handling IBN7 ISUP Fast ANM

IBN7 ISUP fast ANM to JI-ISUP ACM/ANM mapping is enhanced to JI-ISUP CPG/ANM mapping. The call flow please refers to Figure 12 ”CNN IBN7 ISUP Fast ANM to JI-ISUP CPG/ANM mapping” .

If the fast ANM with no charge and ANM (NOCHG) mapping feature is turned off, ANM is just mapped to CPG and no ANM is sent out. The IAA parameters of the INTL_CALLED exchange will be added to CPG. Except this, the mapping is not impacted.

Figure 12 CNN IBN7 ISUP Fast ANM to JI-ISUP CPG/ANM mapping

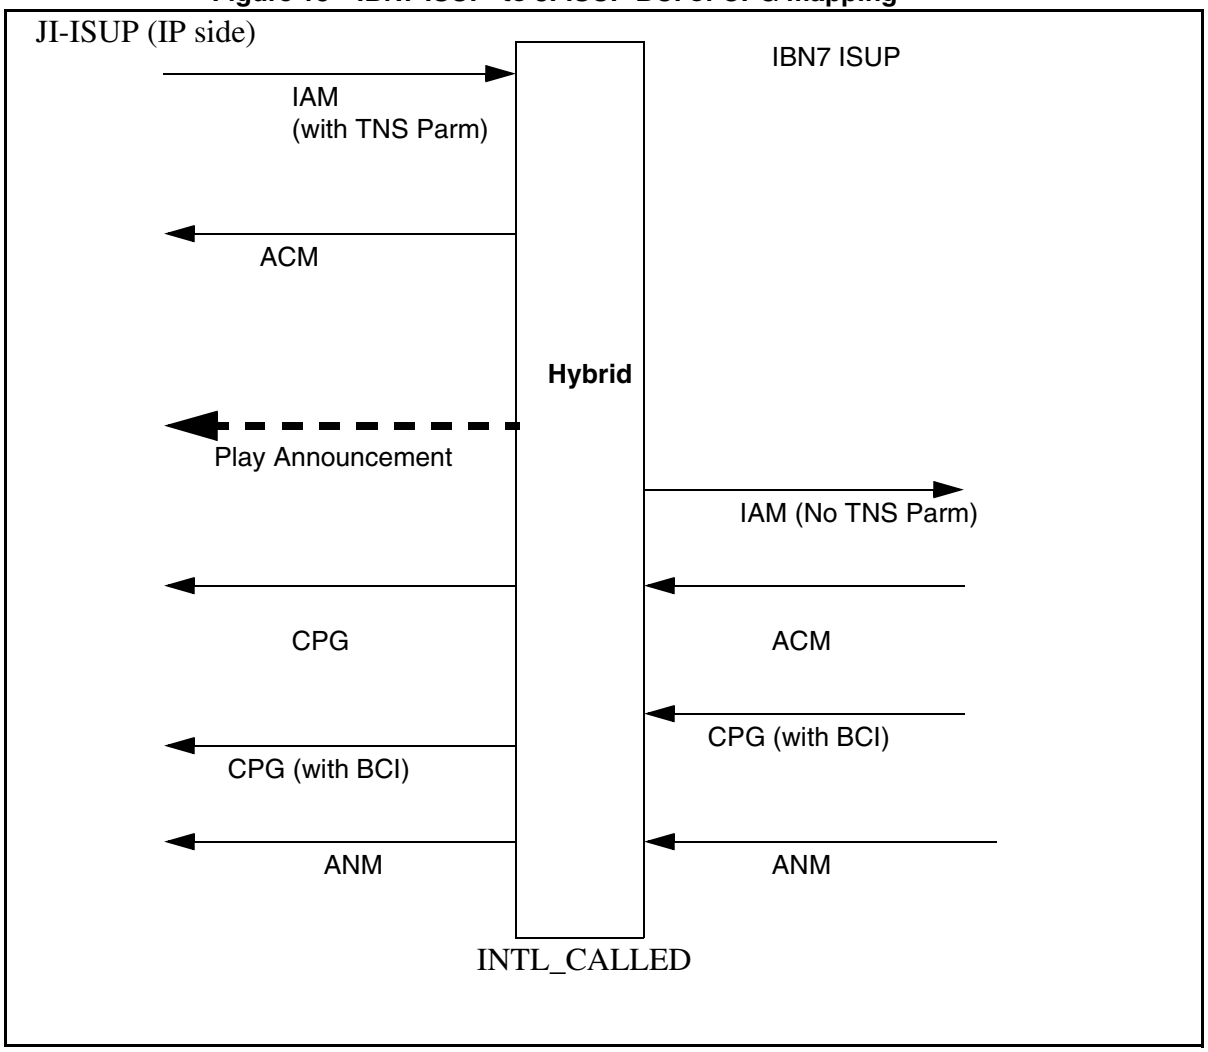


49.2.3.6 IBN7 ISUP to JI-ISUP BCI of CPG Mapping

After the first CPG is sent back to JI-ISUP side, if there is a CPG with BCI is received from IBN7 ISUP side, it is mapped to CPG which has BCI in JI-ISUP side. The BCI mapping rule is the same as BCI of ACM to BCI of CPG mapping. The rule please refers to RS section of A59017299 table 52 “Parameter Mapping - ANSI7+ ISUP ACM to JI-ISUP ACM”.

Please refer to Figure 13 "IBN7 ISUP to JI-ISUP BCI of CPG mapping".

Figure 13 IBN7 ISUP to JI-ISUP BCI of CPG mapping



49.2.4 Account Code (ACCT)

49.2.4.1 Functional Overview

"Account Code" service enables the subscriber to enter an account code during the call setup in order to classify the call on the customer's bill.

The hybrid checks the customer group (CUSTGRP) and the network class of service (NCOS) to see if an account code is required on this call. If it is, the hybrid sends back second dial tone or announcement to prompt the subscriber to enter an account code. The hybrid receives the account code digits as DTMF tones over the voice path.

When entering the account code, the subscriber has the option to enter the reset digit (*). This causes all account code digits entered by the subscriber during the present stage of dialing to be ignored. Accompanying the '*' is a reset tone, ~~of datafillable duration,~~ to prompt the subscriber to begin re-entering the required digits where the first digit dialed breaks the reset tone.

Once the account code digits are entered, the hybrid checks to see if the required number of digits has been entered and the call continues. The entered account code digits will be contained in the AMA billing record.

If the subscriber enters the hash (#) during the dialing phase it is treated as end of dialing. At this point, if the minimum required number of digits has been collected, the call proceeds to the next phase of call processing.

ACCT is supported in following interworking scenarios on hybrid by this activity:

- JI-ISUP -> JI-ISUP
- JI-ISUP -> IBN7 ISUP
- JI-ISUP -> ETSI ISUP V1
- JI-ISUP -> ETSI ISUP V2
- JI-ISUP -> SIP-T (JI-ISUP)
- JI-ISUP -> SIP-T (No ISUP to IMS)

Please refers to Figure 14 "ACCT Interworking with ISUP Functional Behavior Diagram" and Figure 15 "ACCT Interworking with SIP-T Functional Behavior Diagram".

Figure 14 ACCT Interworking with ISUP Functional Behavior Diagram

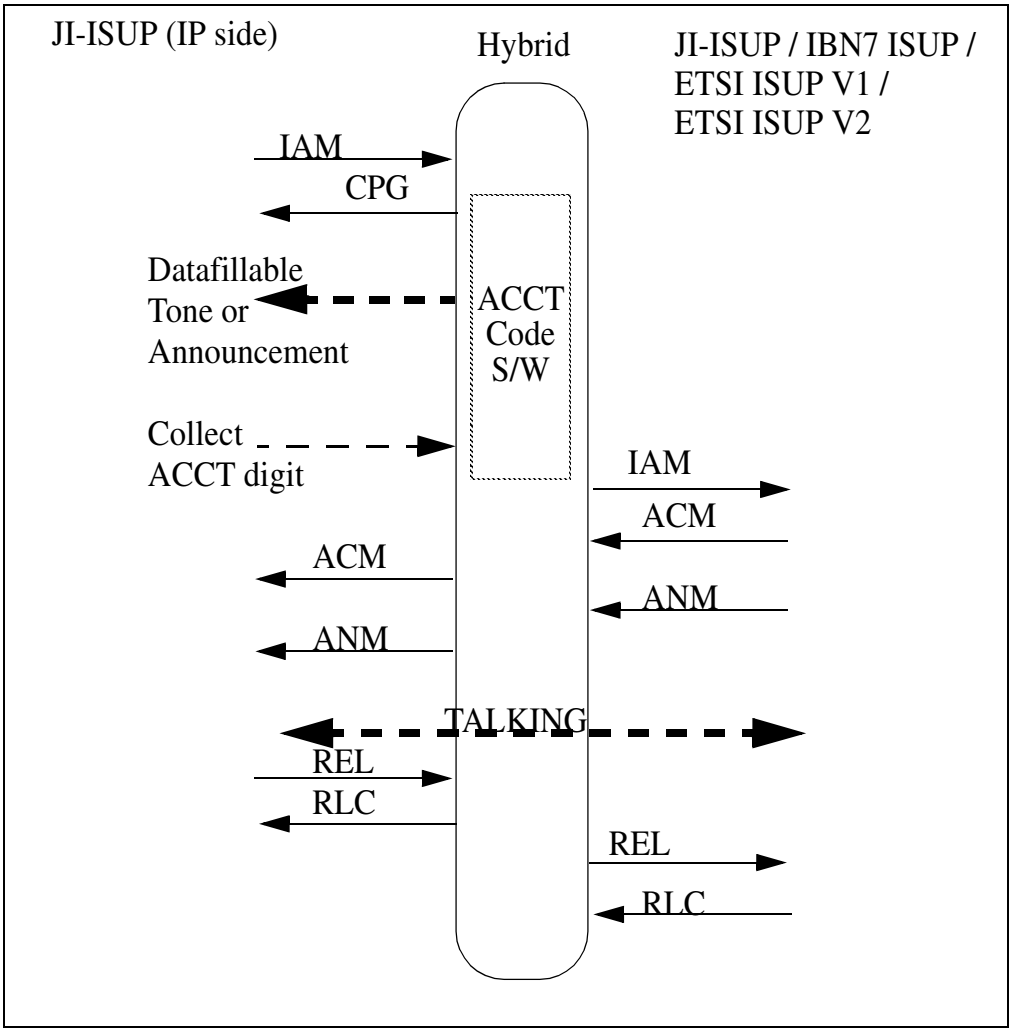


Figure 15 ACCT Interworking with SIP-T Functional Behavior Diagram

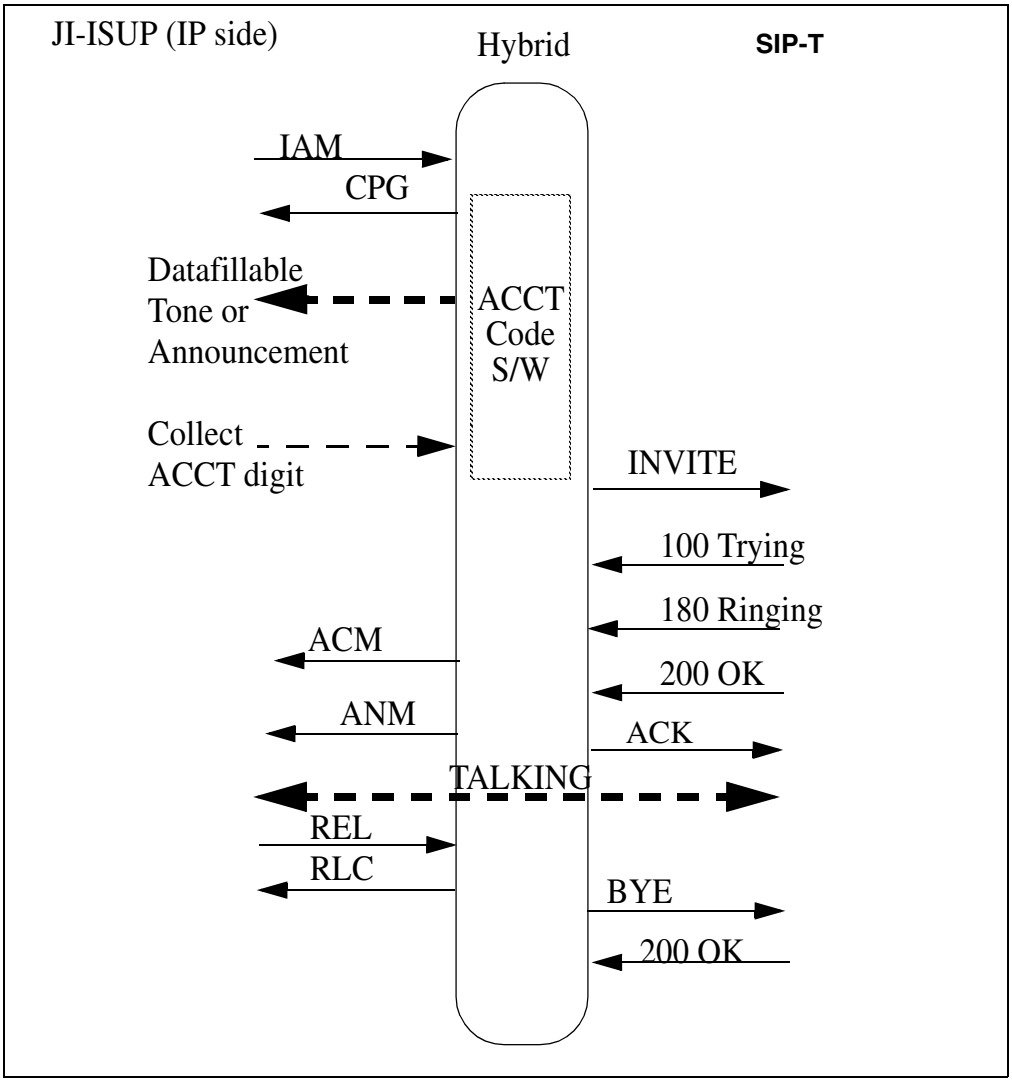

49.2.4.2 Reset Tone

When entering the account code, the subscriber has the option to enter the reset digit (*). This causes all account code digits entered by the subscriber during the present stage of dialing to be ignored and “Reset tone” is played. This tone is stopped when first digit is received or reset tone duration is time out.

~~The reset tone duration is controlled by the office parameter RESET_TONE_DURATION_160MS in table OFCVAR.~~

~~For JI-ISUP or IBN7 ISUP to account code calls, the maximum reset tone duration is 24 seconds, even if datafill represents a larger value.~~

The specification of reset tone is shown in Table 6 ”Specification of Reset tone”.

Table 6 Specification of Reset tone

Tone	Single Frequency	Cadence	Duration	Level
Reset Tone (for reset of the digit collection)	400 Hz	Constant	~~Datafillable~~ (0.5 second)	-16 dBmO +/-0.5 dB

49.2.4.3 Tone/Announcement Handling

The JI-ISUP agent, on receipt of the first digit, handles the tone/announcement in the following fashion:

- 0 - 9, ‘*’ - Tone/Announcement stopped
- ‘#’ - Tone stopped/Announcement continues

49.2.4.4 Effect On Permanent Signal Timer

If digit 0 through 9 is entered as a first digit then the permanent signal timer is stopped, and the interdigit timer is used to collect the remaining digits.

If `*' or `#' is entered as the first digit the handling of the permanent signal timer is shown in Table 7 ”Account Code Handling of First Digit” .

Table 7 Account Code Handling of First Digit

Digit Entered	Perm Signal Timer
* (asterisk)	restarted
#(octothorpe)	restarted

49.3 Hardware Requirements or Dependencies

Announcement hardware UAS needs to be present in Hybrid.

49.4 Software Requirements or Dependencies

. N/A

49.5 Limitations and restrictions

. N/A

49.6 Interactions

Due to this activity is a migration, we don't change any code about interaction. So all the interactions are the same as the legacy MMP features.

For more information about NTC, please refer to original documents in AR0480, AR1344, AR1599, AR1816 and A59017299.

For more information about CNN, please refer to original documents in A59027517 and A59034248.

For a detailed description about ACCT, please refer to activities AR2028 and A59017299.

50: Functional Description (FN): A00002757

50.1 Feature name

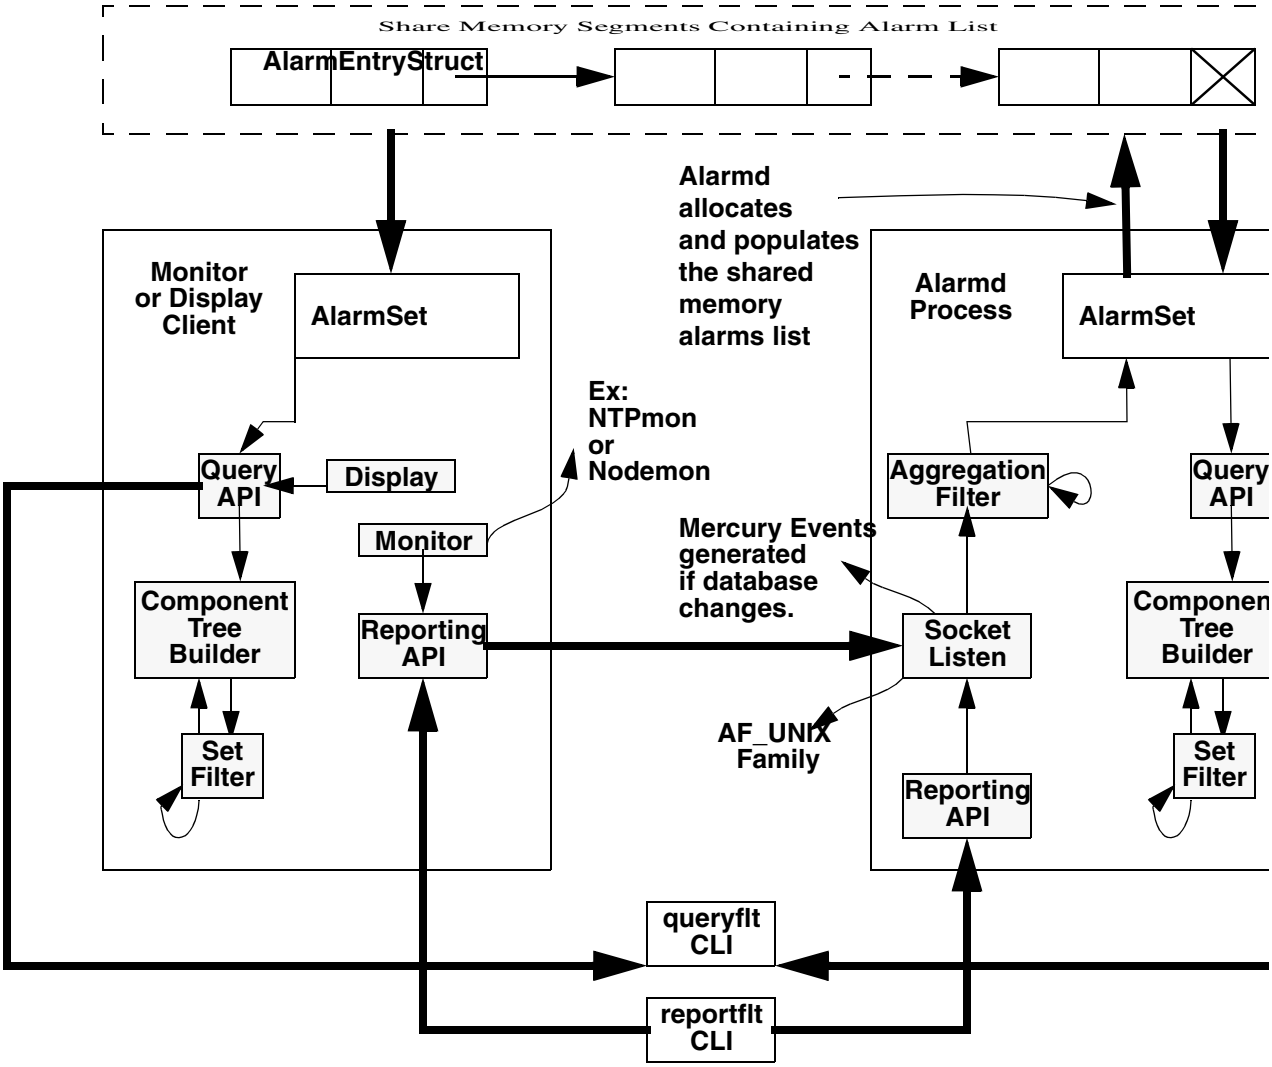
A00002757 CBM FAULT MANAGEMENT (HA)

50.2 Description

This feature provides a generic framework for centralizing fault information for the Next Generation SDM (CBM) product and for the SSPFS platform.

The mandate is to collect detailed fault information about components in the CBM cluster, maintain a list of current alarms, summarize the list in a hierarchical fashion, and report this information to clients in the desired fashion.

Figure 1 Alarmd Server/Client Process and Data Flow



50.2.1 User Interfaces

This feature will require changes to the QueryCBM command in the CBMMTC maintenance tool, as well as various Logs commands for respective CBMMTC levels.

50.3 Hardware Requirements or Dependencies

SSPFS defined platform.

50.4 Software Requirements or Dependencies

A00003617 SSPFS Alarmd Integration will provide the light control API, and component monitors for this feature.

50.5 Limitations and restrictions

N/A

50.6 Interactions

A00003617 SSPFS Alarmd Integration will provide system level monitors that will use the ReportingAPI part of this feature to record any alarms. It will also make use of the Query API in this feature to retrieve alarms stored in the Alarms Databsae.

A00002164 The Application Manager(SAM) for HA will use the Reporting API part of this feature to record any alarms. It will also make use of the Query API in this feature to retrieve alarms stored in the Alarms Databsae.

51: Functional Description (FN): A00002765

51.1 Feature name

XLAGRP Refinements for Coin Station-Paid Routing

51.2 Description

This feature enhances the Unbundling Translations and Routing functionality by adding the ability to refine the XLAGRP based upon the calling service class and the billing method. With this feature, outgoing translations can now be applied specifically to a coin station-paid call.

The implementation of this feature allows the full range of calling service class and billing methods to be utilized in XLAGRP refinements. New table XLACLASS allows XLAGRP refinements based on a range including coin, station, hotel, and restricted. New table XLABILL allows XLAGRP refinements based on a range including paid, collect, third, cards, special calling, special called.

51.2.1 Background

In TOP09, AF7159 introduced the XLAGRP refinement mechanism for unbundling translations and routing. It created tables XLAGRP, XLASPID, XLAODIGS, and TOPSDP to setup the refinement structure including SPID[1] and originating digits.

Translations Group (XLAGRP) names are datafilled in table XLAGRP, which allows the operating company the ability to datafill various names to represent groupings for translation purposes as needed. These XLAGRP names are then used in the refinement tables to arrive at a final XLAGRP to be used in table TOPSDP (TOPS Dial Plan).

Table TOPSDP centralizes translation and screening attributes. The index into table TOPSDP is chosen in a flexible manner, giving the operating company the ability to fit their individual network needs. Obtaining an XLAGRP and indexing into table TOPSDP is referred to as the ***XLAGRP*** method of performing translations and screening for TOPS calls.

AF7159 provided an initial XLAGRP to be defined in table TOPSTOPT, which is indexed based on a trunk group. It also provided XLAGRP refinements for SPID and originating digits.

[1]Serivice Provider Identification

In TOP12, A59006822 enhanced the XLAGRP method with additional definitions for the initial XLAGRP and additional refinements. It allowed the initial XLAGRP to be defined in table TOPEATRK for EA calls and in table OPRINFO for operator calls. It also provided XLAGRP refinements for Carrier Identification Code (CIC) and EA region, which is based on either a LATA or a ZONE as defined by feature 59006827.

This feature supports all existing XLAGRP methods and enhances the refinement characteristics by adding calling service class and billing methods.

51.2.2 New XLAGRP Refinement Order

To preserve the existing XLAGRP refinement datafill, the new refinements are added at the end of the existing order list for non-EA calls. Thus XLACLASS then XLABILL will refine after XLAODIGS. For EA calls, XLACLASS and XLABILL will refine after XLAODIGS as well. Although this inserts the new refinement tables in the middle of refinement for EA calls, it saves the extra datafill needed in XLACLASS and XLABILL to accomodate those XLACIC and XLAEAREG XLAGRPs.

The following diagrams illustrate the existing XLAGRP refinement order with the new tables, XLACLASS and XLABILL, included.

The figures below outline the refinement order for both EA and NON-EA calls:

Figure 1 XLAGRP Refinement Order NON Equal Access

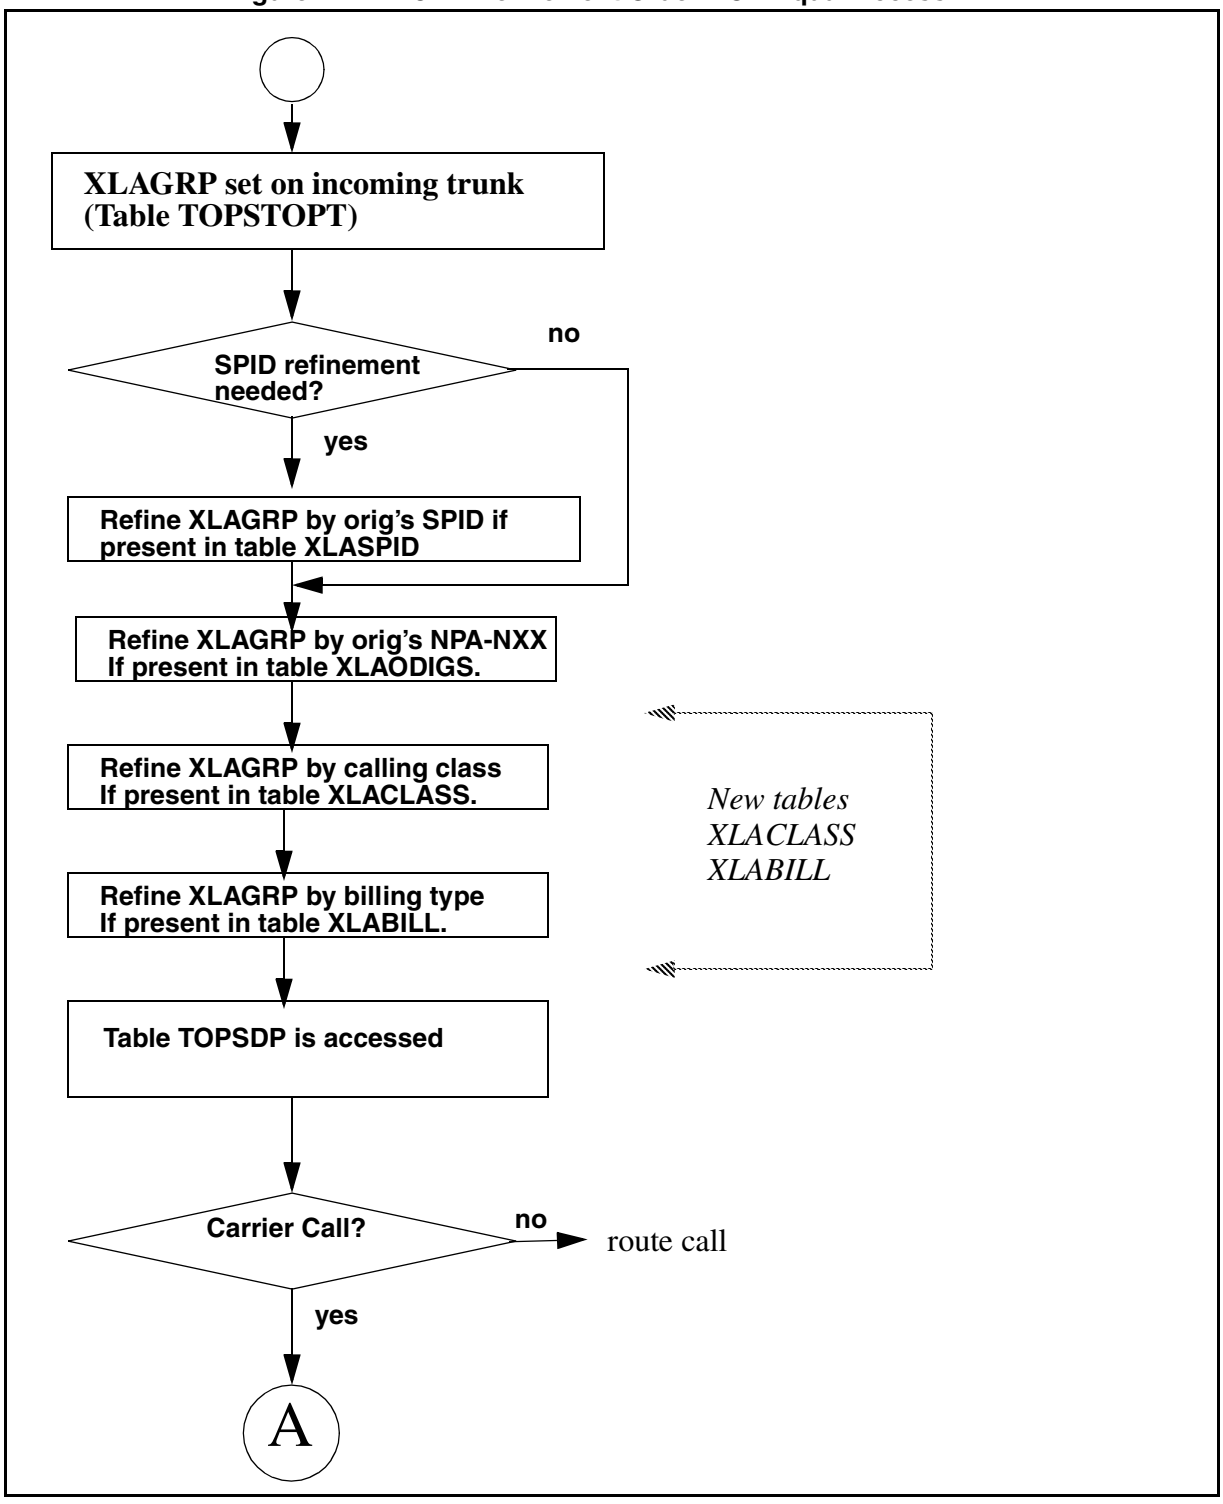

Figure 2 XLAGRP Refinement Order For Equal Acess Calls

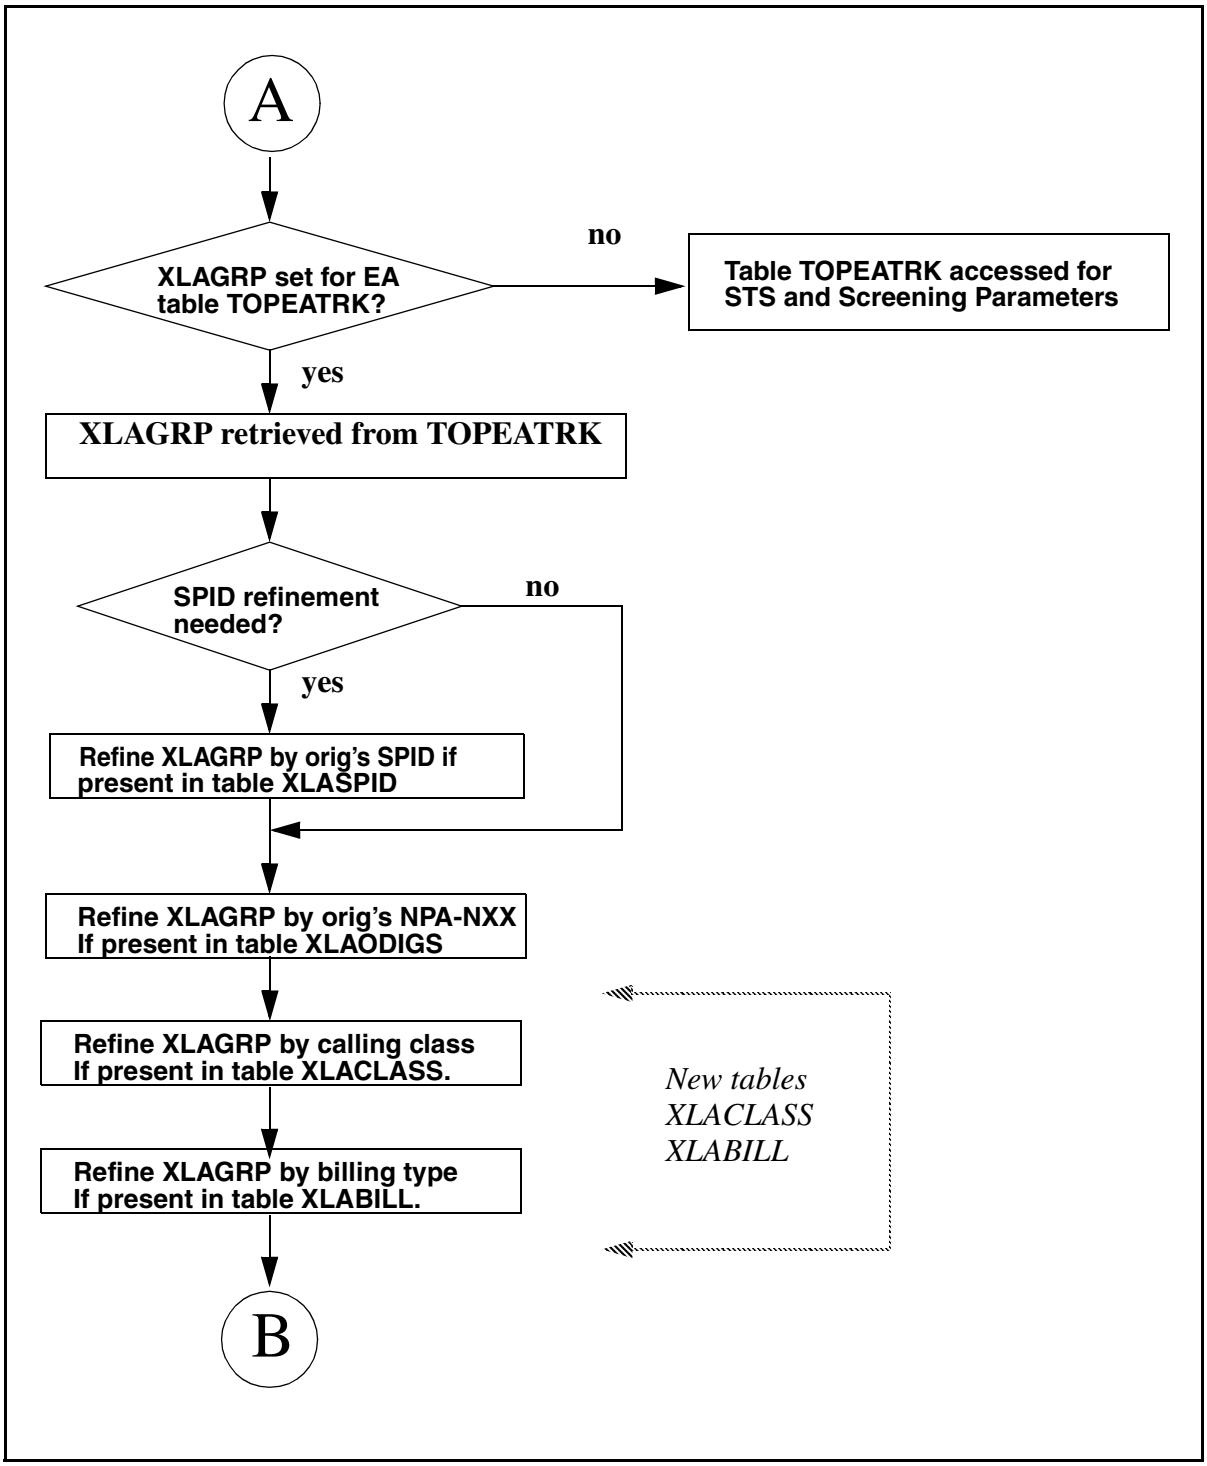

Figure 3 XLAGRP Refinement Order For Equal Acess Calls

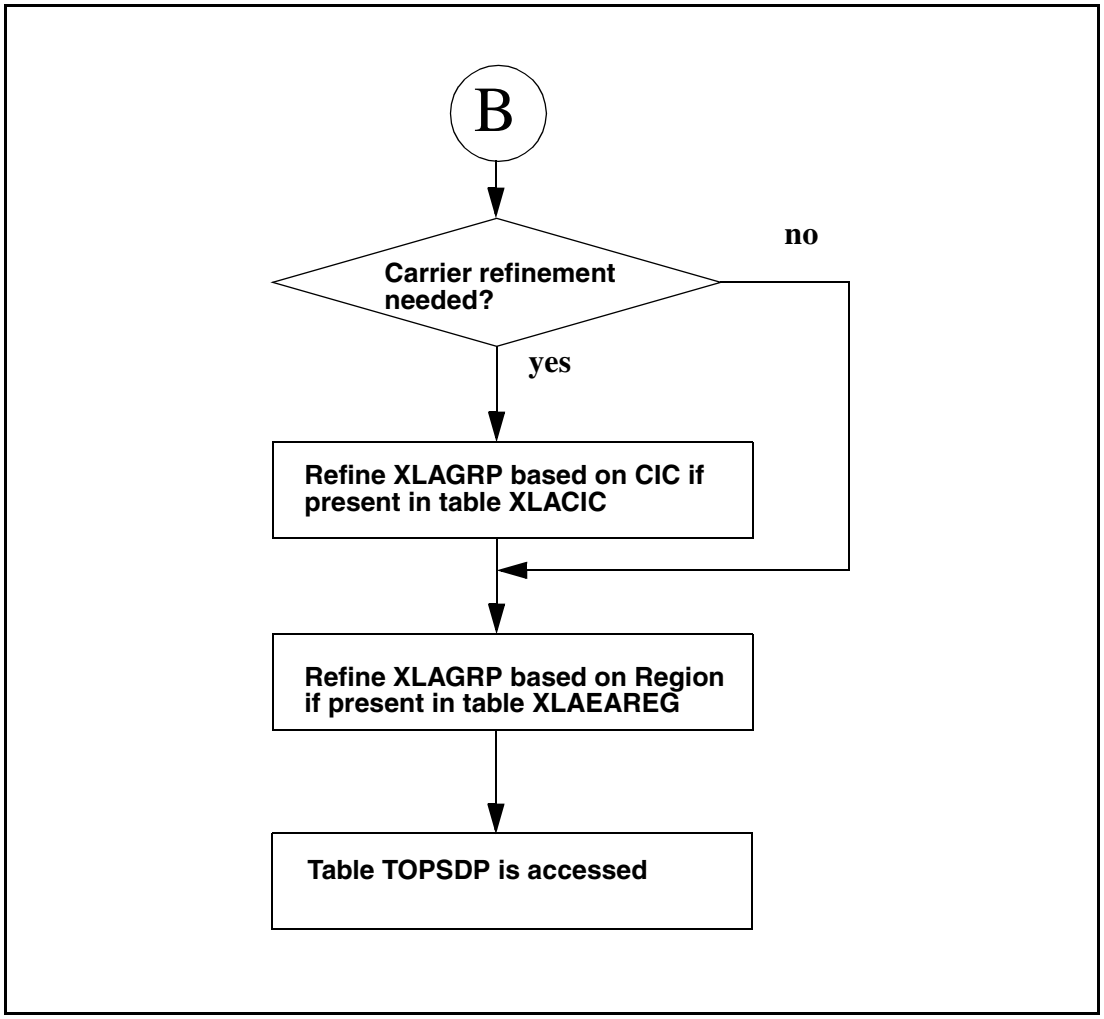

51.2.3 Table XLACLASS

Table XLACLASS allows the XLAGRP to be refined based upon the calling service class. The index of the table is the existing XLAGRP and the calling service class. It then provides a new XLAGRP if a match is found.

Table 1 Example of Table XLACLASS

XLAGRP	CLGCLASS	NEWXLGRP
TRK1	COIN	TRK1COIN
TRK1	STATION	TRK1STA

The XLAGRP names in fields XLAGRP and NEWXLAGRP must first be datafilled in table XLAGRP.

Field CLGCLASS supports a range of {UNKNOWN, STATION, COIN, HOTEL, RESTRICTED}.

51.2.4 Table XLABILL

Table XLABILL allows the XLAGRP to be refined based upon the billing type. The index of the table is the existing XLAGRP and the bill type. It then provides a new XLAGRP if a match is found.

Table 2 Example of Table XLABILL

XLAGRP	BILLTYPE	NEWXLGRP
TRK1COIN	PAID	TRK1COINPAID_ROUTE
TRK1COIN	COLLECT	TRK1COIN_NOROUTE

The XLAGRP names in fields XLAGRP and NEWXLAGRP must first be datafilled in table XLAGRP.

Field BILLTYPE supports a range of {UNSPEC, PAID, COLLECT, THIRD, CCARD, SPLCLG, SPLCLD}.

Note: Station paid and person paid are both handled by the PAID criteria. Both are PAID calls but may have a different rate applied. Since this refinement is to capture the billing method not the rate, station and person ratings are treated the same. This applies to all billing types.

51.2.5 Table Flow Example

This example section illustrates the new refinement tables and how they achieve special routing for coin station paid calls. It is simplified by using an incoming trunk group with non-EA calls. A59006822 fully details XLAGRP methods for EA and operator calls. It is further simplified by not having SPID or originating digit refinements. These are fully documented in AF7159.

Table 1 TOPSTOPT

GRPKEY	ACDDATA	DISPCLG	ADASERV	ADASANS	ANITOCLI	OLNSQRY	DCIBIDX	LNPCLGAM	XLA SCHEM		SPIDPRC	TRKSPID	
									NEWXLA	XLAGRP		DFLTSPID	SPID
TRK1	QMSCAM	N	NONE	NA	N	NONE	0	N	Y	**TRK1**	N	N	

Table 2 XLASPID does not have a match

Table 3 XLAODIGS does not have a match

Table 4 XLACLASS

XLAGRP	CLGCLASS	NEWXLGRP
TRK1	COIN	TRK1COIN
TRK1	STATION	TRK1STA

Table 5 XLACLASS

XLAGRP	CLGCLASS	NEWXLGRP
TRK1COIN	PAID	TRK1COINPAID_ROUTE
TRK1COIN	COLLECT	TRK1COIN_NOROUTE

Table 6 TOPSDP

XLAGRP	STS	OPERPRTN	ORIGSCRN	OPERSCRN	MCCSPRTN	MCCSSCRN	LCANAME
TRK1	619	PRTNM1	SCR1	OPR1	PRTNM1	MCCS1	LCA00001
TRK1COINPAID_ROUTE	619	PRTNM1	SCR1	OPR1	PRTNM1	MCCS1	LCA00001
TRK1COIN_NOROUTE	619	NPRT	NSCR	NSCR	NPRT	NSCR	NLCA
TRK1COIN	619	NPRT	NSCR	NSCR	NPRT	NSCR	NLCA

- STS - This is the service translations scheme which is also the index into code translations (i.e., Table HNPACONT).
- OPERPRTN - This is the operator pretranslator name that is used for performing pretranslations from the operator position. It is used to index into Table STDPRTCT.
- ORIGSCRN - This is the class of service screening name that is used for screening based upon the location of the originator. It is used to index into Table CLSVSCRC.
- OPERSCRN - This is the class of service screening name that is used for screening when an operator or service node is associated with the call. It is also used to index into Table CLSVSCRC.
- MCCSPRTN - This is the pretranslator name that is used for performing pretranslations for the Mechanized Calling Card Service (MCCS) sequence calls. It is used to index into Table STDPRTCT.
- MCCSSCRN - This is the class of service screening name that is used for screening when performing the call screening for Mechanized Calling Card Service (MCCS) sequence calls. It is used to index into Table CLSVSCRC.
- LCANAME - This is the local call area screening name which is used to determine if the call is local. It is used to index into table LCASCRCN or LCAINFO.

For non-EA COIN PAID calls arriving on TRK1, the initial XLAGRP is determined from table TOPSTOPT and refinements are performed as follows. The current XLAGRP is noted after the arrow.

1. Table TOPSTOPT provides the initial XLAGRP name

----> TRK1

2. SPID refinements are not needed, no change

3. Originating digits are not found in XLAODIGS, no change

4. Table XLACLASS finds TRK1 COIN, changes XLAGRP

---> TRK1COIN

5. Table XLABILL finds TRK1COIN PAID, changes XLAGRP

----> TRK1COINPAID_ROUTE

The final XLAGRP for this non-EA COIN PAID call is TRK1COINPAID_ROUTE. This XLAGRP is indexed in table TOPSDP to find the screening and translations indices.

Note: In this example, if the coin call was billed collect then the final XLAGRP would have been TRK1COIN_NOROUTE which can be setup in table TOPSDP to have screening and translations indices which do not route or route to treatment. Also note that the XLAGRP, TRK1COIN, can be added to TOPSDP and be setup for indices which do not route. This ability limits the amount of datafill needed to only allow coin paid calls to complete. Thus, the refinement TRK1COIN COLLECT in XLABILL is not needed nor the TRK1COIN_NOROUTE XLAGRP. These were only included here to illustrate the options.

51.2.6 Activation

When activating feature A00002765 in a site where XLAGRPs are already in use, the following is recommended.

- For a new trunk group to begin using the XLAGRP translations and is not dependent on existing translations, a new XLAGRP name should be assigned to the trunk group and the new XLAGRP used in the refinement tables as needed. This has no interaction with existing translations since existing XLAGRPs will not find matches in the new tables.
- For an existing trunk group with XLAGRP translations (or a new trunk group which will use existing XLAGRP translations), it is recommended to work backwards in the refinement order. By adding the final XLAGRP first, no matches will be found until the first refinement using the existing XLAGRP is datafilled. For example, if TRK1 has XLA1 defined in TOPSTOPT and has existing translations for SPID where (XLA1 SPID XLA1SPID) is datafilled in table XLASPID, then to create a coin station_paid route for these calls, first add new XLAGRPs (XLA1SPIDCOIN and XLA1SPIDCOINPAID) to table XLAGRP then add to table XLABILL (XLA1SPIDCOIN PAID XLA1SPIDCOINPAID) [so far no changes will occur]. Then add to table XLACLASS (XLA1SPID COIN XLA1SPIDCOIN) - [once this is added coin station_paid calls will route using XLA1SPIDCOINPAID].

  Note: Ensure all XLAGRPs have datafill in table TOPSDP; be sure that XLA1SPIDCOIN can still route correctly. These are the calls which are coin but not paid for that trunk group with that SPID. TOPSDP will need to point to something that goes to treatment (if desired) otherwise they will route to the last route found in standard translations.

51.3 Hardware Requirements or Dependencies

NA

51.4 Software Requirements or Dependencies

UNBN0101, OSB00101

51.5 Limitations and restrictions

- XLACLASS is limited to a range containing UNKNOWN, STATION, COIN, HOTEL, RESTRICTED.
- XLABILL is limited to a range including UNSPEC, PAID, COLLECT, THIRD, CCARD, SPLCLG, SPLCLD.
- Station billing and person billing may have different rates but are both treated the same in table XLABILL. For example, station paid and person paid will both refine under the PAID criteria.
- This feature is intended to be used with the dollar pre-pay coin functionality. Limitations for this function include:
  - — External rater not support with OSSAIN
  - — External rater, Coin signalling, ACTS not supported in Global loads

51.6 Interactions

This feature can alter the translations and route selected for calls using the XLAGRP method.

52: Functional Description (FN): A00002760

52.1 Feature name

A00002760 - Panther Enhancements For Hybrid Office Support

52.2 Description

Panther tool provides automatic software load upgradation facility for peripherals like DTC, DMSCP SPMs, SMG4 etc.

While upgrading a particular variant of SPM using panther(eg. DMSCP) in a hybrid office which has more than one variant of SPMs(eg. both DMSCP and SMG4), the following problems occur.

- In addition to creating a plan for the desired variant(DMSCP) of SPM, panther has a limitation of creating an upgrade plan for other variants also(eg. SMG4).
- While executing the plan, craft is unable to retain the loads that were existing in the other variant, since the PLAN forces a change in the load for other variants as well. As a result, the RMs and CEMs of other variants of SPMs in a Hybrid office are loaded with the wrong load which may lead to the outages.

This SN07 activity **A00002760**: 'PANTHER ENHANCEMENTS FOR HYBRID OFFICE SUPPORT'ensures upgrading of different variants of SPMs with their corresponding loads. This activity is supported only for the offices that has SPMs provisioned in it.

The various functionalities provided as part of this activity are:

- Eight new EXT files, one for each variant of SPM are available for the crafts.
- Blocking of panther upgrade for SPMs in case of no EXT file on the distribution volume. This blocking is done only in the customer site.

  Note: *However in labs, if there is no EXT file present in the distribution volume, a new prompt is introduced either to continue the upgrade of SPMs or blocking the upgrade for SPMs.*
- Modification of the table SPMLDVAL to support SN releases and creation of a new field to determine the variant of SPM. The size of the table SPMLDVAL is also increased from 256 to 2048.
- ONP support to the table SPMLDVAL.

- Modification of FILECOPY command and filecopy report in Panther to copy appropriate loads to the destination volume based on the load information available in the EXT files.
- Modification of filecopy reports to display the variant of SPM.
- Modification of FILECOPY command to support multiple FILECOPY in an upgrade cycle.
- Modification of PMUPGRADE PLAN command to create tasks based on the load information available in the EXT files.
- Enhancement of the CI tool, SPMLDINFO to support all the variants of SPM.
- Modification of the 'QUERYPM FILES' mapci command to display load release information for all variants of SPMs.
- Introduction of additional warning message during manual loading(loadmod and bulkload) of devices of all variants of SPMs.

  Note: *Refer to the activity ACT.89007535 - SPM MR Loadname Decoder for more information.*

52.2.1 Modification of table SPMLDVAL to support all the product lines of SPM

The table SPMLDVAL is enhanced to support the load lineup for all the following product lines of SPMs.

- DMSCP - NA
- DMSCP - INTL
- SMG4 - ATM
- SMG4 - IP
- IW - ATM
- IW - IP
- DPT - ATM and
- DPT - IP

52.2.1.1 Modification of the key of the table

In SN06, this table supports the load lineup for DMSCP class of SPMs only and the tuple format is as shown below.

SP 17 1 0 (CEM71BA) (COH0071) (DL271AZ) (DLC71AZ) (DSP71BA) (OC371AZ) (SYN71AZ) $

In SN07, the key of the table is modified to support all the product lines of SPMs by introducing a new field. The tuple format is given below with the new field in bold.

SP 17 0 0 **SPMNA** (CEM17BU) (DLC17BV) (DL217BT) (DSP17BU) $
SP 17 0 0 **SPMIN** (CST17BS) (DLC17BV) (DL217BT) (DSP17BU) $
SN 06 0 0 **MG4AT** (MG419BR) (ATC19BO) (IED19BO) (OC419BN) $
SN 06 0 0 **MG4IP** (MG419BR) (GEM19BN) $
SN 06 0 0 **IWSAT** (IWS19BP) (ATC19BO) (SYN19BN) $
SN 06 0 0 **IWSIP** (IWS19BP) (GEM19BN) $
SN 06 0 1 **DPTAT** (IWS19BP) (ATC19BO) (DSP19BN (COH0019) $
SN 07 0 1 **DPTIP** (IWS20BA) $

52.2.1.2 Introduction of ERROR messages during table control operations

During tuple addition, table control checks for the valid combination of load type and product type that are added. The valid combination of the load type and the product type for any tuple are as follows:

- load type: SP and product type: SPMNA and SPMIN.
- load type: SN and product type: MG4AT, MG4IP, IWSAT, IWSIP, DPTAT and DPTIP.

When a tuple with invalid combination of load type and product type is added in table SPMLDVAL, the following error messages are displayed.

```
ERROR: Cannot datafill MG4AT product type for SP loadtype.
       Only SPMNA or SPMIN are valid for the SP loadtype.
```

```
ERROR: Cannot datafill MG4IP product type for SP loadtype.
       Only SPMNA or SPMIN are valid for the SP loadtype.
```

```
ERROR: Cannot datafill IWSAT product type for SP loadtype.
       Only SPMNA or SPMIN are valid for the SP loadtype.
```

```
ERROR: Cannot datafill IWSIP product type for SP loadtype.
       Only SPMNA or SPMIN are valid for the SP loadtype.
```

```
ERROR: Cannot datafill DPTAT product type for SP loadtype.
       Only SPMNA or SPMIN are valid for the SP loadtype.
```

```
ERROR: Cannot datafill DPTIP product type for SP loadtype.
       Only SPMNA or SPMIN are valid for the SP loadtype.
```

```
ERROR: Cannot datafill SPMNA product type for SN loadtype.
       Only MG4AT or MG4IP or IWSAT or IWSIP or DPTAT
       or DPTIP are valid for the SN loadtype.
```

```
ERROR: Cannot datafill SPMIN product type for SN loadtype.
       Only MG4AT or MG4IP or IWSAT or IWSIP or DPTAT
       or DPTIP are valid for the SN loadtype.
```

52.2.1.3 Increasing the size of the table

The size of this table is also increased from 256 to 2048 tuples to support all the product lines of SPMs.

52.2.1.4 ONP support to the table

In SN06, table SPMLDVAL contains both the INTL and NA DMSCP loads in the same tuple. i.e. One tuple contains CST, CEM, STM and OC3 loads. CEM and OC3 loads are specific to DMSCP NA product whereas CST and STM loads are specific to DMSCP INTL product of SPM.

In SN07, since a new field is introduced to identify the product type of each tuple, such a combination of loads becomes invalid. So, during the transfer of the table SPMLDVAL from release SN06 to SN07, a single tuple with both DMSCP NA and INTL loads is splitted up into two tuples. The product type of the first tuple is written as SPMNA and contains CEM and OC3 loads. On the other hand, the product type of the second tuple is written as SPMIN and contains CST and STM loads.

52.2.2 EXT File in load tape to datafill SPMLDVAL

With the implementation of this feature, every spectrum (both succession and TDM) load release tape shall contain an EXT file with the load lineup information for different spectrum load releases and this EXT file will be used to datafill table SPMLDVAL during Panther execution. As a result of this, table SPMLDVAL contain tuples with the loadtype and the device load lineup of various spectrum load releases. In case of offices with no SPMs, there is no impact to the existing panther upgrade behavior.

The EXT file which contains the device load lineup of all the spectrum load releases shall be available through load tape or ESD at the customer site.

The EXT file for DMSCP class of SPMs, **SPMLDEXT** is already in place. Eight new EXT files for different products of SPMs are introduced. The existing SPMLDEXT file will also be used during an upgrade from SN06 to SN07.

- **SPMNAEXT** for DMSCP - NA
- **SPMINEXT** for DMSCP - INTL
- **MG4ATEXT** for SMG4 - ATM
- **MG4IPEXT** for SMG4 - IP
- **IWSATEXT** for IW - ATM
- **IWSIPEXT** for IW - IP
- **DPTATEXT** for DPT - ATM
- **DPTIPEXT** for DPT - IP

These files have details of spectrum load-lineups of all Nortel supported releases. The sample tuples in table SPMLDVAL for the above eight EXT files respectively are shown below:

SP 17 0 0 **SPMNA** CEM17BU DLC17BV DL217BT DSP17BU $
SP 17 0 0 **SPMIN** CST17BS DLC17BV DL217BT DSP17BU $

The SPMNAEXT and SPMINEXT files shall contain the data starting from load release **SP14.8.1.** The MG4ATEXT, IWSATEXT, IWSIPEXT, DPTATEXT files shall contain the data starting from load release **SN03.1.0** onwards. The MG4IPEXT and DPTIPEXT files shall be empty because these

two products are currently not available. A maximum of 292 tuples are available in each of these EXT files.

52.2.3 Modification in filecopy stage

The filecopy command checks the availability of the EXT file in the distribution volume and first executes the EXT file to datafill table SPMLDVAL and then copies the EXT file from the tape (or any other distribution volume) to the destination volume.

1. In case of customer site, the following warning is displayed if the EXT file is not present.

****** WARNING: EXT file to datafill table SPMLDVAL is not available in the distribution volume. SPMs will not be considered for upgrade. If SPMs are required to be upgraded, quit and start pmupgrade again with the EXT file in the distribution volume. If SPMs are not required to be upgraded, continue filecopy.***

- If SPMs are also required to be upgraded, then the craft can quit filecopy at a later stage and start the filecopy again with the proper EXT file in the distribution volume.
- If the SPMs are not required to be upgraded, then the craft can just continue with the upgrade and no loadmapping shall be done for any of the SPM loads.

Note 1: When the above mentioned warning message is displayed,

- no prompt shall be displayed for any of the SPM current loads,
- the SPM current loads shall not be included in the filecopy report and as a result
- SPMs shall not be included in the plan.

Note 2: *In case of designer Lab, the following prompt is displayed if the EXT file is not present.*

****** WARNING : EXT file to datafill table SPMLDVAL is not available in the distribution volume. Do you want to still consider SPMs for upgrade?***
Please confirm ("YES", "Y", "NO", or "N"):

— *In case the craft enters "Yes" or "Y", SPMs will be upgraded without the EXT file. The same customer site behavior is maintained but the crafts shall have the flexibility of running panther upgrade without checking for the EXT file. This can result in upgradation of SPM*

devices with incorrect loads in a hybrid lab with different product lines of SPM.

— *In case of "No" or "N", SPMs will not be considered for upgrade and the behavior mentioned above in Note 1 shall occur.*

2. If more than one EXT file of the same type is present in the distribution volume, then the following warning message is displayed.

WARNING: Multiple possible replacements found on load distribution volume for <extfile> file: <extfile_ver> <extfile_ver> Any replacement EXT file name may be chosen from the distribution volume. If necessary, consult the PM release documentation or contact the next level of support.

Please enter the replacement file name, Or "Q" (Quit FILECOPY)

If this message is received, the craft needs to enter the correct EXT file name. In case of incorrect file name the following message is displayed.

Response is not one of the allowable options.
Please enter the replacement file name, Or "Q" (Quit FILECOPY)

The above message will be repeated whenever the user enters a wrong response. If the user enters Q, then it will come out of filecopy phase of Panther.

Note: *The extfile in the above WARNING message can be any one of the following: SPMNAEXT, SPMINEXT, MG4ATEXT, MG4IPEXT, IWSATEXT, IWSIPEXT, DPTATEXT and DPTIPEXT.*

3. If the EXT file to be processed is already present in the destination volume, then the following message is displayed.

***** WARNING: <extfile_ver> file already exists in the destination volume.**

Note 1: The extfile in the above WARNING message can be any one of the following: *SPMNAEXT, SPMINEXT, MG4ATEXT, MG4IPEXT, IWSATEXT, IWSIPEXT, DPTATEXT and DPTIPEXT.*

Note 2: All the other existing WARNING messages specific to SPMLDEXT file are applicable for the new EXT files also.

4. During filecopy stage when there is no replacement load in the distribution volume for a particular current load, in SN06, panther prompts the user to enter a new load as follows:

```
*** No replacement found on load distribution volume for DSP17AH load.
Any replsacement load name may be chosen from the load distribution
volume. If necessary, consult the PM release documentation or
contact the next level of support.
Please enter the replacement load name, or "S" (Same), or "Q" (Quit FILECOPY)
>
```

In SN07, the "**replacement load name**" option is removed from the above prompt for all current loads (XPM, SPM, ENET...). This is because panther had already checked for any replacement loadname in the distribution volume and found none and so there is no significance of this option. This prompt shall be modified as follows:

```
*** No replacement found on load distribution volume for DSP17AH load.
If necessary, consult the PM release documentation or contact the next level of support.
Please enter "S" (Same), or "Q" (Quit FILECOPY)
>
```

Note: The loadmapping can also be made using 'SET LOADSELECT' command as follows:

>SET LOADSELECT DSP16AH_010007 DSP17AR_010017

No new restrictions or verifications are done during "SET LOADSELECT" command so that the craft has the flexibility of mapping different loads.

5. Whenever the same current load is present in different product lines of SPMs(NA DMSCP and MG4K ATM) and if there is one EXT file(SPMNAEXT) on the distribution volume, panther shall display, at the most only one prompt for that current load. This prompt is only for the current load for which the EXT file is present. Panther shall not prompt for other product lines of SPMs.

   Also in the filecopy report, the loadmapping is not displayed for all the product lines of SPMs but displayed only for the product for which the EXT file is present. On the other hand, if there were two EXT files (SPMNAEXT and MG4ATEXT) on the distribution volume, panther shall display the prompt twice for the same current load as shown in figure 1 below. If the craft enters DSP17XX for DMSCP NA current load and DSP17YY for MG4K ATM load, then the load file selection report shall be displayed as shown in figure 1 below.

Figure 1 Multiple possible replacement prompt and load file selection report

```
*** Multiple possible replacements found on load distribution
volume for DSP16XX_010025 DMSCP NA load: DSP17XX_010025 DSP17YY_010025

Any replacement load name may be chosen from the load distribution
volume. If necessary, consult the PM release documentation or
contact the next level of support.
Please enter the replacement load name, or "S" (Same), or "Q" (Quit FILECOPY)

*** Multiple possible replacements found on load distribution
volume for DSP16XX_010025 MG4K ATM load: DSP17XX_010025 DSP17YY_010025

Any replacement load name may be chosen from the load distribution
volume. If necessary, consult the PM release documentation or
contact the next level of support.
Please enter the replacement load name, or "S" (Same), or "Q" (Quit FILECOPY)
```

```
                    LOAD FILE SELECTION REPORT
CURRENT LOAD        PM TYPE     FW TYPE     AUTO-SELECTED FILES     EXCLUDED
------------        -------     ------    ----------------------    --------
DSP16XX_010025       SPMNA                   DSP17XX_010025
DSP16XX_010025       MG4AT                   DSP17YY_010025
```

6. At the end of filecopy stage, two reports are generated to display the loadmapping of the current load and the new loads. The format of the two reports are as shown below.

```
                        LOAD FILE SELECTION REPORT
CURRENT LOAD      FW TYPE        AUTO-SELECTED FILES                EXCLUDED
------------      -------        -------------------                --------
DLC17AQ_010016                   Same Load
DSP17AQ_010016                   DSP17AN_010013
```

```
                        LOAD FILE COPY REPORT
CURRENT LOAD      FW TYPE        FILE STATUS   AUTO-SELECTED FILES
------------      -------       -------------  -------------------
DLC17AQ_010016                          S      Same Load
DSP17AQ_010016                        C        DSP17AN_010013
```

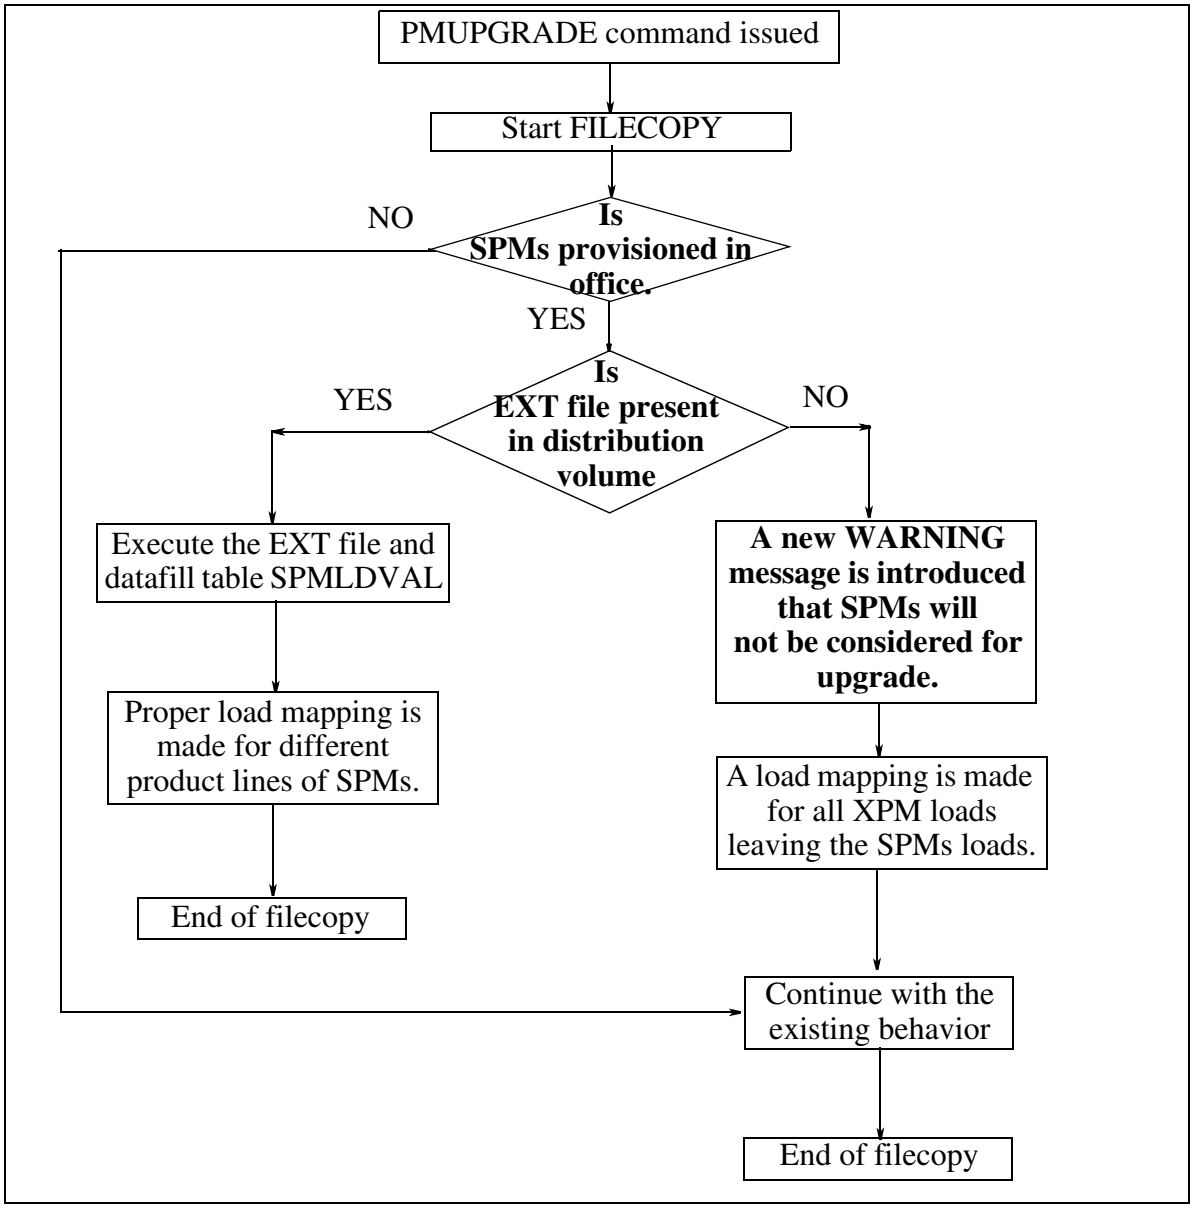
The format of the two reports is changed to display the product type of the corresponding loadmapping as shown below. For SPM loads, this column

shows the SPM variant to which the current load belongs to, whereas for other peripheral loads this column shows None.

```
                    LOAD FILE SELECTION REPORT
CURRENT LOAD       PM TYPE  FW TYPE    AUTO-SELECTED FILES          EXCLUDED
------------       -------  -------    ------------------           --------
DLC17AQ_010016      SPMNA                  Same Load
DSP17AQ_010016      SPMNA                 DSP17AN_010013
DSP17AQ_010016       MG4AT                 Same Load
```

```
                    LOAD FILE COPY REPORT
CURRENT LOAD       PM TYPE  FW TYPE    FILE STATUS      AUTO-SELECTED FILES
------------       -------  -------    -----------      ------------------
DLC17AQ_010016      SPMNA                    S               Same Load
DSP17AQ_010016     SPMNA                     C             DSP17AN_010013
DSP17AQ_010016      MG4AT                    S               Same Load
```

Figure 2 FILECOPY command behavior in customer site



52.2.4 Modification of Planning stage

The planning stage is modified to create tasks based on the SPM product type information of the load mapping. Figure 3 explains the modified panther upgrade planning stage assuming only one load mapping is present during the filecopy stage. A new field called PM TYPE is added in the task to identify the product type of the task. The modification of planning stage is explained below.

Figure 3 Desired behavior of upgrade plan

Suppose there are 8 SPMs in the office as follows.
SPM 1 - DMSCP NA,
SPM 2 - DMSCP INTL,
SPM 3 - SMG4 ATM,
SPM 4 - SMG4 IP,
SPM 5 - IW ATM
SPM 6 - IW IP
SPM 7 - DPT ATM
SPM 8 - DPT IP

Initial Conditions:
The current load of all the DSP RMs(DMSCP+SMG4+IW) is DSP16XX.
The DMSCP NA load tape has DSP71XX load and SPMNAEXT file which is specific to DMSCP NA product line of SPMs.

Action:
DMSCP NA load tape is inserted, which has DSP71XX load and FILECOPY is executed. START PLAN is executed followed by DISPLAY PLAN step.

Filecopy report:

CURRENT LOAD	**PM TYPE**	FW TYPE	FILE STATUS	AUTO-SELECTED FILES
DSP16XX_010032	**SPMNA**		**C**	**DSP71XX_010036**

Plan:

PMUPGRADE PLAN REPORT
Upgrade Layer: 1

TASK 1:
SITE:
LOADS: FROM **DSP16XX_010032** TO **DSP71XX_010036**
NODES: **SPM 1**
PM TYPE: **SPMNA**
REQUIRES: none
LOADED FROM FLASH: NO
AUTOMATED: YES

Result:
The plan is not created for other SPMs though the current load is present in other product lines of SPMs also.

52.2.5 Enhancement of the CI tool - SPMLDINFO

The CI tool SPMLDINFO is used to query the following for the DMSCP class of SPMs only.

- list of device loads for a particular load release,
- spectrum load release name for a given device load and
- list of spectrum load releases running in individual SPMs.

This activity enhances the tool, **'SPMLDINFO'** to support the loads of SMG4 and IW class of SPMs also. There are 3 subcommands for this CI tool which are explained below.

- **Listload:** Displays the device load lineup information for a given spectrum load release name.
- **Listrelease**: Displays the spectrum load release name for a given device loadname.
- **ListspmLoad**: Display the running release load name for the SPMs in the office. Listspmload command has 3 sub-options.
  - — Option '**all**' can be used to list the load release names for all SPMs in the office. If no SPMs are datafilled in the office, then it displays the following warning message and stops execution.
    No SPMs are datafilled in the office.
  - — In the second option, the user can specify a range, say SPM 1 4, in which case, the load release names of all SPMs in the given range is displayed. If an SPM within the specified range is not datafilled, then the following warning message is displayed.
    SPM <spm no> is not datafilled.
  - — If only 1 SPM number is specified, then the command will display the running release load for that SPM. If SPM is datafilled in the office, it displays the datafilled SPM number and relevant data against it. When the entered SPM number is not provisioned, then it displays the following warning message and stops execution.
    SPM No Load Release Name
    ------ ----------------
    SPM <spmno> is not datafilled.

Please refer to Section 13.9 of Configuration Document for more information about the CI tool.

52.2.6 Enhancement of ‘Querypm files’ command

The ‘**Querypm files**’ command displays the running release load name for a DMSCP SPM if the load name is datafilled in table SPMLDVAL. This activity enhances the command ‘Querypm files’ to display the running release load name for SMG4 and IW class of SPMs also. With this enhancement, querypm files displays the name of the running release load of any variant of SPM towards the end of the command output.

In case the running RM loads in an SMG4 or an IW SPM do not match with any of the load release lineups datafilled in table **SPMLDVAL**, then a warning will be displayed to the craftsperson.

Running MG4K ATM Load Release : Load lineup of this SPM does not match with any of the load releases datafilled in table SPMLDVAL.

If the CEMs/RMs of an SPM are out of service such that the running loads in each of the devices cannot be determined, then it will display the following warning message.

Running IWS ATM Load Release : Unable to contact the devices. The requested data cannot be retrieved.

Please refer to section 13.9.6 of Configuration Document for more information about QueryPM files enhancement.

52.2.7 Modification of manual upgrade

52.2.7.1 Loadmod command:

The following WARNING message is displayed in the loadmod command for DMSCP class of SPMs only.

WARNING : Table SPMLDVAL is not datafilled for this loadname. Please add the data in table SPMLDVAL. Do you want to continue without datafilling the table? Please confirm ("YES", "Y", "NO", or "N"):

This activity introduces the above WARNING message in the loadmod and bulkload command for SMG4 & IW/DPT class of SPMs also. The above warning message is displayed when the load file name used for loading is not available in table SPMLDVAL against the product type of the posted SPM.

If the craft enters YES, loadmod shall continue. But the data for this loadname will not be available in table SPMLDVAL for later reference. Entering the data

in table SPMLDVAL is mandatory for information retrieval because SPMLDINFO tool gets the required data from this table. The consequences of going ahead without datafilling the table SPMLDVAL are given below:

- The SPMLDINFO tool will not be able to display the load release information for that particular load.
- The Querypm files command will not be able to display the running release load name for that SPM.

However, there would not be any service impact or impact on the loading process even if the user decides to go ahead with the loading process without datafilling table SPMLDVAL.

If the craft enters NO, loadmod command will be aborted and the craft can issue loadmod command after updating table SPMLDVAL.

52.2.7.2 BULKLOAD command:

When a number of SPMs of different product types are posted and the bulkload command is performed, the load file name used for loading is checked in table SPMLDVAL against the product types of the posted SPMs. Incase the load file is present for some products of SPMs and not present for some other products, then the following warning message is displayed with a prompt:

WARNING : The specified loadname is not datafilled in table SPMLDVAL for the following SPMs:
SPM 1 2 3 4
Contact your next level of support before proceeding with upgrade. Do you want to continue without datafilling the table?
Please confirm ("YES", "Y", "NO", or "N"):

Figure 4 gives the changes in Manual Upgrade procedure for SPM peripheral with the implementation of this feature.

53: Functional Description (FN): A00002765

53.1 Feature name

XLAGRP Refinements for Coin Station-Paid Routing

53.2 Description

This feature enhances the Unbundling Translations and Routing functionality by adding the ability to refine the XLAGRP based upon the calling service class and the billing method. With this feature, outgoing translations can now be applied specifically to a coin station-paid call.

The implementation of this feature allows the full range of calling service class and billing methods to be utilized in XLAGRP refinements. New table XLACLASS allows XLAGRP refinements based on a range including coin, station, hotel, and restricted. New table XLABILL allows XLAGRP refinements based on a range including paid, collect, third, cards, special calling, special called.

53.2.1 Background

In TOP09, AF7159 introduced the XLAGRP refinement mechanism for unbundling translations and routing. It created tables XLAGRP, XLASPID, XLAODIGS, and TOPSDP to setup the refinement structure including SPID[1] and originating digits.

Translations Group (XLAGRP) names are datafilled in table XLAGRP, which allows the operating company the ability to datafill various names to represent groupings for translation purposes as needed. These XLAGRP names are then used in the refinement tables to arrive at a final XLAGRP to be used in table TOPSDP (TOPS Dial Plan).

Table TOPSDP centralizes translation and screening attributes. The index into table TOPSDP is chosen in a flexible manner, giving the operating company the ability to fit their individual network needs. Obtaining an XLAGRP and indexing into table TOPSDP is referred to as the ***XLAGRP*** method of performing translations and screening for TOPS calls.

AF7159 provided an initial XLAGRP to be defined in table TOPSTOPT, which is indexed based on a trunk group. It also provided XLAGRP refinements for SPID and originating digits.

[1]Serivice Provider Identification

In TOP12, A59006822 enhanced the XLAGRP method with additional definitions for the initial XLAGRP and additional refinements. It allowed the initial XLAGRP to be defined in table TOPEATRK for EA calls and in table OPRINFO for operator calls. It also provided XLAGRP refinements for Carrier Identification Code (CIC) and EA region, which is based on either a LATA or a ZONE as defined by feature 59006827.

This feature supports all existing XLAGRP methods and enhances the refinement characteristics by adding calling service class and billing methods.

53.2.2 New XLAGRP Refinement Order

To preserve the existing XLAGRP refinement datafill, the new refinements are added at the end of the existing order list for non-EA calls. Thus XLACLASS then XLABILL will refine after XLAODIGS. For EA calls, XLACLASS and XLABILL will refine after XLAODIGS as well. Although this inserts the new refinement tables in the middle of refinement for EA calls, it saves the extra datafill needed in XLACLASS and XLABILL to accomodate those XLACIC and XLAEAREG XLAGRPs.

The following diagrams illustrate the existing XLAGRP refinement order with the new tables, XLACLASS and XLABILL, included.

The figures below outline the refinement order for both EA and NON-EA calls:

Figure 1 XLAGRP Refinement Order NON Equal Access

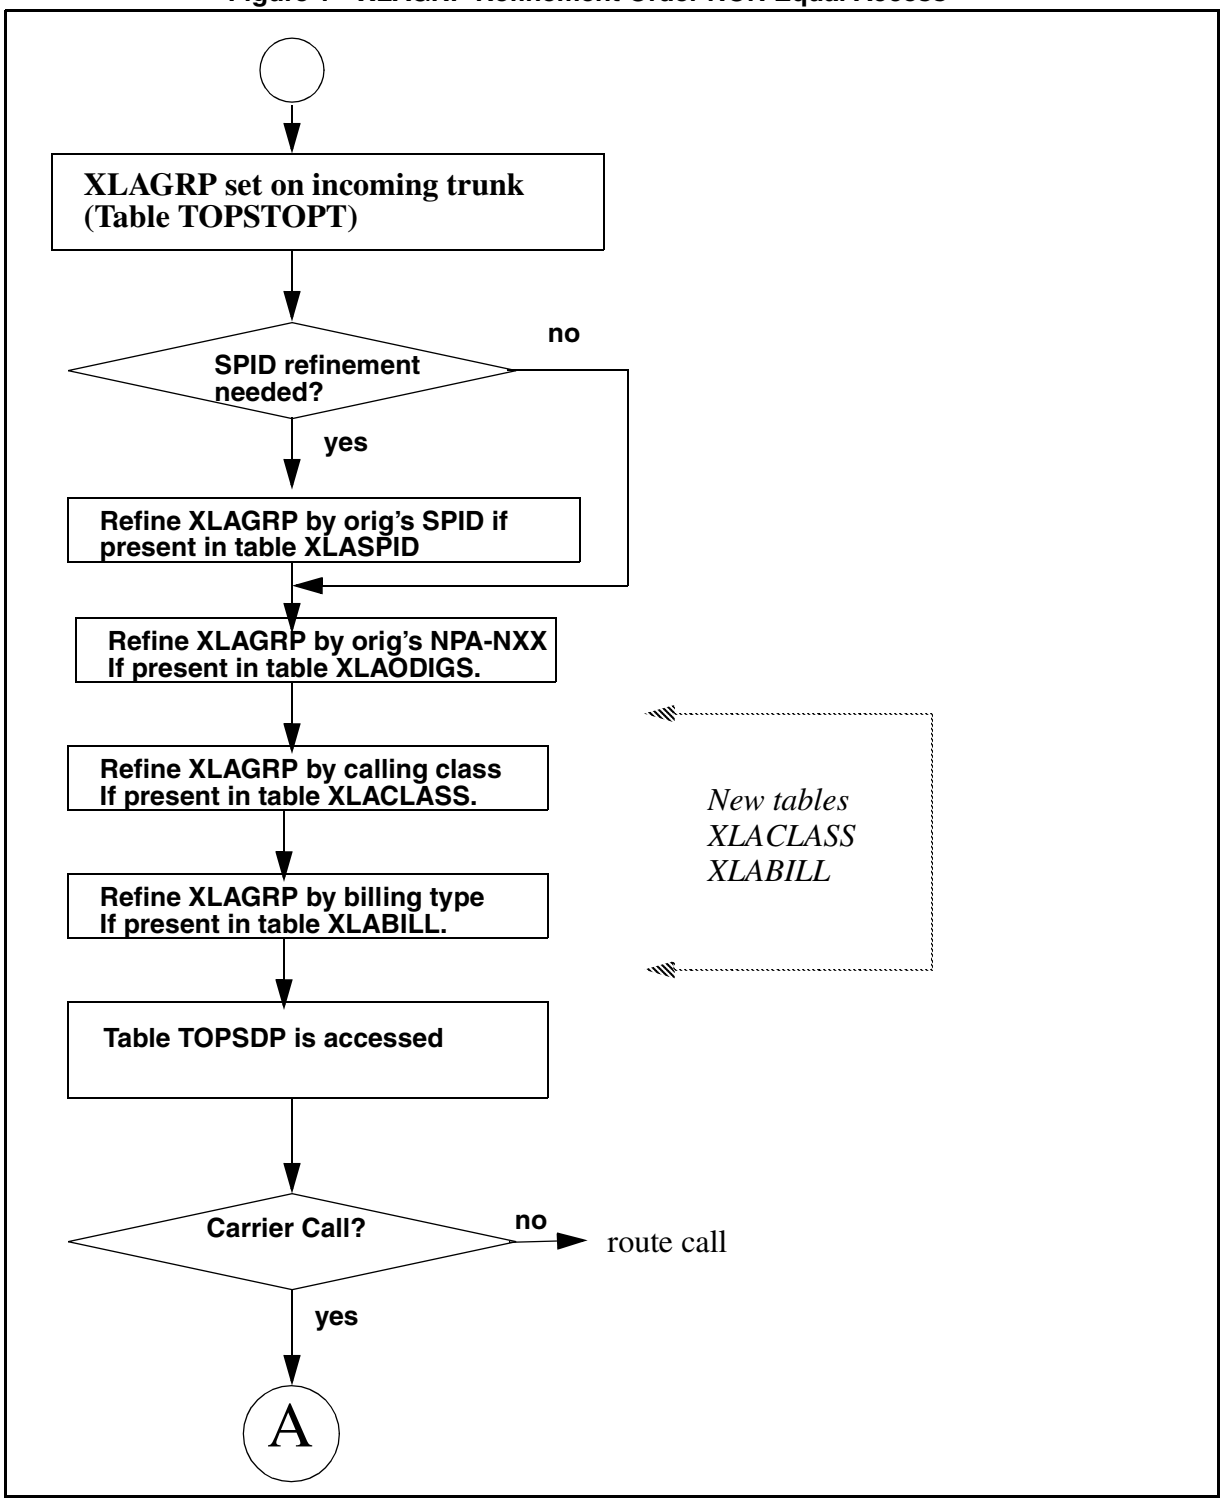

Figure 2 XLAGRP Refinement Order For Equal Acess Calls

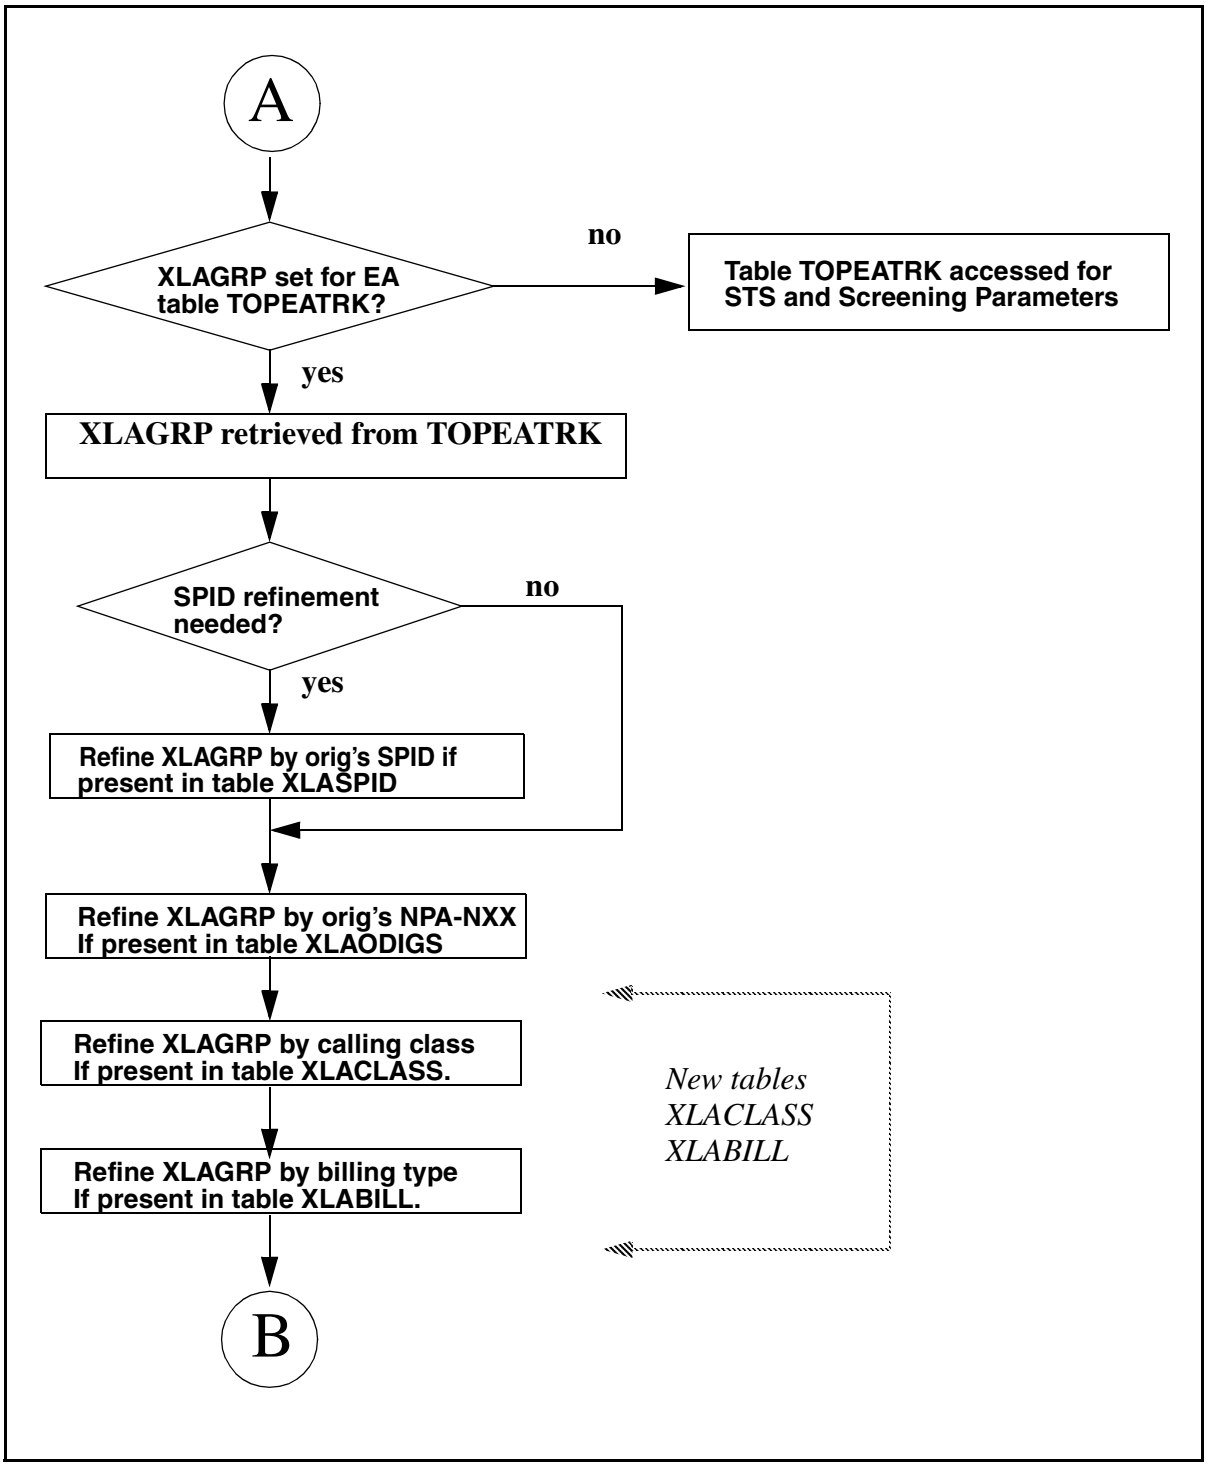

Figure 3 XLAGRP Refinement Order For Equal Acess Calls

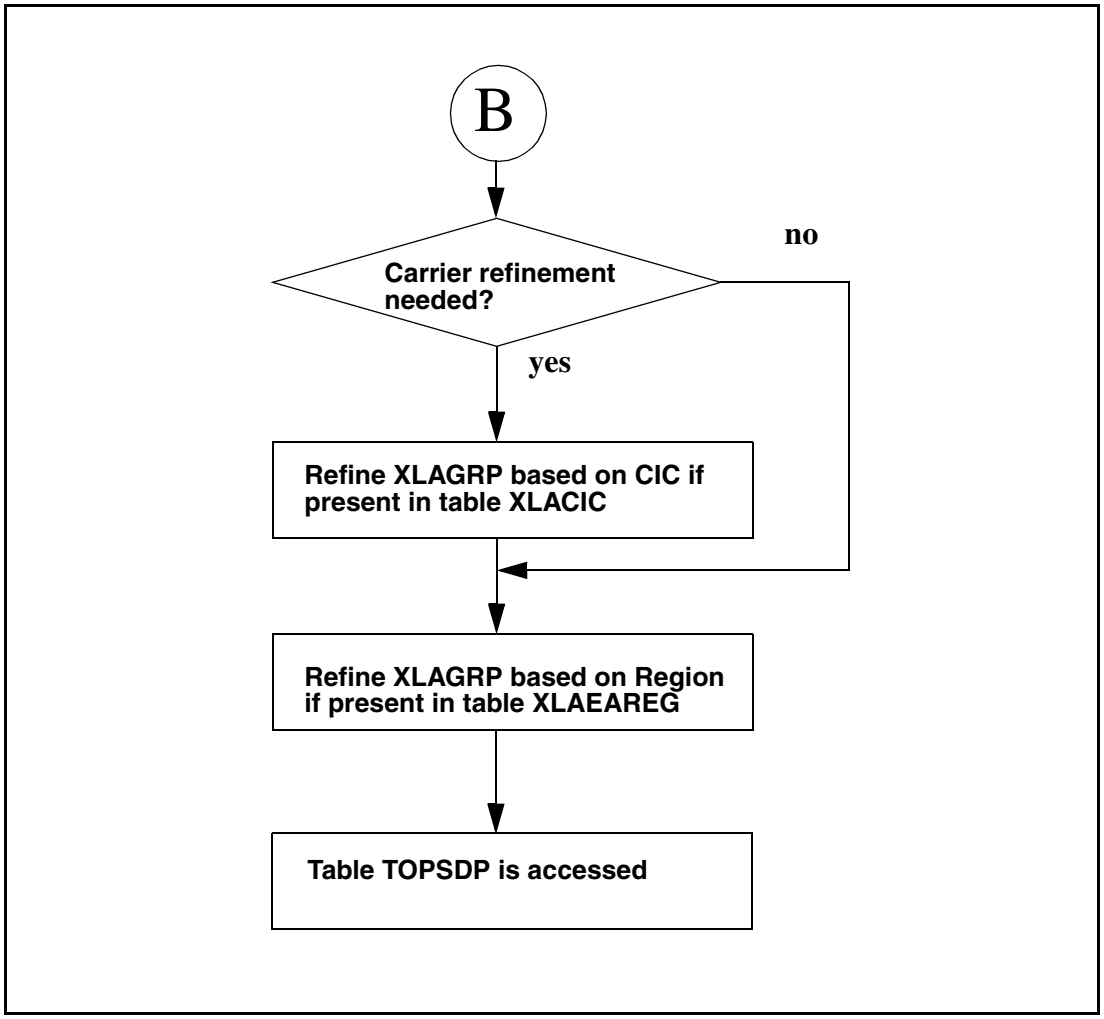

53.2.3 Table XLACLASS

Table XLACLASS allows the XLAGRP to be refined based upon the calling service class. The index of the table is the existing XLAGRP and the calling service class. It then provides a new XLAGRP if a match is found.

Table 3 Example of Table XLACLASS

XLAGRP	CLGCLASS	NEWXLGRP
TRK1	COIN	TRK1COIN
TRK1	STATION	TRK1STA

The XLAGRP names in fields XLAGRP and NEWXLAGRP must first be datafilled in table XLAGRP.

Field CLGCLASS supports a range of {UNKNOWN, STATION, COIN, HOTEL, RESTRICTED}.

53.2.4 Table XLABILL

Table XLABILL allows the XLAGRP to be refined based upon the billing type. The index of the table is the existing XLAGRP and the bill type. It then provides a new XLAGRP if a match is found.

Table 4 Example of Table XLABILL

XLAGRP	BILLTYPE	NEWXLGRP
TRK1COIN	PAID	TRK1COINPAID_ROUTE
TRK1COIN	COLLECT	TRK1COIN_NOROUTE

The XLAGRP names in fields XLAGRP and NEWXLAGRP must first be datafilled in table XLAGRP.

Field BILLTYPE supports a range of {UNSPEC, PAID, COLLECT, THIRD, CCARD, SPLCLG, SPLCLD}.

Note: Station paid and person paid are both handled by the PAID criteria. Both are PAID calls but may have a different rate applied. Since this refinement is to capture the billing method not the rate, station and person ratings are treated the same. This applies to all billing types.

53.2.5 Table Flow Example

This example section illustrates the new refinement tables and how they achieve special routing for coin station paid calls. It is simplified by using an incoming trunk group with non-EA calls. A59006822 fully details XLAGRP methods for EA and operator calls. It is further simplified by not having SPID or originating digit refinements. These are fully documented in AF7159.

Table 1 TOPSTOPT

GRPKEY	ACDDATA	DISPCLG	ADASERV	ADASANS	ANITOCLI	OLNSQRY	DCIBIDX	LNPCLGAM	XLA SCHEM		SPIDPRC	TRKSPID	
									NEWXLA	XLAGRP		DFLTSPID	SPID
TRK1	QMSCAM	N	NONE	NA	N	NONE	0	N	Y	**TRK1**	N	N	

Table 2 XLASPID does not have a match

Table 3 XLAODIGS does not have a match

Table 4 XLACLASS

XLAGRP	CLGCLASS	NEWXLGRP
TRK1	COIN	TRK1COIN
TRK1	STATION	TRK1STA

Table 5 XLACLASS

XLAGRP	CLGCLASS	NEWXLGRP
TRK1COIN	PAID	TRK1COINPAID_ROUTE
TRK1COIN	COLLECT	TRK1COIN_NOROUTE

Table 6 TOPSDP

XLAGRP	STS	OPERPRTN	ORIGSCRN	OPERSCRN	MCCSPRTN	MCCSSCRN	LCANAME
TRK1	619	PRTNM1	SCR1	OPR1	PRTNM1	MCCS1	LCA00001
TRK1COINPAID_ROUTE	619	PRTNM1	SCR1	OPR1	PRTNM1	MCCS1	LCA00001
TRK1COIN_NOROUTE	619	NPRT	NSCR	NSCR	NPRT	NSCR	NLCA
TRK1COIN	619	NPRT	NSCR	NSCR	NPRT	NSCR	NLCA

- STS - This is the service translations scheme which is also the index into code translations (i.e., Table HNPACONT).
- OPERPRTN - This is the operator pretranslator name that is used for performing pretranslations from the operator position. It is used to index into Table STDPRTCT.
- ORIGSCRN - This is the class of service screening name that is used for screening based upon the location of the originator. It is used to index into Table CLSVSCRC.
- OPERSCRN - This is the class of service screening name that is used for screening when an operator or service node is associated with the call. It is also used to index into Table CLSVSCRC.
- MCCSPRTN - This is the pretranslator name that is used for performing pretranslations for the Mechanized Calling Card Service (MCCS) sequence calls. It is used to index into Table STDPRTCT.
- MCCSSCRN - This is the class of service screening name that is used for screening when performing the call screening for Mechanized Calling Card Service (MCCS) sequence calls. It is used to index into Table CLSVSCRC.
- LCANAME - This is the local call area screening name which is used to determine if the call is local. It is used to index into table LCASCRCN or LCAINFO.

For non-EA COIN PAID calls arriving on TRK1, the initial XLAGRP is determined from table TOPSTOPT and refinements are performed as follows. The current XLAGRP is noted after the arrow.

1. Table TOPSTOPT provides the initial XLAGRP name

----> TRK1

2. SPID refinements are not needed, no change

3. Originating digits are not found in XLAODIGS, no change

4. Table XLACLASS finds TRK1 COIN, changes XLAGRP

---> TRK1COIN

5. Table XLABILL finds TRK1COIN PAID, changes XLAGRP

----> TRK1COINPAID_ROUTE

The final XLAGRP for this non-EA COIN PAID call is TRK1COINPAID_ROUTE. This XLAGRP is indexed in table TOPSDP to find the screening and translations indices.

Note: In this example, if the coin call was billed collect then the final XLAGRP would have been TRK1COIN_NOROUTE which can be setup in table TOPSDP to have screening and translations indices which do not route or route to treatment. Also note that the XLAGRP, TRK1COIN, can be added to TOPSDP and be setup for indices which do not route. This ability limits the amount of datafill needed to only allow coin paid calls to complete. Thus, the refinement TRK1COIN COLLECT in XLABILL is not needed nor the TRK1COIN_NOROUTE XLAGRP. These were only included here to illustrate the options.

53.2.6 Activation

When activating feature A00002765 in a site where XLAGRPs are already in use, the following is recommended.

- For a new trunk group to begin using the XLAGRP translations and is not dependent on existing translations, a new XLAGRP name should be assigned to the trunk group and the new XLAGRP used in the refinement tables as needed. This has no interaction with existing translations since existing XLAGRPs will not find matches in the new tables.
- For an existing trunk group with XLAGRP translations (or a new trunk group which will use existing XLAGRP translations), it is recommended to work backwards in the refinement order. By adding the final XLAGRP first, no matches will be found until the first refinement using the existing XLAGRP is datafilled. For example, if TRK1 has XLA1 defined in TOPSTOPT and has existing translations for SPID where (XLA1 SPID XLA1SPID) is datafilled in table XLASPID, then to create a coin station_paid route for these calls, first add new XLAGRPs (XLA1SPIDCOIN and XLA1SPIDCOINPAID) to table XLAGRP then add to table XLABILL (XLA1SPIDCOIN PAID XLA1SPIDCOINPAID) [so far no changes will occur]. Then add to table XLACLASS (XLA1SPID COIN XLA1SPIDCOIN) - [once this is added coin station_paid calls will route using XLA1SPIDCOINPAID].

  Note: Ensure all XLAGRPs have datafill in table TOPSDP; be sure that XLA1SPIDCOIN can still route correctly. These are the calls which are coin but not paid for that trunk group with that SPID. TOPSDP will need

to point to something that goes to treatment (if desired) otherwise they will route to the last route found in standard translations.

53.3 Hardware Requirements or Dependencies

NA

53.4 Software Requirements or Dependencies

UNBN0101, OSB00101

53.5 Limitations and restrictions

- XLACLASS is limited to a range containing UNKNOWN, STATION, COIN, HOTEL, RESTRICTED.
- XLABILL is limited to a range including UNSPEC, PAID, COLLECT, THIRD, CCARD, SPLCLG, SPLCLD.
- Station billing and person billing may have different rates but are both treated the same in table XLABILL. For example, station paid and person paid will both refine under the PAID criteria.
- This feature is intended to be used with the dollar pre-pay coin functionality. Limitations for this function include:
  - — External rater not support with OSSAIN
  - — External rater, Coin signalling, ACTS not supported in Global loads

53.6 Interactions

This feature can alter the translations and route selected for calls using the XLAGRP method.

54: Functional Description (FN): A00002766

54.1 Feature name

Add Extension Registers for Billing OM's

54.2 Description

54.2.1 AMA OMs

The ATTAMA OM group now has the maximum limit of 32 registers. Another group will be created to contain the extra extension registers. Only the extension registers for AMANS and AMUNANS will reside in the new ATTAMA2 OM group. The maximum register value for this group is now 32767 before it resets to 0. The extension register will allow capturing the number counter rollovers.

The new extension functionality will be implemented under SOC control. This will allow for controlled customer implementation and also provide the ability to disable the new extension if required.

The following shows the existing ATTAMA group along with the new ATTAMA2 group.

```
ATTAMA

54.8 Glossary

Term	Description

55: Functional Description (FN): A00002822

55.1 Feature name

User Interface Manager for CBM

55.2 Description

The User Interface Manager provides a user interface for local CBM maintenance, administration and system monitoring. The UI consolidate all of the primary maintenance operations under a single unified program which resembles the CM MAP interface.

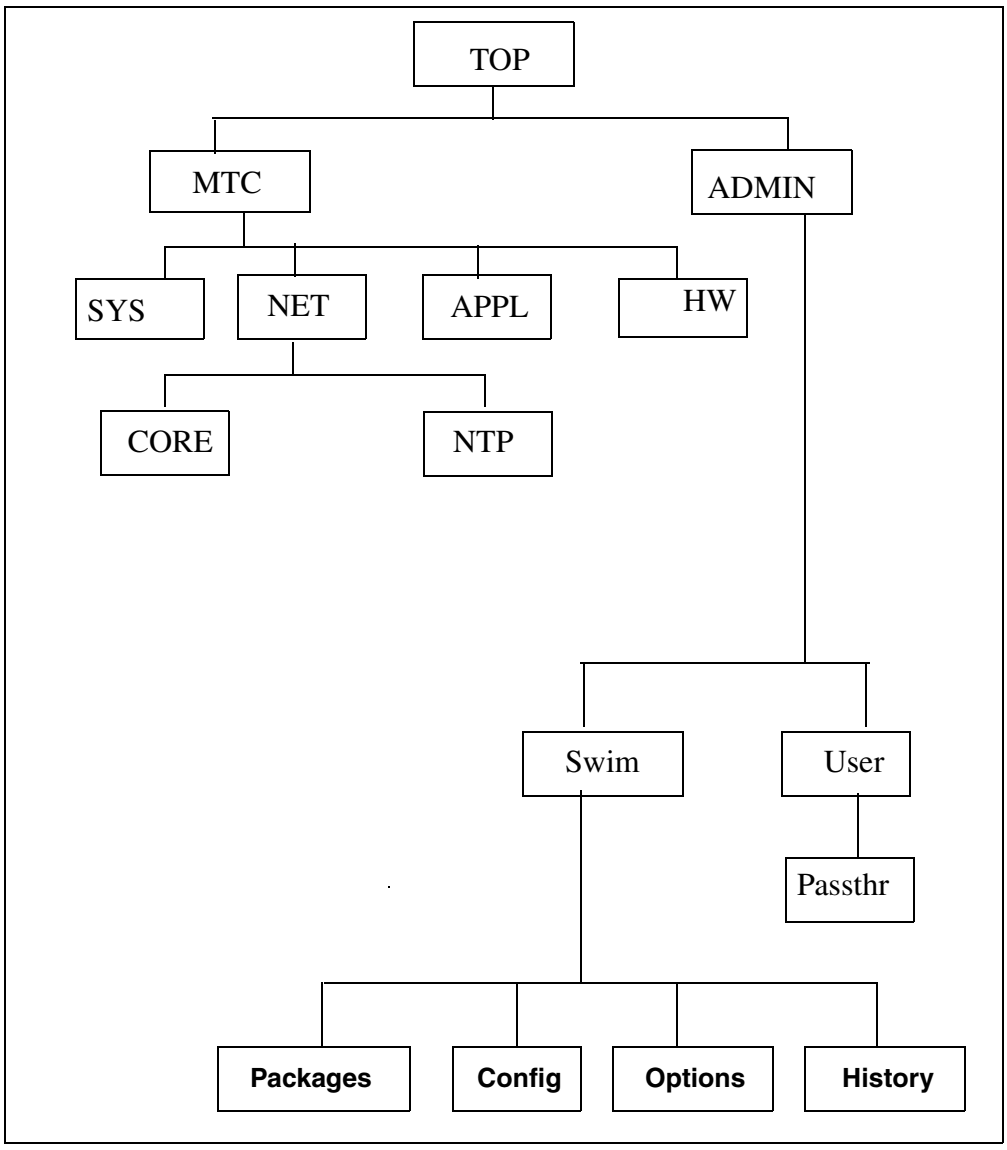
The operations that can be accessed through the UI are divided into two categories; maintenance and system administration. Maintenance provides access and control over the CBM application software. System administration functions include CBM configuration, package installation/removal.

The UI provides input and output to a human operator. When a user selects an operation in the UI, a function contained in the appropriate maintenance subsystem is invoked.

The UI is organized into a system of screens. The screens are organized in a hierarchy, and each screen represents a functional area.

The UI functional structure is shown in Figure 1 below. This is the intended view for CSEN07 (CBM) and is subject to changes as the product evolves.

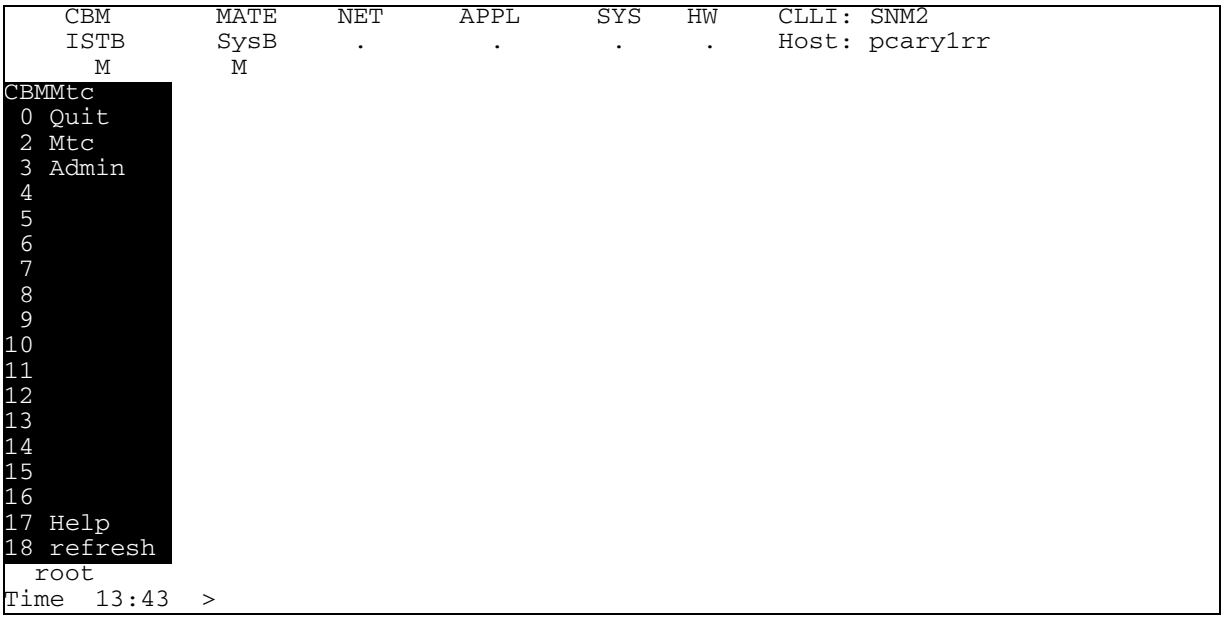
Figure 1 UI functional structure.



55.3 Functionality

The CBM screens are not identical to the MAP screens, but they retain the basic structure and input/output mechanisms as the MAP. Each CBM screen is divided into five areas: alarm banner, command list, output, clock, and input. A typical CBM screen is shown in figure 2.

Figure 2 CBM Main Level Display



55.3.1 Alarm Banner

The top area (referred as I in fig. 2)contains the current screen title and the CBM alarm banner. The alarm banner indicates the node state for the CBM and the state of the major CBM components.This area is updated dynamically, and appears on every CBM screen.

55.3.2 Command List

The area on the left is the CBM command menu(referred as II in fig. 2). Commands available at the current level are listed in MAP style and the current level is displayed at the top of the list.

55.3.3 Output

The area on the right is the RMI output window(referred as III in fig. 2). The information in this window can be either static or dynamic.

55.3.4 Clock

The CBM clock and current userid are displayed at the bottom left of the screen(referred as IV in fig. 2). The clock is updated dynamically.

55.3.5 Input

The single line at the bottom right of the screen is used for CBM input(referred as V in fig. 2).

55.3.6 Commands Available at ‘All’ Levels

The following commands are generally available at each level. The use of and output from these commands is essentially the same. They are:

1. Quit: Quits the current level and moves back to the previous one. You may specify the option ALL in order to exit the CBM from any level.
2. Help: Obtains help specific to the current level. If information on a specific command is desired you may type the command name as an option to get information pertaining to that specific command.
3. Refresh: If the screen display is corrupted, use refresh to force a redraw of the screen.

These commands will not be listed in the screen command descriptions later in this document.

55.3.7 CBM Main Level

The main menu breaks all functions into either the maintenance category, or the system administration category. Additional categories may be added in the future as needed.

There is no default output for this level other than the main banner.

Commands:

1. Mtc: Displays the SDM Maintenance Level.(position 2 in fig. 3)
2. Admin: Displays the SDM System Administration Level.(position 3 in fig. 3)

Figure 3 CBM Main Level Display

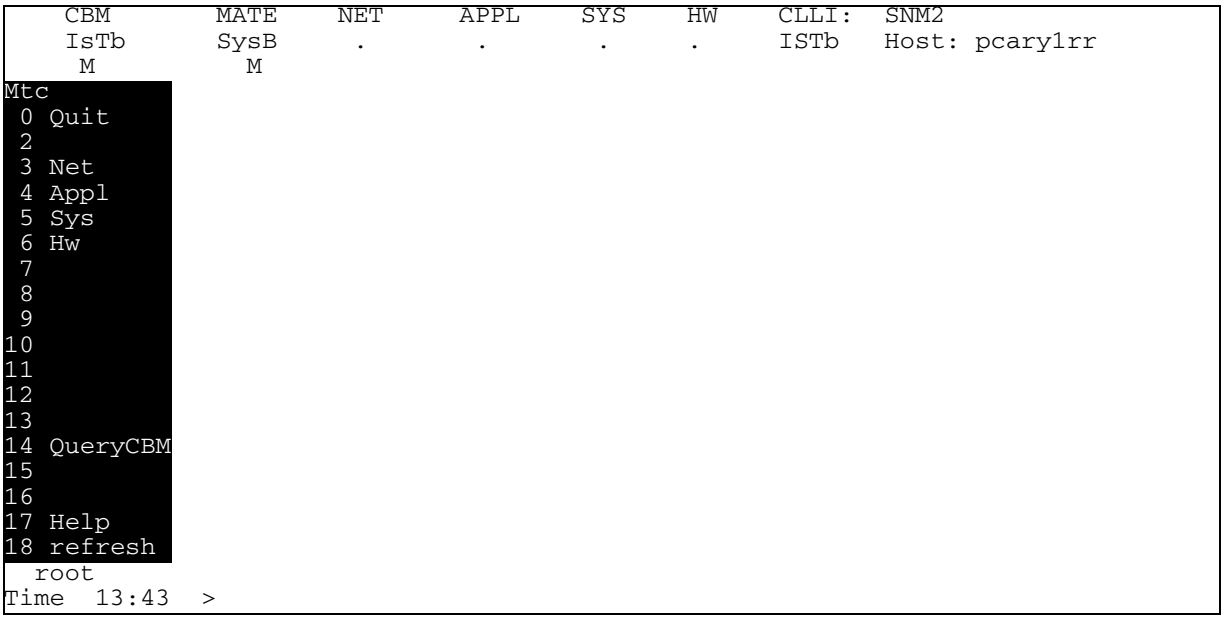
55.3.8 CBM Maintenance Level:

The maintenance level is the highest level for maintenance related commands.

Commands:

1. Net: Displays the LAN Connectivity Level.(position 3 in fig. 4)
2. Appl: Displays the Software Application Status Level.(position 4 in fig.4)
3. Sys: Displays the operating system s/w status level.(position 5 in fig.4)
4. Hw: Displays the Hardware Status Level.(position 6 in fig. 4)

Figure 4 CBM Maintenance Level Display



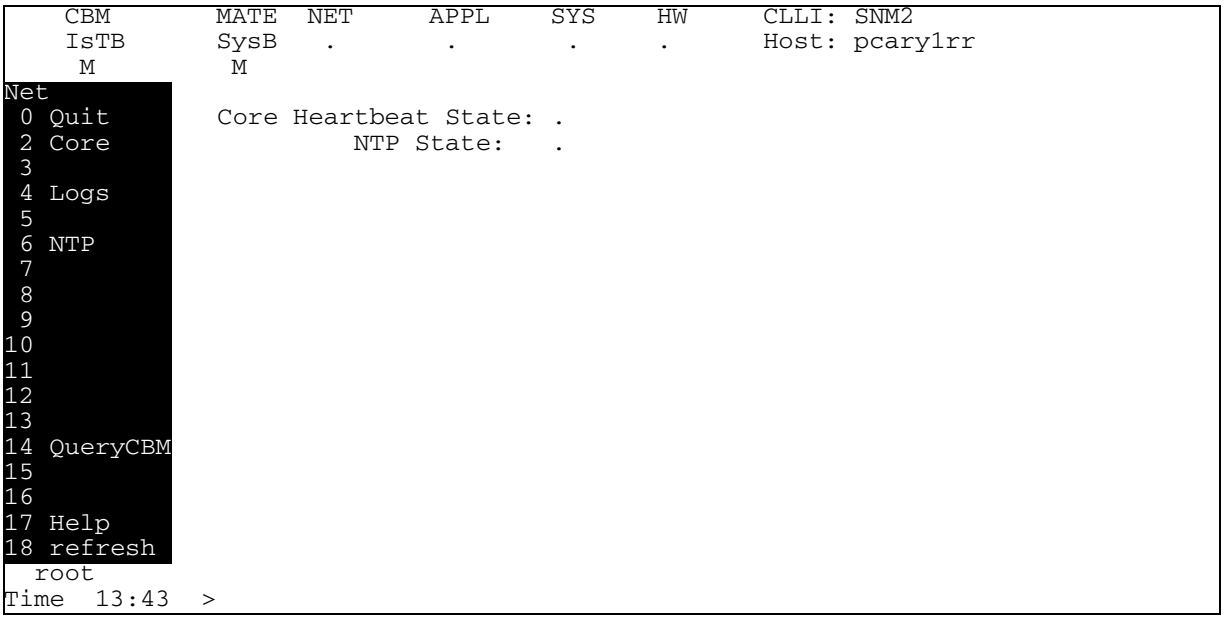
55.3.8.1 Net Connectivity Level

The net level shows the status indicator for the core heartbeat and NTP state.The status indicators displayed at this level are updated dynamically.

Commands:

1. Core: Go to core level (position 2 in fig. 7)
2. NTP: Go to the NTP level.(position 5 in fig. 7)

Figure 5 CBM Net Connectivity Level



55.3.8.1.1 Core Level

The Core level shows the communication paths to the Core and it also monitors the state of that communication. Figure 6 and 7 shows the display for the Ethernet connected cbm's and the OC3 connected cbm's respectively. The command line equivalents of the command are shown in Table 1

Commands:

1. Add: Add a communication path to the Core.
2. Change: Change the values for the given communication path to the Core.
3. Delete: Delete the given communication path to the Core.

Table 1 Core screen command line equivalents

UI Command	Command line equivalents
Add	No command line equivalents
Change	No command line equivalents
Delete	No command line equivalents

Figure 6 CBM Core Level(Ethernet Connected)

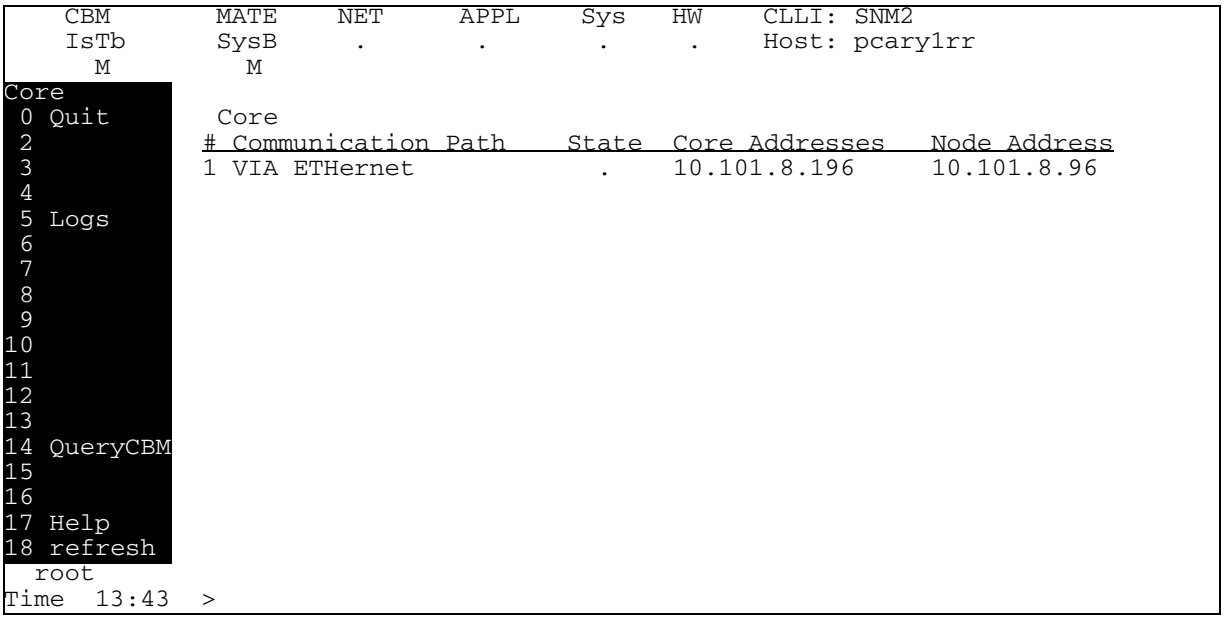


Figure 7 CBM Core Level (OC3 Connected)

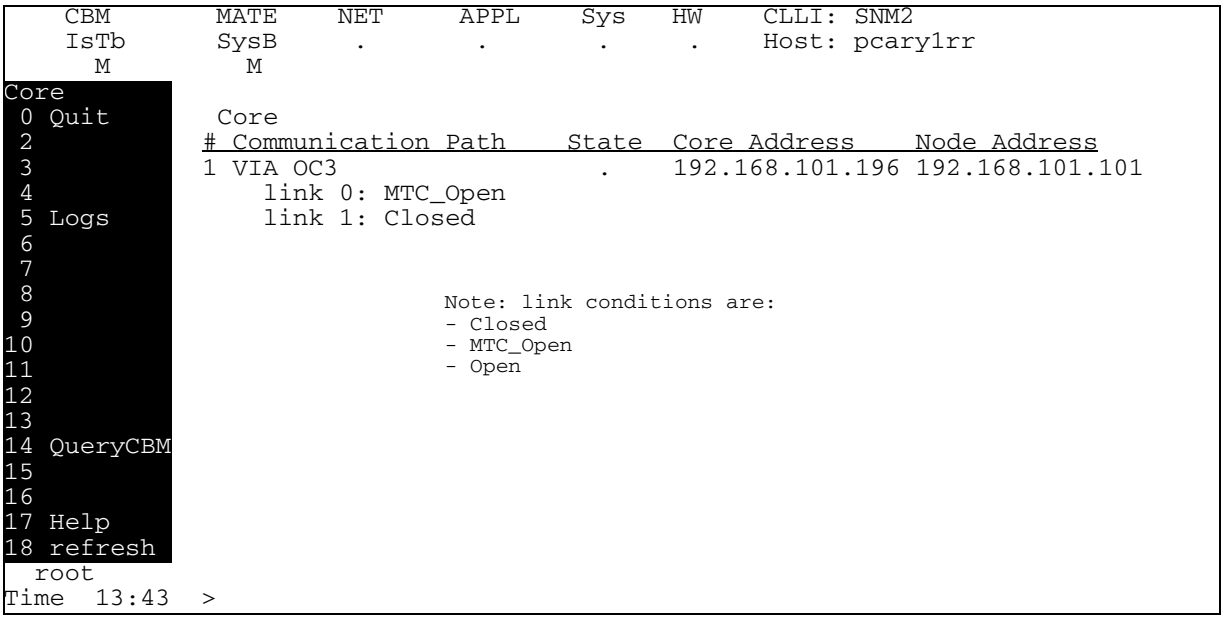
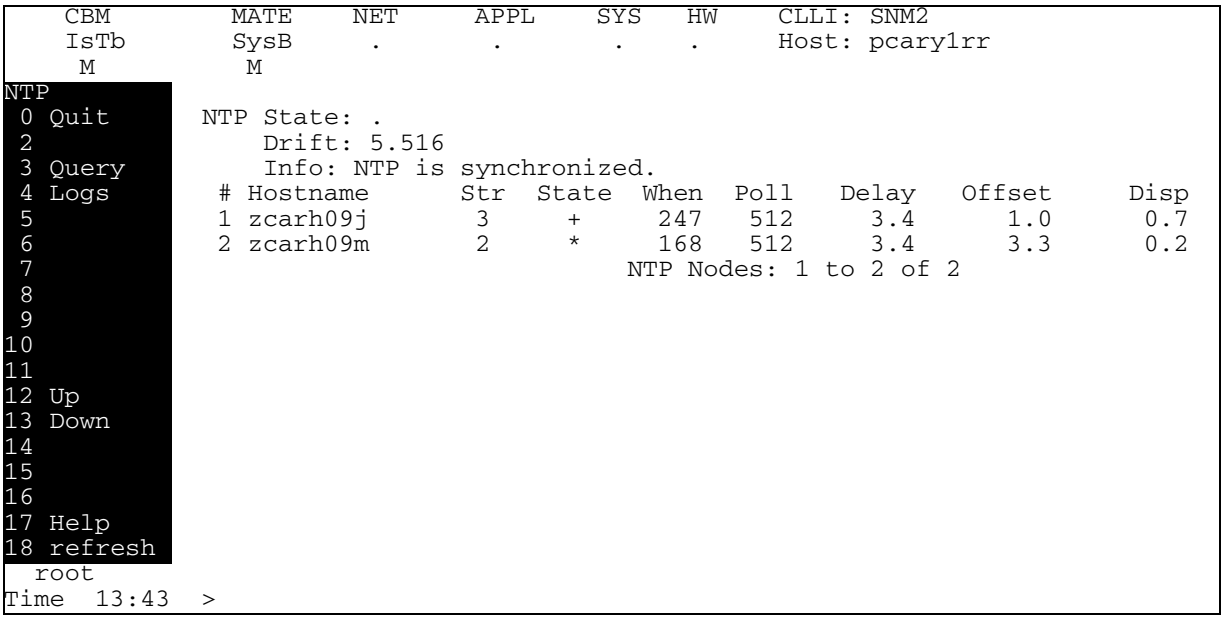


55.3.8.1.2 NTP Level

The NTP level will synchronize the system clock. This level allows you to configure NTP daemon to synchronize the system clock with the NTP server(s)/peer(s). There are no command line equivalents commands for the NTP level.

Figure 8 CBM NTP Level



55.3.8.2 CBM Software Application Status Level

The Software Application Status Level shows the application status indicators.For each installed application, this level shows the application description and the current state. Application control is available on each of the installed application.

The status indicators displayed at this level are updated dynamically.

Commands:

1. Logs: Display application status logs.(postion 4 in fig. 9)
2. Bsy: Issues a busy command to the application. Busying an application will run the stop script for that application, and will shutdown all associated processes(position 7 in fig. 9).The parameter for this command is the application number (far left) or the GROUP keyword, which changes the overall state to ManB. Application that are Offline remain offline. The output for this command is displayed beneath the dynamic information. (e.g. bsy 2)

3. RTS: Issues a Return To Service command to the application. Returning an application to service will run the data reformat script for that application, and will initiate all processes associated with that application.(position 8 in fig. 9).The parameter for this command is the application number (far left) or the GROUP keyword, which changes the overall state to InSv(In Service).The InSv state is represented by a dot ".". The output for this command is displayed beneath the dynamic information.
4. OffL: Issues an Offline command to the application.(postion 9 in fig 9)The parameter for this command is the application number (far left) or the GROUP keyword, which changes the overall state to Offline. The applications themselves become ManB, and applications that are Offline remain Offline.The output for this command is displayed beneath the dynamic information in fig. 9).

55.3.8.3 CBM System Level

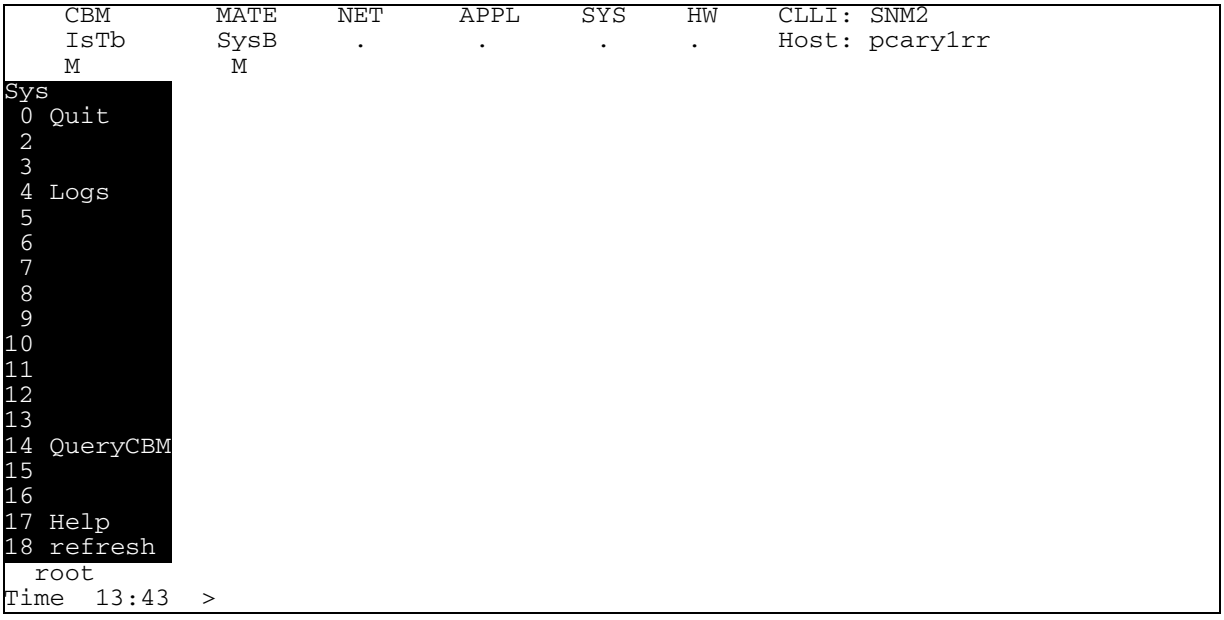
The CBM system level shows the status of operation system software parameters.

Commands:

Logs : Display the last events reported

QUERYCBM <flt, flt mate , status > : Commands are invoked as shown in Table 2.

Figure 10 CBM SYS Level



55.3.8.4 CBM Hardware Status Level.

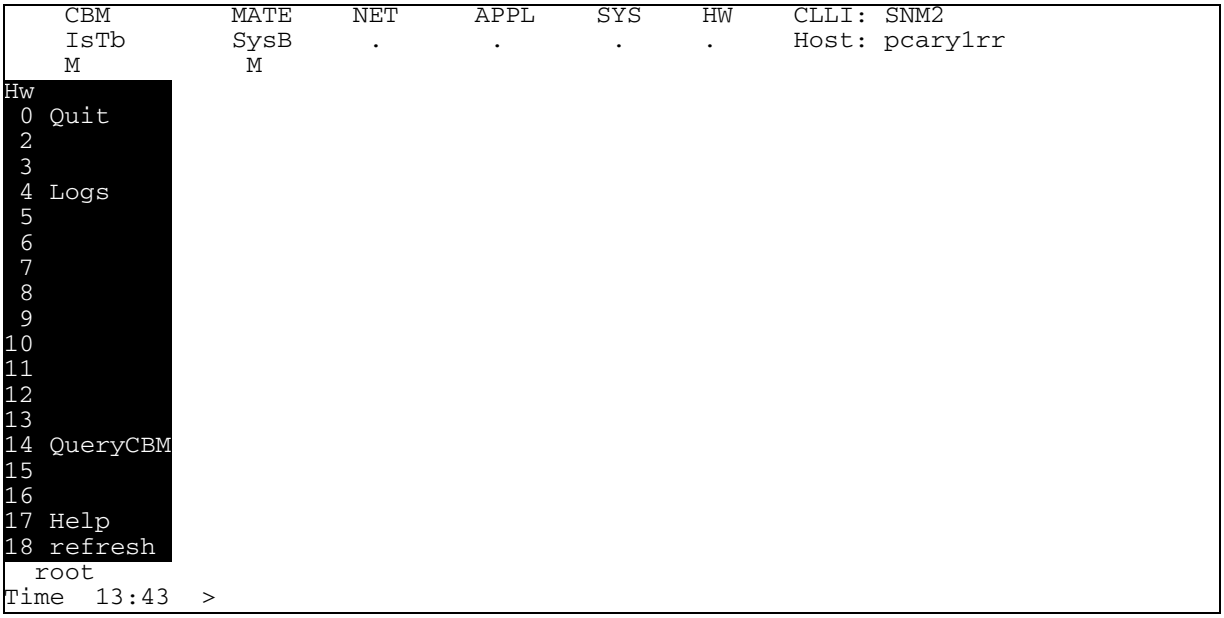
The CBM hardware status level shows the hardware status indicators.The status indicators displayed at this level are updated dynamically.

Commands:

Logs: Displays the last event reported .

QueryCBM < flt, flt mate, status >: Commands are invoked as shown in Table 1

Figure 11 CBM Hardware Level



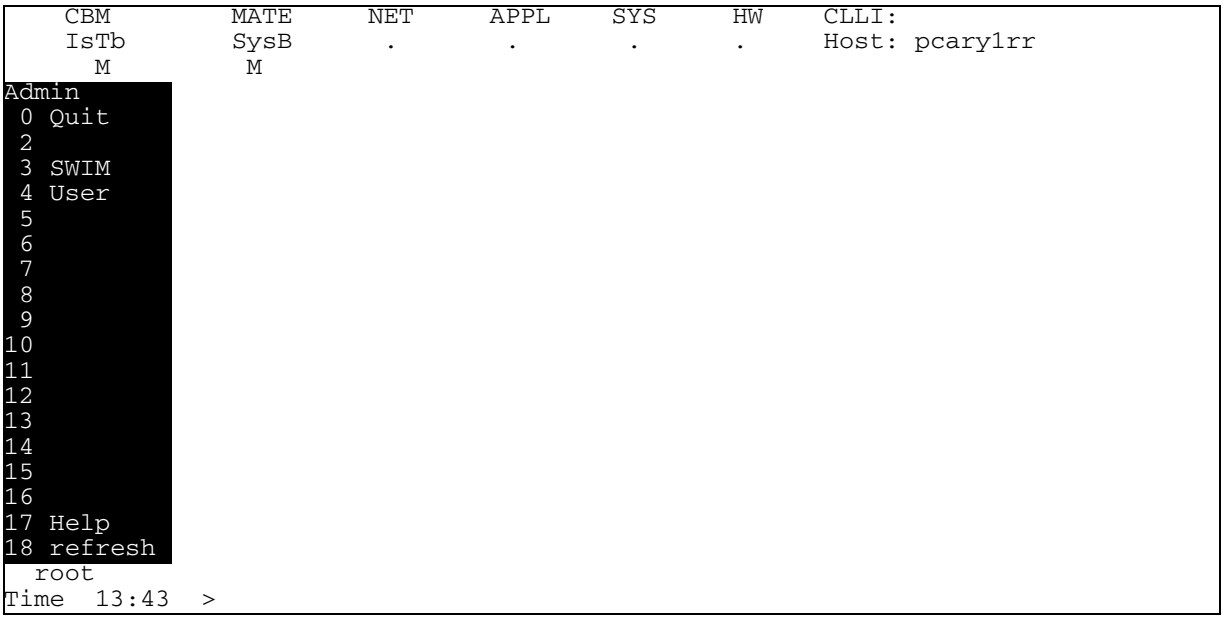
55.3.9 CBM Administration Level

The Admin level is the highest level for system administration commands. The commands available under system administration are dependent on the user id. The root user has full access to all commands. The maint class users are given only a subset of the system administration commands.

Commands:

1. Users: Enter the user administration level.(postion 4 in fig. 10)
2. SWIM: Enter the software inventory management level.(postion 3 in fig. 10)

Figure 12 CBM Admin Level



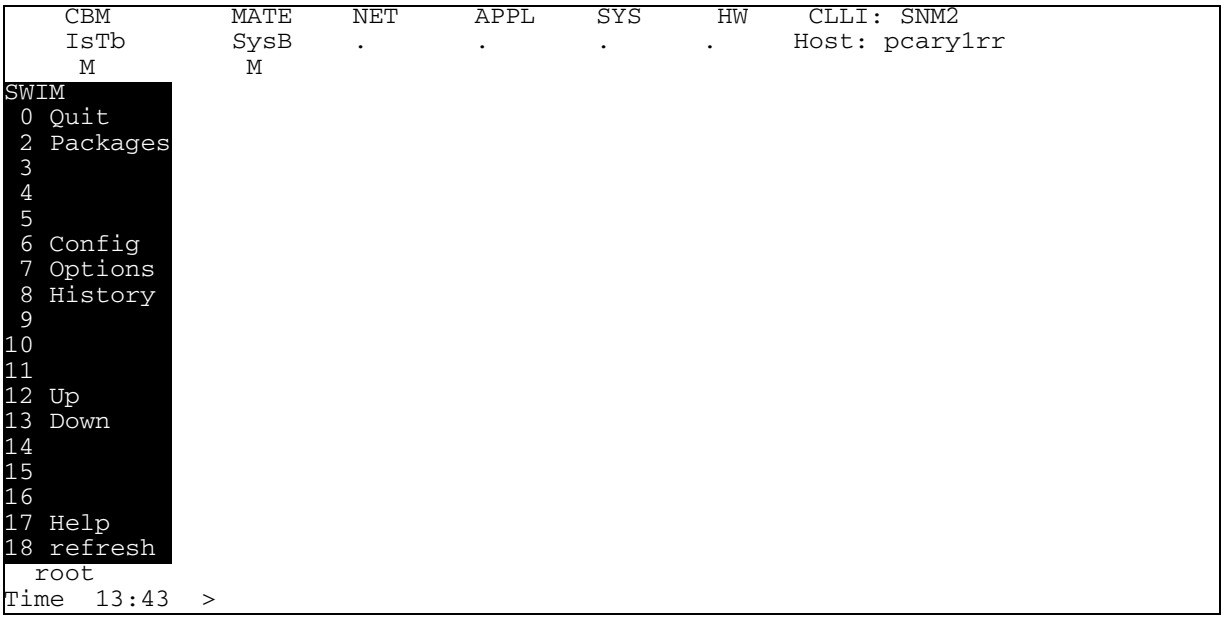
55.3.9.1 SWIM

The swim level of the CBM provides software inventory management.The SWIM level interface will show the product level information and the application status information.

Commands:

1. Packages: Enter the software packages level(position 2 in fig. 13).
2. Config: Enter the software configuration level(position 6 in fig. 13).
3. Options: Enter the options level(position 7 in fig. 13).
4. History: Enter the software history level(postion 8 in fig. 13).

Figure 13 CBM SWIM Level



55.3.9.1.1 SWIM Packages Level

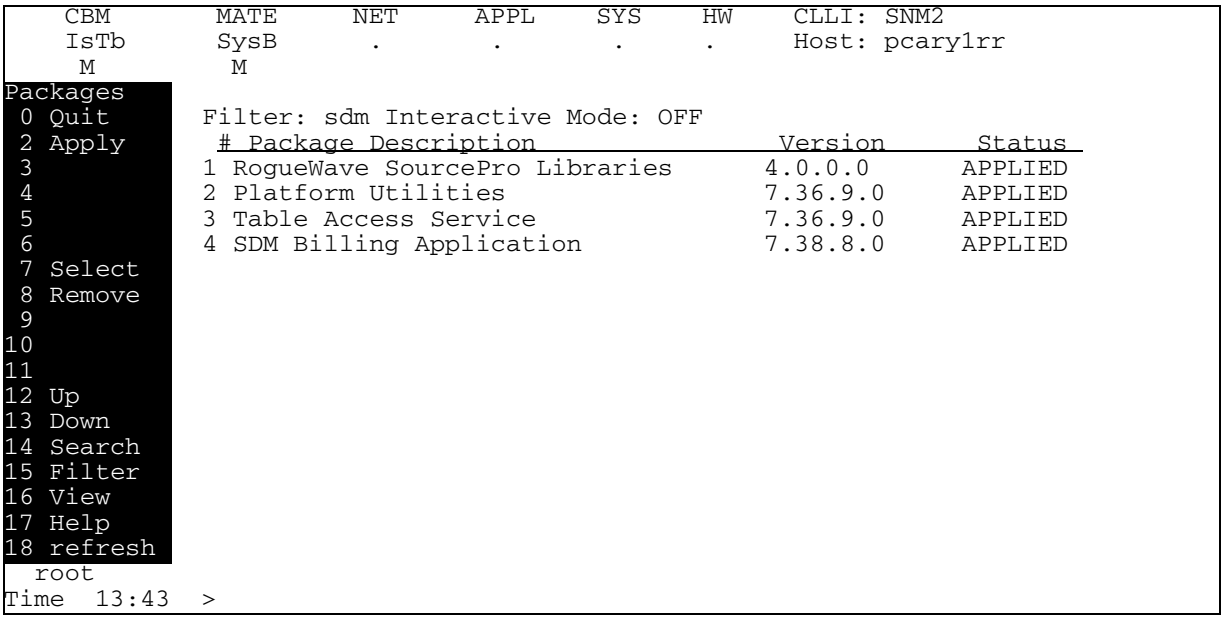
This level contains commands to list and remove installed software. It shows the list of packages which exist on the system. The software can be applied or removed from this level for maintenance purposes. The list columns include: a list index number representing the package in each row, the package name,instance or description , the version number which is currently installed, and the package status (APPLIED, PARTIAL or FAILED).The Status column was added to identify if the package has been APPLIED, if there is a NEWer instance (SDM/Nortel software only and mostly for lab environment) or if the package has NOT been APPLIED, no instance on the system. APPLIED packages versions are currently in use. PARTIAL packages are packages that had an error during installation and are only partially installed. PARTIAL and FAILED packages should be removed from the system. The Packages level is updated every 20 seconds or when you use the Refresh command. The Packages level is shown in Figure 14.

Commands:

1. Apply : Install the selected packages(postion 2 infig. 14).
2. Select : Selects a package. A selected package appears highlighted within the software list. A selected entry can be deselected by selecting it again(position 7 in fig. 14).
3. Remove: Remove software. This command can be used to remove software that is in any of the APPLIED, PARTIAL,or FAILED states(postion 8 in figure 14).

4. Search: Search the list for the given text, and reposition the list when a match entry is found(postion 14 in fig. 14).
5. Filter: Filter the list of software(position 15 in fig. 14)
6. View: Toggle between showing the software description, the software package instance and the software package name(position 16 in fig. 14).

Figure 14 CBM Packages Level



55.3.9.1.2 CBM Apply Level

The Packages Apply level shows a list of packages which exist on the source. The default source is automatically listed when entering the Apply level for the first time. The default source can be changed within the Options level. The list columns include: a list index number representing the package in each row, the package description, instance name or package name The current version listed beside every package is updated every 20 seconds or when you use the Refresh command. The command line equivalents are shown in table 3.

Commands :

1. Source: Choose a source directory from which to load packages.
2. Reload: Reload the list of packages from the current source.
3. Select: Selects a package. A selected package appears highlighted within the software list. A selected entry can be deselected by selecting it again.
4. Apply: Apply packages on this CBM

5. Upgrade: Upgrade all packages to the latest versions available on the source .
6. Search: Search the list for the given text, and reposition the list when a match entry is found.
7. Filter: Filter the list of software.
8. View: Toggle between showing the software description, the software package instance and the software package name

55.3.9.1.3 CBM Config Level

The Config level shows the list of applications which have configuration programs associated with them. Each configuration program can be executed by using the Config command. The Config level is updated every 20 seconds or when you use the Refresh command. The config level is shown in Figure 15.

Commands:

1. Select: Selects a package. A selected package appears highlighted within the software list. A selected entry can be deselected by selecting it again.
2. Config: Configure packages
3. Search: Search the list for the given text, and reposition the list when a match entry is found.
4. Filter: Filter the list of software
5. View: Toggle between showing the software description, the software package instance and the software package name.

56: Functional Description (FN): A00002823

56.1 Feature name

SDM CORE HA MAINTENANCE (HA OAMMTCE)

56.2 Description

This activity adds support for connecting an SDM/CBM to an XA-core using Ethernet on the IRM stack. Support for connecting an SDM to 3PC will be maintained.

From Figure 1 on page 572, one can see that the new connectivity model of CBM goes from:

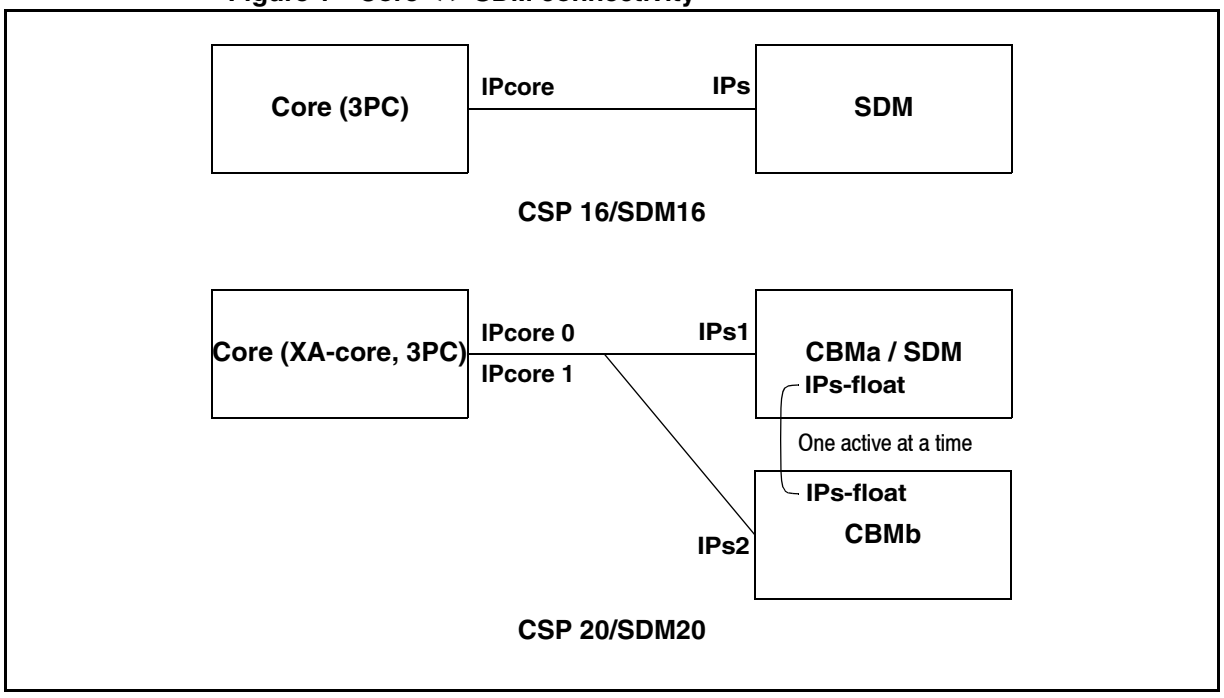
- a single SDM address (as seen by the core)
- a single Core IP address (There is support for a different Lancomm address.)

to:

- two Core IP addresses of which SDM/CBM will only use one.
- one floating IP address for the SDM/CBM cluster which is used by the active CBM node.
- one fixed IP address for each CBM node (for SDM the floating and fixed address would be the same)

The related core activity A00002510 routes messages between the legacy LANCOMM IP stack and the newer IRM IP stack. This activity identifies the SDM/CBM floating IP address to the A00002510 code so that applications using the LANCOMM stack can communicate with the SDM/CBM.

Figure 1 Core <-> SDM connectivity



In addition to the above, support is being added for core side applications to query the TCP port numbers and RPC service numbers of their peers on the SDM.

56.8 Glossary

Term	Description
CBM	Core and Billing Manager

57: FN: Node ISTB for SPM Carrier Outage: A00002858

57.1 Feature name

Mark SPM/STM1 Node ISTb under the PM banner whenever one of its carriers goes SysB or one of its line carriers has a remote alarm.

57.2 Description

57.2.1 Background

Nortel's customers have expressed the desire to have a SysB carrier cause its SPM node to go ISTb under the PM banner. This would provide the telco a visual MAP alert that a carrier outage may be causing multiple trunk failures. Adding this capability would make SPM work like DTC. But most importantly, this feature will reduce the chance of long duration outages when the telco is not aware that a carrier problem is disrupting service. This feature will also reduce the chance of problems during a Panther upgrade since these types of carrier problems can prevent sparing on the OC3.

Feature A59036987 attempted to address this concern by adding the display of S/P/D/d/R under the TRKS banner.

57.2.2 Operation

There will be two new "triggers" that can cause a SPM node to go ISTb under the PM banner:

57.2.2.1 Trigger 1: Check SysB Carrier on OC3 RM

When one of the OC3's carriers goes SysB, which corresponds to a Bellcore state of OOS-AU-FAF (which is same as OC3 carrier state of IS-UPS-FAF). FAF is FAcility Failure. Note that this trigger corresponds to "S/P/D/d" in the A59036987 feature. While the carrier is SysB, any of its trunks will be in the CFL condition and not able to bear traffic.

Here's an example of the existing log that will be seen when a carrier goes SysB:

MSH706BM * CARR511 JUN04 05:46:03 6200 **SYSB** CARRIER SPM 34
CKT: 13 CarrName: SPM34_STS1P_1_VT15P_3_DS1P_3
Carrier: STS1P 1 VT15P 15 DS1P 1
Previous State: **INSV**

This trigger clears when the carrier is no longer SysB (e.g. CARR510 log when the carrier is RTS'd and goes InSv).

For STM-1 international product, the trigger will occur when a STM-1 carrier goes SysB.

57.2.2.2 Trigger 2: Check RFI Alarm on STS3L Carrier

When one of the OC3'sInSv STS3L carriers has a RFI (Remote Failure Indication) alarm. Such an alarm can be caused by cutting the TX fiber on the OC3. Note that this trigger corresponds to "R" (for Remote alarm) in the A59036987 feature. Since OC3 sparing will not be allowed while the remote alarm condition is present on the line carrier, the OC3 is effectively in an E2 outage condition due to the loss of redundancy.

Here's an example of the existing log that will be seen when a remote alarm is raised on a line carrier. Note that the carrier data in table MNHSCARR would have to set the RFI alarm as reportable (RFI MN RPT) for this log to be seen.

```
MSH8_03BM   * CARR310 APR18 10:27:41 3204 FLT  CARRIER SPM  41
                CKT: 178  CarrName: ATM_STS3L_SPM_41_CKT_178
                Carrier: RM     2 OC3S   0 STS3L  0
                Failure: RFI     Set
```

If the RFI alarm is set as NRPT (non-reportable) for the carrier, then the log will not be seen but the trigger will still occur. Note that the CI command:

MAPCI;MTC;TRKS;CARRIER;POST {carrier};LISTALM

will always show the presence of the alarm, independent of whether MNHSCARR sets the alarm as RPT or NRPT for the carrier.

This trigger clears when the RFI alarm clears (as reported by a CARR310 "RFI Clear" log).

For STM-1 international product, trigger will occur when a InSv STM1M carrier has a RFI alarm.

57.2.3 MAPCI PM Display

When one of these triggers occur, the new ISTb reason string will appear in the existing SPM300 log that occurs whenever a OC3 RM goes ISTb. See Log section below for details. The severity off this ISTb MAP alarm will be minor, so it won't appear under the "1 SPM" display below.

Here's how the MAP's PM level will appear for the ISTb SPM when one of the above triggers has occurred. Note that the "S" under TRKS is part of an existing feature that indicates a section-level carrier (e.g. OCS3) is SysB.

```
XAC      MS     IOD     Net      PM      CCS     Lns     Trks    Ext     APPL

```

57.2.4 QUERYPM FLT Display

The telco can use this command:

MAPCI;MTC;PM;POST SPM ISTB;QUERYPM FLT REASON

to show what faults caused the SPM node(s) to become ISTb. If one of the SPM's carriers has gone SysB, then the output will look like this:

>querypm flt reason
OC3 0 ISTb NonCritical faults:
Check SysB Carrier
CEM 0 ISTb NonCritical faults:
Check Carrier on OC3 RM

The "Check SysB Carrier" is a new reason that can cause a OC3 RM to go ISTb, which results in the CEM going ISTb, and hence the node ISTb. The "Check Carrier on OC3 RM" is a new ISTb reason for CEMs that will only occur when one (or both) of our two triggers have occurred.

For the STM1 product, CEM ISTb reason will appear as "Check Carrier on STM RM".

If the 2nd trigger occurs (i.e. remote alarm on a line carrier), then the output will look like this:

```
>querypm flt reason
OC3 0 ISTb NonCritical faults:
Check RFI Alarm on STS3L Carrier
CEM  0 ISTb NonCritical faults:
Check Carrier on OC3 RM
```

The “Check RFI Alarm on STS3L Carrier” is the other new reason that can cause a OC3 RM to go ISTb.

For the STM1 product, the STM ISTb reason will appear as “Check RFI Alarm on STM1M Carrier” and the CEM ISTb reason will appear as “Check Carrier on STM RM”.

Note that our two new “triggers” are the only RM ISTb reasons that can also cause the Node to go ISTb.

57.2.5 LISTALM Display

The LISTALM command for the ISTb SPM will produce this output when one of the triggers has occurred. Note that it just reflects the Minor alarm reason that caused the node to go ISTb.

```
ListAlm: SPM 26  CEM 0
SEVERITY    ALARM       ACTION
-----------------------------
Critical    None
Major       None
Minor       ISTB        RPT
No_Alarm    None
```

57.2.6 Logs

When one of the new triggers occur, the existing CARRxxx log will occur as shown above. In addition, the existing SPM300 log will occur to show the OC3 RM has gone ISTb for one of the new ISTB text reasons. The severity of these SPM300 logs will be non-critical for each new reason.

Note: the maximum length for an ISTb reason string is 64 characters, so we can make the reasons longer if that would help.

57.2.6.1 Check SysB Carrier

This log will occur if one of the SPM's carriers goes SysB:

```
STEC207AM   *  SPM300 MAY30 15:57:33 4093 TBL  Device Fault Report
      Location   : SPM : 26   OC3 : 0
      Status     : Alarm Raised
      Problem Description: Non Critical
       7A: Check SysB Carrier
      Action     : Refer to NTPs for Alarm Clearing Procedures.
      Cardlist   :
       No Cardlist Available.
```

57.2.6.2 Check RFI Alarm on STS3L Carrier

This log will occur if one of the SPM's STS3L line carriers recieves a RFI external alarm (e.g. due to TX fiber cut). Note that STS3L will be substituted with STM1M on STM1 nodes.

```
STEC207AM   *  SPM300 MAY30 15:57:33 4093 TBL  Device Fault Report
      Location   : SPM : 26   OC3 : 0
      Status     : Alarm Raised
      Problem Description: Non Critical
       7A: Check RFI Alarm on STS3L Carrier
      Action     : Refer to NTPs for Alarm Clearing Procedures.
      Cardlist   :
```

For the STM1 product, the 7A string above will instead appear as "Check RFI Alarm on STM1M Carrier".

57.2.6.3 OC3 ISTb Log

If the OC3 RM was previously InSv when the trigger occurred, then the following SPM500 "Device State Change" log will occur when the OC3 transitions to ISTb. There are no changes to this log. Here's an example:

```
STEC207AM   *  SPM500 MAY30 15:57:33 4194 INFO Device State Change
          Location: SPM : 26   OC3 : 0
          From    : InSv
          To      : ISTb
```

57.2.6.4 Node ISTb Log

If the SPM node was previously InSv when the trigger occurred, then the existing NODE500 “Node State Change” log will occur when the SPM node transitions to ISTb. There are no changes to this log. Here’s an example:

```
OLSC_SN06BT CM        * NODE500 JUN04 15:14:16 1000 INFO Node State Change
      Location: SPM 33 Unit 0
      From:     InSv ( Connected, Active )
       To:     ISTb ( Connected, Active )
```

57.2.7 Troubleshooting why SPM Node is ISTb

Determining which carrier caused the SPM Node to go ISTb depends on the type of reason given under QUERYPM FLT REASON:

57.2.7.1 Check SysB Carrier

Find which SPM is ISTb:

mapci;mtc;pm;post spm istb

then post the SysB carriers on the SPM:

trks;carrier;post spm {spm# from current post set} sysb

Then follow existing troubleshooting procedures for SysB SPM carriers.

57.2.7.2 Check RFI Alarm on STS3L Carrier

Find which SPM is ISTb:

mapci;mtc;trks;carrier;post spm istb

then post the line carriers on that SPM:

trks;carrier;post spm {spm# from current post set};next

The map will look something like this:

```
XAC      MS     IOD     Net      PM     CCS     Lns     Trks    Ext     APPL
 SysBTh    .     NODLOG    .      1 SPM     .       .     232CCS   3Crit    .
                                   *C*                      *C*     *C*
             CLASS    ML   OS ALRM  SYSB  MANB UNEQ OFFL  CBSY PBSY  INSV

14 Detail_
15 ListAlm_
16
17 Perfmon_
18
```

The faulty line carrier will be the one with an alarm (e.g. “m”) under the “MA” column. Use LISTALM or PERFMON;PPQUERY to confirm the alarm. Then follow existing troubleshooting procedures for clearing alarms on a STS3L carrier. One thing to check for is a cut TX fiber on the OC3.

For the STM1 product, everythings the same except STM1M will appear instead of STS3L (and STM1R will appear instead of OC3S).

57.3 Hardware requirements

There are no new hardware dependencies introduced by this feature.

This feature will only work on TDM (legacy) SPM nodes (i.e. SPM and STM1). Anywhere that OC3 RM or STS3L carrier is referred to in this document for SPM, you can substitute STM RM or STM1M carrier when referring to a STM1.

Succession ATM/IP-based nodes (MG4K, IW, LSA, STS1) will **not** support this feature in the initial release.

57.4 Software Requirements or Dependencies

There are no new software dependencies introduced by this feature.

The feature will be “off” by default, but can be turned “on” by the customer.

This feature will impact Local CEM and RM loads for the SPM and STM1 products in the SN07/20 release, and will impact the SN07/20 (i.e. SHR20) Core load.

57.5 Limitations and restrictions

1. As stated above, the feature is only supported on TDM (legacy) SPM nodes, which includes the STM1.

2. Note that existing feature A59036987 will also show “P” for a ManB line carrier, whereas this new feature ignores any ManB carrier.
3. This feature will be “off” by default. An option will be provided (in Table OFCENG) for the customer to turn the feature “on” for all SPMs in the office. There will be no way to control the feature for individual SPMs. It is strongly recommended that the customer leave the feature “on” so they can avoid any long duration outages due to SPM carrier problems.
4. For the feature to be “on”, the new SN07/20 Core and Local loads must be running. If an upgrade is in progress where the customer is running the new SN07/20 Local loads but still has the pre-SN07/20 Core loads, then the feature will not activate until the new SN07/20 Core load is also running (e.g. after a No Restart SWACT).
5. While this feature is backwards compatible, it wil not be forwards compatible when the feature is enabled. For example, telco can run the new SN07/20 Local load with an older Core load as described above in #4 (this is “backwards compatibility”), but telco cannot run the new SN07/20 Core load with an older Local load when the feature is turned “on” in the new Core load (via Table OFCENG). If forward compatibility is needed, the feature must be turned “off” in the new Core load.
6. When the feature is activated or deactivated via Table OFCENG, it will take up to 45 minutes for this change to propagate throughout the system. The user will be warned about this delay time when the change is made. The same amount of delay will be incurred when the telco first upgrades the Core to the new SN07/20 load via NoRestartSWACT.
7. The carrier alarm level in Table MNHSCARR will not have an impact on whether a specific carrier can cause the node to go ISTb. So even if the carrier is set to NRPT (Non-Reportable), if it drops SysB, then it will cause the node to go ISTb. Same with the remote alarm trigger.
8. It only takes a single SysB carrier on the SPM node (including one DS1P or E1P path carrier) to cause the node to go ISTb. Any ManB or OFFL carrier will not cause the node to go ISTb.
9. If both “triggers” are present on the same OC3/STM at the same time, then only the last one reported will be shown when QUERYPM FLT REASON is done. If the last trigger is cleared, then QUERYPM FLT REASON will show the first trigger (until the first trigger is also cleared).

57.6 Interactions

This new feature works very similar to the 17/SN04 A59036987 feature that reports “S/P/D/d” under TRKS banner for a SysB carrier and “R” for a line carrier with a remote alarm. There are **no** interactions between them. Note that “S/P/D/d/R” will continue to be displayed under the TRKS banner.

With both features operating concurrently, the telco will have more info available on the MAP display to isolate the carrier issue *if* there is only *one* node ISTb. If the PM banner shows "1 SPM", then the telco will know this extra info by examing the right-most letter under the TRKS banner display:

1. "**S**": telco will know that a SysB section carrier (OC3S, STM1R) has caused the SPM to go ISTb.
2. "**P**": telco will know that a SysB line carrier (STS3L, STM1M) has caused the SPM to go ISTb. If "P" appears and there is no ISTb SPM, then we know there is a ManB line carrier on one of the SPMs. This ManB line carrier will prevent OC3 sparing so the SPM has a E2 loss of redundancy.
3. "**D**": telco will know that a higher-level path carrier (STS1P, DS3P, VC4P) going SysB has caused the SPM to go ISTb.
4. "**d**": telco will know that a lower-level path carrier (DS1P, VT15, VC12P, E1P, E1L) going SysB has caused the SPM to go ISTb.
5. "**R**": telco will know that a InSv line carrier (STS3L, STM1M) with remote RFI alarm has caused the SPM to go ISTb.

The TRKS letters above ("S/P/D/d/R") are shown in their priority order of precedence. This means that if a "S" and "D" fault exist concurrently, then the "S" preceeds the "D" so only "S" is shown.

If *more than one* SPM is ISTb, then the telco will still know the highest level carrier severity, but won't know which SPM it is on. For example, a "2 SPM" under PM banner and a "S" under TRKS banner means one SPM has a "S" fault and the other SPM has "S" or lower fault.

57.9 References

A59036987 FN in PLS FMDOC - 17/SN04 release.

58: Functional Description (FN): A00002900

58.1 Feature Name

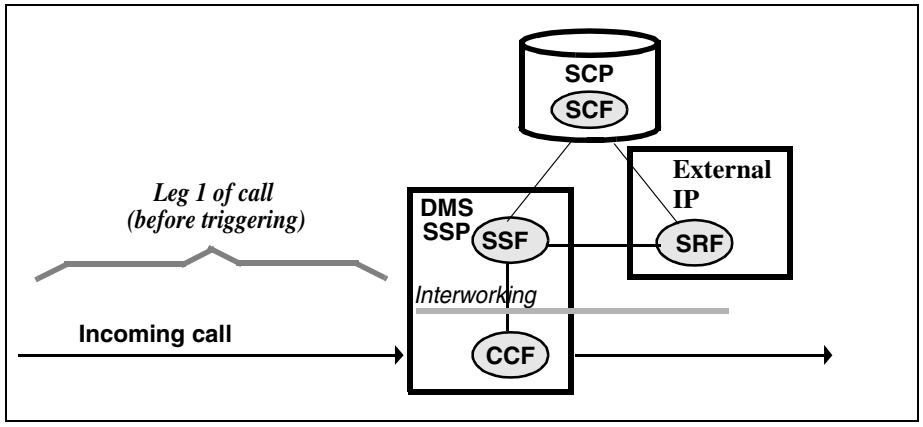
China INAP Compliance Enhancement Part 2

58.2 Description

58.2.1 Functional Overview

This feature will enhance the external IP capabilities and support multiple ApplyChargings on ISN07 TDM and CS2Kc platform for China market. The external IP supported in this feature has direct connection through China ISUP to SCP (as figure 1), SSP would not provide assisting SSP functionality.

Figure 2 Network diagram



This feature is based on feature A89008388: China IN SSP capabilities and feature AG5145: External IP, please see reference 7,10 for more information.

Two main functionalities are implemented in this feature:

- External IP enhancement

  For China INAP, several enhancements are made to fully support external IP:

  - Enhance operation EstablishTemporaryConnection
  - Enhance operation InitialDP

    Parameter iPAvailable and iPSSPCapabilities are required in IDP operation. SSP is able to set these two parameters by datafill.
  - Charging the temporary connection to external IP using ApplyCharging operation

    According to China requirement, charging to the temporary connection to external IP is required. Charging per duration and time are both supported in this feature.
  - Unsuccessful connection to external IP handling enhancement

    Several scenarios of unsuccessful connection to external IP are enhanced to comply with China requirement.
  - CISUP: Map the post answer ANM(CON) to CPG
- Multiple ApplyChargings support
  - Support up to 3 ACs

    Now up to 3 ACs can be accepted and handled simultaneously during an INAP call. For multiple ACs, corresponding ACRs can be sent to SCP if required.

Function ‘CISUP: Map the post answer ANM(CON) to CPG’ is for China ISUP originator only. The other functions are agent independent, i.e. they are supported on the originating agents with the condition: the originating agent <-> INAP interworking is ALREADY supported. For example, China ISUP, IBN lines, SIP-T (no ISUP), China PRI.

These functions are detailed in Section 2.2.2 to 2.2.3.

58.2.1.1 Functional Requirements

The functions to enhance China IN SSP capabilities are based on the following specification:

— China INAP specification (See reference 1)

— China INAP test specification (See reference 2)

— Supplementary Specification of China IN CS-1 INAP (See reference 3)

— Test specification of Supplementary Specification of China IN CS-1 INAP (See reference 4)

58.2.1.2 Data Requirement

The datafill is the same as that for normal IN call.

58.2.2 External IP enhancement

58.2.2.1 EstablishTemporaryConnection enhancement

The ETC is defined as below in China INAP specification:

```
EstablishTemporaryConnection OPERATION
  ARGUMENT
    SEQUENCE {
      assistingSSPIPRoutingaddress [0] IMPLICT OCTET STRING;
      correlationID[1] IMPLICT OCTET STRING OPTIONAL;
      legID [2] CHOICE{
        sendingSideID[0] IMPLICIT OCTET STRING( SIZE(1) )} OP-
        TIONAL;
      scfID [3] IMPLICT OCTET STRING(SIZE (3)OPTIONAL;
      .....}
```

Parameters scfID and legID are supported in this feature. legID indicates which leg of a call is connected to the SRF for user interaction. Currently, external IP can only be connected to calling party. This feature will only support the decode of parameter legID.

Parameter correlationID has fixed length 3 bytes.

Parameter assistingSSPIPRoutingAddress is checked according to China INAP requirement:

— the format is Generic number

— If scfID and correlationID are not contained in assistingSSPIPRoutingaddress, the NOA of assistingSSPIPRoutingaddress should be national number(0000011) or Subscriber number(0000001). For national number, it consists of the prefix 0, Area code and office code, the length of the number is 4~8. For Subscriber number, it consists of office code, the length of the number is 4~5.

For the outgoing IAM to external IP, the format of CDPN within IAM is different considering that the number of CDPN is even or odd. Examples are shown in table 1 and 2:

Table 1 CDPN with 8 digits assistingSSPIPRoutingAddress

	8	7	6	5	4	3	2	1
1	Even	Nature of Address						
2	INN indica-tor	Numbering Plan Indicator			Spare

10	3rd Correlation ID				2nd Correlation ID			
11	5th Correlation ID				4th Correlation ID			

12	Filler (0)	6th Correlation ID

58.2.2.2 InitialDP enhancement

According to China INAP, IPAvailable and IPSSPCapabilities should be supported in IDP operation, SSP should fill these two parameters according to its abilities.

In order to build iPAvailable and iPSSPCapabilities into IDP, option INITDP_PARM of table SERVINFO is extended to add two new fields **IP_AVA** and **IPSSP_CAP** to indicate whether parameters IPAvailable and IPSSPCapabilities will be carried in IDP. These two fields should be datafilled at the same time. These two fields can also be datafilled for those variant other than China.

Meanwhile, option SRF_INFO is extended to add new filed **IP_INFO** to provide detailed information of the IP capability within SSP.

For China market, if IP_AVA and IPSSP_CAP are datafilled and IP_INFO is not datafilled, parameters iPAvailable and iPSSPCapabilities are set to default value according to China INAP, the default value of iPAvailable is ‘01’H (which indicates that the IP is available), the default value of iPSSPCapabilities is ‘#0C00’ (which indicates that DTMF digit collection and tone & announcement is supported). If IP_INFO is datafilled, then iPAvailable and iPSSPCapabilities are set according to this datafill. That means IP_INFO will take effect only if IP_AVA and IPSSP_CAP are datafilled, otherwise, the information of this datafill will not be carried in IDP.

IP_INFO contains two subfields: IP_AVAILABLE and IPSSP_CAPABILITIES, which contains values for parameter IPAvailable and IPSSPCapabilities respectively.

According to China INAP, there are 14 kinds of IP capabilities which are indicated by parameter iPSSPCapabilities. These capabilities can be datafilled in IPSSP_CAPABILITIES as shown in table 3:

Table 3 IP Capabilities defined in China INAP

IPSSPCapabilities parameter	Value	Meaning	IPSSP_CAPABILITIES selections
1st byte, bit 0	0/1	Not support/Support IPRoutingAddress	IPRA
1st byte, bit 1	0/1	Not support/Support VoiceBack	VOICE_BACK
1st byte, bit 2	0/1	Not support/Support VoiceInformation, recognize through voice, speech.	VOICE_INFO_SPEECH
1st byte, bit 3	0/1	Not support/Support VoiceInformation, recognize through voice, voice.	VOICE_INFO_VOICE

1st byte, bit 4	0/1	Not support /SupportText to Voice conversion.	TEXT_TO_VOICE
1st byte, bit 5	0/1	Not support/Support fax.	FAX
1st byte, bit 6	0/1	Not support/Support recorder.	RECORDER
1st byte, bit 7	0/1	Not support/Support script.	SCRIPT
2nd byte, bit 0	0/1	Not support/Support manual operator.	MAN_OPERATOR
2nd byte, bit 1	0/1	Not support/Support conference.	CONFERENCE
2nd byte, bit 2	0/1	Not support/Support tone & announcement.	TONE_ANNC
2nd byte, bit 3	0/1	Not support/Support DTMF digit collection.	DTMF_DIGCOL
2nd byte, bit 4	0/1	Not support/Support sending DTMF signal.	SEND_DTMF_SIG
2nd byte, bit 5	0/1	Not support/Support sending FSK signal.	SEND_FSK_SIG
2nd byte, bit 6,7	To be defined.		
3rd, 4th bytes	To be defined.		

Below is an example of datafill:

Table 4 SERVINFO datafill example

Example of datafill:
TABLE SERVINFO
200 (INITDP_PARMS (SERVKEY) (CDPA) (**IP_AVA**) (**IPSSP_CAP**) $)
(SRF_INFO (EARLY_ANS ANS_ON_ANNS)
(**IP_INFO Y** (**IPRA**) (**VOICE_INFO_SPEECH**)
(**TONE_ANNC**)(**DTMF_DIGCOL**)$)$)$

58.2.2.3 Charging the temporary connection to external IP using ApplyCharging operation

Currently, DMS SSP does not charge the temporary connection to external IP. According to China INAP:

If the charging is based on duration:

— SCP should send AC before ETC, and the startChargePattern is ‘AnswerReceived’

— When SSP receives AC and ETC, SSP begin to prepare for charging. SSP start charging after receiving answer message from external IP.

When originator abandon, SSP releases the connection to external IP or SSP receives release message, the charging is stopped, and ACR is sent to SCP.

— The other requirement of processing AC parameters are not changed.

If the charging is based on time:

— SCP can send AC before ETC or during the speech phase. If AC is sent before ETC, then the startChargePattern can be ‘Immediately’ or ‘AnswerReceived’. Otherwise, if AC is received during the speech phase, the startChargePattern should be ‘Immediately’.

— The fee is carried in surCharge parameter of AC, meanwhile AC does not carry chargeClass parameter.

— SSP can send ACR immediately or after the connection to external IP is released.

58.2.2.4 Unsuccessful connection to external IP handling enhancement

If the ETC is received between PA and SRR, SSP should report unexpected component sequence error.

58.2.2.5 CISUP: Map the post answer ANM(CON) to CPG

There are two conditions under which the mapping will occur:

— Condition 1: SSP has received an answer message from external IP or called party and transmitted it to the originating office, when the SSP connect to the external IP or the called party (if the first connection is to external IP) again, SSP will receive another answer message.

— Condition 2: SSP has received CTR and PCUI, SSP sent ACM and ANM to the originating office, when the called party answer, SSP will receive another answer message.

This functionality will implement that: if the second or later answer message is CISUP ANM containing BCI or CISUP CON, then it will be mapped to CPG and transmitted to the originating office.

58.2.3 Multiple ApplyChargings support

58.2.3.1 Support up to 3 ACs

In this feature, up to 3 ACs can be accepted and handled simultaneously during an INAP call. The number 3 is the maximum number of in-effect ACs, it does not include the number of expired(that is, a final ACR has been sent) ACs.

The chargeRecordIdentifier parameter is used to identify the AC operation, different ACs should have unique chargeRecordIdentifier. If two ACs have an identical chargeRecordIdentifier, then the newly received one will be rejected with ReturnError (UnexpectedDataValue).

If an AC with chargeUserIndicator equaling 1(calling party) or 2(called party) had been received, then any subsequent ACs with the same chargeUserIndicator will be rejected with ReturnError(TaskRefused(generic)). In orther words, on a call at most 1 AC is allowed for the calling/called party. However, this restriction does not apply to the specified charge number(chargeUserIndicator = 127).

If there are already 3 ACs in effect on the call, then all subsequent ACs will be rejected with ReturnError(TaskRefused(generic)).

For multiple ACs, corresponding ACR(s) can be sent respectively for each AC. ACR will be sent to SCP in three conditions:

1. If the calling/called party hangs up, the following actions are taken:

- The call (or only the called party, depending on the on-hook party and armed EDPs) is taken down
- ACR for each AC is sent respectively

2. If the cost/time limit for one of the ApplyChargings is reached, the following actions are taken:

- The call (or only the called party, depending on armed EDPs) is taken down
- The forceReleaseCause in the ApplyCharging whose charge/time limit is reached is stored in the backward release message
- ACR for each AC is sent respectively. If the supervisionMethod in the AC for which we are sending ACR is costGranted, the reasonForReport parameter in the ACR is ChargeLimitReached; if the supervisionMethod is timeGranted, the reasonForReport is TimeLimitReached.

3. If the heartbeat timer for one of the ApplyChargings expires, the following action is taken:

- An ACR for the AC is sent

Multiple treatments can be played if more than one ACs require warning tone/ announcement to be played at a desired time before the charge/time limit is reached, provided the restrictions below:

— All tones/announcements are only played to the calling party

— If multiple treatments are required to play at almost the same time, DMS SSP will play the 1st started treatment and suppress other

treatments which try to start at the time when the 1st treatment is playing.

59: Functional Description (FN): A00002901

59.1 Feature name

Activity A00002901 - Enhanced Meet-Me Conference (EMMC)

59.2 Description

59.2.1 Background

Existing Meet-Me Conference allows users to have a conference call without the conference setup time required with most other conferencing features. A directory number and a time is given to all conferees before the conference takes place. The conferees dial the directory number at the chosen time and are entered into the conference. This enables the conferees to quickly get on with the conference.

The user begins a Meet-Me conference by dialing the designated Meet-Me number. The maximum number of participants for a given conference is established in datafill and is associated with the customer group by the SUPERCNF option in table CUSTHEAD. As of BCS-25 it is datafillable whether the first caller must be a member of the Meridian Digital Centrex (MDC) customer group family. In either case if the first caller is a trunk it must have disconnect supervision. Note that other participants in the conference do not necessarily have to be members of the MDC customer group or have disconnect supervision if they are on incoming trunks. Other participants may always access the conference locally or from remote locations over all types of incoming trunk facilities if the datafill in table MMCONF allows them. The first caller receives audible ringing tone until the arrival of the second caller. The conference begins with the arrival of the second caller to the Meet-Me number. Each new participant to arrive on the bridge is announced with an audible confirmation tone to all the current participants. For each customer group, the number of 6-port conference circuits required by Meet-Me Conference are allocated for a customer group in table CUSTENG, option CONF6C.

But in the existing Meet-Me Conference feature, there is no security protection function provided to the conference. If a conference is reserved and datafilled in table MMCONF, anyone who knows the conference bridge DN can dial this DN and start a conference. Also, when a conference is in progress, anyone can enter the conference if he/she knows the conference DN and the conference is not being locked by other conferees. This leak makes the conference unsafe. Because of the limitation of associating the maximum number of 6-port conference circuits to customer group, the number of conference that can be reserved in one customer group is restricted too.

To resolve above limitations and leaks, this feature provides an Enhanced Meet-Me Conference with security protection and other functionalities.

59.2.2 Feature Requirement

Enhanced Meet-Me Conference service on CS2Kc provides a conference bridge which conference participants can enter by dialing a specific DN.

Conference is divided into 2 types: scheduled or timeless. A scheduled conference is the conference that predetermines conference date/time, conference elapsed time so that only within the reserved period of time could the conference be started. Scheduled conference has two sub-type: periodicity and non-periodicity conference type. The user can specify a scheduled conference as a periodically effective reserved conference, what means this conference is reserved with start date/time and elapsed time and the reservation can become effective daily/weekly/monthly. If the scheduled conference is reserved as non-periodicity, the reservation will get effective only once. With timeless conference, the conference DN is reserved timeless. Conference can be started whenever it is needed.

Conference participants are classified into 2 categories: chair-person and invited participants. Chair-person is the conference organizer, only one chair-person exists in one conference. Invited participants are the others invited to join the conference. The number of invited participants can be up to (N-1) per conference where N is the maximum number of conferees allowed in one conference session, it can be from 3 to 30. The chair-person and the invited participants are not necessarily subscribers from CS2Kc. The chair-person and the invited participants can dial into the conference from a IBN line and a CISUP/CTUP/SIP-T trunk.

Conference is secured by assigning conference password for all participants and chair-person. The chair-person and invited participants will have different passwords. The different passwords are the only means to distinguish the roles of chair-person and invited participants while conferees set up their calls to conference. These two password can not be the same. They are datafilled by the operator, and they are visible to operator. Please refer to section 2.2.3 for detail description.

It is optional for the conference organizer whether to let the conference starts without a chair-person. If so, the conference is allowed to start only after the chair-person arrives the conference. Otherwise, the conference can start when any conferee arrives.

In the case that the conference must start after the chair-person arrives, all invited participants arrives the conference before the chair-person will be given an announcement to declare that the chair-person has not arrived and the conference has not started. After that, the invited participants will be given

music and placed on hold. When the chair-person arrives, the on-hold participants will be placed into the conference.

In the case that allows the participants enter no matter whether chair-person has arrived, the situation is simpler. When a conferee arrives (if this is a timeless conference or it is in the reserved time of a schedule conference), just place him/her into the conference.

All conferees can have the conference through the conference bridge. In the progress of conference, if a new conferee enters the conference, all online conferees will hear a short ringing tone for announcing the arrival. Another short ringing tone will provide to the existing conferees if a conferee has disconnected. After at least two conferees have arrived and been placed into, the conference can really start.

Another option is given based on the status of the chair-person. The conference organizer can choose whether the conference will go on after the chair-person has disconnected while the conference is being reserved. If this option is set to TRUE, the conference can continue after the chair-person has disconnected from the conference. If this option is set to FALSE, the conference will end while the chair-person drops off even though there are still other conferees online.

For scheduled conference, System should play alarm tone or announcement to participants when time is expired before N minutes. (N is provisionable, e.g N=5 minutes.)

Every call into the conference DN should be mutual control or calling-party control. If a conference participant drops off, the corresponding conference port is automatically released.

Once the Enhanced Meet-Me Conference service is provisioned, it is available to the conference participants at any time, until the service provision is removed. However, the service provision can NOT be removed while the conference is still on.

59.2.3 Conference Provision

Enhanced Meet-Me Conference can be provisioned in a new table EMMCDATA with these aspects:

- Conference bridge DN
- Conference reservation type -- timeless, scheduled or periodicity conference
- Conference Date, Start Time, Elapsed Time. (If the conference type is timeless, this provision information is disable)

- Max number of ports available for the conference
- Invited participant password
- Chair-person password
- Quick start option: whether to allow the conference start if the chair-person has not entered
- ID of the Greeting to conference participants: operator can datafill a default greeting for each conference. If the customer has specific requirement for the greeting, and if software and hardware resource are enough, the operator can datafill a specific greeting for the customer. But this functionality is not guaranteed.
- Audio gruop number for playing music.
- System should play alarm tone to participants when time is expired before N minutes. N can be provisionable. (If the conference type is timeless, this provision information is disable.)
- Allow_to_continue option: whether to allow the conference to continue after the chair-person drops off
- Billing option: whether to generate a specific billing record for the conference

The provision capability is provided by a table EMMCDATA. The operator can datafill this table for each reserved conference session. The datafill examples of scheduled conference and timeless conference are shown below:

Figure 1 Datafill Example of Table EMMCDATA

