packetizationinteger	New	NUMBER	Indicate the packetization rate. Refer to table “PACKETIZATION_MAP“. The default value is “0”.

Field	New/ Changed	Entry	Explanation and action
t38	New	NUMBER(1)	Indicate whether the T38 setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.
rfc2833	New	NUMBER(1)	Indicate whether the RFC2833 setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.
comfortnoise	New	NUMBER(1)	Indicate whether the comfort noise setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.
bearertypedefault	New	CHAR(1)	Indicate whether this profile is a default profile. Available values are “Y” and “N”. Char “Y” indicates this profile is default profile for this bearer network type, char “N” indicates this profile is not the default one. This field can not be NULL. The default value is “N”. Please note that there will be up to 1 default profile every bearer network fabric type.
networkdefault	New	CHAR(1)	Indicate whether this profile is network default profile. Available values are “Y” and “N”. Char “Y” indicates this profile is the default profile in network, char “N” indicates this profile is not the default one. This field can not be NULL. The default value is “N”. Please note that there will be up to 1 network default profile totally.

53.5.2.15 GWCNode

53.5.2.15.1 Functional description

This table is used to store attributes of GWC node. Two new fields will be added into this table. Please refer to DID document for details.

53.5.2.15.2 Fields

The following table lists fields of this table.

Table 1 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
Network_Instance	New	VARCHAR2 (32)	Indicates the name of the associated network instance.
Network_Codec_Profile_Name	New	VARCHAR2 (32)	Indicates the associated network codec profile. Refer to table “GWC_NETWORK_CODEC_PROFILE“.

53.5.2.16 GWCPROFILE

53.5.2.16.1 Functional description

This table is used to store attributes of Gateway Controller profile. One new field will be added into this table, which is used to indicate whether network instance is needed to be associated to this GWC or not.

53.5.2.16.2 Fields

The following table lists the new field of this table.

Table 2 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
BEARER_INSTANCE_REQUIRED	New	CHAR(1)	Indicate whether network instance is needed to be associated to this GWC or not. Available values are “Y” and “N”. Char “Y” indicates need, char “N” indicates not need. The default value is “Y”. This field can not be NULL.

53.5.2.17 GATEWAYPROFILE

53.5.2.17.1 Functional description

This table is used to store attributes of Gateway profile. One new field will be added into this table, which is used to support the fabric type check when customer associate gateway to GWC node. Please refer to DID document for details.

53.5.2.17.2 Fields

The following table lists fields of this table.

Table 3 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
BEARER_FABRIC_RESTRICTION_LIST	New	Embedded table of "RestrictList_NT" type	The Name of this field is: Bearer fabric restriction list. This field can be NULL. This field would list the bearer fabrics to which the gateway is restricted. In most cases, this list will be empty and there will be no restriction. But for some special gateway (e.g. MG9000IP and ATM versions), the values would be provided.

53.6 Service Orders (SO) (CM & SESM)

Not applicable.

53.7 Software optionality control (SOC)

Not applicable.

53.8 Element Management

Prior to SN07, the SESM server could support only one bearer network fabric type (IP/AAL1/AAL2) at one time. As of SN07, each GWC will be associated with a beaer network instance, which defines the associated bearer network fabric type. This information will be provided by the customer as they add the GWC through the GWC-EM. In addition to the beaer fabric instance, GWC-EM will allow the cutomer to define multiple network codec "profiles" in the system and will allow the customer to select the desired profile as they add the GWC to the network.

53.8.1 New/modified GUIs

Table 31 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
GWC-EM	Changed

53.8.2 GUI information

53.8.2.1 GWC-EM GUI

Gateway Controller Element Manager Graphical User Interface

53.8.2.1.1 Functional description

The GWC-EM database will be changed to include a new MIB table: GET_NETWORK_CODEC_PROFILE.

The following functionality is added to the GWC-EM:

1. Support the provisioning of multiple network codec profiles.
   - — Display network codec profile on GWC-EM GUI.
   - — Add network codec profile from GWC-EM GUI.
   - — Delete network codec profile from GWC-EM GUI.
   - — Change network codec profile from GWC-EM GUI.
2. Support the specification of a bearer network fabric instance and a network codec profile for each GWC.
   - — Display bearer network fabric instance and network codec profile of each GWC on GWC-EM GUI.
   - — Associate bearer network fabric instance and network codec profile with one GWC when adding GWC node from GWC-EM GUI.
   - — Change the associated network codec profile of one GWC node from GWC-EM GUI.

53.8.2.1.2 GUI usage and implications

GUIs must be used in the following sequence:

Current datafill order unchanged.

53.8.2.1.3 GUI size

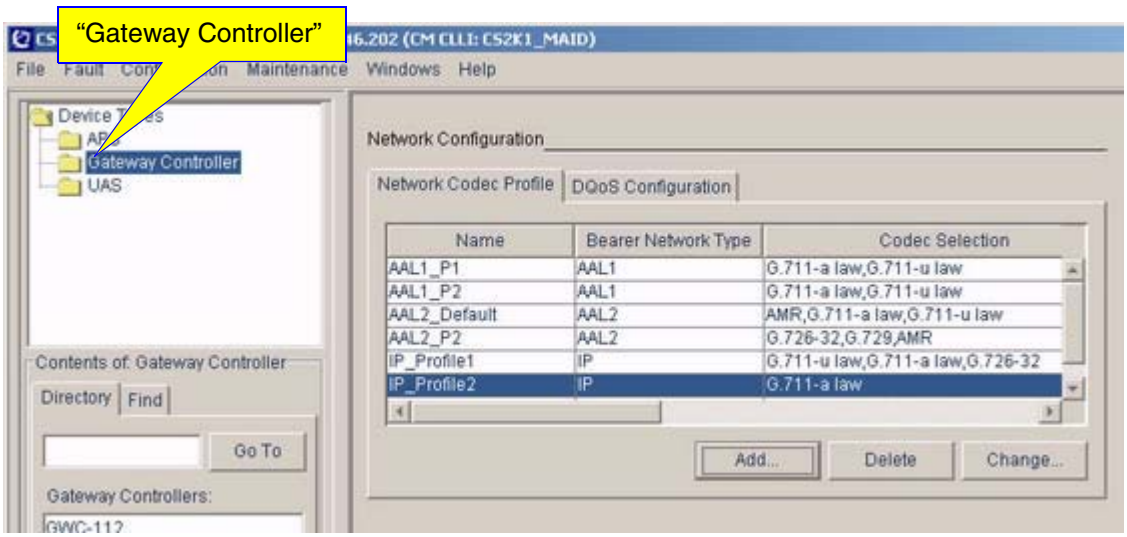
Table 32 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
GWC-EM	Unchanged	Unchanged	Unchanged

53.8.2.1.4 Usage Example: Display network codec profile

When customer click the “Gateway Controller” type from the device type tree at the left side, all network codec profiles will be displayed on the right side. (Please refer to “Figure 1 Network codec profile display panel”)

Figure 1 Network codec profile display panel



All existing codec profiles will be displayed in a table, each profile includes following parameters:

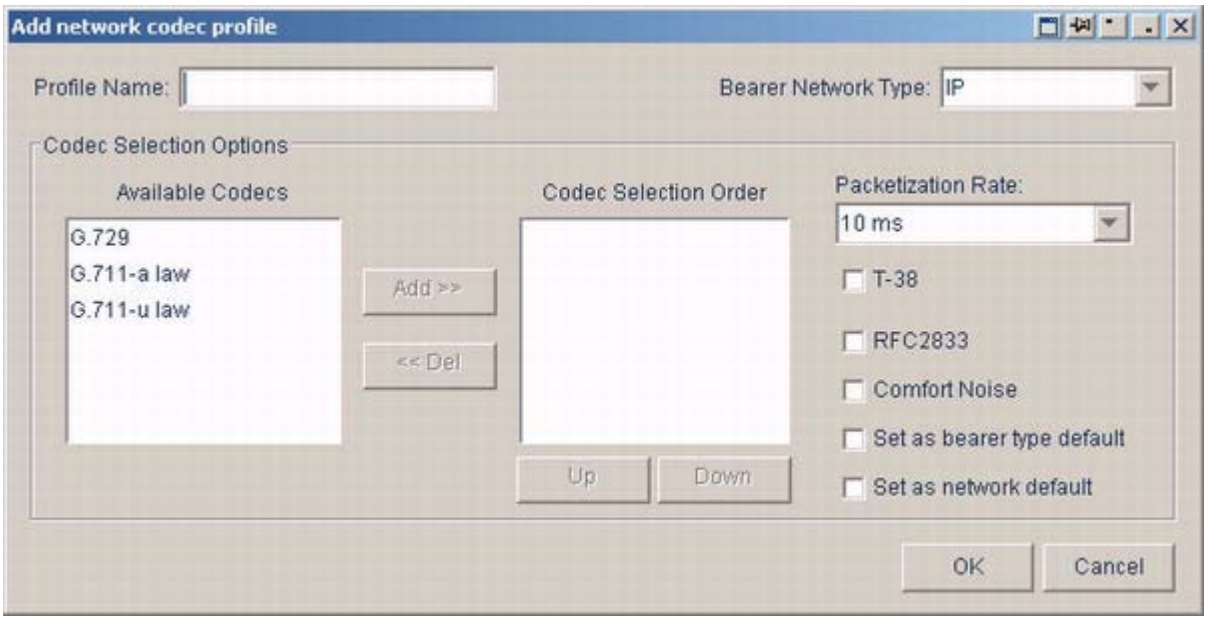
Table 4 Parameters of network codec profile

Parameter name	Description	Notes
Name	The name of the profile.	
Bearer Network Type	Indicates the bearer network fabric type.	
Codec Selection	Indicate the codecs used in this profile.	
Packetization rate	Indicate the packetization rate.	For IP bearer type only.
T-38	Indicate whether the T38 setting is enabled.	For IP bearer type only.
RFC2833	Indicate whether the RFC2833 setting is enabled.	For IP bearer type only.
Comfort noise	Indicate whether the comfort noise setting is enabled.	For IP bearer type only.
Default Profile	Indicate whether this profile is a default profile. Please note that there will be up to 1 default profile every bear network fabric type.	

53.8.2.1.5 Usage Example: Add network codec profile

Customer will be able to add one new network codec profile just by clicking the “Add” button, then a dialog “Add network codec profile” will be popped up. (Please refer to “Figure 2 Add network codec profile dialog”)

Figure 2 Add network codec profile dialog

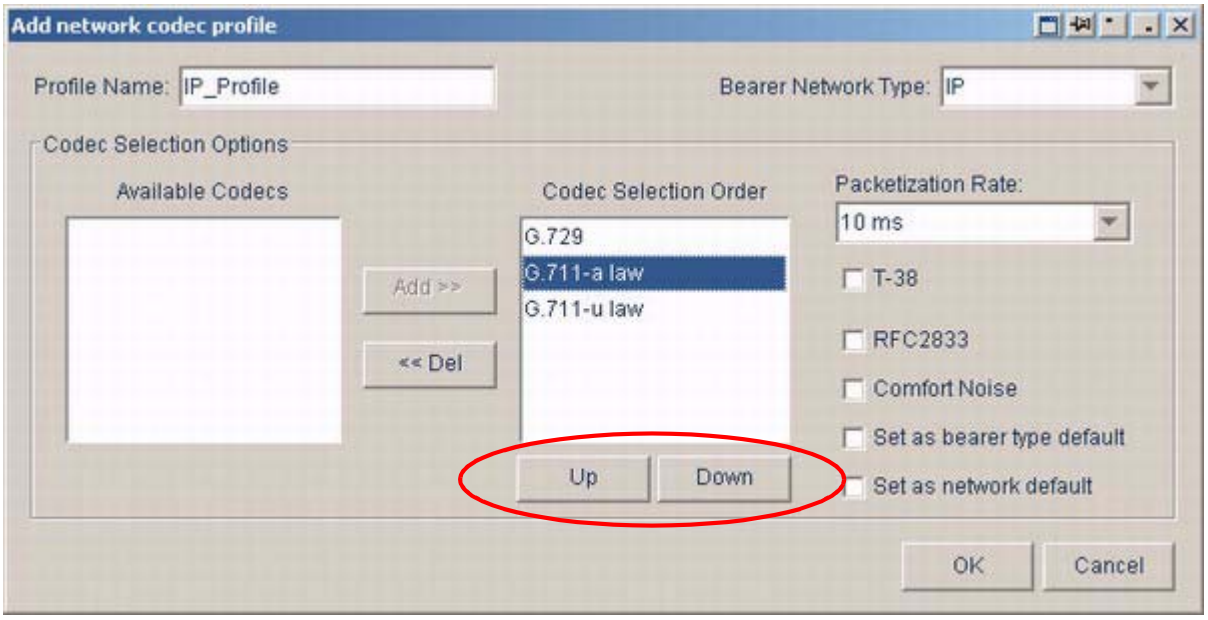


When customer select a bearer network type from the droplist box, the corresponding available codecs will be displayed below in the left list box. The available codec list may be different for different bearer network type.

Please note that the codec selecting is different from SN06 version. Customer won't select different codec for “Compression codec”, “Default codec” and “Alternative Codec” one by one. The available codecs will be listed at left side, customer should be able to select them just by highlighting codec item and clicking the “Add >>” button. Then the selected codec will be added into codec selection. Contrarily, customer could delete some codec from the selection by highlighting the codec item and clicking the button “<< Del”.

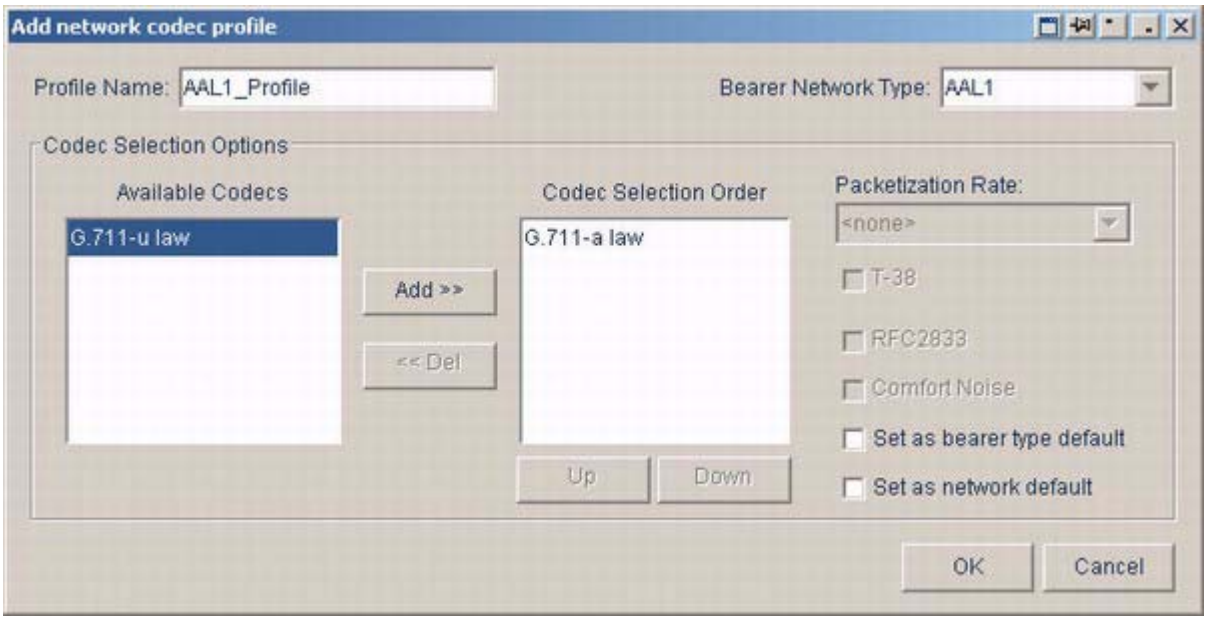
In the codec selection, the order of the codec determines how the device will treat them. For example, the first one will be mapped to “Compression codec”, the second one will be mapped to “Default Codec”, and the last one will be mapped to “Alternative Codec”. Additional, customer could change the order of codecs by highlighting the codec item and clicking the “Up” and “Down” buttons.

Figure 3 Change the order of codecs in the selection



Please note that parameters “Packetization Rate” and LCO options (T38, RFC2833, and Comfort Noise) are settings for IP bearer type only. If customer select “AAL1” or “AAL2” as the bearer network fabric type, these settings will be disabled.

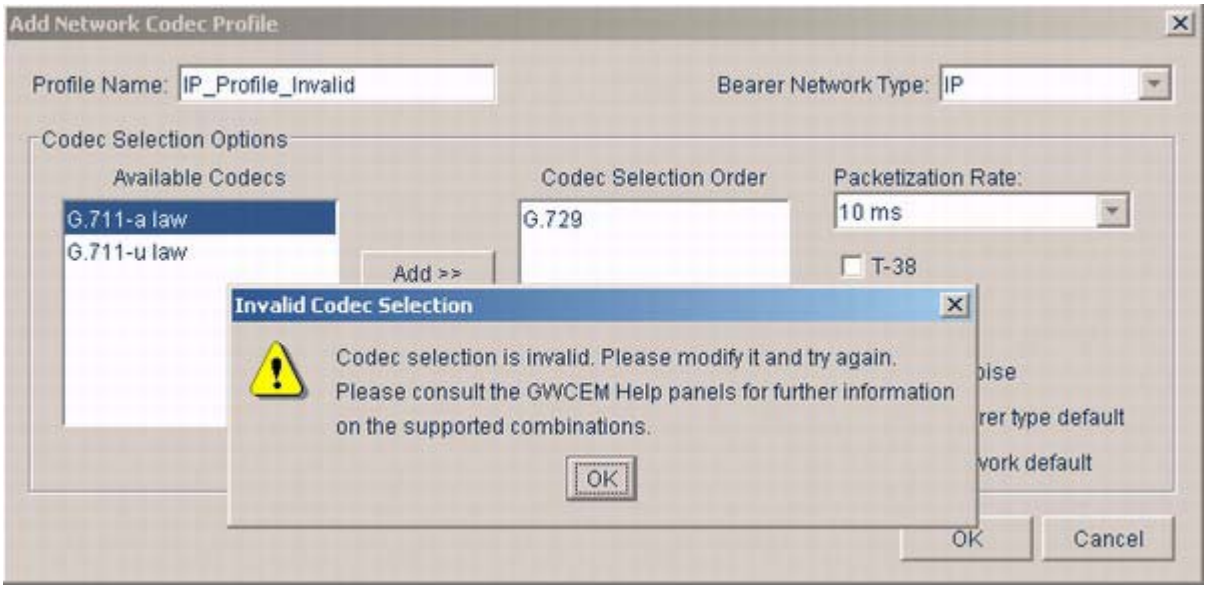
Figure 4 Select “AAL1” as the bearer network fabric type



Customer will be able to use the recommended codec setting by clicking the button “Recommended Codec Setting”, then the recommended setting will be restored into the dialog. Note that the recommended codec setting will be different for different bearer network type.

If customer select an invalid codec selection, alert dialog will be popped up. (Please refer to “Figure 5 Alert dialog for invalid codec selection”)

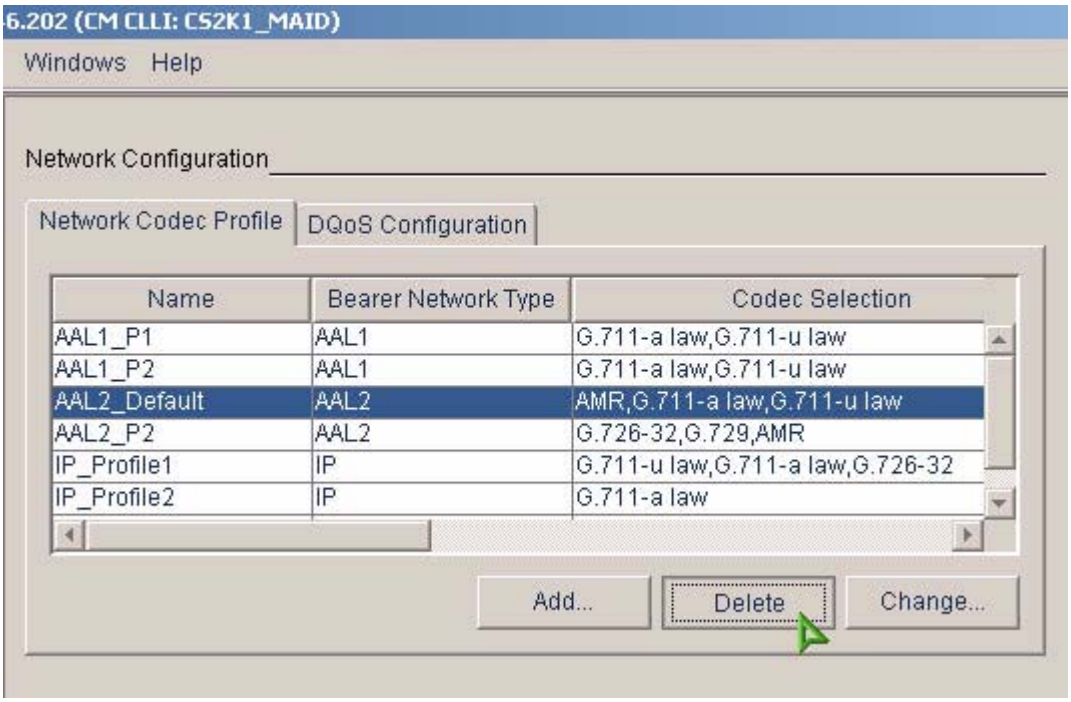
Figure 5 Alert dialog for invalid codec selection



53.8.2.1.6 Usage Example: Delete network codec profile

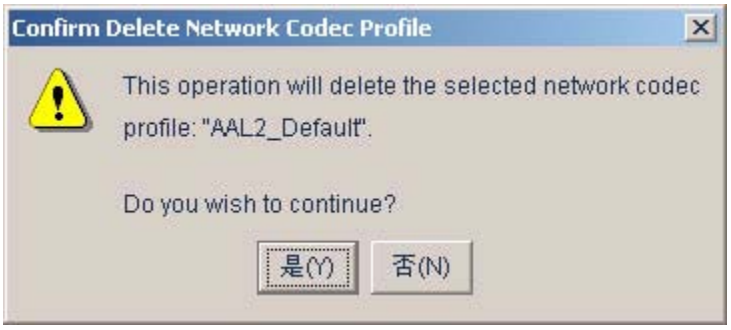
Customer will be able to delete one existing network codec profile just by highlighting the profile row from the table, and click the “Delete” button. (Please refer to “Figure 6 Delete existing network codec profile”)

Figure 6 Delete existing network codec profile



Once customer click the “Delete” button, one confirmation dialog will be popped up.

Figure 7 Delete network codec profile confirmation dialog

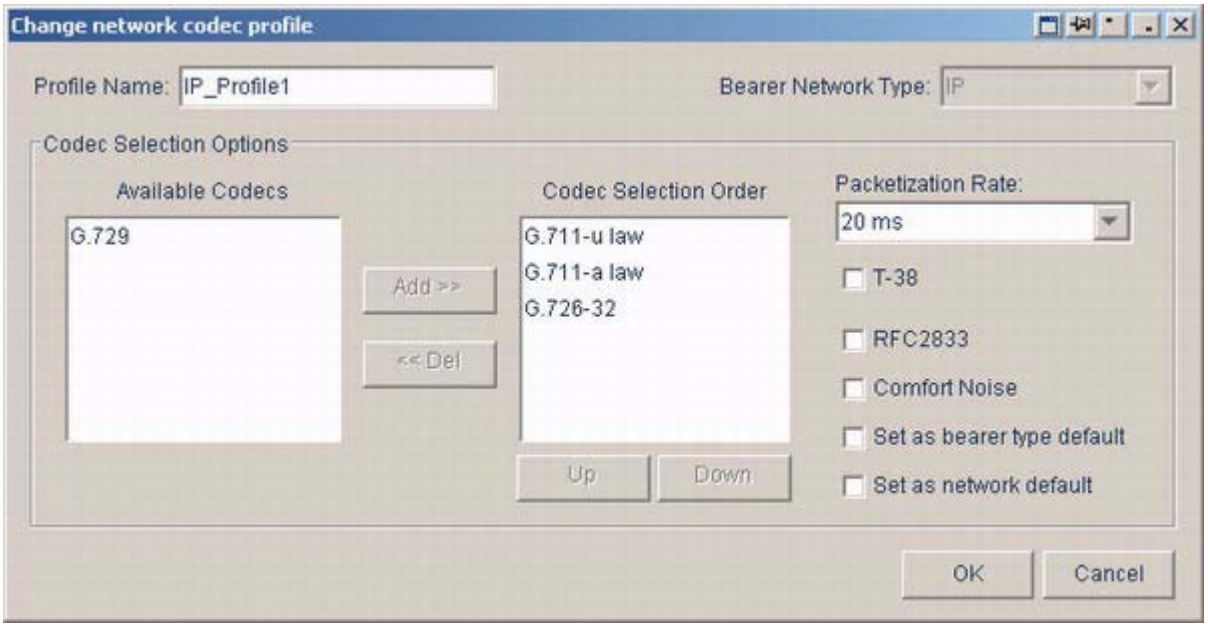


The operation result will be displayed in a pop-up dialog, and the codec profile table will be updated according to the result. Please note that if any GWC using this profile, the delete operation will be failed.

53.8.2.1.7 Usage Example: Change network codec profile

Customer will be able to change one existing network codec profile just by highlighting the profile row from the table, and click the “Change” button. Then the dialog “Change network codec profile” will be popped up. All parameters of the profile will be filled in the dialog. (Please refer to “Figure 8 Change existing network codec profile”)

Figure 8 Change existing network codec profile

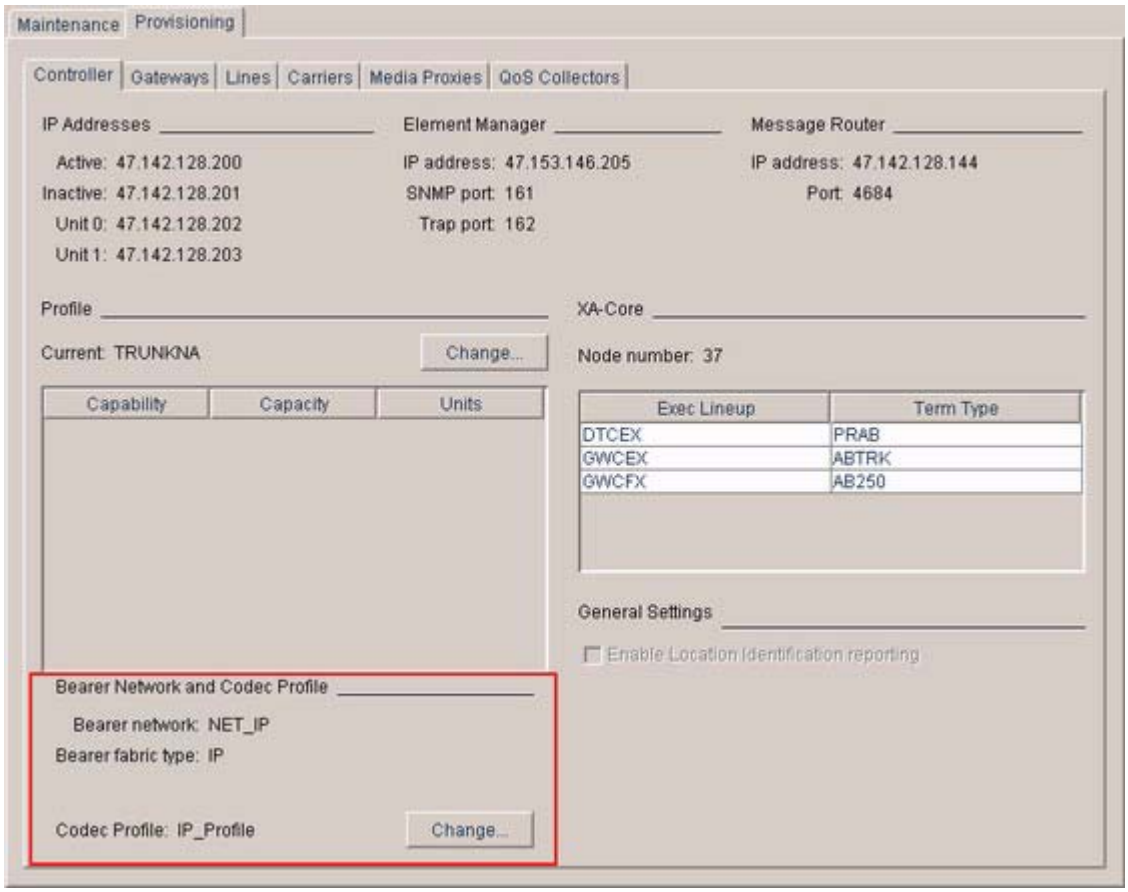


Note that the bearer network type of the profile is not allowed to be changed. Please refer to "53.8.2.1.5 Usage Example: Add network codec profile" section for how to change other parameters. Once the profile was updated successfully, these parameters will be updated into all GWCs using this profile.

53.8.2.1.8 Usage Example: Display GWC node

A new section will be added to the GWC provisioning panel to indicate the bearer network and codec profile configuration for the selected GWC.

Figure 9 Display GWC node



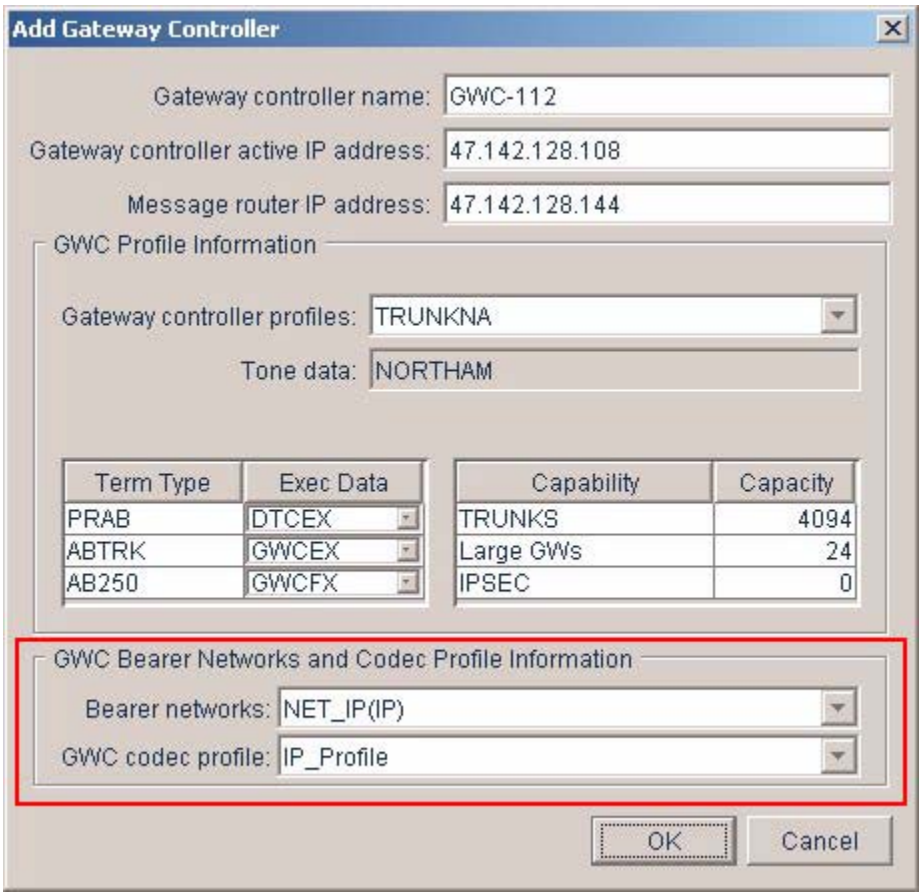
The new section includes two part, one is bearer network area and another is codec profile area. A “Change...” button will be added to the right of the codec profile fields to allow customer to change the codec configuration for the GWC.

This information will be displayed on the GUI with other GWC’s informations together while customer select a GWC from the GWC device list tree.

53.8.2.1.9 Usage Example: Add GWC node

Two new list boxes will be added to the “Add GWC Node” dialog to allow customers to select a specific bearer network instance and codec profile while a GWC is adding to the system.

Figure 10 Add GWC node



One of these two new box contains the bearer network list, another contains the codec profile list. The codec profile list must match the bearer network, that means, if customers select a bearer network instance belonging to “IP” bearer type, then the codec profile box will only contain the names of “IP” codec profiles; if customer select a “AAL1” bearer network instance, the codec profile box will be changed to only contain the “AAL1” codec profile names.

And if customers leave the codec profile box not selected, a default codec profile based on the bearer network type will be selected automatically.

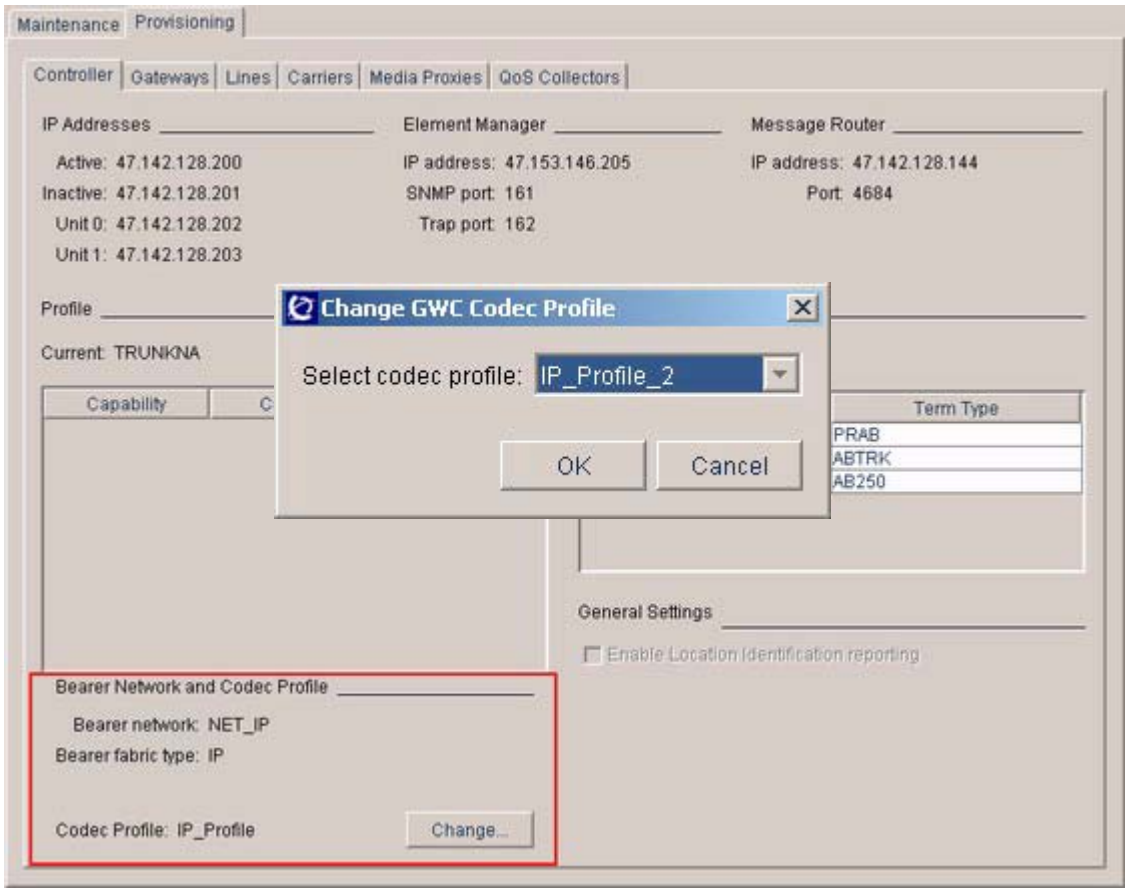
Once the addition operation has been performed successfully, a dialog like following will be pushed to the customer to indicate that the GWC was added to the system without errors.

Figure 11 Add GWC node result dialog

53.8.2.1.10 Usage Example: Change GWC network codec profile

When customers click the “Change...” button on the right of the codec profile fields on the GWC provisioning panel, a “Change Codec Configuration” dialog will be created like the following figure.

Figure 12 Change GWC's network codec profile



From this dialog, customers can select a different codec profile for the specific GWC even after the GWC has been provisioned already and a dialog with successful information will be displayed for customers if the operation has been performed without errors. Otherwise, a error message will be returned to the customers.

53.8.2.1.11 GUI release history update

1. Support the provisioning of multiple network codec profiles.
   - — Display network codec profile on GWC-EM GUI.
   - — Add network codec profile from GWC-EM GUI.
   - — Delete network codec profile from GWC-EM GUI.
   - — Change network codec profile from GWC-EM GUI.
2. Support the specification of a bearer network fabric instance and a network codec profile for each GWC.

— Display bearer network fabric instance and network codec profile of each GWC on GWC-EM GUI.

— Associate bearer network fabric instance and network codec profile with one GWC when adding GWC node from GWC-EM GUI.

— Change the associated network codec profile of one GWC node from GWC-EM GUI.

53.8.2.1.12 Supplementary information

53.9 Command interface changes

53.9.1 Directory: TRAVER

53.9.1.1 Directory description

TRAnslations VERification.

53.9.1.2 Accessing directory: TRAVER

53.9.1.2.1 Access to directory or MAP level and return to CI

CI> TRAVER <traver options>

Traver is a single command interface rather than an envirnment that is entered. You are automatically returned to the CI level after execution of the command.

53.9.2 Command: TRAVER TR

53.9.2.1 Command type: unchanged

53.9.2.2 Command target: unchanged

53.9.2.3 Command availability: unchanged

53.9.2.4 Command description

Traver an originating trunk based with the digits provided. The originating trunk (TRAVER TR) command is changed as follows:

When encountering a CND FABRIC or CND BEARNET selector in the translations route, three options are created for determining the originator's bearer fabric or network in order to determine how to interprete the CND route selection.

- TRKMEM option: The fabric or network of the member specified will be used.

- NEW FABRIC option: Allows the user to specify the bearer fabric {ENET, AAL1, AAL2, or IP} of the specified trunk group.
- NEW BEARNET option: Allows the user to specify the bearer network (32 char vector identifying a BNETNAME provisioned in table BEARNETS) of the specifified trunk group.
- If none of the above options is specified, the TDM network will be assumed for the specified trunk group for non-DPT trunk groups.
- For DPT trunk groups, where none of the above options is specified, the bearer fabric or network will be obtained from table TRKOPTS.

53.9.2.5 Command syntax

Table 33 <CommandName> command parameters and variables

Command	Parameters and variables
TRAVER **TR**	Next par is: <CLLI> STRING Enter: <CLLI> [<CLLIOPT>] [<MBGOPTS>] [<TRIGOPT>] **[<TRKMEM>] [<FABRIC>] [<BEARNET>]** <DIGITS OR N FOR NO DIGITS> [<CDNIE>] [<NSF>] [<TNSIE>] [<OSAIE>] [<BC>] [<SR>] [<PI>] [<TRI>] [<NETINFO>] [<FINFO>] [<RPOAP>] [<RPOAS>] [<NOA>] [<AIN_OPTIONS>] [<AIN_INFO>] [<SCAIIN>]
Parameters and variables	Description
[<TRKMEM>}	Existing option. Input is unchanged. Will now be used to obtain the bearer network and bearer fabric to be used when making conditional translations decisions CND FABRIC or CND BEARNET.
[<FABRIC>]	New option. Allows user to specify the FABRIC (ENET, AAL1, AAL2, or IP) to be used in making conditional routing decisions based on FABRIC. This fabric will be used in making these decisions, even if the trunk group does not currently have members on the fabric specified.
[<BEARNET>]	New option. Allows user to specify the bearer network (up to 32 character BNETNAME provisioned in table BEARNETS) to use as the originating bearer network. This will also imply the FABRIC, since the FABRIC is a field in table BEARNETS. Both of these will be used when making conditional routing decsions based on FABRIC or BEARNET (CND selectors). The network specified will be used, even if the trunk group does not have members on that network.

53.9.2.6 Qualifications and warnings

- Non-DPT trunk groups can have members that are spread across the varioius networks. During call processing, an effort will be made to match the originator's network to a trunk member of a like network. Traver will not be enhanced to show this selection process.
- Line group originations (eg: HUNT, MDN, ACD) will use the network fabric of the primary member of the group to determine the network fabric.
- If the FABRIC or BEARNET option is used to specify the bearer network information of a trunk group, this information will be used in TRAVER to determine the routing, even if the trunk group does not have members in that network. This allows users to test the translations before adding members, but also allows for verification to pass when during call processing it could actually fail.
- If a user enters the FABRIC option, and a CND BEARNET is encountered in the translations, the FABRIC specified will be used for the CND FABRIC, and the TDM network will be used for CND BEARNET.

53.9.2.7 Responses

53.9.2.7.1 Undefined BEARNET specified

Since the user will be prompted for a 32 character string rather than a list of tuples provisioned in table BEARNET, an invalid entry should be met with a response indicating where to look for the valid information.

Table 34 MAP outputs with associated meanings and actions

Command TRAVER TR <trunk group CLLI> <digits> BEARNET <BNETNAME>
<RESPONSE>: <description> **Meaning:** The BEARNET name entered does not exist in table BEARNETS. **System or user actions:** Choose a BNETNAME of out table BEARNETS.
<RESPONSE>: <description> **Meaning:** **System or user actions:**

53.10 Security

53.10.1 Network configuration

Document recommendations on confirguration of network edge devices (eg Firewalls, NATs NAPTs, Routers) as a result of this activity.

53.10.2 Key management

Not appicable.

53.10.3 Protocol

Not applicable.

53.10.4 Authentication

Not applicable.

53.11 Configuration Walkthrough

What are the provisioning steps/activities for this compoent? Include:

- Software and services
- messaging/signaling/protocols for component interaction
- provisioning routing
- other provisioning
- logical order and dependencies of component porvisioning
- SWACTS/RESTARTS.

54: Configuration (CN): A00003971

54.1 Hardware and Software Requirements

When a manual or force swact is issued on the CEM protection level MAP, if the command fails, a reason should be displayed along with the existing response.

When the RTS of a RM fails due to invalid load in the flash, a message is displayed. This existing message needs to be corrected to include a ‘have a’ to make it grammatically correct.

54.2 Command interface changes

54.2.1 Directory: <directory name/MAP level>

CEM PROT level (protection level)

54.2.1.1 Directory description

This level is used to perform a manual/forced sparing on a CEM.

54.2.1.2 Accessing directory: <directory name>

54.2.1.2.1 Access to directory or MAP level and return to CI

To access the protection level for a CEM unit, the following is used on the command interface.

mapci;mtc;pm;post spm <spm_number>;select cem <cem number>;prot

To quit and return to the CI level, the following command is used

quit mapci

54.2.2 Command: <Manual/Force>

54.2.2.1 Command description

Manual command performs a manual sparing action on the selected CEM unit.

54.2.2.2 Responses

In case of failure or refusal of the manual/force sparing command, a response is output indicating the reason for failure/refusal. The list of reason strings in the response is as shown below

No swact comment
Node not inservice
Will disrupt service
Maintenance in progress

No response from unit(s)
Data-sync blocked swact.
Clock-sync blocked swact.
Carriers not up.
Hardware failure.
Unit not active. Hence cannot switch activity.
Mate CEM blocking swact.
Mate not present. Node is in simplex mode
Mate not available. Check the state of mate unit
Unable to contact mate. Mate isolated
Mate unit's state is worse off
Mate unit has already assumed activity.
Swact in progress.

Figure 1, "MAP command response for CEM swact failure/refusal" shows the format of the response on the MAP.

Figure 1 MAP command response for CEM swact failure/refusal

54.2.3 Directory: <directory name/MAP level>

RM circuit pack level

54.2.3.1 Directory description

This level is used to perform maintenance commands on a RM.

54.2.3.2 Accessing directory: <directory name>

54.2.3.2.1 Access to directory or MAP level and return to CI

To access the RM level for the circuit pack, the following is used on the command interface.

mapci;mtc;pm;post spm <spm_number>;select <RM circuitpack ><RM unit number>

To quit and return to the CI level, the following command is used

quit mapci

54.2.4 Command: <RTS>

54.2.4.1 Command description

RTS command returns the circuit pack(s) to service.

54.2.4.2 Responses

In case of failure a message is displayed on the MAP.

If the failure is due to an invalid load in the flash, the following message is displayed on the MAP.

RM does not valid load in Flash**.**

This message has been changed to

RM does not have a valid load in Flash.

Figure 2, "MAP response for RTS failure due to invalid load in flash" shows the format of the response on the MAP.

55.1 Upgrade Impact

55.1.1 Element Management Upgrade

This activity is responsible for handling modifications from the SN06.2 release to the SN07 release. No user interaction is required; the updates are automatically applied when the system is upgraded from SN06.2 to SN07.

Prior to the SN07 release, H.323 Endpoint Groups were listed in the Endpoint Group panel. With the updated phlosophy of adding this datafill as EPG carrier groups, previously provisioned H.323 endpoints are moved to the Carrier Panel. This is accomplished by updating the endpoint type field in the oracle database during the upgrade process and therefore no user interaction is required.

When the user provisions a H.323 GW, one of the required fields that must be datafilled is the reserved terminations. In 6.1 and 6.2, performing this action also filled in the Endpoint Groups that were assocaited with the GW. The user had the option of selecting any value as long as it was less than or equal to the maximum number of terminations allowed for that gateway type as defined by the GWs profile. A side affect of this was that more terminations then were requested would be provisioned if the user did not pick a multiple of 24/32 (North America/International). For example, a user had the option of filling in 34. If the user chose this number, the system would automatically provision 48/64 terminations. The count for the number of terminations listed in the gateway panel and stored internally was the value input by the user, not the actual count of terminations auto-generated. Because of unwanted side affects that are realized with the new “change” features provided by this activity, this value is converted to the actual number of terminations provisioned and will be updated internally and in the gateways display panel after an upgrade to SN07.

55.4 Element Management

55.4.1 New/modified GUIs and Functionality

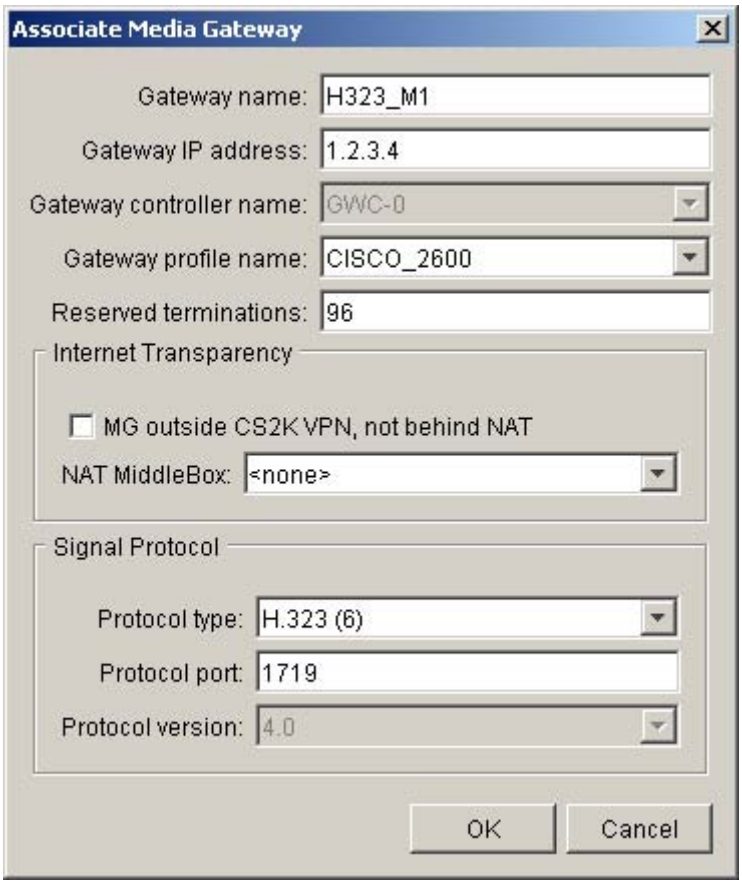
This section describes the Updates to GUIs affected by H.323 provisioning as a result of this activity. It lists dialogs that have cosmetic changes and the new functionality associated with them. For some cases, existing dialogs have not been changed but new functionality has been modified to accommodate updated H.323 provisioning. These dialogs are listed in this section too as a means to describe the new functionality.

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, DELETED
Associate Media Gateway	Changed functionality in SN07
GWC Provisioning Panel Endpoint Group Component	Deleted in SN07
Add Carrier	New for H.323 in SN07
GWC Provisioning Panel Carrier Component	New for H.323 in SN07
Trunks Associated with EPG Dialog	New for H.323 in SN07
Change Gateway	Changed in SN06.2, propped into SN07
Change Gateway IP address and Port Dialog	New in SN06.2, propped into SN07 by this activity
Change Gateway Capacity Dialog	New for H.323 in SN07
Disassociate Gateway	Changed functionality in SN07
Delete Carrier	New for H.323 in SN07

55.4.2 GUI information

55.4.2.1 GUI name: Associate Media Gateway



55.4.2.1.1 Functional description

The Associate Media GW dialog is displayed by using the configuration menu from the main CMT GUI or by selecting the “Associate” button from the GW panel of a GWC. This dialog is used to add H.323 GWs to the CMT which in turn populates the GWC device. The fields that are available with this dialog have not been updated in the SN07 release, however, functionality has been updated.

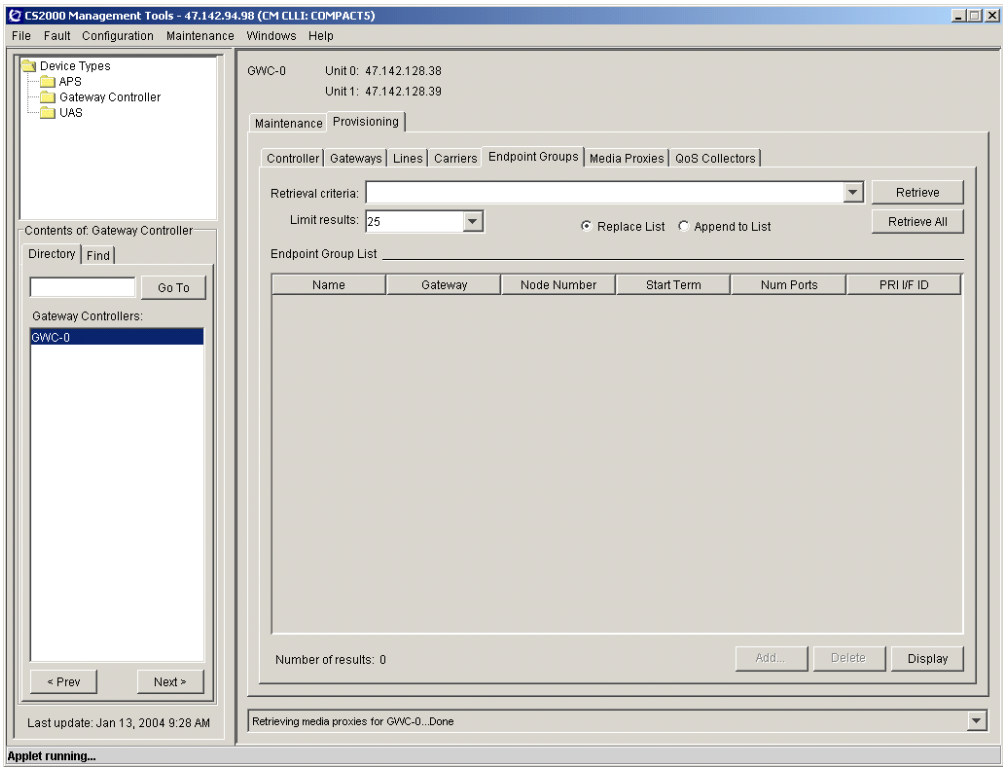
55.4.2.1.2 GUI usage and implications

Prior to the SN07 release, adding a H.323 GW to the system had unique functionality for H.323 GWs in that EPGs were automatically created and added to the system. The size of the EPGs (24 or 32) is dependent upon configuration options selected when the CMT product is initially installed. For North American systems, 24 is used, International systems, 32. As well, the number of EPGs provisioned was automatically calculated by the system so

that the appropriate number of groups were added as dictated by the mandatory "Reserved terminations" field. With pre-SN07 functionality, the location of the TIDs allocated was under system control.

In SN07, this behavior has been altered. EPGs are no longer automatically added. Because of this, a separate and additional step of adding the EPGs is required using the "Add carrier" operation. Details concerning the the add carrier operation are described in a later section of this document. In other words, adding a GW does not give the system terminations capability, it is only used as a means of adding a GW which must then be filled with terminations. Profiles for H.323 gateways have not been altered by this activity and the maximum capacities implemented in pre-SN07 releases are still applicable.

55.4.2.2 GUI name: EndpointGroup Panel



55.4.2.2.1 Functional description

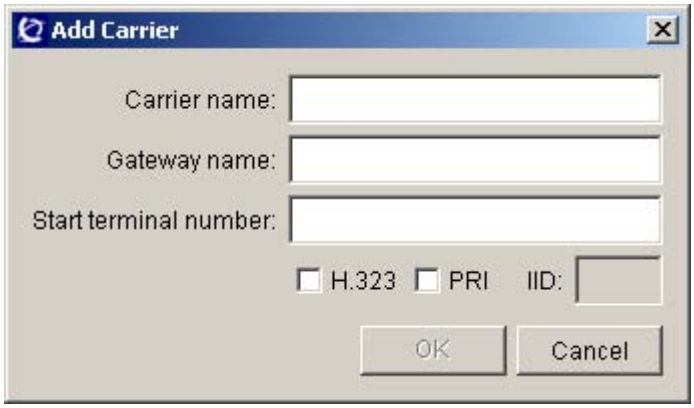
In pre-SN07 releases the Endpoint Groups panel was used to display the Endpoint Groups and attributes for H.323 GWs. Because of the updated philosophy of adding the EPGs using the carrier dialogs and logic, this panel is removed in the SN07 release and replaced by the Carriers Panel.

55.4.2.2.2 GUI usage and implications

Deleted in SN07.

Note: The GUI listed in this document shows the Endpoint Groups tab. This is a temporarily GUI depiction used for discussion purposes only. For the released version of the SN07 product the GWC tabs will not include this panel.

55.4.2.3 GUI name: Add Carrier



55.4.2.3.1 Functional description

The Add Carrier dialog is an existing dialog that is now available for provisioning H.323 EPGs. This dialog is displayed when the user selects the "add" button from the "Carriers Panel" and is used to add EPGs to H.323 GWs. As in previous releases, the size for the EPG is dependent upon the configuration set when installing the CMT. For North American systems, 24 is used, for International systems, 32 is used.

55.4.2.3.2 GUI usage and implications

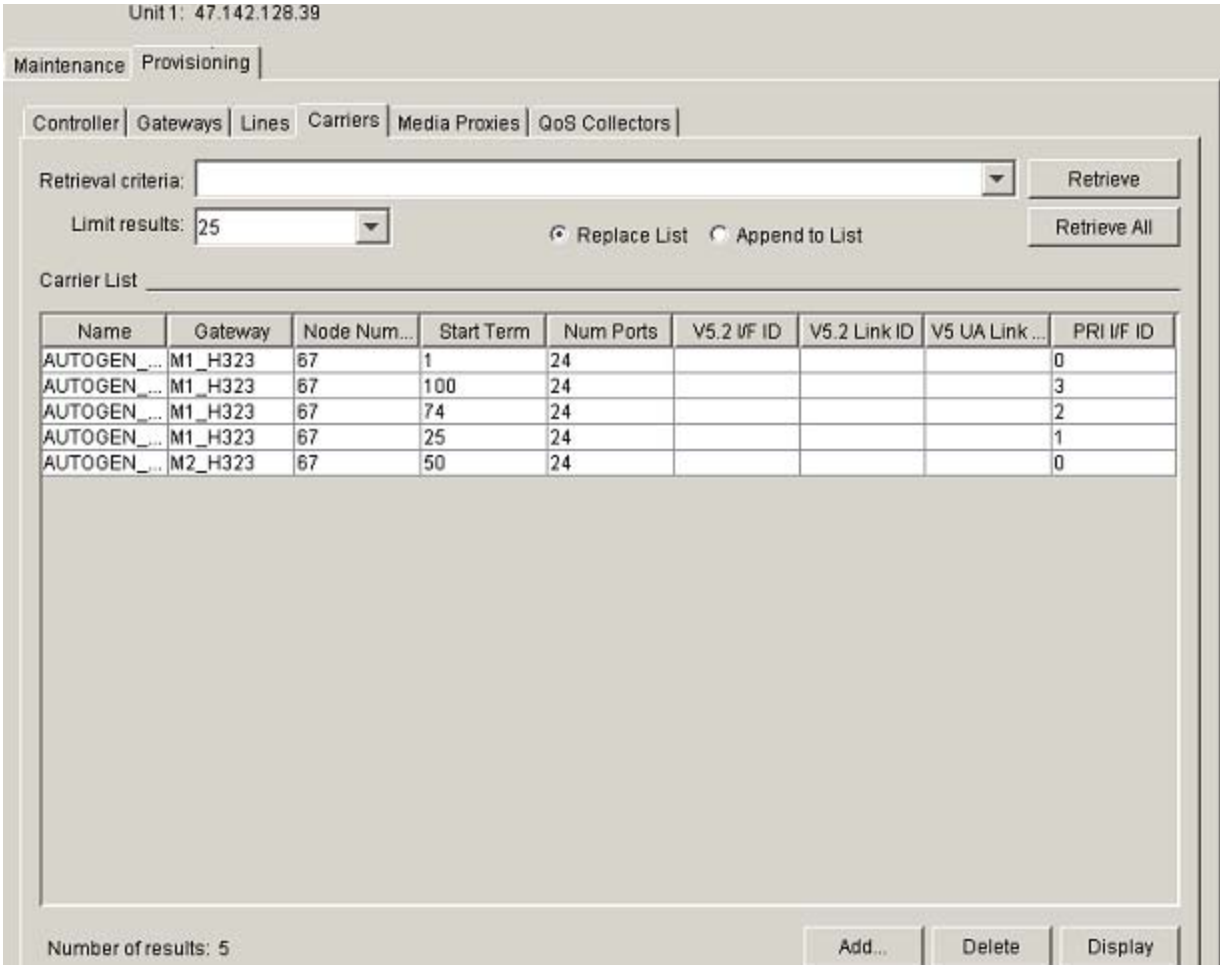
H.323 EPGs are added to the system as PRI groups and mimic the provisioning behavior of PRI carriers. However, in order to provision H.323 GW's, the H.323 checkbox should be selected. Selecting this checkbox causes the IID values to be auto generated by the system and are not required to be input by users. The naming convention "EPG" (described below) is unique to H.323 GWs and selection of the H.323 check box mandates that this convention is followed.

The Carrier name field is used to input the name of the EPG and this name must be unique within the GW. Naming conventions for these EPGs are fairly simple and should be input as follows; EPG_XXX where XXX represents an integer value between 000 and 999. The integer part must be zero padded and must be preceeded by the "_" character. Example datafill might be: EPG_000. Having duplicate EPGs names on different GWs is allowed.

The “Gateway name” field is used to indicate which GW the EPG is added to. In order for the operation to succeed, the GW specified must already exist within the system. Multiple EPGs can be added to a GW up to the maximum capacity as dictated by the reserved capacity that is provisioned for the GW. For example, a GW on a North American system that has a reserved capacity of 240 can have up to 10 EPGs added to it (10 EPGs x 24 EPs = 240 EPs).

The “Start terminal number” field is a new optional field made available in the SN07 release for all carrier service types. If this field is left blank the system will automatically pick which TIDs are used and how they map to the EPs. These values and mappings can be displayed using the Carrier Panel and Trunks Associated Dialog described later in this document. As well, the listAllCarriers XML interface (described later in this document) can be used to view these values. If the user puts a value in for the “Start terminal number” field, a contiguous block of 24 or 32 endpoints are created at the specified starting location. If a Contiguous range of TID locations following the starting location is not available, the operation will fail.

55.4.2.4 GUI name: Carrier Panel



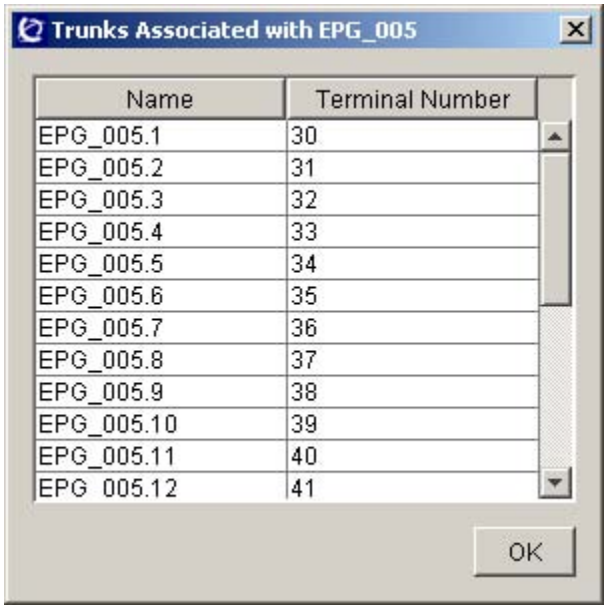
55.4.2.4.1 Functional description

The Carrier Panel is an existing panel that is now used for display of H.323 EPGs. This panel is made available by selecting the Carrier tab from the GWC Provisioning panel. In order to display H.323 EPGs provisioned, the "Retrieve" and "Retrieve All" buttons should be selected. Information such as the EPG name, associated GW, Node Number and Start Term, Number of Ports are pertinent to H.323 EPGs listed.

55.4.2.4.2 GUI usage and implication

This panel should be used to view attributes of EPGs associated with H.323 GWs. It replaces the Endpoint Group panel that was used to display this information prior to the SN07 release. In order to expand a EPG and see EP/TN mappings a EPG should be selected and the "Display" button should be selected. Details concerning this functionality are listed below.

55.4.2.5 GUI name: Trunks associated with EPG Expansion Dialog



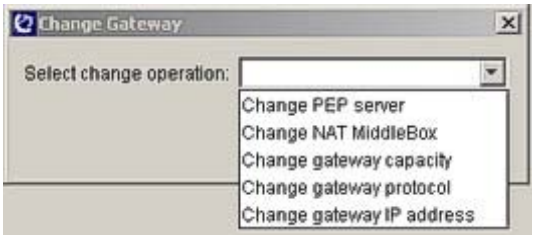
55.4.2.5.1 Functional description

The Trunks Associated dialog is an existing dialog that is now available for viewing H.323 EPG mappings in the SN07 release. This dialog is generated by selecting a EPG within the carriers panel and selecting the “display” button.

55.4.2.5.2 GUI usage and implications

This dialog is used to view EP/TN mappings for a H.323 EPG. It can be used to view system or user defined starting TN mappings. The naming conventions for individual EPs is EPG_XXX.xx where xx is an integer between 1 and 32.

55.4.2.6 GUI name: Change GW



55.4.2.6.1 Functional description

The Change GW dialog is used as a starting point to change attributes of an existing GW. A user picks the attribute they want to change from the combo box and the dialog is expanded to display appropriate fields. The Change GW dialog is a existing dialog that has been amended to include the “Change

gateway IP address" pick. This update was introduced in SN06.2 release and this activity is responsible for moving this functionality into the SN07 product.

In addition to the IP address pick update, new functionality of supporting "Change gateway capacity" is now supported for H.323 GWs.

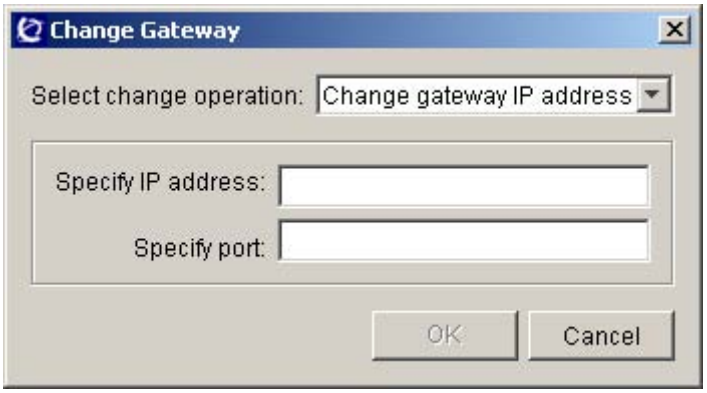
This dialog is rendered by selecting a GW from the GWs panel and selecting the "change" button. Once the dialog is display the combo box arrow is selected to display the pick.

55.4.2.6.2 GUI usage and implications

The change IP address and Port ability is restricted to updating H.323 GWs that are assocaited with a NAT. If an attempt is made to change the IP address of a GW type other than H.323, the operation will fail. In addition, only 1 GWs IP address or Port can be updated at a time using this operation. If multiple GWs are selected in the GWs panel the "Change gateway IP address" pick is not rendered.

> ***Note:*** The ability to change a small line GWs IP address to discovery is available by going to the gateways panel and selecting the "change" button with no GW rows selected. For this case, a unique change dialog is rendered that allows this operation. Changing a H.323 GWs IP address to discovery is not supported and has not been affected by this activity.

55.4.2.7 GUI name: Change GW IP address and Port



55.4.2.7.1 Functional description

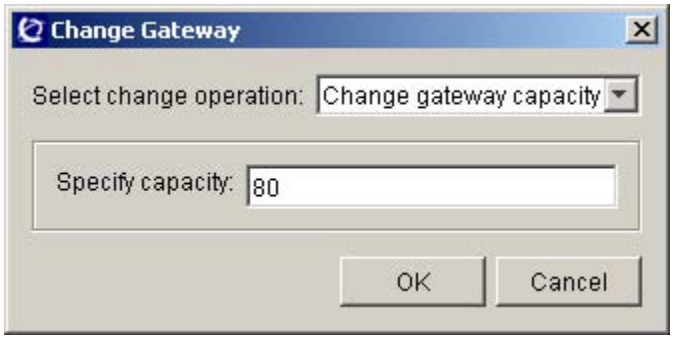
The Change GW IP address and Port dialog was newly added in the SN06.2 release and propped to SN07 by this activity. This dialog allows users to change the IP address and/or Port associated with a H.323 GW. Either the IP address, Port or both can be changed with a single transaction. However, in order to change only one of the values the other value must be input with the previously provisioned value. For example, if a user wanted to change the port

from 4721 to 4800 but leave the IP address alone they would put 4800 in the port field and the already provisioned IP address in the IP address field.

55.4.2.7.2 GUI usage and implications

This dialog allows users to change IP address and/or Ports associated with H.323 GWs. If a non-H.323 GW attempts to change the IP address to a value other than discovery, this action will fail. If a H.323 GW attempts to change the IP address to discovery, the operation will fail.

55.4.2.8 GUI name: Change GW Capacity



55.4.2.8.1 Functional description

The Change gateway capacity dialog is an existing dialog that is now available for changing the capacity of H.323 GWs in the SN07 release. This dialog is generated by selecting a GW or range of GWs within the GWs panel and selecting the “change” button. Once the dialog is rendered, select the “change gateway capacity” pick for the list made available by selecting the combo box arrow.

55.4.2.8.2 GUI usage and implications

Changing the H.323 GWs capacity in the SN07 release mirrors changing the capacity for other GW types. The capacity can be increased or decreased with the following constraints. A GWs capacity can be increased to the maximum allowed capacity for the GW type as dictated by the profile. A GWs capacity can be decreased to a smaller value as long as it is changed to a value greater than or equal to the number of EPs already allocated. If the user wants to change the capacity to a number smaller then the number of EPs provisioned, then the delete carriers operation should be used to remove EPG carrier group capacity and then the change capacity operation should be performed. Note that changing the capacity does not add or delete EPGs from the gateway. Changing the capacity only affects the potential number of EPs that can be provisioned. In order to add or remove EPGs, the “add carrier” or “delete carrier” operations should be used.

55.4.2.9 GUI name: Disassociate GW

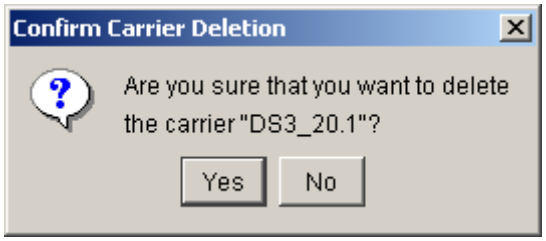
55.4.2.9.1 Functional description

The Disassociate Media Gateway is the dialog used to remove a GW from the CMT and subtending elements. It is displayed when the user selects a GW and pushes the Disassociate button on the GWs panel. The GUI for this operation has not been updated in the SN07 release, however, functionality associated with this action has.

55.4.2.9.2 GUI usage and implications

Disassociating a H.323 GW in a pre-SN07 release performed automatic deletions of EPGs and individual EPs dependent upon the EP state. In SN07, this behavior is modified so that H.323 GW deletions mirror behavior of other GW deletions in that if EPs exist for the GW, the transaction will fail. In other words, deletion of a H.323 GW requires the user to remove all EPGs from the GW prior to attempting the disassociate GW operation.

55.4.2.10 GUI name: Delete Carrier



55.4.2.10.1 Functional description

The Delete Carrier dialog is an existing dialog this is now available to remove H.323 EPGs from the system. This dialog is generated by going to the carriers panel, selecting a carrier, then pushing the “delete” button.

55.4.2.10.2 GUI usage and implications

This operation should be used to remove EPGs from a H.323 GW. In order to remove the EPG carrier group, the EPs within the group must be in an Installation Busy (INB) condition or the “unknown” state.

55.5 User Interface changes

55.5.1 OSSGate User Interface

This activity modifies support for the operations listed below:

- **changeMG capacity (updated functionality for H.323)**
- **changeMG IP address and port (new parameters)**
- **associateMG (updated functionality for H.323)**
- **addCarrier (updated functionality for H.323)**
- **queryEndpointGroup (deleted in SN07)**
- **listAllCarriers (updated functionality for H.323)**
- **disassociateMG (updated functinality for H.323)**
- **deleteCarrier (updated functinality for H.323)**

55.5.2 Terminology & Description of New Method Parameters

55.5.2.1 changeMG Capacity

This feature introduces the ability to change the EPG provisioning capacity of a previously provisioned GW. Although this capability currently exists for GWs using other protocols, it is now supported for GWs using the H.323 protocol.

55.5.2.2 changeMG IP address and Port

This feature introduces the ability to change the IP address and/or Port address associated with an existing GW. This capability is only supported for H.323 gateways that have a NAT associated with them and will be rejected if a GW with a protocol other than H.323 attempts the change IP/Port operation. Support for this operation allows a user to change the IP address, Port, or both with a single transaction.

55.5.2.3 assocMG

Associate MG is the OSSGate XML interface used to datafill new Media Gateways. The interface to associate a GW using XML was available with the introduction of H.323 functionality in the SN06.1 release. This interface has not been modified from the previous release. However, it is important to realize that functionality provided for this action is changed in SN07 in that EPGs are no longer automatically provisioned. In order to add EPGs to a GW, an additional step of adding a EPG carrier group or groups is required.

55.5.2.4 addCarrier

The addCarrier interface is an existing interface that is now used to provision H.323 EPGs. This command will add a EPG of size 24 or 32 endpoints to a

GW dependent upon market configuration. CMT systems that were configured as “North America” will provision EPGs of size 24, and systems configured as “International” will provision EPGs of size 32. In order to provision a GW with multiple EPGs, this command should be called repeatedly with a unique EPG.

This command will automatically grab the first available block of contiguous TID space TNs available on the GWC if the optional “FirstTN” tag is not used. The user can also specify the starting TID location if this field is included. This option gives users the ability to assign EPs to specific TID locations if they desire. If a firstTN tag is included, the system will assign a contiguous group of 24 or 32 EPs (system specific depending upon North American or International configuration) starting at the given location. If any of the TNs in the range are unavailable the command will fail.

55.5.2.5 queryEndpointGroup

This interface is removed in the SN07 release. In order to retrieve EP/TID mappings for H.323 GWs, the listAllCarriers interface should be used.

55.5.2.6 listAllCarriers

The list all carriers XML command is an existing command that should be used starting in SN07 to retrieve EP/TID mappings for H.323 GWCs. This command replaces the queryEndpointGroup command. Several filters (FILTER_ALL, FILTER_GWC, FILTER_MG, and FILTER_CARRIER) are available to limit the range of mappings to return. For details concerning use of these filter please refer to the XML examples and schema listings below.

55.5.3 XML - Example Commands and Responses

Listed below are syntax examples of the XML commands affected by the H.323 work in this activity. For some cases, new functionality is introduced. For others, new optional tags in reference to H.323 are highlighted. The XML in these examples are formatted for ease of understanding.

55.5.3.1 XML command examples for Change MG command

The following are examples of the enhanced change MG XML commands and the corresponding response messages for each operation supported by this activity. This activity introduces three new attributes that can be changed on an existing H.323 GW, the capacity, the IP address, and the Port. The capacity change is a stand alone operation while the IP address and Port changes can be combined.

Example format of **changeMG** IP address and/or Port

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList >
      <Command>
            <Interface>cs2kCfgMgrIf</Interface>
            <Methods>
                  < changeMG usn="1" version="1.0" >
                        <Parameters>
                              <mgUIName>H323_M1</mgUIName>
                              <mgIpAddr>22.44.66.88</mgIpAddr>
                              <mgProtocolPort>88</mgProtocolPort>
                        </Parameters>
                  </assocMG>
            </Methods>
      </Command>
</CommandList>
```

Example format of successful **changeMG** response to change IP address and Port:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
      <Response>
            <Interface>cs2KCfgMgrIf</Interface>
            <Methods>
                  <changeMG usn="1" version="1.0">
                        <RC>0</RC>
                        <mgUIName>H323_M1</mgUIName>
                        <MsgTxt>H323_M1 Change MG Successful.
                        All Change MG requests have been processed.</MsgTxt>
                  </changeMG>
            </Methods>
      </Response>
</CommandList>
```

Example format of failed **changeMG** response to change IP address and Port:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
      <Response>
            <Interface>cs2KCfgMgrIf</Interface>
            <Methods>
                  <changeMG usn="1" version="1.0">
                        <RC>43</RC>
                        <MsgTxt>* H323_M1 Change MG Failed - Invalid MG Name
                        All Change MG requests have been processed.</MsgTxt>
                  </changeMG>
            </Methods>
      </Response>
</CommandList>
```

Example format of **changeMG** Capacity

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList >
        <Command>
                <Interface>cs2kCfgMgrIf</Interface>
                <Methods>
                        < changeMG usn="1" version="1.0" >
                                <Parameters>
                                        <mgUIName>H323_M1</mgUIName>
                                        <reservedTerminations>500</reservedTerminations>
                                </Parameters>
                         </assocMG>
                </Methods>
        </Command>
</CommandList>
```

Example format of successful **changeMG** response to change Capacity :

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
        <Response>
                <Interface>cs2KCfgMgrIf</Interface>
                <Methods>
                        <changeMG usn="1" version="1.0">
                                <RC>0</RC>
                                <mgUIName>H323_M1</mgUIName>
                                <MsgTxt>H323_M1 Change MG Successful.
                                All Change MG requests have been processed.</MsgTxt>
                        </changeMG>
                </Methods>
        </Response>
</CommandList>
```

Example format of failed **changeMG** response to change Capacity

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
        <Response>
                <Interface>cs2KCfgMgrIf</Interface>
                <Methods>
                        <changeMG usn="1" version="1.0">
                                <RC>43</RC>
                                <MsgTxt>* H323_M1 Change MG Failed - Invalid MG Name
                                All Change MG requests have been processed.</MsgTxt>
                        </changeMG>
                </Methods>
        </Response>
</CommandList>
```

55.5.3.2 Command Examples for Associate MG command

The command syntax for assocMG command has not changed from prior releases in reference to adding H.323 GWs. The syntax is listed here as a convenience.

Example format of an **assocMG** command

```
<?xml version="1.0" encoding="UTF-8"  ?>
<CommandList>
  <Command>

      </Parameters>
   </assocMG>
  </Methods>
 </Command>
</CommandList>
```

55.5.3.3 Command Examples for Add Carrier command

The addCarrier command is an existing XML interface that is now used to provision H.323 EPGs. After adding a H.323 GW this command should be used to populate the terminations. The firstTN tag is optional and is used to dictate the starting location of a contiguous block of 24 or 32 EPs.

Example format of an **addCarrier** command **with optional firstTN** tag**:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList >
      <Command>
            <Interface>EndptGrpProvIf</Interface>
            <Methods>
                  <addCarrier usn="1" version="1.0" >
                        <Parameters>
                              <mgName>H323_M1</mgName>
                              <carrierName>EPG_001</carrierName>
                              <svcData>
                                 <H323 />
                              </svcData>
                              <firstTN>649</firstTN>
                        </Parameters>
                  </assocMG>
            </Methods>
      </Command>
</CommandList>
```

Example format of an **addCarrier** command **without optional firstTN** tag

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList >
        <Command>
                <Interface>EndptGrpProvIf</Interface>
                <Methods>
                        <addCarrier usn="1" version="1.0" >
                                <Parameters>
                                        <mgName>H323_M1</mgName>
                                        <carrierName>EPG_001</carrierName>
                                        <svcData>
                                           <H323 />
                                        </svcData>
                                </Parameters>
                        </assocMG>
                </Methods>
        </Command>
</CommandList>
```

Example format of successful **addCarrier** response:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
        <Response>
                <Interface>EndptGrpProvIf</Interface>
                <Methods><addCarrier usn="1" version="1.0">
                        <ReturnData>
                                <Row><firstTID>649</firstTID>
                                <numberOfTids>24</numberOfTids></Row>
                                <RC>0</RC>
                                <MsgTxt>Add CARRIER operation was successful</MsgTxt>
                        </ReturnData>
                </Methods>
        </Response>
</CommandList>
```

Example format of failed **addCarrier** response:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
        <Response>
                <Interface>EndptGrpProvIf</Interface>
                <Methods><addCarrier usn="1" version="1.0">
                        <MethodName>queryMG</MethodName>
                        <RC>4</RC>
                        <MsgTxt>EGP> The mgName does not have corresponding MG UI
name <MsgTxt>
                </Methods>
        </Response>
</CommandList>
```

55.5.3.4 Command Examples for List All Carriers command

The list all carriers command is an existing command that is now used to view mappings for H.323 EPGs. This command replaces the queryEndpointGroup command that was used in pre-SN07 releases. Several different tag filters are available to determine the scope of listings. For more details concerning other filters, refer to the schema later in this document.

Example format of **listAllCarriers** command with GWC filter**:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList >
        <Command>
            <Interface>EndptGrpProvIf</Interface>
            <Methods>
                    <listAllCarriers usn="1" version="1.0">
                    <Parameters>
                            <FILTER_GWC>
                               <gwcName>GWC-6</gwcName>
                            </FILTER_GWC>
                    </Parameters>
                    </listAllCarriers>
            </Methods>
        </Command>
</CommandList>
```

Example format of successful **listAllCarriers** response

```
<?xml version="1.0" encoding="UTF-8"?>
<CommandList>
<Response>
<Interface>EndptGrpProvIf</Interface>
<Methods>
<listAllCarriers usn="1" version="1.0">
<ReturnData>
<gwc name="GWC-6">
        <mg name="H323_M1">
<carrier name="EPG_001">
<svcData>
<service>PRI</service>
<IID>7</IID>
</svcData>
<endptList>
<endPt name="EPG_001.1"><tid>36 1</tid></endPt>
<endPt name="EPG_001.2"><tid>36 2</tid></endPt>
:
:
<endPt name="EPG_001.22"><tid>36 22</tid></endPt>
<endPt name="EPG_001.23"><tid>36 23</tid></endPt>
<endPt name="EPG_001.24"><tid>36 24</tid></endPt>
</endptList>
</carrier>
<carrier name="EPG_002">
<svcData>
<service>ISUP</service>
</svcData>
<endptList>
<endPt name="EPG_002.1"><tid>36 1401</tid></endPt>
<endPt name="EPG_002.2"><tid>36 1402</tid></endPt>
<endPt name="EPG_002.3"><tid>36 1403</tid></endPt>
:
:
<endPt name="EPG_002.22"><tid>36 1422</tid></endPt>
<endPt name="EPG_002.23"><tid>36 1423</tid></endPt>
<endPt name="EPG_002.24"><tid>36 1424</tid></endPt>
</endptList>
</carrier>
</mg>
</gwc>
<RC>0</RC>
<MsgTxt>
Retrieval of Carriers Successfully Completed. </MsgTxt>
</ReturnData>
</listAllCarriers>
</Methods>
</Response>
</CommandList>
```

Failed response to **listAllCarriers** command

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
      <Response>
            <Interface>EndptGrpProvIf</Interface>
            <Methods>
                <listAllCarriers usn="1" version="1.0">
                    <MethodName>listAllCarriers</MethodName>
                    <RC>4</RC>
                    <MsgTxt> The gwcName does not have corresponding Gateway
Controller</MsgTxt>
                </listAllCarriers>
            </Methods>
      </Response>
</CommandList>
```

55.5.3.5 Command examples of Disassociate MG

Tags values for the disAssocMG XML command are not changed in the SN07 release. Functionality for issuing this command has changed, however. Command syntax is listed here as a convenience to the reader.

Example format of **disAssocMG** command

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList >
      <Command>
          <Interface>cs2kCfgMgrIf</Interface>
          <Methods>
                  <disAssocMG usn="1" version="1.0">
                  <Parameters>
                        <mgUIName>H323_M1</mgUIName>
                  </Parameters>
                  </listAllCarriers>
          </Methods>
      </Command>
</CommandList>
```

55.5.3.6 Command examples of Delete Carrier

Tags values for the delete carrier XML command are not changed in the SN07 release. Functionality for issuing this command has changed, however. Command syntax is listed here as a convenience to the reader.

Example format of **Delete Carrier**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList >
        <Command>
            <Interface>EndptGrpProvIf</Interface>
            <Methods>
                    <deleteCarrier usn="1" version="1.0">
                    <Parameters>
                            <mgName>H323_M1</mgName>
                            <carrierName>EPG_000</carrierName>
                    </Parameters>
                    </listAllCarriers>
            </Methods>
        </Command>
</CommandList>
```

55.5.4 XML Schema Listings for affected H.323 commands

55.5.4.1 Change MG

The XML tags for the changeMG have been changed in the SN07 release. In SN06.2 and prior releases, the choice of “profile” or “capacity” was listed. Underlying server code did not support “profile” changes using this command so this tag has been removed. New tags “mgIpAddr” and “mgProtocolPort” have been added as optional parameters. With the new schema, the user has the ability to include the reserved termination choice or the IP address and/or Port choice, but, cannot list both choices within a single transaction. Since the IP address and Port tags have been made optional, the user can include either or both within a single transaction. Note that failure to include any of the choice tags will result in a failed operation.

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
            version="1.0"
            xml:lang="en" >

 </xsd:complexType>
</xsd:schema>
```

55.5.4.3 Add Carrier

The add carrier operation is now used to datafill H.323 EPG carrier groups. To datafill this type of carrier group, the H.323 service type should be used. For H.323 EPG carrier groups, the IID value should not be entered because it is auto-generated by the system.

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
            version="1.0"

  </xsd:simpleType>

</xsd:schema>
```

55.5.4.4 List All Carriers

The list all carriers schema is an existing interface that should be used to view Endpoint/TID mappings. This interface replaces the SN06.1 and SN06.2 queryEndpointGroup interface. No changes have been made to this interface for SN07, but, since it is now a required interface to list mappings for H.323 GWs it is listed here as a convenience.

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
```

```
            version="1.0"
            xml:lang="en" >
 <!-- ********************************************************************** -->
 <!-- * Define listAllCarriers Method Parameters  -->
 <!-- ********************************************************************** -->
 <xsd:complexType name="listAllCarriersMethodType">
  <xsd:sequence>
   <xsd:element name="Parameters" type="listAllCarParamsType" />
  </xsd:sequence>
  <xsd:attributeGroup ref="Usn_VersionAttrbGroup" />
 </xsd:complexType>
 <xsd:complexType name="listAllCarParamsType">
  <xsd:choice>
   <xsd:element name="FILTER_ALL" type="xsd:string" fixed="" />
   <xsd:element name="FILTER_GWC" type="filterGWCType" />
   <xsd:element name="FILTER_MG" type="filterMGType" />
   <xsd:element name="FILTER_CARRIER" type="filterCarType" />
  </xsd:choice>
 </xsd:complexType>
 <xsd:complexType name="filterMGType">
  <xsd:sequence>
   <xsd:element name="mgName" type="CarMGNameType" />
  </xsd:sequence>
 </xsd:complexType>
 <xsd:complexType name="filterCarType">
  <xsd:sequence>
   <xsd:element name="mgName" type="CarMGNameType" />
   <xsd:element name="carrierName" type="CarrierNameType" />
  </xsd:sequence>
 </xsd:complexType>

</xsd:schema>
```

55.5.4.5 Disassocate MG

Tags values for the disAssocMG XML command are not changed in the SN07 release. Schema's is listed here as a convenience to the reader.

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
            version="1.0"
            xml:lang="en" >

  </xsd:sequence>
 </xsd:complexType>
</xsd:schema>
```

55.6 Configuration Walkthrough

As previously mentioned, H.323 provisioning rules have changed from the 6.2 to the SN07 release. The following sections give a quick overview of operations used for provisioning and highlight the differences in the 2 releases. The operations are supported using either the CMT GUI or the XML interfaces except where indicated.

55.6.1 Adding a H.323 EPG

- SN06.2
  - — Add a H.323 GWC to the system
  - — Associate GW with the GWC
    - Adds GW to GWC
    - Adds EPG to GW
    - Picks starting TID automatically
    - Requires query to identify TID information for table TRKMEM
- SN07
  - — Add a H.323 GWC to the system
  - — Associate GW with the GWC

- Adds a GW to GWC
- Reserves TID space for EPGs

— Add EPGs to GW using Add Carrier command

- Allows users to specify starting TID
- Consistent with PVG trunking
- Repeat this step for the desired number of EPs and EPGs
- Query can be used to identify TID information if desired

55.6.2 Deleting a H.323 GW

- SN06.2
  - — Ensure EPs on the GW are in an Out Of Service state
  - — Select the GW to delete and issue disassociate MG command
    - Deletes EPGs from the GW
    - Deletes GW

- SN07
  - — Ensure EPs on the GW are in an Out Of Service state
  - — Delete EPGs from GW using Delete Carriers command
    - Repeat this step until all EPGs are removed
  - — Delete GW using Disassociate MG command

55.6.3 Increasing the Reserved Capacity for a H.323 GW

- SN06.2
  - — Not available

- SN07
  - — Select the GW from the GW GUI and issue change operation
    - Change value must be less than or equal to maximum value as dictated by GWs profile
    - GWC must have enough TID locations unreserved to accommodate change as dictated by the GWCs profile
  - — Add additional EPGs to GW using Add Carrier command
    - Allows users to specify starting TID
    - Consistent with PVG trunking

- Repeat this step for the desired number of EPs and EPGs
- Query can be used to identify TID information if desired

55.6.4 Decreasing the Reserved Capacity for a H.323 GW

- SN06.2
  - — Not available

- SN07
  - — Select and remove EPGs that are over the new lower limit if necessary using the Delete Carrier operation
  - — Select the GW from the GW GUI and issue change operation
    - Decreases TID reserve capacity allocated for GWC
    - Does not remove any EPs

56: Configuration (CN): A00004005

56.1 Hardware and Software Requirements

There is no pre-configuration assumptions/criteria.

56.2 Initial Configuration

There is no initial configuration. However, when replacing the session Server chassis with a spare in order to replace the motherboard and when the unit will not boot properly or when there is a need to verify that the BIOS is properly set up use this procedure: as soon as the server comes up with the HP Invent intro screen, hit F2 to go to BIOS When the BIOS screen eventually comes up, arrow over to Boot and change the 1st Boot Priority to be CDROM. F10 to save and exit. The Session Server will reboot again and will eventually go to the prompt that will boot the server.

56.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable.

56.4 Upgrade Impact

56.4.1 Dump and Restore

Not Applicable.

56.4.2 Element Management Upgrade

Not Applicable.

56.5 Data schema (DS) (CM, MIBS, RDB)

Not Applicable.

56.6 Service Orders (SO) (CM & SESM)

Not Applicable.

56.7 Software optionality control (SOC)

Not Applicable.

56.8 Element Management

The Session Server element manager is not used to perform or change configuration procedures, instead it is used to view the status of the system and to perform maintenance actions. Please refer to the FN section for snap shots of various GUI panels.

56.9 Command interface changes

On the Session Server there is a new command line interface tool developed to get system status and perform maintenance actions from command line as well as to facilitate the web based GUI implementation.

56.9.1 <mtccli Link Commands>

The mtccli tool supports the following link maintenance actions: lock, unlock, and swlnk.

56.9.1.1 Command syntax

Table 1 <mtccli lock> command parameters and variables

Command	Parameters and variables
mtccli lock	0|1
Parameters and variables	Description
lock	lock the inactive link

Table 2 <mtccli unlock> command parameters and variables

Command	Parameters and variables
mtccli unlock	0|1
Parameters and variables	Description
unlock	Unlock the inactive link.

Table 3 <mtccli swlnk> command parameters and variables

Command	Parameters and variables
mtccli swact	
Parameters and variables	Description
swlnk	Switch link activity.

Table 4 MTCCLI Link Command outputs with associated meanings and actions

Command: mtccli lock 0|1
mtccli lock 0|1 Reason: link already locked. **Meaning:** This response warns users that the link is already in a locked state **System or user actions:** You should unlock the link first before attempting to lock it. Use mtccli status to check link status, before attempting this command.
mtccli unlock 0|1 Reason: link already unlocked. **Meaning:** This response warns users that the link is already unlocked. **System or user actions:** You should lock the link first before attempting to unlock it. Use mtccli status to check link status, before attempting this command.
mtccli swlnk Reason: inactive link is locked Reason: inactive link is locked. the command fails due to attempting to switch link activity when inactive link is locked **Meaning:** This response warns users that the inactive link is locked. **System or user actions:** You should unlock the inactive link first before attempting to lock it. Use mtccli status to check link status, before attempting this command.

56.9.2 <mtccli Node Commands>

The mtccli tool supports the following node maintenance actions: swact, jam, and unjam.

56.9.2.1 Command syntax

Table 5 <mtccliswact|jam|unjam> command parameters and variables

Command	Parameters and variables
mtccli swact	<force>
Parameters and variables	Description

Table 5 <mtccliswact|jam|unjam> command parameters and variables

Command	Parameters and variables
swact	Performs unit switch of activity. This command supports the force option. It can be executed from the active unit only.

Table 6 <mtccli jam> command parameters and variables

Command	Parameters and variables
mtccli jam	
Parameters and variables	Description
jam	Performs jam of the inactive unit.This command can be executed from the active unit only.

Table 7 <mtccli unjam> command parameters and variables

Command	Parameters and variables
mtccli unjam	
Parameters and variables	Description
unjam	Performs unjam of the inactive unit. This command can be executed from the active unit only. There is one condition where the unjam action can be executed from the inactive unit: If the inactive is in a jammed state, and the active unit is unavailable, then the unjam command can be executed from the inactive unit.

Table 8 MTCCLI swact Command outputs with associated meanings and actions

Command: mtccli swact
mtccli swact Please wait this action may take up to 130 sec. Command passed. **Meaning:** This response gives users the estimated time it could take to execute the swact command as well as report that the command status. **System or user actions:** no action is required, command passed.

Table 8 MTCCLI swact Command outputs with associated meanings and actions

Command: mtccli swact
mtccli swact Error: Command failed. Reason: Mate not available. **Meaning:** This response warns users that the mate unit is unavailable. **System or user actions:** You should have both units booted and in enabled state before attempting the swact command.
mtccli swact Command failed. Reason: Not active unit. **Meaning:** This response warns users that the command is issued on the inactive unit. **System or user actions:** You should login to the active unit before issuing the swact command.
mtccli swact Error: Command failed. Reason: Application is out-of-sync. **Meaning:** This response warns users that the command failed because the mate unit operation state is diabled. **System or user actions:** You should wait until the mate operation state is enabled before attempting the swact command. Use mtccli status command to check mate operation status.
mtccli swact Please wait this action may take up to 130 sec. Error: Command failed. Reason: PRECHECK FAILED: application rejected request. **Meaning:** This response warns users that application rejected the swact request. **System or user actions:** You should check the design logs to find out the name of the application rejecting the request. Then try the command again, if the problem persists then contact your next level of support.

Table 9 MTCCLI jam Command outputs with associated meanings and actions

Command: mtccli jam
mtccli jam Reason: Not active unit. **Meaning:** This response warns users that the command is issued on the inactive unit. **System or user actions:** You should login to the active unit before issuing the jam command.

Table 10 MTCCLI unjam Command outputs with associated meanings and actions

Command: mtccli unjam
mtccli unjam Reason: already unjammed. **Meaning:** This response warns users that unit is not in a jam state or the command is issued on the inactive unit. **System or user actions:** You should jam the unit before attempting to the unjam command. Or if the command is issued on the inactive unit then, log to the active unit before issuing the unjam command.

56.9.3 <mtccli Reboot and Halt Commands>

The mtccli tool supports reboot and halt maintenance actions for both units from the active unit. In order to reboot the inactive unit the “mtccli rebootmate” command should be used, and to halt the inactive unit the “mtccli haltmate” command should be used.

56.9.3.1 Command syntax

Table 11 <mtccli reboot> command parameters and variables

Command	Parameters and variables
mtccli reboot	force
Parameters and variables	Description
reboot	reboot the active unit. This command can be executed from the active unit only.

Table 12 <mtccli halt> command parameters and variables

Command	Parameters and variables
mtccli halt	force
Parameters and variables	Description
halt	halt the active unit. This command can be executed from the active unit only.Warrning: after halting the system you have to physically be in front of the unit and press the rest button to recover the unit.

Table 13 <mtccli rebootmate> command parameters and variables

Command	Parameters and variables
mtccli rebootmate	force
Parameters and variables	Description
rebootmate	rebootmate command is used to reboot the inactive unit. This command can be executed from the active unit only.

Table 14 <mtccli haltmate> command parameters and variables

Command	Parameters and variables
mtccli haltmate	force
Parameters and variables	Description
haltmate	haltmate command is used to halt the inactive unit. This command can be executed from the active unit only. Warning: after halting the system you have to physically be in front of the unit and press the rest button to recover the unit.

Table 15 MTCCLI reboot Command outputs with associated meanings and actions

Command: mtccli reboot
mtccli reboot Reason: Not active unit. **Meaning:** This response warns users that the command was issued on the inactive unit. **System or user actions:** You should issue the reboot command from the active unit. Use mtccli status command to check units activity, before attempting this command.
mtccli reboot Reason: Mate is available. **Meaning:** This response warns users that the inactive unit is still available. **System or user actions:** You can not reboot the active unit if the inactive is still available. You should reboot the inactive unit first using rebootmate, then switch activity before attempting to reboot.

Table 16 MTCCLI halt Command outputs with associated meanings and actions

Command: mtccli halt
mtccli halt Reason: Not active unit. **Meaning:** This response warns users that the command was issued on the inactive unit. **System or user actions:** You should issue the halt command from the active unit. Use mtccli status command to check units activity, before attempting this command.
mtccli halt Reason: Mate is available. **Meaning:** This response warns users that the inactive unit is still available. **System or user actions:** You can not halt the active unit if the inactive is still available. You should reboot the inactive unit first using rebootmate, then switch activity before attempting to halt.

Table 17 MTCCLI rebootmate Command outputs with associated meanings and actions

Command: mtccli rebootmate
mtccli rebootmate Command failed. Reason: Not active unit. **Meaning:** This response warns users that the command was issued on the inactive unit. **System or user actions:** You should issue the rebootmate command from the active unit. Use mtccli status command to check units activity, before attempting this command.
mtccli reboot Reason: Mate is available. **Meaning:** This response warns users that the inactive unit is still available. **System or user actions:** You can not reboot the active unit if the inactive is still available. You should reboot the inactive unit first using rebootmate, then switch activity before attempting to reboot.
mtccli rebootmate Please wait this action may take up to 230 sec. Error: Command failed. Reason: PRECHECK FAILED: application rejected request. **Meaning:** This response warns users that the reboot mate command can not be executed because application failed precheck request. **System or user actions:** You should check design logs to find out the name of the application rejecting the request. Then try the command again, if the problem persists, then contact your next level of support.

Table 18 MTCCLI haltmate Command outputs with associated meanings and actions

Command: mtccli haltmate
mtccli haltmate Reason: Not active unit. **Meaning:** This response warns users that the command was issued on the inactive unit. **System or user actions:** You should issue the halt command from the active unit. Use mtccli status to check activity status, before attempting this command.

Table 18 MTCCLI haltmate Command outputs with associated meanings and actions

Command: mtccli haltmate
mtccli haltmate Reason: Mate is available. **Meaning:** This response warns users that the inactive unit is still available. **System or user actions:** You can not halt the active unit if the inactive is still available. You should reboot the inactive unit first using rebootmate, then switch activity before attempting to halt.
mtccli haltmate Please wait this action may take up to 230 sec. Error: Command failed. Reason: PRECHECK FAILED: application rejected request. **Meaning:** This response warns users that the halt mate command can not be executed because application failed precheck request. **System or user actions:** You should check design logs to find out the name of the application rejecting the request. Then try the command again, if the problem persists, then contact your next level of support.

56.9.4 <mtccli Query Commands>

The mtccli tool supports the following system query commands: qrycpu, qryzmb, qrymem, qryntp, qrycputl, qryoper, qrymateoper and queryip.

56.9.4.1 Command syntax

Table 19 <mtccli qrycpu> command parameters and variables

Command	Parameters and variables
mtccli qrycpu	
Parameters and variables	Description
qrycpu	Displays CPU load average and 1 minute load average thresholds

Table 20 <mtccli qryzmb> command parameters and variables

Command	Parameters and variables
mtccli qryzmb	
Parameters and variables	Description
qryzmb	Displays number of zombie processes and the alarm thresholds

Table 21 <mtccli qrymem> command parameters and variables

Command	Parameters and variables
mtccli qrymem	
Parameters and variables	Description
qrymem	Displays system memory report and the alarm thresholds based on the amount of avail memory remaining.

Table 22 <mtccli qryntp> command parameters and variables

Command	Parameters and variables
mtccli qryntp	
Parameters and variables	Description
qryntp	Displays NTP servers report.

Table 23 <mtccli qrycputl> command parameters and variables

Command	Parameters and variables
mtccli qrycputl	
Parameters and variables	Description
qrycputl	Displays CPU utilization report and the CPU utilization alarm thresholds average.

Table 24 <mtccli queryip> command parameters and variables

Command	Parameters and variables
mtccli queryip	
Parameters and variables	Description
queryip	Displays server IP addresses.

Table 25 <mtccli qryoper> command parameters and variables

Command	Parameters and variables
mtccli qryoper	
Parameters and variables	Description
qryoper	Displays server operation state.

Table 26 <mtccli qrymateoper> command parameters and variables

Command	Parameters and variables
mtccli qrymateoper	
Parameters and variables	Description
qrymateoper	Displays mate operation state.

56.9.4.2 Example

```
mtccli qrycpu
CPU Load Average report retrieved on Thu Apr 22 13:56:54 2004:

      1 min Load Avg: 1.04
      5 min Load Avg: 1.07
     15 min Load Avg: 0.83

 Number of Processes: 68

   Alarm Description: 1 minute load average
     Minor threshold: 10.00
     Major threshold: 20.00
  Critical threshold: 40.00

mtccli qryzmb
Zombie process report retrieved on Thu Apr 22 13:57:15 2004:

 Number of Zombie Processes: 0

  Alarm Description: Number of zombie processes
    Minor threshold: 5
    Major threshold: 10
 Critical threshold: 15

mtccli qryntp
NTP report retrieved on Thu Apr 22 13:57:30 2004:

  Total number of time servers: 2
  Number of accessible servers: 2
Number of synchronized servers: 2
Time Offset from server 10.40.4.101: 8(ms)
```

```
mtccli qrycputl
CPU Utilization report retrieved on Thu Apr 22 13:57:47 2004:

      5 min Util Avg: 4.18
     20 min Util Avg: 5.05
     30 min Util Avg: 0.00
   Alarm Description: cpu utilization average
     Minor threshold: over 95.00% for 5 minutes
     Major threshold: over 99.00% for 20 minutes
  Critical threshold: over 99.00% for 30 minutes

mtccli queryip
Query IP Address report for unit 0:
Description     IP Address
localptp        192.168.1.1
localport0      10.40.5.57
localport1      10.40.5.58
localblade      10.40.5.59
activeip        10.40.5.64
inactiveip      10.40.5.63
mateptp         192.168.1.2
mateport0       10.40.5.60
mateport1       10.40.5.61
mateblade       10.40.5.62

mtccli qryoper
Enabled

mtccli qrymateoper
Disabled
```

56.9.5 <mtccli System Status and Alarms Commands>

In addition to the query commands the mtccli tool supports the status and alarms commands.

The status command displays both Session Servers units status.

```
mtccli status
Unit 0 Status:
              Jam:  Link0:  Link1:  PTPLink:  OperationState:
Unit0  Inact  no    . Inact . Act    .        Enabled
Unit1  Act    no    . Act   . Inact  .        Enabled
```

The alarms command displays the overall system alarms

```
mtccli alarms
 SessServer      SYS      CON      APPL             Unit: 1
  simplx        NTP      MatCon   simplx
    M                      M        M
```

The status/alarms commands have support the -c option to display a continues system status/alarms. To exit the continues mode enter Ctrl-c.

56.9.5.1 Command syntax

Table 27 <mtccli status> command parameters and variables

Command	Parameters and variables
mtccli status	-c option
Parameters and variables	Description
status	Displays both units status. The -c option can be used to run the command in continues mode. To exit -c option, enter Ctrl-c

Table 28 <mtccli alarms> command parameters and variables

Command	Parameters and variables
alarms	-c option
Parameters and variables	Description
alarms	Displays overall alarms status. The -c option can be used to run the command in continues mode. To exit -c option, enter Ctrl-c

57.11 Configuration Walkthrough

58: Configuration (CN): A00004045

58.1 Hardware and Software Requirements

In order to perform CLIDN call tracing on the DMS-250, SOC UTRS0012 must be ON and the desired termination number(s) must be datafilled in table CLIDN.

58.2 Initial Configuration

This feature impacts EANT, PRI, DAL, ONAL, ONAT and IMT trunks.

This feature creates a section for existing table CLIDN (see Section 13.5.1).

58.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

58.4 Upgrade Impact

58.4.1 Dump and Restore

If ACTPATCH KGL03 (UCS19)is active on Dump side, then UTRS0012 will be set to RTU "Y" and "ON" on ONP to the sourced release (restore side UCS20 and above).

58.4.2 Element Management Upgrade

N/A

58.5 Data schema (DS) (CM, MIBS, RDB)

58.5.1 New table

Table CLIDN is new to the UCS DRU, but currently exists in DMS-100/200.

Table 1 New table

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
CLIDN	NEW	UNCHANGED

58.5.2 Table/MIB/Remote Database Schema information

58.5.2.1 Name: CLIDN

Calling Line Identification Directory Number

58.5.2.1.1 Functional description

Table CLIDN allows for a maximum of 67 ten-digit directory number (DN) (area code + office code + DN) tuples for which CLI call tracing is provided.

These DNs are external to the switching unit. The ten-digit DNs include an area code + office code + directory number or a service code.

For a service code (i.e., 411, 911, 0, etc.) or a seven-digit DN, the letter N must be prefixed to make the total digit count equal to 10. The system internally translates the letter N to 0.

Table CLIDN is associated with the TRK605 log on the DMS-250 switch. When the called number is datafilled in table CLIDN, UTRS0012 SOC option is ON and the incoming trunk type is supported (trunk types: EANT, PRI, DAL, ONAL, ONAT or IMT), the TRK605 log is generated.

The TRK605 log report contains the following fields:

- the incoming trunk group and number
- the outgoing trunk group and number
- the called party number
- the originating party number
- the date and time

58.5.2.1.2 Usage sequence and implications (CM Only)

No other tables need to be datafilled prior to entering data into table CLIDN.

58.5.2.1.3 .Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
CLIDN	0	67	

58.5.2.1.4 Fields

The following table lists field description for table CLIDN.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
DIGITS	N/A		numeric digits 0-9 and N	*Digits.* The entry is equal to the ten-digit DN of a line external to the switching unit. The letter N must prefix service codes like 411, 911 and 0. This action makes the total digit count equal to 10. The system translates the letter N internally to 0.

58.5.2.1.5 Datafill example

The Figure 1 shows an example of datafill for table CLIDN. The example contains a service code, 7-digit DN and 10-digit DN.

Figure 1 MAP example for table CLIDN

```
TABLE: CLIDN

DIGITS
----------
NNNNNNN411
NNN8765000
2018213456
```

58.5.2.1.6 Table release history update

Design activity A00004045 (CLIDN for DMS-250) introduced log report TRK605 to the UCS DRU in SN07.

Design activity AN1658 (Inter-Switch Call Trace) introduced log report TRK605 in CNA05.

58.5.2.1.7 Supplementary information

N/A

58.5.2.1.8 Translation verification other tools

Table CLIDN does not use translation verification tools.

58.11 Configuration Walkthrough

In order to perform CLIDN call tracing on the DMS-250, SOC UTRS0012 must be ON and the desired called number(s) must be datafilled in table CLIDN.

59: Configuration (CN): A00004046

59.1 Initial Configuration

Customers must consider the ECAN requirements of trunk members that will comprise trunk groups within the network. The inability to set more than two simultaneous SPMECIDX values within a trunk group is the source of this constraint.

The SPMECIDX field identifies a particular ECAN configuration tied to trunk members within a trunk subgroup. The existing TRKSGRP table only allows two tuples within the same trunkgroup. Therefore, for SPM based trunks coexisting with ENET based trunks, there are only 2 possible ECAN alternatives available.

59.2 Office parameters (CM)

The ECAN_EDGE_STRATEGY office parameter's role is changing slightly in SN07. This change impacts the role of this office parameter for determining ECAN implementation strategy within the network.

59.2.1 Modified office parameters

Table 1 Modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	ECAN_EDGE_STRARTEGY	CHANGED	CM

59.2.2 Parameter information

59.2.2.1 ECAN_EDGE_STRATEGY

ECAN_EDGE_STRATEGY in table OFCENG.

59.2.2.1.1 Functional description

The ECAN_EDGE_STRATEGY is used to determine ECAN resource allocation strategy within the network. The role of this parameter is changing in SN07 to only impact AAL1 networks. The assumption is that all other packet networks are EDGE strategy by default.

59.2.2.1.2 Provisioning rules

No Change

59.2.2.1.3 Range information

No Change

59.2.2.1.4 Activation

No Change

59.2.2.1.5 Dependencies

No Change

59.2.2.1.6 Consequences

No Change

59.2.2.1.7 Verification

No Change

59.2.2.1.8 Memory requirements

No Change

59.2.2.1.9 Parameter release history update

ECAN_EDGE_STRATEGY in table OFCENG in SN07 and beyond will only apply to AAL1 bearer networks. All other packet network type such as IP will assume the edge ECAN strategy.

59.3 Upgrade Impact

59.3.1 Dump and Restore

There is no impact to upgrades.

59.3.2 Element Management Upgrade

Not applicable.

60: Configuration (CN): A00004126

60.1 Hardware and Software Requirements

It is assumed that all basic provisioning is complete up to and including Table SPMECAN.

60.2 Initial Configuration

Not Applicable.

60.3 Upgrade Impact

60.3.1 Dump and Restore

All tuples in Table SPMECAN will contain the new IGNOREEC field as they are transferred from the old BCS side to the new. The new field will be set FALSE as a default value. There is no preparation that must be done by the customer until after the dump and restore has completed.

If the customer wishes to change the field afterwards then they must use standard Table Control mechanisms to set the IGNOREEC bool to Y.

60.3.2 Element Management Upgrade

Not Applicable.

60.4 Data schema (DS) (CM, MIBS, RDB)

60.4.1 New/modified tables, MIBs, or Database Schema

Adding a new IGNOREEC field to the existing table definition of SPMECAN.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SPMECAN	CHANGED	NEW

60.4.2 Table/MIB/Remote Database Schema information

60.4.2.1 Name: SPMECAN

SPM Echo Cancellation Table

60.4.2.1.1 Functional description

Table SPMECAN provides entries which define the attributes of specific ECAN setup. Tuples in Table TRKSGRP can assign (as an option) an index into Table SPMECAN to that subgroup. All trunks which use this subgroup

will also use the specific SPMECAN setup as defined in the SPMECAN tuple associated to the index used by subgroup tuple.

60.4.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

- Current datafill order unchanged.

60.4.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SPMECAN	0	256	new field adds 1 bool (bit) to overall size of physical store. Since the store is word aligned there is actually no additional memory usuage.

60.4.2.1.4 Fields/OIDs

The following table lists fields/OIDs for SPMECAN.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
IGNOREEC	NEW	NA	Y/N	Long Name: ignoreec Default Value: N For rules on setting this bool see “60.5 Configuration Walkthrough” on page 3262

60.4.2.1.5 Datafill example

The following example shows sample datafill for table SPMECAN:

```
>table spmecan
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED

TABLE: SPMECAN
>lis
TOP
ECINDEX TONDS TONMG TONEDMOD S56KB AUTON NLP NSMAT SOS TDINC  MDLA MERL ACOM
FAREC BK2BK IGNOREEC S2COMPAT ECBYTE1 ECBYTE2 ECBYTE3 ECBYTE4
---------------------------------------------------------------------------
```

```
1     Y     Y     G165     Y     Y   Y     Y   Y     Y  32MS  6DB 33DB
N     Y     N    S2C_NORM      00      00      00      00
```

60.4.2.1.6 Table release history update

A new field is added to Table SPMECAN called IGNOREEC. This field (if set to Y) is used to instruct CEM Callp if it should use the FAREC and BK2BK fields in the SPMECAN tuple to set up ECANs for individual calls. If the field is set N, then ECANs are set up using the EC bits in the ACM/ANS and ANI callp messages in the CEM.

60.4.2.1.7 Supplementary information

Not Applicable

60.4.2.1.8 Translation verification other tools

None.

60.5 Configuration Walkthrough

The walkthrough or datafill order for this table has not changed. The IGNOREEC field can be set Y or N depending on the use of the SPMECAN tuple in table TRKSGRP. The following rule apply:

- When changing the IGNOREEC bit from N to Y, it cannot be set Y if there are existing TRKSGRP tuples that use this SPMECAN index (tuple) and support any signaling type other than CCS7.

  The following string is output at the MAP table control when this error occurs (where nnn = range of datafilled trksgrp tuples):

  ```
  "Non-CCS7 tuple(s) in Table TRKSGRP are using this ECAN index."
  "See SGRP Index:nnnn in Table TRKSGRP."
  ```

- When changed to Y, the new setting of the IGNOREEC bit will apply to all TRKSGRP CCS7 tuples that use the SPMECAN index.
- When changing the IGNOREEC bit from Y to N, it can be set N even if there are tuples in Table TRKSGRP that use this SPMEC index. The setting of the bit to N will be applied to all Trunk Subgroups that use this SPMECAN index.
- When changing a tuple in Table TRKSGRP to use an existing SPMECAN index that has the IGNOREEC bool set to Y, the TRKSGRP tuple must only support ISUP. If it supports any other signaling type the following error messages appear (depending on whether the load is a CNA or UCS load):

  CNA:

  ```
  "SPMECIDX IS NOT SUPPORTED ON THIS TRUNK"
  "TYPE FOR MG4K NA100 PTS."

  "SPMECIDX IS NOT SUPPORTED ON THIS TRUNK"
  "TYPE FOR MG4K NA100 ISDN."
  ```

  UCS:

```
"SPMECIDX IS NOT SUPPORTED ON THIS TRUNK"
"TYPE FOR MG4K UCS PTS."

"SPMECIDX IS NOT SUPPORTED ON THIS TRUNK"
"TYPE FOR MG4K UCS  ISDN."
```

61: Configuration (CN): A00004131

61.1 Hardware and Software Requirements

No new hardware or software requirements are created by this activity.

61.2 Initial Configuration

Standard configuration applies.

61.3 Office/Subnet parameters (OP/SP) (CM & SESM)

61.3.0.0.1 Activation

BCH negotiation functionality applies only when SOC option TRKGRP:OLISCRN is set to ‘1’ and is set to ‘ON’.’.

61.4 Upgrade Impact

NONE.

61.5 Data schema (DS) (CM, MIBS, RDB)

61.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Not applicable.

62.10 Configuration Walkthrough

Not applicable.

63: Configuration (CN): A00004260

63.1 Hardware and Software Requirements

Only requires SN07 load in Core. Will be patched back to SN06.

The parameter and log names are different between SN06 and SN07. In SN06, there will be ATM606, ATM806, and ATM807 logs. In SN07, these logs have been replaced with XPKT301, XPKT806, and XPKT807, respectively. Versions of this DDOC prior to issue AA24 will show the names used in SN06, while issue AA24 and later will show the names used in SN07.

63.2 Initial Configuration

At the CI prompt, enter these commands:

- ENGWRITE ON
- TABLE OFCENG
- POS XPKT806_SMG4_RAISE_CLEAR

which positions on the first of the four new tuples.

63.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Introducing three new office parameters for Table OFCENG in the CM.

63.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	XPKT806_SMG4_RAISE_CLEAR	New	CM
OFCENG	XPKT806_IW_RAISE_CLEAR	New	CM
OFCENG	XPKT806_DPT_RAISE_CLEAR	New	CM
OFCENG	XPKT806_SUPPRESSES_XPKT301	New	CM

63.3.2 Parameter information

63.3.2.1 XPKT806_SMG4_RAISE_CLEAR

SMG4 node threshold parameters for raising and clearing XPKT806 alarm.

63.3.2.1.1 Functional description

This parameter controls the raising of an XPKT806 major alarm for SMG4 nodes due to the number of XPKT301 hits against the SMG4 nodes. It also controls clearing the alarm via an XPKT807 log.

There are four subfields for this tuple:

1. RAISE_THRESHOLD - when the number of XPKT301 logs against the SMG4 node crosses (i.e. reaches or exceeds) this number during the raise cycle, then generate an XPKT806 log with major alarm, update “nn PKT” display under the APPL banner, and change the node to a clear cycle. Range is 0 to 32767. Default is 0, which disables this feature for all SMG4 nodes. Recommended value is 2.
2. RAISE_CYCLE - number of minutes in the “raise cycle” where we count the number of XPKT301 logs against the SMG4 node to see if XPKT806 needs to be generated. Range is 1 to 1440, where 1440 = 60 minutes per hour times 24 hours in a day. So we can go as fast as every minute, or as slow as every day. Default is 15, which is also the recommended value.
3. CLEAR_THRESHOLD - when the number of XPKT301 logs against the SMG4 node meets (or falls below) this number during the clear cycle, then generate an XPKT807 log, update “nn PKT” display under the APPL banner, and change the node to a raise cycle. Range is 0 to 32767. Default is 0, meaning there must be no XPKT301 failures against the node during the clear cycle to generate the XPKT807 log. Recommended value is 0.
4. CLEAR_CYCLE - number of minutes in the “clear cycle” where we count the number of XPKT301 logs against the SMG4 node to see if XPKT807 needs to be generated. Range is 1 to 1440. Default is 5, which is also the recommended value.

63.3.2.1.2 Provisioning rules

It is recommended (but not enforced) that RAISE_THRESHOLD should be greater than or equal to CLEAR_THRESHOLD. When this situation is encountered, the user will be warned with:

Warning: CLEAR_THRESHOLD should not exceed
RAISE_THRESHOLD.

If RAISE_THRESHOLD is set to a zero value (i.e. disabling the feature), then this message will be seen instead:

Note: Disabled reporting of XPKT806 alarms for all SMG4 nodes.

If the feature is disabled (i.e. RAISE_THRESHOLD = 0) and the user attempts to change the other fields, then this warning will be generated:

Warning: Altering these fields will have no effect since the feature is disabled (i.e. RAISE_THRESHOLD = 0).

63.3.2.1.3 Range information

Since this tuple has subfields, we will show 4 numbers for each table entry. The

Table 2 Range Information

Minimum	Maximum	Default
0, 1, 0, 1	32767, 1440, 32767, 1440	0, 15, 0, 5 Setting RAISE_THRESHOLD to 0 disables this feature for all SMG4 nodes.

numbers correspond to the subfields described above in the Functional Description.

63.3.2.1.4 Activation

Activation is immediate and will be conveyed to the user with this message whenever the parm values are changed while RAISE_THRESHOLD is non-zero (i.e. feature is enabled):

Note: This office parm change takes effect immediately for all SMG4 nodes by resetting the detection cycles with the updated parameter values.

If any XPKT806 alarms are present when the feature becomes disabled, then the alarms will be cleared immediately.

If any XPKT806 alarms are present when the parameters are changed while the feature is enabled, then the alarms will remain raised.

63.3.2.1.5 Dependencies

None

63.3.2.1.6 Consequences

None

63.3.2.1.7 Verification

To check that the office parameter changes are working, go to the MAPCI;MTC;APPL;PKT;SPM_ATM level and enter the PARMS command.

To actually see the XPKT806 alarm raised, you will need to cause XPKT301 logs via ATM call connection failures. Do NOT cause these failures in a live switch.

63.3.2.1.8 Memory requirements

No memory impact.

63.3.2.1.9 Parameter release history update

Introduced new XPKT806_SMG4_RAISE_CLEAR parameter for Table OFCENG that controls raising XPKT806 alarm for SMG4 nodes.

63.3.2.2 XPKT806_IW_RAISE_CLEAR

IW node threshold parameters for raising and clearing XPKT806 alarm.

63.3.2.2.1 Functional description

This parameter controls the raising of an XPKT806 major alarm for IW nodes due to the number of XPKT301 hits against the IW nodes. It also controls clearing the alarm via an XPKT807 log.

There are four subfields for this tuple:

1. RAISE_THRESHOLD - when the number of XPKT301 logs against the IW node crosses (i.e. reaches or exceeds) this number during the raise cycle, then generate an XPKT806 log with major alarm, update “nn PKT” display under the APPL banner, and change the node to a clear cycle. Range is 0 to 32767. Default is 0, which disables this feature for all IW nodes. Recommended value is 2.
2. RAISE_CYCLE - number of minutes in the “raise cycle” where we count the number of XPKT301 logs against the IW node to see if XPKT806 needs to be generated. Range is 1 to 1440, where 1440 = 60 minutes per hour times 24 hours in a day. So we can go as fast as every minute, or as slow as every day. Default is 15, which is also the recommended value.
3. CLEAR_THRESHOLD - when the number of XPKT301 logs against the IW node meets (or falls below) this number during the clear cycle, then generate an XPKT807 log, update “nn PKT” display under the APPL banner, and change the node to a raise cycle. Range is 0 to 32767. Default is 0, meaning there must be no XPKT301 failures against the node during the clear cycle to generate the XPKT807 log. Recommended value is 0.
4. CLEAR_CYCLE - number of minutes in the “clear cycle” where we count the number of XPKT301 logs against the IW node to see if XPKT807 needs to be generated. Range is 1 to 1440. Default is 5, which is also the recommended value.

63.3.2.2.2 Provisioning rules

It is recommended (but not enforced) that RAISE_THRESHOLD should be greater than or equal to CLEAR_THRESHOLD. When this situation is encountered, the user will be warned with:

Warning: CLEAR_THRESHOLD should not exceed RAISE_THRESHOLD.

If RAISE_THRESHOLD is set to a zero value (i.e. disabling the feature), then this message will be seen instead:

Note: Disabled reporting of XPKT806 alarms for all IW nodes.

If the feature is disabled (i.e. RAISE_THRESHOLD = 0) and the user attempts to change the other fields, then this warning will be generated:

Warning: Altering these fields will have no effect since the feature is disabled (i.e. RAISE_THRESHOLD = 0).

63.3.2.2.3 Range information

Since this tuple has subfields, we will show 4 numbers for each table entry. The

Table 3 Range Information

Minimum	Maximum	Default
0, 1, 0, 1	32767, 1440, 32767, 1440	0, 15, 0, 5 Setting RAISE_THRESHOLD to 0 disables this feature for all IW nodes.

numbers correspond to the subfields described above in the Functional Description.

63.3.2.2.4 Activation

Activation is immediate and will be conveyed to the user with this message whenever the parm values are changed while RAISE_THRESHOLD is non-zero (i.e. feature is enabled):

Note: This office parm change takes effect immediately for all IW nodes by resetting the detection cycles with the updated parameter values.

If any XPKT806 alarms are present when the feature becomes disabled, then the alarms will be cleared immediately.

If any XPKT806 alarms are present when the parameters are changed while the feature is enabled, then the alarms will remain raised.

63.3.2.2.5 Dependencies
None

63.3.2.2.6 Consequences
None

63.3.2.2.7 Verification
To check that the office parameter changes are working, go to the MAPCI;MTC;APPL;PKT;SPM_ATM level and enter the PARMS command.

To actually see the XPKT806 alarm raised, you will need to cause XPKT301 logs via ATM call connection failures. Do NOT intentionally cause these failures in a live switch!

63.3.2.2.8 Memory requirements
No memory impact.

63.3.2.2.9 Parameter release history update
Introduced new XPKT806_IW_RAISE_CLEAR parameter for Table OFCENG that controls raising XPKT806 alarm for IW nodes.

63.3.2.3 XPKT806_DPT_RAISE_CLEAR
DPT node threshold parameters for raising and clearing XPKT806 alarm.

63.3.2.3.1 Functional description
This parameter controls the raising of an XPKT806 major alarm for DPT nodes due to the number of XPKT301 hits against the DPT nodes. It also controls clearing the alarm via an XPKT807 log.

There are four subfields for this tuple:

1. RAISE_THRESHOLD - when the number of XPKT301 logs against the DPT node crosses (i.e. reaches or exceeds) this number during the raise cycle, then generate an XPKT806 log with major alarm, update “nn PKT” display under the APPL banner, and change the node to a clear cycle. Range is 0 to 32767. Default is 0, which disables this feature for all DPT nodes. Recommended value is 2.
2. RAISE_CYCLE - number of minutes in the “raise cycle” where we count the number of XPKT301 logs against the DPT node to see if XPKT806 needs to be generated. Range is 1 to 1440, where 1440 = 60 minutes per hour times 24 hours in a day. So we can go as fast as every minute, or as slow as every day. Default is 15, which is also the recommended value.

3. CLEAR_THRESHOLD - when the number of XPKT301 logs against the DPT node meets (or falls below) this number during the clear cycle, then generate an XPKT807 log, update “nn PKT” display under the APPL banner, and change the node to a raise cycle. Range is 0 to 32767. Default is 0, meaning there must be no XPKT301 failures against the node during the clear cycle to generate the XPKT807 log. Recommended value is 0.
4. CLEAR_CYCLE - number of minutes in the “clear cycle” where we count the number of XPKT301 logs against the DPT node to see if XPKT807 needs to be generated. Range is 1 to 1440. Default is 5, which is also the recommended value.

63.3.2.3.2 Provisioning rules

It is recommended (but not enforced) that RAISE_THRESHOLD should be greater than or equal to CLEAR_THRESHOLD. When this situation is encountered, the user will be warned with:

Warning: CLEAR_THRESHOLD should not exceed RAISE_THRESHOLD.

If RAISE_THRESHOLD is set to a zero value (i.e. disabling the feature), then this message will be seen instead:

Note: Disabled reporting of XPKT806 alarms for all DPT nodes.

If the feature is disabled (i.e. RAISE_THRESHOLD = 0) and the user attempts to change the other fields, then this warning will be generated:

Warning: Altering these fields will have no effect since the feature is disabled (i.e. RAISE_THRESHOLD = 0).

63.3.2.3.3 Range information

Since this tuple has subfields, we will show 4 numbers for each table entry. The

Table 4 Range Information

Minimum	Maximum	Default
0, 1, 0, 1	32767, 1440, 32767, 1440	0, 15, 0, 5 Setting RAISE_THRESHOLD to 0 disables this feature for all DPT nodes.

numbers correspond to the subfields described above in the Functional Description.

63.3.2.3.4 Activation

Activation is immediate and will be conveyed to the user with this message whenever the parm values are changed while RAISE_THRESHOLD is non-zero (i.e. feature is enabled):

> Note: This office parm change takes effect immediately for all DPT nodes by resetting the detection cycles with the updated parameter values.

If any XPKT806 alarms are present when the feature becomes disabled, then the alarms will be cleared immediately.

If any XPKT806 alarms are present when the parameters are changed while the feature is enabled, then the alarms will remain raised.

63.3.2.3.5 Dependencies

None

63.3.2.3.6 Consequences

None

63.3.2.3.7 Verification

To check that the office parameter changes are working, go to the MAPCI;MTC;APPL;PKT;SPM_ATM level and enter the PARMS command.

To actually see the XPKT806 alarm raised, you will need to cause XPKT301 logs via ATM call connection failures. Do NOT cause these failures in a live switch.

63.3.2.3.8 Memory requirements

No memory impact.

63.3.2.3.9 Parameter release history update

Introduced new XPKT806_DPT_RAISE_CLEAR parameter for Table OFCENG that controls raising XPKT806 alarm for DPT nodes.

63.3.2.4 XPKT806_SUPPRESSES_XPKT301

Suppress XPKT301 logs while XPKT806 alarm is raised against SPM node impacted by the XPKT301.

63.3.2.4.1 Functional description

This parameter controls the suppression of XPKT301 logs for SPM nodes that are already in an XPKT806 alarm condition. Possible values are Y and N, with default of N and recommended value of Y. This parameter is “off” (N) by default, so it must be turned “on” (Y) to suppress XPKT301 logs.

63.3.2.4.2 Provisioning rules

None

63.3.2.4.3 Range information

Table 5 Range Information

Minimum	Maximum	Default
N	Y	N

63.3.2.4.4 Activation

Activation is immediate. When value is changed from N to Y, the customer will see this informational message:

> Note: XPKT301 logs are now being suppressed for SPM nodes with the XPKT806 alarm raised.

When values is changed from Y to N, the customer will see this informational message:

> Note: No longer suppressing XPKT301 logs.

63.3.2.4.5 Dependencies

None

63.3.2.4.6 Consequences

None

63.3.2.4.7 Verification

Only way to verify operation is to cause a flood of XPKT301 failures that result from ATM call connection failures, then verify the XPKT301 logs are suppressed as XPKT806 alarms occur. Do NOT cause these failures in a live switch.

63.3.2.4.8 Memory requirements

No memory impact.

63.3.2.4.9 Parameter release history update

Introduced new XPKT806_SUPPRESSES_XPKT301 office parameter in Table OFCENG to suppress XPKT301 logs while XPKT806 alarm is raised.

63.4 Upgrade Impact

63.4.1 Dump and Restore

No impact.

63.5 Data schema (DS) (CM, MIBS, RDB)

No impact.

63.6 Service Orders (SO) (CM & SESM)

No impact.

63.7 Software optionality control (SOC)

No impact.

63.8 Element Management

No impact.

63.9 Command interface changes

63.9.1 Map Level: MTC

63.9.1.1 Level description

Modify the APPL banner in the existing/resident Map MTC level so a new alarm will be displayed whenever one of the SMG4/IW/DPT nodes have an XPKT806 alarm present. The new alarm is “nn PKT” with major severity, where “nn” is the number of SMG4/IW/DPT nodes with the alarm and “PKT” is Packet. The precedence of “nn PKT” with respect to existing APPL alarms is that “nn PKT” is higher than a SDM billing alarm but lower than a SysB SDM alarm.

Here’s how the Map banner will appear if two nodes have the XPKT806 alarm:

```
XAC      MS     IOD     Net      PM     CCS     Lns     Trks    Ext     APPL
   .       .       .       .       .       .       .       .       .    2 PKT
                                                                        M

Error: PKT command not supported in MTXP/MSH Combo loads.

63.9.3.7 Responses

If non-Combo load, then only response is to take user to the PKT level described below.

63.9.4 Map Level: PKT

63.9.4.1 Level description

Added new/resident Map PKT (for "Packet") level to show a dynamic summary of nodes contributing to the "nn PKT" alarm, and provide a new SPM_ATM command.

Here's how the Map will appear at the new PKT level when there are two SPM nodes with an XPKT806 alarm. The "SPM_ATM = 2" is the dynamic status that shows the number of ATM SPM (MG4K, IW, DPT) nodes that are contributing to the current "nn PKT" alarm. When there are no nodes with the XPKT806 alarm, a dot will be shown instead of a number (e.g. "SPM_ATM = .").

```
XAC       MS      IOD      Net       PM      CCS      Lns      Trks     Ext      APPL

None

63.9.5.7 Responses

Only response is to take user to the SPM_ATM level described below.

63.9.6 Map Level: SPM_ATM

63.9.6.1 Level description

Added new/resident Map SPM_ATM level to display the dynamic XPKT806 alarm status on all 86 possible SMG4/IW/DPT nodes, and provide commands to troubleshoot the XPKT806 alarm on a node. Here's how the SPM_ATM level will appear when SPMs 62 and 65 have the XPKT806 alarm. Note that the dynamic PKT status is also shown (e.g. "SPM_ATM = 2" in the example below).

```
XAC       MS      IOD      Net       PM      CCS      Lns      Trks     Ext      APPL
   .        .        .        .        .        .        .        .        .      2 PKT
                                                                                   M
SPM_ATM            OAMAP   ATMFW    SDM    SPMCP   SWMTC   SDMBIL   PKT    TOPSIP
  0 Quit              .       .       .       .       .       .     2 PKT     .
  2                                                                   M
  3
  4 Status_          SPM_ATM = 2
  5 SumAll           Status of SPMs with XPKT806 alarms:

 14
 15
 16
 17
 18
   RLYNCH4
 Time  10:35  >
```

Per the key above:

- "." indicates a supported SPM node class (e.g.SMG4) that has the feature enabled (via Table OFCENG) but does not currently have an XPKT806 alarm.
- "*" indicates a supported SPM node class that currently has an XPKT806 alarm raised (and, of course, the feature is enabled).
- "/" indicates a supported SPM node class that has the feature disabled so XPKT806 alarms will be ignored.
- "-" indicates an unsupported SPM node class (e.g. Legacy TDM SPM).

63.9.6.2 Accessing Map level: SPM_ATM

Command	Parameters and variables
STATUS	<SPMNO> (0 to 85)
Parameters and variables	Description
<SPMNO>	Displays the XPKT806 statistics for the given SPM.

63.9.7.6 Qualifications and warnings

None

63.9.7.7 Responses

63.9.7.7.1 Command output

Table 9 MAP outputs with associated meanings and actions

STATUS Command
SPM: <SPMNUM> Class: <SPM Class> XPKT806 alarm: <stat> Which Cycle XPKT301 Thresh Time Cycle Cycle Type Hits Limit Elpsd Max ----- ------ ------ ------ ----- ----- Prev <CyTy> <Hits> <Thrs> <Time> <Max> Curr <CyTy> <Hits> <Thrs> <Time> <Max>
Meaning: Shows the statistics for processing XPKT806 alarms on the given SPM, where each parameter is described below: <stat> is “Raised” or “Clear” depending on the current **STAT**us of the XPKT806 alarm for the SPM. <SPMNUM> is the **NUM**ber of the **SPM**. <SPM Class> is the **SPM Class**, which is one of “SMG4”, “IW” (for BRDG_ONLY IW), or “DPT” (for DPT_ONLY IW). <CyTy> is the **CY**cle **TY**pe, which can be “Raise” or “Clear”. If “raise”, then raise cycle is determining whether XPKT806 alarm should be raised. If “clear”, then clear cycle is determining whether XPKT806 alarm should be cleared. <Hits> is the number of XPKT301 **HITS** (i.e. logs) against the node during the cycle. <Thrs> is the value of **THR**e**S**hold Limit in the cycle that must be reached to raise or clear the XPKT806 alarm. If the SPM class is SMG4 and the Cycle Type is “raise” cycle, then <Thrs> will be the value of RAISE_THRESHOLD in the XPKT806_SMG4_RAISE_CLEAR tuple in Table OFCENG. <Time> is the **TIME** Elapsed in the cycle. <Max> is the **MAX** time in the cycle. For a clear cycle on a IW node, this is the value of the CLEAR_CYCLE in the XPKT806_IW_RAISE_CLEAR parameter. **Note1:** if the feature is disabled for the SPM, then only the first line above is shown and the second line will be “Feature disabled - see PARMS command.” An example is shown below. **Note2:** if the first cycle is still running after a restart or enabling of the feature, then “Prev” info will not be valid. In this case, the entire “Prev” info line is replaced with “**Init**” until the initial current cycle completes. An example is shown below. **System or user actions:** If the XPKT806 alarm is present, you should analyze the XPKT301 logs and determine what ATM network problem is causing this node to raise the XPKT806 alarm. If the XPKT301 failures are acceptable, then consider raising the RAISE_THRESHOLD and/or RAISE_CYCLE sub-parameters in Table OFCENG for the particular SPM node class type.

63.9.7.8 Example

If the XPKT806 alarm is present on SPM 62, then the user enters “STATUS 62” at the SPM_ATM level and will see output like this:

```
SPM: 62  Class: SMG4  XPKT806 alarm: Raised
Which  Cycle  XPKT301 Thresh Time  Cycle
Cycle  Type    Hits   Limit Elpsd  Max
-----  ------ ------ ------ ----- -----
 Prev  Raise      3      3     4    15
 Curr  Clear      1      2     2     5
```

In this example, the alarm was raised on SPM 62 during the previous cycle when 3 XPKT301 failures were detected at 4 minutes into the 15 minute raise cycle. The RAISE_THRESHOLD was 3. The current cycle shows that we have had 1 XPKT301 failure at 2 minutes into the 5 minute clear cycle. If the cycle ends with less than 2 XPKT301 failures, then the XPKT806 alarm will automatically be cleared.

If the first cycle is running after a restart or after enabling the feature, then the output of STATUS will appear as:

```
SPM: 64  Class: IW  XPKT806 alarm: Clear
Which  Cycle   XPKT301  Thresh  Time   Cycle
Cycle  Type     Hits   Limit   Elpsd   Max
-----  ------  ------  ------  -----  -----
 Prev   Init
 Curr   Raise       0       2      2      5
```

If the feature is disabled for the SPM, then the output will appear as:

```
SPM: 64  Class: IW  XPKT806 alarm: Clear
Feature disabled - see PARMS command.
```

63.9.8 Command: SUMALL

63.9.8.1 Command type: Listed MENU

63.9.8.2 Command target: All

63.9.8.3 Command availability: RES

63.9.8.4 Command description

New command under the SPM_ATM level that shows the XPKT806 status for all SPMs that support this alarm (i.e. SMG4/IW/DPT).

63.9.8.5 Command syntax

Table 10 <CommandName> command parameters and variables

Command	Parameters and variables
SUMALL	(none)

63.9.8.6 Qualifications and warnings

None

63.9.8.7 Responses

63.9.8.7.1 Command output

Table 11 MAP outputs with associated meanings and actions

SUMALL Command

```
SPM Clas Cycle XPKT301 Thresh Time  Cycle
Num Type Type   Hits   Limit Elpsd  Max
--- ---- ----- ------ ------ ----- -----
<n><Clas><CyTy><Hits> <Thrs> <Time> <Max>
 .
 .
<n><Clas><CyTy><Hits> <Thrs> <Time> <Max>
```

Meaning: SUMALL lists the XPKT806 status for every supported SPM, where each parameter is described below. Supported SPMs are SMG4, IW, and DPT.

<SPM Num> is the **NUM**ber of the **SPM**.

<Clas>: **CLAS**s **TYPE** of the SPM node - can be “SMG4”, “IW”, or “DPT”.

<CyTy> is the **CY**cle **TY**pe, which can be “Raise”, “Clear”, or “Disabled”. If “Raise”, then raise cycle is determining whether XPKT806 alarm should be raised. If “Clear”, then clear cycle is determining whether XPKT806 alarm should be cleared. So don’t get confused: a “Clear” in this column means the XPKT806 alarm is raised for the node and we are looking to clear it. If “Disabled”, then the feature is currently disabled for this SPM node class and the other fields on this row will be blank. Run the “PARMS” command to see how to enable the feature for a SPM node class.

<Hits> is the number of XPKT301 **HITS** (i.e. logs) against the node during the current cycle.

<Thrs> is the value of **THR**e**S**hold Limit in the current cycle that must be reached to raise or clear the XPKT806 alarm. If the SPM class is SMG4 and the Cycle Type is “raise” cycle, then <Thrs> will be the value of RAISE_THRESHOLD in the XPKT806_SMG4_RAISE_CLEAR tuple in Table OFCENG.

<Time> is the **TIME** Elapsed in the current cycle.

<Max> is the **MAX** time in the current cycle. For a clear cycle on a IW node, this is the value of the CLEAR_CYCLE in the XPKT806_IW_RAISE_CLEAR parameter.

System or user actions: Useful for showing the XPKT301 hits across all SPMs in the ATM network.

Table 11 MAP outputs with associated meanings and actions

SUMALL Command

63.9.8.8 Example

Output of SUMALL command when there are only 5 ATM SPM nodes:

```
SPM Clas Cycle XPKT301 Thresh Time  Cycle
Num Type Type   Hits   Limit Elpsd  Max
--- ---- ----- ------ ------ ----- -----
 60 SMG4 Raise     0      3    12    15
 61 SMG4 Clear     1      3     4     5
 62 DPT  Raise     0      4    12    15
 63 DPT  Raise     0      4    12    15
 64 IW   Disabled
```

In this example, only one of the nodes (SPM 61) has the XPKT806 alarm raised. So SPM 61 is currently 4 minutes into a 5 minute “Clear” cycle, during which it has had one XPKT301 log (i.e. “hit”) against it. If three more XPKT301 hit occurs during this cycle (for a total of 4), then the alarm will not clear since the CLEAR_THRESHOLD is 3. If no more XPKT301 hits occur, then the alarm will automatically clear. Note that the feature is disabled for the IW class.

63.9.9 Command: SUMFAIL

63.9.9.1 Command type: Listed MENU

63.9.9.2 Command target: All

63.9.9.3 Command availability: RES

63.9.9.4 Command description

New command under the SPM_ATM level that shows the XPKT806 status for only those SPMs that currently have the XPKT806 alarm raised.

63.9.9.5 Command syntax

Table 12 <CommandName> command parameters and variables

Command	Parameters and variables
SUMFAIL	(none)

63.9.9.6 Qualifications and warnings

None

63.9.9.7 Responses

63.9.9.7.1 Command output

Table 13 MAP outputs with associated meanings and actions

SUMFAIL Command
SPM Clas Cycle XPKT301 Thresh Time Cycle Num Type Type Hits Limit Elpsd Max --- ---- ----- ------ ------ ----- ----- <n><Clas><CyTy><Hits> <Thrs> <Time> <Max> . . <n><Clas><CyTy><Hits> <Thrs> <Time> <Max> **Meaning:** SUMFAIL lists the status for every SPM that currently has the XPKT806 alarm raised. <SPM Num> is the **NUM**ber of the **SPM**. <Clas>: **CLAS**s **TYPE** of the SPM node - can be “SMG4”, “IW”, or “DPT”. <CyTy> is the **CY**cle **TY**pe, which can be “Raise” or “Clear”. If “raise”, then raise cycle is determining whether XPKT806 alarm should be raised. If “clear”, then clear cycle is determining whether XPKT806 alarm should be cleared. So don’t get confused: a “Clear” in this column means the XPKT806 alarm is raised for the node and we are looking to clear it. <Hits> is the number of XPKT301 **HITS** (i.e. logs) against the node during the current cycle. <Thrs> is the value of **THR**e**S**hold Limit in the current cycle that must be reached to raise or clear the XPKT806 alarm. If the SPM class is SMG4 and the Cycle Type is “raise” cycle, then <Thrs> will be the value of RAISE_THRESHOLD in the XPKT806_SMG4_RAISE_CLEAR tuple in Table OFCENG. <Time> is the **TIME** Elapsed in the current cycle. <Max> is the **MAX** time in the current cycle. For a clear cycle on a IW node, this is the value of the CLEAR_CYCLE in the XPKT806_IW_RAISE_CLEAR parameter. **System or user actions:** Useful for showing the XPKT301 hits across all SPMs in the ATM network that have an XPKT806 alarm raised.

63.9.9.8 Example

Output of SUMFAIL command when only 1 ATM SPM node in the office currently has the XPKT806 alarm raised:

```
SPM Clas Cycle XPKT301 Thresh Time  Cycle
Num Type Type   Hits   Limit Elpsd  Max
--- ---- ----- ------ ------ ----- -----
61 SMG4 Clear     1      3     4     5
```

In this example, only one of the nodes (SPM 61) has the XPKT806 alarm raised. So SPM 61 is currently in a clear cycle, during which it currently has had one XPKT301 hit. If three more XPKT301 hit occurs during this cycle (for

a total of 4 hits), then the alarm will not clear since the CLEAR_THRESHOLD is 1. If no more XPKT301 hits occur, then the alarm will automatically clear.

63.9.10 Command: PARMS

63.9.10.1 Command type: Listed MENU

63.9.10.2 Command target: All

63.9.10.3 Command availability: RES

63.9.10.4 Command description

New command under the SPM_ATM level that shows the office parameter values that control the reporting of XPKT806 alarms for the supported ATM SPMs. Also shows the parameter controlling XPKT301 suppression while the XPKT806 alarm is raised.

63.9.10.5 Command syntax

Table 14 <CommandName> command parameters and variables

Command	Parameters and variables
PARMS	(none)

63.9.10.6 Qualifications and warnings

None

63.9.10.7 Responses

63.9.10.7.1 Command output

Table 15 MAP outputs with associated meanings and actions

PARMS Command
Table OFCENG parameters that control threshold reporting: OFCENG Parameter Name — Raise Thrhld — Raise Cycle — Clear Thrhld — Clear Cycle XPKT806_SMG4_RAISE_CLEAR <x1> <y1> <a1> <b1> XPKT806_IW_RAISE_CLEAR <x2> <y2> <a2> <b2> XPKT806_DPT_RAISE_CLEAR <x3> <y3> <a3> <b3> Table OFCENG parameter that suppresses XPKT301 logs: XPKT806_SUPPRESSES_XPKT301 = <YES/NO> **Meaning:** PARMS command lists the current value of every office parameter that controls the threshold reporting of the XPKT806 alarm. Note that there are a set of values for every support ATM SPM class. Also shows the parameter that control suppressing XPKT301 logs while an XPKT806 alarm is raised against any SPM node impacted by the XPKT301. **System or user actions:** Shows user where to go in Table OFCENG to change the way XPKT806 is handled. Note that setting the RAISE_THRESHOLD to zero will disable reporting XPKT806 for that ATM SPM class.

63.9.10.8 Example

Output of PARMS command:

```
Table OFCENG parameters that control threshold reporting:
                         Raise   Raise  Clear   Clear
OFCENG Parameter Name    Thrhld  Cycle  Thrhld  Cycle
-----------------------  ------  -----  ------  -----
XPKT806_SMG4_RAISE_CLEAR      1      5       0      3
XPKT806_IW_RAISE_CLEAR        1      5       0      3
XPKT806_DPT_RAISE_CLEAR       1      5       0      3

Table OFCENG parameter that suppresses XPKT301 logs:
  XPKT806_SUPPRESSES_XPKT301 = NO
```

Note that XPKT806 reporting is currently disabled for all DPT nodes.

63.9.11 Command: CLEAR

63.9.11.1 Command type: Listed MENU

63.9.11.2 Command target: All

63.9.11.3 Command availability: RES

63.9.11.4 Command description

New command under SPM_ATM level that manually clears the XPKT806 alarm for a specified SPM node.

63.9.11.5 Command syntax

Table 16 <CommandName> command parameters and variables

Command	Parameters and variables
CLEAR	<SPMNO> (0 to 85)
Parameters and variables	Description
<SPMNO>	Manually clears the XPKT806 alarm for the given SPM.

63.9.11.6 Qualifications and warnings

If the alarm is raised, user will be prompted to confirm the action before proceeding. Here's the prompt that will appear:

Warning: confirm clearing XPKT806 alarm on SPM <nn> : (Y/N)>

where <nn> is the same number given as the option for the CLEAR command.

63.9.11.7 Responses

63.9.11.7.1 Command output

Table 17 MAP outputs with associated meanings and actions

CLEAR Command
XPKT806 alarm cleared for SPM <SPMNO> **Meaning:** Confirms that the XPKT806 alarm was manually cleared for the given SPM, where <SPMNO> is the number of the SPM. **System or user actions:** Helpful for user to manually clear an XPKT806 alarm without waiting for the clear interval to complete.

63.9.11.8 Example

If the XPKT806 alarm is present on SPM 63, then here's what is seen when the user manually clears the alarm:

```
clear 63
Warning: confirm clearing XPKT806 alarm on SPM  63 : (Y/N)>
y
Successful - XPKT806 alarm cleared for SPM 63
```

In this example, the alarm is successfully cleared so the SPM is reset into a fresh raise cycle with the XPKT301 hit counter cleared for that SPM.

If the SPM does not currently have the XPKT806 alarm present when CLEAR is run, then the output will appear as:

```
clear 63
No action taken - XPKT806 alarm is not present for SPM 63
```

63.9.12 Command: ZERO

63.9.12.1 Command type: Listed MENU

63.9.12.2 Command target: All

63.9.12.3 Command availability: RES

63.9.12.4 Command description

New command under SPM_ATM level that zero's the XPKT301 hit counter in the current cycle for a specified SPM node. See STATUS command for display of the XPKT301 hit counter in the current cycle.

63.9.12.5 Command syntax

Table 18 <CommandName> command parameters and variables

Command	Parameters and variables
ZERO	<SPMNO> (0 to 85)
Parameters and variables	Description
<SPMNO>	Manually zero's XPKT301 hit counter for the given SPM.

63.9.12.6 Qualifications and warnings

None

63.9.12.7 Responses

63.9.12.7.1 Command output

Table 19 MAP outputs with associated meanings and actions

ZERO Command
XPKT301 hit counter reset to 0 in current cycle for SPM <SPMNUM> **Meaning:** Confirms that the XPKT301 hit counter was reset to zero in the current cycle, where <SPMNO> is the number of the SPM. **System or user actions:** Helpful for user to manually zero the XPKT301 hit counter in the current cycle without waiting for the clear cycle to complete.

63.9.12.8 Example

Here's what is seen when the user manually zero's the XPKT301 hit counter for SPM 62:

```
>status 62
XPKT806 alarm: Raised   SPM: 62  Class: SMG4

Cycle  XPKT806  XPKT301  Time  Raise   Clear
       Alarm    Hits   Left  Thresh  Thresh
-----  ------  ------  ----  ------  ------
 Prev  Clear       3    11       3       2
 Curr  Raised      1     3       3       2
> zero 62
XPKT301 log hits reset to 0 for SPM 62
>status 62
XPKT806 alarm: Raised   SPM: 62  Class: SMG4

Cycle  XPKT806  XPKT301  Time  Raise   Clear
       Alarm    Hits   Left  Thresh  Thresh
-----  ------  ------  ----  ------  ------
 Prev  Clear       3    11       3       2
 Curr  Raised      0     2       3       2
```

In this example, the XPKT301 hit counter was 1 as shown by the first STATUS command. After the ZERO command, the second STATUS command confirms the counter was zeroed.

63.10 Security

No impact.

63.11 Configuration Walkthrough

This feature is "off" by default, so start by enabling the feature for each node type (SMG4, IW, DPT) with the appropriate office parameter in Table OFCENG (described above). Once enabled, the feature will run autonomously without user intervention to raise XPKT806 major alarms for any node that exceeds its XPKT301 threshold, then automatically clear the alarm with the clear threshold is met.

OFCOPT	MAX_NUMBER_ACD_AGENTS_PER_SWITCH	CHANGED	CM

65.3.2 Parameter information

65.3.2.1 MAX_NUMBER_ACD_AGENTS_PER_SWITCH

Maximum Number of Automatic Call Distribution Agents Per Switch

65.3.2.1.1 Functional description

This is a pre-existing office parameter which specifies the maximum number of ACD agent positions that the operating company can assign on the switching unit.

The purpose of this parameter will not be changed by this activity.

The range of this parameter will be increased to have a maximum value of 30,000 agents. The ability to assign a new value to this parameter will be restricted. A new value can only be assigned by changing the limit of the feature SOC.

When the SOC usage limit is increased or decreased, the value stored in the office parameter will be automatically updated to reflect the new limit. See section 13.7 for SOC information.

65.3.2.1.2 Range information

Table 2 Range Information

Minimum	Maximum	Default
0	30000	0

This activity increases the maximum value of the office parameter.

65.3.2.1.3 Memory requirements

No memory impact.

65.3.2.1.4 Parameter release history update

The maximum value is being increased from 9999 to 30000 for SN07.

65.4 Upgrade Impact

65.4.1 Dump and Restore

This feature requires no operating company intervention during dump/restore or any other phase of ONP.

65.5.2 Table/MIB/Remote Database Schema information

65.5.2.1 Name: ACDGRP

ACD Group Info

65.5.2.1.1 Functional description

ACDGRP is an existing table. This table defines ACD groups. A new field is introduced by this activity to specify the size (number of digits) of the Login ID. The size is either 4 or 5 digits. Default value is 4 digits.

65.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

65.5.2.1.3 Size

The size of table ACDGRP is not impacted by this activity.

65.5.2.1.4 Fields

The following table lists fields for ACDGRP.

A new field IDSIZE is added to this table. All other fields of this table are unchanged.

Table 4 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
IDSIZE	New	None	4 or 5	Size of the Login ID in number of digits.

65.5.2.1.5 Datafill example

The following example shows sample datafill for table ACDGRP. In this example, group ACDTEST1 is using 5 digit login IDs while the other 2 groups are using 4 digit login IDs.

Figure 1 Example tuples from table ACDGRP

                    N               4
                                                            $
```

65.5.2.1.6 Table release history update

Since BCS18.

65.5.2.1.7 Supplementary information

Dump and Restore impact. There will be upgrade impact to table ACDGRP due to the new field IDSIZE introduced by this activity. The reformat procedures will default the value of this field to 4 during ONP.

65.5.2.1.8 Translation verification other tools

ACDGRP does not use translation verification tools.

65.5.2.2 Name: KSETLINE

Key Set Line Information table

65.5.2.2.1 Functional description

KSETLINE is an existing table. This table defines INCALLS KEY to key number 1 on ACD set. This activity changes the field POSID, which is the ACD position ID associated with the INCALLS KEY. The POSID will be changed to a 5 digit number.

65.5.2.2.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

65.5.2.2.3 Size

The size of table KSETLINE is not impacted by this activity.

65.5.2.2.4 Fields

The following table lists fields for KSETLINE.

The existing field POSID is changed in this table. All other fields of this table are unchanged.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
POSID	Changed	None	5-digit number between 00001 and 30000.	ACD Position ID associated with the INCALLS key.

65.5.2.2.5 Datafill example

The following example shows sample datafill for table KSETLINE. Note the 5 digit POSIDs.

```

65.5.2.2.6 Table release history update

Since BCS10.

65.5.2.2.7 Supplementary information

Dump and Restore impact. There will be upgrade impact to table KSETLINE due to the change to the field POSID introduced by this activity. The reformat procedures will prefix a digit 0 to all ACD Position IDs upgraded during ONP.

65.5.2.2.8 Translation verification other tools

KSETLINE does use translation verification tools but are not impacted by this activity.

65.5.2.3 Name: KSETFEAT

Key Set Feature Information table

65.5.2.3.1 Functional description

KSETFEAT is an existing table. This table defines SUPR feature data when assigned to a keyset feature key. This activity changes the field POSID, which is the ACD position ID associated with the supervisor feature. The POSID will be changed to a 5 digit number.

65.5.2.3.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

65.5.2.3.3 Size

The size of table KSETFEAT is not impacted by this activity.

65.5.2.3.4 Fields

The following table lists fields for KSETFEAT.

The existing field POSID is changed in this table. All other fields of this table are unchanged.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
POSID	Changed	None	5-digit number between 00001 and 30000.	ACD Position ID associated with the SUPR key.

65.5.2.3.5 Datafill example

The following example shows sample datafill for table KSETFEAT. Note the 5 digit POSIDs.

Figure 3 Example tuples from table KSETFEAT

```
                FEATKEY     FEATURE

```

65.5.2.3.6 Table release history update

Since BCS10.

65.5.2.3.7 Supplementary information

Dump and Restore impact. There will be upgrade impact to table KSETFEAT due to the change to the field POSID introduced by this activity. The reformat procedures will prefix a digit 0 to all SUPR Position IDs upgraded during ONP.

65.5.2.3.8 Translation verification other tools

KSETFEAT does use translation verification tools but are not impacted by this activity.

65.5.2.4 Name: IBNFEAT

IBN Line Feature Information table

65.5.2.4.1 Functional description

IBNFEAT is an existing table. This table defines ACD and SUPR feature data when assigned to IBN sets. This activity changes the field POSID which is the ACD position ID associated with the ACD or SUPR options on the set. The POSID will be changed to a 5 digit number.

65.5.2.4.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

65.5.2.4.3 Size

The size of table IBNFEAT is not impacted by this activity.

65.5.2.4.4 Fields

The following table lists fields for IBNFEAT.

The existing field POSID is changed in this table. All other fields of this table are unchanged.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
POSID	Changed	None	5-digit number between 00001 and 30000.	ACD Position ID associated with the ACD or SUPR option.

65.5.2.4.5 Datafill example

65.5.2.4.6 Table release history update

Since BCS10.

65.5.2.4.7 Supplementary information

Dump and Restore impact. There will be upgrade impact to table IBNFEAT due to the change to the field POSID introduced by this activity. The reformat procedures will prefix a digit 0 to all ACD Position IDs upgraded during ONP.

65.5.2.4.8 Translation verification other tools

IBNFEAT does use translation verification tools but are not impacted by this activity.

65.5.2.5 Name: ACDLOGIN

ACD Login Table

65.5.2.5.1 Functional description

ACDLOGIN is an existing table. This table maps ACD Login IDs to a corresponding password, if needed. This table also maps Customer groups to the corresponding ACD Login ID, if requested. This table is indexed by Login ID.

65.5.2.5.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

65.5.2.5.3 Size

Table 8 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ACDLOGIN	0	30,000	Memory is allocated dynamically through the use of SEGSTOR in blocks of 512. Two words of protected store is needed per tuple.

65.5.2.5.4 Fields

The following table lists fields for ACDLOGIN.

A range of the LOGINID field is changed by this activity. Remaining fields of this table are not changed.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
LOGINID	Changed	None	5-digit number between 00001 and 30000	The range of ACD Login ID is expanded to accommodate 30,000 Login IDs.

65.5.2.5.5 Datafill example

The following example shows sample datafill for table ACDLOGIN. Note the 5 digit LOGINIDs.

Figure 5 Example tuples from table ACDLOGIN

```
LOGINID CUSTGRP PSWD OPTIONS

04120 Y CGA N (VARWRAP 100) $
```

65.5.2.5.6 Table release history update

Since BCS18.

65.5.2.5.7 Supplementary information

Dump and Restore impact. There will be upgrade impact to table ACDLOGIN due to change in field LOGINID made by this activity. The reformat procedures will prefix a digit 0 to all Login Ids upgraded during ONP.

65.5.2.5.8 Translation verification other tools

ACDLOGIN does not use translation verification tools.

65.5.2.6 Name: ACDENLOG

ACD Enhanced Login

65.5.2.6.1 Functional description

Table ACDENLOG is an existing table. It allows multiple customer groups the full range of Login IDs for their ACD agents. This table is indexed by a two-part key, made up of the Partition Number (PARTNO) and Login ID (LOGINID). The table format is same as table ACDLOGIN with one additional field, ACTIVATE.

65.5.2.6.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

65.5.2.6.3 Size

Table 10 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ACDENLOG	0	30,000	Memory is allocated dynamically through the use of SEGSTOR in blocks of 512. Two words of protected store is needed per tuple.

65.5.2.6.4 Fields

The following table lists fields for ACDENLOG.

The range of the LOGINID field is changed by this activity. Remaining fields of this table are not changed.

Table 11 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
LOGINID	Changed	None	5-digit number between 00001 and 30000	The range of ACD Login ID is expanded to accommodate 30,000 Login IDs.

65.5.2.6.5 Datafill example

The following example shows sample datafill for table ACDENLOG. Note the 5 digit LOGINIDs.

Figure 6 Example tuples from table ACDENLOG

```

```

65.5.2.6.6 Table release history update

Since BCS20.

65.5.2.6.7 Supplementary information

Dump and Restore impact. There will be upgrade impact to table ACDENLOG due to change in field LOGINID made by this activity. The reformat procedures will prefix a digit 0 to all Login Ids upgraded during ONP.

65.5.2.6.8 Translation verification other tools

ACDENLOG does not use translation verification tools.

65.6 Service Orders (SO)

This activity does not introduce any new Service Order commands, LCCs, or options.

65.6.1 Service order change details

When the ACD option is added to a line (ADO, NEW, NEWACD commands), or when ACD option data is changed (CHF command), one of the prompts offered by Servord is POSID. Currently, any value between 0001 and 9999 is accepted as valid input for the POSID. This activity will change the acceptable value of POSID to be a 5 digit value in the range of 00001 to 30000.

65.6.1.1 How service order commands are presented

65.6.1.1.1 Description

The range of valid input for the POSID prompt has changed. Previously, the POSID was entered as a 4 digit value in the range of 0001 to 9999. It will now be entered as a 5 digit value in the range of 00001 to 30000.

65.6.1.1.2 Applicability

The POSID prompt is applicable to Servord commands ADO, NEW, NEWACD, and CHF only when they are used to manipulate the data associated with the ACD or SUPR line option.

65.6.1.1.3 Example

The following figures show an example of adding the ACD option to an existing business set using the ADO command. Note that when the system prompts for POSID, the user must now provide a 5 digit value in the range of 00001 to 30000. Previously, a 4 digit value would have been accepted.

Figure 7 Example of the ADO command in prompt mode

```
SO:
>ado
SONUMBER:    NOW   3 11  6 AM
>
DN_OR_LEN:
>6218000
OPTKEY:
>1
OPTION:
>acd
ACDGROUP:
>acdtest1
ACDSGRP:
>0
IDNUM:
>y
POSID:
>00018
OPTKEY:
>$
COMMAND AS ENTERED:
ADO NOW 3 11 6 AM 6218000 ( 1 ACD ACDTEST1 0 Y 0009 ( ) ( ) ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
```

Figure 8 Example of the ADO command in no-prompt mode

```
SO:
>ado $ 6218000 1 acd acdtest1 0 y 00018 $
```

The NEW, NEWACD, and CHF commands also offer the POSID prompt when used to manipulate ACD data. Examples of these commands are not provided because the effect of this change is identical to the ADO example shown above. POSID must now be input as a 5 digit value.

65.6.1.1.4 Command prompts

The valid input has changed for system prompt POSID.

Table 12 Valid input for POSID

Prompt	Valid input	Description	Areas affected by prompt
POSID	00001 to 30000	ACD agent position ID.	Affects Servord commands ADO, NEW, NEWACD, and CHF when used to manipulate ACD option data.

65.7 Software optionality control (SOC)

This feature will be controlled by a standard usage based SOC. The usage limit will define the maximum number of ACD agents in the switch.

The default usage limit will be 0 ACD agents. During ONP from previous loads, the SOC usage limit will be set to match the value of office parameter MAX_NUM_ACD_AGENTS_PER_SWITCH. Thus there will be no impact to existing customers who do not purchase this SOC.

The SOC usage limit will control the maximum number of ACD agents in the switch. The office parameter MAX_NUM_ACD_AGENTS_PER_SWITCH will automatically be updated to match the SOC usage limit anytime the SOC usage limit is changed (increased or decreased).

The other aspects of this feature including 5 digit login optionality, ability to use login IDs between 10000 and 30000, and mandatory use of 5 digit POSIDs are not controlled in anyway by the SOC.

Table 13 SOC

SOC option name:	ACD00101

65.9 Command interface changes

65.9.1 Command: ACDDEBUG

65.9.1.1 Command type: NON-MENU

65.9.1.2 Command target: All

65.9.1.3 Command availability: RES

65.9.1.4 Command description

ACDDEBUG is a CI tool created to display ACD data structures in both dynamic and static environments.

The available commands are:

QUERY - Allows display of ACD data structures

CPIDTOAGT - Displays LEN and DN for entered line cpid or CLLI and member number for an entered trunk cpid.

QUIT - Quits from ACDDEBUG environment

Currently, the Query command uses a 4 digit positionID as an index in order to display ACD agent data. This activity will extend the command so that the data structures of an ACD agent with a 5 digit position will be displayed.

65.9.1.5 Command syntax for changed parameters

Table 14 ACDDEBUG command parameters and variables

Command	Parameters and variables
QUERY AGENTDATA	ALL, GROUP, POSID

67.5 Data schema (DS) (CM, MIBS, RDB)

67.5.1 New/modified tables, MIBs, or Database Schema

New table IPAPPL will be created to store data on each SCTP instance.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
IPAPPL	NEW	NEW
TRIGITM	Changed	NEW
TRIGINFO	Changed	NEW

67.5.2 Table/MIB/Remote Database Schema information

67.5.2.1 Name: IPAPPL - Internet Protocol Appliction

67.5.2.1.1 Functional description

Table IPAPPL defines the IP Application instance that data will be transmitted over for a given service. This table is being created for the AIN on SCTP/IP project but it is being designed so that it could be used by other applications (ie. ACB/AR, NMS) that may want to use IP as a transport in the future. The table will contain the connection information for controlling the communications processes associated with the transport.

67.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

IPAPPL

TRIGITM

OR

TRIGINFO

Tables TRIGITM and TRIGINFO use the INST (sctp instance) that is datafilled in table IPAPPL.

67.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
IPAPPL	0	64	Memory is automatically allocated for 64 Intelligent Network SCTP instances.

67.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for Table IPAPPL.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
INSTKEY	NEW	subfield	0-64	Defines the SCTP instance number.
INSTNAME	NEW	subfield	8 character vector	Defines the SCTP instance name.
TRANSPRT	NEW	subfield	SCTP	Defines the transport to be used by the application.
IPDEVICE	NEW	subfield	EIU/HIOP	Specifies the device that the instance will use.
IPADDRS	NEW	subfield	Vector of up to 4 IPV4 IP addresses	Specifies the remote IP addresses to be used for the instance.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
IPPORT	NEW	subfield	UNSIGNEDINT	Specifies the IP port to be used.
OPTLIST	NEW	subfield	VECTOR of IP_OPTION_LIST	Specifies optional data associated with the instance.
Application	NEW	refinement of optlist	Service {AIN}	Defines the service that is using the insctance.
Multihoming	NEW	refinement of optlist		Specifies if the insctance supports multihoming.
Mode	NEW	refinement of optlist	Client, Server	Specifies if the insctance is a client or server.
Setprime	NEW	refinement of optlist	1 to 4	Specifies which of the IP address in the IPADDRS field is the primary.

67.5.2.1.5 Datafill example

The following example shows sample datafill for table IPAPPL

TABLE IPAPPL

67.11 Configuration Walkthrough

68: Configuration (CN): A00004872

The SN07 services contained in this activity are assigned similar to current legacy methods. These services are ACD OBS/FOBS, ACD EMK, MBSCAMP, MOH, EBO/EBX, and DCBI. For more general information on these services, see the FN section of this document.

68.1 Hardware and Software Requirements

These services are configured in Succession as they are in Legacy. The tones provided by these services for a pure Succession network are provided by a gateway (GW), and therefore the physical characteristics of those tones are a product of the GW playing the tone. Information pertaining to this tones must be configured before the tone can be provided for Legacy offices where the tones are provided by the MTM. For Succession lines, since the tone is provided by the GW, no tone datafill is required.

68.2 Initial Configuration

Not applicable.

68.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable.

68.4 Upgrade Impact

68.4.1 Dump and Restore

Not applicable.

68.4.2 Element Management Upgrade

Not applicable.

68.5 Data schema (DS) (CM, MIBS, RDB)

68.5.1 New/modified tables, MIBs, or Database Schema

Datafill in Table STN is not required for a pure Succession office.

68.5.2 Table/MIB/Remote Database Schema information

68.5.2.1 Name: Table STN

Special Tones

68.5.2.1.1 Functional description

Table STN is used to provision the hardware associated with special tones, typically played from a MTM circuit pack. With this activitiy, datafill is not required to support a purely Succession switch. If Legacy lines exist on the

switch, this datafill is still required as it exists today in order to provide tones from the MTM..

68.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

68.5.2.1.3 Size

There is no change to the size limits to Table STN.

68.5.2.1.4 Fields/OIDs

There are no new fields for Table STN.

68.5.2.1.5 Datafill example

The following example shows sample datafill for table STN for Legacy, which is not required for Succession.

STN EBOT 1 MTM 5 14 3X68AC 10 0

68.5.2.1.6 Table release history update

Not applicable.

68.5.2.1.7 Supplementary information

The services of this activity that require special tones to be configured must now state that the tone can be provisioned via Table STN for Legacy lines, but this is no longer a requirement for packet lines. Also, the “typical” tone characteristics can be stated but if the tone is played by the GW, these characteristics are a product of the GW providing the tone.

The following table lists examples of current documentation and notes on the changes required.

Table 1 Changes required for special tones via Table TONES

Document type	Current information	Modification needed
Data Schema for Table TONES description (volume 10 in LEC017)	Functional description states: The special tones listed below are generated on cards located on a trunk module (TM) or maintenance trunk module (MTM), and defined in table STN instead of table TONES: *BVTONE: IBN busy verification tone *CWT: call waiting tone *DISTCWT: distinctive call waiting tone *EBOT: executive busy override tone *ERWT: expensive route warning tone *OHQT: offhook queuing tone *ROH: receiver offhook tone	It should be noted that these tones may exist in Table STN when the tone is played by the TM/MTM device for Legacy/TDM lines.
Translations Guide for DCBI feature (volume 11 in LEC017)	Description states: Both parties of the current call can receive an optional warning tone before the barging-in of the activating station occurs. The application of this tone is a customer group option. The DCBI tone contains 440 Hz at 13dbm. Datafill sequence show Table STN as a table requiring datafill for feature, stating: You must enter data in table STN to define the special tones used with DCBI.	It is suggested that the actual tone be stated as “typically” 440hz at 13dbm (since the characteristics can now be dependent on the GW configuration). It should be noted that the DCBITONE is not required for packet lines
Data Schema for Table CUSTSTN DCBITIONE (volume 3 in LEC017)	CUSTSTN option DCBITIONE states : Tone circuits in table STN with the code EBOT supply the warning tones	The TONE EBOT may be provided from a GW so that Table STN datafill is not required
Translations Guide for MBS Busy Override (volume 14 in LEC017)	Operation of feature states that when the calling party presses the EBO key, the called party and the party connected to the called party hears 500 ms of EBO warning tone. The translations table flow mentions defining EBOT in table STN for this feature. Datafilling table STN describes the provisioning required.	The “typical” tone length is 500 ms. The EBOT tone datafill is not a requirement for packet lines.
Translations Guide for Station camp on for Meridian Business Set (volume 15 in LEC017)	Translations table flow states: Table STN is required for tones that require trunk cards and allows MBSCAMP to work to another MBS. A 3X68AC... is required along with CWT datafill. The summary of table flow defines table STN and gives datafill for CWT tone.	The CWT tone is no longer needed for MBSCAMP to a Succession pphone (standard CWT buzz is now supplied). However it is still required of a Legacy pphone.

Table 1 Changes required for special tones via Table TONES

Document type	Current information	Modification needed
Translations Guide for ACD OBS (volume 16 in LEC017)	Description states “If OBSWTONE is set to Y,make an entry in table STN. Refer to the data schema section of this document for additional information on table STN.”	An entry is not required in table STN for a packet line.

68.5.2.1.8 Translation verification other tools

Table STN does not use translation verification tools.

68.6 Service Orders (SO) (CM & SESM)

68.10 Security

Not applicable

68.11 Configuration Walkthrough

In order to configure the SN07 services ACD OBS, EBO, and DCBI to play tones from the GWs, if the office is a legacy office which plays the tone through the MTM, the current TABLE STN provisioning is still used. For provisioning these services on packet lines using audio servers for conferencing, no tones datafill is required.

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	REPORT_ISUP _CI_TO_CM	NEW	CM

69.3.1 Parameter information

69.3.1.1 Name: REPORT_ISUP_CI_TO_CM

Reporting of Cause Indicator to CM.

69.3.1.1.1 Functional description

This parameter will enable sending of supervision to GWC for reporting of the cause indicator of Relase message to CM. The cause indicator will be attached to the Clear Forward or Clear Back Message.
This implementation of this parameter is being done in ISN07 (SNWCSH07).

69.3.1.1.2 Provisioning rules

This parameter enables sending of supervision when set to TRUE and disables when set to FALSE.

69.3.1.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
Boolean {N,Y}	n/a.	N

69.3.1.1.4 Activation

Any changes are activated immediately.

69.3.1.1.5 Dependencies

None.

69.3.1.1.6 Consequences

None

69.3.1.1.7 Verification

No verification required for this parameter.

69.3.1.1.8 Memory requirements

No memory impact.

69.3.1.1.9 Parameter release history update

Creating Office Parameter REPORT_ISUP_CI_TO_CM in table OFCENG.

69.4 Upgrade Impact

70.5 Data schema (DS) (CM, MIBS, RDB)

70.5.1 New/modified tables, MIBs, or Database Schema

As part of this feature the following modification was made to the UEMG Megaco Enterprise MIB:

The previous definition of nnMegacoFaultType had only one type in it:

```
nnMegacoFaultType OBJECT-TYPE
    SYNTAX     INTEGER
               {
                 rootTermStatusChange     (1)
               }
    MAX-ACCESS accessible-for-notify
    STATUS     current
    DESCRIPTION
       "Type of Megaco Fault"
::= { nnMegacoNotifObjects 1 }
```

This has been replaced by the following definition:

```
nnMegacoFaultType ::= TEXTUAL-CONVENTION
    STATUS     current
    DESCRIPTION
       "Enumeration of Fault Types Megaco Maintenance will throw."
    SYNTAX     INTEGER
               {
                 rootTermStatusChange     (1),          -- generic reason
                vMGAdminStatusOutOfService (2),  - VMG was administratively set
to out of service

                 cardLocked (3),          -- card is locked
                 cardDisabled (4),        -- card is disabled
                 cardInitializing (5),        -- card is initializing
                   lineMtceOnPairNotReady (8),    -- Line maintenance is not ready
              megacoMtceOnPairNotReady (9),    -- Megaco maintenancec is not ready
```

```
                gwcLinkStatusDown (51), -- first hop layer 2 down
                edgeRouterUnreachable(52),  -- pings to reach first hop failed
                gWCUnreachable (53),      -- pings to reach GWC failed
                noGWCReply (54),          -- GWC didn't reply to ServiceChange
                bearerSubsystemOnPairNotReady (55),
                aal1BearerSubsystemOnPairNotReady (56),
                ipBearerSubsystemOnPairNotReady (57),
                                --- skip 58
            carrier NotProvisioned (59), -- physical interface not provisioned
                carrierNotReady (60), -- physical interface not ready
             networkInterfaceNotProvisioned (61),   -- layer 2 not provisioned
                networkInterfaceNotReady (62),    -- layer 2 not ready
                messagingInterfaceNotProvisioned  (63),  -- call control not
provisioned
                messagingInterfaceNotReady (64),  -- call control not ready
                                --- skip 65 and 66
                bearerInterfaceNotProvisioned  (67),  -- bearer subnet not
provisioned
          bearerInterfaceNotReady (68), -- bearer subnet not ready
                .
                .  (more types)

             }
```

70.8 Element Management

The Switched Line Services Screen will now have a new field on the GW Status Config tab “Fault status”. This field will show what, if any, faults have been raised against the VMG.

70.8.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
GW Status Config Tab under the Switched Line Services screen	CHANGED

70.8.2 GUI information

70.8.2.1 GUI name: GW Status Config

GateWay Status Configuration tab.

70.8.2.1.1 Functional description

A new field will be added to the Gateway Status Configuration tab to show what alarms have been raised against the VMG.

The status screen will in most cases automatically be updated when alarms are raised against the VMG. In addition, when the user presses the Refresh button, the correct fault status will be displayed, based on what VMG alarms have been raised to the EM.

70.8.2.1.2 GUI size

Table 2 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
GW Status Config	1	1 per MG9000	NA

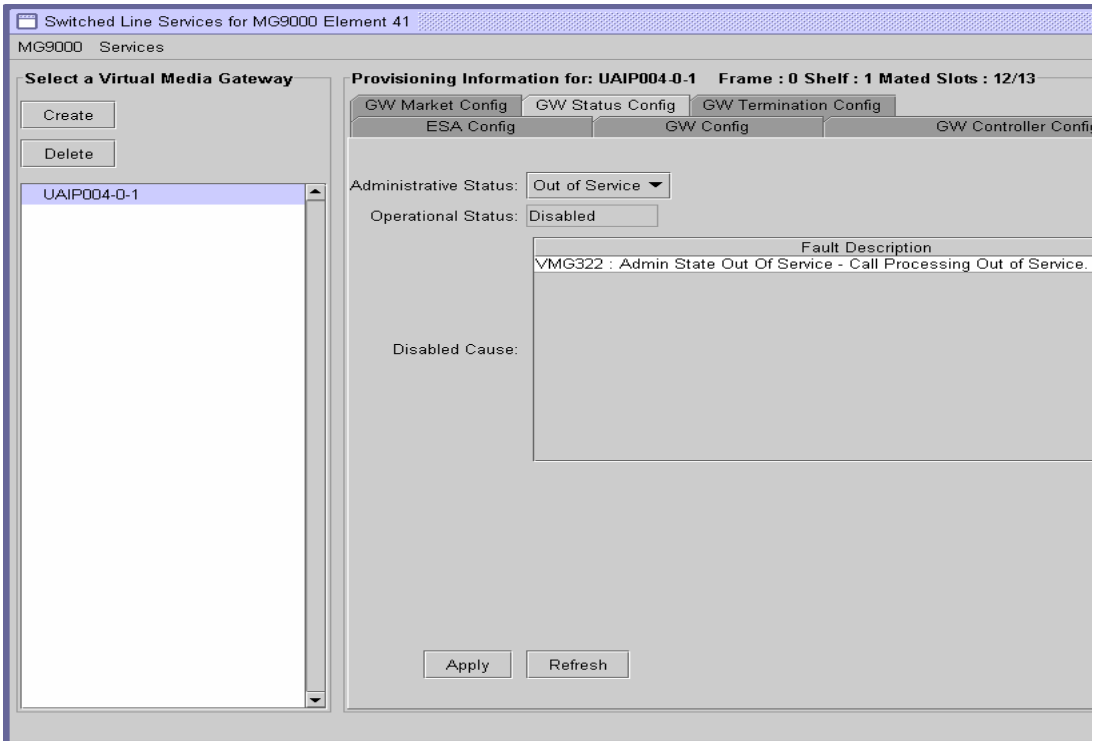
70.8.2.1.3 GUI fields

The following table lists the new field for GUI GW Status Config.

Table 3 GUI field descriptions

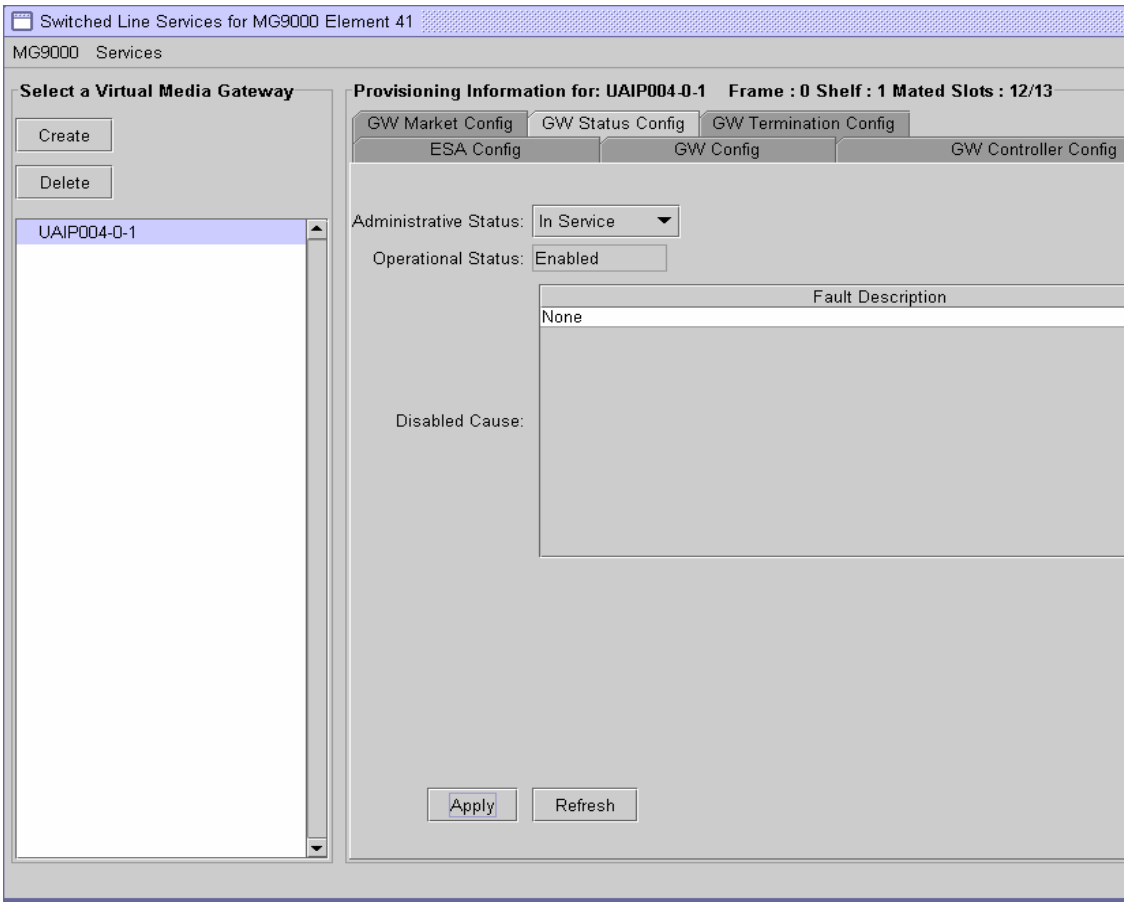
Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
outOfService State	New	No	Fault Status for VMG	Displays the VMG faults raised for this VMG. If there are no faults, then this field will display “None”	None

70.8.2.1.4 Usage example



This example shows a VMG with Administrative Status Out of Service. In this state, the Disabled Cause field will show one alarm as show above.

The example below shows a VMG that is in an Enabled state.



70.8.2.1.5 GUI release history update

None

71.8.1 Command: <command name>

71.9 Security

71.9.1 Secure Data Transfer to OSS with OpenSSH sftp

This feature provides optional secure outbound file transfer using OpenSSH sftp client. The sftp client protects all data including sensitive user s' password by encrypting the data before it leaves SDM/CBM and decrypting the data after it arrives the downstream OSS. The sftp also provides data integrity check to ensure that no one has tampered the data during the transfer.

The SBA user can configure the secure file transfer by adding or changing an existing schedule tuple in billmtc. For SN07, the user has to manually accept the downstream host key for each destintation before configuring secure outbound file transfer to the destintation. The actual configuration details are documented in the configuration section.

71.9.2 Downstream OSS password protection

This feature also enhances SBA password protection scheme by using SDM/CBM private data manager (documented in A00005074) to store all the passwords for OSS access. The private data manager is responsible for storing the data in an encrypted form.

71.10 Configuration Walkthrough

71.10.1 Host key acceptance for downstream OSS

Figure 1 Host key acceptance

```
In AIX
> login: root
> root's Password: xxxx
> su - maint
> /usr/bin/ssh -l maint wcary2p3
The authenticity of host 'wcary2p3 (47.135.213.53)' can't be established.
RSA key fingerprint is ef:f8:b9:b5:4e:15:71:66:09:82:0d:93:fa:ce:58:ff.
Are you sure you want to continue connecting (yes/no)? yes
```

71.10.2 SBA specific configuration

SBA secure outbound file transfer can be configured by adding or changing an existing schedule tuple after the user has done a host key acceptance. The following shows an example on how a user can configure secure outbound file transfer. The text in bold indicate the field values that are different from FTPW

Figure 2 Prompts for schedule add

Valid streams are {'OCC'}.
Press Enter to accept 'OCC'.
Enter Stream: occ

Valid file format types are {'DIRP'}.
Press Enter to accept 'DIRP'.
Enter File_Format_Type:

Destination can have between 1 and 15 alphanumeric characters.
Enter Destination: OOS

Valid protocols are {'FTPW', 'RFTPW' 'SFTPW}.
Press Enter to accept 'FTPW'.
Enter Protocol: SRTFPW

Primary destination must follow IP address format (i.e. N.N.N.N
where N indicates a number between 0 and 255).
Enter Primary_Destination: 47.135.213.53

Primary port can be 22 or between 1025 and 65535.
Press Enter to accept '22'.
Enter Primary_Port:

Alternate destination must follow IP address format (i.e. N.N.N.N
where N indicates a number between 0 and 255).
Enter Alternate_Destination: 47.135.213.53

Alternate port can be 22 or between 1025 and 65535.
Press Enter to accept '22'.
Enter Alternate_Port: 22

... (con't on next figure)

Figure 3 Prompts for Schedule add (con't)

```
Start time is in time of day format (hh:mm) where hh is hours between 0
and 23 and mm is minutes between 0 and 59.
Enter Start_Time: 00:00

Stop time is in time of day format (hh:mm) where hh is hours between 0
and 23 and mm is minutes between 0 and 59.
Enter Stop_Time: 23:00

Interval can be between 5 and 1440 minutes.
Press Enter to accept '120'.
Enter Interval: 5

Remote storage directory can have between 1 and 255 characters.
Enter Remote_Storage_Directory: /billing

Remote login can have between 1 and 20 characters.
Enter Remote_Login: test

Remote password can have between 1 and 20 characters.
Enter Remote_Password:
Re-enter Remote_Password:

Maximum retries can be between 0 and 10.
Press Enter to accept '3'.
Enter Maximum_Retries:

Retry wait time can be between 1 and 60 seconds.
Press Enter to accept '1'.
Enter Retry_Wait_Time:

File extension can have between 0 and 3 characters.
Enter 'Blank' for no file extension.
Press Enter to accept 'Blank'.
Enter File_Extension:

Field separator can have 1 character.
Press Enter to accept '.'.
Enter Field_Separator:

WARNING: Billing files associated with this tuple will not
transfer downstream when Active is set to No.

Valid active values are {'No', 'n', 'Yes', 'y'}.
Press Enter to accept 'No'.
Enter Active: y
```

After schedule tuple configuration is completed, the user can run the sftp client manually to verify that the downstream OSS is ready for file transfer using SFTPW protocol. In other words, ready for accepting connection from a sftp client.

It should also be noted that the SFTPW protocol will be in effect in the next interval once you make the tuple active.

Figure 4 Steps to run sftp manually to verify downstream availability for SFTP

1. logon to SDM/CBM as root

2. Run sftp command to connect to the downstream OSS

sftp -oPreferredAuthentications=password <loginId>@<IP> -oPort=<port#>
e.g. sftp -oPreferredAuthentications=password test@47.135.213.53 -oPort=22

3. If you get back a password prompt: “test‘s password:” , then the downstream is ready for SFTPW otherwise please refer to the required software component and configuration sections for more details.

72: Configuration (CN): A00005074

72.1 Hardware and Software Requirements

OMDD application running on the SDM/CBM is InSv. OpenSSH is installed on the SDM/CBM.

72.2 Initial Configuration

The initial configuration of OMDD is not changed by this activity.

72.3 Element Management

72.3.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
OMUI	Changed

72.3.2 GUI information

The OMUI “Add File Transfer Destination” and “Modify File Transfer Destination” menus are modified by this activity.

72.3.2.1 GUI name: OMUI

OMDD User Interface

72.3.2.1.1 Functional description

The “Add File Transfer Destination” menu in OMUI enables the user to configure a destination where OMDD can transfer OM reports. The “Modify File Transfer Destination” menu enables the user to modify an already configured file transfer destination.

This activity modifies the Add and Modify File Transfer Destination menus of OMUI. From now on, when a user adds or modifies a file transfer destination, he/she will be asked to select the type of file transfer for the destination in addition to the already existing parameters. The choices for the type of file transfer will be “Standard” and “Secure” .

If the user chooses “Secure”, a warning message will be printed along with the confirmation prompt. This warning message informs the user that secure file transfer would fail if OpenSSH was not installed on the SDM/CBM.

Figure 1 shows an example configuration of file transfer destination using the modified menu. The same changes are made in the “Modify File Transfer Destination” menu also.

Figure 1 OMUI File Transfer Destination menu

Add File Transfer Destination (for a secure file transfer destination)

File Transfer Destination name > ftd1
Destination IP Address > 1.1.1.1
Type of File Transfer: Standard/Secure > Secure
Destination Port [22] >
Destination Login > user1
Destination Password >
WARNING: File Transfer to this destination will fail if OpenSSH is not installed.
Please install OpenSSH if it is not already installed.
Add File Transfer Destination(Y/N)?

Add File Transfer Destination (for a standard file transfer destination)

File Transfer Destination name > ftd2
Destination IP Address > 1.1.1.2
Type of File Transfer: Standard/Secure > Standard
Destination Port [21] >
Destination Login > user1
Destination Password >
Add File Transfer Destination(Y/N)?

SDM/CBM output - black
User input - blue
Step newly added by this activity - red

72.4 Configuration Walkthrough

This activity introduces an additional step in the add and modify file transfer destination menus of OMUI. This does not change the existing configuration methods of OMDD.

73: Configuration (CN): A00005160

73.1 Hardware and Software Requirements

A data network must be engineered and commissioned to enable UDP and ICMP echo messaging between OSSAIN/OSAC switches and OSSAIN service nodes. Refer to "73.10 Security" on page 3372 for information relevant to configuring the data network. Refer to the FN section of this DDOC for more information about capacity engineering.

XA-Core Ethernet interface cards should be commissioned on the switch before attempting to convert OSSAIN nodes to use them.

OSSAIN service nodes, provided either by Nortel Networks or by a third party vendor, must be in place.

73.2 Initial Configuration

For overall information about configuring OSSAIN, refer to the *OSSAIN User's Guide* (297-8403-901) and to SN-specific documentation.

If this feature is being commissioned on a switch that does not already have XA-Core Ethernet interfaces, it is important to develop an overall IP address plan that will last when the switch begins to use Succession functionality. Refer to Nortel Networks system engineering documentation for more information.

Also refer to engineering documentation for specific information about commissioning XA-Core Ethernet interface cards. Existing CI XAIPTOOL may be useful in working with XA-Core Ethernet interfaces.

An SN must not be on the same subnet as a core Ethernet interface unless it is intended that the core use that interface, and its associated core IP address, when sending messages to that SN. A local subnet check in the core routing software will select the core interface rather than the EIU router if a local subnet match is found. This applies both to XA-Core Ethernet interfaces and to EIUs that are configured as interfaces instead of routers, although whether a local subnet match is found for the XA-Core Ethernet interface depends on interactions with other features.

Migration from EIU to XA-Core Ethernet interface at a switch can be done gradually, on a per far-end node basis. OSAC hosts and remotes do not have to be converted at the same time. For example, an OSAC remote can send messages via its EIU to the host's XA-Core Ethernet interface IP address, and the host responds using its XA-Core Ethernet interface to the IP address that the remote uses with its EIU. Also, an OSAC host or remote can use XA-Core Ethernet interface for messaging with some service nodes, and EIU for

messaging with others. A service node can communicate with some switches that use XA-Core Ethernet interface and with others that use EIU.

See "73.11 Configuration Walkthrough" on page 3373 for the steps in converting a switch to use XA-Core Ethernet interface rather than EIU for messaging with a specific far-end node (SN or OSAC switch).

73.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable.

73.4 Upgrade Impact

73.4.1 Dump and Restore

No customer action is required. On an ONP from pre-SN07 to SN07 or later, OSSAIN nodes are automatically datafilled in table OANODINV to use the EIU data path.

73.4.2 Element Management Upgrade

Not applicable.

73.5 Data schema (DS)

73.5.1 New/modified tables

Table 1 New or modified tables

Table name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
Table OANODINV	changed	unchanged
Table CMIPADDR	changed	unchanged
Table QMSMIS	changed	unchanged

73.5.2 Table information

73.5.2.1 Name: Table OANODINV

Operator Services System Advanced Intelligent Network Node Inventory

73.5.2.1.1 Functional description

This table maps an OSSAIN node identifier to a unique node name. It defines the transport layer protocol used for messaging to the given node and specifies protocol related network address information. This table also allows datafilling OSSAIN node specific information.

73.5.2.1.2 Usage sequence and implications (CM Only)

The following tables must be datafilled before OANODINV:

- ENSITES
- ENTYPES
- OANODNAM
- CMIPADDR, for OANODINV tuples with field DATAPATH = XAETHR

Current datafill sequence is unchanged for tables that are datafilled after table OANODINV.

73.5.2.1.3 Size

This activity increases the store for each OANODINV tuple by 4 bytes.

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
OANODINV	0	768 (unchanged)	Approximately 1038 bytes per tuple. Refer to the Engineering (EI) section of this DDOC for more information.

Note: The amount of store used by table OANODINV depends on the NODEID values that are datafilled in table OANODNAM. To avoid wasting store, avoid datafilling higher NODEID values than needed.

73.5.2.1.4 Fields

The following table shows the top-level fields for table OANODINV.

Table 3 Table OANODINV field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NODENAME	unchanged			
NODEAREA	refinements changed	This field consists of subfield ONPMTYPE and refinements		
ONPMTYPE	unchanged	This is a selector field.	OSN, OSNM, or OSAC (unchanged)	unchanged
AUDTRIES	unchanged			
AUDRTIMR	unchanged			
AUDFREQ	unchanged			

ONPMTYPE = OSN

If the entry in subfield ONPMTYPE is OSN, datafill refinements as shown in the following table.

Table 4 OSN refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
ENNODENO	unchanged			
PROTOCOL_ AREA	unchanged			
ADDRESS_ AREA	unchanged			
DATAPATH_ AREA	New	This field consists of subfield DATAPATH and refinements		
DATAPATH	New	This is a selector field.	EIU or XAETHR	Data path. Enter EIU if the data path for this OSN is to use Ethernet Interface Unit. Enter XAETHR if the data path for this OSN is to use XA-Core Ethernet interface cards, and also datafill refinement field CMIPADDR.
CMIPADDR	New	This is a refinement field, present only if selector DATAPATH = XAETHR	four numbers, each 0 to 255	Computing Module Internet Protocol Address. Enter an IP address from the ACTIVEIP field of a CMHOST tuple in table CMIPADDR. To distribute messaging over the physical links, datafill one ACTIVEIP address for half of the nodes and the other ACTIVEIP address for the other half.
HOSTNAME	unchanged			
FAIL_DET	unchanged			
ONODTYPE	unchanged			
ONODLOC	unchanged			
ONODSITE	unchanged			
ONODINFO	unchanged			

ONPMTYPE = OSNM

If the entry in subfield ONPMTYPE is OSNM, datafill refinements as shown in the following table.

Table 5 OSNM refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
ENNODENO	unchanged			
PROTOCOL_ AREA	unchanged			
ADDRESS_ AREA	unchanged			
NMTCPORT	unchanged			
DATAPATH_ AREA	New	This field consists of subfield DATAPATH and refinements		
DATAPATH	New	This is a selector field.	EIU or XAETHR	Data path. Enter EIU if the data path for this OSNM is to use Ethernet Interface Unit. Enter XAETHR if the data path for this OSNM is to use XA-Core Ethernet interface cards, and also datafill refinement field CMIPADDR.
CMIPADDR	New	This is a refinement field, present only if selector DATAPATH = XAETHR	four numbers, each 0 to 255	Computing Module Internet Protocol Address. Enter an IP address from the ACTIVEIP field of a CMHOST tuple in table CMIPADDR. To distribute messaging over the physical links, datafill one ACTIVEIP address for half of the nodes and the other ACTIVEIP address for the other half.
FAIL_DET	unchanged			
TSTTIME	unchanged			
RTSTIME	unchanged			
ONODTYPE	unchanged			
ONODLOC	unchanged			

Table 5 OSNM refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
ONODSITE	unchanged			
ONODINFO	unchanged			

ONPMTYPE = OSAC

If the entry in subfield ONPMTYPE is OSAC, datafill refinements as shown in the following table.

Table 6 OSAC refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RELATION_ AREA	A refinement of this field is changed	This field consists of subfield RELATION and refinements		
RELATION	unchanged	This is a selector field. If SELF is entered, there are no refinements. If OTHER is entered, datafill the refinement fields shown below.	SELF or OTHER	unchanged
ENNODENO	unchanged			
PROTOCOL_ AREA	unchanged			
ADDRESS_ AREA	unchanged			
DATAPATH_ AREA	New	This field consists of subfield DATAPATH and refinements. This field is present only if selector RELATION = OTHER.		

Table 6 OSAC refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
DATAPATH	New	This is a selector field.	EIU or XAETHR	Data path. Enter EIU if the data path for this OSAC node is to use Ethernet Interface Unit. Enter XAETHR if the data path for this OSAC node is to use XA-Core Ethernet interface cards, and also datafill refinement field CMIPADDR.
CMIPADDR	New	This is a refinement field, present only if DATAPATH = XAETHR	four numbers, each 0 to 255	Computing Module Internet Protocol Address. Enter an IP address from the ACTIVEIP field of a CMHOST tuple in table CMIPADDR. To distribute messaging over the physical links, datafill one ACTIVEIP address for half of the nodes and the other ACTIVEIP address for the other half.
ONODTYPE	unchanged			
ONODLOC	unchanged			
ONODSITE	unchanged			
ONODINFO	unchanged			

73.5.2.1.5 Datafill example

The following example shows sample datafill for table OANODINV. A bold font is used to highlight the new fields introduced by this activity.

```
NODENAME  NODEAREA                                    AUDTRIES AUDRTIMR AUDFREQ
-------------------------------------------------------------------------------

              SWITCH_C Y 2 SN 1 DD 34 CITYC DAA2    4        5      60
```

73.5.2.1.6 Table release history update

The DATAPATH_AREA field, with selector subfield DATAPATH and refinement CMIPADDR, is added for OSN, OSNM, and OSAC OTHER tuples. The CMIPADDR refinement field is present only if DATAPATH = XAETHR.

73.5.2.1.7 Supplementary information

When XAETHR is entered as the data path, the IP address in the OANODINV CMIPADDR refinement field must be used by the far-end node as the destination address for OSSAIN messages. This same IP address will be the source IP address for OSSAIN messages sent to the far-end node.

The XAETHR data path cannot be datafilled in table OANODINV unless the IP address in refinement field CMIPADDR has been previously added to table CMIPADDR, as the ACTIVEIP entry in a CMHOST tuple. If an attempt is made to violate this restriction, the following error message is displayed:

```
The CMIPADDR entry in OANODINV must match an ACTIVEIP
entry in a CMHOST tuple in table CMIPADDR.
```

The XAETHR data path cannot be datafilled in table OANODINV if the node is identified in table QMSMIS as a server for OSSAIN QMS MIS. If an attempt is made to change the OSSAIN QMS MIS server's data path to XAETHR, the following error message is displayed:

```
This node is datafilled in table QMSMIS. DATAPATH XAETHR
is not supported for an OSSAIN QMS MIS server.
```

73.5.2.1.8 Translation verification tools

Table OANODINV does not use translation verification tools.

73.5.2.2 Name: Table CMIPADDR

Computing Module Internet Protocol Addresses

Note: The only changes are a new cross-check with table OANODINV and a new error message. However, because earlier releases of Nortel Networks documentation may have missed some of the details about this table, this feature goes into some detail in documenting the fields.

73.5.2.2.1 Functional description

Table CMIPADDR contains the IP addresses and subnet masks associated with the XA-Core, as well as the gateway router IP address and the edge device IP addresses and subnet masks.

73.5.2.2.2 Usage sequence and implications (CM Only)

Table CMIPADDR is datafilled during commissioning of the Ethernet interfaces in an XA-Core switch. Changing the gateway or host address information after that may cause data mismatches between various nodes in the IP network.

This activity (A00005160, OSSAIN XA-Core Data Messaging Capacity Enhancements) adds the following dependency: Table CMIPADDR must be datafilled before a tuple with DATAPATH = XAETHR can be added to table OANODINV.

73.5.2.2.3 Size

Current size unchanged.

73.5.2.2.4 Fields

The following table lists the top-level fields for table CMIPADDR.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
KEY	unchanged	This field consists of subfields KEYCLASS and ENTRYNO.		
KEYCLASS	unchanged		GATEWAY, CMHOST, AMDIHOST, ETHRLNK	Key class. Indicates the class of tuple being datafilled. Enter GATEWAY to datafill the IP address of a gateway router. There can be only one GATEWAY tuple. Enter CMHOST to datafill an active IP address for the XA-Core. There can be two CMHOST tuples (total two active host IP addresses). Enter ETHRLNK to datafill a physical Ethernet link. There can be up to 8 ETHRLNK tuples, with each tuple corresponding to a physical link. AMDIHOST was added to allow datafill of an IP address to be used with an AMDI link for CLIP (Classical IP) over ATM. This value cannot be datafilled in SN07 or ISN07.
ENTRYNO	unchanged		0 to 7	Entry number. This is used to create a unique key. The KEYCLASS limits the ENTRYNO values that can be datafilled: GATEWAY: 0 to 0 CMHOST: 0 to 1 AMDIHOST: N/A ETHRLNK: 0 to 7
DATA	unchanged	This field consists of selector field SELCLASS and refinements.		
SELCLASS	unchanged	This is a selector field	GW, HOST, AMDI, ETHR	Selector class. The KEYCLASS in the key must match the SELCLASS entry as follows: GATEWAY: GW CMHOST: HOST AMDIHOST: AMDI ETHRLNK: ETHR

SELCLASS = GW

If the entry in subfield SELCLASS is GW, datafill refinements as shown in the following table.

Table 8 GW refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GTWYIP	unchanged		four numbers, each 0 to 255	Gateway IP address. Enter an address for a gateway router. This address is downloaded to the Ethernet interface card or packlet. ***Note 1:*** VRRP and similar redundancy schemes allow a pair of routers to use a single IP address. ***Note 2:*** The GTWYIP entry may be the same as an address entered for an edge device in an ETHRLINK tuple, in case there is an Ethernet LAN but no WAN. It may not be the same as any other IP address in table CMIPADDR.
NETID	unchanged		0 to 1	Network (i.e., subnet) identifier. Enter 0. In SN07 there can be only one Ethernet-based subnet for the core.

SELCLASS = HOST

If the entry in subfield SELCLASS is HOST, datafill refinements as shown in the following table.

Table 9 HOST refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
ACTIVEIP	unchanged		four numbers, each 0 to 255	Active IP address for the XA-Core. This will be one of the IP addresses used by applications and advertised outside of the core. The active IP addresses are dynamically associated with physical interfaces. If an active IP address is bound to a physical interface that suffers a failure, it will be automatically rebound to a different interface in the same subnet.
NETMASK	unchanged		1 to 30	Subnet mask. Enter the number of leading ‘1’s in the mask.

Table 9 HOST refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NETID	unchanged		0 to 1	Network (i.e., subnet) identifier. Enter 0. In SN07 there can be only one Ethernet-based subnet for the core.

SELCLASS = AMDI

This value cannot be datafilled in SN07/ISN07.

SELCLASS = ETHR

If the entry in subfield SELCLASS is ETHR, datafill refinements as shown in the following table.

Table 10 ETHR refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SLOTID	unchanged	This field consists of subfields SLOT and SIDE		
SLOT	unchanged		0 to 18	Slot. The physical slot number on the XA-Core shelf where the Ethernet interface card resides. (For EIOP, this is where the IOP resides.) ***Note:*** Refer to XA-Core engineering documentation for packfill restrictions.
SIDE	unchanged		UNKNOWN, FRONT, REAR	Side. The location on the XA-Core shelf where the Ethernet interface card resides. Enter FRONT or REAR. ***Note:*** Refer to XA-Core engineering documentation for packfill restrictions.
PACKLET	unchanged		NONE, LOWER, UPPER	Packlet. For EIOP, enter the location of the Ethernet packlet on the IOP card. For other Ethernet interfaces such as HIOP and HCMIC, enter NONE.
CARDIP	unchanged		four numbers, each 0 to 255	Card IP address. This address is used only within the interface card or packlet, and is not advertised.
CARDNETM	unchanged		1 to 30	Card subnet mask. Enter the number of leading ‘1’s in the mask.

Table 10 ETHR refinement field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
MTCIP	unchanged		four numbers, each 0 to 255	Maintenance IP address. This is used by the core for maintenance of the interface card or packlet from the core. This address is not advertised.
MTCNETM	unchanged		1 to 30	Maintenance subnet mask. Enter the number of leading ‘1’s in the mask.
EDGEIP	unchanged		four numbers, each 0 to 255	Edge device IP address. This is the address of the device to which the Ethernet interface is directly attached. This address is used by the core in performing integrity checks, using ICMP echo requests, on the point-to-point link between the Ethernet interface card or packlet and the edge device to which it is attached. Assuming the edge device is a Passport 8600, datafill the physical IP address of the CallP VLAN/subnet on the Passport 8600 that the HIOP or HCMIC subtends.
NETID	unchanged		0 to 1	Network (i.e., subnet) identifier. Enter 0. In SN07 there can be only one Ethernet-based subnet for the core.

73.5.2.2.5 Datafill example

The following example shows sample datafill for table CMIPADDR.

```
KEY         DATA
---------------------------------------------------------
GATEWAY 0   GW (172 16 0 1) 0
CMHOST 0    HOST (172 16 14 108) 20 0
CMHOST 1    HOST (172 16 14 109) 20 0
ETHRLNK 1   ETHR 12 REAR NONE (172 16 14 104) 20
            (172 16 14 110) 20 (172 16 0 2) 0
ETHRLNK 2   ETHR 6 REAR NONE (172 16 14 106) 20
            (172 16 14 112) 20 (172 16 0 3) 0
```

73.5.2.2.6 Table release history update

Table CMIPADDR was introduced and modified in CSP16 by the following features:

- A59025829, IRM Plan B
- A59029386, CLIP on the XA-Core
- A59029980, Succession HIOP Maintenance Software

In CSP20 (SN07), new cross-checks and error messages are added by the following features:

- A00002510, LANCOMM IP over IRM - adds cross-checks with table IPNETWRK.
- A00005160, OSSAIN XA-Core Data Messaging Capacity Enhancements (this feature) - adds cross-checks with table OANODINV.

73.5.2.2.7 Supplementary information

In SN07/ISN07, only one subnet is supported for the core Ethernet interfaces. All active IP, maintenance IP, and card IP addresses must be unique, and they must all have the same netmask and the same subnet.

A GATEWAY or CMHOST tuple can be changed or deleted only if all links associated with the subnet are off-line. An ETHRLNK tuple can be changed or deleted only if the link is off-line.

Warning: Changes to the GATEWAY or CMHOST IP addresses or subnet information in this table after the initial commissioning may cause data mismatches between various nodes in the IP network.

This activity (A00005160, *OSSAIN XA-Core Data Messaging Capacity Enhancements*) adds the following error message. This message is printed if an attempt is made to delete or change a CMHOST tuple whose active IP address is datafilled in table OANODINV.

```
ERROR: The active IP address in this tuple is referenced
by table OANODINV. The tuple cannot be changed or deleted
as long as table OANODINV references it.
```

Note: Much other datafill may depend on the OANODINV tuple. To avoid having to delete and re-add all this other datafill if it is necessary to change the IP address plan, one can temporarily change the DATAPATH field in the OANODINV tuple to EIU. However, this does not imply that the CMHOST tuples can be changed without major impact on the OSSAIN application.

73.5.2.2.8 Translation verification and other tools

Table CMIPADDR does not use translation verification tools.

73.5.2.3 Name: Table QMSMIS

QMS MIS Link Definition Table

Note: The only changes are a new cross-check and a new error message.

73.5.2.3.1 Functional description

Table QMSMIS defines the links used by a Queue Management System Management Information System (QMS MIS) application and also defines the audit frequency for the links.

73.5.2.3.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

73.5.2.3.3 Size

Current size unchanged.

73.5.2.3.4 Fields/OIDs

The following table lists the top-level fields for table QMSMIS.

Table 11 QMSMIS field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
INDEX	unchanged			
DATALINK	unchanged			

73.5.2.3.5 Datafill example

The following example shows sample datafill for table QMSMIS.

```
INDEX                                                DATALINK
-----------------------------------------------------------
OSSAIN                          ETHERNET MIS_OSSAIN 24 7001
TOPS                                  MPC (3 3 1) (4 4 2) $
```

73.5.2.3.6 Table release history update

Cross-checks are added to enforce that an OSSAIN QMS MIS server cannot be datafilled in table OANODINV with data path XAETHR.

73.5.2.3.7 Supplementary information

If an attempt is made to datafill an OSSAIN tuple whose node has data path XAETHR in table OANODINV, the following error message is displayed:

```
THIS NODE HAS DATAPATH XAETHR IN TABLE OANODINV. OSSAIN
QMS MIS SERVERS MUST USE THE EIU. XA-CORE ETHERNET DATA
PATH IS NOT SUPPORTED FOR OSSAIN QMS MIS.
```

73.5.2.3.8 Translation verification and other tools

Tools unchanged.

73.6 Service Orders (SO) (CM & SESM)

Not applicable.

73.7 Software optionality control (SOC)

Table 12 SOC

SOC option name:	OSSAIN Base
SOC option title:	OSSAIN Base
SOC option control type:	state
New SOC option?	No
SOC option order code	OSAN0101
Option defined in DRU:	TOPS

73.8 Element Management

Not applicable.

73.9 Command interface changes

73.9.1 Command: QUERYPM (in OAINPMDIR directory)

73.9.1.1 Command type: Listed MENU

73.9.1.2 Command target: All

73.9.1.3 Command availability: RES

73.9.1.4 Command description

The QUERYPM command is available in a number of different MAP levels. In general, it is used to display information about the posted peripheral module (PM).

This feature changes the output that is displayed when the QUERYPM command is issued with no arguments in the OAINPMDIR directory. The OAINPMDIR directory is entered from the MAPCI;MTC;PM level by posting an OSN, OSNM, or OSAC node. These node types are used for the TOPS OSSAIN application.

73.9.1.5 Command syntax

The command syntax is unchanged. In the OAINPMDIR directory, the QUERYPM command may be entered with no parameters or with the constant FLT parameter. This feature only changes the output when QUERYPM is entered with no parameters.

73.9.1.6 Qualifications and warnings

None.

73.9.1.7 Responses

This feature changes only the success response. It does not change the error responses.

The success response displays information about the posted node, from table OANODINV. None of the information that was displayed prior to this feature is changed in format or meaning. This feature adds a new line to the success response, corresponding to new information in table OANODINV.

The new line displays the data path used for the posted node. The data path can be EIU or XAETHR. EIU refers to the Ethernet Interface Unit. XAETHR refers to XA-Core Ethernet interface cards such as HIOP and HCMIC. If the node uses an XAETHR data path, the display also shows the active CM host IP address that the switch uses in messaging with the node.

The success response does not require any user action. It is visible on both XA-Core and BRISC. On BRISC the data path will always be EIU. On XA-Core, it can be either EIU or XAETHR.

73.9.1.8 Example

The following figure shows an example success response for a posted node with connectivity through XA-Core Ethernet cards using active host IP address 172.16.1.109. The figure uses a bold font to highlight the new line that has been added to the display.

```
NODENAME: DAA_01
NODEID:   1
PROTOCOL: UDP
IPADDR:   172.16.20.205
DATAPATH: XAETHR (172.16.1.109)
ONODTYPE: SN
ONODLOC:  1 DD 33
ONODSITE: CITYC
HOSTNAME: SWITCH_C
```

Actual data values depend on datafill in table OANODINV.

73.9.2 Command: BUFSTATS (in OSSAINCI directory)

73.9.2.1 Command type: NON-MENU

73.9.2.2 Command target: All

73.9.2.3 Command availability: RES

73.9.2.4 Command description

OSSAINCI is an existing directory that provides non-menu commands that are used primarily by Nortel Networks customer support personnel. The OSSAINCI directory is accessed by entering the directory name. Most of the commands are related to tracing of OSSAIN messages. The new BUFSTATS command is not related to tracing; it is related to buffer resources.

The BUFSTATS command allows the user to view information about the queues and buffer pools that are used for processing messages incoming to OSSAIN via an XA-Core Ethernet interface. It also allows the user to reset the low water marks associated with the free queues.

73.9.2.5 Command syntax

Table 13 BUFSTATS command parameters and variables

Command	**Parameters and variables**
BUFSTATS	DISPLAY, RESET
Parameters and variables	**Description**
DISPLAY	Displays information about buffer resources
RESET	Resets low water marks associated with free queues used by the application.

73.9.2.6 Qualifications and warnings

Low water marks are approximate. (Realtime and possible blocking involved in keeping them accurate would be counter-productive.) In-queue counts are also approximate, but are closer to accurate than low water marks.

Displaying buffer stats frequently during peak traffic hours can cause blocking.

73.9.2.7 Responses

Table 14 MAP outputs with associated meanings and actions

Response to command BUFSTATS with no parameters, or with DISPLAY parameter

The system displays information about the queues. Following is an example. The numbers will vary.
 	
`XAETHR Free Qs/Pools`
`====================`
`Bytes/buff  Alloc  Count   LWM`
`----------  -----  -----  -----`
`   64        300    270    114`
`  128        300    281     70`
`  320        150    150    147`
 	
`XAETHR Inuse Qs`
`===============`
`Use     Count`
`-----   -----`
`CallP     45`
`Mtce       3`
 	
Meaning:
 	
Bytes/buff — number of message body bytes in buffers
Alloc — number of buffers allocated
Count — approximate number of buffers currently in queue
LWM — low water mark
Use — kind of messages the queue/pool is used for
 	
User actions:
 	
No user action is required.

Table 15 MAP outputs with associated meanings and actions

Success response to command BUFSTATS with RESET parameter
`LWMs have been reset for all FreeQs` **Meaning:** The System has reset the low water marks of the free queues. **User actions:** No user action is required.

73.9.2.8 Example

Table 16 Usage example for OSSAINCI BUFSTATS command

Description of task:	Study free queue low water marks during a defined study period.
At the beginning of the study period:	
Command: MAP response: Command: MAP response: Command: MAP response:	>OSSAINCI OSSAIN: >BUFSTATS RESET LWMs have been reset for all FreeQs >LEAVE CI:
At the end of the study period:	
Command: MAP response: Command: MAP response: Command: MAP response	>OSSAINCI OSSAIN: >BUFSTATS DISPLAY *<display similar to that in Table 14 on page 3369>* >LEAVE CI:

73.9.3 Command: SCREENTAB (in OSSAINCI directory)

73.9.3.1 Command type: NON-MENU

73.9.3.2 Command target: All

73.9.3.3 Command availability: RES

73.9.3.4 Command description

OSSAINCI is an existing directory that provides non-menu commands that are used primarily by Nortel Networks customer support personnel. The OSSAINCI directory is accessed by entering the directory name. Most of the commands are related to tracing of OSSAIN messages. The new SCREENTAB command is not related to tracing; it is related to an internal table that the switch maintains.

The SCREENTAB command allows Nortel Networks support personnel to view the contents of the internal table. The internal table does not affect any functionality in the SN07/ISN07 releases. It is for possible future use.

73.9.3.5 Command syntax

Table 17 SCREENTAB command parameters and variables

Command	Parameters and variables
SCREENTAB	none

73.9.3.6 Qualifications and warnings

None.

73.9.3.7 Responses

Table 18 MAP outputs with associated meanings and actions

Response to command SCREENTAB

The system displays information about the internal table. Following is an example. The numbers will vary.
 	
`idx (hex)  entry  collisions`
`---------  --------------------------  ----------`
`00B9  2F8EE0B9  (47.142.224.185)  0`
`0201  2FF50E01  (47.245.14.1)  0`
 	
Meaning:
 	
idx — index into internal hash table
entry — data in internal hash table
collisions — number of hash collisions to access entry
 	
User actions:
 	
No user action is required.

73.9.3.8 Example

Table 19 Usage example for OSSAINCI SCREENTAB command

Description of task:	View contents of internal hash table.
Command: MAP response:	`>OSSAINCI` `OSSAIN:`
Command: MAP response:	`>SCREENTAB` *<display similar to that in Table 18 on page 3371>*
Command: MAP response	`>LEAVE` `CI:`

73.10 Security

A secure network is assumed. The risk in using OSSAIN in an insecure network is greater with XA-Core Ethernet interface cards than with the EIU. This is because the EIU can offer some protection to the core by screening out messages from unwanted IP addresses. With XA-Core Ethernet interface cards, anyone with access to the central office LAN has direct access to the core.

73.10.1 Network configuration

Firewalls and routers must allow UDP datagrams to and from the IP addresses and ports used for OSSAIN.

- IP addresses
  - — In the core, OSSAIN may use the active CMHOST IP addresses datafilled in table CMIPADDR, the IP address in the CMIPADDR tuple of table IPNETWRK, or both. Which core IP addresses OSSAIN uses is based on datafill in table OANODINV.
  - — IP addresses of OSSAIN and OSAC nodes are datafilled in the IPV4ADDR field of table OANODINV.
  - — If OSSAIN is configured to use EIUs, it uses them as routers.
- Ports
  - — OSSAIN uses UDP ports 5289 through 5293 in the core, regardless of whether it is configured to use EIUs or XA-Core Ethernet interfaces.
  - — UDP ports used in service nodes for OSSAIN messaging are datafillable in the following tables and fields:
    - – table OANODINV, field NMTCPORT in OSNM refinement
    - – table OASESNPL, fields CPPORT and MTCPORT in various refinements

  Note: Although an OSAC remote switch does not have have datafill for a centralized service node's maintenance port, it does send messages to and receive messages from this port. The centralized service node is datafilled in the OSAC remote as an OSN node, and in the OSAC host as an OSNM node. The OSAC remote sends datagrams to and receives datagrams from the centralized service node at the NMTCPORT datafilled in the OSAC host, as well as at the session pool ports datafilled in both switches.

OSSAIN also requires that the data network support ICMP echo requests and replies to and from the IP addresses used for OSSAIN nodes (both OSAC switches and service nodes).

This activity does not restrict whether the active host IP addresses in table CMIPADDR are in the same or a different subnet than the CM IP address used by the EIU.

73.10.2 Key management

N/A.

73.10.3 Protocol

N/A.

73.10.4 Authentication

N/A.

73.11 Configuration Walkthrough

This section outlines steps for converting OSSAIN to use XA-Core Ethernet interface, rather than EIU, for messaging with a single far-end node (SN or OSAC switch). This procedure has the following prerequisites:

- The secure, engineered data network must be up. Firewalls and routers must be configured to allow ICMP echo and UDP messaging between the XA-Core Ethernet interface to be used and the far-end node. (Refer to "73.10 Security" on page 3372 for information about UDP ports used for OSSAIN.)
- The XA-Core Ethernet interfaces must be commissioned.
- If an SN is involved (it will be unless it's an OSAC link being changed), the method for changing the switch IP address on the SN must be understood. This method is different for different service nodes.

Once the prerequisites are satisfied, there are several ways the change could be made. The sequence shown here is straightforward and will not cause sessions in progress to fail; however, it may cause SysB alarms in switches in the OSAC network. These alarms will clear automatically once the conversion is successfully completed. If avoiding such alarms is a priority, more steps may be needed. For example, if an OSAC host is being converted to use XA-Core Ethernet interface for messaging with a particular SN, it will need to briefly off-line the SN, and this will raise alarms in the OSAC remotes unless the SN's session pools and the SN itself have first been busied in the remotes.

1. At the switch that is to start using XA-Core Ethernet interface cards:

a. Drain all session pools datafilled against the far-end node. This is done at the SesnPool level (SESNPOOLDIR) of the DMS MAP. Wait for the session pools to transition to ManB.

Note: Drain is not supported for OSN node types. If an OSAC remote is being converted to use XA-Core Ethernet interface for an OSN, temporarily route the traffic elsewhere rather than draining.

b. Off-line all session pools datafilled against the far-end node.

c. At the OAINPMDIR directory, busy and off-line the far-end node.

d. In table OANODINV, modify the tuple for the far-end node to use XAETHR data path, and datafill the CMIPADDR field.

2. At the far-end node, change its configuration to use the new IP address for the switch.

— If the far-end node is an SN, follow SN-specific procedures for this step.

— If the far-end node is an OSAC switch, follow the steps below at that switch. These steps assume that switch A is the one being changed to use XA-Core Ethernet interfaces, and switch B is the one where the steps below are performed.

a. Busy and off-line switch A at the OAINPMDIR directory, if this has not already been done.

b. Modify the tuple for switch A in table OANODINV, changing the IPV4ADDR field to the IP address that was datafilled in switch A against switch B in the CMIPADDR field of table OANODINV.

c. At the OAINPMDIR MAP directory, Busy and RTS switch A. Ensure that all session pools to switch A are SysB.

3. At the switch that is to start using XA-Core Ethernet interface cards:

a. Busy and RTS the far-end node and session pools.

4. Check logs and OMs at both both ends, and make test calls.

5. Configure firewalls and routers in the data network to disallow messaging between the CM IP address datafilled in table IPNETWRK and the far-end node, if desired.

Note: Refer to the FN section of this DDOC (A00005160, *OSSAIN XA-Core Data Messaging Capacity Enhancements*) for a limitation regarding inconsistent IP address datafill detection. This limitation exists only in OSAC remote switches, and only if the OSAC host switch is below SN07/ ISN07, the service node is below OAP release 9, or both.

74: Configuration (CN): A00005190

74.1 Hardware and Software Requirements

Tables IPNETWRK and MSCDINV must be data filled before table SDMINV.

74.2 Initial Configuration

No hardware needs to be present to configure an SDM or CBM connected by DS512 or OC3 on the Core.

74.3 Office/Subnet parameters (OP/SP) (CM & SESM)

No change.

74.4 Upgrade Impact

74.4.1 Dump and Restore

No change

74.4.2 Element Management Upgrade

No change.

74.5 Data schema (DS) (CM, MIBS, RDB)

74.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/OLD/UNCHANGED)
SDMINV	CHANGED	UNCHANGED

74.5.2 Table/MIB/Remote Database Schema information

74.5.2.1 Name: SDMINV

DS512 connected SDM inventory table

74.5.2.1.1 Functional description

This table contains the PEC codes, location, link information, and IP address information related to a DS512 connected SDM. This activity adds a new PEC for a simplex CBM which is OC3 connected.

74.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

Current datafill order unchanged.

74.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SDMINV	0	1	No change

74.5.2.1.4 Fields/OIDs

The following table lists the changed field for table SDMINV.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SHELFPEC	Changed	none	NTRX50DA NTRX50EB NTRX51EL NTRX51LS	NTRX51LS is being added for the simplex CBM OC3 connected shelf type.

Figure 2 SDM MAPCI screen CSP20 (DS512 connected SDM)

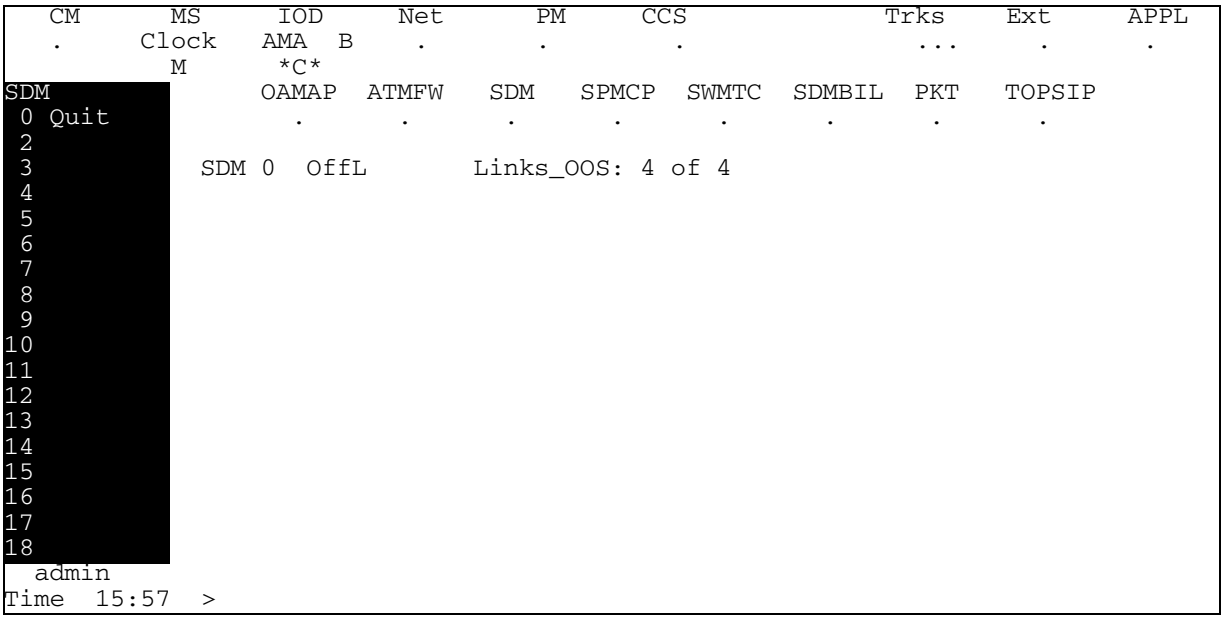

Figure 3 SDM MAPCI screen CSP20 (OC3 connected CBM)

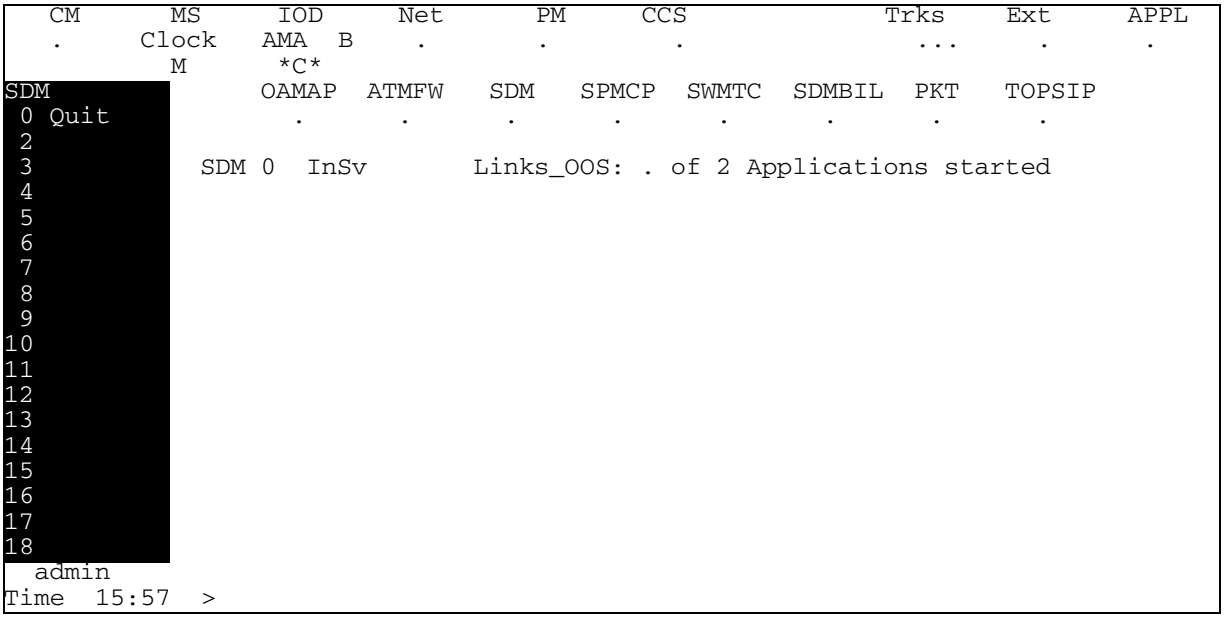

74.9.1.1 MAP level description

This map level displays the state information related to the SDM.

It also provide commands to query additional status as well as control the state of a DS512 connected SDM.

To the existing mapci screen, small modifications are being added to support an OC3 connected CBM.

From the customer's perspective, there is little visual difference between the two supported environments. The differences are as follows:

- Only 2 links are supported to a CBM.
- The platform, locate, querysdm status, querysdm config, and querysdm loads commands are not supported on a CBM.
- The querysdm flt command will only display core side faults for a CBM.
- A new field is visible as long as there is heartbeating with the CBM which presents the overall application status of the CBM. i.e."Applications started" and "Applications stopped".

74.9.1.2 Accessing path: appl:SDM

74.9.1.2.1 Access to directory or MAP level and return to CI

mapci;mtc;appl;sdm

74.9.2 Command: QuerySDM

74.9.2.1 Command type: Listed MENU

74.9.2.2 Command target: All

74.9.2.3 Command availability: RES

74.9.2.4 Command description

This is an existing command to query information concerning the SDM.

The command will be missing parameters when CBM connected and will only return Core side faults on a CBM.

74.9.2.5 Command syntax

Table 4 QuerySDM command parameters and variables

platform	Parameters and variables
sdm	QuerySDM: Query information about the SDM. Parms: [<QuerySDM Option> {FLT, LOADS, STATUS, CONFIG}]
cbm	QuerySDM: Query information about the SDM. Parms: [<QuerySDM Option> {FLT}]

74.9.2.6 Qualifications and warnings

no change

74.9.2.7 Responses

No change in response

74.9.3 Command: Locate

74.9.3.1 Command type: Listed MENU

74.9.3.2 Command target: All

74.9.3.3 Command availability: RES

74.9.3.4 Command description

Displays the card location of all cards on an SDM FX.\

On a CBM, this command is not supported.

74.9.3.5 Command syntax

The locate command has no parameters.

74.9.3.6 Qualifications and warnings

No Change

74.9.3.7 Responses

74.9.3.7.1 <response>

The response for a CBM will be:

```
Locate command is not supported for shelf pec NTRX51LS.
```

74.9.4 Command: rebootsdm

74.9.4.1 Command type: Unlisted MENU

74.9.4.2 Command target: All

74.9.4.3 Command availability: RES

74.9.4.4 Command description

Sends a message to the SDM instructing it to reboot. This command is not supported on a CBM.

74.9.4.5 Command syntax

No parameters

74.9.4.6 Qualifications and warnings

no change

74.9.4.7 Responses

74.9.4.7.1 <response>

The response for a CBM will be:

```
Locate command is not supported for shelf pec NTRX51LS.
```

74.9.5 Command: haltsdm

74.9.5.1 Command type: Unlisted MENU

74.9.5.2 Command target: All

74.9.5.3 Command availability: RES

74.9.5.4 Command description

Sends a message to the SDM instructing it to halt. This command is not supported on a CBM.

74.9.5.5 Command syntax

No parameters

74.9.5.6 Qualifications and warnings

no change

74.9.5.7 Responses

74.9.5.7.1 <response>

The response for a CBM will be:

```
Locate command is not supported for shelf pec NTRX51LS.
```

76.8 Command interface changes

Not Applicable.

76.9 Security

Not Applicable.

76.10 Configuration Walkthrough

Not applicable

77: Configuration (CN): A00005734

77.1 Hardware and Software Requirements

All CM processors (PPC, 68K etc) and any SN07 or equivalent CM load

77.2 Initial Configuration

To configure this feature, you must datafill table MULTITM with any relevant timezones, including local time (during non-DST, this is zero offset from the CM clock. During DST, this is the offset from the CM clock to go back to non-DST)

Any lines that required this feature must have the MTZ option added through SERVORD.

77.3 Upgrade Impact

77.3.1 Dump and Restore

No new dump or restore activity required.

77.3.2 Element Management Upgrade

n/a

77.4 Data schema (DS) (CM, MIBS, RDB)

None

77.5 Service Orders (SO) (CM & SESM)

77.5.1 New line option MTZ

77.5.1.1 Description

The option MTZ is used on any line that is physically located in a different time zone to the controlling CM. When the user activates other time related features (Such as Wake Up Call Request), the time will be converted to their local time, rather than the CM time.

77.5.1.2 Example

Figure 1 Example of the MTZ option

```
SO:
>ado
SONUMBER:    NOW   2  2 19 PM
>
DN_OR_LEN
>7205011
OPTkey:
>1
OPTION:
>MTZ
SO_MTZ_NAME:
>loc
OPTKEY:
>$
COMMAND AS ENTERED
ADO NOW 2 2 19 PM 7205011 (1 MTZ LOC)$
ENTER Y TO CONFIRM, N TO REJECT OR E TO eDIT
>Y
```

77.5.1.3 Option prompts

Table 1 System prompts for MTZ option

Prompt	Valid input	Description	Areas affected by prompt
TIMEZONE	Keys in table MULTITM		

77.5.1.4 Assignability

The following functionalities apply to this option:

- set functionality: Yes
- subset functionality: no
- DN functionality: no
- key functionality: no

77.5.1.5 Option prerequisites

Table MULTITM must have data in it.

77.6 Configuration Walkthrough

Datafill table MULTITM with timezone information. Add option MTZ to relevant lines. Feature is activated automatically.

78: Configuration (CN): A00006483

78.1 Hardware and Software Requirements

Multiple Universal Audio Servers (UAS) or Audiocodes Media Servers (AMS) or some other packet-based announcement resource equivalent must be networked to provide the announcement resources. The announcement resource devices must be capable of being configured and networked to meet the announcement port demands.

78.2 Initial Configuration

Table SERVRINV must be datafilled with a gateway controller (GWC) to be used as an Audio Controller GWC that will have subtending announcement resource devices.

78.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable.

78.4 Upgrade Impact

78.4.1 Dump and Restore

Prior to SN06, the ANNC option did not exist. When the Core is upgraded to SN06, the reformat procedure for table SERVSINV assigns by default the ANNC option. The default value specified for the ANNTERMS field is 300 if no other options (i.e. 3PORT or 6PORT) are datafilled. The default value will not change in SN07. If 3PORT or 6PORT is datafilled, the ANNC ANNTERMS value is adjusted accordingly against the value in NUMTERMS. For upgrades from SN06 to SN07, the ANNC option ANNTERMS value is simply transferred.

78.4.2 Element Management Upgrade

Not applicable.

78.5 Data schema (DS) (CM, MIBS, RDB)

78.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SERVSINV	CHANGED	UNCHANGED

78.5.2 Table/MIB/Remote Database Schema information

78.5.2.1 Name: SERVSINV

Server Subtending Node Inventory Table

78.5.2.1.1 Functional description

Table SERVSINV contains the names of the server subtending nodes and their associated gateways. The subtending node relevant to this activity is the audio server node(AUD).

78.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

78.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVSINV	0	256	Protected

78.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for SERVSINV.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SRVSNAME	Not Changed		see subfields	*Server Subtending Name key*. This field contains subfields XPMTYPE and XPMNO. Specifies the logical subtending node off the GWC
	Not changed	XPMTYPE	PM_TYPE	*XPM Type*. For an audio server node, enter AUD.
	Not changed	XPMNO	0 to 255	*XPM Number*. Enter the XPM number for the peripheral.
SRVRNAME	Not changed		see subfields	*Server Name*. This field contains subfields XPMTYPE and XPMNO. Specifies the associated gateway controller of the subtending node.
	Not changed	XPMTYPE	PM_TYPE	*XPM Type*. Enter GWC.
	Not changed	XPMNO	0 to 255	*XPM Number*. Enter the corresponding GWC node number found in table SERVRINV.
NUMTERMS	Not changed		1024, 2048, or 4095	*Number of Terminals*. FOr AUD node, it is recommended that 4095 be used.
OPTIONS	Not changed		see subfield	*Options*. This field contains subfields for 3PORT, 6PORT, and/or ANNC for conferencing and announcement resources.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTIONS	Not changed		ANNC	*ANNC OPTION*. The subfield ANNC is used for announement terminal allocation and to indicate the number of simultaneous announcements. The field contains the subfield ANNTERMS.
	Changed	ANNTERMS	1 to 1280	Announcement terminals. Enter value up to 1280.

78.5.2.1.5 Datafill example

The following example shows sample datafill for table SERVSINV
:

Table 4 Example of table SERVSINV

```
>table servsinv
TABLE: SERVSINV
>list all
TOP
      SRVSNAME      SRVRNAME NUMTERMS                                  OPTIONS
-------------------------------------------------------------------------------
      AUD   1       GWC   1     4095                                (ANNC 1280)$

      AUD   4       GWC   2     4095     (3PORT 300)(6PORT 120)(ANNC 300)$
```

78.5.2.1.6 Table release history update

The following information was added: The ANNTERMS maximum value for the ANNC option of the OPTIONS field has increased from 300 to 1280.

78.5.2.1.7 Supplementary information

The ANNC option has a maximum ANNTERMS value of 1280 because of a GWC limitation.

78.5.2.1.8 Translation verification other tools

SERVSINV does not use translation verification tools.

78.6 Service Orders (SO) (CM & SESM)

Not applicable.

79.3 Office/Subnet parameters (OP/SP) (CM & SESM)

79.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	IO_WARNING_ THRESHOLD	NEW	XA-Core

79.3.2 Parameter information

79.3.2.1 IO_WARNING_THRESHOLD

IO_WARNING_THRESHOLD

79.3.2.1.1 Functional description

This parameter defines a utilization warning threshold for all IO service types (CMIC, ETHR, AMDI) in the system. The IOCAP monitoring toolset uses the value of this parameter to peg the IOTHRESH register of the IOCAP OM whenever the IO utilization level of any IO service has exceeded this threshold on the switch.

79.3.2.1.2 Provisioning rules

There is no formula for provisioning this office parameter. However, this office parameter should be set by the customer in such a manner that will allow sufficient advance warning time for their maintenance personnel to upgrade or reconfigure their IO devices in case the condition reoccurs often.

79.3.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
1	100	100

79.3.2.1.4 Activation

Any change activation for this office parameter is immediate.

79.3.2.1.5 Dependencies

Not applicable.

79.3.2.1.6 Consequences

If this office parameter is set low, the IOTHRESH register might be in pegged more often than necessary. If this office pararmeter is set high, the customer may not have enough advance notice to upgrade their IO configuration.

79.3.2.1.7 Verification

To verify, users can modify and display the value of IO_WARNING_THRESHOLD on table OFCENG via table control.

79.3.2.1.8 Memory requirements

No memory impact.

Units per memory block = <10>

Words per memory block = <510>

If the parameter value = <25>

words required = (((parameter value - 1)/units per block) + 1) *words per block = <>

79.9 Command interface changes

The following new directories will be provided in this feature.

79.9.1 Directory: CAPACITY

This existing CAPACITY MAPCI level will be modified to provide a new IOCAP MAPCI level in XA-Core only. The new IOCAP level will provide IO utilization and IO messaging throughput information for HCMIC and HIOP IO cards.

79.9.1.1 Directory description

This new IOCAP MAPCI level will be giving the IO utilization values and messaging throughput information for each IO service type (CMIC, ETHR and AMDI). The information on this new MAPCI level will be updated once every minute.

79.9.1.2 Accessing directory: CAPACITY

79.9.1.2.1 Access to directory or MAP level and return to CI

To access this directory, type:

> MAPCI; MTC; CAPACITY

To return to the CI environment, type:

> QUIT ALL

79.9.2 Command: IOCAP

This is a new command available under the CAPACITY MAPCI level in XA-Core only.

79.9.2.1 Command type: Listed MENU

79.9.2.2 Command target: XA-Core only

79.9.2.3 Command availability: RES

79.9.2.4 Command description

This new IOCAP MAPCI level will be giving the IO utilization values and messaging throughput information for each IO service type (CMIC, ETHR and AMDI). The information on this new MAPCI level will be updated once every minute.

79.9.2.5 Command syntax

Table 3 IOCAP command parameters and variables

Command	Parameters and variables
IOCAP	none
Parameters and variables	Description

79.9.2.6 Qualifications and warnings

Not applicable.

79.9.2.7 Responses

79.9.2.7.1 IOCAP response

Table 4 MAP outputs with associated meanings and actions

Command
Service: The type of IO service of the values shown on the same line is captured. **Meaning:** Possible IO service types are CMIC, ETHR and AMDI. **System or user actions:** Not applicable

Table 4 MAP outputs with associated meanings and actions

Command
IOUTIL%: The average utilization of all active links in the system captured in the previous minute. **Meaning:** The value is given as a percent of total system and can take up to 3 digit. **System or user actions:** Not applicable
TxMsg/s: The average number of transmitted messages captured in the last minute for this IO service type. **Meaning:** The unit is number of transmitted messages per second. **System or user actions:** Not applicable
TxSize: The average size (in bytes) of all transmitted messages in the last minute. **Meaning:** The unit is in bytes. **System or user actions:** Not applicable
RxMsg/s: The average number of received messages captured in the last minute for this IO service type. **Meaning:** The value unit is the number of received messages per second. **System or user actions:** Not applicable
RxSize: The average size (in bytes) of all received messages in the last minute. **Meaning:** The unit is in bytes. **System or user actions:** Not applicable

This MAPCI level can be used for monitoring current IO throughput. Under normal condition, there is no response required from maintenance personnel. The descriptions of all fields displayed under this level are given above. These responses are seen in XA-core only.

79.9.2.8 Example

Table 5 Usage examples for IOCAP command

Description of task:	This new IOCAP MAPCI level will be giving the IO utilization values and messaging throughput information for each IO service type (CMIC, ETHR and AMDI). The information on this new MAPCI level will be updated once every minute.
Command: MAP response:	MAPCI; MTC; CAPACITY; IOCAP See example output below.

An example output of this new MAPCI level is given below.

IOCAP MAPCI Level

```
 XACM      MS     IOD     Net      PM     CCS     Lns     Trks     Ext     APPL

79.9.3 Command: QUIT

This command will allow the user to exit IOCAP MAPCI level and to return to IOCAP higher MAPCI level (CAPACITY MAPCI level).

79.9.3.1 Command type: Listed MENU

This QUIT command is listed in IOCAP menu.

79.9.3.2 Command target: XA-Core only

This new IOCAP QUIT command is available in XA-Core only.

79.9.3.3 Command availability: RES

79.9.3.4 Command description

This command will allow the user to exit IOCAP MAPCI level and to return to IOCAP higher MAPCI level (CAPACITY MAPCI level).

79.9.3.5 Command syntax

Table 6 QUIT command parameters and variables

Command	Parameters and variables
QUIT	none

79.9.3.6 Qualifications and warnings

Not applicable.

79.9.3.7 Responses

79.9.3.7.1 QUIT

Table 7 MAP outputs with associated meanings and actions

Command
If QUIT is issued, the user will be returned to one MAPCI level higher than their current MAPCI level. If QUIT ALL is issued, the user will be returned to CI level. **Meaning:** Not applicable. **System or user actions:** Not applicable. **Meaning:** The IOCAP MAPCI level is exitted and user is returned to one MAPCI level higher or to CI level. **System or user actions:** Not applicable.

79.9.3.8 Example

Table 8 Usage examples for QUIT command

Description of task:	
Description of task	Exit the IOCAP MAPCI level and return the user to CI level or one MAPCI level higher..
Command: MAP response:	Example: QUIT ALL Example: >

79.9.4 Directory: IOCAPCI

79.9.4.1 Directory description

This new IOCAPCI is provided to allow customers to display the IO utilization history data.

79.9.4.2 Accessing directory: IOCAPCI

79.9.4.2.1 Access to directory or MAP level and return to CI

To access this directory type:

> IOCAPCI

To return to CI environment, type:

> QUIT

79.9.5 Command: IOMAX

79.9.5.1 Command type: NON-MENU

79.9.5.2 Command target: XA-Core only

79.9.5.3 Command availability: RES

79.9.5.4 Command description

This command displays the hourly high watermark value captured for each IO service type (CMIC, ETHR or AMDI). The value is captured every hour of day for the last 31 days. The data survives all types of restarts (warm, cold and reload).

The date of the month will be in sequence. For every hour in the future (there is no data collected yet), a blank character will be displayed.

79.9.5.5 Command syntax

The command syntax for this command is as follows.

```
> q iomax
Display IO high watermark report.
Parms: <service> {CMIC,
                  ETHR,
                  ATM,
                                  ALL}
```

Table 9 IOMAX command parameters and variables

Command	Parameters and variables
IOMAX	service
IOMAX	<Service> (CMIC, ETHR, AMDI, ALL)
Parameters and variables	Description
Service	Possible values are CMIC, ETHR, AMDI or ALL
CMIC	Displays only CMIC hourly max history data
ETHR	Displays only ETHR hourly max history data

Table 9 IOMAX command parameters and variables

Command	Parameters and variables
AMDI	Displays only AMDI hourly max history data
All	Displays all hourly.max history data for CMIC, ETHR, and AMDI.

79.9.5.6 Qualifications and warnings

Not applicable.

79.9.5.7 Responses

79.9.5.7.1 IOMAX response

The following is the response if IOMAX CMIC is issued.

Table 10 MAP outputs with associated meanings and actions

Command
IOMAX CMIC: history data of CMIC hourly maximum utilization are displayed. **Meaning:** CMIC hourly maximum history data are displayed. **System or user actions:** Not applicable.
IOMAX ETHR: history data of ETHR hourly maximum utilization are displayed. **Meaning:** history data of ETHR hourly maximum utilization are displayed. **System or user actions:** Not applicable.
IOMAX AMDI: history data of AMDI hourly maximum utilization are displayed. Meaning: history data of AMDI hourly maximum utilization are displayed. System or user actions: Not applicable.
IOMAX ALL: history data of CMIC, ETHR, AMDI hourly maximum utilization are displayed. Meaning: history data of CMIC, ETHR, AMDI hourly maximum utilization are displayed. System or user actions: Not applicable.

79.9.5.8 Example

Table 11 Usage examples for IOMAX command

Description of task	Display the history data of IO hourly max utilization.

```

79.9.6 Command: IOAVG

79.9.6.1 Command type: NON-MENU

79.9.6.2 Command target: XA-Core only

79.9.6.3 Command availability: RES

79.9.6.4 Command description

This command displays the hourly average value captured for each IO service type (CMIC, ETHR or AMDI). The value is captured every hour of day for the last 31 days. The data survives all types of restarts (warm, cold and reload).

The date of the month will be in sequence. For every hour in the future (there is no data collected yet), a blank character will be displayed.

79.9.6.5 Command syntax

The command syntax for this command is as follows.

```
> q ioavg
Display IO average report.
Parms: <service> {CMIC,
                  ETHR,
                  ATM,
```

ALL}

Table 12 IOAVG command parameters and variables

Command	Parameters and variables
IOAVG	service
IOAVG	<Service> (CMIC, ETHR, AMDI, ALL)
Parameters and variables	Description
Service	Possible values are CMIC, ETHR, AMDI or ALL
CMIC	Displays only CMIC hourly average history data
ETHR	Displays only ETHR hourly average history data
AMDI	Displays only AMDI hourly average history data
All	Displays all hourly.average history data for CMIC, ETHR, and AMDI.

79.9.6.6 Qualifications and warnings

Not applicable.

79.9.6.7 Responses

79.9.6.7.1 IOAVG response

The following is the response if IOAVG CMIC is issued.

Table 13 MAP outputs with associated meanings and actions

Command
IOAVG CMIC: history data of CMIC hourly average utilization are displayed. **Meaning:** CMIC hourly average history data are displayed. **System or user actions:** Not applicable.
IOAVG ETHR: history data of ETHR hourly average utilization are displayed. **Meaning:** history data of ETHR hourly average utilization are displayed. **System or user actions:** Not applicable.
IOAVG AMDI: history data of AMDI hourly average utilization are displayed. Meaning: history data of AMDI hourly average utilization are displayed. System or user actions: Not applicable.

Table 13 MAP outputs with associated meanings and actions

Command
IOAVG ALL: history data of CMIC, ETHR, AMDI hourly average utilization are displayed. Meaning: history data of CMIC, ETHR, AMDI hourly average utilization are displayed. System or user actions: Not applicable.

79.9.6.8 Example

Table 14 Usage examples for IOAVG command

Description of task	Display the history data of IO hourly average utilization.
Command: MAP response:	Example: IOAVG CMIC Example: Average CMIC Utilization Hour Date 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 2/1 9 7 8 6 5 7 8 11 17 22 28 30 40 55 50 47 61 57 59 62 59 39 31 21 2/2 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/3 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/4 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/5 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/6 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/7 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/8 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/9 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/10 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/11 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/12 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/13 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/14 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/15 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/16 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/17 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/18 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/19 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/20 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/21 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/22 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/23 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/24 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/25 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/26 5 7 9 8 7 8 9 8 15 23 21 29 39 53 49 42 59 51 55 57 53 47 31 21 2/27 3 8 7 6 9 8 4 7 11 19 27 31 38 51 47 45 55 53 57 56 51 49 29 14 2/28 9 9 8 7 7 7 8 7 18 28 18 29 37 48 55 48 58 48 59 59 57 48 27 18 2/29 8 7 8 10 8 9 7 1/30 3 8 7 6 9 8 4 12 16 21 27 29 39 49 47 45 55 53 57 56 51 49 29 14 1/31 8 6 5 7 8 7 6 9 11 19 27 31 39 49 53 43 51 55 53 57 56 51 31 21

```

79.9.7 Command: DISP

79.9.7.1 Command type: NON-MENU

79.9.7.2 Command target: XA-Core only

79.9.7.3 Command availability: RES

79.9.7.4 Command description

This DISP command displays the utilization and messaging throughput values of each IO service type of the last 60 minutes with option CURR (for example when a command is issued at 2:35, displayed data is from 1:34 to 2:34) or previous full hour with option PREV (for example when a command is issued at 2:35, displayed data is from 1:00 to 2:00). This information survives all types of restarts (warm, cold and reload).

79.9.7.5 Command syntax

The command syntax for this command is as follows.