```
TABLE: EMMCDATA
LKEY RESERVE SIZE CHRPSWD PARTPSWD QUICK GREETING AUDIOGRP ENDALARM CONTINUE

AUDIO12 5 N N
```

Note: The key filed LKEY is composed of SNPA, OFCCODE and STNCODE (which form the bridge DN). The filed RESERVE denotes the reservation type of the conference.

The first tuple shows an example of timeless conference with bridge DN 28 8019998. The user can start a conference at any time from this bridge DN. The timeless conference type is denoted in the filed RESERVE with “TIMELESS“.

The second tuple of in this example is a scheduled conference which provides a conference bridge DN 28 8019996. This conference can support up to six conferees to arrives. It starts at 8:00 am on Dec. 11, 2003 and carries through

for 120 minutes. The schedule information is denoted by the field RESERVE with “SCHEDLED NONPERIOD 2003 12 11 08:00 60“. During this period of time, anyone with correct password can enter the conference if the number of the online conferees has not exceeded conference size (in this example, it is 6). This conference session allows the conference to start before the chair-person arrives. It will play a greeting (denoted by EMMCOMPA) to all conferees when they arrives. It allows the conference continue after chair-person disconnects from conference and it will generate a separate billing record for this conference session. Field ENDALLARM denotes that five minutes before the expired time of this conference (10:00 am), an alarm tone will be given to remind the conferees.

The third tuple is also a scheduled conference and it is reserved for periodically used. It is denoted in filed RESERVE with “SCHEDLED DAILY 2003 12 02 10:00 300“. The users can use this conference bridge at 19:00 for 5 hours each day from Dec. 02, 2003 until this tuple is removed by the operator.

The size of this table is up to 8192.

When datafilling a tuple in table EMMCDATA, a corresponding tuple is datafilled in table DNINV to make this feature can be triggered via dialling the conference bridge DN. A new feature name EMMC is defined for this feature. Figure 2 shows an example of traver from a line 82220008 to bridge DN 8015555 (the second conference datafilled in Figure 1).

59.2.4 Conference Processing

The conference should be protected to prevent any accidental or malicious invader. This function is implemented by assigning conference password for all invited participants and specific chair-person password. During dialling phase, after dialling conference bridge DN, all conferees (invited participants and chair-person) are required to input passwords. Only the ones having inputted correct passwords are guaranteed to enter the conference. Conferees

are guided by prompt and announcements when they dialling password. Conferees need input password once in dialling process if a correct password is inputted. Their roles are identified by passwords.

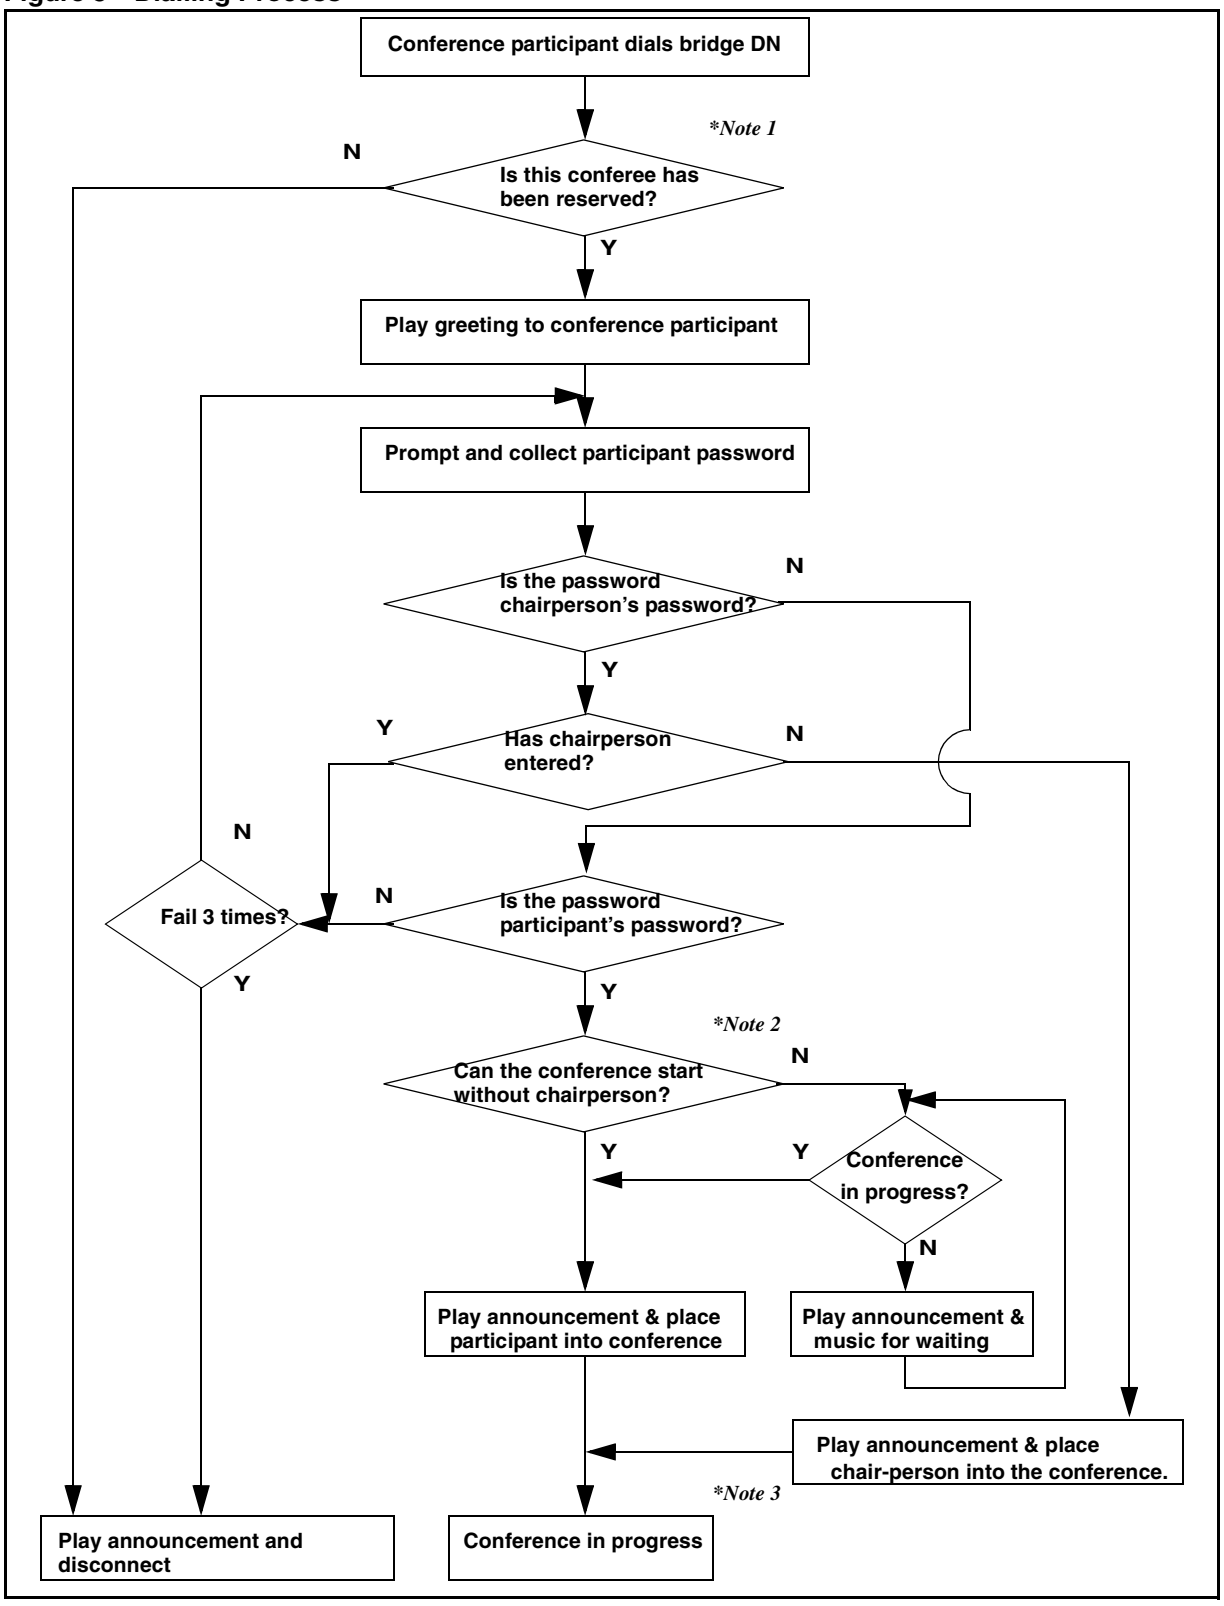
During the dialling process, some announcement are provided to guide the user how to execute following steps. The user can bypass the announcement by directly dialling any key. These announcements are:

- Greeting to welcome the user arrives the conference. This greeting can be datafilled on a per conference basis. So different conference may have different greeting.
- Prompt for collecting conferee's password.
- Prompt for reminding the user has inputted wrong password and to input again.
- Prompt for welcoming the chair-person enters the conference.
- Prompt for welcoming an invited participant enters the conference.
- Prompt for welcoming an invited participant but to place this participant on hold because the chair-person has not entered.
- Prompt for reminding the user has made some error and will be disconnected from the conference.

With the scheduled conference type, before N minutes to the end time (N is datafilled in field ENDALARM in table EMMCDATA), an announcement will play to all participants that the conference will end in N minutes.

The dialling conference DN and password process are shown in figure 1.

Figure 3 Dialling Process



Note: 1. If the conference type is scheduled and the dialling date/time is within the reserved conference start date/time and elapsed time, or the conference type is timeless, we think that the conference has been reserved.

Note: 2. Whether a conference can start without a chair-person is controlled by datafilling a quick start option for each conference session.

Note: 3. Under following two circumstance, we think that the conference is in progress: I. The chair-person has entered the conference. II. If the conference session has quick start option, an invited participant is the first conferee and is allowed to entered the conference.

After the conferee gets through the password verification and enters the conference, a conference port is allocated for this conferee. He/She will occupy one port of 6-port conference circuit mounted of CTM/MTM on TDM side or a member of UAS on IP side. The hardware resource will not be freed until the conferee drops off. If the conference reaches the maximum allowed size specified in table EMMCDATA, further call attempts will receive busy treatment. Until a conferee disconnects and thereby provides a vacant port on the conference, further user is allowed to enter. If the conference is under maximum size but it is unable to attach hardware resource, the user will receive NOSC treatment.

During conference processing, each new participant arriving on the bridge is announced with an audible confirmation tone to all the current participants. Similarly, A burst of dial tone is provided each time a conferee leaves the conference. When all conferees are dropped from the conference, all the conference circuits are freed. It is datafillable whether the conference will end after the chair-person disconnects.

For scheduled conference, an alarm tone will be played to all participants when elapsed time will be expired in N minutes. N is a number that When the predetermined elapsed time expires, the conference ends and all conferees (chair-person and invited participants) disconnect from the conference. For the timeless conference, the conference can keep on till all conferees drop off, no elapsed time limitation.

59.2.5 Conference Billing

When the billing option is datafilled, a billing record is generated for each session of the conference, and only one record is generated.

The billing record includes the following:

- Conference start date/time: the time that the first participant enters the conference if quick start option is set to TRUE, or when the chair-person is placed into the conference if quick start option is set to FALSE.

- Conference end time: the time all the participants have dropped off
- Conference port usage: the maximum number of ports used during the conference session. This is not the conference allowed size datafilled in the table, but the maximum actual used ports in conference progress.
- Conference bridge DN

According to different datafill of field QUICK in table EMMCDATA for different conference, conference start date/time have different definitions. If this field is set to TRUE, which means the conference can start without the chair-person entering, conference start date/time record the date and time when the first conferee enters the conference, no matter this conferee is a chair-person or an invited participant. If this field is set to FALSE, which means the conference can only start after the chair-person enters, conference start date/time record the date and time when the chair-person enters the conference.

Conference end time always records the time when the last conferee drops off from the conference.

A conference session denotes the period of time from conference start time to conference end time. In a scheduled conference, if all conferees drops off, it is considered that this conference session has completed. If the time hasn't expired, any user can still start the conference. But it will be thought as a new conference session. For each conference session, only one billing record is generated. And the billing record is only associated with this conference session.

Conference port usage records the maximum number of ports used during a conference session, i.e. the maximum number of online conferees at the same time during a conference session.

Conference bridge DN should also appear in the billing record.

One thing should be noticed, the control of generated billing record is per conference base, but not per conference session base. That means the field BILLING in table EMMCDATA can only control the generation of the billing record to the conference datafilled in the same tuple. If this conference has multi conference sessions, all sessions will (or will not) generate the billing records according to the filed BILLING.

An ama log will be generated as the billing record for each conference session. This ama log contains a structure code (the structure code can be selected from x0510, x0511, x0512, x0513 or x0514) and a module code (612) to record billing information. MC612 is appended to the structure code. The conference bridge DN is stored in the structure code, the other information are stored in the module code. One ama log is to be generated for one conference session.

Figure 4 is an example of a billing record, the module code 612 is appended to the structure code 40514.

The conference bridge DN is stored in the filed ‘EXT TERM OPEN DIGITS 1’ as 000000008015555c. In the module code 612 appended to the structure code, filed ‘GENERIC DIGITS STRING 1’ records the conference start date/time: 17:06:12.8 on Aug., 27, 2003. Field ‘GENERIC DIGITS STRING 2’

records the conference end date/time: 17:07:08.6 on Aug., 27, 2003 and the maximum ports used during this conference session: 3 ports.

59.3 Hardware Requirements or Dependencies

This feature uses conference circuits provide by six-party conference card on TDM side or UAS on IP side to implement conference bridge.

59.4 Software Requirements or Dependencies

N/A

59.5 Limitations and restrictions

- All changes to the conference bridge DN and other information should be done through table EMMCDATA. Any other method of changing the DN is not supported.
- The hardware resource in the switch is not guaranteed enough to support all reserved conference at the same time. If a large conference is supported by a UAS on CS2Kc, it is not possible to guarantee with absolute certainty that sufficient UAS ports will always be available to allow additional persons to join the conference. If an additional person tries to join a large conference at a time when a UAS port is not available, the system provides treatment (a reorder tone) to the user and leaves the existing conference intact. Same thing will happen on TDM side.
- Touch tone commands should be provided to the chair-person and invited participants to implement specific control to the conference. To provide touch tone commands, DTMF tone must be able to be detected during talking phase in a call. But implementing DTMF tone detection needs a lot of development effort, so touch tome commands functionality will leave as a potential function of this feature in the future.
- When a subscriber is being included in an Enhanced Meet-Me Conference, all flash activation/deactivation feature is forbidden.
- Multiple Appearance Directory Number (MADN) is forbidden while a subscriber is being included in the conference.

59.6 Interactions

- If these features have been activated (Three Way Call, Attendant Console, Station Controlled conference, Preset Conference, Directed Call Pickup, Call Forward, Simring) on a subscriber, it is not allowed to terminate on Enhanced Meet-Me Conference bridge DN.
- If a conferee has the call forward busy (CFB) feature, calls to the conferee are forwarded during the conference.
- 3-way call and call waiting will be disable if a user is in conference progress.

- When a subscriber is being included in an Enhanced Meet-Me Conference, feature Calling Number Delivery Blocking (CNDB), Calling Number Blocking (CNB), Calling Name and Number Blocking (CNNB) is allowed.

60: Functional Description (FN): A00002960

60.1 Feature name

SN07:A00002960 - Originator Identification Screening

60.2 Description

This feature allows customers to block call terminations to certain ISUP EANT trunks when the Charge Number (CN) or Calling Party Number (CPN) identifiers is not available[1]. The intent of this new functionality is to allow only calls with one of the originating identifiers to complete over certain ISUP EANT trunks. All other calls will advance to the next trunk in the route list.

Please refer to the following sections for additional information:

- "SOC Control: UTRS0011" on page 611
- "Table TRKOPTS: ORIGIDSCR" on page 611.
- "Call Processing" on page 612

60.2.0.1 SOC Control: UTRS0011

The new SOC order code UTRS0011, UCS Orig ID Screen, is introduced by this feature. When UTRS0011 is IDLE calls will not be blocked on any ISUP EANT trunks when the CPN or CN is not available. The new ORIGIDSCR option in Table TRKOPTS can be datafilled when SOC is IDLE. When UTRS0011 is ON certain calls can be blocked. For more information see "Call Processing" on page 612.

The functionality introduced by this feature has been patched in older releases under password activated patch ATM51. During ONP processes UTRS0011 will have STATE set to 'ON' if the old side has patch ATM51 applied and activated. Otherwise, the SOC is set to IDLE.

60.2.0.2 Table TRKOPTS: ORIGIDSCR

A new trunk group option, ORIGIDSCR, is introduced in Table TRKOPTS for ISUP EANT trunks only. This allows the customer to specify which ISUP EANT trunks perform originator identification screening. For more information see "Call Processing" on page 612.

[1] For the purpose of this document the CN or CPN is considered available when at least the NPA is available. Refer to "60.2.0.3 Call Processing".

Figure 1 Table TRKOPTS Examples

TABLE: TRKOPTS

TRK1 ORIGIDSCR ORIGIDSCR

When an attempt to add ORIGIDSCR to a trunk other than EANT type or an MF EANT trunk the following error message is generated by table control:
TABLE: TRKOPTS

*** ERROR - ORIGIDSCR can only be assigned to EANT ISUP trunks.

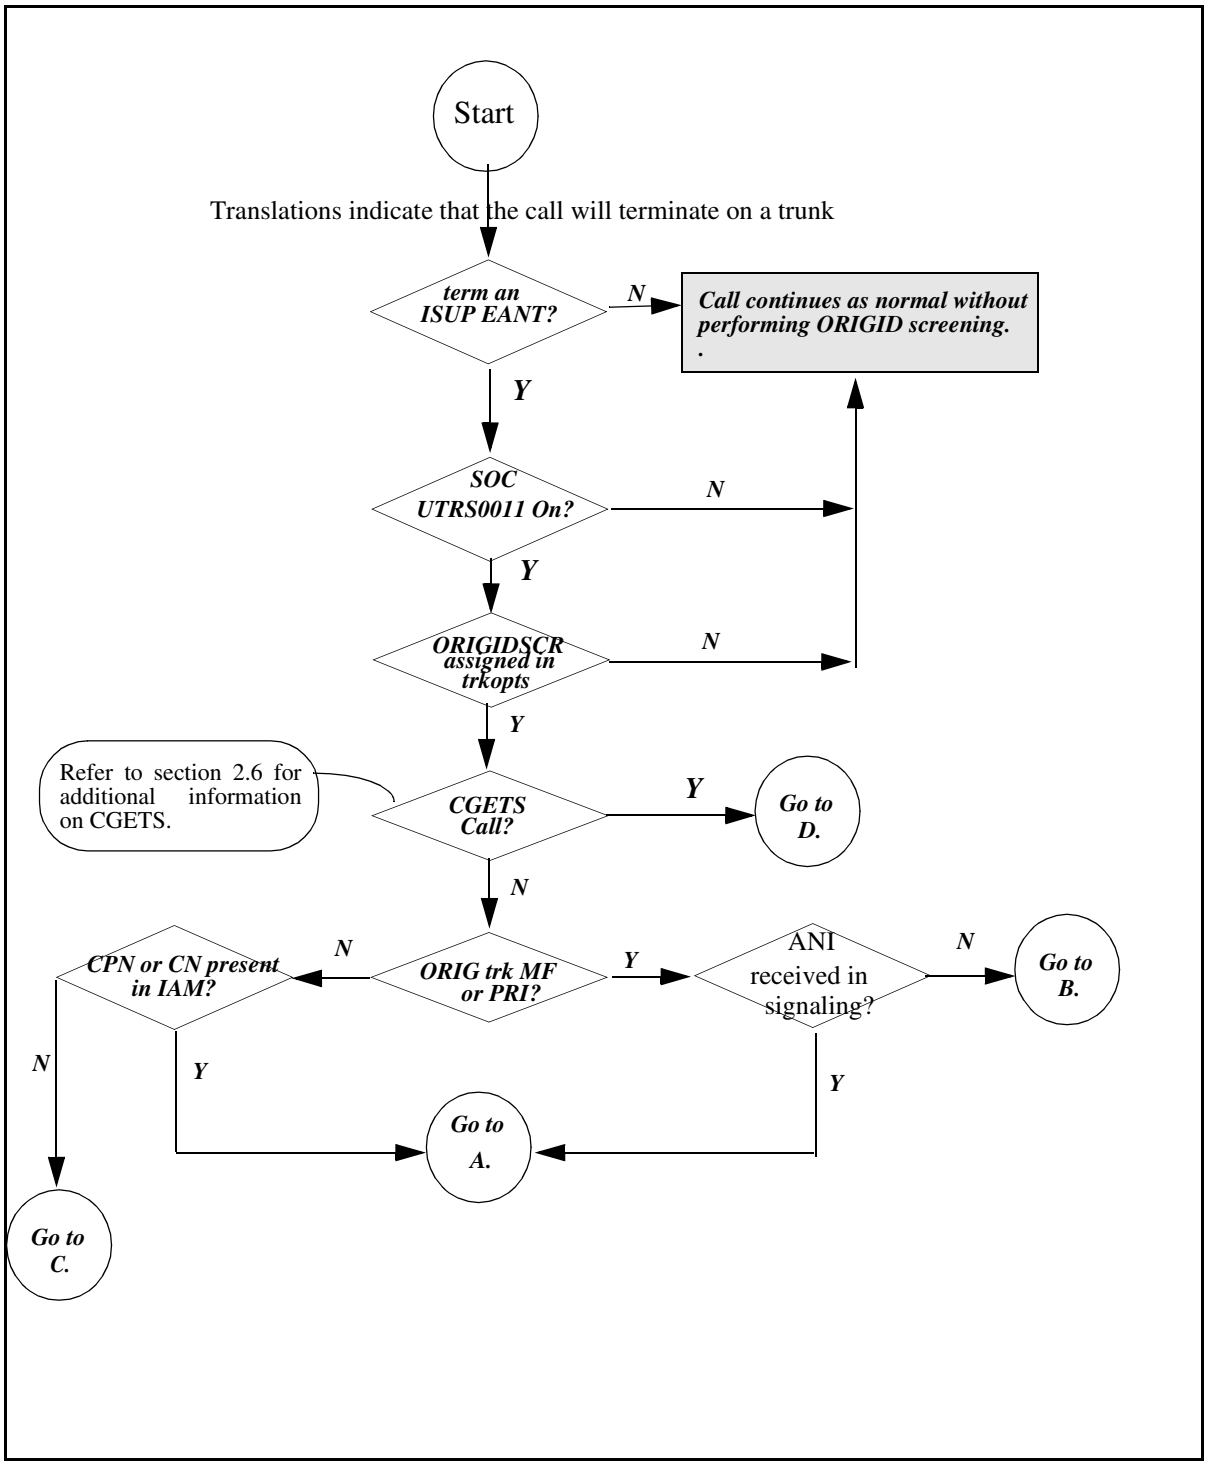
When an attempt to add ORIGIDSCR to an incoming trunk the following error message is generated by table control:
TABLE: TRKOPTS

*** ERROR - ORIGIDSCR can not be assigned to Incoming trunks.

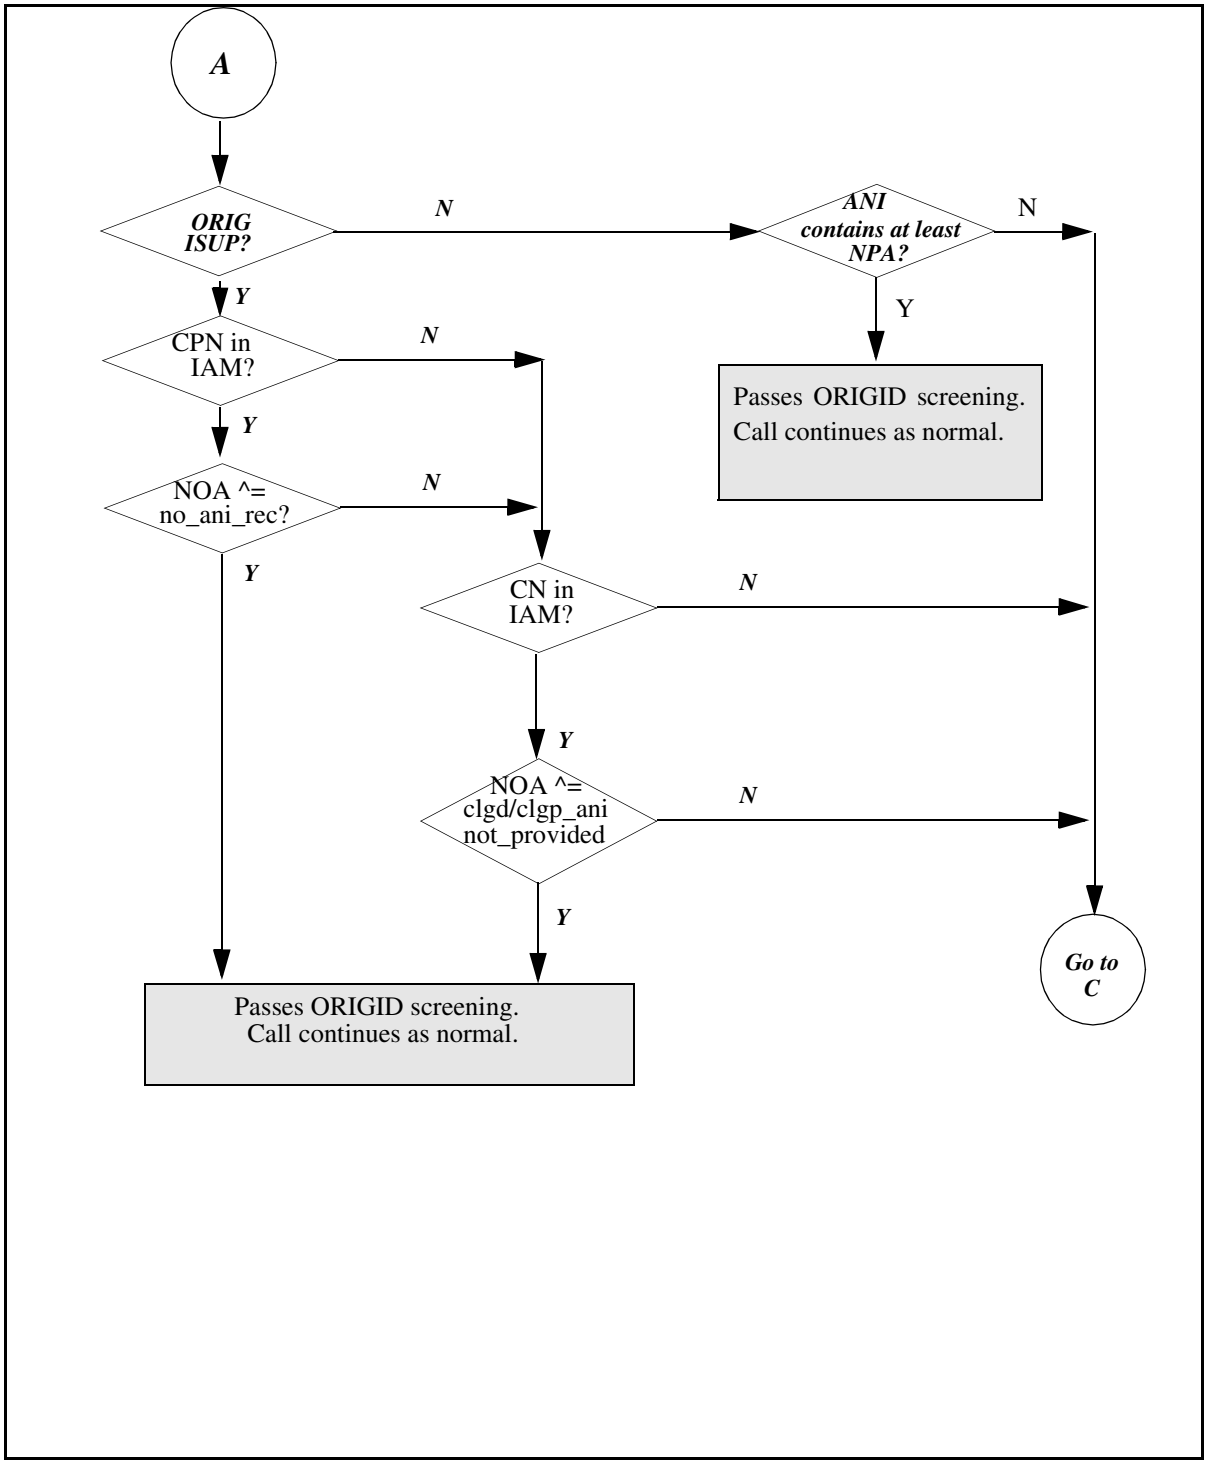
60.2.0.3 Call Processing

Call processing is enhanced to block call terminations on ISUP EANT trunks when ORIGIDSCR is assigned in Table TRKOPTS if the CN or CPN is not available from the incoming signaling or originator datafill. This feature is also controlled by SOC UTRS0011. Starting on page 613 is a detailed flow chart that describes the behavior of this feature.

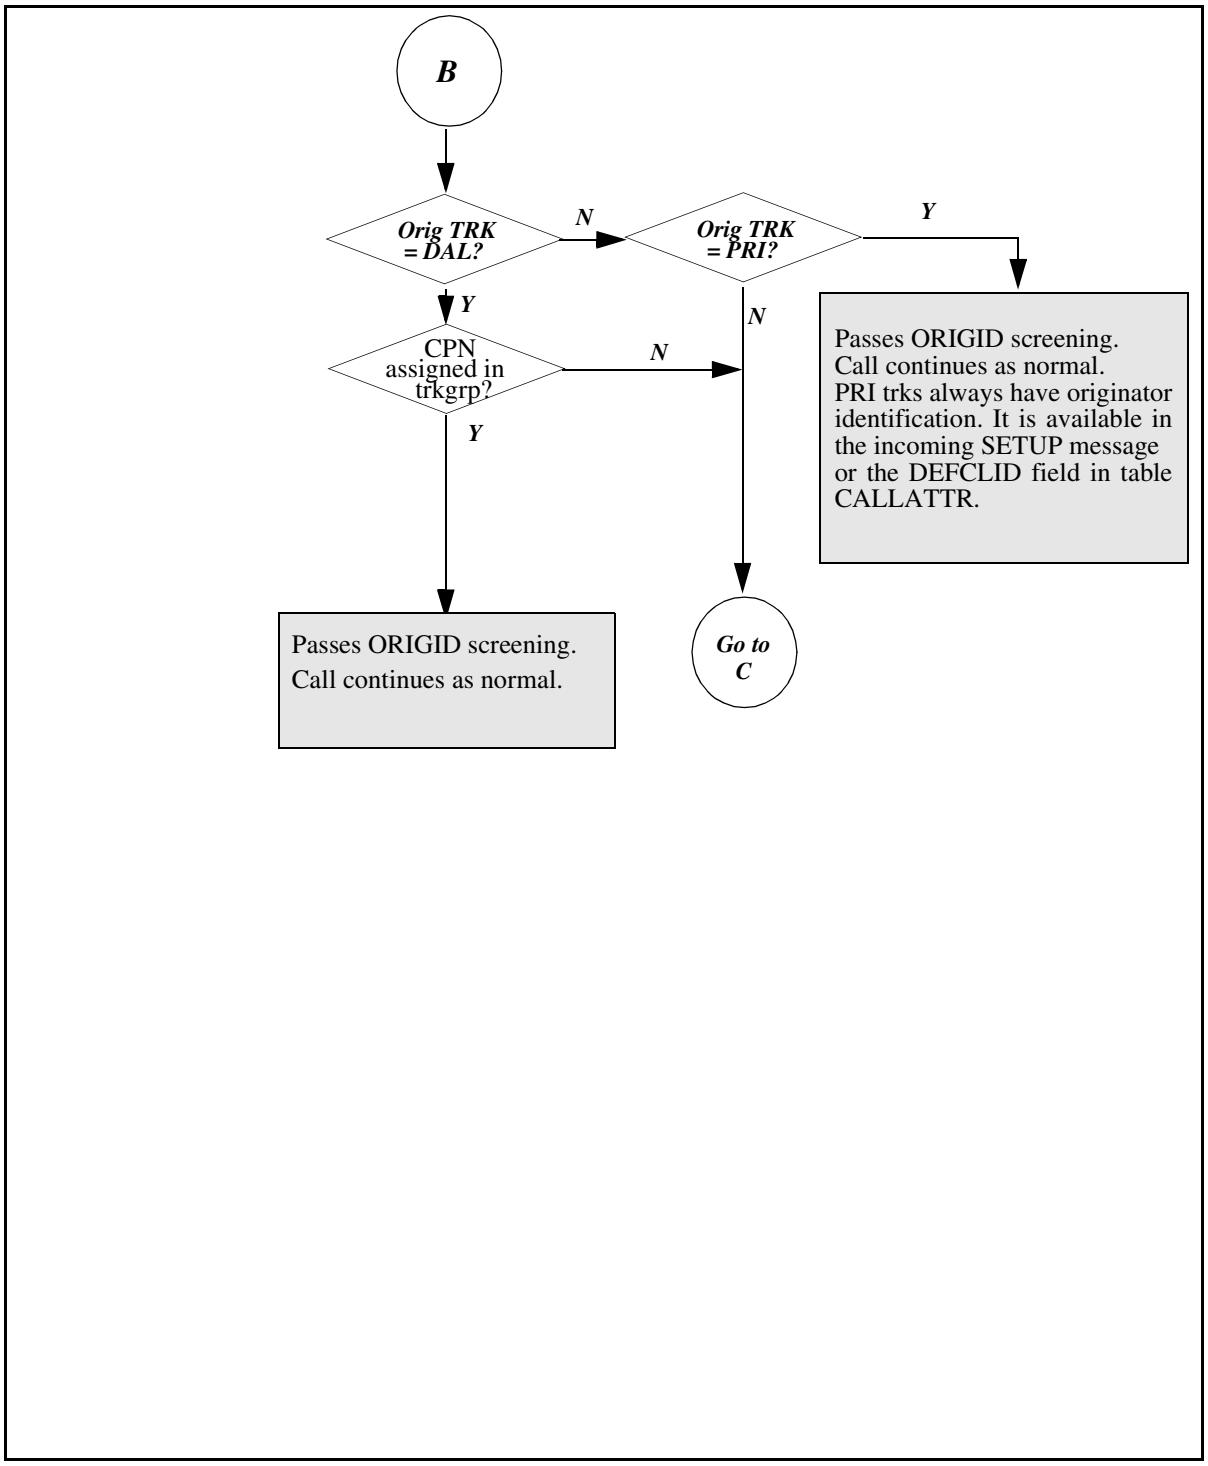
60.2.1 Originator Identification Screening Flow Chart



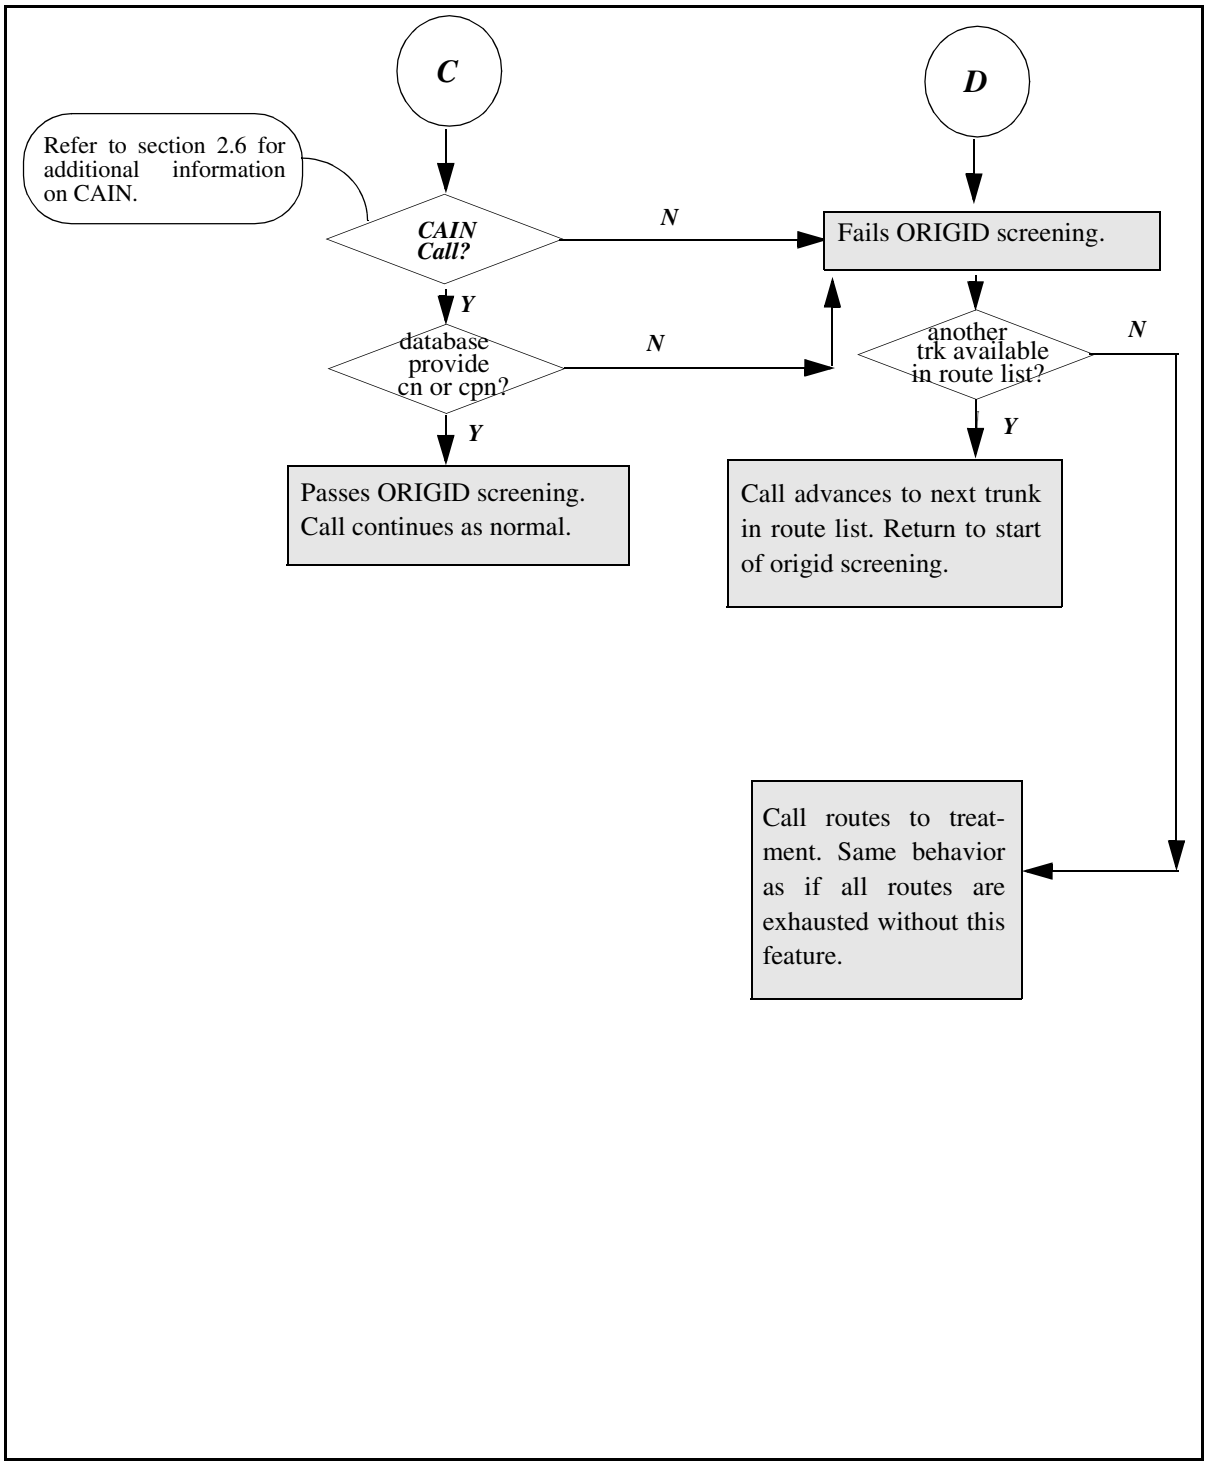
60.2.2 Originator Identification Screening Flow Chart - PART A



60.2.3 Originator Identification Screening Flow Chart - PART B



60.2.4 Originator Identification Screening Flow Chart - PART C & Part D



60.3 Hardware Requirements or Dependencies

None.

60.4 Software Requirements or Dependencies

None.

60.5 Limitations and restrictions

The new option ORIGIDSCR in Table TRKOPTS can only be assigned to 2w or outgoing ISUP EANT trunks. ORIGIDSCR can not be assigned to incoming ISUP EANT trunks.

This feature does not support interaction with Dynamically Controlled Routing (DCR.).

60.6 Interactions

Blocking of ANI delivery

This feature only considers if the CPN or CN is available from the incoming signaling or originator datafill. It does not consider if the originator or terminator has blocked delivery of this information in datafill. Therefore, the blocking of information has no impact on this feature. It is possible for originator screening to pass but the outgoing IAM to not contain CN or CPN because of one of the blocking features. Examples are:

Table RTEATTR	Datafill in Table RTEATTR can block sending out CPN, CN, and other parameters. It can also include CPN, CN, or other parameters.
IMT trunks: Table TRKGRP	Datafill in Table TRKGRP for IMT trunks can block sending out the CPN or CN with field CPIXFER.
EANT trunks: Table TRKGRP	Datafill in Table TRKGRP for EANT trunks can block sending out the CPN or CN with option TMANIDLV.
Tables ANIS-CUSP & UNIPROF	Datafill in both tables can block sending out the CPN or CN with field ANIDELV.

CAIN

CAIN calls can receive a CPN or CN from the SCP. If CPN and CN are not available from the incoming trunk then CAIN calls must check if the database supplied them.

Assume that SOC UTRS0011 is ON and the route determined by CAIN translations provides two possible trunks, TRK1 and TRK2. Only TRK1 has the new ORIGIDSCR option assigned in Table TRKOPTS which is discussed in "Table TRKOPTS: ORIGIDSCR" on page 611. Neither incoming signalling nor the originator datafill provided the CPN or CN but CPN or CN was supplied by the database so the call can terminate on TRK1. If the CAIN database had not supplied CN or CPN the call would route advance to TRK2.

CGETS

This feature does not support the termination of CGETS calls on trunks with ORIGIDSCR assigned. If a CGETS call attempts to route over a trunk that has this feature activated it will always route advance.

61: Functional Description (FN): A00002970

61.1 Feature name

SMG4 Remote Site Provisioning

61.2 Description

SMG4s can be provisioned at multiple sites for a given CS2K. However, the SN06 and previous releases, have a limitation. SMG4s cannot be provisioned at multiple sites on the same floor, row, frame position and shelf position .

This feature aims at rectifying this limitation. As part of the feature enhancements, the following functionalities are introduced :

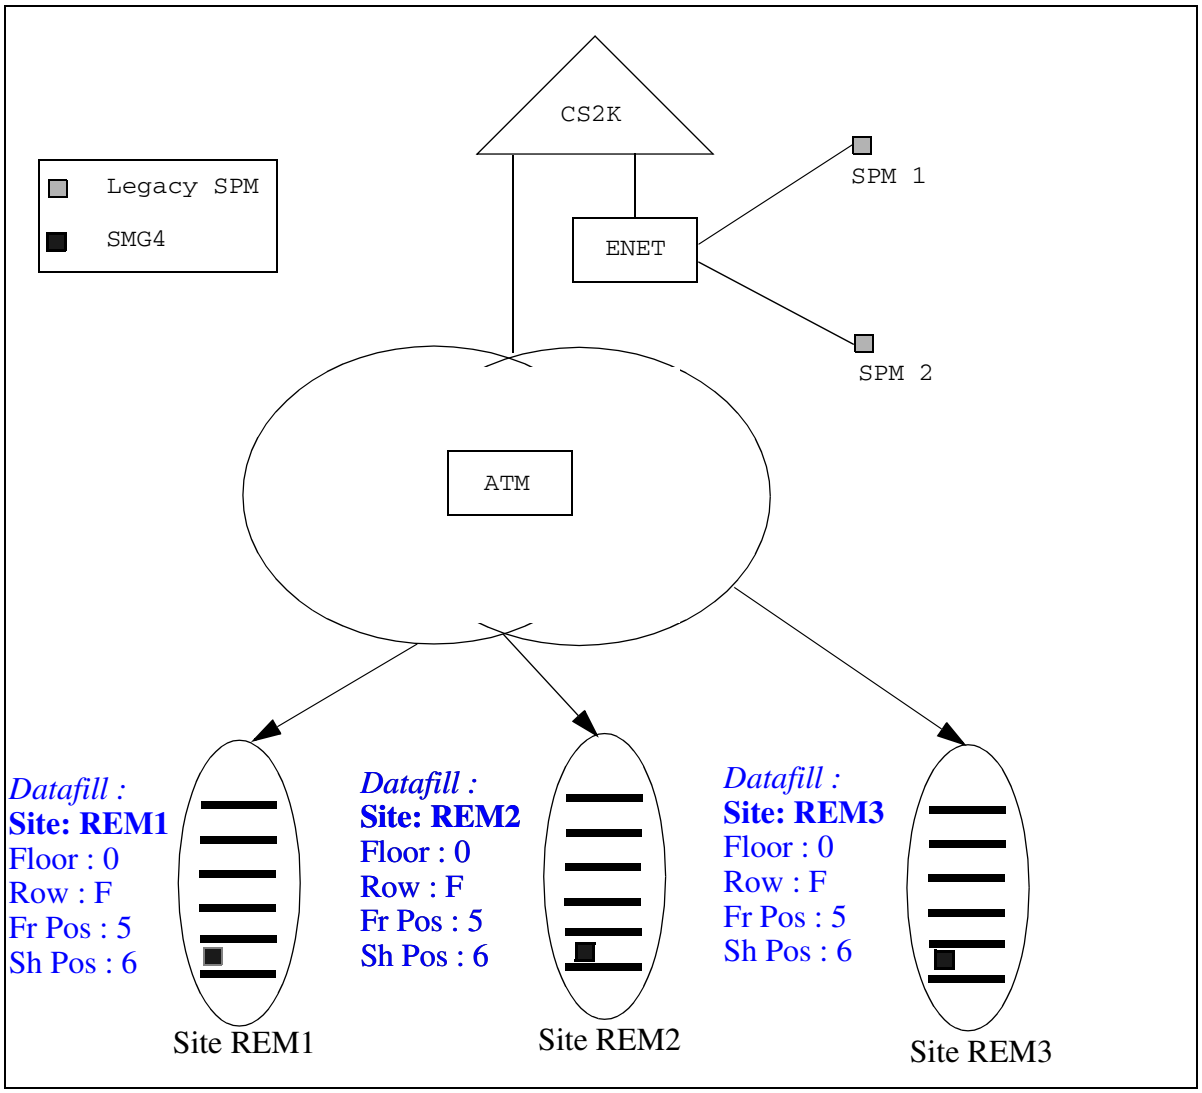
- Introduction of an inservice editable field, ‘SITE’ in Table MNNODE for SMG4s only.
- While datafilling the shelf position in the Table MNSHELF, the new field ‘SITE’(Table MNNODE) is also taken into consideration (for unique check of location) along with the fields, floor(Table MNNODE), row(Table MNSHELF), frame position(Table MNSHELF) and shelf position(Table MNSHELF).
- The ‘SITE’ field datafill in Table MNNODE is also reflected in the existing MAPs, Logs and Tools wherever the site name is displayed.

61.2.1 Functional Overview

This feature introduces an inservice editable field, ‘SITE’, in Table MNNODE. Hence, while datafilling the shelf position for an SMG4 in Table MNSHELF, a uniqueness check is performed taking the site also into consideration apart from the other fields. The other fields that determine the uniqueness of location are floor(TableMNNODE), row(Table MNSHELF), frame position(Table MNSHELF) and shelf position(Table MNSHELF).

Figure 1 shows how the fields - site, floor, row, frame position and shelf position determine the uniqueness of location of an SPM. Also, it is illustrated in the figure that as a result of this feature, SMG4s can now be provisioned at multiple sites on the same floor, row, frame position and shelf position.

Figure 1 The desired datafill behaviour

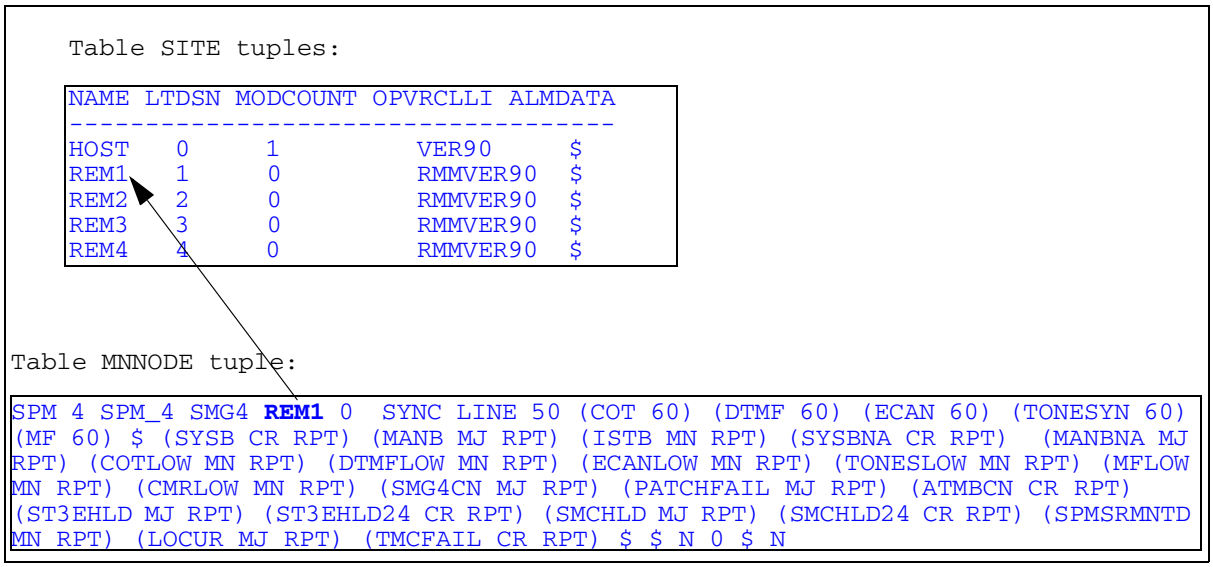


The major functionality changes as a result of this feature are :

61.2.1.1 Table MNNODE changes

A new field,'SITE' has been introduced in the Table MNNODE. This field accepts a four character site name while provisioning(add /modify) the table MNNODE. The allowed values for this field are the sitenames present in Table SITE. Any other sitename, not present in Table SITE, will fail the datafill operation. An example tuple with the new field, and its relationship with Table SITE is shown in Figure 2.

Figure 2 Table MNNODE tuple example with SITE field made editable



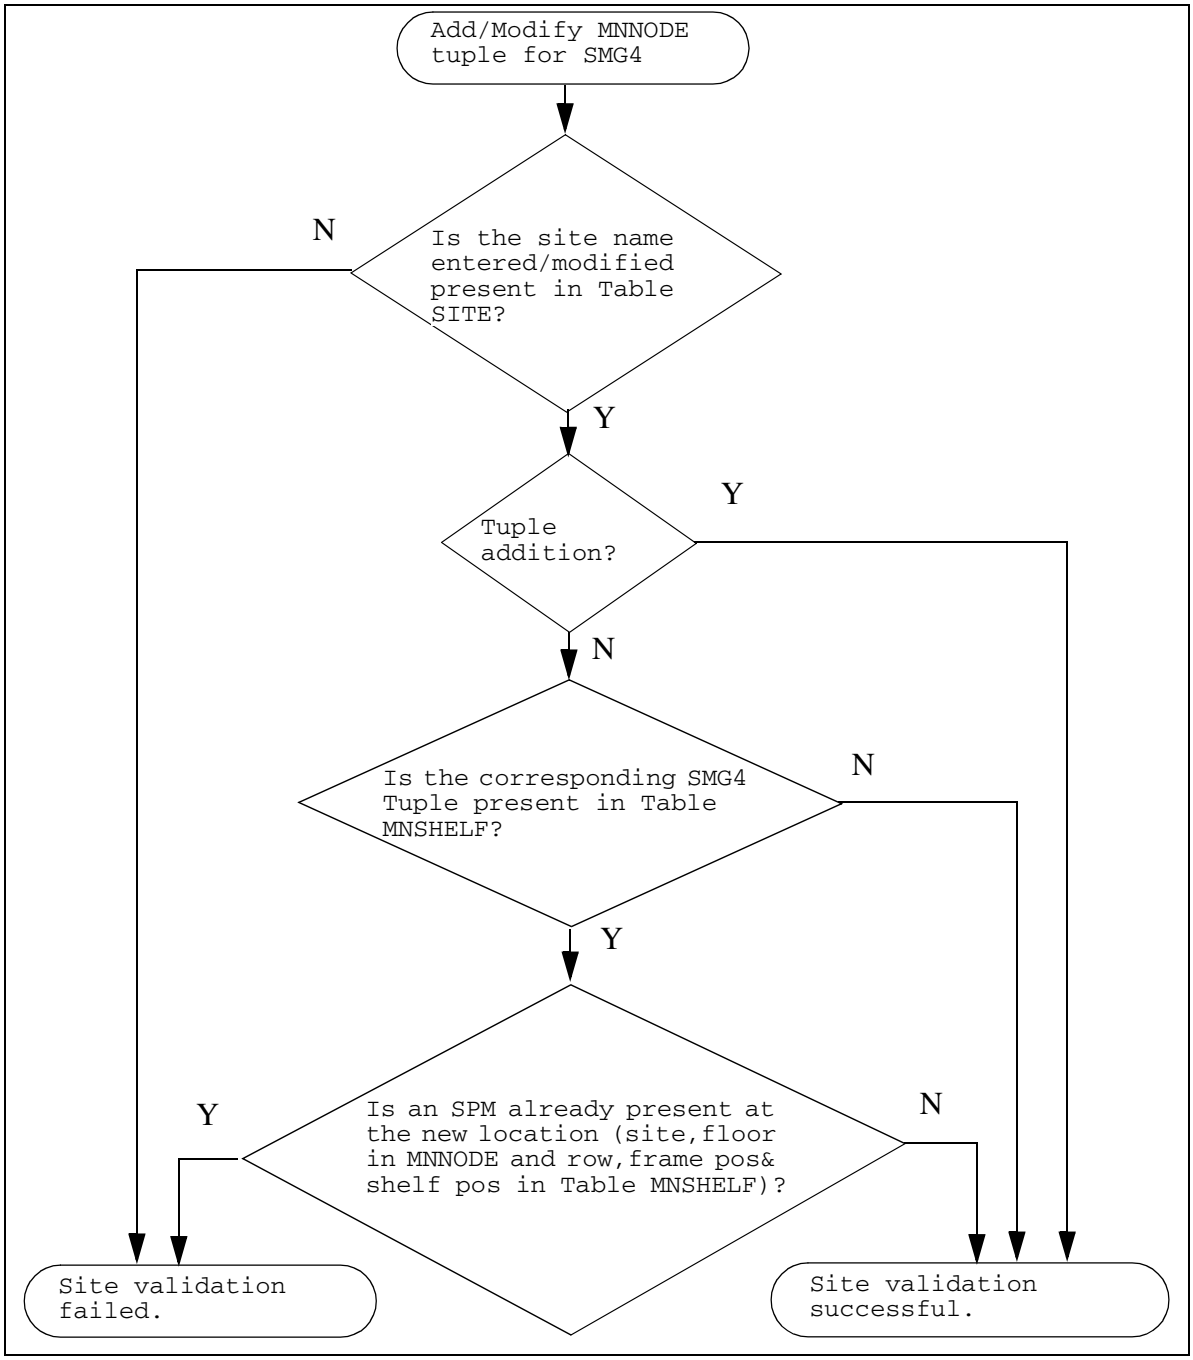
A provisioning example with reference to this feature is shown in Section 61.9 of this document.

Over ONP from previous releases, the value of this new field is defaulted to ‘HOST.’ After an ONP, for SMG4s that are located at a remote site, and are already provisioned, the provisioning information in MNNODE has to be modified appropriately.

This new field is independent of the existing field, ‘REMOTE’ in Table MNNODE. This is because, FSP alarms on remote SMG4 nodes will be reported at the core based on the REMOTE bool in table MNNODE and are not dependent on this new field, ‘SITE’.

Figure 3 shows a flow diagram of how the MNNODE datafill operation proceeds after adding this new field.

Figure 3 Flow Chart for Table MNNODE 'SITE' field validation



The new error messages introduced as a result of the site field validation have been described in the Data Schema in the Configuration document of A00002970.

61.2.1.2 Changes in MAPs, Logs and Tools

The feature also takes care of reflecting the data of the newly introduced field, ‘SITE’ in all the MAPs, Logs and Tools that display the site name for an SPM.

The MAPs and Tools that display site name have been listed in the CN document(Configuration) for this feature, i.e. A00002970.

The Logs that display site name have been listed in the FM document(Fault Management) for this feature, i.e. A00002970.

61.10 References

1. A00002970 in PLS FMDOC.

62: Functional Description (FN): A00002966

62.1 Feature name

Base Re-architecture Phase 2

62.2 Description

The feature is a follow-up to Base Re-architecture Phase 1 which re-architected the SDM platform software to decouple the AIX specific software from the common base software and port it from AIX compiler to open sourced GCC compiler. The common base software can be compiled across multi-platforms, such as AIX, Sun, and be used by SDM and CBM products.

The following major functions are expected to be ported from the SDM to the CBM in the feature:

- **Passthru users using SSH/telnet:** this functionality enables customers to access the Core/CM by logining the CBM through telnet/SSH client software. The user will be automatically forwarded to the Core/CM or the destination configured for the user. No command can be initiated on the CBM by passthru class users. The user interface for managing the passthru users is described in the FN of the feature A00002822 - User Interface Manager for CBM.
- **Restrict shell for maint class users:** all maint class users on the CBM are using the restrict shell to meet security requirement. It uses pretty much the same mechanism as in the SDM except that unix standard man pages are used instead of SDM-own fashioned help command. The user interface for managing the maint class users is described in the FN of the feature A00002822 - User Interface Manager for CBM.
- **Cbmgather tool:** an equivalent platgather tool, which is called cbmgather, is developed on the CBM. The difference from platgather is that the cbmgather doesn't collect the platform specific information, such as splitmode related log, FXgather, etc.

In addition to the porting work, the following new enhancements to the SDM or/and the CBM are expected to be completed in the feature:

- Add querytape subcommand in the apply level of sdmmtc for the SDM to retrieve the version information from the specified tape. It has the following syntax:

  querytape <dat0 | dat1 >

  dat0: tape drive in the domain 0

dat1: tape drive in the domain 1

The help information can be obtained through the help subcommand in the apply level.

- Add a new option to platgather/cbmgather to specify number of days' logs to be collected in order to accommodate some special need when the entire custlog and designlog files are expected to be collected. The new option looks like as follows:

  platgather -n <# of days' log> for the SDM

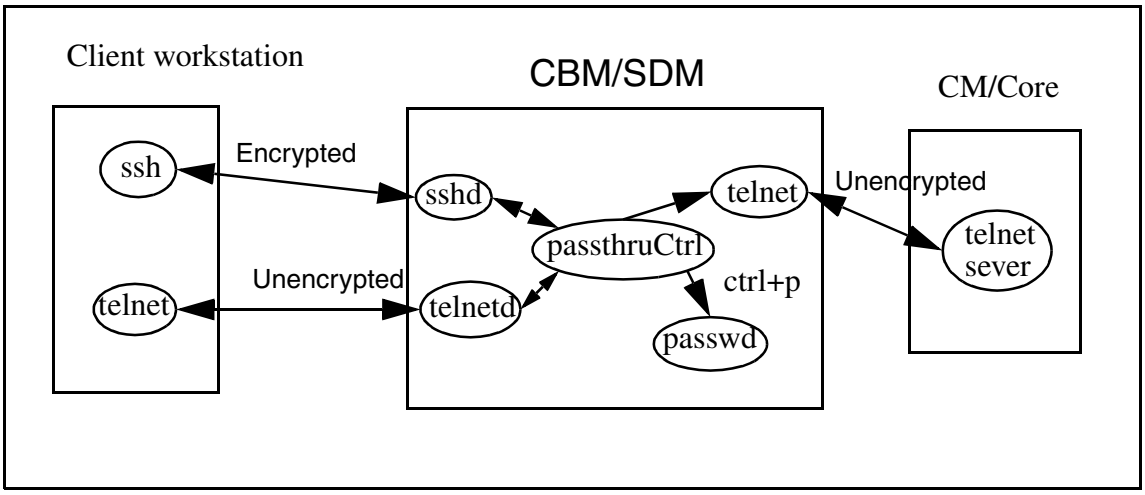
  cbmgather -n <# of days' log> for the CBM

  Where the number ranges from 1 to 7.

- Provide the capability for the passthru users themselves to change their own passwords for the SDM and the CBM. The functionality is requested from our customers and will eliminate the need of administrative users to change the passwords for the passthur users when they want.

  Figure 1, "Functional behavior diagram for passthru users using telnet/ssh" shows how the passthru users work on the CBM/SDM.

Figure 1 Functional behavior diagram for passthru users using telnet/ssh



- List, add, change and modify the passthru users through the command line tool - passthru.

62.3 Hardware Requirements or Dependencies

SSPFS platform hardware and FX

62.4 Software Requirements or Dependencies

SSPFS platform software and SDM

62.5 Limitations and restrictions

Passthru users don’t support the slicing on the CBM in the current release

63: Functional Description (FN): A00002979

63.1 Feature name

A00002979: Panther Electronic Software Delivery

63.2 Description

The PMUPGRADE DMS tool is part of the PANTHER initiative to automate the peripheral module (PM) software upgrade process for DMS switches. PM software upgrades are tedious and time consuming for Nortel customers, usually performed over several off-hour maintenance shifts. PANTHER's goals with respect to the PM software upgrade process are to:

- simplify
- reduce interval
- reduce cost
- improve quality

The purpose of this feature (Feature Number: A00002979) is to update and verify the unreleased CSP10 feature SD0910 so that it is able to be safely released and sustained in the current TDM and Succession environments. This is necessary to ensure the proper working of this feature with the new products and functionality that have been introduced since SD0910 was originally developed (e.g. SPM, XA-Core, etc.)

The purpose of the original CSP10 feature SD0910 is to supplement the PMUPGRADE tool for the electronic delivery of PM upgrade files to the DMS switch. Electronic software delivery (ESD) will contribute to interval and cost reduction of the PM upgrade process. This will allow Nortel customers to deploy new services and conform to changing regulatory requirements in a timely fashion and at a reasonable cost.

The PM upgrade process consists of three phases:

- administration of the new PM upgrade release files (PM load files, PM patch files, and the PM patch cross-reference file) by the PMUPGRADE tool
- production of a recommended PM upgrade plan by the PMUPGRADE tool
- execution of this upgrade plan by the SWUPGRADE PM tool

Feature SD0910 was designed to supplement the PMUPGRADE tool to support the electronic delivery of new PM upgrade files to the DMS switch during the file administration phase of the PM upgrade. The PMUPGRADE design component which deals with physical DMS volumes and files is extended to handle connections to remote FTP volumes. The traditional tape delivery of PM upgrade files remains fully supported by PMUPGRADE. Electronic software delivery helps reduce the need for site access to the DMS switch by customer personnel during the PM upgrade process. This promotes remote activation and supervision of the PM upgrade process.

63.2.1 Feature Limitations

Panther does not handle electronic software delivery of DMS-Core load files. Only PM loads and patches are handled by Panther. However, it is possible to manually transfer DMS-Core load files via FTP when initiating the file transfer from the DMS.

Secure File Transfer (SFT - NTP 297-5051-304 “SuperNode Data Manager Secure File Transfer User Guide” for more information) is currently not supported to transfer files between the DMS-Core and SDM when the file transfer is initiated from the DMS-Core. Therefore, in order for Panther ESD to access the SDM remote FTP volumes, the SDM will need to support normal or anonymous FTP protocol.

63.3 Hardware Requirements or Dependencies

None

63.4 Software Requirements or Dependencies

None

63.5 Limitations and restrictions

The electronic software delivery capabilities provided to PANTHER by features SD0910 and A00002979 is only supported on DMS switches which have TCP/IP connectivity via a SDM.

63.6 Interactions

None.

64: Functional Description (FN): A00003073

64.1 Feature name: SimRing Deny Redirection (SRDR)

64.2 Description

SimRing is a terminating end office feature. It resides in the Pilot DN's terminating end office and allows a user defined group of up to five DNs to be alerted simultaneously when a specific member (pilot DN) of this group is called. The SimRing group is comprised of a single Pilot DN (PDN) and up to 4 Non-Pilot Member DNs (NPMDNs or MDNs). The first alerted DN that answers the call is connected to the calling party, and the other alerted DNs are released.

This feature, SimRing Deny Redirection (SRDR), enhances SimRing by providing an optional method to allow a SimRing call to forward based only on the Pilot DN's call forwarding options. The NPMDNs are not allowed to forward the call. Without this option the NPMDNs behavior is unchanged, i.e., they are allowed to forward based on the call forwarding options on the NPMDN.

64.3 Hardware Requirements or Dependencies

No new hardware dependencies are introduced by this feature.

64.4 Software Requirements or Dependencies

Redirection Framework.

64.5 Limitations and restrictions

1. The NPMDN's terminating switch must not forward a call which has been marked as having been previously forwarded five (5) times.

This feature relies on the terminating switch of the NPMDN to adhere to the following standards by not forwarding a call which has already been forwarded five times.

— GR-586-CORE, *LSSGR: Call Forwarding Subfeatures (FSD 01-02-1450)*

3.1.1.2.A *Subfeature Construction and Assignment* CFDA: The sequential forwarding limit is five.

— TR-NWT-000972, *Call Forwarding Subfeatures: Switching System Requirements Using Signaling System No. 7 (SS7)*

3.1.1.4.D *Sequential Forwarding* Within the SS7 network or tandem SS7 networks the total number of all (intra and inter-switch) forwardings for each call should be limited. A count of the number of sequential forwardings is kept in the Redirection Counter field in the Redirection Information parameter.

3.1.3.1 *Sequential Forwarding Limit Reached* When the call ... has already been forwarded five times which is the sequential CF limit ... the call should not be forwarded...

2. SRDR is not compatible with a NPMDN terminating end office that uses any overflow or redirection that ignores the redirection/sequential-forwarding counter (for example RCF).

3. SRDR is not compatible with any SCP query/response which results in the modification of the redirection count.

For example, after the PDN-NPMDN call leg leaves the PDN's office, it is possible for an SSP (i.e., a tandem office in the network or the NPMDN's terminating office) to query an SCP and receive a message, analyze_route for example, with instructions for the SSP to reset the redirection count.

4. For inter-office PDN-NPMDN call legs, SRDR is supported when the connection between the Pilot DN's office and the NPMDN's office is ISUP all the way, PRI all the way, or ISUP/PRI interworking. It is not supported for any other network topology.

5. For inter-office PDN-NPMDN call legs, the existing office parm REDIRECTION_FRAMEWORK in table OFCVAR must be set to Y.

6. SRDR is not compatible with the following features when NPMDN and forwarded to DN are in the same office:

- RCF (Remote Call Forwarding)
- LOD (Line Overflow to Directory number)
- LOR (Line Overflow to Route)
- SCMP (Series Completion)
- DNH (Directory Number Hunt)
- KSH (Key Short Hunt)

64.6 Interactions

1. For the PDN-NPMDN leg, when member_dn_redir_allowed is set to NO, the call is made to look as if five redirections have taken place. Therefore, subsequent AIN queries on the PDN-NPMDN leg will include redirection parameters.
2. For calling number delivery, the EBS NPMDN will display the pilot DN and No Ans Fwd as the redirecting DN/reason when the pilot and NPMDN are in the same customer group but in separate offices connected over an ISUP IBN trunk.
3. If the Simring Redirection bool is set to 'NO' on a Simring group that has member DNs that route via ISUP/PRI trunk to a business set agent capable of displaying a REASON, then that set will display a REASON of Call Forward Don't Answer along with the calling party ID. With the Simring Redirection bool set to 'YES' the display of the terminating business set will not display a REASON of Call For -ward Don't Answer.

65: Functional Description (FN): A00003154

65.1 Feature name

MG9000 Manager Capacity Increase

65.2 Description

In the SN07 release the MG9000 Manager will be required to support a maximum capacity of 110,000 H.248 native lines and 75 MG9000 network elements. The pre-SN07 maximum capacity for the MG9000 Manager is 55,000 lines and 60 MG9000 network elements. The recovery time for the 55,000 line configuration is 90 minutes per SN06 Engineering Guidelines. This feature by requirement will meet or exceed the current documented SN06 recovery time, under the new extended capacity requirements.

The reason for the long recovery times is that per the current software architecture, managed objects have to be instantiated within the EM to allow OAM&P. To achieve the SN07 requirements specific managed objects in the MG9000 Manager design will be collapsed. These objects will have their data persisted to the Oracle database and their business logic collapsed into a container class. This design simplifies the recovery of the “leaf nodes” in the system, which require the most memory footprint and instantiation resources during application startup.

Included as part of this design, all configurable MG9000 data will be persisted and restored from the Oracle database. There will also be work required to support maintenance release and major release upgrades.

65.3 Hardware Requirements or Dependencies

This feature will apply to all supported hardware platforms, per SN07 Succession Server Platform Foundation Software specification.

65.4 Software Requirements or Dependencies

None

65.5 Limitations and restrictions

MG9000 provisioning actions will not be accepted in the event of a loss of communication with the Oracle Database hosted on the CS2M host.

65.6 Interactions

None.

65.8 Glossary

66: Functional Description (FN): A00003154

66.1 Feature name

SN07 Take Back and Transfer Enhancements - A00003154

66.2 Description

Tack Back and Transfer (TBT) is a service which allows a terminator to initiate a conference call or transfer the call to another party using the Switch_Hook_Flash (SHF) capability.

This activity, A00003154, provides the following new capabilities in a TBT call:

1. A **Connect_To_Resource** (CTR) message requesting an internal switch resource for only digit collection.
2. A PRI connection between a UCS DMS-250 switch and an external resource (i.e Intelligent Peripheral -IP).
3. The interaction context between the SCP and IP can be specified as Connect_1129_style.

In addition to supporting additional CTR scenarios, this feature addresses all of the issues associated with the CAIN OMs for Take Back and Transfer calls.

For additional information concerning Tack Back and Transfer, refer to feature A89008913, Take Back and Transfer Feature Sourcing and Re-Engineering.

66.3 Connect To Resource Overview

Take Back and Transfer supports the receipt of the **Connect_To_Resource**(CTR) message in response to the Switch-Hook_Flash Event Request message sent at the **O_Mid_Call** EDP.

Connect_To_Resource message allows connection of a resource to an existing two-party call, which can be used for applications that need to provide announcements and/or collect digits from the user, such as with debit card calls. The SCP may return a CTR message to request the SSP to route the call or a leg of the call to a resource.

For detailed information about the **Connect_To_Resource** message, refer to feature AX0974 which implemented the **Connect_To_Resource** message as defined by GR-1298 CORE AIN Switching Systems Generic Requirements, Issue 7.

66.3.1 Internal Resource

This activity provides the capability for TBT calls to connect to an internal resource for only digit collection using a **Connect_To_Resource** message.. The SSP interprets a **Connect_to_Resource** message without a Destination Address parameter as a request to access an internal switch resource. The connection to an internal resource for a TBT call is requested through a Conversation package.

If a LegID is specified and a non-specified leg abandons the call, the following actions are performed:

— The switch cancels the resource interaction

— The switch sends a CTR_Clear in a response package with a ClearCause parameter set to userAbanodon

If a LegID is specified and the user on the leg abandons or is disconnected in some other way before the Connect_To_Resource is complete:

— The UCS DMS-250 switch cancels the resource interaction.

— The UCS DMS-250 switch sends a CTR_Clear in a response package with a ClearCause parameter set to userAbandon.

66.3.2 PRI Support for Intelligent Peripheral Connection

In SN06, activity A89008913 provided support for a SS7- IMT connection between the DMS-250 and the external resource (i.e. Intelligent Peripheral - IP). This SN07 activity provides the functionality that allows a PRI connection between the DMS-250 and the IP for TBT calls. When the Destination Address parameter is included in the **Connect_to_Resource** message, the SSP interprets the message as a request for an IP. For TBT calls, the **Connect_to_Resource** message must be designated as a Conversation package.

When an SCP requests a local SSP to make a connection to an IP and the local SSP has a direct ISDN or SS7connection to the IP, the indicated IP is referred to as a local IP. The local IP is designated in datafill by the IPTRUNK option in table TRKGRP. PRI can only be used for local IP connections.

66.3.3 Connect_1129_style support for Intelligent Peripheral Interface (IPI)

In SN06, activity A89008913 provided the Connect_only capability. This SN07 activity provides Connect_1129_style functionality for TBT calls. Connect_1129_Style provides the capability to allow for an SSP to interwork an exchange of data between an IP and SCP. During the active connection to an IP, data may be exchanged between the SCP and IP using certain PRI

message or a certain ISUP message, the **Call_Info_From_Resource** message and the **Call_Info_To_Resource** message.

With Connect_1129_style, the IP can be used to collect digits from the end user. After the digits have been collected, the IP sends the collected digits to the SSP within the Remote Operation (RO) parameter.

For PRI, the RO parameter can be sent with:

- Disconnect message
- Facility message

For IMT, the RO parameter can be sent with:

- ISUP FAR message
- ISUP Release message.

Data can be passed between the SSP and the SCP using the **Call_Info_From_Resource** and **Call_Info_To_Resource** message. Upon receipt of a valid FAC or FAR message, the UCS DMS-250 switch builds a **Call_Info_From_Resource** message, containing the IPReturnBlock parameter.

The expected response to the **Call_Info_From_Resource** message is the **Call_Info_To_Resource** message.

For detailed information concerning Connect_1129_style, refer to AX0974, Networkbuilder Connect_to_Resource.

66.3.3.1 Determination of IPI

The CONNECT_1129_STYLE method can be specified by one of three ways:

- The CAINSTRConnectionType extension parameter in the Connect_To_Resource message. Refer to UCS08 feature AX0190.
- The STR_CONNECTION_TYPE in table CAINXDFT for the associated CAINGRP.
- The tuple STR_CONNECTION_TYPE in table CAINPARM. Refer to UCS08 feature AX0190 for more information.

66.3.3.2 Timers

With the CONNECT_1129_Style, the timer TSTRC provides a maximum time limit for a CTR-Connection to an IP. It is started when the IP answers and canceled with the CTR-Connection is cleared, either by the SSP or IP. The TSTRC_TIMER field in table CAINPARM determines the time duration for the TSTRC timer. The following are the values for the TSTRC_TIMER:

- Range - 0 to 60 minutes, with the value of 0 disabling the timer
- Default - The timer will have a default value of 6 minutes.

66.3.3.3 Call_Info_From_Resource message

The Call_Info_From_Resource message is sent by the SSP to send intermediate information from an IP to the SCP during the Connect_1129-style connection.

The IPReturnBlock parameter is used to send the result of any user-interaction with the IP to the SCP.

Table 1 indicates the parameters supported by the Call_Info_From_Resource message.

Table 1 Call_info_From_Resource Message Parameters

Call_Info_From_Resource Message
IPReturnBlock
ExtensionParameter

66.3.3.4 Call_Info_To_Resource message

The Call_Info_To_Resource message is sent by the SCP. This message is used to provide a response to the intermediate information received from the IP through the UCS DMS-250 switch during an active Connect_1129_style connection. This message is used in response to the Call_Info_From_Resource.

Table 2 indicates the parameters supported by the Call_Info_To_Resource message.

Table 2 Call_info_To_Resource Message Parameters

Call_Info_To_Resource Message
ResourceType
StrParameterBlock
ExtensionParameter

66.4 Operational Measurements support for Take Back and Transfer

OMs – Operational Measurements of data that are collected and displayed as the switch performs various operations. The affected CAIN OM groups that are addressed by this re-engineering activity for TBT functionality are listed below:

- CAINAGOM
- CAINMSGR
- CAINMSGS
- CAINTRIG

The scope of this activity is limited to the above mentioned CAIN OM groups and the associated Registers for TBT functionality.

66.4.1 Group: CAINAGOM

The Carrier Advanced Intelligent Network Per-Agency Operational Measurements (CAINAGOM) group provides threshold reporting of OMs on a per agency basis.

CAINAGOM consists of eight tuples:

• TOTAL - represents the sum of OM tuples pegged on a per agency basis.

• DAL - represents measurements occurring on DAL originating or terminating agencies.

• EANT - represents measurements occurring on EANT originating or terminating agencies.

• ONAL-represents measurements occurring on ONAL originating or terminating agencies.

• ONAT-represents measurements occurring on ONAT originating or terminating agencies.

• PRI - represents measurements occurring on PRI originating or terminating agencies.

• IMT - represents measurements occurring on IMT originating or terminating agencies.

For Call Configurations (CC) between CC4 (ThreePartySetup) to CC11 (Transfer) the controlling leg i.e, TermA being the controlling leg shall be the originating agent for the following registers:

- AGRESPR

- AGEDPRCD
- AGEDPREQ
- AGCTRCNV
- AGCTRCLR

In CC11 (Transfer), if TermB initiates SHF (Switch_Hook_Flash) for Multiple transfer, then TermB would become the new controlling leg and hence TermB shall be considered as the originating agent for the above mentioned registers.

66.4.1.1 Register: AGRESPR

Counts the number of responses the switch receives from the SCP for calls originating on the agent type of the associated tuple. This register is pegged when the switch receives successfully decoded messages.

When we transition from CC2 (StableTwoParty) to CC4 by means of Originate_Call response for O_Mid_Call query, Orig being the originator of the first leg and the only leg at this point shall be pegged for this register.

66.4.1.2 Register: AGEDPRCD

Counts the number of times a valid Request_Report_BCM_Event component is received.

This register is pegged after the successful validation of the RRBCME component.

66.4.1.3 Register: AGEDPREQ

Counts the number of EDP requests sent for calls originating on the agent type of the associated tuple.

This register is pegged after the successful launch of EDP request form the SSP to the SCP.

66.4.1.4 Register: AGCTRCNV

Counts the number of conversational Connect_To_Resource messages received by each type of CAIN agent on the SSP.

This register is pegged after the successful decoding of CTR in conversation message.

The registers AGRESPR in group CAINAGOM and RESPRCVD in group CAINTRIG are not pegged when CTR message is received in conversation

package. These registers are pegged only when CTR message is received in response package.

66.4.1.5 Register: AGCTRCLR

Counts the number of CTR_Clear messages sent by CAIN agents on the SSP.

This register is pegged after the successful launch of CTR_Clear message form the SSP to the SCP.

66.4.2 Group: CAINMSGR

The Carrier AIN Messages Received (CAINMSGR) group reports the number of CAIN TCAP messages received from the Service Control Point (SCP) related to call processing.

When an unarmed event processing happens then the register corresponding to the SSP's action taken is not pegged.

For ex: In CC6 (PARTYONHOLD) call configuration if the Passive Leg 1 (Orig) disconnects, then the SSP performs disconnect leg processing with LegID 1 and the call transitions to CC2 (STABLE2PARTY). In this scenario, the register DISCLEG is not pegged.

To make it clear, a register of this OM group is pegged only when the corresponding message is received by SSP from the SCP and not when the SSP internally performs that message action due to unarmed event processing.

66.4.2.1 Register: CONTINUE

Counts the number of Continue messages received by the switch.

This register is pegged after the successful decoding of CONTINUE message.

66.4.2.2 Register: DISCON

Counts the number of Disconnect messages received by the switch.

This register is pegged after the successful decoding of DISCONNECT message.

66.4.2.3 Register: RRBCMEVT

Counts the number of Request_Report_BCM_Event operations received by the switch.

This register is pegged after the successful decoding of RRBCME component.

66.4.2.4 Register: CON2RSRC

Counts the number of Connect_To_Resource messages received by the switch.

This register is pegged after the successful decoding of CTR message.

This register will be pegged for CTR message both in response and conversation package.

66.4.2.5 Register: ORIGCALL

Counts the number of Originate_Call messages the switch receives.

This register is pegged after the successful decoding of ORIGINATE_CALL message.

66.4.2.6 Register: MERGECL

Counts the number of Merge_Call messages the switch receives.

This register is pegged after the successful decoding of MERGE_CALL message.

66.4.2.7 Register: DISCLEG

Counts the number of Disconnect_Leg messages the switch receives.

This register is pegged after the successful decoding of DISCONNECT_LEG message.

66.4.2.8 Register: ACKNOW

Counts the number of Acknowledge messages the switch receives.

This register is pegged after the successful decoding of ACKNOWLEDGE message.

66.4.3 Group: CAINMSGS

The Carrier AIN Message Sent (CAINMSGS) group provides OMs for TCAP messages sent to the Service Control Point (SCP) for CAIN processing.

66.4.3.1 Register: ODISC

Counts the number of O_Disconnect messages sent to the SCP.

This register is pegged after the successful encoding of O_DISCONNECT message.

66.4.3.2 Register: OMIDCALL

Counts the number of O_Mid_Call messages sent to the SCP.

This register is pegged after the successful encoding of O_MID_CALL message.

66.4.3.3 Register: CTRCLR

Counts the number of CTR_Clear messages sent to the SCP.

This register is pegged after the successful encoding of CTR_CLEAR message.

66.4.3.4 Register: OABANDON

Counts the number of O_Abandon EDP-Request messages the switch sends to the SCP.

This register is pegged after the successful encoding of O_ABANDON message.

66.4.3.5 Register: FAILUREO

Counts the number of Failure_Outcome messages the switch sends to the SCP.

This register is pegged after the successful encoding of FAILURE_OUTCOME message.

66.4.4 Group: CAINTRIG

The Carrier AIN Trigger (CAINTRIG) group provides OMs for each Carrier Advanced Intelligent Network (CAIN) trigger and Event Detection Point.CAINTRIG consists of 24 tuples on each DMS switch.

The OMs related to a TBT call are listed below:

• ODISC - represents OMs relating to calls that encounter the O_Disconnect event

• OABANDON-represents OMs relating to calls that encounter the O_Abandon event.

• SHF-represents OMs relating to calls that encounter the Switch_Hook_Flash event.

66.4.4.1 Register: RESPRCVD

Counts the number of responses the switch receives from the SCP that can be decoded and the requested action attempted.

This register is pegged after successful decoding of the message and the requested action being attempted.

66.4.4.2 Register: EDPSRCVD

Counts the number of times the switch receives a valid Request_Report_BCM_Event component.

This register is pegged after successful validation of the RRBCME component.

66.4.4.3 Register: EDPREQ

Counts the number of EDP requests sent to the SCP.

This register is pegged just before the successful launch of EDP request form the SSP to the SCP.

66.4.4.4 Register: CTRCONV

Counts the number of conversational Connect_To_Resource messages the switch received from the SCP.

This register is pegged after the successful decoding of CTR in conversation message.

The registers AGRESPR in group CAINAGOM and RESPRCVD in group CAINTRIG are not pegged when CTR message is received in conversation package. These registers are pegged only when CTR message is received in response package.

66.4.4.5 Register: CCLRCONV

Counts the number of CTR_Clear conversational messages sent to the SCP.

This register is pegged after the successful launch of CTR_Clear message from the SSP to the SCP.

67: Functional Description (FN): A00003233

67.1 Feature name

LANComm Tool Enhancements.

67.2 Description

This feature will provide necessary enhancments to existing LANComm tools. The following tools will be addressed: ARPMONCI, IPROUTCI, NETMAN, SNPINGCI, UDPCI, and IPOMSCI. The operation of existing Command Increments (CI) will not be changed. However NETMAN's 'FREE' CI, IPROUTCI's 'ROUTER' CI, SNPINGCI's REG and DEREG CI have been limited to the lab environment. IPROUTCI's 'DELROUTE' CI, ARPMON's 'DEQ' and 'CACHE QUEUE' CI have been created and secured by ToolSup.

The new ARPMON CI 'DEQ' has been implemented to remove entries from the ARP Cache. This will allow the user to invalidate specific ARP Cache entries.

UDPCI's UCBDUMP will be enhanced to display additional information.

The existing tool IPOMSCI will undergo no functional changes.

67.3 Hardware Requirements or Dependencies

Not applicable.
There are no new Hardware dependencies.

67.4 Software Requirements or Dependencies

Not applicable.
There are no new Software dependencies.

67.5 Limitations and restrictions

Limitations: (Secured by ToolSup)

- IPROUTCI's DELROUTE
- ARPMONCI's DEQ

Restrictions: (Lab environment only)

- NETMAN's FREE CI
- IPROUTCI's ROUTER
- SNPINGCI's REG
- SNPINGCI's DEREG

67.6 Interactions

Use of any ToolSup secured command will impact DMS operations. A complete understanding of not only TCP/IP, but also DMS operations and DMS specific implementation characteristics is required to use these tools.

70.8 Glossary

Term	Description
New term	Definition

71: Functional description (FN): A00003280

71.1 Feature name

A00003280 - SIP on NGSS Tracing/Debug Framework

71.2 Description

This activity SIP on NGSS Debug and Tracing is a stand alone tool. It controls the Radvision SIPT Toolkit log module and filters the internal NGSS traces which are written into the tracing files.

This feature is primarily targetted to Customer Support groups like GNPS. While the tool will be available in the field, due to the impact of running the tracing session on the capacity of the field office, it should not be done on a regular basis or at high traffic levels.

71.2.1 Overview

This tool can run in these two mode:

1. Simple Mode - straightforward usage tracing SIP messages
2. Prompt Mode - more sophisticated usage, needs a deeper knowledge what to trace and how to used this tool.

71.2.1.1 Simple Mode

The following is an overview of a typical Simple Mode tracing session.

1. user needs a telnet session to the NGSS
2. start a Simple Mode by a command **/opt/apps/bin/sp2ktrace start**
3. stop a Simple Mode by a command **/opt/apps/bin/sp2ktrace stop**
4. tracing file is located in NGSS directory **/opt/apps/logs** with the name as siptrace.YYYYMMDD.MSG.00001 (example **siptrace.20040318.MSG.00001**)
5. the siptrace file contains the SIP messages provided by Radvision Transport layer:

```
T  88b63c8 03/19/2004 14:09:13 INFO   - TRANSPORT    -

```

6. for continuous tracings you can type command on NGSS:

> tail -f /opt/apps/logs/siptrace.20040318.MSG.00001

to get traces onto the screen.

71.2.1.2 Prompt Mode

The following is an overview of a Prompt Mode tracing session.

1. user needs a telnet session to the NGSS

2. enter a Prompt Mode (command line interface) by a command **/opt/apps/bin/sp2ktrace** as example:

```
root@unit0 root]# /opt/apps/bin/sp2ktrace
```

3. type **help** to see which commands are available

```
SIPTRACE> help
These commands are provided:
  Help
  set (layer<1-19>  filter<0-63>)
  status
  start
  stop
  Users
  display <all | Session Server Name> - for IP address status
  prtcache
  Quit
-------------------------------------------------------------
Additional info for SET command:
  Layers and their corresponding numbers are shown by
  STATUS command.
  1 - all layers (ex. SET 1 2 sets all layers filter=INFO=2).
  There are 6 Filters as:
  DEBUG=1 INFO=2  WARN=4  ERROR=8 EXCEP=16 LOCKDBG=32.
  Filters can be logically combined - if you want to trace for ex.
  layer PARSER (7) with filters ERROR (8) and EXCEP (16)
```

```
  SET 7 24
  For cleanup use filter 0 (example SET 7 0 for above).
  Use SET 1 63 (to set tracing for everything)
  use SET 1 0  (to cleaunp everything).
  Please be aware SET command only sets tracing.
  You must use START command to start tracing
  and use STOP command to end it.
Tracing files are in the directory /opt/apps/logs/.

SIPTRACE>
```

4. type **status** command to see all available Layers and Filters:

```
SIPTRACE> status

SIPTRACE> stop
```

In the example above you can see three users. A server is a permanent thread with a pid (processID=15704), your session with a userID mtc and pid 16802and one Simple Mode with userID MSG and hardcoded pid 00001. The “00001”s behind a pid column belong to the active column indicating that this session is active - it means it collects data.

8. the siptrace file for the above tracing session (pid 22958) is located in NGSS directory /oipt/apps/logs/siptrace.20040319.mtc.22958 with few first lines as:

```
=== SESSION ENTERED: [pid:22958/mtc]  Fri Mar 19 14:17:19 2004

```

9. stop the session by the **stop** command.

10. exit session by a **quit** command.

71.3 Hardware Requirements or Dependencies

Customer offices without the Session Server will not have the functionality delivered by this feature.

71.4 Software Requirements or Dependencies

71.5 Limitations and restrictions

This tool has the following limitations:

1. Tool is currently configured for 10 concurrent Trace Clients. The Simple Mode is counted as a Client.

2. The user of this tool needs an access (a telnet session) to the NGSS machine.

3. There can run only one Client in the Simple Mode at a time.
(it would not have a sense to duplicate very same tracing)

4. Every Trace Client gets own output trace file which is being used until the Trace Client session ends (by **quit** command in the Prompt Mode or ***sp2ktrace stop*** in the Simple Mode). It means if a user starts a session on Monday and runs it over 3 days - there will be only one Trace Client file with a creation date i.e. Monday date.

5. The Trace Server trace file. In contrast of the Trace Client trace file, the Trace Server trace file is created on every day. The trace file creation is not done few seconds after midnight but by the first event recorded into the server file (after midnight - which can be few hours from the midnight) depending on tracing activities/setup.
6. If the size of any client output file (siptrace) created by this tool (in the directory /opt/apps/logs) exceeds limit (default is 10 MBytes) then this file will be over written from the beginning. This event is recorded together with the overwritten counter.
7. All siptrace* files in the directory /opt/apps/logs/ older than 3 days will be deleted automatically by the tracing tool. This removal is triggered by new sp2ktrace session.
8. Other files in the directory /opt/apps/logs need to be deleted manually. Please note the file created by monitoring in the Simple Mode is appended every time when tracing starts (by a command ***sp2ktrace start***) on the same date.
9. **WARNING**: Do not delete active/current (today) server file and prevent deletion of the active Trace Client's files. Deleted files will not be re-created.
10. **SWACT:** the current version of the tracing tool does not automatically swact when NCGL platform does a swact. The sp2ktrace tool needs to be started on both units (active/inactive) prior a swact if tracing over the swact is required. In a case of a application swact the sp2ktrace tool needs to be restarted manually.
11. **Configuration:** The configuration file sp2ktraceConfig is created when tool runs for very first time in the directory /opt/apps/logs. This file has currently two (default) parameters:

- NUMBEROFINITLOGS 300
- CLIENTFILESIZEMB 10

The first parameter configures the number of logs to be printed into the server siptrace file during the initialization (when SIP Gateway is Unsuspended). The default value is 300 logs but can be increased up to the maximum of 25000.

The second parameter allows to increase the size of the client siptrace file from the default value 10 Mbytes up to the maximum of 500 Mbytes.

These parameter must be changed prior the SIP Gateway is Unsuspended to be used.

72: Functional Description (FN): A00003371

72.1 Feature name

The activity name for this task is Common Inventory and Data Consolidation A00003371.

72.2 Description

This feature introduces a Common Inventory data schema and eliminates redundant data. It provides for creation of new components and modification of a number of existing components summarized as follows:

- a new centralized inventory database schema in Oracle representing network element data and its relationships (logical and physical associations) with other entities in the system.
- a new JDBC-based API that allows applications to add, modify, remove, and retrieve inventory information from the schema.
- a new event notification and registration component for applications to register for data addition/deletion/modification events.
- an new inventory schema upgrade infrastructure for supporting upgrades from one release of the inventory schema to another.
- Modification of all relevant applications in the SESM package to use the new common inventory, including the elimination of the NETWORK and PROXY schema data. Affected applications are: GWC Manager, UAS Manager, Alarm Manager, Proxy Agent, Data Engine, NetworkView, Service Broker, Line Provisioning, Trunk Provisioning, LMM, Cs2kCfgMgr, V52CfgMgr ProfileManager and TMM.

Part of the effort in providing this feaure includes generation of IEM compliant customer logs. This is the only customer visible aspect of this feature and is captured in an accompanying Fault management document.

New term	Definition

73: Functional Description (FN): A00003452

73.1 Feature name

Intelligent Portal insertion for low portal density networks.

73.2 Description

This feature enables Network Operators to reduce the provisioning of Media Proxies/Portals (MP)in the network, as implemented by Activity A90007980.

MP are now only mandatory on the following GWC types:

- Line GWC with GW behind NAT or GW external to the CS2K core.
- SIP-T GWC

MP provisioning against all other GWC types is optional, and require no additional provisioning to support this new functionality.

[APG provisioning is subject to change once feature reaches DID_R state]

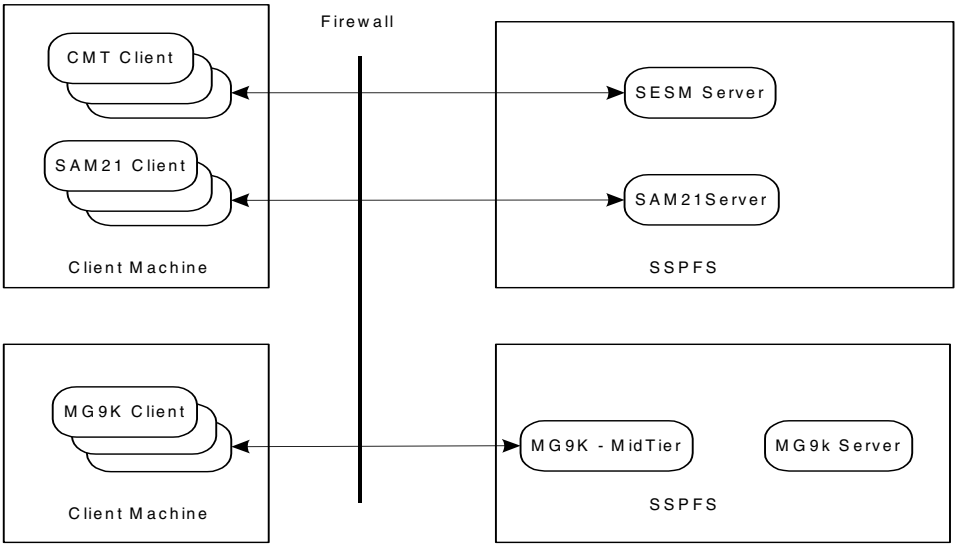
74.2 Description

74.2.1 Purpose:

The primary purpose for this feature is to facilitate firewall protection for traffic for the Succession OAM&P GUI Client/Server communication, the Succession GUI's will work even with the addition of a firewall in the customer network. Along with sending the data through a firewall, the data will also be encrypted.

Figure 1 Purpose of A00003454



This was done with the addition of a SOCKS proxy on the client and server machines. The Succession GUI's will send all messages to a SOCKS proxy listening on a specific port on the client machine. The client SOCKS proxy will send all the messages to a SOCKS proxy listening on a specific port on the server machine.

There are two compents that have customer impact.

1. Configuring the client and server ports.

2. Starting, stopping, and getting the status of the SOCKS proxy on the server machine.

The applications that are covered with this activity include the CMT, SAM21 EM, and MG9K EM GUI's.

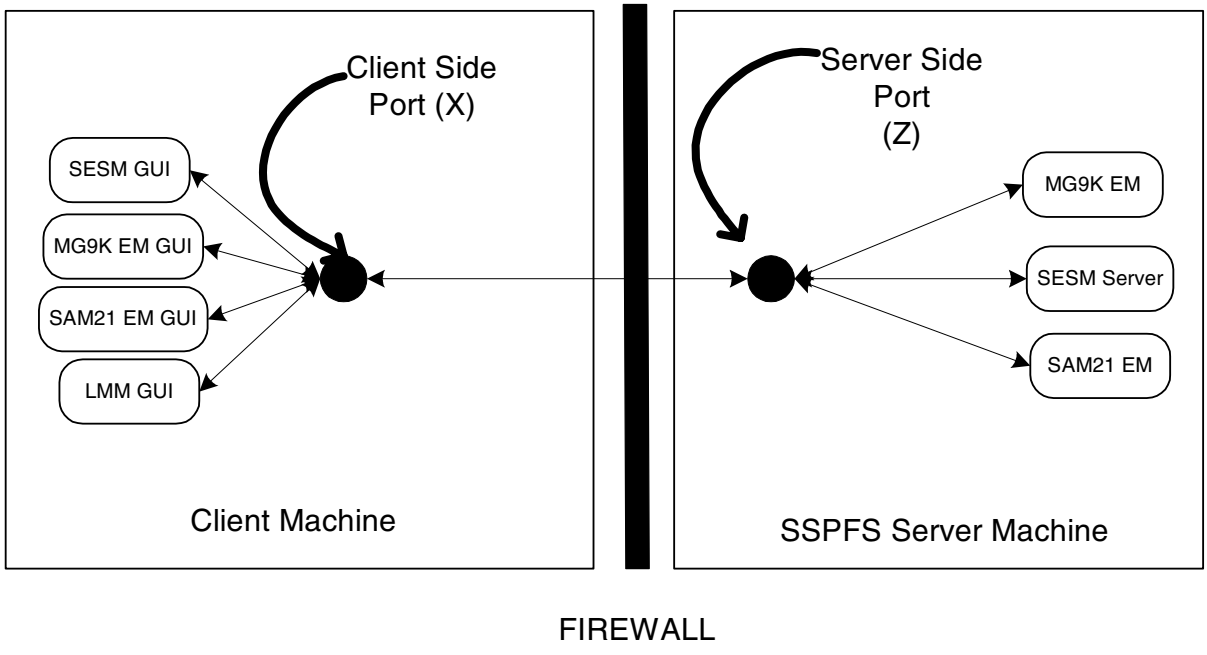
74.2.2 Configuration

There is one changed command the customer will use to configure this feature, the *cli* command. The functions that will be added is to configure the port and to list the currently used ports

- A port on the SSPFS server machine used to receive all requests from clients.
- A port on the client machine that concentrates all requests from the client to the server.
- A port on the client machine to receive all the requests from the Succession GUI applications.

The following figure depicts the ports configured. Each of the ports has a default value. If the default value is acceptible, it is not necessary to configure the ports with the cli command. If the default value is not the value required, the cli command is used to change these ports.

Figure 2 Ports configured



The port configuration takes place on each SSPFS server the SOCKS software is used on. The SSPFS machines that would require configuration are those that contain the GUI's covered by this feature.

As shown, the Server Side Port, referenced as Z will be configured using the *cli* command. This is the port that requests from all client machines will be concentrated to. If a firewall is in place, the Server Side port Z must be opened to allow these messages through. The default value for this port is 10080. It is recommended that port 10080 is used, but if it is necessary to change, the software on the server machine will ensure there are no port collisions on the SSPFS machine by verifying that the port is not in file /etc/services. All SSPFS server machines must configure this to the same value.

The Client Side port, referenced as X will also be configured using the *cli* command. Upon startup of the client machines, the Succession GUI will connect to that port. This port is an internal port used only on the client machine. There is no firewall configuration necessary. All SSPFS machines must be configured to the same value. The default value for this port is 10080 and may be configured to a different value.

74.2.2.1 Consistent configuration of ports

The ports configured through the offices must be configured consistently across all offices in the network. If the ports are not configured consistently, the GUI's will not function correctly. See the troubleshooting section for information on incorrect behavior.

74.2.2.2 Port conflicts on server side

The ports on the server side will be added to the file /etc/services. If the port is already bound into /etc/services, the configuration will not be allowed. The list of ports in /etc/services is not exhaustive, and the customer should know the site specific configuration of the SSPFS ports.

Note that in the MG9K case, the database host machine (as defined in the DB_HOST variable) must be upgraded to SN07 before the MG9K Midtier.

74.2.3 Start and Stop of server component

There is a new command added to start, stop, and restart the server side component that is listening on the Server Side port.

If the *cli* command is used to change the Server Side Port, the change takes effect immediately, as the the SOCKS server on the SSPFS machine is restarted.

74.2.3.1 Impacts to restarting SOCKS server

If the server side component is reconfigured or restarted, the clients GUI's covered by this feature will need to be restarted. Also, the following server's

on the SSPFS where the SOCKS proxy is restarted will need to be restarted as well.

- MG9K Mid-Tier
- SAM21 EM
- Notification Service
- SESMService
- NPM
- PSE

74.2.4 Starting and stopping the SOCKS process using *servman*

The socks process is a run level command, which means that any time the server is restarted for any reason socks will be automatically started. There should be no reason for the customer to start or stop socks except in Nortel directed troubleshooting.

If the SOCKS server is stopped and then started, the Succession servers running on the same SSPFS machine will need to be restarted. The GUI clients that are active and communicating with the server will also need to be restarted.

74.2.4.1 Starting the SOCKS server

/etc/init.d/socks start

```
SOCKS server successfully started
```

```
If servstart SOCKS does not work the following error
will be displayed.
```

```
The SOCKS server could not be started due to the port
<port number> is already in use. Verify the port is
not configured for another use.
```

74.2.4.2 Stopping the SOCKS server

/etc/init.d/socks stop

```
SOCKS server successfully stopped
```

74.2.4.3 Querying the SOCKS server

s/etc/init.d/socks status

```
SOCKS server RUNNING
```

If the SOCKS server is not running the result will be:

```
SOCKS server STOPPED
```

74.3 Hardware Requirements or Dependencies

There are no new hardware requirements added with the introduction of this feature.

74.4 Software Requirements or Dependencies

There are no new software requirements or dependencies added by this feature.

74.5 Limitations and restrictions

The Client Side ports as shown in figure 2 must be free for the Succession GUI's shown to operate.

The Server Side port as shown in figure 2 must be opened on a firewall that supports stateful packet inspection.

Reconfiguration of Server Side port requires server side Socks Proxy restart, EM restart, and client application restart.

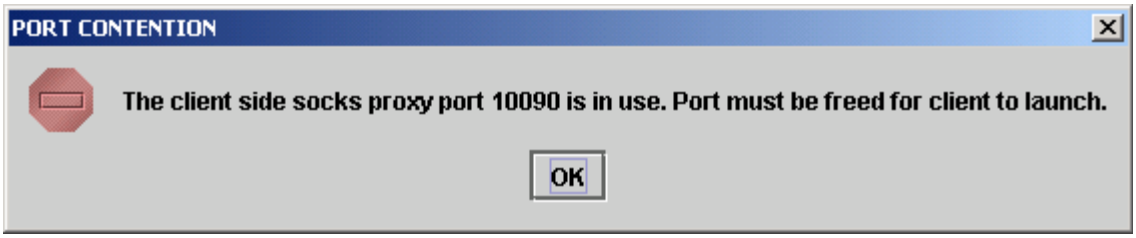
74.6 Troubleshooting

At times, there may be configuration errors which cause port contention on the client machine or servers configured with different ports. In both these cases a failure by the client to launch or connect will be encountered.

74.6.1 Client Port Binding Error

If the port on the client machine is already bound to another process then the client GUI will fail to start. If the port is already bound to another process, and the client will not start successfully, the following dialog to show there is a problem with a port contention:

Figure 3 Dialog specifying port contention upon startup on the client machine



The solution to this is to free the port in the client machine. Depending upon what type of client machine used, the solution will differ. Closing the application will free the port.

74.6.2 Server Configuration Errors

If there are server side configuration differences between offices there will be a failure of the GUI to connect to the server machine. If office A is configured for the server to listen on port 10080, and office B is configured for the server to listen on port 10090. If there are only GUI's launched to communicate with either office A or office B, there will be no problems. If GUI's are launched to communicate with both office A and B, then there will be a failure to communicate with one of the offices. The GUI that is launched to communicate with one office, say office A will work. If there are other GUI's launched to communicate with office A, those will also work. If there is a GUI launched to communicate with office B, those communications will fail.

The recourse to solving this problem is to verify if there is in fact a configuration error. If there is a configuration error, there are two ways to get the GUI's to launch correctly.

74.6.2.1 Re-Launch GUI's

If the GUI to server B, as described in the previous section needs to be launched, and the desire is to not reconfigure the server, the GUI's launched that are communicating with office A need to be closed.

After all the GUI's have been closed, re-launch the GUI to office B.

74.6.2.2 Re-Configure server

Reconfiguring the server is the best solution to this problem. Configure all the server side ports to the same value on all offices. Please see the CN section to determine how to reconfigure the server side ports.

74.6.3 Server side Socks Proxy not running

If the Socks Proxy is not running on the server side, the following dialog will be displayed.

Figure 4 Dialog specifying server side.socks proxy is not running

74.7 Interactions

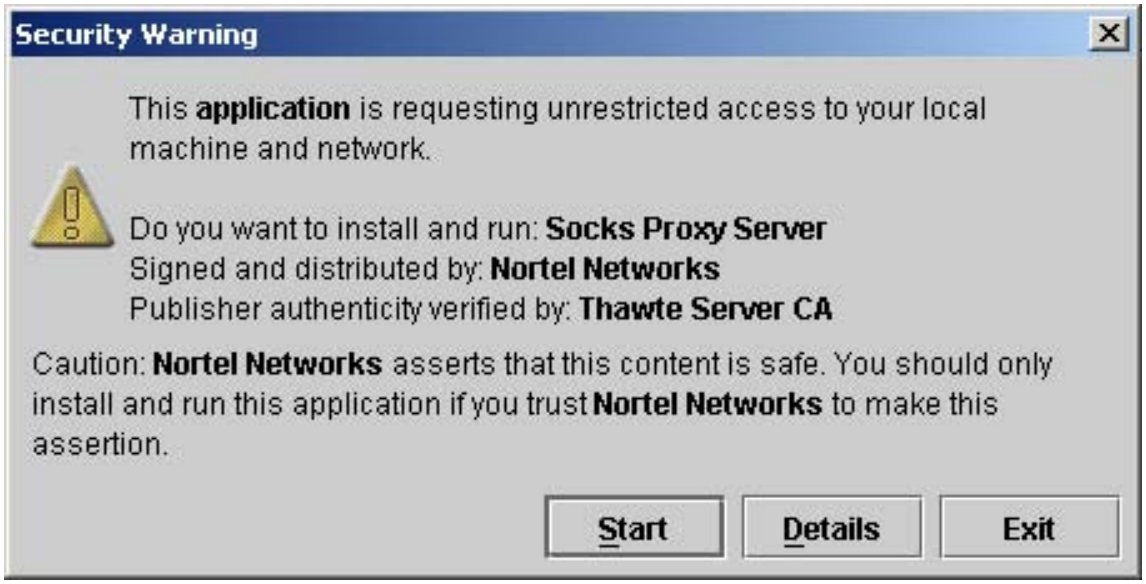
74.7.1 Launch sequence

When launching a Succession GUI the succession GUI outline will launch and a new dialog will be shown. This dialog is shown so the user knows that the Client Side Socks Proxy is being launched. The following dialog

Figure 5 Dialog shown when Client Socks Proxy is being launched

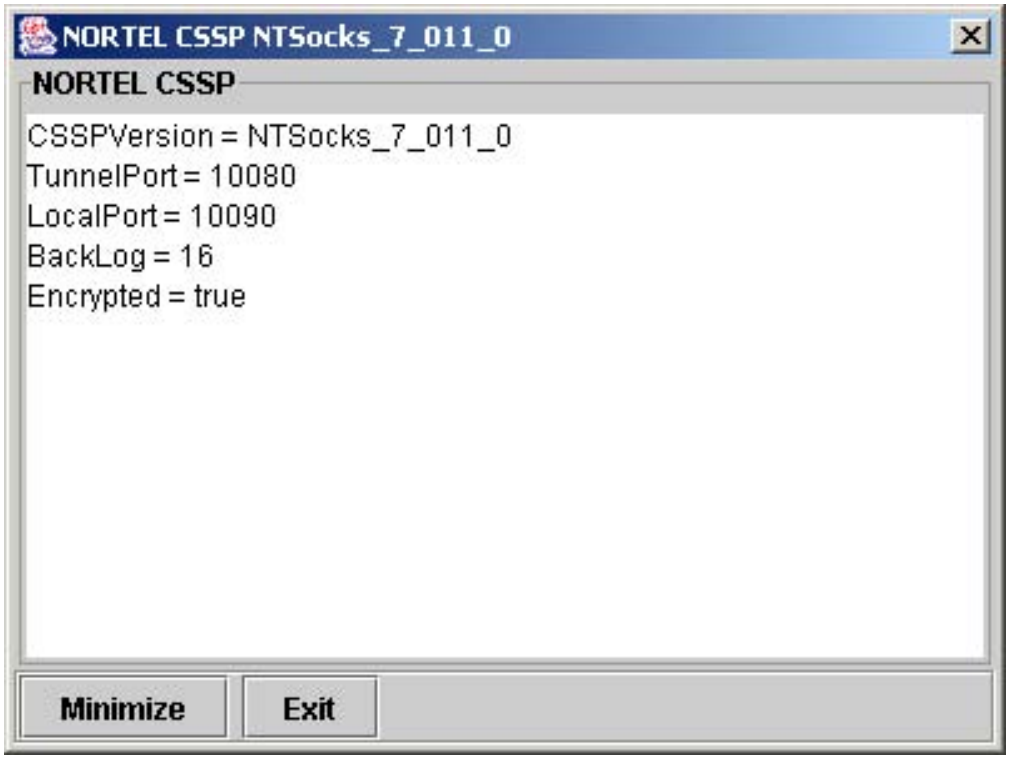
When launching an application after starting this feature, the user will be prompted to allow a new Java Web Start application unrestricted access to the client machine, prior to launching a Succession GUI as follows:

Figure 6 Added Security Warning dialog when starting Succession GUI's



The client side SOCKS proxy has a small GUI that automatically opens up at the start of the first client application on the client machine. The GUI will automatically minimise itself, but may be opened to see parameters of the connection. The client side SOCKS proxy may be terminated also from this GUI by hitting the 'Exit' button. Note that hitting the 'Close' button only re-minimises the GUI; it does not terminate the client side SOCKS proxy. Note that the parameters cannot be changed; they are shown for reference only. Figure 7 shows an example of the GUI.

Figure 7 Nortel Client Side SOCKS Proxy GUI



74.7.2 Nortel CSSP

The NORTEL CSSP is iconified at startup. The Minimize button will iconify the window as will the x on the top right of the window.

The Exit button will exit the process, and any GUI's that are using the NORTEL CSSP will need to be restarted from the application launch point.

The NORTEL CSSP will remain open until the Exit button is pressed. The NORTEL CSSP will be shared by all the Succession GUI's that use it.

75: Functional Description (FN): A00003459

75.1 Feature name

A00003459 - SSC re-architecture

Activity 1: SYSB Line alarm/log and LGRP alarm/pm map support

75.2 Description

This activity covers a part of the SSC re-architecture work. It has four main design components:

- Add new alarm for succession SYSB line.
- Generate a new log when the above alarm is raised/cleared.
- Add a new pm sublevel for LGRP and
- Raise alarm when there are LGRPs in SYSB state.

75.2.1 New alarm for SYSB lines

This alarm will only be supplied to Succession office. The class of the alarm (MINOR, MAJOR, or CRITICAL) will be displayed in the system status display area under the header Lns of the mapci display (i.e. under Lns header of mapci;mtc). Here is the map window:

```
XAC       MS      IOD      Net       PM      CCS      Lns      Trks     Ext      APPL
 .        .        .        .         .        .      LGRP       .        .        .
                                                      *C*
   MTC
  0 Quit
  2
  3 MTCNA
  4 SRSTATUS
  5 BERP
  6 CAPACITY
  7
  8
  9 XAC
 10 MS
 11 IOD
 12 Net
 13 PM
 14 CCS
 15 Lns
 16 Trks
 17 Ext
 18 APPL
   YD
 Time  10:56  >
```

Currently, the alarm for Lns has four types: CUT, DF, HAZ, PSPD. Accordingly, the alarm is displayed using the following characters for the combination of alarms of the same severity:

{ 1}: ' CUT '
{ 2}: One of the following diagnostic failure alarms: 'Diag', 'Fac ', 'SDiag', ...
{ 3}: 'CT DF'
{ 4}: ' HZD '
{ 5}: 'HZ CT'
{ 6}: 'HZ DF'
{ 7}: 'H C D'
{ 8}: 'PSPD '
{ 9}: 'CT PS'
{10}: 'PS DF'
{11}: 'C P D'
{12}: 'HZ PS'
{13}: 'H C P'
{14}: 'H P D'
{15}: 'HCPD '

With the new addition of SYSB alarm, the following character display will be used to indicate the multiple alarms occuring at a given time:

Table 1 new alarm display

	CUT	DF	HAZ	PSPD	SYSB
'SYSB '					X
'CT SB'	X				X
'DF SB'		X			X
'CD SB'	X	X			X
'HZ SB'			X		X
'CH SB'	X		X		X
'DH SB'		X	X		X
'CDHSB'	X	X	X		X
'PS SB'				X	X
'CP SB'	X			X	X
'DP SB'		X		X	X
'CDPSB'	X	X		X	X
'HP SB'			X	X	X

Table 1 new alarm display

	CUT	DF	HAZ	PSPD	SYSB
'CHPSB'	X		X	X	X
'DHPSB'		X	X	X	X
'CDHPS'	X	X	X	X	X

The alarm will only be applied to succession lines (excluding ABI) in the entire office. The severity of the alarm is based on the alarm thresholds, which are set independently. A new office parameter **SYSBALARM** will be created in table OFCVAR. The new office parameter will have a default value {10, 20, 30} which will be set at IPL time and will survive all restarts.

AlmStat at the LTP level will be changed to display and modify the threshold of SYSBALARM. The new display of this command without parameter will look like the following:

```
OFFICE TOTALS

             OFFICE LINE FAILURE TOTALS

                        OFFICE   OFFICE OFFICE OFFICE
                        CURRENT  MINOR  MAJOR  CRITICAL
 Ext   Diag Fail  (D)     1       10     20      30
 Facility Fault   (F)     0       10     20      30
 Short Diag Fail  (S)     0       10     20      30
 Needs Ext  Diag  (N)     0       10     20      30
 Set Missing   (MSET)     0       10     20      30
 Card Missing (MCARD)     7       100    150     200
 Shower Queue (QUEUE)     0       100    150     200
 Major ICMOLINE(IMAJ)     0       100    150     200
 Minor ICMOLINE(IMIN)     0       100    150     200
 Loop Sig Set  (LSET)     0       100    150     200
 Loop Sig Card(LCARD)     0       100    150     200
 TCM sync loss    (T)     0       100    150     200
 Loop Performance (P)     0       100    150     200
 Major CPERROR (CMAJ)     0       5      10      15
 Minor CPERROR (CMIN)     0       5      10      15
 Major RapidMSG(OMAJ)     0       10     20      30
 Minor RapidMSG(OMIN)     0       10     20      30
 Utility Card     (U)     0       100    150     200
 State = PLO   (PSPD)     6       10     20      30
 State = HAZ (HAZARD)     0       0      1       10
 State = SYSB (SYSB)      6       10     20      30

......
```

where 6 in this example is the total number of SysB lgrp lines in the office.

Use the following command to change the SYSB threshold:

AlmStat SYSB minor_value major_value critical_value

The input values must be in ascending order, or the command will be rejected. User could also change the threshold via table OFCVAR, but a warning will be displayed on the MAP: “WARNING : This parameter should only be changed using the ALMSTAT command at the LTP”.

This alarm can be disabled by changing the threshold to (0 0 0) via table control on table ofcvar. Again, a warning message will be displayed for this action.

75.2.2 New log for SYSB line alarm

A new log LINE 811 will be generated when the alarm is raised or cleared. The format of the log will be as below:

RTP7 *** LINE 811 DEC01 17:45:14 2000 THR LNS ALARM
Category: Communications
Cause: thresholdCrossed
Severity: CRITICAL
ThresholdID: SYSB_LINES

RTP7 ** LINE 811 DEC01 17:45:14 2000 THR LNS ALARM
Category: Communications
Cause: thresholdCrossed
Severity: MAJOR
ThresholdID: SYSB_LINES

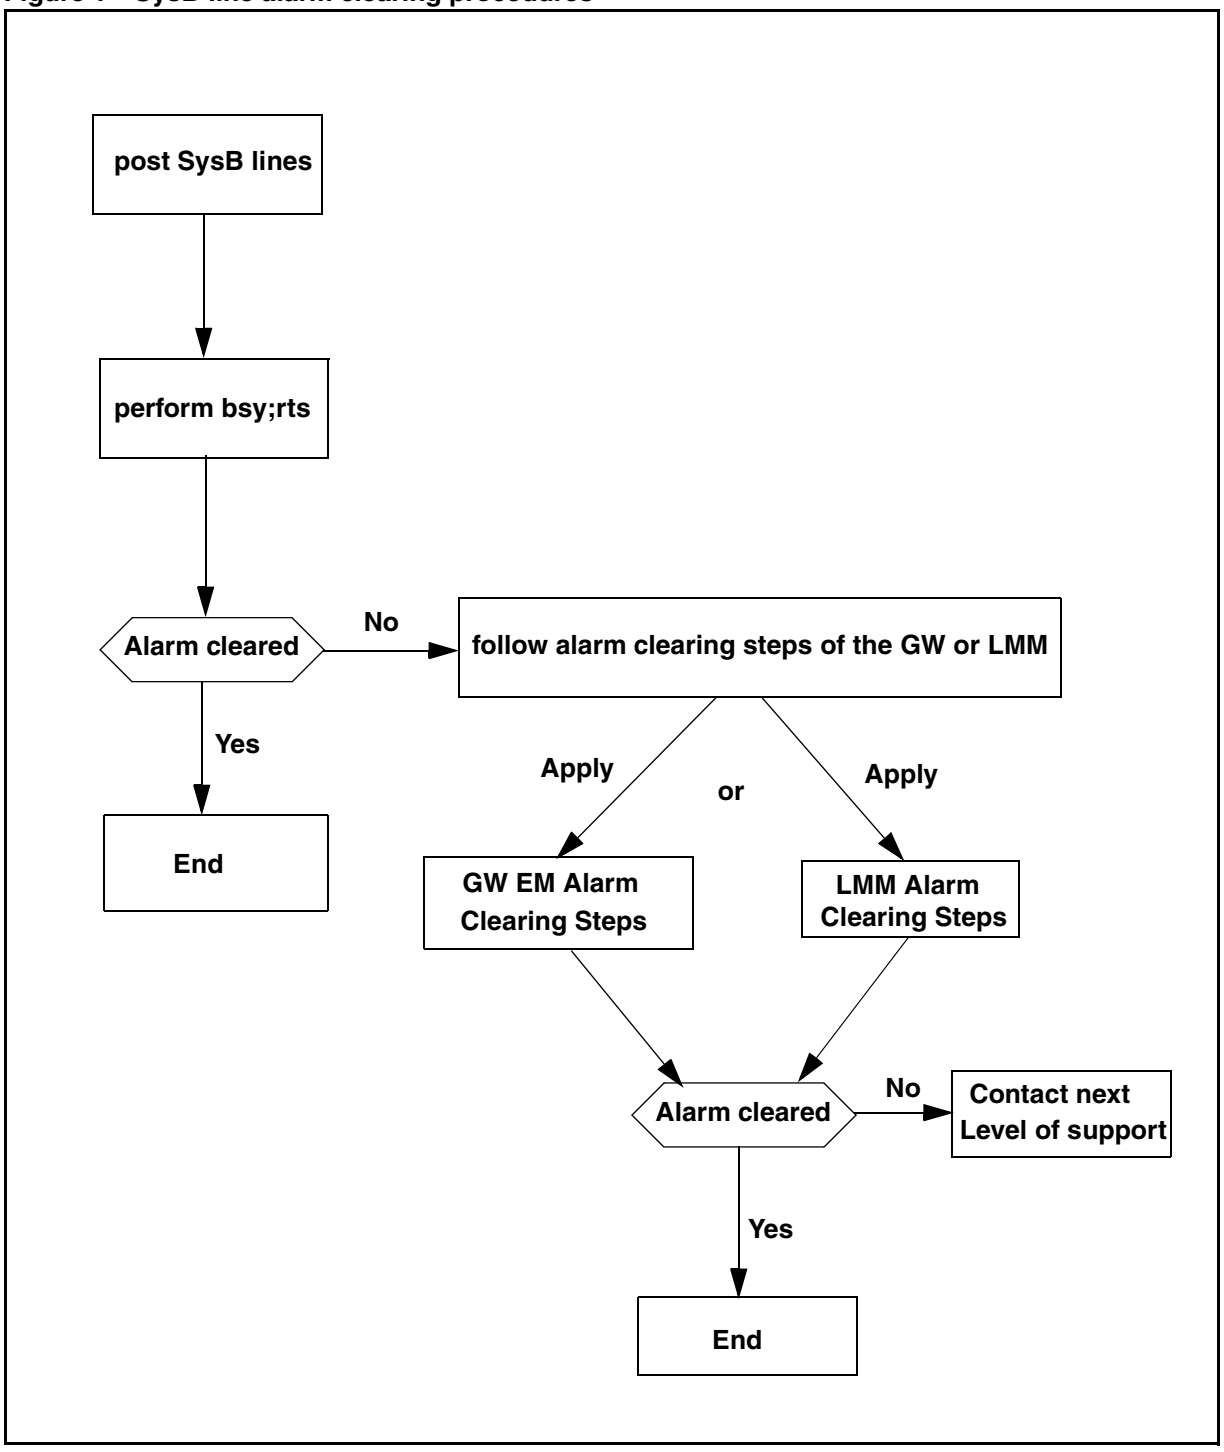
RTP7 * LINE 811 DEC01 17:45:14 2000 THR LNS ALARM
Category: Communications
Cause: thresholdCrossed
Severity: MINOR
ThresholdID: SYSB_LINES

RTP7 LINE 811 DEC01 17:45:14 2000 THR LNS ALARM
Category: Communications
Cause: thresholdCrossed
Severity: CLEAR
ThresholdID: SYSB_LINES

75.2.3 SysB lns alarm clearing procedures

Please refer to the summary flowchart depicted in the following figure to clear the SysB Lns alarm:

Figure 1 SysB line alarm clearing procedures



Note: For MG9K, the alarm clearing procedures are documented in A00005016.

75.2.4 LGRP maintenance

This feature will provide a new lgrp maintenance support on the core. The following lists the work items to be done:

- lgrp pm map interface support to allow user to post lgrp nodes and perform maintenance action against the posted lgrp node
- lgrp SysB alarm support
- support for new lgrp map maintenance commands: bsy, rts, offl and QueryPM

75.2.4.1 New pm map level for lgrp

User will be able to post LGRP under the PM maintenance level. The map window is very similar to other LCDs:

```
 XAC       MS      IOD      Net       PM      CCS      Lns      Trks     Ext      APPL
  .        .        .        .       2lgrp     .        .        .        .        .
                                      *C*
LGRP                                  SysB     ManB     OffL     CBsy     ISTb     InSv
 0 Quit           PM                    4        0        0        0        0        0
 2 Post_          LGRP                  2        0        0        0        0        0
 3 Listset
 4             LGRP: LG   00 0         SysB
 5
 6             POST:
 7 Bsy
 8 Rts
 9 OffL
10
11 Disp_
12 Next
13
14 QueryPM
15
16
17
18
  YD
Time  09:05  Pref>
```

The state of the posted lgrp will be displayed, so does the total numbers of LGRPs in each state.

Command Bsy, Rts, and Offl can only be issued for the large node lgrp (i.e. only for a lgrp of S type).

75.2.4.2 Bsy command

Command Bsy will send a man_bsy message to GWC. The map will wait for an ACK from gwc with 5 second timer. Upon receiving man_bsy message, GWC will disable the heartbeat between MG9K and GWC, and send an man_bsy_ack message back to the core. Upon receiving the ACK, Bsy command will kill all the calls and change the node state to ManB. If timeout occurs, the core will send bsy force request to gwc and change the node state to ManB.

Bsy nowait command will also be supported. This command does the same thing as Bsy command but user gets the prompt back immediately.

This command can only be issued on a node state of OFFLINE, SYSTEM BUSY, or INSERVICE.

75.2.4.3 Rts command

Command Rts will send man_rts message to gwc and wait for an ACK. Upon receiving man_rts message from the core, gwc will reenable the heartbeat between MG9K and GWC, and send man_rts_ack (if service-change-disconnected message is received from MG9K) back to the core.

If man_rts_ack message is received, the map process will handle it as tid-idle message is received (i.e. change the state to Insv and send down the line state table to gwc, etc). Map display will be updated accordingly.

If 90-second timeout occurs, a “TIMEOUT ON WAIT FOR REPLY FROM GWC” message will be displayed on the map and no state change will occur.

Rts force command will do the same thing as Rts, except that it does not wait but immediately change the node state to SysB.

Rts nowait command allows the user to get the prompt back immediately.

Rts force nowait command does the same thing as Rts force.

Rts command can only be issued on a ManB state.

75.2.4.4 Offl command

Command Offl will take the lgrp posted to unequipped state. It can only issued from ManB state.

> ***Note:*** The lgrp node state will be set to OFFL (like most of the PM nodes are) after the node provisioning. User will need to perform manual action in order to bring the node into service.

75.2.4.5 QueryPM command

Command QueryPM will show the posted LGRP node data information:

```
  XAC      MS     IOD     Net      PM     CCS     Lns     Trks    Ext     APPL
   .       .       .       .      2lgrp    .       .       .       .       .
                                   *C*
 LGRP                             SysB    ManB    OffL    CBsy    ISTb    InSv
  0 Quit          PM                4       0       0       0       0       0
  2 Post_         LGRP              2       0       0       0       0       0
  3 Listset
  4             LGRP: LG   01 0      SysB
  5
  6             QueryPM
```

14 QueryPM
15
16
17
18
  YD
Time  09:12  Pref>
```

75.2.4.6 New pm alarm for LGRP

The new alarm will be displayed under the PM banner and will be raised when there are LGRP nodes that are in SysB (machine busy).

The severity of this alarm will follow the rule of existing PM alarms: If the number of SysB lgrp exceeds 10 percent of the total pm in the office of all types, set the alarm class to CRITICAL. Otherwise, set the alarm to MAJOR if there is at least one SysB lgrp. The alarm will be cleared only when the state of all lgrp nodes is changed to other state (via Bsy or Offl command).

75.2.4.6.1 lgrp alarm clearing procedures

The most common reason of lgrp sysb alarm is due to OOS (Out of Service) of MG9K or due to state mismatch between the lgrp node in the core and the MG9K VMG the lgrp represents. User should use the alarm clearing procedure in A00005015 as the guild for clearing the alarm. If none of them clears the sysb alarm in the core, call GNPS for next level support.

75.2.4.7 Software upgrade for LGRP

Since the initial LGRP node state will be set to OFFL upon provisioning, swact applications needs to be provided for core upgrade from SN06 to SN07 and from SN07 to SN07.

75.2.4.7.1 Swact from SN07 to SN07

An swact application for LGRP node state transfer will be provided such that InSv state will be transfered to the inactive side during ONP. The following table dictates the preswact node status check for LGRP:

Table 2

	Inactive Side (states)				
Active side (state)	OFFL	INSV	SYSB	MANB	CBSY
OFFL	match	---	---	---	---
INSV	match	match	---	---	match
other state	---	---	---	---	

Only the entry marked as “match” will pass the preswact node status check.

75.2.4.7.2 Swact from SN06 to SN07

In SN06, the initial LGRP node state is InSv or SysB. A patch will be required to bypass the node status check for LGRP so that preswact will always pass for LGRP node status check.

76: Functional Description (FN): A00003485

76.1 Feature name

A00003485 - ISUP 200,000 Ports Trunk Support.

76.2 Description

76.2.1 ISUP 200K Ports Trunk Support

This feature increases the limit on the size of table C7TRKMEM for a standalone SSP from 165,000 tuples to a maximum of 200,000 tuples.

The constraints which will allow table C7TRKMEM to realize an increased maximum number of tuples from 165,000 to 200,000 are:

- Switch is a stand-alone SSP.
- Universal Signaling Platform.

If an attempt to exceed the above maximum of 200,000 tuples is made, a pre-existing error message is printed which states that the number of tuples in table C7TRKMEM is at the supported limit.

When ISUP, PRI, DPT, and PTS ports are provisioned the total ports for the SSP can not be above 200,000 total trunk ports.

76.2.2 EPUTIL

EPUTIL is a CI tool in the CM(Type EPUTIL on the CI prompt to access the tool) tool which allows a user to capture and display maintenance messages sent from the GWCs to the CM. This tool has been available as a lab-only tool until now. This feature will make this tool field ready.

Given below is a list of the various commands that will be available to the user in EPUTIL.

1. **EPTRACE**: This is the main test tool available to the user. It provides the user with commands to turn ON/OFF the trace, display the captured messages etc. Given below is a list of the sub-commnads available at this level:
   a. **SELECT**: Allows the user to select a node for the trace. The user has an option of selecting all nodes or a specific node.
      eg SELECT ALL : selects all nodes
      SELECT GWC <GWC NO> : selects the specified GWC

      Note : A maximum of seven nodes can be selected at a given time(applicable only when specific nodes are being selected)

b. **REMOVE**: Allows the user to remove a selected node. The user can remove all nodes, or can remove a specific node
   eg REMOVE ALL : removes all selected nodes
   REMOVE GWC <GWC NO> : removes the specified GWC

c. **START**: Starts the TRACE

d. **STOP**: Stops the TRACE

e. **LIST**: Lists all the captured bundle messages
   eg LIST ALL : Lists all the captured messages
   LIST GWC <GWC NO> : Lists all the captured messages for the specified GWC

f. **SHOW**: Shows the details regarding the specified bundle message

   Figure 1 below displays a sample output for the SHOW command

Figure 1 Sample Display for SHOW command

```
**********************************************************
Msg Received at: 2004/01/13 11:14:47.206 TUE.
 GWC Number: 80(0x0050), Node Number: 28(0x001C)
Bundle Count: 3, (0x0003)
Sequence No: 6, (0x0006)

       Individual Messages
      ===============

       Message 1 <==
      Received from Node 28(0x001C)
      Terminal Number: 801 (0x0321), CPID: CKT ETSIV2OG 1
       Individual message type: um_car (0x0003)
       Carrier Event:tid_cflt(0x0003) Amount: 3(0x0003)

       Message 2 <==
      Received from Node 28(0x001C)
      Terminal Number: 804 (0x0324), CPID: CKT ETSIV2IC 1
       Individual message type: um_car (0x0003)
       Carrier Event:tid_cflt(0x0003) Amount: 3(0x0003)

       Message 3 <== Received from Node 28(0x001C)
      Terminal Number: 807 (0x0327), CPID: CKT ETSISPAREOG 1
       Individual message type: um_car (0x0003)
      Carrier Event:tid_cflt(0x0003) Amount: 3(0x0003)
**********************************************************
```

g. **STATUS**: Displays the current status of the TRACE(displays whether the TRACE is ON/OFF, and all the GWCs selected for the TRACE).

h. **COUNT**: Displays the total number of messages captured

i. **HELP**: Provides the user with the list and a brief description of all available commands at the EPTRACE level

1. **EPPTABLE**: Displays the details regaring all the processes in the input handler. The details include the Process ID, the In Use Queues and the Mailbox ID
2. **FQTABLE**: Lists the free queues
3. **NODEMAP**: Displays the node to process mapping
4. **HELP**: Provides the user with the list and a brief description of all available commands at the EPUTIL level

76.3 Hardware Requirements or Dependencies

This increased limit of table C7TRKMEM can only be realized for Succession offices with Universal Signaling Platform is being used as SS7 network interface.

76.4 Software Requirements or Dependencies

None

76.5 Limitations and restrictions

76.5.1 ISUP 200K Ports Trunk Support

- Support of only 64k of trunks being transfered during upgrades in the states, INB, RES, or MB.
- When ISUP, PRI, DPT, and PTS ports are provisioned the total ports for the SSP can not be above 200,000 total trunk ports.

76.5.2 EPUTIL

- A maximum of 1024 messages can be captured by EPUTIL if the trace is turned on for all GWCs. In case the trace is turned on for specific nodes, then a maximum of 512 messages can be captured for each of the selected nodes.
- EPUTIL captures the messages at the input handler, and hence turning on the trace might have some real time impact. It is recommended that this tool be used at off-peak hours
- EPUTIL does not keep track of all the users that are logged into the tool simulaneously. Care should be taken when multiple users use this tool.

76.8 Glossary

Term	Description
USP	Universal Signaling Platform
CM	Central Module
GWC	Gateway Controller

77: Functional Functional Description (FN): A00003486

77.1 Feature name

A00003486 - Gateway location information

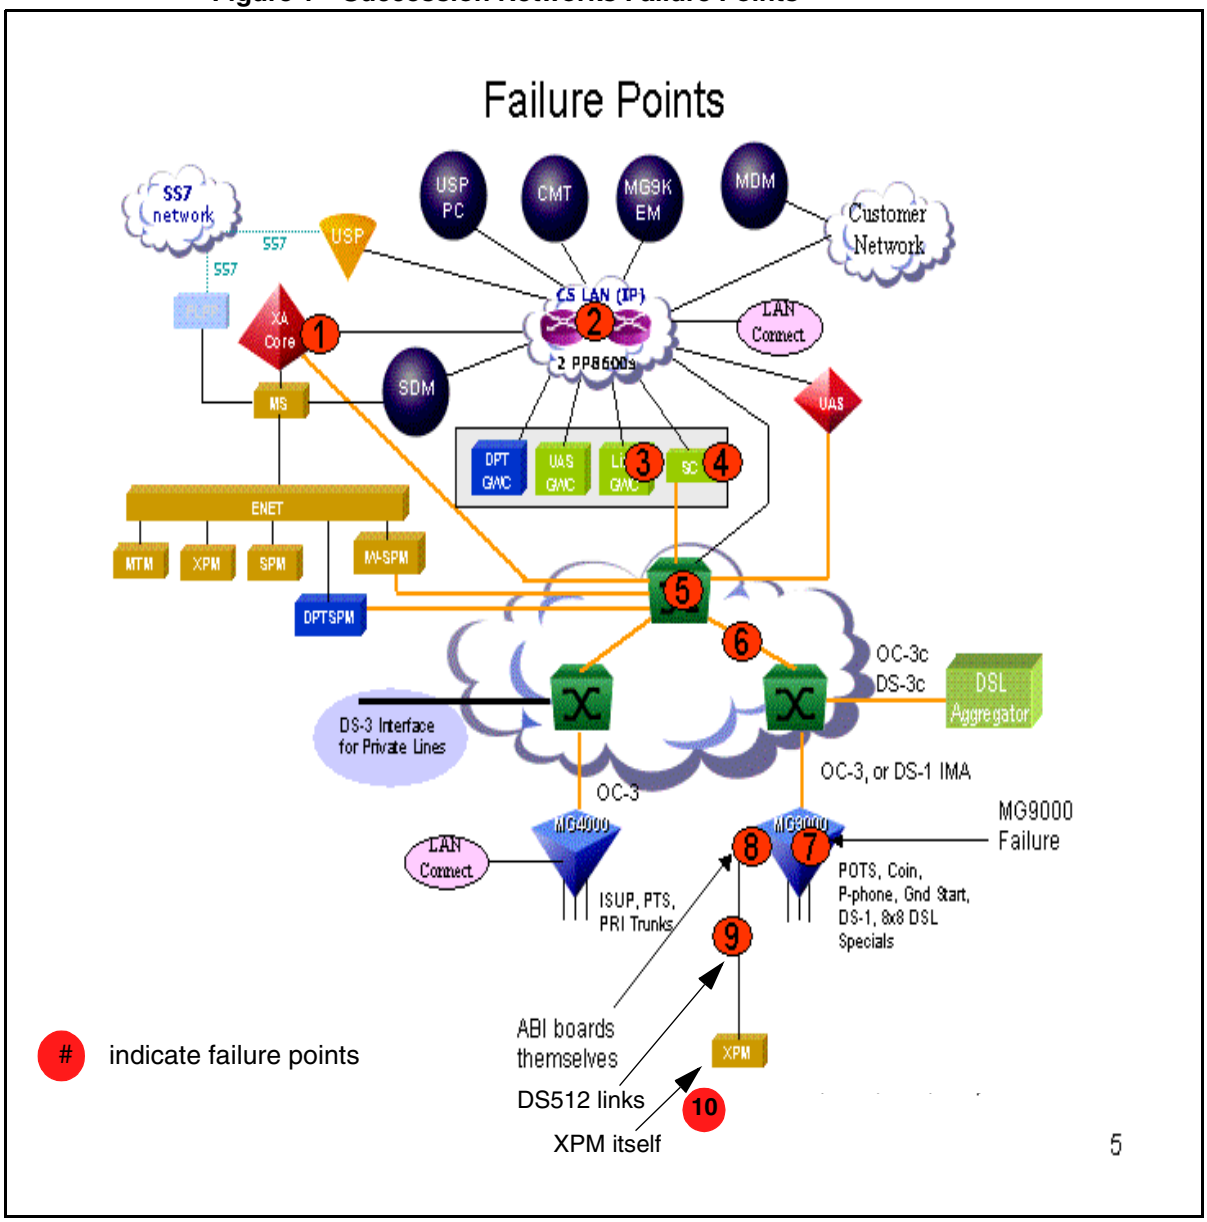
This Core feature is available in the SN07 release.

77.2 Description

The purpose of this feature is to provide physical location data for MG9K gateways which host only ABI XPMs to aid in the determination and ultimately the resolution of ABI XPM and line troubles on the Core where applicable.

Currently, these service impacting failures can occur in many different points in the Succession networks. Please refer to Figure 1 on page 697.

Figure 1 Succession Networks Failure Points



The ability to identify MG9Ks involved in the ABI configurations and their lines and their physical location was not easily determined.

This feature will aid in identifying the failure points detectable by the Core by providing necessary and accurate location data. Then using this newly provisioned data to correctly report and identify problem areas in the form of Logs, OMs, and Mapci commands.

In order to provide these new functionalities, the customer will see changes in the following areas:

- operation of Table LTCINV
- introduction of new Table GATWYINV
- display of the QueryPM command for ABI XPMs

77.2.1 Table LTCINV

The impact to this table consists of moving most of the ABI gateway information out of the EXTDS512 option and replacing it with a key to the ABI gateway information provisioned in table GATWYINV. For details on what/how this is provisioned, refer to the CN section of this feature.

77.2.2 Table GATWYINV

This is a new table on the Core designed to house gateway related information. The term gateway in this context has a flexible meaning. Gateway could refer to the physical gateway, where the hardware and call processing entity are the same. Gateway could also refer to a logical gateway, where the hardware contains many call processing entities each of which are considered a gateway. Therefore the meaning you choose depends on the construction of the "gateway".

For our more experienced DMS customers, provisioning of "gateways" in this table does not result in node creation, even though the name "INV" might suggest otherwise. Therefore the maintenance and management of the gateway is still performed from the Element Manager.

For details on what/how this table is provisioned, refer to the CN section of this feature.

77.2.3 ABI QueryPM

The impact to this command is a change in the amount of data displayed as a result of issuing the command. The command itself has not changed. For details on how this functionality has changed, refer to "Map Level: QUERYPM MAPCI command" in the CN section of this feature.

77.3 Hardware Requirements or Dependencies

There is no hardware dependencies required to execute this feature.

77.4 Software Requirements or Dependencies

This feature requires the Core load to be a Succession load. Specifically Succession release SN07 or later.

77.5 Limitations and restrictions

The new GATWYINV table will not have flow through provisioning in this release. There are plans to have flow through for this table in a future release.

For our more experienced DMS customers, provisioning of “gateways” in this table does not result in node creation, even though the name “INV” might suggest otherwise. Therefore the maintenance and management of the gateway is still performed from the Element Manager.

As is the current functionality today, flow through provisioning for this ABI Gateway and its corresponding location information is not available in this release. There are plans to have this ABI gateway data flow through in the future.

Although the new GATWYINV table is being designed for many different types of Gateways, for this initial SN07 release, only ABI gatways are allowed to be provisioned.

As is the currently functionality today of table LTCINV, the ability to change the hosting GWC once provisioned in the new GATWYINV table is not allowed.

77.6 Interactions

The following are the feature interactions for this feature:

- Features which this feature is dependant on:
  - — none
- Features which are dependent on this feature:
  - — A00004430 - ATM SVC ATM606 logs (Mike Domino)

    This feature possibly will need access to the Location information to format logs accurately.
- Features which have an interaction with this feature:
  - — A00003490 - Network Change and ABI XPM Migration (Kim Newnam)

    This feature plans to allow change to GWC host and ABI IP address data. This data will be moving to the new GATWYINV table and this functionality will have to be addressed from the new table.
  - — A00002380 - ABI ESA Logs (Diane Williford)

    This feature is possibly changing the Mapci levels for ABI. This may impact ABI QueryPM and ABI Link Mtc which is being impacted by this feature.

77.8 Glossary

Term	Description
VMG	Virtual Media Gateway - this is a logical representation of a gateway.
ABI XPM	An XPM which is provisioned in table LTCINV with the optional attribute EXTDS512. These XPMs are physically connected to MG9K Gateways via a DS512 interface.

78: Description (FN): A00003487

78.1 Feature name

Tri-modal provisioning - A00003487 in FMDOC library.

Note that this Functional Description covers all the SN07 Trimodal Call Server Features:

- a00003488: TriModal Call Signaling and Connectivity
- a00003662: TriModal Call Server Bridge Maintenance
- a00003509: TriModal Support for Lawful Intercept
- a00003947: TriModal Logs and OMs
- a00003948: TriModal GWC EM
- a00004046: TriModal ECAN support

78.2 Description

78.2.1 Existing Functionality

Prior to SN07, the CS2000 call server had very limited knowledge about the packet bearer network. Only a single packet bearer network was supported along with the legacy ENET bearer network. Individual agents were associated with a bearer network based upon the connectivity of the node that hosted the agent. For example, a trunk member that was assigned to a DTC would be associated with the legacy ENET bearer network. A trunk member that was assigned to either a GWC or an MG4K would be associated with the packet bearer network. Since both the GWC and the MG4K tag their hosted agents as ‘packet bearer network’, the core connectivity cannot distinguish between the various types of packet bearer networks are are available (i.e., IP, AAL1, AAL2). This is the basis for the CS2000 call server restriction that it can only support a single packet bearer network prior to SN07.

78.2.2 Feature Functionality

In the SN07 release, work is being started in the CS2000 Call Server to support multiple bearer networks. These bearer networks include both the legacy ENET bearer network and up to seven additional packet bearer networks.

In the SN07 release, a bearer network framework is implemented but full integration of all possible supported configurations will not be supported in this release. In SN07, the focus will be on supporting three bearer networks with full interworking between them[1]:

- ENET

- AAL1 packet network
- IP packet network

The main focus in SN07 is to support a Universal Access (UA)- AAL1 and a Universal Access (UA) - IP configuration with a single CS2000 Call Server. In addition, there are requirements to support some limited Carrier Hosted Services (CHS) functionality as well (i.e., H.323 and Media Call Server 5200 (MCS5200).

Interworking between the UA-AAL1 and UA-IP configurations in a multi-bearer network configuration is supported in SN07. However, interworking with the CHS agents is limited in SN07. In SN07, there is no support for interworking between the H.323 gateway (using a Media Portal) and the IP IW SPM. For this reason, a loop around trunk, hosted by a PVG on the CHS bearer network and hosted by a PVG in the UA IP bearer network or an MG4K in the UA AAL1 bearer network or an SPM/DTC in the ENET network, must be used to provide connectivity between the H.323 GW and all other agents on the CS2000 Call Server.

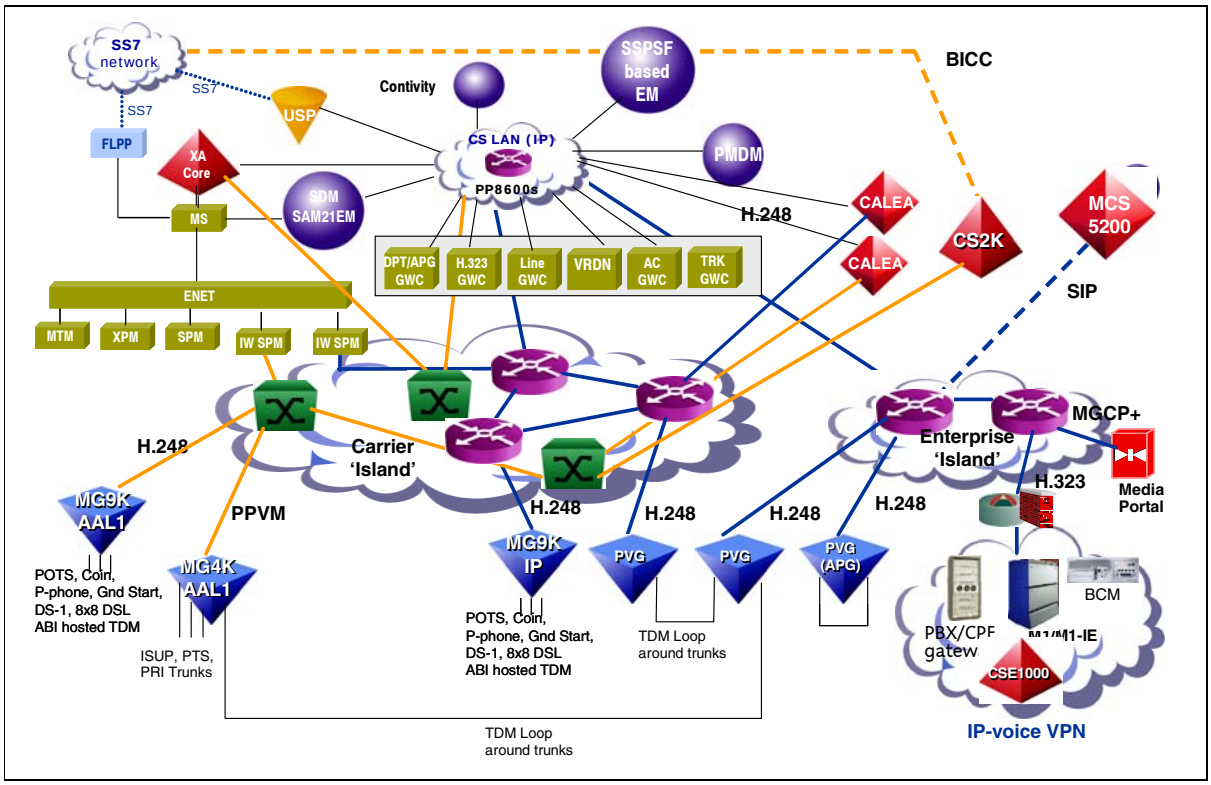
The following list provides a view of the limitations associated with H.323 calls in this configuration:

- Multiple billing records generated - A call from am H.323 agent to an MG9000 AAL1 native line would be represented as two calls in the CS2000 call server, each generating its own billing record.
- H.323 agent access to announcements - Since there is no announcements accessible to the CHS IP network (i.e., no IP IW bridge supported), announcements cannot be played to the H.323 agent. Any CS2000 Call Server services will not be able to use announcements and any treatments will have to be configured to ‘release with cause’ and the announcement would be provided by the enterprise bearer network.
- H.323 agent access to conferencing - Since there is no conference circuits accessible to the CHS IP network (i.e., no IP IW bridge supported), conferencing services cannot be supported to the H.323 agent.
- H.323 agent access to test trunk facilities - Since there is no test trunk circuits accessible to the CHS IP network (i.e., no IP IW bridge supported), trunk tests cannot be supported to the H.323 gateway.

A diagram of the network topology is shown in the following figure.

[1]AAL2 packet networks are not going to be tested in a multi-bearer network configuration, but there is nothing to block this type of bearer network from being configured.

Figure 1 SN07 supported multi-bearer network topology



In SN07, the following gateways and packet agents are supported in the multi-bearer network configuration.

Table 1 Gateways and packet agents supported in SN07

Bearer Network	Gateway	Agents
ENET	None[a]	supported SN07 legacy peripherals which includes both lines and trunk

Table 1 Gateways and packet agents supported in SN07

Bearer Network	Gateway	Agents
ATM AAL1 (UA)	MG4000	ISUP trunks PTS trunks PRI trunks BICC DPT trunks
	GWC[b]	BICC DPT trunks
	MG9000	POTS lines Pphone lines Coin lines Ground Start lines
	MG9000 with ABI	supported SN07 ABI peripherals which includes both lines and trunk
	DPT SPM	BICC DPT trunks
IP (UA)	PVG (for loop-around trunk access only for support of H.323)	ISUP trunks PRI trunks
	MG9000	POTS lines Pphone lines Coin lines Group Start lines
	MG9000 with ABI	supported SN07 ABI peripherals which includes both lines and trunk
IP (CHS)	PVG (for loop-around trunk access only for support of H.323)	ISUP trunks PRI trunks
	GWC[c]	SIP-T DPT trunks
	H.323 GWs (Cisco, Westel, BCM, M1)	PRI trunks

a. There are no ‘gateways’ support on the ENET. However, there is a list of supported legacy peripherals for Succession Call Servers. This list remains unchanged by this feature.
b. Not a true bearer gateway. This is included to illustrate the support for BICC DPT trunk.
c. Not a true bearer gateway. This is included to illustrate the support for SIP-T DPT trunk.

Connectivity between the supported bearer networks is accomplished by using IW SPM bridges. The CS2000 Call Server is modified to allow support of both the ATM AAL1 based IW SPM and the IP based IW SPM at the same time. Prior to SN07, the CS2000 Call Server could only support one type of IW SPM. A single IW bridge pool was supported. In SN07, support for multiple bridge pools is introduced.

Control is given to the Succession customer to configure how the supported bearer networks in the CS2000 Call Server connect to each other. This is controlled by provisioning the types of interworking bridges needed to connect one bearer network to another. The interworking bridges available in SN07 are the following:

- IW SPM AAL1 - connects an AAL1 bearer network to the ENET
- IW SPM IP - connects an IP bearer network to the ENET

Prior to SN07, Succession configurations used the IW SPM AAL1 to connect an AAL1 bearer network to the ENET and used the IW SPM IP to connect an IP bearer network to the ENET. This is still supported in SN07 with multi-bearer network support. In this multi-bearer network configuration, a connection between an AAL1 bearer network and an IP bearer network will use two IW bridges (i.e., 1 IW SPM AAL1 and 1 IW SPM IP using the ENET to connect the two packet bearer networks). The following figures illustrate the connection topologies[1].

[1]Note that thesefigures are logical representations and are not meant to imply physical connectivity of the bearer networks.

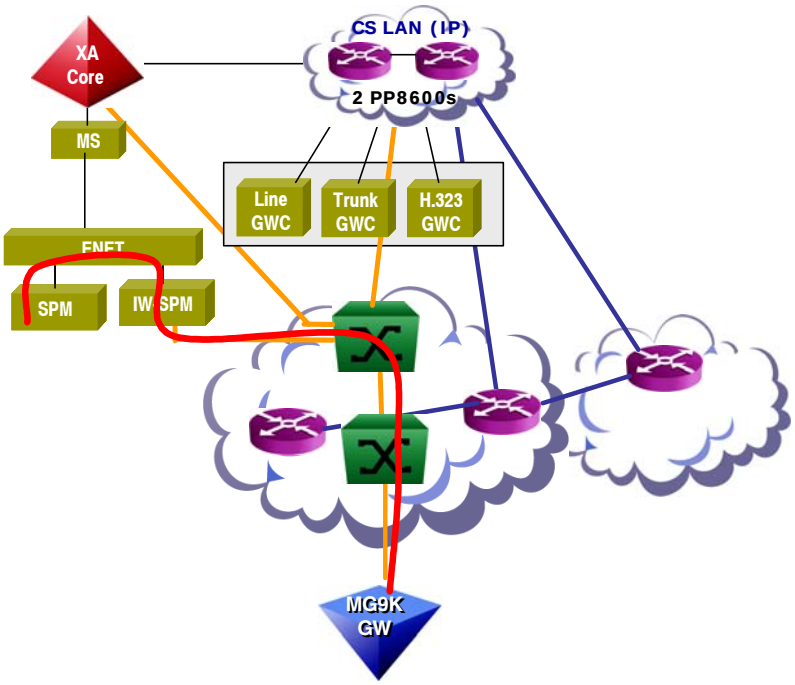


Figure 2 ATM AAL1 (UA) to ENET connection topology

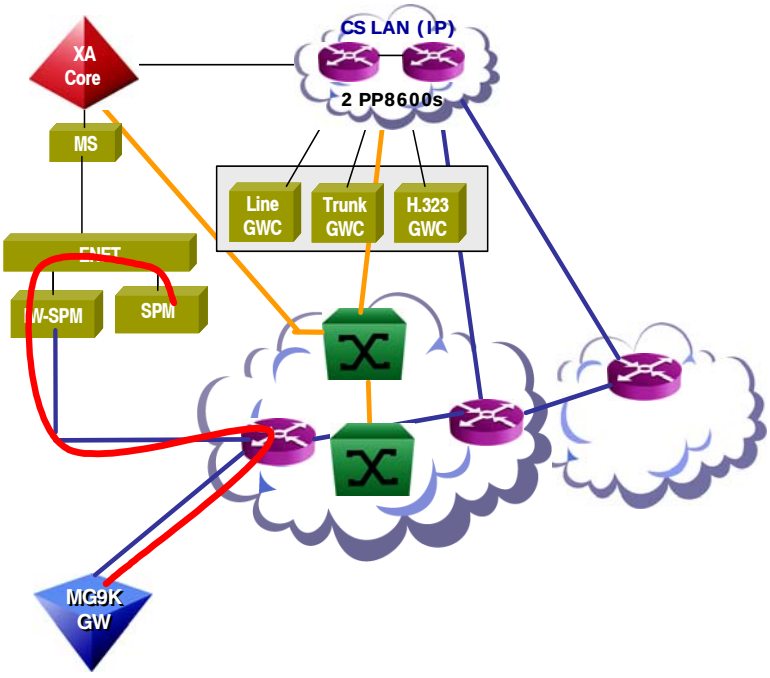

Figure 3 IP (UA) to ENET connection topology

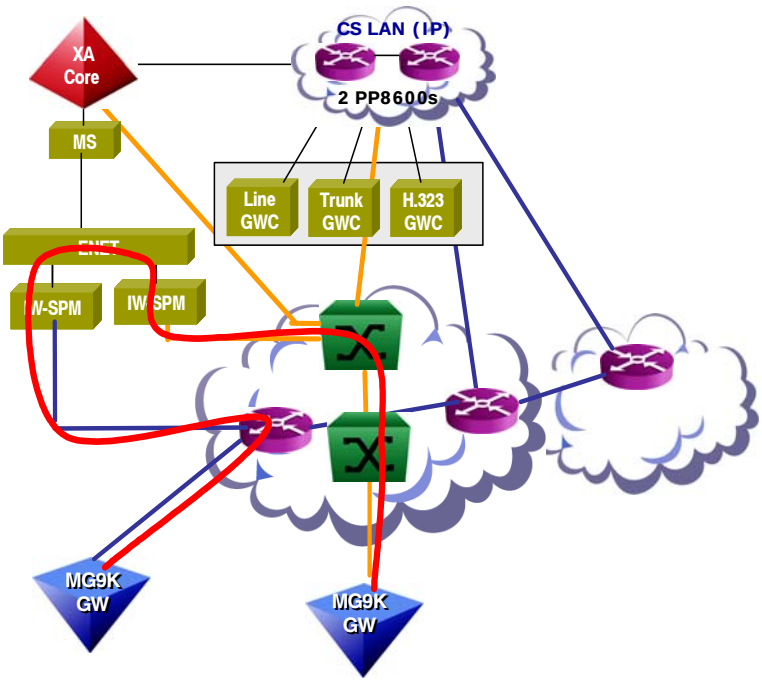

Figure 4 ATM AAL1 (UA) to IP (UA) connection topology

The following areas will be addressed in more detail in the following sections:

- Bearer network and connectivity provisioning
- Multiple bearer network support in the GWC EM
- Core connectivity connection management
- IW Bridge management
- OAMP changes on the CS2000 Call Server
- Lawful Intercept
- Service circuit support
- Groups with members in multiple bearer networks
- Trunk selection (like network selection)
- DPT (BICC and SIP-T) interworking including audible ringing support
- Translations and Routing changes
- USP messaging
- ECAN across multiple bearer networks
- Voice quality

- ONP
- Capacity

78.2.2.1 Bearer network and connectivity provisioning

The purpose of the provisioning changes are to allow bearer networks to be defined and associated to individual agents. Once this is accomplished, there are rules created that define which bearer networks can connect to each other and how that connection is accomplished.

When the CS2000 Call Server is requested to make a connection between two endpoints, it needs to know the bearer network associated with each endpoint. If this model were followed for provisioning, then each line and trunk member datafill would have to include an indication of the bearer network. This level of provisioning is cumbersome and very repetitive in most cases. For this reason, a hierarchical model is used in SN07. An assumption is made that a node (either an SPM node or a line/trunk GWC) supports one and only one bearer network. This allows the bearer network to be associated with the node and then this information is applicable to all the endpoints associated with that node. In other words, the bearer network for the endpoint is derived from the bearer network of the node that hosts the endpoint. Note that endpoints that are hosted on legacy peripherals which are then hosted on MG9000 ABI, will derive their bearer network from the GWC that hosts the MG9000 ABI.

There is one exception to the above behavior and it is in the area of DPT trunk support. Given the dynamic endpoint association that is made between the hosting node and the DPT trunk member, GWCs configured as DPT GWCs will not have an associated bearer network at the node level. The bearer network is associated with the DPT trunk group. The DPT endpoint obtains its associated bearer network from the DPT trunk group that is associated to it on a call-by-call basis.

The following provisioning changes are made by this activity:

- Bearer network definition
- Bearer network node association
- Bearer network DPT trunk group association
- IW bridge pool definition
- IW bridge pool assignment
- Bearer network connectivity

78.2.2.1.1 Bearer network definition A new table is introduced (Table BEARNETS) that defines the bearer network and the bearer fabric associated with this bearer network. The key to the table is a bearer network index. This index is needed to make it easy to change the bearer network name (i.e.,

without having to delete and re-add the entry). Index 0 is always reserved for the ENET tuple, if it exists.

The OPTIONS field in this table identifies an optional bearer network characteristics. In SN07, the following options are supported:

- Default packet network - specifies the default packet bearer network in the office. This is used during the ONP process as well as an endpoint bearer network designation if a node-based bearer network cannot be determined.

Table BEARNETS supports up to eight bearer networks in the CS2000 Call Server. Refer to the Configuration section for more details on Table BEARNETS.

Figure 5 Table BEARNETS example datafill

```
TABLE: BEARNETS
NETIDX BNETNAME     DISPLAY FABRIC OPTIONS
-----------------------------------------
NET 0  TDM_ENET     ENET    ENET   $
NET 1  NET_AAL1     ATM     AAL1   (PACKET_NETWORK_DEFAULT)$
NET 2  NET_IP       IP      IP     $
NET 3  NET_AAL2     AAL2    AAL2   $
```

78.2.2.1.2 Bearer network node association Association of the bearer network is done at the node level in the CS2000 Call Server. In order to minimize table changes and to provide minimal impact to DMS legacy offices, legacy peripheral nodes do not require an explicit association to the ‘ENET’ bearer network. This will be assumed in within the CS2000 Call Server.

However, any node that hosts packet bearer network endpoints requires that the bearer network be associated with the node. This is applicable to the following nodes:

- GWC (Table SERVRINV) - GWCs host many types of endpoints: lines and trunks)
- MG4K (Table MNNODE)
- DPT SPM (Table MNNODE)

Table SERVRINV is modified to include a new field BEARNETS. This field lists all the supported bearer networks associated with the GWC. In SN07, only one entry for this field is supported, which would always be marked as the default=Y. This information is populated by the GWC Element Manager when a GWC is defined in SN07. Refer to the Configuration section for more details on Table SERVRINV.

Figure 6 Table SERVRINV example datafill

```
TABLE: SERVRINV

GWC 0     IP  47 192 48 24 (POTS POTSEX)  (KEYSET  KSETEX)  $
NORTHAA (NET_AAL1 Y) $ $
```

Table MNNODE is modified for ‘SMG4’ class of SPM’s (i.e., MG4Ks) to include a new field BEARNETS. This field lists all the supported bearer networks associated with the MG4K. In SN07, only one entry for this field is supported, which would always be marked as the default=Y. Refer to the Configuration section for more details on Table MNNODE.

Figure 7 Table MNNODE example datafill - MG4K

```
TABLE: MNNODE

(SPMECIDX 0)$
```

78.2.2.1.3 Bearer network DPT trunk group association DPT trunk groups require an association to the bearer network. Changes are made to

Table TRKOPTS where the DPT trunk groups are defined. As part of this change, it was decided to change the option used to indicate a DPT trunk group. The DPT application is removed from the DYNAMIC option. A new DPT option is created to define a DPT trunk group. This new option contains a field to designate the associated bearer network. Other application users for the DYNAMIC option remain unchanged. Refer to the Configuration section for more details on Table TRKOPTS.

Figure 9 Table TRKOPTS example datafill

```
TABLE: TRKOPTS
OPTKEY          OPTINFO

DPTTRK DPT      DPT BICC NET_AAL1 1
SIPTRK DPT      DPT SIPT NET_IP N MGC2 PROF MGCTWO Y
OCTRK  DYNAMIC  DYNAMIC ISUP IP IP OC
```

78.2.2.1.4 IW bridge pool definition A framework is needed to allow multiple bridge pools to be defined in the CS2000 Call Server. This framework is intended to support any type of bridge that may be used to connect two bearer networks together.

In SN07, there is only one bridge type supported, the core-managed IW SPM bridge. In defining a bridge pool of this type, the two bearer networks that this bridge can connect together are specified. Other types of bridges may require additional information to be defined.

The bridge pool name is first defined in Table CLLI. Note that the number of members in the CLLI is not applicable to the bridge pool. New table NETBRDGE is created to define the bridge pool and its type. Refer to the Configuration section for more details on Table NETBRDGE.

Figure 10 Table CLLI and Table NETBRDGE example datafill

```
TABLE CLLI
CLLI          ADNUM   TRKGSIZ                    ADMININF
-----------------------------------------------------
ENET_TO_AAL1  321     0       ENET_TO_AAL1_BRIDGE_POOL
ENET_TO_IP    322     0       ENET_TO_IP_BRIDGE_POOL

TABLE: NETBRDGE
BRDGCLLI      TYPE        DISPLAY BEARNETS

ENET_TO_AAL1  CORE_BRDGE  E-A1    (TDM_ENET NET_AAL1) $
ENET_TO_IP    CORE_BRDGE  E-IP    (TDM_ENET NET_IP)   $
```

78.2.2.1.5 IW bridge pool assignment Once a bridge pool has been defined, the individual IW SPM bridge nodes needs to be associated with a bridge pool. Table MNNODE is modified for ‘IW’ class of SPM’s whose

DPT_INFO indicates an IW SPM (i.e., not a DPT SPM) to include a new field BRDGCLLI. This field lists all the supported bridge pools associated with the IW SPM. In SN07, only one entry for this field is supported. Refer to the Configuration section for more details on Table MNNODE.

Figure 11 Table MNNODE example datafill - IW SPM

```
TABLE: MNNODE
NODEKEY ALIAS NODEINFO
-----------------------------------------------
SPM  1 SPM_1  IW   1   SYNCH   INTERNAL   15   (DTMF 60)  (ECAN
60) (TONESYN 60) $(SYSB CR RPT)  (MANB MJ RPT) (DTMFLOW MN RPT)
(ECANLOW MN RPT)(TONESLOW MN RPT)  (PATCHFAIL MJ RPT)  (ATMBCN
CR RPT)(SMCHLD MF RPT)  (SMCHLD24 CR RPT)  $ BRDG_ONLY
(ENET_TO_AAL1) $ (SPMECIDX 0)$
```

78.2.2.1.6 Bearer network connectivity Now that the bearer networks have been defined and the bridge pools have been defined, the next step is to define the connectivity rules between the bearer networks. An assumption is made that a connection between two endpoints on the same bearer network will always be allowed to proceed. The rules being discussed here apply only to a connection request made between two endpoints that are associated with different bearer networks. These rules answer the following questions:

- Can a bearer network connect to another bearer network?
- What bridge pool or bridge pools are used to support a connection between two bearer networks?
- With trunk groups that support members in multiple bearer networks, what order, within trunk group member selection, should the bearer networks be attempted

Two new tables are created to allow the customer to provide answers to these questions. Table NETPATH provides a set of bridge pool combinations. These can be thought of as ‘connectivity routes’ and assist in answering the second question posed above. Note that it is possible to create a NETPATH entry that contains more than one bridge pool which would instruct connectivity to obtain multiple bridges for the connection. Note that this is also possible to create a NETPATH entry that conatins no bridge pools which would instruct connectivity to allow the connection to proceed with no bridgese needed.[1]

Table NET2NET allows the customer define which bearer networks connect to other bearer networks, the order that trunk group member selection uses and what ‘connectivity route’ should be used (i.e., points to an entry in Table NETPATH). If there are no connecting networks specified in Table NET2NET, then a connection request from that bearer network to any other bearer network

[1]The customer may use this option when there are two bearer networks that have the same fabric. No bridge is needed to connect the two bearer networks.

will be denied. Refer to “Trunk selection (like network selection)” on page 743 for more information on using the bearer network ordering in Table NET2NET.

Refer to the Configuration section for more information on Tables NETPATH and NET2NET.

Figure 12 Table NETPATH example datafill

```
TABLE: NETPATH
PATHIDX       NETBRDGE
----------------------------------------
  0           $
  1           (ENET_TO_AAL1)  $
  2           (ENET_TO_IP)    $
  3           (ENET_TO_AAL1) (ENET_TO_IP)$
```

Figure 13 Table NET2NET example datafill

```
TABLE: NET2NET

  NET_AAL1         (TDM_ENET1)     (NET_IP 3)    $
  NET_IP           (NET_AAL1 3)   (TDM_ENET 2)   $
```

78.2.2.2 Multiple bearer network support in the GWC EM

As described in the previous section, the bearer network needs to be associated with the GWC. New GWCs are added using the GWC Element Manager (EM). Information input using the GWC EM GUIs is then automatically updated in CS2000 Call Server tables (such as Table SERVRINV).

Prior to SN07, the GWC EM supported only one packet network. Characteristics about that packet bearer network were defined and associated with all the GWCs in the office.

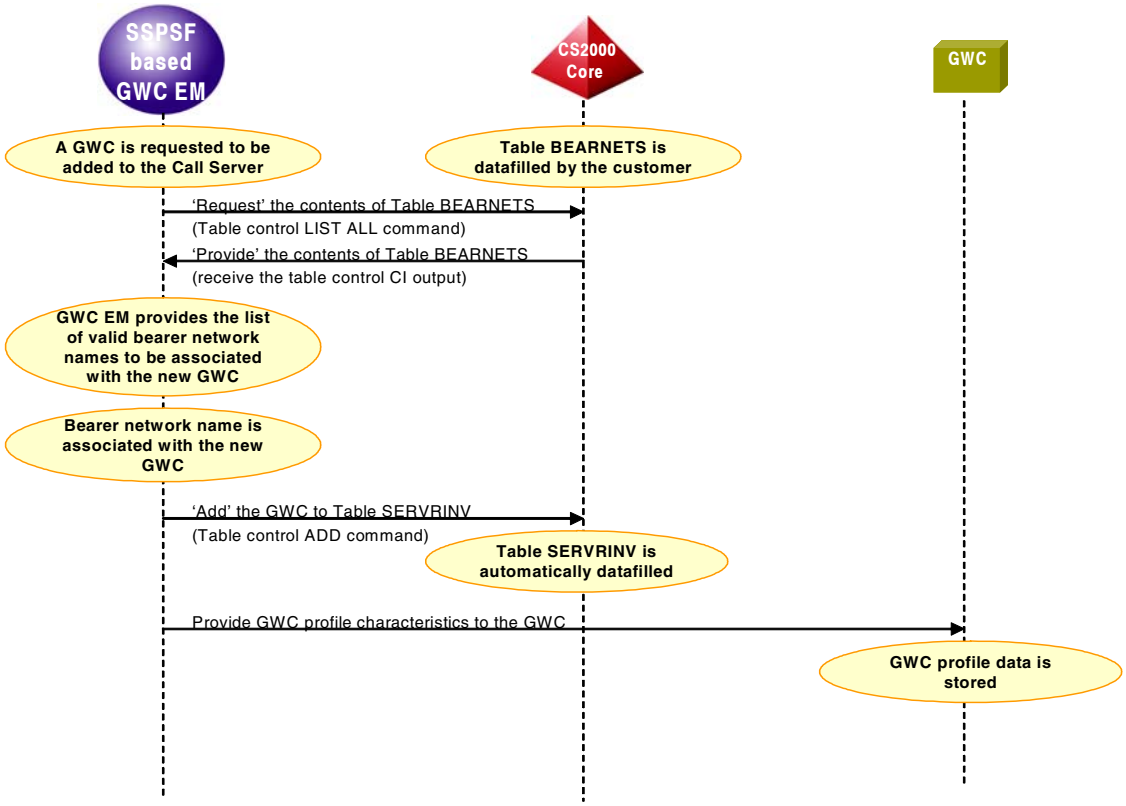
In SN07, changes are made to the GWC EM to support multiple bearer networks. These changes involve the following:

- Support the provisioning of multiple bearer network codec profiles.
  - — Display bearer network codec profile on GWC-EM GUI.
  - — Add bearer network codec profile from GWC-EM GUI.
  - — Delete bearer network codec profile from GWC-EM GUI.
  - — Change bearer network codec profile from GWC-EM GUI.

- Support the specification of a bearer network and a bearer network codec profile for each GWC.
  - — Display the bearer network and network codec profile of each GWC on GWC-EM GUI.
  - — Associate the bearer network and network codec profile with one GWC when adding GWC node from GWC-EM GUI.
  - — Change the associated bearer network codec profile of one GWC node from GWC-EM GUI.
- Support population of the selected bearer network in the CS2000 Call Server table SERVRINV

The following figure illustrates the steps involved in flowing the data from the GWC EM to the CS2000 Call Server. Refer to the Configuration section for more information on the GWC EM GUI screens that are available in SN07.

Figure 14 GWC EM flow through provisioning for bearer network



78.2.2.3 Core connectivity connection management

Core connectivity is a function in the CS2000 Call Server that handles connection requests that are made from the CallP and Services applications. Prior to SN07, core connectivity processed requests to make a connection between endpoints. Endpoints were designated as being ‘internal’ (i.e., connected to the ENET) or ‘external’ (i.e., connected to the packet bearer network). Core connectivity knew that if a request was made to connect and ‘internal’ endpoint to an ‘external’ endpoint, then an IW bridge was needed. It would request a bridge from the office-wide IW bridge pool.

In SN07, core connectivity is changed to support multiple bearer networks and multiple bridge pools. Rather than making assumptions that a bridge from a bridge pool is needed to make a connection, core connectivity references tables NET2NET and NETPATH when a connection between two unlike bearer networks is requested. If these tables indicate that a connection should not be made, then core connectivity denies the connection request to the CallP application. The CallP application would then route the call to a Network Blocking (NBLH) treatment causing the call to not be completed.

The following figures provide examples on how core connectivity uses the datafill to process a connection request from the CallP application.

Figure 15 ATM AAL1 (UA) to ENET connection request

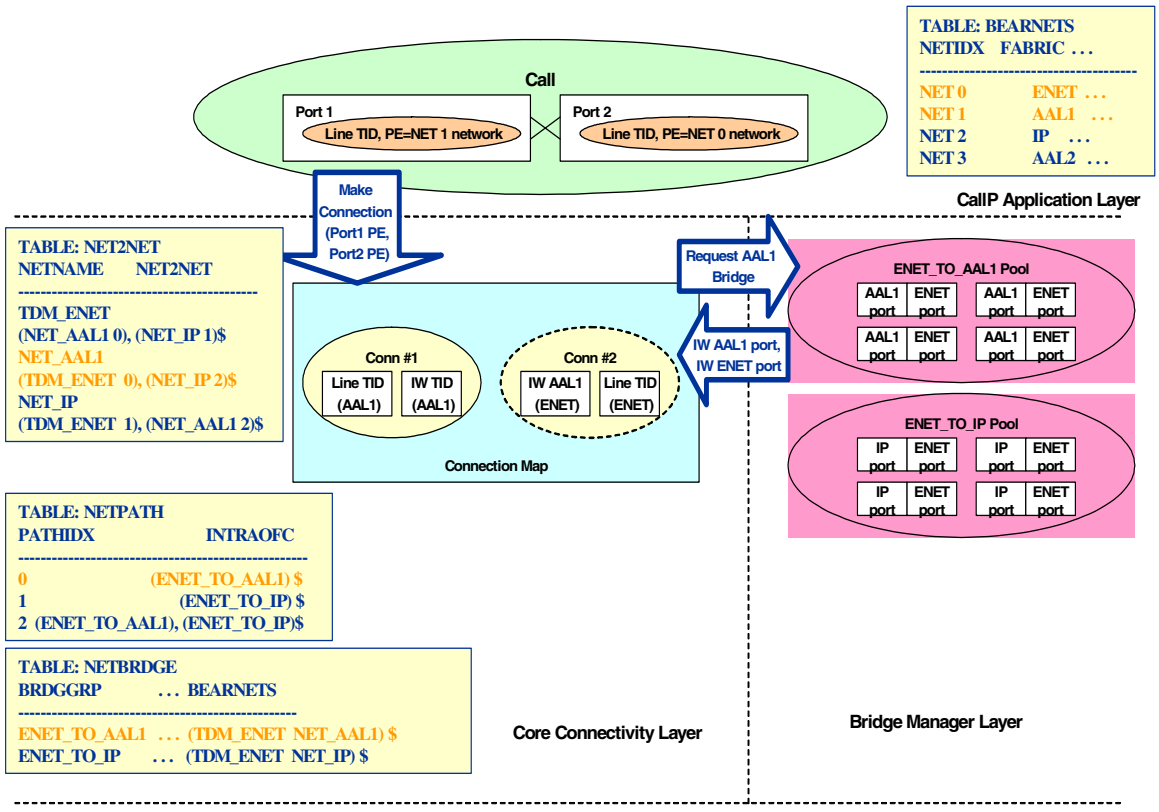


Figure 16 IP (UA) to ENET connection request

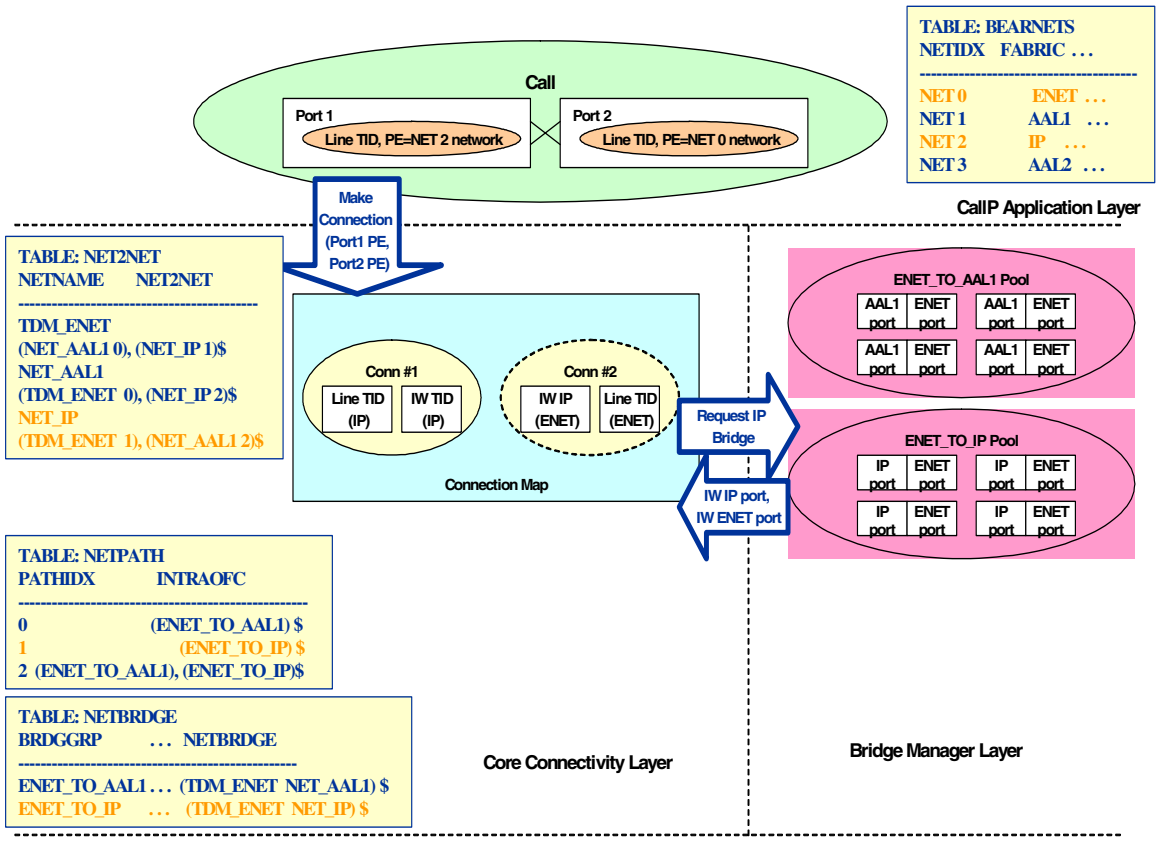

Figure 17 ATM AAL1 (UA) to IP (UA) connection request

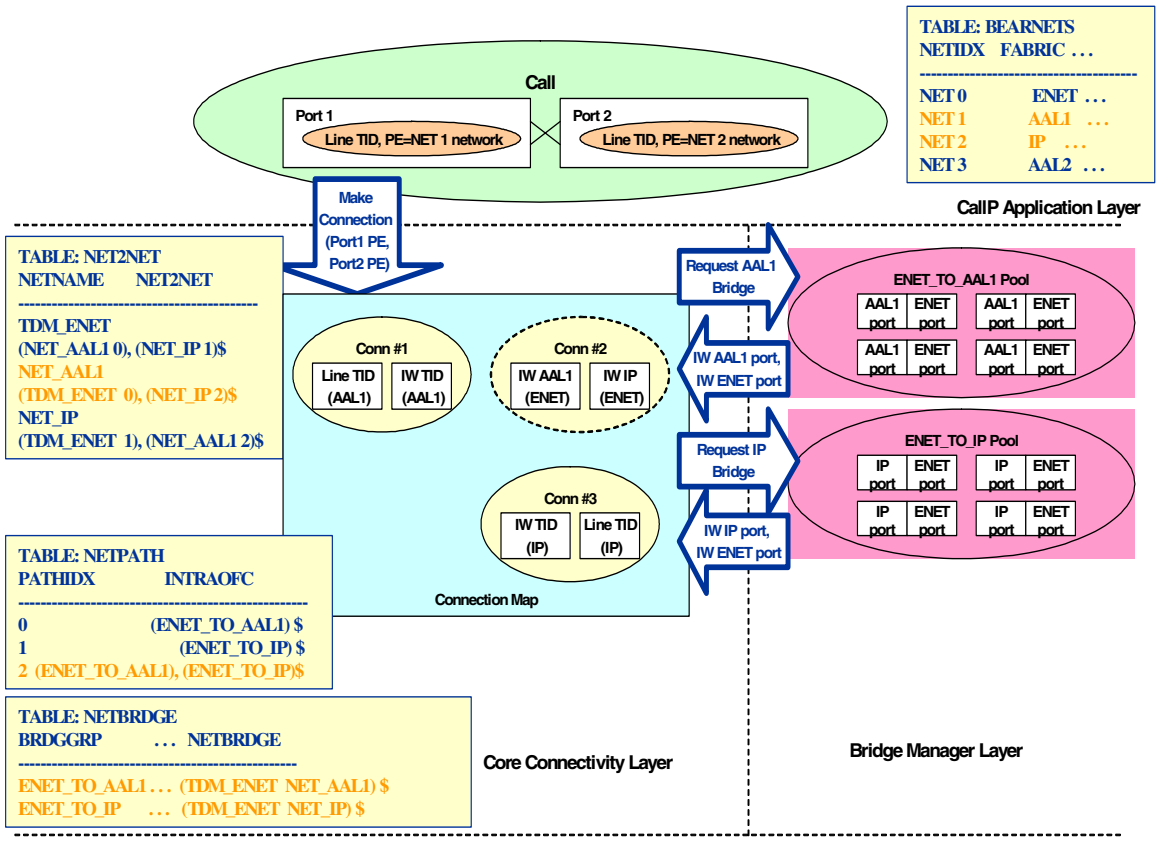

Figure 18 ATM AAL2 to IP (UA) connection request

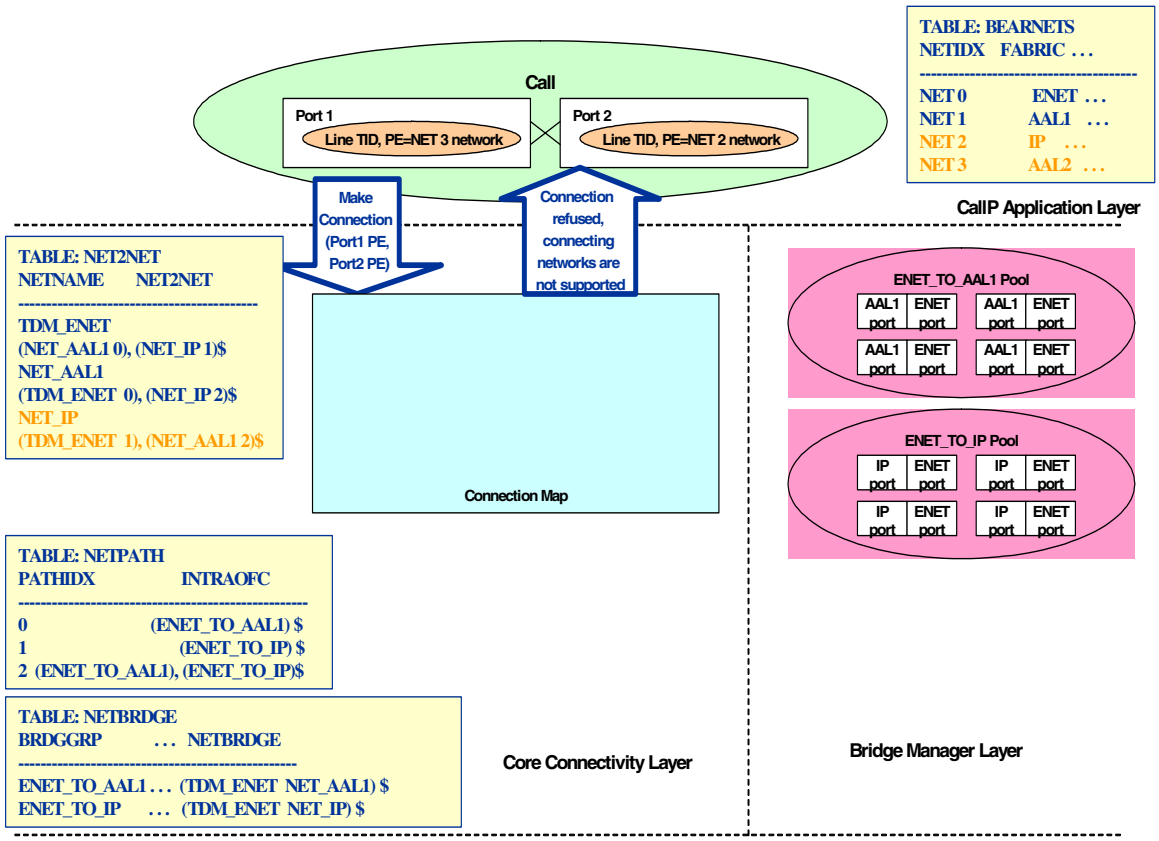


Core connectivity supports a set of connection operations. All of the possible connection requests that the CallP application may request in support of the services supported on the CS2000 Call Server map to one of these connection operations.

- Make a connection
- Break a connection
- Hold a connection
- Restore a connection
- Move a connection

These connection operations can be performed multiple times on a single call depending upon the services that are invoked. Each time a connection operation is performed, the connectivity datafill is consulted to determine how the connection map should be modified. IW bridges may be added or removed to maintain the most optimized connection topology for the call.

The following is an example of a 3-way call. The originating line (A) is on the AAL1 bearer network. The first terminating line (B) is on the IP bearer network and the second terminating line (C) is on the ENET network.

Table 2 Example 3-way call

Step	Description	Connectivity Operation	Connection Map
1	'A' calls 'B'	Make connection	Connection 1 : active • 'A' endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 : active • 'B' endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 3 : active • Bridge #1 endpoint (ENET) • Bridge #2 endpoint (ENET)
2	'A' flashes and puts 'B' on hold	Hold connection	Connection 1 : held • 'A' endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 : held • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 3 : freed • Bridge #1 endpoint (ENET) • Bridge #2 endpoint (ENET)
3	'A' calls 'C'	Move connection	Connection 1 : active • 'A' endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 : held • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 4: active • Bridge #1 endpoint (ENET) • 'C' endpoint (ENET)

Table 2 Example 3-way call

Step	Description	Connectivity Operation	Connection Map
4	'A' flashes and connects to 'B' and 'C'. A conference circuit is obtained on the MTM.	Move connection	Connection 1 : active • 'A' endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 : active • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 4: freed • Bridge #1 endpoint (ENET) • 'C' endpoint (ENET) Connection 5: active • Bridge #1 endpoint (ENET) • CF3P(0) endpoint (ENET) Connection 6: active • Bridge #2 endpoint (ENET) • CF3P(1) endpoint (ENET) Connection 7: active • 'C' endpoint (ENET) • CF3P(2) endpoint (ENET)
5	All parties disconnect	Break connection	Connection 1 : freed • 'A' endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 : freed • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 5: freed • Bridge #1 endpoint (ENET) • CF3P(0) endpoint (ENET) Connection 6: freed • Bridge #2 endpoint (ENET) • CF3P(1) endpoint (ENET) Connection 7: freed • 'C' endpoint (ENET) • CF3P(2) endpoint (ENET)

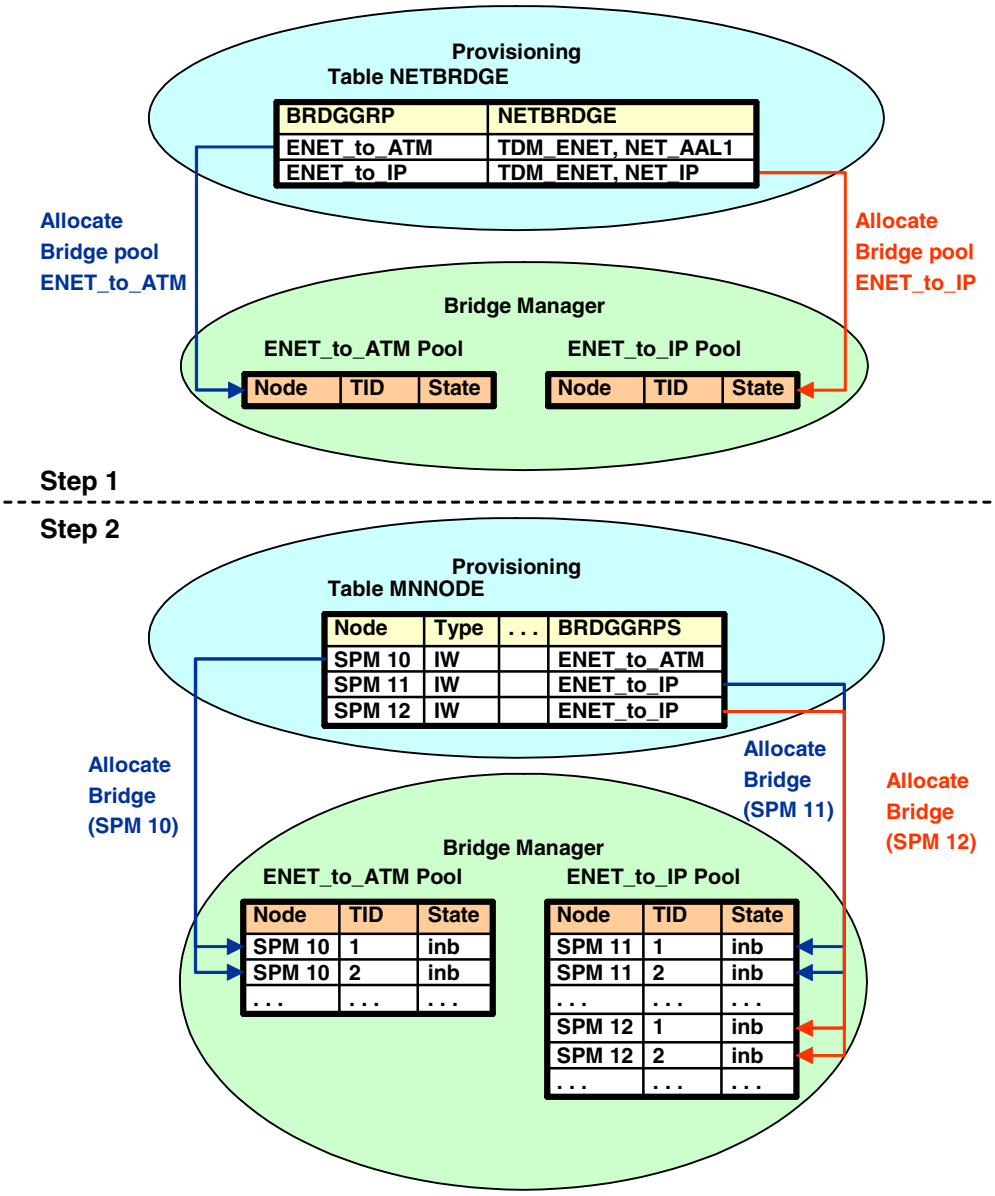
78.2.2.4 IW Bridge management

IW bridge management is a function in the CS2000 Call Server that manages the pool of IW SPM bridges. Prior to SN07, a single, office-wide pool of available IW bridges was managed by this utility. Each IW bridge node is composed of four groups of 504 bridge endpoints each. When an IW bridge node was provisioned in Table MNNODE, a set of four groups of 504

endpoints were added to the bridge pool. As the group of 504 endpoints was brought into service, these endpoints became available for Core Connectivity to use. The bridge manager function interfaced with maintenance and Core Connectivity to manage the set of available IW bridge endpoints in the office.

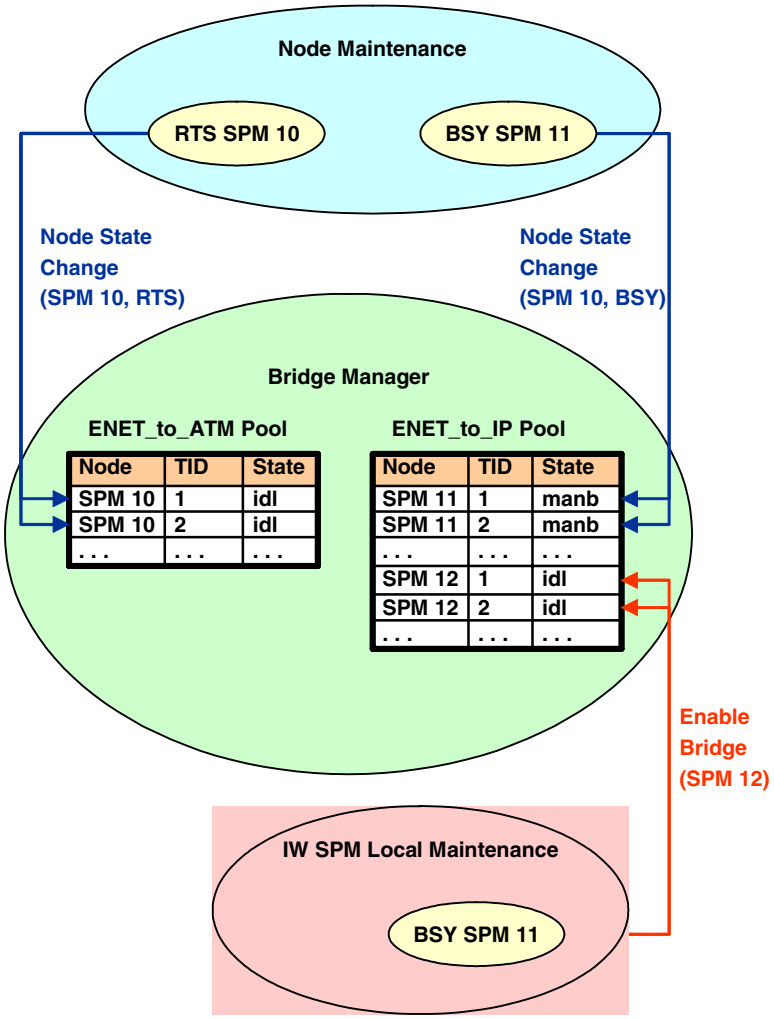
In SN07, the office-wide, single bridge pool is changed to support multiple bridge pools in a single CS2000 Call Server. A bridge pool is created when it is datafilled in Table NETBRDGE and the first IW SPM node is defined in that bridge pool in Table MNNODE. Additional individual IW bridge nodes are added (still in the 4 groups of 504 endpoints each) as they are provisioned in Table MNNODE against the newly created bridge pool.

Figure 19 IW bridge pool creation



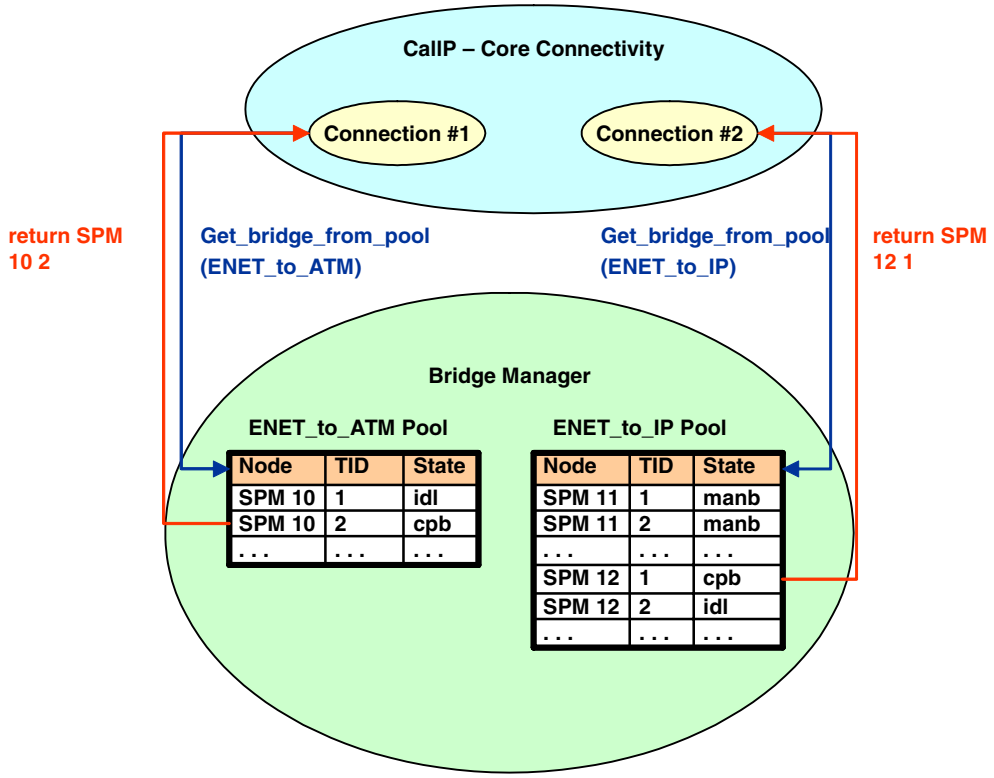
Once the bridge pools are created through provisioning, the individual IW bridge nodes are brought into service. This causes the nodes in the associated bridge pool to become available for use.

Figure 20 IW bridge maintenance



With idle IW bridge endpoints available in their associated bridge pools, the Bridge Manager can respond to requests from Core Connectivity to get a bridge. If more that one bridge is needed for a connection request, the Core Connectivity makes a request for each bridge needed.

Figure 21 IW bridge request



78.2.2.5 OAM changes on the CS2000 Call Server

OAM changes associated with the support of multiple bearer networks are limited in SN07. It is recognized that many additional requirements should be implemented and will be addressed in a future release.

In SN07, this feature does address the following areas:

- IW bridge OAM
- Trunk group OAM
- DPT OAM
- Office-wide usage OAM

Since many of these changes have impacts to customer OSSMINE interfaces, the activation of these changes is controlled by a new office parameter, MULTINET_DISPLAY_ACTIVE. Setting this parameter to ‘Y’ allows these changes to be visible. Setting this parameter to ‘N’ hides these changes. Note that this parameter does not impact the ability to support call connections between multiple bearer networks.

78.2.2.5.1 IW bridge OAM In SN07 with the support of multiple bridge pools, changes are made to the IWBM 800 series logs. These logs are

generated to monitor the usage thresholding of the bridge pools in the office. When office parameter MULTINET_DISPLAY_ACTIVE is set to 'Y', then a new information line is output indicating the associated bridge pool that is causing the generation of the log. Refer to the Fault Management section of the document for more information.

Figure 22 IWBM 800 log example

```
RTP7  **  IWBM800 SEP17  12:16:55  6600  1st Threshold Exceeded
          The number of interworking bridges in use has
          exceeded 70 percent of all bridges in the pool.
           Total number of IW bridges:  2016
           Number of available IW bridges: <NN>
           Bridge Pool: <bridge pool CLLI from Table NETBRDGE>
```

In addition to the modified IWBM 800 logs, the existing OM group IWBM is modified to provide a set of registers for each bridge pool that is defined in Table NETBRDGE. In addition to the registers that were present in the OM group prior to SN07, additional call type usage registers are added. IWBM contains registers to monitor the following usage information:

- Number of attempts to get a bridge from the associated pool
- Number of failures to get a bridge from the associated pool
- Number of get bridge aborts from the associated pool
- Number of attempts to free a bridge from the associated pool
- Number of failures to free a bridge from the associated pool
- Number of free bridge aborts from the associated pool
- Indicates when the number of 'in use' bridges exceeds 70% of the total bridges in the associated pool
- Indicates when the number of 'in use' bridges exceeds 90% of the total bridges in the associated pool
- Indicates when the number of 'in use' bridges falls below 65% of the total bridges in the associated pool
- Indicates when the number of 'in use' bridges falls below 85% of the total bridges in the associated pool
- Number of times a bridge from the associated pool was used to connect to a test facility
- Number of times a bridge from the associated pool was used to connect to an announcement or conference facility

Refer to the Performance Management section of the document for more details.

Note that the value of MULTINET_DISPLAY_ACTIVE office parameter does not impact the availability of this OM group. It is always available in SN07.

78.2.2.5.2 Trunk group OAM With support for multiple bearer networks, a trunk group can be configured to have members is multiple bearer networks. The existing TRK and TRNK2 OM groups only provide data on a per trunk group basis. When office parameter MULTINET_DISPLAY_ACTIVE is set to 'Y', then new OM groups (TRK2NET1 and TRK2NET2) are created to provide a per trunk group and per bearer network view of the trunk group usage.

OM group TRK2NET1 contains the same set of registers that existing OM group TRK contains. It contains registers to monitor the following usage information:

- Automatic congestion control
- Invalid or no automatic number identification (ANI)
- Number of calls answered
- Automatic number identification (ANI) office failure
- Number of successful connections
- Network management reroutes
- Glare
- Answer messages sent and received on incoming trunks
- Answer messages sent and received usage on incoming trunks
- Total incoming attempts
- Incoming failures
- Invalid authorization code
- Maintenance busy usage
- Maximum busy circuits
- Total outgoing attempts
- No answer on trunk (timed out)
- Number of overflows, all trunks busy
- Answer messages sent and received on outgoing trunks
- Outgoing failures
- Outgoing matching failures

- Pre-route abandons
- System busy usage
- Number of tandem calls
- Total usage
- Traffic busy usage

            0
```

78.2.2.5.3 DPT OAM In providing support for multiple bearer networks, a requirement to support both BICC and SIP-T DPT protocols in the same office was also requested. Prior to SN07, the DPT OM groups did not indicate the associated DPT protocol.

In SN07, when office parameter MULTINET_DISPLAY_ACTIVE is set to ‘Y’, then the following changes are made:

- Provide an office-wide, per-protocol DPT performance summary

- Provide a per-DPT node, per-protocol DPT performance summary

A new OM group (DPTOFCP) is created to provide an office-wide, per-DPT protocol performance summary. This group is modeled after the DPTOFC OM group and contains the same set of registers. Two DPT protocols are supported: BICC and SIP-T. The following registers are included per protocol:

- Get DPT terminal attempts
- Get DPT terminal failures
- Get DPT optimized terminal failures
- DPT terminal usage
- DPT terminal usage high water mark
- DPT port depletion

Figure 25 DPTOFCP OM group example

            0             0             0             0
```

Changes are made to the existing DPTNODE OM group. This OM group provides a per-DPT node performance summary. In SN07, each DPT node can only support one DPT protocol. For example, a DPT capable MG4K node can only support BICC. DPT GWC nodes can support either BICC or SIP-T but not at the same time. When MULTINET_DISPLAY_ACTIVE is set to 'Y', additional information is added to the DPTNODE OM group to display the following additional information:

- DPT protocol
- For SPM-type nodes, the associated bearer network and SPM node type are also displayed[1]

[1]DPT GWCs are considered bearer independent, so the associated bearer network is not included for DPT GWCs.

78.2.2.5.4 Office-wide usage OAM With support for multiple bearer networks, it is a requirement to be able to monitor the performance of the traffic over each bearer network. The existing OFZ and OFZ2 OM groups only provide an office-wide view. When office parameter MULTINET_DISPLAY_ACTIVE is set to ‘Y’, then new OM groups (OFZ2NET1 and OFZ2NET2) are created to provide a per bearer network view of office traffic.

OM group OFZ2NET1 contains the same set of registers that existing OM group OFZ contains. It contains registers to monitor the following traffic information for each bearer network defined in Table BEARNETS:

- Incoming trunk subscriber abandoned calls
- Incoming trunk switch abandoned calls
- Incoming trunk calls routed to an announcement
- Incoming trunk calls routed to a tone
- Incoming trunk calls to lock-out
- Incoming trunk calls to outgoing trunk calls
- Incoming trunk calls to terminating line calls
- Lines manual busy
- Number of incoming trunk calls
- Number of originating line calls
- Originating line switch abandoned calls
- Originating line calls routed to an announcement
- Originating line calls to lock-out
- Originating line calls to outgoing trunk calls
- Originating line calls routed to a tone
- Originating line calls to terminating line calls
- Outgoing trunk match failures
- Outgoing trunk network attempts
- Outgoing trunk original seize failures
- Outgoing trunk retrial match failures
- Outgoing trunk retrial seize failures
- Terminating line blocked
- Terminating line match failures
- Terminating line network attempts

OM group OFZ2NET2 contains the same set of registers that existing OM group OFZ2 contains. It contains registers to monitor the following traffic information for each bearer network defined in Table BEARNETS:

- No circuits available on business network trunks
- No circuits available on inward dial trunks
- No circuits available on intermachine trunks
- No circuits available on intertoll trunks
- No circuits available on local tandem trunks
- No circuits available on offnet trunks
- No circuits available on connect trunks
- No circuits available on toll completing trunks
- No circuits available on circuit trunks
- No circuits available on all other trunks
- Calls routed to GNCT treatment
- Switch originated partial dial calls
- Switch originated calls to permanent signal treatment

78.2.2.6 Lawful Intercept

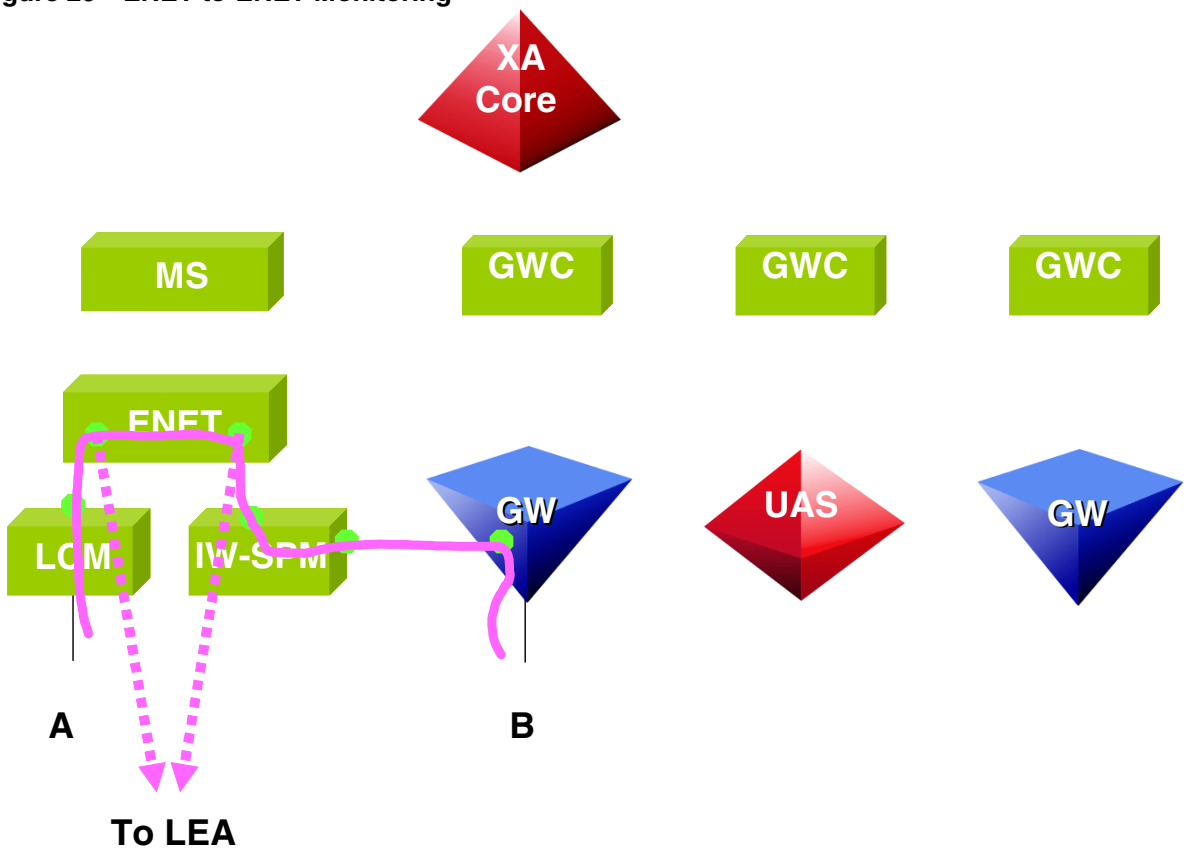
Lawful Interception is the ability to perform call monitoring on selected agents. Call monitoring includes:

- Call Data monitoring - reporting details about monitored calls (e.g. time of the call, dialled digits, parties involved, etc.)
- Call Content monitoring - delivery of both sides of a monitored conversation to law enforcement

With support for multiple bearer network in a single CS2000 Call Server, lawful intercept must provide the ability to do Call Content monitoring on all required call types and all supported bearer connections. Previous to SN07, Call content monitoring was supported for the following call types:

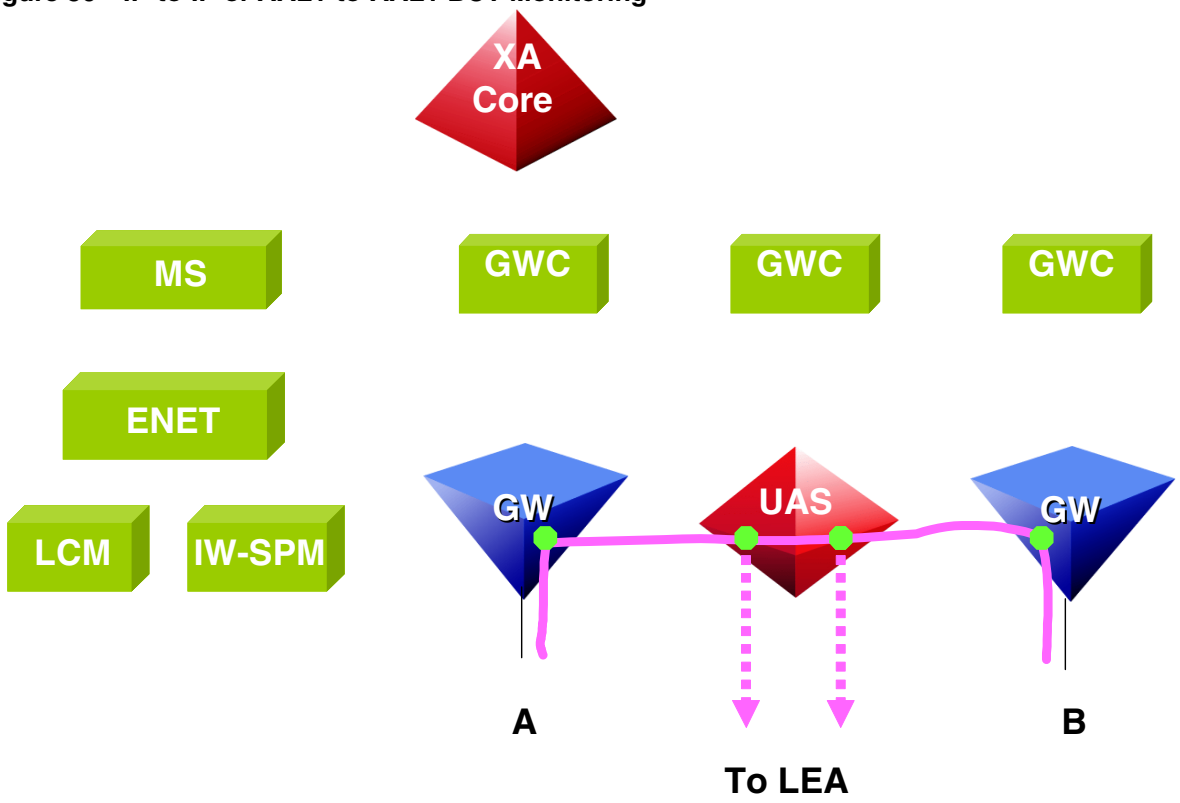
- ENET-to-ENET: replicas are attached to the primary ENET pathends which broadcast the transmit of each endpoint (legacy monitoring)

Figure 29 ENET-to-ENET Monitoring



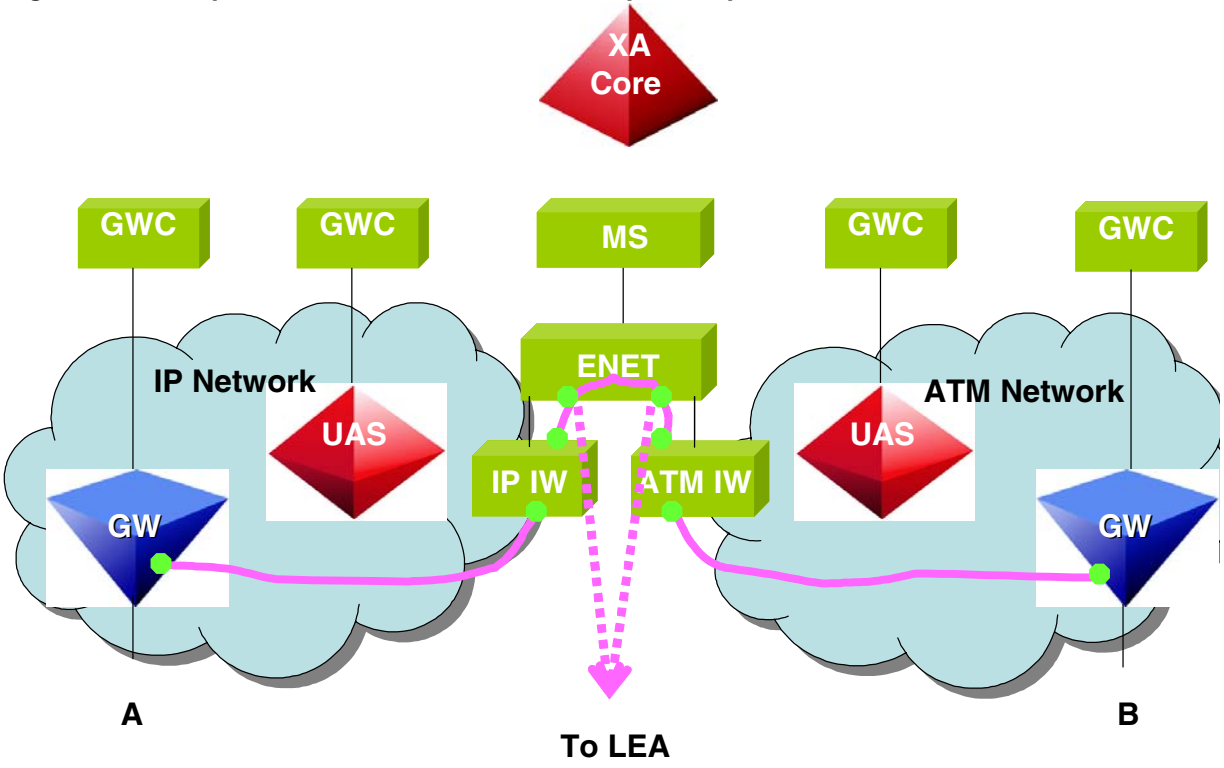
- IP-to-IP: primary call is tandemed through a Centralized Replicator (CR) to which replicas are attached. This functionality is known as Bearer Channel Tandeming (BCT).
- AAL1-to-AAL1: when BCT is active, the same strategy is used as in IP-to-IP calls. If not, then broadcast connections are attempted. This works for Packet Trunking - AAL1 solutions where the only AAL1-to-AAL1 calls involve MG4Ks which support broadcast connections.

Figure 30 IP-to-IP or AAL1-to-AAL1 BCT Monitoring



In SN07, there are no impacts to the replication models that are used to lawful intercept. Since the connection model for supporting a packet bearer network 1 to packet bearer network 2 connection involves using 2 IW SPM bridges, lawful intercept will used the ENET-to-ENET model to perform replication. Also, there is no impact to the connections made to the Law Enforcement Agency (LEA). A single interface is supported for all the replication methods. Refer to the following figure for an example connection with lawful intercept.

Figure 31 Multiple bearer network lawful intercept example



In summary, this means that in a CS2000 Call Server that supports three bearer networks (ENET, AAL1 and IP), that the following replication points will be used:

- ENET
  - — for ENET-to-ENET calls
  - — for AAL1-to-IP calls
  - — for ENET-to-AAL1 calls
  - — for ENET-to-IP calls
- UAS IP
  - — for IP-to-IP calls
- UAS AAL1
  - — for AAL1-to-AAL1 calls[1]

78.2.2.7 Service circuit support

Service circuits include specialized components needed to support the following:

- Announcements

[1]If the call involves only 2 MG4Ks, then the UAS is not needed (MG4Ks can broadcast the bearer path). But if an MG9K is involved, then the UAS is required.

- Conferencing
- Line and trunk test facilities

Each Succession configuration provides support for these service circuits in different ways. The following table provides a view of how these components are supported prior to SN07.

Table 3 Pre-SN07 service circuit support

Succession Configuration	Service Circuit Type	Service Circuit Support
PT-AAL1	announcements	ENET-based MTM
	conferencing	ENET-based MTM
	line/trunk test facilities	ENET-based MTM
UA-AAL1	announcements	ENET-based MTM
	conferencing	ENET-based MTM
	line/trunk test facilities	ENET-based MTM
PT-IP (XA Core)	announcements	ENET-based MTM and/or UAS (IP)[a]
	conferencing	ENET-based MTM and/or UAS (IP)[b]
	line/trunk test facilities	ENET-based MTM
PT-IP (CS2Kc)	announcements	UAS (IP or AAL2)
	conferencing	UAS (IP or AAL2)
	line/trunk test facilities	UAS (IP or AAL2) with Sage box
UA-IP (XA Core)	announcements	ENET-based MTM and/or UAS (IP)
	conferencing	ENET-based MTM and/or UAS (IP)
	line/trunk test facilities	ENET-based MTM
UA -IP (CS2Kc)	announcements	UAS (IP)
	conferencing	UAS (IP)
	trunk test facilities	UAS with Sage box
	line test facilities	AccessCare

a. Directed terminations for announcements is used if both platforms are present. ENET originating agents use the announcements on the MTM and IP originated agents use announcements on the UAS.

b. Directed terminations for conferencing is used if both platforms are present. ENET requesting agents use the conference ports on the MTM and IP requesting agents use conference ports on the UAS.

In SN07, in order to support multiple bearer networks and multiple service circuit platforms, then the directer terminations function would have to be changed to take into account multiple packet bearer networks. This work is not being done in SN07. This means that only a single platform for providing announcements, conferencing and test facilities is supported in a multple packet bearer network configuration. Since full service circuit functionality is provided when using the MTM as the platform, this is the configuration that is supported. This means that all packet bearer networks must allow connectivity to the ENET network in order to obtain announcements, conference ports and test facilities. If this network connectivity is not in place, then services that requires these facilities will fail.

78.2.2.8 Groups with members in multiple bearer networks

The CS2000 Call Server maintains line group types and trunk group types. These groups are comprised of individual members. Here are some examples of these groups:

- Centrex customer group
- Hunt group
- MADN group
- Trunk group

There is no restriction in place to require that all the members of the line group types be assocaited with a single bearer network. For example, a hunt group can can members in all supported bearer networks. There are connectivity implications to consider in the case. In order to ensure seemless group functionality among all its members, then the associated bearer networks must be able to connect to each other (i.e., Table NET2NET must indicate connectivity between the bearer networks). If connectivity is not fully supported, then some group services may fail.

There is no restriction in place to require that all the members of a trunk group be assocaited with a single bearer network. Refer to the next section for more details on like network selection for trunk groups.

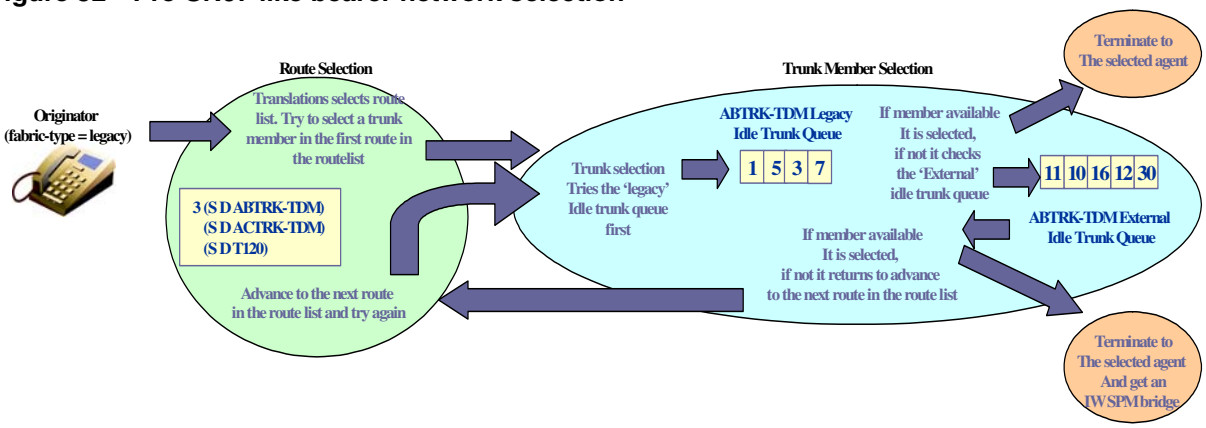
78.2.2.9 Trunk selection (like network selection)

Prior to SN07, the CS2000 Call Server tried to optimize bearer network connections by trying to select a trunk member whose bearer network matched the bearer network of the originating agent. Since there were only two bearer networks supported (‘internal’ and ‘external’), the trunk selection utility internally maintained an idle trunk queue for each of the two bearer networks. When a request was made to select a trunk member, the trunk selection utility would determine the bearer network of the originating agent and then traverse the ‘matching’ bearer network’s idle trunk queue looking for an available trunk member. If a member was found, it would be selected and returned to CallP

which would then request that a connection be made to that selected member (note that this connection would not require an interworking bridge).

If it did not find a member, it would search the ‘other’ bearer network’s idle trunk queue looking for an available trunk member. If a member was found, it would be selected and returned to CallP which would then request that a connection be made to that selected member (note that this connection would require an interworking bridge). If both queues are checked and no available member can be found, then the request is returned with an indication that the call should advance to the next route in the route list.

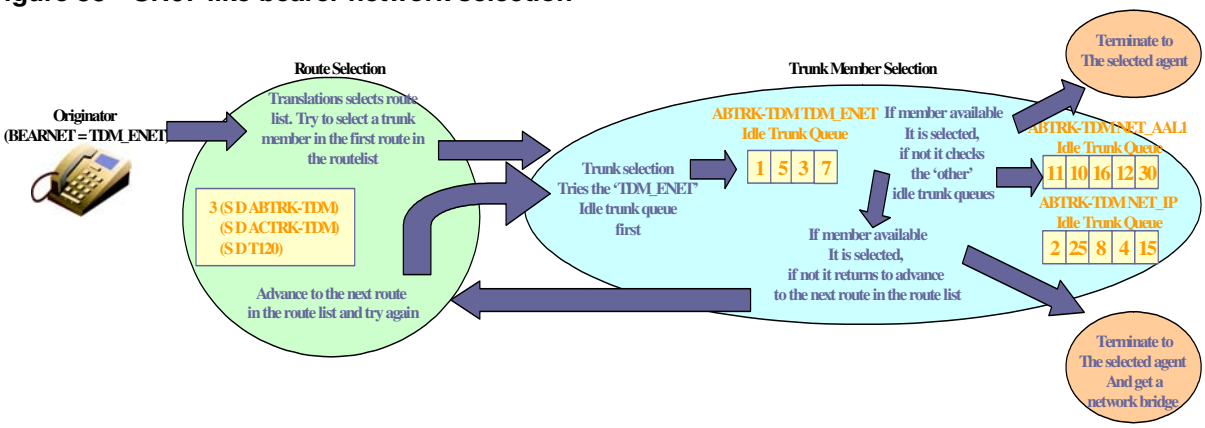
Figure 32 Pre-SN07 like bearer network selection



In SN07, the trunk selection utility is changed to support multiple bearer networks (i.e., more that two). When a request was made to select a trunk member, the trunk selection utility determines the bearer network of the originating agent and then traverses the ‘matching’ bearer network’s idle trunk queue looking for an available trunk member. If a member was found, it would be selected and returned to CallP which would then request that a connection be made to that selected member (note that this connection would not require an interworking bridge).

If it did not find a member, it would search the ‘next’ bearer network’s idle trunk queue looking for an available trunk member. The ‘next’ bearer network is determined by the order that the connecting bearer networks are datafilled in Table NET2NET. If a member was found, it would be selected and returned to CallP which would then request that a connection be made to that selected member (note that this connection would require an interworking bridge). If it did not find a member, it would continue searching it’s idle trunk queues in the Table NET2NET bearer network order until it either found an available member or exhausted all of its bearer networks. If all bearer networks are exhausted, then the request is returned with an indication that the call should advance to the next route in the route list.

Figure 33 SN07 like bearer network selection



The following is an example trunk selection request.

- Originating agent's bearer network = NET_AAL1
- Table NET2NET datafill
  - NET_AAL1 -> (TDM_ENET 0) (NET_IP 2)
- Terminating trunk group has members in all three bearer networks

The following is the order that the trunk selection utility will try to find an available trunk member:

1. Trunk group members in the NET_AAL1 bearer network
   - This is first because this is the originator's bearer network.
2. Trunk group members in the TDM_ENET bearer network
   - This is second because it is the first entry in Table NET2NET.
3. Trunk group members in the NET_IP bearer network
   - This is third because this is the second entry in Table NET2NET.

78.2.2.10 DPT (BICC and SIP-T) interworking including audible ringing support

Providing support for both BICC and SIP-T DPT protocols in the same CS2000 Call Server impacts the following areas:

- DPT terminal selection
- DPT audible ringing support

78.2.2.10.1 DPT terminal selection The algorithm for determining which node to host a DPT trunk call differs for BICC and SIP-T. Now that both are supported in the same CS2000 Call Server, this feature must ensure that both function properly.

Changes are needed for the BICC DPT terminal selection algorithms to make sure the bearer network of the hosting DPT capable node matches the bearer network of the DPT trunk group that was selected in translations.

The following table defines the algorithms for each protocol.

Table 4

DPT Protocol	Direction	Algorithm
SIP-T	outgoing	CS2000 Call Server selects the next available GWC node that is provisioned to support SIP-T (Tables SERVRINV and SERVSINV). Note that the bearer network of the DPT trunk group does not factor into the selection process.
SIP-T	incoming	The VRDN GWC selects the next available GWC node that is provisioned to support SIP-T (Tables SERVRINV and SERVSINV). The VRDN GWC builds it list of available SIP-T GWCs because the SIP-T GWCs register with it. BICC GWCs do not register with the VRDN GWC.
BICC	outgoing	CS2000 Call Server tries to put the DPT trunk on the most optimized BICC DPT capable node. BICC DPT capable nodes include the following: • BICC GWCs (bearer network independent) • MG4Ks (with an associated bearer network) • DPT SPMs (with an associated bearer network) If the originating agent is on the MG9K, then a BICC GWC is selected. Note that the bearer network of the DPT trunk group does not factor into the selection process because BICC GWCs can support any bearer network. If the originating agent is on the MG4K, then that same MG4K is selected provided the bearer network of the DPT trunk group matches the bearer network of the MG4K. If the bearer network of the DPT trunk group does not match the bearer network of that same MG4K, then terminal selection will try the BICC GWC (since it is bearer network independent) first, then it will try to get another MG4K that does support the DPT trunk group's bearer network. If the originating agent is on a legacy peripheral, then the DPT SPM is selected (if present) provided the bearer network of the DPT trunk group matches the bearer network of the DPT SPM. If the bearer network of the DPT trunk group does not match the bearer network of any DPT SPM in the office, then terminal selection will try the BICC GWC (since it is bearer network independent) first, then it will try to get any MG4K that does support the DPT trunk group's bearer network.

Table 4

DPT Protocol	Direction	Algorithm
BICC	incoming	Prior to SN07, the CS2000 Call Server attempts to initially put the DPT terminal on an MG4K for message normalization and then will move it to the most optimized location based upon what agent the call terminates to. The reason for doing this was to provide a hosting node that had the ability to play tones and collect digits in the case where a service was invoked prior to digit translations and line/trunk termination. In SN07, the CS2000 Call Server continues to place the DPT terminal on an MG4K or DPT SPM for normalization. However, this MG4K/DPT SPM's associated bearer network must now match the bearer network of the incoming BICC DPT trunk group. If no match can be found, then the call is sent to a BICC GWC to be normalized. Note that this leaves no place to support tones and digit collection for those services that may be invoked prior to agent termination. Once the DPT call is normalized, the CS2000 Call Server attempts to optimize the location of the DPT context based on the terminating agent in the call. If the terminating agent is on an MG9K, then the DPT context is moved to a BICC GWC. Note that the bearer network of the BICC DPT trunk group does not factor into the optimization process because BICC GWCs can support any bearer network. If the terminating agent is on an MG4K, then the DPT context will be moved to that MG4K provided the bearer network of the terminating agent's MG4K matches the bearer network of the BICC DPT trunk group. If it does not match, then the DPT context remains where it is (i.e., where it was normalized). If the terminating agent is on a legacy peripheral, then the DPT context will be moved to a DPT SPM (if present) provided the bearer network of the DPT SPM matches the bearer network of the BICC DPT trunk group. If a DPT SPM cannot be found, then the DPT context is moved to a BICC GWC and an IW SPM bridge from the associated bridge pool is used to connect the bearer network of the DPT trunk group and the legacy peripheral. If a BICC GWC is not present, then the call remains where it is (i.e., where is was normalized) and an IW SPM bridge from the associated bridge pool is used.

78.2.2.10.2 DPT audible ringing support The means for providing audible ringing on egress DPT trunk calls differs based upon the DPT protocol being used. Now that both protocols are support in the same CS2000 Call Server, care is taken to ensure that audible ringing functions properly is all scenarios, including bearer network interworking scenarios.

On an incoming DPT SIP-T trunk call where the DPT SIP-T trunk is asked to apply audible ringing, the DPT SIP-T trunk uses Remote Bearer Control (RBC) to ask the originating call server to apply the audible ringing tone on its behalf. On an incoming DPT BICC trunk, the DPT BICC trunk uses Bearer Channel Proxy - No-Anchor (BCP-NA) to ask the terminating gateway to apply audible ringing back towards the originating call server. The following table illustrates the scenarios and how audible is applied.

Table 5 DPT audible ringing scenarios

Originating Agent	Terminating DPT Agent	How audible ringing is applied
Line (TDM_ENET)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Trunk (TDM_ENET)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Line (NET_AAL1)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Trunk (NET_AAL1)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Line (NET_IP)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Trunk (NET_IP)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Line (TDM_ENET)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
Trunk (TDM_ENET)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
Line (NET_AAL1)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
Trunk (NET_AAL1)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
Line (NET_IP)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the Line GW towards the line agent
Trunk (NET_IP)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the Trunk GW towards the trunk agent
DPT BICC (NET_AAL1)	Line (TDM_ENET)	BCP-NA used to ask the AAL1 IW SPM to apply audible ringing towards the AAL1 network
DPT BICC (NET_AAL1)	Trunk (TDM_ENET)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
DPT BICC (NET_AAL1)	Line (NET_AAL1)	BCP-NA used to ask the MG9K to apply audible ringing towards the AAL1 network

Table 5 DPT audible ringing scenarios

Originating Agent	Terminating DPT Agent	How audible ringing is applied
DPT BICC (NET_AAL1)	Trunk (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
DPT BICC (NET_AAL1)	Line (NET_IP)	BCP-NA used to ask the AAL1 IW SPM to apply audible ringing towards the AAL1 network
DPT BICC (NET_AAL1)	Trunk (NET_IP)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
DPT SIP-T (NET_IP)	Line (TDM_ENET)	BCP-NA used to ask the IP IW SPM to apply audible ringing towards the IP network. If it cannot accommodate the request, the RBC is used to ask the originating call server to play audible ringing.
DPT SIP-T (NET_IP)	Trunk (TDM_ENET)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
DPT SIP-T (NET_IP)	Line (NET_AAL1)	BCP-NA used to ask the IP IW SPM to apply audible ringing towards the IP network. If it cannot accommodate the request, the RBC is used to ask the originating call server to play audible ringing.
DPT SIP-T (NET_IP)	Trunk (NET_AAL1)	Not in the CS2000 Call Server. Audible riging is applied in the next call server.
DPT SIP-T (NET_IP)	Line (NET_IP)	BCP-NA used to ask the line gateway to apply audible ringing towards the IP network. If it cannot accomodate the request, the RBC is used to ask the originating call server to play audible ringing.
DPT SIP-T (NET_IP)	Trunk (NET_IP)	Not in the CS2000 Call Server. Audible riging is applied in the next call server.
DPT BICC (NET_AAL1)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
DPT SIP-T (NET_IP)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible riging is applied in the next call server.

78.2.2.11 Translations and Routing changes

With support for multiple bearer networks, there is an assumption that calls should remains on the same bearer network as much as possible. Given this assumption, the following changes are made in SN07:

- Routing based upon the bearer network
- TRAVER modifications to support multiple bearer networks

78.2.2.11.1 Routing based upon the bearer network Prior to SN07, the CND/NOT PKT conditional route selector allowed the customer to force routing between the ENET and the packet bearer network. In SN07, this selector is replaced by new conditional route selectors:

- CND/NOT
- FABRIC
- BEARNET

The FABRIC conditional route selector replaces the PKT conditional route selector. During translations and routing, the fabric of the originating agent's bearer network is examnied and determines the next route in the route list. This allows the customer to explicitly keep a call on a particular bearer network fabric. During the ONP to SN07, the FABRIC selector replaces any PKT selectors found.

The BEARNET conditional route selector is new in SN07. During translations and routing, the originating agent's bearer network is examnied and determines the next route in the route list. This allows the customer to explicitly keep a call on a particular bearer network.

Refer to the Configuration section of the document for additional information.

Figure 34 Conditional routing example datafill

```
TABLE: OFRT
-----------------------------------------------------------
100 (CND FABRIC ENET ST 200) (CND FABRIC AAL1 ST 201)
    (CND FABRIC IP ST 202) $
101 (CND BEARNET TDM_ENET ST 200) (CND BEARNET NET_AAL1 ST 201)
    (CND BEARNET NET_IP ST 202) $
```

78.2.2.11.2 TRAVER modifications to support multiple bearer networks In order to support the new conditional route selectors described above, changes are needed in TRAVER to provide the correct route selection. In SN07, TRAVER needs to determine either the fabric or the bearer network of the originating agent.

If the originating agent is a line, then TRAVER will identify the fabric or bearer network and apply that knowledge to any FABRIC or BEARNET conditional route selectors that it finds.

If the originating agent is a trunk group, then TRAVER cannot automatically identify the fabric or the bearer network information. This is because this designation is not made at the trunk group level but is made at trunk member level.. Therefore, changes are made to TRAVER to allow either a trunk member to be specified explicitly or to specify the bearer network to use for the originating trunk group. The existing TRAVER option TRKMEM is modified to include the determination of the associated bearer network. A new option, BEARNET, as added to support the bearer network designation for a trunk group[1].

[1]TRAVER determines the fabric based upon the associated bearer network.

Refer to the Configuration section of the document for additional information.

78.2.2.12 USP messaging

In SN07, the USP is an optional component. When it is present, it provides the connection from the CS2000 Call Server to the SS7 network. ISUP signaling messages and TCAP transaction messages traverse through the USP interface.

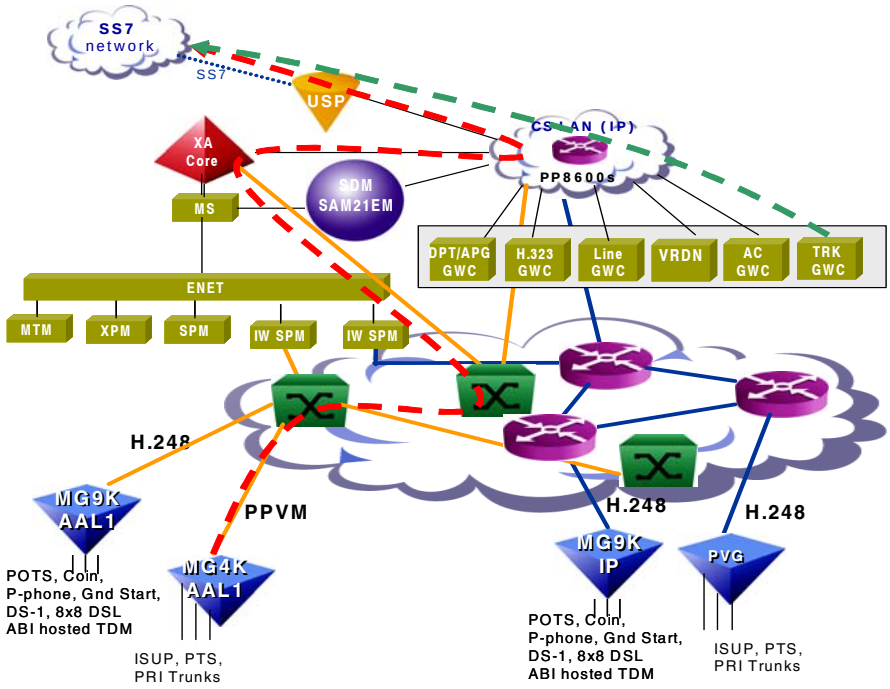
TCAP transaction messages are always generated by the CS2000 Call Server. However, ISUP signaling messages are generated from the ISUP trunk peripherals. The path that the ISUP message takes to get to the USP varies based upon the type of trunk peripheral.

Table 6 USP messaging path for ISUP signaling messages

ISUP trunk peripheral	USP messaging path
GWC	GWC -> CS LAN -> USP
MG4K (AAL1)	MG4K -> AAL1 bearer network -> CS2000 -> CS LAN -> USP
DPT SPM (AAL1)	DPT SPM -> CS2000 -> CS LAN -> USP
legacy peripheral	Legacy peripheral -> CS2000 -> CS LAN -> USP

The USP supports multiple messaging paths and defines them on a per node basis.

Figure 35 USP messaging paths



78.2.2.13 ECAN across multiple bearer networks

Echo cancellation (ECAN) can be applied differently in each bearer network. In an IP bearer network, the packet latency is generally large enough to require 100% ECAN. ECAN is only turned off if an individual call requires that it be turned off (i.e., FAX call).

In an AAL1 bearer network, the packet latency may not be large enough to require ECAN. ECAN in the AAL1 network is generally expensive hardware to purchase and would like to be avoided, if possible. The existing office parameter, ECAN_EDGE_STRATEGY, determines the ECAN strategy used for the AAL1 networks.

Refer to feature A00004046: Echo Cancellation Support for TriModal Call Server 2000 for more information on ECAN.

78.2.2.14 Voice quality

In supporting the connections between packet bearer networks using multiple IW bridges, the voice quality may experience some degradation. The area of concern is in packet latency and delay.

Latency and delay are concerned with how long it takes for a packet of voice to transit the bearer network(s) from end to end. Generally, there is a budget of

150 ms given to a packet. If the delay increases past 150 ms, then the possibility of the end subscribers talking over top of each other increases. The following factors effect the latency and delay that a packet experiences:

- packetization rate and jitter buffer
- transcoding delay
- ECAN
- IP routers
- overall distance travelled

The following tables provide a few examples of latency.

Table 7 MG9K IP to MG9K AAL1 call analysis

MG9K IP to MG9K AAL1 call analysis	10 ms packetization	20 ms packetization
MG9K IP packetization	10	20
Leg 3 router hops, assume 3 routers	3	3
IP IW SPM jitter buffer	30	60
ENET	1	1
AAL1 IW packetization	6	6
MG9K AAL1 jitter buffer	2	2
Total latency	52	92

78.2.2.15 ONP

Due to the nature of the changes made to the connectivity function in the CS2000 Call Server, they are applicable to all Succession configurations in SN07, regardless of how many bearer networks are supported. In order to preserve call processing over the ONP, the provisioning of Tables BEARNETS, NETBRDGE, NETPATH and NET2NET must be accomplished during the table transfer.

Refer to the Configuration section for more details on the ONP procedures.

78.2.2.16 Capacity

In general, there are no changes to the capacity parameters for a CS2000 Call Server that supports multiple bearer networks. The total number of endpoints (i.e., lines and trunks) supported remains unchanged. The BHCA capacity of the call server remains unchanged.

The only capacity change is the number of IW SPM bridge nodes supported in a singel office. Prior to SN07, there was a limit of 14 IW SPM bridge nodes supported in an office. In SN07, this limit is removed. The limitation that the CS2000 Call Server can support only 78 SPM nodes of any type is the only remaining capacity limitation for IW SPM nodes. In other words, all the SPM nodes in the office must sum to less that (or equal to) 78 nodes. This includes all the legacy SPMs, MG4Ks, DPT SPMs and IW SPMs in the office.

78.3 Hardware Requirements or Dependencies

In SN07, the following gateways and packet agents are supported in the multi-bearer network configuration.

Table 8 Gateways and packet agents supported in SN07

Bearer Network	Gateway	Agents
ENET	None[a]	supported SN07 legacy peripherals which includes both lines and trunk
ATM AAL1 (UA)	MG4000	ISUP trunks PTS trunks PRI trunks BICC DPT trunks
	GWC[b]	BICC DPT trunks
	MG9000	POTS lines Pphone lines Coin lines Ground Start lines
	MG9000 with ABI	supported SN07 ABI peripherals which includes both lines and trunk
	DPT SPM	BICC DPT trunks
IP (UA)	PVG (for loop-around trunk access only for support of H.323)	ISUP trunks PRI trunks
	MG9000	POTS lines Pphone lines Coin lines Ground Start lines
	MG9000 with ABI	supported SN07 ABI peripherals which includes both lines and trunk

Table 8 Gateways and packet agents supported in SN07

Bearer Network	Gateway	Agents
	GWC[c]	SIP-T DPT trunks

a. There are no ‘gateways’ support on the ENET. However, there is a list of supported legacy peripherals for Succession Call Servers. This list remains unchanged by this feature.
b. Not a true bearer gateway. This is included to illustrate the support for BICC DPT trunk support.
c. Not a true bearer gateway. This is included to illustrate the support for SIP-T DPT trunk support.

78.4 Software Requirements or Dependencies

This feature requires SN07 North America XA-CORE load or later.

78.5 Limitations and restrictions

In SN07, only one bearer network entry will be supported in table SERVRINV and it will be restricted to the default network because SESM will only support a single bearer network per GWC.

In SN07, an IW bridge will be restricted to a single bridge pool.

In SN07, only one bearer network entry will be supported for DPT SPM and it will be required to be the default network.

In SN07, only one bearer network entry will be supported for MG4K and it will be required to be the default network.

In SN07, the DPT trunk groups datafilled in table TRKOPTS will be restricted to a single network protocol.

In SN07, networks must be configured with full inter-connectivity in table NET2NET.

Customer groups may contain agents from various bearer networks, but all agents within a customer group must be fully inter-connected via NET2NET.

The maximum size of the table BEARNETS will be 8 tuples.

The maximum size of the table NETBRDGE shall be 64 tuples.

Carrier Hosted Services (MCS, H.323, and Centrex IP) are not supported in SN07.

In a multiple packet bearer network configuration, it is expected that the service circuits (i.e., announcements, conference ports and test facilities) be accessed on the MTM (via the ENET).

E911 is a regulatory service that requires all lines to have access to a PSAP. This feature introduces a means to block connectivity between agents that are on different bearer networks. Care should be taken when engineering the office to ensure that all lines have connectivity access to an E911 PSAP. Line PSAPs are not supported.

Operator services is a regulatory service that requires all lines to have access to an operator. This feature introduces a means to block connectivity between agents that are on different bearer networks. Care should be taken when engineering the office to ensure that all lines have connectivity access to operator services access points.

Hyper-PRI is not supported for packet based agents. Multiple fabrics are not supported within a PRI group.

SIP-T is supported on a single IP network only, as the APG resource selection is not supported across mutliple bearer fabrics.

This feature does not support in-service line/trunk migrations or cutovers from one bearer network to another bearer network.

This feature does not support in-service node migrations or cutovers from one bearer network to another bearer network.

79: Functional Description (FN): A00003489

79.1 Feature name

A00003489 - ABI SMS Support

79.2 Description

This activity adds support for the SMS and its subtending SLC-96s to the list of legacy PMs supported by the ABI program. The ABI program allows legacy host XPMs to be connected to the packet network without use of an ENET and an I/W Bridge. Instead the XPM is connected to an ABI card in the MG9K via its legacy DS-512 interface. The MG9K in turn provides connectivity to the packet network. This feature will support Mode 1 and Mode 2 SLC-96s. It will work with both the existing ATM MG9K and be integrated with the new IP version.

The main customer viable changes for this activity will be the ability yo provision the EXTDS512 optional field as part of the tuple in table LTCINV for the SMS Peripheral Type. The optional field is used to identify the IP Address of the ABI Card and the Gateway Controller that the peripheral is 'hosted' off (the GWC must be datafilled in table SERVRINV prior to entering this information). A full description of the table control changes is available in the Data Schema section of this document (part of the Configuration chapter).

79.3 Hardware Requirements or Dependencies

There are no hardware requirements for this project. Integration with the IP project will require the new IP MG9K.

79.4 Software Requirements or Dependencies

The CM changes will go directly into SN07. The SMS load is currently frozen. The last load was built in the XPM14 time frame out of the XPM13BC context. The load will be brought on stream in XAX20 to add this new functionality.

79.5 Limitations and restrictions

- Only Mode 1 and Mode 2 SLCs will be supported. Mode 3 SLCs might also work, but, they will not be tested.
- RMM support will not be added to the SMS.
- Line Test will therefore only be supported using RMMs located in other XPMs at the site with the SMS or via DIal Up External test sets.

79.6 Interactions

This new code will need to interact with the existing ABI framework for link maintenance, packet connection setup, and MG9K ESA.

79.8 Glossary

Term	Description
ABI	Access Bridging Interface
SLC	Subscriber Loop Carrier
SMS	Subscriber Module for SLC-96/RT
XAX	Current XPM design stream for MX77 loads

80: Functional Description (FN): A00003490

80.1 Feature name

Feature A00003490 - Support for ABI XPM tuple Change - XA-Core

This feature is sourced in the Succession SN07 release.

80.2 Description

This feature provides the ability:

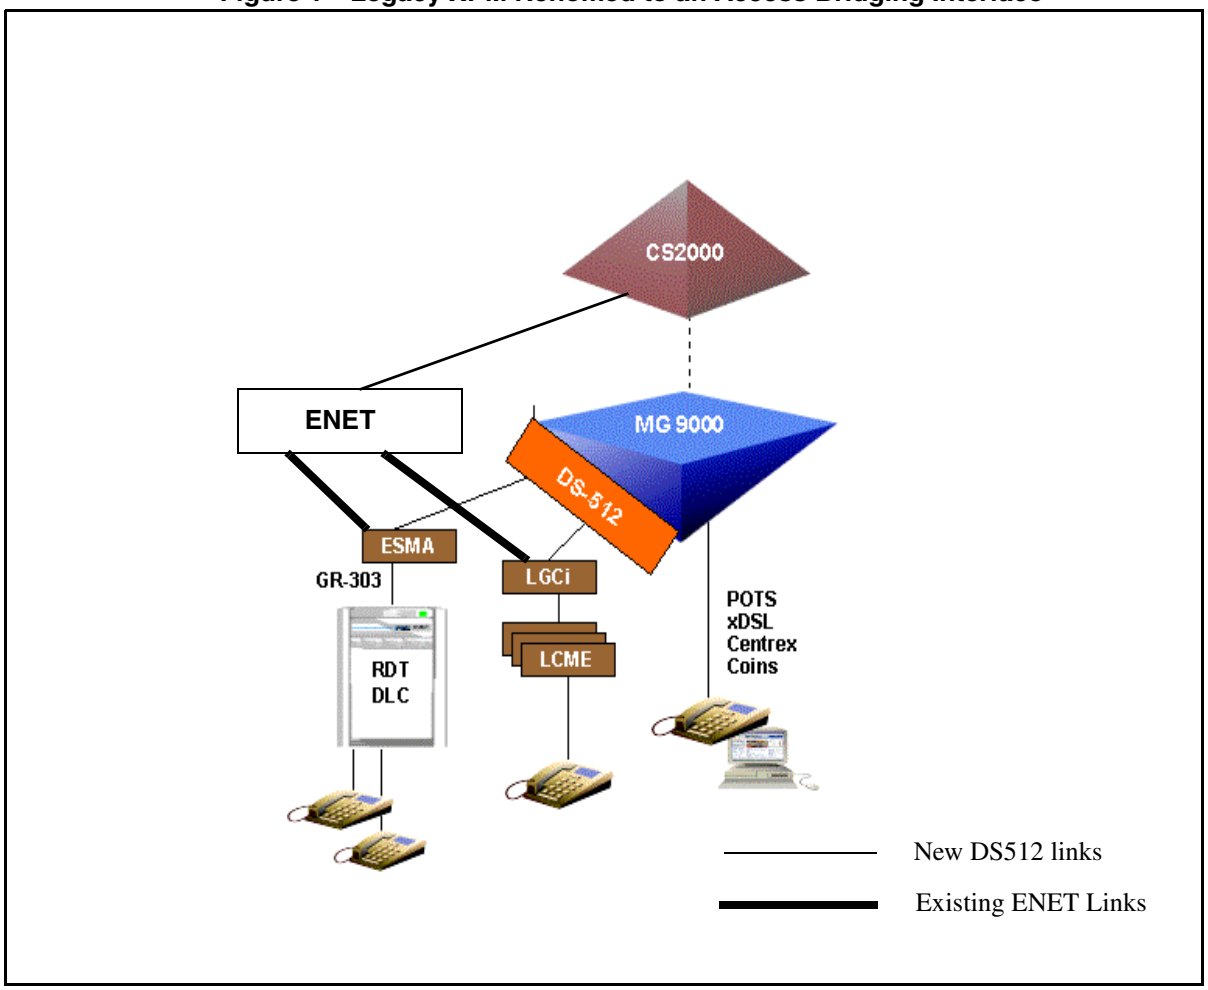
- to change the network fabric for a TDM based XPM from Enet/Jnet to DS512 interface
- restrict the use of this change only during the XPM rehome procedures

Currently, legacy XPMs are connected to either a ENET or JNET network. Rehome of the legacy XPMs to the ABI configuration is accomplished by connecting the XPM to the DS512 interface in a MG9000 gateway. The DS512 serves as the interface between the TDM links to the XPM and the OC3 interface coming out of the MG9000 and into the ATM network. Please refer to “Figure 1 Legacy XPM Rehomed to an Access Bridging Interface” on page 762.

The ability to perform a network interface change has the following benefits:

- simplifies the ABI XPM rehome methods and procedures
- in some instances, this may be the only way to change to an ABI network interface. Offices with a fully configured network cannot datafill a “fake” XPM because there is no free network links

Figure 1 Legacy XPM Rehomed to an Access Bridging Interface



The ability to change the network interface via the table control change operation is only available during the XPM rehome activity. To control the activation of the table control change operation, the installation personnel utilizes the TOOLSUP and ABIREHOME CI tools. Please refer to "Command interface changes" in the configuration (CN) section of this feature for detailed command information. This table control operation is merely one piece of the overall installation and rehome process. For the complete installation process, please refer to Installation Method 72-1682 XPM to MG9000 DS-512 Rehome. Optionally, a secondary capability to rehome an ABI XPM to a different gateway with a new IP address, will also be provided.

For a complete list of restrictions associated with the ABI XPM rehome operation, please refer to "80.5 Limitations and restrictions" on page 765.

In order to provide these new functionalities described above, the customer will see changes in the following areas:

- operation of table LTCINV

- operation of new ABIREHOME CI tool

80.2.1 Table LTCINV Impacts

Table LTCINV changes consist of modifications to the original SN05 ABI XPM tuple change operation restrictions. No other changes have been made to the table. For a complete list of the current ABI XPM tuple operation restrictions, please refer to “80.5 Limitations and restrictions” on page 765.

For a change operation on XPM tuple in LTCINV, the following four types of change are allowed:

1. **ENET change** - This is an existing functionality that has not been altered. In this type of change, the ENET links of the XPM can be changed to any available valid ENET links.

2. **ABI change** - In this type of change, the XPM can be moved to a different ABI on the same GWC.

3. **ENET to ABI change** - In this type of change, the ENET links of the XPM are removed and an attribure EXTDS512 is added which indicates that the XPM is being moved from ENET to ABI. The EXTDS512 attribute has the information about which ABI the XPM is being moved to.

4. **ABI to ENET change** - In this type of change, the attribute EXTDS512 is removed and ENET links are added which indicates the XPM is being moved from ABI to ENET.

When change operation is not successful there is a need to rollback the changes that have been done. The rollback is done based on the type of change.

80.2.2 New ABIREHOME CI Tool

The ABIREHOME CI tool is intended to be used by qualified personnel only. Therefore, the ABIREHOME tool must be enabled via the TOOLSUP password control mechanism.

The ABIREHOME CI directory contains commands specific to the rehoming process. This directory will contain only the following commands in SN07:

- Rehome query commands
  - QUERY_ABI_REHOME_STATUS/QRS: This command displays the status of the ABI rehome control mechanism. Several commands can only be executed when the Rehome State is ON.

- QUERY_IMPACTED_NODES/QIN: This command is used to display all the nodes currently marked as impacted.
- FIND_AFFECTED_NODES/FAN: This command is used to display all the nodes impacted by rehome of given XPM node. This does not show that the given XPM has been marked as impacted by Rehome, rather it only displays the node and those subtending nodes which would be affected if this node is rehomed.
- SHOW_NODE_STATUS / SHOWNS: This command displays the current status, through ABI rehome, of a specified XPM node, or all rehoming XPM nodes.
- DISP_LINK_CHANNEL_MAP/DLC: This command displays the link channel map for a specified XPM node.
- DISP_LINK_INFO/DLI: This command displays the status of a specified node and the status of that node's links.
- DISP_IOUI_ROUTE_DATA/DRD: This command displays the IO Routing data for a specified node.

• INVASIVE rehome commands

- SET_ABI_REHOME_STATUS: This command turns on the functiality for all the following invasive commands, and the overall ABI Rehome procedure. This status must be ON during the execution of the ABI Rehome procedure, as indicated in the Installation Method.
- MARK_NODE_DS512_RESULT: This command sets the DS512 Link Verified bit for the specified node. If the node is marked PASS for the DS512 Link Verification test, the XPM and its subtended nodes are marked as 'Affected By Rehome.' If the XPM is marked FAIL for the DS512 Link Verification test, the XPM and its subtended nodes are cleared from being marked as 'Affected By Rehome.' This permits the user to clear a node that was errantly marked as PASSed.
- ADJUST_FRAME_SYNC/AFS - This command is used to adjust the frame sync on the ABI cards to sync to the inactive XPM unit.
- SEND_GWC_STATIC_DATA/GWCSD : Send GWC Static Data. This command is used to send a limited static data update request to GWCs with new or deleted ABI XPMs.
- ABORT_GWC_STATIC_DATA/ABORT_GWCSD : Abort GWC Static Data. This command is used to send a limited static data update request to UNDO the recent GWC static data updates, following and AbortSwact ONLY.

  - LINE_STATUS_CHG : This command provides the ability to input a range of LENs and either display all line states in that range, or change the line states from one state to another.

- HIDDEN commands
  These commands SHOULD NOT BE EXECUTED. These commands are only intended for use by Nortel GNPS personnel in a recovery and/or data collection situation.
  - SLC: Set Link Channels Idle. This command sets the link and channel maps to Idle, for a specified node. Thiscommand will cause call deaths, if there are active calls on the node at the time.
  - SAN: Set Affected Nodes. This command is used to set the protected rehome bit for each node impacted by rehoming the given XPM.
  - CAN: Clear Affected Nodes. This command is used to clear the protected rehome bit for each node impacted by rehoming the given XPM.
  - SHOW_GWCSD: Show GWC Static Data. This command displays the GWC Static Data transactions that have been captured via LTCINV table control operations. This static data is automatically sent to the GWC following the XACore Swact, or AbortSwact.
  - CLEAR_GWC_SD_TABLE: This comand clears the GWC Static Data transactions that have been captured via LTCINV table control operations. If this command is executed prior to the XPM Rehome XACore SWACT, the GWC will not be updated with appropriate static data, and the GWC must be Node BSY and RTS'ed to recover the correct static data.

80.3 Hardware Requirements or Dependencies

While this feature does allow for the change to the network interface for an existing XPM, it does not require that the hardware be present in order to perform this operation.

80.4 Software Requirements or Dependencies

This feature does require the Core load to be a Succession load. The Succession load contains the MSH DRU. The MSH DRU is where key software resides for this feature functionality.

80.5 Limitations and restrictions

It was thought to be beneficial to list the ABI XPM provisioning limitations and restrictions which existed before and after this feature.

ABI XPM Provisioning Limitations and Restrictions	SN05	SN06	SN06.2	SN07
LTCINV tuple must be entered with ENET CSLNKTAB links or the EXTDS512 option, but not both.	X	X	X	X
EXTDS512 option may be assigned to LGCI and SMA2	X	X	X	X
EXTDS512 option may be assigned to LGC, LTC, LTCI			X	X
EXTDS512 option may be assigned to SMS				X
Add/Change/Delete of the derived C-side links in CSLNKTAB for ABI XPMs is not allowed.	X	X	X	X
Change of the GWC of the External XPM is not allowed.	X	X	X	X
Change of the External XPM to a gateway on a different GWC, as defined in GATWYINV, is not allowed.				X
Change of an LTCINV tuple from ENET to EXTDS512, or EXTDS512 to ENET, is allowed if the following conditions are true: - Change is being performed on the Inactive XACore, - ABI XPM Rehome is in progress, - The XPM is out of servic, and the XPM's ENET C-side links are OFFL or UNEQ. - The XPM either has no ISDN datafilled -or- has ISDN and is capable of doing pside-to-pside switching (has an NTAX78BA timeswitch or similar timeswitch with pside-to-pside switching capable) - The XPM (e.g. LTC) has no trunks datafilled on it.				X
IP address associated with the EXTDS512 option must be unique for each External XPM.	X	X	X	X
Change of the IP address associated with the EXTDS512 option (either in LTCINV or in GATWYINV) is allowed, if the XPM is MANB or OFFL. This can be performed on the Active XACore, or on the Inactive XACore as part of the ABI Rehome process.	X	X	X	X
XPM Rehome from ENET to ABI should NOT be executed over ONP.	X	X	X	X
TRNSL C, TRNSL MSG C and TRNSL EMSG C directs the user to the MG 9000 Element Manager. No C-side link information maintained in the Core.	X	X		

80.6 Interactions

This feature introduces the capability to change network interfaces for existing XPMs via a table control change operation during the rehome process. It is designed to have no impact on existing XPMs that will not be rehomed.

80.8 Glossary

Term	Description
Rehome	Moving of XPMs from one network to another network. More specifically from the ENET to the ABI or vice-versa Also, Moving of subtending devices from one XPM to another XPM. In the case of an ABI configuration, the XPM is considered a subtending device to the GWC.
ABI XPM	An XPM which is provisioned in table LTCINV with the optional attribute EXTDS512
network change	When the network interface type of an XPM is changed via the Table Control Change operation in Table LTCINV.

81: Functional Description (FN): A00003495

81.1 Feature name

APG integration with MP for NAT traversal.

81.2 Description

This feature is an enhancement of the CS 2000 Media Proxy NAT (Network Address Translator) traversal solution. It adds support for the APG (Anchor Packet Gateway) to this solution.

The MP (Media Proxy) NAT traversal solution was developed in SN06 under activity 89007980. It involves proxying a media path through an MP if the calling agents are in different IP (Internet Protocol) address domains, in order to ensure that media can flow between both parties.

The APG is a network device needed to support certain SIP-T (Session Initiation Protocol for Telephony) features on the CS 2000, mainly those that require the SIP-T leg to collect digits or play tones. The APG is inserted into the media path whenever SIP-T control logic determines that it is needed. The APG was developed in SN04 under activity 59031163.

Previous to this feature, calls requiring both an MP and an APG were not supported.

81.3 Hardware Requirements or Dependencies

None, apart from the hardware requirements and dependencies inherited from the APG and NAT traversal features, on which this feature is based. Please refer to the functional descriptions of these features for more details.

81.4 Software Requirements or Dependencies

None, apart from the software requirements and dependencies inherited from the APG and NAT traversal features, on which this feature is based. Please refer to the functional descriptions of these features for more details.

81.5 Limitations and restrictions

None, apart from the limitations and restrictions inherited from the APG and NAT traversal features, on which this feature is based. Please refer to the functional descriptions of these features for more details.

81.6 Interactions

None.

82.1 Feature name

Control of Shasta Media Proxy

82.2 Description

This feature implements the Nortel proprietary protocol MPCP 4.0 for the CS2K GWC platform.

MPCP is a simple protocol that is very loosely based on the IETF protocol MGCP. It uses a small subset of the MGCP messages, which are modified and extended with experimental parameters and proprietary interpretation of existing parameters. It is used by the GWC to control a Shasta BSN 5000 Media Portal as a Media Proxy (MP).

83: Functional Description (FN): A00003506

83.1 Feature name

Activity A00003506 - H.248 Per Trunk Signalling (PTS) Development

83.2 Description

This SN07 activity provides PTS trunking capabilities for the Succession Call Server 2000 (CS2K). Specifically, this activity provides incoming, outgoing, and two-way interconnections from a North American End Office (EO), Access Tandem (AT), or InterExchange Carrier (IEC) to the Public Switch Telephone Network (PSTN) as well as Private Branch eXchange (PBX) systems.

Figure 1 illustrates the CS2K network components that are applicable to this activity. The PSTN interconnection is provided using PTS trunk groups configured on a Gateway Controller (GWC) peripheral type where H.248 protocol is supported between the GWC and the Media Gateway (MG). The specific MG planned to provide this PTS functionality is Nortel's Passport Voice Gateway (PVG). The PVG load that will support PTS trunks is planned to be available in the SN07.1 release time frame.

The PTS trunk group types providing interconnection to the PSTN and PBX's are listed in Table 1, "Supported GWC PTS Trunk Group Types," on page 772.

Table 1 Supported GWC PTS Trunk Group Types

Trunk Group Type	Direction
OP	IC,OG,2W
ES	IC,OG,2W
PX	IC,OG,2W
IBNTI	IC
IBNTO	OG
IBNT2	2W
ATC	IC,OG,2W
IT	IC,OG,2W
SC	IC,2W
CELL	IC,OG,2W
DAL	IC,OG,2W

Table 1 Supported GWC PTS Trunk Group Types

Trunk Group Type	Direction
EANT	IC,OG,2W
ONAT	IC,OG,2W

This activity supports the following pulse types:

- MF - Multi-Frequency
- DP - Dial Pulse (for PX, DAL, IBN2W, IBNTO, and IBNTI only)
- DT - DigiTone (for PX, DAL, IBN2W, IBNTO, and IBNTI only)
- NP - No Pulse (For Outgoing FXS signalling only)

This activity supports the following Start Signal types:

- WK -WinK
- IM - IMmediate
- DD - Delay Dial
- GS - Ground start fxS
- LS - Loop start fxS

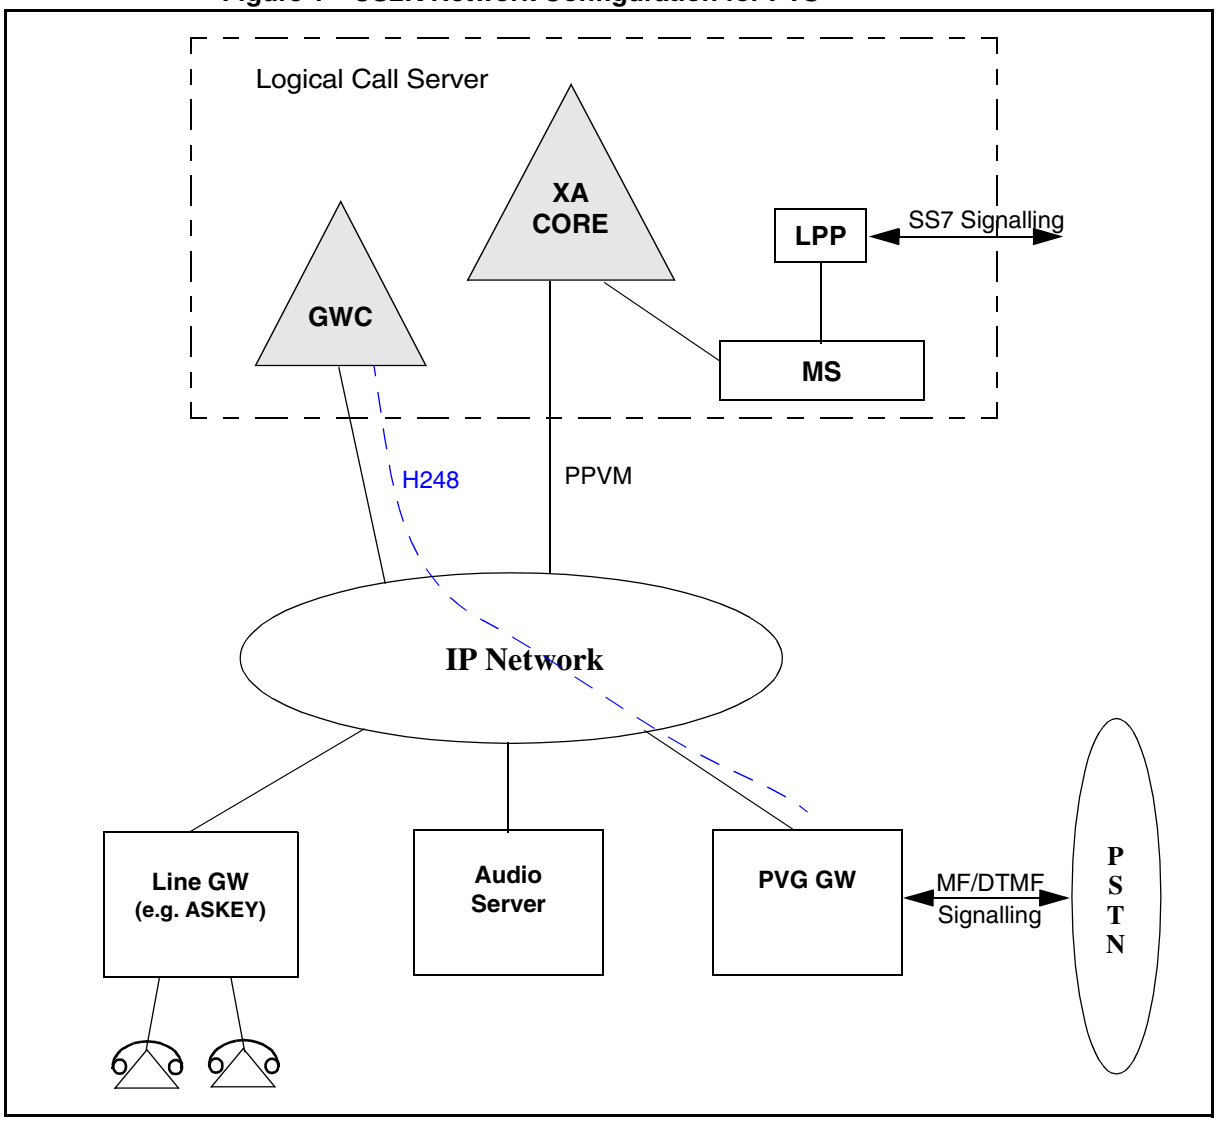
This activity supports the following Card Codes:

- DS1SIG
- FXSLS
- FXSGS

The supported combinations of trunk group type, pulse type and start signal type for this activity include the same combinations as supported in the legacy DM100 Switching System. Any restrictions or limitation from that support are included in section “83.6 Limitations and Restrictions” on page 785.

The base framework for H.248 PTS on GWC was established by prep features A89007187 and A89007652 in SN06. These prep features introduced limited PTS support for Outgoing Operator (OP), Emergency Services (ES), Direct Access Line (DAL), and Equal Access Network Trunk (EANT) trunk group types. This current activity in SN07 builds upon this base framework established in SN06.

Figure 1 CS2K Network Configuration for PTS



83.3 Functional Description

83.3.1 CS2K Provisioning Overview

As with the legacy DMS100 switching system, the GWC PTS trunk related data is provisioned on the CS2K core using the same data tables. These data tables include tables CLLI, TRKGRP, TRKSGRP, TRKOPTS, and TRKMEM. In addition, GWC node and endpoint provisioning is required and is accomplished using the Call Server 2000 Manager (CS2M).

When provisioning PTS trunks on a GWC, there are no restrictions regarding the distribution of the trunk members. Trunk members can be distributed over more than one GWC, over more than one MG, and can consist of any number of channels on a T1. However, if a T1 is to have its channels divided across trunks groups, those trunks groups must have the same card code provisioned in table TRKSGRP (e.g. DS1SIG, FXSLS, or FXSGS).

Also, a combination of trunk groups with different signalling types, on the same GWC, is supported. For example, ISUP and PTS trunks on the same GWC is a supported configuration.

Hybrid PTS trunk groups that consist of members distributed across a GWC and a different peripheral type, such as a DTC, are ***not*** supported.

83.3.2 CS2M GWC Node and Endpoint Provisioning

The CS2M provides the capability to configure a GWC by selecting the ADD GWC NODE command under the Configuration tab. The subsequent popup window allows the user to provision the GWC name, IP and router IP. In addition, the user provisions the Gateway controller profile and associated profile data information including Tone data, Exec data, and Type list for the GWC node being added. This activity provides the capability to select a specific GWC profile and profile data to configure GWCs to support PTS trunks.

The CS2M also provides the capability to configure an MG by selecting the Associate Media Gateway command under the configuration tab. The subsequent popup window allows the user to provision the GW name, IP, GWC name, and Gateway Profile name. For this activity the Gateway Profile name specified must be PVG. In addition, the user must also select the protocol type. For this activity, Megaco (4) must be selected to indicate H.248 protocol.

The CS2M also provides the capability to add carriers to a GWC. This is accomplished by first selecting a specific GWC, then selecting the provisioning tab. Once under the provisioning tab, the carrier tab can then be selected. Once under the carrier tab, the user can click the ADD button which triggers a POPUP where the user provisions the Carrier Name and Gateway Name. This carrier provisioning task accomplishes the provisioning of 24 PTS endpoints at a time on the specified GWC and carrier. The endpoints and

subsequent node and terminal numbers are mapped in the CS2K to a trunk group and member in table TRKMEM. See section “83.3.7 Table TRKMEM” for information regarding provisioning of table TRKMEM.

The capabilities to configure an MG and add carriers to a GWC are not introduced by this activity, but are included here to clarify the specific field values required to support PTS trunking.

83.3.3 Table SERVRINV Provisioning

When a GWC node is added from the CS2M, a subsequent and corresponding tuple is added to table SERVRINV. This tuple contains GWC name, network type, IP address, exec lineups and termtypes, tone set value, and options. This activity provides the capabilities to add a GWC node to table SERVRINV, either manually or via the CS2M tool that will support new exec_lineups for GWCs configured as PTS GWCs. The following table includes the new exec_lineup and termtype combinations which are supported for the PTS GWC.

Table 2 Supported PTS Exec Lineup/Term Type Combinations

PTS Exec Lineup with ABTRK TermType	PTS Exec Lineup with AB250 TermType	GWC PTS Trunks Supported
GWCEX	GWC250	All GWC PTS trunk groups except for PX trunk groups using FX signalling.
GWCEX	GWCFX	All GWC PTS trunk groups including PX with FX signalling except for for EANT, ONAT, and DAL trunk groups.
GWCEX	<none>	All GWC PTS trunk groups except for PX trunk groups using FX signalling and EANT, ONAT, and DAL trunk groups.

83.3.4 Table TRKOPTS Provisioning

This activity enhances the functionality of table TRKOPTS by adding the capability to provision option GWCPTSTK to any PTS trunk group identified in Table 1, “Supported GWC PTS Trunk Group Types,” on page 772 Figure 2 below shows an example tuple in table TRKOPTS with the GWCPTSTK option provisioned and highlighted.

In addition, the GWCPTSTK option contains a single sub-option, PRELOADANI. This sub-option is a boolean value which identifies GWC PTS trunk groups which support a call model that allows the ANI digits to be sent from the Core to the GWC prior to receiving any ANI request from the peripheral. The SN07 Feature A00003630 TGCP for the Cable Market introduced this PRELOADANI sub-option. This sub-option is currently only applicable to OP and ES trunk group types and will not be allowed to be set to

Y for any other GWC PTS trunk group type. Please refer to the feature documentation for activity A00003630 for additional information.

Figure 2 Table TRKOPTS GWCPTSTK Option

```
TABLE: TRKOPTS

                    OPTKEY
                                                                        OPTINFO
-------------------------------------------------------------------------------
        GWCPTSCLLI GWCPTSTK
                                                                    GWCPTSTK N
```

The GWCPTSTK option can only be added to a trunk group after the trunk group has been provisioned in table TRKGRP and before any trunk members of that group are provisioned in table TRKMEM.

In addition, the GWCPTSTK option is incompatible with some of the existing TRKOPTS options. Restrictions are added to prevent the incompatible options from being added together with the GWCPTSTK option on the same trunk group.

Table 3 TRKOPTS Options Incompatible with GWCPTSTK

TRKOPTS Option	Incompatibility Reason
Q118OPT	This activity supports IBN basic call only. No option support
SUPVOPT	This activity supports IBN basic call only. No option support
DPT	ISUP Specific Option
DYNAMIC	ISUP Specific Option
CNAMINGN	ISUP Specific Option
RLT	ISUP Specific Option
OSNC	ISUP Specific Option
DLYFWDXMT	Not supported for GWC PTS trunks
BLOCKLNP	ISUP Specific Option
VOICELAW	ISUP Specific Option
CGETSRESP	ISUP or ISDN Specific Option

Table TRKOPTS is also used to restrict trunk group, subgroup, or member capabilities non-compatible with the GWCPTSTK option.

The trunk group restrictions enforced by the GWCPTSTK option are unique for each supported GWC PTS trunk group type. These trunk group restrictions are discussed in section “83.3.5 Table TRKGRP”, section “83.6 Limitations and Restrictions”, and in the Configuration customer facing section.

The trunk subgroup restrictions enforce by the GWCPTSTK option are discussed in section “83.3.6 Table TRKSGRP”, section “83.6 Limitations and Restrictions”, and in the Configuration customer facing section.

The trunk member restrictions enforced by the GWCPTSTK option are discussed in section “83.3.7 Table TRKMEM”, section “83.6 Limitations and Restrictions”, and in the Configuration customer facing section.

83.3.5 Table TRKGRP

The TRKGRP tuple for a GWC PTS trunk is unchanged from the legacy DMS100 switching system. However, restrictions are enforced on GWC PTS trunk groups in table TRKGRP when the GWCPTSTK option is added to the trunk group in table TRKOPTS. Refer to section “83.6 Limitations and Restrictions” and the Configuration customer facing section for further information.

83.3.6 Table TRKSGRP

The TRKSGRP tuple for a GWC PTS trunk is unchanged from the legacy DMS100 switching system. However, with an IP network configuration, the responsibility of providing low level PTS signalling requirements is delegated to the MG. As a result, there is data currently provisioned in table TRKSGRP that is not applicable to PTS trunks configured on a GWC. Specifically, the IDGTIME and TRKGRDTM fields are not used by the CS2K in this configuration. In addition, other tuple field restrictions are enforced on GWC PTS trunk subgroups when the GWCPTSTK option is added in table TRKOPTS. Refer to section “83.6 Limitations and Restrictions” and the Configuration customer facing section for further information.

83.3.7 Table TRKMEM

The provisioning of a GWC PTS tuple in table TRKMEM requires a node number and a terminal number on the GWC. The node and terminal numbers are mapped to the specific endpoints during endpoint provisioning from the CS2M. Provisioning of the endpoints on the CS2M is recommended prior to table TRKMEM provisioning in order to map trunk members to specific carriers. Refer to section “83.3.2 CS2M GWC Node and Endpoint Provisioning” for additional information on GWC PTS endpoint provisioning.

Before a GWC PTS trunk member is allowed to be provisioned in table TRKMEM, the GWCPTSTK option must be present on the trunk group in table TRKOPTS. Table control enforces this restriction. In addition, if option GWCPTSTK exist on a trunk group, table control will disallow the addition of trunk members on non-GWC peripheral types, such as a DTC. Hybrid GWC

PTS trunk groups that consist of members distributed across a GWC and a different peripheral type, such as a DTC, are ***not*** supported. Please refer to section “83.6 Limitations and Restrictions” and the Configuration customer facing section for further information.

83.3.8 Echo Cancellation

This activity restricts the ECSTAT field in table TRKSGRP to allow only values of EXTERNAL or INTERNAL for GWC PTS trunk groups. The ECSTAT value of INTERNAL signifies that echo cancellation is to be performed by the MGs where this trunk group is provisioned. The ECSTAT value of EXTERNAL signifies that echo cancellation is NOT to be performed by the MG where the trunk group is provisioned. The ECSTAT field value of UNEQ is not supported. Field ESUPR is also restricted to allow only a value of ‘N’ for GWC PTS trunk groups.

83.3.9 Padding

Padding data is provisioned on the CS2K core in table PADDATA. For each GWC PTS trunk group in table TRKGRP, field PADGRP is provisioned. When a call is established, the padgrp for each agent involved in the call is retrieved and mapped in table PADDATA to determine the gain or loss. This gain or loss is specified to the MG via H.248 signalling. The PADGROUP ETLL should be used for PTS trunks configured on a GWC. Please refer to the SN06 PT-IP Engineering Guidelines for additional information on padgroup values.

83.3.10 H.248 Package Requirements

In order to support PTS trunks configured on a GWC using H.248 protocol between the GWC and MG the following H.248 packages are supported:

- Basic Channel Associated signalling (CAS) Package ITU-T Recommendation H.248.25 (7/2003)
- Robbed Bit Signalling (RBS) Package - ITU-T Recommendation H.248.25 (7/2003)
- Generic (G) Package -ITU-T Recommendation H.248.1 (03/2002)
- TDM Circuit (TDMC) Package - ITU-T Recommendation H.248.1 (03/2002)
- DTMF Detection (DD) Package - ITU-T Recommendation H.248.1 (03/2002)
- Extended DTMF (XDD) Package - ITU-T Recommendation H.248.16 (11/2002)
- Enhanced DTMF (EDD) Package - ITU-T Recommendation H.248.16 (11/2002)
- Basic Call Progress Tones Generator (BCG) Package - ITU-T Recommendation Q.1950 (12/2002)

- Call Progress Tones Generator (CG) Package - ITU-T Recommendation H.248.1 (03/2002)
- Extended Call Progress Tones (XCG) Package - ITU-T Recommendation Q.1950 (12/2002)
- Basic Service Tones (SRVTN) Package - ITU-T Recommendation Q.1950 (12/2002)
- Network (NT) Package - - ITU-T Recommendation H.248.1 (03/2002)
- H.248 Inactivity Timer (IT) Package - ITU-T Recommendation H.248.14 (03/2002)

Both the Basic CAS and RBS package include properties which the MG, to be compliant, must provide at least a default value for each of the properties. For interoperability with the CS2K, a set of these properties are provisioned on the MG.

83.3.11 PVG Profiles

For the PVG, a profile is provisioned on a DS1 carrier basis during installation of the PVG by Nortel Networks. Currently there are four profiles which support PTS trunks and are dependent on the supported cardcode and pulse types provisioned in table TRKSGRP. A PVG profile table mapping is shown below in Table 4, “PVG DS1 Profile Mapping,” on page 780.

Table 4 PVG DS1 Profile Mapping

PVG Profile Name	TRKSGRP Cardcode	TRKSGRP InComing Pulsetype	TRKSGRP OutGoing Pulsetype	Trunk Group Restrictions
ds1sig_mfr1.prof	DS1SIG	MF,DT, DP	MF,DP	None
ds1SigMwMfr1.prof *	DS1SIG	MF,DT, DP	MF,DP	None*
ds1sig_dtmf.prof	DS1SIG	DT,DP	DT,DP	Not Supported for OP, SC, ES, ATC, IT, ONAT, and EANT.
fxsls.prof	FXSLS	DT,DP	DT,DP	Supported for DAL and PX groups only
fxsgs.prof	FXSGS	DT,DP	DT,DP	Supported for DAL and PX groups only

* should be used in place of ds1SigMfr1.prof, if the far-end trunk group is setup to generate the multi-wink operator ringback signal.

Some office parameters are no longer applicable to PTS trunks provisioned on a GWC. Their values are now provisioned on the PVG through the use of PVG Profiles. The affected office parameters are listed in section “83.6.1 Office Parameters”.

83.3.12 Trunk Maintenance

83.3.12.1 Trunk Maintenance Manager (TMM) Support

The following commands will be supported on the TMM for GWC PTS trunks. No changes were introduced to provide this functionality for GWC PTS trunks.

- POST
- BSY
- BSY ALL
- FRLS
- RTS
- RTS ALL

83.3.12.2 Trunk Test Position (TTP) Level Support

Support for the following TTP level commands for PTS trunks configured on GWCs is provided.

- QUIT
- Post_
- BSY [<STATE>] [<ALL or A>] where STATE is MB, SB, or INB. SB is not supported for GWC trunks
- BSY [<ALL or A>]
- RTS with opts RTS, ALL, RES, INI, IDL, RLS, C (M, CP, BOTH)
- Hold
- NEXT
- RLS
- CktInfo
- Level_
- FRLS
- SEIZE

The following TTP level commands are not supported for PTS trunks configured on GWCs:

- TST
- Ckt_

NOTE: The T108 test is supported for PTS incoming trunks. Note: special translations are required to support an incoming T108 test (e.g. call translated to CLLI TRKLPBK).

The following TTP level commands are not supported for all trunks configured on GWCs (PTS, ISUP, etc.):

- BSY SB
- CktLoc
- TrnslVf_
- StkSdr_
- Pads

83.3.12.3 TTP MANUAL Level Support

The following MANUAL level commands are supported for PTS trunks configured on a GWC. The same restrictions on the BSY and RTS commands apply in the MANUAL level as exist in the TTP level for GWC PTS trunks.

- QUIT
- Post_
- BSY
- RTS
- Hold
- NEXT
- OP_
- FRLS
- SGNL
- RLS

The following MANUAL level commands are not supported for PTS trunks configured on a GWC:

- TST

The following MANUAL level commands are not supported for PTS trunks configured on a GWC because they require a hybrid office configuration:

- LOSS
- TGEN

- Noise
- TDet
- Hset

The following MANUAL level commands are not supported for all trunks configured on a GWC (PTS, ISUP, etc.):

- Jack_
- CallTrf

83.3.12.4 TTP MONITOR Level Support

The following MONITOR level commands are supported for PTS trunks configured on a GWC. The same restrictions on the BSY and RTS commands apply in the MONITOR level as exist in the TTP level for GWC PTS trunks.

- QUIT
- Post_
- BSY
- RTS
- Hold
- NEXT
- RLS
- FRLS

The following MONITOR level commands are not applicable to PTS trunks configured on a GWC:

- CPos_
- CktMon
- TST

The following MONITOR level commands are not supported for PTS trunks configured on a GWC because they require a hybrid office configuration:

- MonTalk
-

The following MONITOR level commands are not supported for all trunks configured on a GWC (PTS, ISUP, etc.):

- MONPOST
- MONLINK

83.3.12.5 TTP DATATTP Level Support

The following DATATTP level commands are supported for PTS trunks configured on a GWC. The same restrictions on the BSY and RTS commands apply in the DATATTP level as exist in the TTP level for GWC PTS trunks.

- Quit
- Post_
- Seize
- BSY
- RTS
- HOLD
- Next
- Rls

The following DATATTP level commands are not applicable to PTS trunks configured on a GWC and are restricted from use.

- BTerm_

The following DATATTP level commands are not supported for PTS trunks configured on a GWC because they require a hybrid office configuration:

- BERT_

83.3.12.6 GWC Swact Support for PTS Trunks

This activity provides for the support of PTS trunks during GWC swact. Any stable call over a PTS trunk configured on a GWC, which performs a warm swact, will remain active over the warm swact. All stable calls are torn down over a GWC cold swact.

83.3.12.7 CS2K Restart Support for PTS Trunks

This activity provides for the support of PTS trunks configured on a GWC over all core restarts. Any stable call will remain active over a warm restart. For any other core restart type, all calls are torn down as expected.

83.3.12.8 CS2K SWACT Support for PTS Trunks

This activity provides support for PTS trunks configured on a GWC during all CS2K swact activities including norestartswact, restartswact, and abortswact.

83.4 Hardware Requirements or Dependencies

Succession Network Hardware

- CS2K
- CS2M
- GWC
- PVG with VSP3-0
- IP Router (i.e. Passport 8600)

83.5 Software Requirements or Dependencies

This activity makes changes to the CS2K core, GWC, and PVG software loads. In addition, changes are made to the CS2M software.

This activity has the following software dependencies:

- CS2K North American load - SNNCSH07
- GWC load - GC070
- SN07.1 PVG load - availability TBD
- SN07 CS2M load - CSM0007

83.6 Limitations and Restrictions

83.6.1 Office Parameters

Some office parameters are no longer applicable to PTS trunks provisioned on a GWC. Their values are now provisioned on the PVG through the use of PVG Profiles. This chart will show which key PTS office parameters are not applicable to GWC PTS trunks.

Office Parameter	Still applicable to GWC PTS trunks?	Notes

PRE_SND_WK_DD_TIME (OFCSTD)	Yes	On originating wink start or delay dial trunks, this is the amount of time that the switch waits (minimum) before sending the leading edge of the start signal (either wink or DD) after origination has been detected. This parameter is in 10 millisecond granularity. This timing is not started until after the origination has been filtered (see ORIGFLTR in TRKGRP datafill).
REC_MAX_DD_TIME (OFCSTD)	No	Maximum duration Delay Dial recognized. On terminating DD trunks, any start signal with an off-hook duration of greater than this value will be considered glare. This is in 160 millisecond granularity.
REC_MAX_WK_TIME (OFCSTD)	No	Same as above except for terminating wink start trunks.
REC_MIN_DD_TIME (OFCSTD)	No	Minimum duration Delay Dial recognized. On terminating DD trunks, any start signal with an off-hook duration of less than this value will be ignored (probably resulting in a 'no start dial' condition with a route advance). This parameter is in 10 millisecond granularity.
REC_MIN_WK_TIME (OFCSTD)	No	Same as above except for terminating wink start trunks.
REC_PRE_DD_TIME (OFCSTD)	No	Timeout for receiving Delay Dial signal leading edge. On terminating DD trunks, the leading edge of the start signal must be received within this time or a "no start dial" condition will be experienced. This parameter is in 150 millisecond granularity. A value of 10 is recommended for GWC based and legacy trunks inter-connection.
REC_PRE_WK_TIME (OFCSTD)	No	Same as above except for terminating wink start trunks.
SND_DD_TIME (OFCSTD)	No	For DP trunks, this is the start signal duration (i.e. time between leading and trailing edges). This parameter is in 10 millisecond granularity.

SND_MF_WK_TIME (OFCSTD)	No	For non-DP trunks (MF trunks), this is the start signal wink duration (i.e. time between leading and trailing edges). This parameter is in 10 millisecond granularity.
SND_DP_WK_TIME (OFCSTD)	No	Same as above except for DP originators.
WK_DD_PRE_DIAL_ DELAY (OFCSTD)	Yes	On terminating wink and delay dial trunks, this is the time delay after the trailing edge of the start signal before outpulsing begins.
EA_REC_MAX_WK_T IME (OFCSTD)	Yes	Equal Access Receive Maximum Wink Time - This parameter specifies the maximum time for recognition of wink for ATC type trunk groups, in 10-ms intervals.
EA_REC_SUB_PRE_ WK_TIME (OFCSTD)	Yes	Equal Access Receive Subsequent Pre-wink - This parameter specifies the timeout for receiving the leading edge of next wink signals for ATC type trunk groups, in 160ms intervals.
EA_REC_1ST_PRE_W K_TIME (OFCSTD)	Yes	Equal Access Receive First Pre-wink Time - This parameter specifies the timeout for receiving the leading edge of the first wink signal for ATC type trunk groups, in 160-ms intervals.
EAEO_REC_1ST_PRE _WK_TIME (OFCSTD)	Yes	Equal Access End Office Receive First Pre-wink Time - This parameter specifies the time of the first pre-wink delay associated with outpulsing from an equal access end office (EAEO), in 160 ms intervals.
EAEO_REC_2ND_PRE _WK_TIME (OFCSTD)	Yes	Equal Access End Office Receive Second Pre-wink Time - This parameter specifies the time of the second pre-wink delay associated with outpulsing from an Equal Access End Office (EAEO), in 160-ms intervals.

IMMED_PRE_DIAL_DELAY (OFCSTD)	No, GWC PTS trunks will use a value of 1 second.	Two-way Immediate Start Trunks Pre-dial Delay - This parameter only applies to two-way immediate start and outgoing trunks. This parameter specifies the delay between seizure and outpulsing of digits, in 10-ms intervals.
MIN_REC_DP_PULSE_WD (OFCSTD)	No	Minimum Received Dial Pulse Width - This parameter allows variable settings for the minimum received dial pulse (DP) width.
PRE_ANI_SPILL_DELAY (OFCSTD)	Yes	Pre-automatic Number Identification Spill Delay - Switching units with outgoing trunks that perform wink and reversal signal calling number outpulsing require this parameter. This parameter specifies the delay between receiving the calling number request signal (wink), and outpulsing the calling number.
DPREC_INTER_DGT_TIMING (OFCSTD)	No	Interdigit timing in DP reception. This parameter specifies the end of digit timing value between two consecutive digits.
SHORT_TIMED_RELEASE_DISC_TIME (OFCSTD)	Yes	Disconnect timing performed on terminator disconnect. The Short TRD is typically used for unbilled calls.
LONG_TIMED_RELEASE_DISC_TIME (OFCENG)	Yes	Disconnect timing performed on terminator disconnect. The Long TRD is typically used for billed calls.
MF_LAST_DIGIT_DELAY (OFCENG)	No	This is a special interdigit delay between the second-to-last and last digit of an MF outpulsing stream. A value of 0 means the delay is no different than between other digits. This parameter is in 10 millisecond granularity.
ACK_WINK_DELAY_TIME (OFCVAR)	Yes	For FGD originations, this is the delay between the end of the address stream and the leading edge of the acknowledgment wink. This parameter is in 10 millisecond granularity.

ANS_DELAY_TIME (OFCVAR)	Yes	For FGD originations, this is the minimum delay between the trailing edge of the acknowledgment wink and offhook indicating answer. This parameter is in 10 millisecond granularity. 500 milliseconds seems large; however, in many cases the in-switch delay to route the call may be greater than 1/2 second.

83.6.2 Hybrid Office Restriction

A hybrid office configuration is not officially supported by this feature. Interworking Legacy agents with GWC PTS trunks require the use of an IW-SPM which is outside the scope of this development. This includes, but not limited to any test equipment that resides in an MTM shelf.

83.6.3 Universal Audio Server Restriction

The UAS does not support H.248 GWC PTS trunks since these trunks require support of the EG (Emergency) parameter. The UAS does not support use of the EG parameter and no further UAS development is planned. The AMS, Audio Media Gateway currently supports H.248 PTS GWC trunks and the EG parameter.

83.6.4 Dialtone Restriction

On some PTS trunk group types, EANT, DAL, ONAT, and possibly others, DIALTONE can be provisioned to values of S, C, or N, respectively Standard, Carrier, or None. The value of C is not restricted from provisioning, but when provisioned it will provide standard dialtone and not carrier dialtone. This restriction is based on the current limitations of the PVG.

83.6.5 Table DIGMAN Restriction

This feature does not support use of the DIGCOM field value of SIG in table DIGMAN with a pulse type of DT.

83.6.6 Table TRKGRP Restrictions

The following trunk group restrictions are enforced by the GWCPTSTK option in table TRKOPTS or the functionality has been determined to be unsupported for this feature.

83.6.6.1 OP Trunk Group Restrictions

- ANITYPE values of WK, REV, and NO are allowed but are restricted based on the value of the DIRection and MODE fields. The table below

provides a support matrix for the combinations of DIRection, ANITYPE, MODE.

Table 5 OP Trunk ANITYPE/Mode Support

DIR	ANITYPE	MODE	Supported
OG	REV	N/A	YES
OG	NO	N/A	NO
OG	WK	N/A	YES
2W	REV	AR/CR	YES
2W	REV	CV	YES
2W	REV	VF	NO
2W	NO	AR/CR	NO
2W	NO	CV	NO
2W	NO	VF	YES
2W	WK	AR/CR	YES
2W	WK	CV	YES
2W	WK	VF	NO

- HOLDTYPE value of JNTHOLD is disallowed for all OP groups.
- EAOSS value of N is allowed. Value of Y is disallowed.

83.6.6.2 ES Trunk Group Restrictions

- FDISCTIM is restricted to allow a value of 0 only.
- SWST is restricted to allow a value of DC only. AC and ADC are disallowed.
- ANI is restricted to allow a value of ANISPILL only. OUTPULSE and NOANI are disallowed.
- RMB has to be set to YES. A value of NO is disallowed.

83.6.6.3 PX Trunk Group Restrictions

No support for the TRKOPTS option DLYFWDXMT for PX trunks is provided by this feature.

83.6.6.4 IBNTI/IBNTO/IBNT2 Trunk Group Restrictions

This activity provides support for “basic call” only on IBN trunk groups. The following fields are restricted with table control, however, if any other field is outside the scope of “basic call”, then no support is implied.

Note: These 1st four fields conflict with requirements. Unsure how the support of these fields was agreed to as a requirement.

- DTI value is restricted to allow value of N. Value of Y is disallowed.
- TRKDSR value is restricted to allow value of N. Value of Y is disallowed.
- REORIG value is restricted to allow value of N. Value of Y is disallowed.
- FLASH value is restricted to allow value of N. Value of Y is disallowed.
- Disallowed IBN OPTIONS include PROPANS, ANISEND, ANIREC, ANIFAIL, DNIS, CLID, and OUTSCHM.

83.6.6.5 ATC Trunk Group Restrictions

None identified

83.6.6.6 IT Trunk Group Restrictions

None identified

83.6.6.7 SC Trunk Group Restrictions

- Option NOUTR is disallowed.

83.6.6.8 CELL Trunk Group Restrictions

None identified

83.6.6.9 DAL Trunk Group Restrictions

None identified

83.6.6.10 EANT Trunk Group Restrictions

None identified

83.6.6.11 ONAT Trunk Group Restrictions

None identified

83.6.7 Table TRKSGRP Restrictions

The following trunk subgroup restrictions are enforced by the GWCPTSTK option in table TRKOPTS and are common to subgroups of all GWC PTS trunk group types.

- SGRP field is restricted to a value of 0 only.
- CARDCODE field is restricted to values of DS1SIG, FXSLS, or FXGLS.
- SGRPVAR is restricted to a value of STD only
- IPULSTYP/OPULSTYP are restricted to allow values of MF, DP, NP, or DT only. Each trunk group type may have additional restrictions.
- Pulse type NP is only supported for Outgoing FXS trunks.

- Pulse types DP and DT are only supported for DAL, PX, and IBN trunk group types.
- ISTARTSG/OSTARTSG are restricted to allow values of WK, IM, DD, GS, or LS. Each trunk group type may have additional restrictions.
- CCONT is restricted to allow values of MW or NO.
- RNGBCK is restricted to allow values of MW or NO.
  - — Note: For GWC PTS trunks the CCONT and RNGBCK functionality is a function of the GW.
  - — Note: Selecting the MW value for RNGBCK is equivalent to turning ON the ringback feature on a particular GWC PTS trunk group. But the physical characteristics of the ringback signal are dictated by the PVG CAS profile associated with a particular carrier (that belongs to the same trunk group via provisioning)

    The PVG supports both types of physical ringback signalling - Expanded In-Band (EI) and Multi-Wink (MW). PVG CAS Profiles to Operator Ringback signalling types are mapped as:

    ds1sigMfr1.prof -> sets the operator ringback signal to EI

    ds1sigMwMfr1.prof -> sets the operator ringback signal to MW

    For the GWC PTS trunks to interact properly with external operator signalling equipment, the proper profile has to be set on that particular carrier on the PVG. This is a per-carrier restriction.
  - — Note: Operator Ringback functionality is only supported while using MF signalling.
- ESUPR is restricted to allow a value of N only.
- ECSTAT is restricted to allow values of EXTERNAL or INTERNAL only.
- Option SPMECIDX is disallowed on GWC PTS trunks.

83.6.8 Table TRKMEM Restrictions

Hybrid GWC PTS trunk groups that consist of members distributed across a GWC and a different peripheral type, such as a DTC, are ***not*** supported.

83.6.9 GWC PTS Trunks Capacity/Engineering Restrictions

A maximum of 42 DS1s or 1008 DS0s worth of NA PTS trunks are supported on a per GWC basis.

For every PTS halfcall, H248/Megaco messages convey PTS trunk signalling and also the bearer path manipulation information to the PVG. This extensive messaging puts constraints on the GWC resources. Hence every GWC PTS trunk datafilled will use GWC resources equal to that of four (4) GWC ISUP trunks.

Table 6, “GWC Trunks Capacity And PTS trunks,” on page 793is meant to illustrate this restriction, in the context of supporting multiple trunk types on the GWC.

Table 6 GWC Trunks Capacity And PTS trunks

Number of PTS trunks Datafilled	Number of other (e.g. ISUP) trunks supported	Total GWC Trunks Capacity.
1008	0	1008
504	2078	2582
350	2694	3044
200	3294	3494
0	4094	4094

Note: This feature does not restrict the support of different trunk types on the GWC, it only restricts the number of other trunk types ‘members/end-points’ that can be datafilled along with the PTS trunk ‘members/end-points’.

83.7 Interactions

The goal of this activity is to provide transparency with the legacy DMS100 Switching System. The same service interactions and service restrictions that exist with legacy non-gwc PTS trunks will also apply to PTS trunks configured on a GWC.

This activity supports interworking with the following agent types during regular call processing as well as when a service interaction, such as three way calling or call transfer, results in a connection with a supported GWC PTS trunk.

84: Functional Description (FN): A00003531

84.1 Feature name

MG9K EM – Frame location enhancements (A00003531)

This feature involves work in both MG9K-EM and SESM.

84.2 Description

This feature consists of following deliverables;

1. Office Frame number is displayed in MG9K EM Alarm browser, IEMS alarm browser and any other alarm browser/s provided by OSS.
2. Internal frame number is hard-coded to zero in VMG name, while provisioning VMG.
3. In MG9K-EM Frameview, frames are displayed without gap. However, any gap present between shelves will continue to be displayed.

   With this change, MG9K-EM Frame view is displayed in a cleaner way. Some of the examples for this cleaner display are;

- MG9K-EM Craft-person can see Master frame as and when he/she opens the Frame view, even when Master frame has two or more empty frames to its left side.
- MG9K-EM Craft-person can see adjacent frames, without scrolling to right in Frameview, even when there is gap between the frames.

4. In MG9K-EM Frameview, Master frame is shown far left and all subtending frames are shown to the right of Master frame going by following logic.

   - Show Master frame far left.

   - Show other frames, whose frame number is higher than that of Master frame on right of Master frame, in increasing order of their Internal frame number (IFN).

   -And then, show other frames, whose IFN is lower than that of Master frame, in increasing order of their IFNs.

As a result of the deliverables #3 and #4, Frameview may not be a mirror reflection of actual line-up of frames in MG9K.

Note that, as in SN6.2, in MG9K-EM Frame view, Internal frame number is shown at the bottom of each frame and Office frame number is shown at the top of each frame. With this, Craft-person can map the MG9K-EM Frame view to actual line-up of frames in MG9K.

5. Office Frame number is used in place of Internal frame number in OMC CSV OM file

6. A *complete* flow through provisioning is supported for ITP VMGs. With this, Frame location information, which is specified in MG9K-EM while provisioning ITP VMGs, is sent to SESM. SESM in turn, updates XA-CORE table LGRPINV.

   With these changes, Craft-person need not manually fill Frame location information in the table LGRPINV. Craft-person just need to provision Frame location information at MG9K-EM

7. A *partial* flow through provisioning is supported for ABI VMGs. With this, Frame location information, which is specified in MG9K-EM while provisioning ABI VMGs, is sent to SESM. However, SESM does not in turn updates XA-CORE table GWINV.

   There is no impact on the way Craft-person handles ABI VMGs, because of these changes. i.e., he/she still needs to manually fill Frame location information in the table GWINV, apart from provisioning Frame location information at MG9K-EM.

   Note: GWINV is a new table, which will be supported in SN07 through the Core feature A00003486 (Gateway location information).

84.2.1 MG9K-EM Frame view

This section gives example screen shots for the deliverable #3 and #4, which are explained in 2.1. For this, two different scenarios are considered.

84.2.1.1 Scenario 1

Let us consider a scenario wherein frames are lined-up from left to right as follows;

- First frame is numbered as 1 and is Master frame
- Second frame is numbered as 3 and is subtending frame

For this scenario, in SN06.2, craft-person need to use horizontal scroll bar to see the non-empty frames (frame #1 and frame #3) and MG9K-EM Frame view would looks like figure #1 and figure #2.

For this scenario, in SN07, craft-person see the non-empty frames as and when he/she opens the Frameview and MG9K-EM Frame view would looks like figure #3.

Even when frames are lined-up from right to left, in both SN06.2 and SN07, Frame view will look the same way as in left to right lineup.

Figure 1 MG9K-EM Frame view in SN06.2 and prior – when Frame view comes up

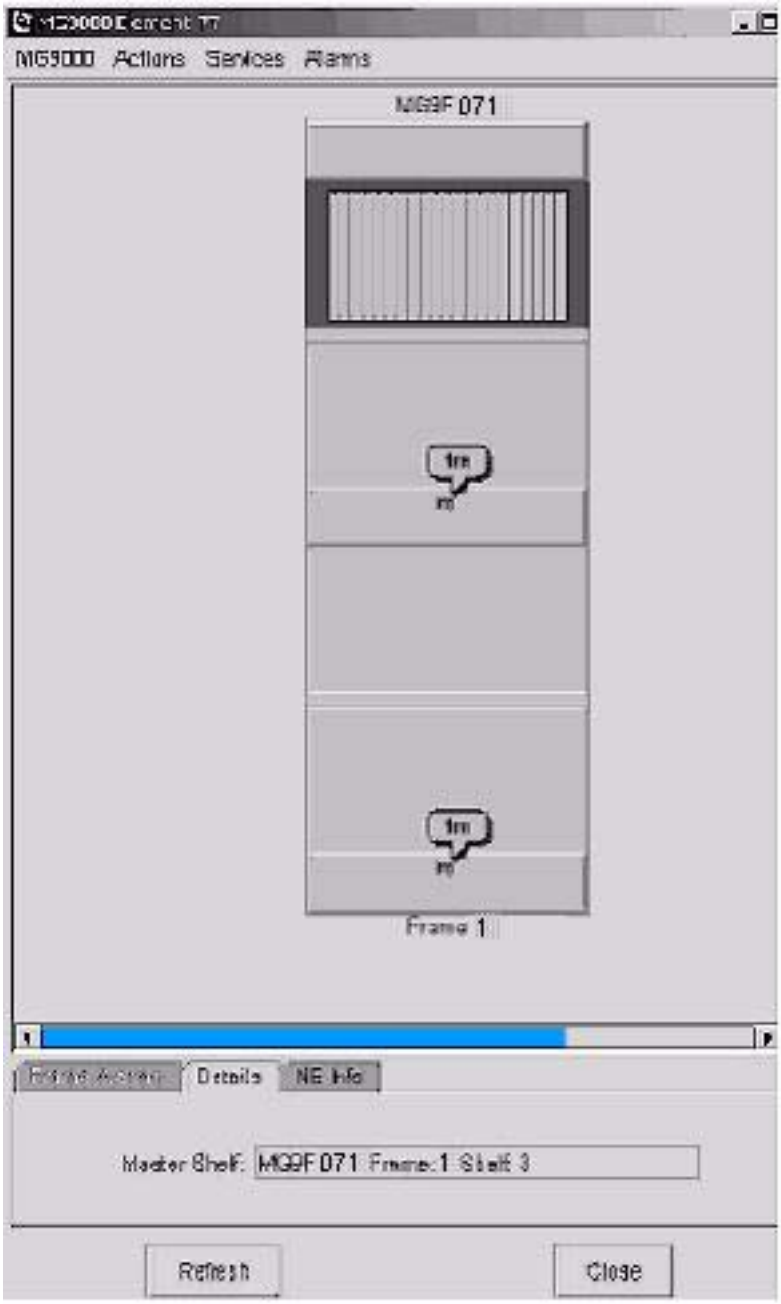

Figure 2 MG9K-EM Frame view in SN06.2 and prior – Horizontally scrolled far right

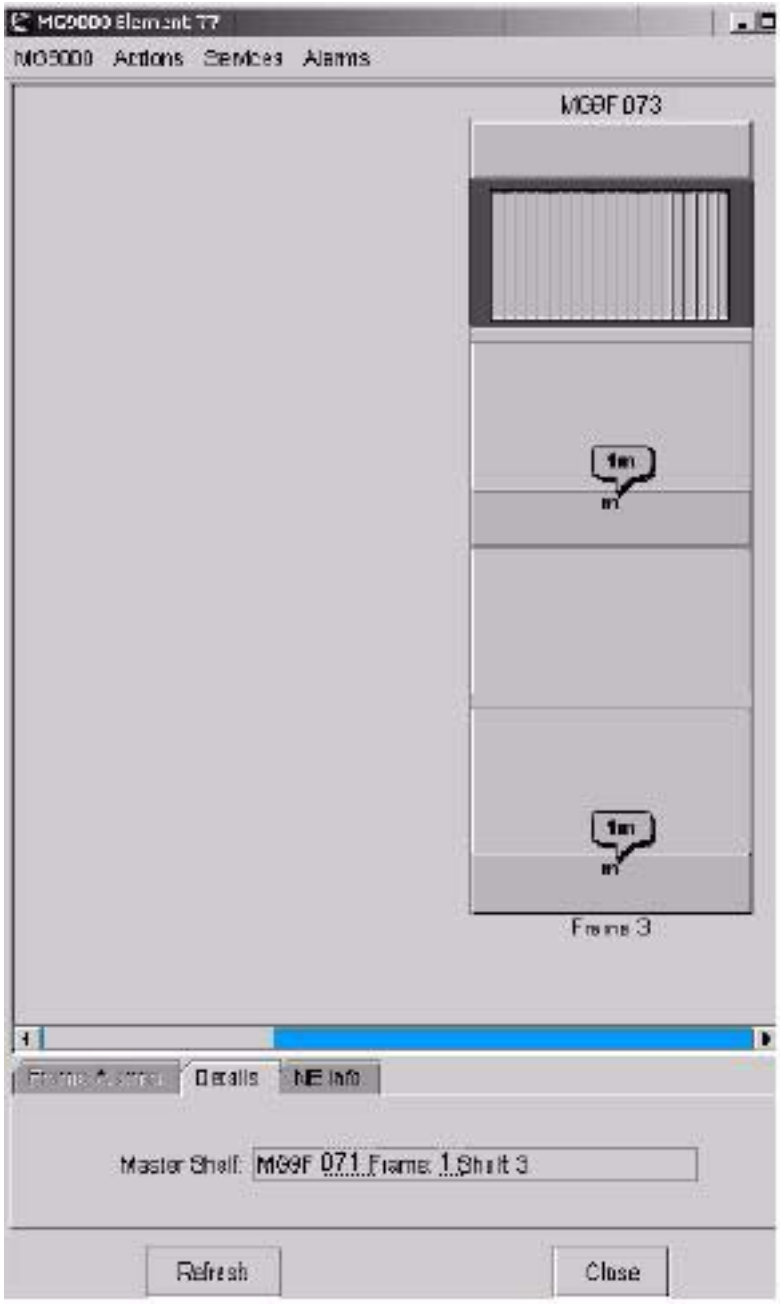

Figure 3 MG9K-EM Frame view in SN07

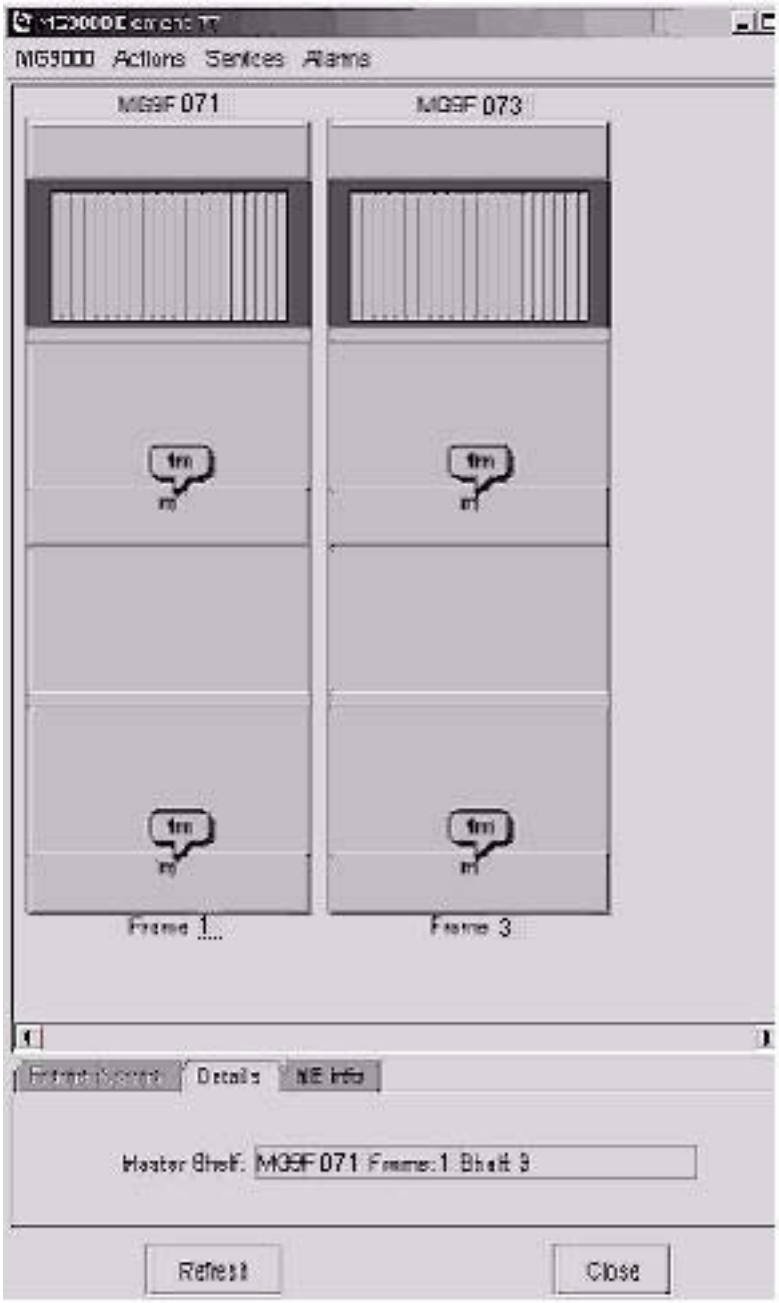


84.2.1.2 Scenario 2

Let us consider a scenario wherein frames are numbered as follows;

- First frame is numbered as 5 and is Master frame
- Subsequent three subtending frames are numbered as 7, 0 and 2 .

For this scenario, in SN06.2, frames would be shown in increasing order of their Internal frame numbers. i.e, as [frame #0][frame #2][frame #5][frame #7]).

For this scenario, in SN07, frames would be shown as [frame #5][frame #7][frame #0][frame #2]); refer to the logic given in section 2.2 point #4.

84.2.2 MG9K-EM Alarm browser

Following figure is an example screen shot for the deliverable #1, which is explained in section 2.1. Note that, without Frame location information being provisioned, 'Description' field in the Alarm browser is shown with default filler 'F' in following format;

Site Flr RPos Bay_id

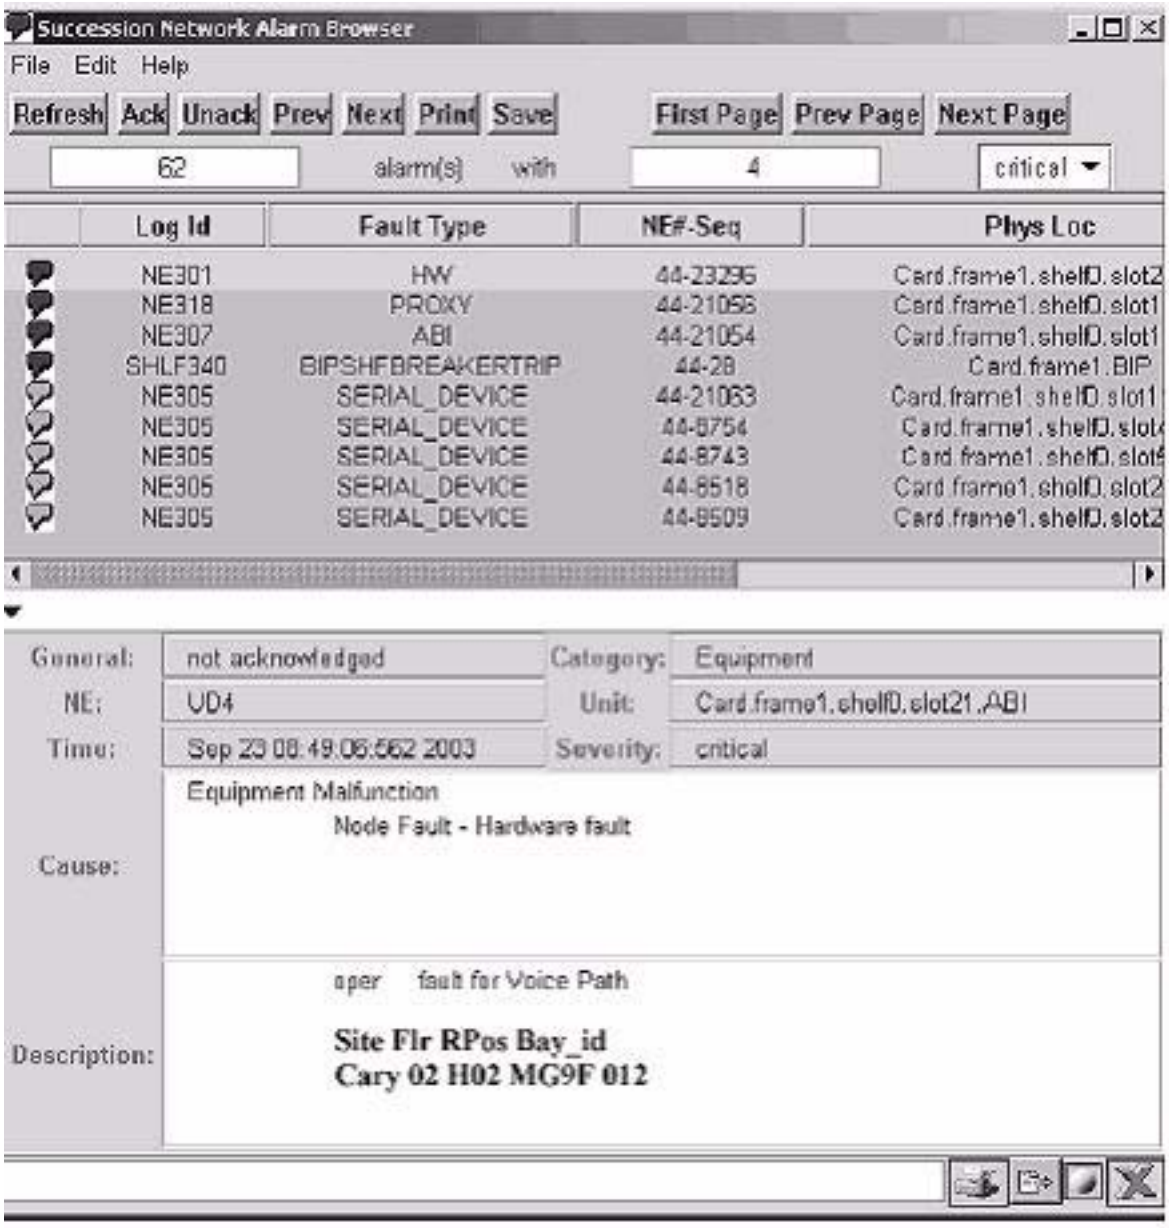
FFFF FF FFFF MG9F FFF

i.e., <Site=FFFF><3 blank space><Flr=FF><2 blank space><RPos=FFFF><3 blank space><Bay-id=MG9F FFF>

When Frame location information is (re)provisioned for a Master frame, all alarms (both Gateway alarms and EM alarms) reported on components in the frame are updated with latest frame location information.

When Frame location information is (re)provisioned for a subtending frame, only Gateway alarms reported on components in the frame are updated with latest frame location information.

Figure 4 MG9K-EM Alarm browser GUI

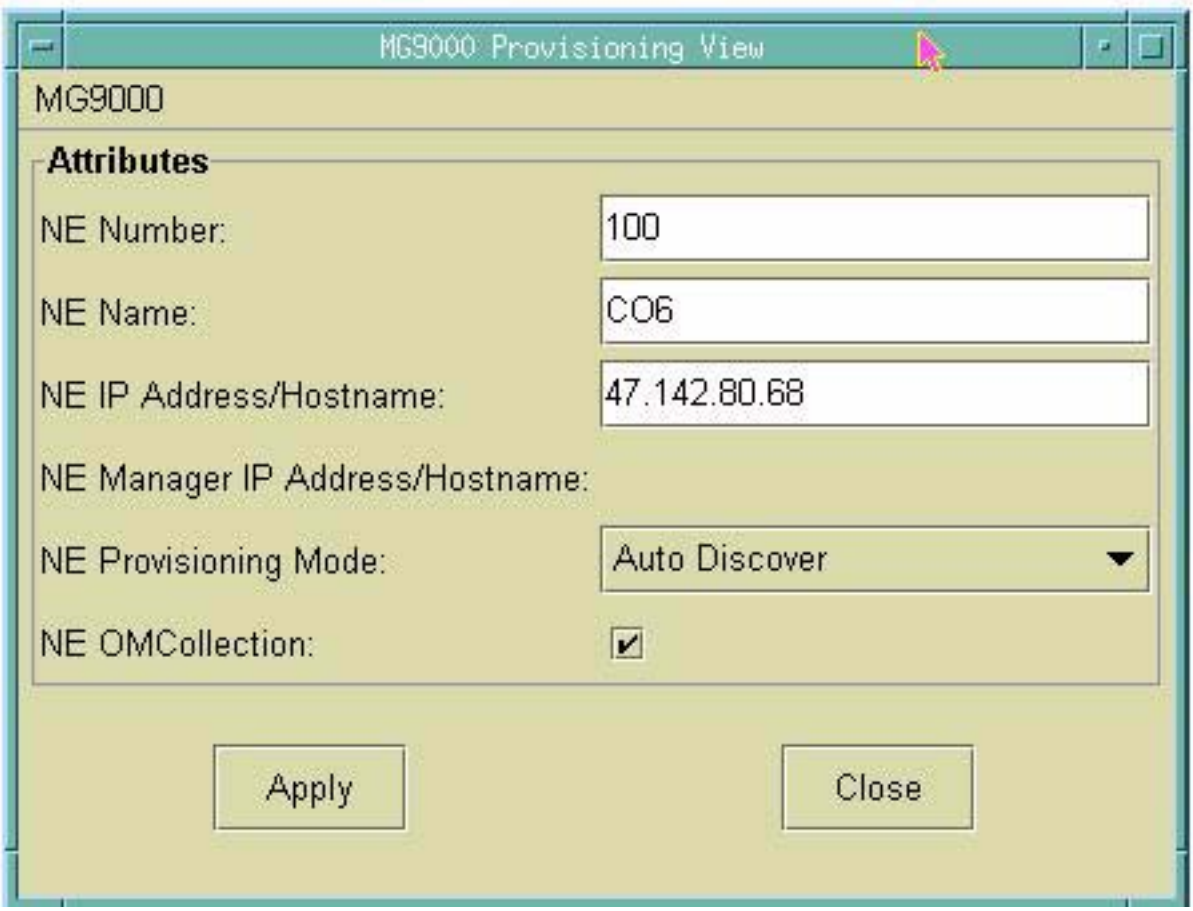


84.2.3 MG9K EM MG9000 Provisioning view

In SN07, a new checkbox “NE OMCollection” is introduced in MG000 Provisioning GUI. Operator can check or uncheck this checkbox. If it is checked, OM Collector will collect OM data starting from its next collection

cycle. If it is unchecked, OM Collector will stop collecting OM data starting from its next collection cycle.

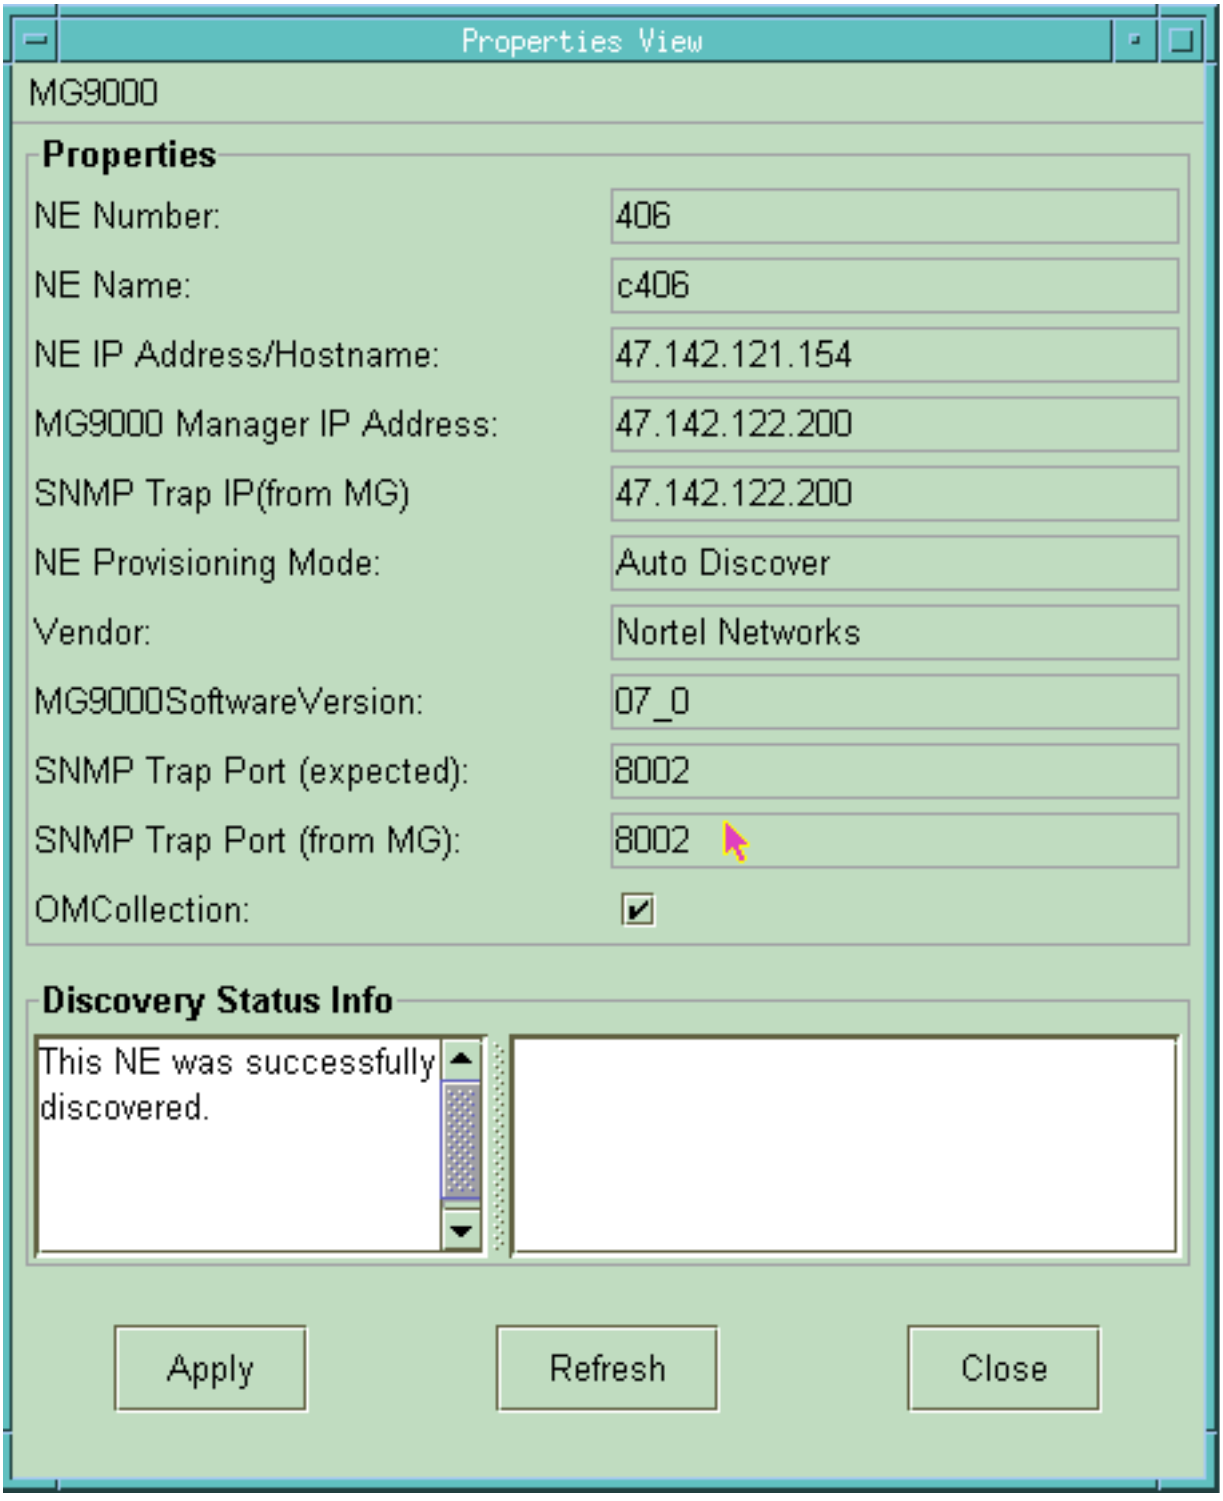
Figure 5 MG9K-EM "MG9000 Provisioning" GUI when "NE OMCollection" is checked



84.2.4 MG9K EM NE Properties view

In SN07, a new checkbox "NE OMCollection" is introduced in NE Properties GUI. Operator can check or uncheck this checkbox. If it is checked, OM Collector will collect OM data starting from its next collection cycle. If it is unchecked, OM Collector will stop collecting OM data starting from its next collection cycle.

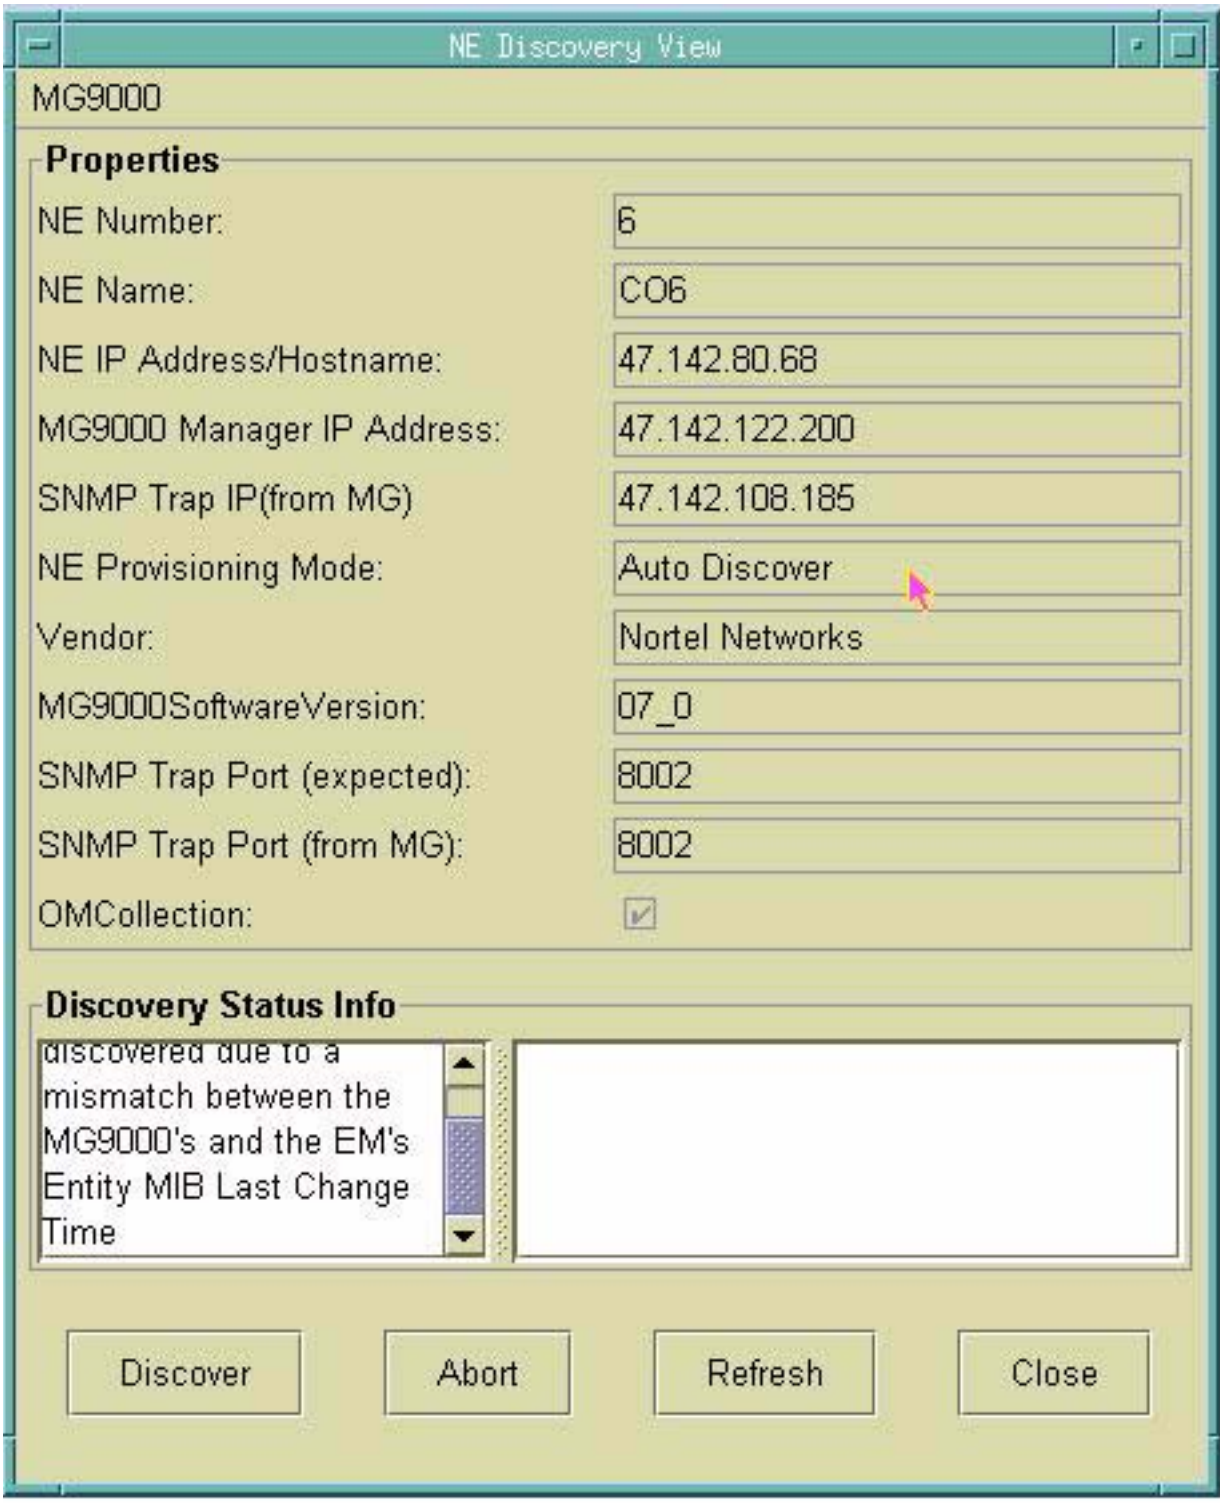
Figure 6 MG9K-EM “NE Properties” GUI when “NE Collection” is checked



84.2.5 MG9K EM NE Discovery view

In SN07, a new checkbox “NE OMCollection” is introduced in NE Discovery GUI. This is a read-only field. It indicates whether OM data collection is enabled or disabled.

Figure 7 MG9K-EM “NE Discovery” GUI when “NE Collection” is checked



84.2.6 MG9K EM NE OM Collector

Starting from SN07, OM Collector depends on MG9K EM as explained below.

- Before OM Collector could start collecting OM data for a NE, as explained in section 2.2.3, the NE has to be created in MG9KEM with “NE Collection” check box checked.

- OM Collector will either stop or restart collecting OM data based on the status of “NE OMCollection” checkbox of MG9KEM. As explained in sections 2.2.4 and 2.2.5, value of the checkbox “NE OMCollection” is modifiable in MG9KEM.

That means, OM Collector need to know IP address of the MG9KEM, with which it is associated. Operator can configure IP address of MG9KEM server through the script "/opt/nortel/omcltr_07/bin/OMCollector config".

84.3 Hardware Requirements or Dependencies

None

84.4 Software Requirements or Dependencies

This feature depends on MG9K changes for the deliverable #5, mentioned in section 2.2.

84.5 Limitations and restrictions

1. VMGs which are provisioned in SN05/SN06+ with non-zero Internal frame number, continue to exist as they are. i.e., they continue to exist with non-zero Internal frame number.
2. Frame location information is sent from MG9K-EM to SESM only at VMG provisioning time. So, any changes done to Frame location information from MG9K-EM after VMG is provisioned, is not sent to SESM. Frame location information present at XACore can be changed, even after VMG is provisioned. Any mismatch, which is introduced as result of such changes, is not audited or corrected.
3. A complete flow through provisioning is not supported for ABI VMGs Hence, for ABI VMGs, Craft-person need to manually enter Frame location information in XA-CORE table GWINV.

84.6 Interactions

This feature is an extension of the SN06.2 feature A00002704 and leverages the work of A00002704, to deliver the items 1 to 6 mentioned in section 2.2, which have impact on the end user.

84.7 Applicable customer facing sections

Indicate with an "X" the customer facing section(s) of the DDOC that apply to this functionality. Indicate with "N/A" the customer facing sections(s) of the DDOC that do not apply to this functionality. The designer(s) of this functionality must complete sections indicated.

84.8 Glossary

Term	Description
CSV	Comma separated values. One format of storing performance data
EM alarm	Alarm generated internally by MG9K EM. Ex; When communication from MG9K EM to MG9K goes down, MG9K-EM generates an alarm with specific problem "Comm Channel Down - Communication Lost to the NE".
Frame location information	It consists of frame type, floor position, row position, frame position, shelf position
Internal (logical) frame number	Frame number, which is unique within a MG9K

[1] Alarm browser GUI would show Frame location information.

Gateway alarm	Alarm reported from gateway.
Master frame	It has the master shelf.
NE	Network element
Office frame number	Frame number, which is unique within an office
OMC	OM Collector
OM data	Operational Measurement data. A.k.a performance data
MG9K frame line-up	MG9K frames are lined-up either left to right or right to left. When frames are lined-up left to right, new frames are positioned/added to right of existing frames, as MG9K grows and frames are numbered from left to right. That means, Master frame will be the left-most frame in the NE. When frames are lined-up right to left, new frames are positioned/added to left of existing frames, as MG9K grows and frames are numbered from right to left. That means, Master frame will be the right-most frame in the NE.
Subtending frame	It has the subtending shelves of a MG9K
VMG	Virtual Media Gateway is a logical representation of a gateway

85: Functional Description (FN): A00003560

85.1 Feature name and Feature ID

Patching SSPFS, CBM, and IEMS via the NPM

A00003560

Document Version: 1.1

85.2 Description

The Network Patch Manager is responsible for patching many Succession Network components previous to SN07. These components include:

GWC cards
MG9K-based cards
SESM
SAM21 EM
NPM
PSE
QCA
MG9K server
MG9K midtier
OM Collector

Beginning with this feature in SN07, the Network Patch Manager is used to patch additional components in Succession Networks as well as components in non-Succession configurations. These new components include the following:

CBM - Core Billing Manager
SSPFS platform
IEMS - Integrated Element Management System

85.2.1 NPM Installation and Configuration

Prior to SN07, the NPM is always installed on the SSPFS machine that contains the CS2000 Management load. Beginning with this feature in SN07, the NPM is delivered as part of the SSPFS platform and not the CS2000 Management load.

In existing customer sites where an NPM is moving from one physical box to another physical box, a migration process is required to ensure the new NPM contains any necessary previous data. This migration process includes the following:

- saving any customer-specific predefined reports that are stored in the NPM database
- saving all patch files from the golden directory
- movement of the data in the previous bullets from the old machine to the new machine
- re-datafilling of the predefined reports into the new NPM
- saving of the patch files in the golden directory on the new machine

In a given customer site, only one NPM should be installed. The SSPFS installation/upgrade/configuration scripts assist in identifying which SSPFS-based machine should have the NPM software installed. In general, the SSPFS-based machine that is to contain the IEMS application is the machine that should have the NPM installed. If an IEMS is not part of a customer site installation, the NPM should be installed on the same machine as the CBM application.

The various supported configurations are now discussed.

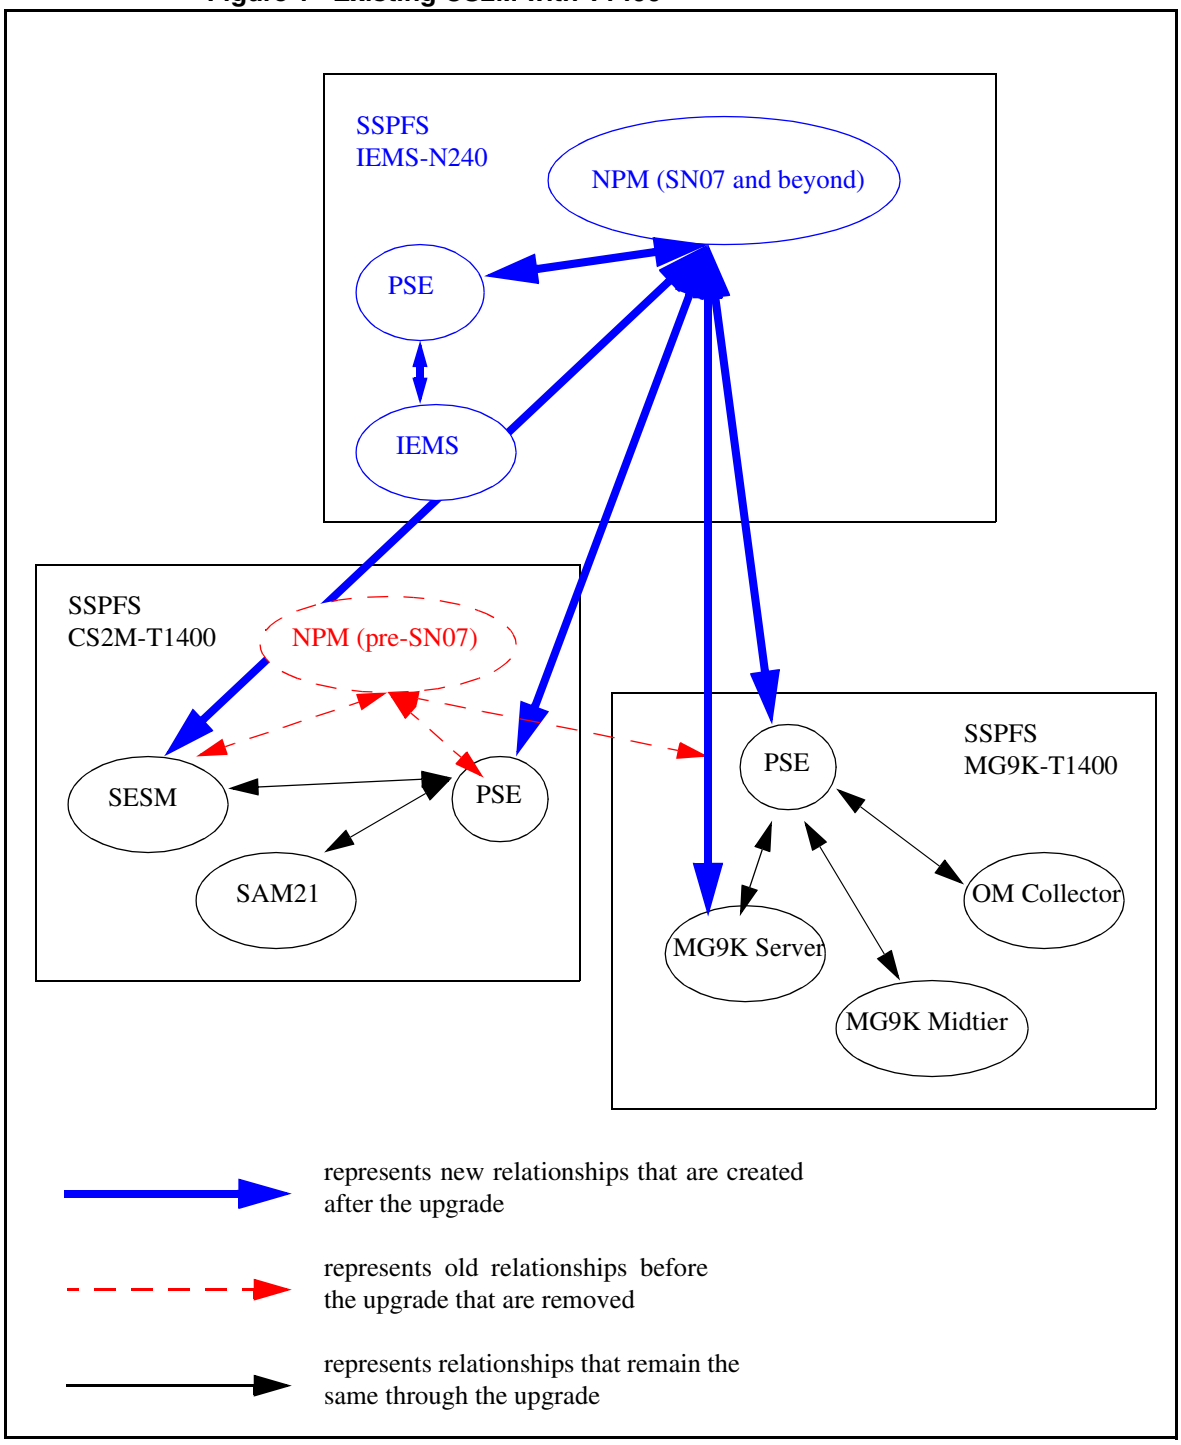
85.2.1.1 Existing CS2M on a T1400

In this configuration, an existing CS2000 customer site is being upgraded to SN07. The site has an existing T1400 SSPFS-based machine with NPM already installed and running with pre-SN07 software. Figure 1, "Existing CS2M with T1400" shows this site with a new N240 being installed that contains the IEMS and NPM running SN07. After the upgrade, the CS2M-based T1400 continues to run in the customer site (with SN07 CS2M software) without the NPM since it would be installed on the new N240 machine. In addition if MG9K EM components are present, these SSPFS-based machines continue to run on T1400(s) with the new SN07 software.

It should be noted in the figure that other patchable components may exist but are not shown to reduce the complexity of the diagram. In addition, the MG9K EM components running on 1 T1400 in the figure may run on separate T1400s. The components not listed in the figure may include:

- optional QCA application running on the T1400 that communicates with the PSE local to the T1400
- the CBM component being introduced in SN07 may be installed on the N240 along with the NPM and IEMS

Figure 1 Existing CS2M with T1400



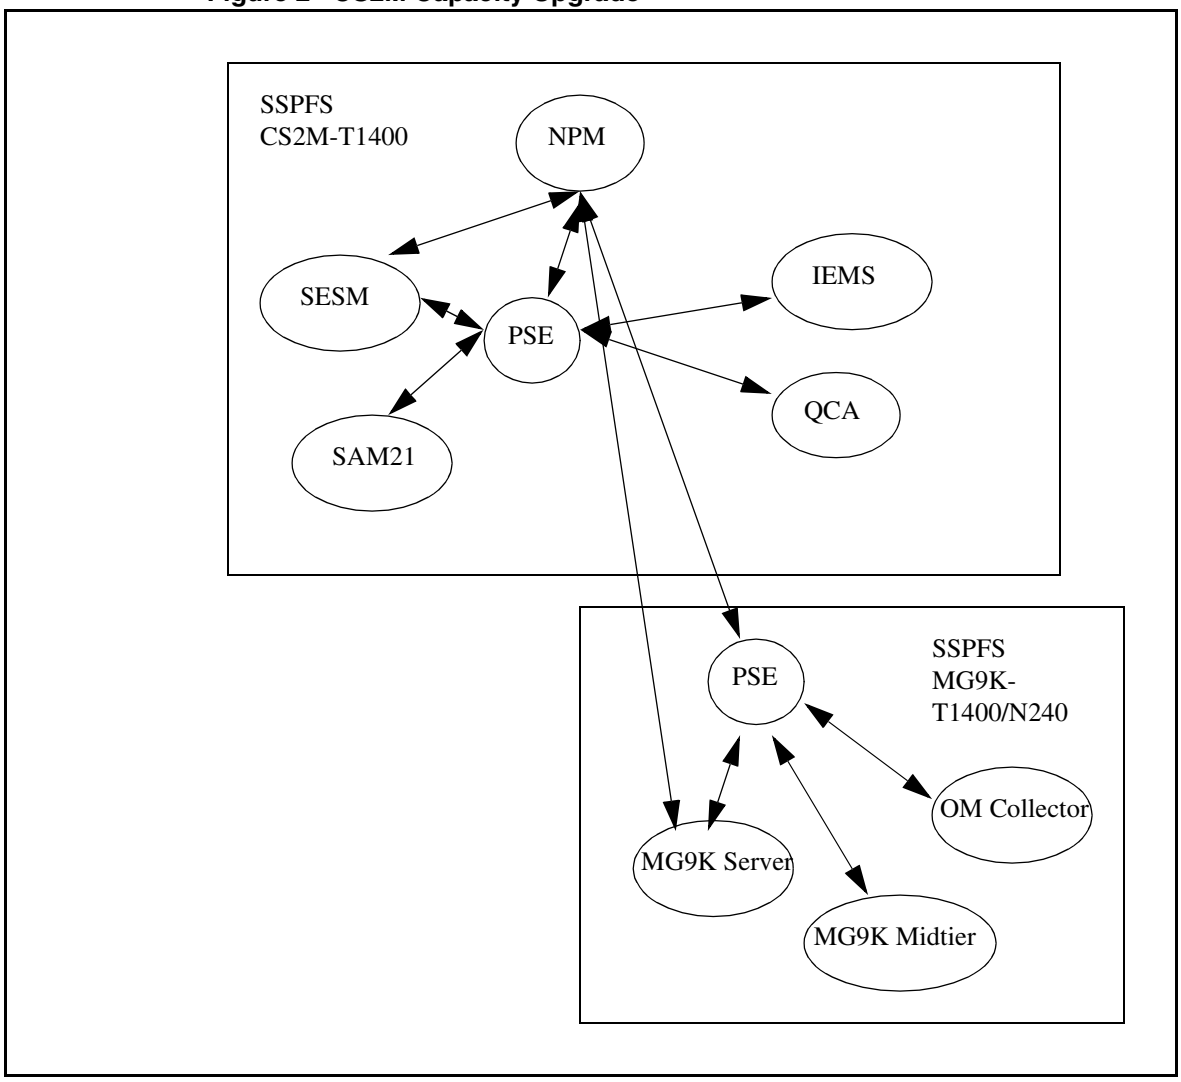
The following steps are required during the upgrade process in this configuration:

- the new N240 machine is commissioned with the SN07 versions of the IEMS and NPM installed on the machine
- the CS2M machine is upgraded to SN07, this process consists of the following:
  - — the PSE on the CS2M T1400 machine is configured to look at the CORBA name service on the new N240 machine
  - — the SESM application is upgraded, the EPM component within SESM now looks at the name service hostname associated with the local PSE to find the location of the NPM (this step ensures the GWCs associated with the EPM are registered with the new NPM)
  - — the NPM is not upgraded in the CS2M T1400 machine (i.e. effectively it is uninstalled)
- the MG9K machine (if present) is upgraded to SN07, this process consists of the following:
  - — the PSE on the MG9K-based T1400 machine(s) are configured to look at the CORBA name service on the new N240 machine
  - — the MG9K components are upgraded, the EPM component within the MG9K-server component now looks at the name service hostname associated with the local PSE to find the location of the NPM (this step ensures the MG9K-based cards associated with the EPM(s) are registered with the new NPM)

85.2.1.2 Existing CS2M gets a Capacity Upgrade

In this configuration, an existing CS2000 customer site has software that is being upgraded from pre-SN07 software to SN07 software and also has hardware that is being upgraded from a T1400 to an SN240. With this scenario, the IEMS component is loaded into the existing CS2M machine. Hence, there is only one place where the NPM can reside. Figure 2, "CS2M Capacity Upgrade" shows this configuration. Optionally shown in the figure is an MG9K-based machine that can run on a T1400 or N240 machine. Regardless of the number of MG9K-based machines or hardware, the NPM and PSEs are configured in the same way.

Figure 2 CS2M Capacity Upgrade



The following steps are required during the upgrade process in this configuration:

- the CS2M T1400 machine is upgraded to an N240 machine
- the SSPFS software on the N240 machine is upgraded to SN07
  - — SSPFS software is upgraded
  - — the PSE on this machine is upgraded to SN07 (since the NPM and PSE will coreside on this box, no configuration of a CORBA name service host is necessary on this machine)
  - — the old version of NPM is unloaded and the SN07 version is loaded
- IEMS is installed on the N240
- CBM is installed on the N240

- the remainder of the applications on the CS2M machine are upgraded to SN07
- the MG9K machine(s) (if present) are upgraded to SN07, from a patching perspective there are no modifications to the existing upgrade procedure

85.2.1.3 New CS2M Office gets an N240

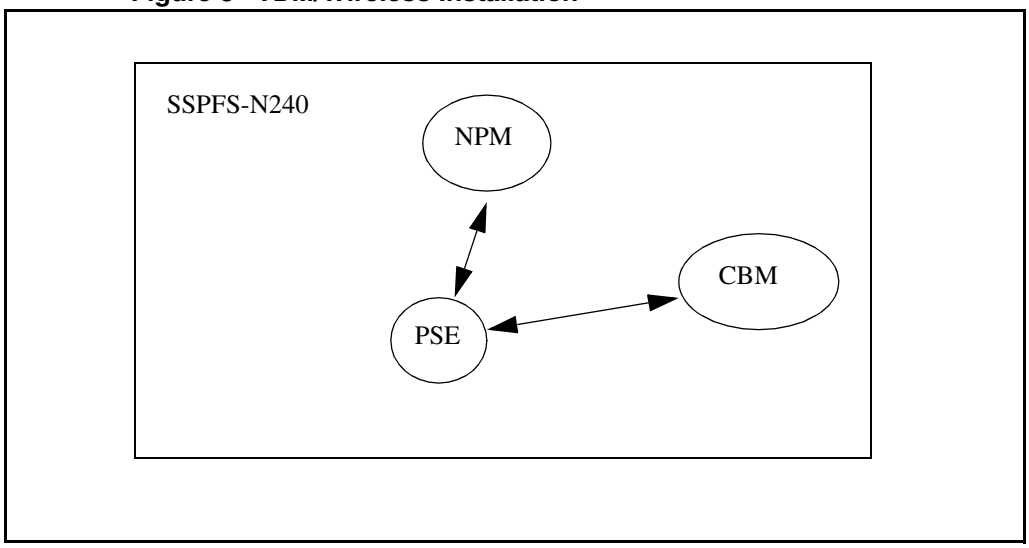
This scenario is similar to the configuration in figure 2. The only difference is this scenario is a ‘new install’ instead of an upgrade. The following steps are required during this ‘new install’ process:

- the SSPFS SN07 software on the N240 machine is installed
  - — SSPFS software is installed
  - — the SN07 PSE on this machine is installed (since the NPM and PSE will coreside on this box, no configuration of a CORBA name service host is necessary on this machine)
  - — the SN07 NPM is installed
- IEMS is installed on the N240
- CBM is installed on the N240
- the remainder of the applications on the CS2M machine are installed with SN07 software
- the MG9K machine(s) (if present) are installed with SN07 software, from a patching perspective there are no modifications to the existing installation procedure

85.2.1.4 TDM/Wireless

Beginning in SN07, existing TDM/wireless customers will be receiving an N240 SSPFS-based machine to handle CBM (SDM in the AIX-based configuration) instead of the SDM (Supernode Data Manager). Since there is only one SSPFS-based machine in this configuration, the NPM can only reside on this machine. In SN07 the process of receiving the new N240 machine is treated as a new install from a patching software perspective since the NPM and PSE components did not exist in this configuration prior to SN07. Figure 3, "TDM/Wireless Installation" shows this configuration.

Figure 3 TDM/Wireless Installation



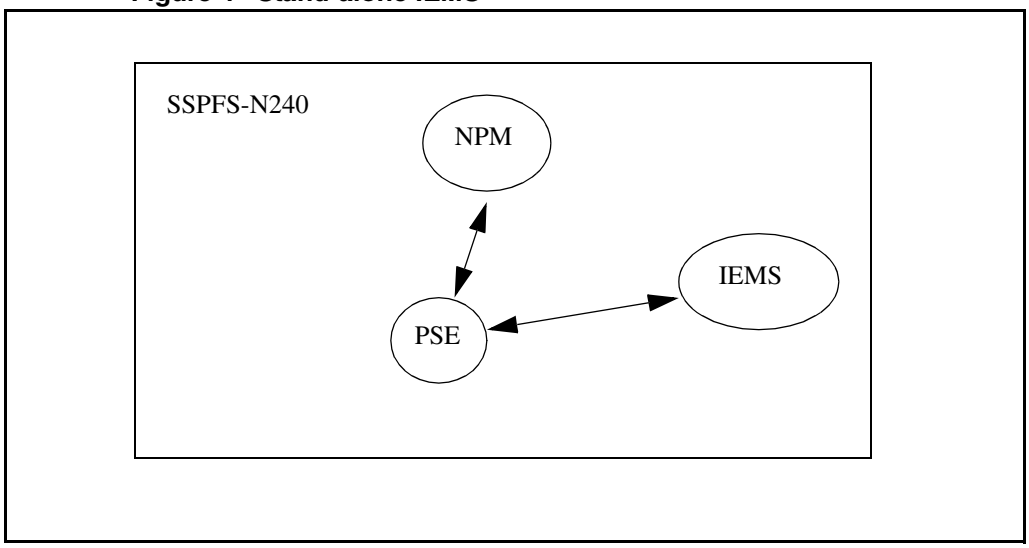
The following steps are required during this ‘new install’ process:

- the SSPFS SN07 software on the N240 machine is installed
  - SSPFS software is installed
  - the SN07 PSE on this machine is installed (since the NPM and PSE will coreside on this box, no configuration of a CORBA name service host is necessary on this machine)
  - the SN07 NPM is installed
- CBM is installed on the N240

85.2.1.5 Stand-alone IEMS

Beginning in SN07, a stand-alone IEMS configuration is supported. This configuration is similar to “85.2.1.4 TDM/Wireless” from a patching software perspective as it is a ‘new install’. Since there is only one SSPFS-based machine in this configuration, the NPM can only reside on this machine. Figure 4, "Stand-alone IEMS" shows this configuration.

Figure 4 Stand-alone IEMS



The following steps are required during this ‘new install’ process:

- the SSPFS SN07 software on the N240 machine is installed
  - — SSPFS software is installed
  - — the SN07 PSE on this machine is installed (since the NPM and PSE will coreside on this box, no configuration of a CORBA name service host is necessary on this machine)
  - — the SN07 NPM is installed
- IEMS is installed on the N240

85.2.2 Only One NPM

There should only be one NPM server installed in each site. This feature attempts to ensure only one NPM is installed via the following ways.

- SSPFS profiles
  No NPM should be installed on an MG9K-based machine. An NPM is preferred to be installed on the IEMS-based machine.
- verification of the PSE NS hostname when the NPM server is started
  When the PSE is configured, the configuration step asks for the hostname/ip address of the NPM server location. This feature modifies the NPM server to look at that configuration value. If the value is ever different from the local machine, the NPM fails to start.

While these steps help prevent more than one NPM from being installed, it is not a guarantee that it will prevent the scenario from occuring.

85.2.3 Patching Maintenance

When the new NPM patchable applications are installed (CBM, SSPFS, and IEMS), the NPM automatically becomes aware of the components. These

components appear in reports and the device list of the GUI. The following functions that exist for other targets in previous releases are now available for IEMS, CBM, and SSPFS.

- apply
- remove
- audit
- restart (IEMS only)
- set/report creation
- plans/automation
- alarms

85.2.3.1 IEMS

Similar to the existing OAM Java-based applications like SESM, SAM21EM, and MG9K EM components, the IEMS requires 2 steps for application and 2 steps for removal of patches.

application

- apply command from the NPM GUI or CLUI (sets patch to applied/ disabled)
- restart command from the NPM GUI or CLUI on IEMS (sets patch to applied/enabled)

removal

- remove command from the NPM GUI or CLUI (sets patch to removed/ enabled)
- restart command from the NPM GUI or CLUI on IEMS to disable the patch (sets patch to removed/disabled)

Beginning in SN06.2, the restart operation from the NPM GUI and CLUI can be automatically scheduled via NPM plans (autorestart). This capability is similar to the automatic application of patches.

85.2.3.2 SSPFS and CBM

Patches that are created and require application to the SSPFS and CBM components require one step from the NPM GUI or CLUI. Likewise for the removal operation. A single apply command or remove command from the NPM GUI or CLUI is sufficient for complete application or removal. If the associated application requires a restart or recreation of an existing process for application or removal, the ‘restart’ action is initiated during the single apply or remove request.

In some cases, an SSPFS or CBM patch may require additional action outside of the NPM GUI or CLUI for complete application or removal. In these cases, the patch is marked as non-autoappliable and contains special application instructions that describes the extra actions that are required.

For application of these patches, the patch appears as applied/disabled after the NPM apply command from the NPM GUI/CLUI. The extra actions described in the special application instructions automatically trigger the patch to become applied/enabled when the actions have been successfully completed. This behavior is also applicable for the remove scenario.

85.2.3.3 Full Matrix

Table 1, “Target/Command Matrix,” on page 821 shows a complete list of patchable applications/devices that are supported by the NPM in SN07. The table indicates the necessary commands required to fully apply or remove patches and whether automation is supported.

Table 1: Target/Command Matrix

	Full Application		Full Removal			
Target	Apply Cmd Required	Restart Cmd Required to enable	Remove Cmd Required	Restart Cmd Required to disable	autoapply supported	autorestart supported
MG9K Cards (OC3, SCI, SCO, ITP, ITX, DS1, ABI)	yes	no	yes	no	yes	n/a
GWC Cards	yes	no	yes	no	yes	n/a
SESM	yes	yes	yes	yes	yes	yes
SAM21 EM	yes	yes	yes	yes	yes	yes
NPM	yes	yes	yes	yes	yes	yes
PSE	yes	yes	yes	yes	yes	yes
QCA	yes	yes	yes	yes	yes	no

Table 1: Target/Command Matrix

	Full Application		Full Removal			
Target	Apply Cmd Required	Restart Cmd Required to enable	Remove Cmd Required	Restart Cmd Required to disable	autoapply supported	autorestart supported
MG9K server	yes	yes	yes	yes	yes	yes
MG9K midtier	yes	yes	yes	yes	yes	yes
OM Collector	yes	yes	yes	yes	yes	yes
IEMS	yes	yes	yes	yes	yes	yes
SSPFS	yes	no[a]	yes	no[a]	yes	n/a
CBM	yes	no[a]	yes	no[a]	yes	n/a

a. In some cases SSPFS or CBM patches may require reboot of applications or machines. These patches are marked as non-autoappliable and require human intervention.

85.2.4 Patch File Format Modifications

For the NPM to track different software with various behaviors, the patch file format is modified with this feature. While the specific details of the patch file format are not in this section, they can be found in the CN document associated with this feature.

85.2.5 Patch Calculation for CBM and SSPFS Patches

Prior to SN07, all NPM-based patching uses a loadname associated with a given device or application to perform patch calculation in determining what patches calculate for any given office. All previous SN07 patch types will continue to use the loadname for calculation purposes.

Beginning in SN07 with this feature, CBM and SSPFS patches that are tracked by the NPM use a new record in addition to the loadname. A functional component record (fc) is introduced into the patch file and the NPM database. This new record is tracked against CBM/SSPFS patches and CBM/SSPFS applications.

The NPM ‘getpatch’ command and ‘apply’ command are updated with this feature to check for the presence of functional component records in a patch file. If these records are present, the records are compared against the the fc’s associated with the devices in the office in addition to the loadname. Both the loadname and functional component records must match for the given patch to calculate for the office.

85.2.6 QCA Patches with Autorestart=”n”

The optional QCA application became patchable via the NPM beginning in SN06.2. With this feature and the patch file format modifications, all QCA patches have the autorestart flag set to ‘n’ by default. This modification is necessary to ensure that the QCA application does not lose service by virtue of an NPM automated task triggering the action. As the QCA application tracks critical customer data, the prevention of unforseen data is paramount.

A00003615 - SSPFS Patching
A00002133 - CBM Patching

86: Functional Description (FN): A00003562

86.1 Feature name

SAM21 Element Manager (EM) support for CICM

86.2 Description

The SAM21 Element Manager now allows the user to:

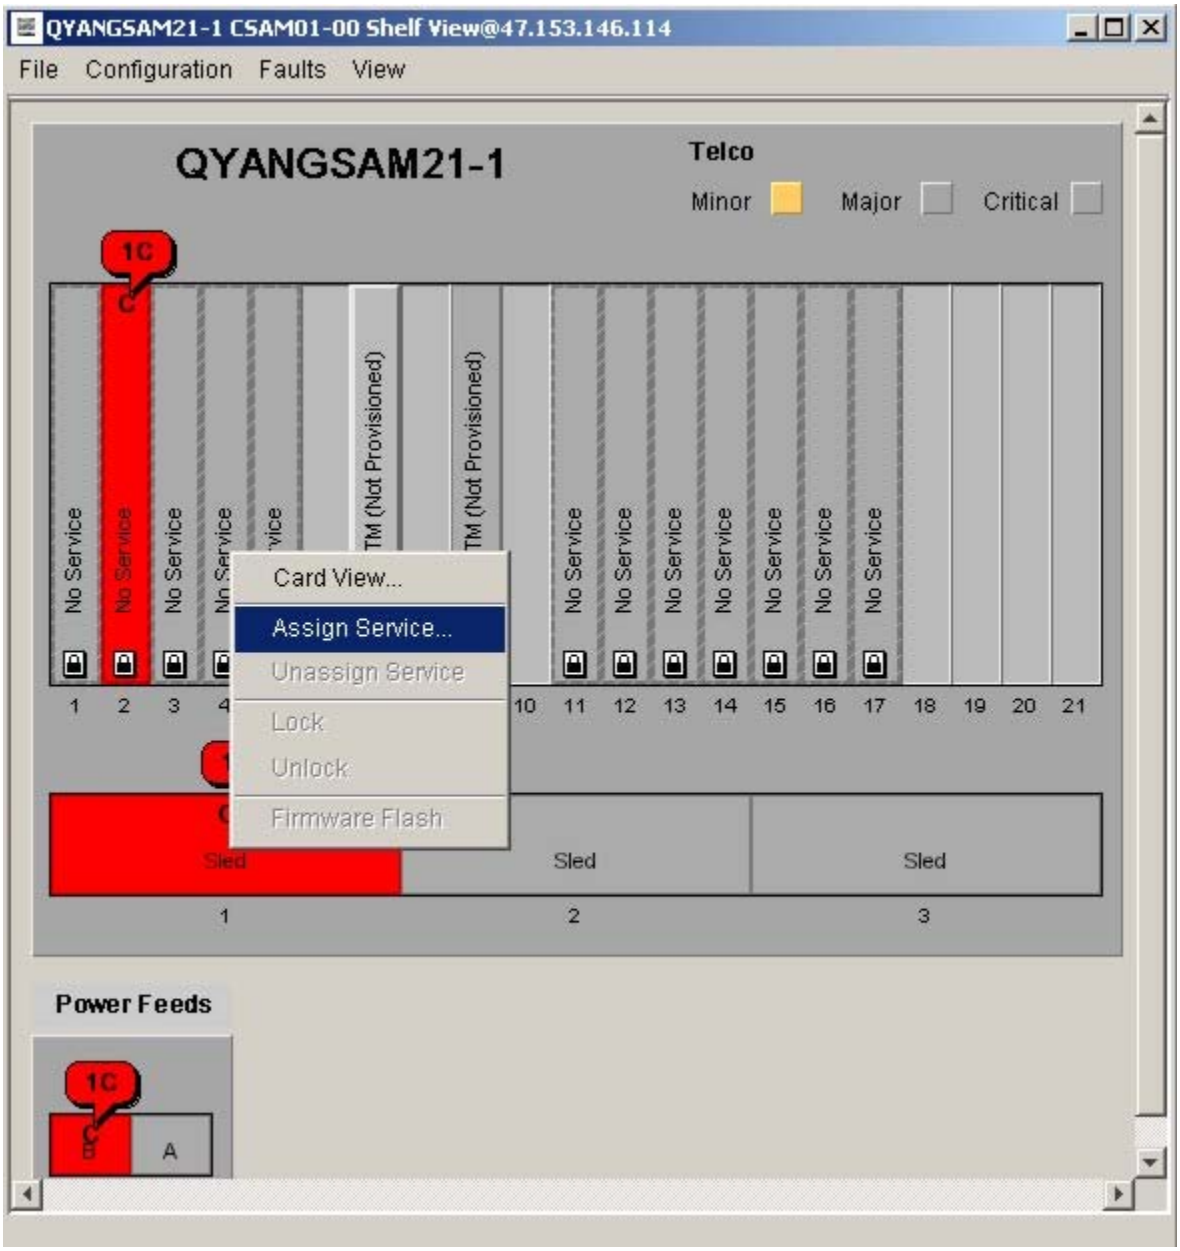
- Provision CentrexIP Client Manager application(also known as “CICM”) on a given MCPN5385 card
- Provision CICM Element Manager application(also known as “CICM-EM”) on a given MCPN5385 card

The SAM21 defines new provisioning panels for the new CICM and CICM-EM service respectively.

86.2.1 Provision CICM Service On a MCPN5385 card

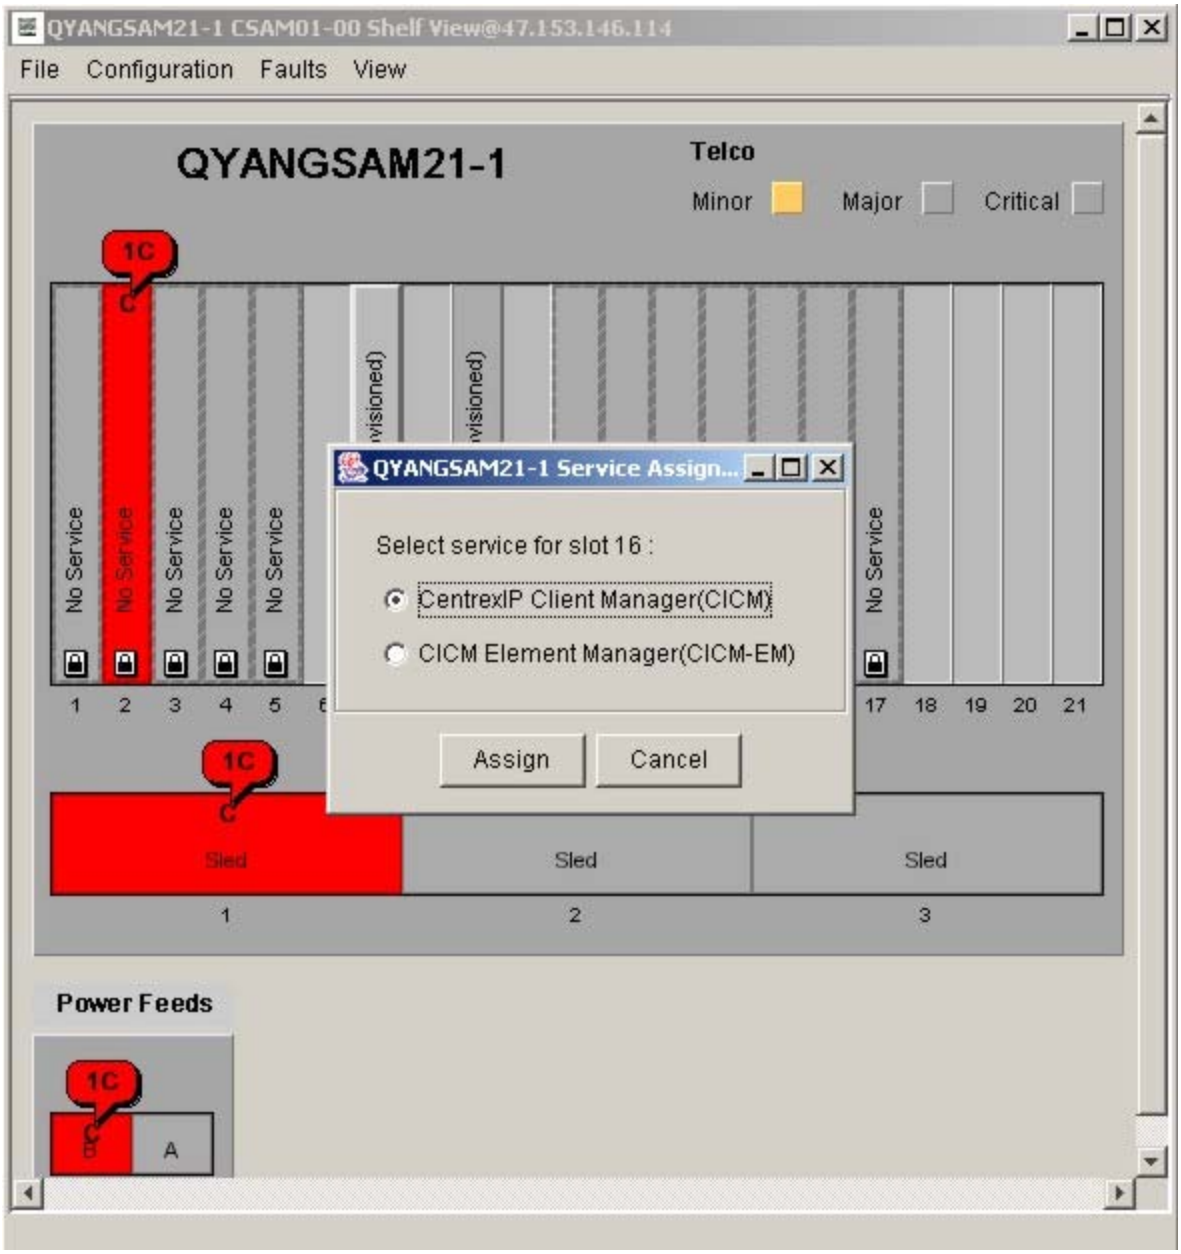
86.2.1.1 Assign Service

The SAM21 EM mechanism to provision service on a card has not changed. When displaying the shelf view, the user can right click on a card to view the Card Popup Menu. If the card currently is not assigned a service, the user can select “Assign Service ...” from this menu.



When the user selects “Assign Service...”, the SAM21 EM displays the Service Assignment popup window. Based on the card’s hardware (model type and memory), the SAM21 EM determines the set of services that can be assigned to the card and allows the user to choose one of them.

The CICM service can be assigned to a MCPN5385 card.

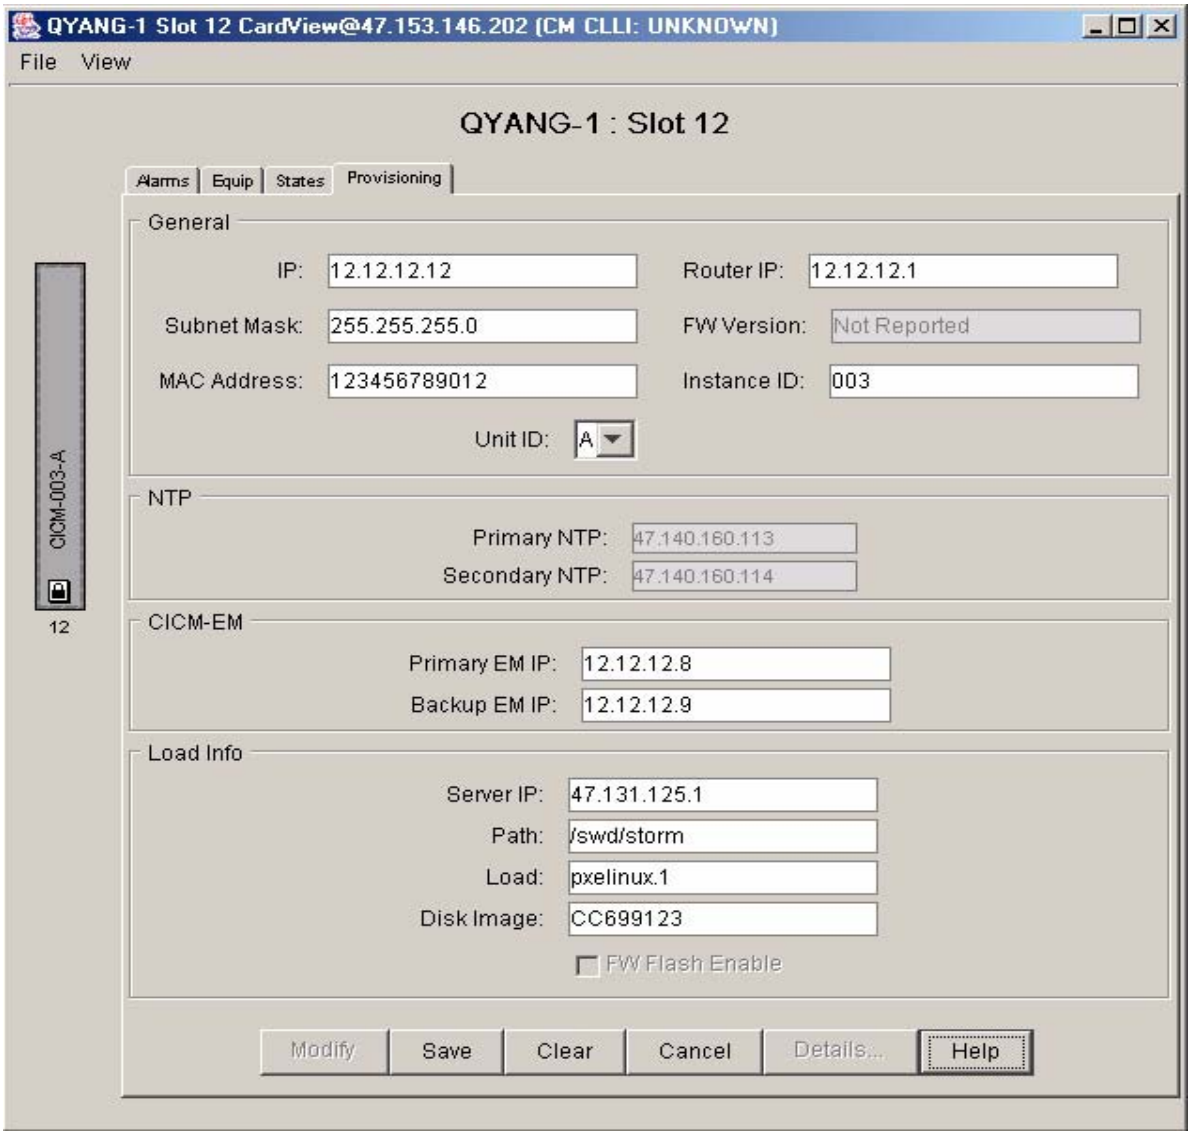


When the user selects the listed “CICM” service and then clicks “Assign”, the SAM21 EM displays a CICM service provisioning panel.

86.2.1.2 CICM Provisioning Panel

The CICM Provisioning Panel displays the following fields. Fields in *italics* are automatically filled in for the user. A picture of the CICM Provisioning Panel follows.

- **IP** : The IP address of the MCPN5385 card.
- **Router IP**: The IP address of the card's router.
- **Subnet Mask** : The card's subnet mask.
- ***FW Version*** : The card's firmware version, will be set to "Not reported" by shelf controller.
- **MAC Address**: The MAC addresses of the MCPN5385 card, need manual input.
- **Instance ID** : The instance integer identifier of the CICM card, and applies to both CICM and CICM-EM.
- **UNIT ID**: 'A' or 'B', identifies the two units of a CICM/CICM-EM pair.
- ***Primary NTP***: The primary NTP server IP address provisioned for NE.
- ***Secondary NTP***: The secondary NTP server IP address provisioned for NE.
- (Load Info) **Server IP** : The IP address of the server (SDM) containing the CICM software load.
- (Load Info) **Path** : The server's directory that contains the CICM software load.
- (Load Info) **Load** : The file name of the CICM Linux bootstrap, distributed with the boot server.
- (Load Info) **Disk Image**: The file name of the CICM software load, distributed with the boot server.
- ***FW Flash Enable*** : Check this box to enable firmware flash on the card. Now Disabled.
- (CICM-EM)**Primary EM IP**: The IP address of the primary CICM-EM, for CICM only.
- (CICM-EM)**Backup EM IP**: The IP address of the backup CICM-EM, for CICM only.



86.2.1.3 Provisioning Rules

Two CICM/CICM-EM cards(card A and B) form a pair to provide redundancy. When provisioning a mated pair of CICM cards, the user can provision the cards in either order. For example, “CICM-110-A” and “CICM-110-B” form a CICM pair.

There is no existing relationship between the IP addresses of the CICM/CICM-EM pair. And there are no active and inactive IP addresses(like the GWC) for CICM card.

Some provision information, including load info, subnet, router, and EM address, should be the same between the CICM/CICM-EM pair. But it is not mandatory. If the craftsperson provides different datafill, the SAM21 EM will prompt a warning message for confirmation.

The CICM/CICM-EM Provisioning Panel verifies the following provisioning rules:

- At most two CICM/CICM-EM cards can be provisioned with the same instance ID, each CICM/CICM-EM pair has a unique instance ID.
- Each MAC address of a CICM/CICM-EM card must be unique among all the cards on SAM21 shelf.

When the user changes the datafill for an existing CICM card, the SAM21 EM performs the change and then displays the following message to the user: "The datafill for this CICM card has been changed. Please ensure that the card's mate uses the same datafill."

86.2.1.4 Maintenance Behavior

This section considers the behavior the user should see when the user attempts a maintenance action on a card provisioned with the CICM service.

- If the user attempts to lock the inactive CICM card, the SAM21 EM immediately attempts to lock the card.
- If the user attempts to lock the active CICM card, the SAM21 EM client displays the following message: "WARNING: This is the active CICM unit. Locking the active unit will cause a service outage. Contact next level NT support before continuing. Do you wish to proceed with the lock?" If the user clicks "Yes", then the SAM21 EM immediately attempts to lock the card.
- If the user attempts to unassign service to an CICM card, the SAM21 EM client displays the following message: "WARNING: Unassigning service to the card in slot x decommissions one of the processor units of CICM node. Do you wish to proceed?". If the user clicks "Yes", then the SAM21 EM unassigns service.

86.2.1.5 Card Replacement

Firstly the user removes a CICM/CICM-EM card from SAM21 EM shelf. Then a card is inserted into the same slot, it will be auto-provisioned with the same provisioning data as the previous card in that slot, so the MAC address will be the old MAC.

Several scenarios are described here:

- If the craftsperson reseated the same card, he needn't to take further action.

- If the craftsperson replaces the card with a different one, then he needs to reprovision its MAC address. If the craftsperson doesn't reprovision the MAC address, the card will fail to boot.
- If the craftsperson exchanges two cards in the same shelf or from different shelves, for example, card A in slot 1, card B in slot 2. After exchange, card A is in slot 2, card B is in slot 1. Card A will be auto-provisioned as card B, card B auto-provisioned as card A. If the user does not reprovision them accordingly, the two cards will not work properly after booted.

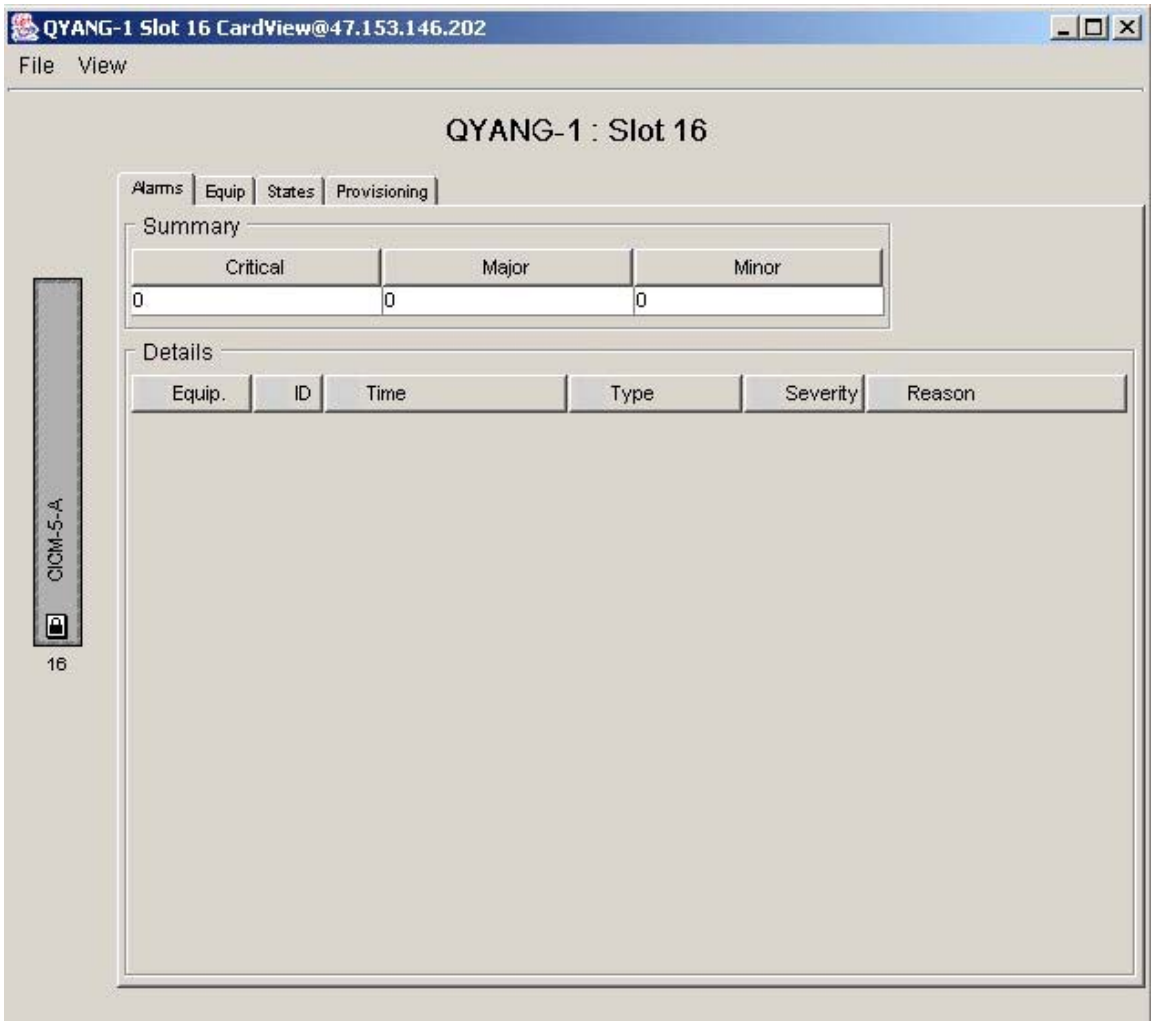
The craftsperson must reprovision the MAC address after card replacement. It is recommended that when replace the card with a different one the user unassigns service from CICM card before removal.

If the craftsperson wants to reinsert a CICM card into a different slot, he must reprovision its MAC address to a dummy one, such as "aaaaaaaaaaaa" before removal, then he can insert it into another slot. Otherwise, he will get an error message stating that the mac address has been reserved by the previous slot. It is recommended that when move the card to another slot the user unassigns service before removal.

86.2.1.6 Card View

Out-of-Service Diagnostics (OOS Diags) for the CICM hardware is not supported in SN07. So the diagnostics tab will not appear on CICM card view.

A picture of the CICM Card View follows.



86.2.1.7 Popup Menu for CICM card

Firmware flash for the CICM hardware is not supported in SN07. When the user right-clicks on the CICM card item on the shelf view, a popup menu will appear, but the “firmware flash” menu item is disabled.

A picture of the CICM Card popup menu follows.

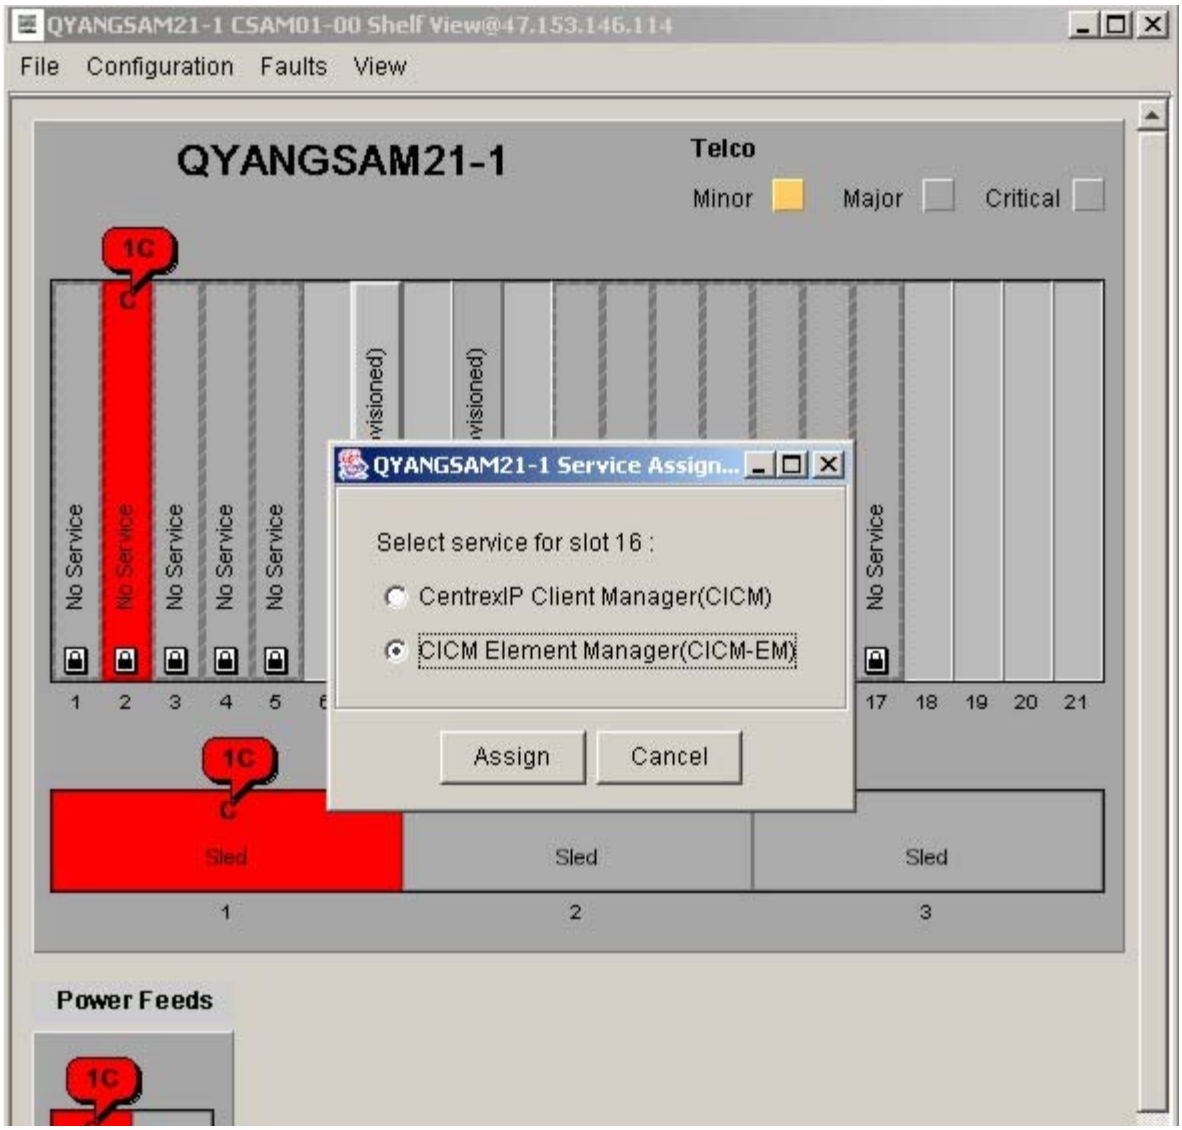
86.2.2 Provision CICM-EM Service On a MCPN5385 card

The CICM-EM is different from CICM card on its provisioning panel. The other aspects, such as maintenance, provisioning rules, etc., is the same as CICM card.

86.2.2.1 Assign Service

When the user selects “Assign Service...” on a MCPN5385 card, the SAM21 EM displays the Service Assignment popup window.

The CICM-EM service can be assigned to a MCPN5385 card.



When the user selects the listed “CICM-EM” service and then clicks “Assign”, the SAM21 EM displays a CICM-EM service provisioning panel.

86.2.2.2 CICM-EM Provisioning Panel

The CICM-EM Provisioning Panel displays the following fields. Fields in *italics* are automatically filled in for the user. A picture of the CICM-EM Provisioning Panel follows.

- **IP** : The IP address of the MCPN5385 card.
- **Router IP**: The IP address of the card’s router.
- **Subnet Mask** : The card’s subnet mask.

- ***FW Version*** : The card's firmware version, will be set to "Not reported" by shelf controller.
- **MAC Address**: The MAC addresses of the MCPN5385 card, need manual input.
- **Instance ID** : The instance integer identifier of the CICM-EM card
- **UNIT ID**: 'A' or 'B', identifies the two units of a CICM/CICM-EM pair.
- ***Primary NTP***: The primary NTP server IP address provisioned for NE.
- ***Secondary NTP***: The secondary NTP server IP address provisioned for NE.
- (Load Info) **Server IP** : The IP address of the server (SDM) containing the CICM-EM software load.
- (Load Info) **Path** : The server's directory that contains the CICM-EM software load.
- (Load Info) **Load** : The file name of the CICM-EM Linux bootstrap, distributed with the boot server.
- (Load Info) **Disk Image**: The file name of the CICM-EM software load, distributed with the boot server.
- ***FW Flash Enable*** : Check this box to enable firmware flash on the card. Now not supported.

SC	Shelf Controller
SDM	Succession Data Manager

SSPFS	Succession Server Platform Foundation Software
GWC	Gateway Controller

87: Functional Description (FN): A00003567

87.1 Feature name

MG9000 Element Manager support for ABI ESA.

87.2 Description

In SN07, ESA capability will be introduced for ABI lines. ABI ESA provides the ability to support basic XPM calls within the MG9000. The MG9000 ABI cards will terminate CSide links of the extending XPMs and give them ESA capability if the MG9000 is out of communication with its assigned Gateway Controller (GWC).

The element manager will build on existing ITP ESA functionality for retrieving the ESA translation data from the core and pushing it to the MG9000. Data common to ITP and ABI VMGs will be handled as in SN06.2. Additionally , new data specific to ABI cards will be retrieved from the core and sent to the MG9000. This data will include, node, BNV and term type entries. This new data will allow the MG9000 to support the associated call processing features for ABI while in ESA mode.

As in SN06.2, this feature provide the following:

- Ability to retrieve the ESA data organized on a VMG basis from the core. This data will be retrieved through the SDM platform on a 24 hour basis. This data will also be retrievable from the SDM on a manual basis. Another manual command on the core will have to be used to generate the core ESA data, the MG9000 EM will not be able to invoke the core's ESA data build.
- The ability to push the required ESA data down to the MG9000 by formatting an XML data file and sending it via FTP to the associated VMGs ABI card using a floating IP address.
- Upgrades of ESA data.

Additionally, this feature will add support for secure FTP for the data transfer between the EM and the MG9000. Currently this transfer occurs over standard non-secure FTP. Functionality will be added to :

- Provide a means to set a password and/or username . This is currently proposed to be via a gui accessible via the EM server.(details TBD)
- Allow data transfer to and from the MG to take place via secure FTP. This change will be transparent to the user. Secure FTP will be used for the OM Collector utility and ESA data ftp to the MG9000.

87.3 Hardware Requirements or Dependencies

No additional ESA requirements are needed for this feature besides the standard CS2000 hardware, the MG9000 EM and the MG9000 Gateway.

87.4 Software Requirements or Dependencies

This feature is providing ABI ESA support capability for the MG9000 EM, as well as secure interface support. It has dependences on the following features:

- A00002380: ESA for ABI: MG9000 , XPM and CM
- A00003737 - LCI Remote Access and Security

87.5 Limitations and restrictions

- The ESA data from the core will be downloaded to the MG9000 only once every 24 hours. This is the same manner in which the core handles loading the RSC with ESA data.
- The MG9000 EM will not allow the modification of any ESA data retrieved from the core.
- The MG9000 EM will not be providing a ESATRVR test tool. This test tool will be supplied by the core.
- The MG9000 EM will provide a mechanism to manually pull the latest ESA data from the Core. This mechanism will not push the ESA data down to the MG9000. The craftsperson will have to manually push the ESA data down to the MG9000 for each VMG. This is to prevent overloading the MG9000 with new data. Also, this mechanize will only work provided that the craftsperson has used the Core command to generate the latest Core xml data file for the EM to retrieve, the EM does not have the ability to invoke this Core command.

88: Functional Description (FN): A00003568

88.1 Introduction

Nortel Networks is expanding its Emergency Call Services (ECS) to handle mobility of Internet Protocol (IP) telephony clients in a Voice over IP (VoIP) Enterprise environment. To provide this capability, enhancements to existing network components are required.

88.1.1 Scope

This document covers the Centrex IP Client Manager (CICM) ECS Location Identification reporting solution. The Location Identification information may also be used for purposes other than ECS.

This functionality is not applicable to the Time Division Multiplexing (TDM) CICM product.

88.1.2 Intended Release

SN07.

88.2 Functional Description

88.2.1 Description

For fixed lines, either in a traditional TDM network or a line connected to an analogue line gateway, the location of the line, for Emergency Call Services (ECS), can be determined using the Calling Line Identity (CLI). Information from region's telecommunications providers would be required to associate a CLI with a location. As the lines are of fixed location the ECS call routing is statically configured as well.

For CICM telephony clients the location of a user is not fixed. Unistim terminals, in an Enterprise, connecting to the Call Server 2000 (CS2K) via the CICM are not statically configured against a particular node in the network topology and their physical location may be anywhere in the Enterprise.

We have implemented a solution where the location information is configured in, and provided by, the Dynamic Host Configuration Protocol (DHCP) server.

When the CICM telephony client boots-up it request can request DHCP options from the DHCP server, this includes Location Identification information options. If available, the DHCP server will return the location information to the set. The CICM gateway will request the location information from the CICM telephony client when a user logins in from the client. The CICM gateway reports the location information, via H.248, to the GWC. If configured, an application running on the Gateway Controller (GWC) re-packages the information and reports it to a Location Recipient application.

The solution also supports the reporting of user defined location identification. This is required for CICM telephony soft clients on networks with DHCP servers that do not support the new location identification DHCP options.

The Location Recipient is outside the scope of this activity.

This solution reports the necessary information to support the Enterprise ECS solution. This solution uses a Location Information Server (LIS) to provide the physical location information. The ECS correlates the LIS information with the client information using IP addresses and MAC address. Please refer to reference [3] for more details.

The mechanism for reporting CICM telephony client location information can also be employed to report the client's location, unique network id (unid), within the network topology. This is required for location/network based policy services:

- Correctly inserting the media portal to traverse NAT devices
- Admissions control

88.2.1.1 Reference Network

Figure 1 CICM Carrier ECS solution reference network shows a example network configuration. It shows an enterprise with a large central campus and several locations.

Table 1 describes each of the locations shown, how they are connected to the carrier network and the DHCP capabilities provided on site.

Table 1 Network Locations

Site	Description	Connectivity to carrier	DHCP capabilities
A1	Central campus	Direct connection to carrier network via NAT.	On site DHCP server supporting multiple scopes and vendor options.

A2	Secondary campus	Via limited bandwidth link to central campus.	On site DHCP server supporting multiple scopes and vendor options.
A3	Satellite office	Via limited bandwidth link to secondary campus.	DHCP is relayed to server on secondary campus
A4	Remote branch office	Hardware VPN device provides access to central campus over a limited bandwidth link into the internet.	VPN device provides DHCP for site – no support for vendor options.
A5	Home user	Dialup or software VPN over the internet to enterprise RAS/ VPN.	None – RAS/VPN provides IP address.

The distinction between sites A4 and A5 is that site A4 is a “known” location, but A5 is a site that is being used for temporary access to the enterprise (e.g. home or hotel).

The DHCP servers in the enterprise are configured with the Location and UNID for each scope it supports. E.g.; Consider a CICM telephony client on the ground floor in the Central Campus building. The DHCP server is configured with the location of CEN GF and UNID of 31 for this scope. The CICM telephony client may request the DHCP vendor option X to retrieve the configured location and unid.

Note: option X refers to the IETF GEOPRIV working group civil and geospatial location identification DHCP options. Please refer to references [1] and [2].

Figure 1 CICM Carrier ECS solution reference network also shows the ‘default’ location identification information configured on the CICM. This is configured against a network domain profile. If a user logs in from CICM telephony client that cannot provide the location identification information, e.g. from site A4 or A5, the default location identification information is used for the client.

88.2.1.1.1 Enterprise ECS solution

For completeness, a description of the Enterprise ECS solution will be outlined and how the CICM ECS Location Identification reporting functionality introduced by this activity meets it’s requirements.

Please refer to reference [3].

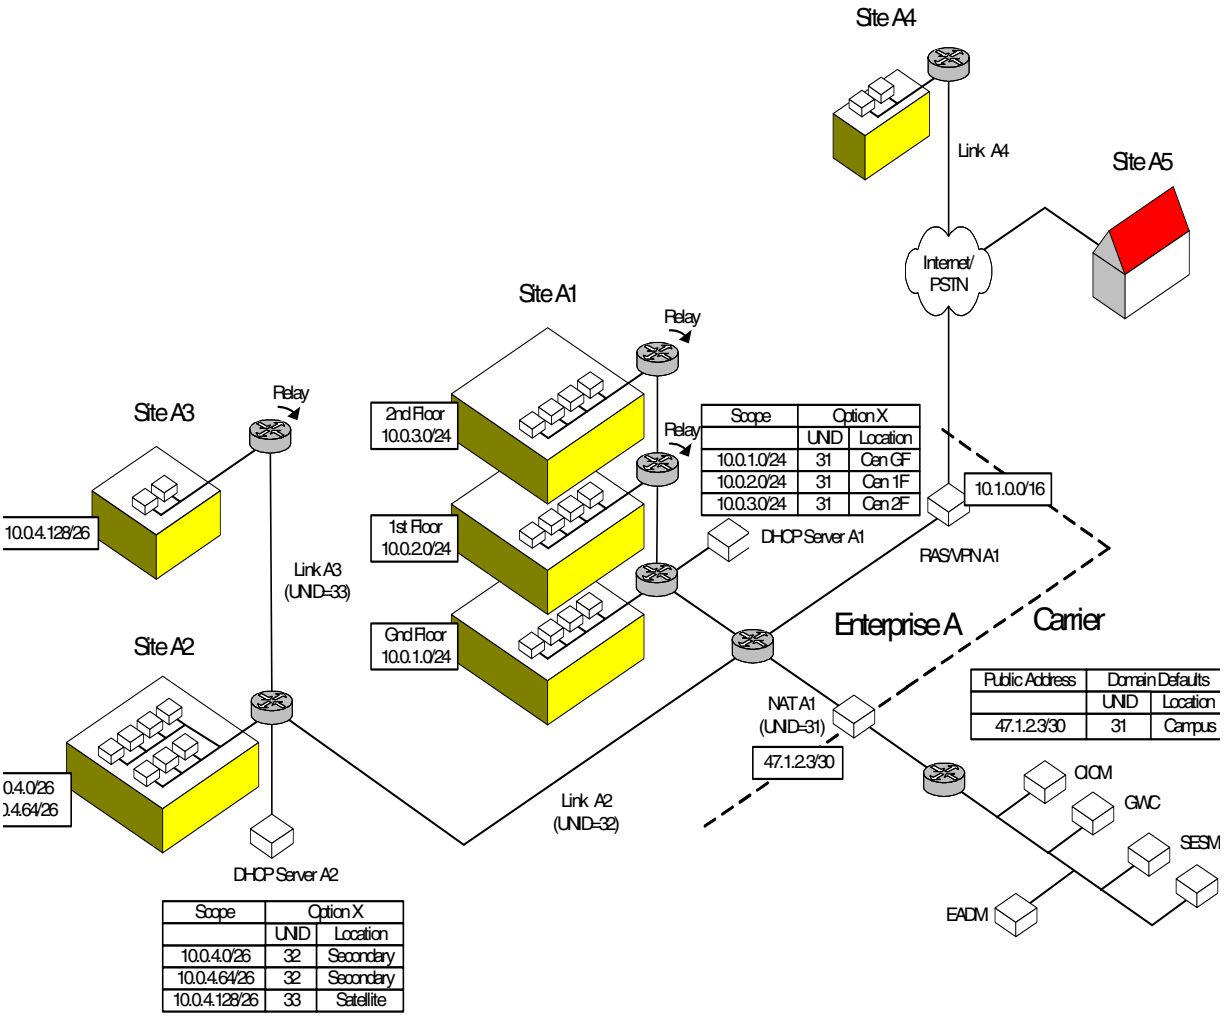
Figure 1 and Figure 2 Enterprise ECS solution reference network gives an example of the network configuration for the Enterprise ECS solution.

In the Enterprise ECS solution the Location Identification information is not configured as options in the DHCP servers. Instead the Location Information Service (LIS) gathers etherswitch/port-to-IP/MAC address associations for all devices connected to the network. The LIS performs this function by gathering information from routers and etherswitches. The LIS forwards the information onto the Emergency Application/Data Manager (EADM).

The EADM determines how emergency calls from telephony clients should be handled and sends this information to the Call Server. To accomplish this, the EADM correlates data from the LIS and the telephony client controller and uses its own network topology data to determine what emergency call handling information to send to the Call Server. In addition, the EADM handles Emergency Response Location (ERL) management and Automatic Location Identification (ALI) entry updates to the ALI Database.

In the CICM ECS Location Identification solution the EADM receives the Location Identification information the gateway controller, e.g. the GWC, not the telephony client controller, e.g. the CICM. Included in the Location Identification information reported by the GWC to the EADM are the telephony client's public IP address, private IP address, MAC address and a way to uniquely identity the client on the Call Server. The EADM correlates this information with the information from the LIS. The EADM can then update the call server with emergency call routing for the telephony client and decide whether to use the Location Identification information reported by the GWC or use Location Identification information from it's own database

Figure 1 CICM Carrier ECS solution reference network



Scope	Option X	
	UNID	Location

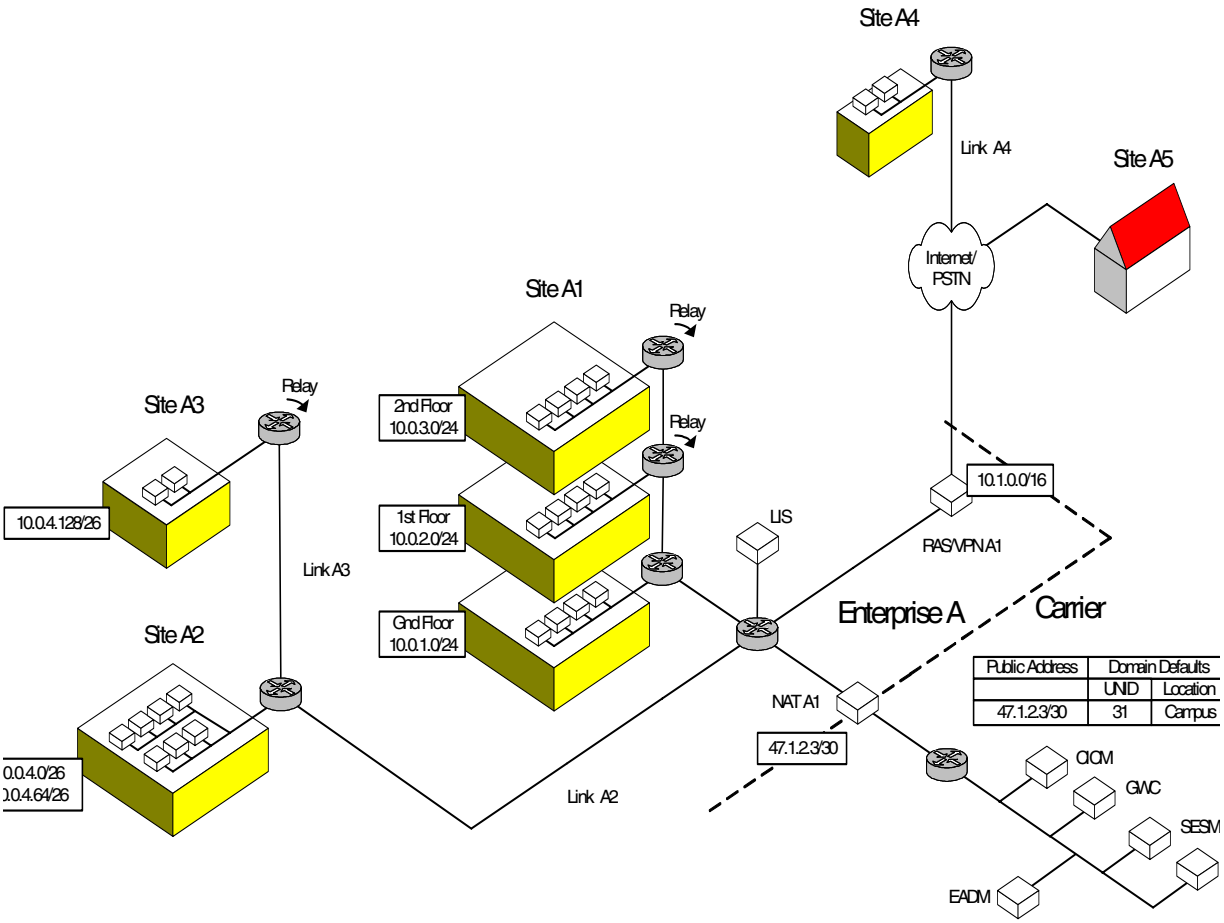
10.0.4.64/26	32	Secondary
10.0.4.128/26	33	Satellite

Figure 2 Enterprise ECS solution reference network



88.2.1.2 Operation overview

The CICM ECS Location Identification solution allows location identification information to be configured at the network level and reported through the network, ultimately being reported to an ECS application. Each component can process the information as required, e.g. the GWC uses the UNID in call processing for NAT traversal.

Figure 3 and Figure 4 show how the Location Identification information is requested and reported through the network when a user logs in to a CICM telephony client.

When a CICM telephony client starts-up it requires the following pieces of information:

- It’s own IP address
- The CICM server settings; IP address, connection retries, server action

For flexibility the CICM telephony client can obtain this information from the DHCP server at start-up. The IP address is obtained as part of the standard DHCP Discover and the CICM server settings are obtained by requesting vendor and site specific options.

The Nortel CICM configuration DHCP option (Nortel-i2004-A) has been extended to include the name of the middle-box that the CICM telephony client gains network connectivity through. The middle-box id is eventually reported northbound and used by the Internet transparency functionality.

The CICM telephony client requests the Nortel Location Identification options from the DHCP Server. The DHCP Server may have none or only some of the options configured. Only the configured Location Identification options will be returned by the DHCP Server to the CICM telephony client.

Please refer to section 2.1.3.1 DHCP for more DHCP configuration details.

When the CICM telephony client registers with the CICM server, the CICM requests the CICM telephony client’s MAC address and middle-box name (Unique Network Identifier).

When a user logs into a CICM telephony client the CICM requests the location information from the CICM telephony client.

In the case of the CICM telephony soft client the user can define the location identification as part of the login interface.

If a Location Identification options is requested by the CICM but not made available by the DHCP Server the CICM telephony client will respond to the CICM with the appropriate Unistim command containing no information.

Once all of the Location Identification information has been collected from the CICM telephony client the CICM registers the successful user login with the GWC via a H.248 location change event of the terminal location package.

The GWC uses this event to trigger an audit of the H.248 location identification package for the termination, to collect the Location Identification information.

The CICM responds to the audit with an H.248 audit message for the termination containing all the available Location Identification information.

The GWC uses the Unique Network Id for call processing and so stores the value internally. The GWC uses the Location Identification information received from CICM for the termination to build a Location Add XML structure to send to the Location Recipient application.

The Location Add XML structure is sent to the Location Recipient application over a TCP/IP connection that the GWC maintains.

More details about the interfaces between the network components involved is given in section 1.1.2.1.3 Interface

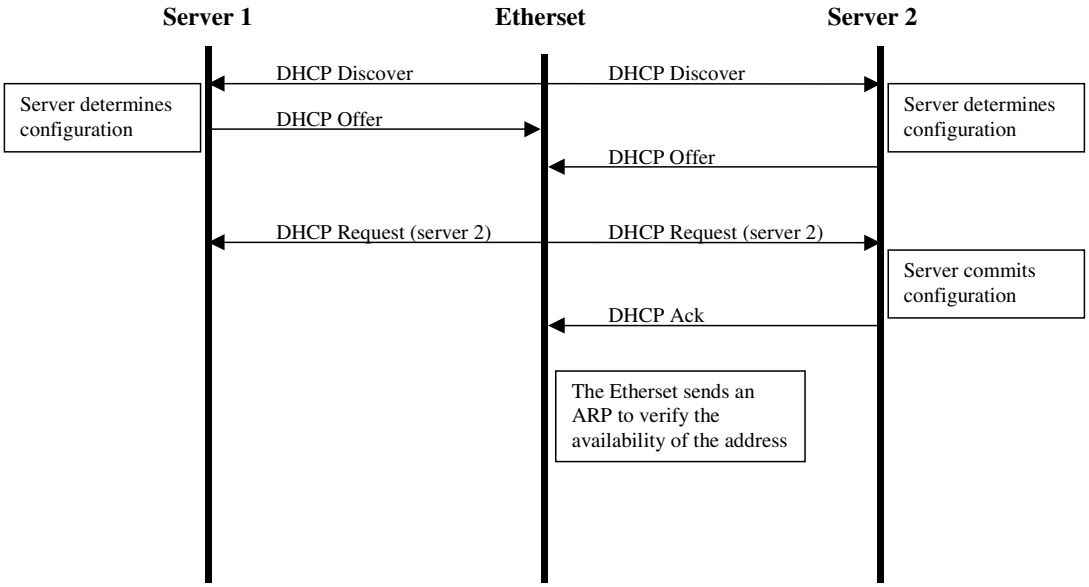
88.2.1.3 Interfaces

The following sections describe how the location identification information is reported from the CICM telephony client through the network.

88.2.1.3.1 DHCP A

CICM telephony client can obtain Nortel-specific configuration information from DHCP server; this includes the Location Identification information. The information is carried by DHCP options in DHCP OFFER message and DHCP ACK message.



1 Nortel specific configuration

5 DHCP vender-specific options (128, 144, 157, 191, and 251) and 5 DHCP site-specific options (128, 144, 157, 191, and 251) can be used to carry Nortel-specific configuration information:

- Nortel-i2004-A
- VLAN-A

12 DHCP vender-specific options (128, 131, 144, 157, 188, 191, 205, 219, 223, 232, 247, and 251) and 12 DHCP site-specific options (128, 131, 144, 157, 188, 191, 205, 219, 223, 232, 247, and 251) can be used to carry Nortel-specific configuration information:

- Nortel-Geo-Civil-A

- Nortel-Geo-Spatial-A

The options are listed (starting from highest priority) below. Higher priority option can overwrite lower priority option if they carry the same information.

- Vender-specific option 128 (highest priority)
- Vender-specific option 131
- Vender-specific option 144
- Vender-specific option 157
- Vender-specific option 188
- Vender-specific option 191
- Vender-specific option 205
- Vender-specific option 219
- Vender-specific option 223
- Vender-specific option 232
- Vender-specific option 247
- Vender-specific option 251
- Site-specific option 128
- Site-specific option 131
- Site-specific option 144
- Site -specific option 157
- Site -specific option 188
- Site -specific option 191
- Site -specific option 205
- Site -specific option 219
- Site -specific option 223
- Site -specific option 232
- Site -specific option 247
- Site -specific option 251 (lowest priority)

At the beginning of the options, a unique identifier identifies the format of the possible Nortel options. The current defined formats are:

Identifier	Comment
“Nortel-i2004-A”	Carrying call server information and Net6 server information
“VLAN-A”	Carrying VLAN information

“Nortel-Geo-Civil-A”	Carrying civil location information
“Nortel-Geo-Spatial-A”	Carrying geospatial location information

2 Nortel-i2004-A option

To facilitate the Internet Transparency functionality for CICM telephony clients, the name of the middle-box (unique network id (UNID)) that the CICM telephony client gains network connectivity through can be configured in the DHCP server.

The Nortel UNID has been added to the Nortel-i2004-A option.

The DHCP option format is:

Type (1 octet):

5 choices are 0x80, 0x90, 0x9d, 0xbf, 0xfb (128, 144, 157, 191, and 251).

Providing a choice of five types allows the IP telephone to work in environments where the initial choice already is used for other purpose.

Length (1 octet):

Variable - depends on message content.

Data (length octets):

- ASCII based
- format

```
Nortel-i2004-
A,iii.jjj.kkk.lll:pppp,aaa,rrr;iii.jjj.kkk.lll:pppp
,aaa,rrr;bbb.ccc.ddd.eee:fffff;nnnnnnnnnnnn.
```

WHERE:

"Nortel-i2004-A" - identifies this as the Nortel option

"," - is used to separate fields

";" - is used to separate servers’ info

"." - is used to signal end of structure

"iii.jjj.kkk.lll:ppppp" - ASCII encoded decimal

- Identifies IP address and port number for server.
- The 1st one identifies the primary server.
- The 2nd one identifies the secondary server.

"aaa"- identifies Action for server (ASCII encoded decimal, range 0..255)

"rrr" - identifies retry count for server (ASCII encoded decimal, range 0..255)

"bbb.ccc.ddd.eee:fffff" - ASCII encoded decimal.

- Identifies IP address and port number for Net6 server.
- This part is optional.

"nnnnnnnnnn" - identifies Unique Network Identification (UNID)

- ASCII based character string, up to 32 bytes long
- Character **';'** is not allowed.

This string may be NULL terminated although the NULL is not required for parsing.

Notes:

- "aaa" and "rrr" are ASCII encoded decimal numbers with a range of 0..255. They identify the "Action Code" and "Retry Count", respectively, for the associated TPS server. Internally to i200x they will be stored as 1 octet (0x00..0xFF). Note that these fields must be no more than 3 digits long.
- First server is always considered "Primary", second server always considered "Secondary".
- If only one server is required, terminate primary TPS sequence immediately with "." instead of ";" e.g. "Nortel-i2004-A,iii.jjj.kkk.lll:ppppp,aaa,rrr."
- If Net6 server ("bbb.ccc.ddd.eee:fffff") and/or UNID ("nnnnnnnnnn") are required, the secondary server need to be specified.
- Action code values:
  0 reserved
  1 UNIStim Hello (currently only this type is a valid choice)
  2..255- reserved
- "iii.jjj.kkk.lll" and "bbb.ccc.ddd.eee" are ASCII encoded, decimal numbers representing the IP address of the server. They do not need to be 3 digits long as the "." and ":" delimiters will guarantee parsing. For example, '001', '01' and '1' would all be parsed correctly and interpreted as value 0x01 internal to the i200x. Note that these fields must be no more than 3 digits long each.
- "ppppp" and "fffff" are the port number in ASCII encoded decimal. It does not need to be 5 digits long as the ":" and "," delimiters will guarantee parsing. For example, '05001', '5001', '1', '00001' etc. would all be parsed correctly and accepted as correct. The valid range is 0..65535 (stored

internally in i200x as hexadecimal in range 0..0xFFFF). Note that this field must be no more than 5 digits long.

- In all cases, the ASCII encoded numbers are treated as decimal values and all leading zeros are ignored. More specifically, a leading zero does not change the interpretation of the value to be OCTAL encoded. For example, 0021, 021 and 21 are all parsed and interpreted as decimal 21.
- "**;nnnnnnnnnn**" is optional.
- When "**;nnnnnnnnnn**" does not exist, "**;bbb.ccc.ddd.eee:fffff**" is optional.
- When "**;nnnnnnnnnn**" exists, "**bbb.ccc.ddd.eee:fffff**" is not optional, it should be set as "**0.0.0.0:0**" when Net6 is not need to be set.
- The following settings are possible valid settings:

Nortel-i2004-A,iii.jjj.kkk.lll:pppp,aaa,rrr;iii.jjj.kkk.lll:pppp,aaa,rrr;bbb.ccc.ddd.eee:fffff;nnnnnnnnnn.

Nortel-i2004-A,iii.jjj.kkk.lll:pppp,aaa,rrr;iii.jjj.kkk.lll:pppp,aaa,rrr;0.0.0.0:0;nnnnnnnnnn.

Nortel-i2004-A,iii.jjj.kkk.lll:pppp,aaa,rrr;iii.jjj.kkk.lll:pppp,aaa,rrr;bbb.ccc.ddd.eee:fffff.

Nortel-i2004-A,iii.jjj.kkk.lll:pppp,aaa,rrr;iii.jjj.kkk.lll:pppp,aaa,rrr.

Nortel-i2004-A,iii.jjj.kkk.lll:pppp,aaa,rrr.

The UNID has two valid formats:

- A middlebox name, and must match one of the IP-VPNs (virtual NATs) provisioned in the GWC EM.
- A middlebox id, this is identified by a '#' followed by a numeric value.

Example valid Nortel-i2004-A DHCP options;

No middlebox name/id configured:

```
Nortel-i2004-
A,11.12.13.14:15,1,6;11.12.13.15:15,1,6.
```

Middlebox name configured:

```
Nortel-i2004-
A,11.12.13.14:15,1,6;11.12.13.15:15,1,6;;middlebox-
1.
```

Middlebox id configured:

```
Nortel-i2004-
A,11.12.13.14:15,1,6;11.12.13.15:15,1,6;;#12345.
```

Note: configuring the UNID in the Nortel-i2004-A DHCP option will affect the operation of the GWC ITA/VCAC functionality. I.e. if the CICM telephony clients reports a UNID (middlebox name/id) to the CICM then this will be used in preference to the middlebox name/id associated with the Network Profile.

3 Location information DHCP options

Our goal is to implement standard DHCP location options. This is achieved by implementing the IETF GEOPRIV working group DHCP options for civil and geospatial location identification. Please refer to references [1] and [2].

At the time of developing this feature the IETF GEOPRIV working group have not finalised the DHCP option numbers for the civil and geospatial location options. Therefore Nortel specific option headers replaced the single byte DHCP option number specified in the GEOPRIV DHCP options. The location information in the option complies to the GEOPRIV specification.

3a Nortel-Geo-Spatial-A option

The DHCP option format is:

Type (1 octet):
12 possible choices are 0x80, 0x83, 0x90, 0x9d, 0xbc, 0xbf, 0xcd, 0xdb, 0xdf, 0xe8, 0xf7, 0xfb (128, 131, 144, 157, 188, 191, 205, 219, 223, 232, 247, and 251).

Providing a choice of five types allows the IP phone to work in environments where the initial choice may already be in use by a different vendor.

Length (1 octet):
The value is variable depending on message content.

Data (length octets):
ASCII based

The format is:

```
"Nortel-Geo-Spatial-A,xxxxxx"
```

where,

Nortel-Geo-Spatial-A" is the unique identifier for Nortel geographic location option. xxxxxx is binary-based GEOPRIV geospatial option, less the DHCP option number byte. Fixed length of 17 bytes.

The data for the Nortel-Geo-Spatial-A DHCP option can be derived in two ways:

1. Configure the spatial location against a network profile or network location on the CICM EM network page. This will provide the whole Nortel-Geo-Spatial -A DHCP option that can be used in the DHCP server. One the data has been copied the spatial location can be deleted from the network profile or network location.
2. Use the IETF GEOPRIV working group internet draft for the geospatial DHCP option. Please see reference XX.

3b Nortel-Geo-Civil-A option

GEOPRIV civil data has a 1 byte length indicator; this means that the civil location data can be up to 255-bytes long. Including the Nortel header this causes a GEORPIV civil data option to be longer than the maximum DHCP option length of 255 bytes. Therefore the option may require fragmenting over more than one DHCP option so a fragment ID has been included.

Only fragment id's of 0 and 1 will be used and this will only be in the case that the civil location option is greater than 230 bytes. However, provision has been made within the Nortel-Geo-Civil-A fragmentation operation for more than two fragments to allow future expansion.

The DHCP option format is:

Type (1 octet):
12 possible choices are 0x80, 0x83, 0x90, 0x9d, 0xbc, 0xbf, 0xcd, 0xdb, 0xdf, 0xe8, 0xf7, 0xfb (128, 131, 144, 157, 188, 191, 205, 219, 223, 232, 247, and 251).

Providing a choice of five types allows the IP phone to work in environments where the initial choice may already be in use by a different vendor.

Length (1 octet):
The value is variable depending on message content.

Data (length octets):
ASCII based

The format is:

```
"Nortel-Geo-Civil-A,i,xxxxxx"
```

where

Nortel-Geo-Civil-A" is the unique identifier for Nortel geographic civil location. i is the fragment identifier for multiple fragmented data. xxxxxx is the GEOPRIV civil DHCP option, less the DHCP option number byte. The maximum size is 230 bytes.

Notes:

"i" is ASCII encoded decimal numbers with a range of 0..4. It identifies the fragment number for multiple-fragmented civil data. If civil data appear in different Nortel-specific options and the fragment IDs are not unique, the higher priority option will overwrite the lower priority option.

Fragments of geo data can be placed in any of the 12 Nortel-specific options. They don't need to follow sequence. However, fragment ID should continue from 0 to n. For example, if fragment 0, 1, 3, and 4 are supplied, only fragment 0 and 1 are accepted.

The data for the Nortel-Geo-Civil-A DHCP option can be derived in two ways:

3. Configure the civil location against a network profile or network location on the CICM EM network page. This will provide the whole Nortel-Geo-Civil-A DHCP option that can be used in the DHCP server. One the data has been copied the civil location can be deleted from the network profile or network location.
4. Use the IETF GEOPRIV working group internet draft for the civil DHCP option. Please see reference XX.

4 I200x DHCP configurations

The i200x has three levels DHCP configuration:

- Off – the client IP address and CICM server information is configured in the client.
- On / Partial – the client IP address is obtained from DHCP and the CICM server information is configured in the client
- On / Full – the client IP address is obtained from DHCP and the CICM server information is configured in the client

When DHCP configuration is Off the UNID, civil location and geospatial location are not obtained from the DHCP server.

When Partial DHCP configuration is used the civil location and geospatial location can be obtained from the DHCP server, but the UNID is not. This is because the UNID is configured as part of the CICM server information which is configured in the client.

When Full DHCP configuration is used the UNID, civil location and geospatial location can be obtained from the DHCP server.

5 M6350 softclient DHCP configurations

The M6350 softclient has two levels DHCP configuration controlled by the 'Automatic Server Selection' check-box on the Server Settings window of the M6350 Configuration Wizard.

- Unchecked – Automatic Server Selection disabled, the CICM server information is configured in the Server Settings window of the M6350 Configuration Wizard.
- Checked – Automatic Server Selection enabled, the CICM server information is obtained from DHCP.

The softclient will always attempt to obtain the UNID, civil location and spatial location from the DHCP server whether Automatic Server Selection is enabled or disabled.

Note: When deleting Civil and Spatial options from the DHCP server the client side will not reflect the changes immediately. The DHCP client contains a DHCP caching mechanism when known DHCP options are not returned from the server. i.e. if an option has been requested and obtained from the DHCP server once it will be cached and used if a subsequent query does not return data for the said option number. If it is required to have the deletion of the option immediately updated on the client side the following mechanism should be used. Instead of deleting the Civil and Spatial Nortel options, simply provide no data for the option. I.e. place 0 into the binary array of the civil and/or spatial options. This will result in overriding the cached data on the client side.

Note: It can take several minutes for changes in the DHCP options to be picked up by the softclient. This is because of the DHCP client contains a DHCP caching mechanism.

88.2.1.3.2 Unistim

Unistim (Unified Networks IP Stimulus) is a Nortel Networks defined protocol for Internet Terminals (IP phones) used for VoIP (Voice over Internet Protocol) telephony services.

The information required for the ECS location identification solutions is:

- Public IP Address
- Private IP Address
- MAC Address
- Civil Location description
- Geospatial Location description
- Unique Network Id

The Public and Private IP Addresses are required for the CICM to manage a telephony client and so are already reported to the CICM prior to this activity.

This activity implemented Unistim commands to request and report the following client information.

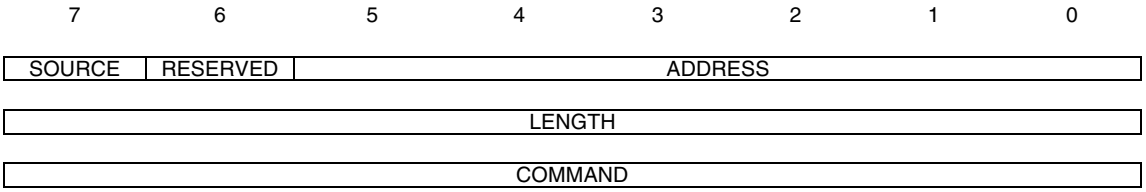
- MAC Address
- Civil Location description
- Geographic Location description
- Unique Network Id

1 Requesting the MAC Address

A CICM telephony client's MAC address is necessary as it is essential to the Enterprise ECS solution, e.g. the MAC address will be used to tie the output of the GWC to the output of the LIS.

The Query MAC Address is introduced as a NI to IT command for the Basic Manager.

Figure 5 Query MAC Address (10 XX)



1st Byte; Command header:

- Source = 0 (originated by NI)
- Address = 0x1A (Basic Manager)

2nd Byte; Length:

- Length = 0x03 (3 bytes)

3rd Byte; Command contents:

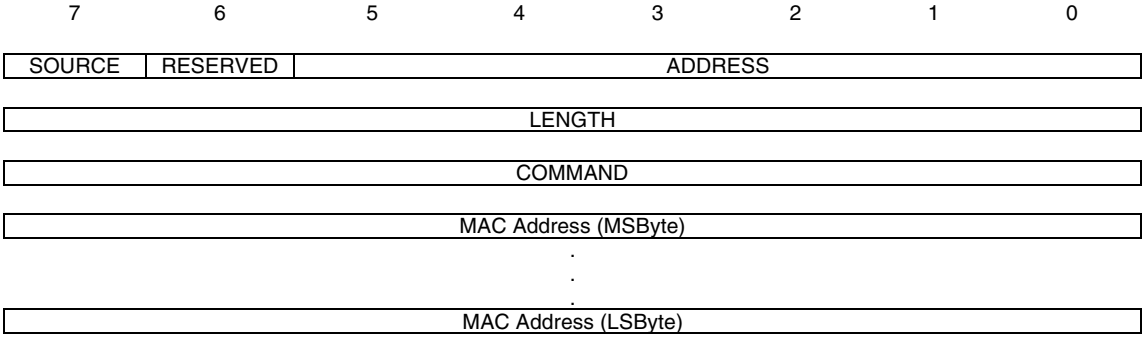
- Command = 0x10 (Query MAC address)

2 Reporting the MAC Address

The CICM telephony client responds to the 'query MAC' command with a 'MAC information report' command containing the clients MAC address. This is a new 'IT to NI' command for the Basic Manager.

An i200x responds with the sets MAC address. A M6350 softclient responds with the MAC address of the host adapter being used.

Figure 6 MAC Information report (11 XX XX XX .. XX)



1st Byte ; Command header:

- Source = 1 (originated by IT)
- Address = 0x1A (Basic Manager)

2nd Byte; Length:

- Length = 0x09 (9-Bytes, 3-Byte header + 6-Byte MAC address)

3rd Byte; Command contents:

- Command = 0x11 (MAC Address report)

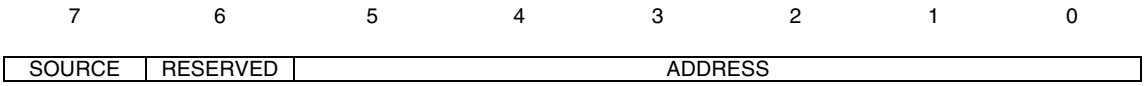
4th Byte; Command contents: MAC Address (MSByte)

9th Byte; Command contents: MAC Address (LSByte)

3 Requesting the Location Identification information

To request the Location Identification information from the telephony client the CICM sends a new Unistim ‘query location’ command. Within the command the CICM can specify which location identification parameters are required, i.e. unique network id, civil location description and geospatial location description. The Query Location Unistim command is a new ‘NI to IT’ command for the Basic Manager.

Figure 7 Query Location (0F XX)



LENGTH							
COMMAND							
RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	GLOC	LOC	UNID

1st Byte ; Command header:

- Source = 0 (originated by NI)
- Address = 0x1A (Basic Manager)

2nd Byte; Length:

- Length = 0x04 (4 bytes)

3rd Byte; Command contents:

- Command = 0x0F (Query Location)

4th Byte; Command contents: indicates which information is being requested

- UNID = 1 if Unique Network Id is required, otherwise UNID = 0
- LOC = 1 if Location descriptor is required, otherwise LOC = 0
- GLOC = 1 if the Geographical Location descriptor is required, otherwise GLOC = 0

4 Reporting the Location Identification information

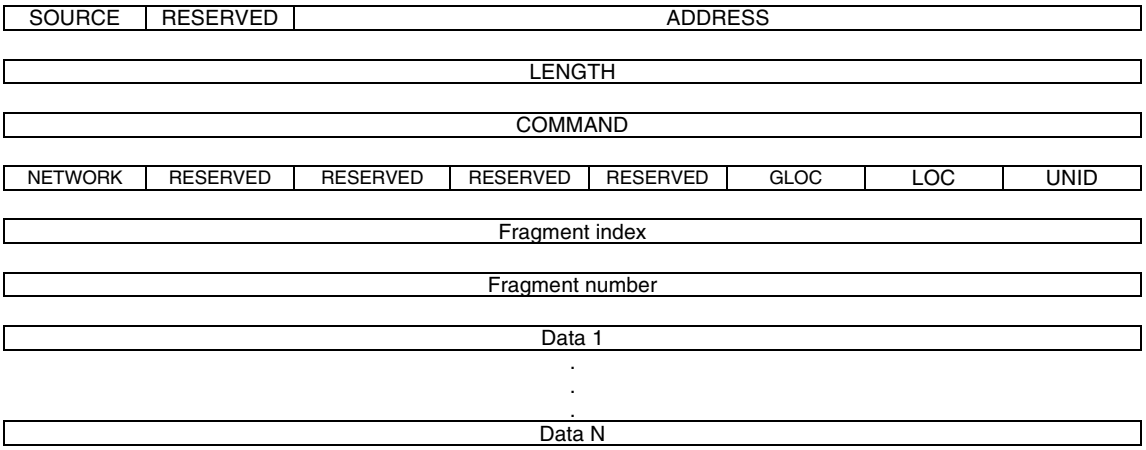
The CICM telephony client responds to the ‘query location’ command with a separate ‘location information report’ command for each requested parameter. This command includes fields for the parameter id, length and value.

The civil location descriptor may too large to fit into a single Unistim command, maximum length is 255-bytes, therefore the ‘location information report’ message supports fragmentation. In the case where the location descriptor is larger than the maximum size to fit into a single Unistim ‘Location Information report’ command the telephony client will fragment the location descriptor and the CICM will rebuild the location descriptor.

The Location Information report Unistim command is a new ‘IT to NI’ command for the Basic Manager.

Figure 8 Location Information report (10 XX XX XX .. XX)

7	6	5	4	3	2	1	0



1st Byte ; Command header:

- Source = 1 (originated by IT)
- Address = 0x1A (Basic Manager)

2nd Byte; Length:

- Length = variable

3rd Byte; Command contents:

- Command = 0x10 (Location Information report)

4th Byte; Command contents: indicates which information is being report, either:

- UNID = 1 if Unique Network Id is reporting in this command; LOC and GLOC must equal 0
- LOC = 1 if Location descriptor is reporting in this command; UNID and GLOC must equal 0
- GLOC = 1 if geospatial location descriptor is reporting in this command; UNID and LOC must equal 0
- NETWORK = 1 if the location information is provided by the network. If NETWORK = 0, the location information has been provided by the user.

  Note: Note: For the UNID, NETWORK must always be 1.

  Note: Note: Location Identification information reported by an i200x etherset will always have NETWORK equal to 1.

Note: Note: NETWORK can only equal to 0 for the Location Identification information reported by the M6350 soft client when the user specifies the location information manually.

5th Byte; Command contents:

- Fragment index – the index of the command within the fragmented command

6th Byte; Command contents:

- Fragment Number – the total number of fragments required to report the location identification data.

7th Byte; Command contents:

- Data 1 – first byte of the Location Information data.

Nth Byte; Command contents

- Data N – last byte of the Location Information data.

If a parameter is requested but not available, e.g. was not provided by the DHCP server, then the terminal responds with a 'location information report' message for the parameter specifying a Length of 6, i.e. the Unistim Location Information report command header with no data.

88.2.1.3.3 H.248

Prior to this activity, the location change event of the terminal location H.248 package was implemented to report the Unique Network ID (UNID) for the CICM telephony client from the CICM to the GWC. This event is reported after a user has successfully logged into a client. The reported Unique Network ID is used for network policy services. This event and operation is maintained by this activity. The location change event is used to trigger an audit of the Terminal State Descriptor, which contains the Location Identification package.

Please refer to Appendix A: H.248 Location Identification package description for more details of the Location Identification H.248 package.

The location change event contains two parameters:

- reg, a Boolean used to indicate whether the termination is being registered to, or un-registered from, the unique network id (locid).
- locid, a String used to represent the unique network id (locid)

When a user logs in to a CICM telephony client the CICM sends a location change event with reg=TRUE and the locid.

When a user logs out from a CICM telephony client the CICM sends a location change event with reg=FALSE.

88.2.1.3.4 Northbound to Location Recipient

The GWC collects the CICM ECS Location Identification information from the CICMs that it controls. The Location Identification information is immediately sent to the Location Recipient. The Location Identification information is reported by the GWC to the Location Recipient in a proprietary XML format. The XML structure is generated from the location information received in the H.248 TermState audit message and termination/endpoint information held in the GWC.

The information required by the Location Recipient is given in Table 2 Location Identification parameters.

Table 2 Location Identification parameters

Parameter	XML tag	Description	Format	Example
Call Server Identifier	csid (attribute of locid element)	Used to identify the Call Server that provides call processing for the CICM telephony client	String	CS2K_LONDON
GWC Identifier	gwcid (attribute of locid element)	Used to identify the Gateway Controller that provides call processing and management for the CICM telephony client	String	GWC-1
Node number	node (attribute of terminal element)	The number the Call Server uses to uniquely identify the CICM node.	Numeric	4
Terminal number	term (attribute of terminal element)	The number the Call Server uses to uniquely identify the CICM telephony client on the node.	Numeric	1
Gateway name	gw (attribute of terminal element)	The name of the gateway, used in the GWC and GWC-EM	String	cicm-1
Endpoint name	ep (attribute of terminal element)	The name of the endpoint on the gateway, used in the GWC and GWC-EM.	Numeric	tp/0/0001
Unique Network ID	unid	Uniquely identifies the middle-box, NAT or LBL that CICM telephony client network is behind.	Numeric	45
Public IP Address	pubip	The public IP address of the CICM telephony client	String	
Private IP Address	privip	The private IP address of the CICM telephony client	String	
MAC Address	mac	The MAC address of the CICM telephony client	String	
Source of Geospatial Location Information	geosrc	Whether the geospatial location descriptor was provided by the Network, e.g. DHCP Server, or by the User, e.g. the M6350 CICM softclient	String	network
Geographic Location Descriptor	geo	The geospatial location of the CICM telephony client. In the GEOPRIV geospatial DHCP option format, not include the single byte option number at the start.	String	
Source of Civil Location Information	civilsrc	Whether the civil location descriptor was provided by the Network, e.g. DHCP Server, or by the User, e.g. the M6350 CICM softclient	String	user
Civil Location Descriptor	civil	The civil location of the CICM telephony client. In the GEOPRIV civil DHCP option format, not include the single byte option number at the start.	String	

The XML schema is provided in Appendix C: Location Identification reporting XML schema.

1 XML messages

Several XML messages are required to support the reporting of location identification data to the location recipient and to maintain the integrity of the data in the location recipient.

1a New Location identification data (add)

When the GWC receives location identification data from the CICM for a newly registered termination it creates an ‘add’ XML structure and sends it to the location recipient.

The H.248 Location Identification package audit from the CICM does not identify if this is the first time the location identification information is being reported for the termination; therefore the GWC uses an internal flag to indicate whether the location identification information has been successfully reported to the Location Recipient. If the flag is false, an ‘add’ XML message is sent to the Location Recipient containing the Location identification information.

The internal GWC per termination ‘location identification’ flag is set when the add XML message is successfully sent to the Location Recipient.

An example ‘add’ XML structure:

```
<?xml version='1.0' encoding="UTF-8"?>
<locid csid=”CS2K_LONDON” gwcid=”GWC-1”>
   <add>
      <terminal node=”4” term=”1” gw=”cicm-1” ep=”tp/0/0001”>
         <unid>45</unid>
         <pubip>47.165.168.100:2000</pubip>
         <privip>10.0.1.16:5000</privip>
         <mac>0E184F93AC01</macc>
         <geosrc>network</geosrc>
         <geo>xxxxxxxxxxxx</geo>
         <civilsrc>network</civilsrc>
         <civil>xxxxxxxxxxxxxxxxxxxxxxxx</civil>
      </terminal>
   </add>
</locid>
```

1b Changed Location identification data (change)

If the GWC receives location identification data from the CICM for a termination that has already successfully reported location identification to the

Location Recipient, the GWC generates a ‘change’ XML structure and sends it to the location recipient.

An example ‘change’ XML structure:

```
<?xml version='1.0' encoding="UTF-8"?>
<locid csid=”CS2K_LONDON” gwcid=”GWC-1”>
   <change>
      <terminal node=”4” term=”1” gw=”cicm-1” ep=”tp/0/0001”>
         <unid>45</unid>
         <pubip>47.165.168.100:2000</pubip>
         <privip>10.0.1.16:5000</privip>
         <mac>0E184F93AC01</macc>
         <geosrc>network</geosrc>
         <geo>xxxxxxxxxxxx</geo>
         <civilsrc>network</civilsrc>
         <civil>xxxxxxxxxxxxxxxxxxxxxxxx</civil>
      </terminal>
   </change>
</locid>
```

1c Remove Location Identification data (remove)
When a user logs out of a CICM telephony client the location identification information is no longer required or reliable. The CICM reports the user log out in a H.248 location change event. When the GWC receives this event it resets the stored unique network id and sends a ‘remove’ XML structure to the location recipient to indicate that the location identification information for the termination/endpoint is no longer valid.

An example ‘remove’ XML structure:

```
<?xml version='1.0' encoding="UTF-8"?>?>
<locid csid=”CS2K_LONDON” gwcid=”GWC-1”>
   <remove >
      <terminal node=”4” term=”1” gw=”cicm-1” ep=”tp/0/0001”>
      </terminal>
   </remove >
</locid>
```

The internal GWC ‘location identification’ flag is reset so that any subsequent location identification information received from the CICM is treated as new information.

1d Synchronize Location Identification data (SYNC)

The location recipient sends this message when it requires the location data to be synchronized.

An example SYNC XML structure:

```
<?xml version='1.0' encoding="UTF-8"?>?>
   <locid >
      <sync/>
   </locid >
```

On receipt of the synchronize message the GWC recovers the Location Identification information for every termination by auditing the Location Identification package for every registered CICM telephony client termination. For unregistered endpoints a ‘remove’ XML message will be sent to the location recipient.

1e Connection Keep-alive (keepalive)

The TCP/IP connection established by the GWC has a time-out, e.g. if no data is sent over the connection for 2 hours the GWC drops the connection. To prevent the connection from being dropped due to this timeout a timer is used. If the timer reaches a predefined time, e.g. 1 hour, the GWC sends a ‘keepalive’ XML structure to the Location Recipient to keep the connection alive. The timer is reset each time data is sent on the connection. The location recipient will ignore the ‘keepalive’ XML structure.

An example ‘keepalive’ XML structure:

```
<?xml version='1.0' encoding="UTF-8"?>?>
   <locid csid=”CS2K_LONDON” gwcid=”GWC-1”>>
      <keepalive/>
   </locid>
```

1f Connection status message (status)

The location recipient sends this message to check that the connection is still active.

An example ‘status’ XML structure:

```
<?xml version='1.0' encoding="UTF-8"?>?>
   <locid>
      <status />
   </locid >
```

The ‘status’ message will be ignored by the Location Identification application on the GWC.

88.2.1.3.5 SNMP

A new SNMP MIB has been introduced to send the Location Identification configuration from the GWC Element Manger to the GWC. Please refer to Appendix B: GWC-LOCATION-CHANGE-REPORTING-MIB.

88.2.1.4 Feature Configuration and Activation

There are several places within the Call Server network that require configuring to enable the CICM ECS Location Identification functionality.

88.2.1.4.1 DHCP Server

The DHCP Server must be configured with the DHCP options for the GEOPRIV civil location identification, GEOPRIV geospatial location identification and unique network id.

Please refer to section 1.2.1.3.1 DHCP.

88.2.1.4.2 CICM telephony clients

1 Ethersets (i200x)

The Etherset (i200x) must be configured to use full DHCP configuration to support the reporting of the UNID, civil and geospatial location Identification.

The Etherset (i200x) must be configured to use partial DHCP configuration to support the reporting of the civil and geospatial location Identification. The reporting of the UNID is not supported when using partial DHCP configuration.

If the Etherset (i200x) is configured not to use DHCP configuration reporting of the UNID, civil and geospatial location Identification is not supported.

The i200x requires phase 2 firmware level D41 and above.

2 Soft client (M6350)

The M6350 softclient has been modified to provide the user with an interface to specify their civil and geospatial location description when logging in.

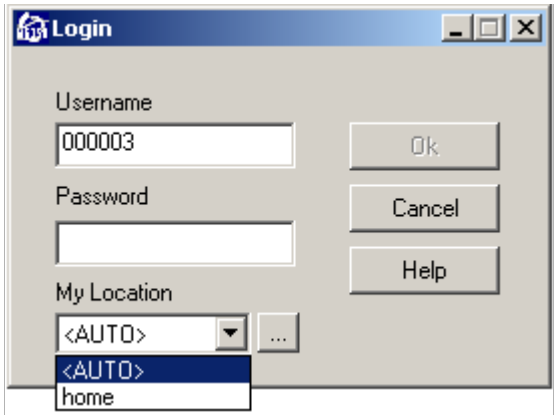
The M6350 CICM softclient has also been modified to allow the user to specify automatic server selection. If this is selected the M6350 softclient retrieves the CICM and Location Identification options from the DHCP server. Meaning that the user is not required to specify the server address.

The CICM telephony softclient must be at release 7.

2a Entering location description

The user log in process has been changed so that the user is prompted to choose a location description. An example is given in Figure 9 CICM Soft client login GUI.

Figure 9 CICM Soft client login GUI

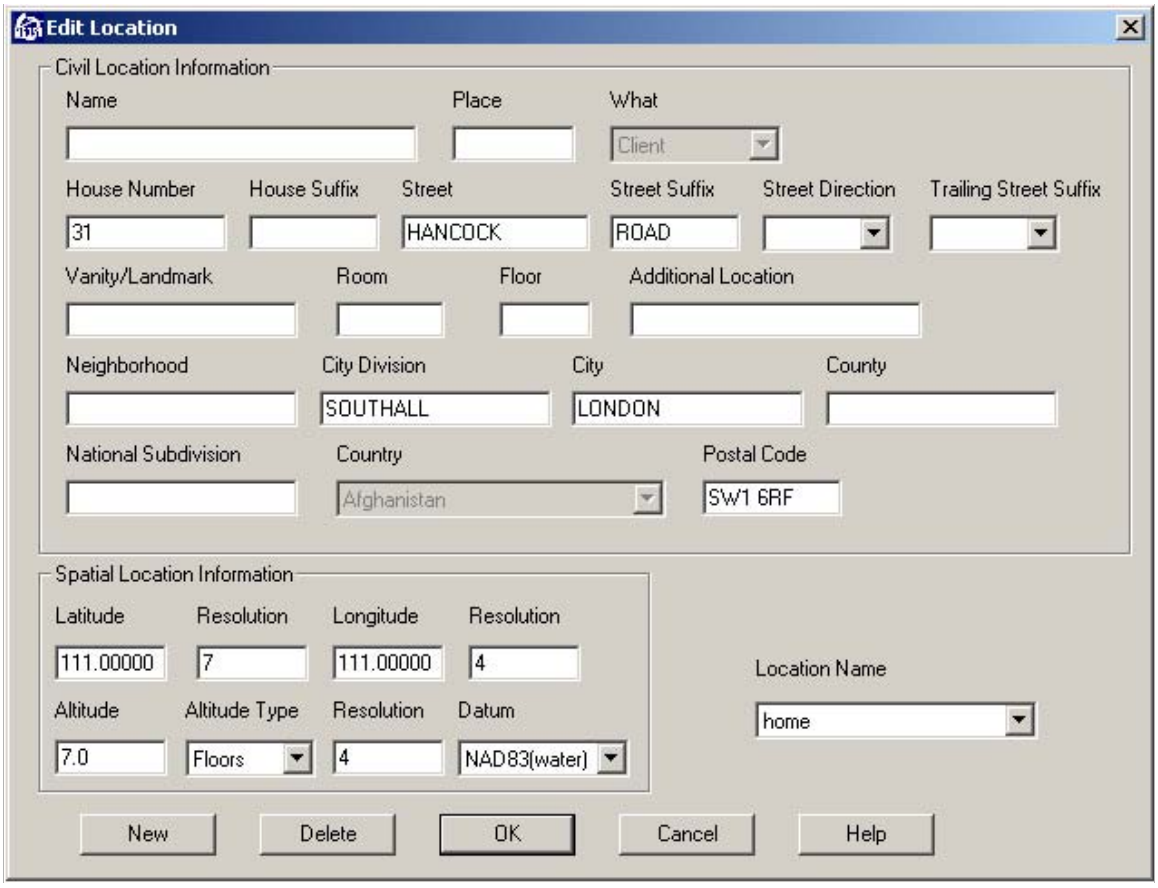


The <AUTO> location is provided if a location, civil and/or geospatial, is provided by the DHCP server.

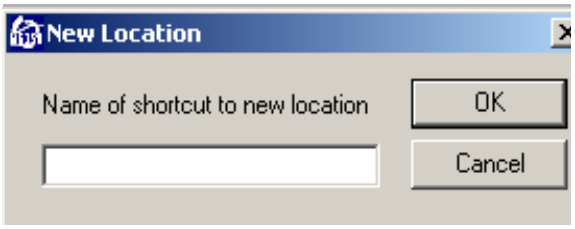
The GUI may provide a list of previously entered locations, which a user can choose from, or enter a new location. The "…" button opens the "Edit Location" window for viewing and editing location details. The existing locations can be viewed and edited in the "Edit Location" window. The <AUTO> location can only be viewed in the "Edit Location" window. New locations are entered in the "Edit Location" window.

An example is given in Figure 10 CICM M6350 Soft client Edit.

Figure 10 Figure 10 CICM M6350 Soft client Edit Location window



The “New” button is used to enter new location details. When “New” is pressed the following windowed is opened. The new location name is specified here.



Entering the location name, which can not be a name used before, and pressing “OK” causes the fields in the existing “edit location” window to be cleared and the new location details can be entered.

When entering location details only the relevant fields need to be modified, e.g. unnecessary fields can be left blank.

Note: Note: if all the fields of the civil or spatial location are left blank then the respective location information parameter is not generated. E.g. If the user know their civil location details but not the spatial location details then they should leave all the spatial fields blank and the client will not generate a spatial location.

The “Delete” button deletes the location currently being viewed.

The “OK” button closes the “edit location” window saving any changes.

The “Cancel” button closes the “edit location” window discarding any changes.

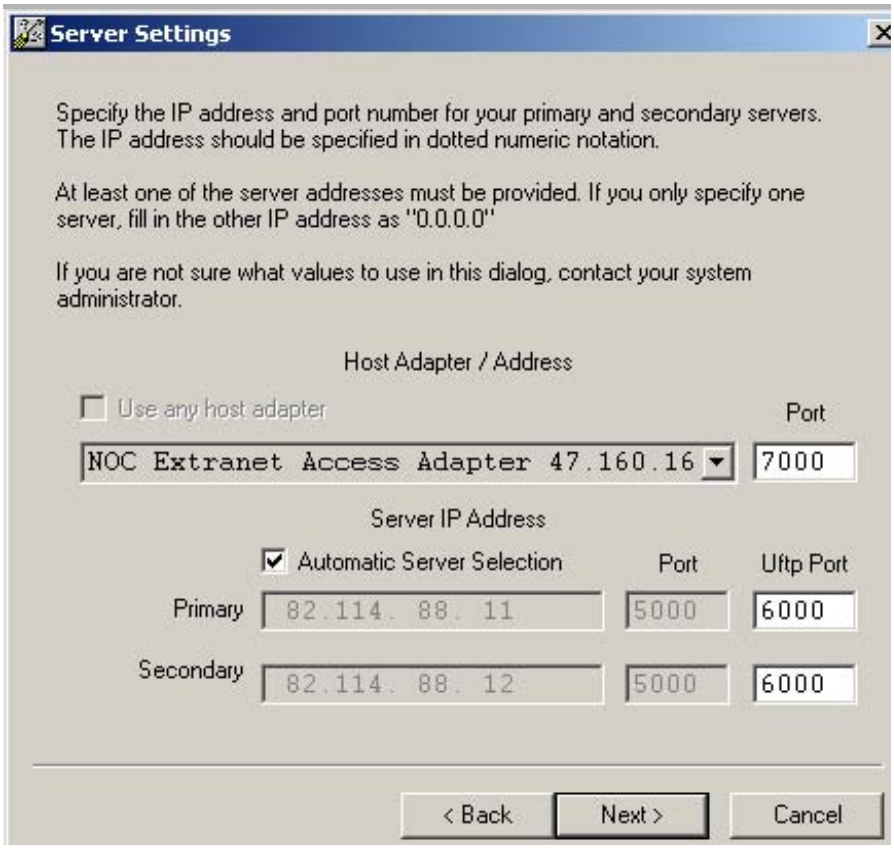
The “Help” button opens the “edit location” help window.

2b Enabling automatic server selection

An existing part of the M6350 softclient “Configuration wizard” is the ‘Server settings’ window. In this window the user specifies the CICM server settings to use. Prior to this activity only manual server selection was available, requiring the user to enter the address of the CICM server. A new option has been provided which allows the user to choose ‘automatic server selection’. When ‘automatic server selection” is enabled the Server settings fields are greyed out as the server settings are obtained from DHCP.

An example is shown in Figure 11 CICM Soft client server settings GUI.

Figure 11 Figure 11 CICM Soft client server settings GUI



Choosing ‘automatic server selection’ means that the server settings are obtained from the DHCP server when the M6350 softclient is started. Please refer to section 1.2.1.3.1 (2) Nortel-i2004-A option for more details.

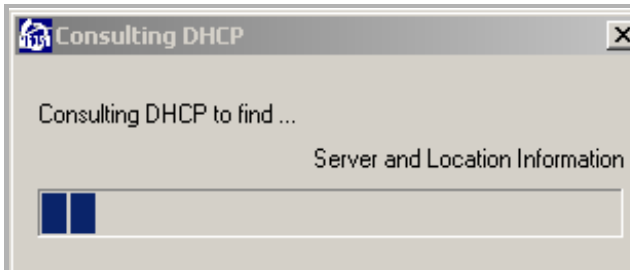
It is suggested that the location details provide by the DHCP server and made available to the user as the <AUTO> location be used, however the user can view the location details and decided whether they wish to use the <AUTO> location or not.

When reporting the civil and geospatial location description to the CICM the M6350 softclient indicates whether the information was provided by the network or user defined. This is because the ECS system may consider a network provided location descriptor more reliable.

2c Starting the M6350 Softclient

Starting the M6350 softclient has not been changed by this feature other than when the M6350 softclient is started a window is opened indicating that a DHCP request is being performed.

If “automatic server selection” is not enabled only the location DHCP options are used from the DHCP server. If “automatic server selection” is enabled the server settings and location DHCP options are used from the DHCP server. Example dialog display when starting the M6350 softclient:



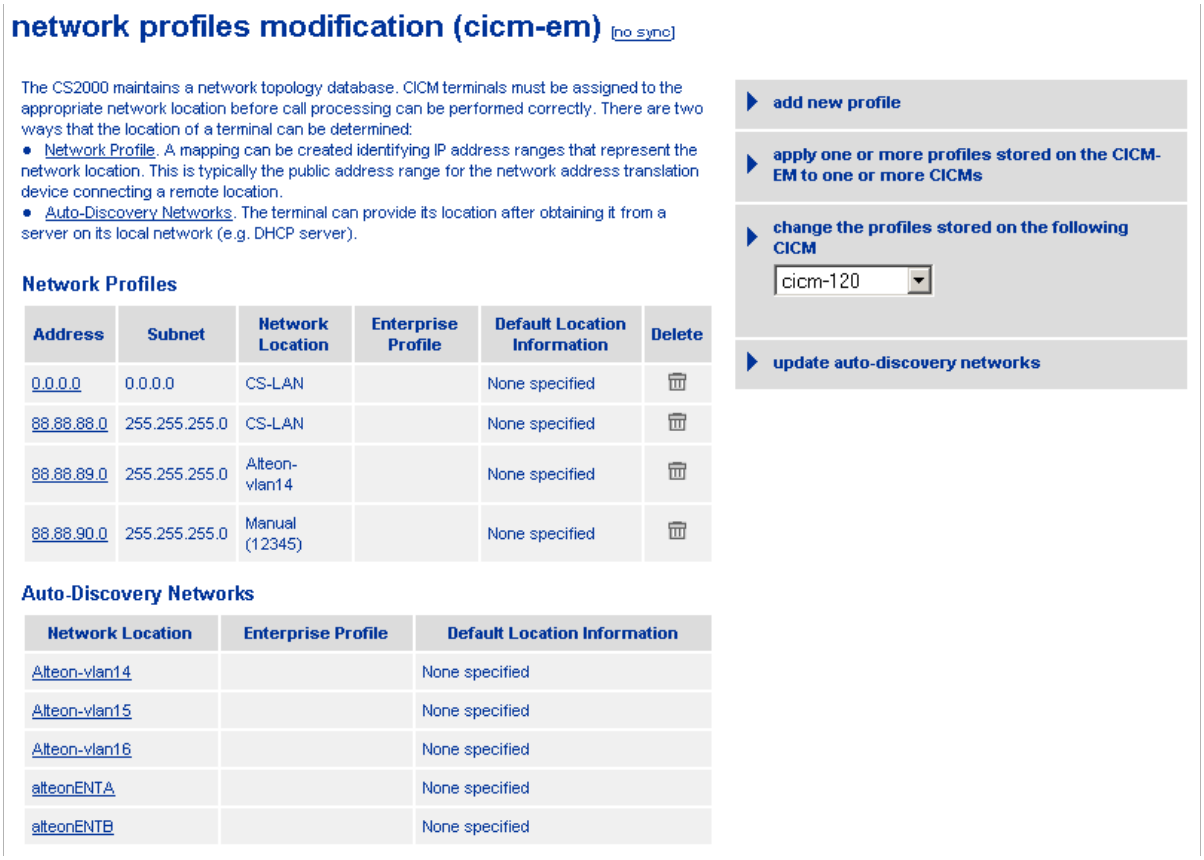
88.2.1.4.3 CICM Element Manager

On the ‘network’ page of the CICM Element Manager the operator has the option to configure a default civil location and default geospatial location against ‘Network Profiles’ and ‘Network Locations’.

One the ‘terminals’ page the operator can view the current location details of a terminal.

1 Network page

The network page of the CICM EM allows profiles to be configured for different enterprises, ranges of IP Addresses. To facilitate ITA a Network Location can be associated with a Network Profile. This Network Location is the default middlebox to use if the client does not provide a middlebox.



In SN06.2 a CICM Network Profile was solely used to associate an Enterprise to a Network Location (middlebox). When a user logs into a CICM telephony client in the Enterprise the middlebox id was derived from the ‘network location’ of the ‘network profile’ and reported to the GWC for call processing purposes.

This process has been superseded in SN07 as CICM telephony clients can now report the middlebox name/id to the CICM. However, the association of Network Profiles to Network Locations has been retained for backwards compatibility, i.e. scenarios when the client does not report the middlebox name/id.

This could be because phase 1 i200x’s firmware does not support the reporting of the middlebox name/id, or when the middlebox name/id is not available in the Nortel-i2004-A DHCP option.

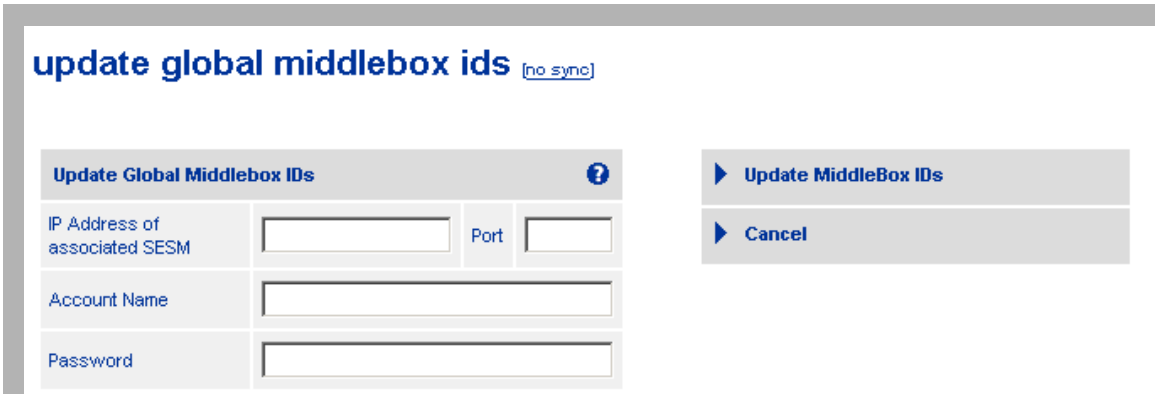
The ‘network location’ can take one of three forms:

- CS-LAN – This is the default Network Location. If this value is used all the clients in the Network Profile are considered to be within the Call Server LAN and therefore ITA is not required Middlebox id of 0.

- An Auto-Discovery Network – These are configured in SESM as IP-VPNs (virtual NATs). The names and id are downloaded from the SESM before they can be used.
- A Manually Defined Limited Bandwidth Link (LBL) – This is when the Enterprise is behind a LBL. The middlebox id must be retrieved manually from the SESM.

1a Auto-Discovery Networks

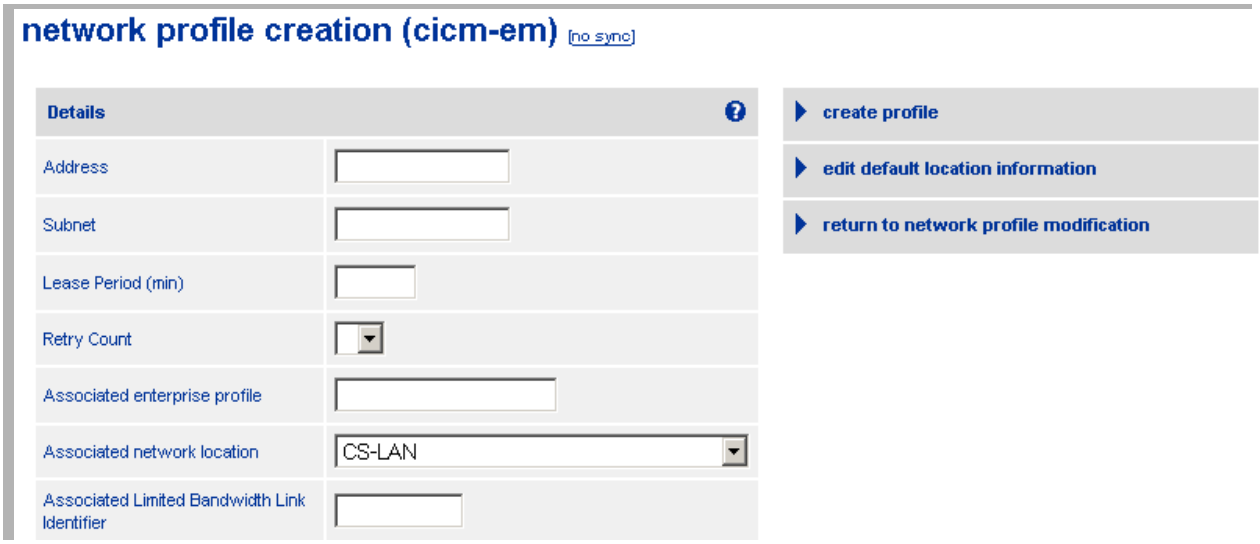
To be able to associate a IP-VPNs (virtual NATs) with a Network Profile they first must be downloaded from the GWC EM. This is achieved by selecting the 'update auto-discovery networks' option on the CICM EM network page. This opens the following page:



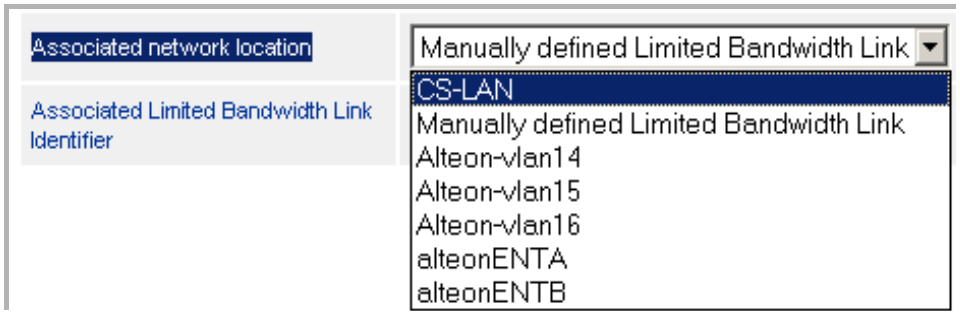
The SESM/GWC EM OSSGate IP Address, Port number, Account name and password should be entered and 'Update MiddleBox Ids' selected. This retrieves the list of IP-VPNs (virtual NATs) from the GWC EM and adds them to the Auto-Discovery Networks List on the CICM EM network page (see above).

1b Configuring a new Network Profile

To configure a Network profile select the 'add new profile' option on the CICM EM network page. This opens the following page:



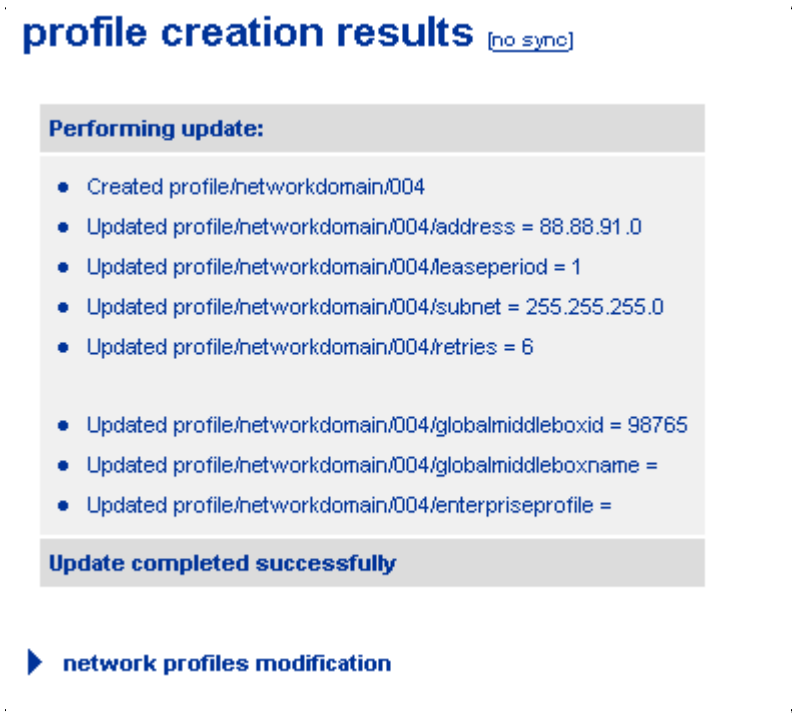
Configure the fields as required. If the clients reside in the CS-LAN leave CS-LAN selected in the 'Associated network location' drop-down menu. Otherwise, select a Auto-Discovery Network or 'Manually Defined Limited Bandwidth Link'. See example below.



If 'Manually defined Limited Bandwidth Link' is selected the 'Limited Bandwidth Link Identifier' must be configured in field 'Manually defined Limited Bandwidth Link'.

If CS-LAN or an Auto-Discovery Network is selected field 'Associated Limited Bandwidth Link Identifier' does not need a value, any value will be ignored unless 'Manually defined Limited Bandwidth Link' is selected.

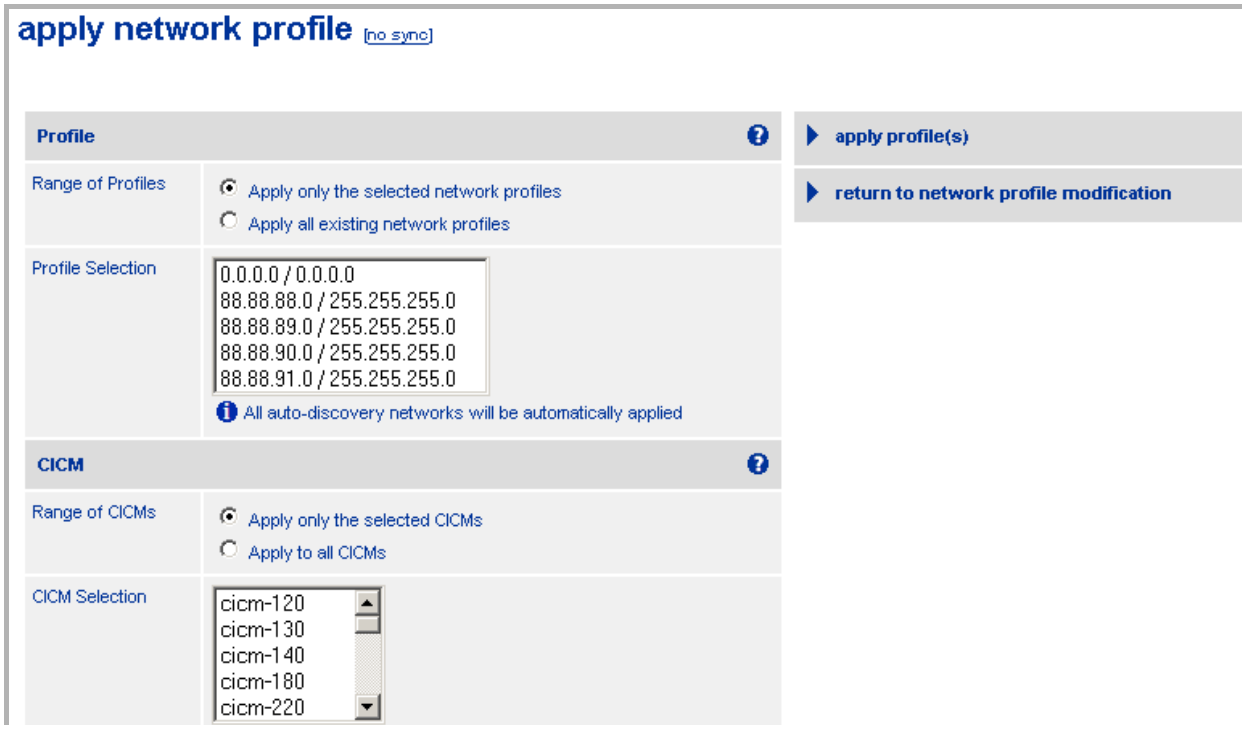
Once the new Network Profile fields have been configure select 'create profile' to save the new Network Profile. A results page shows what actions have been performed.



Select ‘network profiles modification’ to return to the CICM EM network page, where the new Network Profile is displayed.

1c Modifying an existing Network Profile
To modify an existing Network profile select the Network Profile's address, which is a hyperlink. This opens the Network Profile page for the selected Network Profile. The fields can be modified and the changes saved by selecting 'save your changes to this profile'.

1d Applying Network Profiles to a CICM gateway
The changes to the Network Profile page must be applied to the CICM gateway before they take affect. This is achieved by selecting 'apply one or more profiles stored on the CICM-EM to one or more CICMs'. This opens the following page:



The Profiles to apply are selected, alternatively all the profiles are selected. The CICMs to apply the Profiles to are selected, alternatively all the CICMs the CICM EM knows about are selected. Select 'apply profile(s)' to apply the profiles to the CICM. The results of the apply are displayed on a new page.

Note: The Auto Discovery Networks MUST be applied to the CICM before they take affect. All the Auto Discovery Networks are always applied to a CICM when a Network Profile is applied.

2 Default Location Information

Default Location Information can be configured against Network Profiles and Network Locations.

The configured Default Location Information will be used if the terminal does not report the location information. The civil and spatial location information is considered separately, e.g. if a terminal reports only civil location information the spatial location information will be taken from the Network Profile or Network Location, and vice versa if the terminal reports only the spatial location information.

The Default Location Information configured against the Network Profile takes precedence over the Default Location Information configured against the Network Location.

Default Location Information can only be configured against Auto-Discovery Network Locations. Default Location Information can not be configured against the CS-LAN or Manually Defined Limited Bandwidth Link Network Locations.

If a terminal reports an Auto-Discovery Network Location as the middlebox name and this matches one of the Auto-Discovery Network Locations then this will be used instead of the Network Location configured against the Network Profile. The Default Location Information configured against the Auto-Discovery Network Location will be used if the terminal does not report Location Information or the Network Profile does not have Default Location Information Configured.

Table 3 Use of Default Location Identification shows example scenarios of how the Default Location Information configured against the Network Profile and Network Location are used. Table 3 Use of Default Location Identification is intended to give example of the operation and is not a complete list of scenarios.

Table 3 Use of Default Location Identification

Information reported by terminal			Network Profile			Network Location		Information reported for terminal (from)		
UNID	Civil Location	Spatial Location	Network Location type	Civil Location	Spatial Location	Civil Location	Spatial Location	UNID	Civil Location	Spatial Location
No	No	No	CS-LAN	No	No	N/A	N/A	CS-LAN	None	None
No	No	No	Manual LBL	No	No	N/A	N/A	LBL Id	None	None
No	No	No	Auto-Discovery	No	No	No	No	Auto-Discovery	None	None

Auto-Discovery	Yes	No	N/A	No	Yes	Yes	Yes	Reported by terminal	Reported by terminal	Network Profile
Auto-Discovery	Yes	Yes	N/A	No	Yes	Yes	Yes	Reported by terminal	Reported by terminal	Reported by terminal
Manual LBL	No	No	N/A	No	Yes	N/A	N/A	Reported by terminal	None	Network Profile
Manual LBL	Yes	No	N/A	No	Yes	N/A	N/A	Reported by terminal	Reported by terminal	Network Profile
Manual LBL	Yes	Yes	N/A	No	Yes	N/A	N/A	Reported by terminal	Reported by terminal	Reported by terminal

2a Configuring Default Location Information against a Network Profile
Default Location Information for a Network Profile can be configured on the Network Profile Creation page or modified on the Network Profile Page, please see sections 1.2.1.4.3(1b) Configuring a new Network Profile and 1.2.1.4.3.(1c) Modifying an existing Network Profile respectively on how to get to these pages.

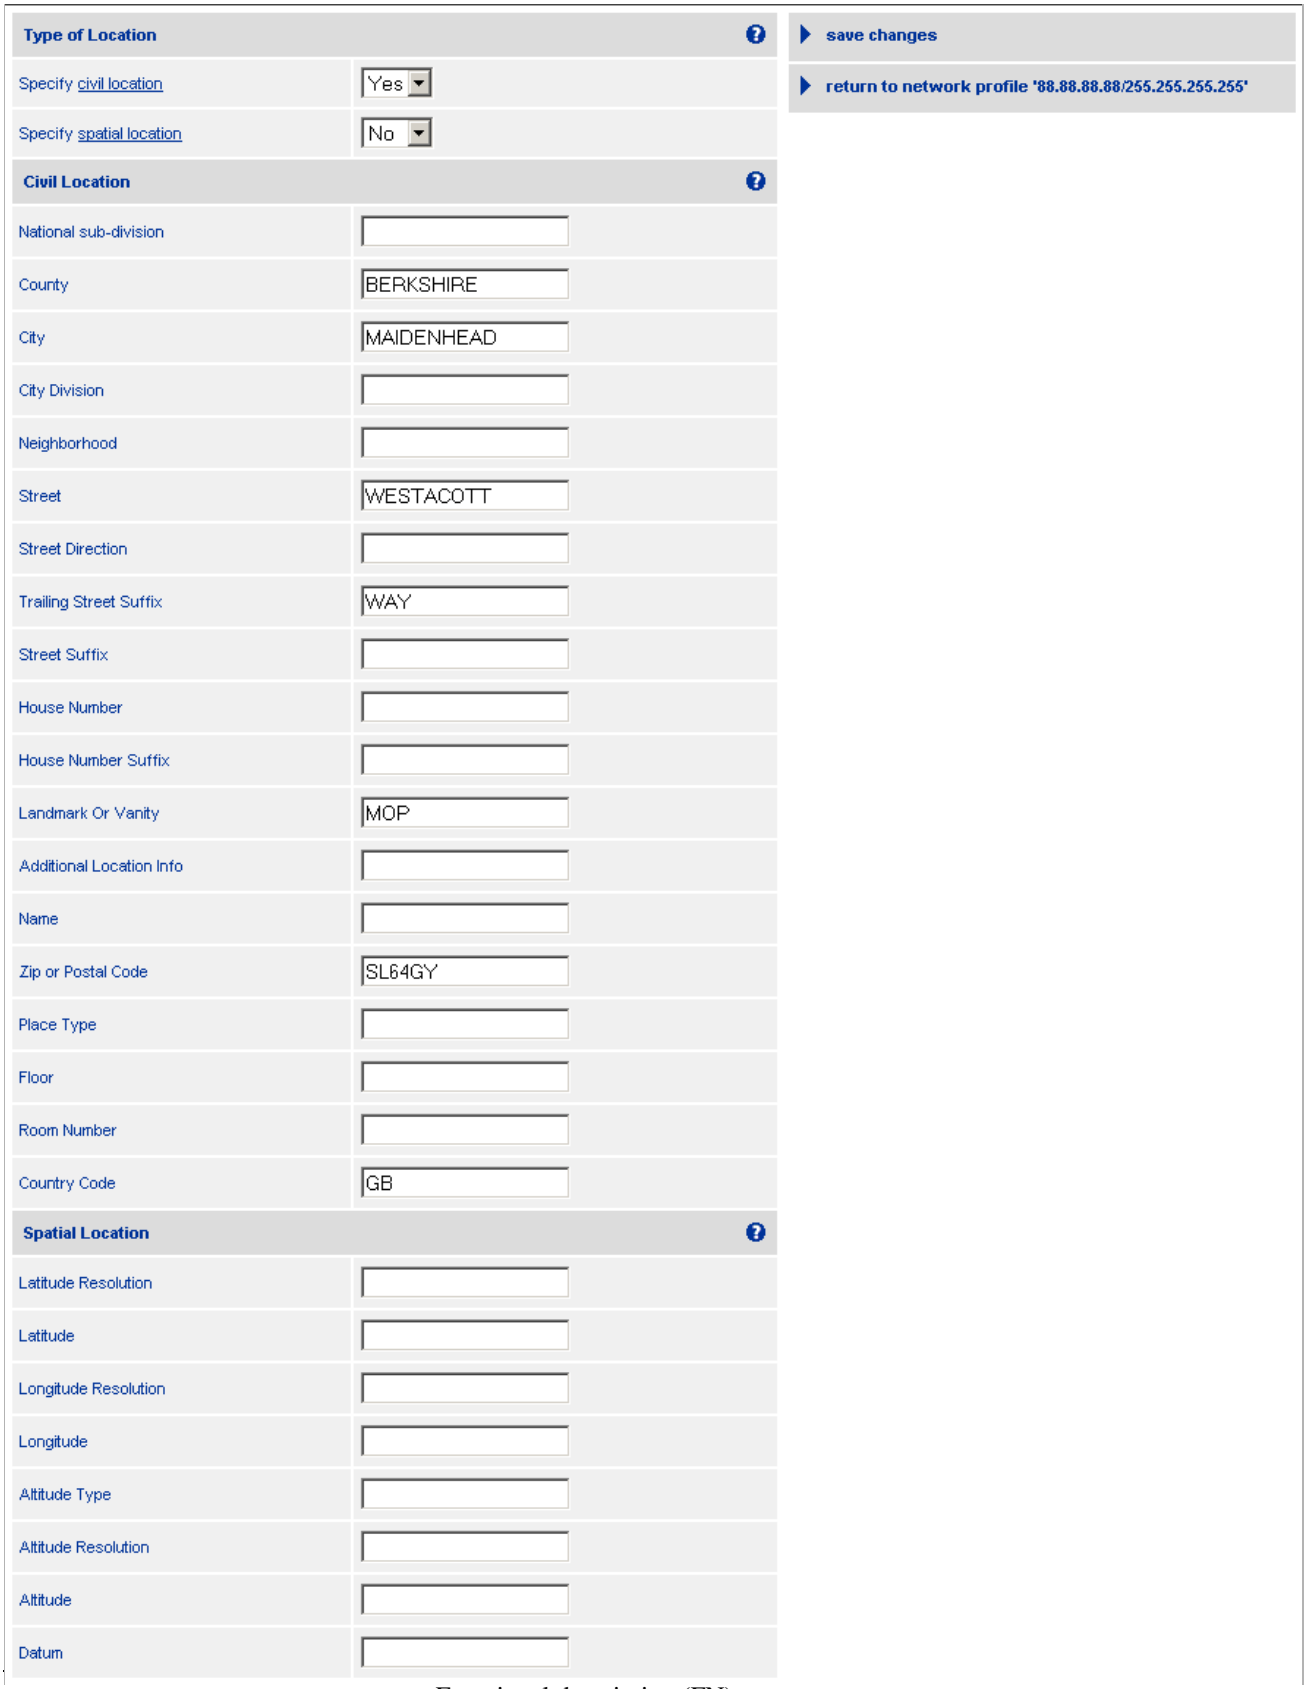
When a Default Location Information is configured for a Network Profile it is displayed when viewing the Network Profile. A textual representation of the Default Location Information is displayed, as well as the Default Location Information formatted as the Nortel-Geo-Civil-A DHCP option for the civil location and the Nortel-Geo-Spatial-A DHCP option for the spatial location.

Once on the page select ‘edit default location information’, on the right at the top, to open the ‘edit default location information’ page for the Network Profile. If the Network Profile already has Default Location Information configured this is displayed.

Default Location information configuration help is displayed by selecting the (?) in the section header.

The general rules for configuring the default location information are as follows:

- Civil Location – all fields other than the Country Code are optional. The Country code must be two letters and a valid ISO-3166 Country Code, the list of Country Codes is provided in the help.
- Spatial Location – the fields must contain numeric characters, other than '-' for negative values and '.' for fractions. The values must be within the specific ranges, which are provided in the help.