```
> q disp
Display table of IO utilization.
Parms: <when> {CURR,
               PREV}
```

```
<service> {CMIC,
           ETHR,
           ATM,
           ALL}
```

Table 15 DISP command parameters and variables

Command	Parameters and variables
DISP	<when> <service>
DISP	<when> (CURR, PREV) <service> (CMIC, ETHR, AMDI, ALL)
Parameters and variables	Description
When	Possible values are CURR or PREV
CURR	Displays the last 60 minutes utilization and messaging throughput of the specified IO service type
PREV	Displays the previous full hour utilization and messaging throughput of the specified IO service type
Service	Possible values are CMIC, ETHR, AMDI or ALL
CMIC	Displays only CMIC utilization and messaging throughput
ETHR	Displays only ETHR utilization and messaging throughput
AMDI	Displays only AMDI utilization and messaging throughput
ALL	Displays utilization and messaging throughput for CMIC, ETHR, and AMDI.

79.9.7.6 Qualifications and warnings

Not applicable.

79.9.7.7 Responses

79.9.7.7.1 DISP response

The following is the response if DISP CURR CMIC is issued.

Table 16 MAP outputs with associated meanings and actions

Command
DISP CURR CMIC: last 60 minutes of CMIC utilization and messaging throughput are displayed. **Meaning:** last 60 minutes data for CMIC utilization and messaging throughput are displayed. **System or user actions:** Not applicable.

Table 16 MAP outputs with associated meanings and actions

Command
DISP CURR ETHR: last 60 minutes of ETHR utilization and messaging throughput are displayed. **Meaning:** last 60 minutes of ETHR utilization and messaging throughput are displayed. **System or user actions:** Not applicable.
DISP CURR AMDI: last 60 minutes of AMDI utilization and messaging throughput are displayed. Meaning: last 60 minutes of AMDI utilization and messaging throughput are displayed. System or user actions: Not applicable.
DISP CURR ALL: last 60 minutes of CMIC, ETHR, AMDI utilization are displayed. Meaning: last 60 minutes of CMIC, ETHR, AMDI utilization are displayed. System or user actions: Not applicable.

79.9.7.8 Example

Table 17 Usage examples for DISP command

Description of task	Display the last 60 minutes of IO utilization and messaging throughput.
Command: MAP response:	Example: DISP CURR CMIC Example: Time IOUTIL% TxMsg/s TxSize RxMsg/s RxSize 16:17 45 23421 34 23421 34 16:18 39 22119 31 21228 32 16:19 38 21228 32 22119 31 16:20 39 23421 31 21221 31 . . . . . . 17:14 41 20023 32 20019 33 17:15 39 21221 31 21228 32 17:16 38 20019 33 23421 34
Command: MAP response:	Example: DISP CURR ETHR Example: Time IOUTIL% TxMsg/s TxSize RxMsg/s RxSize 16:17 45 23421 34 23421 34 16:18 39 22119 31 21228 32 16:19 38 21228 32 22119 31 16:20 39 23421 31 21221 31 . . . . . . 17:14 41 20023 32 20019 33 17:15 39 21221 31 21228 32 17:16 38 20019 33 23421 34
Command: MAP response:	Example: DISP CURR AMDI Example: Time IOUTIL% TxMsg/s TxSize RxMsg/s RxSize 16:17 45 23421 34 23421 34 16:18 39 22119 31 21228 32 16:19 38 21228 32 22119 31 16:20 39 23421 31 21221 31 . . . . . . 17:14 41 20023 32 20019 33 17:15 39 21221 31 21228 32 17:16 38 20019 33 23421 34

79.9.8 Command: STATUS

79.9.8.1 Command type: NON-MENU

79.9.8.2 Command target: XA-Core only

79.9.8.3 Command availability: RES

79.9.8.4 Command description

This command displays all status information including current version of IOCAPCI tool, timestamp in terms of hour and minute, the current IO utilization values of all IO services (CMIC, ETHR, AMDI), the current value of the IO_WARNING_THRESHOLD office parm.

79.9.8.5 Command syntax

The command syntax for this command is as follows.

```
> q STATUS
Display current IOCAP status.
```

Table 18 STATUS command parameters and variables

Command	Parameters and variables
STATUS	no parameter

79.9.8.6 Qualifications and warnings

Not applicable.

79.9.8.7 Responses

79.9.8.7.1 STATUS response

The following is the response if STATUS is issued.

Table 19 MAP outputs with associated meanings and actions

Command
STATUS: Status information such as IOCAPCI version, current utilizations and IO_WARNING_THRESHOLD office parm are displayed. **Meaning:** Status information such as IOCAPCI version, current utilizations and IO_WARNING_THRESHOLD office parm are displayed. **System or user actions:** Not applicable.

79.9.8.8 Example

Table 20 Usage examples for STATUS command

Description of task	Display status information such as IOCAPCI version, current utilizations and IO_WARNING_THRESHOLD office parm.

Command: MAP response:	Example: DISP CURR CMIC
	Example:
	`> status`
	`IOCAP Version 1.0`
	`Time CMICUTIL ETHRUTIL AMDIUTIL`
	`17:16 32 29 15`
	`IO_WARNING_THRESHOLD office parm is set to 100.`

Performance Management (PF)

Introduction

This chapter describes impacts to performance management, such as operational measurements and performance measurements, for the features planned for this release. Only those features with performance-management impacts are listed.

Featid	Title
A00002012.AA13	XA-Core CMIC/RTIF HIOP Maintenance Software
A00002340.AA07	Add Extension Registers for Billing OM's
A00002538.AA07	Performance Measurements Tools
A00002766.AA05	Add Extension Registers for Billing OM's
A00003487.AA27	SN07 Trimodal Call Server Features
A00003531	MG9K EM – Frame location enhancements
A00003687.AA06	TOPS Wireless Intelligent Network Integration
A00003767.AA29	IP ABI PPVM Robustness & Msg Loss Alarms
A00003773.AA08	Trunk Group Based Quality of Service (QOS) Operational Measurement (OM) support for MG4K-IP
A00004036.AA42	Off-Board Service Control
A00004271.AA08	SIP App Server SOC
A00004430.AA08	SVC Failure OMs
A00004500.AA15	IN TCAP Messaging on IP

A00005160.AA10	OSSAIN XA-Core Data Messaging Capacity Enhancements
A00006693	XA-Core IO Capacity Monitoring Toolset

1: Performance (PF): A00002012

1.1 Performance management strategy

This feature does not change the performance management strategy of the XA-Core system.

1.2 Performance management tools and utilities

This feature changes the Operational Measurements (OM) structure for the CMIC, RTIF, and AMDI functionality on the XA-Core. This is so that the OMs will reflect port/link separation of the CMIC and RTIF functionality on the new CMIC/RTIF HIOP card. All OMs changed, deleted, or added by this feature belong to the XACORE OM group.

1.3 Operational Measurements (OM), Group XACORE

1.3.1 OM description

1.3.1.1 Current OM structure for CMIC, RTIF, and AMDI

Currently, the CMIC and RTIF functionalities peg the following OMs: XACMIC, XARTIF, XALOCP, and XAREMP. With this OM structure in place for CMIC, RTIF, and AMDI, these OMs do not distinguish between packlet or device (port or link) state changes. Please refer to “Table 1 Current OM structure for CMIC, RTIF and AMDI” on page 3421.

Table 1 Current OM structure for CMIC, RTIF and AMDI

Functionality	OM	Pegged by event
CMIC	XACMIC	- CMIC packlet Insv -> OOS because of fault - CMIC link Insv -> OOS
RTIF	XARTIF	- RTIF packlet InSv -> OOS because of fault
RTIF	XALOCP	- RTIF local port InSv -> OOS because of fault
RTIF	XAREMP	- RTIF remote port InSv -> OOS because of fault

Table 1 Current OM structure for CMIC, RTIF and AMDI

Functionality	OM	Pegged by event
AMDI	XAMDI	- AMDI packlet InSv -> OOS because of fault - AMDI port InSv -> OOS because of fault
AMDI	XAMDILNK	- AMDI link InSv -> OOS because of fault

1.3.1.2 Release history update

The OM group XACORE is being modified in release CSP20.

With the Ethernet Maintenance feature (A59019176) the Ethernet OMs were extended to support port/link separation. This allowed a more accurate count of the various packlet, port, and link faults. Since this feature also implements port/link separation for CMIC and RTIF on HIOP, it will extend the existing CMIC and RTIF OMs to distinguish between packlet and device (port or link) state changes. Consequently, we will have a more refined count of the CMIC and RTIF component state changes.

This feature also changes the OMs related to the AMDI functionality. This is so that we'll have a consistent OM structure for components with port and link devices in the XA-Core system.

1.3.1.3 Please refer to "Table 2 New OM structure for CMIC, RTIF, and AMDI" on page 3423.**Registers**

Table 2 New OM structure for CMIC, RTIF, and AMDI

Functionality	OM	Pegged by event	New/Deleted/ Changed
CMIC	XACMIC	- CMIC packlet InSv -> OOS because of fault - CMIC link InSv -> OOS because of fault	Deleted
CMIC	XCMIC	CMIC packlet InSv -> OOS because of fault	New
CMIC	XCMICPRT	CMIC port InSv -> OOS because of fault	New
CMIC	XCMICLNK	CMIC link InSv -> OOS because of fault	New
RTIF	XARTIF	RTIF packlet InSv -> OOS because of fault	Deleted
RTIF	XALOCP	RTIF local port InSv -> OOS because of fault	Deleted
RTIF	XAREMP	RTIF remote port InSv -> OOS because of fault	Deleted
RTIF	XRTIF	RTIF packlet InSv -> OOS because of fault	New
RTIF	XRTIFPRT	- RTIF local port InSv -> OOS because of fault - RTIF remote port InSv -> OOS because of fault	New
RTIF	XRTIFLNK	- RTIF local link InSv -> OOS because of fault - RTIF remote link InSv -> OOS because of fault	New
AMDI	XAMDI	- AMDI packlet InSv -> OOS because of fault	Changed
AMDI	XAMDIPRT	- AMDI port InSv -> OOS because of fault	New
AMDI	XAMDILNK	- AMDI link InSv -> OOS because of fault	Unchanged

The XACORE group new OM register display on the MAP terminal is as follows:

Figure 1 OM XACORE Group Display

XAPE	XARXPE	XASM	XARXSM
XAIOP	XARXIO	XADISK	XATAPE
XRTIF	XRTIFPRT	XRTIFLNK	XCMIC
XCMICPRT	XCMICLNK	XARXABRT	XARXBASE
XARXFULL	XARXALL	XAMDI	XAMDIPRT
XAMDILNK	XETHR	XETHRPRT	XETHRLNK

1.3.2 Register XACMIC

1.3.2.1 Register description

Existing XA-Core CMIC (XCMIC) peg register counts the number of critical CMIC packlet and link faults detected on the XA-Core.

1.3.2.2 Register release history update

Register is being removed in CSP20. In order to have consistent naming convention for OMs in the XACORE group, from CSP20, the CMIC packlet faults are going to be counted by the new peg register XCMIC. The CMIC link faults are going to be counted by the new peg register XCMICLNK.

1.3.3 Register XCMIC

1.3.3.1 Register description

The XA-Core CMIC (XCMIC) peg register counts the number of critical CMIC packlet faults detected on the XA-Core.

1.3.3.2 Register release history update

Register is being introduced in CSP20.

1.3.3.3 Associated registers

None.

1.3.3.4 Associated logs

The system generates the MScomm log report (XAC303) when a CMIC packlet goes out of service.

The system generates the MScomm Alarm Cleared (XAC603) when the CMIC fault clears on the packlet.

1.3.4 Register XCMICPRT

1.3.4.1 Register description

The XA-Core CMIC PORT (XCMICPRT) peg register counts the number of critical CMIC port faults detected on the XA-Core.

1.3.4.2 Register release history update

Register is being introduced in CSP20.

1.3.4.3 Associated registers

None.

1.3.4.4 Associated logs

The system generates the MScomm log report (XAC303) when a CMIC port goes out of service.
The system generates the MScomm Alarm Cleared (XAC603) when the CMIC fault clears on the port.

1.3.5 Register XCMICLNK

1.3.5.1 Register description

The XA-Core CMIC LINK (XCMICLNK) peg register counts the number of critical CMIC link faults detected on the XA-Core.

1.3.5.2 Register release history update

Register is being introduced in CSP20.

1.3.5.3 Associated registers

None.

1.3.5.4 Associated logs

The system generates the MScomm log report (XAC303) when a CMIC link goes out of service.

The system generates the MScomm Alarm Cleared (XAC603) when the CMIC fault clears on the link.

1.3.6 Register XARTIF

1.3.6.1 Register description

The existing XA-Core RTIF (XARTIF) peg register counts the number of critical RTIF packlet faults detected on the XA-Core.

1.3.6.2 Register release history update

Register is being removed in CSP20. In order to have consistent naming convention for OMs in the XACORE group, from CSP20, the RTIF packlet faults are going to be counted by the new peg register XRTIF.

1.3.7 Register XALOCP

1.3.7.1 Register description

The existing XA-Core RTIF (XARTIF) peg register counts the number of critical RTIF local port faults detected on the XA-Core.

1.3.7.2 Register release history update

Register is being removed in CSP20. From CSP20, the RTIF local port faults are going to be counted by the new peg register XRTIFPRT.

1.3.8 Register XAREMP

1.3.8.1 Register description

The existing XA-Core RTIF (XARTIF) peg register counts the number of critical RTIF remote port faults detected on the XA-Core.

1.3.8.2 Register release history update

Register is being removed in CSP20. From CSP20, the RTIF remote port faults are going to be counted by the new peg register XRTIFPRT.

1.3.9 Register XRTIF

1.3.9.1 Register description

The XA-Core RTIF (XRTIF) peg register counts the number of critical RTIF packlet faults detected on the XA-Core.

1.3.9.2 Register release history update

Register is being introduced in CSP20.

1.3.9.3 Associated registers

None.

1.3.9.4 Associated logs

The system generates the RTIF log report (XAC305) when an RTIF packlet goes out of service.

The system generates the RTIF Alarm Cleared log report (XAC605) when the RTIF fault clears on the packlet.

1.3.10 Register XRTIFPRT

1.3.10.1 Register description

The XA-Core RTIF PORT (XRTIFPRT) peg register counts the number of critical RTIF port faults detected on the XA-Core.

Note: There are no separate peg registers for local and remote RTIF port faults. Both peg XRTIFPRT.

1.3.10.2 Register release history update

Register is being introduced in CSP20.

1.3.10.3 Associated registers

None.

1.3.10.4 Associated logs

The system generates the RTIF log report (XAC305) when an RTIF port goes out of service.

The system generates the RTIF Alarm Cleared log report (XAC605) when the RTIF fault clears on the port.

1.3.11 Register XRTIFLNK

1.3.11.1 Register description

The XA-Core RTIF LINK (XRTIFLNK) peg register counts the number of critical RTIF link faults detected on the XA-Core.

Note: There are no separate peg registers for local and remote RTIF link faults. Both peg XRTIFLNK.

1.3.11.2 Register release history update

Register is being introduced in CSP20.

1.3.11.3 Associated registers

None.

1.3.11.4 Associated logs

The system generates the RTIF log report (XAC305) when an RTIF link goes out of service.

The system generates the RTIF Alarm Cleared log report (XAC605) when the RTIF fault clears on the link.

1.3.12 Register XAMDI

1.3.12.1 Register description

Existing XA-Core AMDI (XAMDI) peg register counts the number of critical AMDI packlet and port faults detected on the XA-Core.

1.3.12.2 Register release history update

Register is being changed in CSP20. From CSP20, the AMDI port faults are going to be counted by the new peg register XAMDIPRT. Register XAMDI will peg the critical faults against the AMDI packlet. No other modification is introduced.

1.3.13 Register XAMDIPRT

1.3.13.1 Register description

The XA-Core AMDI PORT (XAMDIPRT) peg register counts the number of critical AMDI port faults detected on the XA-Core.

1.3.13.2 Register release history update

Register is being introduced in CSP20.

1.3.13.3 Associated logs

The system generates the AMDI log report (XAC309) when an AMDI port goes out of service.

The system generates the AMDI Link Condition Cleared (XAC609) when the AMDI fault clears on the port.

2: Performance (PF): A00002340

2.1 Performance management strategy

This feature provides the new OM groups FCDRTM1E, FCDRTM2E and FCDRALG2.

2.2 Performance management tools and utilities

None

2.3 Performance Measurements (PM), Operational Measurements (OM), and stats

2.3.1 PM, OM, and stats format

N/A

2.3.2 OM Group FCDRTM1E (applies only to DMS)

2.3.2.1 OM description

OM Group FCDRTM1E

The group FCDRTM1E is only pegged when the UBFR0008 SOC is ON.

This group is used for register overflows from the OM group FCDRTMP1.

2.3.2.2 Release history update

The OM group is being provided new in the UCS20 release.

2.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

```
FCDRTM1E

CLASS: HOLDING
START:2003/04/04 09:35:00 FRI; STOP: 2003/04/04 09:40:00 FRI;

2.3.3 Register (applies only to DMS)

TMPLT_0 through TMPLT_31

2.3.3.1 Register description

Each register is associated with the CDR template being used for a CDR billing record. The CDR template index corresponds to the register number.

The index number of a CDR template may be viewed from the MAP under the CI CTMPLT. The “TEMPLATE ALL” command will list out the indexes.

The data range for these registers is a decimal value of 0-65535.

This OM group supports indexes 0-31.

Example: CDR template UCS13 is index 9. The related OM register will be TMPLT_9.

```
>ctmplt
>template all
The list of indices and defined templates is as follows:
 0 : CDR2AMA
 1 : CDR2AMA2
 2 : CDR2AMA3
 3 : RESERVED03
 4 : RESERVED04
 5 : AMAREC
 6 : UCS09
 7 : UCS11
 8 : UCS12
 9 : UCS13
```

2.3.3.2 Register release history update

All the registers in this group are new in the UCS20 release.

2.3.3.3 Associated registers

Each register is this OM group is related to a register in group FCDRTMP1. When the register in group FCDRTMP1 reaches 65535, the associated extension register in group FCDRTM1E will be incremented. If the SOC is IDLE, the FCDRTM1E register will not be pegged. In either case, the register in group FCDRTMP1 will wrap to 0 when it overflows.

Example:

Group FCDRTMP1; Register TMPLT_9
Group FCDRTM1E; Register TMPLT_9

A FCDRTM1E register in is pegged once for every FCDRTMP1 register overflow. A value of 1 in the FCDRTM1E overflow register indicates 65535 pegs. A value of 1 in the FCDRTMP1 register indicates one peg.

Once the FCDRTM1E overflow register is pegged, the register in FCDRTMP1 will reset to 0 and resume pegging.

2.3.3.4 Associated logs

None

2.3.4 OM Group FCDRTM2E (applies only to DMS)

2.3.4.1 OM description

OM Group FCDRTM2E

The group FCDRTM2E is only pegged when the UBFR0008 SOC is ON.

This group is used for register overflows from the OM group FCDRTMP2.

2.3.4.2 Release history update

The OM group is being provided new in the UCS20 release.

2.3.4.3 Registers

OM group registers display on the MAP terminal as follows:

```
FCDRTM2E

CLASS: ACTIVE
START:2003/04/24 13:00:00 THU; STOP: 2003/04/24 13:08:17 THU;

2.3.5 Register (applies only to DMS)

TMPLT-32 through TMPLT_63

2.3.5.1 Register description

Each register is associated with the CDR template being used for a CDR billing record. The CDR template index corresponds to the register number. The index number of a CDR template may be viewed from the MAP under the CI CTMPLT. The “TEMPLATE ALL” command will list out the indexes.

The data range for these registers is a decimal value of 0-65535.

This OM group supports indexes 32-63.

Example: CDR template UCS13 is index 9. The related OM register will be TMPLT_9.

```
>ctmplt
>template all
The list of indices and defined templates is as follows:
 0 : CDR2AMA
 1 : CDR2AMA2
 2 : CDR2AMA3
 3 : RESERVED03
 4 : RESERVED04
 5 : AMAREC
 6 : UCS09
 7 : UCS11
 8 : UCS12
 9 : UCS13
```

2.3.5.2 Register release history update

All the registers in this group are new in the UCS20 release.

2.3.5.3 Associated registers

Each register is this OM group is related to a register in group FCDRTMP2. When the register in group FCDRTMP2 reaches 65535, the associated extension register in group FCDRTM2E will be incremented. If the SOC is IDLE, the FCDRTM2E register will not be pegged. In either case, the register in group FCDRTMP2 will wrap to 0 when it overflows.

Example:

Group FCDRTMP2; Register TMPLT_21
Group FCDRTM2E; Register TMPLT_21

A FCDRTM2E register in is pegged once for every FCDRTMP2 register overflow. A value of 1 in the FCDRTM2E overflow register indicates 65535 pegs. A value of 1 in the FCDRTMP2 register indicates one peg.

Once the FCDRTM2E overflow register is pegged, the register in FCDRTMP2 will reset to 0 and resume pegging.

2.3.5.4 Associated logs

None

2.3.6 OM Group FCDRALG2 (applies only to DMS)

2.3.6.1 OM description

OM Group FCDRALG2

The group FCDRALG2 is only pegged when the UBFR0008 SOC is ON.

This group is used for register overflows from the OM group FCDRALGR.

2.3.6.2 Release history update

The OM group is being provided new in the UCS20 release.

2.3.6.3 Registers

OM group registers display on the MAP terminal as follows:

```
FCDRALG2

CLASS: ACTIVE
START:2003/09/18 03:45:05 THU; STOP: 2003/09/18 03:54:45 THU;

BESTFIT
RTEATTR

2.3.7.1 Register description

These registers have the same description as those in the group FCDRALGR. The only difference is that these are extension registers. This means that one count here is equal to 65535 counts of the same register in FCDRALGR. They keep track of the number of times the register in group FCDRALGR have overflowed.

2.3.7.2 Register release history update

All the registers in this group are new in the UCS20 release.

2.3.7.3 Associated registers

Each register is this OM group is related to a register in group FCDRALGR. When the register in group FCDRALGR reaches 65535, the associated extension register in group FCDRALG2 will be incremented. If the SOC is IDLE, the FCDRALG2 register will not be pegged. In either case, the register in group FCDRALGR will wrap to 0 when it overflows.

Example:

Group FCDRALGR; Register FIXED

Group FCDRALG2; Register FIXED

A FCDRALG2 register in is pegged once for every FCDRALGR register overflow. A value of 1 in the FCDRALG2 overflow register indicates 65535 pegs. A value of 1 in the FCDRALGR register indicates one peg.

Once the FCDRALG2 overflow register is pegged, the register in FCDRALGR will reset to 0 and resume pegging.

2.3.7.4 Associated logs

3.3.1 PM, OM, and stats format

3.3.2 OM Group template (applies only to DMS)

XASTAT OM group

3.3.2.1 OM description

OM group XASTAT

Capacity operational measurements

3.3.2.2 Release history update

The OM group XASTAT is being modified in CSP20. It will be changed as follows:

Register XASCMPLX will be removed from OM group XASTAT since this measurement is not valid in XA-Core.

3.3.2.3 Registers

It is the same as in previous releases except the register XASCMPLX is removed.

In previous releases, XASTAT OM group registers display on the MAP terminal as follows:

```
XASTAT

CLASS: ACTIVE
START:2003/09/11 12:30:00 THU; STOP: 2003/09/11 12:48:29 THU;
SLOWSAMPLES:        12 ; FASTSAMPLES:        111 ;

          XASUTIL   XASPUTIL   XASCMPLX   XASSCHED
          XASFORE   XASMAINT     XASDNC      XASOM
```

```
          XASGTERM      XASBKG    XASAUXCP     XASNETM
           XASSNIP     XASPESC     XASNXFR     XASOVER
          XASOTHLD

    0
                  0           0           0           0
                  0           0           0           0
                  0           0           0           0
                  0           0           0           0
                  0
```

After removing XASCMPLX in CSP20, it will be displayed as:

```
XASTAT

CLASS: ACTIVE
START:2003/09/11 12:30:00 THU; STOP: 2003/09/11 12:48:29 THU;

4.3.3 Register (applies only to DMS)

4.3.3.1 Register description

AMANS2 - overflow for AMANS from group ATTAMA

AMUNANS2 - overflow for AMUNANS from group ATTAMA.

4.3.3.2 Register release history update

All the registers in this group are new in the UCS20 release.

4.3.3.3 Associated registers

ATTAMA.AMANS - ATTAMA2.AMANS2
ATTAMA.AMUNANS - ATTAMA2.AMUNAS2

The range of each of these registers is an decimal value of 0 - 32767.

When the ATTAMA register reaches its maximum value of 32767 and overflows, it increments the associated overflow register in group ATTAMA2. The ATTAMA register will then reset to 0 and resume incrementing.

The registers in the group ATTAMA2 indicate the number of times the associated register in group ATTAMA has overflowed. One peg in the ATTAMA2 register indicates 32767 pegs that were handled by the ATTAMA register.

4.3.3.4 Associated logs

None

5: Performance (PF): A00003487

5.1 Performance management strategy

Trimodal Call Server provides support for multiple bearer networks in a single CS2K Call Server. In order to monitor the performance of the call server, additional OMs are needed. These new OMs provide per-bearer network performance metric collection that will enable the customer management system to monitor the performance of the call server as a whole as well as the individual bearer networks.

5.2 Performance management tools and utilities

No change

5.3 Performance Measurements (PM), Operational Measurements (OM), and stats

The following is a list of the new and changed OM groups for the Trimodal Call Server feature:

- DPTNODE (changed)
- DPTOFCP (new)
- IWBM (changed)
- OFZ2NET1 (new)
- OFZ2NET2 (new)
- TRK2NET1 (new)
- TRK2NET2 (new)

5.3.1 PM, OM, and stats format

5.3.2 DPTNODE OM Group

5.3.2.1 OM description

DPTNODE OM group measures the DPT performance for each DPT capable node. The group contains registers that maintain DPT terminal usage and failure counts.

5.3.2.2 Release history update

The DPTNODE OM group is being modified in SN07 to add additional information to the OM tuples. If the DPT Node is a GWC, then the associated DPT protocol (i.e., BICC or SIP-T) is added to the information. If the DPT Node is an SPM (i.e., either MG4K or DTP SPM), then the associated bearer

network, DPT protocol and SPM node type is added to the information. The registers are unchanged and the pegging of the registers are unchanged.

The addition of this new information is controlled by the value of a new SN07 office parameter, MULTINET_DISPLAY_ACTIVE. If this parameter is set to 'Y', then the new information is displayed. If the parameter is set to 'N', then the DPTNODE OM group appears as it did prior to SN07.

5.3.2.3 Registers

DPTNODE OM group registers display on the MAP terminal as follows:

Figure 1 DPTNODE OM Group Display

```
>omshow dptnode active

```

5.3.2.4 Group structure

DPTNODE OM group provides 1 tuple(s) for each GWC or SPM node that is capable of hosting a DPT call.

Key field: Unchanged

Info field: DPT_NODE_OM_PM_INFO

For GWC nodes, the info field contains the DPT protocol (BICC or SIP-T) associated with the GWC as data filled in the SERVSINV table.

For MG 4000 and DPT SPM nodes, the info field contains the associated bearer network, the DPT protocol (BICC), and the SPM node type (SMG4 or DPT). The bearer network is comprised of the Network ID and Name as data filled in the BEARNETS table and linked to the SPM-based node through the MNNODE table. The DPT protocol will always be BICC because SPM nodes do not support SIP-T protocol in SN07. The SPM node type is either SMG4 (for MG4Ks) or DPT (for DPT SPMs). This information is derived from the node type found in Table MNNODE.

5.3.2.5 Associated OM groups

Unchanged.

5.3.2.6 Associated functional groups

Unchanged

5.3.2.7 Associated functionality codes

None

5.3.2.8 OM group registers logic flow chart

Unchanged.

5.3.2.9 Register DPTGTAT

5.3.2.9.1 Register description Get Terminal Attempts (DPTGTAT) registers a peg for each attempt to get a DPT terminal on the associated node.

5.3.2.9.2 Register release history update Register is unchanged in SN07.

5.3.2.9.3 Associated registers DPTGTAT2 (an extension register for DPTGTAT)

5.3.2.9.4 Associated logs Unchanged.

5.3.2.10 Register DPTGTFL

5.3.2.10.1 Register description Get Terminal Failures (DPTGTFL) registers a peg for each failed attempt to get an un-optimized DPT terminal on the associated node.

5.3.2.10.2 Register release history update Register is unchanged in SN07.

5.3.2.10.3 Associated registers None.

5.3.2.10.4 Associated logs Unchanged.

5.3.2.11 Register DPTGTFLO

5.3.2.11.1 Register description Get Terminal Failures Optimized (DPTGFLO) registers a peg for each failed attempt to get an optimized DPT terminal on the associated node.

5.3.2.11.2 Register release history update Register is unchanged in SN07.

5.3.2.11.3 Associated registers None.

5.3.2.11.4 Associated logs Unchanged.

5.3.2.12 Register DPTUSAG

5.3.2.12.1 Register description DPT Terminal Usage (DPTUSAG) registers a count of the total usage within a transfer period. Usage is pegged by the number of terminals in Call Processing Busy (CPB) or Call Processing Deload (CPD) state at a sampling that occurs every 100 seconds.

5.3.2.12.2 Register release history update Register is unchanged in SN07.

5.3.2.12.3 Associated registers DPTUSAG2 (extension register for DPTUSAG)

5.3.2.12.4 Associated logs Unchanged.

5.3.2.13 Register DPTHWT

5.3.2.13.1 Register description DPT Terminals usage High Water (DPTHWT) registers a count of the terminal usage high water mark within a transfer period. The high water mark is equivalent to the following:

- (inservice number) - (low water mark)

The low water mark updates for each attempt to get a terminal. The OM compares the current high water mark to the previous high water mark every 100 seconds. An update is made if the current value exceeds the previous value.

5.3.2.13.2 Register release history update Register is unchanged in SN07.

5.3.2.13.3 Associated registers None.

5.3.2.13.4 Associated logs Unchanged.

5.3.3 DPTOFCP OM Group

5.3.3.1 OM description

DPTOFCP OM Group measures the performance of the supported dynamic packet trunk protocols for the office. The two supported protocols are BICC and SIP-T.

5.3.3.2 Release history update

DPTOFCP OM group is new in SN07.

The addition of this new DPTOFCP OM group is controlled by the value of a new SN07 office parameter, MULTINET_DISPLAY_ACTIVE. If this parameter is set to ‘Y’, then the tuples of the DPTOFCP OM group are displayed. If the parameter is set to ‘N’, then the tuples of the DPTOFCP OM group are not displayed.

5.3.3.3 Registers

DPTOFCP OM group registers display on the MAP terminal as follows:

```

5.3.3.4 Group structure

DPTOFCP OM group provides 1 tuple(s) for each DPT protocol that is active in the office.

Key field: DPT_PROTOCOL_TYPE {BICC, SIP-T}

Info field: DPTOFCP_SIG_INFO

- Identifies the protocol being used in the office.

5.3.3.5 Associated OM groups

DPTOFC OM group gives an overall office-wide DPT performance measurement. DPTOFCP OM group provides a per-DPT capable node performance view.

5.3.3.6 Associated functional groups

The following functional groups are associated with DPTOFCP OM group:

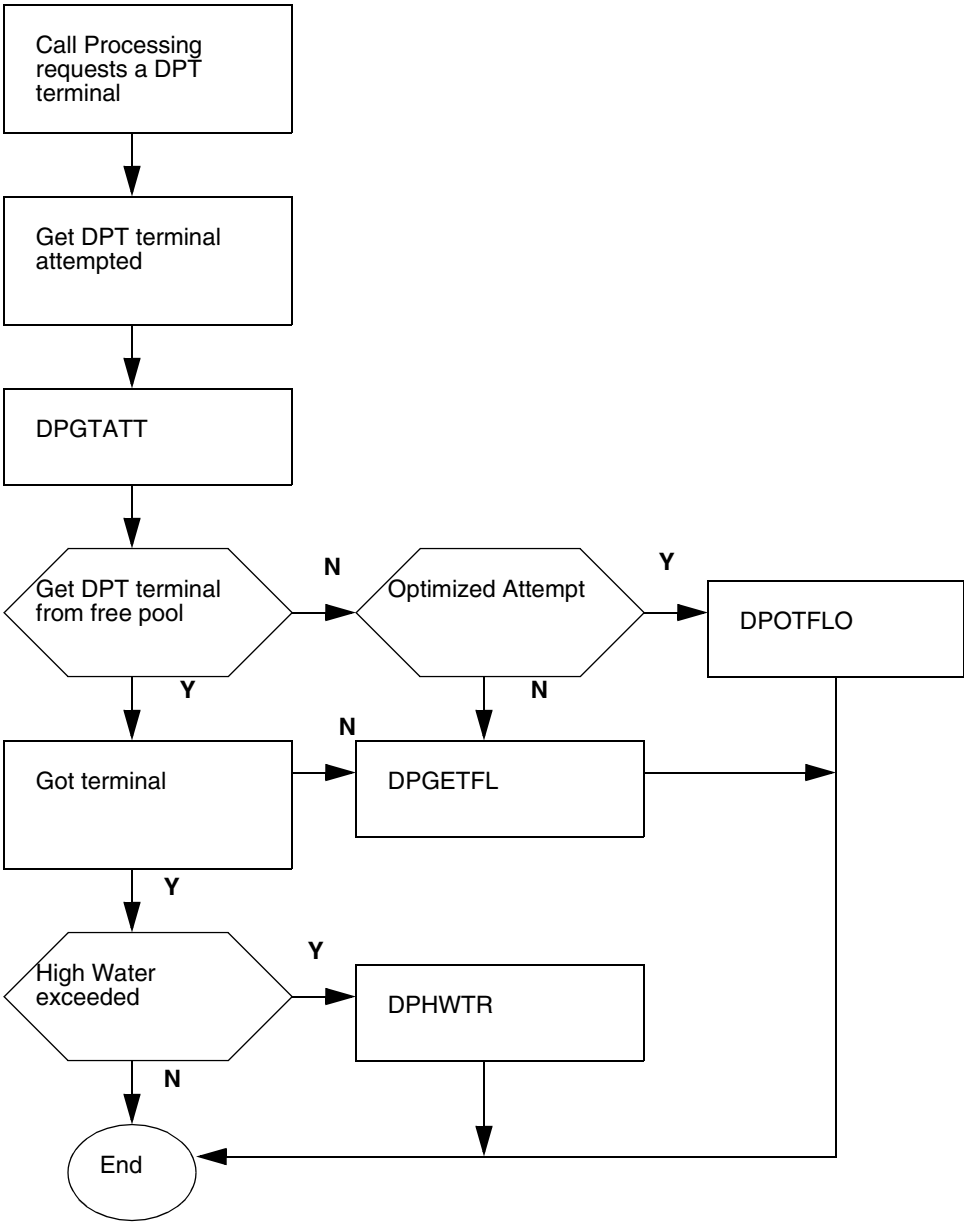
- Dynamic Packet Trunks

5.3.3.7 Associated functionality codes

Table 1 Functionality codes associated with OM group

Functionality	Code
Dynamic Packet Trunks	

5.3.3.8 DPTOFCP OM group registers logic flow chart



5.3.3.9 Register DPGTATT

5.3.3.9.1 Register description Get Terminal Attempts (DPGTATT) registers a peg for each attempt to get a DPT terminal on the associated protocol.

5.3.3.9.2 Register release history update Register is new in SN07.

5.3.3.9.3 Associated registers DPGTATT2 (an extension register for DPGTATT)

5.3.3.9.4 Associated logs None.

5.3.3.10 Register DPGETFL

5.3.3.10.1 Register description Get Terminal Failures (DPGETFL) registers a peg for each failed attempt to get an un-optimized DPT terminal on the associated protocol.

5.3.3.10.2 Register release history update Register is new in SN07.

5.3.3.10.3 Associated registers DPGETFL2 (an extension register for DPGETFL).

5.3.3.10.4 Associated logs None.

5.3.3.11 Register DPOTFLO

5.3.3.11.1 Register description Get Terminal Failures Optimized (DPOTFLO) registers a peg for each failed attempt to get an optimized DPT terminal on the associated protocol. Pegs to DPOTFLO are benign and do not require corrective action.

5.3.3.11.2 Register release history update Register is new in SN07.

5.3.3.11.3 Associated registers DPOTFLO2 (an extension register for DPOTFLO).

5.3.3.11.4 Associated logs None.

5.3.3.12 Register DPUSAGE

5.3.3.12.1 Register description DPT Terminal Usage (DPUSAGE) registers a count of the total usage within a transfer period. Usage is pegged by the number of terminals in Call Processing Busy (CPB) or Call Processing Deload (CPD) state at a sampling that occurs every 100 seconds.

5.3.3.12.2 Register release history update Register is new in SN07.

5.3.3.12.3 Associated registers DPUSAGE2 (extension register for DPUSAGE)

5.3.3.12.4 Associated logs None.

5.3.3.13 Register DPHWTR

5.3.3.13.1 Register description DPT Terminals usage High Water (DPHWTR) registers a count of the terminal usage high water mark within a transfer period. The high water mark is equivalent to the following:

- (inservice DPT terminals) - (free DPT terminals)

Free DPT terminals represent inservice terminals in the free queue that are eligible for call processing. The high water mark is calculated every 10 seconds. The register updates if the value from the current calculation is greater than the previous value kept in the register for that transfer period.

5.3.3.13.2 Register release history update Register is new in SN07.

5.3.3.13.3 Associated registers DPHWTR2 (an extension register for DPHWTR).

5.3.3.13.4 Associated logs None.

5.3.3.14 Register DPRTDPL

5.3.3.14.1 Register description DPT Port Depletion (DPRTDPL) registers the number of attempts to get a DPT terminal that failed due to port depletion (i.e., exceeding the DPT_MAX_PORT office parameter value).

5.3.3.14.2 Register release history update Register is new in SN07.

5.3.3.14.3 Associated registers DPRTDPL2 (an extension register for DPRTDPL).

5.3.3.14.4 Associated logs None.

5.3.4 IWBM OM Group

5.3.4.1 OM description

IWBM OM Group is modified to count different events on the specific bridge pools that are defined in the call server.

5.3.4.2 Release history update

IWBM OM group is changed in SN07.

5.3.4.3 Registers

IWBM OM group registers display on the MAP terminal as follows:

Figure 3 IWBM OM Group Display

```
>omshow iwbm active

IWBM

```

5.3.4.4 Group structure

IWBM OM group provides 1 tuple(s) for each IW SPM bridge pool that is active in the office. .

Key field: IW SPM bridge pools

Info field: BEARER_NETBRIDGE_CLLI

- Associated bridge pool name (i.e., ‘ENET_TO_IP’). This bridge pool name is defined in Table CLLI and Table NETBRDGE. Each IW SPM bridge node is associated with a bridge pool in Table MNNODE.

5.3.4.5 Associated OM groups

None.

5.3.4.6 Associated functional groups

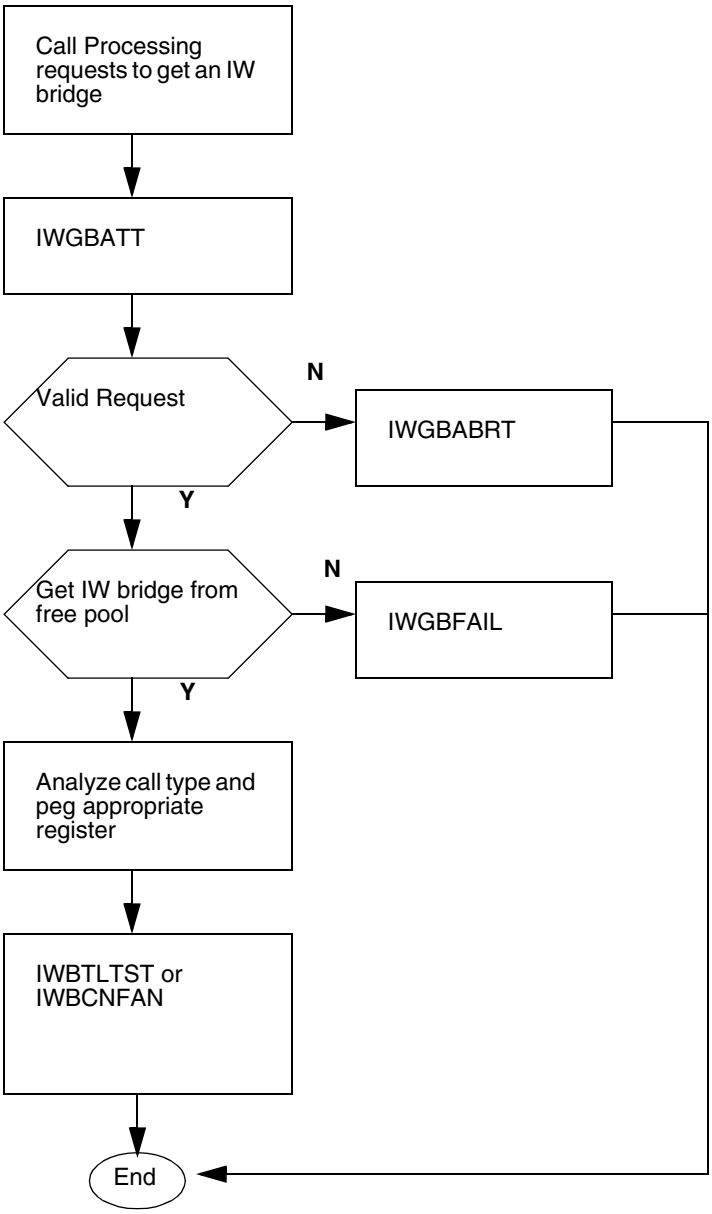
The following functional groups are associated with IWBM OM group:

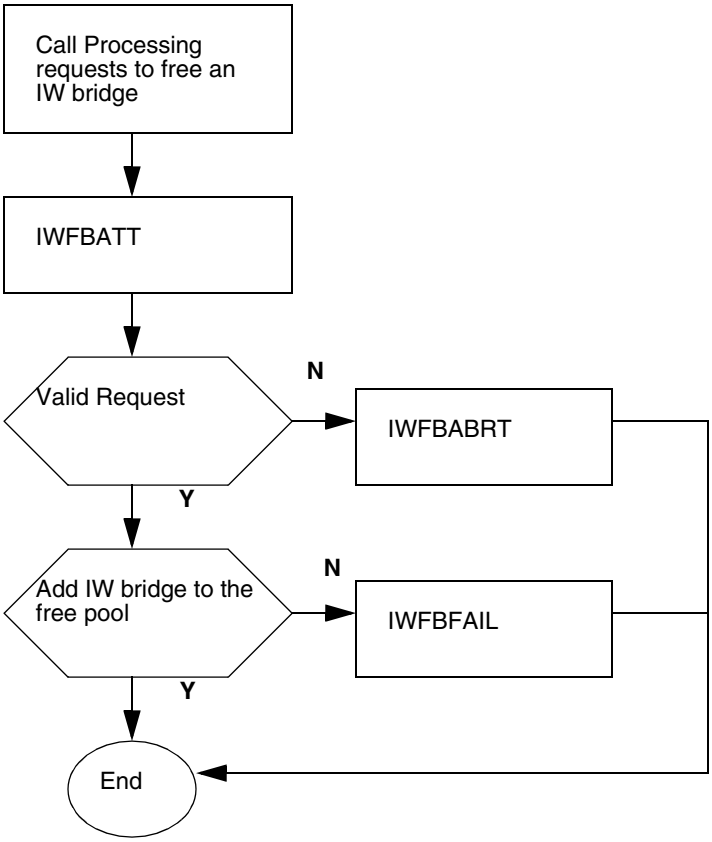
- IW SPM Bridges

5.3.4.7 Associated functionality codes

None

5.3.4.8 IWBM OM group registers logic flow chart





5.3.4.9 Register IWGBATT

5.3.4.9.1 Register description IW Get Bridge Attempts (IWGBATT) registers a peg for each attempt to get an IW SPM bridge port on the associated IW SPM bridge node.

5.3.4.9.2 Register release history update Register is changed in SN07.

5.3.4.9.3 Associated registers IWGBATT2 (an extension register for IWGBATT)

5.3.4.9.4 Associated logs None.

5.3.4.10 Register IWGBFAIL

5.3.4.10.1 Register description IW Get Bridge Failure (IWGBFAIL) registers a peg when a get bridge attempt fails as a result of queue failure. The normal cause of a queue failure is that all bridges are busy on the associated node.

5.3.4.10.2 Register release history update Register is changed in SN07.

5.3.4.10.3 Associated registers None.

5.3.4.10.4 Associated logs None.

5.3.4.11 Register IWGBABRT

5.3.4.11.1 Register description IW Get Bridge Aborted (IWGBABRT) registers a peg when a get bridge attempt aborts the system as a result of incorrect data in the request.

5.3.4.11.2 Register release history update Register is changed in SN07.

5.3.4.11.3 Associated registers None.

5.3.4.11.4 Associated logs None.

5.3.4.12 Register IWFBATT

5.3.4.12.1 Register description IW Free Bridge Attempts (IWFBATT) registers a peg when a attempt is made to free an IW SPM bridge from an associated call. When an interworked call ends, the system makes a free bridge attempt.

5.3.4.12.2 Register release history update Register is changed in SN07.

5.3.4.12.3 Associated registers IWFBATT2 (extension register for IWFBATT)

5.3.4.12.4 Associated logs None.

5.3.4.13 Register IWFBFAIL

5.3.4.13.1 Register description IW Free Bridge Failure (IWFBFAIL) registers a peg when a free bridge attempt fails.

5.3.4.13.2 Register release history update Register is changed in SN07.

5.3.4.13.3 Associated registers None.

5.3.4.13.4 Associated logs None.

5.3.4.14 Register IWFBABRT

5.3.4.14.1 Register description IW Free Bridge Aborted (IWGBABRT) registers a peg when a free bridge attempt aborts the system as a result of incorrect data in the request.

5.3.4.14.2 Register release history update Register is changed in SN07.

5.3.4.14.3 Associated registers None.

5.3.4.14.4 Associated logs None.

5.3.4.15 Register IWBTLTST

5.3.4.15.1 Register description IW Bridge for Trunk and Line Testing (IWBTLTST) registers a peg every time an IW bridge is used for a packet agent's access to trunk and/or line test facilities present on the ENET (i.e., MTM test circuits).

5.3.4.15.2 Register release history update Register is changed in SN07.

5.3.4.15.3 Associated registers None.

5.3.4.15.4 Associated logs None.

5.3.4.16 Register IWONSET1

5.3.4.16.1 Register description IW Bridge Onset 1 (IWONSET1) indicates that the number of in use IW bridges exceeds 70% of the associated bridge pool. The system pegs this register when the number of in use bridges in the pool reaches 70%. The system must peg register IWABATE1 before pegging IWONSET1 again.

5.3.4.16.2 Register release history update Register is changed in SN07.

5.3.4.16.3 Associated registers IWABATE1. The system must peg register IWABATE1 before pegging IWONSET1 again.

5.3.4.16.4 Associated logs None.

5.3.4.17 Register IWONSET2

5.3.4.17.1 Register description IW Bridge Onset 2 (IWONSET2) indicates that the number of in use IW bridges exceeds 90% of the associated bridge pool. The system pegs this register when the number of in use bridges in the pool reaches 90%. The system must peg register IWABATE2 before pegging IWONSET2 again.

5.3.4.17.2 Register release history update Register is changed in SN07.

5.3.4.17.3 Associated registers IWABATE2. The system must peg register IWABATE2 before pegging IWONSET2 again.

5.3.4.17.4 Associated logs None.

5.3.4.18 Register IWABATE1

5.3.4.18.1 Register description IW Bridge Abate 1 (IWABATE1) indicates that the total number of IW bridges in use is less than 65% of the associated bridge pool. The system pegs this register after pegging register IWONSET1 and then crosses the 65% threshold. The system must peg register IWONSET1 again before it pegs this register a second time.

5.3.4.18.2 Register release history update Register is changed in SN07.

5.3.4.18.3 Associated registers IWONSET1. The system pegs this register after pegging register IWONSET1 and then crosses the 65% threshold. The system must peg register IWONSET1 again before it pegs this register a second time.

5.3.4.18.4 Associated logs None.

5.3.4.19 Register IWABATE2

5.3.4.19.1 Register description IW Bridge Abate 2 (IWABATE2) indicates that the total number of IW bridges in use is less than 85% of the associated bridge pool. The system pegs this register after pegging register IWONSET2 and then crosses the 85% threshold. The system must peg register IWONSET2 again before it pegs this register a second time.

5.3.4.19.2 Register release history update Register is changed in SN07.

5.3.4.19.3 Associated registers IWONSET2. The system pegs this register after pegging register IWONSET2 and then crosses the 65% threshold. The system must peg register IWONSET2 again before it pegs this register a second time.

5.3.4.19.4 Associated logs None.

5.3.4.20 Register IWBCNFAN

5.3.4.20.1 Register description IW Bridge for Conference and Announcement Usage (IWBCNFAN) registers a peg every time an IW bridge is used for a packet agent's access to conference or announcement facilities present on the ENET (i.e., MTM service circuits).

5.3.4.20.2 Register release history update Register is new in SN07.

5.3.4.20.3 Associated registers None.

5.3.4.20.4 Associated logs None.

5.3.5 OFZ2NET1 OM Group

5.3.5.1 OM description

OM group Office to Network Group 1 (OFZ2NET1) provides traffic analysis information for each bearer network. Using primary route scoring, the group counts calls for the intended destination rather than for the terminating destination.

OFZ2NET1records the structure of traffic that arrives at an office on a particular bearer network, the first routing, and the routing of outgoing traffic. A call routes to a tone or announcement if:

- the tone or announcement is the intended destination of the call.
- an error condition occurs that includes a tone or announcement as a part of the call treatment.

  Note: The a treatment routes the call to another tone or announcement, OFZ2NET1 counts only the first tone or announcement.

OM groups OFZ and OFZ2 provide traffic analysis information office wide. OFZ2NET1 and OFZ2NET2 provide similar traffic analyses with further refinement on a per-bearer network basis for an office.

New office parameter MULTINET_DISPLAY_ACTIVE must be set to *Y* before the system can display OFZ2NET1.

The following table contains the registers that count incoming calls. The register TRKORIG counts each incoming call on the bearer network. One of the following registers counts each incoming call:

- ICANN
- ICLKT
- NICOG
- ICTRM
- ICTONE
- ICABNC
- ICABNM
- TRKORIG

The count depends on if the source of the call is a line or a trunk.

Table 2 Incoming calls

Register	Intended destination	Routing
NICOG(2)	trunk	trunk
ICTRM(2)	line	line
ICANN	trunk, line, announcement	announcement
ICTONE	trunk, line, tone	tone
ICLKT	trunk, line	lockout
ICABNC	trunk, line	customer abandon
ICABNM	trunk, line	machine abandon
TRKORIG(2)	all	all

The following table contains a list of registers that count originating calls. Register LINEUSG counts each originating call. One register from registers LINEANN, LINELKT, LINEOG, LINETRM, LINETONE and LINEABDN counts each originating call. The system routes a call to an intended destination. The intended destination of the call is either a tone or an announcement. The system routes a call if an error condition is present. The error condition must include a tone or announcement as part of its treatment. If a treatment routes the call to another tone or announcement, the OFZ2NET1 only counts the first tone or announcement.

Table 3 Originating calls

Register	Intended designation	Routing
LINEOG(2)	trunk	trunk
LINETRM(2)	line	line
LINEANN	trunk, line, announcement	announcement
LINETONE	trunk, line, tone	tone
LINELKT	trunk, line	lockout
LINEABDN	trunk, line	abandon
LINEUSG(2)	trunk, line	all

The following table contains registers that count terminating calls on the associated bearer network. Register TRMLNAT counts each terminating call. Registers TRMMCHFL and TRMBLCK count calls on a blocked network. LNMBSYPC counts lines that are made manually busy.

Table 4 Terminating calls

Register	Event
TRMMCHFL	Network Blockage Heavy Traffic (NBLH) or Network Blockage Normal Traffic (NBLN)
TRMBLCK	Network Blockage Normal Traffic (NBLN)
LNMBSYPC	line manual busy
TRMLNAT(2)	all outgoing traffic

5.3.5.2 Release history update

OFZ2NET1 OM group is new in SN07.

Office parameter OFFICETYPE in table OFCSTD controls the generation of the registers for OFZ2NET1. When the system reports an answer indicator to CM from the outgoing trunk, the OM Answer register for the outgoing trunk increases.

5.3.5.3 Registers

OFZ2NET1 OM group registers display on the MAP terminal as follows:

```

The validity of a OFZ2NET2 register in an officetype is given in the following table

Table 5 OFZ2NET1 OM registers

Register	Present In Officetype
ICANN	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
ICLKT	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
NICOG	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
NICOG2	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
ICTONE	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
TRKORIG	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
TRKORIG2	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
OGNWAT	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
OGNWAT2	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
OGMFL	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
OGTRMFL	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
OGOSF	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice

Register	Present In Officetype
OGROSF	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
ICABNM	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
ICABNC	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww, nooffice
LINEANN	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINELKT	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINEOG	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINEOG2	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINETRM	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINETRM2	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINETONE	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINEUSG	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINEUSG2	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
ICTRM	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
ICTRM2	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww

Register	Present In Officetype

TRMLNAT2	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
TRMMCHFL	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
TRMBLCK	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LNMBSYPC	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww
LINEABDN	off100, offcomb, offcombtops, off100scp, off100oesd, offcomboesd, off250ibn, offeadas, offcombitops, offmtx100i, off500, offcomblww

5.3.5.4 Group structure

OFZ2NET1 OM group provides 1 tuple(s) for each bearer network datafilled in Table BEARNETS. The group structure is dependent upon the office type of the call server.

Key field: Bearer network ID

Info field: BEARNETS_INFO

- Bearer network ID (i.e., ‘NET 0’)
- Bearer network name (i.e., ‘TDM_ENET’)

5.3.5.5 Associated OM groups

OFZ OM group gives an overall office-wide traffic performance measurement.

5.3.5.6 Associated functional groups

The following functional groups are associated with OFZ2NET1 OM group:

- Succession North America
- Succession International

5.3.5.7 Associated functionality codes

None

5.3.5.8 OFZ2NET1 OM group registers logic flow chart

5.3.5.9 Register ICABNC

5.3.5.9.1 Register description Incoming Calls Abandoned (ICABNC) counts incoming calls on the associated bearer network that the subscriber abandons before processing. These calls do not require treatment. This register would get pegged against the bearer network of the originator.

5.3.5.9.2 Register release history update Register is new in SN07.

5.3.5.9.3 Associated registers Register ICABNM counts incoming calls on the associated bearer network that the machine abandons.

5.3.5.9.4 Associated logs The system generates TRK114 when the system cannot determine the destination of an incoming call during DP reception.

The system generates TRK116 when the system cannot determine the destination of an incoming call during MF reception.

The system generates TRK162 is the outpulsing of either a trunk-to-trunk or line-to-trunk call encounters trouble. These calls use DTMF signaling.

5.3.5.10 Register ICABNM

5.3.5.10.1 Register description Incoming Calls Abandoned (ICABNM) counts incoming calls on the associated bearer network that the machine abandons before processing. The machine abandons a call when a call times out at the upstream office while waiting for a receiver. The machine also abandons a call when there is an equipment problem. This register would get pegged against the bearer network of the originator.

5.3.5.10.2 Register release history update Register is new in SN07.

5.3.5.10.3 Associated registers Register ICABNC counts incoming calls on the associated bearer network that the subscriber abandons.

5.3.5.10.4 Associated logs The system generates TRK114 when the system cannot determine the destination of an incoming call during DP reception.

The system generates TRK116 when the system cannot determine the destination of an incoming call during MF reception.

The system generates TRK162 is the outpulsing of either a trunk-to-trunk or line-to-trunk call encounters trouble. These calls use DTMF signaling.

5.3.5.11 Register ICANN

5.3.5.11.1 Register description Incoming Call to an Announcement (ICANN) register counts incoming calls on the associated bearer network that the system routes to an announcement.
The announcement is the result of a treatment applied during origination, or the intended result of the call. Register ICANN counts the call before it attempts to get a network connection. Register ICANN counts calls that the system routes to a treatment that routes the call to an announcement. The

register only counts these calls one time. This register would get pegged against the bearer network of the originator.

5.3.5.11.2 Register release history update Register is new in SN07.

5.3.5.11.3 Associated registers Register LINEANN counts originating calls that the system routes to an announcement.

5.3.5.11.4 Associated logs The system generates TRK138 when the system routes a call to a treatment after the call is call processing busy.

5.3.5.12 Register ICLKT

5.3.5.12.1 Register description Incoming Calls to Lockout (ICLKT) counts incoming calls that fail and that the system routes to lockout. The call fails for one of the following reasons:

- The incoming trunk loses its true identity
- The system cannot connect the call to a tone or announcement
- A forced release initiates manually
- A forced release initiates because call processing requests a delay (CP_WAITDENY count the call)

This register would get pegged against the bearer network of the originator.

5.3.5.12.2 Register release history update Register is new in SN07.

5.3.5.12.3 Associated registers None.

5.3.5.12.4 Associated logs The system generates TRK111 if the system encounters a problem or assigns a treatment during a trunk-to-trunk call.

The system generates TRK113 when the call processing of a trunk-to-trunk call encounters a problem.

The system generates TRK123 when the node hosting the trunk member sends the wrong message to the core. The system generates TRK123 several times when a problem is present in one of the following elements:

- the originating trunk
- the terminating trunk

5.3.5.13 Register NICOG

5.3.5.13.1 Register description Incoming to Outgoing (NICOG) counts incoming calls on the associated bearer network from the following agents:

- trunks

- preset conferences
- originating test lines

This register would get pegged against the bearer network of the originator.

5.3.5.13.2 Register release history update Register is new in SN07.

5.3.5.13.3 Associated registers NICOG2 register (extension register for NICOG).

5.3.5.13.4 Associated logs None.

5.3.5.14 Register ICTONE

5.3.5.14.1 Register description Incoming Call to Tone (ICTONE) counts oncoming calls on the associated bearer network that the system routes to a tone.
The tone is the result of a treatment applies during origination, or the tone is the intended result of the call. Register ICTONE counts the call before it attempts to find a network connection. Register ICTONE count a call that the system routes to a tone one time. This register would get pegged against the bearer network of the originator.

5.3.5.14.2 Register release history update Register is new in SN07.

5.3.5.14.3 Associated registers Register LINETONE counts originating calls on the associated bearer network that the system routes to a tone.

5.3.5.14.4 Associated logs The system generates TRK138 when the system routes a call to a treatment after the call is call processing busy.

5.3.5.15 Register ICTRM

5.3.5.15.1 Register description Incoming to Terminating (ICTRM) counts incoming calls on the associated bearer network that the system routes to a line. This register would get pegged against the bearer network of the originator.

5.3.5.15.2 Register release history update Register is new in SN07.

5.3.5.15.3 Associated registers Register ICTRM2 (extension register for ICTRM).

5.3.5.15.4 Associated logs None.

5.3.5.16 Register LNMBSYPC

5.3.5.16.1 Register description Line Manual Busy Peg Count (LNMBSYPC) counts lines on the associated bearer network that are manual busy.
Every POTS line is pegged by one when transitioning to a manual busy state. Pegging of each PPhone.PSET/DATA/ISDN line depends upon number of virtual identifiers (VIDs) associated with that line, and may be more than once, when made manual busy either by LTP/BSY or maintenance action. This register would get pegged against the bearer network of the originator.

5.3.5.16.2 Register release history update Register is new in SN07.

5.3.5.16.3 Associated registers None.

5.3.5.16.4 Associated logs None.

5.3.5.17 Register TRKORIG

5.3.5.17.1 Register description Number of Incoming Calls (TRKORIG) counts incoming calls on the associated bearer network that the core recognizes. The intended destination of the call is a line, trunk, announcement or tone. Register TRKORIG counts calls after a call control block and a call process are obtained. The register may count the calls before all incoming digits are received. This register would get pegged against the bearer network of the originator.

5.3.5.17.2 Register release history update Register is new in SN07.

5.3.5.17.3 Associated registers Register TRKORIG counts each incoming call. A peg in this register should have a corresponding peg in one of the following registers as the destination is determined:

- Register ICABNC (counts the call if the subscriber abandons the call)
- Register ICABNM (counts the call if the core abandons the call
- Register ICANN (counts the call if the destination is an announcement)
- Register ICLKT (counts the call if the call locks out)
- Register NICOG (counts the call if the destination is a trunk)
- Register ICTRM (counts the call if the destination is a line)
- Register ICTONE (counts the call if the destination is a tone)

Register TRKORIG2 (extension register for TRKORIG).

5.3.5.17.4 Associated logs None.

5.3.5.18 Register LINEUSG

5.3.5.18.1 Register description Number of Originating Calls (LINEUSG) counts originating call on the associated bearer network that the core recognizes.
After a call condense block and a call process are obtained, LINEUSG counts a call. Register LINEUSG counts the call before dialing is set up. LINEUSG can count a single call at least once. The call is only a single call from the point of view of the caller. The system counts a three-way call when the flashing switch hook recognizes a correct feature origination signal. The feature origination signal is for the flashing line.

5.3.5.18.2 Register release history update Register is new in SN07.

5.3.5.18.3 Associated registers Register LINEUSG counts each originating call. A peg in this register should have a corresponding peg in one of the following registers as the destination is determined:

- Register LINEABDN (counts the call if the call abandons)
- Register LINEANN (counts the call if the destination is an announcement)
- Register LINELKT (counts the call if the call locks out)
- Register LINEOG (counts the call if the destination is a trunk)
- Register LINETRM (counts the call if the destination is a line)
- Register LINETONE (counts the call if the destination is a tone)

Register LINEUSG2 (extension register for LINEUSG).

5.3.5.18.4 Associated logs None.

5.3.5.19 Register LINEABDN

5.3.5.19.1 Register description Originating Calls Abandoned (LINEABDN) counts originating calls on the associated bearer network that the system abandons before the system routes the calls to a trunk, line or treatment.

5.3.5.19.2 Register release history update Register is new in SN07.

5.3.5.19.3 Associated registers None.

5.3.5.19.4 Associated logs The system generates LINE106 if the system cannot determine a call destination during dial pulse reception on a line.

The system generates LINE108 if the digitone reception on a lines encounters a problem.

5.3.5.20 Register LINEANN

5.3.5.20.1 Register description Originating Calls to Announcement (LINEANN) counts originating calls on the associated bearer network that the system routes to an announcement.
The announcement can be the result of a treatment during origination, or the intended result of the call. The system counts the call in LINEANN before an attempt to find a network connection occurs.

5.3.5.20.2 Register release history update Register is new in SN07.

5.3.5.20.3 Associated registers The system counts ICANN incoming calls that the system routes to an announcement.

5.3.5.20.4 Associated logs The system generates LINE138 if the system routes a call to a treatment after it is call processing busy.

5.3.5.21 Register LINELKT

5.3.5.21.1 Register description Originating Calls to Lockout (LINELKT) counts originating calls on the associated bearer network that fail on the intended destination that the system routes to lock out. The register counts these calls when the calls do not connect. Register LINELKT also counts the calls when the system does not routes the call to a treatment. The call fails for one of the following reasons:

- line load control (line is dead)
- a speech link is not available (call is queued until a speech link becomes available and is the caller remains off-hook that call can be successful, but LINELKT only pegs one time)
- A digitone receiver, or one of a network connection to a digitone receiver is not available (if caller remains off-hook, the call clears when the problem is successful, but LINELKT only pegs one time)

5.3.5.21.2 Register release history update Register is new in SN07.

5.3.5.21.3 Associated registers None.

5.3.5.21.4 Associated logs The system generates LINE104, LINE105, LINE109, or LINE204 is call processing encounters a problem.

The system generates NET130 if the system cannot find a network path.

The system generates OM2200 if a threshold condition exceeds the limit.

5.3.5.22 Register LINEOG

5.3.5.22.1 Register description Originating Calls to Outgoing (LINEOG) counts originating calls on the associated bearer network that the system routes to a trunk or a test facility.

5.3.5.22.2 Register release history update Register is new in SN07.

5.3.5.22.3 Associated registers Register LINEOG2 (extension register for LINEOG).

5.3.5.22.4 Associated logs None.

5.3.5.23 Register LINETONE

5.3.5.23.1 Register description Originating Calls to Tone (LINETONE) counts originating calls on the associated bearer network that the system routes to a tone.
Register LINETONE counts the call before it attempts to find a network connection. The tone is either the result of a treatment, or the intended result of the call. Register LINETONE counts calls that the system routes to a treatment that routes the call to a tone. Register LINETONE only counts the call one time.

5.3.5.23.2 Register release history update Register is new in SN07.

5.3.5.23.3 Associated registers Register ICTONE counts incoming calls that the system routes to a tone.

5.3.5.23.4 Associated logs The system generates LINE138 is the system routes a call to a treatment after it is call processing busy.

5.3.5.24 Register LINETRM

5.3.5.24.1 Register description Originating Calls to Terminating (LINETRM) counts originating calls on the associated bearer network that the system routes to a line. Register LINETRM counts the call if a line is available or is not available.

5.3.5.24.2 Register release history update Register is new in SN07.

5.3.5.24.3 Associated registers Register LINETRM2 (extension register for LINETRM).

5.3.5.24.4 Associated logs None.

5.3.5.25 Register OGMFL

5.3.5.25.1 Register description Outgoing Match Failures (OGMFL) counts calls on the associated bearer network that fail to find a network path to a selected outgoing or test trunk on the first attempt. A second attempt occurs to find an idle trunk and a network path.

5.3.5.25.2 Register release history update Register is new in SN07.

5.3.5.25.3 Associated registers None.

5.3.5.25.4 Associated logs The system generates NET130 if the system cannot find a network path.

5.3.5.26 Register OGNWAT

5.3.5.26.1 Register description Outgoing Network Attempts (OGNWAT) counts incoming and outgoing calls on the associated bearer network that are intended for an exact outgoing or test trunk.
A single call can use two or more network paths to different ports for the service circuit. For example, connection by a conference circuit requires more that one network path.

5.3.5.26.2 Register release history update Register is new in SN07.

5.3.5.26.3 Associated registers Register OGNWAT2 (extension register for OGNWAT).

5.3.5.26.4 Associated logs None.

5.3.5.27 Register OGOSF

5.3.5.27.1 Register description Outgoing Original Seize Failures (OGOSF) counts calls on the associated bearer network that fail to seize an outgoing trunk on the first attempt after network paths are acquired. A second attempt occurs to find an idle trunk and a network path, and to seize the trunk. One of the following conditions causes a failure:

- a reversed trunk
- failure to receive a known start-dial
- not planned stop-dial
- time-out before expected stop-dial
- CCS7 errors

5.3.5.27.2 Register release history update Register is new in SN07.

5.3.5.27.3 Associated registers None.

5.3.5.27.4 Associated logs The system generates TRK113 is the call processing of a trunk-to-trunk call encounters a problem.

The system generates TRK121 is the system does not receive an acknowledgement wink from the far-end equipment. The wink indicates that it is ready to receive digits. The digits are received during outpulsing on an outgoing trunk.

The system generates TRK162 if the outpulsing of either a trunk-to-trunk or line-to-trunk call encounters a problem. The line-to-trunk calls use DTMF signaling.

The system generates C7UP111 when an outgoing ISUP call attempt fails.

5.3.5.28 Register OGTRMFL

5.3.5.28.1 Register description Outgoing Retrial Match Failures (OGTRMFL) counts calls on the associated bearer network that fail on the seconds attempt to find a network path to a selected outgoing or test trunk.

5.3.5.28.2 Register release history update Register is new in SN07.

5.3.5.28.3 Associated registers Register OGMFL counts the first trial match failures.

5.3.5.28.4 Associated logs The system generates NET130 if the system cannot find a network path.

5.3.5.29 Register OGROSF

5.3.5.29.1 Register description Outgoing Retrial Seize Failures (OGROSF) counts calls on the associated bearer network that fail on the second attempt to seize an outgoing trunk. This attempt occurs after the network paths have been acquired. One of the following conditions causes a failure:

- a reversed trunk
- failure to receive a known start-dial
- not planned stop-dial
- time-out before expected stop-dial
- CCS7 errors

The system disconnects the call after the second failure and the call received start signal time-out (SSTO) treatment. An equal access call received signal timely BOC (STOB) or signal time-out IC.INC (STOC) treatment.
The system pegs OGROSF when a second attempt occurs to ruin a continuity test (COT) for an outgoing ISUP trunk. The second attempt occurs if the first COT attempt fails.

5.3.5.29.2 Register release history update Register is new in SN07.

5.3.5.29.3 Associated registers Register OGOSF counts the first seize failures.

5.3.5.29.4 Associated logs The system generates TRK113 is the call processing of a trunk-to-trunk call encounters a problem.

The system generates TRK121 is the system does not receive an acknowledgement wink from the far-end equipment. The wink indicates that it is ready to receive digits. The digits are received during outpulsing on an outgoing trunk.

The system generates TRK162 if the outpulsing of either a trunk-to-trunk or line-to-trunk call encounters a problem. The line-to-trunk calls use DTMF signaling.

The system generates C7UP111 when an outgoing ISUP call attempt fails.

5.3.5.30 Register TRMBLCK

5.3.5.30.1 Register description Terminating Blocks (TRMBLCK) counts attempts to obtain a voice path to a terminating lines on the associated bearer network that fail. This failure occurs when no free channel is present between the host network and the terminating line.

The system counts more that one failed attempt if part of a hunt group directs the call.

The system also counts each attempt in OFZ2NET1 registers TRMMCHFL and TRMLNAT.
If no alternate line is available, the system routes the call to network blockage normal traffic (NBLN) treatment. This register would get pegged against the bearer network of the originator.

5.3.5.30.2 Register release history update Register is new in SN07.

5.3.5.30.3 Associated registers None.

5.3.5.30.4 Associated logs The system generates NET130 if the system cannot find a network path.

The system generates LINE138 or TRK138 when the system routes a call to a treatment after the call is call processing busy.

5.3.5.31 Register TRMMCHFL

5.3.5.31.1 Register description Terminating Match Failures (TRMMCHFL) counts calls on the associated bearer network that fail to find a network path to terminating line.

The system counts more that one failed attempt if the call goes to a part of a hunt group.

Failure in the path search sequence can occur is the host switch network cannot obtain a path. It the network cannot find an alternate path, the system routes the call to a network blockage heavy traffic (NBLH) treatment.

Failure in the path search sequence can occur in the final cause of failure is failure to obtain a free channel on a link between the host switch network and the terminating line. Registers TRKBLK and TERMBLK count the failure to obtain a free channel.
If no alternate line is available, the system routes the call to network blockage normal traffic (MBLN) treatment.

5.3.5.31.2 Register release history update Register is new in SN07.

5.3.5.31.3 Associated registers None.

5.3.5.31.4 Associated logs The system generates NET130 if the system cannot find a network path.

The system generates LINE138 or TRK138 when the system routes a call to a treatment after the call is call processing busy.

5.3.5.32 Register TRMLNAT

5.3.5.32.1 Register description Terminating Network Attempts (TRMLNAT) counts attempts to find a voice path on the associated bearer network to terminating line. The complete path includes the following elements:

- a segment through the network
- a channel on the link between the line module and the network
- a matching channel on the line shelf

Register TRMLNAT counts a call only for each attempt. The calls count each attempt, whether is succeeds or fails.

5.3.5.32.2 Register release history update Register is new in SN07.

5.3.5.32.3 Associated registers Register TRMLNAT2 (extension register for TRMLNAT).

5.3.5.32.4 Associated logs None.

5.3.6 OFZ2NET2 OM Group

5.3.6.1 OM description

OFZ2NET2 OM Group provides information for traffic analysis per bearer network. The OM group is modeled after group OFZ2. The OFZ2NET2 OM group counts calls that the system routes to generalized no circuit treatment (GNCT). The system routes a call to GNCT when a trunk group is the last route in the route list and all trunks are busy.

OFZ2NET2 registers with the prefix *NCKT* count the number of calls by the trunk or call types routed to GNCT for outgoing trunks or for the outgoing side of two-way trunks. Register names correspond to an entry in field No Circuit Class (NCCLS) which is datafilled for each trunk defined in table TRKGRP.

Office parameter OFFICETYPE in table OFCSTD controls the generation of the registers for OFZ2NET2. When the system reports an answer indicator to CM from the outgoing trunk, the OM Answer register for the outgoing trunk increases.

5.3.6.2 Release history update

OFZ2NET2 OM group is new in SN07.

The addition of this new OFZ2NET2 OM group is controlled by the value of a new SN07 office parameter, MULTINET_DISPLAY_ACTIVE. If this parameter is set to ‘Y’, then the new OFZ2NET2 OM group is displayed. If the parameter is set to ‘N’, then the OFZ2NET2 OM group is not displayed.

5.3.6.3 Registers

OFZ2NET2 OM group registers display on the MAP terminal as follows:

5.3.6.4 Group structure

OFZ2NET2 OM group provides 1 tuple(s) for each bearer network datafilled in Table BEARNETS

Key field: None

Even if the key field is none, the Key is bearer network.

Info field: BEARNETS_INFO

- Bearer network ID (i.e., ‘NET 0’)

- Bearer network name (i.e., ‘TDM_ENET’)

5.3.6.5 Associated OM groups

OFZ2 OM group gives an overall office-wide traffic performance measurement.

5.3.6.6 Associated functional groups

The following functional groups are associated with OFZ2NET2 OM group:

- Succession North America
- Succession International

5.3.6.7 Associated functionality codes

None

5.3.6.8 OFZ2NET2 OM group registers logic flow chart

5.3.6.9 Register NCKTBN

5.3.6.9.1 Register description No circuit business network trunks (NCKTBN) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because Meridian Digital Centrex (MDC) trunk is not available.

This register would get pegged against the bearer network of the originator.

5.3.6.9.2 Register release history update Register is new in SN07.

5.3.6.9.3 Associated registers None.

5.3.6.9.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.10 Register NCKTID

5.3.6.10.1 Register description No circuit inward dial trunks (NCKTID) counts calls on the associated bearer network that the system routes

to generalized no circuit treatment (GNCT). The system routes a call to GNCT when a direct inward dial or direct outward dial trunk is not available.

5.3.6.10.2 Register release history update Register is new in SN07.

5.3.6.10.3 Associated registers None.

5.3.6.10.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

This register would get pegged against the bearer network of the originator.

5.3.6.11 Register NCKTIM

5.3.6.11.1 Register description No circuit intermachine trunks (NCKTIM) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because a circuit intermachine trunk is not available.

This register would get pegged against the bearer network of the originator.

5.3.6.11.2 Register release history update Register is new in SN07.

5.3.6.11.3 Associated registers None.

5.3.6.11.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.12 Register NCKTIT

5.3.6.12.1 Register description No circuit intertoll trunks (NCKTIT) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because an intertoll trunk is not available.

This register would get pegged against the bearer network of the originator.

5.3.6.12.2 Register release history update Register is new in SN07.

5.3.6.12.3 Associated registers None.

5.3.6.12.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.13 Register NCKTLT

5.3.6.13.1 Register description No circuit local tandem trunks (NCKTLT) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because a local tandem trunk is not available.

This register would get pegged against the bearer network of the originator.

5.3.6.13.2 Register release history update Register is new in SN07.

5.3.6.13.3 Associated registers None.

5.3.6.13.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.14 Register NCKTOF

5.3.6.14.1 Register description No circuit offnet trunks (NCKTOF) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because an offnet or direct dial trunk is not available.

This register would get pegged against the bearer network of the originator.

5.3.6.14.2 Register release history update Register is new in SN07.

5.3.6.14.3 Associated registers None.

5.3.6.14.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.15 Register NCKTON

5.3.6.15.1 Register description No circuit connect trunks (NCKTON) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because a dedicated access or mobile telephone exchange trunk is not available.

This register would get pegged against the bearer network of the originator.

5.3.6.15.2 Register release history update Register is new in SN07.

5.3.6.15.3 Associated registers None.

5.3.6.15.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.16 Register NCKTOT

5.3.6.16.1 Register description No circuit other trunk (NCKTOT) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because one of the following types of trunk is not available:

- test line
- test desk
- maintenance trunks
- AV101

This register would get pegged against the bearer network of the originator.

5.3.6.16.2 Register release history update Register is new in SN07.

5.3.6.16.3 Associated registers None.

5.3.6.16.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.17 Register NCKTRT

5.3.6.17.1 Register description No circuit trunks (NCKTRT) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because one of the following types of trunk is not available:

- 0+/0- tandem to TOPS
- outgoing to AMR2 or CAMA
- outgoing local

- recording completing outgoing
- TOPS outgoing

This register would get pegged against the bearer network of the originator.

5.3.6.17.2 Register release history update Register is new in SN07.

5.3.6.17.3 Associated registers None.

5.3.6.17.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.18 Register NCKTTC

5.3.6.18.1 Register description No circuit toll completing trunks (NCKTTC) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the calls to GNCT because a toll completing trunk is not available.

This register would get pegged against the bearer network of the originator.

5.3.6.18.2 Register release history update Register is new in SN07.

5.3.6.18.3 Associated registers None.

5.3.6.18.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.19 Register NCKTOSC

5.3.6.19.1 Register description No service circuit trunks (NCKTOSC) counts calls on the associated bearer network that the system routes to generalized no circuit treatment (GNCT). The system routes the call because automatic number announcement or automatic intercept trunk is not available.

This register would get pegged against the bearer network of the originator.

5.3.6.19.2 Register release history update Register is new in SN07.

5.3.6.19.3 Associated registers None.

5.3.6.19.4 Associated logs The system generates ATB100 when the system routes again a call that the system blocks. The system blocks the call when the call attempts to seize a specified numbering plan area (NPA) The system can also block a call that attempts to seize a trunk to a specified central office (CO).

The system generates LINE138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

5.3.6.20 Register MDPD

5.3.6.20.1 Register description Machine dialed partial dials (MDPD) counts machine-dialed calls on the associated bearer network that the system routes to partial dial treatment.

This register would get pegged against the bearer network of the originator.

5.3.6.20.2 Register release history update Register is new in SN07.

5.3.6.20.3 Associated registers None.

5.3.6.20.4 Associated logs The system generates TRK114 if the system cannot determine call destination during dial pulse (DP) reception for an incoming call.

The system generates TRK116 if the system cannot determine call destination during multi-frequency (MF) reception for an incoming call.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK182 when the system cannot determine call destination of an incoming call because the system had problems during Digitone reception.

5.3.6.21 Register MDPSIG

5.3.6.21.1 Register description Machine dialed permanent signal (MDPSIG) counts machine-dialed calls on the associated bearer network that the system routes to permanent signal treatment.

This register would get pegged against the bearer network of the originator.

5.3.6.21.2 Register release history update Register is new in SN07.

5.3.6.21.3 Associated registers None.

5.3.6.21.4 Associated logs The system generates TRK115 when the system cannot determine call destination. The system was not able to determine call destination because the system had problems during dial pulse (DP) reception for an incoming call.

The system generates TRK117 when the system cannot determine call destination. The system was not able to determine call destination because system had problems during multi-frequency (MF) reception for an incoming call.

The system generates TRK138 if the system routes a call to treatment after the call was call processing busy.

The system generates TRK183 when a permanent signal problem occurs. The problem occurs because the system had problems during Digitone reception of an incoming call.

5.3.6.22 Register DPTRC

5.3.6.22.1 Register description DPT Reservation Control (DPTRC) counts the number of DPT terminal requests that are blocked due to DPT bandwidth resevation.

This register would get pegged against the bearer network of the originator.

5.3.6.22.2 Register release history update Register is new in SN07.

5.3.6.22.3 Associated registers Register DPTRC2 is an extension register for DPTRC.

5.3.6.22.4 Associated logs None.

5.3.7 TRK2NET1 OM Group

5.3.7.1 OM description

TRK2NET1 OM Group provides information for per trunk group traffic analysis per bearer network. The OM group is modeled after group TRK. The TRK2NET1 OM group provides information on trunk traffic for each trunk group. The registers in TRK2NET1 count the following:

- routing attempts
- seizure attempts
- seize failures
- total trunk use
- busy state use

OM groups TRK and TRNK2 provide traffic data summaries on a per-trunk group basis for all trunk groups in an office. TRK2NET1 and TRK2NET2 provide similar traffic data summaries with further refinement on a per-bearer network basis for each trunk group for all trunks groups in an office.

Office parameter OFFICETYPE in table OFCSTD controls the generation of the registers for TRK2NET1. When the system reports an answer indicator to CM from the outgoing trunk, the OM Answer register for the outgoing trunk increases.

5.3.7.2 Release history update

TRK2NET1 OM group is new in SN07.

The addition of this new TRK2NET1 OM group is controlled by the value of a new SN07 office parameter, MULTINET_DISPLAY_ACTIVE. If this parameter is set to ‘Y’, then the new TRK2NET1 OM group is displayed. If the parameter is set to ‘N’, then the TRK2NET1 OM group is not displayed.

5.3.7.3 Registers

TRK2NET1 OM group registers display on the MAP terminal as follows:

5.3.7.4 Group structure

TRK2NET1 OM group provides 1 tuple(s) for each trunk group and each bearer network that the trunk group has members provisioned in.

Key field: None

Info field: OM2TRKINFO

- CLLI
- bearer network ID (i.e., ‘NET 0’)
- bearer network name (i.e., ‘TDM_ENET’)
- trunk group direction. (i.e., ‘IC—incoming trunk, OG—outgoing trunk, 2W—two-way trunk’)
- total number of trunk circuits in the group in the associated bearer network (i.e., ‘20’)
- number of trunk circuits in the associated bearer network available for service at the end of the reporting period. (i.e., ‘19’)

The office parameter OFFICETYPE in table OFCSTD specifies the type of office. The value of OFFICETYPE controls the generation of TRK2NET1 registers. Correct entries for OFFICETYPE appear below:

- OFF100 Local

- OFF1000ESD Australian local
- OFFCOMB Combined local/toll
- OFFCOMBLWW Combined local/toll with wireless
- OFFCOMBTOPS Combined local/toll with traffic operator position system (TOPS)
- OFF200 Toll
- OFF2000ESD Australian toll
- OFF200TOPS Toll with TOPS
- OFF200300 Combned gateway/toll
- OFF250 DMS-250
- OFF250IBN DMS-250/SL-100
- OFF300 Gateway
- OFF500 DMS-500

The office type parameters appear in table OFCSTD. When the system reports an answer indication to CM from the outgoing trunk, the OM Answer register for the outgoing trunk increases.

The validity of a TRK2NET1 register in an officetype is given in the following table

Table 6 TRK2NET1 OM Group Registers

Register	Present In Officetypes
INCAATT	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd, offcomb300, nooffice
PRERTEA1	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd, offcomb300, nooffice
NINFAIL	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd, offcomb300, nooffice

Register	Present In Officetypes
NATMPT	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd, offcomb300, nooffice
NVFLATB	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd, offcomb300, nooffice
GLARE1	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd, offcomb300, nooffice
OUTFL	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd, offcomb300, nooffice
TRFCU	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd,offcomb300,nooffice
SBSYU	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd,offcomb300,nooffice
MBSYU	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd,offcomb300,nooffice
TRKNWBLK	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd,offcomb300,nooffice
CNCTAT	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, off200avon, offtollavon, off100scp , off100oesd, off200oesd, offcomboesd,offcomb300,nooffice

Register	Present In Officetypes
TNDMATT	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, off300, offtollavon, off100scp, off100oesd, off200oesd, offcomboesd,offcomb300,nooffice
ANIOFCFL	off100, off200, offcomb, offcombitops, off200tops, offcombtops , off200tops, offcombtops, off500, offcomblww, offcomb300, offtollavon,nooffice
NANF	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off200tops, offcombtops, off500, offcomblww, offcomb300, offtollavon,nooffice
TOTBSYU	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, offcomb300, offtollavon, off100oesd, off200oesd, offcomboesd, nooffice
NANSWER	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off300, offcomb300, off100oesd, off200oesd, offcomboesd, nooffice
NACCCNG	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, nooffice
NOANSWR	off100, off200, offcomb, offcombitops, off200tops, offcombtops, off250, off250ibn, offmtx100i, off500, offcomblww, nooffice
NINANSWR	off100, off200, offcomb, offcombitops, off200tops, offcombtops, nooffice
OUTANSWR	off100, off200, offcomb, offcombitops, off200tops, offcombtops, nooffic
ANSUFIN	off100, off200, offcomb, offcombitops, off200tops, offcombtops, nooffice
INVATHCD	off250, off250ibn, offmtx100i,off500, offcomblww, offcomb300
MAXBSY	off250, off250ibn, offmtx100i,off500, offcomblww, offcomb300

5.3.7.5 Associated OM groups

The OFZ provides information about calls based on the source of the call. This OM group also provides information about calls based on the intended destination of the call. This information is on an office-wide basis.

The OFZ2NET1 and OFZ2NET2 provide information about calls on a per bearer network based on the source of the call. This OM group also provides

information about calls based on the intended destination of the call. This information is on an office-wide basis per bearer network.

The OTS provides information about calls based on the source of the call. This OM group also provides information about calls based on the intended destination of the call. This information is on an office-wide basis.

5.3.7.6 Associated functional groups

The following functional groups are associated with TRK2NET1 OM group:

- Succession North America
- Succession International

5.3.7.7 Associated functionality codes

None

5.3.7.8 TRK2NET1 OM group registers logic flow chart

Figure 17 Termination to an outgoing trunk

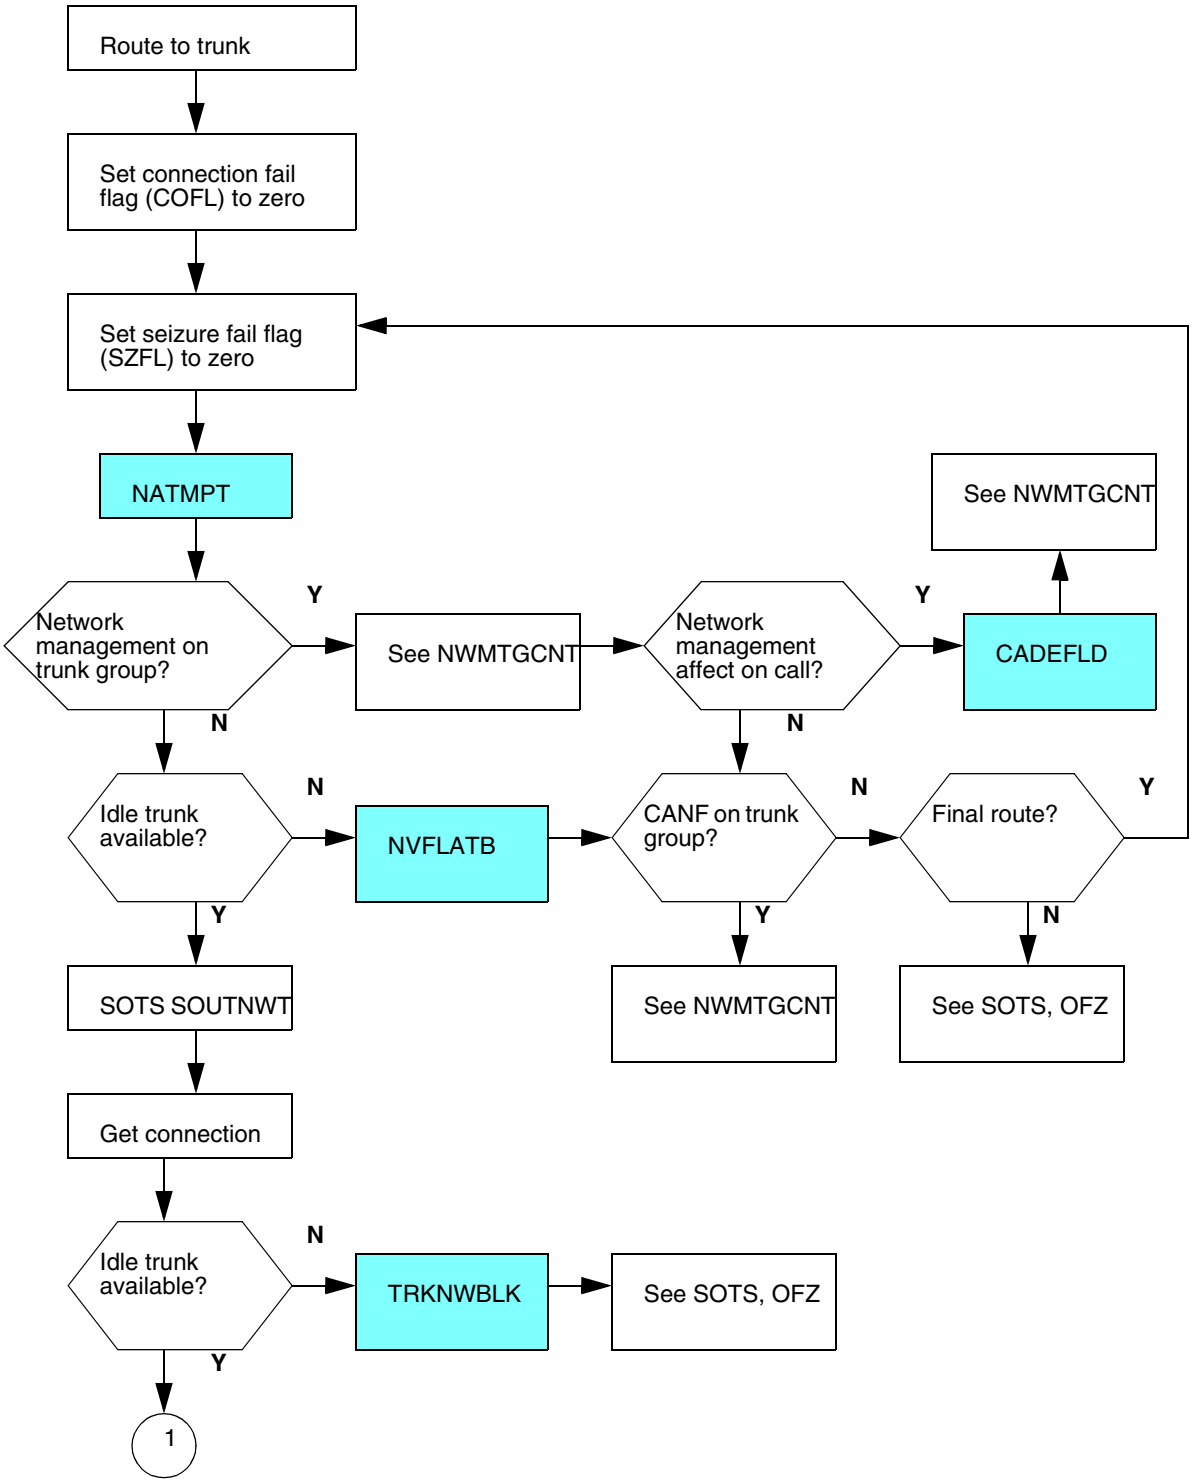

Figure 18 Termination to an outgoing trunk (continued)

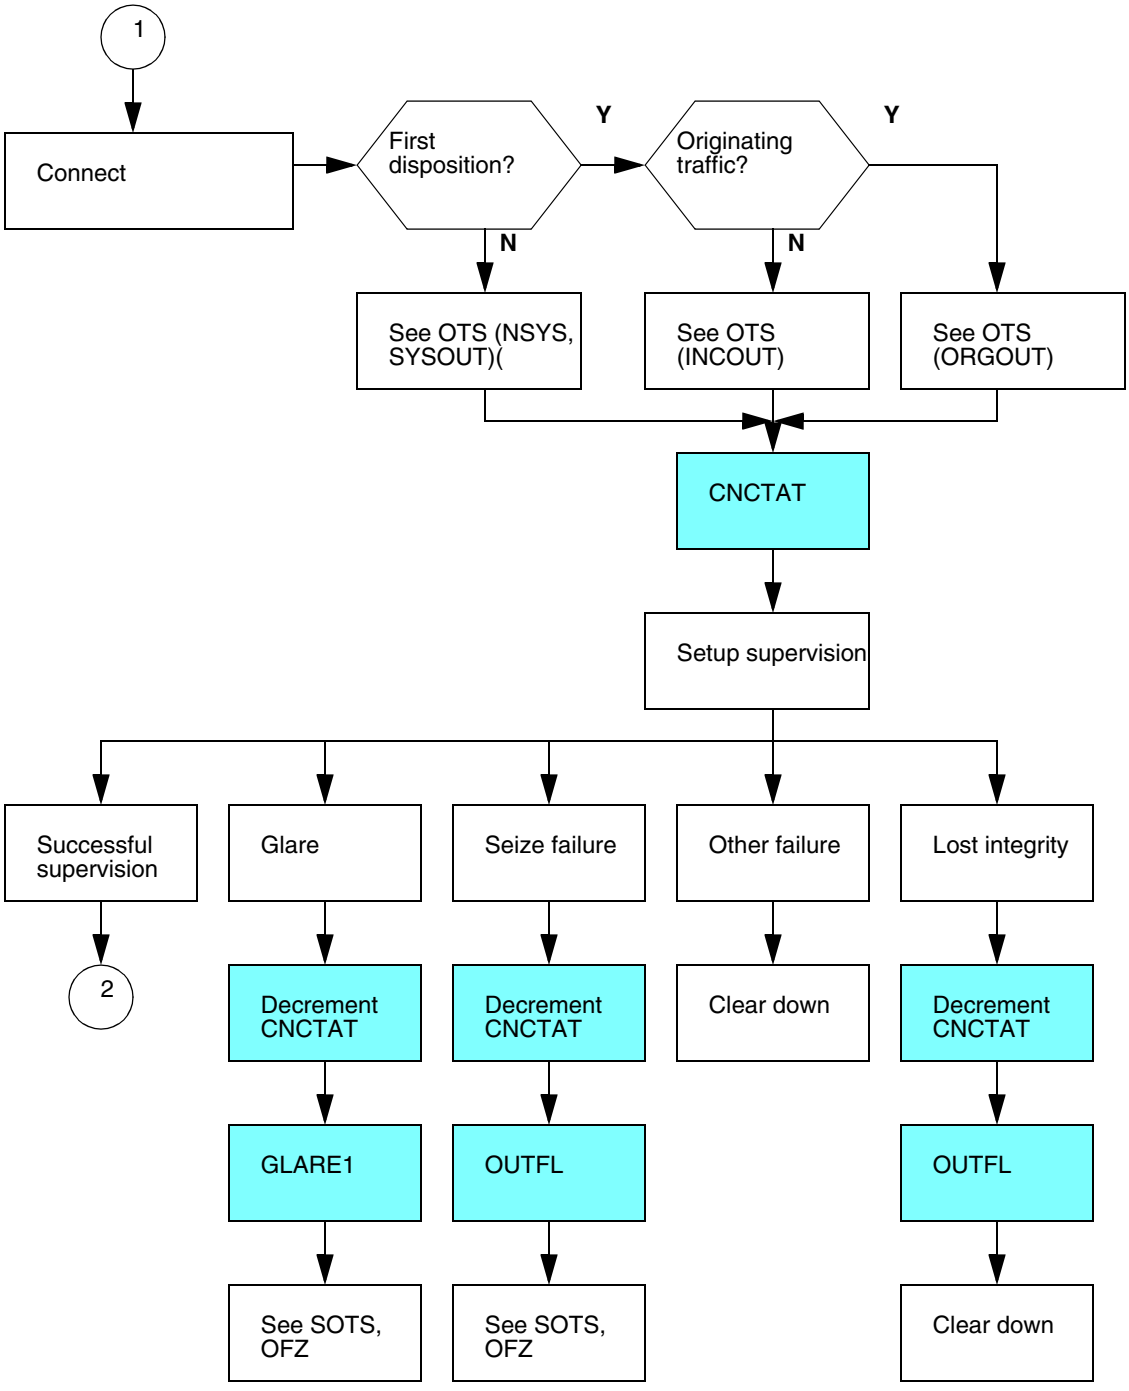

Figure 19 Termination to an outgoing trunk (continued)

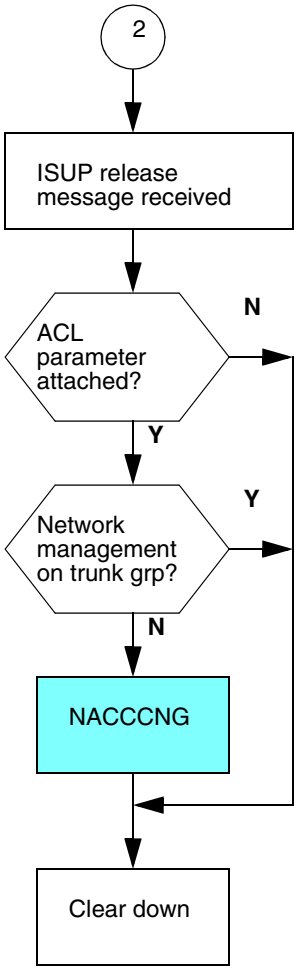

Figure 20 Trunk group busy usage registers

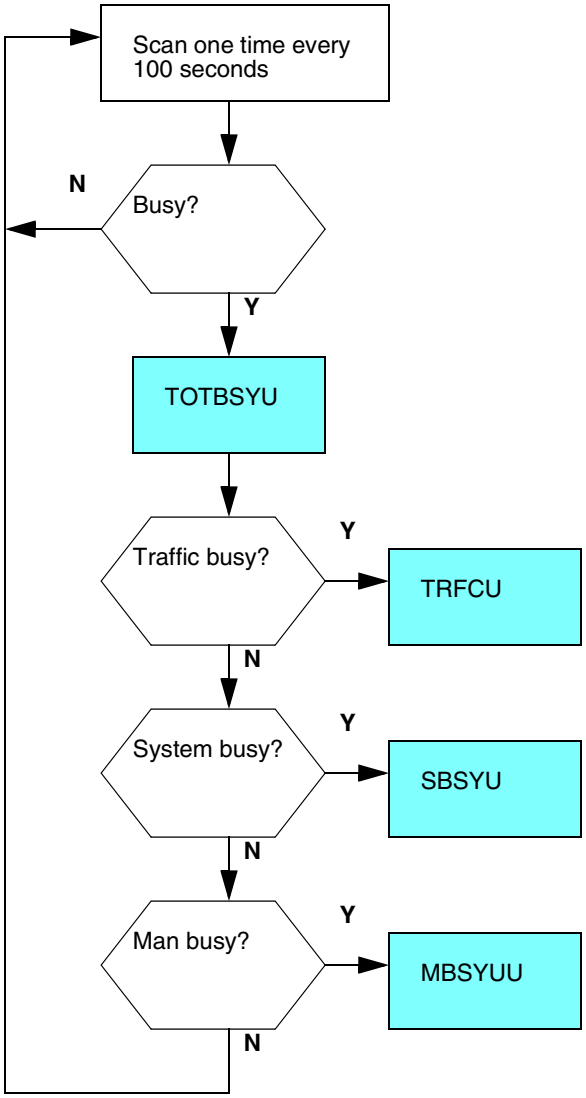

Figure 21 Origination from a trunk

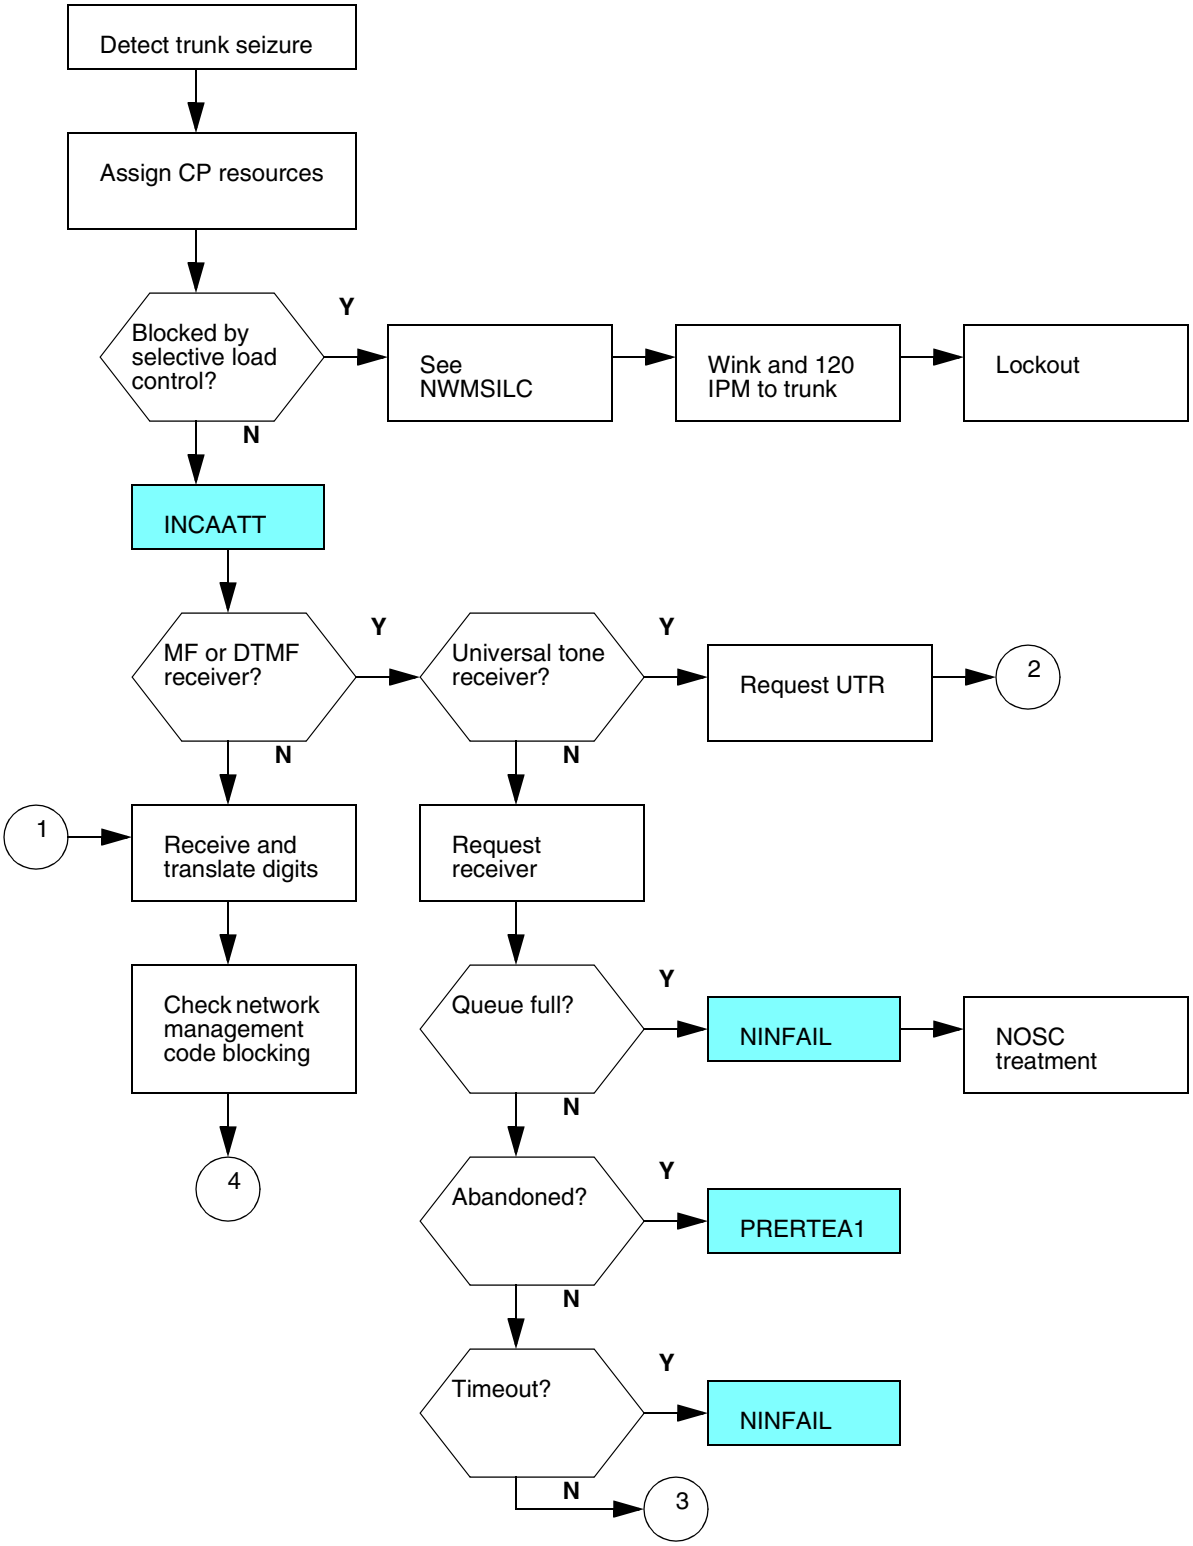

Figure 22 Origination from a trunk (continued)

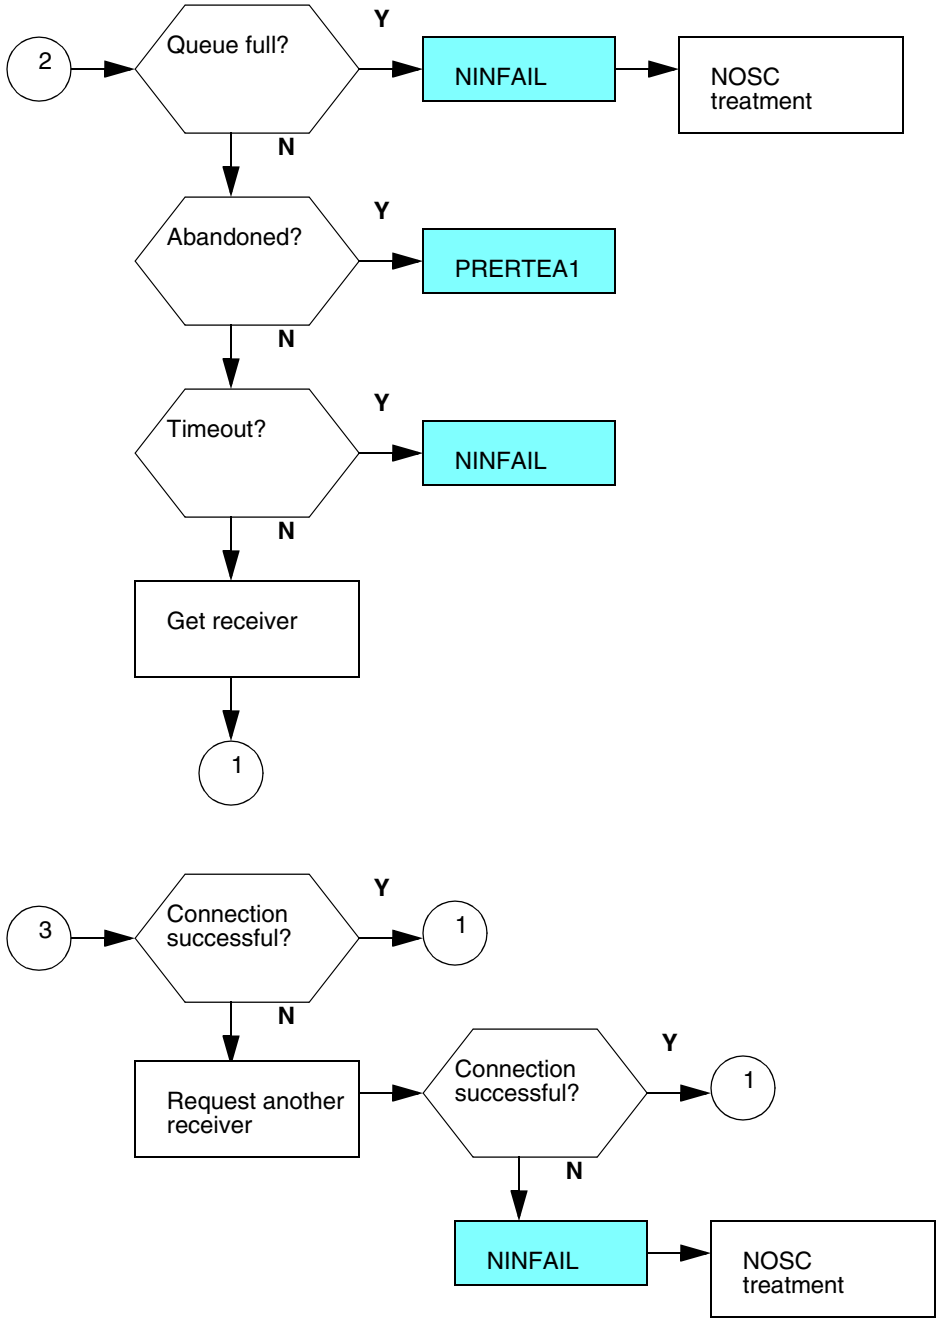

Figure 23 Origination from a trunk (continued)

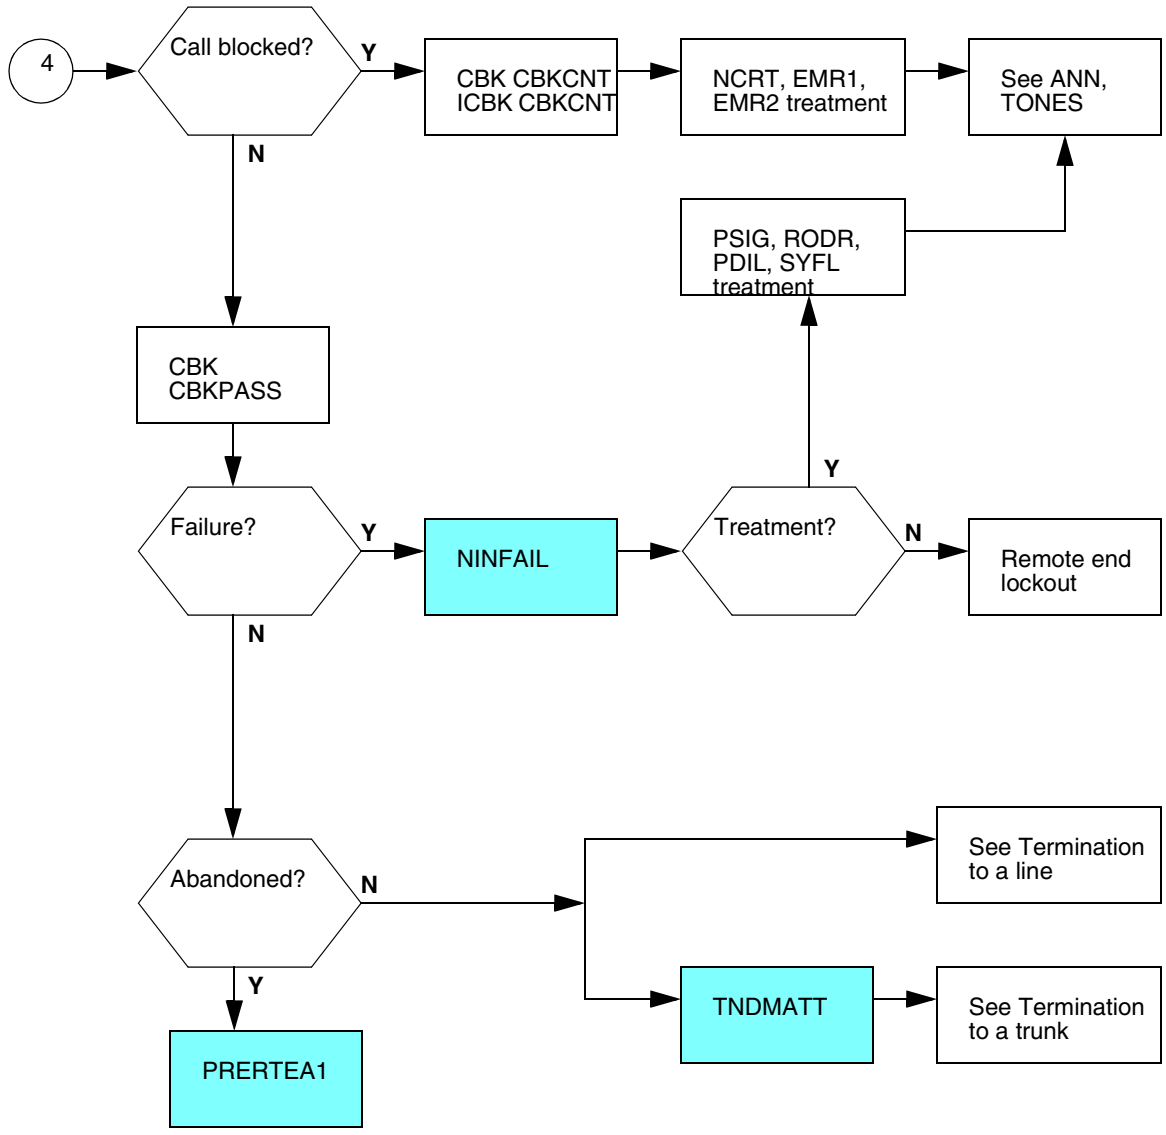

Figure 24 Trunk group answered calls

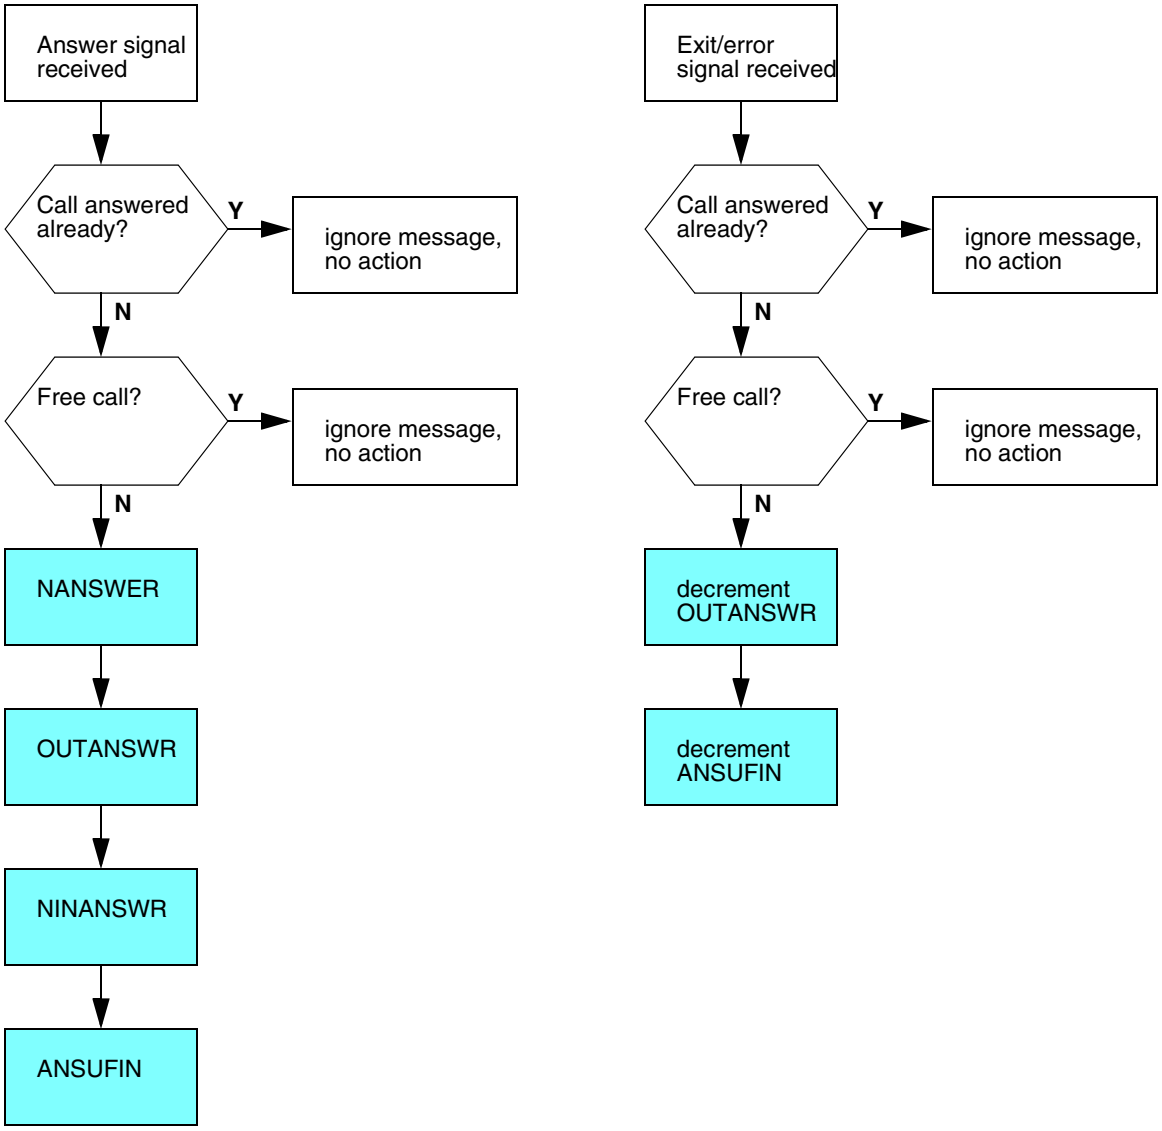

5.3.7.9 Register NACCCNG

5.3.7.9.1 Register description Automatic congestion control (NACCCNG) counts the number of times that a trunk group enters Automatic Congestion Control (ACC) congestion.

This register will be pegged against the CLLI and bearer network of the originator.

5.3.7.9.2 Register release history update Register is new in SN07.

5.3.7.9.3 Associated registers None.

5.3.7.9.4 Associated logs None.

5.3.7.10 Register NANF

5.3.7.10.1 Register description Invalid or no automatic number identification (ANI) signals (NANF) counts incoming centralized-automatic message accounting (CAMA) or TOPS calls for which:

- the system receives invalid ANI signaling
- the system did not receive ANI signaling
- the numbering plan area code (N0/1X) or the central office code (NNX) of the calling number for the incoming trunk group is not correct Register ANF increases when the system attaches the necessary receiver to the call.

5.3.7.10.2 Register release history update Register is new in SN07.

5.3.7.10.3 Associated registers None.

5.3.7.10.4 Associated logs The system generates TRK120 when the call server or the intervening operator encounters problems. Problems can occur during operator number identification (ONI) spill for an incoming call over a CAMA trunk. The system cannot determine the call origination address.

5.3.7.11 Register NANSWER

5.3.7.11.1 Register description Answer supervisions (NANSWER) count all line/trunk to trunk answered calls. This register is the answer register for the outgoing trunk.

5.3.7.11.2 Register release history update Register is new in SN07.

5.3.7.11.3 Associated registers None.

5.3.7.11.4 Associated logs None.

5.3.7.12 Register INVATHCD

5.3.7.12.1 Register description
INVATHCD counts authorization codes that are not correct. The register is pegged against the CLLI and bearer network of the originator.

5.3.7.12.2 Register release history update Register is new in SN07.

5.3.7.12.3 Associated registers None

5.3.7.12.4 Associated logs None.

5.3.7.13 Register MAXBSY

5.3.7.13.1 Register description

MAXBSY scans the trunk group and pegs the counter if the number of busy circuits exceeds the maximum number that the system recorded earlier.

Note: MAXBSY will always be set to zero for DPT trunks

5.3.7.13.2 Register release history update Register is new in SN07.

5.3.7.13.3 Associated registers None

5.3.7.13.4 Associated logs None.

5.3.7.14 Register ANIOFCFL

5.3.7.14.1 Register description Automatic number identification (ANI) office failure (ANOOFCFL) counts incoming calls for which the originating office detects an ANI failure. Failure can be detected despite correct key pulse and signaling terminal control signals. The missing information digits, missing category code or the complete lack of digits indicates an ANI failure.

5.3.7.14.2 Register release history update Register is new in SN07.

5.3.7.14.3 Associated registers None.

5.3.7.14.4 Associated logs Register TRK118 generates when the system encounters trouble during ANI spill for an incoming call. In this example, the system cannot determine call originating address.

Register TRK119 generates when an operator keys in the originating station number identification and releases the call. The operator releases the call because the system encounters trouble with DMS ANI.

5.3.7.15 Register CNCTAT

5.3.7.15.1 Register description Successful connections (CNCTAT) counts outgoing seizure attempts on the trunk group that appear to result in successful connection.

Register CNCTAT increases before the system knows if the seizure is successful. The count reduces by 1 (decreases) if an indication of glare or seize failure is received. This register generates for all correct office types.

5.3.7.15.2 Register release history update Register is new in SN07.

5.3.7.15.3 Associated registers Register GLARE1 increases when the system drops an earlier selected trunk. The system drops the trunk because the peripheral module detects an origination before it can seize the trunk.

5.3.7.15.4 Associated logs None.

5.3.7.16 Register GLARE1

5.3.7.16.1 Register description Glare (GLARE1) increases when the system drops a trunk that the system selects at an earlier time. The system drops this trunk because the PM detects an origination before the PM can seize the trunk. The operating company gives information that indicates that outgoing calls give way to simultaneous incoming calls (glare).

The system attempts a new selection. If the system encounters glare again, the system routes the call to generalized no-circuit (GNCT) treatment. Register GLARE1 increases again.

This register will be pegged against the CLLI and bearer network of the terminator.

5.3.7.16.2 Register release history update Register is new in SN07.

5.3.7.16.3 Associated registers Register CNCTAT counts outgoing seizure attempts on the trunk group that result in connections.

Register OUTFL counts errors on an outgoing trunk after an attempt to seize the trunk.

5.3.7.16.4 Associated logs The system generates log TRK113 if the system encounters problems during call processing of a trunk-to-trunk call. The system generates TRK121 if the call server does not receive an acknowledgement wink from the far-end equipment. An acknowledgement wink indicates that the far-end equipment is ready to receive digits.

5.3.7.17 Register NINANSWR

5.3.7.17.1 Register description Answer messages sent and received on incoming trunk (NINANSWR) counts the answered calls for incoming traffic for each incoming or two-way trunk.

This register is not pegged in the current load.

5.3.7.17.2 Register release history update Register is new in SN07.

5.3.7.17.3 Associated registers None.

5.3.7.17.4 Associated logs None.

5.3.7.18 Register ANSUFIN

5.3.7.18.1 Register description Answer messages received and sent usage on incoming trunk (ANSUFIN) is a usage register that shows the number of answered calls on incoming trunk calls. This register measures traffic in the answered state for each incoming or two-way trunk. The register measures the occupancy in Erlangs.

The value of register ANSUFIN increases every 100 seconds according to the number of trunks occupied with answered calls.

This register is not pegged in the current load.

5.3.7.18.2 Register release history update Register is new in SN07.

5.3.7.18.3 Associated registers None.

5.3.7.18.4 Associated logs None.

5.3.7.19 Register INCAATT

5.3.7.19.1 Register description Incoming attempts total (INCAATT) counts incoming seizures on a trunk group, including seizures that fail or that the system abandons before routing.

This register will be pegged against the CLLI and bearer network of the originator.

5.3.7.19.2 Register release history update Register is new in SN07.

5.3.7.19.3 Associated registers None.

5.3.7.19.4 Associated logs None.

5.3.7.20 Register NINFAIL

5.3.7.20.1 Register description Incoming failures (NINFAIL) increases when any one of the following events occurs on a trunk that has originated a call or appears to have originated a call:

- permanent signal
- partial dial time-outs and false starts
- bad digits, including bad signaling terminal (ST) digit
- any originations on one-way outgoing trunks
- lost integrity on the network path while connected to a service circuit or to another trunk before answer

- failure to attach a receiver after two attempts
- receiver queue overflow
- receiver queue wait time-out
- failure to time-out after 30 s while waiting for a multi frequency receiver
- progress message of a type not expected in the current call environment
- force-release before connection

These events can indicate a need for maintenance action. These events can result in call failure if a call was in progress.

This register will be pegged against the CLLI and bearer network of the originator.

5.3.7.20.2 Register release history update Register is new in SN07.

5.3.7.20.3 Associated registers None.

5.3.7.20.4 Associated logs The system generates TRK111 if a trunk-to-trunk call encounters problems or if the system routes the call to a treatment.

The system generates log TRK114 if the system cannot determine the call destination during dial pulse (DP) reception for an incoming call.

The system generates log TRK115 if the system cannot determine the call destination during DP reception for an incoming call.

The system generates log TRK116 if the system cannot determine call destination during multi frequency (MF) reception for an incoming call.

The system generates log TRK117 if the system cannot determine call destination during MF reception for an incoming call.

The system generates log TRK138 if the system routes a call to a treatment after being call processing busy.

The system generates log TRK182 if the system cannot determine call destination during Digitone (DT) reception for an incoming call.

The system generates log TRK183 if a permanent signal problem occurs when an incoming call encounters problems during DT reception.

The system generates log TRK213 when the system encounters problems on a trunk.

This register will be pegged against the CLLI and bearer network of the originator.

5.3.7.21 Register MBSYU

5.3.7.21.1 Register description Maintenance busy usage (MBSYU) is a usage register. Every 100 s the system scans the trunk group. This register records if a trunk is in one of the following states:

- manual busy
- seized
- network management busy

5.3.7.21.2 Register release history update Register is new in SN07.

5.3.7.21.3 Associated registers None.

5.3.7.21.4 Associated logs None.

5.3.7.22 Register NATMPT

5.3.7.22.1 Register description Number of attempts (NATMPT) increases when the system routes an outgoing call to a trunk group.

Register NATMPT increases before network management controls increase. This register increases before an idle trunk and a network connection to the trunk are available.

This register will be pegged against the CLLI and bearer network of the terminator.

5.3.7.22.2 Register release history update Register is new in SN07.

5.3.7.22.3 Associated registers None.

5.3.7.22.4 Associated logs None.

5.3.7.23 Register NOANSWR

5.3.7.23.1 Register description No Answer on trunk [Timed out] (NOANSWR) is a peg register which counts the number of times a call has been taken down after a specified time-out value has been reached, as part of Black Box Fraud prevention (BBFP). The time-out value is implemented on a trunk-group basis and can be set to either one, two, three, four, or five minute intervals. Upon expiration of the timer, the NOANSWR register is pegged.

NOANSWR functionality is activated and deactivated via the DLYFWDXMT option datafill of table TRKOPTS on a trunk-group basis. Register NOANSWR is pegged when the black box fraud timer or DLYFWDXMT timer expires before an answer supervision signal is received. The time-out value is datafilled in table TRKOPTS.

Register NATMPT gets pegged once per trunk per bearer network attempted.

5.3.7.23.2 Register release history update Register is new in SN07.

5.3.7.23.3 Associated registers None.

5.3.7.23.4 Associated logs Log TRK610 is generated each time the NOANSWR register is pegged.

5.3.7.24 Register NVFLATB

5.3.7.24.1 Register description Number of overflows, all trunks busy (NVFALTB) increases when a call with access to the trunk group overflows the group. The system routes the call because an idle trunk is not available. A call can access the same group more than one time. Overflow can occur only one time. Overflow occurs if the system cannot use the first trunk because of seize fail, glare or network blockage. Register NVFLATB increases when the system cannot find an idle trunk on the first or any of the following access attempts.

Register NATMPT gets pegged once per trunk per bearer network overflowed.

5.3.7.24.2 Register release history update Register is new in SN07.

5.3.7.24.3 Associated registers None.

5.3.7.24.4 Associated logs The system generates ATB100 when the system blocks an attempt to seize a trunk to a specified numbering plan area or central office. The system advances the call to another route.

5.3.7.25 Register OUTANSWR

5.3.7.25.1 Register description Answer message received and sent usage on an outgoing trunk (OUTANSWR) is a usage register that shows the number of answered calls on outgoing trunk calls. This register measures traffic in the answered state for each outgoing or two-way trunk. The register measures the occupancy in Erlangs.

The value of register OUTANSWR increases every 100 seconds according to the number of trunks occupied with answered calls.

This register is not pegged in the current load.

5.3.7.25.2 Register release history update Register is new in SN07.

5.3.7.25.3 Associated registers None.

5.3.7.25.4 Associated logs None.

5.3.7.26 Register OUTFL

5.3.7.26.1 Register description Outgoing failures (OUTFL) counts attempts to seize an outgoing trunk in the trunk group that fail because of following:

- signaling problems
- loss of accuracy
- outgoing failures
- seizure failures

The system releases the trunk. The system performs a maximum of two attempts to seize a trunk. The system counts each failed attempt in OUTFL. If a second attempt to seize a trunk fails, the system routes the call to treatment.

The system can generate a log message. Generation of a log message depends on the cause of the failure.

The system generates register OUTFL for office types that are correct.

This register will be pegged against the CLLI and bearer network of the terminator.

5.3.7.26.2 Register release history update Register is new in SN07.

5.3.7.26.3 Associated registers Register CNCTAT counts outgoing seizure attempts on the trunk group that result in connections.

Register GLARE1 increases when the system drops a trunk that the system selects at an earlier time. The system drops the trunk because the PM detected an origination. The PM detects an origination before the PM seizes the trunk.

5.3.7.26.4 Associated logs The system generates TRK113 if the system encounters problems during call processing of a trunk-to-trunk call.

The system generates TRK121 if the DMS does not receive an acknowledgement wink from the far-end equipment. The acknowledgement wink indicates that the equipment is ready to receive digits.

The system generates TRK122 if the central control detects a loss of accuracy on both planes of the trunk equipment.

The system generates TRK162 if the system encounters problems during outpulsing of a trunk-to-trunk or line-to-trunk call. The call uses dual-tone multi frequency (DTMF) signaling.

The system generates TRK213 if the system encounters problems on a trunk.

5.3.7.27 Register TRKNWBLK

5.3.7.27.1 Register description Outgoing matching failure (TRKNWBLK) counts attempts to find a path from an incoming trunk or originating line to a selected trunk that fail. Failure occurs as a result of network blockage.

If the system blocks an outgoing call, the call again attempts to select a trunk. If the system blocks this attempt, TRKNWBLK counts the call again. The system routes the call to NBLH treatment.

This register will be pegged against the CLLI and bearer network of the terminator.

5.3.7.27.2 Register release history update Register is new in SN07.

5.3.7.27.3 Associated registers None.

5.3.7.27.4 Associated logs The system generates NET130 if the system cannot find a network path.

5.3.7.28 Register PRERTEA1

5.3.7.28.1 Register description Preroute abandon (PRERTEA1) counts incoming attempts the system abandons before the system can complete routing.

This register will be pegged against the CLLI and bearer network of the originator.

5.3.7.28.2 Register release history update Register is new in SN07.

5.3.7.28.3 Associated registers None.

5.3.7.28.4 Associated logs The system generates register TRK113 if the system encounters problems during call processing of a trunk-to-trunk call.

The system generates TRK116 if the system cannot determine the call destination during multi frequency reception for an incoming call.

5.3.7.29 Register SBSYU

5.3.7.29.1 Register description System busy usage (SBSYU) is a usage register. Every 100 seconds the system scans the trunk group. This register records if a trunk is in one of the following states:

- remote busy
- peripheral module busy
- system busy
- carrier fail
- deloaded

5.3.7.29.2 Register release history update Register is new in SN07.

5.3.7.29.3 Associated registers None.

5.3.7.29.4 Associated logs The system generates TRK106 if a self-test on trunk equipment fails.

The system generates TRK109 when a self-test on a DS-1 facility fails.

5.3.7.30 Register TNDMATT

5.3.7.30.1 Register description Tandem (TNDMATT) counts incoming calls on a trunk group that first routes to an outgoing trunk group. Register TNDMATT increases before the system determines if the outgoing trunk group is busy, or if a junctor path is available.

This register will be pegged against the CLLI and bearer network of the originator.

5.3.7.30.2 Register release history update Register is new in SN07.

5.3.7.30.3 Associated registers None.

5.3.7.30.4 Associated logs None.

5.3.7.31 Register TOTBSYU

5.3.7.31.1 Register description Total usage (TOTBSYU) is a usage register. Every 100 seconds the system scans the trunk group and register TOTU records if any trunk in the group is busy.

5.3.7.31.2 Register release history update Register is new in SN07.

5.3.7.31.3 Associated registers Register MBU counts manual busy trunks.

Register SBU counts system busy trunks.

Register TRU counts call processing busy trunks.

TOTU = TRU + SBU + MBU.

5.3.7.31.4 Associated logs None.

5.3.7.32 Register TRFCU

5.3.7.32.1 Register description Traffic busy usage (TRFCU) is a usage register. Every 100 s the system scans the trunk group. This register records if a trunk in the group is in one of the following states:

- call processing busy (TK_CP_BUSY)
- call processing busy deload (TK_CP_BUSY_DELOAD)
- lockout (TK_LOCKOUT)

5.3.7.32.2 Register release history update Register is new in SN07.

5.3.7.32.3 Associated registers None.

5.3.7.32.4 Associated logs None.

5.3.8 TRK2NET2 OM Group

5.3.8.1 OM description

TRK2NET2 OM Group provides information for per trunk group traffic analysis per bearer network. It contains extension registers for registers found in OM Group TRK2NET1.

5.3.8.2 Release history update

TRK2NET2 OM group is new in SN07.

The addition of this new TRK2NET2 OM group is controlled by the value of a new SN07 office parameter, MULTINET_DISPLAY_ACTIVE. If this parameter is set to ‘Y’, then the new TRK2NET2 OM group is displayed. If the parameter is set to ‘N’, then the TRK2NET2 OM group is not displayed.

5.3.8.3 Registers

TRK2NET2 OM group registers display on the MAP terminal as follows:

Figure 25 TRK2NET2 OM Group Display

```
>omshow trk2net2 active 'TRI1ITOGS7 NET 0'

5.3.8.4 Group structure

TRK2NET2 OM group provides 1 tuple(s) for each trunk group and each bearer network that the trunk group has members provisioned in.

Key field: None

Info field: TRK2NET1_INFO

- CLLI
- bearer network ID (i.e., ‘NET 0’)
- bearer network name (i.e., ‘TDM_ENET’)
- trunk group direction. (i.e., ‘IC—incoming trunk, OG—outgoing trunk, 2W—two-way trunk’)
- total number of trunk circuits in the group in the associated bearer network (i.e., ‘20’)
- number of trunk circuits in the associated bearer network available for service at the end of the reporting period. (i.e., ‘19’)

The office parameter OFFICETYPE in table OFCSTD specifies the type of office. The value of OFFICETYPE controls the generation of TRK2NET2 registers. Correct entries for OFFICETYPE appear below:

- OFF100 Local
- OFF1000ESD Australian local
- OFF100SCP DMS-100 Service Control Point (SCP)
- OFF200 Toll
- OFF200AVON DMS100/200 local/toll with Autovon (U. S. and Canada)
- OFF200ESD Australian toll
- OFF200TOPS Toll with TOPS
- OFF200/300 Combined gateway/toll
- OFF250 DMS-250
- OFF250IBN DMS-250/SL-100
- OFF300 Gateway
- OFF500 DMS-500
- OFFCOMB Combined local/toll
- OFFCOMB300 Combined local/toll and gateway
- OFFCOMB300ITOPS Combined local/toll and gateway with international TOPS (ITOPS)
- OFFCOMBITOPS Combined local/toll with ITOPS

- OFFCOMBLWW Combined local/toll with wireless
- OFFCOMBESD Australian combined local/toll
- OFFCOMBTOPS Combined local/toll with traffic operator position system (TOPS)
- OFFMTX100 DMS-MTX with DMS100

The office type parameters appear in table OFCSTD. When the system reports an answer indication to CM from the outgoing trunk, the OM Answer register for the outgoing trunk increases.

5.3.8.5 Associated OM groups

The TRK2NET1 OM group provides the primary registers. The registers found is TRK2NET2 are pegged only if the registers in TRK2NET1 overflow.

5.3.8.6 Associated functional groups

The following functional groups are associated with TRK2NET2 OM group:

- Succession North America
- Succession International

5.3.8.7 Associated functionality codes

None

5.3.8.8 TRK2NET2 OM group registers logic flow chart

Refer to TRK2NET1 for register flow charts.

5.3.8.9 Register NANSWER2

5.3.8.9.1 Register description Answer supervisions (NANSWER2) count all line/trunk to trunk answered calls. This register is the answer register for the outgoing trunk.

This register will be pegged against the CLLI and bearer network of the terminator.

5.3.8.9.2 Register release history update Register is new in SN07.

5.3.8.9.3 Associated registers NANSWER in TRK2NET1 OM group.

5.3.8.9.4 Associated logs None.

5.3.8.10 Register CNCTAT2

5.3.8.10.1 Register description Successful connections (CNCTAT2) counts outgoing seizure attempts on the trunk group that appear to result in successful connection.

Register CNCTAT2 increases before the system knows if the seizure is successful. The count reduces by 1 (decreases) if an indication of glare or seize failure is received. This register generates for all correct office types.

This register will be pegged against the CLLI and bearer network of the terminator.

5.3.8.10.2 Register release history update Register is new in SN07.

5.3.8.10.3 Associated registers CNCTAT in TRK2NET1 OM group.

5.3.8.10.4 Associated logs None.

5.3.8.11 Register INCAATT2

5.3.8.11.1 Register description Incoming attempts total (INCAATT2) counts incoming seizures on a trunk group, including seizures that fail or that the system abandons before routing.

This register will be pegged against the CLLI and bearer network of the originator.

5.3.8.11.2 Register release history update Register is new in SN07.

5.3.8.11.3 Associated registers INCAATT in TRK2NET1 OM group.

5.3.8.11.4 Associated logs None.

5.3.8.12 Register NATMPT2

5.3.8.12.1 Register description Number of attempts (NATMPT2) increases when the system routes an outgoing call to a trunk group.

Register NATMPT2 increases before network management controls increase. This register increases before an idle trunk and a network connection to the trunk are available.

5.3.8.12.2 Register release history update Register is new in SN07.

5.3.8.12.3 Associated registers INATMPT in TRK2NET1 OM group.

5.3.8.12.4 Associated logs None.

5.3.8.13 Register SBSYU2

5.3.8.13.1 Register description System busy usage (SBSYU2) is a usage register. Every 100 seconds the system scans the trunk group. This register records if a trunk is in one of the following states:

- remote busy
- peripheral module busy
- system busy
- carrier fail
- deloaded

5.3.8.13.2 Register release history update Register is new in SN07.

5.3.8.13.3 Associated registers SBSYU in TRK2NET1 OM group.

5.3.8.13.4 Associated logs The system generates TRK106 if a self-test on trunk equipment fails.

The system generates TRK109 when a self-test on a DS-1 facility fails.

5.3.8.14 Register TNDMATT2

5.3.8.14.1 Register description Tandem (TNDMATT2) counts incoming calls on a trunk group that first routes to an outgoing trunk group. Register TNDMATT2 increases before the system determines if the outgoing trunk group is busy, or if a junctor path is available.

This register will be pegged against the CLLI and bearer network of the originator.

5.3.8.14.2 Register release history update Register is new in SN07.

5.3.8.14.3 Associated registers TNDMATT in TRK2NET1 OM group.

5.3.8.14.4 Associated logs None.

5.3.8.15 Register TOTBSYU2

5.3.8.15.1 Register description Total usage (TOTBSYU2) is a usage register. Every 100 seconds the system scans the trunk group and register TOTBSYU2 records if any trunk in the group is busy.

5.3.8.15.2 Register release history update Register is new in SN07.

5.3.8.15.3 Associated registers TOTBSYU in TRK2NET1 OM group.

5.3.8.15.4 Associated logs None.

5.3.8.16 Register TRFCU2

5.3.8.16.1 Register description Traffic busy usage (TRFCU2) is a usage register. Every 100 seconds the system scans the trunk group. This register records if a trunk in the group is in one of the following states:

- call processing busy (TK_CP_BUSY)
- call processing busy deload (TK_CP_BUSY_DELOAD)
- lockout (TK_LOCKOUT)

5.3.8.16.2 Register release history update Register is new in SN07.

5.3.8.16.3 Associated registers TRFCU in TRK2NET1 OM group.

5.3.8.16.4 Associated logs None.

6: Performance (PF): A00003531

6.1 Performance management strategy

OM Collector (OMC) fetches performance data from MG9K through FTP, converts the performance data to CSV format and writes the converted data into a file. In subsequent sections of this document, this file is termed as “OMC CSV file”. OSSs which are present towards north bound interface of OMC, make use of these OMC CSV files.

6.2 Performance management tools and utilities

OMC CSV file contains data in the following format;

<ScalarTableName-1>
<performance parameter name 1>, <performance parameter name 2>...
Value1, Value2...

<NonScalarTableName-2>
<performance parameter name 1>, <performance parameter name 2>...
Source, Value1, Value2...

An example data in a SN06.2 OMC CSV file is as follows;

Miscellaneous
snmpInvalidMsgs,snmpInBadCommunityNames,snmpInPkts
0,0,1769

norCarrSonetMediumIntervalTable
Source,norCarrSonetMedIntervalOpt,nnorCarrSonetMedIntervalLBC
Frame2.Shelf0.Slot10.Port1,99,100
Frame2.Shelf0.Slot11.Port401,100,100

Here, the table ‘Miscellaneous’ is a Scalar table. That means, it’s Performance parameters are Scalar SNMP attributes. So, they are not identified by any ‘source’. Whereas, the table norCarrSonetMediumIntervalTable is a non-scalar table. That means, it’s Performance parameters are non-scalar SNMP attributes. So, they are identified by appropriate source, namely Frame number, Shelf number, Card number and Port number.

In SN06.2, OMC CSV file uses Internal frame number for values of Performance parameters of non-scalar table. In above example, number 2 shown next to ‘Frame’ is Internal frame number of the ‘source’ of the performance parameter.

In SN07, OMC CSV file will use Office frame number for values of Performance parameters of non-scalar table. So, if Frame location information is provisioned for frame-2, example SN06.2 data which is shown above, will be as follows in SN07.

Miscellaneous
snmpInvalidMsgs,snmpInBadCommunityNames,snmpInPkts
0,0,1769

norCarrSonetMediumIntervalTable
Source,norCarrSonetMedIntervalOpt,nnorCarrSonetMedIntervalLBC
Frame080.Shelf0.Slot10.Port1,99,100
Frame080.Shelf0.Slot11.Port401,100,100

In this SN07 example, number '080' shown next to 'Frame' is Office frame number.

If Frame location information is not provisioned partially or completely for frame-2, example SN06.2 data which is shown above, will be as follows in SN07.

Miscellaneous
snmpInvalidMsgs,snmpInBadCommunityNames,snmpInPkts
0,0,1769

norCarrSonetMediumIntervalTable
Source,norCarrSonetMedIntervalOpt,nnorCarrSonetMedIntervalLBC
FrameFFF.Shelf0.Slot10.Port1,99,100
FrameFFF.Shelf0.Slot11.Port401,100,100

6.2.1 Configuring PCF software

Following are the steps to be followed to start/stop collection of OM data.

At the MG 9000 Manager Mid-tier server

1. Issue the following change directory command to enter the appropriate directory:
   # cd /opt/nortel/omcltr_07/bin
2. While configuring OM Collector, specify IP address of the EM server, to which OM Collector is associated.Also specify the IP address of the Oracle server.
   If it is a first time configuration of OM COllector, then Operator will be allowed either to perform configuration or to exit. The script which the user needs to run here is **/opt/nortel/omcltr_07/OMCollector_config.sh**

   If it is a reconfiguration of OM COllector, the Operator will be shown a menu using which she can change the EM server IP Address and/or Oracle Server IP Address. For this the user has to run **/opt/nortel/omcltr_07/bin/OMCollector config**.

   An example result when configuration is done first time:
   # ./OMCollector_config.sh
   Starting OM Configuration ...

```
Please enter the IP Address of MG9K server?
Press the enter key to accept the default ?
Default: [] => 47.142.122.200
Please enter the IP Address of Oracle Server?
Press the enter key to accept the default ?
Default: [] => 47.142.208.207

**********************************************************
**
        EM Server IP Address       : 47.142.122.200
        Oracle IP Address          : 47.142.208.207

                **********************************************
                **********

Is the above information correct?
Press the enter key to accept the default (y/n)?
Default: [n] => y
Configuring system, please wait ...

Configuration complete ...
```

An example result when old configuration exist and Operator reconfigures again:

```
# ./OMCollector_config.sh
Starting OM Configuration ...
Setup has detected configuration settings from a previous installation.

**********************************************************
**
        EM Server IP Address       : 47.142.122.200
        Oracle IP Address          : 47.142.208.207
**********************************************************
**
Is the above information correct?
Press the enter key to accept the default (y/n)?
Default: [n] => n

Please enter the IP Address of MG9K server?
Press the enter key to accept the default ?
Default: [47.142.122.200] => 47.142.92.67

Please enter the IP Address of Oracle Server?
Press the enter key to accept the default ?
Default: [47.142.208.207] => 47.142.217.8
```

```
**********************************************************
**
        EM Server IP Address       : 47.142.92.67
        Oracle IP Address          : 47.142.217.8
**********************************************************
**
Is the above information correct?
Press the enter key to accept the default (y/n)?
Default: [n] => y
Configuring system, please wait ...

Configuration complete ...
```

An example result when old configuration exist and Operator wants to retain the configuration:

```
# ./OMCollector_config.sh
Starting OM Configuration ...
Setup has detected configuration settings from a previous installation.

**********************************************************
**
        EM Server IP Address       : 47.142.92.67
        Oracle IP Address          : 47.142.217.8
**********************************************************
**

Is the above information correct?
Press the enter key to accept the default (y/n)?
Default: [n] => y
Configuring system, please wait ...

Configuration complete ...
```

An example result when the user changes the configuration using the menu options:

```
# ./OMCollector config
Starting OM Configuration ...

Main Configuration Menu

1) Change IP Address of EM Server
2) Change Oracle IP Address
3) Display current settings
4) Exit from Main Menu
```

Please make a selection => 1

EM Server IP Address Configuration Menu

1) Enter new EM Server IP Address
2) Exit to Main Menu
Please make a selection [Current: 47.142.92.67] => 1

Please enter the IP Address of EM Server ?
Default: [47.142.92.67] => 47.142.122.200

Please wait ... trying to contact server.

EM Server IP Address Configuration Menu

1) Enter new EM Server IP Address
2) Exit to Main Menu
Please make a selection [Current: 47.142.122.200] => 2

Main Configuration Menu

1) Change IP Address of EM Server
2) Change Oracle IP Address
3) Display current settings
4) Exit from Main Menu
Please make a selection => 2

Oracle IP Address Configuration Menu

1) Enter new Oracle IP Address
2) Exit to Main Menu
Please make a selection [Current: 47.142.217.8] => 1

Please enter the IP Address of Oracle Server ?
Default: [47.142.217.8] => 47.142.208.207

Please wait ... trying to contact server.

1) Enter new Oracle IP Address
2) Exit to Main Menu
Please make a selection [Current: 47.142.208.207] => 2

Main Configuration Menu

```
1) Change IP Address of EM Server
2) Change Oracle IP Address
3) Display current settings
4) Exit from Main Menu
Please make a selection => 3

          CURRENT SETTINGS
 Package Name              :NTomclt07
 Version  :NTOMCLTR_7_16_0
EM Server IP Address  : 47.142.122.200
 Oracle Server IP          :47.142.208.207

 Main Configuration Menu

1) Change IP Address of EM Server
2) Change Oracle IP Address
3) Display current settings
4) Exit from Main Menu
Please make a selection => 4
#
```

3. Start EM Server/Midtier and create NE. While creating NE, specify whether OM data needs to be collected by checking the “NE OMCollection” check box. This check box is also modifiable through the GUI "View/Modify NE Properties". Thus, Operator can start, stop, restart OM data collection through MG9K EM.
4. Start "/opt/nortel/omcltr_07/bin/OMCollector start". With this step, OM Collector will start collecting OM data for the NE, for which “NE OMCollection” check box is checked in MG9K EM.

6.3 Performance Measurements (PM), Operational Measurements (OM), and stats

None

7: Performance (PF): A00003687

7.1 Performance management strategy

This feature is an extension of SN06 feature A000000816: “Wireless ADACC with Release.” This feature provides additional functions involving TCAP messaging between mobile switching centers (MSCs), message centers (MCs), and TOPS. The main tools used to monitor the performance of these features are operational measurements (OMs).

OM group IS41TOPS was created by feature A00000816 in SN06. With the functional additions of this SN07 feature, OM group IS41TOPS is no longer sufficient. This feature creates three new OM groups (SMSTOPS, WINTOPS, and TC7WRLSS) and removes group IS41TOPS.

Events which previously pegged registers in group IS41TOPS will now peg registers in OM groups WINTOPS and TC7WRLSS. For more information including a complete mapping of old to new registers, see the Functional Description chapter of this document.

7.2 Performance management tools and utilities

The new OM group is accessed using the OMSHOW command from the Maintenance and Administrative Position (MAP).

7.3 Operational Measurements (OMs)

This feature creates the following OM groups:

- SMSTOPS
- WINTOPS
- TC7WRLSS

This feature removes the following OM group:

- IS41TOPS

All events formerly pegged in group IS41TOPS are now pegged in groups WINTOPS and TC7WRLSS.

Table 1 OM group SMSTOPS

Register	Meaning
SMSSENT, SMSSENT2	SMS sent
SMSSUCC, SMSSUCC2	SMS success

Table 1 OM group SMSTOPS

Register	Meaning
SMSFAIL, SMSFAIL2	SMS failure
SMSTIME, SMSTIME2	SMS time-out
SMSNETWK	SMS failure due to network problems
SMSTERM	SMS failure due to terminal (cell phone) problems
SMSRADIO	SMS failure due to radio interface problems
SMSMISC	Miscellaneous SMS failure

Table 2 OM group WINTOPS

Register	Meaning
WINBEGIN, WINBEGI2	IS-41 AnalyzedInformation or GSM InitialDP received
REQCONN, REQCONN2	IS-41 ConnectResource or GSM EstablishTemporaryConnection sent
DISCONN, DISCONN2	IS-41 AnalyzedInformation with action code of “disconnect call” or GSM DisconnectTemporaryConnection sent. This event is not part of the normal IS-41 call flow, but it is part of the normal GSM call flow. If this is pegged for IS-41, it means ADACC with release was not provided.
CONNECT, CONNECT2	IS-41 AnalyzedInformation or GSM Connect sent
WINEND, WINEND2	GSM Application End received; no equivalent IS-41 message
ERRCONN	MSC could not connect to TOPS using TLDN
ERRDISC	TOPS disconnected unexpectedly while providing operator assistance. IS-41 only; when this occurs in a GSM call, WINEND is pegged but not DISCONN or CONNECT.
ERRSSFT	MSC’s service switching function timer expired. Should not happen if TOPS Reset TImer is datafilled properly in Table ISUPTRK.
ABANDON	Wireless caller disconnected prior to receiving ADACC with release.
RESTIMR, RESTIMR2	ResetTimer sent (IS-41 and GSM)
NOTLDNS	No TLDNs available in Table TOPSTLDN

Table 2 OM group WINTOPS

Register	Meaning
NODATA	TOPS could not find EXT block associated with incoming TLDN call from MSC
RXLAFAIL	TOPS call could not obtain original called digits and defaulted to 411
SANTIMR	MSC did not release trunk to TOPS, or MSC did not send Application End
TLDNTIME	A TLDN was allocated for an MSC call which never arrived. The TLDN is allocated to a new call.

Table 3 OM group TC7WRLSS

Register	Meaning
INVOKES, INVOKES2	TCAP INVOKE sent
INVOKER, INVOKER2	TCAP INVOKE receives
RETRESS, RETRESS2	TCAP RETURN RESULT sent
RETRESR, RETRESR2	TCAP RETURN RESULT received
RETERRS	TCAP RETURN ERROR sent
RETERRR	TCAP RETURN ERROR received
REJECTS	TCAP REJECT sent
REJECTR	TCAP REJECT received
ABORTS	TCAP ABORT sent
ABORTR	TCAP ABORT received
NOTRIDS	No transaction identifiers
MBFULL	Incoming message from MSC ignored due to heavy traffic
RTFNOXLA	SCCP routing failure: No translation of such nature
RTFNOXLS	SCCP routing failure: No translation for this specific address
RTFSUBCG	SCCP routing failure: Subsystem congestion
RTFSUBFL	SCCP routing failure: Subsystem failure
RTFUNEQ	SCCP routing failure: Unequipped user
RTFNETFL	SCCP routing failure: Network failure

Table 3 OM group TC7WRLSS

Register	Meaning
RTFNETCG	SCCP routing failure: Network congestion
RTFMISCE	SCCP routing failure: Failure other than the above seven
GTTFAIL	Global Title Translation failure

7.3.1 OM format

These OMs apply to events occurring on the TOPS switch during the course of a wireless (cellular) phone originated call to TOPS. In large TOPS offices, many such calls can occur during the reporting period, so several of the OMs introduced by this feature include extension registers. The extension registers are noted in the OM register text.

7.4 OM Group SMSTOPS

7.4.1 OM description

SMSTOPS

Short Message Service - TOPS

7.4.2 Release history update

Created in SN07

7.4.3 Registers

OM group registers display on the MAP terminal as follows:

Figure 1 OM Group Display

SMSSENT	SMSSENT2	SMSSUCC	SMSSUCC2
SMSFAIL	SMSFAIL2	SMSTIME	SMSTIME2
SMSNETWK	SMSTERM	SMSRADIO	SMSMISC

7.4.4 Group structure

OM group SMSTOPS provides one tuple for each wireless network type.

Key field: IS41 and GSM. There are two tuples in OM group SMSTOPS: one for IS-41 SMS and one for GSM SMS.

Info field: None

7.4.5 Associated OM groups

Registers in groups SMSTOPS and TC7WRLSS are pegged when TOPS sends an SMS and receives an acknowledgment.

7.4.6 Associated functional groups

None

7.4.7 Associated functionality codes

None

7.4.8 OM group registers logic flow chart

Register SMSSENT is pegged when TOPS sends a short message into the SS7 network.

Register SMSSUCC is pegged when TOPS receives a positive acknowledgment from the message center.

Register SMSFAIL is pegged when TOPS receives a negative acknowledgment from the message center.

Register SMSTIME is pegged when TOPS receives no acknowledgment from the message center within a customer-defined time period.

Patterns

- Every SMS attempt will peg SMSSENT plus one of the other registers. If an acknowledgment arrives after the time period has expired, the success or failure OM is pegged in addition to the time-out OM.
- The value of register SMSSENT should be close to the value of register SMSSUCC, with any slight inequality due to reporting period boundaries. If the value of SMSSUCC is significantly less than the value of SMSSENT, SMS failures are occurring either at TOPS, within the SS7 network, or at the message center.

7.4.9 Register SMSFAIL

7.4.9.1 Register description

Short Message Service Failure

SMSFAIL is a peg register. It is incremented whenever TOPS receives a negative acknowledgment from the message center following an SMS attempt.

7.4.9.2 Register release history update

Created in SN07

7.4.9.3 Associated registers

Extension register SMSFAIL2

7.4.9.4 Associated logs
TOPS131 or TCAP100, depending on type of failure

7.4.10 Register SMSMISC

7.4.10.1 Register description
Short Message Service Miscellaneous failure

SMSMISC is a peg register. It is incremented whenever TOPS receives a negative acknowledgment from the message center saying the message could not be delivered due to a miscellaneous failure (not network, terminal, or radio interface).

7.4.10.2 Register release history update
Created in SN07

7.4.10.3 Associated registers
None

7.4.10.4 Associated logs
TOPS131

7.4.11 Register SMSNETWK

7.4.11.1 Register description
Short Message Service Network failure

SMSNETWK is a peg register. It is incremented whenever TOPS a negative acknowledgment from the message center saying the message could not be delivered due to a network failure.

7.4.11.2 Register release history update
Created in SN07

7.4.11.3 Associated registers
None

7.4.11.4 Associated logs
TOPS131

7.4.12 Register SMSRADIO

7.4.12.1 Register description
Short Message Service Radio interface failure

SMSRADIO is a peg register. It is incremented whenever TOPS receives a negative acknowledgment from the message center saying the message could not be delivered due to a radio interface failure.

7.4.12.2 Register release history update
Created in SN07

7.4.12.3 Associated registers
None

7.4.12.4 Associated logs
TOPS131

7.4.13 Register SMSSENT

7.4.13.1 Register description
Short Message Service Sent

SMSSENT is a peg register. It is incremented whenever TOPS sends an SMS to a message center.

7.4.13.2 Register release history update
Created in SN07

7.4.13.3 Associated registers
Extension register SMSSENT2

7.5 OM Group WINTOPS

7.5.1 OM description

WINTOPS

Wireless Intelligent Network - TOPS

7.5.2 Release history update

Created in SN07

7.5.3 Registers

OM group registers display on the MAP terminal as follows:

Figure 2 OM Group Display

WINBEGIN	WINBEGI2	REQCONN	REQCONN2
DISCONN	DISCONN2	CONNECT	CONNECT2
WINEND	WINEND2	RESTIMR	RESTIMR2
ABANDON	ERRCONN	ERRDISC	ERRSSFT
NOTLDNS	NODATA	RXLAFAIL	SANTIMR
TLDNTIME			

7.5.4 Group structure

OM group WINTOPS provides one tuple for each wireless network type.

Key field: IS41 and GSM. There are two tuples in OM group WINTOPS: one for IS-41 WIN and one for GSM CAMEL (Customized Applications for Mobile network Enhanced Logic).

Info field: None

7.5.5 Associated OM groups

Registers in groups WINTOPS and TC7WRLSS are pegged when TOPS provides a Wireless Intelligent Network service such as wireless ADACC with release.

7.5.6 Associated functional groups

None

7.5.7 Associated functionality codes

Table 4 Functionality codes associated with OM group

Functionality	Code
TOPS Wireless RLT	00034426

7.5.8 OM group registers logic flow chart

For a description of when these OMs are pegged, refer to the IS-41 call flow figure at the beginning of the Functional Description chapter.

Patterns

- Every WIN call flow, whether successful or not, will peg WINBEGIN.
- A successful WIN call flow (IS-41 or GSM) pegs registers WINBEGIN, REQCONN, and CONNECT.
- A successful GSM CAMEL call flow also pegs registers DISCONN and WINEND.
- Registers ABANDON and RESTIMR are pegged under normal circumstances and do not indicate problems.
- Register DISCONN on an IS-41 WIN call does not necessarily indicate a problem. In IS-41, it is always pegged in conjunction with another register. The other register indicates if a problem has occurred.
- Problems are indicated by the following registers: ERRCONN, ERRDISC, ERRSSFT, NOTLDNS, NODATA, RXLAFAIL, SANTIMR, and TLDNTIME.

7.5.9 Register ABANDON

7.5.9.1 Register description

Abandon

ABANDON is a peg register. It is incremented on a WIN call when the calling party disconnects before receiving ADACC with release.

This is a common occurrence. The wireless caller can hang up while in queue for operator, or hang up because the operator couldn't find the listing, or hang up without accepting call completion. In all of these cases, ABANDON is pegged.

7.5.9.2 Register release history update

Created in SN07

7.5.9.3 Associated registers

None

7.5.9.4 Associated logs

None

7.5.10 Register CONNECT

7.5.10.1 Register description

Connect

CONNECT is a peg register. It is incremented when TOPS directs the MSC to connect to the requested number. In IS-41, this is when TOPS sends the AnalyzedInformation RETURN RESULT. In GSM, this is when TOPS sends the Connect.

7.5.10.2 Register release history update

Created in SN07

7.5.10.3 Associated registers

Extension register CONNECT2

7.5.10.4 Associated logs

None

7.5.11 Register DISCONN

7.5.11.1 Register description

Disconnect

DISCONN is a peg register. It is incremented when TOPS directs the MSC release the trunk to TOPS. In IS-41, this is when TOPS sends the AnalyzedInformation RETURN RESULT with an Action Code of “disconnect call.”. In GSM, this is when TOPS sends the DisconnectTemporaryConnection.

This register is not normally pegged on an IS-41 call. When it is, it indicates the caller did not receive ADACC with release.

This register is pegged on all successful GSM wireless ADACC with release calls.

7.5.11.2 Register release history update

Created in SN07

7.5.11.3 Associated registers

Extension register DISCONN2

7.5.11.4 Associated logs

None

7.5.12 Register ERRCONN

7.5.12.1 Register description

Error Connect

ERRCONN is a peg register. It is incremented on a WIN call when the MSC cannot connect to TOPS using the TLDN provided by TOPS. This might be due to translation or circuit failures at the MSC or in the network.

7.5.12.2 Register release history update

Created in SN07

7.5.12.3 Associated registers

None

7.5.12.4 Associated logs

TOPS131

7.5.13 Register ERRDISC

7.5.13.1 Register description

Error Disconnect

ERRDISC is a peg register. It is incremented on a WIN call when TOPS unexpectedly releases its trunk to the MSC. This register is only pegged on an IS-41 call. On a GSM call, registers WINBEGIN, REQCONN, and WINEND are pegged, but not DISCONN and CONNECT.

7.5.13.2 Register release history update

7.5.18.3 Associated registers

Extension register RESTIMR2

7.5.18.4 Associated logs

None.

7.5.19 Register RXLAFAIL

7.5.19.1 Register description

Retranslation Failure

This is a peg register which is incremented when a TOPS IS-41 or GSM call arrives, but TOPS cannot find the original called number and must use a default of 411. This register can be pegged in conjunction with NODATA, if the reason the original called number cannot be found is that there is no extension block.

7.5.19.2 Register release history update

Created in SN07.

7.5.19.3 Associated registers

None.

7.5.19.4 Associated logs

A TOPS131 is generated if the reason for using the default 411 is that the TCAP data was not found.

7.5.20 Register SANTIMR

7.5.20.1 Register description

TOPS sanity timer expiration

This is a peg register which is incremented whenever the TOPS IS-41 or GSM call end sanity timer expires. TOPS starts this timer after sending the IS-41 AnalyzedInformation RETURN RESULT or GSM Connect to the MSC. If the MSC does not release the trunk and end the TOPS call before the timer expires, TOPS ends its call and frees resources.

7.5.20.2 Register release history update

Created in SN07.

7.5.20.3 Associated registers

None.

7.5.20.4 Associated logs

TOPS131

7.5.21 Register TLDNTIME

7.5.21.1 Register description

TLDN time-out

This is a peg register which is incremented whenever the TOPS IS-41 or GSM SCP process finds a TLDN which has been allocated for more than 30 seconds. The TLDN is idled, then selected for use by the next TOPS IS-41 or GSM call. This allows the TLDN list to be cleaned up if some MSC calls end before routing to TOPS.

7.5.21.2 Register release history update

RTFNOXLA	RTFNOXLS	RTFSUBCG	RTFSUBFL
RTFUNEQ	RTFNETFL	RTFNETCG	RTFMISCE
GTTFAIL			

7.6.4 Group structure

OM group TC7WRLSS provides one tuple for each combination of wireless network type and TOPS wireless application.

Key field: There are four tuples as follows:

- SMS_IS41
- SMS_GSM
- WIN_IS41
- WIN_GSM

Info field: None

7.6.5 Associated OM groups

Registers in groups SMSTOPS and WINTOPS are also pegged during wireless TOPS calls.

7.6.6 Associated functional groups

None

7.6.7 Associated functionality codes

Table 5 Functionality codes associated with OM group

Functionality	Code
TOPS Wireless RLT	00034426

7.6.8 OM group registers logic flow chart

7.6.8.1 SMS TOPS calls

Register INVOKES is pegged when TOPS sends a short message into the SS7 network.

Register RETRESR is pegged when TOPS receives a positive or negative acknowledgment from the message center (MC). Group SMSTOPS has registers indicating SMS failure has occurred.

The remainder of the registers are pegged in failure scenarios. If registers GTTFAIL or NOTRIDS are being pegged, this means SMS messages are not being sent due to failure at TOPS. If registers beginning with “RTF” (route failure) are being pegged, failures are occurring in the SS7 network before the SMS arrives at the MC.

7.6.8.2 WIN TOPS calls

A successful WIN TOPS call should peg only registers INVOKES, INVOKER, and RETRESS.

The remainder of the registers are pegged in failure scenarios. If registers GTTFAIL or NOTRIDS are being pegged, this means WIN TOPS messages are not being sent due to failures at TOPS. If registers beginning with “RTF” (route failure) are being pegged, failures are occurring in the SS7 network before the TOPS message arrives at the MSC.

7.6.9 Register ABORTR

7.6.9.1 Register description

Abort Received

7.6.10.4 Associated logs
TCAP100

7.6.11 Register GTTFAIL

7.6.11.1 Register description
Global Title Translation Failure

GTTFAIL is a peg register. It is incremented whenever TOPS cannot look up GTT information for a destination number. The GTT information is datafilled in Tables C7GTTYPE and C7GTT. When TOPS cannot obtain this information, it cannot send the SMS into the network. The operator or automated node receives a failure indication.

A TOPS131 log is generated containing the destination number which caused the failure. Table C7GTT must be updated to include the destination number.

Extension register INVOKES2

7.6.13.4 Associated logs
None

7.6.14 Register MBFULL

7.6.14.1 Register description
Mailbox full

This is a peg register which is incremented whenever a TOPS IS-41 or GSM TCAP message arrives at the TOPS SCP interrupt handler but cannot be sent to the TOPS SCP process due to heavy switch load. This means TOPS is receiving more IS-41 or GSM traffic than it can handle.

On wireless DA calls, the incoming message is ignored, which will result in calls going to treatment in the MSC. It is not anticipated that TOPS IS-41 or GSM messaging will ever be high enough to peg this register. If this register is pegged, contact Nortel Networks to increase the number of internal mailboxes available to the TOPS IS-41 SCP application.

7.6.14.2 Register release history update
Created in SN07.

7.6.14.3 Associated registers
None.

7.6.14.4 Associated logs
None. Generating a log under these circumstances would further degrade switch performance.

7.6.15 Register NOTRIDS

7.6.15.1 Register description
No transaction identifiers

NOTRIDS is a peg register. It is incremented whenever TOPS attempts to send an IS-41 or GSM TCAP message but cannot because no transaction identifiers (TRIDs) are available. Each TCAP operation requires a TRID to process the response.

TRIDs are allocated automatically by the DMS, so if this register is pegged, contact Nortel Networks.

8: Performance (PF): A00003767

8.1 Performance management strategy

The strategy is to collect useful counts for each SCTP association on the ABI cards on the MG9K. The OMs that will be collected will be collected in 15 minute samples and will have a history of the last 96 samples collected. The currently being collected sample will also be visible. The OMs currently being collected will only be viewable from a dshell command on the MG9K ABI card or through a MIB browser. The historical in addition to these methods will also be saved in the MG9K OM journal.

8.2 Performance management tools and utilities

The MG9K will collect the MIB info for the current and historical OMs. The historical OMs will be saved in the OM journal on the MG9K. All the MIBs can also be viewed through a MIB browser and can also be seen using Dshell commands on the ABI card.

8.3 Performance Measurements (PM), Operational Measurements (OM), and stats

NORTEL-UEMG-RELMSGING-MIB

8.3.1 PM, OM, and stats format

Component: MG9K ABI card

History: New MIB in SN07

MIB object type: columnar, there is one MIB instance per SCTP association

MIB syntax:

NnRelMsgSctpAssocOmCurrEntry has the following entries all are 32 bit counters:

nnRelMsgSctpAscCurrClosed: Times the association has been closed

nnRelMsgSctpAscCurrAbort: Times the association has been aborted

nnRelMsgSctpAscCurrOutPacks: Number of packets sent out

nnRelMsgSctpAscCurrInPacks: Number of packets received

nnRelMsgSctpAscCurrDiscPacks: Number of packets discarded

nnRelMsgSctpAscCurrRetranPacks: Number of packets retransmitted

nnRelMsgSctpAscCurrT1expires: Number of times the T1 timer expired

nnRelMsgSctpAscCurrT2expires: Number of times the T2 timer expired

nnRelMsgSctpAscCurrT3expires: Number of times the T3 timer expired

nnRelMsgSctpAscCurrCongCount: Times the association became congested

nnRelMsgSctpAscCurrCongCleared: Times the association cleared congestion

NnRelMsgSctpAssocOmIntervEntry has the following entries all are 32 bit counters:

nnRelMsgSctpAscInterval: Historical intervals 1-96 with 96 the oldest

nnRelMsgSctpAscIntervClosed: Times the association has been closed

nnRelMsgSctpAscIntervAbort: Times the association has been aborted

nnRelMsgSctpAscIntervOutPacks: Number of packets sent out

nnRelMsgSctpAscIntervInPacks: Number of packets received

nnRelMsgSctpAscIntervDiscPacks: Number of packets discarded

nnRelMsgSctpAscIntervRetranPacks: Number of packets retransmitted

nnRelMsgSctpAscIntervT1expires: Number of times the T1 timer expired

nnRelMsgSctpAscIntervT2expires: Number of times the T2 timer expired

nnRelMsgSctpAscIntervT3expires: Number of times the T3 timer expired

nnRelMsgSctpAscIntervCongCount: Times the association became congested

nnRelMsgSctpAscIntervCongCleared: Times the association cleared congestion

OFZ_ORGFSET

8.3.3.4 Associated logs

The SCTP threshold alarms being added are indirectly based off of several on the OMs being collected in the MIB. The MIB field nnRelMsgSctpAscCurrRetranPacks in nnRelMsgSctpAssocOmCurrTable will show the number of retransmissions being collected in the current sample. Likewise the nnRelMsgSctpAscIntervRetranPacks in NnRelMsgSctpAssocOmIntervEntry will supply the historical counts for the

last 96 15 minute periods that were collected. Both of these can be used to the relMsgLinkDegraded alarm for crossing the retransmission threshold.

The relMsgLinkSevDegraded will also correlate to the crossing of the message loss threshold and will relate to the following MIB fields. nnRelMsgSctpAscCurrDiscPacks in NnRelMsgSctpAssocOmCurrEntry for the currently being collected sample and nnRelMsgSctpAscIntervDiscPacks in NnRelMsgSctpAssocOmIntervEntry for the historical samples.

The nnRelMsgSctpAscCurrClosed and nnRelMsgSctpAscCurrAbort in NnRelMsgSctpAssocOmCurrEntry for the currently being collected sample relate to the relMsgLinkFail alarm for when the SCTP association fails and prevents reliable messaging.This will also be shown by the nnRelMsgSctpAscIntervClosed and nnRelMsgSctpAscIntervClosed in NnRelMsgSctpAssocOmIntervEntry for the historical samples

9: Performance (PF): A00003773

9.1 Performance management strategy

This capability allows QOS monitoring for MG4K-IP based trunks.

9.2 Performance management tools and utilities

The activity A89007725 in SN06, '*Trunk Group based QoS OM'* provided a new trunk group based operational measurement group (TRKQOSOM) on the Succession Call Server. This feature A00003773-'*OM FOR TRKQOS FOR MG4K IP'*, extends trunk group based QoS OM support to MG4K-IP.

QOS threshold values for packet loss, jitter, and delay (latency) shall be datafilled in table OFCVAR tuple PACKET_QOS_OM_THREHSOLDS.

When the capability is enabled via datafilling PACKET_QOS_OM_THREHSOLDS in table OFCVAR, QOS statistics for MG4K-IP based trunk calls will be monitored. If any of the threshold values (jitter, delay, loss) are exceeded for the call, the data for that trunk group in OM group TRKQOSOM will be incremented.

To view the TRKQOSOM data, use the OMSHOW CI command as follows:

```
>OMSHOW TRKQOSOM ACTIVE
```

9.3 Performance Measurements (PM), Operational Measurements (OM), and stats

9.3.1 PM, OM, and stats format

TRKQOSOM:

Components: GWC and MG4K-IP based TDM Trunk Groups

Performance Measurement Name: TRKQOSOM

Performance Measurement Description: Presents QOS threshold crossing counts on a per trunk group basis. Counts presented include JITTER, DELAY, and PACKETLOSS.

History: The TRKQOSOM OM group was created in SN06 for GWC trunk groups. When this feature completes in SN07.1, this OM group will support both GWC and MG4K-IP based TDM trunk groups.

9.3.2 OM Group template

9.3.2.1 OM description

TRKQOSOM -Trunk Quality Of Service Operational Measurement

9.3.2.2 Release history update

The TRKQOSOM OM group was created in SN06. TRKQOSOM OM group support for MG4K-IP based trunk groups is developed in SN07.1.

9.3.2.3 Registers

OM group registers display as follows:

Figure 1 OM Group Display for TRKQOSOM

PKTLOSS	JITTER	DELAY

9.3.2.4 Group structure

OM group provides one tuple for each MG4K-IP based trunk group.

Key field: Common Language Name (*CLLI*): A value corresponding to the entries in table *CLLI* for which MG4K-IP members have been datafilled.

Info field: None.

9.3.2.5 Associated OM groups

None.

9.3.2.6 Associated functional groups

None.

9.3.2.7 Associated functionality codes

None.

9.3.2.8 OM group registers logic flow chart

The registers in this group will be incremented if the QOS statistics collected at the end of a MG4K-IP based trunk call indicate that the statistic has exceeded the threshold value datafilled in table *OFCVAR* tuple *PACKET_QOS_OM_THRESHOLDS*.

9.3.3 Register

9.3.3.1 JITTER Register description

Register *JITTER*.

JITTER is a peg register used to indicate that the jitter QOS statistic for a call has exceeded the datafilled *JITTER* threshold in table *OFCVAR* - *PACKET_QOS_OM_THREHSOLDS*.

Interarrival time jitter is an estimate of the statistical variance of RTP data packet interarrival times. The Jitter value calculated as the smoothed mean absolute value of the difference between the sending interval at a source and the interarrival time at a receiver. It is a running filtered average, basically a low pass filter with a 1/16 contribution each sample.

$jitter_{new} = jitter_{old} + [(\text{instantaneous jitter} - jitter_{old}) / 16]$

Where, instantaneous jitter = $| [rec_i - rec_{i-1})] - [sent_i - sent_{i-1}] |$
rec_i / $sent_i$ = Time when i^{th} data packet is received/sent.

9.3.3.2 DELAY Register description

Register *DELAY.*

DELAY is a peg register used to indicate that the delay/latency QOS statistic for a call has exceeded the datafilled *DELAY* threshold in table *OFCVAR - PACKET_QOS_OM_THREHSOLDS*.

The round-trip delay is calculated when a RTCP reception report is received. The Delay (latency) is smoothed as,
$delay_{new} = delay_{old} + [(\text{instantaneous delay} - delay_{old}) / 16]$

Where instantaneous delay = | A - LSR - DLSR |
A = time a source received this reception report
LSR = last Send Report timestamp received field
DLSR = delay since last Send Report field

9.3.3.3 PKTLOSS Register description

Register *PKTLOSS*.

PKTLOSS is a peg register used to indicate that the packet loss QOS statistic for a call has exceeded the datafilled *LOSS* threshold in table *OFCVAR - PACKET_QOS_OM_THREHSOLDS*.

Packet loss rate is calculated in percentage as
[RtpCumulativeLostPackets *100] / [RtpPacketsReceived + RtpCumulativeLostPackets]

Where, RtpPacketsReceived - The number of the RTP packets received from the IP network.
RtpCumulativeLostPackets - The number of lost RTP packets in the receiving direction. The count represents the Cumulative Number of Packets Lost field that is inserted in to the RTCP reception blocks.

9.3.3.4 Register release history update

Registers are existing for GWC trunk groups from SN06. From SN07.1 these registers supports both GWC based TDM trunk groups and MG4K-IP based trunk groups.

9.3.3.5 Associated registers

None

9.3.3.6 Associated logs

A new log - *MG4K-IP OM Failure log,* shall be introduced by feature *A00003650 - 'MG4K-IP ECAN, SCTP and OM Failure logs'*. The QOS measurements shall be pegged on the GEM card per CLLI basis. The pegs are stored in 16 bit integers. If these overflow, then the MG4K-IP OM Failure log shall be generated with a reason. The reason code description for the log are Jitter peg overflow, Delay Peg Overflow, Packet Loss Peg Overflow. The pegs in the GEM shall be reset to 0 when this log is generated.

10: Performance (PF): A00004036

10.1 Performance management strategy

Not applicable.

10.2 Performance management tools and utilities

Not applicable.

10.3 Operational Measurements (OM)

This activity will not be enabling any new OMs, however, similar to operations performed due to service access code driven commands, existing OM groups/ registers will be pegged to reflect the relevant incremental update attempts for the same service. For example, an attempt to activate SCF via some off-board interface will be pegged as though the subscriber had gone off-hook and dialed the activation access code for SCF.

For clarity, the following sections will outline in detail what OMs, if any, will be pegged when a request for an off-board service update or change is being processed.

10.3.1 Group1 Services OM Group

The following sub-sections defined the OM groups associated with the Group1 services.

The service CSMI and LDS pegs perticular OM group. However, these OM groups are for CallP specific pegging. Therefore, for service control perspective they are not affected nor pegged.

Other Group1 services does not have any OM groups.

10.3.1.1 ACRJ OM Group

Operational Measures associated with the Anonymous Call Rejection service.

10.3.1.1.1 Release history update

Not Applicable

10.3.1.1.2 Registers used for Off-board service updates

OM group registers display on the MAP terminal as follows. The registers used for pegging off-board service updates are in ***bold italics***.

10.3.1.1.3 ACRJ OM Group Display

Figure 1 ACRJ OM Group Display

```
>omshow acrj active

          0       0
```

10.3.1.1.4 ACRJACT

Register ACRJACT (Anonymous Call Rejection Activation) will be pegged if the ACRJ Update message successfully activate the ACRJ service.

10.3.1.1.5 ACRJDACT

Register ACRJDACT (Anonymous Call Rejection Deactivation) will be pegged if the ACRJ Update message successfully deactivate the ACRJ service.

10.3.1.1.6 ACRJAUNV

Register ACRJAUNV (Anonymous Call Rejection Universal Activation) will be pegged if the ACRJ Update message successfully activate the usage based ACRJ service.

10.3.1.1.7 ACRJDUNV

Register ACRJDUNV (Anonymous Call Rejection Universal Deactivation) will be pegged if the ACRJ Update message successfully deactivate the usage based ACRJ service.

10.3.3.2.1 SCRJEATT

Register SCRJEATT (Selective Call ReJection Editing ATTempt) is pegged each time a subscriber updates his/her SCRJ programmed data via some edit session. Similar to the operations performed via service access code controlled edit session, the SCRJEATT register will be pegged for each of the following off-board service update requests.

- addition of DN to a subscriber's SCRJ list

- deletion of a DN from a subscriber's SCRJ list
- request to delete all DNs in a subscriber's SCRJ list
- request to delete all anonymous or private entries in a subscriber's SCRJ list

10.3.3.2.2 SCRJEDEN

Register SCRJEDEN (Selective Call ReJection Editing DENial) is pegged each time a subscriber's attempt to update his/her SCRJ programmed data via some edit session is denied. The SCRJEDEN register will be pegged when/if the following is true for a given SCRJ off-board service update request.

- SLE not ENABLED in table CUSTSTN
- SCRJ not ENABLED in table RESOFC

10.3.3.2.3 SCRJACT

Register SCRJACT (Selective Call ReJection ACTivation) is pegged each time a subscriber activates his/her SCRJ service. Similar to the operations performed via service access code controlled activation, the SCRJACT register will be pegged for each occurrance of the an off-board service update activation request.

10.3.3.2.4 SCRJDACT

Register SCRJDACT (Selective Call ReJection DeACTivation) is pegged each time a subscriber deactivates his/her SCRJ service. Similar to the operations performed via service access code controlled activation, the SCRJDACT register will be pegged for each occurrance of the an off-board service update deactivation request.

10.3.3.2.5 SCRJDENY

Register SCRJDENY (Selective Call ReJection DENY) is pegged each time a subscriber's attempt to update his/her SCRJ programmed data via some edit session is denied due to the presence of the DENY option. The SCRJDENY register will be pegged for each of the following off-board service update request attempts.

- DOR option present on the given SCRJ subscriber's line
- SCRJ enabled office wide and DENY SCRJ option present on the given subscriber's line

10.3.3.3 Registers used for DRCW Off-board service updates

OM group registers display on the MAP terminal as follows. The registers used for pegging off-board service updates are in ***bold italics***.

10.3.3.3.1 DRCWEATT

Register DRCWEATT (Distinctive Ringing Call Wait Editing ATTempt) is pegged each time a subscriber updates his/her DRCW programmed data via some edit session. Similar to the operations performed via service access code controlled edit session, the DRCWEATT register will be pegged for each of the following off-board service update requests.

- addition of DN to a subscriber's DRCW list
- deletion of a DN from a subscriber's DRCW list
- request to delete all DNs in a subscriber's DRCW list
- request to delete all anonymous or private entries in a subscriber's DRCW list

10.3.3.3.2 DRCWEDEN

Register DRCWEDEN (Distinctive Ringing Call Wait Editing DENial) is pegged each time a subscriber's attempt to update his/her DRCW programmed data via some edit session is denied. The DRCWEDEN register will be pegged when/if the following is true for a given DRCW off-board service update request.

- SLE not ENABLED in table CUSTSTN
- SCF not ENABLED in table RESOFC

10.3.3.3.3 DRCWACT

Register DRCWACT (Distinctive Ringing Call Wait ACTivation) is pegged each time a subscriber activates his/her DRCW service. Similar to the operations performed via service access code controlled activation, the DRCWACT register will be pegged for each occurrance of the an off-board service update activation request.

10.3.3.3.4 DRCWDACT

Register DRCWDACT (Distinctive Ringing Call Wait DeACTivation) is pegged each time a subscriber deactivates his/her DRCW service. Similar to the operations performed via service access code controlled activation, the DRCWDACT register will be pegged for each occurrance of the an off-board service update deactivation request.

10.3.3.3.5 DRCWDENY

Register DRCWDENY (Distinctive Ringing Call Wait DENY) is pegged each time a subscriber's attempt to update his/her DRCW programmed data via some edit session is denied due to the presence of the DENY option. The DRCWDENY register will be pegged when/if the following is true for a given DRCW off-board service update request.

- DOR option present on the given DRCW subscriber's line
- DRCW enabled office wide and DENY SCA option present on the given subscriber's line

10.3.3.4 Registers used for SimRing Off-board service updates

10.3.3.4.1 SIMRACT

Register SIMRACT (SIMultaneous Ringing ACTivation) is pegged each time a subscriber activates his/her SIMRing service. Similar to the operations performed via service access code controlled activation, the SIMRACT register will be pegged for each occurrance of the an off-board service update activation request.

10.3.3.4.2 SIMRDACT

Register SIMRDACT (SIMultaneous Ringing DeACTivation) is pegged each time a subscriber deactivates his/her SIMRing service. Similar to the operations performed via service access code controlled activation, the SIMRDACT register will be pegged for each occurrance of the an off-board service update deactivation request.

10.3.3.4.3 SIMREATT

Register SIMREATT (SIMultaneous Ringing Editing ATTempt) is pegged each time a subscriber updates his/her SIMRing programmed data via some edit session. Similar to the operations performed via service access code controlled edit session, the SIMREATT register will be pegged for each of the following off-board service update requests.

- addition of DN to a subscriber's SIMRing list
- deletion of a DN from a subscriber's SIMRing list

10.3.3.4.4 SIMREDEN

Register SIMREDEN (SIMultaneous Ringing Editing DENial) is pegged each time a subscriber's attempt to update his/her SIMRing programmed data via

some edit session is denied. The SIMREDEN register will be pegged when/if the following is true for a given SIMRing off-board service update request.

- SLE not ENABLED in table CUSTSTN
- SCF not ENABLED in table RESOFC

10.3.3.5 Register release history update

```

10.3.5.2.1 SCFEATT

Register SCFEATT (Selective Call Forwarding Editing ATTempt) is pegged each time a subscriber updates his/her SCF programmed data via some edit session. Similar to the operations performed via service access code controlled

edit session, the SCFEATT register will be pegged for each of the following off-board service update requests.

- addition of DN to a subscriber's SCF list
- deletion of a DN from a subscriber's SCF list
- request to delete all DNs in a subscriber's SCF list
- request to delete all anonymous or private entries in a subscriber's SCF list
- set the forwarding DN
- clear the forwarding DN

10.3.5.2.2 SCFEDEN

Register SCFEDEN (Selective Call Forwarding Editing DENial) is pegged each time a subscriber's attempt to update his/her SCF programmed data via some edit session is denied. The SCFEDEN register will be pegged when/if the following is true for a given SCF off-board service update request.

- SLE not ENABLED in table CUSTSTN
- SCF not ENABLED in table RESOFC

10.3.5.2.3 SCFACT

Register SCFACT (Selective Call Forwarding ACTivation) is pegged each time a subscriber activates his/her SCF service. Similar to the operations performed via service access code controlled activation, the SCFACT register will be pegged for each occurrance of the an off-board service update activation request.

10.3.5.2.4 SCFDACT

Register SCFDACT (Selective Call Forwarding DeACTivation) is pegged each time a subscriber deactivates his/her SCF service. Similar to the operations performed via service access code controlled activation, the SCFDACT register will be pegged for each occurrance of the an off-board service update deactivation request.

10.3.5.2.5 SCFDENY

Register SCFDENY (Selective Call Forwarding DENY) is pegged each time a subscriber's attempt to update his/her SCF programmed data via some edit session is denied due to the presence of the DENY option. The SCFDENY register will be pegged for each of the following off-board service update request attempts.

- DOR option present on the given SCF subscriber's line

- SCF enabled office wide and DENY SCF option present on the given subscriber's line

10.3.5.3 Registers used for SCA Off-board service updates

OM group registers display on the MAP terminal as follows. The registers used for pegging off-board service updates are in ***bold italics***.

Figure 9 SCA OM Group Display

        0       0       0       0
        0       0       0       0
        0       0       0       0
        0
```

10.3.5.3.1 SCAEATT

Register SCAEATT (Selective Call Acceptance Editing ATTempt) is pegged each time a subscriber updates his/her SCA programmed data via some edit session. Similar to the operations performed via service access code controlled edit session, the SCAEATT register will be pegged for each of the following off-board service update requests.

- addition of DN to a subscriber's SCA list
- deletion of a DN from a subscriber's SCA list
- request to delete all DNs in a subscriber's SCA list
- request to delete all anonymous or private entries in a subscriber's SCA list

10.3.5.3.2 SCAEDEN

Register SCAEDEN (Selective Call Acceptance Editing DENial) is pegged each time a subscriber's attempt to update his/her SCA programmed data via

some edit session is denied. The SCAEDEN register will be pegged when/if the following is true for a given SCA off-board service update request.

- SLE not ENABLED in table CUSTSTN
- SCF not ENABLED in table RESOFC

10.3.5.3.3 SCAACT

Register SCAACT (Selective Call Acceptance ACTivation) is pegged each time a subscriber activates his/her SCA service. Similar to the operations performed via service access code controlled activation, the SCAACT register will be pegged for each occurrance of the an off-board service update activation request.

10.3.5.3.4 SCADACT

Register SCADACT (Selective Call Acceptance DeACTivation) is pegged each time a subscriber deactivates his/her SCA service. Similar to the operations performed via service access code controlled activation, the SCADACT register will be pegged for each occurrance of the an off-board service update deactivation request.

10.3.5.3.5 SCADENY

Register SCADENY (Selective Call Acceptance DENY) is pegged each time a subscriber's attempt to update his/her SCA programmed data via some edit session is denied due to the presence of the DENY option. The SCADENY register will be pegged when/if the following is true for a given SCA off-board service update request.

- DOR option present on the given SCA subscriber's line
- SCA enabled office wide and DENY SCA option present on the given subscriber's line

          0
```

10.3.9.1.4 SCPAATT

Register SCPAATT (Speed Calling Program Activation ATTempt) will be pegged if the Speed Call Update message successfully added or changed a Speed Call DN.

10.3.9.1.5 SCAOVFL

Register SCAOVFL (Speed Calling Activation OVerFLow) is pegged if the Speed Call Update message failed to program the Speed Call Cell because of a lack of software resources; for example, a lack of HEAP memory in reserve for Speed Calling.

10.3.9.1.6 SCADENY

Register SCADENY (Speed Calling Activation DENY) is pegged if the Speed Call Update message failed to program or erase a Speed Call Cell because of an invalid Speed Call Cell number.

11: Performance (PF): A00004271

11.1 Performance management strategy

The system needs to monitor and provide output as to whether the limit settings for SOCs CS2B0008 and CS2B0009 are being exceeded, as well as what the high water usage mark is for each. A new DMS OM group is the method chosen to capture this information.

11.2 Performance management tools and utilities

The DMS OM system.

11.3 Performance Measurements (PM), Operational Measurements (OM), and stats

11.3.1 PM, OM, and stats format

N/A

11.3.2 OM Group NGSSOM

11.3.2.1 OM description

The NGSSOM group provides information on the maximum number of simultaneous calls that utilize the NGSS platform as well as indication of the number of times the limit settings of the CS2B0008 and CS2B0009 usage SOCs have been exceeded.

11.3.2.2 Release history update

The OM group is created in SN07.

11.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

Figure 1 OM Group Display

None

12: Performance (PF): A00004430

12.1 Performance management strategy

OM group AL1SVCOM is introduced in SN07. This OM group maintains OM peg counts for ATM SVC origination and ATM SVC failures on a nodal basis for SMG4, IW SPM, DPT SPM, MG9K, and MG9K ABI gateways.

Origination registers are pegged upon external network setup attempts by the Core. Failure registers are pegged when the Core receives ATM SVC failure messages from SMG4, IW SPM, DPT SPM, MG9K, and MG9K ABI gateways.

12.2 Performance management tools and utilities

12.3 Performance Measurements (PM), Operational Measurements (OM), and stats

12.3.1 PM, OM, and stats format

Component: Core OM group
Performance Measurement name: AL1SVCOM
Performance measurement description: AAL1 external network origination and failure pegs per node.
History: Created in SN07

12.3.2 OM Group - AL1SVCOM

Table 1 Registers for OM group AL1SVCOM

Register	Description
NOSVCAT	Number of SVC call attempts.
NOSVCAT2	Extension register for nosvcatt.
NOSVCFL	Number of SVC call failures.
ISSVCAT	Number of intraswitched (local) SVC call attempts
ISSVCAT2	Extension register for issvcsat.
ISSVCFL	Number of intraswitch (local) SVC call failures.
DPTSVCA	Number of interswitch (DPT) SVC call attempts.

Table 1 Registers for OM group AL1SVCOM

Register	Description
DPTSVCA2	Extension register for dptsvca.
DPTSVCF	Number of interswitch (DPT) SVC call failures.
NRTEDEST	ATM cause code 3 - no route to destination - SVC call failures.
NOUSRRES	ATM cause code 18 - no user responding - SVC call failures.
VPCINAVL	ATM cause code 35 - requested VPI/VCI not available - SVC call failures.
BWTHNAVL	ATM cause code 37 - user cell rate not available - SVC call failures.
TEMPFAIL	ATM cause code 41 - temp failure - SVC call failure reference.
RESUNAVL	ATM cause code 47 - Resource unavailable SVC call failure reference
OTH_CC	All other ATM cause codes SVC call failures.

12.3.2.1 OM group AL1SVCOM description

AL1SVCOM provides origination and failure register pegs, on a nodal basis, for SMG4, IW SPM, DPT SPM, MG9K, and MG9K ABI AAL1 external bearer path connections.

12.3.2.2 Release history update

SN07 - Introduced by activity A00004430.

12.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

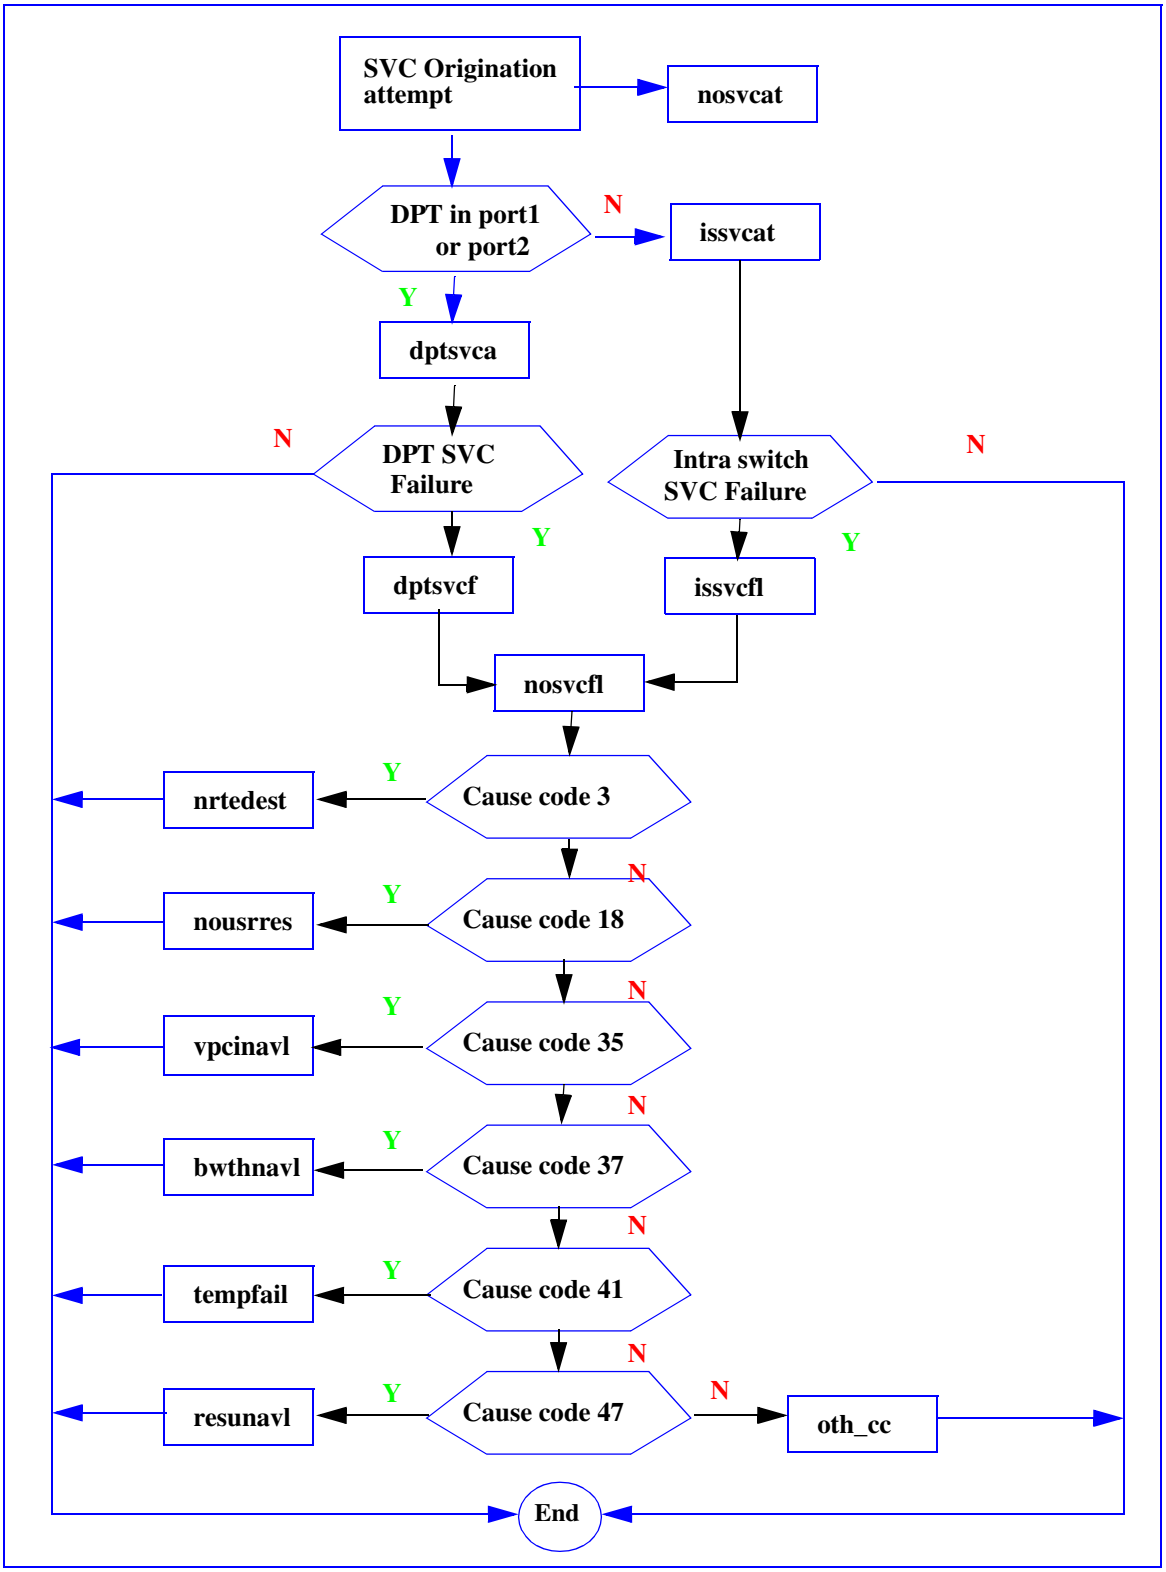
Figure 2 AL1SVCFL OM Group Register Flow



12.3.3 Register BWTHNAVL

12.3.3.1 Register description

Bandwidth not available.

This register is pegged for external network bearer path ATM SVC failures when the ATM cause code sent back from either an SPM node (SMG4, IW SPM, DPT SPM) or GWC is cause code 37 (user cell rate not available).

12.3.3.2 Register release history update

Introduced in SN07.

12.3.3.3 Associated registers

ISSVCFL, DPTSVCF, NOSVCFL

12.3.3.4 Associated logs

XPKT301 or XPKT302.

12.3.4 Register DPTSVCA

12.3.4.1 Register description

Number of interswitch (DPT) SVC call attempts.

This register is pegged against an originating or terminating agent's node for SVC origination attempts, when the originating or terminating agent call processing selector is a DPT trunk.

12.3.4.2 Register release history update

Introduced in SN07.

12.3.4.3 Associated registers

NOSVCAT, ISSVCAT

DPTSVCA + ISSVCAT = NOSVCAT

12.3.4.4 Associated logs

<None>

12.3.5 Register DPTSVCF

12.3.5.1 Register description

Number of interswitch (DPT) SVC call failures.

This register is pegged against an originating or terminating agent's node when the originating or terminating agent call processing selector is a DPT trunk, and the SVC connection either fails during call setup, or is taken down for an established call.

12.3.5.2 Register release history update

Introduced in SN07.

12.3.5.3 Associated registers

NOSVCFL, ISSVCFL

DPTSVCF + ISSVCFL = NOSVCFL

12.3.5.4 Associated logs

XPKT301 or XPKT302.

12.3.6 Register ISSVCAT

12.3.6.1 Register description

Number of intraswitch SVC call attempts.

This register is pegged for each intraswitched external network bearer path SVC origination.

12.3.6.2 Register release history update

Introduced in SN07.

12.3.6.3 Associated registers

DPTSVCA, NOSVCAT

DPTSVCA + ISSVCAT = NOSVCAT

12.3.6.4 Associated logs

<None>

12.3.7 Register ISSVCFL

12.3.7.1 Register description

Number of intraswitch SVC connection failures.

This register is pegged for each intraswitch SVC connection failure that occurs during call setup, or for established connections.

12.3.7.2 Register release history update

Introduced in SN07.

12.3.7.3 Associated registers

DPTSVCF, NOSVCFL

DPTSVCF + ISSVCFL = NOSVCFL

12.3.7.4 Associated logs

XPKT301 or XPKT302.

12.3.8 Register NOSVCAT

12.3.8.1 Register description

Number of SVC attempts.

This register is pegged for each external network bearer path SVC origination, for each node.

12.3.8.2 Register release history update

Introduced in SN07.

12.3.8.3 Associated registers

ISSVCAT and DPTSVCA

ISSVCAT + DPTSVCA = NOSVCAT

12.3.8.4 Associated logs

<None>

12.3.9 Register NOSVCFL

12.3.9.1 Register description

Number of SVC connection failures.

This register is pegged for all SVC setup and established call connection failures against the node.

12.3.9.2 Register release history update
Introduced in SN07.

12.3.9.3 Associated registers
ISSVCFL and DPTSVCF

ISSVCFL + DPTSVCF = NOSVCFL

12.3.9.4 Associated logs
XPKT 301 and XPKT302.

12.3.10 Register NOUSRRES

12.3.10.1 Register description

No user responding SVC connection failure.

This register is pegged for external network bearer path ATM SVC failures when the ATM cause code sent back from either an SPM node (SMG4, IW SPM, DPT SPM) or GWC is cause code 18 (no user responding).

12.3.10.2 Register release history update
Introduced in SN07.

12.3.10.3 Associated registers
ISSVCFL, DPTSVCF, NOSVCFL

12.3.10.4 Associated logs
XPKT301 and XPKT302.

12.3.11 Register NRTEDEST

12.3.11.1 Register description

No route to destination SVC call failure.

This register is pegged for external network bearer path ATM SVC failures when the ATM cause code sent back from either an SPM node (SMG4, IW SPM, DPT SPM) or GWC is cause code 3 (no route to destination).

12.3.11.2 Register release history update
Introduced in SN07.

12.3.11.3 Associated registers
ISSVCFL, DPTSVCF, NOSVCFL

12.3.11.4 Associated logs
XPKT301 and XPKT302

12.3.12 Register OTH_CC

12.3.12.1 Register description

All other ATM cause codes.

This register is pegged for external network bearer path ATM SVC failures when the ATM cause code sent back from either an SPM node (SMG4, IW SPM, DPT SPM) is not one of (3, 18, 35, 37, 41, or 47).

12.3.12.2 Register release history update
Introduced in SN07.

12.3.12.3 Associated registers
ISSVCFL, DPTSVCF, NOSVCFL

12.3.12.4 Associated logs
XPKT301 and XPKT302

12.3.13 Register RESUNAVL

12.3.13.1 Register description

Resource unavailable SVC connection failure.

This register is pegged for external network bearer path ATM SVC failures when the ATM cause code sent back from either an SPM node (SMG4, IW SPM, DPT SPM) or GWC is cause code 47(resource unavailable).

12.3.13.2 Register release history update
Introduced in SN07.

12.3.13.3 Associated registers
ISSVCFL, DPTSVCF, NOSVCFL

12.3.13.4 Associated logs
XPKT301 and XPKT302

12.3.14 Register TEMPFAIL

12.3.14.1 Register description

Temp failure SVC connection failure.

This register is pegged for external network bearer path ATM SVC failures when the ATM cause code sent back from either an SPM node (SMG4, IW SPM, DPT SPM) or GWC is cause code 41 (temp failure).

12.3.14.2 Register release history update

Introduced in SN07.

12.3.14.3 Associated registers

ISSVCFL, DPTSVCF, NOSVCFL

12.3.14.4 Associated logs

XPKT301 and XPKT302

12.3.15 Register VPCINAVL

12.3.15.1 Register description

Request VPI/VCI not available.

This register is pegged for external network bearer path ATM SVC failures when the ATM cause code sent back from either an SPM node (SMG4, IW SPM, DPT SPM) or GWC is cause code 35 (requested VPI/VCI not available).

12.3.15.2 Register release history update

Introduced in SN07.

12.3.15.3 Associated registers

13: Performance (PF): A00004500

13.1 Performance management strategy

Not Applicable

13.2 Performance management tools and utilities

Not Applicable

13.3 Performance Measurements (PM), Operational Measurements (OM), and stats

This activity adds new OMs in a ne OM group. The new OM group is INSCTP OM for AIN transports. The following sections will outline in detail what OMs will be pegged.

13.3.1 New OMs

MSGOUT - Pegs Outgoing IN messages using SCTP

MSGIN - Pegs Incoming IN messages using SCTP

SENDFAIL - Pegs IN messages using SCTP for which send failed

DATAERR - Pegs IN messages which encountered errors at application data

DATARCVD - Pegs for Incoming IN message decoding

MSG2BIG- Pegs IN Messages which failed due to message length

BMSFAIL - Pegs instances when buffer errors encountered while sending IN messages over SCTP

NOTREADY - Pegs when SCTP layer indicates that it is not ready to process the message.Please note that this register even though displayed part of the OM group INSCTP, is NOT used by this activity.

Figure 1 INSCTP Group Display

```

        0       0       0       0
        0       0       0       0
```

13.3.1.1 MSGOUT

Register MSGOUT (IN SCTP MSG Out) will be pegged for every outgoing AIN message using the SCTP transport.

13.3.1.2 MSGIN

Register MSGIN (IN SCTP MSG In) will be pegged for every incoming AIN message using the SCTP transport.

13.3.1.3 SENDFAIL

Register SENDFAIL (IN SCTP SeND FAilure) will be pegged for every outgoing AIN message using the SCTP transport that failed.

13.3.1.4 DATAERR

Register DATAERR (IN SCTP Data ERRor) will be pegged for every Data Error that occurs which causes a messaging failure.

13.3.1.5 MSG2BIG

Register MSG2BIG (IN SCTP message too BIG) will be pegged for every outgoing message that failed to be send because of the message size being too BIG. (i.e beyond the maximum size) Please refer to the EI section for maximum message size allowed.

13.3.1.6 BMSFAIL

Register INSCTBMS (IN SCTP BMS buffer failure) will be pegged if any buffer failure results in send or recieve failure.

13.3.1.7 DATARCVD

Register DATARCVD will be pegged when the IN msg is received from SCTP stack and we are ready to decode the IN message.

13.3.1.8 NOTREADY

Register NOTREADY is used to indicate that the SCTP layer is not ready to send or receive a message. This Register is presently not used with the current functionality(but will be displayed on OMSHOW as one of the registers in the group).

13.3.1.9 Associated OM groups

14: Performance (PF): A00005160

14.1 Performance management strategy

Performance management for the OSSAIN product is described in 297-8403-901, *Operator Services System Advanced Intelligent Network (OSSAIN) User's Guide*.

This feature (A00005160, *OSSAIN XA-Core Data Messaging Capacity Enhancements*) adds registers to one existing OM group in the DMS core, and adds one new OM group in the DMS Core. The new OM group can be used in analyzing messaging throughput of TOPS applications that send and receive UDP datagrams.

14.2 Performance management tools and utilities

Standard DMS tools for managing OMs.

14.3 Operational Measurements (OM)

14.3.1 OM Group template

14.3.1.1 OM description

OM group OAPNMTC

Open Automated Protocol (OAP) Node Maintenance Operations and Responses

OAPNMTC contains a register for each node maintenance operation and response message defined in the OAP protocol. The purpose of the registers in this OM group is to track usage of the operations and responses. These OM registers are pegged on a per node basis.

14.3.1.2 Release history update

Six new registers, three basic and three extension, are added in SN07. The new registers are associated with the Node Connectivity Test operation.

As of SN07, tuples are displayed for nodes datafilled as OSN as well as for nodes datafilled as OSNM.

14.3.1.3 Registers

OM group registers display on the MAP terminal as follows:

Figure 1 OM Group OAPNMTC Display

```
NODEAUD     NODEAUD2    NDEAUDS   NDEAUDS2
NDEAUDE     NDEAUDE2    NODEBSY   NODEBSY2
NDEBSYS     NDEBSYS2    NDEBSYE   NDEBSYE2
NODETST     NODETST2    NDETSTS   NDETSTS2
NDETSTE     NDETSTE2    NODERTS   NODERTS2
NDERTSS     NDERTSS2    NDERTSE   NDERTSE2
  NDLOG       NDALARM   NODECON   NODECON2
NDECONS     NDECONS2    NDECONE   NDECONE2
```

14.3.1.4 Group structure

Unchanged.

14.3.1.5 Associated OM groups

Unchanged.

14.3.1.6 Associated functional groups

Unchanged.

14.3.1.7 Associated functionality codes

OSAN0101, OSSAIN Base.

14.3.1.8 OM group registers logic flow chart

A flow chart is not helpful in understanding this particular OM group.

14.3.1.9 Register description

Note: Registers that existed prior to SN07 are unchanged, and are not re-documented here. This section documents only the new registers.

14.3.1.9.1 Register NODECON

Node Connectivity Test

Register NODECON is pegged each time a Node Connectivity Test request or response is sent from or received by the switch.

Register release history: Register NODECON is introduced in SN07.

Associated registers: NDECONS, NDECONE.

Associated logs: None.

Extension register: NODECON2

14.3.1.9.2 Register NDECONS

Node Connectivity Test Success Response

Register NDECONS is pegged each time a Node Connectivity Test Success Response is sent from or received by the switch.

Register release history: Register NDECONS is introduced in SN07.

Associated registers: NODECON, NDECONE.

Associated logs: None.

Extension register: NDECONS2

14.3.1.9.3 Register NDECONE

Node Connectivity Test Error Response

Register NDECONE is pegged each time a Node Connectivity Test Error Response is sent from or received by the switch.

Register release history: Register NDECONE is introduced in SN07.

Associated registers: NODECON, NDECONS.

Associated logs: None.

Extension register: NDECONE2

14.3.2 OM Group template

14.3.2.1 OM description

OM group TDGTHRU

TOPS Datagram Throughput

14.3.2.2 Release history update

The OM group is being created in TOPS20/SN07/ISN07.

14.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

Figure 2 OM Group TDGTHRU Display

SND48	SND48X	SND96	SND96X
SND160	SND160X	SND224	SND224X
SND296	SND296X	SND368	SND368X
SND512	SND512X	SNDLG	SNDLGX
RCV48	RCV48X	RCV96	RCV96X
RCV160	RCV160X	RCV224	RCV224X
RCV296	RCV296X	RCV368	RCV368X
RCVLG	RCVLGX		

Each register counts the number of messages in a particular size range that a TOPS application sent or received during the reporting period. The numbers in the register names indicate the size ranges or "buckets," as explained in Table 2, "TDGTHRU Registers," on page 3622.

14.3.2.4 Group structure

OM group TDGTHRU provides 1 tuple for each of the four fixed key values shown below.

Key field: TOPS_DGRAM_IDX specifies the TOPS application and data path to which the peg counts in the tuple apply. The fixed key values are listed below along with their meanings:

Figure 3 Key values for OM group TDGTHRU

Key Value	Meaning
OA_EIU	OSSAIN application using Ethernet Interface Unit
OA_XAETHR	OSSAIN application using XA-Core Ethernet interface
POS_IPXPM	TOPS position application using IP-XPM
OC_IPXPM	Operator Centralization application using IP-XPM

Info field: None

14.3.2.5 Associated OM groups

None.

14.3.2.6 Associated functional groups

None.

14.3.2.7 Associated functionality codes

Table 1 Functionality codes associated with OM group

Functionality	Code
Base TOPS	OSB0101

14.3.2.8 OM group registers logic flow charts

This section includes 8 flow charts: one for pegging SNDxxx registers and one for pegging RCVxxx registers, for each of the four tuples.

For more information about the specific registers, please refer to Table 2, "TDGTHRU Registers," on page 3622.

Figure 4 Flow chart for pegging send (SND) registers in OA_EIU tuple

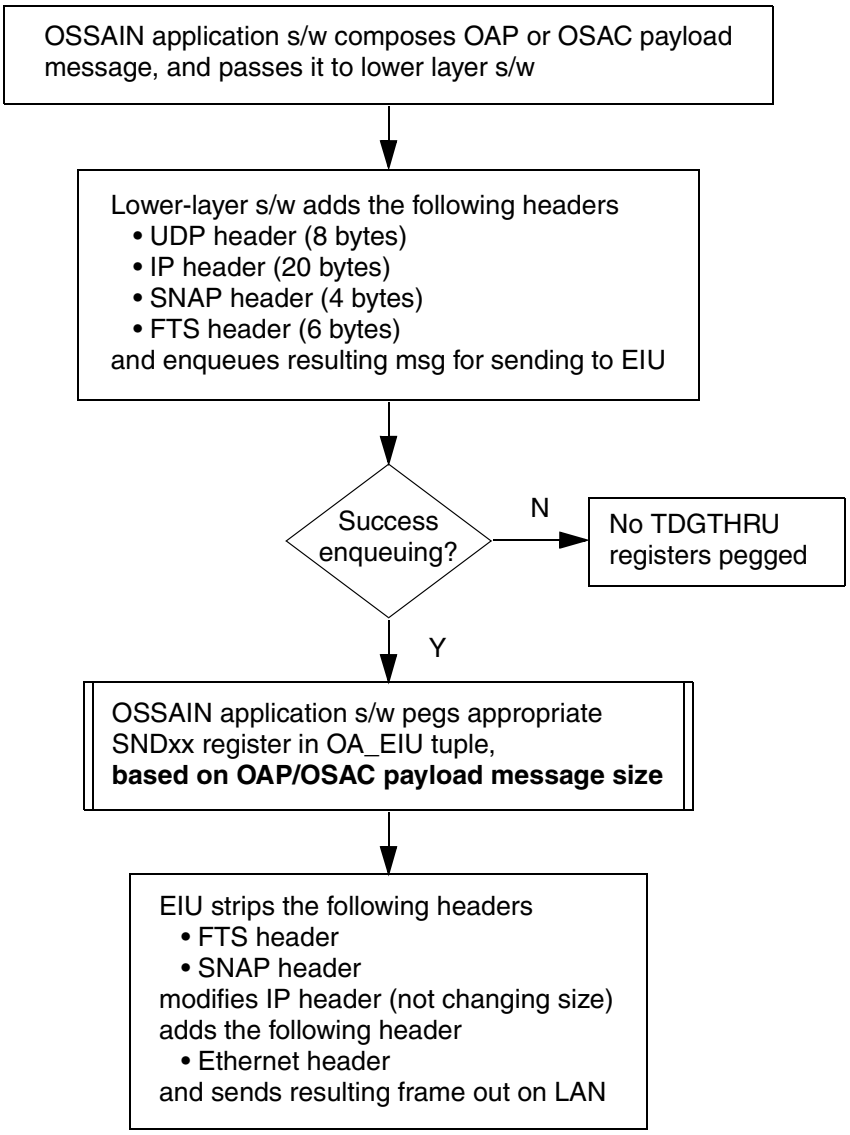

Figure 5 Flow chart for pegging send (SND) registers in OA_XAETHR tuple

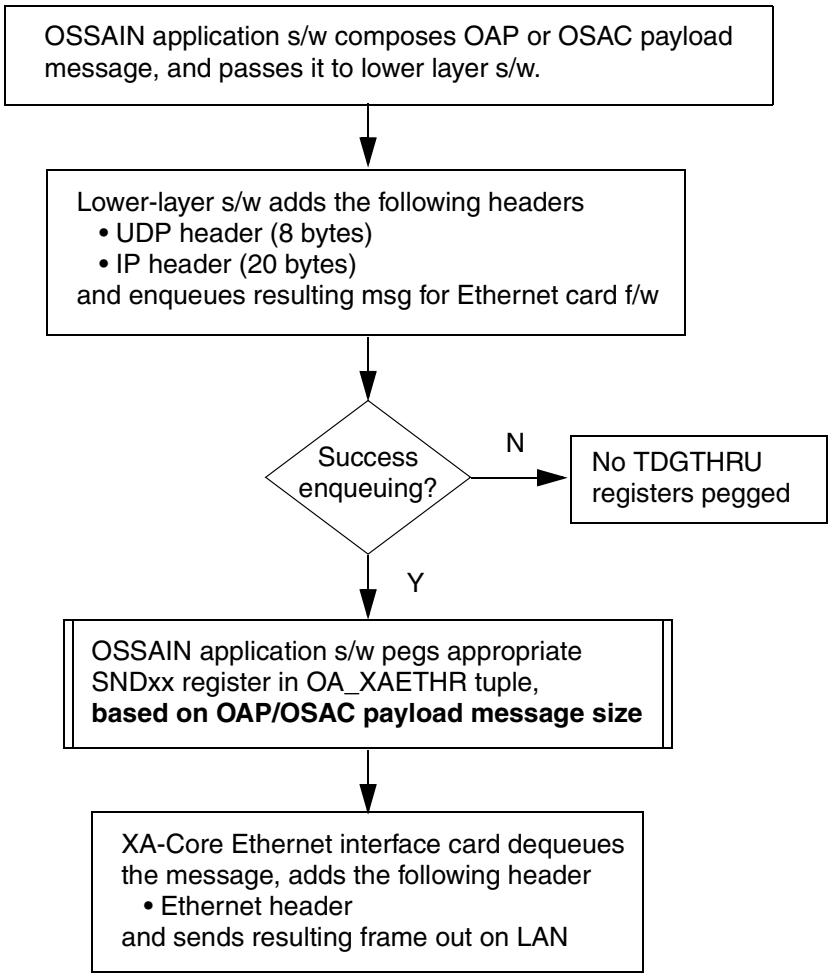

Figure 6 Flow chart for pegging send (SND) registers in POS_IPXPM tuple

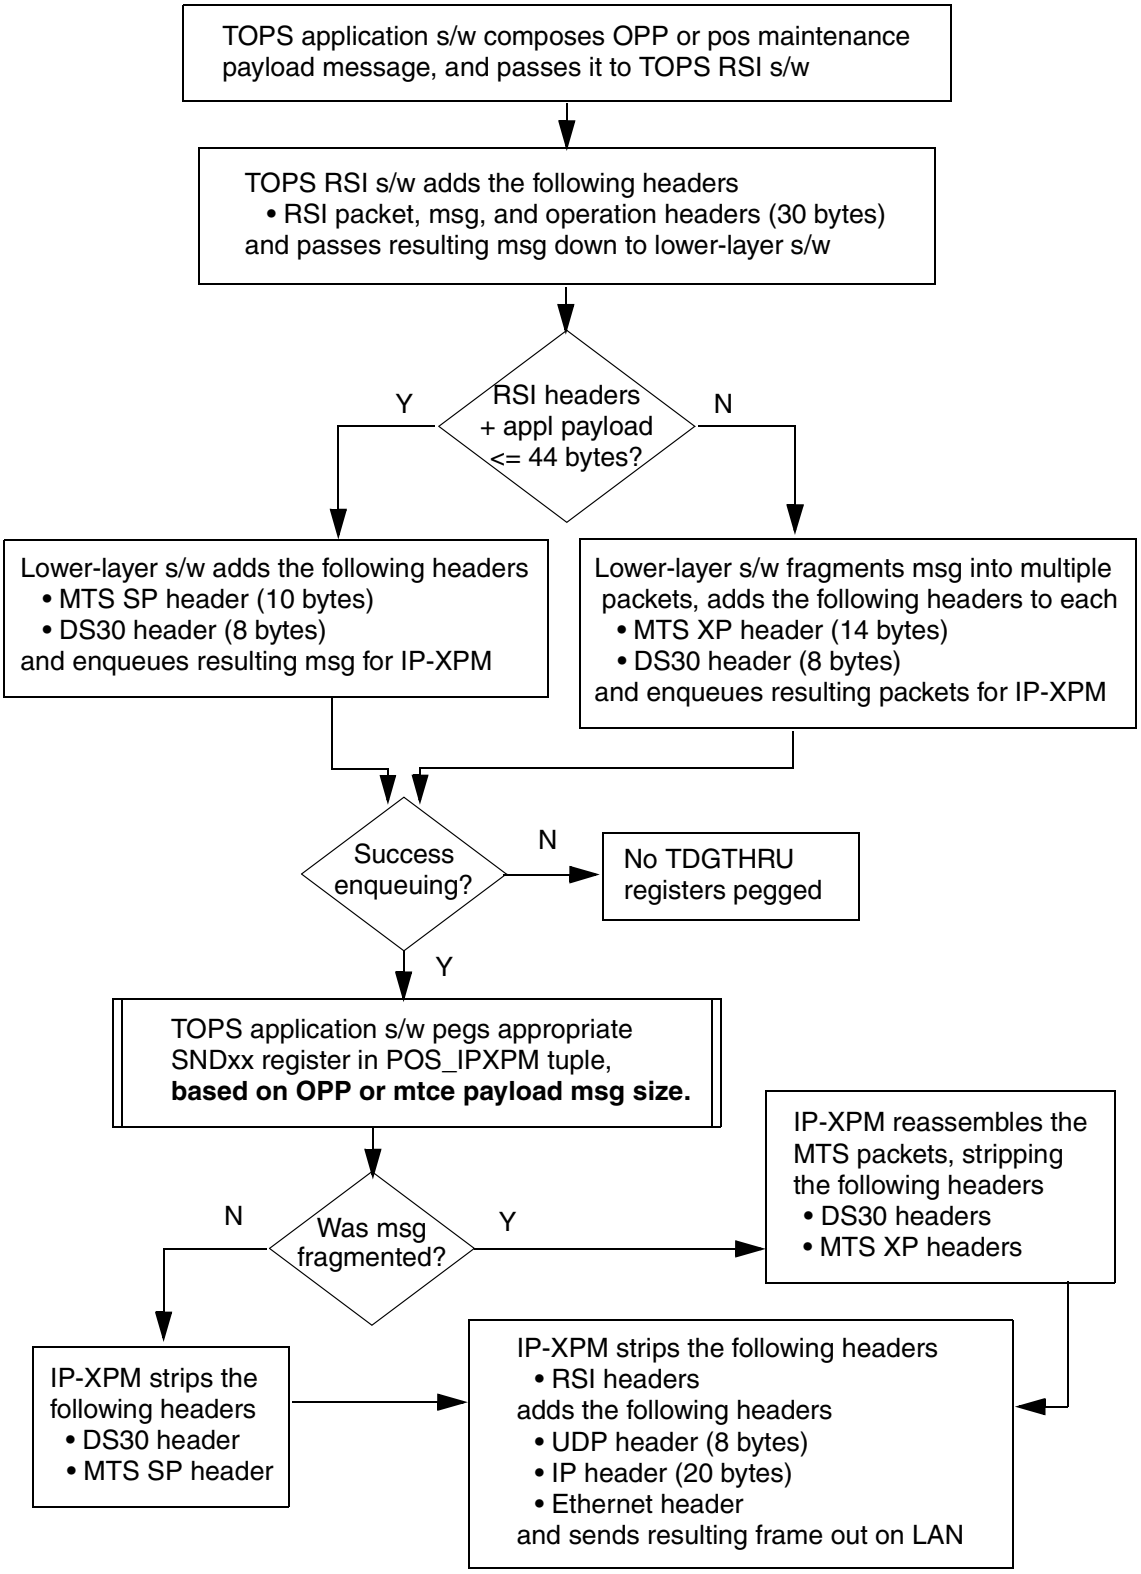

Figure 7 Flow chart for pegging send (SND) registers in OC_IPXPM tuple

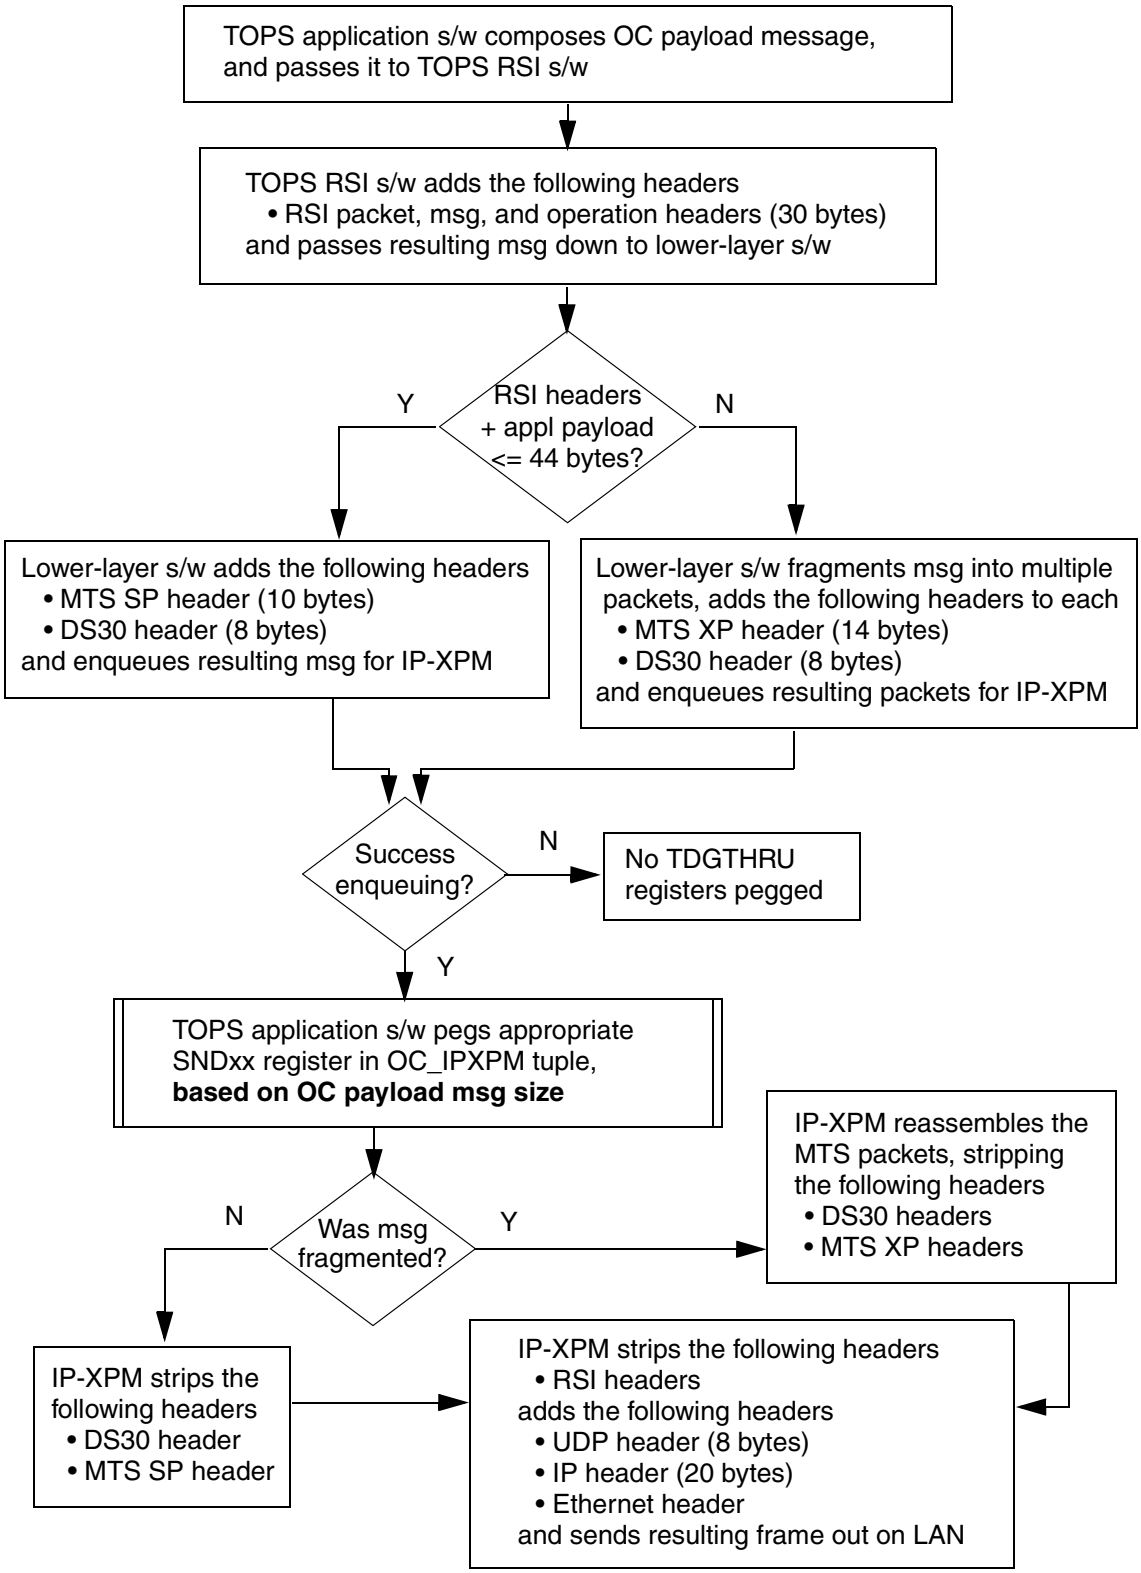

Figure 8 Flow chart for pegging receive (RCV) registers in OA_EIU tuple

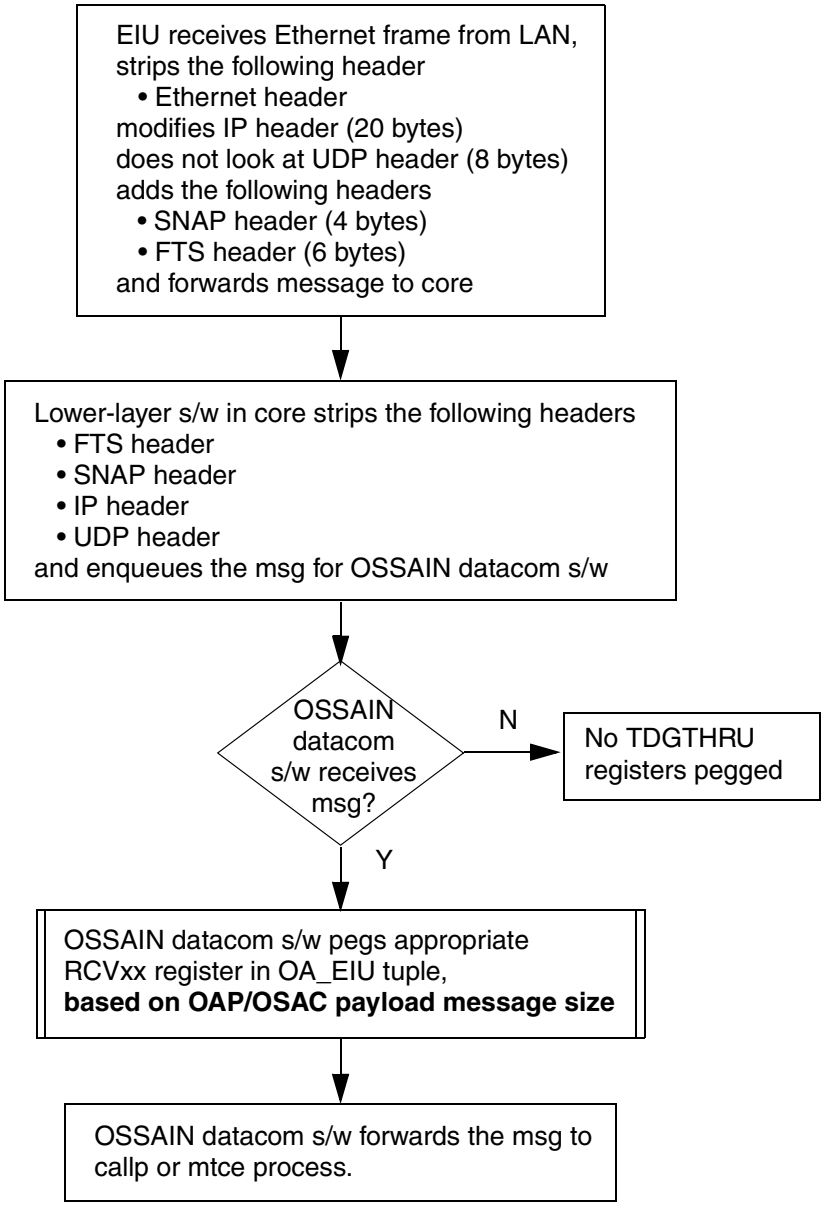

Figure 9 Flow chart for pegging receive (RCV) registers in OA_XAETHR tuple

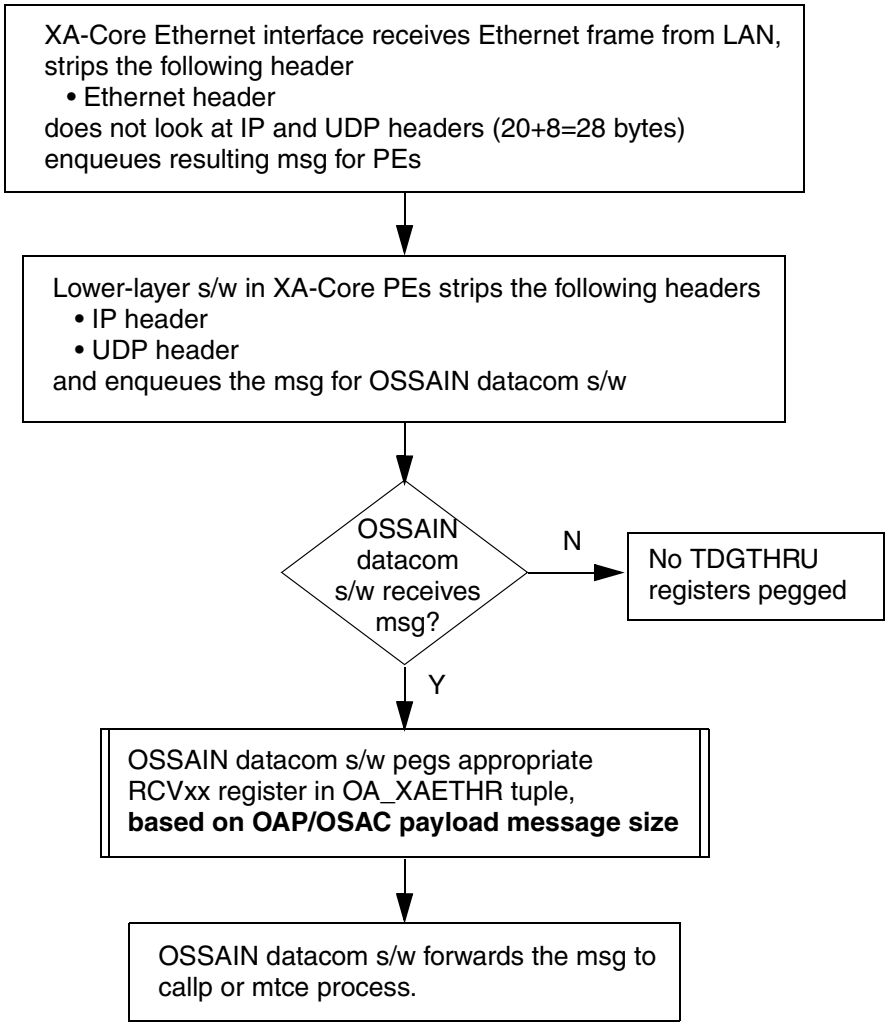

Figure 10 Flow chart for pegging receive (RCV) registers in POS_IPXPM tuple

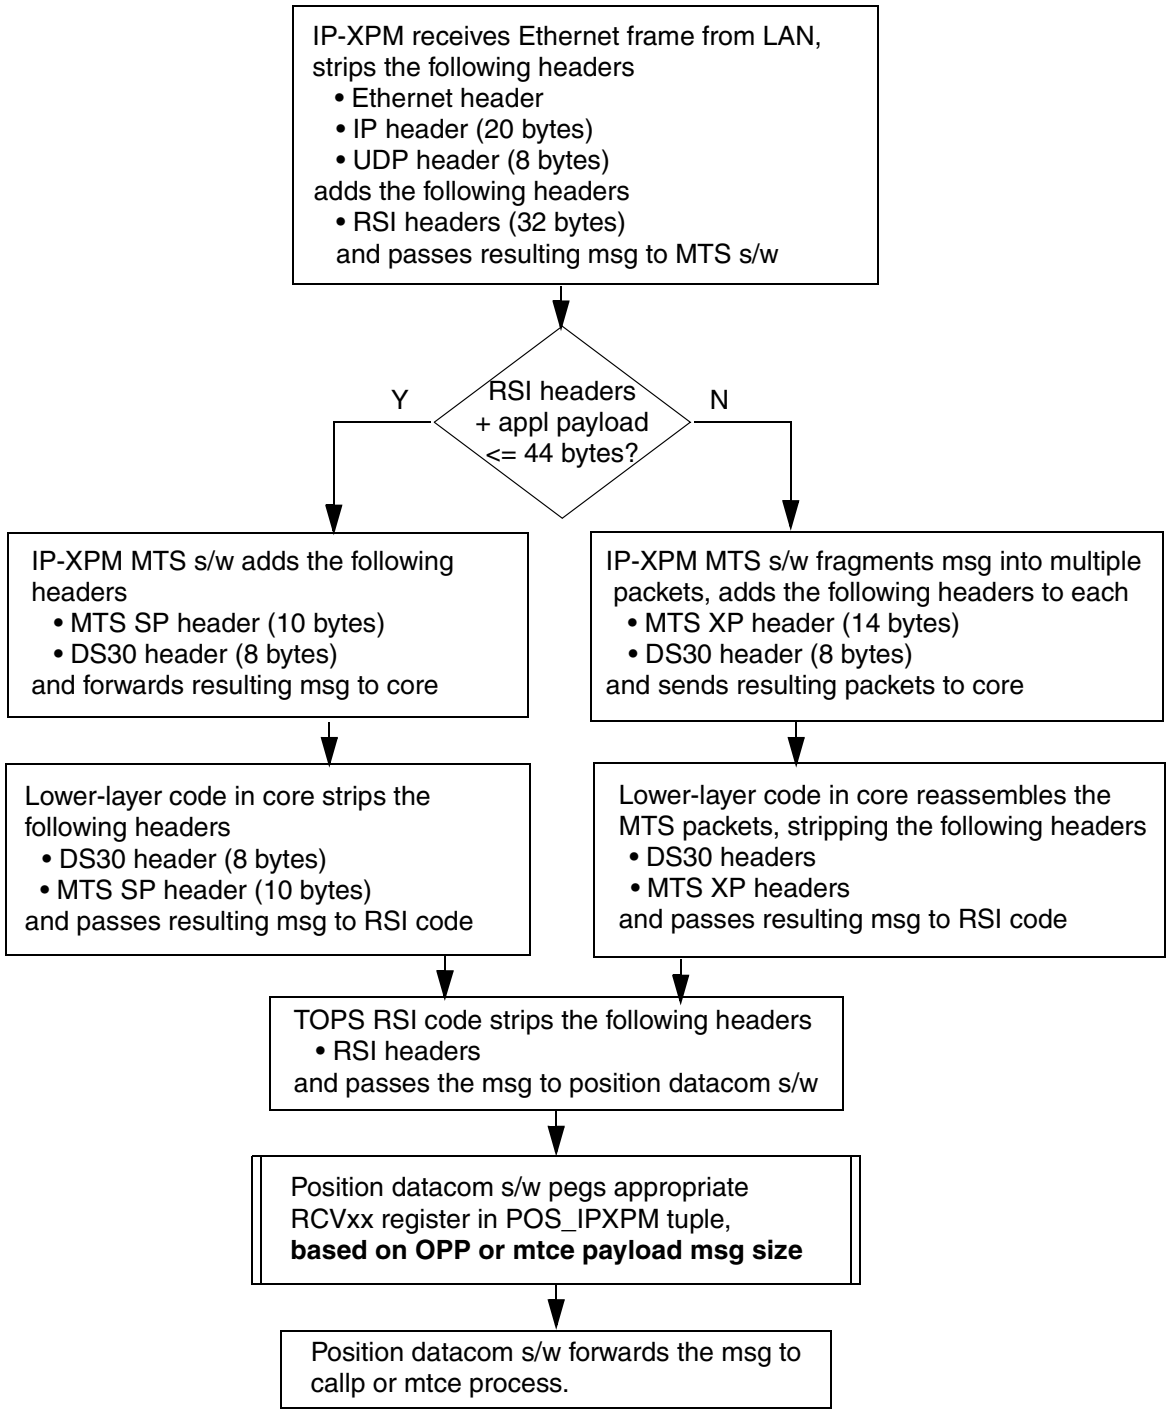
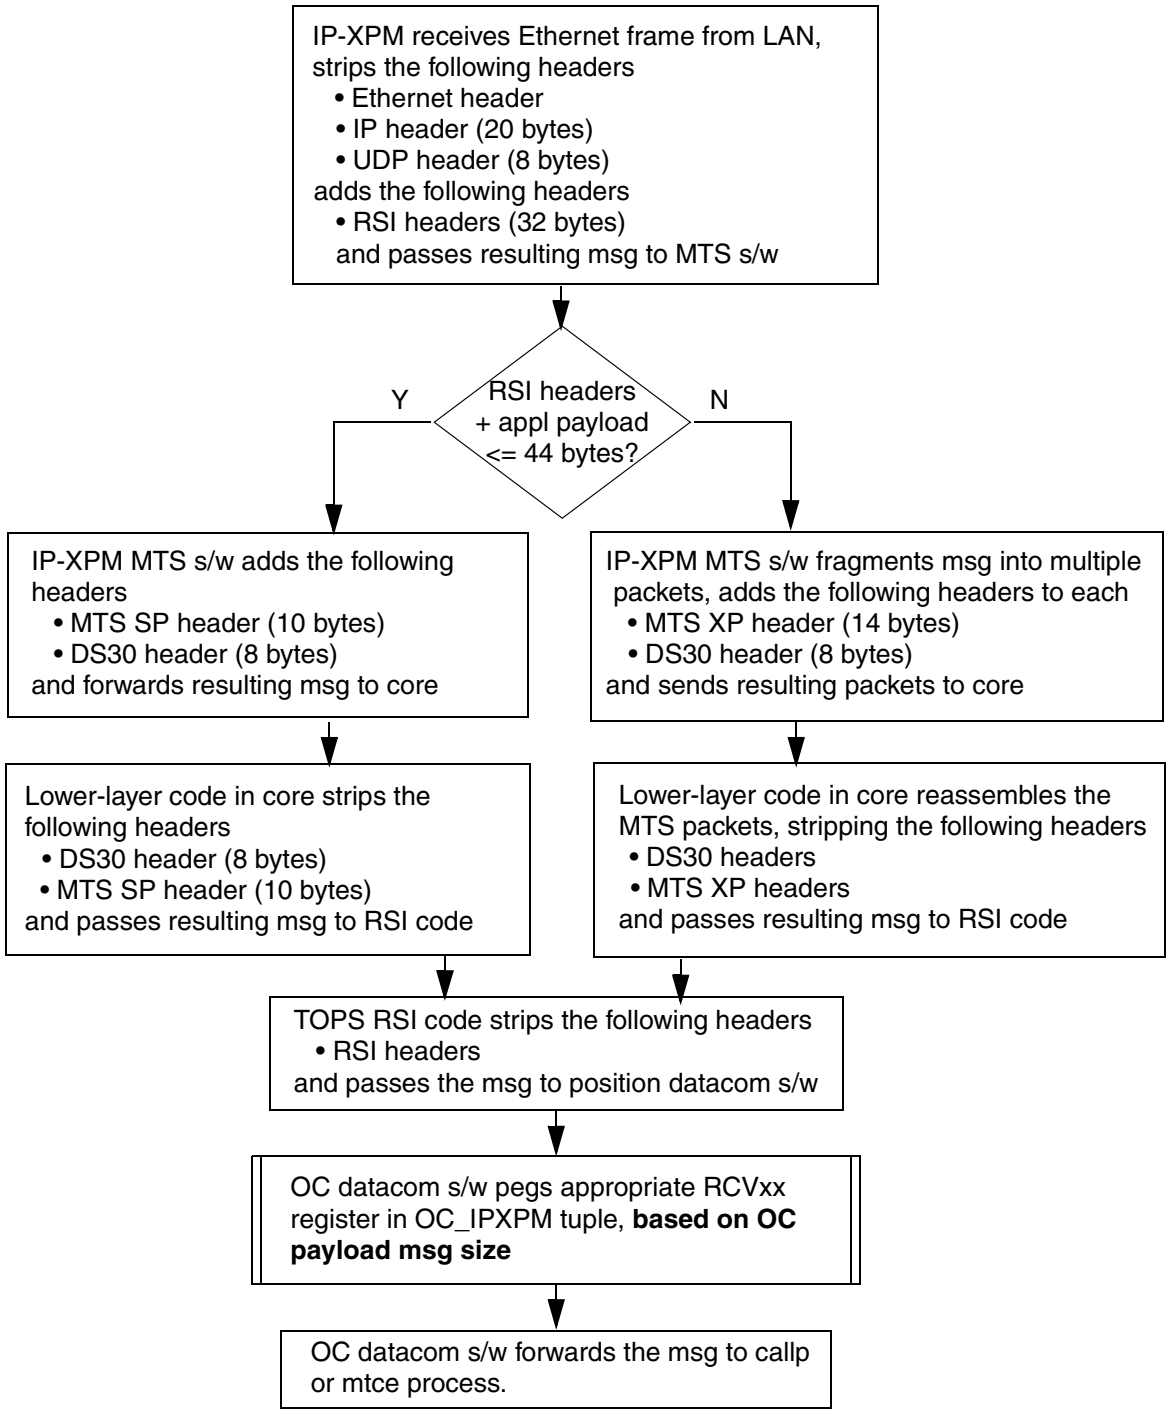


Note: Failure at any point before the message gets to position datacom s/w results in no registers being pegged in group TDGTHRU.

Figure 11 Flow chart for pegging receive (RCV) registers in OC_IPXPM tuple



Note: Failure at any point before the message gets to OC datacom s/w results in no registers being pegged in group TDGTHRU.

0.0.0.1 Register release history update

All registers in this group were created in TOPS20/SN07/ISN07.

0.0.0.2 Associated registers

None.

0.0.0.3 Associated logs

None

Table 2 TDGTHRU Registers

Short Register Name	Long Name	Explanation
SND368 and SND368X	Send 368 Bytes	Peg register. Counts the number of messages sent from the core, of size > 296 bytes and <= 368 bytes. SND368X is an extension register.
SND512 and SND512X	Send 512 Bytes	Peg register. Counts the number of messages sent from the core, of size > 368 bytes and <= 512 bytes. SND368X is an extension register.
SNDLG and SNDLGX	Send Large	Peg register. Counts the number of messages sent from the core, of size > 512 bytes. SNDLGX is an extension register.
RCV48 and RCV48X	Receive 48 Bytes	Peg register. Counts the number of messages received by the core, of size <= 48 bytes. RCV48X is an extension register.
RCV96 and RCV96X	Receive 96 Bytes	Peg register. Counts the number of messages received by the core, of size > 48 bytes and <= 96 bytes. RCV96X is an extension register.
RCV160 and RCV160X	Receive 160 Bytes	Peg register. Counts the number of messages received by the core, of size > 96 bytes and <= 160 bytes. RCV160X is an extension register.
RCV224 and RCV224X	Receive 224 Bytes	Peg register. Counts the number of messages received by the core, of size > 160 bytes and <= 224 bytes. RCV224X is an extension register.
RCV296 and RCV296X	Receive 296 Bytes	Peg register. Counts the number of messages received by the core, of size > 224 bytes and <= 296 bytes. RCV296X is an extension register.

Table 2 TDGTHRU Registers

Short Register Name	Long Name	Explanation
RCV368 and RCV368X	Receive 368 Bytes	Peg register. Counts the number of messages received by the core, of size > 296 bytes and <= 368 bytes. RCV368X is an extension register.
RCVLG and RCVLGX	Receive Large	Peg register. Counts the number of messages received by the core, of size > 368 bytes. RCVLGX is an extension register.

14.3.3.2 Register release history update

All registers in this group were created in TOPS20/SN07/ISN07.

14.3.3.3 Associated registers

None.

14.3.3.4 Associated logs

None

14.3.3.5 elease history update

All registers in this group were created in TOPS20/SN07/ISN07.

14.3.3.6 Associated registers

None.

14.3.3.7 Associated logs

None

15: Performance (PF): A00005160

15.1 Performance management strategy

15.2 Performance management tools and utilities

The new OM group can be displayed and collected via OMSHOW interface regularly by Telcos to monitor system IO throughput.

15.3 Performance Measurements (PM), Operational Measurements (OM), and stats

This feature will provide a new OM group IOCAP.

15.3.1 PM, OM, and stats format

15.3.2 OM Group template (applies only to DMS)

New OM group IOCAP provides information on IO capacity such as utilization and utilization high watermark and IO throughput information on a per IO service type (CMIC, ETHR and AMDI).

15.3.2.1 OM description

OM group IOCAP provides one tuple per IO service type available in the office. Possible IO service types are CMIC, ETHR and AMDI.

Key field: IO_SERVICE.

Info field: none.

15.3.2.2 Release history update

The OM group is being created in CSP21 and will be patched backed to CSP20.

15.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

Figure 1 OM Group Display

IO_SERVICE IOUTIL IOHWM TXMSGPS TXSIZE RXMSGPS RXSIZE IOTHRESH

15.3.2.4 Group structure

OM group provides one tuple for each IO service type. There are 3 possible IO service types (CMIC, ETHR, AMDI).

Key field: IO_SERVICE indicates the IO service type the information is captured. Possible IO service types are CMIC, ETHR, and AMDI. The service type is displayed as 4 character string (CMIC, ETHR, AMDI).

Info field: None.

15.3.2.5 Associated OM groups

Not applicable.

15.3.2.6 Associated functional groups

The following functional groups are associated with OM group: none

15.3.2.7 OM group registers logic flow chart

Not applicable.

15.3.3 Register (applies only to DMS)

IOHWM

15.3.3.1 Register description

IOHWM is a high watermark register holding the highest utilization value of the specified IO service type over the OM transfer period.

15.3.3.2 Register release history update

Register is being created in CSP21 and patched back to CSP20.

15.3.3.3 Associated registers

None.

15.3.3.4 Associated logs

None.

15.3.4 Register (applies only to DMS)

IOTHRESH

15.3.4.1 Register description

IOTHRESH is a peg register holding the number of one minute interval in the transfer period the IO utilization has exceeded the value of the IO_WARNING_THRESHOLD office parm.

15.3.4.2 Register release history update

Register is being created in CSP21 and patched back to CSP20.

15.3.4.3 Associated registers

None.

15.3.4.4 Associated logs

None.

15.3.5 Register (applies only to DMS)

IOUTIL

15.3.5.1 Register description

IOUTIL is a usage register holding the average utilization value of the specified IO service type. This value is accumulated every minute and the average is calculated for every OM transfer period.

15.3.5.2 Register release history update

Register is being created in CSP21 and patched back to CSP20.

15.3.5.3 Associated registers

None.

15.3.5.4 Associated logs

None.

15.3.6 Register (applies only to DMS)

RXMSGPS

15.3.6.1 Register description

RXMSGPS is a usage register holding the average total system number of received messages of the specified IO service type. This value is accumulated every minute and the average is calculated for every OM transfer period. The unit is number of messages per second.

15.3.6.2 Register release history update

Register is being created in CSP21 and patched back to CSP20.

15.3.6.3 Associated registers

None.

15.3.6.4 Associated logs

None.

15.3.7 Register (applies only to DMS)

RXSIZE

15.3.7.1 Register description

RXSIZE is a usage register holding the average incoming message size of the specified IO service type. This value is accumulated every minute and the average is calculated for every OM transfer period. The message size unit is in bytes.

15.3.7.2 Register release history update

Register is being created in CSP21 and patched back to CSP20.

15.3.7.3 Associated registers
None.

15.3.7.4 Associated logs
None.

15.3.8 Register (applies only to DMS)
TXMSGPS

15.3.8.1 Register description
TXMSGPS is a usage register holding the average total number of outgoing messages of the specified IO service type. This value is accumulated once every minute and the average is calculated for every OM transfer period. The unit is in number of messages per second.

15.3.8.2 Register release history update
Register is being created in CSP21 and patched back to CSP20.

15.3.8.3 Associated registers
None.

15.3.8.4 Associated logs
None.

15.3.9 Register (applies only to DMS)
TXSIZE

15.3.9.1 Register description
TXSIZE is a usage register holding the value of average size of outgoing messages of the specified IO service type. This value is accumulated once every minute and the average is calculated for every transfer period. The value unit is in bytes.

15.3.9.2 Register release history update
Register is being created in CSP21 and patched back to CSP20.

15.3.9.3 Associated registers
None.

15.3.9.4 Associated logs
None.

Accounting (ACC)

Introduction

This chapter describes new and changed features that are planned for this release.

Featid	Title
A00003007.AA34	AMA Enhancements for DTAG International Gateway
A00004036.AA42	Off-Board Service Control
A00004137.AA12	ANI Billing
A00005363.AA16	CAIN FlexCDR Enhancements

1: Accounting (ACC): A00004036

1.1 Accounting strategy

The generally accounting strategy for this activity is to continue to perform whatever billing for successful updates that is done today for service activation/deactivation, list editing, etc. In addition to performing the standard billing, a Service Logic Identification Module (module code 039) will be appended to the current record is an AMAslpid is included in the corresponding update request.

1.2 CM billing due to Update Requests

The AMA records generated as per the service requirements and the GR1298 requirements (Update and Query messages) for all the service groups whose provisioning and activation is being controlled and queried by the Update and query messages are as follows :

1.2.1 Group1 Services AMA

Only three services Automatic Call Back (ACB), Automatic Recall (AR) and Make Set Busy (MSB) generates the AMA record. All other services does not have any AMA record associated with them.

1.2.1.1 Update Message for ACB (Universal) and AR (Universal)

Consistent with the billing performed as a result of Automatic Call Back (universal - usage based), and Automatic Recall (universal - usage based) being modified via access code, a callcode 330 record (structure code 1030) will also be provided to record successful deactivation of ACB (universal) , and AR (universal). All other service in this group do not generate an AMA record.

1.2.1.2 Update Message for MSB

Consistent with the billing performed as a result of MSB being modified via access code, a callcode 006 record (structure code 510) will also be provided to record successful activation and deactivation of MSB.

1.2.1.3 Module code 039

When an *AMAslpid* is provided with an update request, a Service Logic Identification Module (module code 039) populated with the *AMAslpid* provided will be appended to any base record associated with the update.

The following MAP example figure is in non-printing text.

Figure 1 Example: ACB deactivation - Update message (with AMAslpid)

1.2.2 Group2 Services AMA

No AMA records are generated for Group2 services.

1.2.3 Group3 Services AMA

1.2.3.1 Update Message for DRCW, SCRJ and SIMRING

Consistent with the billing performed as a result of Distinctive Ringing / Call Waiting , Selective Call Rejection being modified via access code, a callcode 330 record (structure code 1030) will also be provided to record successful DRCW or SCRJ activation, deactivation, list edit operations, etc. SIMRING does not generate a AMA record.

1.2.3.2 Module code 039

When an *AMAslpid* is provided with an update request, a Service Logic Identification Module (module code 039) populated with the *AMAslpid* provided will be appended to any base record associated with the update.

The following MAP example figure is in non-printing text.

1.2.4 Group4 Services AMA

1.2.4.1 Updates to Call Forwarding

Consistent with the billing performed as a result of Call Forwarding being modified via access code, a callcode 31 record (structure code 614) will be provided for successful CFW activation (POTS or IBN/RES) and a callcode 31 record (structure code 96) will be provided for successful CFW deactivation (POTS or IBN/RES).

There are no billing records provided for Call Forward Busy or Don't Answer activation or deactivation for either POTS or IBN/RES.

1.2.4.2 Module code 039

Impact to be determined.

When an *AMAslpid* is provided with an update request, a Service Logic Identification Module (module code 039) populated with the *AMAslpid* provided will be appended to any base record associated with the update.

The following MAP example figure is in non-printing text.

1.2.5 Group5 Services AMA

1.2.5.1 Updates to Selective Call Forwarding

Consistent with the billing performed as a result of Selective Call Forwarding being modified via access code, a callcode 330 record (structure code 1030) will also be provided to record successful SCF activation, deactivation, list edit operations, etc.

1.2.5.2 Module code 039

When an *AMAslpid* is provided with an update request, a Service Logic Identification Module (module code 039) populated with the *AMAslpid* provided will be appended to any base record associated with the update.

The following MAP example figure illustrates the above as it relates to the extension of a Selective Call Forwarding CLASS AMA record . The Module Code 039 portion of the record is represented as ***bold italics***.

1.2.9 Group9 Services AMA

No AMA records are generated for Group9 Services.

1.3 Other changes

Not applicable.

2: Accounting (ACC): A00004137

2.1 Accounting strategy

Module Code 838[1] is appended to SC0220 AMA records when the Calling Party Number (CPN) or Billing Number (BN) are delivered to the terminating party over a PRI connection.

2.2 Accounting tools and utilities

Not applicable.

2.3 Accounting task flows

Not applicable.

2.4 CM billing changes

2.4.1 Structure codes

No changes are made to the SC0220; however, a new module, MC838, will be appended for PRI terminating calls that deliver CPN/BN when this feature is active.

2.4.2 Structure code 220

SC220 is generated for calls that perform a CAIN query and return an AMASlpID in the response. When this feature is active (SOC UTRS0014 is set to ON), an MC838 will be appended to the SC0220 AMA record for calls that terminate on PRI trunks that signal the CPN or BN in the SETUP message.

Only one MC828 will ever be appended to a SC220 record.

Table 1 Structure code

Information	Field number
Structure code	220

2.4.3 Module code

Module Code 838 - Egress Data Module

2.4.4 Module code 838

Module description. The following table provides information for module code 838.

[1]Module Code 838 is not a Bellcore defined module in GR-1100-CORE.

.

Table 2 Module code

Information	Field number	Number of characters
Module Code	88	4

2.4.5 Tables (fields)

This feature has the following field:

- Communications ISDN (ACI)/ISDN Features

2.4.6 Field 344

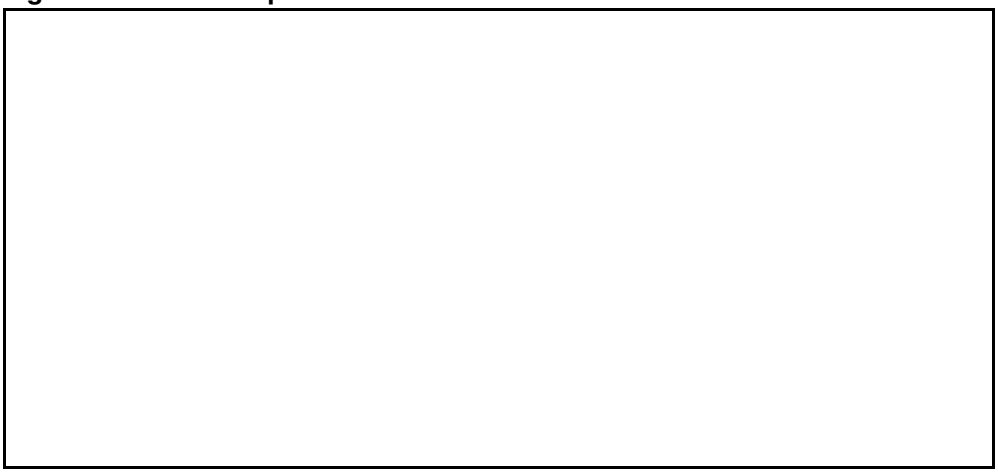
Field description. The following table provides information for field 344.

Table 3 Table (Field) 344 characters - values and meaning

Character	Value	Meaning
1-2	00	Constant
3	1	CPN/BN has been delivered to the terminating end.
	2-9	unassigned
4	C	SIGN character (HEX C)

The following MAP example figure is in non-printing text.

Figure 1 MAP example



2.5 Other changes

Not applicable.

3: Accounting (ACC): A00005363

3.1 Accounting strategy

This activity creates 4 new fields: BUSCSTID, SLPID1ST, DGI300, and DGI301. The new fields are not part of and cannot be added to any predefined templates. The new fields are available for the use in creation of telco defined flexible CDR templates. The billing format of the new fields is NT format and therefore do not contain structure codes or module codes.

3.2 Accounting tools and utilities

The following tools are used to create data for or display the new fields: CDRTST, CDRDUMP, FCDRSRCH and CTMPLT

3.3 Accounting task flows

SN07 Feature Subset Cross Reference Tables: International Features

Feature to Functional Group Cross Reference

Table 1 shows feature IDs, feature titles, and the corresponding functional group (under Stream and release).

For details on specific features, please refer to the FN sections starting on

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release
Note: Core is comprised of CCM, CNA, CSP, MSH, SHR, and UCS streams.		
A00001914.AA11	CEPT International Line Restriction Enhancements	WT20
A00001918.AA13	CEPT Feature Warning with Announcement for Bangladesh	WT20, Core20
A00001919.AA09	CEPT Services Password Enhancement	WT20, Core20
A00001920.AA09	Metering OOS Enhancements	WT20
A00001921.AA14	CIS Toll Call Ringing	WT20, Core20
A00001923.AA16	CIS Subscriber Categories	WT20, Core20
A00001930.AA14	Last and Total Call Meter Inquiry Services	WT20
A00001935	Provisioning Support for Centrex-IP Nodes and Lines	PNM07
A00002053.AA14	AMA Records for Metered Features	WT20, Core20
A00002101.AA17	Allow ITX only SSUTR2	WT20, XPM20
A0002173.AB06	System of Operative-Searching Measures (SOSM) for Digital Multiplex System (DMS) MMP	WT20, Core20

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release
A00002252.AA04	MG9K Lines Preprovisioning	Core20
A00002291.AA20	Trunk Offering Expansion	WT20, Core20, XPM20
A00002293.AA12	Registered Call Line Option	WT20, Core20
A00002319.AA09	MWI control via ISUP	WT20
A00002364.AA08	CLI/RDN/OCN capture in Billing Record (CDR) for ANSI ISUP and HK ISUP on DRU GSP20	WT20
A00002365.AA08	CWR Support over Trunks for Brazil Market	WT20, Core20
A00002367.AA12	BRI Preset Conference Base	WT20, Core20
A00002377.AA12	10 AFC Keys for BRI Directory Number	WT20, Core20, XPM20
A00002512	GWC-EM Internet Transparency VCAC Provisioning	PNM07
A00002638.AA14	PCA SW Metering Support for Billing	WT20, Core20
A00002639.AA14	CEPT PSTN: Analogue Call Waiting Indication	WT20, Core20
A00002640	CEPT PSTN: Call Forward Delayed Programming	WT20
A00002641.AA20	CEPT PSTN: Analogue Outgoing Call Barring	WT20
A00002642.AA14	CEPT PSTN: Analogue Query and 3Party	WT20, Core20
A00002644	Common Topology Identifier Provisioning	PNM07
A00002654.AA24	CEPT AR (Class Callback)	WT20, Core20
A00002655.AA13	CEPT ACRJ (Rejection of Unidentified Calls)	WT20, Core20
A00002678.AA15	Telefonica IN Enhancements	WT20, Core20
A00002680.AB09	CEPT / Telefonica Spain Changed Number Indication	Core20
A00002702.AA15	No Line Origination Without Charging	WT20
A00002713.AA17	Spanish ISUP enhancements for Telefonica	WT20, CICM07
A00002751.AA08	China BRI Supplementary Services using Keypad protocol	WT20, Core20
A00002754.AA12	China INAP Compliance Enhancement Part 1	WT20

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release
A00002755.AA13	China PSTN Line Service Compliance	WT20, Core20
A00002756.AA21	Japan Trunk Services	WT20, Core20, GWC10
A00002844.AA09	Excessive Metering Detection (EMD) Support for Metered Trunks	WT20
A00002884.AA16	ETSI BRI Preset Conference Service Interactions	WT20, Core20
A00002900.AA09	China INAP Compliance Enhancement Part 2	WT20, XPM20, GWC10
A00002904.AA12	CTI Toggle	Core20
A00002916.AA33	CS2K connectivity to XPM remote	Core20, GWC07, XPM07
A00003051.AA07	Call Forward Do Not Answer for BRI Hunt	WT20, Core20
A00003147.AA09	DP Digit Reception Control	WT20, Core20, XPM07
A00003227	SN07, IN support for User to User Service (UUS)	WT20
A00003405.AA03	ECAN Support for International Trunks	Core20
A00003410.AA12	Honduras ETSI ISUP variant	WT20, Core20, XPM07
A00003411.AA10	New TONESET for Honduras	WT20
A00003465.AA14	ETSI BRI Channel reservation override	WT20, XPM20
A00003466.AA06	MLPP Default Precedence Level on Terminations	WT20
A00003467.AA13	Reverse Translations Enhancements via CUSTMOD Option	WT20, Core20
A00003495	APG Integration with MP for NAT Traversal	GWC10
A00003624	H.323 Out-of-band Interworking with APG	GWC10
A00003627.AA24	T.38 FAX Support for International H.323	GWC10

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release
A00003686.AA11	Re-Routing Based on Release Cause Value	WT20
A00003695.AA08	ANSI ISUP FGD on CS2K	GWC10

Functional Descriptions (FN)

Introduction

This chapter describes new and changed Internatonal features that are planned for this release.

Featid	Title
A00001914.AA11	CEPT International Line Restriction Enhancements
A00001918.AA13	CEPT Feature Warning with Announcement for Bangladesh
A00001919.AA09	CEPT Services Password Enhancement
A00001920.AA09	Metering OOS Enhancements
A00001921.AA14	CIS Toll Call Ringing
A00001923.AA16	CIS Subscriber Categories
A00001929.AA15	RUSSIAN ISUP-ISDN Interworking
A00001930.AA14	Last and Total Call Meter Inquiry Services
A00001935	Provisioning Support for Centrex-IP Nodes and Lines
A00002053.AA14	AMA Records for Metered Features
A00002100.AA12	ISUP_R_2000 (Russia ISUP V2+) Operator Call on Busy Subscriber (Toll Break In)
A00002101.AA17	Allow ITX only SSUTR2
A0002173.AB06	System of Operative-Searching Measures (SOSM) for Digital Multiplex System (DMS) MMP
A00002252.AA04	MG9K Lines Preprovisioning
A00002291.AA20	Trunk Offering Expansion

A00002293.AA12	Registered Call Line Option
A00002319.AA09	MWI control via ISUP
A00002358.AB01	H.323 tunneling over QSIG
A00002364.AA08	CLI/RDN/OCN capture in Billing Record (CDR) for ANSI ISUP and HK ISUP on DRU GSP20
A00002365.AA08	CWR Support over Trunks for Brazil Market
A00002367.AA12	BRI Preset Conference Base
A00002377.AA12	10 AFC Keys for BRI Directory Number
A00002470.AA09	Fixed Price Service for Turkey
A00002512	GWC-EM Internet Transparency VCAC Provisioning
A00002638.AA14	PCA SW Metering Support for Billing
A00002639.AA14	CEPT PSTN: Analogue Call Waiting Indication
A00002640	CEPT PSTN: Call Forward Delayed Programming
A00002641.AA20	CEPT PSTN: Analogue Outgoing Call Barring
A00002642.AA14	CEPT PSTN: Analogue Query and 3Party
A00002644	Common Topology Identifier Provisioning
A00002654.AA24	CEPT AR (Class Callback)
A00002655.AA13	CEPT ACRJ (Rejection of Unidentified Calls)
A00002678.AA15	Telefonica IN Enhancements
A00002680.AB09	CEPT / Telefonica Spain Changed Number Indication
A00002702.AA15	No Line Origination Without Charging
A00002713.AA17	Spanish ISUP enhancements for Telefonica
A00002751.AA08	China BRI Supplementary Services using Keypad protocol
A00002754.AA12	China INAP Compliance Enhancement Part 1
A00002755.AA13	China PSTN Line Service Compliance
A00002756.AA21	Japan Trunk Services

A00002844.AA09	Excessive Metering Detection (EMD) Support for Metered Trunks
A00002884.AA16	ETSI BRI Preset Conference Service Interactions
A00002900.AA09	China INAP Compliance Enhancement Part 2
A00002904.AA12	CTI Toggle
A00002916.AA33	CS2K connectivity to XPM remote
A00003051.AA07	CFGD (Call Forward Group Don't Answer) for BRI Hunt Groups
A00003147.AA09	DP Digit Reception Control
A00003227	SN07, IN support for User to User Service (UUS)
A00003405.AA03	ECAN Support for International Trunks
A00003410.AA12	Honduras ETSI ISUP variant
A00003411.AA10	New TONESET for Honduras
A00003465.AA14	ETSI BRI Channel reservation override
A00003466.AA06	MLPP Default Precedence Level on Terminations
A00003467.AA13	Reverse Translations Enhancements via CUSTMOD Option
A00003495	APG Integration with MP for NAT Traversal
A00003624	H.323 Out-of-band Interworking with APG
A00003627.AA24	T.38 FAX Support for International H.323
A00003686.AA11	Re-Routing Based on Release Cause Value
A00003695.AA08	ANSI ISUP FGD on CS2K
A00003696.AA15	G-ISUP Routing Enhancements
A00003951	Support for the i2001 Internet Telephone
A00004205.AA12	Japan PRI Backward Voice Path Solution
A00004503.AA11	Calling Party Number Serving Country Code(SCC)
A00004563.AA12	Moroccan ISUP v2 on DMS100

A00004565.AA15	Line to Moroccan ISUP V2 interworking
A00004743.AA07	Line originations CLI modification through CALLCNTL in ISN07
A00004750.AA13	Even Bit Inversion(EBI) Support on DTCO2
A00004931.AA07	Indian ISUP
A00004933.AA04	Indian ISUP Charging
A00004981	GWC-EM Internet Transparency VCAC provisioning support for CentrexIP gateways
A00005164.AA06	Russia ISUP V2+ on CS2K
A00005802.AA07	SPM Companding Law Provisioning
A00006001.AA16	Russian ISUP and Tones for International SPM
A00006032	LROA, LRS and NOCOLL SN07 Support for C&W Cayman

1: Functional Description (FN): A00001914

1.1 Feature name

CEPT International Line Restriction Enhancements.

1.2 Description

1.2.1 Introduction

International Line Restriction feature gives the administrator the capability to restrict outgoing calls for the subscriber according to the predefined restriction classes. The administrator can assign, de-assign, activate or deactivate this feature on a line via Service Order or assign and de-assign the feature by using the default option functionality. Subscribers are able to activate, deactivate or interrogate ILR feature by dialing access codes.

The following enhancements are provided by this activity over existing CEPT International Line Restriction Feature:

- Two new restriction classes are defined.
- Temporary opening of barred lines are provided.
- Special tone is given to subscriber who has ILR feature active.

These enhancements are developed according to the requirements of the Bangladesh Market.

The existing International Line Restrictions feature became more flexible by a new activity A00002641 CEPT PSTN: Analogue Outgoing Call Barring. A new table ILRCLASS is defined for datafilling barring classes. For detailed information about this new table, please refer to that feature's FN document.

The ILRCLASS table stores the definition of the barring programs for the ILR service. The International Line Restriction line option references this table.

Table ILRCLASS can hold up to maximum of 100 tuples and the same should be the number of R-Codes, that is R-code range varies from 00 to 99. The R-Codes values are unique in table ILRCLASS, except 'NN'.

During ONP the ILRCLASS table is populated with the previously hard coded barring programs and the R-codes of the ILRCLS tuple in table ISERVOPT. The R-codes are not stored in the ILRCLS tuple in ISERVOPT any more.

During ONPs to this activity, the default tuples are restored.

The existing behavior about activating, deactivating or interrogating ILR feature sequence has not been changed.

The details of the enhancements developed according to the requirements of the Bangladesh Market are below:

1.2.2 New Restriction Classes

Two new restriction classes are defined. These are Deny only National calls (DNATL) and Deny only LoCaL calls (DLCL).

- **DNATL (Deny only NATionaL):** In this restriction class, deny only national class calls but allow other calls.
- **DLCL (Deny only LoCaL):** In this restriction class, deny only local class calls but allow other calls.

These restriction classes are added to the default restriction classes. They will be restored at ONPs similar to existing ones.

1.2.3 Temporary Opening Of Barred Lines

A new functionality is defined for ILR feature. This functionality provides the subscriber to deactivate the feature per call basis. The line will be barred again automatically after subscriber going on hook.

This functionality can be used either for a single party call or at the second leg of a complex call such as enquiry, I3WC or I6WC.

If a subscriber wants to make a call through a direction which has been restricted by his ILR feature already, can use this temporary opening functionality to make the call instead of deactivating the feature totally.

For the single party call, temporary deactivation is done by the subscriber in this way:

(idle) LH SDT # SC * PW # (Special Dial Tone) DIGITS

For complex calls, temporary deactivation is done after flashing:

(flash) SDT # SC * PW # (Special Dial Tone) DIGITS

The Service Code for temporary deactivation is datafilled at table ACCODE. Example datafill at table ACCODE is as follows:

Figure 3 Example datafill of table ACCODE.