Type of Location	
Specify civil location	Yes
Specify spatial location	No

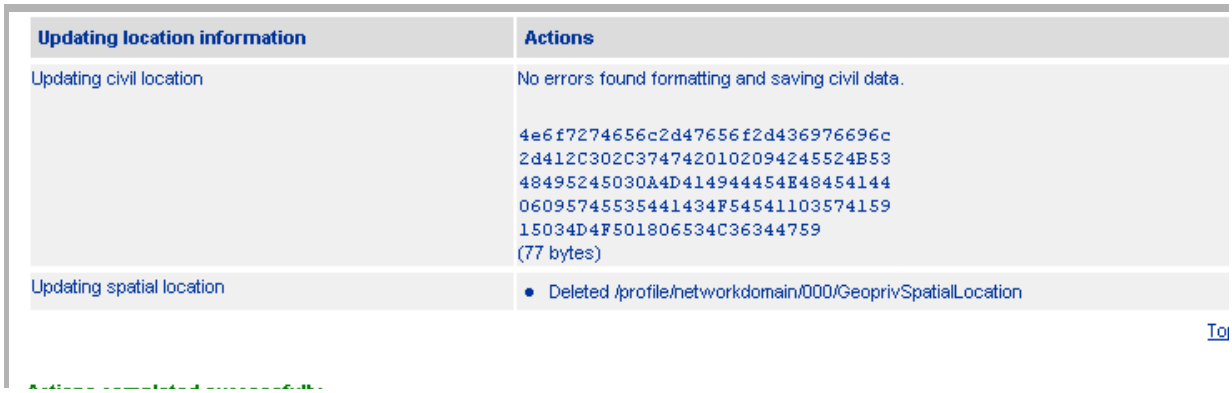
Functional description (FN)

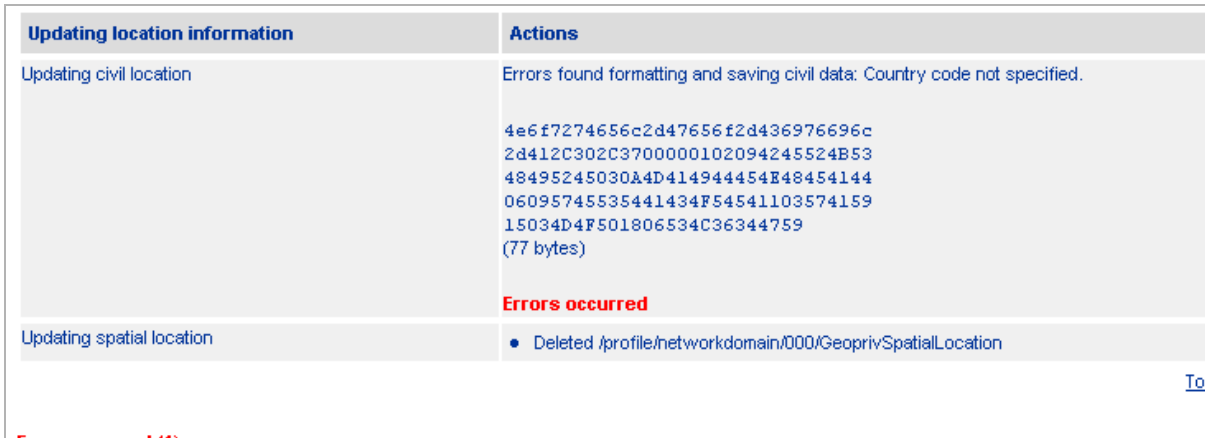
Once the Default Location Information has been configure, or modified, select ‘save changes’ to save the Default Location Information to the Network Profile. The ‘updating location information’ page reports the outcome of the ‘save changes’, e.g.



Updating location information	Actions
Updating civil location	No errors found formatting and saving civil data. 4e6f7274656c2d47656f2d436976696c 2d412C302C3747420102094245524B53 48495245030A4D414944454E48454144 0609574553544143 4F54541103574159 15034D4F501806534C36344759 (77 bytes)
Updating spatial location	• Deleted /profile/networkdomain/000/GeoprivSpatialLocation

To

The page reports whether errors were found while formatting and saving the default location information. If no errors were found the outcome “No errors found formatting and saving civil data.” and “No errors found formatting and saving spatial data.” for the civil and spatial locations respectively is reported. If errors are found they are listed and the total number of errors found is reported. E.g. For the case when the country code (mandatory field) has not been specified.



Updating location information	Actions
Updating civil location	Errors found formatting and saving civil data: Country code not specified. 4e6f7274656c2d47656f2d436976696c 2d412C302C3700000102094245524B53 48495245030A4D414944454E48454144 0609574553544143 4F54541103574159 15034D4F501806534C36344759 (77 bytes) **Errors occurred**
Updating spatial location	• Deleted /profile/networkdomain/000/GeoprivSpatialLocation

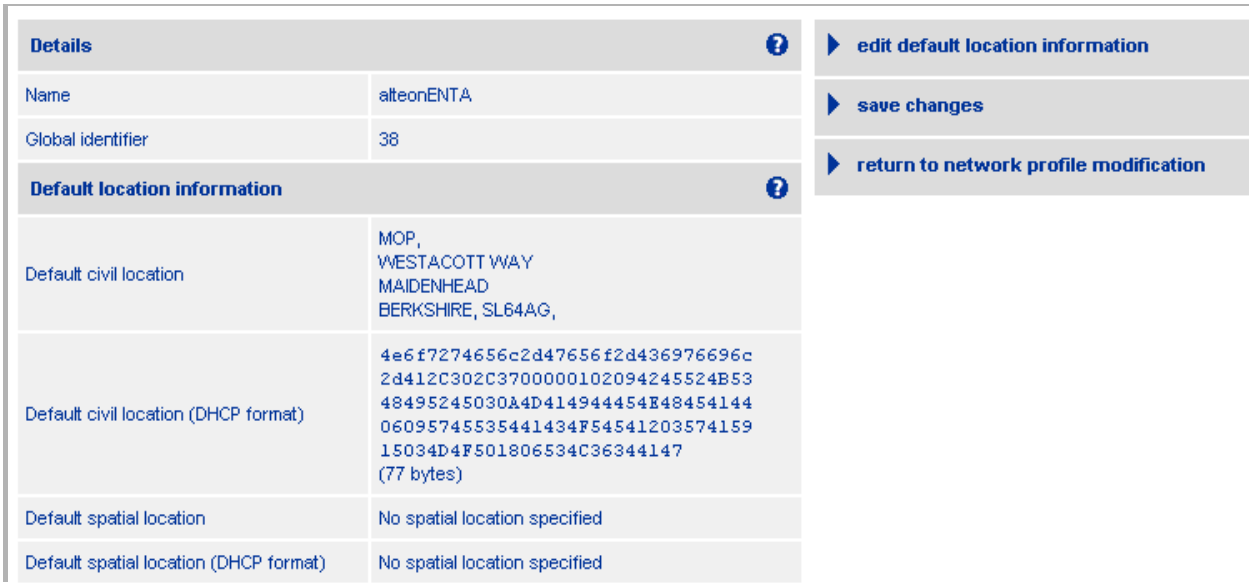
To

Even if errors are found a best effort is made format and save the default location information, it is the responsibility of the operator to re-edit the default location data to rectify the errors found.

Note: Changes to the Default Location Information for a Network Profile must be applied to the CICM gateway before they will take affect. Please see section 1.2.1.4.3(1d) Applying Network Profiles to a CICM gateway.

2b Configuring Default Location Information against a Network Location
Default Location Information for a Network Location can be configured on the 'auto-discovery network' page for an Auto-Discovery Network Location. To get to this page select the Network Location from the Auto-Discovery Networks list on the Networks page. An example is shown in section 1.2.1.4.3(1) Network page.

When a Default Location Information is configured for a Network Location it is displayed on the 'auto-discovery network' page. A textual representation of the Default Location Information is displayed, as well as the Default Location Information formatted as the Nortel-Geo-Civil-A DHCP option for the civil location and the Nortel-Geo-Spatial-A DHCP option for the spatial location.



Once on the page select 'edit default location information', on the right at the top, to open the 'edit default location information' page for the Network Location. If the Network Location already has Default Location Information configured this is displayed.

Please refer to section 1.2.1.4.3(2a) Configuring Default Location Information against a Network Profile for detail configuring the Default Location Information fields.

3 Terminal Page

The current location details of a terminal can be viewed in the Networking Information section of the terminal page.

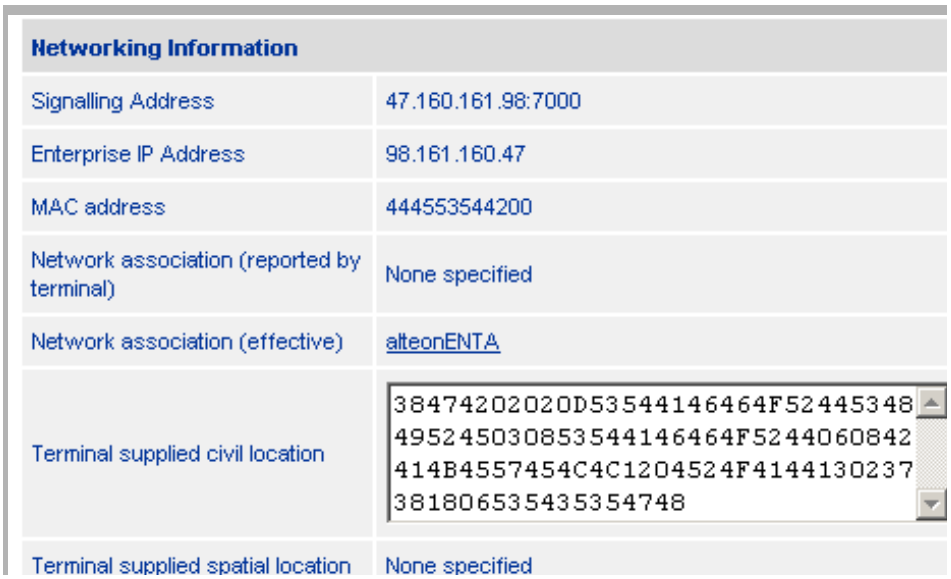


Table 4 Description of Network Information fields on terminal page

Name	Description	Comments
Signaling Address	Public IP Address of terminal signalling network interface	
Enterprise IP Address	Private IP Address of terminal	
MAC Address	MAC Address of terminal signalling network interface	
Network association (reported by terminal)	The middlebox name/id reported by the terminal.	
Network association (effective)	The middlebox name/id reported to the GWC for the terminal.	If this is an auto-discovered middlebox name, this is a hyperlink to the auto-discovery network page for the Network location.
Terminal supplied civil location	The civil location (bytes) reported by the terminal.	Does not contain the civil location taken from the Network Profile or Network Location.
Terminal supplied spatial location	The spatial location (bytes) reported by the terminal.	Does not contain the spatial location taken from the Network Profile or Network Location.

The Network Information on the terminal page is historic, e.g. it is not updated when a user logs out of the terminal and is only updated when a user logs into the terminal.

88.2.1.4.4 GWC Element Manager

The CICM ECS Location Identification functionality on the GWC is activated via the GWC Element Manager GUI.

1 Configuring the Location Recipient

The destination for the Location Identification information, e.g. the Location Recipient, is configured in the GWC Element Manager. The Location Recipient is configured in the Location Recipient tab of the Network Devices section of the Network panel. The default value for the Location Recipient DNS, IP Address and Port number is <not configured>. Please see Figure 12, GWC Element Manager Network Panel, that follows.

To configure the Location Recipient press the change button. This opens to 'Change Add Location Recipient' window. Please refer to "Change Location Recipient window" on page 888.

Figure 12 GWC Element Manager Network Panel

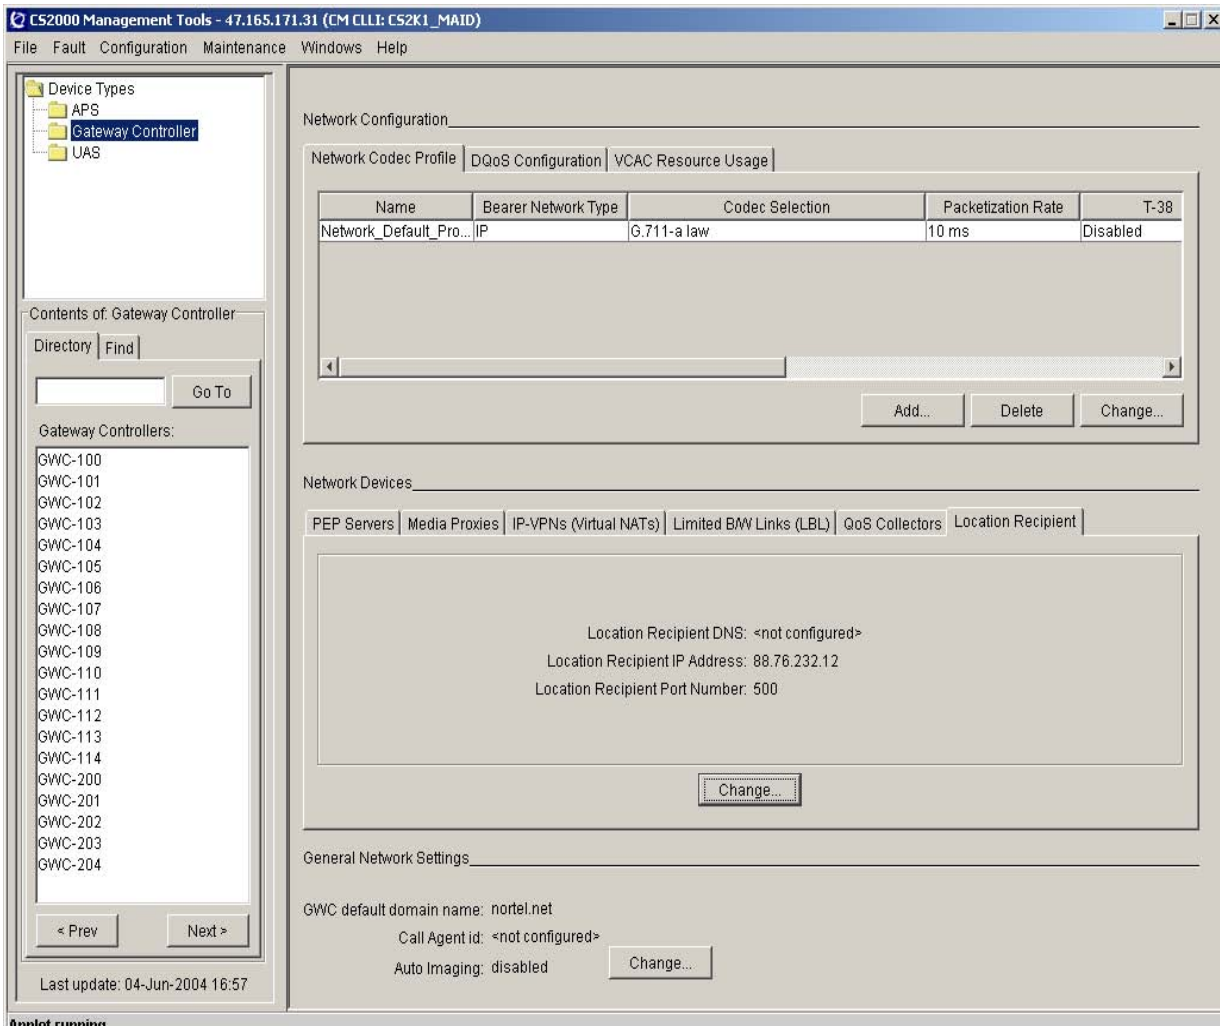

Figure 13 Change Location Recipient window

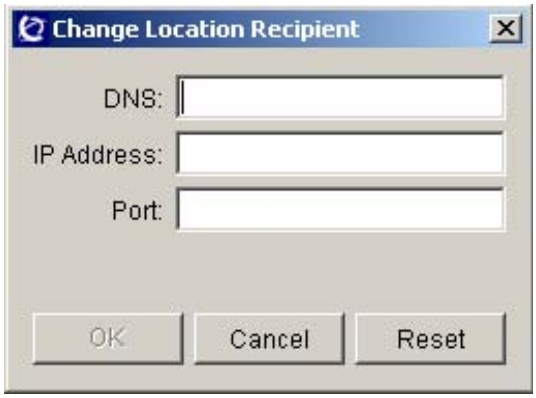


Each field has a Change Location Recipient window has *tip-text*.

The format of the DNS is any valid DNS character string that does not contain spaces. The format of the IP Address is <0-255>.<0-255>.<0-255>.<0-255>. The format of the port is any number in the range 0 to 65535, the Change Location Recipient window will only allow the user to enter data is the correct format.

Once the data has been entered the OK button is pressed to submit the data.

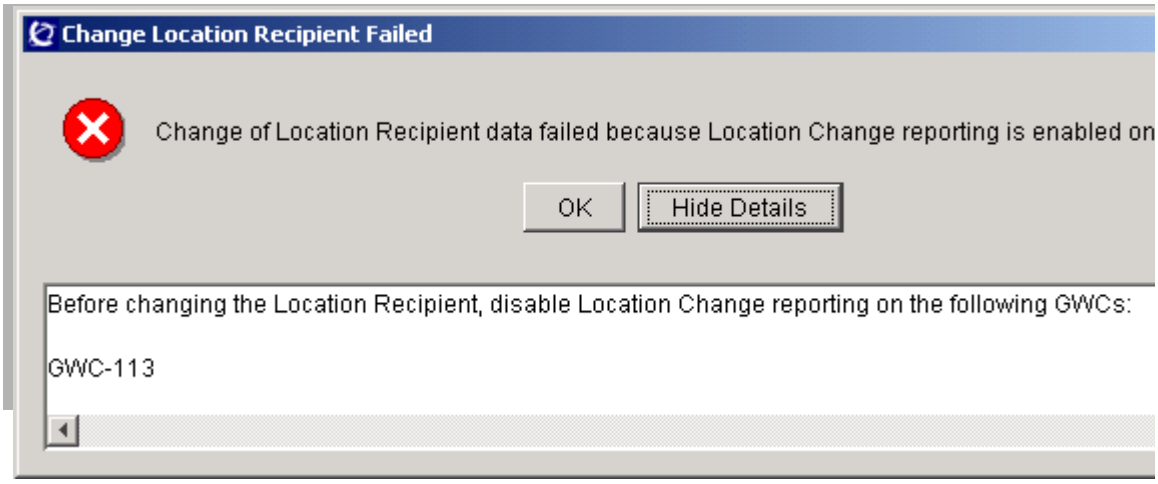
An error dialog is displayed if an incorrect value is entered in any of the fields. To allow either, or both, the DNS and IP Address to be configured, *blank* is considered a valid entry.

The following configuration combinations are acceptable:

- DNS, IP Address and Port Number – the GWC will use the DNS in preference to the IP Address. If the DNS look-up is not successful the connection will be attempted with the IP Address.
- DNS and Port Number – the IP Address takes the value <not configured>
- IP Address and Port Number – the DNS takes the value <not configured>

The Location Recipient values cannot be changed if the Location Recipient is associated with a GWC. Figure 14 Change Location Recipient failure window gives an example of the error message.

Figure 14 Change Location Recipient failure window



To unconfigure the Location Recipient the change button is pressed, then in the Change Location Recipient window the reset button is used to enter the default values, e.g. <not configured>, and OK is pressed to submit the data.

2 Activating the Location Change reporting on the GWC

The Location Change reporting from a GWC to the Location Recipient is activated via a checkbox in the GWC controller-provisioning panel. Please refer to Figure 15 GWC Controller provisioning panel.

The checkbox is only available for 'large line gateway' GWC profiles.

The checkbox cannot be checked if a Location Recipient has not been configured. Please refer to Figure 16 Location Change reporting checkbox error for an example of the error message.

When the checkbox is check the GWC Element Manager sends the Location Recipient configuration values to the GWC via SNMP. A 'status' parameter is also sent to the GWC, this has the value 'enabled'.

When the checkbox is unchecked the GWC Element Manager sends the 'status' parameter to the GWC, this has the value 'disabled'.

If the GWC is performing 'Device Recovery' Location Recipient configuration can not be transferred to the GWC via SNMP. Figure 17 GWC Device Recovery error shows the error dialog that will be displayed.

Figure 15 GWC Controller provisioning panel

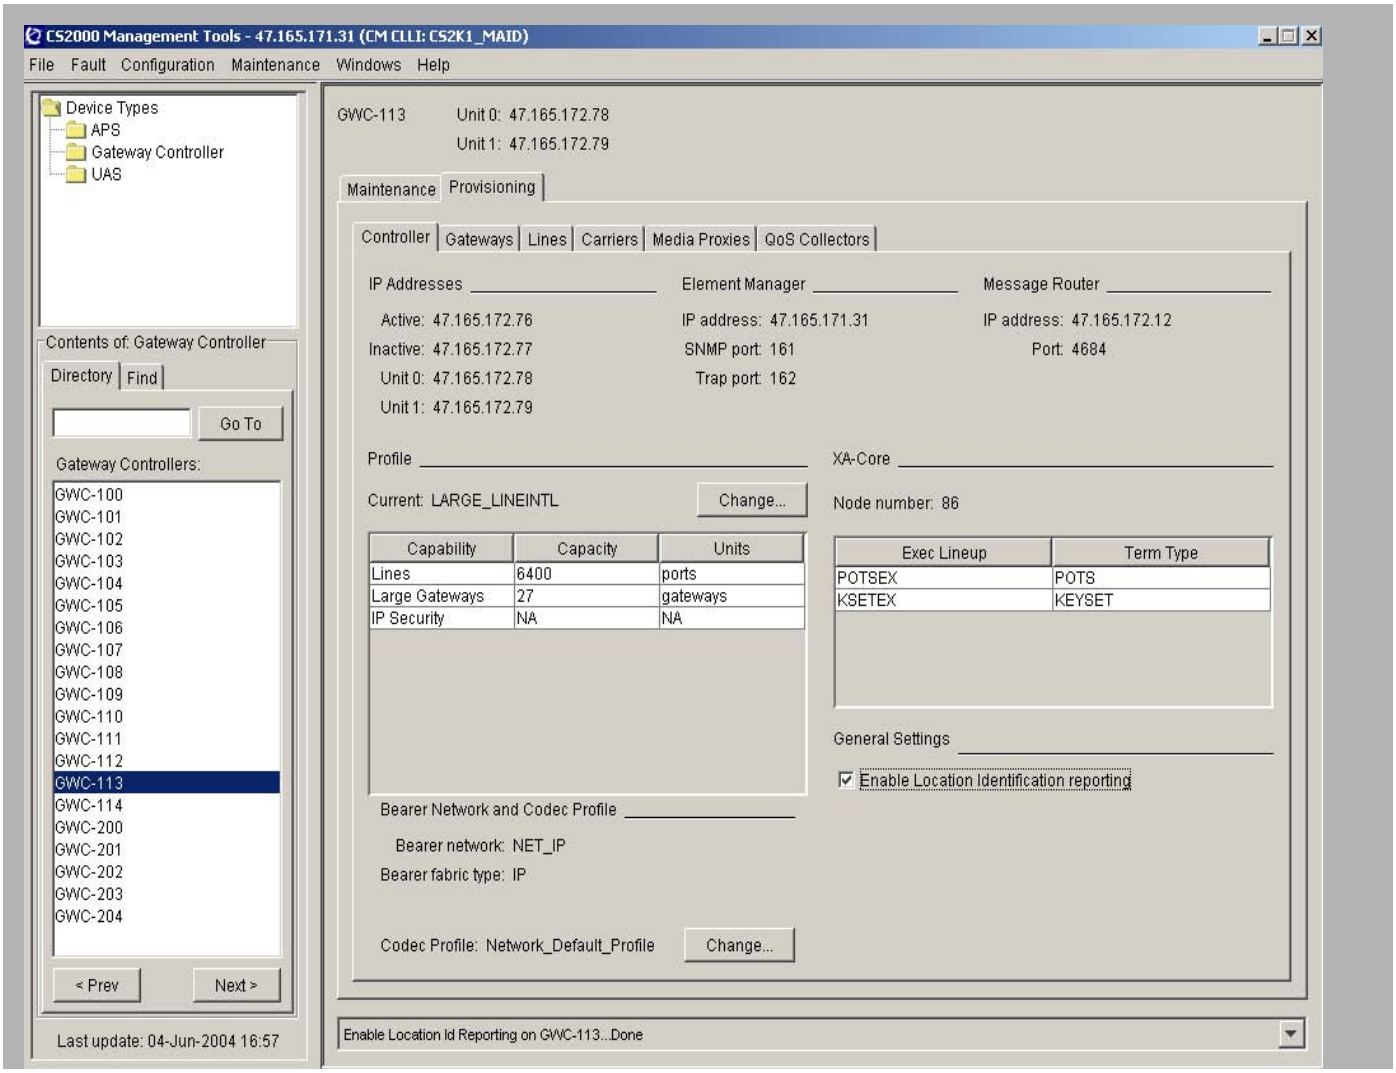


Figure 16 Location Change reporting checkbox error

Figure 17 GWC Device Recovery error

88.2.1.5 GWC Location Identification reporting application operation

This section describes the operation of the Location Identification reporting application on the GWC. The application is responsible for:

- Interfacing with the H.248 application, this includes:
  a. Notification on receiving a H.248 terminal location package location change event for a termination.
  b. Sending an audit request on the H.248 location identification package for a termination.
  c. Notification on receiving a H.248 location identification package audit.
- Queuing Location Identification information to be sent to the Location Recipient.
- Recovery and auditing of Location Identification information.
- Establishing and maintaining the TCP/IP connection to the Location Recipient.

The Location Identification reporting is enabled for a GWC in the GWC Element Manager, please refer to section 1.2.1.4.4 GWC Element Manager.

The GWC Element Manager enables Location Identification reporting on the GWC via SNMP.

When the Location Identification reporting application is enabled it does the following:

- Initialises the queue, recovery and audit mechanisms
- Establishes a TCP/IP connect to the configured Location Recipient

Once the Location Identification reporting application has been initialised it can:

- Accept notifications from the H.248 application
- Send audit requests to H.248 application
- Accept XML from the Location Recipient TCP/IP connection
- Send XML structures to the Location Recipient TCP/IP connection

The operation of the GWC Location Identification reporting application for an initial user login is described in section 1.2.1.2 Operation overview.

If the TCP/IP connect cannot be established to the Location Recipient the Location Identification reporting application queues the Location Identification information to be sent. Once the connection is established the queued Location Identification information is processed and sent to t he Location Recipient.

If the queue overflows, the recovery indicator is set for the termination. The Location Identification reporting application regularly audits the recovery indicators for all terminations. If the audit detects a set recovery indicator for a termination it initiates an audit of the H.248 Location Identification package for the termination.

While the TCP/IP connection is not established the Location Identification reporting applications does not use the Location identification information audit/recovery procedures.

The GWC Location Identification reporting applications operates until instructed to stop by the GWC Element Manager.

88.2.1.6 CICM Middle-box Id reporting operation Internet Transparency and VCAC

This activity has changed the way that middleboxes are configured in the CICM EM and introduced a new method to allow the CICM terminal to report the middlebox name/id.

Internet transparency (ITA) was originally introduced in SN06; The Internet Transparency Application Agent is required by telephone service providers with customers that are either using low bandwidth links or protecting their networks with uncontrolled NA(P)Ts. Prior to SN06, the CS2000 GWC did not have the ability to handle calls involving media gateways behind NA(P)Ts. These NA(P)Ts separate two networks with different IP address space - such as a private enterprise network and common address realm. The ITA introduces the ability to dynamically allocate NA(P)T binds through the use of a Media Proxy, so endpoints behind NA(P)T boxes remain reachable on a per-call basis.

In SN06.2 ITA was extended to CICM gateways, however because the CICM it is more of a signalling proxy rather than a media gateway, it does not require

an association with any single middlebox; it can support terminals from behind a number of middleboxes. Therefore a means to associate terminals with middleboxes was introduced. This was achieved by using Network Profiles; a middlebox id can be specified for an Enterprise, range of IP addresses, in the CICM Element Manager (EM). When a user logs into a CICM telephony client from within Enterprise, the middlebox id is reported to the GWC in Megaco/H.248 messaging. The GWC ITA agent then uses the middlebox id to determine whether a media portal should be introduced.

In SN07 due to this activity the provisioning of the Network Profile middlebox id has been changed. The middlebox name or id can be obtained by the CICM telephony client from DHCP and provided to the CICM gateway on registration. If the middlebox name or id is not provided by the CICM telephony client the middlebox id in the network profile is used.

The provisioning of the Network Profiles has been modified. The user can now download a list of IP-VPNs (virtual NATs) from the GWC EM, and associate one of the downloaded 'Auto-Discovery Networks' as the 'Network Location' for the Network Profile. Alternatively, the user can manually associate a 'Limited Bandwidth Link', configured in the GWC EM, using its Global Id, obtained from the GWC EM.

The middlebox name provisioned in DHCP and reported by the CICM telephony client must match one of the 'Auto-Discovery Networks' downloaded from the GWC EM so that the 'unique global id' can be determined and reported to the GWC.

If the middlebox name provisioned in DHCP and reported by the CICM telephony client does not match one of the 'Auto-Discovery Networks' downloaded from the GWC EM, the middlebox is taken from the appropriate Network Profile, and it's 'unique global id' is be determined and reported to the GWC.

The middlebox id can be provisioned in DHCP; it must be in the format #<number>, e.g. #12345. The # indicates that this is a middlebox id rather than middlebox name. The middlebox id does not have to match one of the 'Auto-Discovery Networks' downloaded from the GWC EM. The middlebox id is reported to the GWC.

The following diagrams show several CICM telephony clients registering with a CICM gateway and the expected operation.

88.2.2 Hardware requirements

None.

88.2.3 Software Requirements or Dependencies

SESM must be at release 7.

GWC must be at release 7.

CICM must be at release 7.

CICM EM must be at release 7.

CICM soft client must be at release 7.

Minimum phase 2 i200x firmware release is Phase2_rel_3_43 (0604D43).

88.2.4 Limitations and restrictions

Phase 1 i200x firmware does not support the new UNID extension to the Nortel-i2004-A DHCP option therefore the middlebox id reported for the terminal will also be taken from the Network Profile.

Phase 1 i200x firmware does not support the new Nortel-Geo-Civil-A and Nortel-Geo-Spatial -A DHCP options therefore the civil and spatial locations reported for the terminal will also be taken from the Network Profile (if Default Location Information configured) or the Network Location (if Default Location Information configured).

A Default Location can not be configured for a ‘Manually Defined LBL’. Default Locations can only be configured for Network Profiles and Auto-Discovered Network Locations.

It is possible that the Call Agent Id (CAID) on the GWC EM is changed; this will result in all the global middlebox id’s of NATs and LBLs being changed. If the CAID is changed then the NATs must be auto-discovered again in the CICM EM and applied to the CICMs, and any ‘Manually Defined LBLs’ configured against Network Profiles must be changed, and the Network Profiles applied to the CICMs.

88.2.5 Interactions

None.

88.2.6 Logs (LG)

None.

88.2.7 Data schema (DS)

Table 5 MIB entries

MIB name (registry key etc)	**MIB version** (from/to)	**New, Modified, Deleted**	**Description** (including backwards compatibility)

88.2.14.1.7 Location Identification reporting Package

PackageID: locId
Version: 1
Extends: tl

This package defines Termination Location Identification reporting for IP Terminals.

1 Properties

1a Unique Network Id
PropertyID: locid (0x0001)
Description: Reports the Unique Network Id (middle-box id) of an IP Terminal for location identification purposes. This is the unique global id assigned to a middle-box when it is configured in 'CS2000 Management Tools'.

Type: String
Possible Values: Any value of meaning between the MG and MGC. Default value is an empty String.
Defined In: Termination State Descriptor
Characteristics: Read only.

1b Public IP Address
PropertyID: pubAddr (0x0002)
Description: Reports the public IP address of an IP Terminal for location identification purposes.

Type: Octet String
Possible Values: Default value is an empty String. If the civil location (loc) or geospatial location (gloc) properties are present then this property must contain a non-default value.

Defined In: Termination State Descriptor
Characteristics: Read only

1c Private IP Address
PropertyID: privAddr (0x0003)
Description: Reports the private IP address of an IP Terminal for location identification purposes.

Type: Octet String
Possible Values: Default value is an empty String. If the civil location (loc) or geospatial location (gloc) properties are present then this property must contain a non-default value.
Defined In: Termination State Descriptor
Characteristics: Read only

1d MAC Address
PropertyID: macAddr (0x0004)
Description: Reports the MAC address of an IP Terminal for location identification purposes.

Type: Octet String.
Possible Values: MAC address encoded in hex. Default value is an empty String. If the civil location (loc) or geospatial location (gloc) properties are present then this property must contain a non-default value.
Defined In: Termination State Descriptor
Characteristics: Read only

1e Source of Geospatial Location information
PropertyID: glocsrc (0x0005)

Description: Identifies whether the network or the user provided the geospatial civil location information.

Type: Enumeration

Possible Values: Not Applicable (0x0001), Network (0x0002), User (0x0003). Default value is 0x0001. If the geospatial location (gloc) property is present then this property must contain a non-default value.

Defined In: Termination State Descriptor

Characteristics: Read only

1f Geospatial Location

PropertyID: gloc (0x0006)

Description: Reports the geospatial location of an IP Terminal.

Type: Octet String

Possible Values: Format specified in the IETF GEOPRIV working group geospatial location Internet draft (defined above). Default value is an empty String.

Defined In: Termination State Descriptor

Characteristics: Read only

1g Source of Civil Location information
PropertyID: locsrc (0x0007)

Description: Identifies whether the network or the user provided the civil location information.

Type: Enumeration

Possible Values: Not Applicable (0x0001), Network (0x0002), User (0x0003). Default value is 0x0001. If the civil location (loc) property is present then this property must contain a non-default value.

Defined In: Termination State Descriptor

Characteristics: Read only

1h Civil Location
PropertyID: loc (0x0008)

Description: Reports the civil location of an IP Terminal.

Type: String

Possible Values: Format specified in the IETF GEOPRIV working group civil location Internet draft (defined above). Default value is an empty String.

Defined In: Termination State Descriptor

Characteristics: Read only

89: Functional Description (FN) A00003571

89.1 Feature name

MG9000 Cards Support A00003571 (ITP, ITX, ABI, SCO)

89.2 Description

This activity supports the release of the following PECCODEs for ITP, ITX, ABI and SCO cards in the MG9000EM:

- Internet Telephony Processor (ITP): NTNY30CA (IP & AAL1 modes)
- Internet Telephony Extender (ITX): NTNY41BA
- Super Core OC3 (SCO): NTNY45CA
- Access Bridging Interface (ABI): NTNY43BA (IP & AAL1 modes)

The user interface for the ITP, ITX, SCO and ABI are not impacted by this feature.

The new VMG of type ABI-IP is added to the VMG provisioning creation. The areas for ‘Silence Suppression (VoIP)’ and ‘QoS Threshold (VoIP Only)’ will be un-gray for this new VMG type (same configuration rules as the current ITP-IP VMG type).

A new field ‘Bearer Address’ will be added in the GW Config pannel. This field will be editable for ABI-IP Vmg type and it will be gray out for all other VMG types but it will display the same IP address use in the CIPOA Address field.

The ‘CIPOA Address’ label will be renamed ‘Signalling Address’.

The OVLD alarm and logs format are used to report the failures of the ‘Stream Control Transmission Protocol’ (SCTP) reported by the ABI.

The MG9000 is reporting SCTP Operational measurementes via a OM collector interface (please refer to A00003767 ‘IP ABI PPVM ROBUSTNESS & MSG LOSS’ for more infromation on OM fields an data collected).

89.3 Hardware Requirements or Dependencies

This activity supports the following new card releases:

— Internet Telephony Processor (ITP): NTNY30CA (IP & AAL1 modes)

— Internet Telephony Extender (ITX): NTNY41BA

— Super Core OC3 (SCO): NTNY45CA

— Access Bridging Interface (ABI): NTNY43BA (IP & AAL1 modes)

89.4 Software Requirements or Dependencies

This activity is released in SN07 MG9000 Element manager and has the correspondent SN07 MG9000 gateway release features:

— A00004109: CALLP CHANGES TO SUPPORT NEW ITP

— A00003767: IP ABI PPVM ROBUSTNESS & MSG LOSS

— A00003729: IP ABI CALLP AND CONNECTIONS

89.5 Limitations and restrictions

The new release of ITP and ABI cards are ONLY supported in the SN07 or higher release for MG9000EM and MG9000.

Due to the change of MIBs the fields in the ‘Silence Suppression (VoIP Only)’ area: Voice *Activity Detection Mode* and *Confort Noise Generator Mode,* for upgrades to SN07 the values VAD and CNG in the MG9000EM will be downloaded to the GW after the NE audit has completed. Before the audit is executed the GW will have the defaults values.

90: Functional Description (FN) A00003576

90.1 Feature name

SN07: Trunk Security

90.2 Description

This feature enables the IP Security (IPSec) capability for the following GWC trunking profiles:

— TRUNKNA

— TRUNKINTL

The IPSec provisioning GUI is modified/enhanced as follows::

— in the “IPSec Profile” panel, the “SA renew thresh” field (which was previously expressed as a percentage of SA lifetime) is changed to “Grace Period (seconds)”.

— a “Comment” field is added to the “Connection Policy” panel. When a connection policy is added, the user can enter descriptive comments in the “Comment” field. These descriptive comments provide an extra level of detail or history regarding that specific connection policy.

— the option to enter the Kerberos service key in hexadecimal format, as well as the currently supported PEM format.

— showing (1) the Kerberos panel and (2) the "KERBEROS" option in the “IPSec Profile” panel “Key Negotiation” field, only if the Kerberos capability is included for that GWC profile.

The IPSec portion of the Gateway Controller on-line help panels are enabled.

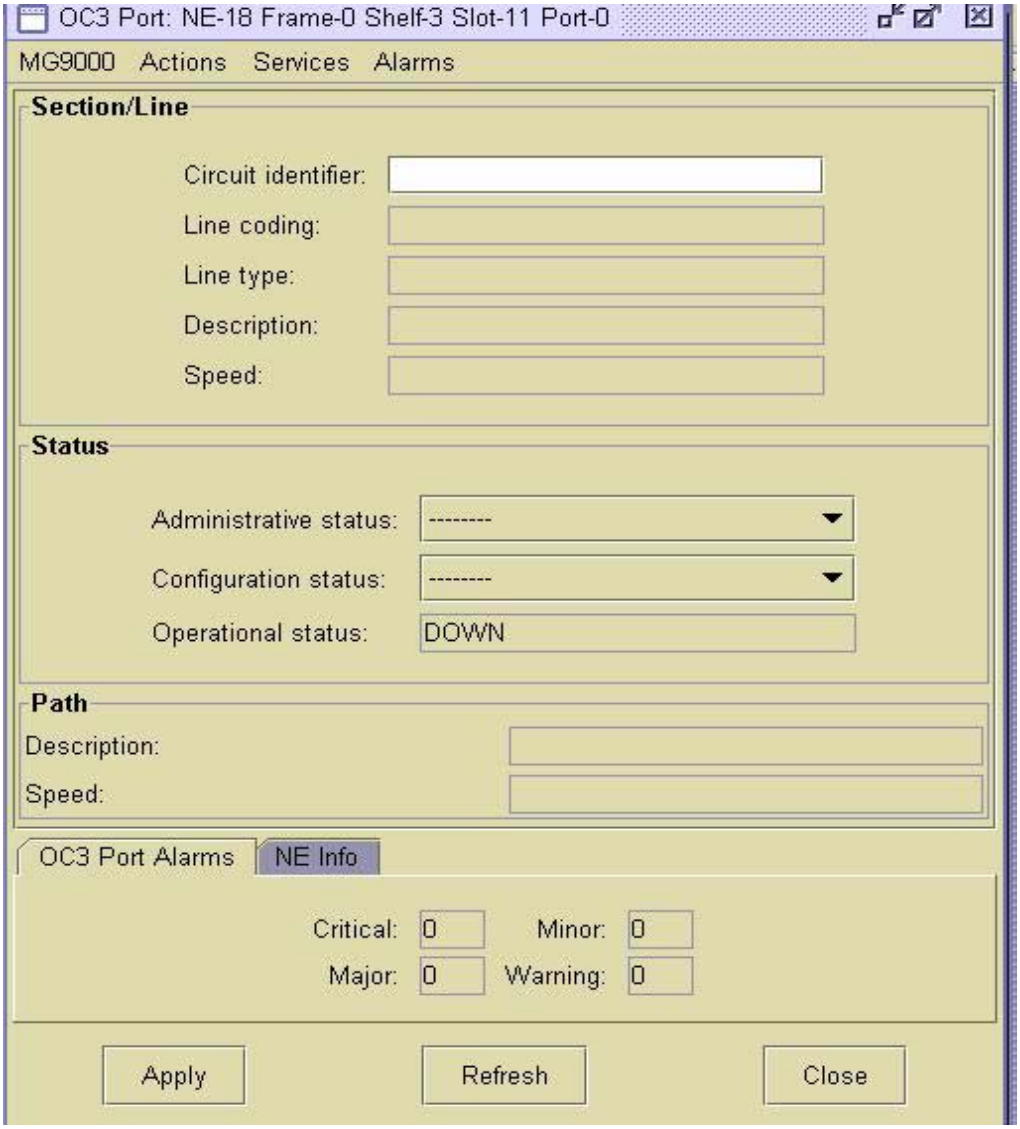
91: Functional Description (FN) A00003591

91.1 Feature name

ActId A00003591 MG9000 OC3 Channelization support from EM.



a. Refer to Actid A00003604 MG9000-OC3 Carrier OAM&P for channelized OC3 carrier.

91.2 Description

This feature enables the user to view and modify (only the administrative and configuration status can be modified) the channelized carrier(OC3) configuration . This document discusses the changes in EM for this feature from user perspective.

91.3 Hardware Requirements or Dependencies

No new requirements. This product runs on the same hardware as the existing MG9k Element Manager application.

91.4 Software Requirements or Dependencies

No new requirements. This activity is packaged with the existing MG9k EM software application.

This feature will be shipped as part of the SN07 stream for the MG9k EM.

91.5 Limitations and restrictions

None

91.6 Interactions

This feature introduces new screens and modifications to the existing GUI

91.6.1 Carrier configuration Display

The screen remains unchanged for concatenated sonet and SDH carrier. Figure 1 shows the carrier configuration details for the concatenated sonet carrier

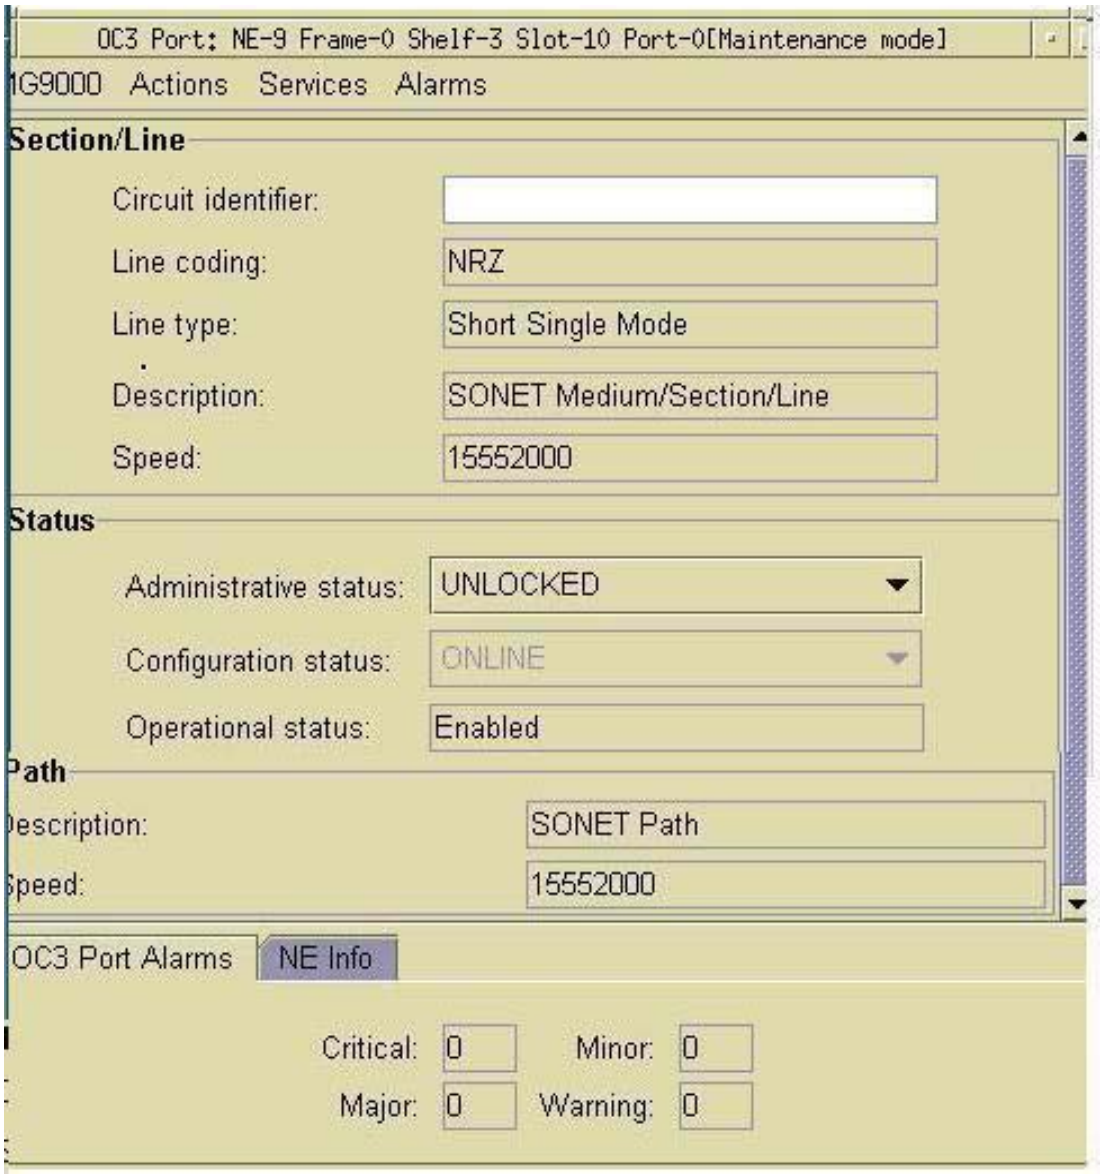


Figure 1 : OC3c Carrier details

If the carrier is in 'channelized mode', clicking on the OC3 Port icon in the OC3 card view will display the screen as shown in the figure 2. This new screen shows totally three icons for STS1 path details. By default OC3 section/ Line description/status is displayed in a tab as shown in figure 2. Double clicking on the STS1 path will display STS1 path information and its status as shown in the figure 3.The user will be able to lock/unlock and online/offline the OC3 section/Line and all the 3 STS1 paths individually.

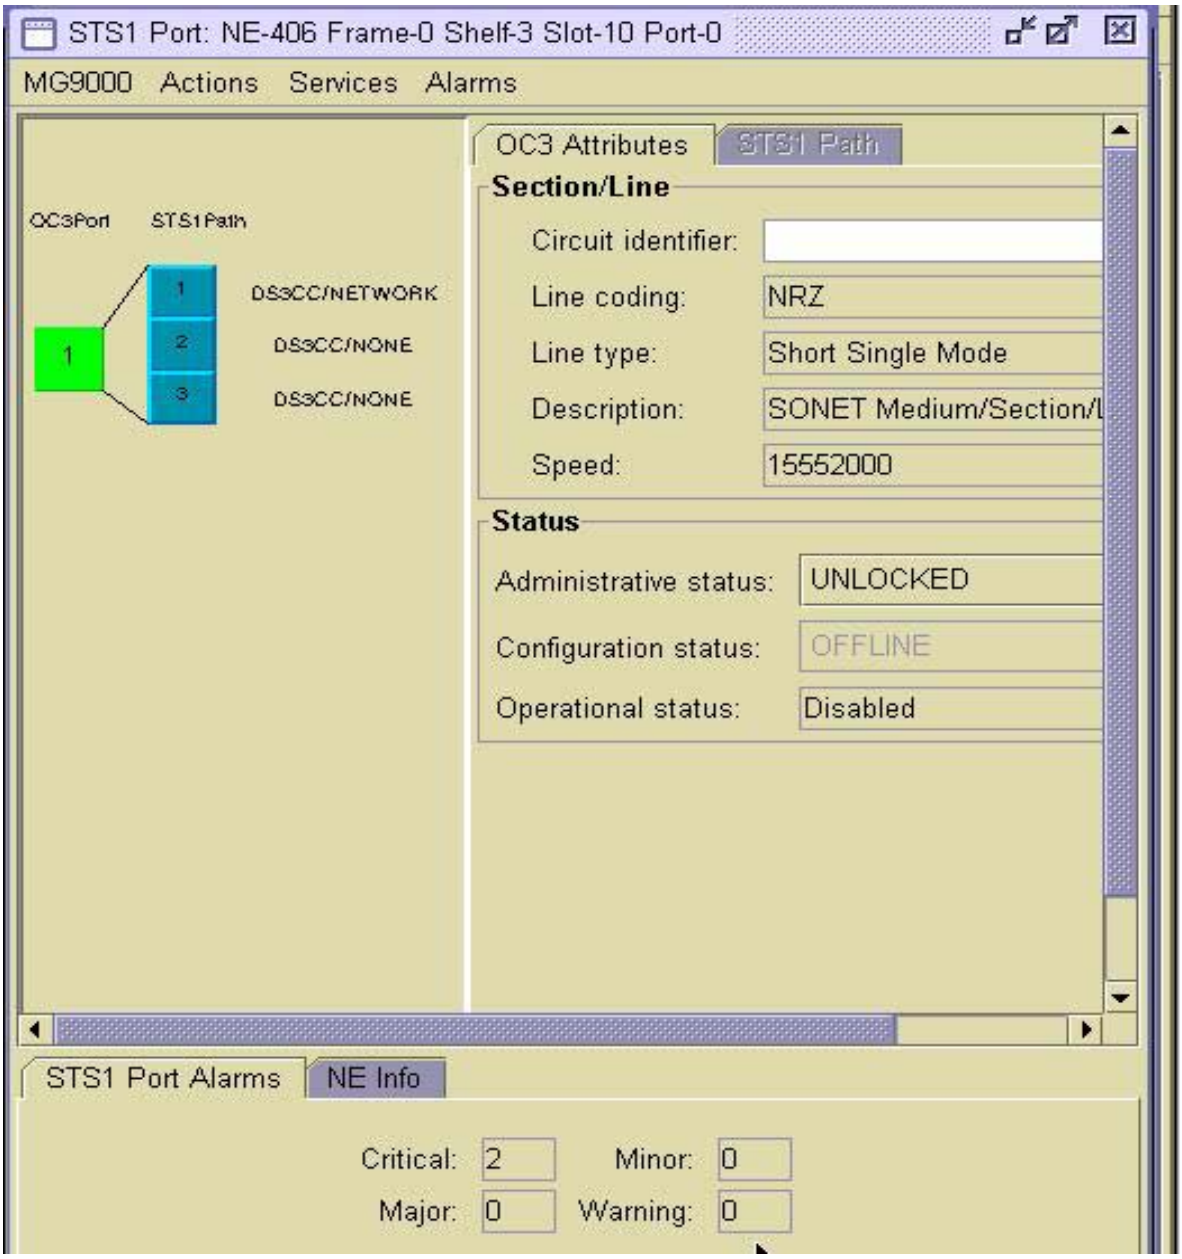

Figure 2 : Section/Line Configuration details for channelized carrier

The label next to the STS1 paths help the user to identify the network carrier and the payload on the paths. The payloads can be STS1, DS3CC and DS3PLCP. If the payload is DS3PLCP, f or network carrier the label would be DS3PLCP/NETWORK and for inactive carrier it would be DS3PLCP/NONE.

The OC3 Section/Line can be locked only after locking all the 3 STS1 paths.When the user tries to lock OC3Section/Line, a warning message “The Network Path should be locked before locking OC3 Section/Line. Are you sure the network path is locked?” will be popped up to the user. If the network path is not locked, the user can cancel OC3Section/Line lock request and lock the network path, then attempt locking OC3Section/Line

For unlocking Network Carrier, the OC3 Section/Line should be unlocked first. When the user tries to unlock the network path, a warning message ”The OC3Section/Line should be unlocked before unlocking the network path. Are you sure the OC3Section/Line is unlocked?” will be displayed to the user. If the OC3Section/Line is not unlocked, the user can cancel network path unlock request and unlock theOC3Section/Line, then attempt unlocking network path

A non-network carrier can not be unlocked.

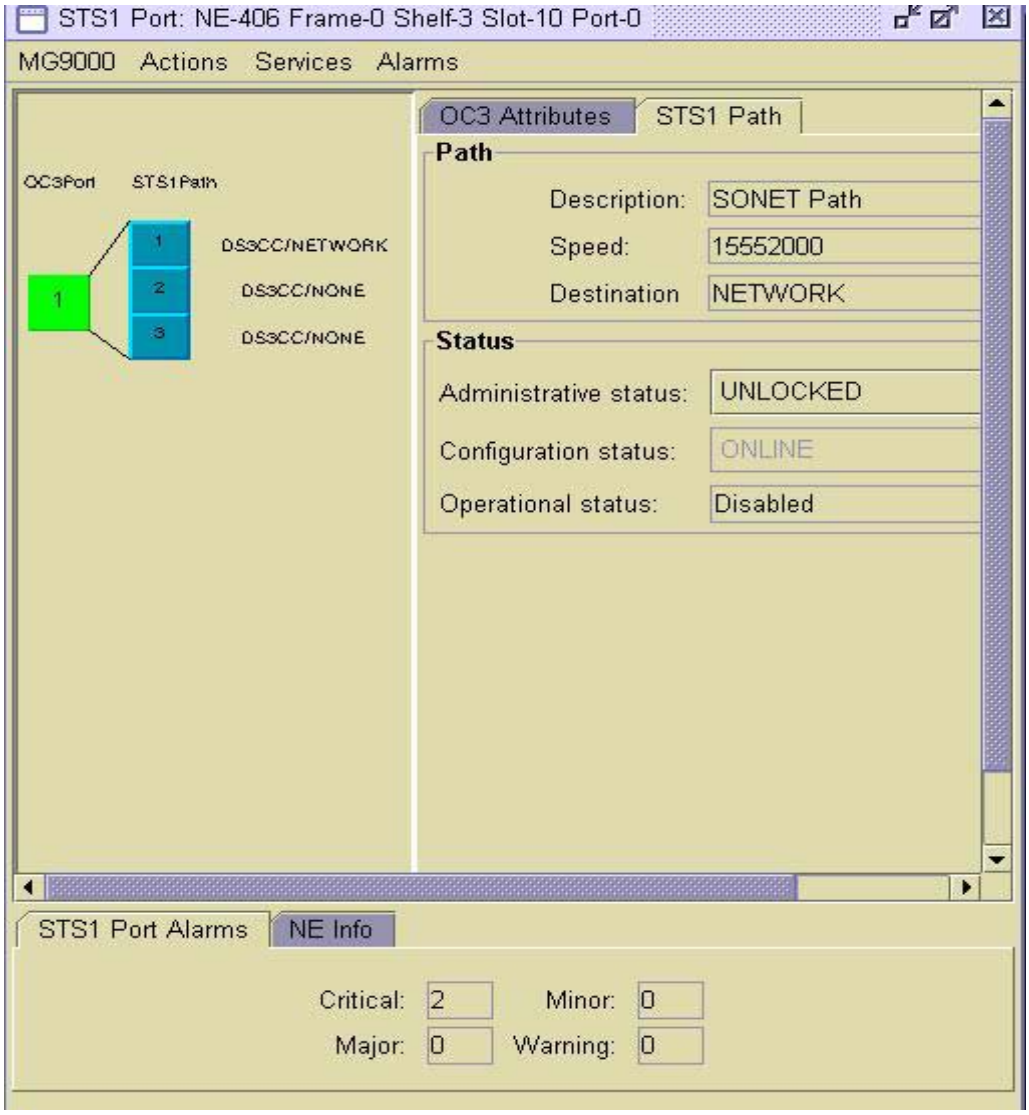

Figure 3 :STS1 path description and status

Figure 4 Default screen if the carrier is not provisioned.

91.6.2 Performance Parameters

If the carrier is configured in concatenated mode (Sonet or SDH), there is no change in the performance parameter screen.

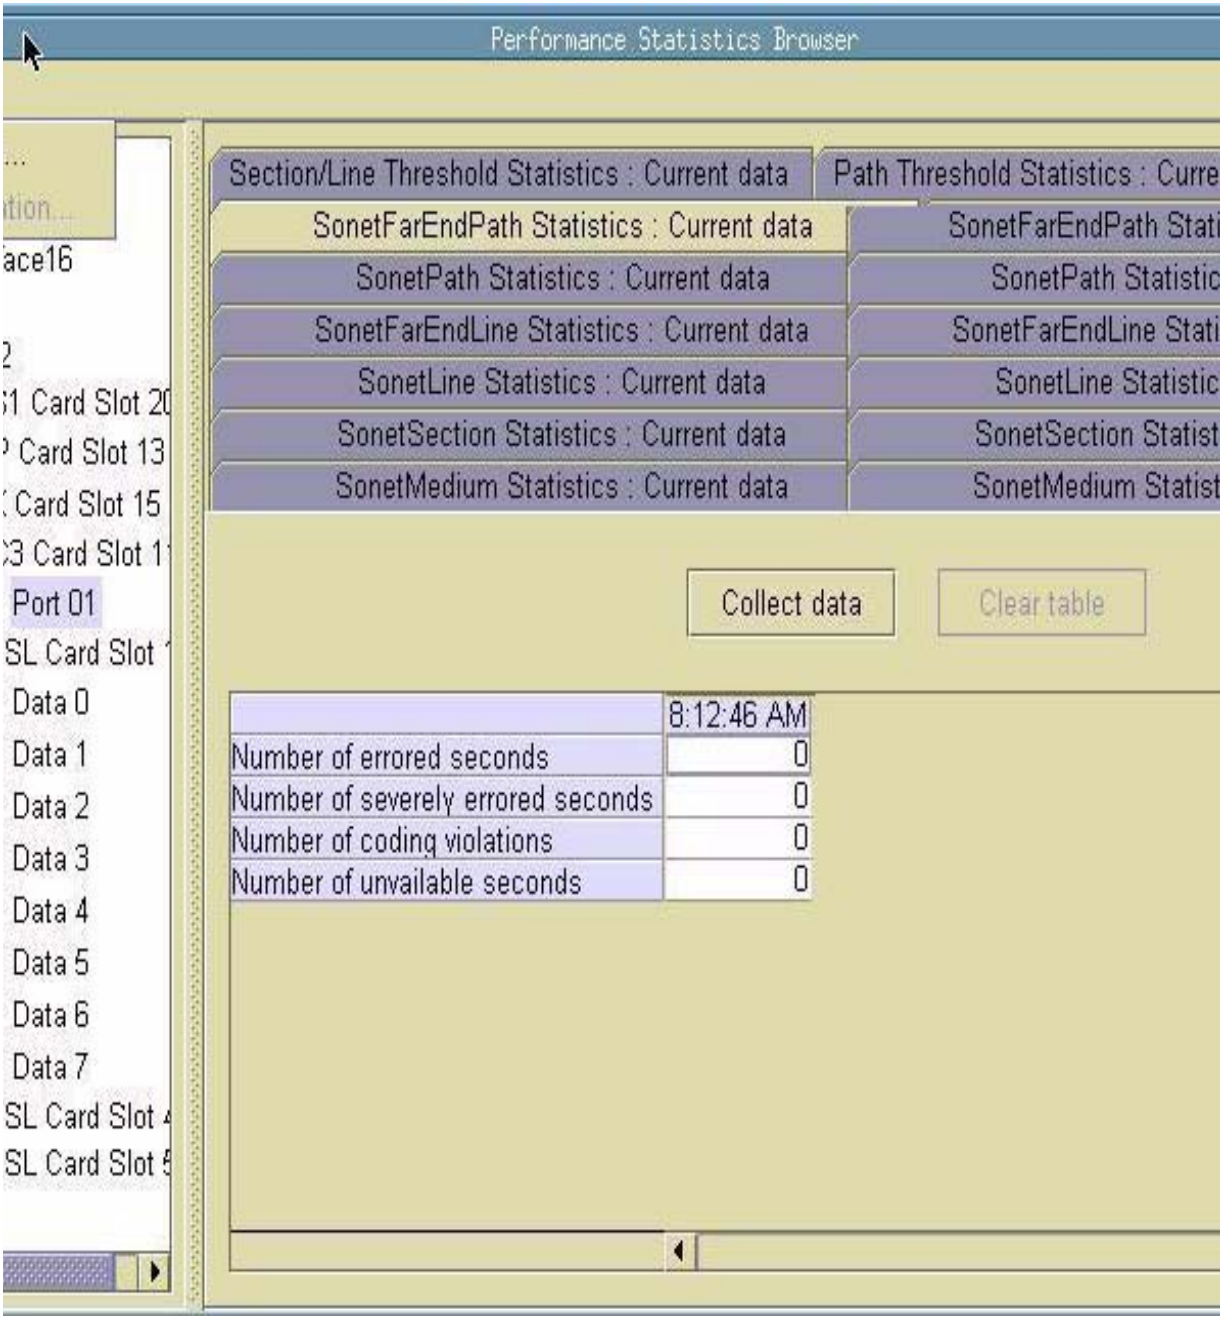

Figure 5: OC3 section/Line , STS3 path peformance parameters

If the carrier is in channelized mode, clicking on OC3 port will display OC3 section/Line information. Three STS1 subnodes will be displayed below Port for STS1 information. Clicking on each of STS1 will display its path performance details. DS3 path performance parameters will be displayed if DS3 is payload is supported on STS1.If the payload is STS1 the nodes label will be STS1-0x and if DS3 payload is selected on the STS1 path the nodes label will be STS1-DS3-0x.

The OC3 channelization feature supports new DS3 - Mibs. The DS3 statistics will be displayed in the performance browser only when the payload selected is DS3Clearchannel(DS3CC) or DS3PLCP for a channelized carrier

The new PMs are DS3Path(Current and history data) and DS3FarEndPath(Current and History data).

The DS3Path PM has the following data

"P - bit number of errored seconds,P - bit number of severely errored seconds,Severely errored seconds,Number of unavailable seconds,P - bit number of coding violations,C - bit number of coding violations, C - bit number of errored seconds,C - bit number of severely errored seconds " .

The DS3FarEndPath PM has

"Number of errored seconds,Number of severely errored seconds,Number of coding violations and Number of unvailable seconds".

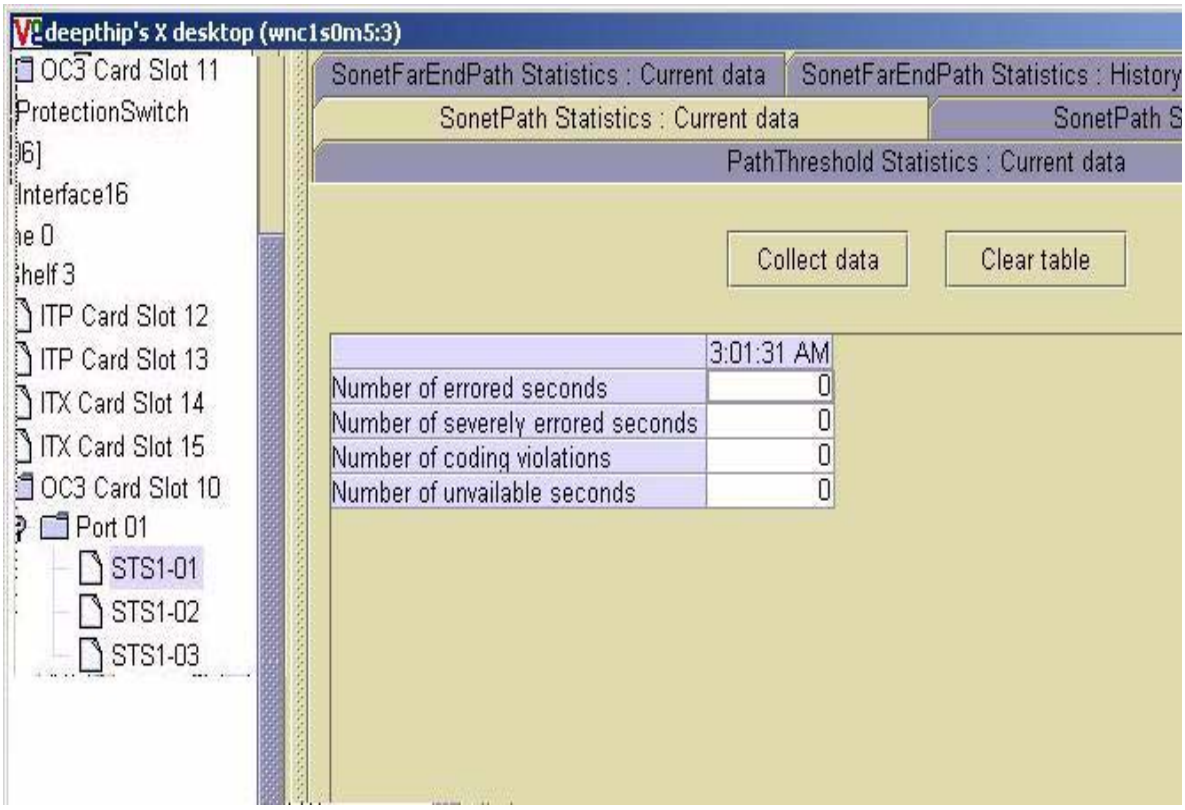

Figure 6 : STS1 Path performance parameters

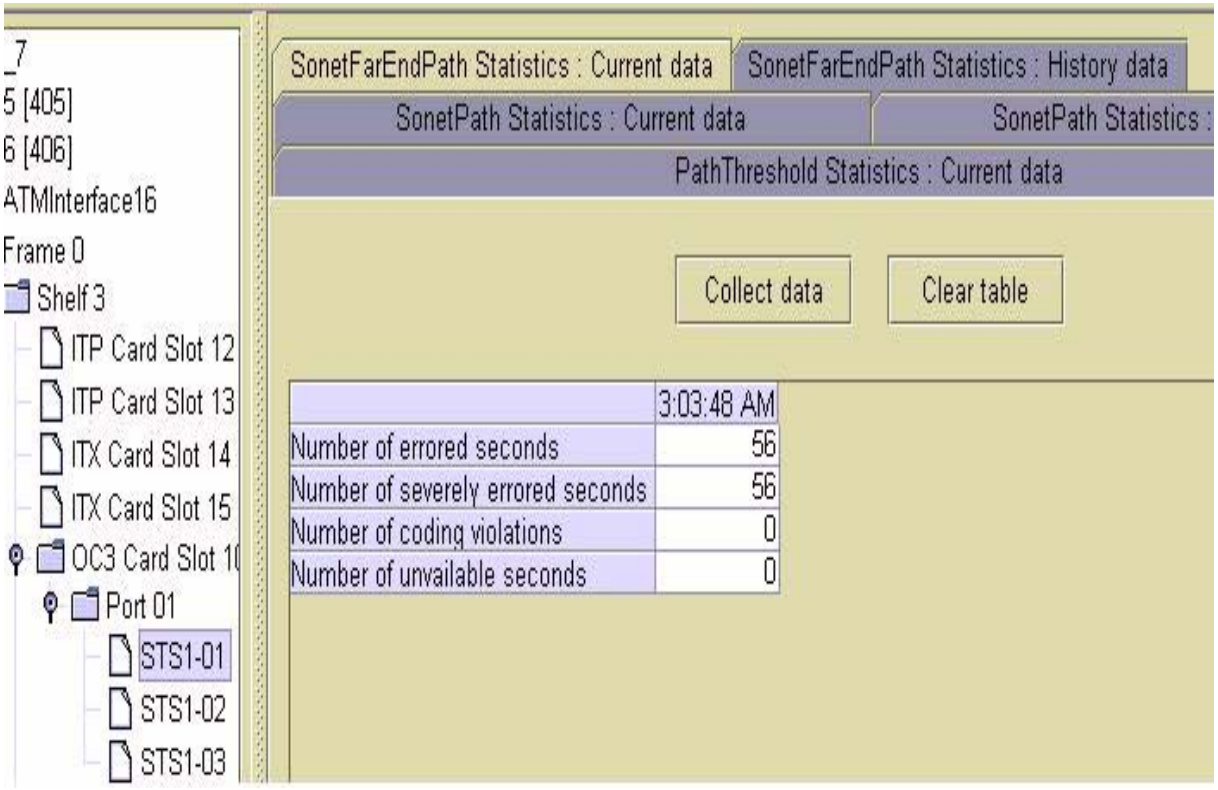

Figure 7. STS1FarEndPath Statistics

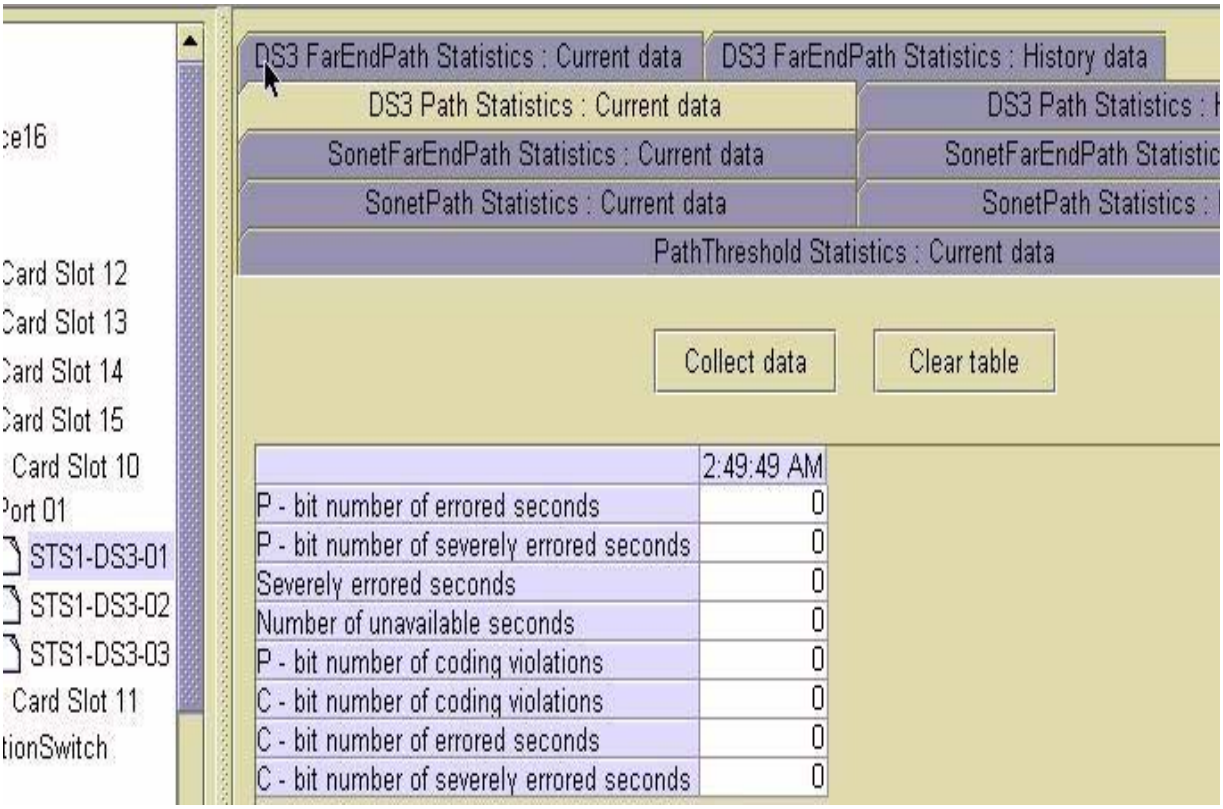

Figure 8: DS3 Path Performance parameters

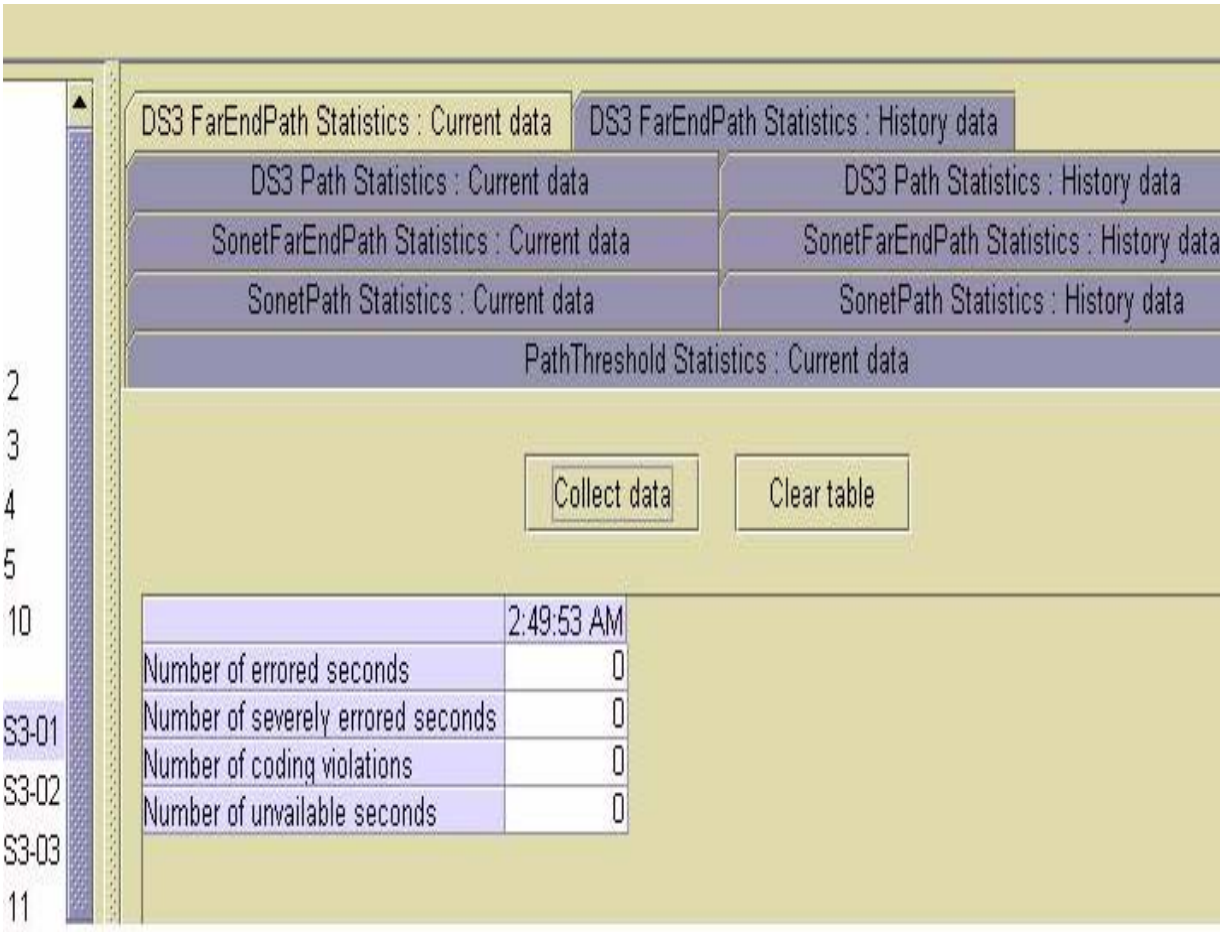

Figure 9: DS3 FarEndPath performance parameters

91.6.3 STS1 and DS3 alarms

From the user perspective, the alarm display will not change.The alarms will be raised for both STS1 path and DS3 payload.Now the STS1 path and DS3 alarms will be included in the OC3 port alarm count.The DS3 alarms to expect at EM will be LOF,RAI and AIS. The alarm description will let the user know whether the alarm belongs to DS3 or STS1.

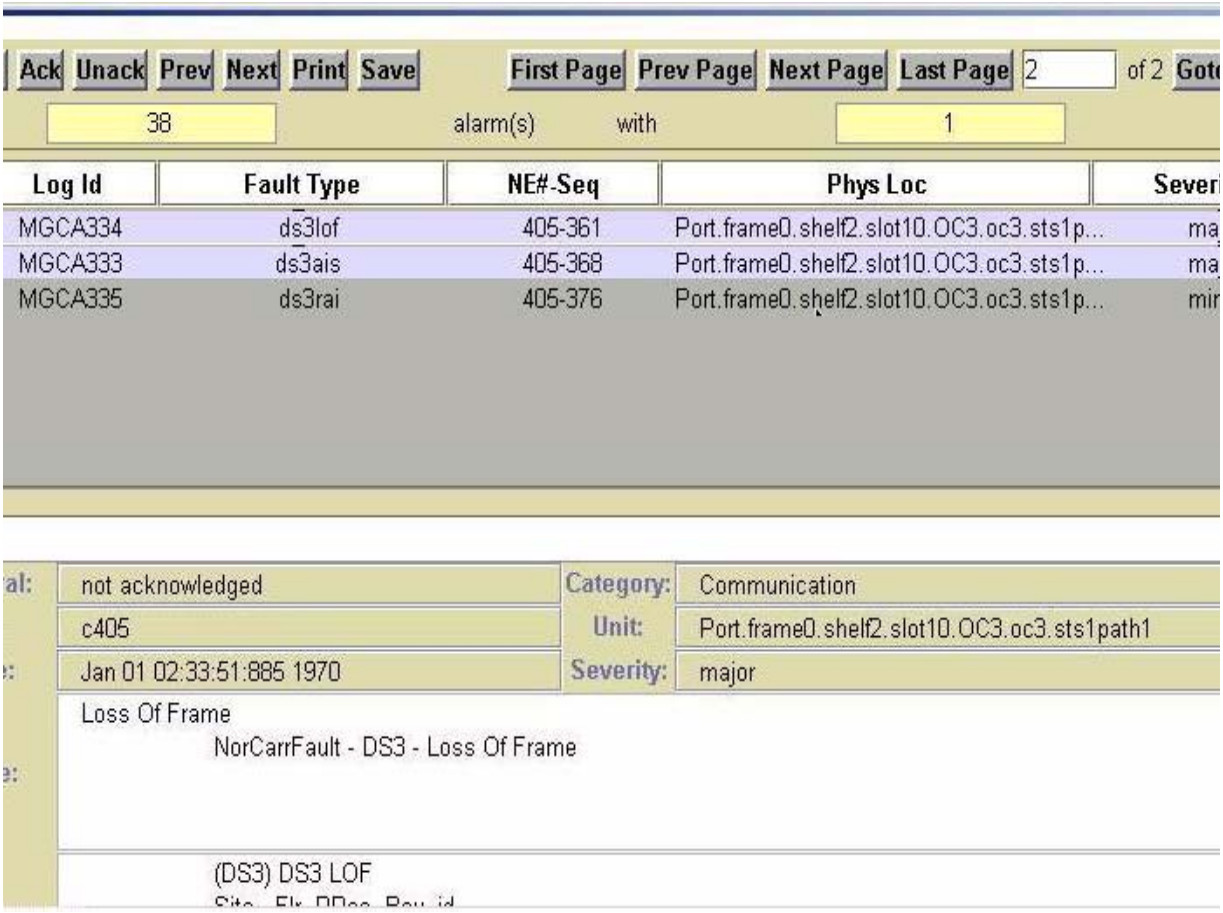

Figure 10: DS3 Alarm information

91.6.4 Upgrade and Downgrade

The user should not try downgrading the MG9K when the carrier is channelized The MG9K in SN07 has new hardware to support channelization, so SN06.2 and below load should not be used on this MG9k. If a SN06.2 MG9K has to be upgraded to SN07, it should have the new hardware.

91.7 Error scenarios

The SNMP set errors will be handled.

91.8 Glossary

STS1 Synchronous Transport Signal Level 1

STS3	Synchronous Transport Signal Level 3
EM	Element Manager
DS3	Digital Signal Type 3
OC3c	Concatenated carrier
OC3	Channelized carrier.
LOF	Loss Of Frame
RAI	Remote Alarm Indication
AIS	Alarm Indication Signal

92: Functional Description (FN): A00003604

92.1 Feature name

OC3 Channelized Support.

92.2 Description

This new feature will allow the user to provision the carrier (only for SONET and not for SDH) in “Channelized” mode in addition to the previously existing functionality.

92.3 Carrier Provisioning Page

This page is used by the user for provisioning the carrier. It is invoked by selecting the DCC card and clicking on the “Carrier à Provisioning” option listed in the Menu. A message “Please select Signal Type and Payload Width for Provisioning the carrier” is displayed to the user.

This page is divided in two sections. Section one contains “Signal Type”, “Payload Width”, “Host Name”, “Line Coding”, “Line Type”, “Query” button and “Submit” button. And the second section contains the details about the STS1 paths.

Initially, the page comes up with only the first section. Only the “Signal Type” field in this section is enabled. Figure 1and Figure 2 show the Carrier Provisioning page with only the first section. Figure 3shows the Carrier Provisioning page with both the sections.

The “Query” button remains enabled always.

92.3.1 SDH Signal Type

If the user selects SDH as the “Signal Type”, the “Payload Width” will contain only STM1 value. The user in this case has to only give a proper “Host Name” and click on the “SUBMIT” button. For this case the second section will not be shown to the user.

Figure 1 shows the screen shot when SDH is selected as “Signal Type”.

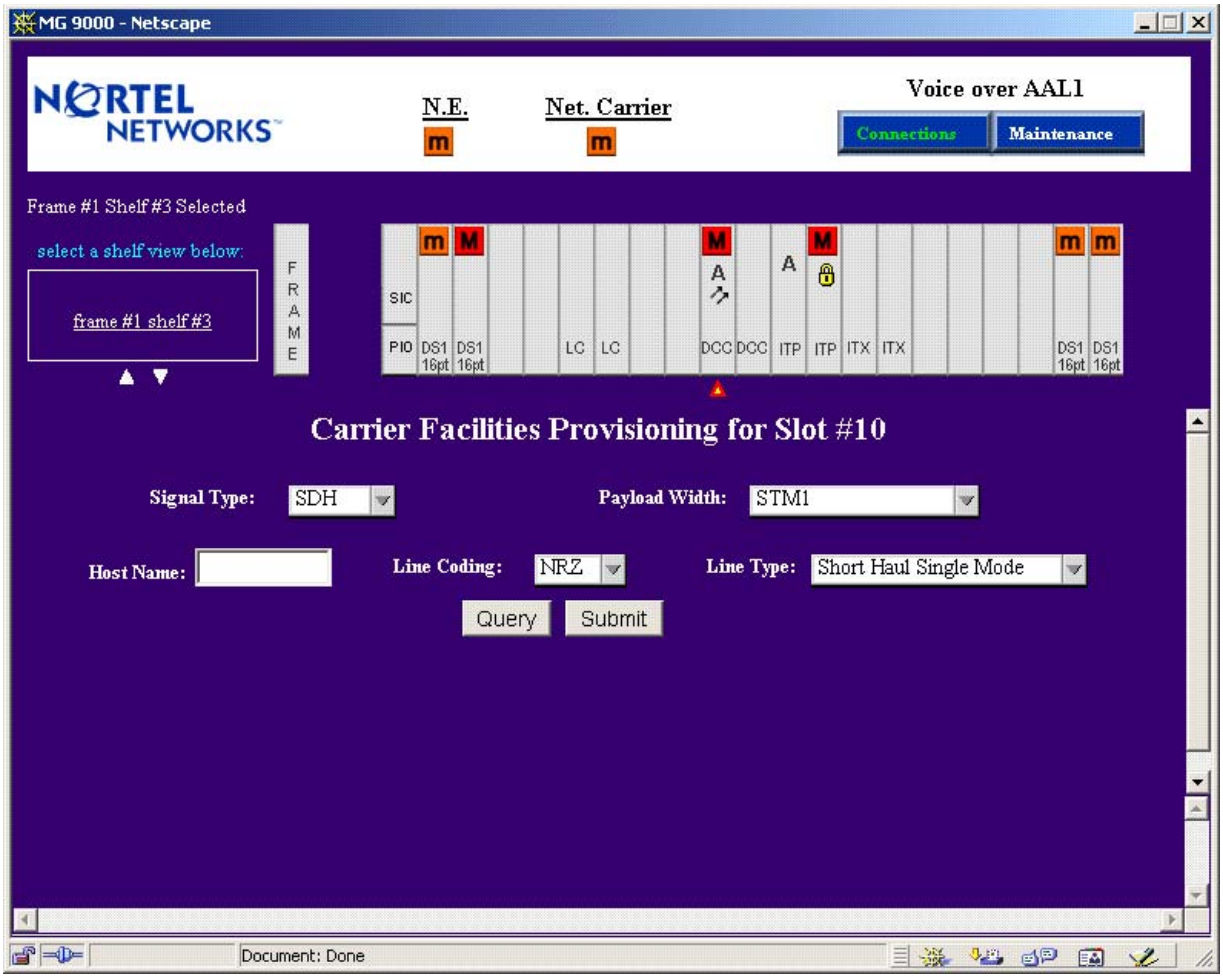

Figure 1 Carrier Provisioning Screen having "Signal Type" as "SDH"

92.3.1.1 SONET Signal Type

If the user selects SONET as the "Signal Type", the "Payload Width" list box will be enabled with "-------" as the default value and "OC3 Concatenated", "OC3" the other values.

92.3.1.1.1 OC3 Concatenated Payload Width

On selecting "OC3 Concatenated", the user has to only give a proper "Host Name" and click on the "SUBMIT" button. For this case the second section will not be shown to the user. Figure 2 shows the screen shot when "OC3 Concatenated" is selected as the "Payload Width".

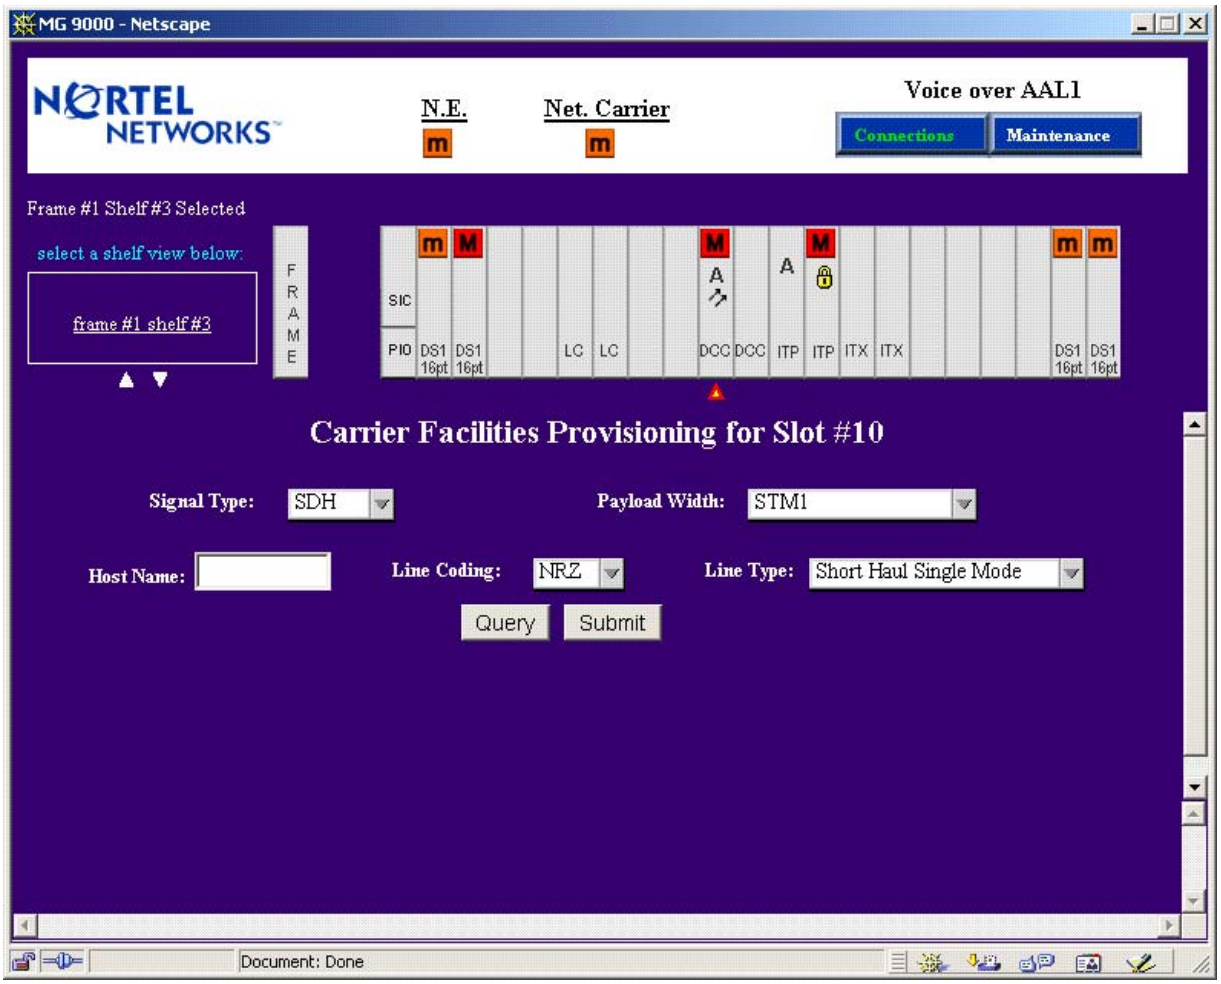

Figure 2 Carrier Provision Screen having "Payload Width" as "OC3 Concatenated"

92.3.1.1.2 OC3 Payload Width

On selecting "OC3" as the "Payload Width", the second section is shown to the user. The "SUBMIT" button of the first section still remains disabled only on IE5.5. For the other browsers, click on this SUBMIT button gives a message saying – 'Submit the path details by clicking the submit button against the path'.

The STS1-1 path of the second section will have the default values of "Payload" and "Destination" as "Ds3clearChannel" and "NETWORK" respectively. The other STS1 paths will have the default values of "Payload" and "Destination" as "Ds3ClearChannel" and "NONE" respectively.

After entering a valid "Host Name", the user has to click on any one of the "SUBMIT" buttons in second section.

If the LCI user selects “sts1” option under the “Payload” list box and clicks on the corresponding “SUMBIT” button, then the carrier will not carry any DS3 Payload though it will be configured in “OC3” mode.

If the user wishes to designate another STS1 path as "Network", then the existing "Network" STS1 path must be changed to "None". After this, the user may choose a different "Network" carrier. An error message “Only one STS1 Path may be designated as a Network carrier” is displayed for this case. Figure 3 shows the screen shot when OC3 is selected as “Payload Width”.

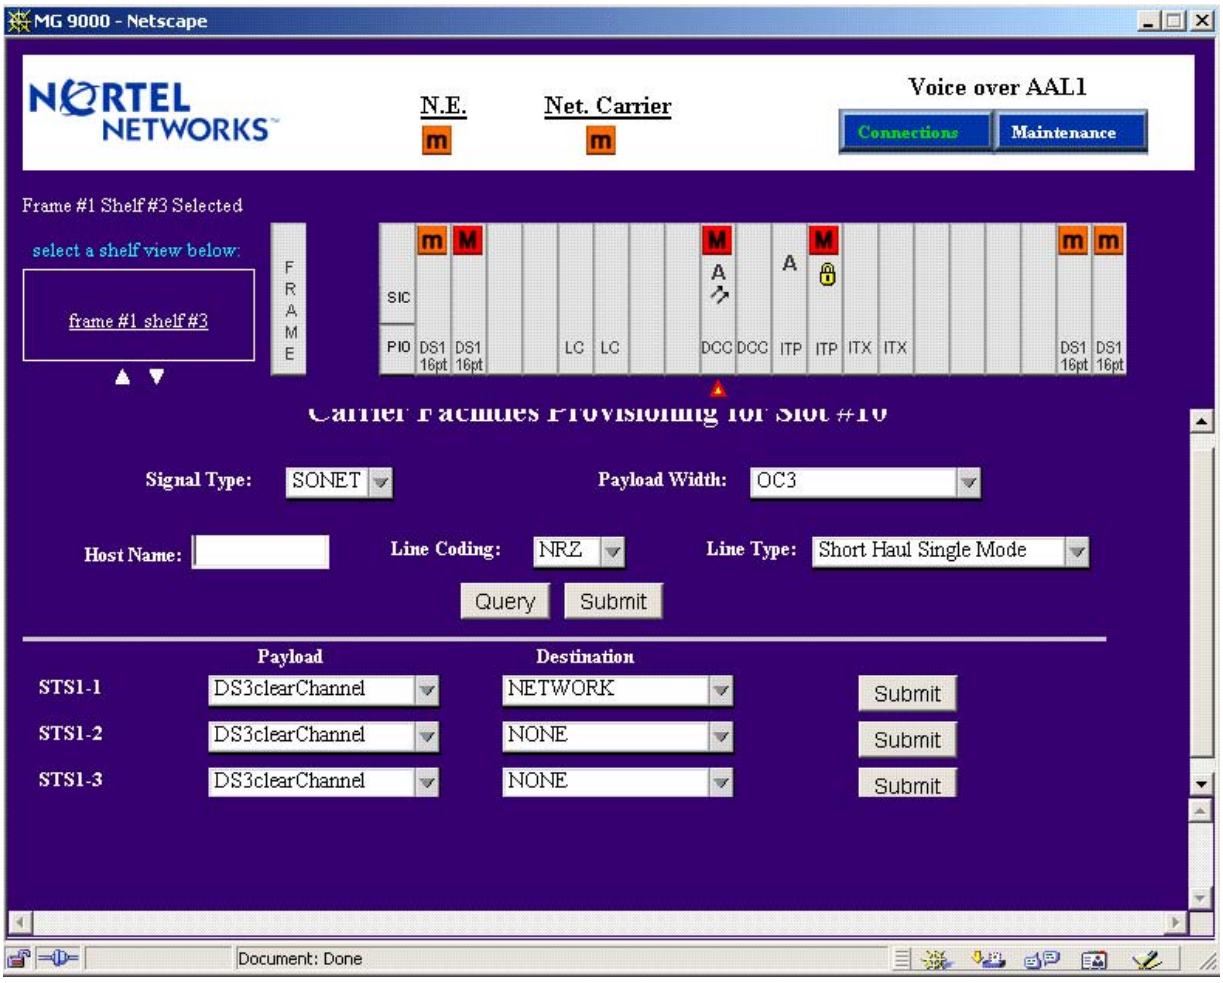

Figure 3 Carrier Provision Screen having “Payload Width” as “OC3”

92.3.2 Carrier Controls Page

This page is used by the user for locking/unlocking the carrier. It is invoked by selecting the DCC card and clicking on the “Carrier à Controls” option listed in the Menu.

92.3.2.1 Carrier provisioned in “SDH” and “OC3 Concatenated” mode

In this case, the old “Carrier Controls” page is displayed to the user as shown in Figure 4. There is no change in the behavior of this page.

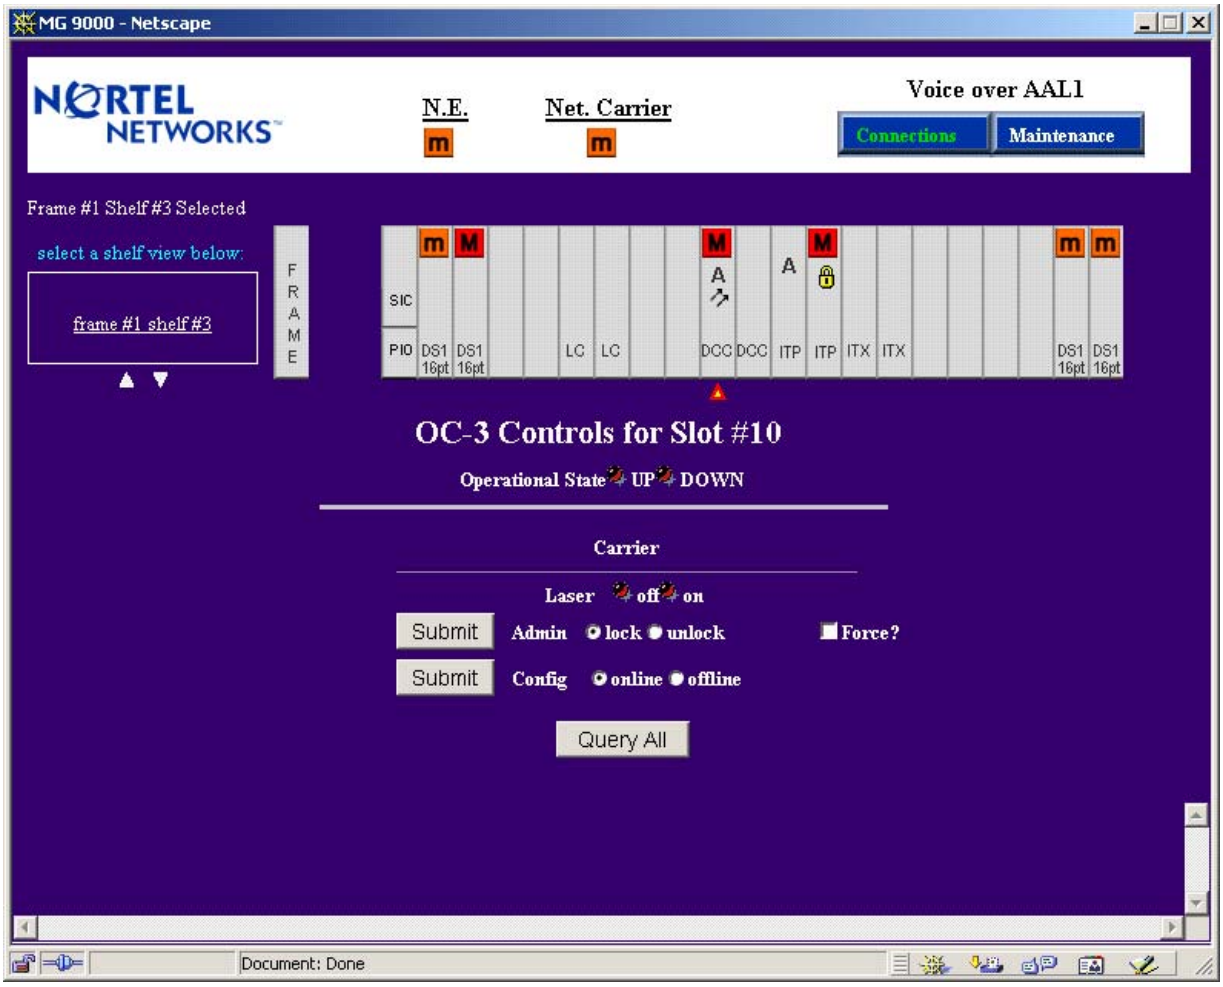

Figure 4 Carrier Controls Screen for SDH and OC3c mode

92.3.2.2 Carrier provisioned in “OC3” mode

In this case an alternative “Carrier Controls” page is displayed to the user as shown in Figure 5.

This page has individual options for locking/unlocking the “OC3 Section/ Line” and the three STS1 paths.

Carrier lock symbol is removed from the DCC card when “OC3 Section/Line” and one of the STS1 paths is unlocked. Under all other conditions, the carrier lock symbol is retained on the DCC card.

Specific error messages are displayed on the active card. The messages guide the user to take appropriate steps while performing any admin/config operations.

Say if the user tries to unlock more than one STS1 paths, then the message “Invalid operation. Only one STS1 Path can be unlocked at any given time” is shown to user.

When the user performs any operations on Controls page, on an inactive card, a general success/failure message is displayed.

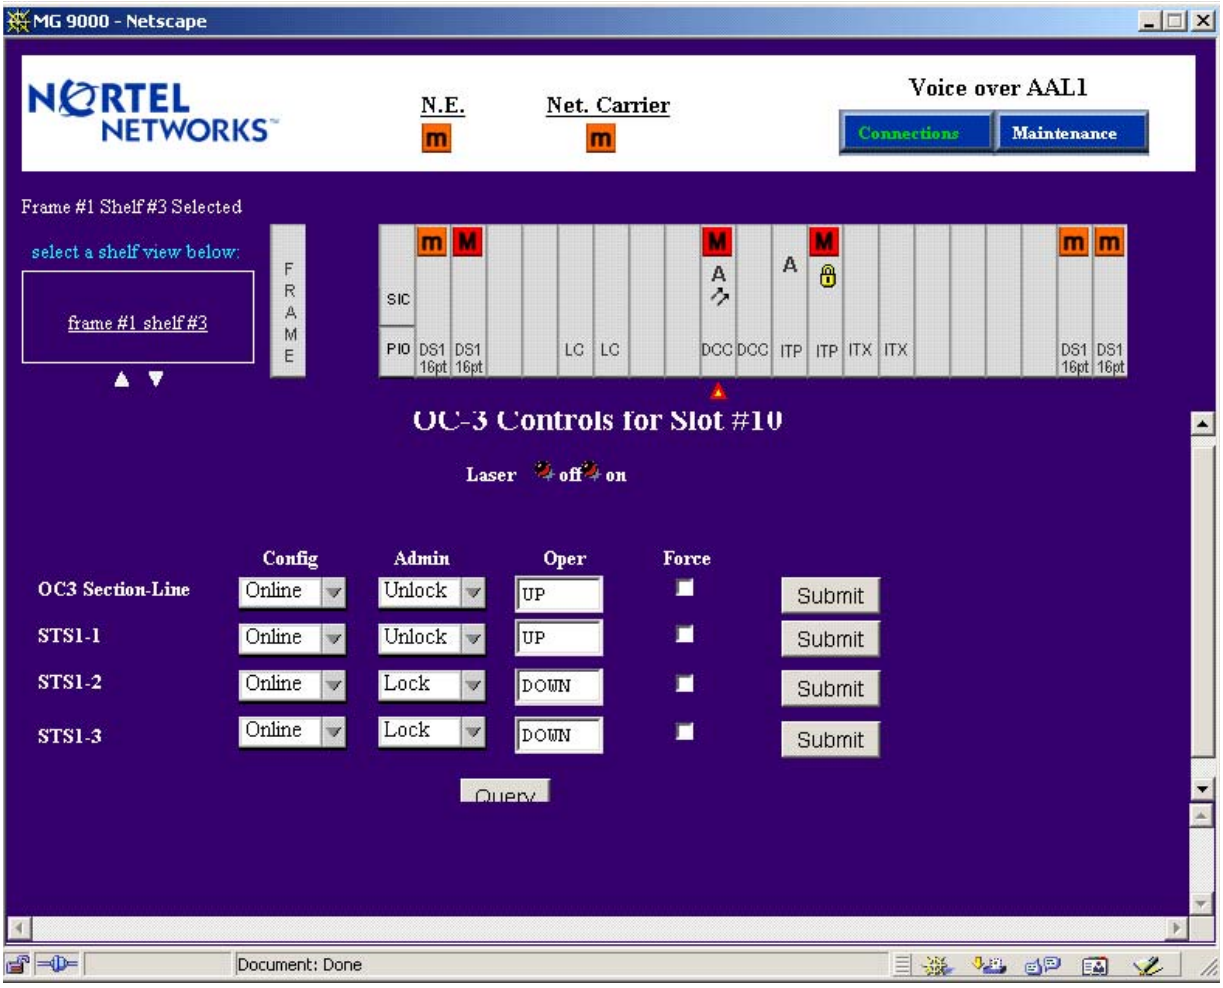

Figure 5 Carrier Controls Screen for OC3 mode

92.3.3 Carrier Status Page

This page is used by the user for viewing the status of the carrier. It is invoked by selecting the DCC card and clicking on the “Carrier à Status” option listed in the Menu.

92.3.3.1 Carrier provisioned in “SDH” and “OC3 Concatenated” mode

In this case, the old “Carrier Status” page is displayed to the user as shown in Figure 6. There is no change in the behavior of this page.

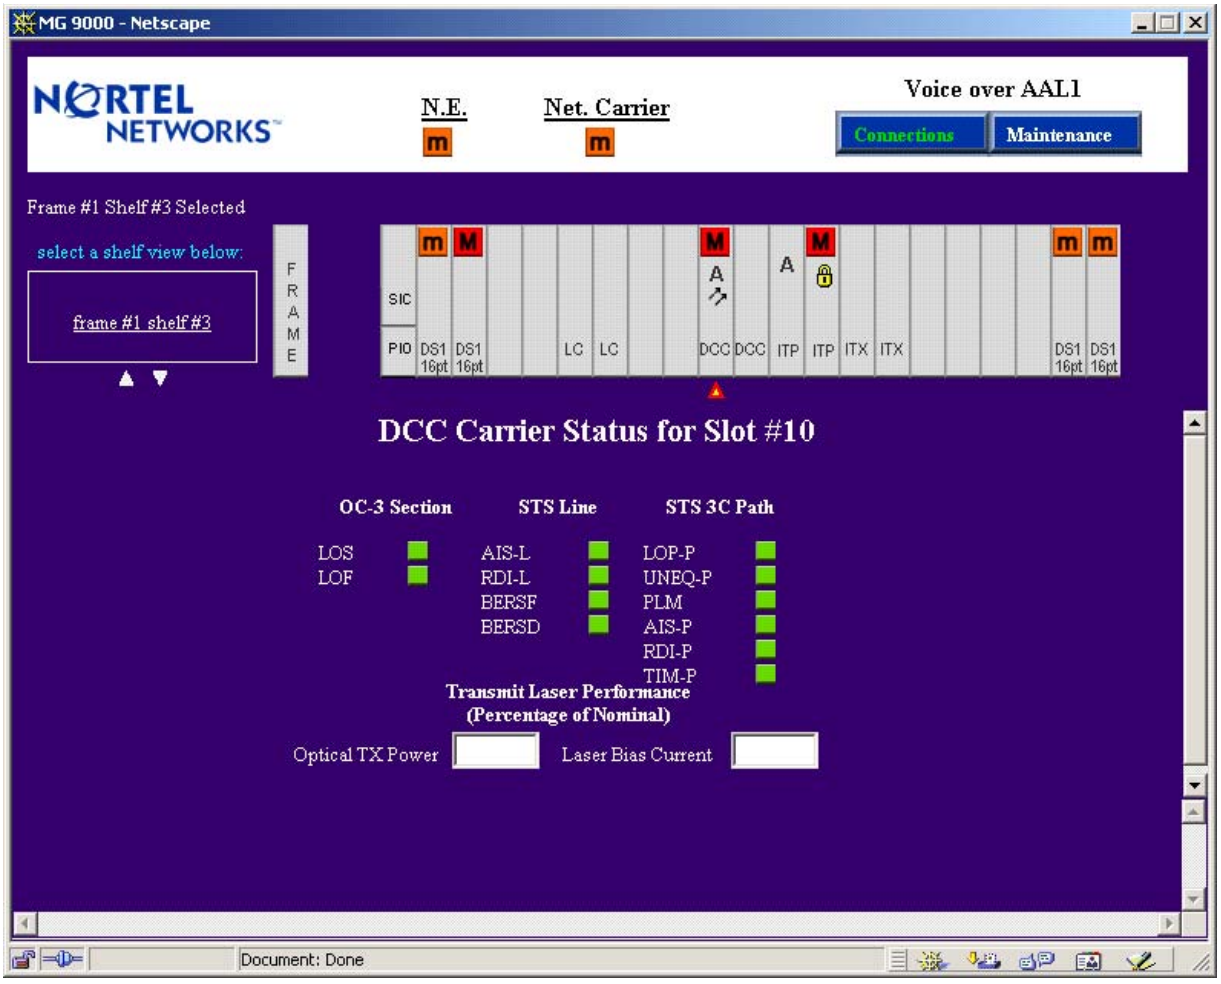

Figure 6 Carrier Status Screen for SDH and OC3c mode

92.3.3.2 Carrier provisioned in “OC3” mode with DS3 Payload

In this case an alternative “Carrier Status” page is displayed to the user as shown in Figure 7. This page will show “OC3 Section”, “STS Line”, 3 STS1 Path and DS3 Path alarms.

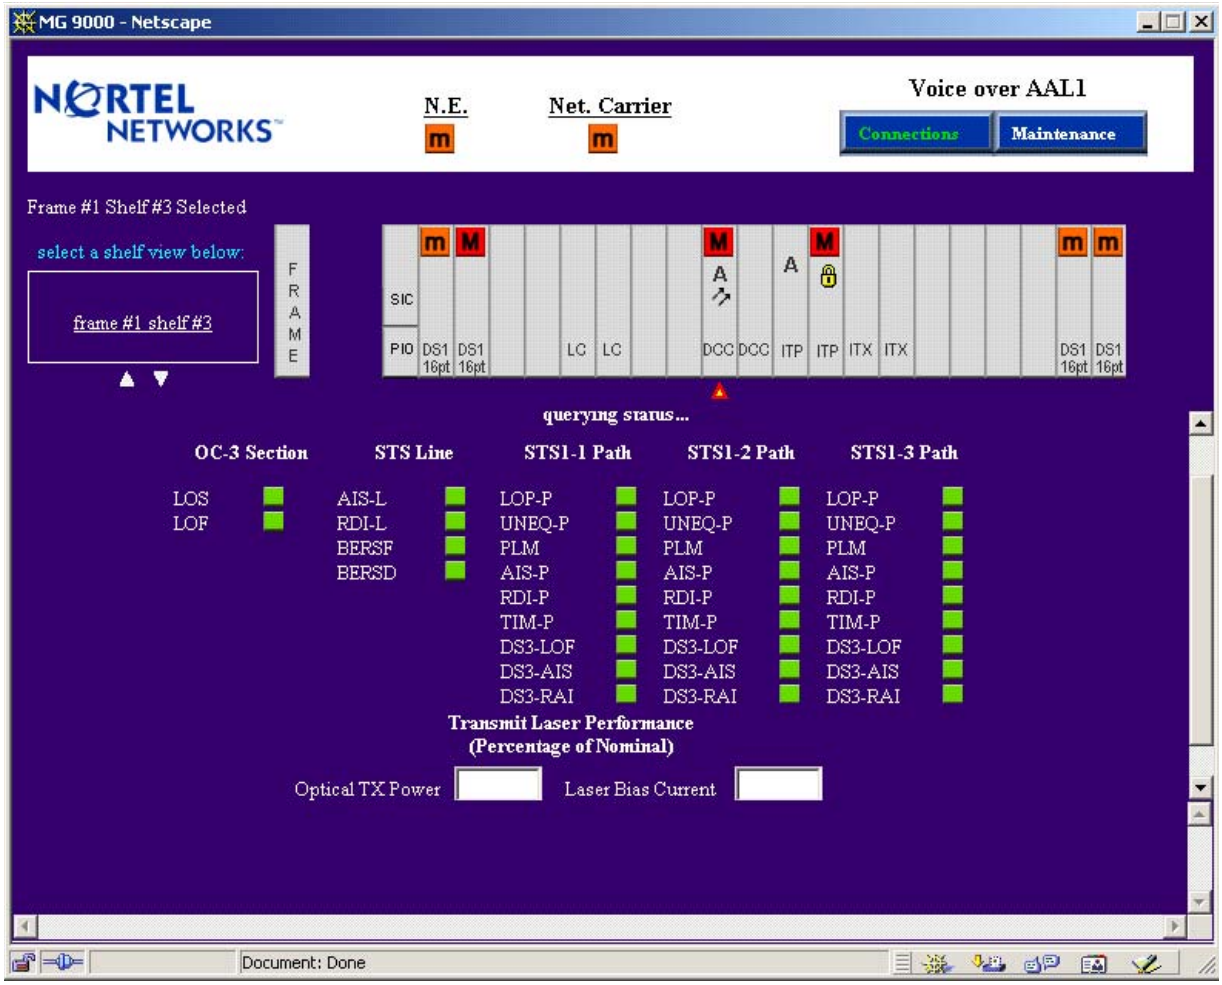

Figure 7 Carrier Status Screen for OC3 mode with DS3 Payload

92.3.3.3 Carrier provisioned in "OC3" mode without DS3 Payload

In this case an alternative "Carrier Status" page is displayed to the user as shown in Figure 8. This page will show "OC3 Section", "STS Line", 3 STS1 Path alarms.

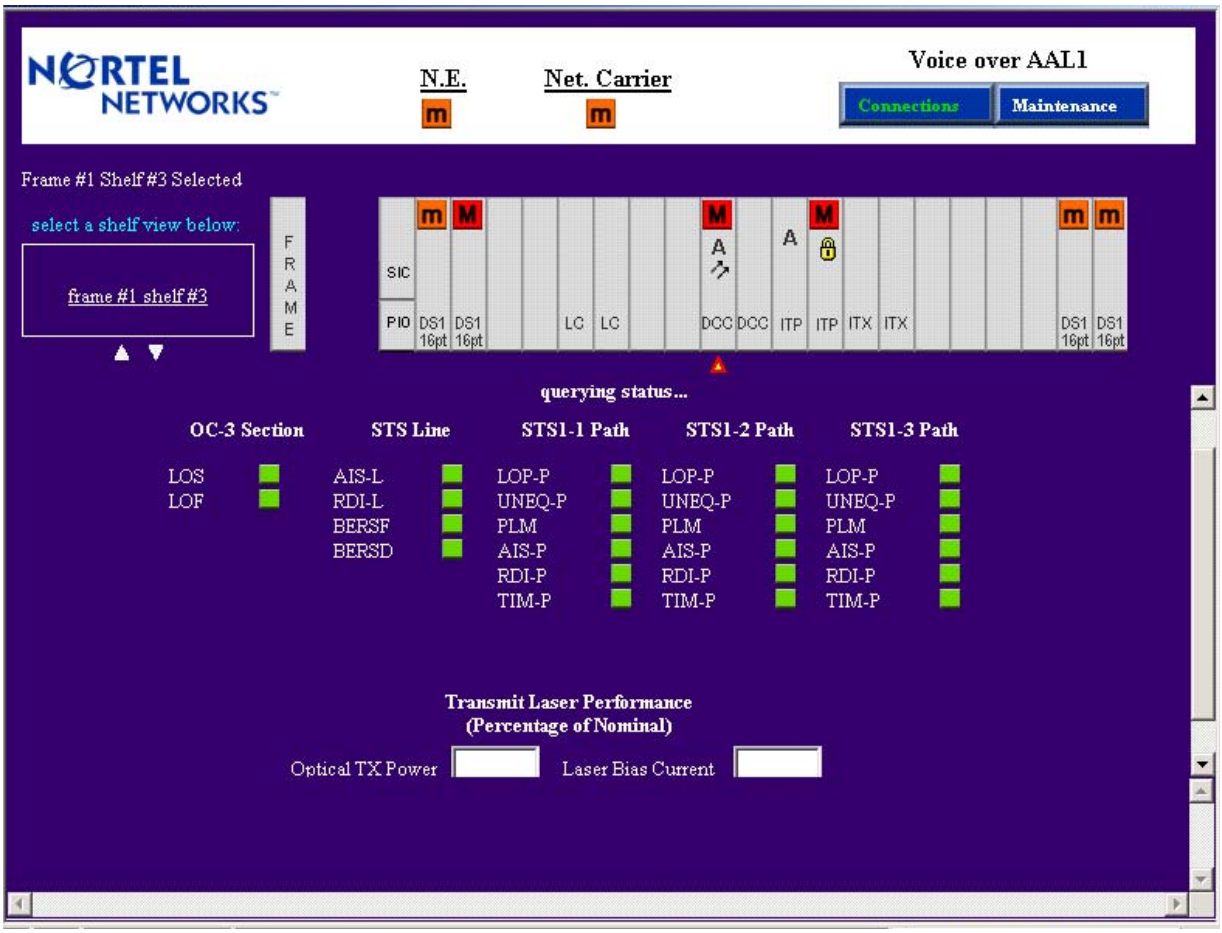

Figure 8 Carrier Status Screen for OC3 mode without DS3 Payload

92.3.4 General

When the LCI user tries to invoke “Carrier Controls” and “Carrier Status” pages prior to provisioning the carrier, a message “Operation cannot be performed as the Carrier is not yet provisioned” is shown.

92.4 Hardware Requirements or Dependencies

There will be no additional hardware requirements introduced as a result of this feature.

92.5 Software Requirements or Dependencies

There will be no additional software requirements introduced as a result of this feature.

92.6 Limitations and restrictions

Upon feature completion, there will not be any visible functional limitations and restrictions on the LCI that may affect the end user.

92.7 Interactions

No change.

93: Functional Description (FN): A00003613

93.1 Feature name and Feature ID

SSPFS: CBM CONFIGURATION PARAMETERS A00003613

93.2 Description

This will add three configuration parameters to the existing SSPFS configuration, which will be configured via the existing “cli” tool:

CM Internet Protocol (IP) Address: The address by which the CM may be reached. This address should be reachable by the SSPFS through VLAN’s, which are defined in the network topology.

Login Greeting: A string that will be displayed to remote telnet users before they attempt to login.

System Location: A string defining the physical location of the SSPFS Server

New menu options for each of these parameters will be added to the existing SSPFS “cli” tool.

93.3 Applicable customer facing sections

This section is mandatory to ensure that OSS vendors and other downstream users receive accurate and complete information.

Indicate with an “X” the customer facing section(s) of the DDOC that apply to this functionality. Indicate with “N/A” the customer facing sections(s) of the DDOC that do not apply to this functionality. Once you mark any of the items below with an “X,” you must complete the corresponding chapter of the template.

93.4 Hardware Requirements or Dependencies

No new hardware or hardware dependencies are introduced.

93.5 Software Requirements or Dependencies

No new customer software or firmware dependencies are introduced in this feature.

93.6 Limitations and restrictions

No limitations or restrictions that is visible to any user are planned as part of this feature.

93.7 Interactions

No interactions between this feature and existing features.

93.8 Glossary

Term	Description

93.9 Configuration

93.9.1 Hardware and Software Requirements

SSPFS platform software and supported hardware are required for this feature.

93.9.2 13.2 Initial Configuration

These new parameters are optional to SSPFS, and will be configured after the initial install or upgrade of SSPFS.

93.10 Office / Subnet parameters (OP/SP) (CM & SESM)

Not Applicable to this feature.

93.11 Upgrade Impact

No upgrade impacts.

93.12 Data schema (DS) (CM, MIBS, RDB)

Not Applicable to this feature.

93.13 Service Orders (SO) (CM & SESM)

Not Applicable to this feature.

93.14 Software optionality control (SOC)

Not Applicable to this feature.

93.15 Element Management

93.15.1 New/modified GUIs

Not Applicable to this feature.

93.15.2 GUI information

Not Applicable to this feature.

93.15.3 CLUI Interface

The existing SSPFS “cli” menu tool will be updated to configure the three new parameters. Details of this are described in the User interface changes section.

93.16 User interface changes

93.16.1 Directory: Configuration/ OAMP Application Configuration

93.16.1.1 Directory description

This existing menu level contains commands to configure switch specific settings that are used by OAMP Applications.

93.16.1.2 Accessing directory: OAMP Application Configuration

93.16.1.3 Access to directory or MAP level and return to CI

As with all menus in the “cli” tool, the enters “x” to exit to the higher level menu.

93.16.2 Command: cm_conf (Configure CM IP Address)

93.16.2.1 Command type: Listed MENU

93.16.2.2 Command target: Other, SSPFS system

93.16.2.3 Command availability: RES

93.16.2.4 Command description

This command will allow the user to configure enter or change the CM IP address. The CM IP address parameter will also be displayed in the CLI Menu level “View”, “software configuration” and the capt_gather tool.

93.16.2.5 Command syntax

This command only takes one parameter, which is an IP address. The IP address must be of the format “0-255.0-255.0-255.0-255”. .

Table 1_ <CommandName> command parameters and variables (Continued)

Command	Parameters and variables
Configure CM IP Address	IP address of the CM

93.16.2.6 Qualifications and warnings

User must be root to change this value.

93.16.2.7 Responses

93.16.2.7.1 Enter the CM IP Address (default: <address>)

This prompts the user for the new CM IP Address. If an address is already configured, it will be displayed in the prompt as the default value. If the user just presses enter, the default value will be taken for this parameter.

93.16.2.7.2 User confirmation

After a user enters valid parameters for this command, they will be prompted:

```
Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
```

This allows the user to review their entry and confirm they want to change these parameters.

93.16.2.7.3 ERROR: IP Address <address> is not valid

The IP address enter was not of a valid format, the user will be prompted to re-enter the IP address.

93.16.2.7.4 Must be root to use this tool

A non-root user is attempting to change the IP address. The command will exit. The user should become root and re-enter the command.

93.16.2.8 Example

Example of changing the CM IP Address (user input in bold):

```
=== Executing "cm_conf"

CM IP:        10.14.71.3

Enter the CM IP Address (default: 10.14.71.3):
10.14.71.5

CM IP:        10.14.71.5

Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
ok

=== "cm_conf" completed successfully
```

93.16.3 Command: cm_unconf (Unconfigure CM IP Address)

93.16.3.1 Command type: Listed MENU

93.16.3.2 Command target: Other, SSPFS system

93.16.3.3 Command availability: RES

93.16.3.4 Command description

This command will allow the user to unconfigure the CM IP address. This is used it the CM IP address is no longer needed, or can be automatically determined via application software (such as systems with OC-3 core connectivity).

93.16.3.5 Command syntax

This command only takes no parameters.

Table 1_ <CommandName> command parameters and variables (Continued)

Command	Parameters and variables
Unconfigure CM IP Address	none

93.16.3.6 Qualifications and warnings

User must be root to change this value.

93.16.3.7 User confirmation

After a user enters valid parameters for this command, they will be prompted:

```
Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
```

This allows the user to review their entry and confirm they want to change these parameters.

93.16.3.7.1 Must be root to use this tool

A non-root user is attempting to unconfigure the IP address. The command will exit. The user should become root and re-enter the command.

93.16.3.8 Example

Example of changing the CM IP Address (user input in bold):

```
=== Executing "cm_unconf"

CM IP:         10.14.71.3

CM IP address will be unconfigured
```

```
Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
ok

=== "cm_unconf" completed successfully
```

93.16.4 Directory: Configuration / Login Session

93.16.4.1 Directory description

This existing menu level contains commands to configure login parameters

93.16.4.2 Accessing directory: Login Session

93.16.4.2.1 Access to directory or MAP level and return to CI

As with all menus in the “cli” tool, the enters “x” to exit to the higher level menu.

93.16.5 Command: telnet_greeting (Telnet Login Greeting)

93.16.5.1 Command type: Listed MENU

93.16.5.2 Command target: Other, SSPFS system

93.16.5.3 Command availability: RES

93.16.5.4 Command description

This command will allow the user to configure enter or change the message shown to users before they attempt to login to this server. This text message may contain multiple lines and has no size limit. This may contain information about this system and or warnings to un-authorized users. On fresh installs or upgrades from older loads, the default message will be “Authorized use only, activities logged”.

93.16.5.5 Command syntax

This command only takes one parameter, which is a text field.

Table 1_ <CommandName> command parameters and variables (Continued)

Command	Parameters and variables
Configure telnet login greeting	Message to be displayed to users before they attempt to login

93.16.5.6 Qualifications and warnings

User must be root to change this value.

93.16.5.7 Responses

93.16.5.7.1 Enter the Telnet Login Greeting Message. Enter a blank line to end the message.

This prompts the user for the Telnet Login Greeting. If a greeting is already configured, it will be displayed above this prompt. If the user just enters a blank line, the Login Greeting Message will be cleared.

93.16.5.7.2 User confirmation

After a user enters valid parameters for this command, they will be prompted:

```
Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
```

This allows the user to review their entry and confirm they want to change these parameters.

93.16.5.7.3 Must be root to use this tool

A non-root user is attempting to change the Telnet Login Greeting address. The command will exit. The user should become root and re-enter the command.

Provide a brief explanation of the response. Define all the variable fields in the response. Indicate if the response is visible on NT40, SUPERNODE, BRISC, All, or Other. If Other specify.

93.16.5.8 Example

Example shown is changing the greeting from the default (user input in bold):

```
=== Executing "telnet_greeting"

Telnet Login Greeting Message:  Authorized use only,
activities logged

Enter the Telnet Login Greeting Message.
Enter a blank line to end the message:
Private Database, Authorized users only

Telnet Login Greeting Message:   Private Database,
Authorized users only

Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
ok

=== "telnet_greeting" completed successfully
```

93.16.6 Directory: Configuration / Location Configuration

93.16.6.1 Directory description

This new menu level contains commands to configure system parameters. The current time zone command “chg_tz (Change Timezone)” will be moved to this level. The new command “sys_loc (System Location)” will also be at this level.

93.16.6.2 Accessing directory: Location Configuration

93.16.6.2.1 Access to directory or MAP level and return to CI

As with all menus in the “cli” tool, the enters “x” to exit to the higher level menu.

93.16.7 Command: sys_loc (System Location)

93.16.7.1 Command type: Listed MENU

93.16.7.2 Command target: Other, SSPFS system

93.16.7.3 Command availability: RES

93.16.7.4 Command description

This command will allow the user to configure enter or change a text string describing the system location. On fresh installs or upgrades from older loads, this string will be empty by default. The System Location parameter will also be displayed in the CLI Menu level “View”, “software configuration” and the capt_gather tool.

93.16.7.5 Command syntax

This command only takes one parameter, which is a text field.

Table 1_ <CommandName> command parameters and variables (Continued)

Command	Parameters and variables
Configure System Location	A line of text decribing the systems physical location

93.16.7.6 Qualifications and warnings

User must be root to change this value.

93.16.7.7 Responses

93.16.7.7.1 Enter the System Location (default: <location>)

This prompts the user for the System Location. If this is already configured, the current value will be displayed and set as the default choice.

93.16.7.7.2 User confirmation

After a user enters valid parameters for this command, they will be prompted:

```
Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
```

This allows the user to review their entry and confirm they want to change these parameters.

93.16.7.7.3 Must be root to use this tool

A non-root user is attempting to change the system location. The command will exit. The user should become root and re-enter the command.

93.16.7.8 Example

Example of changing the CM IP Address (user input in bold):

```
=== Executing "sys_loc"

System Location:        NCRTP Lab 4

Enter the CM IP Address (default: NCRTP Lab 4): NCRTP
Lab 5

System Location:        NCRTP Lab 5

Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
ok

=== "sys_loc" completed successfully
```

93.17 Security

Only the Login Greeting has any security implications. The greeting should not reveal any system information and if often using to inform persons that only authorized or employee use is allowed. As other Nortel products have this same mechanism, we anticipate customers will have a Login Greeting message established.

93.18 Configuration Walkthrough

These parameters may be configured at any time. On SSPFS system which will use the CBM applications, these parameters must be set. These parameters are not required on other SSPFS systems. However their use should be encouraged.

94: Functional Description (FN): A00003615

94.1 Feature name and Feature ID

SSPFS: A00003615 - SSPFS packaging/patch enhancements

94.2 Description

This feature is divided into five completely individual parts:

Part one - Patching Enhancements - Deals with patching SSPFS electronically. It includes the building of incremental patching.

Part two - Platform Upgrade Downtime Reduction - Reduce platform upgrade down time to be less than a target of 1 hour.

Part three- Debugging Tools - Enhanced debugging tools, this includes the inclusion of Sun Explorer and an enhanced platgather.

Part four - Provide a cli tool to mount an iso image on the SSPFS unit.
Part five - SSPFS 3rdparty software upgrades.

94.8 Glossary

Term	Description

95: Functional Description (FN): A00003617

This feature serves the following purposes:

1. Use alarmD as the reporting (writing to customer logs and lighting alarm lights) and storage mechanism for all platform related alarms.

2. In addition to existing fault monitors, provide new monitors that will monitor the following system components.

- CPU load average

- Memory usage

- Swap space

In addition to this, the existing file system monitor will be enhanced to monitor a lot more than just file system usage.

95.1 Feature name and Feature ID

Feature Name: AlarmD Integration

Feature ID: A00003617

95.2 Description

This feature serves the following purposes:

1. Use alarmD as the reporting (writing to customer logs and lighting alarm lights) and storage mechanism for all platform related alarms.

2. In addition to existing fault monitors, provide new monitors that will monitor the following system components.

- CPU load average

- Memory usage

- Swap space

In addition to this, the existing file system monitor will be enhanced to monitor a lot more than just file system usage.

3. It will provide interfaces to turn on, turn off and query alarm lights on Netra 1400 and N240 platforms. A command line interface to do the same will also be provided.

4. A command to query all the faults on a system (an aggregate view of the system) will be included. This command can be invoked from command line or through the cli interface.

95.4 Hardware Requirements or Dependencies

Certain components of this feature will be supported only on field grade hardware.

When an alarm is raised or cleared, the corresponding alarm light will be turned on and off only on T1400s and N240s.

Logs will be generated on other platforms. However, the turning on, turning off and querying the state of a light will be supported only on T1400s and N240s.

95.5 Software Requirements or Dependencies

No requirements identified at this time.

95.6 Limitations and restrictions

95.7 Interactions

A00001953 - Common Platform Capabilities - introduced a set of fault monitors. The reporting mechanism used by these monitors was through two separate calls. The first call was to write a customer log. The second was to turn on/ off an alarm light. The state of a fault was not maintained.

As part of this feature, alarmD will be used to write logs and light a light as part of a single call. It will also store the state of a fault associated with a particular monitor. These faults will be aggregated to provide a blanket view of the system at an instant in time. Existing monitors (the ones provided as part of A00001953) will be modified to make use of the capability that alarmD provides.

Time: Thu Jul 17 22:20:04 EDT 2003

State: Cleared

Category: Software

Component Id: FSMon

Description: No File System related problems reported at this time.

95.9 Cli interface to query platform state.

A cli interface to query the “state” of the system will be made available.

The interface will allow the user to query a comprehensive state of the system (this includes information about all monitors registered with AlarmD) or just the pieces that have faults tagged against them will both be available.

Both these commands can be invoked either from cli or directly from command line.

The output of these commands has not been defined fully yet. In time, this document will be updated to reflect the output of these commands.

The anticipated output looks like this:

The cli interface to these commands will be as shown below:

Step 1: Type in cli

```
> cli
```

This brings up the following menu

```
Command Line Interface
 1 - View
 2 - Configuration
 3 - Other

 X - exit

select - 2
```

Step 2: Select choice 2 (Configuration) from the menu. This will bring up the following options.

```
Platform Monitor Status

1 - all Monitor

2 - faults
```

Configuration

1 - NTP Configuration

2 - Apache Proxy Configuration

3 - DCE Configuration

4 - OAMP Application Configuration

5 - CORBA Configuration

6 - IP Configuration

7 - DNS Configuration

8 - Syslog Configuration

9 - Database Configuration

10 - NFS Configuration

11 - Bootp Configuration

12 - Restricted Shell Configuration

13 - Security Services Configuration

14 - Login Session

15 - Location Configuration

16 - Cluster Configuration

17 - Succession Element Configuration

18 - snmp_poller (SNMP Poller Configuration)

X - exit

select - 17

Step 3: Select 17 (Succession element configuration). That will bring up the following menu

Succession Element Configuration

1 - RESMON Application Configuration

2 - NPM Application Configuration

3 - PSE Application Configuration

4 - OMPUSH Application Configuration

X - exit

select - 1

Step 4: Select 1 (Resmon Aplication configuration).

RESMON Application Configuration

1 - queryFaults (Query all faults on the box)

2 - enableLocalLogs (Enable Local Logging Of Faults)

3 - disableLocalLogs (Disable Local Logging Of Faults)

X - exit

select - 1

Step 5: Select 1 (Query Faults).

If there are no alarms on the box the output will look like this

=== Executing "queryFaults"

Alarm database does not conatin Faulted Nodes

=== "queryFaults" completed successfully

If alarms are raised, the output will look like this (sample output)

```
** SPFS310 NOTICE: bge2: link down
        Network Interface down
        Tue Mar 30 17:31:58 2004

 ** SPFS310 NOTICE: bge0: link down
        Network Interface down
        Tue Mar 30 17:32:02 2004
```

95.10 Cli interface to turn off local logging

Run through steps 1-4 from 2.9.

In the RESMON Application Configuration menu ,select 3 (disableLocalLogs).

RESMON Application Configuration

1 - queryFaults (Query all faults on the box)

2 - enableLocalLogs (Enable Local Logging Of Faults)

3 - disableLocalLogs (Disable Local Logging Of Faults)

X - exit

select - 3

This will print out the following message:

=== Executing "disableLocalLogs"

=== "disableLocalLogs" completed successfully

95.11 Cli option to turn ON local logging

Run through steps 1-4 from 2.9.

In the RESMON Application Configuration menu ,select 3 (disableLocalLogs).

RESMON Application Configuration

1 - queryFaults (Query all faults on the box)

2 - enableLocalLogs (Enable Local Logging Of Faults)

3 - disableLocalLogs (Disable Local Logging Of Faults)

X - exit

select - 2

This will print out the following message:

=== Executing "enableLocalLogs"

=== "enableLocalLogs" completed successfully

95.12 Glossary

Term	Description
FSMon	File System Monitor
AlarmD	The fault reporting utility that will be provided as part of the SSPFS
CPU	Central Processing Unit
CPU Load	The number of processes on the “ready” queue (that is, processes that are not blocked waiting for IO, but are in a “run” state).
15 minute Load average	The average CPU load over 15 minutes
NIC	Network interface card.

96: Functional description (FN): A00003618

96.1 Feature name and Feature ID

Succession Solaris Platform Foundation Service (SSPFS): High Availability Enhancements A00003618

96.1.1 Description

This feature will enhance the existing SSPFS High Availability framework in the following ways:

Application Groups may have unique IP Address: This allows for IEMS and SESM co-residency and provides a framework for future application co-residency.

Expanded HA API: complete set of C++ and command line tools for applications which needs to interface with the HA framework, such as CBM and NPM.

Cluster Software upgrade: A newer version of the cluster software from Continuous Computing Corporation is introduced. This provides enhanced "split-brain" resolution and memory mapped file handling required by SBA.

Enhanced Ethernet interface fail over: This will introduce Continuous Computing Corporation's UpLink product to provide faster Ethernet interface fail over on both simplex and HA cluster SSPFS system. On simplex systems, this removes the use of Solaris IP multipathing. Solaris IP multipathing required two test IP Addresses, which will no longer be needed, reducing the number of IP Addresses required by SSPFS.

Non-replicated application file systems: This gives applications a new option to have their file systems not replicated by the HA software, required by the CBM applications.

Cluster state change notification to applications: applications may register to be called when a cluster state change occurs (such as a swact).

User option to disable cluster fail over: a new option is added to the existing "cli" tool which allows users to disable cluster fail over (or swact) as needed.

When cluster failover is enabled or disabled, the following log entries will be written to

Feb 22 23:24:49 bimmer maint: Evicting cluster nodes. Cluster failover disabled.

Feb 22 23:26:03 bimmer maint: Joining cluster nodes. Cluster failover enabled.

96.1.3 Hardware Requirements or Dependencies

No new hardware or hardware dependencies are introduced. All existing field grade SSPFS hardware will work with the Ethernet interface fail over enhancement.

96.1.4 Software Requirements or Dependencies

No new customer viable software or firmware dependencies are introduced in this feature. All software introductions are contained in the SSPFS load.

96.1.5 Limitations and restrictions

Currently, the secondary cluster node is created through cloning process, which takes an extended period of time to complete. Efforts are being made to reduce the time required by this procedure.

96.1.6 Interactions

Interactions between this feature and several existing features. Several of the enhancements are specifically for the CBM and NPM applications.

96.2 Configuration

96.2.1 Hardware and Software Requirements

All preparatory configuration changes were in place since SN06.2 for upLink inclusion. SSPFS platform software and supported hardware are required for this feature.

96.2.2 Initial Configuration

This feature will introduce changes to the SSPFS installation tool to support application specific IP address configuration. These changes will be mirrored in the post-install “cli” tool IP configuration tool discussed below. The menus and behavior for settings IP addresses will be the same at install as in the post-install “cli” tool.

96.2.3 Office / Subnet parameters (OP/SP) (CM & SESM)

Not Applicable to this feature.

96.2.4 Upgrade Impact

The details of an HA cluster upgrade from SN06.2 to SN07 are addressed in a separate activity, corrective caf in SN07, A00004860. However, this feature will alter the Ethernet interface fail over on upgrade (which will 'free up' test addresses in simplex systems) as well as introduce a new version of the cluster software.

96.2.5 Data schema (DS) (CM, MIBS, RDB)

Not Applicable to this feature.

96.2.6 Service Orders (SO) (CM & SESM)

Not Applicable to this feature.

96.2.7 Software optionality control (SOC)

Not Applicable to this feature.

96.2.8 Element Management

96.2.8.1 New/modified GUIs

Not Applicable to this feature.

96.2.8.2 GUI information

Not Applicable to this feature.

96.2.8.3 CLUI Interface

The existing SSPFS “cli” menu tool will be updated. Details of this are described in the User interface changes section.

96.2.9 User interface changes

96.2.9.1 Directory: Configuration/ IP Configuration

96.2.9.1.1 Directory description This existing menu level contains commands to configure the systems IP network settings

96.2.9.1.2 Accessing directory: IP Configuration 1

Access to directory or MAP level and return to CI
As with all menus in the “cli” tool, the enters “x” to exit to the higher level menu.

96.2.9.2 Command: conf_test (Configure IP Multipathing Test Addresses)

96.2.9.2.1 Command type: Listed MENU

96.2.9.2.2 Command target: Other, SSPFS system 1

96.2.9.2.3 Command availability: RES 1

96.2.9.2.4 Command description

This command will be removed. The functionality provided by this command will be replaced by UpLink. UpLink configuration will be completely automated.

96.2.9.2.5 Command syntax N/A

96.2.9.2.6 Qualifications and warnings N/A.

96.2.9.2.7 Responses

96.2.9.3 Command: config_ip (Configure System IP Addresses)

96.2.9.3.1 Command type: Listed MENU

96.2.9.3.2 Command target: Other, SSPFS system

96.2.9.3.3 Command availability: RES

96.2.9.3.4 Command description

This command will allow the user to configure the public IP addresses on both simplex and HA cluster systems.

96.2.9.3.5 Command syntax

This command is interactive.

96.2.9.3.6 Qualifications and warnings

User must be root to configure the system IP address(es).

96.2.9.3.7 User confirmation After a user enters valid parameters for this command, they will be prompted:

```
Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
```

This allows the user to review their entry and confirm they want to change these parameters.

96.2.9.3.8 Application association with additional IP address

If the user chooses to configure an additional IP address, then that address must be associated with a particular application. The user will be prompted for the “name” of that application. This application name should match the servman application group name for this application.

In SN07, the only valid combined system, that will require multiple virtual IP addresses, is a system that will support both IEMS and CS2M. So, in SN07, the only reasonable option will be ‘iems’.

96.2.9.3.9 Must be root to use this tool

A non-root user is attempting to configure the IP address. The command will exit. The user should become root and re-enter the command.

96.2.9.3.10 Cluster restart order message

After a successful IP change on an HA cluster system, the cluster units must be restarted in a particular order. This message is given to the user:

```
The network changes have been made, however the cluster requires a restart
of both units.  The units must be restarted in the below order.

1) Login as root on the console of the standby unit and shut it down with
   the command: "shutdown -i 0 -y".
2) After the standby unit has shutdown, restart the acitve unit with
   the command: "shutdown -i 6 -y".
3) After the restart is complete, the new network settings are in effect.
4) Boot the standby unit with the command "boot".
```

96.2.9.3.11 Example

Example of changing the IP Addresses on a cluster (user input in bold). Notice that the current values are indicated in brackets.

****** There will be no error checking on the application string that is entered…the string must be entered accurately. The only check will be to ensure that an alpha-numeric literal is entered. *****

```
=== Executing "config_ip"

Enter the hostname for this cluster [znc0s0jy] znc0s0jx
Enter  primary  cluster ip address for znc0s0jx [47.142.108.199] 47.142.108.11
Configure additional cluster ip address ? [yes] yes
Enter additional cluster ip address for znc0s0jx [47.142.108.201] 47.142.108.12
Enter application for cluster ip address 47.142.108.12 [iems] iems
Configure additional cluster ip address ? [no]
Enter ip address for unit zero   [47.142.108.220] 47.142.108.7
Enter ip address for unit one    [47.142.108.221] 47.142.108.8

Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
ok

=== "config_ip" completed successfully
```

96.2.9.4 Directory: Configuration / Cluster configuration

96.2.9.4.1 Directory description

This existing menu level contains configuration commands and directories.

96.2.9.4.2 Accessing directory: Configuration / cluster configuration

Access to directory or MAP level and return to CI

As with all menus in the “cli” tool, the enters “x” to exit to the higher level menu.

96.2.9.5 Command: disable_failover (Disable cluster node Fail over)

96.2.9.5.1 Command type: Listed MENU

96.2.9.5.2 Command target: Other, SSPFS system

96.2.9.5.3 Command availability: RES

96.2.9.5.4 Command description

This command MUST be run from the ACTIVE node in the cluster. This command will allow the user to disable a cluster fail over. (activity will remain on current node of the cluster, data will still be replicated).

96.2.9.5.5 Command syntax

This command takes one parameter, but is interactive. If a user enters this command a series of other questions will be asked to allow user to disable or re-enable failover.

96.2.9.5.6 Qualifications and warnings User must be root to change this value.

96.2.9.5.7 Responses

```
Cluster Fail over is manually disabled.
```

This informs the user that HA fail over has been manually disabled. A Customer log entry will be generated to indicate this state ‘transition’.

User confirmation

After a user enters valid parameters for this command, they will be prompted:

```
Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
```

This allows the user to review their entry and confirm they want to change these parameters.

```
Must be root to use this tool
```

This message appears when a non-root user is attempting to disable fail over. The command will exit. The user should become root and re-enter the command.

Example

Example shown (user input in bold):

96.2.9.6 Command: req_failover (manual request to failover)

96.2.9.6.1 Command type: Listed MENU

96.2.9.6.2 Command target: Other, SSPFS system

96.2.9.6.3 Command availability: RES

96.2.9.6.4 Command description

This command MUST be run from the ACTIVE node in the cluster. This command will allow the user to perform/initiate a cluster fail over. (all applications on the active node will stop, and the Active node will give up activity).

96.2.9.6.5 Command syntax

This command takes no parameters. If a user enters this command a series of other questions will be asked to confirm the operation.

96.2.9.6.6 Qualifications and warnings

User must be root to change this value.

96.2.9.6.7 Responses

```
Cluster Failover initiated
```

This informs the user that HA fail over has been manually disabled. A Customer log entry will be generated to indicate this state ‘transition’.

```
User confirmation
```

After a user enters valid parameters for this command, they will be prompted:

*** Warning: This command will initiate a cluster switch of activity ***

```
Enter "ok" to commit changes
Enter "quit" to exit
Enter anything else to re-enter settings
```

This allows the user to review their entry and confirm they want to change these parameters.

```
Must be root to use this tool
```

This message appears when a non-root user is attempting to disable fail over. The command will exit. The user should become root and re-enter the command.

96.2.9.6.8 Example

Example shown (user input in bold):

96.2.10 Security

97: Functional Description (FN): A00003630

97.1 Feature name

TGCP for the Cable Market

97.2 Description

The TGCP for the Cable Market feature implements the Trunking Gateway Control Protocol (TGCP) for ISDN User Part (ISUP) and Per Trunk Signaling (PTS) trunk groups on the Succession Call Server 2000 (CS2K). Specifically, this activity provides:

- incoming and outgoing interconnection from a North American End Office (EO) to the Public Switch Telephone Network (PSTN) using ISUP trunk groups.
- incoming and outgoing interconnection from a North American EO to the PSTN for Operator Services.
- incoming interconnection from a North American EO to the PSTN for Emergency Services.

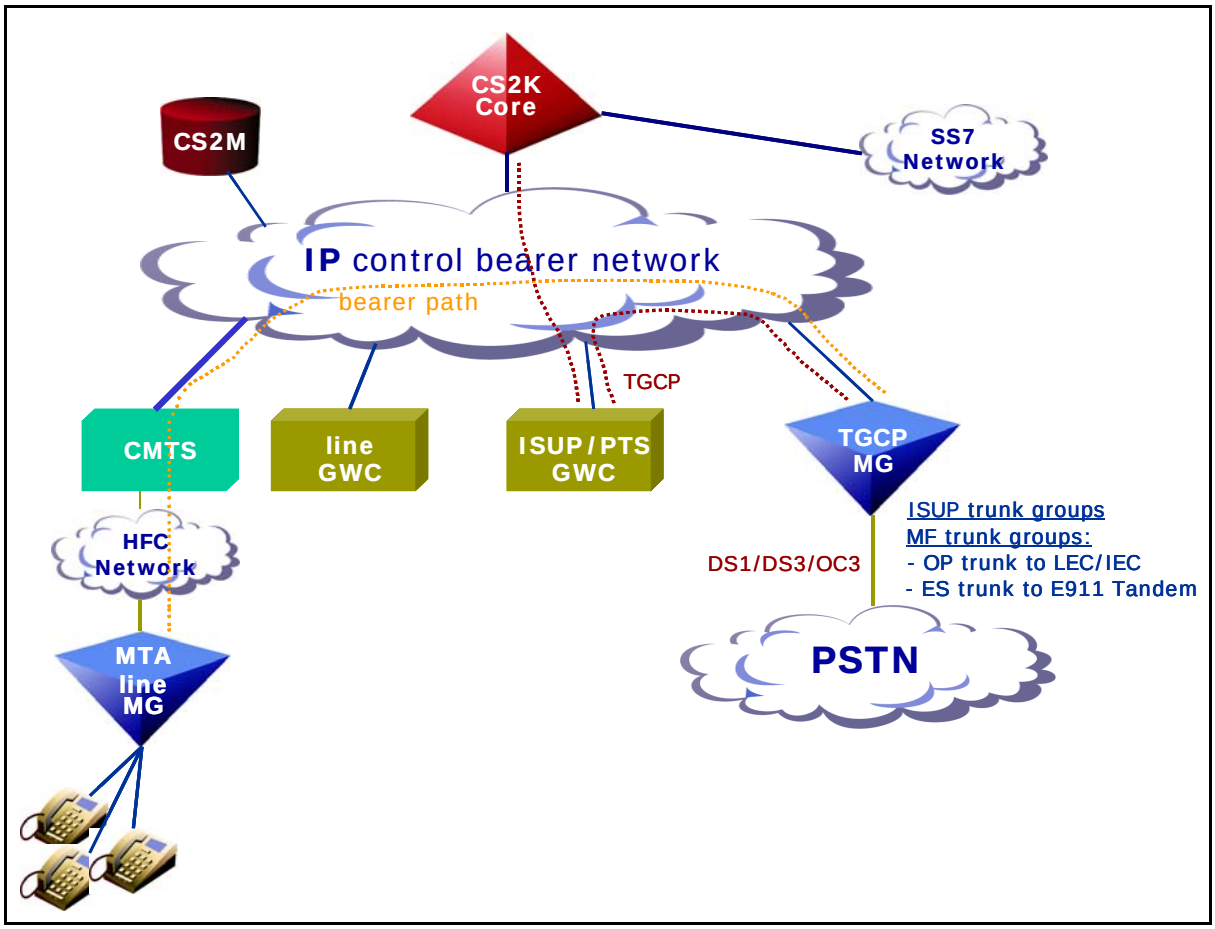
ISUP Inter-Toll (IT) and Access To Carrier (ATC) trunks are supported for interconnection to the PSTN. Multi-Frequency (MF) Operator (OP) trunks are supported for interconnection to a Local Exchange Carrier (LEC) operator system. MF Emergency Service (ES) and OP trunks are supported for interconnection to an Emergency 911 (E911) Tandem switch.

The ISUP and MF trunk interconnection capability provided by this activity is supported for the North American Integrated Access - Cable (IAC) solution.

Figure 1 illustrates the CS2K network components relevant to this activity. PSTN interconnection is provided using ISUP and MF trunks configured on a Gateway Controller (GWC) peripheral type. TGCP is supported between the GWC and the Media Gateway (MG). A third party gateway vendor is providing the Media Gateway functionality. Development on the Media Gateway is beyond the scope of this activity. The goal of this activity is to achieve TGCP third party gateway compliancy on the CS2K.

This activity describes the necessary changes on the Core, GWC, and Call Server 2000 Manager (CS2M) to support ISUP IT, ISUP ATC, MF OP, and MF ES trunk signaling and associated services on a TGCP MG. External signaling transparency is provided for the ISUP and MF trunks configured on a GWC. Additionally, limited service transparency is provided as described in this document. The Core, GWC, and CS2M changes are provided as part of the SN07 software release.

Figure 1 IP Cable Network Configuration



Operator and 911 call *originations* are supported for agents configured on the following MG types:

- Multimedia Terminal Adapter (MTA) line MGs (line agents)

Refer to the solutions specifications for Integrated Access Cable for the complete list of line MGs supported in the SN07 release.

Operator and 911 call originations are **not** supported with MGs other than those listed above. However, there are service interactions that may result in the conferencing or transfer of an OP or ES trunk into a call with an agent other

than those listed above. This activity supports interoperability with the following agent types when a service interaction[1] results in a connection with either an OP or ES trunk:

- Dynamic Packet Trunk (DPT)
- ISUP trunk
- PRI trunk
- line

Interworking between TGCP MGs and the Universal Audio Server (UAS) is supported for providing media services such as voice announcements.

97.3 Functional Description

97.3.1 Operator Services Interconnection

Interconnection from the CS2K EO to a LEC operator switch is provided using MF OP trunk types.

Traditional Bell and Modified Operator Services Signaling (MOSS) are supported. Both signaling types provide two stage signaling:

	stage 1	**stage 2**
Traditional Bell	KP+called number+ST/STP/ST2P/ST3P	KP+I[a]+7 digit ANI+ST
Modified OSS	KP+called number+ST/STP/ST2P/ST3P	KP+II+7 digit ANI+ST/ STP[b]

a. A single information (I) digit is provided with Traditional Bell, two information (II) digits with MOSS.
b. ST is signaled for LEC call completions. STP is signaled for IEC call completions and is provided for completeness.

To configure an OP trunk for Traditional Bell signaling, field EA in table TRKGRP must be provisioned as ‘N’. To configure an OP trunk for MOSS signaling, fields EA and EAOSS must be provisioned as ‘Y’ and ‘N’ in table TRKGRP respectively.

The capabilities listed below are supported by this activity. For these capabilities, transparency is provided with the legacy switching system:

- LEC interconnection
- Traditional Bell signaling

[1]Examples of service interactions include, but are not limited to, three-way calling and call transfer. Call forwarding is excluded. Call forwarding to an OP or ES trunk is not supported.

- MOSS
- Busy Line Verification (BLV)
- Operator Barge-In (BI)
- Operator Ringback
- Operator Recall
- Outgoing OP trunk
- Incoming OP trunk support for BLV and BI
- Hold types of Term Hold and No Hold
- MF signaling
- Reversal ANI request type
- Flexible ANI (FANI) digits - applies to MOSS only
- Intercept calls

The key ***exclusions*** for this activity are listed below. For a complete list of restrictions and limitations, refer to section "97.6 Limitations and restrictions" on page 987.

- Coin control signals
- DP and DTMF[1] address signaling
- Exchange Access Operator Services Signaling (EAOSS)
- 2-way OP trunks

Table control restrictions are added by this activity to enforce the SN07 restrictions for MF OP trunks. Refer to the Configuration customer facing section of this document for more information on these restrictions.

97.3.2 Emergency Services Interconnection

Interconnection from the CS2K EO to an E911 tandem switch is provided using MF ES or MF OP trunk types. In SN07, only an *outgoing* MF ES trunk type or an *outgoing* MF OP trunk type is supported. For call completions from the E911 tandem switch back to the CS2K EO, Signaling System Number 7 (SS7) trunks must be configured.

Two stage Traditional Bell signaling is supported on the OP trunk type as described in section 97.3.1 on page 975. Two stage Traditional Bell signaling is supported on the ES trunk type, providing the called number (i.e. 911) and Automatic Number Identification (ANI) digits to the E911 tandem switch as follows:

[1]Restriction applies to DTMF signaling of the called and ANI address digits. DTMF signaling related to pressing keys on the originating line's keypad is supported.

	stage 1	stage 2
Traditional Bell	KP+911+ST	KP+I+7 digit ANI+ST

The capabilities listed below are supported by this activity for both the OP and ES trunk types (unless noted otherwise). For these capabilities, transparency is provided with the legacy switching system:

- E911 tandem interconnection
- Ringback
- Outgoing ES and outgoing OP trunk [only]
- Hold type of Term Hold
- MF signaling
- Reversal ANI request type

In addition to the list above, ES trunk types provide specific capabilities that are controlled through provisioning in table TRKGRP. The following TRKGRP capabilities are also supported by this activity for the ES trunk type:

- Audible Ringing:

  Field AUDRING specifies whether audible ringing should be applied to the originator. The values Y and N are supported by this activity.

- Automatic Number Identification (ANI) Type:

  Field ANI specifies what type of outpulsing to provide on the ES trunk. Only a value of “ANISPILL” is supported by this activity. “ANISPILL” specifies the called digits (i.e. 911) should be outpulsed followed by the ANI digits.

- Switch Hook Status:

  Field SWST specifies the action taken when the switch detects the originating subscriber has gone onhook. Only a value of “DC” is supported by this activity. “DC” provides an onhook signal towards the E911 tandem when the originating subscriber goes onhook.

- Calling Line Identification:

  Field CLI specifies whether CLI logs should be generated by the switch. The values Y and N are supported by this activity.

- Abandon Hold Time:

  Field ABNHLDTM ensures ANI outpulsing completes in the event the calling party goes onhook prior to the completion of outpulsing. A timer value, in seconds, is specified. All timer values are supported by this activity.

- Special Billing Directory Number:

  Field SPBDN controls whether to signal the calling number or special billing number as the ANI digits for line originations. The values Y and N are supported by this activity for this field.

The key ***exclusions*** for this activity are listed below. For a complete list of restrictions and limitations, refer to section "97.6 Limitations and restrictions" on page 987.

- B911 interconnection
- DP and DTMF[1] address signaling
- Incoming and 2-way ES trunks and OP trunks

Table control restrictions are added by this activity to enforce the SN07 restrictions for MF ES trunks. Refer to the Configuration customer facing section of this document for more information on these restrictions.

97.3.3 ISUP interconnection to PSTN

Interconnection from the CS2K EO to the PSTN is provided using ISUP IT or ISUP ATC trunk types.

The key ***exclusions*** for this activity are listed below. For a complete list of restrictions and limitations, refer to section "97.6 Limitations and restrictions" on page 987.

- Digit collection on ISUP trunks

97.3.4 Provisioning

The provisioning in Succession CS2K is distributed among several interfaces:

- the CS2M is used to provision GWC nodes, register MGs with GWCs, and bulk provision endpoints (i.e., by carrier);
- the CS2K core can be used to provision GWC node data and trunk related data; and
- OSSGate can also be used to provision trunk related data, register MGs with GWCs, and bulk provision endpoints by carrier.

97.3.4.1 GWC Node Provisioning

The CS2M is used to provision trunking GWC nodes with TGCP ISUP and MF trunks. The provisioning of the GWC includes:

- updating table SERVRINV on the CS2K core;

[1]Restriction applies to DTMF signaling of the called and ANI address digits. DTMF signaling related to pressing keys on the originating line's keypad is supported.

- configuring TGCP MGs on the GWC; and
- provisioning carriers/endpoints on the GWC.

97.3.4.1.1 New GWC Exec Lineup

Upon adding a GWC node, table SERVRINV is updated with the GWC node data including node number, tone data, and exec line-up data. A new exec line-up, GWCABEX, is created for the GWC. The new exec line-up is provisionable in table SERVRINV and applies to a term type of ABTRK. This exec line-up must be provisioned in table SERVRINV for GWCs that support MF OP and/or ES trunks.

Refer to the Configuration customer facing section of this document for further information on the new exec line-up.

The CS2M interface for configuring GWC nodes allows the selection of the GWCABEX exec line-up for TRUNKNA (N.A. trunking) GWCs. Refer to the Configuration customer facing section of this document for further information on the CS2M.

97.3.4.1.2 Configuring TGCP MGs

TGCP MGs are registered with a GWC via the CS2M. For this activity, the CS2M interface for associating an MG with a GWC is expanded to include the TGCP protocol type and a new gateway profile name.

Refer to the Configuration customer facing section of this document for further information on the CS2M.

97.3.4.1.3 GWC Endpoint Provisioning

The CS2M provides the capability to provision endpoints of a GWC on a carrier basis (i.e., 24 or 31 endpoints). The endpoints on a GWC must be provisioned prior to adding the tuple entries in table TRKMEM. The CS2M provides a list of terminal identifiers which must be entered in the tuple for table TRKMEM.

For GWCs supporting TGCP MGs, CS2M permits provisioning carriers of 24 endpoints at a time. The carrier naming convention follows the TGCP convention outlined below.

TGCP Endpoint Naming Convention
The TGCP endpoint naming convention follows the standards proposed in the PKT-SP-TGCP-I05-030728 TGCP Specification.The format supports a DS-0 channel endpoint type on a trunking gateway:

- **ds/<unit-type1>-<unit #>/<unit-type2>-<unit #>/.../<channel #>** where

— **<unit-type>** is defined to be one of “s”, “su”, “oc3”, “ds3”, “e3”, “ds2”, “e2”, “ds1”, and “e1”;

— **<unit #>** is a decimal value referring to the particular instance of <unit-type>;

— **<channel #>** is a decimal value indicating the channel number at the lowest level in the hierarchy (e.g., DS-0); and

— **ds** is fixed, identifying the endpoint naming scheme.

For SN07, the CS2M and GWC support TGCP MGs with DS1 interfaces, OC3 interfaces containing channelized DS3 and DS1 levels, and DS3 interfaces with channelized DS1 levels as defined in Table 1, “TGCP MG interfaces and Endpoint Naming” below.

Table 1 TGCP MG interfaces and Endpoint Naming

TGCP MG Interface	Endpoint Naming Convention
DS1 interface	ds/ds1-#/#
OC3 interface with DS3 and DS1 levels	ds/oc3-#/ds3-#/ds1-#/#
DS3 interface with DS1 level within a logical processor (or slot)	ds/s-#/ds3-#/ds1-#/#
DS3 interface without DS1 framing	ds/s-#/ds3-#/#

Refer to the Configuration customer facing section of this document for further information on the CS2M.

97.3.4.2 Trunk Group Provisioning

GWC ISUP and MF trunk related data is provisioned on the CS2K core using the same data tables as for legacy TDM trunks, namely tables CLLI, TRKGRP, TRKSGRP, TRKOPTS, and TRKMEM (ISUP trunks also require tables ISUPDEST and C7TRKMEM to be provisioned). Additionally, a new option is added in table TRKOPTS which must be assigned to OP and ES trunks groups provisioned on a GWC.

When provisioning an MF trunk group on a GWC, there are no restrictions regarding the distribution of the trunk members. An MF trunk group may be configured with trunk members spanning one or more GWCs or spanning one or more MGs. The trunk group can consist of any number of channels on a DS1 (e.g. 1, 5 or 24 channels).

MF trunk groups consisting of trunk members distributed across different peripheral types, such as a GWC and DTC, are ***not*** supported.

There are no restrictions regarding provisioning ISUP trunk groups on a GWC. Hybrid ISUP trunk groups are supported.

ISUP and MF trunk groups on the same GWC are supported. ISUP and MF trunk groups on the same MG are supported (the MG vendor is responsible for supporting ISUP and MF trunk groups on the same MG).

97.3.4.2.1 Table TRKOPTS

A new trunk group option, GWCPTSTK, is added in table TRKOPTS. This option identifies PTS packet trunks that provide connectivity between the packet network and the PSTN. Option GWCPTSTK must be provisioned against the MF OP or ES trunk group CLLI ***after*** provisioning table TRKGRP and ***prior*** to adding trunk members in table TRKMEM.

The GWCPTSTK option is used to restrict trunk group, subgroup, and member capabilities incompatible with GWC PTS trunks. This option cannot be added to a trunk group with the trunk group and subgroup restrictions listed in “97.6 Limitations and restrictions” on page 987.

This option can not be added to a trunk group that has pre-existing entries in table TRKMEM[1]. Additionally, this option can not be removed until all entries in table TRKMEM have been deleted.

The GWCPTSTK option contains a single sub-option, PRELOADANI. This sub-option identifies PTS packet trunk groups which support a call model that allows the ANI digits to be sent from the Core to the GWC without receiving an ANI request from the far-end. The MG is responsible for handling the ANI request and responding with the ANI digits stream.

Refer to the Configuration customer facing section of this document for further information on the new trunk group option.

97.3.4.2.2 Table TRKGRP

The tuple entry in table TRKGRP for ISUP IT, ISUP ATC, MF OP, and MF ES trunks remains unchanged. However, restrictions are added to table TRKGRP to prevent the activation of capabilities not supported on GWC MF trunks in the SN07 release. Refer to section “97.6 Limitations and restrictions” on page 987 and the Configuration customer facing section of this document for further information.

97.3.4.2.3 Table TRKSGRP

With an IP network configuration, the responsibility of providing low-level MF signaling requirements is delegated to the MG (e.g., A/B bit transition). As

[1]This can occur only if an attempt is made to add option GWCPTSTK to a trunk group with members on a peripheral type other than a GWC, such as a DTC.

a result, data currently provisioned in table TRKSGRP is not applicable to OP and ES trunks configured on a GWC. Specifically, the IDGTIME and TRKGRDTM fields in table TRKSGRP are not used by the CS2K. The MG is expected to comply with GR-505 and GR-506 regarding MF timings. Refer to the MG provisioning guidelines for further information related to administering this data.

Restrictions are added to table TRKSGRP to prevent the activation of capabilities not supported on GWC MF trunks in the SN07 release. Refer to section "97.6 Limitations and restrictions" on page 987 and the Configuration customer facing section of this document for further information.

97.3.4.2.4 Table TRKMEM

The tuple entry in table TRKMEM for a GWC peripheral type requires a node number and terminal number be entered[1]. The terminal numbers are obtained when the endpoints are provisioned on the GWC using the CS2M. Endpoint provisioning must be completed prior to provisioning table TRKMEM. Refer to section "97.3.4.1.3 GWC Endpoint Provisioning" for further information.

The option GWCPTSTK must be provisioned in table TRKOPTS prior to adding MF OP or ES trunk members in table TRKMEM. Table control for table TRKMEM enforces this restriction. Additionally, if option GWCPTSTK exists on a trunk group, table control disallows the addition of trunk members on peripheral types other than a GWC, such as a DTC.

Refer to the Configuration customer facing section of this document for further information on the table TRKMEM restrictions.

97.3.4.3 OSSGate

OSSGate provides a machine interface for provisioning components within Succession. The main functionality of OSSGate is to act as a gateway to the Node, Carrier, Trunk, and Line provisioning applications and the Trunk Maintenance application.

OSSGate supports provisioning of tables TRKSGRP and TRKMEM for ISUP and MF trunks on GWCs. OSSGate is subject to the provisioning restrictions described in sections "97.3.4.2.3 Table TRKSGRP" on page 981 and "97.3.4.2.4 Table TRKMEM" on page 982.

For carrier provisioning, OSSGate supports the naming convention of TGCP described in section "97.3.4.1.3 GWC Endpoint Provisioning" on page 979.

Refer to the Configuration customer facing section of this document for further information on OSSGate.

[1]Changes to table TRKMEM to support a GWC PMTYPE were provided in a previous Succession release.

97.3.5 Echo Cancellation

Echo cancellation must be applied from the TDM side of the network. This is because any delay that enters the packet network can become too long for the echo cancellers on the MGs to handle.

In the SN07 release for OP and ES trunk groups, echo cancellation is always performed by the MG. With TGCP, the MG always performs echo cancellation by default.

Table control restrictions are added to table TRKSGRP to reflect that external echo cancellation is always applied by the MG. Table control enforces field ESUPR be provisioned as "N" and field ECSTAT be provisioned as either "EXTERNAL" or "INTERNAL". ECSTAT set to "INTERNAL" indicates that the echo cancellation is performed in the MG; ECSTAT set to "EXTERNAL" indicates that the echo cancellation is performed on the TDM trunk. See NTP NN10068-461 "Upgrading the GWC" for further details.

For GWC ISUP trunks in SN07, echo cancellation is performed by the MG based on trunk data (i.e., ECSTAT field in table TRKSGRP) unless the echo cancellation info in the ISUP messages (e.g., IAM, ACM, CPG) indicate that it has already been performed between the CS2K and the source of the echo.

97.3.6 TGCP Package Requirements

The TGCP packages used to support ISUP, MF OP, and MF ES trunks in the SN07 release include:

- ISUP Trunk (IT) Package
- MF FGD Operator Services (MO) Package
- MF Terminating Protocol (MT) Package

97.3.7 Trunk Maintenance

In the IP network architecture, the MG owns the physical hardware. The DS1 carrier is no longer owned or maintained by the CS2K. As a result, the maintenance behavior of ISUP and MF trunks configured on a GWC is changed.

97.3.7.1 CS2K Trunk States

The trunk state of carrier failure (CFL) has a new definition for trunks configured on a GWC. The CFL trunk state indicates the circuit on the MG is out-of-service. The CS2K places a trunk into the CFL state when a TGCP RestartInProgress (RSIP) message with a RestartMethod of "forced" is received from the MG. Recovery from the CFL state back to an IDLE state only occurs if the MG notifies the CS2K the circuit is back in service. The MG

notifies the CS2K a circuit is back in service by sending an RSIP with a RestartMethod of “restart”.

In the packet cable architecture, the Media Gateway Controller (MGC) does not have knowledge of the reason the MG has taken one or more circuits out of service. There could be a card failure, carrier failure or a maintenance action being performed on the circuit by the MG. The reason for the removal of a circuit from service is beyond the scope of the CS2K.

The CS2K supports receiving an RSIP on an individual endpoint, carrier, or gateway basis. If a carrier failure occurs on the MG, the MG may send twenty-four individual RSIP messages or one RSIP message on the carrier to the CS2K.

97.3.7.2 Trunk Test Position (TTP)

Limited maintenance is supported at the TTP level of the MAP for TGCP MF trunks provisioned on a GWC. Restrictions also apply to the MANUAL, MONITOR and DATA levels of the MAP (accessed through the “Level_” command on the TTP). Refer to Table 2 for a summary of the commands supported and not supported in the SN07 release.

Table 2 TTP Level Command Summary

Level	Supported Commands	Unsupported Commands
TTP	Quit, BSY[a] (with optional states INB, MB), RTS, BSY ALL, FRIs, Post_, Hold, NEXT, Level_, *TST*, *Ckt_*	BSY[b] (with optional state SB), **SEIZE**, **CktInfo**, CktLoc, TrnslVf_, StkSdr_, Pads
MONITOR[c]	Quit, Post_, BSY, RTS, Hold, NEXT, FRIs, *TST*, *MonTalk*,	MONPOST, MONLINK, **CktMon**, **CPos_**, **RLS**
MANUAL	Quit, Post_, BSY, RTS, Hold, NEXT, *LOSS*, *TGEN*, *TST*, *Noise*, *TDET*, *Hset*	**OP_**, Jack_, **SGNL**, CallTrf, **RLS**
DATA	Quit, Post_, BSY, RTS, Hold, NEXT, FRIs, *BERT_*	**Seize**, **BTerm_**, **RLS**

a. BSY at all levels is supported only with optional states INB and MB.
b. BSY with optional state SB is blocked at all levels.
c. MONITOR level is inaccessible is if GWC MF trunk is posted and no InterWorking (IW) bridges are available.

Several of the unsupported commands in Table 2 are prevented by existing maintenance restrictions added in a prior release. This activity implements only those restrictions required above the existing maintenance restrictions (shown in **bold** text in the table), e.g., the outpulse command (**OP_**) is not supported at the MANUAL level of the MAP.

Several supported commands (shown in *italics* text in the table) are dependent on the availability of certain components in the IAC solution. Test line tests of trunk connections (*TST* command at the TTP, MONITOR and MANUAL levels) require appropriate test line facilities on the Audio Controller[1]. The other TTP commands require Interworking (IW) bridges to provide the necessary functionality. These hardware dependencies also apply for manual test line trunk tests performed from the Automated Test Trunk (ATT) level of the MAP.

Maintenance support at the TTP MAP level for TGCP ISUP trunks is subject to the same set of supported/unsupported commands listed in Table 2, with the exception of the MF restricted commands (shown in **bold** text) which are supported for ISUP. In addition, any existing restrictions at the C7TTP MAP level for GWC ISUP trunks also apply to TGCP ISUP trunks.

Refer to the Configuration customer facing section of this document for further information on the restrictions added by this activity.

97.3.7.3 Trunk Maintenance Manager (TMM)

Trunk maintenance for ISUP and MF trunks is supported through TMM. TMM is an existing trunk maintenance application which uses an interface provided by CS2M. The following TMM maintenance commands are supported:

- POST by gateway name, trunk group/CLLI, or carrier;
- BSY, BSY INB, RTS, FRLS, and Query Endpoint State (QES) on posted set.

The Post by Carrier supports the carrier naming convention of TGCP described in section “97.3.4.1.3 GWC Endpoint Provisioning” on page 979.

97.3.7.4 Trunk Audits

The trunk audits for PTS trunks on legacy peripherals are changed as necessary to align with the new behavior for PTS trunks configured on a GWC. Automatic recovery actions are no longer performed on PTS trunks in CFL state. Placement into and out of the CFL state is strictly controlled by notification from the MG (as discussed in section “97.3.7.1 CS2K Trunk States” on page 983). Enhancements are provided to audits both on the core and GWC.

Trunk audits of GWC ISUP trunks was added in a prior Succession release.

[1]The availability of test line facilities on the Audio Controller are indicated by the office parameter EXTERNAL_GATEWAY_TEST_LINES in table OFCVAR on the core.

97.3.8 Initialization

When the GWC is initially brought into service it awaits notification from the MG that it is inservice and ready to process calls. The trunks transitions from a PMB state to a CFL state[1] at this time. Upon receipt of an RSIP (with a RestartMethod of "restart") on the gateway from the MG indicating the MG is inservice, the CS2K begins the process of bringing all CFL trunks into an inservice state. This process includes setting the trunk state to IDL and sending an acknowledgement of the RSIP to the MG. The MG begins scanning for seizures (e.g., remote make busy, call setups) from the far-end (note that seizure-state changing events are persistent in TGCP).

Note that following a restart if the MG has a number of endpoints (e.g., channels) out of service, the GWC/CS2K is unaware of this.

The GWC is also capable of handling RSIPs on a trunk/endpoint basis. However, to minimize the number of messages generated, it is recommended the MG send an RSIP on the gateway when coming inservice.

97.3.9 Swacts and Restarts

This activity provides support for CS2K core restarts, CS2K core swacts, GWC node restarts, and GWC swacts.

For core reload and cold restarts or GWC cold swact and node restarts, all MF calls on the GWC(s) are taken down. The CS2K initiates the necessary cleanup of resources on the MG using TGCP signaling. The same behavior applies to warm restarts on the core and warm swacts on the GWC with one exception, stable MF calls on the GWC(s) remain active. ISUP and MF calls in the answered state are considered stable on the CS2K core.

This activity also supports norestart swact, restartswact and abortswact on the CS2K core.

97.3.10 IP Network loss between the GWC and MG

The GWC monitors its connection to the MG by sending a heartbeat message (in the form of an AuditEndpoint (AUEP) message wildcarded on the gateway) every 10 seconds in the absence of any other messaging between the GWC and MG. A heartbeat loss is detected if after 40 seconds no acknowledgement to the heartbeat message is received by the GWC from the MG.

Upon detecting heartbeat loss, the GWC transitions the trunks on the MG to a CFL state and begins sending heartbeat messages every 2 minutes. During this period, if the GWC receives any message from the MG, the GWC/CS2K

[1]Note trunks in the MB or INB state are unaffected. Trunks remain in these states until manually brought into service via the TTP or TMM.

begins the process of trunk recovery by: deleting all connections on the MG; and re-starting the regular heartbeat message with the MG.

97.3.11 QoS Reporting

QoS reporting on the GWC is supported to measure voice quality. The TGCP end-of-connection statistics are reported by the MG to the GWC. The GWC collects and transfers the end-of-connection statistics to a QoS Collector Application (QCA) server, where they are correlated with the billing records.

97.3.12 Accounting

Transparency is provided with the Automatic Message Accounting (AMA) records generated for the legacy billing system. No changes are required by this activity.

97.3.13 Fault Management

Transparency is provided with the trunk related Operational Measurements (OM), Logs and Alarms supported for the legacy OA&M system. No changes are required by this activity.

97.4 Hardware Requirements or Dependencies

This activity has the following hardware dependencies:

- The MG functionality is provided by a third party gateway vendor supporting TGCP as described in the PKT-SP-TGCP-I05-030728 TGCP specification.
- Test Line tests of TGCP MG trunk connections to the PSTN require an Audio Controller (AC), an UAS, and a SAGE 945RTS testhead unit to perform tests.

97.5 Software Requirements or Dependencies

This activity enhances the CS2K core, GWC, and CS2M to support a TGCP MG hosting ISUP IT, ISUP ATC, MF OP, and MF ES trunks as described in the previous sections. The SN07 software load is required on the CS2K core. The GC070 software load is required in the GWC. The PNM07 software load is required on the CS2M.

97.6 Limitations and restrictions

The TGCP PKT-SP-TGCP-I05-030728 TGCP specification limits support of MF trunk interconnection to a LEC Access Tandem. Interconnection to an Inter-Exchange Carrier (IEC) operator system is not supported.

The CS2K supports manual busying (ManBusy[1]) of ISUP and MF trunks configured on a GWC. The MO package of the TGCP PKT-SP-TGCP-I05-030728 TGCP specification does not support sending a busy signal from the GWC to the MG. When a ManBusy is performed on MF trunks hosted on a TGCP MG, the trunks will go CFL.

IAC (hybrid) configurations involving TDM elements are not supported in SN07.

IAC configurations involving APG components are not supported in SN07. Without APGs, limited support of DPTs is provided: services on DPTs requiring digit collection or applying tones are not supported.

The following limitations and restrictions apply to *both* MF OP and MF ES trunks:

- Hybrid trunk groups are not supported. A trunk group containing members on a GWC can not include members on any other legacy peripheral type (e.g. DTC).
- MF trunks are not supported on a GWC with lines, DPTs, or ACs.
- Test trunk calls are not supported.
- The outpulse (OP_) command at the MANUAL level of MAPCI is not supported.
- Field OPULSTYP in table TRKSGRP is restricted to ‘MF’.
- Only wink start trunks are supported. Field OSTARTSG in table TRKSGRP is restricted to ‘WK’.
- Echo cancellation is always provided by the MG. Field ESUPR is restricted to ‘N’. Field ECSTAT in table TRKSGRP is restricted to ‘EXTERNAL’ or ‘INTERNAL’.
- Coin control signals are not supported. A coin control signal, if sent from the far-end, will be ignored. Field CCONT in table TRKSGRP is restricted to ‘NO’. Although coin control is not applicable to ES trunks, field CCONT is still restricted to ‘NO’.
- Only Ringback signal of ‘MW’ is supported in the CS2K. Field RNGBCK in table TRKSGRP is restricted to ‘NO’ or ‘MW’.

  The MG is responsible for handling the ringback signal sent from the far-end. The CS2K will process all ringback requests as a ‘MW’ ringback request.
- This activity supports operator and 911 *originations* **only** for **line** MGs approved for deployment with the Integrated Access Cable solutions.

[1]i.e., BSY MB from the TTP MAP level

Operator and 911 originations on PRI, ISUP, and DPT trunks are not supported.

Service interactions may result in the conferencing or transfer of an OP or ES trunk into a call. This activity supports interoperability with the following agent types when a service interaction[1] results in a connection with either an OP or ES trunk:

— DPT

— ISUP trunk

— PRI trunk

— line

- Interworking with legacy peripherals is not supported.
- Call forwarding to OP and ES trunks is not supported.

The following limitations and restrictions apply to *MF OP trunks only*:

- Exchange Access Operator Services Signaling (EAOSS) is not supported. Field EAOSS in table TRKGRP is restricted to 'N'.
- Hold type of joint hold is not supported. Field HOLDTYPE in table TRKGRP is restricted to 'TERMHOLD' or "NOHOLD".
- Only ANI request types of reversal is supported. Field ANI_REQUEST in table TRKGRP is restricted to 'REV'.

The following limitations and restrictions apply to *MF ES trunks only*:

- B911 interconnection is not supported. An ES trunk group is supported for E911 Tandem interconnection *only*.
- Incoming and two-way trunks are not supported. Field DIR in tables TRKGRP and TRKSGRP is restricted to 'OG'.
- Field ANI in table TRKGRP is restricted to 'ANISPILL'. The value 'ANISPILL' signals the dialed digits (i.e., 911) followed by the ANI digits. The values 'NOANI' and 'OUTPULSE' are not supported.
- The switch hook status field, SWST, in table TRKGRP is restricted to 'DC'. The value 'DC' signals an onhook towards the E911 tandem when the originating subscriber goes onhook. The values 'AC' and 'ADC' are not supported.

  Note the switch hook status tone field, SWSTTN, in table TRKGRP is only applicable when field SWST is set to 'AC' or 'ADC'. Therefore, field SWSTTN is ignored.
- The forced disconnect timing field, FDISCTIM, in table TRKGRP is restricted to '0'. Forced disconnect timing is not supported.

[1]Examples of service interactions include, but are not limited to, three-way calling and call transfer. Call forwarding is excluded. Call forwarding to an OP or ES trunk is not supported.

- The disconnect tone type field, DISCTON, in table TRKGRP is specific to B911. This field is not supported. The value provisioned for this field is ignored.
- The integrity tone time field, INTTT, in table TRKGRP is specific to B911. This field is not supported. The value provisioned for this field is ignored.
- Field BILLDN in table TRKGRP is not supported. This field is PRI specific and 911 originations on PRI trunks are not supported. The value provisioned for this field is ignored.

The following limitations and restrictions apply to *both* ISUP IT and ATC trunks:

- feature interactions involving digit collection are not supported including, but not limited to:
  - — CFRA
  - — DISA
  - — AIN

97.7 Interactions

This activity supports interactions between ISUP IT, ISUP ATC, MF OP, and MF ES trunks and the following line based services:

- Three way calling
- Call Transfer
- Call Forwarding (all variations except CFRA)[1]
- Call Waiting

Transparency with the legacy DMS service set is provided for these services. The same service interactions and restrictions that exist with legacy MF OP and ES trunks also apply to MF OP and ES trunks configured on a GWC.

This activity supports interoperability with the following agent types when a service interaction, such as three way calling or call transfer, results in a connection with either an OP or ES trunk:

- DPT
- ISUP trunk
- PRI trunk
- line

[1]Call forwarding for operator and 911 is not supported in the legacy switching system. Attempts to call forward to operator or 911 is blocked by the switch software. CS2K is consistent with legacy and blocks attempts to call forward.

98.1 Feature name

SCTP (Stream Control Transmission Protocol) Enhancements on XA-Core

98.2 Description

Many of Nortel's customers plan to migrate their existing ATM networks to IP networks in the near future. These customers perceive that IP networks might be cheaper to deploy than ATM networks, or that IP will become the end-user convergence protocol for developing new revenue-generating services.

By adding IP interfaces to the existing MG4K product, our customers will be able to migrate from an ATM network to an IP network simply by upgrading existing equipment. Thus the birth of MG4K-IP product.

The protocol chosen for communication between the MG4K-IP and the XA-Core via the IP network cloud is SCTP.

SCTP has been designed to overcome the limitations of TCP as well as supporting the extra requirements of PSTN signalling over IP networks. (Please refer to SCTP RFC for more details of TCP limitations as well as SCTP requirements.)

In short, SCTP offers:

- Acknowledged error-free non-duplicated transfer of user data
- Application-level segmentation to conform to discovered MTU size
- Sequenced delivery of user datagrams within multiple streams, with an option of order-of-arrival delivery for individual datagrams
- Optional multiplexing of user datagrams into SCTP datagrams, subject to MTU size restrictions
- Enhanced reliability through support of multi-homing at either or both ends of the association.

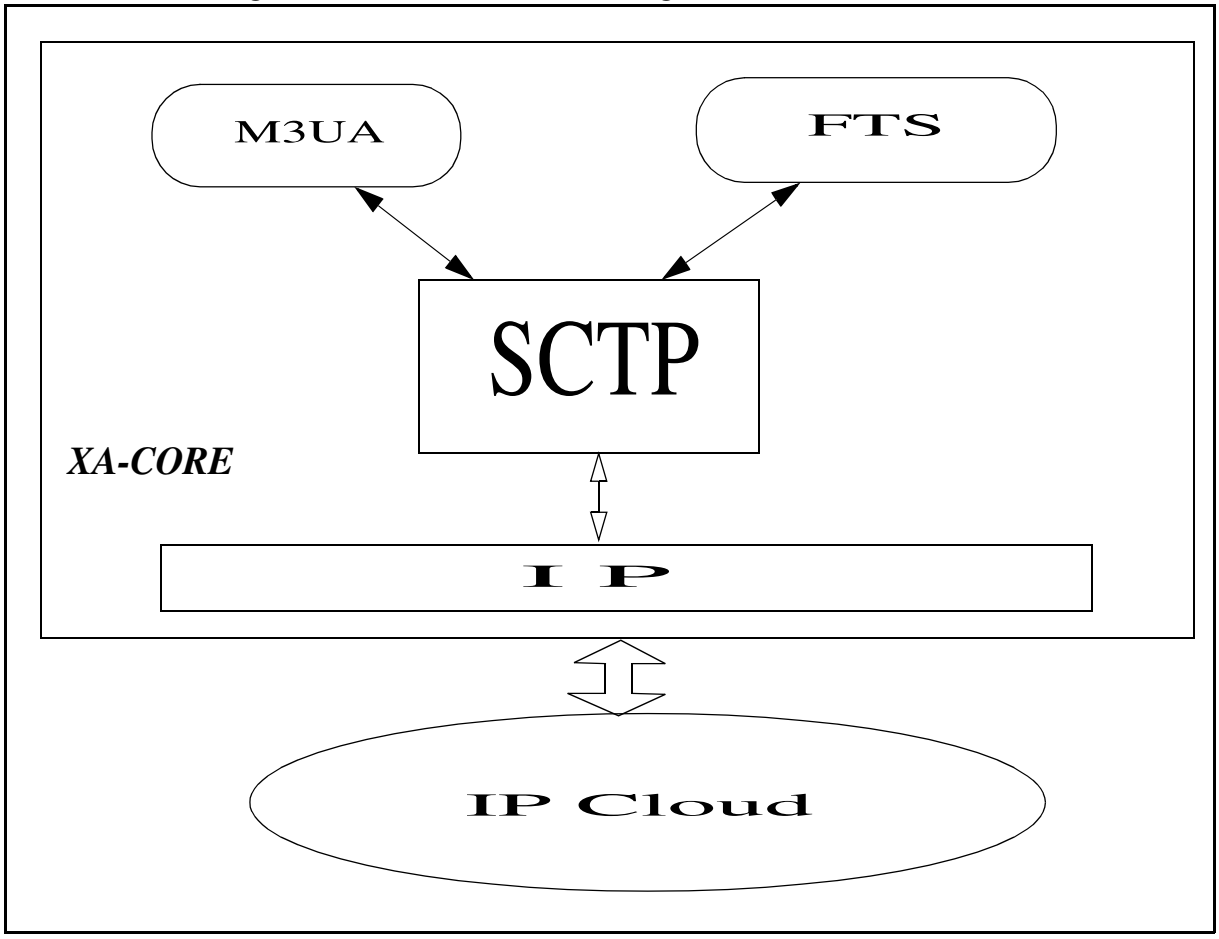
This feature aims at enhancing the existing SCTP framework on the XA-Core, implemented under feature A59023997, so as to

- achieve the desired messaging rate of 4500 msg/sec from the current 400 msg/sec. This will translate to supporting 30 MG4k-IPs

- improve the message transmission reliability as well as sustainability

The Figure 1 on page 995 shows the functional behaviour for SCTP

Figure 1 Functional Behavior Diagram



98.3 Hardware Requirements or Dependencies

There are no hardware requirements or dependencies introduced by this feature

98.4 Software Requirements or Dependencies

Table 1 Project Requirements

#	**Requirement number and source document/version/page** **Requirement text**	**Critical** (R/S/D) **Compliant** (Y/N/C/P/Cnn)	**Comments**
1		R	
	Increase SCTP messaging rate from 400 msg/sec to 4500 msg/sec	Y	
2		R	
	Operate within the EN task timing restrictions with regards to latency and blocking	Y	This requirement came from the group responsible for EN task under which SCTP will run at message reception. This is an internal requirement
3		R	
	Add a new method in the Upper layer API - sctp_fast_send	Y	This requirement came from the IP-CCM group. This is also an internal requirement
4			

Compliant value definitions:

- Y – Element will be compliant upon feature completion.
- N – Element will not be compliant upon feature completion.
- C – Existing code currently compliant and will not be affected.
- P – Element will be partially compliant at feature completion.
- Cnn – Element conflicts with element number “nn”. The element that will be compliant will have value of “Y” for compliancy.

98.5 Limitations and restrictions

None

98.6 Interactions

SCTP is the transport layer protocol used by M3UA and CALEA. There will be no changes to the APIs for these applications

99: Functional Description (FN): A00003650

99.1 Feature name

A00003650: MG4K-IP Logs Core Component

99.2 Description

This feature provides logs for the MG4K-IP product in SN07. The log series MG4I is introduced by this activity. The following logs are supported:

- MG4I 501 - Stream Control Transmission Protocol (SCTP) IP Control Connection Maintenance (CCMT) Core connection state change
- MG4I 502 - SCTP IPCCM Peer connection state change
- MG4I 300 - Media Integrity Failure

The MG4I 501 and 502 logs are used by the IPCCM subsystem to generate logs to track the state transitions of SCTP connections from the MG4K-IP node to the core and peer nodes. The MG4I 300 is generated for problems reported by the corresponding subsystem in the CEM/GEM on the MG4K-IP node. However, the changes required in the CEM/GEM for these logs is to be implemented in SN08.

99.2.1 SCTP IP CCMT connection state change

The MG4I 501 log is generated for state change of the SCTP connection between the call server and the MG4K-IP node.

```
RTPH *** MG4I501 MAY02 22:04:48 800 INFO SCTP Core Conn State Change
      State Change From: ESTABLISHED To: CLOSED
      Reason : FAR END DISCONNECTED
      From Node : CORE (47.108.11.3:5050; Associd: 10)
         To Node : SMG4 6 (47.142.211.1:5050)
      Location: SPM 6 Type: SMG4 Fabric: IP
```

The MG4I 502 log is generated for state change of the SCTP connection between an MG4K-IP node and its peer node.

```
RTPH MG4I502 MAY02 22:04:48 800 INFO SCTP Peer Conn State Change
   State Change From: ESTABLISHED To: CLOSED
   Reason : FAR END DISCONNECTED
   From Node : SMG4 6 (47.108.11.3:5050; Associd: 10)
      To Node : SMG4 5 (47.142.211.1:5050)
   Location: SPM 6 Type: SMG4 Fabric: IP
```

99.2.2 Media Integrity Failure

The MG4I 300 log is generated for any integrity failure detected in the media path for a call.

```
RTPH MG4I300 SEP04 03:41:44 2801 TBL  Media Integrity Failure
      Call Type: G711
      Src IP: 47.108.11.3:5050 Dest IP:47.142.211.1:5050
      Description: RTCP Media Integrity Timer Expired
      Location: SPM 1    Type: SMG4    Fabric: IP
```

99.3 Hardware Requirements or Dependencies

This feature is specific to the MG4K-IP product line with associated hardware.

99.4 Software Requirements or Dependencies

No new software dependencies are introduced by this activity.

The MG4I 300 log is generated for problems reported by the corresponding subsystem in the CEM/GEM on the MG4K-IP node. However, the changes required in the CEM/GEM for these logs is to be implemented in SN08.

99.5 Limitations and restrictions

None.

99.6 Interactions

These logs are accessible through the LOGUTIL CI interface in SOS. The craftsperson can access the MG4K-IP specific logs as follows:
>logutil
>open MG4I
>back all

100: Functional Description (FN): A00003651

100.1 Feature name

MG4K-IP XA-Core Support for IPCCM (IP Control Connection Management) & OAM (Operations Administration & Maintenance)

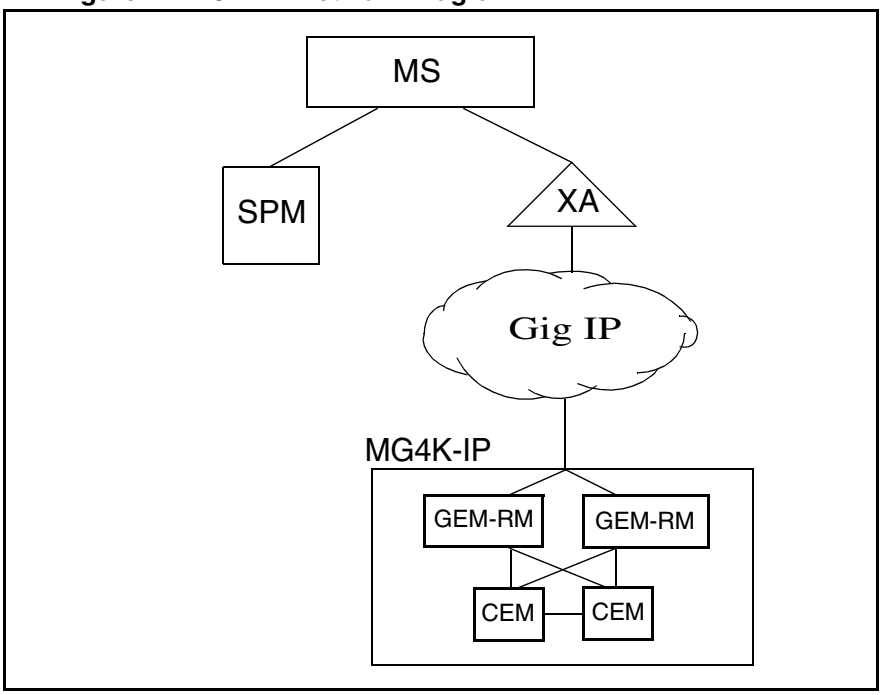
100.2 Description

This activity is a part of the set of SN07 activities associated with the MG4K-IP Program. This program provides the capability of IP connected MG4K gateways as part of the general Succession Voice-Over-Packet portfolio.

Within this document, the term MG4KIP refers to a node of type SPM, of class SMG4, or IW, which is connected to the XA-Core via a Gigabit Ethernet Network.

This activity's focus is on the MG4KIP "Data Link Management" and "Data Link OAM" aspects.

Figure 1 MG4KIP Network Diagram



100.3 Hardware requirements

No new hardware dependencies are introduced by this feature per se. This feature utilizes existing GEM-RM hardware (Product Equipment Code = NTLZ20BA) and other existing hardware associated with the MG4K platform.

100.4 Limitations and restrictions

In Succession Release SN08, a maximum of 30 IP-based MG4K nodes are supported in a given office.

100.5 Interactions

This feature provides the mechanism and interfaces for MAPCI-based management of the Xa-Core-To-MG4KIP (aka “core”) connections, and MG4IP-To-MG4KIP (aka “peer”) connections.

The maintenance paradigm is based directly on what exists today for ATM-based MG4K nodes, in order for the OAM interface for the nodes to be consistent, regardless of the network fabric type.

100.11 Command interface (CI)

100.11.1 New/modified commands

Table 1 New or modified commands

Command name	NEW, CHANGED OR DELETED	New name (if renamed)	Directory/MAP level name	MENU/NON-MENU /HIDDEN
IPCONN	New		SPMDIR/SPM	Menu
CORECONN	New		IPCONN/ IPCONN	Menu
BSY	New		CORECONN/ CORECONN	Menu
RTS	New		CORECONN/ CORECONN	Menu
PEERCONN	New		IPCONN/ IPCONN	Menu

This feature introduces 3 new map levels and 4 new subcommands. The 'IPCONN' map level is visible when posting any SPM at the 'PM' level. (This map level is consistent with the existing 'ATMCONN' map level which is also visible when posting any SPM from the PM level).

For any SPM which has GEM-RMs provisioned, selecting the IPCONN map level will provide access to the 'Coreconn' and 'Peerconn' MAP levels, for display and management of the core and peer connections respectively. This functionality is consistent with what exists today when selecting the ATMCONN map for SPMs which have ATM-RMs provisioned.

For more details, please refer to the CI section of this document.

101: Functional Description (FN): A00003662

This ducument presents an overview of the software functionality to be deliverred in this feature. It also helps determine if customer documentation is required.

101.1 Feature name

Trimodal Call Server Bridge Maintenance.

101.2 Description

Currently, in SN06, the XA-Core can support only one packet bearer fabric, ATM or IP.

The Bridge Maintenance should be able to support multi bearer fabric Call Server configurations. In SN07, Tri-modal Call Server configurations will support ATM and IP as external bearer fabrics at the same time. Bridge Maintenance should be able to manage the bridges so that ENET-ATM, ENET-IP and ATM-IP connections can be realized.

To realize ATM to IP bridging, two bridges will be inserted in the call. One bridge provides the ENET-ATM connection and the other one provides the ENET-IP connection. These two bridges will then be connected at the ENET providing the ATM to IP end to end path. See Figure 1.

This feature does not cover the OM and logs impacts. The OMs and l;ogs work for the Bridge Manager area will be covered in feature A0003947 (Tri-modal Logs and OMs).

102.1 Feature name

A00003667 - SESM NB Alarm Interface Changes required for OSS

Succession Element and Subelement Manager Northbound Alarm Interface Changes required for OSS

102.2 Description

This SN07 feature (A00003667 - SESM NB Alarm Interface Changes required for OSS) modifies some of the existing functionality in the SESM alarm system. Primarily, it refines and updates the CORBA interface to include data that enhances the usability of the alarm notifications. This includes a resynchronization mechanism, improved performance, and a change to the data passed to include additional alarm information.

The majority of these changes do not impact the customer as they are transparent to the user. The customer areas impacted include:

- SESM Alarm GUI - removal of acknowledge and de-acknowledge interface. This change is discussed in the configuration section.
- SESM Syslog Alarm Feed - this feed will be disabled by default as the primary northbound feed will be CORBA notifications to the IEMS. The resulting Nortel Standard or SCC2 logs should be identical to those generated in previous releases. This change is discussed in the configuration section.
- Change to alarm log generated when SESM cannot communicate with a managed device. Previously, the log was owned by the device, now it will be a SESM alarm and will be a major instead of a critical. This change is discussed in the fault management section.
- Creation of a log to identify when SESM is encountering difficulties generating CORBA notifications for alarm events. This change is discussed in the fault management section.
- Creation of a log upon startup and shutdown of SESM.

102.3 Hardware Requirements or Dependencies

N/A - No new hardware is required.

102.4 Software Requirements or Dependencies

The change to the interface requires that all clients of the SESM alarm system are upgraded to be able to continue to use the alarm notifications. Without

being upgraded, existing clients of the alarm system notifications will not function.

102.5 Limitations and restrictions

With this feature, the SESM alarm GUI no longer allows alarm acknowledgements. This ability is present in the IEMS alarm GUI and all alarm acknowledgements should be done there.

102.8 Glossary

Term	Description

103: Functional Description (FN): A00003669

103.1 Feature name

Media Gateway 4000 - Internet Protocol (MG4K-IP) Prep Feature

103.2 Description

MG4KIP Product to support following table control changes

- FABRIC field is included in table MNNODE
- It enforces restriction on RM datafill based on the FABRIC type in MNNODE.
- RM datafill restriction in table MNCKTPAK.
- Signalling Address datafill in MNMGPIP for MG4K (and IW) tuples
- VLAN TCIs datafilled in MNMGPIP for Bearer and Signalling paths on GEM RMs
- DIFFSERV codepoints for signalling and voice data added to table MNIPPARM
- Media Integrity Indicator added to table MNIPPARM

Note that the signalling address design description is described under feature A00003659.

103.3 Hardware Requirements or Dependencies

No new hardware requirements for this feature.

103.4 Software Requirements or Dependencies

This feature requires SN07 loads in the call server, MG420 loads in the MG4K CEMs and GEM20 in the GEM RMs.

103.5 Limitations and restrictions

- New SGFABRIC field is only for the MG4K SPMs. It is not part of the IW or DMSCP SPMs node datafill.
- SGFABRIC field change is restricted - certain conditions must be met before the tuple is allowed to change.
- Signalling IP address changes are restricted on MG4K - GEM must be out of service because this would cause node isolation.

- Signalling IP address cannot be enabled unless a valid signalling IP address has already been datafilled. Once enabled, the signalling IP address cannot be changed without disabling it first.
- VLAN TCI-VID for bearer is restricted to 255 on NTLZ20AA, BA, and CA cards due to Broadcom Calisto DSP specification.
- Media Integrity Indicator requires RTCP to be enabled prior to enabling MI.

103.6 Interactions

This feature interacts with functionality provided by A00003659, which did not include an FN or a CN section. All table changes are documented in this feature instead.

104: Functional Description (FN): A00003672

104.1 Feature name

NTLZ20CA Core Definition

104.2 Description

This feature provides the software support for the new NTLZ20CA 1000bLX (1300 nm, single mode) w/ LC connector peccode for the IP MG4K/IW GEM card.

104.3 Hardware Requirements or Dependencies

There are no hardware requirements or dependencies being introduced by this feature. This is simply adding a new peccode to the existing list of supported peccodes for MG4K and IW SPMs.

Note: The actual new card hardware is NOT required for this peccode to be implemented as a supported peccode for MG4K.

104.4 Software Requirements or Dependencies

There are no software requirements or dependencies being introduced by this feature. This is simply adding a new peccode to the existing list of supported peccodes for MG4K and IW SPMs.

104.5 Limitations and restrictions

There are no limitation introduced by this feature. This is simply adding a new peccode to the existing list of supported peccodes for MG4K and IW SPMs.

104.6 Interactions

There are no interactions with other features introduced by this feature. This is simply adding a new peccode to the existing list of supported peccodes for MG4K and IW SPMs.

104.8 Glossary

Term	Description
IP	Internet Protocol
GEM	Gigabit Ethernet Module

105: Functional Description (FN): A00003687

105.1 Feature name

TOPS Wireless Intelligent Network Integration

105.2 Description

This feature enhances Table TOPSTLDN, introduced in SN06, to make it easier to deploy and maintain TOPS feature A00000816: "TOPS Wireless ADACC with Release." The enhancement is to allow the temporary local directory number (TLDN) to be chosen based on the identity of the originating mobile switching center (MSC). MSC is a generic term for a wireless (cellular) end office.

This feature also allows TOPS to send short text messages to a wireless phone using Short Message Service (SMS). TOPS can send short text messages using either Interim Standard 41 (IS-41) or Global System for Mobile Communications (GSM) specifications. IS-41 and GSM provide different definitions of a Mobile Application Part (MAP) layer which sits on the Transaction Capabilities Application Part (TCAP) layer of Signalling System #7 (SS7).

This feature also adds some preparatory work for supporting ADACC with Release in a GSM environment. This function cannot be used at this time.

Finally, this feature removes operational measurement (OM) group IS41TOPS and replaces it with three new OM groups. The new groups can be used for GSM as well as IS-41 and for SMS as well as wireless ADACC.

105.3 Background

105.3.1 TOPS support of wireless intelligent network (WIN) capabilities

In SN06, TOPS feature A00000816: "TOPS Wireless ADACC with Release" added the capability to release cellular directory assistance (DA) calls back to the originating MSC for call completion. This release is accomplished using IS-41 messages to transmit the requested directory number (DN) from TOPS to the MSC. The MSC then releases the trunk to TOPS and connects forward to the requested DN. Prior to this SN06 feature, such calls were "hairpinned," meaning the trunks to and from TOPS stayed in the voice path between the calling and called parties for the duration of the call.

The IS-41 TCAP messages used for the TOPS DA call completion call flow are part of the Wireless Intelligent Network (WIN) modifications to IS-41. These modifications are described in standard IS-771.

A successful IS-41/IS-771 ADACC with Release call flow is depicted in figure 1 on page 1017.

105.3.2 TOPS support of short message service (SMS)

TOPS positions can already send short text messages using an e-mail interface over the Internet. Such an SMS message might contain the address of the requested listing on a DA call. The TOPS switch is not aware of these messages.

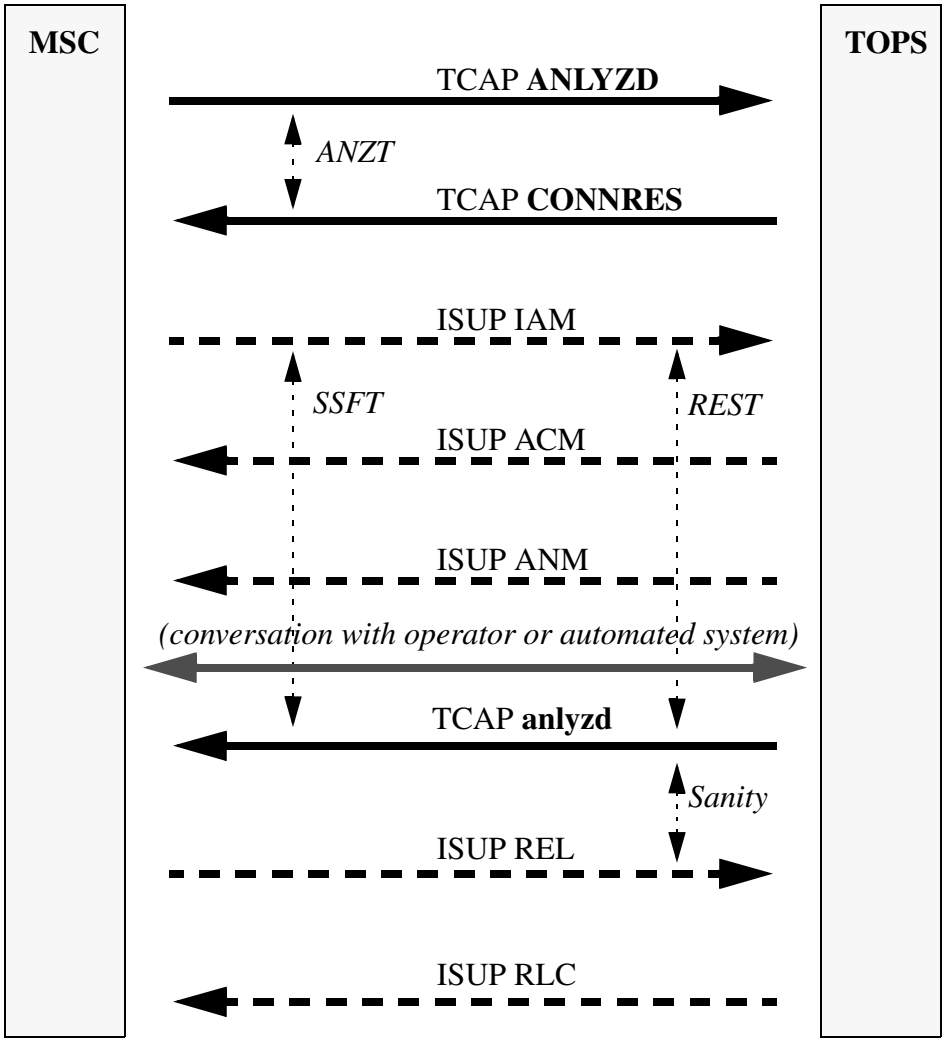
TOPS switches have supported SS7 TCAP applications for a long time, and SS7 TCAP is a common way to transport SMS in today's wireless networks. This feature allows TOPS to send SMS using either IS-41 or GSM, which are based on SS7 TCAP. By using TCAP to send TOPS SMS, the customer can avoid IP security and connectivity issues. The customer can also track the performance of TOPS SMS via operational measurements (OMs) and logs.

105.4 Specifications

This feature is based on the following IS-41 and GSM specifications:

- ANSI-41D (Wireless Intersystem Operations, formerly IS-41)
- 3GPP TS 29.002 V4.C.0: Mobile Application Part (MAP) specification, phase 4

Figure 1 Successful TOPS IS-41 ADACC with release, introduced in SN06



In the above diagram,

- A horizontal solid arrow and a message type in **bold** represents a TCAP message as defined in the IS-41 WIN specifications.
- A horizontal dashed arrow represents an ISUP message.
- A vertical dashed arrow on the MSC side represents an IS-41-defined timer. A vertical dashed arrow on the TOPS side represents an internal TOPS timer.
- The horizontal double-ended arrow represents two-way speech path between the wireless caller and TOPS.

105.5 Feature overview

This feature contains the following components. The work is divided into two areas, with some changes affecting both.

105.5.1 Wireless ADACC with Release

- Modified DMS table TOPSTLDN (TOPS Temporary Local Directory Number) which allows the customer to datafill TLDNs to be used in TOPS IS-41 call flows. Previously, any TLDN could be sent to any wireless end office. This feature allows TLDNs to be chosen on a per MSC basis. This helps the telco when they are activating WIN TOPS call flows in new MSCs (and desire a smaller or different TLDN range) but do not wish to affect existing MSCs.
- New table MSCIDMAP (MSC Identifier Mapping) which provides a mapping from MSC identifiers (MSCIDs) to entries in Table TOPSTLDN. This mapping allows the telephone company to control which TLDNs are sent to which MSCs.
- Addition of a new RLT type, RLT_GSM, to Table ISUPTRK. This table already allows datafill of three different RLT types: RLT_REL, RLT_FAR, and RLT_IS41. **Value RLT_GSM is for future use and cannot be datafilled at this time.**
- Removal of tuple NUM_OF_IS41TOPS_EXT_BLKS in Table OFCENG. This parameter controlled the number of extension blocks allocated for TOPS IS-41 calls. This parameter had to be set manually. It is replaced by to NUM_OF_WIN_TOPS_EXT_BLKS in Table OFCAUT. Table OFCAUT automatically allocates extension blocks for IS-41 and GSM calls. Also, the name of the EXT block is changed from IS41TOPS_EXT_BLK to WIN_TOPS_EXT_BLK. This name shows up when using OMSHOW to view the registers in OM group EXT.
- Addition of tuple RLT_FOR_GSM in Table TOPSFTR. This tuple will be used to control GSM ADACC with Release. **Tuple RLT_FOR_GSM is for future use and cannot be set to 'Y' at this time.** GSM ADACC with Release is under the control of existing Software Optionality Control (SOC) option OSEA0104, and tuple RLT_FOR_GSM acts as an on/off switch once the SOC option is enabled. This SOC option also controls IS-41 ADACC with Release.

105.5.2 Short message service (SMS)

- TOPS support of the following TCAP SMS messages, as described in the specifications listed in section 105.4. These messages allow TOPS to send short text messages to wireless phone callers and receive acknowledgment from the message center (MC).
  - — IS-41 SMSDeliveryPointToPoint INVOKE (from TOPS to MC)

— IS-41 SMSDeliveryPointToPoint RETURN RESULT (from MC to TOPS)

— GSM ForwardShortMessage (from TOPS to MC)

— GSM ForwardShortMessage Ack (from MC to TOPS)

- New field, WIRELESS, in Table TOPSTOPT. This field allows the customer to mark a trunk group as connecting to a wireless network. If so, the customer can datafill whether the network uses IS-41 or GSM for TCAP messaging. This field is used when TOPS sends a short message on a non-WIN call. On a WIN call the network type is already known.
- New TOPS parameter in Table TOPSPARM, SMS_LOG_MC_FAILURE. This parameter controls whether a TOPS131 log is generated when the message center returns a negative acknowledgment following a TOPS SMS attempt. A negative acknowledgment always pegs OMs in new groups SMSTOPS and TC7WRLSS, but the TOPS131 log can provide additional information.
- New TOPS parameter in Table TOPSPARM, SMS_TIMEOUT. This parameter controls the duration of the timer which is set when TOPS sends an SMS. If TOPS does not receive a response from the message center when the timer expires, the message is considered timed out, and resources are freed. See “105.7 TOPS short message service (SMS)” on page 1025 for more information.
- A new SS7 global title translation name, MDNMCGT. This translation name is used to route IS-41 and GSM short messages to the correct message center (MC).
- New DMS table TOPSMCDB for lab testing of TOPS SMS.
- Two additional DMS SS7 subsystems, TIS41SIM and TGSMSIM, to be used for TOPS lab testing.

105.5.3 Changes affecting both areas

- Creation of three new operational measurement (OM) groups to record events for IS-41 SMS, GSM SMS, IS-41 WIN, and GSM WIN[1]. The new groups will record application level events as well as transport level events. The new OM groups are SMSTOPS, WINTOPS, and TC7WRLSS. These three groups replace group IS41TOPS, which is removed.
- Update to TOPS131 log added in SN06. This feature allows the log to be used for GSM as well as IS-41, and for short message service as well as ADACC service.

[1]GSM WIN is known as Customised Applications for Mobile network Enhanced Logic (CAMEL). TOPS uses the term Wireless Intelligent Network (WIN) to describe both IS-41 WIN and GSM CAMEL calls flows. These call flows attach a TOPS operator or service node to provide a transient service, and then the MSC releases TOPS and the wireless call proceeds.

- A new DMS Signaling System #7 (SS7) subsystem, GSMTOPS. This subsystem resides on the TOPS node and will initially be used to send and receive GSM SMS messages. The subsystem number is datafilled in Table C7LOCSSN.

This feature does not introduce any TOPS Automatic Message Accounting (AMA) changes.

105.6 TLDN selection by mobile switching center identifier (MSCID)

105.6.1 Changes to Table TOPSTLDN

Prior to this feature, Table TOPSTLDN defined one large pool of TLDNs to be used on WIN calls. Several tuples might be present in Table TOPSTLDN, but these tuples were combined together to make a single pool. When an IS-41 AnalyzedInformation (ANLYZD) message arrived from an MSC, TOPS would pick any idle TLDN from the overall pool and send it to the MSC in the ConnectResource (CONNRES) message. These messages are shown in Figure 1 on page 1017.

This strategy works for a few MSCs but is not sufficient when deploying the feature across many MSCs. If hundreds of MSCs from across a region are using TOPS IS-41, they must all share the same TLDN pool. This means that when the customer is initially provisioning their network for TOPS IS-41, they must ensure that every TOPS TLDN is available and usable in every MSC as well as in every intermediate tandem switch on the way to the TOPS switch.

A better approach is to allow differentiation of TLDN chosen based on the identity of the originating MSC. To do this requires a change in Table TOPSTLDN as well a new table, MSCIDMAP, which is described in the next section.

This feature changes Table TOPSTLDN such that each group of TLDNs is identified by a pool ID. A maximum of 2,000 pools can be datafilled, and a maximum of 2,000 TLDNs can be datafilled. The pool ID is used in Table MSCIDMAP. The following figures show the change to Table TOPSTLDN.

Note that each tuple defines a range of TLDNs. In Figure 2, the following ranges of TLDNs are defined:

- 2012201234 to 2012201234: 1 TLDN
- 2013364400 to 2013364899: 500 TLDNs
- 2018591400 to 2018591489: 90 TLDNs

Figure 2 Table TOPSTLDN in SN06, prior to this feature

```
TABLE: TOPSTLDN
                   KEY
---------------------
2012201234 2012201234
  20133644   20133648
 201859140  201859148
```

This feature identifies each range of TLDNs with a pool ID, and expands the TLDNs to 10 digits for better readability. So the datafill in Figure 2 would appear as follows in SN07. This datafill still represents 591 TLDNs.

Figure 3 Table TOPSTLDN in SN07

```
TABLE: TOPSTLDN
POOLID   FROMDIGS     TODIGS
---------------------------
0      2012201234 2012201234
1      2013364400 2013364899
2      2018591400 2018591489
```

TLDN ranges in Table TOPSTLDN are allowed to overlap. This helps the customer when they are verifying the function on a new MSC while other MSCs are processing live traffic. The following figure shows overlapping TLDN ranges.

Figure 4 Table TOPSTLDN in SN07

```
TABLE: TOPSTLDN
POOLID   FROMDIGS     TODIGS
---------------------------
0      2012201200 2012201259
1      2012201250 2012201269
2      2012201200 2012201200
```

105.6.1.1 TLDN methodology

The telco's goal should be to have one large TLDN pool, or several smaller TLDN pools, serving all MSCs. This allows the TLDNs to be selected quickly. So the goal should be to minimize the number of tuples in Table MSCIDMAP (see next section).

The main reason for these tables is to assist in deployment of TOPS wireless intelligent network services. Established MSCs might be using hundreds of TOPS TLDNs, while a new MSC might need TLDNs from the same pool, but

only a small subset while the feature is being set up. Once the feature is verified on the new MSC, the MSC's datafill can be changed so it uses the main pool.

The telco providing operator services will reserve the TOPS TLDNs for these call types. Even in a nationwide network it should be possible to find enough TLDNs, since the TLDNs chosen probably begin with the NPA-NXX of the TOPS switch. If the TOPS switch supports several NXXs, this makes finding available DNs easier.

2,000 is the maximum number of TLDNs which can be datafilled on a TOPS switch. Due to the short holding time of under one second, a couple hundred TLDNs should be enough to handle heavy WIN TOPS traffic. If problems begin to occur, TLDNs can remain held for up to 30 seconds before the TLDN selection code re-uses them.

105.6.1.2 Dump and restore for Table TOPSTLDN

When upgrading from SN06 to a later release, each TOPSTLDN tuple from the SN06 side is restored with sequential pool IDs starting at 0, and each TLDN is expanded to 10 digits. So the Figure 2 and Figure 3 represent a dump and restore from SN06 to a later release.

105.6.2 New table MSCIDMAP

This feature introduces Table MSCIDMAP which allows the selection of TLDNs on a per-MSC basis.

The MSC Identifier (MSCID) is defined in IS-41D, chapter 5, section 6.5.2.82. It consists of a market identifier (16 bits) and a switch number (8 bits). It is a mandatory field in the IS-41 ANLYZD message which initiates a TOPS IS-41 ADACC with Release call.

When TOPS receives an ANLYZD, it selects an idle TLDN from Table TOPSTLDN and sends it back to the MSC in the TCAP CONNRES message. This feature allows TOPS to select a TLDN based on the MSCID in the ANLYZD. This is done using new Table MSCIDMAP. Table MSCIDMAP maps the MSCID from the ANLYZD to a list of TLDN pool IDs from Table TOPSTLDN. TOPS then selects an idle TLDN from one of these pools.

The following figure shows sample datafill in Table MSCIDMAP. Up to 255 TLDN pool IDs can be datafilled against a given MSCID.

Figure 5 Table MSCIDMAP

```
TABLE: MSCIDMAP
MSCID          POOLIDS
----------------------
12  100  (0) (1) (2) $
65    2      (0) (1) $
65    3          (0) $
66   27          (1) $
66   29      (1) (2) $
700   2          (2) $
```

105.6.2.1 Switch number wildcarding

Because a TOPS switch might be serving hundreds if not thousands of MSCs, Table MSCIDMAP is designed with some wildcarding capabilities. It is not necessary to datafill every switch number within a market ID. If a tuple is datafilled with just the market ID, and no switch number, the tuple will match all MSCIDs with the same market ID.

It is also possible to datafill several market ID and switch number combinations for the same market ID, and then add a market ID wildcard tuple for all other switch numbers using the same market ID.

The following figure shows examples of switch number wildcarding. All MSCIDs beginning with market ID 65 will match the first tuple, except MSCID (65, 3) which matches the second tuple.

Figure 6 Table MSCIDMAP with switch number wildcarding

```
TABLE: MSCIDMAP
MSCID          POOLIDS
----------------------
65  $    (0) (1) (2) $
65  3          (0) $
66 27          (1) $
66 29      (1) (2) $
67  $      (0) (2) $
```

105.6.2.2 Market ID wildcarding

Tuple {$, $} matches any MSCID not otherwise matched in Table MSCIDMAP. If present, it is the default tuple. If the MSCID in the TCAP ANLYZD message does not match any other tuple in Table MSCID (including any tuples with wildcarded switch numbers), tuple {$, $} is used.

Figure 7 Table MSCIDMAP with default tuple

```
TABLE: MSCIDMAP
MSCID          POOLIDS
----------------------
 $  $    (0) (1) (2) $
65  3            (0) $
66  $            (1) $
66 29        (1) (2) $
67  $        (0) (2) $
```

105.6.2.3 Failure to match MSCID

If the MSCID for a given call does not match any tuple in Table MSCIDMAP (either explicitly or via wildcarding), a RETURN ERROR is sent to the MSC so the wireless 411 call is disconnected. A TOPS131 log is generated indicating no TLDNs are available.

A failure to match implies that the market ID wildcard tuple is not present, since this tuple matches any MSCID.

105.6.2.4 Dump and restore

When performing a switch upgrade from an SN06 TOPS switch to a later release, the following steps are performed automatically:

1. Table TOPSTLDN is restored as described in section 105.6.1.
2. If TOPSTLDN contains any datafill on the restore side, a {$, $} tuple is created in Table MSCIDMAP containing all pools from Table TOPSTLDN.

This will create one large pool serving all MSCs, which is equivalent to the SN06 function of Table TOPSTLDN.

105.7 TOPS short message service (SMS)

105.7.1 Message flow

This feature allows TOPS to send short text messages into the SS7 network. TOPS sends these messages when requested by the operator position or automated service node.The message flow is summarized below. Later subsections show message diagrams, OMs pegged, etc.

- A TOPS call arrives from a wireless (cell) phone. TOPS knows the calling party is using a wireless phone if at least one of the following conditions hold:
  - — The call originated with a WIN message transaction (ANLYZD/ CONNRES)
  - — New TOPSTOPT field `WIRELESS` indicates the calling trunk group is from a wireless network (non-WIN)

  When presenting the call to the Open Position Protocol (OPP) compliant position or Open Automated Protocol (OAP) compliant service node, TOPS indicates that the calling party is using a wireless phone.
- The operator position sends a short text message and a destination directory number (DN) to TOPS switch using OPP, or the service node sends a short text message and a destination DN using OAP.
- TOPS checks whether the destination DN is the same as the calling number. This feature allows TOPS to send an SMS to the calling party only. TOPS denies the SMS attempt with an appropriate OPP or OAP message if the destination DN is not equal to the calling number.
- TOPS decides whether to send SMS using IS-41 or GSM. This decision is made as follows:
  - — If the TOPS call originated using IS-41 WIN, TOPS already knows the originating wireless network type, and TOPS uses IS-41.
  - — If the TOPS call did not originate using IS-41 WIN, TOPS looks at the calling trunk group datafill in Table TOPSTOPT. New field `WIRELESS` in Table TOPSTOPT indicates whether the calling trunk is IS-41 or GSM. TOPS chooses to use IS-41 or GSM based on the contents of this field.
  - — If the TOPS call did not originate using IS-41 WIN, and calling trunk group is not marked as wireless in Table TOPSTOPT, TOPS sends a failure indication to the operator position or service node using OPP or OAP, respectively. The call is not a wireless phone call, and TOPS did not indicate to the position or service node that the call is from a wireless phone. The position or service node should not request an SMS when the calling phone is not a wireless phone.

- Once TOPS has decided which standard to use, TOPS composes an outgoing TCAP INVOKE containing the short message.
- To route the TCAP INVOKE, TOPS looks in the global title translation tables C7GTTYPE and C7GTT. This feature adds a new SS7 translation name, MDNMCGT, for routing short messages to the message center (MC). TOPS uses the destination number to index the global title translation tables. This will route the SMS to the calling party's home message center.
- TOPS sends the TCAP INVOKE. If the message is sent successfully, TOPS returns a success indication to the position or service node using OPP or OAP, respectively. If the message is not sent successfully, TOPS indicates the failure to the position or service node.
- TOPS starts an internal timer equal to the new `SMS_TIMEOUT` parameter in Table TOPSPARM. If this timer expires, a log and OM are generated to notify the telephone company.
- When the acknowledgment from the message center arrives, TOPS pegs an OM and/or generates a log based on the response (success or failure). TOPS does not send a notification to the position if the SMS succeeded or failed.