```
>table accode
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: ACCODE
>pos STARCEPT 34 34
STARCEPT 34 34 FEAT (FTR ILR) (PF 2) (MM 2 15) (FUNC TEMPDEACT) $
```

1.2.4 Special Dial Tone Given To Subscriber when ILR is Active

The subscriber will be warned with a special tone by the system on off hook if he has ILR option active. If the ILR feature is inactive, then the subscriber will hear the ordinary dial tone.

Giving special tone will be optional and determined according to a datafill at table ISERVOPT. A new field is added to the existing ILRCLS tuple named SDT. It can be datafilled as either YES indicating that the special tone will be given or NO for giving ordinary dial tone. The default value for SDT field is N. Example datafill can be seen at Figure 1 for SDT field in ISERVOPT table for ILRCLS tuple.

At MMP19 to MMP20 ONP this field will have the default value N.

1.2.5 Feature Metering

In table MTRFEAT, the feature metering counts are provisioned for ILR operations.

ILR index is used on MTRFEAT table to get the corresponding charge unit counts for assignment, de-assignment, administrator activation, administrator deactivation, subscriber activation, subscriber deactivation and subscriber interrogation.

ILR usage metering option will be used for Temporary Deactivation functionality.

For other details about metering please refer to the A59019295-CEPT International Line Restriction FN document.

1.2.6 OM (Operational Measurements)

The ILR OMs are adopted to support the flexible definition of the barring programs in table ILRCLASS. The ILR OM provides per OM group the number of activations, deactivations, usages and unsuccessful deactivations.

There are two OM groups for ILR. ILR OM group includes ILRCERR, ILRUINT, ILRINTG and newly defined TEMPDAC and TEMPUDAC OM registers.

TEMPDAC, TEMPUDAC OMs are defined for successful temporary deactivation and unsuccessful temporary deactivation counts.

ILRCLASS OM group includes activation, deactivation, usage and unsuccessful deactivation OM registers for barring classes defined at table ILRCLASS.

Refer to PF Section for the details about these registers.

1.3 Hardware Requirements or Dependencies

No hardware dependency.

1.4 Software Requirements or Dependencies

None.

1.5 Limitations and restrictions

Please refer to the activity A59019295-CEPT International Line Restriction FN document for limitations and restrictions about the basic ILR functionalities.

In order to use ILR temporary deactivation functionality when subscriber also has WML feature active, the parameter WML_OCT_IS_LINE_OPT_PARM at table OFCENG should be set to Y and FTCODE field for the WML line option should be Y.

NACK treatment will be applied to the subscriber if he tries to use temporary deactivation when ILR is inactive.

If subscriber interrogates the ILR feature after successful temporary deactivation, CONF tone will be applied as the feature is not fully deactivated but only temporary deactivation has occurred.

After establishing a conference call, it is not able to use temporary deactivation functionality.

Table ILRCLASS does not apply to BRI line option.

The barring programs apply to the whole office. Different barring programs for different customer groups are not possible.

1.6 Interactions

Please refer to the interactions part of the activity A59019295-CEPT International Line Restriction about ILR functionalities.

2: Functional Description (FN): A00001918

2.1 Feature name

CEPT Feature Warning with Announcement for Bangladesh.

2.2 Description

This feature provides special announcements as warning message for the existing CEPT features, the system will give an announcement (which tells the feature is active) to the subscriber when he goes off hook and then will give dial tone to the subscriber.

This feature provides optional special announcements for the following features ;

- CEPT Do Not Disturb (CDND)
- CEPT Call Diversion Flavours ;
  a. Call Forward Universal (CFU)
  b. Call Forward Fixed (CFF)
  c. Call Forward Busy (CFB - Programmable and Fixed)
  d. Call Forward Don't Answer (CFD - Programmable and Fixed)
  e. Call Diversion To Announcement (CDTA - Absentee service)
  f. Call Diversion To Operator (CDTO)
- CEPT Wakeup Call (IWUC)

Please refer to FN document A59019083 in PLS FMDOC for more detailed information about CDND and CEPT Call Forwarding and also FN document A59019097 for IWUC feature.

This feature also enhances the special dial tone for the line which has active call forward feature. If announcement doesn't take place, providing special dial tone when the user goes off hook will be optional. The telco will have the optionality to give special dial tone or only dial tone to the subscribers.

2.2.1 General Considerations

This activity is being developed for lines which satisfy the following conditions.

- Line must have IBN as Line Class Code.

- Customer group must have CEPT customer group option.
- Line must have CEPT line option.
- Line must have at least one of the CDND, CFU, CFF, CFB, CFD, CDTA, CDTO, IWUC options and its state must be active;

2.2.2 Provisioning the Special Dial Tone

Special dial tone will be optional. If any warning announcement doesn't take place, and any call forward feature is active the system will give special dial tone or only dial tone to the subscriber when he goes off hook according to the new implemented field **SPECIAL_DIAL_TONE** of the existing tuple **CEPT_CFX** in **ISERVOPT** table. Existing **CFD_CFB_INDICATION** field will appear for datafilling only if **SPECIAL_DIAL_TONE** field is datafilled as Y.

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
```

2.2.3 Provisioning the Announcements

This feature makes the warning announcements optional. The Telco operator have the optionality to choose the announcements as warning message.

For taking control of the new announcements, new **CEPT_ANN** tuple is implemented in the existing **ISERVOPT** table.

New **CEPT_ANN** tuple has two main fields as following;

- ANN_STATE
- CEPTANNS
  - — CFU
  - — CFB
  - — CFD
  - — CDND
  - — CDTA
  - — CDTO
  - — IWUC

ANN_STATE field can be datafilled with one of the **DIAL_TONE**, **SPECIAL_DIAL_TONE** or **IMMEDIATELY** options.

Due to more than one subscriber can connect to the same announcement CLLI at the same time, some special conditions may happen as following; if a subscriber goes off hook while another subscriber is already listening to the announcement, then the following subscriber hears DIAL_TONE, SPECIAL_DIAL_TONE or the announcement IMMEDIATELY according to the ANN_STATE field until the announcement returns to the beginning.

If **ANN_STATE** field is set to;

- **DIAL_TONE** : the following subscriber hears dial tone until the announcement returns to the beginning, then he listens to the warning announcement and then hears the dial tone.
- **SPECIAL_DIAL_TONE** : the following subscriber hears special dial tone until the announcement returns to the beginning, then he listens to the warning announcement and then hears the dial tone.
- **IMMEDIATELY** : the following subscriber hears the announcement immediately regardless of which part of the announcement is currently being played, after this part ends, it returns to the beginning and the subscriber listens to the warning announcement from beginning to the end and then hears the dial tone.

The **ANN_STATE** field covers all the announcement types and is valid for all of them.

CEPTANNS field can be datafilled with the feature options which have warning announcements. At least one option must be datafilled for this field and also more than one feature options can be datafilled as well.

If no option was provided for **CEPT_ANN** tuple then an error is given as following and addition or changing the tuple is rejected.

Figure 2 Error message for no option

```
>add
MACHINES NOT IN SYNC - DMOS NOT ALLOWED

>IMMEDIATELY
CEPTANNS:
>cfu
CEPTANNS:
>cfb
CEPTANNS:
>cfb
CEPTANNS:
>$
MULTIPLE ANNOUNCEMENT OPTIONS ARE NOT ALLLOWED FOR CEPT_ANN TUPLE
TUPLE TO BE ADDED:
CEPT_ANN CEPT_ANN IMMEDIATELY (CFU) (CFB) (CFB) $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
```

If the related feature option is datafilled for the **CEPTANNS** field then, when the subscriber goes off hook he hears warning announcement for this feature. If the related feature option is not datafilled for the **CEPTANNS** field or **CEPT_ANN** tuple does not exist in **ISERVOPT** table, then the subscriber hears the special dial tone or only dial tone as existing states of the features (table 4 describes them).

CFF Functionality is included in CFU, because they have same functionality excluding subscriber programming. If one of CFU or CFF feature is active and **CFU** option is datafilled for the **CEPTANNS** field then subscriber hears announcement as warning message.

In case of one or more features are active together on the same line, each feature will have priority over the other ones. CFU has highest priority in this case. According to these priorities , it is decided which announcement will be given. The following table lists the possible conditions of the announcements in case more than one feature active together (CFU, CFB and CFD can be active together only in case of MULTIPLE_CFX_ACTIVE field of CEPT_CFX tuple in ISERVOPT table is set to Y).

Table 1 Announcement to be given in case of more than one options are active together

Features which are active together	Announcement to be given
CFU or CFF, CFB, CFD, IWUC	CFU
CFU of CFF, CFB, IWUC	CFU
CFU or CFF, CFD, IWUC	CFU
CFB, CFD, IWUC	CFB
CFB, IWUC	CFB
CFD, IWUC	CFD
CDND, IWUC	CDND
CDTA, IWUC	CDTA
CDTO, IWUC	CDTO
Only IWUC	IWUC

If a wakeup request is active for the line and the same line has other announcement options then IWUC announcement has the lowest priority than the other feature announcements.

If the user dials a digit before the announcement hasn't finished then announcement is stopped and it's reverted to normal call processing.

The following table gives brief information about what the subscriber hears when he goes of hook if the announcements take place and the features' oldstates without the announcements.

Table 2 What the subscriber hears when he goes off hook

Features	Old States : SPECIAL_DIAL_TONE : N	Old States : SPECIAL_DIAL_TONE : Y	New states with the announcements
CFU or CFF	Dial Tone	Special Dial Tone	"Your Call Forward Universal feature is active"
CFB	Dial Tone	Special Dial Tone	"Your Call Forward Busy feature is active"
CFD	Dial Tone	Special Dial Tone	"Your Call Forward Don't Answer feature is active"
CDND	Dial Tone	Special Dial Tone	"Your Do Not Disturb feature is active"
CDTA	Dial Tone	Special Dial Tone	"YourCall Diversion To Announcement feature is active"
CDTO	Dial Tone	Special Dial Tone	"Your Call Diversion To Operator feature is active"
IWUC	Dial Tone	Dial Tone	"Your Wakeup Call feature is active"

>disconnect
TRUNK DISCONNECTED
```

The CLLI names of the CEPT announcements are hardcoded and will be added to the CLLI table by the code itself when the CEPT_ANN tuple is added to ISERVOPT table.

Table ANNPHLST can be datafilled after the phrases are recorded in **dramrec** level. The announcement CLLIs use the phrases according to the datafills in table ANNPHLST. In order to be in service, each announcement CLLI must be taken in service by **"bsy;rts"** using the **"mapci;mtc;trks;ttp"** level.

Since the standart announcement type is used for implementing this feature, many subscribers may connect to the same announcement CLLI at the same time, and this max connections number is datafilled at the MAXCONN field of the announcement tuple in table ANNS. This field can be set up to 255.

2.3 Hardware Requirements or Dependencies

n/a

2.4 Software Requirements or Dependencies

n/a

2.5 Limitations and restrictions

- If all the datafills for CEPT announcements are done and if an announce can not be started due to a failure of the announce trunk then special dial tone or only dial tone is provided according to **SPECIAL_DIAL_TONE** of the **CEPT_CFX** tuple. For IWUC feature, only dial tone will be provided.
- In table ANNS, CYTIME field of the announcement tuples should be datafilled the same as the recorded announcement phrase time. If the recorded phrase lengths are bigger than the datafilled CYTIME field of the ANNS table, then from the beginning of the recorded phrase, only the datafilled CYTIME period is played. If the recorded phrase lengths are smaller than the datafilled CYTIME, then after the phrase is finished it will return to the beginning and be played until the datafilled CYTIME period is ended, and dial tone is provided after this time period.
- If a PLGC warm swact takes place during the announcement, digit collection can not be performed, user must go on hook and off hook again.
- Flexible digit analysis can not be used due to the nature of warning announcement feature. Because during the announcement the first digit must be reported to CM to end the announcement and the feature. The feature will revert to normal CallP, so XPM will report the digits seperately.
- When the first subscriber goes off hook and connected to the empty annc trunk member, and if ANN_STATE field is set to DIAL_TONE or SPECIAL_DIAL_TONE, then a short time such as 0.5 sec. dial tone may be connected and then the whole annc is applied due to the XPM applies annc over dial tone in this case.

2.6 Interactions

- Interactions with CFIND and MWT;
  CEPT announcements have lowest priority than CFIND and MWT announcements. If one of them has applied the announcement then CEPT announcements will not be applied.
- WML (Warm Line);
  Warm line timer will start after the announcement is completed.
- If the pilot of DLH/MLH hunt group has one or more of the active announcement features, its members will not get warning announcement due to the members don’t have these feature options. Only the pilot has warning announcement.

3: Functional Description (FN): A00001919

3.1 Feature name

CEPT SERVICES PASSWORD ENHANCEMENT

3.2 Description

3.2.1 Introduction

This feature provides password enhancement for CEPT features and remote access to CEPT feature. These two main functionalities are:

3.2.1.1 CEPT Features' Password (CEPTPW)

This feature introduces a new line option to provide unique password for the subscriber. This password is valid for the features which are ILR (International Line Restriction) for IBN lines, OCB (Outgoing Call Barring) for BRI lines.

Currently, ILR and OCB have password utility and have their own passwords. Subscriber can set a new password which is valid for that feature when activating ILR on IBN lines or OCB on BRI lines. Therefore, subscriber can program different passwords for each activation of ILR or OCB.

Instead of this, new password feature provides a unique password for the subscriber, and subscriber will have ability to change this password by activation/programming this feature.

This unique password is used for existing password controlled features ILR, OCB and new feature CEPT Features Remote Access which is described in next section.

3.2.1.2 Cept Features Remote Access (CEPTRA)

This feature introduces new framework (CEPTRA - CEPT Features Remote Access) to control some CEPT feature functionalities of IBN lines from remote agents.

Currently, only CFRA is supported to control CEPT Call Forwarding flavors remotely. This feature replaces this CFRA functionality and CEPTRA controls following CEPT Features

- ILR (International Line Restriction)
- IWUC (International Wake-Up)
- Call Forwarding flavours (CFU, CFB and CFDA)
- CEPTPW (Cept Features' Password which is going to be implemented by first part of this activity).

CEPTRA allows activation/programming, deactivation or interrogation of CEPT features on end user's phone from a remote location. Two ways of using CEPTRA are:

- from a telephone resident on the same switch as the end user's set.
- from a set outside the end user's switch using a Direct Inward System Access (DISA) number

Note: Throughout this document, "base station" refers to end user's telephone set, and base station can only be IBN line.

3.2.2 Notation

ACK Positive acknowledgement

BT Busy Tone

CT Confirmation Tone

DT Dial Tone

FC Feature Code

IND Indication Tone

LH Lift Handset

NACK Negative Acknowledgement

RR Register Call (Flash)

RH Replace Handset

SC Service Code

SCT Special Confirmation tone

SDT Special Dial Tone

SIT Special Information Tone

TN Telephony Number

3.2.3 General Considerations

CEPTPW feature is provided for both IBN and BRI lines. There are some prerequisites to allow CEPTPW which are

- Line should have CEPT line option in order to use CEPTPW option if line class code is IBN.

- CEPTPW is supported only on ETSI version of BRI lines.
- CEPTPW is applicable only Point To Multipoint connection type of BRI lines.
- A new tuple CEPTPW should be provisioned to assign this feature to the subscriber.

CEPTRA is provided for only base agents whose Line Class Code is IBN.

- Line should have CEPTPW option.
- CEPTPW feature should be in “ACTIVE” state.

3.2.4 Feature Description of CEPTPW

This feature (CEPTPW) is assigned to the subscriber in following two ways:

- Assign directly to the subscriber by SERVORD
- Assign as a default CEPT feature via customer group

Feature has one line option field “STATUS” indicating status of the feature, it has three different states which are:

- DEACTIVE : states that password is equal to DEFAULT PIN which is provisioned in ISERVOPT table. Subscriber should activate password by using password changing sequence on his telephone, after that he will be able to use password controlled features such as ILR or CEPTRA. If he tries to perform one of the actions of password controlled features, he will get announcement “PLEASE CHANGE YOUR PASSWORD FIRSTLY”, after that he should goes on hook and should change the password by dialing activating/programming digit sequence of CEPTPW.
- ACTIVE: states that password is changed by the subscriber on his telephone, and has ability to use password controlled features.
- LOCKED: states that maximum wrong password entry is reached while performing password controlled features. Subscriber could not use password controlled features if the status of feature is LOCKED, he will get announcement “YOUR PASSWORD IS LOCKED, PLEASE CONTACT WITH NEAREST TELECOM MANAGEMENT TO YOU” while he tries to perform one of the actions of password controlled features.

Administrator can assign, deassign, activate and deactivate this feature via SERVORD. Administrator can only activate this feature via SERVORD if and only if CEPTPW is in “LOCKED” state in order to give permission to subscriber to control password related features. In this case, password is not changed, remains same as before and subscriber continues to use old password, this process is used if subscriber remembers the old password. Otherwise, if subscriber does not remember the PIN while CEPTPW is in “LOCKED” or “ACTIVE” state, administrator deactivates the feature via

SERVORD in order to reset the password as DEFAULT_PIN and set feature status as “DEACTIVE” which means subscriber should change the PIN to activate the feature by dialing activation digit sequence.

Subscriber can perform two actions to control this feature which are:

- **Activation/Programming**: (idle) LH DT * SC * OLD_PW * NEW_PW * NEW_PW# SCT RH
- **Interrogation**: (idle) LH DT *# SC * PW # SCT RH

The prerequisites to execute the CEPTPW are the followings:

- provisioning parameters in a new CEPTPW tuple in ISERVOPT table
- provisioning announcements
- assigning CEPTPW by SERVORD or as a default CEPT feature for IBN lines.

There are some parameters which are provisioned in existing ISERVOPT table in order to execute this feature, this is done by adding new tuple named as CEPTPW in this table and explained in detail at next section.

3.2.4.1 Provisioning ISERVOPT parameters

There is a new tuple defined for this feature in table ISERVOPT, and the parameters of this tuple is required for CEPTPW and CEPTRA performing. This new tuple includes the following parameters:

- **MAX_PIN_RETRY** {0 TO 9}: indicates that how many times that subscriber can enter wrong PIN while doing password related issues. ‘0’ means infinite PIN retry is allowed.
- **DEFAULT_PIN** {TABLE [0 TO 3] OF DIGIT}: indicates that the initial PIN when administrator assigns this feature to the subscriber. Subscriber should change the default PIN to activate the password feature.
- **PIN_VALIDATION** {BOOLEAN}: indicates that changing of unique password of which all digits are same as each other such as ‘2222 or 3333’ is disallowed or allowed. If it is set as ‘Y’, PIN validity is on and such PIN programming is not allowed and subscriber will get NACK tone or announcement “PASSWORD NUMBERS CAN NOT BE SAME AS EACH OTHER. PLEASE PROGRAM A DIFFERENT PASSWORD” according to announcement availability.
- **ANNOUNCE** {BOOLEAN}: indicates that announcements are used instead of SDT while user programming. Announcements will be applied to the subscriber if it is set as ’Y’; otherwise when it is set as ’N’, SDT or NACK/CONFIRMATION tone will be applied instead of announcements.
- **ANNOUNCE_STATE** {SILENCE, AUD_ RNG}: indicates that the subscriber hears only silence or audible ringing until the announcement

returns to the beginning, then he listens related announcement. This field is visible only if ANNOUNCE field is set as ‘Y’; otherwise it is invisible because there is no need to define announcement state since tones are used instead of them.

- **CEPT_ANNCS** {CEPT_ANNC_VECTOR}: indicates the used announcements in CEPTRA and CEPTPW features and the corresponding announcement trunk which is connected for the entered announcement name. This optionality provides flexibility to use any announcement CLLIs. Please refer to the Configuration section of this feature for more details.

The ISERVOPT table can be datafilled as follows:

Figure 1 Example of datafilling CEPTPW tuple when ANNOUNCE is ‘Y’

 >n
TUPLE TO BE ADDED:
CEPTPW CEPTPW 3 1111 Y N
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
JOURNAL FILE INACTIVE
```

In this case, the tuple can be seen from the listing of ISERVOPT table as follows:

Figure 4 The View of CEPTPW Tuple in ISERVOPT Table (ANNOUNCE is 'N')

```
>table iservopt

SOPTSKEY                                                SOPTSVAR
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
CEPTPW  CEPTPW                                          3 1111 Y N$
```

Deletion of this tuple is allowed even if there is already a line with CEPTPW option or CEPTPW is provisioned as a default CEPT feature. However, a message is displayed in order to warn administrator that CEPTPW will not provide its functionality at all. This warning message is :

'WARNING: CEPTPW can be on any agent or default CEPT feature. WARNING: CEPTPW does not work without this tuple.'

Additionally, if this tuple is not datafilled in ISERVOPT table, assigning of this feature by SERVORD or default CEPT feature is not allowed. A message is generated as warning **'CEPTPW tuple is not datafilled in ISERVOPT table'**

3.2.4.2 Provisioning Announcements

Announcements can optionally be provided instead of supported tones. The new tuple CEPTPW has ANNOUNCE fields, taking the values {N, Y}.

- if the CEPTPW tuple is not present, or the field ANNOUNCE is set to 'N', tones are given
- If ANNOUNCE is set to 'Y' announcements are provided instead of tones.

The announcement type to be used in table ANNS is STD.

The announcements are:

- **CEPTPW_CHGPIN** : '*Please change your password firstly by activating CEPTPW feature*'

This announcement is applied to the subscriber when he tries to use one of the password controlled features in case of CEPTPW is in DEACTIVE state (means unique password is reset as DEFAULT PIN provisioned in ISERVOPT table). This announcement is datafilled as CEPTPW_CHGPIN 0 in the Figure 5.

- **CEPTPW_LOCKED** : '*Your password is LOCKED. Please contact with nearest TELECOM management to you*'

This announcement is applied to the subscriber when he tries to use one of the password controlled features in case of CEPTPW is in LOCKED state (meant subscriber had entered number of MAX_PIN_RETRY times wrong password sequentially). This announcement is datafilled as CEPTPW_LOCKED 0 in the Figure 5.

- **CEPTPW_VLDPIN** : '*Password numbers can not be same as each other. Please program a different password*'

This announcement is applied to the subscriber when he tries to change/ program a unique password of which digits are the same as each other such as '1111' or '3333'. This restriction is valid only if the PIN_VALIDATION field of CEPTPW tuple in ISERVOPT table is set as 'Y'; otherwise such PIN entries

are allowed.This announcement is datafilled as CEPTPW_VLDPIN 0 in the Figure 5.

Additionally, this announcement is applied to the subscriber when he tries to change the unique password to the default password provisioned in CEPTPW tuple. In this case,

if **PIN_VALIDATION** is **N**, this announcement is:

'*Password can not be equal to default password. Please program a different password*'

If **PIN_VALIDATION** is **Y**, this announcement is:

'*Password can not be changed as default password or password digits can not be same as each other. Please program a different password*'

- **CEPTRA_DNPIN** : 'Please enter your telephone number followed by the star key and your unique password'

This is an interruptible announcement and applied to the subscriber when he dials DISA DN in order to use CEPTRA. It is datafilled as CEPTRA_DNPIN 0 in the datafill example in the Figure 5.

- **CEPTRA_SCODE** : '*Please enter a code to activate deactivate or query the status of desired CEPT feature*'

This is an interruptible announcement and is applied to the subscriber when he entered telephone number and password successfully in time of using CEPTRA. It is datafilled as CEPTRA_SCODE 0 in the datafill example in the Figure 5.

In case of failure of applying any of this announcements (for example, desired announcement is not provisioned in CEPTPW tuple) the corresponding tone will be applied to the subscriber. Mapping between tones and announcements is as shown Table 1 below.

Table 1 Announcement to Tone mapping

Announcement	Tone
CEPTRA_DNPIN	**Special Dial Tone (SDT)** or **Dial Tone** (it is applied in case of R1 loopback trunk connection required)
CEPTRA_SCODE	

Announcement	Tone
CEPTPW_CHGPIN	NACK tone
CEPTPW_LOCKED	
CEPTPW_VLDPIN

>position CEPTRA_DNPIN 5 pad 1
RECORDING ON DRAM 0
USE TRUNK HSET MEMBER 2
>position CEPTRA_SCODE 5 pad 1
RECORDING ON DRAM 0
USE TRUNK HSET MEMBER 2
>disconnect
TRUNK DISCONNECTED
```

Table ANNPHLST can be datafilled after the phrases are recorded in **dramrec** level. The announcement CLLIs use the phrases according to the datafills in table ANNPHLST. In order to be in service, each announcement CLLI must be takes in service by **"bsy;rts"** using the **"mapci;mtc;trks;ttp"** level.

Since the standard announcement type is used for implementing this feature, many subscribers may connect to that same announcement CLLI at the same time, and this max connections number is datafilled at the MAXCONN field of the announcement tuple in ANNS. This field can be set up to 255.

3.2.4.3 Provisioning CEPTPW as Default Feature for IBN lines

In the existing functionality, CEPT customer line option is assigned to customer group with DEFAULT_FEATURE_ON (Y/N) parameter, and if the default feature is set to Y, there will be optional sub fields indicate default features. It is expressed as following:

CUST783 CEPT CEPT Y (ICWT)(WML) (IWUC) (CDND) (CFU) (CFB) (CFD) (CFRA) (ILR)(SCL) (ICT)(LNR) (I3WC)(I6WC) (CCBS) $

This feature defines a new default feature CEPTPW as sub field of CEPT tuple in CUSTSTN. Since CEPTPW option is incompatible with CFRA option, operator could not add CEPTPW and CFRA together to the same customer group, that means they can not be assigned same customer group. In this case, an error message will be printed

"**WARNING: CEPTPW AND CFRA ARE INCOMPATIBLE OPTIONS. WARNING: PLEASE REMOVE ONE OF THEM**".

Subscriber can activate CEPTPW even if it isn't on line while CEPTPW is a default feature. In this case, subscriber can try activation infinite times.

The datafilled tuple will be as following:

CUST783 CEPT CEPT Y (ICWT)(WML) (IWUC) (CDND) (CFU) (CFB) (CFD) (ILR)(SCL) (ICT)(LNR) (I3WC)(I6WC) (CCBS) (**CEPTPW**)$

3.2.4.4 Servord Provisioning

Servord Provisioning is provided only CEPTPW feature, and it can be controlled by the following operations:

- Administrator assignment
- Administrator deassignment
- Administrator activation
- Administrator deactivation
- Subscriber activation/programming
- Subscriber interrogation

3.2.4.4.1 Administrator Assignment

This feature is assigned by the administrator via Service Order when requested by the subscriber.

For IBN lines:

The CEPT line option is prerequisite for CEPTPW line option, so CEPT line option must be assigned first or at the same time to assign CEPTPW line option to a subscriber.

If CEPTPW option is assigned to a subscriber not having CEPT option, an error message "**Can not add CEPTPW option if line does not have CEPT option, firstly add CEPT line option**" is printed on screen.

The administrator has to enter one field STATUS within the CEPTPW option.

- STATUS should be entered "DEACTIVE". The administrator is unauthorized to enter "ACTIVE" or "LOCKED" as STATUS in order to comply with the requirement that is subscriber should activate password feature on his telephone after assignment.

Figure 7 Example of CEPTPW Assignment via Service Order for IBN lines

3.2.4.4.2 Administrator Deassignment

The administrator may deassign CEPTPW option by using the DEO (Delete Option) command via Service Order.

For IBN lines:

Removing of CEPT line option from a line is not allowed to the administrator, when CEPT and CEPTPW options are both on the line. An error message '**Deletion of CEPT line option is not allowed when CEPTPW option is on**

the line' is printed when the administrator tries to delete CEPT option from a line.

Figure 9 Example of Deassignment via Service Order for IBN lines

>y
```

3.2.4.4.3 Administrator Activation

The administrator can activate CEPTPW feature if and only if CEPTPW is already in “LOCKED” state which means subscriber exceeds the maximum wrong PIN entry while performing password related feature actions.

This action is performed when subscriber remembers the old PIN and wants to continue to use this PIN as CEPT password.

3.2.4.4.4 Administrator Deactivation

The administrator may deactivate the CEPTPW on a subscriber line by using the CHF (Change Feature) command, this action can be performed if CEPTPW is already in “ACTIVE or “LOCKED” states.

This action is performed when subscriber do not remember the old PIN and wants to use default password as CEPT password. However, subscriber should have activate the CEPTPW after this function because it is now in DEACTIVE state.

Figure 13 Example of CEPTPW Deactivation via Service Order for IBN lines

CEPTPW DEACTIVE

--------------------------------------------------------------------------------
```

3.2.4.4.5 Subscriber Activation/Programming

CEPTPW option is in DEACTIVE state after assignment or deactivation by administrator, after these two actions subscriber should activate CEPTPW by using following dialing sequence:

(idle) LH DT * SC * OLD_PW * NEW_PW * NEW_PW# SCT RH

OLD_PW and NEW PW is a four digits pass code and OLD PW is equal to DEFAULT_PW provisioned in table ISERVOPT. NEW_PW should be different that OLD_PW and should not be equal to DEFAULT_PIN.

There is no difference in dialing digit sequence for activation or programming, the difference is if the OLD_PIN is equal to DEFAULT_PIN, this action is called as “activation” and state of the CEPTPW feature is set as “ACTIVE”, NEW_PW is set as a unique CEPT password; otherwise, action is called as ‘programming” and only action is setting NEW_PW as unique CEPT password.

For only IBN lines, during the talking mode the subscriber may activate the CEPTPW by dialing the following digit sequence:

(talking) RR SDT * SC * OLD_PW * NEW_PW * NEW_PW# SCT RH

The dialling accode for activation is provisioned in ACCODE table for IBN lines. The datafilling of ACCODE table is as follows:

For IBN lines:

```
>table accode

XLANAME     FROMD     TOD     XLADATA
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
STARCEPT  66  66  FEAT (FTR  CEPTPW) (PF 2) (MM 2 20) (FUNC  ACT) $
```

The dialling code for activation is provisioned in IBNXLA table for BRI lines. The datafilling of IBNXLA table is as follows:

For BRI lines:

```
>table ibnxla
TOP
KEY RESULT
----------
PTTACT 66 FEAT N N CEPTPWA
```

When journal file is active, subscriber activation data is updated on journal file. If journal file is inactive, CSFJF log is generated.

3.2.4.4.6 Subscriber Interrogation

The subscriber may interrogate if the subscriber remembers the right CEPT unique password. In the following sequence, the subscriber receives a SCT, when dialed password is equal to CEPT unique password.

(idle) LH DT *# SC * PW # SCT RH

For IBN lines, during the talking mode the subscriber may interrogate the password by dialing the following sequence:

(talking) RR SDT *# SC * PW # SCT (talking) RH

If the dialed password is same as the CEPT unique password the subscriber receives a SCT, otherwise the dialed password is not right receives a SIT.

The dialling accode for interrogation is provisioned in ACCODE table for IBN lines. The datafilling of ACCODE table is as follows:

For IBN lines:

```
>table accode

XLANAME     FROMD     TOD     XLADATA
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
STARCEPT  C66  C66  FEAT (FTR  CEPTPW) (PF 3) (MM 2 10) (FUNC  INT) $
```

The dialling code for interrogation is provisioned in IBNXLA table for BRI lines. The datafilling of IBNXLA table is as follows:

For BRI lines:

```
>table ibnxla
TOP
KEY RESULT
----------
PTTACT C66 FEAT N N CEPTPWI
```

3.2.4.5 CEPTPW Interactions with ILR & OCB

CEPTPW feature provides a generic CEPT password for all password related CEPT features which are ILR on IBN lines and OCB on BRI lines. Normally, subscriber have ability to set different passwords while activating these features, therefore if the line has CEPTPW, subscriber should use this unique password for all functions which needs password such as activation or deactivation. However, there are some scenarios in assignment of CEPTPW, and these are explained in Table 2.

Table 2 Password status after feature assignments

Password Status according to options on agent after action is performed						
Before Action			**After Action**			**PASSWORD STATUS**
ILR	OCB	CEPTPW	ILR	OCB	CEPTPW	
X			X		X	Subscriber should use unique CEPT password* while activating ILR.
X		X	X			Subscriber can choose different passwords while activating ILR.
	X			X	X	Subscriber should use unique CEPT password* while activating OCB.
	X	X		X		Subscriber can choose different passwords while activating OCB.
		X	X		X	Subscriber should use unique CEPT password* while activating ILR.
		X		X	X	Subscriber should use unique CEPT password* while activating OCB.

X abbreviates this option exists on this agent.

* Subscriber should activate CEPT generic password after assignment of CEPTPW (by SERVORD or as DEFAULT feature) in order to use password related features (ILR, OCB or CEPTRA). Otherwise, announcement "**Please change your password firstly by activating CEPTPW feature**" is applied to the subscriber and not allowed to control the requested feature.

Administrator assignment of ILR and OCB is different than normal cases when CEPTPW has already on line as line option or default CEPT feature. It is explained as following:

3.2.4.5.1 Administrator Assignment of ILR when CEPTPW is on line

Administrator may assign ILR via SERVORD currently as shown in Figure 11, however when CEPTPW is already on line while assigning ILR, the ILRPW field is not prompted for provisioning since CEPTPW is providing a unique password for this line.

Figure 15 Current Administrator Assignment of ILR (reminder)

3.2.5 Feature Description of CEPTRA

This feature introduces a new framework (CEPTRA - CEPT Features Remote Access) to control some CEPT feature functionalities of IBN lines from remote agents.

3.2.5.1 Provisioning CEPTRA feature

CEPTRA (Cept Features Remote Access) feature provides remote programming of the some CEPT features which are:

- ILR (International Line Restriction)
- IWUC (International Wake-Up)
- Call Forwarding flavours (CFU, CFB and CFD)
- CEPTPW (Cept Features' Password which is going to be implemented by first part of this activity).

In order to use this feature, a DISA DN should be defined with 'CEPTRA' option. This option should be the only option on this DISA DN and is not compatible with other DISA options. This definition can be done in two ways:

- by provisioning DNROUTE table
- by using NEWDN servord command

3.2.5.1.1 Definition DISA DN by provisioning DNROUTE table

DISA DN could be defined by provisioning DNROUTE table as following:

Figure 19 Provision of DNROUTE table

```
TABLE: DNROUTE
>
>add
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED

3.2.5.1.2 Definition DISA DN by NEWDN servord command

DISA DN can be defined with CEPTRA option by using NEWDN command as following:

Figure 20 Processing NEWDN command to define DISA DN with CEPTRA opt.

3.2.5.2 Remote Programming of CEPT Features

The common abbrevations used programming of the CEPT features remotely are explained as following.

A service code (SC), PIN is the Personal Identification Number, TN1 is the DISA DN, TN2 is the base station DN, TN3 is the destination number to which incoming calls of T2 shall be diverted.

3.2.5.2.1 ILR -International Line Restriction

Control Procedure

- Activation and programming: (idle) LH DT TN1 Announcement "CEPTRA_DNPIN" (SDT) TN2 * PIN # Announcement "CEPTRA_SCODE" (SDT) * SC * PIN * CR# SCT RH
- Deactivation: (idle) LH DT TN1 Announcement "CEPTRA_DNPIN" (SDT) TN2 * PIN # Announcement "CEPTRA_SCODE" (SDT) # SC * PIN # SCT RH
- Interrogation: (idle) LH DT TN1 Announcement "CEPTRA_DNPIN" (SDT) TN2 * PIN # Announcement "CEPTRA_SCODE" (SDT) *# SC # SCT RH

A service code (SC) is 33, PIN is the personal Identification Number, CR Call Restriction Programming Digits (provisioned in ILRCLS tuple ISERVOPT table)

During activation and programming;

The subscriber will receive a SIT instead of SCT if the activation fails,

If a restriction needs to be applied on the line, the previous restriction must be cancelled by the subscriber. This ensures that no one can change the restriction class except for those who knows the password.

During deletion;

The subscriber receives a SIT, if an invalid password (PIN) is dialled.

During interrogation;

If ILR is active in the line, subscriber receives SCT otherwise receives SIT.

Please refer to 'CEPT International Line Restriction AT.59019295' for more details.

3.2.5.2.2 IWUC -International Wake-Up Call

- **Control Procedure**
- Activation and programming: (idle) LH DT TN1 Announcement "CEPTRA_DNPIN" (SDT) TN2 * PIN # Announcement "CEPTRA_SCODE" (SDT) * SC * Time # SCT RH
- Deactivation: LH DT TN1 Announcement "CEPTRA_DNPIN" (SDT) TN2 * PIN # Announcement "CEPTRA_SCODE" (SDT) # SC * Time #

SCT RH **or** LH DT TN1 Announcement CEPTRA_DNPIN (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) # SC # SCT RH

- Interrogation: LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) *# SC * Time# SCT RH **or** LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) *# SC * Time# SCT RH

A service code (SC) of 55 is recommended for the feature.

During activation and programming;

On a successful subscriber activation with programming, ACK treatment will be given.

The subscriber will receive special dial tone when going off hook while feature is active.

During deletion;

On a successful subscriber deletion sequence, ACK treatment will be given and the diversion is cancelled.

For unsuccessful deletion NACK is given and no change in the state of the diversion.

During interrogation;

On a successful subscriber interrogation results in ACK treatment.

On a un successful subscriber interrogation results in NACK treatment.

Please refer to ‘International Wake-Up Call AT.59019097’ for more details.

3.2.5.2.3 CFU – Call Forward Unconditional

Control Procedure

- Activation and programming: (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) * SC * TN3 # SCT RH

- Deactivation: (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) # SC# SCT RH
- Interrogation: (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) *# SC # SCT RH

A service code (SC) of 21 is recommended for the feature.

During activation and programming;

On a successful subscriber activation with programming, ACK treatment will be given.

The subscriber will receive special dial tone when going off hook while feature is active.

During deletion;

On a successful subscriber deletion sequence, ACK treatment will be given and the diversion is cancelled.

For unsuccessful deletion NACK is given and no change in the state of the diversion.

During interrogation;

On a successful subscriber interrogation results in ACK treatment.

On a un successful subscriber interrogation results in NACK treatment.

Please refer to ‘CEPT Call Diversion and CEPT Do Not Disturb AT.59019083’ for more details.

3.2.5.2.4 CFB P – Call Forward Busy Programmable

Control Procedure

Activation and programming: (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) *SC*TN3 ACK RH

Deletion:(idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) #SC#ACK RH

Interrogation: (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) *#SC#IND RH

A service code (SC) of 60 is recommended for the feature.

During activation and programming;

On a successful subscriber activation with programming, ACK treatment will be given.

The subscriber will receive special dial tone when going off hook while feature is active.

During deletion;

On a successful subscriber deletion sequence, ACK treatment will be given and the diversion is cancelled.

For unsuccessful deletion NACK is given and no change in the state of the diversion.

During interrogation;

On a successful subscriber interrogation results in ACK treatment.

On an unsuccessful subscriber interrogation results in NACK treatment.

Please refer to ‘CEPT Call Diversion and CEPT Do Not Disturb AT.59019083’ for more details.

3.2.5.2.5 CFD P - Call Forward Do not Answer Programmable

Control Procedure

Activation and programming: (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) *SC*TN3 ACK RH

Deletion: (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) #SC#ACK RH

Interrogation: (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) # SC TN3#IND RH

or (idle) LH DT TN1 Announcement “CEPTRA_DNPIN” (SDT) TN2 * PIN # Announcement “CEPTRA_SCODE” (SDT) *#SC#IND RH

A service code (SC) for CFD is datafillable in table ACCODE by the administrator.

During activation and programming;

On a successful subscriber activation with programming, ACK treatment will be given.

The subscriber will receive special dial tone when going off hook while feature is active.

During deletion;

On a successful subscriber deletion sequence, ACK treatment will be given and the diversion is cancelled.

For unsuccessful deletion NACK is given and no change in the state of the diversion.

During interrogation;

On a successful subscriber interrogation results in ACK treatment.

On a unsuccessful subscriber interrogation results in NACK treatment.

Please refer to ‘CEPT Call Diversion and CEPT Do Not Disturb AT.59019083’ for more details.

3.2.6 Info Log for CEPTRA usages

A new log family (CEPT) is introduced by this feature, and it has two members CEPT100 and CEPT101 logs. These are explained as:

3.2.6.1 CEPT100 Log

A new log (CEPT100) is introduced by this feature due to the security reasons and provides to trace back. This log records the some informations which are:

- Base DN
- Originating DN
- Originating Trunk

CEPT100 log is generated if and only if subscriber password feature (CEPTPW) is locked via remote accessing to CEPT features by using CEPTRA.

3.2.6.1.1 CEPT101 Log

This log is generated when subscriber attempts to use supported CEPT features (ILR, IWUC, CEPTPW, CFU, CFD, and CFB) from remote agents via CEPTRA. This log has five fields which are:

- Base DN
- Originating DN
- Originating Trunk
- Feature
- Action

If subscriber can not pass the authorization state (PIN verifying for base agent) or the subscriber has dialed invalid digits of which translation does not result on any CEPT feature request, this log is not generated since there is no feature request.

Please refer to FM section of this book for more details.

3.2.7 Feature Metering

Feature metering is a system used to charge for subscriber feature meterable activities either by the administrator or the subscriber itself. Since this system is not supported on BRI agents, there will be no feature charging for this type of agents while CEPTPW actions are performed.

3.2.7.1 Feature Metering for CEPTPW

In table MTRFEAT, the feature metering counts are provisioned for CEPTPW operations and subscriber is metered for the following operations:

Administrator assignment : A datafillable number of charge units may be charged for each time when the administrator assigns the feature to a line.

Administrator deassignment : A datafillable number of charge units may be charged for each time when the administrator deassigns the feature from a line.

If CEPTPW is a default feature (for only IBN lines), when cancelling default feature optionality of CEPTPW (via removing CEPTPW from CEPT tuple in CUSTSTN table), CEPTPW is automatically deassigned from lines of this customer group, and lines having CEPTPW option is charged as deassign feature metering.

Administrator activation : A datafillable number of charge units may be charged each time when the administrator successfully activates CEPTPW feature in case it is in “LOCKED” state.

Administrator deactivation : A datafillable number of charge units may be charged each time when the administrator successfully deactivates (resets password) CEPTPW feature in case it is in “LOCKED” state.

Subscriber activation : A datafillable number of charge units may be charged for each subscriber successful activation that results with a SCT.

Subscriber Interrogation : A datafillable number of charge units may be charged for each subscriber interrogation.

CEPTPW index is used on MTRFEAT table to get the corresponding charge unit counts for assignment,deassignment, administrator activation, administrator deactivation, subscriber activation and subscriber interrogation.

The subscriber is metered when the administrator enters MOG option and MOG_ID like (mog_0, mog_1, mog_2, . . . etc.) to subscriber’s line via Service Order.

In Figure 21, from the map the provisioning is as follows:

Figure 21 CEPTPW Metering

```
>table mtrfeat
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: MTRFEAT

CEPTPW MOG_0  44  (ASSIGN 12)  (DEASSIGN 10) (ADMACT 9)
                  (ADMDEACT 7) (SUBACT 6) (INTERROG 2)  $
```

3.2.7.2 Feature Metering for CEPTRA

There is not new additional feature metering definition for CEPTRA feature and existing procedures are valid. Subscriber is charged for meterable activities when he/she performs remote access programming of related feature, there will be no any additional feature metering for using CEPTRA.

3.2.8 OM (Operational Measurements)

The new OM group CEPTPW is introduced to measure CEPTPW operations. This OM group has 9 registers and named as:

PWACT, PWUACT, PWCHG, PWUCHG, PWINTG, PWUINTG, PWLCK, PWUSG, PWCERR

Additionally, the new OM group CEPTRA is introduced to measure CEPTRA operations. This OM group has 5 registers and named as:

CPTRAATT, CPTRAHOV, CPTRASOV, CPTRAFAL, CPTRASUC

Refer to PF Section for the meaning of these registers and details.

3.3 Hardware Requirements or Dependencies

Not Applicable

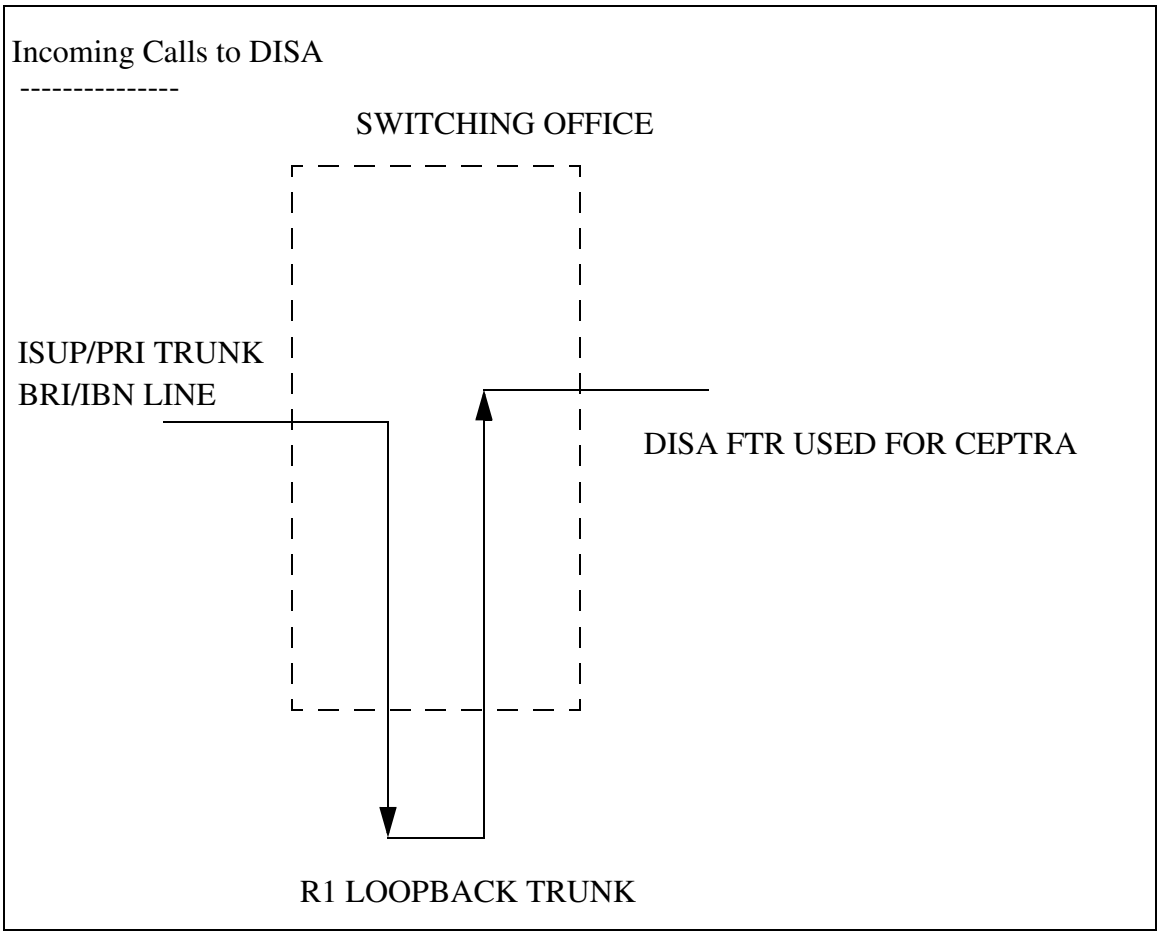
3.4 Software Requirements or Dependencies

Not Applicable

3.5 Limitations and restrictions

- The R1 loopback trunks are required for the CEPTRA feature activation calls made over ISUP/PRI trunks and the BRI lines. Although R1 loopback trunks are not needed for the calls made over IBN line, they are used to have consistency for the metering point of view, therefore, the calls through DISA DN can be metered. Loopback trunks are inserted between all incoming calls and the DISA at the terminating office. In this case, if tones are used instead of announcements, DIAL TONE is applied to the subscriber instead of SDT.

Figure 22 Loopback Trunk Configuration



- CEPTRA should be the only option provisioned in DISA DN. There must be no additional option such as CFRA, SIMRING on DISA DN.
- CEPTPW is incompatible with CFRA option. Administrator could not provision these two option on same agent by SERVORD. In addition, same customer group could not have both options as default CEPT feature, these actions are restricted.
- Digits dialed by subscriber are not considered till related announcement starts. (in CEPTRA)
- Supported trunks are represented in below table. (in CEPTRA)

Table 3 Supported Trunks

ETSI ISUP
R1 (NTLS01, 02,09) , R2 (Base)
ETSI PRI

- For the markets that support the UTR (Universal Tone Receiver) card configuration on the XPM, the digit collection is supported on incoming ISUP/TUP/FDCP R2 trunk directly, no R1 loopback trunks are required. Please refer to activity A00002755 for more details.

3.6 Interactions

- CEPT FEATURES REMOTE ACCESS (CEPTRA) : If the remote station has 3WC, then the remote station will not be allowed to flash & initiate a 3WC once the remote access has started. If the remote station is involved in a call which allows three way calling, the remote station will be allowed to flash and make a remote access call. Once the remote access call is made the remote station will not be allowed to flash again to conference in the original call. The caller must wait for the remote access to complete before attempting to return to the original call. The above restriction is applied only if the remote access call is intra nodal.
- CEPTPW and AUL are incompatible with each other.
- CEPTPW and CFRA are incompatible with each other.

4: Functional Description (FN): A00001920

4.1 Feature name

Metering OOS Enhancements.

4.2 Description

This feature enhances existing metering structure in terms of deassigned meters of lines. In current metering system, a subscriber becomes meterable via a MOG option. Depending on assigned MOG id, software meters (which may be up to 4) are assigned to subscriber.

When MOG option is removed from subscriber, all assigned meters on subscriber are sent to OOS. If MOG option is reprovisioned on the same DN, meter counts of assigned meters starts with zero, since it is initialized.

The purpose of this feature is to store meter counts of agents when any MOG deletion process is performed and to restore meter counts back when MOG addition is performed on same agent.

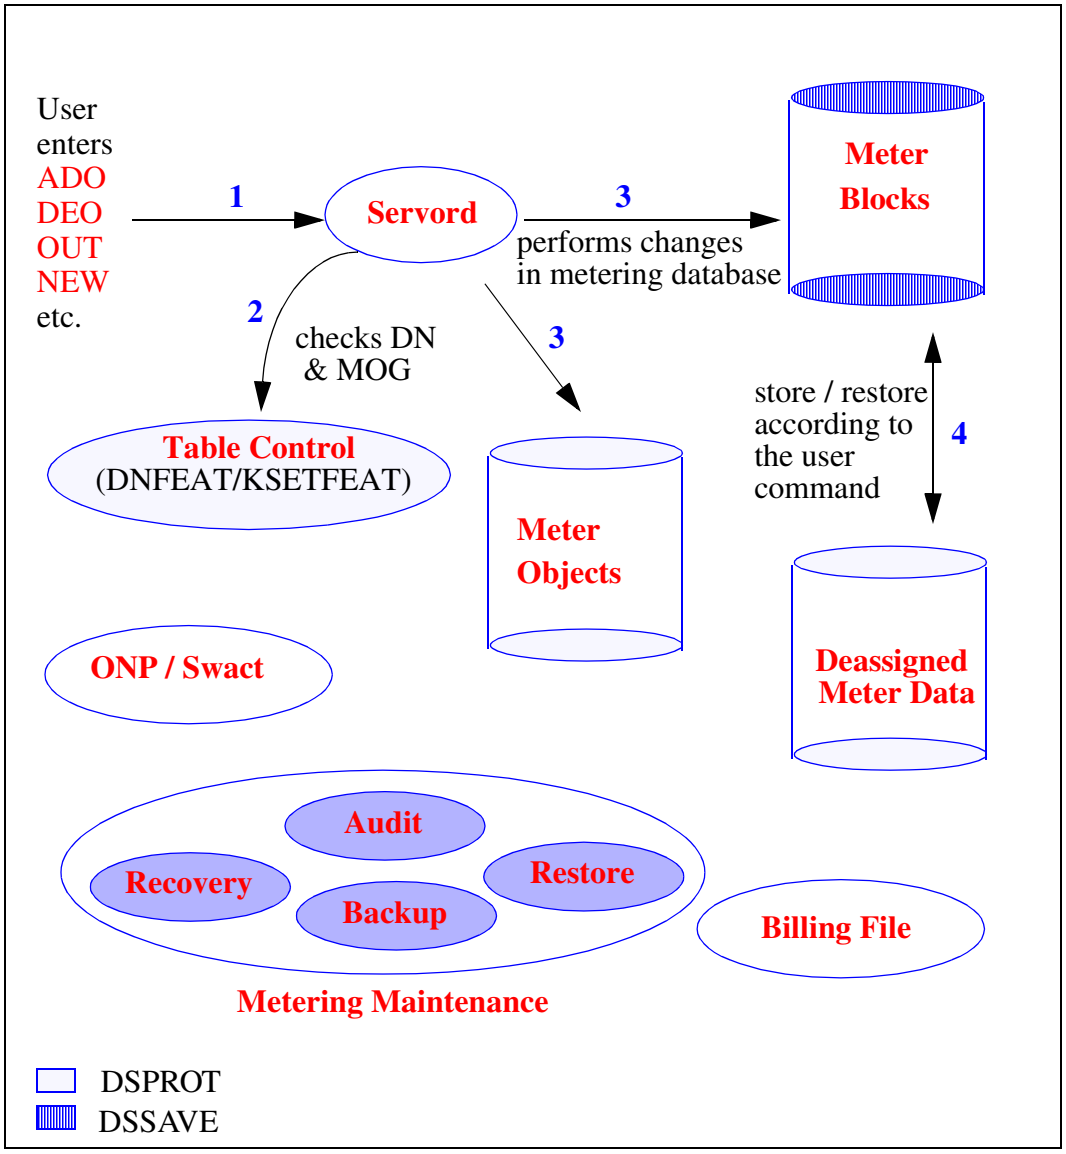
While storing line meter counts, it is important to supply consistency after restarts, image reloads or restore operations. To manage metering consistency for deassigned meters, line metering maintenance processes (Backup & Restore, Audit, Recovery, ONP) are enhanced.

In addition to this, in current metering system, billing records for metered lines are generated by referring to billing file. Billing file includes both OOS meters and INUSE meters which means that deassigned meters are also included in this file.

This feature is optional with a SOC option. When state of SOC is ON, feature becomes active, otherwise system behaves as it was before this functionality.

The feature is implemented in ISN07.

Figure 1 Functional Behavior of Feature



Main changes that have been introduced with this feature can be listed as follows;

- Activation of Feature
- New Table MTRDEASS
- Adding / Deleting MOG Option
- Metering Maintenance Support
- Billing File Interaction
- New Log MTR150

- New NONRES Command DEASCLR

In following sections, changes introduced with this feature are mentioned in details.

4.2.1 Activation of Feature

This feature is functional in Bangladesh and TRNC market. For the other markets this feature is not functional. So activation of feature is controlled by SOC.

METR_Deassigned_Support is a state SOC and it has two states, ON and IDLE. Default state of *METR_Deassigned_Support* is IDLE. When its state is ON, this feature becomes functional.

Table 1 SOC for Activation of Feature

SOC group:	METR
SOC option name:	METR0016
SOC option title:	METR_Deassigned_Support
SOC option control type:	state
New SOC option?	Yes
Option defined in DRU:	WT20
Affected products:	DMS100-MMP

Activation of SOC is done by a password control. The passwords are unique for each office. When deactivation is being performed, a restriction is handled in order not to change state of SOC easily. NCW_MOG parameter in MTRSYSPM table is checked. If value of this parameter is “DISALLOWED”, changing SOC state to IDLE is forbidden. SOC can be set to IDLE, when this parameter is “ALLOWED”. Also if there is at least one tuple in MTRDEASS table, setting state of METR0016 SOC is forbidden.

Note: Changing value of NCW_MOG parameter requires a reload restart.

There is another SOC option within this feature. It is used to decide sending deassigned meters to OOS or not, where Bangladesh behaves differently from other markets.

Table 2 SOC for Preventing to Sent Deassigned Meters to OOS

SOC group:	METR
SOC option name:	METR0017

SOC option title:	METR_Prevent_Sent_OOS
SOC option control type:	state
New SOC option?	Yes
Option defined in DRU:	WT20
Affected products:	DMS100 - MMP

METR_Prevent_Sent_OOS is also a state SOC which has two possible states; ON and IDLE. Default state of SOC is IDLE.

Activation/Deactivation of these two SOC options depends to one another as follows:

- State of *METR_Deassigned_Support* can be set to IDLE only when state of *METR_Prevent_Sent_OOS* is IDLE.
- State of *METR_Prevent_Sent_OOS* can be set to ON only when state of *METR_Deassigned_Support* is ON.

Activation of feature for Bangladesh market is as following:

- State of *METR_Deassigned_Support* is set to ON
- Then, state of *METR_Prevent_Sent_OOS* is set to ON.

Activation of feature for TRNC market is as following:

- State of *METR_Deassigned_Support* is set to ON.
- State of *METR_Prevent_Sent_OOS* is always IDLE.

Activation/Deactivation of *METR_Deassigned_Support* and *METR_Prevent_Sent_OOS* is forbidden while a maintenance process (meter audit/recovery) or billing process is running.

4.2.2 New Table MTRDEASS

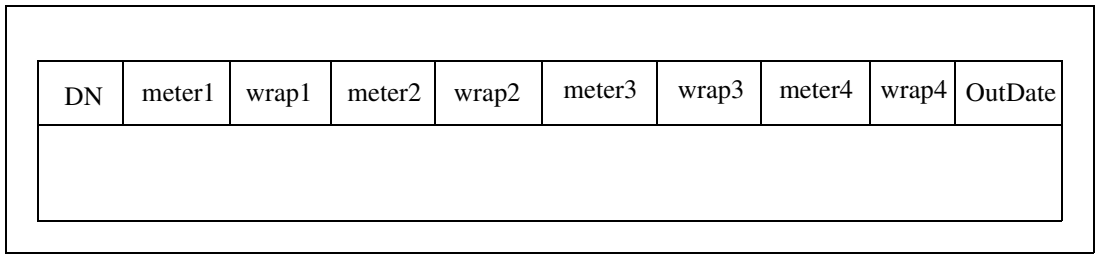
When a metered line (IBN/ETSI BRI) is deleted or when MOG option is removed from a line, assigned meters (which may be up to 4) of DN are stored as deassigned meters in a new table in DSPROT.

To provide a user interface of new storage of deassigned meters, MTRDEASS table is created. This table is read only that is, any of the tuples can not be changed or deleted. But user can see meter counts of deassigned meters of agents whenever requests.

It is important to mention that, while listing meter counts of each meter of agent, meter counts are retrieved from meter blocks in DSSAVE.

The content of each tuple in MTRDEASS table is as follows;

Figure 2 Structure of MTRDEASS Table



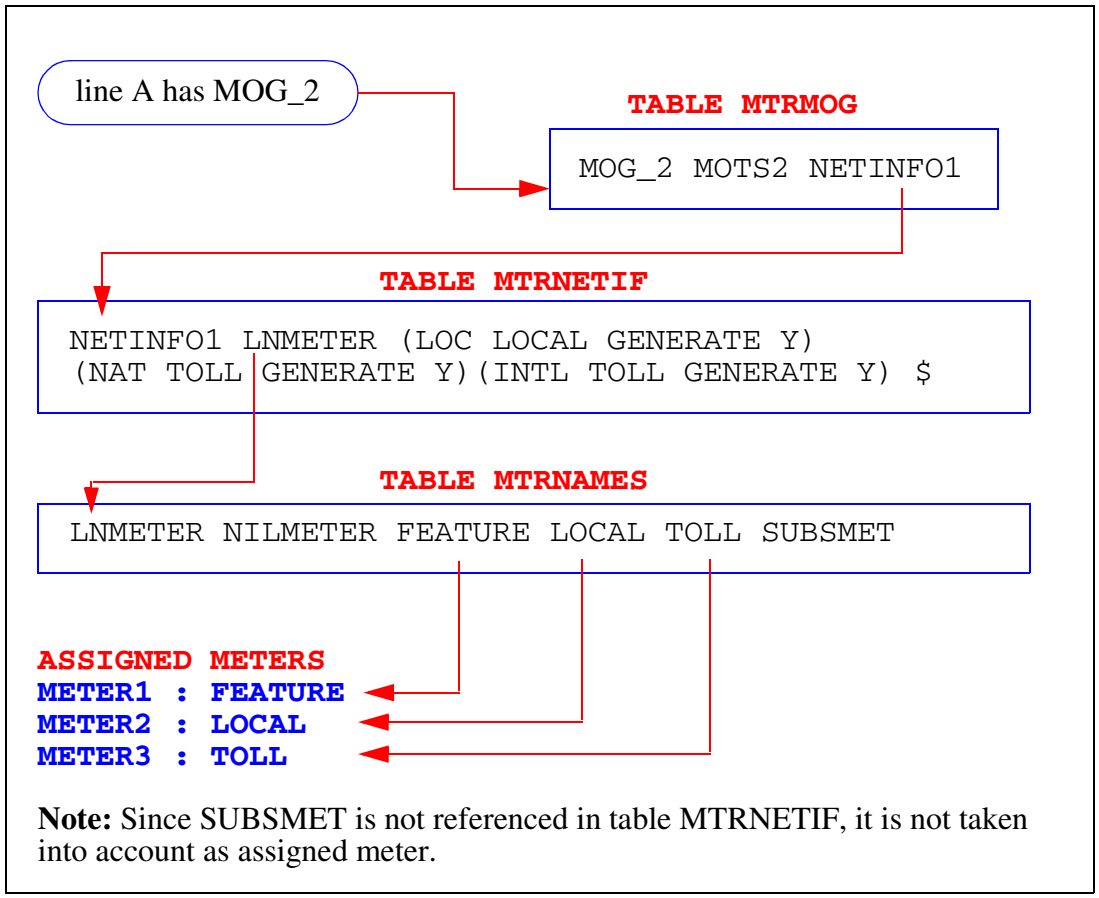
DN: Directory number of agent (which may be up to 18)

Wrap: Y/N, indicating date meter counts has exceeded 99999999 and wrapped.

Date: Date of deleting MOG option. Its format is as follows; yyyy/mm/dd hh:mm:ss. Date is modified every time a change has been made on tuple in MTRDEASS table.

Meter1, meter2, meter3, meter4: Assigned meters which depends on MOG id. These meters are determined as follows:

Figure 3 Retrieving Assigned Meters



Note: Since SUBSMET is not referenced in table MTRNETIF, it is not taken into account as assigned meter.

The table lists last counts of agent when MOG deletion is performed. For every assigned meters (which may be up to 4) of agent, meter count and wrap information are listed with date of adding tuple to MTRDEASS table.

Maximum number of tuples in MTRDEASS table is limited to 65520.

4.2.3 Adding / Deleting MOG Option

When user performs any operation that results with MOG deletion, assigned meters of agent are stored in MTRDEASS table. All servord commands that causes MOG deletion/addition is considered. Some examples of commands are below.

4.2.3.1 Delete MOG Option

DEO command is used to remove an option from a specified DN. While removing MOG option from an agent, its assigned meters are stored in the system as deassigned meters.

If there is no space available in MTRDEASS table to add deassigned meters, a warning message is displayed to inform user about this.

```
Format of warning message is as follows;

NO SPACE AVAILABLE IN MTRDEASS
TABLE.DEASSIGNED METER COUNTS WILL BE LOST!
```

In addition to this, a new MTR log is generated to log last count of each deassigned meter.

Here is the an example of MOG deletion process.

```
>qdn 7835401
-----------------------------------------------------
DN:     7835401
TYPE: SINGLE PARTY LINE
SNPA: 102   SIG: DT    LNATTIDX: N/A
LINE EQUIPMENT NUMBER:     HOST  00 0 00 03
LINE CLASS CODE:  IBN
IBN TYPE: STATION
CUSTGRP:         CUST783      SUBGRP: 0  NCOS: 0
CARDCODE:  6X93AA   GND: N  PADGRP: STDLN  BNV: NL MNO: N
PM NODE NUMBER     :    42
PM TERMINAL NUMBER :    4
OPTIONS:
DGT MOG MOG_2
-----------------------------------------------------
>deo $ 7835401 mog $ y y
COMMAND AS ENTERED:
DEO NOW 3 3 31 AM 7835401 ( MOG ) $
MACHINES ARE OUT OF SYNC, SERVICE ORDERS NOT ALLOWED
JOURNAL FILE IS INACTIVE, SERVICE ORDERS NOT ALLOWED
```

When MOG option is deleted, corresponding meters in meter block are marked as DEASSIGNED and an entry is added into MTRDEASS table to store deassigned meters.

```
TABLE MTRDEASS
TOP

DEAKEY    METER1   WRAP1 METER2  WRAP2  METER3 WRAP3 METER4 WRAP4  OUT_DATE
-------------------------------------------------------------------------------
1027835401 00000012 N   00000015  N   00000020  N   -------- -   2003/03/31 12:34:00

BOTTOM
```

4.2.3.2 Add MOG Option

ADO command is used to assign an option to a specified DN. While adding MOG option to a DN, deassigned meter table is checked before assigning new meters to DN. If there is any deassigned meter for the DN, a cross check between new meters and previously deassigned meters is performed. If there is any matching meters, meter counts of these meters are restored. If not, newly assigned meters are initialized to zero.

- If same MOG option is assigned to DN, all deassigned meters are reassigned with last meter counts.

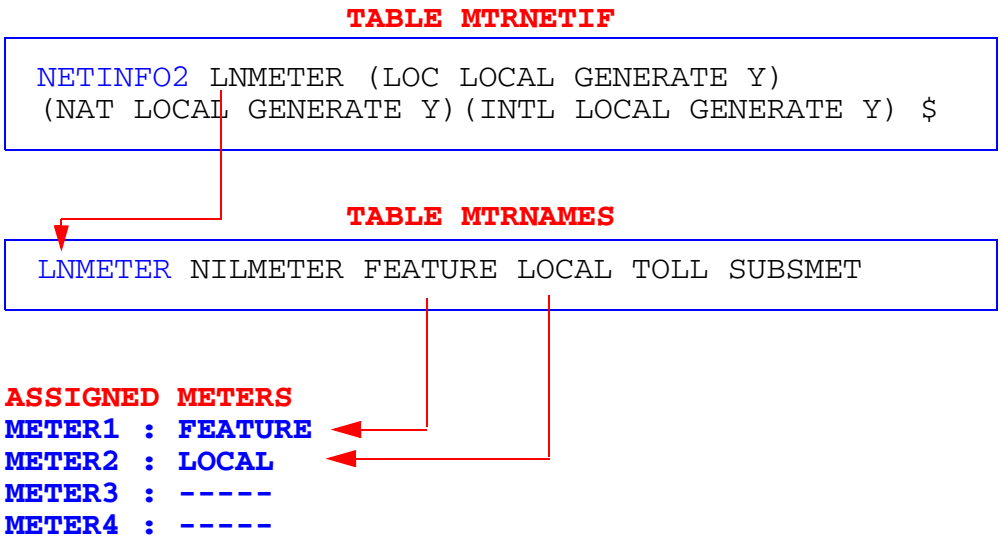
```
>ado $ 7835401 mog mog_2 $ y y
COMMAND AS ENTERED:
ADO NOW 3 3 31 AM 7835401 ( MOG MOG_2) $
1. METER NAME: FEATURE     2.METER NAME: LOCAL
3. METER NAME: TOLL         4.METER NAME: -------
MOGID MOG_2  HAS ABOVE METERS ASSIGNED.

>mtrcount line 7835401
**************************************************
DN      : 1027835401
DATE    : 03/04/01
MTR NAME: FEATURE     MTR COUNT: 00000012 WRAP: N
MTR NAME: LOCAL       MTR COUNT: 00000015 WRAP: N
MTR NAME: TOLL        MTR COUNT: 00000020 WRAP: N
**************************************************
```

- If a different MOG id is assigned to DN,

```
>ado $ 7835401 mog mog_3 $ y y
COMMAND AS ENTERED:
ADO NOW 3 3 31 AM 7835401 ( MOG MOG_3) $
1. METER NAME: FEATURE        2. METER NAME: LOCAL
3. METER NAME: -------        4. METER NAME: ------
MOGID MOG_3 HAS ABOVE METERS ASSIGNED.

Assigned meters of MOG_3 is as follows:
```



Entry in MTRDEASS table is checked whether there is any matching meters with previously deassigned meters. For any matching meter, assigned bits are set to TRUE and mismatched meters are stored in MTRDEASS table.

```
TABLE MTRDEASS

```

4.2.3.3 Remove a DN From System

OUT command is used to remove an agent from system. If there is MOG option on outed DN, its assigned meters are stored in MTRDEASS table to be able to restore when this DN is given into service with MOG option again.

4.2.3.4 Add a DN to System

NEW command is used to define a new DN in system. With this command, specified option can be assigned to DN. If MOG option is being assigned with NEW command, MTRDEASS table is checked whether there is an entry for DN. If there is, and if any deassigned meters match with newly assigned meters, meter counts of matching meters are restored back.

> ***Note:*** This feature supports restoring deassigned meters of huntgroups (DLH, DNH, MLH) too.

4.2.4 Line Metering Maintenance

Metering database composed of more than one component. Some of them resides in DSSAVE and some of them in DSPROT. These two places are affected by different process such as; DSPROT is affected by image reloads or survives all restarts whereas DSSAVE survives during image reboots and affected by RESTORE process.

Because of different effects of restarts, image reloads or restore operations there may occur inconsistencies between data in DSSAVE and data in DSPROT.

To detect and recover these inconsistencies, Audit and Recovery processes are run.

- **Meter recovery process**

Meter recovery process runs after each reload restarts and meter restore processes. After reload restarts or restore processes there may be inconsistencies in metering system. Recovery process handles this within three main passes.

In first pass, link between meter object (DSPROT) and meter blocks (DSSAVE) are broken to be associated again in further steps.

In second pass, meter blocks in inservice meter table in DSSAVE are traversed. For every in use meter block, its meter object pointer and mog id is retrieved from DNFEAT/KSETFEAT table.

- If there is no entry for this DN in DNFEAT/KSETFEAT table, or
- If there is no meter object pointer, or
- If there is no MOG option on this agent,

then this agent is decided to be recycled with its all assigned meters.

If agent has a valid meter object pointer and MOG option, assigned meters in agent data and in meter block are compared, if there is a difference, mismatched meter is recycled.

In third pass of recovery process, all meter objects are traversed to find if there is any meter object which has MOG option but has no associated meter block. If there is any, a new meter block is allocated in DSSAVE.

- **Line Meter Audit Process**

Line audit runs periodically, manually and after all restarts to verify the integrity between DSPROT (meter objects) and DSSAVE (meter blocks). It is composed of two main passes.

In first pass, all meter objects are traversed and a cross checking is done between the agent data and the information in meter block. During this cross check operation,

- agent that doesn't have a meter block although there is MOG in meter object
- agent whose owner doesn't match with the owner in the meter block
- agent whose assigned meters doesn't match with the ones in meter block

are controlled and necessary logs are generated to inform the user about inconsistency.

If there an inconsistency between assigned meters of an agent, mismatched meters are set as recycled and if at least one meter of meter block is recycled this meter block is added into recovery table. During third run of audit process after line meter recovery, these recycled meters are cleared and sent to OOS.

In second pass of audit process, all in service meter blocks are traversed (examining audited meter blocks) to report such inconsistencies as non-existent owners and to rebuild the free queue as it goes along. During second pass,

- if owner of meter block is not valid, then agent is recycled.
- If meter block is in use, its meter object is tried to be reached. If there is no associated meter object with this meter block, then this agent is recycled.
- Or, if agent has a meter object but it doesn't have mog option, then agent is recycled.

4.2.4.1 Enhancement of Metering Recovery Process

Behavior of metering recovery process is changed as follows:

In terms of deassigned meters in meter block, recovery process tries to provide a consistency between data in meter block and data in MTRDEASS table.

In second pass, if DN doesn't exist in KSETFEAT/DNFEAT tables, MTRDEASS table is checked.

- If it is there, agent is not recycled and if there is any deassigned meter in meter block, date information of related tuple in MTRDEASS is updated. If there is not any deassigned meter in meter block, tuple in MTRDEASS table is cleared.
- But if doesn't exist in MTRDEASS table too, deassigned meters in meter block are checked. If there is at least one deassigned meter in meter block, a new entry is added into MTRDEASS table to be in sync with meter block.
- While adding a tuple into MTRDEAS table during recovery, MTR153 log is not generated.

In third pass of recovery process, after allocating a new meter block for DN, MTRDEASS table is checked whether there is an entry in MTRDEASS for this DN. If there is, tuple is deleted since there is not any deassigned meter in newly allocated meter block.

4.2.4.2 Enhancement of Metering Audit Process

Behavior of metering audit process is changed as follows;

Audit process tries to recycle agent whose DNs doesn't exist in KSETFEAT/DNFEAT tables. But within this feature, a further check is made in MTRDEASS table, since DN can be found there. If it is there, recycling agent is avoided.

During third run of audit process after recovery, meters that are decided to be recycled are saved in MTRDEASS table as deassigned meters.

To decide to send them to OOS or not, *METR_Prevent_Sent_OOS* SOC option check is required, since Bangladesh behaves differently.

- For Bangladesh market, state of *METR_Prevent_Sent_OOS* is ON which means that recycled meters are not sent to OOS.

4.2.4.3 ONP and Swact Support

This feature changes the behavior of ONP as follows;

- MTRDEASS table is not transferred during ONP, instead this during transfer of meter blocks, for deassigned meters in meter block a new entry is added into MTRDEASS table. By this way, MTRDEASS is re-datafilled and date information reflects the date of ONP.
- During transfer of meter blocks in MASPECT stage of SWACT, meter counts of deassigned meters are transferred too.

4.2.5 Billing File Generation

Billing file is used to generate billing record for metered lines. Storage of meter billing records are to an external store type such as disk or tape.

Billing file includes both OOS meters and inservice meters. OOS meters are written into file first, then inservice meters are appended. To distinguish OOS meters and inservice meters a separator is used. An example for content of billing file is as follows;

```
BILLING IS TAKEN .....
R021112132202BIL
>mtrprint R021112132202BIL
DN              DATE   METER NAME  COUNT    WRAP
-----------------------------------------------
1027838888    02/11/12 FEATURE     00000009  NO
1027838888    02/11/12 LOCAL       00000005  NO
1027838888    02/11/12 TOLL        00000008  NO
9999999999    99/99/99 * END OOS * 99999999  NO
1027835572    02/11/12 FEATURE     00000084  NO
1027835572    02/11/12 LOCAL       00000018  NO
1027835572    02/11/12 TOLL        00000000  NO
```

With this functionality, deassigned meters are also included in billing file. But the section where deassigned meters are included differs in Bangladesh and TRNC market.

- In Bangladesh market, deassigned meters are included within inservice meters section since they are not sent to OOS.
- In TRNC market, deassigned meters are included within OOS meters section.

There is no indication for deassigned meters in billing file, they are distinguished from INUSE meters by the help of another report that has been reported manually to billing center or by checking unchanged meter counts during billing periods.

When *METR_Prevent_Sent_OOS* SOC is ON, OOS file is not included in billing file although it contains OOS meters.

4.2.6 Log Generation

A new log report MTR150 is added to the MTR log system. This log is generated when there is no space available in MTRDEASS table for a new tuple.

An example of the log format is as follows:

```
MTR150 APR1 12:00:13 1234 INFO MTRDEASS DATA LOST
DN:7835401 METER NAME: LOCAL USER:ADMIN
METER COUNT: 00000012 WRAP:N
NO FREE SPACE IS AVAILABLE IN MTRDEASS TABLE
```

This log is generated for each assigned meter of DN.

User is also warned by a warning message which is displayed while deleting MOG option from DN. By the help of this warning message, user can give up deleting MOG option.

In existing structure, when MOG option is removed, MTR153 log is generated while deallocating the meter block or when clearing all recycle meters. MTR153 log is an information log, whose text is as follows;

```
MTR153 APR1 12:00:13 1234 INFO METER DELETED
DN:000001027835401
MANUALLY DELETED METERS ARE RECORDED ON OOS JOURNAL FILE
METER NAME: LOCAL METER COUNT: 0000 0012
```

For deassigned meters which are not sent to OOS with this feature, MTR153 log is generated with a different text.

```
MTR153 APR1 12:00:13 1234 INFO METER DELETED
DN:000001027835401
MANUALLY DELETED METERS ARE RECORDED ON MTRDEASS TABLE.
METER NAME: LOCAL METER COUNT: 0000 0012
```

In TRNC market, deassigned meters are sent to both OOS and MTRDEASS tables. In these cases, MTR153 log is generated as following:

```
MTR153 APR1 12:00:13 1234 INFO METER DELETED
DN:000001027835401
MANUALLY DELETED METERS ARE RECORDED ON MTRDEASS TABLE
AND OOS JOURNAL FILE.
METER NAME: LOCAL METER COUNT: 0000 0012
```

4.2.7 New NONRES Command DEASSCLR

This is a NONRES command and it is accessed by TOOLSUP. It is used for deleting all content of MTRDEASS table.

There is no need to add a help option to DEASSCLR command since a detailed warning message is displayed to inform the user about result of executing this command.

> DEASSCLR

A warning message is displayed first when DEASCLR command is run.

```
************************************************
DANGER: LOSS OF METERING DATA IN MTRDEASS TABLE
        This command deletes all tuples in
        MTRDEASS table.
************************************************
```

Then a YES/NO prompt is displayed. If user select Y, command is executed, otherwise user gives up to continue.

This command is referenced when all DN numbers is to be changed. In such a case all DNs are needed to be removed from system and added again. In this period, number of tuples in MTRDEASS table can reach maximum limit. By using this command, all content of MTRDEASS table is cleared.

4.2.8 Enhanced ZAPMTRS Command

ZAPMTRS command clears meter counts of all software meter including recycled meters.

When this feature is functional, if ZAPMTRS command is executed, meter counts of deassigned meters are cleared too. Since meter counts of deassigned meters are cleared, there is no need to keep a tuple associated with these deassigned meters. So all content of MTRDEASS table is cleared during process of ZAPMTRS command.

4.3 Hardware Requirements or Dependencies

None.

4.4 Software Requirements or Dependencies

None.

4.5 Limitations and restrictions

- Maximum number of entries in MTRDEASS table is 65520.
- Limitations and restrictions of metering system exists for this feature.
- *METR_Prevent_Sent_OOS* can not be activated when state of *METR_Deassigned_Support* is IDLE.
- Metering OOS enhancements are not supported for meter trunk agent.

- Number of deassigned DNs and INUSE DNs can not exceed 120000.
- Adding or deleting a tuple into MTRDEASS table via RESTAB tool is restricted.
- Journal file is not updated during adding/deleting a tuple to/from MTRDEASS table since they are done internally.
- Maximum number of entries in recovery table is 2048, when it exceeds this size, meter counts of these meter blocks are lost.

4.6 Interactions

- Feature is not affected by ENABLE_METERING parameter in OFCENG table.
- Feature is not affected by ACT.59022090 “Excessive Metering Detection”

5: Functional Description (FN): A00001921

5.1 Feature name

SN07-Activity ACT.A00001921 “CIS Toll Call Ringing”

5.2 Description

When a call request comes from toll exchange over any incoming trunk to a line, a distinct ringing is applied to the called subscriber indicating that it is a toll call. This functionality is provided by existing feature AU3129 Long Distance Alert (LDA). With this activity ACT.A00001921 “CIS Toll Call Ringing”, the existing LDA feature is enhanced to provide CIS market requirements. Refer to AU3129FN.AB06 in PLS DOC Library for existing LDA feature details.

There are three enhancement items to apply toll call ringing for CIS market requirements:

- Existing LDA feature is still working with C, S, F, C30, CSR, C3C ringing schemes. The new ringing scheme C6R for CIS market will be added with this activity.
- Existing office parameters LDA_ENABLED, LDA_DEFAULT_CALLTYPE, LDA_OM_ENABLED, LDA_ALERT_NO_CLID, LDA_CWT_TIMEOUT, LDA_PATTERN in table OFCENG are moved to the new tuple “LONG_DIST_ALERT” in table ISERVOPT.
- Existing datafill sequence for LDA option in table TRKOPTS will be changed to apply toll call ringing for incoming ETSI ISUP V2+ trunk group using the Nature of Address (NOA) indicator of called party number parameter in received ISUP_IAM message.

The new ringing scheme “C6R” is defined to provide the required values for CIS in this activity. Toll call ringing cadence will be different from the local call ringing cadence.

According to reference document AU3129FN.AB06 in PLS DOC, in page 15 Figure 1 Functional flow diagram for Toll call recognition:

- Part of “CPC is Operator” is not provided in existing functionalty.
- The office parameter LDA_DEFAULT_CALL_TYPE in table OFCENG and CALLTYPE field in table LDASCRN can take any value of LONG_DISTANCE or NORMAL.

5.2.1 CIS Ringing Patterns

Physical ringing is the application of an alternating current (AC) applied between the tip (A lead) and the ring (B lead) of the line loop. The frequency

of the alternations and the voltage are distinctive parameters of the ringing. The waveform of the AC current is usually sinusoidal. The overall timing envelope of these current pulses is termed the cadence. The initial pattern repeats and the time needed to complete one iteration is termed the cycle time. The complete toll call ringing signal specification is:

Frequency: 25 +/- 2 Hz

Output level: 95 +/- 5 V

Cadence: 1.2 sec on (+/- 0.12), 2 sec off (+/- 0.2)

The toll call ringing cadence required for CIS is 1.2 seconds on, 2 seconds off, giving a cycle time of 3.2 seconds. However, due to the fact that actual cycle time of the Ringing Generator to be used in CIS (6X30AA, 6x30CA for ILCM, 6x60CA for RLCM) is 6 seconds, actual pattern will be 1 seconds on, 2 seconds off, 1 seconds on, 2 seconds off. This cadence lies well within 10% tolerance of the CIS.

Field RNGTYPE for related frame in table LCMINV and V5SIG must be datafilled to the new ring type “C6R” in order to provide ringing cadence required for CIS market.

DMS-100i standard ringing cadence which is 2 seconds on, 4 seconds off is used for local call ringing. The actual toll call ringing and local call (standard) ringing cadences provided for CIS are shown in Figure1.

Figure 1 CIS Ringing Cadences

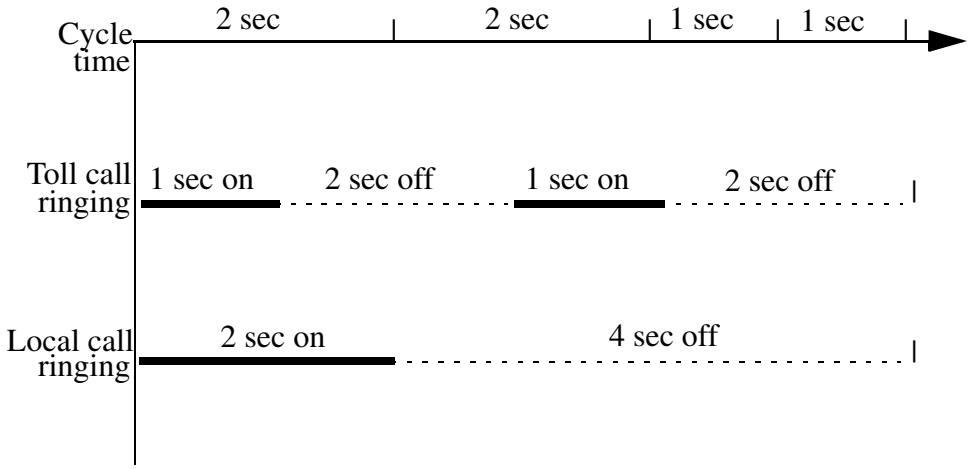

Table 1 Standard Ringing Specification

RING CODE	RING TYPE	DESCRIPTION	CADENCE (Seconds)
P(0)	C6R	Standard ringing	2 s ON, 4 s OFF
P(4)	C6R	Toll Call Ringing	1 s ON, 2 s OFF, 1 s ON, 2s OFF

5.2.2 Enhancement of existing LDA feature to apply Toll Call Ringing

There are three enhancement item to apply toll call ringing:

- Existing LDA feature is still working with C, S, F, C30, CSR, C3C ringing schemes. The new ringing scheme C6R will be added with this activity.
- Existing office parameters LDA_ENABLED, LDA_DEFAULT_CALLTYPE, LDA_OM_ENABLED, LDA_ALERT_NO_CLID, LDA_CWT_TIMEOUT, LDA_PATTERN in table OFCENG are moved to the new tuple “LONG_DIST_ALERT” in table ISERVOPT.

Refer to section 13.1.2.2 of Configuration document of this activity for this item details.

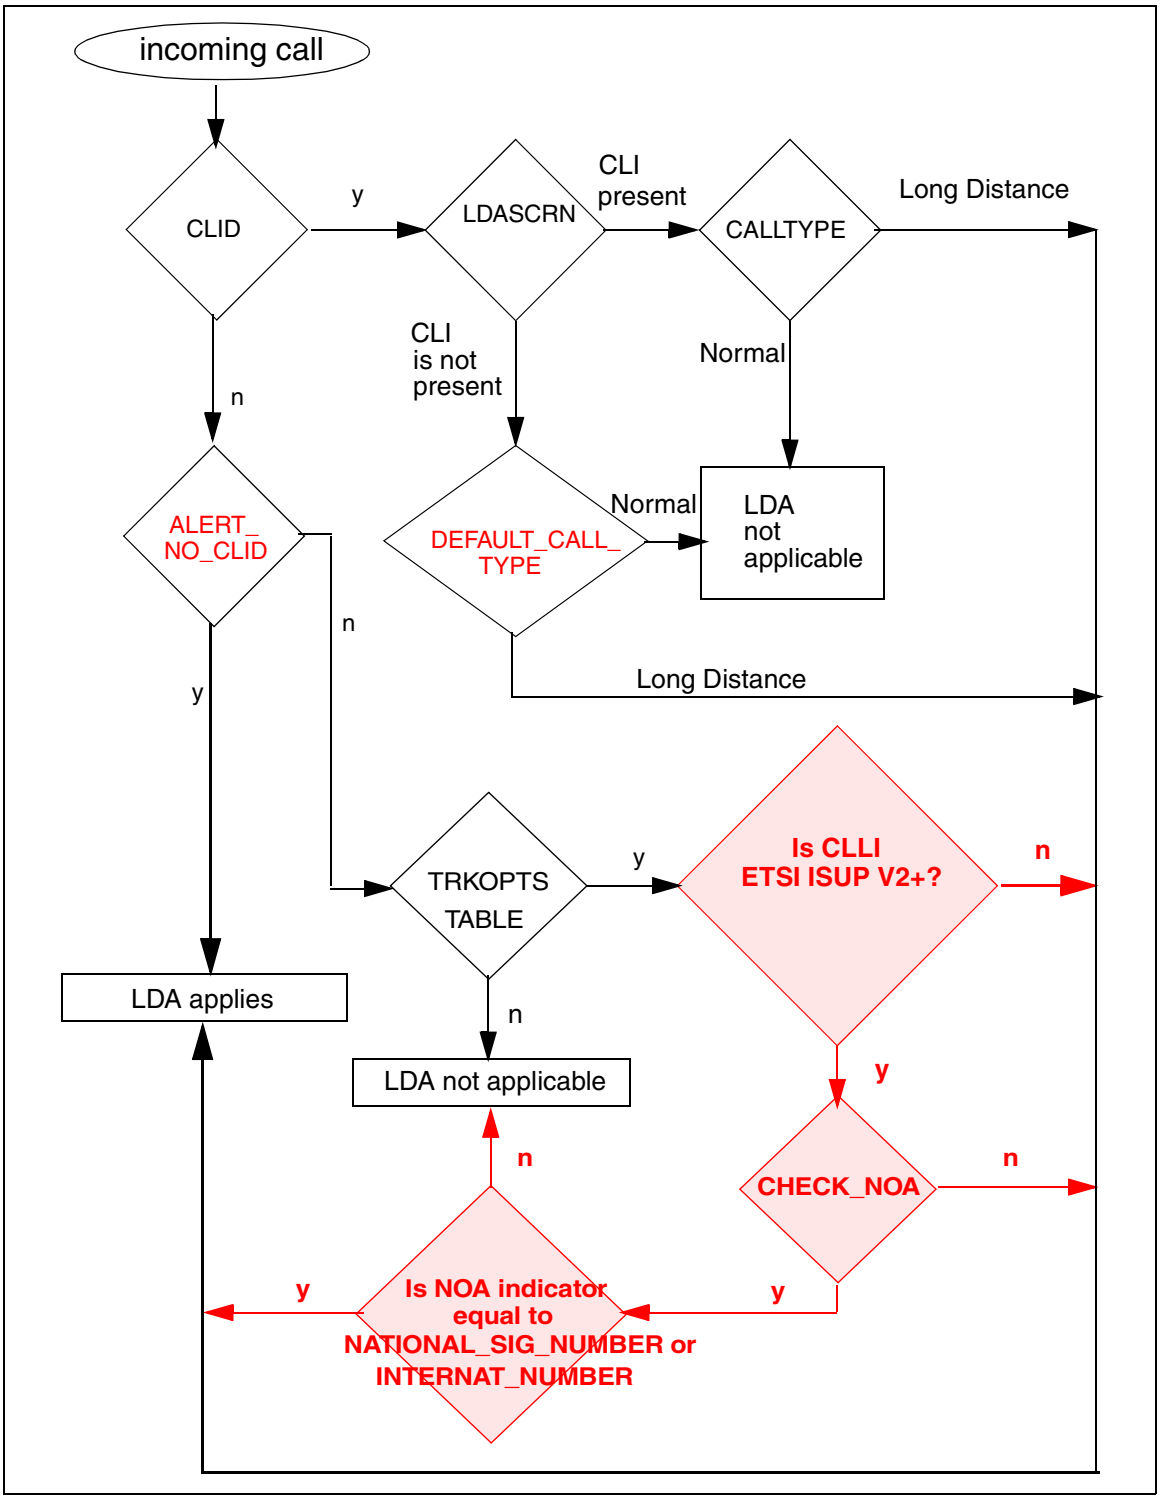
- Existing datafill sequence for LDA feature in table TRKOPTS will be changed to apply toll call ringing for incoming ETSI ISUP V2+ trunk group using the Nature of Address (NOA) indicator of called party number parameter in received ISUP_IAM message. The new field CHECK_NOA for LDA option in table TRKOPTS is defined to supply CIS market requirement. If dedicated trunk group with LDA option in table TRKOPTS is datafilled any kind of ETSI ISUP V2+, the value of CHECK_NOA is used to apply toll ringing. If this value is Y, local terminating exchange checks the Nature of Address (NOA) indicator of called party number parameter in received ISUP_IAM message and applies toll call ringing patterns to terminating line if NOA is equal to:
- National Number
- International Number

Otherwise, local ringing pattern is applied to the terminating line.

If the value of CHECK_NOA field is N, toll call ringing pattern is applied to the terminating line.

Refer to section 13.1.2.1 of Configuration document of this activity for this item details.

Figure 1 Functional flow diagram for Toll call recognition



The red parts of functional flow diagram in Figure 1 are improved with this activity.

Toll call can be recognized by the following methods. Please refer to “Figure1 Functional flow diagram for Toll call recognition” on page 31.

- Screening (If the CLI is delivered)
- Dedicated Toll Trunks (If CLI is not delivered)

5.2.2.1 Screening

This method is applicable only if the CLI is delivered. Existing table LDASCRN is used to screen the incoming CLI against a CLI_RANGE of numbers and identify the call type (Long Distance or Normal)

If the CLI of an incoming call cannot be screened with the Table LDASCRN, the call type will be the value of DEFAULT_CALL_TYPE field of LONG_DIST_ALERT tuple in table ISERVOPT.

By default DEFAULT_CALL_TYPE is LONG_DISTANCE.

5.2.2.1.1 Table LDASCRN

The existing table LDASCRN has fields ZONE, CLI_RANGE and CALLTYPE. For MBS sets, an additional field KEYLIST is added. The fields ZONE as well as CLI_RANGE will be used as the key for searching the table.

ZONE

This field is a part of the key used to search the LDASCRN table. The ZONE sub-option of the LDA option in the terminating line, will be used to index into this table. Logically, this field is a representation of the Called DN range.

CLI_RANGE

This field represents the range of Calling Line Id (CLI) to be screened for the corresponding ZONE. It is divided into 2 subfields:

FROMDIGS, specifying the starting number of the CLI_RANGE

TODIGS specifying the ending number of the CLI_RANGE.

This field also forms a part of the key to search in the LDASCRN table.

CALLTYPE

It can take any value of LONG_DISTANCE or NORMAL. This field has the call type for the corresponding ZONE.

This list contains the key numbers of the DNs to which the LDA feature applies. All of the DNs must belong to the same ZONE.

Method of Determination:

1. The ZONE of the terminating station is obtained from the ZONE sub-option in it's LDA line option.

2. This ZONE as well as the calling DN(CLI) is used as the key to search in the table LDASCRN.

3. If the search is successful, the type of the call will be the CALLTYPE of the tuple matched.

4. If the search fails, the check for CPC will be made to determine if the caller is an operator.

5. If the search fails and the caller is not operator, the type of the call will be that of DEFAULT_CALL_TYPE of LONG_DIST_ALERT tuple in table ISERVOPT.

5.2.2.2 Dedicated Toll Trunk

If CLI is not available then the toll call recognition is done depending on the value of ALERT_NO_CLID field of LONG_DIST_ALERT tuple in table ISERVOPT.

If it's value is Y, then distinctive alerting is provided to the terminating line.

If it's value is N, feature processing will continue to check table TRKOPTS for an alerting indication. Incoming trunk CLLI with LDA option is searched in the table TRKOPTS for toll call determination.

If dedicated trunk group with LDA option in table TRKOPTS is datafilled any kind of ETSI ISUP V2+, the value of CHECK_NOA is used to apply toll ringing. If this value is Y, local terminating exchange checks the Nature of Address (NOA) indicator of called party number parameter in received ISUP_IAM message and applies toll call ringing patterns to terminating line if NOA is equal to:

- National Number
- International Number

Otherwise, local ringing pattern is applied to the terminating line.

If the value of CHECK_NOA field is N, toll call ringing pattern is applied to the terminating line.

5.3 Hardware Requirements or Dependencies

The ring generators are partly controlled by four internal 8-section Dual-In-Line Package (DIP) switches. The DIP switches control the ringing subcycle length, ringing frequency and amplitude, and direct current (DC) offsets of ringing voltages. Each DIP switch controls the characteristics of each subcycle, there being four subcycles in a ringing cycle.

For CIS, the switches on the 6X30AA need to be set as follows :

Table 2 The switches on the 6X30AA for CIS market

SWITCH	SETTINGS	VOLTAGE	FREQ	SLOT SUBCYCLES
(SW1-4)	8 7 6 5 4 3 2 1	AC / DC	(HZ)	(SECONDS)
1 to 4	X 1 1 1 0 1 0 0	82 / -52	25	2 2 1 1

NOTE: The symbols under the heading SETTINGS are interpreted as:

0 = ON,1 = OFF, X = either ON or OFF.

The arrow on the DIP switch indicates the ON direction.

The Ringing will be supported over the following peripherals:

- Line Concentrating Module (LCM).
- Remote Line Concentrating Module (RLCM)

5.4 Software Requirements or Dependencies

The new ringing scheme datafilled in table LCMINV can be downloaded to LCM during RTS as part of the static data. The static data for the ringing scheme for the CIS market are defined in a separate new WT module “C6RRGINI”.

5.5 Limitations and restrictions

For CIS, the office parameter IMMEDIATE_RING_ENABLE in table OFCENG will be set to “Y” since immediate physical ringing is required. But immediate physical ringing is not working for long distance calls.

6: Functional Description (FN): A00001923

6.1 Feature name

CIS Subscriber Categories

6.2 Description

6.2.1 Introduction

This feature is to support subscriber categories for CIS market. In this way:

- Existing Calling Party Category (CPC) line options feature which assigns subscriber category to IBN line is used,
- CPC line options feature is also extended to assign subscriber category to BRI lines,
- CPC option is also given as customer group option,
- Subscriber category based authentication in CIS network is implemented.

6.2.2 Overview

In CIS telephony network, subscribers are categorized according to network access privileges. Subscriber categories are the ten privilege categories according to the rights such as accessing to intrazonal, interzonal, international networks and to special services out of local network. CIS Subscriber categories with their definition are given in Please refer to “Table 1 CIS Subscriber Categories” on page 100..

Table 1 CIS Subscriber Categories

CATX	Definition
CAT1	Apartment or enterprise telephone, having access rights to intrazonal, interzonal and international networks.
CAT2	Hotel telephone, having access rights to intrazonal, interzonal and international networks.
CAT3	Apartment, enterprise or hotel telephone, for local calls only.
CAT4	Enterprise telephone, having access rights to intrazonal interzonal and international networks, and to special services out of local network. Although it is not supported as DMS tool, a priority is ensured waiting for free resources in connections with intrazonal and interzonal networks.
CAT5	Enterprise tel.for offices of Ministry of Communication, having access rights to intrazonal, interzonal, and international networks, and to special services out of local network.

CATX	Definition
CAT6	Interzonal or universal pay station, having access rights to intrazonal, interzonal, and international networks, and to special services out of local network.
CAT7	Apartment or enterprise telephone, having access rights to intrazonal, interzonal and international networks, and to special services out of local network.
CAT8	Enterprise telephone with data transmitting devices, facsimile facilities and electronic mail, having access rights to intrazonal, interzonal, and international networks.
CAT9	Local pay stations, for local calls only.
CAT0	Reserved

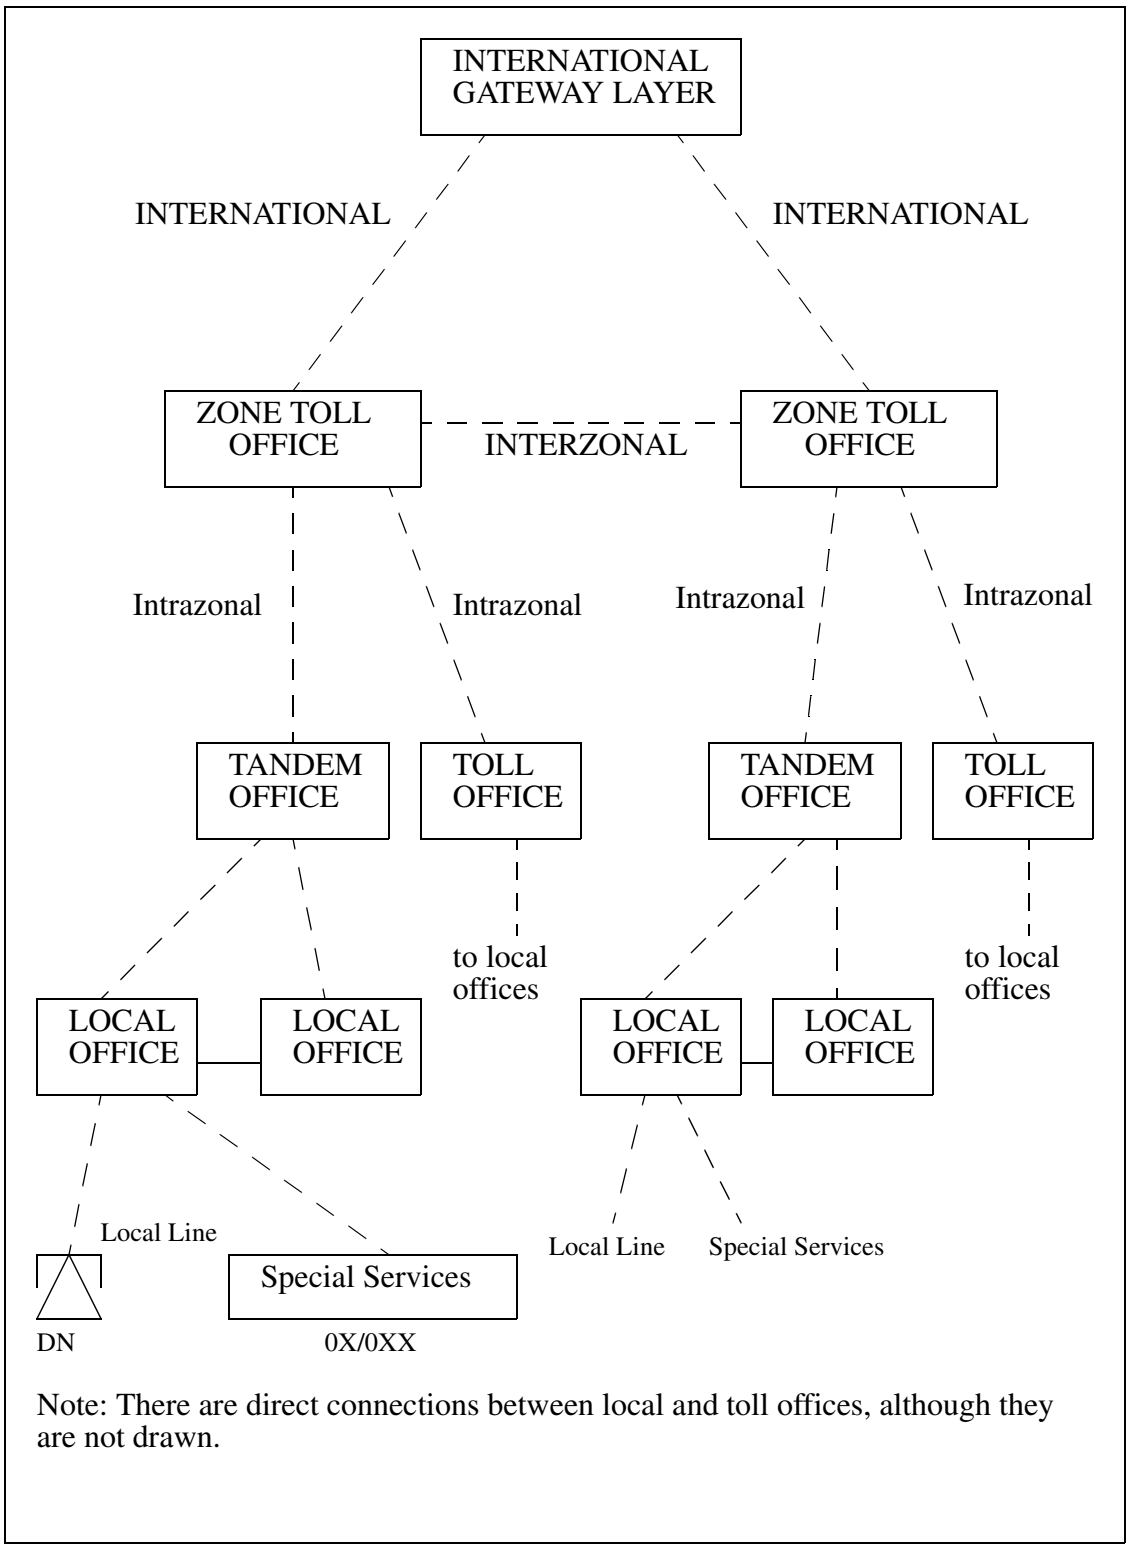
Figure 1 gives a concise view of CIS network. Network types in CIS network are

- International network
- Interzonal network
- Intrazonal network
- Local network

Groups of local offices build areal zones. There can be several toll offices serving local networks in a zone but there is one zone toll office, which is a gateway to the zone such that provides intrazonal, interzonal, international, intrazonal special services and interzonal special services calls. Local offices provide local calls and local special service calls.

There are no restrictions for local calls, and operator calls. All other types of toll routed calls have restrictions differing from one subscriber category to another.

Figure 1 CIS Telephony Network Topology



Note: There are direct connections between local and toll offices, although they are not drawn.

This feature consists of the following main parts:

- Assigning subscriber categories as line or customer group option, and mapping CIS Subscriber Categories to Calling Party Categories (CPC).
- Definition and evaluation of authorization for the categories in zone toll offices of CIS network.

6.2.3 Assigning Subscriber Category (CPC)

In feature CPC line options, CPC value can be assigned as line option for IBN lines, and in this feature, this functionality is extended for BRI lines. Additionally, CPC value can be assigned to customer group option of the line. CPC line option has priority on customer group CPC option, and if line option CPC is assigned then customer group CPC option will be ignored. When CPC line option and CPC option of line's customer group are not assigned, default CPC values are assumed to be valid and their corresponding values are sent in outgoing trunk message.

CPC name is assigned as line or customer group option. To assign a CPC value to a line, SERVORD commands are used (refer to SO section of Configuration document, optcn). CPC names are shown in Please refer to "Table 2 CPC names to assign as line or customer group options and their definitions" on page 103.. CPC name RSRVD is defined in this feature to meet CIS market requirement for CAT0 (reserved).

Table 2 CPC names to assign as line or customer group options and their definitions

CPC names (MMP)	Description
UNKNOWN	unknown subscriber
ORD	ordinary subscriber
PRIOR	subscriber with priority
MAINT	test call
SPM	pay phone
OPER	national operator
TRAN	data call
ITDN	subscriber with special services
FOC	free of charge subscriber
METER	local pay phone
VIS	voice information services subscriber
LOCAL	local network subscriber

Table 2 CPC names to assign as line or customer group options and their definitions

CPC names (MMP)	Description
CNDB	subscriber owner of CNDB
HOTEL	hotel subscriber
AU_ORD	automatic subscriber without priority
AU_PRIO	automatic subscriber with priority
RSRVD (new)	Reserved (newly added type to support CIS Subs. Cat. 0)

To assign as customer group option, table control commands are used for table CUSTSTN (refer to DS section of Configuration document, optcn). In Please refer to "Figure 2 Example CUSTSTN datafill for customer group option CPC" on page 104., customer group CPC option example datafill is shown.

Figure 2 Example CUSTSTN datafill for customer group option CPC

```
TABLE: CUSTSTN
CUSTNAME OPTNAME OPTION
-----------------------------------------------
CUST783 CPC CPC ORD
```

In this feature, CIS Subscriber Categories (CAT**X**, X: 0 to 9) are mapped to CPC values and corresponding CPC values are assigned as subscriber categories. This mapping is shown in Please refer to "Table 4 CPC name, CIS Subscriber Category and Russian ISUP CPC mapping" on page 105.. When a CPC value not shown in Please refer to "Table 3 CIS Subscriber Categories and their corresponding CPC values for MMP" on page 104.is assigned in CIS network, its corresponding CIS subscriber category is assumed to be CAT1 (CPC assumed to be ORD). But, when CPC values not shown in Please refer to "Table 3 CIS Subscriber Categories and their corresponding CPC values for MMP" on page 104.are assigned at zone toll offices and line screening is enabled, each CPC's privilege is evaluated itself (not as ORD).

Table 3 CIS Subscriber Categories and their corresponding CPC values for MMP

CIS Subs. Cat.	CPC value (MMP)
CAT1	ORD
CAT2	HOTEL
CAT3	LOCAL

Table 3 CIS Subscriber Categories and their corresponding CPC values for MMP

CIS Subs. Cat.	CPC value (MMP)
CAT1	ORD
CAT4	PRIOR
CAT5	FOC
CAT6	SPM
CAT7	ITDN
CAT8	TRAN
CAT9	METER
CAT0	**RSRVD (new)**

In CIS Subscriber Categories feature, only Russian ISUP V2+ trunk is supported that is unsimilar to CPC line options feature which also supports FDCP trunks. CPC values are mapped to Russian ISUP CPC values internally in software. In Please refer to "Table 4 CPC name, CIS Subscriber Category and Russian ISUP CPC mapping" on page 105., CPC name, corresponding CIS Subscriber Category and Russian ISUP CPC mapping is shown for Russian ISUP v2+ trunks.

Table 4 CPC name, CIS Subscriber Category and Russian ISUP CPC mapping

CPC name	CIS Subs. Cat.	Russian ISUP CPC
UNKNOWN*	(CAT1)	ISUP_CPC_SUBSCRIBER_1 (#0A)
ORD	CAT1	ISUP_CPC_SUBSCRIBER_1 (#0A)
PRIOR	CAT4	ISUP_CPC_PRIORITY (#0B)
MAINT*	(CAT1)	ISUP_CPC_SUBSCRIBER_1 (#0A)
SPM	CAT6	RISUP_TOLL_PAYPHONE (#0F)
OPER*	(CAT1)	ISUP_CPC_SUBSCRIBER_1 (#0A)
TRAN	CAT8	ISUP_CPC_DATA_CALL (#0C)
ITDN	CAT7	RISUP_SUBSCRIBER_W_ACCESS_SS (#E3)
FOC	CAT5	RISUP_SUBSCRIBER_FREE_OF_CRG (#E2)
METER	CAT9	RISUP_LOCAL_PAYPHONE (#E5)
VIS*	(CAT1)	ISUP_CPC_SUBSCRIBER_1 (#0A)
LOCAL	CAT3	RISUP_LOCAL_NETWORK_SUBSCRIBER (#E4)
CNDB*	(CAT1)	ISUP_CPC_SUBSCRIBER_1 (#0A)

Table 4 CPC name, CIS Subscriber Category and Russian ISUP CPC mapping

CPC name	CIS Subs. Cat.	Russian ISUP CPC
HOTEL	CAT2	RISUP_HOTEL_SUBSCRIBER (#E1)
AU_ORD*	(CAT1)	ISUP_CPC_SUBSCRIBER_1 (#0A)
AU_PRIO*	(CAT1)	ISUP_CPC_SUBSCRIBER_1 (#0A)
RSRVD (new)	**CAT0**	RISUP_SUBSCRIBER_CATEGORY_0 (#E0)

* These CPC values are assignable but don't have their own CIS Subs. Cat. equivalent. Therefore, their corresponding CIS categories are assumed to be CAT1 and they are equivalent to CPC value ORD (ORDinary).

6.2.4 Authorization at Zone Toll Offices of CIS Network

Subscriber category based authorization is controlled at zone toll offices of CIS network.

This feature introduces two new boolean parameter on ISERVOPT table to control category screening on zone toll offices. A zone toll office is the one whose zone toll screening functionality is set to YES. The second parameter is defined to control screening of subscribers which are connected to office. When this parameter is set to YES, zone toll screening is done for calls of subscribers connected to zone toll office.

The parameters are set with table control commands in table ISERVOPT by system engineering (refer to DS section of Configuration document, optcn). In Please refer to "Figure 3 Example ISERVOPT datafill for CIS market" on page 106., an example tuple datafill is shown.

Figure 3 Example ISERVOPT datafill for CIS market

```
TABLE: ISERVOPT
SOPTSKEY SOPTNAM ZONETOLL_SCRN LINE_SCRN
------------------------------------------------------------------------------
zonetoll_scrn zonetoll_scrn Y/N Y/N
```

At the zone toll office, ISUP CPC of originator (call coming from incoming trunk or zone toll office itself) is inverse mapped to CPC value. Hence, corresponding CIS subscriber category for this CPC value can also be obtained (Please refer to "Table 4 CPC name, CIS Subscriber Category and Russian ISUP CPC mapping" on page 105.).

Network and service access privileges of each subscriber category are given in Please refer to "Table 5 Network and Service Access Privileges of

Categories (Y: allowed, N: not allowed)" on page 107.. These are derived from subscriber category definitions.

Table 5 Network and Service Access Privileges of Categories (Y: allowed, N: not allowed)

Categories		Network Types /Inter- and Intrazonal Special Services			
CPC value	**CIS Subs. Cat.**	**Intrazonal Network**	**Interzonal Network**	**International Network**	**Inter-/ Intrazonal Sp. Serv. Calls**
ORD	CAT1	Y	Y	Y	N
HOTEL	CAT2	Y	Y	Y	N
LOCAL	CAT3	N	N	N	N
PRIOR	CAT4	Y	Y	Y	Y
FOC	CAT5	Y	Y	Y	Y
SPM	CAT6	Y	Y	Y	Y
ITDN	CAT7	Y	Y	Y	Y
TRAN	CAT8	Y	Y	Y	N
METER	CAT9	N	N	N	N
RSRVD	CAT0	N	N	N	N

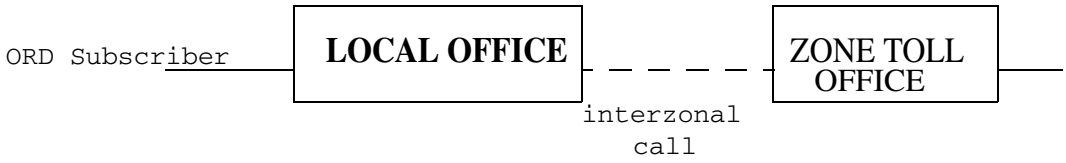
This feature implements network and service access privileges of CIS subscriber categories in terms of call translation classes. A two dimensional table which is indexed with CPC name (CIS Subs. Cat.) and call translation class is used to obtain privileges of CIS subscriber categories. This table is named CISCPCPR (CIS CPC PRivileges, refer to DS section of Configuration document, optcn). It is datafillable for all CPC values. Default values are empty, and no restriction is applied to subscriber categories having no tuple. In Please refer to "Figure 4 Example CISCPCPR datafill for CIS market" on page 107., an example datafill for table CISCPCPR is shown. In this example, subscriber category ORD has privilege YES for all call translation classes. YES means call routing is allowed at zone toll office. All CPC values can be datafilled to table CISCPCPR. When line screening is enabled at table ISERVOPT, all assignable 17 CPC values are checked for their privilege at table CISCPCPR. But, CPC values from incoming Russian ISUP v2+ trunk are expected to be the ones in Please refer to "Table 4 CPC name, CIS Subscriber Category and Russian ISUP CPC mapping" on page 105..

Figure 4 Example CISCPCPR datafill for CIS market

```
TABLE: CISCPCPR
CPC_NAME
                                                    OPTIONS
-------------------------------------------------------------------------------
ORD (unknown) (iagrp) (attend) (dial_att) (local) (special)
(emergency) (national) (continental) (intercontinental) (international)
(operator_assisted) (intl_op_assisted) (rural) (collect) (cellular) $
```

Table CISCPCPR is used to authorize the call at zone toll office. By using CIS Subs. Cat. (CPC name) and call translation class on table CISCPCPR, zone toll office decides to route the call. When privilege is okay, the call is routed to destination. Otherwise, toll denied treatment is sent to originator. An example situation is illustrated in Figure 5.

Figure 5 Subscriber category based authorization in CIS network



The interzonal call originated by an ORD category subscriber is queried on table CISCPCPR at zone toll office for privilege check. If privilege is okayed, the call is routed. Otherwise, toll denied treatment is sent to originator.

6.3 Hardware Requirements or Dependencies

N/A

6.4 Software Requirements or Dependencies

N/A

6.5 Limitations and restrictions

- CPC line and customer group option feature is applicable only for IBN, BRI and coin lines. Lines which are connected with v5.2 link can also be given CPC option.
- Pphones can not be assigned CPC line option.
- CPC line option has priority on CPC customer group option. When both of them are not assigned, default values are sent.

- In CPC options feature, sending CP Activity over FDCP outgoing trunk is only supported for default variant. Non-default variant(s) (today, China market) is/are not supported.
- In CIS network, CPC screening at zone toll office is done for incoming Russian ISUP V2+ trunk calls, and can also be enabled for calls originated from lines connected to zone toll office.
- When ISUP CPC values except from ones in Please refer to "Table 4 CPC name, CIS Subscriber Category and Russian ISUP CPC mapping" on page 105.come to zone toll office from Russian ISUP v2+ trunk, it is treated as CPC value of ORD. Hence, no restriction is applied to such calls.

7: Functional Description (FN): A00001929

7.1 Feature name

RUSSIAN ISUP-ISDN Interworking.

7.2 Description

This activity addresses the ability to support ETSI BRI -RUSSIA ISUP V2+, and ETSI PRI - RUSSIA ISUP V2+ interworkings on the DMS. It is implemented in ISN07.

Please note that for the rest of this document, the following short forms are used:

— R_ISUP for RUSSIA ISUP V2+

— BRI for ETSI BRI

— PRI for ETSI PRI

This activity is based on the existing ETSI ISUP V2 - ISDN interworking (Please see reference 3. AJ4323-ETSI ISUP V2 ISDN INTERWORKING (PRI/BRI) FN Document).

In addition to the existing functionality described in this reference activity , the following BRI/PRI-R_ISUP interworking requirements are implemented on DMS switches for call processing:

- Handling of Russia specific ISUP messages (CCL, RNG).
- Handling of CRG and FAC messages.
- Handling of network initiated SUS message which is received from the network.

Assignment of Calling Party Categories to BRI lines and mapping of these CPC values to ISUP CPC values is implemented by ISN07 activity A00001923 - ‘CIS SUBSCRIBER CATEGORIES’.

TBI is not supported by this activity. TBI support is provided by ISN07 activity A00002100 ‘ISUP-R 2000 OPERATOR CALL ON BUSY SUBSCRIBER (TBI) ENHANCEMENT’.

7.3 BRI - R_ISUP interworking

7.3.1 Handling R_ISUP Specific Messages

7.3.1.1 Calling Line Clear (CCL) Message

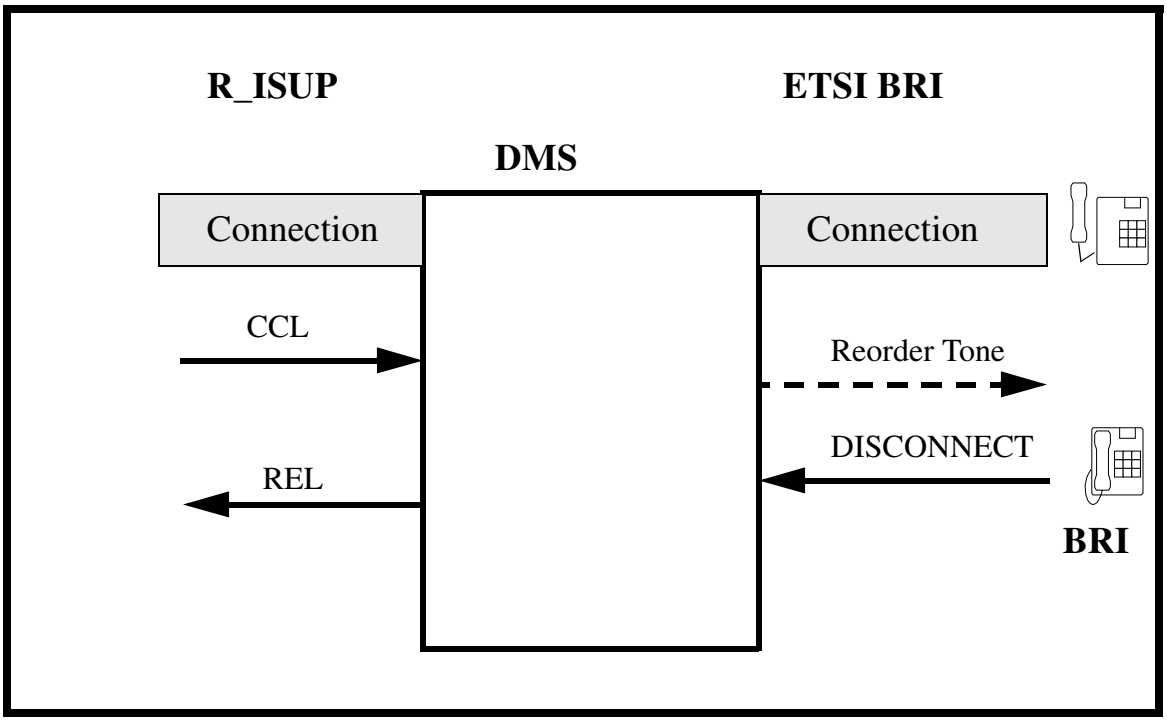
Generation:

CCL message is not generated in BRI to R_ISUP interworking.

Reception:

When CCL message is received instead of REL message, DMS stops billing speech path is disconnected, reorder tone is applied to BRI line, lines and trunks are held until terminating line is on hook. When the terminating line is on hook, REL message is sent backward, lines and trunks are released.

Figure 1 Call Clearing with CCL message: BRI Termination



7.3.1.2 Ring (RNG) message

Generation:

RNG message is not generated in BRI to R_ISUP Interworking.

Reception:

DMS ignores RNG message in cases it is received at terminating exchange.

7.3.1.3 Handling Charge (CRG) Message

Generation:

CRG message is not generated in BRI to R_ISUP Interworking.

Reception:

DMS ignores CRG message in cases it is received.

7.3.1.4 Handling Facility (FAC) Message

CFN message will be sent as a reply if FAC is received from an R_ISUP trunk in R_ISUP to BRI interworking.

7.3.2 ISUP INR/INF and IDR/IRS Messages

Figure 2 Default Tuple in table ISUPSVC

```
>table ISUPSVC
RUSSIA_EIV2
(INR_INF GENERATION_AND_RECEPTION (CGN_REQUESTED) $)
(IDR_IRS RECEPTION ) $
```

Default tuple in ISUPSVC table for R_ISUP V2 is given in Figure 2 ‘Default Tuple in table ISUPSVC’.

ETSI ISUP variants use their default tuples while determining how to process IAM messages without CLI (or CPC = UNKNOWN), or INR/IDR messages.

The default tuple can be modified, or new tuples for Russia ISUP V2+ can be added by table control commands.

The entries within ISUPSVC table should be referenced within TRKOPTS table in order to assign the specified behavior in the ISUPSVC tuple to a certain trunk group **in cases where default Russia tuple will not be used.**

Figure 3 “Example TRKOPTS Datafill”gives an example TRKOPTS datafill.

Figure 3 Example TRKOPTS datafill

```
>table TRKOPTS
OPTKEY OPTINFO
--------------
ICRSISUP ISUPSVC ISUPSVC RUSSIA_ALTERNATIVE_TUPLE
BOTTOM
```

Additionally, the trunk groups can be configured in order not to request any information (i.e. not send any IDR or IRS) by datafilling these tables. With the datafills given in Figure 4 “ISUPSVC and TRKOPTS datafills for preventing INR/IDR generation”

Figure 4 ISUPSVC and TRKOPTS datafills for preventing INR/IDR generation

```
DATAFILL FOR PREVENTING INR/IDR GENERATION FOR A CERTAIN
TRUNK GROUP.

ISUPSVC
RUSSIA_AVOID_REQUESTS  (INR_INF  (RECEPTION))  (IDR_IRS
(RECEPTION))$

TRKOPTS
2WRSISUP ISUPSVC ISUPSVC RUSSIA_AVOID_REQUESTS
```

The behavior for incoming and outgoing Russia ISUP V2+ trunks is explained in Table 1 “Possible ISUPSVC configurations and corresponding behavior for incoming trunks” and in Table 2 “Possible ISUPSVC configurations and corresponding behavior for outgoing trunks”

Table 1 Possible ISUPSVC configurations and corresponding behavior for incoming trunks.

IC Trunk Configuration		IC Trunk Behavior
INR-INF	**IDR-IRS**	**ISUP -to- BRI**
Generate & Receive	Receive	Generate INR to request information from originator. Process INF message.
	OR	
	None	Do not generate IDR

IC Trunk Configuration		IC Trunk Behavior
INR-INF	**IDR-IRS**	**ISUP -to- BRI**
Receive OR None	Receive OR None	Do not generate INR Do not generate IDR
	Generate & Receive	Generate IDR to request information from originator, if the connected agent has MCID assigned. Process IRS message Do not generate INR

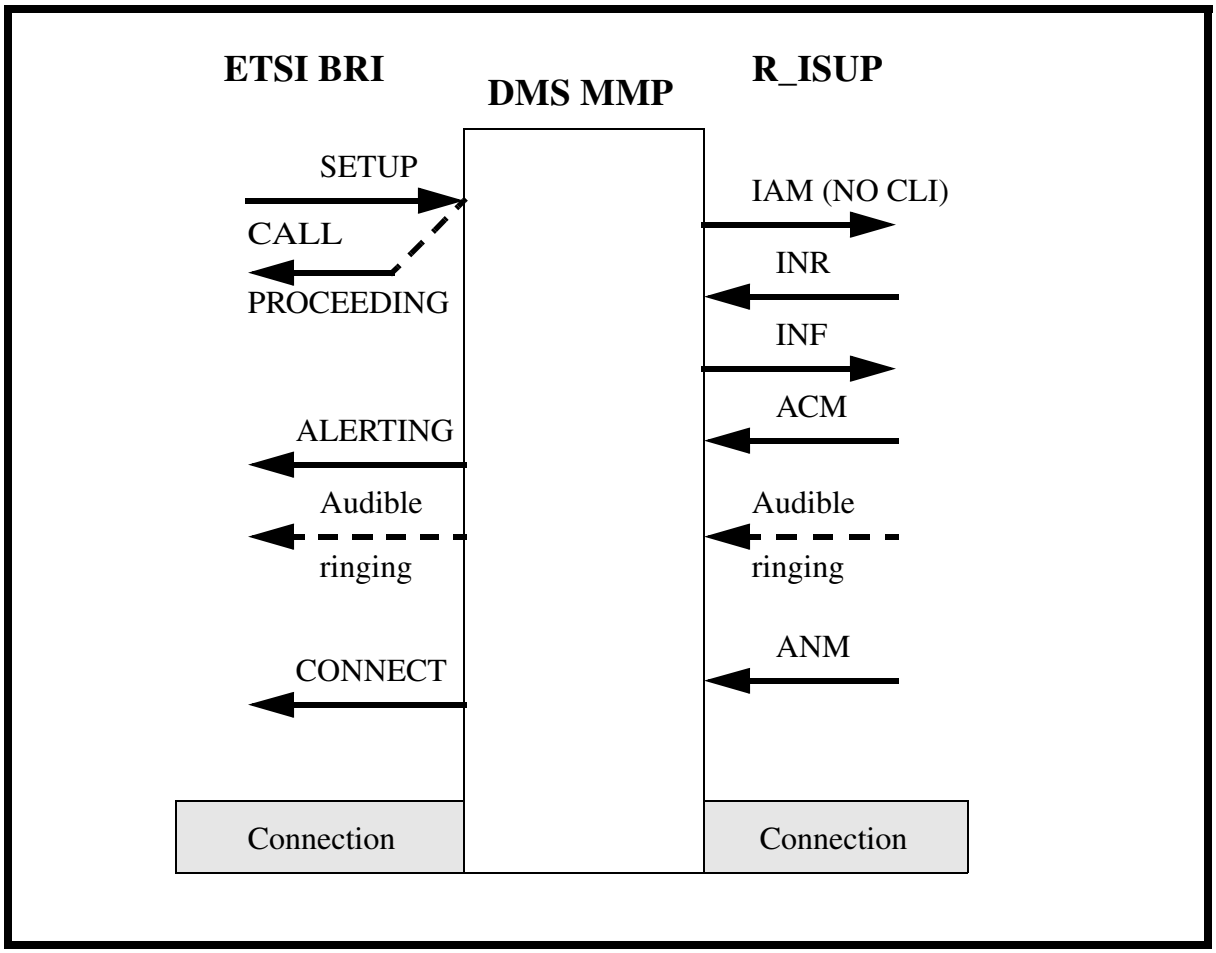
Table 2 Possible ISUPSVC configurations and corresponding behavior for outgoing trunks

OG Trunk Configuration		OG Trunk Behavior
INR-INF	**IDR-IRS**	**BRI -to- ISUP**
Generate & Receive OR Receive	None	Ignore IDR messages received from the terminating side Process INR message received from the terminating side and send back INF with the available information.
None	Generate & Receive OR Receive	Process IDR message received from the terminating side and send back IRS. Send an INF message to the terminating side which includes no information, if an INR message is received.

OG Trunk Configuration		OG Trunk Behavior
INR-INF	**IDR-IRS**	**BRI -to- ISUP**
Generate & Receive	Receive	Process IDR message received from the terminating side and send back IRS. Process INR message received from the terminating side and send back INF with the available information.
Receive	Generate & Receive	

Figure 5 shows an example for the INR/INF messaging according to the default datafill in Figure 2 “Default tuple in table ISUPSVC”

Figure 5 Call setup, CLI is absent, INR message is sent for CLI request



7.3.3 Handling SUS Message

User initiated SUS and RES messages are ignored when received.

Generation:
R_ISUP does not send SUS message when terminating line goes on hook.

Reception:

If a network initiated SUS message is received from network, call is released immediately. REL with “Normal Call Clearing” cause is sent back.

Figure 6 Call releasing to Network Initiated SUS Message in BRI->R_ISUP Interworking

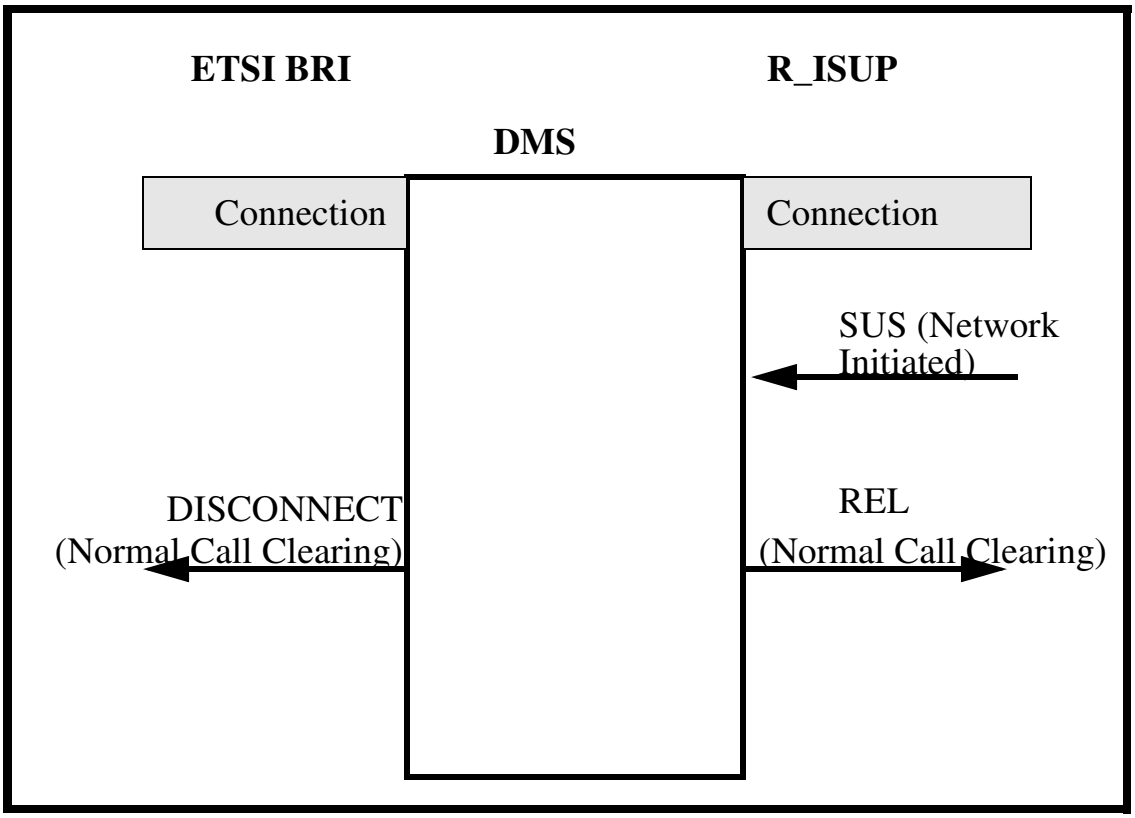


Figure 7 Call releasing when network initiated RES message is received after network initiated SUS message

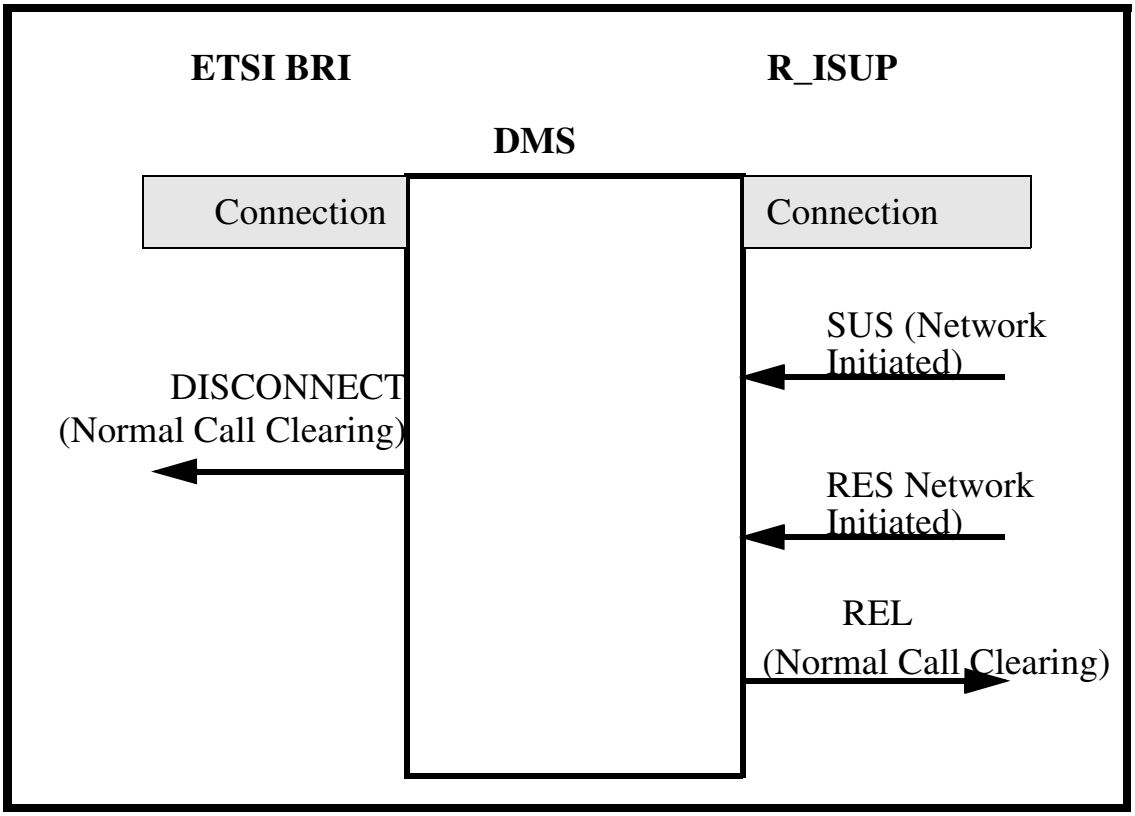


7.3.4 Nature of Address Indicator parameter

Table 3“NOA values of Calling Party Number for different call types” shows the call types and the corresponding ‘Nature of Address Indicator’ (NOA) values in the IAM message for BRI to R_ISUP interworking.

Table 3 NOA values of Calling Party Number for different call types

Call Types	Nature of Address Indicator
Local Calls	National (significant) Number
National Calls	National (significant) Number
International Calls	National (significant) Number

Table 4“NOA values of Called Party Number for different call types” shows the call types and the corresponding ‘Nature of Address Indicator’ (NOA) values in the IAM message for BRI to R_ISUP interworking.

Table 4 NOA values of Called Party Number for different call types

Call Types	Nature of Address Indicator
Local Calls	Subscriber Number
National Calls	National (significant) Number
International Calls	International Number

7.3.5 Assignment and Mapping of CPC values

Assignment of Calling Party Categories to BRI lines and mapping of these CPC values to ISUP CPC values is implemented by ISN07 activity A00001923- ‘CIS SUBSCRIBER CATEGORIES’.

7.4 PRI- R_ISUP Interworking

7.4.1 Handling R_ISUP Specific Messages

7.4.1.1 Calling Line Clear (CCL) Message

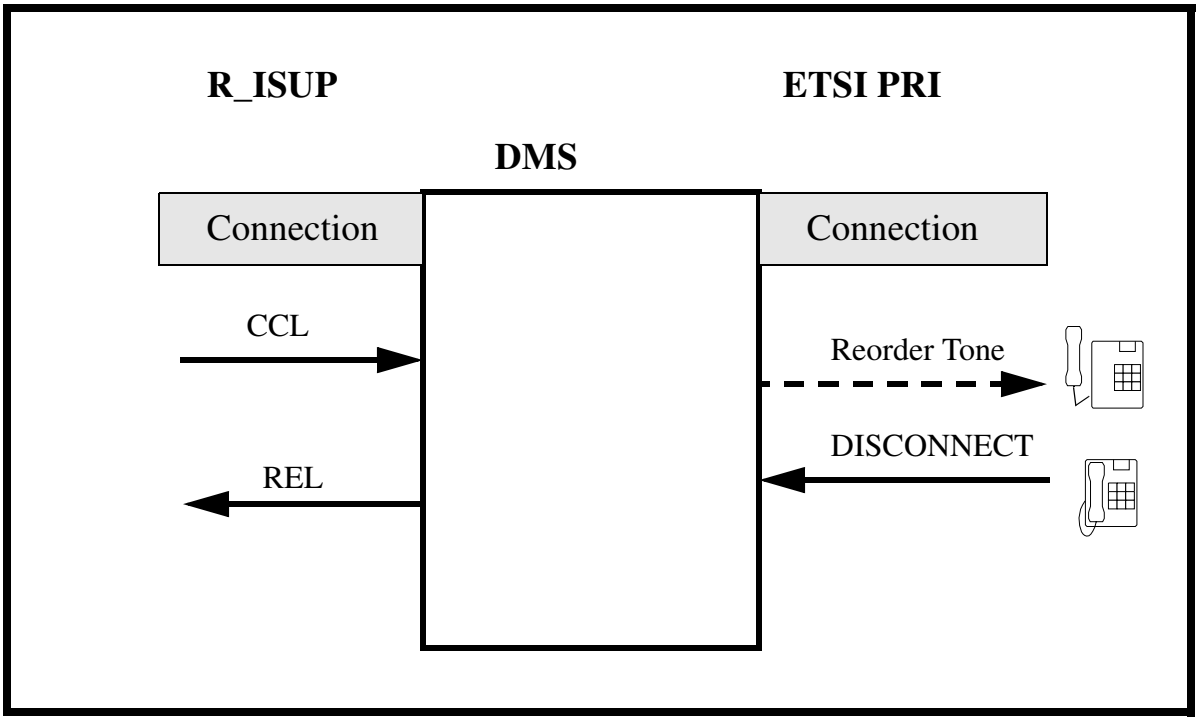
Generation:

CCL message is not generated in PRI to R_ISUP Interworking.

Reception:

When CCL message is received from R_ISUP, DMS stops billing, reorder tone is applied to PRI side, speech path is disconnected, lines and trunks are held. When release message is received from PRI, lines and trunks are released.

Figure 8 Call clearing with CCL: PRI Termination



7.4.1.2 Ring (RNG) Message

Generation:

RNG Message is not generated in PRI to R_ISUP Interworking.

Reception:

DMS ignores RNG message in cases it is received at terminating exchange.

7.4.1.3 Charge (CRG) Message

Generation:

CRG message is not generated in PRI to R_ISUP Interworking.

Reception:

DMS ignores CRG message in cases it is received.

7.4.1.4 Handling Facility (FAC) Message

CFN message will be sent as a reply if FAC is received from an R_ISUP trunk in R_ISUP to PRI interworking.

7.4.2 ISUP INR/INF and IDR/IRS Messages

The behavior for incoming and outgoing Russia ISUP V2+ trunks is explained in Table 3“Possible ISUPSVC configurations and corresponding behavior for incoming trunks” and in Table 4“Possible ISUPSVC configurations and corresponding behavior for outgoing trunks”

Table 5 Possible ISUPSVC configurations and corresponding behavior for incoming trunks

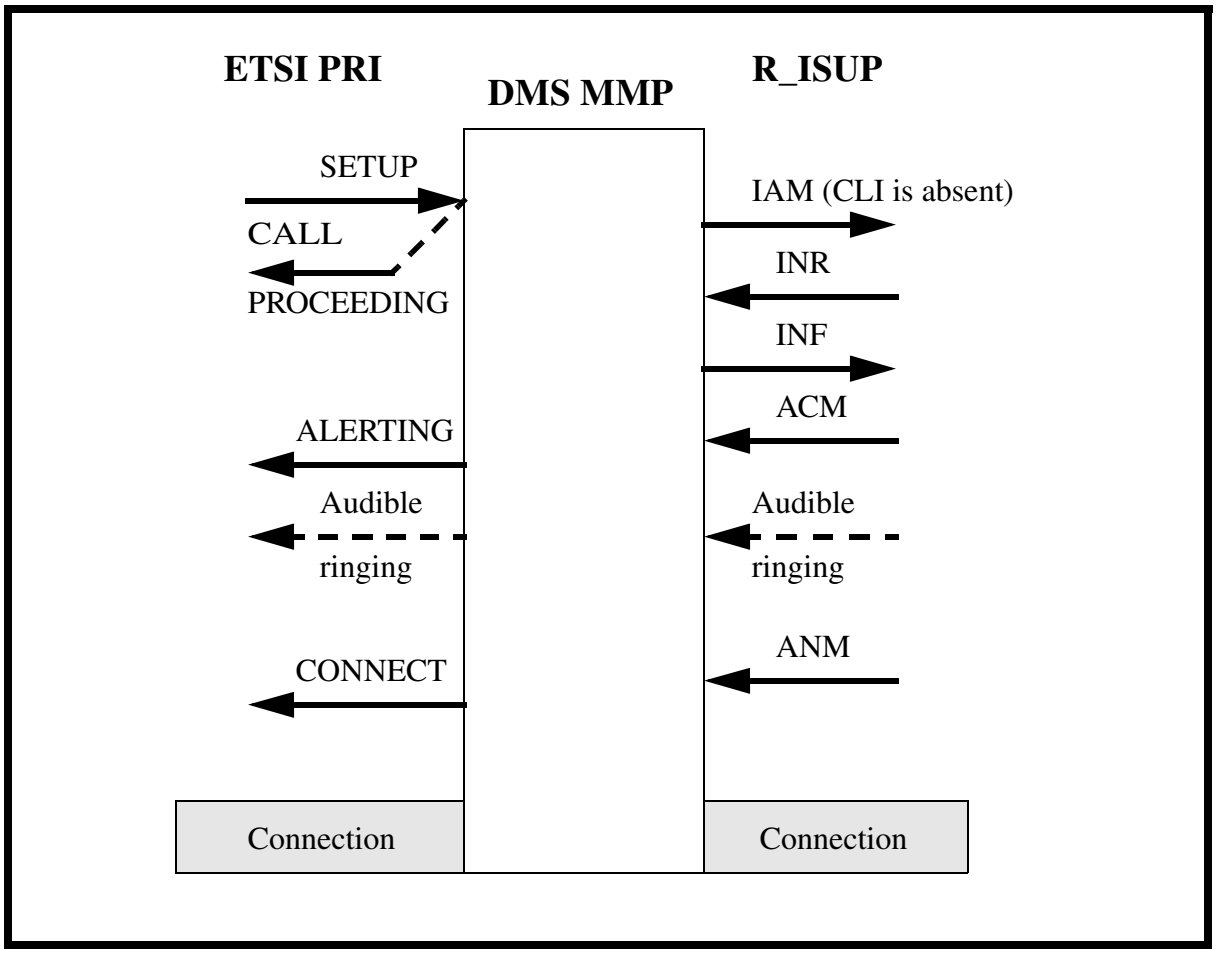
IC Trunk Configuration		**IC Trunk Behavior**
INR-INF	**IDR-IRS**	**ISUP -to- PRI**
Generate & Receive	Receive OR None	Generate INR to request information from originator. Process INF message. Do not generate IDR
Receive OR None	Receive OR None	Do not generate INR Do not generate IDR
	Generate & Receive	Generate IDR to request information from originator, if the connected agent has MCID assigned. Process IRS message Do not generate INR

Table 6 Possible ISUPSVC configurations and corresponding behavior for outgoing trunks

OG Trunk Configuration		OG Trunk Behavior
INR-INF	**IDR-IRS**	**PRI -to- ISUP**
Generate & Receive OR Receive	None	Ignore IDR messages received from the terminating side Process INR message received from the terminating side and send back INF with the available information.
None	Generate & Receive OR Receive	Process IDR message received from the terminating side and send back IRS. Send an INF message to the terminating side which includes no information, if an INR message is received.
Generate & Receive	Receive	Process IDR message received from the terminating side and send back IRS. Process INR message received from the terminating side and send back INF with the available information.
Receive	Generate & Receive	

Figure 9 shows an example for the INR/INF messaging according to the default datafill in Figure 2 “Default tuple in table ISUPSVC”

Figure 9 Call Setup, CLI is absent, INR and INF messages are sent



7.4.3 Handling SUS Message

User initiated SUS and RES messages are ignored when received.

Generation:
R_ISUP does not send SUS message when terminating line goes on hook.

Reception:
If a network initiated SUS message is received from the network, REL with "Normal Call Clearing" cause is sent back and a DISCONNECT message with also "Normal Call Clearing "cause is sent to PRI side.

Figure 10 Disconnection when network Initiated SUS is received

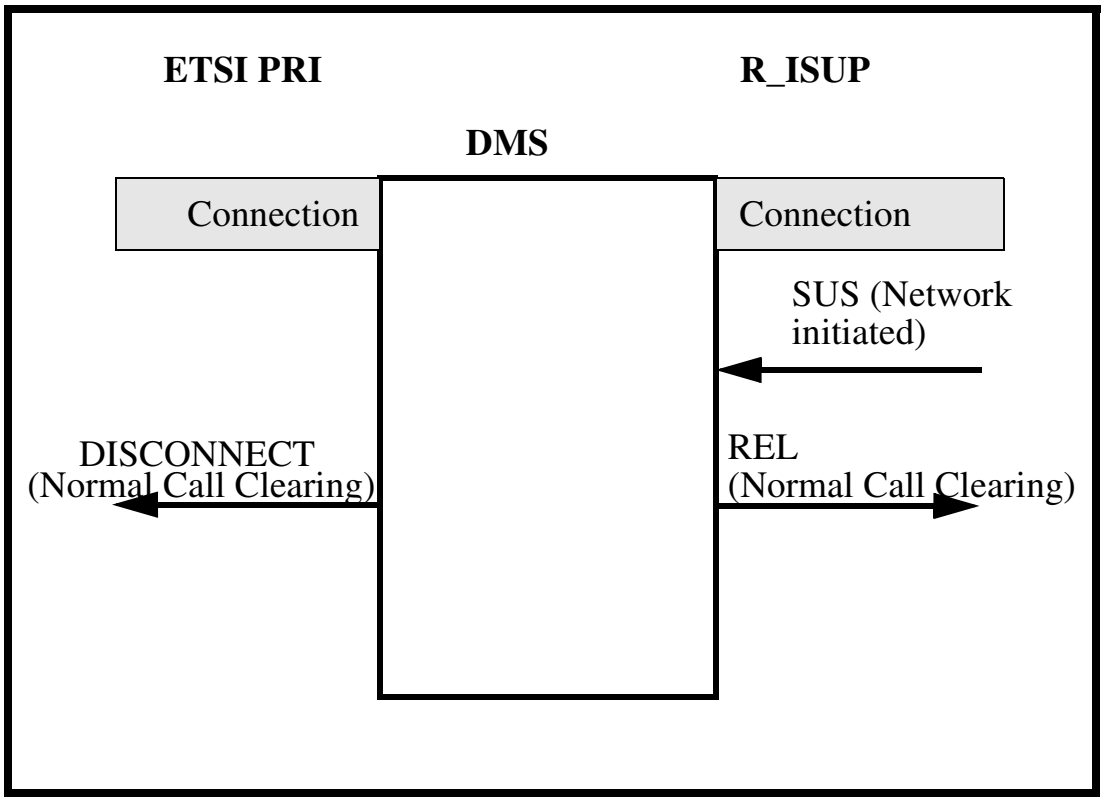


Figure 11 Call releasing when network initiated RES message is received after network initiated SUS message

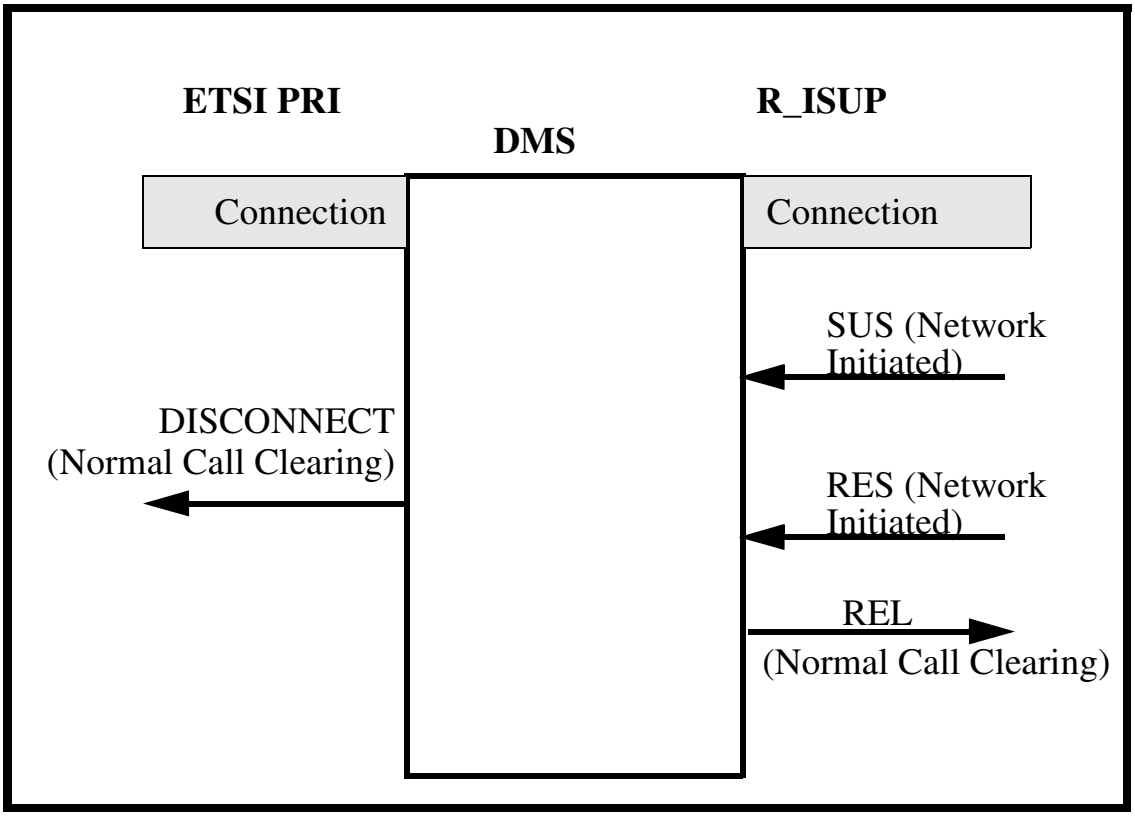

7.4.4 Nature of Address Indicator parameter

Table 7“NOA values of Calling Party Number for different call types” shows the call types and the corresponding ‘Nature of Address Indicator’ (NOA) values in the IAM message for PRI to R_ISUP interworking.

Table 7 NOA values of Calling Party Number for different call types

Call Types	Nature of Address Indicator
Local Calls	National (significant) Number
National Calls	National (significant) Number
International Calls	National (significant) Number

Table 8“NOA values of Called Party Number for different call types” shows the call types and the corresponding ‘Nature of Address Indicator’ (NOA) values in the IAM message for PRI to R_ISUP interworking.

Table 8 NOA values of Called Party Number for different call types

Call Types	Nature of Address Indicator
Local Calls	Subscriber Number
National Calls	National (significant) Number
International Calls	International Number

7.4.5 Assignment and Mapping of CPC values

CPC values cannot be assigned to PRI trunks.

For PRI -> R_ISUP Interworking, Normal Calling Subscriber (Subscriber Category 1) is sent as the CPC parameter in the outgoing IAM message.

For R_ISUP-> PRI Interworking the CPC parameter in the IAM message is ignored.

7.5 Hardware Requirements or Dependencies

Russia ISUP V2+ is supported only on PDTCs which are equipped with SX05.

7.6 Software Requirements or Dependencies

N/A

7.7 Limitations and restrictions

No specific implementation is done for BRI-R_ISUP interworking cause value mappings with this feature. Cause value mappings are the same as BRI-ISUP_V2 interworking.

7.8 Interactions

Assignment of Calling Party Categories to BRI lines and mapping of these CPC values to ISUP CPC values is implemented by ISN07 activity A00001923- ‘CIS SUBSCRIBER CATEGORIES’.

8: Functional Description (FN): A00001930

8.1 Feature name

Last and Total Call Meter Inquiry Services

8.2 Description

8.2.1 Introduction

The purpose of this activity is providing Last and Total Call Meter Inquiry (CMI) services.

- **LCMI (Last Call Meter Inquiry)** is a service which allows the subscriber to inquire about the meter count for the last call made, via dialing a predefined number. When the number is dialed, the meter count of the last call and the feature meter count of the last call (if exists) is announced in English. Please note that only answered calls and feature calls (i.e. subscriber activation, deactivation, interrogation calls and feature usage) are taken into consideration for the announcement provided to LCMI service.

In case last call meter count is equal to zero, it is announced to indicate that last call was a free call. However feature meter count is not announced if it is equal to zero.

- Like LCMI, **TCMI (Total Call Meter Inquiry)** allows the subscriber to inquire about the total meter count, via dialing a predefined number. When the number is dialed, total of all assigned meters of the subscriber is announced in English[1].

CMI services are supported for IBN lines with FPS or MOG option, and ETSI BRI lines with MOG option. Please note that FPS (Fixed Price Service) option can be assigned to IBN lines only. Refer to the activity A89007209 “Fixed Price Service for Bangladesh” for further information on FPS.

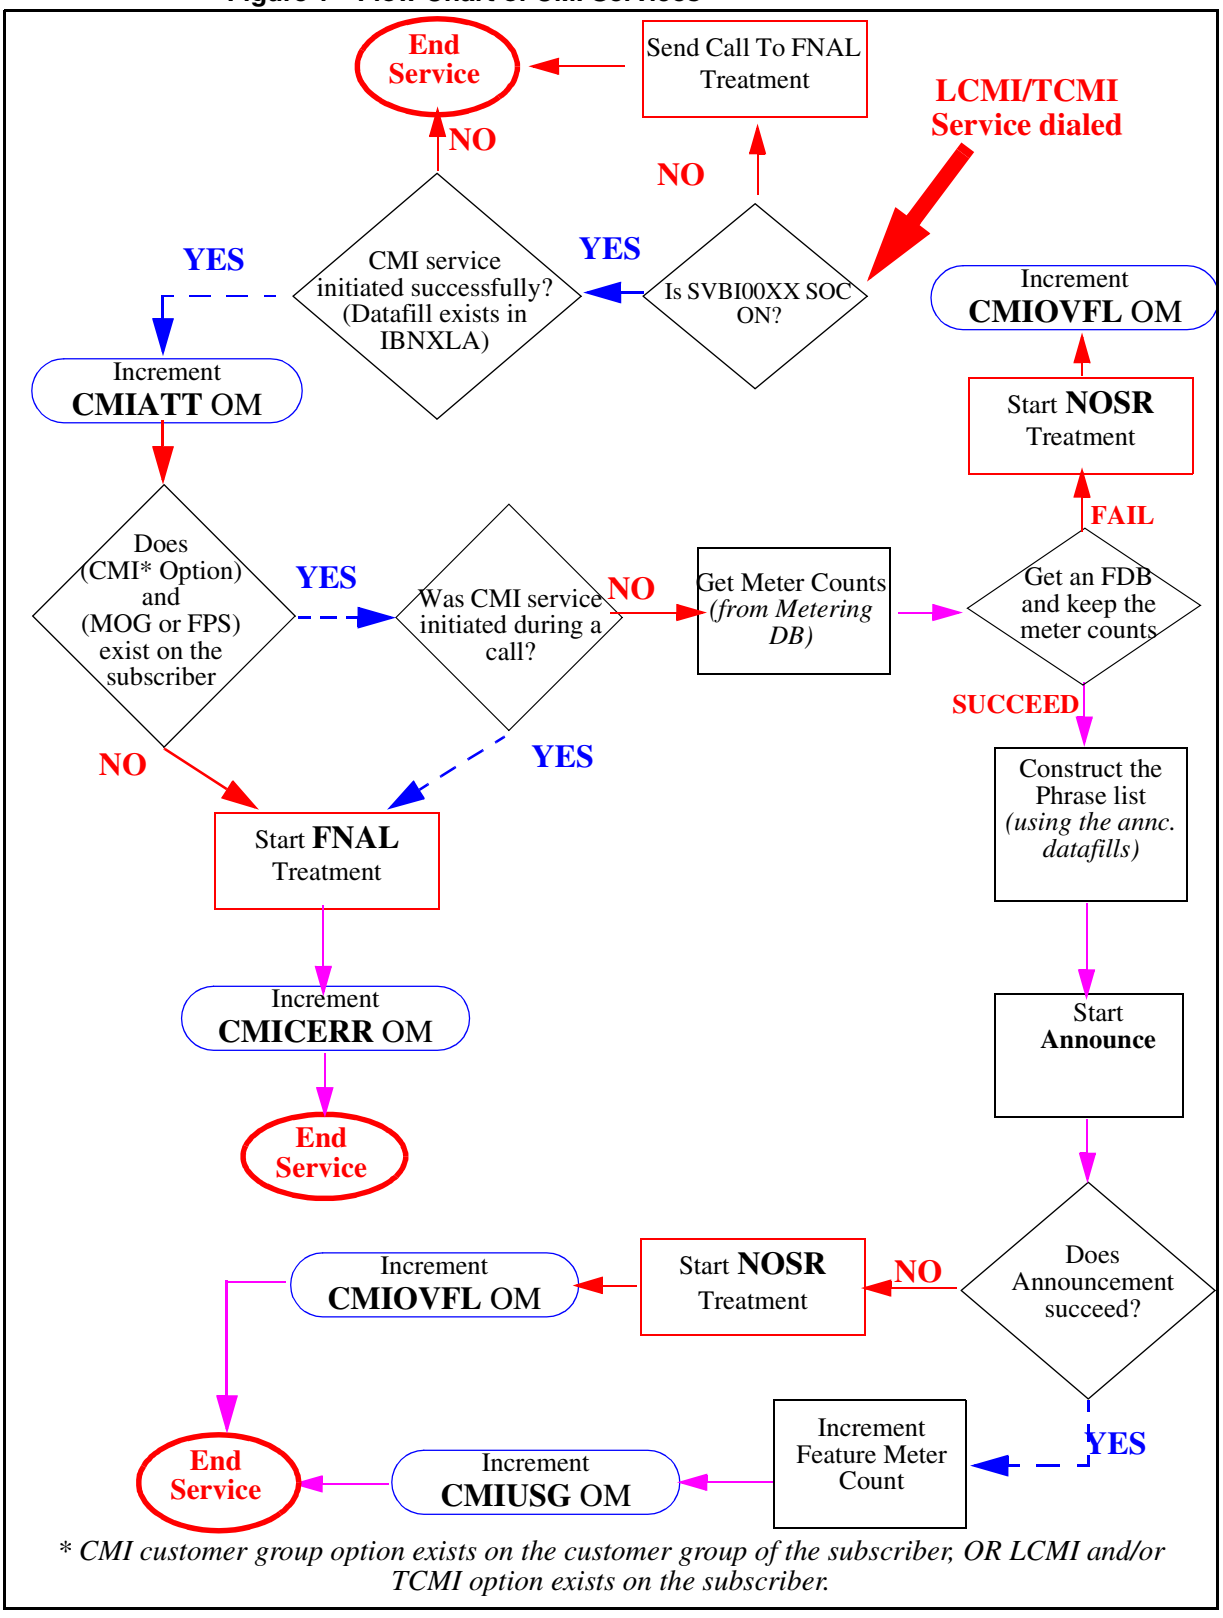
CMI services can be used by subscribers who use hardware metering (i.e. SPM and COIN) as well as software metered subscribers.

This design is implemented in ISN07.

Figure 1 shows the steps followed when TCMI or LCMI service is initiated.

[1]In the total call meter announce for subscribers with FPS option, instead of MOG, remaining credits, not the total of meters, is announced.

Figure 1 Flow Chart of CMI Services



8.2.2 Activation of Feature

CMI services will be activated for a subscriber, only if the following are provided:

1. State of SVBI0033 SOC must be ON in the office.
2. Since this is a metering dependant service, MOG option must have been assigned to the line or FPS option must exist on the subscriber.
3. TCMI/LCMI option must exist on the subscriber or the CMI customer group option must exist on the customer group that the subscriber belongs to.

8.2.2.1 SVBI0033 SOC

In order to control the office wide functionality of the TCMI and LCMI services, one state SOC is designed, which is given the name SVBI0033 SOC. SVBI0033 SOC has two states: SOC_ON and SOC_IDLE. In the SOC_ON state, SVBI0033 SOC is fully functional. In the IDLE state, the LCMI and TCMI features can be provisioned, but the usage of the service is not enabled.

Table 1 SVBI0033 SOC

SOC Group	SVBI
SOC Option Name	SVBI0033
SOC Option Title	Call Meter Inquiry
SOC Option Control Type	State
New SOC Option?	Yes
Option defined in DRU	WT20
Affected Products	DMS100 - MMP

Default state of SOC is IDLE.

Activation/Deactivation of SOC is done by password control. The password is unique for each office.

However, datafilling tables (i.e IBNXLA, IBNLINES, CUSTSTN, etc.) does not depend on the state of the SOC. This means that datafills could be done even if SVBI0033 SOC is not ON. But note that CMI services can not be activated if SVBI0033 SOC is IDLE.

For all MOG and FPS subscribers, last call and last feature meter counts are initialized when state of SVBI0033 SOC is changed to IDLE.

State of SVBI0033 SOC can not be changed from ON to IDLE while one of DUMP, METERING RESTORE, or METERING LINE RECOVERY processes. One of following error messages are displayed:

“DUMP is in progress“

“METER LINE RECOVERY process is in progress“

“METER RESTORE is in progress“

and change state is aborted.

8.2.2.2 LCMI and TCMI Line Options

Two new line options TCMI and LCMI are introduced. CMI line options are boolean options, which means it has no subfields. For ETSI BRI lines, they are compatible with point to point and point to multi point mode.

CMI line options can be assigned/deassigned to subscriber via SERVORD software. When TCMI/LCMI line options are assigned to a line, datafill will be added into one of tables IBNLINES (for IBN lines) or KSETLINE (for ETSI BRI lines) depending on the line type.

8.2.2.2.1 Administrator Assignment

CMI line options can be assigned to IBN lines and ETSI BRI lines through SERVORD software via ADO (Add Option) and NEW commands. TCMI and LCMI line options can be assigned to IBN and ETSI BRI subscribers only (as a DN feature for ETSI BRI lines, and the assignment is only aplicable to the keys of ETSI BRI line that has a DN). In order to assign TCMI or LCMI option to a line, line should have a MOG or FPS option. Please note that FPS option is supported for IBN lines only.

```
ado $ <DN> TCMI $

ado $ <DN> LCMI $
```

If line has none of MOG or FPS options, new CMI option can not be assigned to the subscriber. In this case system will reply with one of the following error messages.

```
"Cannot add LCMI since line does not have MOG or FPS option"

"Cannot add TCMI since line does not have MOG or FPS option"
```

If MOG and CMI options are intended to be assigned at the same time, MOG option should be given first so that the feature metering of administrative assignment is done correctly. Please refer to section 2.2.5 Feature Metering for more information on feature metering.

LCMI and TCMI line options cannot be added via EST (Establih hunt group) command, since addition of MOG and FPS by EST is not allowed and LCMI and TCMI line options require MOG or FPS previously assigned.

8.2.2.2.2 Administrator Deassignment

The administrator may deassign CMI option by using the DEO (Delete Option) and OUT commands through SERVORD software.

```
deo $ <DN> TCMI $

deo $ <DN> LCMI $
```

8.2.2.2.3 Deassignment of MOG Option

If both MOG and CMI options are intended to be deassigned from a line at the same time, CMI option must be deassigned first, so that feature metering of administrator deassignment is done correctly. Please refer to section 2.2.5 Feature Metering for more information on feature metering.

```
deo $ <DN> LCMI MOG $

deo $ <DN> TCMI MOG $
```

MOG option deletion is prohibited if line has TCMI and/or LCMI option. The following error message is generated:

```
"Error: Cannot delete MOG since TCMI requires MOG option."

"Error: Cannot delete MOG since LCMI requires MOG option."
```

8.2.2.2.4 Deassignment of FPS Option

FPS option deletion is prohibited if line has LCMI and/or TCMI line options. The following error message is generated FPS option is attempted to be deassigned from a line which has LCMI/TCMI line option.

```
"Error: Cannot delete FPS since TCMI requires FPS option."

"Error: Cannot delete FPS since LCMI requires FPS option."
```

8.2.2.3 Interaction with SWAP and CLN Commands

Last call and last feature meter counts of FPS and MOG agents are preserved during SWAP and CLN operations. In other words, last call and last feature meter counts of old len will be moved to new len during SWAP and CLN.

The following example shows the behavior of CMI service when SWAP command is applied to FPS agent (Behavior of MOG agent is the same). Please note that CMI SOC is ON.

8.2.2.4 Adding TCMI and LCMI Line Options to IBNXLA

TCMI and LCMI services are provisioned through translation table IBNXLA. The numbers to be dialed for TCMI and LCMI services are provisioned in table IBNXLA and can be datafilled by the customer. LCMI and TCMI

features are added to the FEATURE field of the FEAT TRanslations SELector (TRSEL) for table IBNXLA.

```
>add  NETXLA XXX FEAT N N LCMI
>add  NETXLA XXX FEAT N N TCMI
XXX - number to be dialed for the service
```

In the following example, 117 is used for TCMI, and 118 is used for LCMI provisioning.

Figure 3 Datafill Sample for Translation Table IBNXLA

```
>table IBNXLA
>pos NETXLA 117
>lis
KEY            RESULT
-----------------------------------------------
NETXLA 117     FEAT N N TCMI

>pos NETXLA 118
>lis
KEY            RESULT
-----------------------------------------------
NETXLA 118     FEAT N N LCMI
```

8.2.2.5 CMI Customer Group Option

CMI customer group option can be assigned to a customer group via CMI customer group option.

The CMI option has two suboptions: TCMI and LCMI. At least one suboption must be assigned while assigning the CMI customer group option. CMI Customer Group option is datafilled in table CUSTSTN.

8.2.2.5.1 Administrator Assignment

CMI customer group option can be assigned to customer groups via datafilling the CUSTSTN table. Since CMI customer group has two suboptions TCMI and LCMI, followings are possible:

```
table CUSTSTN

     add <CUSTNAME> CMI CMI TCMI $

     add <CUSTNAME> CMI CMI LCMI $
```

```
add <CUSTNAME> CMI CMI TCMI LCMI $
```

In case subscriber has TCMI or LCMI suboption assigned already, and existing option is attempted to be assigned again, one of the following error messages is displayed:

"Duplicate XXX option is not allowed."

"XXX option already exists."

XXX - LCMI or TCMI

However CMI customer group option can be assigned to customer group although all of the group members do not have MOG or FPS option. But in order to use CMI service, IBN/ETSI BRI subscriber must have MOG or FPS option.

8.2.2.5.2 Administrator Deassignment

The administrator may deassign CMI option completely by deleting the tuple using the DEL command.

```
del <CUSTNAME> CMI
```

Please note that removing CMI option from a customer group means that removing both LCMI and/or TCMI options from the customer group.

In order to remove one of TCMI or LCMI features, independent from the other, related tuple must be changed from CUSTSTN table.

```
cha <CUSTNAME> CMI XXX
```

XXX - LCMI or TCMI

8.2.2.6 Feature Metering

LCMI/TCMI services will be charged when an administrator assignment, deassignment or subscriber usage action of LCMI/TCMI line option occurs. This means feature meter of the subscriber is incremented when the administrator initiates an LCMI/TCMI line option assignment/deassignment to a line, or when the subscriber uses LCMI/TCMI services.

Like LCMI and TCMI line options, feature metering of the subscriber is incremented during the subscriber usage only.

Please note that feature metering is only supported for IBN lines. Feature metering on ETSI BRI lines is not supported. For IBN lines, MTRFEAT table must be datafilled properly for feature metering.

For subscribers with FPS option, feature meter count is decremented from subscriber's credit directly. Refer to the activity A89007209 "Fixed Price Service for Bangladesh" for further information on FPS.

In the announcement, provided by LCMI service, the feature meter count of the last call (if any) will be included. In other words, feature meter count increment, which is caused by the current usage of the LCMI service, will not be reflected to the announcement. Feature meter increments caused by the administrator assignment/deassignment of any feature are not reflected to the LCMI announcement (i.e. only increment of feature meter count caused by subscriber usage is announced).

8.2.2.7 CMI OM Group

CMI OM Group provides information about the successful and unsuccessful usage and performance of CMI features (SVBI0033 SOC must be ON). CMI OM group has four registers with names CMIATT, CMIUSG, CMIOVFL, and CMICERR. These OM registers are pegged by LCMI and TCMI features. CMI OM group is multi-tuple, which includes LCMI and TCMI tuples.

CMI Registers

- **CMIATT - CMI ATTEMPT**

This register counts the number of attempts for TCMI/LCMI service to be invoked. Generally this register is incremented each time LCMI or TCMI service is initiated. This means, LCMI/TCMI service is successfully translated through translation table IBNXLA and successfully activated.

- **CMIUSG - CMI USAGE**

This register counts the number of times LCMI/TCMI service is successfully completed. This register is incremented just after the announcement is successfully played.

- **CMIOVFL - CMI OVERFLOW**

This register counts the number of times LCMI/TCMI service can not be successfully completed due to insufficient system resources. It is incremented when the announcement can not be provided to the subscriber.

- **CMICERR - CMI CUSTOMER ERROR**

This register counts the number of times CMI service is not provided to the subscriber, due to illegal initiation (i.e. initiation of the CMI service during active call) of the service or subscriber is not allowed to use the service.

Following figure shows the map display of CMI OM registers.

Figure 4 Map display of CMI OM Registers

```
>omshow CMI active
CMI

CLASS:   ACTIVE
START:2003/05/25 12:00:00 SUN; STOP: 2003/05/25 12:01:47 SUN;

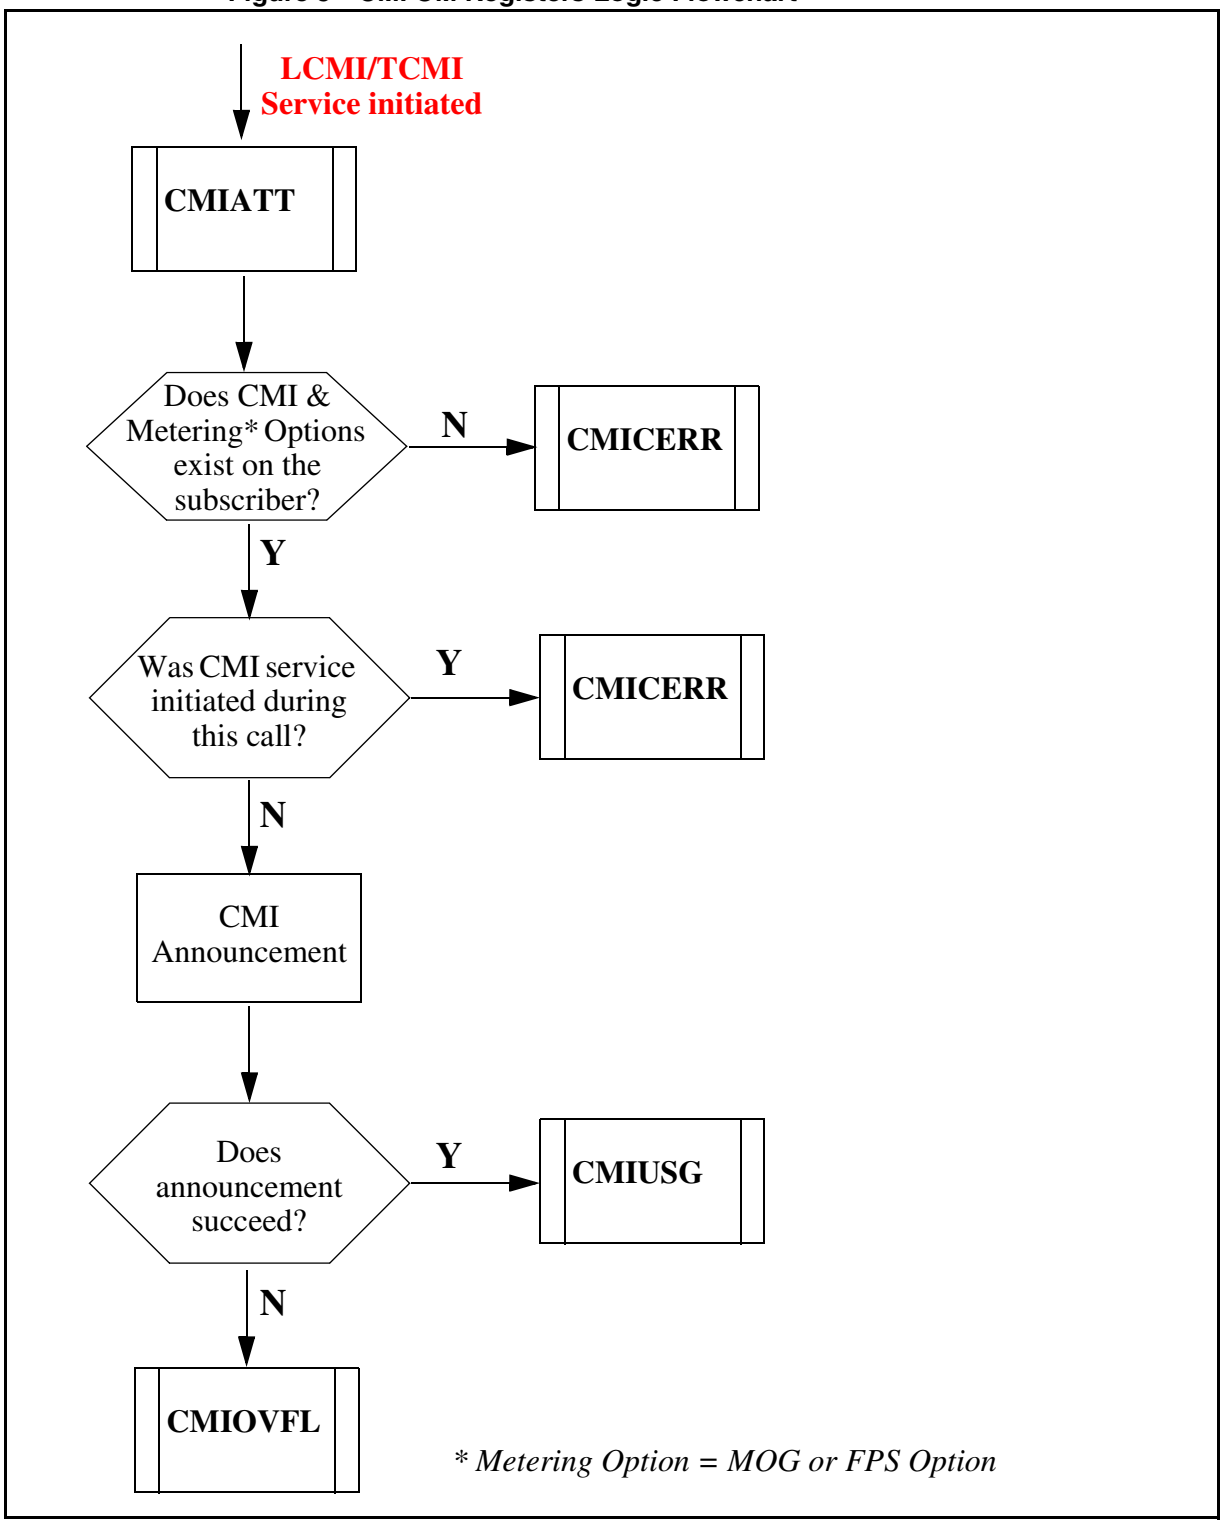
         KEY (CMI_OPTIONS)

                  CMIATT CMIUSG   CMIOVFL          CMICERR
         0 TCMI   4       2       1                1
         1 LCMI   10      9       1                0
```

See Figure 4 for pegging cases of CMI OM registers.

Figure 5 CMI OM Registers Logic Flowchart



8.2.2.8 Enhancement of MTRCOUNT Command

MTRCOUNT command, which displays the software meter counts of the subscriber having MOG, is enhanced in order to display the last call meter count, last feature meter count, and the total of all meter counts assigned to the subscriber when SVBI0033 SOC is ON (when used with “line” parameter). Map display is as follows:

Figure 6 Map Display for MTRCOUNT LINE command

```
>mtrcount LINE 7835406
************************************************************

DN     : 1027835406
DATE   : 03/07/18
MTR NAME: FEATURE           MTR COUNT:  00000000 WRAP: N
MTR NAME: LOCAL             MTR COUNT:  00000000 WRAP: N
MTR NAME: TOLL              MTR COUNT:  00000000 WRAP: N

          TOTAL             MTR COUNT: 000000000
          LAST CALL         MTR COUNT:  00000000
          LAST FEATURE      MTR COUNT:  00000000
************************************************************
```

When MTRCOUNT command is used with TRUNK/LMG (Line Meter Group) option, when SVBI0033 SOC is ON, TOTAL of assigned meter counts of trunk/lmg is displayed. Example map displays are as follows:

Figure 7 Map Display for MTRCOUNT TRUNK command

8.2.2.9 Enhancement of QFPS Command

QFPS FPS CI command, which displays the FPS credit of the subscriber having FPS, is enhanced in order to display the last call meter count, last feature meter count, and the total of all meter counts assigned to the subscriber when SVBI0033 SOC is ON. QFPS command with ZERO, UNUSEDFOR, DN and ALL options are enhanced by this activity. Map display is as follows:

Figure 9 Map Display for QFPS command

8.2.2.10 CMI Announcements

CMI announcements are custom announcements that consist of a number of simple phrases, in English, datafilled in table ANNPHLST (See Appendix B for sample announcement datafill). Each simple phrase has a corresponding recording on the EDRAM card.

Feature meter count announce is provided by datafilling table ANNPHLST properly. CMIFTRANN_START phrase idicates the start of feature announce sentence, while CMIFTRANN_STOP indicates the end of the feature announce sentence.

Please note that announcement sequence strictly depends on the datafill in table ANNPHLST. If it is not datafilled properly, announcement will be provided in wrong sequence.

8.2.2.10.1 Simple Phrase Names Used in CMI Announcement

The simple phrase names provided for CMI service for English language and the corresponding phrases recorded on the EDRAM are shown in table below. These are assigned on a EDRAM using the ASSIGN command. Please refer to “APPENDIX A Assigning EDRAM Phrases Using DRAMREC CI Command”.

Table 2 List of English Phrases in CMI Service

Phrase Name	Recording	Phrase Name	Recording
CMIENG1	Your	CMIENG2	Last Call
CMIENG3	Total	CMIENG4	Meter Count is
CMIENG37	Last Feature	CMIENG5	Thank you for your calling
CMIENG39	Credit is	CMIENG38	Remaining
CMIENG6	One	CMIENG7	Two
CMIENG8	Three	CMIENG9	Four
CMIENG10	Five	CMIENG11	Six
CMIENG12	Seven	CMIENG13	Eight
CMIENG14	Nine	CMIENG15	Ten
CMIENG16	Eleven	CMIENG17	Twelve
CMIENG18	Thirteen	CMIENG19	Fourteen
CMIENG20	Fifteen	CMIENG21	Sixteen
CMIENG22	Seventeen	CMIENG23	Eighteen
CMIENG24	Nineteen	CMIENG25	Twenty
CMIENG26	Thirty	CMIENG27	Forty
CMIENG28	Fifty	CMIENG29	Sixty

Phrase Name	Recording	Phrase Name	Recording
CMIENG30	Seventy	CMIENG31	Eighty
CMIENG32	Ninety	CMIENG33	Hundred
CMIENG34	Thousand	CMIENG35	Million
CMIENG36	Zero	**CMIENG**	Language delimiter (optional)
CMIENGFTRANN_ START	delimiter for feature announce starting	**CMIENGFTRANN_ STOP**	delimiter for feature announce stopping
CMIENG_MTR_CREDIT	meter count/credit	CMIENGCNT_LSTFTR	last feature meter count
CMIENGCNT_LSTOT	last/total/remaining	CMIENGLSTOT	last//total

Red - Main phrases

Blue - Number Phrases

Black - Compound Phrases

Green - delimiters

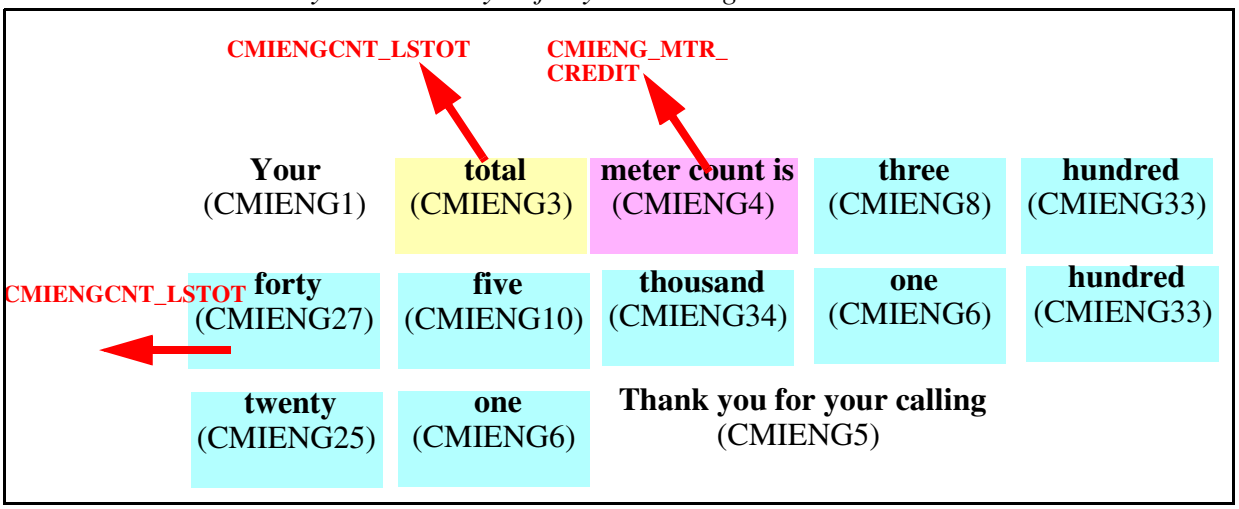
Please note that compound phrases and delimiters should not be recorded manually. Corresponding phrases are decided dynamically at run time.

8.2.2.10.2 CMI Announcement Example

Examples of announcements for CMI service is shown in the following table, announcing:

- **Example 1: TCMI announcement provided to subscriber having MOG option.**

"Your total meter count is three hundred forty five thousand one hundred twenty one. Thank you for your calling."

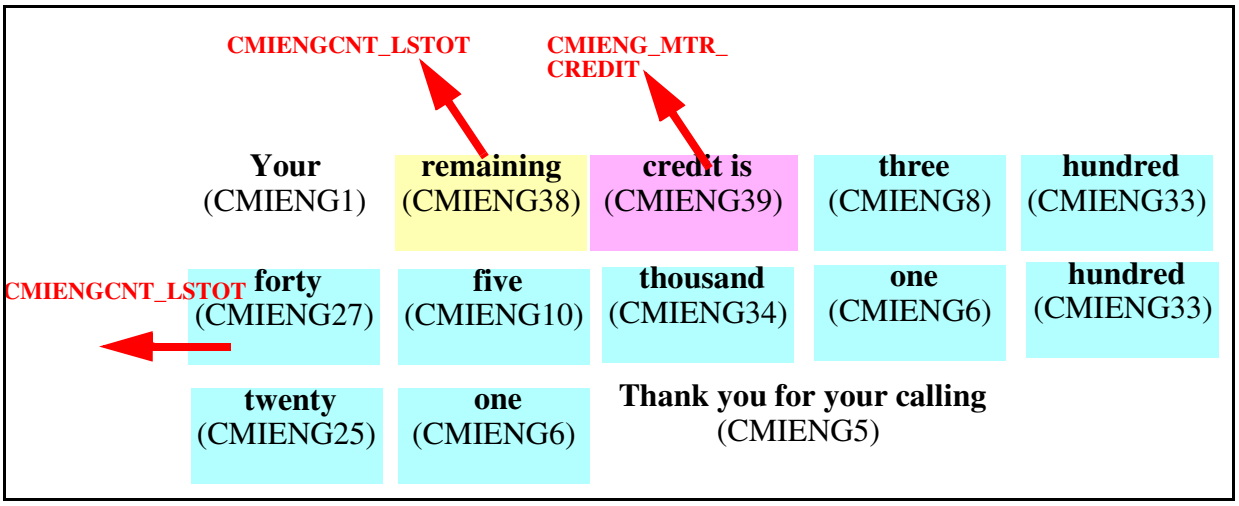


- **Example 2: TCMI announcement provided to subscriber having FPS option.**

"Your remaining credit is three hundred forty five thousand one hundred twenty one. Thank you for your calling."

- **Example 3: TCMI announcement provided to subscriber having FPS option.**

"Your remaining credit is three hundred forty five thousand one hundred twenty one. Thank you for your calling."



8.3 Hardware Requirements or Dependencies

This feature uses the Enhanced Digital Recorded Announcement Machine (EDRAM) to provide the announcement for CMI service. The CMI simple phrases are loaded into EDRAM as voice files.

8.4 Software Requirements or Dependencies

Software and hardware metering should be enabled via office parameter ENABLE_METERING. ENABLE_METERING must be YES in order to use CMI services.

8.5 Limitations and Restrictions

1. The total recording time for all the phrases is limited by the EDRAM hardware. All phrases making up CMI announcement must exist on one physical EDRAM card. NTP-297-1001-527 contains the complete description on EDRAM.
2. Hardware and software metering should be enabled via office parameter ENABLE_METERING. In case ENABLE_METRING is NO, meter counts are not updated after each call, and CMI announcement does not reflect the correct values of meter counts.
3. LCMI and TCMI services can not be initiated during an active call.
4. Last call meter count and last feature count of MOG Subscribers are preserved during warm, cold and reload restarts, since these counts are saved in DSPROT memory. But these counts are not survived during office reboot.But please note that last call meter count and last feature count of FPS subscribers are preserved during WARM restarts only.
5. State of SVBI0033 SOC can not be changed to IDLE state from ON state, while one of DUMP, METERING RESTORE, or LINE RECOVERY processes are running.

8.6 Interactions

Please note that only the features that CMI service has interaction with are explained below.

8.6.1 Call Diversion

Call diversion to LCMI and TCMI services is allowed. But, in case a subscriber diverts his phone to LCMI/TCMI service, others calling the diverting DN hears the BUSY tone. However, diverting subscriber himself will be able to call LCMI/TCMI service.

8.6.2 Hunt Groups

CMI services are supported for DNH, DLH and MLH Hunt Groups. In the last meter count announce for MLH and DLH members, meter counts of the last call made by “any member” (i.e subscriber himself or anybody else) is included.

In the total meter count announce, total of all meters assigned to the hunt group is included.

8.6.3 MSN on ETSI BRI

CMI and MSN on ETSI BRI interaction behavor is just like the behavior of CMI and Hunt groups.

8.6.4 Reverse Charging

LCMI service is compatible with reverse charging. In case originating agent initiates LCMI service after a reverse charged call, “last call meter count =0” is announced to the subscriber. In case LCMI service is initiated by the terminating agent (i.e charged party), subscriber is announced the actual value of the meter count, consumed during the last call.

8.6.5 FNT (Free Number Terminating)

CMI services arecompatible with FNT option. Last call/feature meter counts of IBN/ETSI BRI agent are updated as zero after answered free call (i.e.If IBN/ ETSI BRI agent initiates LCMI service after a free call, last call meter count of the agent is announced as zero). Please note that feature meter count increments (due to usage or activation of any metered feature) during FNT call are not reflected to the last call meter count.

8.6.6 HOLD

LCMI announcement is released when LCMI announcement is held, in order not to cause any troubles during complex call scenarios in ETSI BRI lines (i.e. 3PTY etc).

8.6.7 Basic Call & Complex Call CMI Interaction

- Consider the following scenario:

Action	Last Call Meter Count	Last Feature Meter Count	Announcement
1. Any Call	4	3	-
2. Subscriber initiates LCMI Service	4	2	Last Call Meter Count = 4 last feature meter Count = 3
3. Subscriber initiates LCMI Service	0	2	Last Call Meter Count = 4 last feature meter Count = 2

In the subscriber’s first initiation of LCMI service, meter counts of the last call is announced to the subscriber. After the announcement, last feature meter count is incremented due to the usage of LCMI service.

In the second initiation of LCMI service, last call meter count of the previous call is preserved, and last feature meter count was two. And again last feature meter count is incremented due to usage of LCMI service.

- In complex call scenarios that contain more than one leg (i.e. Call Transfer, Three Way Call and Six Way Call), meter count of the latest disconnected leg is announced to the charged agent. Consider the following scenario of 3WC:

1. Agent A has 3WC option.
2. Agent A calls Agent B.
3. Agent B answers the call.
4. Agent A flashes, and calls Agent C. (A-B call on hold)
5. Agent C answers. (A-C call active)

For possible scenarios after this step, lately disconnected leg's meter count is reflected to the announcement provided to Agent A (i.e. charged agent), since last call meter count is updated when all of the connected calls are released.

8.9 APPENDIX A Assigning EDRAM Phrases Using DRAMREC CI Command

This section explains the command required to assign an internal recording on EDRAM to an external phrase name (up to 16 alpha numerics) in order to datafill table ANNPHLST. The internal recordings in the corresponding voice files are downloaded already to the EDRAM. *RECORD* is a subcommand under DRAMREC utility. For complete information, refer to NTP-297-1001-527 *Digital Recorded Announcement Machine DRAM and EDRAM Guide.*

Table 3 ASSIGN Phrase Names to Internal EDRAM Recordings

8.10 APPENDIX B Datafill for CMI Announcements

This appendix describes changed datafill required for CMI announcements on an EDRAM card. For complete information, refer to NTP-297-1001-527 *Digital Recorded Announcement Machine DRAM and EDRAM Guide.*

The sequence to datafill EDRAM and CMI related tables are shown below.

8.0.9.1 Table TMINV

This table defines the location of two EDRAM hardware cards within the Maintenance Trunk Module (MTM).

Figure 10 Table DTMINV - Sample Datafil

```
 TMNM FRTYPE FRNO SHPOS FLOOR ROW FRPOS        LKDATA  EQPEC
    LOAD   EXECS                                SCTMLOC
-----------------------------------------------------------------
       DTM    0    TME    0    51     1   B     3   0 10 12  0 1X80AA
EDRMAE47   MTMEX         SINGLE_CARD         MTM     2 12
```

8.0.10.2 Table DRAMS

This table contains the information about two physical EDRAM cards and the arrangement of speech memory. Each physical card can be divided into 8 single-density virtual cards or 4 double-density virtual cards. The datafill below divides one physical card into 4 double-density virtual cards.

Figure 11 Table DRAMS - Sample Datafil

```
DRAMCARD TMTYPE TMNO TMCKT  CARDCODE
                                                              CARDINFO
-----------------------------------------------------------------
    1  0    DTM    0     0    1X80AA
                                                  CTLR          DRAM1

    1  2    DTM    0     2    1X80AA
RAM (1) $

    1  4    DTM    0     4    1X80AA
RAM (2) $

    1  6    DTM    0     6    1X80AA
RAM (3) $
```

8.0.11.3 Table EDRAMINV

This table contains the voice file information fort he EDRAM. Voice files contain internal recordings for simple phrases. Up to 8 single-density voice files or 4 double-density voice files can be downloaded to a specific EDRAM card.

Table 1 Table EDRAMINV - Sample Datafill

EDRAMNM	TUPINFO	
DTM 0 3	ANN	CMIANN1
DTM 0 4	ANN	CMIANN2

Four voice files, CMIANN1 to CMIANN2 contain English phrases.

After datafilling table EDRAMINV, DTM must be reloaded with announce files. Then the phrases must be assigned.

8.0.11.4 Table CLLI

This table is used to define new CLLIs for two announcement groups. Field TRKGRSIZE defines the total number of members in each group.

Table 2 Table CLLI - Define Announcement CLLI

CLLI	ADNUM	TRKGRSIZE	ADMININFO
CMIENG	800	10	CALL_METER_INQUIRY_ENGLISH

8.0.11.5 Table ANNS

This table assigns the CLLI name defined in table CLLI to an announcement type. Field CLLI contains the CLLI name. For CMI service, field ANTYPE must be datafilled with *CMI*. The value in field MAXCONN has no impact to custom announcements such as CMI since for a custom announcement, the maximum number of simultaneous connections that can be made to one announcement is hard-coded to 1. CMI Announcement is repeated for number

Table 3 Table ANNS - Sample Datafill

CLLI	ANTYPE	TRAFSNO	MAXCONN	CYTIME	MAXCYC
CMIENG	***CMI***	25	1	0	2

of times defined by MAXCYC field. But please note that once you datafill this tuple, it is very hard to change it.

8.0.11.6 Table ANNMEMS

This table contains the assignments for each announcement member in the announcement group defined in table ANNS. Each tuple here corresponds to one trunk member in its group at MAP TTP level. For custom announcement such as CMI, hardware type must be DRAM, only one track can be datafilled in field TRACKLIST and the track number must be 0. For each EDRAM card, e.g. DTM 2, only up to 29 members (1 to 29 at the last column) can be datafilled.

Table 4 Table ANNMEMS - Sample Datafill

ANNMEM		HDWTYPE	CARD	TRACKLIST			
CMIENG	0	DRAM	DRA	0	DTM	0	14

8.0.11.7 Table ANNPHLST

Each tuple in this table defines one custom announcement. For CMI service, the announcement number (the second field of USERANN) must be unique. Phrase list to be announced is generated dynamically at runtime. Adviced datafill for CMI announcement is like the following if feature meter count will be announced in the LCMI announcement:

Figure 12 Sample Datafill For CMI Announcement, Announcing Last feature also meter count

```
ANNPHKEY          PHSLIST
-------------------------------------------------------------------
CMIENG        1   CMIENG   CMIENG1   CMIENGLSTOT   CMIENG_MTR_CREDIT
CMIENGCNT_LSTOT

CMIFTRANN_START       CMIENG1       CMIENG37       CMIENG_MTR_CREDIT
CMIENGCNT_LSTFTR CMIFTRANN_STOP

CMIENG5 $
```

TCMI announcement with the above datafill will be like the following for **MOG subscriber**:

"Your total meter count is three hundred forty five thousand one hundred

twenty one. Thank you for your calling."

For the **FPS subscribers**. it will be:

"Your remaining creadit is three hundred forty five thousand one hundred

twenty one. Thank you for your calling."

LCMI Announcement for **MOG subscribers**(feature meter count is not equal to 0) will be:

"Your last call meter count is three hundred forty five thousand one hundred

twenty one. Your last feature meter count is five. Thank you for your calling."

For FPS subscribers(feature meter count is not equal to 0) will be:

"Your last call credit is three hundred forty five thousand one hundred

twenty one. Your last feature meter credit is five. Thank you for your calling."

If last feture meter count of the subscriber is equal to zero, feture meter is not announced.

Adviced datafill for CMI announcement is like the following if feature meter count will be announced in the LCMI announcement:

Figure 13 Sample Datafill For CMI Announcement, without last feature meter count announcing

```
ANNPHKEY          PHSLIST
-----------------------------------------------------------------
CMIENG        1   CMIENG   CMIENG1   CMIENGLSTOT   CMIENG_MTR_CREDIT
CMIENGCNT_LSTOT

CMIENG5 $
```

Last feature meter count is not announced in LCMI announcement (even if last fetature meter count is different than zero), while TCMI announcement remains the same. This time,

LCMI Announcement for **MOG subscribers** will be:

"Your last call meter count is three hundred forty five thousand one hundred

twenty one. Thank you for your calling."

For **FPS subscribers** it will be:

"Your last call credit is three hundred forty five thousand one hundred

twenty one. Thank you for your calling."

If more than one tuple is datafilled for CMI service in this table, only the first, decided by the unique announcement numbers (e.g. 1 in the above table), is used for announcement playing on each cycle.

The announcement number in this table can be from 1 to 255. For better real time performance, it's recommended to assign the announcement number from 1 up.

9: Functional Description (FN): A00001935

9.1 Feature name

Provisioning Support for Centrex-IP Nodes and Lines

9.2 Description

Feature A0001935 will deliver the lines flow through and pre-provisioning functionality in the Succession Element and Sub-element Manager (SESM) required for the Centrex IP Client Manager (CICM) integration with Succession. The design will be split into Nodes provisioning for CICM Gateways (GWs), and lines provisioning for CICM terminations.
The Nodes provisioning feature component will provide for the provisioning of CICM GWs. Nodes provisioning will also provide functionality to pre-provision the CICM terminations in the GWC-EM and to pre-provision LENs (Line Equipment Numbers) in XACore table LNINV. The Lines Provisioning component will provide flow through of service information entered at OSSGate (SERVORD+ commands). New line provisioning functionality will be delivered to allow line data to be transmitted to the CICM Element Manager (CICM-EM).

9.3 Hardware Requirements or Dependencies

Not applicable.

9.4 Software Requirements or Dependencies

Not applicable.

9.5 Limitations and restrictions

None.

9.6 Interactions

This feature will integrate the Centrex-IP client provisioning with the existing Succession SERVORD+ system. Centrex-IP client ommands/data will distributed to the CICM-EM from the SERVORD+ system within the SESM. The following commands will trigger data distribution to the CICM-EM from SESM SERVORD+:

- NEW, EST, ADD, OUT, DEL, CDN, CHDN, CLN/CTP, CKLN/CKTP, ADO, DEO, CHF

This list is subject to change until final DSUM approval.

Term	Description
New term	Definition

10: Functional Description (FN): A00001965

10.1 Feature name

H.323 DPNSS Tunnelling on CS2K

10.2 Description

This SN06 activity, A00001965, provides the capability to connect DPNSS PBXs to the CS2K and provide Carrier Hosted VPN service to the PBX using DPNSS networked feature signalling between extensions on the PBXs and CS2K hosted Lines[1]. The same level of service is provided for network calls between PBXs and Lines connected to different CS2K call servers.

This feature is only available in the International CS2K software load.

The proposed system uses a customer premise located Gateway which interfaces to TDM DPNSS trunks from the PBX and tunnels the DPNSS signalling over a H323 IP connection to the CS2K. The Gateway to be used is the Westell iQ2030.

The DPNSS signalling from the Westell H.323 DPNSS interface is tunnelled transparently by the CS2K to either:

- another DPNSS PBX connected to the CS2K via a Westell H.323 gateway or
- IBN7 trunks supporting the existing Nortel proprietary DPNSS feature transparency capability (DFT).

This tunneling capability supports end to end transparency of DPNSS Real Calls (Basic Call Service & Call Associated Services (CAS)) and DPNSS Virtual Calls (Non-Call Associated Services (NCAS)) in the above call scenarios as if the intermediate H323 and IBN7 trunks were not present.

The same level of service is provided as for TDM DPNSS trunk connected to a DMS MMP.

Figure 1 shows possible configurations that are supported in CS2K for the deployment of H.323 Westell Gateway by this feature for DPNSS tunnelling applications.

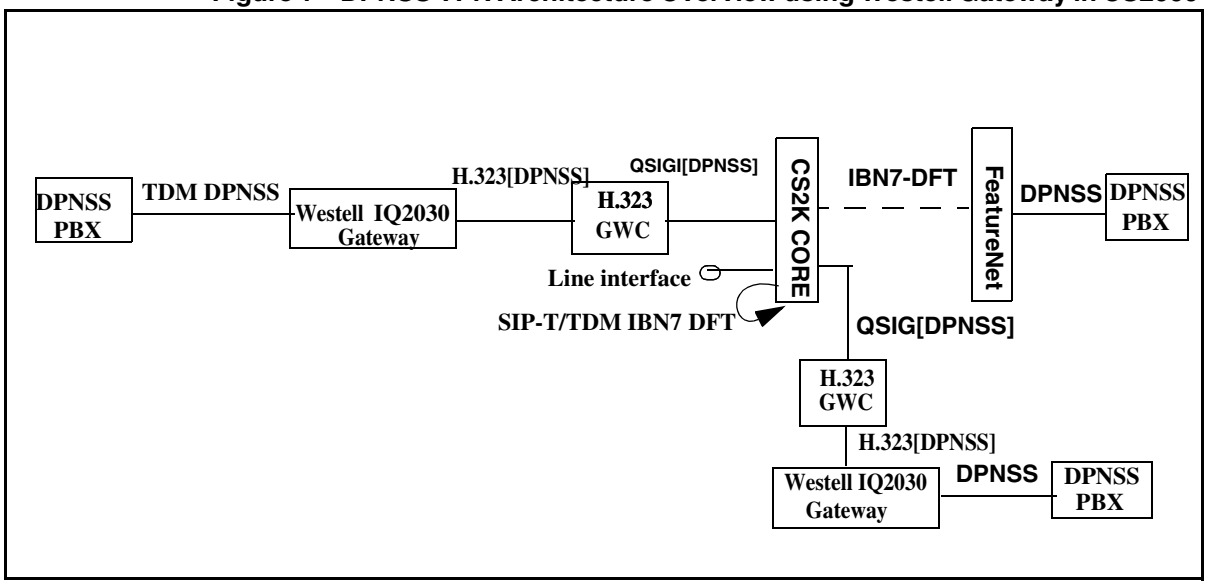
[1]Direct interworking of the H.323 DPNSS interface to CS2K hosted lines will not support DPNSS transparency in SN06. In SN06, calls between H.323 DPNSS interfaces and CS2K hosted lines need to be routed via an IBN7 looparound (TDM or SIP-T) to support DPNSS feature transparency.

The following call scenarios are supported:

- Westell To Westell H.323-QSIG[DPNSS] tunnelled calls.
- Westell call to CS2K and over IBN7-DFT to FeatureNet.
- Westell call to Madiatrix line (off CS2K) over SIP-T or IBN7 looparound.

The H.323 GWC performs also the function of H.323 Gatekeeper.

Figure 1 DPNSS VPN Architecture Overview using Westell Gateway in CS2000



10.2.1 Operational Overview

The H.323 Gateway component of the H.323 system uses H.225 basic call control messaging protocol which is based on Q.931/Q.932 message and H.450.1 service signalling mechanism.

To support both call related and Call Independent, Connection-Oriented signalling supplementary services (CAS and NCAS) which are required by this feature, the feature aligns itself with Q.932 Generic Functional Protocol for VPN applications and its use of Facility Information Element.

Furthermore, the DPNSS message is tunnelled using Westell defined manufacturer specific Operations as part of the h4501SupplementaerService field of the H323-UserInformation PDU.

This information in turn is mapped into Q.932 defined Facility Information element as part of ASN.1 PER encoded serviceAPDU element in H.450 Supplementary Service APDU using Nortel defined H.323 Operation.

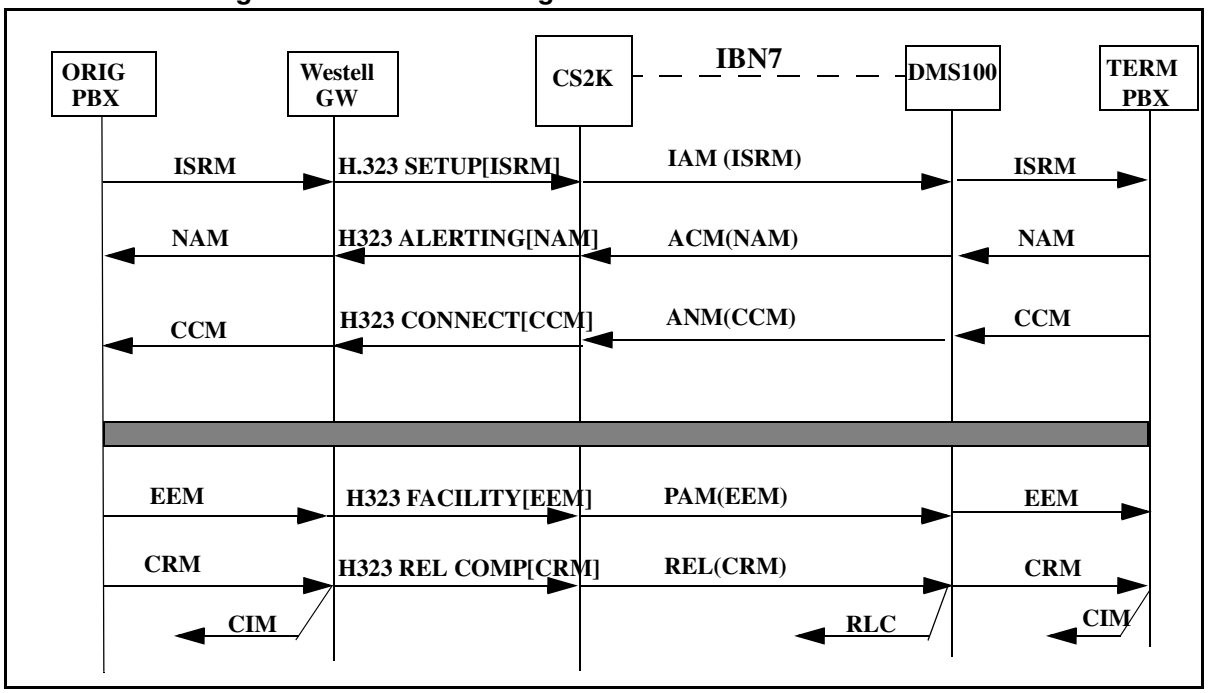
As per Westell H.323 Tunnelling specification, the DPNSS service strings are included in the Transparency service APDU and the number parameters (e.g CLI) are included in Address Service APDU.

10.2.2 External Message Interface

The following are the decomposition of messages and the external interfaces that are provided by CS2K as a transit node.

DPNSS real call includes support for basic call in addition to support for DPNSS services which require bearer channel (e.g: route optimization, executive intrusion, call diversion) and other centrex type of services. The DPNSS services supported are as part of DPNSS transit node functionalities.

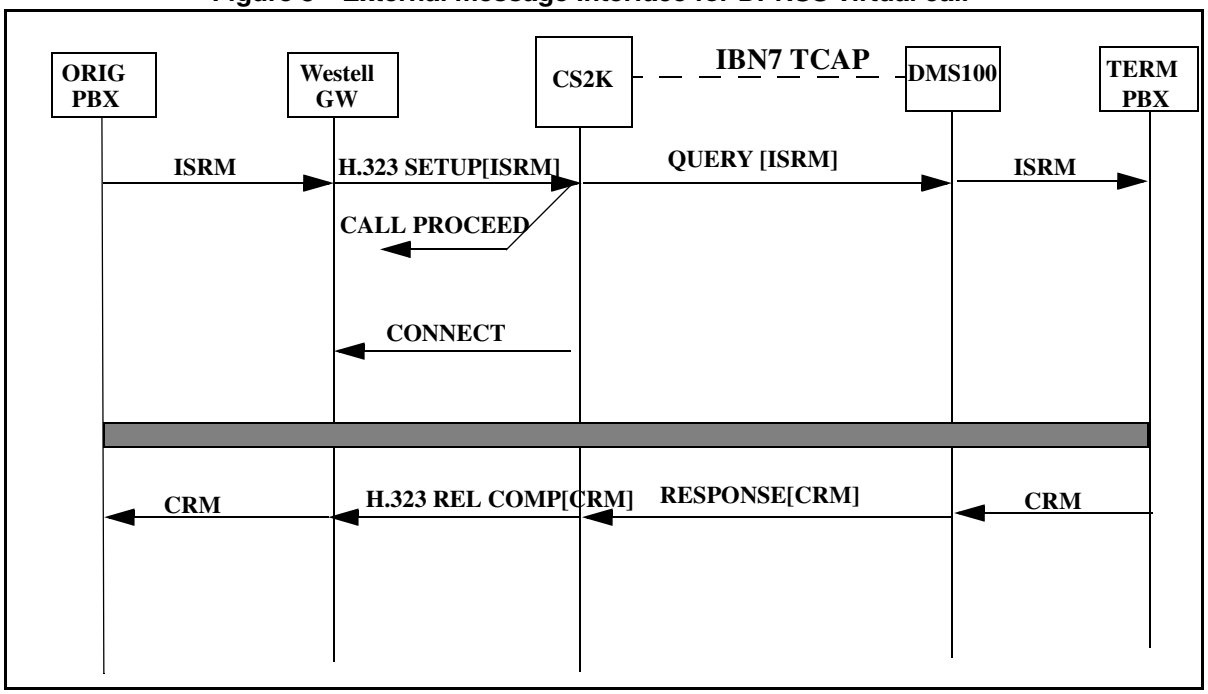
Figure 2 External message Interface for DPNSS real call



The DPNSS virtual calls, or NCAS calls, are bearer independent and include supporting services such as Call Back When Free, Message Waiting Indicator.

To support DPNSS virtual calls, this feature uses the IBN7 TCAP and existing INTERWRK subsystem (as part of SCCP) as used by TDM DFT. However a new architecture is introduced to interface the incoming H.323-QSIG[DPNSS] NCAS messages to IBN7 TCAP, and for the incoming IBN7 TCAP messages, to direct them to the QVPN VID starter instead of DPNSS feature starter.

Figure 3 External message Interface for DPNSS virtual call



The external interface to CS2K on the H.323 IP side for Interworking/Transit of DPNSS signalling over QSIG/IP networks, are provided by Westell gateway [15]. On the network side, the external interfaces shown are as those provided by [7] and [8] for Real and Virtual calls respectively.

10.2.3 Trunks Provisioning

The QSIG H.323 trunk is provisioned as Variant QSIGPRI, Issue ISO1996 in table LTDEF. In addition, the service option H323 in table LTDATA is added to the LTID of the QSIG trunk (as introduced by feature A00001895).

In addition, the existing DFT option in table NCOS is re-used This option is accessed via table LTCALLS against the QSIG trunk for QSIG to IBN7 DFT calls. For IBN7 DFT to QSIG calls, the same DFT option is used in table NCOS.

This feature does not introduce a new datafill of its own.

Please See “Appendix A: Basic call Setup” on page 168. for the datafill information related to Basic Calls.

Please See “Appendix B: Datafills for DPNSS CBWF and MWI” on page 175. for the datafills for CBWF and MWI

10.2.4 SOC Functionality

As part of H.323 base functionality, this feature supports both state and usage SOC functions.

The state SOC, controls (enables) the provisioning of the QSIG H.323 trunks.

The usage SOC, limits the maximum number of H.323 endpoints that can be datafilled on a CS2K as represented by the H.323 QSIG trunk members.

The H.323 SOC ordercode is: CS2B0004.

For further details on SOC functionality as supported by this feature, refer to A00001895 and A00002225.

10.2.5 Support for Netinfo

The Netinfo parameter consisting of customer group and NCOS, as supporetd in the DMS100 can optionally be used by this feature.

In order to be able to generate the Netinfo parameter on the H.323-QSIG trunk, option XLARTE is required to be added in table LTCALLS.

10.3 Hardware Requirements or Dependencies

The proposed system to support H.323 DPNSS tunnelling, uses a customer premise located Gateway which interfaces to TDM DPNSS trunks from the PBX and tunnels the DPNSS signalling over a H.323 IP connection to the CS2K. The Gateway used is the Westell iQ2030.

10.4 Software Requirements or Dependencies

This feature is as part of the group of features introduced in SN06 (and SN06.1) to support H.323 IP connections in the CS2K.

This feature has dependency with the following activities:

A00001895	H.323 Base Application(GWC9.1)
A00002358	H.323 QSIG(GWC9.1)
A00002225	H.323 Provisioning
A00001913	H.323 OAM(SESM6.1)

10.5 Limitations and restrictions

As stated earlier, this feature provides VPN transit functionalities for the hosted CS2K. Therefore, any originating or end node functionalities that relate to DPNSS features are not supported by the host CS2K. Any support for originating/terminating DFT as end-node functionalities on CS2k Madiatrix lines, require DFT (IBN7 TDM/SIP-T) looparounds.

Direct BTUP inteworking for PSTN breakout calls from the CS2K are also not supported. DFT looparounds will be required for such calls.

ROP functionality as required by the transit exchange is supported. However The ROP billing as a DPNSS feature is not supported over the QSIG trunk.

Billing records in general will be based on the incoming QSIG trunk rather than the DPNSS.

Data calls are not supported by Westell gateway.

Name Display service is not supported (as currently is not supported in DMS100 for DPNSS).

Tables TMTMAP and FAILMSG are not supported by QSIG. This results in not being able to provide flexible treatments and cause mapping in IBN7/ QSIG interworking call scenarios. This implies that we can not use table TMTCNTL in conjunction with table TMTMAP to be able to flexibly apply annoncements locally by the CS2K, while letting the tones to be applied remotely by the PABX based on specific causes. This restriction together with H.323 gateway limitation in applying tones such as user_busy, means that we should always set the AUDTRMT option in table LTDATA to 'N'.

Westell gateway (together with other current H.323 gateways) can not be made to apply RingBack tone after the Connect. This means for certain services which rely on CS2K to apply the RingBack tone after connection, the CS2K will not be able to apply the tone.

10.6 Interactions

None.

15. Interworking/Transit of DPNSS Signalling Over QSIG and IP Networks - WP-13-000-016.012

10.10 Appendix A: Basic call Setup

The example gives below the the translations and the setup for a basic all originating from TDM switch over DPNSS-WESTELL connected to CS2K switch. The incoming Trunk on CS2K is QSIG and it goes over SIP-T looparound to land on the Mediatrix line on CS2K.

Important Points for setting up the translations for a Basic DPNSS-WESTELL-QSIG-SIP-T - Line call in CS2K switch:

- The Customer Group/NCOS combination of the Terminating line should have DFT option in table NCOS.
- When travering from QSIG trunk to SIP-T trunk, the CFT selector should get hit.
- The NCOS/Customer Group combination of the QSIG trunk should have DFT option in table NCOS.
- In table LTDATA, for the QSIG trunk, the PRI_IP_PROT option and H323 as the VOIP Protocol for that option should be added.

The details below are from TDM Switch.

10.12 Appendix C: Westell Gateway Configuration

The number routing between Gateway and Gatekeeper is not been deployed. This functionality as specified by the Gateway and uploaded to gatekeeper, would enable the gatekeeper to route the incoming calls based on the prefix (for example) to the Gateway. Instead, the CS2K translation enables the function of call routing required to each Gateway (for example as governed by the trunk group).

10.13 Appendix D: SN06.2: Supported DPNSS/Centrex Features over Westell.

The following tables represent the set of DPNSS and Centrex services tested as part of the SN06.2 ICAF activity: A00004897

The list of DPNSS services is exhaustive.

All end-node functionality (calling and called) has been tested by going over an ANSI SIPT DFT looparound.

Table 1 DPNSS Services

DPNSS Service	Nodal[a] Transit	Network Transit[b]	End Node Calling/Called	Comment
CLI Display	Y	Y	Y	
Busy Information	Y	Y	Y	
CBWF	Y	Y	Y	
Executive intrusion	Y	Y	Y	The feature is been blocked and not supported for lines where the intruded party is on the CS2K.
Divert on No Reply	Y	Y	Y	Both with/without drop-back diversion
Divert on Busy	Y	Y	Y	Both with/without drop back diversion
Divert-Immediate	Y	Y	Y	Both with/without drop-back diversion
HOLD	Y	Y	Y	
Call Offer	Y	Y	Y	

Table 1 DPNSS Services

Call Waiting	Y	Y	Y	The service has been tested with respect to Centrex but the DPNSS specific signalling has not been verified.
ROP	Y	Y	Y	With exception of ROP Billing
MWI[c]	Y	Y	Y	Not been tested with actual voice mail box
				Services that can be expected to be "broadly" supported in CS2K but have not been explicitly tested/verified in CS2K as part of this feature.
Three Party Call	Y	Y	Y	The functionally equivalent Centrex 3WC has been verified. With the same limitations in terms of the required DPNSS specific signalling as in TDM.
Non-Specified Information	Y	Y	Y	
Service-Independent strings	Y	Y	Y	
Redirection	Y	Y	Y	
Series Call	Y	Y	Y	
Night Service	Y	Y	Y	
Centralised Operator	Y	Y	Y	
				Services that can be expected to be supported in TRANSIT but have not ben explicitly tested / verified by this feature.
Extension Status	Y	Y	N	
Controlled Diversion	Y	Y	N	
Three Party takeover	Y	Y	N	
Remote Alarm Reporting	Y	Y	N	
Add-on Conference	Y	Y	N	
Time Synchronization	Y	Y	N	
Call Back When Next Used	Y	Y	N	
Do not Disturb	Y	Y	N	

Table 1 DPNSS Services

Remote Registration of Diversion	Y	Y	N	
Remote Registration of Do not Disturb	Y	Y	N	
Priority Breakdown	Y	Y	N	
Call Back Messaging	Y	Y	N	
Loop Avoidance	Y	Y	N	
Forced Release	Y	Y	N	
Text Message	Y	Y	N	
Charge Reporting	Y	Y	N	
Network Address Extension	Y	Y	N	
Call Park	Y	Y	N	
Call Distribution	Y	Y	N	
Route Capacity Control	Y	Y	N	
Wait on Busy	Y	Y	N	
Call Pick-up	Y	Y	N	
Travelling Class of Service	Y	Y	N	
Number Presentation Restriction	Y	Y	N	

a. Nodal Transit is referred as transit configuration where CS2K acts as ‘pure transit’ with Westell gateway(s) serving both Ingress and Egress gateways.
b. Network transit is referred as supporting DPNSS signalling transparently (DFT) across the network via IBN7 DFT (or SIP-T) proprietary signalling.
c. Nortel’s Proprietary

The following list of centrex services is not exhaustive, but represents the set of services that have been tested and verified.

Table 2 Centrex Services

Centrex Service	Nodal Transit	Network Transit	End Node Calling/Called	Comment
Meet Me Conference (Flash only)	Y	Y	Y	

Station Controlled Conference	Y	Y	Y	
Permanent hold	Y	Y	Y	
Three Way Call	Y	Y	Y	
Call waiting (Direct Answer)	Y	Y	Y	
Make set Busy	Y	Y	Y	
Malicious call hold	Y	Y	Y	
Blind Call Transfer	Y	Y	Y	
Call Transfer	Y	Y	Y	
Call Park	Y	Y	Y	
Call Park Retrieve	Y	Y	Y	
Call Pick-up	Y	Y	Y	
Call Forward Don't Answer	Y	Y	Y	The forwarding is done over UKISUP
Call Forward Immediate	Y	Y	Y	The forwarding is done over UKISUP
Call Forward Busy	Y	Y	Y	The forwarding is done over UKISUP
Business set Camp On				**These services have not been tested/verified on the CS2K**
Malicious Call Hold with Call Forward				
MADN Hold - Activate				
MADN Hold - Cancel				
Preset Conference (CS2K as nodal transit)				
Call Waiting (Flash Feature Code Answer)				
Call Forward Universal chaining (with no DPNSS diversion)				
Make Set Busy Intra-Group				

11: Functional Description (FN): A00002053

11.1 Feature name

A00002053 “AMA Records for Metered Features”

11.2 Description

The purpose of this activity is to provide detailed information for feature subscriber’s metered functions by generating an AMA record and an optional AMA log.