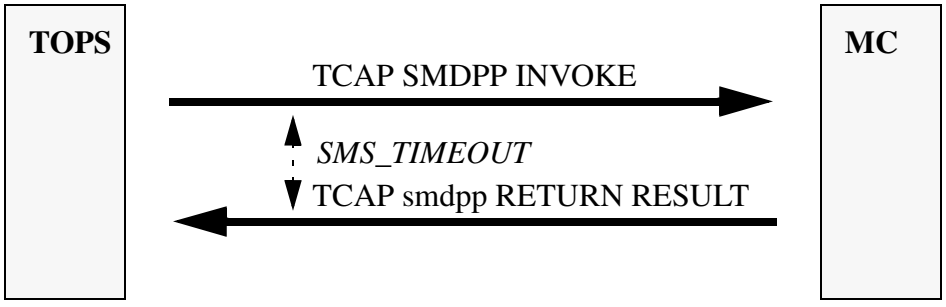
The following sections show diagrams of SMS messaging for IS-41 and GSM.

105.7.2 Successful IS-41 SMS transaction

In this scenario, TOPS sends the SMS to the message center, which responds with a positive acknowledgement. According to IS-41, the absence of a Cause Code parameter indicates success.

TOPS pegs OMs SMSSENT and SMSSUCC in group SMSTOPS (key `IS41`). TOPS also pegs OMs INVOKES and RETRESR in group TC7WRLSS (key `SMS_IS41`).

Figure 8 Successful TOPS IS-41 SMS to message center



105.7.3 Unsuccessful IS-41 SMS transaction

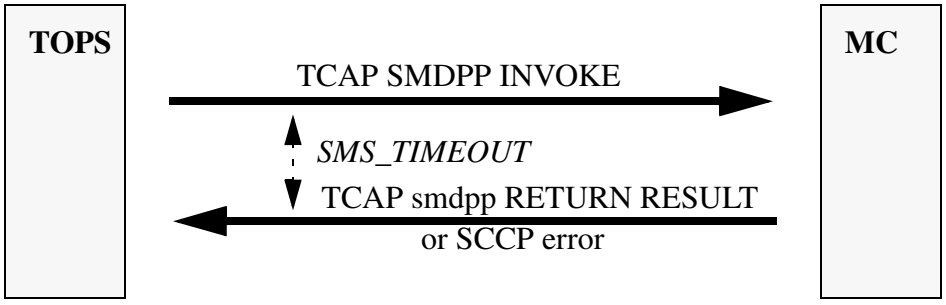
In this scenario, TOPS sends the SMS to the message center, but failures occur in the network, or the message center cannot process the SMS. TOPS receives a negative acknowledgment from an intervening node or from the message center, depending on where the error occurred. The message center's response contains a Cause Code field indicating why the message could not be delivered.

Possible reasons for failure include network problems, terminal (cell phone) problems, radio interface problems, and other miscellaneous problems (e.g. message format).

TOPS pegs OMs SMSSENT and SMSFAIL in group SMSTOPS (key `IS41`). TOPS also pegs one of the failure reason OMs (SMSNETWK, SMSTERM, SMSRADIO, and SMSMISC). TOPS also pegs OMs INVOKES and RETRESR in group TC7WRLSS (key `SMS_IS41`).

TOPS generates a TOPS131 log indicating the reason for failure, as directed by new Table TOPSPARM parameter `SMS_LOG_MC_FAILURE`.

Figure 9 Unsuccessful TOPS IS-41 SMS to message center (smdpp contains cause code)



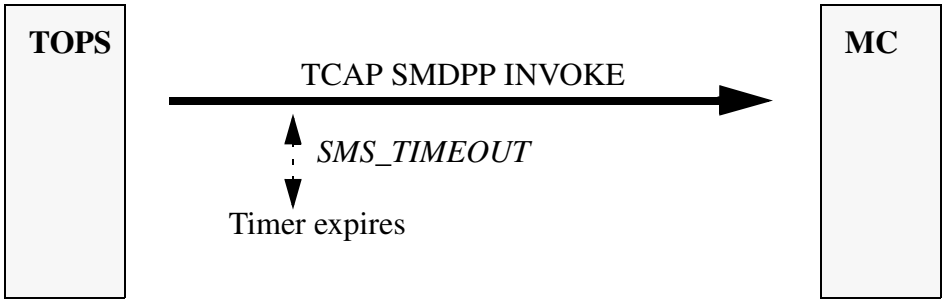
105.7.4 SMS time-out (IS-41)

In this scenario, TOPS sends the SMS to the message center but receives no reply within the time-out period (as defined by parameter `SMS_TIMEOUT` in Table TOPSPARM).

TOPS pegs OMs SMSSENT and SMSTIME in group SMSTOPS (key `IS41`). TOPS also pegs OM INVOKES in group TC7WRLSS (key `SMS_IS41`).

TOPS generates a TOP131 indicating an SMS time-out occurred.

Figure 10 SMS time-out (IS-41)

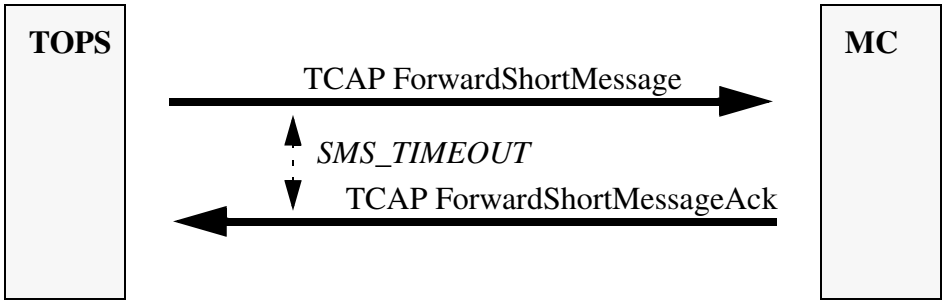


105.7.5 Successful GSM SMS transaction

In this scenario, TOPS sends the SMS to the message center, which responds with a positive acknowledgement.

TOPS pegs OMs SMSSENT and SMSSUCC in group SMSTOPS (key `GSM`). TOPS also pegs OMs INVOKES and RETRESR in group TC7WRLSS (key `SMS_GSM`).

Figure 11 Successful TOPS GMS SMS to message center



105.7.6 Unsuccessful GSM SMS transaction

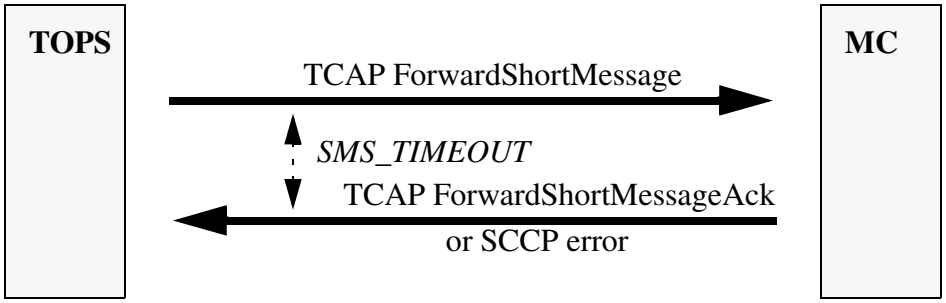
In this scenario, TOPS sends the SMS to the message center, but failures occur in the network, or the message center cannot process the SMS. TOPS receives a negative acknowledgment from an intervening node or from the message center, depending on where the error occurred. The message center's response contains the error cause and any diagnostic information.

Possible reasons for failure include network problems, terminal (cell phone) problems, radio interface problems, and other miscellaneous problems (e.g. message format).

TOPS pegs OMs SMSSENT and SMSFAIL in group SMSTOPS (key GSM). TOPS also pegs one of the failure reason OMs (SMSNETWK, SMSTERM, SMSRADIO, and SMSMISC). TOPS also pegs OMs INVOKES and RETRESR in group TC7WRLSS (key SMS_GSM).

TOPS generates a TOPS131 log indicating the reason for failure, as directed by new Table TOPSPARM parameter SMS_LOG_MC_FAILURE.

Figure 12 Unsuccessful TOPS GSM SMS to message center (ack contains cause code)



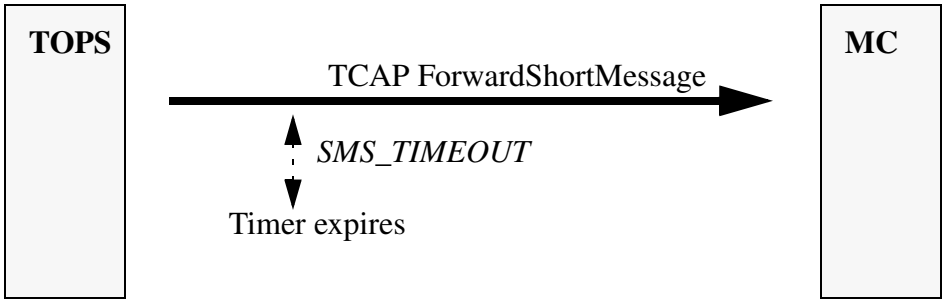
105.7.7 SMS time-out (GSM)

In this scenario, TOPS sends the SMS to the message center but receives no reply within the time-period (as defined by parameter SMS_TIMEOUT in Table TOPSPARM).

TOPS pegs OMs SMSSENT and SMSTIME in group SMSTOPS (key GSM). TOPS also pegs OM INVOKES in group TC7WRLSS (key SMS_GSM).

TOPS generates a TOP131 indicating an SMS time-out occurred.

Figure 13 SMS time-out (GSM)



105.7.8 TOPS SMS engineering considerations

Short messages sent by TOPS can be up to 200 characters in length. When headers and ancillary fields are added in, the overall message length can reach 250 bytes. Each time a position or automated node sends a SMS which is then forwarded to the SS7 network, the SMS is actually sent twice: once using OPP or OAP over IP from the position or service node to the switch, and once over the SS7 links into the network.

If a switch is supporting 300 active operators handling 20-second directory assistance calls, and an SMS containing the listing is sent on each call, this represents 54,000 calls per hour at 250 bytes per call. The total is 13.5 megabytes per hour which is equivalent to 3.75 kilobytes per second.

Both the IP links to the positions and service nodes as well as the SS7 links to the network must be able to handle this increased messaging. Call durations, numbers of operators, and SMS-to-call ratio should be taken into account when deploying this feature.

105.7.9 Operator and automated node interaction

Operators and automated service nodes receive an immediate indication that the SMS was successfully sent or could not be sent. They do not receive the later acknowledgment from the message center. The reason is that the SMS might be sent at the end of the call, and TOPS call throughput would be diminished if the operator or automated service node had to wait for the acknowledgment from the message center before leaving the call.

TOPS still tracks the message center results of the SMS (using OMs and logs) but the operator or service node is not aware of the outcome.

Another effect is that the response from the message center might arrive after the AMA record for the call is generated. So this feature does not record in AMA whether the SMS was successfully received by the message center.

105.8 IS41TOPS OM group modification

In SN06, the original TOPS IS-41 feature added OM group IS41TOPS. This group recorded application-level and transport-level events for the IS-41 ADACC with release call flow.

This SN07 feature is adding support of GSM and SMS. The number of registers to record application-level and transport-level events for combinations of the two applications (RLT and SMS) and the two protocol standard (IS-41 and GSM) requires more than 32 registers, which is the maximum number of registers in an OM group.

So this feature creates the following three groups. All three groups use a key field with values IS-41 and GSM, so all three groups are used for both wireless network standards.

- SMSTOPS: This group records application-level events for the TOPS short message service.
- WINTOPS: This group records application-level events for wireless ADACC with release. This group uses WIN in the name since wireless intelligent network capabilities are used to provide ADACC with release for both IS-41 and GSM.
- TC7WRLSS: This group records transport-level events such as types of TCAP messages sent and received, SS7 errors, etc. on TOPS wireless calls (SMS and WIN, as well as IS-41 and GSM).

All events formerly pegged in IS41TOPS are now pegged in the new groups. The following table shows the new representations of the IS41TOPS OMs.

IS41TOPS register (SN06)	New group (SN07), key IS41 or WIN_IS41	New register (SN07)
ANINFINV	WINTOPS	WINBEGIN
ANINFIN2	WINTOPS	WINBEGI2
CONNRES	WINTOPS	REQCONN
CONNRES2	WINTOPS	REQCONN2
ANINFRR	WINTOPS	CONNECT
ANINFRR2	WINTOPS	CONNECT2
ANINFRD	WINTOPS	DISCONN
ANINFRD2	WINTOPS	DISCONN2
RESTIMR	WINTOPS	RESTIMR
RESTIMR2	WINTOPS	RESTIMR2
TLDNTIME	WINTOPS	TLDNTIME
SANTIMR	WINTOPS	SANTIMR
CFRABAN	WINTOPS	ABANDON
CFRDISC	WINTOPS	ERRDISC
CFRFAIL	WINTOPS	ERRCONN
CFRSSFT	WINTOPS	ERRSSFT
RETERRS	TC7WRLSS	RETERRS
RETERRR	TC7WRLSS	RETERRR
REJECTS	TC7WRLSS	REJECTS
REJECTR	TC7WRLSS	REJECTR

IS41TOPS register (SN06)	New group (SN07), key IS41 or WIN_IS41	New register (SN07)
NOTLDNS	WINTOPS	NOTLDNS
NODATA	WINTOPS	NODATA
RXLAFAIL	WINTOPS	RXLAFAIL
MBFULL	TC7WRLSS	MBFULL
RTFNOXLA	TC7WRLSS	RTFNOXLA
RTFNOXLS	TC7WRLSS	RTFNOXLS
RTFSUBCG	TC7WRLSS	RTFSUBCG
RTFSUBFL	TC7WRLSS	RTFSUBFL
RTFUNEQ	TC7WRLSS	RTFUNEQ
RTFNETFL	TC7WRLSS	RTFNETFL
RTFNETCG	TC7WRLSS	RTFNETCG
RTFMISCE	TC7WRLSS	RTFMISCE

For more information on the groups created by this feature, refer to the Performance chapter of this document.

105.9 Customer visible changes

As mentioned in “105.5 Feature overview” on page 1018, this feature has several customer-visible changes.

105.9.1 Wireless ADACC with Release

- Table TOPSTLDN (changed) and Table MSCIDMAP (new): Together, these tables map MSC identifiers to TLDN pool(s) used when selecting a TLDN at the beginning of an IS-41 WIN call. See “105.6 TLDN selection by mobile switching center identifier (MSCID)” on page 1020, as well as the Configuration chapter of this document.
- Changed tables OFCENG, OFCAUT, and ISUPTRK: The TOPS IS-41 extension block parameter is removed from Table OFCENG and added to Table OFCAUT. In Table ISUPTRK, a value is created for future use. See the Configuration chapter of this document.
- Table TOPSFTR: This feature adds a new tuple, `RLT_FOR_GSM`, which controls GSM ADACC with Release. GSM ADACC with Release is under the control of existing SOC option OSEA0104.

105.9.2 Short message service (SMS)

- Changed table TOPSTOPT: A new field, WIRELESS, is added for defining the wireless network type on a non-WIN wireless call.
- Changed table TOPSPARM: Two new TOPS parameters, SMS_LOG_MC_FAILURE and SMS_TIMEOUT, are added. See the Configuration chapter of this document.
- SS7 datafill and maintenance: Action is required on the TOPS switch to define and activate the new SS7 subsystem, GSMTOPS, in order to send and receive GSM SMS TCAP messages. Please refer to “105.16 Appendix A: Datafill changes for SMS” on page 1038.
- SS7 global title translation name: A new translation name, MDNMCGT, is added to allow TOPS to route IS-41 and GSM short messages to message centers. This translation name is datafilled in existing table C7GTTYPE. Please refer to “105.16 Appendix A: Datafill changes for SMS” on page 1038.
- Existing OM groups: This feature creates a new SS7 subsystem, and many existing OM groups have registers which are pegged when this new subsystem is in use. See “105.17 Appendix B: Operational measurements (OMs)” on page 1040 for more information.
- Test tool: This feature adds a TOPS SMS test tool consisting of new Table TOPSMCDB and new SS7 subsystems TIS41SIM and TGSMSIM. See “105.18 Appendix C: TOPS message center (TOPSMC) test tool” on page 1042 for more information.

105.9.3 Changes affecting both areas

- Changed operational measurement (OM) group IS41TOPS: OM group IS41TOPS is replaced by three new OM groups: SMSTOPS, WINTOPS, and TC7WRLSS. See “105.8 IS41TOPS OM group modification” on page 1030, as well as the Performance chapter of this document.
- Changed log TOPS131: This log appears when problems occur during the course of a wireless TOPS RLT call. Additional text reasons are added for SMS failures. See the Fault Management chapter of this document.
- Existing logs: This feature generates existing TCAP logs (such as the TCAP100) when errors occur in TCAP message formats, or unexpected TCAP messages are received. See Nortel Networks Log Report Reference Manual (297-8021-840) for more information about TCAP logs.

105.10 Hardware Requirements or Dependencies

Not applicable.

105.11 Software Requirements or Dependencies

Not applicable.

105.12 Limitations and restrictions

105.12.1 General restrictions

- TOPS Wireless ADACC with Release is supported in North American TOPS offices only.

105.12.2 TOPS Wireless Intelligent Network restrictions

- Only one form of RLT (ISUP, IS-41, or GSM) can be employed a given trunk group. A trunk group cannot support both IS-41 and GSM RLT.
- A maximum of 4,096 market identifiers can be datafilled in Table MSCIDMAP (see “105.6.2 New table MSCIDMAP” on page 1022).
- A maximum of 32,767 MSCIDs can be datafilled in Table MSCIDMAP. An MSCID is a combination of a market ID and a switch number.
- TOPS does not support GSM CAMEL calls at this time. The `RLT_GSM` value in field RLT of Table ISUPTRK is for future use.
- Pool IDs cannot be added to Table TOPSTLDN unless they already exist in Table MSCIDMAP.
- TLDN pools in Table TOPSTLDN cannot be changed or deleted if they are in use in Table MSCIDMAP. This helps prevent the customer from altering a TLDN’s internal store while the TLDN is in use.
- It is not possible to add a wildcard market ID and non-wildcard switch number tuple to Table MSCIDMAP.

105.12.3 TOPS SMS restrictions

- The SMS can be sent to the calling party only.
- In North America, the length of the SMS destination number must be 10 digits.
- The position or service node cannot send a second SMS while the first is in progress.
- SMS is supported on IP positions only, due to the maximum length of the SMS (200 bytes). Service nodes already use an IP datapath.
- SMS is not supported in the Time Division Multiplex (TDM) operator centralization (OC) environment[1], again due to length. If the OC environment uses a TDM data path, the SMS cannot be transmitted from the host switch to the remote switch, so the SMS attempt is denied. To support sending the SMS from the host to the remote, OC-IP must be employed.

[1]TDM OC uses the TOPS Message Switch (TMS) for the OC data path.

- SMS is supported in the Operator Services System Automated Intelligent Network (OSSAIN) centralization environment, known as OSAC. OSAC already uses an IP data path so SMS messages can be transmitted.
- Since TOPS might not have the International Mobile Subscriber Identity (IMSI) or Mobile Identification Number (MIN), there is no provision for routing SMS based on these numbers.
- Since TOPS only sends SMS to the calling party, there is no provision for prepending the country code prior to global title translation. The routing is based on the national number only.
- TOPS does not support SMS notification, a supplementary service which informs the message originator that the SMS was delivered to the destination phone. TOPS indicates in outgoing SMS TCAP messages that SMS notification is not required. If TOPS receives an SMS notification message, it is ignored.
- The AMA record does not indicate if the SMS was successfully acknowledged by the message center. For more information, see "105.7.9 Operator and automated node interaction" on page 1030.

105.13 Interactions

105.13.1 Interactions with cell phone users

Interactions involving wireless (cell) phone features and IS-41 or GSM processing on the MSC are outside the scope of this feature. This feature is limited to TOPS behavior given the following inputs:

- IS-41 and GSM messaging
- ISUP messaging
- Behavior of operator or automated service node

105.13.2 Interactions with intelligent TOPS peripherals

This feature allows Open Position Protocol (OPP) compliant operator positions to send short messages into the SS7 network via the TOPS switch. This feature also allows Open Automated Protocol (OAP) compliant automated service nodes to send short messages via the TOPS switch. To support these capabilities, OPP and OAP are updated. Please refer to the latest releases of OPP and OAP for information on the transport of SMS from the operator position or service node to the TOPS switch.

105.13.3 Wireless number portability

Wireless number portability allows a wireless customer to keep their dialable Mobile Directory Number (MDN) while moving to another service provider. Their nondialable IS-41 mobile identification number (MIN) or GSM international mobile subscriber identity (IMSI) changes, but their MDN remains the same.

The MDN is sent to TOPS as the calling party number when originating a call from a cell phone which has been ported. When a land line calls a ported cell phone, the original ("donor") MSC uses WNP capabilities to determine where the call should be routed.

This has the following effects on the call flows and functions of this feature.

105.13.3.1 Wireless intelligent network

TOPS WIN call setup is based on the initial WIN message and the originating trunk group. Whether the calling party has ported or not, the originating MSC sends an IS-41 ANLYZD or GSM InitialDP to start the call, and TOPS knows which protocol to use when handling the call.

The call arrives on an ISUP trunk group in Table ISUPTRK. IS-41 RLT or GSM RLT is datafilled against the trunk group, so the calling party number is not a consideration.

In a different case, a wireless caller uses TOPS WIN to connect to another wireless phone which has been ported. The TOPS WIN call flow is not changed. TOPS forwards the MDN of the called wireless phone to the MSC using the **analyzd** or Connect message. The MSC must then determine if the MDN has been ported. In other words, the WNP work is done after TOPS leaves the call, and TOPS does not need to indicate if a number is ported.

105.13.3.2 Short message service

At this time, TOPS can only send an SMS to the calling party. The MDN is sent as the calling party number. So TOPS sends the SMS to the MDN, which routes the SMS to the message center associated with the "donor" switch. The donor switch's MC then does the work to determine that the MDN has been ported. The donor switch's MC then forwards the SMS to the proper MC. So again, TOPS is not affected by WNP.

105.16 Appendix A: Datafill changes for SMS

Enabling TOPS SMS requires datafill and other action in the following categories:

- **SS7**: Enable the IS41TOPS and GSMTOPS subsystems.
- **Global title translation:** Update Table C7GTTYPE and C7GTT to route SMS TCAP messages to the proper message centers.
- **Trunk group**: Mark incoming wireless calls as IS-41 or GSM on a trunk group basis in Table TOPSTOPT.

These actions are described in this appendix.

105.16.1 A.1: SS7 datafill and maintenance

The following items are required to enable TOPS IS-41 and GSM TCAP messaging.

- Table C7LOCSSN: Add tuples for the IS41TOPS and GSMTOPS subsystems. Define two different subsystem numbers which will be used by MSCs to send TCAP messages to TOPS.

- MAP operation: From the SCCPLOC level of the MAP (MAPCI;MTC; CCS;CCS7;SCCPLOC), post and return to service the IS41TOPS and GSMTOPS subsystems.
- Table C7RTESET: TOPS SMS will not work unless there are CCS7 route set(s) defined to the message centers of calling parties. Depending on the configuration of the SS7 network, it might be possible to reuse the ISUP trunk route sets for TOPS SMS.

105.16.2 A.2: Global title translation

This feature adds an SS7 translation name, MDNMCGT, which is used for routing outgoing TOPS SMS messages to the appropriate message center. MDNMCGT is datafilled in Table C7GTTYPE and is already present in Nortel Networks MTX switches.

The following figures show datafill for Table C7GTTYPE and Table C7GTT. This datafill routes all TOPS SMS (whether IS-41 or GSM) messages to a service transfer point (STP) which already has significant SMS translation datafill. This TOPS datafill offloads the SMS global title translation to the customer's existing STP named STPA. The datafill assigns a global title number of 17 which is commonly used for mobile directory number (MDN) to message center (MC) routing.

TOPSSMS ANSI7 17 (MDNMCGT) $
```

Figure 15 Table C7GTT

```
TABLE: C7GTT
GTTKEY GTTRSLT
----------------------------------------
TOPSSMS 0 9 PCONLY (TOPSTOSTPA_RS 0) $ GT
```

105.16.3 A.3: Trunk group datafill

On a WIN call, the wireless network type is already known, since IS-41 messages were exchanged to begin the call. On a non-WIN wireless call (e.g. 0-, or 411 when WIN is not supported) the call arrives with standard trunk signalling and no indication that the calling party is using a cellular phone.

This feature allows customers to mark trunk groups as carrying wireless (cellular) traffic, and to further indicate whether the wireless network connected by the trunk group is IS-41 or GSM. TOPS uses this datafill when composing a short message. The trunk group datafill determines whether TOPS composes the SMS using IS-41 or GSM.

This requires the customer to segregate incoming trunk groups into IS-41 wireless, GSM wireless, and non-wireless categories. This is necessary since there is no ISUP signal which indicates that the calling party is using a cellular phone. Also, with wireless number portability (WNP), the NPA-NXX of the calling party number can no longer be used to determine the network type based on the originating MSC. A WNP user may have ported their mobile directory number from an IS-41 switch to a GSM switch or vice versa.

The following diagram shows three trunk groups in Table TOPSTOPT. One is from a wireline end office, one is from an IS-41 end office, and one is from a GSM end office.

Figure 16 Table TOPSTOPT

```
TABLE: TOPSTOPT

WIRELESS_IS41 N Y NONE NA Y N NONE 0 N N N N N N 0 N Y IS41
WIRELESS_GSM  N Y NONE NA Y N NONE 0 N N N N N N 0 N Y GSM
```

105.17 Appendix B: Operational measurements (OMs)

This feature creates three new OM groups: SMSTOPS, WINTOPS, and TC7WRLSS. The registers in these groups count specific events occurring during TOPS IS-41 and GSM call processing. Please refer to “105.8 IS41TOPS OM group modification” on page 1030 and the Performance chapter of this document for more information on these new OM groups.

The following appendix describes this feature’s effects on existing OM groups.

105.17.1 B1: SS7 operational measurements

Several existing OM groups are defined for pegging events relating to SS7 and TCAP messaging. These groups usually start with “C7” or “TCAP.” More information about these groups can be found in NTP 297-8021-814: “Operational Measurements Reference Manual.”

Two existing TCAP OM groups, TCAPUSAG and TCAPERRS, are useful when tracking this feature, since these OM groups have SS7 subsystem as their

key. To track TOPS IS-41 events, use subsystem name IS41TOPS as the key. To track TOPS GSM events, use subsystem name GSMTOPS as the key.

OM group TCAPUSAG contains several registers which are pegged during the course of a wireless TOPS call in addition to the pegs in the new groups introduced by this feature. The following table maps the OM registers in group TCAPUSAG to messages sent and received during a wireless TOPS call.

Table 1 TCAPUSAG mapping to TOPS IS-41 and GSM ADACC event

Register	Description and applicability to TOPS IS-41 ADACC
TCMSGOUT, TCMSGOU2	Total TCAP messages originating on this node Pegged for all IS-41 and GSM TCAP messages sent by TOPS
TCMSGIN, TCMSGIN2	Total TCAP messages terminating at this node Pegged for all IS-41 and GSM TCAP messages received by TOPS
TCUNIDIR, TCUNIDI2	Total TCAP msgs sent/rcvd w/ package type UNIDIRECTIONAL Not pegged on wireless TOPS calls
TCQWPERM, TCQWPER2	Total TCAP msgs sent/rcvd w/ package type QUERY W/ PERM Pegged when TOPS receives ANLYZD. Also pegged when TOPS sends an SMS.
TCQNPERM, TCQNPER2	Total TCAP msgs sent/rcvd w/ package type QUERY W/O PERM Not pegged on wireless TOPS calls
TCCWPERM, TCCWPER2	Total TCAP msgs sent/rcvd w/ package type CONV W/ PERM Pegged when TOPS receives CONNFAILRPT
TCCNPERM, TCCNPER2	Total TCAP msgs sent/rcvd w/ package type CONV W/O PERM Pegged when TOPS sends CONNRES and RESETTIMER
TCRESPNS, TCRESPN2	Total TCAP msgs sent/rcvd w/ package type RESPONSE Pegged when TOPS sends anlyzd. Also pegged when TOPS receives response from message center.
TCINVKL, TCINVKL2	Total components sent/rcvd of type INVOKE LAST Pegged when TOPS received ANLYZD and CONNFAILRPT; also when TOPS sends CONNRES and RESETTIMER; also when TOPS sends an SMS.
TCINVKNL, TCINVKN2	Total components sent/rcvd of type INVOKE NOT LAST Not pegged on wireless TOPS calls
TCRSLTL, TCRSLTL2	Total components sent/rcvd of type RETURN RESULT LAST Pegged when TOPS sends anlyzd
TCRSLTNL, TCRSLTN2	Total components sent/rcvd of type RETURN RESULT NOT LAST Not pegged on wireless TOPS calls

Table 1 TCAPUSAG mapping to TOPS IS-41 and GSM ADACC event

Register	Description and applicability to TOPS IS-41 ADACC
TCRTERR, TCRTERR2	Total components sent/rcvd of type RETURN ERROR Pegged when TOPS sends AnalyzedInformation RETURN ERROR
TCREJECT, TCREJEC2	Total components sent/rcvd of type REJECT Pegged when TOPS sends AnalyzedInformation REJECT, or receives SMS REJECT
TCABORT, TCABORT2	Total TCAP msgs sent/rcvd w/ package type ABORT Not pegged on wireless TOPS calls

105.18 Appendix C: TOPS message center (TOPSMC) test tool

This feature introduces a test tool for verifying TOPS short message service. The test tool consists of two service control point (SCP) processes, one for IS-41 and one for GSM, which simulate message centers (MCs). These SCP processes run on the TOPS switch.

The simulated message centers are reached using the SS7 network. When an operator or automated node creates an SMS, TOPS formats the SMS into a TCAP message. TOPS uses either IS-41 or GSM, depending on the wireless network type of the calling party. TOPS then uses global title translation to send the TCAP message into the SS7 network.

The message arrives at one of the SCP simulators, which uses the destination number to index new Table TOPSMCDB (TOPS Message Center Database) to determine the disposition of the message. Possible results are:

- Successful acknowledgment sent back to TOPS switch
- Negative acknowledgment with cause code sent back to TOPS switch
- TCAP REJECT with reject reason sent back to TOPS switch
- Time-out (no response)

When TOPS receives the response (or the `SMS_TIMEOUT` timer expires), TOPS pegs OMs in new groups SMSTOPS and TC7WRLSS. In failure situations TOPS generates a TCAP log or a TOPS131 log.

Recall that the protocol chosen (IS-41 or GSM) is based on WIN messaging. If the call is not a WIN call, the protocol chosen is based on incoming trunk group datafill in Table TOPSTOPT. If the protocol is IS-41, but the global title translation datafill routes the SMS to the GSM simulator, the GSM simulator will generate a TCAP log and reject the SMS before accessing Table TOPSMCDB. The same is true for sending a GSM SMS to the IS-41 MC simulator.

The components are as follows, and the remainder of this appendix describes them in more detail.

- Table TOPSMCDB: This table allows datafill of destination numbers and SMS dispositions for these numbers.
- SS7: New subsystems TIS41SIM and TGSMSIM
- Global title translation: C7GTTYPE and C7GTT datafill is required to route SMS messages to the simulators.

105.18.1 C.1: Table TOPSMCDB

Table TOPSMCDB allows datafill of up to 64 SMS destination numbers. The disposition of the short message attempt is datafilled against each number. Table TOPSMCDB can serve short messages based on IS-41 and GSM.

The available dispositions are as follows:

- SUCCESS: A successful SMS acknowledgment is sent back to TOPS.
- ERROR: A negative acknowledgment with a cause code is sent back to TOPS. The cause codes are different for IS-41 and GSM, so datafilling ERROR requires the datafill of an IS-41 cause code and a GSM cause code.
- REJECT: Setting a disposition of REJECT causes a TCAP REJECT message to be sent back to TOPS. Since IS-41 and GSM share TCAP REJECT reasons, separate fields are not necessary. The reject reason consists of two fields, a problem type and a problem code.

If an SMS arrives at a simulator and the destination number is not found in Table TOPSMCDB, the SMS is ignored. Eventually the TOPS SMS timer will expire and the SMSTOPS OM TIMEOUT will be pegged. The TOPS SMS timer is set by parameter SMS_TIMEOUT in Table TOPSPARM.

A final TOPSMCDB field, DELAYSEC, indicates how long the simulators should wait before sending the SMS response. This is used to simulate real-world exchanges with message centers. It is datafilled for all dispositions.

> ***Note:*** The simulator is not multi-threaded. SMS messages arriving during the DELAYSEC delay are not processed until the delay time has expired. If several SMS messages arrive at once, they are processed sequentially. So the response time for the later short messages can easily exceed normal SMS time-out values.

The following figure shows three destination numbers in Table TOPSMCDB.

Figure 17 Table TOPSMCDB

```
TABLE: TOPSMCDB
DESTDIGS RESPAREA DELAYSEC

9199910000 SUCCESS 2
```

105.18.2 C.2: SS7 datafill and maintenance

The following items are required to enable the TOPS IS-41 and GSM message center simulators.

- Table C7LOCSSN: Add tuples for the TIS41SIM and TGSMSIM subsystems.
- MAP operation: From the SCCPLOC level of the MAP (MAPCI;MTC; CCS;CCS7;SCCPLOC), post and return to service the TIS41SIM and TGSMSIM subsystems.
- Table C7RTESET: Datafill of Table C7RTESET is optional, since it is possible to define an internal SS7 link to the simulators, as described in the next section.

  It is also possible to set up looparound SS7 links, or to set up a looparound which goes through an STP. When setting up looparound links, datafill in C7RTESET and other SS7 tables (e.g. C7LKSET) is required. Using looparound links, or links to a second test switch where the TOPS MC simulators are running, is a more realistic way to test the SMS function.

105.18.3 C.3: Global title translation

The following figure shows datafill which will route all SMS attempts to the TOPS MC IS-41 simulator using internal SS7 links. The tuple in Table C7GTT can be split into several tuples in order to send some SMS attempts to the IS-41 MC simulator while other SMS attempts go to the GSM MC simulator.

106: Functional Description (FN): A00003693

106.1 Feature name

MG9K ESA for SMSI subtending ABI

Adding SMS to the supported peripheral types for Emergency Stand Alone (ESA) service for lines off the Access Bridge Interface (ABI) cards of an MG9K Media Gateway 9000 (MG9K).

106.2 Description

Another SN07 feature A00002380 provides the ability for the Succession Call Server 2000 (CS2000) to support Emergency Stand Alone calling on the following DMS-100 Legacy Extended Peripheral Modules (XPM) subtending a Media Gateway 9000 (MG9K):

- LGC, LGCI
- LTC, LTCI
- SMA2

This feature A00003693 adds SMS to the list of supported XPM types.

106.3 Hardware Requirements or Dependencies

There are no hardware requirements or dependencies for this feature.

106.4 Software Requirements or Dependencies

This ESA activity on the MG9000 is dependent upon the following activity for successful completion.

A00003567: MG 9000 Element Mgr Support for ABI ESA

The primary function of this component is to pull ESA data from the Core, organize this information in the EM in a meaningful way for the MG9K, and put it into the ESA subsystem on the ABI in a usable format.

A00002380: MG9K ABI ESA

This feature is the base feature which provides ESA service for lines off the ABI cards on an MG9K.

A00003489: Subtending SMS from ABI

This feature is adding support for SMS to the ABI. It is another SN07 feature.

The following activities support ITP ESA. ABI ESA and ITP ESA have a common design and the ITP documents should be considered as preliminary reading. The ABI ESA documentation supersedes the ITP ESA documentation.

A00002020: ESA Translation Download [ITP - CM]

A00002019: ESA EM Enhancements [ITP - MG9000 EM]

A00001982: ESA Enhancements [ITP - MG9000]

The following activities are related to this activity.

A00003486: Gateway Location Information [CM]

106.5 Limitations and restrictions

106.5.1 Entering ESA

- Only calls that are in an active state (i.e. talking state) will survive warm entry into ESA mode.
- Calls that are intraswitched on RLCMs, OPMs, or OPACs can survive warm entry (not just network switched calls).
- Calls that won't survive entry into ESA mode may be released over a period of time (not immediately).
- Since P-phones are not supported on an RCS, they are not impacted by this feature.

106.5.2 During ESA

- Coin loop-start lines will be supported in ESA; however, ESA will supervise coin return upon call completion. The MG9K only supports CDF (Coin Dial First) and Coinless Coin phones.
- ESA between physical MG9000 master shelves (separate MGs) is not allowed.
- All members of a MADN group will be allowed to originate calls.
- Dialing a MADN member will result in a termination to the first idle MADN member and only this member. Not all MADN members will receive ringing.
- ESA is unavailable when DCC packs are out of service.

- ESA call processing is only supported between VMGs (ABIs or ITPs) currently in ESA on the same MG9000. Partial ESA (one VMG in ESA and another VMG not in ESA but on the same MG9000--commonly called *one up, one down*) is not supported.
- Emergency service (i.e. 911) translations are supported, but not emergency service features.
- No maintenance actions (whether from LCI, EMs, card-pulls, etc.) are recommended while in an ESA operational mode.
- Hunting is linear to those DNs physically residing on a VMG. Hunting on a hunt group that is divided across several VMGs does not guarantee true linear hunting for the entire group.
- Dialing directly to a DNH hunt member will cause a termination to that member. If the member is not available, hunting will be done only on the group members local to that VMG.
- If the "H" selector is used in table ESAPXLA then a call dialed with those digits will hunt through all hunt group members on the VMG. The Sequence Number, which normally causes hunting to start from a specific member, is not supported.
- The ESAPXLA table in the Core should be provisioned with the emergency service numbers (i.e. 911) needed while in ESA. Each VMG (as represented by an ABI XPM or LGRP) must be provided with its own emergency service line as well as table ESAPXLA translations terminating to the DN of that line.
- Basic call processing during ESA is supported for analog lines on RLCMs, OPMs, and OPACs. Intraswitching is not supported.

106.5.3 Exiting ESA

- Warm exit from ESA is not supported. Any call attempts or stable calls that coincide with exit from ESA will be torn down by the controlling MGC.
- Service codes are only supported on a limited basis for ESA. Emergency service 911 calls (or any other call using a service code) will not be preserved over ESA exit.

106.6 Interactions

While ABI ESA will be supported for the Legacy XPMs noted in section 106.2, it will not supersede Legacy ESA for Remote Switching Center (RSC) XPMs. RSCs that subtend an ABI XPM will enter existing Legacy ESA when an isolation occurs. They will not be controlled by ABI ESA. All existing RSC ESA functionality will remain intact.

107: Functional Description (FN): A00003698

107.1 Feature name

A00003698 - Razor Gateway Requirements For Trunking.

107.2 Description

This feature provides an extension to the existing CALLTRAK/TRMTRACE functionality found on the Core. Currently there isn't a way to initiate a Trmtrace to capture incoming SIP based calls. This shortcoming is addressed by functionality delivered to the Core, GWC, and the Session Server network elements.

This feature is primarily targetted to Customer Support groups like GNPS. While the tool will be available in the field, due to the impact of running a Calltrak session on the capacity of the field office, it should not be done on a regular basis or at high traffic levels.

107.2.1 Background information

Previous releases of the Calltrak/Trmtrace functionality provided the interfaces required to turn on and off the GateWay Controller Trmtrace functionality. Prior to SIP based calls, the Core was able to start the Trmtrace on the GWC for a new call and so capture the trace from the beginning of the call. For SIP calls, this was no longer sufficient. The Core found out about SIP calls too late in the Call sequence to start the trmtrace. Also, the SIP GWC that would be used for a SIP call was not always pre-defined. These shortcomings are addressed by the functionality delivered by this feature.

The Session Server and the Core will now be able to track and initiate the Trmtrace on a SIP call for both incoming and outgoing SIP trunks. The user will only need to know the trunk group CLLI for that SIP trunk (or Access Link) in order to capture the GWC Trmtrace from the beginning. The Session Server will also capture (locally) the SIP messages and GCP messages used in the life of the traced call.

107.2.2 Overview and Core information

The following is an overview of a typical tracing session.

1. Using the Calltrak interface, the user will select the SIP trunk (using the DPT select option). (No Changes to functionality)
2. The user will then start the calltrak trace. This has the following behaviour:
   a. The selected DPT trunk (in this case a SIP trunk) is noted and a 'setup' message is sent to a sip GWC.

b. The SIP GWC sends the setup message to each NGSS.

c. Each NGSS starts its trace on the selected trunk group/Link.

3. First call starts (either in the Core or NGSS).

a. The origination point sends a 'start_trmtrace' message to the selected SIP GWC.

b. The selected GWC initialized the trmtrace module to capture the trmtrace information on the supplied TID.

c. The selected GWC will also initialize a buffer to capture the messages (GCP messages specifically).

4. Other calls may or may not start/stop during this time.

5. First call Stops (either in the Core or the NGSS, based on which started it and knows it is being traced).

a. The release is sent followed by the 'stop_trmtrace' message for that TID.

b. The GWC stops the trmtrace for that TID (but doesn't touch other in-progress tracing).

6. More of the other calls...

7. The user stops the calltrak trace.

a. The setdown message is sent to the arbitrary SIP GWC.

b. GWC forwards the message to each NGSS

c. Each NGSS stops in-progress call trmtraces and responds to the GWC with a list of stopped trmtrace descriptions (ie, like in the core output: GWC 9, TID 17...) for each TID that was traced on.

d. This GWC then collects all responses and sends one or more unsolicted message to the core with this information.

e. Core outputs the list of stopped trmtrace messages to the user (using existing interface).

8. User is able to retrieve the captured information from the appropriate network elements in the GWC list and the NGSS.

There are no new Core interfaces. The current CallTrak and TRMTRACE interfaces are utilized along with the SELECT DPT option. Once a SIP trunk group is SELECTed, the TRMTRACE ON and START commands will work together to initiate the functionality.

Every effort is made to keep the user interfaces the same where they existed previously. For example the CallTrak interface to select a SIP based trunk is unchanged (the SELECT DPT option is utilized) and no other option needs to be set.

107.2.3 GWC information

The GateWay Controller interface to display the captured trmtrace information will be the same (trmtrc, printout, dumpall). There will not be another interface to display the captured GCP messages (as these are captured on the NGSS). There is a command to display the TID to CallID mapping for calls that are traced from the NGSS. The following is an example:

From the GWC Telnet session (or PMDEBUG session, although that is very slow and is not recommended):

GWCUP>NGss

Config,Debug,Traces.

NGss> Traces

CLearlistcalli,GCPDebugtrace,GCPDPtdebugtra,GCPDPTMsgtrace,

GCPIsupdebugtr,GCPISUPMsgtrac,GCPISUPProctra,GCPMsgtrace,

GCPUDPDebugtra,GCPUdpmsgtrace,MTCDebugtrace,MTCMsgtrace,

MTCProctrace,**TRmtrccallidti**.

GCPDebug>TRmtrccallidti

Sorry, No Call Data available

(or if there is something, it will have a list of callID to TID's)

Traces> CLearlistcalli

!! List is Empty

(or list is cleared)

There are limitations to the output from the commands. Only the last 20 calls will be output in the callID to Tid mapping list for this GWC. The data is stored in a circular buffer and will over-write the oldest data first when more than 20 calls have been trmtraced from the NGSS.

107.2.4 NGSS information

The Session Server will only have a file that needs to be looked at to collect the information that is captured. The file is located in the application traces directory:

/opt/apps/logs

And the filename is:

NGSS_trmtrace.trace

The file will never be deleted automatically by the tool (unless it is very old and the partition has reached it's upper limit - see limitations section), so the craft will always have to ensure to remove the file after collecting the information. The file can be looked at using on board tools like 'cat', 'vi', and 'more'. Also the file could be copied off board for downstream use.

The file will contain SIP messages, GCP messages, and basic call flow information like timestamp, direction of call, and callID. This information will be presented in ASCI format (indented to provide readability).

107.3 Hardware Requirements or Dependencies

Customer offices without the Session Server will not have the functionality delivered by this feature.

107.4 Software Requirements or Dependencies

The Session Server feature, A00003280 (SP2K Debug and Tracing) must be available. Also, certain other features developed for the Session Server will be required (Call Processing support, etc) as well.

107.5 Limitations and restrictions

The feature will only apply to offices with the Session Server, SIP application. The VRDN support will not be implemented with this feature.

There will be a limitation on the file size in use on the NGSS per session. The upper limit of data per session will be 10 Mb. The size of the NGSS_trmtrace.txt file will continue to grow over multiple sessions as the information will not be removed unless the craftperson takes a manual action. The upper limit of the /opt/apps/logs directory will be enforced within the trace server application (see Actiivty A00003280), but the only files that will be removed autonomously are the the ones that have their name start with "siptrace".

The GWC will only contain a listing of the latest 20 calls that started TrmTrc from the NGSS. The mapping of NGSS CallID to TID will be limited to this.

107.8 Glossary

Term	Description
NGSS	Another acronym for the Session Server
GWC	GateWay Controller
SIP	In-band signalling protocol, RFC 2962
VRDN	GWC that provides the SIP session server functioanlity, to be replaced by the NGSS.

108: Functional Description (FN): A00003704

108.1 Feature name

OSSAIN Enhancements for SN07

108.2 Description

The feature enhances the OSSAIN product with the following:

- Short Messaging Service
- Wireless Release Link Trunking for Directory Assistance Call Completion
- Alternate Hosting for Passive Operators
- Alter Speech Path for no ANI Calls
- Passive Operator Message Capacity Enhancement
- DA SN Request for DAS Only Service
- Alter Speech Path during Passive Function Provider Connections
- OSAC Session Pool State Inform Message Usage
- Authorization Codes and Module Code 305
- AMA Service ID Usage
- Resource Increases
- OSSAIN Open Automated Protocol (OAP) Version 9.0 and SOC

Short Messaging Service (SMS) is fully designed under feature A00003687; however this feature provides the needed OSSAIN changes to support SMS for SNs. This includes informing the SN of a wireless caller, and processing an SMS message received from the SN.

Wireless Release Link Trunking (RLT) for Directory Assistance Call Completion is designed under feature A00000816 and A00003687; however, this feature will add the wireless RLT functionality for OSSAIN SN DACC calls.

Alternate Hosting for Passive Operators is supported by this feature. It allows an alternate host to be selected for passive operator requests which cannot be serviced by the primary host.

Alter Speech Path for no-ANI Calls is supported by this feature. Incoming IT trunks which do not forward ANI but use DA SN functionality require the ability to split/join the calling party as needed.

Passive Operator Message Capacity Enhancement reduces the amount of OPP messaging sent to position when a SN releases itself from the call.

DA SN Request for DAS-only service allows a SN to request DAS services without attaching an operator.

Alter Speech Path during Passive Function Provider Connections allows a SN to forward an optional datablock to the switch to indicate the switch should alter the speech path when connecting a passive operator.

OSAC Session Pool State Inform Message Usage allows the SN to be informed of OSN state changes for SN originated session pools. It disables the unnecessary message from being used for other origination types such as subscriber originated.

Authorization Codes allow a SN to send an authorization code to TOPS to be included in AMA for calling cards, commercial credit cards, and authcodes. This feature also updates AMA and TDR to support generating an alphanumeric authcode for commercial credit cards.

AMA Service ID ensures the service id sent from the SN will be used in AMA records instead of one defined in datafill in either table AMASRVID or TQMSSERV.

Resource Increases ensures OAP can support increases to the number of operators, positions, services, and call queues.

OAP Protocol Version 9.0 adds support for the above new functions. With the addition of version 9.0, the number of back releases will be increased to also support version 5.0. Version 9.0 is included in SOC option, OSAN0102; however, it has a new TOPSFTR entry, OSSAIN_RELEASE_20, to activate the functionality.

108.2.1 Short Messaging Service (SMS)

SMS functionality, as provided by feature A00003687, can be used to send text messages to a wireless caller. It allows an operator or a SN to forward SMS text messages to TOPS; TOPS will forward the message on to a Message Center (MC); and the MC forwards it to the subscriber. In order for a SN to send a SMS message to TOPS, OAP enhancements are needed and provided by this feature.

To send SMS messages, a SN will need to know if the caller is wireless. TOPS will use phone class type of ‘mobile’ for all wireless callers supported.

For wireless (mobile) calls, a SN can utilize a new OAP operation to send SMS messages to the caller. The new operation, **SMS Request Operation**, includes

one new datablock. The new datablock, **SMS Datablock**, contains the following fields:

- existing field, **Directory Number Digit Count**, to record number of digits in the destination number
- existing field, **Directory Number**, to record the destination number
- new field, **SMS Text Block Length**, to indicate length of text message
- new field, **SMS Text Block**, to include the text message up to 200 bytes

The switch will respond with either one of the following responses:

- **SMS Success Response**
- **SMS Error Response**

The responses indicate the switch has processed the message and attempted to forward it to the Message Center. Responses from the Message Center are not forwarded to the SN.

New OM registers are added to existing OM group, OAPCP10, to record the usage of this new operation and it's responses.

Note: OAP will not restrict the allowed character set for SMS messages.

108.2.2 Wireless RLT for Directory Assistance Call Completion (DACC)

Features A00000816 and A00003687 provide wireless services which include DACC and RLT for the TOPS environment. This feature supports RLT for wireless DACC calls in the OSSAIN environment.

The SN will be informed if RLT is eligible for the wireless call. If so, and the SN requests RLT in the float request for DACC, then OSSAIN will perform wireless RLT and release the call.

108.2.3 Alternate Hosting for Passive Operators

Alternate hosting, as provided by feature NC0152, is supported in OSSAIN for passive operators with this feature's release. If a passive operator is requested from a host which either is not available or the call deflects/overflows, table OCHOSTQ is consulted to determine if an alternate host is datafilled.

If an alternate host is defined in table OCHOSTQ for the passive operator's call queue, then it will be used based on the options datafilled. The options include datalink failure, deflection, and queue overflow. If one of these options occurs and is datafilled, then the call will route to the alternate host datafilled. Only one alternate host can be datafilled for all options per call queue.

Thus, if a passive operator request was received by TOPS and the call was sent to a host which deflected the call (for example), then TOPS would check table

OCHOSTQ, per the call queue, and determine if an alternate host is available for deflect purposes. If found, TOPS would request an operator from the alternate host giving the passive operator request a second chance.

OSSAIN supports both standalone and OC environments for alternate hosting as defined by existing table OCHOSTQ and OCPARMS parameter, SWITCH_NAME.

The SN is only informed once for either a success or failure. It will not be informed when the first attempt fails and an alternate host is selected. Thus, if the SN runs a timer and chooses to utilize alternate hosting, the timer should be increased to account for alternate host requests.

108.2.4 Alter Speech Path for no ANI calls

A SN is able to alter the speech path for a calling party with no directory number. This is necessary for IT trunks which do not send ANI but do use Service Nodes for DA Automation.

108.2.5 Passive Operator Message Capacity Enhancement

This feature enhances the AN1926: OSSAIN Simultaneous Interactions design by reducing the number of OPP messages sent to position when the SN releases itself. The original design sent all call details when the position was connected and again when the SN was released. The new design will eliminate resending full call details when the SN is released for certain scenarios.

If only the following operations or no operations are sent from the SN between connecting the passive operator and releasing the SN, then full call details will not be sent.

- Speech Path Request
- Pass Thru Request
- Gen AMA Request
- Append AMA Request

These operations either alter the operator's display when the operation is processed or has no effect on displays.

Other operations which do not affect the operator displays on SN release may be added in a future release; however, this initial structure introduced will ensure the reduction in OPP messaging for basic DAA calls.

108.2.6 DA SN Route to DAS-only Service

A DA SN may need to route a call to the DAS environment without attaching an operator. It may do this to utilize DAS automated functions such as announcements and call completion.

This feature changes the TOPSAUTO option of table OAFUNDEF to include a DAS option. Since the DAS option will require a CT4Q and refinement option, instead of OPRONFL, the TOPSAUTO option is now broken into refinement areas for each automated system.

When the DAS automated function is used, the call will be routed to the DAS without an operator being attached. If ADASPLUS is available for the call, the DAS Call Begin message will contain the ADASPLUS eligible indicator. There are no changes to the ADAS+ functionality nor is this feature dependent on ADAS+.

If an error occurs, such as timing out after sending the call begin, then call is then sent to an operator.

Table 1 Table OAFUNDEF

108.2.7 Alter Speech Path during Passive Function Provider Connections

There is a DAA (Directory Assistance Automation via DA SN) scenario in which an operator and the subscriber are incorrectly hearing portions of music on hold and call arrival tones. The following further describes the scenario and the enhancement to alleviate this problem.

For a DA SN, a passive operator request can result in the caller being placed into queue for a brief period of time. When an operator becomes available, he/she is connected to the call and the SN is notified. The SN may respond by sending speech path change requests to alter the speech path for the calling party so they do not hear the call arrival tones and the operator does not hear the music on hold announcement.

Since there is a small amount of processing time, pre-SN07 functionality does allow the subscriber to hear call arrival tones and the operator to hear part of the music on hold announcement (all varying based upon processing time).

Following is a possible DAA passive operator call scenario and OAP messaging:

1. Subscriber dials a DA call. TOPS connects a service node voice link to the call and routes the call to a DAA node.
2. TOPS sends the Session Begin message to the DAA node.
3. The DAA node (active node) collects the city and listing information from the subscriber.
4. DAA node sends TOPS a Passive Function Provider Request.
5. TOPS responds by sending a Call Queue Information DB indicating the call has been queued.
6. At this point the DAA node begins playing an announcement to the subscriber indicating their queued condition.
7. Once a position becomes available, TOPS informs the DAA node by sending a Passive Operator Being Connected Message.
8. Shortly after the above message, TOPS sends the Passive Operator Connected Message.
9. The DAA node sends TOPS a Speech Path Request message instructing TOPS to make the subscriber voice path 0-way.

Before TOPS can execute the Node's instruction the call arrival tones have already been played and the operator may hear music on hold.

10. The DAA node plays the city and listing information to the operator.

OSSAIN is enhanced in SN07 to allow the Speech Path DB to be optionally included in the Passive Function Provider Request operation. If included it will be stored and processed when the passive operator is connected. It includes a new range of options to indicate the party and status to apply when the operator is connected. OAP 9.0 is required to support this new option.

108.2.8 OSAC Session Pool State Inform Message Usage

For Operator Services Nodes (OSN) in an OSAC remote, this feature restricts the usage of the Session Pool State Inform message to SN originated session pools only. It removes the unnecessary message from being sent for other session pool originators, such as subscriber, in an OSN.

- When an OSN session pool, datafilled as SN origtype in table OASESNPL of the OSAC remote, changes state (busy or return to service), the SN will be informed so it does not attempt to originate a session to the remote.
- When other OSN session pool originators (subscriber, OSACORIG, OSACTERM) change state in the remote, the SN does not need to be notified. This feature disables the ability to send the message for these session pools.

108.2.9 Authorization Codes

There are a number of scenarios in which a SN may need to send TOPS an authorization code to be placed into the AMA record. This feature enhances OAP version 9.0 to support a new datablock and fields to provide authorization codes from the SN to TOPS.

To support both alphanumeric and numeric codes, the new OAP field allows up to 20 ASCII characters. The SN will need to ensure any BCD formatted authcode is converted prior to populating OAP. TOPS will read the field as ASCII and convert to other formats as needed.

The SN will also need to populate OAP with the type of authorization code being sent. Included in AMA records, and available in OAP, are the following:

- Calling cards - Module Code 611 with generic context id 80002 supports up to 15 digits to record authorization code received from the bank.
- Commercial Credit cards - New Module Code 305 supports up to 15 EBCDIC characters to record the alphanumeric authorization code received from the clearing house.
- Authcode - Module Code 102 supports 14 digits to record the authorization code entered by the subscriber and validated by the bank.

108.2.9.1 AMA Module Code 305 and TDR

New module code 305 is supported to generate an alphanumeric authorization code as provided by commercial credit card clearing houses. It will be used in place of module code 611, which generates a numeric authorization code used by calling cards.

Both AMA and TDR billing systems have been updated to include the new information. AMA supports new module code 305; while TDR supports a new field, commercial credit card authcode, in the appropriate templates.

The downstream billing processors will need to be prepared to accept the commercial credit card authorization code information when working with commercial credit cards.

Note: AMA module code 305 uses OFCENG/OFCAUT CRS_SUBRU_POOL2_SIZE and thus it must be re-provisioned appropriately.

108.2.10 AMA Service ID Usage

TOPS allows a user-defined service id to be placed into AMA. TOPS can obtain the service id from datafill or from an OAP message. This feature ensures a service id sent from a SN via OAP is used instead of datafill defined in tables AMASRVID or TQMSSERV.

108.2.11 Resource Increases

This feature ensures OAP can support resource increases for the following:

- Operator IDs up to 65,535
- Position IDs up to 9999
- Call Queue IDs up to 8190

Note: Although this feature ensures OAP can send and receive these higher ranges, it does not alter either TOPS base or AMA functionality. To utilize these new ranges, ensure TOPS base and AMA modifications have been completed.

108.2.12 OAP Protocol Version 9.0

OAP protocol version 9.0 includes all new OAP information provided by this feature and discussed in this document. The enhancements include:

108.2.12.1 New / changed Fields

- New field, SMS Text Block
- New field, SMS Text Block Length
- Existing field, Speech Path Status is expanded to include options to indicate to alter speech path when the operator is connected
- New field, Authorization Number Type (Format)
- New field, Authorization Code Length
- New field, Authorization Code

108.2.12.2 New / Changed Datablocks

- New datablock, SMS DB
- New datablock, Authorization Number DB

108.2.12.3 New / Changed Operations

- New operation, SMS Request
- New operation, SMS Success Response
- New operation, SMS Error Response
- Existing operation, Passive Function Provide Request has a new optional datablock, Speech Path DB.
- Existing operation, Class Charge Request, has a new optional datablock, Authorization Code DB.

  Note: OAP 5.0 will be supported along with OAP 9.0. This feature changes support for 3 versions back to 4 versions back.

Please reference *OSSAIN OAP Specification Document - NIS Q235-1 (version 2.0)* for details of the changes.

108.2.13 SOC and Table TOPSFTR

OAP 9.0 and functionality described in this document are controlled by existing SOC option OSAN0102; however, table TOPSFTR is changed to included a new entry for OSSAIN_RELEASE_20. TOPSFTR can be used to turn this feature's functionality on/off as needed.

108.3 Hardware Requirements or Dependencies

None

108.4 Software Requirements or Dependencies

- OSSAIN Enhancements, SOC option OSAN0102
- OSSAIN base functionality, SOC option OSAN0101
- TOPS base functionality, SOC option OSB00101

108.5 TOPS SMS engineering considerations

Short messages sent by TOPS can be up to 200 characters in length. When headers and ancillary fields are added in, the overall message length can reach 250 bytes. Each time a position or automated node sends a SMS which is then forwarded to the SS7 network, the SMS is actually sent twice: once using OPP or OAP over IP from the position or service node to the switch, and once over the SS7 links into the network.

If a switch is supporting 300 active operators handling 20-second directory assistance calls, and an SMS containing the listing is sent on each call, this represents 54,000 calls per hour at 250 bytes per call. The total is 13.5 megabytes per hour which is equivalent to 3.75 kilobytes per second.

Both the IP links to the positions and service nodes as well as the SS7 links to the network must be able to handle this increased messaging. Call durations, numbers of operators, and SMS-to-call ratio should be taken into account when deploying SMS functionality.

108.6 Limitations and restrictions

- SMS may affect EIU provisioning. Please refer to the above engineering considerations and the OSSAIN User's Guide for more information.
- Although this feature ensures OAP can handle resource increases as noted, it does not modify TOPS base nor AMA functionality necessary to utilize the new ranges.
- New TOPSAUTO function, DAS can be used for transferring; however, like all TOPSAUTO functions, it is not available for triggering/recalls nor passive operator requests.

108.7 Interactions

The new DAS function in table OAFUNDEF does not interact with existing ADAS+ functionality. ADAS+ can be setup for the DAS function, but is not required to obtain DAS-only service.

109: Functional Description (FN): A00003711

109.1 Feature name

CS2000 SUPPPORT FOR GateWay Inter Machine Trunk (GWIMT) ON Passport Voice Gateway

109.2 Description

This activity provides a limited set of gateway services on the long distance application of Succession Communication Server 2000 with a partial compliance of ITU-T Recommendation Q.767 Blue Book version signaling protocol and ITU-T Recommendation Q.764 White Book version) (ISUP92) signaling protocol (international use only). This functionality is supported on the IMT GLOBAL trunk agency which are provisioned as gateway trunk agents[1]. This feature supports interworking the gateway trunk agency with a set of supported national long distance signalling agencies.

109.3 Functional overview

109.3.1 Background

The IMT Global trunk agency on the Succession CS2000 is enhanced to support a limited set of gateway services and a partial compliance of ITU-T Recommendation Q.767 Blue Book version (Q.767) and an international use of ITU-T Recommendation Q.764 White Book version (ISUP92).

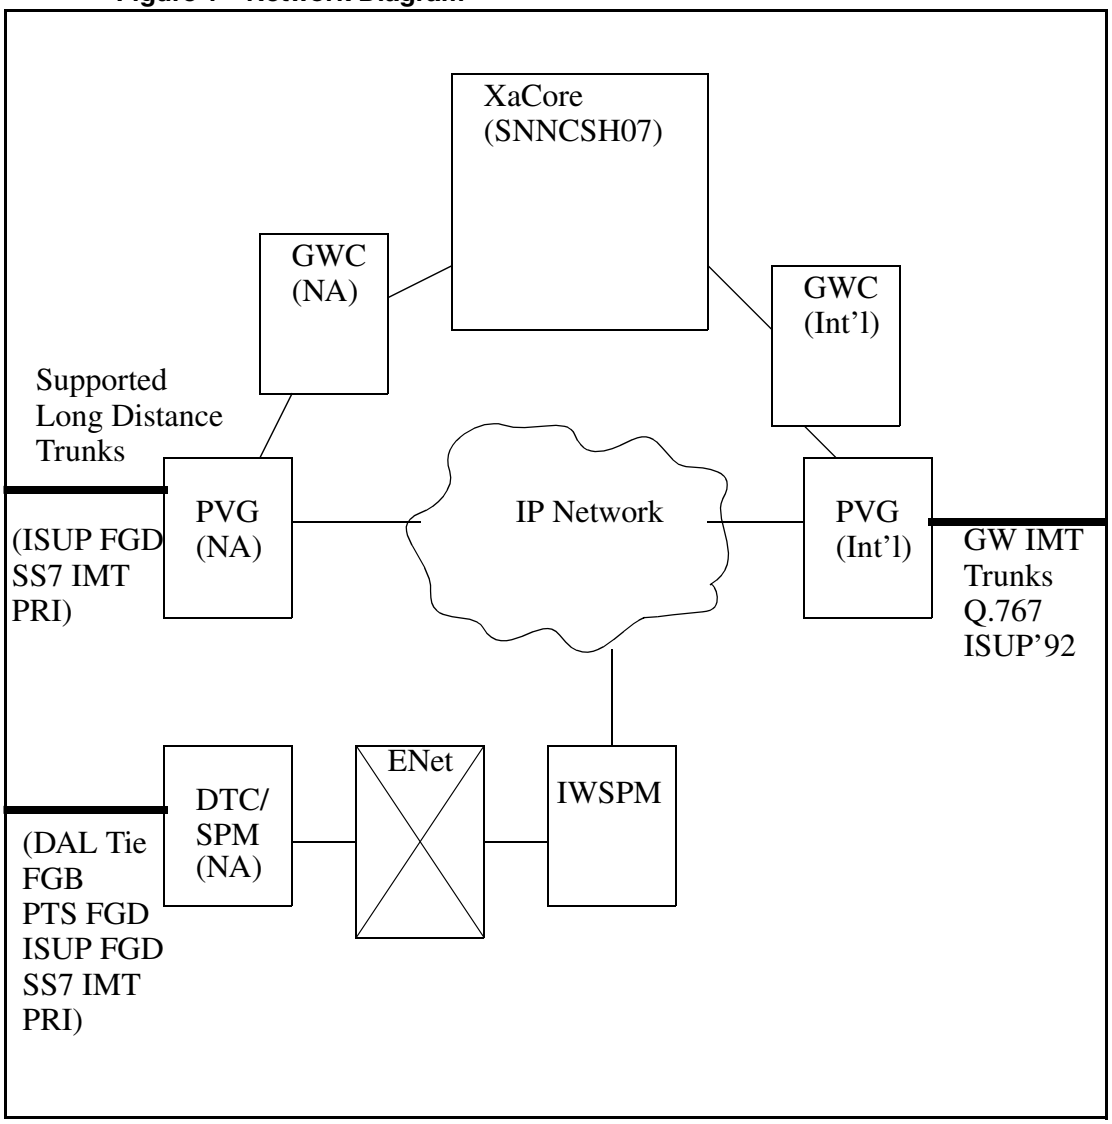
This feature allows Inter-eXchange Carriers (IXC) in World Zone-1 countries to provide limited gateway services on the Succession Communication Server 2000 operating as a UCS DMS-250 with either Q.767 or ISUP92 protocols.

109.3.2 Network Overview

This feature allows the IXCs to connect Succession CS2000 directly to foreign exchanges in the international network with either Q.767 or ISUP92 protocol signalling. This feature supports interworking gateway trunk agency with a set of existing UCS national trunk agencies. The following diagram shows the network connectivity for gateway trunk on Succession CS2000.

[1]IMT trunk agent in Table TRKGRP provisioned with NETSPEC field value of GLOBAL and new table TRKGRP option GWYTRK

Figure 1 Network Diagram



109.3.3 Supported Gateway services

The limited set of gateway functionality is supported by this feature on the Succession CS2000 and is only applicable in the World Zone-1 (WZ-1) market. The new functionality introduced by this feature includes:

- Introduction of new option GWYTRK in table TRKGRP to provision the IMT GLOBAL trunks agents as gateway trunks.
- Support for Q.767 and ISUP92 (international use) signalling protocol on the IMT GLOBAL trunk agency with GWYTRK option.
- Message Compatibility and Parameter compatibility procedures on gateway trunks with ISUP92 protocol.

- Interworking between ISUP92/Q.767 gateway trunks and supported national long distance trunk agencies:
  - IMT Inter
  - IMT Intra
  - FGD SS7
  - FGD PTS[1]
  - UCS PRI
  - FGB[1]
  - DAL TIE[1] [2]
- Support of direct termination and transit 15-digit IDDD calls.
- Support direct termination and transit Code 11 and Code 12 calls (operator assisted calls).
- Support of tie-route connection between Succession CS2000 Communication Servers within WZ-1 using ISUP92/Q.767 gateway trunks.
- Mapping of new cause values defined in ITU-T Recommendation Q.850 received on ISUP92 to normal_unspecified on non-ISUP92 trunks.
- Introduction of new protocol Q.767 in table CSEMAP and TMTMAP for ISUP92/Q.767 gateway trunk agents.
- Calling Party Category (CPC) screening, routing, and override.
- Data calls
- Test calls
- Supporting Q.767 and ISUP92 gateway trunks as terminating agents for Carrier AIN (AIN) calls on supported national long distance trunk agents.
- Support of table C7UPTMR for Q.767 and ISUP92 gateway trunks
- New SOC option GIMT0003 to control gateway services.

109.4 Feature description

109.4.1 Enhancements to IMT Global trunk agency

The existing IMT Global trunk agency is enhanced to provide gateway services. Gateway trunks are provisioned in table TRKGRP as IMT Global trunks~~,~~ with GWYTRK option selected.

[1]PTS trunks supported only in hybrid configuration

[2]Supported DAL TIE pulse type of MF and DT and start signal of WINK.

The GWYTRK option prompts for two fields SERVCC and C11C12PT. The field SERVCC identifies the serving country code of the foreign exchange in which the gateway trunk is connected. The field C11C12PT provides a pretranslator name for Code 11 and Code 12 calls received on the gateway trunk agency. Please refer to section 1.4.3 Gateway Services for applications of these fields.

On the gateway trunks, two versions of SS7 protocol for international use are supported:

- ISUP92

ISUP92 refers to partial compliance to ITU-T Recommendation Q.764 White Book version that is provided by this feature. The ISUP92 protocol is provisioned in table TRKSGRP with protocol CCITT version ISUP92 and variant V1.

- Q.767

Q.767 refers to ITU-T Recommendation Q.767 BlueBook version that is provided by this feature. The Q.767 protocol is provisioned in table TRKSGRP with protocol CCITT version BLUE and variant V1.

109.4.2 Message Protocols

The following sections describe the support for limited set of Q.767 and ISUP92 protocols that this feature provides.

109.4.2.1 Support for ISUP92 protocol

This feature provides the following support for ISUP92 protocol agencies:

1. Allows IMT Global trunks to be provisioned as ISUP92 trunks in table TRKSGRP with protocol CCITT, version ISUP92 and variant V1 (hereafter referred to as ISUP92 gateway trunk).
2. This features introduces a new option GWYTRK for IMT Global agents in table TRKGRP. This option enables gateway functionality on the ISUP92 trunks and provisions the trunk for international use of the ISUP92 protocol.
3. Message Compatibility Parameter (MCP) processing as per the ISUP92 recommendations in Q.764, Section 2.9.5.2 - 2.9.5.4
4. Parameter Compatibility Parameter (PCP) processing as per the ISUP92 recommendations in Q.764, Section 2.9.5.2 - 2.9.5.4
5. Mapping of new cause values received on ISUP92 trunks to Normal unspecified (31) if the other trunk in the call is one of the other supported trunk agencies.

For more information see “APPENDIX A: Messages and Parameters Supported on ISUP92” on page 1123.

109.4.2.1.1 Handling of Unexpected messages received on ISUP92 An unexpected or out of sequence message is a message which is supported, and is valid, but has been received when it is not expected in the call.

If such messages are received, the following applies:

- If a Release (REL) message is received for a circuit which is idle, it is acknowledged with a Release Complete message.
- If a Release Complete message is received relating to an idle circuit, it is ignored.
- If any other message is received relating to an idle circuit, a reset message is sent.

In general, unexpected messages received relating to call processing busy circuit, are ignored with the following qualifications:

- Release message and any circuit supervision messages are accepted and processed at any time during the call.
- After sending an IAM, and prior to receiving an ACM or CON, only REL and CPG messages are accepted. Receipt of any other message causes a release sequence to be initiated.
- After a Release message is received, any other call-related messages are discarded.
- If a Release Complete message is received relating to a busy circuit for which a Release message has not been sent, the circuit is released and a Release message sent.
- Blocking messages may be received at any time.

109.4.2.1.2 MCP/PCP processing

109.4.2.1.2.1 Compatibility procedures

The compatibility procedures[1] described below have been designed to ensure predictable network behavior, when the switch receives unrecognized signaling information. Refer to ISUP92 Q.761-Q.764 for a more detailed explanation of the compatibility procedures.

The ISUP92 recommendation Q.764, Section 2.9.5.3, recommends that if a message arrives that is unrecognized, or contains unrecognized parameters, the switch follows a compatibility procedure. Two new optional parameters

[1]In this document MCP means Message Compatibility information Parameter and PCP means Parameter Compatibility information Parameter.

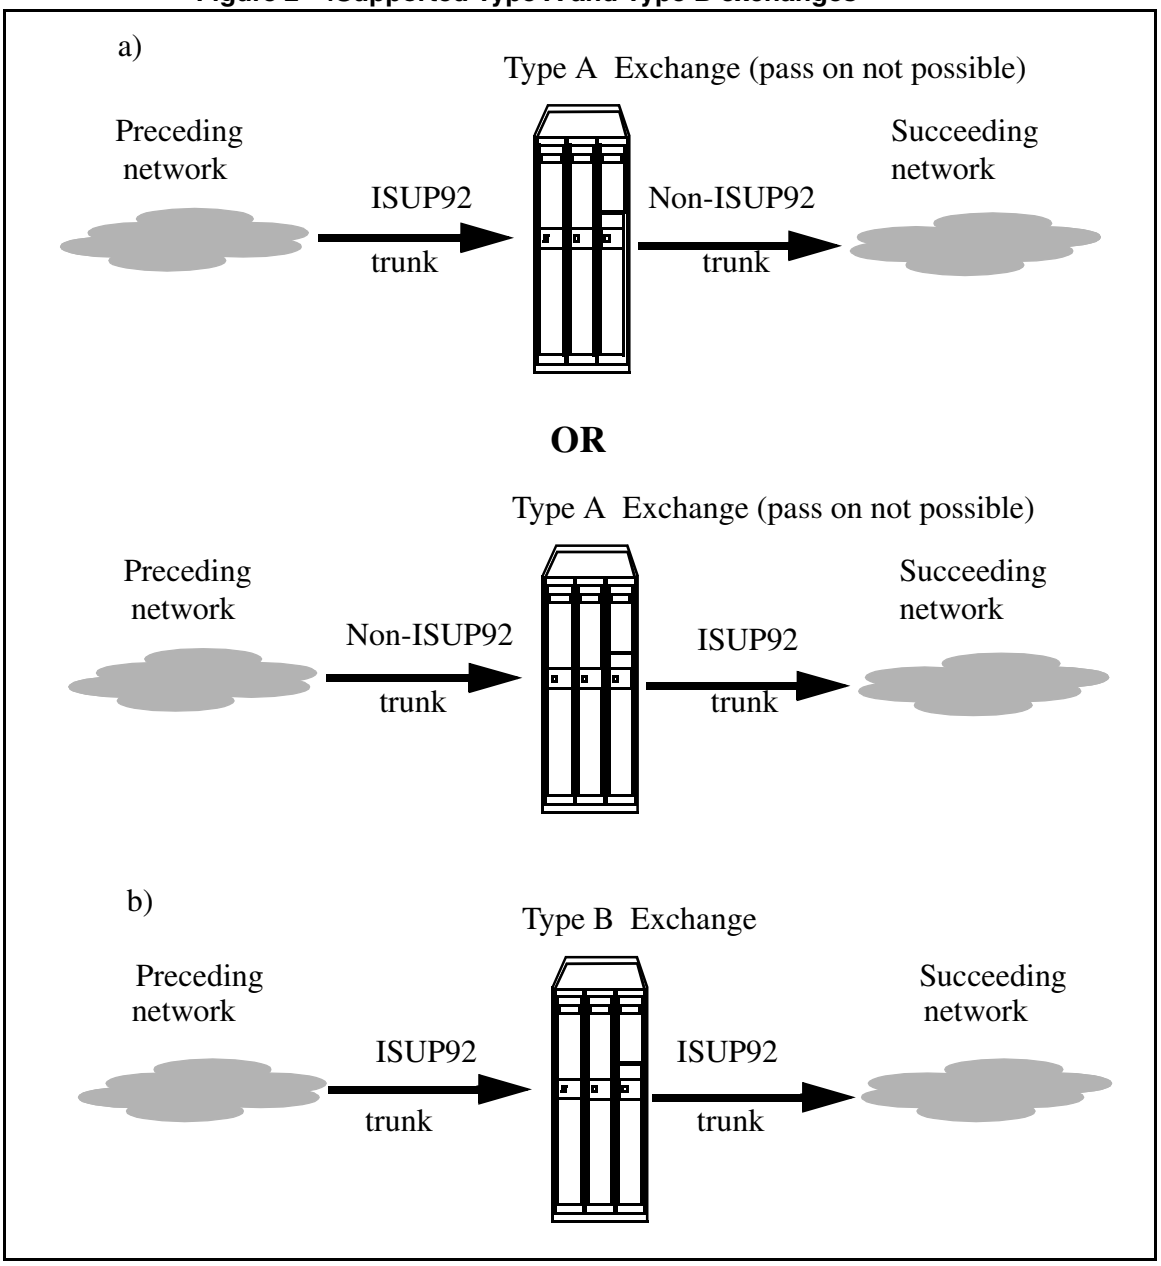
provide the functionality of the compatibility procedure: the message and parameter compatibility parameters.

109.4.2.1.2.2 Operation of the CS2000 as a Type A and Type B exchange

The Succession CS2000 interprets compatibility procedures found in
compatibility parameters according to the type of exchange. The Succession CS2000 behaves as a Type B exchange when both trunks (the originating and terminating trunks) in the call are ISUP92 gateway trunks; otherwise, Succession CS2000 behaves as a Type A exchange (pass on not possible). Succession CS2000 does not support behaving as a Type A exchange (pass on possible).

Examples of Type A and Type B exchanges supported by Succession CS2000 are given in Figure 2

Figure 2 .Supported Type A and Type B exchanges



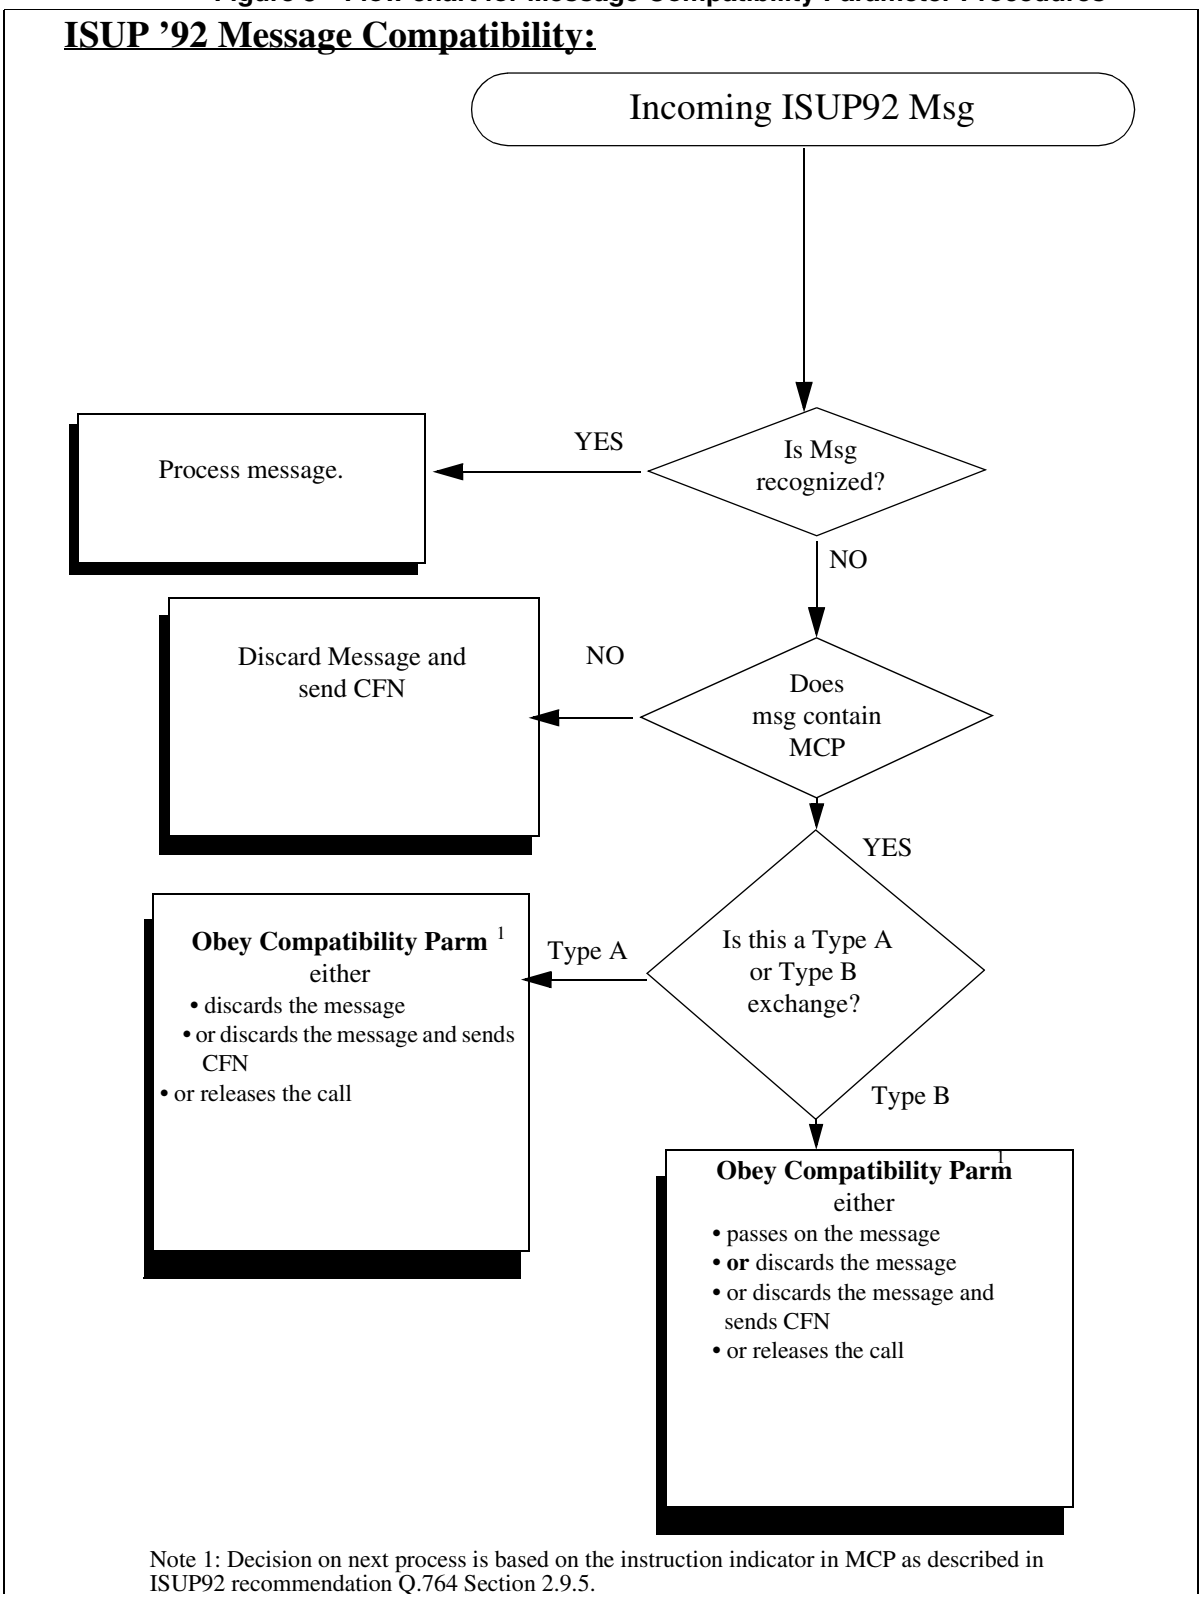
109.4.2.1.2.1 Message Compatibility Parameter Procedure

The MCP information pertains to the procedure to be followed, if the switch does not recognize an incoming message. Compatibility procedures can be applied at either a Type A or Type B exchange.

This feature provides the functionality to scan any unrecognized message received from an ISUP92 trunk for the optional MCP. If the message contains the parameter, the Succession CS2000 obeys the parameter. If there is no MCP in an unrecognized message, the switch discards the message and returns a confusion message. All CFN messages generated as a result of MCP processing contain appropriate cause and diagnostic information.

When the Succession CS2000 acts as a Type A exchange, it may receive an ISUP92-compliant Network Resource Message (NRM). The NRM is not one of the minimum set of mandatory messages that the Succession CS2000 must recognize, as stated in the ISUP92 recommendation Q.761, Table 3. Upon receipt of this message at the Succession CS2000, the switch scans the NRM for
the optional MCP. If the switch finds the parameter, it applies the message compatibility parameter procedure for Type B exchange. Figure 3 shows a flowchart of the procedure followed upon receipt of an ISUP92 message at the Succession CS2000.

Figure 3 Flow chart for Message Compatibility Parameter Procedures



Note 1: Decision on next process is based on the instruction indicator in MCP as described in ISUP92 recommendation Q.764 Section 2.9.5.

Note:
As a Type B exchange, the Succession CS2000 may transit an unrecognized message. As a Type A exchange, the Succession CS2000 does not transit an unrecognized message.

Table 1 and Table 2 explain how the switch interprets the instruction indication's bit patterns to execute the subsequent process. This is based on ISUP92 recommendation Q.764, Section 2.9.5.

Table 1 Message Compatibility for a Type A exchange (pass on not possible)

Bits								Meaning
H	***G***	***F***	**E**	**D**	**C**	**B**	**A**	
X	X	X	X	X	X	1	X	Release Call
X	X	X	0	0	X	0	X	Release Call
X	X	X	1	0	0	0	X	Discard Message
X	X	X	1	0	1	0	X	Discard Message and send CFN[a]
X	X	X	X	1	0	0	X	Discard Message
X	X	X	X	1	1	0	X	Discard Message and send CFN[a]

a. CFN messages contain an appropriate cause value and diagnostic information.

Table 2 Message Compatibility for a Type B exchange

Bits								Meaning
H	***G***	***F***	**E**	**D**	**C**	**B**	**A**	
X	X	X	X	X	X	1	1	Release Call
X	X	X	X	0	X	0	1	Pass on Message
X	X	X	X	1	0	0	1	Discard Message
X	X	X	X	1	1	0	1	Discard Message and send CFN[a]
X	X	X	X	X	X	X	0	Pass on Message

a. CFN messages contain an appropriate cause value and diagnostic information.

where bit A is Transit at Intermediate Exchange Indicator,
0 = Transit interpretation
1 = End node interpretation

Note:

Only type B exchanges examine this indicator. If it is set to "Transit Interpretation", the other indicators are ignored. If it is set to "End Node Interpretation", the following actions are performed.

bit B is Release Call Indicator,
0 = Do not release
1 = Release call
bit C is Send Notification Indicator,
0 = Do not send
1 = Send notification
bit D is Discard Message Indicator,
0 = Do not discard message
1 = Discard message
bit E is Pass On Not Possible Indicator,
0 = release call
1 = discard information
bits F-G are spare bits,
bit H is Extension Indicator, and
X means a don’t care value.

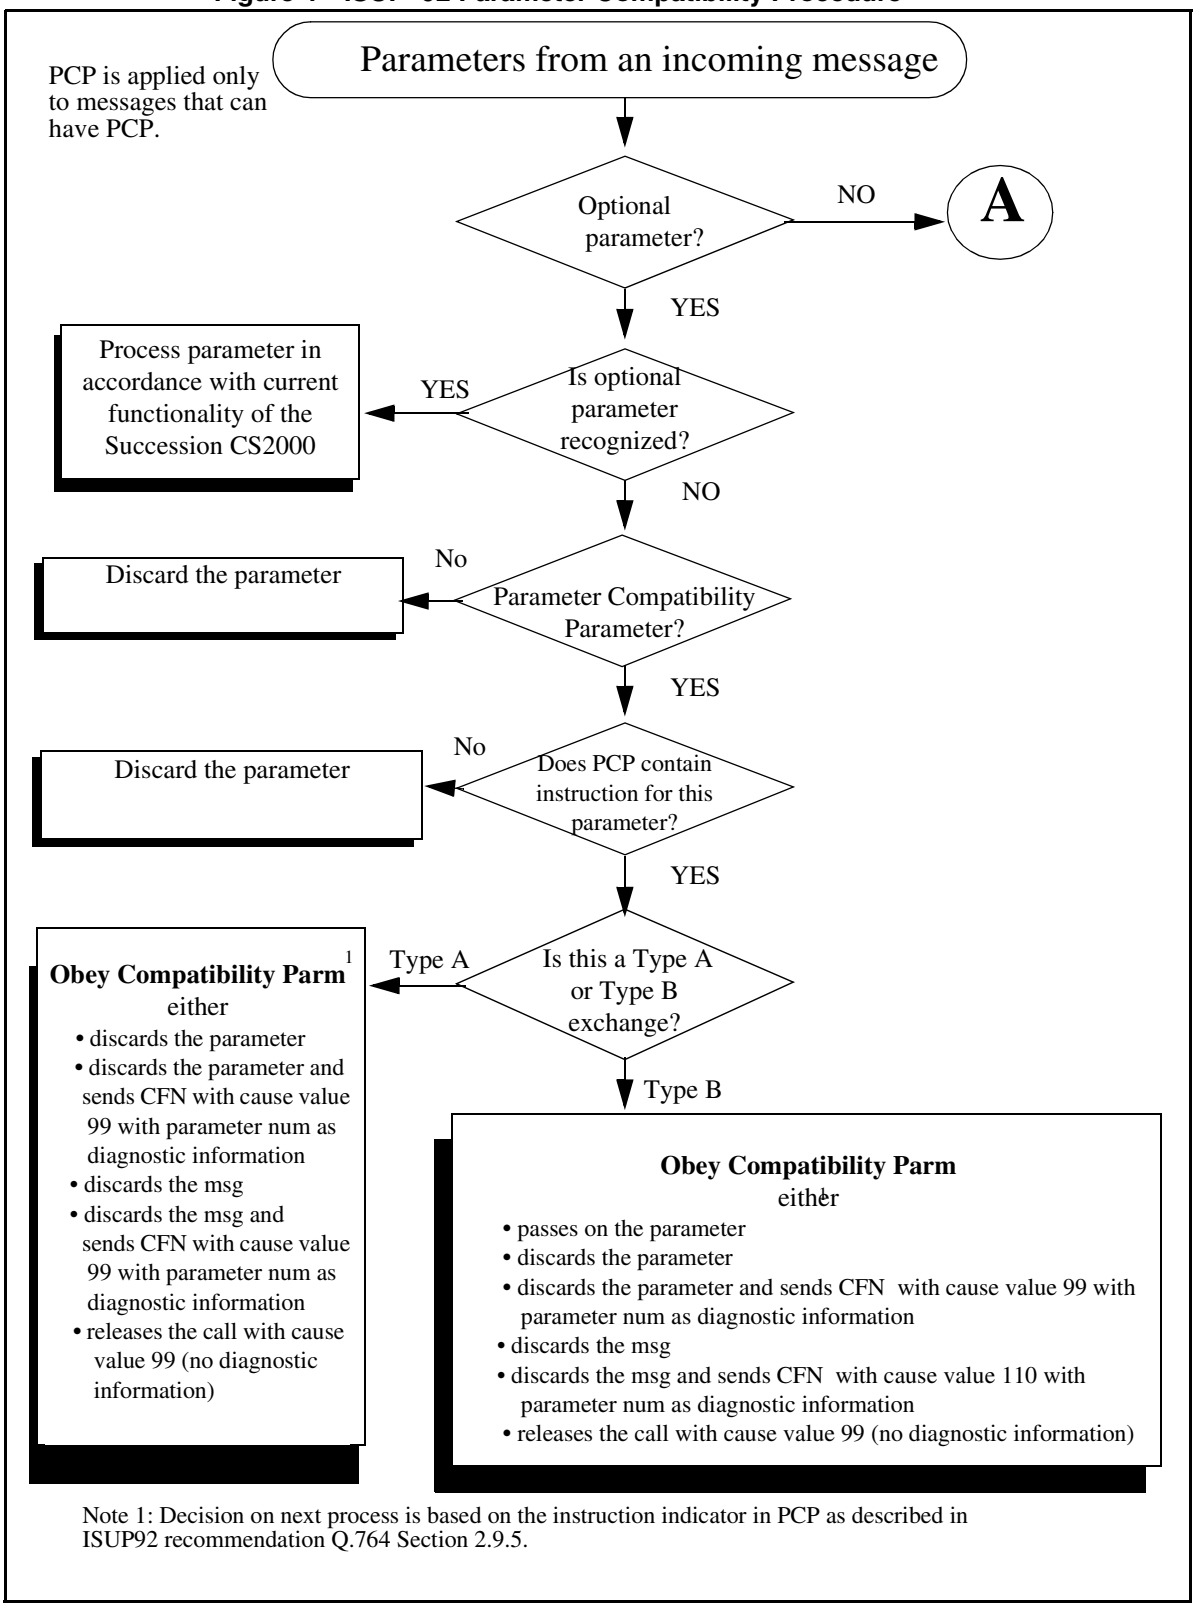
109.4.2.1.2.0.1 Parameter Compatibility Parameter Procedure

The PCP contains information pertaining to the procedure the Succession CS2000 follows if it recognizes an incoming message, but it does not recognize one of the parameters contained in that message. The switch can only treat optional parameters as unrecognized parameters, since it always recognizes mandatory parameters.

This feature allows the Succession CS2000 to scan messages for the optional PCP when it receives the messages from an ISUP92 trunk. If the switch finds a PCP within the message, it obeys the instruction of the parameter. Please refer to Figure 4 and Figure 5 for the procedure the switch follows when it receives unrecognized information in messages that can have PCP.

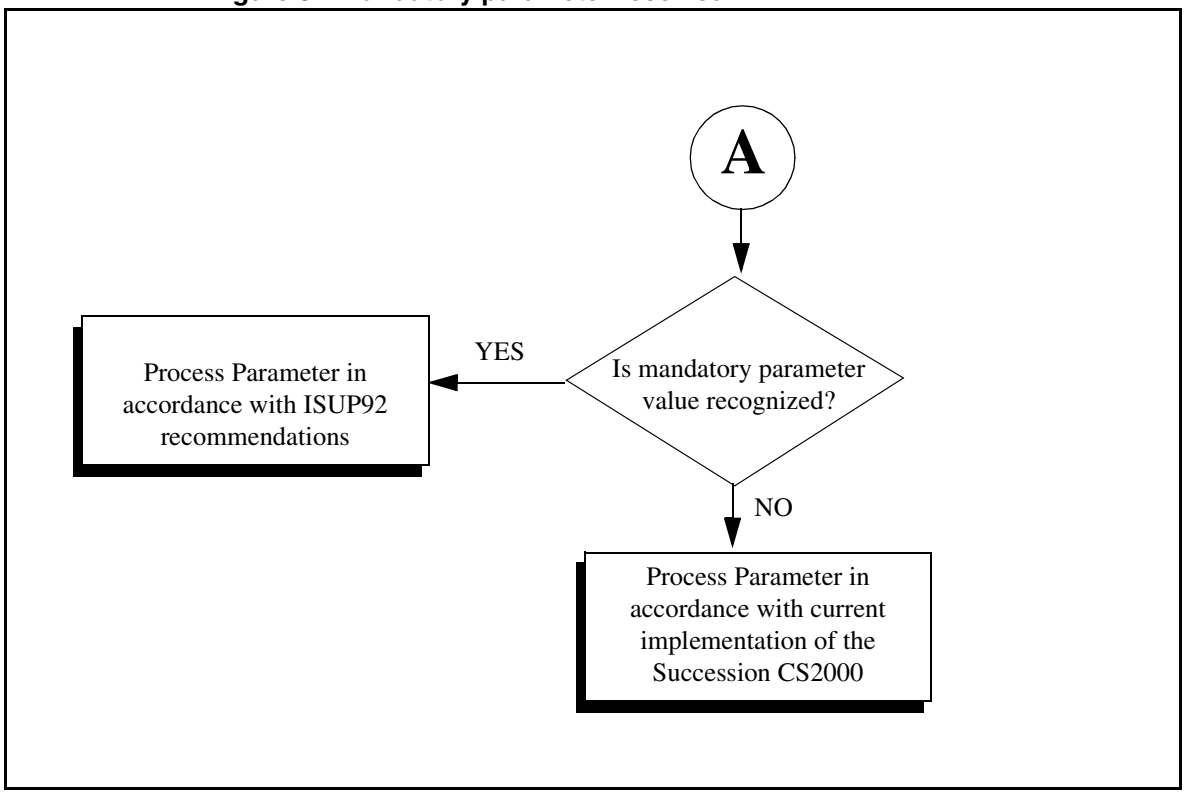
All CFN messages generated as a result of PCP processing contain appropriate cause and diagnostic information.The Diagnostic Information includes all the parameters that caused

Figure 4 ISUP '92 Parameter Compatibility Procedure



Note 1: Decision on next process is based on the instruction indicator in PCP as described in ISUP92 recommendation Q.764 Section 2.9.5.

Figure 5 Mandatory parameter received



If the Succession CS2000 receives a mandatory parameter with an unrecognized value, it functions as specified in the Q.764 recommendations. If the switch receives a recognized optional parameter with an unrecognized value, it functions as specified in the Q.764 recommendations.

If the Succession CS2000 receives a message containing an unrecognized optional parameter without related parameter compatibility information, the switch discards the parameter and allows the call to proceed.

Table 3 and Table 4 explain how the Succession CS2000 interprets the PCP instruction based on ISUP92 recommendation Q.764, Section 2.9.5. See Figure 4 and Figure 5 for detail.This feature uses the following approach for PCP implementation.

- For IAM message if the instruction indicates **discard message** OR **discard message and send notification**, it is treated as equivalent to **release call**.
- For IAM message If more than one instruction is received for a parameter, the most severe instruction that was received is applied. This is achieved by performing the logical OR operation of all instructions per parameter.

- If an instruction contains multiple indicators, the precedence followed depends on the type of exchange.

  For type A exchange, the precedence (higher to lower) is

  — release call

  — discard parameter and send notification

  — discard parameter

  — pass on

  For type B exchanges, the indicator precedence followed for:

- BIT A is set to 0 i.e. Transit_node Interpretation is

  — pass on (If BIT A is set to 0 i.e. Transit_node Interpretation) PCP along with the parameters included in the PCP parameter are tandemed, unless another PCP instruction contravenes this indication, in which case the end_node interpretation precedence would be followed.

- BIT A is set to 1 i.e. End_node Interpretation is

  — release call

  — discard parameter and send notification

  — discard parameter

  — pass on

- If more than one PCP is received, the PCP that was received first is used.
- In the REL message, only discard / pass on parameter instructions are applicable.
- The PCP parameter itself is tandemed only if the type of exchange is type B.

The following tables explain how the switch interprets the PCP instruction based on ISUP92 recommendation Q.764, Section 2.9.5.

Table 3 Parameter Compatibility for a Type A exchange (pass on not possible)

Bits								Meaning
H	*G*	*F*	E	D	C	B	*A*	
X	X	X	X	X	X	1	X	Release the call
X	X	X	X	1	0	0	X	Discard the message[a]
X	X	X	X	1	1	0	X	Discard the message and send CFN [b]
X	X	X	1	0	X	0	X	Discard the parameter[c]

Bits								Meaning
H	*G*	*F*	E	D	C	B	*A*	
X	0	0	0	0	X	0	X	Release the call
X	0	1	0	0	0	0	X	Discard the message[a]
X	0	1	0	0	1	0	X	Discard the message and send CFN [b]
X	1	0	0	0	X	0	X	Discard the parameter[c]
X	1	1	0	0	X	0	X	Release the call

a. If the message is the IAM message, the switch releases the call.
b. CFN messages contain an appropriate cause value and diagnostic information.If the message is the IAM message, the switch releases the call and returns no CFN.
c. If bit C is set, the switch returns a CFN message. CFN messages contain an appropriate cause value and diagnostic information.

Table 4 Parameter Compatibility for a Type B exchange

Bits								Meaning
H	*G*	*F*	E	D	C	B	*A*	
X	X	X	X	X	X	1	1	Release the call
X	X	X	X	1	0	0	1	Discard the message[a]
X	X	X	X	1	1	0	1	Discard the message and send CFN[b]
X	X	X	1	0	X	0	1	Discard the parameter[c]
X	X	X	X	X	X	X	0	Pass on the parameter
X	X	X	0	0	X	0	1	Pass on the parameter

a. If the message is an IAM, the switch releases the call.
b. CFN messages contain an appropriate cause value and diagnostic information. If the message is an IAM, the switch releases the call and returns no CFN.
c. If bit C is set, the switch returns a CFN message. CFN messages contain an appropriate cause value and diagnostic information.

bit A means that is transited at Intermediate Exchange Indicator

0 = Transit interpretation
1 = End node interpretation

Note:

Only type B exchanges examine this indicator. If the exchange sets it to Transit Interpretation, the other indicators are ignored. If the exchange is set to End Node Interpretation, the switch performs the following actions:

bit B is Release Call Indicator

0 = Do not release
1 = Release call

bit C is Send Notification Indicator
0 = Do not send
1 = Send notification

bit D is Discard Message Indicator
0 = Do not discard message
1 = Discard message

bit E is Discard Parameter Indicator
0 = Do not discard parameter (pass on)
1 = Discard parameter

bits F-G are pass on not possible indicator:
00 = Release the call
01 = Discard the message
10 = Discard the parameter
11 = Release the call

bit H is Extension Indicator

Note:

If pass on is set (bit D =0 or bit E = 0) but not possible, then bits C, F and G are examined

109.4.2.2 Support for Q.767

This feature provides the following support for Q.767 protocol agencies:

1. Allows IMT Global trunks to be provisioned as Q.767 gateway trunks in table TRKSGRP with protocol CCITT, variant v1 and version BLUE (hereafter referred to as Q.767 trunk).
2. This features introduces a new option GWYTRK for IMT Global agents in table TRKGRP. This option enables limited gateway functionality on the Q.767 trunks and provisions the trunk for international use of Q.767 protocol on Succession CS2000.

For more information see “Appendix B: Messages and Parameters Supported on Q.767” on page 1138.

109.4.2.2.1 Handling of Unrecognized & Unexpected messages For Q.767

All messages that are not included in table 32 (***Appendix B: Messages and Parameters Supported on Q.767***) are considered as unrecognized messages and are treated as per ITU - T Blue Book Q.767 section 4.1.1. Unrecognized messages are discarded without disrupting normal call handling. No logs are produced for unrecognized messages.

An unexpected or out of sequence message is a message which is supported, and is valid, but has been received when it is not expected in the call.

If such messages are received in the Q.767 to Q.767 case, the following applies:

- If a Release (REL) message is received for a circuit which is idle it is acknowledged with a Release Complete message.
- If any other message is received relating to an idle circuit a reset message is sent.
- If a Release Complete message is received relating to an idle circuit it is ignored.

In general, unexpected messages received relating to call processing busy circuit are ignored with the following qualifications:

- Release message and any circuit supervision messages are accepted and processed at any time during the call.
- After sending an IAM, and prior to receiving an ACM or CON, only REL and CPG messages are accepted. Receipt of any other message causes a release sequence to be initiated.
- After a Release message is received, any other call-related messages are discarded.
- If a Release Complete message is received relating to a busy circuit for which a Release message has not been sent, the circuit is released and a Release message sent.
- Blocking messages may be received at any time.

109.4.2.3 Q.767/ISUP92 Cause value handling

This feature enhances the keys into table TMTMAP and table CSEMAP to include a new protocol Q.767 for calls originating/terminating on Q.767 and ISUP92 trunk agents.

For calls that release at terminator first with a cause value other than *Normal call clearing* (cause value of 16), Succession CS2000 accesses table CSEMAP with the originating trunk agent protocol and the cause value. The cause value is mapped to an extended treatment value when the fields RTEADV and RECOL are set to ‘N’ in table CSEMAP.

This extended treatment value along with the trunk agent protocol is then used to access table TMTMAP to determine the action to be taken for the call. For calls in which Succession CS2000 have applied a treatment, the applied treatment along with the protocol of the trunk agent is used to access table TMTMAP to derive the action to be taken for the call.

For calls with an action of local treatment (table TMTMAP field TMTPROC value of either LOCAL, ISLOCAL, or INTLOCAL), existing Succession CS2000 functionality is applied.

For calls with an action of non-local treatment (table TMTMAP field TMTPROC value of NOLOCAL) and originated on Q.767 or ISUP92 trunk agents, the carrier is responsible to properly provision the Q.767 protocol in table TMTMAP to reflect the proper location field value of INTL_NET (*International network*) to reflect the generation of the location took place in the international network.

The following excerpt is from ITU-T Recommendation Q.850 which identifies the proper handling of the location field in the CAUSE parameter for international exchanges:

i) If the event causing the generation of the location field takes place in an international exchange (i.e. incoming or outgoing or international transit exchange) the location is set to *International network.*

For calls originating on UCS trunk agent and has terminated to Q.767 or ISUP92 trunk agent, the CS2000 modifies the LOCATION field derived from table TMTMAP with the LOCATION field value of INTL_NET (*International network)* to reflect the generation of the location took place in the international network.

For calls originating on UCS trunk agent and has **not** successfully routed to a Q.767 or ISUP92 trunk agent or has terminated to a UCS trunk agent, the existing table TMTMAP functionality is utilized and the location field is not modified.

For type A exchanges (ISUP92 trunk agents interworking with non-ISUP92 trunk agents), the CS2000 maps the following ISUP92 cause values to *normal, unspecified* (Cause value 31) prior to accessing table CSEMAP and also CS2000 maps the following ISUP92 cause values from table TMTMAP to *normal, unspecified* (Cause value 31) prior to sending the CAUSE value for non-local treatments:

- Preemption (T1.619) (8 or CSE_8)
- Pre-emption Circuit reserved for re-use (9 or CSE_9)
- Subscriber absent (20 or CSE_20)
- User information discarded (43 or CSE_43)

- No Preempt Circuit Available(46 or CSE_46)
- Incompatible Agents(53 or CSE_53)
- Inconsistency in designated info (62 or CSE_62)
- Non-existent CUG (90 or CSE_90)
- Message with unrecognized parameter discarded (110 or CSE_110)

For type B exchanges (ISUP92 trunk agent interworking with ISUP92 trunk agent), the CS2000 does not perform the ISUP92 cause value mappings to *normal unspecified* (Cause value 31) as performed on type A exchanges.

109.4.2.3.1 Mapping of ISUP92 cause values for non-ISUP92 trunks The following table summarizes the mapping of ISUP92 cause values for non-ISUP92 trunks.

Table 5 Mapping of ISUP92 cause values for non-ISUP92 trunks

Release Incoming Trunk	CSEMAP Cause	Release Outgoing Trunk	Outgoing Cause
ISUP92	ISUP92 Cause	ISUP92	CSEMAP Cause Value
ISUP92	Non-ISUP92 Cause	ISUP92	CSEMAP Cause Value
ISUP92	ISUP92 Cause	Q767	Normal Unspecified
ISUP92	Non-ISUP92 Cause	Q767	CSEMAP Cause Value
ISUP92	ISUP92 Cause	UCS Agent	Normal Unspecified
ISUP92	Non-ISUP92 Cause	UCS Agent	CSEMAP Cause Value
Q767	ISUP92 Cause	ISUP92	Normal Unspecified
Q767	Non-ISUP92 Cause	ISUP92	CSEMAP Cause Value
Q767	ISUP92 Cause	Q767	Normal Unspecified
Q767	Non-ISUP92 Cause	Q767	CSEMAP Cause Value
Q767	ISUP92 Cause	UCS Agent	Normal Unspecified
Q767	Non-ISUP92 Cause	UCS Agent	CSEMAP Cause Value
UCS Agent	ISUP92 Cause[a]	Q767	Normal Unspecified
UCS Agent	ISUP92 Cause[a]	ISUP92	Normal Unspecified
UCS Agent	Non-ISUP92 Cause	Q767	CSEMAP Cause
UCS Agent	Non-ISUP92 Cause	ISUP92	CSEMAP Cause

a. CSEMAP does not differentiate between CCITT coding standard or National coding standard.

109.4.2.4 Q.767 and ISUP92 Protocol Timers

This feature allows flexibility to set timers per trunk sub-group basis for the Q.767/ISUP92 trunks. Table TRKSGRP field TMRNAME value provides the index into Table C7UPTMR. Table C7UPTMR allows to set timers based on a per trunk sub-group basis. If the TMRNAME field is not provisioned, then the default values are used.

For more information see “Appendix C: Q.767/ISUP92 Timers” on page 1146.

109.4.2.4.1 Q.118 Timer This feature does not support suspend (SUS) and resume (RES) functionality on the ISUP92/Q.767 trunk agency. The gateway functionality is required to tandem any received SUS or RES messages (when the appropriate indicators indicate the message is network initiated) and not process these messages when the originating agency is Gateway trunk. For other originating agencies the existing suspend-resume functionality is performed. For this reason, Q.118 timer in section 4.3.2 in ITU Q.118 recommendation is not supported. Timer value associated with T6 is ignored and the timer is not set which corresponds to a infinite timer value.

109.4.3 Gateway services

109.4.3.1 Supported calltypes

The Q.767/ISUP92 gateway trunks support the following calltypes:
- direct termination and transit IDDD calls
- direct termination and transit international operator assisted calls
- direct termination and transit Code 11/Code 12 calls

All calltypes are handled as automatic service calls. This feature also supports tie-route connections between two Succession CS2000 Communication Servers using the ISUP92/Q.767 trunk agency.

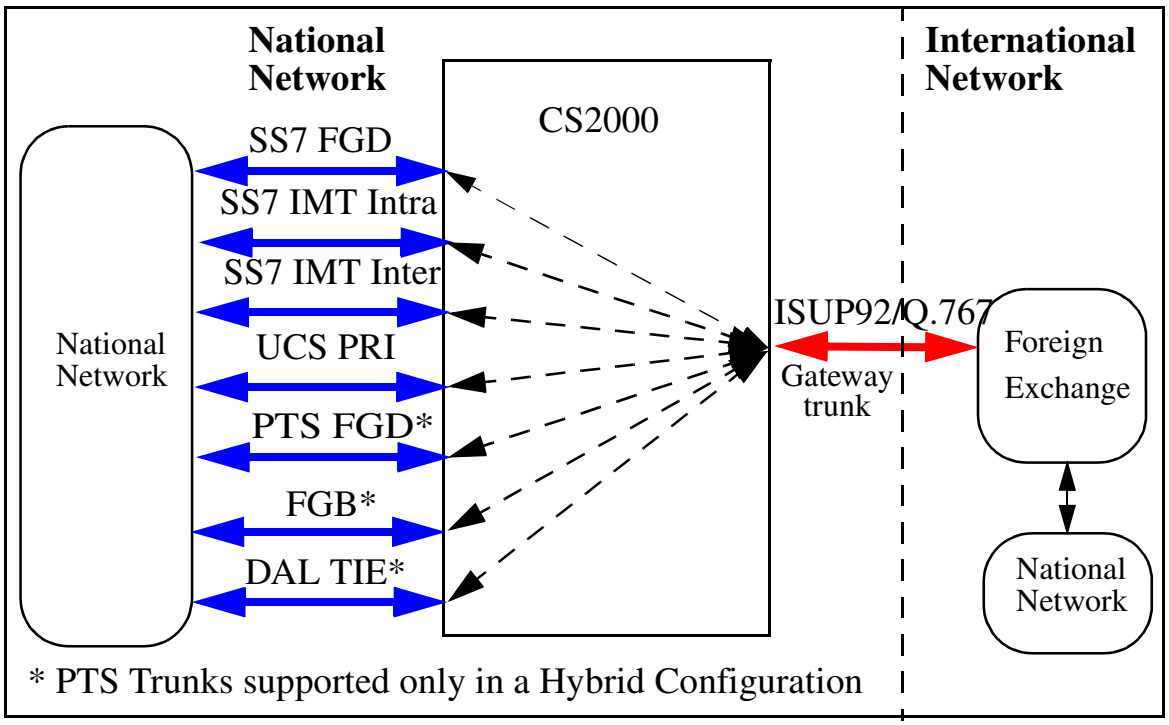
This feature supports 15-digit IDDD requirements for both the called party number and the calling party number. The ISUP92/Q.767 trunk agency supports receiving and outpulsing two Nature of Address (NOA) values for both calling party number and called party number based on below mentioned supported calltypes:
- National significant number (0000011)
  - direct termination IDDD calls
  - direct termination operator assisted calls
  - direct termination Code 11/Code 12 calls
- International significant number (0000100)
  - transit IDDD calls
  - transit operator assisted calls
  - transit Code 11/Code 12 calls

The Q.767/ISUP92 gateway trunks are used to inter-connect to foreign exchanges. The table TRKGRP GWYTRK option field SERVCC identifies the serving country code of the foreign exchange. The foreign exchange provides the international interface for the national network of the serving country code.

The Succession CS2000 provides the international interface for the national network associated with the table OFCVAR parameter OFC_SERVING_CC. Table OFCVAR parameter OFC_SERVING_CC is provisioned with the country code that is associated with the country that resides the Succession CS2000. This feature is only supported in WZ-1 countries; therefore, the only supported country code for the office parameter OFC_SERVING_CC is 1. The supported UCS trunk agents are associated with the country code of the office parameter OFC_SERVING_CC.

The following figure illustrates the supported trunk agencies interworking and the international interface between the national network being served by Succession CS2000 and the international network.

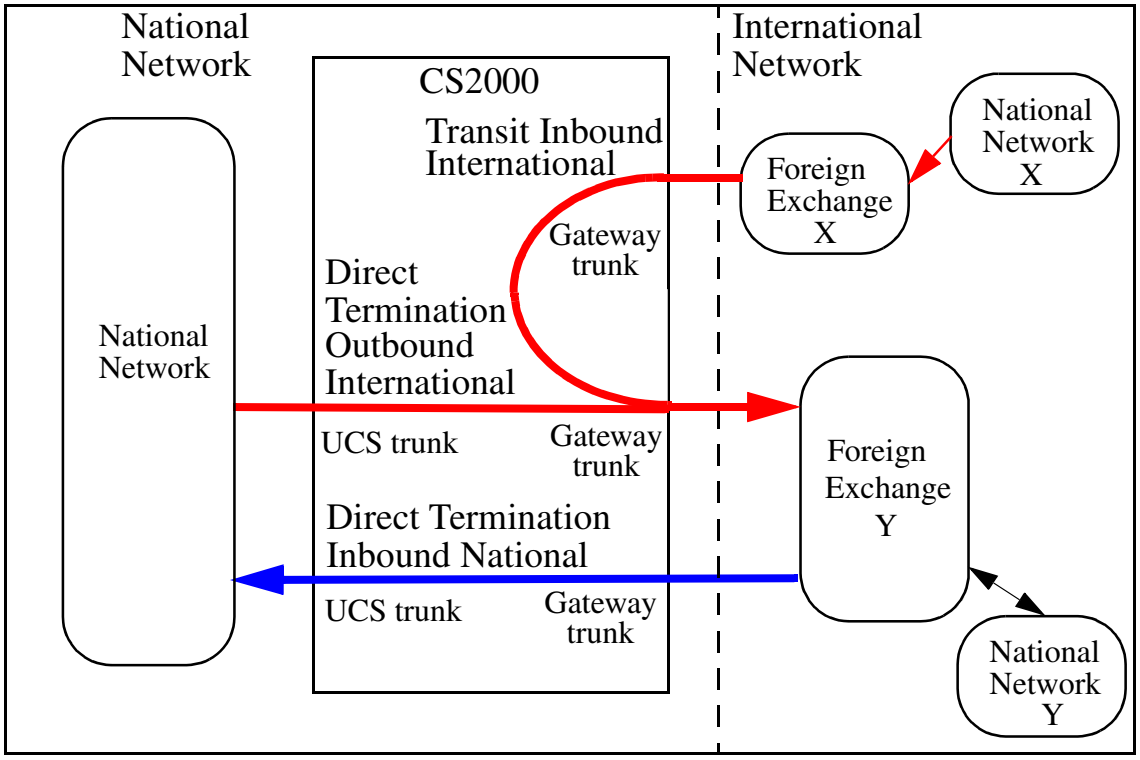
Figure 6 Supported trunk agent interworkings



109.4.3.1.1 Direct Termination calls Direct termination outbound international calls pertains to IDDD calls which are routed to a foreign exchange which serves the country code prefixed to the called number. The foreign exchange would serve the national network of the country code. For direct termination outbound international (IDDD) calls, the call would be routed to a ISUP92/Q.767 trunk which is connected to the foreign exchange that serves the country code prefixed on the called number.

Direct termination inbound national calls pertain to national calls routed from a foreign exchange which are destined for the country (serving country code) in which the Succession CS2000 resides. For direct termination inbound national calls, the call would be routed (via translations) to the supported UCS agents. The supported UCS agents are associated with the national network of the serving country code. Figure 7 illustrates supported direct termination calltypes.

Figure 7 Direct Termination calltypes



Direct Termination Outbound International:

For direct termination outbound international calls, the call origination occurs on one of the supported UCS trunk agents or a ISUP92/Q.767 trunk agency (in the case of a transit inbound international call from a foreign exchange) and terminates to a ISUP92/Q.767 trunk agency where the call is typed as an international (IDDD) call. The terminating ISUP92/Q.767 trunk agency is connected to the foreign exchange serving the country code prefixed on the called number. For the call to be classified as a direct termination outbound international call, the serving country code (table TRKGRP GWYTRK option field SERVCC) that is associated with the terminating ISUP92/Q.767 trunk agency would be EQUAL to the country code prefixed on the called number.

For originations on the supported UCS agents, this feature supports existing international (IDDD) translations (IP and IN translations) and existing Carrier AIN functionality to allow the call to be routed to the terminating ISUP92/ Q.767 trunk agency. For originations on ISUP92/Q.767 trunk agency, this feature supports existing international (IDDD) translations (IP and IN translations) to allow the call to be routed to the terminating ISUP92/Q.767 trunk agency.

For more information see “Appendix D: Call Information (IAM message) for Gateway Calltypes” on page 1149.“109.17 Appendix E: Callflow diagram” and “109.18 Appendix F: Datafill examples”for more details on DMS250 processing of direct termination outbound international calls.

Direct Termination Inbound National:

For direct termination inbound national calls, the connected foreign exchange routes the call as a national call to the Succession CS2000 via ISUP92/Q.767 trunk agency. For the call to be classified as a direct termination inbound national call, the Succession CS2000 would call type the call as a national call (via table STDPRTCT CT selector with CALLFEAT of OFFNET or table STDPRTCT S/T selectors).

The ISUP’92/Q.767 trunk agency would utilize table TYP2PRTM to derive the pretranslator name (to access table STDPRTCT) based on the received called party number NOA. This feature supports the following pretranslation selectors from table STDPRTCT:

- CT selector (calltype of OFFNET)
- S selector
- T selector

The other pretranslation selectors are not supported.

This feature supports existing national translation system (HNPACONT). This feature supports the following translation routing selectors from table HNPACONT:

- S route selector
- N route selector
- T route selector (supported UCS routing tables)
- SX route selector
- TRMT route selector

The other translation routing selectors are not supported.

The outgoing call information is updated based on the information/translations derived/performed by the Succession CS2000.

For more information see “Appendix D: Call Information (IAM message) for Gateway Calltypes” on page 1149.“109.17 Appendix E: Callflow diagram” and “109.18 Appendix F: Datafill examples” for more details on DMS250 processing of direct termination inbound national calls.

109.4.3.1.2 Transit calls

Transit calls pertains to international calls which are routed to a foreign exchange (gateway) which does not serve the country based on the country code prefixed on the called number. This foreign exchange would then route the call as either a direct termination inbound national call or a transit outbound international call to another foreign exchange that is serving the country code prefixed on the called number.

Transit inbound national call pertains to national calls (gateway serving the country code prefixed on the called number) which were transit through a foreign exchange that did not serve the country code of the subscriber (calling party number) and terminates to the serving country code of the Succession CS2000. Transit inbound national calls are handled in the same manner as direct termination inbound national call.

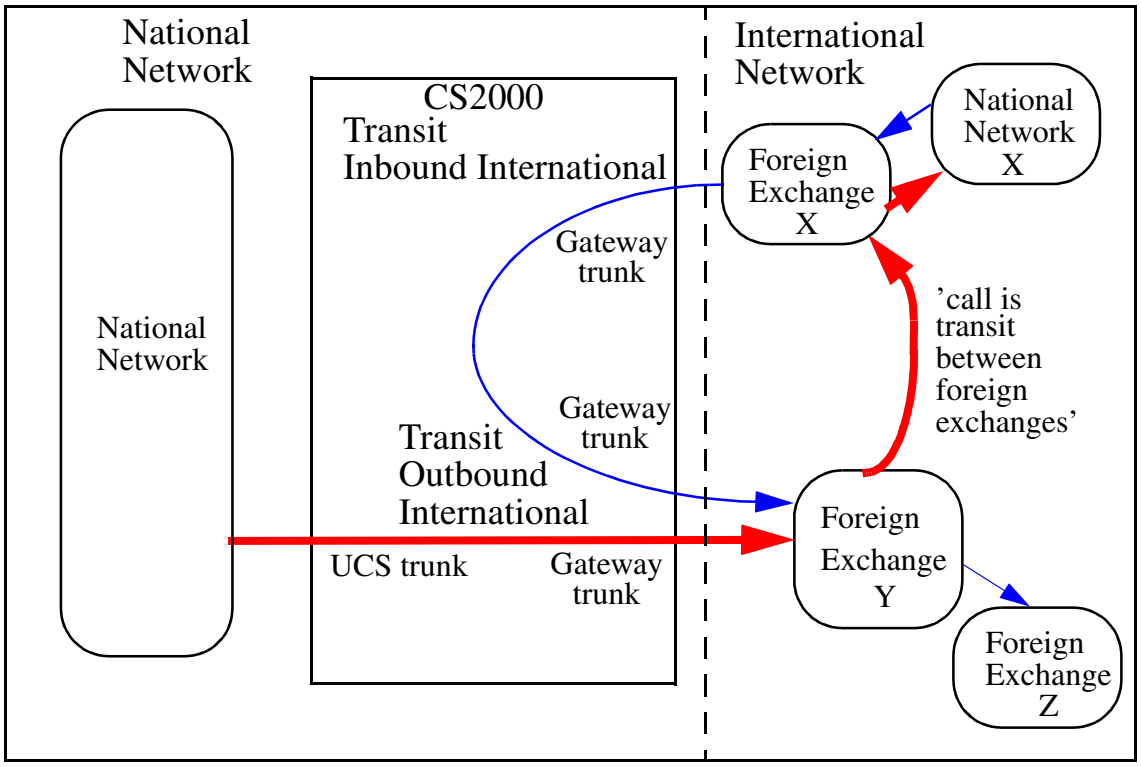
For more information see “Appendix D: Call Information (IAM message) for Gateway Calltypes” on page 1149.“109.17 Appendix E: Callflow diagram” and “109.18 Appendix F: Datafill examples” for more details on CS2000 processing of transit calls.

Transit Outbound International

For transit outbound international calls, the call origination occurs on either the supported UCS agents or ISUP92/Q.767 trunk agency and the call is typed as an international (IDDD) call. Transit outbound international (IDDD) calls could have originated from the national network serving the Succession CS2000 (originated on supported UCS agents) or from a foreign exchange using the Succession CS2000 as a transit foreign exchange (gateway) where the incoming call is a transit inbound international call and the outgoing call is a transit outbound international call.

Figure 8 illustrates transit outbound international calls coming from either the national network (origination on supported UCS trunk agent) or international network (origination on ISUP92/Q.767 trunk agent).

Figure 8 Transit outbound international call type



For ISUP92/Q.767 trunk agency originations existing international translations (IP and IN translations) is supported and for supported UCS agents originations existing international translations (IP and IN translations or Carrier AIN) are supported.

The ISUP92/Q.767 trunk agency would utilize table TYP2PRTM to derive the pretranslator name (to access table STDPRTCT) based on the received called party number NOA.

International translations would have routed the call to a ISUP92/Q.767 trunk agency. For the call to be classified as a transit outbound international call, the terminating trunk agent is an ISUP92/Q.767 trunk agent and the serving country code (table TRKGRP option GWYTRK field SERVCC) for ISUP92/Q.767 trunk agent is NOT EQUAL to the country code prefixed on the called number.

109.4.3.1.3 Operator calls

This feature supports following types of operator assisted calls:

- Inbound national OA calls (Direct)
- Outbound international OA calls (Direct & Transit)
- Inbound national Code 11 and Code 12 calls (Direct)
- Outbound international Code 11 and Code 12 calls (Direct & Transit)

109.4.3.1.3.1 Inbound National OA calls (Direct)

Calls originating on Q.767/ISUP92 gateway trunk agents, are identified as inbound national operator assisted (OA) call via pretranslations (in table STDPRTCT, subtable STDPRT, S selector with TYPCALL field value of OA or T selector with TYPCALL field value of OA). The S and T selector by default call type the call as a national call (OFFNET). Succession CS2000 treats inbound national OA call (S and T selectors with TYPCALL value of OA in table STDPRTCT) as direct termination inbound national calls except the CPC value is not modified (unless modified by the SX routing selector via table RTEATTR) in the outgoing call information (ISUP or PRI trunk terminations).

Inbound national OA calls can also use the CT selector with CALLFEAT value of OFFNET to pretranslate the call. The CT selector with CALLFEAT value of OFFNET has the option of using the new option CPCSCRN to perform CPC screening, routing, or override the incoming CPC but the call is treated as a direct termination inbound national call.

The carrier is responsible to append any WZ-1 prefix digits.

For more information see “Appendix D: Call Information (IAM message) for Gateway Calltypes” on page 1149.“109.17 Appendix E: Callflow diagram” and “109.18 Appendix F: Datafill examples” for detail on CS2000 processing of inbound national OA calls.

109.4.3.1.3.2 Outbound international OA calls (Direct & Transit)

Direct termination outbound international OA and Transit outbound international OA calls originate on supported UCS agents or Q.767/ISUP92 gateway trunk and terminate on Q.767/ISUP92 gateway trunk. These calls are identified as international operator assisted call via NT selector with TYPCALL field value of OA in table STDPRTCT, subtable STDPRT.

The NT selector call types the call as an international call. Succession CS2000 treats outbound international OA call (NT selector in table STDPRTCT) as either a direct termination outbound international call or a transit outbound international call based on the comparison between the country code prefixed on the called number and the serving country code (table TRKGRP option GWYTRK field SERVCC) of the terminating Q.767/ISUP92 gateway trunk agent. For either case, the CPC value is not modified (unless modified by the SX routing selector via table RTEATTR or the NT selector option CPCSCRN functionality). The NT selector option CPCSCRN in table STDPRTCT provides the optionallity to perform CPC screening, CPC routing, and CPC override for calls originating on Q.767/ISUP92 gateway trunk agents.

For more information see “Appendix D: Call Information (IAM message) for Gateway Calltypes” on page 1149.“109.17 Appendix E: Callflow diagram” and “109.18 Appendix F: Datafill examples” for details on CS2000 processing of outbound international OA calls.

109.4.3.1.3.3 Code 11/Code 12 calls:

An operator can place international calls to other operators by including Code 11 (Hexadecimal B) or Code 12 (Hexadecimal C) in called number. Code 11 (`B’) is used internationally to signify Directory Assistance and Code 12 (`C’) is used to indicate General Operator Assistance.

109.4.3.1.3.3.1 Outbound International Code 11/12 calls (Direct & Transit)

These calls originate either on Gateway trunk or UCS Agents and terminate on Gateway trunk.

In WZ-1, code 11digit (B) and code 12 digit (C) are commonly translated to “121” and “131” respectively. For outbound international Code 11 and Code 12 calls, the national operator includes 121 or 131 in place of the Code 11 or Code 12 digit in the called number. The international exchange would then convert the 121 and 131 to Code 11 digit (B) and Code 12 digit (C), respectively.

The called number contents from a national operator position could have the following format (Recommendation Q.107):

<01> + <country code> + <extra digit> + <121 or 131> + <digits>
- ‘01’: WZ-1 prefix digits for international operator assisted calls
- extra digit: (Optional) extra digit designating the incoming international exchange is used in cases where more than one incoming international exchange can be reached in the country of destination. (It is recognized that some existing equipment does not permit the insertion of the extra digit)
- digits: (Optional) number of a particular operator position or group of positions

For calls originating on Q.767/ISUP92 gateway trunk agents, the CS2000 scans the called number for the Code 11 and Code 12 digits. If the Code 11 or Code 12 digits exist in the called number, the Succession CS2000 replaces these digits in the called number with 121 or 131, respectively along with prefixing the called number with 0 or 01 based on the NOA of the called number. Succession CS2000 uses the pretranslator name from table TRKGRP option GWYTRK option field C11C12PT to access table TYP2PRTM along with the NOA of the called number.

The IAM called number contents from a foreign operator position via foreign exchange could have the following format (Recommendation Q.107):

<country code> + <extra digit> + <code 11 or code 12> + <digits> + #F
- extra digit: (Optional) extra digit designating the incoming international exchange is used in cases where more than one incoming international exchange can be reached in the country of destination. (It is recognized that some existing equipment does not permit the insertion of the extra digit)
- digits: (Optional) number of a particular operator position or group of positions

The Succession CS2000 would treat the call as either a direct termination outbound international OA call or transit outbound international OA call based on the comparison between the country code prefixed on the called number and the serving country code (table TRKGRP option GWYTRK field SERVCC) of the terminating Q.767/ISUP92 gateway trunk agent. For either case, the CPC value is not modified (unless modified by the SX routing selector via table RTEATTR or by NT selector option CPCSCRN in table STDPRTCT).

The carrier is responsible to remove any WZ-1 prefix digits and perform digit manipulation (via translations) to convert the 121 and 131 digits to Code 11 digit and Code 12 digit, respectively.

For more information see “Appendix D: Call Information (IAM message) for Gateway Calltypes” on page 1149.“109.17 Appendix E: Callflow diagram” and “109.18 Appendix F: Datafill examples” for details on DMS250 processing of outbound international code 11/12 calls.

109.4.3.1.3.3.2 Inbound National Code 11/12 calls (Direct)

These calls originate on Gateway trunk and terminate on UCS agent.

For calls originating on Q.767/ISUP92 gateway trunk agents, the CS2000 scans the called number for the Code 11 and Code 12 digits. If the Code 11 or Code 12 digits exist in the called number, the Succession CS2000 replaces these digits in the called number with 121 or 131, respectively.Also, Succession CS2000 prefixes digit(s) 0/01 based on the incoming NOA. Succession CS2000 uses the pretranslator name from table TRKGRP option GWYTRK option field C11C12PT to access table TYP2PRTM along with the NOA of the called number.

The IAM called number contents from a foreign operator position via foreign exchange could have the following format (Recommendation Q.107):

<extra digit> + <code 11 or code 12> + <digits> + #F

- extra digit: (Optional) extra digit designating the incoming international exchange is used in cases where more than one incoming international exchange can be reached in the country of destination. (It is recognized that some existing equipment does not permit the insertion of the extra digit)
- digits: (Optional) number of a particular operator position or group of positions

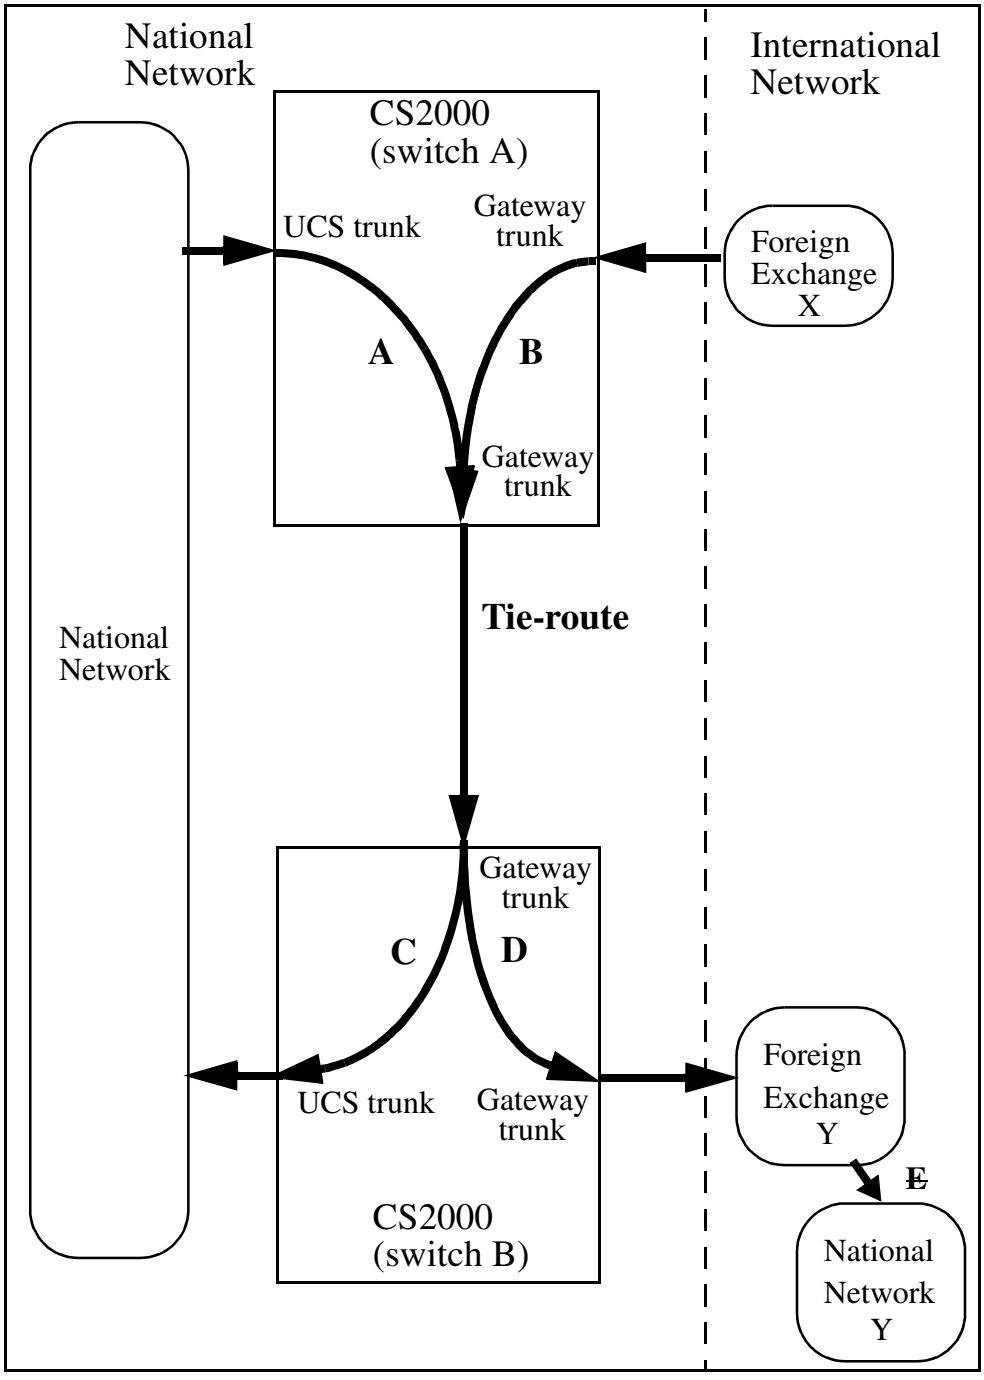
The Succession CS2000 would treat direct termination inbound national code 11 or code 12 call as a direct termination inbound national OA call based on pretranslations.

For more information see “Appendix D: Call Information (IAM message) for Gateway Calltypes” on page 1149.“109.17 Appendix E: Callflow diagram” and “109.18 Appendix F: Datafill examples” for details on DMS250 processing of inbound national code 11/12 calls.

109.4.3.2 Tie-route support

Tie-route connections are used when the carrier has more than one switch with the gateway functionality. These switches would be directly connected to each other via gateway trunk agency. The tie-route connection may be used by the carrier to route calls between the switches based on which switch has the available connection to the destination foreign exchange or the destination national network. Figure 9 illustrates the supported tie-route connection between two CS2000 Communication Servers.

Figure 9 Tie-route connection



The carrier would be expected to use the national backbone to tandem any national traffic within the carrier's network or within the national network. The tie-route connection could be used to route the following gateway calltypes:

- direct termination inbound national calls (connection B to connection C)
- direct termination outbound international calls (connection A to connection D)
- any transit outbound international calls (connection B to connection D)

Please refer to Section "109.19 Appendix G: Tie-route Connection Example" on page 1183. for example on tie-route connection.

109.4.3.3 Calling Party Category(CPC) handling

New table CPCSCRN is implemented to provide the following functionality:

- CPC screening
- CPC routing
- CPC override

Table CPCSCRN is only accessible by ISUP92 and Q.767 gateway trunk agencies. Table CPCSCRN is accessed as a two part key with the NT/CT option CPCSCRN index value (CPCINDEX) and the incoming call CPC value (0 to 255). If the tuple is not present in table CPCSCRN, the call is allowed to continue.

A new Table STDPRTCT option CPCSCRN is added to NT selector for the DD and OA type of call (TYPCALL field) and CT selector with CALLFEAT of OFFNET. CPCSCRN option requests for an index value (0 to 255).

Table 6 Table STDPRTCT CT selector

Selector	CALLFEAT	MINDIGS	MAXDIGS	NOPREDIGS	OPTIONS
CT	OFFNET	0 TO 18	0 TO 18	0 to 7	CPCSCRN

Table 7 Table STDPRTCT NT selector

Selector	TYPCALL	NOPREDIG	TRANSYS	OPTIONS
NT	DD	0 to 7	IP,IN	CPCSCRN
NT	OA	0 to 7	IP,IN	CPCSCRN

TYPCALL can have the following values:
DD: Direct Dial

OA: Operator Assisted
NP: Nil type of call (CPCSCRN option is not available for this value)
NL: No prefix local (CPCSCRN option is not available for this value)

Table 8 CT/NT option CPCSCRN

Options	CPCSCRN Index
CPCSCRN	0 to 255

Table CPCSCRN contains three fields:

- Action:
  - Continue: allows the call to proceed
  - Block: routes the call to treatment
- Override STS:
  - N: STS is not overridden
  - Y: STS is overridden with provisioned STS. Table control prompts for STS when Override STS is set to 'Y'.
- Override CPC:
  - N: CPC is not overridden
  - Y: CPC is overridden with provisioned CPC. Table control prompts for CPC value (0 to 15) when Override CPC is set to 'Y'.

Table 9 Table CPCSCRN

FIELD NAME	RANGE OF VALUES	STATUS	DEFAULT VALUES
CPCINDEX	{0 TO 255}	NEW	N/A
CPC	Alphanumeric character string, which are mapped to range 0-255. The first 16 values are same as given in table 36. Other values are from CPC_16 to CPC_255.	NEW	N/A
ACTION	{ACTION_CONTINUE, ACTION_BLOCK}	NEW	ACTION_ CONTINUE
OVRDSTS	{Y, N}	NEW	N
STS	{000 TO 999}	NEW	N/A
OVRDCPC	{Y, N}	NEW	N

Table 9 Table CPCSCRN

FIELD NAME	RANGE OF VALUES	STATUS	DEFAULT VALUES
CPC	Alphanumeric character string, which are mapped to range 0-15. The values are same as given in table 10.	NEW	N/A

Table 10 Table CPCSCRN CPC values

CPCSCRN CPC value	Integer value of CPC
UNKNOWN	0
OP_FRENCH	1
OP_ENGLISH	2
OP_GERMAN	3
OP_RUSSIAN	4
OP_SPANISH	5
CPC_6	6
CPC_7	7
CPC_8	8
OP_NATIONAL	9
SUBSCRIBER1	10
PRIORITY	11
DATA	12
TEST	13
NON_VOICE	14
PAYPHONE	15

The field *Action* is used to screen the incoming CPC value based on the CPCSCRN index value obtained from the new CT/NT option CPCSCRN in table STDPRTCT and the incoming CPC value. The field ACTION either allows the call to continue or blocks the call by routing the call to Call Not AlloweD (CNAD) treatment.

The field *OVRDSTS* is used to provide a new STS value for the call when the *Override STS* value is set to 'Y'. If the value is set to 'N', table CPCSCRN does not prompt for a new STS value and the last derived STS value is used for the call.

The field *OVRDCPC* is used to override the incoming CPC value with a new CPC value for the call when *Override STS* value is set to 'Y'. If the value is set to 'N', table CPCSCRN does not prompt for a new CPC value and the incoming CPC value is maintained for the call.

The following CPC values were extracted from ITU-T Recommendation Q.767 section 3.11:

00000000 : Unknown
00000001 : operator, language French
00000010 : operator, language English
00000011 : operator, language German
00000100 : operator, language Russian
00000101 : operator, language Spanish
00000100 : available to Administrations
to for selecting a particular
00001000 : language by a mutual agreement
00001001 : reserved (see Recommendation Q.104) (Note)
00001010 : ordinary calling subscriber
00001011 : calling subscriber with priority
00001100 : data call (voice band data)
00001101 : test call
00001110 : spare
00001111 : payphone
00001000 :

11111110: national use
11111111: spare

Example datafill:

```
Table STDPRTCT, subtable STDPRT

0117 0117 NT DD 3 IP (CPCSRCN 1)$
```

Table CPCSCRN is accessed with the CPCINDEX value of 1 along with the call CPC value of 2 (OP_ENGLISH).

```
Table CPCSCRN

1 OP_ENGLISH CONT Y 611 Y OP_SPANISH
```

For a call with the CPC value of 2 (OP_ENGLISH), the call is allowed to continue (ACTION_CONTINUE), the STS for the call is updated to 611, and the CPC for the call is updated with a value of OP_SPANISH (5).

The call CPC is also allowed to be overridden by using the SX selector during translations of the call. The SX selector provides the index to access table RTEATTR. The REPLACE field in Table RTEATTR is enhanced to prompt for a CPC value. Table-10 provides table RTEATTR CPC values.

The CPC value replaces the CPC value for the Calling Party Category parameter in the outgoing IAM on the trunk provisioned against the SX selector. This functionality is only available for Q.767 and ISUP92 gateway trunk agents.

Table 11 Table RTEATTR CPC values

RTEATTR CPC value	Integer value of CPC
UNKNOWN	0
OP_FRENCH	1
OP_ENGLISH	2
OP_GERMAN	3
OP_RUSSIAN	4
OP_SPANISH	5
CPC_6	6
CPC_7	7
CPC_8	8
OP_NATIONAL	9
SUBSCRIBER1	10
PRIORITY	11
DATA	12
TEST	13

Table 11 Table RTEATTR CPC values

RTEATTR CPC value	Integer value of CPC
NON_VOICE	14
PAYPHONE	15

Example datafill:

```
Table HNPACONT, subtable RTEREF

724 (SX GITU1E1AN03 CPC_OVRD) $
```

CPC_OVRD is the index into table RTEATTR.

```
Table RTEATTR

CPC_OVRD $ $ CPC SUBSCRIBER1
```

The outgoing CPC value is set to SUBSCRIBER1

109.4.3.4 Satellite Restrictions

This feature supports the existing Succession CS2000 satellite functionality for the ISUP92/Q.767 trunk agent to enable double satellite hop restriction. Double satellite hop restriction is invoked when the terminating trunk agent TRKSGRP field SAT is provisioned with a value of 'Y'.

Double satellite hop restriction:

For originating calls on the Succession CS2000 which have an indication that the call has been previously involved in a satellite connection (via originating trunk agent table TRKSGRP field SAT with a value of 'Y' and/or the Nature of Connection with an indication of at least one satellite circuit in the connection), the Succession CS2000 restricts the call from terminating on a trunk agent with an indication of a satellite connection (via terminating trunk agent table TRKSGRP field SAT value of 'Y'). Succession CS2000 performs route advance to the next available route in the route list.

109.4.3.4.1 Gateway (ISUP92/Q.767) satellite indication:

The value of table TRKSGRP field SAT is interpreted as below:

- Table TRKSGRP field SAT:

  N: No satellite circuit in the connection

Y: Satellite circuit in the connection

The value of ‘Satellite indicator’ in ‘Nature of Connections parameter’ is interpreted as below:

- Nature of Connection (reflected as ’O/G ind.’ below tables):

  00: No satellite circuit in the connection

  01: One satellite circuit in the connection

  10: Two satellite circuit in the connection

  11: spare

109.4.3.4.2 UCP Inter/Intra ISUP IMT satellite indication: The value of table TRKSGRP field SAT is interpreted as below:

- Table TRKSGRP field SAT:

  N: No satellite circuit in the connection

  Y: One satellite circuit in the connection

The value of ‘Satellite indicator’ in ‘Nature of Connections parameter’ is interpreted as below:

- Nature of Connection (reflected as ’O/G ind.’ below tables):

  00: No satellite circuit in the connection

  01: One satellite circuit in the connection

  10: Two satellite circuit in the connection

  11: Three or more satellite circuits in the connection

- I3PA (II digits reflects satellite connection):

  II digits (Facility code) of I3PA dialplan is a two digit value reflecting the following information:

  calltype (first digit of facility code)

  - 0x: national calls
  - 2x: COS
  - 56: data call

  second digit of facility code

•queued at previous switch

•satellite at previous switch

109.4.3.4.3 SS7 FGD satellite indication:

The value of table TRKSGRP field SAT is interpreted as below:

- Table TRKSGRP field SAT:

  N: No satellite circuit in the connection

  Y: One satellite circuit in the connection

The value of 'Satellite indicator' in 'Nature of Connections parameter' is interpreted as below:

- Nature of Connection (reflected as 'O/G ind.' below tables):

  00: No satellite circuit in the connection

  01: One satellite circuit in the connection

  10: Two satellite circuit in the connection

  11: Three or more satellite circuits in the connection

109.4.3.4.4 UCS PRI, PTS FGD, FGB, DAL TIE satellite indication:

These trunk agencies are only supported on land-base transmission medium and do not provide any type of outgoing indicator that a satellite was involved in the call.

109.4.3.4.5 ISUP 'Satellite indicator' values in the outgoing IAM

The following table gives the value of 'ISUP Satellite indicator' in 'Nature of Connection Parameter' in outgoing IAM.

Note: *Please note that, call is ROUTE ADVANCED until a terminator with SAT set to N (not equipped with satellite), for all other combination of values which are not listed in Table12, Table13 and Table 14.*

Table 12 ISUP 'Satellite indicator' values for Gateway terminating to UCS agent

Y	N	01

109.4.3.5 Test calls on Gateway Trunks.

Test lines are used to test trunk connections to other offices, both local and toll. Test Line Tests (TLT) are run under the control of the calling office, and can be initiated either manually from the Trunk Test Position (TTP) level or automatically from the Automatic Trunk Test (ATT) level of Maintenance & Administration Position (MAP). TLT can test both the originating and terminating ends of trunks, and can be used to simulate most conditions that may arise under normal operating conditions.

Test calls are defined as calls originating from test facilities on the near end switch, going over the trunk to be tested and finally terminating on test equipment of far end switch. This feature supports test calls on Q.767/ISUP92 gateway trunk for the following testlines:

— T100 (Balanced Termination testline)

— T101[1] (Communication testline)

— T102 (Milliwatt testline)

Test facilities, supported by this feature include ATT, and the TST and OP commands of the TTP MAP level. ATR originated test calls are not supported by this feature.

Please refer to Section “109.20 Appendix H: Test Call” on page 1187. for more details on test calls.

109.4.3.6 Data Calls on Gateway Trunks.

This feature supports data calls for calls originating and/or terminating on Q.767/ISUP92 gateway trunk agencies. Data calls are supported on the following bearer services:

- 64kbps Unrestricted
- 56kbps

Following matrix shows the interworking supported by this feature for data calls:

[1]T101 testline is supported only in a hybrid configuration.

Table 15 Interworking Matrix For Data calls

	Terminating Agency							
Orig. Agency	Gateway	UCP Intra	UCP Inter	FGD SS7	FGD PTS	UCS PRI	FGB	DAL TIE
Gateway	X	X	X	X	X	X	X	X
UCP Intra	X							
UCP Inter	X							
FGD SS7	X							
FGD PTS	X							
UCS PRI	X							
FGB	X							
DAL TIE	X							

Please refer to Section “109.21 Appendix I: Data Call” on page 1195. for more details on data calls.

109.4.3.7 ECAN support

Echo Canceller support is integrated into the PVG for ISUP92/Q.767.

Following section describes the messaging and office configuration for ECAN.

Please refer to Section “109.22 Appendix J: ECAN” on page 1203.

109.4.3.7.1 Echo Control Messaging

In relation to the ISUP messaging protocol, echo canceller control operates according to the following picture. The echo control information in the first forward-going message and the first backward-going message per call is used for the duration of that call.

Typically the IAM is the first forward-going message, and the ACM is the first backward-going message. However, a CON, CPG or ANM may also be sent as the first backward-going message. The logic to enable / disable the EC in backward-going message is described in more detail later.

Forward Address Parameter for Echo Cancellation (IAM)

Figure 10 IAM Message for Q.767/ISUP92

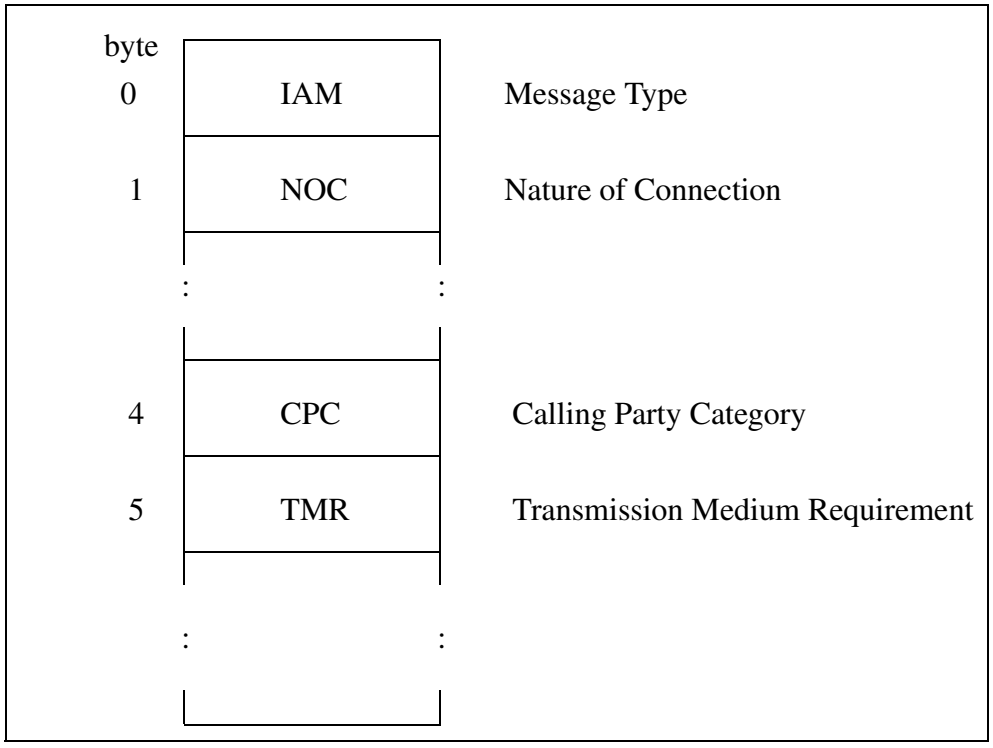

Figure 11 IAM Message for UCS ISUP

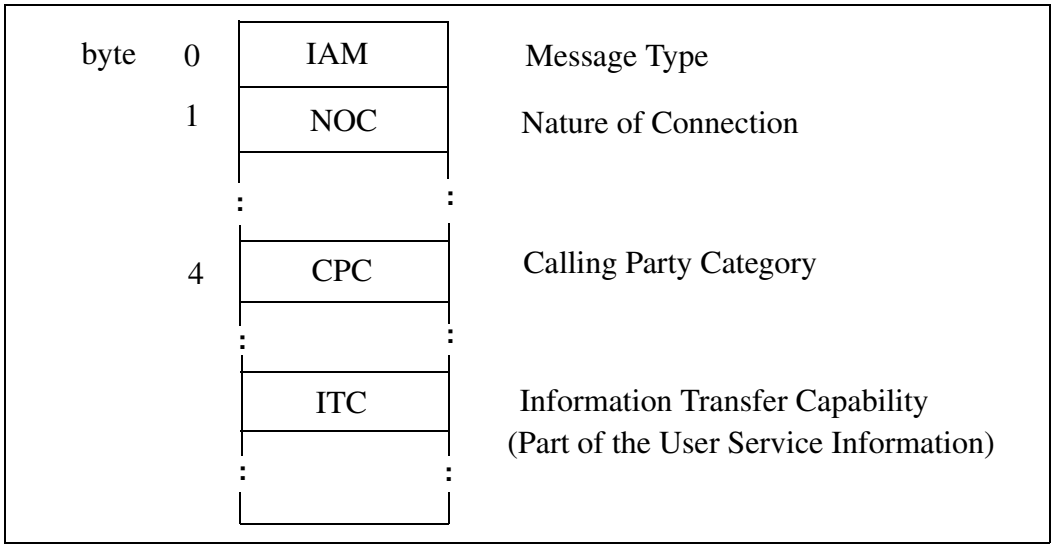


Nature of Connection (For both UCS and Q.767/ISUP92)

H	G	F	E	D	C	B	A
			X				

E = Echo Control

0 - outgoing half echo device not included

1- outgoing half echo device included

Transmission Medium Requirement (For Q.767/ISUP92 only)

H	G	F	E	D	C	B	A
						X	X

0000 0000 = speech

0000 0011 = 3.1 kHz audio

0000 0010 = 64 kb/s data call

Information Transfer Capability (For UCS only)

H	G	F	E	D	C	B	A
			X	X	X	X	X

00000 = speech

01000 = Unrestricted digital Information - data call

10000 = 3.1 kHz audio

Data Call:

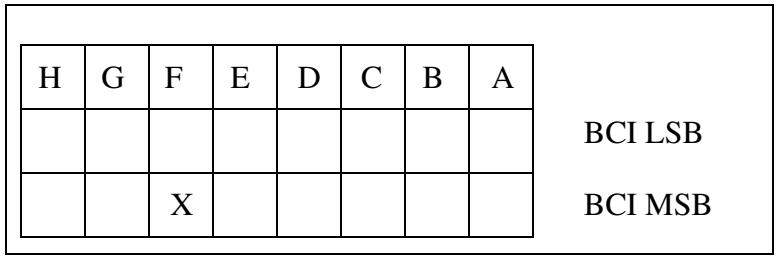
If the TMR or ITC in USI parameter in the incoming IAM indicates that it is a

data call, the echo controllers at the incoming and outgoing exchange remains OFF for the duration of the call, regardless of the echo control bit in any message.

Backward Call Indicator (ACM, CON, CPG, ANM)

The backward call indicator is included in ACM, CON, CPG and ANM messages for both ITU protocol and UCS protocol.

Figure 1 Echo cancel indication bit in Backword call indicator



BCI MSB

0000 0000 = incoming half echo device not included

0010 0000 = incoming half echo device included

Indication of an incoming echo canceller included by a transit switch is given in the BCI of the ACM, CON, CPG or ANM. The BCI of the ACM and the CON is mandatory but is optional in the ANM and CPG.

The EC information in the first backward-going protocol message (e.g. ACM, CON, CPG or ANM) per call is used to notify EC status to the transit switch. EC information in the later messages is ignored. So, two cases may occurred during the call processing. In most cases, EC-bit is a mandatory part of the messages. However, in the case where EC-bit is optional and is not present, the next message is examined. In all cases, by the time the call reaches to the answer stage (after received ANM), at least one message with EC-bit should be sent to both trunks in the incoming and outgoing directions.

109.4.3.7.1.1 Table TRKSGRP

Echo canceller control is provided on a trunk subgroup basis, in table TRKSGRP. No checking is done in table control to ensure that all trunks in this subgroup do in fact have echo cancelling equipment present. Three fields pertain to echo canceller control:

- **ECSTAT** -this should be datafilled '**INTERNAL**' to allow the echo canceller to be used by call processing when required. If left at the default of 'UNEQ', the canceller remains OFF at all times.
- **ABCNTL** - this should be datafilled '**NONE**' to indicate that the echo canceller does not monitor the trunk's AB bits for activation information.

109.4.3.8 A-LAW/U-Law Conversion

The Succession CS2000 should be configured to use u-law PCM encoding in world zone-1. The ISUP92/Q.767 trunk agencies are only supported on E1 spans using A-law PCM encoding. The PVG will perform A-law to u-law conversion as required.

PCM encoding conversion on a per call basis is enabled, if transmission medium requirement parameter indicates speech and 3.1 kHz (PCM encoding conversion requirements is based on Q.764 section 2.1.1.3 b). The user information layer 1 protocol identification field of the user service information (USI) parameter in IAM must reflect the proper PCM encoding: 'Recommendation G.711 u-law' for supported UCS SS7 trunk agents (SS7 FGD, SS7 IMT Intra, and SS7 IMT Inter) and 'Recommendation G.711 A-law' for the ISUP92/Q.767 trunk agent. For UCS PRI trunk agent, user information layer 1 protocol identification field of the Low layer compatibility element in the Q.931 Setup must reflect 'Recommendation G.711, u-law speech'.

For 64K unrestricted data calls, the conversion between A-law and u-law PCM encoding on a per call basis is disabled. The user information layer 1 protocol identification field must reflect the proper PCM encoding value as stated in the previous paragraph.

109.4.3.9 Overlap Sending

Gateway trunks support overlap sending and that the field OVRLAP in table TRKSGRP is required to be set to enter overlap sending. If a 'F' digit is not received on called number when field OVRLAP in table TRKSGRP is set to 'Y', CS2000 will wait based on T35 timer value (if table C7UPTMR is not used, then default value is 5 seconds) for a subsequent address message (SAM) prior to processing the called number. If SAM is not received within the T35 time, CS2000 will proceed processing the called number.

CS2000 does not support overlap receiving and will always outpulse the called number in 'ENBLOC' format.

109.4.4 ISUP92/Q.767 interworking with supported national trunk agencies.

The supported CS2000 trunk agencies interworking with Q.767/ISUP92 trunks:

- SS7 IMT Inter(UCP)
- SS7 IMT Intra(UCP)
- FGD SS7(UCP)
- FGD PTS[1]
- UCS PRI
- FGB[1]
- DAL TIE[1] [2]

The following interworkings are supported by this feature:

Table 16 Interworkings Supported

Originating Agency	Terminating Agency
ISUP92	ISUP92
Q.767	Q.767
ISUP92	Q.767
Q.767	ISUP92
ISUP92/Q.767	IMT Intra
ISUP92/Q.767	IMT Inter
ISUP92/Q.767	DAL TIE
ISUP92/Q.767	FGB
ISUP92/Q.767	FGD PTS
ISUP92/Q.767	FGD SS7
ISUP92/Q.767	PRI
FGD SS7	ISUP92/Q.767
FGD PTS	ISUP92/Q.767

[1]PTS trunks supported only in a hybrid configuration

[2]Supported DAL TIE pulse type of MF and DT and start signal of WK.

Table 16 Interworkings Supported

Originating Agency	Terminating Agency
FGB	ISUP92/Q.767
IMT Intra	ISUP92/Q.767
IMT Inter	ISUP92/Q.767
DAL TIE	ISUP92/Q.767
PRI	ISUP92/Q.767

109.4.4.1 Interworking between UCP ISUP & ISUP92 /Q.767

The supported UCP ISUP[1] messages that are interworked to ISUP92/Q.767 are:

- Address Complete Message (ACM)
- Answer Message (ANM)
- Initial Address Message (IAM)
- Release (REL)

The supported ISUP92/Q.767 messages that are interworked to UCP ISUP are:

- Address Complete Message (ACM)
- Answer Message (ANM)
- Connect Message (CON)
- Initial Address Message (IAM)
- Release (REL)

For details on interworking between UCP ISUP & ISUP92 /Q.767 Please refer to Section “109.23 Appendix K: UCP ISUP & ISUP92/Q.767 Interworking” on page 1207.

109.4.4.2 Interworking ISUP92/Q.767 with PTS agents

The supported ISUP92/Q.767 messages that are interworked to PTS agencies are:

- Address complete message (ACM)
- Answer message (ANM)
- Initial Address message (IAM)
- Release message (REL)

[1]UCP ISUP protocol on Succession CS2000 is implemented on IMT and SS7 FGD agents.

- Release complete message (RLC)

For details on interworking between PTS agents & ISUP92/Q.767 Please refer to Section “109.24 Appendix L: Interworking of ISUP92/Q.767 with PTS agents” on page 1236..

109.4.4.3 Interworking with PRI agents

109.4.4.3.1 UCS PRI & ISUP92/Q.767 Message Interworking

The supported UCS PRI messages that interwork to ISUP92/Q.767 are:

- Setup Message (SETUP)
- Alerting Message (ALERT)
- Progress Message (PROG)
- Connect Message (CONN)
- Disconnect Message (DISC)
- Release Message (REL)
- Release complete Message (REL COM)

The supported ISUP92/Q.767 messages that interwork to UCS PRI are:

- Address Complete Message (ACM)
- Answer Message (ANM)
- Connect Message (CON)
- Initial Address Message (IAM)
- Release Message(REL)
- Release Complete Message (RLC)

For details on interworking between UCS PRI and ISUP92/Q.767 Please refer to Section “109.25 Appendix N: Interworking between ISUP92/Q.767 and UCS PRI” on page 1243.

109.4.4.4 Interworking between ISUP92 and Q.767 protocols

This feature supports interworking between ISUP92 trunks and Q.767 trunks.

All the Messages except the following is interworked between ISUP92 and Q.767. These messages are supported only on ISUP92 trunks. The below messages on Q.767 trunk are considered as unrecognized messages and are treated as per ITU - T Blue Book Q.767 section 4.1.1. Unrecognized messages are discarded without disrupting normal call handling. No logs are produced for unrecognized messages.

- Confusion Message (CFN)
- Facility Request Message (FAR) != 02
- Facility Reject Message (FRJ)
- Facility Accept Message (FAA)
- User to User Information Message (USR)

All the Parameters except the following are supported in Q.767. These parameters are supported only on ISUP92 trunks. On Q.767 trunks they are discarded.

- Redirecting Number
- Redirection Information
- Redirection Number
- Parameter compatibility information
- Message compatibility information
- Call Diversion information

The other interworking issues are:

- Mapping of new cause values: For information on this issue please refer to section 1.4.2.3.
- Handling of MCP and PCP parameters: For more information on this issue, please refer to section 1.4.2.1.2.

109.4.5 Optionality

The functionality provided by this feature is controlled by SOC option GIMT0003.

109.4.6 Data schema (DS)

This feature introduces, the following two new tables:

- CPCSCRN
- CCTABLE

The following tables are modified by this feature:

- TRKGRP
- TRKSGRP
- STDPRTCT
- RTEATTR

- CSEMAP
- TMTMAP

This feature introduces one new office variable - OFC_SERVING_CC in OFCVAR.

Please refer to the “Data Schema Changes (DS)” section of this feature document (A00003711) for more details about this.

109.4.7 AMA/Billing information (AM)

This feature supports UCS13 CDR template. The fields are captured as per the existing support, except the following fields:

INCINTL: This field is set based on the ‘Nature of Address’ in ‘Calling Party Address’ parameter. If the ‘Nature of Address’ in ‘Calling Party Address’ parameter is set to ‘Intl_sig_number’ then the field is set to ‘Y’.

CLGPTYNO: This field captures up to most significant 15 digits calling party address digits received in the ‘Calling Party Address’ parameter of IAM.

CALLEDNO: This field captures most significant 15 digits of called party address used in translations.

DIALEDNO: This field captures most significant 15 digits of called party address after pretranslations.

OUTPULNO: This field captures most significant 15 digits of outpulsed number. If translations insert a ‘B’ or ‘C’ digits in the outpulsed number then these digits will be represented by ‘*’ and ‘#’ in the TBCD digit format respectively.

PREDIG: Three bits defining dialed prefix digits. For Code11 and Code12 calls, this field captures ‘0’.

CNPREDIG: The called number prefix digits. For Code11 and Code 12 calls, this field captures ‘0’.

109.5 Feature impact

109.5.1 Interactions

109.6 Hardware Requirements or Dependencies

GWIMT trunks are supported via dedicated PVG VSPs and international carrier (E1or STM-1) interfaces. PVG VSPs for GWIMT trunks are separate from any VSPs which may be used to provide trunking to the national network in world zone 1. GWIMT PVG VSPs must also be controlled by one or more dedicated Gateway Contollers.

109.7 Software Requirements or Dependencies

GWIMT is supported initially in the Succession North American Combo load SNNCSH07; the corresponding GWC load supporting GWIMT trunks in this release is the international GC070 variant (GI070).

109.8 Limitations and restrictions

- GWIMT trunks are not supported on DTC type peripherals in SNNCSH07. Only PVG based GWIMT trunks are supported.
- Echo Cancelation is provided by the PVG VSP under this activity. Support for external echo cancelors is not provided.
- Carrier AIN calls can terminate to GWIMT trunks, however calls originating on GWIMT trunks do not encounter Carrier AIN (CAIN) triggers.
- CLI screening on ISUP92/Q.767 gateway trunk agency is not supported.
- Gateway trunk agencies (ISUP92/Q.767) supports only ADDR dialplan. This restriction is provided as datafill restriction.
- When option GWYTRK is datafilled in table TRKGRP, the fields CLIREQ and CLISCRN must be set to N. This is also implemented as datafill restriction.
- Local Number Portability (LNP) is not support on ISUP92/Q.767 gateway trunk agency.
- The maximum number of called number digits supported by this feature is 15 (15-digit IDDD) excluding the end-of-digit signal (F).
- The maximum number of calling number digits supported by this feature is 15 (15-digit IDDD) excluding the end-of-digit signal (F).
- The feature implements only a limited set of GSP features, on Succession CS2000 in the role of a UCS DMS-250 switch.
- Support for ISUP92 and Q.767 protocols are subject to partial compliance as stated within this feature.

- This feature support only internal echo cancellers, in which case ESUPR field should be set to N, ECSTAT field should be set to INTERNAL, and ABCNTL field should be set to NONE in table TRKSGRP.
- For transit inbound code 11/code 12 calls a maximum of 14 called party address digits are supported.
- For code 11/code 12 calls, only one code 11 or code 12 signal codes is supported in the called party address digits stream.
- RLT functionality is not supported by this feature. This includes support of RLT option on ISUP92/Q767 agencies and interworking of ISUP92/Q767 agencies with RLT trunk agents.
- CGETS functionality, including IAM priority, is not supported on GWIMT trunks.

109.9 Interactions

109.9.1 CIC routing/CIC delivery

The feature doesn't support CIC routing on ISUP92 and Q.767 trunks. CIC routing on UCS agents are supported as per the existing functionality.

The TNS/CIP parameters received on ISUP92/Q.767 gateway agencies are discarded. In the case when ISUP92/Q.767 gateway trunks are terminating agencies, these parameters are not delivered.

109.9.2 AX0205 'UCS TRKGRP NOA Enhancements'

Feature AX0205 'UCS Trunkgroup NOA Enhancements' enhances Nature of address delivery in called party address parameter of outgoing IAM. This feature affects the INBOUND direct termination calls terminating on Inter/ Intra network ISUP IMTs.

The NOA outpulsed in called party address parameter of outgoing IAM for these calls is the value of OUTNOA datafilled in table TRKGRP. Please refer to feature AX0205 for more details.

109.9.3 Carrier AIN

ISUP92/Q.767 trunk agency as an originator

Carrier AIN functionality is not supported on an incoming call on a ISUP92/ Q.767 trunk agency.

ISUP92/Q.767 trunk agency as a terminator

The ISUP92/Q.767 trunk agency is supported as a terminating agent for incoming calls on the supported CS2000 agencies that are CAIN capable. Any PICs, TDPs, triggers and EDPs supported on the originating CS2000 agencies, are supported by this feature with the following restrictions.

- Any Carrier AIN SS7 parameters that are not supported within the ISUP92/Q.767 trunk agency protocol is not delivered/included in any outgoing messages on the ISUP92/Q.767 trunk agency.

- Direct termination routing to the terminating ISUP92/Q.767 trunk agency is supported via table TERMRTE only.
- The terminating call model is not supported.

109.9.4 User-To-User Parameter Mapping

Reference feature document AD9067 ‘Support for User to User Parameter’ for proper requirements when mapping of the User to User parameter is required.

109.13 APPENDIX A: Messages and Parameters Supported on ISUP92

Messages and Parameters that are supported on ISUP92 trunks are listed in the following tables in this section.

109.13.1 International ISUP92 message base

The table below represents the list of recognized messages for an international ISUP92 trunk at the Succession CS2000.

Note: S/R means Send/Receive. Dis/CFN means Discard and send CFN (confusion message)

Note: P/T/D means Process (Process the message), Tandem (Tandem message across network) and Discard (Discard and ignore the message) respectively.

Table 17 International ISUP92 Messages recognized by the Succession CS2000

Acronym	Message Name	Send/Receive/ Dis/CFN	Process/ Tandem/Discard
ACM	Address complete	S/R	P
ANM	Answer	S/R	P

Table 17 International ISUP92 Messages recognized by the Succession CS2000

Acronym	Message Name	Send/Receive/ Dis/CFN	Process/ Tandem/Discard
BLO	Blocking	S/R	P
BLA	Blocking Acknowledgment	S/R	P
CPG	Call Progress	S/R	T
CGB	Circuit Group Blocking	R	P
CGBA	Circuit Group Blocking Acknowledgment	S	P
GRS	Circuit Group Reset	S/R	P
GRA	Circuit Group Reset Acknowledgment	S/R	P
CGU	Circuit Group Unblocking	R	P
CGUA	Circuit Group Unblocking Acknowledgment	S	P
CON	Connect	S/R	P
COT	Continuity	S/R	P
CFN	Confusion	S/R	P
CCR	Continuity Check Request	S/R	P
FAA	Facility Accepted	Dis/CFN	Discard
FAR	Facility Request	R[a]	Discard/ Tandem
FRJ	Facility Reject	[b]Dis/CFN	Discard
FOT	Forward Transfer	S/R	T
IAM	Initial Address	S/R	P
INR	Information Request	S[c]	T
REL	Release	S/R	P
RLC	Release Complete	S/R	P
RSC	Reset Circuit	S/R	P
RES	Resume	S/R	T[d]
SAM	Subsequent Address	S/R	P
SUS	Suspend	S/R	T[e]
UBL	Unblocking	S/R	P
UBA	Unblocking Acknowledgment	S/R	P
USR	User-to-user information	Dis/CFN	Discard

a. If FAR != 02 is received, the Succession CS2000 discards the FAR and returns.
If FAR = 02 (user-to-user service), the Succession CS2000 tandems the FAR

b. If FRJ is received, the Succession CS2000 discards the FRJ and returns CFN with cause value 97 with FRJ as the diagnostic information.

c. There is no call processing done for this message, the Succession CS2000 tandems this message. Succession CS2000 always delivers the CLI in enbloc format. If an incomplete CLI is received, the Succession CS2000 does not generate INR msg but instead discards the calling party parameter.
d. RES msg is tandemed only if the Resume indicator is set to network initiated and the message is received on the terminator after the ANM, and the originator agency does not support existing Succession CS2000 Suspend/Resume functionality. For all other cases it is discarded.
e. SUS msg is tandemed only if the suspend indicator is set to network initiated and the message is received on the terminator after the ANM, and the originator agency does not support existing Succession CS2000 Suspend/Resume functionality. For all other cases it is discarded.

109.13.2 International ISUP92 parameter base

The Succession CS2000 supports the following parameters for the given supported messages in accordance with ISUP92 for the Succession CS2000 exchange.

Notations used are:

F = mandatory fixed length parameter

V = mandatory variable length parameter

O = optional parameter

The proprietary and national parameters are discarded unless specified.

When the Succession CS2000 generates a REL or CFN message, the location field of the cause parameter is set to ‘International Network’. If the REL message is generated using table TMTMAP, the location field of the cause parameter is taken from the ‘location’ field of the table entry. Please refer to section 1.4.2.3 for more details on cause handling.

‘ISUP92 minimum set’ refers to the recommended minimum set of parameters to be supported for each supported message based on ITU-T Recommendation Q.761 White Book version table 4 for international use.

109.13.2.1 Initial Address Message (IAM)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the IAM message as shown in Table 18. All parameters not contained in table 18 are subject to the rules of the PCP procedures.

Table 18 Parameters supported in the IAM Message ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Nature Of Connection Indicators	F	Process	ISUP92 minimum set
Forward Call Indicators	F	Process	ISUP92 minimum set
Calling Party's Category	F	Process	ISUP92 minimum set
Transmission Medium Requirement (TMR)	F	Process	ISUP92 minimum set supported values[a].
Called Party Number	V	Process	ISUP92 minimum set
Access Transport	O	Tandem	ISUP92 minimum set
Calling Party Number	O	Process	ISUP92 minimum set
Closed User Group Inter lock Code	O	Tandem	ISUP92 minimum set
Connection Request	O	Discard	
End of Optional Parameters	O	Process	ISUP92 minimum set
Generic Notification	O	Discard	
Generic Number	O	Discard	
Generic Reference	O	Discard	
Location Number	O	Discard	
MLPP Precedence	O	Discard	
Optional Forward Call Indicators	O	Tandem	ISUP92 minimum set
Original Called Number	O	Tandem	ISUP92 minimum set

Table 18 Parameters supported in the IAM Message ISUP92

Parameter Name	Type	Action	Notes
Origination ISC Point Code	O	Discard	
Parameter Compatibility Information	O	See Section 1.4.2.1.2	
Propagation Delay Counter	O	Discard	
Redirecting Number	O	Tandem	ISUP92 minimum set
Redirection Information	O	Tandem	ISUP92 minimum set
Transmission Medium Requirement Prime	O	Discard	
User service information	O	Process	ISUP92 minimum set
User Service Information prime	O	Discard	
User teleservice information	O	Discard	
User-to-user Indicators	O	Tandem	ISUP92 minimum set
User-to-user information	O	Tandem	ISUP92 minimum set
Call reference	O	Discard	National use only
Generic digit	O	Discard	National use only
Network specific facility	O	Discard	National use only
Remote operations	O	Discard	National use only
Service activation	O	Discard	National use only
Transit network selection	O	Discard	National use only

a. Supported values are Speech, 64 Kbit/s unrestricted, and 3.1 Khz audio

109.13.2.2 Address complete message (ACM)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the IAM message as shown in Table 19. All parameters not contained in table 19 are subject to the rules of the PCP procedure.

Table 19 Parameters supported in the ACM Message ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Backward call indicators	F	Process	ISUP92 minimum set
Optional backward call indicators	O	Process	ISUP92 minimum set
Cause indicators	O	Tandem	ISUP92 minimum set
User-to-user indicators	O	Tandem	ISUP92 minimum set
User-to-user information	O	Tandem	ISUP92 minimum set
Access transport	O	Tandem	ISUP92 minimum set
Generic notification Indicator	O	Tandem	ISUP92 minimum set
Transmission medium used	O	Tandem	ISUP92 minimum set
Echo control information	O	Tandem	ISUP92 minimum set
Access delivery information	O	Tandem	ISUP92 minimum set
Redirection number	O	Tandem	ISUP92 minimum set
Parameter compatibility information	O	Tandem	ISUP92 minimum set
Call diversion information	O	Tandem	ISUP92 minimum set
Redirection number restriction	O	Tandem	ISUP92 minimum set
End of optional parameters	O	Tandem	ISUP92 minimum set

Table 19 Parameters supported in the ACM Message ISUP92

Parameter Name	Type	Action	Notes
Call reference	O	Discard	National use only
Network specific facility	O	Discard	National use only
Remote operations	O	Discard	National use only
Service activation	O	Discard	National use only

109.13.2.3 Answer message (ANM)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the ANM message as shown in Table 20. All parameters not contained in table 20 are subject to the rules of the PCP procedure.

Table 20 Parameters supported in the ANM Message ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Backward call indicators	O	Tandem	ISUP92 minimum set
Optional backward call indicators	O	Tandem	ISUP92 minimum set
User-to-user indicators	O	Tandem	ISUP92 minimum set
User-to-user information	O	Tandem	ISUP92 minimum set
Connected number	O	Tandem	ISUP92 minimum set
Access transport	O	Tandem	ISUP92 minimum set
Access delivery information	O	Tandem	ISUP92 minimum set
Generic notification indicator	O	Tandem	ISUP92 minimum set
Parameter compatibility information	O	Tandem	ISUP92 minimum set
Call history information	O	Tandem	ISUP92 minimum set

Table 20 Parameters supported in the ANM Message ISUP92

Parameter Name	Type	Action	Notes
Generic number	O	Tandem	ISUP92 minimum set
Transmission medium used	O	Tandem	ISUP92 minimum set
Redirection number	O	Tandem	ISUP92 minimum set
Echo control information	O	Tandem	ISUP92 minimum set
Redirection number restriction	O	Tandem	ISUP92 minimum set
End of optional parameters	O	Tandem	ISUP92 minimum set
Call reference	O	Discard	National use only
Network specific facility	O	Discard	National use only
Remote operations	O	Discard	National use only
Service activation	O	Discard	National use only

109.13.2.4 Call progress message (CPG)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the CPG message as shown in Table 21. All parameters not contained in table 21 are subject to the rules of the PCP procedure.

Table 21 Parameters supported in the CPG Message ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Event information	F	Process	ISUP92 minimum set
Backward call indicators	O	Tandem	ISUP92 minimum set
Optional backward call indicators	O	Tandem	ISUP92 minimum set
Cause indicators	O	Tandem	ISUP92 minimum set

Table 21 Parameters supported in the CPG Message ISUP92

Parameter Name	Type	Action	Notes
User-to-user indicators	O	Tandem	ISUP92 minimum set
User-to-user information	O	Tandem	ISUP92 minimum set
Access transport	O	Tandem	ISUP92 minimum set
Redirection number	O	Tandem	ISUP92 minimum set
Transmission medium used	O	Tandem	ISUP92 minimum set
Access delivery information	O	Tandem	ISUP92 minimum set
Generic notification indicator	O	Tandem	ISUP92 minimum set
Parameter compatibility information	O	Tandem	ISUP92 minimum set
Call diversion information	O	Tandem	ISUP92 minimum set
Redirection number restriction	O	Tandem	ISUP92 minimum set
End of optional parameters	O	Tandem	ISUP92 minimum set
Call reference	O	Discard	National use only
Network specific facility	O	Discard	National use only
Remote operations	O	Discard	National use only
Service activation	O	Discard	National use only

109.13.2.5 Connect message (CON)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the CON message as shown in Table 22. All parameters not contained in table 22 are subject to the rules of the PCP procedure.

Table 22 Parameters supported in the CON Message ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Backward call indicators	F	Process	ISUP92 minimum set
Optional backward call indicators	O	Tandem	ISUP92 minimum set
User-to-user indicators	O	Tandem	ISUP92 minimum set
User-to-user information	O	Tandem	ISUP92 minimum set
Access transport	O	Tandem	ISUP92 minimum set
Generic notification Indicator	O	Tandem	ISUP92 minimum set
Parameter compatibility information	O	Tandem	ISUP92 minimum set
Call history information	O	Tandem	ISUP92 minimum set
Generic number	O	Tandem	ISUP92 minimum set
Transmission medium used	O	Tandem	ISUP92 minimum set
Redirection number	O	Tandem	ISUP92 minimum set
Echo control information	O	Tandem	ISUP92 minimum set
Redirection number restriction	O	Tandem	ISUP92 minimum set
Access delivery information	O	Tandem	ISUP92 minimum se
Connected number	O	Tandem	ISUP92 minimum se

Table 22 Parameters supported in the CON Message ISUP92

Parameter Name	Type	Action	Notes
End of optional parameters	O	Tandem	ISUP92 minimum set
Call reference	O	Discard	National use only
Network specific facility	O	Discard	National use only
Remote operations	O	Discard	National use only
Service activation	O	Discard	National use only

109.13.2.6 Facility Accept (FAA) & Facility Request Messages (FAR)

The Succession CS2000 discards FAA Messages and sends Confusion message on an ISUP92 trunk.If FAR ! = 02, is received, the DMS-250 discards the FAR .If FAR with facility indicator set to User-to-User service (00000010), is received, the DMS-250 tandems the FAR.

109.13.2.7 Continuity Message (COT)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the COT message as shown in Table 23.The proprietary and national use parameters are not supported.

Table 23 Parameters supported in the COT Message on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Continuity Indicators	F	Tandem	ISUP92 minimum set

109.13.2.8 Circuit Group ReSet (GRS) & circuit Group Reset Acknowledge messages (GRA)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the GRS & GRA messages as shown in Table 24. The proprietary and national use parameters are not supported.

Table 24 Parameters supported in the GRS & GRA Messages on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Range and Status	V	Process	ISUP92 minimum set

109.13.2.9 User-to-User Information Message (USR)

The Succession CS2000 discards USR Messages and sends Confusion message on an ISUP92 trunk.

109.13.2.10 Facility Reject message (FRJ)

The Succession CS2000 discards the FRJ and returns CFN with cause value 97 with FRJ as the diagnostic information.

109.13.2.11 Circuit Group blocking (CGB), block ACK(CGBA), unblocking (CGU), unblock ack (CGUA) messages.

The Succession CS2000 on an ISUP92 trunk supports the mandatory parameters in the CGB, CGBA, CGU, CGUA messages as shown in Table 25. The CGB, CGBA, CGU, or CGUA messages do not have optional parameters.

Table 25 Parameters supported in the CGB,CGBA,CGU,CGUA Messages on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Circuit group supervision msg type indicator	F	Process	ISUP92 minimum set
Range and Status	V	Process	ISUP92 minimum set

109.13.2.12 Blocking (BLO), block ack (BLA), Continuity check request (CCR), unblock (UBL), unblock ack (UBA), Reset circuit (RSC) messages.

The Succession CS2000 on an ISUP92 trunk supports the mandatory parameters in the BLO, BLA, CCR, UBL, UBA, RSC messages as shown in Table 26. The BLO, BLA, CCR, UBL, UBA, RSC messages do not have optional parameters.

Table 26 Parameters supported in the BLO, BLA, CCR, UBL, UBA, RSC Messages on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	

109.13.2.13 Confusion Message (CFN)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the CFN message as shown in Table 27.

Table 27 Parameters supported in the CFN Message on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Cause Indicators	V	Process	ISUP92 minimum set
End of Optional Parameters	O	Process	ISUP92 minimum set

109.13.2.14 Release Message (REL)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the CON message as shown in Table 28. All parameters not contained in table 28 are subject to the rules of the PCP procedure.

Table 28 Parameters supported in the REL Message ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Cause Indicators	F	Process	ISUP92 minimum set
Automatic congestion level	O	Discard	The switch handles this parameter on a link-by-link basis. If received, the parameter is removed from the message and not transited.
User-to-user indicators	O	Tandem	ISUP92 minimum set
User-to-user information	O	Tandem	ISUP92 minimum set
Access transport	O	Tandem	ISUP92 minimum set
Parameter compatibility information	O	Tandem	ISUP92 minimum set
Redirection number restriction	O	Tandem	ISUP92 minimum set
Access delivery information	O	Tandem	ISUP92 minimum set
End of optional parameters	O	Tandem	ISUP92 minimum set
Network specific facility	O	Discard	National use only
Signalling Point Code	O	Discard	National use only
Redirection Number	O	Discard	National use only
Redirection Information	O	Discard	National use only

109.13.2.15 Release Complete Message (RLC)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the RLC message as shown in Table 29. Parameters not contained in table 29 are

treated as unrecognized parameters.

Table 29 Parameters supported in the RLC Message on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Cause Indicators	O	N/A	ISUP92 minimum set
End of Optional Parameters	O	N/A	ISUP92 minimum set

109.13.2.16 Forward Transfer Message (FOT)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the FOT message as shown in Table 30. All parameters not contained in table 30 are treated as unrecognized parameters.

Table 30 Parameters supported in the FOT Message on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
End of Optional Parameters	O	Tandem	ISUP92 minimum set
Call reference	O	Discard	National Use only

109.13.2.17 Suspend (SUS) & Resume (RES) Messages

The Succession CS2000 on an ISUP92 trunk supports the parameters in the SUS & RES messages as shown in Table 31. All parameters not contained in table 31 are treated as unrecognized parameters.

Table 31 Parameters supported in the SUS & RES Message on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Suspend/Resume indicators	F	Tandem/ Discard[a]	ISUP92 minimum set
End of Optional Parameters	O	Process	ISUP92 minimum set
Call reference	O	Discard	National Use only

a. If the Suspend/ Resume indicator (in the SUS/RES message) is set to network initiated and the message is received on the terminator after the ANM, the message is Tandemed. For all other cases it is Discarded.

109.13.2.18 Subsequent Address Message (SAM)

The Succession CS2000 on an ISUP92 trunk supports the parameters in the SAM message as shown in Table 32.

Table 32 Parameters supported in the SAM Message on ISUP92

Parameter Name	Type	Action	Notes
Message Type	F	Process	ISUP92 minimum set
Subsequent number	V	Process	ISUP92 minimum set
End of Optional Parameters	O	Process	ISUP92 minimum set

109.14 Appendix B: Messages and Parameters Supported on Q.767

Messages and Parameters that are supported on Q.767 trunks are listed in the Tables in this section. Messages and parameters marked for national use, are discarded

109.14.1 International Q.767 Message Base

The Table below represents the list of recognized messages for an international Q.767 trunk at the DMS-250 exchange.

Note: S/R means Send/Receive.

Note: P/T means Process (Process the message), Tandem (Tandem message across network) respectively.

Table 33 International Q.767 Messages recognized by the Succession CS2000

Acronym	Message Name	Send/Receive	Process/ Tandem
ACM	Address complete	S/R	P

Table 33 International Q.767 Messages recognized by the Succession CS2000

Acronym	Message Name	Send/Receive	Process/ Tandem
ANM	Answer	S/R	P
BLO	Blocking	S/R	P
BLA	Blocking Acknowledgment	S/R	P
CPG	Call Progress	S/R	T
CGB	Circuit Group Blocking	R	P
CGBA	Circuit Group Blocking Acknowledgment	S	P
GRS	Circuit Group Reset	S/R	P
GRA	Circuit Group Reset Acknowledgment	S/R	P
CGU	Circuit Group Unblocking	R	P
CGUA	Circuit Group Unblocking Acknowledgment	S	P
CON	Connect	S/R	P
COT	Continuity	S/R	P
CCR	Continuity Check Request	S/R	P
FOT	Forward Transfer	S/R	T
IAM	Initial Address	S/R	P
INR	Information Request	S[a]	P
REL	Release	S/R	P
RLC	Release Complete	S/R	P
RSC	Reset Circuit	S/R	P
RES	Resume	S/R[b]	T
SAM	Subsequent Address	S/R	P
SUS	Suspend	S/R[c]	T
UBL	Unblocking	S/R	P
UBA	Unblocking Acknowledgment	S/R	P

a. There is no call processing done for this message, the DMS-250 tandems this message. DMS-250 always delivers the CLI in enbloc format. If an incomplete CLI is received, the DMS-250 does not generate INR msg but instead discards the calling party parameter.
b. If the Resume indicator (in the RES message) is set to network initiated and the message is received on the terminator after the ANM, and the originator agency does not support existing DMS-250 Suspend/Resume functionality, the message is Tandemed. For all other cases it is Discarded.

c. If the Suspend indicator (in the SUS message) is set to network initiated and the message is received on the terminator after the ANM, and the originator agency does not support existing DMS-250 Suspend/Resume functionality, the message is Tandemed. For all other cases it is Discarded

109.14.2 International Q.767 Parameter Base

The Succession CS2000 supports the following parameters for the given supported call processing messages in accordance with Q.767 recommendation for the DMS-250 exchange.

F = mandatory fixed length parameter

V = mandatory variable length parameter

O = optional parameter

The proprietary and national use parameters are discarded.

'Q.767 minimum set' refers to the recommended minimum set of parameters to be supported for each supported message based on ITU-T Recommendation Q.767 Blue Book version tables C-5 to C-28.

109.14.2.1 Initial Address Message (IAM)

The Succession CS2000 on an Q.767 trunk supports the parameters in the IAM message as shown in Table 34. All parameters not contained in table 34 are discarded.

Table 34 Parameters supported in the IAM Message at Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set
Nature Of Connection Indicators	F	Process	Q.767 minimum set
Forward Call Indicators	F	Process	Q.767 minimum set
Calling Party's Category	F	Process	Q.767 minimum set
Transmission Medium Requirement (TMR)	F	Process	Q.767 minimum set
Called Party Number	V	Process	Q.767 minimum set
Access Transport	O	Tandem	Q.767 minimum set

Table 34 Parameters supported in the IAM Message at Q.767

Parameter Name	Type	Action	Notes
Calling Party Number	O	Process	Q.767 minimum set
Closed User Group Inter lock Code	O	Tandem	Q.767 minimum set
End of Optional Parame-ters	O	Process	Q.767 minimum set
Optional Forward Call Indicators	O	Tandem	Q.767 minimum set
User service information	O	Process	Q.767 minimum set
User-to-user information	O	Tandem	Q.767 minimum set
Call reference	O	Discard	National use only
Generic digit	O	Discard	National use only
Network specific facility	O	Discard	National use only
Remote operations	O	Discard	National use only
Service activation	O	Discard	National use only
Transit network selection	O	Discard	National use only

109.14.2.2 Address Complete (ACM), Answer Message (ANM), Call Progress (CPG), Connect (CON), Release (REL) Messages.

The parameters supported in these messages are given in Table 35. All the parameters shown in table 35 are tandemed.

Table 35 Parameters supported in ACM, CPG, ANM,CON and REL messages

Message	Parameters tandemed
ACM	Optional Backward Call Indicators, Cause Indicator, User to user indicators[a], User to user information, Access Transport

Table 35 Parameters supported in ACM, CPG, ANM,CON and REL messages

Message	Parameters tandemed
CPG	Optional Backward Call Indicators, Backward Call Indicators, User to user information, Access Transport
ANM	Backward Call Indicators, Connected Number[a], User to user information, Access Transport
CON	Connected Number[a], Backward call indicator, User to user indicators, User to user information, Access Transport
REL	User to user information. Automatic congestion Level[b]

a. It is tandemed only if it is valid as per Q767 recommendations.
b. It is processed as per Q767 recommendations and is not tandemed.

109.14.2.3 Continuity Message (COT)

The Succession CS2000 on an Q.767 trunk supports the parameters in the COT message as shown in Table 36.

Table 36 Parameters supported in the COT Message on Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set
Continuity Indicators	F	Tandem	Q.767 minimum set

109.14.2.4 circuit Group ReSet (GRS) & circuit Group Reset Acknowledge messages (GRA)

The Succession CS2000 on an Q.767 trunk supports the parameters in the GRS & GRA messages as shown in Table 37.

Table 37 Parameters supported in the GRS & GRA Messages on Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set
Range and Status	V	Process	Q.767 minimum set

109.14.2.5 Circuit Group blocking (CGB), block ack (CGBA), unblocking (CGU), unblock ack (CGUA) messages.

The Succession CS2000 on an Q.767 trunk supports the mandatory parameters in the CGB, CGBA, CGU, CGUA messages as shown in Table 38. The CGB, CGBA, CGU, or CGUA messages do not have optional parameters.

Table 38 Parameters supported in the CGB,CGBA,CGU,CGUA Messages on Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set
Circuit group supervision msg type indicator	F	Process	Q.767 minimum set
Range and Status	V	Process	Q.767 minimum set

109.14.2.6 Blocking (BLO), block ack (BLA), Continuity check request (CCR), unblock (UBL), unblock ack (UBA), Reset circuit (RSC) messages.

The Succession CS2000 on an Q.767 trunk supports the mandatory parameters in the BLO, BLA, CCR, UBL, UBA, RSC messages as shown in Table 39. The BLO, BLA, CCR, UBL, UBA, RSC messages do not have optional parameters.

Table 39 Parameters supported in the BLO, BLA, CCR, UBL, UBA, RSC Messages on Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set

109.14.2.7 Release Complete Message (RLC)

The Succession CS2000 on an Q.767 trunk supports the parameters in the RLC message as shown in Table 40. Parameters not contained in table 40 are treated as unrecognized parameters and discarded.

Table 40 Parameters supported in the RLC Message on Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set
Cause Indicators	O	N/A	Q.767 minimum set
End of Optional Parameters	O	N/A	Q.767 minimum set

109.14.2.8 Forward Transfer Message (FOT)

The Succession CS2000 on an Q.767 trunk supports the parameters in the FOT message as shown in Table 41. All parameters not contained in table 41 are treated as unrecognized parameters.

Table 41 Parameters supported in the FOT Message on Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set
End of Optional Parameters	O	Tandem	Q.767 minimum set
Call reference	O	Discard	National Use only

109.14.2.9 Suspend (SUS) & Resume (RES) Messages

The Succession CS2000 on an Q.767 trunk supports the parameters in the SUS & RES messages as shown in Table 42. All parameters not contained in table 42 are treated as unrecognized parameters.

Table 42 Parameters supported in the SUS & RES Message on Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set
Suspend/Resume indicators	F	Tandem/ discard[a]	Q.767 minimum set

Table 42 Parameters supported in the SUS & RES Message on Q.767

Parameter Name	Type	Action	Notes
End of Optional Parameters	O	Process	Q.767 minimum set
Call reference	O	Discard	National Use only

a. If the Suspend/ Resume indicator (in the SUS/RES message) is set to network initiated and the message is received on the terminator after the ANM, the message is Tandemed. For all other cases it is Discarded.

109.14.2.10 Subsequent Address Message (SAM)

The Succession CS2000 on an Q.767 trunk supports the parameters in the SAM message as shown in Table 43.

Table 43 Parameters supported in the SAM Message on Q.767

Parameter Name	Type	Action	Notes
Message Type	F	Process	Q.767 minimum set
Subsequent number	V	Process	Q.767 minimum set
End of Optional Parameters	O	Process	Q.767 minimum set

109.15 Appendix C: Q.767/ISUP92 Timers

Table 44 Q.767/ISUP92 Timers for International use

(ISUP/Q.767) /Q.118	Cause of initiation	Table C7UPTMR timer	Range (default value)
T1 4-15 s	When release message is sent	NQ764T1	1-60 s (15 s)
T2 3 min	When suspend request controlling exchange receives suspend (user) message	NQ764T2	1-240 s (180 s)
T3	Not used on the international interface		
T4	Not used on the international interface

T23 1 min	When initial circuit group reset message is sent	NQ764T23	1-180 s (60 s)
T24 < 2 s	When check tone is sent	NQ764T24	0.1-2.0 s (1 s)
T25 1-10 s	When initial continuity check failure is detected	NQ764T25	1-30 s (10 s)
T26 1-3 min	When second or subsequent continuity check failure is detected	NQ764T26	1-240 s (120 s)
T27 4 min	When continuity check failure indication is received	NQ764T27	1-300 s (240 s)

Table 44 Q.767/ISUP92 Timers for International use

(ISUP/Q.767) /Q.118	Cause of initiation	Table C7UPTMR timer	Range (default value)
T28	Not used on the international interface		
T29 300-600 ms	Congestion indication received when T29 not running	Not imple-mented	
T30 5-10 s	Congestion indication received when T29 not running	Not imple-mented	
T31	Not used on the international interface		
T32	Not used on the international interface		
T33	Not used on the international interface		
T34	Not used on the international interface		
T35 15-20 s	At receipt of the latest digit and before the minimum or fixed number of digits have been received	NQ764T35	1-60 s (20 s)
T36 10-15 s	When transit or incoming international exchange receives continuity check request message	NQ764T8	1-60 s (15 s)

a. This timer is not used for answer timing. Instead field LCDDUR in table TRKGRP1 is used for answer timing purpose.The value of LCDDUR for terminating trunk provides the answer timing. The range of this field is 0-60, supporting upto 60 minutes. If the value is 0, then no answer timing is done on this switch and call continues.

109.16 Appendix D: Call Information (IAM message) for Gateway Calltypes

This Appendix describes the pertinent information in the ISUP IAM message as it pertains to the supported Gateway Calltypes:

- Direct Termination Outbound International
- Direct Terminational Inbound National
- Transit Outbound International

109.16.1 Direct Termination Outbound International

The CS2000 would calltype the call as a international (IDDD) call and perform the following gateway functions on the outgoing call information (Initial Address message (IAM)):

- Called party number parameter (Refer ITU-T Recommendation Q.107)
  - set Nature of Address (NOA) to value of national significant number (0000011)
  - called number format (15-digit IDDD + F)(<true Country Code>+<NN>+F)
    - strip any international prefix (’011’ for WZ1 format)
    - Strip the country code digits.
    - end-of-digit (#F) is suffixed to the called number
    - called number is delivered using enbloc format
- Calling party number parameter (if received in originating call information)
  - Nature of Address (NOA) would be set to International significant number (0000100)
  - Calling party number would be prefixed with the serving country code of CS2000 (per office basis) Note: maximum of 15-digit is supported.
  - existing CLI (ANI) delivery functionality is used to determine if calling party parameter is delivered.
- Calling party category (CPC) parameter
  - CPC value would be set to (00001010) ’ordinary calling subscriber’ only if the CPC value has not been overridden by the CPCSCRN option and has a value associated with ’not used’ values as defined in recommendation Q.767 section C.3.9. The ’not used’ values are:
    - 00000000: calling party’s category unknown at this time
    - 00001001: reserved (see Recommendation Q.104)
    - 11100000
      to
      11111110: spare for national use
- Forward Call Indicator parameter

- Bit A (National/international call indicator) would have been set to value of 0'call to be treated as a national call'

109.16.2 Direct Terminational Inbound National

For direct termination inbound national calls, the ISUP92/Q.767 gateway trunk agency would expect to receive the following call information (Initial Address message (IAM)) from the preceding foreign exchange:

- Called party number parameter
  - Nature of Address (NOA) would have been set to value of National significant number (0000011)
  - called number format (10-digit NN + F)
    - called number would contain WZ-1 national number (10-digit).
    - If end-of-digit (#F) is suffixed to the called number, CS2000 would strip end-of-digit prior to accessing table STDPRTCT.
    - For incomplete called number (called number not suffixed with end-of-digit ('F' digit)) Succession CS2000 waits for subsequent address message (SAM) until the Succession CS2000 receives either an end-of-digit or time-out occurs waiting for SAM prior to proceeding with translations.
- Calling party number parameter
  - Nature of Address (NOA) would have been set to International significant number
  - Calling party number would have been prefixed with the country code of the subscriber. Maximum of 15 digits are supported (based on 15-digit IDDD format). Most significant digits exceeding 15 digits is removed from the calling party number.
    - If end-of-digit (#F) is suffixed to the calling party number, CS2000 would remove the end-of-digit.
    - If an incomplete calling party number is received (calling party number incomplete indicator (NI) is 'incomplete', CS2000 would discard the calling party number.
- Calling party category (CPC) parameter
  - CPC value would have been set to (00001010) 'ordinary calling subscriber' depending on calltype (DDD, OA)
- Forward Call Indicator parameter
  - If Bit A has not been set to value of'0' (call to be treated as an national call), CS2000 would set Bit A to value of'0'(Recommendation Q.767 section C.3.20).

109.16.3 Transit Outbound International

For transit inbound international calls, the gateway trunk agency would have received the following initial call information (Initial Address message (IAM)) where the preceding foreign exchange would have performed the following function on the initial call information in the IAM:

- Called party number parameter
  - Nature of Address (NOA) would have been set to value of International significant number (0000100)
  - called number format (15-digit IDDD + F)
    - called number would contain WZ-1 national number (10-digit).
    - If end-of-digit (#F) is suffixed to the called number, CS2000 would strip end-of-digit prior to accessing table STDPRTCT.
    - For incomplete called number (called number not suffixed with end-of-digit ('F' digit)) Succession CS2000 waits for subsequent address message (SAM) until the Succession CS2000 receives either an end-of-digit or time-out occurs waiting for SAM prior to proceeding with translations.
- Calling party number parameter
  - Nature of Address (NOA) would have been set to International significant number
  - Calling party number would have been prefixed with the country code of the subscriber. Maximum of 15 digits are supported (based on 15-digit IDDD format).
    - If end-of-digit (#F) is suffixed to the calling party number, CS2000 would remove the end-of-digit.
    - If an incomplete calling party number is received (calling party number incomplete indicator (NI) is 'incomplete', CS2000 would discard the calling party number.
- Forward Call Indicator parameter
  - If Bit A has not been set to value of'1' (call to be treated as an international call), CS2000 would set Bit A to value of'1'(Recommendation Q.767 section C.3.20).

The CS2000 would calltype the call as a international (IDDD) call and perform the following gateway functions on the outgoing call information (Initial Address message (IAM)):

- Called party number parameter (Refer Recommendation Q.107)
  - called number format (15-digit IDDD + F)
  - strip any international prefix based on the national dialing plan
  - Nature of Address (NOA) would have been set to value of International significant number (0000100)
  - called number would have been prefixed with proper country code by the subscriber

- end-of-digit (#F) is suffixed to the called number
- CS2000 delivers the called number in enbloc.

- Calling party number parameter (if delivered based ANI delivery functionality)
  - Nature of Address (NOA) is set to International significant number (0000100)
  - If call originated on Q.767/ISUP92 gateway trunk agent, Succession CS2000 assumes the country code has been prefixed on the calling party number by the preceding foreign exchange. If call originated on UCS agent, the OFC_SERVING_CC office parameter value is prefixed on the calling party number. Note: maximum of 15 digits is supported.
- Calling party category (CPC) parameter
  - CPC value would be set to (00001010)'ordinary calling subscriber' only if the CPC value has not been overridden by the CPCSCRN option and has a value associated with 'not used' values as defined in recommendation Q.767 section C.3.9. The 'not used' values are:
    - 00000000: calling party's category unknown at this time
    - 00001001: reserved (see ITU-T Recommendation Q.104)
    - 11100000
      to
      11111110: spare for national use
- Forward Call Indicator parameter
  - If Bit A has not been set to value of'1' (call to be treated as an international call), CS2000 would set Bit A to value of '1'(Recommendation Q.767 section C.3.20).

109.17 Appendix E: Callflow diagram

The following figures illustrate the call flow for the gateway functionality. The shaded boxes indicate the functionality provided by this feature.

Figure 12 Gateway functionality call flows

109.18 Appendix F: Datafill examples

This appendix describes example datafill for the different types of calls supported by this feature.

109.18.1 Direct Inbound National Call.

This is an example of a direct inbound national call where a foreign exchange routes a call destined for US to a CS2000 in WZ-1. The CS2000 calltypes the call as a national call and routes the call to a US national trunk agency as a direct inbound national call.

Originating Trunk: Gateway Trunk

IAM msg:

NOA= National (3)

Called Number = 2142221234F

CPC=0

FCI bit A = 0 (National)

Since GWYTRK2 serving country code (SERV_CC) is not equal to the called number country code (’507’), the call is calltyped as a transit outbound international call. The call is being routed to a trunk to a foreign exchange in Mexico (country code of ‘52’) as a transit call to Panama (country code ‘507’).

called number = 507+7242212345+F

Called number NOA = International[1] (4).

Calling Party Number = 1+2146112211 (Since the originator is a UCS national agent, Country Code from table OFCVAR is prefixed)

Calling Party Number NOA = International[2] (4).

CPC = SUBSCRIBER1

109.18.5 Inbound National OA Calls (Direct)

This is an example of a direct inbound national OA call where a foreign exchange routes a call destined for US to a CS2000 in WZ-1. The CS2000 calltypes the call as a national OA call and routes the call to a US national trunk agency as a direct inbound national OA call.

Originating Trunk: Gateway Trunk

IAM msg:

[2]NOA is set to international significant number due to calltype of transit outbound international call and the originator is a UCS national agent.

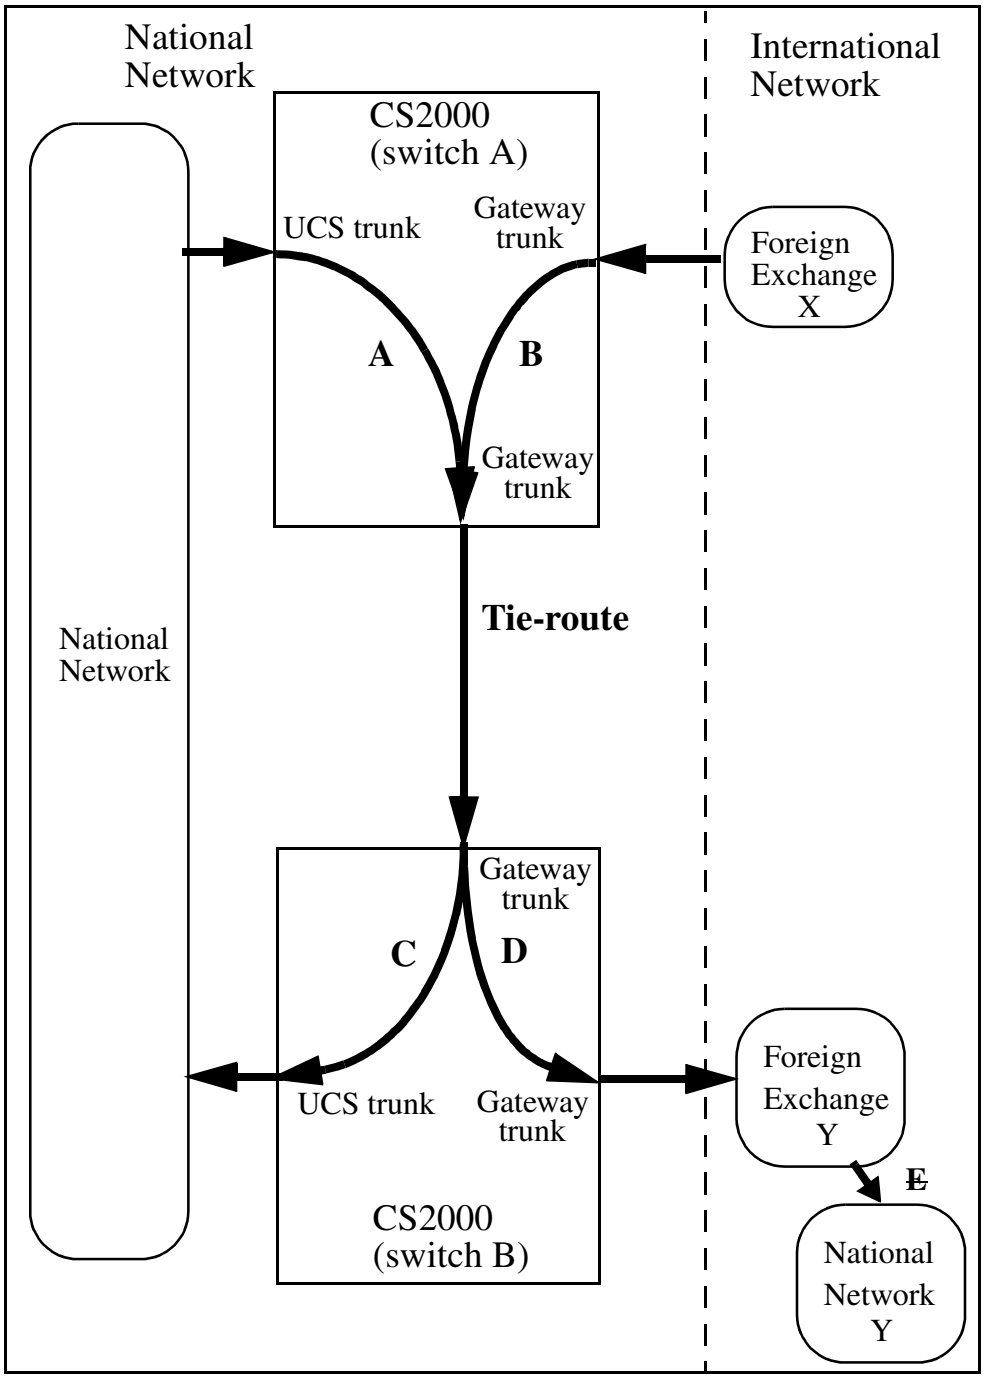
109.19 Appendix G: Tie-route Connection Example

Figure 20 Tie-route connection



Direct termination inbound national calls:

In figure 20, connection B to connection C illustrates direct termination inbound national calls over a tie-route connection. In this case, the call is routed as a national call on switch A and switch B.

Example:

A carrier has two gateway switches (CS2000 with gateway functionality): one on the east coast of the country and one on the west coast of the country. A foreign exchange routes a direct termination inbound national call to the east coast gateway switch but the call destination is on the west coast of the country. The gateway switch on the east coast would route the call as a national call over the gateway trunk agency (tie-route connection). The gateway switch on the west coast would then route the call as a national call to the supported trunk agency which accesses the national network on the west coast.

In figure 20, connection A to connection C illustrates direct termination inbound national calls over a tie-route connection. In this case, the call is routed as a national call on switch A and switch B.

Example:

A carrier has two gateway switches (CS2000 with gateway functionality): one in country X in WZ-1 and another in country Y in WZ-1 where country Y requires all international traffic to go through a gateway switch. A subscriber in country X dials a 1+national number, the gateway switch translates the call as a national call and routes the call over the tie-route connection (gateway trunk agency).

The gateway switch in country Y would treat the call as a direct termination inbound national call since the call originated on a gateway trunk agency and the calltype is a national call. Based on translations, the call would be routed to a CS2000 trunk agent that accesses the national network in country Y.

Direct termination outbound international calls:

In figure 20, connection A to connection C illustrates direct termination outbound international call over a tie-route connection. In this case, the call is routed as an direct termination outbound international call on switch A and a direct termination inbound national call on switch B.

Example:

A carrier has two gateway switches (CS2000 with gateway functionality): one in country X in WZ-1 and another in country Y in WZ-1 where country Y requires all international traffic to go through a gateway switch. A subscriber in country X dials a 011+country code (’1’)+national number, the gateway switch translates the call as an international call and routes the call over the tie-route connection (gateway trunk agency). The gateway switch in country Y would treat the call as a direct termination inbound national call since the call originated on a gateway trunk agency and the calltype is a national call. Based on translations, the call would be routed to a CS2000 trunk agent that accesses the national network in country Y.

In figure 20, connection A to connection D illustrates direct termination outbound international call over a tie-route connection. In this case, the call is routed as an direct termination outbound international call on switch A and on switch B.

Example:

A carrier has two gateway switches (CS2000 with gateway functionality): one in country A in WZ-1 and another in country B in WZ-1 where country B requires all international traffic to go through a gateway switch to access the national network. A subscriber in country B dials a 011+country code for country Y+national number, the gateway switch (switch A) translates the call as an direct termination outbound international call since the country code of the called number is EQUAL to the serving country code of the gateway trunk agency and routes the call over the tie-route connection.

The gateway switch in country B would translate the call as an international call and treat the call as a direct termination outbound international call since the country code of the called number is EQUAL to the serving country code of the gateway trunk agency. The gateway trunk agency would interconnect to the gateway switch in the destination country (country Y).

Transit outbound international calls:

In figure 20, connection B to connection D illustrates transit outbound international call over a tie-route connection. In this case, the call is routed as an transit outbound international call on switch A and on switch B.

Example:

A carrier has two gateway switches (CS2000 with gateway functionality): one on the east coast of the country and one on the west coast of the country. A foreign exchange routes a transit inbound international call to the east coast gateway switch but the call destination is a country that is connected to the gateway switch on the west coast of the country. The gateway switch on the east coast would route the call as an international call over the gateway trunk agency (tie-route connection).

The east coast gateway switch would treat this call as a transit outbound international call since the call is terminating to a gateway trunk agency and the destination country code prefix on called number is NOT EQUAL to the serving country code of the gateway trunk agency (country code of '1' since it resides in WZ-1).

The gateway switch on the west coast would then route the call as an international call to a gateway trunk agency that connects to the transit foreign exchange or could route the call as an international call to a gateway trunk agency that has a direct termination to the destination country (direct termination outbound international call).

In figure 20, connection A to connection D illustrates transit outbound international call over a tie-route connection. In this case, the call is routed as an transit outbound international call on both switch A and switch B.

Example:

A carrier has two gateway switches (CS2000 with gateway functionality): one in country A in WZ-1 and another in country B in WZ-1 where country B has the connection to a transit foreign exchange. A subscriber in country A dials a 011+country code for country X+national number, the gateway switch (switch A) translates the call as an transit outbound international call since the country code of the called number is NOT EQUAL to the serving country code of the gateway trunk agency (country code of '1' since country B is in WZ-1) and routes the call over the tie-route connection.

The gateway switch in country B would translate the call as an international call and treat the call as a transit outbound international call since the country code of the called number is NOT EQUAL to the serving country code of the gateway trunk agency. The gateway trunk agency would interconnect to a foreign exchange in country Y which has a direct connection to country X.

109.20 Appendix H: Test Call

This feature ensures that testcalls originated from any of the following test facilities:

- TTP - MAP level (Manual tests)
- ATT - MAP level (Automatic tests)

for performing tests on Q767 and ISUP92 Gateway trunks, these are terminated on the specified testlines.

Testlines that are supported by this feature are T100, T101[1], T102.

109.20.1 Origination of Testcall

This feature utilizes TST & OP commands available at MAP level and ATT for supporting origination of test calls on UCS agenda and ISUP92/Q.767.

IAM Message Generation:

The IAM message transmitted from the originating, near end switch to the terminating, far end switch is formatted as a test call IAM. The test call IAM is sent over the ISUP IMT trunks that has to be tested.

The test call IAM contains the following parameters:

- Nature of Connection Indicator
  - — the Satellite Indicator field for test calls depends on TRKSGRP datafill in the same way as for non-test calls
  - — the Continuity Check Indicator field for test calls contains the Continuity Check Not Required code (‘00’) regardless of TRKSGRP datafill
  - — the Echo Suppressor Indicator field contains the Outgoing Half Echo Suppressor Not Included code (‘0’) regardless of TRKSGRP datafill
- Calling Party Category - contains the Test Call code (‘00001101’). This value is sent in the test call IAM regardless of what facility initiates the test, line call or the number of test digits.
- Called Party Address - the Nature of Address and Numbering Plan Indicator fields of the Called Party Address parameter for test calls depend on the address signals to be transmitted. If the Called Party Address parameter contains a called party address having number of address digits greater than three; on the terminating, far end switch, then the Nature of Address field is encoded with the National (Significant) Number code ('0000011') and the Numbering Plan Indicator is encoded with the ISDN/

[1]T101 testline is supported only in a hybrid configuration.

Telephony Numbering Plan code ('001'). If the Called Party Address parameter contains a test line number (i.e. a 3 digit test code) the Nature of Address field is encoded with the Test Line Test code ('1110111') and the Numbering Plan Indicator is encoded with the Unknown numbering plan code ('000'). This allows the terminating, far end switch to apply appropriate dialing plan and translation to the received digits to terminate the call to the desired test line.

- User service information - Layer 1 information field in this parameter is dependent on datafill in CARRMTC table.

109.20.2 Translations & Termination of test call

At the far end switch, pretranslator used for test calls is obtained from the office parameter GLOBAL_TESTCALL_PRTNM, if the Nature of address (NOA) in called party address parameter of incoming IAM for a testcall is Testline Testcode (‘1110111’). If GLOBAL_TESTCALL_PRTNM is NPRT then pretranslator datafilled in PRTNM field of table TRKGRP is used. Ordinarily GLOBAL_TESTCALL_PRTNM is datafilled as ‘C7PT’ as pretranslator for testline numbers.

Dialplan used for a testcall depends upon the Numbering plan indicator field of incoming IAM. If numbering plan indicator is ‘ISDN_TELEPHONY_NUM_PLAN’, dialplan datafilled in TRKGRP is used. If dialplan datafilled in TRKGRP is NIL, dialplan from table OPT250 is taken. If the numbering plan indicator in incoming IAM is ‘UNKNOWN_NUM_PLAN’, dialplan is taken as ADDR.

All optional parameters (including CLI) are ignored while processing incoming Test call IAM. If CLI is received in the incoming IAM, it is not processed but it is delivered to the terminator if terminator is non-testline.

If the NOA in the Called Party Address parameter of incoming IAM indicates testline testcode, then subtable STDPRT of table STDPRTCT should be datafilled as standard route to testlines. If the route is not datafilled in table STDPRTCT then call takes universal translations. Serving Translation Scheme (STS) in such a case is derived in the following manner:

- for calls originating on INTRA IMT, STS is derived from office parameter DEFAULT_STS in table OFCVAR.
- for calls originating on GLOBAL IMT, STS is derived using OPART & TPART fields of table TRKGRP.

The selector, in table STDPRTCT, subtable STDPRT, which are supported for pretranslation of test calls are S, T, D, CT.

Once the Trunk Under Test (TUT) is connected to specified testline at the far end switch, test equipment at the near end switch starts the desired test and after the completion of the test, a log report is generated indicating the results.

109.20.3 TTP MAP level

TST and OP are the two commands at this level which are use for initiating a testcall on a trunk.

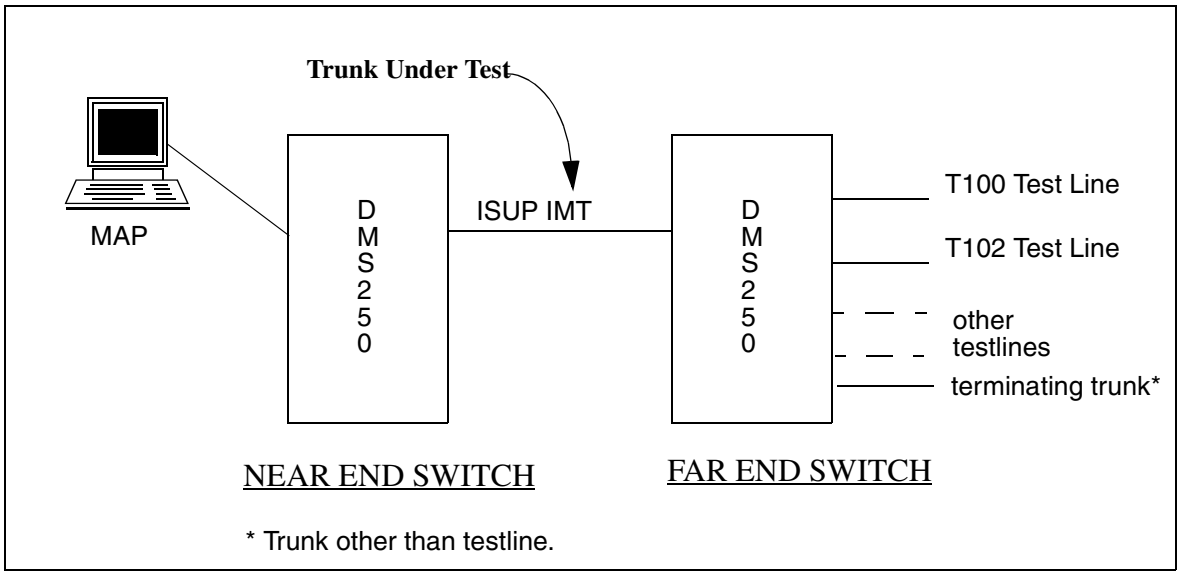
109.20.3.1 TST command

It takes a single parameter identifying the desired test and provides the ability to perform standard tests on a trunk. Following format of the command is supported.

- TST T10X, where X is in the range {0,2}

Example: Following figure depicts the configuration for manually testing the ISUP IMT, supported by this feature, from TTP MAP level:

Figure 21 Trunk testing from the TTP level of the MAP



For command TST T102 (Milliwatt testline) given at the TTP MAP level, the call flow till termination on the testline is as follows:

Origination at the near end switch

Table CLLIMTCE; *pos IMT761C7LP00*

This table gives TSTNOIND, which is used to index into table TSTLCONT and MWIDX, which is used to index into table MWDATA.

Table 48 Table CLLIMTCE;

CLLI	SCLLI	MIN ALM	MAJ ALM	CRIT ALM	SYNC TYPE	TST NO IND	MW IDX	SIG TST	PRFX DIG	DIAG DATA
IMT761LP00	IMT761	5	10	15	NSS	**0**	**0**	N	N	(4)

*Table TSTLCONT; pos **0**; sub TLNOS*; *pos T102*

Table 49 Table TSTLCONT;sub TLNOS

TESTLINE	TLNUMBER	TL_MFC_ OG_SIG
T102	**102**	N

Table MWDATA; pos **0**

Table 50 Table MWDATA

IDXKEY	MWDATA
0	**0 1004**

The table TSTLCONT contains the address digits (102 in this example) to be outpulsed for the corresponding Testline. Outgoing testcall IAM, on the trunk under test, contains these address digits as address information. Since this table cannot be datafilled for more than 12 address digits, TST command can be used to outpulse at the maximum 12 address digits only.

As described in section 1.17.1, since the number of address digits are 3, Nature of Address in the IAM is set to Test line Test Code. This nature of address at the far-end-switch will indicate office parameter GLOBAL_TESTCALL_PRTNM is to be used for pretranslations.

The table MWDATA gives the frequency and the decibel level which near end switch expects from far end switch while performing the milliwatt test.

In this example the decibel level and frequency are 0 and 1004 Hz respectively.

Translation & Termination at the far end switch

Since the Nature of Address is Test Line Test Code, Office Parameter GLOBAL_TESTCALL_PRTNM is looked at to get a pretranslator name for Test Call. If the value is NPRT, then the PRTNM of TRKGRP is used.

Table OFCVAR; *pos GLOBAL_TESTCALL_PRTNM*

Table 51 Table OFCVAR

PARMNAME	PARMVAL
GLOBAL_TESTCALL_PRTNM	**C7PT**

Table STDPRTCT; pos C7PT; sub STDPRT; *pos 102*

Table 52 Table STDPRTCT

FROMDIGS	TODIGS	PRETRTE
102	102	DD 3 **TERM102T** 3 3 NONE

The call terminates on TERM102T Test Line and subsequent tests are performed on the Trunk Group on which the above TST command was initiated.

The above example explains termination of testcall on a testline directly through route specified in table STDPRTCT. A testcall can also be terminated on a testline using universal translation. This is explained in the example of the next section (1.17.3.2).

109.20.3.2 OP command

This command has two formats

- OP ‘xxxxxxx’, where xxxxxxx are valid dialed digits that may be translated at the far end office.
- OP T10X, where T10X identifies a valid trunk testline test.

Example:

For the command OP 2141001234 given at the TTP MAP level, the call flow till termination is as follows:

Origination at the near end switch

As described in section 1.17.1, since the number of address digits are 10, Nature of Address in the IAM is set to National Significant Number. This nature of address at the far-end-switch will indicate that PRTNM of Table TRKGRP is to be used for pretranslations.

Translation & Termination at the far end switch

Table TRKGRP; pos IMT761C7LP00

Table 53 Table TRKGRP

GRPKEY	GRPTYP	TRAFSNO	PADGRP	NCCLS	GRPINFO
IMT761C7LP00	IMT	40	NPDGP	NCIM	UCSUST 0 2W **IMT** MIDL 16 7 16 UCS2UCS NIL CN NONE 4 ALWAYS ADDR **111 0** GLOBAL N N N VOICE_DATA NONE 4 160 (OHQ)(OHQTERM) $

The OPART and TPART obtained from TRKGRP is used to derive STS from Table PARTOSTS.

Table PARTOSTS; pos 00 111

Table 54 Table PARTOSTS

KEY	STS
00 111	611

The PRTNM (IMT in this example) obtained from table TRKGRP along with the incoming NOA (NATL in this example) is used to position into table TYP2PRTM.

Table TYP2PRTM; pos IMT

Table 55 Table TYP2PRTM

KEY	OPRTNM
IMT NATL	**IMT**

Table PRETNAME; pos IMT

Table 56 Table PRETNAME

Table 57 Table STDPRTCT;Sub STDPRT

FROMDIGS	TODIGS	PRETRTE
214	21	CT OFFNET 2 20 0 (**UNIVIDX CT**) $

The STS derived previously is used to index into table STS2CTDB to get the Translator name for the call.

Table STS2CTDB; pos 611

Table 58 Table STS2CTDB

STS	OFFXNAM	ONXNAM
611	**IUCS611**	IUCS611

Table CTCODE; pos; IUCS611 214 214

Table 59 Table CTCODE

XLANAME	FROMD	TOD	XLADATA
IUCS611	214	214	RTE (PF 0) (MM 7 15) (DEST **111**) $

Table CTRTE; pos IUCS611 111

Table 60 Table CTRTE

XLANAME	RTEREF	RTELIST
IUCS611	111	(S **IMT762C7DR03**) $

Hence the call terminates on IMT762C7DR03.

OP T10x command takes the digits to be outpulsed from table TSTLCONT which cannot be datafilled for more than 12 address digits and hence this command cannot be used to outpulse more than 12 address digits.

Please Refer to AD9016 (Open Number Plan for UCS ISUP IMT) for more details on Universal Translations.

Please refer to NTP 297-1001-595 (Trunks Maintenance Guide) for more details on the OP Command.

109.20.4 Parameter Interworking

This section describes the interworking of parameters which are specific to test call.

- For testcalls that originate on ISUP IMT and terminate on ISUP IMT following table shows the interworking of parameters:

Table 61 Parameter Interworking (ISUP to ISUP)

IAM (Incoming)	IAM (Outgoing)
Calling Party Category: ISUP_CPC_TEST_CALL	Calling Party Category: ISUP_CPC_TEST_CALL

- For a test call originating on ISUP92/Q.767 with 3.1KHz audio as TMR, and terminating on any of the supported ISUP IMTs, bearer capapility in the outgoing IAM will be speech.
- When a test call terminates on any of the supported IMTs then following table shows the mapping of Nature Of Address (NOA) and Numbering Plan Indicator of the Called Party Address (CPA) parameter in the outgoing IAM:

Table 62 Outgoing IAM Parameters

Outgoing IAM parameter	CPA length > 3	CPA length < = 3
Called Party Nature of Address	NATIONAL (‘0000011’)	ISUP_TESTLINE(‘1110111’)
Called Party Numbering Plan Indicator	ISDN/Telephony Numbering Plan(‘001’)	Unknown(‘000’)

109.20.5 Billing

Generation of CDRs for testcall can be controlled by office parameter CDR_FOR_TESTLINE in table OFCOPT. If CDR_FOR_TESTLINE is ‘Y’ CDR would be generated for the testcall with COMPCODE field as 7.

After successful completion of call using OP command, ‘RLS R’ command is used at the TTP MAP level to release the trunk. In this case, the COMPCODE field of CDR is populated with ‘5’.

109.21 Appendix I: Data Call

109.21.1 Data call Identification

109.21.1.1 UCP ISUP IMT (INTER/INTRA) Origination

- A call originating on an UCP ISUP IMT (Intra/Inter) is identified as a data call if
  - — information digits in case of I3PA dialplan are ‘56’. In this case the call is a 56k data call.
  - — the Information Transfer Capability(ITC) in User Service Information parameter of incoming IAM, indicates data (UNRESTRICTED DIGITAL[1], RESTRICTED DIGITAL). If ITC is RESTRICTED DIGITAL the call is 64k restricted digital call. If ITC is UNRESTRICTED DIGITAL and User Rate in USI is 56kbps, then the call is 56k digital call else, it is 64k unrestricted digital call.

[1]When Information Transfer Capability in User Service Information parameter of incoming IAM is 3.1kHz or Speech and the dialplan is I3PA, information digits decide whether a call is a datacall.

109.21.1.2 ISUP92/Q767 Origination

- A call originating on an Q.767/ISUP92 is identified as a data call if Transmission Medium Requirement parameter in the incoming IAM indicates data (UNRESTRICTED DIGITAL). The distinction between 56k data and 64k data is done depending upon the User Rate as is done in case of UCP INTRA agency. For these two protocols, TMR is mandatory parameter and USI is optional parameter. If both these parameters are received in IAM then TMR takes precedence in determining if the call is a datacall.

109.21.1.3 PRI Origination

- The Information Transfer Capability(ITC) in Bearer Capability parameter in incoming SETUP message indicates data (UNRESTRICTED DIGITAL, RESTRICTED DIGITAL). If ITC is RESTRICTED DIGITAL, the call is 64k restricted digital call. If ITC is UNRESTRICTED DIGITAL and Access Data Rate in Bearer Capability is 56kbps, then the call is 56k digital call else, it is 64k unrestricted digital call.

109.21.1.4 PTS Origination

For Data calls origination on PTS agents, the BCNAME field in Table TRKGRP for the PTS CLLI should be datafilled with 56KDATA or 64KDATA[1]. Later, that particular PTS agent can be used for making data calls on DMS-250.

109.21.2 Bearer Capability Screening

109.21.2.1 Origination Screening:

The call's BC (CALLBC[2]) is compared with the BCNAME field of the originating trunk (FILEDBC). If screening fails the call is given Service Currently UNavailable treatment (SCUN). BC compatibility check is done using table BCCOMPAT.

[1]Note that while 64KDATA may be datafilled on the PTS (FGD) agent, the rate will be treated as 56K. 64K data rate is not supported on PTS agents.
[2]CALLBC is the bearer capability of the call, and FILEDBC is value of the BCNAME field of table TRKGRP. FILEDBC is used as TERMBC while indexing in table BCCOMPAT.

109.21.2.2 Termination Screening:

The call's BC is compared with bearer capability of the terminating trunk using table BCCOMPAT. If terminating screening fails the call-route advances to the next route choice in the route list. If route exhaustion occurs, call is blocked. The treatment applied at this point is Generalized No Circuit Treatment (GNCT). The screening will pass or fail based on the datafill in table BCCOMPAT. Table 63 shows table BCCOMPAT with example datafills:

Table 63 Table BCCOMPAT to check BC Compatibility

CALLBC[a]	TERMBC[1]
56KDATA	64KDATA
64KDATA	VOICE_DATA
56KDATA	VOICE_DATA
VOICE_DATA	64KDATA
VOICE_DATA	56KDATA

a. CALLBC and TERMBC form the key for table BCCOMPAT.

Table BCCOMPAT defines bearer capability pairs that are compatible with one another. For Example, the fourth tuple in above table means a trunk with BC of VOICE_DATA can allow a call of BC 64KDATA.

Note:

- all the BC s used in this table must be defined in the table BCDEF.

If a data call terminates over a UCP INTRA trunk with I3PA in the dialplan field of TRKGRP then information digits are outpulsed as 56 only when it is a 56k data call.

In the Nature of Connection indicator parameter of the outgoing IAM, satellite indicator field is set to one satellite circuit in the connection.

109.21.3 Interworking

Following matrix shows the interworking supported by this feature:

Table 64 Interworking for Data-calls.

	Terminating Agency							
Orig. Agency	Gateway	UCP Intra	UCP Inter	FGD SS7	FGD PTS	UCS PRI	FGB	DAL TIE
Gateway	X	X	X	X	X	X	X	X
UCP Intra	X							
UCP Inter	X							
FGD SS7	X							
FGD PTS	X							
UCS PRI	X							
FGB	X							
DAL TIE	X							

109.21.4 Parameter Interworking

This section describes the interworking of parameters which are specific to datacall.

109.21.4.1 ISUP92/Q.767 to UCP

The incoming USI and TMR parameters on ISUP92/Q.767 are mapped as follows to the ANSI USI on the outgoing UCP IMT:

Table 65 Mapping of USI on UCP when no USI is received on ISUP92/Q.767

Q767/ISUP92 ISUP IAM		UCP ISUP IAM
TMR	OPTIONAL USI	MANDATORY USI

Q767/ISUP92 ISUP IAM		UCP ISUP IAM
64 K Unres.	NONE	Information transfer capability - 64 kbps Unrestricted
		Information transfer rate - 64 kbps
		Coding Standard - National Standard
		Transfer Mode - Circuit mode

Table 66 Mapping of USI on UCP when 2 byte USI is received on ISUP92/Q.767

Q767/ISUP92 ISUP IAM		UCP ISUP IAM
TMR	OPTIONAL USI	MANDATORY USI
64kbps Unres.	Information Transfer Capability - Any value supported.	Information transfer capability - 64kbps Unres
	Information transfer rate - 64 kbps - Packet mode calls (00000) - For other values give BCNI[a] treatment.	Information transfer rate - 64 kbps - 64 kbps ***Call fails***
	Coding Standard - All Values	Coding Standard - National Standard
	Transfer Mode - Circuit mode - Packet mode[b]	Transfer Mode - Circuit mode ***Call fails***

a. BCNI is given when wideband data calls are originated on non-wideband trunks. Wideband data calls on wideband trunks are blocked with FNAL treatment.
b. Packet mode data calls are blocked with FNAL treatment.

Table 67 Mapping of USI on UCP when 4byte USI is received on ISUP92/Q.767

Q767/ISUP92 ISUP IAM		UCP ISUP IAM
TMR	OPTIONAL USI	MANDATORY USI
64 kbps unrestricted.	ITC - Any value supported.	ITC - 64 Kbps Unrestricted.
	Information transfer rate[a] - 64 kbps - Packet mode calls (00000) - For other values give BCNI[b] treatment.	Information transfer rate - 64 kbps - 64 kbps ***Call fails***
	Coding Standard - All Values	Coding Standard - National Standard
	Transfer Mode - Circuit mode - Packet mode[c]	Transfer Mode - Circuit mode ***Call fails***
	Layer 1 information - Any supported value	Layer 1 Information[d] - Tandemed
	User Rate - 56 Kbps - All other Values	User Rate - 56 kbps - Not built on the UCP side.

a. Information Transfer Rate with values of 1472 Kbps with Coding Standard as National and Multirate are unrecognized USI values.
b. BCNI is given when wideband data calls are originated on non-wideband trunks. Wideband data calls on wideband trunks are blocked with FNAL treatment.
c. Packet mode data calls are blocked with FNAL treatment.
d. The layer 1 info. is built on the UCP only if the User Rate is 56 Kbps. The 4 byte incoming USI is sent out as a 4 byte USI only if the User Rate is 56 Kbps. For all other values, the 4 byte USI is sent out as a 2 byte USI.

Note:

3 byte USI is not valid for data calls.

Table 68 Calling party category interworking (ISUP92/Q.767 to UCP)

ITU IAM(Incoming)	UCP (Outgoing)
Calling Party Category: ISUP_CPC_DATA_CALL	Calling Party Category: ISUP_CPC_DATA_CALL

109.21.4.2 ISUP92/Q.767 to ISUP92/Q.767

The supported values of TMR and USI are tandemed in case of an ISUP92/Q.767 - ISUP92/Q.767 call. If no USI is received, then a default 2byte USI is built on the outgoing side if the incoming TMR is 64K Unrestricted.

Table 69 ISUP92/Q.767 to ISUP92/Q.767 call with TMR 64K Unres and no USI

Outgoing ISUP92/Q.767 TMR/USI	
TMR	OPTIONAL USI
- 64 kbps unrestricted	ITC - 64 kbps unrestricted. ITR - 64 Kbps unrestricted Coding Standard - National Standard Transfer Mode - Circuit mode

109.21.4.3 UCP to ISUP92/Q.767

The incoming USI parameter on UCP IMT is mapped as follows to TMR and USI on ISUP92/Q.767:

a. When optional parameters are present in IAM or option ISDNXFER is set in table TRKGRP for originating agency then following table shows the interworking of parameters:

Table 70 Calling party category interworking (UCP to Gateway ISUP)

UCP IAM (Incoming)	ITU IAM (Outgoing)
Calling Party Category: ISUP_CPC_DATA_CALL	Calling Party Category: ISUP_CPC_DATA_CALL

Table 71 Mapping of incoming USI on UCP to TMR & USI on ISUP92/Q.767

	User Rate - 56 Kbps

Table 73 Calling party category interworking (UCP to Gateway ISUP)

UCP IAM (Incoming)	ITU IAM (Outgoing)
Calling Party Category: — DATA	Calling Party Category: — SUBSCRIBER1

109.21.5 Billing

DIGDATA field in the CDR indicates if a call is a datacall. It is a boolean and a value ‘Y’ indicates a datacall.

109.22 Appendix J: ECAN

109.22.1 Application of Echo Cancellers on Transit Switch

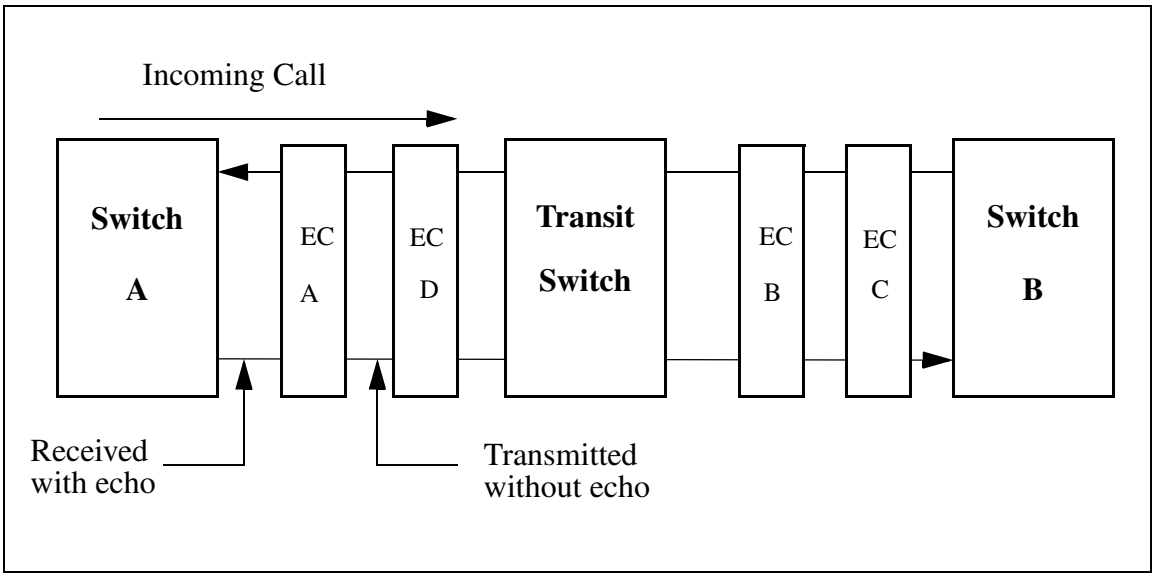
Figure-22 illustrates the use of echo cancellers in a general transit call situation.
Echo canceller A is enabled as the outgoing echo canceller. At the transit switch, a forward message is received indicating that a previous switch has enabled an echo device. Therefore, the transit switch does not enable echo canceller B. At switch B, echo canceller C is enabled as the incoming device. At the transit switch, the first backward acknowledgment indicates

that a succeeding switch has already included an incoming echo device. Thus, it does not enable echo canceller D.

Typically, during call setup in the forward direction, an echo canceller is activated on the outgoing trunk if required. During the backward acknowledgment phase of the call setup, an echo canceller is activated on the incoming trunk if required. This is the conventional setup.

The echo canceller device is physically connected on a per carrier basis, but it can control echo on a per trunk basis (DMS implementation). Since there are two speakers in a call, an echo device is needed in both directions for both parties to benefit. Hence, the term ‘half-echo cancellers’ for one direction. Although, at most, only one incoming and one outgoing echo device should be enabled.

Figure 22 Application of Echo Cancellers on transit switch



109.22.2 Echo Canceller Control Logic

The activation of Echo Canceller is completed at the call setup phase when echo control is required. And it is deactivated at the end of every call.

The diagram below describes how echo control is handled along with a typical ISUP call sequence.

Figure 23 Example of echo control in ISUP messaging

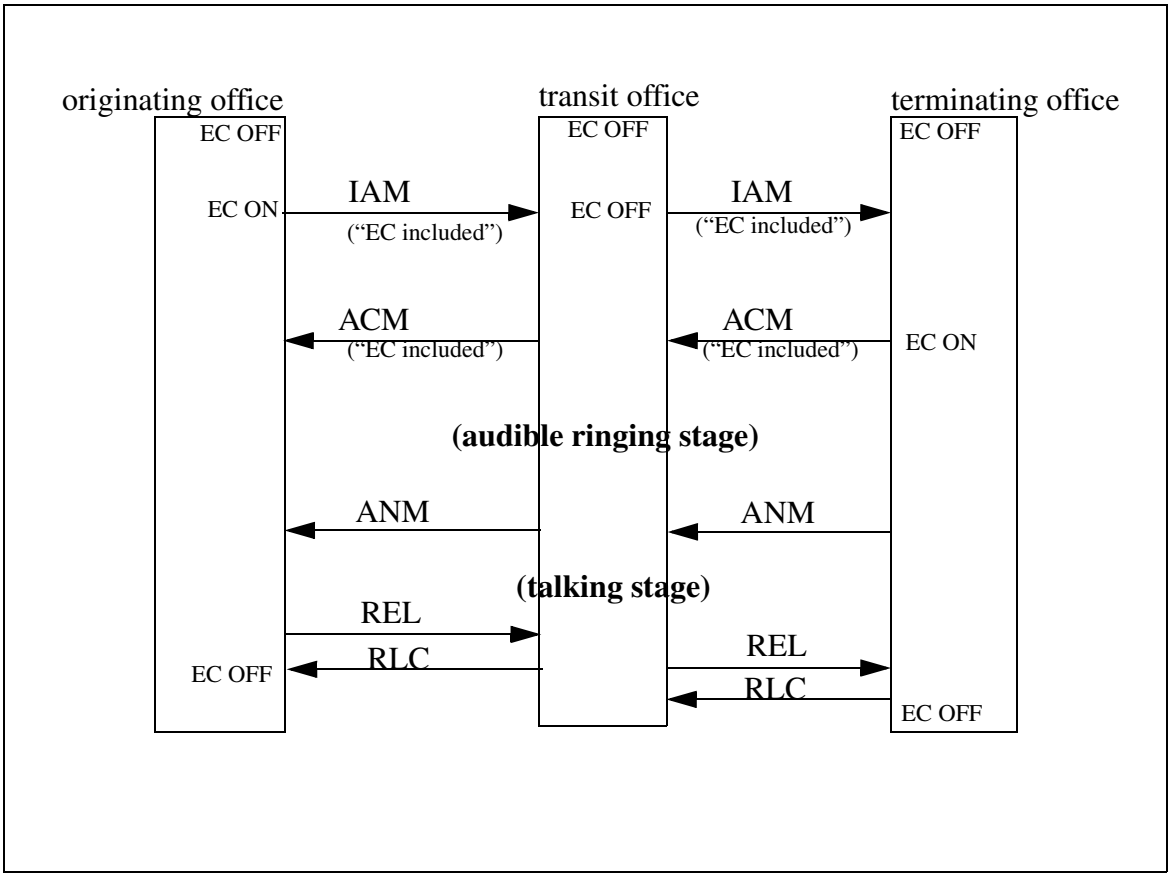


Figure 24 Example of echo control in DTMF digit collection call

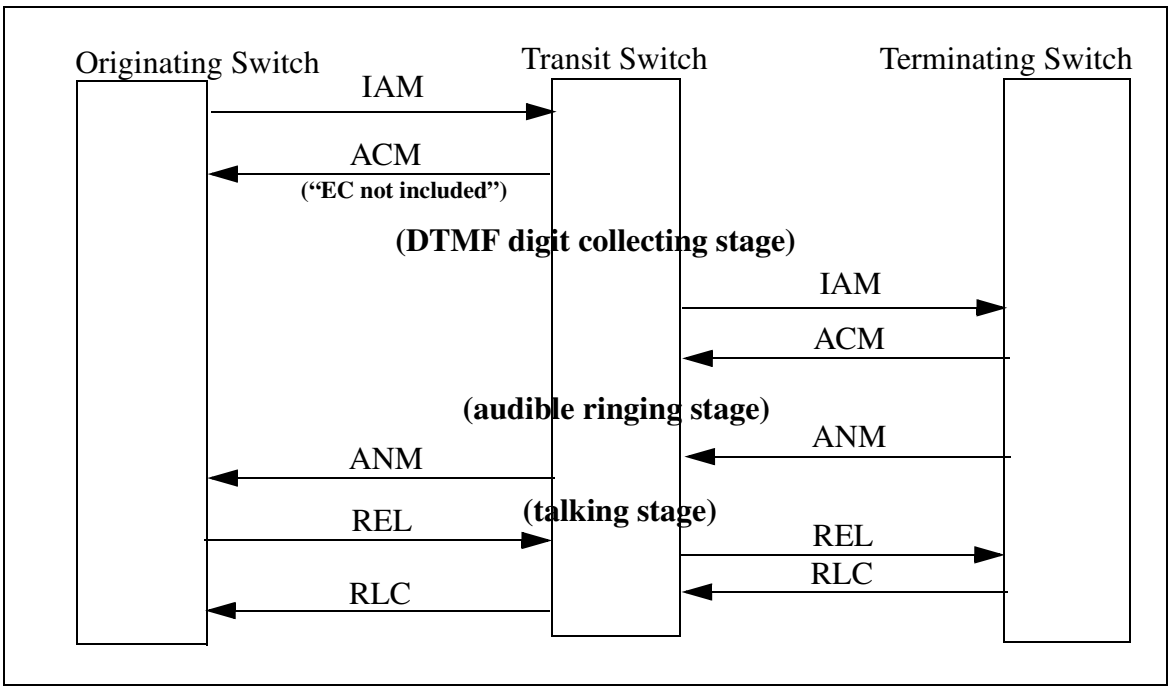


For calls which require DTMF digit collection (Figure-24), an ACM message always be send back immediately from the transit switch to the originating switch for requesting the digit collection. Therefore, the EC bit is set to "not included", no matter the transit switch has or has not received the EC indication from the terminating switch.

109.22.3 Outgoing Echo Cancellers

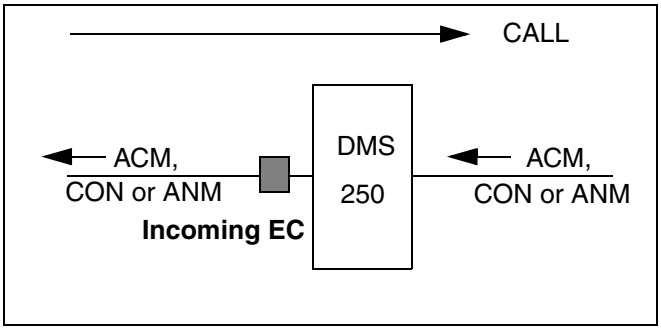
A) Criteria for echo cancellation:

- the incoming seizure (e.g. IAM) indicates no forward echo canceller yet; incoming CPC and TMR fields, if available, indicate voice-only call.
- echo canceller is datafilled in TRKSGRP and is available for use.

B) Signalling upon echo canceller activation:

- outgoing IAM Echo Control bit is set to 'included'.

Figure 25 EC on the trunk in the incoming direction



For the outgoing echo cancellers, the disable/enable commands are send to the EC module after received IAM. However, for the incoming echo cancellers (Figure - 25), the disable/enable commands are not be sent to the EC module until it receives the first backward messages (ACM, CON or ANM).

109.23 Appendix K: UCP ISUP & ISUP92/Q.767 Interworking

The following figures show the message flow diagram for UCP ISUP and ISUP92/Q.767 interworking:

Figure 26 UCP ISUP & ISUP92/Q.767 Interworking (Enbloc)

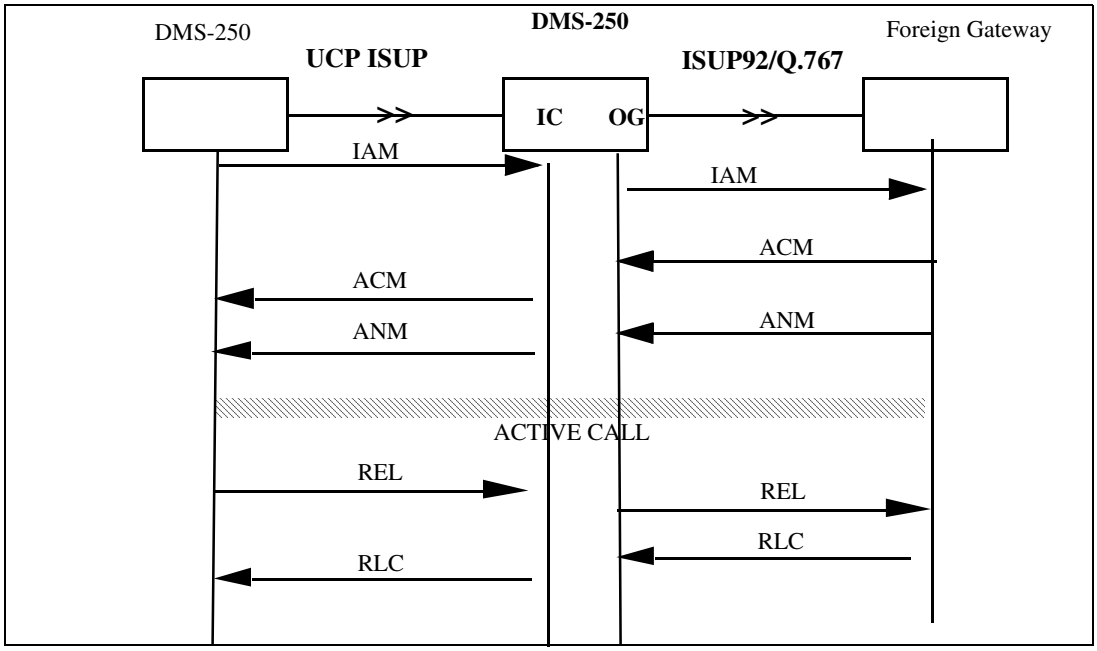


Figure 27 ISUP92/Q.767 & UCP ISUP Interworking (Overlap Sending)

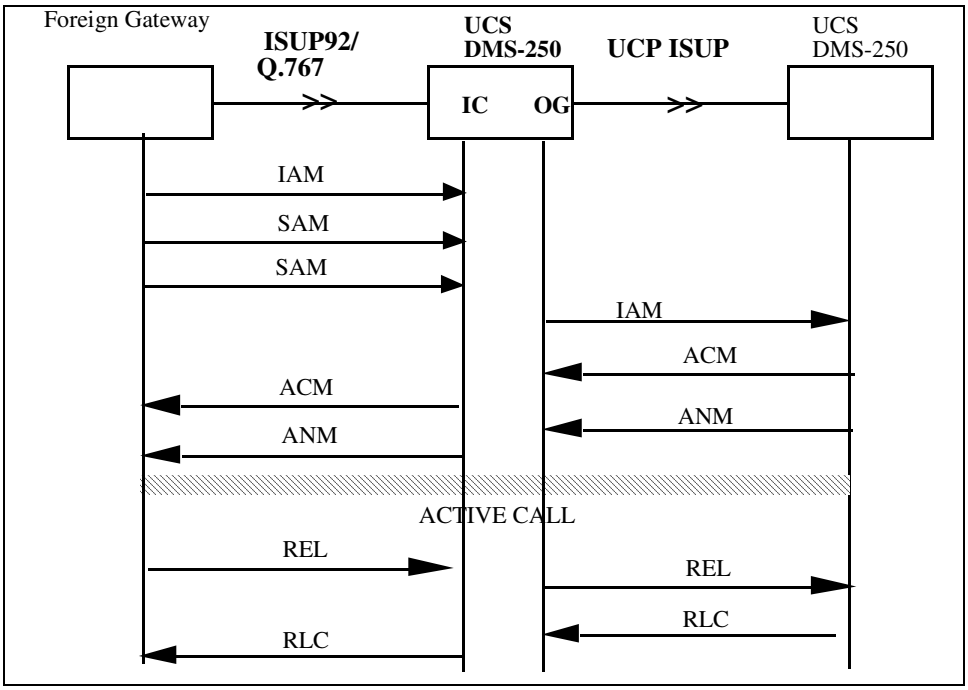

Overlap method of address signaling supports the transport of called party address digits in multiple messages. If the incoming IAM message contains no digits in the Called Party Number, or incomplete digits in the Called Party Number (end-of-digit (F) is not suffixed on the called number), and the field OVLAP in table TRKSGRP is set to 'Y', the DMS-250 enters in overlap mode. Upon receipt of such an IAM message, a timer is started. The DMS-250 waits until all the information is available (via SAMs), or the timer is expired, before translations are performed. It should be noted that the DMS-250 always sends all the Called Party address digits in the Initial Address Message.

Message parameters which need to be interworked, are described in this section. Parameters are keyed as 'F' for fixed mandatory, 'V' for variable length mandatory and 'O' for optional.

Table 74 IAM - UCP ISUP to ISUP92/Q.767

UCP ISUP IAM	ISUP92 IAM
Nature of Connection Indicator (F)	Nature of Connection Indicator (F)
Called Party Number (V)	Called Party Number (V)

Forward Call Indicator (F)	Forward Call Indicator (F)
Calling Party Category (F)	Calling Party Category (F)
User Service Information (V)	Transmission Medium Requirement $(F)_3$ User Service Information (O)

$_1$Note:The Calling Party Number is considered valid and is supported on gateway trunks only if the fields “calling party number incomplete indicator (NI)” is set to “Complete” and the “screening indicator” is “user provided, verified and passed” or “network provided” otherwise it is invalid and is discarded.

$_2$Note: Charge Number is not supported in ISUP92/Q.767 IAM.

$_3$ Note: User Service Information is a mandatory parameter in UCP while it is optional in ISUP92/Q.767. When interworking from UCP to ISUP92/Q.767, the information in the USI parameter is mapped to both the USI optional parameter and to the TMR parameter in the ISUP92/Q.767 IAM.

The formats of the TMR and USI parameters are provided below for reference.

Table 75 Transmission Medium Requirement (in ISUP92/Q.767)

	8	7	6	5	4	3	2	1
Octet 1	Transmission Medium Requirement							

Table 76 User Service Information (in UCP ISUP)

	8	7	6	5	4	3	2	1
Octet 1	Ext	Coding standard		Information transfer capability				
Octet 2	Ext	Transfer mode		Information Transfer rate				
Octet 3	Ext	User layer protocol id						
Octet 4	Ext	Spare		Rate				

Table 77 USI, Information Transfer Rate to TMR Mapping

USI - Information Transfer Rate	TMR - Transmission Medium Requirement
speech	speech
64 Kbit/s unrestricted digital info.	64 Kbit/s unrestricted
64 Kbit/s restricted digital info.	64 Kbit/s unrestricted
3.1 kHz audio	3.1 kHz audio
7 kHz audio	3.1 kHz audio*
15 kHz Audio	3.1 kHz audio*

* Based on Table BCCOMPAT datafill. If this mapping is not datafilled, then the call is treated due to bearer incompatibility.

The following shows the interworking of the ISUP92/Q.767 IAM message to UCP ISUP IAM message:

Table 78 IAM - ISUP92/Q.767 to UCP ISUP

ISUP92/Q.767 IAM	UCP ISUP IAM
Nature of Connection Indicator (F)	Nature of Connection Indicator (F)
Forward Call Indicator (F)	Forward Call Indicator (F)
Calling Party Category (F)	Calling Party Category (F)
Transmission Medium Requirement (F)	User Service Information $(V)_1$

Table 78 IAM - ISUP92/Q.767 to UCP ISUP

ISUP92/Q.767 IAM	UCP ISUP IAM
Called Party Number (V)	Called Party Number (V)
Transit Network Selection (O)	
User Service Information (O)	User Service Information (V)
Calling Party Number $(O)_2$	Calling Party Number (O)

$_1$Note: The User Service Information in the UCP IAM message is encoded based on the USI of the ISUP92/Q.767 IAM if received. If the USI parameter is not received in the ISUP92/Q.767 IAM, then the TMR parameter is used to encode the USI as shown in the Table below.

$_2$Note: The Calling Party Number is considered valid and is supported on gateway trunks only if the fields “calling party number incomplete indicator (NI)” is set to “Complete” and the “screening indicator” is “user provided, verified and passed” or “network provided” otherwise it is invalid and is discarded.

Table 79 ISUP92/Q.767 TMR to UCP ISUP USI Parameter Mapping

ISUP92/Q.767 Transmission Medium Requirement	UCP ISUP User Service Information
	Coding Standard - CCITT standardized coding (default)
Transmission Medium Requirement - Speech - 64 kbit/s unrestricted - 3.1 kHz audio	Information Transfer Capability - Speech - 64 kbit/s Unrestricted digital Info - 3.1 kHz audio
	Transfer mode - Circuit mode (default)
	Information Transfer Rate - 64 kbit/s (default)

109.23.2.3 Answer Message (ANM)

Table 94 shows the tandeming and discarding of parameters from a UCP to Q.767 ANM.

Table 94 UCP -> Q767parameters in the ANM message

UCP Parameter	Type	Action
Message type	F	Tandem
Call reference	O	Discard
Carrier Selection	O	Discard
Internetwork Specific ANM	O	Discard
Intranetwork Specific ANM	O	Discard
Network Specific Information	O	Discard
Multiple Business Group (Network Information)	O	Discard
Operator Information	O	Discard
User-to-user indicators	O	Discard
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.2.4 Call Progress Message (CPG)

Table 95 shows the tandeming and discarding of parameters from a UCP to Q.767 CPG.

Table 95 UCP -> Q767 parameters in the CPG message

UCP Parameter	Type	Action
Message type	F	Tandem
Event information	F	Tandem
Cause indicators	O	Discard
User-to-user indicators	O	Discard
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.2.5 Pass Along Message (PAM)

Table 96 shows the tandeming and discarding of parameters from a UCP to Q.767 PAM.

Table 96 UCP -> Q767 parameters in message PAM

UCP Parameter	Type	Action
Message type	F	Tandem

109.23.2.6 Release Message (REL)

Table 97 shows the tandeming and discarding of parameters in REL message when a cause value other than Normal call Clearing is received.

Table 97 UCP -> Q767 parameters in message REL

UCP Parameter	Type	Action
Message type	F	Tandem
Cause indicators	V	Process
User-to-user information	O	Tandem

Table 97 UCP -> Q767 parameters in message REL

UCP Parameter	Type	Action
User-to-user indicators	O	Discard
End of optional parameters	O	Tandem

Table 98 shows the tandeming and discarding of parameters in REL message when a cause value of Normal Call Clearing is received.

Table 98 UCP -> Q767 parameters in message REL

UCP Parameter	Type	Action
Message type	F	Tandem
Cause indicators	V	Process
User-to-user information	O	Tandem
User-to-user indicators	O	Discard
End of optional parameters	O	Tandem

109.23.2.7 Suspend/Resume Message (SUS/RES)

Table 99 shows the tandeming and discarding of parameter in the SUS and RES messages from a UCP trunk to Q.767 trunk.

Table 99 UCP -> Q767 parameters in message RES and SUS

UCP Parameter	Type	Action
Message type	F	Tandem
Suspend/Resume indicators	F	Tandem
End of optional parameters	O	Tandem

109.23.3 Parameter interworking for messages from ISUP92 to UCP

109.23.3.1 Initial Address Message (IAM)

Table 100 shows the tandeming and discarding of parameters from a ISUP92 trunk to UCP trunk.

Table 100 ISUP92 ->UCP parameters in the IAM message

ISUP92 Parameter	Type	Action
Message Type	F	Tandem
Nature Of Connection Indicators	F	Process
Forward Call Indicators	F	Process
Calling Party's Category	F	Process
Transmission Medium Requirement (TMR)	F	Mapped
Called Party Number	V	Process
Access Transport	O	Tandem
Calling Party Number	O	Process
Closed User Group Interlock Code	O	Tandem
Optional Forward Call Indicators	O	Tandem
User service information	O	Process
User-to-user information	O	Tandem
Original Called Number	O	Tandem
Redirecting Number	O	Tandem
Redirection Information	O	Tandem
User to User Indicators	O	Tandem
End of optional parameters	O	Tandem

109.23.3.2 Address Complete Message

Table 101 shows the discarding and tandeming of parameters for a ISUP92 to UCP ACM when the SOC NSER0003 is ON and OFCVAR field ACTIVATE_INTER_INTRA_UNANS_CALL is set to ‘Y’.

Table 101 ISUP92 ->UCP parameters in the ACM message

ISUP92 Parameter	Type	Action
Message type	F	Tandem
Backward call indicators	F	Process
Access transport	O	Tandem
Access delivery information	O	Discard
Call diversion information	O	Discard
Cause indicators	O	Tandem
Echo control information	O	Discard
Generic notification indicator	O	Discard
Optional backward call indicators	O	Discard
Parameter compatibility information	O	Discard
Redirection number	O	Tandem
Redirection number restriction	O	Tandem
Transmission medium used	O	Discard
User-to-user indicators	O	Tandem
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

Table 102 shows the discarding and tandeming of parameters in ISUP92 to UCP ACM when SOC NSER0003 is not ON and field ACTIVATE_INTER_INTRA_UNANS_CALL in table OFCVAR is not set to ‘Y’.

Table 102 ISUP92 ->UCP parameters in the ACM message

ISUP92 Parameter	Type	Action
Message type	F	Tandem
Backward call indicators	F	Process
Access transport	O	Tandem
Access delivery information	O	Tandem
Call diversion information	O	Tandem
Cause indicators	O	Tandem
Echo control information	O	Tandem
Generic notification indicator	O	Tandem
Optional backward call indicators	O	Tandem
Parameter compatibility information	O	Tandem
Redirection number	O	Tandem
Redirection number restriction	O	Tandem
Transmission medium used	O	Tandem
User-to-user indicators	O	Tandem
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.3.3 Answer Message (ANM)

Table 103 shows the tendeming and discarding of parameters for a ISUP92 to UCP ANM.

Table 103 ISUP92 ->UCP parameters in the ANM message

ISUP92 Parameter	Type	Action
Message type	F	Tandem
Access delivery information	O	Discard
Access transport	O	Tandem
Backward call indicators	O	Tandem
Call history information	O	Discard
Connected number	O	Tandem
Echo control information	O	Discard
Generic notification indicator	O	Discard
Generic address	O	Discard
Optional backward call indicators	O	Discard
Parameter compatibility information	O	Discard
Redirection number	O	Tandem
Redirection number restriction	O	Tandem
Transmission medium used	O	Discard
User-to-user indicators	O	Tandem
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.3.4 Call Progress Message (CPG)

Table 104 shows the tandmenig and discarding of parameters in the ISUP92 to UCP message.

Table 104 ISUP92 -> UCP parameters in the CPG message

ISUP92 Parameter	Type	Action
Message type	F	Tandem
Event information	F	Tandem
Access delivery information	O	Tandem
Access transport	O	Tandem
Backward call indicators	O	Tandem
Call diversion information	O	Tandem
Cause indicators	O	Tandem
Generic notification indicator	O	Tandem
Optional backward call indicators	O	Tandem
Parameter compatibility information	O	Tandem
Redirection number	O	Tandem
Redirection number restriction	O	Tandem
Transmission medium used	O	Tandem
User-to-user indicators	O	Tandem
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.3.5 Connect Message (CON)

CON message is not supported in UCP protocol. Table 105 shows the parameters which will be tandemed and discarded while sending an ANM to the UCP trunk.

Table 105 ISUP92 -> UCP parameters in the CON message

ISUP92 Parameter	Type	Action
Message type	F	Mapped
Backward call indicators	F	Tandem
Access delivery information	O	Discard
Access transport	O	Tandem
Call history information	O	Discard
Connected number	O	Tandem
Echo control information	O	Discard
Generic notification indicator	O	Discard
Generic address	O	Discard
Optional backward call indicators	O	Discard
Parameter compatibility information	O	Discard
Redirection number	O	Tandem
Redirection number restriction	O	Tandem
Transmission medium used	O	Discard
User-to-user indicators	O	Tandem
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.3.6 Continuity Test Message (COT)

As shown in table 106 this message is tandemed to the UCP trunk.

Table 106 ISUP92 -> UCP parameters in Message COT

ISUP92 Parameter	Type	Action
Message type	F	Tandem
Continuity indicators	F	Tandem

109.23.3.7 Forward Transfer Message (FOT)

As shown in table 107 FOT message is tandemed to the UCP trunk.

Table 107 ISUP92 -> UCP parameters in message FOT

ISUP92 Parameter	Type	Action
Message type	F	Tandem
End of optional parameters	O	Tandem

109.23.3.8 Release Message (REL)

Table 108 shows the tandeming and discarding of parameters in REL message when a cause value other than Normal call Clearing is received.

Table 108 ISUP92 -> UCP parameters in message REL

ISUP92 Parameter	Type	Action
Message type	F	Tandem
Cause indicators	V	Process
Access delivery information	O	Discard
Access transport	O	Discard
Automatic congestion level	O	Discard
Parameter compatibility information	O	Discard
Redirection number restriction	O	Discard
User-to-user information	O	Discard

Table 108 ISUP92 -> UCP parameters in message REL

ISUP92 Parameter	Type	Action
User-to-user indicators	O	Discard
End of optional parameters	O	Tandem

Table 109 shows the tandeming and discarding of parameters in REL message when a cause value of Normal call Clearing is received.

Table 109 ISUP92 -> UCP parameters in message REL

ISUP92 Parameter	Type	Action
Message type	F	Tandem
Cause indicators	V	Process
Access delivery information	O	Tandem
Access transport	O	Tandem
Automatic congestion level	O	Discard
Parameter compatibility information	O	Tandem
Redirection number restriction	O	Tandem
User-to-user information	O	Tandem
User-to-user indicators	O	Tandem
End of optional parameters	O	Tandem

109.23.3.9 Suspend/Resume Message (SUS/RES)

These messages are tandemed as shown in table 110.

Table 110 ISUP92 -> UCP parameters in message RES and SUS

ISUP92 Parameter	Type	Action
Message type	F	Tandem

Table 110 ISUP92 -> UCP parameters in message RES and SUS

ISUP92 Parameter	Type	Action
Suspend/Resume indicators	F	Tandem
End of optional parameters	O	Tandem

109.23.4 Parameter mapping for messages from UCP to ISUP92

This section shows the parameter tandeming and discarding for the messages coming on the UCP trunk and going to the ISUP92 trunk.

Reference feature document AD9067‘Support for User to User Parameter’ for proper requirements when mapping of the User to User parameter is required.

109.23.4.1 Initail Address Message (IAM)

Parameter tandeming and discarding for the IAM is shown in table 111.

Table 111 UCP -> ISUP92 parameters in the IAM message

UCP Parameter	Type	Action
Message Type	F	Tandem
Nature Of Connection Indicators	F	Process
Forward Call Indicators	F	Process
Calling Party's Category	F	Process
User service information	F	Mapped
Called Party Number	V	Process
Calling Party Number	O	Process
Carrier Identification	O	Discard
Carrier Selection	O	Discard
Charge Number	O	Discard
Channel Assignment Map	O	Discard
Generic Address	O	Discard
Generic Digits	O	Discard

Table 111 UCP -> ISUP92 parameters in the IAM message

UCP Parameter	Type	Action
Jurisdiction Information	O	Discard
Multiple Business Group (Network Information)	O	Discard
Network Specific Facilities	O	Discard
Network-Specific IAM	O	Discard
Operator Information	O	Discard
Operator Service Indicator	O	Discard
Originating Line Information	O	Discard
Remote Operations	O	Discard
Supplementary Line Information	O	Discard
Transit network selection	O	Discard
User service information (mandatory variable length parameter in UCP protocol)	O	Process
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.4.2 Address Complete Message (ACM)

Table 112 shows the discarding and tandeming of parameters for a UCP to ISUP92ACM when the SOC NSER0003 is ON and OFCVAR field ACTIVATE_INTER_INTRA_UNANS_CALL is set to ‘Y’.

Table 112 UCP -> ISUP92 parameters in the ACM message

UCP Parameter	Type	Action
Message type	F	Tandem
Backward call indicators	F	Process
Call reference	O	Discard

Table 112 UCP -> ISUP92 parameters in the ACM message

UCP Parameter	Type	Action
Cause indicators	O	Tandem
Network specific facility	O	Discard
User-to-user indicators	O	Tandem
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

Table 113 shows the discarding and tandeming of parameters in UCP to ISUP92 ACM when SOC NSER0003 is not ON and field ACTIVATE_INTER_INTRA_UNANS_CALL in table OFCVAR is not set to ‘Y’.

Table 113 UCP -> ISUP92 parameters in the ACM message

UCP Parameter	Type	Action
Message type	F	Tandem
Backward call indicators	F	Process
Call reference	O	Discard
Cause indicators	O	Tandem
Network specific facility	O	Discard
User-to-user indicators	O	Tandem
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.4.3 Answer Message (ANM)

Parameter tandeming and discarding for ANM message form UCP to ISUP92 are shown in table 114.

Table 114 UCP -> ISUP92parameters in the ANM message

UCP Parameter	Type	Action
Message type	F	Tandem
Call reference	O	Discard

Table 114 UCP -> ISUP92parameters in the ANM message

UCP Parameter	Type	Action
Carrier Selection	O	Discard
Internetwork Specific ANM	O	Discard
Intranetwork Specific ANM	O	Discard
Network Specific Information	O	Discard
Multiple Business Group (Network Information)	O	Discard
Operator Information	O	Discard
User-to-user indicators	O	Discard
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.4.4 Call Progress Message (CPG)

Parameter tandeming and discarding for CPG message form UCP to ISUP92 are shown in table 115.

Table 115 UCP -> ISUP92 parameters in the CPG message

UCP Parameter	Type	Action
Message type	F	Tandem
Event information	F	Tandem
Cause indicators	O	Discard
User-to-user indicators	O	Discard
User-to-user information	O	Tandem
End of optional parameters	O	Tandem

109.23.4.5 Continuity Test Message (COT)

Parameter tandeming and discarding for COT message form UCP to ISUP92 are shown in table 116.

Table 116 UCP -> ISUP92 parameters in Message COT

UCP Parameter	Type	Action
Message type	F	Tandem
Continuity indicators	F	Tandem

109.23.4.6 Pass Along Message (PAM)

Parameter tandeming and discarding for PAM message form UCP to ISUP92 are shown in table 117.

Table 117 UCP -> ISUP92 parameters in message PAM

UCP Parameter	Type	Action
Message type	F	Tandem

109.23.4.7 Release Message (REL)

Table 118 shows the tandeming and discarding of parameters in REL message when a cause value other than Normal call Clearing is received.

Table 118 UCP -> ISUP92 parameters in message REL

UCP Parameter	Type	Action
Message type	F	Tandem
Cause indicators	V	Process
User-to-user information	O	Tandem
User-to-user indicators	O	Discard
End of optional parameters	O	Tandem

Table 119 shows the tandeming and discarding of parameters in REL message when a cause value of Normal call Clearing is received.

Table 119 UCP -> ISUP92 parameters in message REL

UCP Parameter	Type	Action
Message type	F	Tandem
Cause indicators	V	Process
User-to-user information	O	Tandem
User-to-user indicators	O	Discard
End of optional parameters	O	Tandem

109.23.4.8 Suspend/Resume Message (SUS)

Table 120 shows the tandeming and discarding of parameters in SUS/RES message.

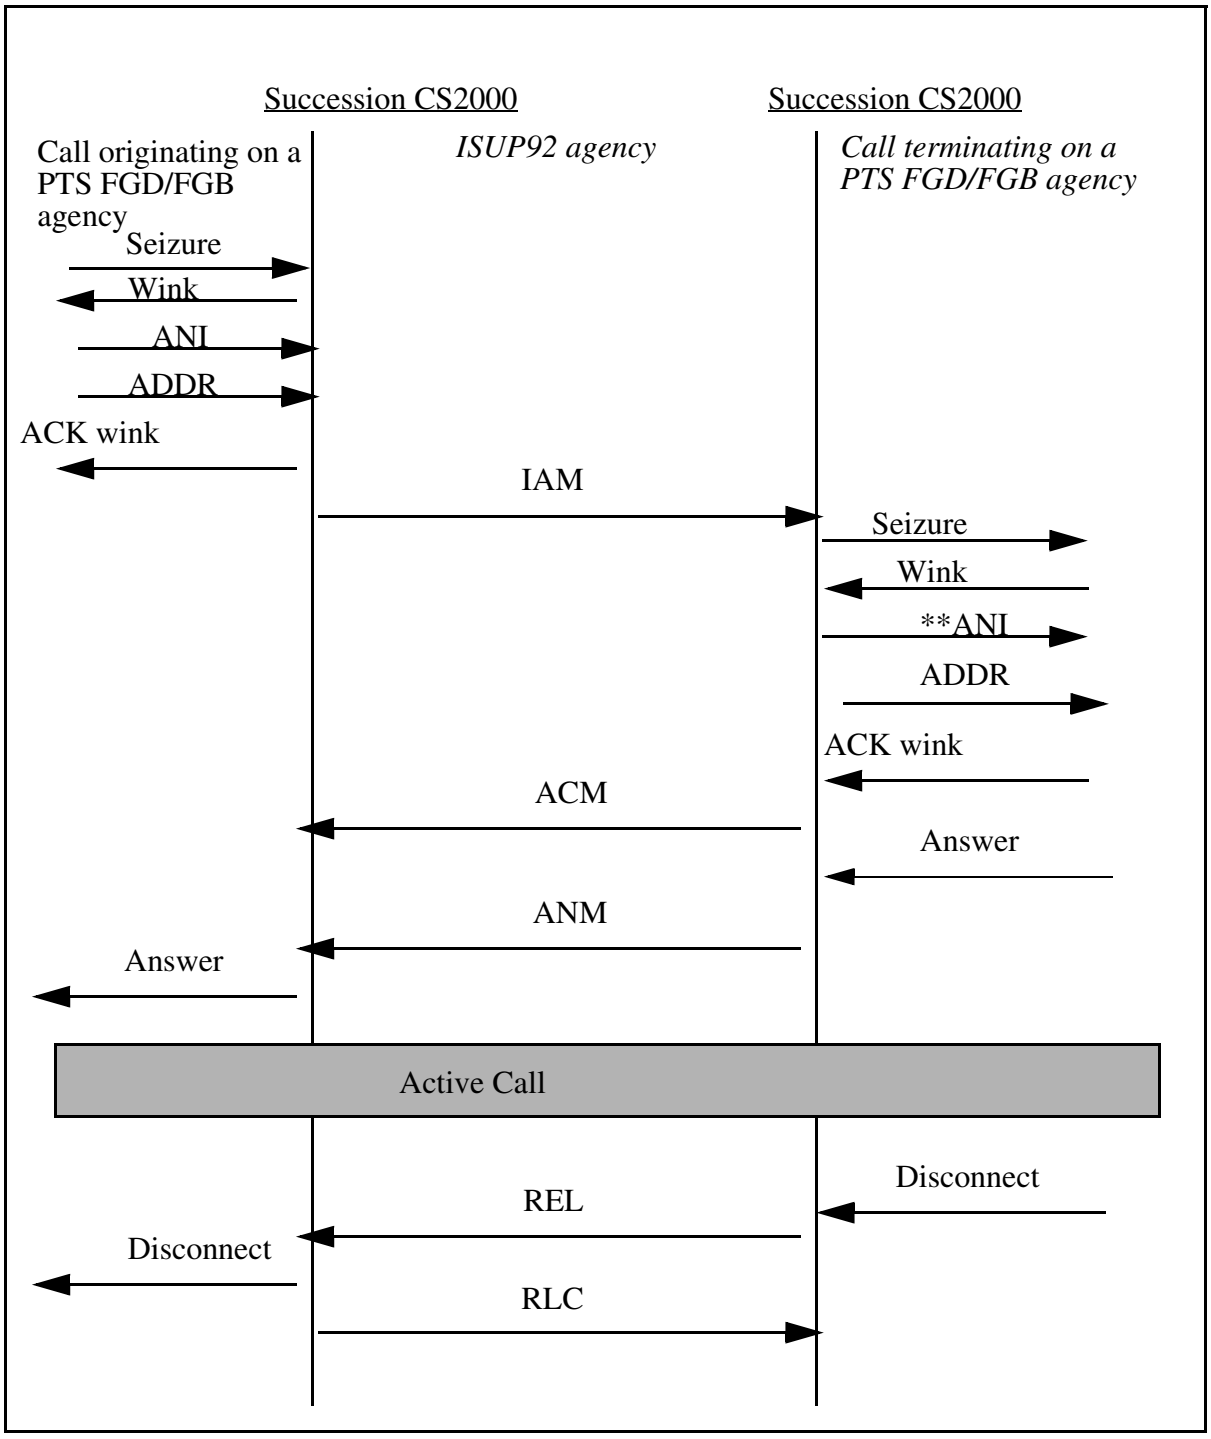
Table 120 UCP -> ISUP92 parameters in message RES and SUS

UCP Parameter	Type	Action
Message type	F	Tandem
Suspend/Resume indicators	F	Tandem
End of optional parameters	O	Tandem

109.24 Appendix L: Interworking of ISUP92/Q.767 with PTS agents

The following diagram depicts the signal flow for a call originating and terminating on an ISUP92/Q.767 agent from a PTS FGD/FGB.

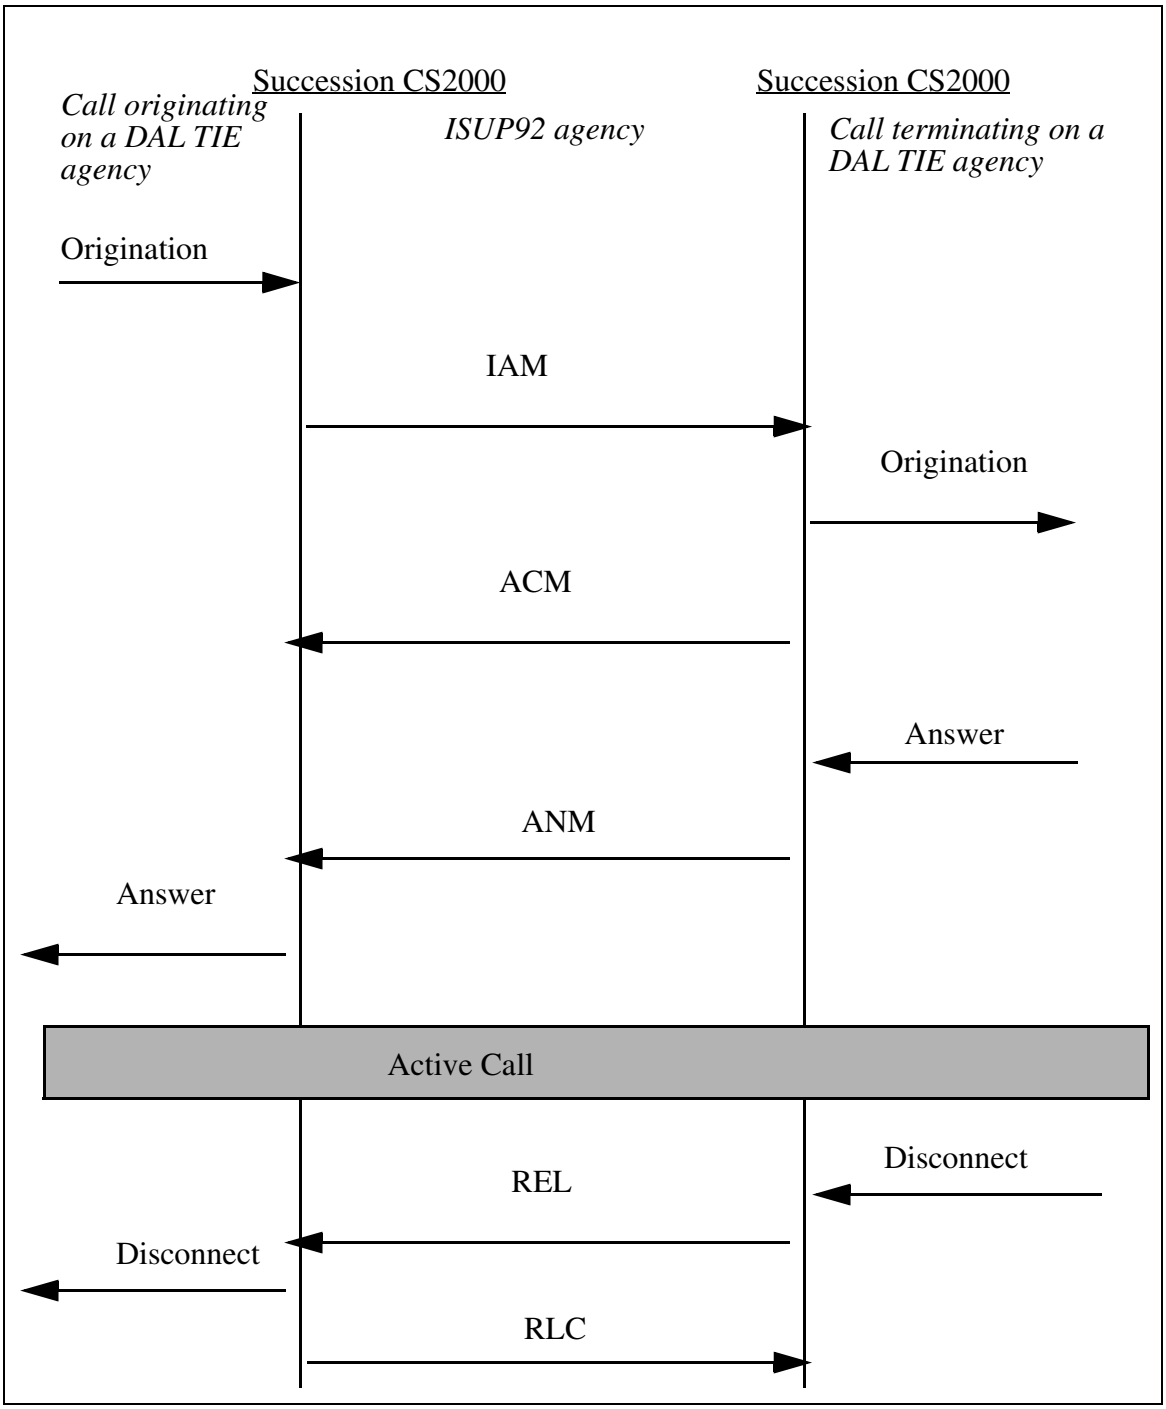
Figure 28 Interworking between ISUP92/Q.767 and PTS FGB/FGD agent.



** In case of FGB, ANI delivery is optional.

The following diagram depicts the signal flow for a call originating and terminating on an ISUP92/Q.767 agent from a DAL TIE.

Figure 29 Interworking between ISUP92/Q.767 and DAL-TIE agents



The following table illustrates the message mapping between the ISUP92/ Q.767 messages and the FGB/FGD messages.

Table 121 ISUP92/Q.767 --> FGB/FGD messages mapping

ISUP92/Q.767 Message	FGB/FGD Message
IAM	Seized message is sent and wink is received after address digits are outpulsed
SAM	**
ACM	--
ANM	Answer message is received.
REL	On-Hook message is received
RLC	--

Note:

*** If Overlap sending is allowed, then Seized message is sent to DAL TIE only after SAM is received.*

The following table explain the mappings between the ISUP92/Q.767 messages and the corresponding DAL TIE messages.

Table 122 ISUP92/Q.767 --> DAL TIE message mapping

Messages	**DAL TIE messages**
IAM	Seized message is sent and wink is received.
SAM	**
ACM	---
ANM	Answer message is received
REL	On-hook message is received
RLC	---

Note:

*** If Overlap sending is allowed, then Seized message is sent to DAL TIE only after SAM is received*

For PTS originations and ISUP92/Q.767 terminations, the default values of parameters in IAM are given below.

Table 123 PTS-> ISUP92/Q.767, value of ISUP Parameter 'Called Party Number' in IAM

ISUP Parameter Field	ISUP value
Nature of Address	National number (0000011)[a]
Numbering Plan Indicator	ISDN (telephony) Numbering Plan (Recommendation E.164) (001)
Odd/Even Indicator	odd (1)- if odd number of digits in the called party, even (0)-if even number of digits in called party

a. The value of this parameter depends on the translation system used in the call.

Table 124 PTS-> ISUP92/Q.767, value of ISUP Parameter 'Nature of Connection Indicators' in IAM

ISUP Parameter Field	ISUP value
Satellite Indicator	Datafill dependant[a]
Continuity Check Indicator	Datafill dependent[b]
Echo Control Device Indicator	Datafill dependent

a. The value of this field depends on the SAT field of table TRKSGRP
b. The value of this field depends on the CONTCHK field of table TRKSGRP

Table 125 PTS-> ISUP92/Q.767, values for ISUP Parameter 'Forward Call Indicator' in IAM

ISUP Parameter Field	ISUP value
National / International Call Indicator	Call to be treated as National (0)
End to End Method Indicator	No end to end method available(00)
Interworking Indicator	Interworking encountered (1)
End to End Information Indicator	No end to end information available (0)
ISDN User Part Indicator	ISDN User part not used all the way (0)
ISDN User Part Preference Indicator	ISDN user part not required all the way (01)
ISDN Access Indicator	Originating access non-ISDN (0)
Trans_called_Num_Ind	Number_Not_Translated
Routing_attempt_Ind	No_routing_attempt(0000000)

Table 126 PTS-> ISUP92/Q.767, values for ISUP Parameter 'Calling Party Category' in IAM

ISUP Parameter Field	ISUP value
Calling Party Category	ordinary subscriber (00001010)

Table 127 Default values for ISUP Parameter 'Transmission Medium Requirement' in ISUP92/Q.767 IAM

ISUP Parameter Field	ISUP value
Transmission Medium Requirement	3.1 Khz audio(00000011)[a]

a. The value of this field depends upon the BCNAME field of table TRKGRP.

Table 128 Default values User Service Information parameter in IAM

ISUP Parameter Field	ISUP value
Coding standards	CCITT (00)

Table 128 Default values User Service Information parameter in IAM

ISUP Parameter Field	ISUP value
Information transfer rate	64_KBits/S (10000)
Information transfer mode	Circuit mode (00)
Information transfer capability	3.1Khz Audio (10000)
Layer1 Identification	Layer1_G711_ALaw(00011)
User Rate	User Rate Nil(00000)
Synchronization	Synchrone(0)
Negotiation	Negot_not_inband(0)

The default values of BCI in ACM is given below for ISUP92/Q.767 to PTS interworking.

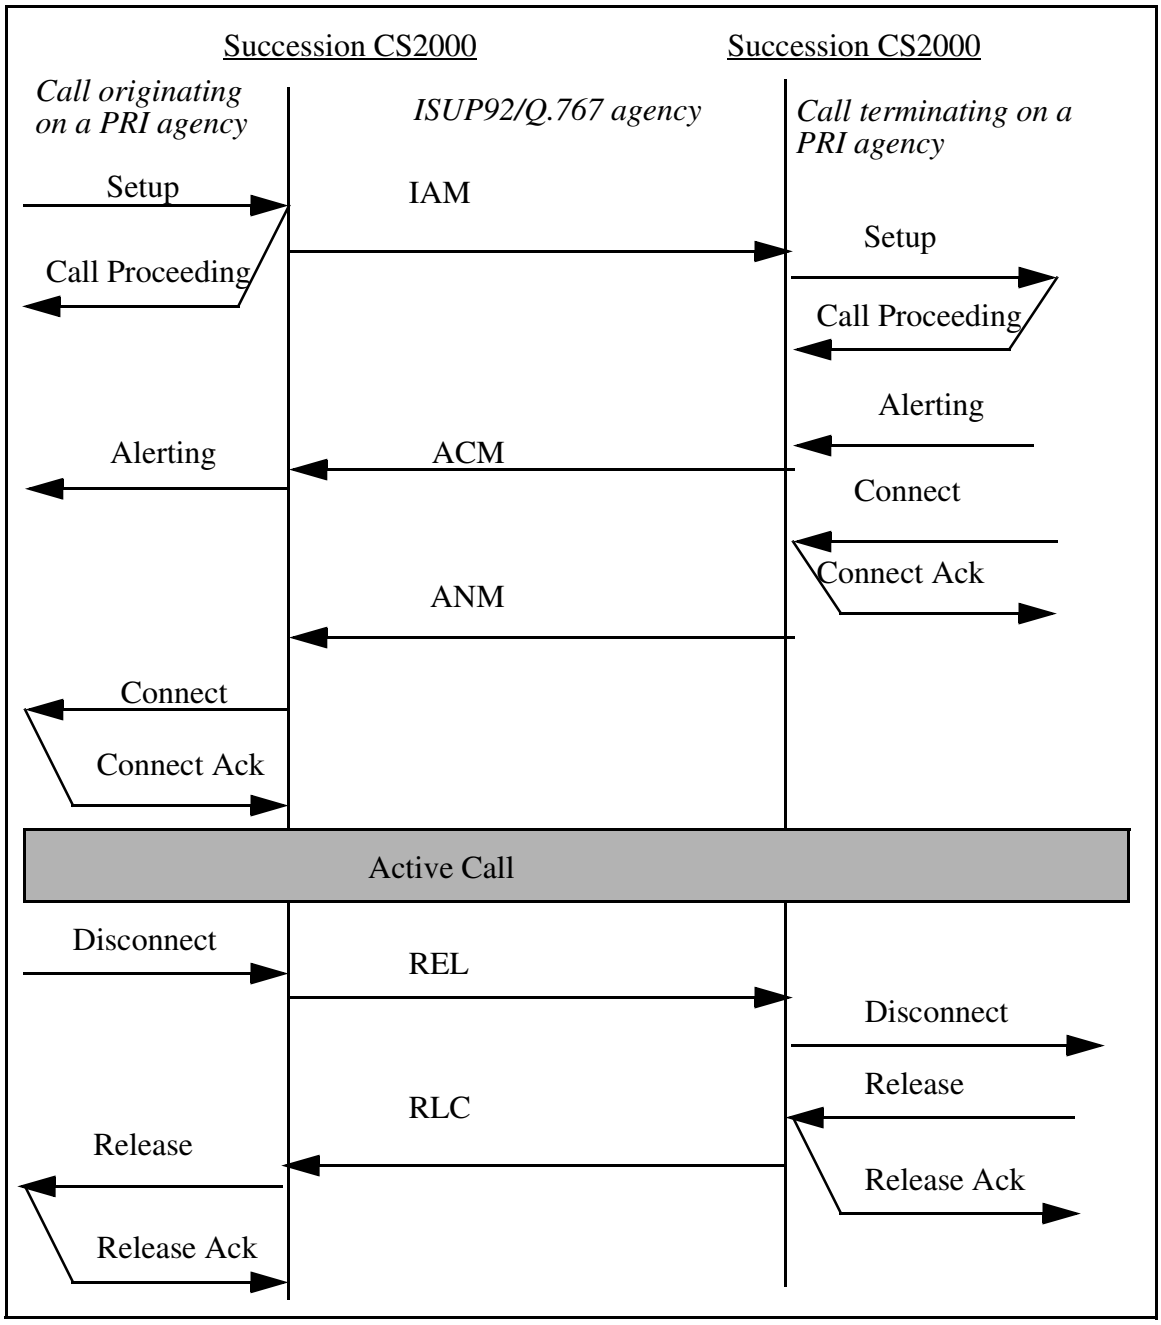
Table 129 Default BCI field values in ACM for ISUP92/Q.767 origination and PTS termination.

Field name	**Default value**
Charge Indicator	10 “Charge”
Called party’s status	No indication (00)
Called party’s category	No indication (00)
End-End_Method indicator	No end-end method available (00)
Interworking indicator	Interworking encountered (1)
End-End information Indicator	No end to end information available (0)
ISUP indicator	ISUP not used all the way (0)
Holding indicator	Holding not requested (0)
ISDN access indicator	terminating access non ISDN (0)
Echo control device indicator	incoming half echo control device not included (0)
SCCP method indicator	No SCCP indication (00)

109.25 Appendix N: Interworking between ISUP92/Q.767 and UCS PRI

The following message sequence diagram depicts the signal flow for a call originating from and terminating on a ISUP92 agent from a PRI agent.

Figure 30 Interworking Between ISUP92/Q.767 and PRI Agents



The following table illustrates the message mapping between the isup92/q767 messages and the corresponding PRI messages:

Table 130 UCS PRI to ISUP92/Q767 Message Mapping[a]

UCS PRI Messages	ISUP Messages
ALERTING*	ACM
CONNECT	CON (if ACM has not been sent) ANM (if ACM has been sent)
DISCONNECT	REL
PROGRESS*	ACM
RELEASE	REL
RELEASE COMPLETE	REL
RESTART	REL
SETUP	IAM

* If ALERT is received, interwoking indicator of BCI in ACM is set to ‘no interworking encountered’. If PROGRESS is received, it is set to ‘interworking encountered’.

a. The ISDNXFER option of table TRKGRP for terminating ISUP agency controls the support of ISDN services, when the originating agency is a PRI trunk. It is recommended to use this option when the entire call path is predetermined to be all the way ISDN user part(all the way ISDN and SS7). If the entire call path is not ISUP all the way, then this option need not be selected. This way, we can avoid unwanted packets(ISDN options which carry services) to be sent over the network.

Table 131 ISUP92/Q.767 to UCS PRI Message Mapping

ISUP Messages	UCS PRI Messages
ACM	ALERT (if Backward Call Indicator bit is set to ‘no interworking encountered’) PROGRESS (if Backward Call Indicator bit is set to ‘ interworking encountered’)
ANM	CONNECT
IAM	SETUP
REL	DISCONNECT

109.25.1 ISUP92/Q.767 and UCS PRI Message Mapping

Table 132 Mapping of SETUP message to IAM message

UCS PRI IEs	ISUP parameter
Bearer Capability (M)	User Service Info/Transmission Medium Requirement
Called Party Number (M)	Called Party Number
Called Party Subaddress (O)	Access Transport*
Calling Party Number (O)	Calling Party Number
Calling Party Subaddress (O)	Access Transport*
Low Layer Compatiblity (O)	Access Transport*
High Layer Compatibility (O)	Access Transport*
Progress Indicator (O)	Forward Call Indicators
User to User (O)	User to User Info
* The IAM Message contains a maximum of one Access Transport parameter, containing UCS PRI IEs as required. The ATP mapping is subject to the datafill in Table ISDNPARM.	

Table 133 Mapping of IAM -> SETUP

ISUP parameter	UCS PRI IEs
Transmission Medium Requirement (V)	Bearer Capability
User Service Information (O)	Bearer Capability
Called Party Number (V)	Called Party Number
Access Transport (O)	*
Calling Party Number (O)	Calling Party Number
Forward Call Indicators (F)	Progress Indicator
User to User Info (O)	User to User Info
* Access Transport parameter contains one or more of: HLC, LLC, Called Party Subaddress, Calling Party subaddress, Display, Facility. These are inserted in the setup message in accordance with UCS PRI encoding rules.	

Table 134 Mapping of ALERT -> ACM[a]

UCS PRI IEs	ISUP parameter
Progress Indicator (O)	No Mapping
User to User Info(O)	User to User Info

a. If an ALERT message is received, an ACM with BCI set to ‘no interworking required’ and ‘ISUP all the way’ is sent on the ISUP side.

Table 135 Mapping of PROGRESS -> ACM[a]

UCS PRI IEs	ISUP parameter
Progress Indicator (F)	No Mapping

a. If an PROGRESS message is received, an ACM with BCI set to ‘interworking required’ and ‘Not ISUP all the way’ is sent on the ISUP side.

Table 136 Mapping of ACM -> ALERT / PROGRESS

ISUP parameter	UCS PRI IEs
Backward Call Indicators (F)	No Mapping
User to User Info (O)*	User to User Info
* UUI mapping happens only for the case of ACM to ALERT. This is because UUI mapping is defined only for non-interworking scenarios.	

Table 137 Mapping of CONNECT -> ANM/CON

UCS PRI IEs	ISUP parameter
User to User Info(O)	User to User Info

Table 138 Mapping of ANM/CON -> CONNECT

ISUP parameter	UCS PRI IEs
User to User Info (O)*	User to User Info

Table 139 Mapping of DISCONNECT -> REL

UCS PRI IEs	ISUP parameter
Cause (V) *[a]	Cause Indicator
User to User Info(O)	User to User Info
*Mandatory in the first call clearing message.	

a. If the Cause Indicator Parameter has a Cause Value other than CI_NORMAL_CLEARING or if the call goes to Treatment then the tables TMTMAP and CSEMAP are used and the mappings are done as per the datafill in these Tables.

Table 140 Mapping of RELEASE / RELEASE COMPLETE -> REL

UCS PRI IEs	ISUP parameter
Cause (O) *[a]	Cause Indicator
User to User Info(O)	User to User Info
* Mandatory in the first call clearing message.	

a. If the Cause Indicator Parameter has a Cause Value other than CI_NORMAL_CLEARING or if the call goes to Treatment then the tables TMTMAP and CSEMAP are used and the mappings are done as per the datafill in these Tables.

Table 141 Mapping of REL -> DISCONNECT

ISUP parameter	UCS PRI IEs
Cause Indicator (V)[a]	Cause

a. If the Cause Indicator Parameter has a Cause Value other than CI_NORMAL_CLEARING or if the call goes to Treatment then the tables TMTMAP and CSEMAP are used and the mappings are done as per the datafill in these Tables.

Note: Reference feature document AD9067 'Support for User to User Parameter' for proper datfill requirements when mapping of the User to User parameter is required.

109.25.1.1 Information Elements and Parameters Mapping

109.25.1.1.1 Bearer Capability <-> User Service Info The following mapping for Bearer Capability and User Service Information is based on different call scenarios. It is not mapped octet by octet since some octet contents may affect the other octet's existence.

109.25.1.1.2 56K Data[1] Call:

Table 142 ISUP92/Q.767 USI -> UCS PRI BC

ISUP User Service Info	PRI Bearer Capability
Octet 1, Coding Standard 00 CCITT	**Octet 3, Coding Standard** 00 CCITT
Octet 1 Information Transfer Capability[a] 01000 unrestricted digital info	**Octet 3, Information Transfer Capability** 01000 unrestricted digital info
Octet 2, Transfer Mode 00 Circuit Mode	**Octet 4, Transfer Mode** 00 Circuit Mode
Octet 2, Information Transfer Rate 10000 64 kbits/s	**Octet 4, Information Transfer Rate** 10000 64 kbits/s
Octet 3, User Information layer 1 protocol 00001 Layer 1 Rate Adaption	**Octet 5, Bearer Capability Multiplier** 00001 CCITT Standardized rate adaption
Octet 3a, User Rate 01111 56kbits/s	**Octet 5a, Access Data Rate** 01111 56kbits/s

a. For all calls Bearer capability screening is done. This is to ensure that unsupported BC values are not sent on any trunk. Refer to feature AD9582 for details on Bearer capability screening.

Table 143 ISUP92/Q.767 TMR -> UCS PRI BC

ISUP Transmission Medium Requirement	PRI Bearer Capability
00000010 unrestricted digital info	**Information Transfer Capability:** 01000 unrestricted digital info.

ISDN user part preference indicator- ISDN user part not required
ISDN access indicator - Originating access non ISDN
SCCP method indicator - No indication

110: Functional Description (FN): A00003717

110.1 Feature name

A00003717 - CICM Flow Through Provisioning, CICM Component

110.2 Description

This document describes the CICM component of new SUCCESSION functionality, providing support for the flow through of line and user provisioning data between the SESM OSSGate provisioning interface and the CICM platform.

Prior to the CICM 7.10 and SUCCESSION SN07 product releases, any provisioning requests targeted at the CICM platform would have been duplicated in 2 separate locations, the SESM OSSGate interface and subsequently the CICM Element Manager, so increasing the complexity of the provisioning operation and correspondingly increasing the possibility of service mismatches occurring due to human error.

As this document is specific to the CICM functionality, it is recommended that it be read with the corresponding SESM documentation, to gain a full understanding - please refer to cross references [1] and [2] on page 1271.

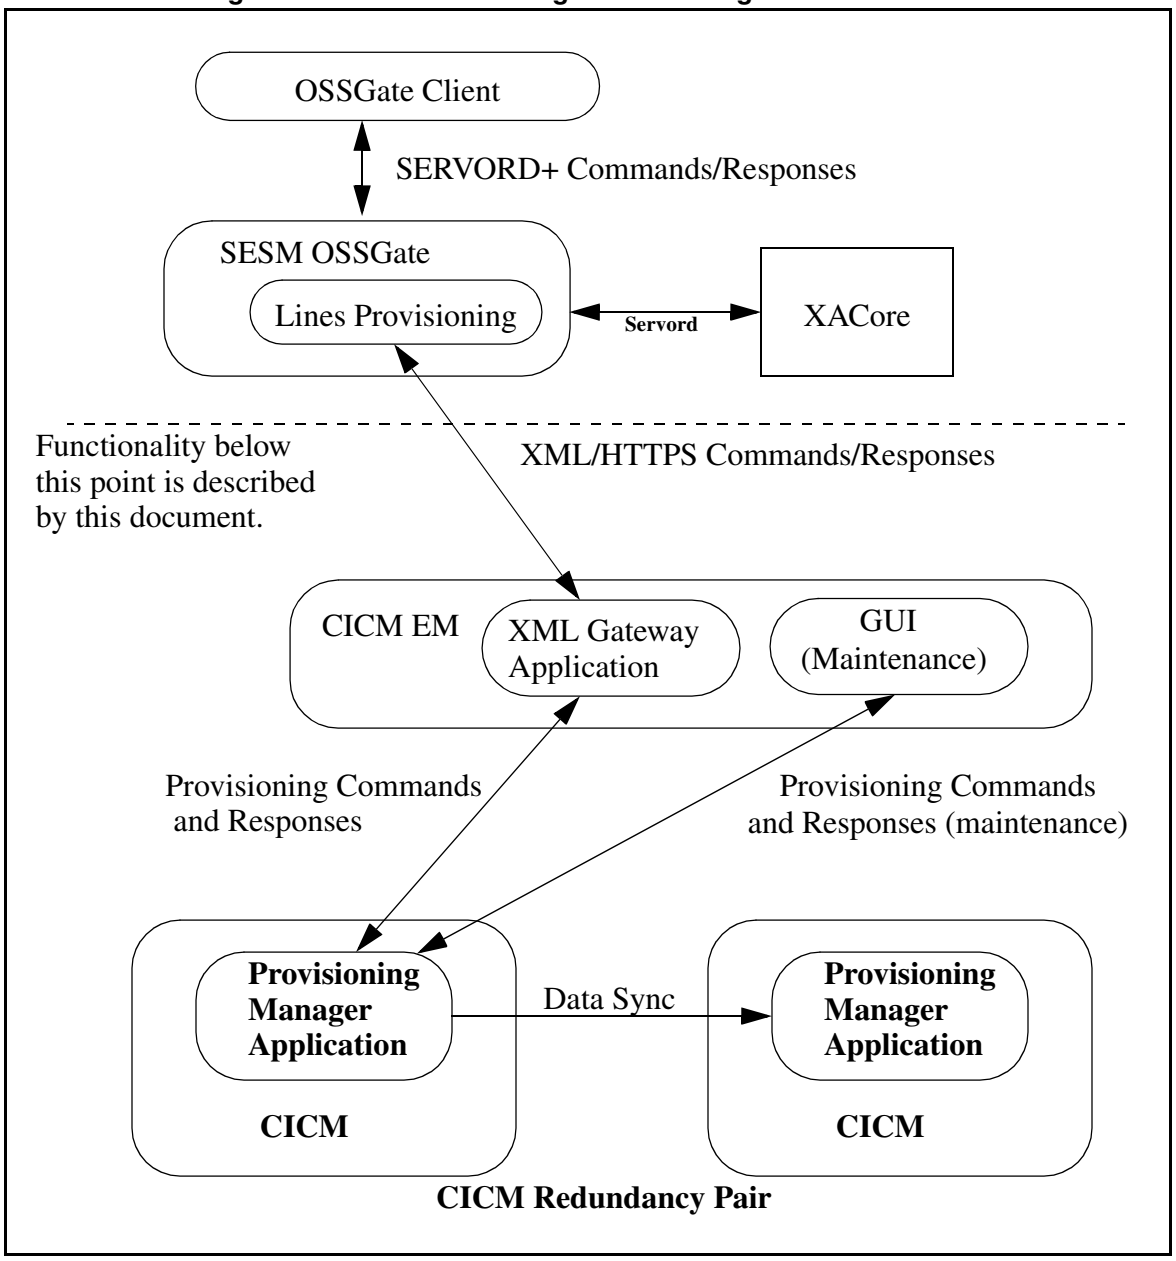
110.3 Document Change History

Table 1 Table Change History

Name	Modifications	Date	Issue
Peter Mitchell	First draft	10/02/2004	AA01
Peter Mitchell Richard Medhurst	Released prior to review	11/02/2004	AA02
Peter Mitchell Richard Medhurst	Incorporated review comments	11/03/2004	AA03
Richard Medhurst	Removed SDN feature Removed EffectiveFeatures Section. Added Undelete Section	17/03/2004	AA04
Richard Medhurst	Removed Undelete user pages from the GUI	22/04/2004	AA05

110.4 High Level Flow Through Provisioning Architecture

Figure 1 CICM Flow Through Provisioning For Succession



110.5 Support For Pre-Provisioned Lines

Changes will be made as part of this activity to support the introduction of pre-provisioned lines (feature key data). The modeling of feature key settings for the CICM lines is modified such that feature key settings are now stored against the line in question, as opposed to any user provisioned against that line. The modeling of lines at the SESM, CS2K and GWC components is also updated by related features to introduce pre-provisioned line support for CICM.

These changes have the following functional implications:

- Line data fill always in existence at the SESM, CS2K and GWC platforms.
- Feature key settings being stored against the line, will survive any operations resulting in the deletion or replacement of a user entity, so allowing. This allows the CICM to remain in sync with the equivalent data fill present at the CS2K.

110.6 Feature Key Parameter Support

As the flow through provisioning activity requires that feature key settings are setup from the SESM OSSGate interface, this activity will ensure parity of support with provided at the CS2K. These changes involve the addition of missing feature key types, and the enforcement of equivalent rules at the flow through provisioning interface as are present at the CS2K.

Prior to this release, when setting up feature key options the options would need to be provisioned in two separate locations. Firstly from the OSSGate interface to provision the feature keys on the CM, and secondly from the CICM EM to ensure that the appropriate CICM node is aware of the feature key settings. With the previous release only a subset of the possible feature key settings were made known to the CICM EM, even though they represent functionality legally supported by the CICM nodes. This anomaly would be worked around by setting the appropriate feature key to the “Unknown” state indicating the presence of an unmappable feature key setting.

The flow through provisioning feature requires that CM feature key settings map correctly to those supported by the CICM EM and CICM. Hence those feature key settings missing from the earlier releases are added as part of this feature to ensure parity. These new mappings are represented by Table 3 and Table 4. These do not represent new functionality, rather the correct modeling of existing functionality.

The following table describes the current feature key support. Where a CICM feature is shown with multiple SESM feature codes, this indicates multiple options applied against that key, with a single option being dominant from a CICM perspective.

Table 2 Feature Key Settings - Existing Pre-CICM 7.10 Mappings

CICM Feature Code	SESM Feature Code	Description
Unassigned		No feature assigned to key
CFU	CFU	Call Forward
MWT	MWT	Message Waiting
CXR	CXR	Transfer
RAG	RAG	Ring Again
SCL	SCL	Speed Call
PDN	PDN	Primary DN
QTD	QTD	Time and date
AGN	INCALLS + DN	ACD Incalls (handled as INCALLS key)
DN	DN	Directory Number
ACDMSB	MSB	ACD make set busy
3WC	3WC	3 way call
DCPK	DCPK	Directed call
ACDNR	ACDNR	ACD not ready
ACDEMR	EMR	ACD answer emergency
SPV	SUPR + DN	ACD incalls supervisor (handled as Supervisor key)
ACDCALLSUP	CLSUP + DN	ACD call supervisor
ACDEMRANS	AEMK + DN	ACD answer emergency
ACDAGNANS	AAK + DN	ACD answer agent
ACDAGNSTA	ASL	ACD agent status
ACDAGNOBS	OBS	ACD observe agent
C06	CNF	6 party conference
AUD	AUD	Auto dial
PRK	PRK	Non directed call
FXR	FXR	Fast transfer
CPU	CPU	Call pickup
ICM	ICM	Intercom (business sets)
CWT	CWT	Call waiting
QBS	QBS	Query busy station

Table 2 Feature Key Settings - Existing Pre-CICM 7.10 Mappings

CICM Feature Code	SESM Feature Code	Description
DASK	DASK	ACD display agent summary
DQS	DQS	ACD display queue status
DQT	DQT	ACD display queue threshold
FAA	FAA	ACD forced agent availability
CIF	CIF	ACD Controlled interflow
NGTSRVCE	NGTSRVCE	ACD supervisor control of night service
LOB	LOB	ACD line of business
CAG	CAG + DN	ACD call agent
CALLFORCE	FORCING	ACD Call Agent with Call Forcing

The following table describes the additional feature key support for this release (excluding ACD DN related functionality).

Table 3 Feature Key Settings - CICM 7.10 Mappings Extensions

CICM Feature Code	SESM Feature Code	Description
AAB	AAB	Automatic Answer Back
ACB	ACB	Automatic Callback
BLF	BLF	Busy lamp field
CCBS	CCBS	Call Completion To Busy Subscriber
CCV	CCV	Call Covering
COT	COT	Customer originated trace
CWD	CWD	Dial call waiting
EBO	EBO	Executive Busy Override
EMW	EMW	Executive message waiting
INSPECT	INSPECT	Calling Name Inspect Key
LVM	LVM	Leave message
MCH	MCH	Malicious call hold
MRFM	MRFM	Multiple Appearance DN Ring Forward
MSBI	MSBI	Make Set Busy Intragroup
MWIDC	MWIDC	Message Waiting Indication
MWQRY	MWQRY	Message waiting query
PRL	PRL	Privacy release

Table 3 Feature Key Settings - CICM 7.10 Mappings Extensions

CICM Feature Code	SESM Feature Code	Description
PRV	PRV	Privacy
SCS	SCS	Speed calling short list
SLQ	SLQ	Single line queuing
UCDLG	UCDLG	Uniform call distribution login
GIAC	GIAC	Group intercom all calls
GIC	GIC	Group intercom
QCK	QCK	Quick conference key
SUBCOM	SUBCOM	Sub community route for emergency calls

The following table indicates those feature codes being added to support ACD DN type functionality. It is possible for multiple feature key settings to be provisioned against a line, and these options may be added or removed individually from the OSSGate interface, however a single dominant feature is always assumed to take precedence from a CICM perspective. The subordinate states are encoded so that CICM may correctly move between feature key settings on the individual options being added or removed.

Table 4 Feature Key Settings - CICM 7.10 ACD DN Mapping Extensions

CICM Feature Code	SESM Feature Code	Description
SPVAGNDN	SUPR + INCALLS + DN	Supervisor key with subordinate INCALLS and DN options (Handled as Supervisor Key)
SPVAGNPDN	SUPR + INCALLS + PDN	Supervisor key with subordinate INCALLS and DN options (Handled as Supervisor key)
SPVPDN	SUPR + PDN	Supervisor key with subordinate PDN option (Handled as Supervisor key)
AGNPDN	INCALLS + PDN	Incalls key with subordinate PDN option (Handled as Incalls key)

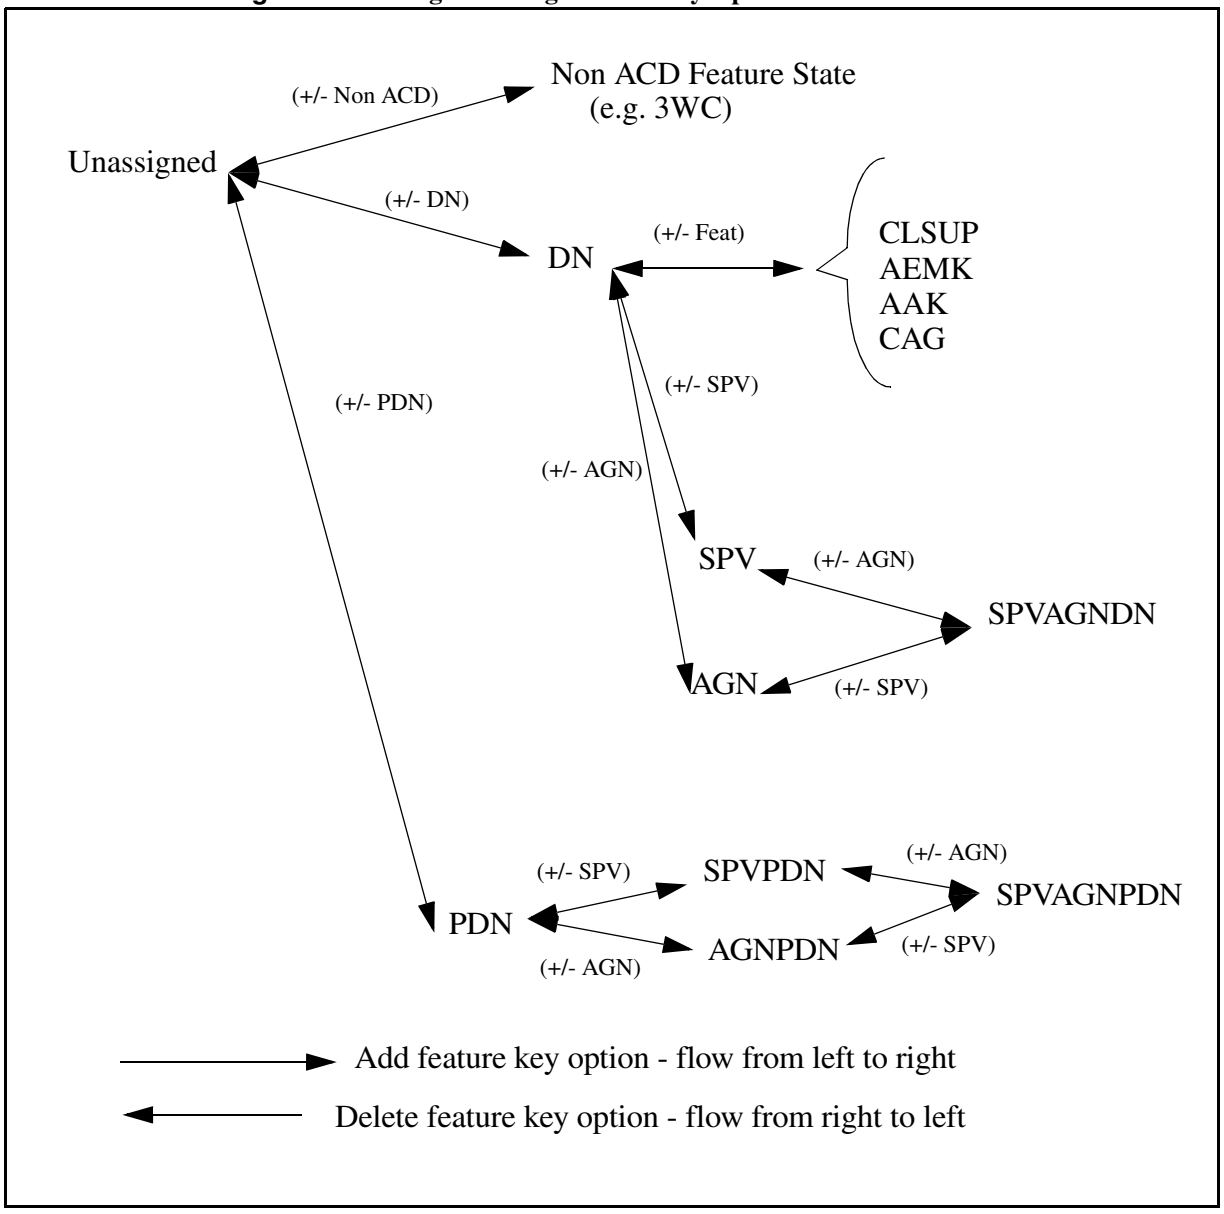
Note: Multiple SESM feature codes indicate that functionality is additive. Order of precedence runs from left to right, with that option listed first being dominant.

110.7 Flow Through Provisioning Interface Supported Operations

Flow Through Provisioning is driven on demand by SESM OSSGate. The usage of OSSGate is beyond the scope of this document, however what is documented in the following sections is a brief overview of the functionality provided on behalf of OSSGate. The relevant SESM documentation should be read to gain an understanding of how to drive that interface - see references [1] and [2] on page 1271.

The diagram shown in Figure 2 shows the valid transition states for adding and deleting feature key settings using the flow through addition and deletion functionality describes in sections 110.7.1 and 110.7.2.

Figure 2 Adding / Deleting Feature Key Options



110.7.1 Feature Key Setting Addition

Feature key settings may be added incrementally against a valid CICM line feature key. The CICM platform will enforce the same rules that the CS2K applies when validating requests to add a feature to a feature key - specifically the translation from the original state to the new state must be valid.

Generically with the exception of ACD functionality this requires a feature key to move from the unassigned state to a new valid state.

Feature key addition will occur as a result of a OSSGate NEW or ADO command line option for ACD type functionality.

110.7.2 Feature Key Setting Deletion

Feature key settings may be deleted consecutively from a valid CICM line feature key. Performing a deletion will remove that option from the key in question, resulting the key moving into a new valid state. Typically this involves the key moving to the unassigned state - or potentially in the case of ACD functionality, to a new valid ACD state.

Feature key deletion will occur as a result of an OSSGate DEO command line option for ACD type functionality.

110.7.3 Feature Key Setting Updating

Feature key settings may be updated or overridden. This forces the feature key into a new state directly, regardless of any feature key setting previously in place. This allows the SESM OSSGate to directly set a feature key without needing to understand its previous state, which would impose additional overhead on the provisioning operation.

Feature key updating will occur as a result of an OSSGate NEW, ADO, DEO or CHF type operation for non ACD type functionality.

110.7.4 Line Outage

Flow through provisioning allows for a line to be reset to its original unassigned state. This has the immediate affect of deleting any user present on that line, and removing any provisioned feature key settings. This would occur if an OUT operation is invoked from OSSGate.

110.7.5 M522 Feature Key Extension Box Updating

Flow through provisioning allows the number of M522 extension boxes provisioned against a CICM line to be manipulated from OSSGate - so ensuring that an identical number of extension boxes are provisioned at the CICM and the CS2K, within the range 0 - 2 extension boxes.

110.7.6 User Creation

Flow through provisioning allows for CICM Users to be created on demand by the OSSGate interface. The presence of a valid User is a pre-requisite for a CICM line to become active as the data fill associated with the user is required for login purposes.

110.7.7 User Deletion

Flow through provisioning allows for the deletion of CICM users on demand by the OSSGate interface. Deletion of a CICM User effectively disables the line associated with that User as it will no longer be possible to log in.

110.7.8 User Updating

Flow through provisioning allows for the manipulation of selected parameters associated with a User. The users Password and/or Profile settings may be manipulated at the request of SESM OSSGate.

110.8 Flow Through Provisioning Order Of Data Fill

For the CICM 7.10 release, line feature key data fill and user data fill have been decoupled in-order to support pre-provisioned lines.

There is no imposed ordering to the order of data fill - feature keys may be setup against a line prior to a User entity being created or vise versa.

As the User entity is created on demand, the User password or profile settings may not be set in advance of creation.

Feature key settings will survive any deletion of an existing User, so allowing a new User to adopt the assigned settings for the line in question.

It is not possible for a line to go in service prior to the creation of a User entity as no mechanism exists for a handset to login exists without a valid User to associate against.

110.9 Provisioning Data Rollback

Flow Through Provisioning request from SESM OSSGate impact many functional components. As an example the setting of a group of feature keys in response to a Servord ADO command, results in provisioning requests being sent to both CICM and the XACORE. The potential exists for a request to fail either partially or completely at either the CICM or the XACORE.

Upon a failure being reported to SESM, the line provisioning application will request that all successful operations be rolled back to the previous state. This helps to maintain data consistency between the various SUCCESSION components.

Should it prove impossible to successfully perform a rollback of the CICM, the CICM EM GUI may be used to perform any manual corrections that are required.

110.10 Security And Access To Flow Through Provisioning

Access to the Flow Through Provisioning interface requires the presence of HTTPS security certificates at both the SESM and the CICM EM platforms.

These security certificates will be provided as part of the installation procedure, however should it be desired to provide alternative certificates, this will be supported.

110.11 Backwards Compatibility

Due to data fill changes required to support pre-provisioned CICM lines, the SESM platform will only provide Flow Through provisioning support for CICMs of vintage 7.10 or later. Any provisioning operation impacting a CICM running the 6.12 release or earlier must therefore be provisioned separately at the OSSGate interface and then subsequently at the CICM EM. This is due to there being no linkage between the SESM box and the CICM XML Gateway application.

This restriction is based on the vintage of the CICM box and not the managing CICM EM box, therefore the same restrictions apply to an installation running CICM EM release 7.10 with subtended CICM 6.12.

No support will be provided by the SESM OSSGate interface for TDM CICM installations.

110.12 Upgrade Considerations

Data fill changes at the CS2K XACore make it difficult to automate an upgrade between CICM 6.12 and CICM 7.10. No upgrade mechanism is therefore provided. Upgrading should be by means of a migration of service from a CICM running release 6.12 and CICM 7.10

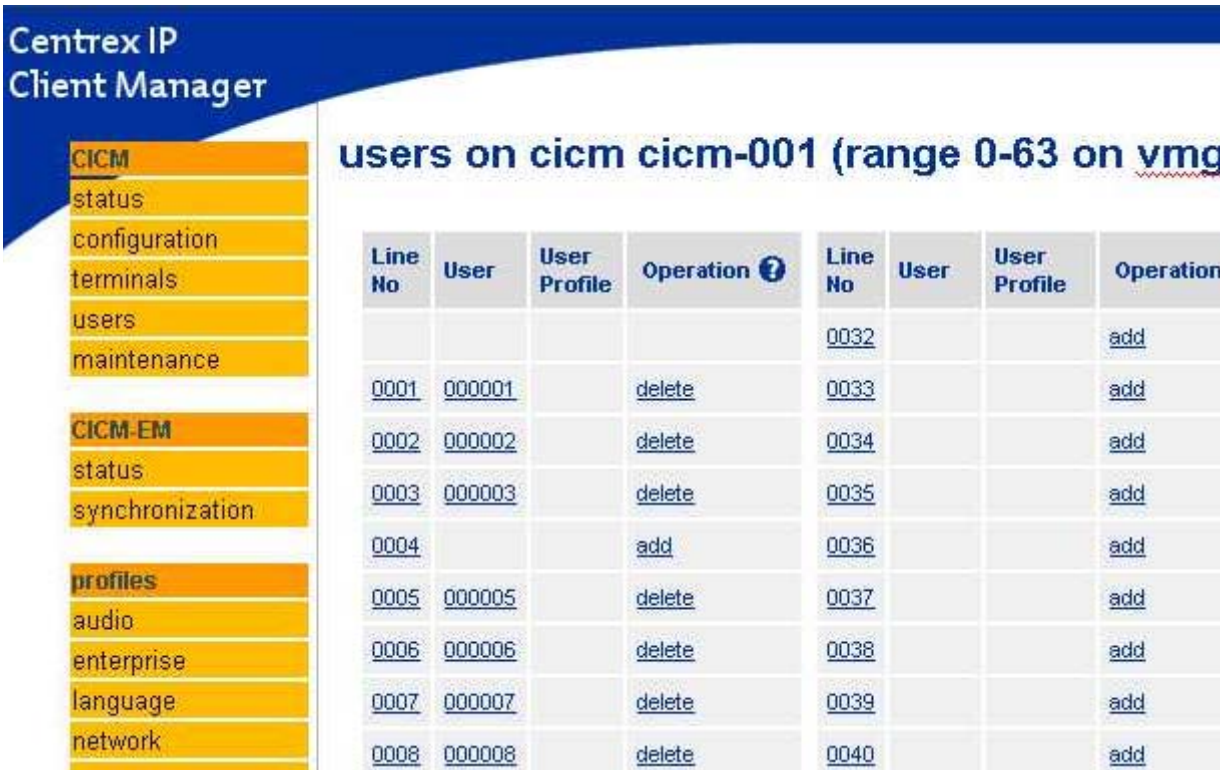
The CS2K XACore load will support existing CICM 6.12 nodes and new CICM 7.10 nodes. Migration of service from CICM 6.12 to CICM 7.10 will be via means of the upgrade procedure described by reference [4] on page 1272.

110.13 User interface changes to the CICM EM GUI

Flow through provisioning changes the location of the feature key data from being held against a user, to being held against a line. This results in changes to the EM pages when managing a 7.10 (of higher) CICM. These changes are detailed in this section.

110.13.1 Editing line feature data

The existing browse users page is modified to provide a link to edit the data associated with a line. Note the additional hyperlink under the “Line No” column



Clicking the hyperlink will load the page where the features can be corrected. In practise this page should not normally be used as the data should be provided by flow through provisioning. However should a mismatch occur, it can be corrected on this page.

110.13.2 Line Feature data entry page

On this page the user may enter the feature data filled against the Line.

110.13.3 Changes to the user and profile pages

The feature key data is no longer stored within the profile or user override portions of the MIB, these page have been altered such that the feature key cannot be set. Instead for a user override the feature key from the line data is displayed along with the user override information. This can be seen in the next diagram. For profile pages no feature key data is displayed.

110.14 Hardware Requirements or Dependencies

Hardware requirements as per a standard CICM installation. No special requirements exist for this functionality.

110.15 Software Requirements or Dependencies

Software must be aligned at the SN07 release at all SUCCESION components.

Specifically:

- CS2K XACORE - CS2M0007 FCS
- CS2K SESM - SESM_7 FCS
- GWC - GN070 FCS
- CICM EM - 7.10 FCS

- CICM - 7.10 FCS

110.16 Limitations and restrictions

The following functional restrictions are imposed by the SESM platform:

- No mechanism to audit the CICM data fill against the SESM and CS2K XACORE.
- No mechanism to query CICM specific data fill from the SESM OSSGate interface (QLEN, QDN and related query operations). However CICM line data can be queried from the CS2K XACore via OSSGate.
- Provisioning requests that require SESM interaction with the CS2K XACORE will not flow through to the CICM. For example the provisioning of Hunt Groups.
- No support for CICM Release 6.12 or earlier.
- No support for TDM CICM releases as this is a SUCCESSION only delivery.

Note: Lack of Hunt Group provisioning flow through may result in a feature key assignment mismatch for those lines forming part of a hunt group. As the CS2K XACore data fill will be correct, this will manifest itself as a labelling mismatch. The outcome of selecting a mismatched feature key will be correct. The CICM EM GUI may be used to correct any mismatches, should this be desired.

110.17 Interactions

Flow through provisioning will interact with the SESM CICM OSSGate interface. This will manifest itself as an extension to the functionality available from OSSGate.

111: Functional Description (FN): A00003718-3719

111.1 Feature name

This document contains the functional description for the Alarms, Logs and Performance feature for the SN07 release of the Centrex IP Client Manager (CICM). The Actid for this feature is A00003718.

111.2 Description

Fault and performance management is an important component of any Network Element in Succession. The ability for operators to detect, monitor and correct erroneous behaviour and hardware outages is key to maintaining Quality of Service in a Succession network.

This feature will revisit the existing fault generation, logging and performance management capability of the CICM system. A new interface has been introduced to the Succession network that will manage the output used by external OSSs to monitor the network element and, for example, detect alarm conditions. This new interface is called the Integrated Element Manager System (IEMS). The IEMS can be accessed using a Graphical User Interface which will give access to the alarms and logs for a network element. This will also interact with the Element Manager GUI.

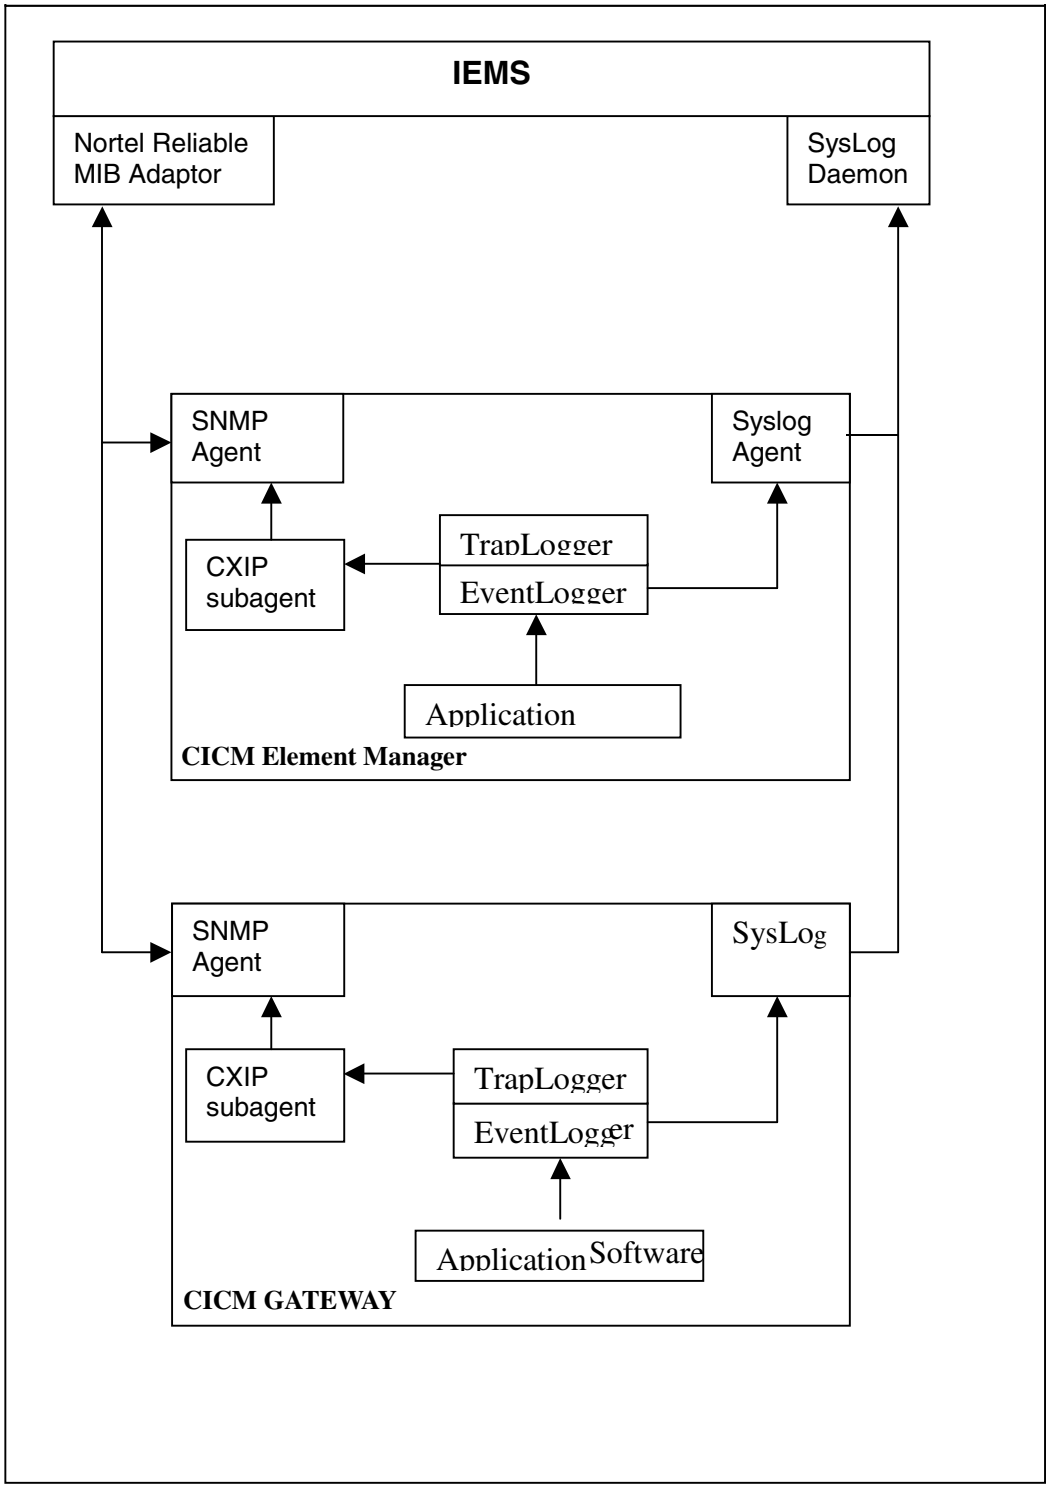
The CICM must integrate with the IEMS. Work needs to be done in this feature to raise alarms, logs and performance metrics in a suitable format that the IEMS can read.

There are two parts of the CICM system that can raise alarms and faults to the IEMS namely the CICM and the CICM Element Manager. The Element manager will raise alarms associated with the Element Manager Platform (e.g. memory shortage) and communication with the CICMs that it manages and will not have knowledge of the alarms and faults generated by the CICM. The CICM will send alarms as SNMP traps directly to the IEMS.

Logs are currently stored locally in debug and event Log files. Pertinent Event Logs must be sent to the OSS using Syslog formatted in the Custlog Format to aid debugging of alarms.

The following figure shows the overall intended system architecture for Faults and Logs.

Figure 1: CICM Fault Architecture

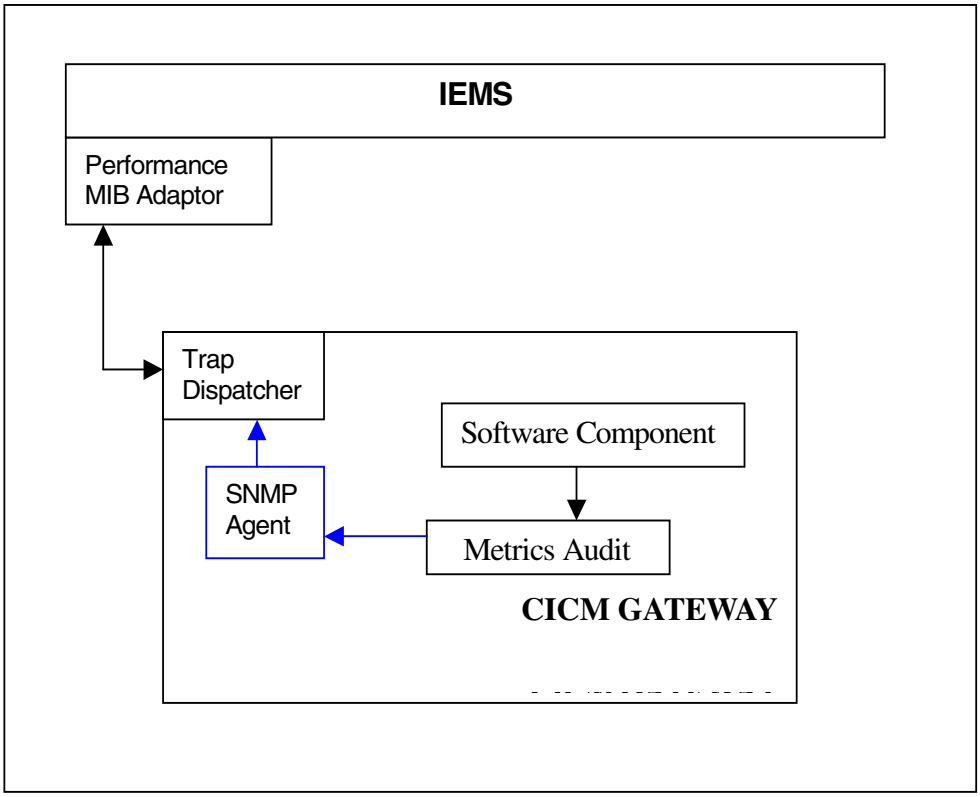


Performance management is a required part of any Succession system. A network element must be able to gather and provide statistical performance data to enable

customers to evaluate the system and gauge where improvements would be most beneficial.

Figure 2 shows the overall intended Architecture for the Performance system.

Figure 2: CICM Performance Architecture



It should be noted that there is no TDM support in this feature. Additional work will be required in order to support TDM within the new architecture. The nature of this extra work is to define and integrate the TDM specific cards into the architecture.

111.3Applicable customer facing sections

111.3.1 Alarms

All alarms are sent to the IEMS as an SNMP trap (to the Nortel Notifications MIB within the Nortel Reliable MIB, see “Nortel Notifications MIB” on page

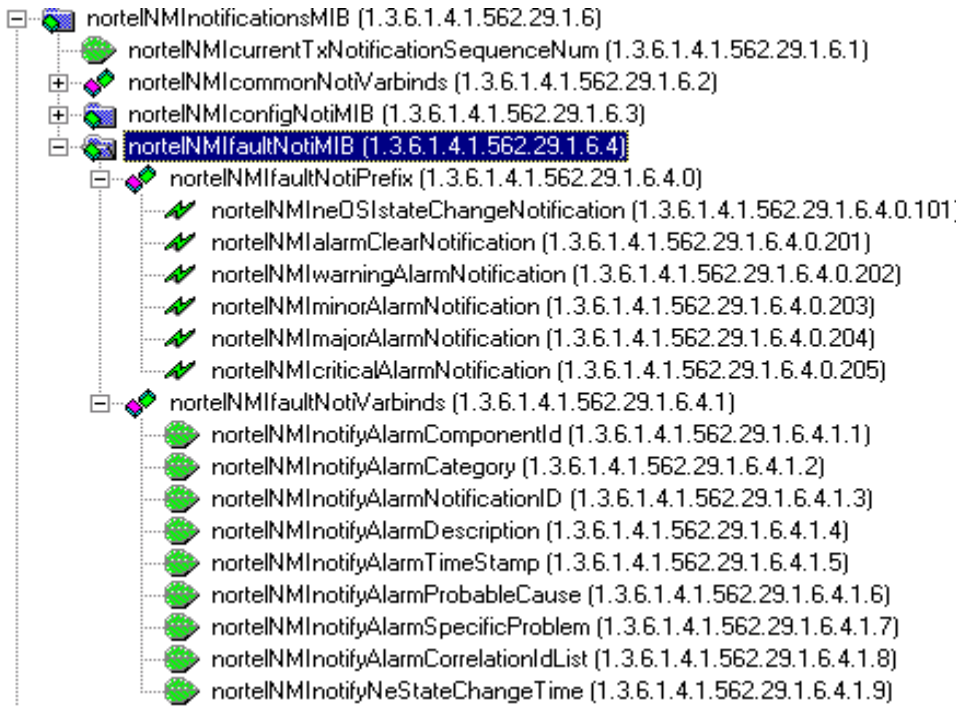
1277) and as a log (to SYSlog, see section “Syslog Details”). Each trap sent from the gateway will incorporate the following details:

- Sequence number.
- Severity indicator (see Table 1).
- Component ID – The distinguished name ID of the component in the Network element that the alarm was raised against (see section 0).
- Category – The category of the Alarm (communications, quality of service, processing error, equipment or environment).
- Notification ID – Unique ID generated from the process number and sequence number combined.
- Description – The description text of the particular alarm.
- Time Stamp – The time the alarm was raised in UTC time.
- Probable Cause – An enum representing one of the most likely causes of the fault as defined in ITU-T X733 & X736.
- Specific problem – A refinement of the probable cause.
- Correlation ID list – To link this alarm with previous alarms and effectively override (clear) those alarms.

Table 1 Alarm severity

	Critical	Major	Minor	Warning
Service Affecting	Yes	Yes	No (or few affected)	No
Action required	Yes	Yes	Yes	No
Recommended Timeliness of Action	Immediately – drop everything	Rapidly – in next work shift	Soon – could be delayed until next day	Later – investigate if reoccurrence
Target Reporting time	Within 2 Sec	Within 30 Sec	Within 2 Min	Within 5 Min

Nortel Notifications MIB



Please refer to the following table for a list of supported alarms.

Alarms

Object	Severity	probable cause
Element Manager		
Comunication failure with gateway Node	Major	44 - responseTimeExcessive
loss of connection with gateway Node	Major	42 - remoteNodeTransmissionError
Loss of communication with both Nodes	Major	44 - responseTimeExcessive
CICM node		
endpoint registration failure		46 - softwareError
max call threshold exceeded	Major	51 - threshold crossed
VMG GWC connection loss	Critical	42 - remoteNodeTransmissionError
VMG max call threshold exceeded	Major	51 - threshold crossed
VMG BHCA threshold exceeded	Major	51 - threshold crossed
network messaging threshold reached	Major	43 - resourceAtOrNearingCapacity
network max connections reached	Major	43 - resourceAtOrNearingCapacity
network transmission failure/ packet loss	Major	54 - transmitFailure
terminal SW update failure	Warning	115 - procedural error
terminal security problem	Minor	116 - UnathorisedAccessAttempt
terminal max no of connections reached	Major	51 - threshold crossed
Platform		
connectivity (Pam) failure	Major	42 - remoteNodeTransmissionError
mate node communication loss	Major	44 - responseTimeExcessive
mate node connection loss	Major	42 - remoteNodeTransmissionError
SW version mismatch between nodes	Minor	57 - version mismatch
Syslog communication failure	Major	6 - communicationsSubsystemFailure
network connection not responding	Critical	6 - communicationsSubsystemFailure
chassis fan failure	Major	21 - heatingorventilationorcoolingsyster
chassis PSU failure	Major	35 - power problem
sw upgrade failure	Minor	115 - procedural error
software component failure	Critical	2 - ApplicationSubSytemFailure
sam 21 version mismatch	Minor	57 - version mismatch
card OOS	Critical	114 - out ofService
Link OOS	Major	114 - Out of Service
host resources fault	Major	43 - resourceAtOrNearingCapacity
Configuration database read/write failure	Critical	46 - softwareError

111.3.2 Component ID's

The CICM is divided into three objects for the purpose of reporting alarms, the CICM element manager, a CICM node and the platform which the EM and the CICM use. These objects contain sub-objects which appended together with the alarm type to form the Component Id.

Table 3: Component ID's

Object	Sub Object	Component Id
CICM element manager	Node (CICM)	CICM=<CICM ID>;NODETYPE=cicmEm
CICM node	Terminal	CICM=<Cicm ID>;Nodetype=Cicm;Component=Terminals;terminal=<terminal ID>
	Cards	CICM=<Cicm ID>;Nodetype=Platform;Component=Card;Card=<card id>
CICM platform	Software Component	CICM=<Cicm ID>;Nodetype=Platform;SoftwareComponent=<component id >

111.3.2.1 Alarm Examples

Major Alarm Notification on Node A:
Component Id: CICM=CICM100A; Nodetype=CICM;User=000001
Category: 1 (communications)
Notification ID: 2
Description: Password Lockout
Probable cause: 101 (authentication Failure)
Specific Problem: user <userID> exceeded failed attempt threshold.
CorrelationId list: (list of alarms relating to other login attempt failures.)

Critical Alarm Notification on node B:
Component Id: CICM=CICM100B;Nodetype=Cicm;Component=chassis
Category: 4 (equipment)
Notification ID: 34
Description: Fan Overheating
Probable cause:21– heatingOrCoolingOrVentilationProblem
Specific Problem:
CorrelationId list: (none)

Minor Alarm Notification on Node B:
Component Id:
Cicm=CICM100B;Nodetype=Cicm;Component=Card;CARD=<card number>
Category: 1 (communications)
Notification ID: 45
Description: Link OOS
Probable cause: 114 (out of Service)
Specific Problem:

CorrelationId list: (none)

Major Alarm Notification on node B:
Component Id: Cicm=CICM100B;Nodetype=Cicm;Component=CARD
Category: 1 (communications)
Notification ID: nnnn:nnnn
Description: Link group alarm - too many links OOS.
Probable cause: 51 (threshold exceeded)
Specific Problem:
CorrelationId list: (list of individual Link OOS alarms)

111.3.2.2 Alarm Throttling

The IEMS can receive logs at a maximum overall network rate. The CICM alarm generation rate must therefore keep within certain bounds in order to not exceed that IEMS rate. To solve this a throttling capability is required.

The alarm manager will meet this requirement by having separate buffers for each severity of alarm. This will enable the critical alarms to be sent immediately and for major, minor and warning alarms to be prioritized in order that they are sent within the required time periods as specified in “Alarm severity” on page 1276, but at a controllable rate. The rate of alarms being raised should be configured in the CICM registry MIB.

111.3.2.3 Alarm Provisioning

The CICM must be provisioned with the data it requires to determine whether it is to send traps and logs to an IEMS. A number of provisioning steps have been added to the preboot provoisioning sequence to allow this. These steps are executed when the CICM load is first installed.
The following questions are asked relating to Alarms:

A prompt is made for an SNMP V1 and/or an SNMP V2c Trap destination as before:
Next, specify the IP addresses of the SNMP management stations that should receive traps and (alarm) notifications from this system.
Enter [list of] SNMP V1 Trap receiver address[es]:
>
Enter [list of] SNMP V2C Notification receiver address[es]:
>

If an IEMS is to be used the ip address of the IEMS should be provisioned in one of the above.

The next question confirms whether the IEMS is to be used.

Are the Above IP addresses IEMS Destinations? [Y\N, default=Y]
>

The next question asks about the Log destination. There will be a further chance to verify that the correct information has been entered (and alter it if not) before it is committed at the end of this provisioning stage. Invalid IP addresses including 0.0.0.0 and 255.255.255.255 will not be allowed.

111.4 Logs

This section describes the changes in logging functionality for both the CICM and the CICM element manager. Both the element manager and the CICM will be responsible for sending its own logs to the IEMS. Logs will not be exchanged between the CICM and element manager. The desired behavior for Logs is that they are sent to the IEMS using CUSTLOG or security log formats via a syslog agent. Three log streams will be used to send logs to up to three different syslog daemons (i.e. IEMS). This is an enhancement of the current functionality where all logs are stored on the CICM. Logs will still be stored on the CICM and the CICM will, in addition, send logs to custlog, audit log and security log streams. Each log must be formatted correctly for that particular stream.

The CICM will produce logs in the custlog or security log formats. This information will then be stored in the IEMS.

For this section the term CICM applies to both the CICM network element and the CICM element manager.

111.4.1 Syslog Details

The CICM will use the syslog protocol to send the logs to the IEMS. The CICM and CICM element manager will both act as senders. They will only be able to create and send syslog messages, they will not be able to receive or relay syslog messages. The CICM will conform to RFC 3164 The BSD syslog protocol [1].

As with most syslog applications UDP port 514 (the syslog port) will be used to send the syslog messages to the IEMS. The total length of the entire packet must not be greater than 1024 bytes. The CICM will not create a log that will exceed this limit.

To successfully send syslog packets to the IEMS the CICM needs to correctly format a syslog packet. The syslog packet can be split into three parts. The first, named the PRI is a number that contains the syslog facility and severity. This number is enclosed in less than and greater than symbols < >.

The syslog facility is used to identify which process is responsible for raising the log. Below are two tables which show the facility and severity values that will be used by the CICM.

Table 4: List of possible syslog facilities.

Code	Facility	Log Stream
0	kernel messages	
1	user-level messages	
2	mail system	
3	system daemons	
4	security/authorization messages	
5	messages generated internally by syslogd	
6	line printer subsystem	
7	network news subsystem	
8	UUCP subsystem	
9	clock daemon	
10	security/authorization messages	
11	FTP daemon	
12	NTP subsystem	
13	log audit	
14	log alert	
15	clock daemon	
16	Local use 0	
17	Local use 1	Custlog
18	Local use 2	
19	Local use 3	Audit log
20	Local use 4	
21	Local use 5	
22	Local use 6	Security log

Table 5: Syslog packet severities

Code	Severity	Mapping custlog values
0	Emergency: system is unusable	
1	Alert: action must be taken immediately	Critical
2	Critical: critical conditions	Major
3	Error: error conditions	Minor
4	Warning: warning conditions	Minor
5	Notice: normal but significant condition	No alarm
6	Information	
7	Debug	

All logs sent to the IEMS must have a severity of 5 – Notice to enable the IEMS to differentiate between the logs and alarms.

The facility and severity fields will be used by the IEMS or another SYSlog daemon to sort the different logs into different problem areas and to highlight significant issues quickly.

The remainder of the syslog message is the MSG part. The MSG part has two fields known as the TAG field and the CONTENT field. The value in the TAG field will be the name of the program which generated the message, i.e. CICM. The CONTENT field contains the log in one of the supported formats, please see below.

Example of a syslog PRI and header.

```
<34>Oct 11 22:14:15 47.34.234.1 XX: Log contents
       PRI  Timestamp         Host IP       process
```

The CICM will send log file header information after a system restart or whenever connection is opened the IEMS.

111.4.1.1Syslog failure.

If the CICM detects that a log stream has collapsed for any reason a SNMP trap will be sent to the IEMS. If the CICM cannot send any logs they will be buffered up to a point until the stream is operational. Please see section on throttling for details of buffer restrictions. If a problem occurs with the IEMS the CICM will not detect this and continue to send logs. These logs may become lost. The CICM will still store a local copy, which can be accessed via the CICM element manager. The CICM offers no guarantee that the log will be seen by the IEMS.

111.4.2Custlog details

The CICM will log the following events using the custlog format and output the logs to the custlog stream.

- Service affecting state changes
- Specific customer/blm requested events
- Data corruptions/data mismatches

The custlog will contain the following information:

Node id is the name of the network element reporting the log. In this case it will be the name of the CICM gateway or element manager, e.g. CICM-100.

Hostname is the name or IP address of the element reporting the problem. In this case it will be the name of the side of active gateway or element manager, e.g. CICM100A

Application name is the type of network element reporting the log. In this case CICM.

Sequence number is a number applied each time the log is outpulsed. It is incremented by one for each log sent out on a particular stream. It is this mechanism that allows the IEMS to detect if it has missed a log. Valid sequence numbers are from 0 to 999. When 999 has been reached the number will be reset.

Report Name is a 4 char string representing the application that the log is being generated for (not the application doing the logging), e.g. CICM

ReportNum is a 3-digit number which ranges specify certain log categories.

Applications that generate new log reports must use the following log numbering scheme. Do not use the range 100-299 unless the log category does not fit into one of the standard categories.

Table 6: Log Categories

Log Category Log	Number Range:
Trouble	300 to 399
Service summary	400 to 499
State Change	500 to 599
Information	600 to 799
Threshold	800 to 899
Expert	900 to 999

Alarm Value is one of: NONE, WARNING, MINOR, MAJOR, CRITICAL All logs will have the value of NONE.

Event Type is one of: CBSY, EXC, FAIL, FLT, INFO, INIT, LO, MANB, OFFL, PASS, PBSY, RTS, SUMM, SYSB, TBL, TRAN, TRAP, UNEQ, THR

Label is a string indicating the type of the log (perhaps identifying a subsystem) Label must not be “instance specific” – i.e. it is the same for all occurrences of log, e.g. Login failure

TextFormat is a string detailing the log information – can be no longer than 860 chars. The following subfields are included in the test format:-

Location is the identifier of the machine sending the log.
Time is the time the error occurred.
ComponentID is an identifer of the system component that is sending the log. For more details see the alarm section.
Description is used to further describe the problem.

Required Syslog message format

May 24 00:02:00 rtpssdm oamp:
| Date, time, hostname, & Application generated by Syslog|

_V2_~I=CICM-130~H=CICM-130A~A=CICM~S=0001~~
| *Node id* || Host Name || Application ||Sequence Number|

CICM 675 NONE INFO SDM OM FILE RETENTION
| Report name|| report no || alarm value ||Event Type ||_____Label_____|

Breakdown of text format sub components.

Location: CICM-130-A^M
| Location |

Time: Fri Jun 04 17:18:56 2004^M
| Time |

ComponentID: CICM=CICM-130-A;NodeType=Cicm;Component=Card;Card=7^M
| Component ID |

Description: terminal id:7 Card 7 is INSV.
| Description |

For further details on field ranges and log reporting guidelines see Appendix A of the DID or http://sdm.ca.nortel.com/vr23/resources/iempg.af05.pdf

The logs should be indented by 8 characters and should be a maximum of 1000 characters. Every log should end with the ^M character.

111.4.3 Security log details

The CICM will log the following events using the security log format and output the logs to the security log stream.

- Unsuccessful terminal logins
- Successful terminal logins
- Unsuccessful PAM authentication
- Successful PAM authentication

Security logs will begin with a field identifying the class of log. For security this field value is class_security.vers01.

A security log will contain the following information. Other optional fields are supported by the log format but are not used by the CICM in this feature.

DST This is the address of the destination, e.g. the IEMS

DOC The document (DOC) field is the name of an accessed resource, e.g. CICM100A.

STAT The STAT field describes the state or status of the designed process. Possible values for this field may include “Failure”, “Success”, “Start”, “End”.

MID The Message Identifier allows message text to change, for translation to other language or to fix a typo, without affecting analysis tools. Another benefit of this would be saving bandwidth by not having to send the message itself. The value MUST be a unique string. The MID values would be stored at each sender, and the actual message templates would be stored at the collectors. This means that each sender (product) must submit to the collector/ analyzer, message template files defining its’ MIDs. Separate template files would be required for each language. The collectors would need to be configured to a certain language. The format of these message template files is defined in Ref 3 Section 3.2, “MID Message Template Format”.

This field is currently not supported by the CICM or the IEMS. A value of 0 will be used.

SRC.OFFENDThe offending source field is the address of the originating packet, which triggered a security audit event. For this feature it will be the IP address of the CICM. If omitted it implies it is the same as the source address.

Optional fields
SRC.USR User name or user id.

EVNT.TYPE The event type field specifies the type or classification of the event, e.g. login.

HOST The name of the host issuing the log.

CMD This field is used to supply a little more information on the security breach. For example in the case of a terminal login failure the field will include the terminal ID and the login the person used.

111.4.4 Audit logs

The following actions will be logged to the audit stream:

- Addition or removal of CICMs from a CICM EM.
- Addition or removal of a profile from either a CICM or a CICM EM (controlled from the EM web pages).
- Any action using flow through provisioning e.g adding/deleting a user.

The audit logs will be in the same format as the security logs.

111.4.4.1 Debug log

Debug logs are logs that are not of interest to Nortel customers, e.g. swerrs should be classed as a debug log. No work will be done to enhance the debug logs. Currently debug logs are viewed via the CICM EM. Debug logs will not be sent via syslog to the IEMS. Any log or notification that is sent to the IEMS will be copied into the debug stream.

111.4.5 Log Throttling

There is an overall maximum rate that the IEMS can receive logs. The CICM logging device will contribute to that overall log rate; so it must therefore keep within certain bounds in order to meet that IEMS rate. To solve this problem a throttling capability is needed. The customer should be able to set the number of logs that can be sent over a specified time frame. When the rate of logs being produced exceeds the threshold the remaining logs will be buffered until a time when they can be sent. If logs are being buffered for an extended period of time it will be possible to fill the buffer. In this scenario logs will be lost. Each log stream will have its own log buffer.

Debug logs will not be throttled as they are simply output to a file and not transmitted to the IEMS. A copy all logs and notifications will be sent to the debug stream even though they may have been buffered and lost. Therefore it should always be possible to get copies of lost logs or notifications.

111.4.6 Log Viewing

The logs which are stored on the CICM will be viewable from a page on the CICM EM. The EM will request the log files from the CICM and display them using a web page. This functionality is not part of this activity.

111.4.7 Log Provisioning

The CICM must be provisioned with the data it requires to determine whether it is to send traps and logs to an IEMS. A number of provisioning steps have been added to the preboot provoisioning sequence to allow this. These steps are executed when the CICM load is first installed.
The following questions are asked for provisioning Logs:
This step follows on from the provisioning of trap information.

The following questions are asked:

Are Logs to be sent to Syslog stream destinations? [Y\N, default=N]
>

Next the ipaddresses of the three syslog destinations are required, A prompt is made for CustomerLog, SecurityLog and Audit Log destinations in turn.

Next, specify the IP addresses of the Syslog management stations that should receive Customer, Security and Audit logs from this system. Enter each IP addresses in dotted form.:

Enter the network address of the Syslog destination for Custlogs:
>

Enter the network address of the Syslog destination for Security Logs:
>

Enter the network address of the Syslog destination for Audit Logs:
>

This Question is followed by the Performance provisioning Step (see Section 2.5.3.1). There will be a further chance to verify that the correct information has been entered (and alter it if not) before it is committed at the end of this provisioning stage. Invalid IP addresses including 0.0.0.0 and 255.255.255.255 will not be allowed.

111.5 Performance

Performance management is an important component of any Network Element in Succession.

A network element must be able to gather and provide statistical performance data to enable third parties to evaluate the system and gauge where improvements would be most beneficial. The ability for operators to monitor behaviour and trends is key to maintaining Quality of Service in a Succession network.

This feature will revisit the existing performance management capability of the CICM system. A new interface has been introduced to the Succession network that will manage the output used by external OSSs to monitor CICM network elements. This new interface is called the Integrated Element Manager System (IEMS).

The CICM and CICM-EM network elements must integrate with the IEMS. Work will be done in this feature to make available performance metrics in a suitable format that the IEMS can read.

Currently a number of performance metrics are gathered in the CICM System and are logged and recorded.

The Performance metrics currently gathered are:

- Percentage Memory usage
- Number of Active Users
- Number of Active connections
- Percentage CPU Usage

Additional metrics that will be gathered include the following:

- Number of Busy hour call attempts
- Number of logged in users
- Number of Logs sent.
- Transmitted bytes/sec
- Received bytes/sec.

Each of these metrics will be collected, averaged over a specific time interval and stored in the MIB.

Within the CICM software an audit function will collect each metric after a specified time interval has elapsed.

Some measurements (those relating to call traffic) will be taken every 5 minutes. Other measurements will be collected and averaged over either 15 or 30 minute intervals. There are no 5 minute interval metrics planned in the CICM. The 15 or 30 minute interval will be configured in the registry MIB. On installation of a new load the user will be prompted to select either 15 or 30 minute data for all metrics, given the number of metrics provided this will be the only method of configuration. The interval selected will apply to all metrics.

The metrics will be stored in the performance MIB and will be collected at intervals by the IEMS.

111.5.1 Performance Metric Provisioning

The CICM must be provisioned with the data it requires to determine the interval over which performance metrics are to be collected. A provisioning step has been added to the preboot provoisioning sequence to allow this. This step are executed when the CICM load is first installed.
The following question is asked for provisioning performance metrics:
This step follows on from the provisioning of log information.

The following question is asked:

Enter the time interval over which performance metrics will be measured [15/30]:
>

There will be a further chance to verify that the correct information has been entered (and alter it if not) before it is committed at the end of this provisioning stage.

111.6 Data schema (DS)

A new MIB has been created as the key for this feature. There is a CICM MIB which makes performance data available to registered Trap listeners. This interface will be unaffected in the SN07 release. The performance data will still be made available via the existing interface for TDM implementations.

The new MIB interface has been created to integrate with the concept of a Nortel standard Performance MIB. The performance MIB has a number of fields for each performance Metric as follows:

- index - unique numeric key for each metric on a CICM basis
- metric name – text describing the name of the metric
- metric value type (counter or gauge)
- metric range - max & min

- metric gauge usage (average or peak)
- metric value holding registers (4 registers)
- metric current value - or
- metric current value OID - if the current value is kept in another MIB.

At the time of writing the MIB interface definition has not been completed, but will be finished in time for this development.

111.7 Hardware Requirements or Dependencies

The following is a list of the minimum hardware required for this feature:

- One CS2K
- One GWC with a CICM profile
- One CICM-EM
- One CICM
- CICM Ethersets
- One IEMS platform

111.8 Software Requirements or Dependencies

Integrated Element Manager System (IEMS) Software is the recommended tool to be used in order to be able to access the output of this feature (loadname and firmware load).

111.9 Limitations and restrictions

The CICM will not guarantee that the IEMS will receive and logs or traps that it sent.

Each CICM can only datafill three log streams. It is possible to create a stream to three different IEMS.

This feature does not support TDM platforms for this release. Only the succession platform is supported. The existing TDM implementation will function as before however this feature is not intended for a TDM release and the necessary TDM components are not supported.

Changing the severity of an alarm, once set, is not supported.

111.10 Interactions

111.11 Glossary

Term	Description
CICM	CentrexIP Client Manager
CICM EM	CentrexIP Client Element manager
MIB	Managed information Base
VoIP	Voice over IP

112: Functional Description (FN): A00003720

112.1 Feature name

Compact Call Server Hybrid Asynchronous Transfer Mode Processor Mezzanine Card Replacement

112.2 Description

This feature is to add support for the new ATM PMC hardware for the Hybrid Compact Call Server, as the old PMC is no longer being fabricated.

There are no customer-visible changes in the operation of the new hardware.

112.3 Hardware Requirements or Dependencies

This feature adds support for the Interphase 4576 ATM PMC to the Compact Call Server hybrid.

With this feature, the MC cards in the hybrid solution will support either a pair of IDT 77252 cards, or a pair of Interphase 4576 cards. Mixed configurations (i.e. where the two ATM PMC cards are not identical) are not supported and the mcblade will not boot.

The MC card with the IDT PMC from Motorola corresponds to a PEC code of NTRX51GY (this includes the base card and the two PMCs).

For the IDT PMC only the PEC code is A0998974

The MC card with the new Interphase PMC from corresponds to PEC code NTRX51HY (including the base card and the two PMCs).

The Interphase PMC by itself is PEC code A0539541.

112.4 Software Requirements or Dependencies

To run the MC cards with the Interphase PMCs, the MC load from SN07 or later must be loaded on the SDM and used by the MC cards.

112.5 Limitations and restrictions

ATM PMC cards of different models may not be placed on the same MC card.

112.6 Interactions

No customer-visible interactions with existing features.

113: Functional Description (FN): A00003767

113.1 Feature name

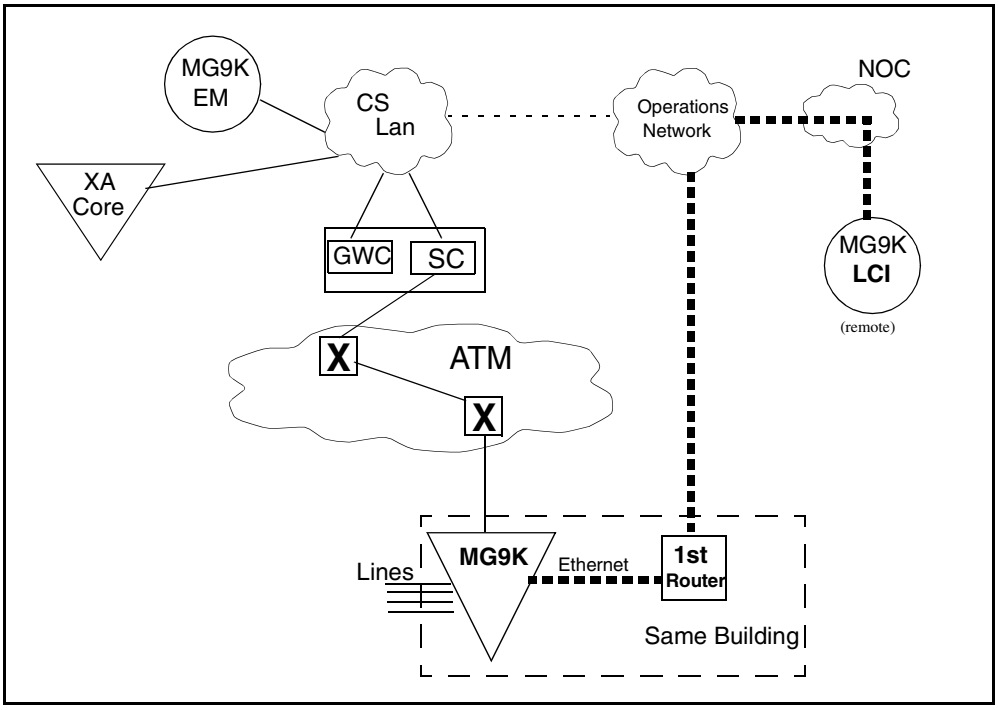
A00003737: LCI Remote Access, Enhancements and MG9000 Security

113.2 Description

Feature A00003737 supplys the MG9K customer with a means for querying the ESA state and the SNMP alarm log history for a node that has lost Element Manager connectivity. The Element Manager remains as the master interface for maintaining the MG9000, with this newly added backup functionality being made available from the Local Craft Interface
The customer requested remote access to the MG9000 LCI. Feature A00003737 provides this new functionality by allowing the ethernet addresses on the DCC cards to be provisionable. Thus, if they choose to support remote access, integrating the newly assigned address into their operations network.

As a result of adding remote access, interfaces (FTP, Telnet, Web Access) into the MG9k need to be secured using the Secure Sockets Layer.

The diagram below provides a simplified overview highlighting the location of the MG9k and its access points (atm/ethernet) within the Succession network.



113.3 Hardware Requirements or Dependencies

NA

113.4 Software Requirements or Dependencies

FTP, used for collecting Operational Measurement files and pushing down provisioning data for configuring ESA, has been replaced with Secure Shell FTP (SSH FTP). Any FTP requests into the MG9K will be required to use a Secure FTP client that supports the behavior as described by the IETF document “SSH File Transfer Protocol.”

Currently the webserver running on the controller cards (DCC), uses HTTP (not secure) for the trasmission of web content between the MG and a web client. Instead of HTTP, HTTPS will be used. This is the secure and encrypted transmission of the web content between the user’s client and the webserver (DCC). The Local Craft Interface will use this protocol for all of it’s actions (commissioning, debug, password maintenance, dual homing management, ESA status’). All MG9K supported web browsers already include support for HTTPS - no customer change required.

FOR GNPS (support) ONLY:

Remote Telnet access has been disabled as a result of the Security portion of this feature. Instead, support groups are to use a Secure Shell client for accessing Dsh. SSH works (from a users stand point) just like telnet. Run the SSH client command at the prompt on a computer that is connected to the same network as the node you are trying to access. All client-server communication is encrypted. Previously telnet allowed anonymous user access; SSH requires userid and password authentication. This is either the default password all MG9000 loads are shipped with, or a customer provisioned password. Once a user has ssh'd into the DCC card, they can telnet internally just as before. Also, SSH clients automatically try to connect to port 22 (default ssh port). The MG9K ssh server is running on port 24. This must be specified by the user of the client. Example (using openSSH client): ssh -l admin -p 24 47.1.1.1

Here we are attempting to ssh to "47.1.1.1" to port 24 as user "admin".

113.5 Limitations and restrictions

No new limitations/restrictions other than the secure client usage mentioned throughout the document.

113.6 Interactions

In previous releases, FTP and LCI communication was not secure. Now, using SSL, these data transmissions are secured. Regardless, the customer interface's look and feel remain unchanged. Required additional user-machine interactions are described in the subsequent sections.

114: Functional Description (FN): A00003767

114.1 Feature name

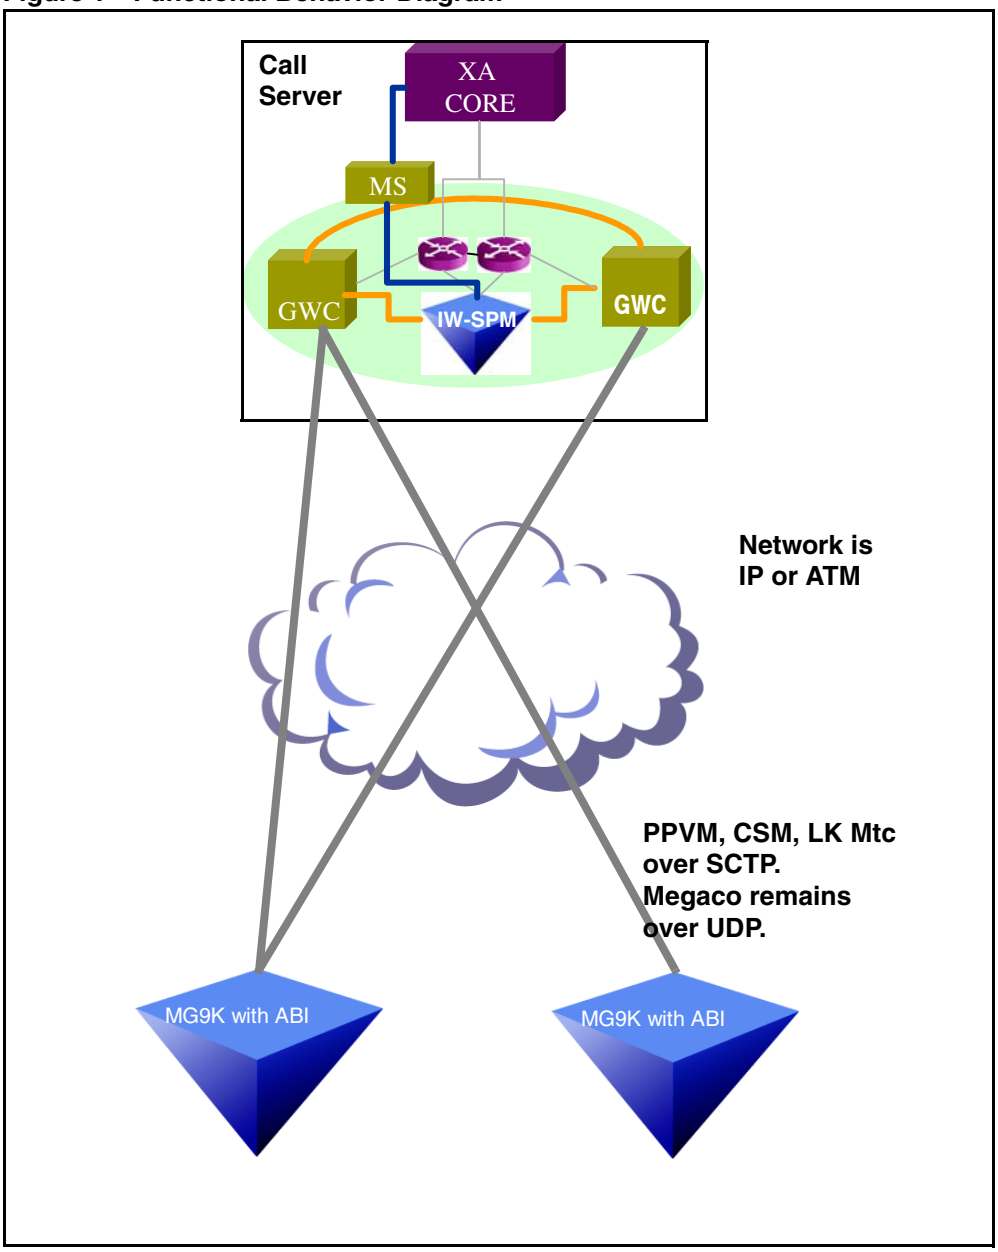
IP ABI PPVM Robustness & Msg Loss Alarms.

This feature would be better named “SCTP for ABI messaging”

114.2 Description

This activity introduces SCTP (Stream Control Transmission Protocol) for messaging transport between a Succession GWC (gateway controller) and MG9K ABI (DS-512) cards. SCTP is used for three of the Nortel proprietary protocols: PPVM (XPM supervision), CSM (Channel Supervision Message), and DS-512 link maintenance.

Figure 1 Functional Behavior Diagram



SCTP is introduced here to provide the customer with a more reliable messaging link between the GWC and ABI cards compared with the existing UDP transport. SCTP is supported on both the IP and ATM network fabrics.

SCTP provides the ability to retransmit lost messages and to ensure that the messages arrive in order. Additionally, SCTP provides alarms when message retransmits or loss get high or when a messaging link is lost. This provides the customer with the ability to find and solve network messaging problems quickly.

SCTP seamlessly and automatically upgrades and downgrades in a customer installation. The customer is not required to provide any configuration information.

When both the GWC and ABI network components are upgraded to SN07, the components will discover that they both support SCTP and will start using SCTP. If only one or neither component supports SCTP, then the existing UDP protocol will continue to be used.

114.3 Hardware Requirements or Dependencies

This activity is compatible with existing GWC and ABI hardware, including ABI hardware introduced in SN07.

114.4 Software Requirements or Dependencies

Requires gateway controller software loads of GC070 or higher.

Requires DMS-100 core loads of SNNCSH07 or higher.

Requires ABI loads of SN07 or higher.

114.5 Limitations and restrictions

None.

114.6 Interactions

None

SCTP	Stream Control Transmission Protocol

115: Functional Description (FN): A00003773

115.1 Feature name

ACT: A00003773, Trunk Group Based Quality of Service (QOS) Operational Measurement (OM) support for MG4K-IP

115.2 Description

The activity A89007725 in SN06, '*Trunk Group based QoS OM'* provided a new trunk group based operational measurement group (TRKQOSOM) on the Succession Call Server. The operational measurement values record instances in which QOS threshold values have been exceeded for calls handled by GWC based TDM trunk group.

This feature A00003773 '*OM FOR TRKQOS FOR MG4K IP'*, extends trunk group based QoS OM support to MG4K-IP. As part of this activity, the operational measurement values record instances in which QOS threshold values have been exceeded for calls handled by MG4K-IP based TDM trunk group.

The QOS statistics that are included in the OM for each MG4K-IP and GWC trunk group are packet loss, jitter, and delay (latency).

When MG4K-IP based trunk calls are released, the QOS statistics for that call are compared to the QOS OM threshold values. If a statistic for the call exceeds the QOS OM threshold value, the OM value for that statistic on the MG4K-IP based trunk group will be incremented.

The OM group will contain entries for each MG4K-IP based TDM trunk group datafilled on the Call Server. In order for the trunk group to appear in the OM group at least one member of the trunk group must be datafilled to reside on a MG4K-IP node via table TRKMEM.

Each entry in the OM group will contain a CLLI and threshold-crossing counters for packet loss, jitter, and delay (latency).

The active registers will contain data for the current reporting interval. The holding registers will contain data for the previous reporting period. The interval for OM peg count transfer from the active to holding registers is controlled by the OM system. Refer to the OM system documentation for details on the available intervals for active to holding transfer.

In SN06, the activity A89007725 introduced a new office parameter *PACKET_QOS_OM_THRESHOLDS* to define QOS OM threshold values for GWC. The same QOS OM threshold values

(PACKET_QOS_OM_THRESHOLDS) defined in table OFCVAR will be applied to all MG4K-IP nodes datafilled on the Call Server. The values may be changed at any time without the need for Call Server/MG4K-IP restart.

The Table 1, “PACKET_QOS_OM_THRESHOLDS Office Parameter,” on page 1304 describes the range of values possible for each QOS OM threshold office parameter datafilled in table OFCVAR.

Table 1 PACKET_QOS_OM_THRESHOLDS Office Parameter

Parameter	Field		Range	Units
PACKET_QOS_OM_THRESHOLDS	Enabled		Y/N	
	Jitter		0 TO 100	Milliseconds (ms)
	Delay		0 TO 500	Milliseconds (ms)
	Loss	Whole	0 TO 9	% packet loss range from 0 TO 9.999999%
		Fraction	0 TO 999999	

The threshold values may be set in table OFCVAR by positioning on and changing the appropriate threshold as shown in Figure 1, "Commands to set threshold values in table OFCVAR":

Figure 1 Commands to set threshold values in table OFCVAR

```
TABLE: OFCVAR
>pos packet_qos_om_thresholds
     PACKET_QOS_OM_THRESHOLDS                    N  1  2  3 4
>change
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
PARMVAL: N  1  2  3 4
>Y 10 30 4 5
TUPLE TO BE CHANGED:
     PACKET_QOS_OM_THRESHOLDS                    Y 10 30 4 5
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
Jitter Threshold : 10 milliseconds
Delay Threshold : 30 milliseconds
Loss  Threshold : 4.500000 %
TUPLE CHANGED
JOURNAL FILE INACTIVE
```

In the above example, the QOS OM threshold reporting was changed such that the reporting is active and the thresholds were set (jitter=10 ms, delay= 30 ms, Packet Loss= 4.5%).

The default values for the OM thresholds will be set to the maximums and the enabled value will be set to N (No).

In order to view the QOS OM threshold crossing data, access the TRKQOSOM group via OMSHOW as shown in Figure 2, "Commands to view the QOS OM threshold crossing data" follows:

Figure 2 Commands to view the QOS OM threshold crossing data

```
>omshow trkqosom active(or holding for previous interval)
TRKQOSOM

CLASS: ACTIVE
START:2002/07/22 12:50:00 MON; STOP: 2002/07/22 12:53:44 MON;
SLOWSAMPLES:        3 ; FASTSAMPLES:        22 ;

     KEY (COMMON_LANGUAGE_NAME)
       PKTLOSS    JITTER     DELAY

     64 IP01S7ITW2
           0        1                0
     65 COMPISUP_OG
           0        0                0
     66 IPD1ITSIMTS7
           0     0                   0

.............................
```

The data presented will include an entry for each MG4K-IP based TDM trunk group datafilled on the Call Server. For each entry, the CLLI will be presented with the PKTLOSS, JITTER, and DELAY threshold crossing data.

Definitions for Packet Loss, Delay and Jitter registers are as follows:

Packet loss rate is calculated in percentage as:
[RtpCumulativeLostPackets *100] / [RtpPacketsReceived + RtpCumulativeLostPackets]

Where, RtpPacketsReceived - The number of the RTP packets received from the IP network.
RtpCumulativeLostPackets - The number of lost RTP packets in the receiving direction. The count represents the Cumulative Number of Packets Lost field that is inserted in to the RTCP reception blocks.

Interarrival time jitter is an estimate of the statistical variance of RTP data packet interarrival times. The Jitter value calculated as the smoothed mean absolute value of the difference between the sending interval at a source and the interarrival time at a receiver. It is a running filtered average, basically a low pass filter with a 1/16 contribution each sample.

$jitter_{new} = jitter_{old} + [(instantaneous\ jitter - jitter_{old}) / 16]$

Where, instantaneous jitter = | [rec_i – rec_{i-1})] – [$sent_i$ – $sent_{i-1}$] |
rec_i / $sent_i$ = Time when i^{th} data packet is received/sent.

The round-trip delay is calculated when a RTCP reception report is received. The Delay (latency) is smoothed as,
$delay_{new}$ = $delay_{old}$ + [(instantaneous delay– $delay_{old}$) / 16]

Where instantaneous delay = | A - LSR - DLSR |
A = time a source received this reception report
LSR = last Send Report timestamp received field
DLSR = delay since last Send Report field

115.3 Hardware Requirements or Dependencies

None

115.4 Software Requirements or Dependencies

This functionality requires SN07 load in the Call Server, and SN07.1 or higher load in the MG4K-IP CEM and GEM RM.

115.5 Limitations and Restrictions

The intent of this activity is to provide an indication of QOS on the Call Server for each MG4K-IP based trunk group. As such, the activity does not attempt to record every violation of the QOS OM threshold. Rather, for the trunk group as a whole, a general indication of QOS health will be provided.

OM peg counts stored in the MG4K-IP that have not been reported to the Call Server will not be maintained over MG4K-IP GEM Sparing and Restarts.

TRKQOSOM OM group shall not be supported for IW-IP nodes.

116: Functional Description (FN): A00003789

116.1 Feature name

SN07: A00003789 - INTRA IMT CAUSE Enhancements

116.2 Description

This feature introduces the capability for originating INTRA IMT trunks to route advance on four specific CAUSE values:

- CAUSE 42 - Switch Equipment Congestion (SWEQCONG)
- CAUSE 47 - Resources Unavailable (RESUNAV)
- CAUSE 51 - This is a non standardized “Service” related CAUSE (CSE_51) utilized by the customer in their own network.
- CAUSE 34 - No Circuits Available (NOCIRCAV)

This feature introduces a new office parmater RTE_ADVANCE_FOR_INTRA_IMT_NCRT in table OFCVAR which controls the optionality to route advance on CAUSE 34 - No Circuit Available (NOCIRCAV). Cause values 42, 47 and 51 are not affected by the office parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT.

PTS and SS7 INTRA IMT originators are supported and must terminate to an SS7 EANT or IMT terminator for the described CAUSE enhancements to take place.

Specifically for SS7 INTRA IMT originators this feature enables CAUSE handling in the CM with existing optional table CSEMAP for all CAUSE values in addition to the specified functionary for CAUSE 34, 42, 47 and 51.

The INTRA IMT CAUSE enhancement capability is controlled on a per trunk group basis using a new option in table TRKOPTS called INTRACSE. **NOTE: Patch SBB41 introduced the TRKOPTS option as INTRA_CSE (w/ underscore) and this activity removes the underscore for TRKOPTS option consistency and ease of use.** The INTRACSE TRKOPTS option can only be assigned to originating (IC, 2W) IMT Trunks with TRKGRP field NETWKSPC set to INTRA. The INTRACSE option contains a “route advance choice” field that can be set to Y or N.

This capability interacts with optional table CSEMAP but does not have a dependency on table CSEMAP. For more information see “Office Parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT” on page 1311.

This capability is under Software Optionality Control (SOC). The SOC order code is NSER0005.

Please refer to the following sections for detailed information on this capability:

- Background Information
- Software Optionality Control NSER0005
- Table TRKOPTS option INTRACSE
- Table OFCVAR Office Parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT
- Call Processing CAUSE Handling

116.2.1 Background Information

It is important to understand the default or existing CAUSE handling behavior for both PTS and SS7 INTRA IMT originators prior to this activity.

PTS INTRA IMT originators that terminate to SS7 EANT and IMT trunks always perform CAUSE handling in the CM as the CAUSE value cannot be passed to the adjacent office due to interworking (PTS to SS7). Therefore "default" CAUSE handling for PTS INTRA IMT originators already exists. The specific CAUSE values impacted by this feature have a default functionality for PTS INTRA IMT originators as follows:

- CAUSE 34, 42 and 47 all route advance by default and can be overridden by associated CSEMAP entries to not route advance or to go to a different treatment. Reference Table 1 below.
- CAUSE 51 is an undefined CAUSE value and by default goes to (RODR) treatment. CSE_51 can be overridden by a CSEMAP entry to route advance or go to a different treatment. Reference Table 1 for details.

Table 1 Default PTS INTRA IMT CAUSE Handling Behavior

CSEMAP	CAUSE 34, 42, 47 Default Result	CAUSE 51 Default Result
No Entry	Route Advance (Default)	TRTMT (Default - RODR)
RTE ADV - N	CSEMAP TRTMT	CSEMAP TRTMT
RTE ADV - Y	Route Advance (CSEMAP)	Route Advance (CSEMAP)

SS7 INTRA IMT originators that terminate to SS7 EANT and IMT trunks do not perform CAUSE handling in the CM prior to this feature. The CAUSE values are passed (bounced) to the adjacent office without any CM interaction.

This activity, when active, will impact both SS7 and PTS INTRA IMT originators in the same way as described in section “116.2.4 Office Parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT” on page 1311. When inactive, the default behavior will be as described in this section "Background Information" .

116.2.2 Software Optionality Control (SOC) NSER0005

The new SOC order code NSER0005 - Intra IMT Cause Enhancements is introduced by this feature. When the NSER0005 SOC state is IDLE, CAUSE handling behavior is unchanged for calls with INTRA IMT originators. The new TRKOPTS option INTRACSE can be data filled when the SOC state is IDLE or ON. The new office parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT can also be changed when the SOC state is set to IDLE or ON.

The new SOC NSER0005 - Intra IMT Cause Enhancements is dependant upon SOC NSER0003 - Inter/Intra IMT for the described functionality to be active.

Changing the NSER0005 SOC state to ON does not in itself enable any new functionality. NSER0005 SOC in conjunction with the INTRACSE TRKOPTS option, enables the CAUSE Enhancements capability described in this document. For more information see “Office Parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT” on page 1311.

116.2.3 Table TRKOPTS option INTRACSE

A new TRKOPTS option called INTRACSE is introduced by this feature. The INTRACSE option contains a field called RTE_ADV_CHOICE that must be data filled to Y or N to select the route advance capabilities described in section “Office Parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT” on page 1311.

Figure 1 shows an example entry of the INTRACSE option data filled on a trunk CLLI in table TRKOPTS.

Figure 1 TRKOPTS option INTRACSE Example Entry

```
TABLE: TRKOPTS
 -------------------------
TRKCLLI   INTRACSE   INTRACSE  RTE_ADV_CHOICE  Y
```

The CAUSE Enhancement capability is dependant on the the originating trunk and therefore The INTRACSE option can only be assigned to IC or 2W INTRA IMT trunks. The option can be assigned to both SS7 and PTS INTRA IMT signaling trunks. The option allows the customer to activate the CAUSE enhancements capability on a per trunk group basis. INTRA IMT originators with this option assigned must terminate to an SS7 terminating trunk to enable the CAUSE Enhancement capability.

Various error messages occur during datafill if the INTRACSE option is assigned to something other than the specified trunk data. Figure 2 below illustrates the error messages associated with the INTRACSE option.

Figure 2 TRKOPTS INTRACSE Datafill Error Messages

Attempts to datafill the INTRACSE option on a trunk type other than IMT, results in the following error message:

'INTRACSE option is supported only for IMT trunk types'

Attempts to datafill the INTRACSE option on an IMT trunk with a NETWKSPC value other than INTRA, results in following error message

'INTRACSE option requires NETWKSPC to be INTRA'

Attempts to datafill the INTRACSE option on an outgoing (OG) trunk, result in the following error message:

'INTRACSE option supports IC and 2W direction only.'

116.2.4 Office Parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT

A new office paramater RTE_ADVANCE_FOR_INTRA_IMT_NCRT is added to table OFCVAR to control the route advance behavior of CAUSE 34 in conjunction with the INTRACSE TRKOPTS option. The functionality of this parameter does not affect the route advance capability of cause values 42, 47 and 51. The values for the parm are {N,Y} and are immediately activated when changed.

The functionality of this office parameter is further explained in the section “CAUSE Processing CAUSE Handling”.

Figure 3 shows an example entry of the office parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT in table OFCVAR.

Figure 3 OFCVAR Office Parameter Example Entry

```
TABLE: OFCVAR
 ------------------------
RTE_ADVANCE_FOR_INTRA_IMT_NCRT  Y
```

116.2.5 Call Processing CAUSE Handling

The CAUSE enhancements capability for this activity is described in "Table 2 INTRA IMT CAUSE Handling Matrix" on page 1313. There are several variables that determine the CAUSE handling behavior for INTRA IMT originators. The variables are summarized as follows:

- SOC NSER0003 - Inter/Intra IMT must be ON. For "Table 2 INTRA IMT CAUSE Handling Matrix" on page 1313 this variable is not listed and the SOC is assumed to be ON.
- SOC NSER0005 - Intra IMT Cause enhancements - IDLE / ON status indicates optionality status. IDLE implies default or existing behavior prior to this activity.
- TRKOPTS option INTRACSE. The presence of the option for a particular trunk allows two things to occur:
  - — Enables CAUSE handling in the CM for INTRA IMT SS7 originators for all CAUSE values in addition to the functionality described in this document for CAUSE values 34, 42, 47 and 51.
  - — Checks the status of office parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT and determines whether to enable or disable CAUSE 34 from route advancing for SS7 and PTS INTRA IMT trunks. However a CSEMAP entry for CAUSE 34 can be used to provide route advance capabilities or change the treatment handling.
- INTRACSE RTE_ADV_CHOICE Y/N - this field impacts CAUSE values 34, 42, 47 and 51 only and when set to Y enables route advance with or without CSEMAP interaction. When set to N default treatment is used or CSEMAP entries can allow route advance or change the treatment.
- CSEMAP entries for CAUSE values 42, 47 and 51. With INTRACSE RTE_ADV_CHOICE = N, the CSEMAP entries determine route advance or treatment CAUSE handling. With INTRACSE RTE_ADV_CHOICE = Y, the call always route advances regardless of CSEMAP entry.

- CSEMAP entry for CAUSE 34. If the office parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT = Y and INTRACSE RTE_ADV_CHOICE = N, the CSEMAP entry determines route advance or treatment CAUSE handling. With INTRACSE RTE_ADV_CHOICE = Y, the call always route advances regardless of CSEMAP entry. If the office parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT = N, INTRACSE RTE_ADV_CHOICE subfield has no impact on CAUSE handling for CAUSE 34. The presence of the INTRACSE option forces the call to go to treatment (NCRT). However a CSEMAP entry for CAUSE 34 can change the treatment or set the route advance bool and the call routes accordingly.

Table 2, "INTRA IMT CAUSE Handling Matrix," on page 1313 describes the CAUSE Enhancement behavior provided by this activity.

Table 2 INTRA IMT CAUSE Handling Matrix

SOC NSER0005	TRKOPTS INTRACSE	CSEMAP	CAUSE 42,47 and 51 Result	CAUSE 34 Result when RTE_ADVANCE_FOR_INTRA_IMT_NCRT=N	CAUSE 34 Result when RTE_ADVANCE_FOR_INTRA_IMT_NCRT=Y
IDLE	N/A	N/A	Default CAUSE Behavior[a]	Default CAUSE Behavior	Default CAUSE Behavior
ON	No Entry	No Entry	Default CAUSE Behavior	Default CAUSE Behavior	Default CAUSE Behavior
ON	No Entry	RTE ADV - N	Default CAUSE Behavior	Default CAUSE Behavior	Default CAUSE Behavior
ON	No Entry	RTE ADV - Y	Default CAUSE Behavior	Default CAUSE Behavior	Default CAUSE Behavior
ON	RTE ADV - N	No Entry	Default TRTMT[b]	Default TRTMT	Default TRTMT
ON	RTE ADV - N	RTE ADV - N	CSEMAP TRTMT	CSEMAP TRTMT	CSEMAP TRTMT
ON	RTE ADV - N	RTE ADV - Y	Route Advance (CSEMAP)	Route Advance (CSEMAP)	Route Advance (CSEMAP)
ON	RTE ADV - Y	No Entry	Route Advance (INTRACSE)	Default TRTMT (NCRT)	Route Advance (INTRACSE)
ON	RTE ADV - Y	RTE ADV - N	Route Advance (INTRACSE)	CSEMAP TRTMT	Route Advance (INTRACSE)
ON	RTE ADV - Y	RTE ADV - Y	Route Advance (INTRACSE)	Route Advance (CSEMAP)	Route Advance (INTRACSE)

a. Default CAUSE Behavior is different for SS7 and PTS See "Background Information" on page 1309. for specific details
b. Default TRTMT for CAUSE 34 is NCRT, CAUSE 42 is NBLH, CAUSE 47 is GNCT, and CAUSE 51 is RODR

116.3 Hardware Requirements or Dependencies

None

116.4 Software Requirements or Dependencies

SOC NSER0005 is dependant on SOC NSER0003 - Inter/Intra IMT. SOC NSER0003 must be ON before SOC NSER0005 call processing capabilities become active.

116.5 Limitations and restrictions

From a Table Control perspective the TRKOPTS option INTRA _CSE can only be assigned to:

- INTRA IMT (IC or 2W) PTS Trunks
- INTRA IMT (IC or 2W) SS7 Trunks

From a Call processing perspective CAUSE handling requires terminations from INTRA IMT trunk originators to EANT or IMT (INTRA or INTER) SS7 trunk terminators.

116.6 Interactions

This capability interacts with optional Table CSEMAP but is not dependant nor does it change the behavior of the CSEMAP table. For details reference Table 2, “INTRA IMT CAUSE Handling Matrix,” on page 1313.

SS7	Signaling System #7

117: Functional Description (FN): A00003905

117.1 Feature name

DIRP ENHANCEMENTS FOR BILLING

117.2 Description

Feature A00003905 increases the number of DIRP volumes in table DIRPPOOL from 24 to 72.

The feature uses SOC to restrict provisioning more than 24 volumes per DIRP pool if the SOC state is IDLE. Rejection messages indicate that this feature is inactive.

The SOC name for this functionality is BASE DIRP enh to 72 vol, and the ORDCODE is BASE0014.

117.3 Hardware Requirements or Dependencies

Feature A00003905 works in conjunction with feature A00002186 to realize 4G of storage capacity for a DIRP subsystem. Feature A00002186 increase DDU storage capacity from 1G to 4G. However, for any feature functionality to be active, 4G DDUs must be present in the switch with the appropriate IOM load.

117.4 Software Requirements or Dependencies

To achieve 4G of DIRP DDU storage capacity, both features A00003905 and A00002186 must be present and active. Both features are enabled and disabled via SOC. IOM load XXXYYYZZZ is required.

117.5 Limitations and restrictions

None.

117.6 Interactions

Feature A00003905 impacts table control for table DIRPPOOL. Expanding the number of volumes per pool necessitated a change in how table DIRPPOOL is manually provisioned. Volumes are no longer provisioned as individual fields but are provisioned in groups of three. Using DIRP MNT to provision volumes is unaffected.

118: Functional Description (FN): A00003923

118.1 Feature name

CTX / RES SCAI Redirection

118.2 Description

Intelligent Call Management (ICM) also known as CompuCall (for X.25 transport) provides communications channel between a computer and a switch that allows a telephone company to provide coordinated switch-based services to applications residing on a customers host computer.

Currently ACD Call Redirection[1] is assigned as an option (SCAIREDIR) to an ACD Group in table ACDGRP on the DMS. Once assigned, incoming calls to the ACD Group generate a DV-Call-Received-C message to the ICM Host computer. Included in this message are the Called Number, Calling Number and Charge Number. If the ICM Host computer wishes to redirect the call, it sends a DV-Call-Redirect message to the DMS switch including the Redirecting DN. If the Host computer does not wish to redirect the call, it sends a Return-Result as the acknowledgement for the DV-Call-Recieved-C message. The Host computer must receive an acknowledgement for the DV-Call-Redirect message before it sends an acknowledgement for the DV-Call-Received-C.

This activity will enhance the ACD Call Redirection feature[1] and extend it's functionality beyond ACD Groups making it available for use on CENTREX and Residential lines.

The option SCAIRDIR will be assignable to any (non-ACD) CENTREX or Residential line as a sub-option to the Extended Call Management (ECM) option. ECM is a required option as it provides the neccessary access to SCAI messaging and capabilities in the (non-ACD) CENTREX or Residential environment. Once assigned, incoming calls to the line will generate redirection messaging that follows the same sequence of events as described above, allowing the ICM Host computer to redirect the call if it wishes to.

[1] *AG2195 - ECM Inbound Redirection & AR0048 - Call Redirection to Specific Line*

118.2.1 Application Logon SCAI Service Version

The dv-Appl-Logon message contains a parameter, Service Version, which uniquely identifies the version of messages which will be used for the session.

This activity requires the use of a Service Version of 09 or newer[2]. Service

Version 09 was developed in CCM07, since the Service Version is upward compatible, all previous Service Version functionality is provided with the latest Service Version[2].

A Service Version of 09 or newer[2] must be specified in the dv-Appl-Logon message in order for the host application to generate and/or recognize the DV-Call-Received-C and DV-Call-Redirect messages for Centrex or Residential lines.

118.2.2 Subscription to SCAI messages

This activity requires subscription to the ROUTING and either RESEVENT or CTXEVENT sub-services found in table SCAISSRV. The default tuple of ROUTING34$ and either RESEVENT07$ or CTXEVENT34$ or newer[3] is required in order to have access to the DV-Call-Received-C and DV-Call-Redirect messages for Centrex or Residential lines.

118.2.3 CTX and Residential SCAIRDIR Line Option

A new option SCAIRDIR will be created as a sub-option to the Extended Call Management (ECM) option[4]. The sub-option SCAIRDIR will have a sub-field called MSGTO that has a range between 1 and 30 seconds. Once assigned, incoming calls to the line will generate DV-Call-Received-C messaging which can be acted upon by the ICM Host computer to redirect the call if desired. The new SCAIRDIR sub-option will be assignable via SERVORD as follows:

```
>SERVORD
SO: ADO $ 05 00 00 05
OPTION: ECM
CALL_EVENTS: Y
MAKECALL: Y
CONF_XFER: Y
MSG_WAIT: Y
SCAICC: Y
CHKLOPT: Y
NETICM: Y
SCAIRDIR: Y
    MSGTO: 30
OPTION: $
```

[2] *As of this document the latest SCAI Service Version was SCAI18*

[3] *As of this document the latest default tuples where ROUTING15$, RESEVENT13$ and CTXEVENT13$*

[4] *ECM is required as it provides the access to SCAI capabilities in the non-ACD CTX and RES environment*

118.2.4 Phone Set Compatibility

The new sub-option SCAIRDIR will be applicable to the same sets as the ECM Line Option[5]. This includes sets that are Meridian Business Set (MBS), 500/2500 IBN and Meridian Feature Transparency (MFT) sets, including EtherSets.

Only single DN apperance per line will be supported by this activity. Lines with features such as Multiple Appearance Directory Number (MADN), Hunt Groups, UCD etc. are not supported

118.2.5 CTX / RES SCAIRDIR Functionality

The DMS sends the dv-Call-Received-C message[6] to the host when a call is received for a CTX/RES line with the SCAIRDIR sub-option and that CTX/RES line belongs to an associated environment with which the host has established a session.

The host must send an acknowledgment back to the DMS within 1 to 30 seconds (as determined by the MSGTO sub-field of the SCAIRDIR sub-option). The host responds to the dv-Call-Received-C in one of the following ways:

- dv-Call-Redirect message[7]
  - — If the host determines the call should be redirected, it responds with a dv-Call-Redirect message
- Return Result
  - — If the host determines call redirection is not required, it responds with a Return-Result message, in which case the call will continue to route to the destDN. The Return-Result message has no parameters.
- Return Error
  - — If the host responds with a Return-Error message, the call will continue to route to the destDN.
- Reject
  - — If the host responds with a Reject message, indicating a protocol error or a message received out of sequence, the call will continue to route to the destDN.
- No Response from Host
  - — If the host does not respond to a dv-Call-Received-C message within a predetermined time period (MSGTO sub-field of SCAIRDIR sub-option) , the call will continue to route to the destDN.
- Response Received Out of Sequence
  - — Any out of sequence messages of this type are treated as extraneous and the DMS responds to the host with a Reject message.

[5] *Reference AR0046 - ECM / SCAI Support for Non-ACD*

[6] *A call to an ECM associated CTX/RES line WITHOUT the SCAIRDIR sub-option will generate the normal dv-Call-Offered-U message*

[7] *Reference AG2195 - ECM Inbound Redirection & AR0048 - Call Redirection to Specific Line*

118.2.6 CTX / RES SCAIRDIR Setup and Validation

For proper CTX/RES SCAIRDIR operation, the following setup and conditions must be met:

1. The SCAI Service Version is at least 09 (SECTION 2.2.1)

2. An ICM switch-host session is established. A successful dv-Appl-Logon request was sent by the host computer.
3. The switch-host session is subscribed to a ROUTING and RESEVENT or CTXEVENT sub-service and the DV-Call-Received-C and DV-Call-Redirect messages within ROUTING. (SECTION 2.2.2).
4. The Centrex/Res line must have the line option ECM with sub-option SCAIRDIR set to 'Y' and the MSGTO sub-field set between 1 and 30 seconds. (SECTION 2.2.3)
5. The line which the host application is monitoring must be associated to the session via dv-DN-Associate.

118.2.7 Message Protocol

The ASN.1 notations for the DV_CALL_RECEIVED_C message are shown in this section. A sample X.209 hex encoding has been provided here. The length fields are variable because the length depends on the variable content. The tag values are taken from the ROSE protocols.

118.2.7.1 CTX / RES dv-Call-Received-C ASN.1 Encoding

call-Received-Error             ERROR    ::=    0
```

118.2.7.2 CTX / RES dv-Call-Received-C Coded Example

The DMS receives a call initiated by the OrigCallingNumber 9192466001 for the destDN of 9194815200 and assigns the call a LocalCallId = 4. The DMS sends a dv-Call-Received-C message to the host who responds with a Return Result message in which case the DMS would continue to route the call to destDN. If the host determined the call should be redirected, it would respond with a dv-Call-Redirect message. If the host determined that there was an error, it would respond with a Return Error message.

INVOKE **DMS ===> HOST**

Table 1: CTX / RES dv-Call-Received-C Coded Example

Hex Dump			Information Element	Comments
Tag	**Len**	**Content**		
A1	2B		INVOKE	this message is 43 bytes decimal
02	02	03 F9	InvokeID	the Invoke ID is decimal 1017
02	01	0A	Operation	the operation is dv-Call-Received-C [10] decimal
30	22		Argument	CallReceived argument is of sequence type and is 34 bytes long decimal
A0	06		NetworkCallId	the NetworkCallId is a constructor 6 bytes
80	01	00	NetworkNodeId	the NetworkNodeId is 0
81	01	04	LocalCallId	the LocalCallId is 4
81	0A	39 31 39 34 38 31 35 32 30 30	destDN	the called DN is 9194815200
82	0C	00 83 39 31 39 32 34 36 36 30 30 31	OrigCallNumber	the first two bytes are fixed and presently unused. The OrigCallNumber is 9192466001
Hex Dump = A1 39 02 02 03 F9 02 01 0A 30 22 A0 06 80 01 00 81 01 04 81 0A 39 31 39 34 38 31 35 32 30 30 82 0C 00 83 39 31 39 32 34 36 36 30 30 31				

RETURN-RESULT **DMS <=== HOST**

Table 3: CTX / RES dv-Call-Received-C Return Error Coded Example

Hex Dump			Information Element	Comments
Tag	Len	Content		
A3	07		RETURN ERROR	the message length is 7 bytes decimal
02	02	03 F9	InvokeID	the Invoke ID is decimal 1017
02	01	00	Error Value	the Error Value is Call-Received-Error (0).
Hex dump =A3 07 02 02 03 F9 02 01 00				

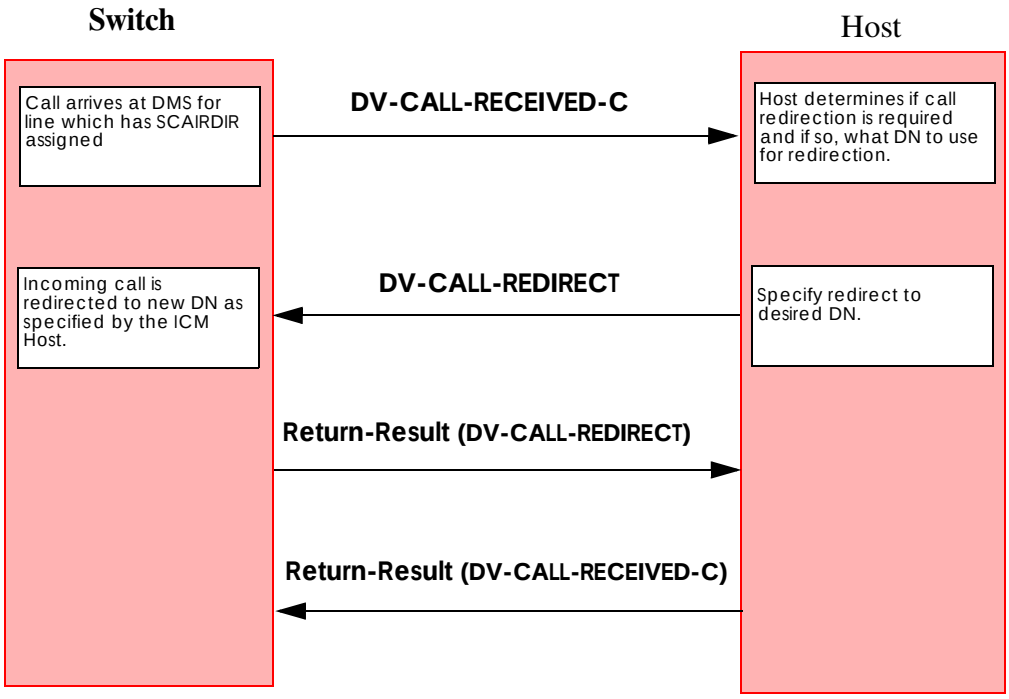
118.2.8 CTX / RES SCAIRDIR Message Flow Example

The following two message flow examples demonstrate basic messaging between the DMS and host computer for:

1. A CTX / RES line that has SCAIRDIR assigned and the incoming call to that line is redirected.
2. A CTX / RES line that has SCAIRDIR assigned and the incoming call to that line routes to the line.

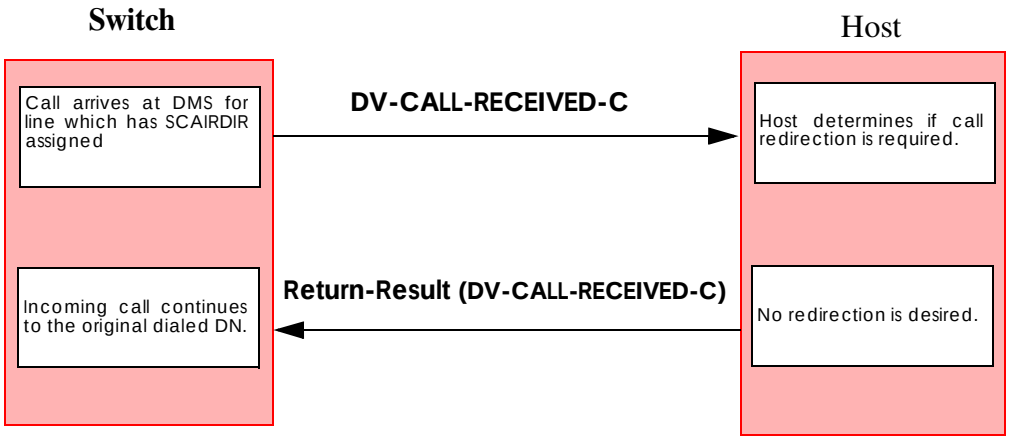
Message Flow for A Redirected Call

Incoming call to a CTX/RES line which has SCAIRDIR assigned and the ICM Host redirects the call to a different DN.



Message Flow for A Non-Redirected Call

Incoming call to a CTX/RES line which has SCAIRDIR assigned and the ICM Host does NOT redirect the call. Call is presented to original DN.



118.3 Hardware Requirements or Dependencies

Not Applicable

118.4 Software Requirements or Dependencies

Not Applicable

118.5 Limitations and restrictions

- This feature *A00003923 - CTX / RES SCAI Redirection* is not compatible with Call Waiting (CWT) or Call Waiting Intra-group (CWI) see Section 2.6 - Interactions.
- The limitations and restrictions that apply to ECM line option, *AR0046 - ECM / SCAI Support for Non-ACD,* will apply to this feature as well.
- Where applicable, the limitations and restrictions of ACD Call Redirection, *AG2195 - ECM Inbound Redirection,* will apply to this feature as well.

118.6 Interactions

- This feature *A00003923 - CTX / RES SCAI Redirection* is not compatible with Call Waiting (CWT) or Call Waiting Intra-group (CWI). If SCAIRDIR has been assigned and activated (via SOC) and CWT / CWI has also been assigned, the originator of a call to the busy set will receive NACK treatment and the busy set will not be presented with Call Waiting tone. It is recommended that CWT/CTI and SCAIRDIR not be assigned to the same phone set.

This activity provides the ways and means for a dv-Call-Received-C message to be generated for a compatible CTX/RES line, the actual redirection of the call is executed via the dv-Call-Redirect message which is not enhanced by this activity. Reference AG2195 - ECM Inbound Redirection & AR0048 - Call Redirection to Specific Line for detailed information on the dv-Call-Redirect message.

119: Functional Description (FN): A00003933

119.1 Feature name

Succession Communication Server (SCS) 2000 - Session Server Manager: SCS 2000 - SIP Gateway application

This activity delivers an RFC 3261 Compliant Interface for the CS 2000 enabling open interoperability with call servers, application servers, and proxy servers using the Session Initiation Protocol (SIP).

The Session Server Manager and SIP Gateway application are part of the SN07 release.

119.2 Feature Synopsis

119.2.1Activity List

Activity A00003933 is the repository for all the FN information associated with the Session Server Manager - SIP Gateway application. The list of activities addressed by this FN includes:

- A00003270 SIP Open Interop Call Processing
- A00003271 Session Server Web Server Interface
- A00003272 Session Server Provisioning Framework
- A00003273 SIP Gateway Application Maintenance
- A00003279 SIP on Session Server Link Maintenance and Load Balancing
- A00003281 SIP on Session Server Call Audit
- A00003933 SIP on Session Server ICAF
- A00003277 Session Server OM Subsystem
- A00003280 SIP on Session Server Tracing/Debug Framework
- A00003282 SIP on Session Server Datasync

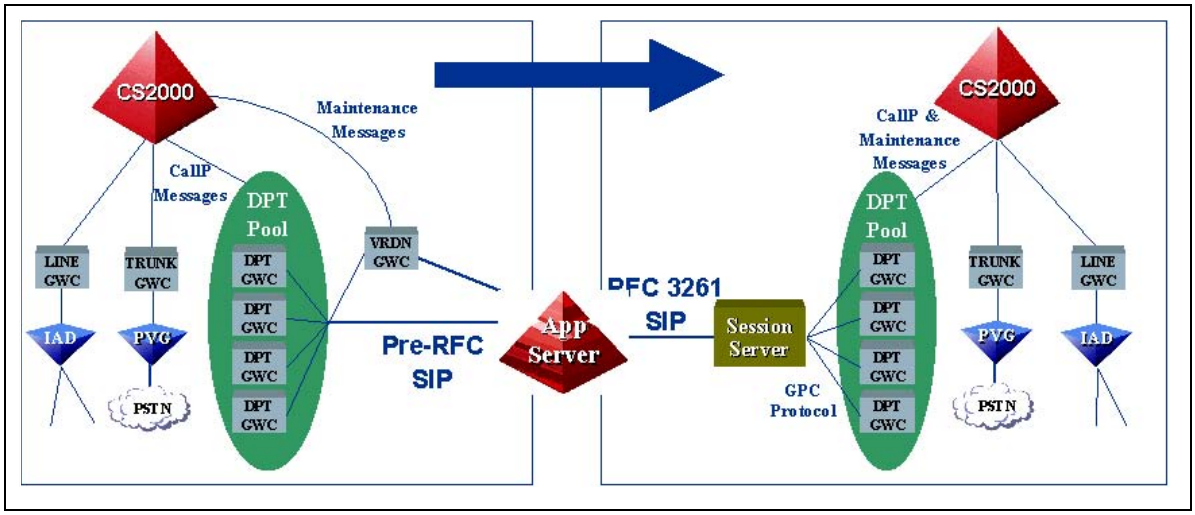
- A00003934 Session Server Project ICAF
- A00004271 SIP App Server SOC
- A00004414 SIP Call Server SOC

119.3 Project Background

SIP is a protocol designed for multimedia communication. The current SCS 2000 SIP offering is a proprietary implementation of SIP for Telephones (SIPT) based on earlier drafts of the SIP specifications. The SCS 2000 SIP implementation was developed to communicate between two CS 2000s and to the Multi-Media Communication Server (MCS). This implementation was available in SN04.

Market drivers are pushing the implementation of SIP to an open interoperability (interop) standard. To meet this requirement, the Session Server Manager is being developed to convert open interop SIP messaging into messages understandable by the CS 2000.

Figure 1 SIP on CS 2000 Evolution



119.3.1 Pre-SN04 VRDN SCTP architecture

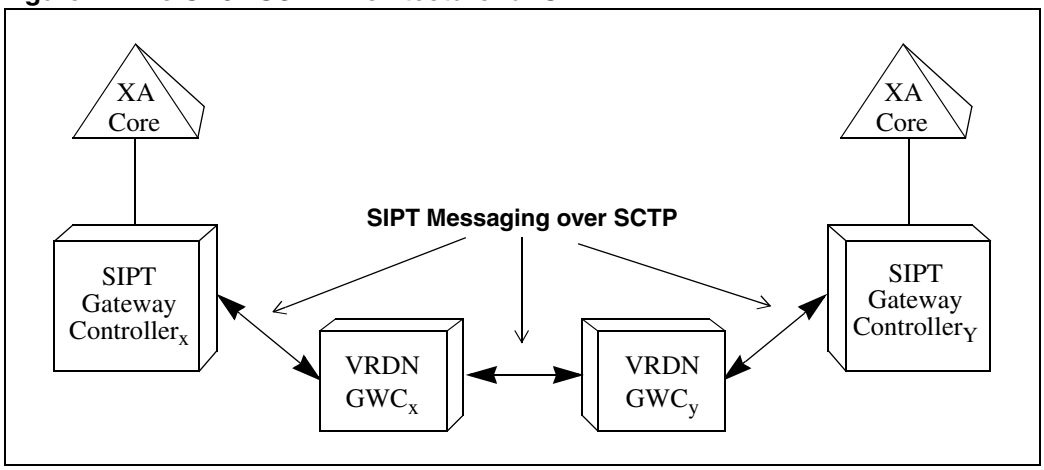
In the initial implementation of SIPT for GWC, signaling path established calls from the VRDN to the remote node. The nodes included SIPT and VRDN gateway controllers. The SIPT gateway controller's function is to process the call while the VRDN is responsible for routing the call. A signaling path exists between the SIPT Gateway Controllers and the VRDN, and between the VRDN and the remote Call Server. Call State is maintained in the VRDN.

The VRDN architecture dynamic packet trunking (DPT) call traverses the following four node types. A visual representation of this architecture is shown in Figure 2, "Pre-SN04 SCTP Architecture for SIPT".

— local SIPT and VRDN gateway controller

— remote VRDN and SIPT gateway controller

Figure 2 Pre-SN04 SCTP Architecture for SIPT



A quick summary of the steps in figure 2 are as follows:

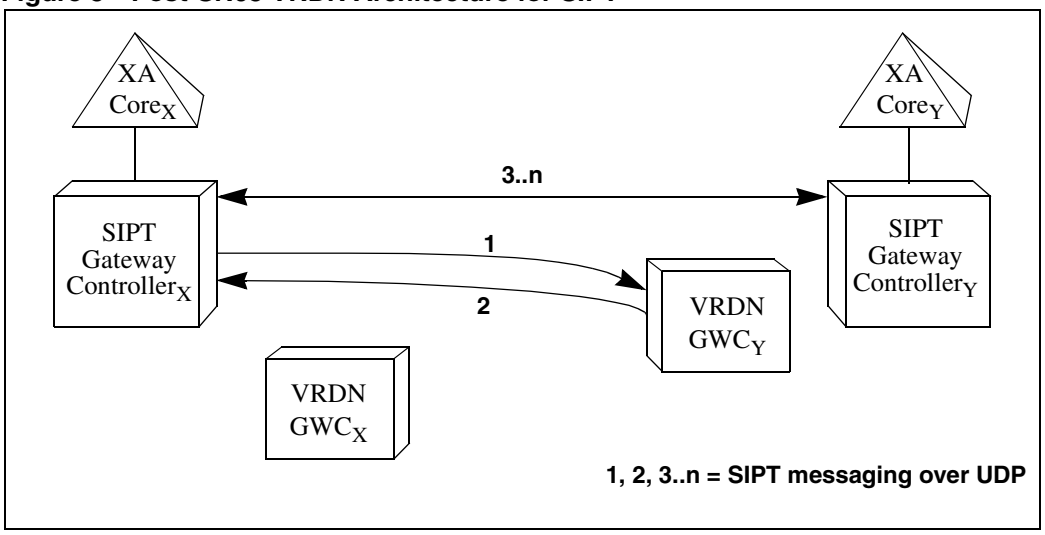
- GWC_X composes an INVITE message and sends it to a local VRDN.
- Local $VRDN_X$ determines which remote VRDN is applicable and then forwards the INVITE.
- Remote $VRDN_Y$ receives the INVITE and determines which of its SIPT gateway controllers should receive the INVITE message. The INVITE message is then sent to that SIPT gateway controller (GWC_Y).

119.3.2Post-SN03 VRDN architecture

In order to overcome limitations when using the previous architecture, a new SIPT architecture was introduced in SN04 (i.e. GWC07). Activity A59034776: “VRDN Capacity Enhancements” provides the majority of the functionality. The purpose of the new architecture was to decrease dependency on the local and remote VRDN.

In the previous architecture, a call from an originating SIPT GWC traverses local and remote VRDN before reaching the destination SIPT gateway controller. With the new architecture, the originating SIPT GWC sends its INVITE directly to the remote VRDN. The remote VRDN replies to the originating SIPT GWC with a 302-Temporarily Moved instead of forwarding the INVITE to the remote SIPT GWC. The 302 message contains the necessary information to contact the remote SIPT GWC. After receiving the 302, the local SIPT GWC sends the INVITE directly to the remote SIPT GWC. A diagram of the new architecture is shown below.

Figure 3 Post-SN03 VRDN Architecture for SIPT



A quick summary of the steps shown in figure 3 are as follows. Note the local VRDN for XA-Core$_X$ is still utilized when call originates from the remote XA-Core.

- Based on MGCINV datafill, a remote VRDN is selected. An INVITE message is sent to that MGC.
- The VRDN on the remote replies with a 302-Temporary Moved message indicating a SIPT GWC for the remote XA-Core. The contact header in the 302 contains the necessary information to reach GWC$_Y$.
- After receiving the 302 message, SIPT GWC$_X$ sends an INVITE to GWC$_Y$, which decides it will accept the call. Standard SIP messaging for call setup is performed. Once the call is complete, it is taken down via the standard SIP mechanisms.

119.3.3VRDN Architecture Limitations

In the VRDN architectures, the SIP stack resides in the gateway controllers and is not compliant to RFC 3261.

In order to move forward in terms of supporting SIP compliancy and greater call volume, a new SIP architecture needs to be created. Hence, the origination of the Session Server Manager platform.

119.3.4Pre-Session Server Manager OAMP Relationships

Before discussing the Session Server Manager platform, the current OAMP component relationship is presented so an understanding of the current scenario exists.

119.3.4.1 Component Relationships

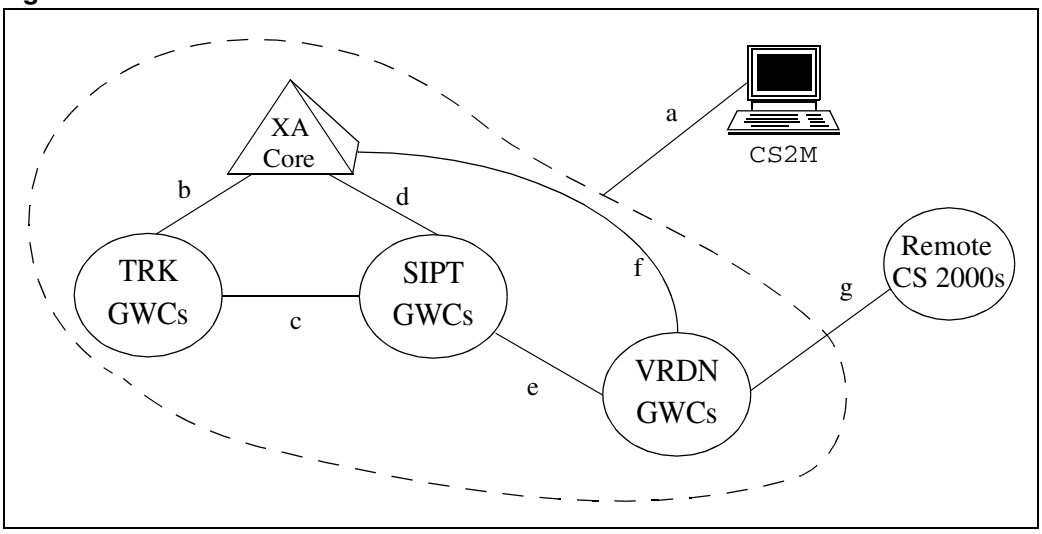
The main components with respect to SIPT call processing are shown and described briefly.

Table 1 SIPT call processing components

Node	Function
XA-Core	General call processing engine of the CS 2000. The XA-Core connects to the IP network via the HIOP and the SDM. SDM is used by CS2M (formerly known as SESM) and the HIOP is used for GWC communications.
TRK GWCs	Functions as the interface between the XA-Core and gateways such as the PVG.
SIPT GWCs	Functions as interface between TRK GWC and the VRDN. Contains SIP call processing functions.
VRDN GWCs	Functions as the "router" to direct incoming/outgoing calls to the appropriate local or remote GWC.
CS2M	General OAM&P platform for most CS 2000 peripherals. Formerly known as SESM.

The figure and follow-on explanation shows and explains at a high level the relationships between each CS 2000 node.

Figure 4 CS 2000 Architecture



a. CS2M provides OAM&P functions for the GWC and Core in the CS 2000 network. CS2M's interaction with the core consists of provisioning datafill such as certain pieces of gateway controller data (e.g. table SERVRINV). CS2M is the main OAM&P component for gateway controllers. OAM&P functions include node and unit provisioning, maintenance, and reporting of performance metrics, logs, and alarms.

b. While CS2M provides most of the OAM&P functions for the trunking GWC, core tables are also utilized for call processing. These tables include SERVRINV, TRKMEM, and TRKSGRP.

c. Only a CallP relationship exists here. This interaction consists of peer messaging in support of outgoing DPT call being routed to, or coming from, a SIPT gateway controller.

d. The local call server uses the SIPT gateway controller to handle DPT calls. Outgoing calls destined for a remote call server are routed through a SIPT gateway controller. For the outgoing call, the core sends the trunk profile index with the IAM which maps to a destination MGC and Telephony Profile in the SIPT GWC. This information determines the remote destination MGC.

   The SIPT gateway controller performs SIP processing and sends out a SIP Invite to the remote MGC. If SCPT is the transport protocol, a local VRDN is utilized. Incoming calls to the SIPT GWC originate from the local VRDN or remote MGC depending on the transport protocol used.

   Datafill from tables SERVRINV, SERVSINV, MGCINV, TELEPROF, TRKSGRP, DPTRKMEM, and TRKOPTS are utilized to perform call processing for the incoming and outgoing call.

e. From an OAM&P perspective, datafill in MGCINV and VRDNINV indicate the MGC for a remote call server. The local call server utilizes the VRDN to route the outgoing call to the remote call server. For an incoming call, the VRDN picks a local SIPT gateway controller to handle the incoming call.

f. Represents maintenance interactions.

g. Represents an outgoing call to remote SIP node or an incoming call.

119.3.4.2 Provisioning

On the core, the below figure illustrates the table control relationships for gateway controllers followed by a brief description of each table. Not every possible table is shown and described.

Figure 5 GWC Table Control Hierarchy

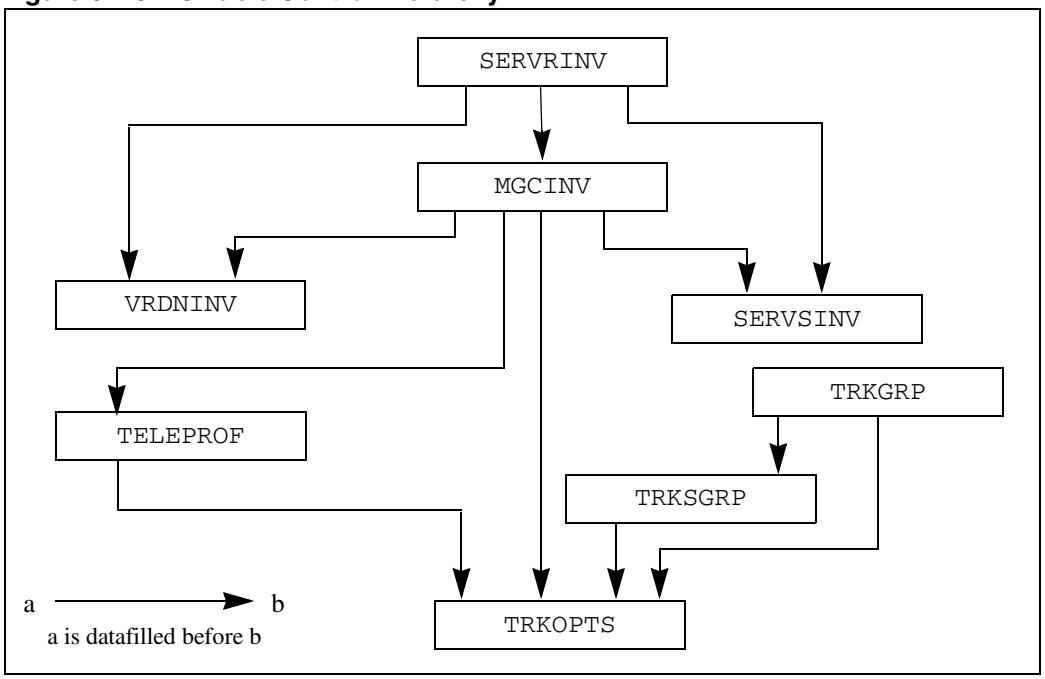


Table 2 Pre-Session Server Manager GWC table descriptions

Table	Description
SERVRINV	Stores provisioned data for gateway controllers including IP addresses, exec information, etc. Gateway controllers are provisioned in CS2M, and then the system automatically enters required datafill in SERVRINV.
MGCINV	Defines remote media gateway controllers for other Call Servers and their associated IP addresses, related virtual router distribution nodes, and connection protocols.
VRDNINV	Defines the locations of the VRDNs and the remote MGCs, which they serve. A VRDN is a dual-purpose device that handles outgoing routing and incoming distribution.
SERVSINV	Contains the names of the server subtending nodes and their associated gateways. The subtending nodes are the Audio Controller and the Dynamic Packet Trunk (DPT).
TELEPROF	Defines the link between a telephony profile and a destination media gateway controller (MGC).
TRKGRP	Contains customer-defined data for each trunk group that exists in the switch.
TRKSGRP	Lists the supplementary information for each subgroup that is assigned to one of the trunk groups listed in table TRKGRP.
TRKOPTS	Provisions special options on trunk groups. For our case, that option is dynamic and the signaling type is SIPT

When utilizing a Session Server Manager-only architecture, many of the above tables may be obsolete. Refer to upcoming sections for complete details.

119.4 Session Server Manager Description and Overview

The Session Server Manager is a platform for delivery of multiple applications. The Session Server Manager consists of a NEBS Level 3 compliant hardware platform plus a software framework and architecture for developing Carrier Grade applications and services. The SIP Gateway application is the initial application for the Session Server Manager platform.

119.4.1Hardware

The hardware platform for the Session Server Manager is the Hewlett Packard HP-CC3310. Components include:

- Dual Intel 2.4 GHz P4 Xeon Processors
- Up to 12 GB RAM (Session Server is 4 GB)
- Memory Speed – 266 MHz DDR
- Local Disk – Dual 73GB or 146GB disk drives (Session Server is 73 GB)
- Multiple GigE copper interfaces (2 on-board plus 2 per NIC)

- 2U Form Factor

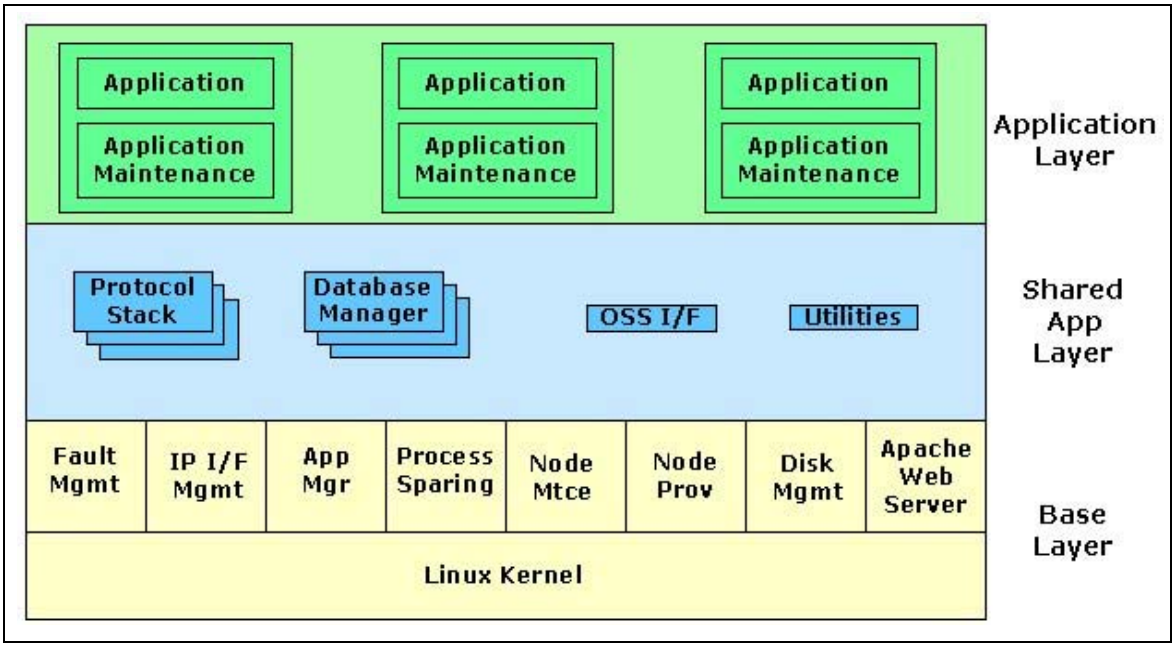
The HP-CC3310 provides processing, memory, and disk capacity for Storage Management (STORM), SIP, and planned SIP applications

119.4.2Software

The Session Server Manager Software has a layered architecture, which consists of the following:

- **The base layer**, which includes the Linux kernel along with a carrier-grade platform for fault management, sparing, and application initialization
- **A shared application layer**, which contains re-usable components that can be integrated as needed into higher level applications
- **An application layer** that includes a maintenance process for each application, which manages the associated processes.

Figure 6 Session Server Manager Software Architecture



119.4.2.1 Session Server Manager Base Layer

The base layer uses Linux version 2.4.22. This base layer provides Carrier Grade capabilities.

Note: This section represents an SN07 view.

Fault/SWACT Management

- Detects hardware faults on the platform
- Monitors for conditions that should prompt an activity switch
- Arbitrates failure requests from applications that need to initiate a SWACT.

IP Interface Management

- Maintains Gigabit Ethernet interfaces on the platform
- Allocates bandwidth to maintenance and application tasks
- Participates in the IP address takeover during an activity switch.

Application Manager

- Provides an interface for applications to bind their maintenance processes into the system
- Monitors and re-initiates application maintenance process as needed
- Provides a possible re-use of SDM application manager software platform.

Node Maintenance

- Provides interfaces for bringing the node into service and initiating application start-up
- Provides a craftsperson interface via a Web Server
- Supports manual and autonomous maintenance actions
- Monitors between active and inactive nodes to that insure failover can be initiated when running in synchronization.

Node Provisioning

- Provides a provisioning interface via Web Server for platform configuration parameters.

Disk Management

- Provides interfaces for disk access
- Supports the STORM application in CS 2000-Compact configurations.

Apache Web System

- Consists of Apache, Apache Tomcat, and Java Runtime environment
- Provides web-based interface for provisioning and maintenance
- Presents an integrated view for all applications running on the platform.

119.4.2.2 Session Server Manager Share Layer

The share layer contains reusable components that are independent of the applications using them.

Note: This section represents an SN07 view.

Application Data Synchronization

- Allows applications to checkpoint data between the active and inactive units at specific points in time.
- Supports variable length buffers that can be refined and versioned by the application

SIP Stack

- Provides an RFC-3261 compliant SIP interface, which can be incorporated into any application running on the platform
- Allows APIs and callback interfaces that permit applications to implement state machines based on event notifications.

Database Manager

- Provides persistent data storage for each application
- Introduces a SQL based database, which is accessed through ODBC and JDBC interfaces, that isolates each application from the underlying database product
- Supports data replication between active and inactive units, and ultimately between multiple active units.

Downstream Interfaces to Billing and OMs/Statistics

- Provides a collection point for billing, and OM data for the system
- Stores information to local disk, which can be accessed via maintenance interfaces
- Opens downstream feeds, in CS 2000 configurations, to SDM for billing and IEMS (Integrated Element Management System) for logs, alarms, and statistics.

Application-specific processes

These applications-specific processes include:

- An application maintenance process
  - — Initiates and then monitored by the base layer application manager
  - — Creates all other processes associated with the application
  - — Provides maintenance actions to transition the application in and out of service.
- Call/Transaction Processing process(es)
  - — Initiates and then monitored by base layer application manager
  - — Creates all other processes associated with the application
  - — Provides maintenance actions to transition the application in and out of service.

119.4.2.3 Session Server Manager Application Layer

The Application Layer consists of a set of applications. The applications may or may not communicate with each other. Each application includes a maintenance application used for monitoring and interacting with the application. The SIP Gateway is the initial application delivered on the Session Server Manager.

119.4.3CS 2000 Architecture with Session Server Manager

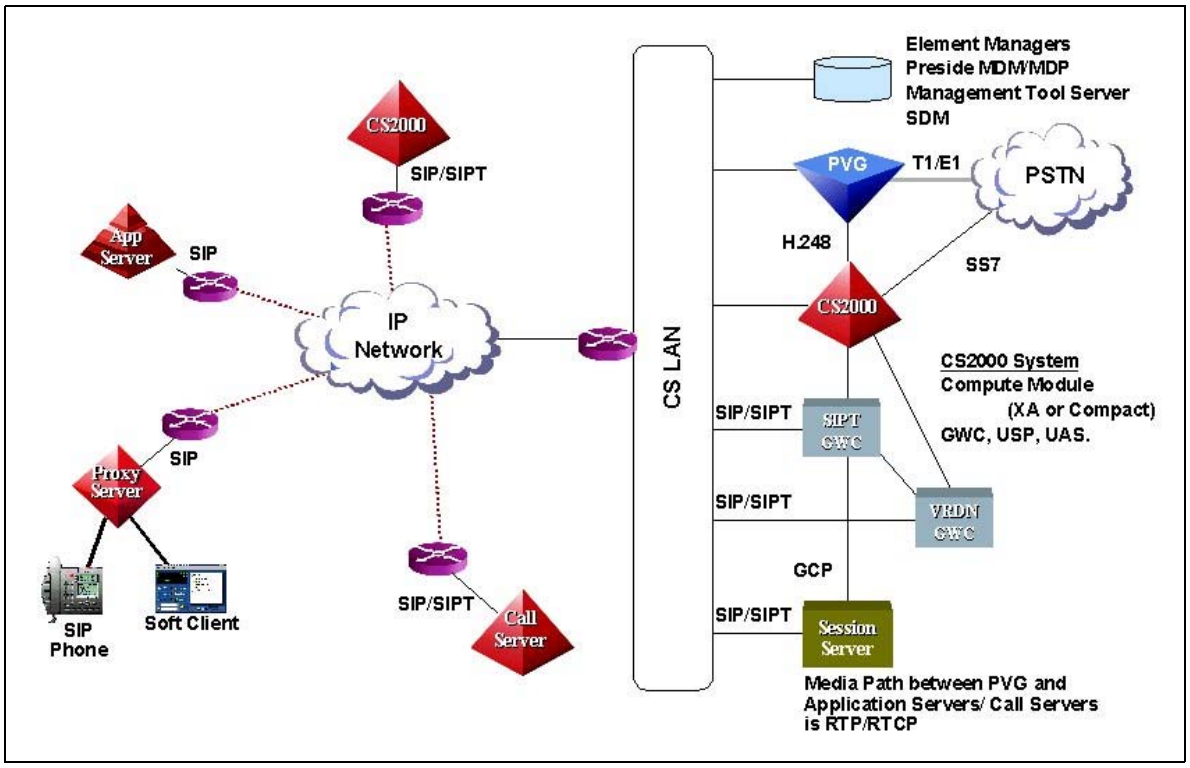
119.4.3.1 VRDN Present

With the Virtual Router Distribution Node (VRDN) present, the Session Server Manager is a peer to the VRDN. The SIPT Gateway Controller will maintain current calls through the VRDN, but will establish new calls through the Session Server Manager. Once the Session Server Manager is providing the SIP Call Processing function and no calls are left on the VRDN, the VRDN can be removed.

Note 1: Installation of the Session Server Manager at the Near End Call Server, requires actions at the Far End Call Server. These actions are addressed in the upgrade section.

Note 2: Once the Session Server Manager is installed in a SCS 2000, the VRDN is to be removed. A configuration with Session Server Manager and VRDN in the same SCS 2000, is only supported as an upgrade path.

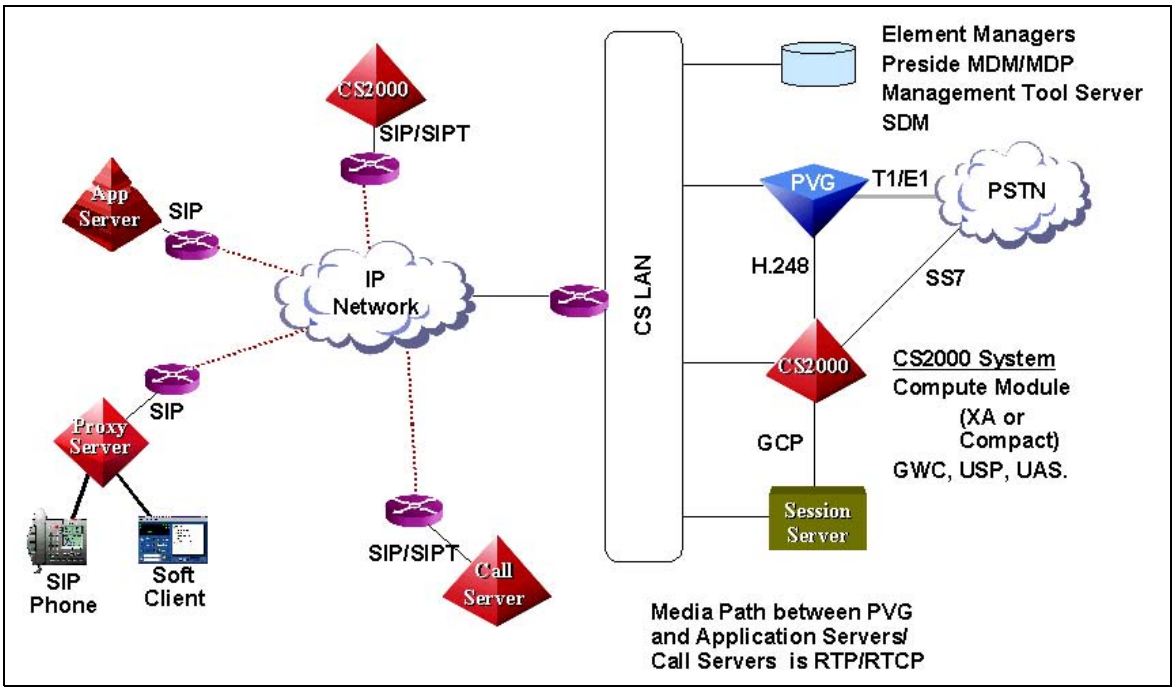
Figure 7 Session Server Manager with the VRDN present



119.4.3.2 VRDN not Present

When the VRDN is not present, the SIPT Gateway Controller establishes all calls throughout the Session Server Manager.

Figure 8 Session Server Manager with the VRDN not present



119.4.4Services and Features

The Session Server Manager interoperates with User Agents on the SIP Network.

- Calling Number Delivery / Blocking
- Calling Name Delivery / Blocking
- Suspend / Resume Handling

119.4.4.1 SIGNALING INTEROPERABILITY

- TDM signaling
  - — ANSI ISUP
  - — ANSI PRI
- Variants

  SIP Signaling from the Session Server Manager is tunneled into the CS 2000 as Dynamic Packet Trunks (DPT). The DPT trunk datafill in the CS 2000 DPT Trunks are provisioned as ISUP trunks. For the SIPT implementation, any variant is allowed for the DPT trunks. SIPT allows

transport of the ISUP payload in the SIP message. Transport is in accordance with the T1S1.7/2003-179R2 - T1.SIP Interworking Output Baseline Document.

SIP Gateways may not support SIPT and not provide an ISUP payload in the SIP message. When communicating with a SIP Gateway that does not provide ISUP payload in the SIP message, the CS 2000 can generate an ISUP payload; however, the payload will be based on the variant type of the DPT trunk. The SIP implementation can only generate ISUP payload for IBNT2 (for NA loads), IBN7 (for International loads), or IT.

Note: DPT trunks to SIP gateways can only be provisioned as IBNT2/ IBN7 or IT.