This feature developed in ISN07 (MMP20) release is an enhancement of the MMP15 activity AT.59022215 ‘Log For Cept Subscriber Functions’ which generates MTR156 log when the feature metering is done successfully due to usage of the feature actions such as assign, usage, deassign, activation, deactivation or interrogation etc.. In this feature, generation of the MTR156 log is made dependent on the SOC option RBIL0014. (For detailed information about this option, please refer to the activity A59013592). When the RBIL0014 is ON, the MTR156 log is not generated and the same information is supplied by a new AMA record (FTR) and its AMA log (AMAB156).

The new FTR record enables to keep the feature usage information by using DIRP (Device Independent Recording Package) and to use them in the downstream billing process. Thus, it allows telco personnel to give detailed information about feature meter count in the customer’s detailed bill.

The AMAB156 log is optionally generated depending on the existing AMA parameter LOGAMA in table AMAOPTS. If this parameter is set to ON, then this log is printed whenever the FTR record is generated.

The generation of the FTR record for the metered actions of ICR feature option depends on the new office parameter FTR_RECORD_FOR_ICR_OPT in table OFCVAR. This parameter is created in this feature to make the generation of FTR record optional when the subscriber is charged for the ICR operations assignment / deassignment / usage.

This feature applies to meterable IBN lines only.

11.2.1 Background

11.2.1.1 Existing MTR156 log

When feature metering is done successfully due to usage of the feature actions, then the existing MTR156 log is generated in the log system with the following information:

- Calling number (10 digits)
- Date (6 digits)
- Time (6 digits)
- Feature code(2 digits)
- Action type (2 digits)
- Feature Metering Count (2 digits)

Calling Number represents the IBN line agent which is metered for feature actions.

Feature Code is datafilled in table MTRFEAT by Telco Personnel and each meterable feature is represented by a feature code.

Action Code is used for the feature activation types which are Assign, Deassign, Usage, Interrog, Admact, Admdeact, Admproc, Subact, Subdeact, Subproc and datafilled in the table ISERVOPT.

For more detailed information, please refer to FN and DS documents of the activity A59022215 in the FMDOC library.

An example for the MTR156 log can be seen in Figure 1.

Figure 1 MTR156 Log Example

```
MTR156 MAR12 10:42:36 6704 INFO LOG
CALLING NUMBER: 1027835489   FEATURE CODE: 21
ACTION: 45                   COUNT: 32
TIME: 10:42:36               DATE: 03/03/12
```

In this activity, MTR156 log generation is made dependent on the SOC option RBIL0014. If this option is set to ON, instead of MTR156 , FTR record and its optional AMAB156 log are generated with the same information as MTR156.

11.2.1.2 Existing AMA record components used in this feature

An AMA record consists of a base Structure Code and optional Module Codes containing specific information relevant to the call. (In this feature, an existing structure code SCI_00514 with call code CCI_006 and the existing module code MCI_612 with context_id 80040 are used to generate the new record.)

Structure code SCI_00514 with call code CCI_006 has already been present in DMS MMP software with the following fields:

Structure code 00514 fields information	Field number
Record descriptor word	000
Hexadecimal identifier	00
Structure code	0
Call type codes	1
Sensor type	2
Sensor identification	3
Recording office type	4
Recording office identification	5
Date	6
Timing indicator	7
Study indicator	8
Called party off-hook	9
Service observed, traffic sampled	10
Operator action	11
Service feature	12
Significant digits in next field	55
Originating open digits 1	500
Originating open digits 2	501
Originating charge information	504
Domestic/international indicator	505
Significant digits in next field	55
Ext terminating open digits 1	126
Ext terminating open digits 2	126
Connect time	18
Elapsed time	19
Completion indicator	280
Module code	88

For detailed information about the SCI_00514 fields, please refer to the NTP documents 297-1001-830 and 297-9051-800. For the new FTR record, only the following fields of SCI_00514 are taken into consideration:

- **Hex ID:** Hex ID field indicates whether the record is successfully populated. “AA” indicates complete record while “AB” indicates resource failure.
- **Structure Code:** In EBAF environment more than one structure codes exist which means different base fields for AMA recording. This field is filled by 40514 for this structure code. The ‘4’ digit in the field indicates that module codes are attached to the base structure code.
- **Call Type Code:** This field is used to differentiate call types. The default AMA record contains the value 006.
- **Date:** Please refer to Table 1 “Date field explanation” below for field mapping.

Table 1 Date field explanation

BCD Char	Meaning
1	Last Digit of Year
2-3	Month
4-5	Day
8	Sign (hex C)

- **Originating Open Digits 1:** This field contains the first 11 digits of the calling number. If there are less than 11 digits, the number is right-justified and padded with 0s.
- **Connect Time:** Please refer to Table 2 “Connect time field explanation.” below for field mapping.

Table 2 Connect Time field explanation

BCD Char	Meaning
1-2	Hours
3-4	Minutes
5-6	Seconds
7	Tenths of Seconds
8	Sign (hex C)

Currently, the structure code SCI_00514 is used with the module code MCI_612 (with context_id 80040) for the ICAMA, IAA and ICR records when SOC option RBIL0014 is ON. (Please refer to the activity A59013592 for the ICAMA and IAA records, and the activity A59021950 for ICR record.) By this activity, the new record type FTR is added to these records for the metered feature actions.

MCI_612 has already been present in MMP software as a Generic Module Code and contains two strings of 15 BCD positions each. Field description of this module code is given in the Table 3.

Table 3 MCI_612 field description

Information	Number of BCD Chars
Module code 612	4
Generic Context Identifier	8
Generic Digit String 1	16
Generic Digit String 2	16

When the SOC option RBIL0014 is ON, the context identifier 80040 is used with the fields shown in the Table 4 and 5.

Table 4 Generic Digits String 1 explanations

BCD Char	Meaning
1-2	Record Code 00 ICAMA / 01 IAA / 02 ICR
3-4	Call Class
5-6	Call Info
7	Unused
8-15	Pulse Count
16	Sign (hex C)

Table 5 Generic Digits String 2 explanations

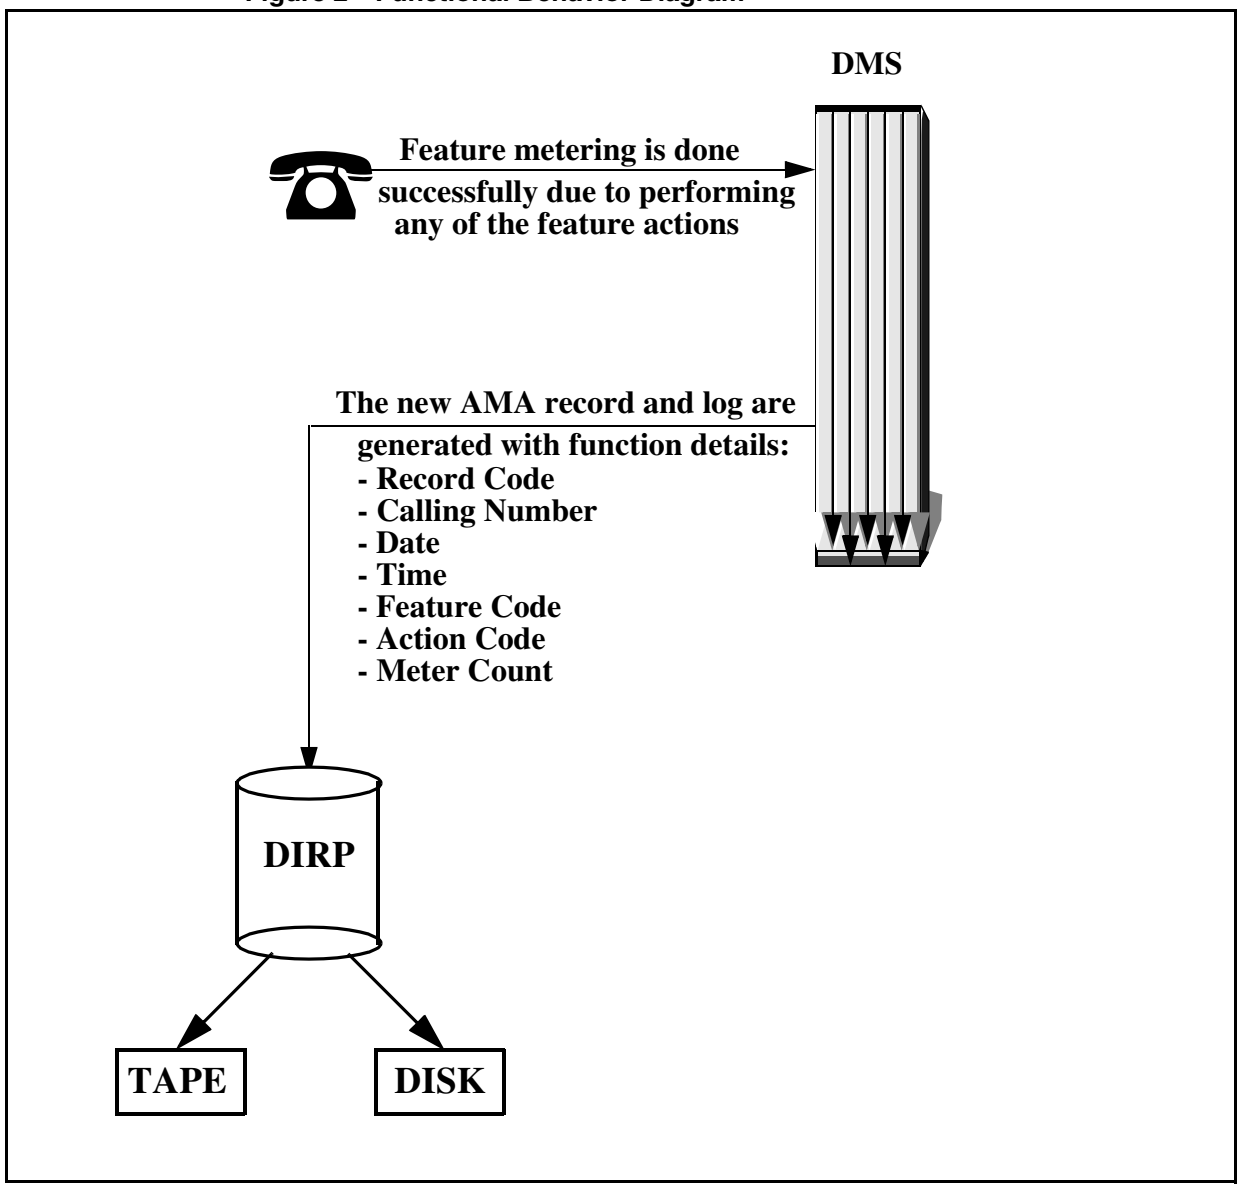
BCD Char	Meaning
1-6	Start Date
7-13	End Time
14	Unused
16	Sign (hex C)

This context_id was created by the activity A59013592 ‘AMA Billing Enhancements for Turkey’. For detailed information, please refer to the documents of this activity in the FMDOC library.

11.2.2 The new AMA record, FTR

The new FTR record is generated in the cases that the MTR156 log is generated (i.e, whenever a feature action is metered) as in the Figure 2, and contains the same information as MTR156 log.

Figure 2 Functional Behavior Diagram



This record consists of the structure code SCI_00514 with call code CCI_006 and module code MCI_612 with context identifier 80040. Since this record generated when the SOC option RBIL0014 is ON, it does not affect the other markets.

In the FTR record, Calling number, Date and Time information for metered feature actions are put in the SCI_00514 fields Originating Open Digits 1, Date and Connect Time respectively, as shown in below:

Calling Number -> ORIGINATING OPEN DIGITS 1

Date -> DATE

Time -> CONNECT TIME

ORIGINATING OPEN DIGITS 1 field in SCI_00514 contains 11 digits. But the Calling Number data of the IBN agent metered for feature actions has 10 digits. So, this data is put in this field as right-justified and the first digit filled by 0.

DATE field of SCI_00514 is filled by the Date data of the metered feature action in the following format:

Table 6 Date field explanation in SCI_00514

BCD Char	Meaning
1	Last Digit of Year
2-3	Month
4-5	Day
8	Sign (hex C)

CONNECT TIME field of SCI_00514 is used to place the Time at which the feature action is metered, as in below:

Table 7 Connect Time field explanation in SCI_00514

BCD Char	Meaning
1-2	Hours
3-4	Minutes
5-6	Seconds
7	Tenths of Seconds
8	Sign (hex C)

Note: Date and Time information are also displayed in the Generic Digits String 2 fields of the appended module code MCI_612 (80040). Please refer to Table 9.

In this feature, EXT TERM OPEN DIGITS 1 field of the SCI_00514 is filled by zeros for the Called DN.

Then the remaining information which are Record Code, Feature Code, Action Code and Feature Meter Count, are put in the Generic Digits String 1 fields of

the MCI_612 (80040) as in Table 8. In this table the usage changes are given in the bold format.

Table 8 Generic Digits String 1 usage for new FTR record

BCD Char	Content
1-2	Record Code **is filled as 03 for the new FTR record**.
3-4	Call Class **is not used and filled as 00 in the new FTR record.**
5-6	Call Info **is not used and filled as 00 in the new FTR record.**
7	Unused field (0).
8-15	Pulse Count **is used to hold the following information:**
	8-9 Feature Code
	10-11 Action Code
	12-13 Unused (00)
	14-15 Meter Count
16	Sign (hex C)

The Record Code field contains 2 digits Record Code data which uniquely identifies the type of the record to distinguish it from the other record types generated when SOC option RBIL0014 is ON. It is set to ‘03’ for the new FTR record since the existing record codes are ‘00’ for Turkish CAMA, ‘01’ for IAA and ‘02’ for ICR.

The Call Class (2 digits, from 3 to 4) and Call Info (2 digits, from 5 to 6) fields are not used in the new FTR record. So, these are filled by zero. Also the seventh digit is already unused and 0.

The Pulse Count field has 8 digits from 8 to 15, and for FTR record it is filled by the Feature Code, Action Code and Feature Meter Count information in the following order:

Feature Code (2 digits) -> Pulse Count (the first 2 digits)

Action Code (2 digits) -> Pulse Count (3 and 4th digits)

Space, 00 -> Pulse Count (5 and 6th digits)

Feature Meter Count (2 digits) -> Pulse Count (7 and 8th digits)

In the fields of the Generic Digits String 2 of 80040, the Date and Time values have already existed and they are continued to display in this FTR record with the same format as before (additional to Date and Time information put in the SCI_00514 fields DATE and CONNECT TIME). The explanations for the existing fields of the Generic Digits String 2 are given in Table 9.

Table 9 Existing Generic Digits String 2 fields

BCD Char	Meaning
1-6	Date
7-13	Time
14-15	Unused
16	Sign (hex C)

The example views of this record can be given as in Figure 3 for ‘calldump’ command and Figure 4 for ‘calldump full’ command.

 MODULE CODE:                  000C      FINAL MODULE
```

In these Figures, Generic Digits String 1 fields are interpreted as in below:

0300000**21**4**5**00**02**C

03: Record Code is FTR (first 2 digits)

00000: Unused space (5 digits after record code)

21: Feature Code (2 digits as 8th and 9th)

45: Action Code (2 digits as 10th and 11th)

00: Two space between Action Code and Meter Count (12th and 13th digits)

02: Meter Count (last 2 digits)

For the metered actions of ICR option (assignment / deassignment / usage), the generation of the FTR record is optional by the newly created office parameter FTR_RECORD_FOR_ICR_OPT in table OFCVAR. When the subscriber having ICR feature option is charged for the ICR operations in MTRFEAT table, the FTR record is generated if the FTR_RECORD_FOR_ICR_OPT is Y, not generated if the FTR_RECORD_FOR_ICR_OPT is N.

When the parameter FTR_RECORD_FOR_ICR_OPT is changed from “N” to “Y”, the following message is displayed;

“WARNING: FTR record generation for ICR feature is activated”

Opposite when FTR_RECORD_FOR_ICR_OPT is changed from “Y” to “N” the following message is displayed;

“WARNING: FTR record generation for ICR feature is deactivated”

11.2.3 The new AMA log, AMAB156

By this activity, the MTR156 log is generated only when the SOC option RBIL0014 is IDLE. If this option is set to ON, an FTR record is generated with an optional AMAB156 log, instead of MTR156. The AMAB156 log contains the same data as FTR record (i.e, MTR 156 data) and it is optionally generated depending on the existing AMA parameter LOGAMA in table AMAOPTS. If the LOGAMA option is ON, AMAB156 log is printed whenever the FTR record is generated.

Record Code is ‘BE’ in AMAB156 in spite of ‘03’ in FTR Record. Because the Record Code values BB, B8, BD are currently used in the AMA logs of the ICR, ICAMA, IAA records.

Please refer to Figure 5 for the example view of AMAB156 log.

Figure 5 AMAB156 LOG Format Example

```
RSNW4E06BK     AMAB156 MAR26 09:23:36 7216 INFO AMA RECORD DATA
          RECORD CODE = BE
          CALLING NUMBER = 1027835406   FEATURE CODE = 21
          ACTION = 45                   COUNT = 02
          TIME = 0923355                DATE = 030326
```

11.2.4 The provisioning for the new FTR record

For the generation of the FTR record and AMAB156 log on MMP load, the following datafills are required:

11.2.4.1 Office Wide Parameters:

1. The below presented datafill is already available in DMS MMP and is not a result of this activity. You can refer to NTP 297-9051-800, DMS 100 MMP AMA Reference Guide, for more information on provisioning of EBAF AMA Recording.

- In table OFCOPT, LAMA_OFFICE parameter is set to ‘Y’.
- In table OFCENG, UNIVERSAL_AMA_BILLING tuple is set to ‘Y’
- In table DIRPSSYS a tuple is required to enable DIRP subsystem to receive AMA records and transfer them onto a recording device.

  Sample entry:

  AMA, Y, 2, 1, AMAPOOL, $, CR, NA, NA, NA, 30, 30, $, N, NA, OPENED, NNNNNNN, 0, NOROTATE, NONE, NONE, N, 64, Y
- In table CRSFMT, the AMA Format is determined.

  Sample Entry:

  AMA, BCFMT, N, NIL_FM, N, N, 0
- In table CRSMAP, the stream associated with the format is defined.

  Sample Entry:

  LAMA AMA
  CAMA AMA

  Note: Other streams have to be associated with other formats instead of AMA. E.g SMDR SMDR.
- In table OFCENG, number of Recording Units to be allocated is determined by use of the following entries. Each entry has a default value

of 100. It is possible to allocate memory for recording units automatically by using table OFCAUT. Please refer to NTP documents 297-9051-855 (Office Parameters Volume 1 of 3 (OFCENG)) and 297-9051-351 (Data schema Reference Manual Volume 8 of 12) for information on provisioning of recording unit pools and auto-provisioning.

The difference between pools are the method of usage and the memory space allocated out of the pool for each recording unit. Different structure codes and module codes require different memory and therefore, they consume memory out of different memory pools.

Pool size default values in table OFCENG are as below:

CRS_PRU_POOL1_SIZE	100
CRS_PRU_POOL2_SIZE	100
CRS_PRU_POOL3_SIZE	100
CRS_SUBRU_POOL1_SIZE	100
CRS_SUBRU_POOL2_SIZE	100
CRS_SUBRU_POOL3_SIZE	100
CRS_SUBRU_POOL4_SIZE	100
CRS_SUBRU_POOL5_SIZE	100

2. To generate the FTR record, the existing SOC option RBIL0014 is set to ON.
3. To generate the AMAB156 log beside the FTR record, the existing LOGAMA parameter in table AMAOPTS is set to ON.
4. To deactivate generation of the FTR record and AMAB156 log, and to activate the MTR156 log generation, the SOC option RBIL0014 is set to IDLE.
5. The new office parameter FTR_RECORD_FOR_ICR_OPT is created in Table OFCVAR by this activity to make optional the FTR record generation for metered actions of the ICR feature. It is set to Y to generate FTR record for the charged ICR operations of subscribers (assign / deassign / usage).

Figure 6 The new OFCVAR parameter

```
> Table OFCVAR

PARMNAME PARMVAL
----------------------------
FTR_RECORD_FOR_ICR_OPT      Y
```

11.2.4.2 Provisioning for metering and record generation

The below presented datafill is already available in DMS MMP and is not a result of this activity. Please refer to the FN and DS documents of the activity A59022215 in the FMDOC library.

1. Only the feature functions of the subscribers having IBN lines and MOG option are metered. MOG option is assigned to the subscriber by SERVORD.
2. The Action Codes are datafilled in the ISERVOPT table. An example for the action codes are shown in Figure 7. In this example, the action codes '03 45 57 04 49 07 98 42 23 46' represent 'Assign DeAssign AdmAct AdmDeact AdmProg SubAct SubDeact SubProg Usage Interrog' respectively.
3. The Feature Codes and Charges for the feature actions are datafilled in the table MTRFEAT as in the example shown in Figure 8. In this example, 54 and 21 are feature codes for ICWT and CLF respectively. The numbers, next to the action codes, are the charge values or meter counts for that action.

   Note: Although the FTR_RECORD_FOR_ICR_OPT is Y in table OFCVAR to generate FTR record for metered actions of ICR feature option, the record is not generated unless a tuple exists for the ICR in table MTRFEAT.

Figure 7 Action Codes in the table ISERVOPT

```
> Table ISERVOPT

SOPTSKEY SOPTSVAR
----------------------------

-----------------------------
ICWT MOG_3 54 (ASSIGN 1) (DEASSIGN 2) (ADMACT 3) (ADMDEACT 4) (SUBACT 6)
(SUBDEACT 7) (USAGE 9) (INTERROG 10) $

CLF MOG_2 21 (ASSIGN 1) (DEASSIGN 2) (USAGE 5) $
```

11.2.4.3 Software Optionality Control

There is no new created Software Optionality Control by this feature. The existing SOC option RBIL0014 is used for this record. It was created by the feature AT.59013592 in MMP13 release. In this activity, for the metered feature actions, the FTR record and AMAB156 log are generated instead of the MTR156 log if the SOC option RBIL0014 is set to ON. When the SOC option RBIL0014 is IDLE, MTR156 log is generated as before.

11.3 Hardware Requirements or Dependencies

No new customer hardware requirements or dependencies are introduced in this feature.

11.4 Software Requirements or Dependencies

This feature uses the existing AMA/Billing framework and the existing components of this framework.

11.5 Limitations and restrictions

- This feature applies to IBN lines only.
- This record is generated for only meterable (having MOG option) feature actions.
- In order to generate the FTR record and AMAB156 log,
  - — the all datafills given in the section 2.2.4 have to be done,
  - — feature metering should be performed successfully.
- Feature Meter Count information is displayed by 2 digits in the FTR record and AMAB156 log. The data shown in this field reflects the value datafilled in the CHARGE field of table MTRFEAT and the range for the charge value has been defined as 0 to 255 in this table. Although 3 digits data is datafilled in the charge field of MTRFEAT table, the last 2 digits will be displayed in the FTR record and AMAB156 log, as in MTR156 log.
- The FTR record for metered actions (assign / deassign / usage) of ICR feature option is not generated unless the office parameter FTR_RECORD_FOR_ICR_OPT is set to Y in table OFCVAR.
- The AMAB156 log is not generated unless the parameter LOGAMA is set to ON in table AMAOPTS, although the FTR record is generated.
- The FTR Records are routed to ICR volume.
- The FTR Records are stored in disks/tapes by using Bellcore AMA Format.
- NT AMA Format is not supported on the MMP.

11.6 Interactions

- If the feature metering according to action type is done successfully then this record is generated.
- AMA in MMP is based on Bellcore AMA Format. This feature uses the existing AMA/Billing framework components with no change in their existing structures to realize customer's requirements. So, there is no effect on the existing AMA subsystem in the MMP load.

12: Functional Description (FN): A00002100

12.1 Feature name

ISUP_R_2000 (Russia ISUP V2+) Operator Call on Busy Subscriber (Toll Break In).

12.2 Description

12.2.1 Notation

The following notations are used throughout whole document:

Party C or called party: The party who is called by the operator when it is in talking state with party A.

Party A: The party who is in the talking state with party C.

Party B or operator: The party who is operator and tries to reach party C when party C is in talking state with party A.

Talking call: The call between party A and party C. This call can be originated by either parties.

Operator call: The call originated by party B (operator) to party C. This call waits called party's acceptance.

Waiting Tone: Call waiting tone

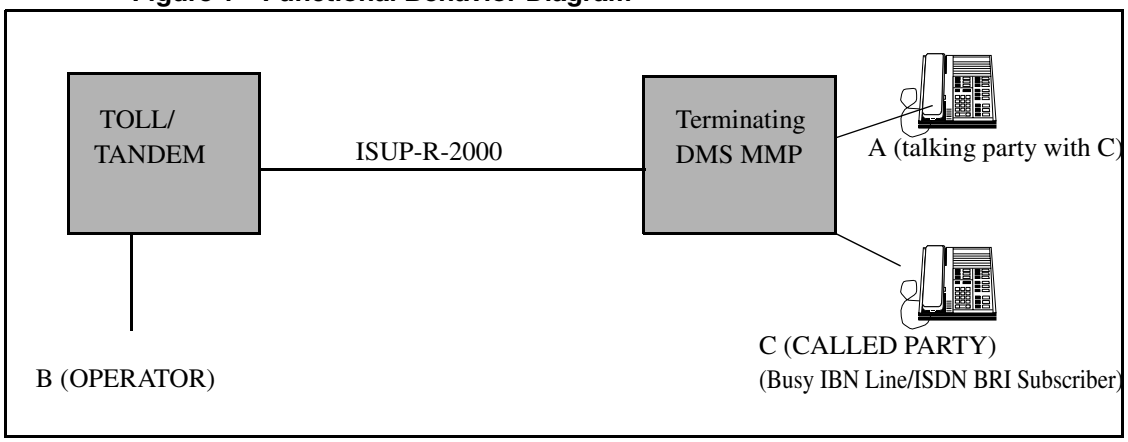
: is used to denote the numerical value instead of hexadecimal value in ISUP messages.
For example #19 denotes 19 as a numerical value, not 25 as hexadecimal value.

12.2.2 Feature Description

ISUP_R_2000 (Russia ISUP V2+) Operator Call on Busy Subscriber (Toll Break In) is implemented in ISN07.

With Russia ISUP V2+ signalling, it is required to establish operator calls to busy subscribers with Call Waiting service for both analogue and ISDN/BRI subscribers. CW is activated automatically and regardless of subscription status of CW, i.e whether the terminating line has CWT option or not.

Figure 1 Functional Behavior Diagram



"Toll Break In" allows a subscriber (party C) in the talking state (connected to a line or trunk, not to a tone or announcement) to be alerted by a call waiting tone when operator call (party B) is attempting to terminate to that line.

CW feature applies call waiting tone to the called party only. The operator side, party B, receives ring back tone during the sending of the call waiting tone to party C.But when TBI occurs, both the called subscriber (party C) and the operator side (party B) will receive the **call waiting tone**.

Operator, Party B, is allowed to wait up to a certain time period (TBI Timer). Within this period, called party C may ignore or reject the operator call and continue with the existing call, hold/release the existing call and answer the operator, party B.

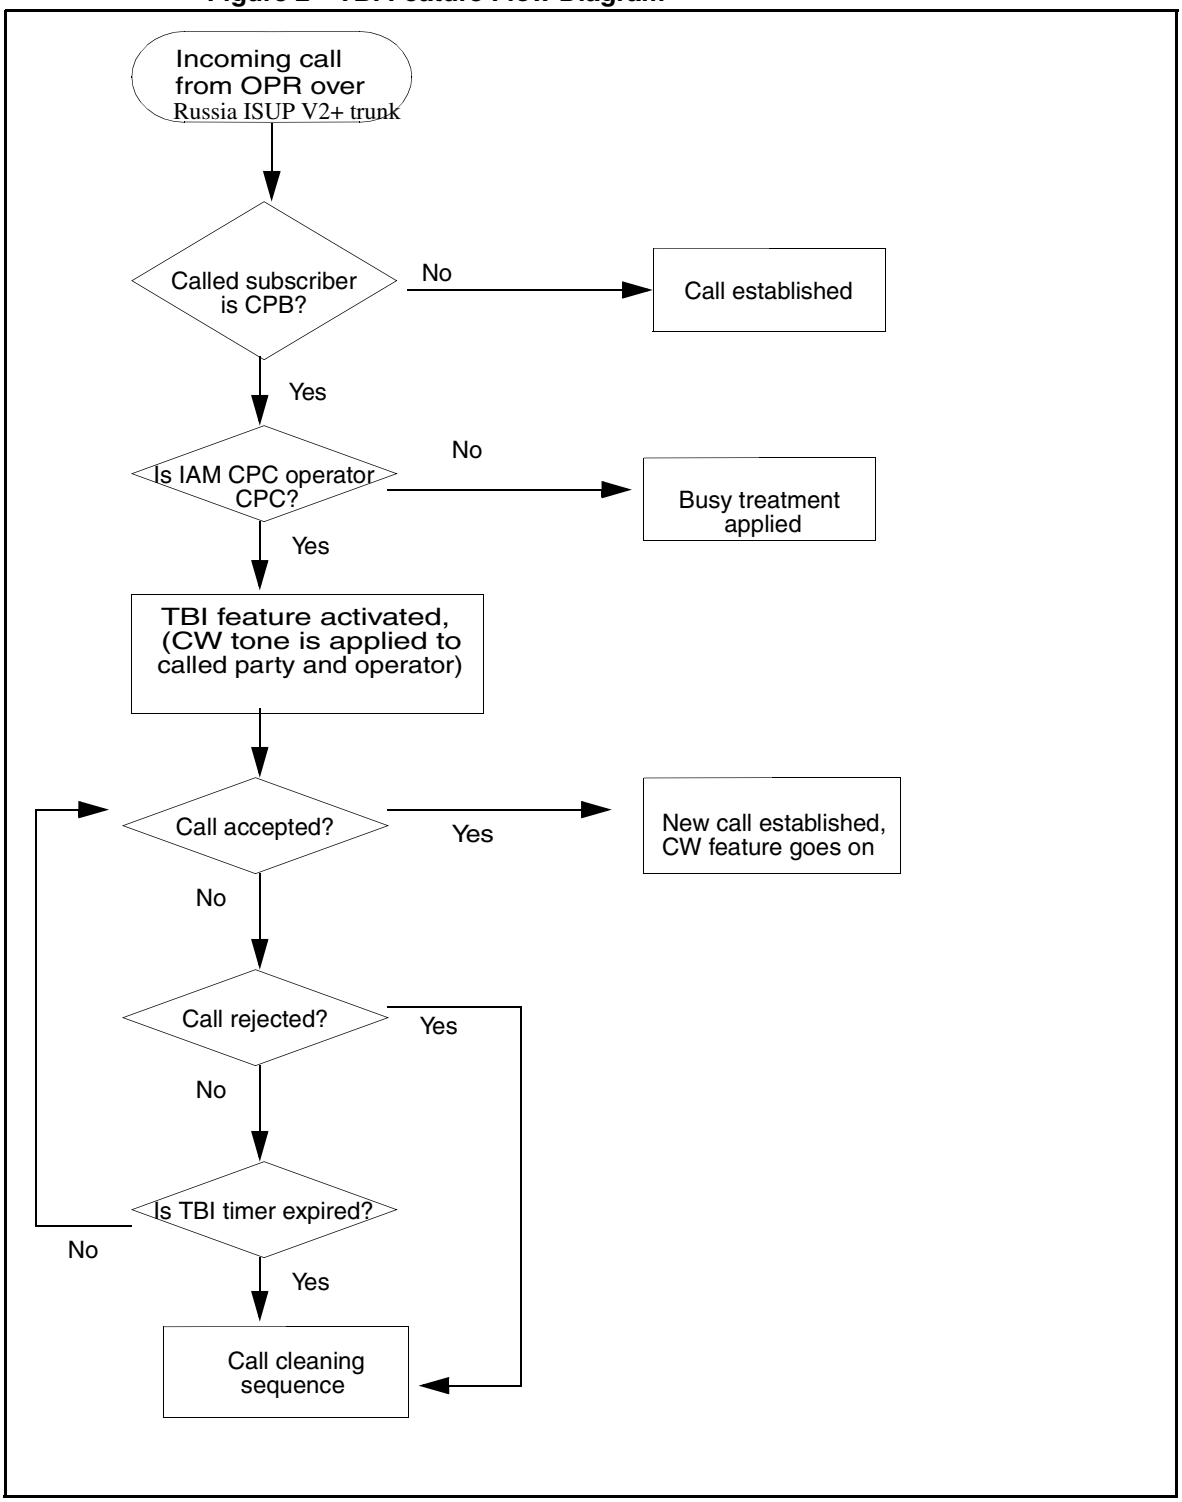
IBN Lines uses Cept CW feature and Cept CW timer is hardcoded as 30 sn. for Turkey. TBI timer will be hardcoded as 20 sn. for operator calls in Russia market. Cept CW Timer will not be changed and it remains 30 sn. for Russia.

ISDN/BRI lines uses ETSI CW feature and there is no specific CW timer for ETSI CW. When TBI occurs, we will use 20 sn. hardcoded TBI Timer for ISDN/BRI lines.

If the timer expires, the operator call is ignored, release message with cause value 'No answer from user / User alerted' is sent to the operator, party B.

Figure 2 illustrates such flow.

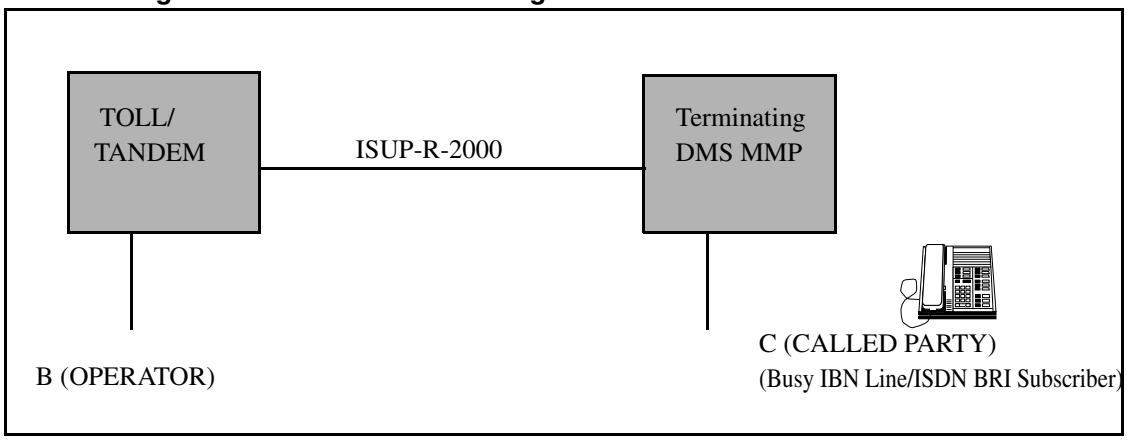
Figure 2 TBI Feature Flow Diagram



* TBI timer is hardcoded as 20 sn. for operator calls.

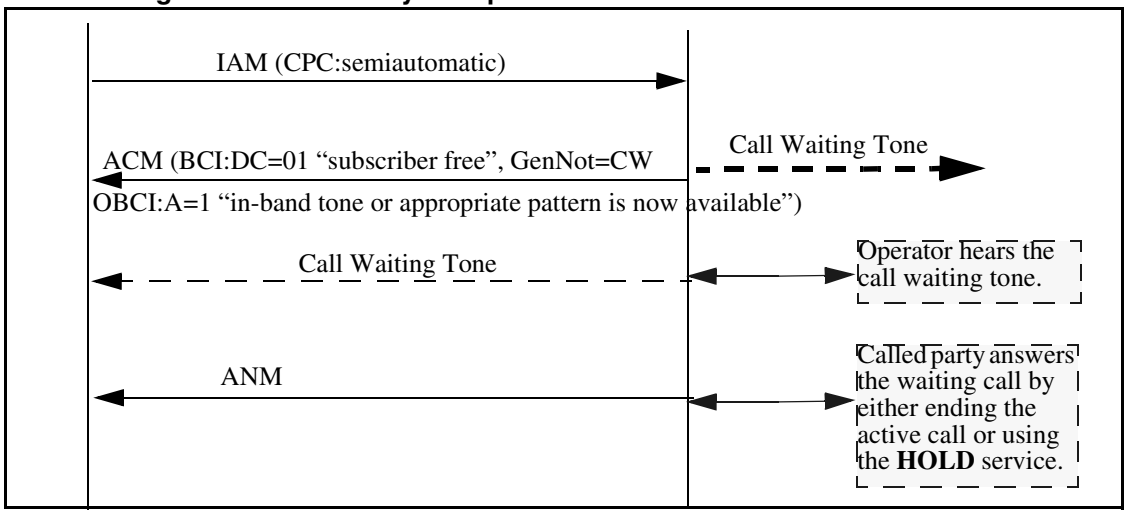
12.2.3 Desired Behavior Scenarios

Figure 3 Desired Behavior Diagram



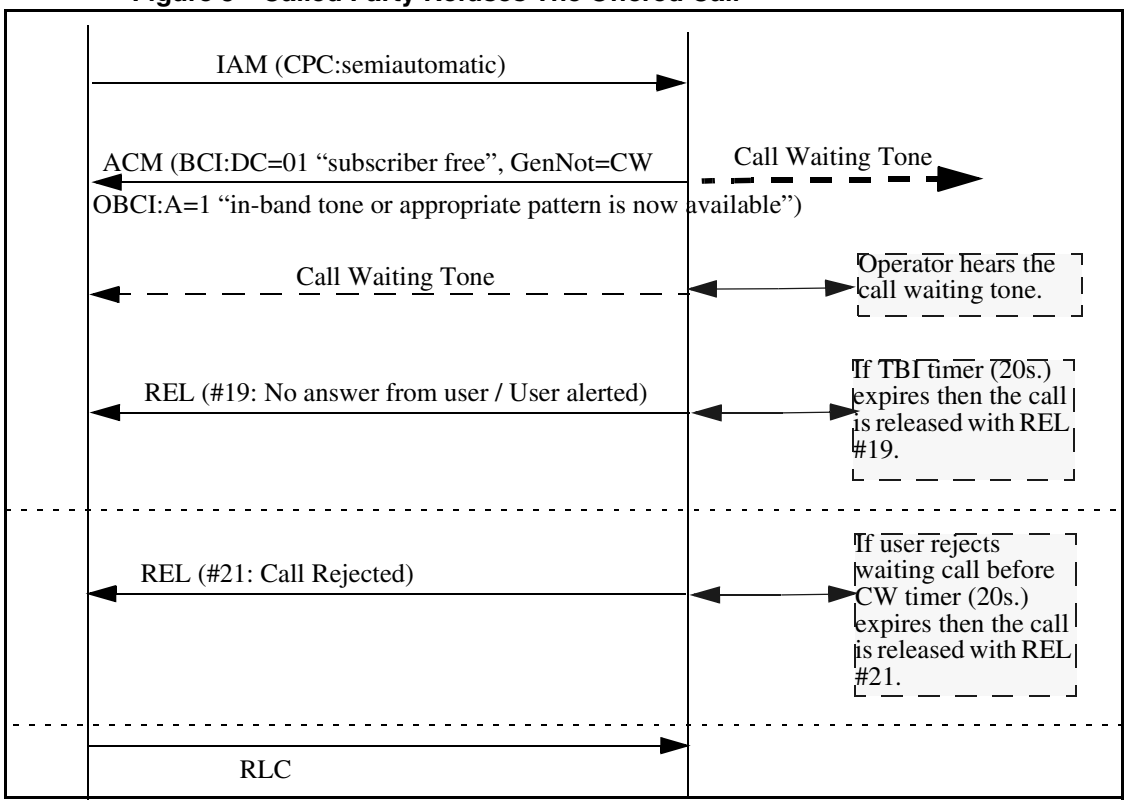
12.2.3.1 Russia ISUP V2+ Operator Calls to Busy IBN Line Subscribers

Figure 4 Called Party Accepts The Offered Call



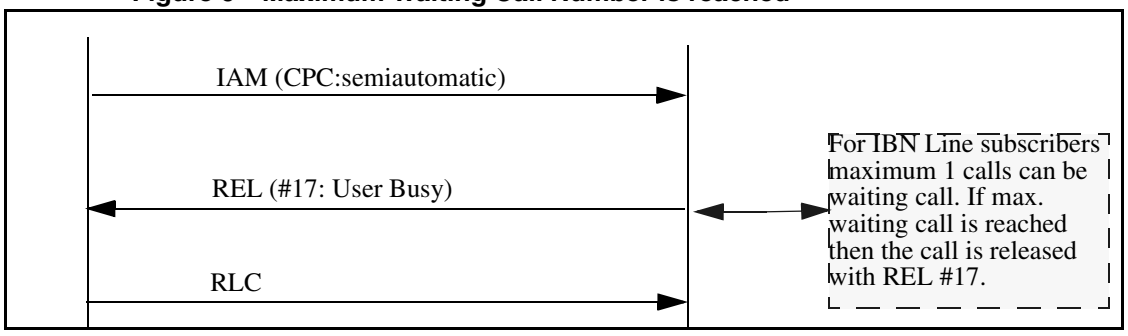
When operator call is answered by called subscriber, basic call procedures are applied as shown in Figure 3.

Figure 5 Called Party Refuses The Offered Call



When an operator call arrives for a busy subscriber (line is CPB), CW is activated automatically. Operator hears the "waiting tone".When called party refuses the offered call above scenario will be seen.

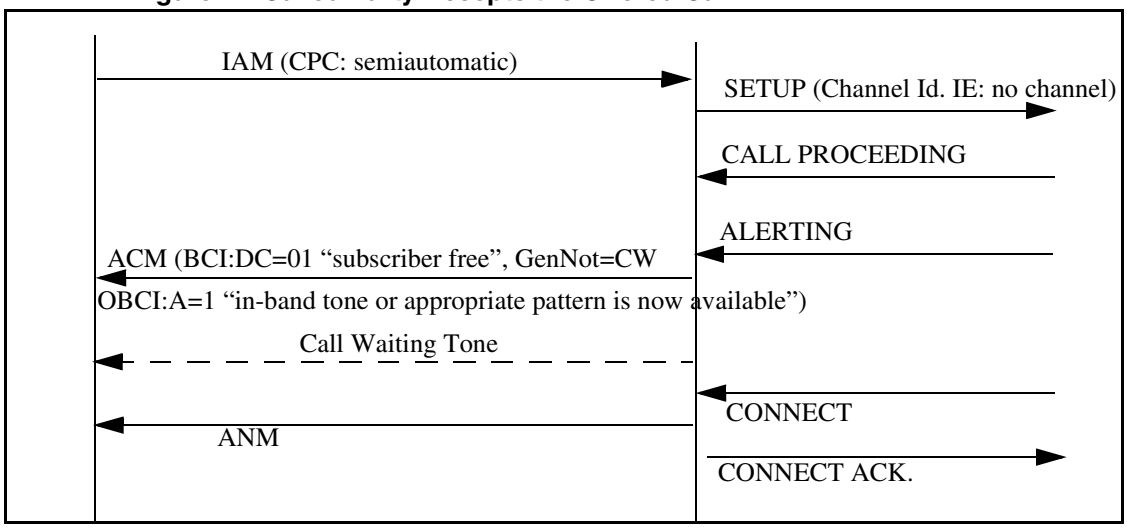
Figure 6 Maximum Waiting Call Number is reached



An IBN Line subscriber can have maximum one active call and one call in CW at the same time.Figure 5 shows the case when these limits are reached.

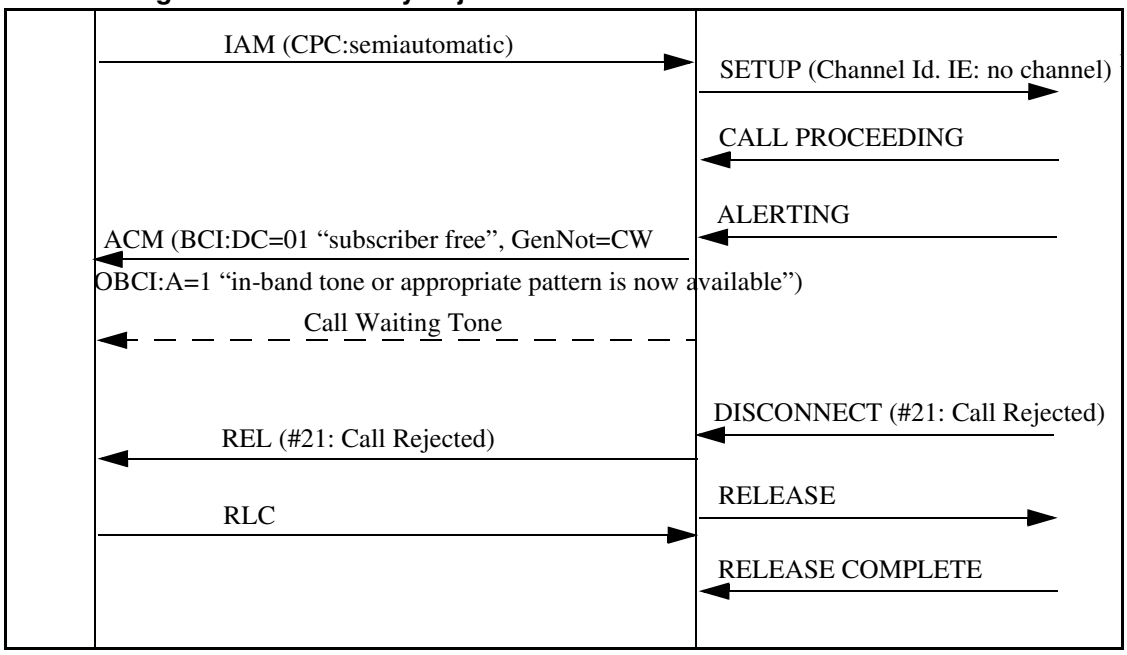
12.2.3.2 Russia ISUP V2+ Operator Calls to Busy ISDN BRI Subscribers

Figure 7 Called Party Accepts the Offered Call



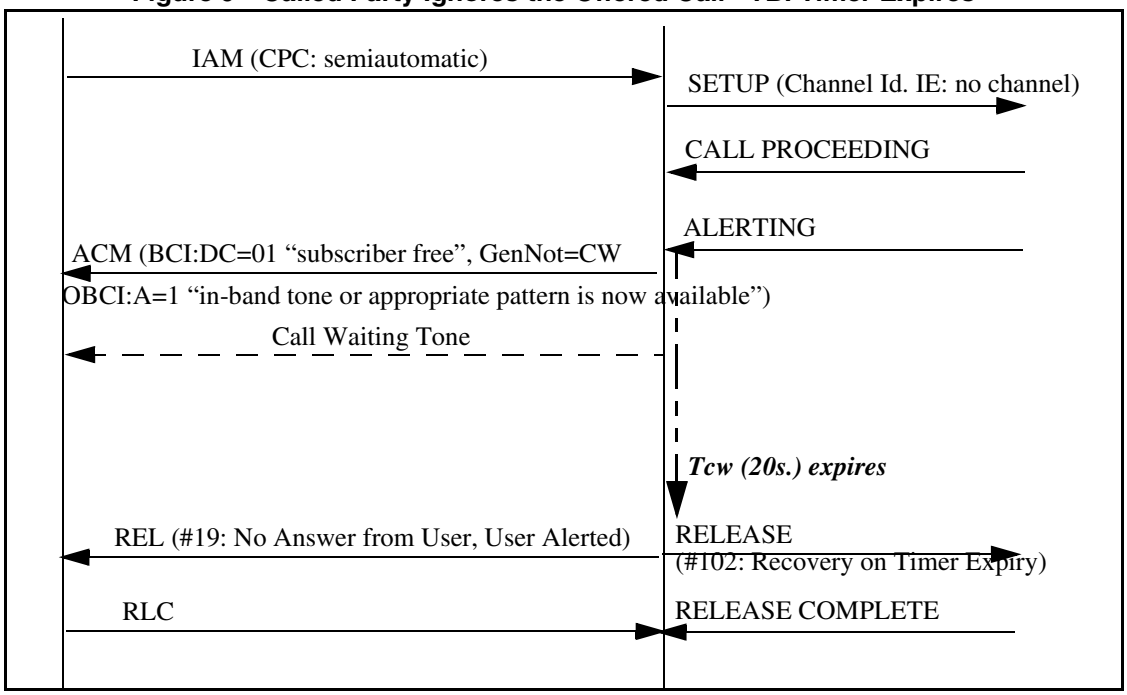
In Figure 7 , an operator call arrives at the terminating office for an ISDN BRI busy subscriber (both B-channels are busy), then the Call Waiting service is invoked and the call is offered to the subscriber with an indication that the channels busy condition exists. When the ALERTING message is received from the called subscriber, an ACM message is sent with the Call Waiting indication to the preceding office. After sending the ACM message, the terminating office applies the “Waiting Tone” to the preceding office. The called party can accept a waiting call either by releasing an existing call according to the basic call procedures or using the Call Hold supplementary service on an existing call.

Figure 8 Called Party Rejects the Offered Call



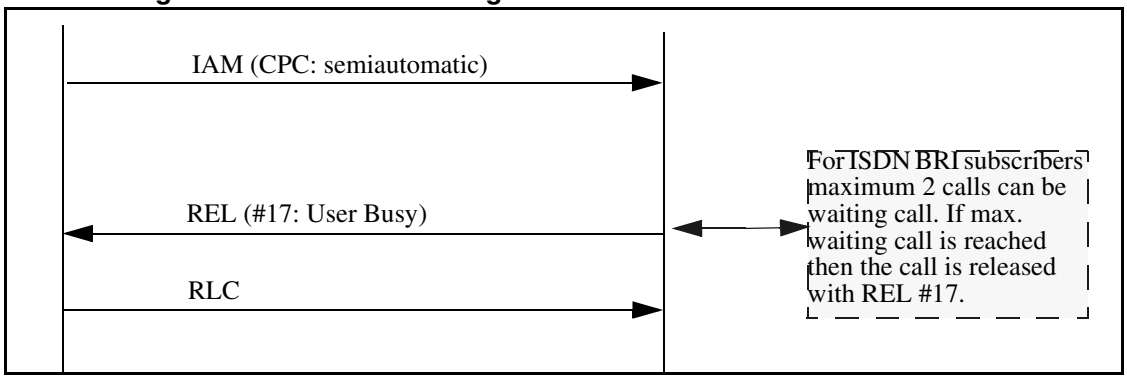
As described in Figure 8 , after the ALERTING message has been sent by the called party, this new waiting call can be rejected before CW timer (20 sec.) expires by sending a DISCONNECT (#21) message.

Figure 9 Called Party Ignores the Offered Call - TBI Timer Expires



In Figure 9 , after the ALERTING message has been sent by the called party, the subscriber decides not to react to this waiting call (neither accepting nor rejecting call). When CW timer (20 sec.) expires, then the network initiates clearing procedure.

Figure 10 Maximum Waiting Call Number is Reached



An ISDN subscriber can have maximum two active calls and two waiting calls at the same time. The called subscriber is considered as busy when the limit on the maximum number of calls which can be waiting has been reached. Any incoming call during this period is cleared by the network.

Figure 11 Called Party sends RELEASE COMPLETE (#17) message

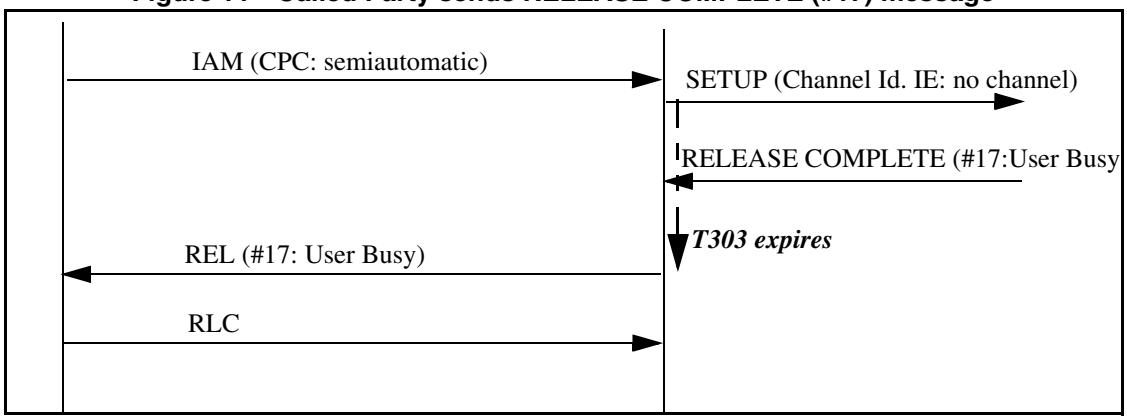


Figure 11 shows the case when the called party sends RELEASE COMPLETE (#17) message in response to SETUP message. If no other response is received from the other users and T303 expires, then the terminating office release the call by sending REL (#17) message to the preceding office.

Figure 12 Operator goes on-hook during call alerting

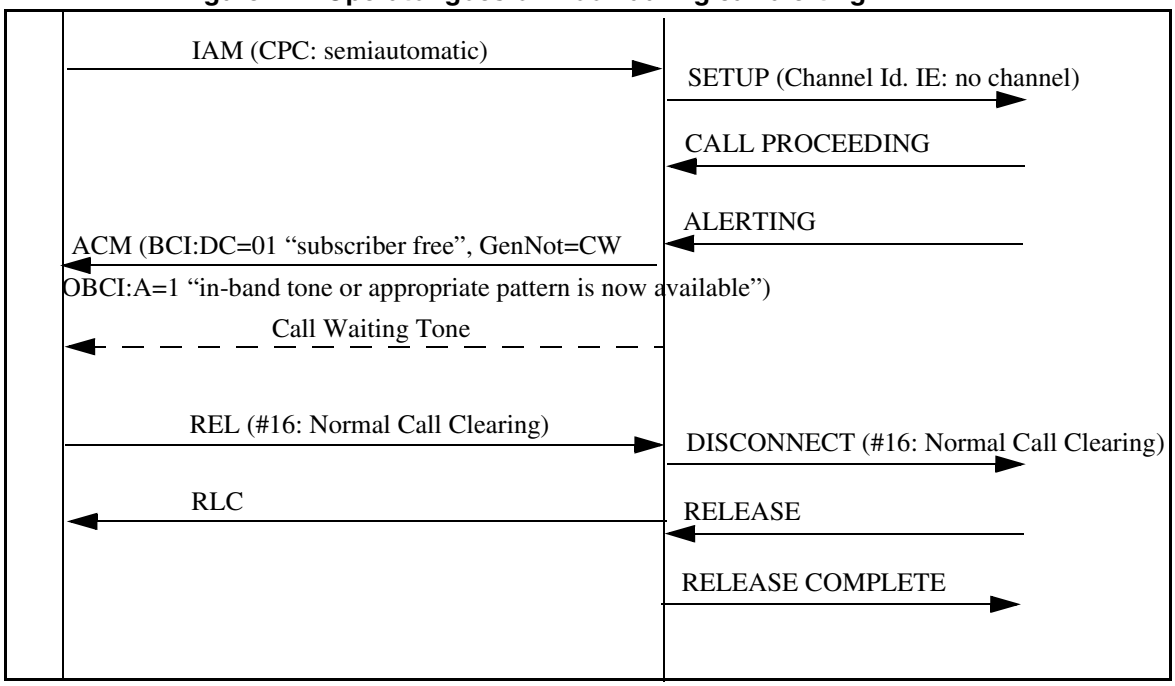

Figure 12 shows the case when the operator goes on-hook during call alerting phase. The basic call clearing procedure applies.

Figure 13 Called Party accepts but no B-channel available to complete the call

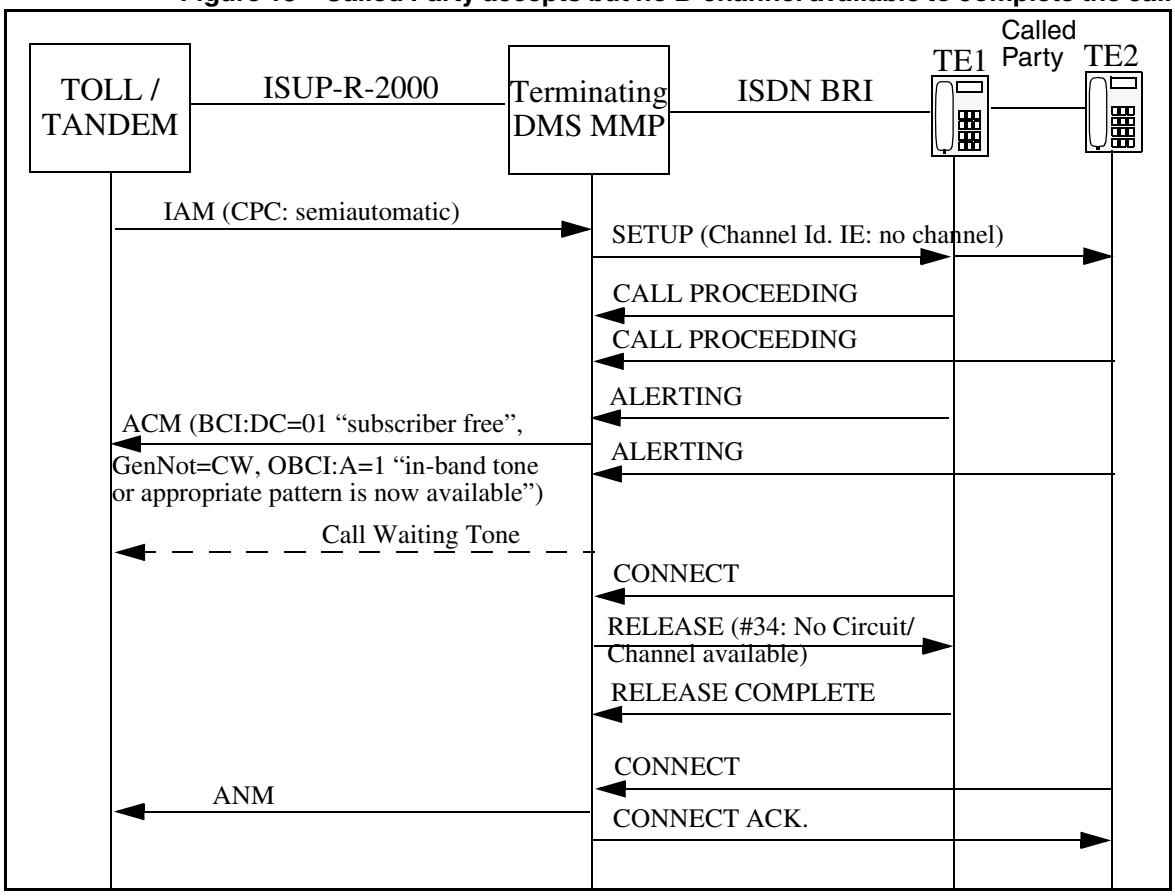

Figure 13 shows the case when a CONNECT message is received from the called party but no B-Channel available to complete the call. On receipt of a CONNECT message from the called party and if no B-channel is available to complete the call (i.e. no channel is free and no channel is reserved for use by this terminal), then the network clears the user and waits for another user B indication for acceptance.

The network shall indicate an error to called party with cause "no B-channels available" (#34). The network shall not clear the call but will wait for another user B indication for acceptance until the calling party clears the call or the CW timer expires.

Figure 14 Called Party accepts but Channel Id. info is not accepted by network

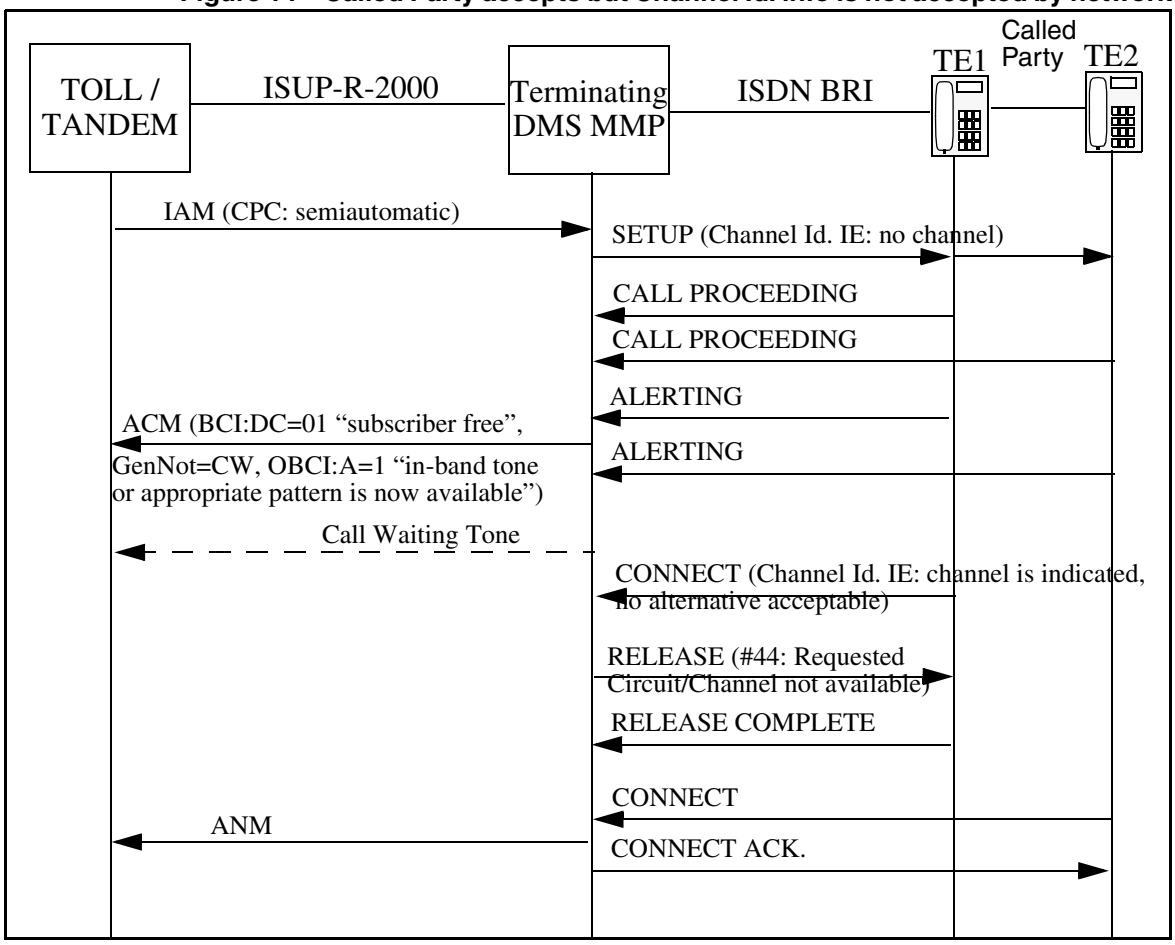

Figure 14 shows the case when the called party accepts the call by sending CONNECT message but the Channel Identification Information specified by the user is not accepted by the network.

If the user returns the Channel Identification Information element in the CONNECT message indicating "channel is indicated, no alternative acceptable" and if the network cannot accept the indicated B-Channel, then the network clears the user and waits for another user B indication for acceptance until the calling party clears the call or the CW timer expires

Figure 15 No message is received in response to SETUP message

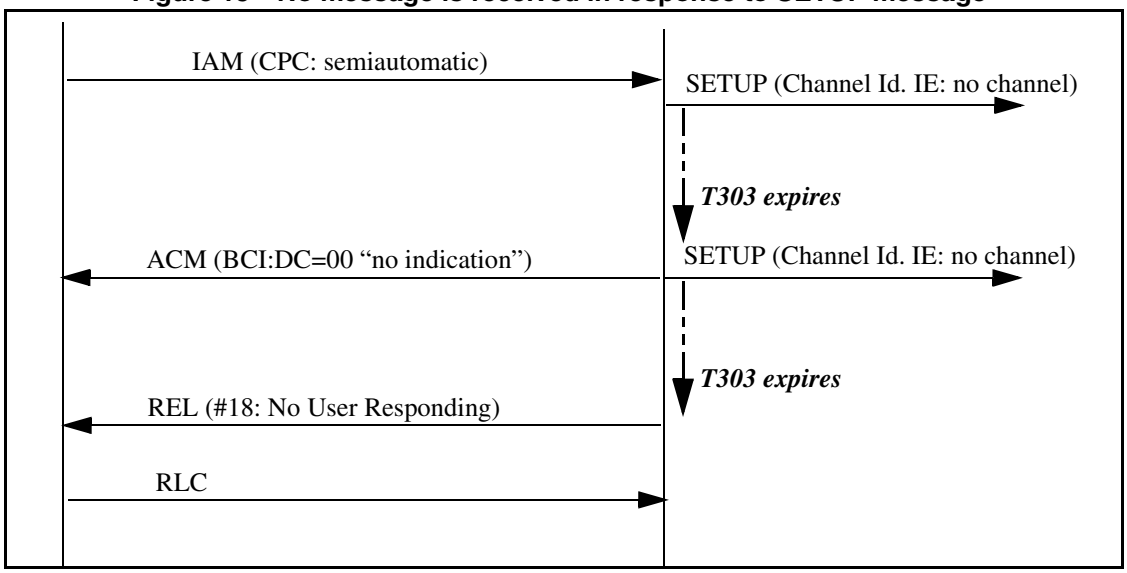

Figure 15 shows the case when no message is received in response to SETUP message.

Figure 16 No message is received after CALL PROCEEDING message

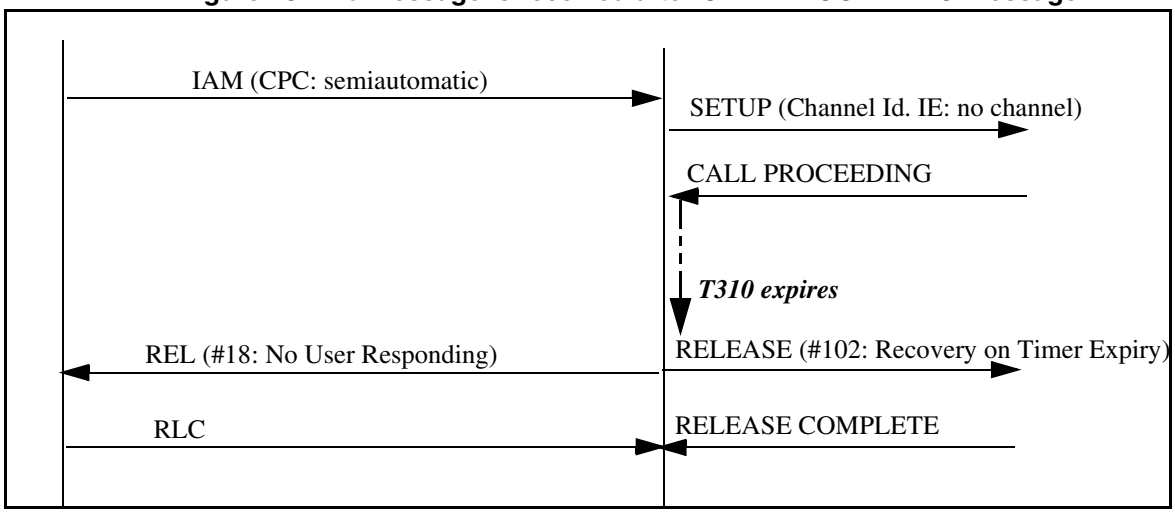

Figure 16 shows the case when no message is received after CALL PROCEEDING message.

12.0.1 Feature Activation

“Toll Break In” does not require any invocation from a subscriber. The feature may be invoked automatically on identification of the required conditions:

- incoming call is operator assisted
  i. Operator calls distinguished from other calls via the calling party parameter placed in IAM message.

ii. CPC (Calling Party Category) values specific to National Network of Russia are listed below:l

Operator Categories	ISUP Coding
Calling party's category unknown at this time **(see note 1)**	0000 0000
National operator	0000 1001
Semiautomatic call, category I OCC I	1111 0001
Semiautomatic call, category II OCC II	1111 0011
Semiautomatic call, category III OCC III	1111 0101
Semiautomatic call, category IV OCC IV	1111 0111

Note 1: This value is processed as semiautomatic call of category IV.

- the called party is busy (line is CPB)
- TBI is offered over Russia ISUP V2+ trunk.

"Toll Break In" activates Call Waiting feature regardless of the subscription status of the CW option.

12.0.1.1 Call Acceptance for IBN Lines

To allow IBN Lines to do some specific actions, R-CODEs are used. R-CODEs stand for flashing and dialing a single digit by controller. For only IBN lines, during the talking mode the subscriber can accept the operator call by dialing the following sequence:

(talking) RR SDT * RCODE

R-codes are data filled through table ISERVOPT as shown below:

Figure 17 R-CODE datafills

```
> table ISERVOPT

SOPTSKEY                                                    SOPTSVAR

RCODE  RCODE (RCODE0  TOGGLE) (RCODE1  DISC_ACT) (RCODE2  XFER) (RCODE3  CON_3WC) (RCODE4 DISC_HOLD) $
```

TOGGLE is used for call acceptance. IBN subscriber can accept operator call by Flash 0 with the above datafill.

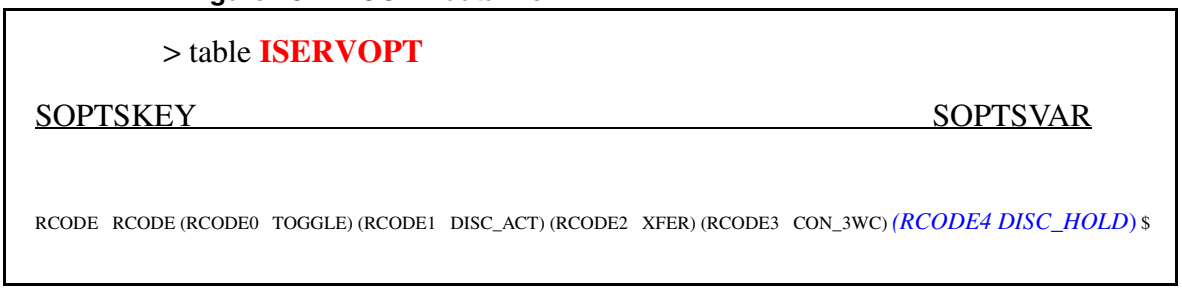
Note: To use R-Codes for IBN Lines, CEPT option must exist on the subscriber and on the customer group that the subscriber belongs to. Russia market uses CEPT by default option.

12.0.1.2 Call Rejection for IBN Lines

For IBN Lines, during the talking mode the subscriber can reject the operator call by dialing the following sequence:

(talking) RR SDT * RCODE

Figure 18 R-CODE datafills



DISC_HOLD is used for call rejection. IBN subscriber can reject operator call by Flash 4 with the above datafill.

12.0.2 Feature Metering and OM Pegs

Feature metering is a system used to charge feature meterable activities to subscribers initiated by either administrator or subscriber itself.

When TBI is active, feature metering for Call Waiting will not be incremented.Also Call waiting OM Pegs are not allowed to increase.

12.0.3 Tones

Following tones are used at various stages of an operator call on busy subscribers:

Call Waiting Tone: provides an indication that a call is being call waited. This tone is provided to the called party and the operator.

To be able to apply the Call Waiting Tone to the operator over Russia ISUP V2+ trunk, we need a CWT trunk defined on MTM device which has 3X68AB/ 3X68AC card on it. Additional datafills are needed as shown below:

Figure 19 Datafill to define a CWT trunk to apply CW Tone

```
>table stn
-------------------------------------------------------------------
SK TMTYPE TMNO TMCKTNO CARDCODE MAXCONN TRAFSNO
-----------------------------------------------
CWT 0 MTM 1 21 3X68AB 3 0
```

Hold Tone: provides an indication that a call is being held. This tone is provided to the held party.

12.1 Hardware Requirements or Dependencies

None

12.2 Software Requirements or Dependencies

None

12.3 Limitations and restrictions

The following limitations and restrictions apply to this feature:

- Only incoming operator calls on Russia ISUP V2+ trunks are supported
- Called party's line state must be CPB.
- TBI is denied if maximum waiting call number is reached for both IBN Lines (max. one active call and one waiting call) and ISDN/BRI lines (max two active calls and two waiting calls).
- TBI is denied to the Category-8 subscribers (Data/Fax Subscribers) for both IBN and ISDN/BRI lines.
- To apply call waiting tone to the operator side, datafill is required as shown in figure 19 on page 52.
- CEPT features are used by Russia market for IBN Lines. CEPT option must exist on the subscriber and on the customer group that the subscriber belongs to for IBN Lines.
- In addition to these, Cept CW limitations and restrictions are also applicable to this feature for IBN Lines.(Please refer to the FN document of activity A59019288 Section 2.4)

Note: CEPT CW restrictions includes **"coin and spm"** line restrictions especially. TBI is restricted to coin and spm lines, like Call Waiting.

- The CW supplementary service is used to support waiting calls on ISDN/BRI lines. The CW supplementary service limitations and restrictions are also applicable to this feature for ISDN/BRI lines. (Please refer to the FN document of activity AR2179HD Section 1.4.1)

12.4 Interactions

TBI feature uses Cept CW feature to provide operator calls on busy subscribers for IBN Lines in Russia Market. So all feature interactions of Cept CW feature are applicable to this feature.(Please refer to the FN document of activity A59019288 Section 2.5)

ISDN/BRI lines uses ETSI CW feature (not Cept CW). ISDN/BRI supplementary services and CW feature interactions will remain unchanged for TBI activity. (Please refer to the Section 4.3.2.9 of the HLD document of Activity AR2179HD)

The following table clarify the interactions between CEPT Call Waiting and other CEPT services. The following legend has been used to denote the interaction between a service A and a service B:

- Compatible-with No interactions (C-N): Services A and B can work together and do not have any interaction with each other.
- Compatible-with Interactions (C-I): Services A and B can work together, but may have some interactions with each other. These interactions may include cases such as service A taking precedence over service B, service A influencing service B in some way.
- Incompatible-not Provisionable (I-P): Services A and B cannot be provisioned together on the same line.
- Incompatible-at Activation time (I-A): Services A and B can be provisioned on the same line, but one should not be invoked while the other is active.
- Not Applicable (N/A): Service A cannot interact with service B.

Figure 20 CEPT Call Waiting interactions with other CEPT Services

Service	Call Waiting Interaction	Description
Automatic Line (AUL)	I-P	AUL and ICWT cannot be provisioned on the same line. So TBI is incompatible with AUL.

Call Completion to Busy Line (CCBS), Network Call Completion to Busy Line (NetCCBS)	C-I	Call Waiting takes precedence over CCBS/ NetCCBS. So TBI takes precedence over CCBS/Net CCBS.
Call Diversion to Operator (CDTO)	C-I	CDTO takes precedence over Call Waiting. With CDTO active, Call Waiting is impossible. So CDTO takes precedence over TBI.
Call Diversion To Announcement (CDTA)	C-I	CDTA takes precedence over Call Waiting. With CDTA active, Call Waiting is impossible. So CDTA takes precedence over TBI.
Call Forward on Busy Programmable (CFB Programmable)	C-I	Call Waiting takes precedence over CFB Programmable. After CWT time-out CFB Programmable is impossible. So TBI takes precedence over CFB Programmable.
Call Forward on Busy Fixed (CFB Fixed)	C-I	Call Waiting takes precedence over CFB fixed. After CWT time-out CFB Fixed is impossible. So TBI takes precedence over CFB fixed.
Call Forward Do not answer programmable (CFD programmable)	C-N	Since the call has not been answered yet, it is already impossible to do Call-Waiting. So it is impossible to do TBI.
Call Forward Do not answer fixed (CFD fixed)	C-N	Since the call has not been answered yet, it is already impossible to do Call-Waiting. So it is impossible to do TBI.
Call Forward Fixed (CFF)	C-I	CFF takes precedence over Call Waiting. With CFF active, Call Waiting is impossible. So CFF takes precedence over TBI.
Call Forward Remote Access (CFRA)	C-I	CFRA takes precedence over Call Waiting. With CFRA active, Call Waiting is impossible. So CFRA takes precedence over TBI.
Call Forward Universal (CFU)	C-I	CFU takes precedence over Call Waiting. With CFU active, Call Waiting is impossible. So CFU takes precedence over TBI.
Denied Origination (DOR)	C-N	
Hunt Group	I-P	Hunt Group and ICWT cannot be provisioned on the same line. So TBI is incompatible with hunt groups

International Call Transfer (ICT)	C-I	The controller may initiate his second call and transfer them if he has a ICT option. If the controller already has a waiting call, ICT is impossible.
Cept Do Not Disturb (CDND)	C-I	CDND takes precedence over Call Waiting. If CDND is active, Call Waiting is impossible, so TBI.
International Line Restriction (ILR)	C-N	
International Three Way Calling (I3WC)	C-I	If a talking call or incoming call is involved with Three Way Calling, then the Call Waiting feature will be disabled during the duration of that call. If the Call Waiting feature is active then the Three Way Calling capability of both non-controlling parties will be disabled if the calls are within the same office. If the non-controlling party is in a different office, the Three Way Calling and Call Waiting capabilities are not affected. In the CWT feature during the enquiry call, the controller may conference the held party, if he has a I3WC option data filled against his line. So if I3WC is in effect on the call, TBI will be denied.
Six Way Calling (I6WC)	C-I	if I6WC is in effect on the call, TBI will be denied.
International Wake-up Call (IWUC)	C-I	When a subscriber goes off-hook on a wake up call (ringing), the subscriber hears disconnect tone or announcement. Call Waiting would not alert the subscriber on a disconnect tone or announcement, the caller will receive busy treatment. Wake-up Call would not alert a subscriber in the talking state even if Call Waiting is available. Wake up Call can be considered to take precedence over Call Waiting. So TBI will be denied if a Wake up Call to an announcement is in progress.
Last Number Redial (LNR)	C-N	
Malicious Call Tracing (MCT)	C-I	MCT and ICWT can not be provisioned on the same line. So TBI is incompatible with MCT on the same line. But if party A calls party B who has MCT, party B can initiate MCT to trace party A even if Call Waiting is active on party A. In that case, party A is held and the waiting party (or held party) gets disconnect tone. When the call is held, Call Waiting cannot active.
Speed Call Short (SCS) / Speed Call Long (SCL)	C-N	

Warm Line (WML)	C-I	If party A (has ICWT and CEPT WML) hears call waiting tone can press Flash and dial ONLY single digit. After party C is accepted by party A, still only single digit can be handled after flash (second flash case). So CEPT feature programming interface can not be used in this stage for CEPT WML.

Figure 21 Other Feature Interactions with TBI

Service	Call Waiting Interaction	Description
Free Number Terminating(AUL)	I-P	FNT disables Call Waiting feature for trunk to line calls. So TBI is incompatible with FNT.
Cancel Call Waiting (CCW)	I-P	CCW activated on the terminating line prevents the operator to break in. So TBI is incompatible with CCW.
Essential Line (ELN)	C-N	
International Call Recording (ICR)	C-I	When a subscriber with ICR option, already involved in a TBI Call, releases the waiting call, then ICR should be produced.
Denied Termination (DTM)	I-P	TBI is incompatible with DTM.
Plug up-place on trouble intercept (PLP)	I-P	TBI is incompatible with PLP.
Suspend Service (SUS)	I-P	TBI is incompatible with SUS.
Flash Ignore (FIG)	I-P	SinceFIG option disables to make flash terminating line can not accept or reject the TBI call.
No Double Connect (NDC)	I-P	ICWT is incompatible with NDC, so TBI.

13: Functional Description (FN): A00002101

13.1 Feature name

'ALLOW ITX ONLY SSUTR2', which maps to actid A00002101 in ISN07.

13.2 Description

This activity,'A00002101-Allow ITX only SSUTR2*' in MMP20, provides a new IC/2W trunk option which allows the DMS Tandem Exchange :

- To transmit and report the received ITX messages.
- To block TAX and CHT messages.
- To allow ITX generation for indirect access calls, if NETAOCD datafill exists at DMS Indirect Access Node.

Regarding to SSUTR2 (reference-[a] ,section 3.2 Call Charging Procedures) ; Bacward Call Charging Scenarios has to be one of the three below: A-) No Backward charging message will be received , B-) TAX (possibly CHT) message(s) will be received , C-) One or several ITX message(s) will be received . Any other backward charging scenarios are not supported by this activity .

In order to ;

- block TAX/CHT and not report
- let the ITX(s) pass and report

to the originator side of the call the incoming (IC) FTUP trunk must hold the new option TELETAX_ITX_SIG .

This activity also enhances the DMS-XPM ITX generation mechanism to prevent zero count ITX generation, this individual behavior is submitted under case:030801-33578 .

13.2.1 Background information:

SSUTR2 defines three backward charging procedures using a combination of charging messages (TAX, CHT, ITX, TXA) to indicate the charging requirements to the billing switch. Please refer to Appendix, Section 2.10.3 for message formats.

At EUR010, TELETAXE_NOSIG option in table TRKOPTS has been provided by the activity AU3283-SSUTR2 SUPPORT FOR BACKWARD CHARGING to control sending of backwards charging messages at DMS Indirect Access Node.

For SSUTR2-SSUTR2 and SSUTR2-SPIROU tandem calls from an incoming trunk marked with the TELETAX_NOSIG option; backward charging messages received on the outgoing SSUTR2 trunk will not be tandemed. Instead , CHT and ITX messages acknowledged with a TXA. Besides, ITX generation is not allowed although NETAOCD datafill exists at DMS Indirect Access Node. Please refer to the section 2.2.2.3 and 2.2.2.4 for the behaviour when TELETAXE_NOSIG option is datafilled.

*__Note:__ SSUTR2 is the French national variant of the ITU-T Q.723 specification (TUP), commonly referred to as French Telephony User Part (FTUP). It is used for interconnection of France Telecom and other licensed domestic operators.

13.2.2 Backward Charging Functionality

Table 1 Backward Charging Functionality

OPTION datafilled for IC/2W trk in the TABLE TRKOPTS	No NETAOCD datafilled at DMS Tandem Exchange	NETAOCD datafilled at DMS Tandem Exchange
No option datafilled (i.e.None of the options TELETAXE_NOSIG and TELETAXE_ITX SIG)	*ITX, TAX and CHT messages are tandemed and reported to CM.* ***Please refer to Figures 1 and 2.***	*The ITX, TAX and CHT messages received are not tandemed, but reported to CM.* *ITX generation is allowed regarding existing tariff for NETAOCD datafills.* ***Please refer to Figures 3 and 4.***
TELETAXE	*ITX, TAX and CHT messages are tandemed and reported to CM.* ***Please refer to Figures 1 and 2.***	*The ITX, TAX and CHT messages received are not tandemed, but reported to CM .* *ITX generation is allowed regarding existing tariff for NETAOCD datafills.* ***Please refer to Figures 3 and 4.***
TELETAXE_NOSIG	*The ITX, TAX and CHT messages received are not tandemed, but reported to CM.. ITX and CHT messages are acknowledged by TXA messages.* ***Please refer to Figures 5 and 6.***	*The ITX, TAX and CHT messages received are not tandemed,but reported to CM. ITX and CHT messages are acknowledged by TXA messages.* *Although NETAOCD datafill exists at tandem exchange, ITX generation is not allowed.* ***Please refer to Figures 7 and 8.***

Table 1 Backward Charging Functionality

OPTION datafilled for IC/2W trk in the TABLE TRKOPTS	No NETAOCD datafilled at DMS Tandem Exchange	NETAOCD datafilled at DMS Tandem Exchange
TELETAXE_ITX_SIG	**The ITX messages received at tandem are tandemed and reported to the CM.** **The TAX and CHT messages received at tandem are not tandemed and not reported to CM, but CHT messages are acknowledged by TXA.** **Please refer to Figures 9 and 10.** **Handling of Charge Message(s) in rare-seen scenarios , under provision of TELETAX_ITX_SIG , is defined in figures 13 to 16.**	**The ITX messages received are not tandemed, but reported to CM.** **The TAX and CHT messages received are not tandemed, but reported to CM.** **ITX and CHT messages are acknowledged by TXA messages.** **ITX generation is allowed regarding existing tariff for NETAOCD datafills.** **Please refer to Figures 11 and 12.** **Handling of Charge Message(s) in rare-seen scenarios, under provision of TELETAX_ITX_SIG , is defined in figures 13 to 16.**

Note :The parts in *italic* in the Table 1 above represent the existing behaviour. The part in **bold** in the Table 1 above represents the new funtionality.

13.2.2.1 Any of the options (TELETAXE_NOSIG or TELETAXE_ITX_SIG) is not datafilled when NETAOCD datafill does not exist:**

Figure 1 ITX received by tandem with no NETAOCD datafill

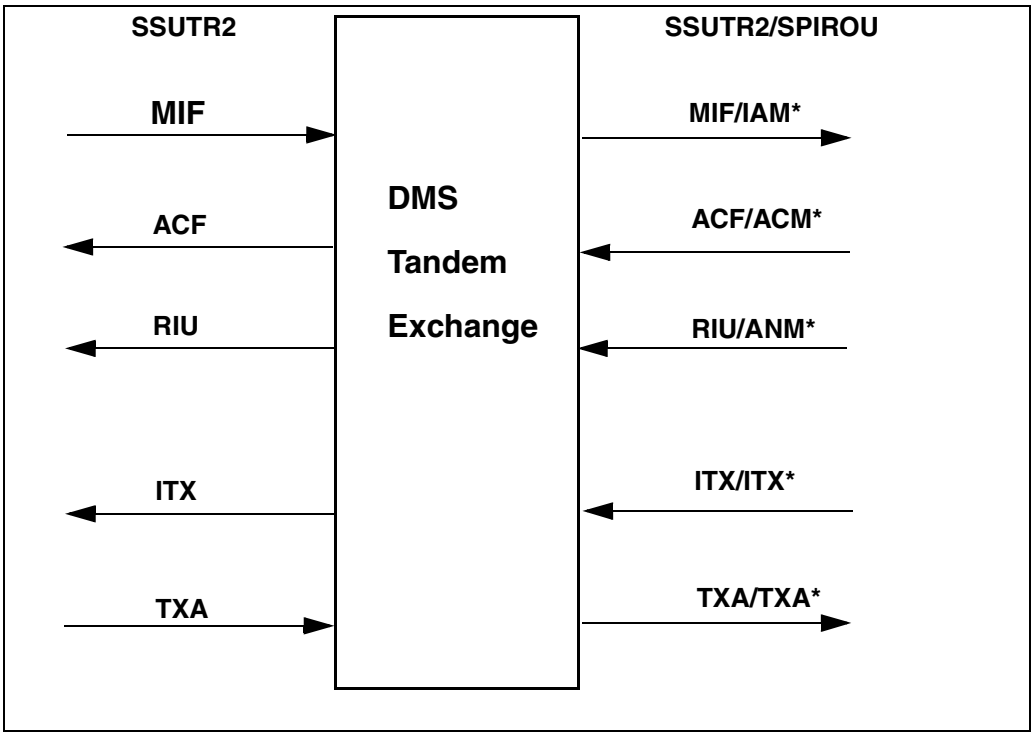

Figure 2 TAX and CHT received by tandem with no NETAOCD datafill

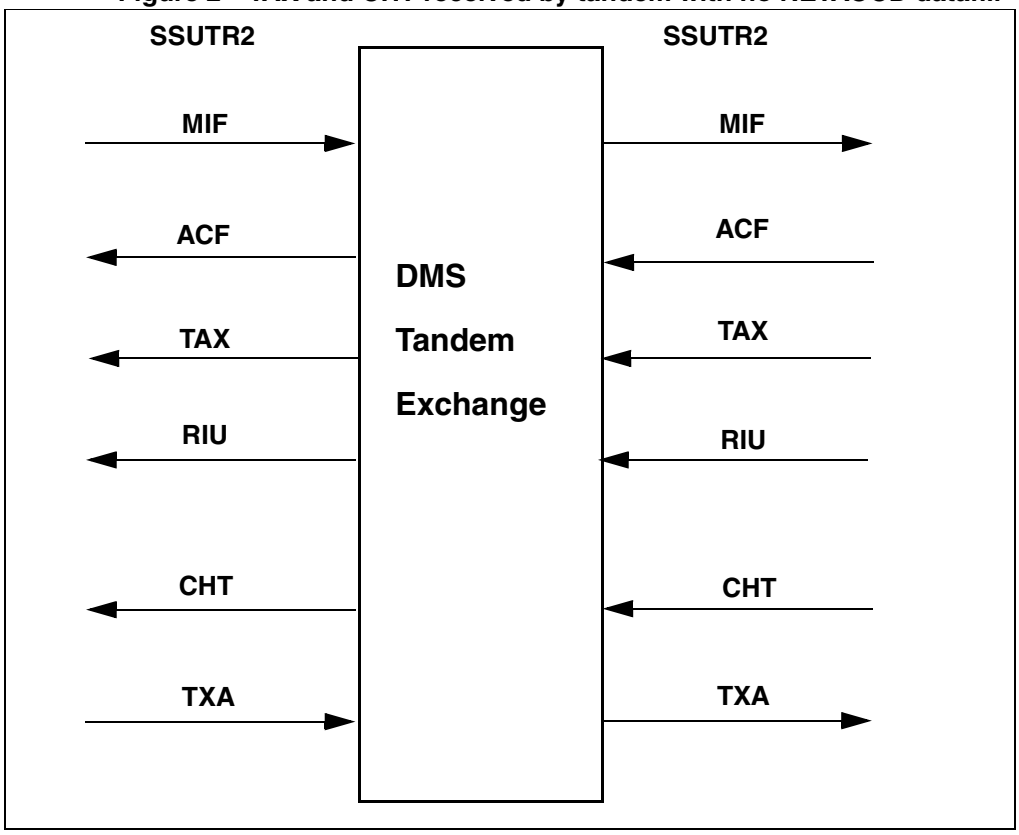

The ITX, TAX and CHT messages received at tandem will be tandemed and will be reported to the CM.

*These messages are SPIROU messages sent from/to DMS Tandem Exchange. For SPIROU, TAX and CHT messages are not supported.

****Note:*** Figure 1 and Figure 2 also represent the case where TELETAXE option is datafilled in Table 1.Any of the options (TELETAXE_NOSIG or TELETAXE_ITX_SIG) is not datafilled when NETAOCD datafill exists**:

Figure 3 ITX received by tandem with NETAOCD datafill

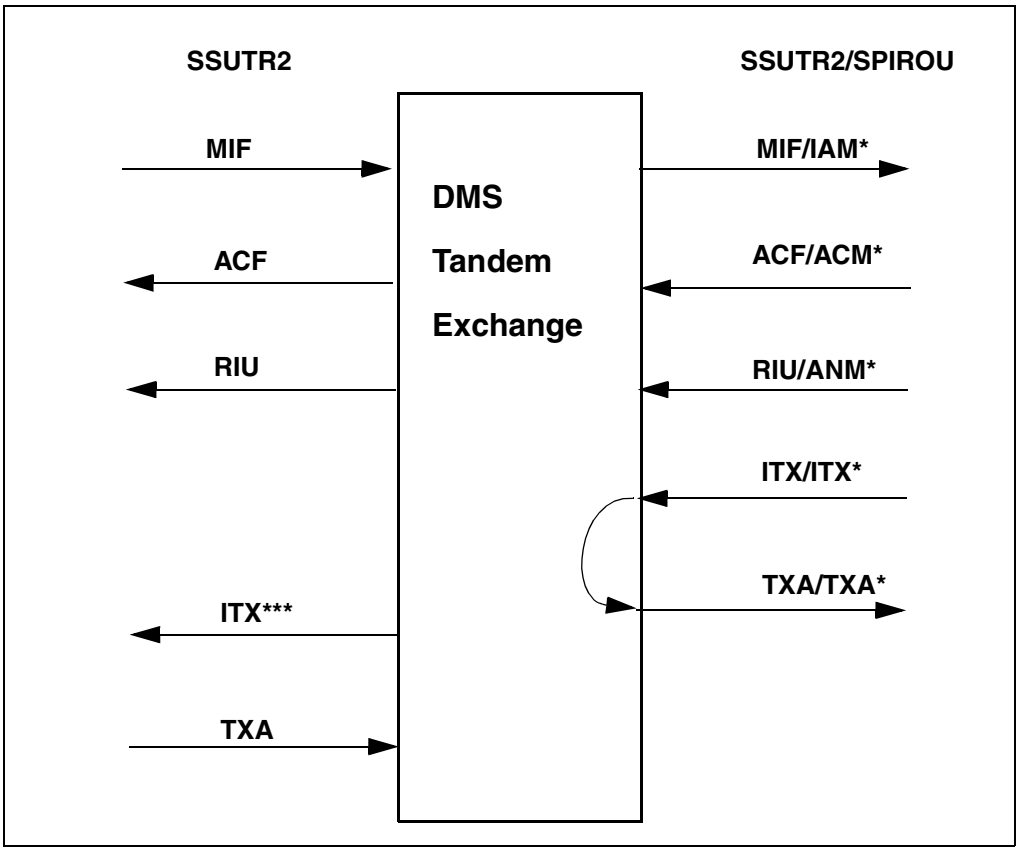

Figure 4 TAX and CHT received by tandem with NETAOCD datafill

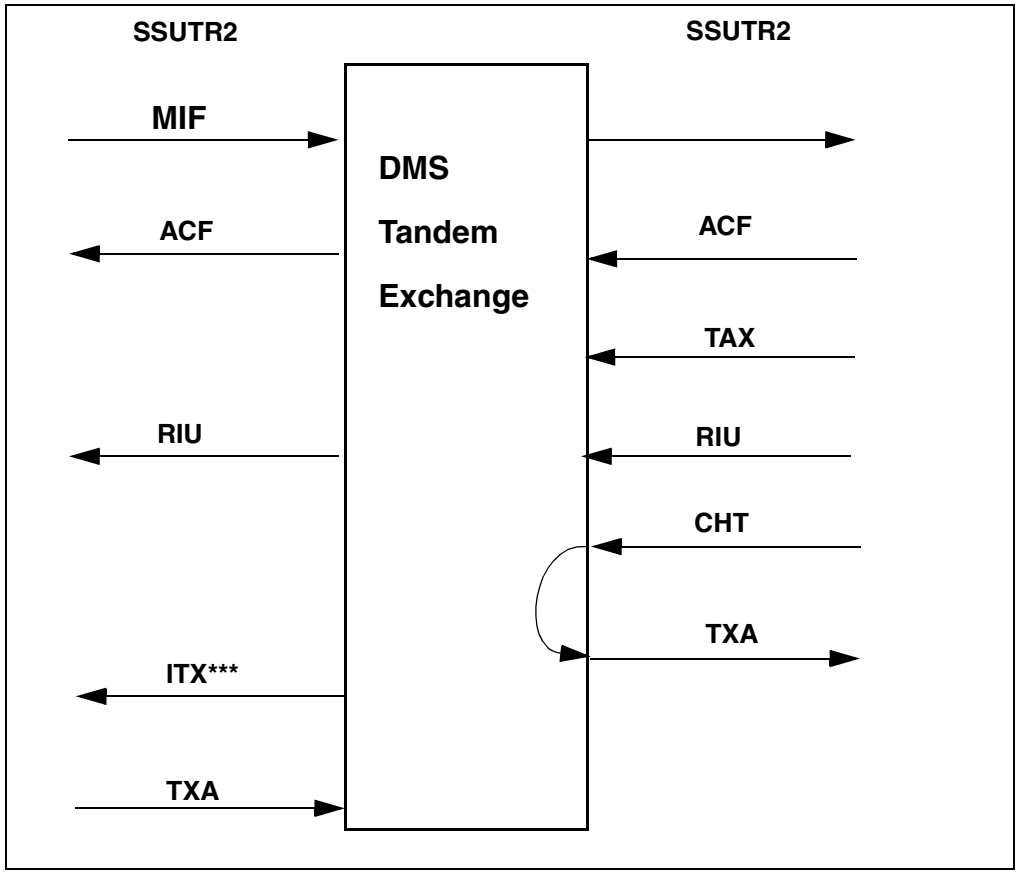

The ITX, TAX and CHT messages received are not tandemed , but reported to CM.

*These messages are SPIROU messages sent from/to DMS Tandem Exchange. For SPIROU, TAX and CHT messages are not supported.

***Note:** Figure 3 and Figure 4 also represent the case where TELETAXE option is datafilled in Table 1.

***ITX generation is allowed regarding existing tariff for NETAOCD datafills

13.2.2.2 TELETAXE_NOSIG is datafilled when no NETAOCD datafill exists:

Figure 5 ITX received by tandem with no NETAOCD datafill

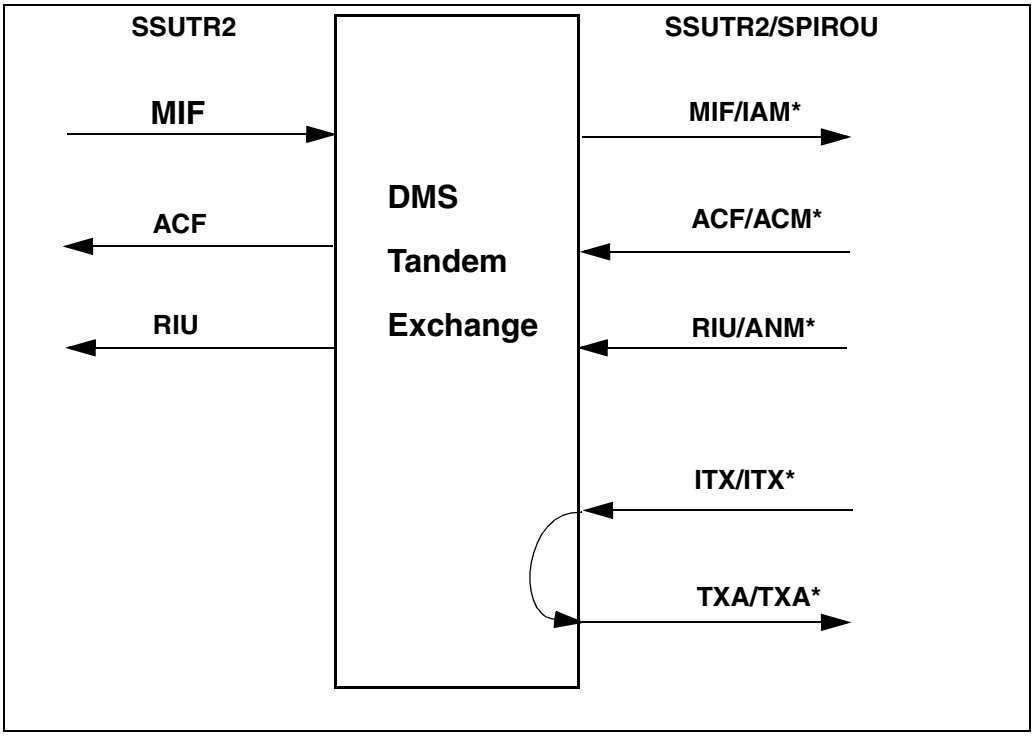

Figure 6 TAX and CHT received by tandem with no NETAOCD datafill

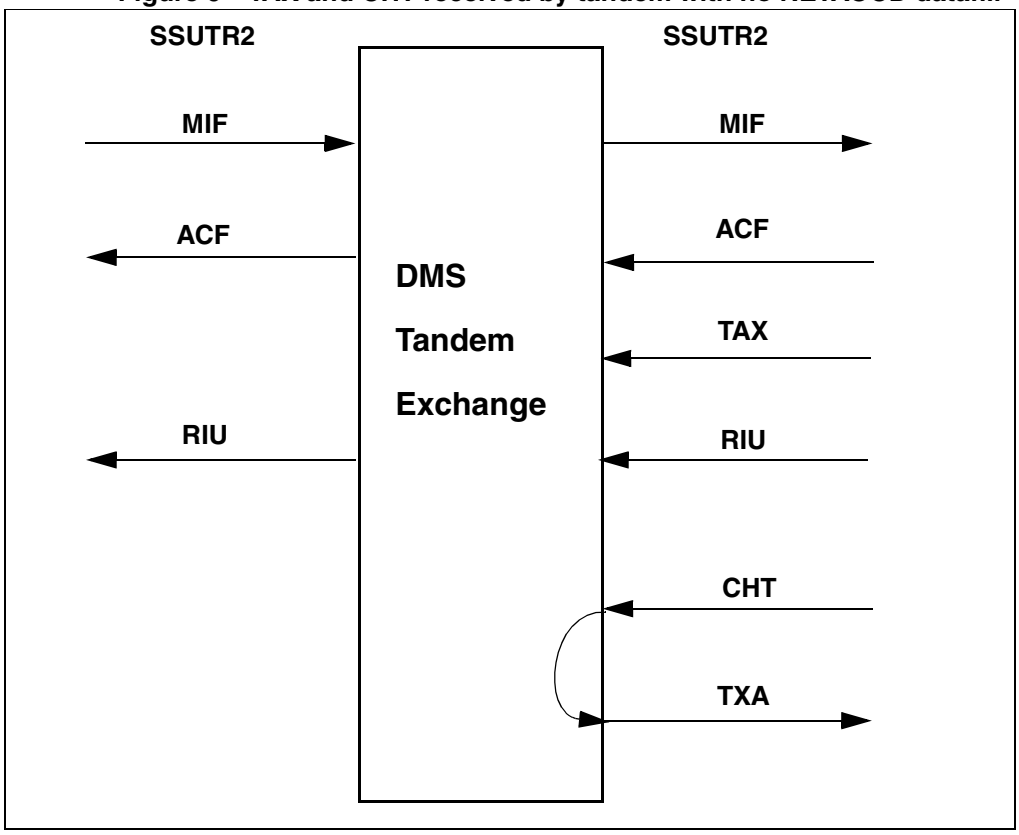

The ITX, TAX and CHT messages received are not tandemed , but reported to CM.

*These messages are SPIROU messages sent from/to DMS Tandem Exchange. For SPIROU, TAX and CHT messages are not supported.

13.2.2.3 Both TELETAXE_NOSIG and NETAOCD are datafilled:

Figure 7 ITX received by tandem with NETAOCD datafill

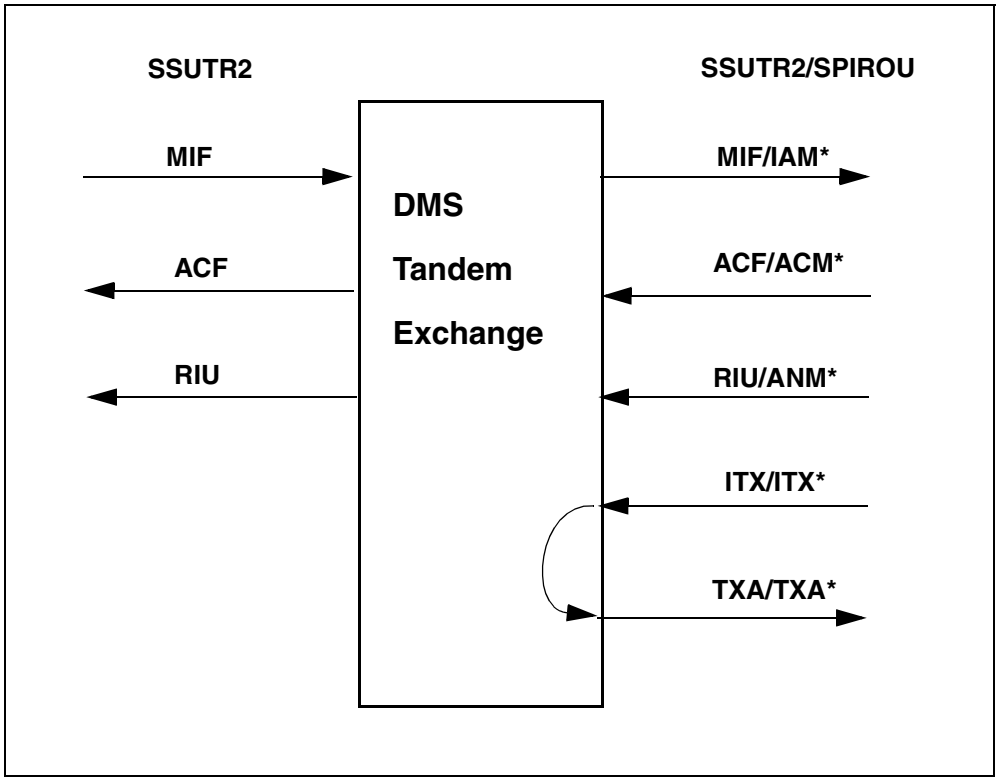

Figure 8 TAX and CHT received by tandem with NETAOCD datafill

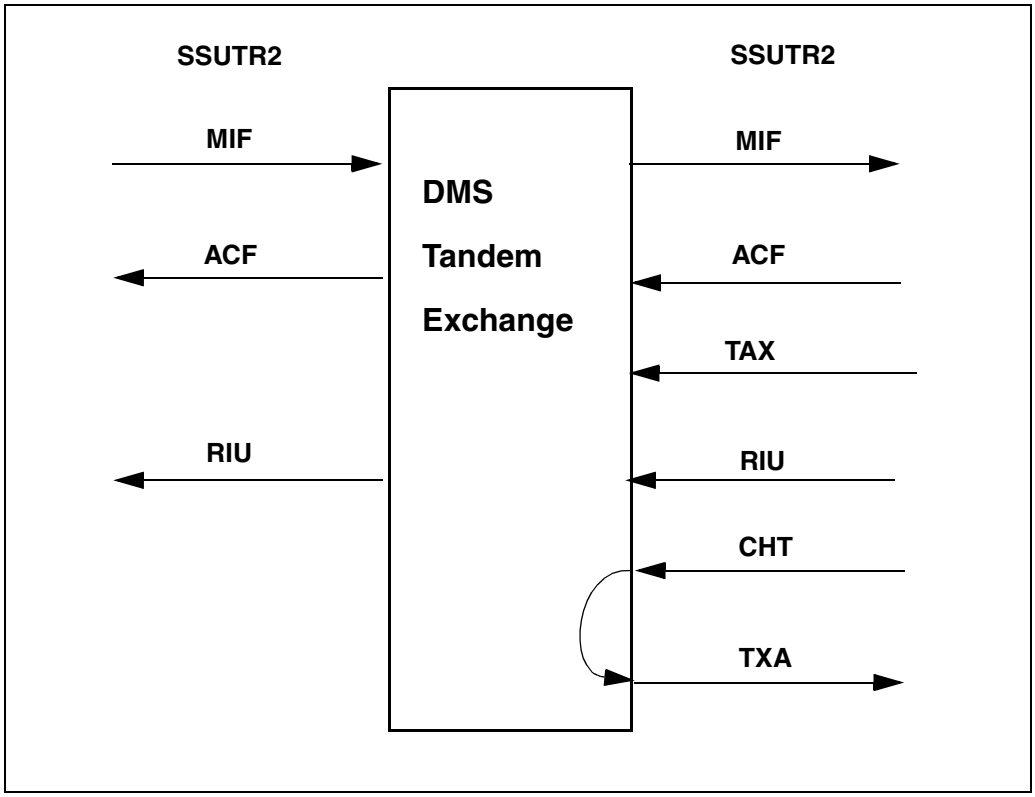
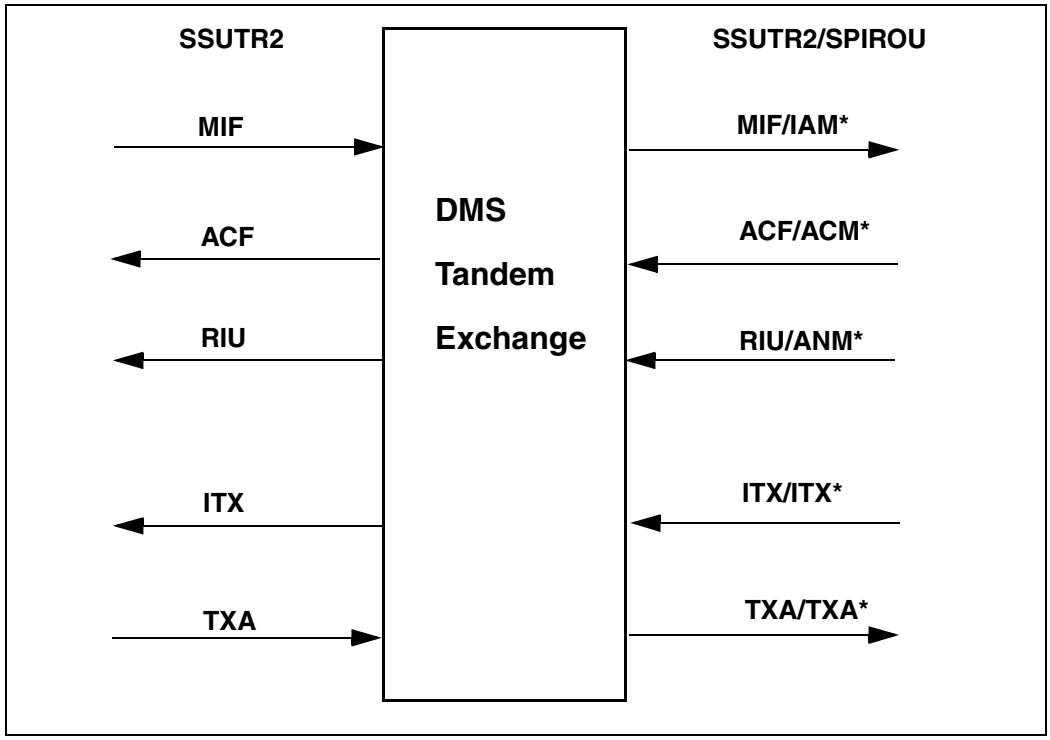


The ITX, TAX and CHT messages received are not tandemed , but reported to CM. ITX and CHT messages are acknowledged by TXA messages. Even if NETAOCD datafill exists at tandem exchange, ITX generation is not allowed.

*These messages are SPIROU messages sent from/to DMS Tandem Exchange. For SPIROU, TAX and CHT messages are not supported.

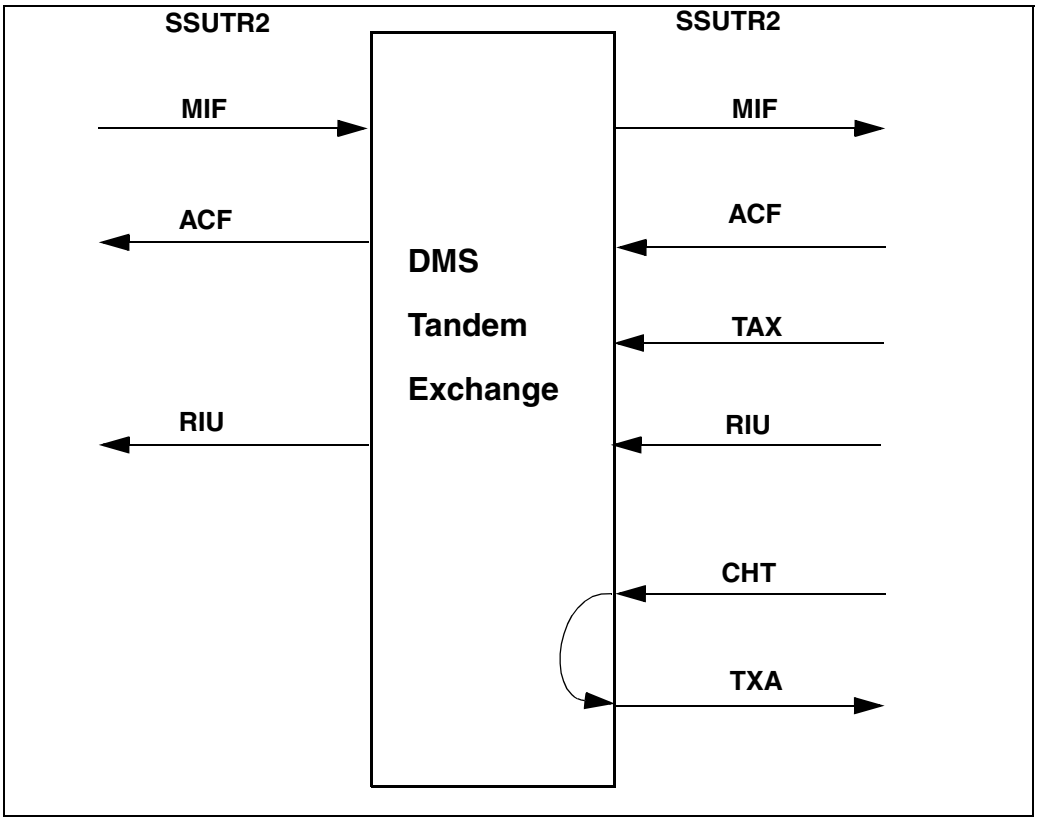
13.2.2.4 TELETAXE_ITX_SIG is datafilled when no NETAOCD datafill exists:

Figure 9 ITX received by tandem with no NETAOCD datafill



The ITX messages received at tandem will be tandemed and will be reported to the CM.

Figure 10 TAX and CHT received by tandem with no NETAOCD datafill



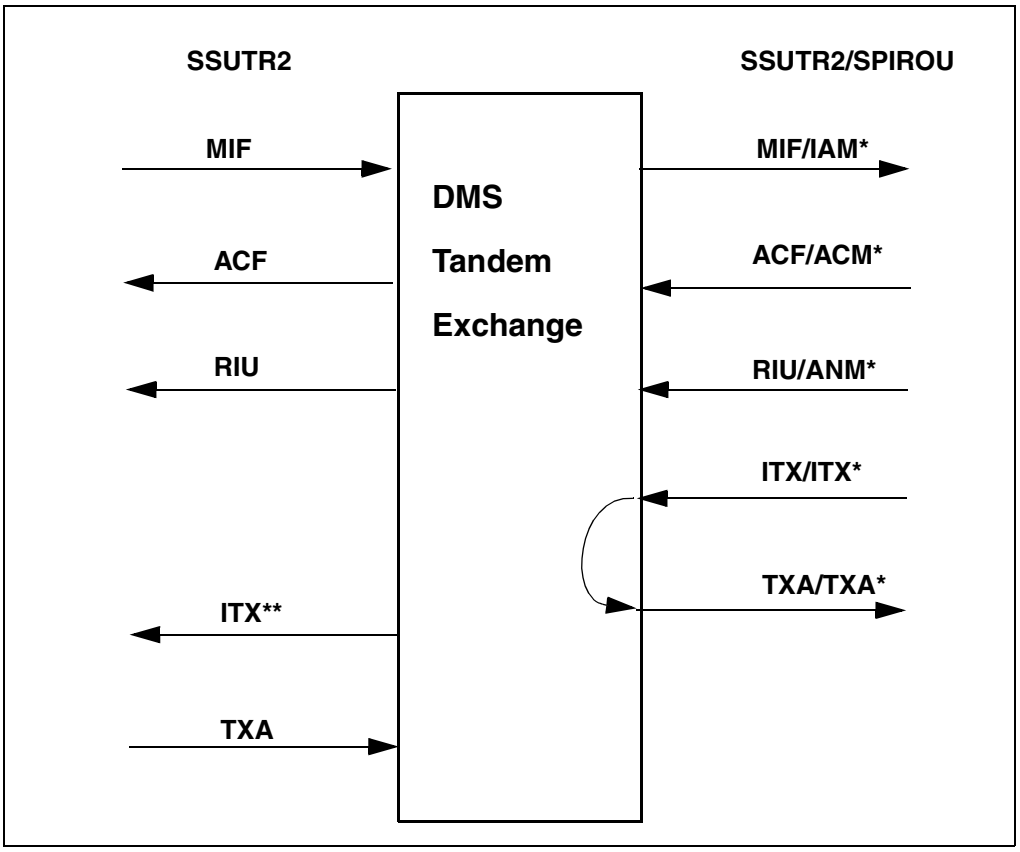
The TAX and CHT messages received at tandem will still not be tandemed and not reported to CM, but CHT messages are acknowledged by TXA.

*These messages are SPIROU messages sent from/to DMS Tandem Exchange. For SPIROU, TAX and CHT messages are not supported.

13.2.2.5 TELETAXE_ITX_SIG is datafilled when NETAOCD datafill exists:

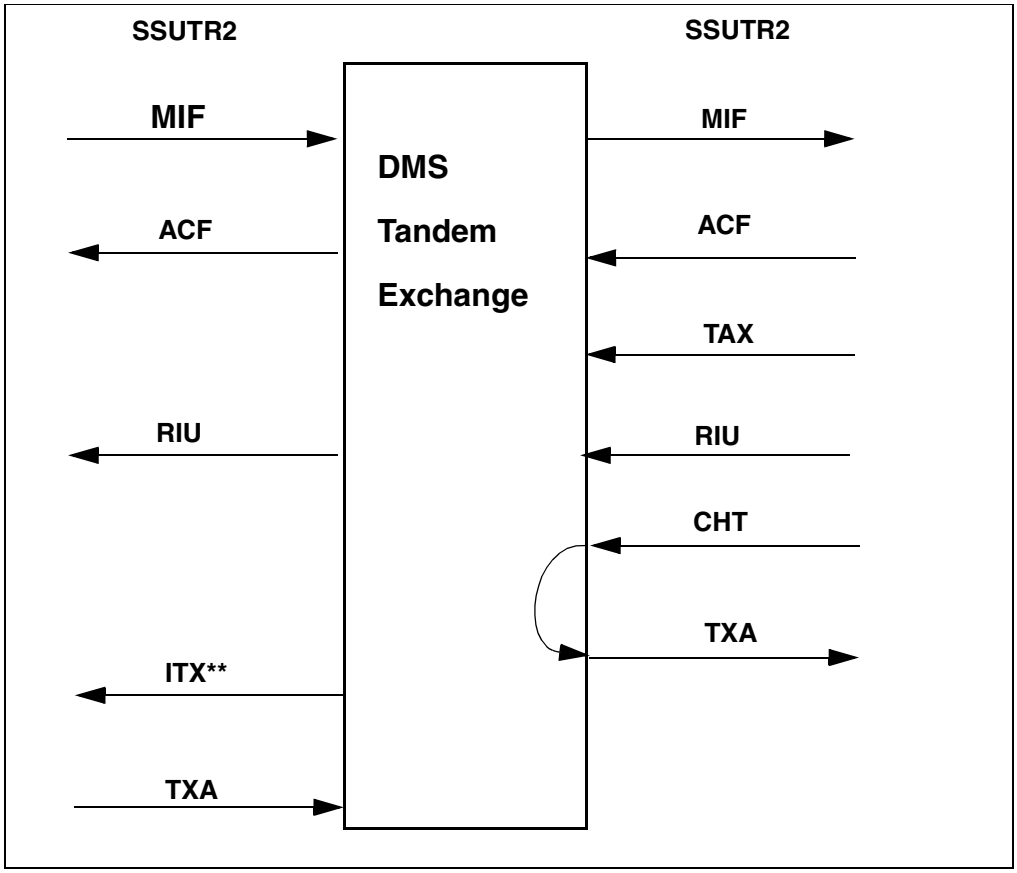
This activity has no impact on existing NETAOCD behaviour.

Figure 11 ITX received by tandem with NETAOCD datafill



The ITX messages received are not tandemed, but reported to CM.

Figure 12 TAX and CHT received by tandem with NETAOCD datafill



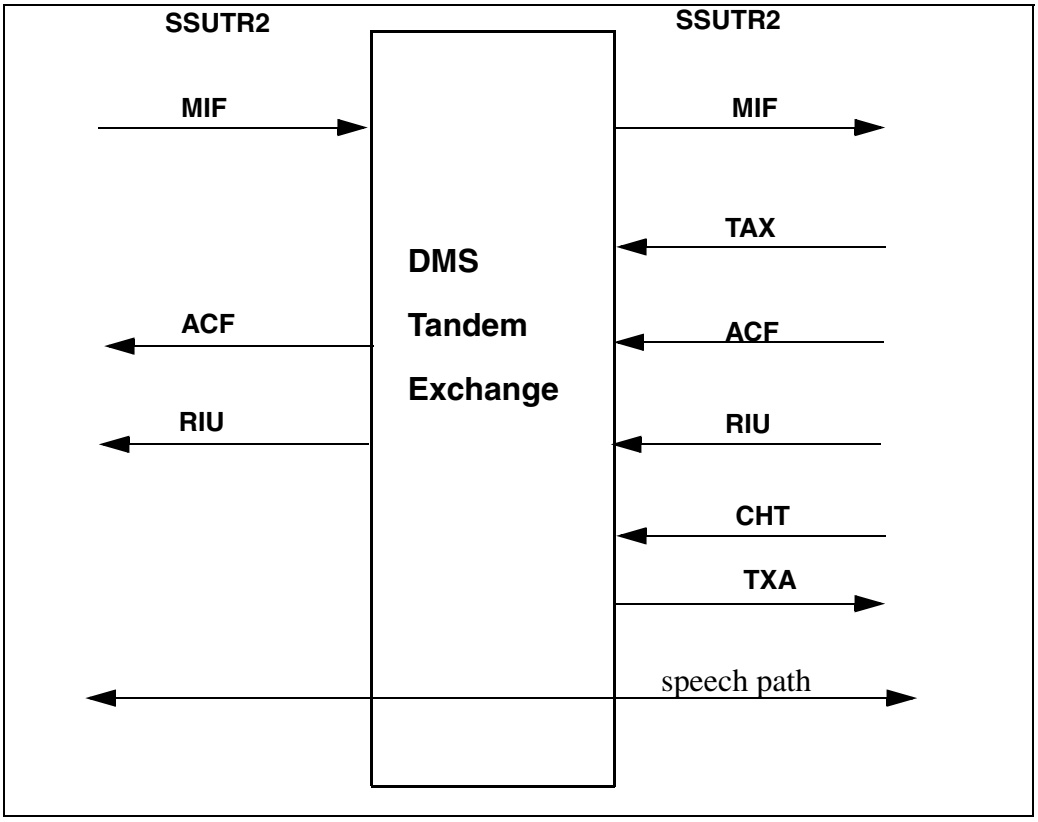
The TAX and CHT messages received are not tandemed, but reported to CM.

*These messages are SPIROU messages sent from/to DMS Tandem Exchange. For SPIROU, TAX and CHT messages are not supported.

**ITX is generated by tandem regarding existing tariff for NETAOCD datafills.

13.2.3 Handling of TAX in pre-ACF condition with Teletax_ITX_SIG Datafilled

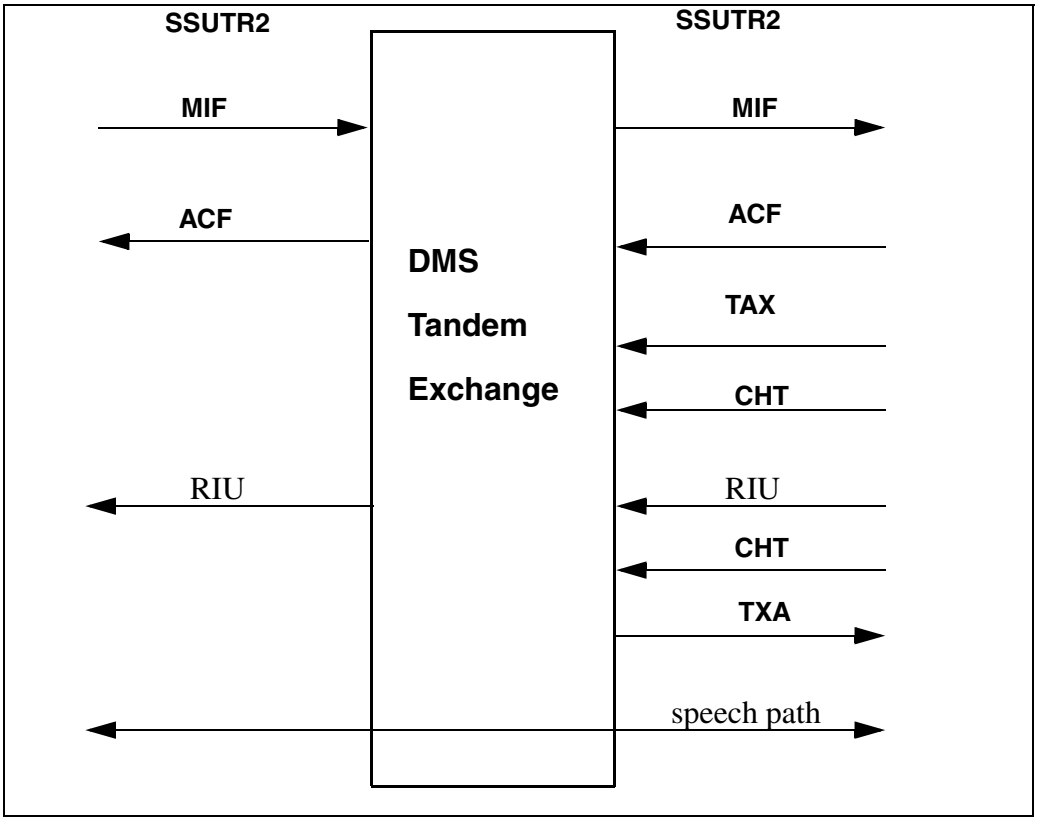
Figure 13 TAX received by tandem in pre-ACF state



The TAX message received at tandem will not be tandemed and not reported to CM.

13.2.4 Handling of CHT in pre-RIU condition with Teletax_ITX_SIG Datafilled

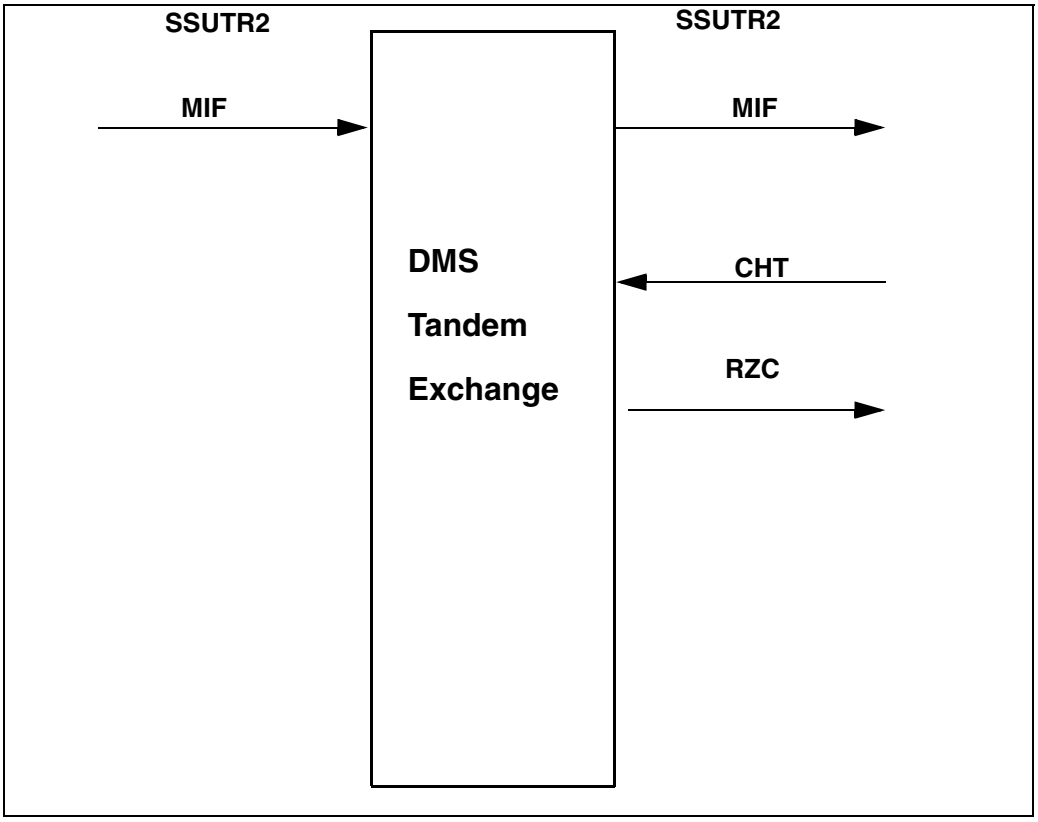
Figure 14 CHT received by tandem with in pre-RIU state with TAX



The CHT messages received at tandem will not be tandemed ,not reported to CM and not acknowledged.

13.2.5 Handling of CHT in pre-ACF condition with TELETAX_ITX_SIG datafilled

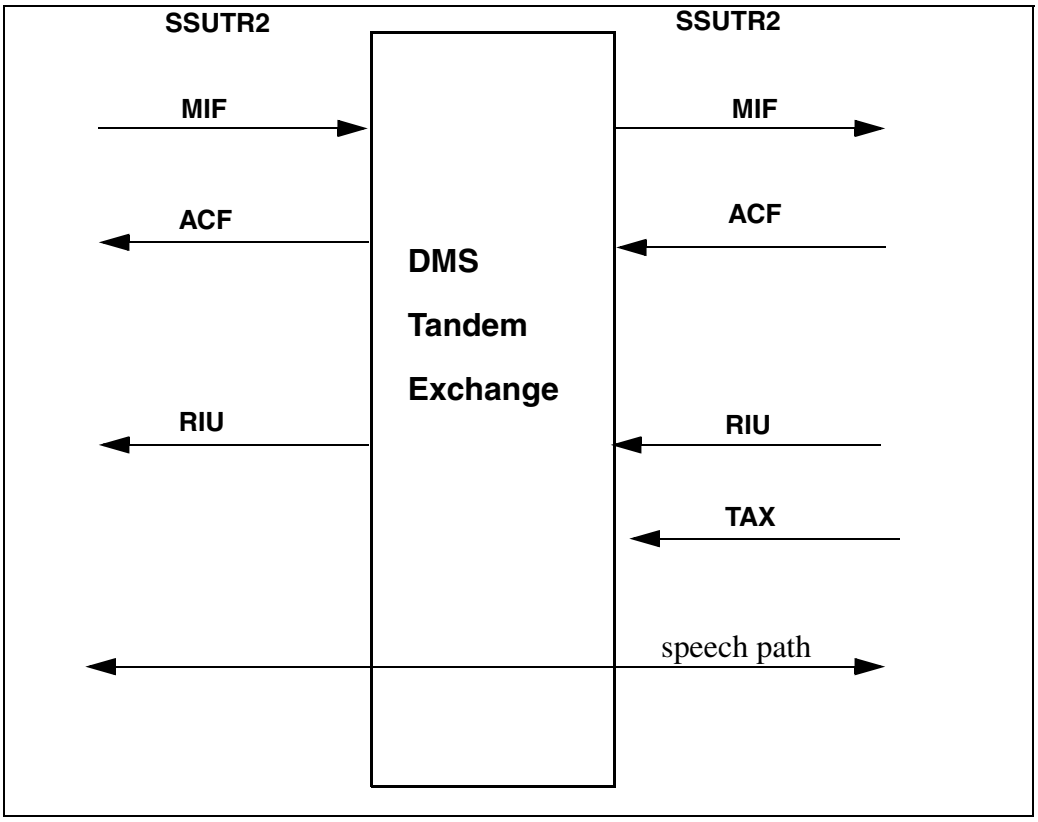
Figure 15 CHT received by tandem in pre-ACF state



The CHT messages received at tandem will not be tandemed ,not reported to CM and not acknowledged, regarding to SSUTR2 specification (Reference-[A]) call will be dropped with RZC message (reset circuit message).

13.2.6 Handling of TAX in post-RIU condition with TELETAX_ITX_SIG datafilled

Figure 16 TAX received by tandem in post-RIU state



The TAX messages received at tandem will not be tandemed and not reported to CM.

13.2.7 Datafill Requirements

13.2.7.1 Table TRKSGRP Datafill

- **SSUTR2 trunk datafill:**

  2WFTUPAB 0 DS1SIG C7UP 2W N N UNEQ NONE Q767 THRH 0 DMS_NODE N N **FRANCE 100_BLUE** $ FTUP2W CIC

- **SPIROU trunk datafill:**

  SPIROUAB 0 DS1SIG C7UP 2W N N UNEQ NONE Q767 THRH 0 DMS N N **SPIROU 100_EIV3** $ 2WN7 CIC

13.2.7.2 Table TRKOPTS Datafill

TELETAXE_ITX_SIG option is datafilled for IC/2W trunks as seen in Table-2 below.

If TELETAXE_ITX_SIG option is assigned to an IC/2W SSUTR2 trunk which is datafilled on peripheral not equipped with an SX05, a warning message is generated. Please refer Figure 9 in CN section of this document.

Additionally, just one of the options TELETAXE_NOSIG and TELETAXE_ITX_SIG will be datafillable for the same trunk at a time.

Table 2 Sample Datafill for TELETAXE_ITX_SIG option in Table TRKOPTS

```
TABLE TRKOPTS
- - - - - - - - - - - - - - -
OPTKEY              OPTINFO
- - - - - - - - - - - - - - - - - - - - - - - - -
2WFTUPBA TELETAXE_ITX_SIG TELETAXE_ITX_SIG
```

13.2.7.3 Metering Datafill

The existing DMS “metering” system which is used to drive ISDN Advice of Charge will be used to determine the number of charge units accured for ITX generation on SSUTR2. This system must be activated per PDTC by the METER option in the table LTCINV.

Please refer the Appendix-2.10.1 for metering datafill example.

13.2.7.4 Traver for ITX generating call

Please refer to Appendix-2.10.2 to find an traver example for SSUTR2-SSUTR2 call when NETAOCD datafill exists.

13.3 Hardware Requirements or Dependencies

This feature is supported only on SX05 DTCO/DTCO2 processor.

13.4 Software Requirements or Dependencies

No changes due to this feature. Existing SOC options for backward charging functionality are used.

13.5 Limitations and restrictions

- This feature is supported only on SX05 DTCO/DTCO2 processor.

- All restrictions and limitations in AU3283-SSUTR2 SUPPORT FOR BACKWARD CHARGING, PLS DOC will be valid for this activity as well.

13.6 Interactions

No changes due to this feature.

Charge rate indicators, charge rate factor and time indicator	*The values of these fields are same as for the CHT message in the section 2.2.5.3 ,Table 4.*	

14: Functional Description (FN): A0002173

14.1 Feature name

System of Operative-Searching Measures (SOSM) for Digital Multiplex System (DMS) MMP.

In ISN07 release, SOSM for IBN/V5.2(IBN) lines and ISUP trunks is developed under the following activities:

- A00002172 "SOSM - Provisioning"
- A00002173 “SOSM - X25 Messaging Interface & Speech Connection”
- A00002178 "SOSM - CALLP and Service Interactions"

In ISN08 release, SOSM support for ETSI[1] BRI and ETSI PRI agents is provided under the following activities:

- A00006861 "SOSM PRI Basic Call and Feature Interactions"
- A00006863 "SOSM BRI Basic Call Interactions"
- A00006864 "SOSM BRI FPE Interactions"

14.2 Feature Synopsis

This feature implements supervision of outgoing/incoming calls from/to certain observed subscribers in the Russian telephone network.

This feature provides the ability to monitor calls :

- from/to present exchange subscribers (IBN/V5.2(IBN) and BRI agents).
- to subscribers of other exchanges called over ISUP/ PRI trunks where the originator is a line, and dialed number is supervised by the CP.

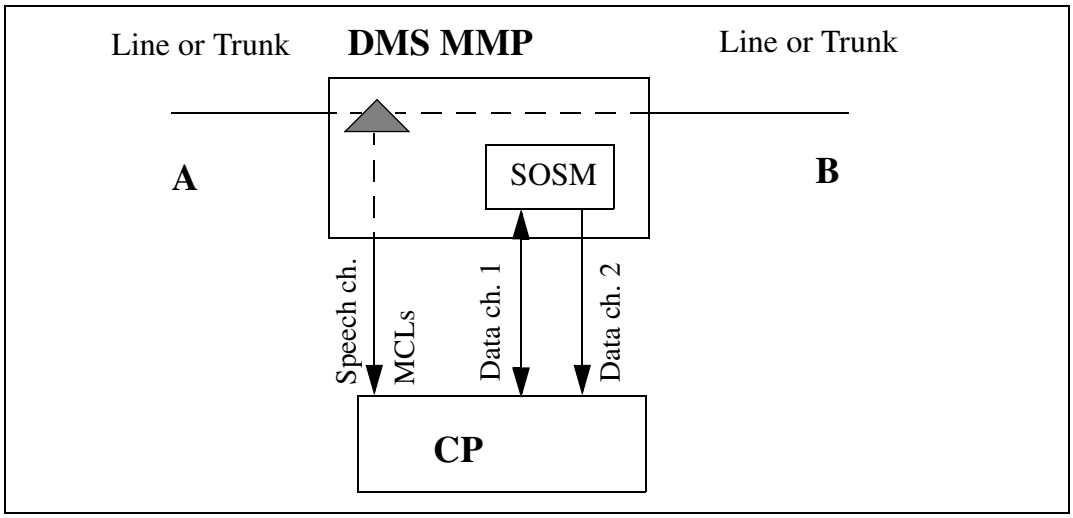
For BRI subscribers monitoring is done DN based, just like IBN subscribers. Thus, in order to monitor all agents on a loop, all of the DNs (MSNs) on the loop must be supervised by CP.

This feature provides SOSM PRI Basic Call and Feature Interactions on ETSI PRI trunks version 1990 on the DMS-100 for the MMP product.

[1]In the rest of the document BRI/PRI will be used instead of ETSI BRI/PRI

14.3 Functional Overview

Figure 1 Control Point (CP) - SOSM & DMS MMP Connection



With this activity, voice information exchange between two parties, A and B in Figure 1, is transmitted to CP over speech channel. Data channel 1 (X.25 protocol) is used for CP to SOSM control commands and SOSM to CP messages. Data channel 2 (X.25 protocol) is used for transmission of information messages from SOSM to CP about the supervised connections.

This feature will be available only for the markets where SOC SOSM0001 is ON. Please refer to Section "2.6 Software Optionality Control (SOC)" on page 149.

14.4 Background Information

This section provides information on other DMS MMP systems used by this feature.

14.4.1 DMS MMP - MPC system

On DMS MMP, X.25 protocol support is implemented in the Multi-Protocol Controller (MPC) system. The system uses either an NT1X89 card on an Input-Output Controller (IOC) shelf or IOM card (NTFX30AA) on an ISME or CISM shelf . MPC system must be installed and configured in the office to allow SOSM system to communicate with the Control Point via X.25 links.

Each MPC card is equipped with three links (1through 3). Each port can be sub-divided into channels. The datafill of the MPC card will determine the configuration of each link. When a link is configured with only one channel, the entire bandwidth of the link is available to that channel.

SOSM system uses links at the minimum 9600 bps . Both channel 1 and 2 of SOSM data interface can be provided on one MPC card, via links 2 and 3.

For datafill instructions of MPC system please refer to section “2.8 Provisioning” on page 150.

Complete information regarding the X.25 and MPC system is available in "297-8991-500 Maintenance and Operations Manual".

14.4.2 SOSM monitoring hardware

SOSM system uses two types of hardware for speech path monitoring. When a call is under "**combined**" surveillance, the speech path information from both parties is transmitted to the CP in a single channel. When “**separate**” monitoring is used, each party’s speech path information is transmitted over its own channel.

Combined monitoring makes use of one Monitoring Connecting Line (MCL) and one Three-way Conference bridge.

Separate monitoring makes use of two Monitoring Connecting Lines, one per party.

> ***Note:*** By design, analog line cards contain a bridge which causes an echo on the backward speech path. If a party in a monitored call is of an analog line card, the party’s MCL will contain a combination of his transmit and receive signals. The transmit signal predominates the other by approximately 20db.

Figure 2 First Variant of connection from DMS to CP via PCM-30

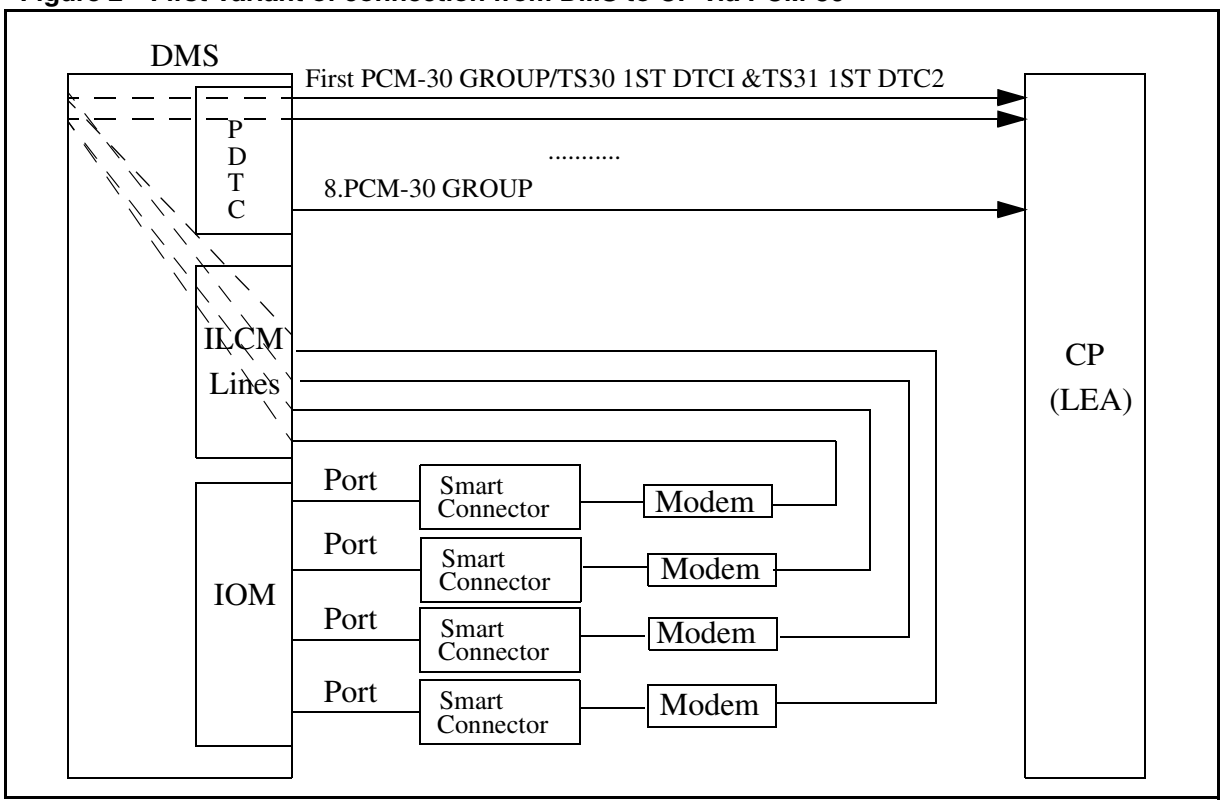


Figure 3 Second Variant of connection from DMS to CP via PCM-30

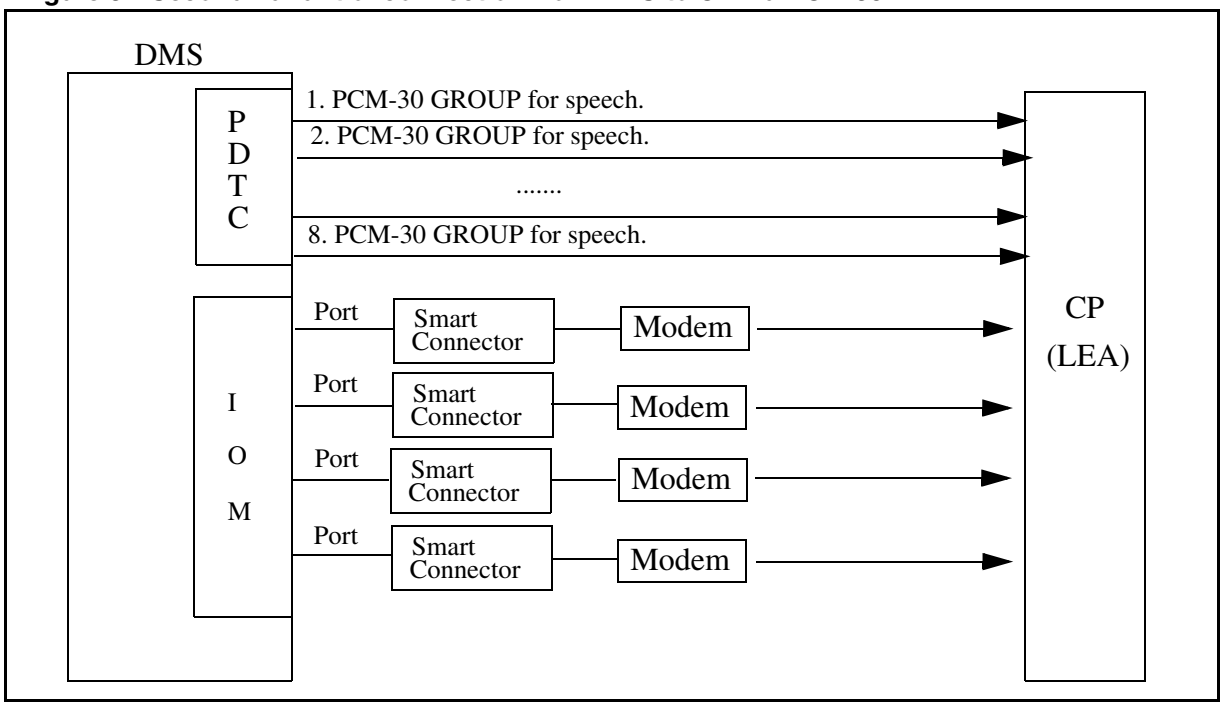

14.4.2.1 MCL hardware

Monitoring Connecting Lines (MCL) -used by SOSM to transmit speech path information- are implemented by using Pulse Code Modulation 30 (PCM-30) trunks provisioned on a Digital Trunk Controller (DTC).

The system uses 8 trunk groups, and each group contains 28 time slots or channels available for speech path information. Each of these channels constitutes an MCL. Time slots 0, 16, 30 and 31 are not used by the DMS MMP - SOSM.

New trunk groups and members dedicated to the SOSM system must be provisioned in the office to allow the SOSM to transmit information to the CP.

For further information on provisioning SOSM trunks, please refer to section “2.8 Provisioning” on page 150.

For information on Digital Trunk Controllers please refer to "297-1001-592 DMS-100 Family Peripheral Modules Maintenance Guide".

14.4.2.2 Three way conference ports

When party A and B are to be monitored jointly, a three way conference bridge is used to connect A, B and the MCL onto one speech path. Three way conference ports are installed in the office for general use by multi-party calls.

Dedicated three way ports should be allocated for SOSM system to ensure proper operation of the SOSM system, and to minimize the impact of SOSM on the normal operations of the office.

Number of conference ports must be equal to the maximum number of simultaneous monitored calls. For example, 168 conference ports must be installed to be able to transmit call contents of 168 jointly monitored calls.

Caution: The SOSM system uses conference ports from a common pool in the DMS MMP. If **all** ports are used by SOSM, normal 3-way or 6-way calls will be denied. Similarly, if **all** ports are used by 3-way or 6-way calls, SOSM monitored calls will be unable to obtain an MCL connection.

For information on provisioning three way conference ports for SOSM, please refer to section “2.8 Provisioning” on page 150.

Complete information regarding conference port circuits is available in "297-8991-500 Maintenance and Operations Manual".

14.5 Feature Description

14.5.1 General System Description

R-1 Status: C
SOSM system consists of hardware and software used to provide communication with the CP and transmit speech information from observed calls.

R-2 Status: PC[1]
The impact of SOSM system on normal exchange operations and quality of service are kept to a minimum.

R-3 Status: C
SOSM system provides the following capabilities:

a. Supervision of all Outgoing (OG)/ Incoming (IC) calls from/to certain observed subscribers of an exchange, supervision of local, intrazonal, toll and international calls.

b. Supervision of Outgoing (OG) local, intrazonal, toll and international calls to pre-determined numbers of telephone network originating from any subscriber of the exchange.

c. Supervision of calls providing subscriber services; changing call direction or numbering information, and other services such as conference calls.

d. Provide information -about subscriber categories and their subscribed services- to CP when requested.

e. On redirected calls such as Call Forward Do Not Answer (CFD) or Call Forward Busy (CFB), provide supervision of the subscriber that originated the service as well as the subscriber to which calls are forwarded.

14.5.1.1 Interworking between SOSM-DMS MMP and CP

R-4 Status: C
The following items must be provisioned in the exchange to allow interaction between SOSM system and Control Point:

a. Trunks for transmission of speech information to CP, either separately for each party or combined (A & B party on one speech channel).

[1]Specification requires no impact, which is not possible to achieve.

b. Data transmission channel between CP and exchange for control commands via X.25 network protocol

c. Data transmission channel between CP and exchange for transmission of call information via X.25 network protocol

R-5 Status: C
For any monitored call (statistical or complete) the following call phases are reported to the CP:

a. Reception of the called party number

b. Called party answer

c. Call release

d. Service usage

R-6 Status: C
For each call phase of a supervised call, the appropriate message is sent to the CP via data channel 2.

R-7 Status: C
Information about monitored calls is transmitted in real time.

R-8 Status: C
The communication link for transmitting speech path information is setup in parallel with the supervised call.

14.5.1.2 Organization of supervision

R-9 Status: C
The telephone numbers of present exchange and network supervised subscribers are specified by the CP via appropriate commands and stored on the DMS MMP.

R-10 Status: C
The maximum number of supervised subscribers on present exchange is 1024.

R-11 Status: C
The maximum number of network supervised subscribers is 1024.

R-12 Status: C
The number of trunks (MCL's) for call content transmission is provisioned as follows. The values given in Table 1, "SOSM capacity," on page 56 are valid for all DMS MMP exchanges of all sizes.

Table 1 SOSM capacity

Max. Number of supervised subscribers	Max. No. of simultaneous supervised calls	Max. No. of Channels (MCLs)	Number of PCM trunk groups
1024 (present exchange) + 1024 (network)	168	224	8

R-13 Status: C
Supervision category is assigned to a supervised subscriber as follows:

a. Full supervision

b. Statistical supervision

R-14 Status: C
Under full supervision, data about the supervised call and information about call phases is transmitted to the CP in real time, as well as call content. Call content is transmitted to CP either over separate channels, or through a single channel by the use of a conference port..

R-15 Status: C
Under statistical supervision call content is not transmitted to CP. Call data and information regarding call phases are sent to the CP in real-time.

R-16 Status: C
When both parties in a call are monitored subscribers, a unique call number is assigned to each, and call monitoring is done as per each subscriber's information.

R-17 Status: C
The supervision category may be changed during an active call (i.e. statistically monitored call may be turned to complete via command from CP).

R-18 Status: C
Adding or removing subscriber from Supervised Subscribers Database is done via commands from CP.

R-19 Status: C
The time interval between the reception and execution of add/change supervised subscribers' data commands does not exceed 30 seconds.

R-20 Status: C
Access of supervised subscribers to previously assigned features is never restricted.

R-21 Status: C
Assignment of new services does not prevent the supervision of a subscriber.

R-22 Status: C
The response time of the SOSM system, from the time an event is registered to the time action is taken, does not exceed 200 ms.

14.5.1.3 Supervision methods

R-23 Status: C[1]
The calling subscriber number identification should be requested if not present. ANI request should be given before the answer phase.

R-24 Status: NA
The electrical parameters of transmitted and received frequency signal conform to requirements for ANI signalling in the network.

14.5.1.4 Operational testing

R-25 Status: C
SOSM system hardware and software functional testing is carried out by commands from CP without interrupting system operations.

R-26 Status: C
Information about any malfunctions affecting operations of the system is transmitted to the CP.

14.5.1.5 System Security

R-27 Status: C
Unauthorized access to the SOSM system is prevented.

R-28 Status: C
Unauthorized intervention with SOSM operational process and SOSM-CP interworking is prevented.

R-29 Status: C
Any unauthorized attempt to access or intervene with the SOSM system is reported to the CP.

R-30 Status: C
No SOSM operations or activity is recorded into DMS MMP system logs.

[1]SOSM system does not request ANI independently. If ANI is required,
the appropriate office configuration must be performed. (For example in ISUP-line interworkings, proper provisioning should exist in ISUPSVC table for the corresponding ISUP trunk.)

14.5.1.6 System initialization and restarts

R-31 Status: C
In the case of emergency service disruptions and subsequent restart of the exchange, SOSM data is not restored, and the CP is informed of the event.

R-32 Status: C
Upon an exchange restart, SOSM is stopped and the appropriate message is sent to the CP.

R-33 Status: C
SOSM system initialization is included as a part of the exchange restart procedures. SOSM restart can be initiated by command from CP without disruption to exchange operations.

R-34 Status: C
Upon software upgrades from MMP to MMP, SOSM is stopped and an appropriate message is sent to CP. All dynamic data about MCL's and monitoring orders are cleared.

SOSM static data (data in SOSMMPC, SOSMTRK and SOSMPARM) is restored.

R-35 Status: NA
Acceptance of the SOSM functions will be agreed with the customer.

14.5.2 SOSM and CP Interface

14.5.2.1 Speech path information

R-36 Status: C
Call content is transmitted to CP via Monitoring Connecting Lines (MCL). Commands and Information messages are transmitted via X.25 links.

R-37 Status: C
MCLs are digital trunks provisioned for use only by the SOSM system, as shown in "Table 1 SOSM capacity" on page 56.

R-38 Status: C
The number of PCM groups can be from 1 to a maximum value as defined in "Table 1 SOSM capacity" on page 56.

R-39 Status: C
Digital trunks for speech path monitoring are PCM-30 trunks with transmission rate of 2048 Mbits/s as per ITU-T Recommendation G.732 with time slots of 64 kbps.

R-40 Status: C
Time Slots (TS) 1 -15 and 17-29 are used for speech path information. TS 16 is not used by CP equipment.

14.5.2.2 X.25 Communications

R-41 Status: NA
There are two acceptable variants for the X.25 communications interface. DMS MMP SOSM system supports both.

R-42 Status: C
Variant 1: TS 30-31 of the zero PCM-30 group are used for data transmission channels 1 and 2 respectively. For other PCM-30 groups, TS 30-31 are reserved for redundancy in case group zero is out of service for any reason.

R-43 Status: C
TS 30 is used for transmitting command from CP to SOSM, and responses to commands from SOSM to CP (Channel 1).

R-44 Status: C
TS 31 is used for transmission of call phase information of monitored calls.

R-45 Status: C
Variant 2: data transmission channels are formed of physical pairs of telephone cables, 0.7 mm in diameter with distance of up to 16 Km.

R-46 Status: C
Information interchange over data channels is performed via modems with 2 or 4 wire terminations.

R-47 Status: C
Information is transmitted in full duplex mode at a bit rate no less than 9600 bps.

R-48 Status: C
Data Transmission Channel (DTC) provides bit error rate of no more than 10^{-5} and no more than 10^{-3} white noise impact within the frequency band 0.3 to 3.4 KHz and SNR +12dB.

R-49 Status: C
Modem parameters and type should meet ITU-T recommendation for Data Transmission Equipment.

R-50 Status: C
DTCs' working order can be tested by the CP. If a DTC goes out of service during transmission, transmission is stopped and some of the un-transmitted data may be lost. Transmission begins again after the DTC is back in service.

R-51 Status: C
If secondary transmission links are available, when a trouble occurs on the channel in use, SOSM system automatically switches to the next available pair of channels.

14.5.3 Information exchange protocol in data transmission channel

R-52 Status: C
Data interchange protocol between SOSM and CP is done based on ITU-T Recommendation X.25.

R-53 Status: C
X.25 protocol contains the network, channel and physical layers. ITU-T V.24 interface is used for the physical layer.

R-54 Status: C
The communications protocol variable parameters setting for second and third layers is done in the appropriate DMS MMP tables.

R-55 Status: C
Values of the variable parameters will be agreed upon with the customer.

14.5.4 Agent Interactions

SOSM supports line-to-line, trunk-to-line and line-to-trunk calls only. Trunk-to-trunk calls at switches will not be monitored. The following items describe the type of SOSM call triggering when different agents are involved in a call:

- **Line - to - line :**

  Only IBN, BRI, V5.2(IBN) lines can be supervised subscribers. Only calls from/to IBN, BRI, V5.2(IBN) lines are supported by SOSM.

  Calling and called party DNs (Office code + DN Digits, excluding area code) are searched in the SOSM database. If either is found, the call will be monitored by SOSM system.

  The DN of the terminating line (Office code + DN Digits, excluding area code) will be searched into the database instead of dialled digits .

  For BRI subscribers, DN based monitoring is supported, which means only supervised DNs (MSNs) in the same loop are monitored. In order to monitor all agents in the BRI loop, an individual monitoring order should be requested for each DN on the loop.

  Please note that all calls originated from a BRI phone set, where no MSNs are defined on the BRI phone set, uses the primary DN of the loop. Thus it is strongly recommended to send monitoring order for the primary DN, as well as other DNs in the loop.

- **Trunk (ISUP/PRI)-to-line (IBN/V5.2(IBN)/BRI) :**

  Presence of calling party number is NOT checked in SOSM database.

  Called line DN (Office code + DN digits, excluding Area Code) is searched in SOSM Database, and if found, SOSM system monitors the call.

  The DN of the terminating line (Office code + DN Digits, excluding area code) will be searched into the database instead of dialled digits .

- **Line (IBN/V5.2(IBN)/BRI)-to-trunk (ISUP/PRI):**

  Calling party number is searched in SOSM database, and if found, the call is monitored.

  The dialled digits (WITH exit codes) are searched in the database, and if found, the call is monitored. For more information about exit codes, please refer to "2.8.3 Provisioning of SOSM specific parameters" on page 160.

- **Trunk-to-trunk :**

  No database searching is done since SOSM is designed for use at end offices.

- **Trunk(ISUP/PRI)-to-line(IBN/V5.2(IBN)/BRI) with call diversion to either line (IBN/V5.2(IBN)/BRI) or trunk (ISUP/PRI):**

  — Call diversion to trunk : The forwarded digits (taken from CFX table) is searched. If found, SOSM will monitor the call.

  — Call diversion to line : The forwarded subscriber's DN (Office code + DN digits, excluding Area Code) is searched in SOSM database, and if found, SOSM system monitors the call.

- **Line(IBN/V5.2(IBN)/BRI)-to-line with call diversion to either trunk(ISUP/PRI) or line (IBN/V5.2(IBN)/BRI):**

  — Call diversion to trunk : The forwarded digits (taken from CFX table) are searched into the database. If found, SOSM will monitor the call.

  — Call diversion to line : The forwarded subscriber's DN (Office code + DN digits, excluding Area Code) is searched in SOSM database, and if found, SOSM system monitors the call.

- **Huntgroup:**

  — *DNH configuration:* Since each member of huntgroup has its own DN, a member or the pilot can be assigned as target. Calls from the pilot/ member are monitored if assigned as target.

  If call is terminated to the pilot and the DN is busy, and the call is passed to another DN in the huntgroup, the call is monitored. Example scenario:

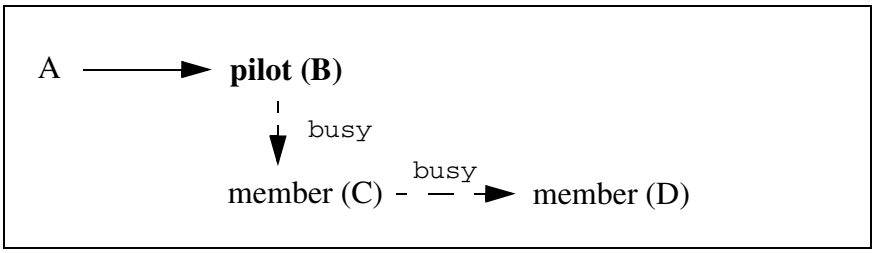

Table 2 Pilot is under surveillance

	1.1	1.2	1.3
Calling DN	A	A	A
Called DN	B	D	D
SOSM Call #	1	1	1
Attribute of choice	01	01	01
Parameters of connection	1C	1C	1C
Code of supp. service phase	00	00	00
MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

— *DLH/MLH configuration:* Since there is one DN, only the pilot DN can be assigned as target. Calls to/from any member or pilot of the huntgroup are monitored if the pilot DN of the huntgroup is target. Note that the pilot DN is sent to CP whether the call is originated or terminated by pilot/member.

— No usage message is sent to CP while hunting a member within the group.

Supervision of EBS lines are not supported by SOSM software.

SOSM supports inteactions with CEPT and BRI Supplemantary Services .

14.5.5 Format of control commands and messages (Channel 1)

Control commands and messages from CP to SOSM are transmitted using the data transmission link channel 1 (using direct connection or via modem).

The commands and response message (where applicable) are listed in the following table.

Table 3 Summary of Channel 1 commands and messages

Command	Response	Reference
Start of SOSM	- Confirmation (received/executed)	section 2.5.7.2 on page 68
Stop of SOSM	- Confirmation (received/executed)	section 2.5.7.3 on page 70
Password setting	- Confirmation (received/executed)	section 2.5.7.4 on page 71
Assignment of Monitoring Connecting Line (MCL) to group	- Confirmation (received/executed)	section 2.5.7.5 on page 73
Setting of objects for monitoring	- Confirmation (received/executed)	section 2.5.7.6 on page 76
Removal of the object of monitoring data.	- Confirmation (received/executed)	section 2.5.7.7 on page 85
Connection to voice path	- Confirmation (received/executed)	section 2.5.7.8 on page 88
Clearing of Monitoring Connecting Line	- Confirmation (received/executed)	section 2.5.7.9 on page 92
Excluding of Monitoring Connecting Line from group	- Confirmation (received/executed)	section 2.5.7.10 on page 96
Request for transmission of objects of monitoring data.	- Confirmation (received/executed) - Data on objects of monitoring	section 2.5.7.11 on page 98
Request for transmission of information about correspondence between MCLs and groups	- Confirmation (received/executed), - Information about correspondence between MCLs and groups	section 2.5.7.12 on page 102
Request for transmission of the list of Supplementary Services (SS)	- Confirmation (received/executed), - List of subscriber's supplementary services	section 2.5.7.13 on page 105
Interruption of messages sent upon the request for transmission of tables contents	- Confirmation (received/executed)	section 2.5.7.14 on page 107
Testing of data transmission channels	- Answering test message	section 2.5.7.15 on page 108

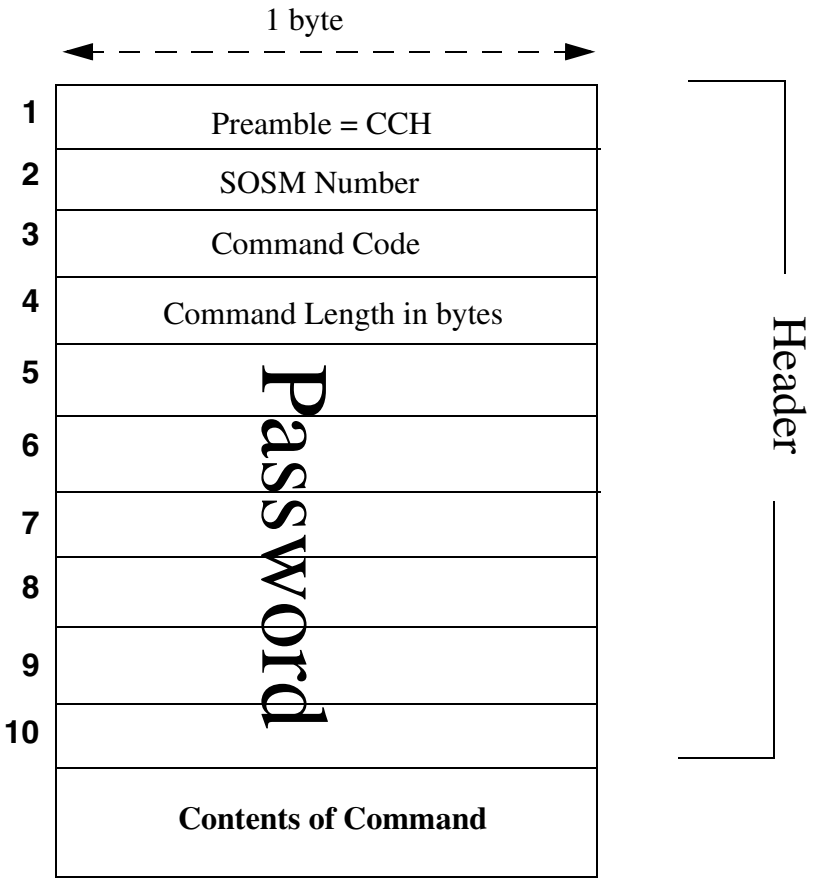
Command	Response	Reference
Objects of monitoring parameters change	- Confirmation (received/executed)	section 2.5.7.16 on page 109
Request for transmission of information about correspondence between exchange incoming group's name and it's conditional number	- Confirmation (received/executed), - Data about correspondence between conditional numbers of incoming groups and their real exchange names	section 2.5.7.17 on page 111
Request for exchange's SW version	- Confirmation (received/executed), Version of exchange's software	section 2.5.7.18 on page 112
	- Unauthorized access to the SOSM software	section 2.5.8.6 on page 121
	- Failure	section 2.5.8.1 on page 114
	- Exchange S/W restart.	section 2.5.8.2 on page 116

14.5.6 Format of CP to SOSM Control Messages

R-56 Status: C

The information field of control commands transmitted from CP to SOSM has the following format:

Figure 4 Format of CP to SOSM control message



First byte is a preamble and has identical value for all commands.

Second byte specifies the SOSM number of the corresponding exchange where the message will be sent.

Third byte defines command code.

Fourth byte defines the length (quantity of bytes) of the command content.

Bytes from fifth to tenth contain SOSM password. The password prevents unauthorized access to the SOSM system. The commands are executed only if the password in the command header is valid.

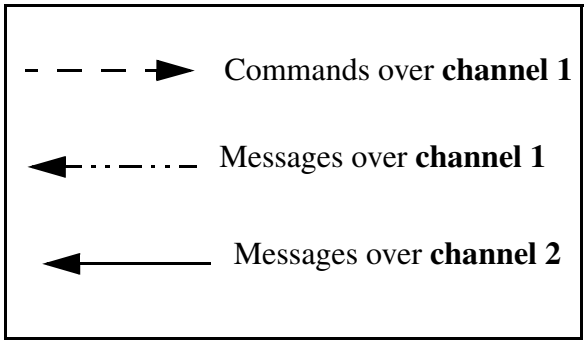
Note: *Initial password is hard-coded by SOSM developers in the SOSM software and reported to the customer.*

Command length and content is different for each command.

14.5.7 CP to SOSM Command Processing

The following sections describe the interactions between the Control Point and the SOSM system. For each command or call phase, the actions taken are described in detail, as well as Message Sequence Charts (MSC). **This activity handles all scenarios within the tests given in section APPENDIX** .

The conventions used in the MSCs are as follows:



14.5.7.1 Generic error handling

When a CP command is received, SOSM system first validates the command and then attempts to execute it.

If the command is properly validated a “confirmation of command reception” message is sent to the CP.

“code of command” field of the confirmation message contains the command code being handled, and the “attribute of command reception” field is set to “**command is received for execution - 00H**".

If the command is properly executed, “confirmation of command execution” message is sent to the CP with “code of command” field including the code of the command being handled. The “attribute of command execution” field is set to “**command executed successfully- 00H**".

14.5.7.1.1 Command reception error handling

Validation of a command includes syntax checking of each and every parameter in the command, as well as combinations of parameters. Syntax

checking is to ensure each parameter received is within the valid range and values. Combination checking ensures that all mandatory parameters within a given command are present.

On any received command, if the password received in command header is not valid, a negative acknowledgment is sent to CP in the form of a “confirmation of command reception” (No:7 NOK). The “Code of command” field is populated with the code of the command that failed. The “attribute of command reception” field is populated with :

— "i**nvalid password character - 15H**" if the password includes unsupported characters.

— "**password mismatch -18H**" if the password does not match system password.

In cases where all characters of the received password are within the supported range, if the password does not match with the system password, “unauthorized access to SOSM”(No:6) message is sent to the CP after sending "confirmation of reception" (No:7 NOK). The “code of access field” in "unauthorized access to SOSM" message includes “**access with wrong password** - **02H**". The message also includes the time at which the access violation occurred in the format **dd:hh:mm:ss** (day, hour, minutes, seconds).

If a command fails validation, a negative acknowledgment is sent to CP in the form of a “confirmation of command reception”(No:7 NOK). The “Code of command” field is populated with the code of the command that failed. The “attribute of command reception” field is populated with an error code.

The following errors and corresponding codes are used for validation failures:

- Incorrect Preamble: When the preamble in the command does not match the preset system preamble (CCH), code **"incorrect preamble’** with value **"01H"** is set.
- Incorrect SOSM Number: When SOSM number in the command header does not match SOSM system number, code **"incorrect sosm number"** with value **"02H"** is set.
- When the command code does not match any of the command codes defined in the specification, code **"invalid message code"** with value**"03H"** is set.
- If the command length (including header) exceeds the maximum message length supported by the system (45 Bytes), code **"message too long"** with value **"04H"** is set.
- If the command length specified in the header does not match the pre-defined command length (as defined in the specification), code **"incorrect message length"** with value **"05H"** is set.

- If the command code is not within the range of supported CP commands as specified in this document, code **"unsupported command"** with value **"06H"** is set.
- If the password specified in the header includes a character which is outside of the printable ASCII range (20H to FFH), code "**"invalid password character"** with value **"15H"** is set.
- If a command (except start SOSM) is received from CP while SOC SOSM0001 is in ON state, and SOSM system is inactive, code **"command out of sequence"** with value **"19H"** is set.
- If command is received during the DS dumping phase of image load of office or during TABXFR and preswact, "**dump restore in progress"** with value "1BH" is set.

Error codes specific to single commands are explained in more detail in the appropriate sections below. A complete list of command reception error codes is provided in "Table 109 Command reception result codes" on page 247 .

If a command fails validation, a rejection message is sent and no further action will be taken by the SOSM system (i.e the command is ignored).

Any command received from CP is ignored while SOC SOSM0001 is IDLE. DMS MMP does not respond to CP messages in this state.

In PRESWACT step of ONP, SOSM is stopped. The commands received are rejected with the reason of **"dump restore in progress"** until SWACT is completed. When SWACT is completed, restart message is sent to CP (Control Point).

14.5.7.1.2 Command execution error handling

If command execution fails, a negative acknowledgment is sent to CP in the form of a "confirmation of command execution". The "code of command" field is populated with the code of the command that failed to execute. The "attribute of command execution" field is populated with an appropriate error code.

For a complete list of error codes please refer to "Table 110 Command execution result codes" on page 248.

14.5.7.2 Start of SOSM (Command N1)

R-57 Status: C
Start of SOSM (command N1) is given by CP to initialize the SOSM system. The SOSM system validates the command, and activates SOSM.

The SOSM number provided in the command header is kept as the current SOSM number and is valid until the next system restart.

This command is expected to contain pre-defined SOSM Initial Password. The initial password begins to be valid again after:

- exchange's failure with loss of data, associated with SOSM operation
- in case of SOSM software restart
- in case of total exchange restart.

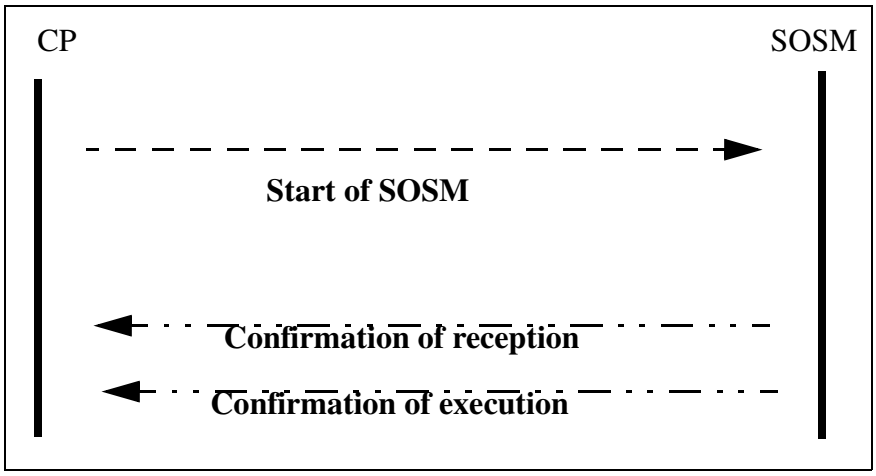
The command format is shown in the following figure.

Figure 5 Start of SOSM command

Code of Command= 01H.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 6 Start of SOSM scenario



Validation error checking:

If "Start of SOSM" command is received when SOSM has already been activated, the command is rejected and "Confirmation of command reception" message is sent to CP. The "attribute of command execution" field is set to code "**command out of sequence**" with value **19H**.

Execution error checking :

If "Start of SOSM" command can not be executed due to technical problems, “Confirmation of command execution” message is sent to CP with the “attribute of command execution” field is set as **"technical_problem - 66H".**

14.5.7.3 Stop of SOSM (Command N2)

R-58 Status: C

"Stop of SOSM" (command N2) is given by CP to stop the SOSM system.

All data related to SOSM operation are deleted and the initial password, set by SOSM developers, is set as the valid password.

Monitoring of all active calls that are under surveillance is stopped, and the MCLs connected to those calls are disconnected, and all data in MCL and monitoring order databases is cleared.

> ***Note:*** *NO INFORMATION IS SENT TO CP about the disconnection of the MCL’s, deactivation of monitoring or any further event in those calls during and after the execution of STOP SOSM command.*

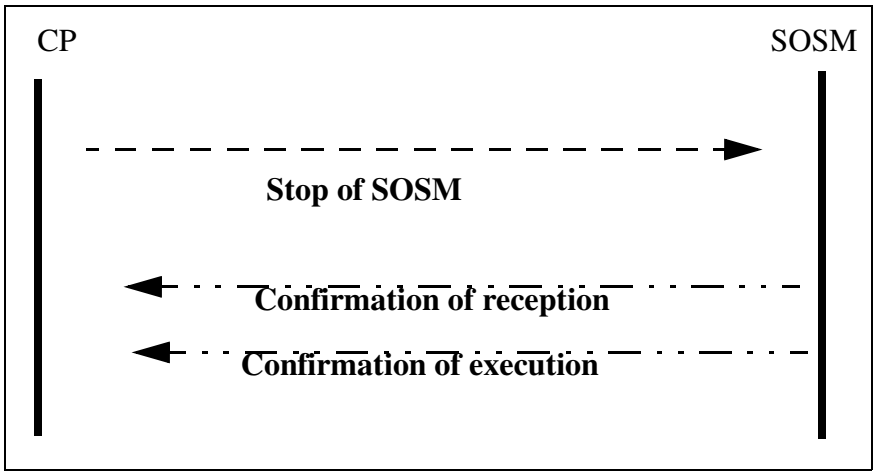
The command format is shown in Figure 7, "Stop of SOSM command".

Figure 7 Stop of SOSM command

Code of *Command* = 02H

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 8 Stop of SOSM



Validation error checking:

If the SOSM system has not been started, the command is rejected and "Confirmation of command execution" message is sent to CP. The "attribute of command execution" field is set to code "**command out of sequence**" with value **19H**.

14.5.7.4 Password setting (Command N3)

R-59 Status: C

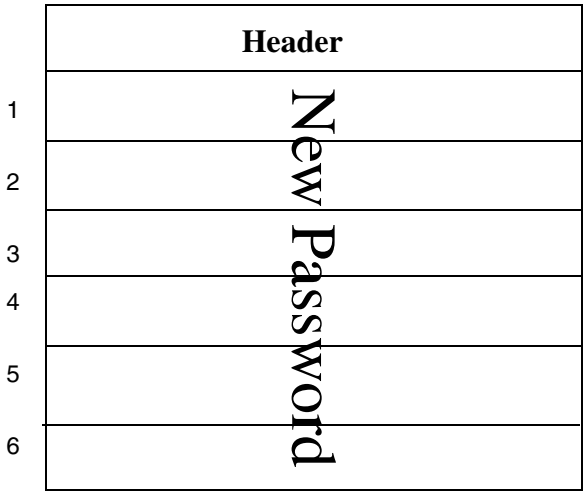
Password Setting (command N3) is sent by CP to set the system password.

This command sets the new password for SOSM operation. The password specified in the "new password" field replaces the current SOSM system password. Any subsequent command must contain the new password.

After a system restart or restart of SOSM, the password is set back to initial system password.

The command format is shown in "Figure 9 Password setting command" on page 72.

Figure 9 Password setting command

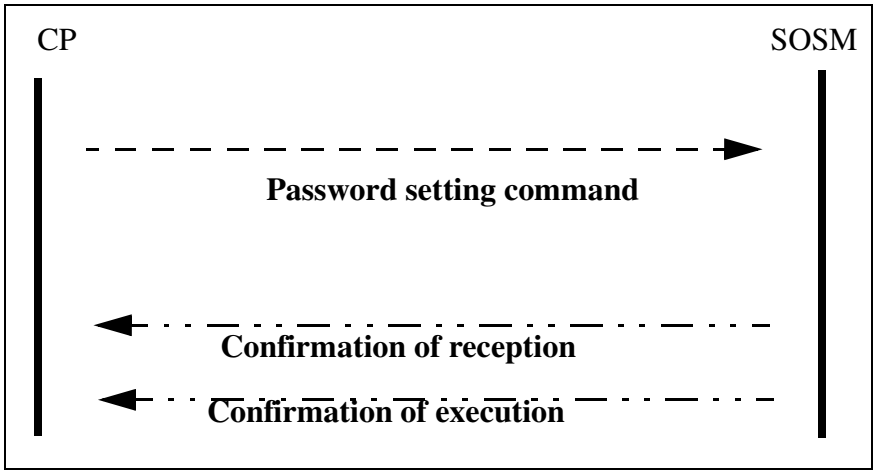


Code of *Command* = 03H

The "new password" parameter must be 6 bytes in length, each with a value within the ASCII printable character range (between **20H** to **FFH**).

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 10 Password setting command



Validation error checking:

If any of the following errors occur the command will be rejected. A "Confirmation of command reception" message is sent to CP. The "attribute of command reception" field is set as follows:

- If any of the new password bytes are outside of the valid PRINTABLE ASCII range of **20H** to **FFH**, code **"invalid password character"** is set with value **"15H"** .
- As in all other commands, password setting command must include a valid “current system password”, which most of the time would be the “initial system password”. Any mismatch will be handled as described in the password checking discussion in “2.5.7.1.1 Command reception error handling” on page 66.

14.5.7.5 Assignment of MCL to group (Command N4)

R-60 Status: C

Assignment of Monitoring Line to Group (command N4) is sent by CP to create and configure MCL groups.

CP defines Monitoring Connecting Lines (MCLs) under a group number. The quantity of MCLs in a group can be from 1 up to the maximum quantity of MCLs between SOSM and CP.

Maximum quantity of MCL groups is also determined by the maximum number of MCLs between SOSM and CP.

The command format is shown in “Figure 11 Assignment of monitoring connecting line to group.” on page 73.

Figure 11 Assignment of monitoring connecting line to group.

	Header
1	MCL group number
2	MCL group type
3	MCL-A number
4	MCL-B number

Code of *Command* = 04H

The most significant three bits (the most significant bit is on the left) of the MCL-A/B number specify the number of the primary PCM-30 group, and the remaining five bits specify the number of the PCM channel (Time Slot) within this primary PCM-30 group.

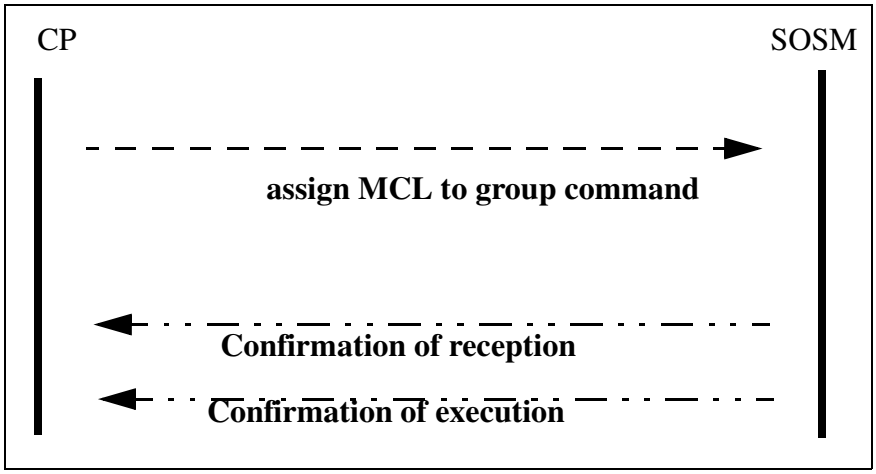
MCL group type:

01H: group for subscribers A and B joint monitoring

11H: group for separate monitoring

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 12 Assign MCL to group command



Requirements:

- Maximum number of MCL groups can not exceed the maximum number of MCLs
- An MCL can not exist in more than one group
- One group may contain MCLs of the same group type, mixed groups (separate and combined) of MCLs are not allowed.
- If Command N4 is received to add MCL's into a group of type "11H - group for separate monitoring", MCLA and MCLB numbers received in the command must correspond to MCL's on the same PCM-30 group.

A new MCL can be added into the MCL database if the following criteria are met.

- MCL group number, MCLA/MCLB number(s) should be within the allowed ranges.
- Number of MCL's and number of MCL groups should remain within the allowed ranges upon execution of the received command.
- If the MCL group received in the message already exists, the group type in the message should match with the existing MCL group's type.

- MCL number(s) should not exist within any of the predefined MCL groups.
- If subject MCL group is for separate monitoring, MCLA and MCLB must be on the same PCM-30.

If the MCL group number does not exist, and the MCLs do not exist in any other group, a new group is created and the new MCLs are stored.

Validation error checking:

If any of the following errors occur, the command will be rejected. A "Confirmation of command reception" message is sent to CP. The "attribute of command reception" field is set as follows:

- If the MCL group number value is less than 1 or exceeds the Maximum Number of MCLs (currently 224), code **"invalid MCL group number"** is set with value **"08H"** .
- If the MCL group type field value is not one of 01H (combined) or 11H (separate), code **"invalid MCL group type"** is set with value **"09H"** .
- If in the MCL number parameter(s), least significant five bits (CL number) do not correspond to a number between 1 and 28, code **"invalid MCL number"** is set with value **"0AH"** .

Execution error checking :

If any of the following errors occur, command execution will fail and the command will be rejected. A "Confirmation of command execution" message is sent to CP. The "attribute of command execution" field is set as follows:

- If MCLA (or MCLB in separate monitoring category) already exists in the database, code "**duplicate MCL number**" is set with value **51H**.
- If in the MCL number parameter(s), most significant three bits do not correspond to a valid trunk group dedicated for SOSM usage, in other words, if the MCL number refers to a PCM-30 group which does not exist in table SOSMTRK, code "**missing PCM-30 group data"** with value "**50H**" is set.
- If the MCL group type is "joint monitoring" and MCL-B field is not either FFH or equal to MCL-A, code **"Invalid MCL B For Group"** is set with value**"5BH"**.
- If the MCL group type is "separate monitoring" and MCL-B is equal to MCL-A, code **"Invalid MCL B For Group"** is set with value **"5BH"**.
- If the MCL group type is "separate monitoring", but MCL-A and MCL-B are not on the same primary PCM-30 group, code **"invalid MCL B for group"** is set with value **5BH**.

- If member_id for MCL does not exist in table TRKMEM, code "**missing trkmem datafill**" with value **53H** is returned and command is rejected.
- If the MCL group to which the MCL is being added, does not match the MCL group type (separate or combined) previously defined for that group, code "**wrong mcl type for group**" with value **52H** is returned and command is rejected.
- If mcl database is being transferred during receiving the command, code **"mcl transfer in progress"** with value **64H** is returned and command is rejected.
- If any other error occurs, code "**invalid parameter"** with value **43H** is returned and command is rejected.

14.5.7.6 Setting an object for monitoring (Command N5)

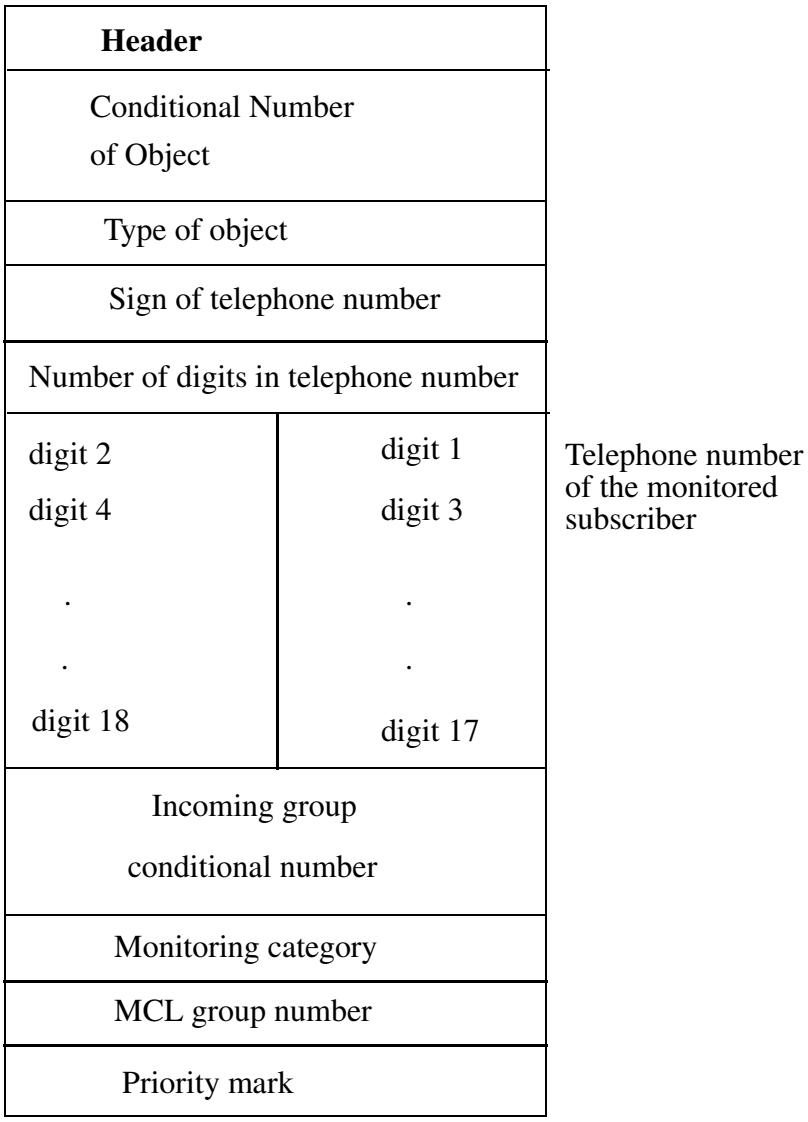
R-61 Status: PC

Setting of Objects for Monitoring (command N5) is sent from the CP to add a monitored subscriber to the database of observed objects.

This command is used to create an object to be supervised with certain properties. The data related to this object is written to the appropriate SOSM database.

The command format is shown in "Figure 13 Setting of objects for monitoring." on page 77.

Figure 13 Setting of objects for monitoring.



Code of *Command* = 05H.

Conditional number of object is unique for each object and is assigned by CP to all objects being monitored. Its value can be within 0000H-FFFEH for "Command N5 - Setting an object for monitoring". The same object may not have several conditional numbers.

"Conditional number of object" parameter might be set as FFFFH in some other CP commands (Please refer to Section “2.5.7.11 Request object data (Command N10)” on page 98.) and Command N8-clearing of MCL (section 2.5.7.9).

FFFFH is not a valid value for "Conditional number of object" in Command N5-setting a monitoring object, Command N6-removal of a monitoring object (section 2.5.7.7), Command N7-connect to voice path (section 2.5.7.8), and Command N15-change a monitoring object (section 2.5.7.16). These commands will be rejected if "Conditional number of object" is received as FFFFH.

Type of object field has following values:

01H:subscriber of present exchange:

This type of object has complete telephone number. Monitoring of IBN and BRI agents are supported by SOSM.

For BRI agents, MSN to be monitored must be given (i.e supervising primary DN or any other DN on the loop is not enough to monitor all calls originating/terminating from/to the loop). In order to provide full monitoring of the BRI loop, all MSNs on the loop must be supervised individually.

02H: telephone network subscriber with complete telephone number;

5-7 digits for local network subscribers

7 digits for present zonal network subscribers

10 digits for other zone subscribers

up to 15 digits for another country’s subscribers

SOSM triggers monitoring for these objects only in line-to-trunk calls where the specified network number is dialled.

12H: telephone network subscriber with incomplete telephone number

Insufficient digits of incomplete numbers are filled by FH

SOSM triggers monitoring for these objects only in line-to-trunk calls where the specified incomplete network number is dialled.

Unsupported:

“03H: group of incoming connecting lines or channels;”

FFH: no value; this value is not accepted as a valid value in Command N5, and the command is rejected if FFH is received within **Type of object**.

FFH value is valid for "Type of Object" parameter only in Command N10. (Please refer to Section “2.5.7.11 Request object data (Command N10)” on page 98.).

> ***Note:*** *In the tables of supervised objects, complete and incomplete telephone numbers coinciding with appropriate first digits can not appear at the same time. After writing this object in the data base if another object with coinciding appropriate first digits (whether more generic or not) is received for recording to the database, it is rejected and this is reported to CP with an appropriate unsuccessful execution code.*
> *This is also valid for network complete numbers.*
> *For example, if the database contains an object of type 12H (or 02H) with digits 216, and subsequently a new object of the type 12H (or 02H) with digits 216329 is wanted to be added, this new object is rejected. If another new object of type 12H (or 02H) and with digits 21 is wanted to be added, this object is also rejected. An object with digits 212 of these types will be accepted.*

Sign of telephone number field has following values:

01H: present exchange subscriber’s telephone number.

02H: local telephone network subscriber’s telephone number (local number).

03H: present zonal telephone network subscriber’s telephone number (zonal number).

04H: another zonal telephone network subscriber’s telephone number (toll number).

05H: another country subscriber’s telephone number (international number).

06H: special services local communication inquiry, informational services telephone numbers or toll and international communication order and inquiry services numeration.

FFH: is used in case of monitoring by connecting lines group number or channels number.

Number of digits in telephone number gives the quantity of the complete digits in the “monitored subscriber’s telephone number” field.

Monitored subscriber telephone number can be complete or incomplete. It can also be local communication special services and inquiry- informational services telephone numbers or toll and international communication order and inquiry services numeration.

> ***Note:*** *According to LONIIS specification, National and international telephone numbers are given with indexes of outlet to urban, toll and international networks and these numbers are corresponding to information dialled by subscriber.*
> *The DMS MMP SOSM expects exit codes in the telephone number. When checking a dialled number in the SOSM subscriber database, the exit codes are NOT removed before searching.*
> *SOSM will not monitor a call FROM a network sosm subscriber, as per specification.*

Unsupported:
Incoming group conditional number DMS MMP does not support this parameter in Command N5, and rejects its all values, but FFFFH.

Category of monitoring defines whether the supervision is performed on a complete or statistical basis. In statistical monitoring a MCL is not connected to speech path where in the complete monitoring case supervised calls are transmitted to CP over the connected MCL.

01H: complete monitoring (joined monitoring).

11H: complete monitoring (separate monitoring).

02H: statistical monitoring.

MCL group number assigns a group of MCLs to a supervised object with complete category of monitoring. It takes the values 01H(1)-E0H (224)and is equal to FFH in case of statistical monitoring.

Priority mark is valid for the complete monitoring category and defines the priority class of the monitored object.

01H: priority object for monitoring.

02H: usual object for monitoring.

FFH: only for statistical monitoring.

“If a call under surveillance -due to a monitoring object with priority class of 01H- can not allocate a free MCL, since all MCLs in the group are busy, another MCL in this group which is used by any monitored call with priority class of 02H is released and connected to that call with 01H priority.” Figure

14, "Clear MCL On Priority" illustrates the messaging between SOSM and CP for this case.

Figure 14 Clear MCL On Priority

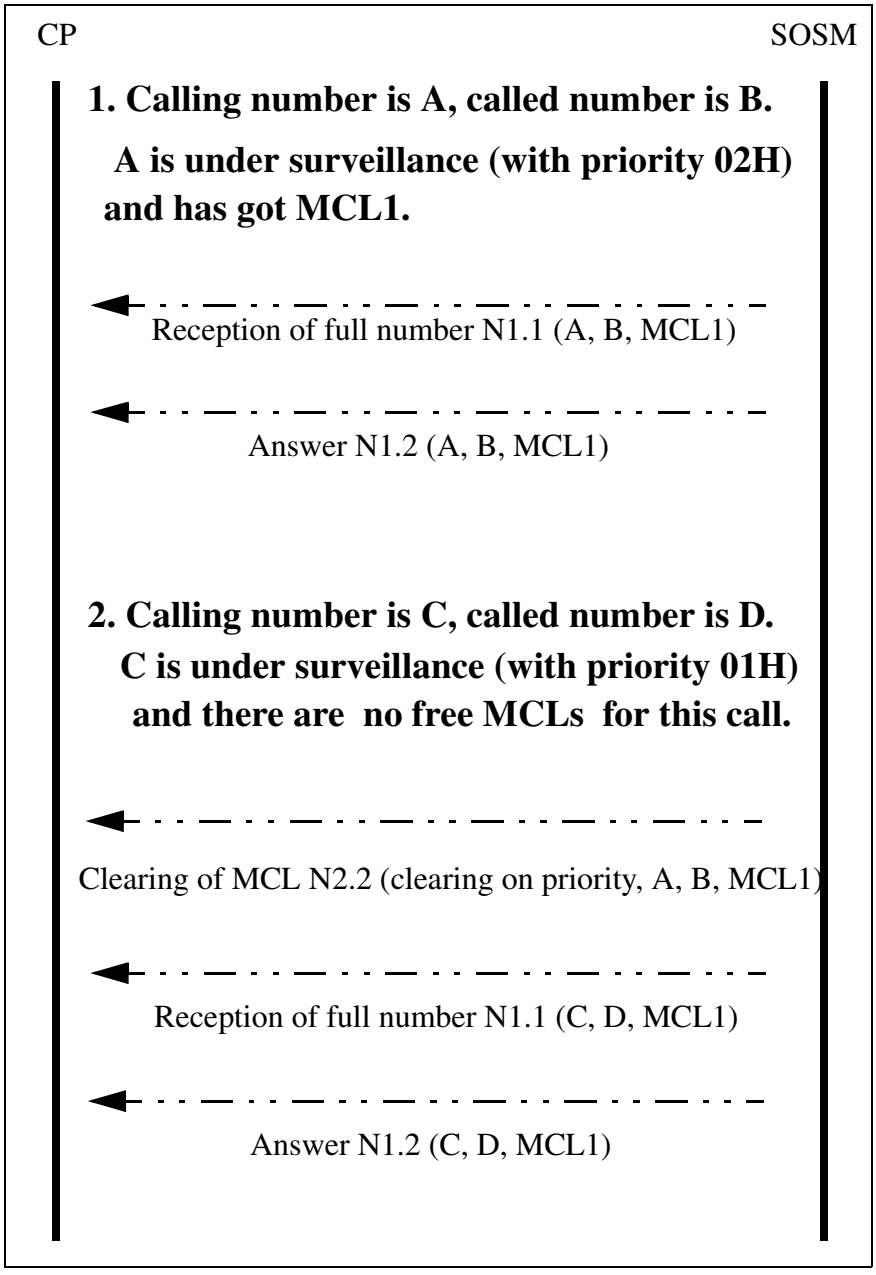


Figure 15, "Assign object of monitoring command" illustrates the messaging between SOSM and CP for handling this command.

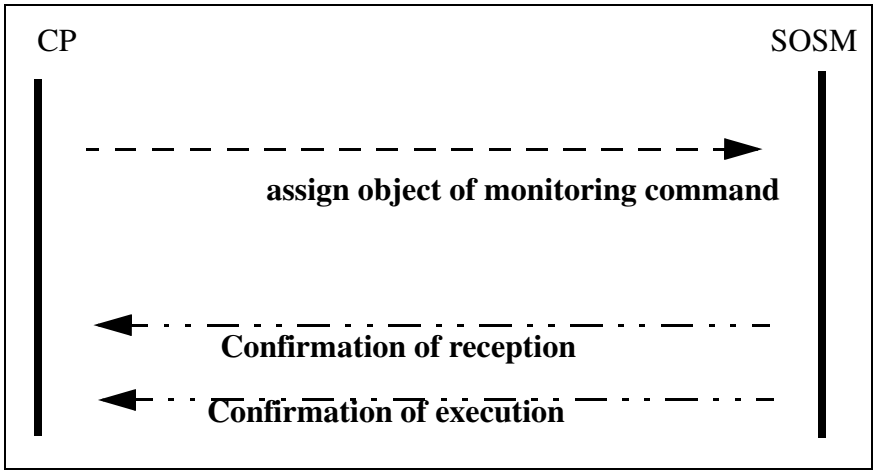
Figure 15 Assign object of monitoring command



Those calls, matching criteria within the new monitoring object, and which are active when this command is received by SOSM, are not monitored. Monitoring of the corresponding subscribers takes place in their succeeding calls.

Validation error checking:

If any of the following errors exist, the command will be rejected. A "Confirmation of command reception" message is sent to CP. The "attribute of command reception" field is set as follows:

- if the "conditional number of object" is not within 0H-FFFEH, code "**invalid conditional number**" is set with value "**1AH**"
- if the "type of object" parameter is not one of {01H, 02H, 03H, 12H}, code **"invalid object type"** is set with value **"0BH"** .
- if the "sign of telephone number" parameter is not one of {01H - 06H}, code **"invalid sign of telephone number"** is set with value **"0CH"** .
- if the "number of digits" is less than one or greater than 18, code **"invalid number of digits"** is set with value **"12H"** .
- if the "category of monitoring" is not one of {01H, 02H, 11H}, code **"invalid category of monitoring"** is set with value **"0FH"** .
- if the "MCL group number" is not FFH or not in the range 01H- maximum number of MCLs, code **"invalid MCL group number"** is set with value **"08H"** .

- if the “priority mark” is not one of {01H, 02H, FFH}, code **"invalid priority code"** is set with value **"10H" .**
- if the “dn digits” are not between 0-9, # (0EH) or * (0DH), **"invalid digit"** is set with value **"11H"**

Execution error checking :

If any of the following errors occur, command execution will fail and the command will be rejected. A “Confirmation of command execution” message is sent to CP. The “attribute of command execution” field is set as follows:

- If the “conditional number of object” already exists in the database, code “**duplicate conditional number of object**” is set with value **42H**.
- if the “type of object” parameter is “incoming group of connecting lines” (03H), code "**unsupported parameter**" with value **5EH** is set, not for toll exchange.
- If the MCL group of the object is not found in the MCL database, code “**mcl info not found**” is set with value **4BH**
- If “monitored subscriber telephone number” is non-unique, this implies that an object of this type with this telephone number already exists in the database. The “attribute of command execution” field is set to code “**non-unique object”** with code **44H**.
- If the “type of object” is “subscriber of present exchange”, and the specified telephone number does not exist in the exchange, the “attribute of command execution” field is set to code “**invalid dn for exchange**” with value **58H**
- If the “type of object” is “subscriber of present exchange”, and if the specified telephone number does not correspond to an IBN, V5.2(IBN) or ETSI BRI agent, “attribute of command execution” field is set to code “**unsupported agent type**” with value **5AH**.
- If the maximum number of objects of the specified type is already provisioned in the exchange (i.e. there are 1024 network or 1024 present subscriber objects in the database), code “**maximum number of objects exceeded**” with value **4FH** is set.
- If the “category of monitoring” and the MCL group type do not match, code “**wrong mcl type for group”** with value **52H** is set.
- If the “category of monitoring” and the "priority mark" do not match, code “**priority code mismatch**” with value **5CH** is set.
- If the “number of digits” parameter does not match the actual number of digits in the “telephone number” parameter (actual number is determined by counting digits until an FFH is reached), code **"invalid number of digits"** is set with value **4DH**.

Note: *"01H" and "02H" values of "priority mark" are valid for combined (01H) and separate (11H) monitoring. "FFH" value of "priority mark" is valid only for statistical monitoring (02H).*

- If the “type of object” and “sign of telephone number” do not form a valid combination, code **"type and sign mismatch"** is set with value **5DH**.

  The following table list the valid combinations:

Table 4 Valid object type and sign of telephone number combinations

Object Type	Sign of Telephone Number
Present Exchange (01H)	Present exchange subscriber (01H) Special services number (06H)
Network subscriber with complete number (02H)	All but “present exchange subscriber” (01H) or FFH
Network subscriber with incomplete number (12H)	All but “present exchange subscriber” (01H)
Group of incoming lines (03H)[a]	FFH only, **Unsupported**

a. not supported in DMS MMP

- If “number of digits” is not valid for “type of object” and the “sign of telephone number”, code **"invalid number of digits"** is set with value "**4DH**".

  Valid number of digits for supported "type of object" and "sign of telephone number" combinations are given in Table 5, “Valid number of digits per object type and sign of telephone number,” on page 84

Table 5 Valid number of digits per object type and sign of telephone number[a]

Type of Object	Sign of Telephone Number	Number of digits
Present Exchange (01H)	Present exchange subscriber (01H)	5-7
	special services (06H)	>1

Table 5 Valid number of digits per object type and sign of telephone number[a]

Type of Object	Sign of Telephone Number	Number of digits
Network subscriber with complete number (02H)	Local number (02H)	5-7
	Zonal number (03H)	toll exit code + zonal exit code + 7
	Toll number (04H)	toll exit code + 10
	International number (05H)	toll exit code + international exit code + up to 15
	special services (06H)	>1
Network subscriber with incomplete number (12H)	Not “Present exchange”	>1 or =1
Group of incoming lines (03H)[b]	FFH	0

a. Toll exit code, zonal exit code and international exit codes are provisionable values. Default values are 8 for toll exit code, 2 for zonal exit code and 10 for international exit code. Detailed information about provisioning of these values is given in “2.8.3 Provisioning of SOSM specific parameters” on page 160.
b. not supported

- If "incoming group conditional number" is not "FFFFH", code "**unsupported parm**" is set with value **5EH**.
- If "mcl group number" is specified (other than FFH) for a statistical monitoring, "**invalid mcl group**" is set with value **49H**.
- If "mcl group number" is specified as FFH for non-statistical monitoring, "**invalid mcl group**" is set with value **49H**.
- If object database is being transferred during receiving the command, **"object transfer in progress"** is set with value **63H**.
- If any other failure occurs, code “**command failed**” with value **FFH** is returned.

14.5.7.7 Remove monitored object (Command N6)

R-62 Status: PC[1]

Removal of the Object from Monitoring (command N6) is sent from CP to remove an object of monitoring from the database.

[1]Conditional number of incoming group field is not supported in DMS MMP

Data about the monitored object is removed from the SOSM database by issuing this command. If at the given moment an object with complete monitoring category is under monitoring, MCL connected to this object is cleared.

Figure 16 Removal of the object from monitoring

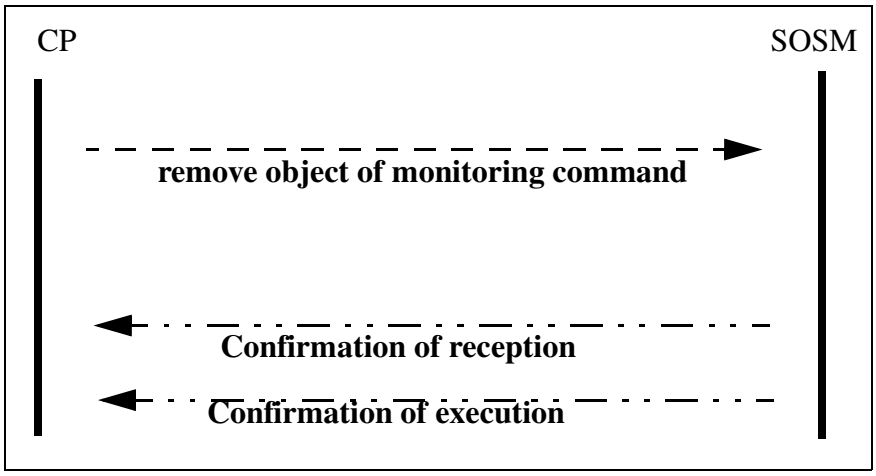
Header		
Conditional Number of Object		
Type of Object		
Sign of telephone number		
Number of digits in telephone number		
digit 2 digit 4 . digit 18	digit 1 digit 3 . digit 17	Telephone number of the monitored subscriber
Conditional number of incoming groups (unsupported)		

Code of *Command* = 06H.

Descriptions of the fields in this command are the same as in “Figure 13 Setting of objects for monitoring.” on page 77.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 17 Remove object of monitoring command



Validation error checking:

Please refer to the validation error checking of the relevant parameters in section “2.5.7.6 Setting an object for monitoring (Command N5)” on page 76 for validation of the parameters in this command.

Execution error checking :

For errors related to the combinations of parameters, digit numbers etc. please refer to section “2.5.7.6 Setting an object for monitoring (Command N5)” on page 76.

- If the object specified in the command is not found in the monitored subscribers database, the command is rejected. The “attribute of command execution” field is set to code “**object not found**” with code **45H**.
- if the “sign of telephone number” parameter does not match the same parameter for the object in the database, code “**sign of dn mismatch”** with value **56H is set,** and the command is rejected.
- if the “telephone number” parameter does not match the same parameter in the object database, code “**digits mismatch”** with value **55H** is set and command is rejected.
- if the “type of object” parameter does not match the same parameter in the object database, code “**object type mismatch”** with value **54H** is set and the command is rejected.
- amount of digits in the “telephone number” parameter does not match the the “Number of digits in telephone number” parameter in the message, “**digits mismatch”** with value **55H** is set and command is rejected.
- If the "conditional number of incoming group" is received with a value but FFFFH, command is rejected with the "**unsupported parm-5EH**" code.

- If object database is being transferred during receiving the command, command is rejected with the **"object transfer in progress-63H".**

14.5.7.8 Connect to voice path (Command N7)

R-63 Status: C

Connection to Voice Path (command N7) is sent from CP to request an explicit connection of MCL to a statistically monitored call.

This command connects an MCL to the speech path defined by the “Number of call” field.

This command can be executed before answer (during ring).

Execution of this command is performed for supervised subscribers with:

- Statistical monitoring category: In this case MCL connection is performed using the MCL group’s number given in the command. Monitoring category of the **call** is set to complete. Priority of MCL connection -in the **call-** is set as 01H.
- Complete monitoring category: For this category ‘Connection to voice path” command is used:
  - — If earlier connected MCL had been released due to “Clearing of MCL” command or its MCL had been connected to a high priority call.
  - — If no MCL had been found during connection of subscribers.

If free MCL cannot be found during the execution of this command, an MCL in the group -which is used for a low priority call- is disconnected, and it is used for the call identified in this command.

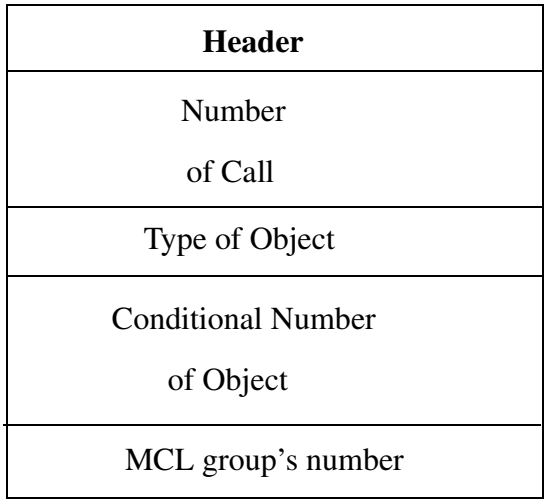
For the complete monitoring category case “MCL group’s number” field is ignored and connection is performed using MCL group defined in “Setting of objects for monitoring” command.

"Command N7-Connect to voice path" does not change the category of monitoring object which is defined by “Command N5-Setting of objects for monitoring". For subscribers supervised with statistical monitoring category, this command connects voice path only for the current active call.

Number of MCL (MCL-A in joint monitoring) to be connected is transmitted to CP in message “MCL’s connection” (N2.1).

The format of this command is shown in “Figure 18 Connection to voice path” on page 89.

Figure 18 Connection to voice path



Code of Command = 07H

Number of call is assigned by DMS MMP exchange for every monitored connection (either incoming or outgoing call). This number is unique for each monitored call, and varies from 0000H up to FFFFH. When it reaches FFFFH it returns again to 0000H.

Other fields correspond to the definitions given for "Setting of objects for monitoring" command.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

This command related call scenarios and call messages are:

1. A is under surveilance as statistical. A calls B. B answers. MCL of joint group is connected to this call with the command No.7 and then call is completed. The messages are:

Table 6 A is under surveilance as statistical.

	1.1	**1.2**	**2.1**	**1.3**
Calling DN	A	A	A	A
Called DN	B	B	B	B
SOSM Call #	1	1	1	1
Attribute of choice	02	02	02	02

	1.1	1.2	2.1	1.3
Parameters of connection	1C	1C	1C	1C
MCL #	#FF	#FF	**1**	1
Code of operation	#FF	#FF	**00**	**05**
Priority	#FF	#FF	#FF	#FF

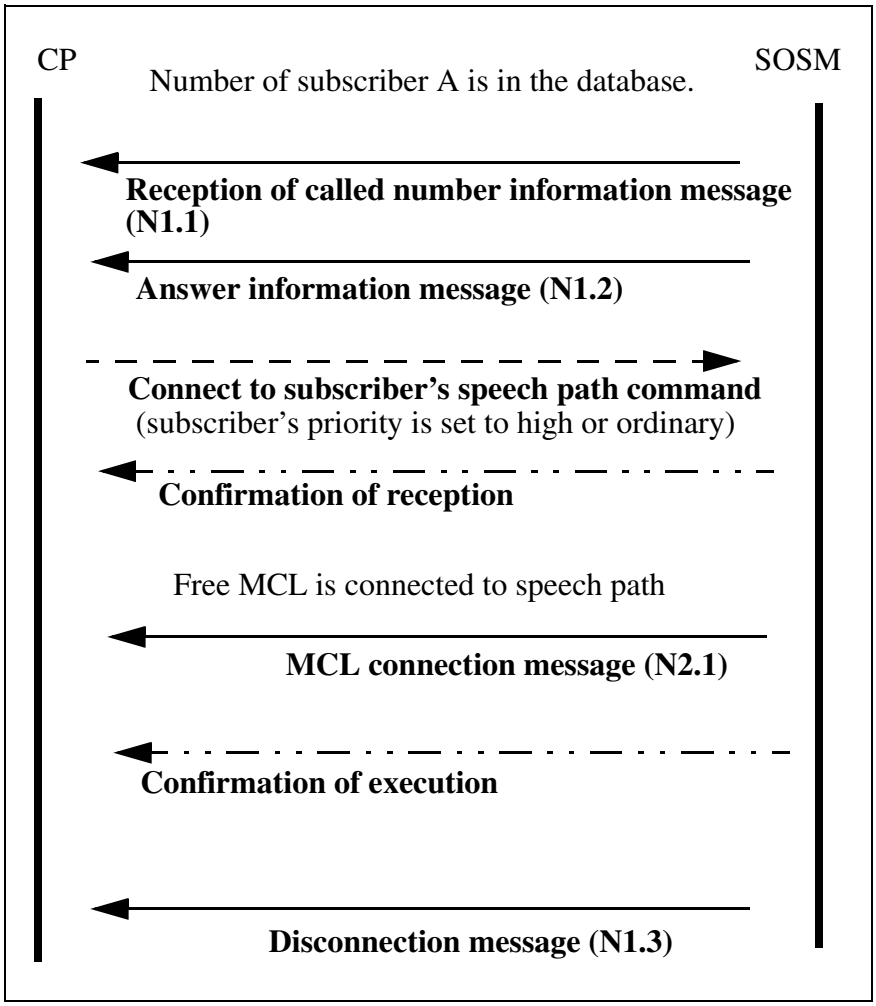
2. A is under surveilance as joint. A calls B. B answers. The MCL connection in the call is disconnected due to priority and then new MCL is connected to this call with the command No.7 *(new MCL is taken from MCL group in database of A line. The MCL information in the command No.7 is ignored)* and then call is completed. The SOSM callp messages for this call are:

Table 7 A is under surveilance as joint

	1.1	1.2	2.2	2.1	1.3
Calling DN	A	A	A	A	A
Called DN	B	B	B	B	B
SOSM Call #	1	1	1	1	1
Attribute of choice	01	01	01	01	01
Parameters of connection	1C	1C	1C	1C	1C
MCL #	1	1	1	**2 (new MCL)**	**2**
Code of operation	00	00	**02**	**00**	**05**
Priority	2	2	2	2	2

As you seen in tables above, MCL and Code of operation informations are only updated in the message 2.1 (MCL connection).

Figure 19 Connect to voice path command



Validation error checking:

Please refer to the validation error checking of the relevant parameters in section "2.5.7.5 Assignment of MCL to group (Command N4)" on page 73 and section "2.5.7.6 Setting an object for monitoring (Command N5)" on page 76 for validation of the parameters in this command.

Execution error checking :

If any of the following error conditions occur, the command is rejected and the specified error code is set in the confirmation message:

- if the "call number" field corresponds to a call which no longer exists (i.e. disconnection occurred), the "attribute of command execution" field is set to "**invalid call number**" code, with value **46H**.

- if the “conditional number of object” field does not match the object monitored in the specified call, the “attribute of command execution” field is set to “**invalid object number**” code with value **47H**.
- if the “type of object” field does not match the type of monitored object involved in the specified call, the “attribute of command execution” field is set to “**invalid object type**” code with value **48H**.
- If the category of monitoring is statistical and MCL group number is greater than 224 then code **"invalid MCL group"** with value **"49H"** is set.
- if the “MCL group number” field specifies an MCL group which does not exist, and if the value of "**category of monitoring**" parameter of the object in database is "**02H- statistical**", the “attribute of command execution” field is set to “**invalid MCL group number**” code with value **49H**.

  Note: If category of the monitoring is complete (either combined or seperate), MCLs of the group specified in the object are used. *MCL group received in the command is ignored even if it is invalid (i.e MCL group greater than 224 or inexisting MCL group).*
- if the call specified in “call number” is already connected to an MCL, code “**call already monitored**” is set with value **4EH**.
- if the MCL is not present in the given group, code “**mcl info not found**” with value **4BH** is set.
- if the connect command is given while a call is ON HOLD, code “**command out of sequence**” with value **4CH** is set.
- If MCL connection cannot be done because of the technical problem in PDTC, code **"sosm command failed"** with value **"FFH"** is set.

14.5.7.9 Clearing of MCL (Command N8)

R-64 Status: C

Clearing of Monitoring Connecting Line (command N8) is sent from CP to request disconnection of an MCL from a call.

This command clears a selected connection between SOSM and CP by force. If parameters in the bytes from 1 up to 5 are given then MCL occupied by present connection is cleared. If only MCL-A (MCL-B number is equal to FFH for joint monitoring) is given (bytes from 1 up to 5 are filled with FFH) then this MCL is cleared.

Format of this command is given in “Figure 20 Clearing of monitoring connecting line” on page 93.

Messages about further phases of monitored call should be transmitted to CP after command Clearing of MCL is sent to SOSM, as in a statistically monitored call.

Figure 20 Clearing of monitoring connecting line

Header
Number of Call
Type of Object
Conditional Number of Object
MCL-A number
MCL-B number

Code of *Command* = 08H

Number of call is the number of a call among incoming and outgoing calls.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

This command related call scenarios and call messages are:

1. A is under surveilance as joint. A calls B. B answers. MCL connection in the call is disconnected with the command No.8 and then call is completed. The messages are:

Table 8 A is under surveilance as joint.

	1.1	1.2	2.2	1.3
Calling DN	A	A	A	A
Called DN	B	B	B	B
SOSM Call #	1	1	1	1
Attribute of choice	01	01	01	01

	1.1	1.2	2.2	1.3
Parameters of connection	1C	1C	1C	1C
MCL #	1	1	1	**#FF**
Code of operation	00	00	**01**	**05**
Priority	2	2	2	2

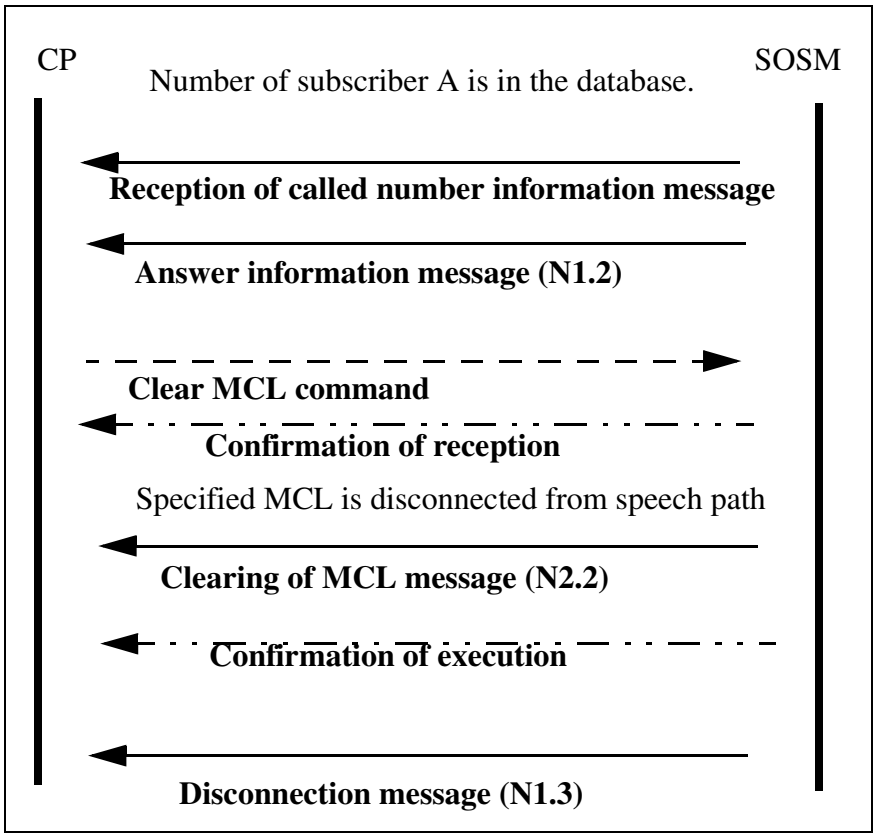
2. A is under surveilance as statistical. A calls B. B answers. The MCL connection is connected to the call with the command No.7 and then MCL connection is disconnected from this call with the command No.8 and then call is completed. The SOSM callp messages for this call are:

Table 9 A is under surveilance as statistical

	1.1	1.2	2.1	2.2	1.3
Calling DN	A	A	A	A	A
Called DN	B	B	B	B	B
SOSM Call #	1	1	1	1	1
Attribute of choice	02	02	02	02	02
Parameters of connection	1C	1C	1C	1C	1C
MCL #	#FF	#FF	**1**	**1**	**#FF**
Code of operation	#FF	#FF	**00**	**01**	**05**
Priority	#FF	#FF	#FF	#FF	#FF

As you seen in tables above, Code of operation information is only updated in the message 2.2 (Clearing of MCL message).

Figure 21 Clearing of MCL command



Validation error checking:

Please refer to the validation error checking of the relevant parameters in section “2.5.7.5 Assignment of MCL to group (Command N4)” on page 73 and section “2.5.7.6 Setting an object for monitoring (Command N5)” on page 76 for validation of the parameters in this command.

Execution error checking :

If any of the following error conditions occur, the command is rejected and the specified error code is set in the confirmation message:

- if the “call number” field is specified and corresponds to a call which no longer exists (i.e. disconnection occurred), the “attribute of command execution” field is set to “**invalid call number**” code, with value **46H**.
- if the “conditional number of object” field is specified and does not match the object monitored in the specified call, the “attribute of command execution” field is set to “**invalid object number**” code with value **47H**.

- if the "type of object" field is specified and does not match the type of monitored object involved in the specified call, the "attribute of command execution" field is set to "**object type mismatch**" code with value **54H**.
- if the MCL number(s) specified are not currently connected to a call, code "**invalid mcl number**" is set with value **4AH**.
- if at the time the command is given the specified call is not connected to an MCL, code "**command out of sequence**" with value **4CH** is set.

14.5.7.10 Exclude MCL command (Command N9)

R-65 Status: C

Excluding of MCL out of Group (command N9) is sent from CP to request the removal of an MCL from an MCL group.

Parameters of this command are the same as for command "Assignment of MCL to group". In case of joint monitoring one MCL (MCL-A) is excluded out of group. MCL-B has the value equal to MCL-A or FFH. In the case of Separate monitoring, two MCLs are deleted from the specified group.

MCL A (and B if not combined) are removed from specified group. If there are no MCLs left in the group, the MCL group is removed as well.

Note: *The MCL numbers in the exclude mcl command* ***MUST*** *match the numbers that were given in the Add MCL command.*
For example, if in the Add MCL command MCL-A was given as #22 and MCL-B was equal to MCL-A, the exclude command must specify MCL-A and MCL-B as #22 #22 respectively. However, if MCL-A was #22 and B was #FF in the add command, the exclude command MUST specify MCL-A as #22 and B as #FF. Failure to do so will result in MCL information not found error.

The format of this command is shown in the following figure.

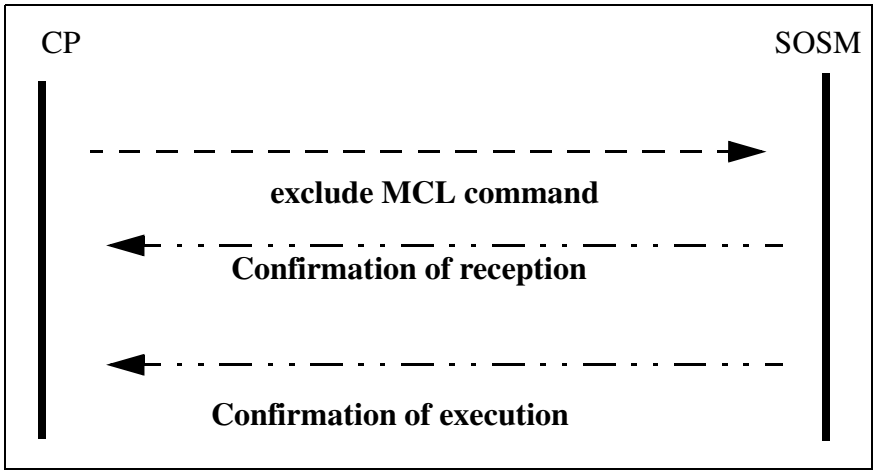
Figure 22 Excluding of MCL out of group

Header
MCL group number
MCL-A number
MCL-B number

Code of Command = 09H

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 23 Exclude MCL from group command



Validation error checking:

When any of the parameters in this command are specified (i.e. are not FFH), validation rules as specified in section “2.5.7.9 Clearing of MCL (Command N8)” on page 92 apply.

Execution error checking :

- If the specified “mcl group” does not exist in the database, the “attribute of command execution” field is set to “**mcl information not found**” code with value **4BH**.
- If MCLA number, received in the command, is not defined in MCL database, the “attribute of command execution" field is set to “**mcl information not found**” code with value **4BH**.
- If the MCL group type is “separate monitoring”, and MCL-B number received in the command is not defined in MCL database, the “attribute of command execution" field is set to “**mcl information not found**” code with value **4BH**.
- If the MCL group type is “separate monitoring”, and MCLB is defined, but not engaged with MCLA, the “attribute of command execution" field is set to “**mcl information not found**” code with value **4BH**.
- If at the time the command is given the MCL(s) specified is in use, the “attribute of command execution” field is set to “**mcl in use**” code with value **41H**.
- If the MCL group type is “separate monitoring” and MCL-B is equal to MCL-A, code **"Invalid MCL B For Group"** is set with value **"5BH"** .

- If mcl database is being transferred during receiving the command, code **"MCL data transfer in progress"** is set with value **"64H"**.

  The behavior in this scenario is changed for this command. For this scenario, the command “Assignment of MCL to group” fails in the validation error checking, That is No:7 (NOK) is only sent to CP but the messages No:7 (OK) and No:8 (NOK) is sent to CP in this command.

14.5.7.11 Request object data (Command N10)

R-66 Status: PC[1]

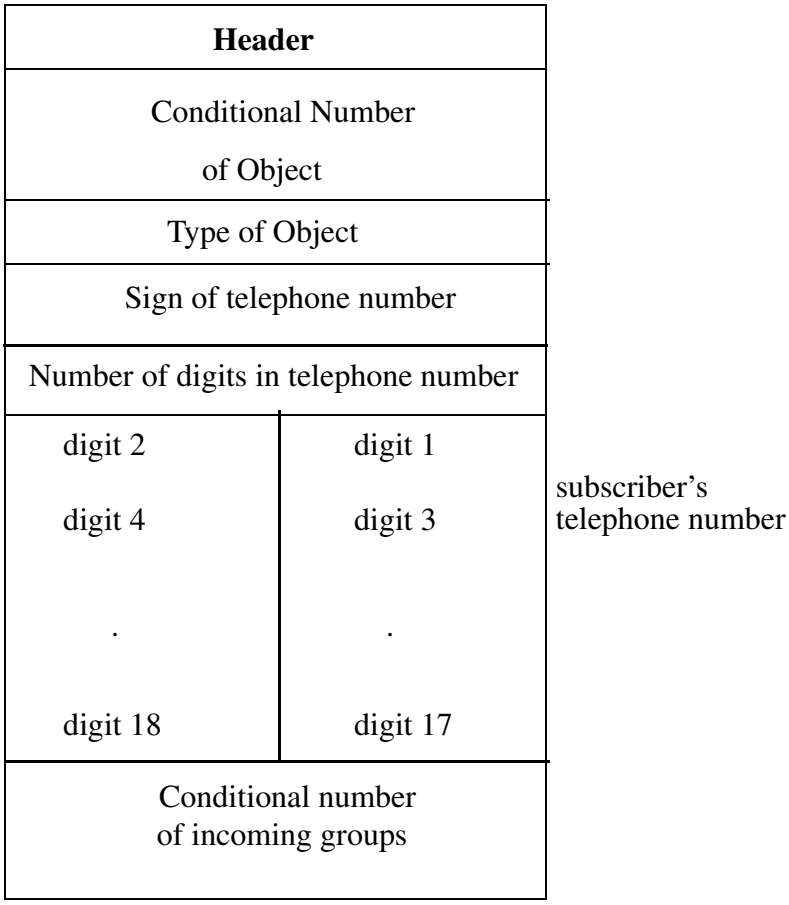
Request for Objects of Monitoring Data Transmission (command N10) is sent from CP to request information about one or more monitored objects.

This command sends a request for information transmission about the monitored object or objects.

The format of this command is shown in “Figure 24 Request for objects of monitoring data transmission” on page 99.

[1]Conditional number of incoming group is not supported in DMS MMP.

Figure 24 Request for objects of monitoring data transmission



Code of *Command* = 0AH

Parameters of this command have the same meanings as for command "Setting of objects for monitoring".

Conditional number of object: If it is set then this object's data are sent to CP.

Type of object: If it is set all this type objects are reported to CP.

Sign of telephone number, number of digits in telephone number, monitored subscriber telephone number: If they are set then this object's data are transmitted to CP.

Not supported in DMS MMP: "Conditional number of incoming group: If this is set this object's data is reported to CP."

If none of the above mentioned parameters is set then all objects of monitoring data are transmitted to CP.

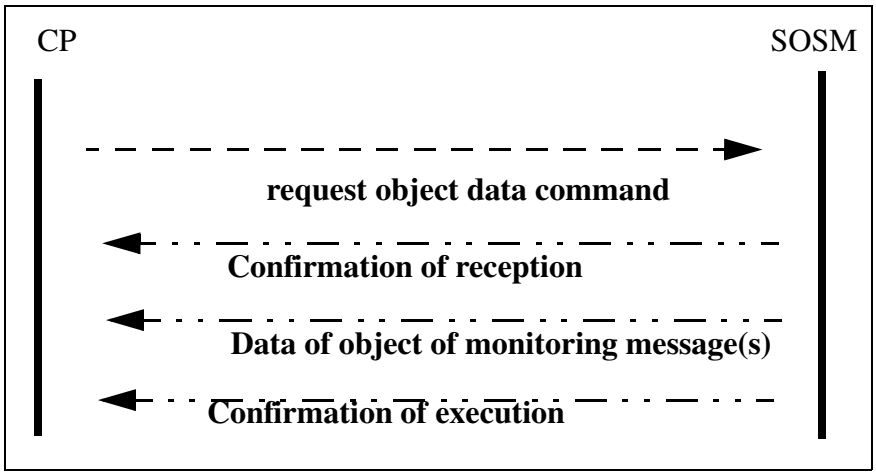
Table 10 Valid parameter combinations for No10, and SOSM actions for each

Conditional Number	Type of Object	DN	Actions
Corresponds to an existing object	FFH	all digits are FF	Transmit object's data (No7:OK - No3 -No8:OK)
Corresponds to an existing object	{01H, 02H, 12H }	all digits are FF	Ensure that the type_of_ objects -in the message and in the database- are same. Otherwise, reject command (No7:OK - No3 - No8:NOK) Transmit object's data. (No7:OK - No3 -No8:OK)
Corresponds to an existing object	{01H, 02H, 12H }	Valid digits and digit count	Ensure that the type_of_ object and digits -in the message and in the database- are same. Otherwise, reject command (No7:OK - No3 - No8:NOK) Transmit object's data. (No7:OK - No3 -No8:OK)
FFFFH	{01H, 02H, 12H }	all digits are FF	Transmit all objects of the type received in the message. (No7:OK -(n* No3) -No8:OK)
FFFFH	{01H, 02H, 12H }	Valid digits and digit count	Find the object with the type_of_ object and digits received in the message. If not found, , reject command (No7:OK - No3 - No8:NOK) Ensure that the type_of_ objects - in the command and in the database- are same. Otherwise, reject command (No7:OK - No3 -No8:NOK) Transmit object's data. (No7:OK - No3 -No8:OK)
FFFFH	FFH	Valid digits and digit count	Find the object with the digits received in the message. If not found, , reject command (No7:OK - No3 - No8:NOK) Transmit object's data. (No7:OK - No3 -No8:OK)
FFFFH	FFH	all digits are FF	Transmit all objects. (No7:OK -(n* No3) -No8:OK)

If more than one object's data is retrieved, several response message will be sent as described in "2.5.8 SOSM to CP Ch.1 messages" on page 113.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 25 Request object data command



Validation error checking:

Please refer to Section “2.5.7.1.1 Command reception error handling” on page 66.

Execution error checking :

For any of the execution errors specified below, data in the request message is copied into the response message Msg.N3 and sent to CP before Msg.N8- "confirmation of command execution" message. (Please refer to Section “2.5.8.3 Data of objects of monitoring (Msg. N3)” on page 116.)

- If the "conditional number of incoming group" is received with a value but FFFFH, command is rejected with the "**unsupported parm-5EH**" code.
- If the conditional number is not FFFFH, but it does not exist in the database, command is rejected with the "**object not found-45H**" code.
- If a telephone number is specified in the command, but it does not exist in the database, command is rejected with the "**object not found-45H**" code.
- If the conditional number corresponds to an object in the database, and if a telephone number is specified in the command, the specified telephone number must comply with the object’s telephone number in the database. Otherwise,command is rejected with "**object not found-45H**" code.
- If the conditional number and telephone number is specified in the command and the conditional number corresponds to an object in the database but phone number does not exist in the database then command is rejected with thethe **"object not found-45H"** code.

- If telephone number is specified within command, and amount of digits in "subscriber's telephone number" does not comply with the value in "number of digits in telephone number" parameter, command is rejected with the "**invalid number of digits-4DH**" code.
- if "type of object" parameter is not one of {01H, 02H, 03H, 12H} or FFH, code **"invalid object type"** is set with value **"48H"**.
- if an object which exists in the database is specified with "sign of telephone number" and/or "conditional number of object", "type of object" received in the command must comply with the object's type in the database. Otherwise, command is rejected with "**object type mismatch-54H**" code.
- if the "sign of telephone number" parameter is not one of {01H - 06H}or FFH, code **"invalid sign of telephone number"** is set with value **"5FH"**.
- If sign of dn in the command does not matches with the sign of dn in database, command is rejected with **"sign of dn mismatch-56H".**
- If all parameters are set in the command but this object does not exits in the database, command is rejected with the **"object not found-45H"**
- If object database is empty, command is rejected with **"no data exists in database-60H"**

14.5.7.12 Request MCL group information (Command N11)

R-67 Status: C

Request for Transmission of Information about MCL and Group Correspondence (command N11) is sent from CP to obtain MCL group configuration.

Any field of the command can be set or empty. Empty fields are filled with value FFH.

- If all fields have value FFH then complete table of correspondence is sent to CP.
- If number of group is given then list of MCLs belonging to this group is reported.
- If MCL group's type is given then correspondence table of MCLs and groups for this type is transmitted to CP.
- If MCL number is given then group corresponding to it is reported to CP.

The format of this command is shown in the following figure.

Figure 26 The request for transmission of the information about MCL and group correspondence

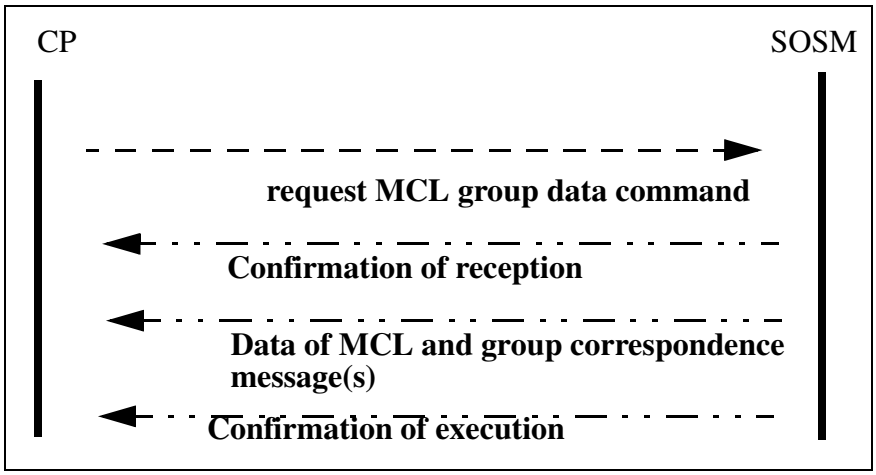
Header
MCL group number
MCL group type
MCL-A number
MCL-B number

Code of *Command* = 0BH

If more than one message is required to transmit the information, several response message will be sent as described in “2.5.8 SOSM to CP Ch.1 messages” on page 113.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 27 Request MCL group information command



Validation error checking:

Please refer to Section “2.5.7.1.1 Command reception error handling” on page 66.

Execution error checking :

- If the MCL group number is not within allowed range (greater than 224 or less than 1), command is rejected with "**invalid MCL group-49H**" code.

- If the value of MCL group type field is not one of 01H (combined) or 11H (separate), code **"invalid MCL group type"** is set with value **"61H".**
- If MCLA and/or MCLB are specified (not FFH), but the specified value is not within allowed range (number of PCM channel in MCLA and MCLB is one of values (0, 16, 30, 31)), command is rejected with "**invalid MCL number-4AH**" code.
- If both MCL group and MCL group type are specified in the command, the group type in the command must comply with the type previously defined in the database. Otherwise, the command will be rejected with "**wrong MCL type for group-52H**".
- If only a valid MCL group number is received in the command, but if it does not correspond to an existing MCL group, command is rejected with "**MCL information not found**" code with value "**4BH**".
- If only MCL group type parameter is set in the received command, but if there is no MCL group of the specified type in the database, command is rejected with "**MCL information not found**" code with value "**4BH**".
- If MCLA and/or MCLB numbers are set in the command, but if the specified MCL(s) does not exist in the database, command is rejected with "**MCL information not found**" code with value "**4BH**".
- If MCL group number, and MCLA and/or MCLB are received in this command, it is checked in the database if the specified MCL(s) are assigned to the given MCL group. If MCL(s) belong to other MCL groups, command is rejected with "**invalid MCL number-4AH**" code.
- If MCL group type and MCLA/MCLB number parameters are set, the value of MCL group type parameter within the command and the type of the MCL group in the database (which includes MCLA/MCLB specified in the command) must be identical. Otherwise, command is rejected with code "**invalid MCL group type-61H**" code.
- If MCL group type and MCLB number parameters are set, and if value of MCL group type is not "separate monitoring",code **"invalid MCL group type"** is set with value **"61H".**
- If MCLA number and MCLB number are specified within the command, MCLA and MCLB numbers must be equal or MCLB must be FF where MCL group type is combined. (Note that MCLA and MCLB number must match with the values in database). Otherwise, command is rejected with "**invalid MCLB for group-5BH**" code.
- If MCLA number and MCLB number are specified within the command, MCLA and MCLB numbers must be different where MCL group type is separate (Note that MCLA and MCLB number must match with the values in database). Otherwise, command is rejected with "**invalid MCLB for group-5BH**" code.

- If MCL database is empty, command is rejected with **"no data exists in database-60H"**.

14.5.7.13 Request subscriber's SS list (Command N12)

R-68 Status: C
Request for Transmission of Supplementary Services List (command N12)

Upon issuing this command SOSM gives the list of supplementary services (SS) that are available to **supported subscribers (IBN/V5.2(IBN)/ETSI BRI)** of present exchange. Digits without value in telephone number field are filled with FFH. Format of this command is given in the following Figure.

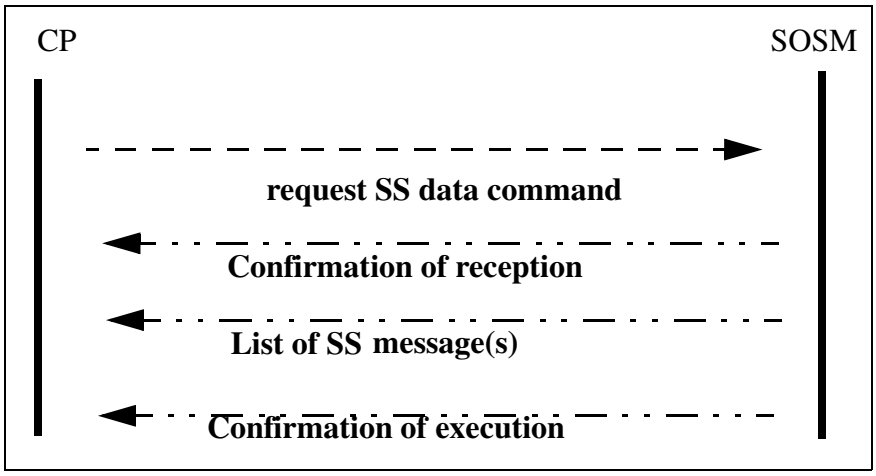
Figure 28 The request for transmission of supplementary services list

Header	
Sign of telephone number: 01H	
Number of digits in telephone number	
digit 2	digit 1
digit 4	digit 3
.	.
.	.
digit 18	digit 17

Code of *Command* = 0CH.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 29 Request SS list command



While executing this command, all features in the customer group and CEPT casual features in table CUSTSTN are sent sent to CP, as well.

This command is not supported for EBS lines. For unsupported line types, the message 8-NOK is sent.

Validation error checking:

Please refer to the validation error checking of the relevant parameters in section “2.5.7.6 Setting an object for monitoring (Command N5)” on page 76 for validation of the parameters in this command.

- If the number of digits specified is greater than 7 (local exchange subscriber), code **"number of digits mismatch"** is set with value **"13H" .**

Execution error checking :

- If the requested subscriber’s telephone number does not exist in the exchange, command execution will fail and the command will be rejected. A “Confirmation of command execution” message is sent to CP and the “attribute of command execution” field is set to code “**invalid dn for exchange**” code with value **58H**.
- If the specified subscriber does not have any assigned supplementary services, A “Confirmation of command execution” message is sent to CP and the “attribute of command execution” field is set to code “**no services found**” code with value **57H**.
- If the requested subscriber’s “sign of telephone number” is not “subscriber of present exchange”, code **"invalid sign of telephone number"** is set with value **"5FH"** .

- If the subscriber is of the unsupported line type, code **"unsupported agent type"** is set with value **"5AH"**.
- If amount of digits in phone No does not comply with the mentioned in byte 2, code **"invalid number of digits"** is set with value **"4DH"**.

14.5.7.14 Interrupt transmission command (Command N13)

R-69 Status: C

Interruption of Messages Output on the Request for Transmission of the Tables Contents (command N13) is sent from CP to stop data transmission.

Current output of information about the query to a SOSM table is stopped upon this command. Un-transmitted portion of the data is lost.

The format of this command is given in the following Figure.

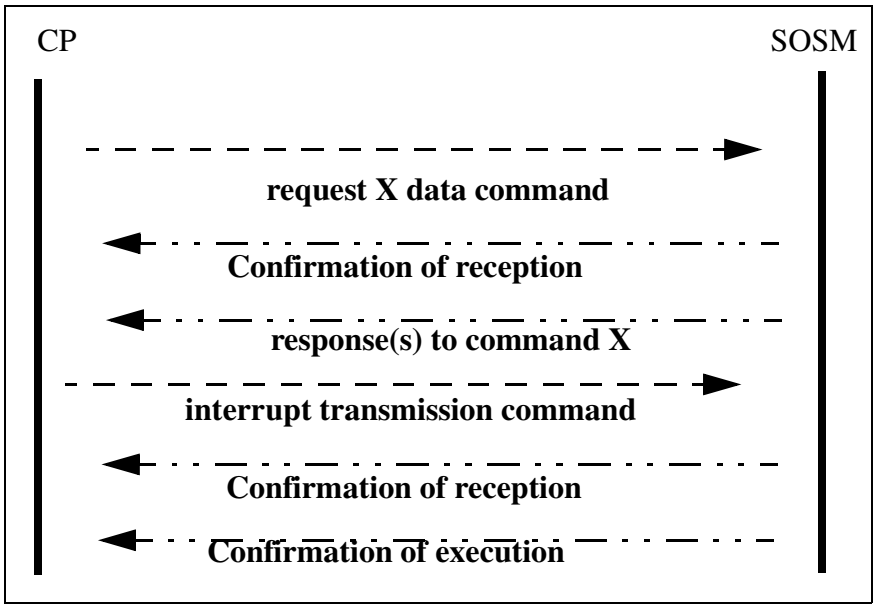
Figure 30 Interruption of messages output on the request for the transmission of the tables contents

Code of *Command* = 0DH

Note: When this command is executed, the message 8-NOK is sent to CP for the command requesting the data transmission.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 31 transmission of information interrupt



Execution error checking :

- If at the time the interrupt request is received no transmission is taking place, command execution will fail and the command will be rejected. A "Confirmation of command execution" message is sent to CP and the "attribute of command execution" field is set to code "**command out of sequence**" code with value **4CH**.

14.5.7.15 Testing DTC command (Command N14)

R-70 Status: C

Testing of Data Transfer Channels (command N14) is sent from CP to validate operational state of the Data Links.

Testing of data transfer channels (DTC) 1 and 2 between SOSM and CP is started upon this command.

If SOSM does not receive a new N14 command during 10 minutes after the last N14 command is received, SOSM tries to switch to the next link datafilled in table SOSMMPC. If the actual link is the last link, then the next link is the first link. If there are no other reserved links, then R-48 is applied. Test answer will only be sent over current channels 1 and 2.

The format of this command is given in the following figure.

Figure 32 Testing of data transfer channels

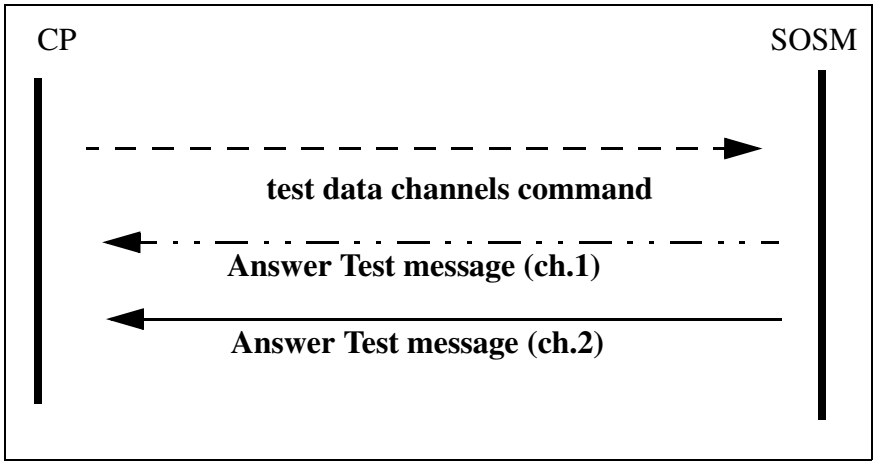
Header
Number of test message

Code of Command = 0EH

Number of test message: It changes cyclically from 00H to FFH.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 33 Test data channel command



14.5.7.16 Change object of monitoring (Command N15)

R-71 Status: Object of Monitoring Parameters Change (command N15) is sent from CP to modify the parameters of an existing object.

Following parameters assigned by the command “Setting of object for monitoring” are changed:

— Category of monitoring

— MCL group number

— Priority mark

If at the moment of this command’s reception, the object is in conversation state then new parameters set by this command takes place from the next call of the object.

The format of the command is given in the following figure.

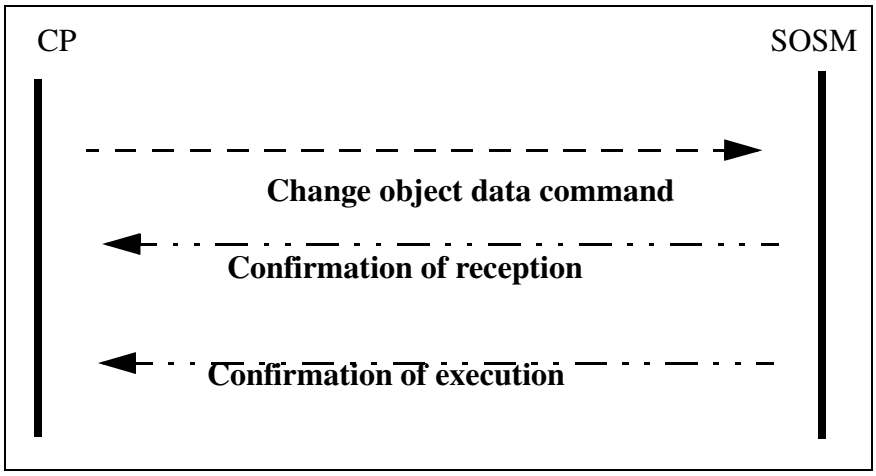
Figure 34 Object of monitoring parameters change

Header
Conditional Number of Object
Category of monitoring
MCL group number
Priority mark

Code of Command = 0FH

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 35 Change object of monitoring command



Validation error checking:

Please refer to the validation error checking of the relevant parameters in section “2.5.7.6 Setting an object for monitoring (Command N5)” on page 76 for validation of the parameters in this command.

Execution error checking :

- If the requested object does not exist in the database, command execution will fail and the command will be rejected. A “Confirmation of command execution” message is sent to CP and the “attribute of command execution” field is set to code “**object not found**” with value **45H**.
- If the MCL group number is not found in the database, code “**mcl info not found**” with value **4BH** is returned and command rejected
- If the type of MCL group specified does not correspond to the Category of monitoring, code “**wrong mcl type for group**” with value **52H** is returned and command is rejected.
- If the "category of monitoring" and the "priority mark" do not match, code **"priority code mismatch"** with value **5CH** is returned and command is rejected.
- If MCL group number is specified for statistical monitoring change order, code "**invalid mcl group**" with value **49H** is returned and command rejected.
- If MCL group number is specified as for non-statistical monitoring change order, code "**invalid mcl group**" with value **49H** is returned and command rejected.
- If me database is being transfferred during receiving the command, code **"me transfer in progress"** with value **63H** is returned and command is rejected.

14.5.7.17 Request incoming group information (Command N16)

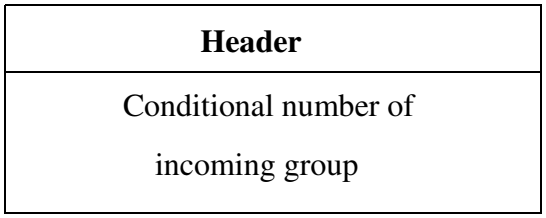
R-72 Status: C

Request for Transmission of Information about Correspondence between Exchange Incoming Group’s Name and It’s Conditional Number (command N16).

Upon receiving this command SOSM should give information about incoming groups’ lines (channels) symbolic exchange’s names correspondence to conditional number of incoming groups.

The format of the command is given in the following figure.

Figure 36 Request for transmission of information about correspondence between exchange incoming group’s name and it’s conditional number

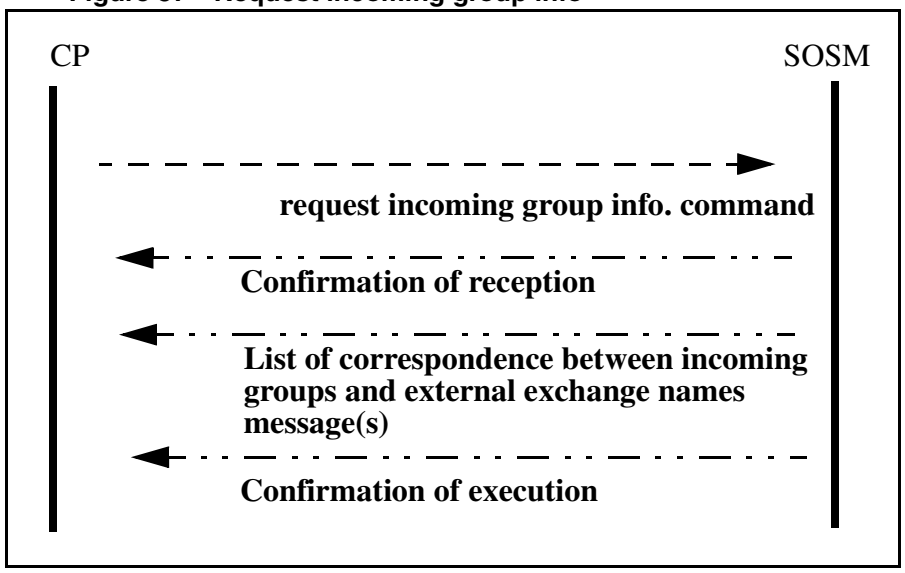


Code of Command = 10H

If the "conditional number of incoming group" value is FFFFH, a complete list of incoming groups on the exchange is sent to the CP.

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 37 Request incoming group info



Execution error checking :

- If the Incoming Group number is specified (i.e. not FFFFH) and that group is not found on the exchange, command execution will fail and the command will be rejected. A "Confirmation of command execution" message is sent to CP and the "attribute of command execution" field is set to code "**object not found**" with value **45H**.

14.5.7.18 Request SW version command (Command N17)

R-73 Status: C

Request of Exchange's SW Version (command N17) is sent by CP to request information about the exchange's software.

SOSM gives the version and edition of exchange's software upon this command.

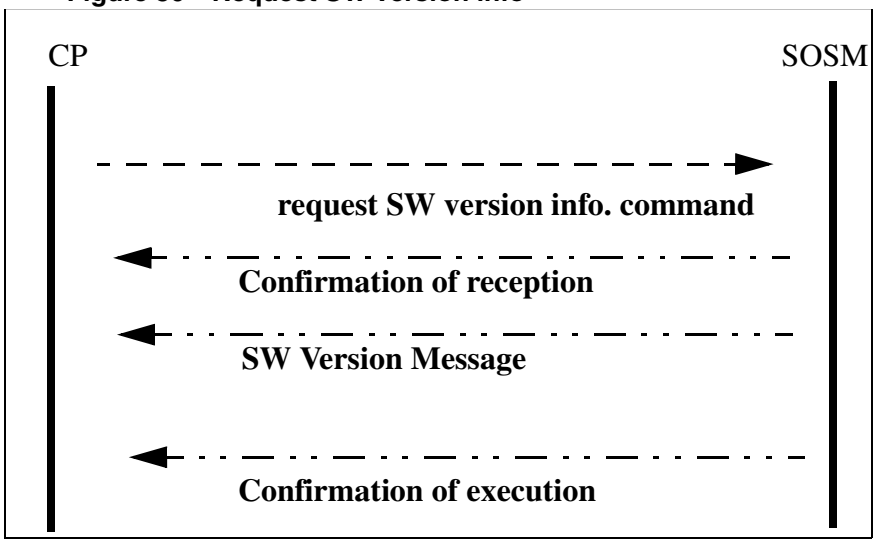
The format of the command is given in the following figure.

Figure 38 Request of exchange's SW version

Code of Command = 11H

The following message sequence illustrates the messaging between SOSM and CP for handling this command.

Figure 39 Request SW version info

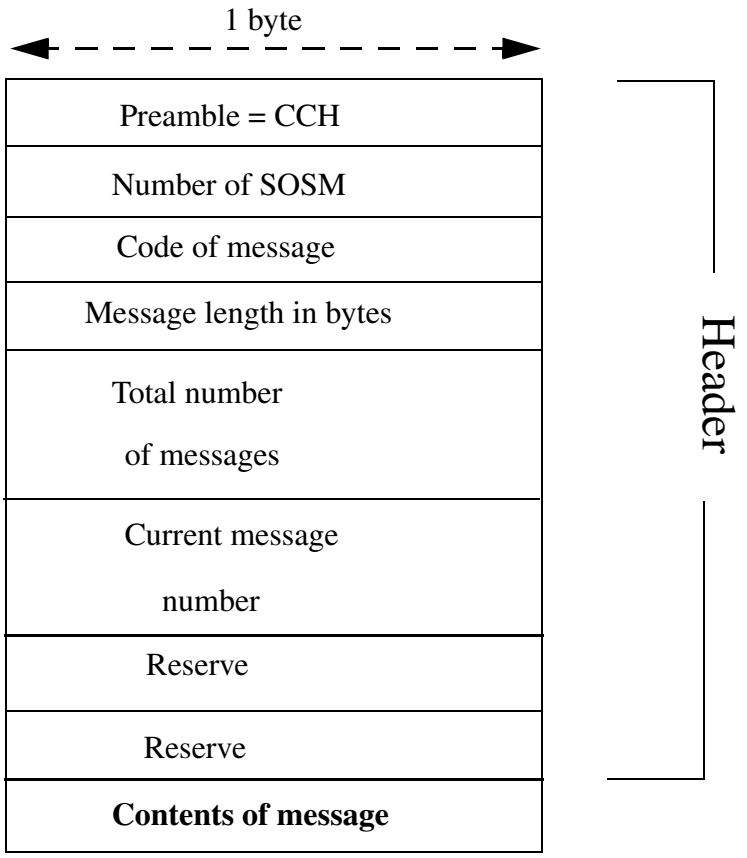


14.5.8 SOSM to CP Ch.1 messages

Channel 1 messages are messages in response to commands from CP or messages informing the CP of system events. For those messages that are sent in response to a command, information regarding the command can be found in section "2.5.7 CP to SOSM Command Processing" on page 66.

R-74 Status: C
The information field of messages from SOSM to CP has the following format:

Figure 40 Format of SOSM to CP Control Message



Total number of messages field is used if the length of a message is insufficient for information transmission to CP. In this case additional messages are formed to transmit the whole information and sequence number of the message is indicated in **Current message number** field. If no additional messages are needed then **Total number of messages** field is equal to 1 in binary code.

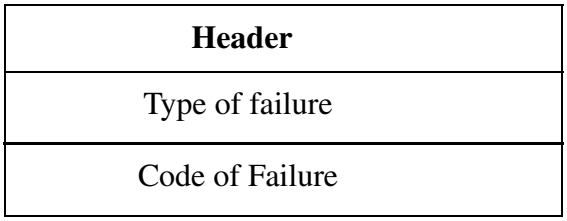
14.5.8.1 Failure Message (Msg.N1)

R-75 Status: C
Failure (message N1) is sent to alert the CP of a system failure.

This message is transmitted in case of exchange's hardware or software failure, influencing SOSM operation or upon monitored objects maintenance.

The format of this message is given in the following figure.

Figure 41 Failure message format



Code of Message = 21H

Type of failure can take the following values:

01H: Causes loss of exchange's SOSM database and requires retransmission of SOSM tables from CP side.

02H: Does not cause SOSM's database loss, but it requires CP operator intervention.

03H: Does not cause SOSM's database loss and does not require SOSM tables retransmission or CP operator intervention.

When a problem occurs during the processing of a SOSM operation, an appropriate code will be reported in the failure message. Since the SOSM software is not to generate any reports or logs on the exchange, when software errors or resource problem occur, the CP will be informed with a failure message. **The CP operator should report these failures to the vendor**.

The following "code of failure" values are defined:

Table 11 Expanded codes of failure

Name	Value	Action
system outage	01H	Inform operating company
subscriber circuit failure	02H	Inform operating company
PCM30 link fault	03H	Inform operating company if problem persists
conference circuit fault	04H	Inform operating company if problem persists[a]
Maximum calls exceeded	06H	None, this may occur if many observed subscribers originate or receive calls at the same time
Resource Problem	10H - 19H	None, this may occur periodically under heavy traffic. report to vendor if this problem persists
software error	20H - FEH	Report to vendor (NETAS)

a. NOTE: under heavy SOSM traffic, it is possible that the conference circuits may fail. This is a limitation of the 3X67 conference circuit card on the MTM or CTM shelf. In those rare cases, failure message will be sent to the CP, the MCL using that conference port card will be release, and message 52 (MCL cleared) will be reported to CP. In addition, NET102 logs (not SOSM specific) may be generated in the office, reporting the card problem.

14.5.8.2 Restart message (Msg.N2)

R-76 Status: C
Exchange S/W Restart (message N2) is sent to inform CP of a system restart.

This message is sent if exchange or SOSM are ready for service after the following events:

— Initial start of exchange

— Failure of exchange

— Restart of exchange's SW

— Upon software upgrade (ONP) from MMP to MMP

— Restart of SOSM system due to system failure

After this message, CP should:

— Send "Start of SOSM" command for initialization of SOSM

— Retransmit SOSM tables

The format of this message is given in the following figure.

Figure 42 Exchange S/W restart

Code of Message= 22H

14.5.8.3 Data of objects of monitoring (Msg. N3)

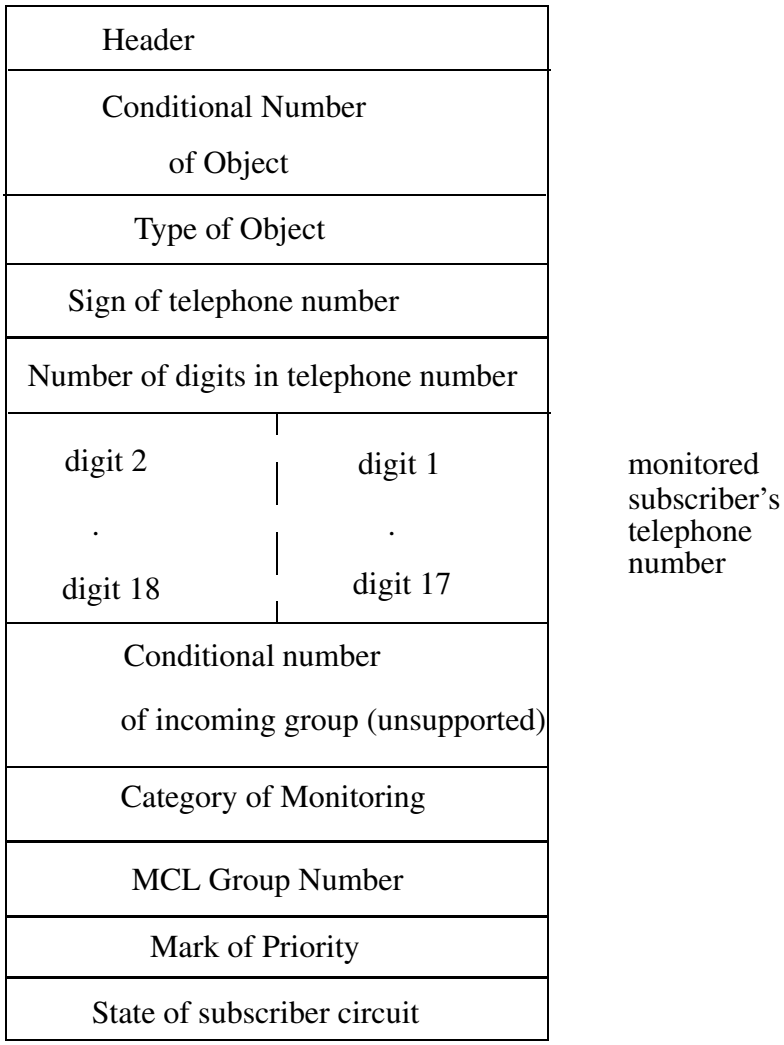
R-77 Status: C
Data of Objects of Monitoring (message N3) is sent to CP as a response to a previous query.

This message is transmitted as an answer upon the command "**Request for objects of monitoring data transmission**". When appropriate fields in this command are filled with FFH then "**Data on objects of monitoring**" message about every monitored object is transmitted to CP.

For information about message sequence and processing please refer to “2.5.7.11 Request object data (Command N10)” on page 98.

Format of the message is given in “Figure 43 Data of objects of monitoring” on page 117.

Figure 43 Data of objects of monitoring



Code of Message = 23H

Unsupported:
Conditional number of connecting lines incoming group is present if type of object = 03H, otherwise is equal to FFFEH.

State of subscriber circuit can take the following values:

00H: Subscriber circuit is in good working order (subscriber can use incoming/ outgoing communication)

01H: Subscriber circuit is out of order (subscriber can not use incoming/ outgoing communication).

If more than one message is required to transmit all the requested data, then **Total number of messages** and **Number of current message** fields in the message header are set.

If no supervised objects with required parameters in command "**Request for objects of monitoring data transmission**" are found in the database then these parameters are repeated in "**Data on objects of monitoring**" message and remaining fields are filled with FFH.

14.5.8.4 Information about MCL groups message (Msg.N4)

R-78 Status: C

The Information about Correspondence between MCLs and Groups (message N4) is sent to CP in response to a previous request.

This message is sent as the answer to the command "Request for Transmission of Information about Correspondence between MCLs and Groups". Message contents length should be 45 bytes. If the message length is less than 45 bytes then the unused bytes are filled with FFH. If more than 45 bytes are needed for information transmission (that means there are more than 11 MCLs in the group) then additional messages are formed. In this case appropriate values should be put in the fields, "**Total number of messages**" and "**Current message number**", of header.

For information about message sequence and processing, please refer to "2.5.7.12 Request MCL group information (Command N11)" on page 102.

Format of the message is given in "Figure 44 Information about correspondence between MCLs and groups" on page 119.

Figure 44 Information about correspondence between MCLs and groups

Header
MCL group number
MCL group type
MCL-A1 number
MCL-B1 number
MCL group number
MCL group type
MCL-A2 number
MCL-B2 number
. . .
MCL group number
MCL group type
MCL-AN number
MCL-BN number
FFH

Code of Message = 24H

14.5.8.5 List of Supplementary Services message (Msg.N5)

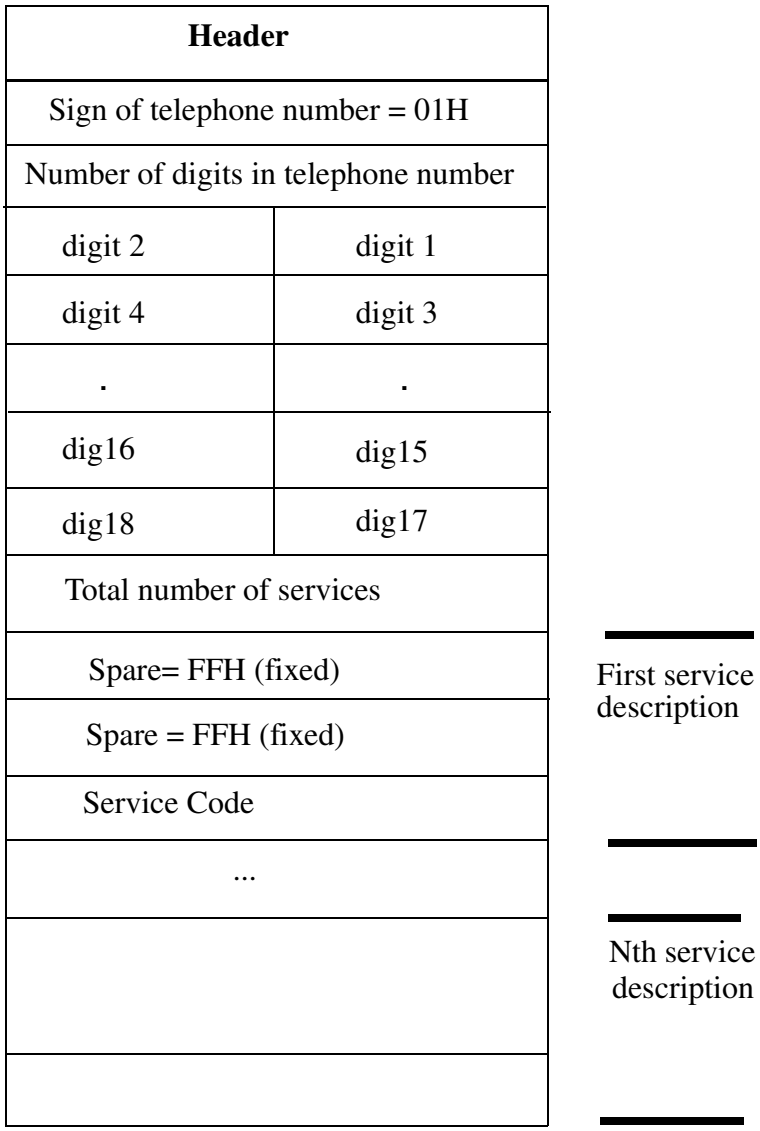
R-79 Status: C
The List of Subscriber's Supplementary Services (message N5)

This message is sent as an answer to the command "Request for Transmission of Supplementary Services List" for every subscriber of the exchange.

For information about message sequence and processing, please refer to "2.5.7.13 Request subscriber's SS list (Command N12)" on page 105.

Format of the command is given in the following figure.

Figure 45 List of Subscriber's Supplementary Services



Code of Message= 25H

The service description parameter is a three byte parameter as follows:

- Byte 1 and Byte 2 are both set to FFH
- Byte 3 represents the Service Code.

The service codes correspond to service names as defined in "Table 108 Subscriber Services Codes" on page 243.

Message length can not exceed 55 bytes including the header. The maximum number of services codes in one message is 11.

14.5.8.6 Unauthorized access message (Msg.N6)

R-80 Status: C

Unauthorized Access to SOSM's Software (message N6) is transmitted to report an unauthorized access to the software and data of SOSM.

The format of this message is given in the following figure.

Figure 46 Unauthorized Access to SOSM's software

Header
Code of access
Date of current month (2 Digits)
Hour (2 Digits)
Minutes (2 Digits)
Seconds (2 Digits)

Code of Message= 26H

Code of access field can take following values;

01H: access trial from forbidden port

02H: access trial with wrong password

03H: trial of SOSM data tables reading/record

04H: trial to refix port of SOSM communication with CP

05H: attempt to access SOSM configuration tables directly (not via SOSMCONF interface[1]

06H: attempt to access SOSMCONF interface with wrong password

[1]Please refer to "2.8.4 Access to SOSM configuration tables and parameters : SOSMCONF" on page 161.

Bytes from 2 up to 45 are used for additional information about unauthorized access as follows:

- Byte 2 to 5 present the time the access violation was detected as:

2	Date of current month (two DIGITS)
3	Hours (Two DIGITS)
4	Minutes (Two DIGITS)
5	Seconds (Two DIgits)

The date and time information is stored in BCD digits from 0 to 9.

14.5.8.7 Confirmation of command reception (Msg.N7)

R-81 Status: C

Confirmation of Command out of CP Reception (message N7) is sent to confirm receipt of a command, or to indicate an error in a command.

This message is transmitted for any received command from CP over data channel 1 after correctness of the command parameters are checked. This check should be done within **400 milliseconds** since the command entered exchange's port.

This message is not transmitted for the command "**Testing of data transfer channels**".

Format of the message is given in the following figure.

Figure 47 Confirmation of command out of CP reception

Header
Code of command
Attribute of command's reception

Code of Message = 27H

Code of command stands for the command for which the confirmation is given.

Attribute of command's reception can take the following values:

00H: command is accepted for execution

Any value other than 0H indicates an error as described in “Table 109 Command reception result codes” on page 247 .

14.5.8.8 Confirmation of command execution (Msg.N8)

R-82 Status: C
Confirmation Command out of CP Execution (message N8) is sent to confirm execution of a command, or to indicate an error in the processing of a command.

This message is sent after execution or non-execution of the command received over channel 1.

This message is not transmitted for the command “**Testing of data transfer channels**”.

The format of the message is given in the following figure.

Figure 48 Confirmation command out of CP execution

Header
Code of command
Attribute of command’s execution

Code of Message = 27H

Code of command stands for the command for which the confirmation is given.

Attribute of command’s execution can take the following values:

00H: command is executed successfully

Any value other than 0H indicates an error as described in “Table 110 Command execution result codes” on page 248.

14.5.8.9 Answer test message (Msg.N9)

R-83 Status: C
Answer Test Message Sent over DTC1 (message N9) for data channel diagnostics.

This message is sent over **all** existing data transfer channel 1s (DTC 1) as an answer to the command “Testing of data transfer channels” which is received over an available DTC1. After the command entered exchange’s port answer message should be sent within 200 milliseconds.

The format of the message is given in the following figure.

Answer test message sent over DTC 1

Header								
Number of test message								
X	X	X	X	X	X	X	X	**State DTC 1**
X	X	X	X	X	X	X	X	**State DTC 2**
PCM group 7	PCM group 6		...				PCM group 0	

Code of Message = 29H

Number of test message should coincide with the value of the “**Number of test message**” field in “**Testing of data transfer channels**” command.

State of DTC 1 and state of DTC 2 can take following values:

1: if the DTC is in working condition

0: in case of DTC failure or absence

Bits of fields “State of DTC 1 and DTC 2” belong to PCM-30 primary groups from 0 up to 7.

14.5.8.10 Incoming group data message (Msg.10)

R-84 Status: PC
Data about Correspondence between Conditional Numbers of Incoming Groups and Their Real Exchange Names (message 10).

This message is issued ONLY upon command from CP. Format of the message is given in Figure 37, "Request incoming group info"..

For information about message sequence and processing, please refer to “2.5.7.17 Request incoming group information (Command N16)” on page 111.

Figure 49 Data about correspondence between conditional numbers of incoming groups and their real exchange names

Header
Conditional number
of incoming group
Incoming group’s symbolic exchange’s name

Code of Message = 2AH

Conditional number of incoming group can take values from 0000H up to FFFEH.

If the field “**Conditional number of incoming group**” in the command “**Request for transmission of information about correspondence between exchange incoming group’s name and it’s conditional number**” (command N16) has the value FFFFH then SOSM should give the whole correspondence table for incoming groups.

If the length of the message exceeds **45** bytes then additional messages are formed with appropriate “**Number of current message**” and “**Total number of messages**” values in the header.

The Incoming group exchange name parameter has the following structure:

- Byte 1 to 2: Common Language Name Identifier: identifies the numeric value of the Incoming Trunk group number
- Bytes 3 and 4: Name length, the length of the actual string representation in bytes
- Bytes 5 to 20: Incoming group’s name in ASCII characters

All remaining bytes in the message are set to FFH.

14.5.8.11 Exchange SW version message (Msg.11)

R-85 Status: C
Version of Exchange's SW is sent as a response to a previous request from CP.

This message is transmitted as an answer to the command "**Request of exchange's SW version**" (command N17).

For information about message sequence and processing, please refer to "2.5.7.18 Request SW version command (Command N17)" on page 112.

The format of the message is given in the following figure.

Version of exchange's SW

Header
Version and edition of exchange's SW

Code of Message = 2BH

Values in bytes from 1 up to 7 define exchange's SW version and edition in ASCII code as follows:

1	B (42H)
2	C (43H)
3	S (53H)
4	5 (35H)
5	5 (35H)
6	. (2E)
7	0 (30H)

- Bytes 1-3 are hard coded to the string 'BCS' in ASCII code
- Bytes 4-5 represent the release number in ASCII code
- Bytes 7-8 represent the sub-release number in ASCII code
- All remaining bytes in the message are set to FFH

14.5.9 Information Messages Transmitted over Data Channel 2

The following messages are sent from SOSM to CP over data channel 2:

- Reception of called subscriber complete telephone number.
- Called subscriber answer.
- Disconnection.
- Supplementary services (SS) using.
- Monitoring Connecting Line's (MCL) connection.
- Clearing of MCL.
- Answering test message.

14.5.9.1 Format of SOSM to CP Information Messages

R-86 Status: C

Information field of the messages about monitored connections have the following format:

Figure 50 Format of Header in Information Messages from SOSM to CP

Byte No.	Parameter
1	Preamble =CCH
2	Number of SOSM
3	Message Code
4	Message length
5	Number of call
6	
7	type of object
8	conditional number of object
9	
10	attribute of object's selection
11	parameter of communications
12	code of SS phase

Byte 1 is the SOSM Preamble, a constant with value CC Hex.

Byte 2 is the SOSM number as assigned by software.

Byte 3 is the message code, values are defined in the following sections.

Byte 4 is the message content length in bytes.

Bytes 5-6 identify the Call Number as previously defined.

Byte 7 identify object type as previously defined

Byte 8-9 identify Conditional Number of Object.

Byte 10 identify the object selection as follows:

Figure 51 Attribute of object selection

Bit No.	Parameter
D1 D0	**Selection according to calling subscriber**
0 1	Complete monitoring, combined
1 1	Complete monitoring, separate
1 0	Statistical monitoring
D3 D2	**Selection according to called subscriber**
0 1	Complete monitoring, combined
1 1	Complete monitoring, separate
1 0	Statistical monitoring
D5 D4	**Selection according to Conditional Number of incoming group (UNSUPPORTED)**
0 1	Complete monitoring, combined
1 1	Complete monitoring, separate
1 0	Statistical monitoring
D7 D6	**Selection according to Conditional Number of Object**
0 1	Complete monitoring, combined
1 1	Complete monitoring, separate
1 0	Statistical monitoring

Byte eleven identifies communications parameters and is defined as follows:

Figure 52 Parameters of communication

Bit No.	Parameter
D3 D2 D1 D0	**Type of communications**

Bit No.	Parameter
0 0 0 1	Outgoing call
0 0 1 0	incoming call
0 1 0 0	international transit
1 0 0 0	toll transit
11 0 0	cross-office call
D5 D4	**Call setup method[a]**
0 1	Direct Dialled(Automatic)
1 0	Operator Assisted (Semi-automatic)
D7 D6	**reserved**
0 0	Reserved = 0

a. Note: The 'type of communications' byte is assigned as 'Semi-automatic' for all operator originating calls.

Byte 12 defines code of supplementary services phase and has the following values:

- 00H - Normal call
- 01H - order of SS service
- 02H - test of SS service
- 03H - abolition of SS service
- 04H - SS activation

Contents of Message field of the information message has the following format:

Figure 53 Format of the Contents field of Information Message

Byte No.	Parameter
1	Attribute of Telephone number
2	Number of digits in telephone number

Byte No.	Parameter
3	Calling DN
4	
5	
6	
7	
8	
9	
10	
11	
12	attribute of telephone number
13	Number of digits in telephone number
14	Called DN
15	
16	
17	
18	
19	
20	
21	
22	
23	Conditional number of incoming group
24	
25	MCL-A number
26	MCL-B number
27	Date of current month (two DIGITS)
28	Hours (Two DIGITS)
29	Minutes (Two DIGITS)
30	Seconds (Two DIgits)

Byte No.	Parameter
31	Priority
32	Operation Code
33	Description of Service
34	
35	
36	Additional Code

Bytes 1 to 11 define the Calling subscriber. Bytes 12 to 22 define the Called subscriber.

Attribute of telephone number is defined as follows:

- 01H - present exchange subscriber
- 02H - local network subscriber
- 03H - local ZONE subscriber
- 04H - OTHER ZONE subscriber
- 05H - Other country subscriber
- 06H - local or international emergency or inquiry services
- FFH - combination without value

Note: *Attribute of telephone number for Called DN will always be present correctly. For calling DN, if the originator is a line in the present exchange, that attribute will be present, otherwise, combination without value (FFH) is set.*

The content of the calling DN field depends on the originator of the call as follows :

— If the call is a line originated call, the DN (Office code + DN Digits, excluding area code) is provided in the calling DN field.

— If the call is a trunk originated call, the incoming ANI digits are provided in the calling DN field. SOSM is not able to determine the sign of the incoming ANI digits, therefore the attribute of the calling DN parameter will be set as #FF in these scenarios.

— If the call is a trunk originated call, and ANI digits are not received, calling DN field are filled with #F.

The content of the called digits depends on the terminating agent as follows :

— If the call terminates to an exchange subscriber, the called DN field will include the DN of the terminating line (Office code + DN Digits, excluding area code) instead of dialled digits.

— If the call terminates to a trunk, called DN field will include all available dialed digits.

Note: *The available digits depend on the dial plan in the given office and changes between Local Offices and Toll/Tandem offices.*

Bytes 23-24 is used when the number of the incoming call to the supervised subscriber can not be determined,otherwise it is set to FFFFH. It may take values from 0000H to FFFFH and corresponds to group's symbolic name."

Bytes 25-26 define the MCL numbers used for monitoring.

Bytes 27-30 define the current month's day and time stamp.

Byte 31 defines the priority of the object.

Byte 32 defines the operation code as:

- Code of connection completion for Disconnection message
- Code of MCL connection for messages Connection of MCL, Reception of called number, Answer and Using of SS services. Please refer to "Table 110 Command execution result codes" on page 248 for an expanded list of mcl connection codes
- Code of MCL clearing for message Clearing of MCL
- Code FFH otherwise

Bytes 33-36 are used for service codes in Use of SS message, otherwise, FFH is used.

If in a call, both Calling and Called parties are monitored objects, then for each party, a separate information message is sent to the CP reporting the call phases, with a unique call number. If MCL connection is required, each "SOSM call" is connected as defined in the subscriber object definition.

The SOSM system can support any monitoring type (statistical, combined or separate) for both agents involved in a call -where both called and calling parties are under surveillance- , if adequate resources are available for MCL connections.

14.5.9.2 Reception of called party number (Msg. No.1.1)

R-87 Status: PC
Reception of the called subscriber telephone number message (N1.1) is sent to CP to report reception of called number in a monitored call.

This message is transmitted after receiving called subscriber's number information and if any of the numbers is found in the SOSM database for supervised objects. If calling number can not be determined, and the originator is a trunk, the number of incoming trunk group is reported instead.

In line-to-trunk overlapped calls, it can be determined if the call should be monitored prior to reception of the full called number. In these calls, reception of called_party number message (MSG.1.1) is sent just after enough digits are received to determine the monitoring object.

The "description of service" fields are set to FFH.

The format of the message is given in "Figure 53 Format of the Contents field of Information Message" on page 129.

Code of Message = 41H.

For links, selected on "complete monitoring" category, this message should be transmitted to CP immediately after free MCL had been fastened to the selected call, or after decision about the absence of free MCL for this call.

The result of MCL allocation is set in the Operation's code "code of MCL unconnection" as follows:

- 00H - Normal connection
- 01H- no free MCL in group
- FFH - for statistical monitoring
- other connection code (Please refer to "Table 110 Command execution result codes" on page 248 for an expanded list of mcl connection codes)

14.5.9.3 Answer message (Msg. No 1.2)

R-88 Status: C
Answer of the Subscriber message (N1.2) is sent to CP to report Answer event in a monitored call.

This message is transmitted after the called subscriber answers the call. Format of the message is given in "Figure 53 Format of the Contents field of Information Message" on page 129.

Code of Message = 42H.

The result of MCL connection is set in the Operation's code "code of MCL unconnection" as follows:

- 00H - Normal connection
- 01H- no free MCL in group
- FFH - for statistical monitoring

other connection code (Please refer to "Table 110 Command execution result codes" on page 248.).

14.5.9.4 Disconnection message (Msg. No 1.3)

R-89 Status: C
Disconnection message (N1.3) is sent to the CP to report call completion.

This message is transmitted when the call is complete and taken down. If applicable, data transmission over MCL is stopped and MCL resources allocated to this conversation are deallocated.

The format of the message is given in "Figure 53 Format of the Contents field of Information Message" on page 129.

The "operation code" field of the message is set to have "code of connection completion" parameter as follows:

- 01H - disconnection because of technical reason
- 02H - disconnection after incomplete dialling
- 03H - disconnection in case of busy called party
- 04H - disconnection if subscriber B does not answer
- 05H - disconnection after normal conversation ends

Code of Message = 43H.

> ***Note:*** **(01H)** Technical reason will be used for any cause values which are not defined above.

14.5.9.5 Service usage message (Msg. No 1.4)

R-90 Status: C
SS services usage message (N1.4) is transmitted when a Supplementary Service (SS) is activated, deactivated, or interrogated by a monitored subscriber.

The format of the message is given in “Figure 53 Format of the Contents field of Information Message” on page 129.

The “description of service” field of the message is populated the service code being used as defined for message “List of Subscriber’s Supplementary Services” on page 120.

The “Additional code” field is populated with FFH.

The “additional code” field is populated with codes of services not defined by international standards. Values of these services should be communicated to the customer**.**

> ***Note:*** *DMS specific service codes are put in the Service Code field as opposed to the Additional Code byte as requested by LONIIS. Refer to “List of Subscriber’s Supplementary Services” on page 120 for complete information.*

Code of Message = 44H.

The value of MCLA, MCLB, category, priority and Operation code fields of this message are determined as follows :

- **Service activation / interrogation / deactivation:**

  IBN subscribers can activate/interrogate/deactivate CEPT services even within a separate call, or during an answered call.

  BRI subscribers can activate/deactivate/interrogate ISDN BRI supplementary services via using CEPT dialing sequences, or via using BRI phone set facilities. Subscriber action using phone set facilities can be done when phone is on-hook. Subscriber action using CEPT dialing sequence can be done in the first call originated from the BRI phone set, or in a new call initiated after holding the active call.

  ISDN PRI Supplementary services are provisioned in related tables for PRI trunks.

  If a subscriber only makes a service activation/deactivation/interrogation at origination, and does not connect to another agent, SOSM does not connect MCLs for this call in order to optimize resource usage. MCLA and MCLB indexes of the messages (service usage (Msg.1.4) and call clearing (Msg.1.3) messages) in these calls are set as FFH.

  The category of the call is filled with monitoring order category.

  The priority of the call is filled with monitoring order priority.

  The parameter of communications field is set to "cross-office call".

  The operation code field of service usage message (Msg.1.4) is set to FFH.

Upon unsuccessful service activation/interrogation/deactivation attempts, SOSM does not send service notification message. Instead, only call clearing message (Msg.1.3) is sent with "*disconnection after incomplete dialling* - 02" operation code. However, if the service is inactive for the monitored subscriber, the call clearing message (Msg.1.3) is sent with "*disconnection because of technical reason* - 01" operation code upon interrogation of the service.

SOSM sends service notification message (Msg.1.4) for the monitored agent's activation/interrogation/deactivation attempts during the call.

If an IBN/V5.2 (IBN) subscriber flashes, and activates/deactivates/ interrogates a CEPT service during an active call, SOSM reports this event with the same call number as in the call data messages of the original call. Additionally, category and priority fields of the message is the same with the call data messages of the original call. However, Parameter of Comm. is set as "cross-office call", the MCL# and Operation Code fields are set to FFH even though it is not FFH in the call data message.

If a BRI subscriber activates/deactivates/interrogates an ISDN BRI supplementary service, after holding the active call, subscriber actions performed in the new call is reported to CP with a new call number. And all other data in the message is filled according to properties of the new call.

Service usage:

In some scenarios, SOSM reports the subscriber services -which are used within a monitored call- to the control point. MCLA and MCLB fields within service usage messages depend on the call state at which SOSM sends the message.

In a monitored call, SOSM allocates MCLs after the dialled digits are successfully translated (just before sending reception of full number message). MCLs are connected as the originating subscriber receives ring-back tone.

If the service usage message is sent before MCL allocation (as in CCBS), MCLA and MCLB fields of the service usage message are filled with FFH. In such scenarios, the operation code of this message will also be populated with FFH.

If the service usage message is sent after MCL allocation, MCLA and MCLB fields of the message are populated with the MCL indexes which are used for the call. The operation code field icludes information about the state of the MCLs (i.e normal connection-00H, -01H- no free MCL in group, etc...)

The below tables shows the list of CEPT and ISDN BRI supplementary services services supported by SOSM:

Table 12 CEPT features supported by SOSM

For the above table,

(**+**) denotes that SOSM sends Msg.1.4. For detailed usage notification of above features, see appropriate section (2.11.x) of this document.

(-) denotes that SOSM does not send Msg.1.4.

(**N/A**) denotes that Msg.1.4 cannot be sent.

14.5.9.6 MCL connection message (Msg No 2.1)

R-91 Status: C
Connection of MCL message (N2.1) is transmitted after MCL connection as a result of command N7.

The format of the message is given in “Figure 53 Format of the Contents field of Information Message” on page 129.

The “operation code” field is populated with “code of MCL unconnection” as follows:

- 00H - normal connection
- 01H- no free MCL in group
- other connection code (Please refer to “Table 110 Command execution result codes” on page 248 for an expanded list of mcl connection codes)

Code of Message = 51H

14.5.9.7 Clearing of MCL message (Msg No.2.2)

R-92 Status: C
Clearing of Monitoring Connecting Line message (N2.2) is transmitted if clearing of MCL has happened for **any reason**.

The format of the message is given in “Figure 53 Format of the Contents field of Information Message” on page 129.

The “operation code” field is populated with “code of MCL clearing” code as follows:

- 01H - on command N8 “clearing of MCL”
- 02H - on monitored object priority
- 03H - on priority as a result of command N7: “connection to voice path”
- 04H - equipment failure

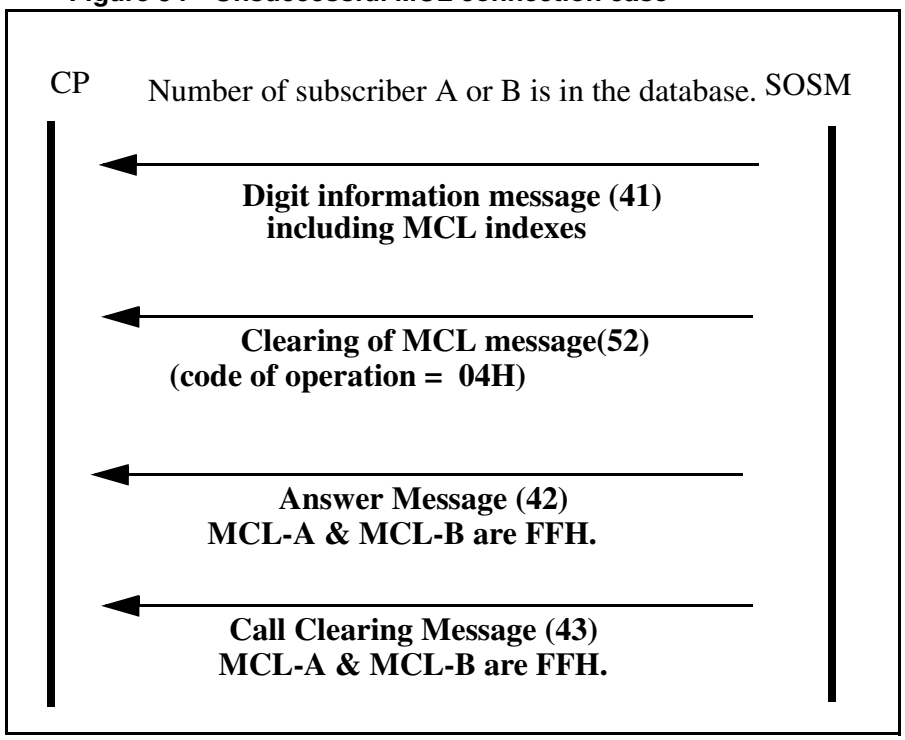
- 05H - on command N6 “removal of object of monitoring”

  Note: *On command “stop sosm” if there is an active monitored call, the MCL is cleared but* ***no message in sent to CP.***

Code of Message = 52H

SOSM only reserves MCLs those will be used within a call while sending reception of full number message (Msg.1.1). Call content delivery is started when the speech path is established between the connected parties. Therefore, SOSM notifies control point about the connection failures (i.e. resource problem, MCL outage,...) using this message with the operation code set to "equipment failure - 04H".

Figure 54 Unsuccessful MCL connection case



14.5.9.8 Answer test message (Msg. No 2.3)

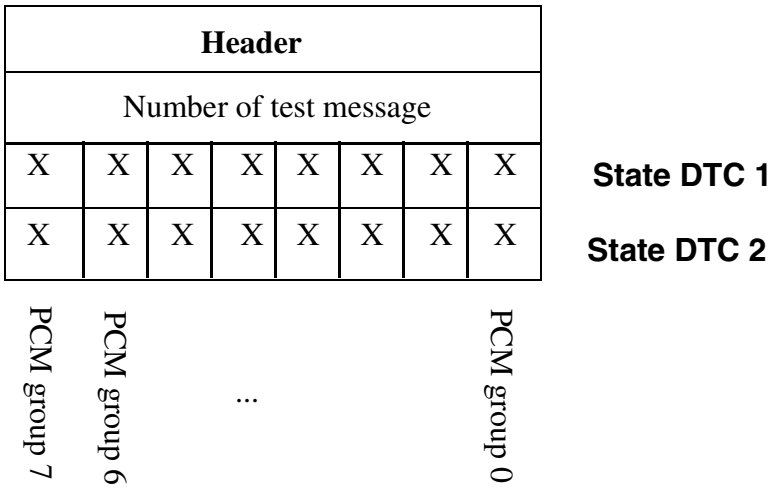
R-93 **Status:** C

Answering test message (N2.3) is sent for diagnostics of data channel 2.

This message is sent over **all** existing data transfer channel 2 (DTC 2) as an answer to the command “Testing of data transfer channels” which is received over an available DTC1. After the command entered exchange’s port answer message should be sent within 200 milliseconds.

The format of the message is given in the following figure.

Figure 55 Answer test message sent over DTC 2



Code of Message = 53H

Number of test message should coincide with the value of the “**Number of test message**” field in “**Testing of data transfer channels**” command.

State of DTC 1 and state of DTC 2 can take following values:

1:if the DTC is in working condition

0:in case of DTC failure or absence

Bits of fields “State of DTC 1 and DTC 2” belong to PCM-30 primary groups from 0 up to 7.

The Channel 2 header fields “number of call”, “type of object”, “conditional number of object”, “sign of object’s selection”, “link’s parameters” and “code of SS phase” are all set to FFH.

14.5.10 Failure Cases message scenarios

14.5.10.1 Failure of Exchange

Figure 56 Failure of exchange causing SOSM tables to be deleted

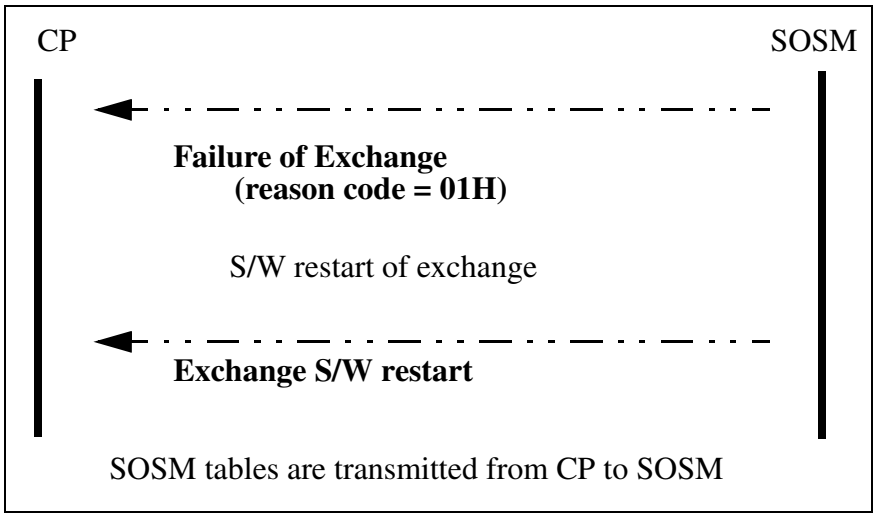


Figure 57 Failure of exchange that does not need CP intervention

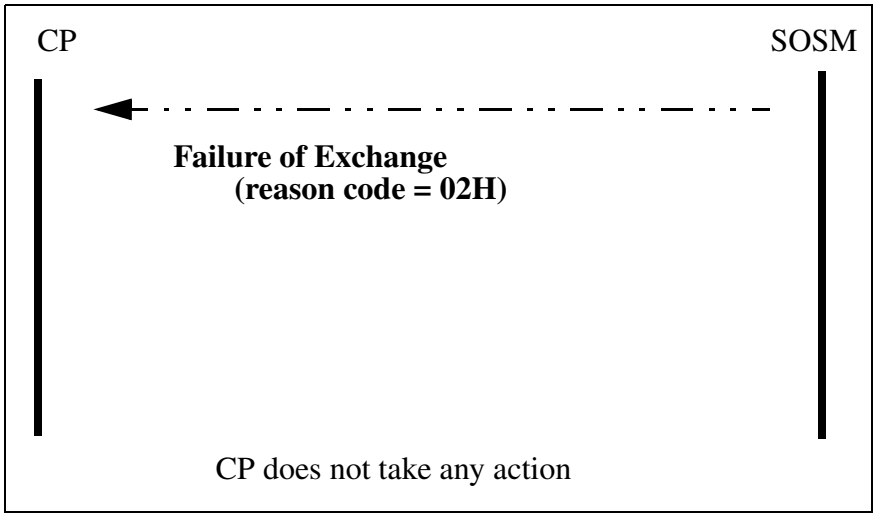

Figure 58 Failure of exchange that needs CP intervention

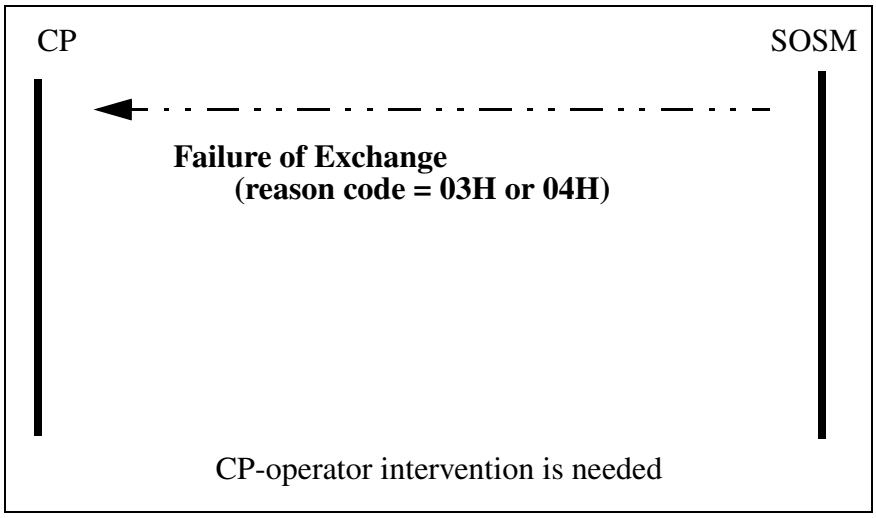

14.5.11 Monitored Call Scenarios

The process of selecting an object of monitoring is as follows:

a. In line originated calls, the DN of the originating line (office code + DN digits, excluding area code) is obtained, and searched in the monitored objects database.

   For BRI subscribers the MSN, which originates the call, is searched in the database. Please note that this is not necessarily the primary DN of the loop.

b. If the call is originated from an incoming trunk, SOSM does not search the originating number in monitoring order database.

   If the call is monitored due to called party, ANI information received from the incoming trunk is reported in the call information messages. If ANI is not received, incoming group number is reported in the Call information message.

c. Called party number is obtained and searched in the monitored object database.

   If the called party is a network subscriber, the dialled digits are searched within the database.

   If called party is a present exchange subscriber, the DN of the terminating subscriber (office code + DN digits, excluding area code) is searced in the database instead of the dialled digits. This way, SOSM monitores all accesses to the present exchange subscribers, and is not impacted by the retranslation scenarios.

If called party is a BRI subscriber, the MSN of the terminating subscriber (not the primary DN on the loop) is searched in the database.

d. If no objects are found, the call continues normally.

e. If one object is found, the call becomes a monitored call, the object's data is retrieved, and the call continues. All subsequent required call events will be reported to the CP. If the object has complete monitoring category, MCL connection is made when ringback tone is received(before answer phase). Please refer to the following figures.

f. If both calling and called objects are found in the database, then two sosm call numbers are assigned for each subscriber's call. The properties of the each subscriber are used for making MCL connection (if required). A separate message for each object is sent to the CP for each required call event.

g. SUSpended agents are not monitored by SOSM, although they exist in monitoring order database.

The following sections describe the messaging that takes place for each call scenario.

14.5.11.1 Supervised Subscriber with Complete Monitoring

Figure 59 Successful MCL connection

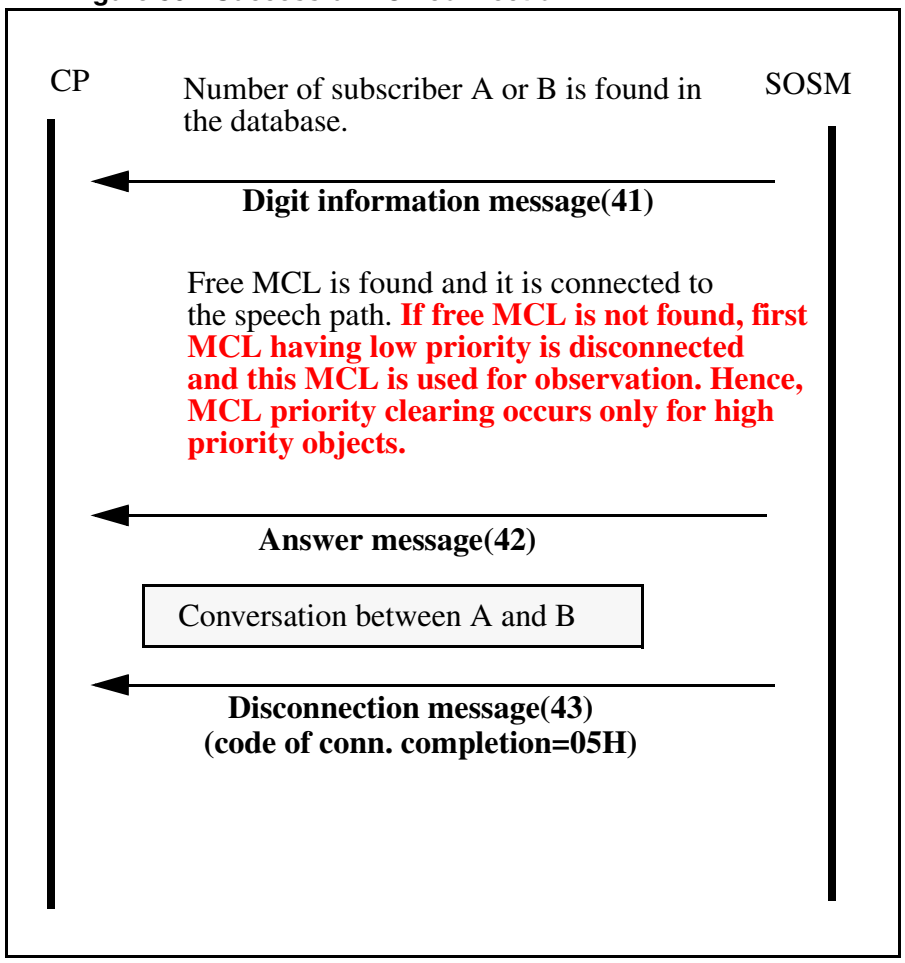

Figure 60 Unsuccessful MCL connection if no free MCL is found

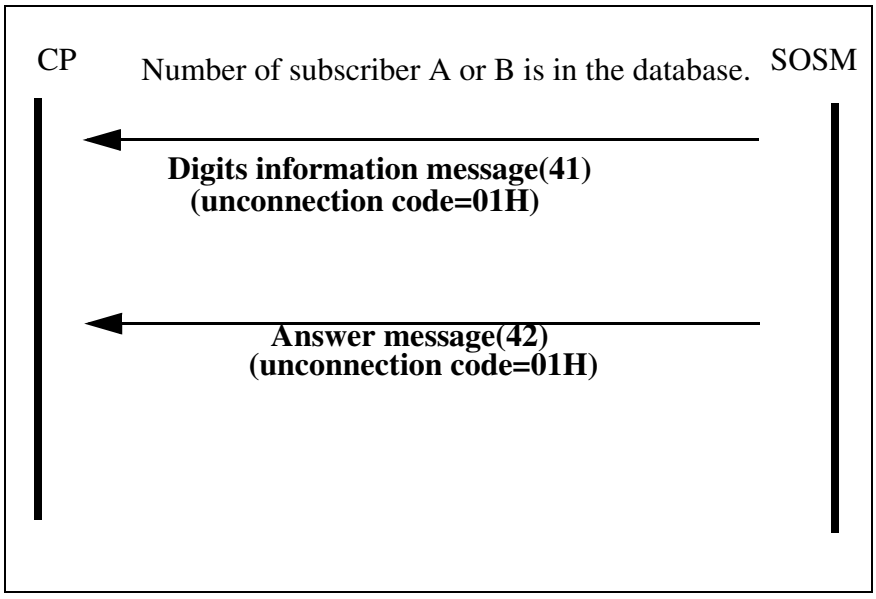

Figure 61 Unsuccessful call setup case (busy/route failure)

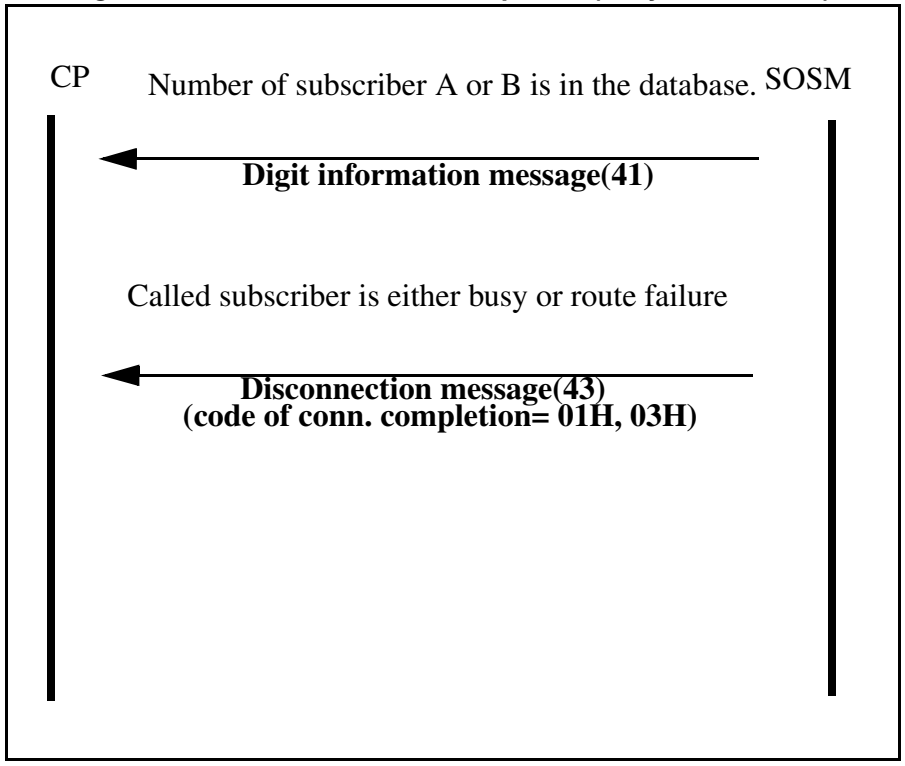

Figure 62 Messaging when the translation fails (partial/no dial)

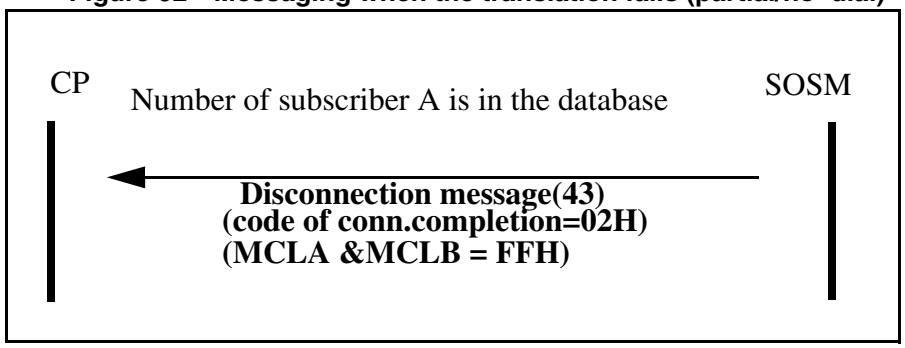

Figure 63 Unsuccessful call setup case (no answer)

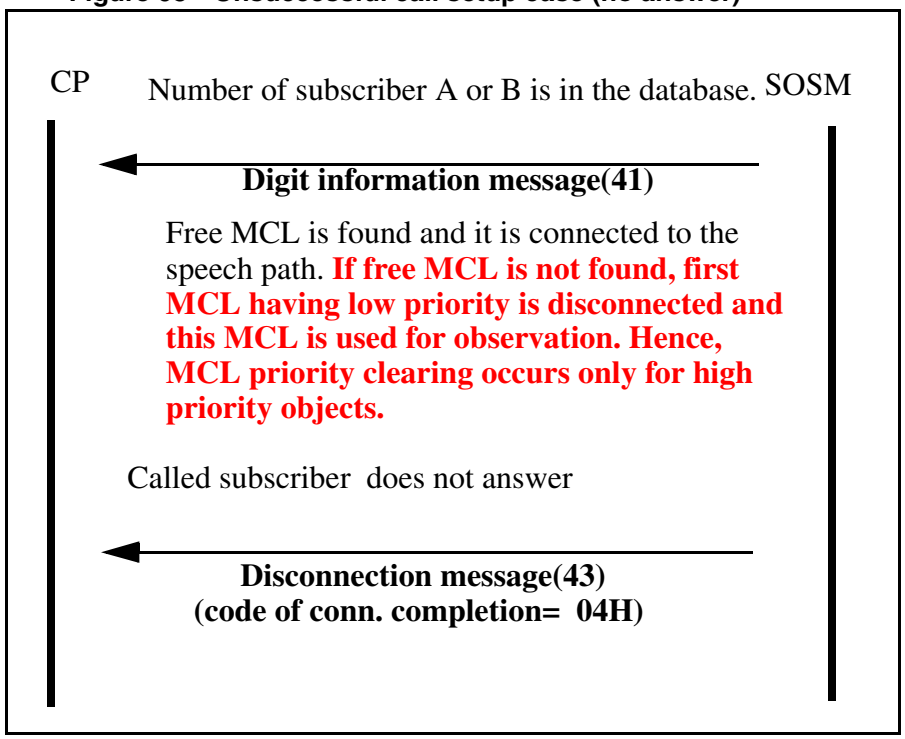
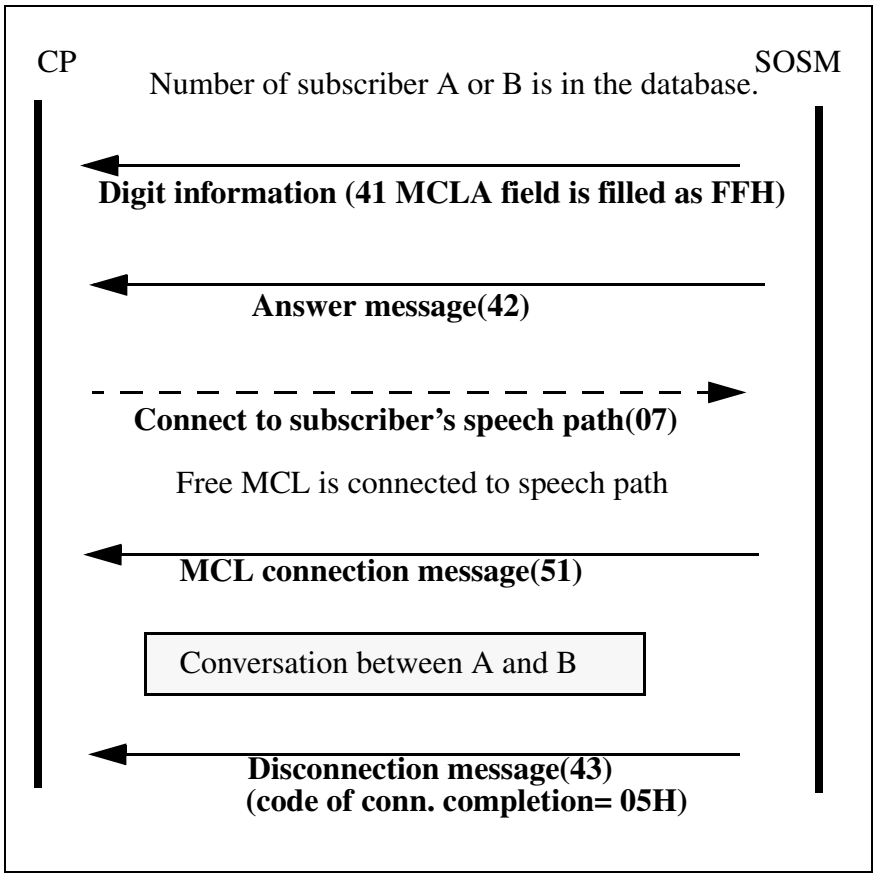


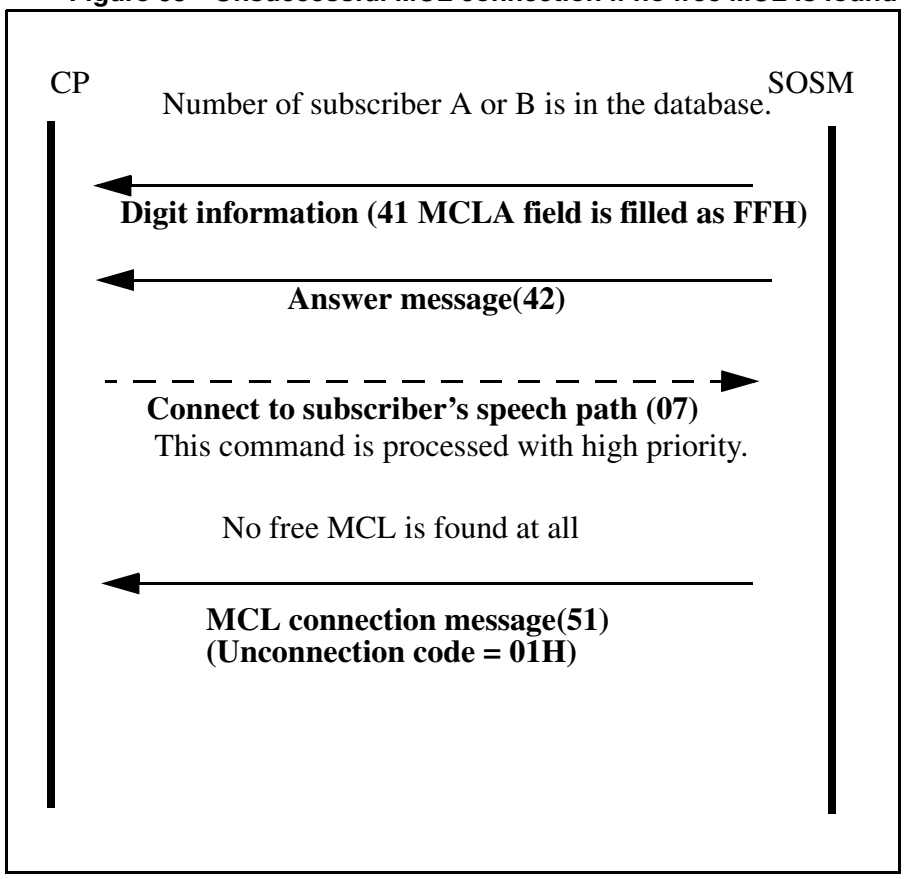
14.5.11.2 Supervised Subscriber with Statistical Monitoring

Figure 64 Successful MCL connection



After receiving "Connect to subscriber's speech path" command, category of monitoring is switched from statistical to complete ONLY for the specified call.

Figure 65 Unsuccessful MCL connection if no free MCL is found



14.6 Software Optionality Control (SOC)

Software Optionality Control is provided for this feature. SOC order code is SOSM0001.

While SOSM0001 is OFF:

- Any message received from CP are ignored. (DMS MMP neither executes the message nor sends response.)
- Access to SOSM configuration CI level is not permitted even if the valid password is entered.
- SOSM configuration tables SOSMMPC, SOSMTRK and SOSMPARM can be reached only within SOSMCONF CI level. Since access to SOSMCONF CI level is not permitted at this state, access to SOSM configuration tables is not possible while SOSM0001 is OFF.

Activation of SOSM0001:

- It is not allowed to turn SOSM0001 to ON state, while there is any other active NBD flavor (DNBD, etc...) on the switch.

While SOSM0001 is ON:

- Activation of any other Network Broadcast Delivery (NBD) application is prevented after turning SOSM0001 to ON state.
- Access to SOSM configuration tables via SOSMCONF CI level is possible.
- Commands received from CP are processed as described in the previous sections.

Deactivation of SOSM0001:

- Turning SOSM0001 OFF deactivates all SOSM applications on the exchange. SOSM is stopped, and all dynamic data within MCL and monitoring order databases are cleared.
- SOSM system password is reset with the initial password.
- Data in SOSMMPC, SOSMTRK and SOSMPARM tables remains unchanged. However, access to these tables are prevented as indicated above.

14.7 Password Management

The SOSM system has 3 different passwords:

- SOSM initial password
- SOSM current password
- SOSM CI access password

A Password is defined as a character string of no more and no less than SIX (6) bytes. Characters are represented as per the ASCII printable character set in the range (20H to FFH).

14.7.1 SOSM initial password

14.7.2 SOSM current password

14.7.3 SOSMCONF CI access password

14.8 Provisioning

The SOSM system makes use of several DMS MMP tables and commands for static data which is used in the operation of SOSM. The following sub-sections describe those tables and commands.

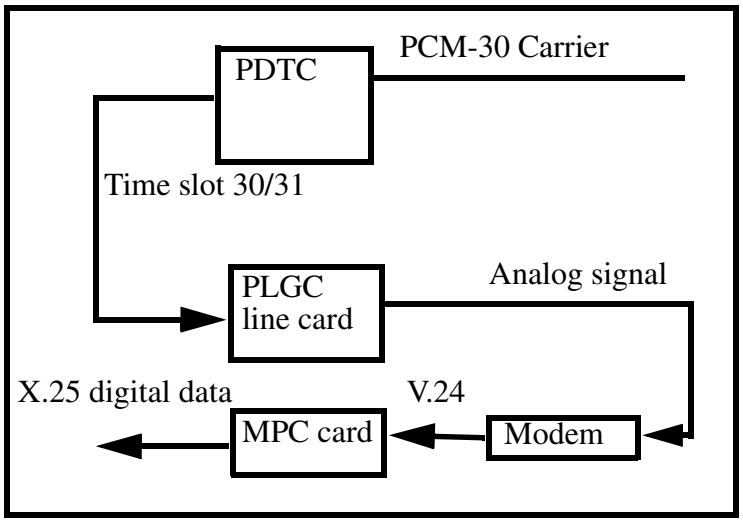
14.8.1 X.25 related tables

SOSM X.25 system uses the MPC card and associated tables to provide X.25 DTC 1 and 2. When X.25 data is transmitted via PCM-30 carriers, additional datafill is required to transfer that data from the PCM-30 carrier into the appropriate MPC card.

The following figure depicts the general configuration required for supporting X.25 on PCM-30. A connection is made between the MCL timeslot 30/31 on the carrier and a line card, via table SPCCON. The analog line is connected to a modem, which is then connected to the V.24 (RS232) port of the MPC card.

For each X.25 channel, a dedicated connection must be made. Semi-Permanent Connection trunks are used for this purpose.

Figure 66 X.25 on PCM-30 hardware configuration



The following sections describe the datafill requirement for MPC operations as well as additional datafill for X.25 on PCM-30 variant.

14.8.1.1 Table IOC

The datafill of this table is needed for IOM. Example datafill is shown in the following:

```
IOCNO FRTYPE FRNO SHPOS FLOOR ROW FRPOS MSCARD
MSPORT PECINFO

-----------------------------------------------

2   ISME 0    33     0   B     0     21    3  FX30AA
MTM 10 3   IOMRAS01 D010PMLD
```

```
3   ISME 0    47     0   B     0     20    3  FX30AA
MTM 11 3  IOMRAS01 D010PMLD
```

14.8.1.2 Table MPC

Table MPC must be datafilled with all the MPC card(s) used by the DMS-MMP. The SOSM system will use some of those cards for it's communications with the CP.

For each pair of data channels between the DMS MMP and the CP, one MPC card must be installed. Link 2 on the card will be used for Data Channel 1, and Link 3 for Data Channel 2.

At a minimum, one card must be installed and dedicated for SOSM. If multiple redundant cards are installed, each card will provide a redundant pair of Channels. When the card currently being used is experiencing trouble, the new card will automatically be selected.

An example datafill of table MPC is shown in the following table.

Table 15 Table MPC datafill example

MPCNO	MPCIOC	IOCCCT	EQ	DLDFILE
0	0	24	1X89BB	MPC403AC
1	1	24	1X89BB	MPC403AC
2	2	4	FX30AA	IOM$LOAD
3	3	4	FX30AA	IOM$LOAD

14.8.1.3 Table MPCLINK

Table MPCLINK is used to specify the protocol parameters of the X.25 link. For each MPC card and port (link), one entry must be datafilled in this table.

An example assumes clocking is provided by the Control Point X.25 card. An example datafill of table MPCLINK is shown in the following table. The example assumes clocking is provided by the Control Point X.25 card.

Table 16 Table MPCLINK datafill example for Modem Connection

LINKKEY	LINKALM	PRTCLDAT
1 1	Y	X2584 0 0 (NODETYPE DTE) (CLKSRCE EXTERNAL) (THRUPUT T9600) (NUMPVCS 1) (PVCDBIT DON)$ $
1 2	Y	X2584 0 0 (NODETYPE DTE) (CLKSRCE EXTERNAL) (THRUPUT T9600) (NUMPVCS 1) (PVCDBIT DON)$ $

Table 17 Table MPCLINK datafill example for Direct Cable Connection[a]

LINKKEY	LINKALM	PRTCLDAT
1 1	Y	X2584 0 0 (NODETYPE DTE) (CLKSRCE EXTERNAL) (THRUPUT T9600) (NUMPVCS 1) (PVCDBIT DON)$ $
1 2	Y	X2584 0 0 (NODETYPE DTE) (CLKSRCE EXTERNAL) (THRUPUT T9600) (NUMPVCS 1) (PVCDBIT DON)$ $

a. Note that datafill in this table may change depending on Control Point configuration.

Each entry corresponds to one link on the card.

The LINKKEY (Link Key) field identifies which MPC is used (i.e. MPC 3 Link 2 will appear as 3 2).

The LINKALM (Link Alarm) field controls the generation of system alarms in case when the link goes in to trouble state (SBSY).

The PRTCLDAT (Protocol Data) field specifies the protocol parameters.

There are several other X.25 L2 and L3 parameters that may be added, depending on the configuration of the control point X.25 system.

14.8.1.4 Table SOSMMPC (new)

Table SOSMMPC is used to map existing MPC cards and links in the office to pairs of SOSM channel 1 and 2. For each SOSM pair of channel, one entry is required.

This table can ONLY be accessed via SOSMCONF CI. Direct access attempt will result in “unauthorized access” message sent to CP, and any table commands thereafter is rejected. For information regarding SOSMCONF please refer to “2.7.3 SOSMCONF CI access password” on page 150.

An example datafill is shown in the following table.

Table 18 Table SOSMMPC example datafill

SOSMLINK	CHNL1	CHNL2
0	0 2	0 3
1	1 2	1 3
2	2 2	3 3

The SOSMLINK field indicates the SOSM Link number. Each new number can be used for redundancy. At least one entry must be present for SOSM to operate.

The CHNL1 and CHNL2 fields specify the MPC number and Link number to be used. MPC number must be a valid MPC datafilled in table MPC. The link number must can be {2 or 3} and must be a valid link datafilled in table MPCLINK.

CHNL1 and CHNL2 do not have to reside on the same MPC card.

Note: *The deletion of the active link in this table is denied while SOSM is active. Other tuples (non-active links) can be deleted or added when sosm is active.*

14.8.1.5 Table LINEATTR

This table is used to define the Line Attribute Index of a line. The SOSM application uses it to define the dedicated lines used for connection between the MCL carrier (TS 30 or 31) and the modem. This line must be have a Line Class Code (LCC) of type **SPC.** An example datafill is shown below:

```
15 SPC NONE NT 15  15 NILSFC 0  PX  NETXLA NTRS02 00
102_NPRT_1 NLCA_NILLA_1 $
```

14.8.1.6 Table LCCOPT

To define SPC line in MMP, the following tuple must be in table LCCOPT.

```
SPC (DGT) $
```

14.8.1.7 Table LENLINES

Example SPC line datafill is shown below:

> Servord

> new $ 7835479 spc 15 HOST 01 0 00 09 DGT $

table LENLINES:

```
HOST 01 0 00 09 S 0 102 7835479 DT 27 102_NPRT_1
NLCA_NILLA_1 $
```

14.8.1.8 TABLE SPCCON

This table is used for making Leased line (Semi-permanent) connections on DMS MMP. The SOSM system uses it to make a connection between an MCL trunk and a line card. The analog output of the line is then connected to the Modem. Trunks and lines datafilled in table SPCCON MUST be of type SPC.

An example datafill is shown below:

Table 19 SPCCON Datafill

SPCKEY	AGENT1	AGENT2	CONNECT
0	SOSMGRP0	LINE HOST 01 0 00 09	Y

Agent 1 identifies the trunk member to use. This trunk must be previously datafilled in table TRKMEM and put into service (please refer to "2.8.2 MCL trunk related datafill" on page 155 for complete information on creation of SOSM MCL trunks).

Agent 2 identifies a line dedicated for the SOSM X.25 connection. This line must be properly created and put in service prior to datafill of table SPCCON.

The CONNECT field indicates if a connection should be established when the datafill is complete.

14.8.2 MCL trunk related datafill

The SOSM MCL trunks are implemented using SPC (Semi-Permanent Connection) trunks with no signalling.

These MCLs are used to transmit speech information to CP, as well as to provide X.25 channels for commands and data (if variant 1 is required).

Note that there is no correspondence between MCL groups and PCM-30 trunk groups. An MCL group can contain members from different PCM-30 trunk groups. However, for each group of PCM-30 carriers, there must be a UNIQUE CLLI assigned as shown in the sections to follow.

To provide MCL trunks the following datafill order is required: CLLI, TRKGRP, TRKSGRP, TRKMEM, SOSMTRK (via SOSMCONF CI).

When a PCM-30 trunk group is datafilled in table SOSMTRK, that trunk group can not be deleted from TRKGRP table.

The sections to follow describe each table and provide a datafill example. For complete information regarding these tables, please refer to the appropriate NTP.

14.8.2.1 Table CLLI

Table CLLI is used to define Common Language Names for every piece of equipment on the DMS MMP. The SOSM system uses it to define MCL trunk groups. An example datafill for SOSM MCL trunk groups in table CLLI is shown in the following table.

Table 20 Table CLLI datafill

CLLI	ADNUM	TRKGRSIZ	ADMININF
SOSMGRP0	218	30	SOSM_MCL_GROUP_0
SOSMGRP1	219	30	SOSM_MCL_GROUP_1
SOSMGRP2	220	30	SOSM_MCL_GROUP_2
SOSMGRP3	221	30	SOSM_MCL_GROUP_3
SOSMGRP4	222	30	SOSM_MCL_GROUP_4
SOSMGRP5	223	30	SOSM_MCL_GROUP_5
SOSMGRP6	224	30	SOSM_MCL_GROUP_6
SOSMGRP7	225	30	SOSM_MCL_GROUP_7

For each PCM-30 group of MCLs, a separate CLLI is required. The number of members specified in TRKGRSZ corresponds to the number of PCM-30 time slots in an MCL group.

14.8.2.2 Table TRKGRP

This table is used to define the characteristics of a trunk in DMS MMP. For each trunk group, a tuple must be datafilled.

The SOSM system uses this table to define MCL trunk groups. An example datafill of this table is shown in the following table. The example shows eight MCL groups for up to 224 MCLs.

Table 21 Table TRKGRP datafill

GRPKEY	GRPTYP	TRAFSNO	PADGRP	NCCLS	GRPINFO
SOSMGRP0	SPC	0	NPDGP	NCRT	OG
SOSMGRP1	SPC	0	NPDGP	NCRT	OG
SOSMGRP2	SPC	0	NPDGP	NCRT	OG
SOSMGRP3	SPC	0	NPDGP	NCRT	OG
SOSMGRP4	SPC	0	NPDGP	NCRT	OG

Table 21 Table TRKGRP datafill

GRPKEY	GRPTYP	TRAFSNO	PADGRP	NCCLS	GRPINFO
SOSMGRP5	SPC	0	NPDGP	NCRT	OG
SOSMGRP6	SPC	0	NPDGP	NCRT	OG
SOSMGRP7	SPC	0	NPDGP	NCRT	OG

For each PCM-30 group a separate trunk group must be defined.

The GRPTYP field MUST be SPC, and the direction field must indicate OG (outgoing).

14.8.2.3 Table TRKSGRP

This table is used to provide more specific information about a trunk group. An example datafill is shown in the following table.

Table 22 Table TRKSGRP datafill

SGRPKEY	CARD-CODE	SGRPVAR
SOSMGRP0	DS1SIG	NOSIG

The card-code filed MUST specify P30CAS, and SGRPVAR must be NOSIG.

14.8.2.4 Table TRKMEM

This table defines the peripheral and carrier parameter of each PCM-30 carrier in a trunk group. The SOSM system uses a PDTC with QDT load for MCL trunks. For each MCL in a PCM-30 group, a tuple must be added to this table. The following table provides an example datafill.

Table 23 Table TRKMEM datafill

CLLI	EXTRKNM	SGRP	MEMVAR	
SOSMGRP0	1	0	PDTC	7 2 21

The CLLI field corresponds to the PCM-30 group name created in table CLLI and further defined in tables TRKGRP and TRKSGRP. The EXTRKNM field identifies the trunk member number. The member information field identifies the PDTC on which the trunk is installed (e.g. PDTC 7) and the carrier number (e.g. 2) and timeslot number (e.g. 21) on that carrier.

For a PCM-30 group of MCLs with all members defined, there must be one tuple per MCL member (i.e. members 1 through 28). If X.25 channels 1 and 2 are transmitted over PCM-30, two additional members are required (30 and 31).

There is a one-to-one correspondence between the member number in field EXTRKNM and MCL number. Mapping of MCL number to Timeslot number is done via the MEMVAR field.

> ***Note:*** *MCL numbers 1 through 15 map to Timeslot 1 through 15. Timeslot 16 IS NOT USED! MCL 16 must be mapped to Timeslot* ***17****, MCL 17 to Timeslot* ***18****, and so on up to MCL 28- timeslot 29. The following table shows an example of this mapping.*

Suppose PDTC 7 carrier 0 is used, and the PCM-30 group number is 0 (i.e. table SOSMTRK contains a tuple: 0 SOSMGRP0). The following table gives the correct mapping between TRKMEM datafill and MCL numbers.

Table 24 Mapping of Time Slot to MCL numbers

Trunk Member Number (EXTRKNM in table TRKMEM)	MEMVAR field	Timeslot	PCM-30 Group number in CP commands and messages	MCL member number (in CP commands and messages)
0	PDTC 7 0	0	N/A	N/A
1	PDTC 7 0 1	1	0	1
2	PDTC 7 0 2	2	0	2
3	PDTC 7 0 3	3	0	3
4	PDTC 7 0 4	4	0	4
5	PDTC 7 0 5	5	0	5
6	PDTC 7 0 6	7	0	6
7	PDTC 7 0 7	7	0	7
8	PDTC 7 0 8	8	0	8
9	PDTC 7 0 9	9	0	9
10	PDTC 7 0 10	10	0	10
11	PDTC 7 0 11	11	0	11
12	PDTC 7 0 12	12	0	12
13	PDTC 7 0 13	13	0	13

Table 24 Mapping of Time Slot to MCL numbers

Trunk Member Number (EXTRKNM in table TRKMEM)	MEMVAR field	Timeslot	PCM-30 Group number in CP commands and messages	MCL member number (in CP commands and messages)
14	PDTC 7 0 14	14	0	14
15	PDTC 7 0 15	15	0	15
16	PDTC 7 0 17	17	0	16
17	PDTC 7 0 18	18	0	17
18	PDTC 7 0 19	19	0	18
19	PDTC 7 0 20	20	0	19
20	PDTC 7 0 21	21	0	20
21	PDTC 7 0 22	22	0	21
22	PDTC 7 0 23	23	0	22
23	PDTC 7 0 24	24	0	23
24	PDTC 7 0 25	25	0	24
25	PDTC 7 0 26	26	0	25
26	PDTC 7 0 27	27	0	26
27	PDTC 7 0 28	28	0	27
28	PDTC 7 0 29	29	0	28
29	PDTC 7 0		N/A	N/A

14.8.2.5 Table SOSMTRK (new)

This table is used by the SOSM system for mapping generic trunk groups into dedicated SOSM trunks. Each entry identifies a trunk group to be used for the PCM-30 group of MCLs.

This table can ONLY be accessed via SOSMCONF CI, while SOC SOSM0001 is ON.

While SOSM0001 is ON,direct access attempt to this table will result in “unauthorized access” message sent to CP, and any table commands thereafter is rejected. For information regarding SOSMCONF please refer to “2.7.3 SOSMCONF CI access password” on page 150.

An example datafill is shown in the following table.

Table 25 Table SOSMTRK example datafill

SOSMGRP	CLLI
0	SOSMGRP0
1	SOSMGRP1

The SOSMGRP field identifies the PCM-30 group number (0 through 7).

The CLLI field identifies the trunk group to be used. The CLLI entered here must correspond to a valid trunk datafilled in tables CLLI, TRKGRP, TRKSGRP and TRKMEM.

When a trunk is datafilled in this table, it can not be deleted from tables TRKGRP and TRKMEM.

Note: *Changing data in this table will result in an "Unauthorized access to SOSM" message if the SOSM system is active, and the change will be rejected. SOSM must be switched OFF with a "STOP SOSM" command from CP before data is removed or changed.*

14.8.3 Provisioning of SOSM specific parameters

Table SOSMPARM is used by SOSM for saving SOSM specific parameters.

This table can ONLY be accessed via SOSMCONF CI while SOC SOSM0001 is ON.

While SOSM0001 is ON, direct access attempt to SOSMPARM will result in "unauthorized access" message sent to CP, and any table commands thereafter is rejected. For information regarding SOSMCONF please refer to "3.6.3 SOSMCONF CI access password" on page 133.

SOSMPARM table has 2 fields ; PARMNAME, and PARMVAL.

PARMNAME is the name of the parameter. Currently, TOLL_EXIT_ CODE, INTRAZONAL_CODE, and INTERNTNL_CODE parameters exist within this table.

The second field is PARMVAL. This field is a refinable area. Each parameter refines this area to hold its required data.

The selector field in PARMVAL area is PARMSEL. It identifies the appropriate subfields within PARMVAL area for the corresponding SOSM parameter.

Table 26 Default SOSMPARM tuples

PARMNAME	PARMVAL	
	PARMSEL	EXCODE
TOLL_EXIT_CODE	TOLL	8 (1 digit is allowed for this parameter)
INTRAZONAL_CODE	INTRAZONAL	2 (1 digit is allowed for this parameter)
INTERNTNL_CODE	INTERNTNL	10 (1-2 digit(s) are allowed for this parameter)

Data in SOSMPARM table can not be deleted. Furthermore, addition of new tuples with table editing commands is prevented by SOSM software. Default values for parameters which are provisionable via SOSMPARM are given in Figure 25, "Default SOSMPARM tuples".

It is not permitted to change PARMSEL for TOLL_EXIT_CODE, INTRAZONAL_CODE and INTERNTNL_CODE by table editing commands.

Note: *Changing data in this table will result in an "Unauthorized access to SOSM" message if the SOSM system is active, and the change will be rejected. SOSM must be switched OFF with a "stop sosm" command from CP before data is changed.*

14.8.4 Access to SOSM configuration tables and parameters : SOSMCONF

Access to SOSM configuration tables, namely, SOSMMPC, SOSMTRK and SOSMPARM is restricted. The only way to reach these tables is with a new CI level called SOSMCONF (SOSM CONFiguration). In order to reach this CI level, the correct SOSM CI access password must be entered.

SOSMCONF provides the access to tables SOSMMPC, SOSMTRK, and SOSMPARM through normal table control, only after a valid password is entered. If password checking fails three consecutive times, the SOSMCONF CI is exited and an unauthorized access message will be sent to CP.

If access to either tables SOSMMPC, SOSMTRK, or SOSMPARM is attempted outside of SOSMCONF level, the corresponding unauthorized access message will be sent to CP.

Access to SOSMCONF CI level is not permitted while SOC SOSM0001 is OFF state.

The following example shows editing of table SOSMTRK via SOSMCONF.

```
>SOSMCONF
THIS IS THE SOSM CONFIGURATION TABLES
          ACCESS INCREMENT
SOSMCONF:
ENTER PASSWORD:
>******
INVALID PASSWORD
ENTER PASSWORD:
>******
 ************************************
 *          ACCESS CONFIRMED *
 *     SOSM CONFIGURATION TABLES *
 *           ACCESS LEVEL *
 ************************************
>table SOSMTRK
TABLE: SOSMTRK
>QUIT
SOSMCONF
>QUIT
CI:
```

In this example, a wrong password was entered, followed by a valid password. Once access is granted, all normal editing can resume using TABLE command.

In the next example, attempt to access table SOSMTRK directly is blocked:

```
>table SOSMTRK
EMPTY TABLE
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: SOSMMPC
>
>ADD 1 SOSMGRP1
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>Y
YOU ARE NOT AUTHORIZED TO REACH TO THIS TOOL
TUPLE TO BE ADDED:
  2     2 2     2 3
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>N
DMO REJECTED
WARNING:  CURRENTLY NOT POSITIONED
>QUIT
CI:
>
```

In the above example, the craftsperson attempts to access the table directly rather than through SOSMCONF. An attempt to ADD a tuple to the table results in unauthorized access message with code **05H**, and the add command is refused.

14.9 Hardware Requirements

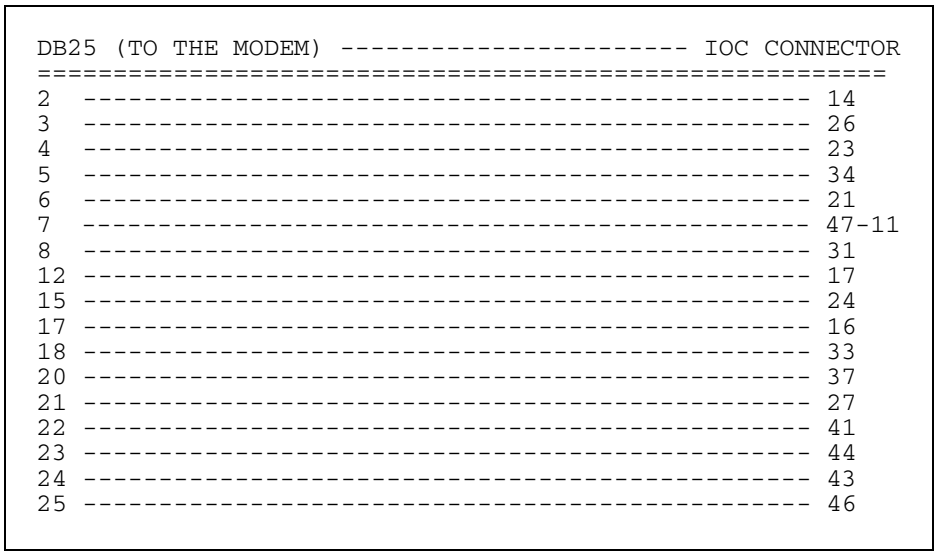
The exchange must be provisioned with additional conference circuits to support SOSM combined monitoring. For each MCL there must be one conference port (i.e. if 112 simultaneous calls with combined monitoring are allowed, 112 conference circuits are required.

Either MPC cards (NT1X89) or IOM must be installed to provide X.25 connection to the control point. For each pair of X.25 channels, one MPC card is needed.

If X.25 data is carried over PCM-30 channels, one dedicated line card per X.25 channel is required on an PLGC.

For each X.25 channel one **synchronous power-up leased line modem** is required to be connected between the serial port of the MPC card, and the data source (either line card for PCM-30 X.25 variant) or directly to the other (CP) modem. The serial port of the modem is connected to the MPC card via IOC to DB25 cable, NT part ID: **PEC NT0X26LY**. Pinout mappings are as follows:

Figure 67 Pinout mappings for DB25-IOC connector



MCL trunks must be provisioned on an existing or new DTC and datafilled as described in “2.8.2 MCL trunk related datafill” on page 155.

Configuring an IOM

The Input Output Module (IOM) replaces the functionality of the DMS IOC. The IOM minimally consists of an IOM motherboard, NTFX30AA, and an IOM paddleboard, NTFX31AA. The NTFX30AA inserts into a universal slot, slot 3 or 4, of an ISME or CISM shelf. The NTFX31AA attaches to thebackplane behind the NTFX30AA. The NTFX30AA paddleboard has twenty 2x4 connector sockets. Two of the twenty are spares, two are Message Switch links (for planes 0 and 1), and the remaining sixteen, numbered 0 through 15, are connected via 26 gauge two-pair twisted-pair cabling to what are called smart-connectors. The cable that connects the paddleboard 2x4 connectors directly to a smart- connector is an NT0X96LU; it has a 2x4 connector on one side, and has a six position modular plug on the smart-connector side. In the case of a CISM shelf, the paddleboard’s connectors are brought out to the bulkhead using cable harnesses (one DB37 per 8 ports and

MS link), and each port appears on the outside of the frame as a separate 1x4 connector; the cable between these 1x4 connectors and the smart-connectors is an NTRX26GA. As viewed by a user of the bulkhead connectors, the IOM in slot 3 is on the right, and the IOM in slot 4 is on theleft. The bottom 1x4 in each column of nine connectors is for a Message Switch link; the upper eight correspond to the eight positions of the 2x4 sockets on the IOM's paddleboard.

**** The following description is restricted to synchronous data links only. ****

For EIA/TIA-232-F, the NTFX34AA smart-connector is used. For ITU_T V.35, either the NTFX35AA or the NTFX35BA smart- connectors are used; the NTFX35AA is used for speeds up to and including 64 KBPS, and the NTFX35BA is used for speeds up to and including 512 KBPS. When the NTFX35BA is used, only two of the sixteen IOM ports, ports 0 and port 8, can be used, and the IOM firmware name is of the form IOMHaann, where a is an alphabetic and n is a numeric. Normally, the regular IOM firmware is used; its name is of the form IOMRaann. Under the regular IOM firmware, any combination of NTFX34AAs or NTFX35AAs can be connected to any of the sixteen ports, observing IOM engineering guidelines to prevent overloading.

Neither a disk nor a DAT can be configured on an IOM that is running IOMHaann (high speed) firmware, but either or both may be on an IOM used for lower speed serial interfaces.

IOM smart-connectors ARE ALWAYS HARDWARE DTEs. They can provide ITU_T circuit 113 (ANSI/EIA/TIA circuit DA) clock. The DTE clock rate is controlled by DMS datafill.

The NTFX35BA smart-connectors' DTE clock is always 512 KBPS.

Smart-connectors, unlike MPC and EMPC cards, provide signal ground isolation, and can therefore be directly connected to DCEs that may or may not provide ground isolation. Modems or modem-eliminators are no longer necessary for National Electric Code compliance.

Smart-connectors may be connected to their IOM paddleboard with up to 750 feet of cabling.

The housing of the smart-connector can and should be bonded to the DCE's ground. This will not cause a ground loop.

The DCE's timing provided to the smart-connector's receive and transmit clocks must be at the same rate and must be in-phase. The easiest way of accomplishing this is to set the DCE to derive its transmit clock from receive data, or by setting both receive and transmit clocks to synchronize with the digital network serving the DCE (the DS1/E1 transmit side should always be traceable to the receive side). In other words, the modem physically connected to a smart-connector should always be set to "slave" timing, and the other modem should be set to either "internal" or "external" timing.

Other than the clocking restriction, both V.35 smart-connectors are perfect implementations of CCITT Red BookAppendix II, and are in the range for maximum compatibility with ITU_T V.11 or EIAConfiguring an IOM-422-B balanced interchange circuit drivers.

The NTFX34AA has a male DB25 connector complying with ISO 2110-1991(E) pin definitions for EIA/TIA-232-F.

The NTFX35AA has a male DB25 connector. The V.35 pin definitions match the DMS EMPC DB25, and are listed on a data sheet provided with every smart-connector. The NTFX35AA can be adapted to an ISO 2593 DTE (male) connector by using an NTFX3505, B0250556. (Standard V.35.)

The NTFX35BA has a male DB25 connector. The V.35 pin definitions match the MVME 709-1 DB25, and are listed on a data sheet provided with every smart-connector. The NTFX35BA can be adapted to an ISO 2593 DTE (male) connector by using an NTFX3506, B0250557. (High speed V.35.)

One of the two twisted-pairs between a smart-connector and the IOM paddleboard transmits data from the smart- connector to the IOM. This pair is biased with 48 vdc which is used to power the smart-connector. If the smart-connector suffers an internal failure or this twisted-pair becomes shorted, the IOM will discontinue powering that line until the short/overload is removed; it will then automatically restore power to that line.

Smart-connectors will illuminate a green LED when they are properly configured and in service.

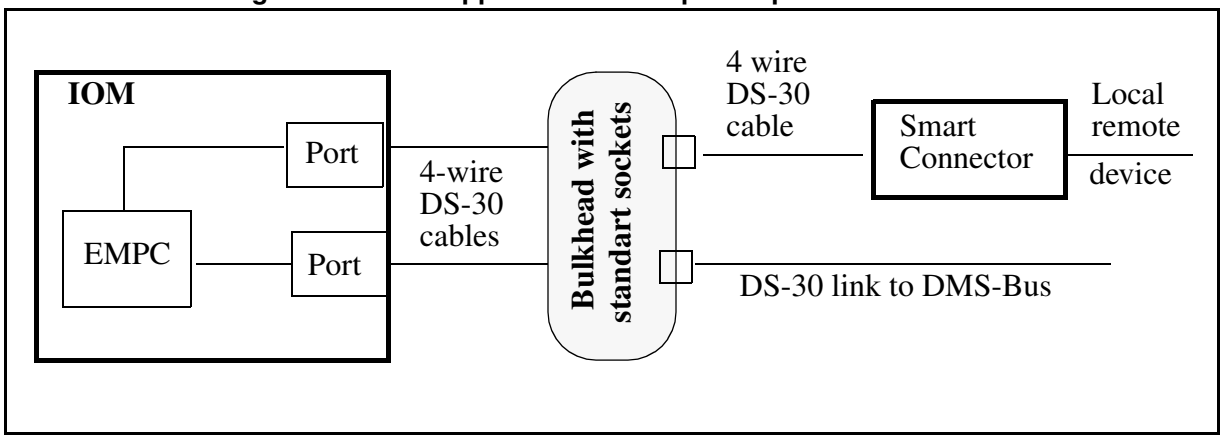
DMS datafill of the IOM is similar to IOC/EMPC datafill; three tables are involved: IOC, MPC, and MPCLINK. The IOM is first datafilled in table IOC and given a unique IOC number; associated with that IOC number are the MS ports, location, and the firmware to be downloaded to the IOM. Then a unique MPC number is arbitrarily chosen and used as an index in table MPC; the MPC number is associated with the IOC number just datafilled in table IOC, and with a port on the IOM, 0 through 15. Unlike EMPCs, the firmware file, already specified in table IOC, is always datafilled in table MPC as IOM$LOAD. In table MPCLINK, the IOM port is indexed with an MPC number, just assigned in table MPC, and a link number which is always 3 for

IOM ports; the MPCLINK entry contains the same configuration parameters that would be used for an EMPC port - with two exceptions for an NTFX35BA. When an NTFX35BA port is entered in table MPCLINK, its Electrospec is 512KV35, and parameter RITMAX should be set to 0. Again, a smart-connector is always a hardware DTE, so only the NODETYPE, DTE or DCE, needs to be set for appropriate LAPB addressing; the hardware type (DCE/DTE/DXE) should not be datafilled.

MAPCI commands allow the IOM firmware version to be queried. There are also commands to ask the IOM if it sees the correct smart-connector on a port, and commands to test data connectivity with the smart-connector via loopback testing. The DMS NTPs cover downloading, programming, and testing of the IOM and its smart-connectors.

At the device end of the cable is a smart connector that performs the necessary mapping between the standart 4-wire interface and the external interface, as summarised in figure 67.

Figure 68 IOM support for serial input/output



14.10 Software Requirements

N/A.

14.11 Feature Interactions

This section describes the feature interactions of SOSM and other subscriber services. For each feature, message sequence is shown identifying some basic information reported to CP.

For IBN agents, SOSM supports usage/activation/deactivation and interrogation of only CEPT features. For BRI agents ISDN BRI Supplementary services are supported.

SOSM sends service usage notification message(s) only if both the subscriber using the service and the monitored subscriber are in the same exchange.

For PRI agents ISDN PRI Supplementary services are supported. But SOSM sends service usage notification message(s) only for ETSIDIV, ECT and CUG supplementary services.

14.11.1 IBN CEPT Services

Usage, activation, deactivation, and interrogation of IBN CEPT services are reported to CP.

SOSM behavior for CEPT service interactions are determined regarding to Annex 2 of "Typical Program and Methods for Certification Tests of Communications Interface and Information Interexchange Protocol in Data Transfer Channels Between SOSM and CP on Electronic Telephone Exchanges" document.

In this document, reporting of service usage messages is mentioned as optional in several scenarios. SOSM reports optional service usage messages to CP if data regarding to usage of the service is available.

Any subscriber can put the connected subscriber on HOLD by FLASH.

In any of the scenarios described, when a party is put on HOLD, its MCL connection (if any) is also held.

The activation, deactivation and interrogation of CEPT IBN features (ILR, IWUC, CFU, CFB, CFD, ICWT, SCL, LNR, WML, CCBS, CND, SUPPRESS, CEPTPW) will be reported to CP. Message 1.4 indicating the code of service to be rendered to the subscriber will be sent. If these CEPT features are not assigned to the line, but exists in table CUSTSTN as default features, message 1.4 will be again send

A subscriber can activate/deactivate/interrogate CEPT features also within answered calls. In such scenarios, SOSM reports service activation/ deactivation/interrogation of CEPT services only for the observed subscribers.

The following shown scenarios through this section are for "complete combined" monitoring. The attribute of object's selection for other monitoring types are shown in "Table 26 Attribute of object's selection values" on page 168.

Table 27 Attribute of object's selection values

	Calling DN is SOSM subscriber	Called DN is SOSM subscriber	No one is SOSM subscriber in message
complete combined	01H	04H	40H
complete separate	03H	0CH	C0H
statistical	02H	08H	80H

If MCL connection cannot be established, only MCL-A and MCL-B fields of call messages are set to FFH, and any other information (i.e. Attribute of Objects Selection) is not affected by the failure.

14.11.1.1 Hold Functionality

Enquiry is responsible to setup multi-party calls as well as a base for Call Waiting, Call Transfer, Three Way Calling and Six Way Calling features.

When a party is added to a call via Enquiry, SOSM criteria check is performed on the added leg. If the controller is a SOSM subscriber, a new SOSM call number is allocated and the new call leg will be monitored as if it was a normal SOSM call. The original connection is also put on hold. When the controller returns to the original first call, the MCL connection is reactivated.

The following sections describe the messaging and behavior in each Enquiry scenario.

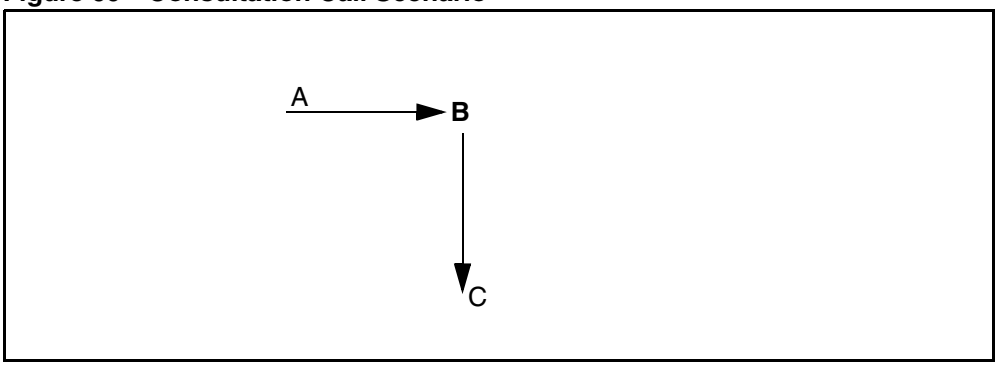
14.11.1.1.1 Consultation Call

In this scenario, B is the controller which has one of the Enquiry feature options. A calls B, B answers. B flashes (holds party A) and calls C. C answers. While A and C are talking, C hangs-up. B flashes and dials R-code for toggle to return to A. Sometime later, conversation ends.

For IBN lines, I3WC, I6WC, ICT, ICWT line options provide this functionality.

If controller exists during consultation call, held party will rering the controller. The existing MCL connection will be active. The same messages will be sent.

Figure 69 Consultation Call Scenario



The message sequence is shown in the following tables

Table 28 A is under surveillance

	1.1	1.2	1.4	1.4	1.3
Calling DN	A	A	B	B	A

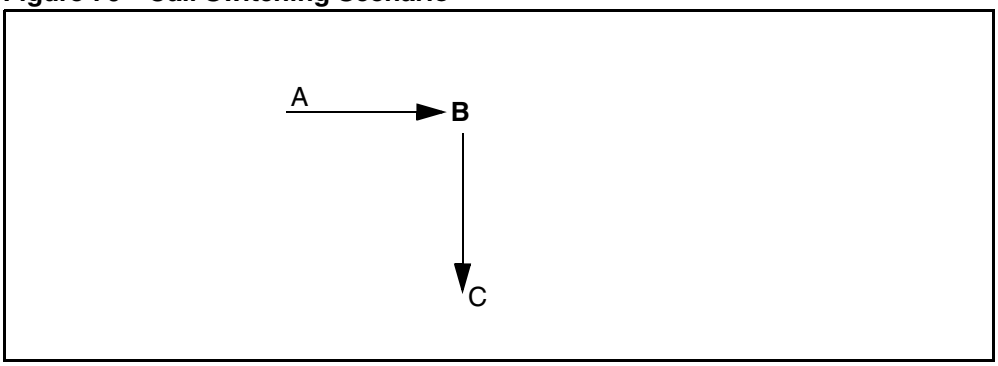
14.11.1.2 Call Switching

In this scenario A calls B, B flashes (holds party A) and calls C. During conversation with C, B flashes (holds subscriber C), then dials R-code for toggle and re-connect to A. B switches to C, and then switches to A again. A to B call disconnects. The other call disconnects.

For IBN lines, I3WC, I6WC, ICT, ICWT line options provide this functionality.

In this scenario, MCL connection suspends after flashes, and resumes when speech is re-established.

Figure 70 Call Switching Scenario



The message sequence is shown in the following tables.

14.11.1.2.1 Drop Held Party during Enquiry

In this scenario B is the controller which has one of the enquiry feature options. A calls B, B flashes and calls C. During conversation with C, B flashes (holds C) and dials R-code for disconnect first held party (A) and reconnects to C. Then B-C call is disconnected.

In this scenario, MCL connection suspends after flashes, and resumes when speech is established.

14.11.1.3 Call Waiting

Call Waiting allows a subscriber (controller) to receive a call while active in another call.

In this scenario, B has the Call Waiting feature. B calls A, A answers and they are talking. C calls B. B hears Call Waiting tone. Then party B holds A with flash and answers C by dialing R-code(toggle). While B and C are talking, C exits. Sometime later, A or B exit.

In this scenario, MCL connection suspends after flashes, and resumes when speech is established.

For IBN lines, ICWT line option provide this functionality.

Figure 73 Call Waiting Scenario

14.11.1.4 Three Way Calling

Three Way Calling feature allows a subscriber to establish a three way conference.

In this scenario, A calls B. B has the Three Way Call feature. B puts A on HOLD, and calls C. Later B flashes (holds C) and conferences A and C into a three way conference by dialing corresponding R-code. The A-B conversation is completed, in due to realization of supplementary service. Then the conference ends.

In this scenario, MCL connection suspends after flashes, and resumes when Conference/speech is established. When all parties are in conference, MCL speech path contains voice from ALL parties.

For IBN lines, I3WC line option provide this functionality.

14.11.1.5 Six Way Calling

The Six Way Calling feature allows a subscriber to establish a six way conference. I6WC option provides this functionality.

In this scenario the controller of a six way call (B) calls A. A answers. B puts A on HOLD and calls C. C answers. B flashes (puts C on hold) and dials R-code for 6WC to CONFerence A and C. The B-A conversation is completed, in due to realization of supplementary service. Then B puts the conference on HOLD and calls D. D answers. B flashes (puts D on hold) and dials 6 to conference all parties. Again due to realization of supplementary service, B-C conversation is disconnected. Then the conference is disconnected.

In this scenario, MCL connection suspends after flashes, and resumes when Conference/speech is established. When all parties are in conference, MCL speech path contains voice from ALL parties.

14.11.1.6 Call Transfer

Call Transfer feature allows to hold the current party, calling a new party (C), and transferring the Held party to the new party. After the transfer, the controller is no longer involved in the call.

If the controller in a Call Transfer is a SOSM agent, the SOSM call ends when the call is transferred. If the party being transferred is the SOSM agent, monitoring continues until the call completes.

The following scenarios provide more details regarding call transfer.

In this scenario, B has the Call Transfer feature. A calls B. B puts party A on HOLD, and dials C. B flashes (puts C on hold) and dials R-code to transfer A to C. A-B and B-C conversations are completed, in due to realization of supplementary service. Then the transferred call ends. ICT line option provides this functionality.

14.11.1.7 Call Forward (Busy, Unconditional, Do Not Answer)

Call Forward allows a subscriber to divert a call to another agent. If one of the parties is SOSM agent in a diverted call, monitoring continues in the new call formed after diversion. If the forwarded agent is a SOSM agent, the call is also monitored.

In this scenario, subscriber A calls B. B has Call Diversion Feature programmed to divert the call to C. CFU, CFB and CFD line options are used for IBN lines.

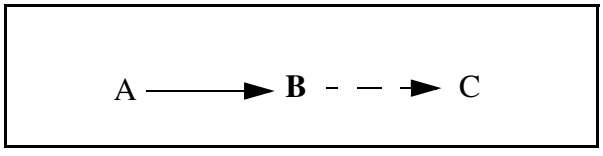

Table 53 A is under surveillance

14.11.1.7.2 Trunk Implementation

In local exchange, if the monitored call is routed over trunk then service usage notification messages (Msg.1.4) are not generated when call diversion (including call forward chain) takes place in other exchange.

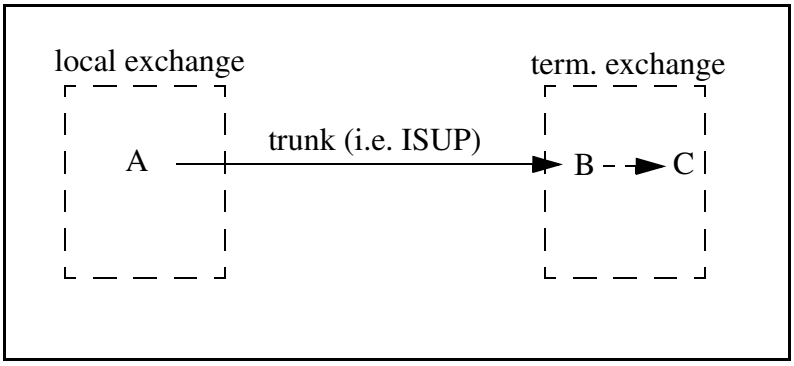

Table 60 A is under surveillance (Local Exchange)

	1.1	1.2	1.3
Calling DN	A	A	A
Called DN	B	B	B
SOSM Call #	1	1	1
Attribute of choice	01	01	01
Parameters of connection	11	11	11
Code of supp. service phase	00	00	00
MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

Table 61 B is under surveillance (Terminating Exchange)

	1.1	1.4	1.2	1.3
Calling DN	A	B	A	A
Called DN	B	C	C	C
SOSM Call #	1	1	1	1
Attribute of choice	04	01	40	40
Parameters of connection	12	1C	12	12
Code of supp. service phase	00	04	00	00

	1.1	1.4	1.2	1.3
MCL #	1	1	1	1
Code of operation	00	00	00	05
Feature Code	FF	Cfu Cfb Cfd	FF	FF

Table 62 C is under surveillance (Terminating Exchange)

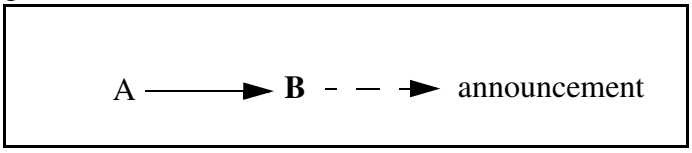
	1.1	1.4	1.2	1.3
Calling DN	A	B	A	A
Called DN	C	C	C	C
SOSM Call #	1	1	1	1
Attribute of choice	04	04	04	04
Parameters of connection	12	1C	12	12
Code of supp. service phase	00	04	00	00
MCL #	1	1	1	1
Code of operation	00	00	00	05
Feature Code	FF	Cfu Cfb Cfd	FF	FF

14.11.1.8 Call Forward to Announcement

This feature allows a subscriber to divert a call to the announcement. This feature can be activated either before or during a call.

If one of the parties is SOSM agent in a diverted call, monitoring continues in the new call formed after diversion.

In this scenario, subscriber A calls B. B has Call Diversion Feature programmed to divert the call to announcement.



For IBN lines, CDTA line option provide this functionality.

Table 63 A is under surveillance

	1.1	1.3
Calling DN	A	A
Called DN	B	B
SOSM Call #	1	1
Attribute of choice	01	01
Parameters of connection	1C	1C
Code of supp. service phase	00	00
MCL #	0	0
Code of operation	00	05
Feature Code	FF	FF

Table 64 B is under surveillance

	1.1	1.3
Calling DN	A	A
Called DN	B	B
SOSM Call #	1	1
Attribute of choice	04	04
Parameters of connection	1C	1C
Code of supp. service phase	00	00
MCL #	0	0
Code of operation	00	05
Feature Code	FF	FF

In line-to-line calls, SOSM stops monitoring the call when the originating subscriber starts to receive the announcement.

However, if the call is established via trunk, call content (annoucement) is sent to control point via MCL channel(s).

14.11.1.9 Speed Call

Speed Call allows a subscriber to make calls dialing abbreviated codes which were programmed before by the subscriber. This feature can be programmed either before or during a call.

Party A dials the abbreviated digits to call B.

For IBN lines, SCL line option provides this functionality.

Table 65 A is under surveillance

	1.1	1.2	1.3
Calling DN	A	A	A
Called DN	B	B	B
SOSM Call #	1	1	1
Attribute of choice	01	01	01
Parameters of connection	1C	1C	1C
Code of supp. service phase	00	00	00
MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

Table 66 B is under surveillance

	1.1	1.2	1.3
Calling DN	A	A	A
Called DN	B	B	B
SOSM Call #	1	1	1
Attribute of choice	04	04	04
Parameters of connection	1C	1C	1C

	1.1	1.2	1.3
Code of supp. service phase	00	00	00
MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

14.11.1.10 Call Completion to Busy Subscriber

This feature allows the subscriber to activate himself against the called party that is busy at the moment. A dials B which is busy. A activates CCBS against B. When B on-hooks, A rings. When A off-hooks, the call is setup automatically established between A and B. SOSM interaction for network CCBS will be supported only over ISUP V2 trunks.

In this scenario, A is SOSM agent. A calls B which is busy at that time. A activates CCBS against B. Then A goes on-hook.

Note that a SOSM call arises due to the activation of CCBS feature; because A is a SOSM agent. After a while, B finishes his conversation and goes on-hook. After B on-hooks, A rings and call is setup between A and B automatically. This is a normal SOSM call between A and B. CCBS line option provides this functionality.

Table 67 A is under surveillance

	1.1	1.3	1.4	1.3	1.4	1.1	1.2	1.3
Calling DN	A	A	A	A	A	A	A	A
Called DN	B	B	B	B	B	B	B	B
SOSM Call #	1	1	2	2	3	3	3	3
Attribute of choice	01	01	01	01	01	01	01	01
Parameters of connection	1C	1C	1C	1C	1C*	1C	1C	1C
Code of supp. service phase	00	00	01	00	04	00	00	00
MCL #	1	1	FF	FF	FF**	2	2	2
Code of operation	00	03	FF	05	FF	00	00	05
Feature Code	FF	FF	CC BS	FF	CC BS	FF	FF	FF

Note 1: * Parameter of connection is always set as 1C in CCBS service usage message, since at this call step, SOSM is unable to determine whether B is a present exchange subscriber or not.

Note 2: ** In CCBS service usage message, MCL number is always set as FF.

14.11.1.11 Malicious Call Trace

This feature allows a subscriber to detect a continuously disturbing number by using double FLASH during the call. If a subscriber activates feature against a calling agent, that agent stays held and a log is produced for the operator to detect the number.

In this scenario, A calls B. B activates feature against A.

For IBN lines, CLF line option provide this functionality.

Table 68 A is under surveillance

	1.1	1.2	1.3
Calling DN	A	A	A
Called DN	B	B	B
SOSM Call #	1	1	1
Attribute of choice	01	01	01
Parameters of connection	1C	1C	1C
Code of supp. service phase	00	00	00
MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

Table 69 B is under surveillance

	1.1	1.2	1.4	1.3
Calling DN	A	A	B	A
Called DN	B	B	A	B
SOSM Call #	1	1	1	1

	1.1	1.2	1.4	1.3
Attribute of choice	04	04	01	04
Parameters of connection	1C	1C	1C	1C
Code of supp. service phase	00	00	04	00
MCL #	1	1	1	1
Code of operation	00	00	00	05
Feature Code	FF	FF	CLF	FF

Note: If terminating line is monitored and has MCT option (CEPT and CLF) then call clearing (Msg.1.3) message is not sent as the originator on-hooks unless MCT is activated.

14.11.1.11.1 Post Disconnection

Definition: If calling party on hooks before called party has activated MCT, and if called party activates MCT by double flash within post diconnection timer then MCT logs will be printed like a normal activation in case of terminating office has calling DN information.

If the terminating line is monitored and has MCT option (CEPT and CLF) then service usage notification (Msg.1.4) and call clearing (Msg.1.3) messages are sent after terminator activates MCT.

14.11.1.12 International Line Restriction

International Line Restriction allows subscribers to restrict some of their own calls.

14.11.1.12.1 Activation from translations

In this scenario, A has ILR option. A activates ILR feature directly from the translations. The message sequence is shown in the following table.

For IBN lines, ILR line option provides this functionality.

Table 70 A is under surveillance

	1.4	1.3
Calling DN	A	A

	1.4	1.3
Called DN	Dilaed Digits	Dilaed Digits
SOSM Call #	1	1
Attribute of choice	01	01
Parameters of connection	1C	1C
Code of supp. service phase	01	00
MCL #	FF	FF
Code of operation	FF	05
Feature Code	ILR[a]	FF

a. * Same feature code is used for OCB.

14.11.1.12.2 Activation during a call

In this scenario, A calls B. During the call, A activates ILR feature.The message sequence is shown in the following table.

Table 71 A is under surveillance

	1.1	1.2	1.4	1.4	1.4	1.3
Calling DN	A	A	A	A	A	A
Called DN	B	B	B	ILR activation digits	B	B
SOSM Call #	1	1	1	1	1	1
Attribute of choice	01	01	01	01	01	01
Parameters of connection	1C	1C	1C	1C	1C	1C
Code of supp. service phase	00	00	04	01	04	00
MCL #	1	1	1	FF	1	1
Code of operation	00	00	00	FF	00	05
Feature Code	FF	FF	HOLD	ILR	HOLE	FF

14.11.1.12.3 ILR Usage

In this scenario, A calls a restricted number. The message sequence is shown in the following table.

Table 72 A is under surveillance

	1.1	1.4	1.3
Calling DN	A	A	A
Called DN	B	B	B
SOSM Call #	1	1	1
Attribute of choice	01	01	01
Parameters of connection	1C	1C	1C
Code of supp. service phase	00	04	00
MCL #	1	1	1
Code of operation	00	00	01
Feature Code	FF	ILR	FF

14.11.1.13 Last Number Re-dial

Last Number Re-dial allows the subscriber to repeat the last dialled number by using a defined code. There is no interaction with SOSM.

In this scenario, A calls B using LNR service. The message sequence is shown in the following table. No usage message is reported to control point for LNR service.

Table 73 A is under surveillance

	1.1	1.2	1.3
Calling DN	A	A	A
Called DN	B	B	B
SOSM Call #	1	1	1
Attribute of choice	01	01	01
Parameters of connection	1C	1C	1C

	1.1	1.2	1.3
Code of supp. service phase	00	00	00
MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

If B is under surveillance, the message sequence is the same with the basic call where called party is under surveillance.

14.11.1.14 Automatic Line

Automatic line allows a subscriber to have a direct connection to a DN which was programmed before by the office personnel as soon as the subscriber goes off-hook. The subscriber does not have effect in activating or deactivating this feature.

If a SOSM agent has this feature and uses it, a SOSM call arises. The message sequence is shown in the following table. AUL line option provide this functionality.

Table 74 A is under surveillance

	1.1	1.2	1.3
Calling DN	A	A	A
Called DN	B	B	B
SOSM Call #	1	1	1
Attribute of choice	01	01	01
Parameters of connection	1C	1C	1C
Code of supp. service phase	00	00	00
MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

If B is under surveillance, the message sequence is the same with the basic call where called party is under surveillance.

14.11.1.15 Warm-Line

WML (Warm Line) feature is similar to HTL except for CEPT_WML_DEFAULT_TMO parameter in table OFCVAR. If the subscriber does not make a call within this time interval, a direct connection to a determined DN is made. This feature can be activated by the subscriber.

SOSM interacts with this feature when a direct feature access is made to activate the feature. The message sequence for activation is shown in the following table. WML line option provide this functionality.

Table 75 A is under surveillance

	1.4	1.3
Calling DN	A	A
Called DN	Dialled digits	Dialled digits
SOSM Call #	1	1
Attribute of choice	01	01
Parameters of connection	1C	1C
Code of supp. service phase	01	00
MCL #	FF	FF
Code of operation	FF	05
Feature Code	WML	FF

When the call is being placed automatically, WML has the same behavior as AUL feature.

If B is under surveillance, the message sequence is the same with the basic call where called party is under surveillance.

14.11.1.16 CEPT Do Not Disturb

While CDND is active for IBN lines, no calls will be routed to this subscriber.

SOSM only interacts with this feature when direct feature access is made to activate or deactivate the feature. The message sequence for activation is shown in the following table.

Table 76 A is under surveillance

	1.4	1.3
Calling DN	A	A
Called DN	Dialled digits	Dialled digis
SOSM Call #	1	1

Code of supp. service phase	00	00
MCL #	1	1
Code of operation	00	03
Feature Code	FF	FF

14.11.1.17 Wake-up Call

This feature allows the subscriber to ring his/her telephone set at a specified time which can be programmed by the subscriber himself/herself.

SOSM only interacts with this feature when direct feature access is made. The message sequence for IWUC activation is shown in the following table.

For IBN lines, IWUC line option provide this functionality.

Table 79 A is under surveillance

	1.4	1.3
Calling DN	A	A
Called DN	Dialled digis	Dialled digits
SOSM Call #	1	1
Attribute of choice	01	01

Feature Code	FF	FF

14.11.1.19 Call Forward Remote Access (CFRA)

CFRA allows user to (de)activate Call Forward and enter the forward-to number by remotely dialling a DISA number and entering a PIN. This feature is implemented by activity A59019083 (MMP14).

Figure 77 CF Remote Access successfull call scenario

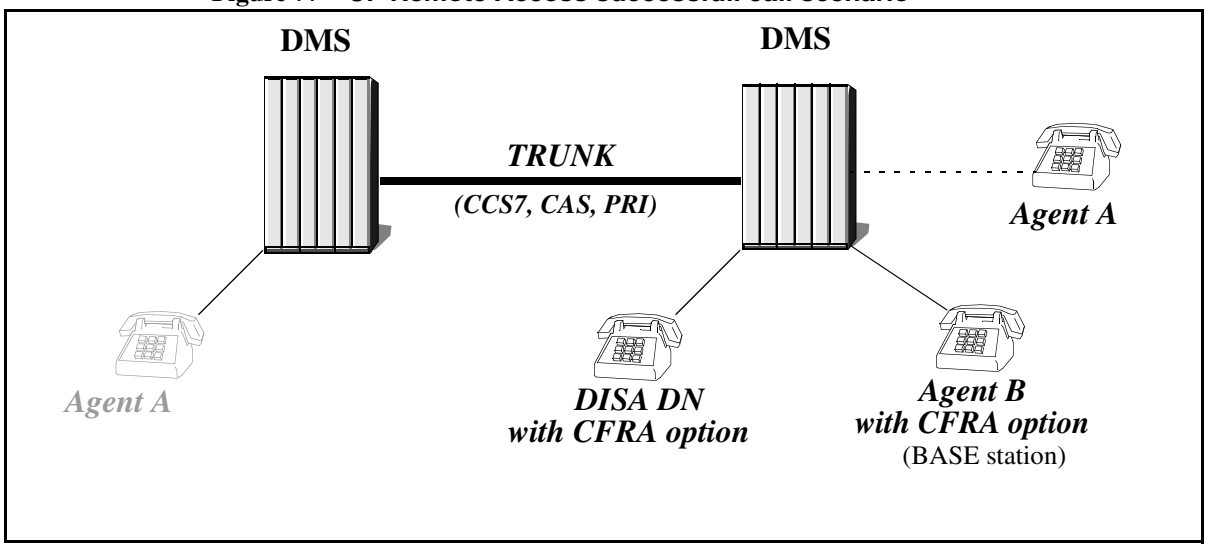

Table 84 A is under surveillance

	1.1	1.3

Note: Since no MCL(s) are assigned during act/deact/inter via CFRA, MCL# field is always set to FFH within Msg.1.4s.

14.11.1.20 CEPT Remote Access (CEPTRA)

CEPTRA (CEPT Features Remote Access) feature allows subscribers to control some CEPT feature functionalities of IBN lines from remote agents. CEPTRA allows activation/programming, deactivation or interrogation of CEPT features on end user's phone from a remote location.

The below figure show the functionality of CEPTRA in MMP.

Figure 78 CEPT Features Remote Access successfull call scenario

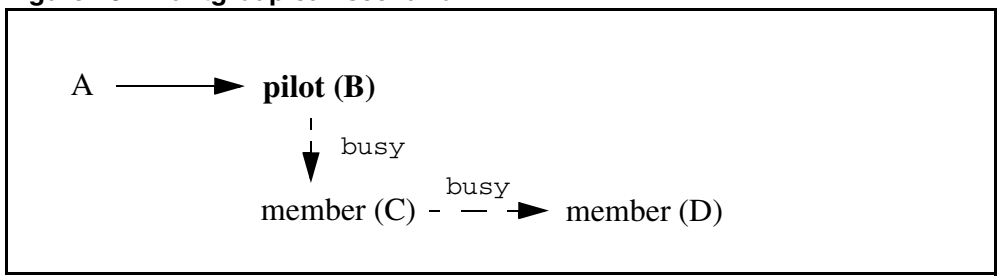
Code of operation	FF	FF
Feature Code	CEP TRA	Feat.

Note1: Since no MCL(s) are assigned during act/deact/inter via CFRA, MCL# field is always set to FFH within Msg.1.4s.

14.11.1.21 Huntgroups (DNH, DLH, MLH)

DNH configuration: Since each member of huntgroup has its own DN, any member or the pilot can be assigned as target. Calls from the pilot/member(s) are monitored if the subscriber is assigned as target.

Figure 79 Huntgroup call scenario



If call is terminated to the busy pilot, and the call is passed to another DN in the huntgroup, the call steps in this scenario are as follows:

1- A calls B while B is busy; **2-** The call is rerouted to C (Realization of hunt group), and C is busy; **3-** The call is rerouted to D (Realization of hunt group); **4-** D answers; **5-** Disconnection of A-D call.

Feature Code	FF	FF	FF

DLH/MLH configuration: Since there is one DN, only the pilot DN can be assigned as target. Calls to/from any member or pilot of the huntgroup are monitored if the pilot DN of the huntgroup is target. Note that the pilot DN is sent to CP whether the call is originated or terminated by pilot/member.

SOSM does not send Hunt Group service usage message to CP while hunting a member within the group.

14.11.2 ISDN BRI Supplementary Services

Usage, activation, deactivation, and interrogation of BRI supplementary services are reported to CP.

"SOSM Message Sequences for ISDN Supplementary Services" (SOSMISDN in FMDOC library) document describes the SOSM behavior for BRI/PRI supplementary services.

In this document, reporting of service usage messages is mentioned as optional in several scenarios. SOSM reports optional service usage messages to CP if data regarding to usage of the service is available.

During activation, deactivation and interrogation of ISDN BRI Supplementary Services, message 1.4 indicating the code of service to be rendered to the subscriber is sent. BRI service act/deact/interrogation can be done in two different ways:

- via using CEPT dialing sequence (CFx, WML, WUCR, OCB)
- via using BRI phone set facilities (CFx and CCBS)

If BRI phone set facilities are used during subscriber action (CFx and CCBS act/deact/int), 1.3 - Disconnect message is not reported to CP, since no off-hook/on-hook takes place.

If CEPT dialing sequence is used during subscriber action, behavior of 1.3 - Disconnect Message varies depending on how dialed digits are sent:

- If digits are sent **inside the origination message,** 1.3 - Disconnect message is reported to CP, as soon as 1.4 - Suppl. Service Usage message is sent (before subscriber goes on-hook).
- If digits are sent **in digits message(s),** 1.3 - Disconect message is sent after subscriber on-hooks.

If BRI supplementary service act/deact/interrogation (using CEPT dialing sequence) takes place after taking active call on HOLD, 1.4 - Suppl. Service Usage and 1.3 - Disconnect messages are sent with a new call number, since subscriber action takes place in a new call. See the following example message sequence.

Consider agent A is under surviellance, and performs the followings in turn:

1. A calls B.

2. B answers.

3. While A and B are talking, A takes A-B call on hold.

4. A activates xx Suppl. Service via using Cept dialing sequence.

5. Activation is successful, and A retrieves A-B call.

6. A goes on hook after a while.

14.11.2.1 Consultation Call (by using ISDN BRI HOLD service)

ISDN BRI HOLD service allows a user to interrupt an active call, and subsequently to re-establish that call or establish other calls.

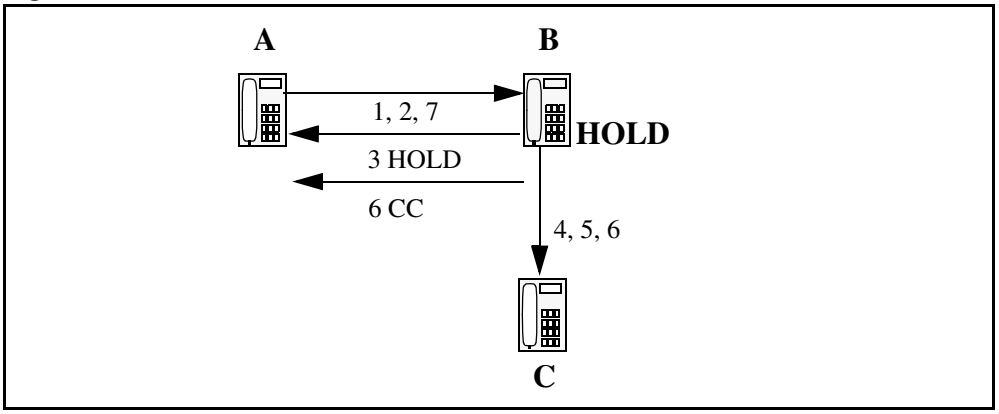
The required SOSM message sequences in Section5 of Annex2 of SOSM Conformance Test document are also valid for ISDN BRI HOLD service.

The following call steps are reported to CP according to SOSM Conformance Test document.

Scenario 1: Controller with a single MSN

1- A dials B; **2-** B answers; **3-** B puts A on hold; **4-** B dials C; **5-** C answers; **6-** B ends the consultation call with C and returns to conversation with A; **7-** disconnection of conversation A-B.

Figure 80 Consultation Call with ISDN BRI HOLD service



The required SOSM message sequences for Consultation Call are listed in Table 93 , Table 94 and Table 94 .

14.11.2.3 Call Waiting (CW)

ISDN BRI Call Waiting (CW) service allows a user to be notified that there is a new incoming call while there is no available B-channel. The user then has the choice of accepting, rejecting or ignoring the new call.

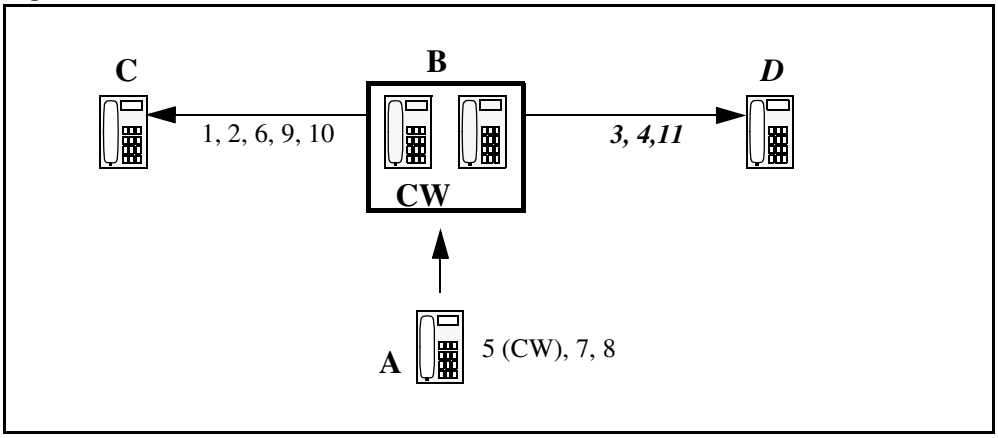
Required SOSM message sequences in Section3 of Annex2 of SOSM Conformance Test document are not valid entirely for ISDN BRI CW service. The difference is that ISDN BRI CW service is invoked when a third call arrives after two calls were made to subscriber B (both B-channels are busy). Therefore, required SOSM message sequences for CW are updated below regarding this difference.

Scenario 1: Controller with a single MSN
(ISDN CW differences from SOSM Conformance Test document are in bold&italic).

1- B dials C; **2-** C answers; **3- B dials D**; **4- D answers**; **5-** A dials B and B is notified about the incoming call; **6-** B puts C on hold and switches to conversation A-B; **7-** B answers; **8-** Disconnection of conversation A-B; **9-** Retrieve conversation B-C; **10-** Disconnection of conversation B-C; **11- Disconnection of conversation B-D**.

Please note that CW service is activated only if both B-channels of BRI access is busy. For this purpose, A-B and A-C calls in the given example are considered to be on different terminals. Therefore, A does not need to put A-B call on hold in order to establish A-C call.

Figure 84 CW Service



The SOSM message sequence is shown in the following tables.

A BRI phone set can have multiple DN's by the use of MSN supplementary service. Below scenario illustrates a CW service usage where A has different MSN numbers.

In below scenario, B1, B2 and B3 represent the MSN1, MSN2 and MSN3 DNs on the same BRI access. In order to realize the scenario below, B1 and B3 must be on the same BRI set, and B2 must be on a different BRI set.

Scenario 2: Controller with different MSN's

(ISDN CW differences from SOSM Conformance Test document are in bold&italic).

1- B1 dials C; **2-** C answers; **3- B2 dials D; 4- D answers**; **5-** A dials B3, B1 and B2 are notified about the incoming call; **6-** B1 puts C on hold and switches to conversation A-B3; **7-** B3 answers; **8-** Disconnection of conversation A-B3; **9-** Retrieve conversation B1-C; **10-** Disconnection of conversation B1-C; **11- Disconnection of conversation B2-D**.

The SOSM message sequence is shown in the following tables.

14.11.2.4 Three Party (3PTY)

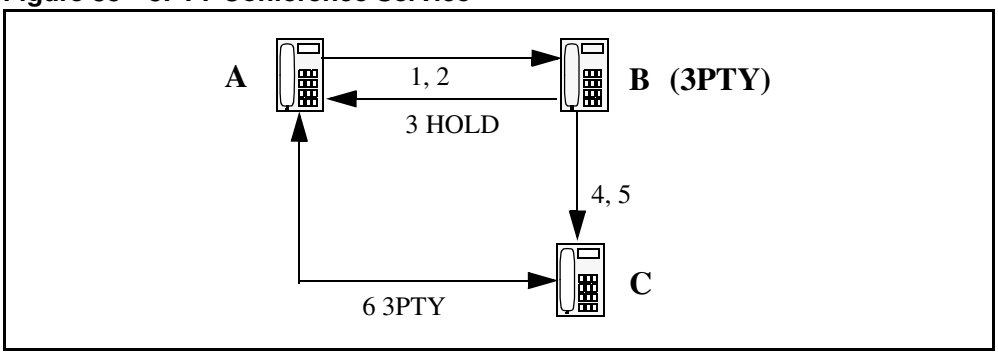
With the ISDN BRI 3PTY service, the served user, which has only one Active-Idle connection, and one Active-Held connection can join the Active-Idle connection with the Active-Held connections, to form a three-way conversation.

For a basic three-way conversation, the following call steps are reported to CP.

Scenario 1: Controller with a single MSN

1- A dials B; **2-** B answers; **3-** B puts A on hold; **4-** B dials C; **5-** C answers; **6-** B put A&C into three-party conference; **7-** disconnection after the end of conversation A-B; **8-** disconnection after the end of conversation B-C.

Figure 85 3PTY Conference Service



The SOSM message sequence is shown in the following tables.

A BRI phone set can have multiple DN's by the use of MSN supplementary service. Below scenario illustrates a CW service usage where A has different MSN numbers.

In below scenario, B1 and B2 represent the MSN1 and MSN2 DNs on the same BRI phone set.

Scenario 2: Controller with different MSN's

1- A dials B1; **2-** B1 answers; **3-** B1 puts A on hold; **4-** B2 dials C; **5-** C answers; **6-** B2 put A&C into three-party conference; **7-** disconnection after the end of conversation A-B1; **8-** disconnection after the end of conversation B2-C.

The SOSM message sequence is shown in the following tables.

During the three-way conversation the served user can request that the network:

— explicitly disconnect one of the remote users and the connection to that remote user,

— terminate the three-way conversation,

— create a private communication with one of the remote users.

Additionally, during three-way conference, one of the remote users can disconnect from the conference. This results in the termination of the

conference (three way bridge is released). After this action, the conversation of the controller with the remaining remote party continues.

Please note that, upon termination of three party conference due to any reason, initial connections are re-established. For example, in Scenario 2 given above (where different MSN's of the controller is used), A is connected to B1, and C is connected to B2 after conference terminates.

In addition to Annex2 of SOSM Conformance Test document, below scenarios are investigated for 3PTY service.

14.11.2.4.1 Disconnection of one remote user, and retention of the other

Scenario1: Disconnection of Held leg A-B

B disconnects subscriber A (Active-Held connection), three-way bridge is released and the call B-C continues.

- When A is under surveillance; the disconnection message of conversation A-B (No.1.3 in step7) is reported to CP.
- When B is under surveillance; the disconnection message of conversation A-B (No.1.3 in step7) is reported to CP.
- When C is under surveillance; no message is reported.

Scenario 2: Disconnection of Active leg B -C

B disconnects subscriber C (Active-Idle connection), three-way bridge is released and the call A-B continues.

- When A is under surveillance; the"No.1.4- SS Usage - HOLE" message is reported when subscriber B retrieves the conversation A-B.
- When B is under surveillance; the disconnection message of conversation B-C (No.1.3 in step8) is reported to CP and the"No.1.4- SS Usage - HOLE" message is reported when subscriber B retrieves the conversation A-B.
- When C is under surveillance; the disconnection message of conversation B-C (No.1.3 in step8) is reported to CP.

14.11.2.4.2 Creation of a private communication with remote user

Scenario 1: Controller returns to the initial held call.

Subscriber B ends the 3PTY call and creates a private communication with subscriber A (Active-Held connection). The three-party bridge is released and there are still two calls (A-B idle and B-C held).

- When A is under surveillance; the“No.1.4- SS Usage - HOLE” message is reported when subscriber B retrieves the conversation A-B.
- When B is under surveillance; the“No.1.4- SS Usage - HOLE” message is reported when subscriber B retrieves the conversation A-B.
- When C is under surveillance; no message is reported to CP.

Scenario 2: Controller returns to initial active call

Subscriber B ends the 3PTY call and creates a private communication with subscriber C(Active-Idle connection). The three-party bridge is released and there are still two calls (B-C idle and A-B held).

- When A is under surveillance; no message is reported to CP.
- When B is under surveillance; no message is reported to CP.
- When C is under surveillance; no message is reported to CP.

14.11.2.4.3 Remote user terminates the call

Scenario 1: A (held party) terminates

Subscriber A disconnects from 3PTY call, three-way bridge is released and the call B-C continues.

- When A is under surveillance; the disconnection message of conversation A-B (No.1.3 in step7) is reported to CP.
- When B is under surveillance; the disconnection message of conversation A-B (No.1.3 in step7) is reported to CP.
- When C is under surveillance; no new message is reported to CP.

Scenario 2: C (active party) terminates

Subscriber B disconnects from 3PTY call, three-way bridge is released and the call A-B continues.

- When A is under surveillance; the“No.1.4- SS Usage - HOLE” message is reported when subscriber B retrieves the conversation A-B.
- When B is under surveillance; the disconnection message of conversation B-C (No.1.3 in step8) is reported to CP and the“No.1.4- SS Usage - HOLE” message is reported when subscriber B retrieves the conversation A-B.
- When C is under surveillance; the disconnection message of conversation B-C (No.1.3 in step8) is reported to CP.

14.11.2.5 Conference Call (ECONF)

The ECONF supplementary service enables a user who is connected to the network via a point to multipoint ISDN ETSI BRI to establish/participate in and control a simultaneous communication involving a number of users up to 6.

Required SOSM message sequences in Section9 of Annex2 of SOSM Conformance Test document are used as a reference for a basic ISDN BRI Conference call.

The following call steps are reported to CP.

Scenario 1: Controller with a single MSN

1- B dials C; **2-** C answers; **3-** B puts C into conference call; **4-** B puts conference call on hold; **5-** B dials A; **6-** A answers; **7-** B adds A into conference call; **8-** completion of one conversation in due to realization of supplementary service; **9-** B dials D; **10-** D answers; **11-** B adds D into conference call; **12-** completion of one conversation in due to realization of supplementary service; **13-** B retrieves the conference call; **14-** disconnection of conference call.

Note: * While adding D into the conference, SOSM replaces B3 with the DN of the controller (B1). This is due to ECONF service behavior. By the activation of ECONF, D is involved into a conference with the controller (B1), and B3 is disconnected from the call.

In addition to Annex2 of SOSM Conformance Test document, below scenarios are investigated for ECONF service.

14.11.2.5.1 Controller isolates and reattaches a conferee

Scenario 1: B isolates A from the conference call.

- When A is under surveillance; a “No.1.4-SS Usage:HOLD” message is reported to CP for the isolation from the conference call.
- When B is under surveillance; no message is reported to CP.
- When C is under surveillance; no action is taken.
- When D is under surveillance; no action is taken.

Scenario 2: B reattaches A to the conference call.

- When A is under surveillance; a “No.1.4-SS Usage:HOLE” message is reported to CP for the reattaching to the conference call.
- When B is under surveillance; no message is reported to CP.
- When C is under surveillance; no action is taken.
- When D is under surveillance; no action is taken.

14.11.2.5.2 Controller drops a conferee from the conference

B disconnects A from the conference :

- When A is under surveillance; the disconnection of conference call (No.1.3 in step14) is reported to CP.
- When B is under surveillance; no message is reported to CP since the disconnection of call A-B (step 8) was already reported.
- When C is under surveillance; no action is taken.
- When D is under surveillance; no action is taken.

14.11.2.5.3 Disconnection of a conferee from the conference

A disconnects from the conference call:

- When A is under surveillance; the disconnection of conference call (No.1.3 in step14) is reported to CP.
- When B is under surveillance; no message is reported to CP since the disconnection of call A-B (step 8) was already reported.

- When C is under surveillance; no action is taken.
- When D is under surveillance; no action is taken.

14.11.2.6 Call Transfer (ECT) for BRI

Explicit Call Transfer is an ISDN supplementary service which enables a user who has two calls, each of which can be an incoming or an outgoing call, to connect the other parties and get out from the call. ECT has two invocation types: implicit invocation and explicit invocation.

The required SOSM message sequences in Section7 of Annex2 of SOSM Conformance Test document are valid for a basic ISDN BRI ECT service.

The following call steps are reported to CP according to SOSM Conformance Test document:

Scenario 1: Controller with a single MSN

1- A dials B; **2-** B answers; **3-** B puts A on hold; **4-** B dials C; **5-** C answers; **6-** B makes call transfer; **7-** disconnection of conversation A-B; **8-** disconnection of conversation B-C; **9-** disconnection of transferred call A-C.

14.11.2.7 Call Forward (Busy, Unconditional, Do Not Answer)

Call Forward allows a subscriber to divert a call to another agent. If one of the parties is SOSM agent in a diverted call after diversion.

In BRI lines call forwarding is provisioned with CFU, CFD, CFB and CFK (Call Forward per Key) line options.

CFK feature can be assigned to any vacant key on the loop. Those DN keys, which are to receive the CFK functionality are specified in a KEYLIST. For CFK, user can provide a different DN for each key specified in the KEYLIST. CFU and CFK provides the same functionality in terms of call forwarding. Therefore, **CFK usage/act/deact/int is reported with "CFU" feature code in 1.4 - Suppl. Service Usage message.**

CFB and CFD features might be assigned per DN in the existing system, and there are 4 types of CFB and CFD which are N (Normal), F (Fixed), P (Programmable), and K (Programmable per Key). Following table shows the overall picture of CFx. Please refer to activity "A59028702 - Support of CFx for Multiple DNs on ETSI BRI" for further information.

Table 143 Overall Picture of CFx

Cfx	Possible Activation
CFU	Per Access
CFK	Per DN
CFB N, F, P	Per Access
CFB K	Per DN
CFD N, F, P	Per Access
CFD K	Per DN

14.11.2.7.1 CFx Act/Deact/Interrogation

BRI Subscriber can act/deact/interrogate CFx flavors either by using CEPT dialing sequences, or via using call forward programming facilities of BRI phone set. **SOSM sends different message sequences to CP for those two kinds of CFx act/deact/interrogation.**

Subscriber actions for Act/Deact/Interrogation of CFx flavors is reported to CP only for the DN initiating the CFx act/deact/interrogation (i.e. Other DNs affected by CFx Act/Deact/Int are not reported), if DN was supervised for monitoring.

a. CFx Act/Deact/Interrogation Using Cept Dialing Sequence

BRI subscriber can act/deact/interrogate CFx flavors using CEPT dialing sequences. Please refer to activity "A59034125 - ISDN BRI CEPT Call Forwarding" for detailed information.

SOSM sends 1.4 - Suppl. Service Usage and 1.3 - Disconnect messages consequently (only for the DN subscriber action is initiated from), when subscriber CFx act/deact/interrogation is completed successfully.

Behavior of 1.3 - Disconnect Message varies depending on how dialed digits are sent. If dialed digits are sent

— inside origination message, 1.3 Message is sent just after 1.4 Message, before subscriber on-hook.

— in digits message(s), 1.3 Message is sent just after subscriber on-hook.

See SOSM message sequences for the example below.

Figure 89 BRI CFx Example

```

There are three DNs defined on this loop, and "$" on the KEYLIST of CFB option states that any DN on the loop will be affected by CFB act/deact/int. Consider that 7831002(A1) and 7831003(A2) are being monitored.

SOSM message sequence reported to CP as a result of CFB programming initiated from A1 is as follows:

Table 144 A1 is under surveillance, CFB programming initiated by A1

Messages	1.4	1.3
Calling DN	**A1**	**A1**
Called DN	Dialled Digits	Dialled Digits
SOSM Call #	**1**	**1**
Attribute of choice	01	01
Parameters of connection	1C	1C
Code of supp. service phase	01	00
MCL #	FF	FF
Code of operation	FF	05
Feature Code	CFB	FF

SOSM message sequence reported to CP as a result of CFB programming initiated from A2 is as follows:

Table 145 A2 is under surveillance, CFB programming initiated by A2

Messages	1.4	1.3
Calling DN	**A2**	**A2**
Called DN	Dialled Digits	Dialled Digits
SOSM Call #	**1**	**1**

Parameters of connection	1C	1C
Code of supp. service phase	01	00
MCL #	FF	FF

Messages	1.4	1.3
Code of operation	FF	05
Feature Code	CFB	FF

If CFB programming is initiated by A3 (not being monitored) no SOSM messages will be reported to CP as a result of CFB programming, although programming affects other DNs.

b. CFx Act/Deact/Interrogation Using Phone Set (when on-hook)

BRI subscriber can act/deact/interrogate CFx flavors using BRI phone set menu, when on-hook. In this kind of subscriber actions, phone set sends facility messages, and act/deact/interrogate action is performed according to the information received in the facility message. However, number of facility messages, and information sent inside the message strictly depends on the BRI phoneset which subscriber action is initiated from.

For example, activating a CFx flavor with an ASCOM Eurit 30 phone set causes deactivation of other CFx flavors active on the set, while this does not happen with TELES.FON sets.

The ASCOM phone sets send three facility messages since the basic service can not be chosen from the phone menu. So the phone set sends the same facility messages for all basic services. Moreover TELES.FON set sends 9 facility messages because even call forward type (CFU, CFB, CFD) can not be chosen from its menu.

Since all facility messages are processed by DMS, SOSM is responsible to report each facility message, which causes successful subscriber action. So a seperate 1.4 - Suppl. Service Usage message is sent for each facility message causing successful act/deact/interrogation.

Please note that 1.3 - Disconnect message is not reported to CP, since no off-hook/on-hook occurs during this kind of CFx act/deact/ interrogation.

In the exaple below, CFB is active for both DNs on the loop, while CFU is also assigned but not active. Consider A1 is being monitored and CFU programming is initiated from A1.

```

When subscriber(A1) initiates CFU activation from ASCOM Eurit 30 phone set, where three facility messages(one per basic service) are sent for CFU activation, and also three facility messages are sent for deactivation of per CFx flavor assigned, facility messages processed by DMS and SOSM message sequence reported to CP would be as follows.

Figure 91 Facility Messages for CFU Activation (Ascom Eurit 30 Set)

14.11.2.7.2 CFx Usage

The Call Forwarding Unconditional (CFU) service causes all incoming calls to a BRI line to be forwarded immediately to an alternative number. The called party's ability to originate calls is unaffected.

The Call Forwarding Busy (CFB) service causes an incoming call to a BRI line to be forwarded immediately to an alternative number if it encounters a busy subscriber. The called party's ability to originate calls is unaffected. The DMS implementation does not support the User Determined User Busy procedures. The DMS uses the Network Determined User Busy procedures.

The Call Forwarding No Reply (CFNR) service causes an incoming call to a BRI line to be forwarded to an alternative number if it is not answered within a specified time. The called party's ability to originate calls is unaffected.

In the scenario given below, subscriber A calls B. B has Call Diversion Feature programmed to divert the call to C. CFU, CFB and CFD line options are used for BRI lines.

SOSM message sequences provided in Section1 of Annex2 of SOSM Conformance Test document are also valid for ISDN BRI Call Forwarding services. The SOSM message sequences of ISDN BRI CF services should be same with CEPT CF ones.

The following call steps are reported to CP:

1- A dials B; 2- call forwarding; 3- C answers; 4- disconnection.

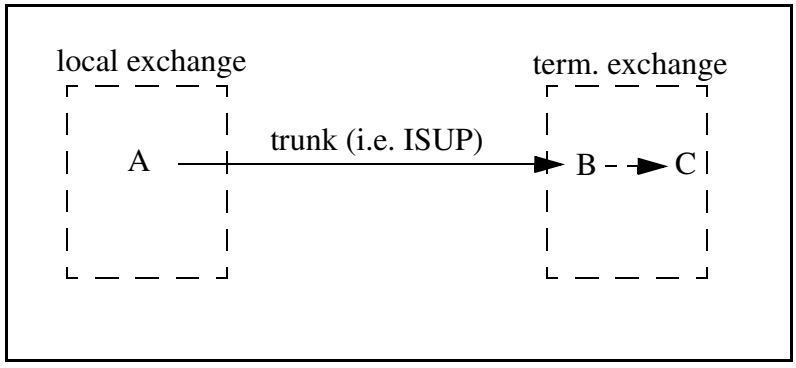
Trunk Implementation

In local exchange, if the monitored call is routed over trunk then service usage notification messages (Msg.1.4) are not generated when call diversion (including call forward chain) takes place in other exchange.



In the scenario given above, the following call steps are reported to CP from the local exchange if the originator is a monitored subscriber or if B's number is observed as a network number at local exchange.

1- A dials B; 2- A receives answer over trunk; 3- disconnection.

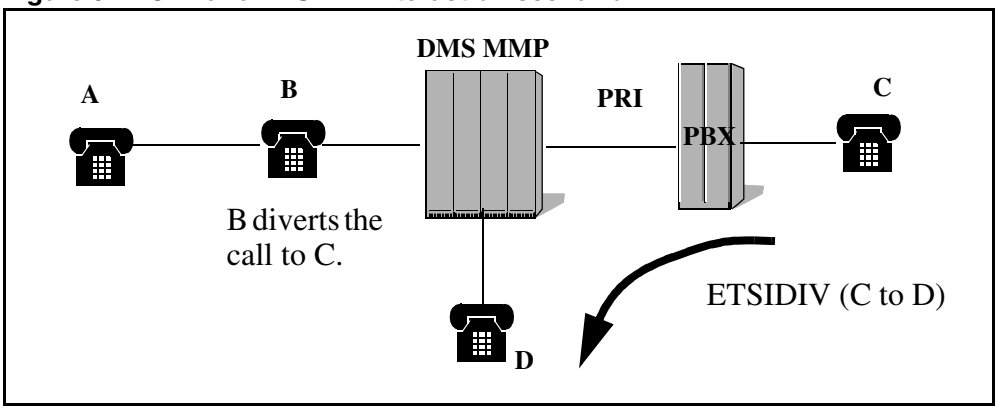
CFx interaction with ISDN PRI ETSIDIV service

ETSIDIV is an ISDN PRI service which allows a private network user to reroute an incoming call from a PRI agent to another network number. CFx service has interaction with ETSIDIV.

As it is described in detail in section "14.11.3.2 ETSIDIV - ETSI PRI Diversion", SOSM is unable to find previous diversion information after the call is rerouted by ETSIDIV service.

Figure 92 CFx and ETSIDIV interaction scenario



Above figure illustrates a scenario where the call is diverted twice with CFx and ETSIDIV services.

In this scenario, SOSM is unable to collect diversion information for ETSIDIV service when D is monitored.

Additionally, if subscriber C uses ETSIDIV Late Release, also B-to-C forwarding data is lost upon activation of ETSIDIV.

Therefore, SOSM does not send ETSIDIV usage message if monitoring starts after ETSIDIV activation (i.e. while monitoring D). Additionally, SOSM sends CFx notification message -only if ETSIDIV Early Release activated-with the available called party information which can be determined after monitoring starts.

In the above scenario, the call steps are as follows.

1- A dials B; **2-** B forwards the call to C over PRI; **3-** C diverts the call to D by using ETSIDIV; **4-** D answers; **5-** disconnection.

Table 158 D is under surveillance in CFx and ETSIDIV interaction

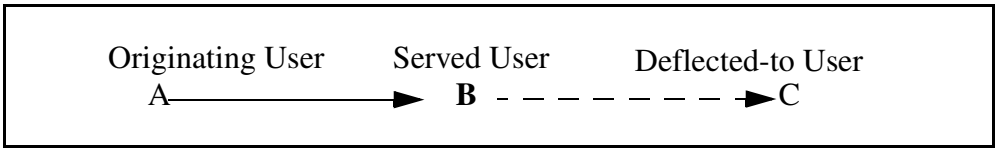
14.11.2.8 Call Deflection (CD)

The ISDN BRI Call Deflection (CD) service allows a user to respond to an incoming call by requesting redirection of that call to another user.



Call deflection service can be invoked in two different ways:

- **Call Deflection Immediate (CDI):** CD is invoked in response to the offered call
- **Call Deflection on Alerting (CDA):** during the period that the served user is being informed of the call

DMS MMP supports two different modes of CD functionality according to the CD subscription option per subscriber: clearcall or retain call. DMS MMP behavior on these subscription options can be summarized as follows:

- **Call Deflection with Early Release (Clear Call on Invocation):** Upon activation of CD service, the served user is immediately disconnected via sending a DISCONNECT message, and the call is rerouted to the deflected-to-user.

- **Call Deflection with Late release (Retain Call Until Alerting):** Upon activation of CD service, DMS MMP establishes a new call between originating user (A) and deflected-to user (C). Initial call between the originating user (A) and served user (B) is not cleared until an alerting indication is received from the deflected-to user (C).

SOSM has different functionalities for CD early release and CD late release.

14.11.2.8.1 Call Deflection with Early Release

The following call steps are reported to CP:

1- A dials B; **2-** B deflects the call to C; **3-** C answers; **4-** disconnection.

14.11.2.8.2 Call Deflection with Late Release

In this scenario, A-B call is retained until deflected-to user (C) begins to alert.

Please note that when the late release of Call Deflection occurs, the deflected call is reported as a new call with a new SOSM call number since there are two calls until reception of alert notification from deflected-to user (C).

Scenario 1: Call is deflected to C (C is idle and alerting)

If the deflected-to user is idle, then CD service clears the initial call between the originator (A) and served user (B).

The following call steps are reported to CP:

1- A dials B; **2-** B requests call deflection to C; **3-** C alerts (call is deflected); **4-** C answers; **5-** Call disconnection (A-C).

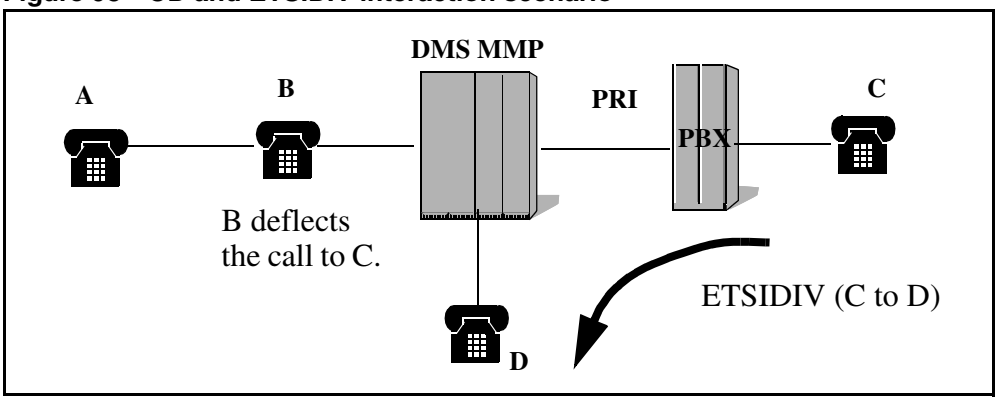
14.11.2.8.3 CD interaction with ISDN PRI ETSIDIV service

ETSIDIV is an ISDN PRI service which allows a private network user to reroute an incoming call from a PRI agent to another network number. CD service has interaction with ETSIDIV.

As it is described in detail in section “14.11.3.2 ETSIDIV - ETSI PRI Diversion”, SOSM is unable to find correct information about diverting and diverted-to subscribers after the call is rerouted by ETSIDIV service.

Figure 93 CD and ETSIDIV interaction scenario



Above figure illustrates a scenario where the call is rerouted twice with CD and ETSIDIV services.

In this scenario, SOSM is unable to collect diversion information for ETSIDIV service when D is monitored.

Additionally, if subscriber C uses ETSIDIV Late Release, also B-to-C deflection data is lost upon activation of ETSIDIV.

Therefore, SOSM does not send ETSIDIV usage message if monitoring starts after ETSIDIV activation (i.e. while monitoring D). Additionally, SOSM sends CD notification message -only if ETSIDIV Early Release activated-with the available called party information which can be determined after monitoring starts.

In the above scenario, the call stepsare as follows.

1- A dials B; **2-** B deflects the call to C over PRI; **3-** C diverts the call to D; **4-** D answers; **5-** disconnection.

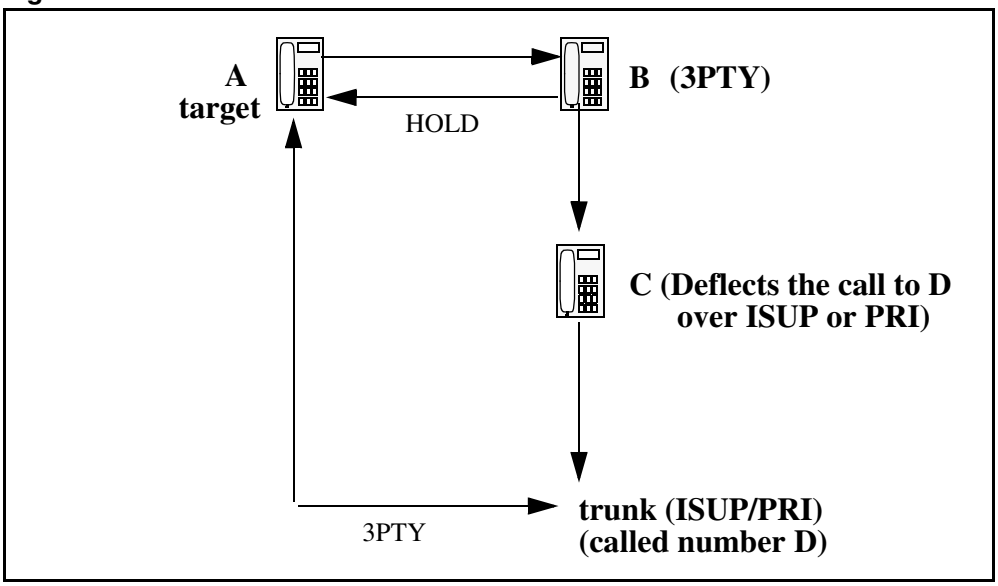
Note: *This column is reported only if ETSIDIV Early Release is invoked.

14.11.2.8.4 CD interaction with multi-party services

When a subscriber deflects a call over an ISUP or PRI trunk, original deflected-to number can not be determined after deflected-to subscriber alerts.

In multi-party services such as conference calls or call transfer, SOSM informs CP about all subscribers involved in the call, even if they are not monitored subscribers.

Figure 94 3PTY Conference Service



Above scenario illustrates a scenario where CD and 3PTY service interacts. In this scenario, SOSM is expected to notify CP about the conference and the conferees (A, B and D), when B establishes conference between A, B and the trunk agent.

However, due to the existing Call Deflection service functionality, SOSM is unable to determine original deflected-to number during activation of three

party conference, if D is not a present exchange subscriber. Therefore, in 3PTY service notification message, C is sent to CP as the called number instead of C.

14.11.2.9 Terminal Portability (TP)

The Terminal Portability (TP) supplementary service allows a user to move one terminal from one socket to another within one given basic access during the active state of a call.

TP service also allows a user to move a call from one terminal to another terminal within one given basic access during the active phase of call.

SOSM messages for the above scenarios are as follows.

Scenario 1 : Call is resumed from the same terminal

1. A dials B; **2.** B answers; **3.** B parked the call; **4.** B resumed the call; **5.** The call completed.

This call scneario is shown in the Figure 95 .

14.11.2.10 Malicious Call Identification (MCID)

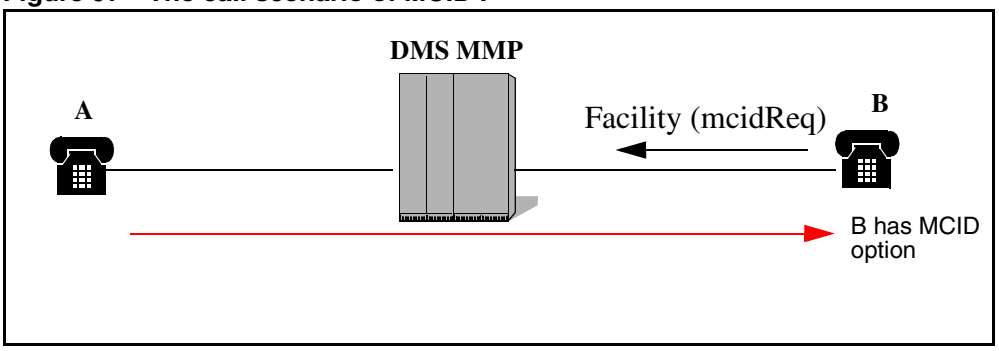
ISDN BRI MCID service enables the network to identify an incoming call. MCID can be invoked either manually by the subscriber or automatically by the network for all unanswered calls. It can be requested during the active phase of call or in the call clearing phase after receipt of DISCONNECT.

The following call steps are reported to CP.

1- A dials B; **2-**B answers; **3-**B invokes MCID service against A; **4-**disconnection of conversation A-B

This call scenario is shown in the Figure 97 .

Figure 97 The call scenario of MCID .



The SOSM message squences of ISDN BRI MCID service is same with CEPT MCT (CLF option). Please refer to Section “14.11.1.11 Malicious Call Trace” on page 405.

SOSM message sequences for MCID are listed in the tables below .

Table 173 A is under surveillance

Code of operation	00	00	00	05
Feature Code	FF	FF	MCID	FF

Note 1: When B attempts to activate MCID multiple times within a call, only the first MCID activation attempt is reported to CP as MCID usage message (1.4) .

Note 2: DMS generates an MCID log for unanswered calls automatically. However, SOSM does not send MCID usage notification for this MCID log, since there is no user action in this scenario.

Note 3: After originator (A) goes onhook, terminator (B) can request MCID within the next 30 secs. This functionality is provided by delaying the release of the call. In this scenario, SOSM behavior will be the same with the behavior in the MCID request during talking.

14.11.2.11 Calling Line Identification Restriction (CLIR)-Temp Mode

The ETSI BRI CLIR service restricts presentation of the calling user's ISDN number and subaddress to the called user. BRI CLIR service can be assigned to subscribers as permanent mode or temporary mode. If the calling user has subscribed to CLIR with permanent mode, then the presentation indicator forwarded thru the network indicates' presentation restricted' for all calls.

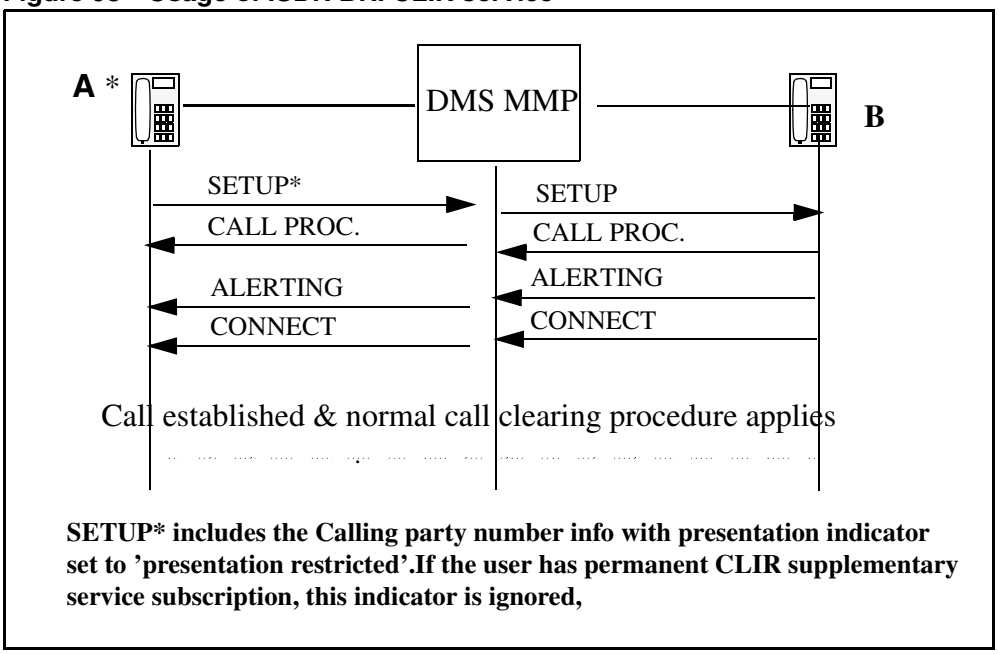
Since there is no user interaction in permanent mode, no SOSM service usage message is reported to CP when the subscriber has CLIR with permanent mode.

If the calling user has subscribed to the CLIR service with temporary mode and CLIR is requested by the user on a per call basis, the calling party number information element containing a presentation indicator is included in the SETUP message, then the originating network shall set the presentation indicator according to that in the received Calling party number information element.

SOSM reports service usage notification message for CLIR (temporary mode) to Control Point, if a SETUP message with presentation indicator set to 'presentation restricted' is received from a monitored subscriber.

CLIR usage notification is sent only for the user of the service - i.e. only when originator is target.

Figure 98 Usage of ISDN BRI CLIR service



The following call steps are reported to CP:

1- A dials B by using CLIR service per call basis; **2-** B answers; **3-** disconnection of conversation A-B.

14.11.2.12 Connected Line Identification Restriction (COLR)-Temp mode

The ETSI BRI COLR service is a service offered to connected party. It restricts presentation of connected party's ISDN number and subaddress to calling party.It can be assigned to subscribers as permanent mode or temporary mode.

If the called user has subscribed to COLR with permanent mode, the presentation indicator forwarded through the network indicates 'presentation restricted' for all calls.

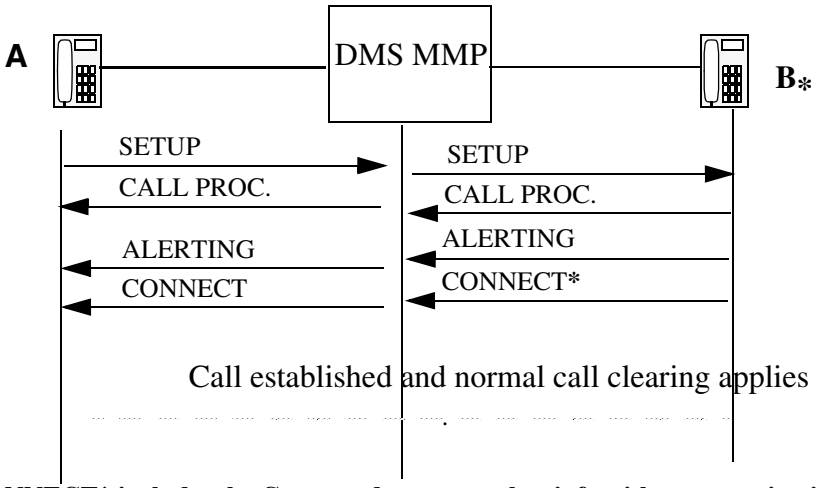
Since there is no user interaction in permanent mode, SOSM does not send service usage message for COLR (permanent mode) to CP.

If the calling user has subscribed to the COLR with temporary mode and if COLR is requested by the user on a per call basis, the Connected Number information element containing a presentation indicator is included in the CONNECT message. Destination network sets the presentation indicator according to presentation indicator in the received Connected Number information element.

SOSM sends service usage notification message for COLR (temporary mode) to CP, upon reception of presentation indicator with 'presentation restricted' value within CONNECT message.

COLR usage notification is expected only for the user of the service - i.e. only if terminating agent is target.

Figure 99 Usage of ISDN BRI COLR service



CONNECT* includes the Connected party number info with presentation indicator set to 'presentation restricted'. If the user has permanent COLR supplementary service subscription, this indicator is ignored,

The following call steps are reported to CP:

1- A dials B; **2-** B answers by using COLR service per call basis; **3-** disconnection of conversation A-B.

14.11.2.13 User to User Signalling (UUS)

ISND BRI UUS service allows either party in a call to provide up to 128 octets of free-format information to the other party. UUS1 Service supports the exchange of information via UUI parameters in the standart call setup and clearing messages such as SETUP.

There are two types of UUS1 request: Implicit and explicit request.

An implicit request is preferred as default. This "preferred" means the call has not to be ended if UUI element can not be passed.

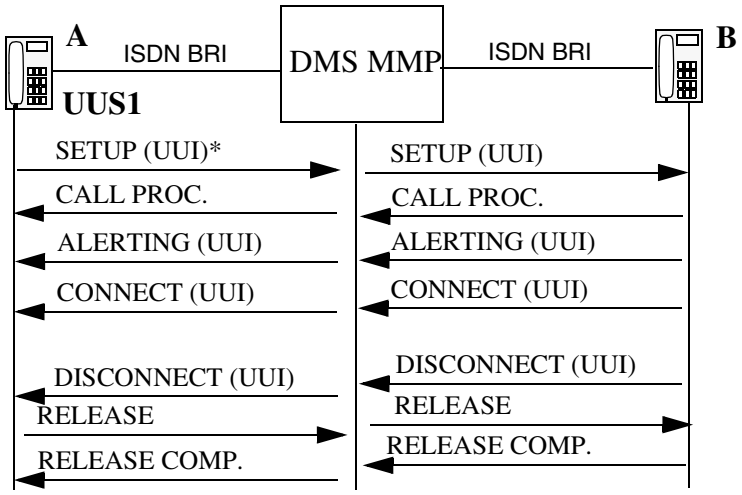
Explicit request has two types as required and preferred. The calling user may be able to specify whether the request for service is required or preferred for the call (whether the call should be completed or not if User to User information can not be passed).

The following call steps are reported to CP if UUS1 service is successfully invoked:

1- A dials B; **2-** UUS1 service successfully invoked; **3-** B answers; **4-** disconnection of conversation A-B.

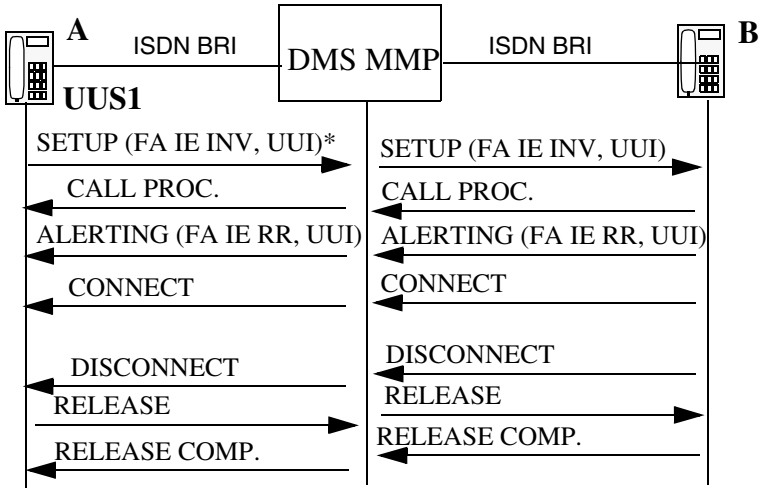
SOSM assumes that the UUS1 service is invoked successfully by the followings: with a valid UUI in SETUP message for UUS1 implicit mode, or with a valid FA IE INV component in SETUP message for UUS1 explicit mode.

Figure 100 Usage of ISDN BRI UUS1 implicit service



*** UUS1 implicit service successful invocation:** If the DMS office receives a valid "User-to-User Information (UUI)" in SETUP message from the calling party, it is assumed that the UUS1 implicit service is invoked successfully and the message "No.1.4- SS Usage" is reported to CP.

Figure 101 Usage of ISDN BRI UUS1 explicit (required or preferred) service



*** UUS1 explicit service successful invocation:** If the DMS office receives a valid "FA IE INV" component in SETUP message from the calling party, it is assumed that the UUS1 explicit service is invoked successfully and the message "No.1.4- SS Usage" is reported to CP.

Table 179 A is under surveillance

Parameters of connection	1C	1C	1C	1C
Code of supp. service phase	00	04	00	00
MCL #	1	1	1	1
Code of operation	00	00	00	05
Feature Code	FF	UUS1	FF	FF

Note: In unsuccessfull calls (called agent is busy, etc..), UUS service is not realized. Therefore, SOSM does not send "No.1.4-SS usage" message for UUS in such calls.

14.11.2.14 Closed User Group (CUG) for BRI

CUG provides a mechanism for forming groups to and from which access is restricted. A specific user may be member of one or more Closed User Groups. Members of a specific CUG can communicate among each other but not, in general, with users outside of the group.

CUG service does not have subscriber interactions Therefore, "No.1.4-SS usage" message is not reported for CUG service. SOSM message sequence for successful calls to/from Closed User Group members is the same with the basic calls.

If a call to a Closed User Group member fails, and if the call is monitored, operation code in the message 1.3 "Call Clearing" can vary according to the treatment set by the CUG service. SOSM does not send service usage notification for CUG in such scenarios.

If the treatment is set to busy treatment by CUG service , the operation code in 1.3 "Call Clearing" message is set to 3 (busy call) otherwise it is set to 2 (partial dialling).

Figure 102 Unsuccessful call from a remote subscriber to CUG

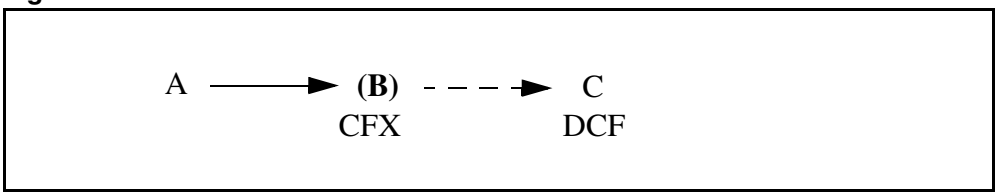
14.11.2.15 Huntgroups (DNH, DLH, MLH)

SOSM behavior for Hunt Group service realization is the same in BRI and IBN agents. For detailed information about SOSM interaction with hunt groups, please refer to Section “14.11.1.21 Huntgroups (DNH, DLH, MLH)” on page 419.

14.11.2.16 Deny Call Forward (DCF)

This feature allows the subscriber the ability to prevent incoming forwarded calls from terminating.

Figure 104 DCF call scenario



The following call steps will be reported to CP:

1. A calls B; **2.** B has any of CFX option and call forwarded to C; **3.** A-C call is disconnected due to DCF service realization.

14.11.2.17 Completition of Calls to Busy Subscriber (CCBS)

The CCBS supplementary service enable user A, when encountering a busy destination B, to have the call completed without having to make a new call attempt when the destination B becomes not busy.

SOSM is responsible to report CCBS act/deact/int and usage to CP, if agent is being monitored.

14.11.2.17.1 CCBS Act

A dials B which is busy. A activates CCBS against B. When B on-hooks, A rings. When A off-hooks, the call is setup automatically established between A and B.

In this scenario, the following call steps will be reported to CP :

1- A dials B; **2-** B is busy; **3-** A activates CCBS against B; **4-** A on-hooks; **5-** A is notified that B is not busy and A initiates a CCBS call to B; **6-** B answers; **7-** disconnection of conversation A-B.

Table 187 A is under surveillance

14.11.2.17.2 CCBS Deact/Interrogation

BRI user can deactivate and interrogate CCBS service via using the BRI phone set menu (when on-hook). Deactivation and interrogation is performed according to the facility messages received from the phone set.

SOSM is responsible to report each facility message processed by DMS, which causes successful deactivation/interrogation of CCBS service, if agent was supervised before.

Please note that 1.3 - Disconnect message is not reported to CP, since no off-hook/on-hook occurs during CCBS deact/interrogation.

Following is the facility messages and SOSM message sequence reported during CCBS deactivation.

Figure 105 Facility Messages for CCBS Deactivation

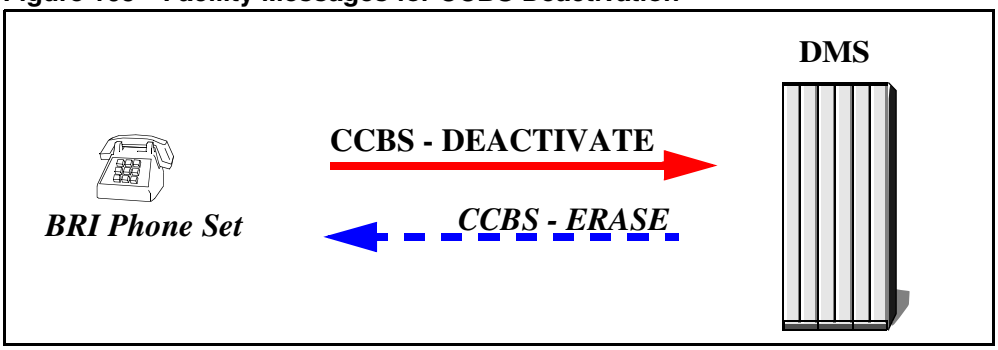

Table 189 A is under surveillance

No of Steps	**1**
Messages	**1.4**
Calling DN	A
Called DN	B*
SOSM Call #	1
Attribute of choice	01
Parameters of connection	1C**
Code of supp. service phase	03
MCL #	FF
Code of operation	FF
Feature Code	CCBS

Note 1: * B is the DN that CCBS was programmed for.

Note 2: ** Parameter of connection is always set as 1C in CCBS service usage message, since at this call step, SOSM is unable to determine whether B is a present exchange subscriber or not.

14.11.2.17.3 CCBS Usage

After CCBS is activated by subscriber A, A goes on hook, then A is notified that B is not Busy and A initiates a CCBS call to B. B answers and for the rest of the call , normal call clearing procedure is applied. Please see Table 187 for SOSM message sequences.

14.11.2.18 Completition of Calls on No Reply (CCNR)

CCNR supplementary service enables user A, encountering a destination B which does not answer the call (No Reply), to have the call completed without having to make a new call attempt when the destination B becomes not busy after having initiated an activity.

SOSM is required to send notification about activation/usage of CCNR service within SOSM ISDN BRI and PRI Supplementary Services Specifications document (SOSMISDN.AA01 in FMDOC library). However, this service can not be realized in NETAS lab, therefore, this requirement is not supported within this activity.

14.11.2.19 Automatic Line (AUL)

Functionality of BRI AUL feature is similar to IBN hot line (AUL) feature. BRI AUL is an administrator assigned feature, and administrator is responsible for activation , deactivation and programming.

SOSM message sequences for BRI AUL usage is the same as message sequences of IBN AUL. Please refer to Section “14.11.1.14 Automatic Line” on page 409.

14.11.2.20 Warm Line (WML)

Warm Line feature for BRI lines has an equivalent functionality to IBN Warm Line. Warm Line feature is assigned from servord, with WML line option. Subfield ’FTCODE’ of WML line option and office parameter WML_OCT_IS_LINE_OPT_PARM together defines the behavior of octothorpe (#) during feature activation (Please refer to FN Document of A59027828 - BRI Hot and Warm Line).

SOSM message sequences for WML act/deact/interrogation is the same as IBN Warm Line feature. Please refer to Section “14.11.1.15 Warm-Line” on page 410.

14.11.2.21 Wake Up Call Request (WUCR)

This feature allows the subscriber to ring his/her phone set at a specified time which can be programmed by the subscriber. For BRI lines WUCR line option provides this functionality.

SOSM Message sequences for WUCR act/deact/interrogation and wake up call is the same as IBN CEPT IWUC. Please refer to Section “14.11.1.17 Wake-up Call” on page 412.

14.11.2.22 Outgoing Call Barring (OCB)

This feature enables calls belonging to certain types to be rejected when they are originated by the served user. Restriction of outgoing calls are performed according to 11 classes of restriction.

In OCB - F (Fixed), the barring program to be restricted is specified while assigning OCB line option to the line. Only administrator has the capability to control OCB functionality (i.e. any user actions are not allowed).

In OCB - UD (User Defined), ISDN BRI subscriber who has OCB line option can actvate, deactivate, and interrogate his/her OCB functionality.

SOSM reports service usage messages to CP, during act/deact/int/usage of OCB service.

14.11.2.22.1 OCB Act/Deact/Interrogation using CEPT dialing Sequence

In this scenario A has OCB option. A activates the OCB feature using CEPT dialing sequence. The message sequence is given in the following table.

Table 190 Activation of OCB - A is under surveillance

	1.4	1.3
Calling DN	A	A
Called DN	Dialed Digits	Dialed Digits
SOSM Call #	1	1
Attribute of choice	01	01
Parameters of connection	1C	1C
Code of supp. service phase	01	00
MCL #	FF	FF
Code of operation	FF	05
Feature Code	OCB*	FF

14.11.2.22.2 OCB Usage

In this scenario, A is under surveillance and calls a restricted number. The message sequence is shown in the following table.

Table 191 OCB Usage - A is under surveillance

	1.1	1.4	1.3
Calling DN	A	A	A
Called DN	B	B	B
SOSM Call #	1	1	1
Attribute of choice	01	01	01
Parameters of connection	1C	1C	1C
Code of supp. service phase	00	04	00
MCL #	1	1	1
Code of operation	00	00	01
Feature Code	FF	OCB*	FF

Note: * The same feature code is used by ILR.

If B is under surveillance no messages are reported to CP during OCB usage.

14.11.3 ISDN PRI Supplementary Services

"SOSM Message Sequences for ISDN Supplementary Services" (SOSMISDN in FMDOC library) document describes the SOSM behavior for BRI/PRI supplementary services.

In this document, reporting of service usage messages is mentioned as optional in several scenarios. SOSM reports optional service usage messages to CP if data regarding to usage of the service is available.

The services ETSIDIV, ECT, CCBS, CCNR, UUS1, MCID, CLIR (temporary mode) and COLR (temporary mode) can be assigned to PRI trunks on DMS. In fact, activation/ deactivation/ usage of these services are initiated from PBX, not on DMS, and since PRI is a trunk access, normally SOSM does not sent any notification about these services, unless the service changes the call topology. Therefore:

- Since the Call Forwarding with Partial Rerouting (ETSIDIV option) and ECT services cause call rerouting, the usage of these services are reported to Control Point (CP) in SOSM message No.1.4“SS usage” when the service is successfully realized upon the request.
- Since the CCBS, CCNR, UUS1, MCID, CLIR (temporary mode) and COLR (temporary mode) services do not cause call rerouting, the usage of

these services are not reported to CP. However, the usage of these services does not cause any abnormal messages to CP.

The remaining services do not have subscriber interactions (such as AOC-D, AOC-E, CLIP, COLP, CLIR-permanent mode, COLR-permanent mode, CUG, SUB, DDI) or the service functionalities are provided by PBX (such as CW, HOLD, 3PTY, CONF, TP). So the “No.1.4-SS usage” message is not reported for the usages of these services. These services calls are monitored as basic call.

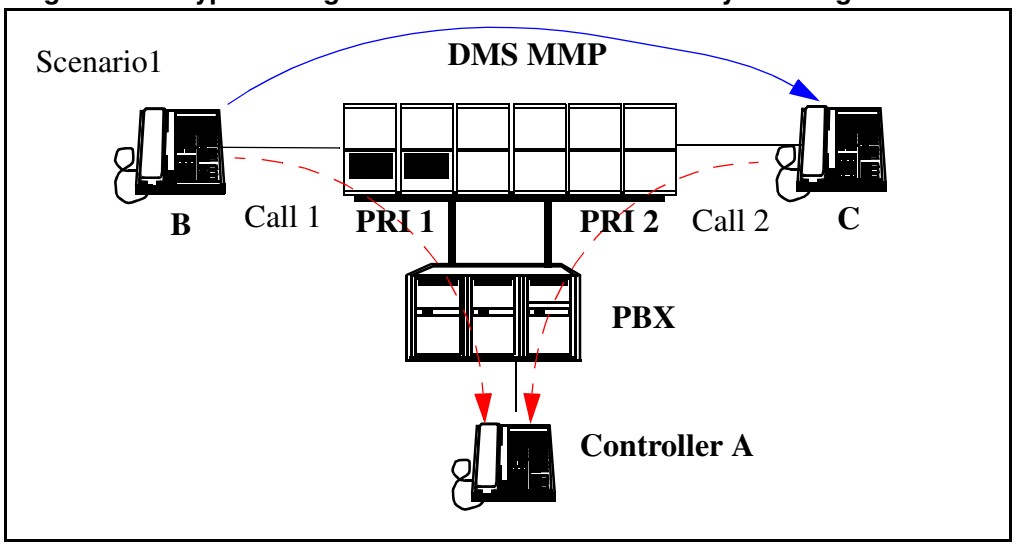
These PRI services can be enabled only via provisionning to related tables on DMS. There is no subscriber utility to activate/ deactivate/ interogate PRI services so the “No.1.4-SS usage” message is not reported for Act/Deact/Intg of ISDN PRI services.

14.11.3.1 ECT for PRI

Explicit Call Transfer is an ISDN supplementary service which enables a user who has two calls to connect the other parties and get out from the call. Any of these calls can be an incoming or an outgoing call.

ECT optimizes the use of ETSI PRI trunks when it is in effect. The ECT feature is associated with an ISDN PRI interface. The PRI interface may terminate on an Intelligent Peripheral (IP), a Private Branch Exchange (PBX) or other Customer Premise Equipment (CPE). Figure 106 and Figure 108 . show a typical usage of ECT for two scenario and the result of successfully invoking ECT.

Figure 106 Typical usage and the result of successfully invoking ECT



The following call steps are reported to CP : Please note that PRI1 and PRI2 are two members of a PRI trunk and A1 represents terminating agent A over

first member of PRI trunk , A2 represents terminating agent A over second member of PRI trunk.

1- B dials A1 over PRI1 ;

2- A1 answers;

3- C dials A2 over PRI2;

4- A2 answers;

5- A2 makes Explicit Call transfer.

6- disconnection of conversation C-A2;

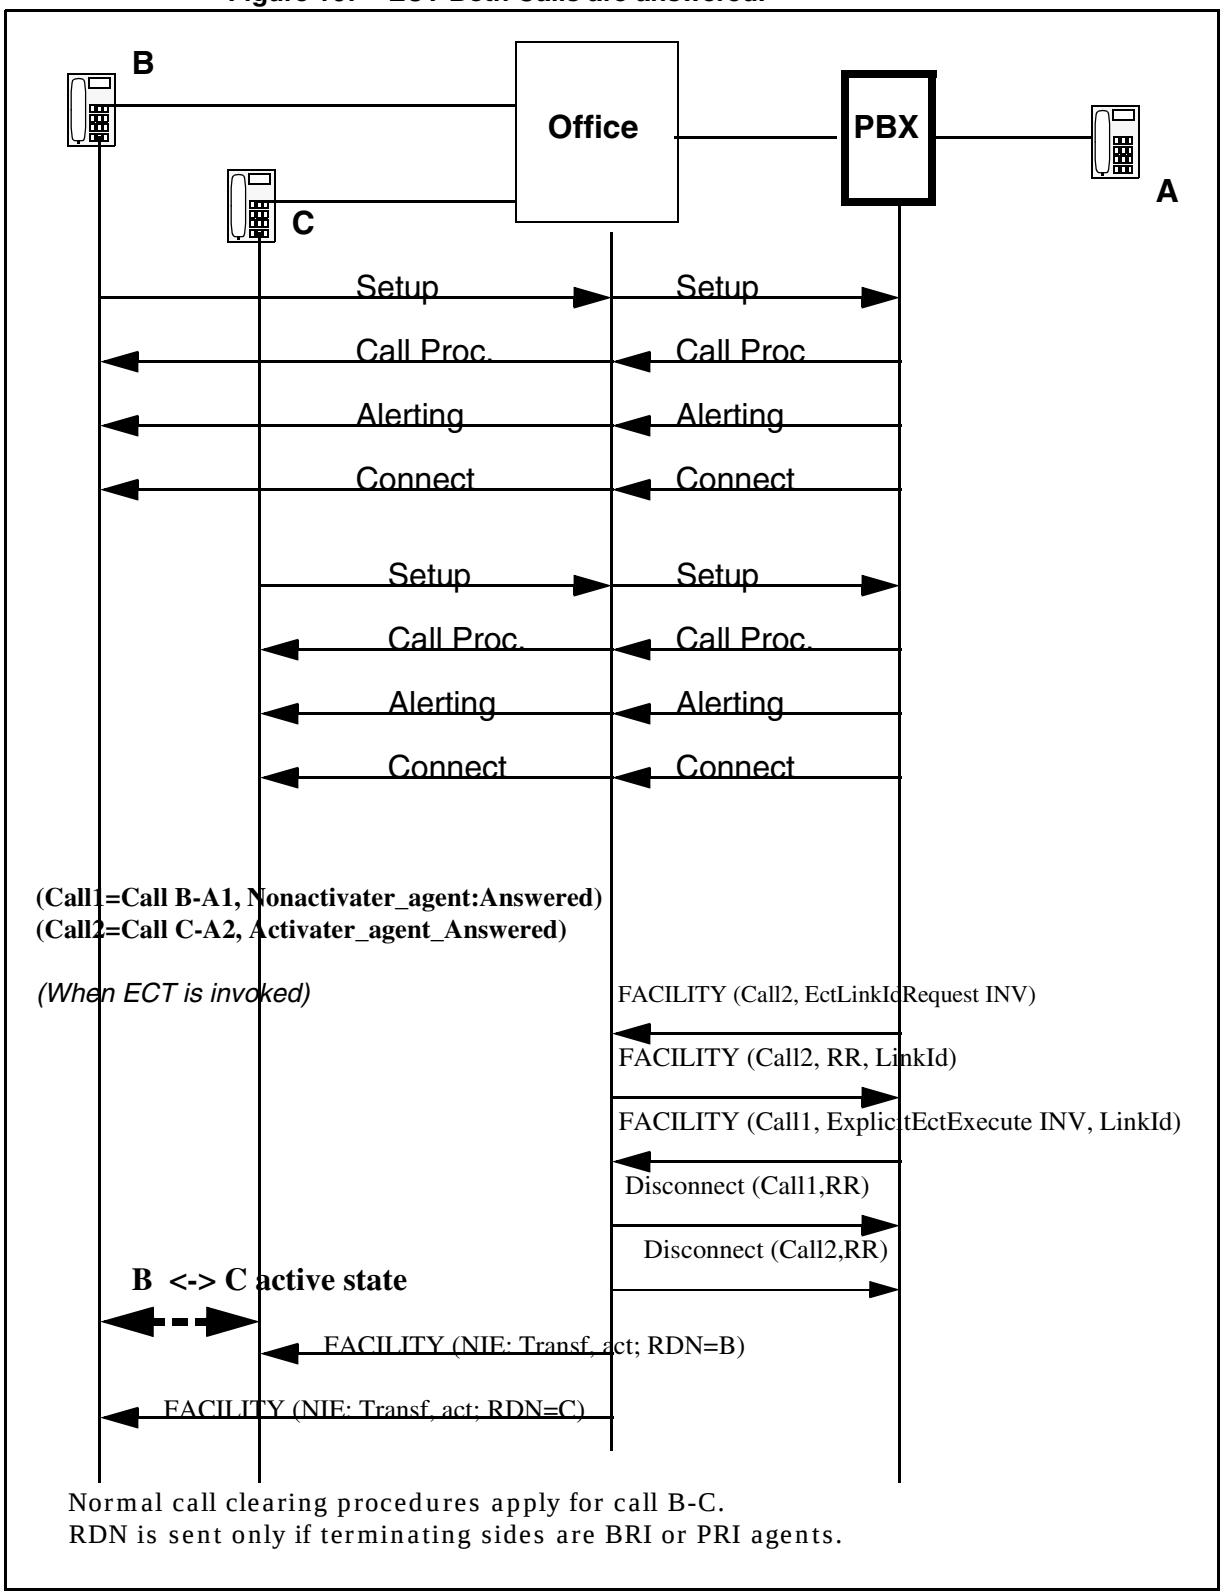
7- disconnection of conversation B-A1;

8- disconnection of transferred call C-B.

As a difference from BRI access, only explicit invocation method of ECT is supported for PRI access signalling. Please note that since the HOLD supplementary service is not supported on ISDN PRI, the “No.1.4 SS usage - HOLD” is not reported to Control Point.

Explicit Call Transfer can be realized while both calls are on talking states as illustrated in Figure.107.

Figure 107 ECT Both Calls are answered.



In the given call, before ECT is invoked, there are two calls between B-A1 (CALL1) and C-A2 (CALL2).

After successful activation of ECT service, a new C-B call is established.

Please note that the direction of the new call depends on the FACILITY messages received over PRI trunks. (i.e, in Figure.107, FACILITY-ExplicitEctExecute message is received within CALL2, and, B is transferred and connected to C to establish C-B call. In cases where FACILITY-ExplicitEctExecute message is received within CALL1, C will be transferred and connected to B. In such cases, B-C call will be established instead of C-B call.) The call steps for this scenario are as follows:

Steps 1,2,3 and 4 are same.

5- A1 makes Explicit Call transfer.*

6- disconnection of conversation B-A1;*

7- disconnection of conversation C-A2;*

8- disconnection of transferred call B-C.*

In tables below, detailed information is given on SOSM parameter values for each step of scenario1 above.

14.11.3.2 ETSIDIV - ETSI PRI Diversion

ETSI PRI Diversion (ETSIDIV) is an ISDN supplementary service which enables a user to reroute an incoming call from a PRI agent to another telephone number. DMS MMP tries to route a call by sending out a SETUP message over ETSI PRI to a private network e.g. Private Branch Exchange (PBX). At the private network, it is decided that this call needs to be diverted. A partial rerouting request is sent to the DMS MMP in a FACILITY message. DMS MMP processes the request and reroutes the call.

There are two modes of ETSIDIV functionality:

Early Release: On receipt of a call rerouting request, the call towards the private network (B) is cleared immediately, and then a new call leg to the diverted-to user (C) is established.

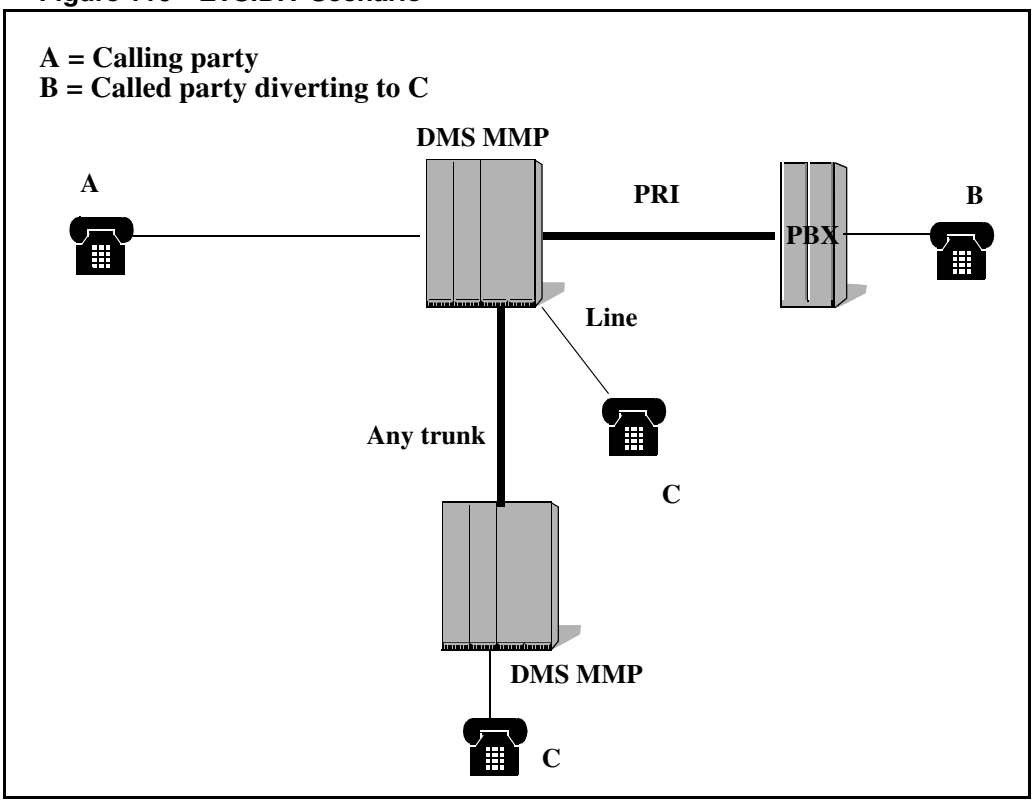
Late Release: First the new diverted call leg is established between the originator (A) and diverted-to user (C), then the call towards the private network (B) is cleared. The connection is maintained between the calling party (A) and the diverting party (B) until it is determined that the diverted-to party (C) is free thus avoiding the scenario where the caller first hears ringing tone then hears busy tone when the call diverts to a busy user.

According to A59007447 (EPRIDIV), Early release only applies to the diversion reasons of CFU, CFB or CD-I (CD-Immediate) and Late release only

applies to the diversion reasons of CFNR, CD-A (CD Alerting) or Unknown in FACILITY message.

ETSIDIV functionality applies to the call forwarding scenario given in Figure 110 :

Figure 110 ETSIDIV Scenario



In the following figures (Figure 111 and Figure 112), the subscriber A can also be POTS line. And the subscriber C can also be POTS line or another subscriber over any supported Russian trunk signallings.

ETSIDIV-Early Release:

The following call steps are reported to CP:

1- A dials B (B is a network subscriber);

2- ETSIDIV request is received and call is rerouted to C (alerting of C).

3- C answers.

4- disconnection

Figure 111 ETSIDIV with early release

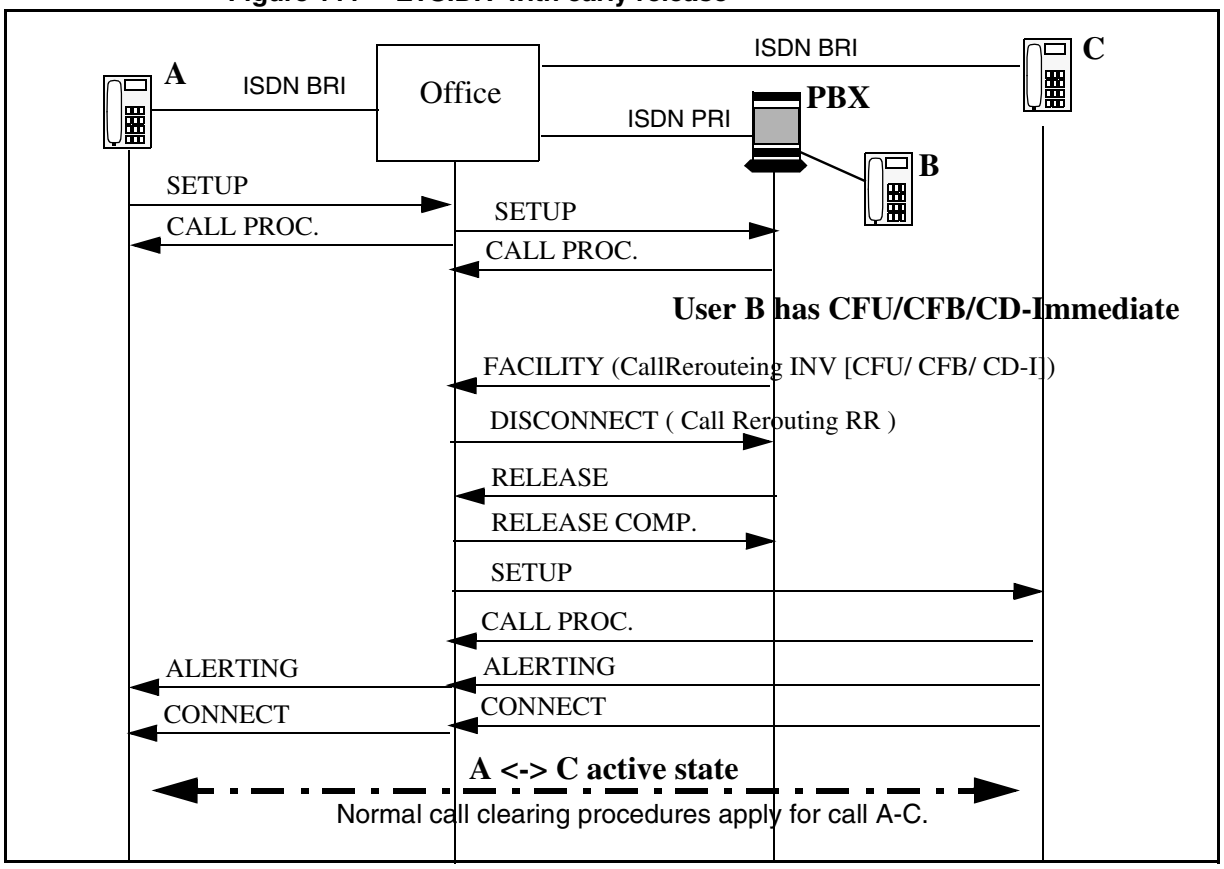


Table 200 A is under surveillance

MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

Note: When ETSIDIV Early Release is invoked successfully, if C is target, ETSIDIV information can not be determined. Therefore, in Table 202 ,there is no 1.4 ETSIDIV usage message.

Please note that, in ETSIDIV service notification messages, C is the number (DN) which is received within PRI facility message. If this number is changed during a translation (with DMOD) which is terminating to a line, in 1.2 message, this number is changed with the terminating line DN.

ETSIDIV-Late Release, successful Diversion Attempt:

In this scenario, A-B call is retained until diverted-to user (C) begins to alert.

1- A dials B;

2- B requests ETSIDIV to C;

3- C alerts (call is forwarded);

4- C answers;

5- Call disconnection (A-C)

MCL #	1	1	1
Code of operation	00	00	05
Feature Code	FF	FF	FF

Note: When ETSIDIV Late Release is invoked successfully, if C is target, ETSIDIV information can not be determined by SOSM. Therefore, in Table 205 , there is no 1.4 ETSIDIV usage message.

ETSIDIV-Late Release, Unsuccessful Diversion Attempt

This scenario is realized when the second leg can not be established successfully due to a problem. This is the case when C is busy. Since second leg is not established, the call is terminated to first leg terminating side. This scenario is only valid for ETSIDIV Late Release. This scenario does not exist for ETSIDIV Early release.

1- A dials B;

2- B requests call diverted to C with ETSIDIV;

3- Call forwarding fails (C is busy);

4- B answers;

5- Call disconnection (A-B).

Table 206 A is under surveillance

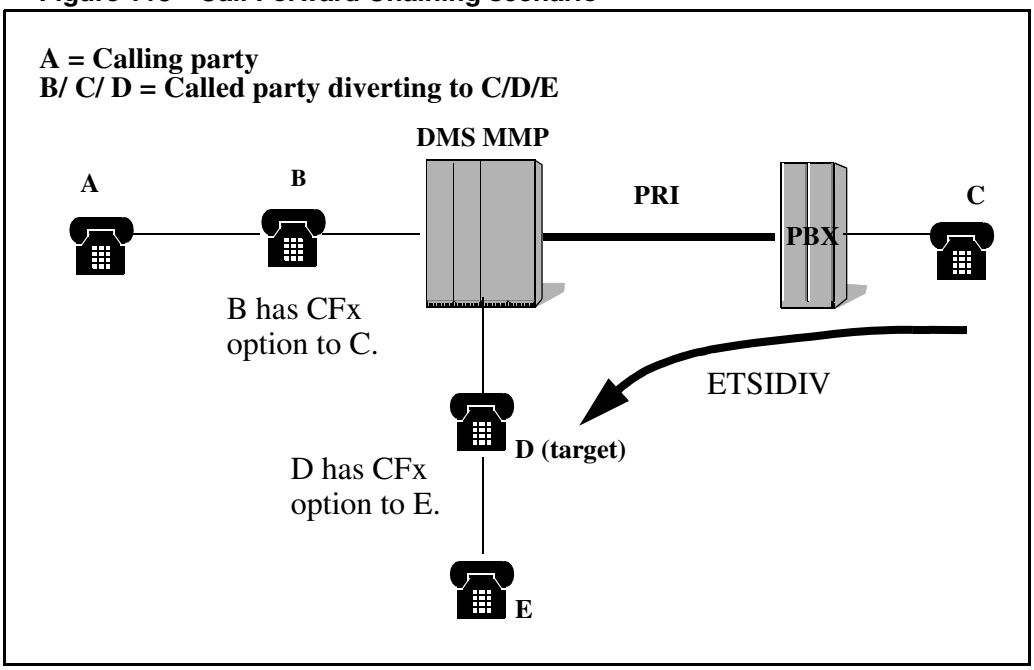
Note: When ETSIDIV Late Release is invoked successfully, if C is target, ETSIDIV information can not be determined by SOSM. Therefore, in Table 208 , there is no 1.4 ETSIDIV usage message.

CFx chaining interaction with ETSIDIV and multiple ETSIDIV

An example scenario for call forward chaining interaction is given in Figure 113 in order to describe SOSM behavior in CFx and ETSIDIV interactions.

Figure 113 Call Forward Chaining scenario



While diverting the call due to ETSIDIV Late Release, data related to prior CFx attempts are lost due to ETSIDIV service functionality.

In the given scenario, C diverts the call using ETSIDIV service. In this scenario, SOSM does not send ETSIDIV service usage notification to CP if monitoring starts after ETSIDIV is activated (i.e. when D or E is the monitored subscriber).

Additionally, in this case, B forwards the call to C, however, as described above, B-to-C diversion data is also lost during realization of ETSIDIV Late Release service. Therefore, SOSM does not send any notification to CP about B-to-C diversion when ETSIDIV Late Release service is activated before monitoring starts (i.e. when D or E is the monitored subscriber).

Above conditions occur while monitoring D. The call steps are as follows:

1- A dials B;

2- B forwards the call to C over PRI;

3- C diverts the call to D by using ETSIDIV;

4- D forwards the call to E;

5- E answers;

6- disconnection.

Table 209 D is under surveillance ETSIDIV -call forwarding interaction

Note: *This column is reported only if ETSIDIV Early Release is invoked.

ISDN BRI Call Deflection (CD) interaction with ETSIDIV

For detailed information, please refer to section 2.11.2.8.3 CD interaction with ISDN PRI ETSIDIV service.

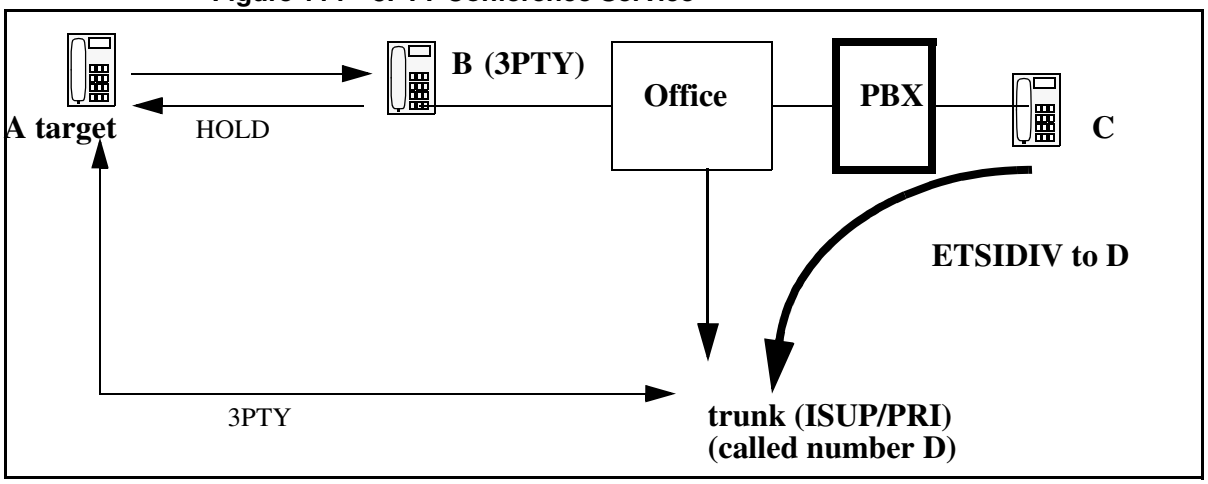
ETSIDIV interaction with multi-party services

When ETSIDIV is activated over a PRI trunk, original diverted-to number can not be determined after diverted-to subscriber alerts.

In multi-party services such as conference calls or call transfer, SOSM informs CP about all subscribers involved in the call, even if they are not monitored subscribers.

Below scenario illustrates an ETSIDIV and 3PTY service interaction. In this scenario, SOSM is expected to notify CP about the conference and the conferees (A, B and D), when B establishes conference between A, B and the trunk agent.

Figure 114 3PTY Conference Service



Due to the existing ETSIDIV service functionality, SOSM is unable to determine original forwarded to digits during activation of three party conference. Therefore, in 3PTY service notification message, C is sent to CP as the called number instead of D.

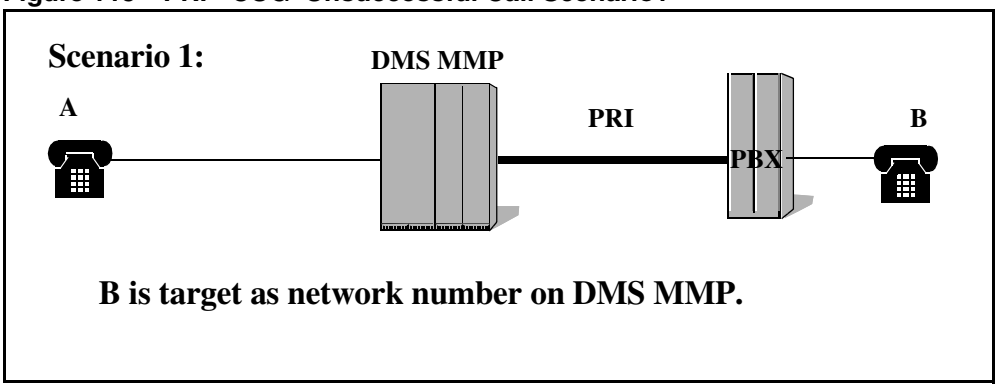
14.11.3.3 CUG - Closed User Group

CUG provides a mechanism for forming groups to and from which access is restricted. A specific user may be member of one or more Closed User Groups. Members of a specific CUG can communicate among each other but not, in general, with users outside of the group. CUG can be provisioned in table ETSIFEAT and LTDATA. These tables should be datafilled to activate this functionality.

CUG service do not have subscriber interactions, the service functionalities are provided by PBX. So the “No.1.4-SS usage” message is not reported for the usages of CUG. Since in SOSM, it is not required to send a special notification for CUG, there will be no special handling for successful call scenarios. So the CUG scenarios will have a similar behavior as normal calls.The operation code can change according to the treatment sent.

Figure 115 is a call failure due to CUG service. Table 210 and Table 211 describe the SOSM message sequence for unsuccessful CUG call scenario.

Figure 115 PRI - CUG Unsuccessful Call Scenario1



In this scenario, the following call steps are reported to CP:

1. A calls subscriber B over PRI trunk; **2-** The call fails due to realization of CUG service.

Table 210 CUG - A(originator) is under surveillance

No of Steps	**1**	**2**
Messages	**1.1**	**1.3**
Calling DN	A	A
Called DN	B	B
SOSM Call #	1	1
Attribute of choice	01	01
Parameters of connection	11	11
Code of supp. service phase	00	00
MCL #	1	1
Code of operation	00	02/ 03
Feature Code	FF	FF

Table 211 CUG - B(terminator) is under surveillance

No of Steps	**1**	**2**
Messages	**1.1**	**1.3**
Calling DN	A	A
Called DN	B	B

No of Steps	1	2
Messages	**1.1**	**1.3**
SOSM Call #	1	1

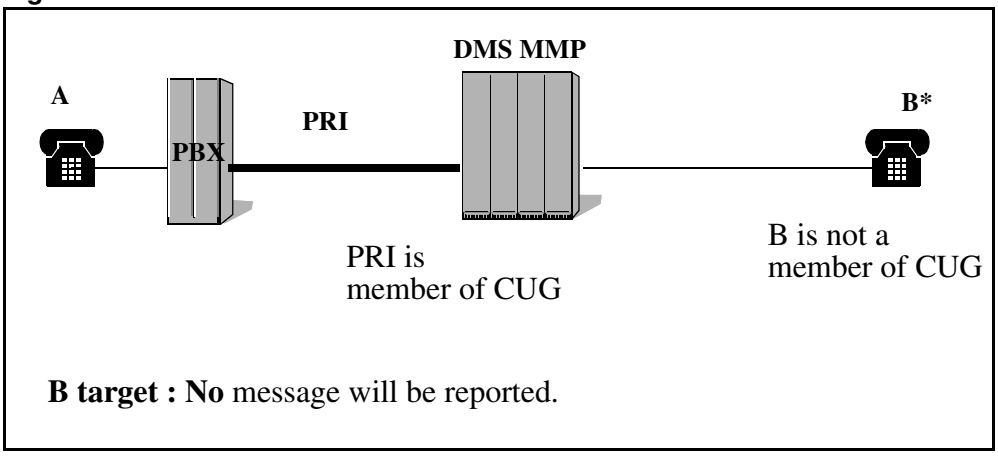
Parameters of connection	11	11
Code of supp. service phase	00	00
MCL #	1	1
Code of operation	00	02/ 03
Feature Code	FF	FF

However, the unsuccessful call scenario given in Figure 116 -where the originator is a PRI agent, which has CUG option- the call does not terminate to the called subscriber if it is not a member of the closed user group. In such scenarios, if the terminating agent is a monitored line, SOSM does not start monitoring, and does not send any call data messages to the CP.

Figure 116 PRI - CUG Unsuccessful Call Scenario2



14.12 ONP, Restart and Swact Interactions

When a software upgrade is taking place via a One Night Process (ONP), all static SOSM data (data in tables SOSMTRK, SOSMMPC and SOSMPARM) is transferred to the new software load automatically.

However, dynamic SOSM data such as monitoring orders, MCL definitions are cleared, MCL's are disconnected and effective system password is initialized at CM swact (during ONP).

During TABXFR, The commands received are rejected with the reason of "dump restore in progress".

In PRESWACT step of ONP, SOSM is stopped. The commands received are rejected with the reason of **"dump restore in progress"** until SWACT is completed. When SWACT is completed, CP is notified via Exchange Restart message.

Upon any system restart (Warm, Cold or Reload) SOSM data is cleared and the CP is notified via Exchange Restart message. Since active calls survive warm restarts, any active call under surveillance will have its MCLs disconnected.

14.13 Restrictions/Limitations

14.13.1 Ring tone

During ringing, mechanical voice is listened from MCL connected to the called DN due to the relay switching because there will be physical connection between MCL and the ring relay in line card of called dn.

14.13.2 Conference circuits usage

The conference ports added to the exchange for SOSM are not pre-allocated to the SOSM system. If all ports are used by normal 3-way or 6-way calls, SOSM will be unable to allocate a conference bridge, and a monitored call will become statistically monitored. Upon conference bridge shortage, CP is informed by an clearing of MCL message (Msg.2.2) after reception of called party number (Msg.1.1).

Similarly, if all conference circuits are used by SOSM, local subscribers will be unable to use 3-way call features.

14.13.3 The restriction of Analog Line cards

By design, analog line cards contain a bridge which causes an echo on the backward speech path. If a party in a monitored call is off an analog line card, the party's MCL will contains a combination of his transmit and receive signals.The transmit signal predominates the other by approximately 20db.

14.13.4 Monitoring of network subscribers

SOSM triggers monitoring for **"telephone network subscriber with complete telephone number"** and **"telephone network subscriber with incomplete telephone number"** type of objects only in line-to-trunk calls where the specified number within the object is dialled.

In overlap outpulsed calls, SOSM starts monitoring the calls for complete network numbers as the received digits matches a DN within the corresponding monitoring order. SOSM does not make any further checks to verify whether the total number of the dialled digits are equal to the number of the digits in monitoring order.

14.13.5 Incoming group of connecting lines

The Incoming group concept is not supported in DMS MMP. DMS MMP always expects to receive FFFFH value for this field, otherwise the message will be rejected.

Additionally, DMS MMP sets this field to FFFFH in all call information messages from SOSM to CP, where ANI is available. Otherwise, incoming trunk number is sent within "Conditional number of incoming group".

14.13.6 SOSM under traffic

Under heavy SOSM traffic, it is possible that the conference circuits may fail. This is a limitation of the 3X67 conference circuit card on the MTM or CTM shelf. In those rare cases, failure message will be sent to the CP reporting Conference Circuit Failure, and the MCL using that conference port card will be released with message 52 (MCL cleared) reported to CP.

In addition, NET102 logs (not SOSM specific) will be generated in the office, reporting the card problem (Integrity Failure).

14.13.7 Image Dump and Restore

During the process of an Image Dump or Restore (when the DMS saves its active image to disk, or restores it from disk) the SOSM system operates in a LIMITED fashion. All Control Point commands are rejected:

- During DS dumping phase of load image,
- During TABXFR phase of ONP,
- After Preswact is started.

If any commands are received during a dump/restore, the command is rejected with negative reception confirmation code **"dump restore in progress"** with value **59H**.

14.13.8 IN Interaction

IN interaction is not supported.

14.13.9 Interaction with digit collection methods

DMS MMP has a flexible digit collection mechanism which means that user dialled digits can be reported to CM as provisioned in digit collection tables. In partial dialling cases, only collected digits that are reported from monitored

line's XPM are sent to the control point within call clearing message (Msg.1.3).

14.13.10 Failures in ISUP-Line call scenarios

SOSM does not monitor the unsuccessful calls when the call setup fails due incoming trunk (i.e. COT failures, ANI failure,...etc).

14.13.11 PM Swact (warm) interactions

If warm swact is applied on the PLGC/GPP of a monitored line in call setup phase, DMS MMP takes down the call. If the subscriber remains off-hook until completion of warm swact, the peripheral prepares the line for a new call origination.

If subscriber on-hooks after PLGC/GPP recovery is over, SOSM sends a call clearing message (Msg.1.3) to the control point with "partial dialling - 02H" operation code for the completion of the new origination.

If the subscriber is a V5.2 agent, GPP sends an additional origination message for this agent during recovery phase (please refer to GPPPRODS document in FMDOC library for detailed information about GPP recovery after warm swact), therefore SOSM reports an extra call clearing message (Msg.1.3) to the control point with "partial dialling - 02H" operation code.

14.13.12 Monitoring of SUSpended agents

SUSpended agents are not monitored by SOSM, although they exist in monitoring order database.

14.13.13 SOSM starting after restarts

After restarts, the recovering of X25 hardware does not complete, right away. So, SOSM cannot be started until X25 hardware is ready to work after restarts.

14.13.14 Call Release over PRI

The call disconnections over PRI are handled such as ISUP trunks when the same disconnection causes are received over PRI. In the case of no disconnection cause received over PRI (from PBX); since the call and PRI trunk are released when the originating party on-hooks, it is decided that the monitoring continues until the originating party on-hooks. Since the real reason of disconnection (busy etc.) is not known by DMS, the disconnection reason in No.1.3 message is set to "disconnection because of no answer" for the unanswered call scenarios.

14.13.15 Supported Line Agents

As present exchange subscribers, IBN, V5.2(IBN) and ETSI BRI lines are supported by SOSM (See “2.2 Feature Synopsis” on page 49 and “14.5.4

Agent Interactions" on page 268). Please note that EBS and V5.2(BRI) lines are not supported by SOSM software.

14.14 Service Codes mapping

14.14.1 Subscriber services codes

These codes are reported to the CP in responses to Monitored object information request and anywhere else where a Service code appears in a message.

A set of codes was supplied by ZNIIS and is used wherever possible. For services which are not covered in that list, the DMS service code is used.

The following table provides the complete list of services available in the Russia market, and their LONIIS code equivalent.

For services where mapping is possible between DMS codes and LONIIS codes, the LONIIS code is used (in field "Service Code"). For those services with no equivalent code in the LONIIS specification, the DMS code is used and placed in the "Service Code".

Note that some services defined by LONIIS do not exist on the DMS MMP in the Russia market. Other services may have two flavors in DMS MMP, but map to a single LONIIS code.

Table 212 Subscriber Services Codes

Feature Name DMS / LONIIS	Service Code	Description
SCL,SCS,SCU	10H	Abbreviated Dialing
APS	74H	Attendant Pay Station
ACD	3BH	Automatic Call Distribution
ACRJ	18H	Anonymous Caller Rejection
AR	19H	Automatic Recall
BNN	25H	Bridged Night Number
CDA	4EH	Call Deflection Alerting
CDI	4FH	Call Deflection Immediate
CPC (RSRVD)	71H	CIS Subscriber Category 0
CPC (UNKNOWN)	53H	CIS Subscriber Category 1
CPC (ORD)	72H	CIS Subscriber Category 1
CPC (MAINT)	54H	CIS Subscriber Category 1

WML	E4H	Warm Line
LOR	F0H	Line Overflow to Route
LDA	1AH	Long Distance Aler
LROA	F2H	Line Reversal on Answer
LRS	F4H	Line Reversal on Seizure

Table 212 Subscriber Services Codes

Feature Name DMS / LONIIS	Service Code	Description
CLF	FCH	Malicious Call Trace
MCID	FCH	Malicious Call Identification
MCT2	FDH	Malicious Call Trace 2
MWT	D0H	Message Waiting (Voice Mail)
OFR	C1H	Overflow Hardware Register
OFS	C2H	Overflow Software Register
ONI	C3H	Operator Number Identification
PILOT	C4H	Pilot of a Hunt Group
PLP	C5H	Plug Up
PMC	C6H	Printed Meter Check
PR1	C7H	Priority 1 Subscriber
PR2	C8H	Priority 2 Subscriber
PRR_CFU, PRR_CFB, PRR_CDI	5AH	Partial ReRouting (ETSIDIV) Call Forward Unconditional, Call Forward Busy, Call Deflection Immediate
PRR_CFNR, PRR_CDA, PRR_Unknown	5BH	Partial ReRouting (ETSIDIV) Call Forward No Reply, Call Deflection Alerting
RCVD	CAH	Type of Terminating Billing
RESL	36H	Restricted Line
REV	27H	Reverse Charging
SCR	CBH	Selective Call Recording
SMDR	37H	
SPM	CCH	Subscriber Premise Meter
SUS	CDH	Suspended Service
SUPPRESS/CLIR	12H	Suppress
TFO	CEH	Terminating Fault Option
TP Suspend	4CH	Terminal Portability (Suspend call)
TP Resumed	4DH	Terminal Portability (Resumed call)
UCD	39H	Uniform Call Distribution

Table 212 Subscriber Services Codes

Feature Name DMS / LONIIS	Service Code	Description
UUS1	26H	User to User Service 1
VM	D0H	Voice Mail
IWUC / WUCR	D4H	Wake-Up Call
WUCR / WUCR	D4H	Wake-Up Call Request

14.14.2 Negative confirmation of command reception codes

The following table describes the expanded error codes for "confirmation of command reception" messages. For a detailed explanation of what causes each code to be sent, please refer to the relevant command in section "2.5.7 CP to SOSM Command Processing" on page 66.

Table 213 Command reception result codes

Code name	Value
command accepted	00H
incorrect preamble	01H
incorrect sosm number	02H
invalid message code	03H
message too long	04H
incorrect message length	05H
unsupported command	06H
invalid type and sign	07H
invalid MCL group number	08H
invalid MCL group type	09H
invalid MCL number	0AH
invalid object type	0BH
invalid sign of telephone number	0CH
incorrect sign of telephone number	0DH
invalid category of monitoring	0FH
invalid priority code	10H
invalid digit	11H
invalid number of digits	12H

Table 213 Command reception result codes

Code name	Value
number of digits mismatch	13H
invalid MCL B for group	14H
invalid password character	15H
unsupported parameter	16H
invalid group for category	17H
password mismatch	18H
command out of sequence	19H
invalid_conditional_number	1AH
dump restore in progress	1BH
command rejected	FFH

14.14.3 Negative confirmation of command execution

The following table describes the expanded error codes for "confirmation of command execution" messages. For a detailed explanation of what causes each code to be sent, please refer to the relevant command in section "2.5.7 CP to SOSM Command Processing" on page 66.

Table 214 Command execution result codes

Code name	Value
command executed	00H
duplicate MCL group	40H
MCL in use	41H
duplicate conditional number of object	42H
invalid parameter	43H
non-unique object	44H
object not found	45H
invalid call number	46H
invalid object number	47H
invalid object type	48H
invalid MCL group	49H
invalid MCL number	4AH

Table 214 Command execution result codes

Code name	Value
MCL information not found	4BH
command out of sequence	4CH
invalid number of digits	4DH
call already monitored	4EH
max num of objects exceeded	4FH
missing PCM-30 group data	50H
duplicate MCL number	51H
wrong MCL type for group	52H
sosm missing trkmem datafill	53H
object type mismatch	54H
digits mismatch	55H
sign of dn mismatch	56H
no services found	57H
invalid dn for exchange	58H
command not allowed during dump	59H
unsupported agent type	5AH
invalid MCL B for group	5BH
priority code mismatch	5CH
type and sign mismatch	5DH
unsupported parameter	5EH
invalid sign of telephone number	5FH
no data exists in database	60H
invalid MCL group type	61H
max num MCL exceeded	62H
object transfer in progress	63H
mcl transfer in progress	64H
invalid digit failure	65H
technical_problem	66H
sosm command failed	FFH

14.14.4 Expanded codes for MCL connection problem reporting

The following table describes the expanded error codes for “mcl unconnection code” in call related messages.

Table 215 MCL unconnection result codes

Code name	Value
Normal connection	0H
no free mcl	01H
mcl not idle (not ready)	1CH
mcl releasing failed	1DH
missing PCM-30 group data	1EH
no free conf. circuit	1FH
conf. circuit connection failed	20H
sosm hardware out of service	22H
invalid agent for connection	23H
Other failure (unknown)	FEH
for statistical monitoring	FFH

ETSIDIV	ETSI PRI Diversion
PRR	Partial Re-Routing

14.17 APPENDIX

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
1		1.1	Exchange start, SW restart	No2
2	No1 SOSM start	2.1	No3 (before SOSM start)	No7-NOK
		2.2	No1 with wrong password	No7-NOK, No6
		2.3	No1 with right password	No7-OK, No8-OK
		2.4	No1 (repeatedly)	No7-OK, No8-NOK or **No7-NOK**
3	No3 Password setting	3.1	No3 with wrong password	No7-NOK, No6
		3.2	No3 with wrong SOSM No	No7-NOK
		3.3	No3 with right password	No7-OK, No8-OK
		3.4	No4 with factory password	NO7-NOK, No6

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
4	No4 Assignment of MCL to group	4.1	No4, Nogr=1, gr.type-01H (combined) NoMCLA=NoMCLB	No7-OK, No8-OK
		4.2	No4, Nogr=1, gr.type-01H (combined) NoMCLB=FF	No7-OK, No8-OK
		4.3	No4, Nogr=1, gr.type-01H (combined) NoMCLA in unadjacent time interval. That is if in test 4.2, MCLA=3 then in test 4.3, MCLA ^= 4	No7-OK, No8-OK
		4.4	No4,Nogr=1,gr.type-01H(combined) NoMCLA ≠ NoMCLB	No7-OK,No8-NOK or **No7-NOK**
		4.5	No4, Nogr=1, gr.type-01H (combined) NoMCLA is distributed. That is it has been already assigned to the group.	No7-OK, No8-NOK
		4.6	No4, Nogr=1, gr.type-01H (combined) NoMCLA from inexisting PCM primary group.	**No7-OK,No8-NOK** or No7-NOK
		4.7	No4,Nogr=2,gr.type-11H(separate) NoMCLA ≠ NoMCLB (in adjacent time interval. That is if for example MCLA is 5 then MCLB is 6)	No7-OK, No8-OK

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
		4.8	No4,Nogr=2,gr.type-11H (separate) NoMCLA ≠ NoMCLB (in unadjacent time interval. That is if for example MCLA is 5 then MCLB is value other than 6)	No7-OK, No8-OK
		4.9	No4, Nogr=2, gr.type-11H (separate) NoMCLA ≠ NoMCLB (different PCM primary groups)	**No7-OK,No8-NOK** or No7-NOK
		4.10	No11, all parameters=FF	No7-OK, No4, No8-OK
		4.11	No4, Nogr=1, gr.type-11H (separate) NoMCLA, NoMCLB	No7-OK, No8-NOK
		4.12	No4, Nogr=2, gr.type-01H (combined) NoMCLA =NoMCLB	No7-OK, No8-NOK
		4.13	No4, Nogr=2, gr.type-11H (separate) NoMCLA is distributed. (That is it has been already assigned to the group)	No7-OK, No8-NOK
		4.14	No4, Nogr=2, gr.type-11H (separate) NoMCLB is distributed. (That is it has been already assigned to the group	No7-OK, No8-NOK
		4.15	No4, Nogr=2, gr.type-11H (separate) NoMCLA=NoMCLB	No7-OK, No8-NOK or **No7-NOK**
		4.16	No4, Nogr=254(inexisting), gr.type- 01H (combined) NoMCLA=NoMCLB	No7-OK, No8-NOK or **No7-NOK**
		4.17	No4, Nogr=3, gr.type-inexisting NoMCLA=NoMCLB	No7-OK, No8-NOK or **No7-NOK**
		4.18	No4, Nogr=3, gr.type-01 NoMCLA - inexisting	**No7-OK, No8-NOK** or No7-NOK
5	No9 Exclusion of MCL from group	5.1	No9, Nogr=1, NoMCLA=NoMCLB	No7-OK, No8-OK
		5.2	No9, Nogr=1, NoMCLB=FF	No7-OK, No8-OK
		5.3	No9, Nogr=2, NoMCLA, NoMCLB	No7-OK, No8-OK
		5.4	No11, all parameters=FFH	No7-OK, No4, No8-OK
		5.5	No9,Nogr=1, NoMCLA ≠ NoMCLB and NoMCLB ≠ FFH	No7-OK, No8-NOK or **No7-NOK**
		5.6	No9, Nogr=1, NoMCLA not defined in TR for links	**No7-OK, No8-NOK** or No7-NOK
		5.7	No9, Nogr=1, NoMCLA is not assigned to a group	No7-OK, No8-NOK

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
		5.8	No9, Nogr=1, NoMCLA is from another group.	No7-OK, No8-NOK
		5.9	No9, Nogr=1, MCLA is engaged with conversation	No7-OK, No8-NOK
		5.10	No9, Nogr=2, NoMCLA=NoMCLB	No7-OK, No8-NOK
		5.11	No9, Nogr=2 NoMCLA not defined in TR for links.	**No7-OK, No8-NOK** or No7-NOK
		5.12	No9, Nogr=2, NoMCLB not defined in TR for links.	**No7-OK, No8-NOK** or No7-NOK
		5.13	No9, Nogr=2, NoMCLA is not assigned to a group	No7-OK, No8-NOK
		5.14	No9, Nogr=2, NoMCLB is not assigned to a group.	No7-OK, No8-NOK
		5.15	No9, Nogr=2, MCLA and MCLB are engaged with conversation	No7-OK, No8-NOK
		5.16	No9, Nogr is not defined, MCLA and MCLB are really distributed. (It means that MCLA and MCLB are assigned to a certain group in practice, but in this test case, number of a non-existent group is indicated.)	**No7-OK, No8-NOK** or No7-NOK
		5.17	No4, Nogr=3, gr.type=01 NoMCLA=5 from primary group 0, No4, Nogr=3, gr.type=01 NoMCLA=5 from primary group 1 No9, Nogr=3, NoMCLA=5 from primary group 1, No11, all parameters=FFH	No7-OK, No8-OK No7-OK, No8-OK No7-OK, No8-OK No7-OK, No4,No8-OK observation of MCLA=5 in the primary group 0

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
6	No5 Taking a subject under observation	6.1	No5, subject type-01H	No7-OK, No8-OK
		6.2	No5, subject type-02H	No7-OK, No8-OK
		6.3	No5, subject type-12H, FH in the end of phone No	No7-OK, No8-OK
		6.4	No5, subject type-03H (not for toll exchange)	No7-OK, No8-NOK
		6.5	No5, subject type-03H (for toll exchange)	No7-OK, No8-OK
		6.6	No5, conditional No is busy, subject type-01H	No7-OK, No8-NOK
		6.7	No5, conditional No is busy, subject type-02H	No7-OK, No8-NOK
		6.8	No5, phone No is already under observation	No7-OK, No8-NOK
		6.9	No5, phone No (complete) is already under observation in the list for incomplete number	No7-OK, No8-NOK
		6.10	No5, phone No (incomplete) is already under observation in the list for complete number	No7-OK, No8-NOK
		6.11	No5, phone No and incoming group conditional number are set.	No7-OK, No8-NOK
		6.12	No5, Nogr. does not comply with observation category.	No7-OK, No8-NOK
		6.13	No5, inexisting Nogr. (inexisting MCL group)	No7-OK, No8-NOK
		6.14	No5, amount of digits in phone No does not comply with the mentioned in byte 5	No7-OK, No8-NOK
		6.15	No5, subject type does not comply with phone No.	No7-OK, No8-NOK
		6.16	No5, number attribute does not comply with phone No.	No7-OK, No8-NOK
		6.17	No5, subject type not defined TR for links.	No7-OK, No8-NOK or **No7-NOK**
		6.18	No5, phone No attribute not defined in TR for links.	No7-OK, No8-NOK or **No7-NOK**
		6.19	No5, observation category not defined in TR for links	No7-OK, No8-NOK or **No7-NOK**

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
		6.20	No5, group No not defined in TR for links	No7-OK, No8-NOK or **No7-NOK**
		6.21	No5, priority mark not defined in TR for links	No7-OK, No8-NOK or **No7-NOK**
		6.22	No5, during conversation of subscriber with statistical observation category	No7-OK, No8-OK observation since the next call (That is monitoring will begin with the first next call)
		6.23	No5, during conversation of subscriber with full observation category	No7-OK, No8-OK observation since the next call (That is monitoring will begin with the first next call)

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
7	No6 Cancellation of observation	7.1	No6, subject type-01H	No7-OK, No8-OK
		7.2	No6, subject type-02H	No7-OK, No8-OK
		7.3	No6, subject type-12H	No7-OK, No8-OK
		7.4	No6, subject type-03H (for toll exchange)	No7-OK, No8-OK
		7.5	No6 during conversation of subject who is under statistical observation	No7-OK, No8-OK
		7.6	No6 during conversation of subject who is under full observation	No7-OK, No8-OK No2.2 (Channel 2)
		7.7	No6, condition No and phone No not inserted into SOSM data base (That is we have correct conditional No and a non-existing phone No)	No7-OK, No8-NOK
		7.8	No6, phone No and conditional number not inserted into SOSM data base (That is we have correct phone No and a non-existing conditional No)	No7-OK, No8-NOK
		7.9	No6, conditional No of CL (incoming) group not inserted into SOSM data base	No7-OK, No8-NOK (**for toll only, local exchanges will always receive FFFFH**)
		7.10	No6, phone No does not comply with conditional No (both parameters are inserted into data base)	No7-OK, No8-NOK
		7.11	No6, subject type not defined in TR for links.	No7-OK, No8-NOK or **No7-NOK**
		7.12	No6, number attribute does not comply with phone No	No7-OK, No8-NOK

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
		7.13	No6,subject type does not comply with phone No	No7-OK, No8-NOK
		7.14	No6, amount of digits in phone does not comply with the mentioned in byte 5	No7-OK, No8-NOK
		7.15	No6, phone No and No of CL group are set	No7-OK, No8-NOK or **No7-NOK**
		7.16	No6, cancellation of observation from network subscriber by full number (taking under observation was provided by not full number)	No7-OK, No8-NOK
		7.17	No6, cancellation of observation from network subscriber by not full number (taking under observation was provided by full number)	No7-OK, No8-NOK

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
8	No7 Connection to speech path	8.1	No7 during conversation of subject with observation category - statistical, Nogr.=1 (combined observation)	No7-OK, No8-OK No2.1 (channel 2)
		8.2	No7 during conversation of subject with observation category - statistical, Nogr.=2 (separate observation)	No7-OK, No8-OK No2.1 (channel 2)
		8.3	during conversation of subject with observation category - full the MCL was not separated due to absence of free ones; No7 after MCL release.	No7-OK, No8-OK No2.1 (channel 2)
		8.4	during conversation of subject with observation category - full the MCL was not separated due to absence of free ones; No7 when MCL are seized. *(That is Command 7 is executed while all MCLs are busy, and due to the higher priority of Command No7, MCLs used by another conversation are released and assigned to the corresponding call)*	No7-OK, No8-OK No2.1 (channel 2) No2.2(channel 2) MCL release by priority
		8.5	No7 during conversation of subject with observation category - statistical, inexisting Nogr.	No7-OK, No8-NOK
		8.6	No7 during conversation of subject with observation category - full combined, Nogr.=1 (after command No8)	No7-OK, No8-OK No2.1 (channel 2)
		8.7	No7 during conversation of subject with observation category - full combined, Nogr.=2 (after command No8)	No7-OK, No8-OK No2.1 (channel 2)
		8.8	No7 during conversation of subject with observation category - full combined and inexisting Nogr. Not coinciding with the mentioned in command No5 (after command No8)	No7-OK, No8-OK No2.1 (channel 2)

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
		8.9	No7 during conversation of subject with observation category - full separate, Nogr.=1 (after command No8)	No7-OK, No8-OK No2.1 (channel 2)
		8.10	No7 during conversation of subject with observation category - full separate, Nogr.=2 (after command No8)	No7-OK, No8-OK No2.1 (channel 2)
		8.11	No7 during conversation of subject with observation category - full separate, inexisting Nogr (after command No8)	No7-OK, No8-OK No2.1 (channel 2)
		8.12	No7 during conversation of subject with observation category - full (combined or separate) with separate MCL *(already assigned MCL)*	No7-OK, No8-NOK
		8.13	No7 during conversation of subject with observation category - statistical subject type 03H, Nogr.=1 (combined observation)	No7-OK, No8-OK No2.1 (channel 2)
		8.14	No7 during conversation of subject with observation category - statistical subject type 03H, Nogr.=2 (separate observation)	No7-OK, No8-OK No2.1 (channel 2)

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
9	No8 Release of monitoring	9.1	No8 according to call identifier during conversation of subject with observation category - statistical, (after command No7)	No7-OK, No8-OK No2.2 (channel 2)
		9.2	No8 according to No MCL during conversation of subject with observation category - statistical, (after command No7)	No7-OK, No8-OK No2.2 (channel 2)
		9.3	No8 according to inexisting NoMCL during conversation of subject with observation category - statistical, (after command No7)	No7-OK, No8-NOK
		9.4	No8 according to call identifier during conversation of subject with observation category - statistical	No7-OK, No8-NOK
		9.5	No8 according to call identifier during conversation of subject with observation category - full combined	No7-OK, No8-OK No2.2 (channel 2)
		9.6	No8 according to No MCL during conversation of subject with observation category - full combined	No7-OK, No8-OK No2.2 (channel 2)
		9.7	No8 according to call identifier during conversation of subject with observation category - full combined and not assigned No MCL.	No7-OK, No8-OK No2.2 (channel 2)
		9.8	No8 according to not assigned No MCL during conversation of subject with observation category - full combined	No7-OK, No8-NOK
		9.9	No8 when MCL is not separated during conversation of subject (due to seizure) with observation category - full combined.	No7-OK, No8-NOK
		9.10	No8 according to call identifier during conversation of subject with observation category - full separate	No7-OK, No8-OK No2.2 (channel 2)
		9.11	No8 according to NoMCLA and NoMCLB during conversation of subject with observation category - full separate	No7-OK, No8-OK No2.2 (channel 2)
		9.12	No8 according to call identifier during conversation of subject with observation category - full separate and not assigned NoMCLA and NoMCLB	No7-OK, No8-OK No2.2 (channel 2)

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
		9.13	No8 according to NoMCLA and NoMCLB set wrong during conversation of subject with observation category - full separate.	No7-OK, No8-NOK
		9.14	A and B - subscribers are subjects with observation category - full combined. No8 according to one out of two separate MCL	No7-OK, No8-OK No2.2 (channel 2) observation of conversation via another MCL.
		9.15	No8 according to call identifier during conversation of subject with observation category -full combined. Subject type 03H.	No7-OK, No8-OK No2.2 (channel 2)
		9.16	No8 according to NoMCL during conversation of subject with observation category -statistical; subject type 03H (after command No7)	No7-OK, No8-OK No2.2 (channel 2)

Tests for checking commands and messages transmitted via channel 1 between SOSM and CP.

No	Commands to be checked	No of tests	No of command sent from CP	Answer messages of exchange SOSM
10	No10 Request for transmission of data about subject to be observed.	10.1	No10 with all parameters besides No of CL group	No7-OK, No3, No8-OK
		10.2	No10 according to No of CL group (for ATS)	No7-OK, No3, No8-NOK
		10.3	No10 according to conditional No	No7-OK, No3, No8-OK
		10.4	No10 according to object type	No7-OK, No3, No8-OK
		10.5	No10 according to attribute, digits amount and phone No	No7-OK, No3, No8-OK
		10.6	No10, all parameters=FFH	No7-OK, No3, No8-OK
		10.7	No10, conditional No does not comply with phone No	No7-OK, No3, No8-NOK
		10.8	No10, conditional No, unreal phone No	No7-OK, No3, No8-NOK
		10.9	No10, phone No and unreal conditional No	No7-OK, No3, No8-NOK
		10.10	No10, subject type not defined in TR for links	No7-OK, No3, No8-NOK
		10.11	No10, phone No attribute not defined inTR for links	No7-OK, No3, No8-NOK
		10.12	No10, number attribute does not comply with phone No	No7-OK, No3, No8-NOK

15: Functional description (FN): A00002252

15.1 Feature name

MG9K LINES PREPROVISIONING

- MG9K - Media Gateway 9000

15.2 Description

Feature 89009298 implements the core code changes required for increasing MG9K line provisioning throughput by preprovisioning. Please refer to ActID 89008025 which details the overall goals of the preprovisioning work effort.

The 89009298 core changes have three components:

1. The format of an MG9K LEN will reflect a physical location. Previously, no correlation existed between an MG9K LEN and its physical location. Instead the LEN correlated to the terminal id of the line. The new format shows a circuit range of 0 to 47. Currently, only 32 circuit line cards are supported for the MG9K.

   OLD FORMAT
   <SITE> <0 to 511> <0 to 9> <subgroup, 0 to 10> <circuit, 0 to 99>

   NEW FORMAT
   <SITE> <frame, 0 to 511> <shelf, 0 to 9> <slot, 2 to 9, 14 to 21> <circuit, 0 to 47>

2. When SESM provisions an MG9K node on shelves 0 to 3 and LGRP data, table LNINV will be automatically datafilled with the available circuits. Subsequent SERVORD+ commands issued by SESM will not add or delete MG9K line datafill from table LNINV. Essentially, autoprovisioning of table LNINV will be disabled for MG9K lines.

   This new functionality will supercede the setting of office parm RDT_SUCC_AUTOCREATE_LNINV for determining the autoprovisioning of table LNINV. This feature, however, does not restrict the MNO_DEFAULT value associated with RDT_SUCC_AUTOCREATE_LNINV. We can assume multiple gateway offices where setting the default MNO would be desirable for all gateways including MG9K. It is the ACTIVE setting that is ignored for MG9K lines.

3. Two new pad groups will be defined for use by gateway lines. PKLNL will be created for use by gateway lines that have LGRP GRPTYPE set to S. PKNIL will be created for use by gateway lines that have LGRP GRPTYPE set to C. These pad group will always be applied to gateway lines during SERVORD provisioning and during SESM provisioning and preprovisioning. Changing of gateway line pad group from these two new groups is permitted via changing the pad group in table LNINV. Default pad levels will also be set for Legacy interaction.

15.3 Hardware Requirements or Dependencies

None.

15.4 Software Requirements or Dependencies

The changes implemented under feature 89009298 require associated code changes in SESM line provisioning and MG EM in order to deliver the described functionality. However, the core changes are completely transparent to existing functionalities. Interactions are detailed below.

15.5 Limitations and restrictions

This feature is specific to MG9K lines.

15.6 Interactions

The feature 89008782 “MG EM - LINE CARD DATA DELIVERY TO SESM” implements the MG9K-EM part of the preprovisioning. It is required for this feature to work properly. It is a compliment of this feature.

The feature 89008025 implements the SESM line provisioning changes that are required by MG9K lines for this feature to work.

Feature 00000420 introduces the office parm RDT_SUCC_AUTOCREATE_LNINV which enables autoprovisioning for non-MG9K line gateways.

16: Functional Description (FN): A00002291

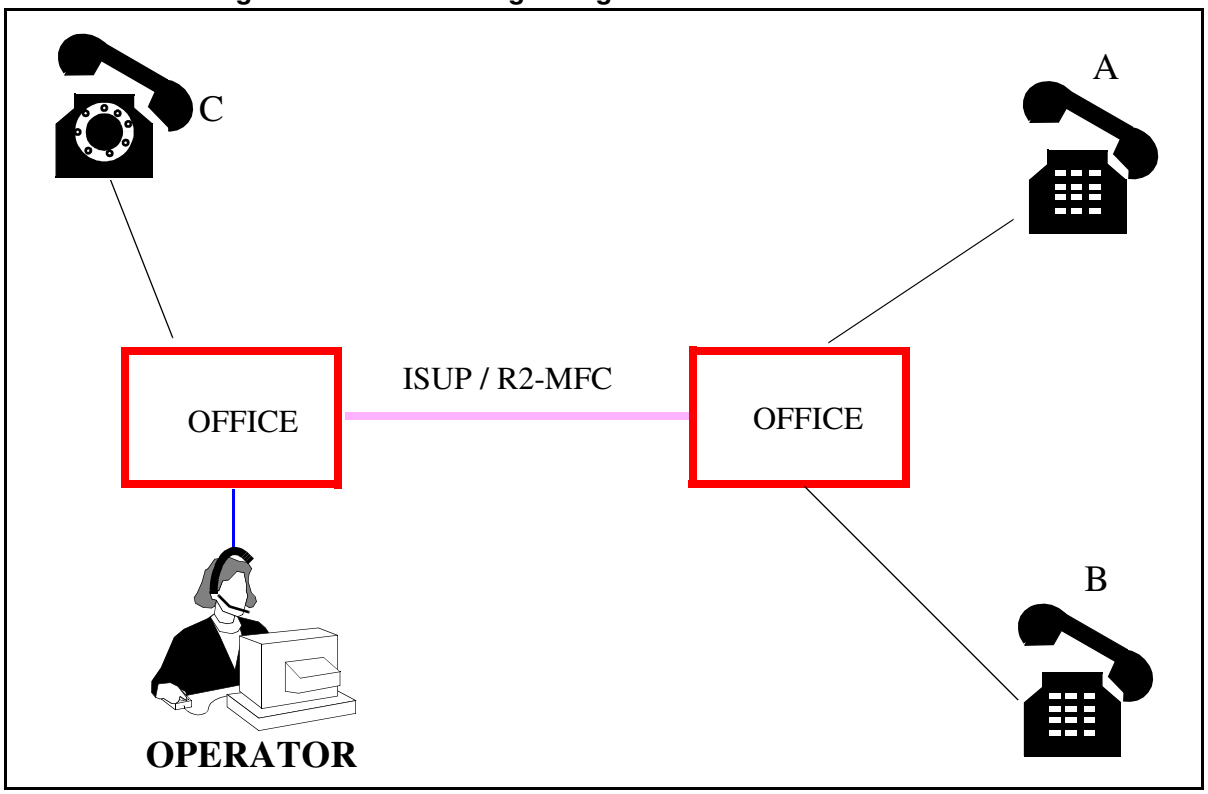
16.1 Feature name

Trunk Offering Expansion.

16.2 Description

“Trunk Offering” (TKO, TOF) is a software package that allows an operator to inform a busy subscriber that another subscriber wants to speak to him. The operator can break into an existing call and inform the busy subscriber verbally about a new, pending call. If the busy subscriber wants to receive the new call, One of the parties in the existing call should goes onhook, then the operator can connect him to the new caller immediately.

Figure 1 Trunk Offering configuration



TKO over ETSI ISUP trunks is already supported for some markets in the World-Trade software starting from the WT14 stream. This FN reflects the

functionality that supports the TKO feature both over ETSI ISUP and FDCP / MFC-R2 trunks for all markets using the default FDCP variant.

Table 1 TKO support today

	Telrad markets	other WT markets
ETSI ISUP trunks	supported in off-stream only.	supported.
FDCP/MFC trunks	supported in off-stream only.	not supported.

In order to provide Telrad markets with TKO feature in on-stream release, this feature propagates the TKO support to MMP20 for the following protocols:

- ETSI ISUP V2 for Ethiopia market,
- ETSI ISUP V2 for Costa-Rica market,
- ETSI ISUP V2 for Vietnam market,
- ETSI ISUP V2 for Georgia market,
- FDCP MFC / R2 and TYPE A.

In addition this FN reflects the Warning tone functionality for Ethiopia market.

Figure 1 LOGICAL VIEW

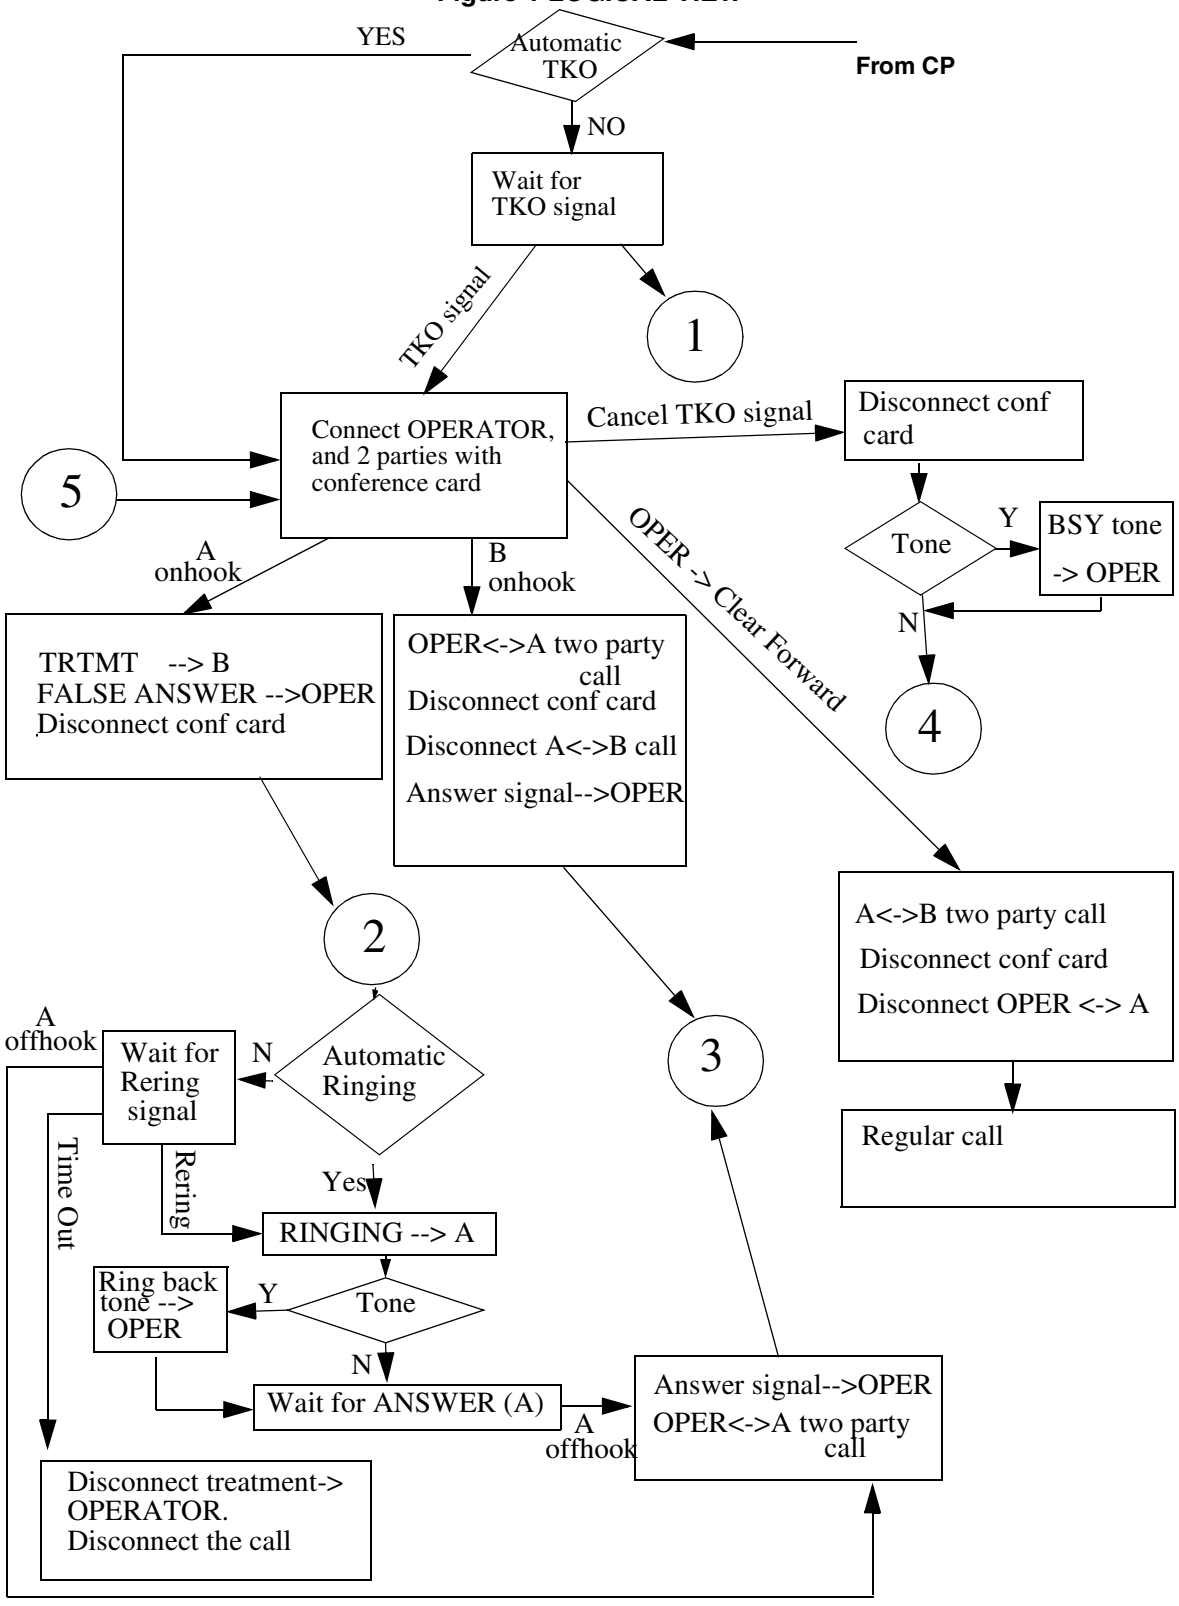


Figure 2 Logical View (continued)

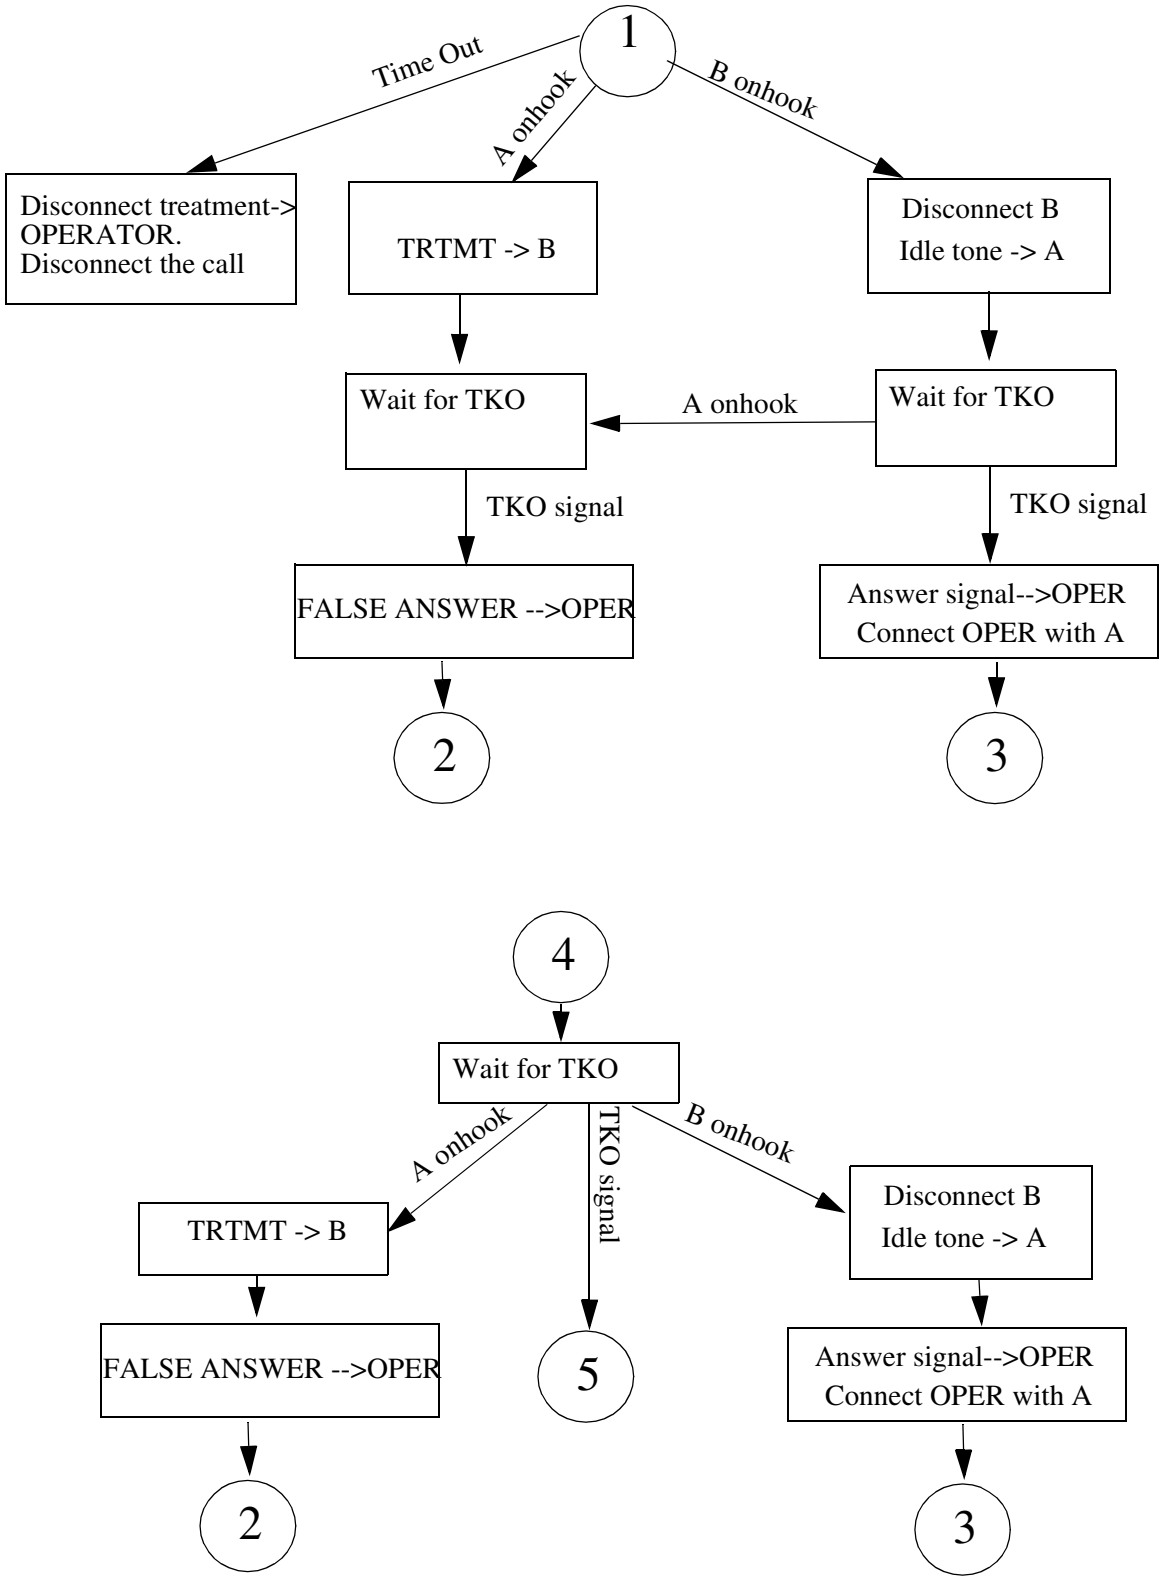

Figure 3 Logical View (continued)

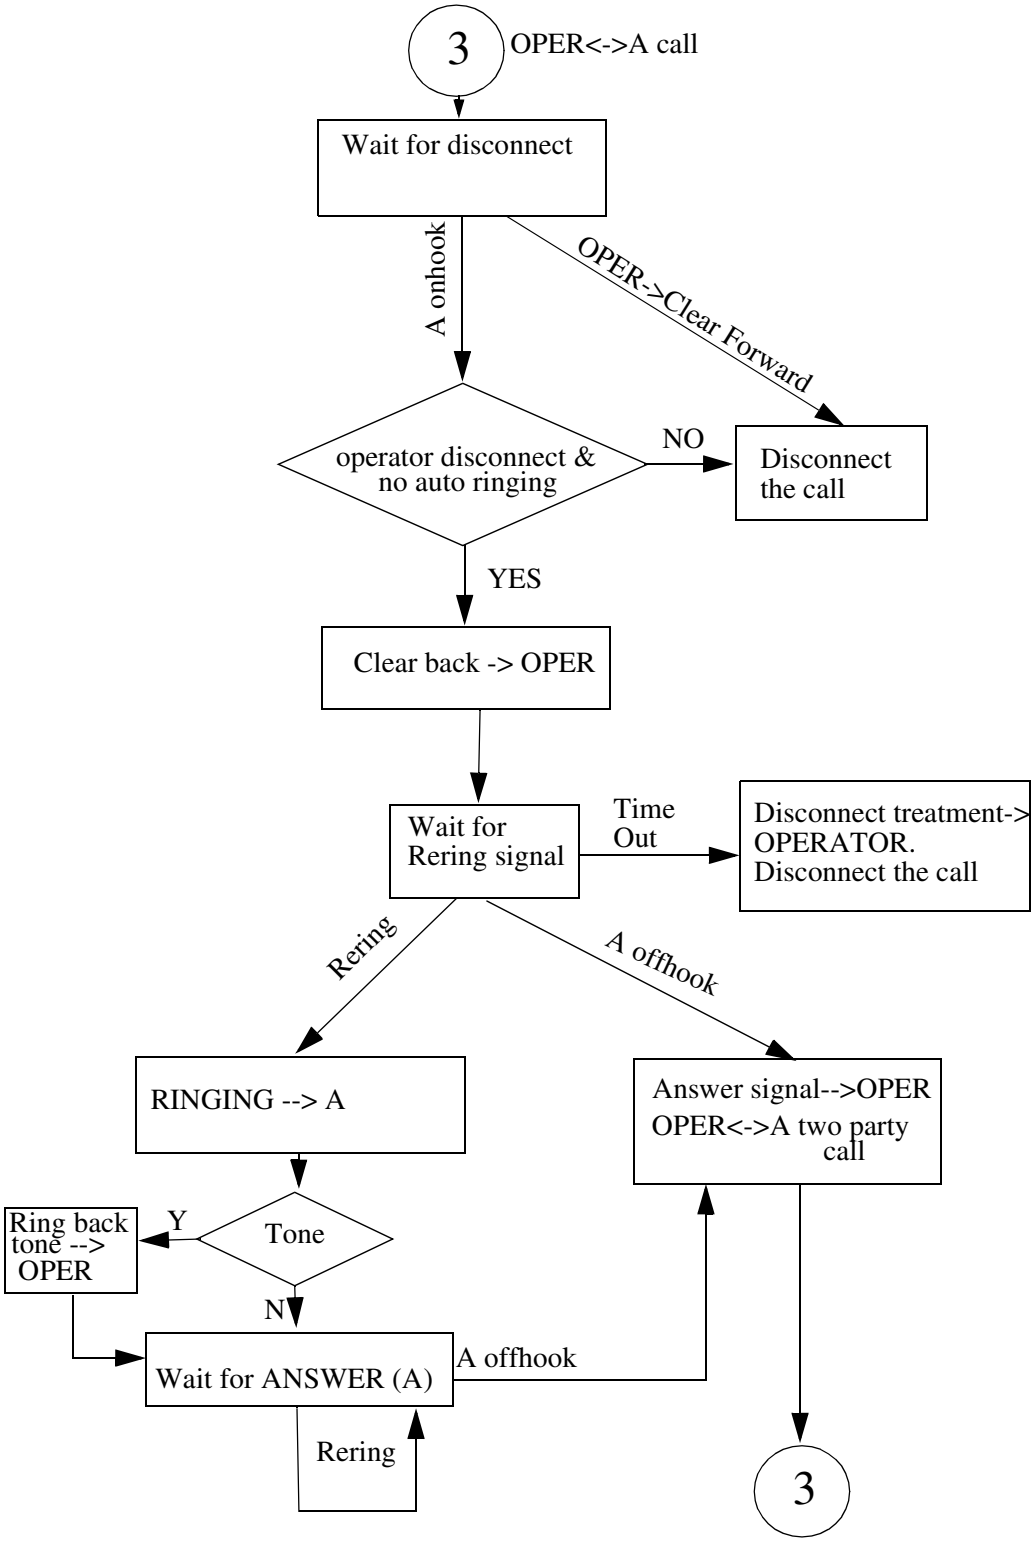

16.2.1 TKO support over ETSI ISUP trunks.

Table 2 ETSI ISUP TKO protocol differences

Event	Variations for Telrad markets	Existing behaviour for other markets
TKO signal	Ethiopia, Vietnam, Georgia: ISUP_FF_NATL (#FF) Costa-Rica: ISUP_F9_NATL (#F9)	Various values, eg. ISUP_FF_NATL (#FF) (egypt), ISUP_FD_NATL (#FD) (Mexico), etc.
OPER Calling Party Cathegory	Vietnam, Costa-Rica, Georgia: ISUP_CPC_OP_NATIONAL (#09) Ethiopia: ISUP_CPC_TKO_OPERATOR (#E6)	Various values, eg. ISUP_CPC_OP_FRENCH (#01), ISUP_CPC_OP_ENGLISH (#02), ISUP_CPC_OP_GERMAN (#03), etc.
Party A goes OffHook in response to the operator Re-Ring signal	A sends SUS message only	A sends ANM message followed by SUS message
Party B goes OnHook to terminate the conference	A sends ANM message	A sends RES message

Figure 4 ISUP TKO messaging flow: Basic case A: A OnHook after conference.

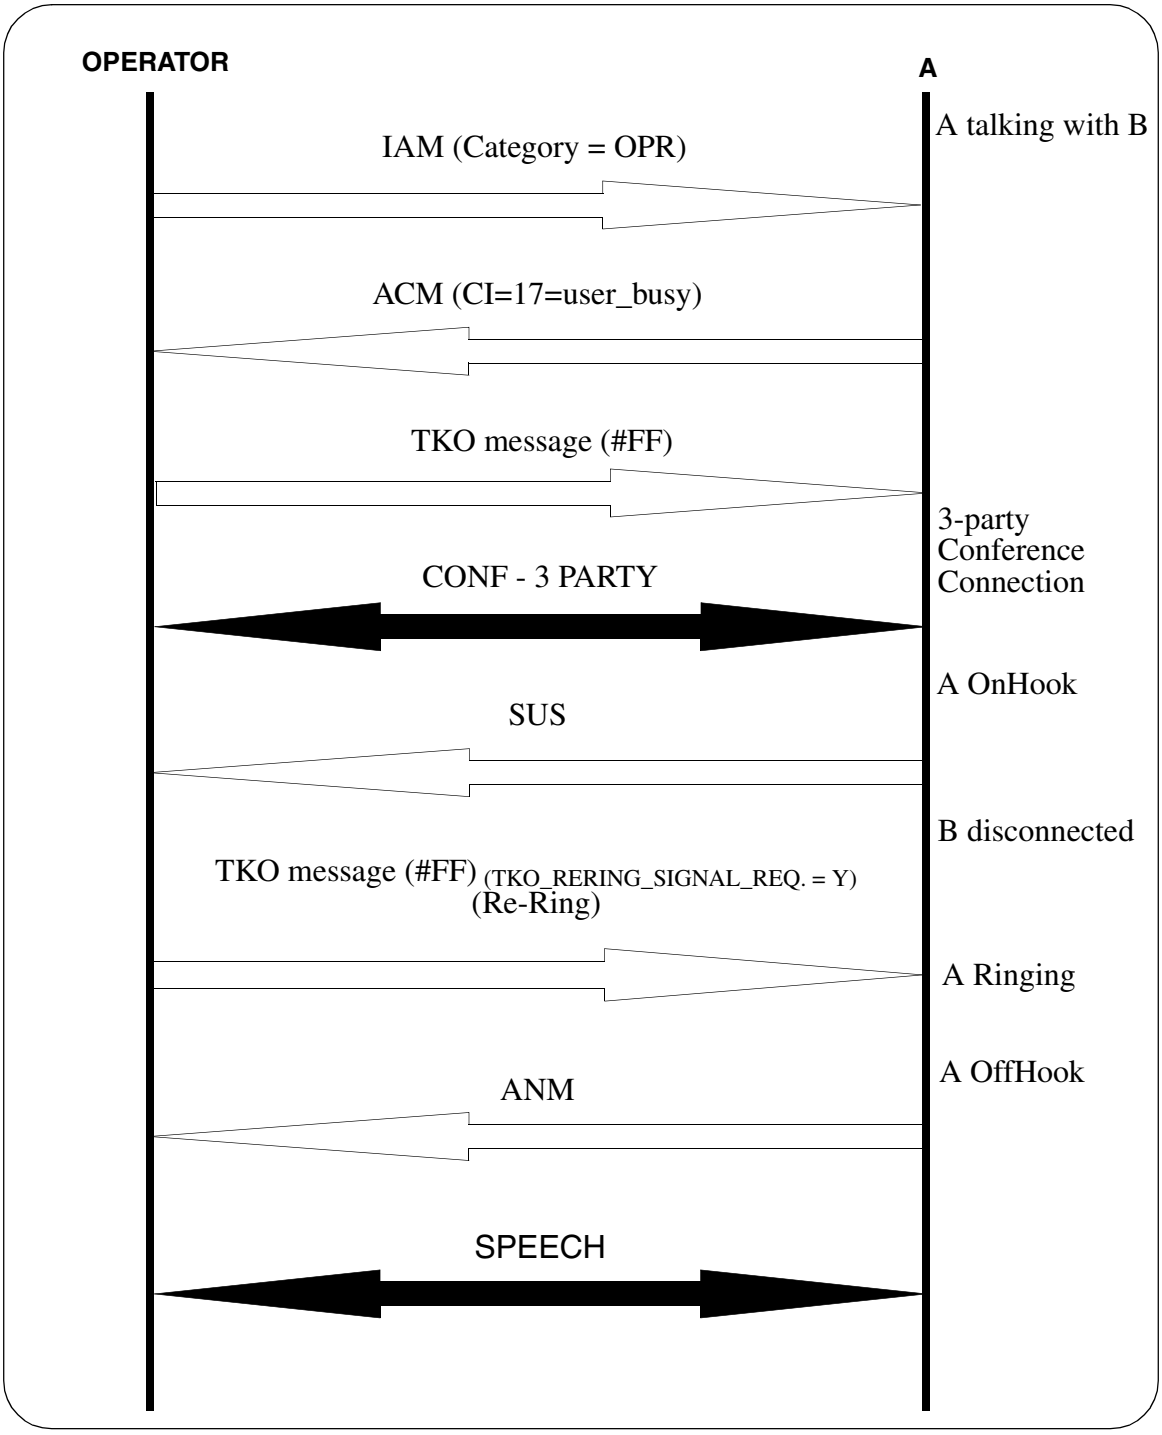

Figure 5 ISUP TKO messaging flow: Basic case B: B OnHook after conference.

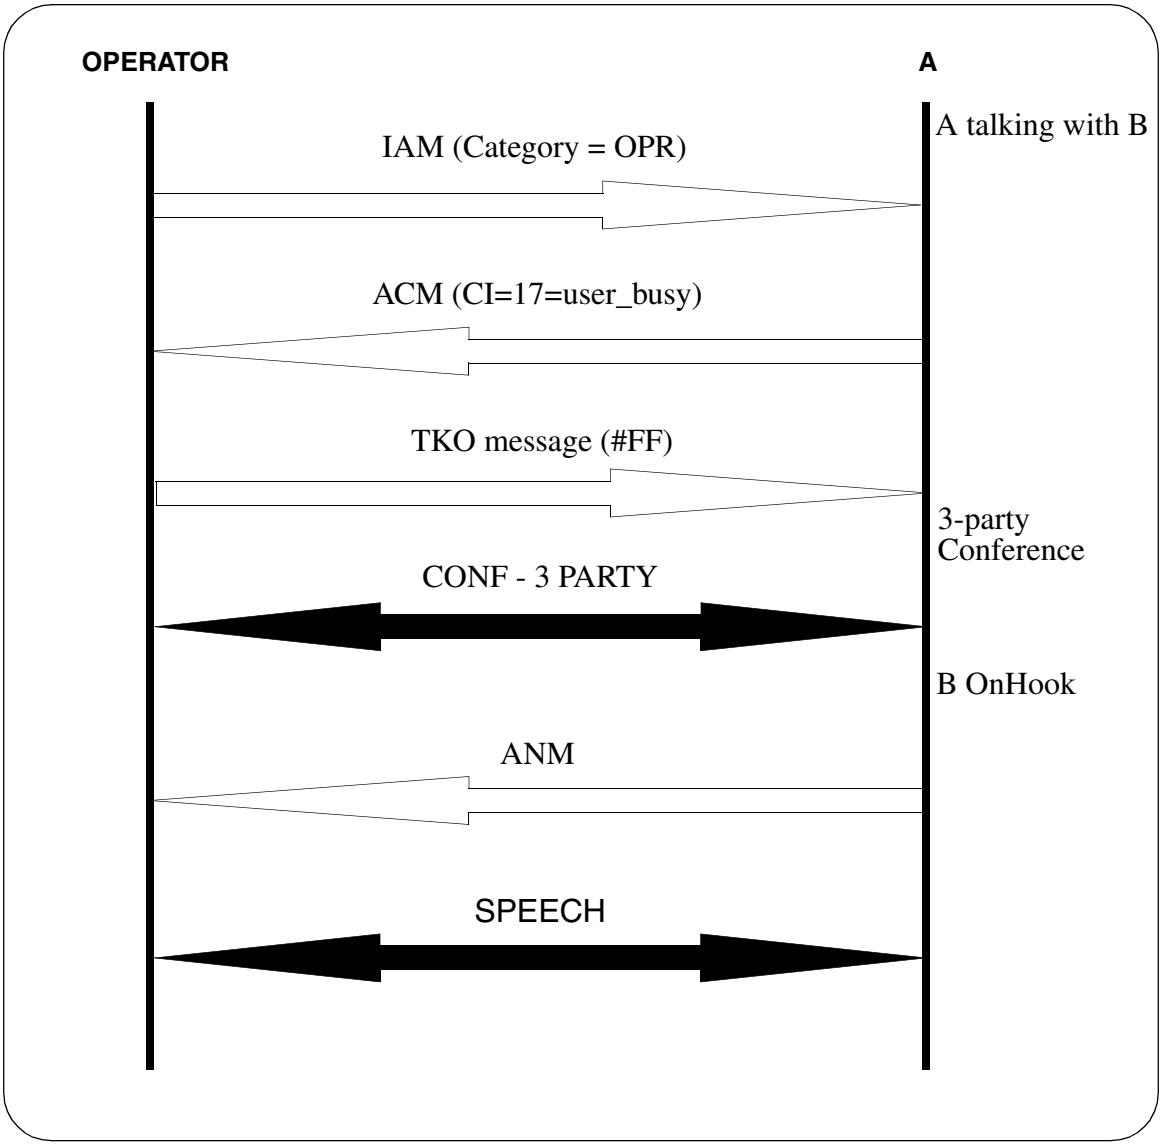

Figure 6 ISUP TKO messaging flow: Basic case C: A reject the operator call.

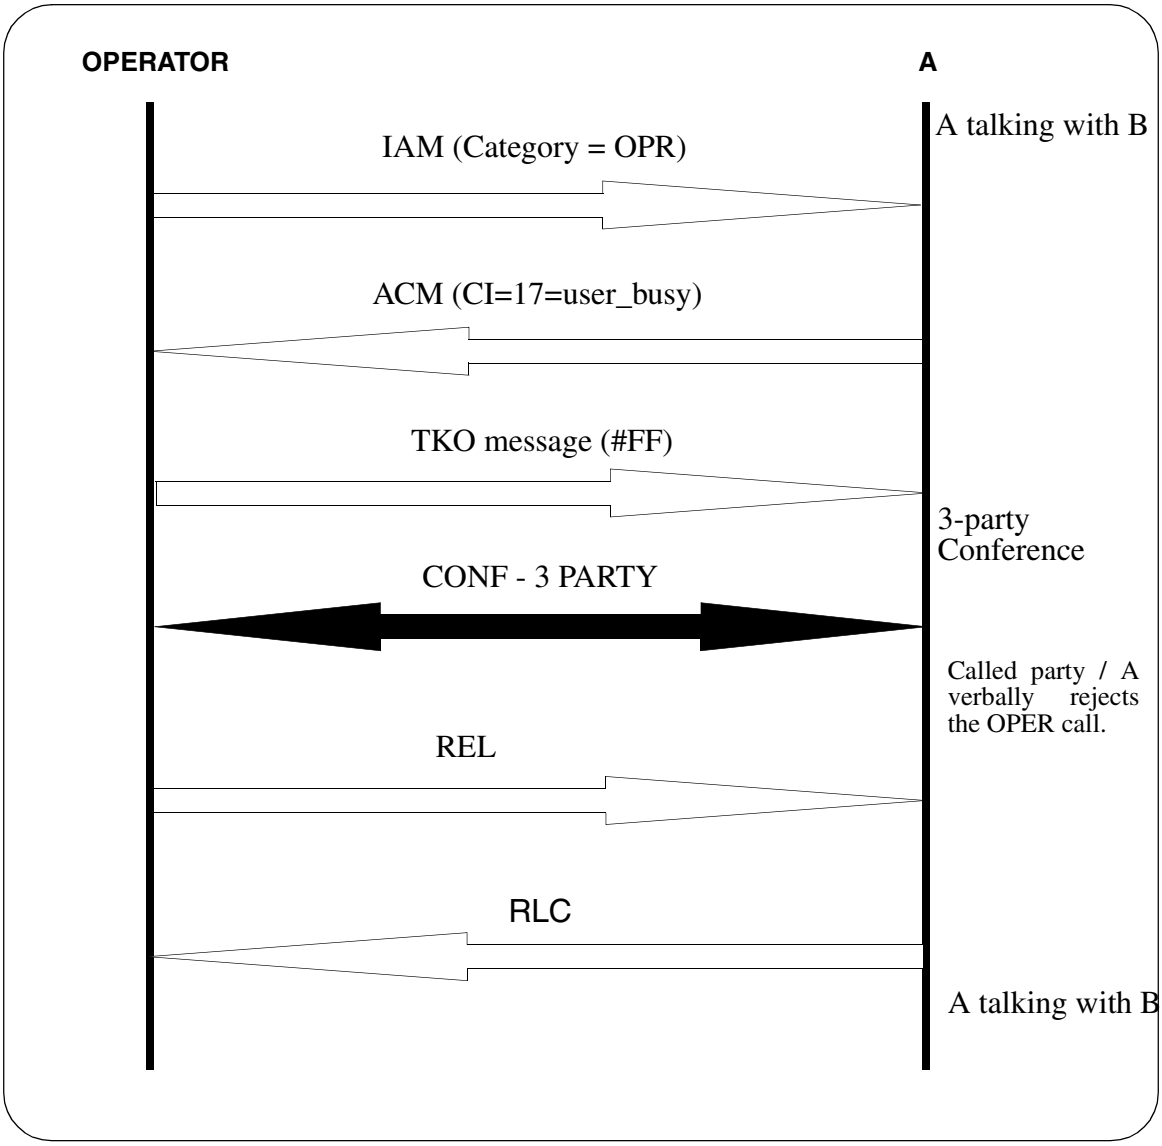

16.2.2 TKO support over FDCP MFC/R2 trunks.

Figure 7 MFC/R2 FOT messaging flow: Basic case A: A OnHook after conference.

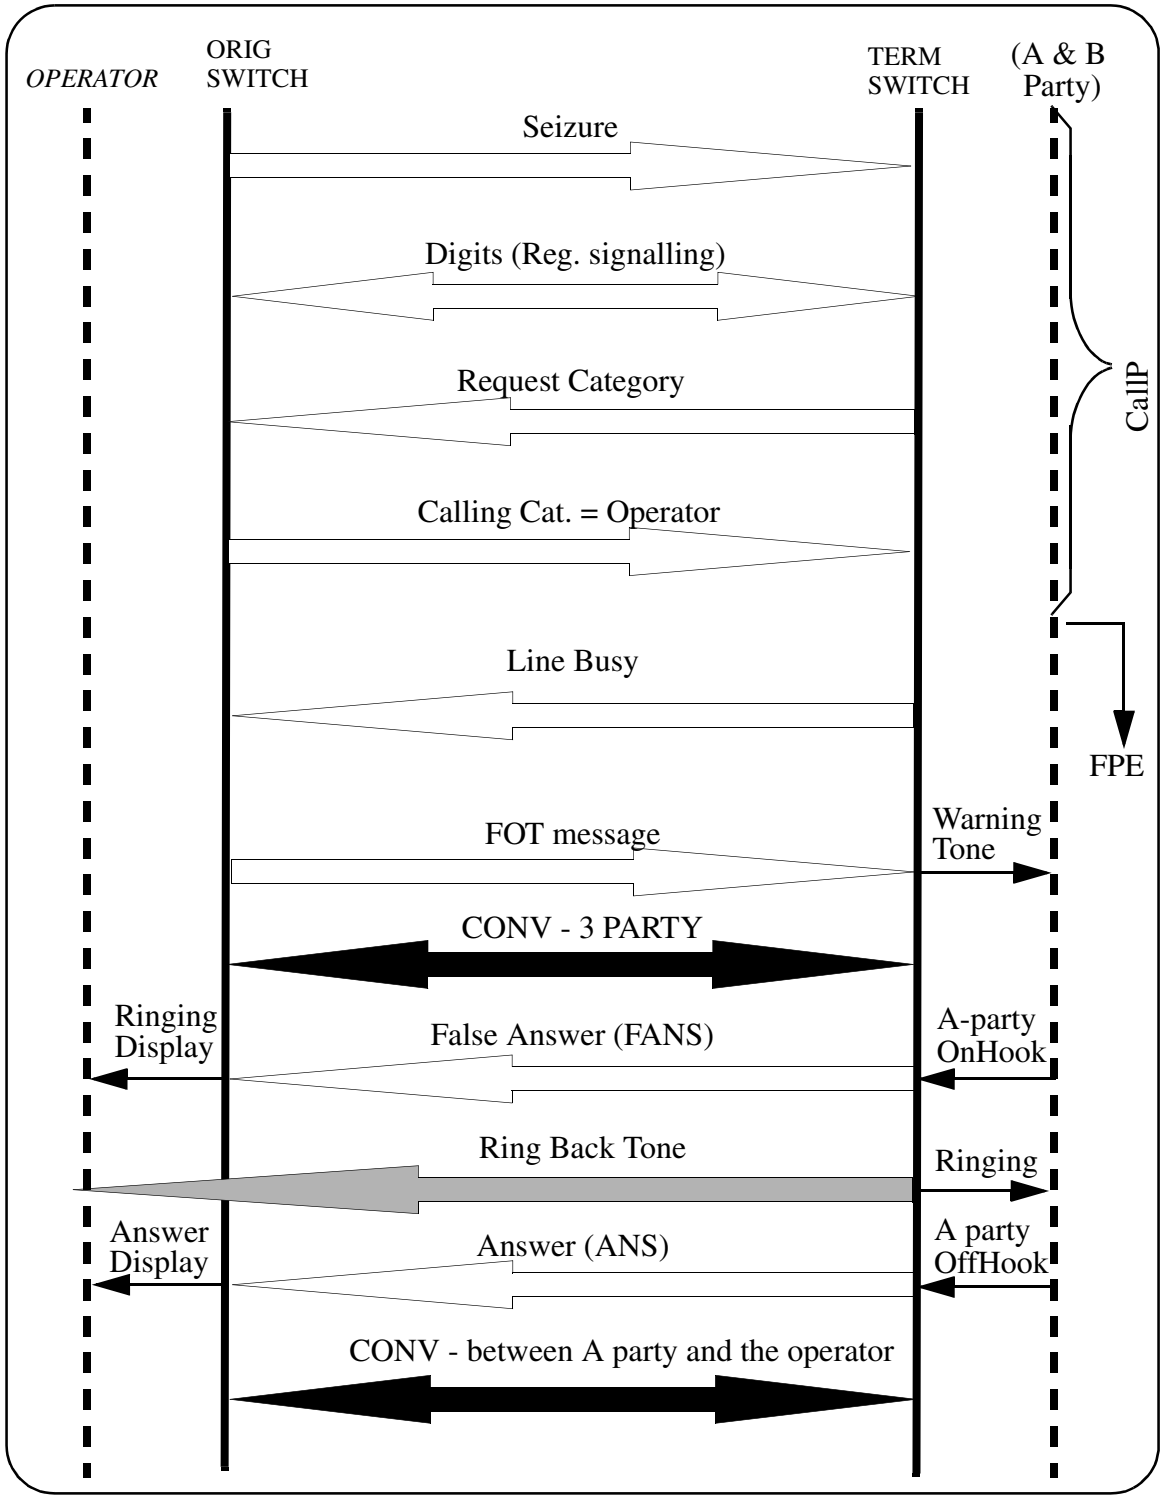

Figure 8 MFC/R2 FOT messaging flow: Basic case B: B OnHook after conference.

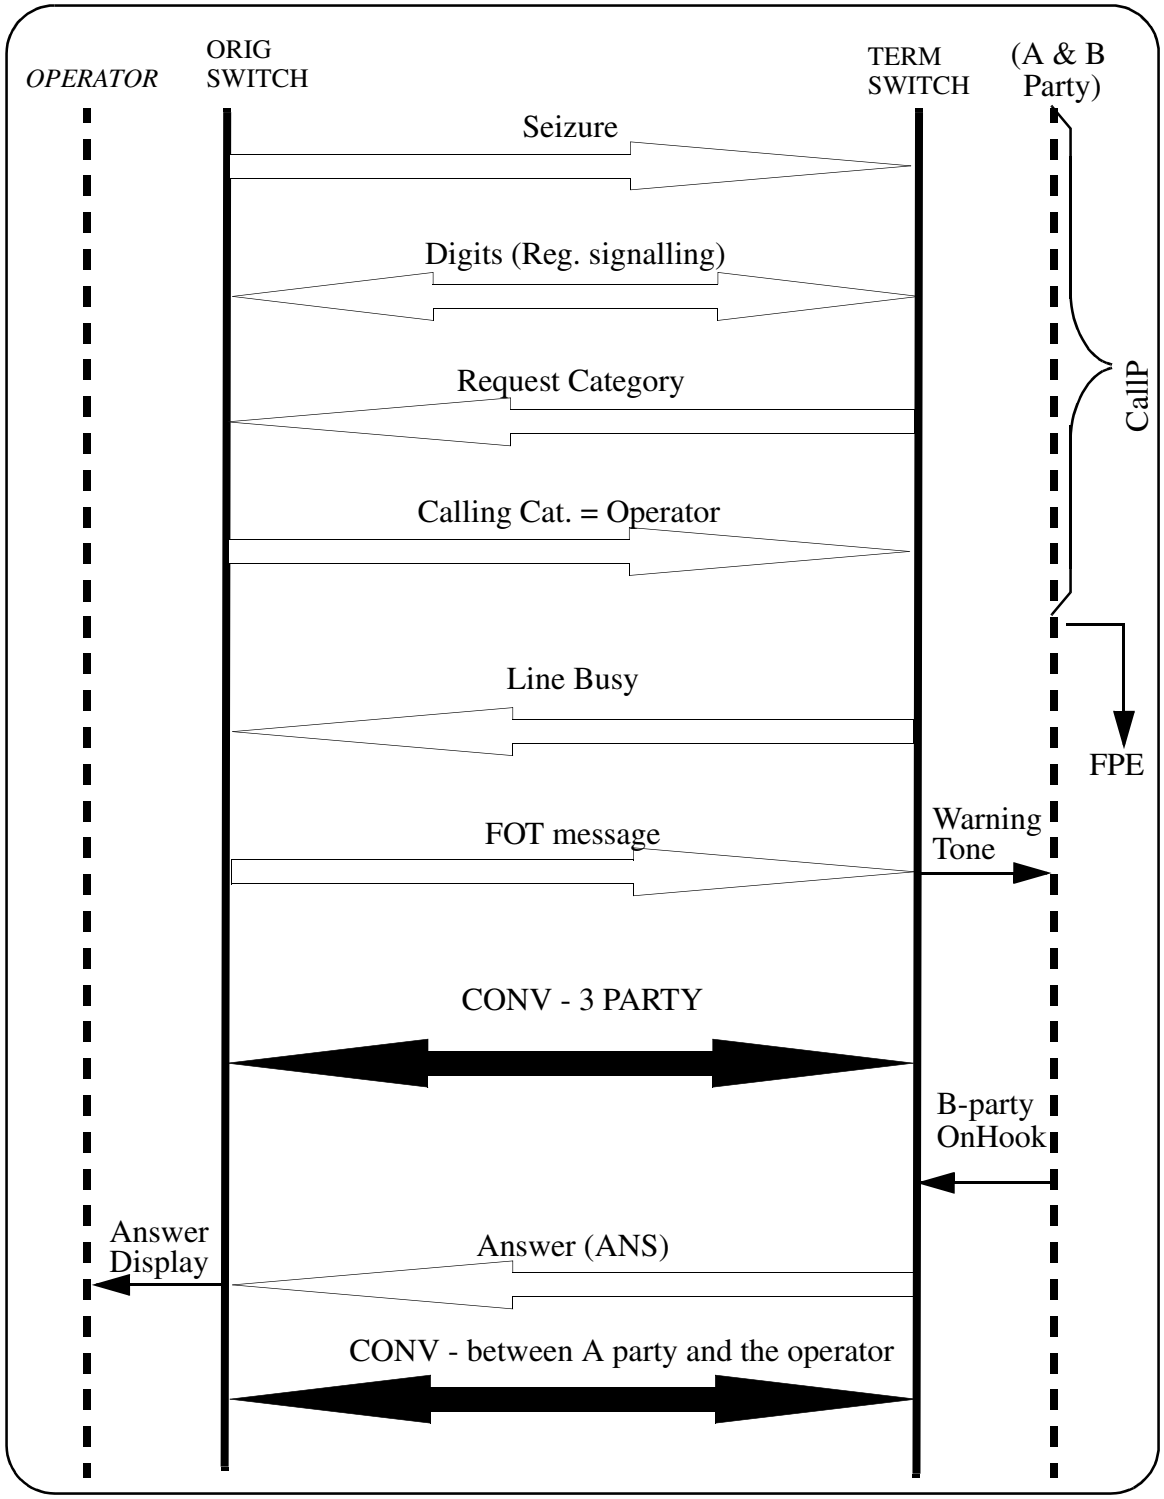

Figure 9 MFC/R2 FOT messaging flow: Basic case C: A reject the operator call.

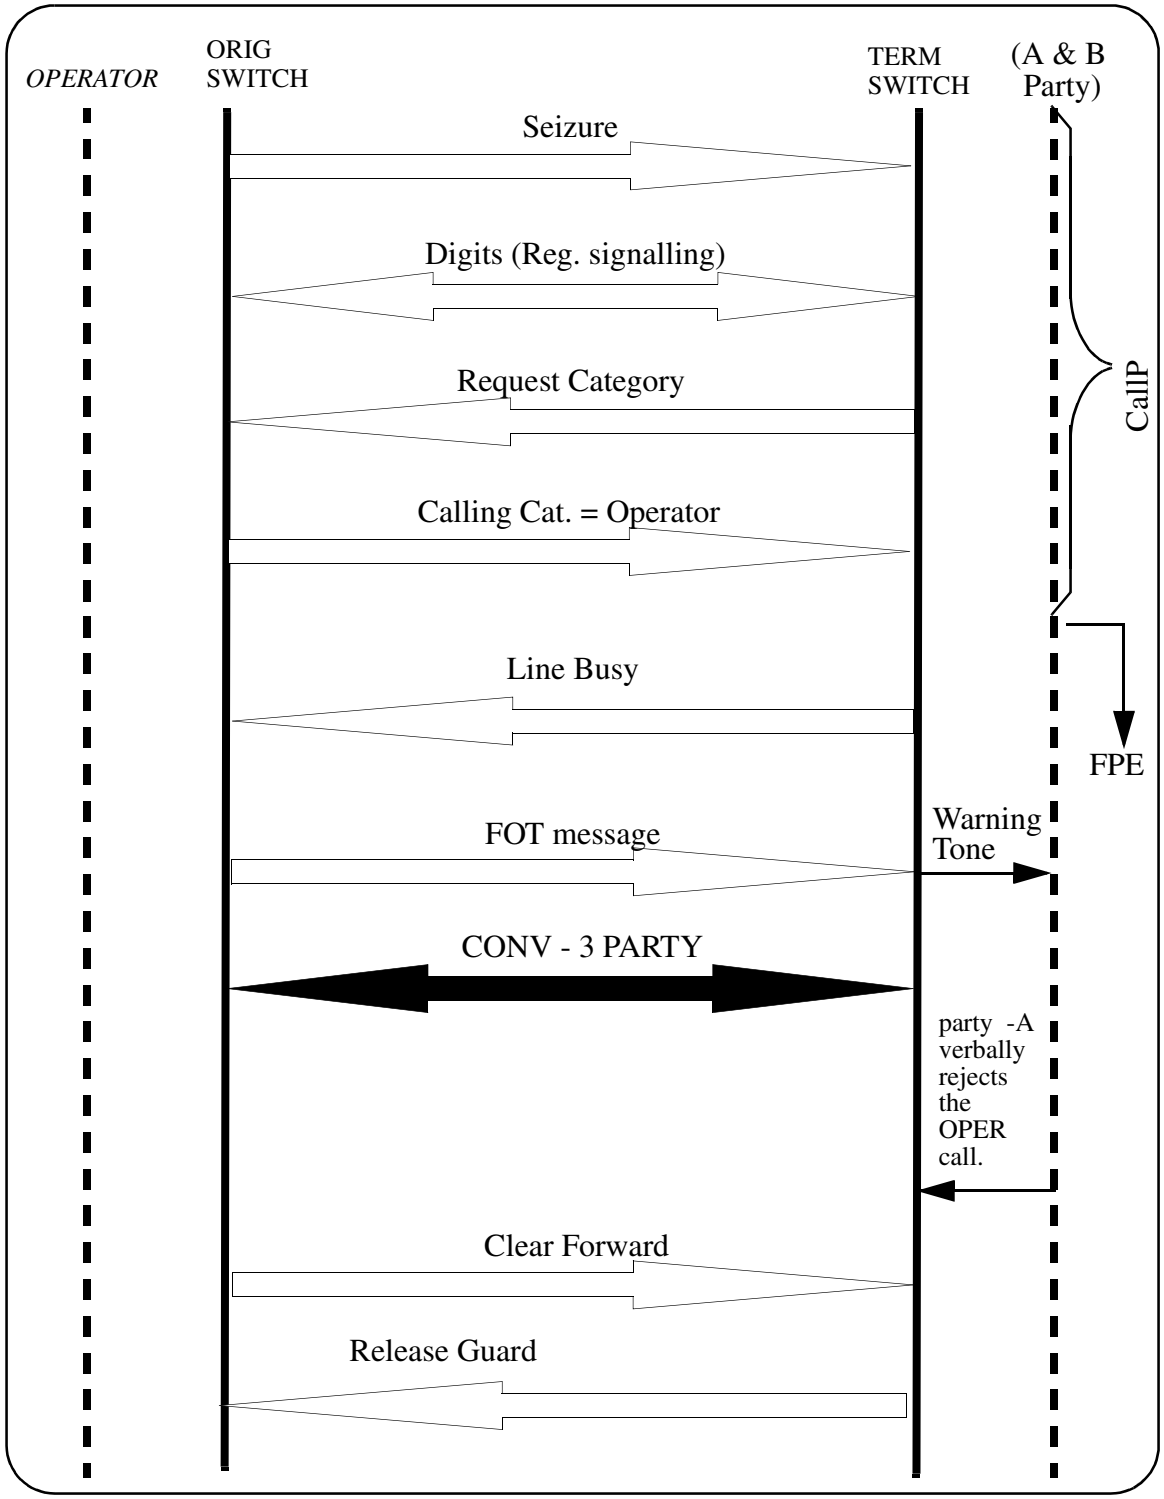

16.2.3 TKO support in Interworking switch of FDCP <-> ETSI ISUP trunks cross.

This feature supports cross situations between the two protocols FDCP and ETSI ISUP in the tandem switch, that includes the following cases:

1. Interworking switch of ETSI ISUP to ETSI ISUP trunks cross.
2. Interworking switch of ETSI ISUP to FDCP trunks cross.
3. Interworking switch of FDCP to ETSI ISUP trunks cross.
4. Interworking switch of FDCP to FDCP trunks cross.

Table 3 ISUP - FDCP equivalence

ISUP Signal	R2 MFC Equivalent Signal	Notes
ISUP_ACM	**Line busy**	Sent as a response to IAM event by TKO. This is done because CPC=Operator, and ACM is sent instead of RLS. For R2-MFC, busy signal (B-3) is sent by CALLP BEFORE feature is activated, regardless of the fact that CPC=Operator.
ISUP_SUS	**FANS (False Answer)**	'FALSE_ANSWER' signal - Notify operator switch of one of the following events: • Terminator is onhook and operator-terminator call is now being established. • Terminator has gone onhook while talking with operator.
ISUP_ANM	**ANS (Answer Message)**	Used to notify operator that terminator has gone offhook.
ISUP_RES	**ANS (Answer Message)**	Used for notifying operator switch that call is re-established (i.e. parties are now talking again).

Figure 10 TKO call on tandem switch with ISUP-FDCP cross

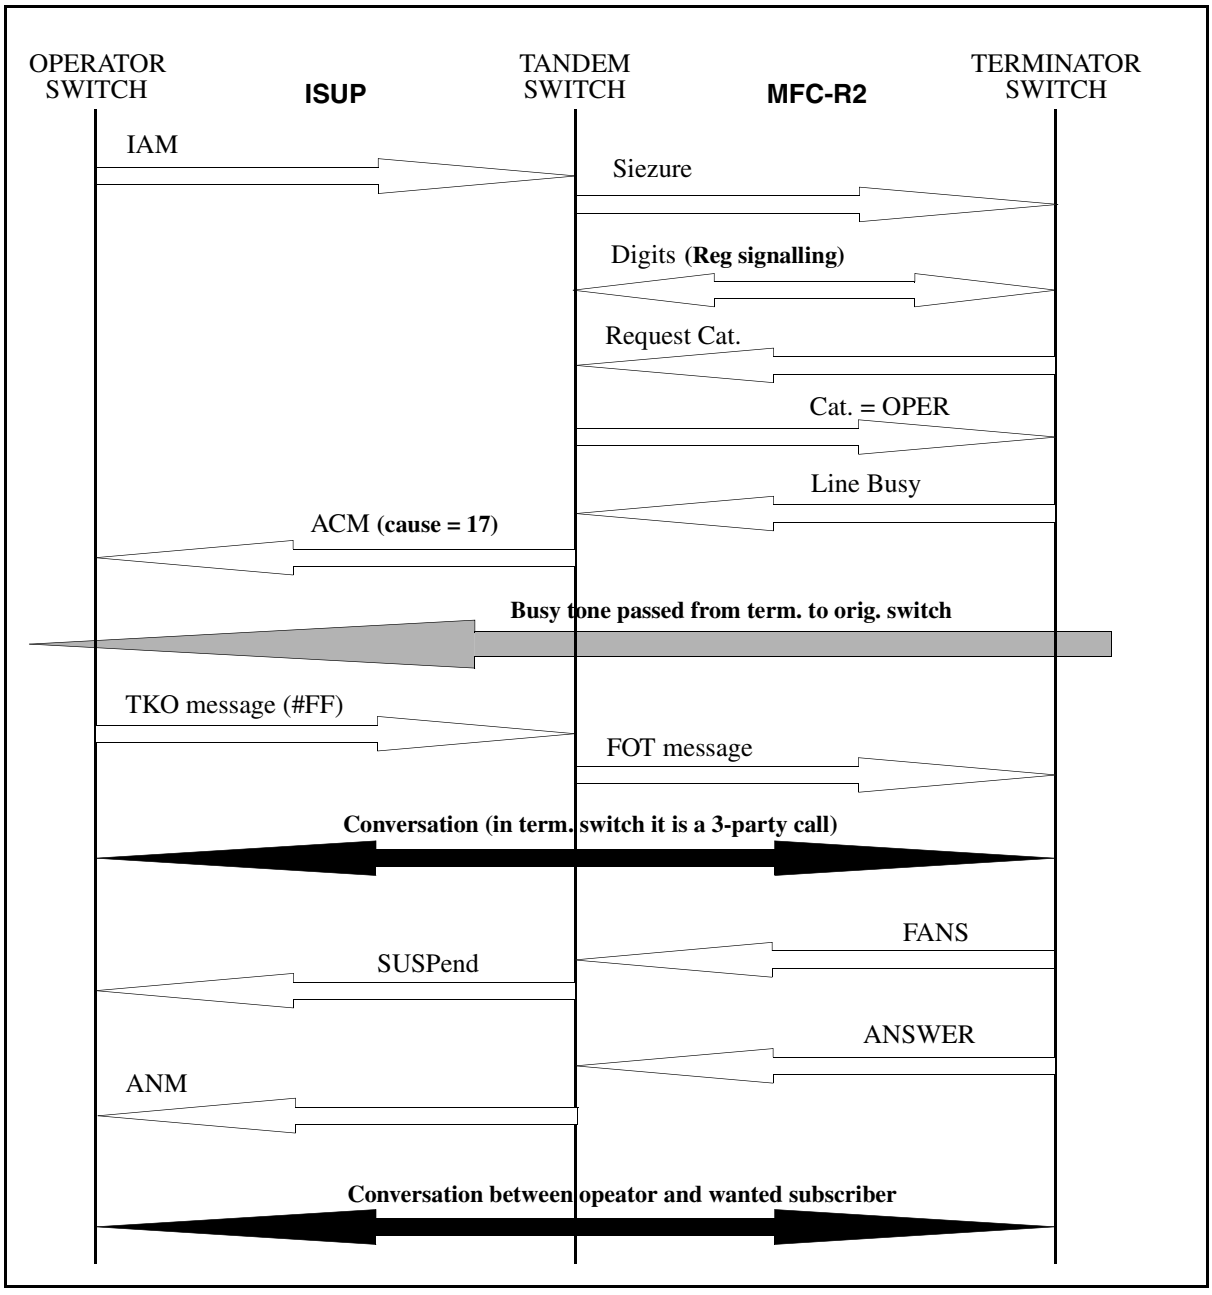

Figure 11 TKO call on tandem switch with FDCP-ISUP cross

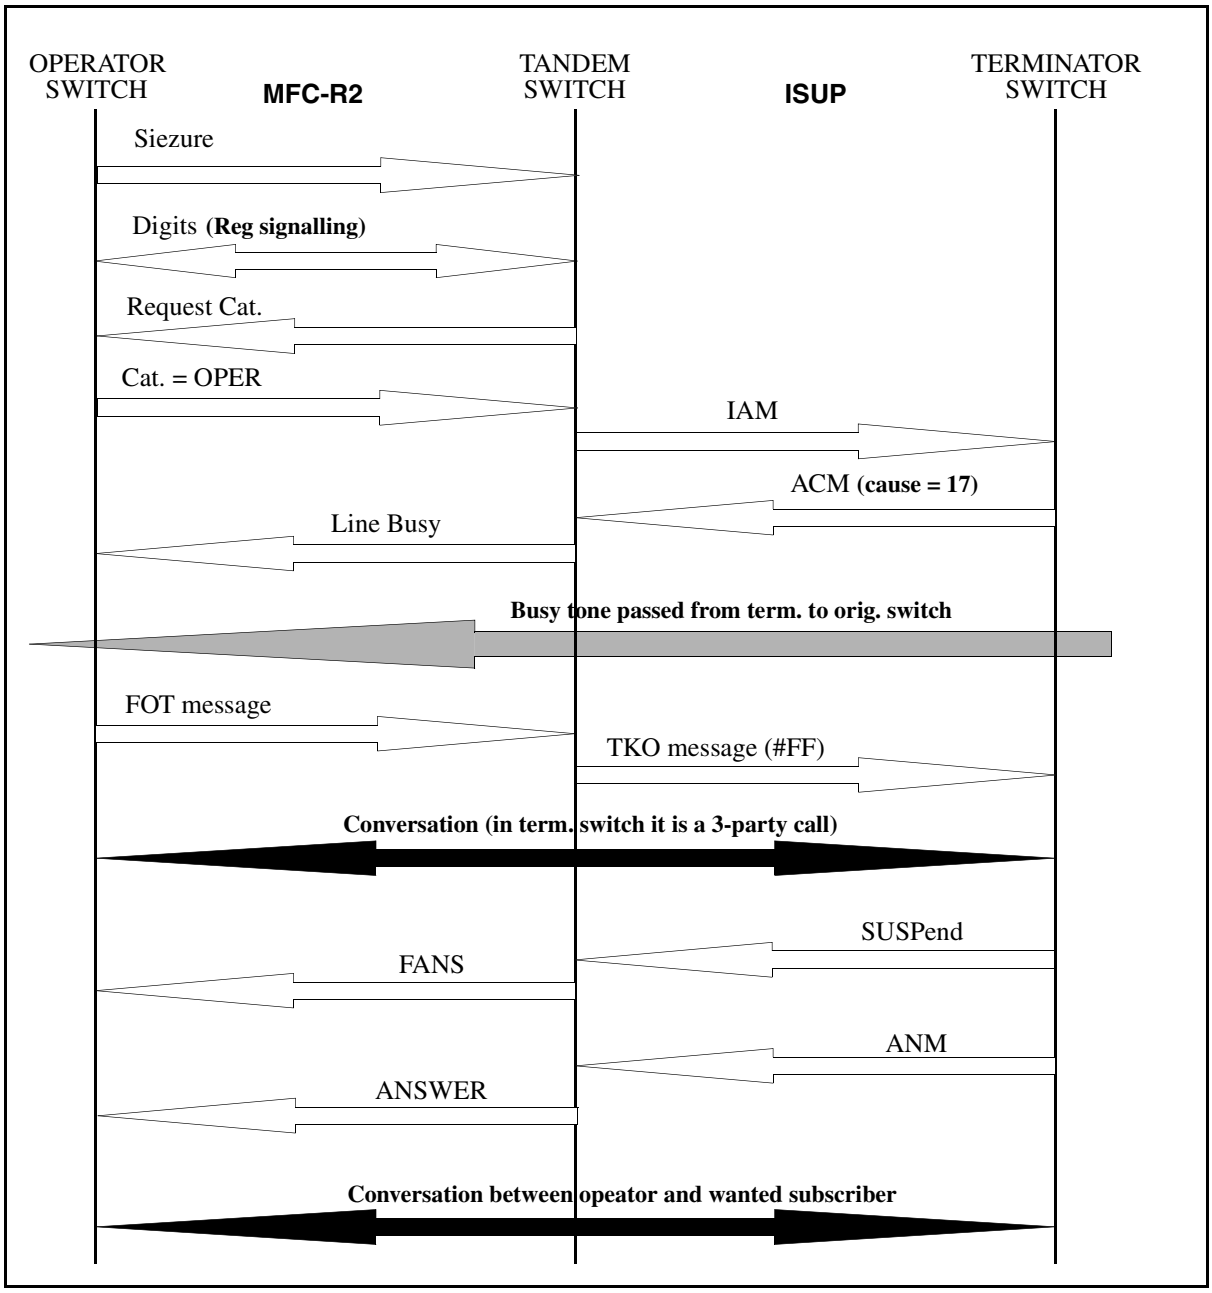

16.2.4 Warning tone for Ethiopia market.

This feature supports warning tone for the existing TLR425 toneset.

The warning tone is used in the Fix Price Service (FPS) feature.
The warnong tone is given when FPS credit limit is exhausted and timer to clear call started.

Table 4 Warning tone requirements

Frequency (Hz)	Level (dbm0)	Tone Id. in hex
1400	-10	9D

The tone consists from 3 repeated patterns of tone 08 for 0.5 secs with a break for 11.5 secs between the tones (tone-brake-tone-brake-tone).

16.3 Hardware Requirements or Dependencies

N/A

16.4 Software Requirements or Dependencies

N/A

16.5 Data Requirements or Dependencies

To enable the Trunk Offering feature in the switch, the office parameter TBI_OFFER in table OFCVAR should be set to one of the following values:

- "MANUAL", which means that the operator has to send a TKO signal manually in order to enter into A-B call, or:
- "AUTO", which means that a TKO signal is not needed, and the operator enters A-B call automatically after the intrusion tone is heard.

In the off-stream TLR13 CM load, eight office parameters defined in tables OFCOPT and OFCENG are used for Trunk Offering.

In the on-stream MMP19 CM load, five office parameters defined in table OFCENG are already used for Trunk Offering.

Merging the off-stream parameters in the on-stream release is done as follows:

1. The parameters TBI_OFFER and TBI_OPR_TIMEOUT are used by this feature in MMP instead of the TLR off-stream parameters TKO_IS_ACTIVE, TKO_AUTO and TKO_TIMEOUT.
2. The parameters:
   — TKO_INTRUSION_TONE,
   — TKO_TONE,

— TKO_RERING_SIGNAL_REQ,

— TKO_OPER_ONLY_CAN_DISC,

— TKO_BREAK_FTR,

are added by this feature in MMP20.

3. The new parameters are added in table **OFCENG**, to comply with the definition of the existing parameters in MMP.

4. The new parameter TKO_INTRUSION_TONE is used in combination with the existing parameter TBI_BACKGROUND_TONE, thus allowing the user to select the desired tone from the toneset. The original hardcoded tone is used as default.

Table 5 Office parameters for TKO in MMP20

Table	Office Parameter	New / Unchanged in WT20	Range	Default value	Description	Notes
OFC VAR	TBI_OFFER	Unchanged	OFF, AUTO, MANUAL	OFF	Sets feature activity and mode	For Telrad markets, this paramater replaces TKO_IS_ACTIVE and TKO_AUTO used in TLR.
OFC VAR	TBI_OPR_TIMEOUT	Unchanged	100 TO 300 sec	100	Timeout value for operator message	Same as TKO_TIMEOUT in TLR.
OFC VAR	LOCAL_TBI_TONE	Unchanged	N,Y	Y	Indicates whether the call being broken into will hear any tone (offering tone and/or background tone) during the intrusion by the operator.	Telrad markets should use the default value “Y”.
OFC VAR	TBI_OFFERING_TONE	Unchanged	N,Y	N	If set to ‘Y’, an offering tone will be played from the toneset for one second only before the operator enters the call. The tone is hardcoded.	Not applicable for Telrad markets.

Table 5 Office parameters for TKO in MMP20

Table	Office Parameter	New / Unchanged in WT20	Range	Default value	Description	Notes
OFC VAR	TBI_BACKGROUND_TONE	Unchanged	N,Y	Y	If set to 'Y', a continuous intrusion tone will be played from the conference card during the conference call. If set to 'N', an intrusion tone will be played from the toneset for one second only before the operator enters the call. The tone is hardcoded, and is different from the offering tone.	Telrad markets should use the default value "Y". Up to this feature, the tone was hardcoded as 450HZ_15DBM. In this feature, the tone is defined by the parameter TKO_INTRUSION_TONE (see next). The previously hardcoded tone is used now as the default tone.
OFC ENG	TKO_INTRUSION_TONE	Unchanged	CONFERENCE_TONE_SET: a range of 7 tones or "no tone".	450HZ_15DBM	Defines the intrusion tone that is played from the conference card during the conference call.	The default tone is set to 450HZ_15DBM to comply with the existing application. In TLR off-stream release, any tone from the set can be used. The default is 450HZ_20DBM. Telrad customers using MMP20 release will retain their own tone either by ONP or by load building.
OFC ENG	TKO_TONE	Unchanged	N,Y	Y	Defines wether the operator receives 'busy' and 'ring-back' tones	Applicable for Telrad markets only.
OFC ENG	TKO_RERING_SIGNAL_REQ	Unchanged	N,Y	Y	Defines wether a "Re-Ring" signal is required (second operator message)	Applicable for Telrad markets only.
OFC ENG	TKO_OPER_ONLY_CAN_DISC	Unchanged	N,Y	N	Defines wether the terminator subscriber can disconnect the call with the operator, or the operator only can disconnect it.	Applicable for Telrad markets only.

Table 5 Office parameters for TKO in MMP20

Table	Office Parameter	New / Unchanged in WT20	Range	Default value	Description	Notes
OFC ENG	TKO_BREAK_FTR	Unchanged	N,Y	N	Enables/disables TKO to a subscriber that has features that disallow calls received (DTM)	Applicable for Telrad markets only.

16.6 Limitations and restrictions

The new trunk option TKO_FDCP should be assigned to incoming FDCP trunk in the table TRKOPTS. It will allow TKO feature **for specific incoming directions**.

TrunK Offering via ETSI ISUP Trunks will be supported only for Costa-Rica, Vietnam, Ethiopia ang Georgia markets.

TrunK Offering via FDCP Trunks will not be supported for 2W Trunks.

OPERATOR to Busy ISDN subscriber: OPERATOR can not break in.

16.7 TREATMENT

In case of TKO can not be applied, a PTOF (Premature_Trunk_OFfering) treatment should be applied to the InComing Trunk.

16.8 Interactions

16.8.1 OPERATOR to call with regret time.

In a scenario where the OPERATOR tries to call A and A is involved in a call with B: If A or B are in regret time, the OPERATOR can break in and disconnect B.

In case a scenario where A or B has been involved in a CWT or 3WC features before OPERATOR call, if A or B was On-Hook and now A or B are in regret time: in this case OPERATOR can not breake in.

Example for above mentioned case:

- A (CWT option) in call with B.
- C calls A. A was got CWT tone.
- C On-Hook.
- A and B continue to be in conversation.

- A On-Hook.
- OPERATOR can not breake in.

16.8.2 OPERATOR to call with OPERATOR on line.

In a scenario where the OPERATOR tries to call A and A is involved in a call with another OPERATOR, the operator can not break in.

.When an OPERATOR is in the process of breaking in to a call another OPERATOR can not initiate a break in process.

16.8.3 OPERATOR to noneTALKING call.

OPERATOR can not break in to the following call states: Off-Hook before dialing, dialing and ringing.

16.8.4 Call Wait (CWT).

The possible situations are:

A has the CWT feature but he is involved in a regular call - The OPERATOR can break in to the call (regular call).

A is involved in a CWT call - Break in can not be effected.

B is involved in a CWT call and A is on the same office - Break in can not be effected.

B is involved in a CWT call and A is not on the same office - There is therefor, no indication that B is involved in a CWT call - The OPERATOR can break in.

A cannot FLASH after OPERATOR enterd the call.

16.8.5 3WC.

The possible situations are:

A has the 3WC feature but he is involved in a regular call - The OPERATOR can break in to the call (regular call).

A is involved in a 3WC call - Break in can not be effected.

B is involved in a 3WC call and A is on the same office - Break in can not be effected.

B is involved in a 3WC call and A is not on the same office - There is therefor, no indication that B is involved in a 3WC call - The OPERATOR can break in.

A cannot FLASH after OPERATOR enterd the call.

16.8.6 Call Forward (CFW) / CFBL / CFDA.

The call forward is transferred. If the second call is BUSY the OPERATOR can break in.

16.8.7 Denied Terminator (DTM).

The OPERATOR can break in only if office parameter TKO_BREAK_FTR is set to Y.

Note. Office parameter TKO_BREAK_FTR for connection via FDCP trunks works only in case when calling paty category was received before all the called party digits were delivered to the switch. For this purpose appropriate entry in the table R2PROT should be datafilled with option ANI_AFTER_1_DIG or CAT_AFTER_1_DIG.

16.8.8 SUS / RSUS.

The OPERATOR can not break in.

16.8.9 MCT.

The OPERATOR can not break in to any call involving MCT.

The OPERATOR can not break in - When B has MCT and the AB call is a line to line call or the AB call is a line to trunk call and when A receives a holding indication.

The OPERATOR can not break in - When A has activated MCT by pressing FLASH.

A cannot FLASH after OPERATOR enterd the call.

16.8.10 OPERATOR to Line who was connected to TREATMENT or TONE call.

The OPERATOR can not break in.

16.8.11 OPERATOR to HUNT GROUP.

In case of all HUNT GROUP (DNH) members are in Busy state, the operator can breaks in last busy member call.

16.8.12 OPERATOR to Busy ISDN subscriber.

OPERATOR can not break in.

16.8.13 OPERATOR to Line with CLI option.

In case of OPERATOR calls Line with CLI option, no information Log will be printed - neither when line is in the call, nor when line is idle.

17: Functional Description (FN): A00002293

17.1 Feature name

Registered Call Line Option

17.2 Description

17.2.1 Introduction

The **Registered Call (RGC)** feature permits a subscriber with the RGC feature activated to redial automatically the last dialled number by going off-hook. When the Registered Call timer (the timeout can be programmed by the customer from 1 to 20 seconds) expires, and the subscriber does not start to dial any number, the feature provides call to the last dialled number.

The RGC feature allows automatic redialing to the last valid call that passed translation and routing (i.e. successfully route the call to terminating subscriber line or to outgoing trunk group or to BLDN treatment) in the switch.

The feature introduces a new line option RGC that supports IBN and ISDN (BRI) lines.

This activity allows automatic deactivation of RGC feature if a special timer expires. The timer value is determined by the new field **AUTO_DEACT_TIMEOUT** in the RGC tuple added to table ISERVOPT.

17.2.2 RGC Activation

- In order to activate RGC feature, subscriber should dial feature code activation (***66** - this number is used in this feature for example) and hang up.
- Subscriber will be able to activate RGC feature to only one destination.
- If subscriber has already activated RGC feature, the previous activation should be cancelled by a new one. The new RGC activation activates the feature to the new destination according to the last valid call performed before the new activation.
- Confirmation tone should be applied to subscriber in case of successful feature activation.
  Log LINE 138 is generated:
  TREATMENT SET = **CONF** CALLED NO = B66
- If dialed call did not pass translation and routing in the switch it will not be registered and activation will be done to the last valid call.

- When the new feature activation is done, the previous timing cycle is cancelled and the timer re-starts from the beginning.
- Log LINE 138 with FNAL treatment is generated when a subscriber, which has not the RGC option, tries to activate RGC feature by dialing *66:
  TREATMENT SET = **FNAL** CALLED NO = B66

17.2.3 RGC Deactivation

- Deactivation of RGC feature may be done by one of the following cases:
  - Automatically if the timer determined by the new field **AUTO_DEACT_TIMEOUT** of RGC option in table ISERVOPT expires.
  - After successful call establishment to registered destination and the terminator answer.
  - By dialling deactivation code (**#66** - - this number is used in this feature for example).
- Confirmation tone should be applied to subscriber in case of successful feature deactivation.
- If the subscriber has already deactivated RGC feature and a new RGC deactivation is done by dialing #66, then log LINE 138 with NACK treatment is generated:
  TREATMENT SET = **NACK** CALLED NO = C66

17.2.4 RGC Treatments

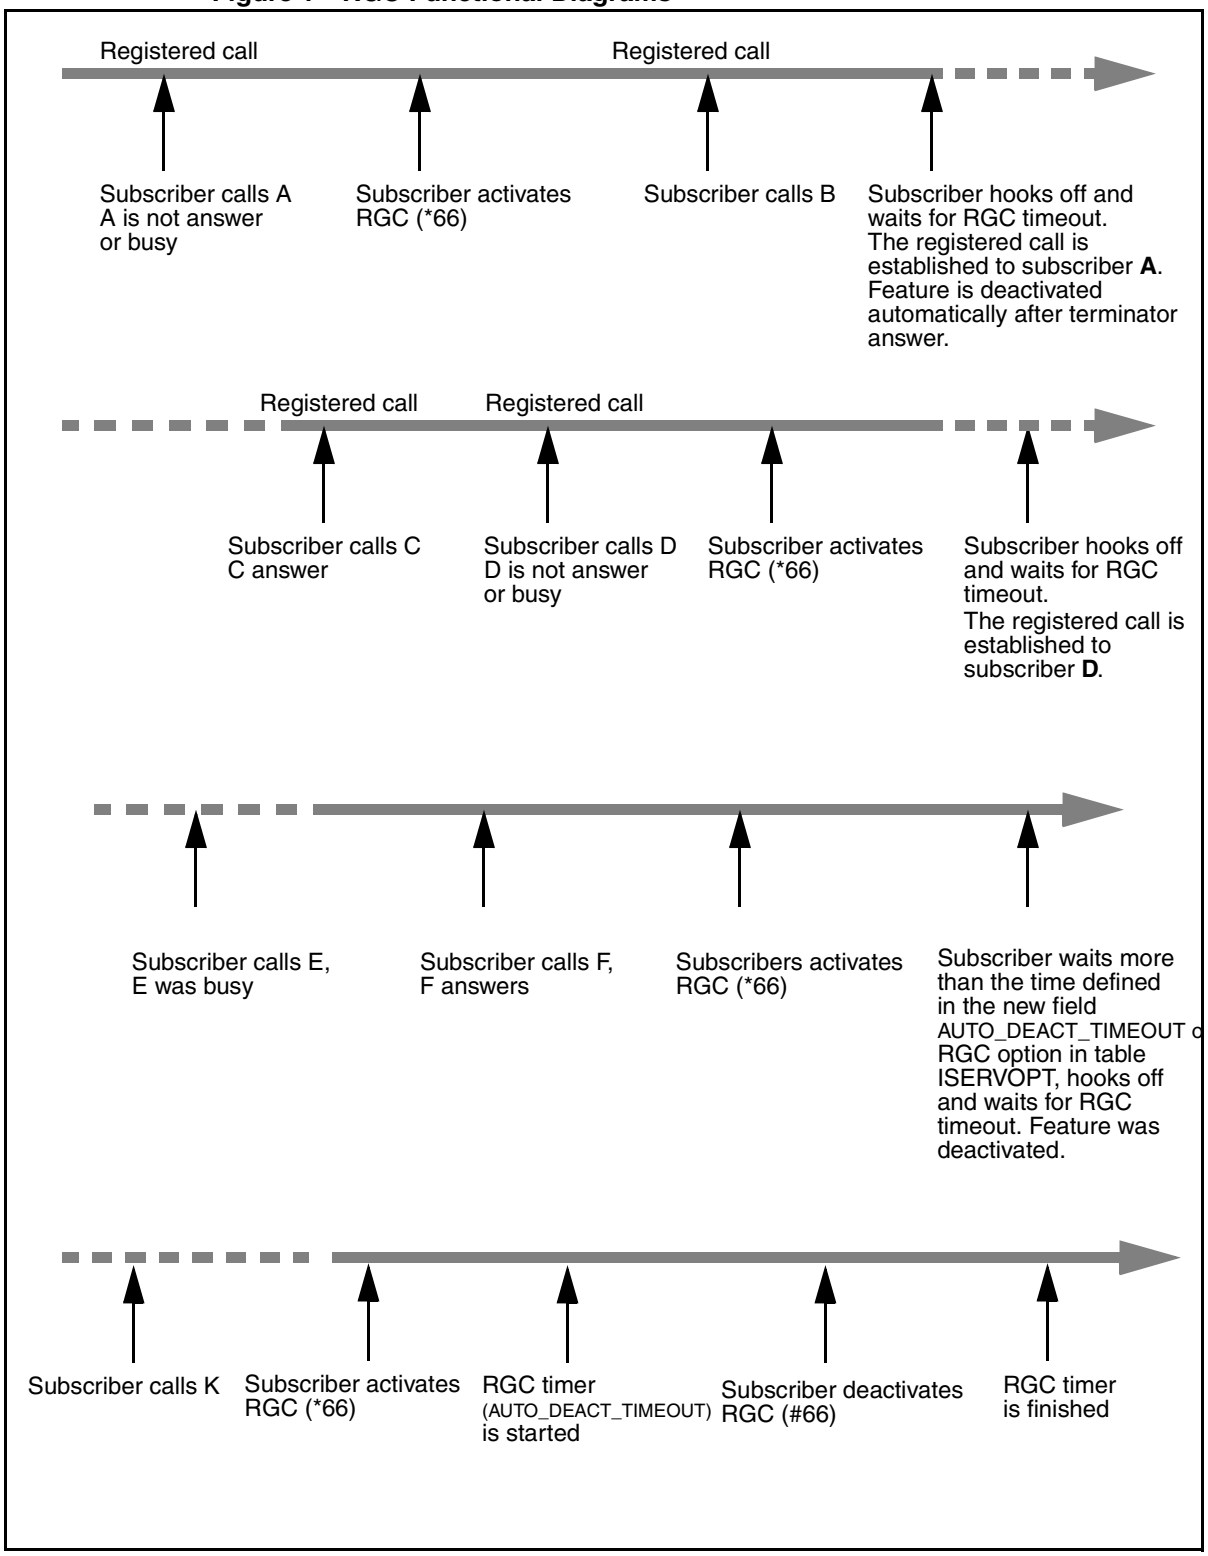
Table 1 Summary of treatments in log LINE138 after RGC activation/deactivation

Treatment	Action	Description of cases
FNAL	Activation	RGC feature is not defined on line
PSIG	Activation	RGC activation without last number stored
CONF	Activation/ Deactivation	Perform the successful RGC activation code
NACK	Deactivation	Double RGC deactivation by user
BLDN	Off-Hook	RGC feature was activated after BLDN call

17.2.5 RGC Functional Diagram

When the subscriber, which has activated RGC feature, goes off-hook, the feature waits for RGC activation timeout (defined in Servord TIMEOUT field). If the subscriber does not start to dial any number, the feature tries to establish a call to the last valid call that was performed before activation. Figure 1, "RGC Functional Diagrams" demonstrates same cases of RGC feature activation and deactivation interactions.

Figure 1 RGC Functional Diagrams



17.2.6 Controlling the RGC deactivation timer

Deactivation timer of RGC feature is fully controlled using the Table Control. A new tuple for RGC option is added to table ISERVOPT. If RGC option is not present in ISERVOPT table, then a value of deactivation timer is set to default (10). The customer can change the default value by adding/changing the RGC tuple to table.

Note: Restarts are not required to activate data changes after adding/ changing/deleting RGC tuple to/from table ISERVOPT.

17.3 Hardware Requirements or Dependencies

Not applicable.

17.4 Software Requirements or Dependencies

Not applicable.

17.5 Limitations and restrictions

- RGC line option is incompatible with WML, ACB, AR, AUL, GIC, MAN, MPB options and for HUNT group.
- Subscriber may activate RGC to one destination only.
- It can be allowed to activate simultaneously up to 1000 RGC requests per switch.
- RGC supports IBN and ISDN (BRI) lines.

17.6 Interactions

18: Functional Description (FN): A00002319

18.1 Feature name

MWI control via ISUP.

18.2 Description

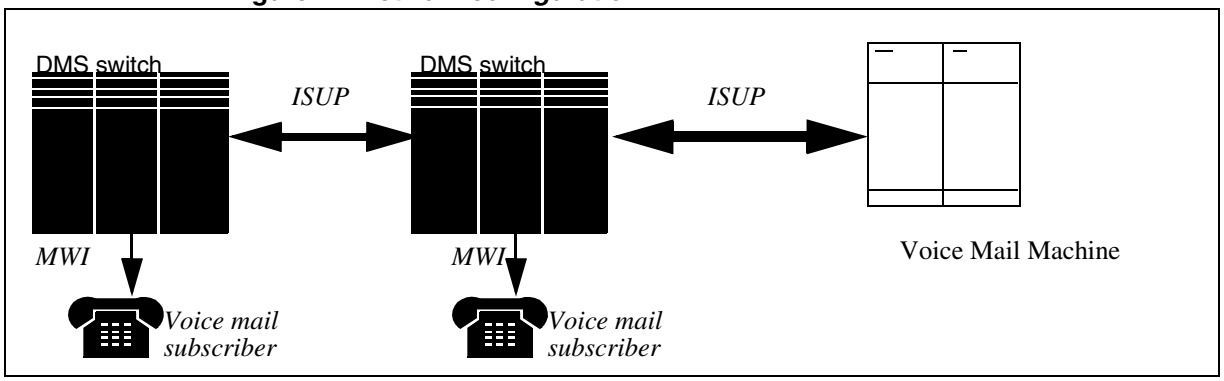
This feature provides Message Waiting Indication functionality via ETSI ISUP V2 protocol.

How this mechanism works:

— The MWT option is assigned to an IBN subscriber line with Voice Mail defined on it. The VMI option is assigned to a BRI subscriber line with Voice Mail defined on it.

— The ISUP IAM message with special activation code is sent from VMM to the DMS-100 switch (See Figure 1, "Network configuration."). The activation code includes 3 digits and may be defined in translation in accordind to customer requirements.

Figure 1 ***Network configuration.***



— For flexibility of the Vmi_Activation_Code definition, the code received in IAM message is replaced by the PXCODE table with constant values : 100 for Stuttered Dial Tone activation, 101 for Stuttered Dial Tone deactivation.

— To allow the MWI control via ISUP, the system invokes the Universal Translation using new ‘VMI’ conditional route selector from the PXRTE table (For details please refer the Configuration document).

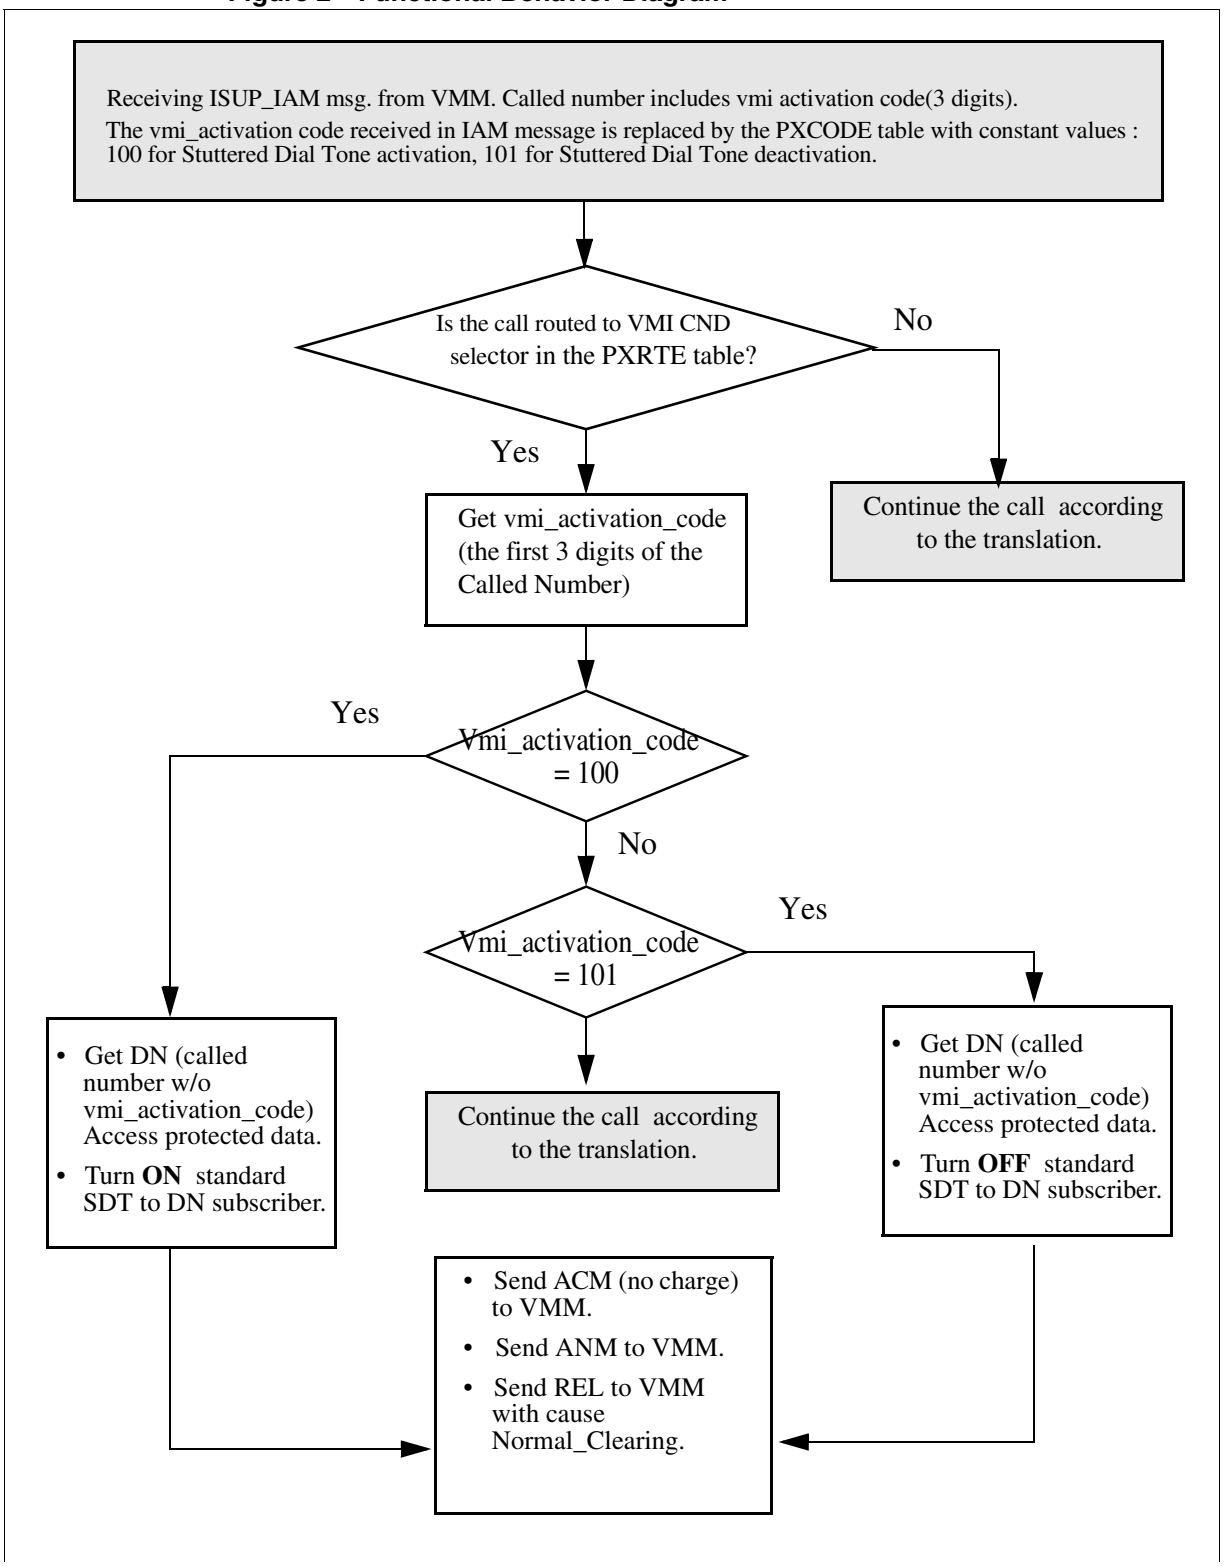
— After VMI Activation Code(the first 3 digits in the Called Number field of the IAM msg) is replaced in the PXCODE and the call pass translation via VMI’ conditional route selector in the PXRTE table, the SDT is set ON/OFF. The SDT is set for DN that is received in the IAM

msg (The Called Number digits without first 3 digits of activation code).

— After SDT tone is set, the ISUP ACM, ISUP ANM and ISUP REL with cause Normal_CLearing messages are sent to VMM. ISUP_REL message is sent as result of NORMCLR (Normal Clearing) defined in the TMTMAP table (For details please refer the Configuration document).

— If the call is not routed to the VMI' conditional route selector, the call is transferred according to defined translation.

Figure 2 Functional Behavior Diagram



18.3 Hardware Requirements or Dependencies

PDTC with SX05 processor or Shrink CPM.

18.4 Software Requirements or Dependencies

QDT20xx or QCI20xx load files for PDTC.

18.5 Limitations and restrictions

- The feature supports only PDTC with SX05 processor(QDT20xx or QCI20xx load files) or Shrink CPM.

18.6 Interactions

Not applicable.

19: Functional Description (FN): A00002358

19.1 Feature name

Feature A00002358 “H.323 tunneling over QSIG“ is part of the “Carrier Hosted Services and H.323 VPN Support“ project.

19.2 Description

The “Carrier Hosted Services and H.323 VPN Support“ project will provide support for tunneling H.323 messages through a CS2K Succession network, thus connecting remote sections of VPNs. It will allow H.323 components to be carrier hosted, with message tunneling done via the QSIG protocol.

The functionalities provided in the feature A00002358 include exclusively Basic Call as well as basic support for CAS and NCAS calls. No supplementary services on CS2K are explicitly supported.

19.3 Hardware Requirements or Dependencies

In the scope of A00002358 the following H.323 call management components are currently envisioned as registering with the GWC:

- BCM
- Meridian M1

The following table indicates, which basic call interworkings between such components will be supported by A00002358.

Table 20 Interworking support for basic call provided by A00002358 based on H.323 component

	BCM	Meridian M1
BCM	yes	yes
Meridian M1	yes	yes

For the exact testing environment which is used to evaluate the above interworkings under feature A00002358, please refer to section 3.1 below.

No other software or hardware line-ups outside the ones mentioned in section 3.1 are used under the scope of this feature for interworking testing between H.323 components.

All other interworkings with H.323 components not mentioned here are outside the scope of A00002358.

19.4 Software Requirements or Dependencies

The following software releases are required on the H.323 components for the functionality provided by A00002358:

BCM software release: BCM3.0

Meridian M1 software release: 25.15

As agents on the above listed H.323 components will be supported:

BCM: Nortel i2400 (model NTEX00)

Meridian: Meridian Business set M2008

19.5 Limitations and restrictions

Feature A00002358 provides trial quality functionality for a customer trial only.

A00002358 only covers Basic Call from a CS2K perspective.

Robustness delivered by A00002358 is to be considered on par with „trial ready“ software. This implies that limited error handling and recovery functionality will be provided.

No commitment is made regarding traffic completion rates for traffic employing the functionality provided by A00002358.

Feature A00002358 delivers support for intra switch calls only (CAS and NCAS); no interworkings to any trunk variants is provided.

19.6 Interactions

A00002358 uses existing call processing functionality within the CM and GWC software and makes extensive use of QSIG as tunneling protocol.

For additional interactions in the area of provisioning and datafill, please refer to feature A00001913 H.323 Provisioning.

19.8 Glossary and Additional Information

Term	Description
New term	Definition

20: Functional Description (FN): A00002364

20.1 Feature name

A00002364 : CLI/RDN/OCN capture in Billing Record (CDR) for ANSI ISUP and HK ISUP on DRU GSP20.

20.2 Description

This feature provides the following functions:

1. Provide new option OCN in table CLICNTL
   - This feature adds a new option named OCN in table CLICNTL. This option is one of the selectors of BILLING_OPTIONS.
2. CLI/RDN/OCN capture in CDR for ANSI ISUP and HK ISUP
   - This feature provides CLI/RDN/OCN and corresponding indicator within CDR records generated on calls whose originating physical port is ISUP trunk according to the capture logic (please refer to Table 1). OCN option, which is introduced by this feature, is available in table CLICNTL.

***Note:** Both CLI and RDN capture in CDR feature have already been implemented for ISUP trunks on DRU GSP.*

Note: This feature is implemented on DRU GSP20 and patched back to GSP10.

20.2.1 Background

CLI and RDN capture in CDR have been implemented for ISUP trunks according to the datafill of table CLICNTL.

The field BILLING_OPTIONS of table CLICNTL specifies a list of numbers from:

- Screening Number (SCRN_NUM)
- Calling Line Identity (CLI)
- Redirecting Number (RDN)
- Charge Number (CHARGE)
- Generic Number (GENERIC_NO)
- Contractor Number (CONTRACTOR)
- Presentation Number (PN)

Table CLICNTL specifies a datafillable precedence order for the customer. The list of BILLING_OPTIONS is checked from left to right, searching for an address that is present. Once an address is found that is presented in the call, then this address is selected for billing purposes.

20.2.2 Detail Description

This feature provides the ability to enable CLI/RDN/OCN and corresponding indicator capture in CDR for ANSI ISUP and HK ISUP on DRU GSP20 according to the capture logic.

This feature is involved in ANSI ISUP and HK ISUP originating calls.

The following is the capture logic.

Table 1 CLI, RDN, OCN capture logic

Situation	Number put in the CDR	Indicator set in the CDR
Both RDN and CLI exist from ISUP message	RDN	10
Both OCN and CLI exist from ISUP message	OCN	01
Only CLI exists from ISUP message	CLI	00
No RDN/OCN/CLI exists from ISUP message	None	11
None of the above	RDN/OCN/ CLI *	10/01/00**

RDN/OCN/CLI * means if RDN exists, put RDN, then OCN if OCN exists, otherwise put CLI.

10/01/00 ** means if RDN is captured, put 10, then 01 if OCN is captured, otherwise put 00 if CLI is captured.

Two spare bits in existing CDR are used as indicator in this feature. The detailed information is listed in the following table.

Table 2 Spare bits usage information in CDR

Situation	Number put in CDR	Word 28/Bit	
		10	9
RDN and CLI existing	RDN	1	0
OCN and CLI only	OCN	0	1
CLI only	CLI	0	0
No RDN, OCN nor CLI	None	1	1
None of Above	RDN/OCN/ CLI*	1/0**	1/0**

Remark: Word 28/Bit 8 is "Answer"

RDN/OCN/CLI* means if RDN exists, put RDN, then OCN if OCN exists, otherwise put CLI.

1/0** means if RDN is captured, put 10, then 01 if OCN is captured, otherwise put 00 if CLI is captured.

The following table shows the current structure of CDR.

Table 3 The structure of CDR

No	Field Name	Offset	Bytes/ Bits	Encoding Type	Field Contents

	Total		128		

20.2.2.1 New option “OCN” in table CLICNTL

OCN option is available for incoming direction in table CLICNTL by this feature.The OCN option can be assigned to any CLICTKEY whose direction is incoming, but only when the CLICTKEY with OCN option is assigned to an ANSI ISUP or HK ISUP trunk, the OCN option can work. If the OCN option is assigned to a CLICTKEY whose direction is outgoing, then an error is given. When the OCN option is datafilled with the highest priority for an ISUP trunk, then OCN is captured in CDR. Thus, CLI/RDN/OCN can be captured in CDR according to the datafill in table CLICNTL. As long as these 3 options are datafilled in the proper order, then CLI/RDN/OCN can be captured in CDR following the capture logic. An example of these 3 options datafill is shown in the figure 1.

Figure 2 CLI/RDN/OCN datafill in table CLICNTL

```
TABLE: CLICNTL

CLICTKEY DIRECTN
---------------
NONE IC $ (RDN) (CLI) $ Y

CLI_ONLY IC (CLI) $ (CLI) $ Y

RDN_ONLY IC (RDN) $ (RDN) $ Y

CLI_THEN_RDN IC (CLI) (RDN) $ (SCRN_NUM) $ Y

RDN_THEN_CLI IC (RDN) (CLI) $ (SCRN_NUM) $ Y

RDN_OCN_CLI IC $ (RDN) (OCN) (CLI) $ Y
```

The following is the example of the error message and warning message.

error message: "OCN option cannot be used for outgoing direction!"

In table CLICNTL, BILLING_OPTIONS and OUTPULSE_OPTIONS use the same list of selectors. So the OCN option is also one of the selectors of OUTPULSE_OPTIONS. But OCN option can not be datafilled as a OUTPULSE_OPTIONS because OUTPULSE_OPTIONS is only used for outgoing direction, but OCN option can only be used for incoming direction. The following is the data structure of table CLICNTL.

Figure 3 Data structure of table CLICNTL

```

      'OCN'                             8
  END STRING RANGE
```

20.2.2.2 Capture CLI/RDN/OCN for ANSI ISUP and HK ISUP

On originating side, after receiving the IAM message, this feature puts CLI/ RDN/OCN in existing CLG_NUM field of CDR according to the capture logic. At the same time, set according indicator in the spare bits of the DMS-GSP-specific CDR unit structure.

If receiving the INF message, because only CLI will be contained in INF message, we have to consider the previous IAM message of this call to see if RDN or OCN exist, then capture corresponding number and set indicator in CDR according to the capture logic.

Furthermore, there is no indicator of the content of the CLG_NUM field in the CDR601 log currently. This feature adds a new field named CLGNUM_IND to CDR601 log report to include the corresponding indicator set in CDR, the new field is appended in the end of CDR601 log report. According to the capture logic, "00", "01", "10", "11" is displayed as the content of the indicator. Figure 3 is an example of the new CDR601 log.

Figure 4 CDR601 log example

21: Functional Description (FN): A00002365

21.1 Feature name

"CWR Support over Trunks for Brazil Market"

21.2 Description

This activity adds the support for the Call Waiting Ringback (CWR)[1] service over ETSI ISUP including national variants, SIP-T, IBN7 and R2 trunks for the Brazilian Market.

When a call is made to a subscriber with CWR and Call Waiting Terminating (CWT) enabled, the CWR service provides an indication to the originating line as to the state of the terminating line. If the terminating line is currently engaged in a stable two-port call that is available for call waiting, a distinctive audible ringback is returned to the originating agent. Otherwise standard audible ringback or busy tone is provided.

The CWR feature is already available. A detailed description of the feature CWR is available in the following documents:

- Activity AF1271 (PLS OLDOC3)

This activity focuses on the support for CWR over trunks (ETSI ISUP including national variants, SIP-T, IBN7 and R2) for both TDM and CS2K. This feature enables the support of CWR over trunks if the CWR option is set for the specific trunk types in table ISERVOPT.

As an additional part, a CWR deactivation utility is provided for specific trunk groups. This option provides the possibility to exclude specific trunk groups from the support of CWR.

21.2.1 CWR Option in Table ISERVOPT

In table ISERVOPT a new option (CWR_ON_TRUNK) is introduced to support CWR over specific trunk types. The CWR_ON_TRUNK option contains the following trunk types:

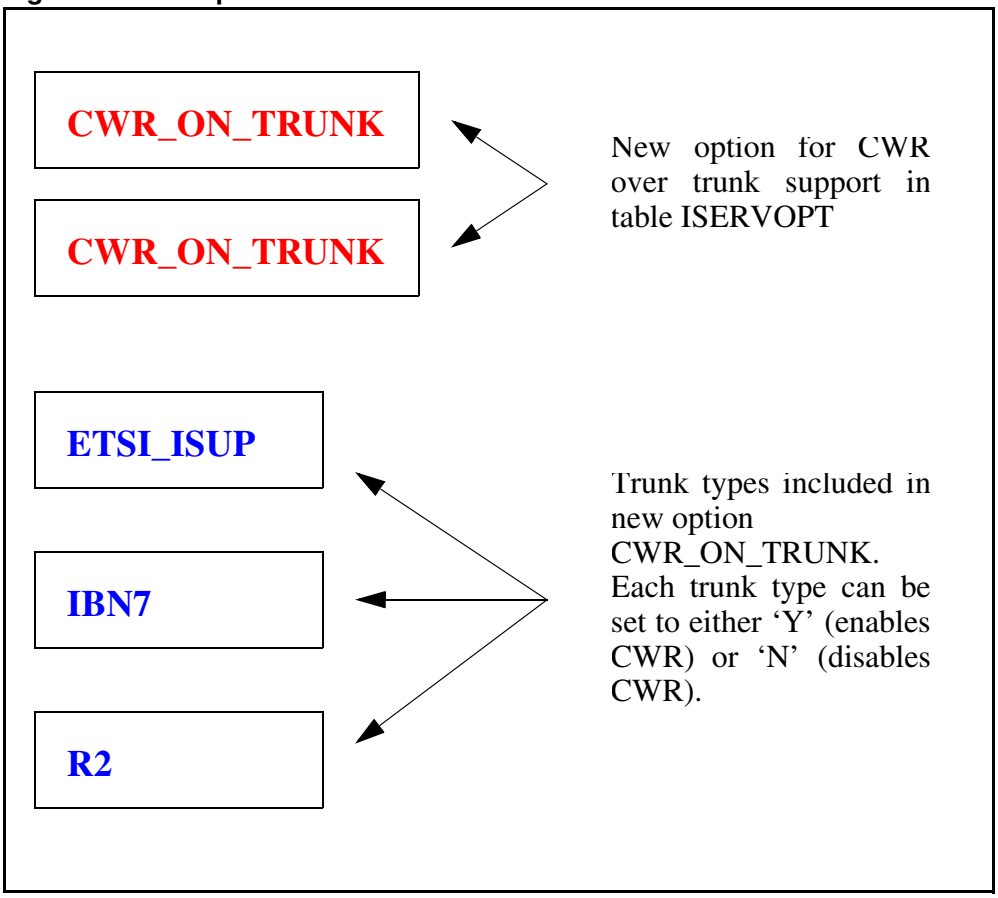
- ETSI_ISUP
- IBN7
- R2

If CWR is desired for a trunk type the corresponding trunk type in option CWR_ON_TRUNK needs to be set to 'Y'. All the trunks groups that belong

[1]GVT Anatel 252 Compliance

to a trunk type listed above will support CWR as soon as the trunk type is set to ‘Y’ in table ISERVOPT. Figure 1 shows the structure of the new option CWR_ON_TRUNK.

Figure 1 New Option in Table ISERVOPT



21.2.1.1 CWR Activation for Trunk Type

The standard audible ringback is the default tone for CWR over trunk that is provided to the originating party. The new option CWR_ON_TRUNK needs to be added in table ISERVOPT to allow distinctive audible ringback (CWR tone) for a trunk type. Every trunk type can be set to either ‘Y’ or ‘N’ individually. The trunk type in option CWR_ON_TRUNK is set to ‘Y’ if the activation of CWR over this trunk type is desired. Figure 2 shows an example on how the option CWR_ON_TRUNK is added and activated for the trunk types ETSI_ISUP and R2 in table ISERVOPT.

21.2.1.2 CWR Deactivation for Trunk Type

The option CWR_ON_TRUNK controls the settings for the trunk types ETSI_ISUP, IBN7 and R2. Each trunk type is considered individually, therefore it is possible to enable or disable CWR over trunk for each trunk type. If the deactivation of CWR over trunk is desired, the corresponding trunk type is set to ‘N’ in option CWR_ON_TRUNK.
There are two possibilities to disable CWR over trunk for the trunk type:

- Change the setting for a trunk type from ‘Y’ to ‘N’:
  In this case only the trunk type that does not require the CWR over trunk ability is disabled. The option CWR_ON_TRUNK remains in table ISERVOPT. The deactivation of a trunk type is shown in Figure 4.

Figure 4 Deactivation of a Trunk Type

```
>table iservopt
>pos cwr_on_trunk
        CWR_ON_TRUNK

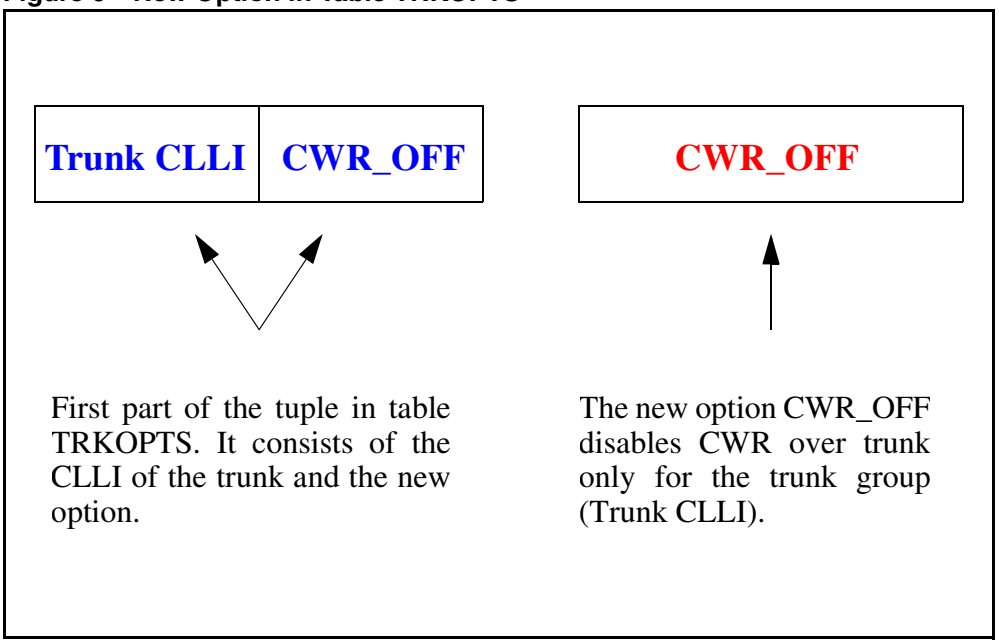
21.2.2 CWR_OFF Option in Table TRKOPTS

The option CWR_ON_TRUNK in table ISERVOPT enables CWR over trunk for the trunk type including all the trunk groups of this trunk type. The new option CWR_OFF in table TRKOPTS provides the possibility to disable CWR over trunk for a specific trunk group without the need of disabling the whole trunk type.

If the CWR_OFF option is assigned to a trunk group in table TRKOPTS the CWR over trunk ability is disabled for the trunk group even if the trunk type is enabled for CWR in option CWR_ON_TRUNK. The option CWR_OFF is independent of the settings in option CWR_ON_TRUNK in table ISERVOPT. Figure 6 shows the structure of the new option in table TRKOPTS.

Figure 6 New Option in Table TRKOPTS



21.2.2.1 Deactivation of CWR for Specific Trunk Group

The new option CWR_OFF is assigned to the trunk group in table TRKOPTS to disable CWR over trunk only for this trunk group. An example of assigning the new option to a trunk group is shown in Figure 7.

Figure 7 Deactivate CWR for Specific Trunk Group

```
>table trkopts
>add rua501isupv2lp cwr_off
>y
OPTION:
>cwr_off
TUPLE TO BE ADDED:
 RUA501ISUPV2LP        CWR_OFF
                                    CWR_OFF
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
>pos rua501isupv2lp cwr_off
 RUA501ISUPV2LP        CWR_OFF
                                    CWR_OFF
>
```

The CWR_OFF option in table TRKOPTS disables CWR over trunk for the specific trunk group independent from the settings of option CWR_ON_TRUNK in table ISERVOPT.

If the CWR_OFF option is removed from a trunk group the settings in option CWR_ON_TRUNK are considered again for CWR over trunk ability. The Figure 8 shows how the CWR_OFF option is removed from a trunk.

Figure 8 Remove CWR_OFF from Trunk Group

```
>table trkopts
>pos rua501isupv2lp cwr_off
 RUA501ISUPV2LP        CWR_OFF
                                          CWR_OFF
>del rua501isupv2lp cwr_off cwr_off
>y
TUPLE TO BE DELETED:
RUA501ISUPV2LP        CWR_OFF
                                          CWR_OFF
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE DELETED
>pos rua501isupv2lp cwr_off
TUPLE NOT FOUND
>
```

Note:
There is no explicit relationship or dependency between the settings in table ISERVOPT and TRKOPTS. It is possible to assign the CWR_OFF option to a trunk group even if the trunk type of the trunk group is disabled in option CWR_ON_TRUNK.

21.3 Hardware Requirements or Dependencies

N/A - Refer to “21.5 Limitations and restrictions”

21.4 Software Requirements or Dependencies

N/A - Refer to “21.5 Limitations and restrictions”

21.5 Limitations and restrictions

21.5.1 TDM Trunks

This activity instructs the PDTC to play distinctive audible ringback (CWR tone) to the originating party. The PDTC must be capable of providing the CWR tone.
The Brazilian toneset, e.g. on the PDTC, supports the CWR tone.

21.5.2 Succession Trunks

This activity instructs the trunk gateway to play distinctive audible ringback (CWR tone) to the originating party. The gateway must be capable of providing the CWR tone.

21.5.2.1 SIP-T Trunks

SIP-T trunks require an APG in order to play distinctive audible ringback (CWR tone) to the originating party. The APG must be capable of providing the CWR tone.

21.6 Interactions

The interactions are unchanged.
Please refer to Activity AF1271 (PLS OLDOC3)

22: Functional Description (FN): A00002367

22.1 Feature name

A00002367 - BRI Preset Conference Base

22.2 Description

This activity allows an ETSI BRI (p-to-mp) station or ETSI ISUP V2 trunk to set up a preset conference with up to 35 conferees by dialling a specific directory number. This invokes simultaneous ringing of preselected conference members. The originator of a preset conference (served user) which has AFC & HOLD line options, is able to addon additional local conferees once the conference is established.

This activity is based on the existing IBN Preset Conference and uses same datafill requirements and restrictions for IBN Preset conference. See the appendix A- section for IBN preset conference background.

In additional, this feature also provides supporting IEs related to CGN, GAP, MLPP, UUI to be sent to conferees.

22.2.1 Preset Conference Call establishment and termination

22.2.1.1 Preconditions

The datafill of existing IBN preset preconf table PRECONF meets the BRI preset Conference requirements.
According to the requirements of spec ‘SIM : PRCONF_BRI issue3’ related to conference call establish , addon functionality and takedown process, the existing table PRECONF should be datafilled as follows:

- BRI Preset Conference should be datafilled to be allowed for the customer group. And the preset conference originator (served user) is a member of the preset conference’s customer group. Conferees does not need to belong to the same customer group.
- ADDON bool must be set to ‘yes’ in the existing table PRECONF. Only originator can add on conferees.
- In order to enable addon functionality, line options AFC and HOLD should be assigned to preset conference originator via Servord first.
- The conferees are specified in advance in a data table. According to the existing feature AF2014 -Preset conference (large), already allows 50

conferee numbers can be assigned to each preset conference DN (Directory Number). In other words, the preset conference can have up to 50 conferees. This includes the originator, all preset conferees and all add on conferees.

- Maximum 64 preset conference DN can be datafilled per office.
- The preset conference may be datafilled upto 14 digits and conferee numbers may be a string of up to 30 digits
- It is required that when the first conferee answers, the conference begins. In order to provide this functionality, the field IMMSTART of PRECONF should be datafilled as ‘yes’
- The field ORIGCONT should be set to ’yes’ to allow that the served user is in control of the conference. when he goes on-hook, the conference is taken down even if there are conferees still on the bridge.
- Associated with each conferee DN will be timeout interval of 15 to 60 seconds and an optional one alternate DN. If the conferee does not answer within the timeout interval, the call attempt ends. But if an alternate DN is datafilled, two call attempts are made on primary address with no answer, then the call is routed to alternate address. Two call attempts will be also directed to the alternate address

22.2.1.1.1 Example of BRI Preset Conference

The table 1 gives the example of BRI preset conference datafill. In this datafill example;

a. 7835599 is the predefined preset conference DN. The customer group of the originator should be ‘CONF6C’ option in the table CUSTENG to be activated conference. Up to 64 preset conference DN can be datafilled in the table PRECONF.

b. 7831016 and 7831002 are the conferees for preset conference DN by index 0. 35 conferees can be datafilled for preset conference DN (7835599).First conferee has the alternate address. Second conferee has no alternate address. The timeouts interval is 15 seconds for both conferees and its alternate address.

-If the conferee 7831002 does not answer within the timeout interval , the call attempt ends.

-If the conferee 7831016 does not answer within two trials, two call attempts will be directed to alternate address.

For the more details datafill for PRECONF table , Please see appendix - A.

Table 1 PRECONF Datafill example

PCNFKEY CONFADDR PCNFVAR OPTIONS
0 0 1027835599 D IBN CUST783A 0 Y N Y N N N $

CUST783A 22 256 63 Y PRIVATE 105 (CONF6C 12)$

22.2.1.2 Preset conference initiation

A served user initiates one preset conference (PRCONF) by dialling a predefined DN, which is associated with conference. The directory number is recognized as a request for a preset conference. Translations check the originator's data against the data of preset conference DN. A check is made if required number of six-port conference bridges can be seized for the conference and the conference is not already in use .If call is valid, the originator will hear audible ringing while calls are originated to all the addresses stored for the desired preset conference. If invalid, the originator will be routed to treatment.

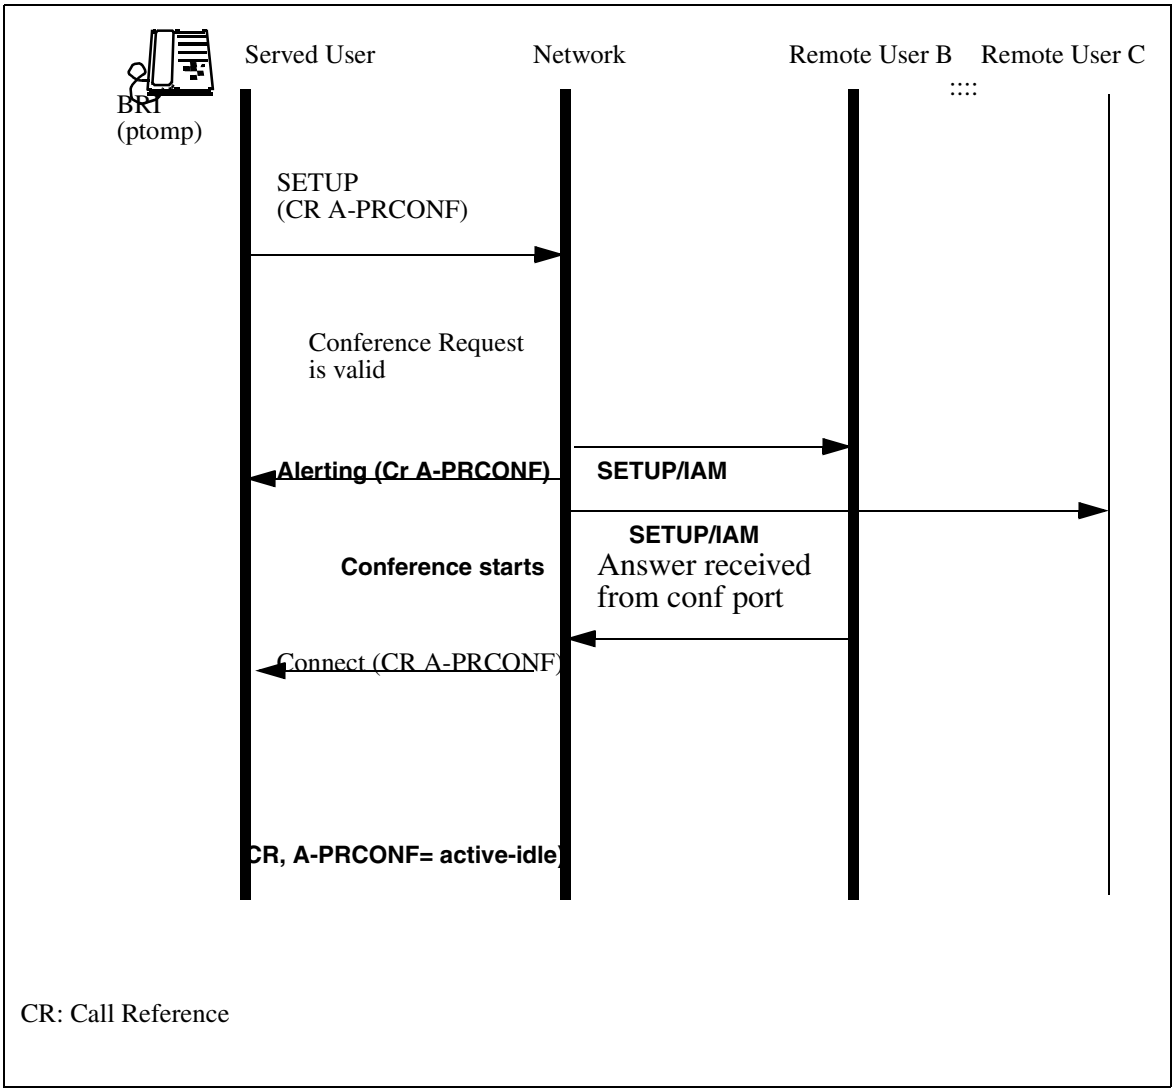
Dialling PRCONF DN invokes simultaneous ringing of the preselected conference members.

There could be more than one served user for a conference, when an attempt is made to originate a conference which has already been initiated, the second served user will be routed to busy tone.

The served user's directory number (DN) can be part of preset conference list of numbers. But originator can not be called as conferee for this preset conference. In other words, if the originator is a predefined preset conferee, we do not call this conferee unless the call is over trunk call.

The conference starts as soon as the first conferee answers (IMMSTART = Y in PRECONF). In this case , the answer will cause the audible ringing to the originator to stop and the conference to begin. Attempts to complete the calls to unanswered conferees will continue, with no audible ringing to originator.

Figure 1 Preset Conference Initiation



22.2.1.3 Add-on functionality

The originator of a preset conference can add on conferees as local call, once the preset conference is established. In order to provide this functionality , the field ADDON of the table PRECONF should be set to ‘yes’ and line options AFC and HOLD. Once the maximum number of conferees is reached , no more conferees may be added.The addon functionality is based on the existing ETSI BRI 6-part conference

22.2.1.3.1 Coding Requirements for DSS1

All components (invoke, return result, return error and reject) is included within a Facility information element. Facility information element can be

conveyed in any appropriate message.Setup, Connect, Facility and Disconnect messages are used within this specification.

Figure 2 ETSI -Q.931 FACILITY Information Element (FIE) with a Service Component embedded.

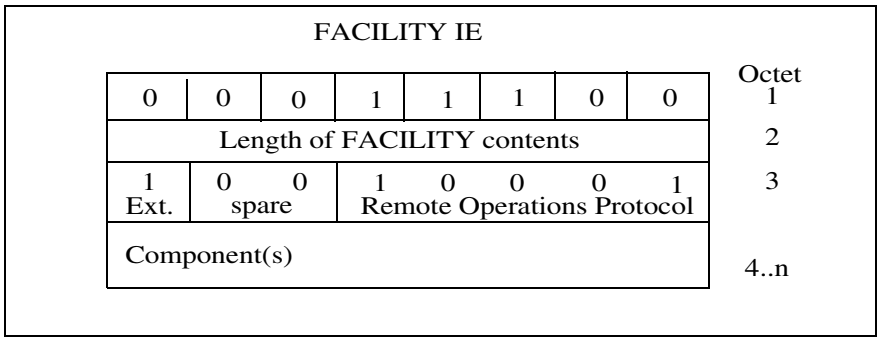


Table-1 shows the definition of the operations and errors required for the addon functionality of ETSI BRI preset conference ,using ASN.1.

```

The served user sends a Facility message with the call reference of the existing call and a facility information element including beginCONF-invoke component.This component may contain a ConfSize parameter, if not the conference size sets to a network dependent value by the network. The beginCONF-return-result component sent to the user includes a ConferenceId and a PartyId parameter which is used to identify the remote user.

To add a new party, the connection to the conference bridge can be either in the (Active,Idle) state or in the (Active,Held) state and the connection to the party to be added can either be in (Active, Idle) state or in the (Active, Held) state. Which means that one of the connections should be held and other should be in (active, idle) state. A Facility message with the call reference of the call to be added and an Add-CONF-invoke component including conferenceId parameter is sent by the user to the network. Then the network sends a DISCONNECT message with AddCONF-return-result component including PartyId parameter which identifies the added party.

22.2.1.5 Preset Call Termination

According to the datafill (ORIGCONT field is set to yes) , the originator is in control of conference. In this case when he goes on-hook, the conference is taken down, even if there are conferees are still on the bridge.

22.2.2 Supporting Information Elements

If information elements (IEs) explained below, is preset in the SETUP message which is sent by originator of preset conference, it is required that these IEs are included in SETUP/IAM messages to all conferees.

The following IEs are supported by this activity:

1 Calling Number (CGN) IE

2 Generic Address Parameter (GAP) IE

> **Note:** NOSCREEN should be datafilled for origination in LTDEF table. And CGN IE should be exist in SETUP message sent by originator.

3 Multi Level Precedence Preemption (MLPP) IE

4 User to User Implicit (UUI) IE

Mapping of the IEs to conferees are supported for the following interworkings:

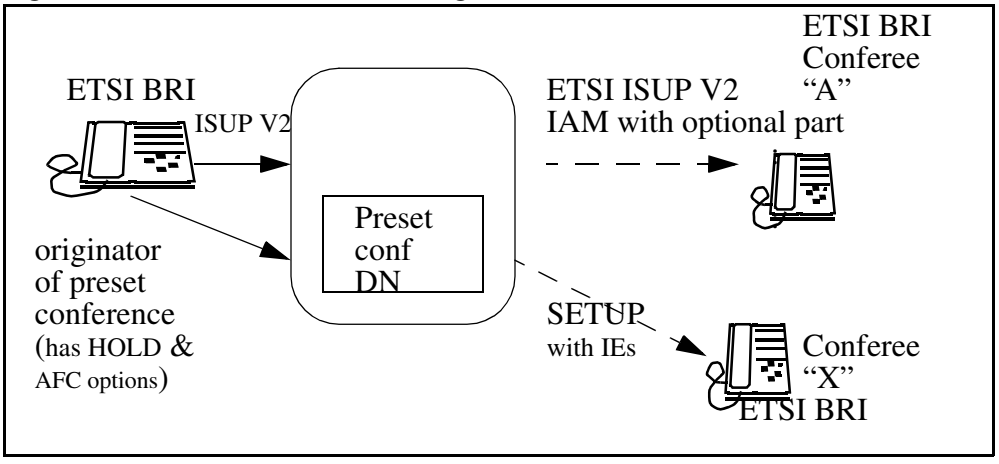
— ETSI BRI(ptomp)-CONF port- ETSI BRI(ptomp),

— ETSI BRI(ptomp)- CONF port-ETSI ISUP V2,

— ETSI ISUP V2-CONF port- ETSI BRI (ptomp) ,

— ETSI ISUP V2-CONF port-ETSI ISUP V2

Figure 10 Functional Behavior Diagram



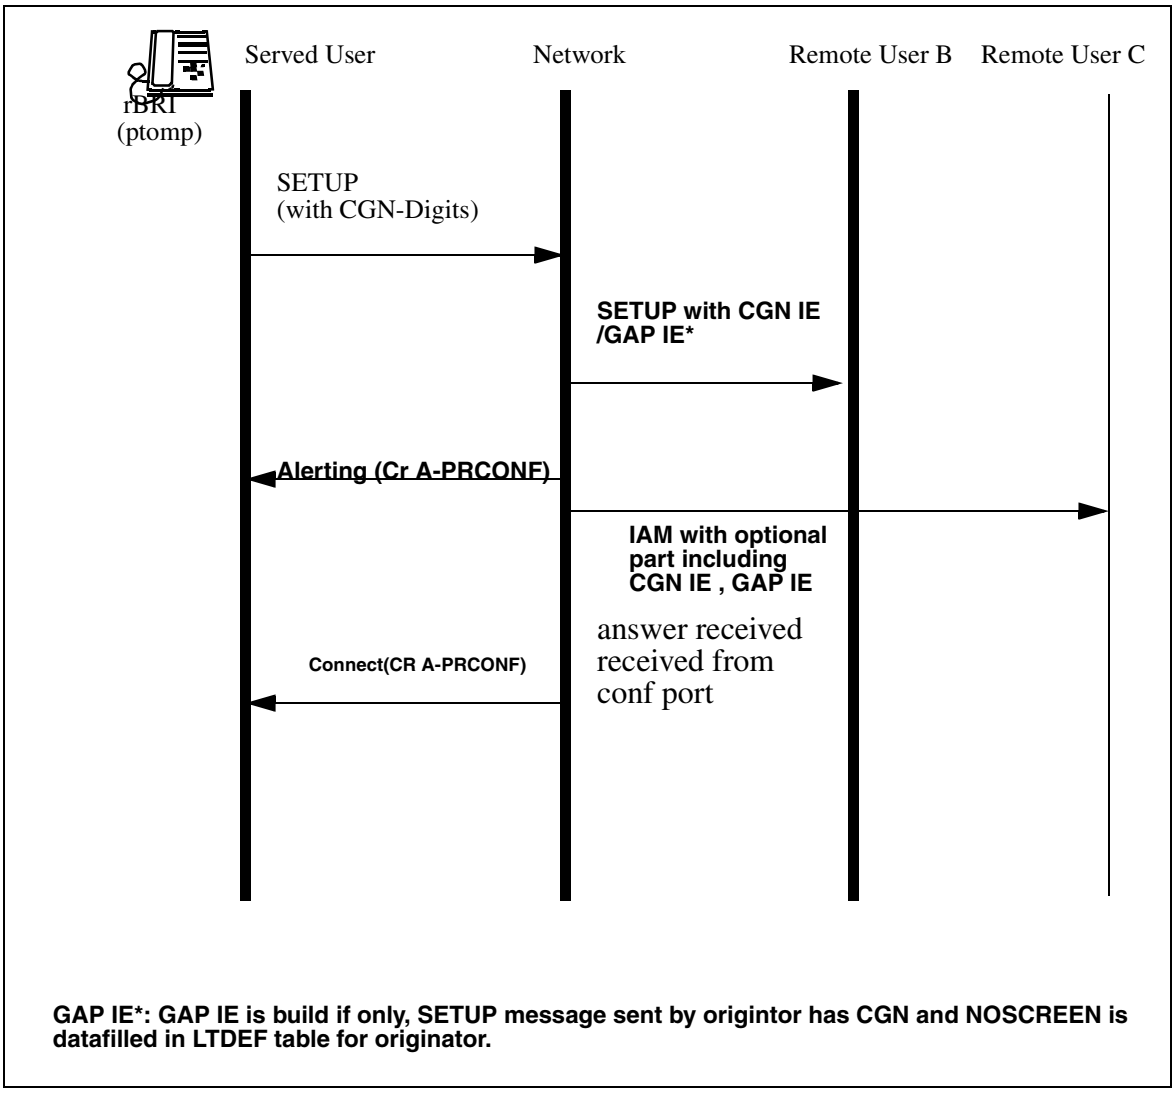
22.2.2.1 CGN IE and GAP IE

The purpose of the calling party number information element is to identify the origin of a call.This information element may be present in the SETUP

message transmitted by the originator to network and in the SETUP message transmitted by the network to conferees. Calling party number field in the SETUP message which is sent from originator may be either actual network number or presentation number (GAP IE is available when NOSCREEN datafill is entered) that the originator wishes to display .In other word, the user is allowed to send any CGN to the switch and the switch does not screen this CGN and does not override it with the provisioned DN. (NOSCREEN datafill is not required for incoming ISUP)

According to spec SIM.PRCONF_BRI issue3, It is required that CGN IE sent by originator (in the SETUP) and GAP IE are sent to all conferees in the SETUP/IAM messages

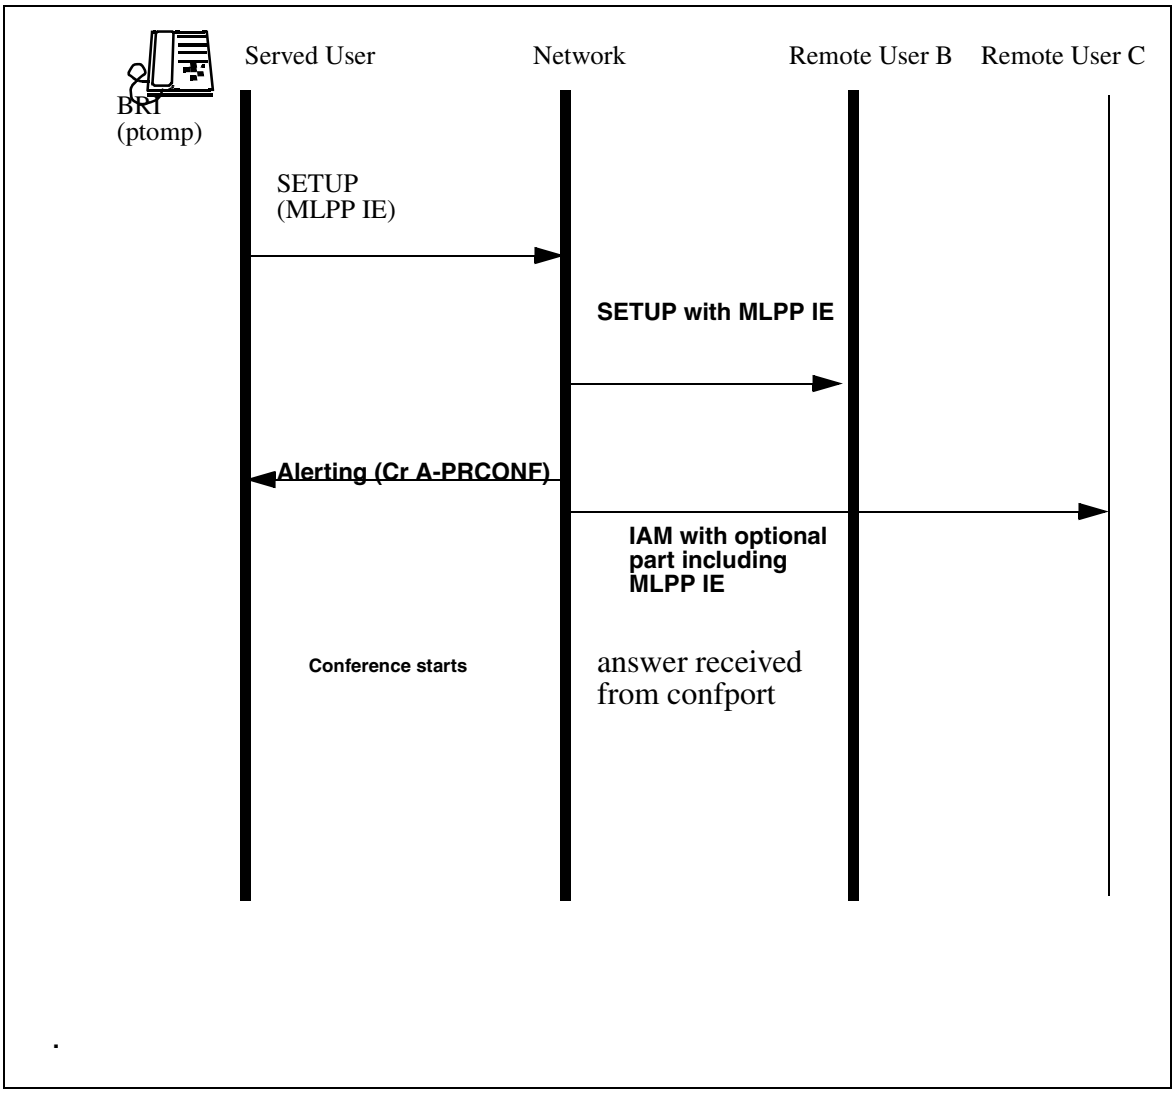
Figure 11 Mapping CGN IE/GAP IE



22.2.2.2 MLPP IE

The MLPP IE may be present in the SETUP message sent by origination which has MLPP line option to network. It is required that in the SETUP/IAM messages sent by network to conferees should includes MLPP IE, if originator has MLPP

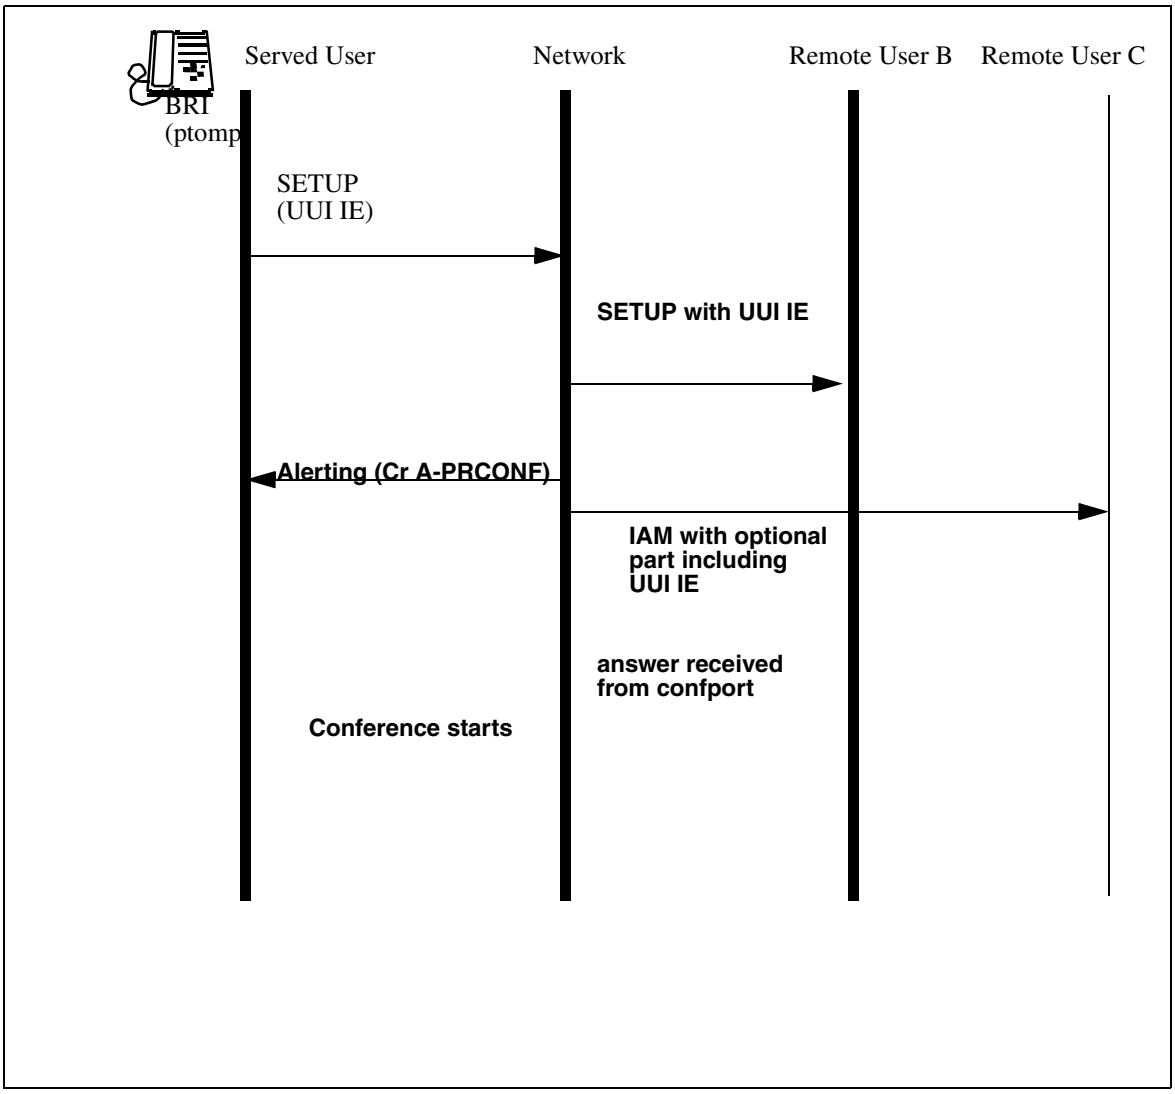
Figure 12 Mapping MLPP IE



22.2.2.3 UUI IE

Only User to User implicit IE will be propagated to conferees , if originator sends SETUP message with UUI IE.

Figure 13)Mapping UUI IE



22.2.3 OM class for Preset Conference

Since this activity is based on the existing IBN preset conference , the existing OM class PCNF is used.

22.2.4 Billing

No AMA/Billing changes for this activity.

22.3 Hardware Requirements or Dependencies

The NT3X67 six-party conference card provides conference facilities on a single card for use with DMS-100 switches. This activity uses same hardware as IBN Preset Conference.

22.4 Software Requirements or Dependencies

The existing IBN preset Conference is used by this activity.

22.5 Limitations and restrictions

Since the feature is based on the existing IBN Preset Conference , the restrictions of IBN preset conference are also valid for this activity.

Only Local calls can be add-on to conference.

The originator of Preset Conference can not start another preset conference.

The call attempts end to a conferee when it is unplugged.

Recommended datafill explained in this FN , should be provided for required functionality

- Served user is in the control of conference (ORIGCONT field is set to yes)
- When the first conferee answers, the conference begins (IMMSTART field is set to yes)
- In order to enable the addon functionality , ADDON field is set to yes.
- 35 conferee can be datafilled in PRECONF.

This activity is implemented for the following interworkings only, the rest of the interworkings are out of scope of this feature:

— ETSI BRI(ptomp)-CONF port- ETSI BRI(ptomp),

— ETSI BRI(ptomp)- CONF port-ETSI ISUP V2,

— ETSI ISUP V2-CONF port- ETSI BRI (ptomp) ,

— ETSI ISUP V2-CONF port-ETSI ISUP V2

22.6 Interactions

Calling Line Identification Presentation/Presentation Restriction

This activity only supports CGN IE to be sent to the conferees in the terminating message. For Special Arrangement (no screening option), if required datafill exists, GAP IE is sent to conferees.

User to User Signalling

This activity only provides UUI IE in setup message to conferees.UUS1 explicit is ignored. But if the originator requests in the FAC IE of the SETUP message that UUS1 is required and the terminator does not accept it, the call should be released according to the UUS1 ETSI spec.

MLPP

The served user provides MLPP information, the same MLPP Information is included into call setup to conferees.

For all feature interactions please refer to the activity A00002884 -'ETSI BRI Preset Conference service interactions'.

22.9 Appendix A- IBN Preset Conference background

The originator (conference controller / served user) dials the predefined DN(specified in table PRECONF) to start the Preset Conference. One the DN is dialled, the preset conference feature will try to connect to all of the pre-selected conference members simultaneously.Audible ringing is provided to all of the conferees.These conferees are specified in advance in a data table PRECONF indexed by conference number and conferee number.(The preset conference DN is always first entry and the conferee number is zero)

These conferees are datafilled in table PRECONF indexed by conference number and conferee number.If the preset predefined DN is dialled a check is made if the required number of six-port conference bridges can be seized for the conference.There are enough six-port conference bridges available the originator receives audible ringing while calls are originated to all the addresses stored for the desired preset conference.

An IMMSTART option can be set in the PRECONF table so that the conference starts as soon as the first conferee answers.

Associated with each conferee DN is a timeout interval and an optional alternate DN. Automatic retrial is attempted on all conferees that have not returned answer within a customer datafillable interval (TIMEOUT option of table PRECONF) of 15 to 60 seconds after the call to conferee was initiated.If a call to a primary address fails to complete within two retrials, and the conferee is provided with an alternate address (ALTADDR option of table PRECONF), then two additional attempts are made on the alternate DN.

Once the preset conference is established, addon of additional conferees can begin if allowed by PRECONF table option ADDON.

The conference is terminated when all conferees disconnect, or if specified by ORIGCONT option in table PRECONF, when the originator of the conference goes on hook.

The following figure gives the brief description of the fields of PRECON.

Table 10 Table PRECONF

Datafilling PRECONF
PRECONF : is a number (0-63) assigned to the preset conference assigned by operating company.
CONFEREE: is a number (0-49) assigned to conferee by the operating company. Conferee 0 which is used to hold the conference's DN must be entered first.
CONFADDR:Conference address Enter the 1-29 digit conference address.
CLASS: Conference Class.
CUSTGRP: Is used to indicate the customer group that owns this preset conference
NCOS: is used to indicate NCOS
ALTADDR: Is used when the class is A.
ORIGCOUNT: is used to indicate whether the originator has control of the conference.
TIMEOUT: Variable Timeout.
ADDON: is used to add additional conferees, if yes, the origintor is allowed to addon conferee.
DIDORIG: DID Origination allowed
IMMSTART:Is used to indicate immediate start.

22.9.1 The range information for the fields of PRECONF

.

Table 11 Table PRECONF

Range of fileds in PRECONF
PRECONF : {0 TO 63}.
CONFEREE: {0 TO 49}
CONFADDR: VECTOR OF UP TO 30 DIGIT'S.(THIRTY_DIGIT_REGISTER.)
CLASS: {P,A,C,D} .
CUSTGRP: CUSTOMER_GROUP when D is selected.
NCOS:{0 TO 511} .
ALTADDR: VECTOR OF UP TO 30 DIGIT'S (THIRTY_DIGIT_REGISTER .)
ORIGCOUNT:{N,Y} ..
TIMEOUT: {15 TO 300}..
ADDON: {N,Y}..
DIDORIG: {N,Y.
IMMSTART:{N,Y}..

The preset conference DN can be datafilled up to 14 digits according to universal numbering plan .The conferee DN and alternate DN can be datafilled up to 30 digits.

23: Functional Description (FN): A00002377

23.1 Feature name

10 AFC Keys for BRI Directory Number

23.2 Description

This feature is required as part of the requirements for the German DBArt in ISN07. This feature allows up to 10 AFC (Additional Functional Call) Keys (and therefore 11 calls) on one DN (Directory Number). The master DN, known as SFC (Single Functional Call) key can have up to 10 AFC Keys associated with it.

This activity allows 11 Call Hold (all calls can be HELD calls) on one DN and 8 Call Waiting per loop if the customer is subscribed to these services.

This service is supported only in point to multipoint configurations.

The old capability allowed provisioning up to 4 AFC Keys (and therefore 5 calls) on one DN. This activity increases the provisioning number of AFC Keys to 10 per DN (and therefore 11 calls) for the DMS ETSI BRI implementation.

ETSI does not limit the number of calls on a TEI (Terminal Endpoint Identifier).

The old capability restricted the maximum call waiting calls per access with 2 and the maximum number of calls allowed on loop with six for terminations. Maximum call waiting calls per access is increased to 8 and maximum number of calls restriction for terminations is removed by this activity.

Summary of the provided capabilities by this activity are as follows:

- The maximum number of calls within an ETSI BRI (p-mp) configuration are 11 calls per DN.

  Number of calls per loop depends on the terminal capabilities.

  The maximum number per DN is provisionable in a range from 1 to 11.

- The maximum number of held calls within an ETSI BRI (p-mp) configuration are 11 calls per DN.

All calls can be HELD calls.

These values are not provisionable.

- The maximum number of waiting calls within an ETSI BRI (p-mp) configuration is 8 calls per access.

  These values are not provisionable.

  The summary of the number of the AFC Keys per DN, HELD calls per DN and CW calls per loop depending on PtoMP and PtoP configurations are shown in Table 1:

Table 1

	Before the activity		After the activity	
	PtoMP	**PtoP**	**PtoMP**	**PtoP**
Number of AFC Keys per DN	4	4	10	4
Number of HELD calls per DN	5	-	11	-
Number of CW calls per loop	2	-	8	-

Note: This activity is only applied to Point-to-Multipoint configurations and Point-to-Point configurations are kept unchanged as before the activity.

23.2.1 Software Optionality Control (SOC) Option

A new SOC option SULN0028, ‘SULN BRI Call Queuing’ is introduced to restrict the usage of the “10 AFC KEYS for BRI DIRECTORY NUMBER” functionality. Following “10 AFC KEYS for BRI DIRECTORY NUMBER” functionality is depend on the SOC option:

- Provisioning of 10 AFC Keys for a DN is possible only for Point-to-Multipoint configuration of ETSI BRI variant and if the SOC is in active state.

The SOC option restricts the datafilling of more than 4 AFC keys instead of restricting functionality of the AFC keys in this activity. In order to prevent the

10 AFC keys option is functioned while the SOC state is IDLE (this can be occur if 10 AFC keys option is assigned to a DN while SOC state is ON and then the SOC state is changed to the IDLE), referring to the Software Optionality Control Application Guidelines, prior to the SOC state transition from ON to IDLE, existing customer datafills for more than 4 AFC keys are determined and a warning is returned to the SOC. Also, a new CI command AFCLIS is created to list the available LTIDs with more than 4 AFC keys. After removing all datafills for more than 4 AFC keys, it can be possible to change the SOC state from ON to IDLE.

23.3 Hardware Requirements or Dependencies

N/A

23.4 Software Requirements or Dependencies

N/A

23.5 Limitations and Restrictions

N/A

23.6 Interactions

Since the number of AFC keys for BRI directory number and the number of waiting calls per loop are changed, there are some service interactions with some of the available BRI services. These service interactions are explained in this section.

23.6.1 Call Hold

23.6.1.1 Background

Call Hold supplementary service allows a user to interrupt communications on an existing call and then, if desired, re-establish the communication.

When the Call Hold supplementary service is invoked, communication on a B-channel is interrupted and the B-channel is released from use by the existing call. A B-channel shall be reserved for use by the terminal (based on the TEI of the terminal) used to invoke Call Hold supplementary service and enable the user to retrieve a call from hold, originate a new call, and establish connection to an incoming call (Activity AR2179 Multi Party Services).

23.6.1.2 Changes on the supplementary service with this activity

This feature allows up to 10 AFC Keys (and therefore 11 calls) on one DN (Directory Number). The master DN, known as SFC (Single Functional Call) key can have up to 10 AFC Keys associated with it. This allows 11 Call Hold (all calls can be HELD calls) on one DN if the customer is subscribed to this service.

This activity increases the AFC range from {1 to 4} to {1 to 10} per DN.

This activity only increases the number of AFC and indirectly affect the HOLD supplementary service. This activity does not make any change on the functionality of HOLD supplementary service.

23.6.2 Call Waiting

23.6.2.1 Background

Call waiting supplementary service enables the call can be offered without a B-channel. In CM terminating utilities exists that are dealing with B-channel idle or busy determination (Activity AR2179 Multi Party Services).

23.6.2.2 Changes on the supplementary service with this activity

This activity allows 8 Call Waiting per loop if the customer is subscribed to this service.

This activity increases the AFC range from {1 - 4} to {1 - 10} per DN and waiting call limit from 2 to 8 per loop.

This activity does not make any change on the functionality of CW supplementary service.

23.6.3 ECT

23.6.3.1 Background

The user is engaged in a telephone call and additional connections have been established. The user can interconnect two of the partners (ECT - Explicit Call Transfer) (Activity A59023626 BRI Explicit Call Transfer).

23.6.3.1.1 Implicit ECT Background

If there is only one held call on a DN, an ECTExecute message is sent from that HELD call and network connects that call with the active idle call. If there are more than one HELD call on a DN, user selects one of the HELD call. Then an ECTExecute message is sent from that selected call and network connects that selected HELD call with the active idle call.

23.6.3.1.2 Explicit ECT Background

A LinkIDRequest message is sent from the active idle call. Then, network sends a LinkID to the user. If there is only one held call on a DN, an ECTExecute message is sent from that HELD call with the LinkID and network connects that call with the active idle call. If there are more than one HELD call on a DN, user selects one of the HELD call. Then an ECTExecute message is sent from that selected call with the LinkID and network connects that call with the active idle call.

23.6.3.2 Changes on the supplementary service with this activity

23.6.3.2.1 Implicit ECT

Because the active held call is selected using the CR in the FAC message, there is no impact to ECT of allowing additional HELD calls.

This activity does not make any change on the implicit ECT supplementary service.

23.6.3.2.2 Explicit ECT

Because the active held call is selected using the CR in the FAC message, there is no impact to ECT of allowing additional HELD calls.

This activity does not make any change on the explicit ECT supplementary service.

23.6.4 Three Party Conference

23.6.4.1 Background

The Three Party Conference (3PTY) supplementary service enables the subscribed user to establish, participate in and control a three-way conversation. It is invoked by the subscribed user who is involved in two calls (one active call and one held call), either of which may be an incoming or outgoing call. The connections are established on each of the two calls prior to invocation of 3PTY supplementary service (Activity AR2179 Multi Party Services).

23.6.4.2 Changes on the supplementary service with this activity

In the old code, if there were more than one Active-Idle connection exists for the same TEI, the network accepted the transfer request and connected the parties.

This activity does not change this behavior and rejects the request if there are more than one Active-Idle connection exists for the same TEI.

23.6.4.3 Hunt Groups (MLH, DNH, DLH)

23.6.4.4 Background

ETSI BRI lines can have only one AFC assigned if they are in MLH (Multiline Hunt), DNH (Directory Number Hunt), DLH (Distributed Line Hunt) hunt groups. More than one AFC can not be assigned.

Up to two terminations are allowed on ETSI BRI terminals in hunt groups. One on the SFC key and on one AFC key.

23.6.4.5 Changes on the supplementary service with this activity

This activity does not change this restriction and therefore this activity has no interaction with hunt groups.

23.6.5 Six Party Conference / Add On Conference

23.6.5.1 Background

The conference (Add On CONF) supplementary service enables a user who is connected to the network via a point to multipoint ISDN ETSI BRI to establish, participate in and control a simultaneous communication involving a number of users. The DMS implementation of the Add On CONF supplementary service restricts the total number of conference parties to 6 Activity A59027439 ETSI BRI 6 PARTY CONFERENCE).

23.6.5.2 Changes on the supplementary service with this activity

Since only one active held call on a DN was possible before this activity, adding a new party which is on HELD state to the CONFERENCE while conference is also on HELD state (two HOLD method) was not possible.

After the activity, since more than one HELD call on a DN is possible, adding a new party which is on HELD state to the CONFERENCE while conference is also on HELD state (two HOLD method) is possible.

This activity does not make any change on the Add On Conference supplementary service. It just allows two hold method as mentioned above.

23.6.6 Preset Conference

The service interaction with ‘Preset Conference’ is handled under ‘Preset Conference’ activity.

Please refer to the ISN07 activity “A00002884 - ETSI BRI Preset Conference Service Interactions”.

25: Functional Description (FN): A00002512

25.1 Feature name

GWC-EM Internet Transparency VCAC Provisioning.

25.2 Description

The Internet Transparency ("ITrans") solution, implemented in the SN06.x stream, provides a means for CS2K to enable IP-telephony across and between VPNs (Virtual Private Networks). This is achieved by taking into account the presence of NAT (Network Address Translator) middleboxes between MGs (Media Gateways) and the 'outside world', and inserting publicly-addressable MP (Media Proxy) devices into the media path where required.

The SN06 provisioning component of this work dealt with:

- datafilling of Media Proxy and (virtual) NAT devices
- association of MGs to an 'adjacent' NAT.
- association of MPs to GWCs (Gateway Controllers)
- downloading of MP/NAT information to GWCs as necessary.

See feature ACTIDs 89007809, 89007814 and 89007657 for further information on the SN06 provisioning functionality.

The present feature (SN07) builds on this provisioning functionality to add support for:

- datafilling of LBL (Limited Bandwidth Link) middleboxes in addition to NATs
- datafilling of RU (Resource Usage) data for use in the VCAC (Virtual Connections & Admissions Control) function of LBLs
- manual or automatic assignment of a GWC to carry out the RU capacity counting function on behalf of an LBL
- 'chaining' of middleboxes (NATs/LBLs) in a hierarchical network topology.
- downloading of MP/NAT/LBL/RU information to GWCs as necessary.

VCAC Background
LBLs are a virtual representation of 'policed' capacity-restricted links in the network. An LBL carries a number ("max count") representing maximum

capacity through the link. Call set-up through the link causes a running total of used capacity to be incremented, and call take-down causes the running total to be decremented. If call set-up will cause the running total to exceed the LBL's maximum capacity figure, the call attempt is rejected and routed to treatment (congestion tone).

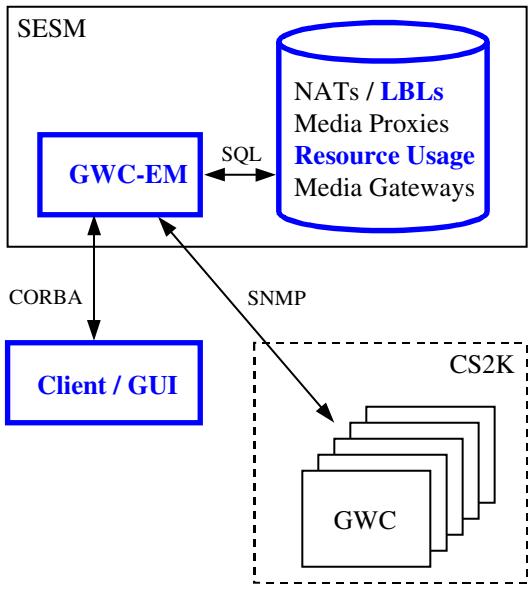
The specific amount used to increment/decrement the running total is supplied by the Resource Usage entry used by the LBL. Each Resource Usage entry has a set of 'capacity-used-per-call' values, depending on the codec and packetization rate in use on the call.

The running total is maintained by a counting device - in the SN07 release this device is a GWC. The counting device for a particular LBL is identified by entering the counter's address into the LBL's IP address field. There is one method for allocating the LBL's counting device:

- "auto-generated" - the LBL's address field is filled automatically when the LBL is first downloaded to a GWC.

25.3 Hardware Requirements or Dependencies

Figure 1 System Configuration



Note: The components outlined in blue will be affected by this provisioning activity.

Requirements for the whole Pre-midcom solution:

- CS2K.

- SESM Platform (Succession Element and Sub-Element Manager).

- IMS manager to handle provisioning of the Media Proxy.

- Uncontrolled NATs.

- Media Proxies.

- MGs.

25.4 Software Requirements or Dependencies

Dependencies:

- GWC should be running a software load of an equivalent stream to that of the SESM/GWC-EM, and should be running under a profile that enables ITrans functionality.

25.5 Limitations and restrictions

- There is only one NAT exit point from a local network.
- A Media Gateway has one or no adjacent middlebox. A NAT/LBL has one or no parent middlebox.
- The maximum length of sequentially 'chained' middleboxes (e.g. A --> B --> C, etc) is five.
- If two gateways are behind the same NAT then they can set up a call without requiring a Media Proxy.
- If two gateways are behind the same LBL, a call between them is not considered to use capacity on that LBL.
- The DQoS IAC solution (ACTID 59039082/59006771) uses "PepServer" middleboxes. The ITrans IAW solution uses NAT/LBL middleboxes. These two solutions are mutually exclusive as defined in the gateway profile service type (i.e. DQOS and ITRANS cannot be defined together in a profile).
- Where an LBL is 'shared' between two or more Succession Call Server networks (see ACTID.A00002644 "Common Topology Identifier Provisioning"), the LBL must be provisioned with exactly the same details on each network.

25.6 Interactions

The provisioning of LBL/RU data brings changes to the following GUIs:

- GWC-EM Network Panel (figures 2, 3, 4)
- Associate Media Gateway window (section 2.7.1.4).

The following features will also make changes in the Network Panel GUI:

- ACTID.A00002644 "Common Topology Identifier Provisioning"
- other [AT LEAST ONE OTHER... get details from Keith Raker]

This feature provisions data for use by the SN07 GWC CallP feature ACTID A00002739 "Virtual Connections Admissions Control".

25.7.1 User Interface - GUI

The upper section of the GWC-EM Network Panel GUI is reorganised to put the exisiting three subsections into tabbed panes. VCAC Resource Usage data is provisioned via the new RU table in a fourth tab in the upper section.

NATs are provisioned as before, except that:

— the tab is renamed “IP-VPNs (Virtual NATs)”

— a new field is added to provision a “Parent” (northbound neighbour) middlebox in the topology.

LBLs are provisioned via a table in a new tab added to the central section of the Network Panel.

Figures 2 and 3 and 4 show the Network Panel:

— before reorganisation (SN06 version)

— after reorganisation, NAT table visible

— after reorganisation, new LBL table visible

The new RU data table can be seen in the upper part of the reorganised view.

Figure 2 Unmodified (SN06) view of GWC-EM Network Panel

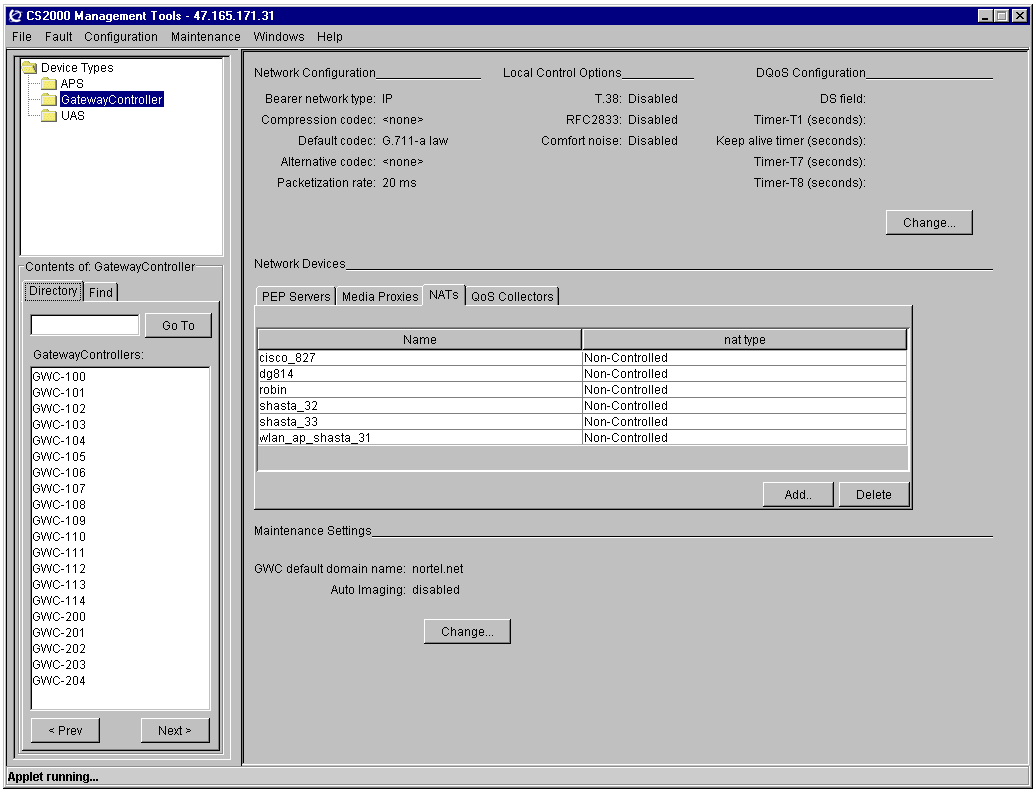

Figure 3 Modified Network Panel (1)

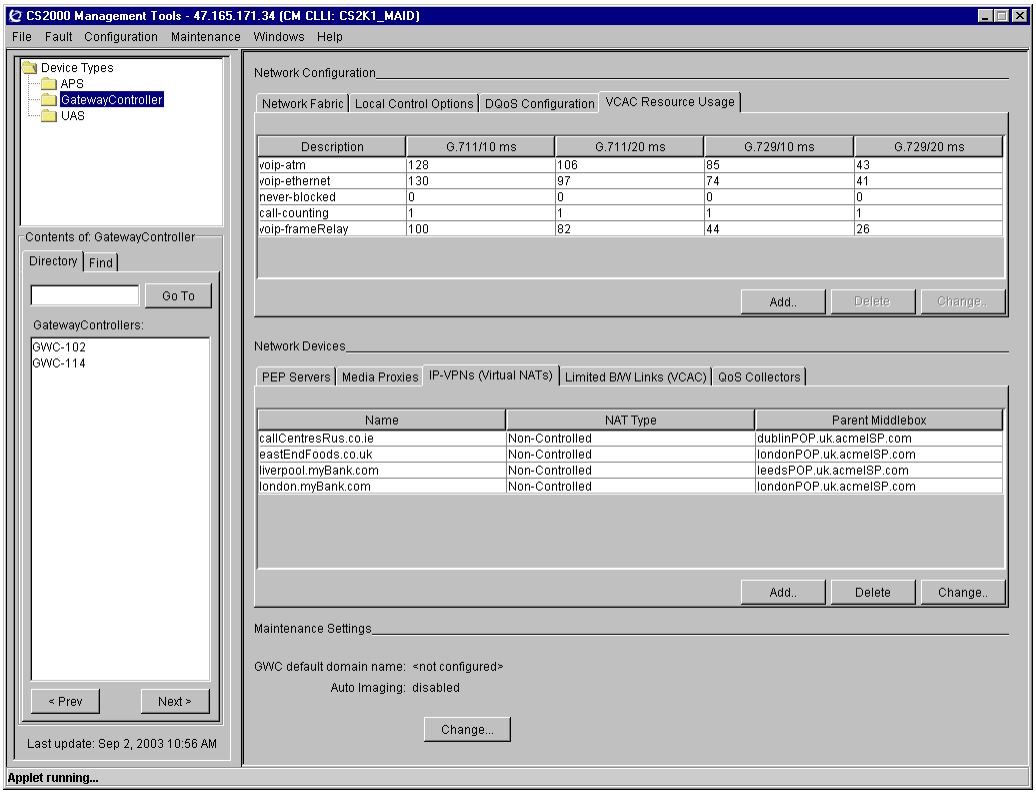

Figure 4 Modified Network Panel (2)

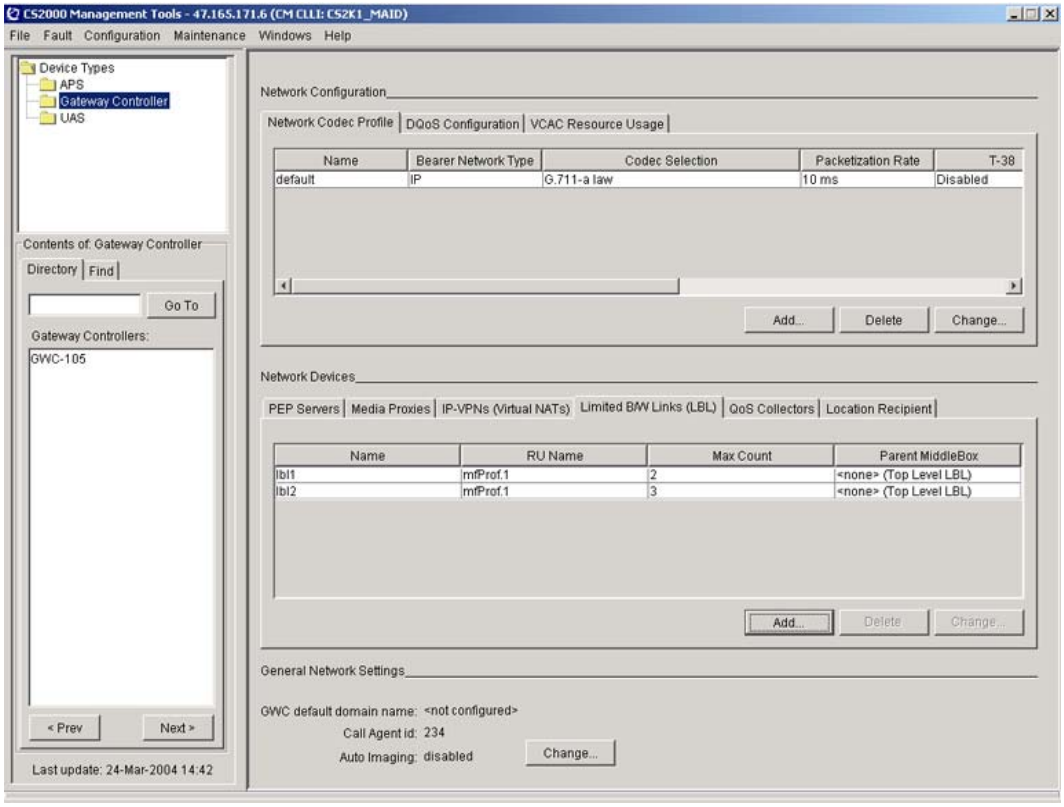
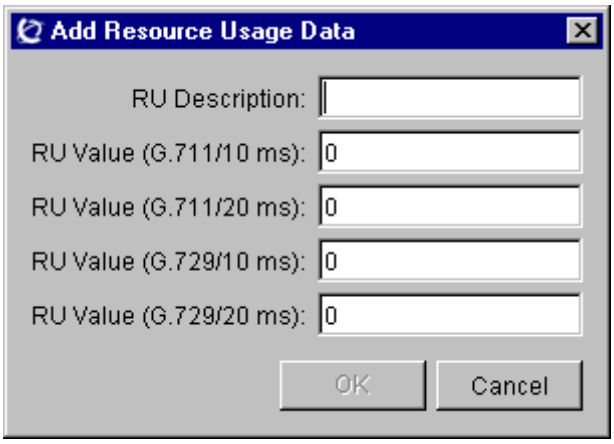


25.7.1.1 Provisioning Resource Usage data: Add, Change, Delete

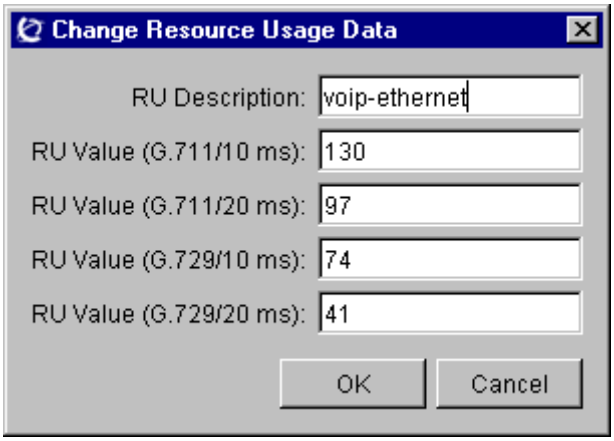
These operations are accessed by clicking the appropriate buttons on the tabbed pane of the VCAC Resource Usage table (figure 3).

Add Resource Usage data: click the “Add” button in the Resource Usage tab to obtain the following box.



Enter a valid text description, and non-negative integer entries for each “RU Value” (zero is provided as a default). Click “OK” to confirm.

Change Resource Usage data: select an RU table entry and click the “Change” button to obtain the following box:



Modify the required data fields and click “OK” to confirm.

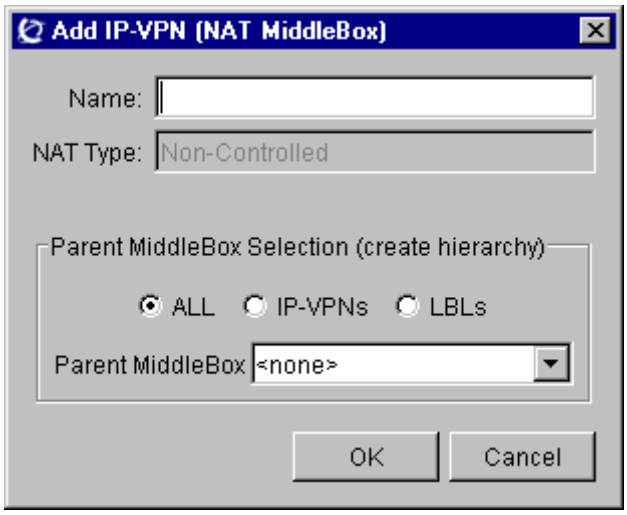
Delete Resource Usage data: select an RU table entry and click the “Delete” button to obtain the following confirmation box:

Click “Yes” to confirm. Note that the operation will be rejected if the RU Factor is currently ‘in use’, i.e. is currently referred to by an LBL.

25.7.1.2 Provisioning NAT middleboxes: Add, Change, Delete

These operations are accessed by clicking the appropriate buttons on the tabbed pane of the IP/VPN table (figure 3).

Add NAT middlebox: click the “Add” button on the “IP-VPNs (Virtual NATs)” tab to obtain the following box:

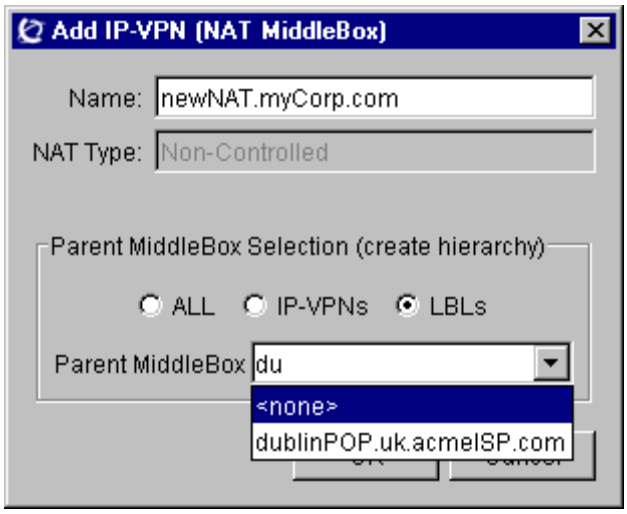


Enter a unique (DNS compliant, see ref 1) name. If appropriate use the filtered selection box to select a Parent Middlebox. Filtering is performed by one or both of:

— radio button selection to limit the choice to only NATs or only LBLs

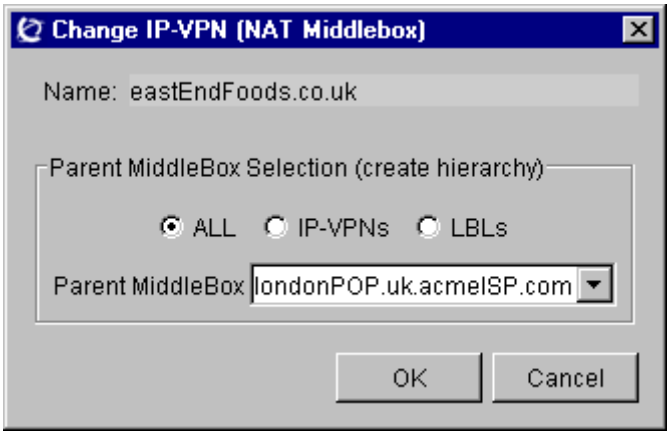
— typing the starting letters of the Parent middlebox name to limit selection to those with matching starting letters.

An example of filtered selection is shown below:



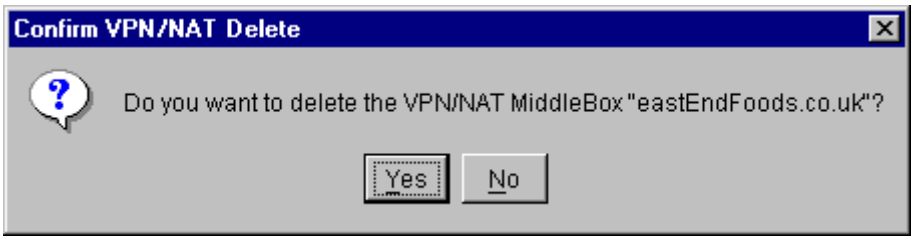
Selection of Parent middlebox is restricted to already provisioned middleboxes. Both NAT and LBL middleboxes can have either a NAT or an LBL as parent. Click “OK” to confirm.

Change NAT middlebox: select a NAT table entry and click the “Change” button to obtain the following box:



Modify the selected Parent middlebox as required (i.e. select another middlebox or <none>), and click “OK” to confirm.

Delete NAT middlebox: select a NAT table entry and click the “Delete” button to obtain the following confirmation box:



Click “Yes” to confirm. Note that the operation will be rejected if the NAT is currently ‘in use’, i.e. is currently referred to:

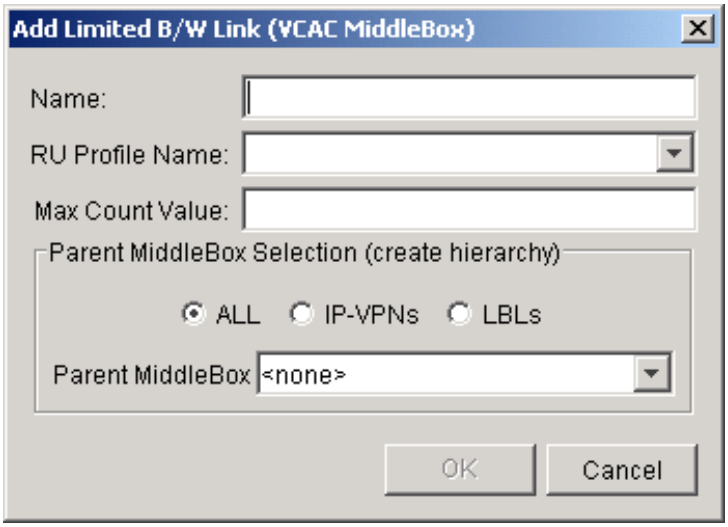
— as a parent by another middlebox

— as an adjacent middlebox by a Media Gateway.

25.7.1.3 Provisioning LBL middleboxes: Add, Change, Delete

These operations are accessed by clicking the appropriate buttons on the tabbed pane of the Low B/W Links table (figure 4).

Add LBL middlebox: click the “Add” button on the “Low B/W Links (VCAC)” tab to obtain the following box:

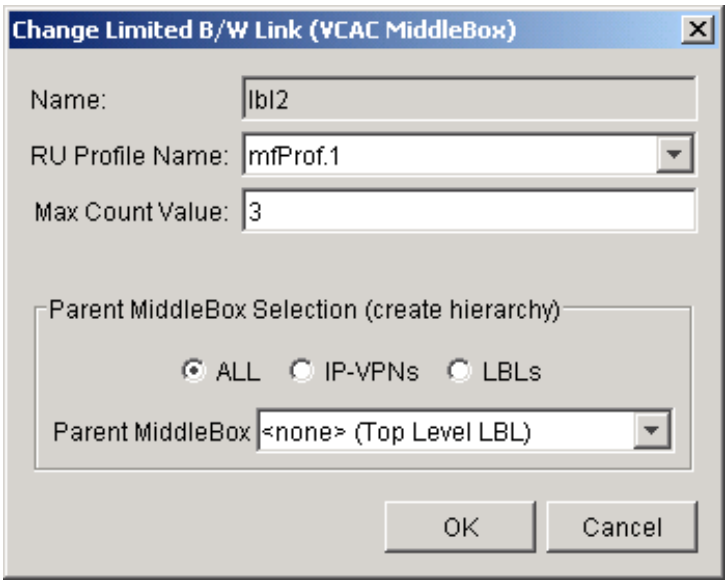


Enter the following information:

- valid text name (DNS compliant, see ref. 1)
- select RU Factor from the list provided
- enter a non-negative integer value for “Max Count Value”
- select Parent middlebox from the (filtered) list. Remember that an LBL can have either another LBL or a NAT as Parent middlebox.

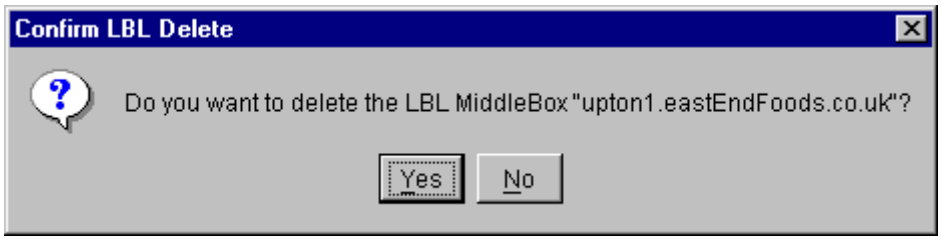
Click “OK” to confirm.

Change LBL middlebox: select an LBL table entry and click the “Change” button to obtain the following box:



The name field is not modifiable, other fields may be edited as required. Parent middlebox may be changed to either another middlebox or <none>. Click “OK” to confirm. NB: the RU Factor and the Parent may not be changed in the same operation - they must be modified in separate change operations.

Delete LBL middlebox: select an LBL table entry and click the “Change” button to obtain the following confirmation box:



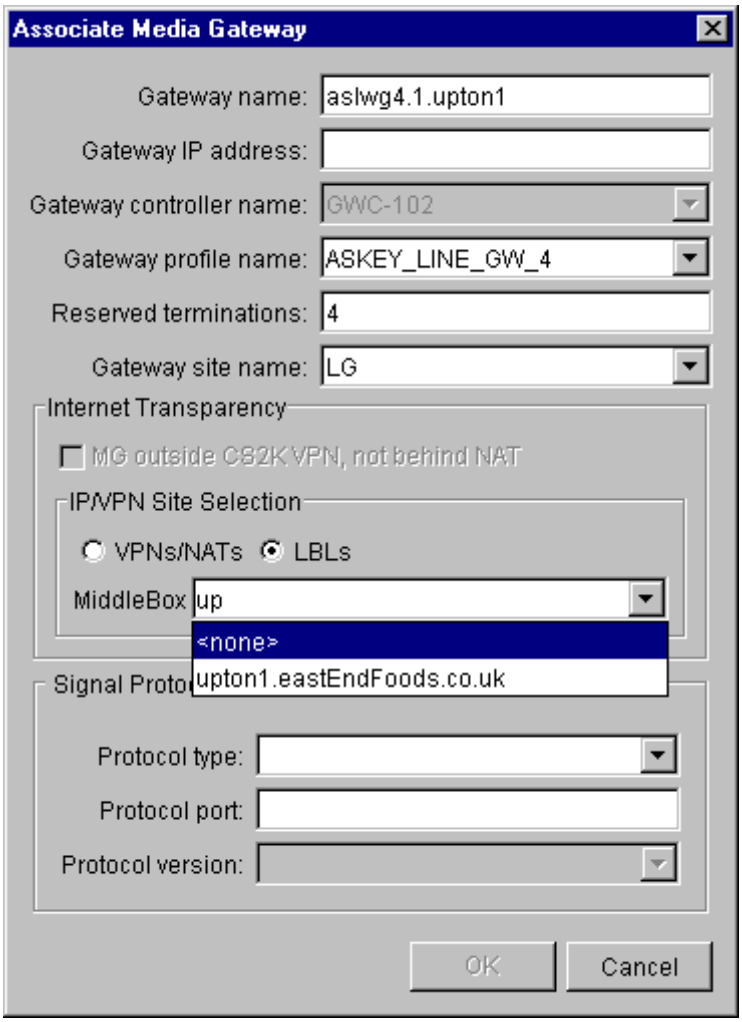
Click “Yes” to confirm. Note that the operation will be rejected if the LBL is currently ‘in use’, i.e. is currently referred to:

— as a parent by another middlebox

— as an adjacent middlebox by a Media Gateway.

25.7.1.4 Associate/Change Middlebox to a Media Gateway

This is unchanged from SN06 functionality except that filtered selection is used to choose an Adjacent Middlebox, as shown below for the Associate operation:



Note: attempting to remove an adjacent middlebox from a Media Gateway will be rejected if the middlebox or any member of it's 'northbound' topology chain is a NAT.

25.7.2 XML Interfaces

Modified Interfaces in Sn07

- Add/Query NATs - added parent middlebox attribute

New Interfaces introduced in Sn07 are as follows:

- Change NATs
- Add/Delete and Change Media Proxies.
- Add/Delete/Query and Change Resource Usage profiles
- Add/Delete/Query and Change LBL entries.
-

25.7.2.1 Add NAT XML command

Add NAT is modified SN07 the <parentMB> tag has been added. The value of this tag must have been previously provisioned into the system to successfully complete this command.

The XML for this command is shown in Figure 5, Figure 6 . Error messages returned are described in Appendix B.

Figure 5 XML command to Add NAT device.

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <addNAT usn="1" version="1.0">
      <Parameters>
        <NATname>NAT-A</NATname>
        <ParentMB>VPN-Eastenders</ParentMB>
      </Parameters>
     </addNAT>
    </Methods>
  </Command>
 </CommandList>
```

Figure 6 XML response to Add NAT

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </addNAT>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.2 Query NAT XML command

The Query NAT response is modified SN07 the <parentMB> tag has been added

The XML for this command is shown in Figure 7, Figure 8. Error messages returned are described in Appendix B.

Figure 7 XML command to Query a NAT

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <queryNAT usn="1" version="1.0">
      <Parameters>
        <NATname>NAT-A</NATname>
      </Parameters>
     </queryNAT>
    </Methods>
  </Command>
 </CommandList>
```

Figure 8 XML response to Query NAT

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
       <ReturnData>
          <NATname>NAT-A</NATname>
         <ParentMB>VPN-Eastenders</ParentMB>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </queryNAT>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.3 Change NAT XML command

Change NAT is new to SN07 because there was no data in the SN06 releases to change, in Sn07 the only attribute that can change is the <ParentMB> tag.The value of this tag must have been previously provisioned into the system to successfully complete this command.

The XML for this command is shown in Figure 9, Figure 10. Error messages returned are described in Appendix B.

Figure 9 XML command to Change specified NAT parent middlebox

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <changeNAT usn="1" version="1.0">
      <Parameters>
        <NATname>NAT-A</NATname>
        <ParentMB>VPN-Eastenders</ParentMB>
      </Parameters>
     </changeNAT>
    </Methods>
  </Command>
 </CommandList>
```

Figure 10 XML response to Change specified NAT

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <changeNAT usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </changeNAT>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.4 Add Media Proxy XML command

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure 11, Figure 12. Error messages returned are described in Appendix B.

Figure 11 XML command to Create a new Media Proxy

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <addMP usn="1" version="1.0">
      <Parameters>
        <MPname>MP-A</MPname>
        <IPAddress>47.165.32.23</IPAddress>
         <Protocol>MGCP+</Protocol>
         <ProtocolVersion>2.0</ProtocolVersion>
       </Parameters>
     </addMP>
    </Methods>
  </Command>
```

Figure 12 XML response to Creating a new Media Proxy command

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <addMP usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </addMP>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.5 Change Media Proxy XML command

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure 13, Figure 14. Error messages returned are described in Appendix B.

Figure 13 XML command to Change IP data of a Media Proxy

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <changeMP usn="1" version="1.0">
      <Parameters>
        <MPname>MP-A</MPname>
        <IPAddress>47.165.32.22</IPAddress>
         <Protocol>MGCP+</Protocol>
         <ProtocolVersion>2.0</ProtocolVersion>
       </Parameters>
     </changeMP>
    </Methods>
  </Command>
```

Figure 14 XML response to Change Media Proxy IP data.

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <changeMP usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </changeMP>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.6 Delete Media Proxy XML command

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure 15, Figure 16. Error messages returned are described in Appendix B.

Figure 15 XML command to Delete a Media Proxy

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <deleteMP usn="1" version="1.0">
      <Parameters>
        <MPname>MP-A</MPname>
       </Parameters>
     </deleteMP>
    </Methods>
  </Command>
 </CommandList>
```

Figure 16 XML response to Deleting Media Proxy .

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <deleteMP usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </deleteMP>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.7 Creating RU profile command

Resource Usage provisioning is new to SN07. To successfully create an RU profile the XML client must provide every Codec/packetRate combination that has been entered into the CS2K config manager.

The XML for this command is shown in Figure 17, Figure 18. Error messages returned are described in Appendix B.

Figure 17 XML command to Create an RU profile

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
     <Methods>
         <addRU usn="1" version="1.0">
         <Parameters>
               <RUDescription>AAL1/IP40</RUDescription>
               <RUValue>
                       <Codec>G.711</Codec>
                       <PacketRate>10 ms</PacketRate>
                       <Value>103</Value>
               </RUValue>
               <RUValue>
                       <Codec>G.711</Codec>
                       <PacketRate>20 ms</PacketRate>
                       <Value>133</Value>
               </RUValue>
               <RUValue>
                       <Codec>G.729</Codec>
                       <PacketRate>10 ms</PacketRate>
                       <Value>132</Value>
               </RUValue>
               <RUValue>
                       <Codec>G.729</Codec>
                       <PacketRate>20 ms</PacketRate>
                       <Value>103</Value>
               </RUValue>
         </Parameters>
         </addRU>
    </Methods>
   </Command>
</CommandList>
```

Figure 18 XML response to Creating an RU profile .

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <addRU usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </addRU>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.8 Changing RU profile command

Resource Usage provisioning is new to SN07. To successfully change an RU profile the XML client must either provide and <RUNewDescription> OR every Codec/packetRate combination that has been entered into the CS2K config manager.

The XML for this command is shown in Figure 19, Figure 20, Figure 21. Error messages returned are described in Appendix B.

Figure 19 XML to Change an RU profile Description.

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <changeRU usn="1" version="1.0">
        <Parameters>
              <RUDescription>AAL1/IP40</RUDescription>
              <RUNewDescription>AAL1/IP71 </RUNewDescription>
         </Parameters>
      </changeRU>
    </Methods>
   </Response>
</CommandList>
```

Figure 20 XML command Change RU profile data

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
     <Methods>
         <changeRU usn="1" version="1.0">
         <Parameters>
               <RUDescription>AAL1/IP40</RUDescription>
               <RUValue>
                       <Codec>G.711</Codec>
                       <PacketRate>10 ms</PacketRate>
                       <Value>123</Value>
               </RUValue>
               <RUValue>
                       <Codec>G.711</Codec>
                       <PacketRate>20 ms</PacketRate>
                       <Value>133</Value>
               </RUValue>
               <RUValue>
                       <Codec>G.729</Codec>
                       <PacketRate>10 ms</PacketRate>
                       <Value>152</Value>
               </RUValue>
               <RUValue>
                       <Codec>G.729</Codec>
                       <PacketRate>20 ms</PacketRate>
                       <Value>163</Value>
               </RUValue>
         </Parameters>
         </changeRU>
    </Methods>
   </Command>
</CommandList>
```

         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </changeRU>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.9 Query RU profile XML command

Resource Usage provisioning is new to SN07. The XML client has the option to either Query all the RU profiles, or the RU data for a particular profile.

The XML for this command is shown in Figure 22, Figure 23, Figure 24, Figure 25. Error messages returned are described in Appendix B.

Figure 22 XML command to Query all RU Profiles

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <queryRU usn="1" version="1.0">
      <Parameters>
     </Parameters>
     </queryRU>
    </Methods>
  </Command>
 </CommandList>
```

Figure 23 XML response to query all RU profiles.

```
<?xml version='1.0'?>

    <Methods>
      <queryRU usn="1" version="1.0">
       <ReturnData>
              <RUDescription>AAL1/IP40</RUDescription>
              <RUValue>
                      <Codec>G.711</Codec>
                      <PacketRate>10 ms</PacketRate>
                      <Value>123</Value>
              </RUValue>
              <RUValue>
                      <Codec>G.711</Codec>
                      <PacketRate>20 ms</PacketRate>
                      <Value>133</Value>
              </RUValue>
              <RUValue>
                      <Codec>G.729</Codec>
                      <PacketRate>10 ms</PacketRate>
                      <Value>152</Value>
              </RUValue>
              <RUValue>
                      <Codec>G.729</Codec>
                      <PacketRate>20 ms</PacketRate>
                      <Value>163</Value>
              </RUValue>

        <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </queryRU>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.10 Delete RU profile XML command

Resource Usage provisioning is new to SN07.

The XML for this command is shown in Figure 26, Figure 27. Error messages returned are described in Appendix B.

Figure 26 XML command to Delete an RU Profile

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <deleteRU usn="1" version="1.0">
      <Parameters>
        <RUDescription>AAL1/IP40</RUDescription>
       </Parameters>
     </deleteRU>
    </Methods>
  </Command>
 </CommandList>
```

 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <deleteRU usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </deleteRU>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.11 Add LBL XML command

Limited Bandwidth Links provisioning is new to SN07. The <CounterGWC> tag is optional, if omitted the the counterGWC is automatically assigned. The <RUDescription> and <ParentMB> values must have been previously provisioned into the system to successfully complete this operation.

The XML for this command is shown in Figure 28, Figure 29. Error messages returned are described in Appendix B.

Figure 28 XML command to Create a LBL device

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
     <Methods>
     <addLBL usn="1" version="1.0">
       <Parameters>
         <LBLname>LBL1</LBLname>
         <CounterGWC>47.132.132.12</CounterGWC>
         <RUDescription>AAL1/ip40</RUDescription>
         <MaxCount>1000</MaxCount>
         <ParentMB>VPN-A</ParentMB>
      </Parameters>
     </addLBL>
    </Methods>
</Command>
```

Figure 29 XML response to Creating a LBL device.

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <addLBL usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </addLBL>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.12 Change LBL XML command

Limited Bandwidth Links provisioning is new to SN07. The <LBLname> tag is required the other changing data tags are optional. The <RUDescription> and <ParentMB> values must have been previously provisioned into the system to successfully complete this operation.

The XML for this command is shown in Figure 30, Figure 31. Error messages returned are described in Appendix B.

Figure 30 XML command to Change a LBL device RU profile.

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
     <Methods>
     <changeLBL usn="1" version="1.0">
       <Parameters>
         <LBLname>LBL1</LBLname>
          <RUDescription>AAL2/ip40</RUDescription>
       </Parameters>
     </changeLBL>
    </Methods>
</Command>
 </CommandList>
```

Figure 31 XML response to Changing a LBL device.

```
<?xml version='1.0'?>
 <CommandList>
  <Response>
   <Interface>ITransIf</Interface>
    <Methods>
      <changeLBL usn="1" version="1.0">
       <ReturnData>
         <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </changeLBL>
    </Methods>
   </Response>
</CommandList>
```

25.7.2.13 Query LBL XML command

The Query LBL is new to SN07

The XML for this command is shown in Figure 32, Figure 33. Error messages returned are described in Appendix B.

Figure 32 XML command to Query a LBL

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <queryLBL usn="1" version="1.0">
      <Parameters>

25.7.2.14 Delete LBL XML command

Limited Bandwidth Links provisioning is new to SN07.

The XML for this command is shown in Figure 34, Figure 35. Error messages returned are described in Appendix B.

</CommandList>
```

25.8 Authorization for Commands

The security for the GUI Client and OSSgate interface includes support for permission or ‘Authorization’ levels for commands. Each command is associated with one or more user groups. In order to execute a command, a user must belong to at least one of the associated user groups. The user groups associated with the new /modifed commands associated with this feature are specified in the table below.

Table 1 Internet Transparency Commands Authorization

Command	User Group				
	mgcadm	mgcrw	mgcmtc	mgcsprov	mgcro
addNat	X	X			
changeNAT	X	X			
queryNAT	X	X	X	X	X
addMP	X	X			
changeMP	X	X			
deleteMP	X	X			
addRU	X	X			
changeRU	X	X			
queryRU	X	X	X	X	X
deleteRU	X	X			
addLBL	X	X			
changeLBL	X	X			
queryLBL	X	X	X	X	X
deleteLBL	X	X

NAT	Network Address Translation
RU	VCAC Resource Usage
SESM	Succession Element and Sub-Element Manager
SNMP	Simple Network Management Protocol
VCAC	Virtual Connection Admission Control
VPN	Virtual Private Network

25.11 Appendix A: ITrans/VCAC Provisioning Steps

This section provides a high-level overview of the provisioning steps required to set up the ITrans VCAC functionality NEW installtion SN07.

1 Network Analysis/Modelling: identify the key locations in the network for NAT and LBL **functions** (not physical devices). Model and provision the Resource Usage values required for the VCAC functionality (see the Engineering Information section of this document. ***TO DO: Julian M. to supply the Engineering Information section***).

2 On the CS2K Config Manager provision model as defined by step 1. Starting with individual NAT/LBL middleboxes: these are provisioned in top-down hierarchical order, i.e. starting with those closest to the network core. Remember that a 'parent' middlebox must be already provisioned before a 'child' that refers to it can be provisioned.

3 On the CS2K Config Manager provision MGs: select the appropriate ITrans middlebox (NAT or LBL) from the topological model as the 'adjacent middlebox' for the MG.

Existing ITrans network models (SN06.x stream, NATs and MGs) may be adapted to the SN07 form by:

1 following steps 1 and 2 above for new middleboxes.

2 changing the parent middlebox fields of existing (NAT) middleboxes as required to insert them at the correct location in the topology.

3 changing the adjacent middlebox field of existing MGs as required to associate them to the appropriate middlebox (NAT or LBL) in the topology.

!!!!!TO DO LBL XSDs

25.13 Appendix C: Error codes and messages

Table 2 Return codes when command is unsuccessful

Cause of error	Return code	Example return messages
Incorrect command version in query	301	Unsupported version
Platform applications internal error: OSS Interface applications cannot connect to required server application	302	Interfacing error
Unable to provision requested Itrans data because of a database error occurred	303	Database error occurred during setting of RU data
Unable to provision requested Itrans data because of invalid input data	304	Cannot set LBL Max count, value must be between 1 and <Max int> Cannot set LBL ParentMB ,value not configured. Cannot set LBL RUDescription, value not configured. Cannot provision RU profile, RUvalue missing
No Itrans data for this query. e.g. no NAT meets selection criteria or the NAT/GWC specified does not exist	305	NAT not found No NAT found for GWC
User is not a member of any of the user groups allowed to perform this action	501	Insufficient permissions to perform this operation

25.13.1 Example Error Message

```
<?xml version='1.0'?>
    <CommandList>
       <Response>
         <Interface>ITransIf</Interface>
            <Methods>
                <queryNAT usn="1.0" version="1.0">
                 <ReturnData>
                    <NATname>nat1111</NATname>
```

```
                    <ReturnCode value= "305" text="NAT not found"/>
                </ReturnData>
               </queryNAT usn="1.0">
            </Methods>
        </Response>
    </CommandList>
```

25.14 Appendix D: XML Commands: description of method parameters

25.14.1 Parameter definitions (new in SN07)

- **ParentMB** - The name of the parent Middlebox for this device. This allows ITrans devices to be connected into a hierarchy. A value of <none> indicates that this device has no parent. TYPE *NoSpaceNameType* .(32 character token without spaces, see xsd definitions in Appendix A).
- **MPname** - The unique name of the Media Proxy. This must be in a valid DNS format . TYPE *NoSpaceNameType*.
- **IPAddress** - The Media Proxy IP address. *TYPE IPAddressType.*
- **Protocol** - The Media Proxy communication protocol (GWC to MP). This must be either MGCP+ or MPCP. *TYPE NoSpaceNameType.*
- **ProtocolVersion** - The Media Proxy communication protocol version. This must be 1.**0 or 2.0 ?????? TO DO** . *TYPE NoSpaceNameType.*
- **RUDescription** - The Resource Usage profile name. *TYPE NoSpaceNameType.*
- **RUValue** - a composite of the following parameters. Codec,PacketRate,Value *TYPE CodecPacketValue*
- **Codec** - A valid codec that has been entered in the CS2K config manager. E.G. G.711 or G.729. *TYPE CodecType*
- **PacketRate** - A valid Packetisation rate. E.G. 10 ms , 20 ms. *TYPE PacketType*
- **Value** - A resource usage value that one call will use. This is the basic call count value that VCAC uses to measure calls through a Limited Bandwidth Link. *TYPE NoSpaceNumberType*
- **RUNewDescription** - The new name of an RU profile. *TYPE NoSpaceNameType*
- **LBLName** - The unique name of the Limited Bandwidth Link device. This must be in a valid DNS format . TYPE *NoSpaceNameType*.
- **CounterGWC** - The VCAC counter GWC IP address. *TYPE IPAddressType*
- **MaxCount** - The VCAC count maximum limit. TYPE ?
-

25.14.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **addNAT** - Method to create a new NAT (virtual NAT function). This method has the following parameters:

- Input data:
  - usn
  - version
  - NATname. The unique name of the NAT device
  - ParentMB (Optional). The name of the parent Middlebox for this device. This allows ITrans devices to be connected into a hierarchy. A value of <none> indicates that this device has no parent. (default = <none>)
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - CallAgentId **-** The value of the Call Agent Id for this Call Agent (CS2k).
  - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

2. **queryNAT** - Method to list the NATs. Optional parameters allow the client to choose the data returned. This method has the following parameters:

- Input data:
  - usn
  - version
  - NATname (Optional, cannot be included as well as GWCname)- A Unique Name of a NAT device, to get full info on a device
  - GWCname (Optional, cannot be included as well as NATname) - To obtain a list of all NATs on a GWC (Use GWC-XX format)
  - ListNATid (Optional) - Set to true if the NAT ids are required.
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - GWCname (only when the GWCname option requested)

– NATname
– ParentMB (only when the full details are requested)
– NATType (returned only when the full details are requested)
– NATid (returned only when ListNATid is set to ‘true’ in the input data)
– ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

3. **changeNAT** - Method that changes a provisioned NAT information into the CS2k Mgr. This method has the following parameters:

• Input data:
– usn
– version
– NATname - unique name for the NAT to be changed
– ParentMB - The new parent middlebox name. Enter <none> to remove the topology for this NAT device. Note: the parent Middlebox name entered must have been already provisioned into the CS2k Mgr.

• Output data:
– usn (value should be the same as the input)
– version (value should be the same as the input)
– ReturnCode

4. **addMP** - Method that creates a Media Proxy device into the CS2k Mgr. This method has the following parameters:

• Input data:
– usn
– version
– MPname - unique name for the MP to be provisioned
– IPAddress - The IP address of the MP device
– Protocol - Enter “MGCP+” for the control protocol of the device
– ProtocolVersion - Enter “1.1” for the control protocol version.

• Output data:
– usn (value should be the same as the input)
– version (value should be the same as the input)
– ReturnCode

5. **changeMP** - Method that changes a provisioned MP information into the CS2k Mgr. This method has the following parameters:

- Input data:
  - usn
  - version
  - MPname - unique name for the MP to be changed
  - IPAddress - The new IPAddress of the MP device.
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode

6. **deleteMP** - Method that deletes provisioned MP information from the CS2k Mgr. This method has the following parameters:

- Input data:
  - usn
  - version
  - MPname - unique name for the MP to be deleted
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode

7. **addRU** - Method that creates resource usage information into the CS2k Mgr. This method has the following parameters:

- Input data:
  - usn
  - version
  - RUDescription - A unique String to label this RU profile
  - RUValue - an RU Value must be entered for every Codec/Packetrate combination that has been created in the CS2k Mgr. An RUValue consists of the following three parameters.
  - Codec - The Codec that this value refers to
  - PacketRate - The packetisation rate this value refers to
  - Value - The VCAC value for a call using this codec/packetrate.
- Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

8. **changeRU**- Method that changes provisioned RU information into the CS2k Mgr. This method has the following parameters:

• Input data:

– usn

– version

– RUDescription - The RU profile to change

– RUNewDescription (Optional - not allowed with RUValue)- The New name of the RU profile

– RUValue (Optional - not allowed with RUNewDescription) - The full list of RU values for this RU profile, this will overwrite the existing values.

– Codec (Optional - not allowed with RUNewDescription) - The Codec that this value refers to

– PacketRate (Optional - not allowed with RUNewDescription) - The packetisation rate this value refers to

– Value (Optional - not allowed with RUNewDescription) - The VCAC value for a call using this codec/packetrate.

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

9. **queryRU** - Method that queries provisioned RU information from the CS2k Mgr. This method has the following parameters:

• Input data:

– usn

– version

– RUDescription (Optional if omitted all RU profiles are returned)- The RU profile to query

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– RUDescription - If RUDescription ommitted from query then a list of multiple dexcription fields are returned.

– RUValue returned if a RUDescription query was requested. A value for every Codec/Packetrate combination is returned, this comprises of the following three parameters.

– Codec returned if a RUDescription query was requested.

– PacketRate returned if a RUDescription query was requested.

– Value returned if a RUDescription query was requested.

– ReturnCode

10. deleteRU - Method that deletes provisioned RU information from the CS2k Mgr. This method has the following parameters:

• Input data:

– usn

– version

– RUDescription - The RU profile to be deleted

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

–

11. addLBL - Method that creates Limited Bandwidth Link information into the CS2k Mgr. This method has the following parameters:

• Input data:

– usn

– version

– LBLname - A unique name for the LBL device

– CounterGWC (optional) a Counter GWC IP address, if ommited the Counter IPaddress is automatically allocated.

– RUDescription - The RU profile that this LBL device is using, the RU profile must exist already in the CS2k Mgr.

– MaxCount - The maximum value that this LBL can handle with respect to the number of calls using the Codec/Packetrate as defined in the RU profile.

– ParentMB - The parent middlebox name, a link into a middlebox hierarchy. The parent middlebox device must already be in the CS2k Mgr.

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

12. changeLBL- Method that changes provisioned LBL information in the CS2k Mgr. This method has the following parameters:

• Input data:

– usn

– version

– LBLname - The name for the LBL device to change.

– CounterGWC (optional) a new Counter GWC IP address.

– RUDescription (optional) - The new RU profile, the RU profile must exist already in the CS2k Mgr.

– MaxCount (Optional)- The new maximum value.

– ParentMB (Optional)- The new parent middlebox name. The parent middlebox device must already be in the CS2k Mgr.

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

13. queryLBL - Method that queries provisioned LBL information from the CS2k Mgr. This method has the following parameters:

• Input data:

– usn

– version

– LBLname (Optional, cannot be included as well as GWCname)- A Unique Name of a LBL device, to get full info on a device

– GWCname (Optional, cannot be included as well as LBLname) - To obtain a list of all LBLs on a GWC (Use GWC-XX format)

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– LBLname - if GWCname option used above, then a list of LBLnames returned without the full info on each device

– CounterGWC returned if LBLname option used.

– RUDescription returned if LBLname option used.

– MaxCount returned if LBLname option used.

– ParentMB returned if LBLname option used.

– ReturnCode

14. deleteLBL - Method that deletes provisioned LBL information from the CS2k Mgr. This method has the following parameters:

• Input data:

– usn

– version

– LBLname - The LBL device to be deleted

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

26.2 Description

26.2.1 Scope

The actual activity will extend the existing NAOC [1] - [7] and PCA [8] - [9] implementation to provide the availability of the software metering counter in the AMA extensions. This approach is needed in order to be fully compliant to the Spanish Metering Requirements [10]. The choosen approach is generic, so it can be reused for any International markets requesting this functionality.

The activity will reuse the existing NAOC tariff database and framework to provide tariff information for every single call. The existing PCA charge calculation routines will be extended to allow charge calculation

The pieces of functionality listed below are planned to be deployed with the current activity:

- Triggering the calculation of call charges for either
  a. all supported NAOC and PCA subscribers on a global (per switch) basis:
     – IBN
     – V5.2 IBN
     – PRI/QSIG
  b. specific PCA subscribers on a per line basis:
     – IBN
- Writing the calculated call charges into a newly introduced extension of the AMA module code 612
- Providing overall SOC control for the functionality mentioned above.

26.2.2 Value for the operator

The main area where PCA SW metering support for Billing can be used is the improvement of the billing process. By having call charges registed in real-time, billing process will be speeded up.

26.2.3 Brief Background Information

26.2.3.1 NAOC (Tariff Database Part)

Network **A**dvice **O**f **C**harge (NAOC) implements the tariffing of calls over the network boundaries. Two network configurations are supported:

1. It operates in a single/multiple carrier environment, where the originating exchange is able to determine the tariff. This improves the performance and reduces the messaging over the network (see Figure 1, "CGP tracking for a Combined CGP and CDP is supported (generic)"). This is generic functionality which supports all versions of ETSI ISUP interconnection trunks.
2. It operates in a multiple carrier environment, where the originating exchange (named Charged Generation Point, CGP) does not know the tariff that will be applied to the call for every call, so it has to retrieve the information over the network from the selected carrier's exchange called Charge Determination Point (CDP, see Figure 2, "NAOC messages are exchanged between different networks (Gemany only)").

Figure 1 CGP tracking for a Combined CGP and CDP is supported (generic)

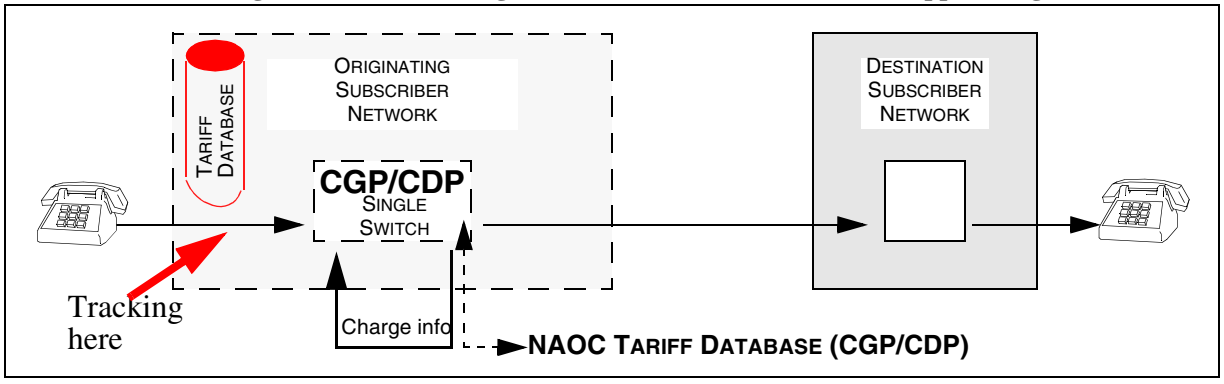

Figure 2 NAOC messages are exchanged between different networks (Gemany only)

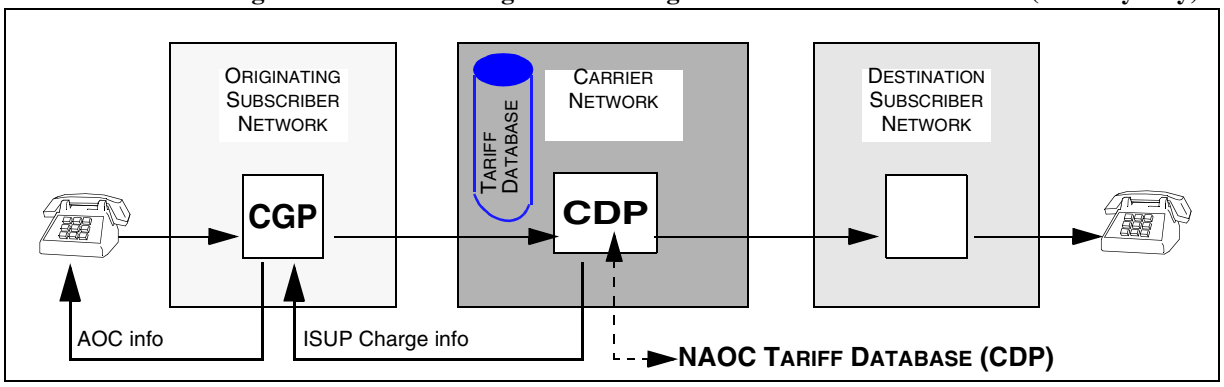


NAOC support for basic call scenarios was developed during MMP12 - MMP13 [1] - [6]. The support for compex call scenarios was introduced in SN05 [7].

26.2.3.2 PCA (Hot Billing Part)

The Payment Ceiling Advice (***PCA***) feature provides a hot-billing functionality for the subscriber's account which allows a customer to meet Regulatory requirements [11] - [13]. The base PCA feature which reuses NAOC functionality was developed for IBN subscribers in the SN04 release for the Succession platform [8]. Additional Regulatory and market requirements were included in SN05 [7] and SN06 [9]. From SN06 onwards, PCA is also available for

1. for TDM IBN subscribers
2. for V5.2 IBN subscribers ob both TDM and CS2K

26.2.3.2.1 PCA feature description

An analogue line subscriber with Line Class Code (LCC) ***IBN*** may request that the ***PCA*** option be added to his or her primary directory number (DN). When ordering this service, the subscriber must specify a particular payment ceiling amount. This amount applies to each of the subscriber's billing cycle (generally every 29 - 32 days, but it can be any period of the year in terms of PCA). If no billing cycle is provided, the subscriber's account will never get resetted.

PCA comes with the following abilities:

- When performing a call, the subscriber's charges are counted during the call and written into the PCA database (PCADB) at the end of the call. This operation is done in real time, so that PCA can provide hot-billing abilities
- The PCA database can be queried at any point of time to retrieve the information regarding a specific subscriber's account.
- The PCA database information can be displayed in either currency units or virtual pulses (which correspond to 1/1000 of one currency units)
- Complex tariff structure described by the NAOC tariffs is fully supported
- Several complex calls scenarios as described in [12] are supported
- PCA database can be automatically resetted based on the provisioned information
- Announcements are provided for approaching or exceeding the PCA limit:
    - ***i. Prepaid or tracking phone bill***

- When a subscriber approaches the PCA limit by exceeding the 80% PCA limit, he hears a (provisionable) announcement he is approaching his limit
- When he exceeds his PCA limit, he hears the announcement, that he exceeds his limit. Depending on the datafilled information, he might not be able to do any additional phone calls (prepaid) or only some specific call classes

ii. Bonus notification

- When a subscriber exceeded the 80% limit, he hears an announcement that encourages him to perform additional calls to get the discount
- When he exceeded his PCA limit, he hears the announcement that he qualified to get a bonus

• PCA supports prepaid functionality and selective force release:

— *Prepaid:*

- When exceeding his PCA limit, the subscriber cannot perform any calls except emergency calls and charge free calls
- When the prepaid account expires, the account is resetted, so that the subscriber cannot perform any calls except emergency calls and charge free calls

— *Selective force release:*

- Depending of the datafilled information, only specific call classes are allowed after the subscriber reached his PCA limit during a call or during the last call

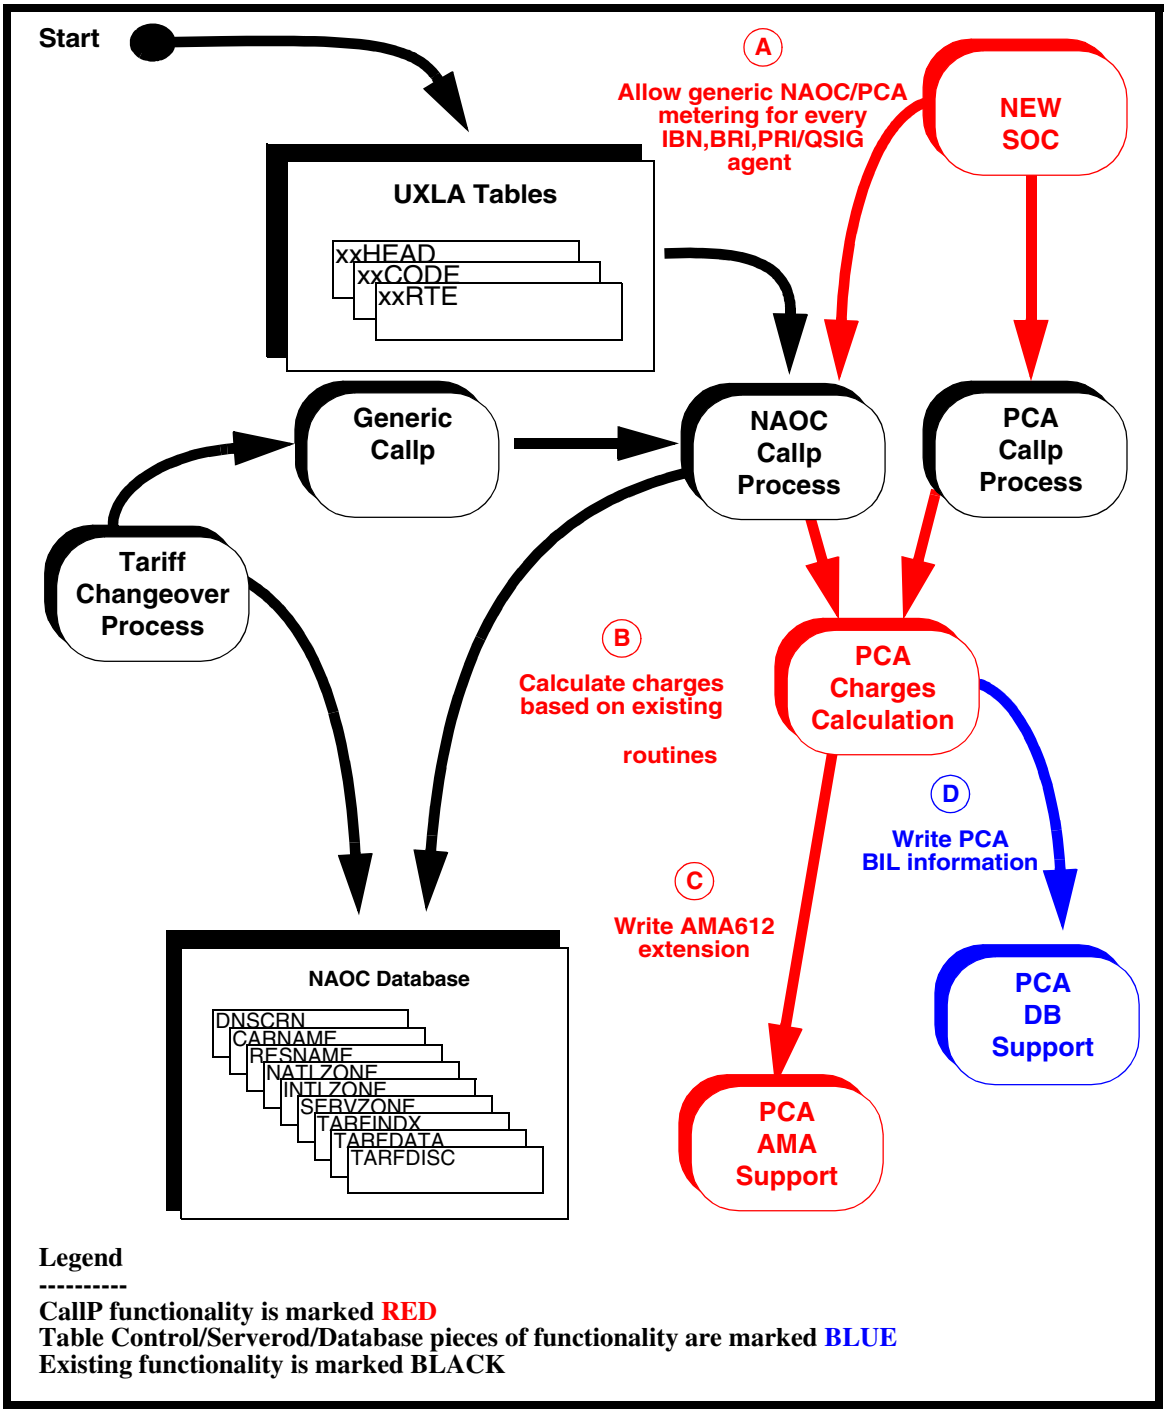
26.3 General Feature Description

The current activity contains of several independant components listed in Chapter “26.2.1 Scope” on page 709. Therefore, the behaviour will be described on a component basis in the chapters below. A brief overview is given in “Figure 3 Interactions with existing NAOC/PCA features” on page 713.

26.3.1 Behaviour

The feature activation will be done by turning SOC on or by assigning the new PCA mode “BIL” to a PCA line.

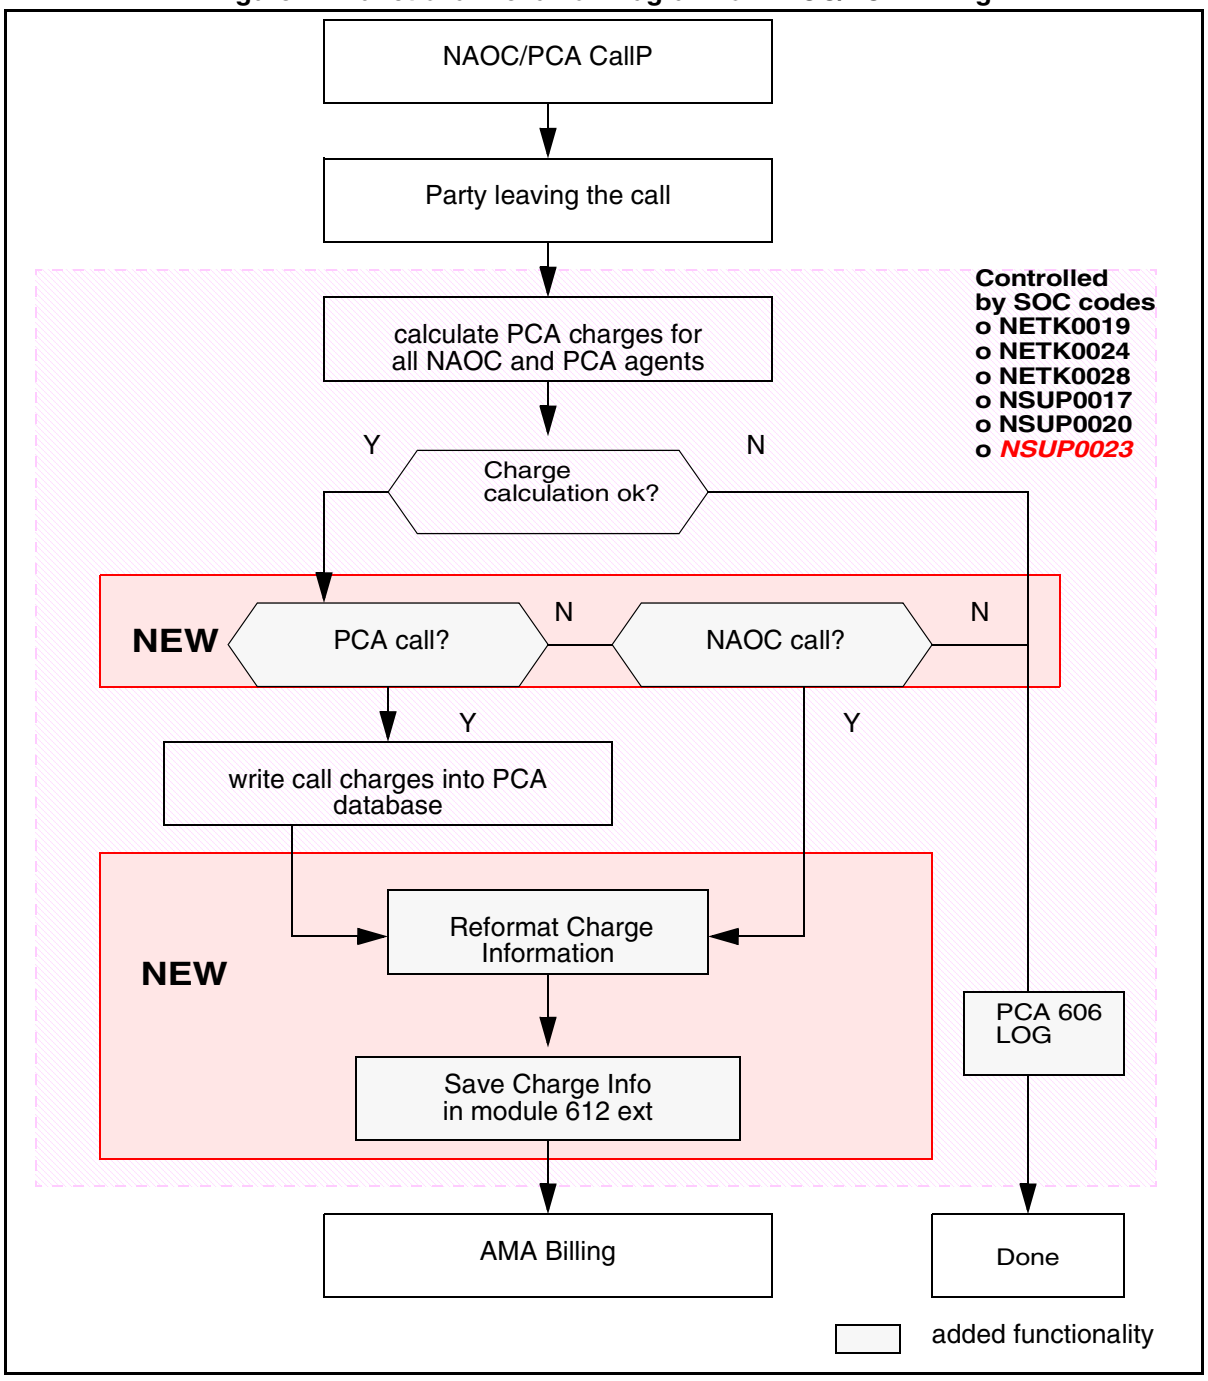
Figure 3 Interactions with existing NAOC/PCA features



Changes are done to both NAOC and PCA CallP code to trigger the call calculation when one party leaves the call. (“Figure 4 Functional Behavior Diagram for NAOC/PCA Billing” on page 714). The calculated call charges

are written in pulse units in the AMA record and if PCA BIL is assigned to the line, they are added to the PCA database.

Figure 4 Functional Behavior Diagram for NAOC/PCA Billing



The calculation of call charges is triggered by the PCA framework. In addition to writing the call charges into the PCADB the just calculated call charges are added to an AMA record as a module 612 extension.

The 30 BCD characters contained in this module 612 extension would be distributed as follows:

Figure 5 New module 612 extension used for NAOC/PCA billing

BCD Char	Length	Meaning
1 - 3	3	**Rating Class at the beginning of the Call** If the billing record is generated by basic call this field will contain the tariff index used for this call from Table TARFDATA, bound by an upper limit of 511 for the Spanish market. If the billing record is generated by a feature action this field will always be set to the value of "511".
4 - 11	8	**Used Meter** The total number of meter pulses **used** for this call or feature action.
12 - 15	4	**Initial meter value MS** The 4 most significant digits of the initial meter pulse value.
16 - 19	4	**Initial meter value LS** The 4 least significant digits of the initial meter pulse value.
20 - 27	8	**Final Meter value** The final meter pulse value, i.e., initial value + used value.
28 - 29	2	**Call Type** This field describes if this is a **basic call** or a **feature action**. If the billing record is generated by basic call this field will be equal to "00". If the billing record is generated by a feature action this field will be equal to a value based on the particular feature as it is provisioned in table NAOCFEAT (per the carrier/reseller).
30	1	**Feature Action**[a] This field describes the type of feature action If the billing record is generated by basic call this field will be equal to "2". If the billing record is generated by a feature action this field will be equal to one of 10 values based on the type of action: (0) assign (1) deassign (2) administrative activation (3) administrative deactivation (4) administrative programming (5) subscriber activation (6) subscriber deactivation (7) subscriber programming (8) usage (9) interrogation

a. Feature billing is described in PLS FMDOC, Module a00002654.

Figure 11, "AMA Record with Module 612 extension" contains an example of an AMA record with the 612 extension.

26.3.2 How To Convert Virtual Pulses To Meter Pulses

The **used meter** value in the AMA module 612 is a function of virtual meter pulses as used by the PCA feature and the provisioning in table CURRCONV.

In order to understand the conversion function you will need some background information:

- The value of a single virtual pulse is equal to 0.001 monetary units, this **cannot** be changed via provisioning.
- The value of a single meter pulse is based on the provisioning in table CURRCONV, specifically the third tuple. This is shown below in Figure 7.

Figure 7 Table CURRCONV - meter pulse value

```
>table currconv
>list all
TOP
CURRNAME CURRVAL
----------------
CHARGING 1 0
DEFAULT 1 0
EURO 6 -2        <-- one meter pulse is 0.06 Euros
BOTTOM
```

The function for the conversion is as follows:

```
meter pulses = (vpa/cv_val) * (1/10^[3+cv_exp])
```

Where:

- **vpa** is equal to the actual number of virtual pulses used.
- **cv_val** is equal to the **value** from the third tuple of table CURRCONV.
- **cv_exp** is equal to the **exponent** from the third tuple of table CURRCONV.

So if we have a call that has used 5630 virtual pulses, the calculation of the number of meter pulses is as follows (based on the provisioning shown in Figure 7):

```
vpa     = 5630
cv_val  = 6
cv_exp  = -2

meter pulses = (5630/6) * (1/10^[3+(-2)])
meter pulses = 93.83
meter pulses = 94 (rounded off)
```

The PCADB level of the NAOCCI tool has been updated with a new command called “convert”. This new command can be used to view this conversion function (including the information from table CURRCONV). The command simply takes the **vpa** as input and it prints out the number of meter pulses based on the **vpa** and data in table CURRCONV, as shown in Figure 8.

Figure 8 CI ‘convert’ command - pcadb level of the naocci tool

```
PCADB:
>convert 5630
Result: 5630 virtual pulses are equal to 94 meter pulses
```

26.4 Interworking

A brief overview of the supported agent interworkings is given below. The combinations of supported interworkings depend on the available NAOC and PCA agents and are listed in “Figure 9 Agent interworking for the current feature” on page 718.

Figure 9 Agent interworking for the current feature

Platform	Originator	Terminating agents							
		IBN lines	ETSI PRI	QSIG (95)	PUSI)	SIP-T	ETSI ISUP V1	ETSI ISUP V2/V2+	BRI
CS2K	IBN	X							
	V5.2 IBN	X							
	PRI/QSIG	X							

As the current functionality ties into the NAOC/PCA framework, the actual feature is able to exist with the features listed below in “Figure 10 Agent interworking for the current feature” on page 718. Red fields mark functionality that has not been implemented while blue fields stand for functionality which was not defined

Figure 10 Agent interworking for the current feature

Platform	Originator for SW Metering Support for Billing	Feature to interact		
		Line HW Metering[a]	AOC[b]	PCA
CS2K	IBN	X		X
	V5.2 IBN			X
	PRI/QSIG		X	

a. Line HW Metering on CS2K is not supported for V5.2 IBN and and not defined for PRI/QSIG
b. AOC is not defined for IBN and V5.2 IBN. Line HW Metering is used instead

26.5 Activation

26.5.1 Global activation via SOC

If all agents have to write their call charges in the AMA records extension, a global activation is needed. This is done by using the SOC code ***NSUP0023*** to activate the trigger for all supported NAOC / PCA agents. This avoids the need to assign AOC or PCA to every single agent.

For this approach, charge calculation will be done in the background. Line agents which have not subscribed PCA will not be seen in the PCA database.

26.5.2 Per line PCA billing activation

26.5.2.1 Provisioning

If a per line activation is needed for PCA functionality is needed, the ***BIL*** option has to be set. This implies that no credit limit tracking will be needed, so no PCA Limit or FRLS information will be neededA provisioning example for the prepaid functionaliy is given below (Figure 11, "How to datafill the PCA per line billing functionality")

Figure 11 How to datafill the PCA per line billing functionality

```
>ado

OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 2 5 24 PM 8838441000 ( PCA $ CAR88 Y EUR BIL) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
```

26.5.2.2 PCA tracking per access interworking with BIL

PCA tracking per access provides a possibility to use one base DN for multiple lines with separate DNs. That is, call charges for all lines of that access are

tracked via one dedicated DN (referred to as base DN). There is specific limit for the number of DNs that can be linked to a base DN.

Call charges will be accumulated to the subscriber's account balance after the call was finished. This number will be used as a source for the billing number.

26.6 Hardware Requirements or Dependencies

This feature does not add any additional hardware requirements and dependencies on top of those one used for NAOC and PCA or for the features that NAOC/PCA do interact with.

26.7 Software Requirements or Dependencies

This feature requires the following features to be activated by SOC:

- ***NETK0019*** Network AOC
- ***NETK0024*** Network AOC Tariff
- ***NETK0028*** CGP Network AOC
- ***NSUP0017*** Payment Ceiling
- ***NSUP0020*** NAOC/PCA Supp Svcs
- ***NSUP0023*** PCA SW Metering Support for Billing (this feature)

NAOC tariff information is required, since ***PCA*** reuses the ***NAOC*** functionality. If no ***NAOC*** information is provided, the payment ceiling counter cannot be updated for that call. NAOC datafill including the NAOC tables and translation options have to be set up in a appropriate way. Please refer to [1] - [7] for additional information.For the per line assignment (PCA BIL), the PCA framework has to be datafilled in a proper way according to [9]. The PCA announcement for the 80-99.9% notification must be datafilled with the announcement CLLI ***PCA1***. The announcement for exceeding the 100% limit must be datafilled with the announcement CLLI ***PCA2***.

26.8 Limitations and restrictions

1. The following limitations and restrictions were inherited from the former PCA features [8], [9]. They have to be considered only if the per line activation (PCA BIL option) is turned on. They will have no effect for the case where the feature is activated by SOC:
   - — PCA and ELN [14] are mutually exclusive, since PCA would restrict the ability of the subscriber to perform calls in emergency cases. Therefore PCA is not allowed on ELN lines.
   - — Emergency calls take priority over PCA, so if the subscriber makes an emergency call, the PCA announcement will not be activated.

— Overlap outpulsing is not supported when a line with PCA has reached at least 80% of its payment ceiling limit.

— PCA may be assigned only to the primary DN of line accesses with multiple DNs (e.g. SDNs). All charges made to that line access will count towards a single payment ceiling limit.

— Fixed Price Service (FPS) and PCA are mutually exclusive and may not be assigned to the same analogue line.

— The Announcement Before Routing (ABR) feature and PCA are incompatible and may not be assigned to the same IBN line. Servord prevents the craftsperson from making such an assignment.

— PCA can be assigned to a maximum number of 65,535 lines per node.

— Per node, there can be up to 65,535 DNs linked to a single base DN

— Nevertheless, the PCA accuracy will be always 1/1000 of one unit datafill with SERVORD. So if the meaning of the value datafilled is 1 million currency units (e.g. Turkish Lira), the accuracy will be 1000 currency units (1000 Turkish Lira)

26.9 Recommendations

1. The following recommendations were inherited from the former PCA development [8], [9]. They have to be considered only if the PCA BIL option is turned on. They will have no effect for the case where the feature is activated by SOC:

- It is not recommended to reset the PCA entries during an active call, if the subscriber has not exceeded his limit yet. Doing so may result in the subscriber hearing the mid-call warning tone prematurely (if limit is being increased) or erroneously not hearing the tone when the 100% limit is reached (if limit is being decreased).
- It is recommended that fax and modems have any Voice Detection Features deactivated, if possible. It is also recommended that these devices have their connection set-up timers set to at least 60 seconds. Announcement length should not exceed 60 seconds.

26.10 Interactions

1. All ***NAOC*** [1] - [7] and ***PCA*** [8], [9] feature interactions also apply to this feature.

2. On a TDM platform, AOC Hardware Metering and PCA can coexist and function independently

27: Functional Description (FN): A00002639

27.1 Feature name

"CEPT PSTN: Analogue Call Waiting Indication"

27.2 Description

This activity provides the following functionality in addition to the existing CEPT Analogue Call Waiting Indication functionality implemented by the activity A59019288, CEPT Call Waiting (FMDOC):

- "Caller Call Waiting" announcement: The waiting party gets an announcement played, that the call is waited. Then normal ringing tone is played. The announcement is optional and controlled by datafill.
- "Called Party Ignores Waiting Call" announcement: After 30sec period (hardcoded), the waiting party hears an announcement followed by a datafillable treatment (please refer to the bullet "Call Waiting Timeout Treatment" below). The announcement is optional and controlled by datafill.
- "Call Waiting Timeout Treatment" . After 30 secs timer expiry (and after the Called Party Ignores Waiting Call announcment, if being applied), a treatment (busy, answer, no_service_circuit timeout etc.) is applied to the Call Waiting Line. The treatment is defined by datafill.

27.2.1 Caller Call Waiting Announcement

The Caller Call Waiting Announcement is applied to the Calling Party if:

- The Called Party has ICWT line option datafilled and activated as covered in section Figure 27.2.3, "Datafilling and activating ICWT (CEPT CWT) option",

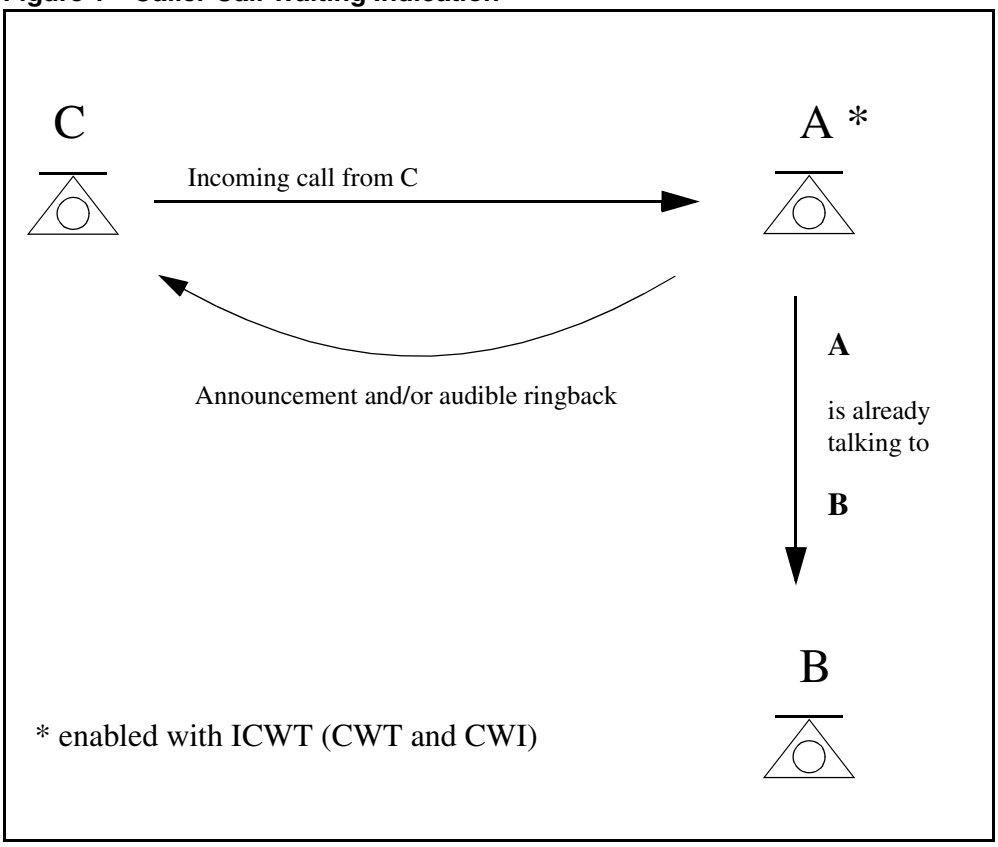
  or

- the Customer Group of the Called Party has ICWT option datafilled in table CUSTSTN and activated by the Called Party as covered in section Figure 27.2.4, "Datafilling and activating Customer Group Based ICWT option",
- The ICWT announcement datafill covered in section "Datafilling ICWT Announcements" on page 730, is done, and
- The boolean ICWT_ANN_ACTIVE of option ICWT is activated (i.e. is set to 'Y') as described in section Figure 27.2.6.1, "Activation of boolean ICWT_ANN_ACTIVE".

The announcement is followed by the standard ring back tone.

If the boolean ICWT_ANN_ACTIVE of option ICWT is set to ‘N’ and if the Called Party has ICWT option datafilled, the standard ring back tone is applied to the Calling Party.

Figure 1 Caller Call Waiting Indication



27.2.2 “Called Party Ignores the Waiting Call” Announcement

If the Called Party ignores the Waiting Call, the “Called Party Ignores the Waiting Call” announcement is applied to the Calling Party to indicate that the Called Party ignored the call if:

- The Called Party has ICWT line option datafilled and activated as covered in section Figure 27.2.3, "Datafilling and activating ICWT (CEPT CWT) option",

  or

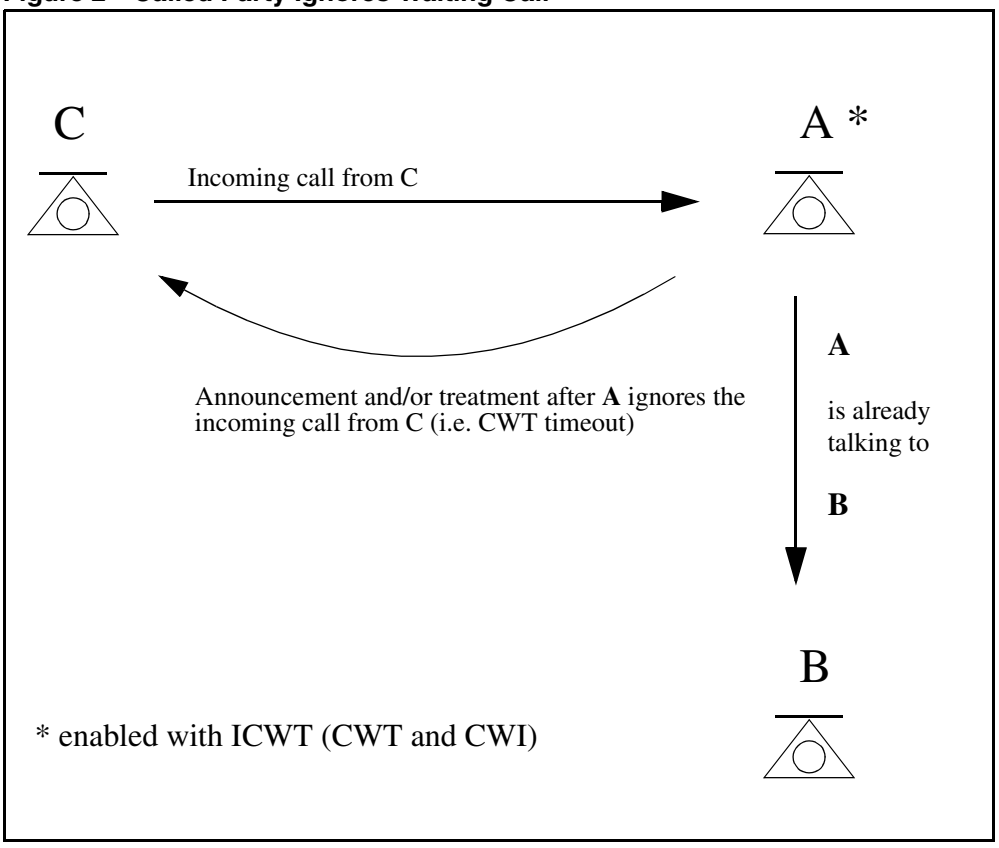
  the Customer Group of the Called Party has ICWT option datafilled in table CUSTSTN and activated by the Called Party as covered in section Figure 27.2.4, "Datafilling and activating Customer Group Based ICWT option",

- The ICWT announcement datafill covered in section “Datafilling ICWT Announcements” on page 730, is done, and
- The boolean ICWT_TMO_ANN_ACTIVE of option ICWT is activated (i.e. is set to ‘Y’) as described in section Figure 27.2.6.2, "Activation of boolean ICWT_TMO_ANN_ACTIVE".

The announcement is followed by the treatment datafilled in ICWT_TMO_ANN_ACTIVE sub-field of ICWT tuple.

If the boolean ICWT_TMO_ANN_ACTIVE is set to ‘N’ and if the Called Party ignores the Waiting (Calling) Call, the treatment datafilled in ICWT_TMO_ANN_ACTIVE sub-field of ICWT tuple is applied to the calling party. For datafilling the ICWT timeout treatment, please refer to section Figure 27.2.6.3, "Datafilling of ICWT_TIMEOUT_TREATMENT".

Figure 2 Called Party Ignores Waiting Call



27.2.3 Datafilling and activating ICWT (CEPT CWT) option

The following figure shows the steps for adding and activating the ICWT line option to the Called Party:

Figure 3 Steps for adding and activating ICWT line option to the Called Party

```
>servord

>y
```

For activating the ICWT option by the user, please refer to the FN section of activity A59019288, CEPT Call Waiting (sub-section, Feature Activation, Deactivation, Interrogation).

27.2.5 Datafilling ICWT Announcements

The “Call Waiting” and “Called User Ignores Waiting Call” announcements are datafilled using the existing CS2K announcement capabilities. Please, note that the CLLIs used for “Call Waiting” and “Called User Ignores Waiting Call” announcements are **hardcoded** to **ICWTANN** and **ICWTTMOANN**, respectively.