119.4.4.2 BEARER INTEROPERABILITY

- Media
  - — Fax -G3, T.38
  - — DTMF- In-band G.711, Out-of-band RFC2833
  - — CODEC -G.711 A/u-law, G.729a/b, codec negotiation
  - — H.248

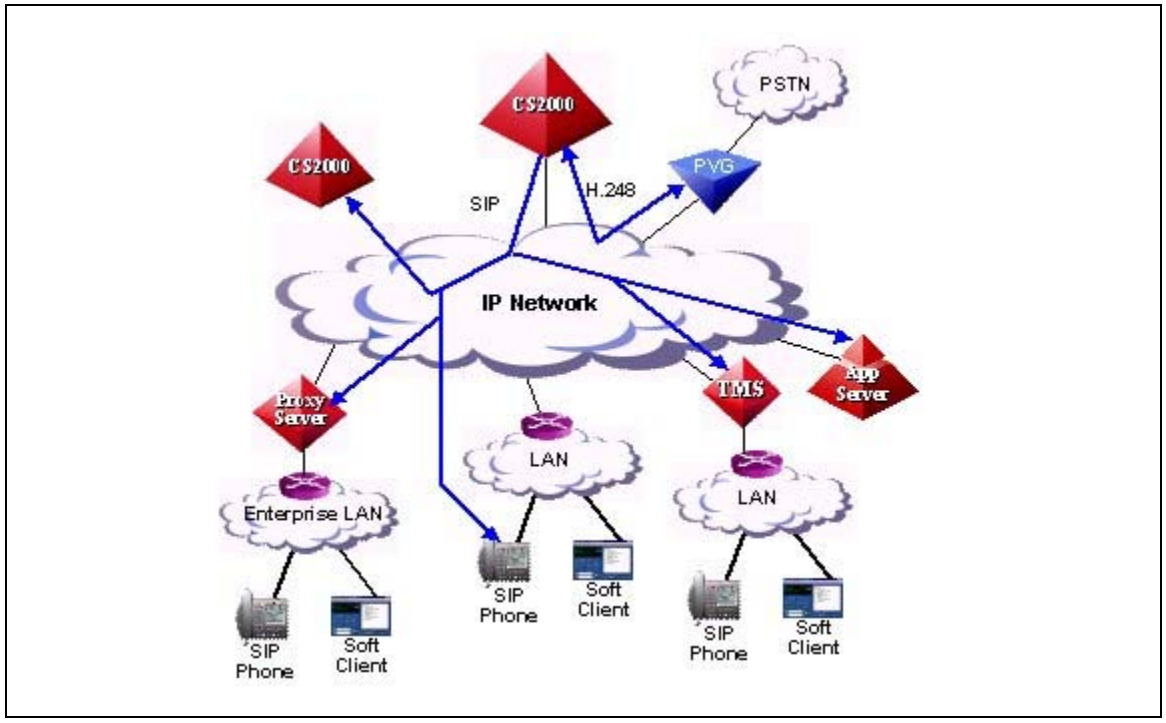
119.4.4.3 MCS & CS 2000 INTEROPERABILITY

- All SIPT supported services and functionality carried over from SN06 are supported on the Session Server Manager
- Backward SIPT compatibility with previous release
- CS 2000 with SN07 is supported with MCS 3.0.

119.5 SIP Compliancy

The initial offering is to allow interoperability with third party proxy servers and application servers. This implementation will update Nortel's compliance to the current IETF standards and drafts.

Figure 9 SIP Standards Compliance



The solution will provide support for (but not limited to) the following standards and drafts:

- RFC 3261[1] - SIP: Session Initiation Protocol
- RFC 3262 - Reliability of Provisional Responses in the Session Initiation Protocol (SIP)
- RFC 3326 - SIP Reason Header
- RFC 2976 - The SIP INFO Method
- RFC 3264[2] - An Offer/Answer Model with the Session Description Protocol (SDP)
- RFC 3265 – Specific Event Notification (SUBSCRIBE/NOTIFY)

[1]Session Server Manager commits to those requirements pertinent to a User Agent Client. Session Server Manager is not a User Agent Server, nor a Back to Back User Agent in SN07.
[2]For SIP to SIP calls, as a B2BUA, we are compliant with RFC 3264.
For SIP to H.248 calls, as a terminating gateway, we are partially compliant due to incompatibilities between the specifications.

- RFC 3311 - The Session Initiation Protocol (SIP) UPDATE Method
- RFC 3323 - A Privacy Mechanism for the Session Initiation Protocol (SIP)
- RFC 3325 - Private Extensions to the Session Initiation Protocol (SIP) for Asserted Identity within Trusted Networks
- Referred-by Mechanism – draft-ietf-sip-referredby-02
- Q.1912.5 - Interworking Between Session Initiated Protocol (SIP) and Bearer Independent Call Control Protocol or ISDN User Part
- SIP Replaces Header – draft-ietf-sip-replaces-03
- SIP Call Control Transfer – draft-ietf-sipping-cc-transfer
- T1S1.7/2003-179R2 - T1.SIP Interworking Output Baseline Document

119.6 SIP Call Processing

In the SN07 release of the Session Server Manager platform, the SIP Gateway application is the only application supported. This section discusses high-level details about this application, and the differences between the Session Server Manager- and GWC-based SIP call processing.

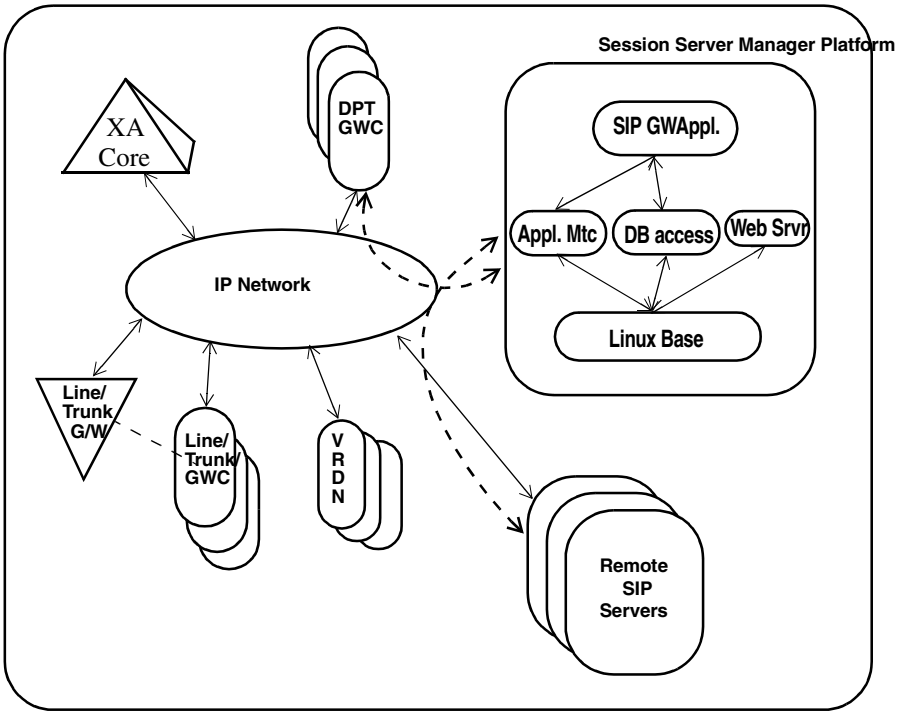
Also presented are example call flows for an incoming and outgoing SIP call.

119.6.1 Description and Overview

The SIP Gateway application on the Session Server Manager platform is the entity primarily responsible to set-up and tear-down calls, maintain accessibility to DPT GWCs and remote SIP servers, and other functions. The SIP Gateway application provides an RFC 3261 compliant SIP interface for interworking. This application also provides the necessary support to be compliant with other RFCs including 3262 (Reliability of Provisional Responses in SIP), and 3264 (SIP Event Notification Mechanism).

Figure 10 illustrates a high-level view of the Session Server Manager when placed within a SCS 2000 SIP solution.

Figure 10 Session Server High-Level view



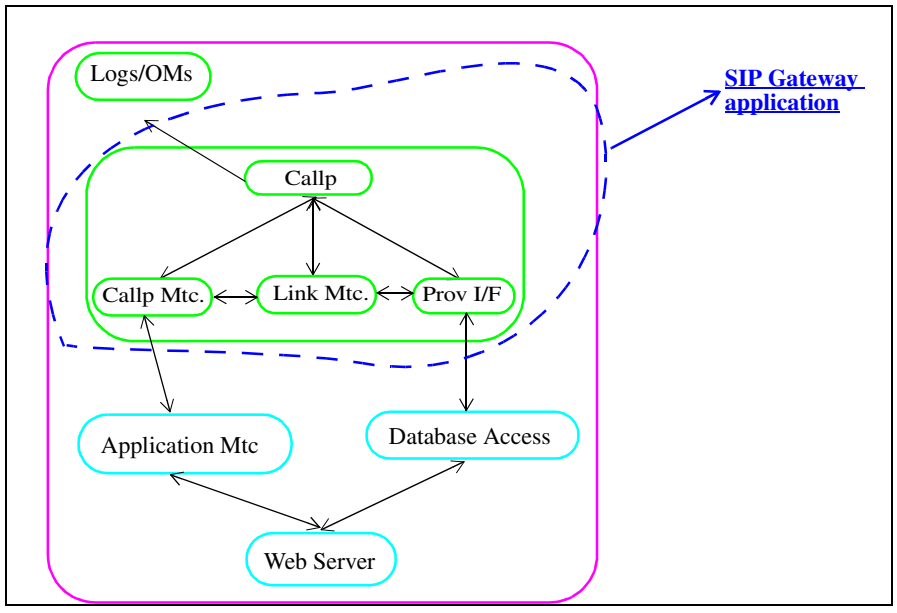
With the new platform, SIP call processing is done within the call processing application in the Session Server Manager. The Session Server Manager communicates with the DPT GWC in a generic call control/maintenance protocol, which will trigger the usage of Dynamic Packet Trunking (DPT) infrastructure to setup and tear-down calls.

As illustrated in Figure 10, "Session Server High-Level view", the Session Server Manager communicates with all the DPT GWCs as well as with remote SIP servers. In this model, all SIP-specific behavior is performed on the Session Server Manager as opposed to the GWC. CS 2000 SIP solution with a Session Server Manager does not require a VRDN, and the tasks originally performed by the VRDN are moved into the Session Server Manager.

Additionally, numerous configuration/maintenance capabilities are also provided within the Session Server Manager and are discussed in subsequent sections of this document.

The SIP Gateway application in the Session Server Manager interworks with different logical components, including call setup, maintenance, and provisioning, to satisfy different roles and responsibilities. Figure 11, "Session Server SIP Gateway application Logical View" illustrates the different logical components that constitute a SIP Gateway application.

Figure 11 Session Server SIP Gateway application Logical View



- **Call Processing Application:** This is the main component responsible for integrating different logical components to enable setup/tear-down of calls. It is responsible to send/receive incoming SIP messages, parse/analyze the message, and take appropriate action. It maintains a call state machine and

generates OMs and logs whenever necessary. It also triggers a billing application to generate a billing record for calls.

- **Call Processing Maintenance**: This component provides the interface for interworking with an application maintenance entity to perform maintenance activities on the SIP Gateway application. When a craftsperson performs a maintenance action, this component is ultimately notified and performs the necessary action. Please see “119.8.2.5 SIP Gateway application maintenance” on page 1406 for additional information.
- **Link Maintenance**: This component is responsible for maintaining the availability of remote SIP servers as well as the availability of SIP GWCs. When bringing the SIP Gateway application into the server, this component discovers and maintains the list of SIPT GWCs available for call processing. In addition, this component is also responsible for maintaining a list of remote SIP servers that are available for communication.
- **Provisioning Interface**: This component provides the call processing entity access to all the provisioned data. Call processing queries this component at various points, including startup, take-down, and call setup, to determine the course of action to be taken.
- **OMs/Logs**: Different components interact with OM/log subsystem to generate logs and OMs. Please refer to sections “119.8.2.7 Logs” on page 1413 and “119.8.2.8 Operational Measurements” on page 1415 for additional information.

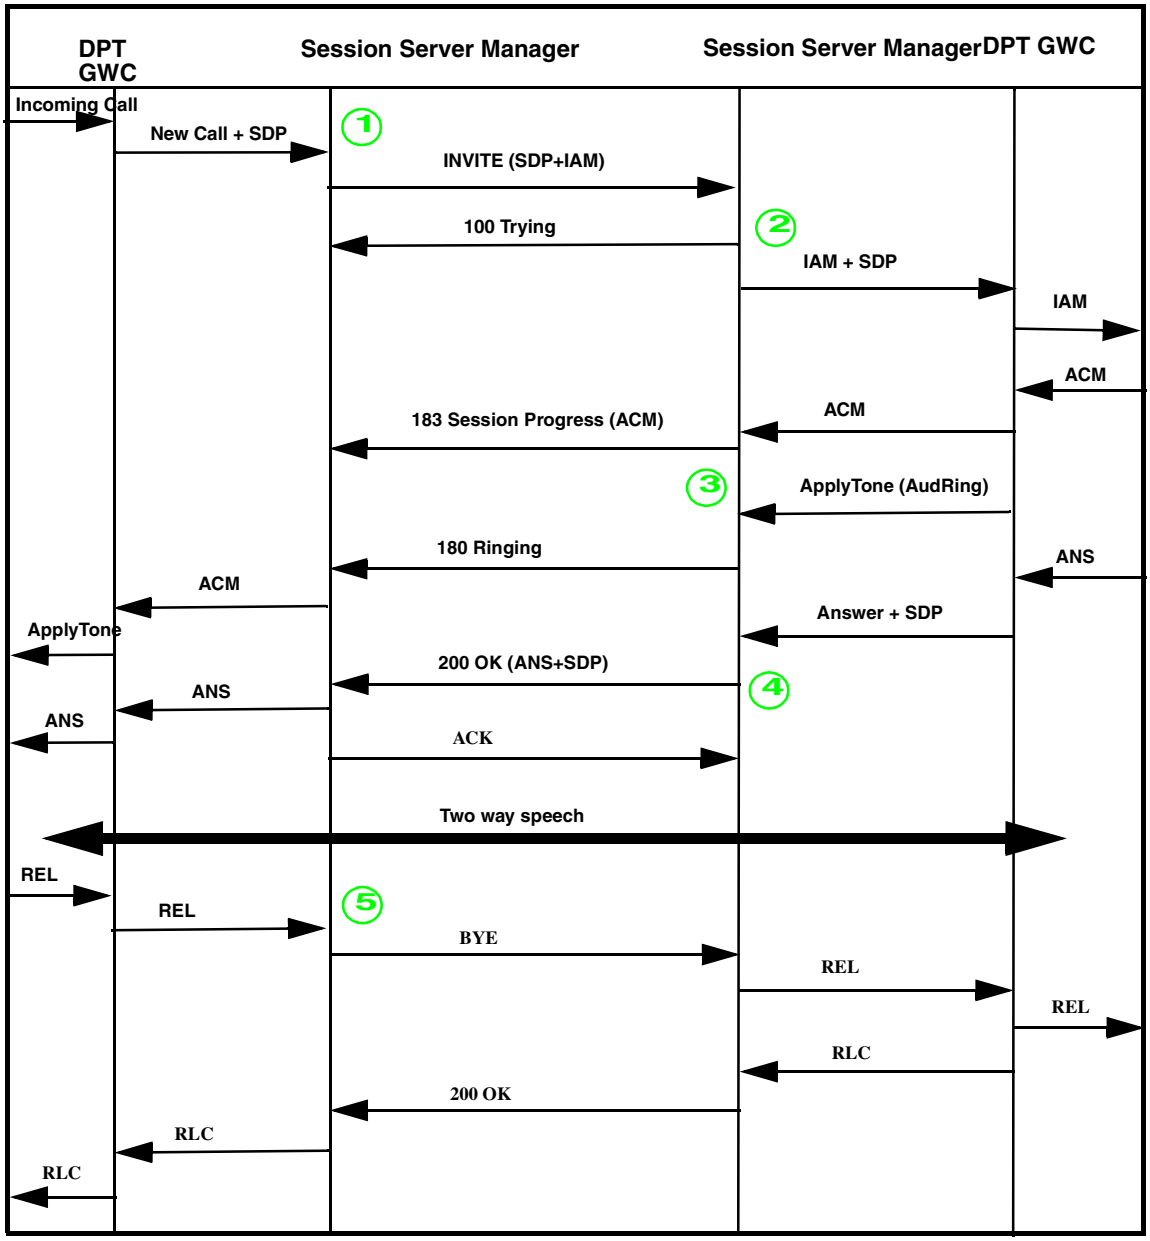
119.6.2Call Flows

Both incoming and outgoing calls between SIP and the Session Server Manager make use of table SIPLINK that is datafilled in the core. SIP Access Link name information from table SIPLINK is downloaded to the Session Server Manager during the DPT GWC discovery process. In order to have successful call processing with a remote SIP server, each remote SIP server must be associated with SIP Access Link name. The SIP Access Link name is uniquely associated with a trunk group in the Core which in-turn is used for set-up of translations for various call-types.

Please refer to configuration section of this document for more information on table SIPLINK.

Figure 12, "Sample Session Server Manager SIP Call Flow" captures a sample call flow for a SIP bridging scenario with Session Server Manager on both sides. Key points on the incoming and outgoing side of the call are discussed.

Figure 12 Sample Session Server Manager SIP Call Flow



For the purpose of this call flow, it is assumed that the core is already set up with translations to route the call over appropriate SIP trunk. A trunk is considered a SIP trunk if it is datafilled as SIPT in table TRKOPTS.

Also, it is assumed that the call flow is happening on a reliable transport protocol like TCP.

1. The core selects one DPT GWC to process the outgoing call. If there is more than one DPT GWC, then the core employs a round-robin algorithm to determine the GWC to which to present the call.

On receipt of the IAM message, the DPT GWC on receipt of the IAM message does the following:

a. Extracts the trunk information and determines if a SIP Access Link is associated with this trunk.

b. If a SIP Access Link is not associated with this call, the call is setup as a pre-Session Server Manager SIP call.

c. If a SIP Access Link is associated with this call, the IP address of the Session Server Manager is retrieved and the IAM is forwarded to the Session Server Manager. (The IP address of the Session Server Manager is sent to the GWC as part of the GWC discovery process. This is discussed in the configuration section).

d. The Session Server Manager then extracts the SIP Access information and retrieves information regarding the remote SIP server to which the call is intended.

e. The SIP INVITE message is constructed with appropriate headers, session description, and payloads (if applicable) and is sent to the remote SIP server.

A sample INVITE message is shown below:

```
INVITE sip:2461803@47.174.73.242 SIP/2.0
From: <sip:9192461802@47.142.210.200>;tag=c8d28e2f-13c4-3f7776e3-160d-41bac49c

"
```

2. On receipt of an incoming SIP call, the Session Server Manager sends back a 100 Trying message to the sending entity while the INVITE is processed. A call processing application retrieves the host or IP address information from the header information to determine the characteristics of the sending entity.

Once the remote server profile is retrieved, the SIPLINK name associated with the remote SIP server is retrieved. The ISUP IAM payload, if any, is also retrieved and forwarded to the DPT GWC along with the SIPLINK information.

The DPT GWC gets the SIP LINK information from the Session Server Manager and determines the trunk, on which the incoming call is processed.

A sample SIP 100 Trying message:

```

```

3. Once the incoming INVITE is processed, the remote SIP server can send any number of provisional responses (18X). ISUP payloads, such as ACM or CPG, are encapsulated in an appropriate provisional response if the remote server is capable of handling ISUP messages.

It is also possible that the provisional responses are used to apply local ringing and/or pass any media information to which the terminating side would like the originating side to hear.

A sample 183 Session Progress and 180 Ringing messages are as follows:

180 Ringing:

5. When either the originating or terminating sides ends the call, the ISUP REL message is forwarded to the Session Server Manager. The Session Server Manager then builds a SIP BYE message, encapsulates the ISUP message, if applicable, and sends it to the remote SIP server.

The remote SIP server on receipt of the BYE message, extracts the ISUP message, if applicable, and forwards to the DPT GWC on its way to the core. It also responds to the BYE with a 200 OK and encapsulates the ISUP RLC whenever applicable.

A sample BYE and 200 OK are as shown:

```

119.7 Carrier Grade Topics

This section describes various aspects of the Session Server Manager platform that contribute to making it a carrier grade product.

119.7.1Call Audits

The Session Server Manager platform provides a secondary call auditing capability for cleaning up stranded calls and reclaiming any call processing resources on the Session Server Manager not associated with valid calls. During normal operation, Session Server Manager calls will be cleaned up properly on call takedown or when a maintenance action results in calls being ended. The call audit assures that the calls are not left up indefinitely due to some type of lost message or other error condition.

Session Server Manager calls are audited in two directions. One audit is between the Session Server Manager and the DPT GWC associated with the call. A second audit is between the Session Server Manager and the remote SIP server associated with the call. Calls are terminated whenever any of three components (Session Server Manager, DPT GWC, or remote SIP server) do not recognize the call being audited.

Call audits between the Session Server Manager and the remote SIP server can be configured to on a per SIP server basis, using either a SIP Info message or a SIP re-invite. When provisioning the Remote SIP Server, the “Use Info for Long Call Audit” parameter can be set to Yes or No to indicate whether to use the “SIP Info message” or not. Refer to “119.8.2.4.2 Remote SIP Servers” on page 1379 for details on provisioning or modifying Remote SIP Server datafill.

If the SIP Info audit method is specified, the Session Server Manager will send a SIP Info message to the SIP server destination at regular intervals. If no response is received on two successive audit attempts or if an error response is received, the call will be taken down.

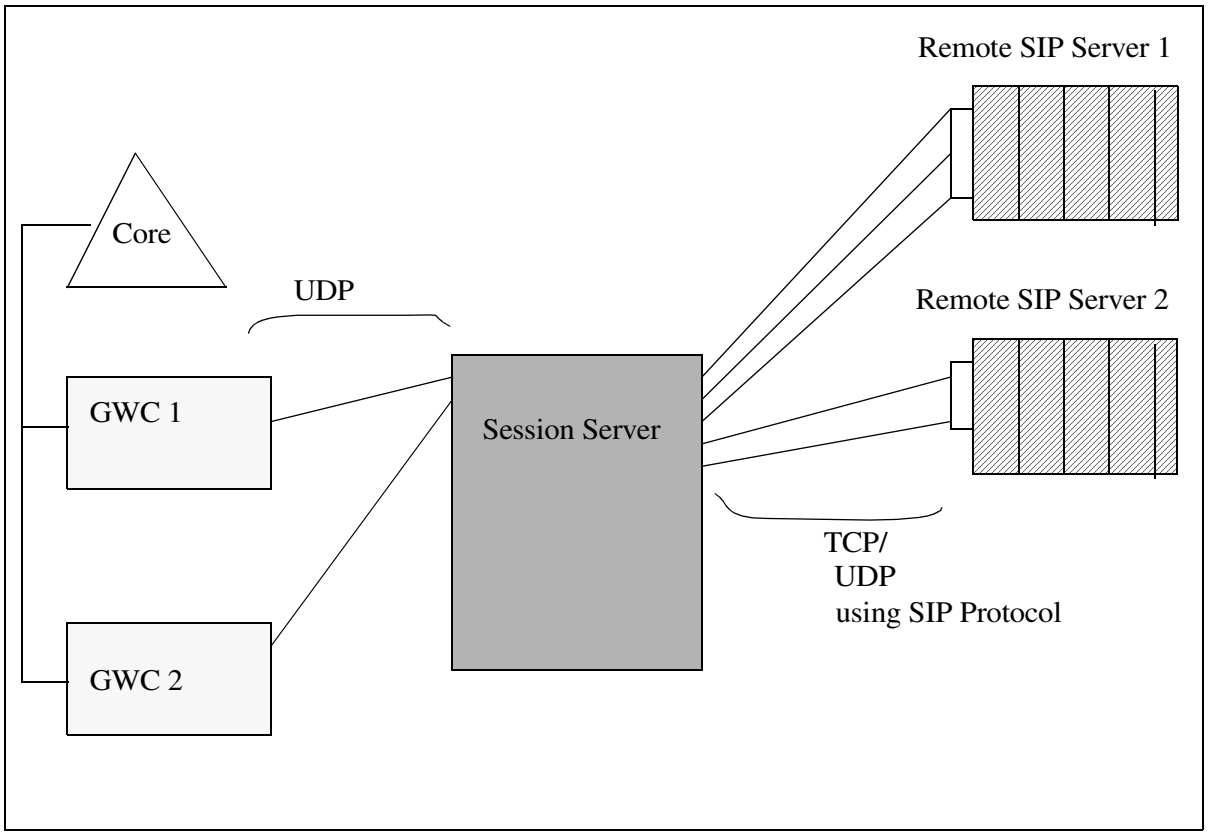
If the remote SIP server does not support the SIP Info message for this purpose, the SIP server must be configured to use the SIP re-invite method for auditing. If this approach is selected, a SIP Invite will be sent at regular intervals for a call once it is answered. Again, successive failures or no response results in the call being taken down. If the call is not answered after multiple audit intervals, the call will be taken down.

119.7.2Link failover mechanism

The link failover mechanism involves routing calls and verifying connectivity between the Gateway Controller (GWC) and the Session Server Manager platform and between the remote Media Gateway Controller (MGC) and the Session Server Manager. The remote SIP server could be a proxy server or a final destination.

Communication between the GWC and the Session Server Manager is accomplished with a normalized proprietary protocol using UDP as the transport medium. Communication between the Session Server Manager and the remote SIP server is through SIP or SIPT with a transport medium of either UDP or TCP. The diagram below illustrates the connectivity between the different entities.

Figure 13 Component Connectivity



To ensure that the remote SIP server is ready to receive messages from the Session Server Manager, an audit mechanism is optionally established between the Session Server Manager and its associated remote servers. The audit mechanism is accomplished by the Session Server Manager sending the SIP OPTIONS request message to the SIP servers upon a consistent interval and waiting for the response. This ability will be configurable per remote server.

When provisioning the Remote SIP Server, the "Options Supported" parameter can be set to Yes or No to indicate whether to use the "Options Supported message" or not. Refer to "119.8.2.4.2 Remote SIP Servers" on page 1379 for details on provisioning or modifying Remote SIP Server datafill.

When the Session Server Manager sends out a SIP OPTIONS message, if a time-out occurs or any failure causes the server using that IP address to be unreachable, the failure count is updated for that IP address. Whenever a message is received on

that IP address, the failure count is reset. If the failure count reaches a specified threshold, the IP address is marked as inactive. If a new message is received on the inactive IP address, it is then reset to ACTIVE.

When all the IP addresses for a particular remote server are marked as inactive, each GWC is sent an access link status message indicating that the link is down. Additionally, an alarm will be raised on the Session Server Manager indicating the SIP-Server message path failure. When at least one IP address for that server becomes responsive, each GWC is sent an access link status message indicating that the link is up.

If a particular server does not care to support the OPTIONS message exchange capability, then its associated access links may appear to be always active. However, if repeated attempts to send SIP messages to a particular destination on a given IP corridor consistently result in failure, then once a threshold of failure has been attained, the access link will be considered out of service. As in the OPTIONS scenario, this results in the transmission of an access link status message to the GWC/Core to indicate the change in status. The access link will be returned to service upon receiving a new call from the IP address in question. In addition, the failed link will periodically be retried for call processing to determine if the link has become active again. If the link continues to fail on these retries, the link will remain out of service and any other IP routes provisioned for the destination SIP server will be used to complete the call.

Additionally, if a particular access link has been orphaned from its server destination, i.e., provisioning has removed a particular access link's remote server association, then this will be treated in the same manner as an audit failure.

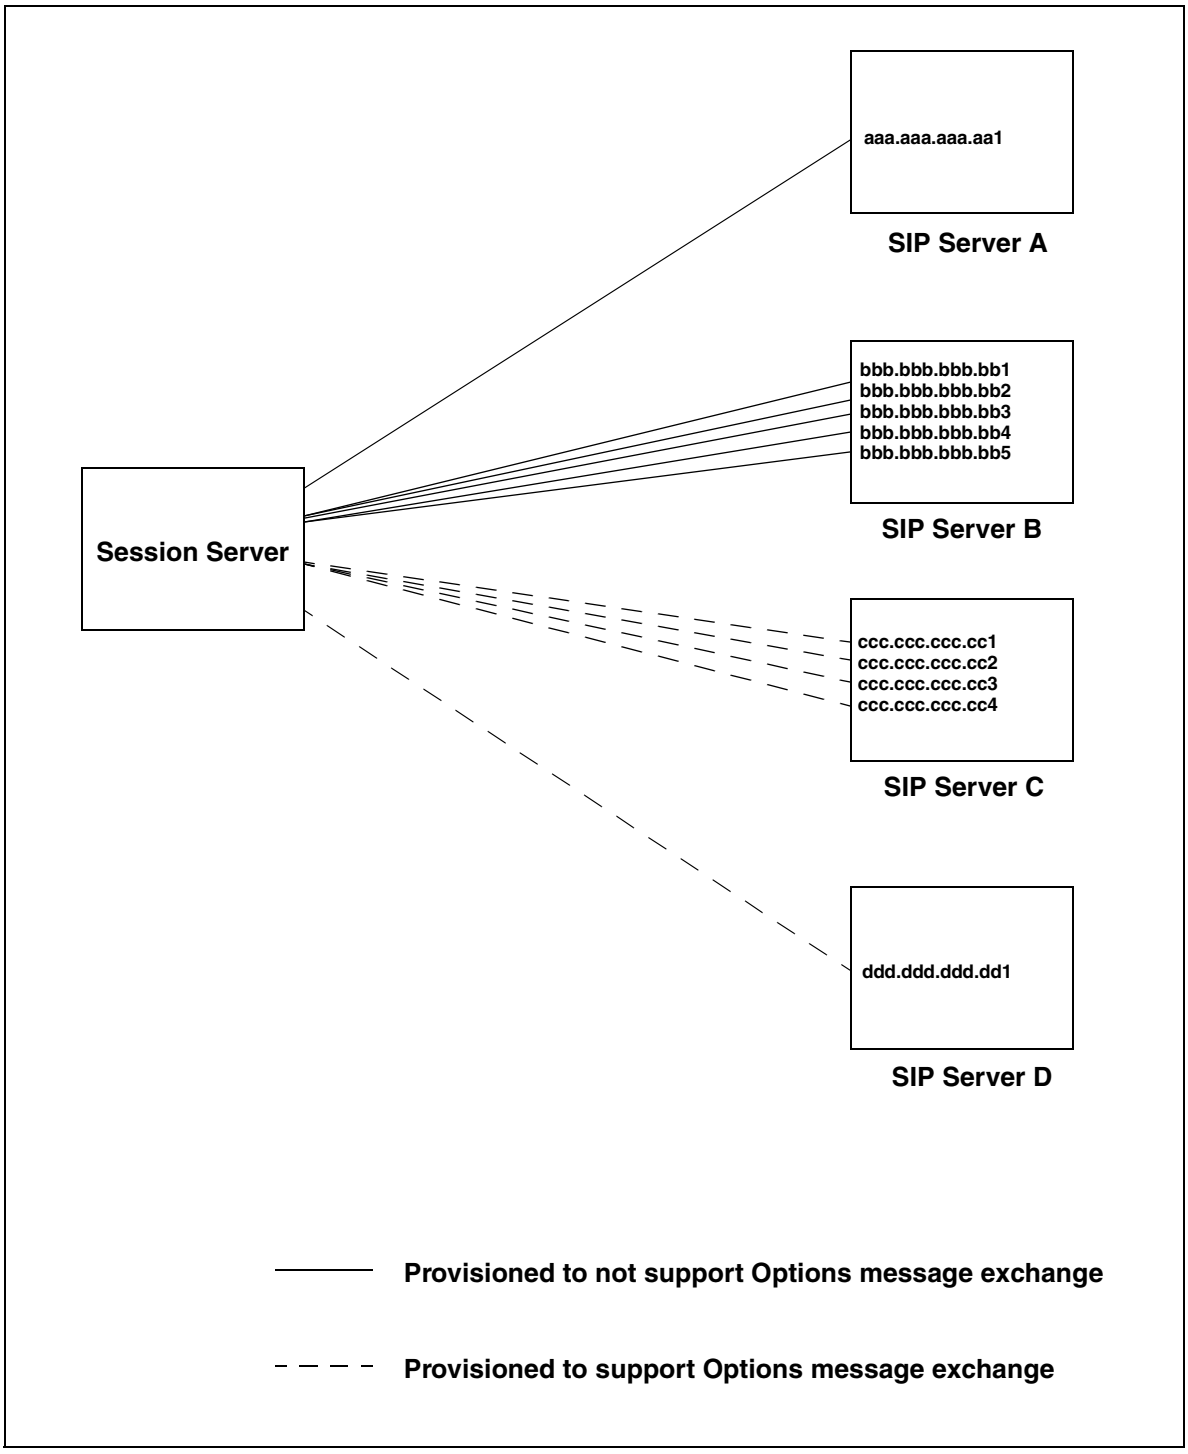
The Session Server Manager is also responsible for responding to SIP OPTIONS messages sent from remote SIP servers. Depending on the maintenance state of the Session Server Manager, it will either respond with a 200 OK (Session Server is in service) or with a 503 (Session Server is in deload or BSY state). When the Session Server Manager is in the deload or BSY state, it will not send SIP OPTIONS messages at each audit interval.

To summarize, link viability to a remote SIP server may be maintained in various different ways based on provisioning and network configuration.

1. Server A in Figure 14 depicts an access link with a singular IP presence may be configured to disable the OPTIONS message exchange mechanism. From the Session Server Manager viewpoint, this connection is always active regardless of the actual transport status, until it achieves a specific level of consistent failure. At this point the access link will be removed from service.

2. As shown in Figure 14 by server B, an access link provisioned to not support OPTIONS messages may consist of multiple IP address destinations. These multiple IP addresses are progressively stepped through service calls bound for the remote SIP server on the given access link. In this setup, if some transport layer problem is encountered, the next IP destination in the list may be attempted until all possible routes are exhausted. Again, if all routes surpass the send failure threshold, the access link will be removed from service.
3. In the figure, the access link to server D is comprised of a single IP address configured to support OPTIONS messages. With the OPTIONS messaging ensuring a valid network connection to the server, any call that reaches the Session Server Manager bound for server D is much more likely to find its intended IP tunnel open. However, as in the server A configuration, if some transient network fault occurs that was not detected by the audit mechanism prior to an attempted message transmission on the link, there is no further fallback mechanism.
4. The final permutation of OPTIONS support and IP presence is embodied in the server C connection. This setup ensures messaging link integrity while also providing the ability to round-robin through the suite of possible destinations to the server if a transient network failure is encountered.

Figure 14 Maintaining SIP Server Links from the Session Server Manager



119.7.3Link Status in the CM

In the CM, the status of an access link can be monitored by posting the associated SIPT trunk group[1] at the MAPCI;MTC;TRKS;DPTRKS level of the MAP. Since the CM has no direct communication with the Session Server, it is dependent on receiving link status information from the SIPT gateway controllers, who receive Access Link Status messages from the Session Server and pass them on to the core.

The status of the access link on the Session Server is determined using the strategy discussed in the previous section (Link Failover Mechanisms). Any change in a link's status detected by the Session Server is immediately propagated to each SIPT gateway controller, then to the core. As long as there is stable communication between the core and at least one SIPT gateway controller and the session server, the status of a SIPT trunk in the CM should mirror that of its associated access link.

For a trunk to be INS at the DPTRKS MAP level, the following conditions must exist:

- On the Session Server, the access link associated with the trunk must be mapped to a Remote SIP Server.
- On the Session Server, the associated Remote SIP Server must have at least one active IP connection. An active connection is defined as one of the following:
  - For a Remote SIP Server configured to support SIP OPTIONS messaging for heartbeats, a connection is active if the Session Server is receiving timely 200 OK responses to its SIP OPTIONS requests on at least one of the IP connections to the remote server.
  - For a Remote SIP Server that doesn't support OPTIONS for heartbeats, a connection is active if the Session Server is successfully sending and/or receiving SIP messages at a level above the failed message threshold on at least one of the IP connections to the remote server. Note that by default the connection is considered active until proven otherwise by exceeding the failed message threshold during call processing.
- The Session Server application must be UNLOCKED.
- In the CM, at least one SIPT GWC must be in-service at the MAPCI;MTC;TRKS;DPTTRM level of the MAP.

When the last of these conditions is met, the Session Server sends an Access Link Status message indicating the link is up to each SIPT GWC. The gateway controllers then propagate the message to the CM, resulting in the state of the trunk group changing to INS.

[1]The association of the trunk group to an access link is defined in CM table SIPLINK.

Once a trunk group is INS, a failure of any of the first three conditions will cause the Session Server to send an Access Link Status message indicating the link is down to each SIPT GWC. The gateway controllers then propagate the message to the CM and the CM changes the status to SYS.

If a situation occurs where there are no longer any in-service SIPT GWCs, the CM changes the state of the trunk to SYS. This is the only time the CM undertakes unsolicited action to remove a link from service; otherwise, link status in the core is totally under the control of the Session Server. In other words, when at least one SIPT GWC is in-service at the DPTTRM level, the only way the trunk group's state can be changed (other than by manual intervention) is if the Session Server sends an Access Link Status message to report the state change.

If the Session Server goes out of service due to a system failure or because of improper shutdown (which would disrupt the ability to send the Access Link Status message to the gateway controllers), all INS SIPT trunks associated with any access links on the Session Server will remain INS.

119.7.4Scalability and Load Balancing

In the initial release of the Session Server Manager product, a single redundant pair of Session Server boxes will satisfy the call volume requirements. If call volume requirements increase in the future, later releases of the Session Server Manager product will address the need to expand the network to include multiple redundant pairings of Session Servers.

If additional DPT GWCs are required to handle increased call volume, they can be introduced without any impact to call processing. In addition to the normal commissioning and provisioning required to add a new DPT GWC, the IP address of the GWC(s) must be added to the list of GWCs connected to the Session Server Manager. This change is done through the web provisioning interface on the Session Server Manager and it can be made while the Session Server box is in service. The new GWC(s) will be used for call processing once they are brought in service. The Session Server Manager uses a simple round-robin scheme to distribute incoming calls across all in-service DPT GWCs.

119.7.5Performance

The committed performance of the Session Server Manager, in SN07, is to meet VRDN equivalency. The VRDN currently supports a call rate of 900K Busy Hour Half Call Attempts (A half call is either the originating leg of a call, or the terminating leg).

The Session Server Manager will support up to 37,5000 simultaneous calls. Given a call model of 2 minute hold time and 30 second intercall delay, this provides a capacity of 900K BHHCA.

119.7.6Upgrades

This section describes the upgrade procedures for offices that want to introduce the Session Server Manager platform into their network. Procedures vary depending on whether the office was previously running SIPT traffic using the VRDN architecture or not. The following topics are covered in this section:

- Upgrading an SCS 2000 office to include the Session Server Manager when SIPT traffic was not previously handled in the office.
- Upgrading an SCS 2000 office to include the Session Server Manager and migrating existing SIPT traffic from the VRDN architecture to the Session Server Manager platform.
- Upgrading the Session Server Manager with new software loads and/or maintenance releases (MRs).

119.7.6.1 Upgrading to Session Server Manager without VRDNs

This section is for offices that did not have SIPT traffic prior to introducing the Session Server Manager platform. Before the Session Server can be inserted in the network, the CS 2000 must first be upgraded to an SN07 or later release. Adding the Session Server Manager is a completely separate step from upgrading the office and sufficient soak time should be employed after the upgrade to SN07 or later, before the Session Server Manager platform is introduced.

The normal upgrades steps should be followed for upgrading the CS 2000, including upgrading peripherals and the DMS core. In addition to requiring an SN07 or later core release, the Session Server Manager platform also requires that all DPT GWC peripherals be at an SN07 or later release. Since the office was not previously running SIPT traffic, DPT GWCs may need to be added or existing TDM GWCs need to be converted to DPT GWCs. The normal procedures for adding or converting to DPT GWCs should be followed, there are no new commissioning or provisioning steps required for the DPT GWCs in order to have them work with the Session Server Manager platform.

Once the upgrade is complete and the DPT GWCs are in place, the following steps should be followed to add the Session Server Manager platform:

- Connect the Session Server Manager hardware platform to the CS 2000 LAN.
  Please refer to feature *NCGL support for SAM-XTS and SP2000*, A00004005 for connection information.
- Commission the Session Server Manager platform.
  Please refer to feature *NCGL support for SAM-XTS and SP2000*, A00004005 for commissioning information.
- Provision core tables to add DPT trunks (TRKGRP, TRKSGRP, and TRKOPTS) and to map the new DPT trunks to SIP access link names in

new table SIPLINK. For more information see “CS 2000 OAMP” on page 1366. In a later step, the SIP access links will be mapped to remote SIP server destinations through the Session Server Manager web interface.

- Provision the Session Server Manager platform using the web interface. For more information see “Session Server Manager OAMP” on page 1368.
- Bring DPT GWCs and DPT TIDs in service, if that hasn’t been done already. This is done using normal procedures for DPT GWCs.
- Bring the CSC 2000 - SIP Gateway application in service using the web interface. For more information see “SIP Gateway application maintenance” on page 1406.
- Once all components (DPT GWCs and Session Server application) are in service, access link names provisioned in core table SIPLINK are transferred to the Session Server Manager and can be seen through the web interface. Complete the Session Server Manager provisioning by mapping the access link names to remote SIP server destinations. For more information see “CS 2000 OAMP” on page 1366.
- Change DMS translations as appropriate to make use of the new DPT trunks for both incoming and outgoing calls. Once the translations changes are made, SIP traffic can begin to flow through the Session Server Manager platform. Customers may choose to route only a small set of test traffic through the Session Server Manager at first, before completing translations changes to include all the desired SIP/SIPT traffic.

119.7.6.2 Upgrading to Session Server Manager with VRDNs

This section is for offices that have existing SIPT traffic using the VRDN architecture and the Session Server Manager is being introduced as a replacement for the VRDNs. With the SN07 release of the Session Server Manager product, SCTP is not a supported transport protocol for SIPT traffic. Therefore, existing SIPT traffic through VRDNs using SCTP cannot be migrated to the Session Server Manager. If UDP is used for the SIPT traffic through the VRDN, that traffic can be migrated to the Session Server Manager using the procedures defined in this section.

Before the Session Server Manager is introduced, the office must first be upgraded to an SN07 or later release. During and immediately after the upgrade, SIPT traffic will continue to flow through the VRDNs. DPT GWCs with an SN07 or later load are capable of handling both traffic through VRDNs and traffic through the Session Server Manager at the same time.

Other than upgrading the DPT GWCs to an SN07 or later release as part of the upgrade process, no additional provisioning changes are needed to make the DPT GWCs work with the Session Server Manager.

Once the CS 2000 upgrade is complete and sufficient soak time has passed to ensure that the upgrade was successful, the Session Server Manager platform can be introduced. The following steps should be followed to add the Session Server Manager and migrate SIPT traffic from the VRDNs to the Session Server Manager:

- Before installing the Session Server on the SN07 CS2K that is being upgraded, be sure that all SN06 CS2Ks that exchange SIP-T traffic with this office have the appropriate core and GWC patches applied. SN06 core patches ATM83P2F and ATM84P2P must be applied to allow the destination IP address of the SN07 CS2K to be changed in table MGCINV. Do not make this configuration change at this time, just make sure the patches are applied. GWC patch XZB41GZU must be applied to all DPT and VRDN GWCs at the SN06 switches to allow them to receive SIP traffic from the Session Server.
- Connect the Session Server Manager hardware platform to the CS 2000 LAN.
  Please refer to feature *NCGL support for SAM-XTS and SP2000*, A00004005 for connection information.
- Commission the Session Server Manager platform.
  Please refer to feature *NCGL support for SAM-XTS and SP2000*, A00004005 for commissioning information.
- Provision new core table SIPLINK with SIP access link names. SIP access links are mapped to SIP server destinations through the Session Server Manager web interface in a later step. In this step, DO NOT provision any DPT trunks against the SIP access link names in table SIPLINK. Instead, use '$' when provisioning the DPT trunk in table SIPLINK. Table SIPLINK will be revisited at a later step to add the trunk-to-link mapping when it is time to actually swing outgoing traffic from the VRDN to the Session Server Manager.
- Provision the Session Server Manager platform using the web interface. For more information see "Session Server Manager OAMP" on page 1368.
- Bring the SCS 2000 - SIP Gateway application in service using the web interface. For more information see "SIP Gateway application maintenance" on page 1406.
- Once all components (DPT GWCs and Session Server Manager application) are in service, access link names provisioned in core table SIPLINK are transferred to the Session Server Manager and can be seen through the web interface. Complete the Session Server Manager provisioning by mapping the access link names to remote SIP server destinations. For more information see "Session Server Manager OAMP" on page 1368.
- At the beginning of this step, all incoming and outgoing SIPT traffic continues to flow through the VRDNs. To swing outgoing SIPT traffic

from the VRDN to the Session Server Manager, revisit core table SIPLINK and change the tuples to include the appropriate DPT trunks against the appropriate access link names. Customers may choose to swing only one trunk at first to test the Session Server Manager, perhaps even adding a new DPT test trunk for this purpose. Note that the remote SIP server provisioning done through the web interface on the Session Server Manager should point to the VRDNs on remote CS2Ks. The remote VRDNs are capable of receiving SIPT traffic from DPT GWCs (pre-migration, if UDP transport is used), or from a Session Server Manager (once a trunk is migrated). Once table SIPLINK is changed, new outgoing calls on the affected DPT trunk will route through the Session Server Manager while existing calls finish up through the VRDN.

- To route new incoming calls through the Session Server Manager, the SN06 core and GWC patches mentioned earlier should have been applied on all CS2Ks that send SIPT traffic to the office being upgraded. Assuming the patches are applied, change the destination IP address in table MGCINV for the switch that has been upgraded. The IP address used to be the IP address of the VRDN on the upgraded switch and it must now be changed to be the IP address of the Session Server Manager. Note that the patches are only required if the remote CS 2000 is not being upgraded to SN07. With an SN07 or later load in the remote CS 2000, the IP address can be changed in table MGCINV without needing a patch. Also, the customer can skip the IP address change altogether if the remote CS 2000 is also being upgraded to include a Session Server Manager. In that case, the DPT trunks can be migrated to the Session Server Manager, which will be configured to send calls to the Session Server Manager on the other switch. Note that VRDNs are required at an office until all incoming and outgoing traffic have been migrated to the Session Server Manager. It should also be noted that the destination IP address for a SIP server configured in the Session Server Manager can be changed on the fly. This is required if the Session Server Manager was sending calls to a remote VRDN and then that remote office is upgraded to use the Session Server Manager.
- In addition to remote CS2Ks, it is possible that the upgraded CS 2000 was also receiving incoming SIP traffic from an IMS. In that case, the IMS configuration data must also be changed to send calls to the Session Server Manager instead of sending calls to the VRDN.
- Once all incoming and outgoing traffic has been migrated from the VRDN to the Session Server Manager, the VRDN GWCs can be removed or converted to another type of GWC.

119.7.6.3 Electronic Software Delivery

Session Server Manager software loads can be delivered by CD or electronically. To deliver the SIP Gateway application electronically, follow these steps:

- First, be sure that the NCGL platform software is installed on the Session Server Manager. Please refer to feature A00004005, Nortel Carrier Grade Linux (NCGL) platform "Session Server" for installation information.
- Transfer the ISO image containing the SIP Gateway application load to the /opt/swd directory on the Session Server Manager. Note that this directory has a size of 1GB and can contain no more than four SIP Gateway loads at once. Be sure to delete old loads to make room for the new load being delivered.

  e.g.: scp <iso image> mtc@<Session Server IP addr>:/opt/swd
- Log into the command line on the Session Server Manager as root.
- Verify that the /cdrom device is not currently mounted by typing:

  umount /cdrom
- Mount the ISO image that was transferred electronically to the /cdrom device:

  mount -o loop /opt/swd/<ISO image> /cdrom
- Follow the instructions below to upgrade or install the SIP Gateway application.

119.7.6.4 Upgrading a Session Server Manager load

Upgrading a Session Server Manager with a new software release or a maintenance release is very much like upgrading any other DMS component. Session Server Managers are deployed in redundant pairs, one box acting as the active unit and another box acting as a hot standby (the inactive unit).

Use the following steps to upgrade:

- Deliver the software load to the inactive unit to be upgraded:

  Note 1:The software load may be delivered by CD or electronically. For instructions on electronic deliver, please refer to section119.7.6.3.

  Note 2:For CD delivery, insert the CD in the CDROM drive and type "mount/cdrom" at the command line.
- Install the SIP Gateway application from the command line.
  Note: The user must be logged in as root.

  Type:

  — cd/cdrom

  — ./InstallApps (or just type cd/cdrom/InstallApps)

  InstallApps will prompt the user to proceed with the upgrade.

- Once the InstallApps script is finished, the SIP Gateway application should come in-service automatically if it is in-service on the active unit.
- Swact the Session Server Manager using the web interface. For more information see “SIP Gateway application maintenance” on page 1406.
- Repeat the procedures for the previously active unit, which is now inactive.

119.8 OAMP

This section describes the Operations, Administration, Maintenance, and Provisioning functionality when utilizing a Session Server Manager architecture. While a majority of the OAMP functions now reside on the Session Server Manager itself, the Call Server 2000 (CS 2000) core does have OAMP changes.

This OAMP section focuses heavily on the first application to be deployed on the Session Server Manager. This application, also referred to as the SIP Gateway, should be assumed to be the main topic of discussion with respect to Session Server Manager operations, administration, maintenance, and provisioning.

119.8.1CS 2000 OAMP

Call Server 2000 Core OAMP changes revolve around new table SIPLINK, which is the trigger point for calls utilizing the Session Server Manager platform as opposed to the VRDN. Also, part of the CS 2000 OAMP changes for an Session Server Manager-only environment involve the retirement of several media gateway controller related tables

The below figure illustrates the table control relationships for gateway controllers in a Session Server-only environment. This is followed by a brief description of each table. Not every possible DMS table is shown and described.

Figure 15 Core OAMP hierarchy with Session Server Manager

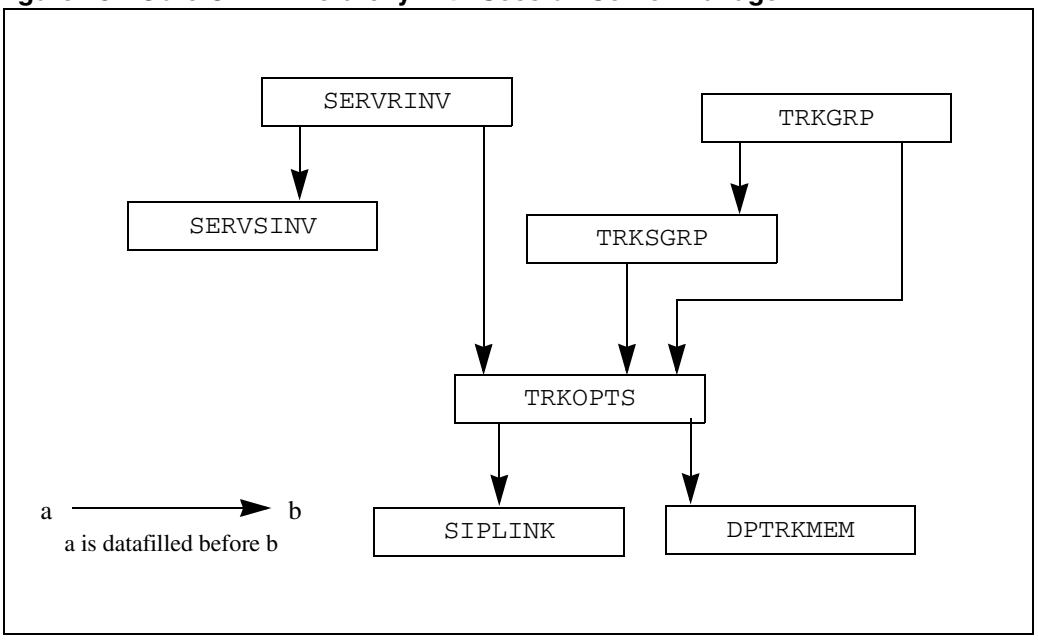


Table 3 Table Descriptions

Table	Description
SERVRINV	Stores provisioned data for gateway controllers including IP addresses, exec information, etc. Gateway controllers are provisioned in CS2M and then the system automatically enters required datafilled in SERVRINV
SERVSINV	Contains the names of the server subtending nodes and their associated gateways. The subtending nodes are the Audio Controller and the Dynamic Packet Trunk (DPT).
SIPLINK	Contains the access link information that is used to direct calls to the appropriate SIP server. This information is also used by Session Server devices for mapping incoming calls.
TRKGRP	Contains customer-defined data associated with each trunk group that exists in the switch.
TRKSGRP	List the supplementary information for each subgroup that is assigned to one of the trunk groups listed in table TRKGRP.
TRKOPTS	Provisions special options on trunk groups. For the Session Server Manager, that option is dynamic and the signaling type is SIPT.
DPTRKMEM	Used to provision ISDN User Part and SIP trunks dynamically for both ATM and IP networks.

The major differences between the old and new data models with respect to core provisioning are as follows:

- Retirement of tables VRDNINV, MGCINV, and TELEPROF. These three table are unnecessary when Session Server Manager functionality is utilized.
- Table SIPLINK is added to contain the access link information.
- Tables TRKGRP, TRKSGRP, TRKOPTS, DPTRKMEM, SERVSINV, and SERVRINV remain unchanged.

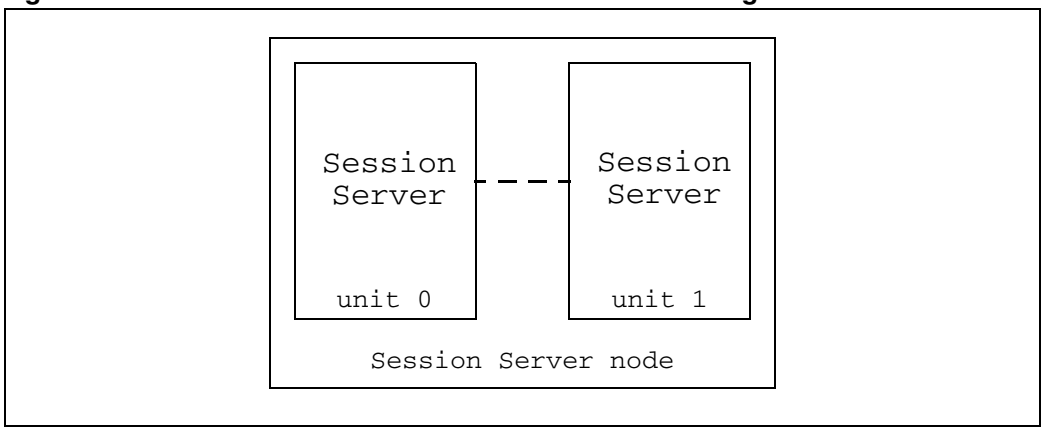
119.8.2Session Server Manager OAMP

This section discusses Operations, Administration, Maintenance, and Provisioning (OAM&P) topics for the new Session Server Manager platform. Topics discussed include the following:

— OAM&P Overview
— Node Provisioning
— Node Maintenance
— SIP Gateway Provisioning
— SIP Gateway Maintenance
— Alarms
— Logs
— Operational Measurements

Before jumping into the sections mention above, a distinction should be made with respect to the Session Server Manager product release and this document. In the SN07 release, the architecture for the Session Server Manager will consist of a dual unit configuration similar to that of gateway controllers. The units consists of an active and inactive unit. Each unit is in reality a fully functional Session Server Manager that is interconnected via a gigabit ethernet LAN.

Figure 16 SN07 Architecture for the Session Server Manager



119.8.2.1 Overview

For the SN07 release of the Session Server Manager, there are four major OAMP areas to discuss. Those areas are as follows:

— Web Based OAM&P
— Provisioning Framework
— Application Maintenance
— Alarms, Logs, and OMs

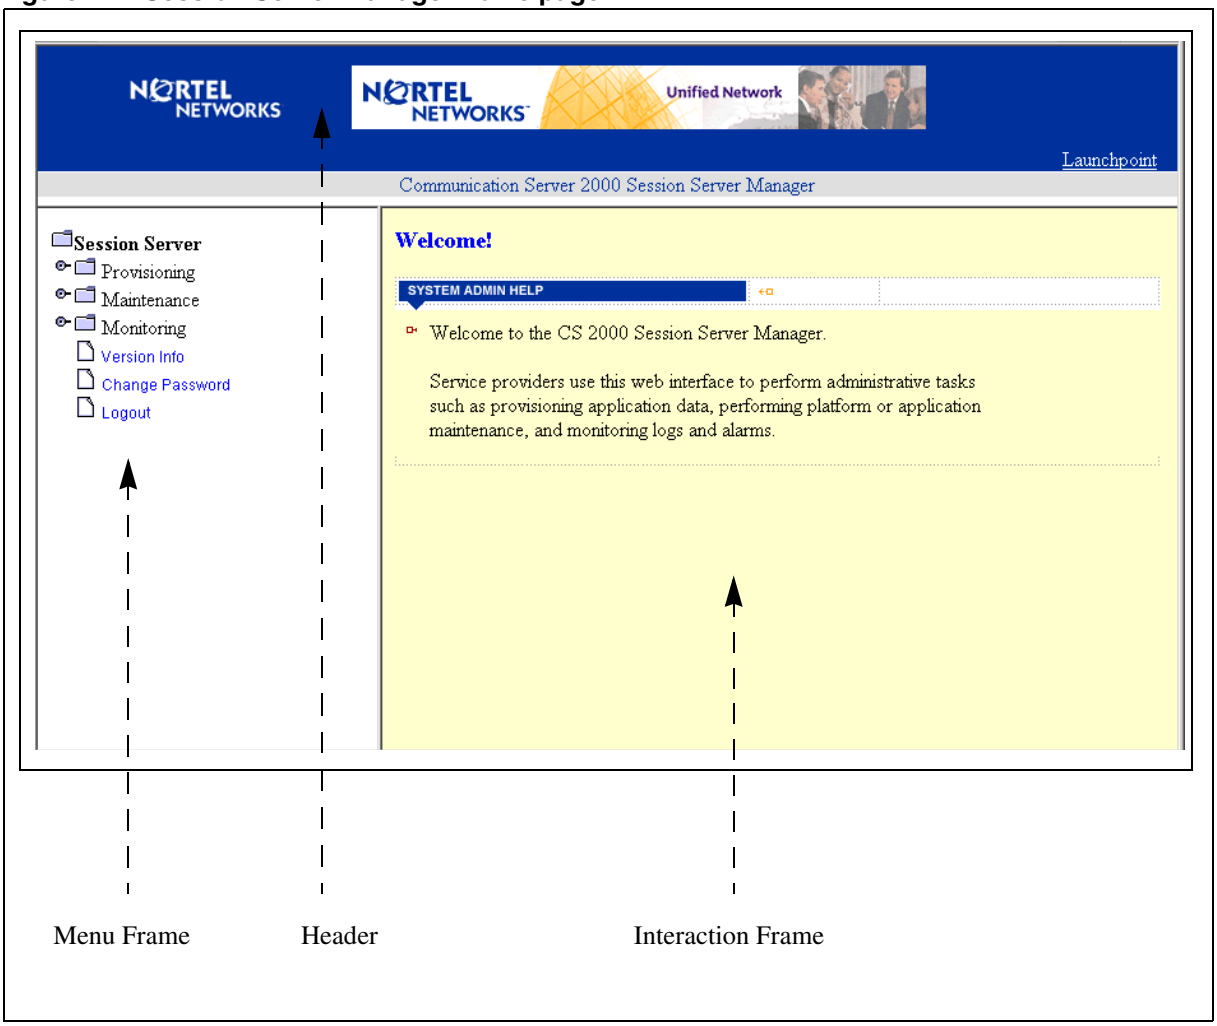
119.8.2.1.1 Web Based OAM&P

One paradigm shift to note is that the Session Server Manager functions as its own element manager. This means that provisioning for a Session Server Manager takes place on the Session Server itself. Additionally, maintenance type activities also take place on the Session Server Manager.

The craftsperson uses a web based interface to perform the provisioning and maintenance activities. This interface consists of a web system[1] running on the Session Server Manager that provides provisioning web pages as well as maintenance related web pages. Please refer to activity A00004005: *NCGL Support for SAM-XTS and Session Server* for details on logging on via the web interface.

An example of the Session Server Manager home page is shown in Figure 17.

Figure 17 Session Server Manager home page



[1]Consists of Apache, Apache Tomcat, and Java Runtime environment.

All Session Server Manager web pages are divided into three areas:

- **Header**
  The area with the Nortel logo and the “Home” and “Help” tags.
- **Menu Frame**
  The user uses the menu bar on the left to locate the proper function in the web page hierarchy.
- **Interaction Frame**
  This area is where a user fills in forms, performs maintenance actions, and obtains relevant information.

119.8.2.1.2 Provisioning Framework

As mentioned before, the Session Server Manager is its own element manager. That also means provisioned data is stored on the Session Server Manager itself. The storage mechanism is an on-board standard query language (SQL) database. Data in this database survives scenarios such as dead office recovery.

119.8.2.1.3 Application Maintenance

In the initial release, only the SIP Gateway application exists on the Session Server Manager. That application is managed via an Application Maintenance entity known as SIP Gateway Maintenance. Again, the web based interface is the craftsperson's way to interact with SIP Gateway Maintenance as described in "119.8.2.5 SIP Gateway application maintenance" on page 1406.

119.8.2.1.4 Alarms, Logs, and OMs

An application on the Session Server Manager, such as the SIP Gateway application, has the ability to generate Alarms, Logs, and Operational Measurements (OM).

119.8.2.2 Platform Commissioning

Platform provisioning for the Session Server Manager takes places during the commissioning phase when the software is installed for the first time. Initial commissioning is not done via the web based interface. Please refer to feature *NCGL support for SAM-XTS and SP2000*, A00004005 for complete commissioning information.

A quick overview of this commissioning phase is detailed below. These steps are meant as an example only.

- Power on (or reset) the Session Server Manager.
- Insert the Session Server Manager installation CD/DVD into the CDROM drive.
- Eventually the user is taken to an initial commissioning screen. Here initial commissioning prompts the user to enter the following data items for initial node provisioning:
  - Hostname - Hostname for this particular Session Server Manager unit. (e.g. "NGSS-Unit0)
  - Unit IP Address - IP Address of this particular Session Server Manager unit.
  - Subnet Mask - Subnet mask for the Session Server Manager.
  - Timezone - The timezone of the Session Server Manager (e.g. EST)
  - One or More NTP Servers - At least one Network Time Protocol server must be datafilled.

- Log Server IP Address [optional] - IP Address of a remote log server if Session Server Manager customer logs are to be reported to a far end entity. If no far end log server is being utilized, this field should remain empty.
- Network Monitor IP Address (mandatory) - Datafill with a network node that can always pinged from the Session Server. It is recommended that you specify the IP address of a highly available node on the network.
- Core IP Address [optional] - Datafilled with the IP address of the Core. This optional field is for future use.
- Web Proxy IP Address [optional] -If the Session Server Manager is to be accessed via a Web Proxy, the web proxy IP address is datafilled. For example, in the Succession environment, this would likely be the SSPFS proxy server.
  If a web proxy is not going to be used, this optional field should be left blank.
- Session Server Manager Location - A text string indicating the location of the Session Server Manager.
- SNMP Trap Destination [optional] - IP Address of the far end node to receive SNMP traps from this Session Server Manager unit. If SNMP traps are not to be reported to a far end node, this optional field should remain blank.

Once the commissioning steps are complete, the Session Server Manager should fully initialize and the craftsperson has access to the on-board web system.

119.8.2.3 Node Maintenance

Please refer to A00004005: *NCGL Support for SAM-XTS and Session Server* for a complete list and description of Session Server Manager Node Maintenance type functions available. A quick summary of some of those functions include:

— Lock/Unlock Node

This provides for the ability to bring a Session Server unit into service.

— Duplex Activities

This provides for the ability for Session Server Manager to SWACT from the Active/Enabled unit to its mate unit.

— System Info

Provides information such as the date, time since last reboot, IP address of the system, and IP address of the web browser looking at the System Info page.

— System Status

Provides CPU, Process, and Memory information

— Connectivity

  Allow the user to setup and monitor a remote host via pings.

— Storage

  Allows a view of file system data includes partition specific data such as total space, used and available space, and the ability to set alarm thresholds based on the amount of space utilized

— Services

  Displays NFS, TFTP, and active remote session status information. e.g. if two SSH sessions are in progress, the active remote session indicates “2”.

— Admin

  Allows the user to perform administrative tasks related to the system. For example the user can reboot the Session Server Manager from this menu.

— Alarms

  Provides the ability to view alarm information which consists of type, id, timestamp, severity, and description.

— Logs

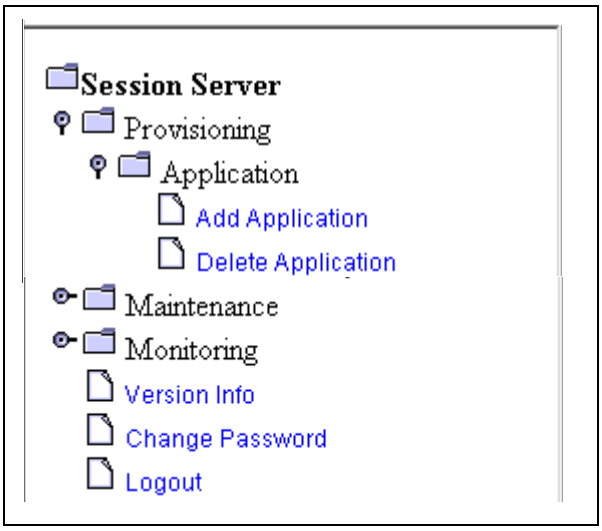
  Provides the ability to view customer related logs that are not application related.

119.8.2.4 SIP Gateway application provisioning

This section describes the provisionable data related to the SIP Gateway application. All SIP Gateway provisioning is performed via the Session Server Manager web interface.

The first provisioning step is to enable the SIP Gateway application if it is not already listed. This is a one time step, but it is required at the outset. When the Application folder in the menu frame is opened the first time, the SIP Gateway application is not listed as shown below.

Figure 18 No SIP Gateway application

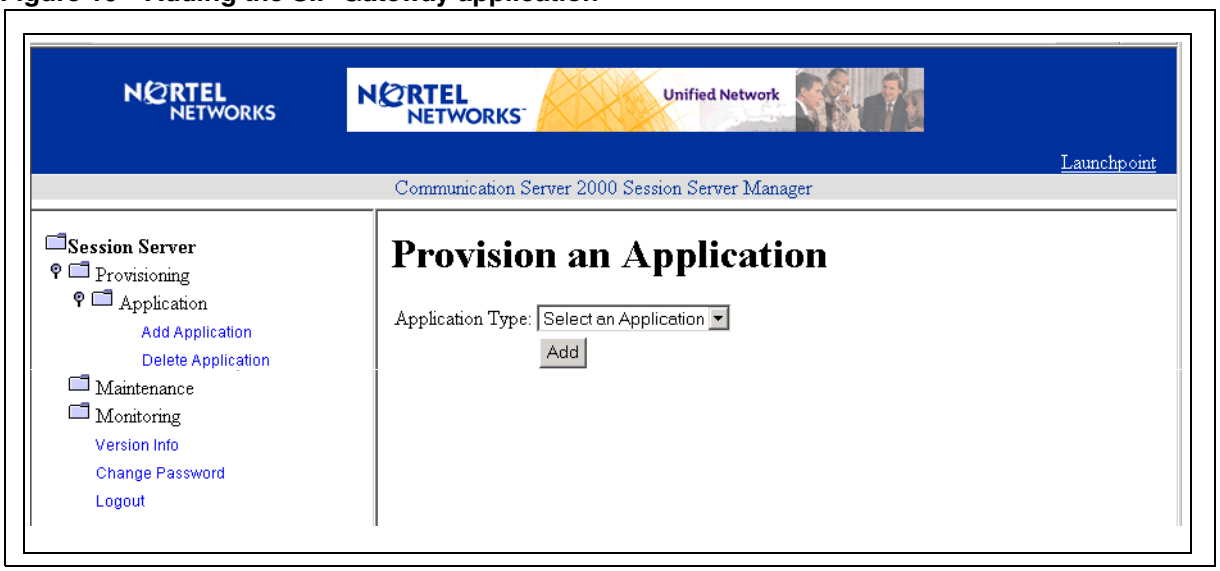


To add the SIP Gateway application, the craftsperson clicks on “Add Application” link and is presented with the **Provision an Application** web form as shown in “Figure 19 Adding the SIP Gateway application” on page 1375. From this point, the craftsperson selects “SIP Gateway” and clicks on “Add” to add the application.

Note: If the SIP Gateway application is already listed, there is no need to provision it.

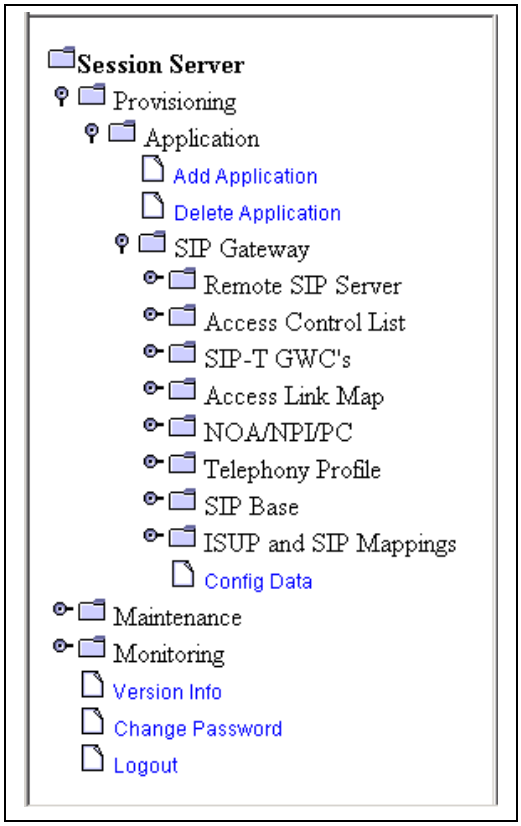
Note: If the SIP Gateway application is already listed and it is added again, that operation does not perform a second add. Also, it does not have a negative impact on the existing SIP Gateway application.

Figure 19 Adding the SIP Gateway application



After adding the application, the craftsperson should close and open the Application folder and the SIP Gateway application will be present. Next, the craftsperson uses the "SIP Gateway" level to perform provisioning.

Figure 20 SIP Gateway provisioning



In the Session Server menu on the left of the page, the following is performed.

- Click on the Provisioning folder
- Click on the Application folder
- Click on the SIP Gateway folder

The provisionable items for the SIP Gateway application consist of required and optional datafill. Certain datafill is optional because either defaults exist or that datafill is not required.

Required Datafill	Optional Datafill[a]
Config Data	Access Control List
Remote SIP Servers	NOA/NPI/PC
SIP-T Gateway Controllers	SIP Base
Telephony Profile	ISUP to SIP Cause Code Map
Access Link Map	SIP to ISUP Response Code Map
ISUP Variant Map[b]	SIP Redirection Map

a. All of the optional datafill items exist in the Mappings sub-folder with the exception of “SIP Base”, which is under the “SIP Gateway” folder.
b. The SIP Base item seen in Figure 20 relates to the ISUP Variant mapping datafill in the Mappings sub-folder.

119.8.2.4.1 Config Data

Before the SIP Gateway application is brought into service, four base configuration parameters should be modified to appropriate values.

LocalTcp

The IP address should be datafilled to match the IP address of the Session Server Manager. The port should be datafilled to 5060.

LocalUdp

The IP address should be datafilled to match the IP address of the Session Server Manager. The port should be datafilled to 5060.

MgcHostName

This parameter should be datafilled to match parameter HOST_MGCNAME in table OFCENG in the local CS 2000 Core.

An example of HOST_MGCNAME in the local CS 2000 core is as follows:

```
TABLE: OFCENG
                        PARMNAME                                        PARMVAL
-------------------------------------------------------------------------------
                    HOST_MGCNAME                                          MGCA
```

In the above scenario, parameter MgcHostName on the Session Server Manager should be datafilled to be MGCA.

If the Session Server Manager is being used to communicate with other CS2Ks that have VRDNs, then it is very important that the MgcHostName parameter match the HOST_MGCNAME parameter in table OFCENG. If it does not match, DPT trunks at the far end CS 2000 will transition to a SYSB state and call processing between the CS2Ks will be halted.

Note: The string associated with the MgcHostName parm will be used to populate the Via Header of the SIP INVITE message. See section “119.6.2 Call Flows” for additional information.

maxCallLegs

This parameter determines the maximum amount of simultaneous SIP transactions. The default setting is 1000.

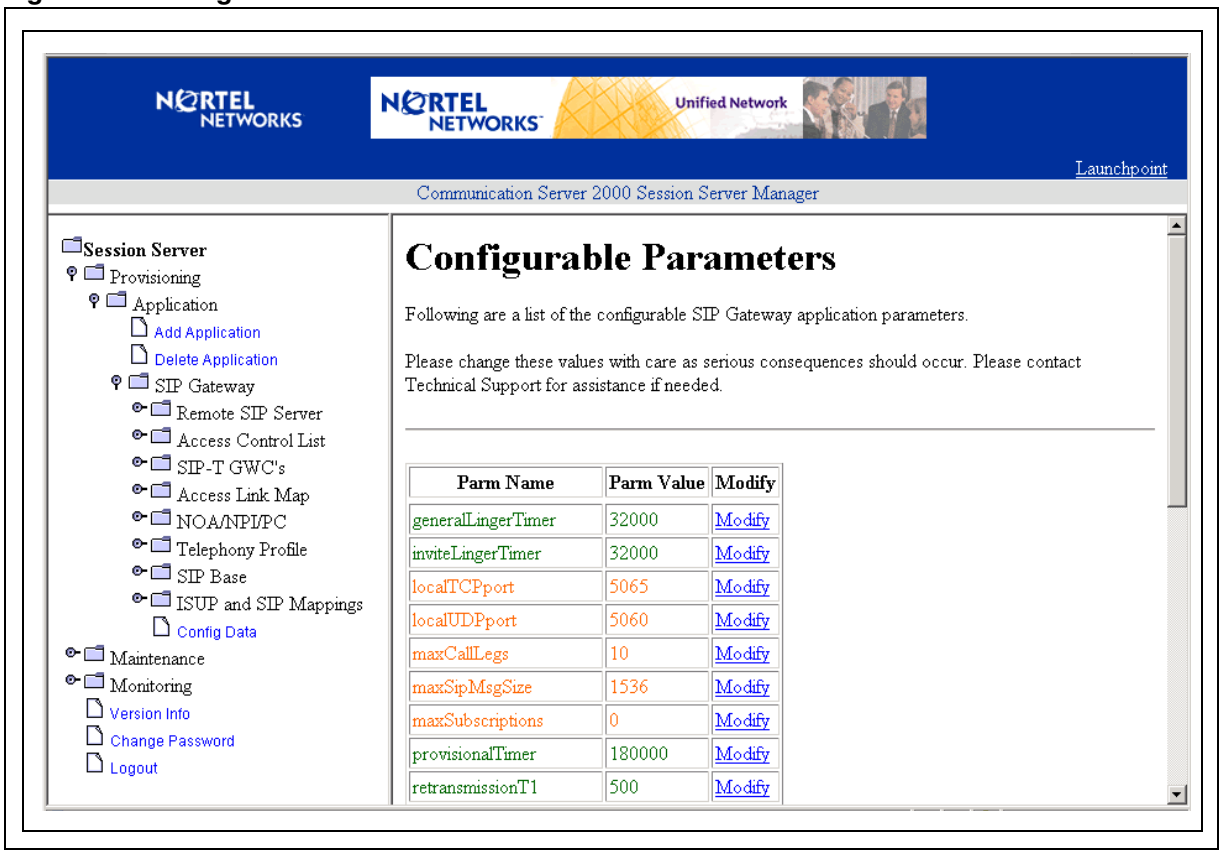
If the SIP Gateway application is in-service when the above values are changed, it must be taken out of service and brought back in-service for the new parameter values to take effect. Details on this may be found in “119.8.2.5 SIP Gateway application maintenance” on page 1406. Next, while many parameters exist on the “Config Data” page, **care** must be taken when changing any of them.

All the configurable parameters are found on the **Configurable Parameters** page. That page is reached from the Session Server Manager main page via:

— Click on the Provisioning folder
— Click on the Application folder
— Click on the SIP Gateway folder
— Click on **Config Data**

An example of the Config Data page can be found in “Figure 21 Configurable Parameters” on page 1378.

Figure 21 Configurable Parameters



The range of values for the configuration parameters are:

- generalLingerTimer 0 - 60000
- inviteLingerTimer 0 - 60000
- maxCallLegs 0 - 40000
- maxSubscriptions 0 - 100000
- provisionalTimer 0 - 540000
- retransmissionT1 0 - 60000
- retransmissionT2 0 - 60000
- retransmissionT4 0 - 60000

119.8.2.4.2 Remote SIP Servers

A remote SIP Server is a remote SIP device that the Session Server Manager communicates with via the session initiation protocol. Two examples are other Call Server 2000s or a Multimedia Communication Server (MCS).

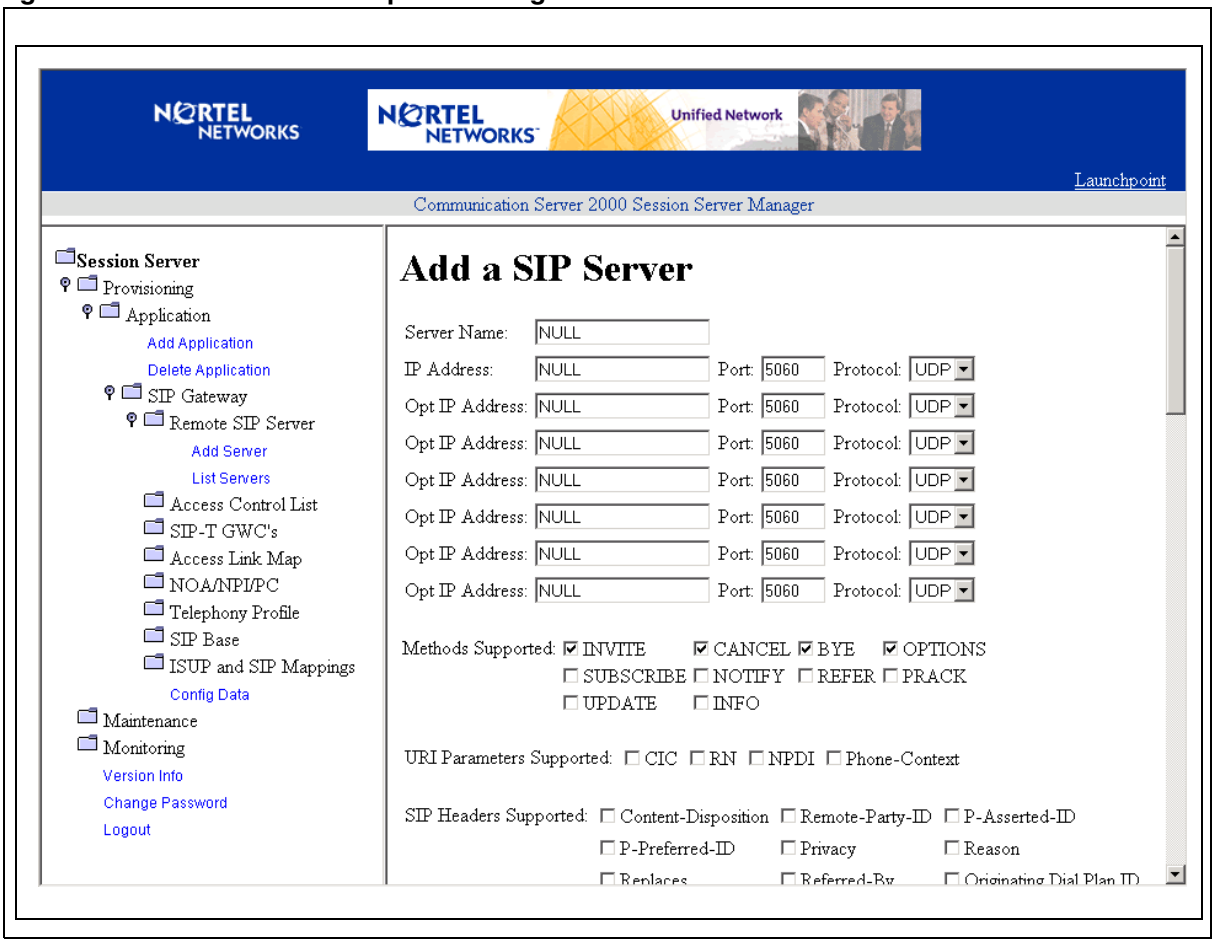
SIP Gateway remote SIP server provisioning is performed by opening the "Remote SIP Server" folder in the left menu. Once there, the following may be performed:

— Remote SIP Server datafill may be added by clicking on the "Add Server" link. Figure 22 shows an example of the page presented to the user after this.

— Remote SIP Servers may also be listed by clicking on "List Servers".

— After listing the Remote SIP servers, the user may choose to delete a particular remote SIP server or modify the data for a particular SIP server.

Figure 22 Remote SIP Server provisioning



Datafill for a remote SIP server consists of the following items:

Table 4 Remote SIP Server Data

Title	Description	Default
Server Name	Character string name for the remote server. ***Note***: Use DNS naming conventions when naming your server.	N/A
IP Address, Port, and Protocol	An IP addresses list that represents the Remote SIP Server. Up to 7 IP addresses and Ports are supported. At least one IP address must be entered. ***Note***: If used for loop-around calls, the IP address for the active Session Server node should be entered.	N/A for IP, 5060 for Ports, and UDP for Protocols
Optional IP Addresses, Ports, and Protocols	Up to 6 additional IP addresses are supported for each remote SIP Server.	N/A for IP, 5060 for Ports, and UDP for Protocols
Server Methods • Invite • Cancel • Bye • Prack • Subscribe • Notify • Refer • Options • Update • Info	• Click on the methods that are supported by the Remote Server	All False
URI Parameters Supported • CIC • RN • NPDI • Phone-Context	• Click on appropriate parameter if it is supported. • CIC parameter carries Carrier Identification Parameter from SIP to ISUP and vice-versa. • Redirect Number is used in LNP scenarios • NPDI indicates the number in Request-Uri is ported • Phone-Context indicates the context of the called party number in the Request-Uri	All False

Table 4 Remote SIP Server Data

Title	Description	Default
SIP Headers Supported • Content-Disposition • Remote-Party-ID • P-Asserted-ID • P-Preferred-ID • Privacy • Reason • Replaces • Referred-By • Originating Dial Plan ID • Billing Number • Rate Plan • Terminating Dial Plan ID • Diversion	• Click appropriate headers that are supported by remote server	All False
ISUP-SIP Cause Map	Contains the name of the mapping table for ISUP Release Cause to SIP response code.	N/A
SIP-ISUP Cause Map	Contains the name of the mapping table for SIP Response code to ISUP Release Cause.	N/A
SIP Redirection Map	Contains the name of the mapping table for redirection mapping.	N/A
ISUP Variant to SIP Version Mapping	Contains the name of the mapping table for ISUP Variant to SIP Version Mapping.	N/A
NOA/NPI to Phone Context Map	Only selectable if URI Parameter-Phone Context is selected. Contains the name of the mapping table for NOA/NPI to Phone Context Mapping.	N/A
SIP Cause Precedence Priority	A list of precedence rules and their respective priority.	Ordered as Listed
APN Representation	Contains the choices for Action Point Number Representation	N/A
BCI Data	Includes: • Interworking indication • ISUP/BICC indicator • ISDN Access Indicator	N/A

Table 4 Remote SIP Server Data

Title	Description	Default
FCI Data	Includes: • Domestic/International Call indication • Interworking indicator • ISDN User Part Indicator • ISUP/BICC Preference indicator • ISDN Access Indicator	N/A
SIP Header Format	Supports the compact or long form of SIP headers.	Compact
Options for Heartbeat	Indicates if SIP Options method is used to determine accessibility of the SIP server.	Yes
Telephony profile Support	An indication of whether or not the Session Server Manager will send the X-Nortel_profile header to this remote SIP Server. ***Note:*** Datafill with "No" when the Remote SIP Server does not support receiving the X-Nortel-Profile header in the SIP message.	Yes
Use Info for Long Call Audit	Long call audit provisioning.	No
Map Non-Screened RPI To Calling #	Whether or not to include RPI header for clg number when building outgoing INVITEs	No
Accept Early SDP	Determines if Early Session Description Protocol are allowed by the remote server	Yes
Accept Invite without SDP	Indicates whether or not to accept an Invite without the SDP and proceed with the call and return a 488 Not Accepted Here error message.	Yes
E.164 Format Allowed	Indicated if the E.164 format is supported. ***Note***: To derives ETSI ISUP message utilizing SIP instead of SIP-T, the value must be set to No.	No
Enforce CODEC- Compatibility	Indicates whether support for other codec is supported. If Yes, then at least one of the codec fields must be set to yes in the Config Data web page.	No
Accepts Encapsulated ISUP	Indicates whether to perform ISUP encapsulation or not.	Yes
Country Code Support	Indicates if country code screening is supported. If yes a country code must be datafilled.	No
Country Code	Indicates if Country Code is supported, then datafill 3 digit Country Code if Country Code Support is set to Yes.	N/A

Table 4 Remote SIP Server Data

Title	Description	Default
Hop-Counter Factor	Set the typical number of HOPS to account for when adjusting for call latency. ***Note***: Hop-Counter Factor is used to derive the Hop-Counter. As specified in the Q1912 Standard, Table 11/ Q19125, the Hop-Counter value = Integer part of (Max-Forwards value / Hop-Counter Factor), where the factor is constructed according to the following principles: • Hop-Counter for a given message should never increase and should decrease by at least 1 with each successive visit to an interworking unit regardless of intervening interworking, and similarly for Max-Forwards in the SIP domain. • The initial and successively mapped values of Hop-Counter should be large enough to accommodate the maximum number of hops that might be expected of a validly routed call.	7
Out of Band DTMF Payload	Indicates the Out of Band DTMF payload monitor/ detection mechanism to use	N/A
Agent Representation	Indicates agent supported ISUP/PRI/Line.	ISUP
“unknown” header	Indicates the String to use when Presentation indication is Unknown	NULL
“anonymous” header	Indicates the String to use when Presentation indication is restricted	NULL

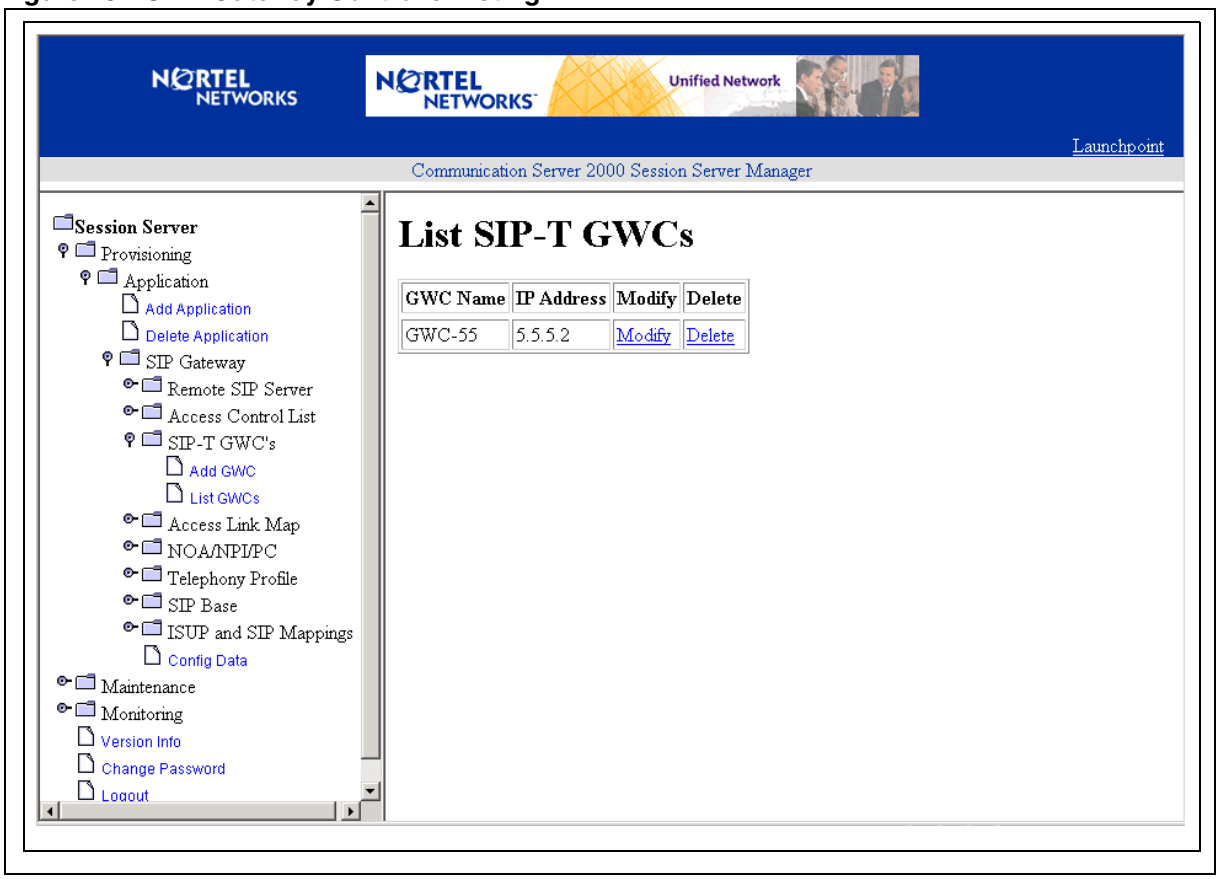
119.8.2.4.3 SIP-T Gateway Controllers[1]

This area of datafill consists of a list of local SIP-T[2] gateway controllers that are used for dynamic packet trunking calls for the SIP Gateway application. SIP Gateway SIP-T GWC provisioning is performed via the following.

- In the SIP gateway provisioning menu, gateway controller datafill may be added using the "Add GWC" link in the SIP-T GWC folder
- It may also be listed by clicking on "List GWC". Once the GWCs are listed, the user may choose to delete a GWC or modify the IP address for a particular GWC.

Datafill for a gateway controller consists of a gateway controller name and its IP address. The IP address should point to the active unit. An example of the craftsperson clicking on "List GWC" is shown in the below figure.

Figure 23 SIPT Gateway Controller listing



[1]All GWCs are still provisioned maintained via CS2M. Datafilling a GWC in the Session Server Manager only indicates that the Session Server Manager will be communicating with that GWC.
[2]SIP-T and DPT gateway controllers are one in the same with respect to the Session Server Manager.

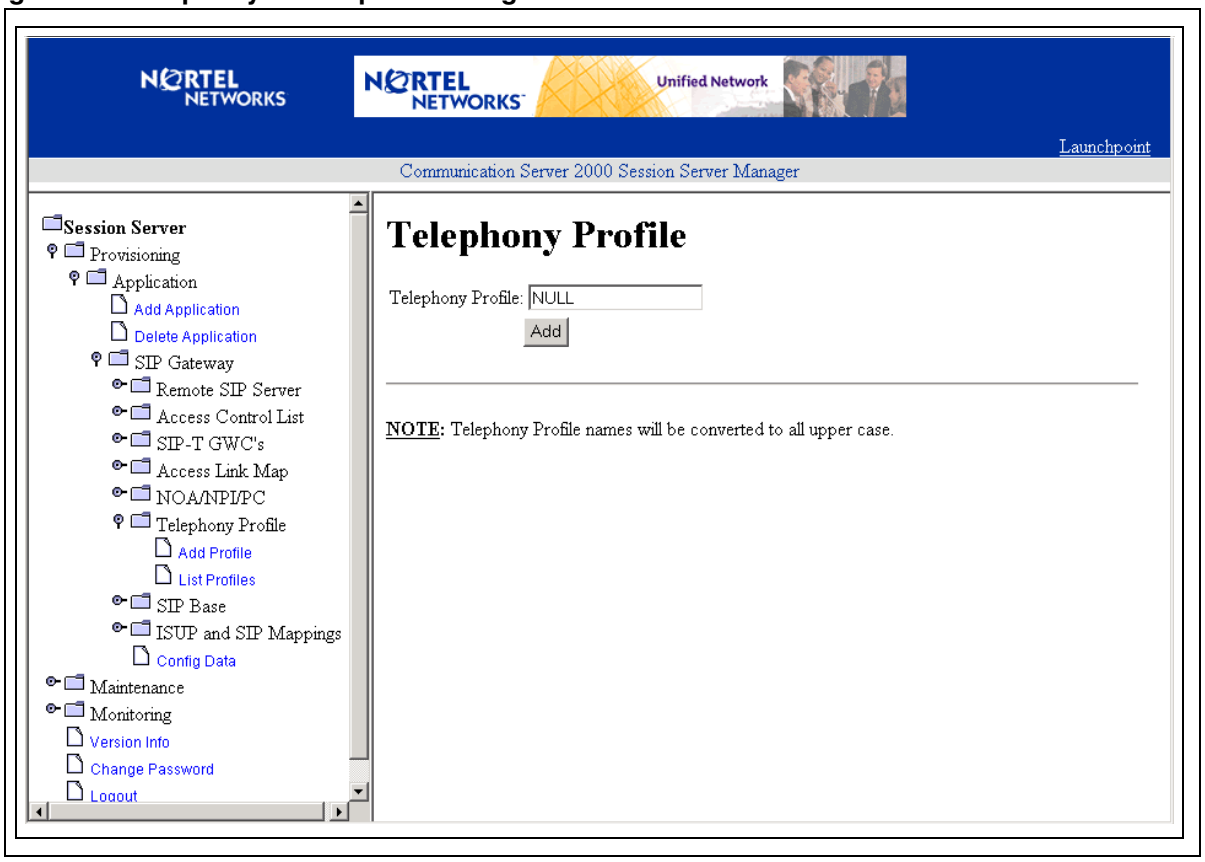
119.8.2.4.4 Telephony Profile

A telephony profile is a simple character string that is mapped to a SIP Access Link and Remote SIP Server pair described in section "119.8.2.4.5 Access Link Map" on page 1386. Telephony Profile provisioning is performed via the following:

- In the SIP gateway provisioning menu, telephony profile datafill may be added using the "Add Profile" link in the Telephony Profile folder.
- It may also be listed by clicking on "List Profiles". Once the profiles are listed, the user may choose to delete a particular one if it is not being used in any Access Link Mappings. Note that modifications on a profile are not allowed whether or not it is being used elsewhere.

An example of a user that is about add a new telephony profile is shown in the figure below.

Figure 24 Telephony Profile provisioning



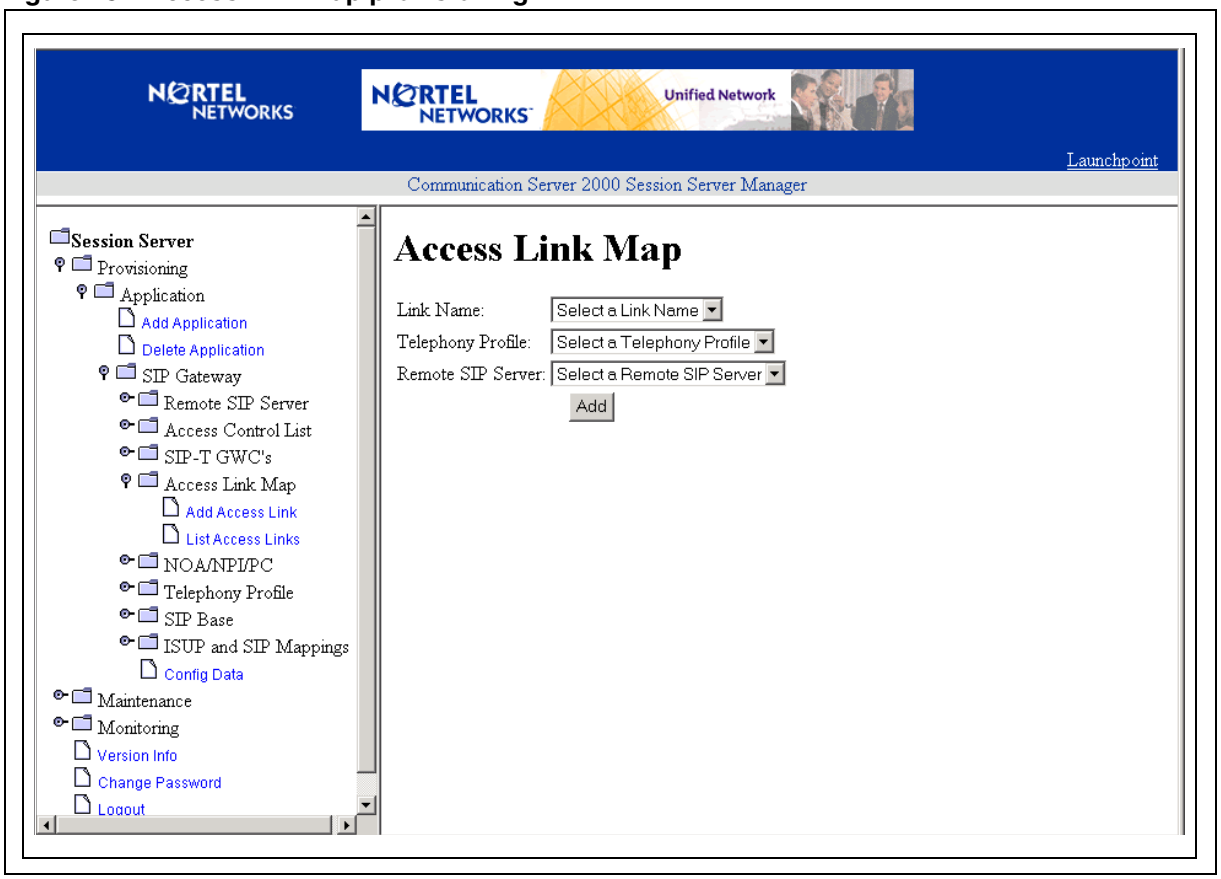
119.8.2.4.5 Access Link Map

An Access Link Map provides the customer with a mechanism to determine the routing of outgoing and incoming SIP calls.

- In the SIP gateway provisioning menu, Access Link Map datafill may be added using the “Add Access Link” link in the Access Link Map folder.
- Access Link mappings can also be listed by clicking on “List Access Links”. Once the access link mappings are listed, the user may choose to delete a particular mapping. Modifications to existing mappings are not allowed.

An example of a user that is about to add a new access link mapping is shown below. An access link mapping consists of an Access Link, Telephony Profile, and a Remote SIP Server.

Figure 25 Access Link Map provisioning



119.8.2.4.6 ISUP Variant Map

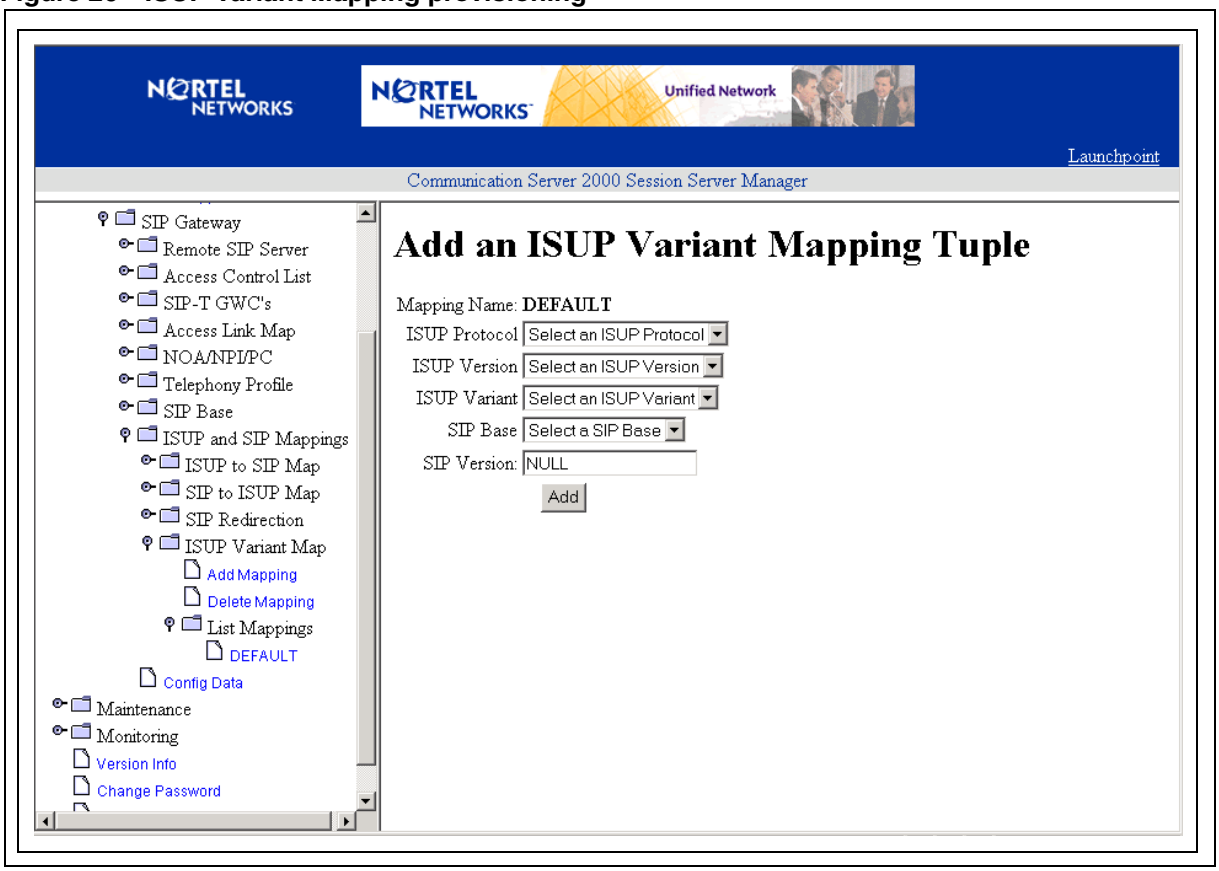
This mapping table provides a mechanism to map ISUP Protocol, Version, and Variant to a SIP Base and Version. Example mappings are shown below.

ISUP Protocol	ISUP Version	ISUP Variant	SIP Base	SIP Version
Q764			ANSI88	<user defined string>
UCP			ANSI88	<user defined string>

When adding the remote SIP servers, if you plan to select a custom mapping value for ‘ISUP Variant to SIP Ver Map’, then add a new variant mapping table using the steps in Figure 26. If DEFAULT was selected for ‘ISUP Variant to SIP Ver Map’ when adding the remote SIP server, the only additional step required is to add a tuple to the DEFAULT mapping table within the ISUP Variant Map folder using the following commands:

- Click on the Provisioning folder
- Click on the Application folder
- Click on the SIP Gateway folder
- Click on the ISUP and SIP Mappings folder
- Click on the **ISUP Variant Map** sub-folder
- Click on List Mappings
- Click on DEFAULT
- In the frame on the right, click Add.
- See “ISUP Variant to SIP Version Mapping information” on page 1428 as a guide for datafill rules.

Figure 26 ISUP Variant Mapping provisioning



At the Add Mapping stage, the user chooses a new mapping name and the base mapping. When the new mapping is created it uses the base mapping as the one from which to clone. The new mapping may then be modified to suit the user's call processing needs.

Once successfully added, the craftsperson may chose to add, modify, or delete tuples in their mapping or even delete their newly added mapping table. If the user were to choose to delete their new mapping, they would simply click on the "Delete Mapping" link within the "ISUP Variant Map" sub-folder. In order to modify a mapping, the craftsperson clicks on "List Mappings" and then clicks on the mapping they wish to modify.

Like other mapping tables, a default mapping table exists called DEFAULT. However this table is different in the fact that it is empty. Also this default table may have tuples added, modified or deleted.

Tuples within an ISUP to SIP Variant mapping table that are added or modified must adhere to specific datafill rules. The legal combination for the columns in a tuple are listed in the appendix in "119.17.1 ISUP Variant to SIP Version Mapping information" on page 1428.

119.8.2.4.7 Access Control List [optional]

In certain scenarios it may be desirable to restrict which far-end nodes are allowed to initiate call processing with SIP Gateway application. The ability to create these restrictions exist in the form of an Access Control List (ACL)[1].

- ACL functionality is optional and can be enabled/disabled by the users. Default value is disabled. ACL is enabled/disabled under system configuration menu of SIP gateway application.
- If ACL is disabled, all incoming SIP messages are accepted.
- Remote SIP servers are automatically included in the ACL list for screening, hence Remote SIP server IP addresses are not required to be provisioned again in the ACL list.
- With ACL enabled, SIP messages only from the list of servers provisioned in ACL list or listed in Remote SIP Server IP list are accepted.
- Please note that all the remote servers/gateways which can talk to NGSS SIP application must be datafilled in ACL, if enabled. For e.g if the remote server is a VRDN, it not sufficient to just datafill VRDN IP address, all SIPT GWCs also need to be included in the ACL, as SIPT GWCs will send SIP messages directly to NGSS.
- If ACL is enabled while both ACL list and Remote Server IP address list are empty, all incoming messages will be dropped. Hence before enabling ACL, care should be taken to properly provision Remote SIP server and/or ACL list.
- In the SIP gateway provisioning menu, access control list datafill may be added using the “Add IP Range” link in the Access Control List folder.

  When the “Add IP Range” link is clicked, the user is prompted for an IP address and a network mask. The range of IP addresses to allow is calculated based on a combination of the IP address and network mask entered.
- Provisioned servers may be listed by clicking on “List IP Ranges”. Once the IP ranges are listed, the user may choose to delete a particular IP range.

[1]Datafill added to the access control list under SIP Gateway provisioning only affects the SIP Gateway application. Other application which exist on the Session Server Manager are not impacted by this datafill.

Note that Remote Server IP address are not listed in this list though they are included in screening the incoming SIP messages.

- To modify an IP address range it must be deleted and re-added. It cannot be modified.
- A range of 0.0.0.0 is not supported because it is the default address if no address has been assigned yet.

A few examples of the IP/mask algorithm include:

10.1.1.1/255.255.255.255 means only one host 10.1.1.1.

10.1.1.1/255/255/255.0 means all host in the range 10.1.1.0 to 10.1.1.255

Figure 27 Access Control List - Adding a New IP Address

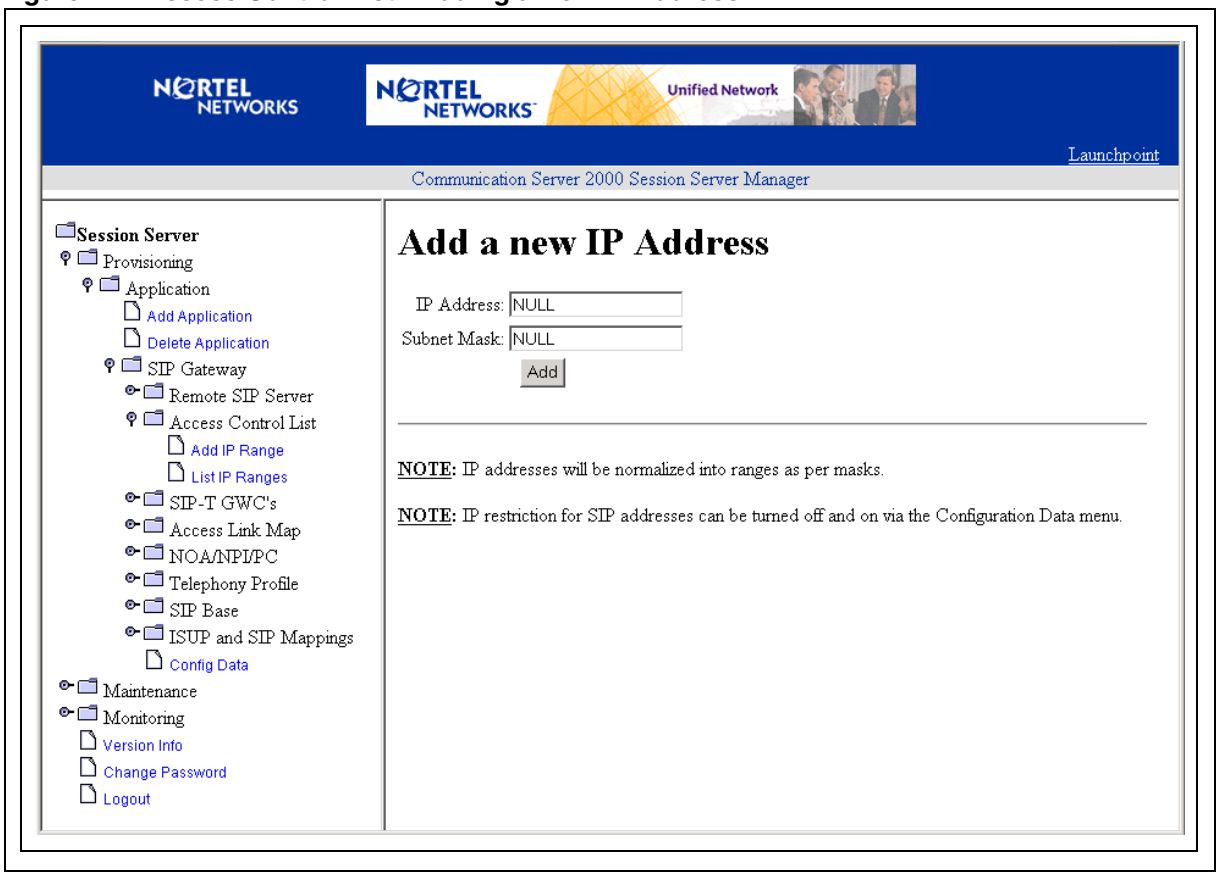


Figure 28 Access Control List - List Ranges

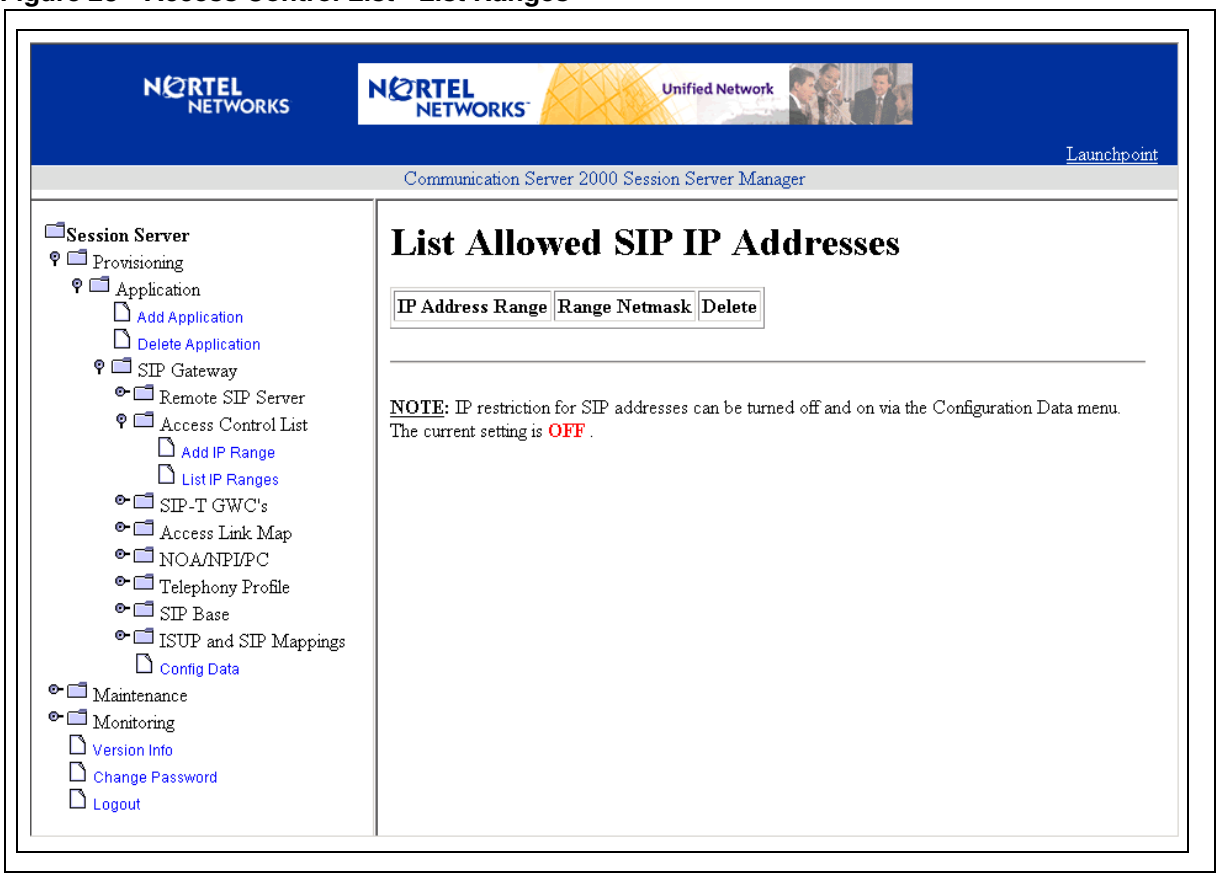

119.8.2.4.8 NOA/NPI/PC Indicator mapping [optional]

The NOA/NPI/PC Indicator mapping represents the Nature of Address/ Numbering Plan to Phone Context Indicator mapping.

When selecting the NOA/NPI/PC folder, three options are available: Add NOA, List NOA, or a subfolder NOA/NPI/PC mapping.

The Add and List pages allow for the addition or deletion of "Nature of Address" values. These entries have been preloaded with standard values.

Figure 29 Adding an NOA

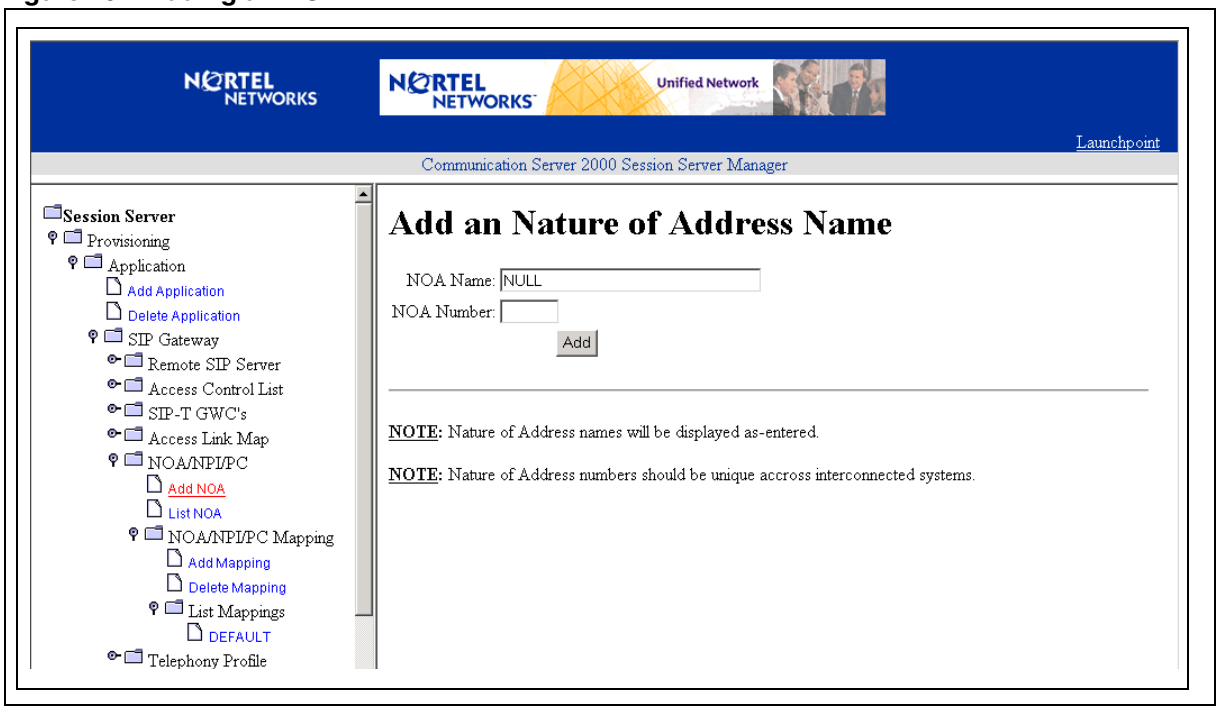

Figure 30 Listing NOAs

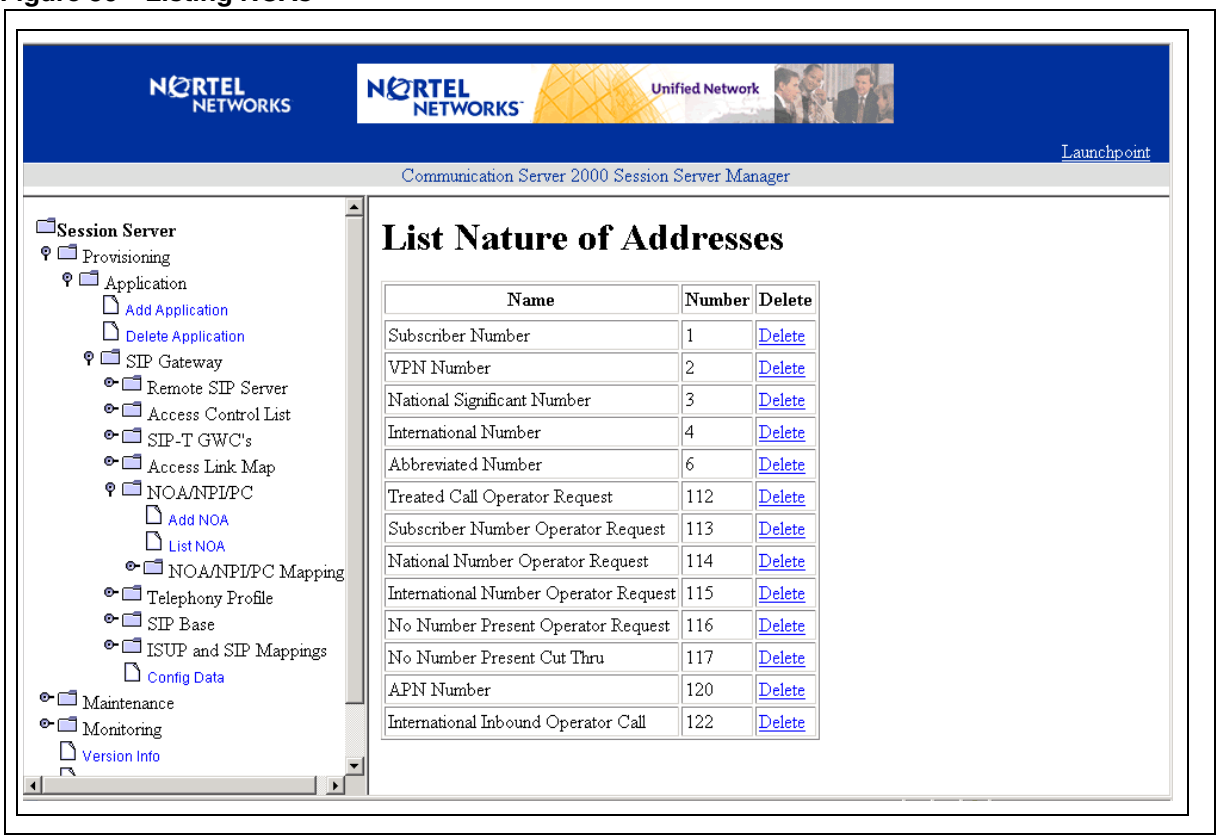

NOA/NPI/PC Mapping subfolder includes options to Add Mapping, Delete Mapping, and List Mappings.

When a call is originated this value will be added to the originating URI to indicate the context or origin of the call. For numbers like 411 and 911 this is necessary in that the number does not by itself identify the geographical origin of the call.

Either the default mapping may be changed to support such a feature or new mapping tables may be created.

Figure 31 Add an NOA to Phone-Context Mapping

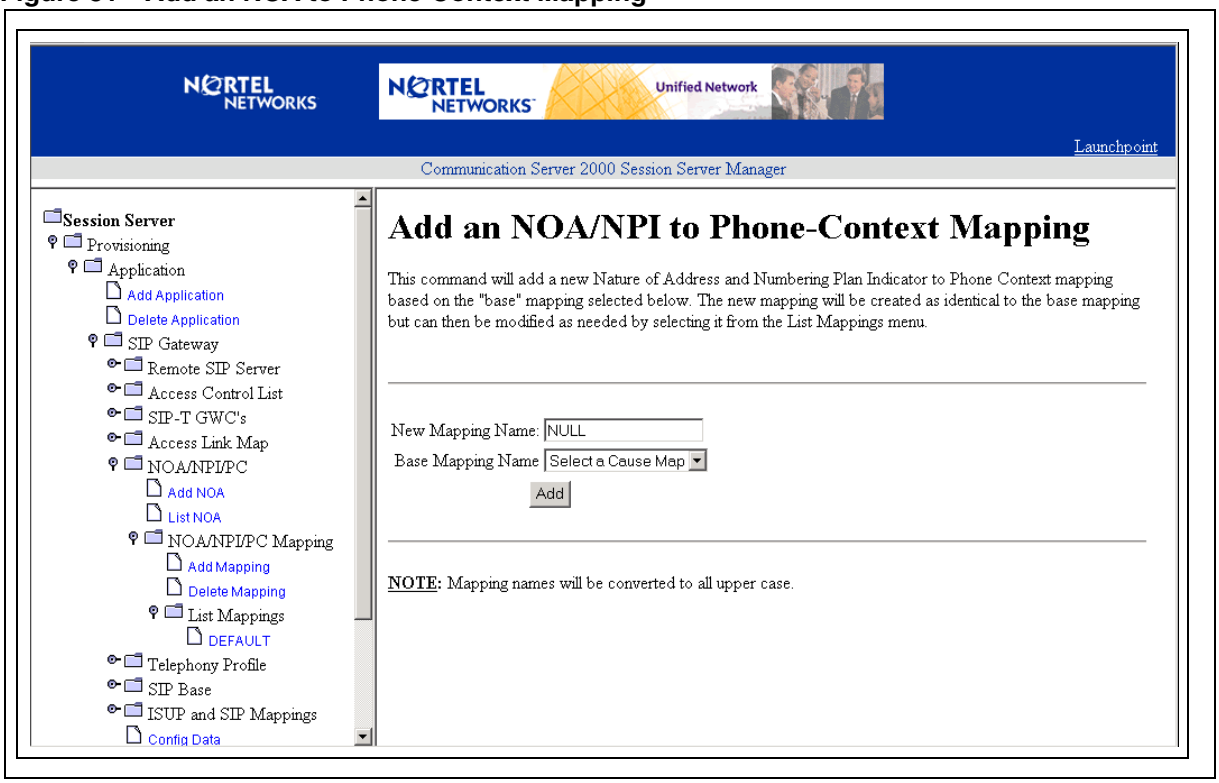

Figure 32 New NOA to Phone-Context Mapping

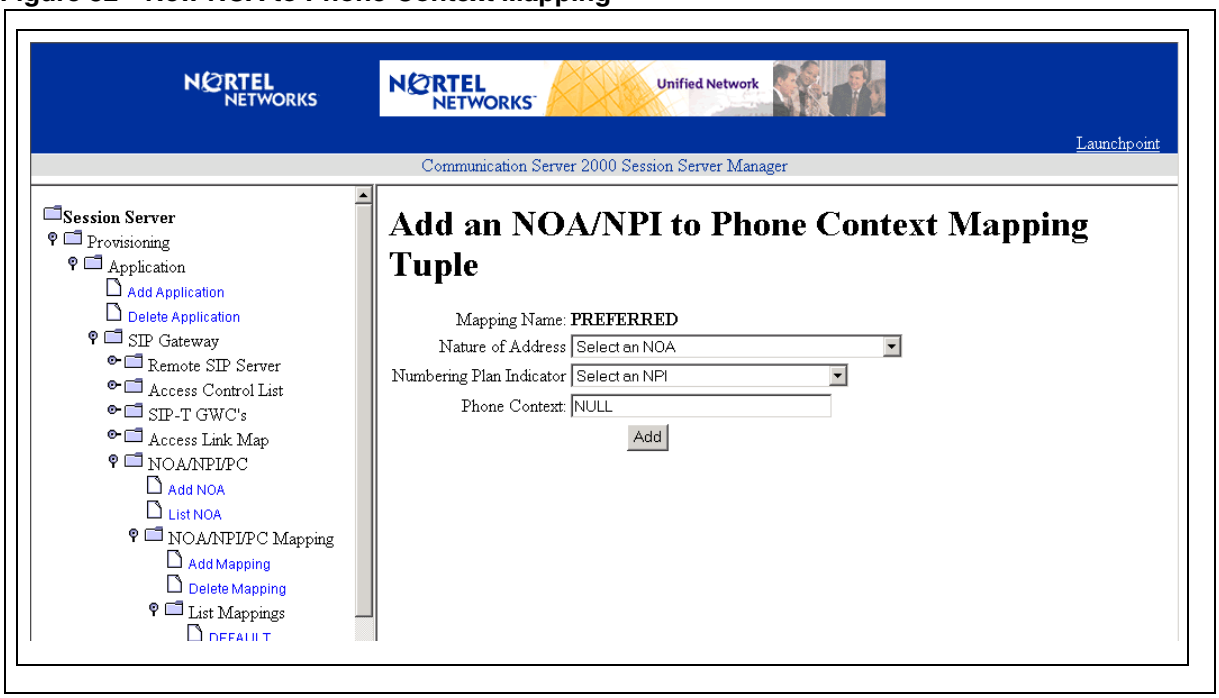

Figure 33 Delete an NOA/NPI to Phone Context Map

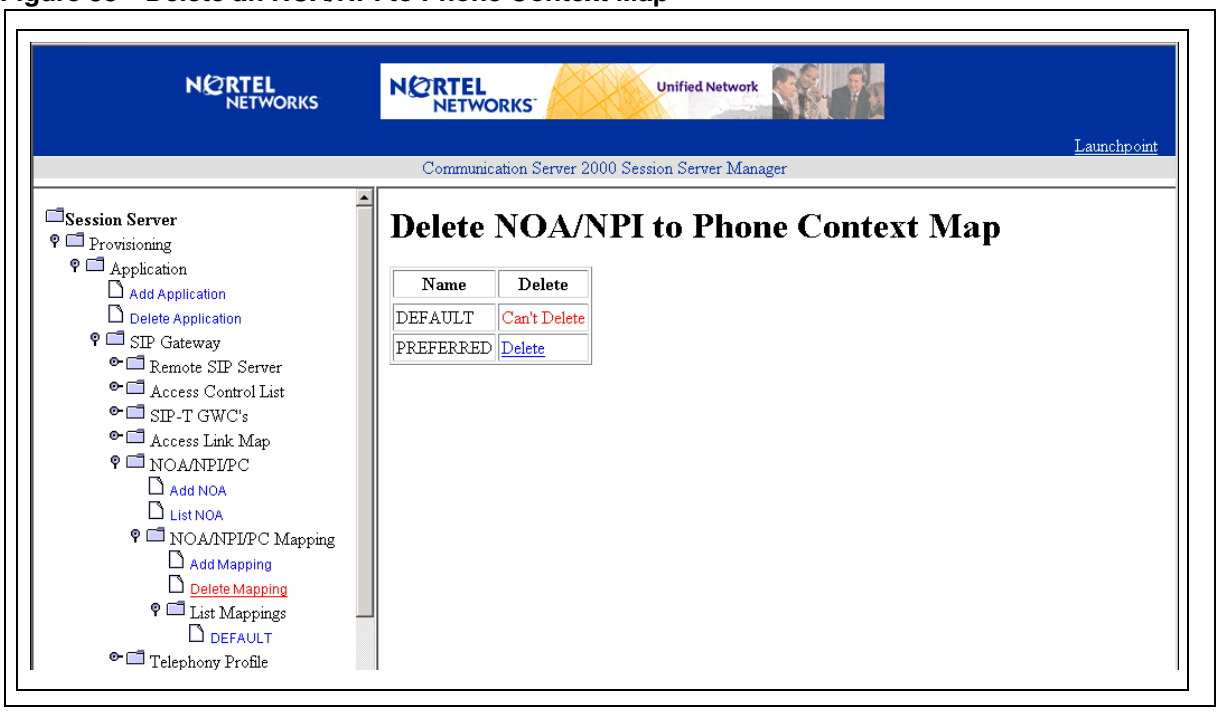

Figure 34 Listing of an NOA/NPI t Phone Context Map

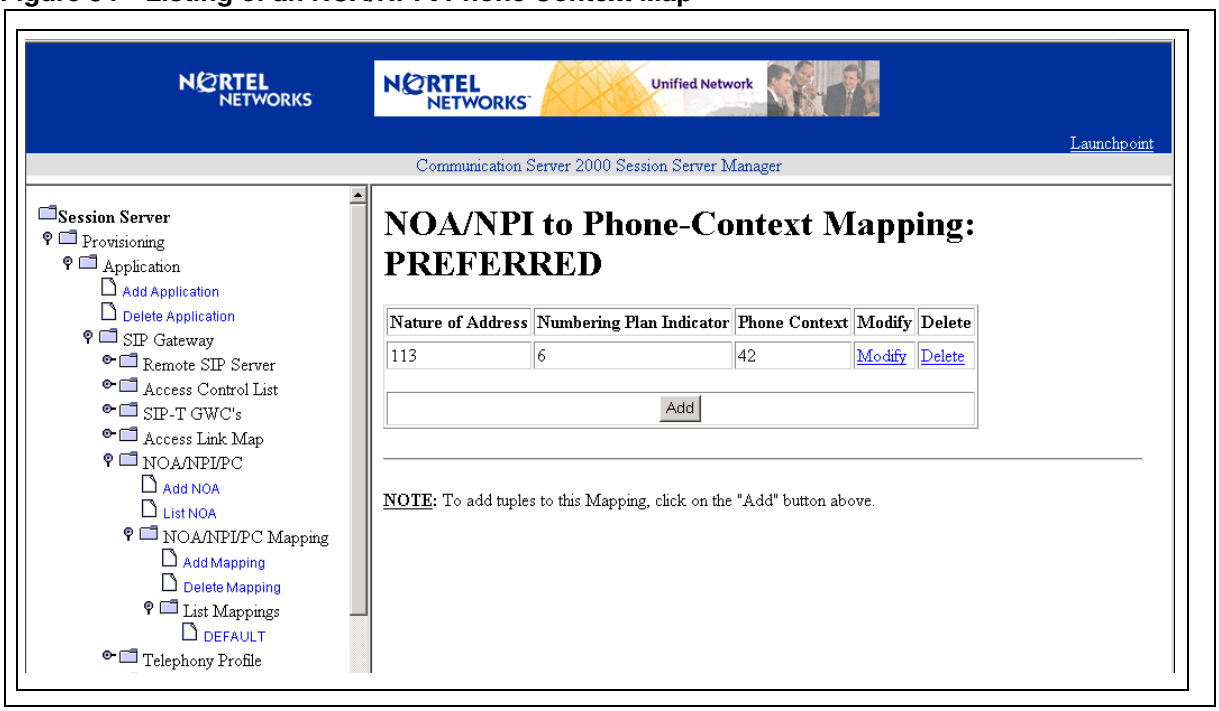


119.8.2.4.9 ISUP Cause to SIP Response code mapping [optional]

An ISUP Cause to SIP Response code mapping table maps an ISUP Release Cause to a SIP Response code. For example, the ISUP release cause value of 17, indicating user busy, might be mapped to a SIP response code value 486 indicating busy.

A single ISUP Cause to SIP Response mapping table consists of nearly eighty ISUP Release Causes mapped to SIP response codes. Along with each mapping is a SIP Text Reason Phrase and an ISUP Text Reason Phrase. See Table 5, "ISUP Release Cause to SIP Response Code mapping" for a partial mapping.

Table 5 ISUP Release Cause to SIP Response Code mapping

ISUP Release Cause	SIP Response Code	SIP Text Reason Phrase	ISUP Text Reason Phrase
.. ..			
4	487	Request Terminated	Send Special Tone Information
5	404	Not Found	Misdialled trunk prefix
6	480	Temporarily Unavailable	Channel Unacceptable
7	487	Request Terminated	Call awarded and being delivered in an established channel
8	487	Request Terminated	Preemption
9	487	Request Terminated	Preemption-circuit reserved for use
16	487	Request Terminated	Normal call clearing
17	486	Busy Here	User busy
.. ..			

The ISUP Cause to SIP Response mapping is termed optional datafill since a pre-defined mapping table exists in the system. This mapping table is called "DEFAULT". This predefined default mapping table may be selected when provisioning a Remote SIP Server described in "119.8.2.4.2 Remote SIP Servers" on page 1379. Note that this pre-defined mapping table cannot be modified.

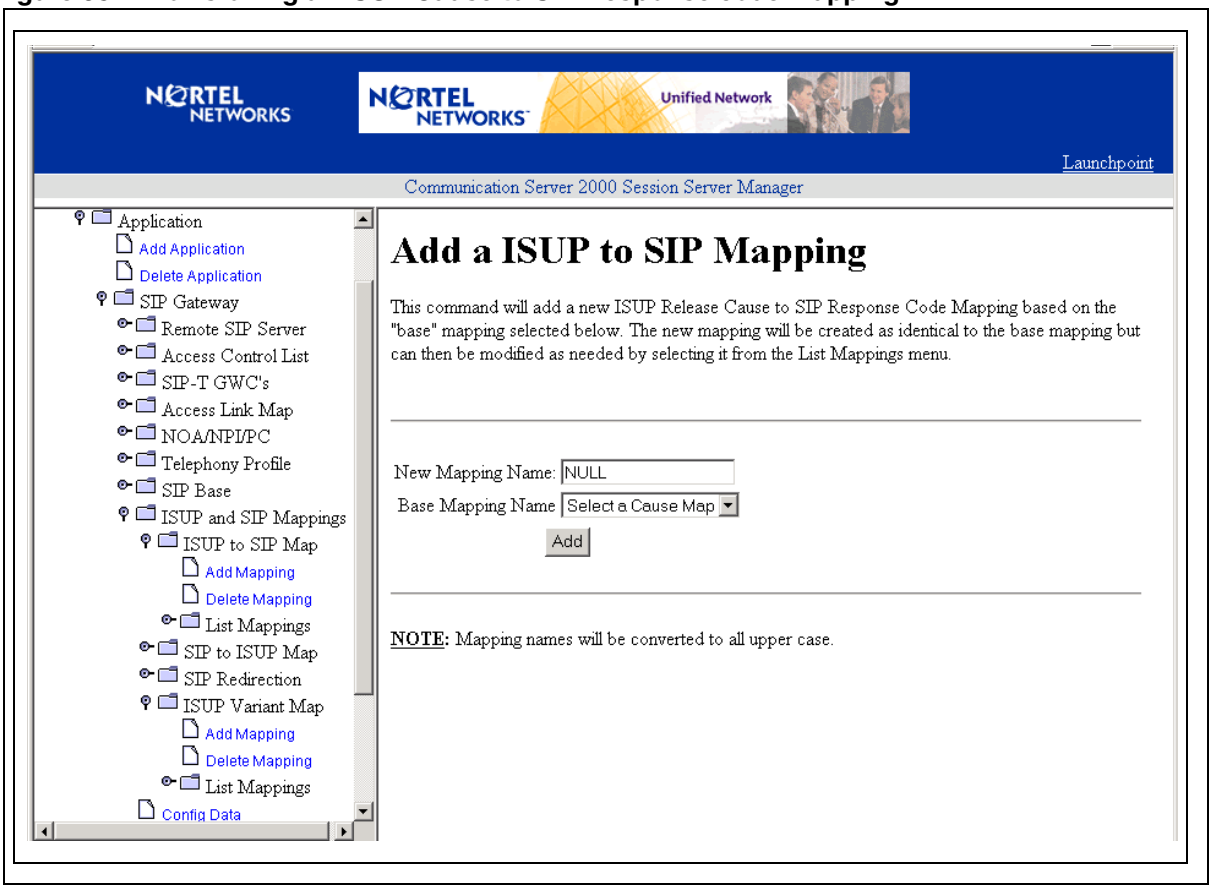
Although a pre-defined mapping exists, users may wish to create new mapping tables for their specific processing needs. This is done through the web interface.

In order to add a new mapping table, the user goes to the “ISUP to SIP Map” sub-folder from the main Session Server Manager menu via the following commands:

— Click on the Provisioning folder
— Click on the Application folder
— Click on the SIP Gateway folder
— Click on the Mappings folder
— Click on the **ISUP to SIP Map** sub-folder
— Click on Add Mapping.

After clicking on “Add Mapping”, Figure 35 shows what a craftsperson sees in the web browser.

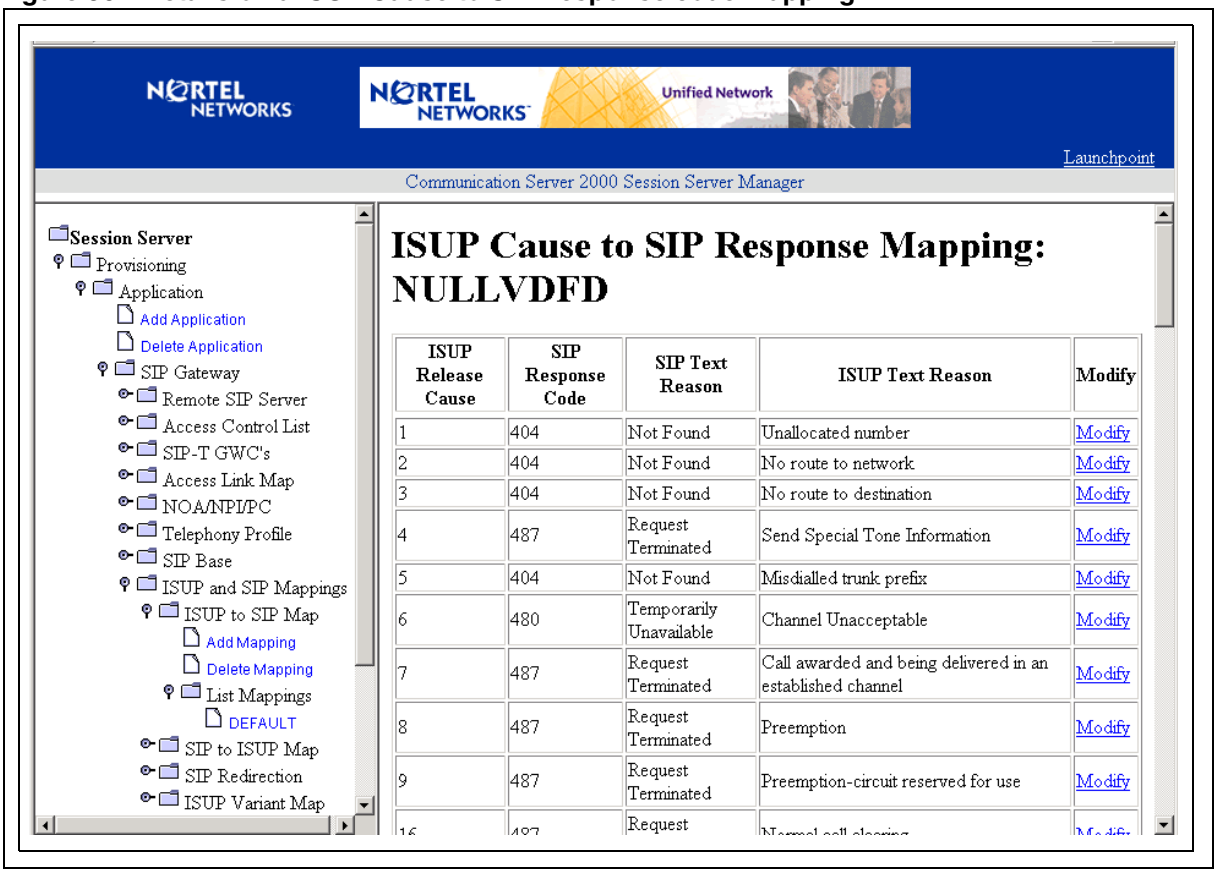
Figure 35 Provisioning an ISUP Cause to SIP Response code mapping



At the Add Mapping stage, the user chooses a new mapping name and the base mapping. When the new mapping is created, it uses the base mapping as the one from which to clone. The new mapping may then be modified to suit the user’s call processing needs. The clone procedure exists so that a user does not have to enter the nearly eighty mappings to complete an ISUP Release Cause to SIP Response Code mapping table. A user is allowed to clone from any of the existing ISUP Release Cause to SIP Response Code mappings.

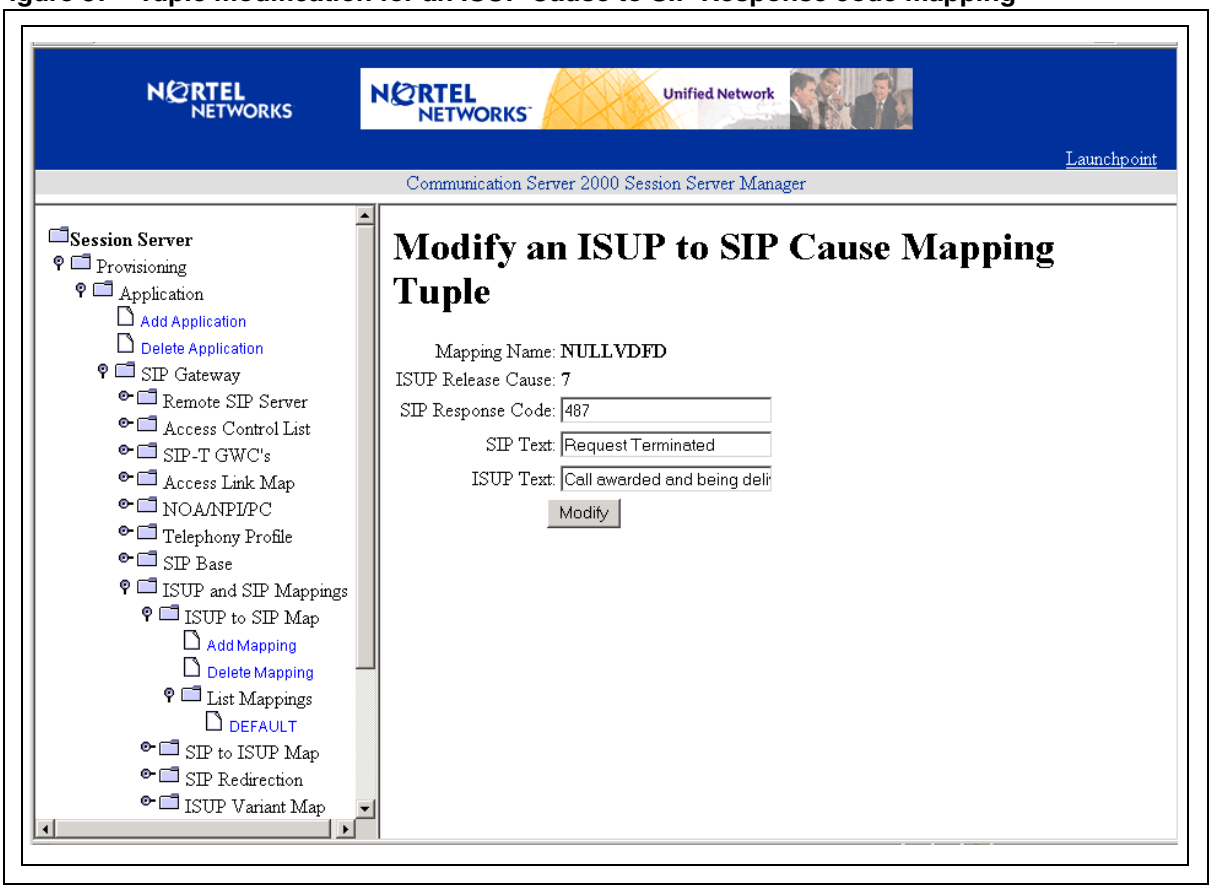
For the previous example, assume that the craftsperson entered a mapping name of MAP123. The mappings that exist in the system may be displayed by clicking on “List Mappings” within the “ISUP to SIP Map” sub-folder. In Figure 36, five mappings exist including the one just created by the craftsperson. Assuming the craftsperson wants to examine or modify the new mapping table, they simply click on the “MAP123” link.

Figure 36 Details on a ISUP Cause to SIP Response code mapping



Once clicked the mapping table is presented in the Interaction Frame. If the craftsperson then wants to modify a single tuple within that mapping table, they simply click on the “Modify” link and a tuple modify screen comes up in the Interaction Frame as shown in Figure 37, on page 1399 .

Figure 37 Tuple modification for an ISUP Cause to SIP Response code mapping



In Figure 37, the craftsperson chose to modify the tuple with the ISUP Release Cause of 5. They are then allowed to modify the SIP Response Code, SIP Text, and ISUP Text.

Existing mapping tables may be deleted by clicking on the “Delete Mapping” link within the “ISUP to SIP Map” sub-folder. When “Delete Mapping” is clicked, the user is presented with a selection of all mapping tables. Note the default mapping cannot be deleted. Finally, if the user attempts to delete a mapping that is in use by a Remote SIP Server, the request is denied.

119.8.2.4.10 SIP Response Code to ISUP Cause mapping [optional]

A SIP Response Code to ISUP Release Cause mapping table maps an SIP Response Codes to ISUP Release Causes. For example, the SIP Response Code of 404 may be mapped to the ISUP Release Cause of 41.

A single SIP Response to ISUP Cause mapping table consists of nearly forty SIP Response Codes mapped to ISUP Release Causes. See Table 6, "SIP Response Code to ISUP Release Cause mapping" for an example of this mapping:

Table 6 SIP Response Code to ISUP Release Cause mapping

SIP Response Code	ISUP Release Cause
400	41
401	21
402	21
403	21
404	1
.. .. ..	.. .. ..

The SIP Response Code to ISUP Release Cause mapping is termed optional datafill since a pre-defined mapping table exists in the system. This mapping table is called "DEFAULT". This predefined default mapping table may be selected when provisioning a Remote SIP Server described in "119.8.2.4.2 Remote SIP Servers" on page 1379. Note this pre-defined mapping table cannot be modified.

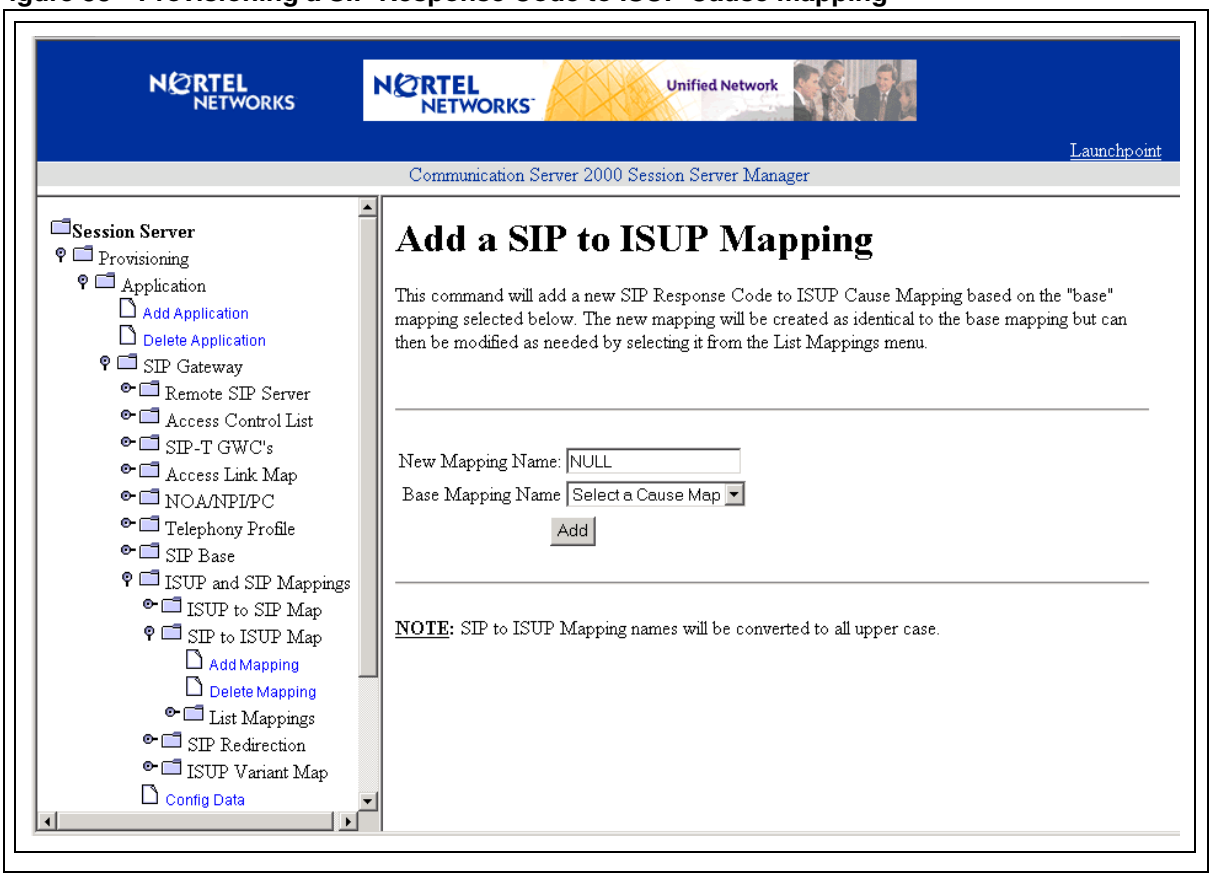
Although a pre-defined mapping exists, users may wish to create new mapping tables for their specific processing needs. This is done through the web interface.

In order to add a new mapping table, the user goes to the "SIP to ISUP Ma" sub-folder from the main Session Server Manager menu via the following commands:

- Click on the Provisioning folder
- Click on the Application folder
- Click on the SIP Gateway folder
- Click on the Mappings folder
- Click on the **SIP to ISUP Map** folder
- Click on Add Mapping

After clicking on "Add Mapping", Figure 38, on page 1401 shows what a craftsperson sees in the web browser.

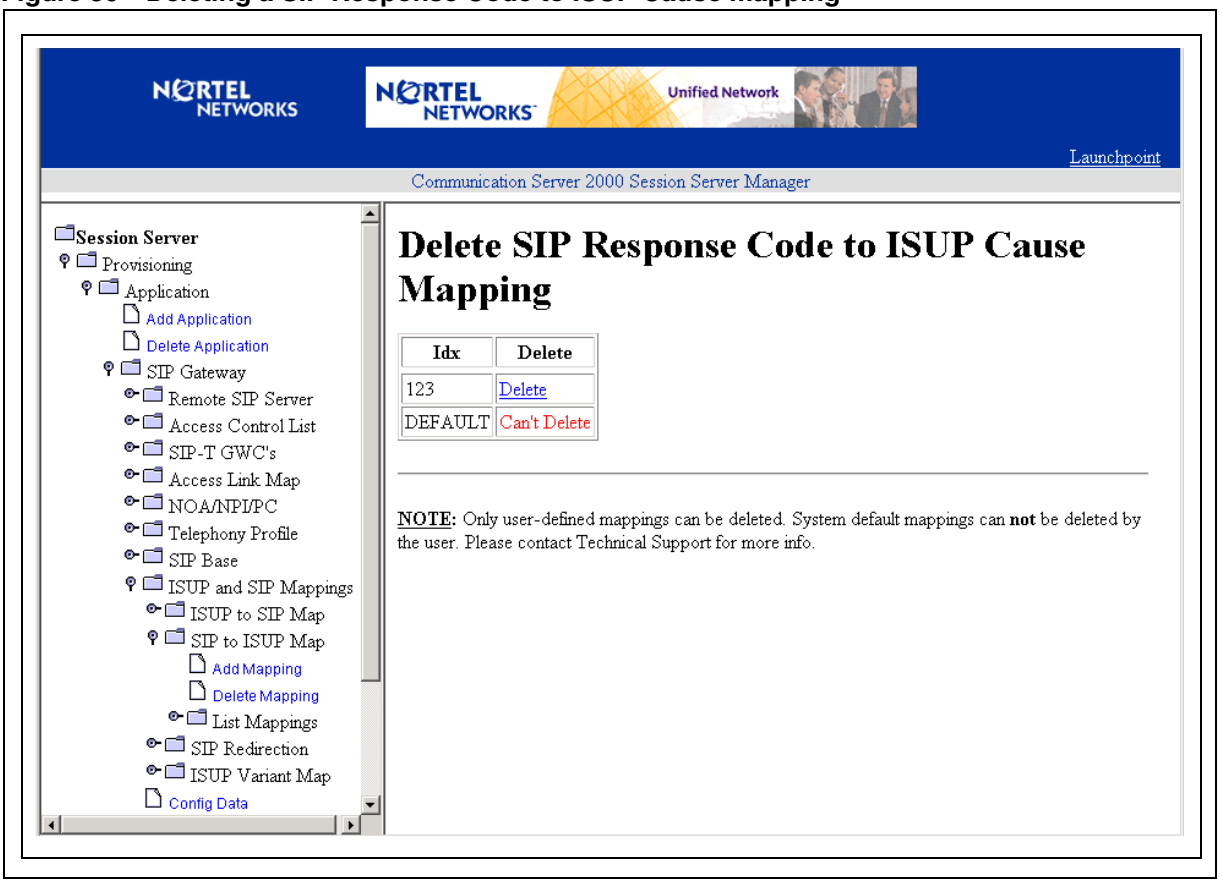
Figure 38 Provisioning a SIP Response Code to ISUP Cause mapping



At the Add Mapping stage, the user chooses a new mapping name and the base mapping. When the new mapping is created, it uses the base mapping as the one from which to clone. The new mapping may then be modified to suit the user's call processing needs. This clone procedure exists so that a user does not have to enter the nearly forty mappings to complete a SIP Response Code to ISUP Release Cause mapping table. Note a user may clone from any of the existing SIP Response Code to ISUP Release Cause mappings.

Once successfully added, the craftsperson may chose to modify tuples in their mapping or even delete the newly added mapping table. If the user were to choose to delete their new mapping, they would simply click on the "Delete Mapping" link within the "SIP to ISUP" sub-folder. Figure 39, on page 1402 shows an example of what is presented to the craftsperson in such a scenario.

Figure 39 Deleting a SIP Response Code to ISUP Cause mapping



119.8.2.4.11 SIP Redirection Mapping [optional]

SIP Redirection Mapping is a mapping of 3xx SIP redirection response messages to an associated 300-699 response codes. This mapping allows the customer to configure a call receiving a 3XX redirection message to be processed as a 300 or 699 related value. An example of the redirection mapping defaults are shown in Table 7, “Redirection mapping defaults”.

Table 7 Redirection mapping defaults

SIP Redirection code	Response Code
300	300
301	301
302	302
305	305
380	380

SIP Redirection Mapping datafill is optional if the customer does not wish to change any of the above pre-defined defaults.

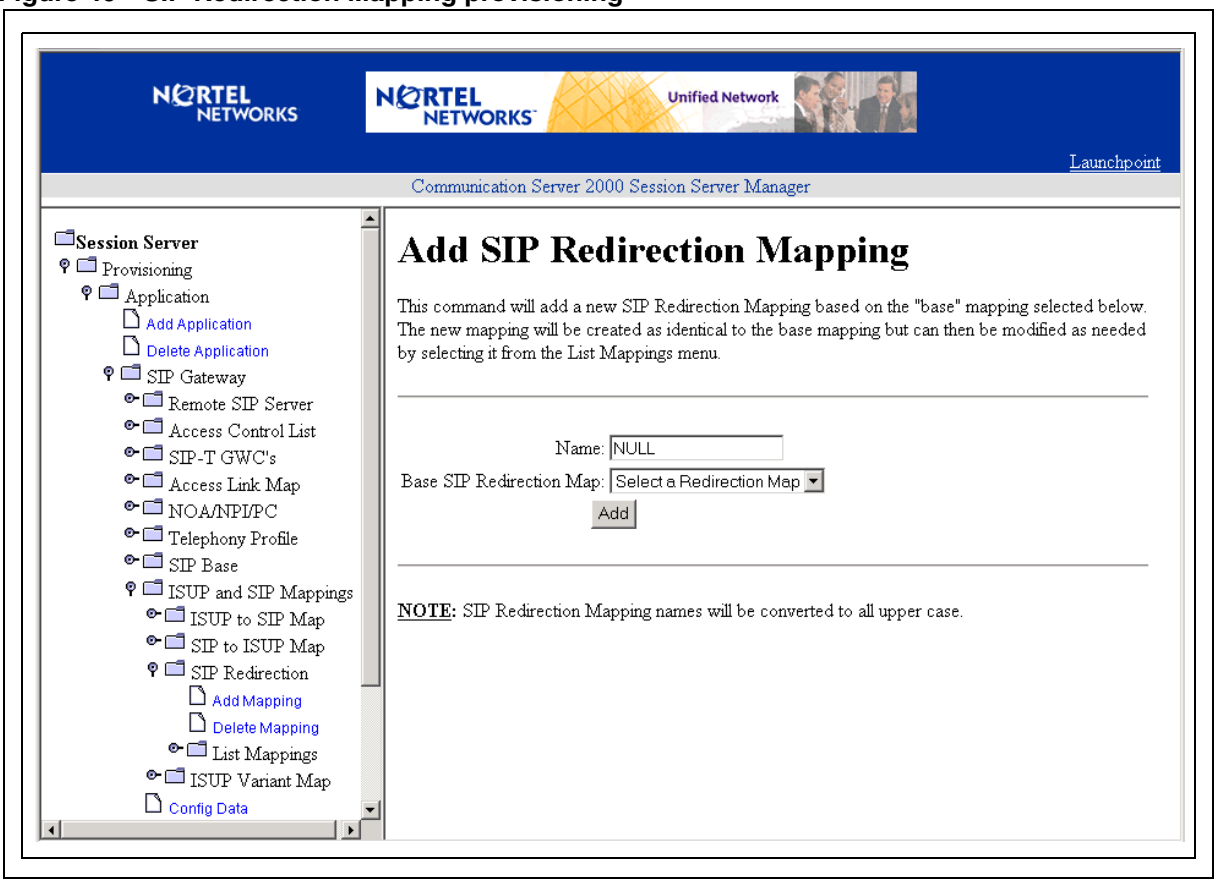
Although the pre-defined default mapping exists, users may wish to create new mapping tables for their specific processing needs. This is done through the web interface.

In order to add a new mapping table, the user goes to the “ISUP to SIP Map” sub-folder from the main Session Server Manager menu via the following commands:

- Click on the Provisioning folder
- Click on the Application folder
- Click on the SIP Gateway folder
- Click on the Mappings folder
- Click on the **SIP Redirection** folder
- Click on Add Mapping

After clicking on “Add Mapping”, Figure 40, on page 1404 shows what a craftsperson sees in the web browser.

Figure 40 SIP Redirection Mapping provisioning



At the Add Mapping stage, the user chooses a new mapping name and the base mapping. When the new mapping is created it uses the base mapping as the one from which to clone. The new mapping may then be modified to suit the user's call processing needs.

Once successfully added, the craftsperson may chose to modify tuples in their mapping or even delete their newly added mapping. If the user were to choose to delete their new mapping, they would simply click on the "Delete Mapping" link within the "SIP Redirection" sub-folder. In order to modify a mapping, the craftsperson clicks on "List Mappings" and then clicks on the mapping they wish to modify.

119.8.2.4.12 SIP Base [optional]

A SIP Base is a simple character string that represents base protocols utilized when provisioning ISUP to SIP Variants described in an section 119.8.2.5. In order to provision a new SIP base, the following is done:

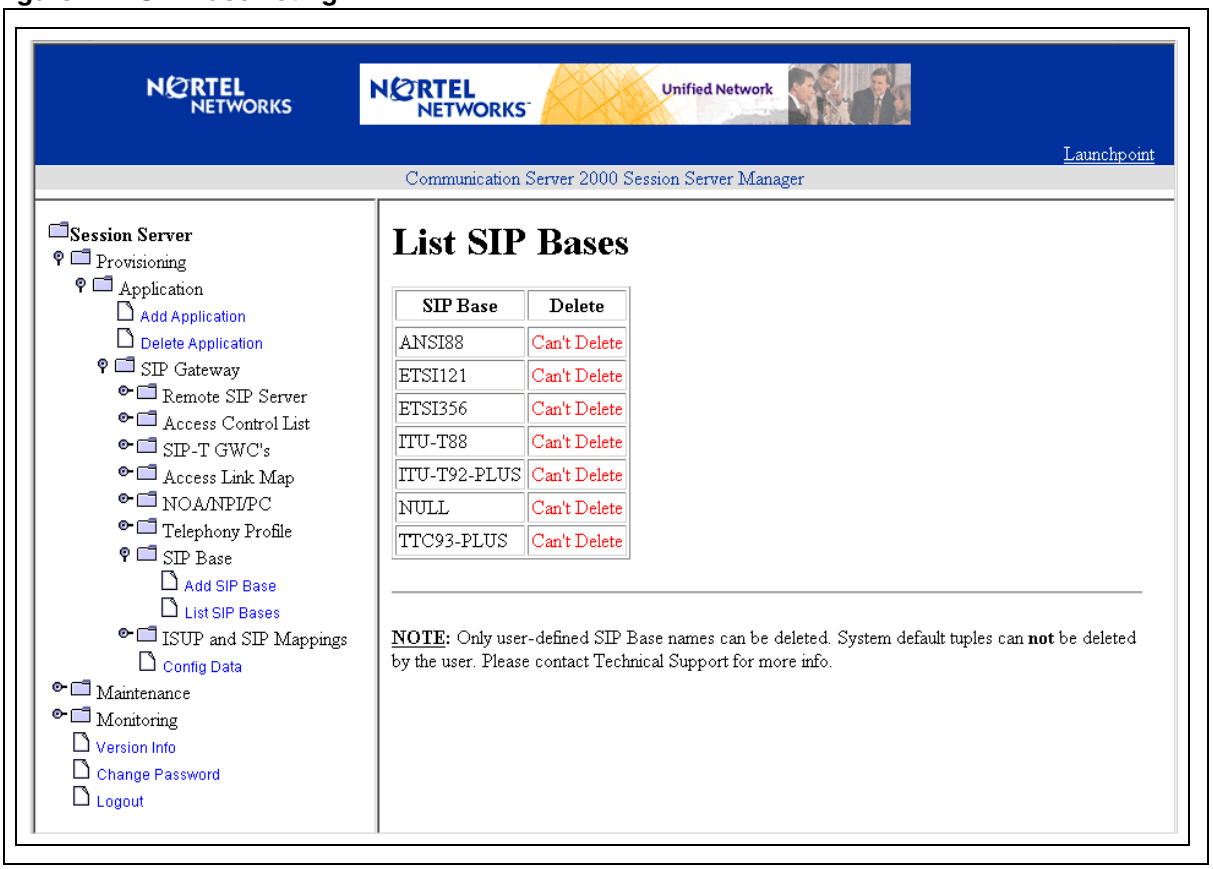
- In the SIP Gateway provisioning menu, SIP Base datafill may be added using the “Add SIP Base” link in the SIP Base folder.
- It may also be listed by clicking on “List SIP Base”. Once the values are listed, the user may choose to delete a particular one if it is not being used in any datafilled tuples in the ISUP Variant Mapping table. Deletions on system defaults are not allowed.

Six protocol defaults exist. Those pre-defined defaults are:

ANSI88	ITU-T92-PLUS	ETSI356
ITU-T88	ETSI121	TTC93-PLUS

An example of a user listing all the SIP Base values in the system is as follows:

Figure 41 SIP Base listing



119.8.2.5 SIP Gateway application maintenance

In previous sections, the functionality of the SIP Gateway application, which resides on the Session Server Manager was described in detail. For the SIP Gateway application to function properly, certain actions must be performed by SIP Gateway maintenance.

Note this section is written with the assumption that the Session Server Manager's unit status is active and enabled. Refer to section "119.8.2.5.2 Unit Status" on page 1411 for allowed maintenance actions when the unit is either not active or not enabled.

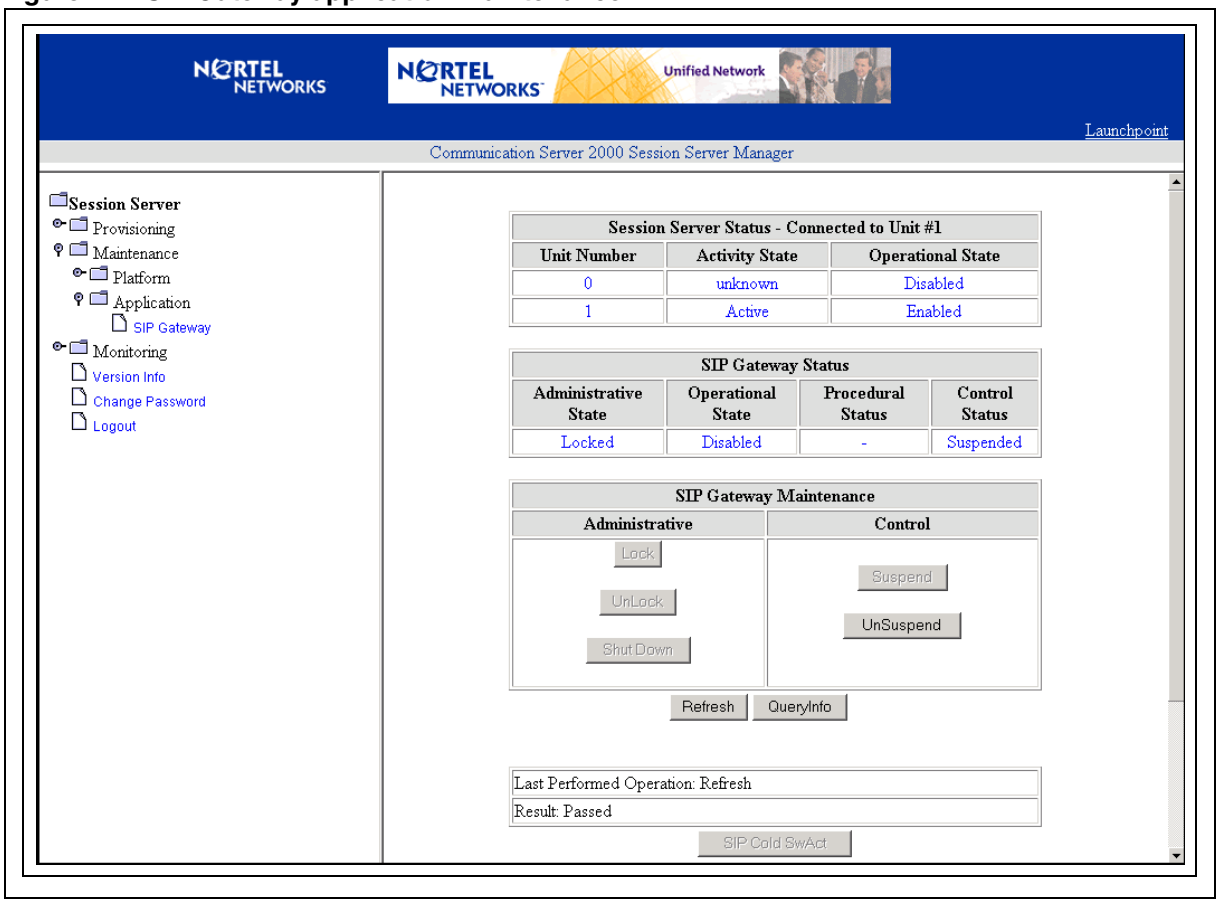
Access the SIP Gateway maintenance section of the web page by going to:

— Click on Maintenance folder

— Click on the Application folder

— Click on SIP Gateway

Figure 42 SIP Gateway application maintenance



Before performing maintenance actions, a basic outline on how to bring the SIP Gateway application into service and out of service is as follows:

Taking the application from out of service to in-service

— Unsuspend followed by Unlock

Taking the application from in-service to out of service

— Lock followed by Suspend

SIP Gateway maintenance utilizes the CCITT X.731 state and status attributes as well as X.731 commands. This is different than the standard DMS Core commands (e.g. BSY, RTS) and state (e.g. INSV), but it is consistent with recent Succession platform additions. The following table shows the four fields that comprise the CCITT X.731 state of the SIP Gateway application. The last column in the table is shown to provide a mapping to old-style DMS states to aid in understanding[1].

Table 8 SIP Gateway application states

Administrative State	Operational State	Procedural Status	Control Status	DMS Style States
Locked	Disabled	-	Suspended	OFFL
Locked	Enabled	-	-	MANB
Locked	Enabled	Terminating	-	MANBP
Unlocked	Enabled	-	-	INSV
Unlocked	Disabled	-	-	SYSB
Shutting Down	Enabled	-	-	INSVD

From the web interface, the above states may be changed via the following maintenance commands. Each of the five maintenance control items are represented by clickable buttons on the web page.

- Administrative State Control- The user can select from the following:
  - — Lock
  - — Unlock
  - — Shut Down
- Control Status Control - The user can select from the following:
  - — Suspend
  - — Unsuspend

[1]The DMS style states are not shown on the SIP Gateway maintenance web page. It is shown above only for understanding.

Depending on the current state, the user is not always allowed access to all of the maintenance control options.

The table below explains what controls are allowed depending on the current Admin State, Operational State, and Procedural Status. Again, DMS Style representation is shown in parenthesized italics to aid in understanding.

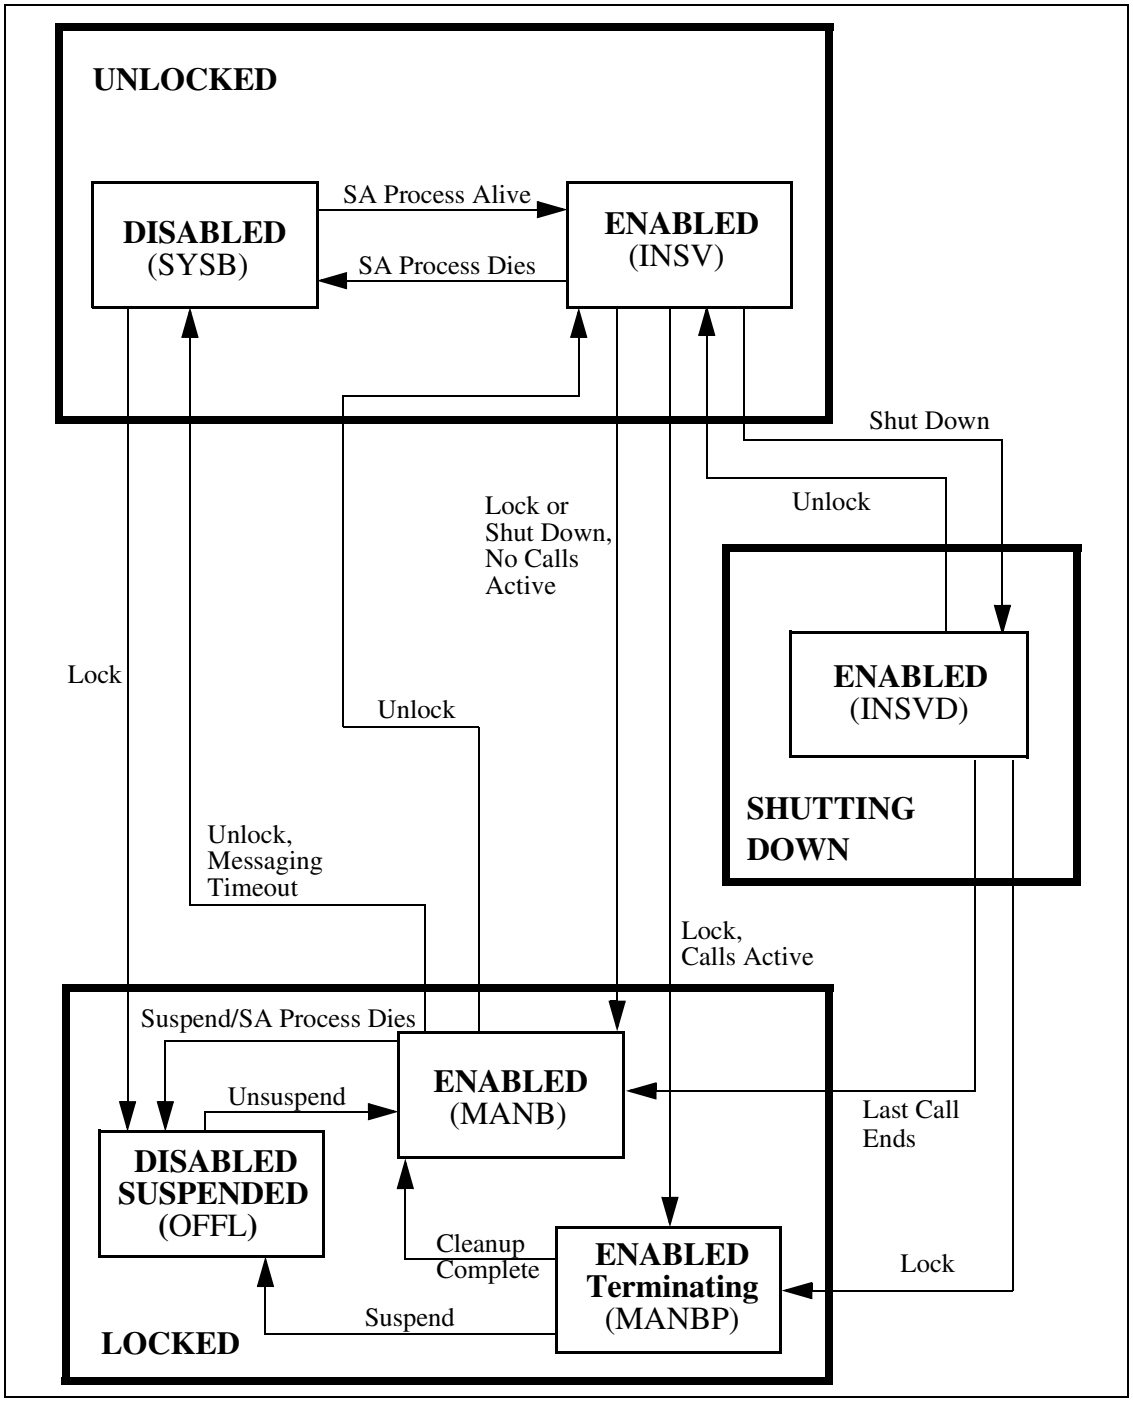
Table 9 SIP Gateway Maintenance External Controls Allowed

Admin State	Operational State	Procedural Status	Control Status	Allowed Controls DMS Style Commands in ()'s
Locked	Disabled	-	Suspended	Admin Control None Control Status Unsuspend (*BSY*)
Locked	Enabled	-	-	Admin Control Unlock (RTS) Control Status Suspend (*OFFL*)
Locked	Enabled	Terminating	-	Admin Control None Control Status: Suspend (*OFFL*)
Unlocked	Enabled	-	-	Admin Control Lock (*BSYFORCE*) Shut Down (*BSY*) Control Status None
Unlocked	Disabled	-	-	Admin Control Lock (*OFFL*[a]) Control Status None
Shutting Down	Enabled	-	-	Admin Control Lock (*BSYFORCE*) Unlock (*RTS*) Control Status None

a. From a DMS perspective, this is a non-standard command. In the DMS model you would expect to do a BSY command, and then an OFFL command to get from the SYSB to OFFL state. However, for the SIP Gateway maintenance state model, SYSB is an error condition where the SIP Gateway process has died due to some error. MANB is a state where the SIP Gateway process should be up and running. Thus, it is more applicable when manually taking the SIP Gateway out of service from the SYSB command to go directly to OFFL (as opposed to first going MANB), as both are states where the SIP Gateway process is not running.

Finally, a maintenance state is presented. DMS system commands are shown in parentheses to aid in understanding. However, DMS style commands are not shown on the web page since CCITT X.731 commands and controls are utilized.

Figure 43 SIP Gateway Maintenance State Diagram



119.8.2.5.1 Application Cold Swact

On the SIP Gateway Application maintenance page, the SIP Cold SWACT button allows users to perform an application cold switch of activity (SWACT) if the Session Server Manager platform is active and enabled. If the unit is not active, the button is not allowed to be pressed.

Assuming the Session Server Manager unit activity status is active and the operational state is enabled, the craftsperson can click the button to perform an application cold SWACT.

Note: From the active unit web page, the unit must be active, enabled, and the mate unit must be on standby and enabled in order to access the SIP Cold SWACT button.

If the user clicks the SIP Cold SWACT button, a dialog box appears to verify that the user wants to proceed with a SIP Gateway cold SWACT. The consequences of performing a SIP Gateway cold SWACT include the following:

- All currently active SIP Gateway calls will be taken down.
- A Session Server Manager force SWACT will then occur.

Note: This is not the normal interface to request a platform SWACT. Only proceed with the SIP Gateway cold SWACT if a platform SWACT has already taken place, and a problem has been detected with SIP Gateway call processing.

119.8.2.5.2 Unit Status

The previous SIP Gateway maintenance sections made the assumptions that the Session Server Manager unit's activity state was active and the operational state was enabled. If unit activity state is not active or the operation state is not enabled, maintenance actions on the SIP Gateway application are not allowed. The only buttons available for use on the SIP Gateway application maintenance page are the refresh and the QueryInfo buttons.

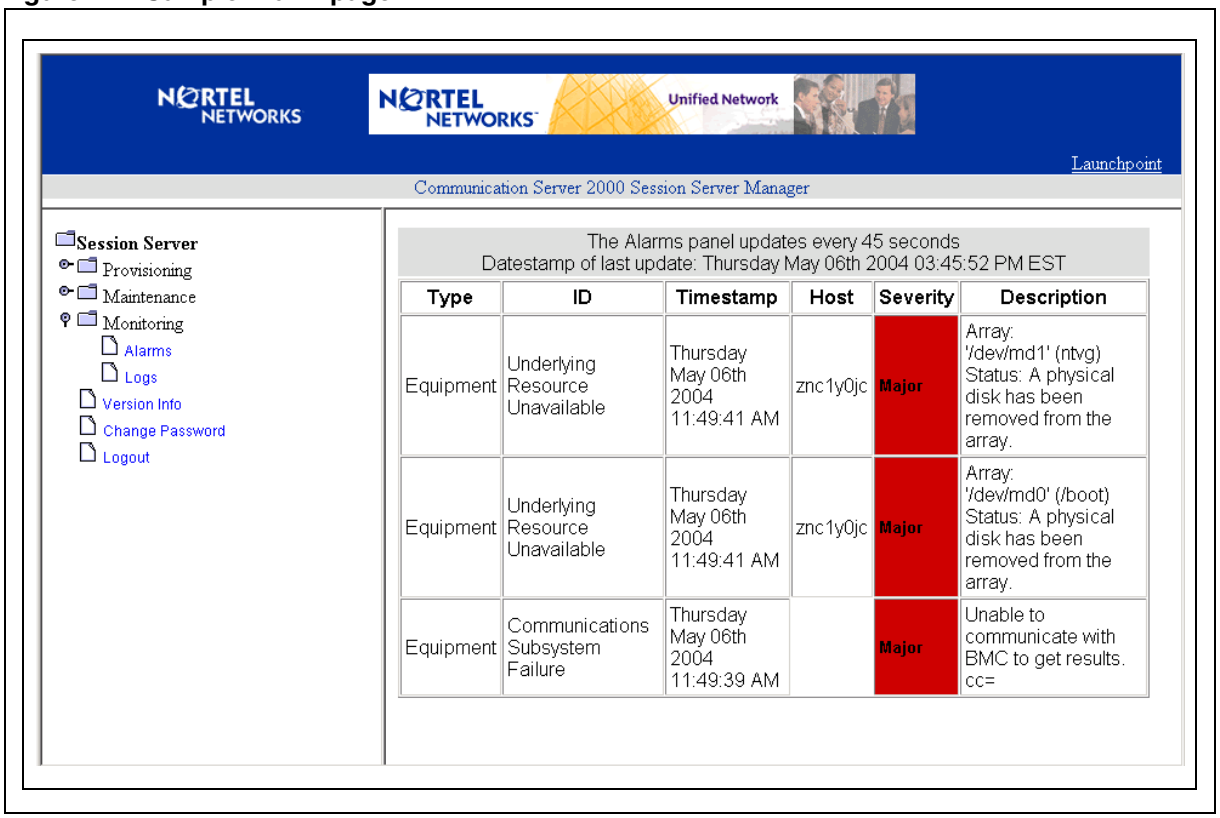
119.8.2.6 Alarms

The Session Server Manager has the capability for applications or the system itself to generate alarms. These alarms can be viewed on the Session Server Manager's Alarm web page. Information shown about particular alarms include the type, identifier, time-stamp, host (unit from which the alarm was raised), severity, and a description of the alarm.

The user may view alarms by going to the alarms web page. The alarm web page is located in the Monitoring menu folder.

Once the craftsperson clicks on Alarms, the alarm web page is presented in the right frame with the current alarm list. The alarm web page updates every 30 seconds and the user also has the option of invoking a re-query of alarms. This is similar to the Alarm implementation for the Storm system.

Figure 44 Sample Alarm page



119.8.2.7 Logs

The Session Server Manager has the capability for applications or the system itself to generate logs. These logs can be viewed on the Session Server Manager's log web page. Information shown about a particular log includes:

- Timestamp
- Session Server device name
- Process that generates the log
- Log ID and number
- Alarm severity
- Log type
- Log label
- Additional information

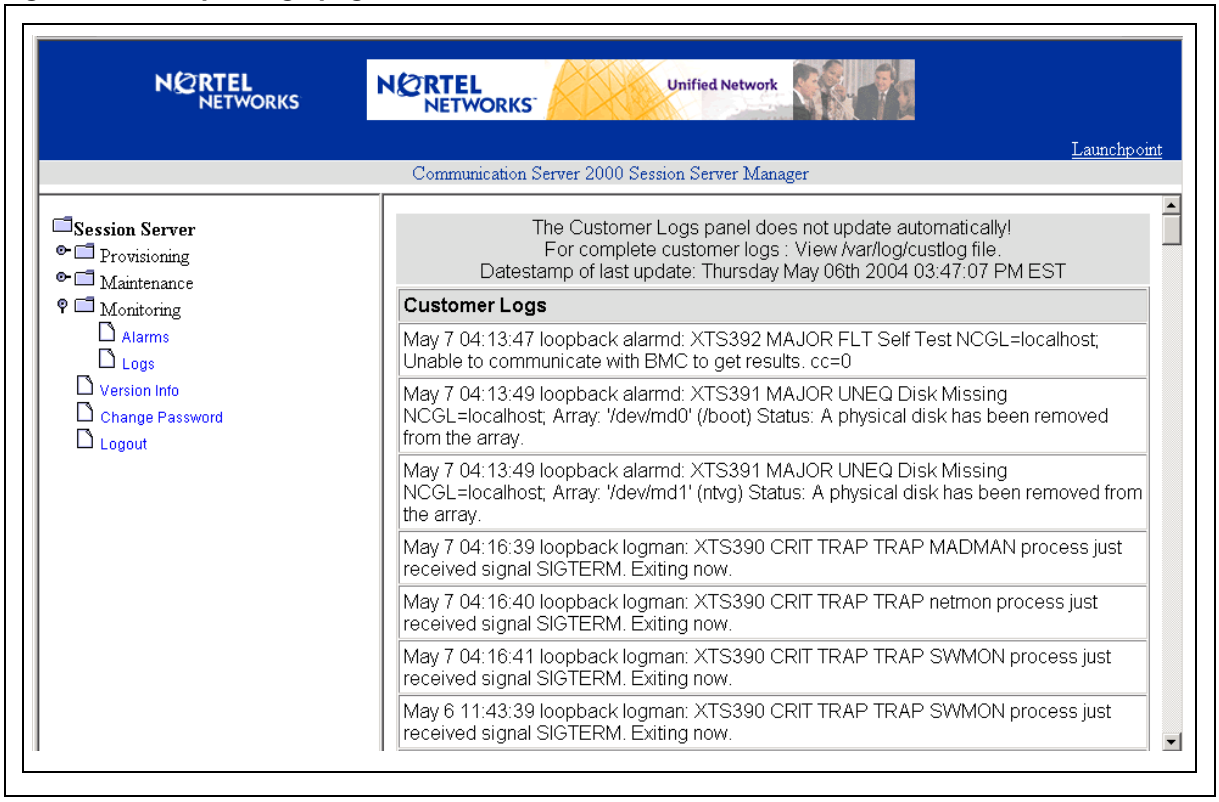
The user may view logs by going to the logs web page located in the Monitoring menu folder.

Note 1: The body of log formats shown in this document are the formats for Session Server logs if viewed from the IEMS (Integrated Element Manager System). Log formats may differ if logs are viewed from the Session Server Web Interface. However the content of the logs will not differ, only the formatting.

Note 2: When viewing logs from an IEMS, log headers may differ slightly from what is shown in this document.

Once the craftsperson click on Logs, the log web page is presented in the right frame with the current log list. A sample log web page is shown below.

Figure 45 Sample Logs page



119.8.2.8 Operational Measurements

Like other Call Server platforms, the Session Server Manager records operational measurements (OMs) for various performance related data items. The OM subsystem is similar to the OM subsystem but is different in some aspects. The majority of OMs pegged in SN07 are directly related to the SIP Gateway application. Also, OMs that are pegged can be viewed via a command line user interface (CLUI) after using secure shell (SSH) to login to the Session Server Manager.

After logging in to the Session Server via SSH to an account such as “mtc”, the user may issue commands such as the help command:

```
[mtc@sserv-unit0 mtc]$ omshow help

        Please select from the following options.

        omshow help
        omshow all active
        omshow all holding
        omshow all lastfive
        omshow <omgroup> active
        omshow <omgroup> holding
        omshow <omgroup> lastfive
        omshow all zero
        omshow <omgroup> zero
        omshow holdingperiod 30
        omshow holdingperiod 15
```

A brief description of the above commands are as follows:

`omshow help` - Print out the commands as shown above.

`omshow all active` - Print out all the OM groups and their associated active registers.

`omshow all holding` - Print out all the OM groups and their associated holding registers.

`omshow all lastfive` - Print out all the OM groups and their register values for the past five minutes.

`omshow <omgroup> active` - Print out the active registers for a particular OM group.

`omshow <omgroup> holding` - Print out the holding registers for a particular OM group.

`omshow all zero` - Zero the active registers for all OM groups.

`omshow <omgroup> zero` - Zero the registers for a particular OM group.

`omshow holdingperiod 30` - Set the holding period to 30 minutes.

`omshow holdingperiod 15` - Set the holding period to 15 minutes.

Operational Measurements are kept in two primary formats for a particular holding period. For example lets assume the holding period time is 30 minutes and the current time is 4:50 PM. The active registers represent 4:30-4:50 PM and the holding registers represent 4:00-4:30 PM. Finally at 5:00PM the active registers are copied to the holding registers. The possible holding periods for the Session Server are 15 and 30 minutes. The default holding period time is 15 minutes.

In addition to the above, the values of OM groups and registers can be output for the current five minute interval. For example, if the current time is 4:04:39 PM, the register values for the last 4 minutes and 39 seconds can be output via the “lastfive” selection.

Note OM values pegged in an application such as the SIP Gateway application may not reach the OM subsystem for a full minute. This can impact what is displayed when the omshow command is used since omshow pulls values from the OM subsystem.

Finally OM group register data pegged on one unit of a Session Server is completely independent of register data on its mate unit. Register data is not transferred from one unit to another.

119.8.2.8.1 Operational Measurements

This section contains a list of three OM groups and registers that are supported in SN07 on the Session Server. OMs on the Session Server are not in any related to operational measurements on the Core. Also, OMs generated on the Session Server are not sent to the CS2K Core.

Table 10 OM Group: SIPGW_CALLP

Register Name	Description
IC_CALL_ATTEMPTS	Total number of incoming call attempts
OG_CALL_ATTEMPTS	Total number of outgoing call attempts
CALLS_ANSWERED	Total number of calls answered
CALLS_ABANDONED	Total number of calls abandoned
CALLS_REJECTED	Total number of calls rejected
CALLS_REDIRECTED	Total number of calls redirected

Table 11 OM Group: SIPGW_SERVICES

Register Name	Description
REFER_ATTEMPTS	Total number of refer attempts[a]
REFER_SUCCESS	Total number of successful refers
IC_DTMF_SUBSCRIBES	Total number of incoming DTMF subscribes
OG_DTMF_SUBSCRIBES	Total number of outgoing DTMF subscribes
IC_DTMF_NOTIFYS	Total number of incoming DTMF notifies
OG_DTMF_NOTIFYS	Total number of outgoing DTMF notifies
IC_FAX_SUBSCRIBES	Total number of incoming fax subscribes
OG_FAX_SUBSCRIBES	Total number of outgoing fax subscribes
IC_FAX_NOTIFYS	Total number of incoming fax notifies
OG_FAX_NOTIFYS	Total number of outgoing fax notifies

a. Registers IC_FAX_SUBSCRIBES, OG_FAX_SUBSCRIBES, IC_FAX_NOTIFYS, and OG_FAX_NOTIFYS exist but are not supported in the SN07 release.

Table 12 OM Group: SIPGW_MISC

Register Name	Description[a]
TCP_CALLS	Total number of TCP Calls
UDP_CALLS	Total number of UDP calls
SIP_MSG_SEND_FAILURES	Total number of SIP Msg Send Failures
INCOMING_SDP_INCOMPATIBLE	Total number of incompatible SDPs received from remote SIP servers
OUTGOING_SDP_INCOMPATIBLE	Total number of incompatible SDPs received from local gateways.

a. Register SIP_MSG_SEND_FAILURES exists but is not supported in the SN07 release.

119.8.2.8.2 CSV files

While the OMSHOW function provides near term information, it does not save performance info after a set period in time. In certain scenarios this historical information may prove to be valuable. Therefore OM information is also saved to comma separated value (CSV) files. Two sets of comma separated files are created.

Short Term

These six comma separated value files represents the last 30 minutes worth of information. Each file consists of a particular five minute interval within the thirty minute timeframe.

Long Term

The long term history represents the last 24 hours worth of information. If the OM collection interval is 15 minutes, then a total of 96 files are kept representing the last 24 hours. However if the collection interval is 30 minutes, 48 files are kept.

Please refer to “119.24 Appendix D: CSV file information” on page 1438 for detailed information on the CSV file locations and the file format.

119.9 Software Optionality Control (SOC)

There are two new core usage SOC options that are used to limit the maximum number of simultaneous calls allowed through the Session Server Manager at any given time. Without one or both of the new SOC options, no call processing can take place using the Session Server Manager. Before discussing the new SOC options, it is important to understand the relationship between the new SOC options and the existing DPT SOC option in the core.

119.9.1Existing DPT SOC option CS2B0005

Calls using the SIPT Gateway application on the Session Server Manager are considered to be DPT (Dynamic Packet Trunking) calls and are therefore limited by the base DPT SOC, CS2B0005. Before Session Server Manager calls can be made, the base DPT SOC must be purchased. This existing DPT SOC option is a usage based SOC and it specifies the maximum number of DPT ports that can be used simultaneously for processing all DPT calls.

Although DPT SOC option CS2B0005 specifies the maximum possible number of DPT ports that can be used in the office, the actual maximum for the office is governed by the office parameter DPT_MAX_PORTS in table OFCVAR. The DPT_MAX_PORTS parm can be set to any value equal to or less than the CS2B0005 SOC option and it allows fine tuning of DPT traffic limits within the bounds of the DPT SOC limit without having to obtain a new SOC limit each time.

Since dynamic packet trunking does not have fixed trunk members, it is possible that a single trunk group in the office can use all the available DPT port capacity. To prevent starvation of DPT ports for calls on other trunk groups, the maximum number of simultaneous DPT calls allowed on a particular trunk group can be limited. This adjustment is made on a trunk group basis using the MAXCALLS field in table DPTRKMEM.

119.9.2Two New Session Server SOCs (CS2B0008 and CS2B0009)

The two new core usage based SOC options for the SIPT Gateway application are CS2B0008 “Call Server to Call Server SOC” and CS2B0009 “Call Server to Application Server SOC”. The combined total limits of these two SOCs should not exceed the limit of the base DPT SOC option, CS2B0005. The maximum number of simultaneous DPT calls allowed for the office is still governed by the DPT_MAX_PORTS parameter in table OFCVAR, although the maximum number of simultaneous Session Server Manager calls can be further restricted by these new SOC options.

Each Session Server Manager call is designated as either a “Call Server to Call Server” call or a “Call Server to Application Server” call. This designation is made in field CONNTYPE of table SIPLINK in the core. In table SIPLINK, each SIP

access communication link is marked according to whether that link is used to communicate to another call server or to an application server. If the link is used to connect to another CS 2000 or an MCS, then field CONNTYPE should be set to CS2CS, denoting a call server to call server connection. If the link is used to connect to some other type of SIP server, then field CONNTYPE should be set to CS2AS, denoting a call server to application server connection.

Current simultaneous usage for each Session Server Manager call type is tracked in the core and calls will be rejected if they cause the corresponding Session Server Manager SOC limit to be exceeded.

119.10 Hardware Requirements or Dependencies

The Session Server Manager is an integrated platform consisting of hardware and software. Please refer to section 119.4.1 for the hardware configuration. There are no additional hardware requirements or dependencies

119.11 Software Requirements or Dependencies

Software requirements include the following:

- Nortel Carrier Grade Linux. Provided by Activity A00004005.
- Session Server Manager NGSS07
- SN07 GWC, CM
- CS2M

In order to maintain the Session Server Manager a web client is needed. The requirement for a web client is as follows:

Supported web clients on a PC:

- Windows 2000, XP, or 2003 based operating system.
- Supported web browsers on those operating systems include:
  - — Internet Explorer 6.0 SP1and above
  - — Netscape 6.2.x, and Netscape 7.1 and above

Supported web clients on a Sparc:

- Solaris 8 or 9
- Supported web browsers on those operating systems include:
  - — Netscape 6.2.x, and Netscape 7.1 and above

The following browser are NOT supported:

- Any browser running on Linux
- Any browser running an OS under VMware
- Any browser running under Solaris on a PC
- Any browser running on MacIntosh hardware
- Mozilla

119.12 Limitations and restrictions

The following limitations and restrictions exist for the Session Server Manager platform and the SIP Gateway application.

1. See section "119.11 Software Requirements or Dependencies" on page 1421 for a comprehensive list of operating systems and web browsers that are supported.
2. Javascript must be enabled in the web browser used.
3. Popup blocking should **not** be enabled within the web browser. Verify that popup blocking is not enabled prior to using the web browser to access the Session Server Manager.
4. When adding or deleting mapping tables via the web client, the craftsperson should allow the add operation to complete before performing other web actions. Aborting a web action via a "Stop" or "Back" can cause incomplete data to be added to the database.

   Invalid mapping tables can always be deleted by the craftsperson via the "Delete Mapping" command in the respective mapping sub-folder.
5. When a new mapping is added to any of the mapping table folders, the folder menu at the left side of the web-browser does not automatically refresh. The user should close/open the folder to see the newly added mapping.
6. For Call scenarios, where an ISUP payload is to be generated, mandatory parameters are mapped from appropriate SIP Headers. As a result, some of the services depending on the trunk-type (IBNT2, IT, EANT) may not be available, if appropriate mapping is not defined.
7. For the List Mappings sub-folder in the "ISUP to SIP Map", "SIP to ISUP Map", "ISUP Variant Map", and "SIP Redirection" mappings:

   If the List Mappings sub-folder is open when a mapping table is added or deleted, the mapping names under the particular List Mappings sub-folder won't change *visually* until that sub-folder is closed and re-opened. The mapping tables will have been added or deleted per the user action. The user is **not** required to open or close the List Mappings sub-folder for the add or delete action to take effect.
8. If the optional trunk telephony profile header is not used in the SIP messages between the Session Server Manager and destination SIP servers, then only a single trunk group can be used to carry the traffic between the Session Server Manager and a single destination SIP server. If multiple trunk groups are required between the Session Server Manager and a single destination SIP server, trunk telephony profile headers are required in the SIP messages to identify which trunk to use for a particular incoming call to the Session Server Manager.

9. Multiple independent and redundant pairs of Session Servers are not supported.
10. No backup and restore functionality is available for the Session Server Manager node in SN07.
11. All currently active SIP Gateway calls will be taken down during a SIP Gateway cold SWACT.
12. The Session Server Manager Web interface utilizes and requires the use of HyperText Transport Protocol Secure (HTTPS).
13. Before HTTPS can be used on the Session Server Manager, a Secure Sockets Layer (SSL) certificate must be obtained and installed.
14. OM values pegged in an application such as the SIP Gateway application may not reach the OM subsystem for a full minute. This impact what is displayed when the omshow command is used since omshow pulls values from the OM subsystem.
15. OM group register data pegged on one unit of a Session Server is independent of register data on its mate unit. Register data is not transferred from one unit to another.
16. WARNING: To ensure data integrity, the command line interface should not be used to enter or change data in the database. Only the web interface should be used to enter or change the provisioned data.
17. Improper reboot or shutdown of the Session Server can result in data loss. Proper procedures should be followed when rebooting or shutting down a Session Server unit.
18. The Session Server 2000 GUI does not support being accessed over a NAT'd connection in SN07. Only direct (same-LAN) and SSPFS web proxied connections are supported.
19. The physical limit for table SIPLINK is 2048 tuples; however, due to the DDM limitation for table DPTRKMEM, table SIPLINK should not be datafilled to more than 400 tuples.
20. If the Session Server goes out of service due to a system failure or because of improper shutdown (thereby disrupting the ability to communicate the link status change to the gateway controllers), all in-service SIPT trunks associated with any access links on the Session Server will remain in-service.

	V2			<user defined string>

Table 13 ISUP Variant to SIP Version mappings

Note blank areas indicate “Not Applicable” values. When adding tuples via the web form that have no applicable values for the respective columns, select “Not Applicable” to represent the blank areas listed in the table.

119.18 Appendix B: SIP on NGSS Tracing/Debug Framework

SIP on NGSS Debug and Tracing (Feature A00003280) is a stand alone tool. It controls the Radvision SIPT Toolkit log module and filters the internal NGSS traces which are written into the tracing files.

This section is primarily targeted to Customer Support groups like GNPS. While the tool will be available in the field, it should not be done on a regular basis or at high traffic levels due to the impact of running the tracing session on the capacity of the field office.

This tool can run in two modes:

1. Simple Mode - straightforward usage tracing SIP messages
2. Prompt Mode - more sophisticated usage, needs a deeper knowledge regarding what to trace and how to used this tool.

119.18.1 Simple Mode

The following is an overview of a typical Simple Mode tracing session.

1. user needs a telnet session to the NGSS
2. start a Simple Mode by a command **/opt/apps/bin/sp2ktrace start**
3. stop a Simple Mode by a command **/opt/apps/bin/sp2ktrace stop**
4. tracing file is located in NGSS directory **/opt/apps/logs** with the name as siptrace.YYYYMMDD.MSG.001 (example **siptrace.20040318.MSG.00001**)
5. the siptrace file contains the SIP messages provided by Radvision Transport layer:

```
T  88b63c8 03/19/2004 14:09:13 INFO   - TRANSPORT    -
T  88b63c8 03/19/2004 14:09:13 DEBUG  - TRANSPORT    - TransportCallbackMsgToSendEv:

    Sending message. local-address=192.168.192.64:5060. remote-
    address=192.168.192.59:5060
```

6. for continuous tracings you can type command on NGSS:

> tail -f /opt/apps/logs/siptrace.20040318.MSG.00001

to get traces onto the screen.

119.18.2Prompt Mode

The following is an overview of a Prompt Mode tracing session.

1. user needs a telnet session to the NGSS
2. enter a Prompt Mode (command line interface) by a command **/opt/apps/bin/sp2ktrace** as example:

```
root@unit0 root]# /opt/apps/bin/sp2ktrace
```

3. type **help** to see which commands are available

```
SIPTRACE> help
These commands are provided:
  Help
  set (layer<1-19>  filter<0-63>)
  status
  start
  stop
  Users
  display <all | Session Server Name> - for IP address status
  Quit
-------------------------------------------------------------
Additional info for SET command:
  Layers and their corresponding numbers are shown by
  STATUS command.
  1 - all layers (ex. SET 1 2 sets all layers filter=INFO=2).
  There are 6 Filters as:
  DEBUG=1 INFO=2  WARN=4  ERROR=8 EXCEP=16 LOCKDBG=32.
  Filters can be logically combined - if you want to trace for ex.
  layer PARSER (7) with filters ERROR (8) and EXCEP (16)
  SET 7 24
  For cleanup use filter 0 (example SET 7 0 for above).
  Use SET 1 63 (to set tracing for everything)
  use SET 1 0  (to cleaunp everything).
  Please be aware SET command only sets tracing.
  You must use START command to start tracing
  and use STOP command to end it.
Tracing files are in the directory /opt/apps/logs/.