The following figure shows the steps for datafilling the ICWT announcements:

Figure 5 Example for datafilling ICWT Announcements

```

27.2.6 ICWT Tuple in Table ISERVOPT

In table ISERVOPT, a new option, ICWT, is introduced to indicate whether the Call Waiting Announcements to be applied to the Waiting (Calling) party.

Option ICWT has three sub fields, ICWT_ANN_ACTIVE, ICWT_TMO_ANN_ACTIVE and ICWT_TIMEOUT_TREATMENT which activate/deactivate “Caller Call Waiting” announcement , “Called Party Ignores Waiting Call” announcement and datafills “Timeout Treatment Value”, respectively.

The Call Waiting Announcements can be activated/deactivated independent from each other.

27.2.6.1 Activation of boolean ICWT_ANN_ACTIVE

The standard audible ringback is the default tone for ICWT feature provided to the Calling Party. The new boolean ICWT_ANN_ACTIVE of option ICWT needs to be activated (i.e. set to ‘Y’) in table ISERVOPT to allow Caller Call Waiting announcement to the Calling party.

The following figure shows an example of how to add and activate the boolean ICWT_ANN_ACTIVE.

Figure 7 Example for adding and activating ICWT_ANN_ACTIVE boolean

```
>table iservopt
>add icwt
>y
OPTION:
>icwt
ICWT_ANN_ACTIVE:

TUPLE TO BE CHANGED:
        ICWT ICWT Y   Y/N BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE CHANGED
```

27.2.6.2 Activation of boolean ICWT_TMO_ANN_ACTIVE

The standard busy tone is the default tone for ICWT feature provided to the Calling Party if the Called Party ignores the Waiting Party. The new boolean ICWT_TMO_ANN_ACTIVE of option ICWT needs to be activated (i.e. set to 'Y') in table ISERVOPT to allow announcement to the Calling party indicating that the Called Party ignores the Waiting Party.

The following figure shows an example of how to add and activate the boolean ICWT_TMO_ANN_ACTIVE.

Figure 9 Example for adding and activating ICWT_TMO_ANN_ACTIVE boolean

```

TUPLE TO BE CHANGED:
        ICWT   ICWT   Y/N   Y BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE CHANGED
```

27.2.6.3 Datafilling of ICWT_TIMEOUT_TREATMENT

The third sub field of ICWT tuple in ISERVOPT is ICWT_TIMEOUT_TREATMENT which is used to select timeout treatment value. The type of the treatment is EXTENDED_TREATMENT (please refer to following table).

UNDT (Undefined_Treatment) is not supported as an ICWT Timeout Treatment and datafilling is prevented by the table control.

If the ICWT tuple is removed from the ISERVOPT table the default value of ICWT_TIMEOUT_TREATMENT is NOSC (no_service_circuit) treatment.

Figure 11 Example for ICWT_TIMEOUT_TREATMENT datafill

```

27.2.7 Deactivation of Caller Call Waiting Announcement

There are four ways of deactivation of applying Caller Call Waiting announcement to the Calling Party:

27.2.7.1 By deactivating or deleting ICWT option

The following figure shows the steps for deleting the ICWT line option from the Called Party:

Figure 12 Steps for removing ICWT line option from the Called Party

```
>servord
SO:
>deo $ 8888587771001
OPTION:
>ICWT
OPTION:
>$
COMMAND AS ENTERED:

DEFFTR: ICWT
>$
TUPLE TO BE CHANGED:
RUACEPT CEPT CEPT Y (CFU) $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

27.2.7.2.1 By deleting the ICWT announcement datafill

The Call Wait announcement is disabled if whole or one part of the announcement datafill for ICWTANN covered in section "Datafilling ICWT Announcements" on page 730, is deleted.

Then, only the standard ringing tone is applied to the Waiting Party.

27.2.7.2.2 By changing the value of ICWT_ANN_ACTIVE to 'N'

The Caller Call Waiting announcement is disabled if the value of the boolean ICWT_ANN_ACTIVE of option ICWT is set to 'N' in table ISERVOPT.

The following figure shows an example of how to deactivate the boolean ICWT_ANN_ACTIVE.

Figure 14 Example for deactivating boolean ICWT_ANN_ACTIVE

```
>table iservopt
>format pack
>pos icwt
        ICWT   ICWT   Y    Y/N BUSY
>cha

        ICWT    ICWT    N   Y/N BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE CHANGED
```

27.2.7.2.3 By removing the option ICWT:

The ICWT announcements are disabled if the option ICWT is deleted from table ISERVOPT. The following figure shows an example of how to delete the option ICWT.

Figure 15 Deletion of Option ICWT

```
>table iservopt
>pos icwt
        ICWT ICWT Y   Y/N BUSY
>del
>y
TUPLE TO BE DELETED:
        ICWT ICWT Y    Y/N BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

27.2.7.3 Deactivation of ICWT Announcement for "Called Party Ignores Waiting Call"

There are four ways of deactivation of applying ICWT "Called Party Ignores the Waiting Call" announcement to the Calling Party:

27.2.7.4 By deactivating or deleting ICWT option

The following figure shows the steps for deleting the ICWT line option from the Called Party:

Figure 16 Steps for removing ICWT line option from the Called Party

```
>servord
SO:
>deo $ 8888587771001
OPTION:
>ICWT
OPTION:
>$
COMMAND AS ENTERED:
DEO NOW 3 6 13 PM 8888587771001 ( ICWT ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
JOURNAL FILE IS INACTIVE, SERVICE ORDERS NOT
ALLOWED
SHOULD ORDER BE DONE ANYWAY? (Y OR N)
>y
```

27.2.7.5 By deactivating or deleting Customer Group Based ICWT option

For deactivation of the ICWT option, please refer to the FN section of activity A59019288, CEPT Call Waiting (sub-section, Feature Activation, Deactivation, Interrogation).

The following figure shows the steps for deleting the Customer Group Based ICWT option from the Customer Group of Called Party:

Figure 17 Steps for removing ICWT line option from the Called Party

```
>table sutstn
>pos ruacept cept
RUACEPT CEPT CEPT Y (CFU) (ICWT) $
>cha
OPTION: CEPT
>
DEFAULT_FEATURE_ON: Y
>
DEFFTR: CFU
>
DEFFTR: ICWT
>$
TUPLE TO BE CHANGED:
RUACEPT CEPT CEPT Y (CFU) $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

27.2.7.5.1 By deleting the ICWT announcement datafill

The Call Wait announcement is disabled if whole or one part of the announcement datafill for ICWTANN covered in section "Datafilling ICWT Announcements" on page 730 is deleted.

Then, only the standard no service circuit is applied to the Waiting Party.

27.2.7.5.2 By changing value of ICWT_TMO_ANN_ACTIVE to 'N'

The ICWT " Called Party Ignores the Waiting Call" announcement is disabled if the value of the boolean ICWT_TMO_ANN_ACTIVE of option ICWT is set to 'N' in table ISERVOPT.

The following figure shows an example of how to deactivate the boolean ICWT_TMO_ANN_ACTIVE.

Figure 18 Example for deactivating boolean ICWT_TMO_ANN_ACTIVE

```
>table iservopt
>format pack
>pos icwt
        ICWT   ICWT   Y/N  Y BUSY
>cha
>y
OPTION: ICWT
>
ICWT_ANN_ACTIVE
>y/n
ICWT_TMO_ANN_ACTIVE:
>n
ICWT_TIMEOUT_TREATMENT:
> BUSY (one of the EXTENDED_TREATMENT)

TUPLE TO BE CHANGED:
        ICWT   ICWT   Y/N   N BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

27.2.7.5.3 By removing the option ICWT:

The ICWT announcements are disabled if the option ICWT is deleted from table ISERVOPT. The following figure shows an example of how to delete the option ICWT.

Figure 19 Deletion of Option ICWT

```
>table iservopt
>pos icwt
        ICWT ICWT Y/N   Y BUSY
>del
>y
TUPLE TO BE DELETED:
        ICWT ICWT Y/N   Y BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

27.3 Hardware Requirements or Dependencies

Standard CS2K hardware.

27.4 Software Requirements or Dependencies

Intl Succession Core and GWC loads.

27.5 Limitations and restrictions

- The duration of ICWT Timeout is hardcoded to 30 seconds.
- The CLLIs of the ICWT announcement trunks are hardcoded to ICWTANN and ICWTTMOANN.
- If UNDT (undefined_treatment) is tried to be datafilled for ICWT_TIMEOUT_TREATMENT sub field , it is prevented by the table control since it is not supported as ICWT Timeout Treatment.

27.6 Interactions

- The interactions supported by the activity A59019288, CEPT Call Waiting, (FMDOC) also supported by this activity.
- When the Called User ignores the Waiting Call and if the Calling User has CCBS option, CCBS procedures take precedence over “Called Party Ignores the Waiting Call” announcement procedures.
- The limitations for ICWT interactions with IN also applies for this activity.

Term	Description
CLLI	Common Language Location Identifier
CWT	Call Waiting Terminating

28: Functional Description (FN): A00002640

28.1 Feature name

CEPT Call Forward Delayed Programming.

28.2 Description

28.2.1 Introduction

This activity caters to telefonica requirements to enhance Call Forward and Call Pickup functionalities in CEPT standards.

Following services are enhanced/provided on CEPT lines:

- Concurrent Call Forwarding, Denied Call Forwarding.
- Subscriber Programmable RINGing for Call Forward Don't Answer.
- Call Pickup, Directed Call Pickup.

28.2.2 Functional Description

28.2.2.1 Concurrent Call Forwarding

The Call Forwarding Simultaneous/Screening (CFS) option allows a user to forward more than one call through a station at a time.

This feature make it possible to forward upto 256 calls simultaneously. However CFS feature allows upto 1024 calls to be forwarded simultaneously.

The administrator is authorized to assign, deassign CFS on a line via Service Order. Administrator can specify maximum number of simultaneous call forwarding for each user and for each flavour of forwarding (Unconditional, Busy, Don't Answer) via Service Order. Once, the number of simultaneous call forward reaches maximum limit, any further calls shall not be diverted.

Alternatively the Control Multiple Call Forwarding (CMCF) option can be used for concurrent call forwarding. The administrator is authorised to assign CMCF option in CUSTSTN table for a customer group.

Subscriber can prevent calls to be forwarded towards his line.

28.2.2.2 Subscriber Programmable RING (SPRING) for CEPT CFD

This activity utilizes the existing feature Call Forward Variable Timer (CFDVT) to provide the functionality of delay programming for CFD.

The administrator is authorized to assign, deassign CFDVT on a line via Service Order. Administrator is able to specify and modify the period of ringing in the case of Call Forwarding by No Answer. PRGRING is suggested for CFDVT ring control attribute. We do not check for FIXRING vs PRGRING.

Subscriber is able to activate, deactivate CFDVT by dialing access code. Subscriber is able to specify or interrogate time-interval in case of Call forwarding by No Answer by dialling access code. Subscriber can be charged for modifications/interrogations of the time-interval which is implemented by the activity A00002638 “Software Metering Support for Billing”.

28.2.2.3 Service of Call Pickup

This activity enables Call Pickup (CPU), Directed Call Pickup (DCPU) feature for a CEPT line. Call Pickup option allows a station to answer incoming calls to another station in the same pickup group. Directed Call Pickup option allows a station to answer a ringing line in the same customer group before the called party answers the ringing line.

For Limitations/Restrictions refer to section 2.5

28.2.3 Operation Procedures

The functionality provided by this activity can be controlled by the following procedures:

* Administrator assignment

* Administrator deassignment

* Subscriber activation

* Subscriber deactivation

* Subscriber interrogation

28.2.3.1 Administrator assignment

Administrator can assign CFS, CFX, CPU, DCPU, DCF using ADO (Add Option) command via Service Order.

28.2.3.3 Subscriber activation

Subscriber can activate CFDVT features that is provisioned on his line by using following dialling sequence:

SC[No of B](*[Time in seconds])#

The third '*' sign and the time is optional. If not used the time delay is not modified from last change. Timer range is 1 to 60s.

If the activation is successful subscriber gets positive acknowledgement, otherwise a negative acknowledgement is played.

28.2.3.4 Subscriber deactivation

Subscriber can deactivate CFDVT features that is provisioned on his line by using following dialling sequence:

#SC#

If the deactivation is successful subscriber gets positive acknowledgement, otherwise a negative acknowledgement is played.

28.2.3.5 Subscriber interrogation

Subscriber can interrogate CFD/CFDVT features that is provisioned on his line by using following dialling sequences:

i. Status of CFD by dialing *#SC#

ii. Verification of DN by dialing *#SC*DN#

iii. Verification of timer value by dialing *#SC*DD#

Here DD is the timer value given for the CFDVT feature that is provisioned on his line, DN is call forward number.

If the timer value dialled by the subscriber matches exactly with the timer value set on the line, subscriber gets a positive acknowledgement. Otherwise a negative acknowledgement is played.

As DN and DD both are numbers, following assumption is made to differentiate between interrogation of DD vs DN:

- If the dialled number of digits is 1 or 2, assume interrogation for timer value.
- If the dialled number of digits is more than 2, assume interrogation for the DN.

28.2.4 Billing for SPRING

The subscribers meter is pegged for changing and interrogation of the CFD delay timer as datafilled in table MTRFEAT against CFDVT feature. Activity A00002638 records the charges in the AMA.

28.2.5 Call Forward Chaining

A call can be forwarded mupltiple times forming a chain, i.e. A->B->C->D->E->F, with the limit of maximum of five call diversions in the chain. Sixth call diversion will not take place, fifth diverted-to station will keep on ringing and the originator will get ring back tone.

28.3 Hardware Requirements or Dependencies

No new hardware will be required for this feature.

28.4 Software Requirements or Dependencies

None.

28.5 Limitations and restrictions

There are some limitations for CPU. These are:

- Uses *SC instead *SC# for invocation.
- Does not support interrogation.

CFDVT option is not available as casual service.

29: Functional Description (FN): A00002641

29.1 Feature name

CEPT PSTN: Analogue Outgoing Call Barring

29.2 Description

29.2.1 Overview

This activity covers the requirements stated in Telefonica General Specification “SERVICE OF RESTRICTION OF OUTGOING CALLS “GT.Eg.d4.017 1ª 4-97

This activity addresses the Telefonica specific changes for the CEPT International Line Restriction” ILR supplementary service. It adds more flexibility to the original ILR activity 59019295.

29.2.2 ILRCLASS table

The ILRCLASS table stores the definition of the barring programs for the ILR service. The International Line Restriction line option references this table.

Figure 1 Example entry in table ILRCLASS

```
TABLE ILRCLASS
DIDD 02 (CNTL) (ICNTL) (INTL) $(09000) (09001)$
```

This entry indicates that the barring program DIDD or Deny International Direct Dial uses the code ‘02’ and bars the international translation classes CNTL, ICNTL and INTL. Additionally calls to the dialled DNs ‘09000’and ‘09001’ are restricted under this barring program. The dialled DN is in this context the DN dialled by the subscriber. The only option influencing this dialled DN string is the NO_ACCODE_DIGITS field in table IBNXLA for selectors like NET. This allows to use the DN barring in Centrex environment for public calls.

Table ILRCLASS can hold up to maximum of 100 tuples and the same should be the number of R-Codes, that is R-code range varies from 00 to 99. The R-Codes values are unique in table ILRCLASS, except ‘NN’

Table ILRCLASS entries with R-Code ’NN’ can not be used in the ILR line option and NIL barring class tuple can’t be deleted from the table ILRCLASS.

During ONP the ILRCLASS table is populated with the previously hard coded barring programs and the R-codes of the ILRCLS tuple in table ISERVOPT. The R-codes are not stored in the ILRCLS tuple in ISERVOPT any more.

During ONPs to this activity, the default tuples are restored.

29.2.3 Privileged user access

Changing the barring programs in table ILRCLASS needs to be communicated to the subscriber base. Therefore this table should be only changeable for a limited number of operators. Therefore it is suggested to set fairly high values for the command classes to update this table. This can be achieved via table CUSTPROT datafill:

Figure 2 Example of ILRCLASS table in CUSTPROT table

```
TABLE CUSTPROT
ILRCLASS 15       25 25 OFF    OFF
```

Only operators with a command class of 25 can change existing tuples and delete and add tuples to this table

29.2.4 ILRCLASS OM

The ILRCLASS OM are adopted to support the flexible definition of the barring programs in table ILRCLASS. The ILRCLASS OM provides per OM group the number of activations, deactivations, usages and unsuccessful deactivations:

Figure 3 flexible ILRCLASS OM group

```
ILRCLASS:   ACTIVE
START:2003/05/10 18:30:00 SAT; STOP: 2003/05/10 18:47:12 SAT;
SLOWSAMPLES:        11 ; FASTSAMPLES:        103 ;
       KEY (ILR_CLASS)
          ACT   DEACT USAGE UNDACT

   02 DIDD
       10 1 25 5
```

The ILR1 OM group is deleted, because all information is stored in the flexible ILR OM group.

The example above shows an OMSHOW output for the new ILRCLASS OM group. It shows for the OM group DIDD with 10 activations, 1 deactivation, 25 times a call was barred due to this program and 5 times the deactivation failed.

29.2.5 ILR OM

ILR OM provides the following information.

Figure 4 ILR OM group

```
ILR:   ACTIVE
START:2003/05/10 18:30:00 SAT; STOP: 2003/05/10 18:47:12 SAT;
SLOWSAMPLES:        11 ; FASTSAMPLES:        103 ;
      ILRCERR    ILRUINT    ILRINTG    TEMPDAC
      TEMPUDAC
      2           0         2           4
      2
```

29.3 Hardware Requirements or Dependencies

This activity is available for MMP and CS2k product.

29.4 Software Requirements or Dependencies

N/A

29.5 Limitations and restrictions

- This table does not apply to the BRI line option OCB.
- The barring programs apply to the whole office. Different barring programs for different customer groups are not possible
- The option if the subscriber can change the barring program or not is set for the office. It is not possible that some subscribers may change their barring program and some are not allowed to change their barring program.
- Announcement is not supported for this activity.
- The table ILRCLASS DN restriction based is supported only for the following ILR feature interactions.
  a. WML
  b. CDX
  c. SCS/SCL
  d. I3WC
  e. ICT
  f. LNR
  g. CND

h. AR

- DN digits in table ILRCLASS will be restricted on all endblock outpulsing calls (where translation has MIN and MAX of equal values).
- For overlap outpulsing calls, if the MIN is less than the number of digits in dialled DN, then the DN will not be restricted.
- The MIN restriction digits should be greater than the number of digits in dialled DN.
- As usual, DN digits as per the Telefonica General Specification "SERVICE OF RESTRICTION OF OUTGOING CALLS "GT.Eg.d4.017 1ª 4-97" is 3 digits and MIN digits should be three.

29.6 Interactions

Unchanged by this activity. Please refer to the NTPs for current interactions or ILR

i. A59019295 - CEPT International Line restriction

j. A59034536 - Wake-Up Call, Call Control

30: Functional description (FN): A00002642

30.1 Feature name

CEPT PSTN: Analogue Query and 3Party

30.2 Description

30.2.1 Overview

Activity A00002642 provides support for “Analogue Query and 3PTY” according to the Telefonica Specification ER.D4.062-6 “SUPPLEMENTARY TELEPHONE SERVICE CONSULT AND THREE PARTY CALL“

Additionally this activity covers a interworking issue between international call transfer and international warm line as documented in Telefonica Specification GT.ER.D4.462-16 “SUPPLEMENTARY TELEPHONE SERVICE CONSULTS AND CALLS TRANSFERENCE “.

As a last item this activity adds the option to turn off playing a hold tone to the held party via table ISERVOPT.

The supplementary services 3wc and call transfer covered in this activity had been implemented in MMP14 activity 59019281 “CEPT 3WC and ICT”

30.2.2 Warning Tone During 3WC Conferences

This activity introduces a new field to the ICONF tuple in table ISERVOPT. If this field is set the CS2k conference circuit of the conference controller is supervised with the H.248 signal “cg/wt”. This field is initialized to “No” to retain existing behaviour

The following tone definition is suggested:

- Frequency: 1400Hz
- Level: -25dB
- On: 400ms, Off: 18000ms, repeated endless

This field can only be set to “Yes” if an audio controller is datafilled in table SERVSINV. This warning tone is not played, if the conference uses a TDM conference circuit.

30.2.3 Warmline Interaction with Enquiry Mode

This activity introduces a new field to the ICONF tuple in table ISERVOPT. If this field is set, the CS2k prevents WML during enquiry mode. This field is initialized to “No” to retain existing behavior.

30.2.4 Hold Tone during Enquiry Mode

This activity introduces a new field to the ICONF tuple in table ISERVOPT. If this field is set, the CS2k does not play the hold tone to the held party.

30.2.5 Example

Below an example of the ICONF tuple after this activity

Figure 1 ICONF tuple in ISERVOPT

```
>add iconf
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
OPTION:
>iconf
ALLOW_ICT_IN_I3WC:
>y
CLF_FLASH_IGNORE:
>y
WARNING_TONE:
>Y
PREVENT_WML_DURING_ENQUIRY
>Y
PREVENT_HELD_TONE
>Y
TUPLE TO BE ADDED:
                    ICONF
                                                          ICONF Y Y Y Y Y
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
```

30.3 Hardware Requirements or Dependencies

The option to play the warning tone to the conference is only available to CS2k. All other functionality described in this document is applicable both to the DMS and the CS2k.

30.4 Software Requirements or Dependencies

None

30.5 Limitations and restrictions

- Warning Tone does not apply to other conference types than I3WC. I6WC or Meet Me conferences do not use the warning tone
- I3WC does not support chaining of conferences on the same office[1]
- In case I3WC conferences are chained via trunks, multiple warning tones might be encountered, if the other office also supports the warning tone

[1]existing limitation, which is not changed by this activity

- If PREVENT_WML_DURING_ENQUIERY bool is set to “Y” it impacts the Bellcore versions of CT and 3WC in a manner, that WML is still possible on CT and 3WC. But it will use the initial digit time out instead of the WML time out
- When the option PREVENT_WML_DURING_ENQUIRY is set to Y, the first digit timeout is set to the value in LN_PERM_SIG_TIME
- When the enquiry/consult call leg triggers IN queries- InfoCollected TDP or Info Analyzed TDP, the inquiry/consult call is not permitted
- The AudioCodes Media Server (AMS) does not support the warning tone. Please set WARNING_TONE to “N” while using the AMS. (Q00937489)
- The SAM16 UAS does not support the H.248 Empty Event Parameter without curly brackets used by the GWC. This takes down the conference, when the conference leader tries to toggle between the other parties (Q00726512)

30.6 Interactions

UAS	Universal Audio Server - A media gateway being capable of providing announcements, conferences and tones
WML	Warm Line. After a short time out a pre configured DN is called.

31: Functional Description (FN): A00002644

31.1 Feature name

Common Topology Identifier Provisioning - Activity ID A00002644

31.2 Description

The Internet Transparency feature, which allows Voice-Over-IP calls to take place in the presence of Network Address Translation(NAT)/IP VPNs, was introduced into Succession in release 6.1. This feature optimises network resource utilisation by determining whether the call path crosses NAT/VPNs and inserting Media Proxies if necessary.

However, calls spanning multiple Call Agents (CS2ks) may result in the insertion of one or more Media Proxies into the call path, even if the call is contained within a single VPN. To avoid this, the inter-Call Agent trunks can be configured to be ‘intra-domain’ SIP-T trunks, thus causing the NAT/VPN information for both ends of the call to be compared. However, for this comparison to operate correctly, the following requirements must be met by the NAT’s numerical identifier within the Call Agents (CS2ks), ie by the NAT’s ‘Middlebox ID’:

— the middlebox ID for each NAT must be unique across all Call Agents

— each NAT must have the same Middlebox ID in all Call Agents

An example of this is shown in Figure 1.

This requirement on middlebox IDs is provided by the feature described in this note, hence allowing the configuration and use of intra-domain SIP-T trunks in SN07.

Each CS2k within the VoIP network must be allocated a unique Call Agent Identifier between 1 and 255. The user is responsible for administration of this number and its allocation among the CS2ks. Once a CS2k has been allocated a Call Agent ID, it should be provisioned into the CS2k Mgr using the capabilites provided by this feature. Ideally this should be co-ordinated with the CS2k upgrade to SN07, as described in 31.11.

When a NAT is provisioned, a middlebox ID is automatically generated by the CS2k Mgr. From SN07 onwards, the CS2k Mgr incorporates the Call Agent

into this automtically generated number, using the provisioned Call Agent ID for that CS2k. This helps to ensure uniqueness of middlebox IDs across multiple CS2ks.

For the special case in which the same NAT is provisioned into multiple CS2ks, it is necessary to ensure that the middlebox ID used for this NAT is the same in all CS2ks. Hence the middlebox ID allocated when the NAT is first provisioned into a CS2k must be used when the NAT is provisioned in subsequent CS2ks. In order to enable this, this feature provides the capability to

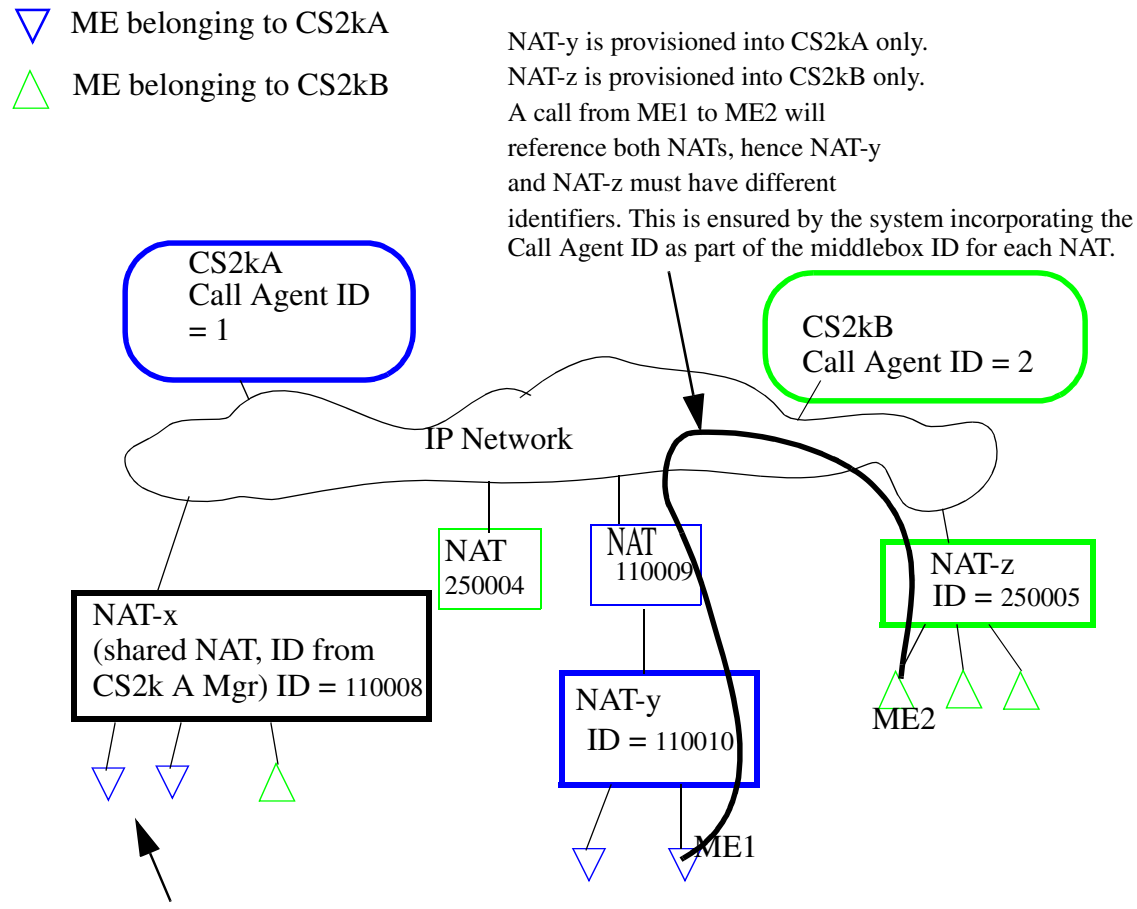
- read the middlebox ID of a provisioned NAT
- specify the middlebox ID as part of the data when provisioning a NAT.

Alternatively, the user may manually allocate any valid unique middlebox ID to a NAT and provision this value into all CS2ks, by-passing the CS2k Mgr middlebox-ID-auto-generation step. The middlebox ID must be an integer between 2 and 16777215 (ID = 1 is reserved by the system for internal use).

An example of ID allocations for a VoIP network with 2 CS2ks in shown in Figure 1 .

If a NAT is provisioned into a CS2k Mgr and the automatically generated middlebox ID is then provisioned into other CS2k Mgrs, care must be taken when deleting this NAT. The NAT must be deleted last from the CS2kMgr that generated the middlebox ID - ie only after it has been deleted from all other CS2k Mgrs.

Figure 1 VoIP network with multiple Call Agents (CS2ks)



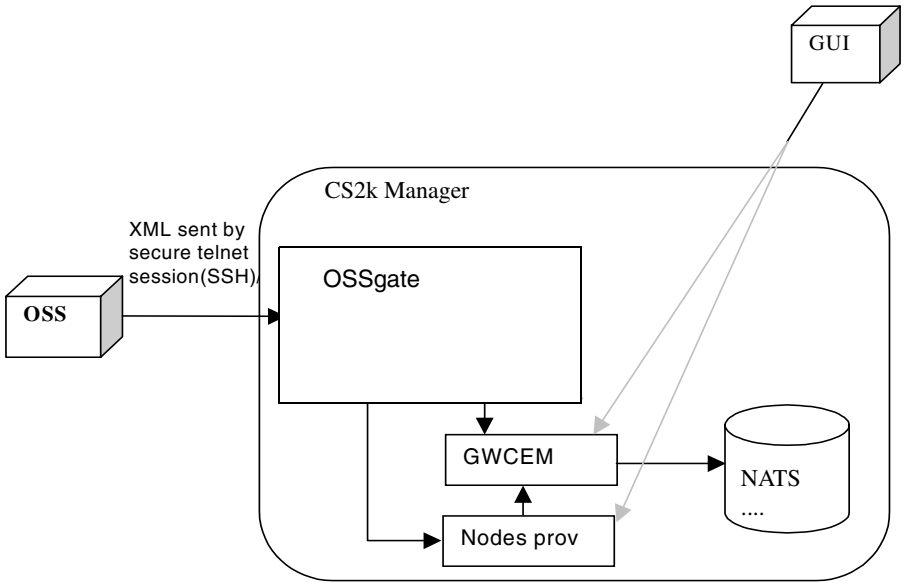
The user operations provided by this feature, which available via the GUI client and via the XML OSS interface, (Figure 2) are:

- Provision/set the Call Agent ID
- Display/list the Call Agent ID
- Specify the NAT middlebox ID during NAT provisioning
- Display/list the NAT Middlebox ID for a selected NAT
- Warning message on deletion of NAT middlebox.

In addition, the following internal functionality changes have been made as part of this feature:

- Automatic update of middlebox ids when Call Agent set for the first time
- Auto-generation of NAT and Pep Server middlebox id based on provisioned Call Agent ID

Figure 2 GUI Client and OSSGate interfaces



31.3 Hardware Requirements or Dependencies

No new hardware is required or introduced by this feature. The application components provided by this feature execute as part of the SESM.

31.4 Software Requirements or Dependencies

Dependencies:

- CR.Q00768898: Extend range in middlebox id in Gatway Controller

31.5 Limitations and restrictions

Upgrade to SN07 should be carried out as described in section 31.11

31.6 Interactions

The following existing GUIs have been modifed:

- Maintenance Settings Panel (see Figure 5).
- Change Maintenance Settings Dialog (see Figure 6).
- Network Devices Panel, NATs tab (see Figure 12).
- Add NAT middlebox Dialog (see Figure 14, Figure 15)
- Delete NAT confirmation Dialog (see Figure 26)

The following existing XML commands have been modified:

- queryNAT (see Figure 9, Figure 20, Figure 22).
- addNAT (see Figure 24).

The following GUIs have been added:

- NAT middlebox ID display dialog (see Figure 13).

The following XML commands have been added:

- queryCallAgentId (see Figure 8)
- setCallAgentId (see Figure 10)

The on-line help facility will be updated with information on the use, syntax and valid values for all the above modifications/additions.

31.8 Call Agent Identifier

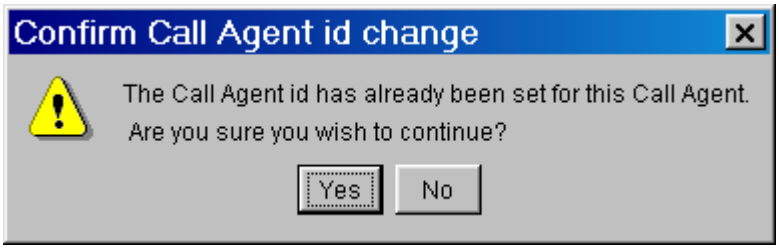
The Call Agent ID has an initial value of <not configured> in newly installed SN07 SESM systems. The Call Agent ID value should be set to a integer value between 1 and 255 by the user for normal operation. The Call Agent ID value must be set before the user can specify Middlebox IDs for NATs during NAT provisioning.

Note that in order to ensure optimum system operation is maintained during an upgrade, the Call Agent Id should be set just prior to upgrade of GWCs to SN07. Details of this are described in section 31.11.

The first time the Call Agent ID is set by the user, the system performs any necessary internal changes for NAT middleboxes which have already been provisioned, to incorporate the newly provisioned Call Agent ID into the NAT middlebox IDs. GWC units which need to be synchronised to this new data wil be identified by having data synchronisation alarms raised against them. (See sections 31.2, 31.11 for more details).

Ideally, the Call Agent ID should only be set once and then not changed. However, setting the Call Agent Id more than once is not prohibited by the CS2k mgr. Note that, for subsequent changes, the new Call Agent ID will only be used in the middlebox ID for NATs provisioned after the change has been made. The middlebox IDs of previously provisioned NATs are not modified. This ensures consistency, in case NATs have been provisioned into multiple Call Agents. If the user does attempt change the Call Agent ID, a warning confirmation message is displayed.

Figure 3



31.8.1 GUI Client

31.8.1.1 Display Call Agent ID

The Call Agent ID is displayed in the Gateway Controller Main Panel, in the ‘Maintenance Settings’ area. This is shown in Figure 4 and Figure 5.

Figure 4 Maintenance Setting Area, GWC management panel

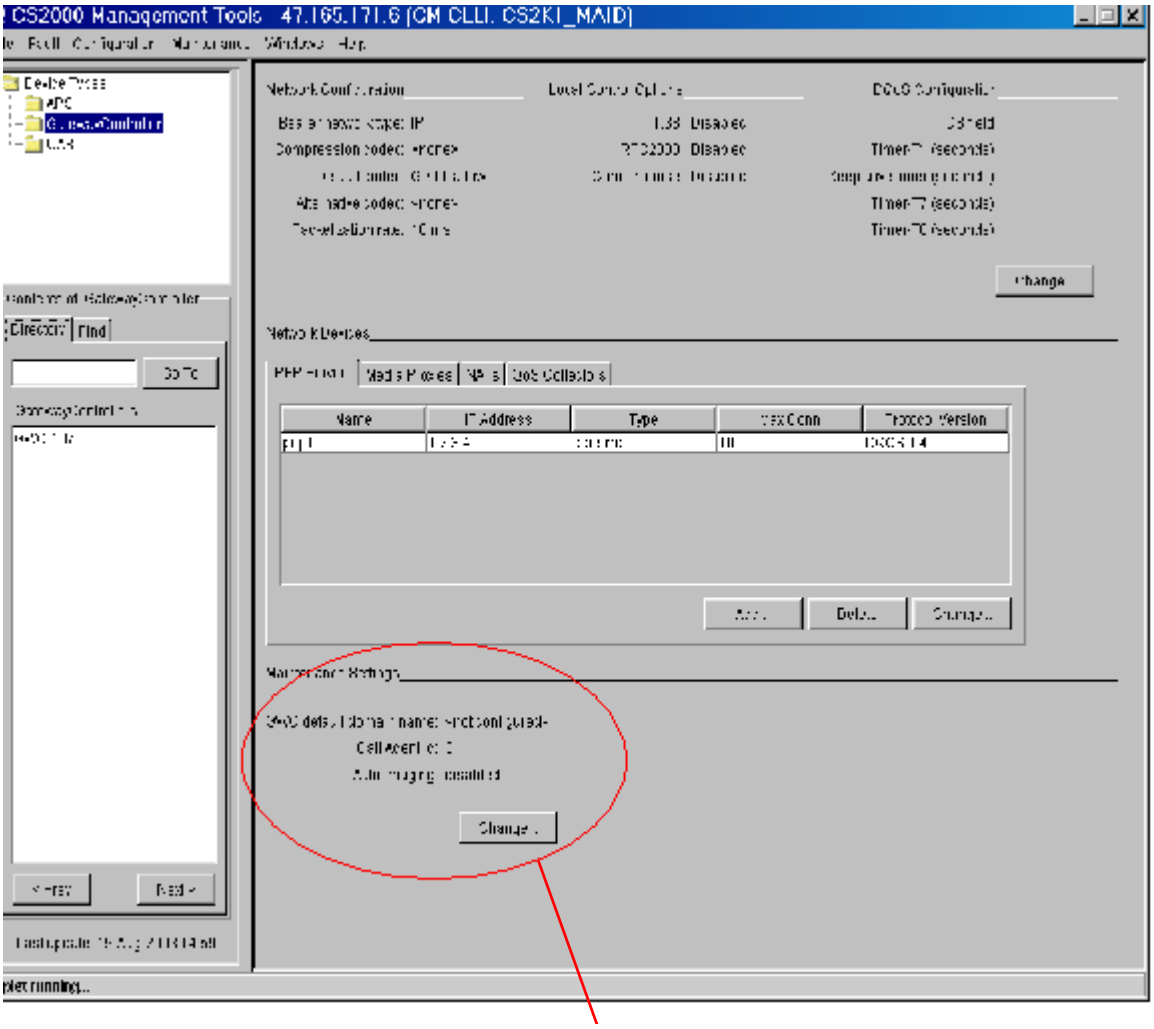


Figure 5 Call Agent ID display and Change button

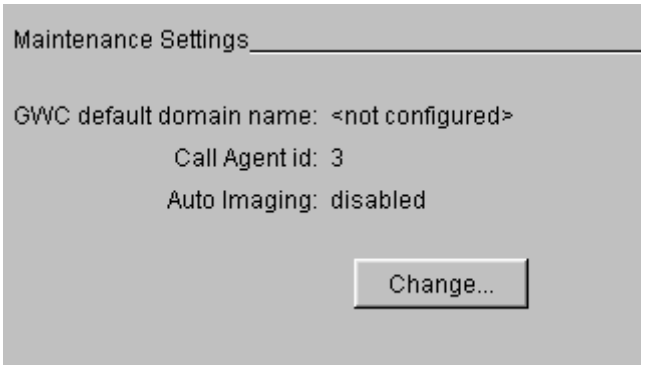
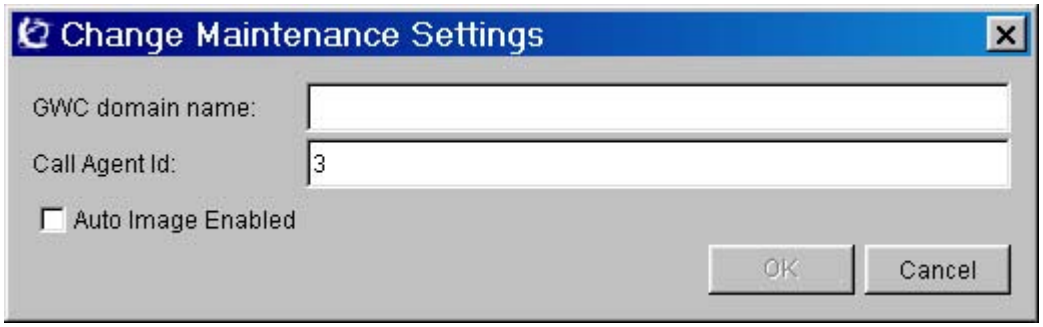


31.8.1.2 Provision Call Agent ID

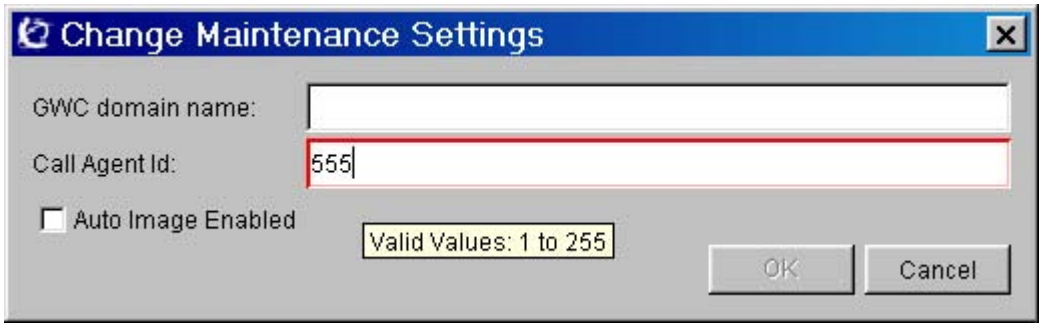
The Call Agent ID can be provisioned/set using the ‘Change’ button in the Maintenance Setting area display (Figure 5). This displays the Maintenance Settings change dialog (Figure 6), which allows the user to set the Call Agent ID to an integer value between 1 and 255. Other maintenance settings may optionally be changed at the same time.

Figure 6 Change Maintenance Settings Dialog



Tool tips for the Call Agent ID are displayed when the cursor is placed within the text field. If the entered value is invalid, the text field is outlined in red and the OK button is disabled (Figure 7).

Figure 7 Invalid Call Agent Id value



31.8.2 XML Interface

31.8.2.1 List Call Agent ID

The Call Agent ID may be retrieved via the XML interface using the following command (Figure 8). If the request is unsuccessful, an error message is returned as described in Appendix B.

Figure 8 XML command queryCallAgentId

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <queryCallAgentId usn="1" version="1.0"/>
    </Methods>
  </Command>
 </CommandList>
```

        <CallAgentId>3</CallAgentId>
        <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </queryCallAgentId>
    </Methods>
   </Response>
</CommandList>
```

31.8.2.2 Provision Call Agent ID

The Call Agent ID can be specified via the XML interface using the setCallAgentId command (Figure 10). If the Call Agent Id cannot be set, an error message is returned as described in Appendix B:

Figure 10 XML Command: setCallAgentId

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>

        <ReturnCode value="0" text="Successful result" />
       </ReturnData>
      </setCallAgentId>
    </Methods>
   </Response>
</CommandList>
```

31.9 NAT middlebox Identifier

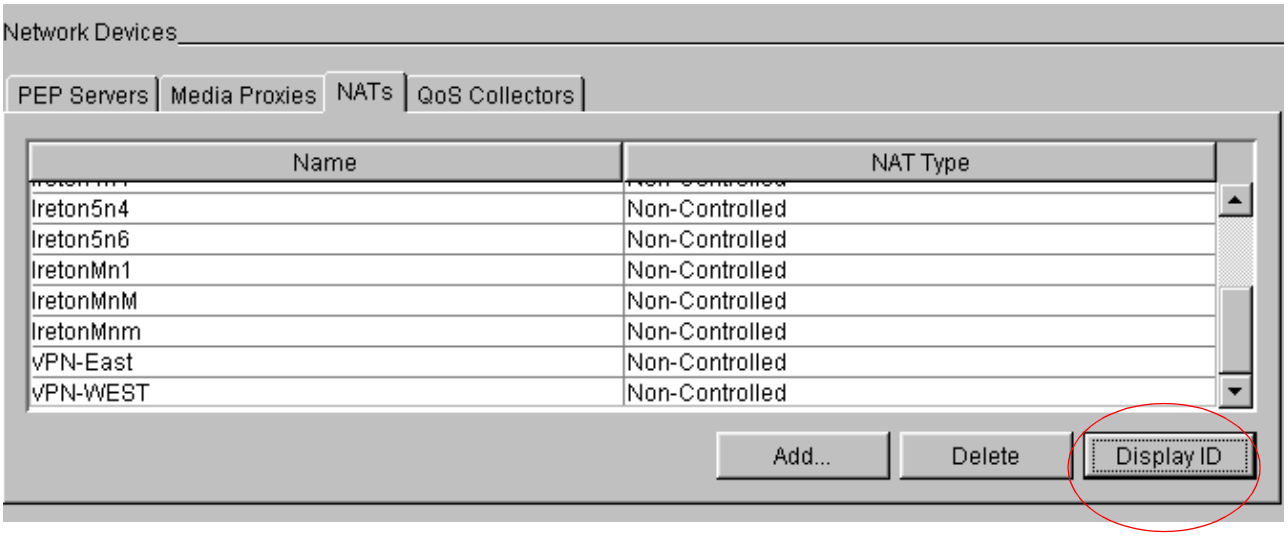
When the user provisions a NAT, the system will automatically allocate a NAT middlebox ID. However, some NATs are provisioned into multiple CS2k Mgrs. For these NATs, it is necessary for the user to override the automatic middlebox ID allocation when the NAT is provisioned into the second and subsequent CS2ks (see section 31.2). This is done by specifying the NAT middlebox ID during provisioning of the NAT. The middlebox ID must be a unique integer between 2 and 16777215

31.9.1 GUI Client

31.9.1.1 Display NAT middlebox ID

The middlebox ID for a NAT can be displayed via the ‘Display ID’ button on the NAT browser, which is a available on the GWC Network Devices tabbed Panel

Figure 12 NATs tab on Network Devices Panel



This brings up an information box displaying the NAT middlebox ID (Figure 13).

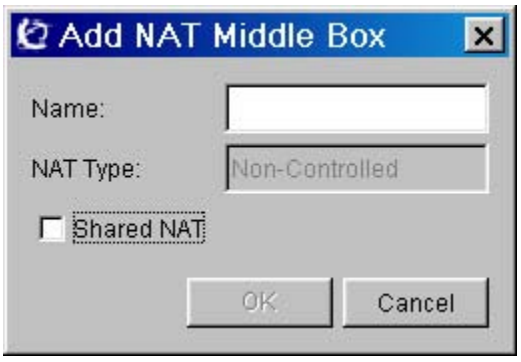
Figure 13 NAT middlebox ID display dialog

31.9.1.2 Specify NAT middlebox ID during NAT provisioning

The middlebox ID for a NAT may be specified during NAT provisioning as follows:

— Use the ‘Add’ button on the NAT browser (see Figure 12) to open the NAT provisioning dialog box (Figure 14).

Figure 14 Add NAT Middle Box dialog



— Check the box marked ‘Shared NAT’. This extends the dialog box to include the middlebox ID provisioning fields (Figure 15).

— Enter valid values for NAT name and NAT ID and press OK (Figure 16).

Figure 15 Add NAT Middle Box dialog with Shared NAT checked

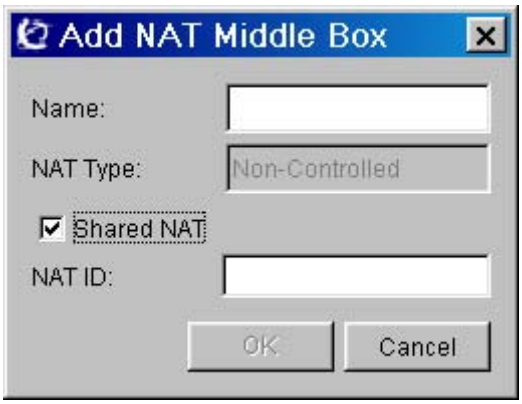


Figure 16 Add NAT Middle Box with valid entries & OK enabled.

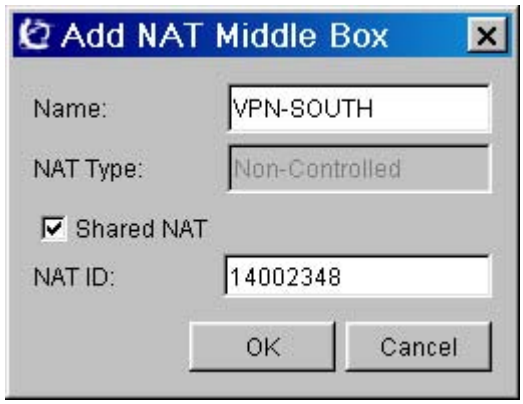
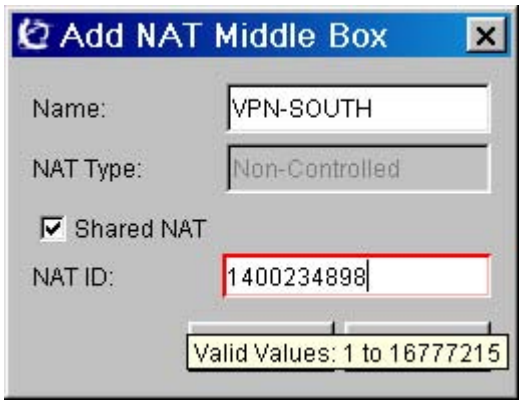


Tool tips are displayed when the cursor is placed over each text field. If invalid values are entered, the text field with invalid data is outlined in red and the OK button is disabled (Figure 17).

Figure 17 Add NAT Middle Box dialog with invalid entry for NAT ID



31.9.2 XML Interface command

31.9.2.1 List NAT middlebox ID

The NAT middlebox ID can be listed as part of the information returned in the queryNAT request. This is done by including the <ListNATid> tag, set to ‘true’, in the XML command. If the tag is set to ‘false’, the NAT middlebox information is listed without the middlebox ID. If this tag is omitted, the NAT middlebox information again is listed without the middlebox ID, for backwards compatibility with previous releases.The XML for this command

is shown in Figure 9, Figure 20, Figure 22. Error messages returned are described in Appendix B.

Figure 18 XML command to query specified NAT, including middlebox ID

31.9.2.2 Specify NAT middlebox ID during NAT provisioning

The middlebox ID can be specified during NAT provisioning over the XML interface by including the <NATid> tag in the addNAT command, as shown in Figure 24. Valid values must be provided for all fields. Error codes are given in Appendix B.

Figure 24 XML Command: addNAT, including middlebox id:

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
   <Command>
     <Interface>ITransIf</Interface>

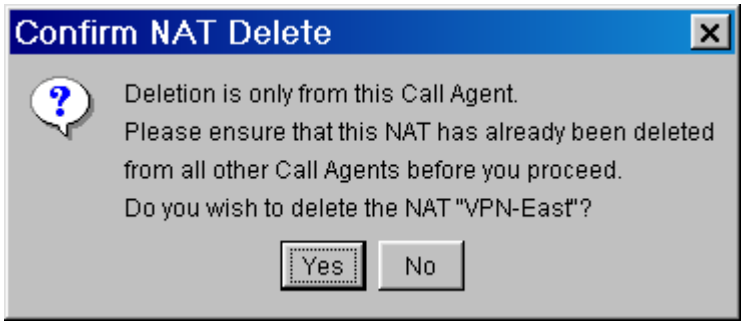
       </ReturnData>
      </addNAT>
    </Methods>
   </Response>
</CommandList>
```

31.10 NAT deletion

If the user has provisioned a NAT into multiple CS2ks, care should be taken when deleting the NAT. If the NAT middlebox ID used for the shared NAT has been automatically generated by one CS2k Mgr, the NAT should not be deleted

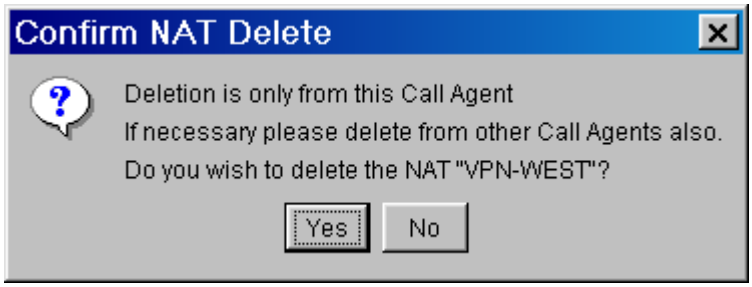
from that CS2k Mgr while it is still provisioned in other CS2ks. It must be deleted from all other CS2k Mgrs first. The GUI client displays a warning when deletion of a NAT whose middlebox id has been generated by this CS2k Mgr is requested, as shown in Figure 26.

Figure 26 Confirm NAT Delete dialog



For other NATs, a general reminder is given that the delete operation results in deletion of the NAT middlebox from this CS2k only.

Figure 27 Confirm NAT Delete dialog



31.11 Upgrade to SN07

During an upgrade to SN07, the need to upgrade the middlebox IDs of already provisioned NATs means that there is a possibility of temporary increase in usage of Media Proxies, depending on the exact network configuration. Hence if Media Proxy resources have been engineered so that this may cause problems, the period of time during which there are GWCs at different software versions should be minimised. It is suggested that one of the following sequences of operation, A or B, is used for upgrade. In steps A & B, ‘Upgrade the CS2k Mgr’ refers in particular to upgrade of the Node Provisioning and GWC EM applications.

A. Upgrade without soak test

1. Upgrade CS2k Mgr to SN07

2. Set a unique Call Agent ID. This causes the SN07 CS2k Mgr to generate new middlebox IDs for already provisioned NATs (and Pep Servers).

3. Upgrade all GWCs that will support internet transparency Media Endpoints to SN07. As part of this upgrade (in particular because of the busy/RTS/SWACT), the new middlebox IDs for already provisioned NATs will be downloaded to each GWC. During this step, GWCs with different versions of software may have different middlebox IDs for the same NAT and hence some additional Media Proxy usage may take place (depending on the exact network configuration and order in which GWCs are upgraded). Hence, if a temporary increase in Media Proxy usage is undesirable (e.g. for network engineering reasons), this step should be done within as short as possible a time window and during a low traffic period.

4. Repeat steps 1-3 for all other CS2ks in the network.

5. Intra-domain SIP-T trunks may now be configured.

B Upgrade with soak test

1. Upgrade CS2k Mgr to SN07

2. Upgrade a small number of GWCs that support internet transparency Media Endpoints to SN07 for soak test

3. Once soak test is complete, set a unique Call Agent ID. This causes the SN07 CS2k Mgr to generate new middlebox IDs for already provisioned NATs (and Pep Servers).

4. Carry out a busy/RTS/SWACT for the (SN07) GWCs that have been soak tested. This will cause the new middlebox IDs to be downloaded to boths sides of these GWCs.

5. Upgrade all other GWCs that will support internet transparency Media Endpoints to SN07. As part of this upgrade (in particular because of the busy/RTS/SWACT), the new middlebox IDs for already provisioned NATs will be downloaded to each GWC. During steps 4 & 5, GWCs with different versions of software may have different middlebox IDs for the same NAT and hence some additional Media Proxy usage may take place (depending on the exact network configuration and order in which GWCs are upgraded). Hence, if a temporary increase in Media Proxy usage is undesirable (e.g. for network engineering reasons), steps 4 & 5 should be done within as short as possible a time window and during a low traffic period.

6. Repeat steps 1-5 for all other CS2ks in the network.

7. Intra-domain SIP-T trunks may now be configured.

31.12 Authorization for Commands

The security for the GUI Client and OSSgate interface includes support for permission or ‘Authorization’ levels for commands. Each command is assoicated with one or more user groups. In order to execute a command, a user must belong to at least one of the assoicated user groups. The user groups assoicated with the new /modifed commands associated with this feature are specified in the table below.

Table 1 Internet Transparency Commands Authorization

Command	User Group				
	mgcadm	mgcrw	mgcmtc	mgcsprov	mgcro
Display Call Agent ID (queryCallAgentId)	X	X	X	X	X
Change Call Agent ID (setCallAgentId)	X	X			
Display NAT ID (queryNAT)	X	X	X	X	X
Provision NAT (addNAT)	X	X

31.15 Appendix B: Error codes and messages

Table 2 Return codes when command is unsuccessful

Cause of error	Return code	Example return messages
Platform applications internal error: OSS Interface applications cannot connect to required server application	302	Interfacing error
Unable to provision requested NAT because a database error occurred	303	Database error occurred during setting of Call Agent Id.

Cause of error	Return code	Example return messages
Unable to provision requested NAT/Call Agent Id of problem with the GWCEM component of the CS2k Mgr.	304	Element Manager Initialisation in progress
No NAT data for this query. e.g. no NAT meets selection criteria or the NAT/GWC specified does not exist	305	NAT not found No NAT found for GWC
User is not a member of any of the user groups allowed to perform this action	501	Insufficient permissions to perform this operation

31.15.1 Example Error Message

```
<?xml version='1.0'?>
    <CommandList>
       <Response>
         <Interface>ITransIf</Interface>
           <Methods>
              <queryNAT usn="1.0" version="1.0">
               <ReturnData>
                  <NATname>nat1111</NATname>
                   <ReturnCode value= "305" text="NAT not found"/>
               </ReturnData>
              </queryNAT usn="1.0">
           </Methods>
       </Response>
    </CommandList>
```

31.16 Appendix C: XML Commands: description of method parameters

31.16.1 Parameter definitions

- **encoding??**
- **version** - The version refers to the version of the method or operation - e.g., the addNAT operation may have version 1.0 and 2.0, where version 1.0 takes parameters X and Y and version 2.0 takes parms X, Y, and Z. TYPE *decimal*.
- **usn** - Unique Sequence Number. This parameter is introduced to facilitate sending multiple XML commands in one file. This parameter value will be used to match the responses with the requests. TYPE *integer*.

- **ReturnCode value**- A numeric value indicating the result of the attempted operation (see Table 3, for range and definitions of each possible value). TYPE *string*.
- **Return code text**- Appropriate text that describes the result of the operation. TYPE *string*.
- **CallAgentId** - The unique integer that has been assigned by the user ot this Call Agent (e.g. this CS2k). This must be a value between 1 and 255. TYPE *integer.*
- **ListNATid** - Indication of whether the NAT id should be included in the response to this command. Set to 'true' if the NATid is required and 'false' if not. TYPE *NoSpaceNameType*.
- **NATname** - The name of the NAT that this command applies to. TYPE *NoSpaceNameType* .(32 character token without spaces, see xsd definitions in Appendix A, section 25.12)
- **NATid** - The unique middlebox id for this NAT. This must be an integer between 2 and 16777215. TYPE *integer.*
- **NATType** - Indicates the type of NAT, in particular, NATType = 1 indicates an uncontrolled NAT. No other values are used in this release. TYPE *string*.
- **GWCname** - The name of the GWC that this command applies to. TYPE *GWCNameType* (string of form GWC-xxxx, see xsd definitions in Appendix A, section 25.12)

31.16.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **queryCallAgentId** - Method that gets the current value of the Call Agent Id for this Call Agent (CS2k). This method has the following parameters:

- Input data:
  - usn
  - version
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - CallAgentId **-** The value of the Call Agent Id for this Call Agent (CS2k).
  - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

2. **setCallAgentId** - Method that sets to Call Agent Id for this Call Agent (CS2k) to the specified value. This method has the following parameters:

- Input data:

– usn

– version

– CallAgentId - The desired value for the Call Agent Id for this Call Agent (CS2k).

- Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

3. **queryNAT** - Method that gets the information regarding a NAT or set of NATs, depending on the parameters specified. If neither a NATname nor a GWCname is included, then information is returned for ALL NATs provisioned in this CS2k Mgr. This method has the following parameters:

- Input data:

– usn

– version

– NATname (optional, cannot be included as well as GWCname) - indicates the NAT for which information should be returned

– GWCname (optional, cannot be included as well as NATname) - returns information for all NATs associated with this GWC

– ListNATid (optional) - if set to true, this returns the NAT id as part information for each NAT, if set to false or if the parameter is omitted the NAT id is not returned.

- Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– NATname

– NATType (returned only when the NATname is specified)

– NATid (returned only when ListNATid is set to ‘true’ in the input data)

4. **addNAT** - Method that provsion a NAT into the CS2k Mgr. This method has the following parameters: If the NAT id is not specified then the CS2k Mgr generates a NAT middlebox id for the NAT.

- Input data:
  - usn
  - version
  - NATname - unique name for the NAT to be provisioned
  - NATid (optional) - indicates the middlebox id that should be allocated to this NAT.
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode

32: Functional Description (FN): A00002654

32.1 Feature name

CEPT AR (CLASS CALLBACK)

32.2 Description

The CEPT telephony service Call Back to Last Received Call enables a subscriber to inquire into the number of network origin of the last received call that was not answered, as well as the date and time in which the call took place, and to allow the subscriber to call back that number by pressing a single digit without the need to go on-hook.

This CEPT service is closely allied to the existing Automatic Recall (AR) service currently implemented in the MMP with the only major differences being that the CEPT service has a slightly different user interface and billing requirements. Thus, the CEPT Call Back to Last Received Call service will be assignable to subscribers as the current AR feature with modifications becoming active when the CEPT option is also provisioned on the line.

The first application of this feature will be for the Spanish market (Telefonica).

A summary of the modifications to the existing AR feature are as follows:

- Call processing - Current AR design only consists of invoking the feature using an access code. This activity will add the CEPT-defined capabilities of activation, deactivation, interrogation, and erasure to the AR feature. These capabilities will only apply to IBN lines with the CEPT line option.
- CEPT AR User Interface - Current AR design uses a telco-defined access code to enable the subscriber to invoke the feature. This activity will enable the subscriber to perform the following CEPT-defined capabilities for AR by using CEPT-defined dialing sequences: activation, deactivation, interrogation, invocation, erasure, and security key change.
- Security Key - Current AR design does not use a security key (i.e. PIN). This activity will add security key capabilities to the AR feature including the ability for both the subscriber and the telco to change the security key. These capabilities will only apply to IBN lines with the CEPT line option.
- Billing - Current AR design has an option to produce AMA billing records for feature use. However, the design uses the North American-defined Bellcore format. This activity will implement the ability for all

CEPT services to produce NAOC-defined billing records and NAOC meter counts for the following CEPT-defined capabilities: activation, deactivation, interrogation, invocation, erasure, and security key change.

32.2.1 CEPT AR Feature Controls

This activity introduces 4 new feature controls in addition to the existing ability to invoke the feature. They are activation, deactivation, interrrogation, and erasure. This activity also introduces a new dialing sequence for invoking the feature following the CEPT specification. NOTE: This new method not replace the existing method for invoking the feature, but will be used when the subscriber is a CEPT line.

With this activity, AR will no longer be activated once provisioned for CEPT lines. The subscriber will need to dial the CEPT-defined activation sequence to make the feature active. Once active, the subscriber may then invoke the feature. To prevent others from invoking the feature and thus incurring charges, the AR feature can be deactivated by dialing the CEPT-defined deactivation sequence. Activation and deactivation require the use of a PIN (Personal Identification Number) in order for the state of the feature to change.

For describing the dialing sequences of these feature contols, the following symbols will be used:

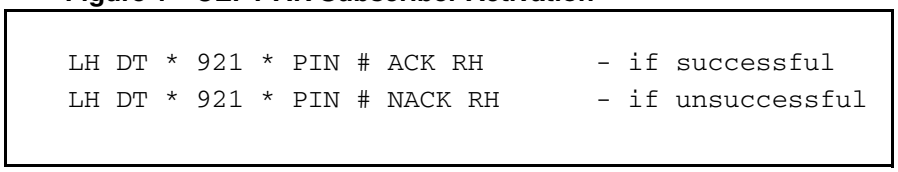
- LH - lift handset
- DT - receive dialtone
- PIN - Personal Identification Number (i.e. password, security key)
- ACK - a positve acknowledgement announcement or tone
- NACK - a negative acknowledement announcement or tone
- RH - replace handset

The ACK/NACK tone is used only if announcement resources are not available. Incomplete activation sequences will result in NACK treatment. (However, an implied octothorpe will be assumed upon digit time-out.).

32.2.1.1 Activation

The subscriber will have the ability to activate CEPT AR by using a special dialling sequence. To activate the CEPT AR feature, the subscriber must execute the sequence depicted in Figure 1.

Figure 1 CEPT AR Subscriber Activation

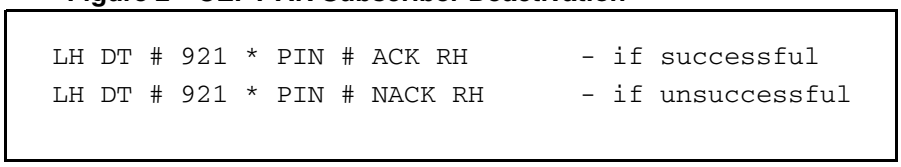


The CEPT AR becomes active immediately after execution of this sequence.

32.2.1.2 Deactivation

The subscriber will have the ability to deactivate CEPT AR by using a special dialling sequence. To deactivate the AR feature, the subscriber must execute the sequence depicted in Figure 2.

Figure 2 CEPT AR Subscriber Deactivation

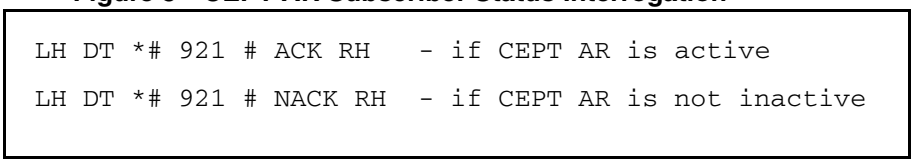


The CEPT AR is deactivated immediately after the execution of this sequence.

32.2.1.3 Interrogation

The subscriber will have the ability to interrogate (i.e. check) the status of the AR feature by using a special dialing sequence. To interrogate the status of the AR feature, the subscriber must execute the sequence depicted in Figure 3.

Figure 3 CEPT AR Subscriber Status Interrogation



32.2.1.4 Erasure

The AR feature stores information about the last incoming call into a register called the Incoming Call Memory Block (ICMB). The subscriber will have the ability to erase the information in the ICMB of the AR feature by using a special dialing sequence. To erase the information in the ICMB, the subscriber must execute the sequence depicted in Figure 4.

Figure 4 CEPT AR Erasure

```
LH DT # 92 # ACK RH   - if erasure is successful
LH DT # 92 # NACK RH  - if erasure is unsuccessful
```

32.2.1.5 Invocation

The subscriber will have the ability to invoke the CEPT AR feature by using a special dialing sequence. To invoke the CEPT AR feature, the subscriber must execute the sequence depicted in Figure 5.

Figure 5 CEPT AR Invocation

```
LH DT *92 # Feature Announcement - if invocation is successful
LH DT *92 # NACK RH              - if invocation is unsuccessful
```

32.2.1.6 Error situations when using AR Feature contols

The subscriber will receive re-order tone and a FTR138 log showing FNAL treatment when dialing an AR feature control sequence in the following situations:

— CEPT and AR options are not assigned on the line.

— Improper feature control is datafilled in table xxCODE for CEPT AR.

32.2.2 CEPT AR Translations

The CEPT AR feature controls must be datafilled using a feature translator in Universal Translations in any XLA xxCODE table, such as, ACCODE or PXCODE. There are five tuples which translations will need datafilled, they are (example Travers are provided in section “32.10 Appendix A - Translation Examples”):

- Activation & PIN change

  These will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function ACT. An example tuple in a xxCODE table would look like:

  ```
  AMBISTAR 921 921 FEAT ( FTR AR) ( PF 4) ( MM 3 15) (FUNC ACT)$
  ```

- Deactivation

This will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function DEACT. An example tuple in a xxCODE table would look like:

```
AMBIOCT 921 921 FEAT ( FTR AR) ( PF 4) ( MM 3 15) (FUNC DEACT)$
```

- Interrogation

  This will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function INTER. An example tuple in a xxCODE table would look like:

```
STARCEPT C921 C921 FEAT ( FTR AR) ( PF 5) ( MM 4 15) (FUNC INTER)$
```

- Erasure

  This will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function DELETE. An example tuple in a xxCODE table would look like:

```
OCT92XL 2 EQ FEAT ( FTR AR) ( PF 3) ( MM 2 15) (FUNC DELETE)$
```

- Invocation

  This will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function USAGE. An example tuple in a xxCODE table would look like:

```
STAR92XL 2 EQ FEAT ( FTR AR) ( PF 3) ( MM 2 15) (FUNC USAGE)$
```

32.2.3 Security Code (PIN) Assignment for Feature Act/Deactivation

The SEC (Security Code) option allows a common PIN to be assigned to specified services on that line. If a feature on a line is added to the SEC feature list, it becomes PIN protected. If a feature on a line is not in the SEC feature list, then it is not PIN-protected. Thus, there can be multiple features on a line, some PIN-protected and some not PIN-protected. Thus, a feature like CEPT AR which requires a PIN can co-exist on a line with a feature like CEPT ACRJ for which the PIN is optional (i.e. AR would be in the SEC feature list and ACRJ would not be.).

If none of the features on a line need PIN-protection, then, of course, the SEC option would not be added at all to the line. Thus if CEPT ACRJ is on a line with no other options and does not need to be PIN-protected, the SEC option need not be provisioned on that line.

32.2.3.1 CEPT AR PIN Assignment

As mentioned previously, PIN protection is required for the CEPT AR service. To associate PIN protection to the AR service, the craftsperson must use SERVORD to add the SEC option to the line provisioned with CEPT AR.

For example, if LEN 0 1 10 5 already has the CEPT AR option, then the following SERVORD sequence shown in Figure 6 should be used to add the SEC option. Figure 7 and Figure 8, respectively, show the resulting QLEN and IBNFEAT tuple.

Figure 6 Example of adding a PIN to CEPT AR using the SEC option

```
SO:
>ado
SONUMBER:    NOW   3  6 16 PM
>
DN_OR_LEN:
>0 1 10 5
OPTION:
>sec
FEATURES:
>ar <---------- The feature to which the SEC PIN applies
FEATURES:
>$
SEC_CODE:
>0000 <-------- The default PIN set by the TELCO (1 to 7 digits)
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 6 16 PM HOST 00 1 10 05 ( SEC ( AR) $ 0000 ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
```

Figure 7 Sample QLEN of CEPT AR and SEC

```
>qlen 0 1 10 5

----------------------------------------------------------------------------------------------

LEN:     HOST  00 1 10 05

TYPE: SINGLE PARTY LINE

SNPA: 613

DIRECTORY NUMBER:     6212064

LINE CLASS CODE:  IBN

IBN TYPE: STATION

CUSTGRP:         IBNTST     SUBGRP: 0  NCOS: 0

SIGNALLING TYPE:  DIGITONE

CARDCODE:  6X17AA    GND: N  PADGRP: STDLN  BNV: NL MNO: N

PM NODE NUMBER     :    204

PM TERMINAL NUMBER :    326

OPTIONS:

CEPT AR NOAMA DGT SEC AR 0000

OFFICE OPTIONS:

AIN TIID

----------------------------------------------------------------------------------------------
```

Figure 8 Sample IBNFEAT tuple with SEC

```
TABLE: IBNFEAT

>format pack

>pos 0 1 10 5 0 sec

HOST 00 1 10 05 0 SEC SEC (AR) $ 0000
```

The reader should note the following regarding the PIN:

- The PIN specified with the SEC option applies to all features in the SEC feature list that are on that line. Thus, for example, if CEPT AR and CEPT ACRJ were both on the above LEN 0 1 10 5 and both features were included in the SEC feature list, both would share the same PIN of 0000.

- The PIN will be visible in Table IBNFEAT and also in the QLEN.
- The PIN length can range from 1 to 7 digits.

32.2.4 Security Code (PIN) Modification for Feature Act/Deactivation

To modify the shared PIN, the service subscriber should dial their designated PIN activation sequence. For example, the CEPT AR subscriber would change their CEPT AR PIN by dialling the following sequence:

* 921 * Current PIN * New PIN #

The CEPT ACRJ subscriber would change their CEPT ACRJ PIN by dialling the following sequence:

* 934 * Current PIN * New PIN #

After the service subscriber dials the '#' (octothorpe) terminating their particular PIN modification sequence (or if the user indicates digit termination by allowing the interdigit timer to expire after the last digit entered), (s)he will be guided by pre-recorded announcements to reenter the new PIN. Figure 9 illustrates the possible announcement sequences that could occur during a PIN change operation. The announcements will only start after the '#' has been entered and if there was successful validation of the *current* PIN.

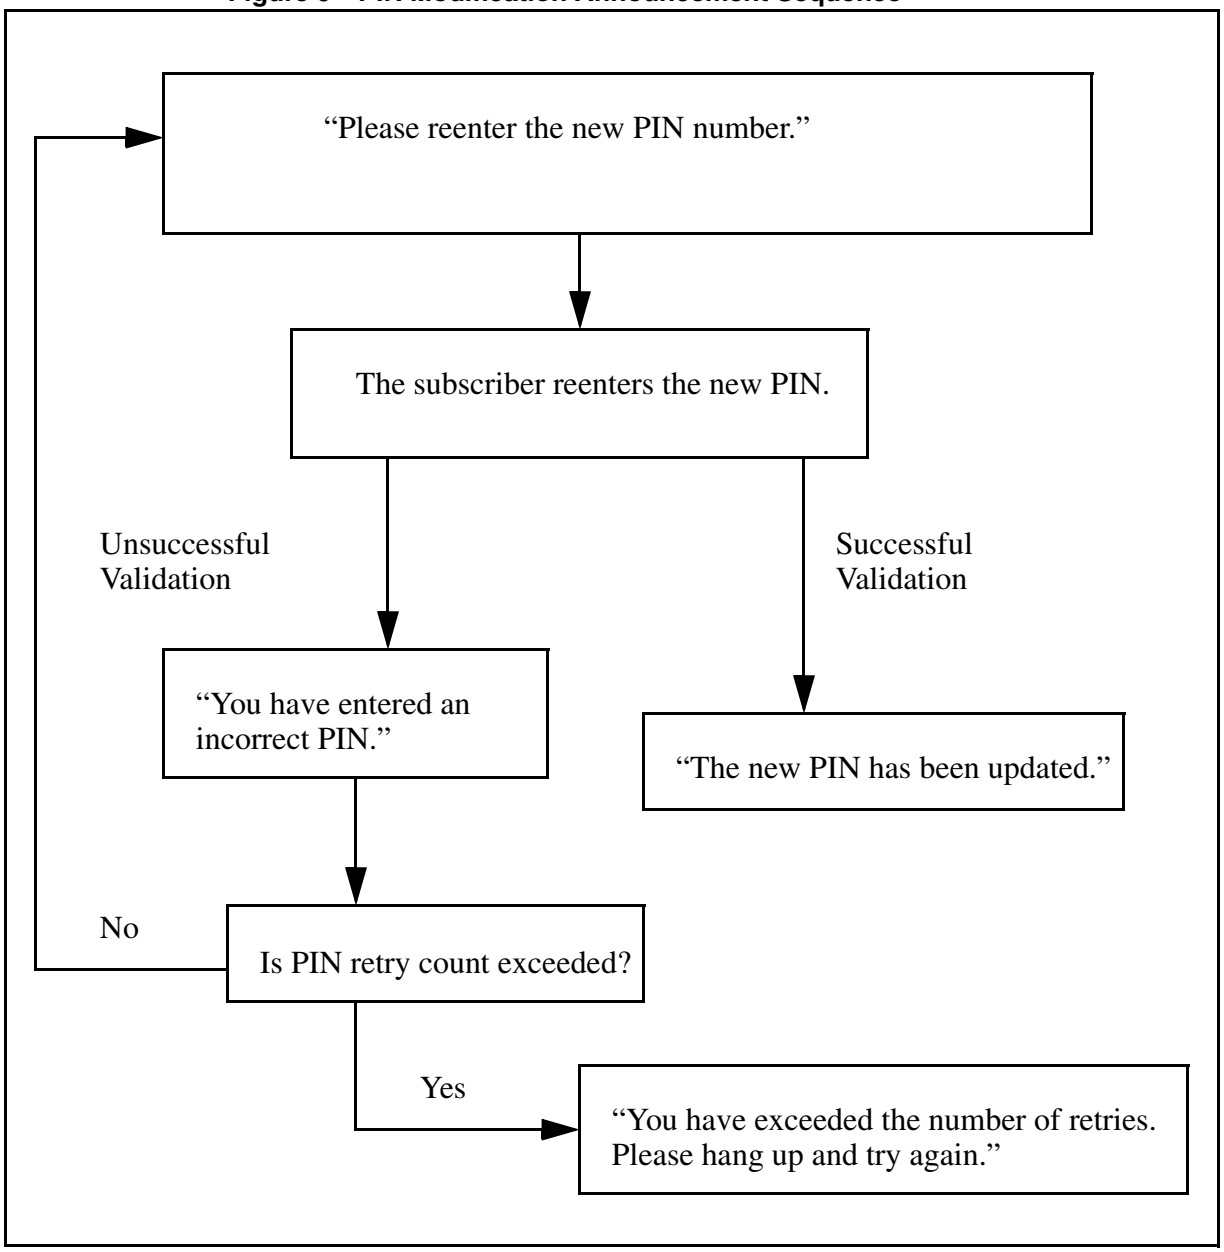
Successful validation of the *current* PIN implies that the entered current PIN matches the stored PIN.

Successful validation of the *new* PIN implies that the entered new PIN was the correct length (1 to 7 digits) and that it was different than the stored PIN.

Upon successful validation of the new PIN, note that the new PIN will be shared by ALL features on the line which are in the SEC feature list.

Note that the PIN can only be changed from the subscriber's phone. Also note that the subscriber will NOT be required to change their PIN from the default PIN upon first usage of the AR or ACRJ feature.

Figure 9 PIN Modification Announcement Sequence



To enable the PIN change capability, the customer group SPP (Station Programmable PIN) option must be datafilled in Table CUSTSTN. It is in this CUSTSTN tuple that the PIN retry count is set as well. The range for the PIN retry count is 1 to 3. See Figure 10 below for an example of an SPP CUSTSTN tuple.

Figure 10 Sample SPP Datafill

```
TABLE: CUSTSTN

IBNTST SPP SPP 3
```

SPP announcements also need to be configured. Refer to NTP 297-8001-350 "Call Forwarding Remote Activation" (CFRA) for more information about SPP as SPP was created as part of the CFRA feature. However, the reader should note that the SPP feature will be invoked automatically in the case of CEPT AR and ACRJ, and not explicitly by the subscriber as stated for CFRA.

32.2.5 NAOC Billing and Metering for CEPT Services

Currently, CEPT services only peg meter counts and produce billing records if World Metering is used. This activity in coordination with feature A00002638: PCA SW Metering Support for Billing **[1]** enhances CEPT services to peg meter counts and produce billing records based on a new table called NAOCFEAT and PCA Software Metering.

This activity introduces a new table, table NAOCFEAT, to be used to determine which feature controls for each CEPT feature will be metered and billed on a per Carrier/Carrier Reseller basis. The table also enables the telco to define what the charges will be for each feature control entered and to define a feature code to be used in the billing record for each feature on a per Carrier/Carrier Reseller basis. Refer to the CN section of this document for a complete description of this new table.

Please refer to the FN and CN sections of feature A00002638 **[1]** for examples and more details on the NAOC meter counts and billing records for CEPT Basic Call.

The NAOC feature billing will be recorded in an AMA record using the new module 612 extension as defined in A00002638 **[1]**. The information contained in the new AMA module is shown in Table 1, "Module 612 extension used for NAOC feature billing," on page 799.

Table 1 Module 612 extension used for NAOC feature billing

BCD Char	Length	Meaning
1 - 3	3	**Rating Class at the beginning of the Call** If the billing record is generated by basic call this field will contain the tariff index used for this call from Table TARFDATA, bound by an upper limit of 511 for the Spanish market. If the billing record is generated by a feature action this field will always be set to the value of “511”.
4 - 11	8	**Used Meter** The total number of meter pulses **used** for this call or feature action.
12 - 15	4	**Initial meter value MS** The 4 most significant digits of the initial meter pulse value.
16 - 19	4	**Initial meter value LS** The 4 least significant digits of the initial meter pulse value.
20 - 27	8	**Final Meter value** The final meter pulse value, i.e., initial value + used value.
28 - 29	2	**Call Type** This field describes if this is a **basic call** or a **feature action**. If the billing record is generated by basic call this field will be equal to “00”. If the billing record is generated by a feature action this field will be equal to a value based on the particular feature, i.e., the featcode, as it is provisioned in table NAOCFEAT (per the carrier/reseller).
30	1	**Feature Action** This field describes the type of feature action If the billing record is generated by basic call this field will be equal to “2”. If the billing record is generated by a feature action this field will be equal to one of 10 values based on the type of action as shown in Table 2, “Feature Actions,” on page 801.

An example (using calldump full) of the AMA billing record is shown in Figure 11, "AMA Record with Module 612 extension".

```

Software feature metering relies on the datafill of Table NAOCFEAT. This table defines the charging per carrier/reseller, per feature, per action.

The carrier/reseller name **must** be defined in either Table CARNAME or Table RESNAME/DNSCRN (for resellers) prior to use in Table NAOCFEAT.

The CEPT features can be associated with software metering with any of the following actions defined in Table 2, “Feature Actions,” on page 801.

Table 2 Feature Actions

Action	Description	Value In Billing Record
assign	assignment	0
deassign	deassignment	1
admact	administrative activation	2
admdeact	administrative deactivation	3
admprog	administrative programming	4
subact	subscriber activation	5
subdeact	subscriber deactivation	6
subprog	subscriber programming	7
usage	usage	8
interrog	interrogation	9

If there is no entry for a particular carrier/feature/action combination, then no software metered billing will be created or used for that particular combination.

Figure 12, "Example entry in Table NAOCFEAT" contains an example of datafill in Table NAOCFEAT for carrier CAR100[1], feature AR.

Figure 12 Example entry in Table NAOCFEAT

```
CARRSNAM FEATNAME FEATCODE ACTIONS
-----------------------------------------------------------------
CAR100   AR       55       (USAGE 7) (ASSIGN 10) (DEASSIGN 10) $
```

To determine what the **used meter** value will be in module 612 for a particular feature action you will need to consider the following: **The provisioned unit value for each action in Table NAOCFEAT is 1/10 of a monetary unit, i.e., 0.10.** Therefore, if 1 metering pulse is equal to 0.06 monetary units per pulse then (based on the example in Figure 12):

- **usage** in meter pulses = `((0.1*7) / 0.06)= 11.67`

To determine what **call type** will appear in the module 612 (for AR usage), it's simply the feature code as provisioned in table NAOCFEAT, i.e., 55. The **feature action** field will be equal to the value 8 (see Table 2, "Feature Actions," on page 801 for details). Thus the module 612 would look like the example shown in Figure 13, "Module 612, for AR usage".

[1]As datafilled in Table CARNAME prior to being used in Table NAOCFEAT.

Figure 13 Module 612, for AR usage

```

MODULE CODE:                          000C       FINAL MODULE
```

NAOCFEAT billing is not supported for every feature/feature action combination, please refer to the matrix in Table 3 on page 802, to see which features support NAOCFEAT billing for which actions.

Table 3 Feature/Action Billing Matrix[a]

		Actions									
		Assign	Deassign	Admact	Admdeact	Admprog	Subact	Subdeact	Subprog	Usage	Interrog
Features	ACRJ	X	X	X	X		X	X	X		X
	AR	X	X	X	X		X	X	X	X	X
	AUL	X	X			X					
	CCBS	X	X		X		X	X		X	X
	CDND	X	X	X	X		X	X			X
	CDTA	X	X	X	X		X	X	X	X	X
	CDTO	X	X	X	X		X	X	X		X
	CFB	X	X		X		X	X	X	X	X
	CFD	X	X		X		X	X	X	X	X
	CFF	X	X		X		X	X		X	X
	CFRA	X	X		X						
	CFU	X	X		X		X	X	X	X	X
	CLF	X	X							X	
	CND	X	X	X	X		X	X	X	X	X
	CNDB	X	X						X		

Table 3 Feature/Action Billing Matrix[a]

		Actions									
		Assign	Deassign	Admact	Admdeact	Admprog	Subact	Subdeact	Subprog	Usage	Interrog
Features	CNDBO	X	X							X	
	ENQ	X	X								
	I3WC	X	X							X	
	I6WC	X	X							X	
	ICT	X	X							X	
	ICWT	X	X	X	X		X	X			X
	ILR	X	X	X	X		X	X			X
	IWUC	X	X		X		X	X	X	X	X
	LNR	X	X		X						
	RR									X	
	SCL[b]	X	X		X	X		X	X	X	X
	SCS	X	X					X	X	X	X
	SUPPRESS	X	X	X	X		X	X		X	X
	WML	X	X	X	X	X	X	X	X	X	X

a. “X” denotes a supported action. An empty block denotes an unsupported action.

b. Billing of ‘admprog’ for SCL pertains to the ability to change the size of the speed call list, not the contents of the list.

32.3 Hardware Requirements or Dependencies

none

32.4 Software Requirements or Dependencies

SN07 or ISN06 Activatable Patch for Telefonica

The NAOC feature billing portion of this feature requires the following feature to be activated by SOC:

- NSUP0023 - PCA SW Metering Support for Billing

  This requires the following SOC features:

  — NETK0019 - Network AOC

— NETK0024 - Network AOC Tariff

— NETK0028 - CGP Network AOC

— NSUP0017 - Payment Ceiling

— NSUP0020 - NAOC/PCA Supp Svcs

+++ TRAVER: SUCCESSFUL CALL TRACE +++

CALL ROUTES TO FEATURE PROCESSING ENVIRONMENT

+++ TRAVER: SUCCESSFUL CALL TRACE +++
```

33: Functional description (FN): A00002655

33.1 Feature name

CEPT ACRJ (Rejection of Unidentified Calls)

33.2 Description

33.2.1 Background Information

ACRJ is an administration assigned feature, but the subscriber as well as administration has the ability of activating, deactivating, and interrogating the status of the feature. When activated, this service causes the switch to reject incoming calls to the line when the call is anonymous, i.e. when the calling name or number is not presented/presentable to the user. The calling party receives an announcement that the call is being rejected because it is anonymous.

33.2.2 CEPT ACRJ Feature Provisioning

CEPT ACRJ is essentially MMP ACRJ with the CEPT interface, PIN protection optionality, and CEPT billing. Accordingly, the feature is provisioned the same as MMP ACRJ except that the CEPT option is added to the line to give the service its CEPT character. In order to add CEPT to the line, CEPT must first be added to the applicable customer group in table CUSTSTN. CEPT ACRJ is available only for IBN lines.

Provisioning changes on the subscriber option can only be done via SO. For CEPT ACRJ both CEPT and ACRJ options should be assigned to the subscriber. There is no limitation or restriction to use together CEPT and ACRJ line options. Whenever CEPT line option is removed from the line ACRJ feature behaves as basic MMP feature instead of CEPT variant and so no CEPT subscriber interface and no CEPT billing will be available. Please refer to FN section of 59019274 CEPT Subscriber Control Functions Framework for CEPT line option.

Figure 1 Sample Feature Provisioning for CEPT ACRJ

ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
```

33.2.3 CEPT Feature Control - Activation//Deactivation/Interrrogation

For describing activation, deactivation, and interrrogation (also known as status verification) sequences, it is useful to define several symbols:

- LH - lift handset
- DT - receive dialtone
- FC - the CEPT feature action code for ACRJ, specified as 934 by the CEPT specification.
- ACK - a positve acknowledgement announcement or tone
- NACK - a negative acknowledement announcement or tone
- RH - replace handset

The ACK/NACK tone is always used for interrogation. For activation/ deactivation, an ACRJ specific announcement exists and the tone is used only if announcement resources are not available. Incomplete activation sequences will result in NACK treatment. (However, an implied octothorpe will be assumed upon digit time-out.)

33.2.3.1 Activation

To activate the CEPT ACRJ feature, the subscriber must execute the sequence depicted in Figure 2.

Figure 2 CEPT ACRJ Subscriber Activation

```
LH DT * FC # ACK RH        - if successful
LH DT * FC # NACK RH       - if unsuccessful
```

The CEPT ACRJ becomes active immediately after execution of this sequence. The entry of a valid activation sequence when the feature is already active is treated as a success.

33.2.3.2 Deactivation

Subscriber has the ability to deactivate CEPT ACRJ by using special dialling sequence. To deactivate the ACRJ feature, the subscriber must execute the sequence depicted in Figure 3.

Figure 3 CEPT ACRJ Subscriber Deactivation

```
LH DT # FC # ACK RH        - if successful
LH DT # FC # NACK RH       - if unsuccessful
```

The CEPT ACRJ is deactivated immediately after the execution of this sequence. THe enty of a valid deactivation sequence when the feature is already deactivated is treated as a success.

33.2.3.3 Interrogation

Subscriber has the capability of interrogating the status of ACRJ by using special dialing sequence. To interrogate the status of ACRJ feature, subscriber must execute the sequence depicted in Figure 4.

Figure 4 CEPT ACRJ Subscriber Status Interrogation

```
LH DT *# FC # ACK RH   - if CEPT ACRJ is active
LH DT *# FC # NACK RH  - if CEPT ACRJ is inactive
```

Subscriber gets re-order tone and a FTR138 log with FNAL is generated for the following cases

— CEPT and ACRJ options are not assigned on the line.

— Improper feature action is datafilled in table ACCODE for CEPT ACRJ.

33.2.4 CEPT ACRJ Translations

The CEPT ACRJ feature must be invoked by a feature translator in Universal Translations in any XLA xxCODE table, such as, ACCODE or PXCODE. There are three tuples which translations will need datafilled, they are:

- Activation

  These will be handled by the existing xxCODE feature selector using the option feature ACRJ (new FTR) and existing option function ACT. An example tuple in a xxCODE table would look like:

```
starcept 934 934 FEAT (FTR ACRJ) (PF 4) (MM 3 15) (FUNC ACT) $
```

- Deactivation

  This will be handled by the existing xxCODE feature selector using the option feature ACRJ (new FTR) and existing option function DEACT. An example tuple in a xxCODE table would look like:

```
octcept 934 934 FEAT (FTR ACRJ) (PF 4) (MM 3 15) (FUNC DEACT) $
```

- Interrogation

  This will be handled by the existing xxCODE feature selector using the option feature ACRJ (new FTR) and existing option function INTER. An example tuple in a xxCODE table would look like:

```
starcept C934 C934 FEAT (FTR ACRJ) (PF 5) (MM 4 15) (FUNC INTER) $
```

33.2.5 PIN Protection Optionality

PIN protection is optionally available to users of CEPT ACRJ. PIN protectection is enabled via provisioning the SEC feature on the line -see AR FN for more information. If PIN protection is enabled for a line with ACRJ assigned, the activation and deactivation sequences are changed as follows (“PIN” represents the 4 digit PIN number).

Figure 5 CEPT ACRJ sequences with PIN Protection

Activation

```
LH DT * FC * PIN # ACK RH       - if successful
LH DT * FC * PIN # NACK RH      - if unsuccessful
```

Deactivation

```
LH DT # FC * PIN # ACK RH       - if successful
LH DT # FC * PIN # NACK RH      - if unsuccessful
```

PIN Modification

```
LH DT * FC * PIN * PIN # <voice prompting> RH
```

Details of the PIN protection option including its provisioning, impact on QLEN and QDN displays, and behavior during PIN modification are given in the PIN Protection Optionality section of the AR DSUM (A00002654). The material for AR applies in a straight-forward manner to the ACRJ feature as well.

33.2.6 Accounting/Billing

Billing records/meter pulses are generated for activation, deactivation, and interrogation. The FN for A00002654 documents the behavior of billing for both CEPT AR and CEPT ACRJ.

33.3 Hardware Requirements or Dependencies

N/A

33.4 Software Requirements or Dependencies

N/A

33.5 Limitations and restrictions

- This feature is only applicable on IBN lines with the CEPT option.
- If calling line information is unavailable (e.g. a trunk involved in the call does not propagate this information) then the call to the terminator will not be blocked due to action of this feature. An alternative mode of behavior - blocking all calls lacking calling line information (and called “Mode A” by CEPT specifications for rejection of unidentified calls) - is not supported.

33.6 Interactions

Same as MMP ACRJ

33.7 Applicable customer facing sections

Note: The Configuration and Accounting sections of A00002654 include information applicable to both the CEPT AR feature and this feature.

AF2879 CLASS: Anonymous Caller Rejection, OLDOC3

A59019274 CEPT Subscriber Control Functions Framework, FMDOC

33: Functional Description (FN): A00002678

33.1 Feature name

Telefonica IN Enhancements

33.2 Description

33.2.1 Overview

This activity enhances the IN platform to meet Telefonica requirements. Some of the components are only relevant to Telefonica, others are more generic and would be available for use in other CS1-R networks. The following enhancements are provided:

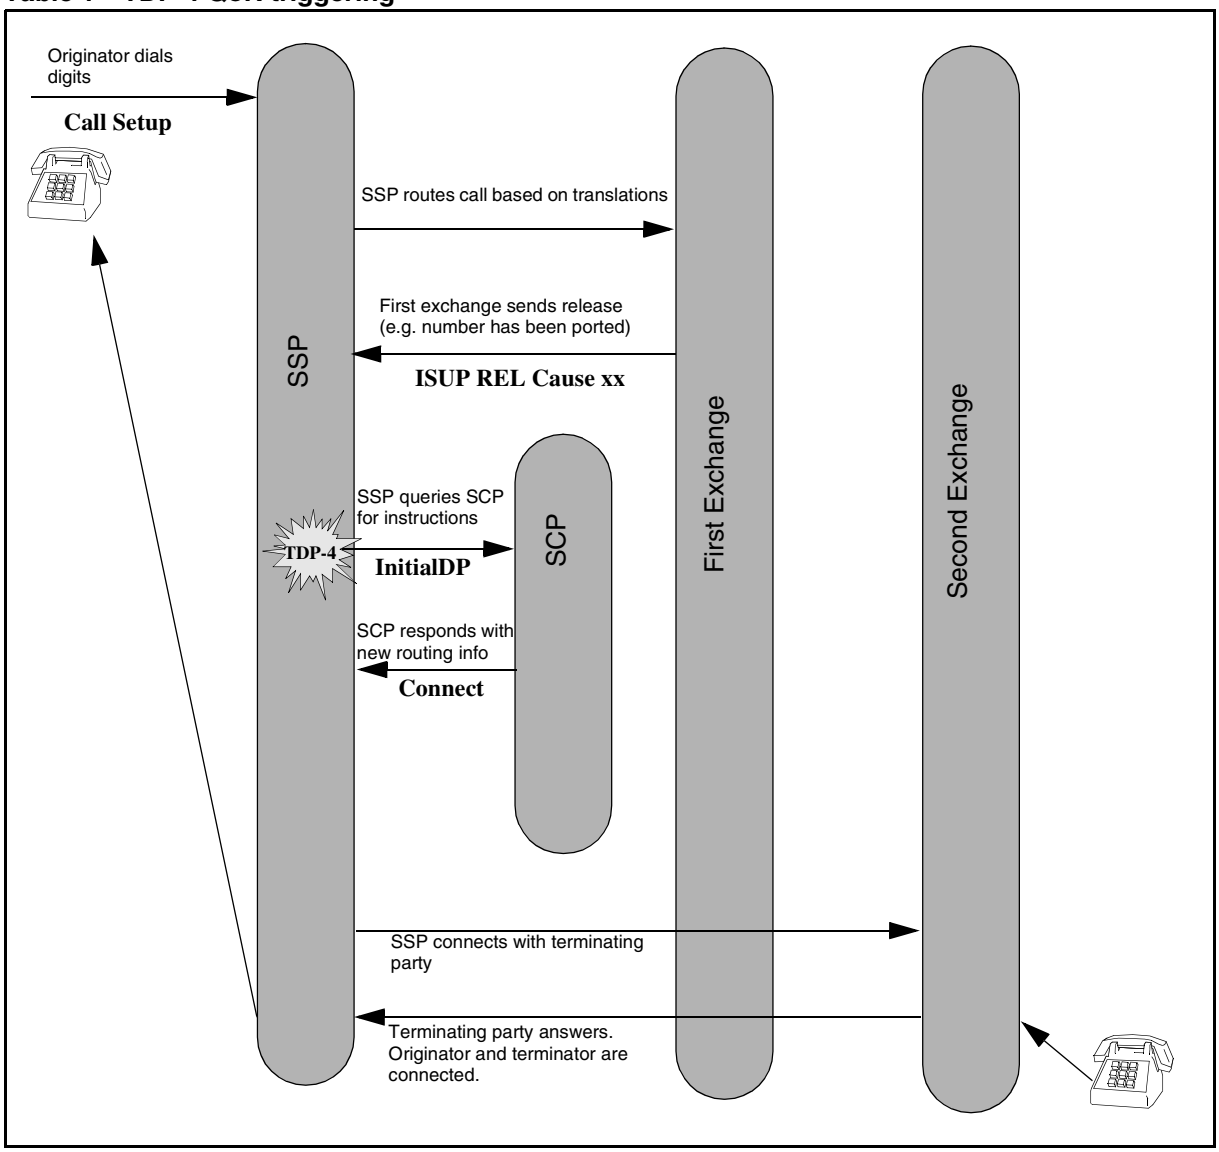
- TDP4 QoR triggering
- CPC Criteria triggering
- FCI handling
- ASF Enhancements
- Overdecadic digits in the CLI parm of the Connect message

For an overview of other IN functionality please refer to [1].

33.2.2 TDP4 Query on Release (QoR) Triggering

TDP4 occurs when a release indication is received from the network or internally within the switch. The feature partially implements TDP4, it only allows IN to be trigger on receipt of an ISUP REL message (from ETSI ISUP and national variants). It does not support releases from other trunk type, nor internal failures to route.

Table 1 TDP-4 QoR triggering



33.2.2.1 Configuration

The criteria for triggering TDP-4 is based on the cause value received in the ISUP message. The release cause value required to trigger TDP-4 is specified in a new criteria type CAUSE in table TRIGGRP. The CAUSE criteria can only be datafilled against NETBUSY triggers. Criteria matching will not be performed on digits at TDP-4, therefore an INFONAME must be datafilled in table TRIGINFO before using the CAUSE criteria.

Figure 1 Example datafill TRIGGRP

```
 KEY
                                                                      TRIGDATA
-------------------------------------------------------------------------------
         ETSIGRP NETBUSY
(GENTRIG ( CAUSE CSE_126) $ MDCKEY1)$
```

The following CAUSE value are supported (Note unsupported values may still be datafilled however they may not trigger.)

Supported Values : 1-5, 8,9, 17-22, 27-29, 34, 38, 41-44, 46,47,50,53,55,57,58,62,63,65,69,70,79,87,88,90,91,95,97,99,102,103,110,111,126

Upto 16 CAUSE values may be specified for a particular trigger group using either the same or different infonames.

Figure 2 Example datafill TRIGGRP

```
 KEY
                                                                      TRIGDATA
-------------------------------------------------------------------------------
TDP4  NETBUSY
(GENTRIG ( CAUSE CSE_126) $ MDCKEY1)
(GENTRIG ( CAUSE CSE_125) $ MDCKEY2)
(GENTRIG ( CAUSE CSE_124) $ MDCKEY2)$
```

The criteria ASSIGNED is also valid at TDP4, in this case all calls in which the originating trunk/line is subscribed to the TDP4 group, will trigger at TDP4 when released.

In addition to the criteria matching, TDP-4 triggering can be controlled on a per switch basis via a new office parm WTIN_TDP4_ACTIVE in table OFCENG. The default value for this parm is FALSE.

A new option CAUSE[1] has been added to the INITDP_PARMS options in table SERVINFO. If this option is present the cause value used to trigger at TDP-4, will be sent to the SCP in the InitDP.

Figure 3 Example datafill SERVINFO

```
SERVIDX                                                                OPTION
-------------------------------------------------------------------------------

4441    (INITDP_PARMS ( SERVKEY) (CDPA) (CPC) (EVENT_TYPE) (CAUSE) $)
           (DIGIT_COLLECTION_INFO ( FULL_CDPA ) $)
           (EDPS_INFO ( EXPLICIT ) $) (CS1R (CONTINUE) (CWA) $)$
```

[1]The CAUSE option is available from SN07 onwards

33.2.2.2 TRAVER support

The TRAVER tool can be used to verify TDP-4 functionality. If a TDP4 trigger is detected the user is prompted to input a cause value, this is then checked against the datafilled criteria.

Figure 4 Example TRAVER using CAUSE triggering at TDP-4

33.2.2.3 TDP-4 Usage example: Local Number Portability

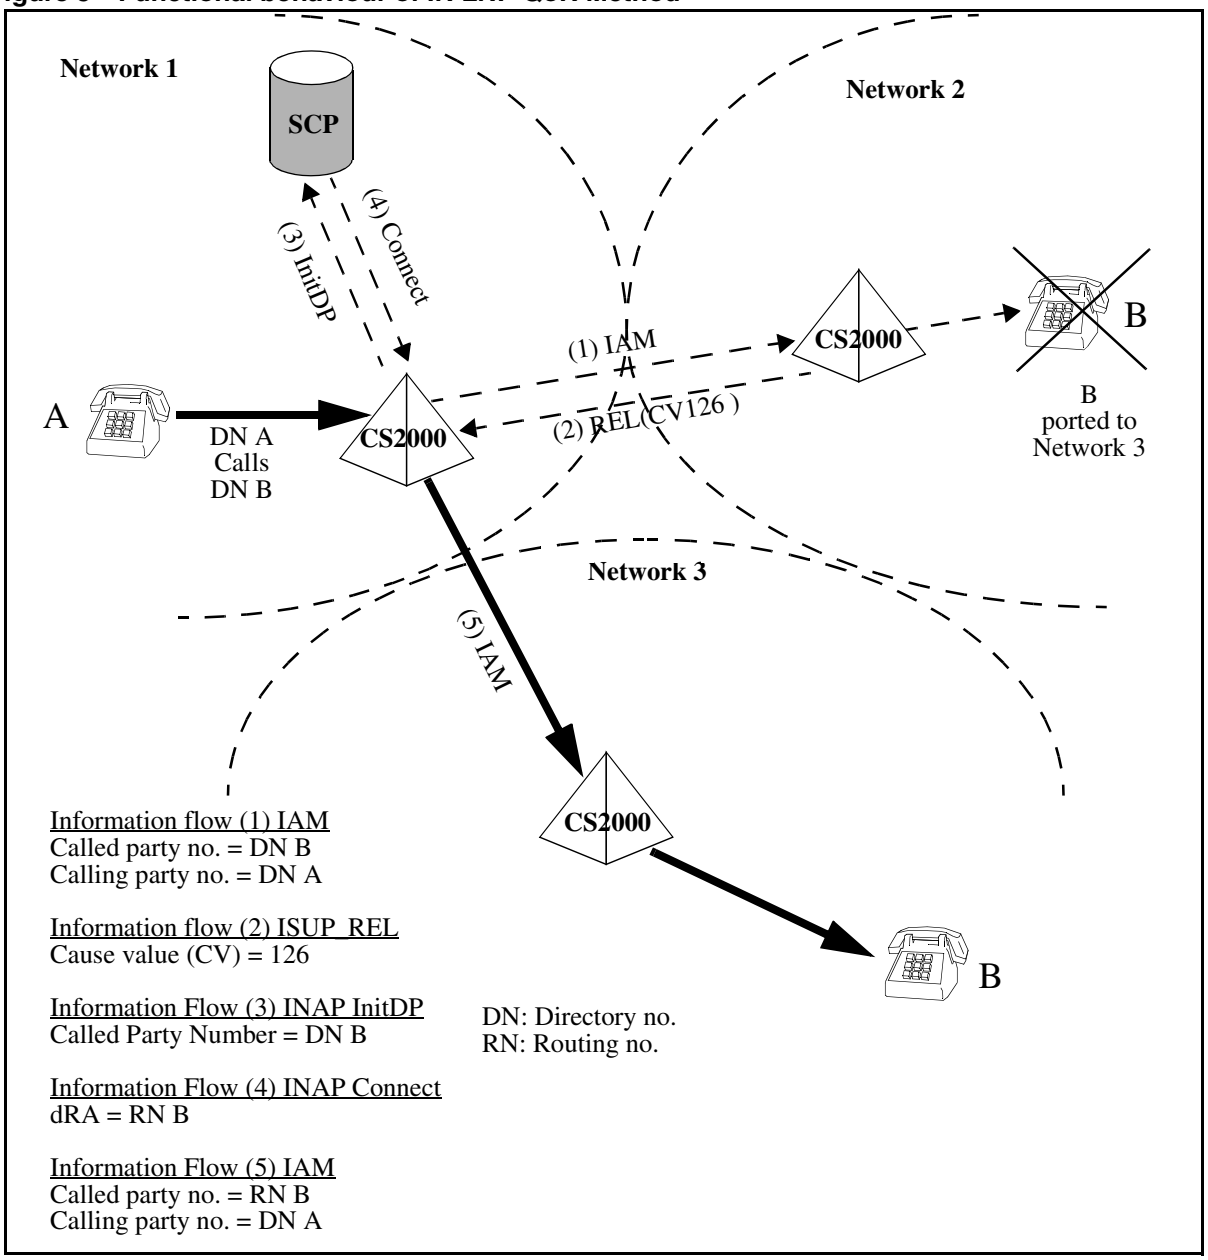
TDP-4 QoR functionality can be used for a variety of services, this example demonstrates an LNP service using TDP-4 triggering.

Local Number Portability (LNP) enables customers to switch from one service provider to another service provider in the same geographical location, without having to change their telephone number.

This feature supports the IN based Local Number Portability by the Query on Release (QoR) method. QoR allows a call to be routed over Spanish ISUP trunks to the donor exchange. If the called directory number is ported, the donor exchange will release the call by sending REL 126 (QoR: NUMBER PORTED) to the QoR serving exchange. The QoR serving exchange (the originating, or in some case an intermediate exchange) upon receiving REL 126 will trigger the IN service and a query will be sent to the SCP. The SCP will reply with the new routing number and the QoR serving exchange will route the call to the recipient exchange based on the new routing number provided by the SCP.

For more information on non-IN LNP please refer to [4].

Figure 5 Functional behaviour of IN LNP QoR Method



33.2.2.3.1 Configuring the CS2K for IN based QoR LNP

The following steps are required to configure the CS2K for IN based QoR LNP

1 Configure trunks to support QoR:

QoR Release sending and receiving is controlled by the LNP option in table ISUPSVC. For more information about the LNP option in table ISUPSVC see [4]. All outgoing trunks that need to support triggering at TDP-4 need to have either the FULL or RX options specified. If the

release should be propagated back to a previous exchange the originating trunk needs to have either the FULL or SEND options specified. If either of these options are datafilled on the originating trunk the call will not trigger at TDP-4 if a QoR specific cause value is used (e.g. 14 or 126), regardless of IN datafill.

To use the Spanish specific ported number release cause (126) rather than the default (14), the SPAIN NATL_LNP_QOR option must be specified in table ISUPSVC. For more information on the SPAIN ISUPSVC options please see [5].

Figure 6 Example datafill ISUPSVC

```
 KEY      SERVICE
-------------------------------------------------------------
LNPSEND   (LNP QOR (SEND) $) (SPAIN (NATL_LNP_QOR) $)$
LNPRX     (LNP QOR (RX)$)$
```

Figure 7 Example datafill TRKOPTS

```
 OPTKEY     OPTINFO
-------------------------------------------------------------------------------
K1S5040SP2A ISUPSVC ISUPSVC        LNPSEND
K1S5040SP2B ISUPSVC ISUPSVC        LNPRX
```

2 Configure TDP-4 trigger criteria:

For trunk originations the TDP-4 trigger criteria needs to be specified in table TRIGGRP and the originating trunk(s) subscribed to the trigger group, either on a per trunk basis in table TRKAIN or on an office wide basis with the AIN_OFFICE_TRIGGRP office parameter in table OFCVAR. For line originations the AIN line option needs to be added via SERVORD

Figure 8 Example datafill TRIGGRP

```

3 Configure translations to modify the NOA post TDP-4:

If a specific NOA is required for Ported Calls (for Spain an NOA of 126 is required), translations needs to be set up to modify the NOA based on the new value specified by the SCP using the CDNRTE and SETCDN options. Example datafill for table CDNCHAR is shown in figure 12, and an example translations setup can be seen in figure 13. See reference [3] for more info on the CDNRTE and SETCDN options

33.2.1 CPC Triggering (only available from SN07 onwards)

This activity allows calls to be triggered based on the Calling Party Category (CPC) for incoming calls from supported protocol.

The CPC is mapped to a generic, protocol independent Calling Party Category Name (CPCNAME) in table CPCCHAR. A new criteria type, CPC, in table TRIGGRP, is then used to trigger calls based on the CPCNAME. The CPC option can be datafilled against the INFOCOL (TDP-2) and INFOANAL (TDP-3) TDPs.

33.2.1.1 Table CPCCHAR

Table CPCCHAR is used to convert the protocol's CPC value, into a generic, protocol independent CPCNAME. This CPCNAME is then used for routing the call.

Each tuple in table CPCCHAR comprises of a CPCNAME, followed by between one and eight protocols, of which four protocols are currently valid. Each protocol has a list of between one and sixteen CPC values to match. The CPC value is specified in decimal.

For more information on table CPCCHAR and CPC routing please refer to [2].

33.2.2 Telefonica FCI

The FCI option in table SERVINFO has been expanded to include a new FCI format of TELEFONICA. If the TELEFONICA FCI option is present, the SSP will accept the FCI in an OCTET STRING with boundaries of 0 to 200 bytes of billing data. For more information on Multivendor FCI please refer to [6].

Figure 17 Example datafill SERVINFO

```
SERVIDX                                                                 OPTION

                        VPN-GN(4),
                        VPN-SGN(5),
                        ServiceProvider(6)
                        },
     legID   [1] LegID
     }

fCIBillingChargingCharacteristics ::= SEQUENCE{
   fCIRegisterClass          [0] ENUMERATED {
                                    first(0),
                                    intermediate(1),
                                    }                          OPTIONAL,
   fCIPartyToCharge          [17] FCIPartyToCharge            OPTIONAL,
   fCIServiceKey             [2] ServiceKey
   fCIChargeNumber           [7] Register                     OPTIONAL,
   correlationID             [1] CorrelationID                OPTIONAL,
   fCITariff                 [18] TESATariff
   fCIFeatures               [15] SET (SIZE (1-8) OF Feature  OPTIONAL,
   fCISuplementaryServices   [14] SET (SIZE (1-8) OF
                                    SuplementaryService
   fCIItems                  [16] SET (SIZE (1-8) OF Item
   }
```

The SSP will check the tag and length of the ASN.1 parameters received to ensure that they are contained in correct structure and then report the ASN.1 encoding in the module 199's appended to the AMA record.

The Parameters the fCIBillingChargingCharacteristics shall/may transport are:

1 First FCI Invocation

Scenario A - Before invoking a control connection operation: ETC, CONNECT and received after the opening of a AMA record on behalf of sending an InitialDP operation to the SCP. The following parameters are Mandatory:

fCIRegisterClass

fCIServiceKey

Scenario B - Before invoking a control connection operation ICA/ Continue and received after the opening of a AMA record on behalf of sending an InitiateCallAttempt operation to the SCP. The following parameters are Mandatory:

fCIRegisterClass

fCIServiceKey

fCITariff

In both cases if this first FCI Operation does not contain all of these mandatory parameters, the SSF shall abort the TCAP dialogue with the SCF and will initiate the release of the call.

The remaining Parameters are optional.

2 Second and subsequent FCI Invocation, which may be sent during the same connection configuration, only the additional information:

fCIFeatures

fCISupplementaryServices

fCIItems

can be sent to the SSP. In the case where EDPS are armed if the FCI contains any other parameters different from the ones mentioned, the SSP shall discard them.

33.2.2.1 NAOC support

If an fCITariff parameter is received, in addition to being it decoded and reported in the module 199's the charge information will be passed to the NAOC framework which is done by a separate activity.(See [7] A00002637 Network AOC support for spanish trunk metering). The CS2K will not generate ISUP TAR messages based on the received fCITariff.

33.2.3 ActivateService Filtering Enhancements

33.2.3.1 Network specific duration

A new office parm has been created called INAP_ASF_FILTERING_TIMEOUT_DUR in table OFCENG to specify the network specific ASF duration. The office parameter accepts values in the range -1 to 86,400 seconds, -1 represents an infinite duration. The default value of the office parm is 0. If the SSP receives a ASF operation with a duration of -2, this indicates the value is network specific and the value of the office parameter is used for the ASF operation. Changes to the office parm will only affect new ASF operations and not any that may currently be processing.

33.2.4 Multi-vendor ASF

This enables the SSP to accept sFBillingChargingCharacteristics that are not in the NortelFreeform format. This is similar to the way FCI can accept multi-vendor FCIBillingChargingCharachteristics.

Figure 19 ASN.1 encoding for Telefonica sFBillingChargingCharacteristics

```
SFBillingChargingCharacteristics::= SEQUENCE {
            sFServiceKey [0] ServiceKey OPTIONAL
            generateChargingInfo [1] TESATariff OPTIONAL
            generateAccountRecord [2] BOOL DEFAULT FALSE
            }
```

In order for the CS2K to accept Telefonica format sFBillingChargingCharacteristics the INAP_VARIANT office parameter in table OFCENG must be set to TELEFONICA

Figure 20 Example datafill INAP_VARIANT office parameter in table OFCENG

```
 PARMNAME                  PARMVAL
--------------------------------------------------------------------------------
INAP_VARIANT               TELEFONICA
```

33.2.5 Overdecadic digits in the CLI parm of the Connect message

This activity adds supports for overdecadic (B-F) digits in the CLI parm of the Connect message. Although the CS2K supports the reception of overdecadic digits, the protocol used for any subsequent routing may not. Therefore care should be taken that if overdecadic digits are used in the CLI parm of a connect message, all signalling protocols used to onward route the call must also support overdecadic CLI digits.

33.3 Hardware Requirements or Dependencies

None

33.4 Software Requirements or Dependencies

A00002713 Spanish ISUP Enhancements for Telefonica is required by this functionality.

33.5 Limitations and restrictions

33.5.1 General Limitations

In SN06.2 the CS2K IN platform has the following limitations:

33.5.1.1 Interactions with Explicit Call Transfer

The CS2K does not support IN service interactions with the Explicit Call transfer feature.

33.5.1.2 Call Forward denial per IN service

It is possible to prevent forwarded calls triggering all services but not on a per service basis

33.5.1.3 Call Waiting

If a Call Waiting signal is received during a call to a ASF (TeleVote service), the IN dialog will be aborted (as expected) and the TeleVote announcement (if applicable) may be cut short.

33.5.1.4 Telemetering

The CS2K does not support the generation of ISUP TAR messages from Tariff information received in an FCI or sFBillingChargingCharacteristics.

33.5.1.5 Three Way Call

It is not be possible for services that arm EDPs or CIRP to use the conference capability of 3WC.

33.5.1.6 Multiple Control Relationships per call

Multiple IN services are not possible in a single call (e.g. using a Calling card to access a TeleVote number). If multiple services are required looparounds are needed.

33.5.1.7 Omit missing ISUP parameters from InitDP

ISUP Parameters missing from ISUP signalling are not omitted from the InitDP, instead an unknown value is used. For example if Redirection info is required in the InitDP and a Redirection Parameter is not received from the ISUP signalling, a redirection parameter with a value of unknown will be sent to the SCP.

33.5.1.8 Filtering Criteria for callingAddressValue and location

The CS2K is not able to filter ASF (TeleVote) calls based on callingAddressValue or location.

33.5.1.9 ETC SCFId CorrelationID

The SCFId and CorrelationID ISUP parameters are not supported by the CS2K. These should be appended to the end of the assistingSSPIPRoutingAddress address

33.5.1.10 Telefonica Specific Extension Parameters

Telefonica specific Extension Parameters are not supported by the CS2K.

33.5.1.11 Cancel Operation

The CS2K does not support the cancel operation.

33.5.1.12 ASF (TeleVote) maximum counters = 20

The CS2K can support a maximum of 20 counters per ASF operation. If more TeleVote numbers are required, several ASF operations are required e.g. one for nbrs 0800000001 to 0800000020, one for 0800000021 to 0800000030 etc.

33.5.1.13 ICA in Begin Package

The CS2K does not currently support the ICA operation in a TCAP begin package.

33.5.2 TDP4 specific limitations

Only the following interworkings are supported. Where ETSI ISUP is listed below this includes all national variants.

- ETSI ISUP -> ETSI ISUP
- Line -> ETSI ISUP
- 3WC-> ETSI ISUP
- CFW -> ETSI ISUP
- PRI -> ETSI ISUP

TDP4 as a trigger point is only detectable from the Routing + Alerting PIC. It should not be possible to detect it post answer. However it is a possible for early ACM and ANM messages to be received from the network, and that these are indistinguishable from the real ACM and ANM. Therefore the SSP will trigger TDP4 even if an ANM or ACM has been received.

The originating line/trunk must be an IN capable agent and be subscribed to the TDP4 group datafilled in TRIGGRP. In the case of Lines, 3WC and CFW the relevant OFCPARMS (e.g WTIN_LINE_TRIGGERING_ACTIVE or INAP_3WC_INTERWORK) must also be datafilled.

34: Functional Description (FN): A00002680

34.1 Feature name

CEPT / Telefonica Spain Changed Number Indication

34.2 Description

This feature is intended for the Telefonica market to provide intercept service using the UAS platform for telco subscribers who dial directory numbers that are no longer in service. The service is known as AIS (Automatic Intercept System) or CNI (Changed Number Intercept). Note that this feature is not CEPT specific, despite the title.

Currently, the DMS supports AIS via a trunk interface to an external machine that provides all the necessary announcements and functionality. This activity will provide the same type of functionality via an on-switch application utilizing the UAS as the announcement platform.

Callers reaching an intercepted number will receive a customized announcement from the UAS which includes the number that has been dialled (base DN) and the new directory number (reference DN) of the subscriber they attempted to call. The reference DN will be associated with the base DN through datafill in the DMS.

Following is a description of how to provision and operate this service:

34.2.1 Routing a Directory Number to Intercept Service

When a subscriber requests a directory number change, their old number will be assigned to OPRT treatment via SERVORD. The intercept treatment OPRT can be assigned via any of the following SERVORD commands: CDN, CHDN, DEL, CICP_OUT, and EXBEST. In the case where only the generic notification is desired (number change notification without informing of the new number), the directory number should be routed to BLDN treatment instead of OPRT via SERVORD.

The OPRT tuples in TMTCNTL are modified to route to the CLLI corresponding to the AIS announcement. This can be accomplished by changing the individual instances (i.e. OPRT in subtable LNT for line terminations) or deleting the OPRT tuple from each TMTCNTL subtable and modifying the entry in OFFTREAT [The entry in OFFTREAT applies to the entire office, but is over-ridden by entries in the other TMTCNTL tuples].

Following is an example of the TMTCNTL datafill necessary to route to OPRT treatment:

Figure 1 TMTCNTL Datafill to Route to AIS

```
TABLE: TMTCNTL

EXTTMTNM   TREAT
----------
 OFFTREAT ( 234)

>SUB;POS OPRT

TREATMT LOG            FSTRTE
--------------------------------
  OPRT   Y  S        AIS_ANN
```

For software or virtual directory numbers (numbers not associated with physical circuits), the intercept service can be specified by routing to OPRT treatment via table DNROUTE as shown below:

Figure 2 DNROUTE Datafill to Route to AIS

```
AREACODE OFCCODE    STNCODE       DNRESULT
-------------------------------------------------------------------------------
   919     991       6100                              D OPRT
```

A list of all directory numbers routed to OPRT treatment can be obtained via the QDNSU command of SERVORD. This command can be used to generate either a numeric count of all numbers routed to OPRT or a listing of all individual directory numbers. Following is an example of the QDNSU command:

Figure 3 Servord QDNSU Command Output

```
>qdnsu
DIRECTORY_NUMBER_RANGE: ALL
>
TREATMENT: UNDT
>oprt
SUMMARY OR DETAIL: S
>d
COMMAND AS ENTERED
QDNSU ALL  OPRT D
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT
>y
WARNING : Queries of all DNs or a large range of DNs
        may run for 30 minutes or more before producing any output
Please confirm ("YES", "Y", "NO", or "N"):
>y
 REPORT ON UNASSIGNED DN
TREATMENT:OPRT
    9199911004 OPRT
    9199916100 OPRT
TOTAL COUNT OF UNASSIGNED DN:         2
TREATMENT:OPRT
```

A directory number that has been sent to OPRT treatment can be reused at any time by using the NEW command of SERVORD.

34.2.2 Datafill for AIS Announcement

34.2.2.1 Table CLLI

The Common Language Location Identifier (CLLI) or name for the AIS announcement must be defined in table CLLI. The value for field TRKGRSIZ must be set to specify how many individual members will exist for this announcement group.

34.2.2.2 Table ANNS

The AIS announcement must be datafilled in table ANNS with ANTYP of AIS and only one entry is permitted. Field MAXCON must be set to one (1) and field CYTIME must be set to zero (0) as the length of each individual announcement is variable and will be determined internally. Field MAXCYC

should be set to one (1) as the AIS announcement is a custom type announcement that ignores this field and is only played once.

The following figure depicts example datafill for the AIS announcement in table ANNS:

Figure 4 AIS Announcement Datafill for Table ANNS

```
TABLE: ANNS

      CLLI ANNARCH TRAFSNO   CYTIME MAXCYC                DATA
-------------------------------------------------------------------------------------
AIS_ANN   NETWK     5       0     1      AIS     1
```

34.2.2.3 Table ANNMEMS

Table ANNMEMS must be datafilled to specify all members of the AIS announcement. The HDWTYPE field must be UAS and the CARD field must be AUD. Since it is desired to provide the AIS announcement simultaneously to more than one user, additional members must be datafilled in this table. The following figure depicts example datafill for the AIS announcement in table ANNMEMS with two members defined:

Figure 5 AIS Announcement Datafill for Table ANNMEMS

```
TABLE: ANNMEMS

        ANNMEM
            HDWTYPE          CARD
                                        MEMINFO
-------------------------------------------------------------------------
    AIS_ANN    0
                UAS           AUD   1       AUD   0
    AIS_ANN    1
                UAS           AUD    1      AUD    0
```

34.2.2.4 Table ANNPHLST

Table ANNPHLST is used to create the AIS announcement from individual phrases. Two new external phrase names are introduced by this activity as valid entries for field PHSLIST. These phrase names are AISBASEDN and AISREFDN. The phrase AISBASEDN represents the digits of the subscriber's old directory number or base DN. The phrase AISREFDN represents the digits

of the subscriber's new directory number or reference DN. The following figure depicts example datafill for the AIS announcement in table ANNPHLST:

Figure 6 AIS Announcement Datafill for Table ANNPHLST

```
TABLE: ANNPHLST

        ANNPHKEY
                                        PHSLIST
-------------------------------------------------------------------------
      AIS_ANN   1
(      AUD_2014) (      AISBASEDN) (       AUD_2015) (       AISREFDN)$
```

All the phrases present in the phraselist must be assigned or recorded on the UAS. Exceptions to this are the phrases AISBASEDN and AISREFDN, which are manipulated internally to produce a phraselist composed of digits. In the above example, AUD_2014 and AUD_2015 are simple text phrases recorded by the Telco. They would be similar to the following: *AUD_2014-- "The number you have called"* and *AUD_2015-- "has been changed. The new number is"*. The result of the entire tuple in ANNPHLST would be *"The number you have called, OLDNUMBER has been changed. The new number is NEWNUMBER"*.

If multiple cycles of this announcement are desired, repeat the ANNPHLST datafill [in the above example, the tuple would be (AUD_2014) (AISBASEDN) (AUD_2015) (AISREFDN) (AUD_2014) (AISBASEDN) (AUD_2015) (AISREFDN)].

Also, if a tone or treatment is desired after the AIS announcement completes, add the phrase associated with the desired treatment to the end of the phraselist. In the above example, assuming AUD_2016 is T120 tone, a fifth phrase is added to the phraselist to provide T120 tone after the AIS announcement [(AUD_2014) (AISBASEDN) (AUD_2015) (AISREFDN) (AUD_2016)].

34.2.3 AIS Data Organization

There are three tables associated with AIS that were introduced previously via activity BV1522. These tables are also utilized by this activity, though some of the fields associated with them are not applicable to this design. These tables are presented below.

34.2.3.1 Table PAUSPATT

This table is intended to define the location of pauses during the speaking of the AIS base and reference directory numbers. This ability is required for the DRAM platform. Given that the Telefonica requirement is specific to the UAS, the functionality of this table is not relevant as the UAS has it's own pause formatting scheme. However, the key of table PAUSPATT is a required field in table AISDBS, so it is necessary to add datafill as shown in the following figure:

Figure 7 AIS Datafill for Table PAUSPATT

```
TABLE: PAUSPATT

      PAUSKEY PAUS1 PAUS2 PAUS3 PAUS4
   ------------------------------------------------------------
      UAS           NP   NP   NP   NP
```

34.2.3.2 Table ISCASSGN

This table introduces the Intercept Status Code (ISC), which is an organizational concept intended to simplify the association of an announcement and a number on intercept. [For example, a seven digit number may be routed to a different announcement than a ten digit number, so this table would have two entries (i.e. c7 and c10) and the appropriate announcements would be associated here. This key (i.e. c7, c10) would then be referenced in table AISDBS as a quick way to route to the desired announcement.] The ISC concept is not utilized by this activity. The only field of interest in this table is AISMSG, which is used to define the announcement CLLI and index. The entry for field AISMSG must correspond to a valid entry in table ANNPHLST for the desired AIS announcement.
The following figure depicts example datafill for this table:

Figure 8 AIS Datafill for Table ISCASSGN

```
TABLE: ISCASSGN

      ISCKEY          AISMSG          OVFLCHK
        TMOUTCHK
   ------------------------------------------------------------
      C7   AIS_TEST   1               NONE
          NONE
```

Fields OVFLCHK and TMOUTCHK dictate routes for overflow and time-out conditions and are not utilized in this design. The overflow condition can be addressed by adding additional members for the AIS announcement or using a T-selector in TMTCNTL to specify a routelist. The time-out condition can be addressed by adding the desired treatment to the end of the announcement in table ANNPHLST, as discussed in section 2.2.2.3 above.

34.2.3.3 Table AISDBS

The main function of table AISDBS is to allow the Telco to associate a reference DN with the base DN. This table also utilizes the key fields from tables PAUSPATT and ISCASSGN. The following figure depicts example datafill for this table:

Figure 9 AIS Datafill for Table AISDBS

```
TABLE: AISDBS

        AISKEY AISPATT ISC    YR    MT    DY LOCAL
                  REFREQ
  ------------------------------------------------------------
     9199911004     UAS  C7   2003     6     3    Y
 DN             9199915555  UAS
```

The date field can be used as a reference by the Telco to identify how long the number has been or should be on intercept treatment; However, it is not used by this feature to provide any functionality. The pause information in fields AISPATT and PAUSREF is not needed by the UAS since it does it's own audio formatting. The field ISC provides an association to the phraselist index in table ANNPHLST for the AIS announcement. Field LOCAL is not utilized by this activity and field REFREQ must be set to DN.

The index into table AISDBS is derived from the dialled digits of the originator. Any prefix digits dialled will be removed and the resulting digits will be used as the index into table AISDBS. This may result in the need to datafill multiple entries of a subscriber's old directory number in table AISDBS to address varied dialling plans of the originator (i.e. An example for the North American dialling plan might be to add a seven digit instance of the base DN for line terminations and a ten digit instance of the base DN for trunk terminations).

34.3 Hardware Requirements or Dependencies

This activity supports the AIS announcement on the UAS platform only. Therefore, AIS announcement members should not be defined on a MTM as this is not supported.

34.4 Software Requirements or Dependencies

None.

34.5 Limitations and restrictions

If the AIS announcement cannot be terminated upon during call processing (i.e. due to a problem in the UAS), the originator will be routed to GNCT treatment. If a problem is encountered providing the AIS announcement, the originator will be routed to BLDN treatment.

The index into table AISDBS is derived from the dialled digits of the originator. Any prefix digits dialled will be removed and the resulting digits will be used as the index into table AISDBS. This may result in the need to datafill multiple entries of a subscriber's old directory number in table AISDBS to address varied dialling plans of the originator (i.e. An example for the North American dialling plan might be to add a seven digit instance of the base DN for line terminations and a ten digit instance of the base DN for trunk terminations).

34.6 Interactions

For ISUP and PRI terminations into the switch providing the AIS service, the OPRT treatment must be mapped as local via table TMTMAP for the AIS announcement to be provided. If OPRT is mapped remotely, the remote office will provide whatever treatment is datafilled there for OPRT treatment.

A flash attempt will be denied from a line connected to the AIS announcement. The flash capability and operation of a trunk terminating to the AIS announcement will be dictated by the switch associated with the trunk. Also, since flashing is denied, features that require flash for activation (such as CWT) will be denied when an agent is connected to an AIS announcement.

Call forwarding from a line to a number on AIS intercept is not supported. In the case of CFU, an attempt to forward to a number on AIS intercept will result in BLDN treatment given to the originator. In the case of CFB, the originator will receive BUSY treatment. In the case of CFD, the forward will not be attempted and the originator will continue to ring the base station. Call forwarding to a number on AIS intercept via trunk will function like a trunk termination to the AIS announcement. That is, the originator will receive the AIS announcement stating the old and new numbers associated with the

forward-to number once the forwarding trigger is reached (i.e. busy condition for CFB or timer expiration for CFD).

No billing or AIS specific OM pegging is performed upon termination to the AIS announcement. The generic OMs associated with announcements are supported.

If the caller does not exit after the completion of the AIS announcement, the call will be routed to DISC (disconnect) treatment.

This feature supports the Primary and Secondary languages associated with the UAS through the assignment of the external pharseIDs LANGUAGE1 or LANGUAGE2 in table ANNPHLST. Specifying LANGUAGE1 will notify the UAS to play the announcement in it's primary language and LANGUAGE2 will notify the UAS to play the announcement in it's secondary language. The SL (Secondary Language) line option is not supported nor is the ability to specify a language directly via ANNPHLST datafill.

35: Functional Description (FN): A00002702

35.1 Feature name

No Line Origination Without Charging

35.2 Description

The purpose of this activity is to provide optionality for restricting line origination of the calls which does not have appropriate charging options. Required line options to originate a call when this functionality is enabled are:

- MOG option for IBN subscribers having CEPT option.
- SMDR line option for non-CEPT IBN subscribers
- SMDR line option for P-phone subscribers
- MOG or SMDR line option for ISDN (ISDNKSET) subscribers

For the cases where the originator line does not comply the above conditions, the call is sent to treatment at origination phase.

In addition, call origination is not allowed and sent to treatment for the below condition to avoid duplicate charging if this functionality is enabled:

- MOG and SMDR line options on the same IBN or ISDNKSET subscriber

Table 1 Functional behavior during call origination when NCW_CHG is set to DISALLOWED

Line type	Has CEPT option	Has MOG option	Has SMDR option	SMDR datafill in XLA tables	Call origination	Charging method

IBN line	N	Y	Y	Y	**Not Allowed**	**N/A**
IBN line	N	Y	N	N	**Not Allowed**	**N/A**
IBN line	N	Y	N	Y	**Not Allowed**	**N/A**
P-Phone	N/A	N/A	Y	N	**Allowed**	**SMDR**
P-Phone	N/A	N/A	Y	Y	**Allowed**	**SMDR**
P-Phone	N/A	N/A	N	N	**Not allowed**	**N/A**
P-Phone	N/A	N/A	N	Y	**Not allowed**	**N/A**
BRI line	N/A	Y	Y	N	**Not allowed**	**N/A**
BRI line	N/A	Y	Y	Y	**Not allowed**	**N/A**
BRI line	N/A	Y	N	N	**Allowed**	**Metering**
BRI line	N/A	Y	N	Y	**Not allowed**	**N/A**
BRI line	N/A	N	Y	N	**Allowed**	**SMDR**
BRI line	N/A	N	Y	Y	**Allowed**	**SMDR**
BRI line	N/A	N	N	N	**Not allowed**	**N/A**
BRI line	N/A	N	N	Y	**Not allowed**	**N/A**

In addition to usage of SMDR line option, SMDR may be activated during translation by setting the SMDR field to Y at the appropriate table IBNXLA tuple.

If SMDR is activated via translation option for an originator IBN or BRI line with MOG option during the call, then the call is sent to treatment to avoid duplicate charging. For this case, the call is sent to treatment after the digits were dialed.

For all mentioned cases where the call is sent to treatment because of using illegal charging method, an MTR 158 log is generated.Treatment type is “No_software_resource” NOSR. The existing treatment in DMS100 MMP is used.

The functionality is enabled by setting the metering system parameter NCW_CHG in table MTRSYSPM to DISALLOWED. This parameter is renamed from the existing metering system parameter NCW_MOG with no change in it's existing functionality.

Note that this activity does not cover successful generation of SMDR records or increasing of meter counts at the end of the call for the allowed calls.

35.2.1 Changes in MTR 158 log format

For supporting the additional SMDR and MOG &SMDR interaction restrictions, existing MTR158 log text is enhanced. Also called DR field is added to log data text for SMDR activation from translation cases. For other log creation cases, there's no dialed digits since the call is sent to treatment during origination.

The new log output is given in Figure 1.

Figure 1 Sample log report for MTR 158 log

```
RSNW4E07 MTR158 JUN12 15:17:50 9600 INFO INVALID CHARGING METHOD

    HOST 02 0 00 06    DN 1027835476
    CALLED DR 0
    CALL RESULT: TRMT- No MOG option
```

Other possible call result texts printed within the log are:

- TRMT-MOG & SMDR on line
- TRMT- No MOG or SMDR on line
- TRMT- MOG option on a line without CEPT
- TRMT-SMDR activation during XLA

Table 2 Possible call result texts in MTR 158 log

Reason	CALL RESULT:
No MOG option on a line with CEPT	TRMT- No MOG option
No SMDR or MOG option on a line without CEPT option	TRMT- No MOG or SMDR on line
MOG option on a line without CEPT	TRMT- MOG option on a line without CEPT
SMDR and MOG options both exists on the line	TRMT- MOG & SMDR on line

Table 2 Possible call result texts in MTR 158 log

Reason	CALL RESULT:
SMDR activated during translation for a line with MOG option	TRMT-SMDR activation during XLA

35.2.2 Renaming of metering system parameter NCW_MOG to NCW_CHG

Existing metering system parameter NCW_MOG defined in table MTRSYSPM is renamed to NCW_CHG within this activity.

NCW_CHG has the same activation/ deactivation, ONP behavior with the old NCW_MOG parameter. For the upgrades to ISN07 from older releases, the value of the NCW_MOG parameter value will be transferred to NCW_CHG.

35.2.3 Complex call interactions for the feature

Complex call interactions of this functionality is as below:

- For call forwarding scenarios, call diversion to another agent will not be allowed if diverting agent has no charging option.
- For conference calls (3WC, 6WC), when this feature is active, a call will not be originated after flash/add on leg of the complex call members without charging option. Agent will not get special dial tone after flash/ add on leg and an MTR 158 log is generated.
- During enquiry call setup, flashing/ add on leg of an agent without charging option in the enquiry call is not allowed. The flash/ addon leg is ignored and the agent will not get special dial tone, also an MTR 158 log is generated.
- An IBN line with call waiting option and without charging option can get the call waiting tone during a call and use the feature.(Mentioned line is included in the first call as terminator).The restriction introduced for this case with the prior activity, ‘No Line Origination Call Without Line Metering Option’ (ACT.A59033820) is removed.

35.2.4 SMDR Restrictions when NCW_CHG is set to DISALLOWED

In case an agent with SMDR option in IDLE state is involved in an active complex call (call diversion, call transfer) and an SMDR record generation for this agent is expected for that call, following operations are restricted:

- Usage of OUT, CLN, CDN, DEL SERVORD commands on the agent
- Removing of SMDR option from the agent via DEO SERVORD command or via table control operations.
- Removing of the agent from IBNLINES/KSETLINE tables via table control operations.

- Adding SUS, DOR, RESL options to the agent via SERVORD and table control operations.

Note that these restrictions are applicable if NCW_CHG parameter in table MTRSYSPM is set to DISALLOWED.

35.2.5 MOG option restrictions when NCW_CHG is set to DISALLOWED

If a line with MOG option has active call forwarding or is not idle, then below operations are restricted:

- Addition of DOR SUS RESL options to the line via SERVORD.
- Deleting of MOG option from the line via servord or via table control operations.
- Removing the line with OUT command or via table control operations.

Note that these restrictions are applicable if NCW_CHG parameter in table MTRSYSPM is set to DISALLOWED.

35.2.6 ICMOG option restriction on IC PRI trunks when NTOW_CHG is set to DISALLOWED

If an incoming (IC) PRI trunk has no ICMOG datafill in table TRKOPTS then call origination from this trunk is restricted.

In case of restriction, new MTR log MTR163 is generated for the IC PRI trunk and the call is sent to “No_software_resource” NOSR treatment.

This restriction is applicable to ETSI PRI trunks if NTOW_CHG value in table MTRSYSPM is set to DISALLOWED.

The details for the new MTR 163 and MTRSYSPM parameter NTOW_CHG are given in Fault management and Configuration sections.

35.3 Hardware Requirements or Dependencies

None

35.4 Software Requirements or Dependencies

None

35.5 Limitations and restrictions

- This feature is not activated if ENABLE_METERING office parm in table OFCENG is set to N
- This function is available only for line origination types which are IBN, ISDNKSET or P-phone.

- For MLH and DLH hunt groups, call origination is not allowed for members that have SMDR option if the pilot DN has MOG option assigned.
- No trunk origination without charging functionality activated by MTRSYSPM NTOW_CHG parameter is only available for ETSI PRI trunks.

35.6 Interactions

This feature is the enhancement of the existing ISN04 activity 'No Line Origination Call Without Line Metering Option' (ACT.A59033820). Except for the points stated in this document, 'No Line Origination Without Charging' feature provides the same functionality with the mentioned A59033820 feature.

QLT command for a MLH or DLH hunt group member BRI line does not display the MOG option assigned to the huntgroup pilot. This is a general behavior for QLT and pilot DN of the huntgroup should be checked for detecting MOG option existence on the hunt group.

36: Functional Description (FN): A00002713

36.1 Feature name

Spanish ISUP enhancements for Telefonica

36.2 Description

36.2.1 Overview

This feature extends the capabilities of the CS2000 Spanish ISUP V2 (PUSI 4/2) trunk interface to support additional capabilities used within the Telefonica Espania (TESA) network.

The existing CS2000 Spanish ISUP V2 (PUSI 4/2) interface is compliant to Telefonica specifications EG.S3.003 4th ed. + appendices 1 and 2 with some minor limitations. It satisfies Spanish national network interconnect requirements.

This feature enhances the Spanish ISUP V2 (PUSI 4/2) interface to provide optional support for additional capabilities used within the Telefonica Espania (TESA) network, and specified in Telefonica specification Gt.EG.s3.403 sections 5 & 6.

The main additional capabilities introduced by this feature are:

- A TESA defined “Call Stamp” in the IAM of all calls- comprising a Call Reference parameter to uniquely identify the call within the network.
- Support of Charge (#TAR) message enhanced at the call originating node.
- Number Portability support is enhanced to support use of Query on Release mode Local Network Portability within the Telefonica network.
- Transit Network Selection support.
- Barring of Reverse Charge Calls to certain (non-billable) lines.

Each capability will be individually controlled by datafill options and will only be supported on Spanish ISUP V2 trunks. Spanish ISUP V2 trunks are configured by the following set of field values in table TRKSGRP.

- Exernal Protocol = ‘**Q767**’

  ITU/ETSI ISUP variants in the CS2000 ISN load.

- Version=‘**100_WHITE**’

  indicates that the variant is based on ITU White Book/ETSI ISUP V2 and

- Variant='**SPAIN**'

  marks the country specific variant as Spain

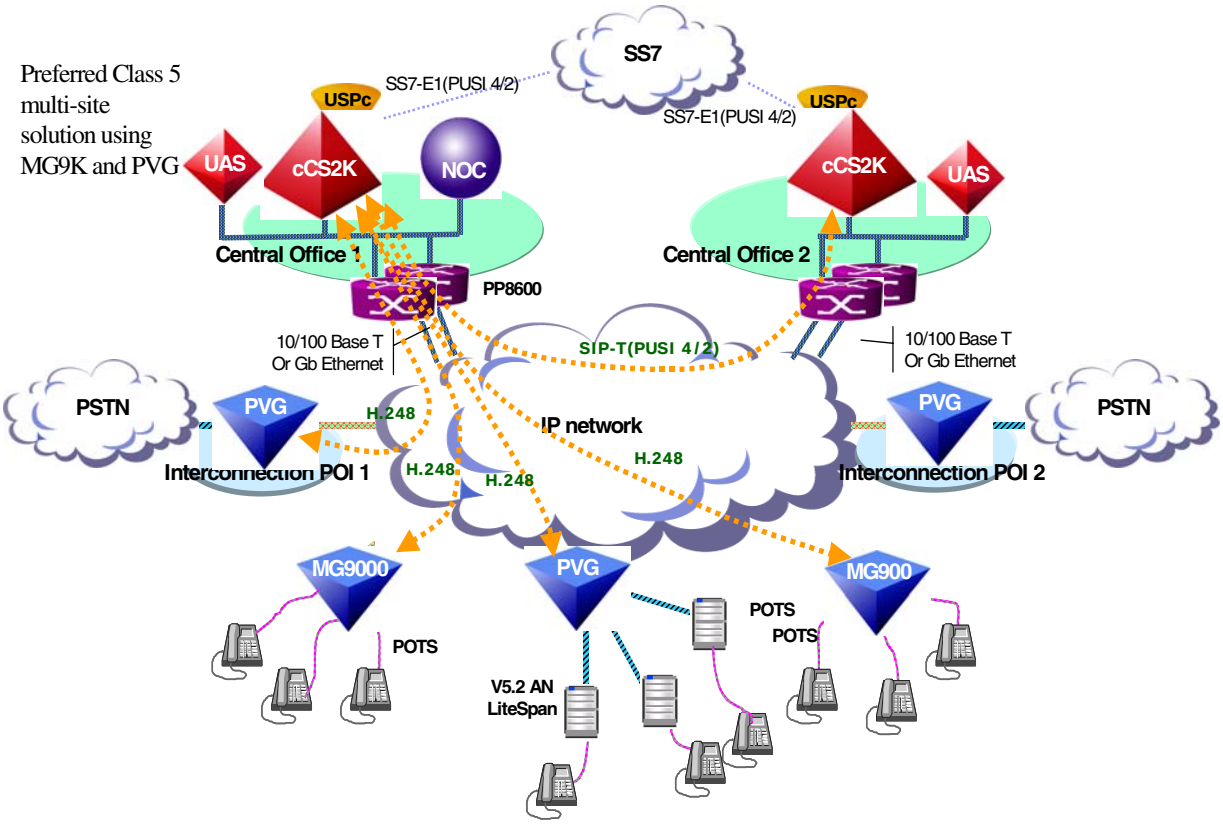
Unless stated otherwise in the body of this document support for the features described in this document is limited to the scenario of PUSI 4/2 trunks interworking to Analog Lines - hosted on an MG9000 Gateway or connected via a PVG V5.2 Gateway as shown in Figure 1.

Figure 1 Supported configuration



36.2.2 Telefonica defined PUSI requirements common to all Operating Companies as defined in GT.EG.S3.403 Section 5

This section describes the CS2000 implementation of Telefonica defined ISUP capabilities that are intended to be common across all Telefonica networks in all countries. These are specified in GT.EG.S3.403 Section 5.

36.2.2.1 BACKWARD COMPATIBILITY (GT.EG.S3.403 Section 5.1)

The CS2000 implementation of PUSI 4/2 fully complies to this requirement for compatibility with the previous and future versions of PUSI, by compliance to Point 2.4. of Rec. Q.761 of the White Book.

36.2.2.2 TIMERS (GT.EG.S3.403 Section 5.2)

The PUSI timer values agreed upon for all the Grupo Telefónica, are contained in the following table. The column on the left contains the timers; the 2nd column shows the values (0 range of values) allocated in Rec. Q.764 of the White Book ITU-T. The values that have been agreed upon by the Grupo Telefónica, can be seen in the 3rd column and the range configurable on the CS2000 in the 4th column..

Timers which are configurable on CS2000 are generally datafilled in table C7UPTMR. One or more tuples should be created in table C7UPTMR with the values required by the Telefonica network and associated to PUSI trunkgroups.

Table 1 PUSI Timer Value

Timer	Q.764 range	EG.S3.403 requirement	CS2000 range in C7UPTMR
T1	15 - 60 s	30 s	1 to 60
T2	3 m	3 m	1 to 240

a. Not required by Telefonica ISUP - Call Modification not supported

36.2.2.2.1 Call Stamp (GT.EG.S3.403 Section 5.3.1)

Overview

The aim is to identify all the calls that enter the network in an unequivocal way, whether this be at the originating local exchange or the frontier exchange with other operators (national or international). There are basically two applications: to be able to use this information when providing services (whether they be on the Intelligent Network or not), and to be able to relate the various records, for rating, statistics, or of another kind, that can be carried out at different nodes on the network.

This service is supported by the CS2000 for calls originating from and Terminating to Lines on the CS2000.

Encoding

"Call reference" and "Generic Digits" are the two parameters that carry this information.

- "Call reference":

  The "call reference" parameter is as specified in Q.763 [3]. The increasing send interpretation will be applied in both fields of this parameter, that is, the least significant bit in the "call identity" field, is bit 1 of octet 1, and the most significant one is bit 8 of octet 3, whereas bit 1 of octet 4 is the least significant one in the "point code" field and bit 6 of octet 5 is the most significant one.

"Generic Digits" - Generic digits implementation is backed out as it is not required by Telefonica.

Procedure

The procedure to be followed at the originating exchanges, will be the same for local exchanges and for frontier exchanges. The originating exchange will carry out the following actions, whether the call is generated from the network itself, or whether it comes from another network:

It will generate the "call reference". It will make a note of all the parameters in the respective register: the rating register at the local exchanges and the accountancy register at the frontier exchanges.

It will include call reference in the PUSI initial address message

The pure transit exchanges that do not have to make any note, will pass this parameter without making any modification at all.

Note: CS2000 does not support this SSP related functionality at present.

The destination exchanges, will discard and will carry on as if they had not received them, if they do not have any specific procedure enabled.

The network outlet exchanges will make a note of this information in the accountancy registers, and will remove the parameters, unless they have a specific agreement with the next network.

CS2000 Datafill Control of Call Stamp

a) Call Reference Parameter:

This feature meets the Telefonica requirements for the Call Reference parameter for calls originating and terminating to analog lines on the CS2000 and entering or leaving the Telefonica network on Spanish ISUP V1 & V2 or Base ETSI ISUP V2 trunks.

It extends the generic ETSI ISUP Call Reference capability implemented by A59023264.

Calls that enter the Telefonica Spanish ISUP V2 network on Spanish ISUP V1 or V2 or ETSI ISUP V2 will be handled as described in feature A59023264.

To control generation of the Call Reference parameter in the IAM for calls from Lines to Spanish ISUP V2 trunks a new service “CALLREF” is introduced to table ISUPSVC. The CALLREF service will have a vector of options to control which scenarios the trunks should add a Call Reference parameter for. In this release only one option value will be available

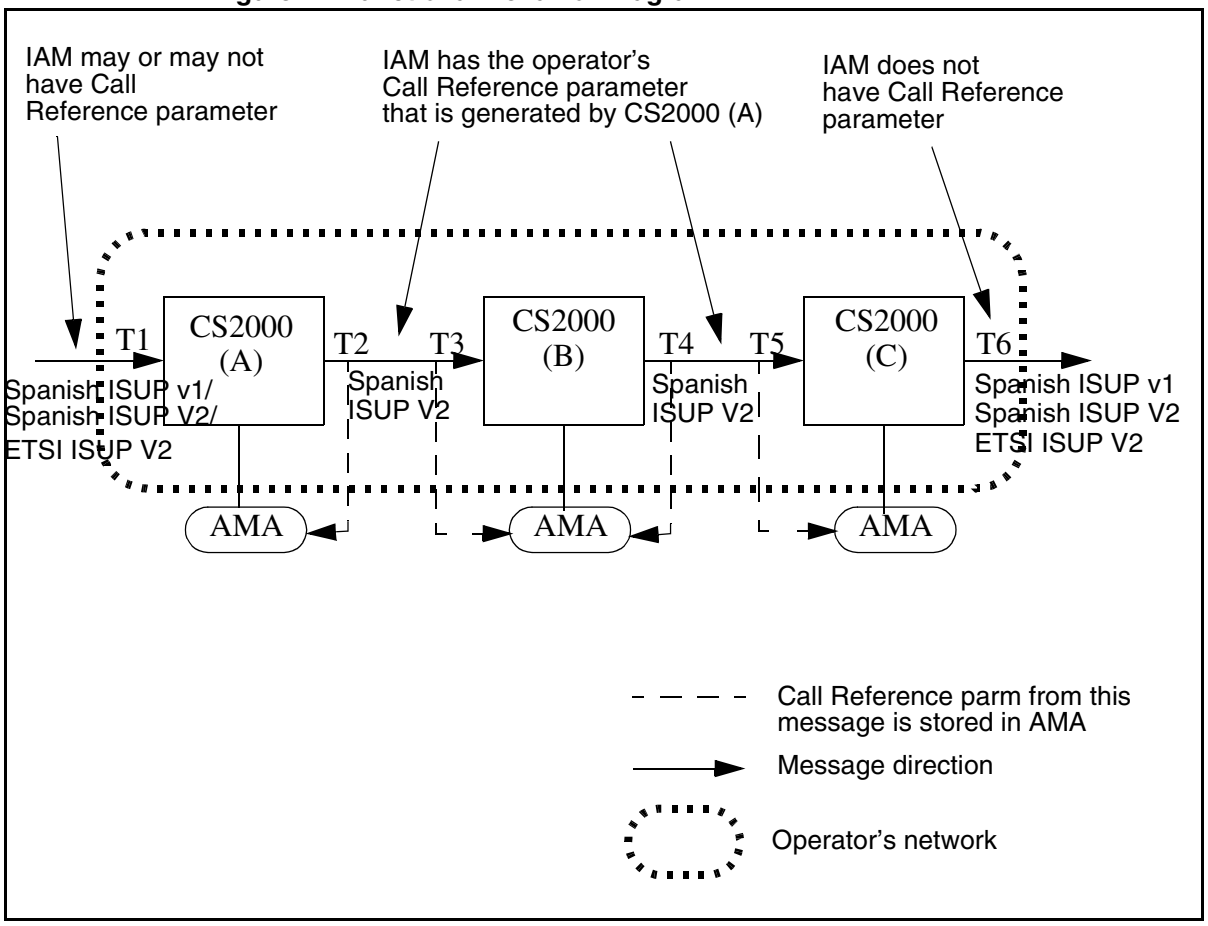
— “LINE” - to indicate that the call reference parameter is required to be generated for Line originated calls.

CALLREF LINE

This option will only take effect on trunkgroups that also have the TRKOPTS option CALLREF datafilled with no suboptions.

The Call Reference paramater may be optionally captured in the AMA billing record as described in A59023264. This capability is extended to the Line origination and termination scenario by the CALLREF LINE option. This option needs to be datafilled for generating AMA records for Call reference in line origination and termination scenario.

Figure 1 Functional Behavior Diagram



:

Table 1 Setting of TRKOPTS and ISUPSVC options for Telefonica network to generate Call Reference for all Line originations

Trunk	TRKOPT CALLREF Datafill	ISUPSVC CALLREF Datafill
Internal trunks within Telefonica network - T2, T3, T4, and T5	`CALLREF $`	CALLREF LINE
T1 and T6 if two-way trunks	`CALLREF (ADD_OVERWRITE )(DELETE ) $`	dont care
T1 if it is a one-way incoming trunk	`CALLREF (ADD_OVERWRITE ) $`	dont care
T6 if it is a one-way outgoing trunk	`CALLREF (DELETE ) $`	dont care

Refer to A59023264 for full details of the Call Reference support on CS2000.

GENERIC_DIGIT_STRING DF007F958000000C

To control Call Reference for transit scenaio follow the TRKOPTS datafill as mentioned in table 1 in page 161.An example is shown below, note that this is not the complete datafill in table TRKOPTS for call reference, derive the

datafill required from the above mentioned table or refer to feature A59023264 in fmdoc for the exhaustive list.

TABLE TRKOPTS

ETSIV2IC CALLREF CALLREF ADD_OVERWRITE

36.2.2.2.2 Services in IN (GT.EG.S3.403 Section 5.3.2

The CS2000 does not support this service. If the generic digits parameters related to this service are received by CS2000 they will be handled according to their corresponding PCI instructions.

The generic digits parameters related to this service are encoded:

"correlationID" would be as follows: the "encoding scheme" must be 011 (binary) and code 11100 (correlationID) would be used as "type of digits".

"SCFID" would be as follows: the "encoding scheme" must be 011 (binary) and code 11011 (SCFID) would be used as "type of digits". The digits" field would be encoded as the parameter "call party address" of the SCCP.

36.2.2.2.3 Authorisation and account codes (GT.EG.S3.403 Section 5.3.3)

The CS2000 does not support this service. If the generic digits parameters related to this service are received by CS2000 they will be handled according to their corresponding PCI instructions.

The generic digits parameters related to this service are encoded as follows:

The encoding details depend on the specific application. For example, if the local originating exchange receives these codes and cryptographs, which increases the safety of these procedures, then the "encoding scheme" must be 011 (binary encoded). The relevant code would be used as "type of digits", 00000 for the account code or 00001 for the authorisation code.

This service may be implemented on CS2000 by inband transmission over ISUP trunks of the Authorisation and account codes as DTMF digits.

36.2.2.2.4 Corporate networks (GT.EG.S3.403 Section 5.3.4)

The CS2000 does not support this service. It will not generate the format of generic digits parameter used by this service. If the generic digits parameter related to this service are received by CS2000 they will be handled according to their corresponding PCI instructions.

The generic digits parameters related to this service are encoded as follows:

The "encoding scheme" must be 011 (binary), and code 00011 (company communications) would be used as "type of digits". The corporate network code in "digits" would go in 2 octets (65536 possibilities).

36.2.2.3 PARAMETERS CONFIGURABLE BY ROUTE (GT.EG.S3.403 Section 5.3.4)

Telefonica requires that frontier exchanges must be able to restrict sending certain parameters out of the network on the basis of the incoming or outgoing route of the call. These parameters will only go to those other routes with which an agreement exists to that effect.

The list of parameters that have to be able to be configurable by route, is defined below.

- Calling number
- Connected number
- Generic number
- Generic digits
- User-to-user information

CS2000 supports this requirement for parameters in the IAM by use of existing table ISPARM. This table allows the network operator to specify one or more parameter(s) to be blocked/removed from an outgoing IAM on a set of trunkgroups that are associated to a particular entry in table ISPARM. Any optional parameter can be removed using this table. Refer to feature A59028040.[10]

Certain parameters in the IAM and other messages may also be blocked by specific datafill that controls the use of messages and parameters on a per service basis.eg: Controls for the User-to-user Service and Call Reference capability.

36.2.3 NETWORK SPECIFIC REQUIREMENTS (GT.EG.S3.403 Section 6)

36.2.3.1 (GT.EG.S3.403 Section 6.1) CTC REQUIREMENTS

Not Applicable

36.2.3.2 (GT.EG.S3.403 Section 6.2)TASA REQUIREMENTS

Not Applicable

36.2.3.3 (GT.EG.S3.403 Section 6.3) TDP + TESA REQUIREMENTS

The following subsections follow the **GT.EG.S3.403 Section** numbering

36.2.3.3.1 (GT.EG.S3.403 Section 6.3.1) Caller categories (TDP requirement)

Not Applicable

36.2.3.3.2 (GT.EG.S3.403 Section 6.3.2) Malicious call. (TESA requirement)

If the destination local exchange does not have the complete calling number. It will make use of the information request procedure to request it. Q.764 xxx2.1.6

The bits for the parameter "information request indicators" that are encoded to 1, are as follows: / "a calling party request indicator") and H ("malicious call identification request indicator"). The rest will go to 0.

36.2.3.4 (GT.EG.S3.403 Section 6.3.3) Rating (TESA requirement)

The following subsections follow the **GT.EG.S3.403 Section** numbering

6.3.3.1General

Telefónica de España requires the following rating procedure, which makes use of the rating information message #TAR and a parameter referred to as &TFA.

Table 2

Rating information message (#TAR) (national use)			
Parameter	Type	Length	

Table 2

Rating information message (#TAR) (national use)			
Type of message	F	1	
&TFA	F	5	

6.3.3.2Encoding.

The rating information message (#TAR) has only two parameters, both compulsory and of fixed length: message type and rate.

The code 1111 1000 has been allocated to the rate parameter (&TFA), but it is never used, given that it is only used in the message #TAR, where it is compulsory. It occupies 5 octets and is compulsory in the message #TAR. The least significant bit in octet 1, indicates whether octets 2 and 3, which contain rating information, are relevant or not; the following less significant bit, indicates whether octets 4 and 5, which contain charging information, are relevant or not; the rest of the bits in the octet are reserved. Octets 2 and 3, indicate the type of rate. Octets 4 and 5 indicate a number of monetary units to charge to the call.

The name and code of the parameter used, is indicated in the following table.

Table 3

ACRONYM	NAME	REF	CODE	notes
&TFA	Rate		1111 1000	@

@ = national use parameter.

The format ¬TFA can be seen in the figure:

ReserveInPInT

Type of rate

Monetary units

The fields for this parameter are as follows:

InT (rate indicator): indicates whether the rating information (the type of rate) included in the parameter is relevant or not.

0: the rating information (octets 2 and 3) is not relevant

1: the rating information (octets 2 and 3) is relevant

InP (call price indicator): indicates whether the charging information (the monetary units) included in the parameter is relevant or not.

0: the charging information (octets 4 and 5) is not relevant

1: the charging information (octets 4 and 5) is relevant

The type of rate: a code that expresses the number for the type of rate that is to be applied (0-65535) in pure binary form (the most significant bit is 8 from octet 3, and the least significant bit is 1 from octet 2).

d) Monetary units: a code that indicates the number of units to be added to the call, expressed in pure binary form (the most significant bit is 8 from octet 5, and the least significant bit is 1 from octet 4).

6.3.3.3Procedure.

The rating procedure that determines the use of the rating message #TAR, together with the use of the various rating indicators (such as those that appear in the "backward call indicators"), is explained in the rating Specification that is in force. The procedures that are followed by default, are explained below.

Criterion for determining whether a call is subject to a rate being applied: all calls will be rated except in the following circumstances:

- If the rate to be applied is zero
- If the final value received for the "backward call indicators" in the "charge indicator", is "no charge" (01), and none of the values received beforehand, if any had been received beforehand, came with the "charge" (10) meaning.

Call rate determination criterion: the originating local exchange will determine the rate to be applied to the call. If a #TAR is received with relevant rating information prior to the address complete message (#MDC) (or the connection message, #COX), then it will apply that rate, and not the one calculated previously. Furthermore, of a #TAR is received at any time, with relevant charging information, it will add to the caller's meter, the value concerned to the price of the call indicated in the message.

The CS2000 will not generate the TAR message in this release.

In transit, the #TAR message will pass without any modifications at all.

In an originating office, no action is taken upon receiving the Charge message and it is ignored .

36.2.3.5 (GT.EG.S3.403 Section 6.3.4) Number Portability (TESA requirement)

This requirement is replaced by that in Addendum A.

This activity implements Numbering Portability by the method of Query on release.Number Portability by IN is covered by a separate activity A00002678

LNP QoR functionality is enabled by existing options in table ISUPSVC which was implemented by feature A59027497.

Additionally , a release cause indicator #126 is supported on spanish trunks for ported numbers.This is controlled by an option in table ISUPSVC in SPAIN service , “NATL_LNP_QOR”.This is a symbolic option , if this option is datafilled along with LNP service datafill, then a cause value of #126 will be sent for ported numbers otherwise the default cause value 14 will be sent on ported number.

Additionally, accepting NOA value #126 is supported on Spanish ISUP variant having SPAIN service datafilled in table ISUPSVC.

SAMPLE DATAFILL for LNP QoR

Datafills as mentioned in Activity A59027497 is required in addition to the following datafills.

TABLE: TRKSGRP

TABLE: TRKOPTS

ETSIV2IC ISUPSVC ISUPSVC EIV2_SPAIN

36.2.3.6 (GT.EG.S3.403 Section 6.3.6) Selection of the Transit Network (TESA requirement)

This requirement is amended by that in Addendum A.

It is necessary to prepare the network to allow the user to select the transit network that each call should use. The issue that concerns the PUSI is how to transport this information and - keeping in mind that in Spain we will soon have other basic telephony service local operators besides Telefónica - indicate to the transit network if the call is offered by subscriber / user selection or through the choice of the operator that provides the access.

It is necessary to note that the existence of several local operators and several transit networks in a same country requires an agreed national network signaling (PUSI) that must be used between frontier exchanges of different networks.

The future anticipates the possibility of selecting a transit network by pre-assignment for all calls of a certain type; in this case, when a user uses the generic dialing (without explicit selection), the calls will be offered to the pre-assigned transit network. Otherwise, the local operator will choose the transit network to which to offer the call.

Whenever the call is offered to a transit network, it must be informed that this call has been offered by user selection (explicit selection or pre-subscription); keeping in mind the existence of local operators other than Telefónica, there will be calls established between subscribers of different local operators that, even without selecting the transit network, must cross the frontier exchanges of these operators and must be discriminated from the former for statistical and accounting purposes.

The origin local exchange will include the Transit Network Selection parameter in the Initial Address Message. This parameter will also be included in the Initial Address Message when the transit network selection is carried out by pre-assignment. This parameter will contain the digits that identify the selected transit network. The transit exchanges will analyze the content of the Transit Network Selection parameter received in the Initial Address Message to route the call to the frontier exchange with the Operator selected by the user.In the frontier exchanges, the initial address messages that do not contain the Transit Network Selection parameter will correspond to calls that do not require the transit network selection.

The following strategy will be used to introduce this parameter:

The update process will take some time during which the prefixes method will be used. In other words, the CSO (Operator Selection Code) will be used as prefix in the Called Party Number parameter. First, the transit network will be updated so that it supports the Transit Network Selection parameter; then, the entire access network will be updated, and when all the network exchanges support the Transit Network Selection parameter (even if they are not using it), it will be necessary to determine a point in time in which to carry out the change.The exchanges will have both logics implemented (prefix and use of

the Transit Network Selection parameter), and at the time determined, the change will be made from one logic to another. At this time, the exchanges will begin to send the Transit Network Selection parameter, as well as the Called Party Number parameter without the prefix. The Transit Network will already be prepared to handle it.

The coding of the transit network selection parameter will be made according to Recommendation Q.763, as shown in the figure:

Even /odd Type of network identifier Network identification plan.Network identifier

a) Odd / even indicator: 0 = even number of digits. 1 = odd number of digits.

a) Odd / even indicator: 0 = even number of digits. 1 = odd number of digits.

b) Type of network identifier: 010 = national code.

c) Network identification plan: 0000 = default value.

d) Network identifier: BCD coding of the digits that identify the selected transit network.

The possible user dialing that will allow the transit network selection for each call will of the type indicated next:

CS200 Implementation

TNS implemented by activity A59017057 will be reused for this feature.

This feature ensures CDPN format requirements for telefonica can be selected due to Spanish ISUP variant and existing Carrier Selection/Preselection datafill. Note that TNS parameter is not supported by this activity.

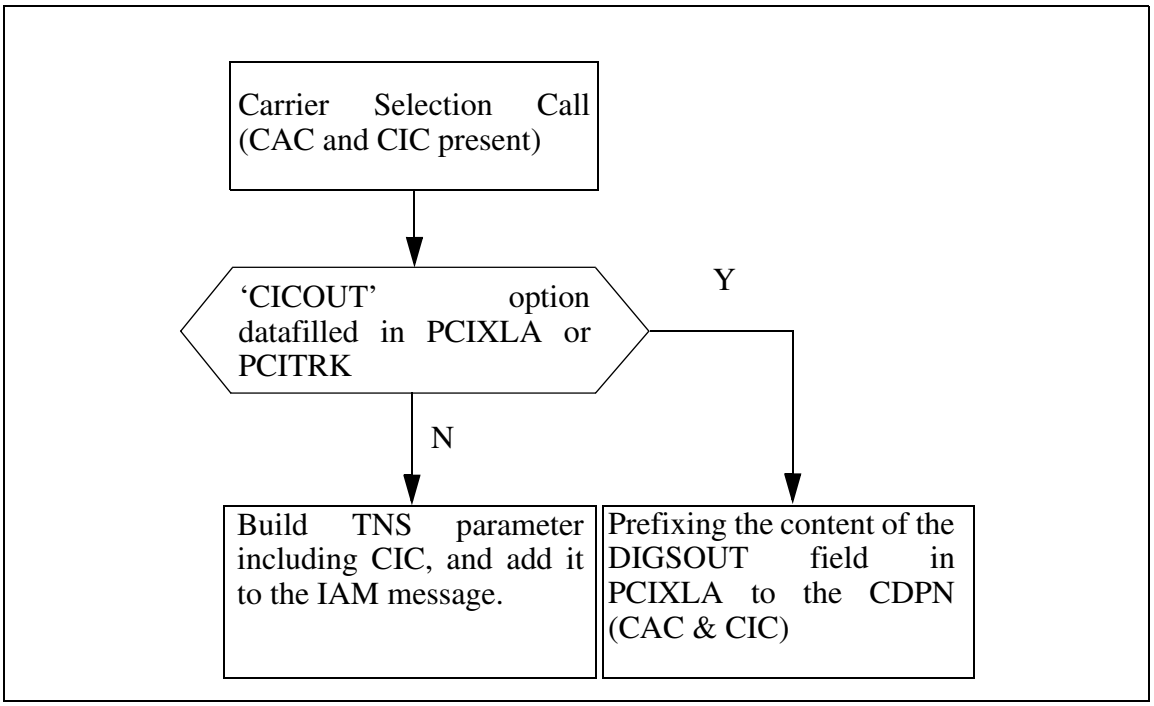
The carrier selection related information can be sent out either in the Transit Network Selection (TNS) parameter or to the called party number (CDPN) parameter.This is controlled by an option in on the outgoing trunk group or the route.

The Carrier Selection related information, the Carrier Access Code (CAC) and the Carrier Identification Code (CIC) can either be transported in the Transit Network Selection Parameter (TNS) or the Called Party Number plus (CDPN+). The Called Party Number plus consists of a prefix (‘10xx’, ‘10’ = CAC and ‘xx’ = CIC) and the regular Called Party Number.

The decision which parameter will be used will be done by the CICOUT option in table PCIXLA or PCITRK. This option was implemented under “[2] A59012694.AA, Carrier Preselection and charge category based routing.” This implementation adds the content of the field DIGSOUT in table PCIXLA as a prefix to the Called Party Number. Therefore this field has to be datafilled with the CAC and CIC information (e.g. ‘10xx’).

In case the CICOUT option is not present in tables PCIXLA or PCITRK, the CIC information will be sent in the Transit Network Selection parameter (TNS). The mechanism for routing according to this information is covered in “[1] A19008748.AA, Austrian ISUP - TNS parameter invoked routing and CLI screening.”

Decision either TNS or CDPN+ is used to transport CS information



36.2.3.7 (GT.EG.S3.403 Section 6.3.7) Vacant Lines (TESA requirements)

CS2000 does not support this requirement. It is not possible to initiate a call from a vacant line on CS2000.

36.2.3.8 (GT.EG.S3.403 Section 6.3.8) Compatibility Information (TESA requirement)

CS2000 is compliant to the following requirements, with no datafill control required.

6.3.8.1Minimum value of message

This edition does not use any message defined by Telefónica de España.

6.3.8.2Minimum value of a parameter

The minimum value of the compatibility information value for a parameter, is the following encoding: "transit interpretation", "do not release call", "do not send notification", "do not discard message (pass it on)" and in the "pass indicator not possible" field, "discard parameter".

This is the one that will be used by default in the parameters defined by Telefónica de España.

36.2.3.9 (GT.EG.S3.403 Section 6.3.9) Reverse charge tagging (TESA requirement)

With respect to reverse charge calls through the operator, it is possible that the person who picks up the telephone and informs the operator that he or she is willing to pay for the call, will not necessarily be the person who eventually does pay for it. As a result, frauds could take place in public places, such as hospitals and hotels, which are provided with direct dialling from extensions.

If this situation is to be prevented, it is necessary to tag the reverse charge calls. With a view to this, bit N from the parameter "forward call indicators" will be used to mean "indicated: reverse charge call", and will be encoded in the following way: if N = 0: ordinary call, if N = 1: reverse charge call. Certain exchanges will generate it, it will pass transparently through transit, and the relevant procedure will be applied at the destination (it will be ignored by default). The frontier exchanges will either set it at 0 or let it pass through transparently, depending on the route.

Note : Cs2k does not set Bit N to 0 or 1 i.e. the frontier exchange capability is not supported.The functionality supported by this activity is just as described in the following paragraph..

Reverse charge tagged calls indicated by the N bit set to 1 in “forward call indicators” will not be allowed to terminate on a line with ACCB (Automatic collect call blocking) option enabled.This will be controlled by an option **REV_CHG** in table ISUPSVC on the incoming trunk.Calls will be checked for reverse charge(bit N) only if this option is datafilled on the incoming spanish ISUP trunk.

36.6 Limitations and restrictions

36.6.1 Agent Interworking

This capabilities introduced by this feature are only supported for the agent interworkings given below. The feature should not be activated on Spanish ISUP v2 trunks that will have any other interworkings as the behavior in other scenarios is undefined.

Figure 2 Agent interworking for the current feature

Platform	Originator	Terminating agents			
CS2K		IBN lines (POTS)	V5.2 IBN (POTS)	PUSI 4/2 (Spanish ISUP V2)	SIP-T(Spanish ISUP V2)
	IBN (POTS)			X	X
	V5.2 IBN (POTS)			X	X
	PUSI 4/2 (Spanish ISUP V2)	X	X	X	X
	SIP-T(Spanish ISUP V2)	X	X	X	X

36.7 Interactions

The current activity interacts with the features listed below and their dependencies to support Line HW Metering and Software Metering and Billing when the charge determination point for the call is not the originating office and the call tariff and/or incremental charges are signalled across the ISUP network:

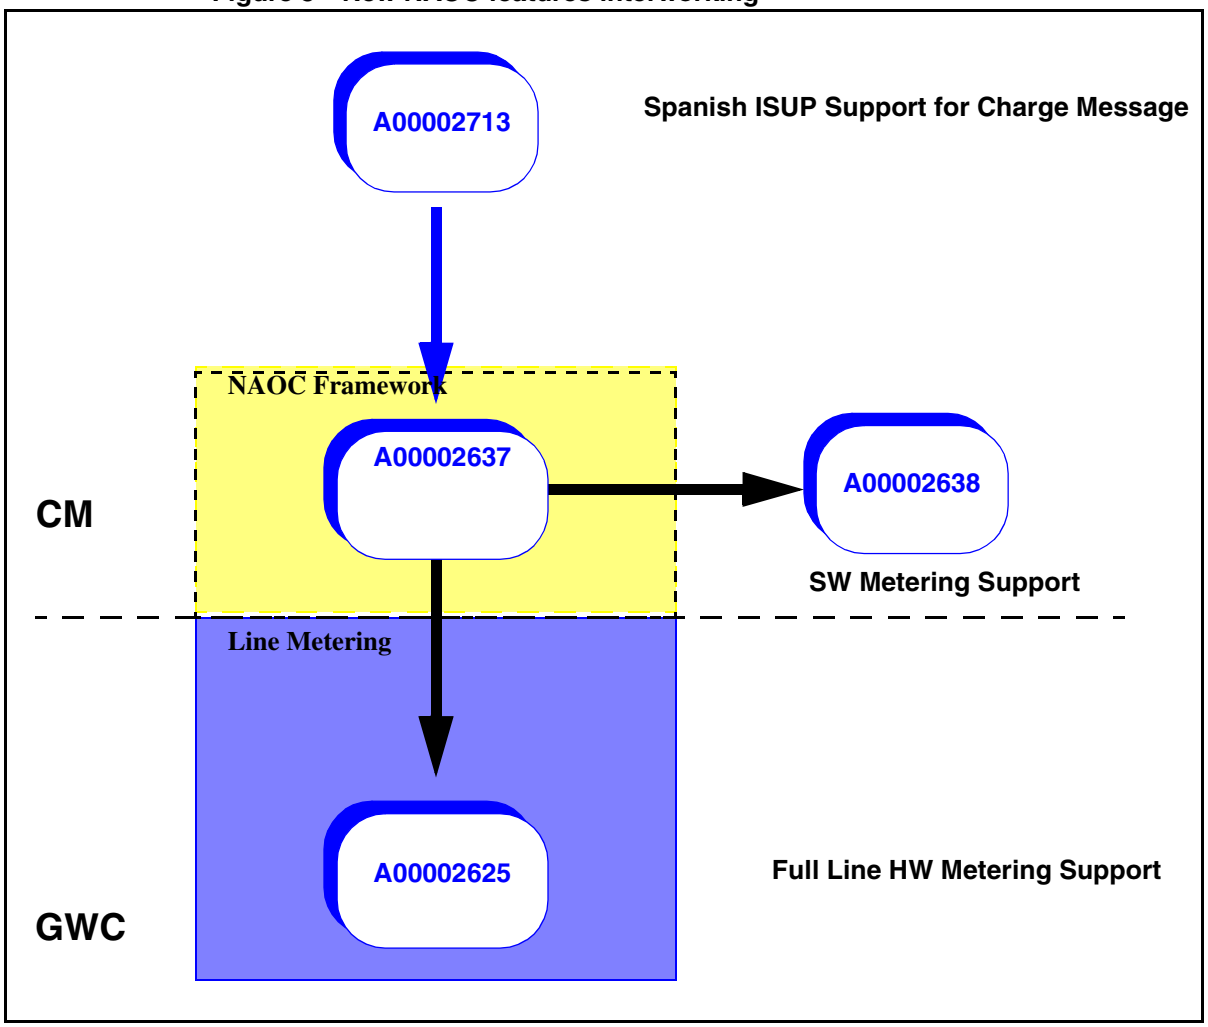
i. NAOC for Spanish Trunk Metering Enhancements [7]

ii. Software Metering Billing support [8}

iii. Full Line HW Metering Billing compliance [9]

A brief overview of the feature interworkings is depicted in Figure 3, "New NAOC features interworking" Refer to A00002637, NAOC for Spanish Trunk Metering Enhancements for further details.

Figure 3 New NAOC features interworking



36.8 Hardware Requirements or Dependencies

No new hardware requirements or dependencies specifically for this feature.

37: Functional Description (FN): A00002751

37.1 Feature name

A00002751 - China BRI Supplementary Services using Keypad protocol

37.2 Description

The feature provides ISN07 with the support of BRI Supplementary Services using Keypad protocol according to "YDN 065- 1997 - China MPT/MII standards".

37.2.1 The services on BRI line using keypad protocol

Table 1 The services using keypad protocol for China market supported in ISN07.

Supplementary Service	Implementation in DMS SN07
Hot Line Service With time out (**WML**)	Yes
WakeUp Call Request(**WUCR**)	Yes
Call Forwarding on No Reply (**CFNR**)	Yes
Call Forwarding Unconditional (**CFU**)	Yes
Call Forwarding on Busy (**CFB**)	Yes
Make Set Busy(**MSB**)	Yes
Calling Line Identification presentation Restriction (**CLIR**)	Partial [a]
Connected Line Identification Restriction(**COLR**)	Yes
Outgoing Call Barring (**OCB**)	Yes
Call Waiting Activation/Deactivation (**CWACT**)	Yes

a. Refer to 2.2.3.4 Restriction and limitation.

The service being shaded will be developed in ISN07

37.2.2 Make Set Busy(MSB)

MSB service provides the same function as Do not Disturb (DnD) which is defined in China Spec. It provides a subscriber with the ability to control the termination of calls.

The function is provided by adding MSB line option to subscriber by means of SERVORD. After being assigned this feature, the default status of MSB is inactive. Subscriber can activate or deactivate this service by dialing access

code. For example, to dial access code “*33#”, the feature is activated, and to dial access code “#33#”, the feature is deactivated.

When the feature is active, any call terminated at this DN will receive busy tone or announcement. At the same time, no notification is sent to terminator.

37.2.2.1 Assignment and Unassignment of the service

The MSB line option is assigned or unassigned by means of SERVORD command as the following example:

Figure 1 The assignment example of MSB option

```
>SERVORD
SO:
>ADO
SONUMBER MAY 95 6 46 PM
>[Enter]
DN_OR_LEN
>ISDN 400
OPTKEY

OPTKEY
>$
COMMAND AS ENTERED:
DEO MAY 95 6 46 PM ISDN 400(1 MSB) $
Enter Y to confirm, N to reject or E to edit
>Y
```

37.2.2.2 Provisioning of Feature Access Codes

The MSB feature access code is defined in table IBNXLA. The provision is as the following example.

Figure 3 Access codes datafill example for MSB

```
Featxla 33 feat N N MSBA
DeFeatxla 33 feat N N MSBD
```

37.2.2.3 Working with multi Key

For a BRI line, only one ETSI BRI Logic terminator Id(Ltid) can be assigned to it. For a BRI Ltid, many DNs can be assigned to it, each DN has an individual key. The MSB is a per DN option, and works on the specified DN only, i.e. it does not affect the other DNs which are assigned to the same BRI Ltid. The MSB is assigned to specified DN using field OPTKEY.

37.2.2.4 Interaction with WUCR service

According to China Spec, the MSB can not coexist with WUCR. In this feature, MSB and WUCR can be assigned to a subscriber simultaneously. MSB has higher priority than WUCR. When MSB is active, any WUC request fail and the corresponding wakeup call can not be established, just like the line is busy. When a request fails, an attempt request will be created automatically according to the office parameter WAKEUP_REQUEST_DELAY. When the attempt request reaches and the MSB is still active, the attempt request fails also and WUCBLCK OM is pegged. If the MSB is inactive, the attempt request will work normally.

37.2.2.5 Interaction with CFX service

The MSB feature has higher priority than CFX. Here the CFX means various call forward services, includes CFU, CFNR, and CFB. When a subscriber has CFX and MSB activated at the same time and a call terminated at the DN, the MSB will work instead of forwarding the call.

37.2.3 Calling Line Identification Restriction(CLIR)

The BRI Calling Line Identification Restriction (CLIR) supplementary service provides the calling party with the ability to prevent presentation of its number to the called party.

To implement CLIR service on BRI line, two services are involved, SUPPRESS and CNDB service. SUPPRESS option is assigned to subscriber, and gives a default status of CLIR. It has been provided in previously release. The CNDB option is provided for BRI line in this feature to give subscriber the ability to control the status of CLIR using keypad protocol.

The CNDB on BRI is independent of SUPPRESS. It works only per call and does not affect SUPPRESS configuration. And the 2nd dial tone will be heard after CNDB access code is dialed. The combination of two services can provide various functions(see following table).

Table 2 Combination of SUPPRESS and CNDB

Status of suppress	Status of CNDB	Function description
Not add the option	Active[a]	The number of calling party can not present to called party
	Not active	The number of calling party can present to called party
Unsuppress[b]	Active	The number of calling party can not present to called party
	Not active	The number of calling party can present to called party
Suppress[c]	Active	The number of calling party can present to called party
	Not active	The number of calling party can not present to called party
Suppress	Not add the option	The number of calling party can not present to called party

a. Assigning CNDB option and dialling access code when initial a call, the CNDB will be activated.For example dial "*62 + called number" (In enbloc mode, dial "*62#called number").It is activated per call.
b. Datafill "SUPPRESS N N/Y" to provision Unsuppress.It corresponds with fields "Option, SUPPRESSDN, SUPPRESSNAME"
c. Datafill "SUPPRESS Y N/Y" to provision Suppress.

37.2.3.1 Assignment and Unassignment of the service

CNDB option and SUPPRESS option are assigned independently. The two options are assigned or unassigned to a BRI line by means of SERVORD command as the following example.

Figure 4 The assignment example of CNDB option

```
>SERVORD
SO:
>ADO
SONUMBER MAY 95 6 45 PM
>[Enter]
DN_OR_LEN
>ISDN 400

OPTKEY
>$
COMMAND AS ENTERED:
ADO MAY 95 6 45 PM 4001 (1 SUPPRESS (PUBLIC Y Y) $ )$
Enter Y to confirm, N to reject or E to edit
>Y
```

37.2.3.2 Provisioning of Feature Access Codes

The CNDB feature access code is defined in table IBNXLA. As a per-call feature, only one access code is provided. The provision is as the following example:

Figure 6 Access codes datafill example for CNDB

```
Featxla 62 feat N N CNDB
```

37.2.3.3 Working with multi Key

Both two options are per DN options, so both do not affect the other DNs' status, which are assigned to the same BRI Ltid.

There is a difference in the method of specifying the DN key of the service between the two options. The SUPPRESS options is specified the DN key using OPTKEY field; The CNDB is specified the DN key using KeyList field.

37.2.3.4 Restriction and limitation

The implementation of CLIR in this feature is not fully compliant with China BRI Spec. It is compliant with China PSTN Spec. In China BRI Spec the CLIR is not a per-call function. That means after setting the CLIR to restricted, any calling number can not present to called party until the CLIR access code is dialed to toggle the status of CLIR. But in this feature the CLIR is a per-call function as mentioned in above description.

37.2.4 COnnected Line identification Restriction (COLR)

The BRI COnnected Line identification Restriction (COLR) supplementary service enables the connected party to prevent the presentation of its number to the calling party.

The function is provided by adding COLR line option to subscriber by means of SERVORD. It provides subscriber with the ability to control the default value of COLR. There are two modes for COLR: temporary and permanent. See following table for difference of the function between two modes:

Table 3 Contrast of temporary and permanent mode of COLR

Mode of COLR	Default value of COLR	Function description
Permanent	RESTRICT	PI equals PI_restricted. The number of connected party can not be presented to the calling party.
	ALLOW	PI equals PI_allowed. The number of connected party can be presented to the calling party.
Temporary	RESTRICT	If the CONNECT message sent by terminator includes CNN IE, PI equals the PI of CNN IE. Otherwise, the PI equals default value PI_restricted.
	ALLOW	If the CONNECT message sent by terminator includes CNN IE, PI equals the PI of CNN IE. Otherwise, the PI equals default value PI_allowed.

When office parameter MARKET_OF_OFFICE in table OFCENG is set to CHINA, the default value of permanent mode can be set to ALLOW, and in both modes subscriber can change the default value of COLR by dialing feature access code. For example, “*34#” makes the default status as restrict; “#34#” makes the default status as allow.

37.2.4.1 Assignment and Unassignment of this service

The COLR option is assigned and unassigned to BRI line by means of SERVORD command as the following example.

Figure 7 The assignment example of COLR option for permanent mode

```
>SERVORD
SO:
>ADO
SONUMBER MAY 95 6 46 PM
>[Enter]
DN_OR_LEN

OPTKEY
>$
COMMAND AS ENTERED:
ADO MAY 95 6 46 PM ISDN 400(1 COLR TEMP ALLOW) $
Enter Y to confirm, N to reject or E to edit
>Y
```

37.2.4.2 Provisioning of Feature Access Codes

The COLR feature access code is defined in table IBNXLA. The provision is as the following example:

Figure 9 Access codes datafill example for COLR

```
Featxla 34 feat N N COLRA
DeFeatxla 34 feat N N COLRD
```

37.2.4.3 Working with multi Key

The COLR is a per DN service. It does not affect the other DNs' status which are assigned to the same BRI Ltid. The DN is specified by the field OPTKEY.

37.2.5 Outgoing Call Baring - User Define(OCB_UD)(need to discuss)

The Outgoing Call Barring enables calls belonging to certain types to be rejected when they are originated by the served user. The served user can choose one of the following three barring programs according to China Spec.

1. DABE code-1: Deny all but emergency calls. All calls are restricted except emergency calls like police, fire department, ambulance, etc.
2. DIND code-2: Deny national and international direct dial calls. All calls except local and international operator assisted calls are restricted.
3. DIDD code-3: Deny international direct dial calls. All international except international operator assisted calls are restricted.

The function is provided by adding OCB line option to subscriber by means of SERVORD. There are two types of OCB, OCBF and OCB-UD. OCBF is assigned by operator, and subscriber can not modify its configuration, which is not required in China market. OCB-UD is assigned by operator also, but subscriber can modify its configuration by access code. When office parameter MARKET_OF_OFFICE in table OFCENG is set to CHINA, the access code sequence is compliant with China Spec as below.

- Activate: *AC*KSSSS#, K is barring program code, SSSS is password;
- Deactivate: #AC*KSSSS#, K is barring program code, SSSS is password;

In OCB-UD, when the feature is active, any call will be checked by the activated bar program. If the call is forbidden, busy tone will be received. The password is needed when activating/deactivating action is taking. This service does not affect any incoming call.

After assigning this feature to subscriber, the password can not be changed directly by subscriber or operator. If operator must change the password, he can delete the service and add the service again by means of SERVORD.

37.2.5.1 Assignment and Unassignment of this service

The OCB option is assigned or unassigned by means of SERVORD. The operator has to enter three fields, BPROG, OCBPW and OCBACTIVE, within the OCB option.

- BPROG is a barring program which restricts origination of a call.Values are defined in table ISERVOPT, but the value will be ignored in China market. The value NIL is default.
- OCBPW is a password which will be used by the served user for activation /deactivation of the feature in OCB-UD. OCBPW can be entered as either ‘NNNN’ or four digits from 0 to 9.
- OCBACTIVE field shows the status of the OCB option indicating if it is activated or deactivated. Values are Y or N. If the value is N, the assignment is OCB-UD; If the value is Y and OCBPW is datafilled as ‘NNNN’, the assignment is OCB-F.

OCB-UD is assigned as the following example.

Figure 10 The assignment example of OCB-UD

```
>SERVORD
SO:
>ADO
SONUMBER MAY 95 6 46 PM
>[Enter]
DN_OR_LEN
>ISDN 400
OPTKEY
>1
OPTION:
>OCB
BPROG
>NIL
OCBPW
>1111(this is password)
OCBACTIVE
>N
OPTKEY
>$
COMMAND AS ENTERED:
ADO MAY 95 6 46 PM ISDN 400(1 NIL 1111 N) $
Enter Y to confirm, N to reject or E to edit
>Y
```

37.2.5.2 Provisioning of Feature Access Codes

The OCB_UD feature access codes is defined in table IBNXLA, as the following example:

Figure 11 Access codes datafill example for OCB

```
Featxla 45 feat N N OCBA
DeFeatxla 45 feat N N OCBD
```

37.2.5.3 Working with multi Key

The OCB is a per DN option, so it does not affect the other DNs' status which are assigned to the same BRI Ltid. The DN is specified by the field OPTKEY.

37.2.6 Call Waiting Activation/Deactivation (CWACT)

This Call Waiting Activation/Deactivation(CWACT) allows the subscriber to activate and deactivate call waiting via feature access codes (i.e. *74, #74).

The function is provided by assigning CWACT line option to subscriber by means of SERVORD command. It works with CW service. The CWACT can only be assigned to a BRI DN that already has CW (Call Waiting), therefore the removal of CW from the DN with CWACT will not be allowed.

There is only one boolean field CW_ACTIVE of the CWACT option. When it is set to 'Y', means that the CW (Call Waiting) is allowed. The 'N' means that the CW (Call Waiting) is not allowed. To set the field to 'Y', "*74#" will be dialed; To set the field to 'N', "#74#" will be dialed .

37.2.6.1 Assignment and Unassignment of this service

The CWACT option is assigned or unassigned to a BRI line by means of SERVORD command. To assign the option to a BRI DN, the CW option must exist on this DN. To delete CW option, CWACT option must be deleted firstly. The assignment is as the following example.

Figure 12 The assignment example of CWACT option

```
>SERVORD
SO:
>ado
SONUMBER MAY 95 6 46 PM
>[Enter]
DN_OR_LEN
>ISDN 400
OPTKEY
>1
OPTION:
>CWACT
CW_ACTIVE:
>Y
OPTKEY
>$
COMMAND AS ENTERED:
ADO MAY 95 6 46 PM ISDN 400(1 CWACT Y) $
Enter Y to confirm, N to reject or E to edit
>Y
```

37.2.6.2 Provisioning Of access codes

The CWACT feature access codes is defined in table IBNXLA. The provision is as following example.

Figure 13 Access codes datafill example for CWACT

```
Featxla 74 feat N N CWACT
DeFeatxla 74 feat N N CWDEACT
```

37.2.6.3 Working with multi Key

The CWACT is a per DN service, so it does not affect the other DNs' status which are assigned to the same BRI Ltid. The DN is specified by the field OPTKEY.

37.3 Hardware Requirements or Dependencies

N/A

37.4 Software Requirements or Dependencies

37.5 Limitations and restrictions

- Interrogating CFX provision by keypad is not supported.

- Interrogating OCB provision by keypad is not supported.
- Interrogating CLIR provision by keypad is not supported.
- Interrogating COLR provision by keypad is not supported.
- Interrogating CWACT provision by keypad is not supported.
- Interrogating MSB provision by keypad is not supported.
- When activating CFX, Specifying bearer service is not supported.
- When activating CFX, Specifying sub-address is not supported.
- The CLIR is not fully compliant with China Spec, please refer to 2.2.3.4.
- WUCR can coexist with MSB, which does not comply with China Spec, please refer to 2.2.2.4.
- WUCR can coexist with CFX, which does not comply with China Spec.
- When OCB is activated with bar program DABE, WML can coexist with it, which does not comply with China Spec.
- When OCB is activated with bar program DABE, 3PTY can coexist with it, which does not comply with China Spec.
- OCB is not affected by CEPTPW in China market.
- 2nd dial tone will be heard after access code is dialed for CFX.
- 2nd dial tone will be heard after access code is dialed for CNDB.

38: Functional Description (FN): A00002754

38.1 Feature name

A00002754 - China INAP Compliance Enhancement Part 1

38.2 Description

This feature is to improve Nortel SSP's INAP functionality to comply with China INAP requirement.

38.2.1 Functional Overview

The enhancement is based on the China INAP specification and China INAP test specification (see reference 1, 2). Following enhancement is provided:

- CallGap(CG) parameter support enhancement: gapInterval.
- Multiple CallGaps support enhancement.
- ResetTimer parameter support enhancement: timerValue.
- CallInformationRequest/Report parameter support enhancement: legID, calledAddress & releaseCause.
- ActiveServiceFiltering parameter support enhancement: sfBillingRecordCharacteristics.
- ApplicationContextName negotiation support.
- ApplyChargingReport enhancement: conversation time measurement
- Support CS-1R ICA.

This feature is developed for both TDM and IP platform.

These functions are not agent specific, they are supported on the originating agents with the condition: the originating agent <-> INAP interworking is ALREADY supported. For example, China ISUP, IBN lines, SIP-T (no ISUP), China PRI.

The office parameter: INAP_Variant is used for China INAP specific enhancement: only when INAP_Variant = Chinese, the China INAP specific enhancement will take effect.

Following sections give detail of this feature:

38.2.1.1 CG parameter Support Enhancement: gapInterval

This enhancement is general for all INAP market.

This enhancement is to enhance the processing for gapInterval value ‘0’.

The CG parameter gapInterval specifies the minimum time between calls being allowed through. A CG with gapInterval = 0 indicates that calls matching the CG’s gapCriteria are not to be rejected. An InitialDP is sent to SCP, with cGEncountered set to the value of this CG’s controlType.

Note: InitialDP will carry the cGEncountered when ‘CGE’ is datafilled in INITDP_PARMS of table SERVINFO.

38.2.1.2 Multiple CGs Support Enhancement

This enhancement is to comply with China INAP specific rules for multiple CGs scenarios (please refer to reference 2):

Suppose: CG2 is received after CG1, within CG1’s duration.

1. Two CGs with same gapCriteria but different controlType

This enhancement is China INAP specific.

In this scenario:

— CG1’s data should be overwritten by CG2 EXCEPT the controlType: the gapIndicator in CG1 is replaced by CG2’s gapIndicator, gapTreatment in CG1 is replaced(or appended) by CG2’s gapTreatment if it exists in CG2.

— The controlType is set to manuallyInitiated because its priority is higher.

As a result, there won’t be a new CG data saved for CG2 but CG1’s parameters are updated. For example: Following two CGs are received,

Table 1 CG1 and CG2 with Same gapCriteria But Different controlType

```
CG1{
    gapCriteria {gapOnService 200}
    gapIndicator {duration=30000sec, gapInterval=30sec}
    controlType=manuallyInitiated
   }
```

```
CG2{
    gapCriteria {gapOnService 200}
    gapIndicator {duration=60000sec, gapInterval=60sec}
    controlType= sCPOverloaded
    gapTreatment {toneID=1, duration=10}
   }
```

Then CG1 will be updated to:

Table 2 Updated CG1

```
CG1{
    gapCriteria {gapOnService 200}
    gapIndicator {duration=60000sec, gapInterval=60sec}
    controlType=manuallyInitiated
    gapTreatment {toneID=1, duration=10}
   }
```

When next INAP calls comes in, the above CG data will be used.

In the above example, if CG1's controlType is sCPOverloaded and CG2's controlType is manuallyInitiated, the updated CG1 will be the same with that is shown in Table 2 because manuallyInitiated has higher priority.

2. Two CGs with different gapCriteria

This enhancement is general for all INAP market.

In this scenario, these two CGs co-exist in SSP. If an IN service is to be triggered and it meets both of these two CG's criterias, then the CG to be activated should be the one whose criteria is more specific.

"More specific" means: first, gapCriteria has a higher priority. Following list shows gapCriteria from high priority to low priority:

- calledAddressValueAndService
- calledAddressValue
- callingAddressValueAndService
- gapOnService

Second, if two CGs have a gapCriteria with same priority, "More specific" means the gapCriteria is more detail. Following are examples:

a. For gapCriteria calledAddressValueAndService, calledAddressValue and callingAddressValueAndService, if two CGs are found in both control types(manuallyInitiated and sCPOverloaded), the CG, whose gapCriteria has higher priority, takes effect.

   For example: Following two CGs are received,

Table 3 CG1 and CG2 with gapCriteria: calledAddressValue

```
CG1{
    gapCriteria{calledAddressValue, 8765}
    gapIndicator {duration=60000sec, gapInterval=60sec}
    controlType=manuallyInitiated
   }
```

Table 3 CG1 and CG2 with gapCriteria: calledAddressValue

```
CG2{
    gapCriteria{calledAddressValue, 87654}
    gapIndicator {duration=60000sec, gapInterval=60sec}
    controlType=sCPOverloaded
   }
```

when an IN service with calledAddressValue is 876543 is to be triggered, CG2 should be activated because its matched address value is longer, in another word, it's more specific.

b. For gapCriteria gapOnService, the one has an exact match takes effect. For example: Following two CGs are received,

Table 4 CG1 and CG2 with gapCriteria: gapOnService

```
CG1{
    gapCriteria{gapOnService, 1}
    gapIndicator {duration=60000sec, gapInterval=60sec}
    controlType=manuallyInitiated
   }
```

```
CG2{
    gapCriteira{gapOnService, 10}
    gapIndicator {duration=60000sec, gapInterval=60sec}
    controlType=sCPOverloaded
   }
```

When an IN service is to be triggered and

- if the service key is 1, CG1 should be activated;
- if the service key is 10, CG2 should be activated;
- if the service key is 101, no CG should be activated.

c. If the criteria is met in both control types and they are the same specific, the CG whose controlType is manuallyInitiated takes effect because its priority is higher. For example: the incoming call matches the criteria of two CGs (Table 5), in this case CG1 should take effect if both of them meet the gap criteria.

Table 5 CG1 and CG2 have the same gapCriteria but different controlType

```
CG1{
    gapCriteria{calledAddressValue, 8765}
    gapIndicator {duration=60000sec, gapInterval=60sec}
    controlType=manuallyInitiated
 }
```

```
CG2{
    gapCriteria{calledAddressValue, 8765}
    gapIndicator {duration=30000sec, gapInterval=60sec}
    controlType=sCPOverloaded
 }
```

Note: This won't happen in China INAP because these two CGs can not coexist, see requirement (1).

38.2.1.3 RT Parameter Support Enhancement: timerValue

This enhancement is to extend the supported timerValue value.

In INAP call, timer Tssf is used to prevent the call from suspending too long, protect the dialogue between SSF and SCF. ResetTimer operation is sent from SCF to SSF, to restart Tssf timer using the timerValue, so that Tssf will not time out. It only takes effect in the following 3 states:

— waiting for instruction (WFI)

— waiting for end of user interaction (WFEOUI)

— waiting for end of temporary connection (WFEOTC)

This feature performs the following enhancement:

1. report UnexpectedDataValue error when the timerValue exceed 0-2047.

This enhancement is China INAP specific.

2. extend the supported timer values between 10 seconds & 60 seconds: 15, 20, 25, 30, 35, 40, 45, 50, 55 seconds support is added. For in-range value other than one of the above values, it is rounded up to the next supported value.

This enhancement is general for all INAP market.

3. extend the supported range for timerValue in WFI state to 1-60 seconds.

This enhancement is general for all INAP market.

38.2.1.4 CIRQ/CIRP Parameter Support Enhancement: legID, calledAddress & releaseCause

This enhancement is general for all INAP market.

This enhancement is to:

1. support CS-1R CIRP: if CIRP is datafilled in the CS1R option of table SERVINFO, the outgoing CIRP will use the CS-1R format, the legID will not be included:

Table 6 Table SERVINFO

```
SERVIDX                                                                  OPTION
-------------------------------------------------------------------------------
200    (INITDP_PARMS ( SERVKEY) (CDPA) (CLI) (CPC) (EVENT_TYPE) $)
           (TCAP_INFO ( INAP_OPT (AUTO_CONTINUE) $)(TCAP_VERSION CCITT_V1)$)
           (CS1R ( CIRP) $)$
```

2. add support for calledAddress and releaseCause parameters in CIRQ/ CIRP:

— calledAddress indicates the incoming called party address that was received by the SSF (i.e. before translation by the SCF) and is as available on the UNI or NNI and interpreted as per the numbering plan. The format is shown in Table 7.

— releaseCause is defined the same as Q.762, which is applied to the indicated or default party.The format is shown in Table 8. The diagnostics is not included in the releaseCauseValue of CIRP.

Note: for release cause, if the incoming release message is not in Q.762 format, then default value: 'normal clearing' is used.

Table 7 calledAddressValue Format (it uses the format of ISUP parameter: GenericNumber)

8	7	6	5	4	3	2	1
Number qualifier indicator							
Odd/even	Nature of address indicator						
NI Ind.	Numbering plan Ind.			Presentation Ind.		Screening Ind.	
2nd address signal				1st address signal			
.....				.....			
Filler(if necessary)				nth address signal			

Table 8 releaseCauseValue Format (same as ISUP parm: CauseIndicators)

8	7	6	5	4	3	2	1
Ext.	Coding standard		spare	Location ...			
Ext.	Cause Value						
Diagnostics (if any)							
.....							
Diagnostics (if any)							

38.2.1.5 ASF Parameter Support Enhancement: sfBillingRecordCharacteristics

This enhancement is general for all INAP market.

This enhancement is to provide support the sFBillingChargingCharacteristics. Whatever received, this parameter and sub-parameter is treated as: noINCharging.

The following functions are provided for sFBillingChargingCharacteristics subparameter:

— noINCharging

— iNCharging

— sendChargeInformation

Note: the decoding of sFBillingChargingCharacteristics is not supported. When received correct sFBillingChargingCharacteristics, no handling, no reject or return error. When recevied sFBillingChargingCharacteristics with problems, no handling, no reject or return error.

Following table gives the definition of SFBCC (highlighted in bold):

Table 9 China INAP ActiveServiceFiltering Definition:

```
ActiveServiceFiltering::= SEQUENCE {
      filteredCallTreatment [0] IMPLICIT SEQUENCE {
        sFBillingChargingCharacteristics [0] CHOICE {
          noINCharging [0] IMPLICIT NULL,
          iNCharging [1] IMPLICIT SEQUENCE {
            ......} OPTIONAL },
          sendChargeInformation [2] IMPLICIT SEQUENCE {...}} OPTIONAL,
        informationToSend [1] CHOICE {
        maximumNumberOfCounters [2] IMPLICIT INTEGER (1..100) OPTIONAL,
        releaseCause [3] IMPLICIT OCTET STRING (SIZE (2..20)) OPTIONAL},
      ......
      }
```

38.2.1.6 ACN Negotiation Support

This enhancement is to provide the following functions:

1. Support China INAP ACNs

This enhancement is China INAP specific.

The ACN definition of China INAP is shown in the following table:

Table 10 China INAP Specific Application Context Name (Based on ISO/IEC DIS 8824-1)

```
ACN pattern:
D'00 - CCITT(ITU-TS)
D'03 - Network Operator
D'xxxx - DNIC (market based)
D'01 - INAP field
D'01 - INAP
D'01 - Application Context
D'xx - specific AC value (see below)
D'00 - market based version
```

Table 10 China INAP Specific Application Context Name (Based on ISO/IEC DIS 8824-1)

ACN Values: DNIC = D'4605 Specific AC values: xx = H'00 - H'07 00 - SSP uses InitialDP to initiate dialogue 01 - SSP uses AssistRequestInstruction to initiate dialogue 03 - SCP uses InitiateCallAttempt to initiate dialogue 04 - SCP uses CallGap to initiate dialogue 05 - SCP uses ActivateServiceFiltering to initiate dialogue 06 - SSP uses ServiceFilteringResponse to initiate dialogue
ACN coding: H'(03 a3 7d 01 01 01 xx 00)

2. Support ACN negotiation

This enhancement is general for all INAP market.

Following ACN negotiation rules for SSP are supported:

a. when SSP sends TC-BEGIN package:

— encode the correct ACN into the package and store the ACN value.

b. when SSP receives TC-BEGIN package:

— if the ACN is supported, go on processing the TC component.

— else, response SCP with TC-U-ABORT. Abort reason is 'application context name not supported'.

— when processing component, if the component contains a China INAP operation, verify the application context according to the operation code (please refer to Table 10). If fails, response SCP with TC-U-ABORT, abort reason is 'application context name not supported'. Else, go on processing the component.

c. when SSP receives the first response from SCP in TC-CONTINUE/ TC-END:

— if the ACN match the ACN value of previous TC-BEGIN, go on processing the TC component.

— else, response SCP with TC-U-ABORT. Abort reason is 'application context name not supported'.

d. when SSP receives the first response from SCP in TC-U-ABORT:

— release the current dialogue.

38.2.1.7 ACR Enhancement: Conversation Time Measurement

This enhancement is China INAP specific.

This enhancement is to fix the following problem: For INAP call being charged using AC operation, when the conversation is longer than 255 seconds, the duration value in ACR will go incorrect. This problem exists in max conversation time, duration, report interval measurement.

38.2.1.8 Support CS-1R ICA

This enhancement is general for all INAP market.

This enhancement is to:

- support ICA in TC-BEGIN package
- support multiple components in TC-BEGIN package

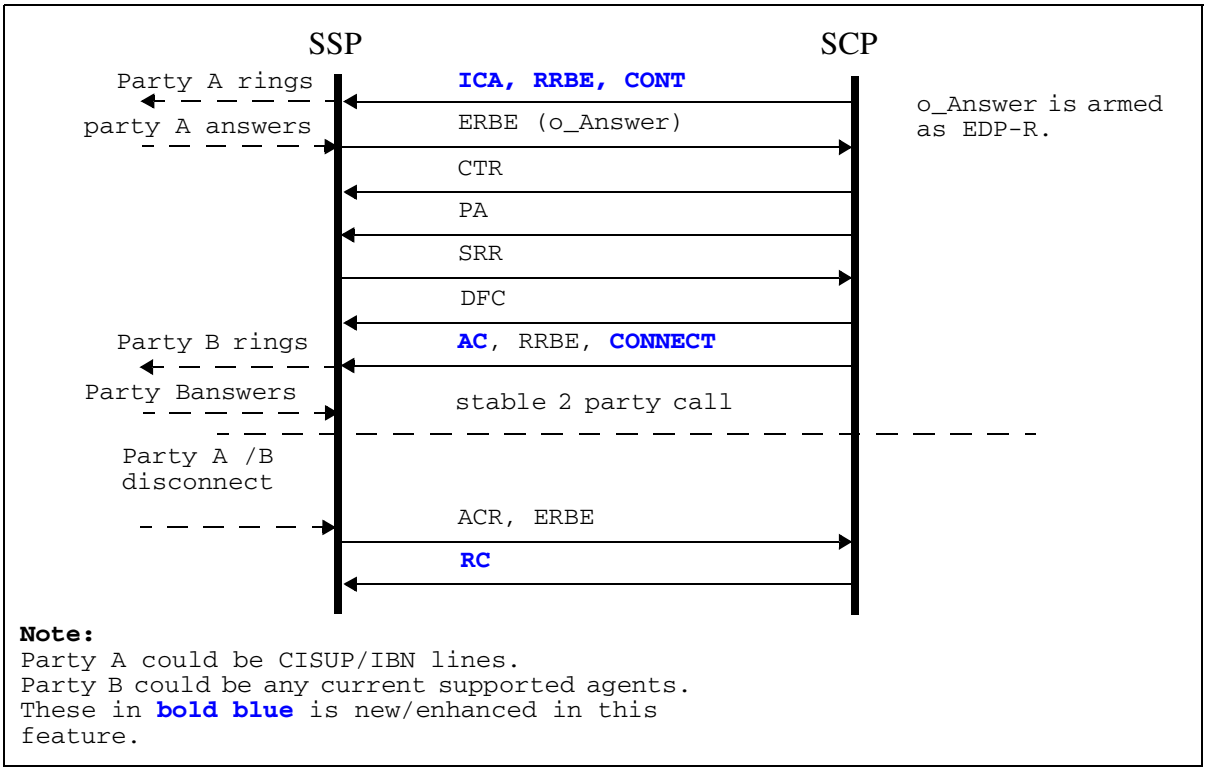
  The operation sequence must be: the first operation is ICA; the subsequence call processing operations could be RRBE, CONT, CWA, FCI, AC; the last operation must be CONT or CWA.

  If the operations in the BEGIN package does not obey the rule, the package will be aborted.

  If the package match the above rules but has logic conflict in the operations it carries, then it is out of this feature's scope. The existing handling will be used. Also the imply and handling of each operation except ICA is out of this feature's scope.
- support CS-1R ICA
- support virtual agent -> IBN line interworking
  No line features is supported in the interworking.
- enhance the AC, CONNECT handling for extended dialogue.

Following figure shows an example for ICA usage:

Figure 1 China ICA Implementation Example



As different markets may have different configuration on ICA in BEGIN package, some general rules is defined for what call related operation can be in BEGIN package:

- If the first operation is callp related, it must be ICA
- If the first operation is ICA, RRBE must be in the same package and the last operation must be CONT (CONTINUE) or CWA (ContinueWithArgument)
- The following callp operations are supported in BEGIN package if the first operation is ICA: RRBE, CWA, CONT, FCI, AC.

38.2.2 Data Requirement

Standard datafill for IN will be used.

38.3 Hardware Requirements or Dependencies

N/A.

38.4 Software Requirements or Dependencies

N/A.

38.5 Limitations and restrictions

- This feature does not support the following ACN negotiation scenario: when SSP receives the first response from SCP in TC-U-ABORT, with abort reason is ‘application context name not supported’, then verify its ACN value, if it is valid, initiate a new dialogue using the new ACN, and release the current dialogue.
- This feature only accepts the Chinese ASF SfBillingChargeCharacteristics, does not handle it. In EINTRACE, this parms is displayed. There is no any handling on this parameter.
- For parameters not mentioned in this document, their implementation exceeds this feature’s range.
- In the scenario that SCP originates a call to IBN lines, only the IBN lines use DGT are supported.

39: Functional Description (FN): A00002755

39.1 Feature name

A00002755 - CHINA PSTN LINE SERVICE COMPLIANCE

39.2 Description

This activity enhances IBN line services to comply with the China PSTN line service requirements in the China specification YDN065 and YDT1128 (partial) for DMS-Hybrid TDM solution and CS2Kc-IAD IP solution.

Table 1 below shows the IBN line services which are chosen to achieve the corresponding China PSTN line service requirements.

Table 1 Line Services Required By China Market

IBN Line Service	Requirement
CEPT SC	YDN065: Abbreviated Dialling
CEPT WML	YDN065: Hot Line Service with Time-Out
CEPT ILR	YDN065: Outgoing Call Barring
CEPT CDND	YDN065: Don't Disturb Service
CLF	YDN065: Malicious Call Tracing
CEPT IWUC	YDN065: Alarm-Call Service
CEPT CFU	YDN065: Call Forwarding Unconditional
CEPT CFD	YDN065: Call Forwarding on No Answer
CEPT CFB	YDN065: Call Forwarding on Busy
CEPT CDTA	YDN065: Absent-Subscriber Service
CEPT ICWT, CEPT SCWID	YDN065: Call Waiting
CEPT CCBS	YDN065: Call Back
CEPT I3WC	YDN065: Three Party Services
CEPT I6WC	YDN065: Conference Service
CND	YDN065: Calling Identity Delivery
CNDB, SUPRESS	YDN065: Calling Identity Delivery Restriction
AUL	YDT1128: Hot Line
CEPTPW	YDT1128: Password

IBN Line Service	Requirement
CEPTRA	YDT1128: Call Forwarding Remote Access
	YDT1128: Outgoing Call Barring Remote Access

This activity is divided into following components:

- Identification of China line service usage
- CEPT line service on the IBN line without CEPT option
- China line service's interaction compliance
- China line service's operation and administration compliance
- New downloadable China toneset CHINALGC

39.2.1 Identification of China line service usage

In order to identify in which market the line services are working, this activity introduce a new field MARKET into the tuple CEPTONCENTREX. At present, two values are available for this field. One is DEFAULT and another is CHINA. For the chinese office, this field must be set to CHINA.

Refer to following datafill example of tuple CEPTONCENTREX:

Figure 1 Datafill example of tuple CEPTONCENTREX

```
TABLE ISERVOPT
==============
CEPTONCENTREX CEPTONCENTREX CHINA (SC) (WML) (ILR) $
```

39.2.2 CEPT line service on the IBN line without CEPT option

For the CEPT line services in Table 1, "Line Services Required By China Market," on page 913, this activity allows them to work on the IBN line without CEPT option. In addition, this activity also allows the following CEPT line services to work on the IBN lines without CEPT option, which are not stated in the China Specification, but are used by China Market on DMS100I:

- CEPT CDTO
- CEPT CFF
- CEPT ICT

In order to allow all CEPT line services mentioned above on the IBN line without CEPT option, the corresponding service options must be present in tuple CEPTONCENTREX in table ISERVOPT. Table 2 below shows the available options in tuple CEPTONCENTREX, and the associated CEPT line services:

***Note**: The CEPTONCENTREX options with **bold** font are introduced by this activity.*

Table 2 CEPTONCENTREX Options and CEPT Line Services

CEPTONCENTREX OPTION	Associated CEPT Line Service
SC	SCL, SCS
WML	WML
ILR	ILR
CDIV	CDND, CFU, CFB, CFD, CFF, CDTA, CDTO, CFRA
ICT	ICT
ICWT	ICWT
IWUC	IWUC
ICWT	ICWT
CCBS	CCBS
I3WC	I3WC
I6WC	I6WC
CEPTPW	CEPTPW
CEPTRA	CEPTRA

Refer to the following datafill example of tuple CEPTONCENTREX:

Figure 2 Datafill example of tuple CEPTONCENTREX

```
TABLE ISERVOPT
==============
CEPTONCENTREX CEPTONCENTREX CHINA (SC) (WML) (ILR) (IWUC) (CDIV)
(ICT) (ICWT) (CCBS) (I3WC) (I6WC) (CEPTPW) (CEPTRA) $
```

39.2.3 China line service's interaction compliance

For the chinese market, the line services in Table 1, “Line Services Required By China Market,” on page 913 have following interactions (Note: this activity does not cover the interaction with the line services out of Table 1):

Table 3 IBN Line Services Interaction according to China requirement

IBN Line Service	Interaction
CEPT SC	The option SCS/SCL can not be assigned together with AUL. No precedence interactions with other line services.
CEPT WML	The option WML can not be assigned together with AUL. CEPT WML can not be activated when the ILR is registered to the class which restricts all calls.
CEPT ILR	The option ILR can not be assigned together with AUL. The ILR can not be registered to the class which restricts all calls when CEPT WML or CEPT I3WC is activated.

IBN Line Service	Interaction
CEPT CDND	The option CDND can not be assigned together with AUL, CDTA, CCBS or IWUC. The CEPT CDND takes precedence of CEPT CFU, CEPT CFD and CEPT CFB. The CEPT CDND takes precedence of the CEPT IWCT, no waiting calls can be established if the CEPT CDND is activated. The CLF can not be performed if the CEPT CDND is activated.
CLF	The option CLF is compatible with other line options. The CLF functionality can not be invoked if the CEPT CDND or CEPT CDTA is activated. When the CLF functionality is invoked, the CLI must be provided if it is available, even the CLI delivery is restricted. For the diverted calls, the original calling party number should be traced if possible.
CEPT IWUC	The option IWUC can not be assigned together with AUL, CDND or CDTA. The CEPT IWUC can not be activated if CEPT CFU, CEPT CFD or CEPT CFB is activated.
CEPT CFU	The option CFU can not be assigned together with AUL, CDTA or CCBS. The CEPT CFU can not be activated if CE PT IWUC is activated. The CEPT CDND takes precedence of CEPT CFU, no calls can be diverted to the destination number if the CEPT CDND is activated. The CEPT CFU takes precedence of CEPT ICWT, CEPT CFD and CEPT CFB. The party who has the CFU is not aware of the occurrence of the unconditional call diversion, and CND is not allowed to invoke on the party who diverting the CFU call. For the diverted call, the original calling party number is provided if possible.
CEPT CFD	The option CFD can not be assigned together with AUL, CDTA or CCBS. The CEPT CDND takes precedence of CE PT CFD, no calls can be diverted to the destination number if the CEPT CDND is activated. The CEPT CFD can not be activated if CEPT IWUC is activated. When the call is diverted, the CND is allowed to invoke on the party who diverting the CFD call. For the diverted call, the original calling party number is provided if possible.
CEPT CFB	The option CFB can not be assigned together with AUL or CDTA. The CEPT CDND takes precedence of CEPT CFB, no calls can be diverted to the destination number if the CE PT CDND is activated. The CEPT CFB can not be activated if CEPT IWUC is activated. The CEPT CFB takes precedence of CEPT ICWT. The party who has the CFB is not aware of the occurrence of the call diversion on busy, and CND is not allowed to invoke on the party who diverting the CFB call. For the diverted call, the original calling party number is provided if possible.

IBN Line Service	Interaction
CEPT CDTA	The option CDTA can not be assigned together with AUL, CCBS, CDND, IWUC, CFU, CFD or CFB. The CEPT CDTA takes precedence of the CEPT ICWT, no waiting calls can be established if the CEPT CDTA is activated. The CLF can not be performed if the CEPT CDTA is activated.
CEPT ICWT, CEPT SCWID	The option ICWT can not be assigned together with AUL. The CEPT CFU and CEPT CFB take precedence of CEPT ICWT, and for the CFU or CFB calls, the SCWID is not allowed.
CEPT CCBS	The option CCBS can not be assigned together with AUL, CDND, CDTA, CFU or CFD. No precedence interactions with other line services.
CEPT I3WC	The option I3WC can not be assigned together with AUL. The CEPT I3WC functionality can no be invoked when the ILR is registered to the class which restricts all calls.
CEPT I6WC	As Nortel provision. There are not detailed requirement according to the China specification YDN065.
CND	The option CND is compatible with other line options. The CND is not allowed to invoke on the party who diverting CFU or CFB calls.
CNDB, SUPRESS	The option CNDB can not be assigned together with AUL. No precedence interactions with other line services.
AUL	The option AUL can not be assigned together with SCS, SCL, WML, ILR, CDND, IWUC, CFU, CFD, CFB, CDTA, ICWT, CCBS, I3WC, I6WC or CNDB. The AUL has the highest precedence against other line services.
CEPTPW	The option CEPTPW is compatible with other line options. No precedence interactions with other line services.

***Note**: Refer to Section 39.10.9.6, 39.10.10.6, 39.10.11.6, Alarm-Call Service is incompatible with call diversion service (Call Forward Unconditional, Call Forward on No answer or Call Forward on Busy), however, refer to Section 39.11.1.1.6, Alarm-Call Service is compatible with call diversion service. After confirmed with the specification YDT1128 drafter, the interaction is that Alarm-Call Service can be assigned together with the call diversion service to the same subscriber, but both service can not be activated at the same time.*

The customer can achieve the China specific line options compatibilities/ incompatibilities by changing the table OPTOPT manually. Regarding the current release, the following changes are required to perform into table OPTOPT according to the China requirement:

— Remove ICWT, I3WC and I6WC options from the CLF tuple;

— Remove CLF option from the ICWT tuple;

— Remove CLF option from the I3WC tuple;

— Remove CLF option from the I6WC tuple;

— Add AUL, CCBS, CDTA and IWUC options to the CDND tuple;

— Add AUL, CDND and CDTA options to the IWUC tuple;

— Add CDTA and CCBS options to the CFU tuple;

— Add CDTA and CCBS options to the CFD tuple;

— Add CDTA option to the CFB tuple;

— Add CDND, IWUC, CFU, CFD, CFB and CCBS options to the CDTA tuple;

— Add CDND, CFU, CFD and CDTA options to the CCBS tuples,

— Add CDND and IWUC options to the AUL tuples.

The changes in table OPTOPT can be done by deleting the existing tuple, and adding a new tuple. Please note that, during the ONP, the table OPTOPT can not be transferred to the inactive side automatically, so the operator has to change the table OPTOPT according to the China requirement manually after the ONP.

The field MARKET of tuple CEPTONCENTREX in table ISERVOPT must set to CHINA to achieve the China line service's interaction compliance.

39.2.4 China line service's operation and administration compliance

39.2.4.1 ILR Password: Display and Change

Prior to this activity, the ILR password can not be displayed by using QDN command (it is masked with "NNNN"), and the password can not be changed by using CHF command. This activity introduces a new field SHOW_CHG_PSWD into the tuple ILRCLS in table ISERVOPT. If this field is set to Y, the ILR password allows to be displayed and changed.

Refer to following datafill example of tuple ILRCLS:

Figure 3 Datafill example of tuple ILRCLS

```
TABLE ISERVOPT
==============
>add
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED

```

39.2.4.2 IWUC: Abort wakeup request if line is in use

The existing implementation of IWUC service, if the line is in use at the scheduled time, the wakeup request may retry after a given time delay. However, according to the China specification, the wakeup request should be aborted automatically if the line is in use.

This activity introduces a new field ABORT_IF_IN_USE into the tuple IWUC in table ISERVOPT. If this field is set to Y, the wakeup request is aborted automatically when the line is in use at the scheduled time, and the IWUC102 log with the reason ‘LINE IN USER’ will be generated to indicate the abortion of the wakeup request.

Refer to following datafill example of tuple IWUC:

Figure 4 Datafill example of tuple IWUC

```
TABLE ISERVOPT
==============

```

39.2.4.3 ICWT: Datafillable Timer for "Called Party Ignores Waiting Call"

In the existing implementation of ICWT service, the time-out of timer "Called Party Ignores Waiting Call" is hardcoded as 30 seconds, however, according to China Specification YDN065, this time-out should be set to 15 seconds.

This activity introduces a new field ICWT_IGNORE_WAITING_TMO into tuple ICWT in table ISERVOPT. The operator can specify a value from 10 to 45 seconds for the timer "Called Party Ignores Waiting Call" of ICWT service. If the tuple ICWT is not present in table ISEROVPT, by default, the time-out of 30 seconds is used.

Refer to following datafill example of tuple ICWT:

Figure 5 Datafill example of tuple ICWT

```

39.2.4.4 CEPTRA: Collect DN and PIN in Different Stages

According to China Specification YDN1128, the service CEPTRA is required to collect DN and PIN in different stages, that is, the subscriber should input DN firstly, and receive prompt, then input PIN.

This activity introduces a new field COLLECT_DNPIN_IN_DIFF_STAGES into tuple CEPTPW in table ISERVOPT, if this field is set to Y, the CEPTRA will collect DN and PIN in different stages.

Moreover, in order to support to play announcements to prompt the subscriber to input DN and PIN, two new announcements (COLLECT_DN_ONLY and COLLECT_PIN_ONLY) are introduced to the service CEPTRA, the operator can datafill tuple CEPTPW in table ISERVOPT to assign the corresponding announcement trunks which are connected for the new announcement names.

When provisioning the announcements for the service CEPTRA, if the field COLLECT_DNPIN_IN_DIFF_STAGES is set to Y, the announcement IDs COLLECT_DN_ONLY and COLLECT_PIN_ONLY are required to provision, and the announcement ID DNPIN is useless, and the datafill is not required. If the field COLLECT_DNPIN_IN_DIFF_STAGES is set to N, the announcement ID DNPIN is required to provision, and the announcement IDs COLLECT_DN_ONLY and COLLECT_PIN_ONLY are useless.

Refer to following datafill examples of tuple CEPTPW and announcement provision when the field COLLECT_DNPIN_IN_DIFF_STAGES is set to Y:

Figure 6 Datafill example of tuple CEPTPW

```

On the above announcements provisioning example, the announcements CEPTRA_COLL_DN and CEPTRA_COLL_PIN for the announcement IDs COLLECT_DN_ONLY and COLLECT_PIN_ONLY should be recorded as:

- **CEPTRA_COLL_DN**: “Please enter your telephone number”

  This is an interruptible announcement and applied to the subscriber when he/she dials DISA DN in order to use CEPTRA. It is datafilled as CEPTRA_COLL_DN 0 in the datafill example in the figure 7.

- **CEPTRA_COLL_PIN**: “Please enter your password of the telephone number which you entered just now”

  This is an interruptible announcement and applied to the subscriber when he/she dials a valid telephone number. It is datafilled as CEPTRA_COLL_PIN 0 in the datafill example in the figure 7.

For provisioning other announcements, please refer to the FN of activity A00001919.

39.2.4.5 SCU on CEPT SCL

When the telecom operating company sets up a Centrex group, some fixed abbreviated codes may request to be defined on per Centrex group basis. This requirement can be fulfilled by using SCU and SCL services in the Centrex group.

Prior to this feature, the SCU service can not be supported on CEPT SCL service. This feature allows the SCU service to be used on the CEPT SCL service if the option SC is datafilled in the tuple CEPTONCENTREX.

Following feature metering charges for SCU on CEPT SCL are introduced:

- ASSIGN - The option SCU is assigned to the line via SERVORD.
- DEASSIGN - The option SCU is de-assigned from the line via SERVORD.
- ADMPROG - The option SCU of the line is changed via SERVORD.
- USAGE - The line which SCU service dials a valid abbreviated code.

The SCU metering is charged only when the option SC is datafilled in the tuple CEPTONCENTREX.

In order to supply feature metering the table MTRFEAT should be datafilled properly for seven meterable activities.In addition the MOG option should have been provisioned against the subscriber. Please refer to FN section of A59017349 feature metering provisioning.

39.2.5 New downloadable China toneset CHINALGC

This activity introduces a downloadable China toneset CHINALGC, which can be specified for the PLGC in table LTCINV to support the ADSI CAS tone.

The toneset CHINALGC has the following tones definitions:

— Test and Diagnostic Tones

— DTMF Tones

— Simple Supervisory Tones

— Periodic Supervisory Tones

The operating company can change the field TONESET of the PLCG datafill in table LTCINV to specify the toneset CHINALGC. For the toneset change, the PLGC is requested to perform BSY and RTS manipulation in the MAPCI interface to take it effect, the toneset parameters can then be downloaded from the CM as part of XPM's static data upon RTS.

Please refer to section “39.12 Tone Specifications” on page 953 for more information.

The following datafills are required for activating feature tones in the existing parameters and tables:

- For all feature tones, in OFCENG table,

  FEATURE_TONE_SET CHINALGC

- For CWT in OFCVAR table,

  CWT_TONE_LENGTH 4

  CWT_TONE_CYCLE_TIME 5

  CWT_NO_OF_ALERTS 3

39.3 Hardware Requirements or Dependencies

N/A.

39.4 Software Requirements or Dependencies

N/A.

39.5 Limitations and restrictions

- According to the existing handling, during the ONP, the table OPTOPT can not be transferred to the inactive side automatically, so the operator has to change the table OPTOPT according to the China requirement manually after the ONP.
- For the line services that Centrex and CEPT are sharing the same line options (such as CFU, CFD and CFB), if the corresponding service options are present in tuple CEPTONCENTEX in table ISERVOPT, then only the CEPT line services can be available in the office.
- Regarding the China requirement of the service “Hot Line Service with Time-Out” in section 39.10.2, the CEPT WML service can not be activated by the subscriber when the CEPT ILR service has been activated as restriction class K=1 on the line. However, the CEPT WML service can be activated by the operator via SERVORD when the CEPT ILR service has been activated as restriction class K=1 on the line.
- Regarding the China requirement of the service “Outgoing Call Barring” in section 39.10.3, the CEPT ILR service can not be activated as restriction class K=1 by the subscriber when the CEPT WML service has been activated or the CEPT I3WC service has been assigned on the line. However, the CEPT ILR service can be activated as restriction class K=1 by the operator via SERVORD when the CEPT WML service has been activated or the CEPT I3WC service has been assigned on the line.

- Regarding the China requirements of the service “Call Forwarding Unconditional” in section 39.10.9, “Call Forwarding on No Answer” in section 39.10.10 and “Call Forwarding on Busy” in section 39.10.11, the CEPT CFU, CFD and CFB services can not be activated by the subscriber when the subscriber has activated a wake-up request. However, the CEPT CFU, CFD and CFB services can be activated by the operator via SERVORD when the subscriber has activated a wake-up request.
- Regarding the China requirement of the service “Three Party Service” in section 39.10.15, the line option I3WC can be assigned to the line by the operator via SERVORD even when the CEPT ILR service is activated as restriction class K=1 on the line.
- Regarding the China requirement of the service “Call Waiting” in section 39.10.13, the CEPT ICWT service can not support the permanent activation. The operator can activate the ICWT service when assigning it to the subscriber, however, the subscriber can deactivate the ICWT by dialing corresponding access code.
- For the subscriber assigned with the CEPT services such as ICWT, I3WC, I6WC and ICT, in order to invoke the corresponding functionalities (such as: toggle, disconnect talking party or establish conference) of these services, the subscriber must to dial the R-Code after flashing. The R-Code is one digit code of 1~9 or 0. This implicitly means only one digit is allowed to input when the subscriber goes flash, and the digit * and # is illegal. It is not allowed to activate/deactivate/program/interrogate other services when these services require the subscriber to dial the R-Code.
- According to the feature A00001919, the R1 loopback trunks are required to perform digit collection for CEPTRA calls incoming from ISUP/TUP/FDCP R2 trunks. However, if UTR (Universal Tone Receiver) card exists on the XPM, the digit collection is supported on incoming ISUP/TUP/FDCP R2 trunks directly, no R1 loopback trunks are required. This feature is responsible to verify this functionality on the China variant trunks (CISUP/CTUP/FDCP C1) only. For the other markets request this functionality, the further verification is required accordingly.
- Refer to existing restrictions of the related line services.

39.6 Interactions

39.10 Appendix 1: China PSTN Line supplementary Services (YDN065)

39.10.1 Abbreviated Dialling

39.10.1.1 Service Description

Subscriber can specify a list of target numbers (local, national or international numbers), and assign a one- or two-digit code (abbreviated code) to each number.

When the subscriber dials the abbreviated code, the switch associates it with the assigned TN and attempts to complete the call.

39.10.1.2 Service Registration

This service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *51*MN*TN#,

— Receives confirmation tone,

— Goes on-hook.

where, the code MN stands for the abbreviated code, the code TN stands for the target number, which can be a local, national or international number.

39.10.1.3 Service Usage

The subscriber can use this service through the following steps:

— Subscriber goes off-hook,

— Receives dial tone

— Dials **MN

where, the code MN stands for abbreviated code.

39.10.1.4 Service Cancellation

This service can be cancelled on the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *51*MN#,

— Receives confirmation tone,

— Goes on-hook.

where, the code MN stands for the abbreviated code.

39.10.1.5 Interaction with other services

a. No collision with other PSTN line services.

39.10.2 Hot Line Service with Time-Out

39.10.2.1 Service Description

If the subscriber lifts the handset and dials no digit during a given time, the switch will set up a call to a predetermined destination number after the timer expires. The subscriber can program the predetermined destination number.

39.10.2.2 Service Registration

This service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *52*TN#,

— Receives confirmation tone,

— Goes on-hook.

where, the code TN stands for the target number.

39.10.2.3 Service Usage

If the subscriber wants to call a predetermined destination number, the call can be established automatically by switch if the subscriber lifts the handsets and dials no digit within 5 seconds.

If the subscriber wants to call the subscriber other than the predetermined destination number, the subscriber can start dialing within 5 seconds, and the call is processed as a regular call.

39.10.2.4 Service Cancellation

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #52#,

— Receives confirmation tone,

— Goes on-hook.

39.10.2.5 Interaction with other services

a. Outgoing Call Barring

Hot Line Service with Time-Out can not be activated when Outgoing Call Barring Service is activated and its restriction class (K) is

registered to 1. On the other hand, Outgoing Call Barring Service can not set its restriction Class (K) to 1 when Hot Line Service with Time-Out Service is activated.

b. No collision with other PSTN line services.

39.10.3 Outgoing Call Barring

39.10.3.1 Service Description

This service restricts the outgoing calls according to the restriction class (K):

— Deny all outgoing calls (K=1), includes the local calls.

— Deny the national and international direct dial calls (K=2).

— Deny the international direct dial calls (K=3)

39.10.3.2 Service Registration

This service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *54*KSSSS#,

— Receives confirmation tone,

— Goes on-hook.

where, the code K stands for the restriction class (K=1/2/3), the code SSSS stands for 4 digits password, which is preassigned by the administrator when the user subscribes this service.

39.10.3.3 Service Usage

If the restriction class is set, all restricted outgoing calls from the phone are routed to a busy tone.

39.10.3.4 Service Cancellation

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #54*KSSSS#,

— Receives confirmation tone,

— Goes on-hook.

where, the code K stands for the restriction class, which must be identical with the registered restriction class; The code SSSS stands for 4-digits password, which is preassigned by the administrator when the subscriber applies this service.

39.10.3.5 Service Interrogation

The subscriber can interrogate service status through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *#54#,

— Receives confirmation tone,

— Goes on-hook.

39.10.3.6 Interaction with other services

a. Hot Line Service with Time-Out

Refer to Section 39.10.2.5, item a.

b. Three Party Services

The subscriber can not apply Three Party Service when Outgoing Call Barring Service is activated and its restriction class (K) is registered to 1, on the other hand, Outgoing Call Barring Service can not set its restriction Class (K) to 1 when Three Party Service is assigned to the subscriber.

c. No collision with other PSTN line services.

39.10.4 Don’t Disturb Service

39.10.4.1 Service Description

This service can be used when the subscriber does not want to receive any incoming calls in a period. The switch will route all incoming calls to an announcement. This service does not impact the outgoing calls of this subscriber.

39.10.4.2 Service Registration

This service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *56#,

— Receives confirmation tone,

— Goes on-hook.

39.10.4.3 Service Usage

If this service is activated, all incoming calls to the subscriber are routed to an announcement.

39.10.4.4 Service Cancellation

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #56#,

— Receives confirmation tone,

— Goes on-hook.

39.10.4.5 Interaction with other services

a. Call Diversion (including: Call Forwarding Unconditional, Call Forwarding on No Answer and Call Forwarding on Busy)

When the subscriber has registered both Call Diversion and Don't Disturb Service at the same time, Don't Disturb Service takes precedence of Call Diversion.

b. Absent-Subscriber Service

Absent-Subscriber Service and Don't Disturb Service are incompatible. The subscriber can not apply Absent-Subscriber Service and Don't Disturb Service at the same time.

c. Call Back

Call Back and Don't Disturb Service are incompatible. The subscriber can not apply Call Back and Don't Disturb Service at the same time.

d. Call Waiting

It is impossible that the subscriber has the waiting call when Don't Disturb Service is activated.

e. Malicious Call Tracing

The malicious call can not be traced when Don't Disturb Service is activated.

f. Alarm-Call Service

Alarm-Call Service and Don't Disturb Service are incompatible. The subscriber can not apply Alarm-Call Service and Don't Disturb Service at the same time.

g. No collision with other PSTN line services.

39.10.5 Malicious Call Tracing

39.10.5.1 Service Description

The subscriber can apply this service to trace the calling number of the malicious call.

39.10.5.2 Service Registration

This service is assigned by the operator per request from the subscriber.

39.10.5.3 Service Usage

The subscriber can use this service through the following steps:

— Subscriber receives a malicious call,

— Goes flash and receives dial tone,

— Dials *32#,

— Receives confirmation tone,

— Goes on-hook.

39.10.5.4 Service Cancellation

This service is cancelled by the operator per request from the subscriber.

39.10.5.5 Interaction with other services

a. Call Diversion (including: Call Forwarding Unconditional, Call Forwarding on No Answer and Call Forwarding on Busy)

   For the call scenario that subscriber A calls subscriber B, and this call is diverted to subscriber C (A->B->C), if the subscriber C requests Malicious Call Tracing service, the switch should provide the number of subscriber A if possible. For some reason or restriction, for example, subscriber A and B belong to the same local network, but subscriber B and C belong to different network, and subscriber B and C are connected via R2 MFC trunk (C1), then the subscriber C only can get the number of subscriber B.

b. Calling Identity Delivery Restriction

   Even when the calling party has Calling Identity Delivery Restricting Service (in this case, the calling number can not be allowed to be displayed on the called party), the operating company must provide the calling number to the subscriber.

c. Don’t Disturb Service

   Refer to Section 39.10.4.5, item e.

d. Absent-Subscriber Service

   The malicious call can not be traced if Absent-Subscriber Service is activated. The subscriber can not apply Absent-Subscriber Service and Malicious Call Tracing at the same time.

e. No collision with other PSTN line services.

39.10.6 Alarm-Call Service

39.10.6.1 Service Description

The switch can ring the phone automatically at the subscriber specified time to remind the subscriber.

39.10.6.2 Service Registration

This service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *55*$H_1H_2M_1M_2$#,

— Receives confirmation tone,

— Goes on-hook.

where, the code H_1H_2 stands for the hour (00-23), M_1M_2 stands for the minute (00-59).

39.10.6.3 Service Usage

At the subscriber specified time, the switch will ring the subscriber's phone. If the subscriber goes off-hook, he/she can receive the reminder announcement, and this service is cancelled automatically. If the call is not answered, the ring will last 1 minute. Five minutes later, the switch will ring the phone again. If the second attempt is also not answered, this service will be cancelled after 1 minute ring. Moreover, at the subscriber specified time, if the phone is in use, this Alarm-Call Service will be cancelled automatically.

39.10.6.4 Service Cancellation

This service can be cancelled on the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #55#,

— Receives confirmation tone,

— Goes on-hook.

39.10.6.5 Interaction with other services

a. Don't Disturb Service

   Refer to Section 39.10.4.5, item f.

b. Absent-Subscriber Service

   Absent-Subscriber Service and Alarm-Call Service are incompatible. The subscriber can not apply Absent-Subscriber Service and Alarm-Call Service at the same time.

c. Call Diversion

Call Diversion and Alarm-Call Service are incompatible. The subscriber can not apply Call Diversion and Alarm-Call Service at the same time.

d. No collision with other PSTN line services.

39.10.7 Interception Calls

The switch should have the capability to intercept the calls that can not be established successfully (for instance, vacant number or the blocked route), and route these calls to the announcement.

39.10.8 Registered Call

This service is not used at present. Omitted here.

39.10.9 Call Forwarding Unconditional

39.10.9.1 Service Description

This service allows the subscriber to divert all incoming calls to a predetermined destination number (including the voice mail box), regardless of the subscriber's state.

39.10.9.2 Service Registration

This service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *57*PQABCD#,

— Receives confirmation tone,

— Goes on-hook.

where, the code PQABCD stands for the predetermined destination number (the number in this example is 6 digits).

39.10.9.3 Service Usage

After this service is activated, all incoming calls to the subscriber will be diverted to the predetermined destination number automatically.

39.10.9.4 Service Cancellation

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #57#,

— Receives confirmation tone,

— Goes on-hook.

39.10.9.5 Service Interrogation

The subscriber can interrogate service status through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *#57*PQABCD#,

— Receives confirmation tone,

— Goes on-hook.

where, the code PQABCD stands for predetermined destination number (the number in this example is 6 digits).

39.10.9.6 Interaction with other services

a. Absent-Subscriber Service

Absent-Subscriber Service and Call Forward Unconditional are incompatible. The subscriber can not apply Absent-Subscriber Service and Call Forward Unconditional at the same time.

b. Don't Disturb Service

Refer to Section 39.10.4.5, item a.

c. Call Waiting

Call Forwarding Unconditional takes precedence of Call Waiting if both services are activated.

d. Alarm-Call Service

Refer to Section 39.10.6.5, item b.

e. Malicious Call Tracing

Refer to Section 39.10.5.5, item a.

f. Call Back

Call Back and Call Forwarding Unconditional are incompatible. The subscriber can not apply Call Back and Call Forward Unconditional at the same time.

g. Call Forwarding on Busy

Call Forward Unconditional Service takes precedence of Call Forwarding on Busy Service if both services are activated.

h. Call Forwarding on No Answer

Call Forwarding Unconditional takes precedence of Call Forwarding on No Answer if both services are activated.

i. Calling Identity Delivery

If subscriber A makes call to subscriber B, and this call is diverted to subscriber C (that is, A->B->C), in case that both subscriber B and C have Calling Identity Delivery Services, only the subscriber C can display the subscriber A's number.

j. No collision with other PSTN line services.

39.10.10 Call Forwarding on No Answer

39.10.10.1 Service Description

This service allows the subscriber to divert the incoming calls to a predetermined destination number if the called party does not answer within a prescribed time.

39.10.10.2 Service Registration

This service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *41*PQABCD#,

— Receives confirmation tone,

— Goes on-hook.

where, the code PQABCD stands for the predetermined destination number (the number in this example is 6 digits).

39.10.10.3 Service Usage

After this service is activated, all incoming calls which are not answered within a prescribed time will be diverted to the predetermined destination number automatically.

39.10.10.4 Service Cancellation

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #41#,

— Receives confirmation tone,

— Goes on-hook.

39.10.10.5 Service Interrogation

The subscriber can interrogate service status through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *#41*PQABCD#,

— Receives confirmation tone,

— Goes on-hook.

where, the code PQABCD stands for predetermined destination number (the number in this example is 6 digits).

39.10.10.6 Interaction with other services

a. Absent-Subscriber Service

Absent-Subscriber Service and Call Forward on No Answer are incompatible. The subscriber can not apply Absent-Subscriber Service and Call Forward on No Answer at the same time.

b. Don't Disturb Service

Refer to Section 39.10.4.5, item a.

c. Alarm-Call Service

Refer to Section 39.10.6.5, item b.

d. Malicious Call Tracing

Refer to Section 39.10.5.5, item a.

e. Call Back

Call Back and Call Forward on No Answer are incompatible. The subscriber can not apply Call Back and Call Forward on No Answer at the same time.

f. Calling Identity Delivery

If subscriber A makes call to subscriber B, and the unanswered call is diverted to subscriber C (that is, A->B->C), in case that both subscriber B and C have Calling Identity Delivery Service, the subscriber A's number can be displayed on both phones of subscriber B and C.

g. No collision with other PSTN line services.

39.10.11 Call Forwarding on Busy

39.10.11.1 Service Description

This service allows the subscriber to divert the incoming calls to a predetermined destination number if the called party is in busy state.

39.10.11.2 Service Registration

This service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *40*PQABCD#,

— Receives confirmation tone,

— Goes on-hook.

where, the code PQABCD stands for predetermined destination number (the number in this example is 6 digits).

39.10.11.3 Service Usage

After this service is activated, if the called line is in use, all incoming calls to the subscriber will be diverted to the predetermined destination number automatically.

39.10.11.4 Service Cancellation

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #40#,

— Receives confirmation tone,

— Goes on-hook.

39.10.11.5 Service Interrogation

The subscriber can interrogate service status through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *#40*PQABCD#,

— Receives confirmation tone,

— Goes on-hook.

where, the code PQABCD stands for predetermined destination number (the number in this example is 6 digits).

39.10.11.6 Interaction with other services

a. Absent-Subscriber Service

   Absent-Subscriber Service and Call Forward on Busy are incompatible. The subscriber can not apply Absent-Subscriber Service and Call Forward on Busy at the same time.

b. Don’t Disturb Service

   Refer to Section 39.10.4.5, item a.

c. Call Waiting

Call Forward on Bust takes precedence of Call Waiting if both services are activated.

d. Alarm-Call Service

Refer to Section 39.10.6.5, item b.

e. Malicious Call Tracing

Refer to Section 39.10.5.5, item a.

f. Calling Identity Delivery

If subscriber A makes call to subscriber B in busy state, and the call is diverted to subscriber C (that is, A->B->C), in case that both subscriber B and C have Calling Identity Delivery Service, only the subscriber C can display the subscriber A's number.

g. No collision with other PSTN line services.

39.10.12 Absent-Subscriber Service

39.10.12.1 Service Description

The subscriber can activate this service when he/she is absent. The operating company will respond to all incoming calls on behalf of the subscriber.

39.10.12.2 Service Registration

This service can be registered through following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *50#,

— Receives confirmation tone,

— Goes on-hook.

39.10.12.3 Service Usage

When this service is activated, all incoming calls are routed to an announcement to inform the calling party that the called party is absent at present.

39.10.12.4 Service Cancellation

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #50#,

— Receives confirmation tone,

— Goes on-hook.

39.10.12.5 Interaction with other services

a. Call Back

Call Back and Absent-Subscriber Service are incompatible. The subscriber can not apply Call Back and Absent-Subscriber Service at the same time.

b. Malicious Call Tracing

Refer to Section 39.10.5.5, item d.

c. Call Waiting

Absent-Subscriber Service takes precedence of Call Waiting. If Absent-Subscriber Service is activated, no waiting calls can be established.

d. Alarm-Call Service

Refer to Section 39.10.6.5, item b.

e. Call Diversion

Refer to Section 39.10.9.6, item a; Section 39.10.10.6, item a; Section 39.10.11.6, item a.

f. Don’t Disturb Service

Refer to Section 39.10.4.5, item b.

g. No collision with other PSTN line services.

39.10.13 Call Waiting

39.10.13.1 Service Description

When the subscriber A is talking with subscriber B, if the subscriber C attempts to make a call to subscriber A, A will get a call waiting indication to know someone else is waiting for a call connection.

39.10.13.2 Service Registration

For the permanent service of Call Waiting, it is assigned by the operator per the request from the subscriber. No special registration action is required when using this service.

If the subscriber only uses this service casually, this service can be registered through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *58#,

— Receives confirmation tone,

— Goes on-hook.

39.10.13.3 Service Usage

When the subscriber A is talking with B, and the subscriber C calls subscriber A, the subscriber A will receive the waiting tone, and the subscriber C will receives ring back tone, the subscriber has three options:

1 Reject the connection request of the waiting subscriber

Do nothing, the waiting call will be dropped after 15 seconds.

2 Hold the active connection and talk with the waiting subscriber

— Subscriber goes flash,

— Receives dial tone,

— Dials 2

3 Terminate the active connection and talk with the waiting subscriber

— Subscriber goes flash,

— Receives dial tone,

— Dials 1

39.10.13.4 Service Cancellation (For casual using)

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #58#,

— Receives confirmation tone,

— Goes on-hook.

39.10.13.5 Interaction with other services

a. Calling Identity Delivery

When both services of Calling Identity Delivery and Call Waiting are activated, the calling number should be displayed on the phone when the subscriber receives the call waiting tone.

b. Call Diversion

Refer to Section 39.10.9.6, item c and Section 39.10.11.6, item c.

c. No collision with other PSTN line services.

39.10.14 Call Back

39.10.14.1 Service Description

This service provides the subscriber with ability to set up an automatic call back in the switch when he/she encounters a busy called party.

39.10.14.2 Service Registration

In case that the called party is busy, the calling party can register a call back request in switch through following steps:

— Subscriber goes flash,

— Receives dial tone,

— Dials *59#,

— Receives confirmation tone,

— Goes on-hook.

39.10.14.3 Service Usage

If this service is registered, when both parties are idle, the calling party is given ring when the calling party answers, the call is set up and called party is given ring.

The call back request is cancelled if the calling party is not answered at the first call back attempt.

39.10.14.4 Service Cancellation

This service can be cancelled by the subscriber through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials #59#,

— Receives confirmation tone,

— Goes on-hook.

39.10.14.5 Interaction with other services

a. Absent-Subscriber Service

   Refer to Section 39.10.12.5, item a.

b. Don’t Disturb Service

   Refer to Section 39.10.4.5, item c.

c. Call Diversion

   Refer to Section 39.10.9.6, item f; Section 39.10.10.6, item e.

d. No collision with other PSTN line services.

39.10.15 Three Party Services

39.10.15.1 Service Description

This service provides a subscriber with the ability to place an existing call on hold and set up a call to another subscriber. The controller can put three parties into a conference, or toggle and drop the active party when the three-way call is in progress.

39.10.15.2 Service Registration

This service is assigned by the operator per request from the subscriber. No special registration action is required when using this service.

39.10.15.3 Service Usage

1 When subscriber A is talking with subscriber B, if subscriber A wants to talk with subscriber C, A can go flash to hold the connection with B and dial the number of C after receiving dial tone, A can talk with C after the connection is created. In case that A can not connect C, A can go flash again to resume the conversation of B.

2 When A is talking with C, if A wants to talk with B again and remain the connection of C, A can go flash and dial digit 2 after receiving dial tone. If A doesn't want to remain the connection of C, A can go flash and dial digit 1 after receiving dial tone, the connection of C will be dropped and the connection is switched to B.

3 When A is talking with C, if A wants B to join in this conversation, A can go flash and dial digit 3 after receiving dial tone, then the three party conference can be established.

4 During the three party conference, if the controller A wants to talk with one party privately and hold another party, A can go flash and dial digit 2.

39.10.15.4 Interaction with other services

a. Outgoing Calling Barring

   Refer to Section 39.10.3.6, item b.

b. No collision with other PSTN line services.

39.10.16 Conference Service

39.10.16.1 Service Description

This service provides more than three ports connection during a call. The conference must be established by the operator.

39.10.17 Calling Identity Delivery

39.10.17.1 Service Description

This service can deliver the calling number to the called party, and display the calling number on the called party's phone.

This service is applicable to the called subscriber only.

This service is assigned by the operator per request from the subscriber. No special registration action is required when the subscriber uses this service.

39.10.17.2 Interaction with other services

a. Call Diversion

   Refer to Section 39.10.9.6, item i; Section 39.10.10.6, item f; Section 39.10.11.6, item f.

b. Malicious Call Tracing

   Refer to Section 39.10.5.5, item b.

c. Call Waiting

   Refer to Section 39.10.13.5, item a.

d. Calling Identity Delivery Restriction

   If the calling number is restricted to the called party, the calling number can not be displayed on the called party even though the called party applies Calling Identity Delivery Service.

e. No collision with other PSTN line services.

39.10.18 Calling Identity Delivery Restriction

39.10.18.1 Service Description

The subscriber can use this service to restrict the display of the calling number on the called party's phone.

39.10.18.2 Service Registration

The subscriber must specify which category he/she belongs to when applying this service from the operator:

— Category A subscriber, who can restrict the calling number delivery through the certain operation on an individual call basis. By default, the calling number is allowed to be displayed on the called party.

— Category B subscriber, who can allow the calling number delivery through the certain operation on an individual call basis. By default, the calling number is restricted to be displayed on the called party.

— Category C subscriber, who never allows the calling number delivery to the called party.

39.10.18.3 Service Usage

1 For the category A subscriber, in this particular call, the calling number is allowed to be delivered to the called party through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *62, following with the called number.

2 For the category B subscriber, the calling number is not allowed to be delivered to the called party through the following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *68, following with the called number,

39.10.18.4 Interaction with other services

a. Malicious Call Trace

Refer to Section 39.10.5.5, item b.

b. No collision with other PSTN line services.

39.11 Appendix 2: Additional China PSTN Line supplementary Services (YDT1128, Partial)

39.11.1 Enhanced Remote Access Services

39.11.1.1 Call Forwarding Remote Access

39.11.1.1.1 Service Registration

This service is assigned by the operator per request from the subscriber.

39.11.1.1.2 Service Activation

The subscriber A can activate the call diversion from the remote location through following steps:

a. Subscriber A goes off-hook and receives dial tone. A dials "$0X_1X_2$PQRYYYY" if the remote phone and the subscriber A's base station do not belong to the same local network, or dials "PQRYYYY" if the remote phone and the subscriber A's base station belong to the same local network.

In the above dialing, "$0X_1X_2PQR$" stands for the area code and the office code of the subscriber A's base station, "YYYY" stands for the access code of this service.

b. Subscriber A receives the announcement which prompts to input the base station number. A dials "PQRABCD", which is the number.

c. Subscriber A receives the announcement which prompts to input the subscriber A's password. A dials "$S_1S_2S_3S_4$", which is the password.

d. Subscriber A receives the prompt announcement. A dials *SC*FTN#, receives the announcement to inform that the operation is successful. A goes on-hook.

In the above dialing, "SC" stands for the access code of call diversion (Unconditional/Busy/No Answer, SC=57/40/41), "FTN" stands for the forwarded target number.

39.11.1.1.3 Service Usage

If the corresponding call diversion of the subscriber A is activated, the call to subscriber A will be diverted to the target number according to the state of the line and the activated type of call diversion.

39.11.1.1.4 Service Deactivation

The subscriber A can deactivate the call diversion from the remote location through the following steps:

a. Subscriber A goes off-hook and receives dial tone. A dials "$0X_1X_2PQRYYYY$" if the remote phone and the subscriber A's base station do not belong to the same local network, or dials "PQRYYYY" if the remote phone and the subscriber A's base station belong to the same local network.

In the above dialing, "$0X_1X_2PQR$" stands for the area code and the office code of the subscriber A's base station, "YYYY" stands for the access code of this service.

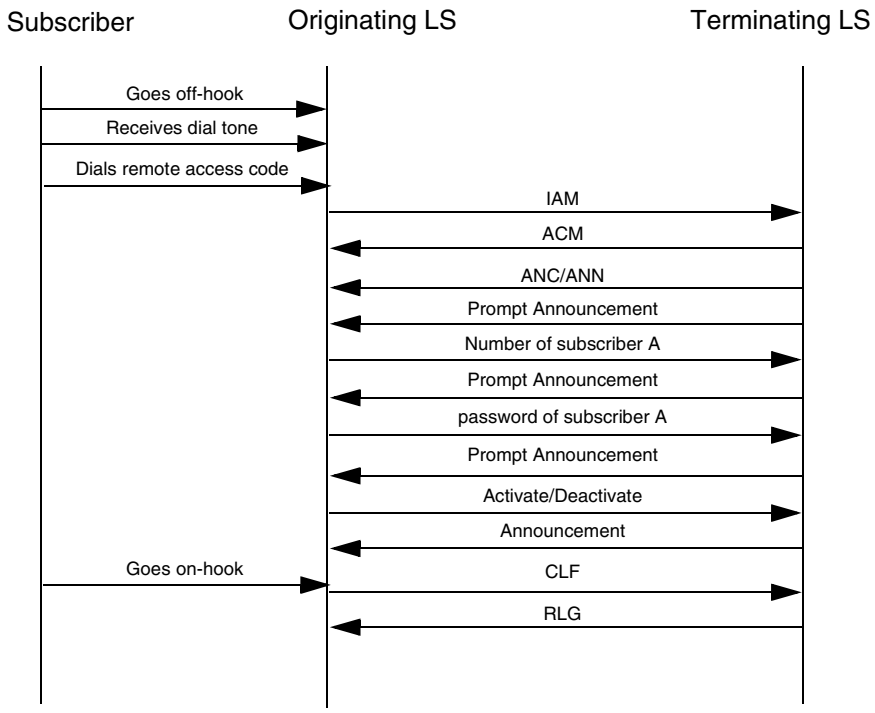
b. Subscriber A receives the announcement which prompts to input the base station number. A dials "PQRABCD", which is the number.

c. Subscriber A receives the announcement which prompts to input the remote subscriber A's password. A dials "$S_1S_2S_3S_4$", which is the password.

d. Subscriber A receives the prompt announcement. A dial #SC#. A receives the announcement to inform that the operation is successful, goes on-hook.

In the above dialing, "SC" stands for the access code of call diversion (Unconditional/Busy/No Answer, SC=57/40/41).

39.11.1.1.5 Signalling Flow



39.11.1.1.6 Interaction with other services

a. Alarm-Call Service

   Both services can be used on the same subscriber.

b. Refer to Section 39.10.10.6, 39.10.11.6 and 39.10.12.5 for the interaction with other services

39.11.1.2 Outgoing Call Barring Remote Access

39.11.1.2.1 Service Registration

This service is assigned by the operator per request from the subscriber.

39.11.1.2.2 Service Activation

The subscriber A can activate the Outgoing Call Barring service from the remote location through the following steps:

a. Subscriber A goes off-hook and receives dial tone. A dials "$0X_1X_2$PQRYYYY" if the remote phone and the subscriber A's base station do not belong to the same local network, or dials "PQRYYYY" if the remote phone and the subscriber A's base station belong to the same local network.

In the above dialing, "$0X_1X_2PQR$" stands for the area code and the office code of the subscriber A's base station, "YYYY" stands for the access code of this service.

b. Subscriber A receives the announcement which prompts to input the base station number. A dials "PQRABCD", which is the number.

c. Subscriber A receives the announcement which prompts to input the subscriber A's password. A dials "$S_1S_2S_3S_4$", which is the password.

d. Subscriber A receives the prompt announcement. A dials *54*$KS_1S_2S_3S_4$#. A receives the announcement to inform the subscriber the operation is successful. A goes on-hook.

In the above dialing, the code K stands for the restriction class:

K=1: Deny all outgoing calls, includes the local calls.

K=2: Deny the national and international direct dial calls.

K=3: Deny the international direct dial calls.

39.11.1.2.3 Service Usage

If Outgoing Call Barring of the subscriber A is activated, all restricted outgoing calls from this phone is routed to a busy tone or an announcement.

39.11.1.2.4 Service Deactivation

The subscriber A can deactivate the Outgoing Call Barring service from the remote location through following steps:

a. Subscriber A goes off-hook and receives dial tone. A dials "$0X_1X_2PQRYYYY$" if the remote phone and the subscriber A's base station do not belong to the same local network, or dials "PQRYYYY" if the remote phone and the subscriber A's base station belong to the same local network.

In the above dialing, "$0X_1X_2PQR$" stands for the area code and the office code of the subscriber A's base station, "YYYY" stands for the access code of this service.

b. Subscriber A receives the announcement which prompts to input the base station number. A dials "PQRABCD", which is the number.

c. Subscriber A receives the announcement which prompts to input the remote subscriber A's password. A dials "$S_1S_2S_3S_4$", which is the password.

d. Subscriber A receives the prompt announcement. A dials "#54*$KS_1S_2S_3S_4$". A receives the announcement to inform the subscriber the operation is successful. A goes on-hook.

39.11.1.2.5 Signalling Flow

Refer to Section 39.11.1.1.5.

39.11.1.2.6 Interaction with other services

a. Refer to Section 39.10.3.6 for the interaction with other services.

39.11.2 Hot Line

39.11.2.1 Service Registration

This service is assigned and programmed by the operator. The subscriber must predetermine the target number when applying this service.

39.11.2.2 Service Usage

When the subscriber goes off-hook, the switch immediately sets up the call to the predetermined terminating target number.

39.11.2.3 Interaction with other services

Hot line can not be compatible with the line services which require the operations via phone.

39.11.3 Password

39.11.3.1 Service Registration

The subscriber must apply this service and provide the password when applying the other line services require password (Such as: Outgoing Call Barring or Remote Access Services).

This service is assigned by the operator.

39.11.3.2 Service Usage

This service only can be used for other PSTN line services which require password.

39.11.3.3 Password Modification

The subscriber only can change the password at his/her own phone station via following steps:

— Subscriber goes off-hook,

— Receives dial tone,

— Dials *77*old_pw*$S_1S_2S_3S_4$*$S_1S_2S_3S_4$#

— Receives confirmation tone,

— Goes on-hook.

where, “old_pw” stands for the old password, “$S_1S_2S_3S_4$” stands for the new password.

39.12 Tone Specifications

39.12.1 DTMF Tones

The DTMF tones specified for China market are contained in the table below:

Tone	Frequency (Hz)	Level (dBm)
DTMF Digit 1	697 + 1209 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 2	697 + 1336 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 3	697 + 1477 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 4	770 + 1209 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 5	770 + 1336 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 6	770 + 1477 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 7	852 + 1209 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 8	852 + 1336 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 9	852 + 1477 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit 0	941 + 1336 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit *	941 + 1209 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit #	941 + 1477 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit A	697 + 1633 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit B	770 + 1633 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit C	852 + 1633 (+/-2.0%)	-7/-9 (+/-3)
DTMF Digit D	941 + 1633 (+/-2.0%)	-7/-9 (+/-3)

Note, according to the China specification YDN065, section 8, for the DTMF tones, the allowed levels of low frequency and high frequency can be -4 ~ -23dBm, and the distinction of the levels of low frequency and high frequency can not exceed 6dBm. This activity sets -7dBm for the low frequency, and -9dBm for the high frequency.

39.12.2 Audible Tones

The following sections provide the tables that describe the audible tones in the CHINALGC toneset specified for the China market. For each tone, a format is provided to include the meaning, frequency, level and cadence information.

39.12.2.1 Idle Tone

Meaning	Silence
Frequency (Hz)	300
Level (dBm)	-
Cadence	Continuous

Note: this tone is cloned from toneset CHINA100.

39.12.2.2 Dial Tone

Meaning	A tone advising that the exchange is ready to receive call information and inviting the user to start sending call information.
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-10 (+/-3)
Cadence	Continuous

39.12.2.3 Special Dial Tone

Meaning	A tone advising that the exchange is ready to receive call information and inviting the user to start sending call information, at the same time reminding the caller that special conditions (such as CFU is activated). are encountered.
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-10 (+/-3)
Cadence	400 ms ON 40 ms OFF Repeated pattern

39.12.2.4 Busy Tone

Meaning	A tone advising the caller that the called party is busy.
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-10 (+/-3)
Cadence	350 ms ON 350 ms OFF Repeated pattern

39.12.2.5 Congestion Tone

Meaning	A tone advising the caller that the groups of lines or switching equipment necessary for the setting up of the required call or for the user of a specific service are temporarily engaged.
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-10 (+/-3)
Cadence	700 ms ON 700 ms OFF Repeated pattern

39.12.2.6 Ring Back Tone

Meaning	A tone advising the caller that the connection has been made and that a calling signal is being applied to the telephone number or service point.
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-10 (+/-3)
Cadence	1000 ms ON 4000 ms OFF Repeated pattern

39.12.2.7 Vacant Number Tone

Meaning	A tone advising the party during a call that a toll call is waiting
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-10 (+/-3)
Condense	100 ms ON 100 ms OFF 100 ms ON 100 ms OFF 100 ms ON 100 ms OFF 400 ms ON 400 ms OFF Repeated pattern

39.12.2.8 Toll Break In

Meaning	A tone advising the party during a local call that the operator wants to establish a toll call to the party.
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-20 (+/-3)
Cadence	200 ms ON 200 ms OFF 200 ms ON 600 ms OFF Repeated pattern

39.12.2.9 Call Waiting Tone

Meaning	A tone advising the user of the call waiting service who engaged on a talking call that another call is attempting to connect to this user.
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-10 (+/-3)
Cadence	400 ms ON 4000 ms OFF Repeated pattern

39.12.2.10 Holding Tone (Reminder Tone)

Meaning	The subscriber on hold receives holding tone during the conference or enquiry call.
Frequency (Hz)	950 (+/-10%)
Level (dBm)	-20 (+/-3)
Cadence	400 ms ON 10000 ms OFF Repeated pattern

39.12.2.11 Howler Tone (Receiver Offhook Tone)

Meaning	Prompts the subscriber to place the receiver on-hook.
Frequency (Hz)	1400 / 2060 / 2460 / 2600 (+/-5%)
Level (dBm)	-6

Meaning	Prompts the subscriber to place the receiver on-hook.
Cadence	100 ms ON 100 ms OFF Repeated pattern

39.12.2.12 Confirmation Tone

Meaning	Indication to a subscriber controlling a supplementary service that the control procedure for access to that service or a service feature has been successfully completed and accepted.
Frequency (Hz)	450 (+/-10%)
Level (dBm)	-10 (+/-3)
Cadence	160 ms OFF 160 ms ON 160 ms OFF 320 ms ON 640 ms OFF Nonrepeated pattern

39.12.3 ADSI CAS Tone

The ADSI CAS tone specified for China market is shown in the table below:

Tone	Frequency (Hz)	Level (dBm)
ADSI CAS tone	2130 + 2750 (+/-0.5%)	-15/-15 (+/-1)

39.12.4 Test and Diagnostic Tones

The test and diagnostic tones are cloned from the toneset CHINA100:

Tone	Frequency (Hz)	Level (dBm)
Low Tone	450	-20
1004Hz Tone	1004	0
950Hz Tone	950	-20
Milliwatt	950	0

39.13 Appendix - Q00869086 FN

This is the documentation for CR: Q00869086 - CI tool for line services auto update.

Notes: In this document, both ‘option’ and ‘service’ are referring to the services that can be provided on lines through SERVORD tool.

39.13.1 Function Description

The SN07 feature “A00002755 China Line Service Compliance” introduces line services that compliant to China line services spec (YDN065). While on SN06, some lines are using non China compliance services.

So the requirement rises: in an SN06 -> SN07 upgrade, update the non China compliance services to compliance services. The CI tool is designed to achieve this.

The CI tool is named “SERVUPD”, it does not require parameters.

The SERVUPD tool uses the datafill in CEPTONCENTREX to decide which services need update. Following table list the decision logic: if the option in ‘CEPTONCENTREX option’ column is datafilled, the service listed in ‘From Service’ column is updated to those listed in ‘To Service’ column. The “Update Description” column describes the update action.

Table 4 Service Update Decision Logic

CEPTONCE NTREX option	From Service	To Service	Update Description
IWUC	WUCR	CEPT IWUC	Wake up call. - The wake up timer setting in WUCR will be transferred to IWUC.
CDIV	MSB	CEPT CDND	Make set busy. - The MSB state will be transferred to CDND.
	CFO	CEPT CDTA/ CDTO	Call forward to operator. - Since CFO can be mapped to CDTA or CDTO, according to the CFO route, it will not be updated by SERVUPD. The operator can update it manually. No update action.
	CFF	CEPT CFF	Call forward fix. - No update action.
ICT	CXR	CEPT ICT	Call transfer.

Table 4 Service Update Decision Logic

CEPTONCE NTREX option	From Service	To Service	Update Description
ICWT	CWT	CEPT ICWT	Call waiting. - Before updating, if the line has CWI, CCW, CWTACT & SCWID, they will be deleted first: the CWTACT state will be transferred to ICWT, the SCWID will be added back after ICWT added. - The ICWT_ACTIVE field will be set to default 'Y' if there was no CWTACT.
CCBS	RAG	CEPT CCBS	Ring back (call complete to busy subscriber). - If RAG is activated on a line, its setting will NOT be transferred to CCBS.
I3WC	3WC	CEPT I3WC	Three way call.
I6WC	CNF(C06)	CEPT I6WC	Six way call. - Only CNF(C06) will be updated to I6WC.

When the operator types ‘SERVUPD’, following actions will be taken:

1. Read the CEPTONCENTREX tuple of ISERVOPT, first check the MARKET field. If it is not China, prompt the error message and abort.

Following is the intended error message.

Table 5 ERROR Message

```
>ServUpd
Error:
ServUpd is for China market usage only.
If the market is China, please set the following field to CHINA, then retry:
table ISERVOPT, tuple CEPTONCENTREX, field MARKET
ServUpd not started.
```

2. If the MARKET is China, get the datafilled options in it.

Following is an example of CEPTONCENTREX.

Table 6 Datafill Example of CEPTONCENTREX in table ISERVOPT

```
SOPTSKEY SOPTSVAR
-----------------
CEPTONCENTREX CEPTONCENTREX China (SC) (WML) (ILR) (CCBS) (I3WC) (CDIV) $
```

3. Prompts to list the services that will be updated one by one, ask for the confirm from operator. (refer to Table 7 on page 960)
4. Then list all services that will be updated, also list the services that can be updated but not datafilled in CEPTONCENTREX, and wait for the confirm from operator.

Following is the intended prompt.

Table 7 Prompt Example of ServUpd

```
>SERVUPD
Update: From 3WC to CEPT I3WC, agree?
Type 'y' or 'n'
>Y
Update: From  CFO to CEPT CDTA/CDTO, agree?
Type 'y' or 'n'
>Y
Update: From  MSB to CEPT CDND, agree?
Type 'y' or 'n'
>Y
Update: From  RAG to CEPT CCBS, agree?
Type 'y' or 'n'
>Y
-----------------------------------------------------------------
Following line service update will be performed:
From 3WC  TO  CEPT I3WC
From MSB  TO  CEPT CDND
From RAG  TO  CEPT CCBS
-----------------------------------------------------------------
Warning:
Following line services can be updated but not required by user:
From 6WC  TO  CEPT 6WC
From CWT  TO  CEPT ICWT
From CXR  TO  CEPT ICT
From WUCR TO  CEPT IWUC
They will not be updated.
-----------------------------------------------------------------
Type 'Y' to start, type 'N' to abort.
>Y
```

5. If the operator types 'N', just abort the command. If the operator types 'Y', perform the service update.

The SERVORD DEO/ADO utilities will be used to perform the update. The SERVORD requirement on line state applies, lines will not be updated if the state is invalid(eg: SB).

6. During update, the result will be printed to the screen. When update finishes, report the summary.

There are four kinds of result:

— success. It is counted in the 'number of success' in summary.

— error occurred. Some options may have been deleted before error occurs, the deleted option will be printed. It is counted in the 'number of not updated' in summary.

— line state not proper. It is counted in the 'number of not updated' in summary.

— partly success: the option is updated successfully, but the option setting before update lost. It is counted in the ‘number of partly success’ in summary.

Following is the result and summary example. Could use the existing CI tool ‘RECORD’ to record the logs into a file on disk.

Table 8 Logs/Report Example of ServUpd

```
Type 'Y' to confirm, type 'N' to abort.
>Y
Services being updated:
-----------------------
LG 0 0 0 0: From 3WC TO CEPT I3WC ... success.
LG 0 0 0 1: From MSB TO CEPT CDND ... success.
......