SIPTRACE>
```

4. type **status** command to see all available Layers and Filters:

```
SIPTRACE> status

SIPTRACE>
SIPTRACE> stop
```

In the example above you can see three users. A server is a permanent thread with a pid (processID=15704), your session with a userID mtc and pid 16802 and one Simple Mode with userID MSG and hardcoded pid 00001. The “00001”s behind a pid column belong to the active column indicating that this session is active - it means it is collects data.

7. the siptrace file for the above tracing session (pid 22958) is located in NGSS directory /oipt/apps/logs/siptrace.20040319.mtc.22958 with few first lines as:

```
=== SESSION ENTERED: [pid:22958/mtc]  Fri Mar 19 14:17:19 2004

```

8. stop the session by the **stop** command.
9. exit session by a **quit** command.

119.19 Hardware Requirements or Dependencies

Customer offices without the Session Server Manager will not have the functionality delivered by this feature.

119.20 Software Requirements or Dependencies

The Session Server Manager feature must be available. Also, certain other features developed for the Session Server Manager will be required (Call Processing support, etc.) as well.

119.21 Limitations and restrictions

This tool has the following limitations:

1. Tool is currently configured for 10 concurrent Trace Clients. The Simple Mode is counted as a Client.
2. The user of this tool needs access (a telnet session) to the NGSS machine.
3. Only one Client can run in the Simple Mode at a time.
4. Every Trace Client gets its own output trace file which is being used until the Trace Client session ends (by **quit** command in the Prompt Mode or ***sp2ktrace stop*** in the Simple Mode). For example, if a user starts a session on Monday and runs it over 3 days, there will be only one Trace Client file with a creation date i.e. Monday date.
5. The Trace Server trace file. In contrast of the Trace Client trace file, the Trace Server trace file is created on every day. (to give a chance to get rid of old/yesterday's files). The trace file creation is not done few seconds after midnight but by the first execution (after midnight) of the print routine (which can be few hours from the midnight) depending on monitoring activities/setup.
6. If the size of any output file (siptrace) created by this tool (in the directory /opt/apps/logs) exceeds limit of 10 MBytes then this file will be over written from the beginning. This event is recorded together with the overwritten counter.
7. All siptrace* files in the directory /opt/apps/logs/ older than 3 days will be deleted automatically by the tracing tool.
8. Other files in the directory /opt/apps/logs need to be deleted manually. ***Note:*** The file created by monitoring in the Simple Mode is appended every time tracing starts (by a command ***siptrace start***) on the same date.
9. **WARNING**: Do not delete active/current (today) server files. Prevent the deletion of active Trace Client's files. Deleted files will not be re-created.
10. This tool provides tracing for multiple threads, which may attempt to write to the same tracing file concurrently. Non-waiting semaphores are used to prevent concurrent access into the client file. This may result in a "lost" trace record rather than to block a thread waiting on the semaphore.
11. **Configuration:** The configuration file sp2ktraceConfig is created when tool runs for very first time in the directory /opt/apps/logs. This file has currently two (default) parameters:

- NUMBEROFINITLOGS 300
- CLIENTFILESIZEMB 10

The first parameter configures the number of logs to be printed into the server siptrace file during the initialization (when SIP Gateway is Unsuspended). The default value is 300 logs but can be increased up to the maximum of 25000.

The second parameter allows to increase the size of the client siptrace file from the default value 10 Mbytes up to the maximum of 500 Mbytes.

These parameter must be changed prior the SIP Gateway is Unsuspended to be used.

119.22 References

- A00003698 - SIP Msg trace

119.23 Appendix C: Database Backup and Recovery

This section explains how database backups are made and how to recover the database from a backup copy.

119.23.1 Database Backup

Database backups are made to secure the information stored in the database. If there is a system or database failure the database can be restored from the backup files. The Solid database is automatically backed up daily based on a timed command. The automatic backup is performed at 1:00 AM each day.

There is only one backup copy of the database. It contains the last or most recently backed up copy of the database. If additional security measures are desired the customer may periodically retrieve the files saved in the backup directory and store them on another machine. A customer could maintain a history of database changes in this manner.

119.23.2 Restoring database from a backup copy

The following procedure is used to restore the database from the backup copy. The database is restored to its state when the backup was made. In general this procedure should only be followed when database corruption has occurred on both units of the NGSS. The database must be restored on the active unit of the NGSS.

1. Jam the Active Unit.
2. Suspend Call Processing
3. Login in to the active unit as mtc and su to root.

   ssh -l mtc <ipaddress>

   su root
4. Run the restorebackup script as shown from the following directory:

   cd /opt/apps/database/solid_install/

   ./restorebackup.sh
5. Unsuspend Call Processing
6. UnJam the Active Unit

Jamming the active unit is necessary to prevent the database from switching activity while its being restored. The database must be restored on the active unit. Call processing should be suspended since the database will not be available.

119.24 Appendix D: CSV file information

This section details the CSV file formats, its location, and shows examples.

119.24.1 CSV File Location

SSH Login Access

If the user desires to login to a session server unit via an account such as MTC and look at the CSV files, the main directory path is /opt/apps/ngsspm. Two subdirectories are located here:

stdhist - This directory contains the 24 hour long term values.

trafhist - This directory contains the 30 minute short term values.

FTP Access

This future section will contain the access information when FTP is utilized using the NGSSPM account to pull CSV files from a session server unit.

119.24.2 CSV File Format

The CSV File Format is shown below:

```
PMFile=Begin
MeasurementCategory,FileCreationTime,EarliestStartTime,LatestCaptureTime,RegisterTypeDefault,ValueTypeDefault
<string="pm">,<string>,<string>,<string>,<string="counter">,<string="integer">
System=Begin
SystemId
<string="SessionServer">
Entity=Begin
Entity
<string= Unit IPAddress>
SubEntity=Begin
SubEntity
<string=["Unit0" | "Unit1"]>
GroupVals=Begin
MeasurementKind,CaptureTime,GroupId,IntervalDuration,Reliability
<string="PeriodBased">,<string>,<string>,<integer>,<string="Valid">
Reg1Name,Reg1Value,Reg2Name,Reg2Value,Reg3Name,Reg3Value,Reg4Name,Reg4Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
Reg5Name,Reg5Value,Reg6Name,Reg6Value,Reg7Name,Reg7Value,Reg8Name,Reg8Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
Reg9Name,Reg9Value,Reg10Name,Reg10Value,Reg11Name,Reg11Value,Reg12Name,Reg12Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
Reg13Name,Reg13Value,Reg14Name,Reg14Value,Reg15Name,Reg15Value,Reg16Name,Reg16Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
Reg17Name,Reg17Value,Reg18Name,Reg18Value,Reg19Name,Reg19Value,Reg20Name,Reg20Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
Reg21Name,Reg21Value,Reg22Name,Reg22Value,Reg23Name,Reg23Value,Reg24Name,Reg24Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
Reg25Name,Reg25Value,Reg26Name,Reg26Value,Reg27Name,Reg27Value,Reg28Name,Reg28Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
Reg29Name,Reg29Value,Reg30Name,Reg30Value,Reg31Name,Reg31Value,Reg32Name,Reg32Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
GroupVals=End
GroupVals=Begin
MeasurementKind,CaptureTime,GroupId,IntervalDuration,Reliability
<string="PeriodBased">,<string>,<string>,<integer>,<string="Valid">
Reg1Name,Reg1Value,Reg2Name,Reg2Value,Reg3Name,Reg3Value,Reg4Name,Reg4Value
<string>,<integer>,<string>,<integer>,<string>,<integer>,<string>,<integer>
Reg5Name,Reg5Value,Reg6Name,Reg6Value
<string>,<integer>,<string>,<integer>
GroupVals=End
SubEntity=End
Entity=End
System=End
PMFile=End
```

Note the above example format consists of two groups. The first with 32 registers and the second with six registers.

119.24.3 Examples

An example CSV file is shown below:

```
# more NGSS.OMs.QoS.2004.5.5_10.15_EDT.csv
PMFile=Begin

```

119.25 Appendix E: Session Server Manager MR Procedure

This procedure details how to perform a software upgrade for a Session Server Manager, Maintenance Release (MR). The MR will consist of release notes, NCGL Platform Manager software, Session Server Manager SIP application software and NCGL Platform Manager patches. The software will be delivered via DVD or via Electronic Software Delivery (ESD) which will be a compressed ISO image that will be delivered to a customer's electronic drop-box. This procedure also details how to back-out of a partially completed MR.

Note: It is important that the individuals performing the MR upgrade record their actions and the CLI sessions to log files.

119.25.1Prerequisites

- Check release notes to see if you can directly upgrade your system to this MR or if you need to first upgrade to a previously released MR. Release notes will be provided on the DVD or with the ESD MR image.
- Obtain physical DVD with MR software or have a copy of the ESD MR image.
- Upgrades NTP, NN10349-461
- A backup copy of the existing SIP application installed on your system needs to be either on DVD or the ISO image needs to be stored locally in the /opt/swd directory.

119.25.2Procedure

119.25.2.1 Perform System Backups

119.25.2.1.1 Backup database

Backup and archive the database before starting the MR and transfer the database file to a secure location of the customer's choosing.

Note: Since the SIP application upgrade procedure overwrites the database files stored in directory /opt/apps/database/solid/, the database backup will be required in the event that you need to downgrade the MR software to the previous load.

To backup the database from the active unit, use a secure file transfer program like scp. The database files that need to be retrieved from Session Sever Manager are in: /opt/apps/database/solid/dbfiles/. The files are solid.db, solid.ini and solmsg.out.

119.25.2.1.2 Backup Security Certificates

If the customer has purchased security certificates from a Certificate Authority then ensure that the customer has a backup of the security certificates files:

server.key, server.crt and certificate.keystore located in directory /opt/base/share/ssl. If not, then transfer a copy of the files to a secure location of the customer's choosing. For more information on Session Sever Manager security certificates see the Session Server and Administration NTP NN10346-611.

119.25.2.2 MR Software upgrade via DVD:

Before beginning the upgrade, check the release notes.

Check Release notes:

- Log into the command line interface on the inactive unit via ssh
- Set the user to **root**
- **su –l** <Enter>
- password <Enter>
- Insert the DVD into the inactive unit
- **mount /cdro**m <Enter>
- **cd /cdrom** <Enter>
- Find and review the release notes
- **ls**
- **Read release notes**
- **cd /** <Enter>
- **umount /cdrom** <Enter>

Step 1 Upgrading NCGL Platform Load

- Check the current version of NCGL software running on the inactive unit by looking at the Current Version indicated in the Platform System Information panel.
- Compare the current version of the “NCGL Platform Load” with the MR Release Notes to see if you need to upgrade the NCGL platform load.
- If the MR contains a newer version of the NCGL platform load then proceed with the NCGL platform upgrade. If not then jump to Step 2 **Applying NCGL Patches**.
- Insert the DVD with the MR software into the inactive Unit.
- Log into the Active Session Server Manager unit via WEB EM and “JAM” the Inactive unit.
  - — From the Session Server Manager launchpoint web page go to Succession Communication 2000 NCGL Platform Manager -> Node Maintenance. In the Maintenance panel click the JAM button on the active unit.

- Log into the NCGL Platform Manager for the Inactive Session Server Manager unit and go to the NCGL Administration page and upgrade the NCGL software.
  - From the Session Server Manager launchpoint web page go to Succession Communication 2000 NCGL Platform Manager -> Administration
  - On the Software Upgrade panel under Protocol select “Local CD ROM”
  - Under the Action heading select the Upgrade button.
  - Once the new NCGL load has been successfully copied to the unit the load name will be display in the Bootload Management panel.
  - Set the new NCGL load to be the default by clicking on the “Set Default” button for the new NCGL load in the Bootload Management panel
- Remove the DVD from the CDROM drive.
- Log into the Active Session Server Manager unit and go to the NCGL Administration web page and select the “RebootMate” button to reboot the Inactive Unit.
- After the reboot completes, log into the Inactive Unit and go to the System Information Web Panel. Verify that the Current Version indicated matches the expected new version of NCGL software.

Step 2 Applying NCGL Patches

- Review MR release notes and identify the required NCGL patches for the load.
- Jam Inactive unit if not already Jammed.
- Copy all required patches from the MR DVD into the /patching/patchholding directory.
  - Log into the command line interface on the inactive unit via ssh
  - Set the user to **root**
  - **su –l** <Enter>
  - password <Enter>
  - Insert the DVD into the inactive unit
  - **mount /cdrom** <Enter>
  - **cd /cdrom** <Enter>
  - Find and identify the patches
  - **ls**
  - Copy patches to /patching/patchholding
  - **cp patchfile /patching/patchholding** <Enter>
  - **cd /** <Enter>

— **umount /cdrom** <Enter>

- Apply and commit the required NCGL patches to the inactive unit. Consult the Upgrades NTP, NN10349-461, for details on NCGL patching procedures.

Step 3 Installing Session Server Manager Software

- Jam Inactive unit if not already Jammed.
- Log into the command line interface on the inactive unit via ssh
- Set the user to **root**
- **su –l** <Enter>
- password <Enter>
- Insert the DVD into the inactive unit
- **mount /cdrom** <Enter>
- **cd /cdrom** <Enter>
- **./InstallApps** <Enter>
- `The NGSS Application layer is currently installed.`
- `Do you wish to uninstall the previous application and install the newer version? (yes, no)`
- **yes** <Enter>

The system will now begin installing the actual Session Server Manager applications. You will see a lot of messages scrolling across the screen. Once they have completed scrolling the process is complete and you can remove the DVD from the CDROM.

To remove the DVD type the following:

- **cd /** <Enter>
- **umount /cdrom** <Enter>
- Remove the DVD from the CDROM drive.
- Login to the Active Session Server Manager unit and reboot the inactive unit by selecting the Rebootmate button from the Administration Web page.
- After the reboot has completed, login to the Session Server Manager for the Inactive unit. Select Version Info and verify that it is updated to correct values for the MR.

Step 4 Activate and soak New Load

- Verify that the Session Server Manager application has achieved synchronization between both Session Server Manager units by performing a QueryInfo from the SIP Gateway Application.
- Unjam the inactive side.

- Places test calls and soak the new load on the inactive side for a period of time specified by the customer.
- Check logs and alarms on the inactive unit.
- Switch activity to make the upgraded Session Server Manager unit active by performing a SWACT.
- Jam newly inactive unit.
- Execute test calls on the new load.
- Check logs and alarms for the active Session Server Manager unit
  Note: There will be an alarm for the jam.
- Monitor system for appropriate period.
- On successful completion of test calls and live traffic soak proceed to step 5 **Complete Duplex Upgrade of Session Server Manager**. If unsuccessful proceed to step 6 **Abort Maintenance Release Upgrade**.

Step 5 Complete Duplex Upgrade of Session Server Manager

- Ensure unit with pre-MR load is JAMMED.
- Repeat Step 1 **Upgrading NCGL Platform Loa**d
- Repeat step 2 **Applying NCGL Patches**
- Repeat step 3 **Installing Session Server Manager Software**
- Verify that the Session Server Manager application has achieved synchronization between both Session Server Manager units.
- Unjam the inactive side.
- Switch activity to make the upgraded Session Server Manager unit active by performing a SWACT.
- Execute test calls on the new load.
- Check logs and alarms for both Session Server Manager units.
- Verify that the Session Server Manager application has achieved synchronization between both Session Server Manager units by performing a QueryInfo from the SIP Gateway Application.
- Monitor system for appropriate period.
- MR Upgrade Procedure is now complete.

Step 6 Abort Maintenance Release Upgrade

- Unjam Inactive unit.
- Switch activity of the Session Server Manager to the unit that has the pre-maintenance release load.

Note: There is a risk that some or all of the existing calls will be lost when the SWACT is performed.

- Jam inactive unit.
- Logon to inactive Session Server Manager unit and from the NCGL platform manager, Administration page, set the default NCGL bootfile to the pre-MR load and Reboot the inactive unit.

  Note: All committed NCGL patches are re-applied by the system when the unit is rebooted.
- Using the pre-MR SIP application DVD perform installation of the software as per Step 3 **Installing Session Server Manager Software.**
- Reboot inactive unit.
- Check to ensure the SIP application is synchronized between both units. If in sync, release the JAM on the inactive unit.
- Switch activity to make the downgraded unit active.
- Execute test calls on the newly active unit.
- Check logs and alarms for both Session Server Manager units.
- Monitor system for appropriate period.
- If the system is unstable, switch activity and Jam Inactive unit. Contact Session Server Manager GNPS for assistance.

119.25.2.3 MR Software upgrade via Electronic Software Delivery

To perform a MR upgrade using the ESD method, the MR package needs to be transferred onto both Session Server Manager units into the /opt/swd directory using a secure file transfer program like scp.

Note: The /opt/swd directory has a size of 1GB and can contain no more than two SIP Gateway loads at once. You may need to remove old ISO images before transferring the latest MR onto the unit. Make sure that you do not delete the ISO image that is currently running on the system, since you will need it in the event that you need to abort the MR upgrade.

Before starting the upgrade backup the database and security certificate.

119.25.2.4 Prepare the ISO Image and Check Release Notes

Prior to beginning this procedure, check the release notes:

- Log into the command line interface on the inactive unit via ssh
- Set the user to **root**
- **su –l** <Enter>

- password <Enter>
- **cd /opt/swd** <Enter>
- Unzip and untar the ISO image.
- **gunzip <ESD_ISO_Image.tar.gz>** <Enter>
  For example: gunzip NGSS0070.70.P.NCL.NAP.VAULT.6.D.tar.gz
- **ls** <Enter>
- **tar –xvf <ESD_ISO_Image.tar>** <Enter>
  For example: tar –xvf NGSS0070.70.P.NCL.NAP.VAULT.6.D.tar
- Verify that tar is successful (you should see a new directory called NGSS0070.70.P.NCL.NAP.VAULT.6.D and it should contain ISO.tape file)
- **rm <ESD_ISO_Image.tar>** <Enter>
  ie. rm NGSS0070.70.P.NCL.NAP.VAULT.6.D.tar
- **cd <ESD_ISO_directory>** <Enter>
  For example: cd NGSS0070.70.P.NCL.NAP.VAULT.6.D
- **ls** <Enter>
- **Read release notes** which are provided with the load in the ESD_ISO_directory.

Step 1 Upgrading NCGL Platform Load

- Check the current version of NCGL software running on the inactive unit by looking at the Current Version indicated in the Platform System Information panel.
- Compare the current version of the “NCGL Platform Load” with the MR Release Notes to see if you need to upgrade the NCGL platform load.
- If the MR contains a newer version of the NCGL platform load then proceed with the NCGL platform upgrade. If not then jump to Step 2 **Applying NCGL Patches**.
- Log into the Active Session Server Manager unit via WEB EM and “JAM” the Inactive unit.
  - — From the Session Server Manager launchpoint web page go to Succession Communication 2000 NCGL Platform Manager -> Node Maintenance, in the Maintenance panel click the JAM button on the active unit.
- Log into the NCGL Platform Manager for the Inactive Session Server Manager unit and go to the NCGL Administration page and upgrade the NCGL software.
  - — From the Session Server Manager launchpoint web page go to the Succession Communication 2000 NCGL Platform Manager -> Administration

— On the Software Upgrade panel under Protocol select “Local File”

— Under the **File** panel enter the location of the bootload image file, (e.g **/opt/swd/<ESD_ISO_directory>/<ESD_ISO_Image>** /opt/swd/NGSS0070.70.P.NCL.NAP.VAULT.6.D/NGSS07_MNCL.ISO.tape).

— Under the Action heading select the Upgrade button.

— Once the new NCGL load has been successfully copied to the unit, the load name will be display in the Bootload Management panel.

— Set the new NCGL load to be the default by clicking on the “Set Default” button for the new NCGL load in the Bootload Management panel.

- Log into the Active Session Server Manager unit and go to the NCGL Administration web page and select the “RebootMate” button to reboot the Inactive Unit.
- After the reboot completes, log into the Inactive Unit and go to the System Information Web Panel. Verify that the Current Version indicated matches the expected new version of NCGL software.

Step 2 Applying NCGL Patches

- Review MR release notes and identify the required NCGL patches for the load.
- Jam Inactive unit if not already Jammed.
- Copy all required patches from directory**/opt/swd/<ESD_ISO_directory** >/ into the **/patching/patchholding** directory.
- Apply and commit the required NCGL patches to the inactive unit. Consult the Upgrades NTP, NN10349-461, for details on NCGL patching procedures.

Step 3 Installing Session Server Manager Software

- Jam Inactive unit if not already Jammed.
- Log into the command line interface on the inactive unit via ssh and switch to be root user.
- **su –l** <Enter>
- password <Enter>
- Verify that the /cdrom device is not currently mounted by typing: umount /cdrom
- Mount the ISO image that was transferred electronically to the /cdrom device: **mount -o loop /opt/swd/<ESD_ISO_directory>/<ESD_ISO_Image> /cdrom** <Enter>
  For example: mount –o loop /opt/swd/NGSS0070.70.P.NCL.NAP.VAULT.6.D/NGSS07_MNCL.ISO.tape /cdrom
- **cd /cdrom** <Enter>
- **./InstallApps** <Enter>

- `The NGSS Application layer is currently installed.`
- `Do you wish to uninstall the previous application and install the newer version? (yes, no)`
- **yes** <Enter>

The system will now begin installing the actual Session Server Manager applications. You will see a lot of messages scrolling across the screen. Once they have completed scrolling then the process is complete and you will need to type the following:

- **cd /** <Enter>
- **umount –f /opt/swd/<ESD_ISO_directory>/<ESD_ISO_Image>** <Enter>
  For example: umount –f /opt/swd/NGSS0070.70.P.NCL.NAP.VAULT.6.D/NGSS07_MNCL.ISO.tape
- Login to the Active Session Server Manager unit and perform a Rebootmate from the Administration Web page.
- After the reboot has completed, login to the Session Server Manager for the Inactive unit. Select Version Info and verify that it is updated to correct values for the MR.

Step 4 Activate and soak New Load

- Verify that the Session Server Manager application has achieved synchronization between both Session Server Manager units by performing a QueryInfo from the SIP Gateway Application.
- Unjam the inactive side.
- Place test calls and soak the new load on the inactive side for a period of time specified by the customer.
- Check logs and alarms on the inactive unit.
- Switch activity to make the upgraded Session Server Manager unit active by performing a SWACT.
- Jam newly inactive unit.
- Execute test calls on the new load.
- Check logs and alarms for the active Session Server Manager unit (Note there will be an alarm for the jam).
- Monitor system for appropriate period.
- On successful completion of test calls and live traffic soak proceed to step 5 **Complete Duplex Upgrade of Session Server Manager**. If unsuccessful proceed to step 6 **Abort Maintenance Release Upgrade.**

Step 5 Complete Duplex Upgrade of Session Server Manager

- Ensure unit with pre-MR load is JAMMED.
- Repeat Step 1 **Upgrading NCGL Platform Load**
- Repeat step 2 **Applying NCGL Patches**
- Repeat step 3 **Installing Session Server Manager Software**
- Verify that the Session Server Manager application has achieved synchronization between both Session Server Manager units.
- Unjam the inactive side.
- Switch activity to make the upgraded Session Server Manager unit active by performing a SWACT.
- Execute test calls on the new load.
- Check logs and alarms for both Session Server Manager unit.
- Verify that the Session Server Manager application has achieved synchronization between both Session Server Manager units by performing a QueryInfo from the SIP Gateway Application.
- Monitor system for appropriate period.
- MR Upgrade Procedure is now complete.

Step 6 Abort Maintenance Release Upgrade

- Unjam Inactive unit.
- Switch activity of the Session Server Manager to the unit that has the pre-maintenance release load.

  Note: There is a risk that some of the existing call will be lost when the SWACT is performed.

- Jam inactive unit.
- Logon to inactive Session Server Manager unit and from the NCGL platform manager, Administration page, set the default NCGL bootfile to the pre-MR load and reboot the inactive unit

  Note: All committed NCGL patches are re-applied by the system when the unit is rebooted.

- Using the pre-MR SIP application ISO image **<ESD_ISO_Image>,** perform installation of the software as per Step 3 **Installing Session Server Manager Software.**
- Reboot inactive unit
- After reboot, check to ensure the SIP application is synchronized between both units. If in sync, release the JAM on the inactive unit.
- Switch active to make the downgraded unit active.

- Execute test calls on the newly active unit.
- Check logs and alarms for both Session Server Manager units
- Monitor system for appropriate period.
- If the system is unstable, switch activity and Jam Inactive unit. Contact Session Server Manager GNPS for assistance.

120: Functional Description (FN): A00003947

120.1 Feature name

Trimodal LOGs and Operational Measurements (OM)

120.2 Description

Beginning in the SN07 release, work is being started to implement a Trimodal Call Server, which will allow TDM agents and multiple packet fabric agents to interwork. In SN07, the packet fabrics that interwork will be limited to IP and ATM (AAL1, AAL2 and AAL5), and the TDM fabric is limited to ENET.

This activity addresses the OMs, Logs, Traver and Translations components of the trimodal call server. This actvity address the following

- New office parameter MULTINET_DISPLAY_ACTIVE
- OM Enhancements
  - New OM group IWBMNODE
  - New OM group TRK2NET1
  - New OM group TRK2NET2
  - New OM group OFZ2NET1
  - New OM group OFZ2NET2
  - New OM group DPTOFCP
  - Enhance DPTNODE
- Log Enhancements
  - IWBM 800 series log enhancements to display the bridge pool
  - new XNET600 series logs for external patcket bearer network connectivity problems
- Translations Enhancements
  - Conditional PKT selector renamed to “FABRIC” and enhanced to support ATM and IP fabrics.

— New BEARNET conditional selector to support criteria checking based on network name.

- Traver enhancements
  - — New Traver option BEARNET to input the network name of the incoming trunk agent to support FABRIC and BEARNET conditional selector routing
  - — Traver TRKMEM option is enhanced to derive the originating trunk bearer network/fabric. The bearer network/fabric is used to support FABRIC and BEARNET conditional selector routing

120.2.1 Office Parameter MULTINET_DISPLAY_ACTIVE

New office parameter MULTINET_DISPLAY_ACTIVE is introduced in CM with an default value of “NO”. The MULTINET_DISPLAY_ACTIVE paramter provides the following functionality

- Control the creation of new OM groups IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2, DPTOFCP
- Control the display of OM groups IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2, DPTOFCP and DPTNODE
- Control the display of bridge pool information in IWBM 800 series logs

The datafilling procedure in TABLE OFCVAR is explained below:

- In response to PARMNAME prompt, type “MULTINET_DISPLAY_ACTIVE”
- In response to PARMVAL prompt, type either YES or NO to indicate the MULTINET display preference.

Please refer to “Table 1 Sample Datafill in table OFCVAR” on page 1454. for sample datafill of MULTINET_DISPLAY_ACTIVE parameter.

Table 1 Sample Datafill in table OFCVAR

PARMNAME	PARMVALUE
MULTINET_DISPLAY_ACTIVE	YES
MULTINET_DISPLAY_ACTIVE	NO

120.2.1.1 Behavior when the parameter is set to ‘YES’

- First time change from ‘NO’ to ‘YES’ using table control or using Table transfer.
  - — The new OM groups IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP are created.
  - — The tuples in the new OM groups IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP are displayed.

- — Pegging of the OM group registers in IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP is started.
- — The signaling type for the DPT node tuple in the DPTNODE OM group is displayed.
- — The display of bridge pool in IWBM 800 series of LOGS is enabled.

• Second time change from ‘NO’ to ‘YES’ using table control

- — The tuples in the new OM groups IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP are displayed.
- — Pegging of the OM group registers in IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP is started.
- — The signaling type for the DPT node tuple in the DPTNODE OM group would be displayed.
- — The display of bridge pool in IWBM 800 series of LOGS is enabled.

120.2.1.2 Behavior when the parameter is set to ‘NO’

• Change from ‘YES’ to ‘NO’ using table control

- — A warning message would be displayed “All OM and LOGs data pertaining to Trimodal call server will be lost.”.
- — The tuples in the new OM groups would not be displayed.
- — The signaling type for the DPT node tuple in the DPTNODE OM group would not be displayed.
- — All the counters for the registers of the new OM groups would be set to zero.
- — The counters of the registers of the new OM groups would not be pegged.
- — The display of bridge pool in IWBM 800 series of LOGS would be disabled.
- — The OMSHOW command would display the OM groupsIWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP and its fields. However the tuples of these OM groups is not be displayed.

120.2.2 OM Enhancements

120.2.2.1 New OM group IWBMNODE

120.2.2.2 New OM group TRK2NET1

120.2.2.3 New OM group TRK2NET2

120.2.2.4 New OM group OFZ2NET1

120.2.2.5 New OM group OFZ2NET2

120.2.2.6 New OM group DPTOFCP

120.2.2.7 Enhance OM group DPTNODE

120.2.3 Log Enhancements

120.2.3.1 IWBM 800 Series Enhancements

The IWBM 800 series logs provide information about usage/thresholds for the IW bridge pool. Prior to SN07, there was only 1 pool of bridges available. Trimodal Call Server would introduce support for multiple bridge pools, so these logs need to be generated for each pool allocated in the office (based upon Table NETBRDGE). IWBM 800, 801, 802, 803 logs is enhanced to show the information about the bridge pool.

The bridge pool info is displayed only when the OFCVAR patameter MULTINET_DISPLAY_ACTIVE is set to YES.

Figure 1 Enhanced IWBM 800 Log with MULTINET_DISPLAY_ACTIVE = YES

```
RTP7  **  IWBM800 SEP17  12:16:55  6600  1st Threshold Exceeded
          The number of interworking bridges in use has
          exceeded 70 percent of all bridges in the pool.
           Total number of IW bridges:  2016
           Number of available IW bridges:   25
           Bridge Pool:  ENET_to_ATM
```

120.2.3.2 XNET 600 Series logs

The XNET 600 series logs provide information on external packet network bearer connection problems. Three new logs are created:

- XNET605 - Bearer Networks Cannot Connect

  This log indicates that the bearer networks of the two parties in a connection attempt are not permitted to inter-connect, based on datafill in table NET2NET.

The telco should determine whether the identified bearer networks are permitted to interconnect. If so, the appropriate datafill should be added to tables NET2NET, and if necessary NETPATH and NETBRDGE. If the bearer networks are not permitted to connect, the telco can:

a. if possible, change DN translations so that the originator can no longer dial the terminator, but will receive a treatment of some type,

b. use the EXTLOGCI command to disable the XNET605 log (see section 120.2.3.3)

c. use LOGUTIL to SUPPRESS the XNET 605 log

d. do nothing, the log will continue to print when two parties on the specified bearer networks attempt to dial one another.

Figure 2 XNET605 Log Example

```
RTP7   XNET605  MAY17  12:16:55  9600 INFO Bearer Networks Cannot Connect
       From Agent              : VOIP 42 2 04 00      DN 6137204200
       From Bearer Network:  IP_PRIMARY
       To     Bearer Network: AAL1_SECONDARY
       Bearer Network Translations resulted in no interconnect
       Check Table NET2NET, NETPATH and NETBRDGE
```

The ‘From Agent’ line indicates the source party of the connection request. This can be in many forms:

- a LEN and DN,
- a Trunk Group name and member number
- a PM type and PM number,
- a Node number and TID (terminal id) when an appropriate device type and device id cannot be determined
- or an “Unavailable” indication when the conection source was an ENET hosted party, but that party can no longer be determined.

The ‘From Bearer Network’ line indicates the bearer network name, as datafilled in table BEARNETS, of the source party . The ‘To Bearer Network’ line indicates the bearer network name, as datafilled in table BEARNETS, of the connection destination party.

- XNET606 - PKT Pathend Has NIL Bearer Net ID

This log indicates a software or provisioning problem in the switch, in that an appropriate bearer network could not be determined through provisioned data for a particular party in a connection attempt.

The telco should report this log to appropriate Nortel Product Support.

The telco can:

- use the EXTLOGCI command to disable the XNET606 log (see section 120.2.3.3)
- use LOGUTIL to SUPPRESS the XNET 605 log
- do nothing, the log will continue to print when the suspect party attempts to place calls

Figure 3 XNET 606 Log Example

```
RTP7   XNET606  MAY17  12:16:55  9600 INFO PKT Pathend Has NIL Bearer Net ID
       Path   - Node: LGRP   07   Tid:  124
       Agent - VOIP 42 2 04 00     DN 6137204200
       Contact Product Support
```

The ‘Path’ line indicates the node at the network connection point, this can be in two forms:

- a PM name and number, and a channel or TID id,
- a node number, and a channel or TID id, when the PM name and number cannot be determined from the node number

The ‘Agent’ line identifies the suspect party, this can be in several forms:

- a LEN and DN,
- a Trunk Group name and member number
- or a Node number and TID (terminal id) when an appropriate device type and device id cannot be determined

- XNET607 - IW Bridge Not Available

  This log indicates that an IW SPM interworking bridge was not available for the connection request, either because

  - of a bridge exhaust condition on one of the bridge pools involved in the connection request,
  - bridges are not inservice, or provisioned for one of the bridge pools involved with the connection request

  The telco can:

  - check for IWBM602 logs indicating a bridge exhaust condition,
  - verify that the bridge pool identified in the log is provisioned on an SPM in table MNNODE,
  - verify that the bridges in the bridge pool identified in the log are in-service.
  - use the EXTLOGCI command to disable the XNET607 log (see section 120.2.3.3)
  - use LOGUTIL to SUPPRESS the XNET 607 log

Figure 4 XNET 607 Log Example

```
RTP7    XNET607  MAY17  12:16:55  9600 INFO IW Bridge Not Available
        Bridge Pool       : ENET_TO_IP
        From Agent        : VOIP 42 2 04 00      DN 6137204200
        From Bearer Network:  IP_PRIMARY
        To      Bearer Network: AAL1_SECONDARY
```

The ‘Bridge Pool’ line indicates the name of the bridge pool, as specified in table NETBRDGE, that has the ‘trouble’ condition. The ‘From Agent’ line indicates the source party of the connection request. This can be in many forms:

- a LEN and DN,
- a Trunk Group name and member number
- a PM type and PM number,
- a Node number and TID (terminal id) when an appropriate device type and device id cannot be determined
- or an “Unavailable” indication when the conection source was an ENET hosted party, but that party can no longer be determined.

The ‘From Bearer Network’ line indicates the bearer network name, as datafilled in table BEARNETS, of the source party. The ‘To Bearer Network’ line indicates the bearer network name, as datafilled in table BEARNETS, of the connection destination party.

120.2.3.3 EXTLOGCI Tool

The EXTLOGCI tool is an existing CI command that controls the XNET series of logs. By using the ENABLE and DISABLE commands, the user can control the production of XNET logs. The XNET 605, 606 and 607 logs are automatically enabled on all restarts.

120.2.4 Translations Enhancements

120.2.4.1 Conditional PKT Selector Enhancements

The CND selector CND_PKTSEL_TYPE was created in SN06 to support Trunk selection based on the incoming Agent Bearer Fabric type ENET or Otherwise

The existing CND “PKT” selector is renamed to “FABRIC” to reflect a more accurate functionality of the selection criteria. Also the Trimodal call server supports multiple packet fabrics like IP, AAL1 and AAL2 on the same switch. To support this the FABRIC selector criteria is expanded to ENET, IP and AAL1 and AAL2 fabrics.

Refer to Figure 5, "CND FABRIC Selector Criteria ENET, IP and ATM" for an overview of the renamed “FABRIC” selector criteria based routing.

Figure 5 CND FABRIC Selector Criteria ENET, IP and ATM

```
TABLE OFRT
POS 100
100 (CND FABRIC ENET ST 901) ===> If fabric = ENET then take OFRT Route 901
   (CND FABRIC IP ST 902) ===> If fabric = IP then take OFRT Route 902
   (CND FABRIC AAL1 ST 903) ===> If fabric = AAL1 then take OFRT Route 903
   (CND FABRIC AAL2 ST 904) ===> If fabric = AAL2 then take OFRT Route 904
```

Please refer to “Table 2 CND FABRIC selector enhancements” on page 1461. for an overview of CND FABRIC selector enhancements.

Table 2 CND FABRIC selector enhancements

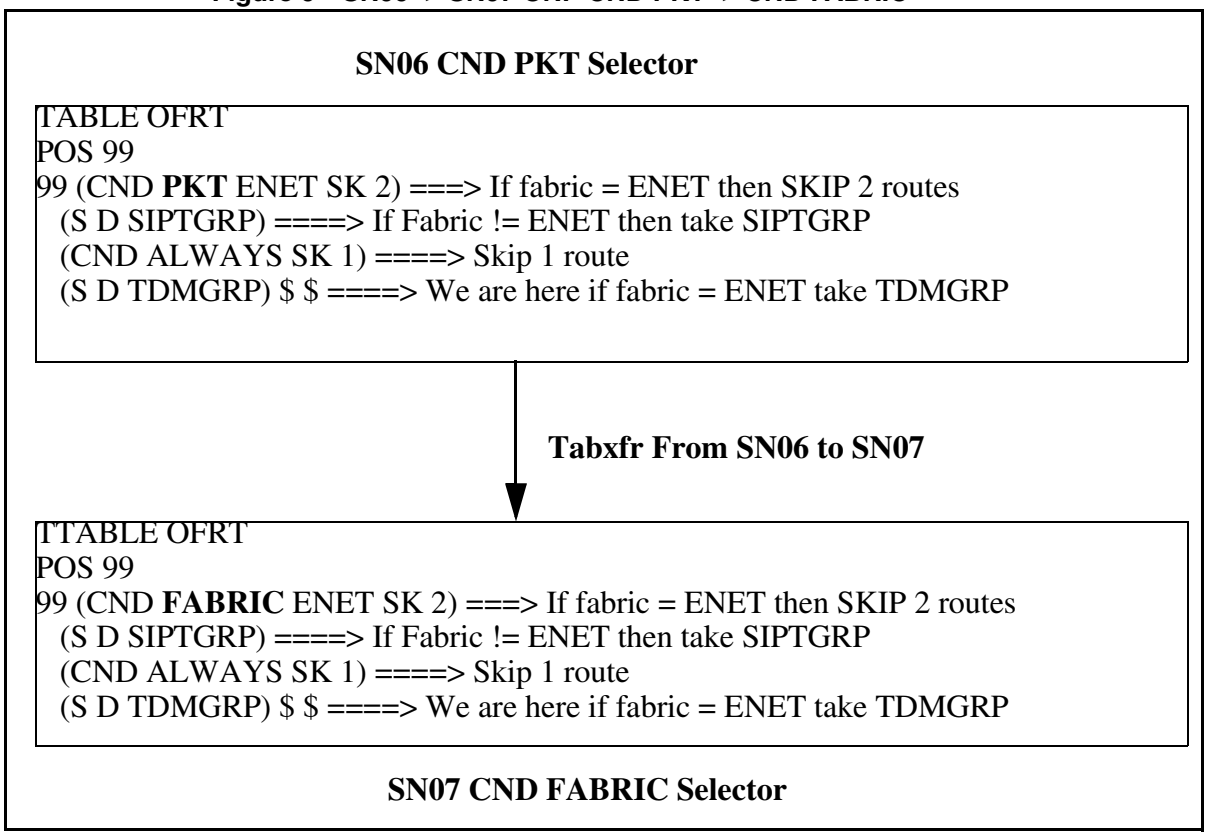
Fileds			Description	Values
RTE			Unchanged	
RTESEL			Unchanged	
	CNDSEL = FABRIC		Changed. New selector FABRIC Replaces PKT	ALWAYS,RND,SNPA,EA,TOD,MIGRATE,NARS,COSMAP,NRR,SITE,CALLCHR,INTERLATA,PKT,TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC**,BEARNET
		PKTSEL	Changed. New Fabric Types added	UNDEF[a], ENET, AAL1, AAL2, IP
		RTETYPE	Unchanged	ST, T, SK

a. No trunk and line agent can belong to an network with fabric as “UNDEF”. Hence “UNDEF” fabric selector is blocked form being datafilled.

120.2.4.1.1 ONP Impact

The SN06 “PKT” selector will be renamed to “FABRIC” in SN07 and later releases. Refer to Figure 6, "SN06 -> SN07 ONP CND PKT -> CND FABRIC" for SN06 to SN07 ONP tabxfr behavior.

Figure 6 SN06 -> SN07 ONP CND PKT -> CND FABRIC



120.2.4.2 New Conditional Selector BEARNET

A new table BEARNET is introduced to support multiple networks for a Trimodal Callserver. The bearer network names are provisioned in table BEARNET. The new BEARNET selection criteria is created based on network names. The BEARNET conditional selector provides routing based on the bearer network name.

Refer to Figure 7, "CND BEARNET Selector Criteria Based on Network Name" for an overview of the BEARNET selector criteria based routing.

Figure 7 CND BEARNET Selector Criteria Based on Network Name

TABLE OFRT
POS 99
100 (CND BEARNET **DFLTTDM** ST 901) ===> BEARNET = DFLTTDM then take OFRT Route 901
(CND BEARNET **DFLTIP** ST 902) ===> BEARNET = DFLTIP then take OFRT Route 902
(CND BEARNET **DFLTATM** ST 903) ===>BEARNET = DFLTATM then take OFRT Route 903

Please refer to “Table 3 CND BEARNET selector” on page 1463. for an overview of CND BEARNET selector..

Table 3 CND BEARNET selector

Fileds			Description	Values
RTE			Unchanged	
RTESEL			Unchanged	
	CNDSEL = BEARNET		New selector FABRIC Replaces PKT	ALWAYS,RND,SNPA,EA,TOD,MIGRATE,NARS,COSMAP,NRR,SITE,CALLCHR,INTERLATA,PKT,TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC**,BEARNET
		NETSEL	NEW.	NTWKNAME values provisioned in Table BEARNETS
		RTETYPE	Unchanged	ST, T, SK

120.2.5 Traver Enhancements

120.2.5.1 Traver option BEARNET based on bearer network name

The new traver option BEARNET is created to input the incoming trunk agent bearer network name. The bearer network name is used to support CND FABRIC and BEARNET selector routing in traver. Refer to Figure 8, "Traver example: with BEARNET Option"for an overview of BEARNET option.

When the BEARNET option is not present in the traver command,

- The Traver tries to determine if the agent is on the TDM network (first tuple in table BEARNET).
- If the agent is not on TDM the office default BEARER NETWORK is used for CND FABRIC and BEARNET selector routing.

For functionality of traver without BEARNET option refer to Figure 9, "Traver example: without BEARNET Option"

Note: The network names defined in table BEARNET will not be displayed in traver command help or prompting.

120.2.5.2 Traver option TRKMEM enhancemens

The existing traver TRKMEM option is enhanced to obtain the originating trunk bearer network name. The bearer network name is used to support CND FABRIC and BEARNET selector routing in traver. Please refer to “Figure 10 Traver example: with TRKMEM Option” on page 1466. for an overview of TRKMEM option.

When the TRKMEM option is not present in the traver command, the traver assumes the default TDM network (first tuple in table BEARNET). The

default TDM network is used for CND BEARNET and FABRIC selector routing. Please refer to “Figure 11 Traver example: without TRKMEM Option” on page 1467. for an overview of traver functionality without TRKMEM option.

Note: When both TRKMEM and BEARNET options are present in the Traver command the “BEARNET” option will be ignored.

121.3 Description

121.3.1 Existing Functionality

Prior to SN07, the CS2000 call server had very limited knowledge about the packet bearer network. Only a single packet bearer network was supported along with the legacy ENET bearer network. Individual agents were associated with a bearer network based upon the connectivity of the node that hosted the agent. For example, a trunk member that was assigned to a DTC would be associated with the legacy ENET bearer network. A trunk member that was assigned to either a GWC or an MG4K would be associated with the packet bearer network. Since both the GWC and the MG4K tag their hosted agents as ‘packet bearer network’, the core connectivity cannot distinguish between the various types of packet bearer networks are are available (i.e., IP, AAL1, AAL2). This is the basis for the CS2000 call server restriction that it can only support a single packet bearer network prior to SN07.

121.3.2 Feature Functionality

In the SN07 release, work is being started in the CS2000 Call Server to support multiple bearer networks. These bearer networks include both the legacy ENET bearer network and up to seven additional packet bearer networks.

In the SN07 release, a bearer network framework is implemented but full integration of all possible supported configurations will not be supported in this release. In SN07, the focus will be on supporting three bearer networks[1]:

- ENET
- AAL1 packet network
- IP packet network

[1]AAL2 packet networks are not going to be tested in a multi-bearer network configuration, but there is nothing to block this type of bearer network from being configured.

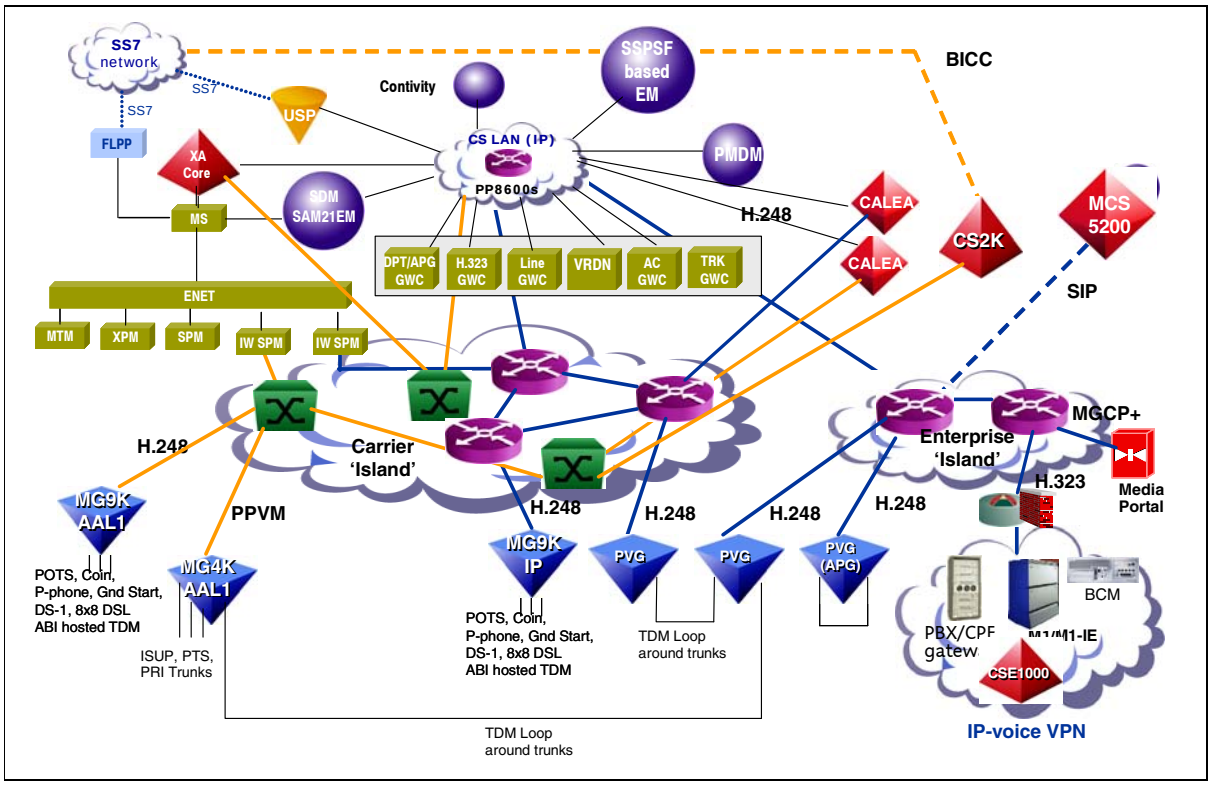
The main focus in SN07 is to support a Universal Access (UA)- AAL1 and a Universal Access (UA) - IP configuration with a single CS2000 Call Server. In addition, there are requirements to support some limited Carrier Hosted Services (CHS) functionality as well (i.e., H.323 and Media Call Server 5200 (MCS5200).

Interworking between the UA-AAL1 and UA-IP configurations in a multi-bearer network configuration is supported in SN07. However, interworking with the CHS agents is limited in SN07. In SN07, there is no support for interworking between the H.323 gateway (using a Media Portal) and the IP IW SPM. For this reason, a loop around trunk, hosted by a PVG on the CHS bearer network and hosted by a PVG in the UA IP bearer network or an MG4K in the UA AAL1 bearer network or an SPM/DTC in the ENET network, must be used to provide connectivity between the H.323 GW and all other agents on the CS2000 Call Server. The following list provides a view of the limitations associated with H.323 calls in this configuration:

- Multiple billing records generated - A call from am H.323 agent to an MG9000 AAL1 native line would be represented as two calls in the CS2000 call server, each generating its own billing record.
- H.323 agent access to announcements - Since there is no announcements accessible to the CHS IP network (i.e., no IP IW bridge supported), announcements cannot be played to the H.323 agent. Any CS2000 Call Server services will not be able to use announcements and any treatments will have to be configured to ‘release with cause’ and the announcement would be provided by the enterprise bearer network.
- H.323 agent access to conferencing - Since there is no conference circuits accessible to the CHS IP network (i.e., no IP IW bridge supported), conferencing services cannot be supported to the H.323 agent.
- H.323 agent access to test trunk facilities - Since there is no test trunk circuits accessible to the CHS IP network (i.e., no IP IW bridge supported), trunk tests cannot be supported to the H.323 gateway.

A diagram of the network topology is shown in the following figure.

Figure 1 SN07 supported multi-bearer network topology



In SN07, the following gateways and packet agents are supported in the multi-bearer network configuration.

Table 1 Gateways and packet agents supported in SN07

Bearer Network	Gateway	Agents
ENET	all Succession supported legacy peripherals	supported SN07 legacy peripherals which includes both lines and trunk

Table 1 Gateways and packet agents supported in SN07

Bearer Network	Gateway	Agents
ATM AAL1 (UA)	MG4000	ISUP trunks PTS trunks PRI trunks BICC DPT trunks
	GWC[a]	BICC DPT trunks
	MG9000	POTS lines Pphone lines Coin lines Group Start lines
	MG9000 with ABI	supported SN07 ABI peripherals which includes both lines and trunk
	DPT SPM	BICC DPT trunks
IP (UA)	PVG (for loop-around trunk access only for support of H.323)	ISUP trunks PRI trunks
	MG9000	POTS lines Pphone lines Coin lines Group Start lines
	MG9000 with ABI	supported SN07 ABI peripherals which includes both lines and trunk
IP (CHS)	PVG (for loop-around trunk access only for support of H.323)	ISUP trunks PRI trunks
	GWC[b]	SIP-T DPT trunks
	H.323 GWs (Cisco, Westel, BCM, M1)	PRI trunks

a. Not a true bearer gateway. This is included to illustrate the support for BICC DPT trunk support.
b. Not a true bearer gateway. This is included to illustrate the support for SIP-T DPT trunk support.

Connectivity between the supported bearer networks is accomplished by using IW SPM bridges. The CS2000 Call Server is modified to allow support of both the ATM AAL1 based IW SPM and the IP based IW SPM at the same time. Prior to SN07, the CS2000 Call Server could only support one type of IW

SPM. A single IW bridge pool was supported. In SN07, support for multiple bridge pools is introduced.

Control is given to the Succession customer to configure how the supported bearer networks in the CS2000 Call Server connect to each other. This is controlled by provisioning the types of interworking bridges needed to connect one bearer network to another. The interworking bridges available in SN07 are the following:

- IW SPM AAL1 - connects an AAL1 bearer network to the ENET
- IW SPM IP - connects an IP bearer network to the ENET

Prior to SN07, Succession configurations used the IW SPM AAL1 to connect an AAL1 bearer network to the ENET and used the IW SPM IP to connect an IP bearer network to the ENET. This is still supported in SN07 with multi-bearer network support. In this multi-bearer network configuration, a connection between an AAL1 bearer network and an IP bearer network will use two IW bridges (i.e., 1 IW SPM AAL1 and 1 IW SPM IP using the ENET to connect the two packet bearer networks). The following figure illustrates this connection topology.

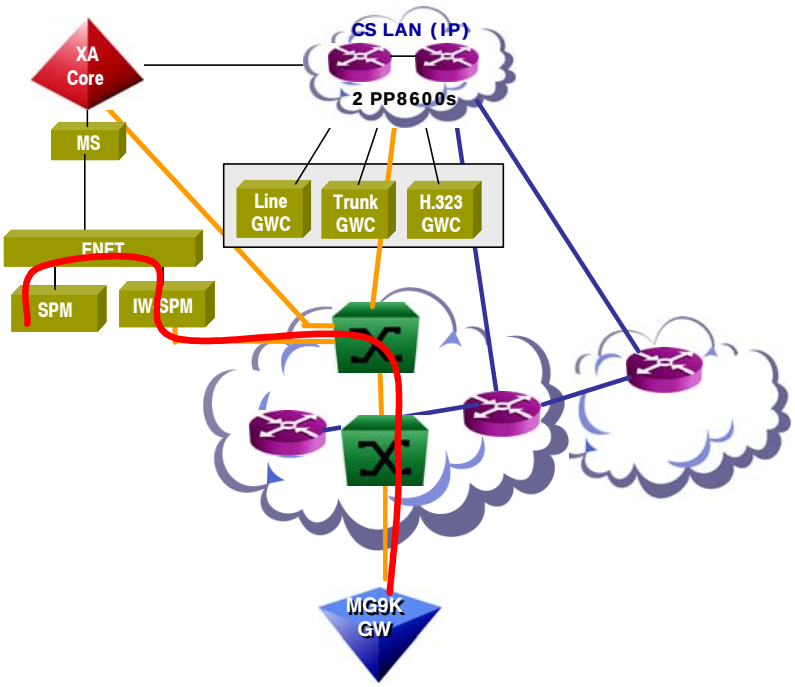


Figure 2 ATM AAL1 (UA) to ENET connection topology

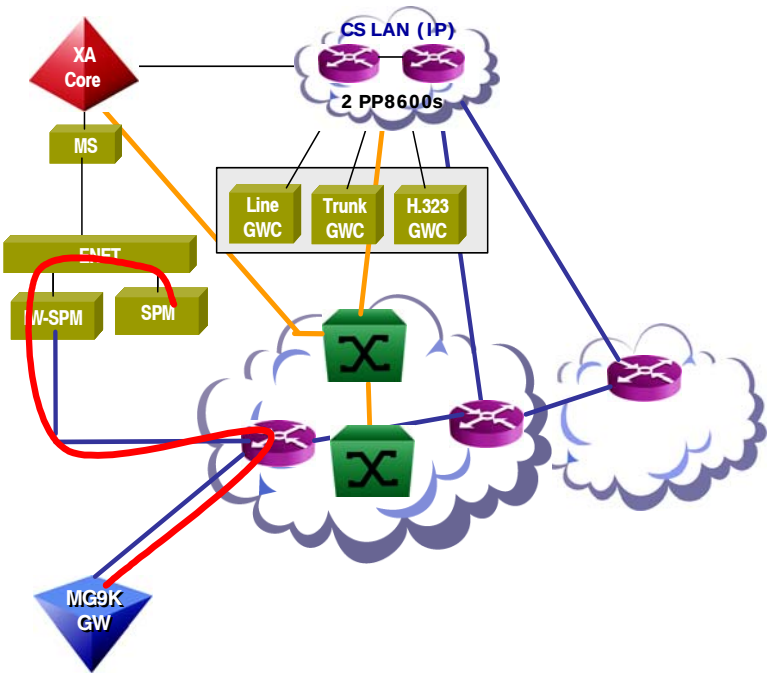

Figure 3 IP (UA) to ENET connection topology

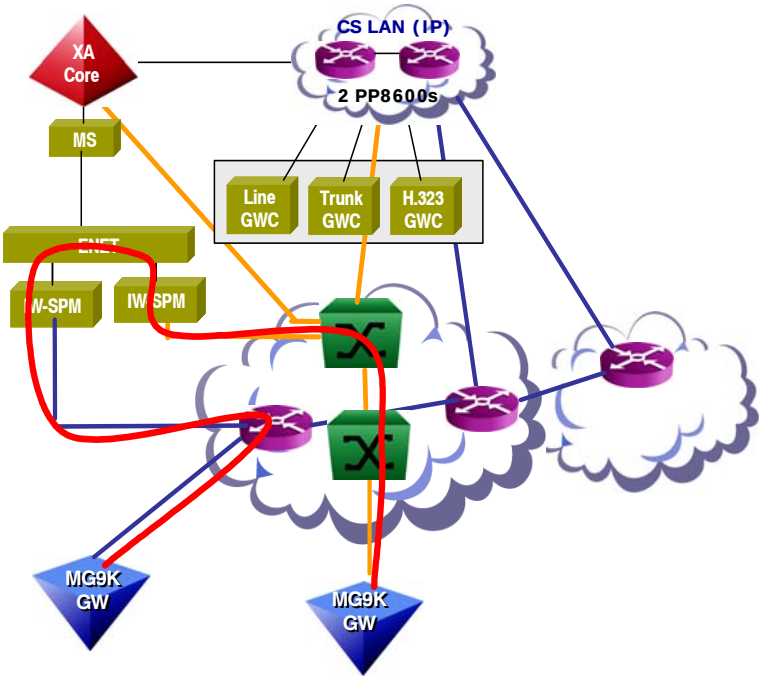

Figure 4 ATM AAL1 (UA) to IP (UA) connection topology

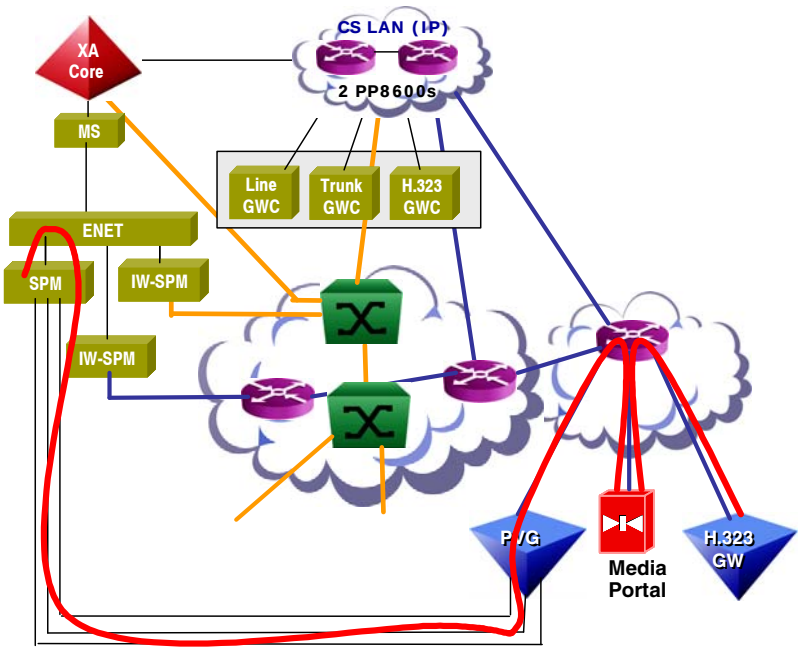

Figure 5 IP (CHS) to ENET connection topology

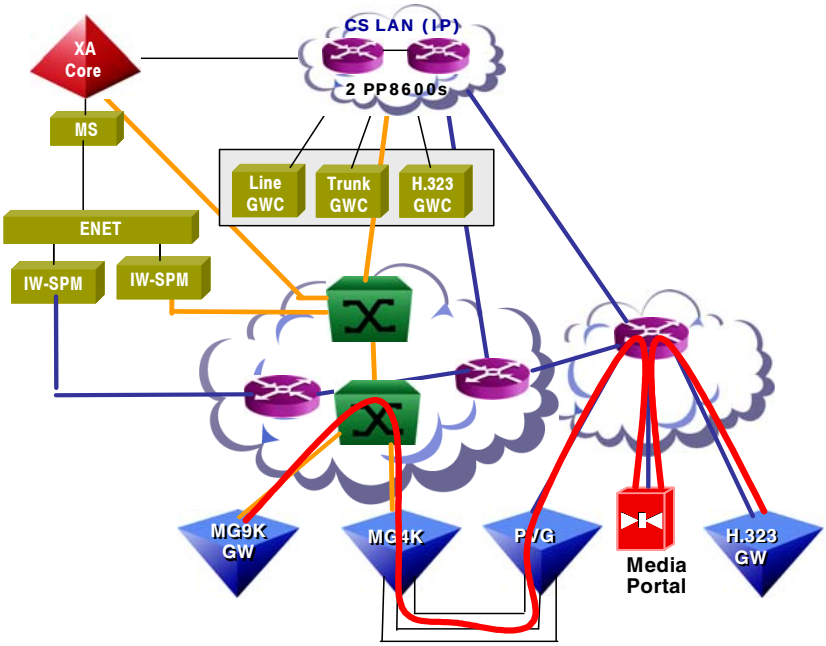

Figure 6 IP (CHS) to ATM AAL1 (UA) connection topology

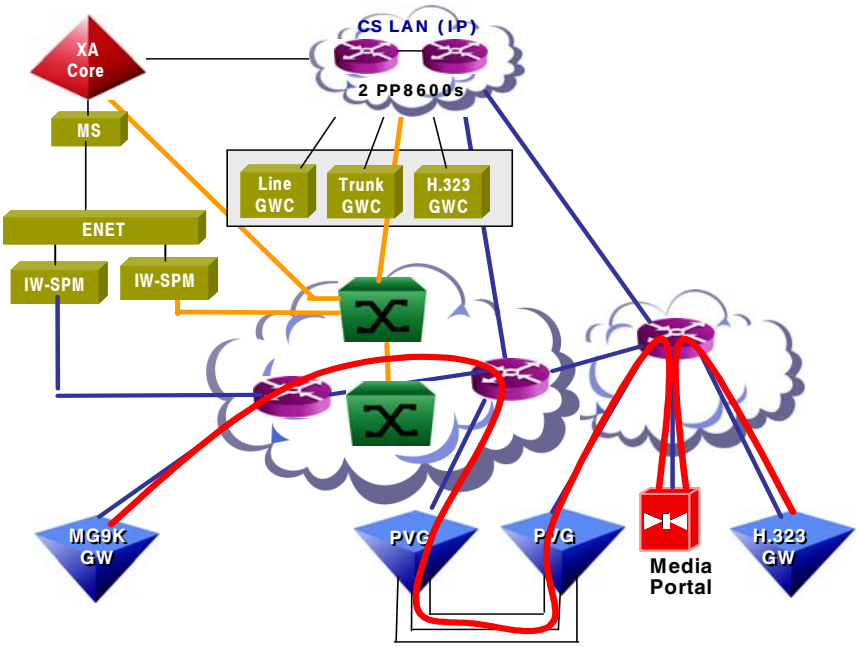

Figure 7 IP (CHS) to IP (UA) connection topology

The following areas will be addressed in more detail in the following sections:

- Bearer network and connectivity provisioning
- Multiple bearer network support in the GWC EM
- Core connectivity connection management
- IW Bridge management
- OAMP changes on the CS2000 Call Server
- Lawful Intercept
- Trunk selection (like network selection)
- DPT (BICC and SIP-T) interworking including audible ringing support
- Translations and Routing changes
- USP messaging
- ECAN across multiple bearer networks
- Voice quality
- ONP

121.3.2.1 Bearer network and connectivity provisioning

The purpose of the provisioning changes are to allow bearer networks to be defined and associated to individual agents. Once this is accomplished, there are rules created that define which bearer networks can connect to each other and how that connection is accomplished.

When the CS2000 Call Server is requested to make a connection between two endpoints, it needs to know the bearer network associated with each endpoint. If this model were followed for provisioning, then each line and trunk member datafill would have to include an indication of the bearer network. This level of provisioning is cumbersome and very repetitive in most cases. For this reason, a hierarchical model is used in SN07. An assumption is made that a node (either an SPM node or a line/trunk GWC) supports one and only one bearer network. This allows the bearer network to be associated with the node and then this information is applicable to all the endpoints associated with that node. In other words, the bearer network for the endpoint is derived from the bearer network of the node that hosts the endpoint[1].

There is one exception to the above behavior and it is in the area of DPT trunk support. Given the dynamic endpoint association that is made between the hosting node and the DPT trunk member, GWCs configured as DPT GWCs will not have an associated bearer network at the node level. The bearer network is associated with the DPT trunk group. The DPT endpoint obtains its associated bearer network from the DPT trunk group that is associated to it on a call-by-call basis.

The following provisioning changes are made by this activity:

- Bearer network definition
- Bearer network node association
- Bearer network DPT trunk group association
- IW bridge pool definition
- IW bridge pool assignment
- Bearer network connectivity

121.3.2.1.1 Bearer network definition A new table is introduced (Table BEARNETS) that defines the bearer network and the bearer fabric associated with this bearer network. The key to the table is a bearer network index. This index is needed to make it easy to change the bearer network name (i.e., without having to delete and re-add the entry). Index 0 is always reserved for the ENET tuple, if it exists.

[1]Note that endpoints that are hosted on legacy peripherals which are then hosted on MG9000 ABI, will derive their bearer network from the GWC that hosts the MG9000 ABI.

The OPTIONS field in this table identifies an optional bearer network characteristics. In SN07, the following options are supported:

- Default packet network - specifies the default packet bearer network in the office. This is used during the ONP process as well as an endpoint bearer network designation if a node-based bearer network cannot be determined.
- ECAN strategy - specifies that the ECAN region strategy should override the bearer network default ECAN edge strategy. This option obsoletes the office parameter ECAN_EDGE_STRATEGY.

Table BEARNETS supports up to eight bearer networks in the CS2000 Call Server. Refer to the Configuration section for more details on Table BEARNETS.

Figure 8 Table BEARNETS example datafill

```
TABLE: BEARNETS
NETIDX BNETNAME     DISPLAY FABRIC OPTIONS
----------------------------------------
NET 0  TDM_ENET     ENET    ENET   $
NET 1  NET_AAL1     ATM     AAL1   (PACKET_NETWORK_DEFAULT)$
NET 2  NET_IP       IP      IP     $
NET 3  NET_AAL2     AAL2    AAL2   $
```

121.3.2.1.2 Bearer network node association Association of the bearer network is done at the node level in the CS2000 Call Server. In order to minimize table changes and to provide minimal impact to DMS legacy offices, legacy peripheral nodes do not require an explicit association to the ‘ENET’ bearer network. This will be assumed in within the CS2000 Call Server.

However, any node that hosts packet bearer network endpoints requires that the bearer network be associated with the node. This is applicable to the following nodes:

- GWC (Table SERVRINV) - GWCs host many types of endpoints: lines and trunks)
- MG4K (Table MNNODE)
- DPT SPM (Table MNNODE)

Table SERVRINV is modified to include a new field BEARNETS. This field lists all the supported bearer networks associated with the GWC. In SN07, only one entry for this field is supported, which would always be marked as the default=Y. This information is populated by the GWC Element Manager when a GWC is defined in SN07. Refer to the Configuration section for more details on Table SERVRINV.

Figure 9 Table SERVRINV example datafill

```
TABLE: SERVRINV

GWC 0     IP  47 192 48 24 (POTS POTSEX)  (KEYSET  KSETEX)  $
NORTHAA (NET_AAL1 Y) $ $
```

Table MNNODE is modified for ‘SMG4’ class of SPM’s (i.e., MG4Ks) to include a new field BEARNETS. This field lists all the supported bearer networks associated with the MG4K. In SN07, only one entry for this field is supported, which would always be marked as the default=Y. Refer to the Configuration section for more details on Table MNNODE.

Figure 10 Table MNNODE example datafill - MG4K

```
TABLE: MNNODE

```

Table MNNODE is modified for ‘IW’ class of SPM’s whose DPT_INFO indicates a DPT SPM (i.e., DPT SPMs) to include a new field BEARNETS. This field lists all the supported bearer networks associated with the DPT SPM. In SN07, only one entry for this field is supported, which would always be marked as the default=Y. Refer to the Configuration section for more details on Table MNNODE.

Figure 11 Table MNNODE example datafill - DPT SPM

```
TABLE: MNNODE

```

121.3.2.1.3 Bearer network DPT trunk group association DPT trunk groups require an association to the bearer network. Changes are made

to Table TRKOPTS where the DPT trunk groups are defined. As part of this change, it was decided to change the option used to indicate a DPT trunk group. The DPT application is removed from the DYNAMIC option. A new DPT option is created to define a DPT trunk group. This new option contains a field to designate the associated bearer network. Other application users for the DYNAMIC option remain unchanged. Refer to the Configuration section for more details on Table TRKOPTS.

Figure 12 Table TRKOPTS example datafill

```

SIPTRK DPT      DPT SIPT NET_IP MGC2 PROF MGCTWO Y
OCTRK  DYNAMIC  DYNAMIC ISUP IP IP OC
```

121.3.2.1.4 IW bridge pool definition A framework is needed to allow multiple bridge pools to be defined in the CS2000 Call Server. This framework is intended to support any type of bridge that may be used to connect two bearer networks together.

In SN07, there is only one bridge type supported, the core-managed IW SPM bridge. In defining a bridge pool of this type, the two bearer networks that this bridge can connect together are specified. Other types of bridges may require additional information to be defined.

The bridge pool name is first defined in Table CLLI. Note that the number of members in the CLLI is not applicable to the bridge pool. New table NETBRDGE is created to define the bridge pool and its type. Refer to the Configuration section for more details on Table NETBRDGE.

Figure 13 Table CLLI and Table NETBRDGE example datafill

```
TABLE CLLI
CLLI          ADNUM   TRKGSIZ                    ADMININF
-----------------------------------------------------
ENET_TO_AAL1  321     0       ENET_TO_AAL1_BRIDGE_POOL
ENET_TO_IP    322     0       ENET_TO_IP_BRIDGE_POOL

TABLE: NETBRDGE

ENET_TO_IP    CORE_BRDG   E-IP    (TDM_ENET NET_IP)   $
```

121.3.2.1.5 IW bridge pool assignment Once a bridge pool has been defined, the individual IW SPM bridge nodes needs to be associated with a bridge pool. Table MNNODE is modified for ‘IW’ class of SPM’s whose

DPT_INFO indicates an IW SPM (i.e., not a DPT SPM) to include a new field BRDGGRPS. This field lists all the supported bridge pools associated with the IW SPM. In SN07, only one entry for this field is supported. Refer to the Configuration section for more details on Table MNNODE.

Figure 14 Table MNNODE example datafill - IW SPM

CR RPT)(SMCHLD MF RPT)  (SMCHLD24 CR RPT)  $ BRDG_ONLY
(ENET_TO_AAL1) $ (SPMECIDX 0)$
```

121.3.2.1.6 Bearer network connectivity Now that the bearer networks have been defined and the bridge pools have been defined, the next step is to define the connectivity rules between the bearer networks. An assumption is made that a connection between two endpoints on the same bearer network will always be allowed to proceed. The rules being discussed here apply only to a connection request made between two endpoints that are associated with different bearer networks. These rules answer the following questions:

- Can a bearer network connect to another bearer network?
- What bridge pool or bridge pools are used to support a connection between two bearer networks?

Two new tables are created to allow the customer to provide answers to these questions. Table NETPATH provides a set of bridge pool combinations. These can be thought of as ‘connectivity routes’ and assist in answering the second question posed above. Note that it is possible to create a NETPATH entry that contains more that one bridge pool. Table NET2NET allows the customer define which bearer networks connect to other bearer networks and what ‘connectivity route’ should be used (i.e., points to an entry in Table NETPATH). If there are no connecting networks specified in Table NET2NET, then a connection request from that bearer network to any other bearer network will be denied. Refer to the Configuration section for more information on Tables NETPATH and NET2NET.

Figure 15 Table NETPATH example datafill

```
TABLE: NETPATH
PATHIDX       NETBRDGE
----------------------------------------
  0           (ENET_TO_AAL1)  $
  1           (ENET_TO_IP)    $
  2           (ENET_TO_AAL1), (ENET_TO_IP)$
  3           (AAL1_TO_IP)    $
```

Figure 16 Table NET2NET example datafill

```
TABLE: NET2NET

  NET_AAL1         (TDM_ENET 0),   (NET_IP  2)   $
  NET_IP           (TDM_ENET 1),   (NET_AAL1 2)  $
```

121.3.2.2 Multiple bearer network support in the GWC EM

As described in the previous section, the bearer network needs to be associated with the GWC. New GWCs are added using the GWC Element Manager (EM). Information input using the GWC EM GUIs is then automatically updated in CS2000 Call Server tables (such as Table SERVRINV).

Prior to SN07, the GWC EM supported only one packet network. Characteristics about that packet bearer network were defined and associated with all the GWCs in the office.

In SN07, changes are made to the GWC EM to support multiple bearer networks. These changes involve the following:

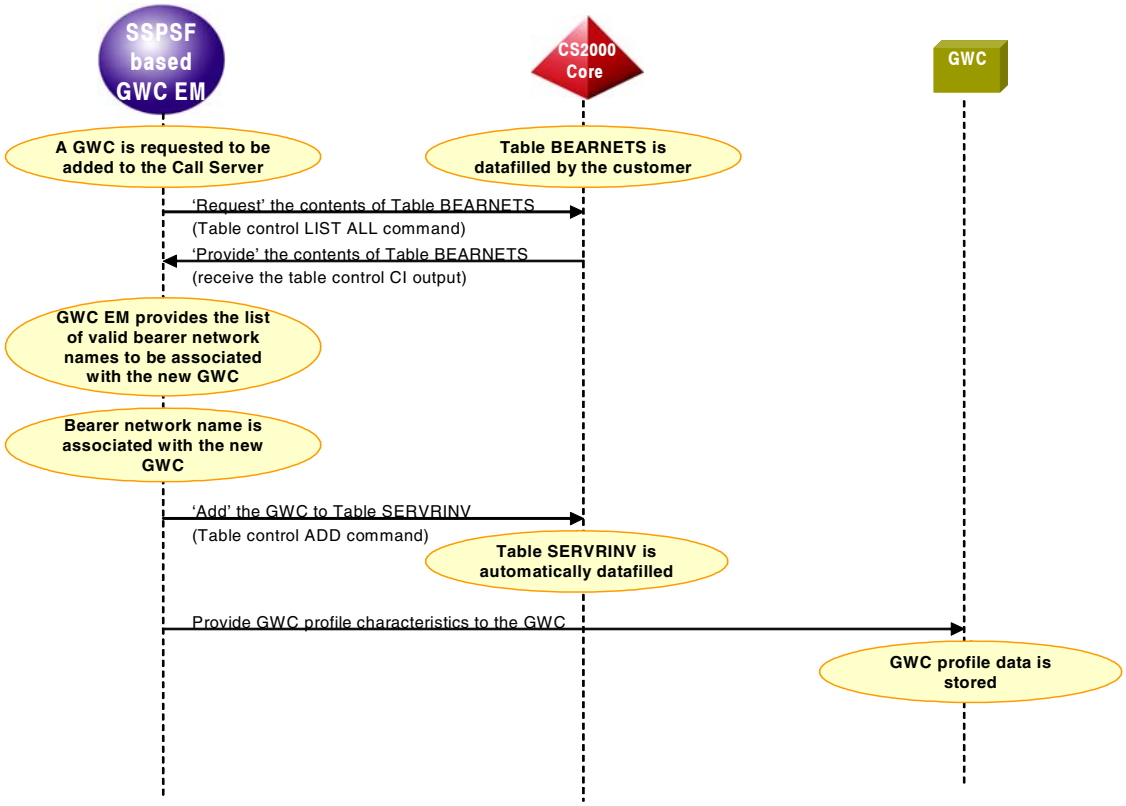
- Support the provisioning of multiple bearer network codec profiles.
  - — Display bearer network codec profile on GWC-EM GUI.
  - — Add bearer network codec profile from GWC-EM GUI.
  - — Delete bearer network codec profile from GWC-EM GUI.
  - — Change bearer network codec profile from GWC-EM GUI.
- Support the specification of a bearer network and a bearer network codec profile for each GWC.
  - — Display the bearer network and network codec profile of each GWC on GWC-EM GUI.
  - — Associate the bearer network and network codec profile with one GWC when adding GWC node from GWC-EM GUI.

— Change the associated bearer network codec profile of one GWC node from GWC-EM GUI.

- Support population of the selected bearer network in the CS2000 Call Server table SERVRINV

The following figure illustrates the steps involved in flowing the data from the GWC EM to the CS2000 Call Server. Refer to the Configuration section for more information on the GWC EM GUI screens that are available in SN07.

Figure 17 GWC EM flow through provisioning for bearer network



121.3.2.3 Core connectivity connection management

Core connectivity is a function in the CS2000 Call Server that handles connection requests that are made from the CallP and Services applications. Prior to SN07, core connectivity processed requests to make a connection between endpoints. Endpoints were designated as being 'internal' (i.e., connected to the ENET) or 'external' (i.e., connected to the packet bearer network). Core connectivity knew that if a request was made to connect and 'internal' endpoint to an 'external' endpoint, then an IW bridge was needed. It would request a bridge from the office-wide IW bridge pool.

In SN07, core connectivity is changed to support multiple bearer networks and multiple bridge pools. Rather than making assumptions that a bridge from a bridge pool is needed to make a connection, core connectivity references tables NET2NET and NETPATH when a connection between two unlike bearer networks is requested. If these tables indicate that a connection should not be made, then core connectivity denies the connection request to the CallP application. The CallP application would then route the call to a Network Blocking (NBLH) treatment causing the call to not be completed.

The following figures provide examples on how core connectivity uses the datafill to process a connection request from the CallP application.

Figure 18 ATM AAL1 (UA) to ENET connection request

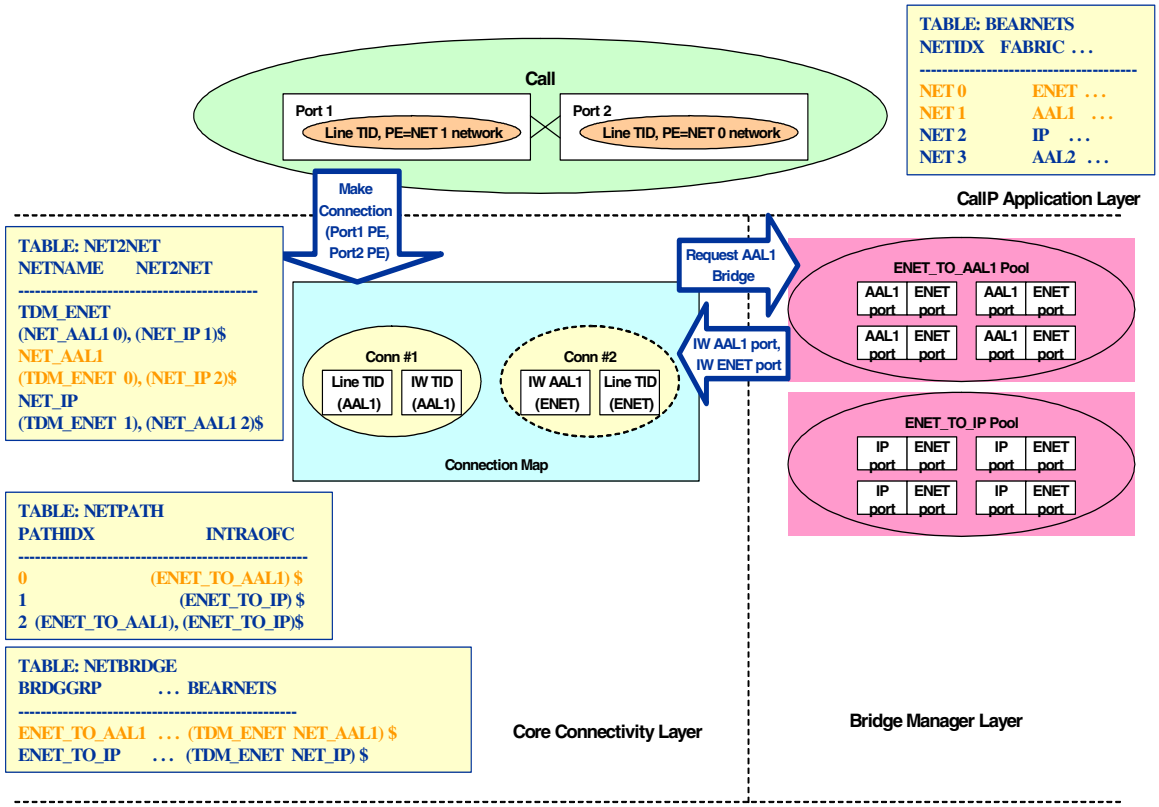


Figure 19 IP (UA) to ENET connection request

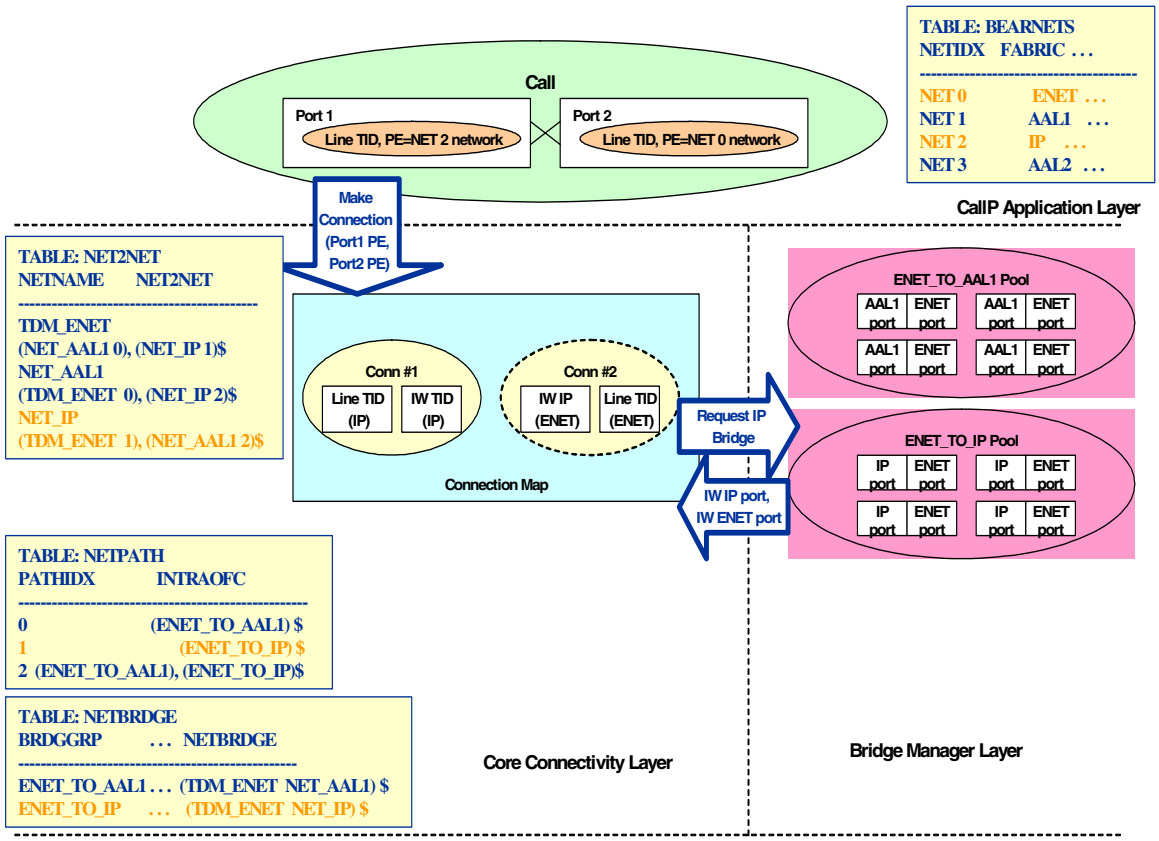

Figure 20 ATM AAL1 (UA) to IP (UA) connection request

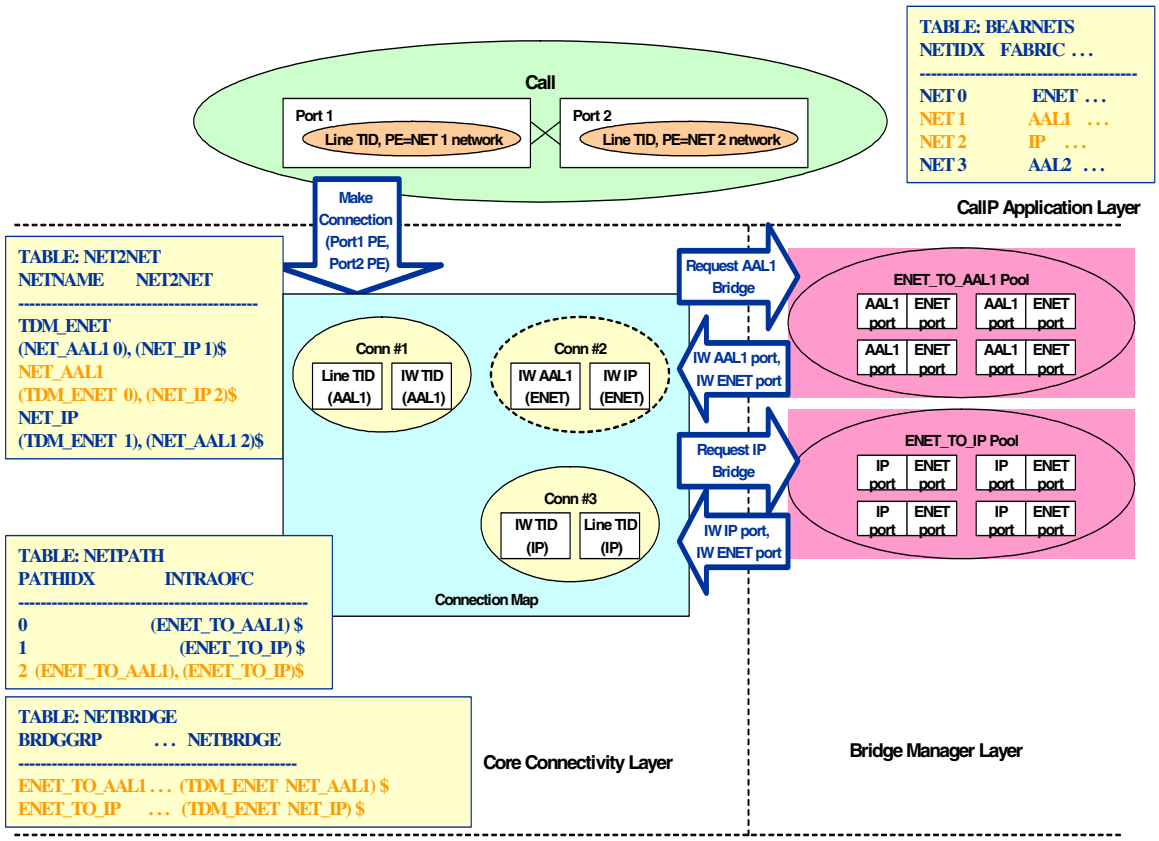

Figure 21 ATM AAL2 to IP (UA) connection request

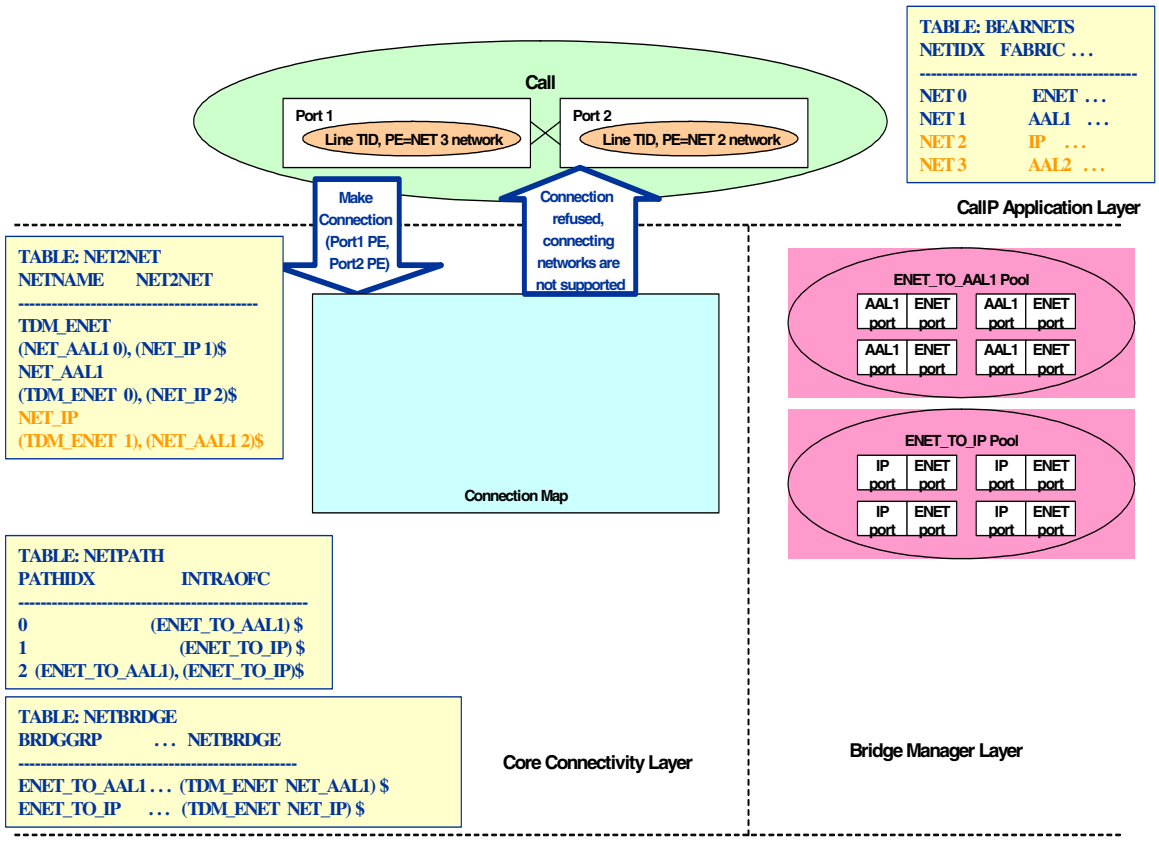


Core connectivity supports a set of connection operations. All of the possible connection requests that the CallP application may request in support of the services supported on the CS2000 Call Server map to one of these connection operations. It is important to understand what these operations mean for connection maps that contain more that one IW bridge. The following table documents this behavior.

Table 2 Core connectivity connection operations

Connection Operation	Description	Actions taken
Make connection	There are 2 external connections involved being created. The packet connections are created first, followed by the ENET connection.	Connection 1 - FCM Makes sent • FROM endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 - FCM Makes sent • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 3 - ENET control (make) sent • Bridge #1 endpoint (ENET) • Bridge #2 endpoint (ENET)
Break connection	Free the ENET connection, and then to break both packet connections. It should be noted that although the ENET connection is freed from the connection maps, the actual ENET path is not physically freed.	Connection 1 - FCM Breaks sent • FROM endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 - FCM Breaks sent • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 3 - ENET control (free) sent • Bridge #1 endpoint (ENET) • Bridge #2 endpoint (ENET)
Hold connection	Hold both packet connections and to free the ENET connection. It should be noted that although the ENET connection is freed from the connection maps, the actual ENET path is not physically freed	Connection 1 - FCM Holds sent • FROM endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 - FCM Holds sent • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 3 - ENET control (free) sent • Bridge #1 endpoint (ENET) • Bridge #2 endpoint (ENET)

Table 2 Core connectivity connection operations

Connection Operation	Description	Actions taken
Restore connection	Restore both the packet connection and then to make a new ENET connection.	Connection 1 - FCM Restores sent • FROM endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 - FCM Restores sent • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 3 - ENET control (make) sent • Bridge #1 endpoint (ENET) • Bridge #2 endpoint (ENET)
Hold as pending move	Free the HOLDING side connection (endpoint that is leaving the call) and freeing the bridge on the holding side. Then hold the HELD side (endpoint that is staying in the call). It should be noted that although the internal connection is freed from the connection maps, the actual ENET path is not physically freed	Connection 1 - FCM Breaks sent • FROM endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 - FCM Holds sent • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 3 - ENET control (free) sent • Bridge #1 endpoint (ENET) • Bridge #2 endpoint (ENET)
Move connection (1 existing IW bridge requiring adding a new IW bridge)	Reuse the bridge connected with the FROM agent, and acquire a bridge for the new TO agent.	Connection 1 - FCM Restores sent • FROM endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 - FCM Makes sent • TO endpoint (NET_IP) • Bridge # 2 endpoint (NET_IP) Connection 3 - ENET control (Make) sent • Bridge #1 endpoint (ENET) • Bridge #2 endpoint (ENET)
Move connection (1 existing bridge requiring removing the existing bridge)	Remove the bridge connected with the FROM agent, and connect the two packet agents directly. Note that the connection map collapses from three connections to just one.	Connection 1 - FCM Moves sent • FROM endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) • TO endpoint (NET_AAL1)

Table 2 Core connectivity connection operations

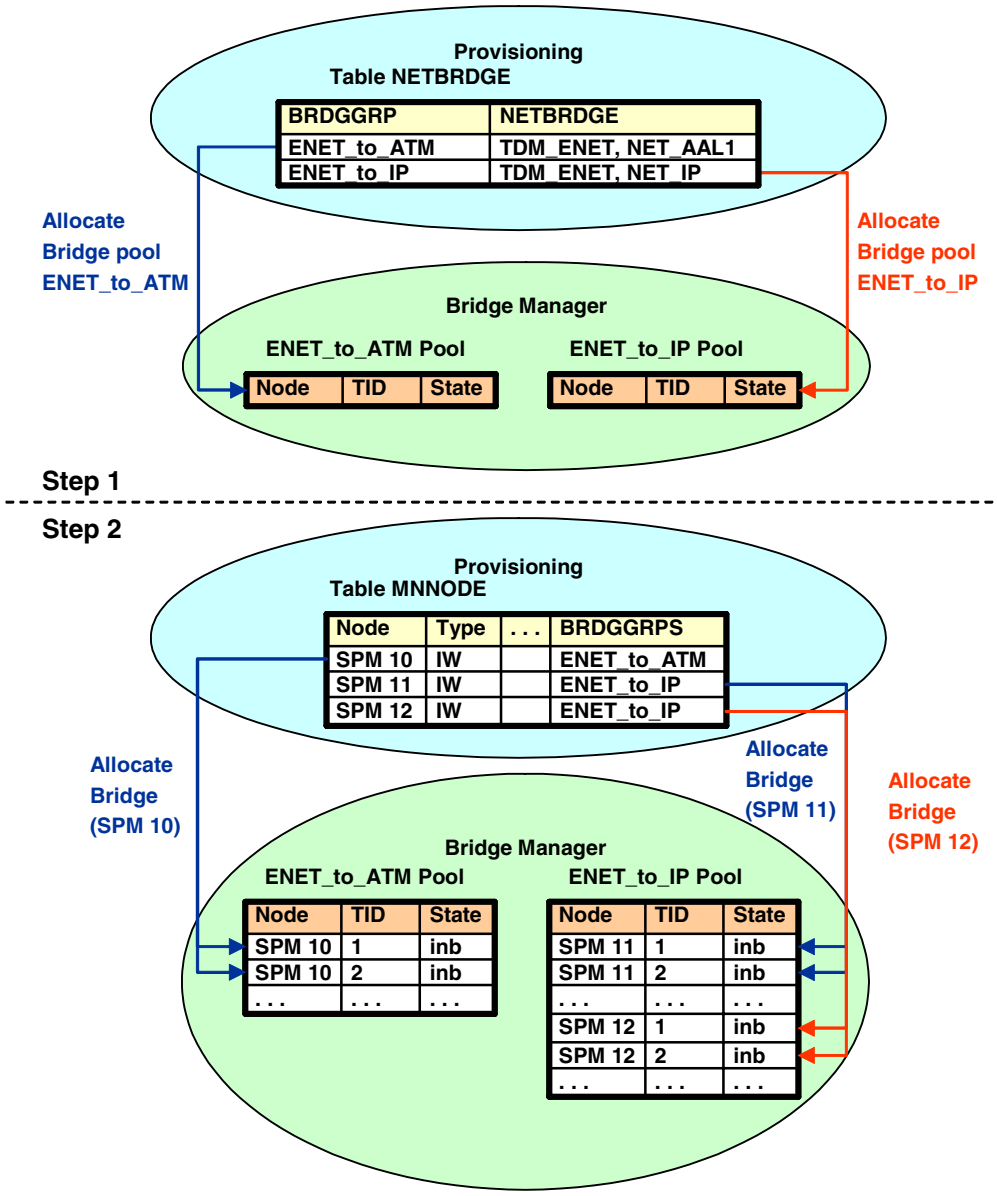
Connection Operation	Description	Actions taken
Move connection (1 existing bridge requiring maintaining existing bridge)	Keep the bridge connected with the FROM agent, and make a connection through the ENET to the TO agent. Note that the connection map collapses from three connections to two connections.	Connection 1 - FCM Restores sent • FROM endpoint (NET_AAL1) • Bridge #1 endpoint (NET_AAL1) Connection 2 - ENET control (Make) sent • Bridge #1 endpoint (ENET) • TO endpoint (ENET)

121.3.2.4 IW Bridge management

IW bridge management is a function in the CS2000 Call Server that manages the pool of IW SPM bridges. Prior to SN07, a single, office-wide pool of available IW bridges was managed by this utility. Each IW bridge node is composed of four groups of 512 bridge endpoints each. When an IW bridge node was provisioned in Table MNNODE, a set of four groups of 512 endpoints were added to the bridge pool. As the group of 512 endpoints was brought into service, these endpoints became available for Core Connectivity to use. The bridge manager function interfaced with maintenance and Core Connectivity to manage the set of available IW bridge endpoints in the office.

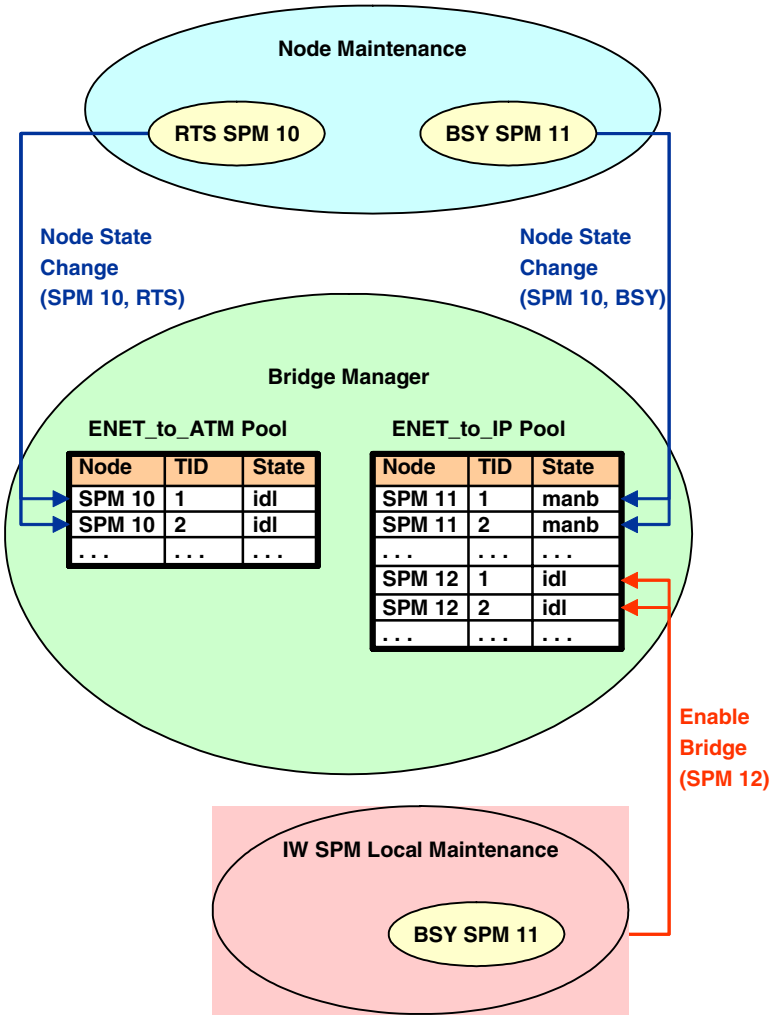
In SN07, the office-wide, single bridge pool is changed to support multiple bridge pools in a single CS2000 Call Server. A bridge pool is created when it is datafilled in Table NETBRDGE. Individual IW bridge nodes are added (still in the 4 groups of 512 endpoints each) as they are provisioned in Table MNNODE against the newly created bridge pool.

Figure 22 IW bridge pool creation



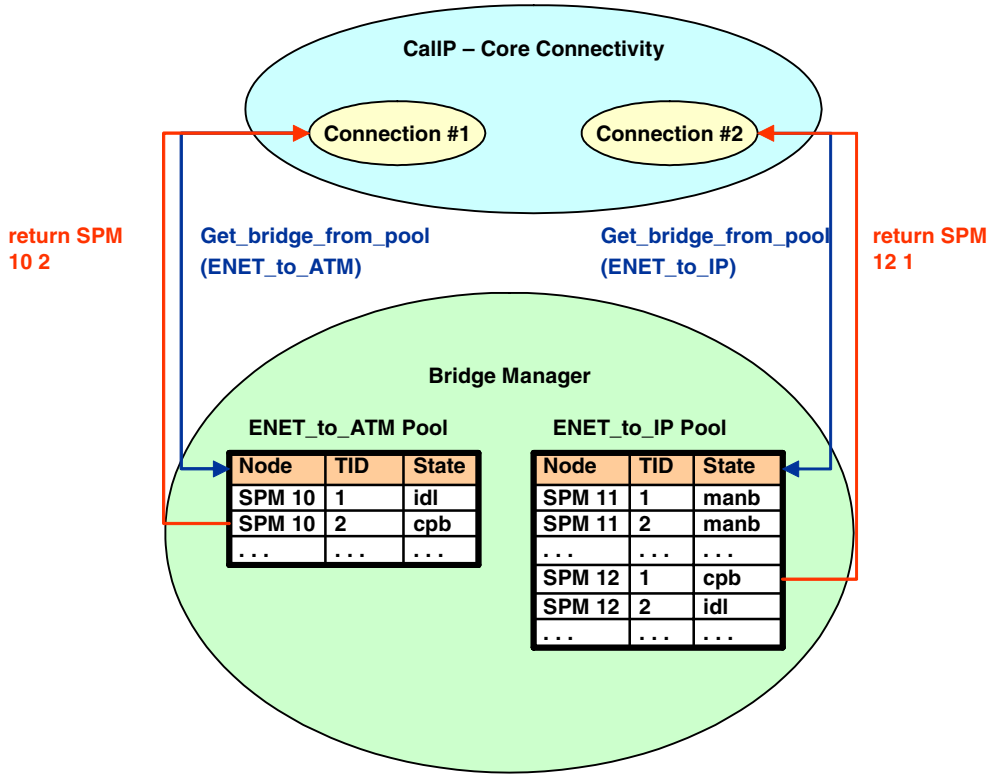
Once the bridge pools are created through provisioning, the individual IW bridge nodes are brought into service. This causes the nodes in the associated bridge pool to become available for use.

Figure 23 IW bridge maintenance



With idle IW bridge endpoints available in their associated bridge pools, the Bridge Manager can respond to requests from Core Connectivity to get a bridge. If more that one bridge is needed for a connection request, the Core Connectivity makes a request for each bridge needed.

Figure 24 IW bridge request



121.3.2.5 OAM changes on the CS2000 Call Server

OAM changes associated with the support of multiple bearer networks are limited in SN07. It is recognized that many additional requirements should be implemented and will be addressed in a future release.

In SN07, this feature does address the following areas:

- Multiple IW bridge pool OAM
- Trunk group OAM
- DPT OAM
- Office-wide usage OAM

Since many of these changes have impacts to customer OSSMINE interfaces, the activation of these changes is controlled by a new office parameter, MULTINET_DISPLAY_ACTIVE. Setting this parameter to ‘Y’ allows these changes to be visible. Setting this parameter to ‘N’ hides these changes. Note that this parameter does not impact the ability to support call connections between multiple bearer networks.

121.3.2.5.1 Multiple IW bridge pool OAM In SN07 with the support of multiple bridge pools, changes are made to the IWBM 800 series logs. These

logs are generated to monitor the usage thresholding of the bridge pools in the office. When office parameter MULTINET_DISPLAY_ACTIVE is set to 'Y', then a new information line is output indicating the associated bridge pool that is causing the generation of the log. Refer to the Fault Management section of the document for more information.

Figure 25 IWBM 800 log example

```
RTP7  **  IWBM800 SEP17  12:16:55  6600  1st Threshold Exceeded
          The number of interworking bridges in use has
          exceeded 70 percent of all bridges in the pool.
           Total number of IW bridges:  2016
           Number of available IW bridges: <NN>
           Bridge Pool: <bridge pool CLLI from Table NETBRDGE>
```

In addition to the modified IWBM 800 logs, a new OM group (IWBMNODE) is created. IWBMNODE provides a set of registers for each IW bridge node provisioned in the CS2000 Call Server. It contains registers to monitor the following usage information:

- Number of attempts to get a bridge
- Number of failures to get a bridge
- Number of get bridge aborts
- Number of attempts to free a bridge
- Number of failures to free a bridge
- Number of free bridge aborts
- Number of times a bridge was used to connect to a test facility
- Number of times a bridge was used to connect to an announcement or conference facility
- Number of times a bridge was used to connect to a line
- Number of times a bridge was used to connect to a trunk

In order to get a view of the usage for the entire bridge pool, the individual bridge node information will have to be summed. Note that the associated bridge pool name is included in the OM group for each node. Refer to the Performance Management section of the document for more details.

Note that the value of MULTINET_DISPLAY_ACTIVE office parameter does not impact the availability of this OM group. It is always available in SN07.

               0              0              0              0
```

121.3.2.5.2 Trunk group OAM With support for multiple bearer networks, a trunk group can be configured to have members is multiple bearer networks. The existing TRK and TRNK2 OM groups only provide data on a per trunk group basis. When office parameter MULTINET_DISPLAY_ACTIVE is set to ‘Y’, then new OM groups (TRK2NET1 and TRK2NET2) are created to provide a per trunk group and per bearer network view of the trunk group usage.

OM group TRK2NET1 contains the same set of registers that existing OM group TRK contains. It contains registers to monitor the following usage information:

- Automatic congestion control
- Invalid or no automatic number identification (ANI)
- Answered call usage
- Number of calls answered
- Automatic number identification (ANI) office failure

- Number of successful connections
- Network management reroutes
- Directional reservation
- Glare
- Answer messages sent and received on incoming trunks
- Answer messages sent and received usage on incoming trunks
- Total incoming attempts
- Incoming failures
- Maintenance busy usage
- Total outgoing attempts
- No answer on trunk (timed out)
- Number of overflows, all trunks busy
- Answer messages sent and received on outgoing trunks
- Outgoing failures
- Outgoing matching failures
- Pre-route abandons
- Protective reservation usage
- System busy usage
- Number of tandem calls
- Total usage
- Traffic busy usage

OM group TRK2NET2 contains the same set of registers that existing OM group TRNK2 contains. It contains registers to monitor the following usage information:

- Number of calls answered (extension from TRK2NET1)
- Number of successful connections (extension from TRK2NET1)
- Network management reroutes (extension from TRK2NET1)
- Directional reservation (extension from TRK2NET1)
- Total incoming attempts (extension from TRK2NET1)
- Total outgoing attempts (extension from TRK2NET1)
- System busy usage (extension from TRK2NET1)
- Number of tandem calls (extension from TRK2NET1)
- Total usage (extension from TRK2NET1)
- Traffic busy usage (extension from TRK2NET1)

121.3.2.5.3 DPT OAM In providing support for multiple bearer networks, a requirement to support both BICC and SIP-T DPT protocols in the same office was also requested. Prior to SN07, the DPT OM groups did not indicate the associated DPT protocol.

In SN07, when office parameter MULTINET_DISPLAY_ACTIVE is set to ‘Y’, then the following changes are made:

- Provide an office-wide, per-protocol DPT performance summary
- Provide a per-DPT node, per-protocol DPT performance summary

A new OM group (DPTOFCP) is created to provide an office-wide, per-DPT protocol performance summary. This group is modeled after the DPTOFC OM group and contains the same set of registers. Two DPT protocols are supported: BICC and SIP-T. The following registers are included per protocol:

- Get DPT terminal attempts
- Get DPT terminal failures
- Get DPT optimized terminal failures
- DPT terminal usage
- DPT terminal usage high water mark
- DPT port depletion

Figure 29 DPTOFCP OM group example

```

```

Changes are made to the existing DPTNODE OM group. This OM group provides a per-DPT node performance summary. In SN07, each DPT node can only support one DPT protocol. For example, a DPT capable MG4K node can only support BICC. DPT GWC nodes can support either BICC or SIP-T but not at the same time. When MULTINET_DISPLAY_ACTIVE is set to ‘Y’,

additional information is added to the DPTNODE OM group to display the following additional information:

- DPT protocol
- For SPM-type nodes, the associated bearer network and SPM node type are also displayed[1]

121.3.2.5.4 Office-wide usage OAM With support for multiple bearer networks, it is a requirement to be able to monitor the performance of the traffic over each bearer network. The existing OFZ and OFZ2 OM groups only

[1]DPT GWCs are considered bearer independent, so the associated bearer network is not included for DPT GWCs.

provide an office-wide view. When office parameter MULTINET_DISPLAY_ACTIVE is set to ‘Y’, then new OM groups (OFZ2NET1 and OFZ2NET2) are created to provide a per bearer network view of office traffic.

OM group OFZ2NET1 contains the same set of registers that existing OM group OFZ contains. It contains registers to monitor the following traffic information for each bearer network defined in Table BEARNETS:

- Incoming trunk subscriber abandoned calls
- Incoming trunk switch abandoned calls
- Incoming trunk calls routed to an announcement
- Incoming trunk calls routed to a tone
- Incoming trunk calls to lock-out
- Incoming trunk calls to outgoing trunk calls
- Incoming trunk calls to terminating line calls
- Lines manual busy
- Number of incoming trunk calls
- Number of originating line calls
- Originating line switch abandoned calls
- Originating line calls routed to an announcement
- Originating line calls to lock-out
- Originating line calls to outgoing trunk calls
- Originating line calls routed to a tone
- Originating line calls to terminating line calls
- Outgoing trunk match failures
- Outgoing trunk network attempts
- Outgoing trunk original seize failures
- Outgoing trunk retrial match failures
- Outgoing trunk retrial seize failures
- Terminating line blocked
- Terminating line match failures
- Terminating line network attempts

OM group OFZ2NET2 contains the same set of registers that existing OM group OFZ2 contains. It contains registers to monitor the following traffic information for each bearer network defined in Table BEARNETS:

- No circuits available on business network trunks
- No circuits available on inward dial trunks
- No circuits available on intermachine trunks
- No circuits available on intertoll trunks
- No circuits available on local tandem trunks
- No circuits available on offnet trunks
- No circuits available on connect trunks
- No circuits available on toll completing trunks
- No circuits available on circuit trunks
- No circuits available on all other trunks
- Calls routed to GNCT treatment
- Switch originated partial dial calls
- Switch originated calls to permanent signal treatment

121.3.2.6 Lawful Intercept

Lawful Interception is the ability to perform call monitoring on selected agents. Call monitoring includes;

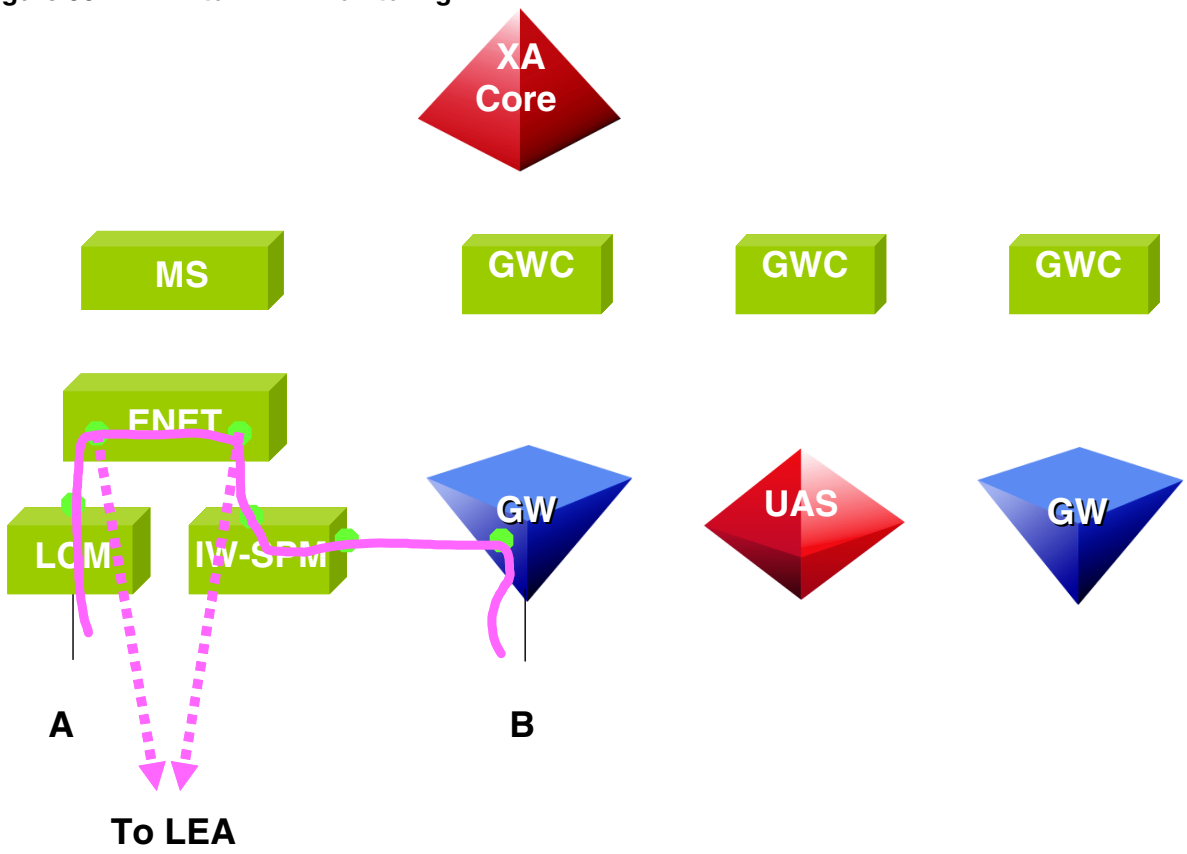
- Call Data monitoring - reporting details about monitored calls (e.g. time of the call, dialled digits, parties involved, etc.)
- Call Content monitoring - delivery of both sides of a monitored conversation to law enforcement

With support for multiple bearer network in a single CS2000 Call Server, lawful intercept must provide the ability to do Call Content monitoring on all

required call types and all supported bearer connections. Previous to SN07, Call content monitoring was supported for the following call types:

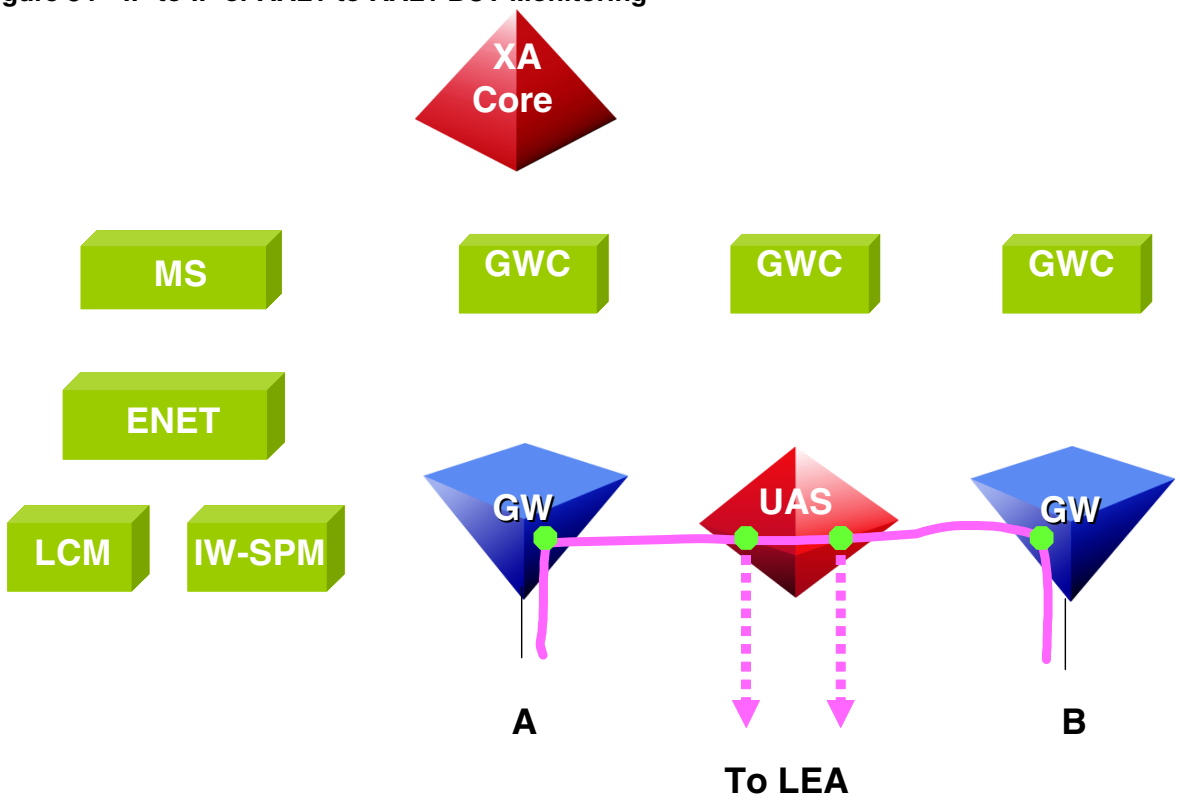
- ENET-to-ENET: replicas are attached to the primary ENET pathends which broadcast the transmit of each endpoint (legacy monitoring)

Figure 33 ENET-to-ENET Monitoring



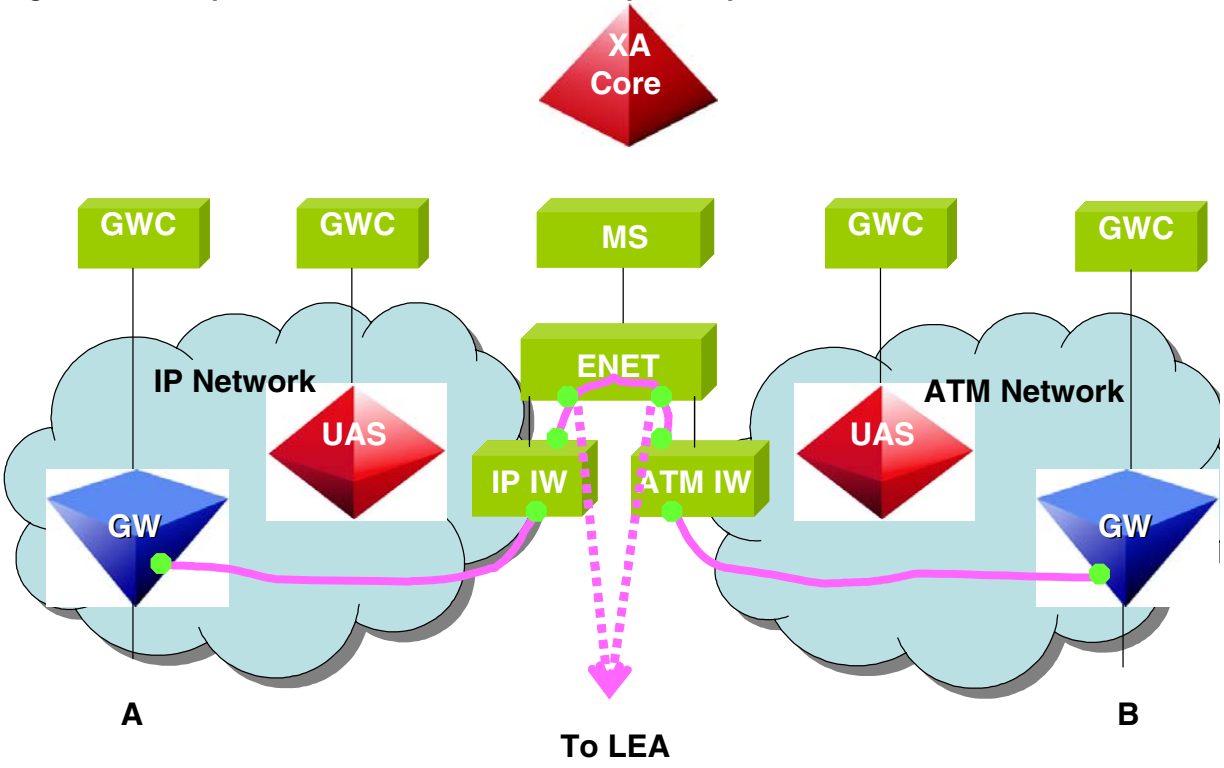
- IP-to-IP: primary call is tandemed through a Centralized Replicator (CR) to which replicas are attached. This functionality is known as Bearer Channel Tandeming (BCT).
- AAL1-to-AAL1: when BCT is active, the same strategy is used as in IP-to-IP calls. If not, then broadcast connections are attempted. This works for Packet Trunking - AAL1 solutions where the only AAL1-to-AAL1 calls involve MG4Ks which support broadcast connections.

Figure 34 IP-to-IP or AAL1-to-AAL1 BCT Monitoring



In SN07, there are no impacts to the replication models that are used to lawful intercept. Since the connection model for supporting a packet bearer network 1 to packet bearer network 2 connection involves using 2 IW SPM bridges, lawful intercept will used the ENET-to-ENET model to perform replication. Refer to the following figure for an example connection with lawful intercept.

Figure 35 Multiple bearer network lawful intercept example



In summary, this means that in a CS2000 Call Server that supports three bearer networks (ENET, AAL1 and IP), that the following replication points will be used:

- ENET
  - — for ENET-to-ENET calls
  - — for AAL1-to-IP calls
  - — for ENET-to-AAL1 calls
  - — for ENET-to-IP calls
- UAS IP
  - — for IP-to-IP calls
- UAS AAL1
  - — for AAL1-to-AAL1 calls[1]

121.3.2.7 Trunk selection (like network selection)

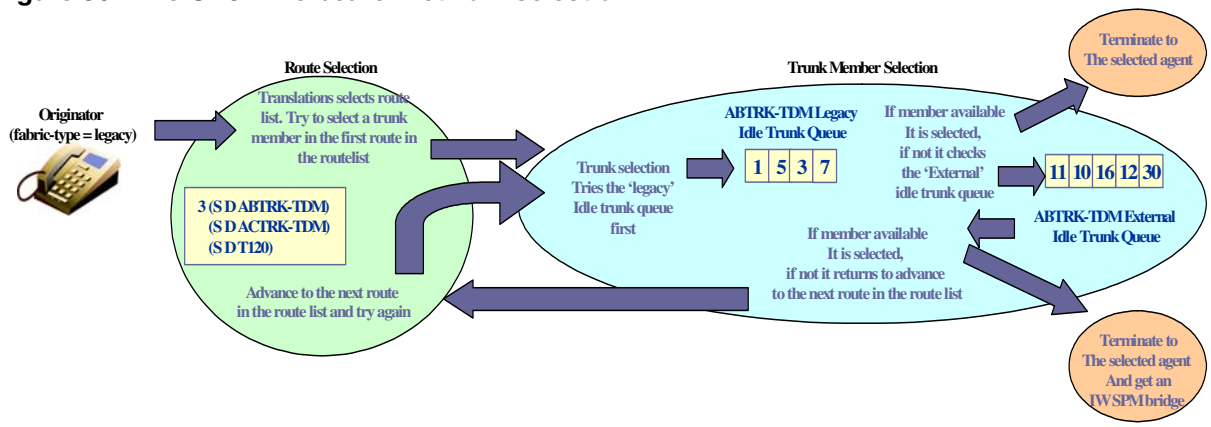
Prior to SN07, the CS2000 Call Server tried to optimize bearer network connections by trying to select a trunk member whose bearer network matched the bearer network of the originating agent. Since there were only two bearer

[1]If the call involves only 2 MG4Ks, then the UAS is not needed (MG4Ks can broadcast the bearer path). But if an MG9K is involved, then the UAS is required.

networks supported (‘internal’ and ‘external’), the trunk selection utility internally maintained an idle trunk queue for each of the two bearer networks. When a request was made to select a trunk member, the trunk selection utility would determine the bearer network of the originating agent and then traverse the ‘matching’ bearer network’s idle trunk queue looking for an available trunk member. If a member was found, it would be selected and returned to CallP which would then request that a connection be made to that selected member (note that this connection would not require an interworking bridge).

If it did not find a member, it would search the ‘other’ bearer network’s idle trunk queue looking for an available trunk member. If a member was found, it would be selected and returned to CallP which would then request that a connection be made to that selected member (note that this connection would require an interworking bridge). If both queues are checked and no available member can be found, then the request is returned with an indication that the call should advance to the next route in the route list.

Figure 36 Pre-SN07 like bearer network selection

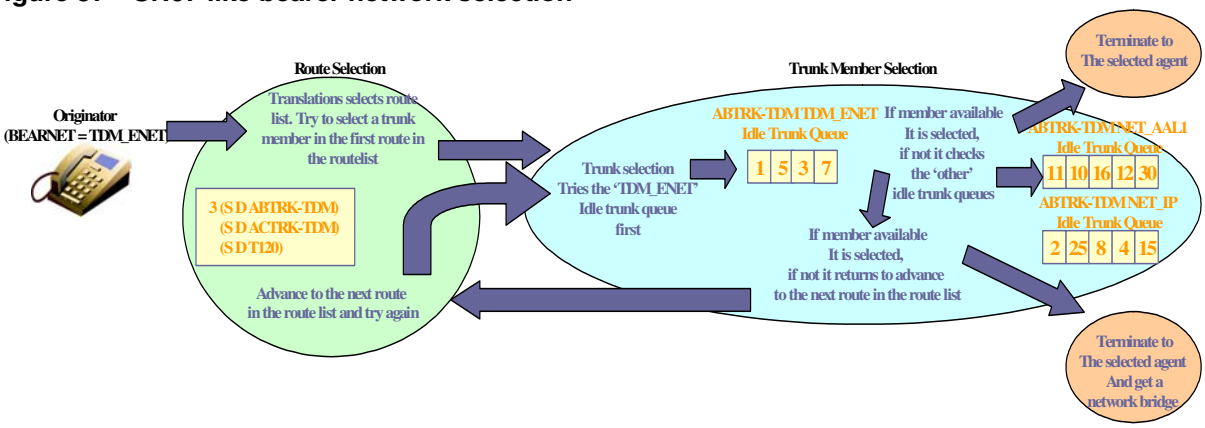


In SN07, the trunk selection utility is changed to support multiple bearer networks (i.e., more that two). When a request was made to select a trunk member, the trunk selection utility determines the bearer network of the originating agent and then traverses the ‘matching’ bearer network’s idle trunk queue looking for an available trunk member. If a member was found, it would be selected and returned to CallP which would then request that a connection be made to that selected member (note that this connection would not require an interworking bridge).

If it did not find a member, it would search the ‘next’ bearer network’s idle trunk queue looking for an available trunk member. The ‘next’ bearer network is determined by the order that the bearer networks are datafilled in Table BEARNETS. If a member was found, it would be selected and returned to CallP which would then request that a connection be made to that selected member (note that this connection would require an interworking bridge). If it did not find a member, it would continue searching it’s idle trunk queues in the

Table BEARNETS bearer network order until it either found an available member or exhausted all of its queues. If all queues are exhausted, then the request is returned with an indication that the call should advance to the next route in the route list.

Figure 37 SN07 like bearer network selection



The following is an example trunk selection request.

- Originating agent's bearer network = NET_AAL1
- Table BEARNETS datafill
  - — NET 0 TDM_ENET . . .
  - — NET 1 NET_AAL1 . . .
  - — NET 2 NET_IP
- Terminating trunk group has members in all three bearer networks

The following is the order that the trunk selection utility will try to find an available trunk member:

1. Trunk group members in the NET_AAL1 bearer network
   - — This is first because this is the originator's bearer network.
2. Trunk group members in the TDM_ENET bearer network
   - — This is second because it is the first entry in Table BEARNETS.
3. Trunk group members in the NET_IP bearer network
   - — This is third because this is the third entry in Table BEARNETS. Note that the second entry in Table BEARNETS had already been attempted.

121.3.2.8 DPT (BICC and SIP-T) interworking including audible ringing support

Providing support for both BICC and SIP-T DPT protocols in the same CS2000 Call Server impacts the following areas:

- DPT terminal selection
- DPT audible ringing support

121.3.2.8.1 DPT terminal selection The algorithm for determining which node to host a DPT trunk call differs for BICC and SIP-T. Now that both are supported in the same CS2000 Call Server, this feature must ensure that both function properly.

Changes are needed for the BICC DPT terminal selection algorithms to make sure the bearer network of the hosting DPT capable node matches the bearer network of the DPT trunk group that was selected in translations.

The following table defines the algorithms for each protocol.

Table 3

DPT Protocol	Direction	Algorithm
SIP-T	outgoing	CS2000 Call Server selects the next available GWC node that is provisioned to support SIP-T (Tables SERVRINV and SERVSINV). Note that the bearer network of the DPT trunk group does not factor into the selection process.
SIP-T	incoming	The VRDN GWC selects the next available GWC node that is provisioned to support SIP-T (Tables SERVRINV and SERVSINV). The VRDN GWC builds it list of available SIP-T GWCs because the SIP-T GWCs register with it. BICC GWCs do not register with the VRDN GWC.

Table 3

DPT Protocol	Direction	Algorithm
BICC	outgoing	CS2000 Call Server tries to put the DPT trunk on the most optimized BICC DPT capable node. BICC DPT capable nodes include the following: • BICC GWCs (bearer network independent) • MG4Ks (with an associated bearer network) • DPT SPMs (with an associated bearer network) If the originating agent is on the MG9K, then a BICC GWC is selected. Note that the bearer network of the DPT trunk group does not factor into the selection process because BICC GWCs can support any bearer network. If the originating agent is on the MG4K, then that same MG4K is selected provided the bearer network of the DPT trunk group matches the bearer network of the MG4K. If the bearer network of the DPT trunk group does not match the bearer network of that same MG4K, then terminal selection will try the BICC GWC (since it is bearer network independent) first, then it will try to get another MG4K that does support the DPT trunk group's bearer network. If the originating agent is on a legacy peripheral, then the DPT SPM is selected (if present) provided the bearer network of the DPT trunk group matches the bearer network of the DPT SPM. If the bearer network of the DPT trunk group does not match the bearer network of any DPT SPM in the office, then terminal selection will try the BICC GWC (since it is bearer network independent) first, then it will try to get any MG4K that does support the DPT trunk group's bearer network.

Table 3

DPT Protocol	Direction	Algorithm
BICC	incoming	Prior to SN07, the CS2000 Call Server attempts to initially put the DPT terminal on an MG4K for message normalization and then will move it to the most optimized location based upon what agent the call terminates to. The reason for doing this was to provide a hosting node that had the ability to play tones and collect digits in the case where a service was invoked prior to digit translations and line/trunk termination. In SN07, the CS2000 Call Server continues to place the DPT terminal on an MG4K or DPT SPM for normalization. However, this MG4K/DPT SPM's associated bearer network must now match the bearer network of the incoming BICC DPT trunk group. If no match can be found, then the call is sent to a BICC GWC to be normalized. Note that this leaves no place to support tones and digit collection for those services that may be invoked prior to agent termination. Once the DPT call is normalized, the CS2000 Call Server attempts to optimize the location of the DPT context based on the terminating agent in the call. If the terminating agent is on an MG9K, then the DPT context is moved to a BICC GWC. Note that the bearer network of the BICC DPT trunk group does not factor into the optimization process because BICC GWCs can support any bearer network. If the terminating agent is on an MG4K, then the DPT context will be moved to that MG4K provided the bearer network of the terminating agent's MG4K matches the bearer network of the BICC DPT trunk group. If it does not match, then the DPT context remains where it is (i.e., where it was normalized). If the terminating agent is on a legacy peripheral, then the DPT context will be moved to a DPT SPM (if present) provided the bearer network of the DPT SPM matches the bearer network of the BICC DPT trunk group. If a DPT SPM cannot be found, then the DPT context is moved to a BICC GWC and an IW SPM bridge from the associated bridge pool is used to connect the bearer network of the DPT trunk group and the legacy peripheral. If a BICC GWC is not present, then the call remains where it is (i.e., where is was normalized) and an IW SPM bridge from the associated bridge pool is used.

121.3.2.8.2 DPT audible ringing support The means for providing audible ringing on egress DPT trunk calls differs based upon the DPT protocol being used. Now that both protocols are support in the same CS2000 Call Server, care is taken to ensure that audible ringing functions properly is all scenarios, including bearer network interworking scenarios.

On an incoming DPT SIP-T trunk call where the DPT SIP-T trunk is asked to apply audible ringing, the DPT SIP-T trunk uses Remote Bearer Control (RBC) to ask the originating call server to apply the audible ringing tone on its behalf. On an incoming DPT BICC trunk, the DPT BICC trunk uses Bearer Channel Proxy - No-Anchor (BCP-NA) to ask the terminating gateway to apply audible ringing back towards the originating call server. The following table illustrates the scenarios and how audible is applied.

Table 4 DPT audible ringing scenarios

Originating Agent	Terminating DPT Agent	How audible ringing is applied
Line (TDM_ENET)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Trunk (TDM_ENET)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Line (NET_AAL1)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Trunk (NET_AAL1)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Line (NET_IP)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Trunk (NET_IP)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
Line (TDM_ENET)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
Trunk (TDM_ENET)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
Line (NET_AAL1)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
Trunk (NET_AAL1)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
Line (NET_IP)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the Line GW towards the line agent
Trunk (NET_IP)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the Trunk GW towards the trunk agent
DPT BICC (NET_AAL1)	Line (TDM_ENET)	BCP-NA used to ask the AAL1 IW SPM to apply audible ringing towards the AAL1 network
DPT BICC (NET_AAL1)	Trunk (TDM_ENET)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
DPT BICC (NET_AAL1)	Line (NET_AAL1)	BCP-NA used to ask the MG9K to apply audible ringing towards the AAL1 network

Table 4 DPT audible ringing scenarios

Originating Agent	Terminating DPT Agent	How audible ringing is applied
DPT BICC (NET_AAL1)	Trunk (NET_AAL1)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
DPT BICC (NET_AAL1)	Line (NET_IP)	BCP-NA used to ask the AAL1 IW SPM to apply audible ringing towards the AAL1 network
DPT BICC (NET_AAL1)	Trunk (NET_IP)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
DPT SIP-T (NET_IP)	Line (TDM_ENET)	BCP-NA used to ask the IP IW SPM to apply audible ringing towards the IP network. If it cannot accommodate the request, the RBC is used to ask the originating call server to play audible ringing.
DPT SIP-T (NET_IP)	Trunk (TDM_ENET)	Not in the CS2000 Call Server. Audible ringing is applied in the next call server.
DPT SIP-T (NET_IP)	Line (NET_AAL1)	BCP-NA used to ask the IP IW SPM to apply audible ringing towards the IP network. If it cannot accommodate the request, the RBC is used to ask the originating call server to play audible ringing.
DPT SIP-T (NET_IP)	Trunk (NET_AAL1)	Not in the CS2000 Call Server. Audible riging is applied in the next call server.
DPT SIP-T (NET_IP)	Line (NET_IP)	BCP-NA used to ask the line gateway to apply audible ringing towards the IP network. If it cannot accomodate the request, the RBC is used to ask the originating call server to play audible ringing.
DPT SIP-T (NET_IP)	Trunk (NET_IP)	Not in the CS2000 Call Server. Audible riging is applied in the next call server.
DPT BICC (NET_AAL1)	DPT SIP-T (NET_IP)	RBC request may be received. Audible ringing is applied on the IP IW SPM towards the ENET
DPT SIP-T (NET_IP)	DPT BICC (NET_AAL1)	Not in the CS2000 Call Server. Audible riging is applied in the next call server.

121.3.2.9 Translations and Routing changes

With support for multiple bearer networks, there is an assumption that calls should remains on the same bearer network as much as possible. Given this assumption, the following changes are made in SN07:

- Routing based upon the bearer network
- TRAVER modifications to support multiple bearer networks

121.3.2.9.1 Routing based upon the bearer network Prior to SN07, the PKT conditional route selector allowed the customer to force routing between the ENET and the packet bearer network. In SN07, this selector is replaced by two new conditional route selectors:

- FABRIC
- BEARNET

The FABRIC conditional route selector replaces the PKT conditional route selector. During translations and routing, the fabric of the originating agent's bearer network is examnied and determines the next route in the route list. This allows the customer to explicitly keep a call on a particular bearer network fabric. During the ONP to SN07, the FABRIC selector replaces any PKT selectors found.

The BEARNET conditional route selector is new in SN07. During translations and routing, the originating agent's bearer network is examnied and determines the next route in the route list. This allows the customer to explicitly keep a call on a particular bearer network.

Refer to the Configuration section of the document for additional information.

Figure 38 Conditional routing example datafill

```
TABLE: OFRT
-------------------------------------------------------
100 (CND FABRIC ENET ST 200) (CND FABRIC AAL1 ST 201)
    (CND FABRIC IP ST 202) $
101 (CND BEARNET TDM_ENET ST 200) (CND BEARNET NET_AAL1 ST 201)
    (CND BEARNET NET_IP ST 202) $
```

121.3.2.9.2 TRAVER modifications to support multiple bearer networks In order to support the new conditional route selectors described above, changes are needed in TRAVER to provide the correct route selection. In SN07, TRAVER needs to determine either the fabric or the bearer network of the originating agent.

If the originating agent is a line, then TRAVER will identify the fabric or bearer network and apply that knowledge to any FABRIC or BEARNET conditional route selectors that it finds.

If the originating agent is a trunk group, then TRAVER identify the fabric or the bearer network. However, a trunk group does not have a fabric or bearer network designation. That designation is done at the trunk member level. Therefore, changes are made to TRAVER to allow either a trunk member to be specified explicitly or to specify the bearer network to use for the originating trunk group. The existing TRAVER option TRKMEM is modified to include the determination of the associated bearer network. A new option, BEARNET, as added to support the bearer network designation for a trunk group[1].

Refer to the Configuration section of the document for additional information.

[1]TRAVER determines the fabric based upon the associated bearer network.

121.3.2.10 USP messaging

In SN07, the USP is an optional component. When it is present, it provides the connection from the CS2000 Call Server to the SS7 network. ISUP signaling messages and TCAP transaction messages traverse through the USP interface.

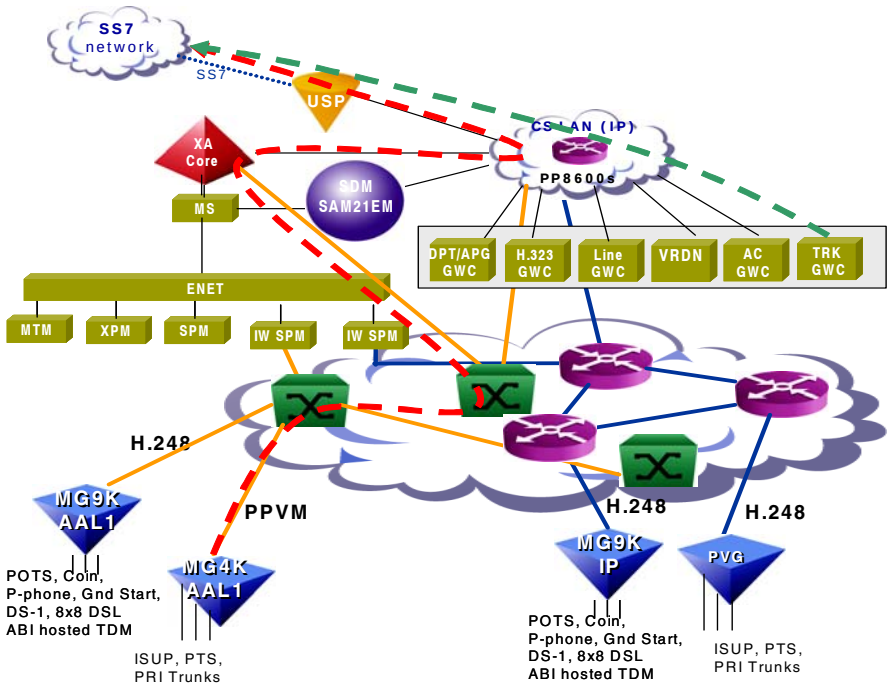
TCAP transaction messages are always generated by the CS2000 Call Server. However, ISUP signaling messages are generated from the ISUP trunk peripherals. The path that the ISUP message takes to get to the USP varies based upon the type of trunk peripheral.

Table 5 USP messaging path for ISUP signaling messages

ISUP trunk peripheral	USP messaging path
GWC	GWC -> CS LAN -> USP
MG4K (AAL1)	MG4K -> AAL1 bearer network -> CS2000 -> CS LAN -> USP
DPT SPM (AAL1)	DPT SPM -> CS2000 -> CS LAN -> USP
legacy peripheral	Legacy peripheral -> CS2000 -> CS LAN -> USP

The USP supports multiple messaging paths and defines them on a per node basis.

Figure 39 USP messaging paths



121.3.2.11 ECAN across multiple bearer networks

Echo cancellation (ECAN) can be applied differently in each bearer network. In an IP bearer network, the packet latency is generally large enough to require 100% ECAN. ECAN is only turned off if an individual call requires that it be turned off (i.e., FAX call).

In an AAL1 bearer network, the packet latency may not be large enough to require ECAN. ECAN in the AAL1 network is generally expensive hardware to purchase and would like to be avoided, if possible.

Prior to SN07, the CS2000 Call Server implemented an office parameter, ECAN_EDGE_STRATEGY to control the ECAN behavior for the office. In SN07, this office parameter is replaced by a new option in Table BEARNETS that allows the ECAN strategy to be defined per bearer network.

Refer to feature A00004046: Echo Cancellation Support for TriModal Call Server 2000 for more information on ECAN.

121.3.2.12 Voice quality

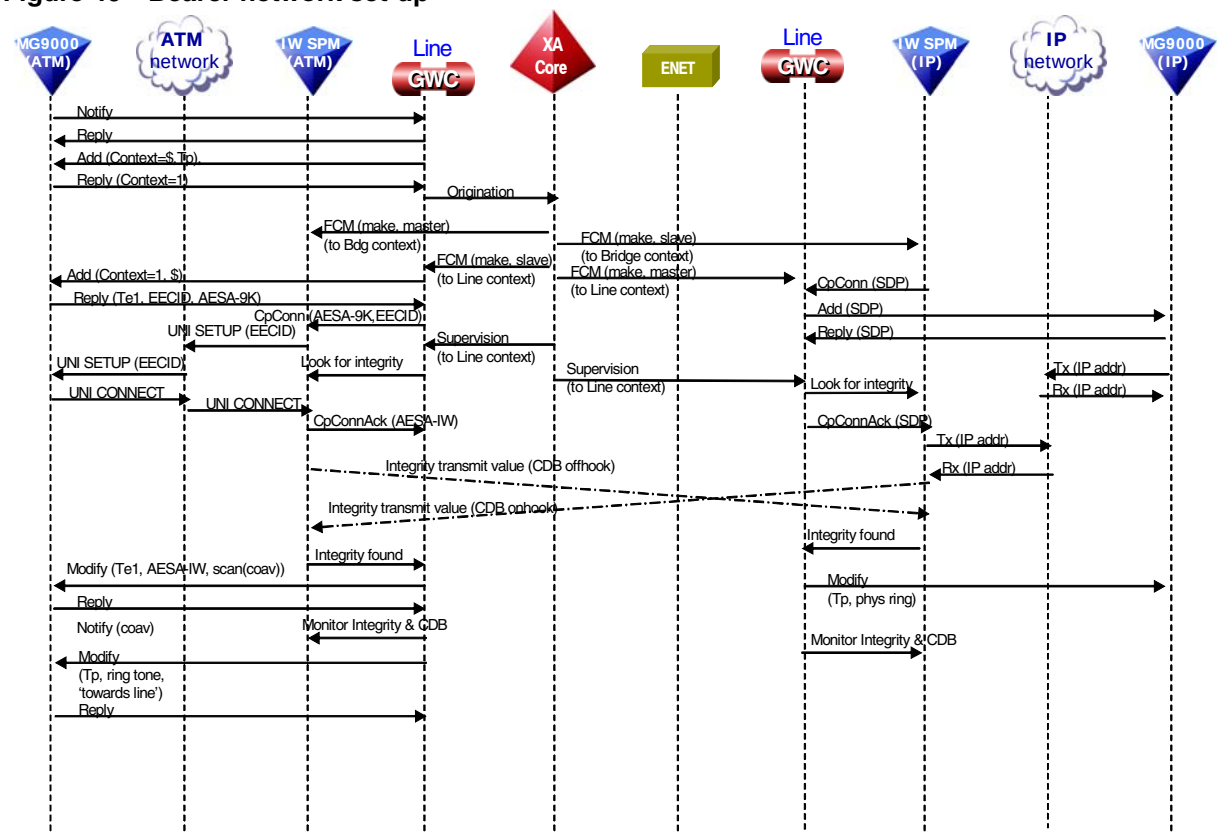
In supporting the connections between packet bearer networks using multiple IW bridges, the voice quality may experience some degradation. The following areas are of concern:

- Possible speech clipping
- Latency and delay

121.3.2.12.1 Possible speech clipping By providing support for multiple bearer networks, the connection set-up times may be very different for each bearer network. It may be possible to set up a bearer connection is one network, ring the line and have the subscriber answer and begin talking prior to the connection being set-up in the other bearer network.

To prevent this from happening, changes are made to the IW SPM to delay sending integrity through the ENET until the packet bearer connection is set-up. This causes the ‘other’ IW SPM to not find integrity and report integrity found to it’s connection peer until the packet bearer network connection has been established. The line GWC will not start physical ringing until it’s connection peer returns that integrity has been found.

Figure 40 Bearer network set-up



121.3.2.12.2 Latency and delay Latency and delay are concerned with how long it takes for a packet of voice to transit the bearer network(s) from end to end. Generally, there is a budget of 150 ms given to a packet. If the delay increases past 150 ms, then the possibility of the end subscribers talking over top of each other increases. The following factors effect the latency and delay that a packet experiences:

- packetization rate and jitter buffer
- transcoding delay
- ECAN
- IP routers
- overall distance travelled

The following tables provides a few examples of latency.

Table 6 MG9K IP to MG9K AAL1 call analysis

MG9K IP to MG9K AAL1 call analysis	10 ms packetization	20 ms packetization
MG9K IP packetization	10	20

Table 6 MG9K IP to MG9K AAL1 call analysis

MG9K IP to MG9K AAL1 call analysis	10 ms packetization	20 ms packetization
Leg 3 router hops, assume 3 routers	3	3
IP IW SPM jitter buffer	30	60
ENET	1	1
AAL1 IW packetization	6	6
MG9K AAL1 jitter buffer	2	2
Total latency	52	92

Table 7 H.323 to MG9K call analysis

H.323 to MG9K AAL1 call analysis	10 ms packetization	20 ms packetization
H.323 packetization	10	20
Leg 1 router hops (1 ms per router) assume worst case, 5 routers	5	5
Media Portal (1 ms assumed)	1	1
Leg 2 router hops, assume 1 router	1	1
PVG jitter buffer (3 x packetization rate)	30	60
PVG transcoding (G.729 to TDM)	5	5
PVG packetization	10	20
Leg 3 router hops, assume 3 routers	3	3
IP IW SPM jitter buffer	30	60
ENET	1	1
AAL1 IW packetization	6	6
MG9K AAL1 jitter buffer	2	2
Total latency	104	184

121.3.2.13 ONP

Given the changes made to the connectivity function in the CS2000 Call Server, they are applicable to all Succession configurations in SN07, regardless of how many bearer networks are supported. In order to preserve call processing over the ONP, the provisioning of Tables BEARNETS, NETBRDGE, NETPATH and NET2NET must be accomplished during the table transfer.

Refer to the Configuration section for more details on the ONP procedures.

121.4 Hardware Requirements or Dependencies

In SN07, the following gateways and packet agents are supported in the multi-bearer network configuration.

Table 8 Gateways and packet agents supported in SN07

Bearer Network	Gateway	Agents
ENET	all Succession supported legacy peripherals	supported SN07 legacy peripherals which includes both lines and trunk
ATM AAL1 (UA)	MG4000	ISUP trunks PTS trunks PRI trunks BICC DPT trunks
	GWC[a]	BICC DPT trunks
	MG9000	POTS lines Pphone lines Coin lines Group Start lines
	MG9000 with ABI	supported SN07 ABI peripherals which includes both lines and trunk
	DPT SPM	BICC DPT trunks
IP (UA)	PVG (for loop-around trunk access only for support of H.323)	ISUP trunks PRI trunks
	MG9000	POTS lines Pphone lines Coin lines Group Start lines
	MG9000 with ABI	supported SN07 ABI peripherals which includes both lines and trunk
IP (CHS)	PVG (for loop-around trunk access only for support of H.323)	ISUP trunks PRI trunks
	GWC[b]	SIP-T DPT trunks
	H.323 GWs (Cisco, Westel, BCM, M1)	PRI trunks

a. Not a true bearer gateway. This is included to illustrate the support for BICC DPT trunk support.
b. Not a true bearer gateway. This is included to illustrate the support for SIP-T DPT trunk support.

121.5 Software Requirements or Dependencies

This feature requires SN07 North America XA-CORE load or later.

121.6 Limitations and restrictions

- In SN07, only one bearer network entry will be supported in table SERVRINV and it will be restricted to the default network because SESM will only support a single bearer network per GWC.
- In SN07, an IW bridge will be restricted to a single bridge pool.
- In SN07, only one bearer network entry will be associated for DPT SPM and it will be restricted to the default network.
- In SN07, only one bearer network entry will be associated for MG4K and it will be restricted to the default network.
- In SN07, the table TRKOPTS will be restricted to a single network and this network will be the default network.
- The datafill procedure proposed in table CLLI is only for documentation purpose in SN07.
- The maximum size of the table BEARNETS will be 8 tuples.
- The maximum size of the table NETBRDGE shall be 64 tuples.

The following list provides a view of the limitations associated with H.323 calls in this configuration:

- Multiple billing records generated - A call from am H.323 agent to an MG9000 AAL1 native line would be represented as two calls in the CS2000 call server, each generating its own billing record.
- H.323 agent access to announcements - Since there is no announcements accessible to the CHS IP network (i.e., no IP IW bridge supported), announcements cannot be played to the H.323 agent. Any CS2000 Call Server services will not be able to use announcements and any treatments will have to be configured to ‘release with cause’ and the announcement would be provided by the enterprise bearer network.
- H.323 agent access to conferencing - Since there is no conference circuits accessible to the CHS IP network (i.e., no IP IW bridge supported), conferencing services cannot be supported to the H.323 agent.
- H.323 agent access to test trunk facilities - Since there is no test trunk circuits accessible to the CHS IP network (i.e., no IP IW bridge supported), trunk tests cannot be supported to the H.323 gateway.

122: Functional Description (FN): A00003951

This Functional Description (FN) covers the work required to support the i2001 Internet Telephone. The FN also covers the work required to support a common User Interface for the i2001, i2002and i2004.

The intended audience: CICM Design community, CICM Test community and Product Line Management.

Intended release: Series 7.0.

122.1 Description

The i2001 is a reduced functionality sibling of the i2002 to reduce cost of manufacture it has a smaller screen, fewer buttons and a cheaper build

The i2001 is also a Phase II Unistim Terminal. Currently the CICM supports Phase I Terminals, as part of the scope of this feature, existing support for the i2002 and i2004 Phase I Terminals will be updated to support the new range of Phase II i2002 and i2004's.

Phase 1 terminals will be MD when the Phase II terminals become available so support for the whole range of Phase II terminals (i2001, i2002 and i2004) on the CICM will be required

122.1.1 Display

The following details apply to the i2001.

- i2001 will have a *32x143* pixel, fully bit-mapped, monochrome, non-grayscale display. This will display 2 lines of 24 5x9 characters.
- The number of Soft labelled feature keys on the i2001 is zero
- Dedicated icon area in the main display area has been removed.
- Dedicated Clock / Calendar area present.
- Dedicated number and context label are present.
- Dedicated down arrow removed.

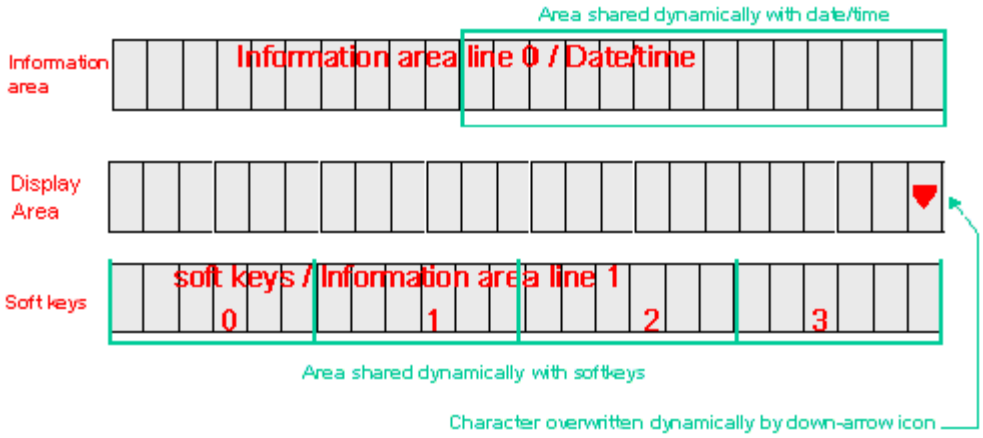

Figure 1 Display layout of i2001

122.1.2 Generic Display Rules

The following rules have been devised for the i200x terminals. These rules have been introduced to allow one common interface across both terminal types and to help avoid issues with Language Translations on soft key strings.

- All strings for menu options should be created with the following rules in mind

  a. Recommended length 12 characters – strings meeting this condition will always be shown in full (both on the information lines and in the context field)

  b. Maximum length 20 character – strings above 12 characters in length and equal to or below 20 characters will be fully displayable in the information line but not in the context field. Long strings in the context field will be cropped off to 11 characters and terminated with an ellipsis to indicate they have been cropped.

  c. Strings above 20 characters to be shown:

  — In the information lines will be cropped off to 19 characters and terminated with an ellipsis to indicate they have been cropped.

  — In the context field will be cropped off to 11 characters and terminated with an ellipsis to indicate they have been cropped.

- The Login Screen echoes entered digits to information line 0 rather than line 1 (please see Figure 2). The username and passwords entered may be up to a maximum of 15 digits. If the username/password entered is longer than the field space left on the screen (i.e. if the “Username” string is 14

characters and 12 username digits are to be entered), the digits will be scrolled to the left and an ellipsis will be inserted to the left of the username to indicate this (please see example below).

U	S	E	R	N	A	M	E		T	E	S	T	:	.	.	3	4	5	6	7	8	9	0	

- Bottom Soft key labels are set to a maximum of 5 characters with the exception of the last soft key on the screen which may use up to a maximum of 6 characters (please see Figure 2). This is due to a limitation of screen space on the i2001.

Figure 2 i2001 - Login Display

- Soft key labels are limited to a small generic subsection of the previously used soft keys (“Ok”, “Cancel”, “Clear”, “Bkspc”, “Menu”, “Help”, “Yes” and “No”).
- Menu options are selected via a scrollable list (instead of being assigned to a soft key). Scrolling may be carried out using the up and down navigation. This allows menu options to be displayed in strings which may be up to a maximum of 20 displayable characters (see rule 1). This is advantageous for the following reasons:
  - — A greater area makes language translations easier.
  - — A more informative string may be displayed.
- The position within a scrollable list is displayed to the far right hand side of the display. 1 character space is reserved to show scroll position.
- All Menu Options in the scrollable list are numerically indexed with the shortcut key number assigned to that option. The numerical indexes will

go from 1 – 9. Options above 9 will have no shortcut assigned/displayed next to the menu option

- A menu option may be selected by either highlighting the option (i2004) or viewing the option (i2002, i2001) and selecting “Ok”. Alternatively the appropriate shortcut key assigned to an option may be selected using the key pad. This will cause the user to jump straight into the menu option required without scrolling.
- All Menu Options are set to a recommended length of 12 characters (so they may be displayed in the context field on the i2004). Please see rule number 1) for further details.
- The Logout option is presented as the first option in the Menu Options List. This will avoid language translation issues on when using a soft key for the same operation.
- All user prompts will be presented on Information line 0 on the display. The maximum length of a prompt is 23 characters. Prompts beyond 23 characters will be cropped down to 22 characters and an ellipsis will be presented as the 23rd character to indicate cropping has taken place. Further text to describe the prompt is viewable on a help screen which is accessed by selecting a “Help” soft key (Please see Figure 3). The help screen presents text to the user by using scrolling pages (Please see Figure 4). The help screen has a maximum number of 255 characters (due to the scrolling functionality). The recommended word size is 24 characters (words exceeding this limit will be word wrapped onto the next line of the display).

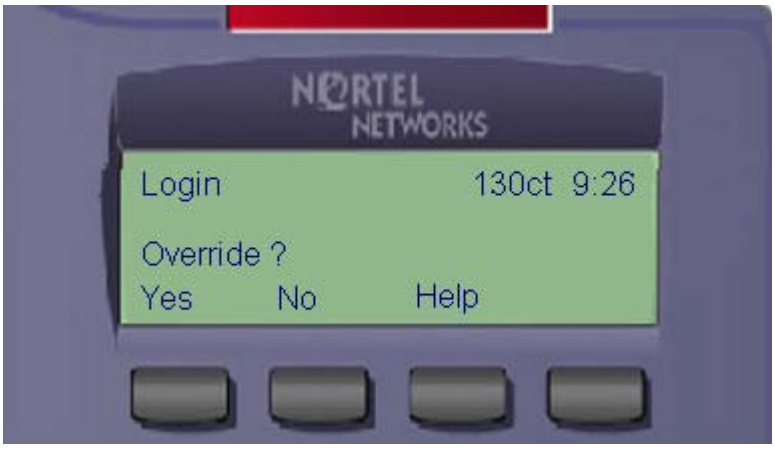

Figure 3 i2001- Override prompt

- User permissions disable

Figure 4 i2001 - Override Help screen

- The Menu system is accessible by either selecting the “Menu” softkey or by selecting the “service” physical key (please see at any time (idle or non-idle).

Figure 5 i2001 - Service key position (used to launch Menu system)

122.1.3 i2001 Display Rules

To show the information required to the user on such a restricted display, the following list of rules have been devised specifically for the i2001. The context-sensitive display that these rules entail are not as intuitive to use as that of the i2004, however there is no choice but to change the position and visibility of information on the display depending upon context if that information is to be displayed at all.

- The Menu options are selected via a scrollable list.
- The relative position within the list is show to the far right of information line 0 via up and down arrows.

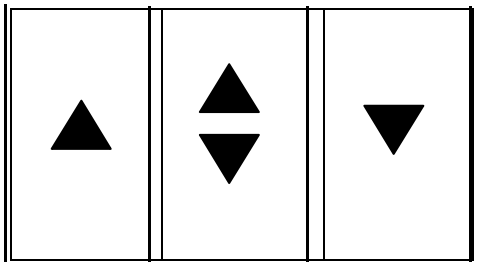

Figure 6 Example of navigation arrows

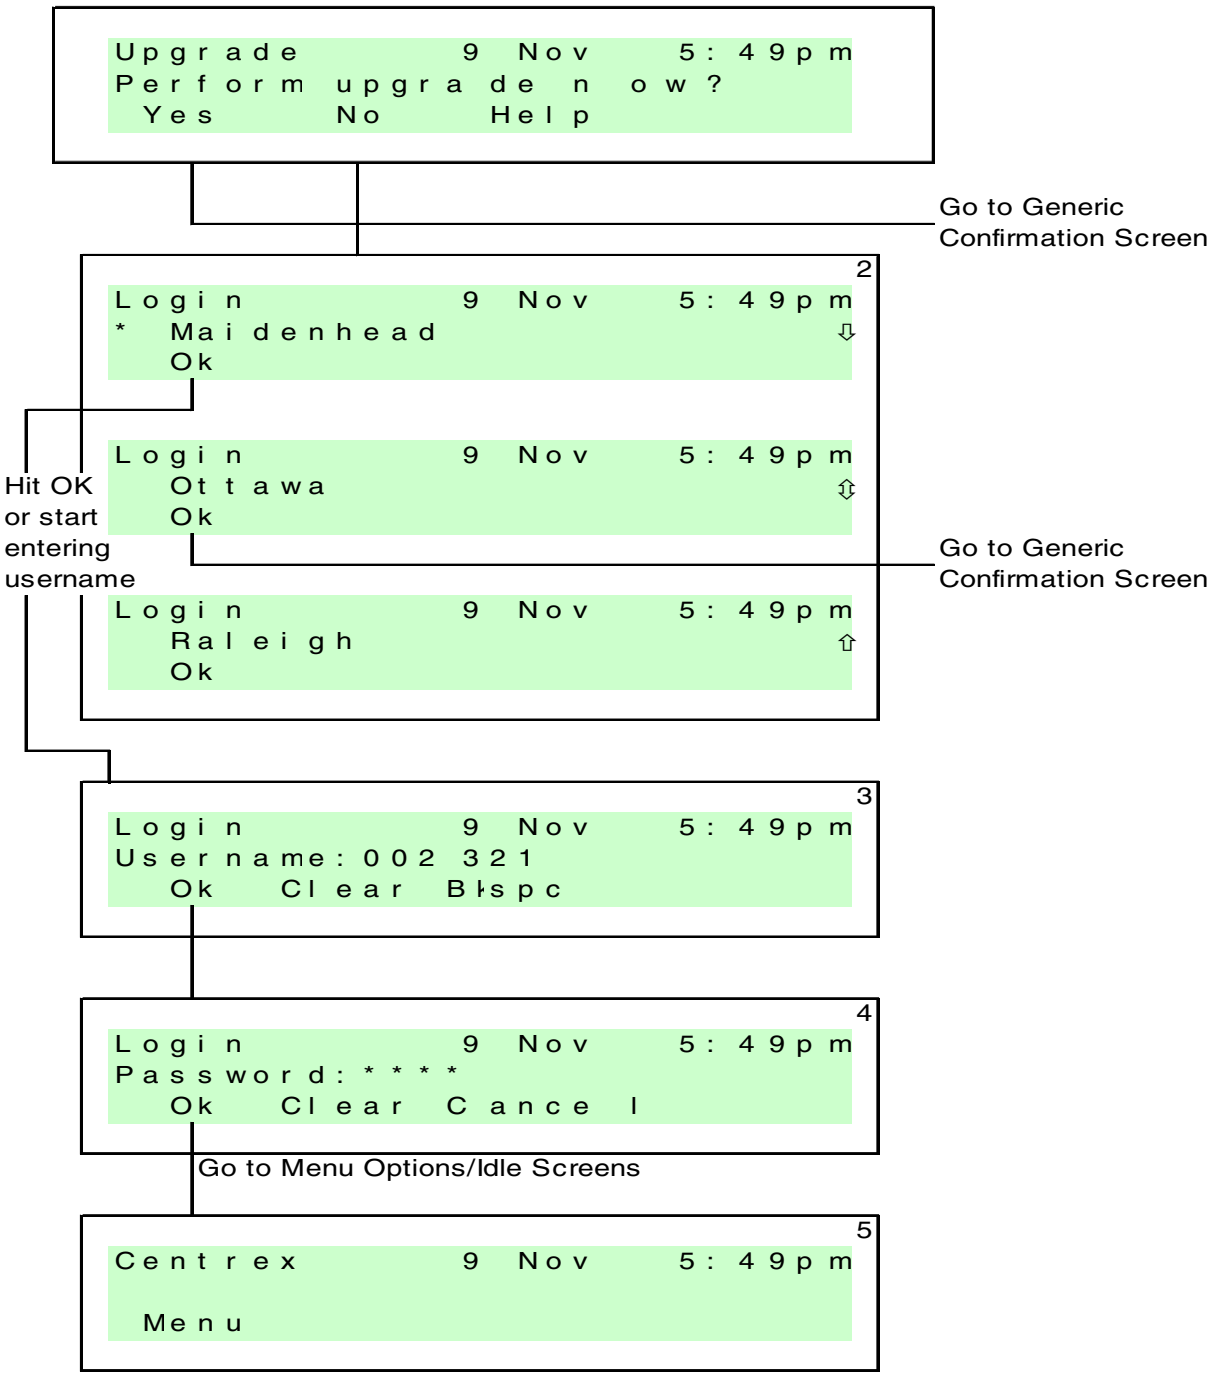
- Information line 1 is dedicated for the Soft keys.
- Time / Date displayed on context line.

122.1.4 i2001 Menu Map

The following screen representations show what will be presented to the user when logging on to a gateway, and navigating the menu options of the i2001.

122.1.4.1 Login Screens



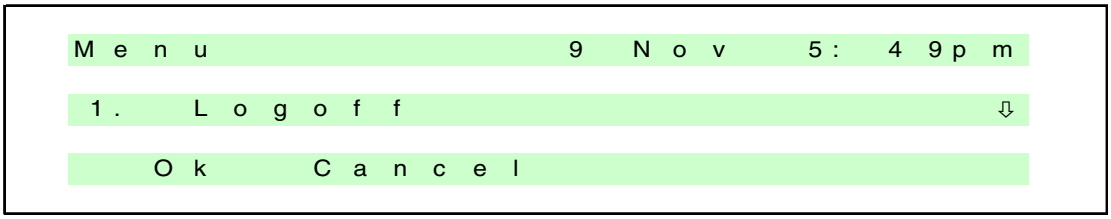
Screen 1 – Only shown if an upgrade is available / required.

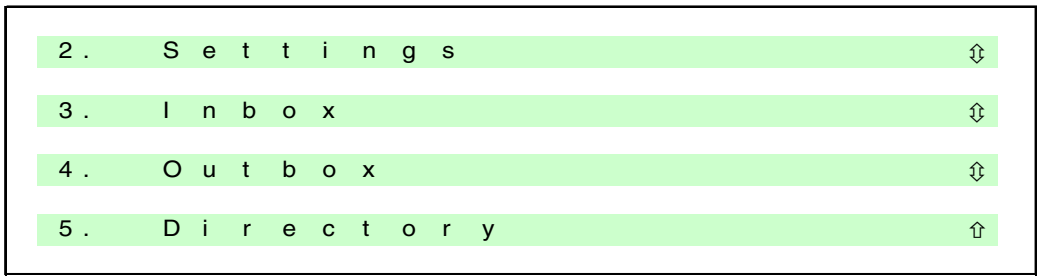
Screen 2 –Selective Gateway Login feature

Screen 2 – A user can either hit “Ok” to accept a gateway to login to, they will then be presented with Screen 3 to login. Alternatively the user may start entering their username digits and this will also accept the currently selected gateway, go to Screen 3 and insert the digit(s) already entered.

Screen 3 – If the username is too long for the display the digits entered will scroll to the left and an ellipsis will be shown to the left of the username to indicate this to the user.

122.1.4.2 Menu Option/Idle Screens



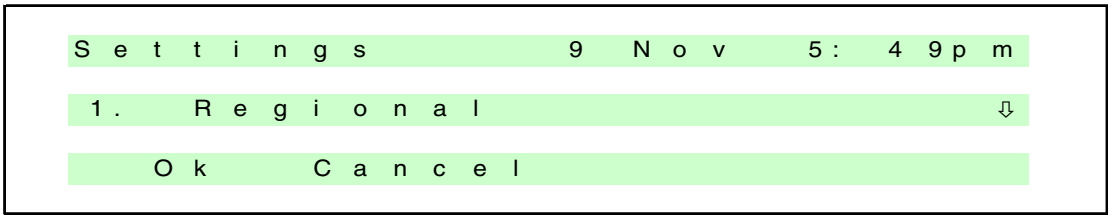


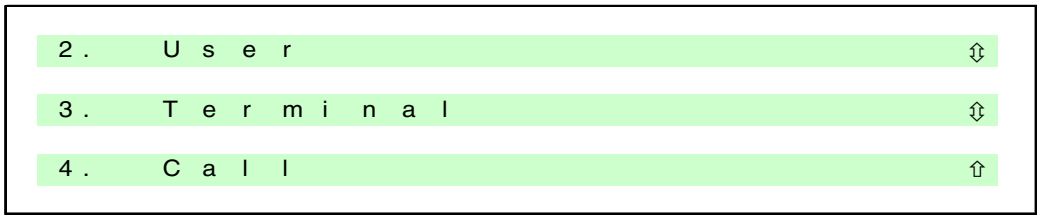
- Menu Option 1: Logoff – a Generic confirmation screen is displayed.
- Menu Option 2: Settings – launches the new i2001 settings menu.
- Menu Option 3: Inbox – Launches the inbox, Inbox is also available via dedicated Inbox key on terminal (i200x). The i2002 will be able to launch the inbox via both the menu and the dedicated key, the i2004 will only be able to access via its existing implementation of the dedicated key.
- Menu Option 4: Outbox – Launches the Outbox, the i2001 does not have a dedicated Outbox key and will only be able to access the Outbox via this

menu system, the i2002 and i2004 terminals will be able to launch the Outbox via the dedicated key. The i2002 will be able to access the Outbox via both the menu and the dedicated key. The i2004 will only access the outbox via the dedicated key.

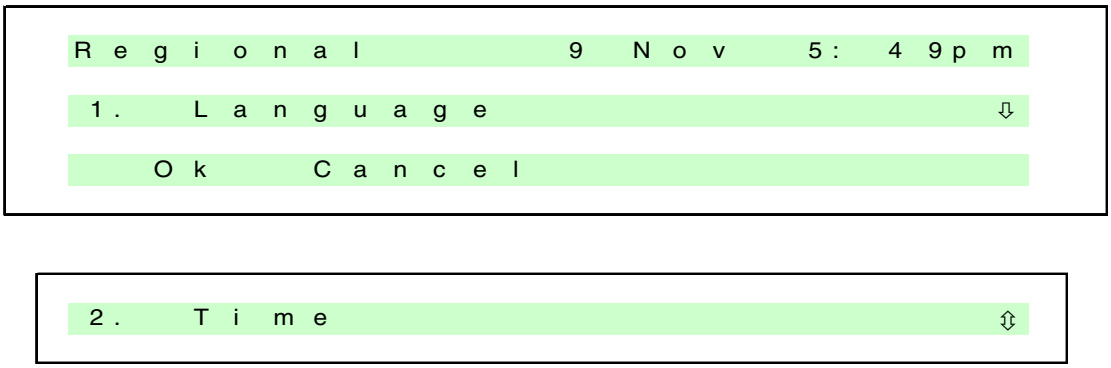
- Menu Option 5:Directory – Launches the directory contact list, the i2001 does not have a dedicated Directory key and will only be able to launch the directory via this menu system, the i2002 and i2004 have dedicated Directory keys to launch the directory

122.1.4.3 Menu Option: Settings

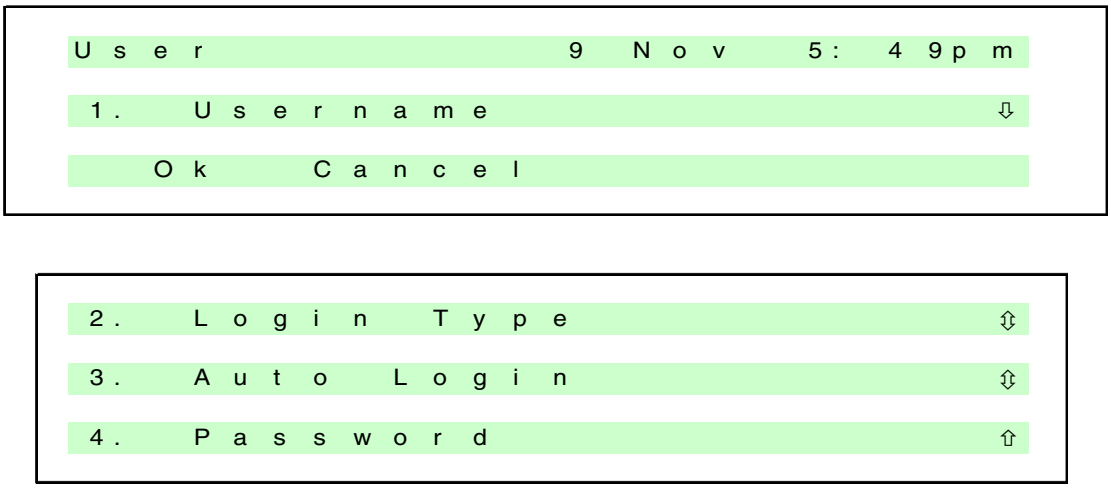




122.1.4.4 Menu Option: Regional Settings

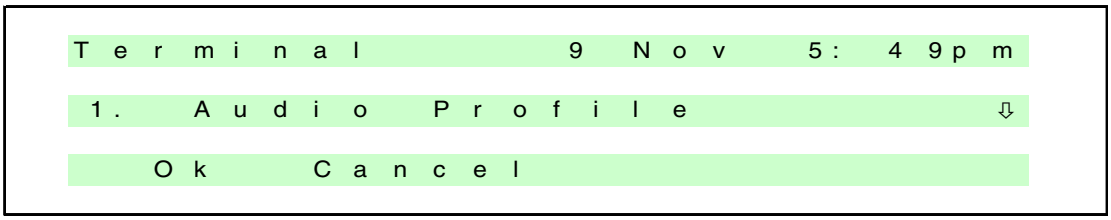


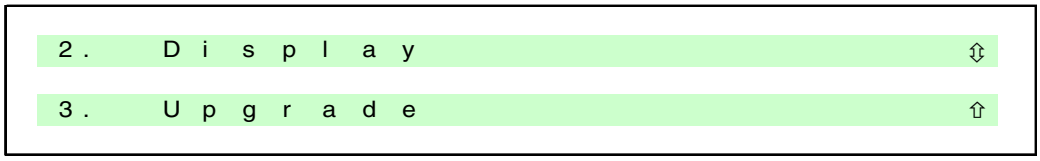
122.1.4.5 Menu Option: User Settings



See section 1.1.4.9 for details of user information screens.

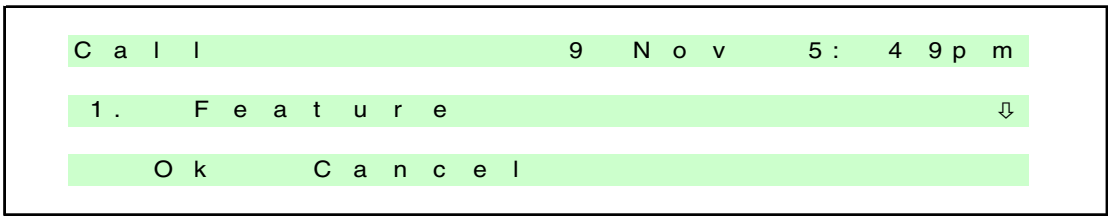
122.1.4.6 Menu Option: Terminal Settings

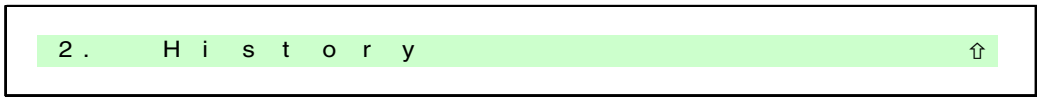




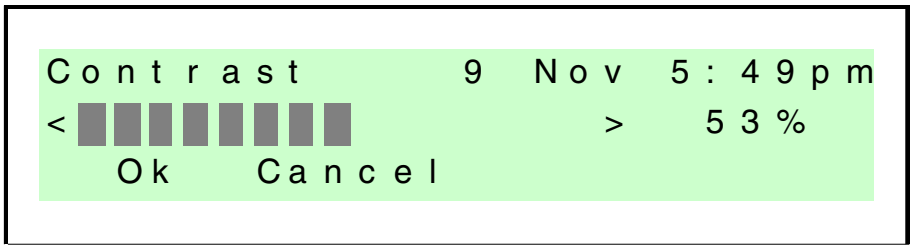
- Terminal Settings Option 1: Launches the Audio Profile menu.
- Terminal Settings Option 2: Launches the display Contrast screen. (2.1.4.8)
- Terminal Settings Option 3: Launches the Upgrade confirmation menu, depending on if an upgrade is available or necessary.

122.1.4.7 Menu Option: Call Settings

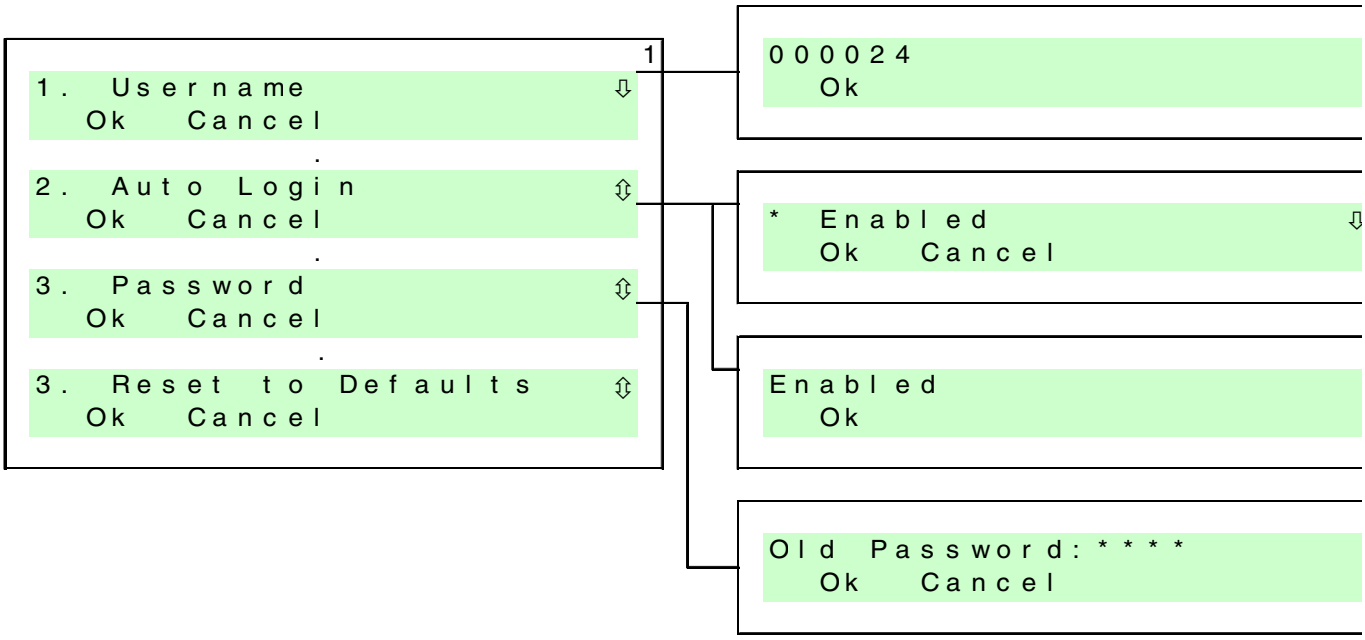




122.1.4.8 Display Contrast Screen



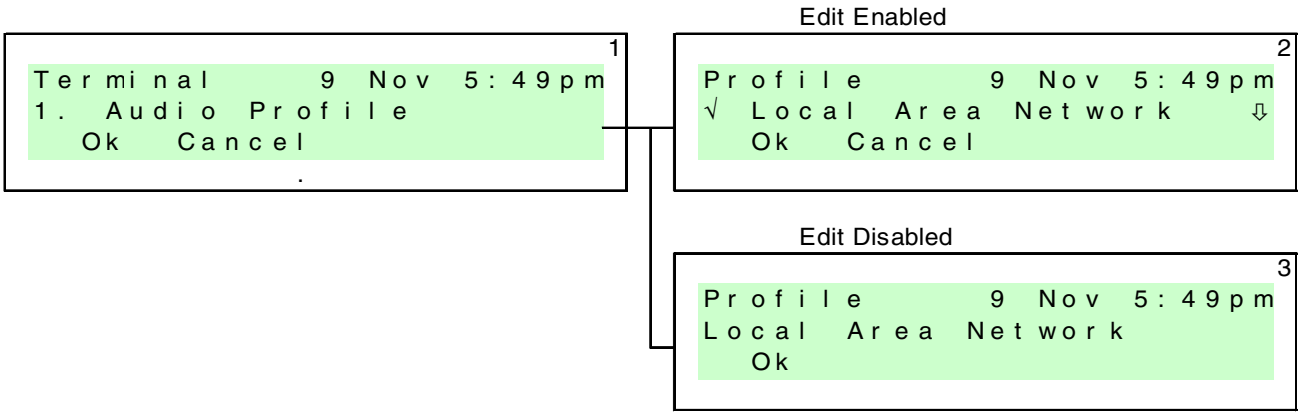
122.1.4.9 User Information Screens



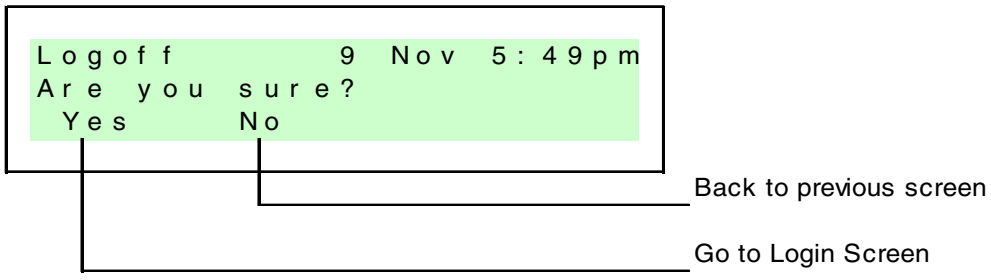
- Screen 3 – The user has permission to edit their Auto Login functionality. The user may enable/disable the feature from this screen.
- Screen 4 – The user has view permission to the Auto Login functionality. The user may only view what their current setting is.

Note: NOTE: The permissions are configurable via the element manager in the user/user profile settings.

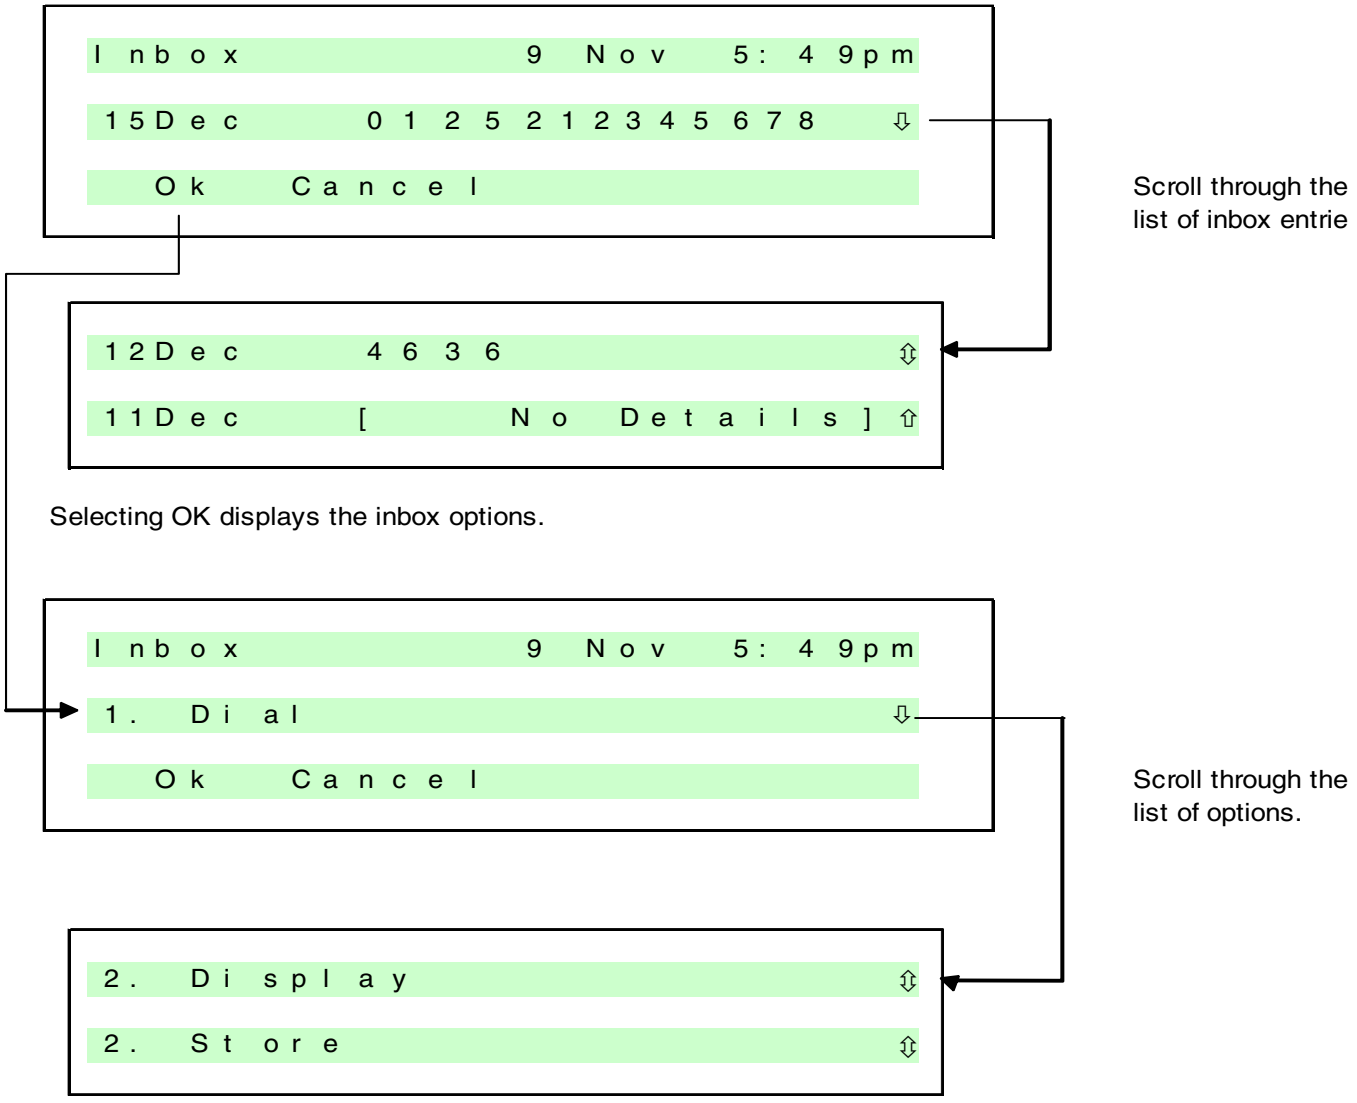
122.1.4.10 Audio Screens



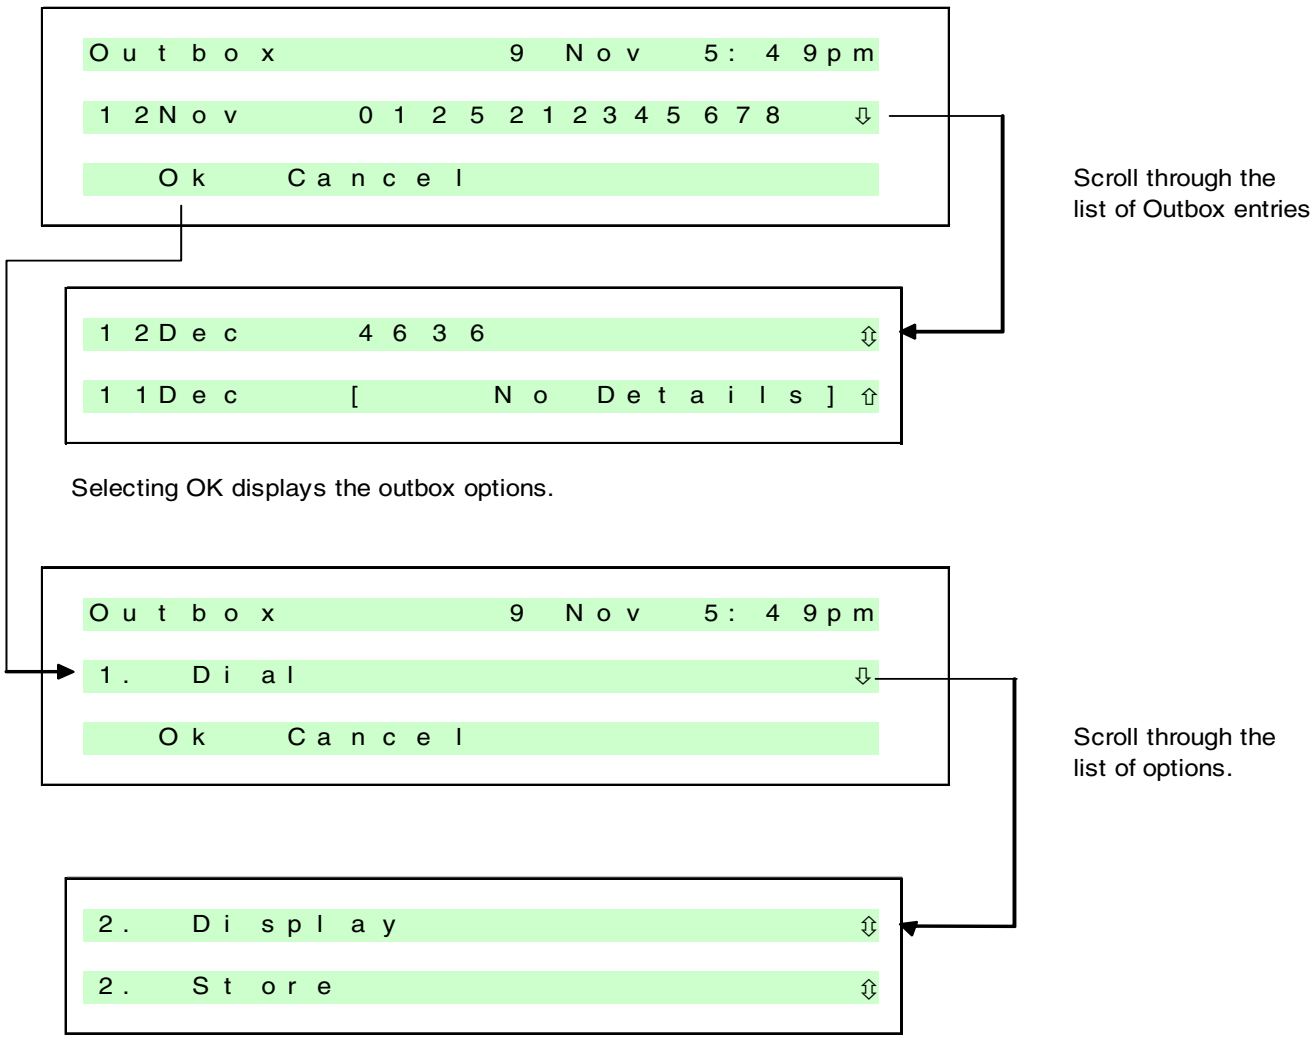
122.1.4.11 Generic Confirmation Screen



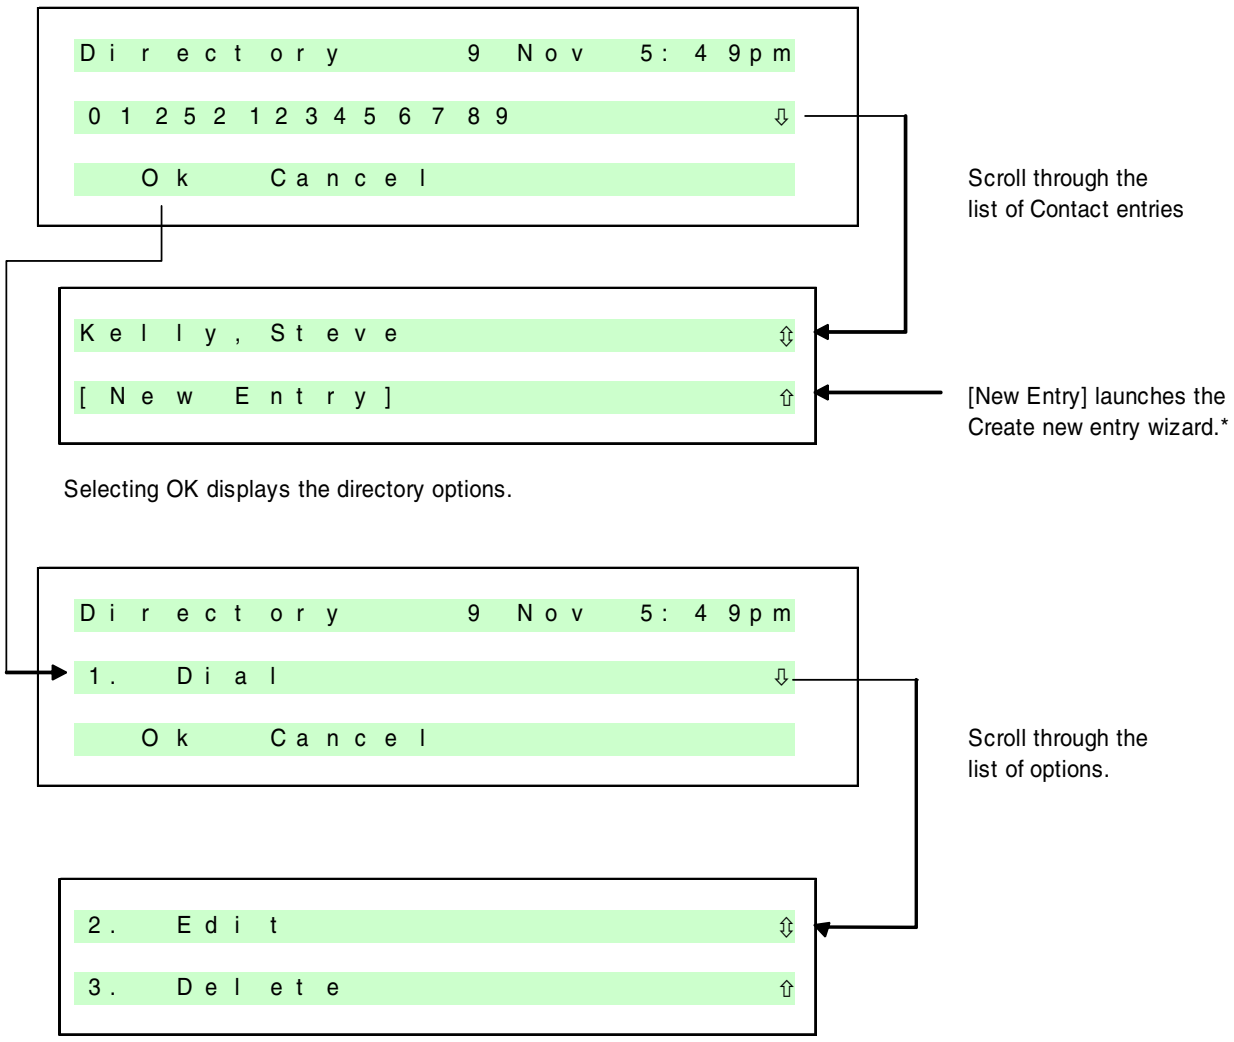
122.1.4.12 Inbox and submenu screens



122.1.4.13 Outbox and submenu screens

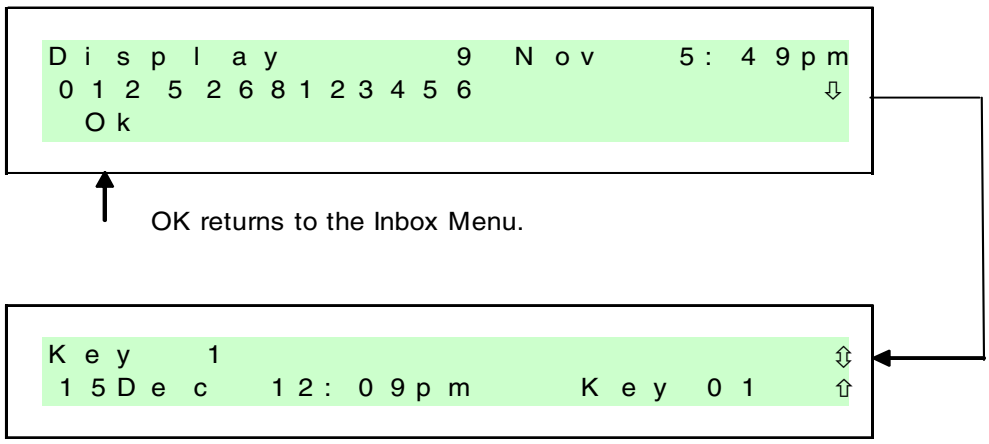


122.1.4.14 Directory display screens

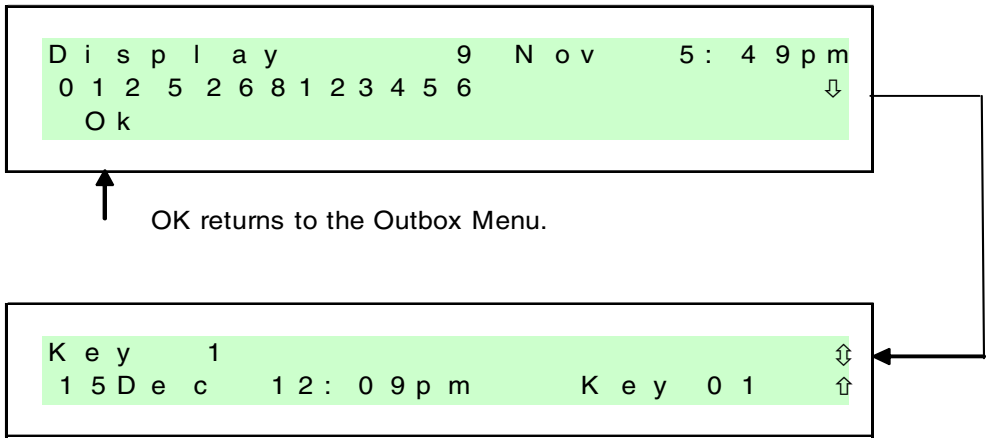


* The [New Entry] option may be ordered to feature at the top of the directory list, so upon entering the directory you will be presented with the first actual entry and press up to select [New Entry]

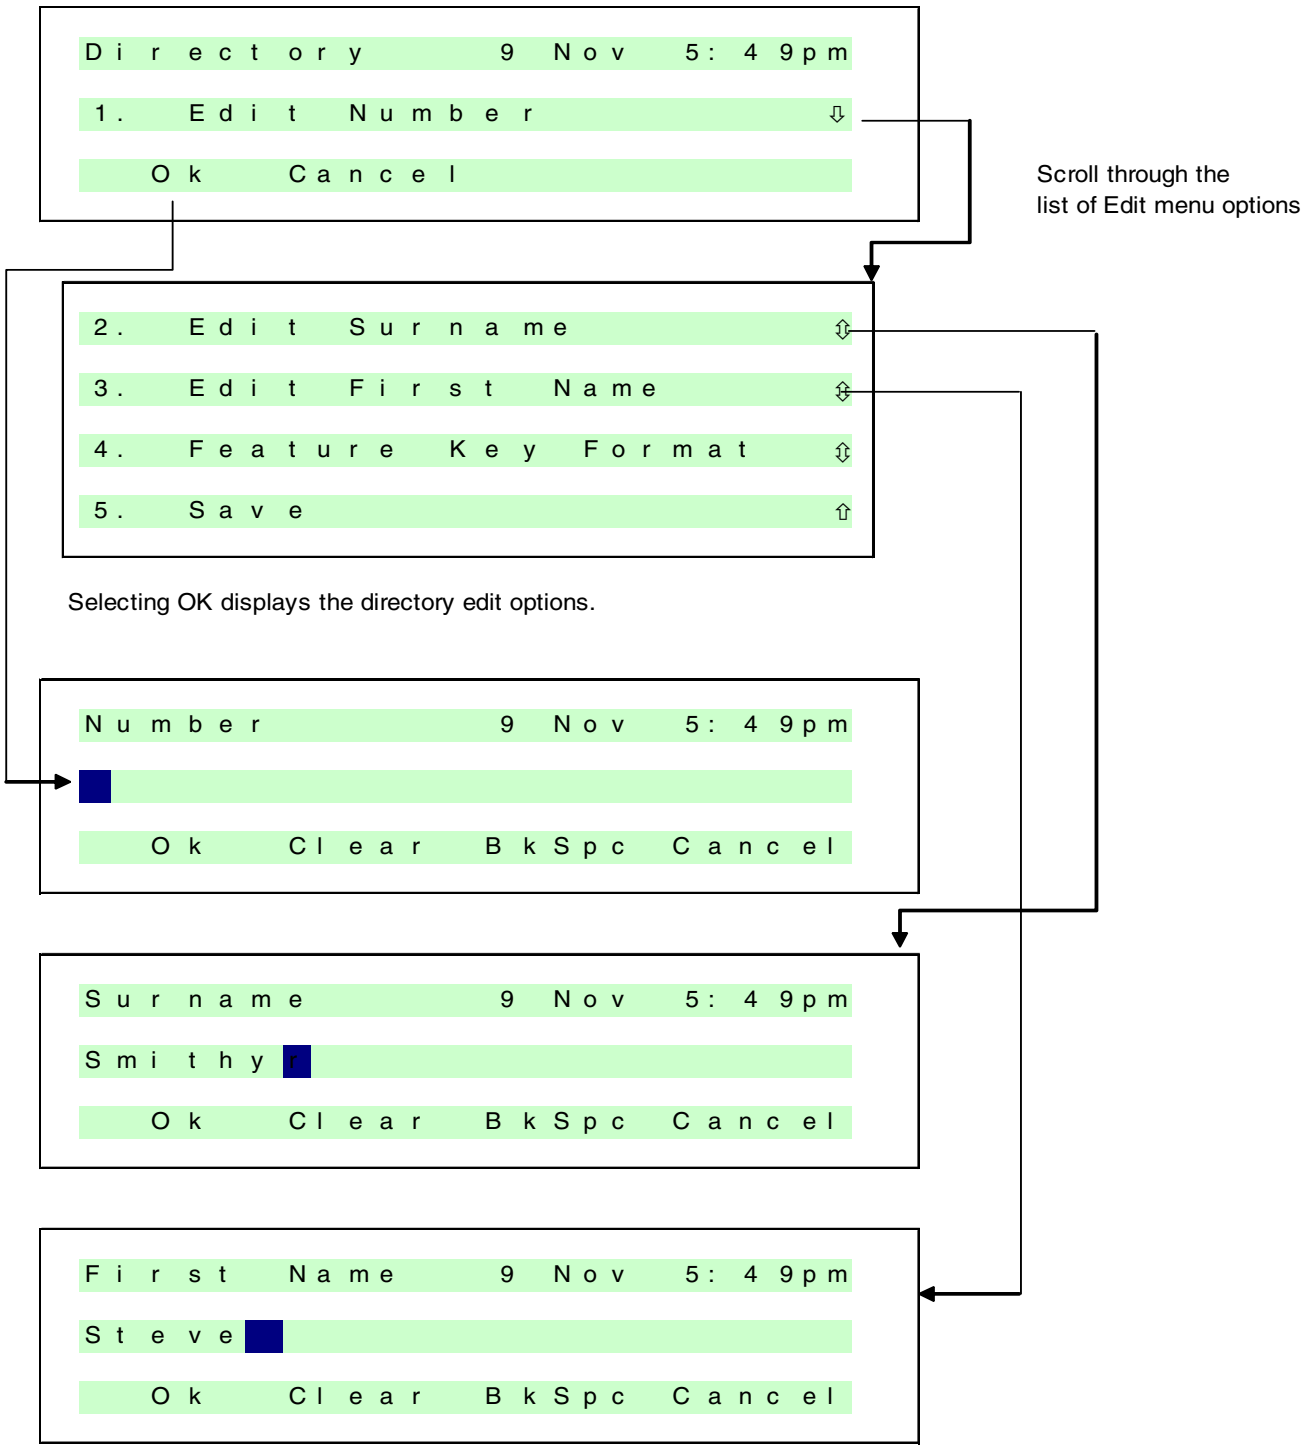
122.1.4.15 Inbox Display Screen



122.1.4.16 Outbox Display Screen

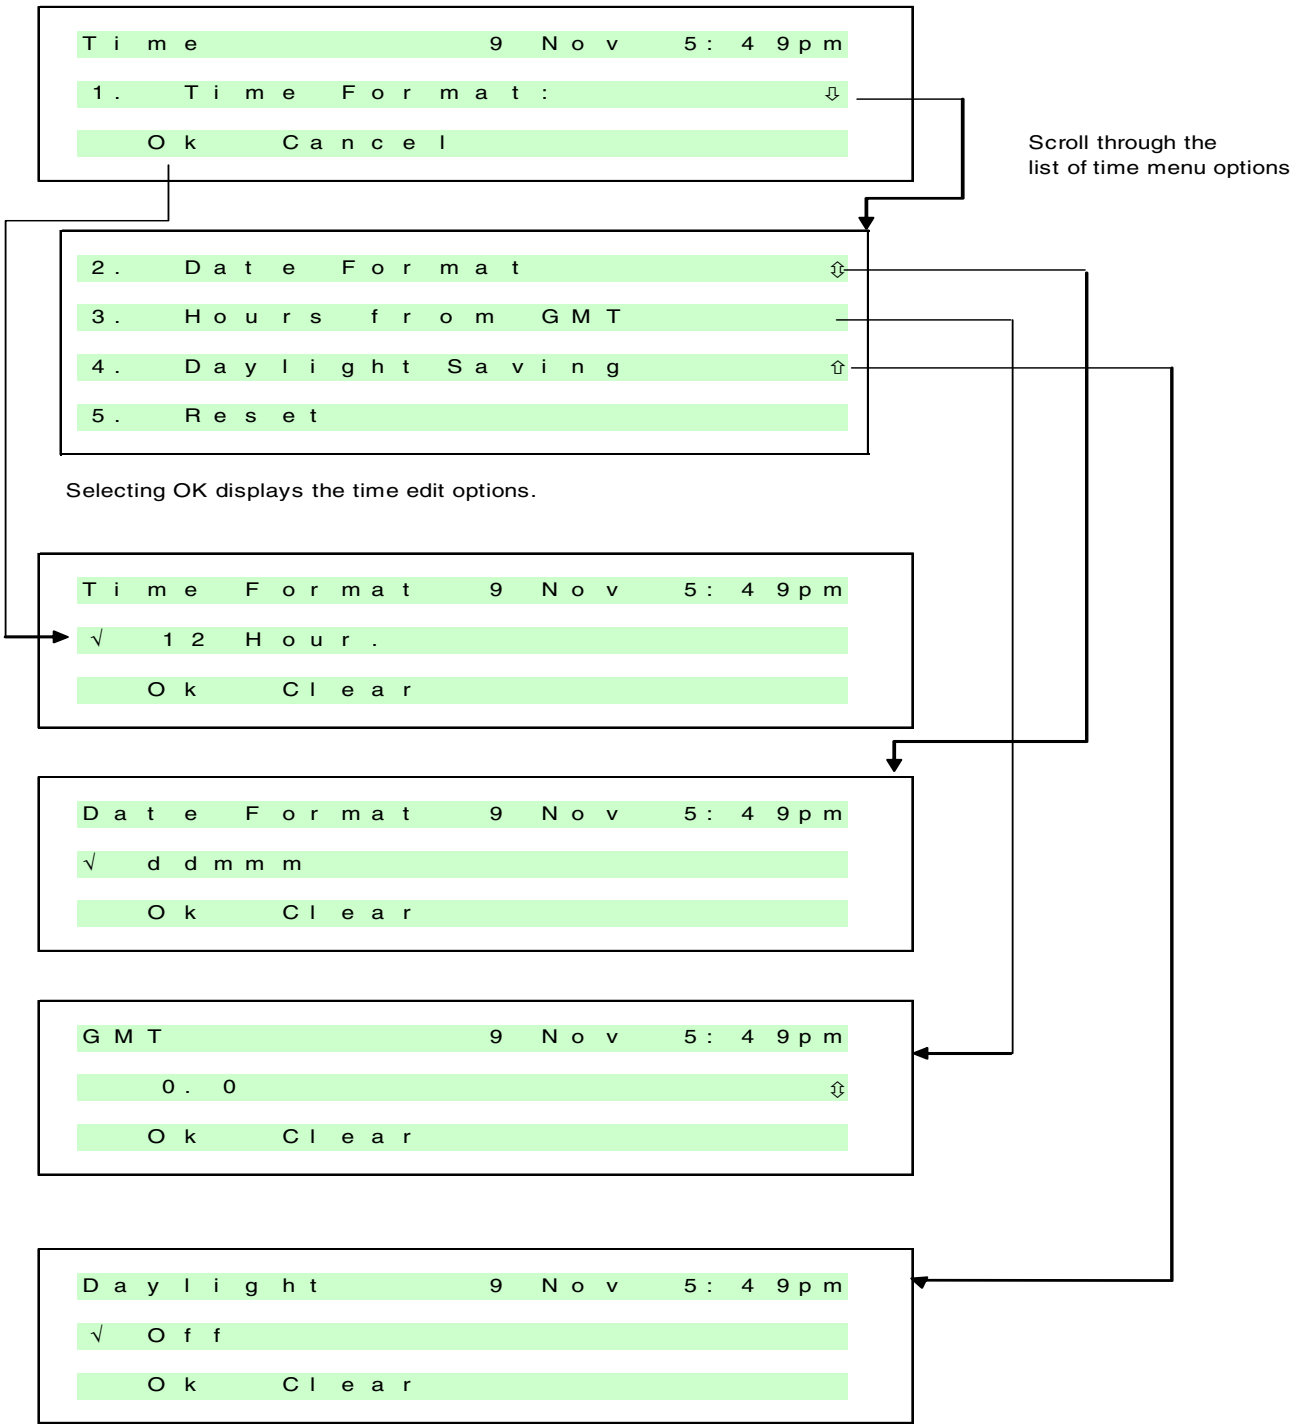


122.1.4.17 Directory Edit screens

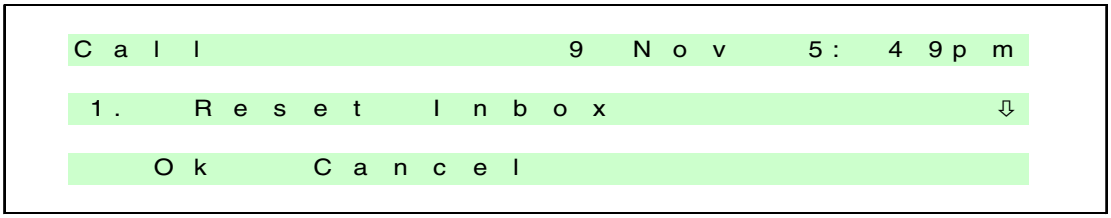


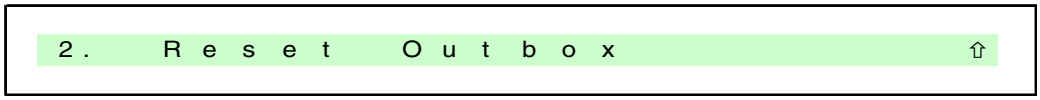
Directory 9 Nov 5:49pm
1. Edit Number
Ok Cancel
Scroll through the list of Edit menu options
2. Edit Surname
3. Edit First Name
4. Feature Key Format
5. Save
Selecting OK displays the directory edit options.
Number 9 Nov 5:49pm
Ok Clear BkSpc Cancel
Surname 9 Nov 5:49pm
Smithyr
Ok Clear BkSpc Cancel
First Name 9 Nov 5:49pm
Steve
Ok Clear BkSpc Cancel

122.1.4.18 Time display screens



122.1.4.19 Call History screens





122.1.5 Administration - Element Manager

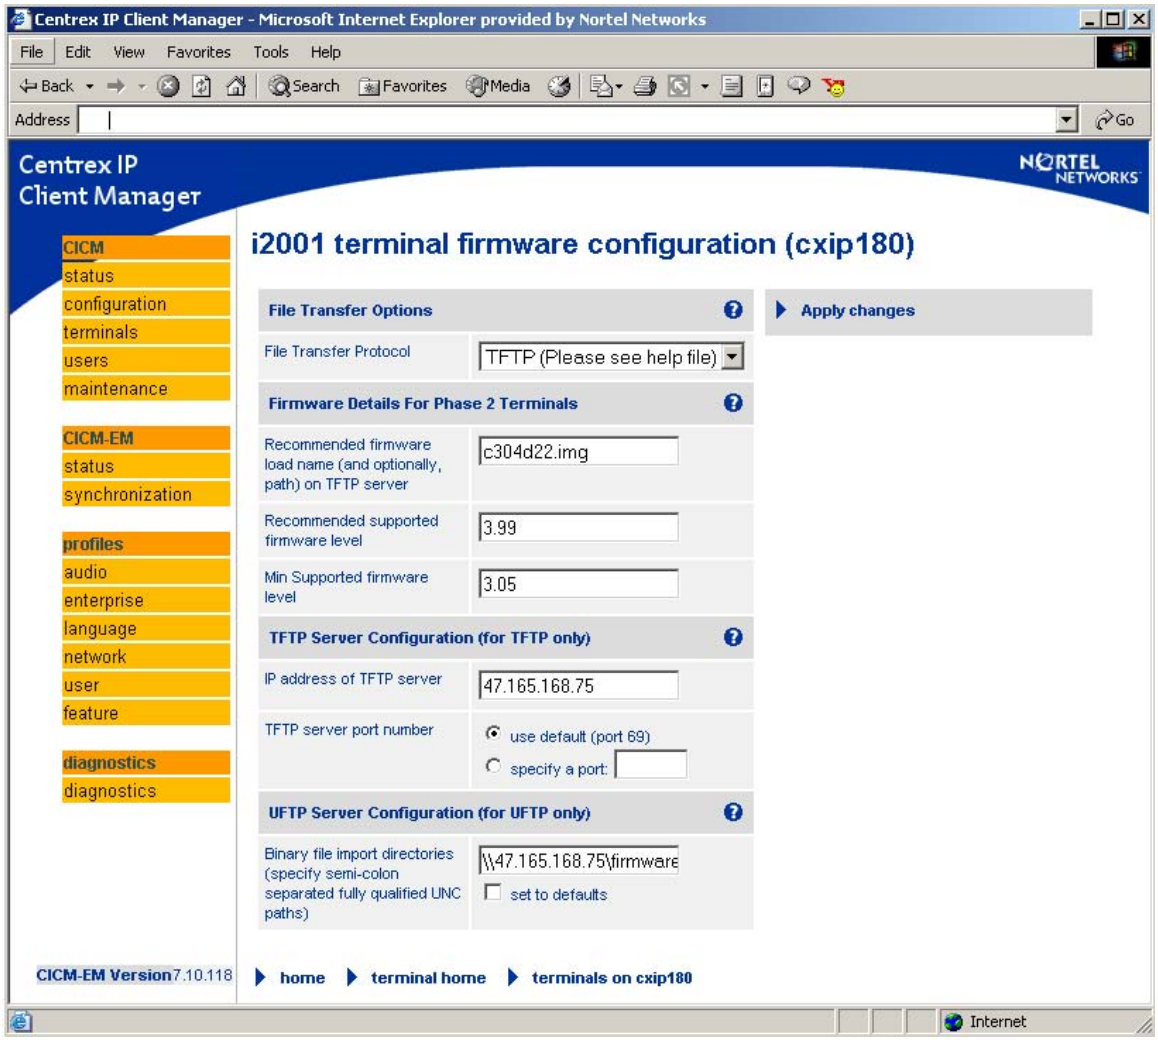


Figure 7 Screen capture of terminal firmware upgrade page

The administration and configuration of the i2001 terminals will use the same pages which are already provided for the i2004 and i2002 terminals (See Figure 7).

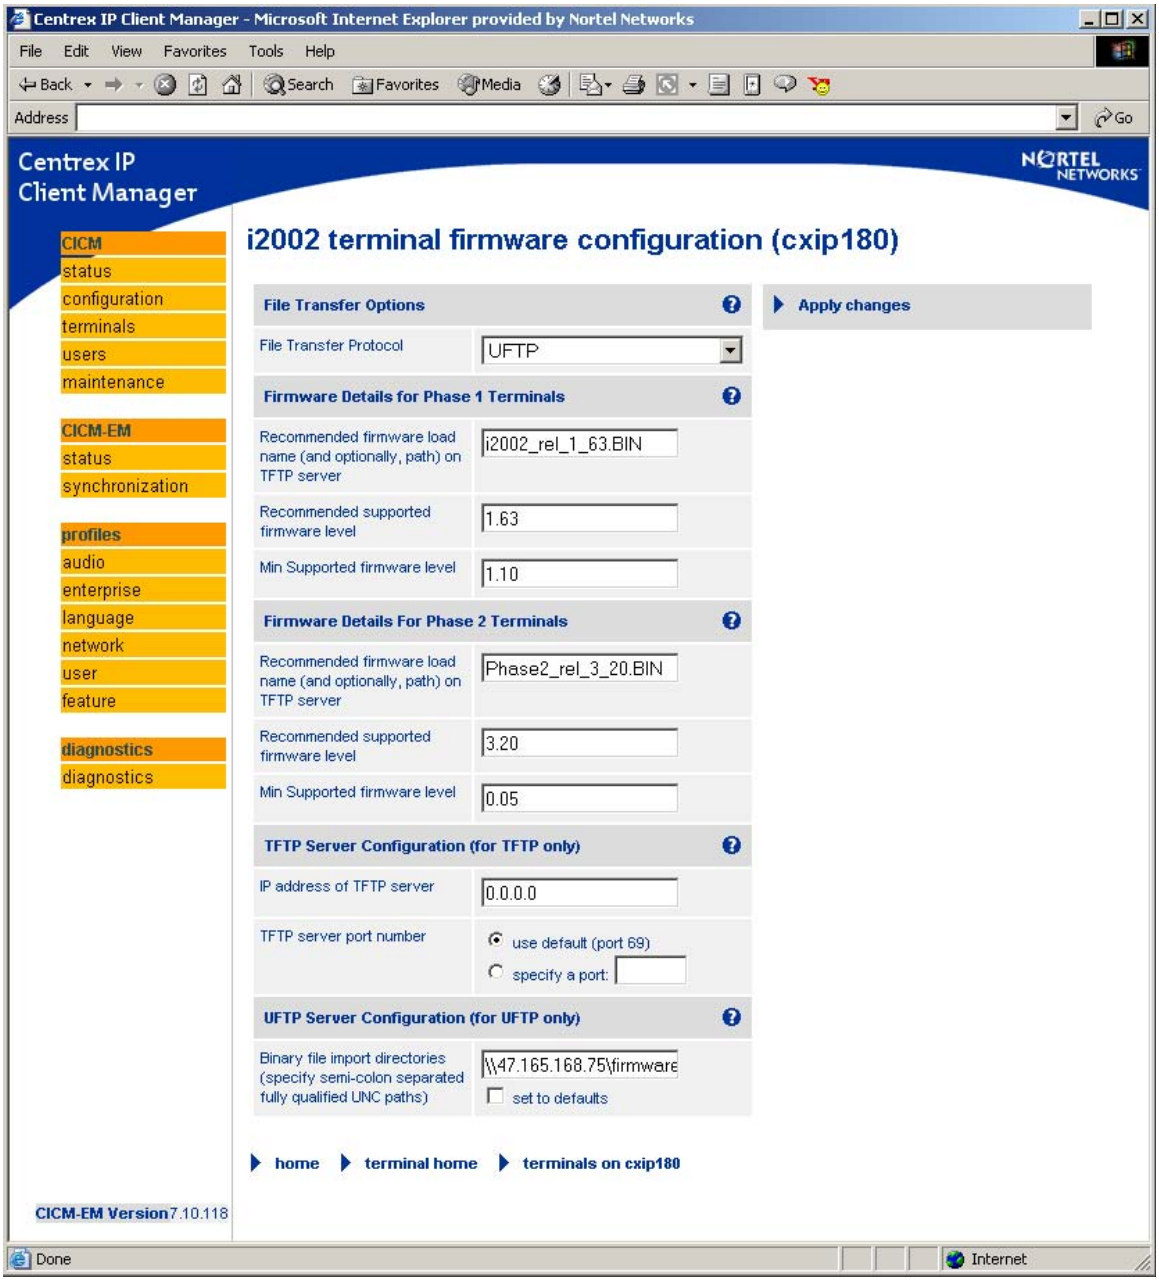

Figure 8 Screen capture of phase 2 terminal firmware upgrade page

User permissions will be editable via the user/user profile pages.

122.2 Interactions

122.2.1 Joint Sessions

The i2001 will only be able to have a joint session with the m6350 Softclient. In this scenario it will always adopt the master position in their master/slave

relationship. In this case, the i2001 will function in the same manner as the i2004.

There will be no support for the i2001 to have a joint session with another i200x.

122.3 Software Requirements or Dependencies

Firmware load *.bin will be used for the development of this feature on the i2001.

122.4 Interactions

This feature will change the existing menu system employed by the i2004 and i2002. Menu options previously displayed on the soft keys will be displayed in the main screen as a scrollable list (using the up and down navigation keys). The Soft keys will only be used for a small sub section of set functions.

The change is beneficial on the i2004 for the support of different languages as longer strings may be used for menu options. Problems had previously been encountered upon translating soft key options which were limited to only 7 characters i.e. a 7 character soft key in English may translate into a 9 character soft key in French which is not easily abbreviated.

122.5 References

123: Functional description (FN): A00003952

123.1 Feature name

Centrex IP Client Manager 3069 termination capacity

123.2 Description

The activity provides both increased capacity, improved RTS performance for the CICM platform as well as the GWC changes required for the CICM line and nodal flow through provisioning work in SN07.The capacity of the CICM is being increased to support around 3000 terminations.

This activity is an enabler for the flow through provisioning actvities ‘A00001935: SESM Provisioning support for Centrex IP Nodes and Lines’ and ‘A00003717: CICM OSMINE READINESS - FLOWTHROUGH PROVISIONING’. All customer visible chaneges are documented under A00001935 and A00003717.

123.3 Hardware Requirements or Dependencies

SN07 baseline hardware required.

123.4 Software Requirements or Dependencies

SN07

123.5 Limitations and restrictions

This activity does not increase the BHHCA.

124: Functional Description (FN): A00003971

124.1 Feature name

A00003971 - SPM Log Robustness

124.2 Description

SPM Log robustness initiative is intended to enhance the logs generated for SPMs.

During an analysis of the CSR responsiveness, it was found that SPM logs did not provide sufficient data for analysis. To provide a faster resolution of SPM issues, a need was felt to enhance the logs generated for SPMs. In conjunction, MAP responses for various commands have been enhanced to provide greater details about the failure/refusal of MAP commands.

124.3 Hardware Requirements or Dependencies

None

124.4 Software Requirements or Dependencies

124.4.1 MAP response modification

When a manual or force swact is issued on the CEM protection level MAP, if the command fails, a reason is displayed along with the existing response. When a RTS is issued on a RM, if the command fails because of the RM not having a valid load in flash, a message appears. This message has been corrected to include a ‘have a’ in the existing message ‘RM does not valid load in Flash’.

More details can be found in the Chapter 13 Configuration of this book.

124.4.2 LOGS

The following existing logs are impacted by this activity

Activity status of the unit/device will be displayed along with the other fields for the following logs

- SPM300 - Device Fault report log
- SPM500 - Device state change log
- SPM650 - Boot loader pass log
- SPM651 - Boot loader fail log
- SPM684 - Erase Flash log
- SPM301 - Patch failed log
- NODE302 - Software Alarm log
- NODE303 - Wrong Application Data
- NODE326 - Hardware Fault
- NODE600 - System Recovery Action
- NODE601 - System Status Notification

TaskName will be displayed along with the taskID for the following logs.

- SPM311 - SW Exception Report
- SPM312 - Trap

New field ‘Reason’ will be added to the following log to provide a reason for protection switch failure.

- SPM331 - Failed Device Protection Switch

The following new logs have been introduced

- SPM 682 - indicates CEM manual reset.
- SPM 683 - indicates reason for CEM swact.
- NODE 602 - indicates reason for CEM state transition

For more details about the enhancement to the above logs, please refer to the Fault Management chapter of this book.

125: Functional Description (FN): A00003995

125.1 Feature name

SN07 H.323 Gateway Change Capability - Actid A00003995

125.2 Description

This document details the Succession CS2K H.323 provisioning functionality being delivered in SN07. It describes the changes being made to the CS2K Management Tools (CMT) GUI (manual) and XML (machine-driven) provisioning components of the CS2K Configuration Management System.

This feature is introduced as on ongoing effort for provisioning H.323 Gateways (GW) and Endpoint Groups (EPG) within the Succession software suite. Software that was included in the 6.1 and 6.2 releases gave users the ability to provision H.323 gateways of fixed capacity and attributes. A desirable amendment to existing functionality is the ability to change the initial provisioning without affecting already provisioned GWs and EPGs.

This feature provides the following new or amended functionality:

- Change the capacity of a H.323 GW after initial provisioning
- Change the IP address of a H.323 GW after initial provisioning
- Change the Port of a H.323 GW after initial provisioning
- Allow users to specify the TID location of EPGs
- Provide modified GUI display capabilities for H.323 EPGs

An important change to point out as a consequence of this feature is that EPGs are no longer automatically added when a H.323 GW is added. This change was implemented so that greater flexibility could be realized when adding EPGs. It gives the users the ability to specify the location of the EPs in the system so that Terminal Space can be controlled, and therefore fragmentation can be better managed.

This document will describe in detail how the new functionality is used and modifications to existing H.323 provisioning features. For a comprehensive discussion concerning H.323 provisioning, please refer to FN SN06.1 CS2K H.323 Provisioning Application - Actid A00001913.

126: Functional Description (FN): A00004005

126.1 Feature name

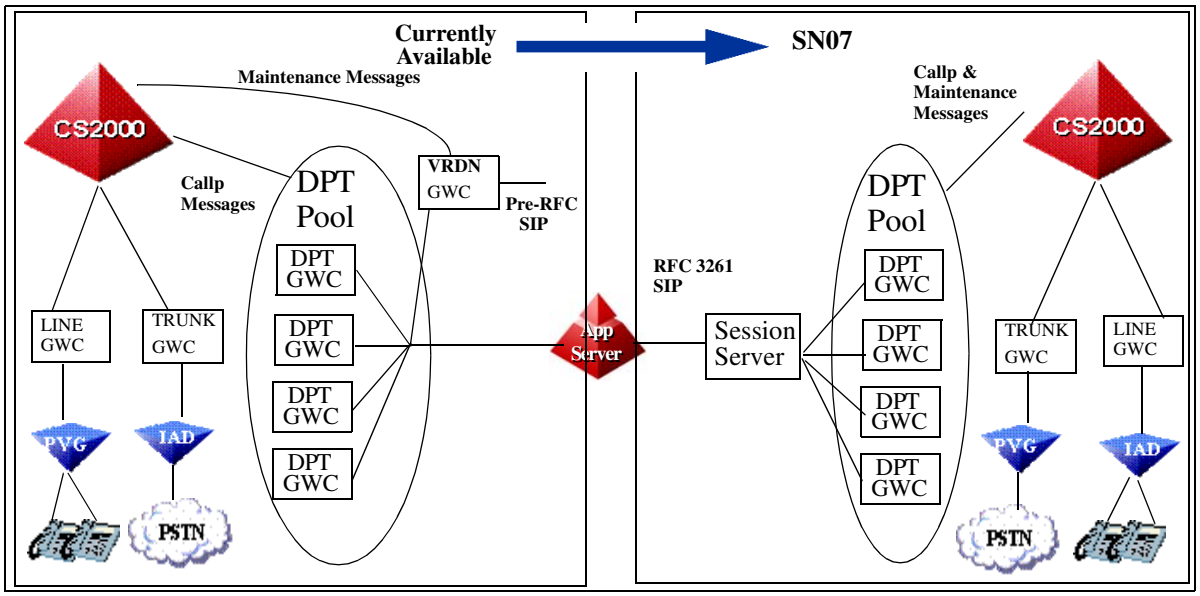
This feature is called Nortel Carrier Grade Linux (NCGL) platform “Session Server” and is being developed under ACTID A00004005.

126.2 Description

126.2.1 Overview

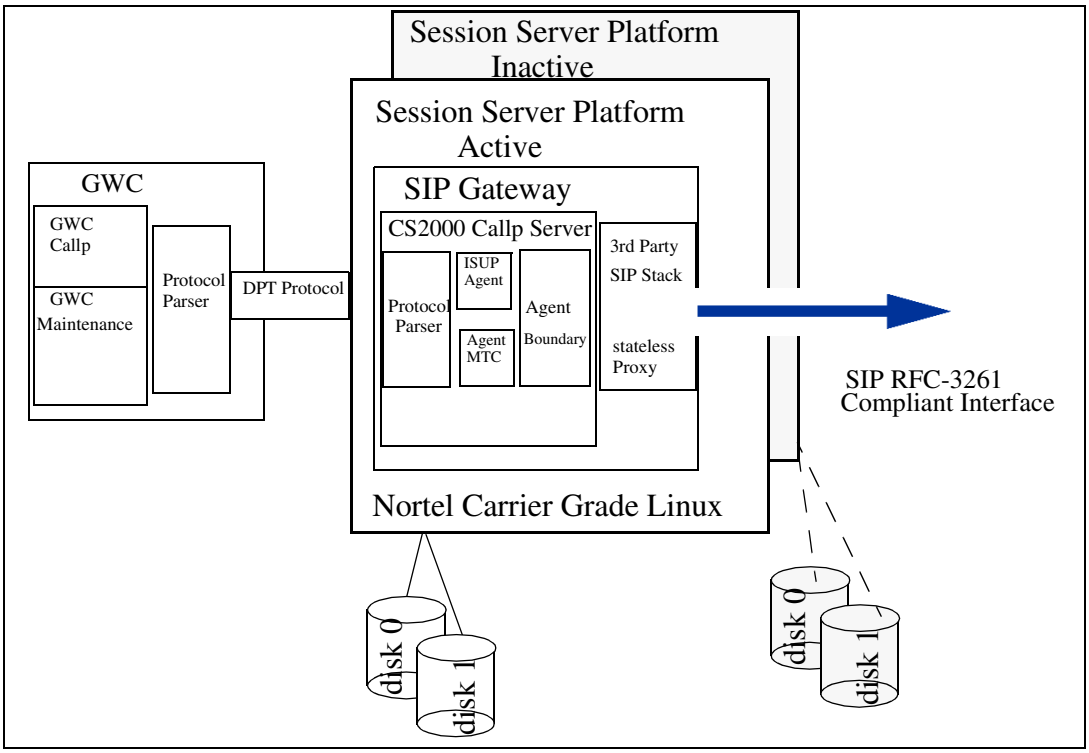
The purpose of this design is to create a highly available base platform for delivery of multiple applications. The Session Server consists of a Network Equipment-Building System (NEBS) Level 3 compliant hardware platform plus a software framework and architecture for developing Carrier Grade applications and services.

Figure 1 Design Intent of Session Server Platform



In the SN07 release, the architecture for the Session Server will consist of a mated pair of Services Application Module- eXtreme Thin Server (SAM-XTS) with a configuration similar to that of gateway controller. The units consists of an active and inactive unit. Each unit is in reality a fully functional Session Server that is interconnected via a gigabit ethernet LAN as shown in Figure 2, "Mated Pair Session Server". Each server provides processor capacity, local disk storage, and high-bandwidth network connectivity.

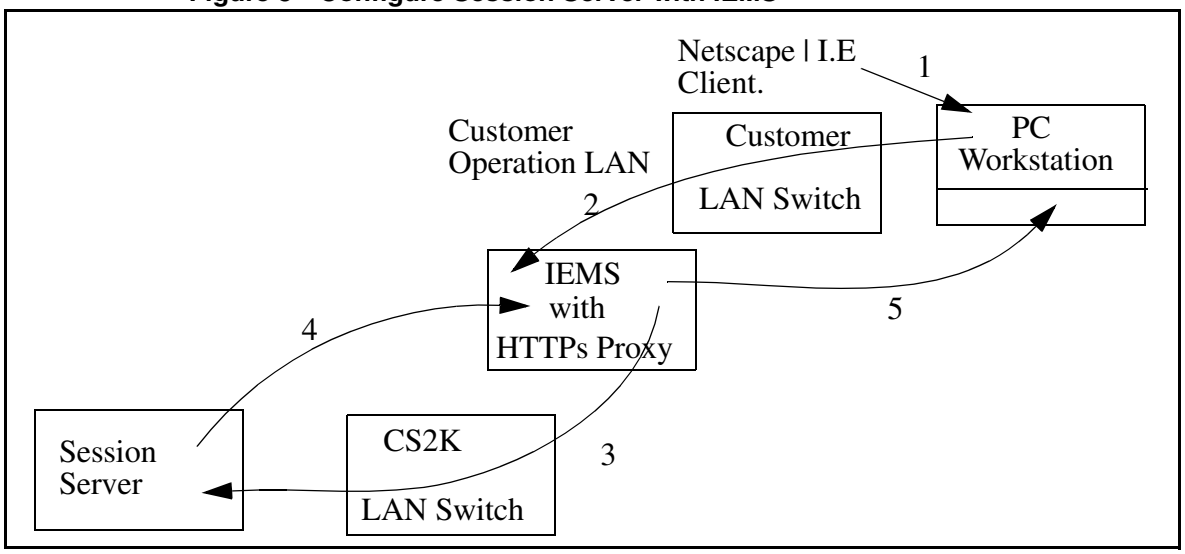
Figure 2 Mated Pair Session Server



The Session Server can be configured to use the Integrated Element Manager System (IEMS) between the customer operation LAN and the Call Server 2000(CS2K) LAN or it can be configured without the IEMS.

Figure 3 shows a proposed configuration with IEMS, where an Hypertext Transfer Protocol (HTTP) proxy is configured on the IEMS to redirect the Netscape/Internet Explorer browser to the Session Server.

Figure 3 Configure Session Server with IEMS



The configuration steps include:

1. user point the browser to web link on the IEMS
2. IEMS invoke the HTTPs proxy
3. the HTTPs proxy on the IEMS will redirect the link to the Session Server
4. Session Server will reply back to IEMS
5. IEMS will in turn respond to user request

The SIP Gateway application is the initial application for the Session Server platform, with the intention to provide a reusable infrastructure that can support additional applications. For complete details on the SIP Gateway Application, please refer to the latest version of the functional description section for feature A00003933.

126.3 Hardware Requirements or Dependencies

The Session Server technology is based on the SAM-XTS a second generation 2U NEBS compliant server from Intel. It is the same chassis as the currently shipping SAM-XTS for STORM, but adds additional CPUs and more RAM.

Each server will be equipped with:

- Dual Intel 2.4 GHz P4 Xeon Processors
- 4 GB RAM is the Standard - could have up to 12 GB RAM
- Memory Speed - 266 MHz DDR
- Local Disk - Dual hot swap 73GB
- Multiple GigE copper interfaces(2 on board + 2 Port NIC)

— NEBS Level 3 compliant

— 2U Form Factor

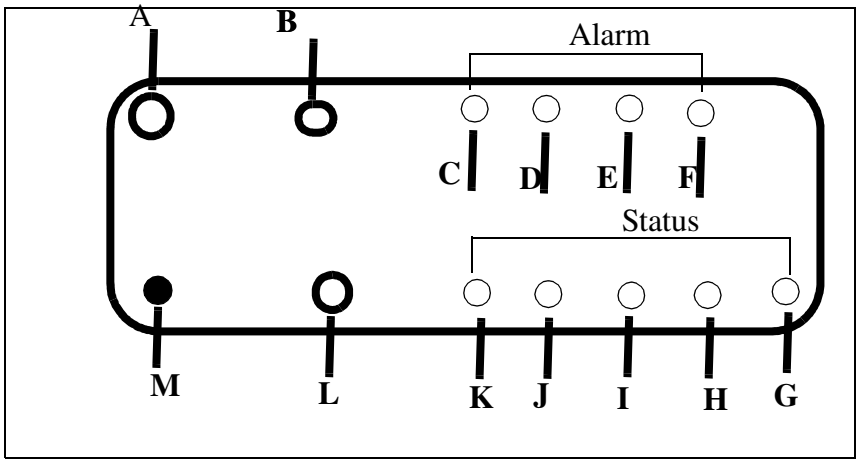
The field replaceable components on the Session Server are:

- Hard disk
- Power supply
- CD drive

126.3.1 Front/Back Panel Features and LEDs

The Session Server front panel features and LEDs are shown in Figure 4, on page 1566.

Figure 4 Front Panel LEDs on The Session Server



Something worth noting here is only the most critical alarm LED is illuminated. For example, if a minor alarm is present and a major alarm occurs, the minor alarm data will be retained; only the major alarm LED will be illuminated. If the condition that set the minor alarm previously still exists when the major alarm is cleared, the minor alarm will once again become illuminated.

Table 1 Front Panel Features

Item	Feature	Description
		Front Panel Switches
A	Power switch	Toggle the server power
B	Reset switch	Reset the server
L	ID switch	Toggles server ID LED
		Front Panel Alarm LEDs and

Item	Feature	Description
C	Critical CRT (red)	When continuously lit, indicates the presence of a critical system fault.
D	Major MJR (red)	When continuously lit, indicates the presence of a major system fault.
E	Minor MNR (red)	When continuously lit, indicates the presence of a minor system fault.
F	Power (amber)	When continuously lit, indicates the presence of a power system fault. The front panel power alarm relay will be engaged.
		Front Panel Status LEDs
G	Disk 0 Activity/Fault LED (green or red)	Indicates disk 0 SCSI hard drive activity when green, or a disk 0 SCSI hard drive fault when red. When flashing green/red indicates that disk 0 is rebuilding disk array.