LG 0 1 0 0: From RAG TO CEPT CCBS ... Line state is not proper, no update. Please
retry later.
LG 0 1 0 1: From RAG TO CEPT CCBS ... success.
......
LG 0 2 0 1: From MSB TO CEPT CDND ... Partly success, the service setting before
update lost.
LG 0 2 0 2: From MSB TO CEPT CDND ... Error occurred. Not updated.
            Deleted Options:
            MSB
......
```

```
ServUpd completed,
Following line services are updated:
------------------------------------------------
3WC  ->  CEPT I3WC
Total number of success lines:       300
Total number of partly success lines:0
Total number of not updated lines:   3
------------------------------------------------
MSB  ->  CEPT CDND
Total number of success lines:       125
Total number of partly success lines:0
Total number of not updated lines:   0
------------------------------------------------
RAG  ->  CEPT CCBS
Total number of success lines:       200
Total number of partly success lines:0
Total number of not updated lines:   2
```

39.13.2 Limitation

- The SERVUPD tool will be used for ONP only, it will be put in no context. The ONP team can bring it to site on tape for usage.
- Only one-way update is supported. This means, when an option is removed from the CEPTONCENTREX tuple in table ISERVOPT, the lines using this option can not be updated using ‘ServUpd’ command. For example:

ServUpd can change the RAG to CEPT CCBS, but can not change CEPT CCBS to RAG.

- The tool only uses SERVORD utilities to delete/add services on line. The service related translations, office parameters, etc. has to be deleted/added by the operator.
- When adding CEPT options to line, if the ‘assign’ action option is datafilled to be metered in table MTRFEAT, and the line has MOG option, the metering of ‘Assign’ will increase.
- When update RAG to CEPT CCBS, if the RAG is activated on the line, SERVUPD will only update RAG to CEPT CCBS, the RAG setting will NOT be transferred to CCBS to reduce the risk.

40: Functional Description (FN): A00002756

40.1 Feature name

A00002756 JAPAN TRUNK SERVICES

40.2 Description

40.2.1 Introduction

This activity migrates Japan trunk services “Notification of Time and Charge” (NTC), “Carrier Name Notification” (CNN) and “Account Code” (ACCT) from the legacy MMP product to CS2K Hybrid product IP side in ISN07. It transparently ports the functionality implemented under these MMP features onto the CS2K Hybrid IP side. “Hybrid” always means “CS2K Hybrid” within this document.

If these services are triggered by incoming IP side in hybrid, they are provided by IP side directly. On the contrary, if triggered by incoming TDM side, they are provided by legacy MMP features.

About the services provided by TDM side in hybrid, it is not the scope of this activity and please read the original MMP activities listed below.

The existing MMP NTC service was implemented by following activities:

- AR0480 Notification Of Time & Charge
- AR1344 NTC
- AR1599 Enhancement to NTC
- AR1816 Multilingual NTC
- A59017299 Japan Interconnect ISUP

The service of “Carrier Name Notification for Japan” has been provided on MMP under following activities:

- A59027517 Equal Access Carrier Name Notification
- A59034248 Carrier Name Notification for Carrier Designation Service

The “Account Code” service on MMP was originally done under following activities:

- AR2028 Account Code
- A59017299 Japan Interconnect ISUP

Also, this feature provides the following interworkings on CS2K Hybrid product IP side in ISN07:

- JI-ISUP to ETSI ISUP V1
- ETSI ISUP V1 to JI-ISUP

40.2.2 Notification of Time and Charge (NTC)

40.2.2.1 Functional Overview

Notification of Time and Charge is a service provided over JI-ISUP trunks to the Japanese domestic market.

The subscriber activates this service by using the NTC service code prior to the destination address digits. A call is registered as requesting NTC service when traversing a tuple in universal translation that has the NTC feature assigned to it. The NTC service contains two calls: original NTC call and NTC callback.

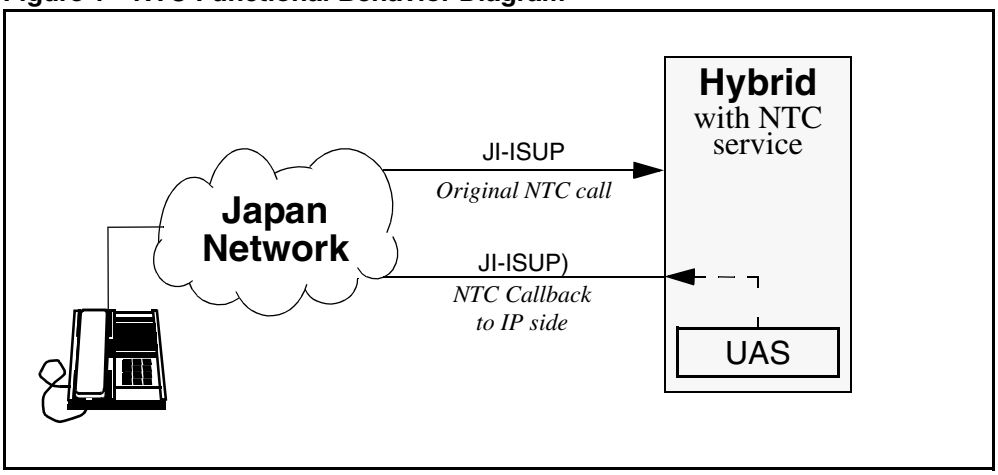
The original NTC call proceeds normally. After a successful call is answered, released and an AMA billing record is produced, NTC service calls the subscriber back using the Calling Line IDentifier (CLID) and provides an announcement indicating such information as the destination address digits, the duration of the original call and the charge amount for this service. The NTC announcement is delivered from EDRAM hardware on Hybrid TDM side. As a Hybrid switch IP side is unlikely to use EDRAM hardware, this activity will rework the feature to use the newer UAS hardware in IP side.

The NTC announcement is a custom announcement that consists of a number of simple and compound phrases. Each simple phrase has a corresponding recording on UAS. Each compound phrase is composed of 1 or simpler phrases.

NTC service is not affected by the out going agent of the original NTC call. The service works providing the interworking from JI-ISUP to the outgoing agent is available and AMA record is used for the call.

Please refer to Figure 1 ”NTC Functional Behavior Diagram”.

Figure 1 NTC Functional Behavior Diagram



40.2.2.2 Linguistic Logic

In this feature, the linguistic logic supports all of the nine languages, Japanese, English, Tagalog, Portuguese, Chinese, Korean, Thai, Spanish and Malay, supported by legacy MMP features.

Following shows the English version NTC announcement.

*This is IDC. The international call you have just made to **A** the number **B** was **C** hours **D** minutes **E** seconds long and cost **F** yen. Repeat, **C** hours, **D** minutes, **E** seconds long and cost **F** yen. Thank you for using IDC. This is a recording.*

Here:

A = Area Name

B = the number recorded by hybrid during the original call.

C = Hours quantity, range is from 1 to 277.

D = Minutes quantity, range is from 0 to 59.

E = Seconds quantity, range is from 0 to 59.

F = Yen quantity, range is from 1 to 10 065 533 yen.

40.2.2.3 Repeating/Skipping a Language during Cyclic Announcement

NTC service provides announcement in a cyclic fashion. In order to provide the subscriber with some control over NTC announcement playing, this feature

supports '*' key for repeating a language in the same cycle and '#' key for skipping to the next language.

— *skipping:* the received '#' keys are used for skipping.

Skipping does not change the playing sequence of the selected languages. This means that a '#' key stops the language currently being played immediately and starts the *next language* right after. The next language here may be the next one on the current cycle, or the first language of the next cycle if the stopped language is the last one of this cycle.

If a '#' key is received while the last language is being played during the last cycle, skipping is ignored. This is so for providing an explicit ending of the NTC service, i.e. either by a complete announcement in the last language or by subscriber disconnect.

— *repeating:* the received '*' keys are used for repeating.

A received '*' key stops the language currently being played immediately and starts to repeat the *same* language on the current cycle.

The maximal number of repeats allowed per cycle of NTC announcement is datafillable via an office parameter. If '*' keys are received beyond the maximum datafilled, the '*' keys are ignored.

Office parameter NTC_ANNC_CONTROL in table OFCVAR has two fields.

1. The first field sets the total number of cycles for NTC service. This field has a range from 1 to 8 with a default value of 2.
2. The second field sets the maximal number of repeats (i.e. '*' keys) allowed per cycle of the announcement. This field has a range from 0 to 7 with a default value of 2.

Let's say there are three languages: A, B and C. One cycle is defined as (A B C) and NTC_ANNC_CONTROL is set to (4 2), i.e. four cycles and maximum of two repeats per cycle. The entire announcement without repeating (note, skipping may be happening) is:

```
(A B C) (A B C) (A B C) (A B C)
```

If skipping occurs during the above announcement, the language sequence would still be the same. The only difference is the skipped language would be stopped (except for *C* in the last cycle above) once the '#' key is received by hybrid and the next language, which may be the next language on the current cycle or the first language on the next cycle, starts playing right after. Without skipping, each language would be played completely.

With repeating, the actual announcement may be:

```
(A A A B C) (A B B C C) (A B C) (A B B C)
```

Note that during the first cycle above, language B or C cannot be repeated any more since the only two repeats allowed per cycle is used up for language A. This means that all the '*' keys received during the playing time of B and C in this cycle are ignored.

40.2.3 Carrier Name Notification (CNN)

40.2.3.1 Functional Overview

When a JI-ISUP IAM reaches hybrid IP side, the IAM is analyzed for a number of parameters as to whether the announcement is to be played. Once hybrid decides to provide Carrier Name Notification announcement (The conditions please refer to A59034248 FN section 3.2.2 "Conditions for Feature activation"), an early ACM is sent to the calling party that serves to open a backward speech path and then the announcement is played.

Please refer to Figure 2 "CNN Call Flow for Interworking with ISUP" and Figure 3 "CNN Call Flow for interworking with SIP-T".

This service is supported in the following interworking scenarios by this activity:

- JI-ISUP -> JI-ISUP
- JI-ISUP -> IBN7 ISUP
- JI-ISUP -> ETSI ISUP V1
- JI-ISUP -> ETSI ISUP V2
- JI-ISUP -> SIP-T (JI-ISUP)
- JI-ISUP -> SIP-T (No ISUP to IMS)

Figure 2 CNN Call Flow for Interworking with ISUP

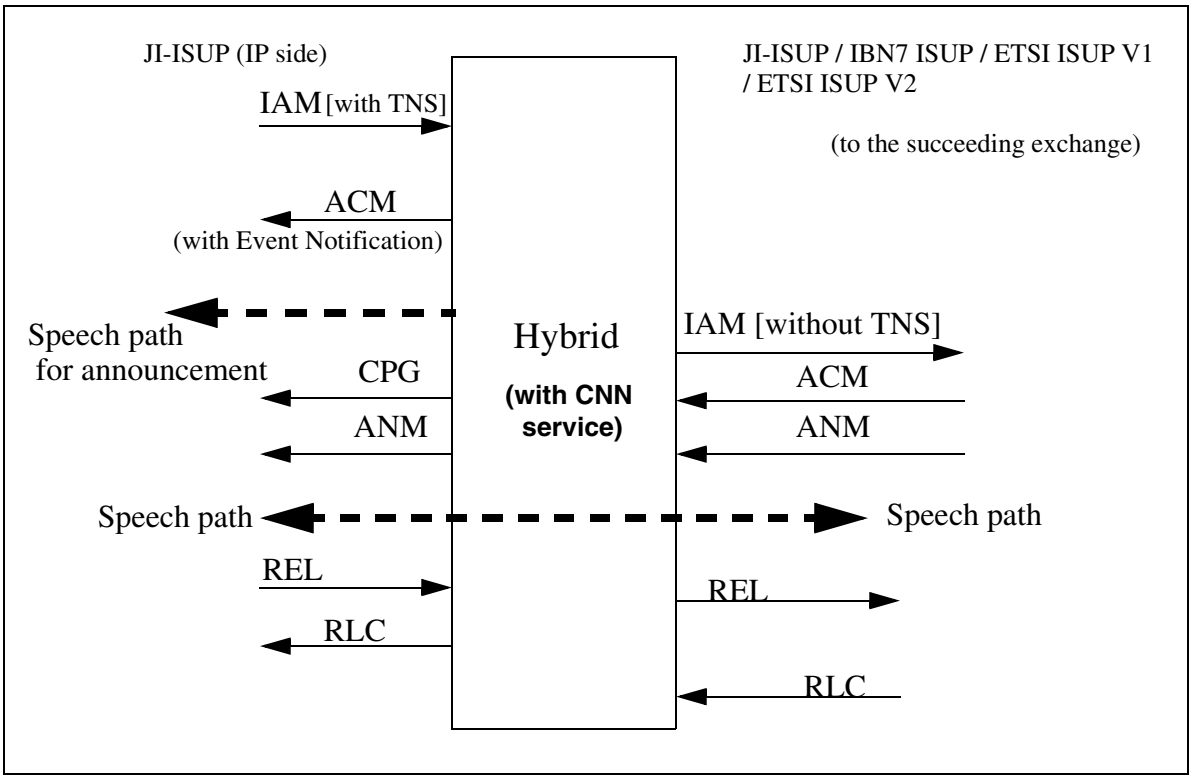


Figure 3 CNN Call Flow for interworking with SIP-T

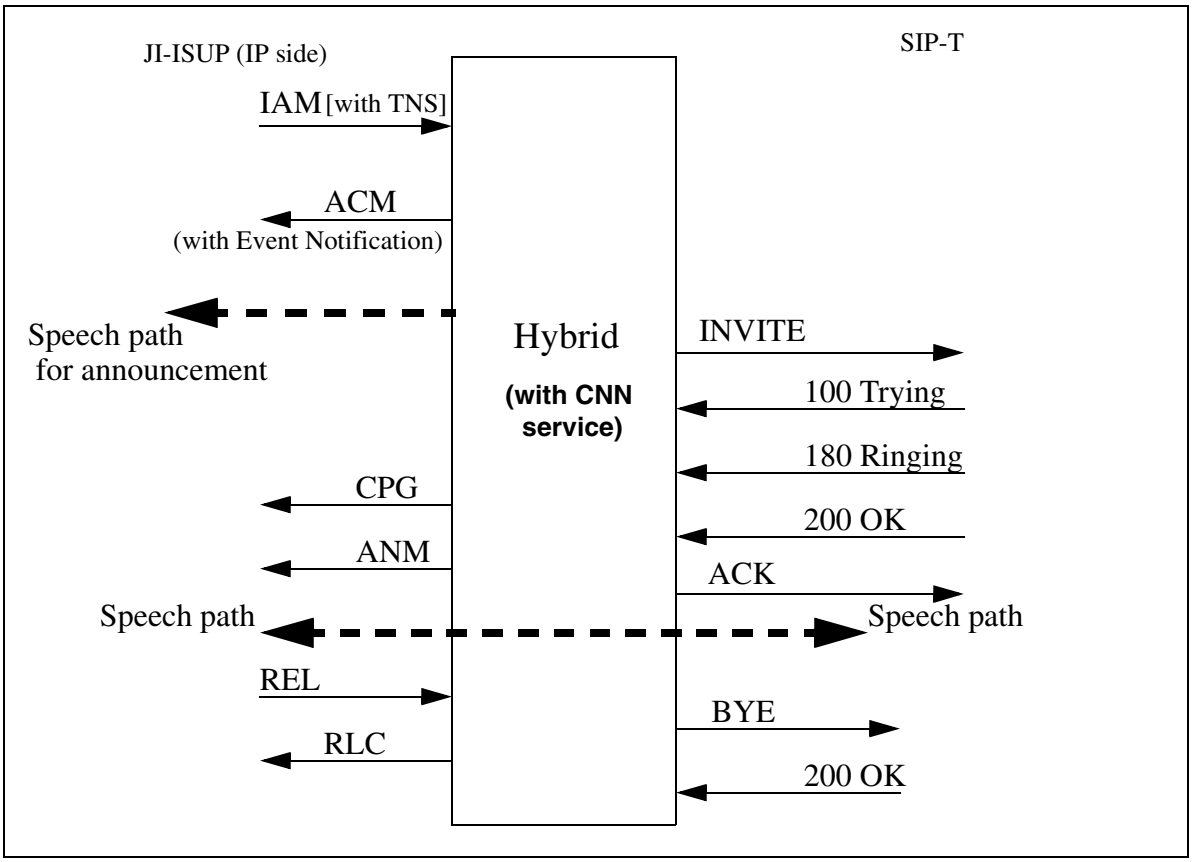


40.2.3.2 Announcement Handling

If all conditions for feature activation are satisfied and the Network Identification Code in the TNS parameter matches with the CARRID datafill in table CARRNAME, then the announcement recorded corresponding to the announcement CLLI is played. Samples for CNN announcement datafill in ANNS & CARRNAME are shown in Figure 4 "Example datafill in table ANNS" and Figure 5 "Example datafill in table CARRNAME". In this sample, the announcement CLLI is “ANNCLLI1” and CARRID is “111111”.

Figure 4 Example datafill in table ANNS

```
ANNCLLI1 NETWK 0 0 1 STND Y 10
```

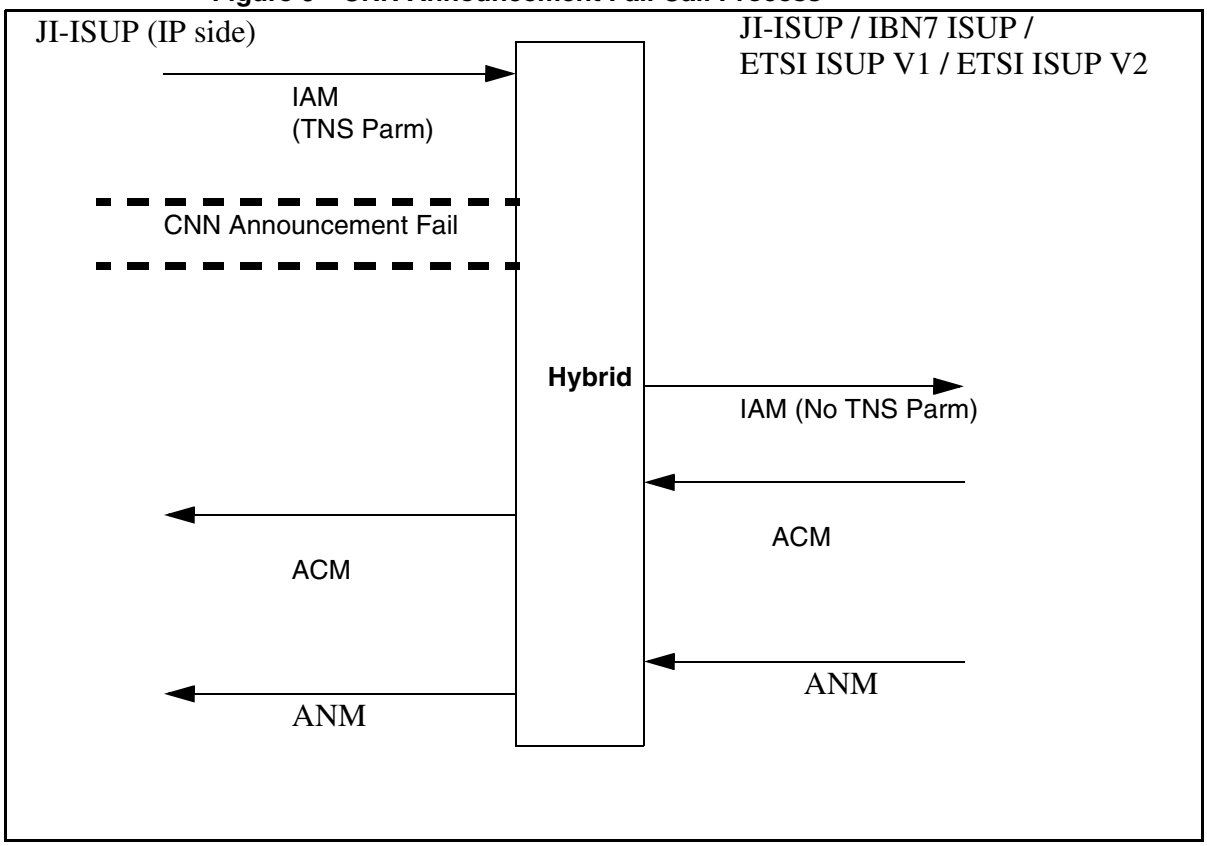
Figure 5 Example datafill in table CARRNAME

```
111111 ANNCLLLI1
```

If CNN announces fail, e.g. all ANNCLLI1 trunks are busy, the call is tandemed as a normal tandem call and the outgoing IAM doesn't contain TNS parameter. At the same time, CNN101 log is generated. For more information about CNN log, please refer to activity A59034248 FN section 3.7 "Logs". The call process of this case please refer to Figure 6 "CNN Announcement Fail Call Process".

Service → i2001

Figure 6 CNN Announcement Fail Call Process



40.2.3.3 Handling of Charge Indicator in BCI of CPG

When CNN feature is triggered, the charge indicator in the CPG is modified according to the CHGIND datafill or the CPGCGIND datafill in table XXCODE / XXHEAD.

The rule of it is shown in Table 1 ”Handling of CPGCGIND in CPG”

Table 1 Handling of CPGCGIND in CPG

CHGIND datafilled	Freedial (NOCHARGE) datafilled	CPGCGIND datafilled	Charge Indicator in CPG
Y / N	N	Y	datafilled value of CPGCGIND
Y	N	N	Datafilled value of CHGIND

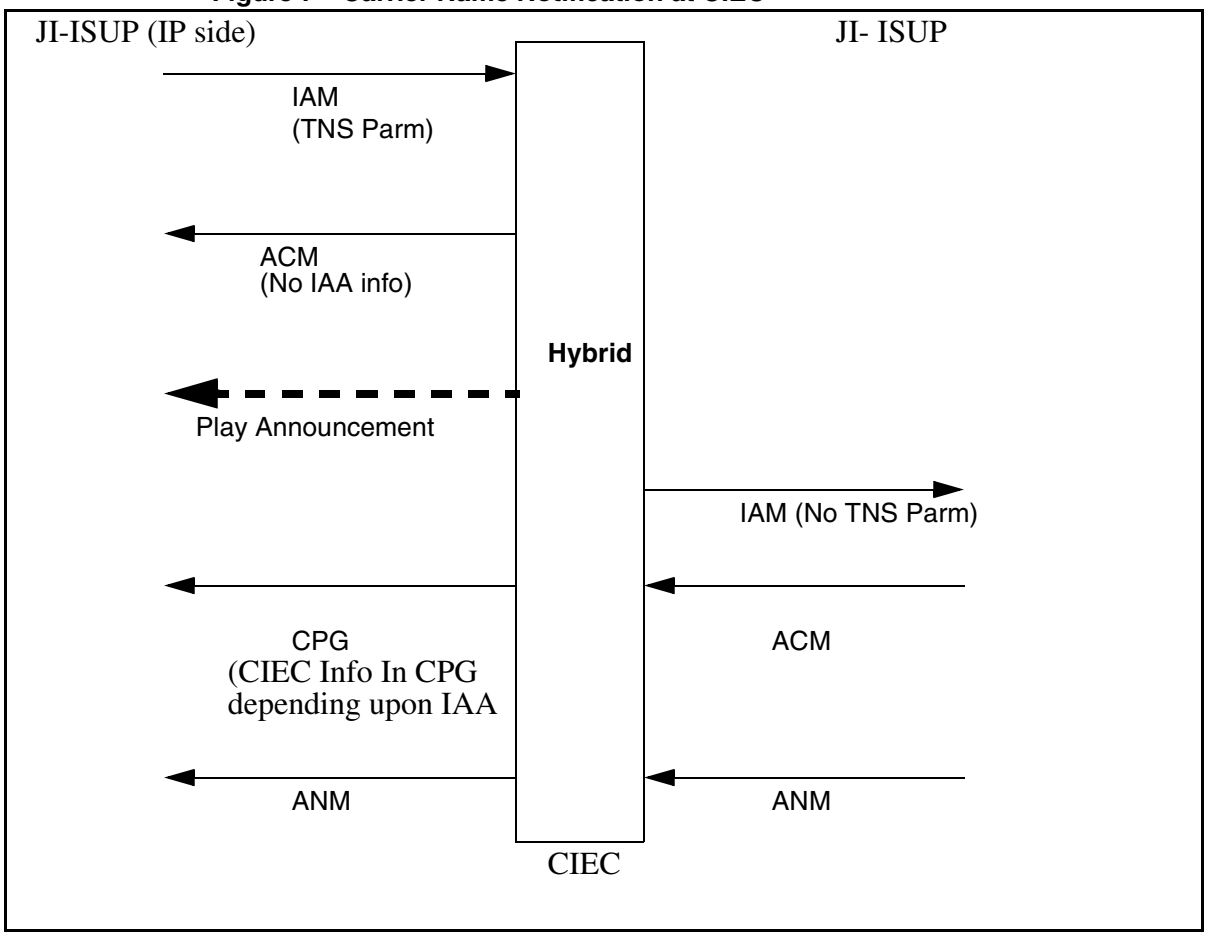
CHGIND datafilled	Freedial (NOCHARGE) datafilled	CPGCGIND datafilled	Charge Indicator in CPG
Y/N	N/Y	Y	Datafilled value of CPGCGIND
Y	N/Y	N	Datafilled value of CHGIND

40.2.3.4 Handling of IAA parameters

IAA is the abbreviation of Inter-Administration Accounting. For more information about IAA, please refer to AU2343 FN section APPENDIX A.

40.2.3.4.1 Carrier Name Notification at CIEC

Figure 7 Carrier Name Notification at CIEC



Please refer to Figure 7 ”Carrier Name Notification at CIEC”.

At hybrid that behaves as a CIEC, if an early ACM for the feature is generated, it will not contain the IAA parameters.

The IAA parameters in the incoming ACM are mapped to the CPG. The IAA parameters of the CIEC are appended to the CPG depending on the IAA logic.

The hybrid will append the CIEC info to the CPG only if all the following conditions are met: -

- the interworking is JI-ISUP to JI-ISUP,
- CIEC datafill in table IAACTRL is encountered during translation;
- all conditions for generating CIEC in IAM are met;
- the incoming ACM must contain the Carrier Info parm (#F1).
- the received TCIT indicator in the incoming IAM must be Backwards (10) or Bothways (11)

If all the above conditions are met, then the behavior depends on which of the following two conditions are met:

(1) if the last sub-block inside the received Carrier Info Parameter in the ACM is CIEC, and the received CIEC Carrier ID is NOT the same as the datafill in ofcparm TELCO_ID or the SUB_TELCO_ID datafill in table IAACTRL, then CIEC is not updated by hybrid. On the contrary, if it is the same as TELCO_ID or SUB_TELCO_ID, then the behavior is like: -

Table 2

CarrierID sub-parm	no change
POI-CA sub-parm	no change (even if EXIT_POI_CA is datafilled)
POI-CAT sub-parm	if received, the ENTRY_POI_CAT overwrites the received one when EXIT_POI_CAT is datafilled. And the received EXIT_POI_CAT is not changed; if not received, this sub-parm is added if EXIT_POI_CAT is datafilled;

(2) if the last sub-block inside the received Carrier Info parameter in the ACM is not CIEC, then the Carrier ID in it is not be the same as the datafill in ofcparm TELCO_ID or the SUB_TELCO_ID datafill in table IAACTRL, then the behavior is like: -

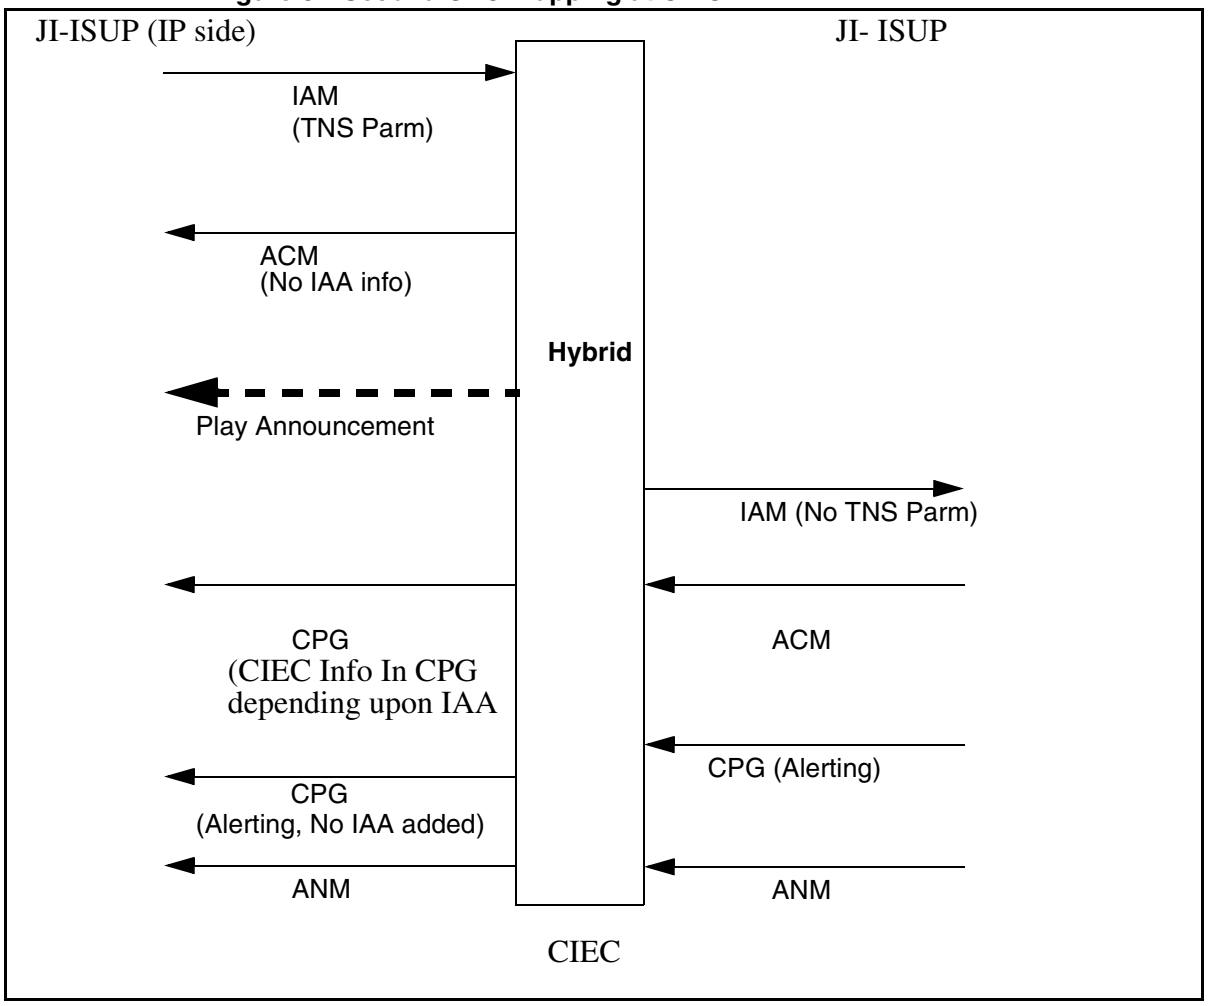
Table 3

CarrierID sub-parm	taken from ofcparm TELCO_ID or SUB_TELCO_ID datafill in table IAACTRL

POI-CA sub-parm	added only if EXIT_POI_CA is datafilled
POI-CAT sub-parm	added if (EXIT_POI_CAT) OR (EXIT_POI_CAT and E NTRY_POI_CAT) is datafilled

After the CPG with IAA is sent out, if there is an alerting CPG coming from outgoing JI-ISUP side, it is just tandemed out to incoming JI-ISUP side and no IAA is added. Please refer to Figure 8 "Second CPG mapping at CIEC".

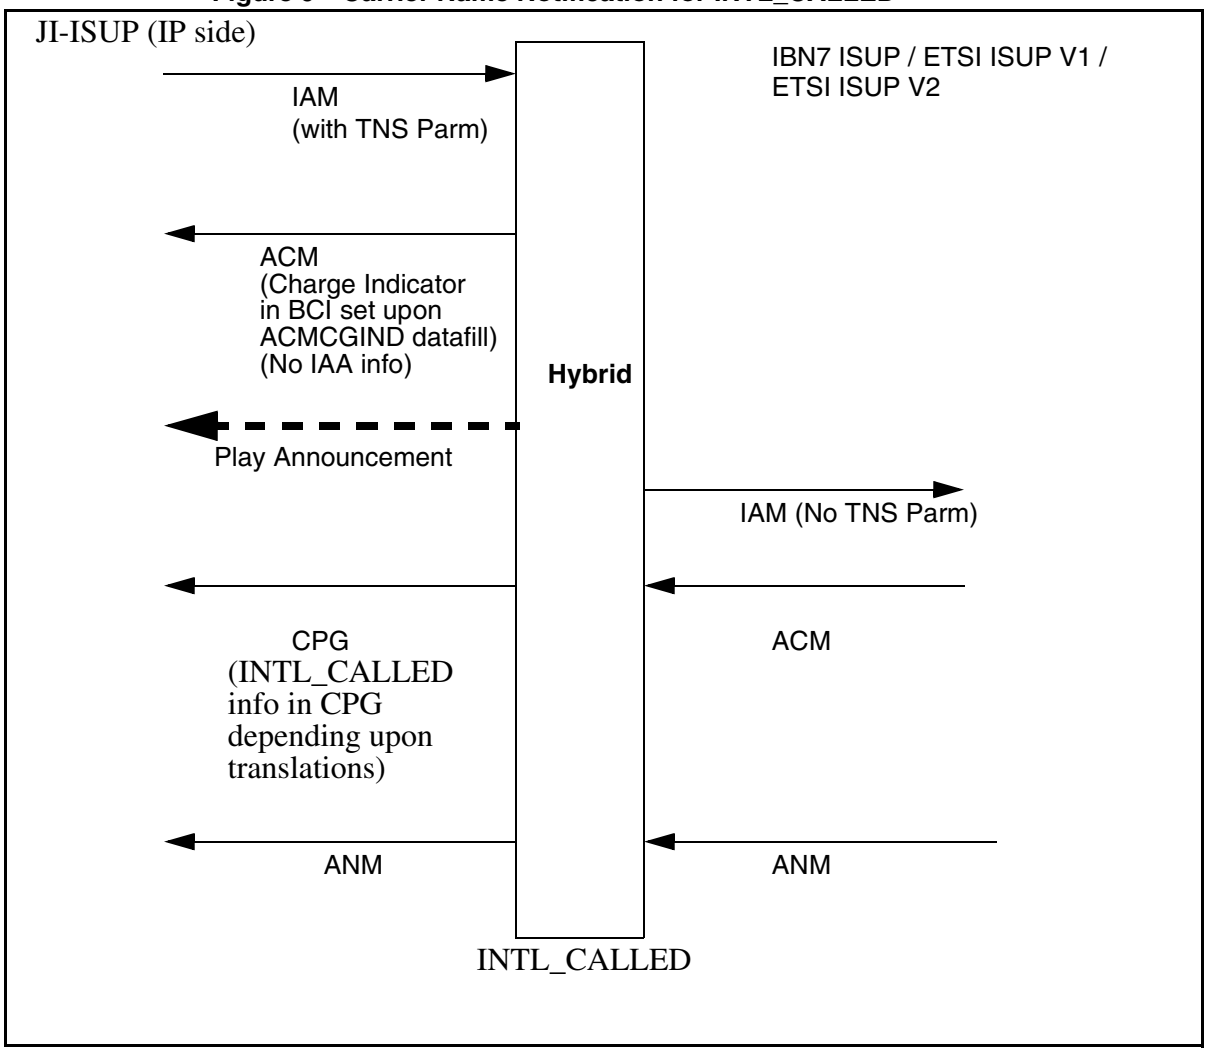
Figure 8 Second CPG mapping at CIEC



40.2.3.4.2 Carrier Name Notification at INTL_CALLED (Outbound International Calls)

Please refer to Figure 9 ”Carrier Name Notification for INTL_CALLED”.

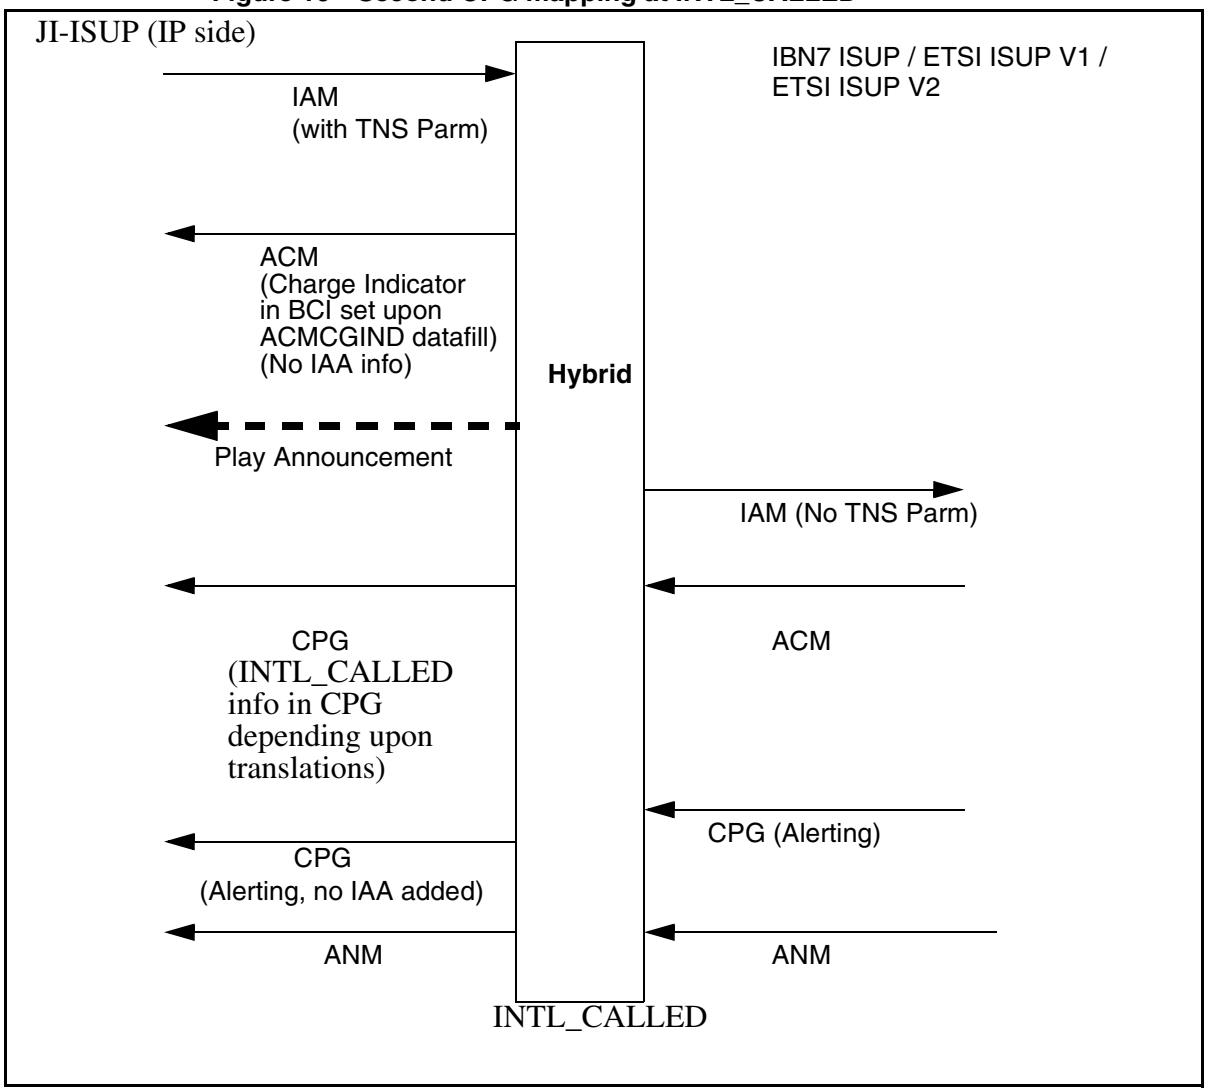
Figure 9 Carrier Name Notification for INTL_CALLED



At hybrid that behaves as an INTL_CALLED (for an international outbound call), if an early ACM for the feature is generated, it will not contain the IAA parameters. So the IAA parameters of the INTL_CALLED will be added to the CPG, i.e. the Carrier Information Parameter containing the Carrier ID.

After the CPG with IAA is sent out, if there is an alerting CPG coming from outgoing IBN7 ISUP side, it is just tandemed out to incoming JI-ISUP side and no IAA is added. Please refer to Figure 10 "Second CPG mapping at INTL_CALLED".

Figure 10 Second CPG mapping at INTL_CALLED



40.2.3.4.3 Carrier Name Notification at IEC

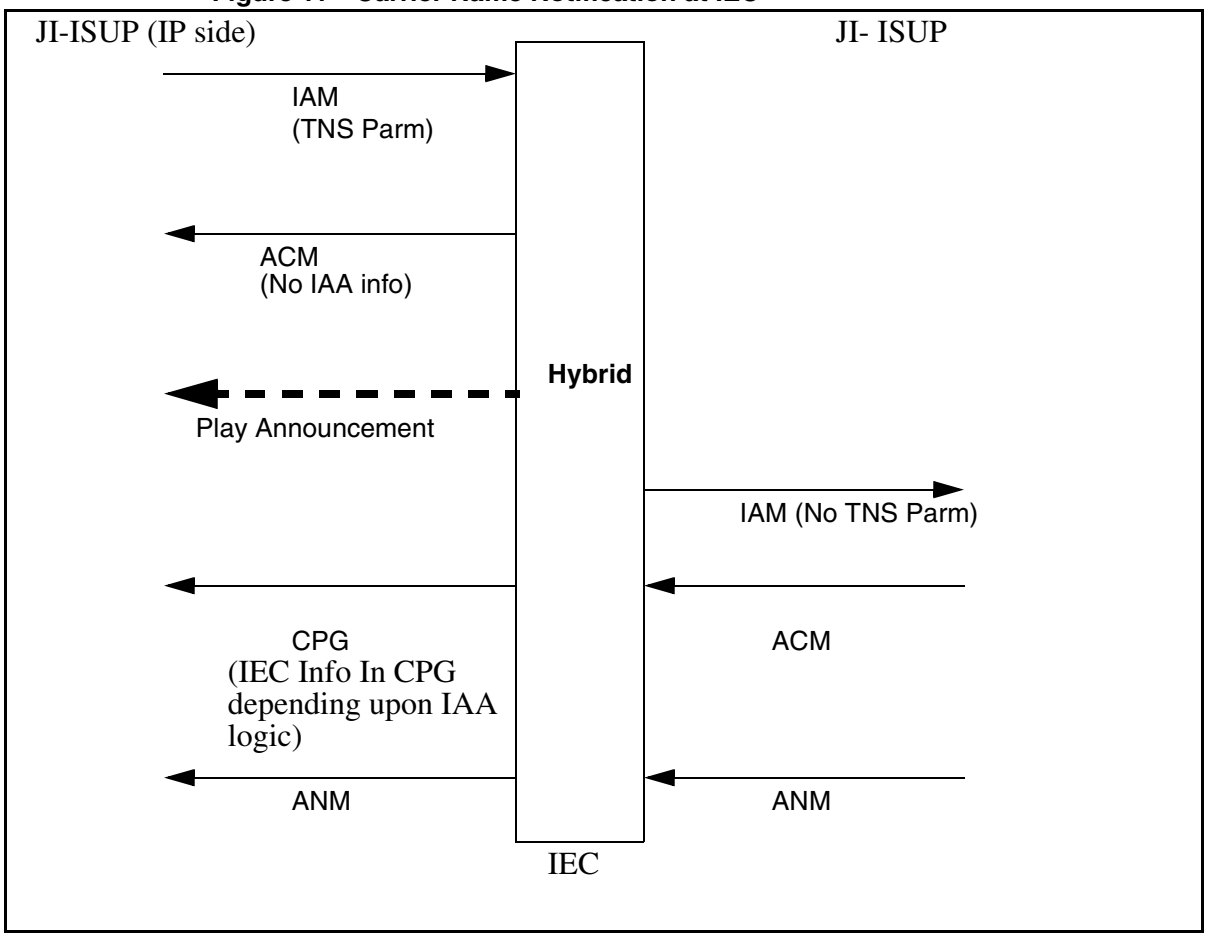
The activation of Carrier Name Notification announcement doesn't differentiate between IEC, CIEC or INTL_CALLED.

If the announcement is played at an IEC, the early ACM generated will not contain the IAA parameters.

The IAA parameters in the incoming ACM are mapped to the CPG. The IAA parameters of the IEC are appended to the CPG depending on the IAA logic.

Please refer to Figure 11 "Carrier Name Notification at IEC".

Figure 11 Carrier Name Notification at IEC



The hybrid updates the IEC carrier info parm to the CPG only if all the following conditions are met:

- the interworking is JI-ISUP to JI-ISUP;
- IEC datafill in table IAACTRL is encountered during translation;
- all conditions for generating IEC in IAM, except the condition regarding the received TCIT value, are met;
- the incoming ACM must contain the Carrier Info parm (#F1);
- the received TCIT indicator in the incoming IAM must be Backward (10) or Bothways (11);

If all the above conditions are met, then the behavior depends on which of the following two conditions are met: -

(1) if the last sub-block of the received #F1 parm is IEC, and this received IEC Carrier ID is NOT the same as the datafill in ofcparm TELCO_ID or the SUB_TELCO_ID datafill in table IAACTRL, then IEC is not updated by hybrid. On the contrary, if it is the same as TELCO_ID or SUB_TELCO_ID, then the behavior is like:

Table 4

CarrierID sub-parm	No Change
POI-CA sub-parm	no change (even if EXIT_POI_CA is datafilled)
POI-CAT sub-parm	if received, the ENTRY_POI_CAT overwrites the received one when EXIT_POI_CAT is datafilled. And the received EXIT_POI_CAT is not changed; if not received, this sub-parm is added if EXIT_POI_CAT is datafilled;

(2) if the Carrier ID in the last sub-block of the received #F1 parm is not the same as the datafill in ofcparm TELCO_ID or the SUB_TELCO_ID datafill in table IAACTRL, then the behavior is like: -

Table 5

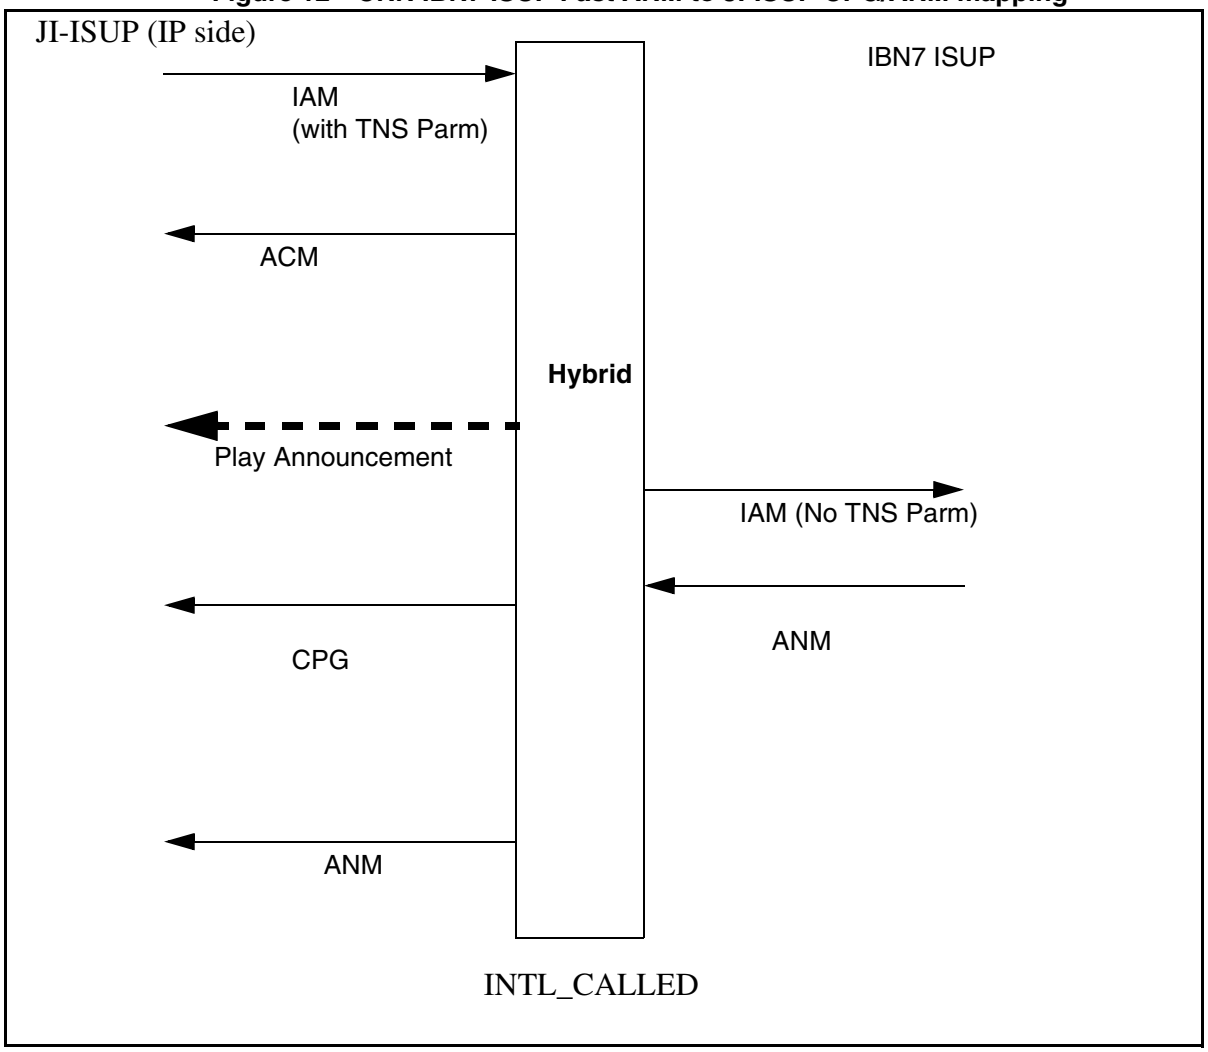
CarrierID sub-parm	taken from ofcparm TELCO_ID or SUB_TELCO_ID datafill in table IAACTRL
POI-CA sub-parm	added only if EXIT_POI_CA is datafilled
POI-CAT sub-parm	added if (EXIT_POI_CAT) OR (EXIT_POI_CAT and E NTRY_POI_CAT) is datafilled

40.2.3.5 Handling IBN7 ISUP Fast ANM

IBN7 ISUP fast ANM to JI-ISUP ACM/ANM mapping is enhanced to JI-ISUP CPG/ANM mapping. The call flow please refers to Figure 12 ”CNN IBN7 ISUP Fast ANM to JI-ISUP CPG/ANM mapping” .

If the fast ANM with no charge and ANM (NOCHG) mapping feature is turned off, ANM is just mapped to CPG and no ANM is sent out. The IAA parameters of the INTL_CALLED exchange will be added to CPG. Except this, the mapping is not impacted.

Figure 12 CNN IBN7 ISUP Fast ANM to JI-ISUP CPG/ANM mapping

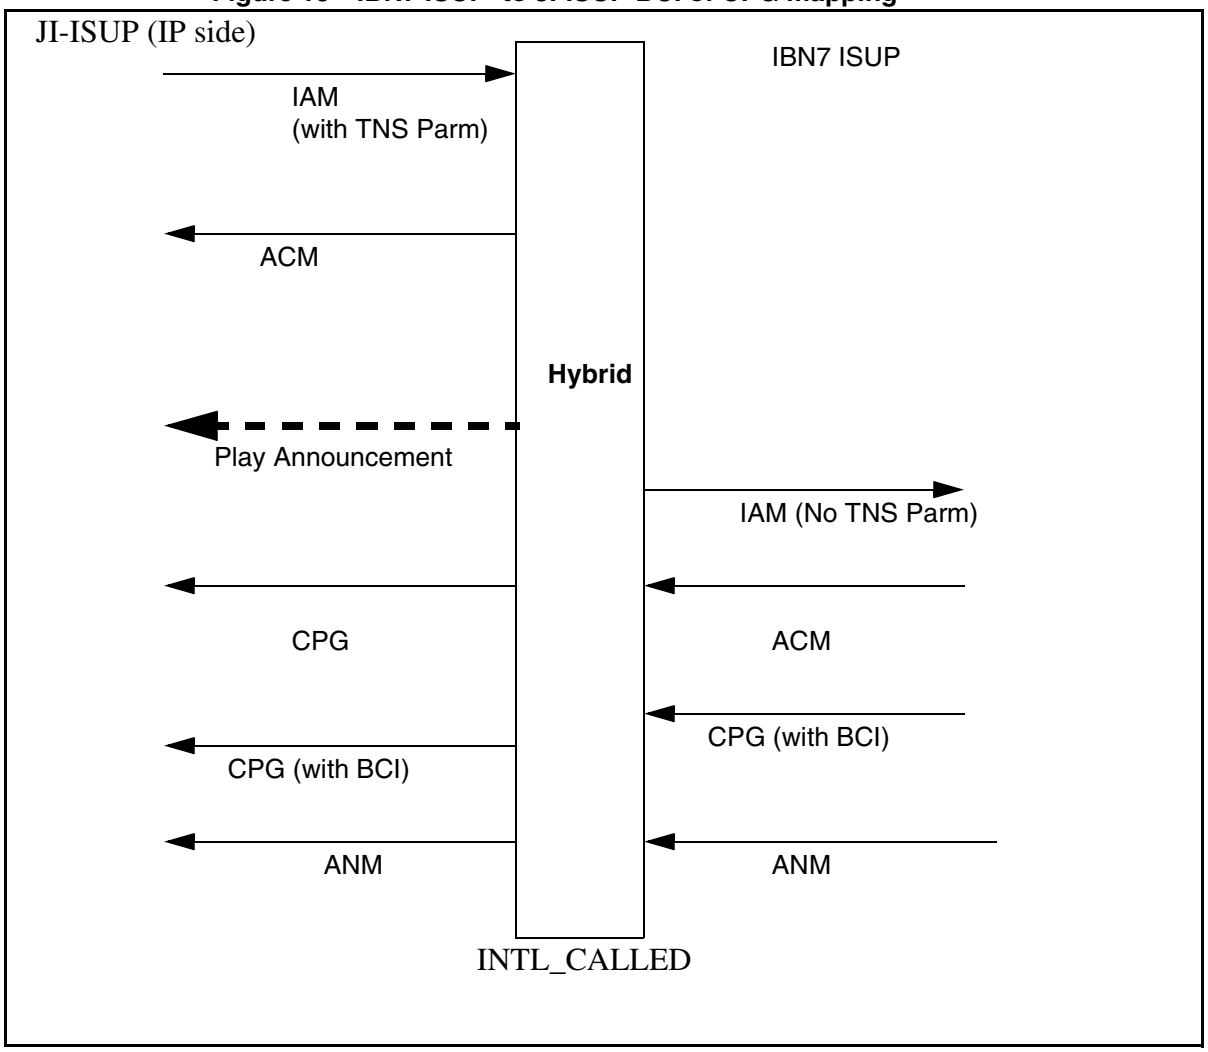


40.2.3.6 IBN7 ISUP to JI-ISUP BCI of CPG Mapping

After the first CPG is sent back to JI-ISUP side, if there is a CPG with BCI is received from IBN7 ISUP side, it is mapped to CPG which has BCI in JI-ISUP side. The BCI mapping rule is the same as BCI of ACM to BCI of CPG mapping. The rule please refers to RS section of A59017299 table 52 “Parameter Mapping - ANSI7+ ISUP ACM to JI-ISUP ACM”.

Please refer to Figure 13 "IBN7 ISUP to JI-ISUP BCI of CPG mapping".

Figure 13 IBN7 ISUP to JI-ISUP BCI of CPG mapping



40.2.4 Account Code (ACCT)

40.2.4.1 Functional Overview

"Account Code" service enables the subscriber to enter an account code during the call setup in order to classify the call on the customer's bill.

The hybrid checks the customer group (CUSTGRP) and the network class of service (NCOS) to see if an account code is required on this call. If it is, the hybrid sends back second dial tone or announcement to prompt the subscriber to enter an account code. The hybrid receives the account code digits as DTMF tones over the voice path.

When entering the account code, the subscriber has the option to enter the reset digit (*). This causes all account code digits entered by the subscriber during the present stage of dialing to be ignored. Accompanying the '*' is a reset tone, ~~of datafillable duration,~~ to prompt the subscriber to begin re-entering the required digits where the first digit dialed breaks the reset tone.

Once the account code digits are entered, the hybrid checks to see if the required number of digits has been entered and the call continues. The entered account code digits will be contained in the AMA billing record.

If the subscriber enters the hash (#) during the dialing phase it is treated as end of dialing. At this point, if the minimum required number of digits has been collected, the call proceeds to the next phase of call processing.

ACCT is supported in following interworking scenarios on hybrid by this activity:

- JI-ISUP -> JI-ISUP
- JI-ISUP -> IBN7 ISUP
- JI-ISUP -> ETSI ISUP V1
- JI-ISUP -> ETSI ISUP V2
- JI-ISUP -> SIP-T (JI-ISUP)
- JI-ISUP -> SIP-T (No ISUP to IMS)

Please refers to Figure 14 "ACCT Interworking with ISUP Functional Behavior Diagram" and Figure 15 "ACCT Interworking with SIP-T Functional Behavior Diagram".

Figure 14 ACCT Interworking with ISUP Functional Behavior Diagram

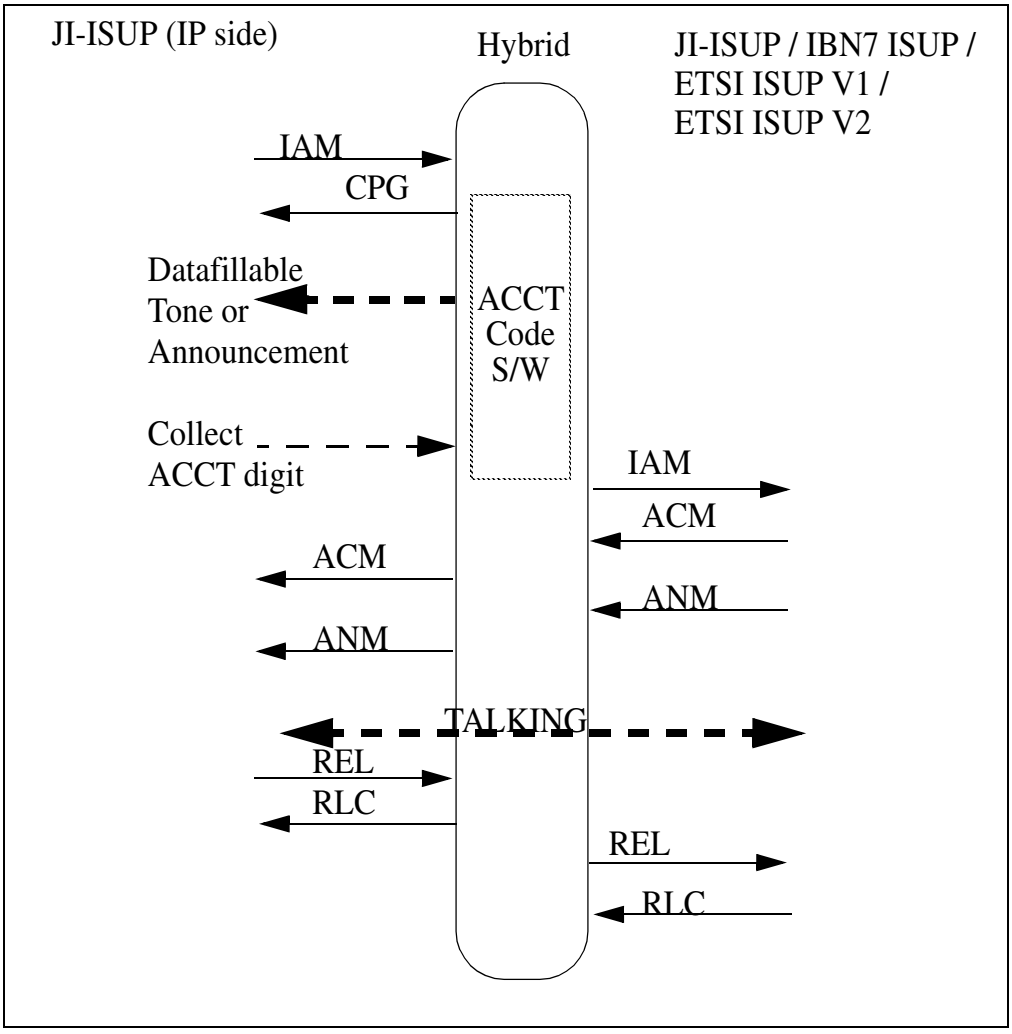


Figure 15 ACCT Interworking with SIP-T Functional Behavior Diagram

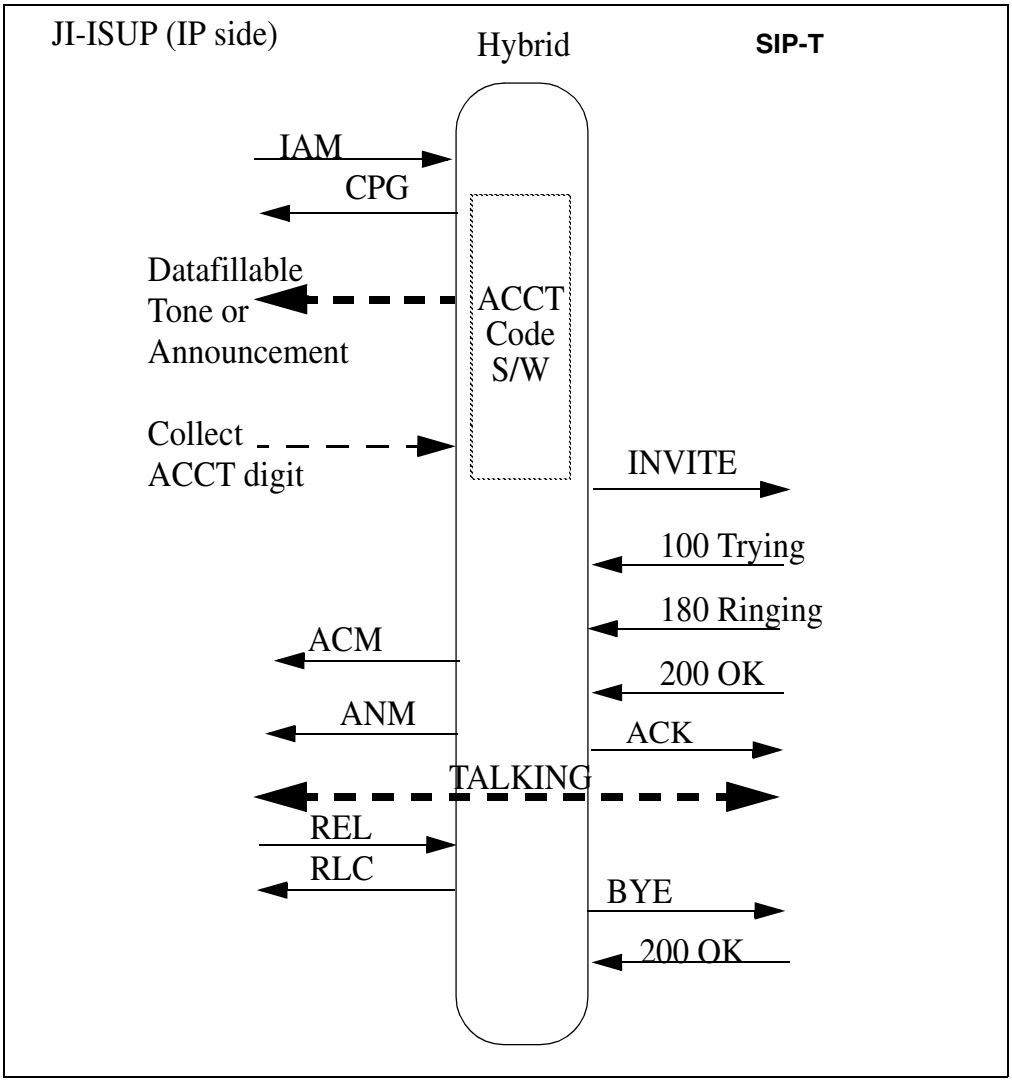

40.2.4.2 Reset Tone

When entering the account code, the subscriber has the option to enter the reset digit (*). This causes all account code digits entered by the subscriber during the present stage of dialing to be ignored and “Reset tone” is played. This tone is stopped when first digit is received or reset tone duration is time out.

~~The reset tone duration is controlled by the office parameter RESET_TONE_DURATION_160MS in table OFCVAR.~~

~~For JI-ISUP or IBN7 ISUP to account code calls, the maximum reset tone duration is 24 seconds, even if datafill represents a larger value.~~

The specification of reset tone is shown in Table 6 ”Specification of Reset tone”.

Table 6 Specification of Reset tone

Tone	Single Frequency	Cadence	Duration	Level
Reset Tone (for reset of the digit collection)	400 Hz	Constant	~~Datafillable~~ (0.5 second)	-16 dBmO +/-0.5 dB

40.2.4.3 Tone/Announcement Handling

The JI-ISUP agent, on receipt of the first digit, handles the tone/announcement in the following fashion:

- 0 - 9, ‘*’ - Tone/Announcement stopped
- ‘#’ - Tone stopped/Announcement continues

40.2.4.4 Effect On Permanent Signal Timer

If digit 0 through 9 is entered as a first digit then the permanent signal timer is stopped, and the interdigit timer is used to collect the remaining digits.

If `*' or `#' is entered as the first digit the handling of the permanent signal timer is shown in Table 7 ”Account Code Handling of First Digit” .

Table 7 Account Code Handling of First Digit

Digit Entered	Perm Signal Timer
* (asterisk)	restarted
#(octothorpe)	restarted

40.2.5 Interworking between JI-ISUP and ETSI ISUP V1

Following interworkings are provided in this feature:

- JI-ISUP (NATL) to ETSI ISUP V1 (INTL)
- ETSI ISUP V1 (INTL) to JI-ISUP (NATL)

Because ETSI ISUP V1 trunk is an international trunk which is datafilled as INTL in table TRKGRP, and JI-ISUP trunk is a national trunk which is datafilled as NATL in table TRKGRP, the gateway supporting the interworking is regarded as an international gateway.

In this feature, the message and parameter mappings for above interworkings in the international gateway is handled based on the Q.767 specification (Application of CCITT ISUP for international ISDN interconnectios). All of messages and parameters which are not supported in Q.767 are not supported in this feature.

Detail mappings are described in Appendix B.

40.3 Hardware Requirements or Dependencies

Announcement hardware UAS needs to be present in Hybrid.

40.4 Software Requirements or Dependencies

. N/A

40.5 Limitations and restrictions

. N/A

40.6 Interactions

Due to this activity is a migration, we don’t change any code about interaction. So all the interactions are the same as the legacy MMP features.

For more information about NTC, please refer to original documents in AR0480, AR1344, AR1599, AR1816 and A59017299.

For more information about CNN, please refer to original documents in A59027517 and A59034248.

For a detailed description about ACCT, please refer to activities AR2028 and A59017299.

40.8 Glossary

Term	Description
ACCT	Account Code
ACM	Address Complete Message
ANM	Answer Message
BLO	Blocking Message
BLA	Blocking Acknowledgement Message
CIEC	Chosen Intermediate Exchange Carrier
CNN	Carrier Name Notification
CPG	Call Progress Message
CSM	Channel Supervision Message (CallP)
DMS	Digital Multiplex System
DT	Dial Tone
ENTRY_POI_CA	Entry Point of Interconnect - Charge Area
ENTRY_POI_CAT	Entry Point of Interconnect - Category
EXIT_POI_CA	Exit Point of Interconnect - Charge Area

Term	Description
EXIT_POI_CAT	Exit Point of Interconnect - Category
IAA	Inter Administration Accounting
IAM	Initial Address Message
IEC	Intermediate Exchange Carrier
INTL_CALLED	International Called Carrier
JI-ISUP	Japan Interconnect ISUP
MCMP	Media Controller Messaging Protocol
MGCP	Media Gateway Controller Protocol
MMP	Multiple Market Platform
MTM	Maintenance Trunk Module
NCCI ISUP	New Common Carrier Interface ISUP
NTC	Notification of Time and Charge
OLEC	Originating Local Exchange Carrier
POI	Point of Interconnect
PVG	Passport Voice Gateway
RBT	Ring Back Tone
REL	Release Message
RLC	Release Complete
TCIT	Transit Carrier Indicator
TLEC	Terminating Local Exchange Carrier
TLC	Test Line Call
TMR	Transmission Medium Requirement

41: Functional Description (FN): A00002844

41.1 Feature name

Excessive Metering Detection (EMD) Support for Metered Trunks

41.2 Description

EMD detects and reports the lines and trunks whose meter counts reach a threshold value. The activation, start time, period and threshold values are provided by provisioning.

EMD funtionality is enhanced for metered trunks with this ISN07 activity.

When the feature is activated, a process is scheduled to wake up at certain times defined by the start time and period. This process runs periodically and compares the current meters of trunks agents with the previously copied ones. The meter delta values obtained from the comparison are compared with a threshold value provisioned prior to the feature activation. The agents whose meter counts reach the threshold value are reported with a new log. After all meters of trunk agents are checked, these values are copied to be used by the next run of the process.

Any desired metered trunk agent can be excluded from EMD process by assigning NEMD (No Excessive Metering Detection) option to that agent in TRKOPTS table.

When the feature is deactivated, EMD process is disabled and allocated data store for the previous meter counts is freed.

This feature can be divided into 6 parts in terms of behavior:

- Provisioning
- Activation/deactivation
- Trunk option
- Log format
- Detection process
- Robustness
- ONP

41.2.1 Provisioning

Existing EMD tuple in MTRSYSPM table is enhanced to include a separate threshold value for trunks. All other fields are common for both line and trunk agents. Changed form of EMD tuple includes the following fields:

- ACTIVATION
  Identifies whether the feature is activated or not.
- START_TIME (Hour and Minute)
  Indicates the start time of EMD process in terms of hour and minute.
- PERIOD
  Indicates running interval of EMD process in terms of days.
- **LINE_THRESHOLD** *(renamed)*
  Indicates the expected maximum value of total delta between previous and current meter counts of a line.
- **TRUNK_THRESHOLD** *(new)*
  Indicates the expected maximum value of total delta between previous and current meter counts of a trunk. If range of turnk threshold is calculated in the same logic with line, it is found as 0..7,999,999,999,992. But this value can not be supported in terms of coding/compile issues. The maximum value that can be supported is 2,147,483,647. According to this maximum value of trunk threshold is decided as 2,100,000,000.

Ranges of parameters of EMD tuple are as follows:

Table 1 EMD tuple with ranges

Field name	Range
ACTIVATION	NO, YES
HOUR	0 TO 23
MINUTE	0 TO 59
PERIOD	1 TO 30 (day)
LINE_THRESHOLD	0 TO 799,999,992
TRUNK_THRESHOLD	0 TO 2,100,000,000

The default values of these fields are as follows:

Table 2 EMD tuple with default values

Field name	Default Value
ACTIVATION	NO
HOUR	4

Table 2 EMD tuple with default values

Field name	Default Value
MINUTE	15
PERIOD	1
LINE_THRESHOLD	20,000
TRUNK_THRESHOLD	200,000

With these default values, EMD process will start at 4:15 am and will be repeated every day.

It is restricted to add or delete a tuple to/from MTRSYSPM table. So EMD tuple can only be changed. The following is a change example of EMD tuple:

Table 3 Change example for EMD tuple in table MTRSYSPM

```

>
```

41.2.2 Trunk Option

EMD process is run for all metered lines and trunks. In order to be excluded from this process, specified trunk is assigned with NEMD (No Excessive Metering Detection) option in TRKOPTS table.

Trunks must have ICMOG/OGMOG option in table TRKOPTS in order to assign NEMD option successfully.

Table 4 NEMD Option Datafill Example in Table TRKOPTS

```
TABLE TRKOPTS
lis all
TOP
OPTKEY            OPTINFO
----------------------------------------
ICPRIBA ICMOG   ICMOG MOG_3
ICPRIBA NEMD    NEMD
BOTTOM
```

41.2.3 Activation/Deactivation

Existing EMD process is used with this feature. This process survives forever and sleeps till it is activated. Activation is provided by datafilling ACTIVATION field of existing EMD tuple in MTRSYSPM table as “YES”.

Behavior of EMD process activation/deactivation for metered lines is not changed and it is same for trunks.

In case of activation, the following scenarios and messages are possible:

- System starts to allocate data store for metered lines and trunks and this is informed with a message. Please refer to “Figure 1 Info message for the store allocation” on page 1041. If store allocation fails, the operator is warned with a message and activation is rejected. Please refer to “Figure 2 Message for the store allocation failure” on page 1041. If store allocation is completed successfully then the operator is informed with a message and feature is activated. Please refer to “Figure 3 Info message for the process activation” on page 1041.

Figure 1 Info message for the store allocation

```
Store allocation is running.
Please wait...
```

Figure 2 Message for the store allocation failure

```
There is NOT ENOUGH DSPERM memory available.
Process could not be activated.
```

Figure 3 Info message for the process activation

```
EXCESSIVE METERING DETECTION process has been activated.
```

- If process died a time ago due to traps or some other reasons, in order to activate the feature any kind of a restart is needed and if so the operator is warned with a message and activation is rejected. Please refer to “Figure 4 Warning message if a restart is needed for activation” on page 1042. If

a restart is necessary for the activation, WARM RESTART is recommended.

Figure 4 Warning message if a restart is needed for activation

```
In order to set the ACTIVATION field to YES,
at least a WARM restart should be performed.
```

If the process dies for any reason, while it is already running, the ACTIVATION field is set to "NO" automatically and the data store allocated for storing the previous meter counts is freed.

If the feature is activated successfully, then the initial run time of the EMD process is determined in the following manner:

- If the current time that the feature is activated is less than the start time (HOUR, MINUTE) which is datafilled in table MTRSYSPM via tuple EMD, then the process is invoked at the same day, at the time indicated by HOUR, MINUTE fields. The PERIOD field indicates after how many days the next invocation is. For example, if feature is activated at 14:35 at 1st day of a month and HOUR, MINUTE and PERIOD are datafilled as 18, 15 and 3, then the process is invoked in the following sequence: at 18:15 of 1st, at 18:15 of 4th, at 18:15 of 7th... and etc. days.
- If the current time that the feature is activated is greater than the start time (HOUR, MINUTE), then the process is invoked at the start time of the next day. For example, if the feature is activated at 14:35 at 3rd day of a month and HOUR, MINUTE and PERIOD are datafilled as 14, 25 and 2 days, then process is invoked in the following sequence: 14:25 of 4th, 14:25 of 6th... and etc. days.
- While the process is sleeping, if the system time is changed to an earlier time, the process wake up time is still the same as set before. If the system time is changed to a time later than process wake up time, the process is waked up as soon as "settime" is handled..

Service

The first process waking up after the activation of the feature is always for only copying the meter counts, that is, none of the meter counts of trunk agents are compared since there is no data about previous meter counts.

If the tuple EMD in table MTRSYSPM is being changed, the following controls are applied:

- If the EMD process is running then changing is rejected and the operator is warned with a message as shown in "Figure 5 Reject message for the tuple change while process is running" on page 1042.

Figure 5 Reject message for the tuple change while process is running

```
EXCESSIVE METERING DETECTION process is running.
Please try again later...
```

- If HOUR, MINUTE or PERIOD fields of the tuple is tried to change while the ACTIVATION field is “YES”, then tuple change is rejected and operator is warned with a message as shown in “Figure 6 Reject message for the HOUR, MINUTE or PERIOD change” on page 1043.

Figure 6 Reject message for the HOUR, MINUTE or PERIOD change

```
To change the HOUR, MINUTE or PERIOD fields,
ACTIVATION field must be NO.
```

If the feature is deactivated by setting the ACTIVATION field from “YES” to “NO”, then the operator is informed with a message as shown in “Figure 7 Deactivation message” on page 1043 that EMD process is disabled and the data store allocated for copying the previous meter counts is freed.

Figure 7 Deactivation message

```
Store deallocation is running.
Please wait...
EXCESSIVE METERING DETECTION process has been deactivated.
```

41.2.4 Detection Process

With this activity detection process is just enhanced to include metered trunks too.

When the process wakes up, it detects all trunk agents whose meter counts reach the threshold value within the period time. When the process first wakes up, the current meter counts of all trunk and line agents are stored, and no comparison is made. The following actions are held for each periodic waking up:

- The current meters of line and trunk agents are compared with the previously copied meters and all agents whose meter counts reached the related THRESHOLD values of the tuple EMD in table MTRSYSPM are reported via EMD log. This log is EMD100 for lines and a new EMD 101 log for trunks.
- The current meter counts are copied to be used as previous values at the next invocation.

Periodic EMD process wakes up at the times determined according to the values of HOUR, MINUTE and PERIOD fields of EMD tuple in table MTRSYSPM.

With the waking up of the EMD process two main functionalities are performed:

- Comparison of meters of agents
- Copying of meters of agents

The running and completion of excessive metering detection process are informed with existing MTR107 (process running) and existing MTR109 (process completed) logs respectively.

41.2.4.1 Comparison of S/W meters of trunk agents

When EMD runs, it checks the meters of trunk agents which do not have NEMD option assigned in TRKOPTS table. For this purpose, the process compares the current meter values with the values which had been stored by the previous run of the process.

The delta values of the assigned meters of a trunk agent are calculated and added to the total delta. This calculation is done in the following manner:

For each assigned meter of the trunk agent:

1. If previous meter value is greater than the current meter value and the current wrap bit is set, then previous value minus the current value is subtracted from the meter wrap value (1,000,000,000,000)
2. If previous meter value is greater than the current meter value but the current wrap bit is not set then this meter is ignored since it means a MOG deassignment and reassignment has occurred.
3. If previous meter value is less than or equal to the current meter value and the current meter wrap bit is set and the previous meter wrap bit is not set then current value minus the previous value is added to the meter wrap value (1,000,000,000,000).
4. If previous meter value is less than or equal to the current meter value and the current meter wrap bit is not set and the previous meter wrap bit is set then this meter is ignored since it means a MOG deassignment and reassignment has occurred.
5. If previous meter value is less than or equal to the current meter value and both the previous and the current meter wrap bit is set or not set then previous value is subtracted from the current value.
6. The delta value found for this assigned meter is added to the total delta.

A few examples are given in “Table 5 Meter delta examples” on page 1044 for delta calculation of a meter. Here “Ignore” means “Do not make a delta calculation”.

Table 5 Meter delta examples

E.g. No	Prv. value of the meter	Prv. wrap bit	Cur. value of the meter	Cur. wrap bit	Delta value of the meter
5	000.000.000.100	N	000.000.000.200	N	000.000.000.100

E.g. No	Prv. value of the meter	Prv. wrap bit	Cur. value of the meter	Cur. wrap bit	Delta value of the meter
3	000.000.000.100	N	000.000.000.200	Y	1.000.000.000.100
4	000.000.000.100	Y	000.000.000.200	N	Ignore
5	000.000.000.100	Y	000.000.000.200	Y	000.000.000.100
2	000.000.000.700	N	000.000.000.300	N	Ignore
1	000.000.000.700	N	000.000.000.300	Y	999.999.999.600
2	000.000.000.700	Y	000.000.000.300	N	Ignore
5	000.000.000.700	Y	000.000.000.300	Y	999.999.999.600
3	000.000.000.000	N	999.999.999.999	Y	1.999.999.999.999

After the total meter delta of the trunk agent is calculated, this value is compared with the threshold value of trunk agent and if the total meter delta of the trunk agent reaches this threshold value, it is reported via EMD log with the reason. For trunk agents a new log, EMD 101, is generated.

An example of delta calculation of meters of a trunk agent for different values of previous and current meter count values is given in “Table 6 Delta calculation of meters of a trunk agent” on page 1045.

Table 6 Delta calculation of meters of a trunk agent

Meters	Previous count	Prv. wrap bit	Current count	Cur. wrap bit	Meter delta
TLOCAL	000.000.006.000	N	000.000.006.800	N	000.000.000.800
TTOLL	000.000.000.150	N	000.000.000.050	N	Ignore
			Total delta		000.000.000.800
Threshold	900		Action (800<900)		Nothing to do
Threshold	800		Action (800=800)		Generate EMD 101
Threshold	600		Action (600<800)		Generate EMD 101

41.2.4.2 Copying of current trunk meters

If the data that belongs to the previous meters are not present, then meter blocks are stored (independent of trunk option NEMD) by EMD process to be used at the next run without comparing meters of trunk agents. Otherwise, after all trunk agents except which have NEMD option are compared, current meter

counts of all trunk agents are copied to be used at the next run. For this purpose, same data store size necessary for storing the current meter counts is allocated. If sufficient data store can not be allocated, feature is deactivated automatically which causes all allocated data store to be freed.

When EMD process runs for the first time, it only copies the current meter blocks.

41.2.4.3 Interaction of EMD process with other metering processes

EMD process has interaction with some metering processes as follows:

41.2.4.3.1 Metering Restore Process

When the wake up time of EMD process comes, if the metering restore process is active, EMD waits for the restore process to be completed and upon completion, it compares previous values with newly restored meter counts. At the end of comparison, it copies current meter blocks as previous meter counts.

If restore process begins to run while EMD process is running, EMD is stopped immediately and upon completion of restore process restarts and compares previous meter counts with newly restored meter counts. At the end of comparison, it copies current meter blocks as previous meter counts.

41.2.4.3.2 Billing of Metered Agents

At the end of billing process, if billing is done successfully, wrap bits are reset. But before resetting wrap bit of a meter block, comparison of its meter count with previous meter counts is handled and EMD 101 log is generated with “BILLING” reason indicating that comparison is handled not in periodic time, in billing time.

41.2.4.3.3 Deassignment of ICMOG/OGMOG Option (TOOS)

While ICMOG/OGMOG option is being deassigned from a trunk agent, its meter block is deallocated and sent to TOOS. But before this, comparison of its meter count with previous meter counts is handled and EMD 101 log is generated with “OOS” reason indicating that comparison is handled not in periodic time, in deassignment of ICMOG/OGMOG time.

41.2.5 Robustness

EMD process survives all restarts RELOAD, COLD and WARM.

The store which is created for keeping previous meter counts is resides in DSPERM and affected by only reboot/upgrades. Previous meter counts are saved during all restarts(reload,cold and warm).

41.2.6 ONP

Since existing EMD tuple has been changed, transfer of MTRSYSPM table is enhanced to support transfer of old format of EMD tuple into new format.

41.2.7 Log Format

When a trunk subscriber whose meter counts reach a threshold value is detected, the operator is warned with a new log EMD101 with the reason in case of:

- A time period
- Billing, if billing process resets the wrap bit of a meter
- OOS, if a meter block is sent to the TOOS table due to ICMOG/OGMOG deassignment
- Wrap around more than once

The meters in the log are determined from the ICMOG/OGMOG assigned to the trunk.

This log includes the following fields:

- Current date and time
- CLLI information of the trunk agent
- Reason
  - PERIODIC: if comparison of meter counts is handled at time indicated in EMD tuple in table MTRSYSPM.
  - BILLING: if comparison of meter counts is handled during billing process, before reseting wrap bits.
  - OOS: if comparison of meter counts is handled during deassignment of MOg option, before deallocating meter block.
  - WRAP: if comparison of meter counts is handled during incrementing meter count, before setting wrap bit to “yes”.
- Date information belonging to the previous meters which reflects the time all the meters copied for the next run at the end of the process.
- For each meter, previous wrap bit and meter count (WRAP1, COUNT1), current wrap bit and meter count (WRAP2, COUNT2) and delta value between them. If a meter is not assigned currently or previously then wrap and meter count fields of that meter are filled with ’*’ signs, the delta field which does not have a valid value is also filled with ’*’ signs.
- At the end of the log, threshold and total meter count delta are located.

An example of EMD101 log is shown in “Figure 8 Sample log report for EMD 101” on page 1048

Figure 8 Sample log report for EMD 101

```
EMD101 JUN10 18:10:12 1367 INFO EXCESSIVE TRUNK METERING

CLLI: ICPRIBA

Reason: PERIODIC

Previous date: 2003/08/12  18:05:10

-------------------------------------------------------------------

```

41.3 Hardware Requirements or Dependencies

N/A.

41.4 Software Requirements or Dependencies

N/A.

41.5 Limitations and restrictions

1. Process runs initially when the day time reaches the datafilled start time whenever the following events occur.
   - Enabling the feature by changing the ACTIVATION field of the tuple EMD in table MTRSYSPM from “NO” to “YES”.
   - Rebooting the system.
   - Meter restore from tape or disk.
   - ONP.

   In the initial run of the process, actual meter counts are copied to the previous meter tables and next process activation time is set according to the PERIOD field
2. Modifying the tuple EMD in table MTRSYSPM is not permitted while excessive metering detection process is running.

3. If HOUR, MINUTE or PERIOD fields of the tuple EMD in table MTRSYSPM are desired to change and ACTIVATION field is "YES" (this means EMD process is active) then tuple change is rejected.
4. First next EMD process skips comparison for a trunk if the following operations are applied to a trunk agent after the current meters are copied.
   - Assigning ICMOG/OGMOG option to a trunk
   - Deassigning ICMOG/OGMOG option from a trunk
5. If any restart occurs while EMD process is running, the process restarts from the beginning after restart is over and previously generated logs are invalid.
6. The concurrent execution of the periodic case and the extreme cases like billing, OOS and wrap around more than once is not handled.
7. If a dump is in progress and more storage is needed for storing any new meters (i.e. via MOG assignment) EMD will not store counts of new meters until the next first run.
8. The process performs the copy, compare and log operations only on the active side.

42: Functional Description (FN): A00002884

42.1 Feature name

A00002884 - ETSI BRI Preset Conference Service Interactions.

42.2 Description

42.2.1 Introduction

The activity “ETSI BRI Preset conference service interactions” allows the interworking for preset conference on BRI with the supplementary services indicated in “Preset Conference for BRI Supplementary Services” specification document.

The activity A00002884 is a continuation of activity A00002367 “BRI Preset conference base” which is based on the existing IBN Preset Conference and uses same datafill requirements and restrictions for IBN Preset conference.

The implementation of this activity has no impact with the supplementary services current working behavior.

42.2.2 Provisioning of BRI Preset Conference

BRI Preset Conference allows an ETSI BRI (point-to-multipoint) station or ETSI ISUP V2 trunk to set up a preset conference with up to 35 conferees by dialling a specific directory number. This invokes simultaneous ringing of preselected conference members. To be able to activate this activity, PRECONF, CUSTENG tables should be datafilled.

In table CUSTENG, the customer group of the originator should have ‘CONF6C’ option to let the conference be activable. CUSTENG table datafill example is given in Table 1.

Figure 1 CUSTENG table datafill example

CUSTNAME	ADNUM	NONCOS	NOIBNTMT	CONSOLES	DOMAIN	GROUPID
CUST783A	22	256	63	Y	PRIVATE	105 (CONF6C 12)$

Table PRECONF contains a predefined preset conference DN and the conferees for this DN.

Preset conference DN should be datafilled to be allowed for a customer group, it is possible to datafill up to 64 preset conference DN in this table.

The conferees are specified in advance in this table. 35 conferee numbers can be assigned to each preset conference DN. This includes the originator, all preset conferees and all add on conferees. The preset conference originator is a member of the preset conference's customer group. Conferees does not need to belong to the same customer group. The conferees can have an alternate address. The time outs interval is 15 seconds for both conferees and its alternate address.

PRECONF table datafill example with a predefined preset conference DN, a conferee with alternate address and an other without alternate address is given in Table 2.

Figure 2 PRECONF Datafill example

PCNFKEY CONFADDR PCNFVAR OPTIONS
0 0 1027835599 D IBN CUST783A 0 Y N Y N N N $
0 1 7831016 A 7831003 15 $
0 2 7831002 C 15 $

A served user initiates one preset conference (PRCONF) by dialling a predefined DN, which is associated with conference. The directory number is recognized as a request for a preset conference. A check is made if required number of six-port conference bridges can be seized for the conference and the conference is not already in use. If call is valid and the conference ports are available, the originator will hear audible ringing (ring back tone). The status of conferees is not important at this moment for the originator to be able to hear ring back tone. If call is invalid (Translations checks for the originator's data against the data of preset conference and required number of six-port conference bridges can not be seized for the conference or the conference is already in use), the originator will be routed to treatment. Use of Notification for call valid scenarios is not required. No notification will be sent to served user even if some/all datafilled conferees are busy.

42.2.3 Call Flows

Conference originator initiates one preset conference by dialling a specific DN. Dialing the DN invokes simultaneous ringing of the preselected conference members.The directory number is recognized as a request for a preset conference. A check is made if required number of six-port conference bridges can be seized for the conference and the conference is not already in use. An IMMSTART option can be set in table PRECONF so that the conference starts as soon as the first conferee answers.

The originator of a preset conference can add on conferees as local call, once the preset conference is established. In order to provide this functionality, the field ADDON of the table PRECONF should be set to ‘yes’ and line options AFC and HOLD. Once the maximum number of conferees is reached, no more conferees may be added.To add a new party, the connection to the conference bridge can be either in the (Active Idle) state or in the (Active Held) state and the connection to the party to be added can either be in (Active, Idle) state.

If ORIGCONT field set to “Yes” in table PRECONF, the originator is in control of conference. In this case when he goes on-hook, the conference is taken down, even if there are conferees are still on the bridge.

Basic call flow will be supported by “Preset Conference Base” feature (A00002367). For detailed information please refer to FN document of A00002367.

42.2.3.1 Successful Case

Figure 3 Preset Conference Initialition

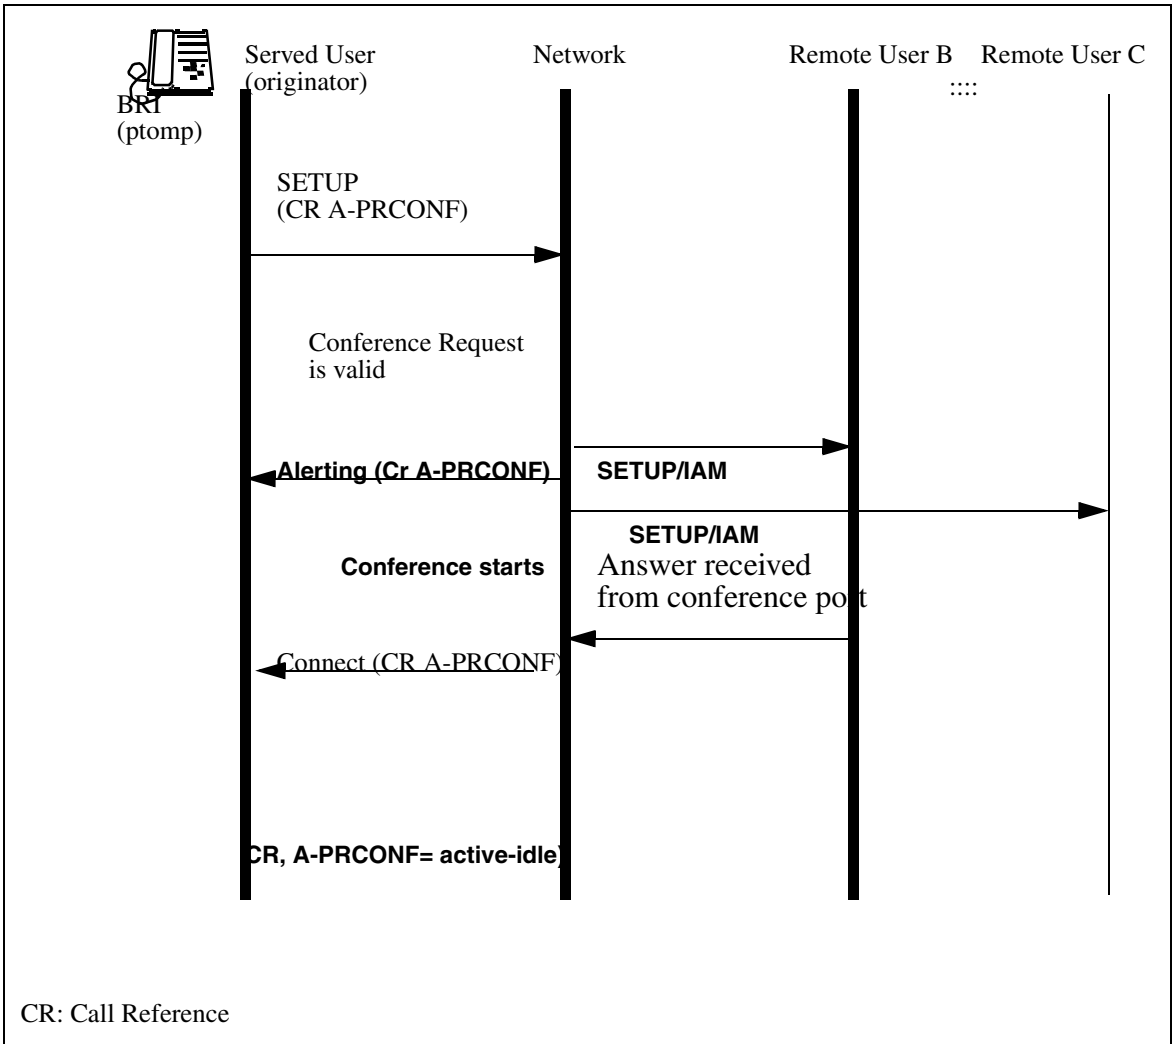

Figure 4 Add-on conferee, when preset conference is in held state

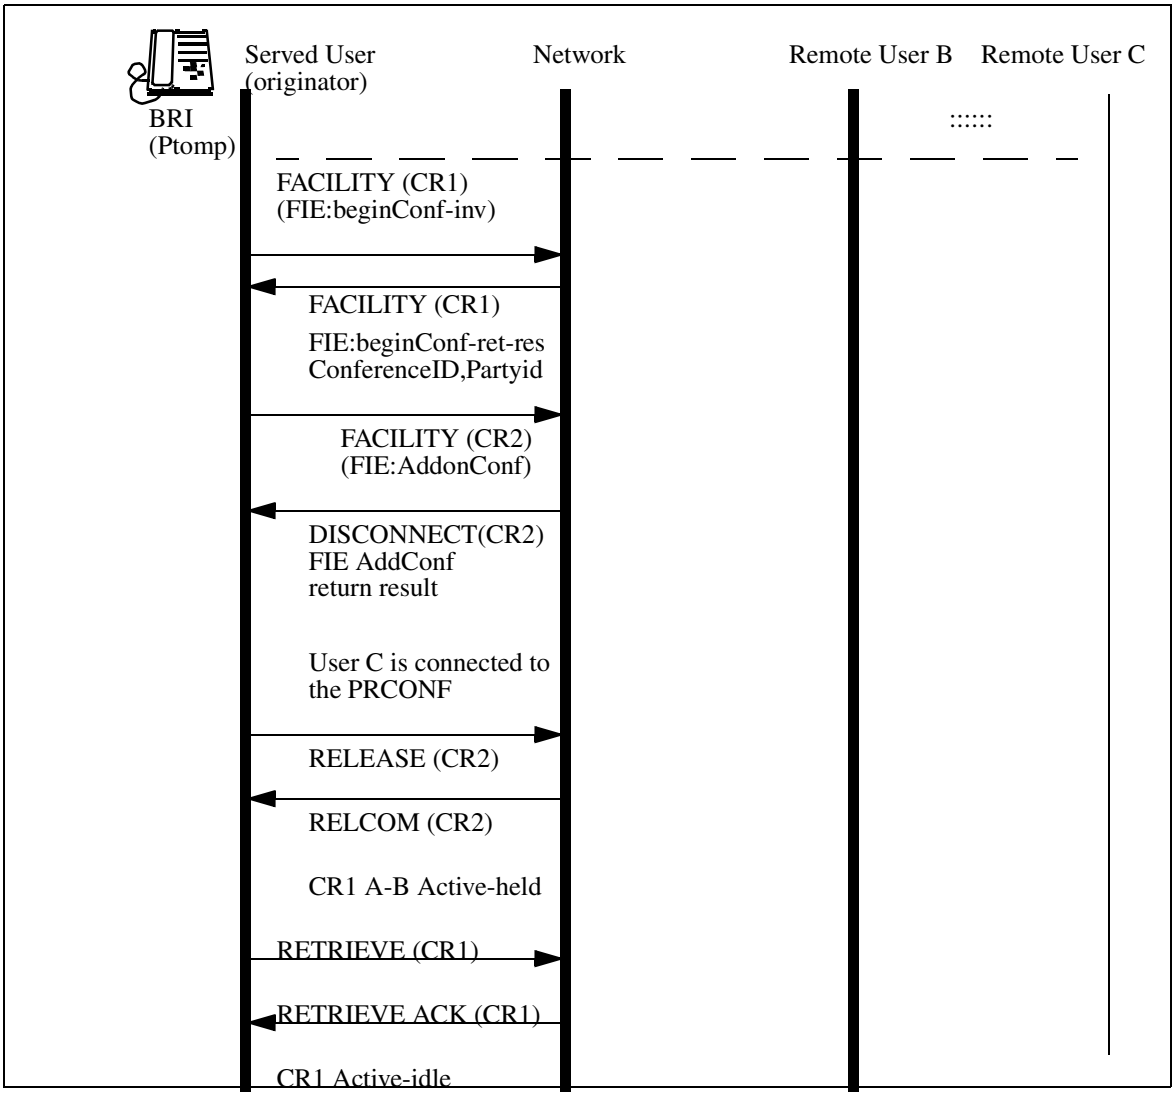

Figure 5 Add-on conferee, when preset conference is active-idle

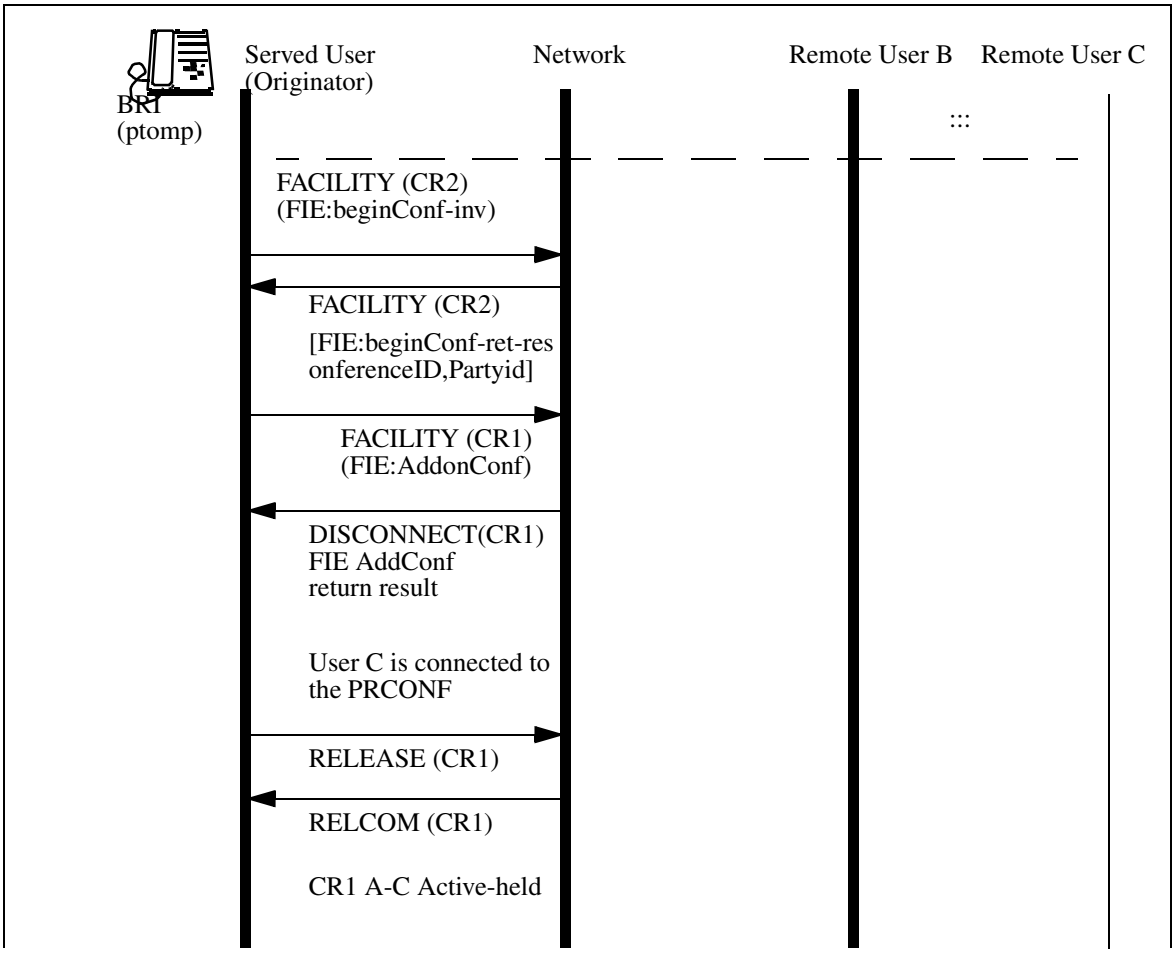

42.2.3.2 Unsuccessful Case

Figure 6 Network receives a BeginCONF-inv in a state other then Active

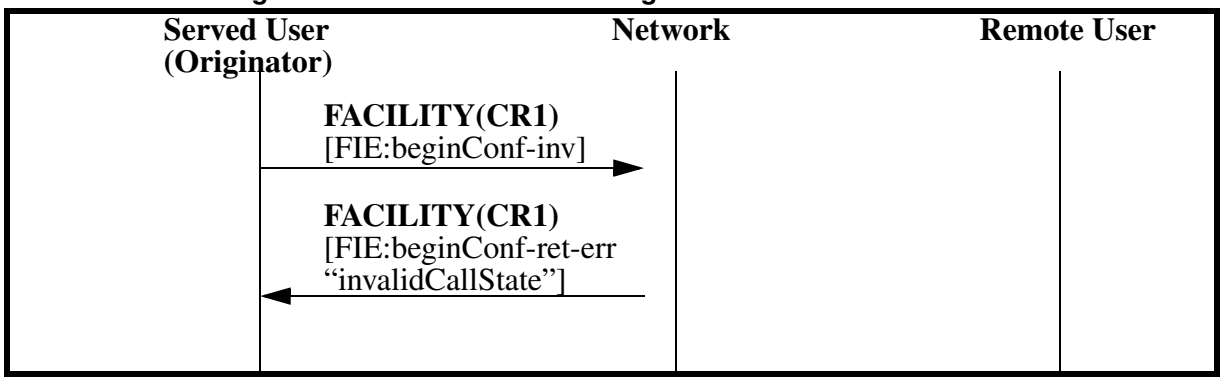

Figure 7 Adding a party which causes interworking restriction violations

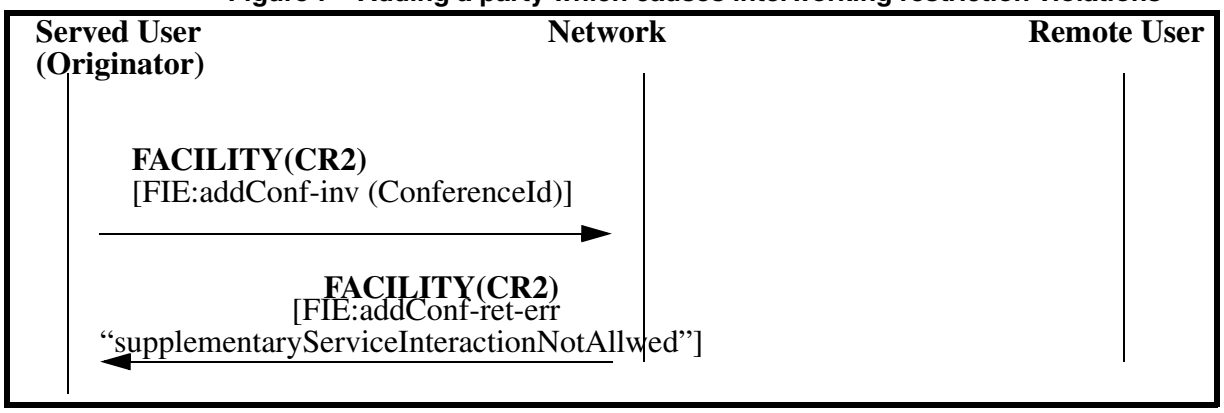

Figure 8 Served user indicates an inappropriate bearer capability.

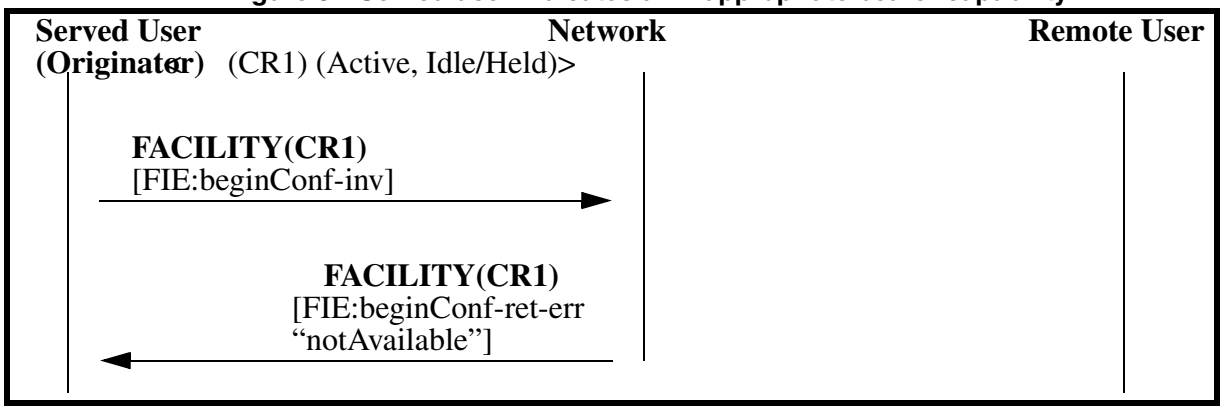

Figure 9 Adding a party when the maximum conference size is reached

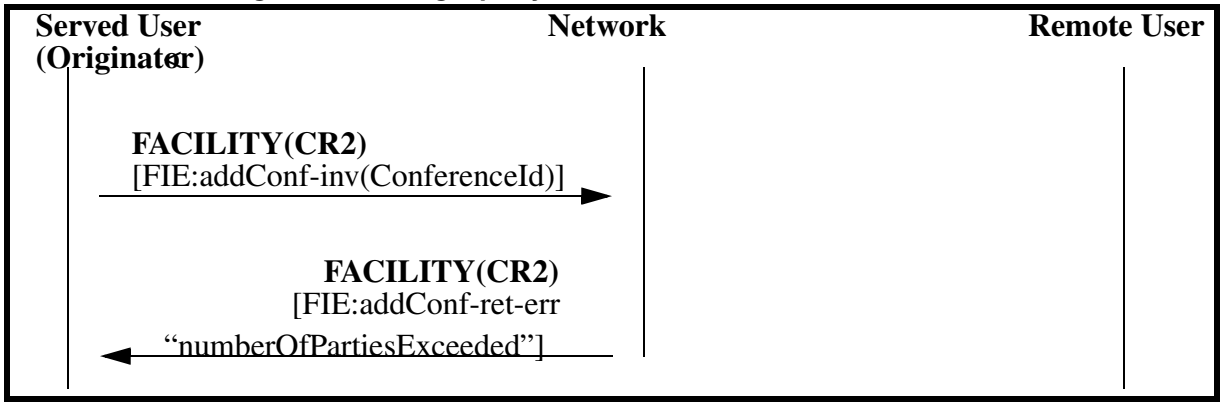

Abbreviations used in sections 2.2.3.1 and 2.2.3.2 are described below:

CRx, CRy: Call Reference used-

A-B:call between user A and PRCONF

A-C:call between user A and user C

FIE: Facility information element.

42.2.4 Supplementary Services Interworkings

42.2.4.1 Interaction of Preset Conference with Advice Of Charge

42.2.4.1.1 General Information about AOC

AOC on BRI is a feature which allows ISDN subscribers to get the number of charge units that the calls they originate consumes. AOC can provide the actual charge unit count on a regular basis during a call or only at the end of a call, or both.The AOC functionality can be controlled/provisioned in the following ways:

- BRI loop (customer) basis, through table KSETFEAT via SERVORD. BRI lines provisioned via SERVORD can have a new option called AOC.
- XPM basis, through table LTCINV for PLGCs, in this table option attribute METER has to be present for all the XPMs that need to provide the AOC functionality.
- The zone (MZONE) and logical network (LNET) options are taken from the xxCODE translation table and the MDI index (MDI) is taken from table LINEATTR. With these 3 values, call processing is able to access the tariff database and to determine the tariff to be used for this call.

42.2.4.1.2 Test Considerations

Current behavior.

AOC will be provided for basic call and for add-on phase of preset conference and no AOC information will be generated for the use of PRCONF equipment and for the calls to the remote users with no additional code changes. AOC interaction with ETSI BRI preset conference will be supported for ETSI BRI origination test cases.

42.2.4.2 Interaction of Preset Conference with Call Waiting

42.2.4.2.1 General Information about CWT

CWT is a feature, which gives subscriber X (talking to subscriber Y) attention to a call from subscriber A. Subscriber X gets a special Call Waiting Tone as

sign of the waiting call. Subscriber A gets audible ringing. CWT functionality can be provisioned via Servord.

42.2.4.2.2 Test Considerations

Current behavior.

42.2.4.3 Interaction of Preset Conference with Call Hold/Retrieve

42.2.4.3.1 General Information about HOLD

HOLD is a feature, which enables subscriber A, talking to subscriber B, to hold B and make or receive a new call. HOLD functionality can be provisioned via Servord.

42.2.4.3.2 Test Considerations

Current behavior. Hold Indications including ISUP, hold announcement and silence will be supported.

42.2.4.4 Interaction of Preset Conference with Connected Line Identification Presentation

42.2.4.4.1 General Information about COLP

The COLP supplementary service provides the connected user's ISDN number to the calling user. COLP functionality can be provisioned via Servord.

42.2.4.4.2 Test Considerations

Current behavior.

COLP request is currently restricted in preset conference.

42.2.4.5 Interaction of Preset Conference with Completion of Call to Busy Subscriber

42.2.4.5.1 General Information about CCBS

The CCBS supplementary service enables user A, encountering a busy destination B to have the call completed without having to make a new call attempt when the destination B becomes not busy. When user A accepts the recall, the network will automatically generate a CCBS call to destination B. CCBS functionality can be provisioned via Servord.

42.2.4.5.2 Test Considerations

Current behavior.

CCBS to busy preset conference is currently prevented.

42.2.4.6 Interaction of Preset Conference with Three Party Service

42.2.4.6.1 General Information about 3PTY

The 3PTY supplementary service enables the user to establish, participate in and control, a three-way conversation, i.e. a simultaneous communication involving the served user and two remote parties. This feature requires HOLD functionality, it can be provisioned via Servord and table CONF3PR should be datafilled to activate 3PTY.

42.2.4.6.2 Test Considerations

Current behavior.

3PTY is not currently available for preset conference call.

42.2.4.7 Interaction of Preset Conference with Meet-me Conference

42.2.4.7.1 General Information about MMC

MMC provides a user with the ability to arrange for a call between more than two participants with all participants accessing a conference bridge.It is activated for a specified period booked in advance by the served user. MMC does not use SERVORD. In order for MMC to work properly, tables CUSTENG and MMCONF must be properly datafilled.

42.2.4.7.2 Test Considerations

Current behavior.

A dialing to a local MMC if a local PRCONF is active on the loop, is currently prevented.

42.2.4.8 Interaction of Preset Conference with Conference Call, Add-on

42.2.4.8.1 General Information about ECOF

This feature enables a user A to simultaneously with more than three parties. add any member to a conference, split a conference to have private conversation, isolate a remote user, reattach an isolated user, drop a conferee or disconnect the conference. This service is supported only in point to

multipoint configurations. ETSI HOLD must be present for the conference to function. Table CONF6PR should be datafilled to activate 3PTY.

42.2.4.8.2 Test Considerations

Current behavior.

Preset conference activity is based on ETSI BRI Six party conference.

42.2.4.9 Interaction of Preset Conference with Direct Dialing In

42.2.4.9.1 General Information about DDI

DDI enables a user to directly call another user on ana integrated services private branch exchange or other private system without attendant intervention. The service shall be based on the use of the ISDN number and shall be provided after pre-arrangement with the service provider.

42.2.4.9.2 Test Considerations

Current behavior.

42.2.4.10 Interaction of Preset Conference with Multiple Subscriber Number

42.2.4.10.1 General Information about MSN

MSN provides the possibility for assigning multiple integrated services digital network numbers to a single interface. This enables the selection of one or multiple distinct terminals attached to the same interface.The service provider shall fix the length of the numbers to be transmitted to the user s installation.

42.2.4.10.2 Test Considerations

Current behavior.

42.2.4.11 Interaction of Preset Conference with Diversion Services

42.2.4.11.1 General Information about Diversion Services

CFF, CFFA, CFGD, CFGDA, CFI, CFIND, CFK, CFMDN, CFO, CFRA, CFS, CFTANN, CFTB, CFTD, CFU, CFW, CFWANN,CFX, CFXDNCT, CFXVAL are different kind of diversion services. These functionalities allows the called number to be diverted to an other number under different circumstances.

42.2.4.11.2 Test Considerations

Current behavior.

42.2.4.12 Interaction of Preset Conference with Closed User Group

42.2.4.12.1 General Information about CUG

CUG provides a mechanism for forming groups to and from which access is restricted. A specific user may be member of one or more Closed User Groups. Members of a specific CUG can communicate among each other but not, in general, with users outside of the group. CUG can be provisioned via Servord and table ETSIFEAT should be datafilled to activate this functionality.

42.2.4.12.2 Test Considerations

Current behavior.

It is required that CUG shall be assigned against the PRCONF DN which is in virtual DN type, and handle from the served user to the PRCONF DN according to CUG settings.

42.2.4.13 Interaction of Preset Conference with Malicious Call Identification

42.2.4.13.1 General Information about MCID

Malicious Call Identification is a supplementary service offered to the called party which enables the called party to request that the calling party be identified to the network and be registered in the network. The data to be registered will be the called party number, calling party number, local time and date of the invocation in the network serving the called user; and as a service provider option: calling party sub-address (if provided by the calling user). MCID can be provisioned via Servord.

42.2.4.13.2 Test Considerations

Current behavior.

42.2.4.14 Interaction of Preset Conference with Subaddressing

42.2.4.14.1 General Information about SUB

The sub-addressing supplementary service allows the called (served) user to expand his addressing capacity beyond the one given by the ISDN number. SUB allows one party in a call to provide a network address extension to supplement the party's own network address or that of the other party. SUB can be provisioned via Servord.

42.2.4.14.2 Test Considerations

Current behavior.

SUB information is currently restricted during preset conference.

42.2.4.15 Interaction of Preset Conference with Explicit Call Transfer

42.2.4.15.1 General Information about ECT

Explicit Call Transfer is an ISDN supplementary service which enables a user who has two calls, each of which can be an incoming or an outgoing call, to connect the other parties in the two calls. ECT can be provisioned via Servord.

42.2.4.15.2 Test Considerations

Current behavior.

The served user can not currently transfer the call to the preset conference but remote users can currently use ECT. Use of ECT by the remote user is currently denied, if this would result in chaining of conferences. No addition to the existing code.

42.2.4.16 Interaction of Preset Conference with User to User Signalling

42.2.4.16.1 General Information about UUS

The UUS supplementary service allows the user to send/receive a limited amount of user-generated information to/from another user-network interface. UUS can be provisioned via Servord.

42.2.4.16.2 Test Considerations

If the served user provides UUS information in the SETUP message to the PRCONF DN, the same UUS information shall be included into the call setup to the conferees.This part of feature interaction will be provided by “BRI Preset conference base” feature (A00002367).

If UUS explicit request exist in SETUP message and service request is Required, the call will be released. Any other UUS information shall be discarded.

42.2.4.17 Interaction of Preset Conference with Multi Level Precedence and Preemption

42.2.4.17.1 General Information about MLPP

The Multi-level Precedence and Preemption (MLPP) supplementary service provides prioritized call handling service. This supplementary service has two parts precedence and preemption. Precedence involves assigning a priority level to a call. Preemption involves the seizing of resources, which are in use by a call of a lower precedence, by a higher level precedence call in the absence of idle resources. MLPP can be provisioned via Servord.

42.2.4.17.2 Test Considerations

If the served user provides MLPP information during call setup to the PRCONF DN, the same MLPP information shall be included into the call setup to the conferees. This part of feature interaction will be provided by "BRI Preset conference base" feature (A00002367).

The PRCONF service shall ensure, that the call from the served users is established as MLPP call, if this was requested.

If a PRCONF has been initiated and is still active any other call to this PRCONF DN shall NOT result in the preemption of the existing PRCONF. The second call to the active PRCONF shall result in busy treatment for the caller. Current behavior for this part.

A PRCONF shall not be preempt able by an attempt to initiate the same PRCONF from a served user with higher precedence level, that the served user who initiated the existing PRCONF. The second call to the active PRCONF shall result in busy treatment for the caller.

If a PRCONF, established as MLPP call, has been initiated from subscriber A and if the conferee's channels are occupied with MLPP calls with low precedence, preemption shall be prevented.

If a new MLPP call comes to a subscriber "A" whose both channels are occupied even one of them is involved in preset conference, (it is the case where subscriber "A" is a conferee of the preset conference) if the precedence of the new call is higher than preset conference call precedence, conference call shall be preempted by the new MLPP call. The figure below is a representation of this scenario.

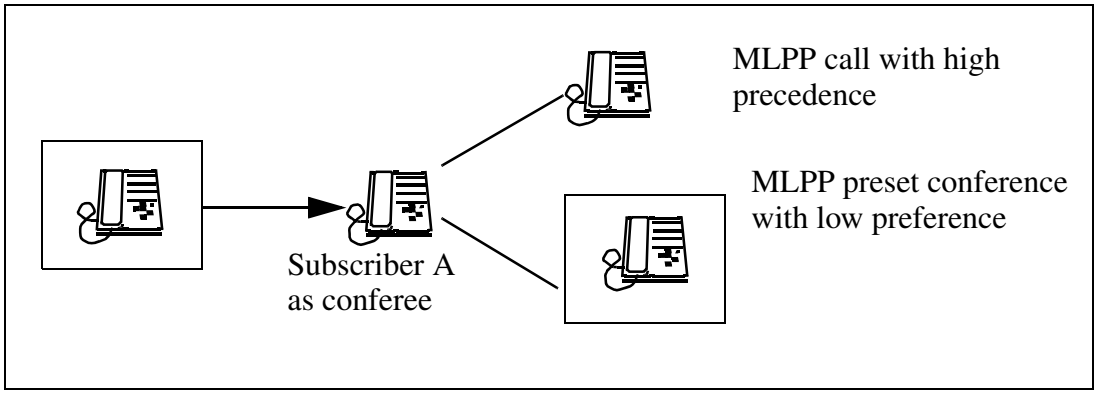

Figure 10 First scenario representation for MLPP - BRI preset conference interaction.

It shall be supported, that a PRCONF DN can be used as a valid Alternate Party for the MLPP service. This requirement will be supported if q955_compliant bool in MLPP_PARMS parameter in table OFCENG is set to “N”. If q955_compliant bool is set to “Y”, connect message will be waiting before routing the call to alternate number, and this timer can erase preset conference route time-out value, to prevent this event, preset conference route timer will be stopped and the call will be route to MLPP alternate number. During an MLPP call if the conferee of preset conference has an alternate number, preset conference tries once to reach the conferee. If the conferee does not answer, the call is routed to MLPP alternate number.

If a new MLPP call comes to served user whose both channels are occupied even one of them is involved in ETSI BRI preset conference, established as MLPP call with low precedence, the new MLPP call shall preempt and drop ETSI BRI preset conference.The figure below is a representation of this scenario

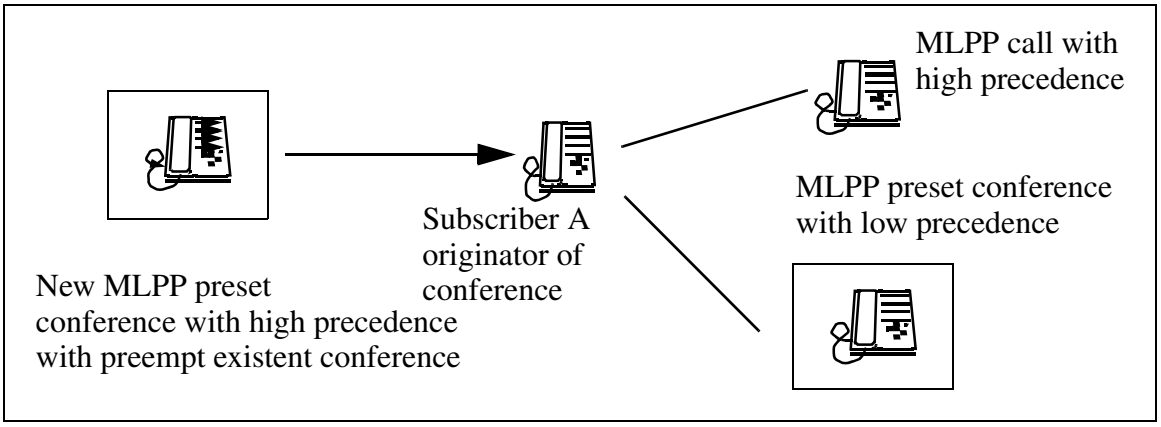

Figure 11 Second scenario representation for MLPP - BRI preset conference interaction.

After preemption, no notification indicator information element will be sent to served user or conferees.

If some of the calls making up the preset conference are non-MLPP (add-on functionality),

- Non-MLPP calls are assigned precedence level given by MLPP_DEFAULT_PRECEDENCE office parameter
- Highest precedence level of the legs is assigned as the precedence level of controller's conference leg. Conferees' legs are preserved their original precedence levels.

If all of the calls making up the conference are non-MLPP,

- Datafilled level on office parameter MLPP_DEFAULT_PRECEDENCE is assigned as the precedence level of both calls.

PRCONF shall ignore all other MLPP related signalling.

42.2.4.18 Interaction of Preset Conference with Calling Line Identification Presentation / Presentation Restriction

42.2.4.18.1 General Information about CLIP/CLIR

Calling Line Identification Presentation is a supplementary service offered to the called party which provides the calling party s ISDN-number, possibly with sub-address information, to the called party. When CLIP is applicable and activated, the network provides the called party with the number of the calling

party at call set-up on all incoming calls. The calling party number may be accompanied by a sub-address.

Calling Line Identification Restriction is a supplementary service offered to the calling party to restrict presentation of the calling party s ISDN-number and sub-address to the called party. When CLIR is applicable and activated, the originating node provides the destination node with a notification that the calling party s ISDN number and any sub-address information are not allowed to be presented to the called party. In this case no calling party number is included in the call offering to the called party's installation.

42.2.4.18.2 Test Considerations

The CLIP/CLIR information sent to the remote users during PRCONF establishing, shall be the same as being provided by the served user to the conference equipment. If the served user provides Generic Address Parameters and additional calling number identifications information in the SETUP message to the PRCONF DN, the same information shall be included into the call setup to the conferees (provided the respective protocol is supporting this).This part of feature interaction will be provided by "BRI Preset conference base" feature (A00002367).

For BRI-BRI, BRI-ISUP and ISUP-BRI interworkings, current working behavior of nosceerning will be kept. For Ex. BRI terminal with special arrangement triggers PRCONF, the unscreened CLI should also be send to the terminators).

42.2.4.19 Interaction of Preset Conference with Conference Chaining

42.2.4.19.1 General Information about Conference Chaining

Conference chaining shall be prohibited, if the conference equipment for both conferences resides on the same local exchange. But it is not possible to prevent conference chaining over remote connections since sent/received notifications are not permitted.

42.2.4.19.2 Test Considerations

No Impact.

42.2.5 OM class for Preset Conference

Since this activity is based on the existing IBN preset conference, the existing OM class PCNF is used.

OM class will be supported by “Preset Conference Base” feature (A00002367). For detailed information please refer to FN document of A00002367.

42.2.6 Billing

No AMA/Billing changes for this activity.

42.3 Hardware Requirements or Dependencies

The NT3X67 six-party conference card provides conference facilities on a single card for use with DMS-100 switches. This activity uses same hardware as IBN Preset Conference.

Since the feature is based on BRI Preset Conference Base, hardware requirements or dependencies of BRI Preset Conference are also valid for this activity.

42.4 Software Requirements or Dependencies

The existing IBN preset Conference is used by this activity.

42.5 Limitations and restrictions

1. Since the feature is based on the existing IBN Preset Conference, and a continuation of BRI Preset Conference Base, the restrictions of IBN preset conference and BRI Preset Conference are also valid for this activity.
2. Since section 4 of Preset Conference for BRI Supplementary Services” specification document which specifies the required interworking for PRCONF on BRI lines, does not contain any information about IBN lines CEPT and CENTREX features interactions, it is assumed in the development of this activity that any changes on the existing interworking which should be supported by the “IBN Preset Conference “feature.
3. If any of the conferees are connected to the DMS switch where the preset conference is being originated and has any of the diversion feature these feature will remain active for incomming preset conference call. If the primary address does not answer call forwarding will be attented if it is activated. On origination to a conference,diversion features will be deactivated. In other words, a direct access user cannot forward incoming calls to a preset conference.

42.6 Interactions

IBN Preset Conference

No Impact

BRI Preset Conference Base

No Impact

10 AFC Keys for BRI Directory Number

“10 AFC Keys for BRI Directory Number” feature (A00002377) allows up to 10 AFC keys on one DN and allows also, 11 call HOLD on one DN and 8 call waiting per loop if the customer is subscribed to these services.To be able to support more than one HELD, it is permitted to make more than two calls on one TEI. That can cause problem if there are two different preset conferences on one TEI and if this TEI tries to send ADDCONF FAC for a new call. Since there is no way to decide to which conference the new call will be added, one of the restrictions below will be followed:

- Two preset Conferences will not be allowed on one TEI.
- Add-on conference will be restricted if there are two preset Conferences on one TEI.
- The new call will be added on a random conference.

According to the information given above, please refer to A00002367 “BRI Preset Conference Base” and A00002377 “10 AFC Keys for BRI Directory Number” features.

42.9 Appendix A- IBN Preset Conference Interactions Background

“IBN Preset Conference (large)” feature (AF2014) enables the maximum number of conferees for an Meridian Digital Centrex (MDC) preset conference to be increased to 50.
The feature interactions required for this feature are described below:

1) If any of the conferees are connected to the DMS switch where the preset conference is being originated and has any of the following features

- Call forwarding don’t answer
- Call forwarding busy
- Call forwarding intragroup

these features will remain active for the incoming preset conference call (if the primary address does not answer call forwarding will be attempted if it is activated).

2) If the originator is active in any conference, flashes, or depresses a CONF key and dials a preset conference DN busy treatment is given. Two preset conferences can not be in conference together.

3) If the preset conference call has been originated in the switch, SMDR may apply to one or more legs. Each leg will be a separate record with conference identification in the SMDR report.

43: Functional Description (FN): A00002900

43.1 Feature Name

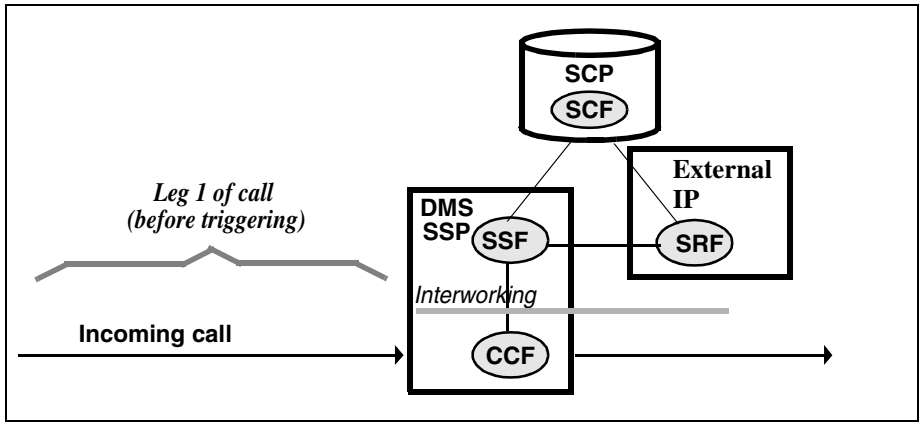
China INAP Compliance Enhancement Part 2

43.2 Description

43.2.1 Functional Overview

This feature will enhance the external IP capabilities and support multiple ApplyChargings on ISN07 TDM and CS2Kc platform for China market. The external IP supported in this feature has direct connection through China ISUP to SCP (as figure 1), SSP would not provide assisting SSP functionality.

Figure 1 Network diagram



This feature is based on feature A89008388: China IN SSP capabilities and feature AG5145: External IP, please see reference 7,10 for more information.

Two main functionalities are implemented in this feature:

- External IP enhancement

  For China INAP, several enhancements are made to fully support external IP:

  - Enhance operation EstablishTemporaryConnection
  - Enhance operation InitialDP

    Parameter iPAvailable and iPSSPCapabilities are required in IDP operation. SSP is able to set these two parameters by datafill.
  - Charging the temporary connection to external IP using ApplyCharging operation

    According to China requirement, charging to the temporary connection to external IP is required. Charging per duration and time are both supported in this feature.
  - Unsuccessful connection to external IP handling enhancement

    Several scenarios of unsuccessful connection to external IP are enhanced to comply with China requirement.
  - CISUP: Map the post answer ANM(CON) to CPG
- Multiple ApplyChargings support
  - Support up to 3 ACs

    Now up to 3 ACs can be accepted and handled simultaneously during an INAP call. For multiple ACs, corresponding ACRs can be sent to SCP if required.

Function ‘CISUP: Map the post answer ANM(CON) to CPG’ is for China ISUP originator only. The other functions are agent independent, i.e. they are supported on the originating agents with the condition: the originating agent <-> INAP interworking is ALREADY supported. For example, China ISUP, IBN lines, SIP-T (no ISUP), China PRI.

These functions are detailed in Section 2.2.2 to 2.2.3.

43.2.1.1 Functional Requirements

The functions to enhance China IN SSP capabilities are based on the following specification:

— China INAP specification (See reference 1)

— China INAP test specification (See reference 2)

— Supplementary Specification of China IN CS-1 INAP (See reference 3)

— Test specification of Supplementary Specification of China IN CS-1 INAP (See reference 4)

43.2.1.2 Data Requirement

The datafill is the same as that for normal IN call.

43.2.2 External IP enhancement

43.2.2.1 EstablishTemporaryConnection enhancement

The ETC is defined as below in China INAP specification:

```
EstablishTemporaryConnection OPERATION
  ARGUMENT
    SEQUENCE {
      assistingSSPIPRoutingaddress [0] IMPLICT OCTET STRING;
      correlationID[1] IMPLICT OCTET STRING OPTIONAL;
      legID [2] CHOICE{
        sendingSideID[0] IMPLICIT OCTET STRING( SIZE(1) )} OP-
        TIONAL;
      scfID [3] IMPLICT OCTET STRING(SIZE (3)OPTIONAL;
      .....}
```

Parameters scfID and legID are supported in this feature. legID indicates which leg of a call is connected to the SRF for user interaction. Currently, external IP can only be connected to calling party. This feature will only support the decode of parameter legID.

Parameter correlationID has fixed length 3 bytes.

Parameter assistingSSPIPRoutingAddress is checked according to China INAP requirement:

— the format is Generic number

— If scfID and correlationID are not contained in assistingSSPIPRoutingaddress, the NOA of assistingSSPIPRoutingaddress should be national number(0000011) or Subscriber number(0000001). For national number, it consists of the prefix 0, Area code and office code, the length of the number is 4~8. For Subscriber number, it consists of office code, the length of the number is 4~5.

For the outgoing IAM to external IP, the format of CDPN within IAM is different considering that the number of CDPN is even or odd. Examples are shown in table 1 and 2:

Table 1 CDPN with 8 digits assistingSSPIPRoutingAddress

	8	7	6	5	4	3	2	1
1	Even	Nature of Address						
2	INN indica-tor	Numbering Plan Indicator			Spare			
3	2nd Assisting Address Signal				1st Assisting Address Signal			
4	4th Assisting Address Signal				3rd Assisting Address Signal			
5	6th Assisting Address Signal				5th Assisting Address Signal			
6	8th Assisting Address Signal				7th Assisting Address Signal			
7	2nd SCF ID				1st SCF ID			
8	4th SCF ID				3rd SCF ID			
9	6th SCF ID				5th SCF ID			
10	2nd Correlation ID				1st Correlation ID			
11	4th Correlation ID				3rd Correlation ID			
12	6th Correlation ID				5th Correlation ID			

Table 2 CDPN with 7 digits assistingSSPIPRoutingAddress

	8	7	6	5	4	3	2	1
1	Odd	Nature of Address						
2	INN indica-tor	Numbering Plan Indicator			Spare			
3	2nd Assisting Address Signal				1st Assisting Address Signal			
4	4th Assisting Address Signal				3rd Assisting Address Signal			
5	6th Assisting Address Signal				5th Assisting Address Signal			
6	1st SCF ID				7th Assisting Address Signal			
7	3rd SCF ID				2st SCF ID			
8	5th SCF ID				4th SCF ID			
9	1st Correlation ID				6th SCF ID			
10	3rd Correlation ID				2nd Correlation ID			
11	5th Correlation ID				4th Correlation ID			

12	Filler (0)	6th Correlation ID

43.2.2.2 InitialDP enhancement

According to China INAP, IPAvailable and IPSSPCapabilities should be supported in IDP operation, SSP should fill these two parameters according to its abilities.

In order to build iPAvailable and iPSSPCapabilities into IDP, option INITDP_PARM of table SERVINFO is extended to add two new fields **IP_AVA** and **IPSSP_CAP** to indicate whether parameters IPAvailable and IPSSPCapabilities will be carried in IDP. These two fields should be datafilled at the same time. These two fields can also be datafilled for those variant other than China.

Meanwhile, option SRF_INFO is extended to add new filed **IP_INFO** to provide detailed information of the IP capability within SSP.

For China market, if IP_AVA and IPSSP_CAP are datafilled and IP_INFO is not datafilled, parameters iPAvailable and iPSSPCapabilities are set to default value according to China INAP, the default value of iPAvailable is ‘01’H (which indicates that the IP is available), the default value of iPSSPCapabilities is ‘#0C00’ (which indicates that DTMF digit collection and tone & announcement is supported). If IP_INFO is datafilled, then iPAvailable and iPSSPCapabilities are set according to this datafill. That means IP_INFO will take effect only if IP_AVA and IPSSP_CAP are datafilled, otherwise, the information of this datafill will not be carried in IDP.

IP_INFO contains two subfields: IP_AVAILABLE and IPSSP_CAPABILITIES, which contains values for parameter IPAvailable and IPSSPCapabilities respectively.

According to China INAP, there are 14 kinds of IP capabilities which are indicated by parameter iPSSPCapabilities. These capabilities can be datafilled in IPSSP_CAPABILITIES as shown in table 3:

Table 3 IP Capabilities defined in China INAP

IPSSPCapabilities parameter	Value	Meaning	IPSSP_CAPABILITIES selections
1st byte, bit 0	0/1	Not support/Support IPRoutingAddress	IPRA
1st byte, bit 1	0/1	Not support/Support VoiceBack	VOICE_BACK
1st byte, bit 2	0/1	Not support/Support VoiceInformation, recognize through voice, speech.	VOICE_INFO_SPEECH
1st byte, bit 3	0/1	Not support/Support VoiceInformation, recognize through voice, voice.	VOICE_INFO_VOICE

1st byte, bit 4	0/1	Not support /SupportText to Voice conversion.	TEXT_TO_VOICE
1st byte, bit 5	0/1	Not support/Support fax.	FAX
1st byte, bit 6	0/1	Not support/Support recorder.	RECORDER
1st byte, bit 7	0/1	Not support/Support script.	SCRIPT
2nd byte, bit 0	0/1	Not support/Support manual operator.	MAN_OPERATOR
2nd byte, bit 1	0/1	Not support/Support conference.	CONFERENCE
2nd byte, bit 2	0/1	Not support/Support tone & announcement.	TONE_ANNC
2nd byte, bit 3	0/1	Not support/Support DTMF digit collection.	DTMF_DIGCOL
2nd byte, bit 4	0/1	Not support/Support sending DTMF signal.	SEND_DTMF_SIG
2nd byte, bit 5	0/1	Not support/Support sending FSK signal.	SEND_FSK_SIG
2nd byte, bit 6,7	To be defined.		
3rd, 4th bytes	To be defined.		

Below is an example of datafill:

Table 4 SERVINFO datafill example

Example of datafill:
TABLE SERVINFO
200 (INITDP_PARMS (SERVKEY) (CDPA) (**IP_AVA**) (**IPSSP_CAP**) $)
(SRF_INFO (EARLY_ANS ANS_ON_ANNS)
(**IP_INFO Y** (**IPRA**) (**VOICE_INFO_SPEECH**)
(**TONE_ANNC**)(**DTMF_DIGCOL**)$)$)$

43.2.2.3 Charging the temporary connection to external IP using ApplyCharging operation

Currently, DMS SSP does not charge the temporary connection to external IP. According to China INAP:

If the charging is based on duration:

— SCP should send AC before ETC, and the startChargePattern is ‘AnswerReceived’

— When SSP receives AC and ETC, SSP begin to prepare for charging. SSP start charging after receiving answer message from external IP.

When originator abandon, SSP releases the connection to external IP or SSP receives release message, the charging is stopped, and ACR is sent to SCP.

— The other requirement of processing AC parameters are not changed.

If the charging is based on time:

— SCP can send AC before ETC or during the speech phase. If AC is sent before ETC, then the startChargePattern can be ‘Immediately’ or ‘AnswerReceived’. Otherwise, if AC is received during the speech phase, the startChargePattern should be ‘Immediately’.

— The fee is carried in surCharge parameter of AC, meanwhile AC does not carry chargeClass parameter.

— SSP can send ACR immediately or after the connection to external IP is released.

43.2.2.4 Unsuccessful connection to external IP handling enhancement

If the ETC is received between PA and SRR, SSP should report unexpected component sequence error.

43.2.2.5 CISUP: Map the post answer ANM(CON) to CPG

There are two conditions under which the mapping will occur:

— Condition 1: SSP has received an answer message from external IP or called party and transmitted it to the originating office, when the SSP connect to the external IP or the called party (if the first connection is to external IP) again, SSP will receive another answer message.

— Condition 2: SSP has received CTR and PCUI, SSP sent ACM and ANM to the originating office, when the called party answer, SSP will receive another answer message.

This functionality will implement that: if the second or later answer message is CISUP ANM containing BCI or CISUP CON, then it will be mapped to CPG and transmitted to the originating office.

43.2.3 Multiple ApplyChargings support

43.2.3.1 Support up to 3 ACs

In this feature, up to 3 ACs can be accepted and handled simultaneously during an INAP call. The number 3 is the maximum number of in-effect ACs, it does not include the number of expired(that is, a final ACR has been sent) ACs.

The chargeRecordIdentifier parameter is used to identify the AC operation, different ACs should have unique chargeRecordIdentifier. If two ACs have an identical chargeRecordIdentifier, then the newly received one will be rejected with ReturnError (UnexpectedDataValue).

If an AC with chargeUserIndicator equaling 1(calling party) or 2(called party) had been received, then any subsequent ACs with the same chargeUserIndicator will be rejected with ReturnError(TaskRefused(generic)). In orther words, on a call at most 1 AC is allowed for the calling/called party. However, this restriction does not apply to the specified charge number(chargeUserIndicator = 127).

If there are already 3 ACs in effect on the call, then all subsequent ACs will be rejected with ReturnError(TaskRefused(generic)).

For multiple ACs, corresponding ACR(s) can be sent respectively for each AC. ACR will be sent to SCP in three conditions:

1. If the calling/called party hangs up, the following actions are taken:
   - The call (or only the called party, depending on the on-hook party and armed EDPs) is taken down
   - ACR for each AC is sent respectively
2. If the cost/time limit for one of the ApplyChargings is reached, the following actions are taken:
   - The call (or only the called party, depending on armed EDPs) is taken down
   - The forceReleaseCause in the ApplyCharging whose charge/time limit is reached is stored in the backward release message
   - ACR for each AC is sent respectively. If the supervisionMethod in the AC for which we are sending ACR is costGranted, the reasonForReport parameter in the ACR is ChargeLimitReached; if the

supervisionMethod is timeGranted, the reasonForReport is TimeLimitReached.

3. If the heartbeat timer for one of the ApplyChargings expires, the following action is taken:
   - An ACR for the AC is sent

Multiple treatments can be played if more than one ACs require warning tone/ announcement to be played at a desired time before the charge/time limit is reached, provided the restrictions below:

— All tones/announcements are only played to the calling party

— If multiple treatments are required to play at almost the same time, DMS SSP will play the 1st started treatment and suppress other treatments which try to start at the time when the 1st treatment is playing.

44: Functional Description (FN): A00002904

44.1 Feature name

CTI Toggle.

44.2 Description

The Switch-Computer Applications Interface (SCAI) specifies an architecture and an Open Systems Interconnection (OSI) application layer protocol suite for peer-to-peer data communication between host computer applications and switch applications, thereby enabling the functional integration of computer systems and telephony switching systems.[1]

Remote Operation Service Element (ROSE) is used to support the interactive communication between the switch and host application.

Currently, ICM services exist for the use of four types of customers.

- Automatic Call Distribution (ACD) customers
- Meridian Digital Centrex (MDC) customers
- Residential (RES) customers
- SL-100 Private Branch Exchange (PBX) customers

ICM uses the following Operation Classes.

- Class 1: Synchronous, reporting success or failure
- Class 2: Asynchronous, reporting success or failure
- Class 5: Asynchronous, outcome not reported

This activity adds a Class 2 call control message, DV_TOGGLE_CALL, which is sent from the customer's host computer to the DMS to toggle between an agent's primary call leg and the consult call leg. The existing ICM messages DV_CALL_HELD_U and DV_CALL_UNHELD_U, will be changed to contain a new parameter that would indicate which leg of the call was held/unheld. The DV_CALL_HELD_U and DV_CALL_UNHELD_U messages will be sent out after a successfull completion of the DV_TOGGLE_CALL message. The above two messages will also be sent out when the calls are toggled manually.

[1]Taken from the ANSI SCAI Standard document: ANSI TI.626-1993

44.2.1 Application Logon SCAI Service Version

The dv-Appl-Logon message contains a parameter, Service Version, which uniquely identifies the version of messages which will be sent during the session. A new Service Version value will be created to uniquely identify the stream of messages which are new or changed during this software release. The new Service Version will be SCAI18.

This new Service Version (SCAI18) must be specified in the dv-Appl-Logon message for the host application to send dv_Toggle_Call messages. If a Service Version lower than SCAI18 is specified, dv_Toggle_Call messages will not be availabe to the Host.

The Service Version is upward compatible. This means all of the functionality enabled and provided with any of the previous Service Versions will be provided in SCAI18. Future DMS-100 software releases will provide additional ICM functionality but will continue to allow the specification of the SCAI18 Service Version. Therefore, applications written to use SCAI18 will not require rewriting to continue to work properly.

44.2.2 Subscription to the new call control message and changed call held/ unheld message.

The following changes in the table SCAISSRV are required to provide subscription to send the new ICM call control message DV_TOGGLE_CALL and the changed call event messages DV_CALL_HELD_U and DV_CALL_UNHELD_U.

44.2.2.1 Subscription for ACD

- A new default tuple TPCC16$ under category TPCC will be created with the new function TOGGCALL for the new message DV_TOGGLE_CALL. TPCC16$ will also contain the optional parameter HDUHDLEG of the function CALLHELD and CALLUNHELD set to Y

44.2.2.2 Subscription for Residential and Centrex lines

- A new default tuple SCAI3WC15$ under the category SCAI3WC will be created with the new function TOGGCALL, for the new message DV_TOGGLE_CALL.
- A new default tuple SCAICC10$ under the category SCAICC will be created with the optional parameter HDUHDLEG of the function CALLHELD and CALLUNHELD set to Y.

44.2.3 Toggle Call Message and changed Held/Unheld message Setup and Validation

The following setup and conditions must be met in order for the host application to invoke the dv-Toggle-Call message.

1. The SCAI Service Version is at least SCAI18
2. An ICM switch-host session is established. A successful dv-Appl-Logon request was sent by the host computer.
3. The line which the host application is monitoring must be associated to the session via dv-DN-Associate.
4. For Centrex/Res lines the line option ECM with suboption CONF_XFER set to 'Y' needs to be assigned to send DV_TOGGLE_CALL.
5. For Centrex/Res lines the line option ECM with suboption SCAICC set to 'Y' needs to be assigned to receive the changed DV_CALL_HELD_U and DV_CALL_UNHELD_U messages.
6. The switch-host session is subscribed to the new call control message, DV_TOGGLE_CALL and the changed messages DV_CALL_HELD_U and DV_CALL_UNHELD_U (SEE SECTION 2.2.2).

44.2.4 Message Protocol

The ASN.1 notations for the new call control message provided by this activity, DV_TOGGLE_CALL is shown in this section. A sample X.209 hex encoding has been provided here. The length fields are variable because the length depends on the variable content. The tag values are taken from the ROSE protocols.

44.2.4.1 Toggle Call ASN.1 Encoding

```
dv-Toggle-Call          OPERATION

44.2.4.2 Toggle Call Coded Example

As shown in "Toggle call between Customer and Advisor2," a host has requested the switch to toggle the call from Customer - Adviosor1 call to Customer-Advisor2 call. The following encoding has to be sent from the host to the DMS to cause the Customer-Advisor1 call to be put on hold and the Customer-Advisor2 call to become active. It is assumed that before the message is sent, the Customer-Advisor1 call was active and Customer-Advisor2 call was on hold.

INVOKE **HOST ===> DMS**

Table 4: dv-Toggle-Call Coded Example

Hex Dump			Information Element	Comments
Tag	Len	Content		
A1	10		INVOKE	the message length is 16 bytes decimal

44.2.5 Message Protocol

The ASN.1 notations for the changed call event message provided by this activity, DV_CALL_HELD_U is shown in this section. A sample X.209 hex encoding has been provided here. The length fields are variable because the length depends on the variable content. The tag values are taken from the ROSE protocols.

44.2.5.0.1 Call Held ASN.1 Definition

```

44.2.5.0.2 Call Held Coded Example

This example illustrates when the user has put the call on hold either using DV-HOLD-CALL or manually. The scenario is, B(DN 919-2463001) calls A(DN 919-4814210) and both of them are in talking state. The host application of A sends the call control message DV_HOLD_CALL to the switch. The call event message DV_CALL_HELD_U, is sent back to the host application, indicating that the primary call on A has been put on hold.

```

44.2.6.2 Call Unheld Coded Example

This example illustrates when the user unholds either using DV-UNHOLD-CALL or manually. The scenario is,A(DN 919-7823640) consults B(DN 919-2463001)and both of them are in talking state. The host application of A sends the call control message DV_HOLD_CALL to the switch. Then the agent manually unholds the held call. The call event message DV_CALL_UNHELD_U, is sent back to the host application, indicating that the held consult leg on A has been unheld.

DMS ===> HOST

44.2.7 Operational Measurements (OM)

44.2.7.1 New/Modified OM groups

When a new ICM message is created it is necessary to create new registers in the associated OM group to peg any application specific outgoing SCAI messages. Two new registers are being added to the SCAISRV4 OM group. These registers are pegged on a SCAIGRP basis.

The following new registers are created by this feature:

- TOGCLLRR - pegged when the switch sends out a RR in response to a valid DV_TOGGLE_CALL message request being received and processed.
- TOGCLLRE - pegged when the switch sends out a RE in response to an invalid DV_TOGGLE_CALL message request being received.

44.2.8 Toggle Call invoke message flow examples

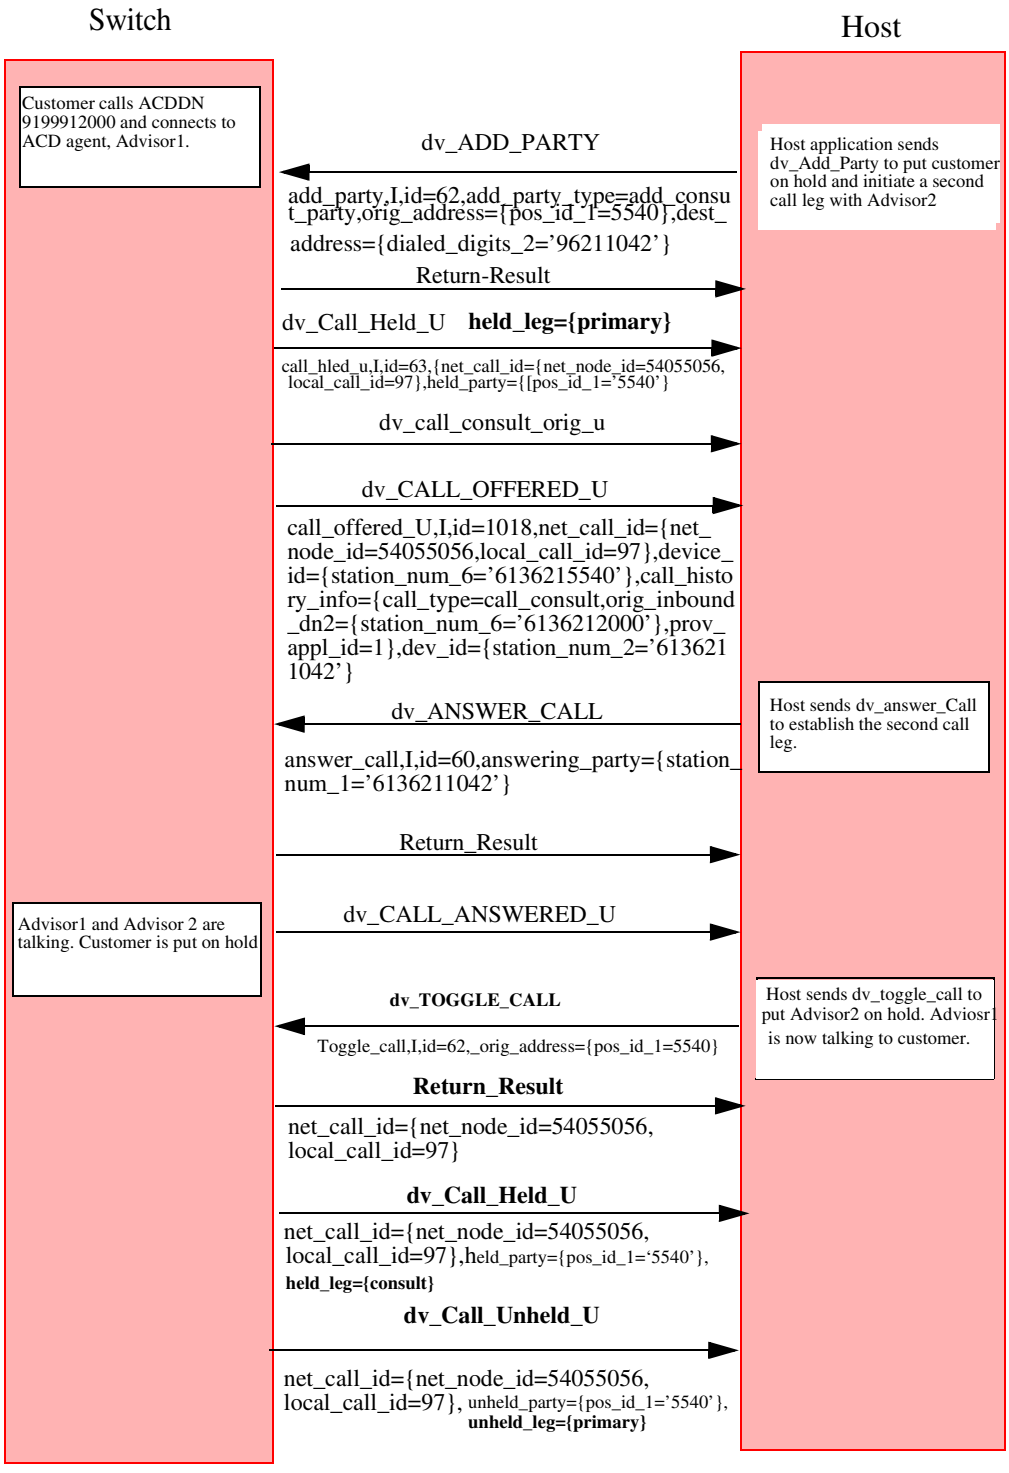
This message is used when an agent has two calls with one being active and the other on hold, and wants to go back and forth between the two calls. When an agent is active on call one and call two is on hold, the host sends the DV_TOGGLE_CALL message, now call one will be put on hold and call two will become active.

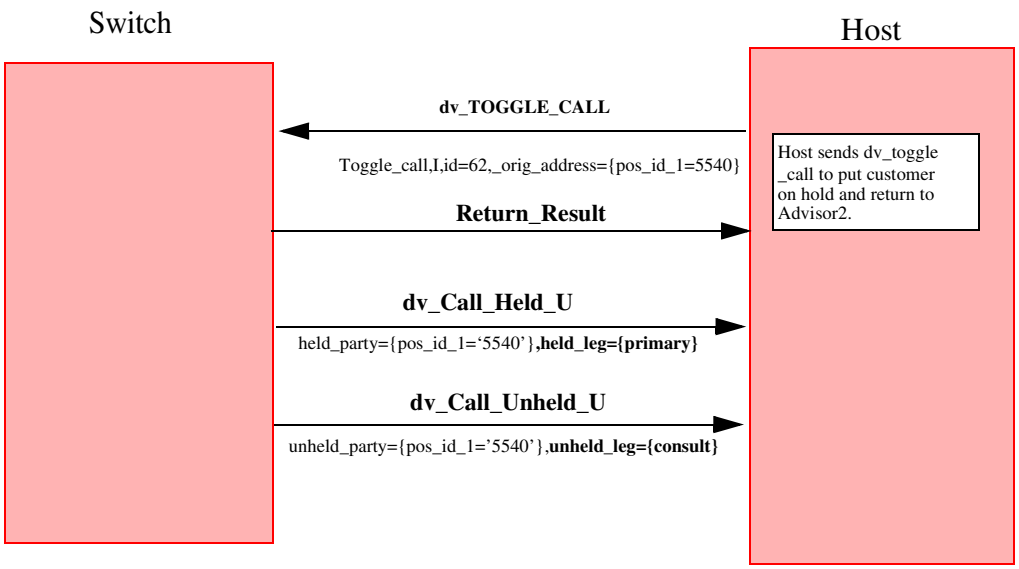
SCAI 3WC/call transfer toggle and set based 3WC/call transfer toggle are not interchangeable on a per call basis. When a call is extended by dv_add_party message, it cannot be controlled by the 3WC/call transfer set feature. Similarly if a call is extended via the 3WC/call transfer set feature, it cannot be controlled by the SCAI 3WC/call transfer.

Some message flow scenarios are considered in this section to get a better understanding of the feature functionality.

The proposed call control message and the additional dv_call_held_u and dv_call_unheld_u messages are highlighted in the figures.

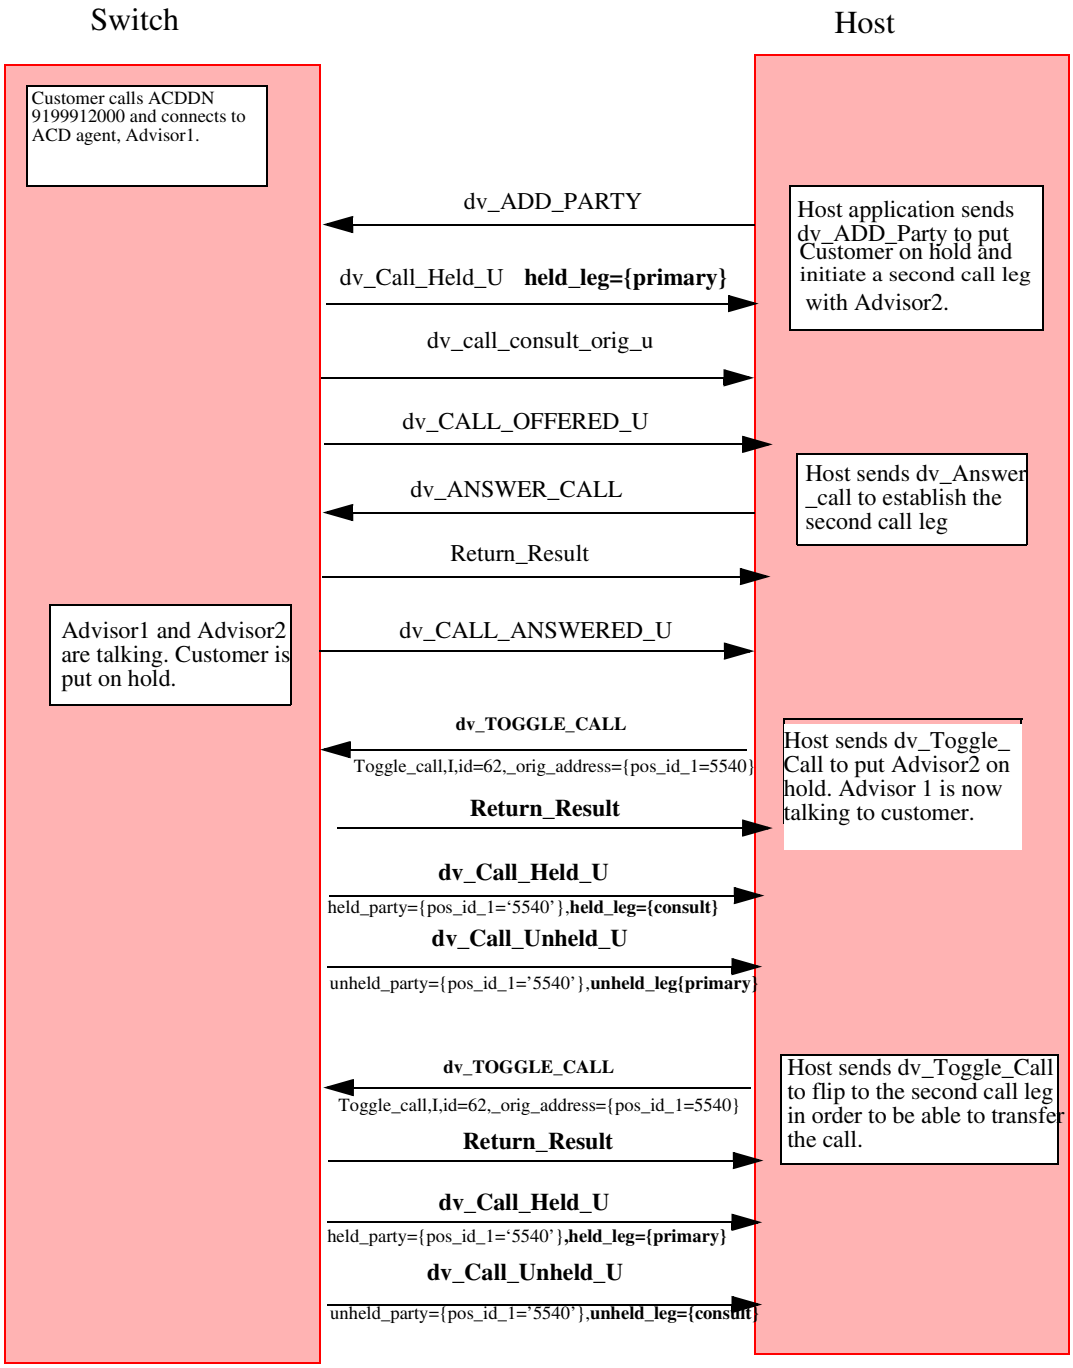
44.2.8.1 Toggle call between Customer and Advisor2

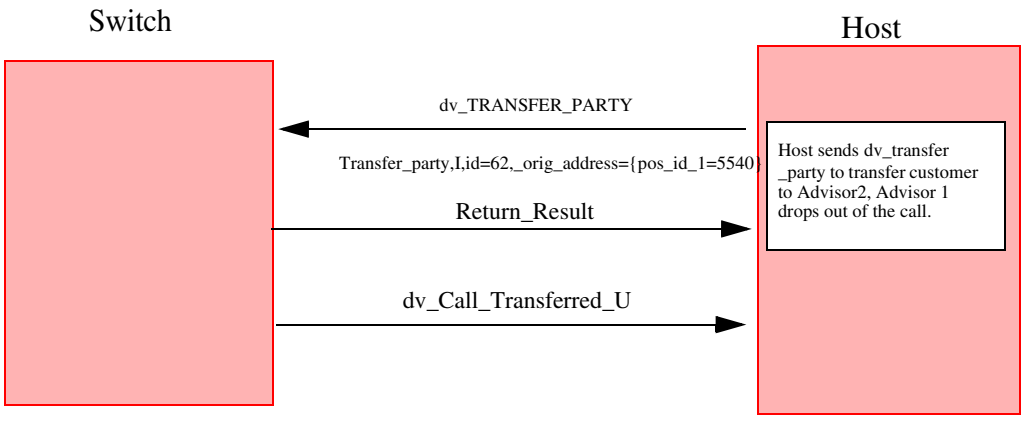




Switch
Host
dv_TOGGLE_CALL
Toggle_call,I,id=62,_orig_address={pos_id_1=5540}
Host sends dv_toggle _call to put customer on hold and return to Advisor2.
Return_Result
dv_Call_Held_U
held_party={pos_id_1='5540'},held_leg={primary}
dv_Call_Unheld_U
unheld_party={pos_id_1='5540'},unheld_leg={consult}

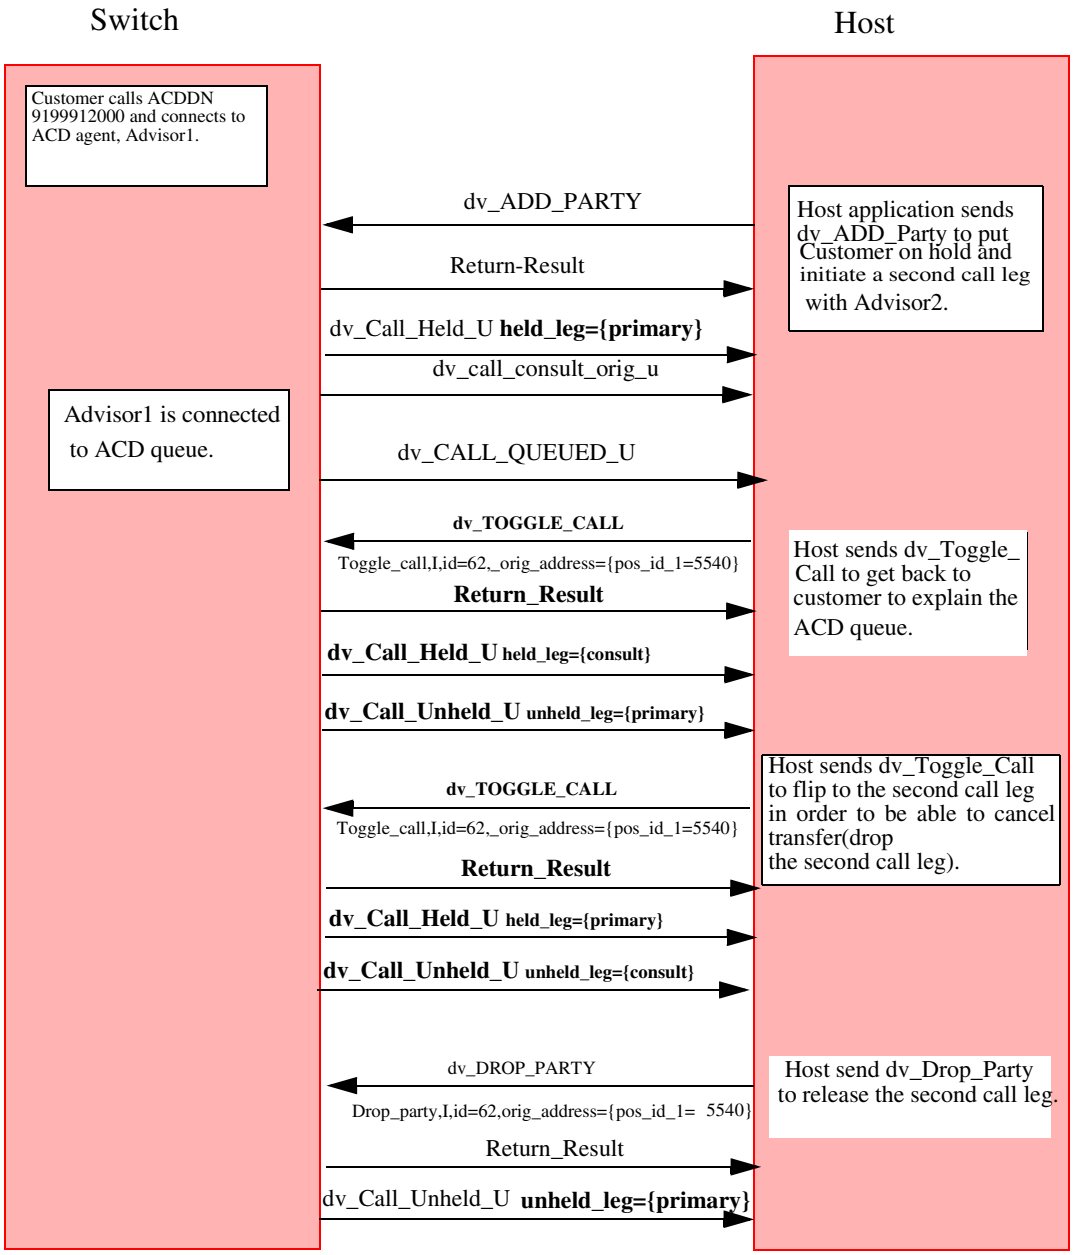
44.2.8.2 Toggle with Transfer





Switch
Host
dv_TRANSFER_PARTY
Transfer_party,I,id=62,_orig_address={pos_id_1=5540}
Host sends dv_transfer _party to transfer customer to Advisor2, Advisor 1 drops out of the call.
Return_Result
dv_Call_Transferred_U

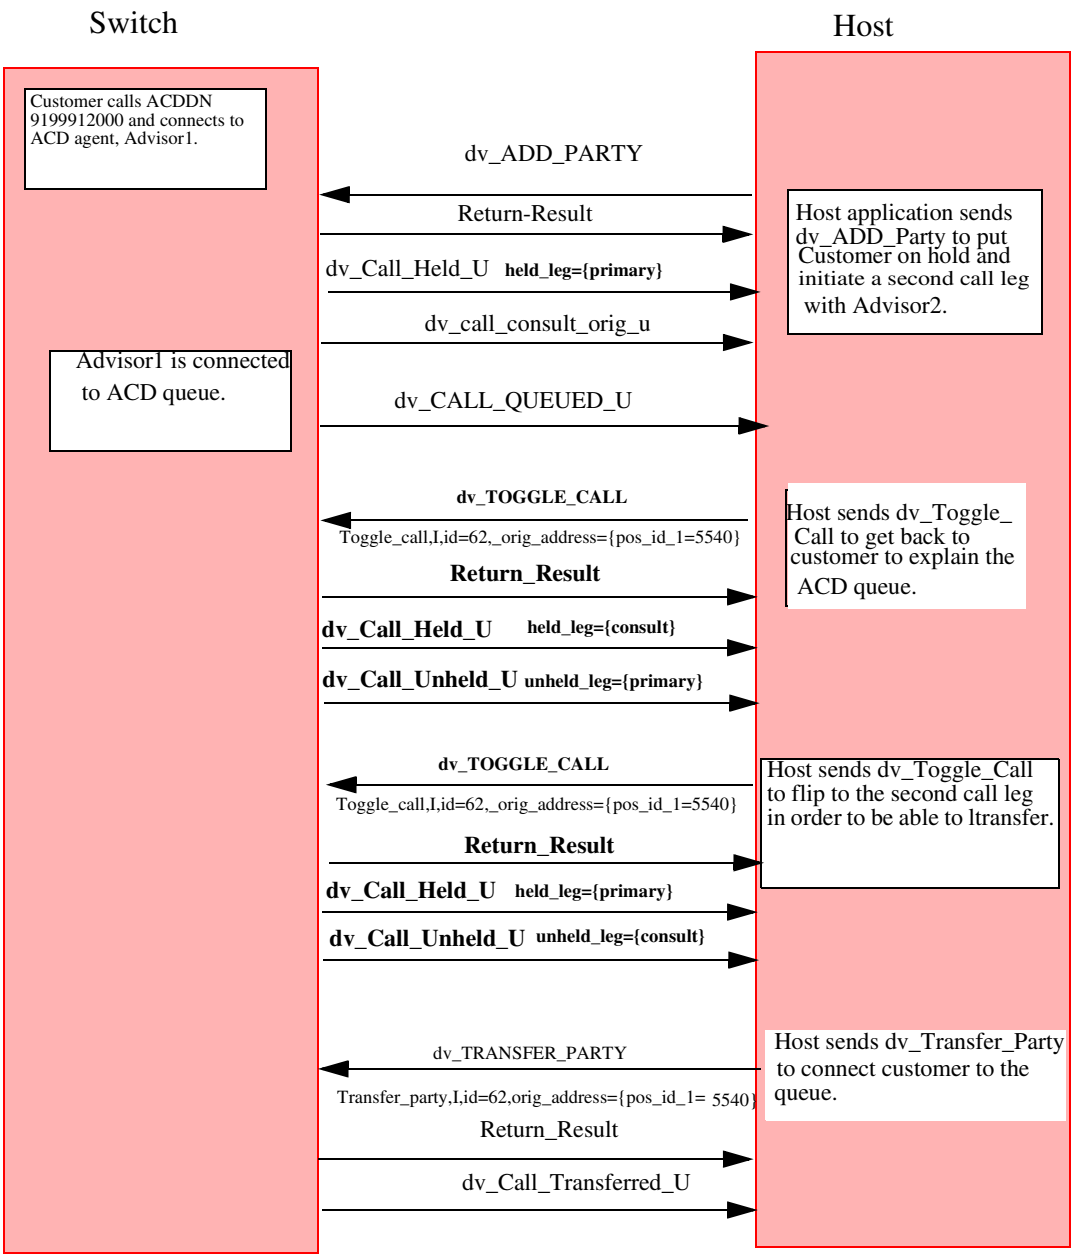
44.2.8.3 Toggle call with cancel transfer



Note:

- Manual toggle cannot be done when a call is in an ACD queue.
- When an ACD queue is reached over a trunk, Toggling is allowed using ICM only when the Audio option is datafilled for that ACD group.

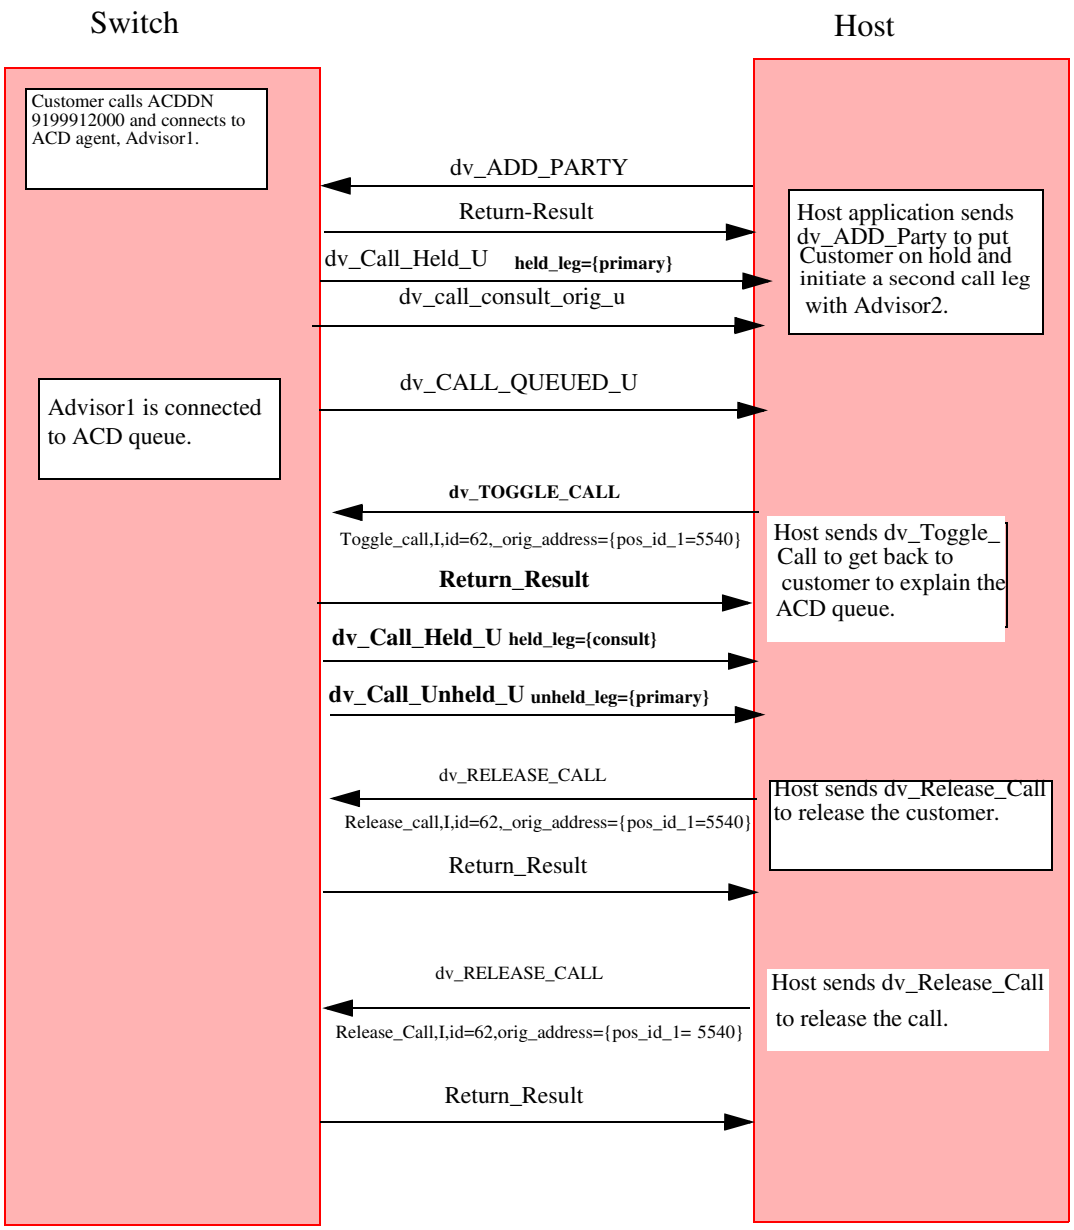
44.2.8.4 Toggle and connect call to queue



Note:

- Manual toggle cannot be done when a call is in an ACD queue.
- When an ACD queue is reached over a trunk, Toggling is allowed using ICM only when the Audio option is datafilled for that ACD group.

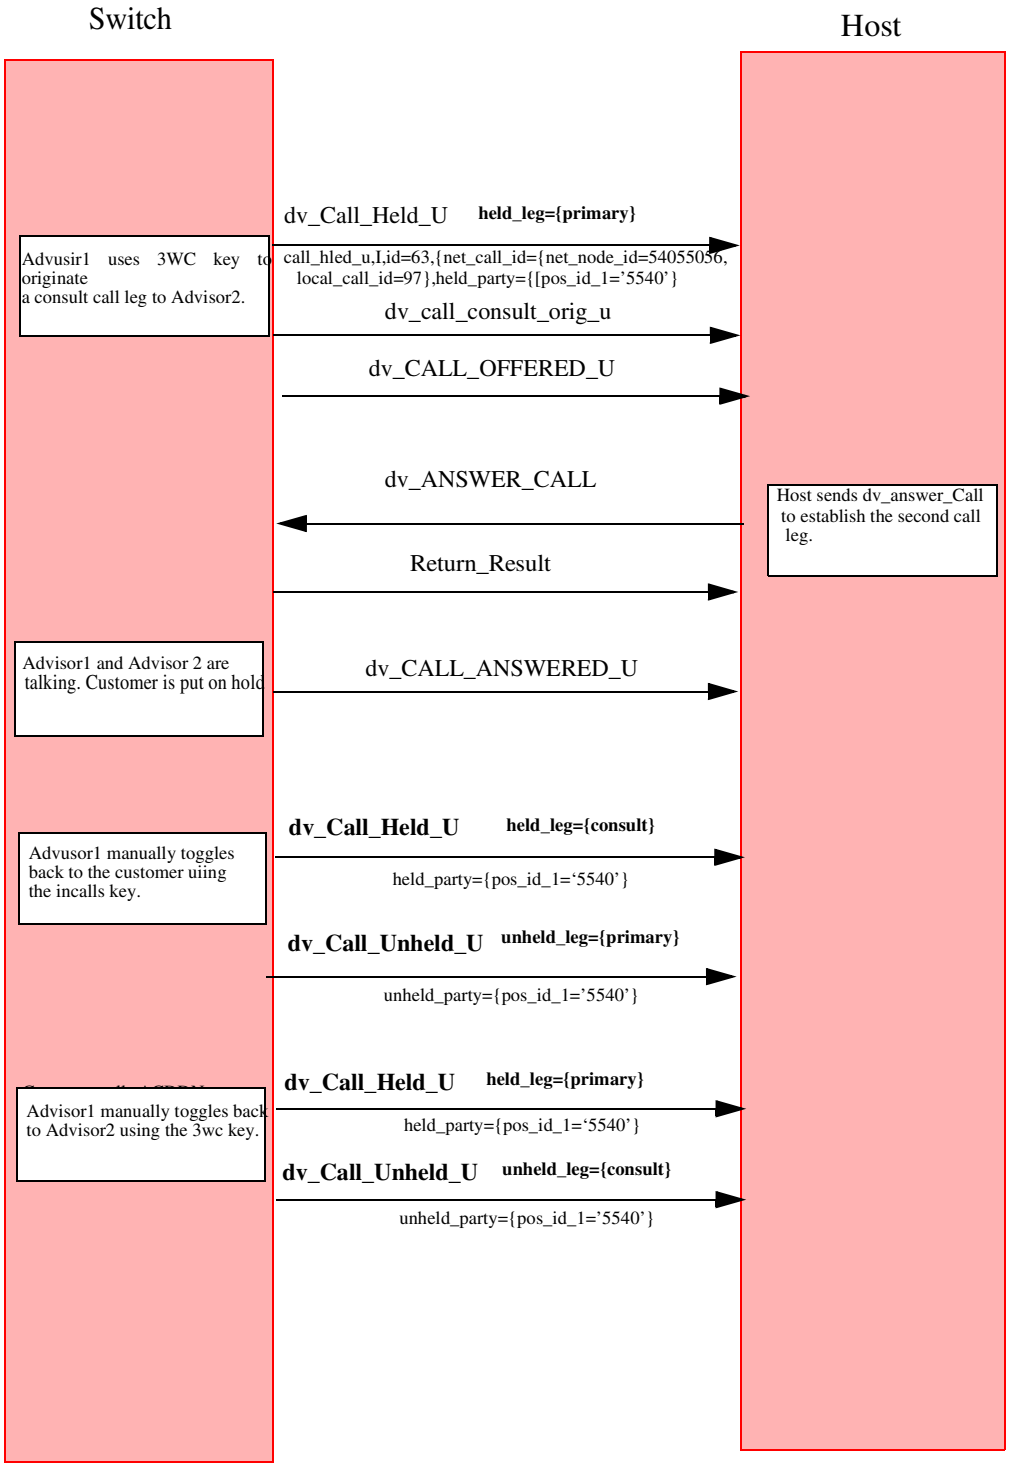
44.2.8.5 Toggle and release call



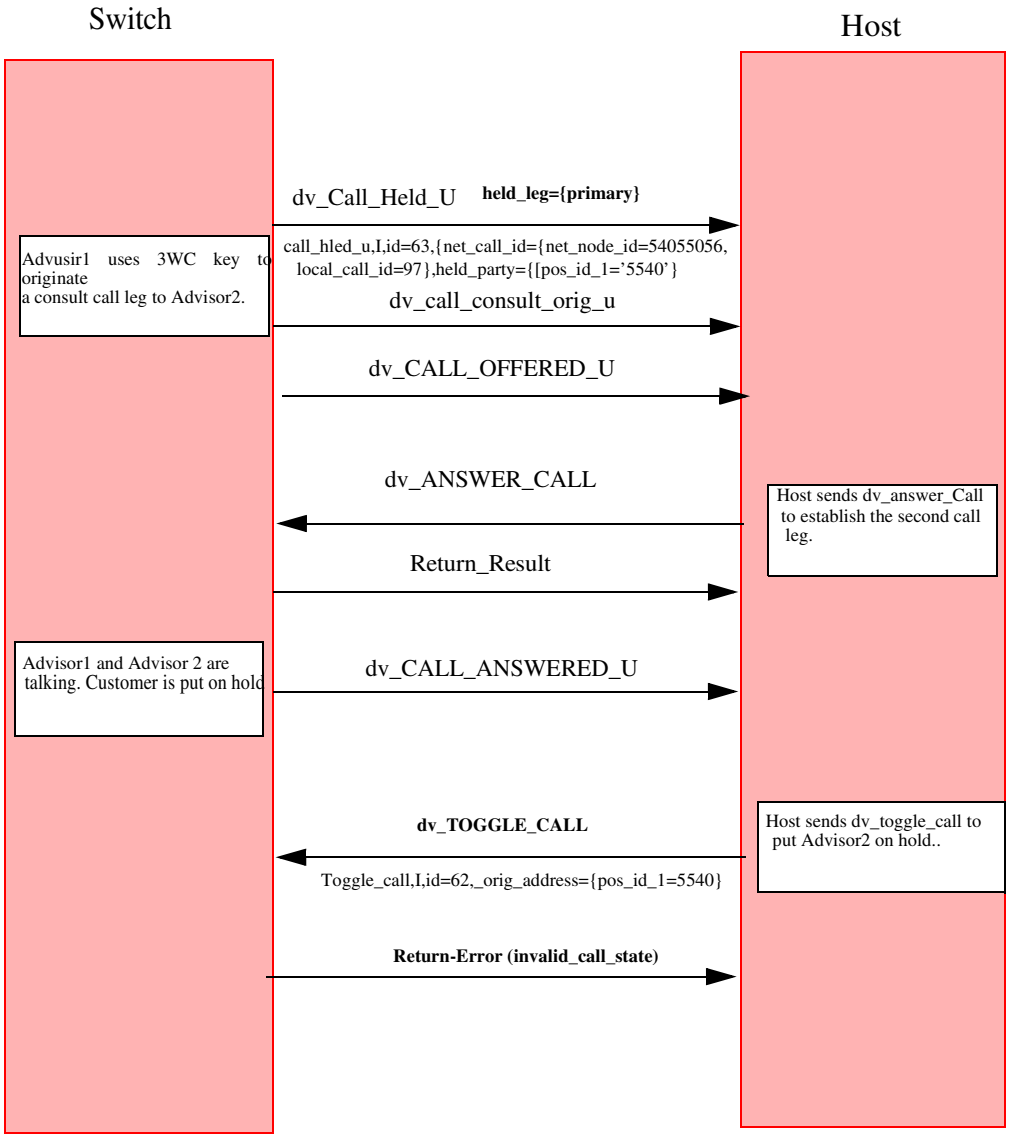
Note:

- Manual toggle cannot be done when a call is in an ACD queue.
- When an ACD queue is reached over a trunk, Toggling is allowed using ICM only when the Audio option is datafilled for that ACD group.

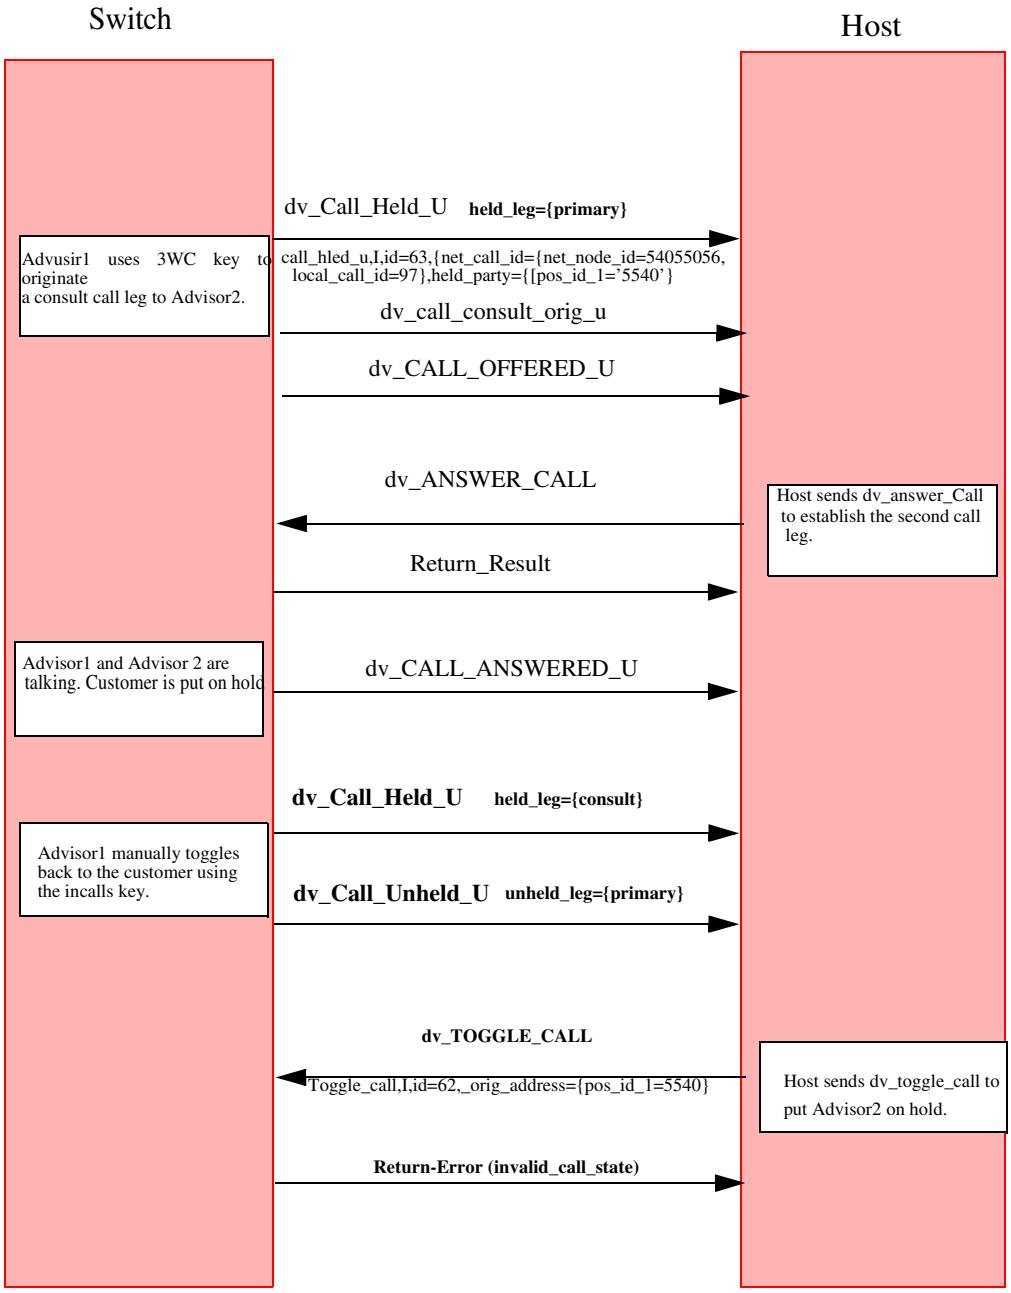
44.2.8.6 Manual toggle call between Customer and Advisor2



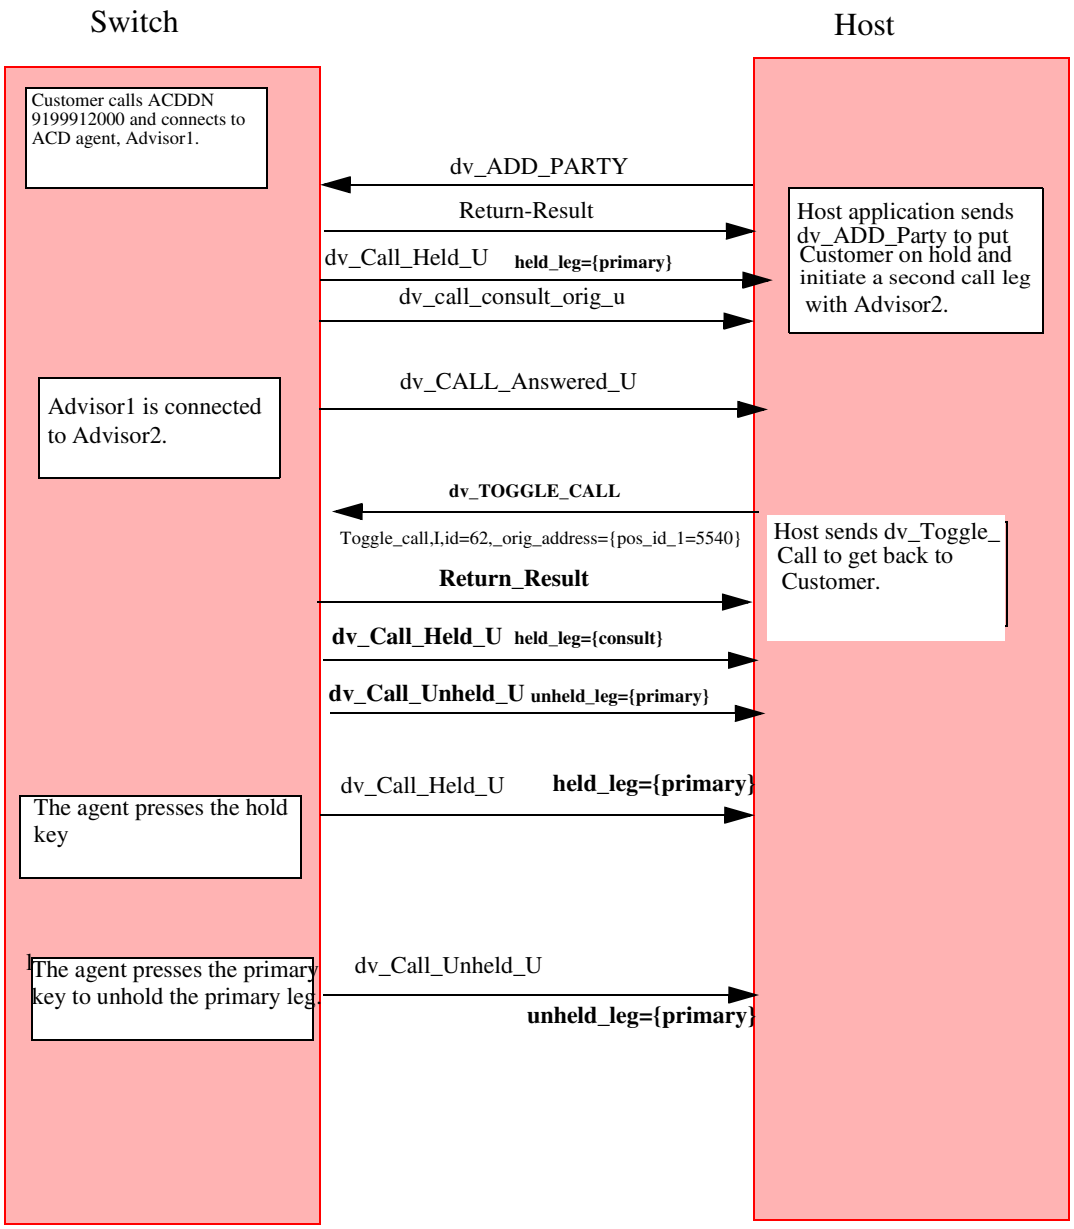
44.2.8.7 Manual consult party with CTI toggle



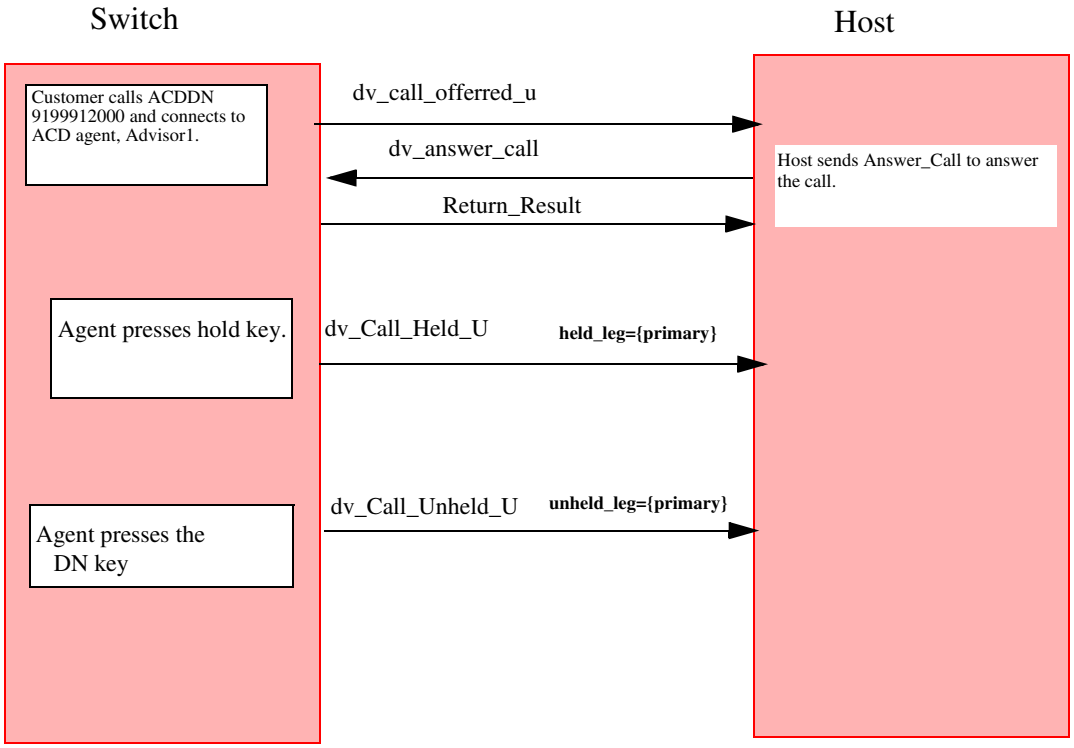
44.2.8.8 Manual toggle with CTI toggle



44.2.8.9 CTI toggle with manual hold



44.2.8.10 Two Party call with Hold



44.2.8.11 Consult and release Advisor2

The following scenario does not require the new message.

1. Customer calls ACD group and is connected to Advisor1.
2. Advisor1 puts customer on hold and connects to Advisor2, using the dv_Add_Party message.
3. Advisor1 ends call with Advisor2 by using the dv_Drop_Party message.
4. Advisor1 is now connected to customer.

44.3 Hardware Requirements or Dependencies

Not Applicable.

44.4 Software Requirements or Dependencies

Not Applicable

44.5 Limitations and restrictions

- The limitations and restrictions that apply to the functionalities of the 3WC flip flop apply to this feature as well. An exception is made by this feature when a call is queued in an ACD queue. Before this feature with 3WC, one could not toggle when the second leg is connected to an ACD queue. With this feature, this restriction has been removed only for ICM initiated toggle. Manual toggle will not be changed or affected.
- When the second call leg is connected to an ACD queue, toggling is ONLY allowed using ICM. Manual toggle is not allowed. The exception to this is when the queued ACD call is over a trunk and when that ACD group has the Audio option datafilled on it.
- Toggling is also not allowed when the call gets presented to an ACD agent..(i.e Call is ringing on the agent) The exception to this is when the ACD agent is reached over a trunk after being given queued audio.
- When the second call leg is connected to an ACD queue which is located in a different switch than the originator of the second call leg, (i.e termination to ACD queue is using a trunk) toggling is not possible unless the Audio option is datafilled in that ACD group.
- When the second call leg is a trunk ACDcall and it gets requeued due to the ACD agent not answering the call, the requeued call cannot be toggled either using ICM or by manual toggle.
- This feature is not supported on IBN (2500) sets.
- The existing restriction for Add_Party, Transfer_Party, Conference_Party and Drop_Party applies to this feature as well. When a consult leg is originated using dv_Add_Party, toggling must also be originated using ICM. When a consult leg is originated manually, toggling must also be done manually.

44.6 Interactions

45: Functional Description (FN): A00002916

45.1 Feature name

CS2K connectivity to XPM remote

45.2 Description

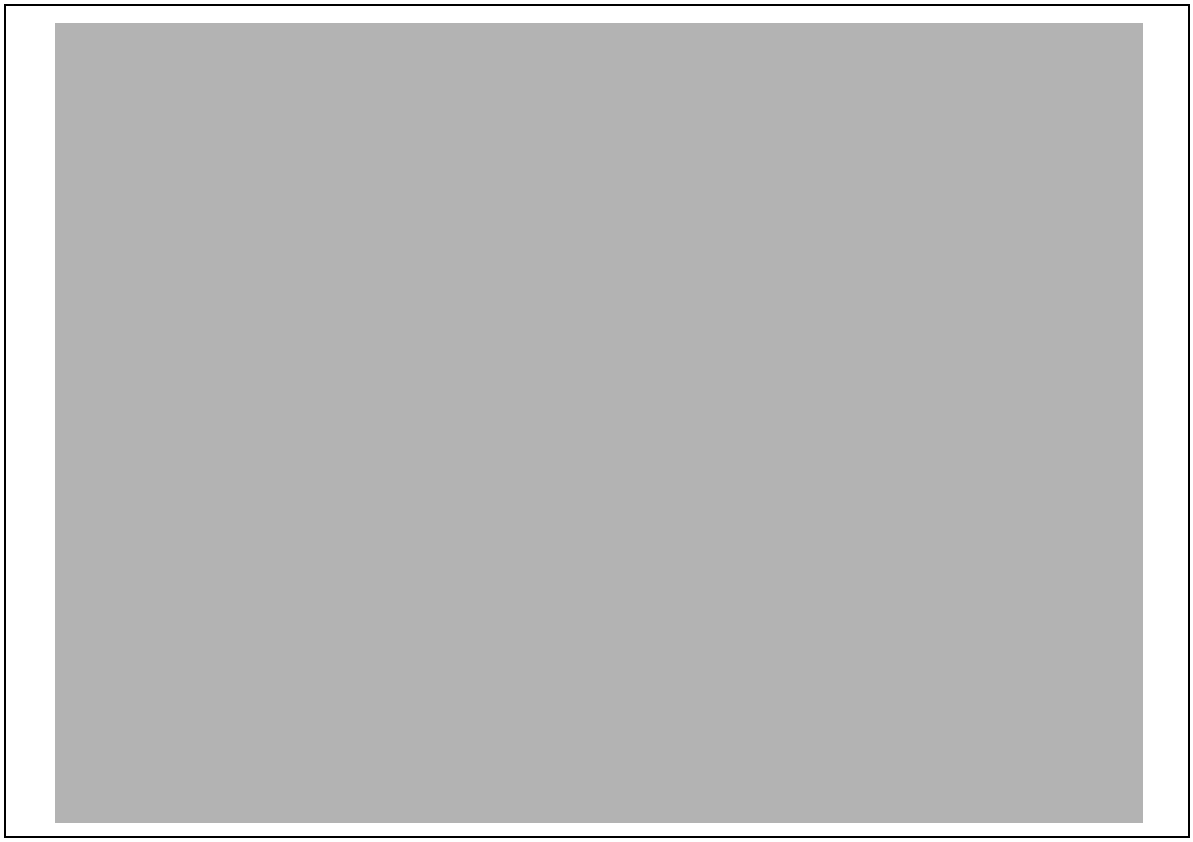
This activity provides a cost effective Succession POTS upgrade, with low POTS port cost. MBS, ETSI BRI and CAS mux lines are also supported by this activity.

This is achieved by directly connecting an RCO2 node to a PVG Gateway via PRI carriers controlled by a GWC, and by removing the dependancy on PLGC and ENET hardware.

The activity is targetted at multiple International customers.

The following Figure shows the network configuration, with the RCO2 connected to a PVG Gateway via PRI carriers controlled by a CS2K Gateway Controller. Standard PRI mapping between trunks, TIDs and PVG endpoints is used. RCO2 virtual c-side messaging links are associated with a real PRI D-channel, and RCO2 virtual c-side speech links are associated with real PRI B-channels. Standard IUAP backhaul is used to transfer PRI messages between the PVG Gateway and the CS2K Gateway Controller. Existing media control protocol is used between the PVG Gateway and the CS2K Gateway Controller.

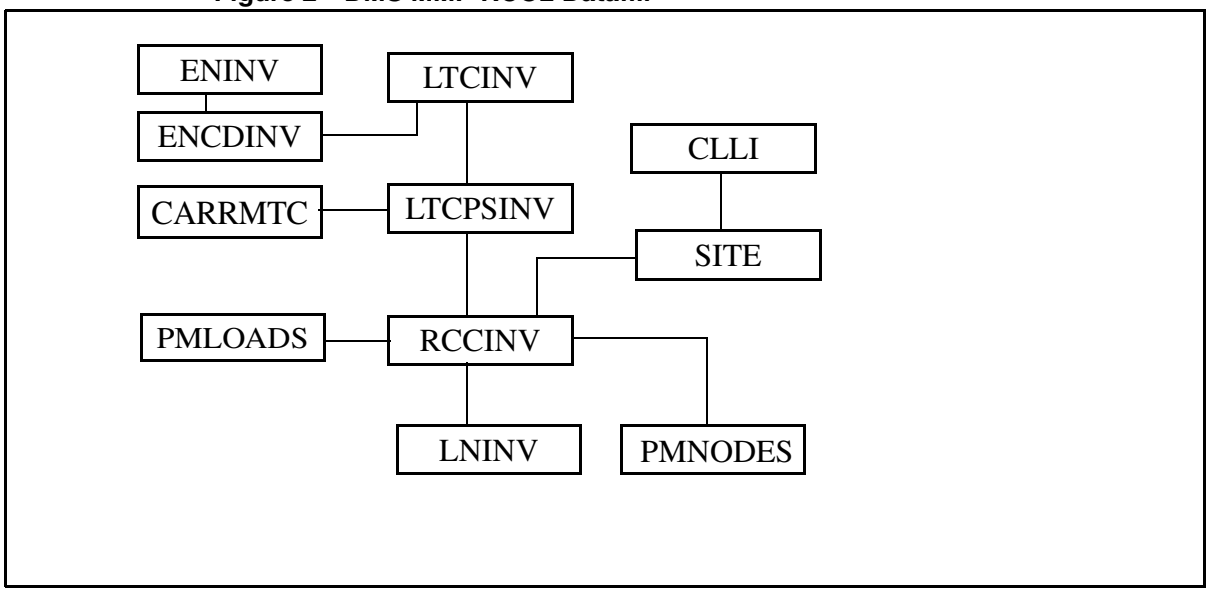
Figure 1 Network configuration diagram



45.2.1 Datafill

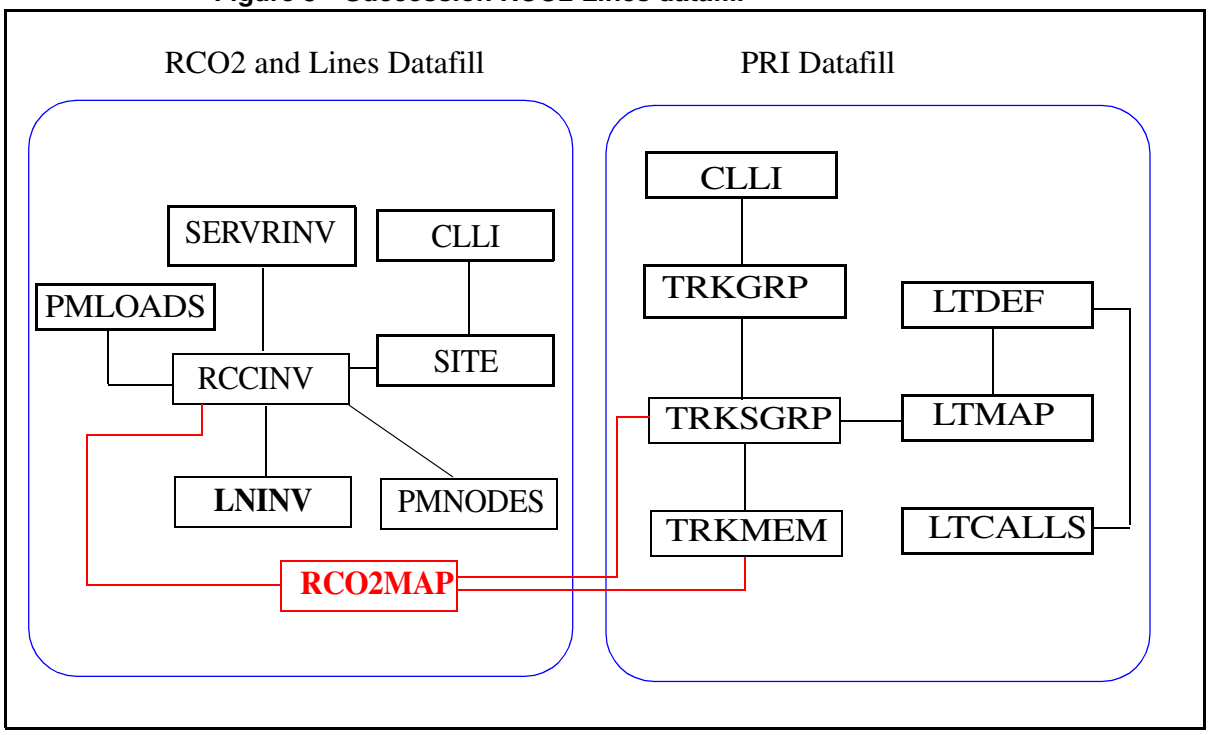
Provisioning of RCO2 lines on a DMS MMP involves datafilling tables in the CM at the mapci level. These tables are shown in the following figure. On the DMS MMP the RCO2 is connected to the PLGC's by PCM30 links. These carriers are datafilled in table CARRMTC.

Figure 2 DMS MMP RCO2 Datafill



In the Succession network the RCO2's are connected to the PVG via PRI trunks. The RCO2's c-side messaging and speech links are associated with PRI D- and B-channels respectively. This association is achieved by the introduction of new table RCO2MAP. The tables that need to be datafilled are shown in the following figure.

Figure 3 Succession RCO2 Lines datafill



The RCO2 subtending off the GWC is datafilled in table RCCINV. Sample datafill is as per the following figure. The CSPM field contains the c-side PM for the RCO2 and consists of two sub-fields - XPMTYPE and XPMNO. The CSLNKTAB field is datafilled with the RCO2's c-side links. The number of entries in the CSLNKTAB field corresponds to the number of RCO2 c-side links. For a RCO2 a minimum of three c-side links must be datafilled. A maximum of 16 c-side links can be provisioned.

Figure 4 Table RCCINV- Sample Datafill

```
RCCNAME ADNUM FRTYPE FRNO SHPOS FLOOR ROW FRPOS EQPEC LOAD
 EXECTAB CSPM CSLNKTAB ESA INTRASW ADDLMSGL OPTCARD TONESET
 PROCPEC E2LOAD EXTINFO OPTATTR
-------------------------------------------------------------------------
RM02 RCO2 0 1 CRSC 0 6 1 C 4 MX85AA WRI17AY
(RMM_TERM RSMEX) (ESALINES ESAEX) $
GWC 205 (1) (2) (3) $Y Y N (UTR6 )(RAM6X69 ) (ISP 16) $ UK100
AX74AA AX74AA UPFWNU01 Y CEXT 1 6 1 C 5 MX86AA L$
```

Datafilling table RCCINV results in table PMNODES being autodatafilled with host GWC and subtending RCO2 node information. Sample datafill in table PMNODES is as per the following figure.

Figure 5 Sample tuple in Table PMNODES :

```
TABKEY EXTNDNUM NODETYPE PMTYPE LEVEL MSGHOST PHYSHOST PORTS STPORT TERMS
STTERM PROTOCOL MS IPML MODE SLLCON NT6X28 LCMLGMEM RSVPORTS RSVTERMS
MATENODE PACKED SUPPCDM CMINCTRL
-------------------------------------------------------------------------
113 1 113 GWC_NODE GWC  0 113 113 16 0 4095 1 MDS30 S N P N N N Y Y N Y YY Y
113 2 114 RCC_NODE RCO2 1 113 113 16 641 4096 MDMSX M N P N N N Y Y N Y YY Y
```

On DMS MMP, the RCO2 tuple in table PMNODES is datafilled with PM_LEVEL of 1.

On DMS MMP, where RCO2's are datafilled off CSPM (C-Side PM) type PLGC's, the datafill in field CSLNKTAB contains the PLGC link (0 to 15) on which the RCO2 is assigned. The PLGC link correspond to the RCO2 c-side links 0 to 15.

In the Succession network, the RCO2's c-side is connected to the PVG by a special PRI agent. This PRI substitutes the messaging and speech links between the RCO2 and PLGC in DMS MMP architecture.

From the CM perspective, the RCO2 is provisioned as a subtending node of the GWC node. Table RCCINV is modified to provision an RCO2 subtending node off a GWC. The following figure shows the existing fields in table RCCINV. The fields for which functionality is modified by this feature are highlighted.

Figure 6 Fields in Table RCCINV

```
>ran
 1 RCCNAME          RCC_KEY_TYPE

10 LOAD             NPMLOAD_INFO
11 EXECTAB          TERM_EXEC_TC_TAB
12 CSPM             XPM_INX
13 CSLNKTAB         RCC_CSLINK_TC_TAB
14 ESA              BOOL
15 INTRASW          BOOL
16 ADDLMSGL         BOOL
17 OPTCARD          EXT_OPT_CARD_TC_TAB
18 TONESET          TONE_SET_TYPE
19 PROCPEC          XPM_PEC_AREA_TAB
20 E2LOAD           NPMLOAD_INFO
21 EXTINFO          EXTENSION_INFO
22 OPTATTR          RCCINV_OPT_ATTR_VECTOR
LOGICAL TUPLE TYPE: RCC_LOGTUPLE
```

For Succession-based RCO2's, the c-side messaging and speech links are no longer datafilled in the CSLNKTAB field of table RCCINV. They are now associated with PRI B-channels and PRI D-channels via new table RCO2MAP.

Table RCO2MAP consists of three fields :

- RCCNAME - this is the key to the tuple. This field is the same as the key to table RCCINV
- CSPM - host c-side PM type and PM number
- GWCPRITAB - PRI trunk CLLI datafill

Datafilling an RCO2 hosted off a GWC in table RCCINV results in table RCO2MAP being datafilled with a nil tuple as follows :

Figure 7 Table RCO2MAP- sample tuple auto-datafilled

```
TABLE RCO2MAP

RCCNAME CSPM GWCPRITAB
-------------------------------------------------------------------------
RM02 RCO2 0 GWC 205 NIL 0
```

This tuple may then be modified by the craftsperson by datafilling the PRI[1] trunk. The PRI CLLI datafilled in RCO2MAP will be a PRI variant that supports NFAS (Non-Facility Associated Signalling) functionality, on which one D-channel supports B-channels from a number of PRI trunks. A sample tuple in table RCO2MAP is as per Figure 8 .

Figure 8 Table RCO2MAP- PRI NFAS Variant

```
TABLE RCO2MAP
RCCNAME CSPM GWCPRITAB
-------------------------------------------------------------------------
RM02 RCO2 0 GWC 205 (PRICLLITST1 1) (PRICLLITST2 1) (PRICLLITST1 31)
```

The first and second PRI starting terminal number will correspond to the D-channel for RCO2 unit 0 and unit 1 respectively. Hence, the first and second starting CLLI must be unique. Also, for these CLLI's Table TRKSGRP must be datafilled with the D-channel information. The subsequent PRI starting terminal numbers correspond to the messaging links. For each of these messaging links table TRKMEM must have the next consecutive 31 time slots datafilled.

The above sample tuple has three PRI trunk starting CLLI's - (PRICLLITST1 1) (PRICLLITST2 1) and (PRICLLITST1 31). Each PRI trunk starting terminal number corresponds to an E1 on the RCO2's c-side. Hence, it is imperative that the number of PRI trunk starting terminal numbers keyed in by the user in table RCO2MAP, must be equal to the number of RCO2 c-side links provisioned in the CSLNKTAB field in table RCCINV.

[1]This is a PRI NFAS variant

The following rules apply to tuples in table RCO2MAP :

- Datafilling a tuple in table RCCINV that has an RCO2 with a c-side PM type of GWC will result in a tuple being autodatafilled in table RCO2MAP.
- Deleting a tuple in table RCCINV that has an RCO2 hosted off a GWC will result in the corresponding tuple being deleted from table RCO2MAP.
- Deletion of tuples in table RCO2MAP is not permitted.
- Changes are permitted only to the GWCPRITAB field. Changing the GWCPRITAB field results in Static Data being downloaded to the GWC with the updated RCO2's c-side link information.
- Changes are not permitted to the CSPM field as it is the RCO2's host PM as datafilled in table RCCINV.
- PRI B-channels must be datafilled in table TRKMEM.
- PRI D-channels must be datafilled in table TRKSGRP.

Impact on other tables :

- SERVRINV - GWC's tuples datafilled in table SERVRINV cannot be deleted if they are referenced by tuples in table RCO2MAP that have RCO2's hosted off that GWC.
- TRKMEM - Tuples that have their trunk TIDs datafilled in table RCO2MAP cannot be deleted.
- TRKSGRP - Tuples that have their trunk TID's datafilled in table RCO2MAP cannot be deleted.

45.2.2 MAPCI

Succession-based RCO2's can be posted at the mapci;mtc;pm level. The following subcommands are supported :

- Post
- Listset
- Trnsl
- Tst
- Bsy
- Rts
- Offl
- LoadPM
- Disp
- Next
- Swact

- QueryPM
- DCH
- IRLINK
- Perform
- ISG

Maintenance of the RCO2's c-side links is disabled at the mapci;mtc;pm level. In addition, the RCO2's c-side carrier information is not displayed at the mapci;mtc;pm level and its sublevel.

45.2.3 Message flow charts

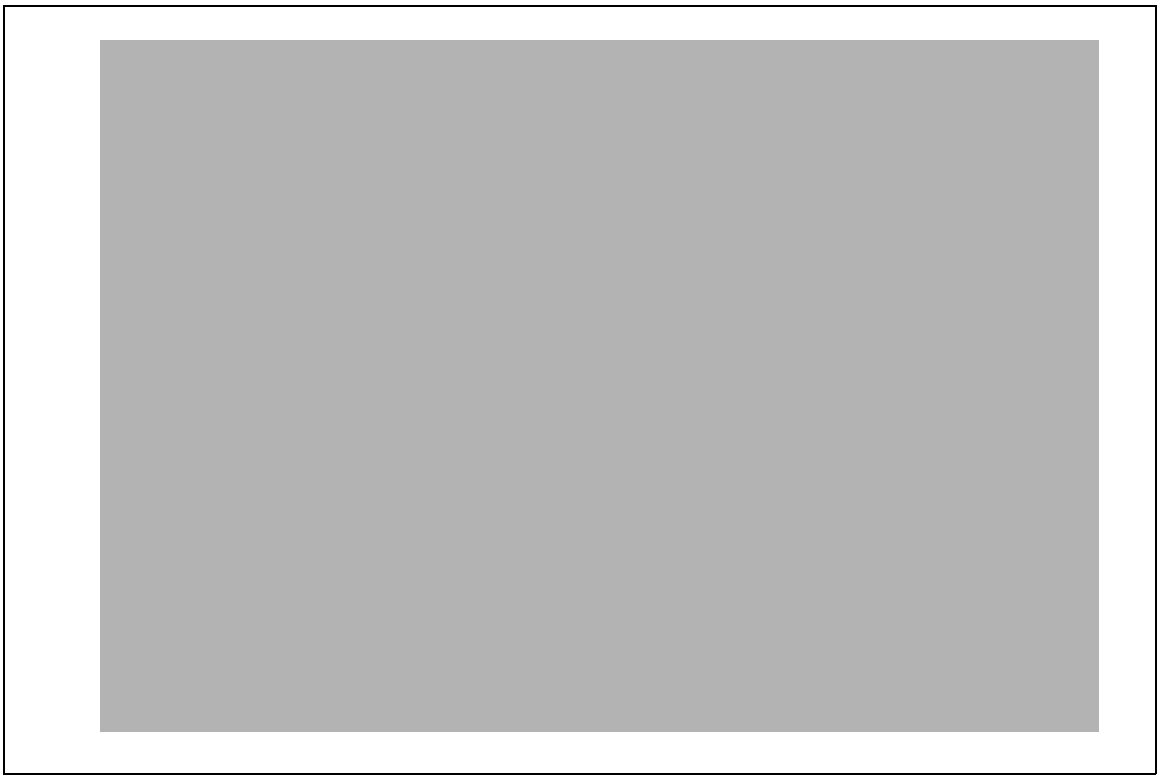
The following message flow charts show messaging between the CS2K and the RCO2. PVG is included in the charts for information purposes only i.e. All messages shown will pass transparently through the PVG. Messages are shown in their basic unwrapped form for clarity i.e. PRI/IUAP headers are not shown.

Messages between PVG and RCO2 will be transported via PRI protocol, using Facility messages. Messages between CS2K and PVG will be transported via IUAP protocol.

45.2.3.1 RCO2 load sequence

Figure 9 RCO2 power on

Figure 10 RCO2 loading



45.3 Hardware Requirements or Dependencies

Both the RSC-M (4xRCO2) and RSC-S (1xRCO2) cabinets will be supported. No new RCO2 hardware is required as part of this activity (e.g. MX76 card).

45.4 Software Requirements or Dependencies

None.

45.5 Firmware Requirements or Dependencies

Upgraded firmware is required for the MX76 combined messaging and CSM card within the RCO2. This allows line signalling to be mapped to Q.931 protocol. The MX76 firmware is part of the UP firmware load e.g. UPFWQM01.

45.6 Limitations and restrictions

- Supported interworking of ETSI BRI supplementary services with POTS and MBS line services are described in A59021068. Unsupported services interworking will require ETSI ISUP V2 loop-arounds.

- Interworking between PVG/RCO2 ETSI BRI lines and TDM lines/trunks must be done via an ETSI ISUP loop-around.
- The ETSI BRI portions of this activity are PV only. Although it is not expected that any ETSI BRI issues will be found specific to this solution, any that are found will be documented in this section at the completion of the activity.
- PCM30 remotes off the RSC-S (e.g. PRLCM) are not supported by this activity.
- GPP and V5.2 lines are not supported by this activity.
- Attendant Console is not supported by this activity.
- DMS MMP does not currently support trunks on an International RCO2. This will also be true for Succession-based International RCO2.
- The 6X69 messaging card for the RCO2 is not supported by this activity.
- The connection of an RCO2 to a PVG Gateway is not supported in the CS2K Hybrid environment.

45.7 Interactions

The following basic call types will be supported :

- PVG/RCO2 POTS-PVG/RCO2 POTS
- PVG/RCO2 MBS-PVG/RCO2 MBS
- PVG/RCO2 ETSI BRI -PVG/RCO2 ETSI BRI
- PVG/RCO2 POTS-PVG/RCO2 MBS
- PVG/RCO2 POTS-PVG/RCO2 ETSI BRI
- PVG/RCO2 MBS-PVG/RCO2 ETSI BRI
- PVG/RCO2 POTS-GWC line[1]
- PVG/RCO2 MBS-GWC line
- PVG/RCO2 ETSI BRI-GWC line

The following trunk interworkings will be supported :

- PVG/RCO2 POTS line to IBN7/ETSI ISUP V1/ETSI ISUPV2/PRI
- PVG/RCO2 ETSI BRI line to IBN7/ETSI ISUP V1/ETSI ISUPV2/PRI

The following CEPT services will be supported : ICWT, I3WC, CFD, ILR and Wake up.

[1]GWC line refers to a Succession line terminated on a small lines Gateway i.e. Mediatrix Analogue Line Gateway (1124).

The following regulatory services will be supported : Lawful Intercept, Number Portability, Carrier Pre-Selection, CLIP, CLIR, Malicious Call Trace.

The following POTS line services will be supported : CLASS[1] on POTS (Calling Name Delivery, Anonymous Call Rejection), Call Forwarding Busy, Call Forwarding No Reply, Call Completion Busy Subscriber, Selective Call Editing, Outgoing Call Barring, 3WC.

The following MBS line services will be supported : CLASS on MBS, same as POTS.

ETSI BRI basic call is supported, including point-to-point (1 terminal) and point-to-multipoint (1-8 terminals).

The following ETSI BRI supplementary services will be supported : 3PTY, AOC-D, AOC-E, CCBS, CD, CFB, CFNR, CFU, CLIP, CLIR, COLP, COLR, CONF, CUG, CW, DDI, ECT, HOLD, MCID, MSN, OCB, SUB, TP, UUS-1, MWI, CCNR, HUNT.

Reference is made to the following two documents for detailed limitations and restrictions for ETSI BRI, as well as ETSI BRI supplemental services and interworkings :

- DMS-100 Implementation of ETSI ISDN Basic Rate Interface at the S/T Reference Point NIS S223-1 01.02
- DMS-100 Implementation of ETSI ISDN Basic Rate Interface at the T Reference Point NIS S223-2 01.02

Note that these two documents describe the full TDM ETSI BRI support. The ETSI BRI support provided by activity A00002916 is a subset. Only ETSI BRI services and interworkings listed in this FN are supported.

There are no new market specific interactions supported by this activity, however, re-use of existing line templates is supported i.e. tones, cadences, Worldline card templates and ringing frequencies.

46: Functional Description (FN): A00003147

46.1 Feature name

A00003147 DP Digit Reception Control

46.2 Description

46.2.1 Purpose

The goal of the work covered by this activity is to provide a mechanism that eliminates the problem about generation of fake emergency service calls and unwanted billing records by line faults, which is a serious nuisance.

46.2.2 Background information

Insulation breakdown due to moisture or chafing of the cable pair due to wind causes the line to appear to be outpulsing digits.With the dial plan for the DMS switches, a pulse of 1 represents digit 1. Since digit "1" is only one pulse, for example, if there are three of these occurring within the interdigit pause, then the DMS routes the call as "111" which is an emergency service number in some countries.

46.2.3 Functional description

By disabling DP digit collection on lines assigned DGT option, the impacts of these fake calls can be eliminated.

The functionality thus provided eliminates the possible generation of these phantom calls by completely disabling DP digit collection with the use of an office parameter; scanning for only offhook, flashes and DTMF tones are permitted.

The change has the following operational impacts/effects:

- Prevents the generation of phantom calls on lines assigned DGT option.
- Dial pulse equipment is not supported on lines assigned DGT option.

46.2.4 Feature Operation

This activity provides control of DP Digit Collection on lines assigned DGT option by introducing a new office parameter DISABLE_DP_RECEPTION_ON_DGT in table OFCENG.

When office parameter DISABLE_DP_RECEPTION_ON_DGT in table OFCENG is assigned to Y, DP digit collection is disabled on lines assigned DGT option, only offhook, flashes and DTMF tones are permitted.

When office parameter DISABLE_DP_RECEPTION_ON_DGT in table OFCENG is set to N, DP digit collection functionality remains unchanged.

The diagram below shows the desired behaviour.

Table 1 Functional Behavior Diagram

'Disable DP Reception on DGT' office parameter	DIGITONE PHONE ON DGT LINE	DIAL PULSE PHONE ON DGT LINE	DIAL PULSE PHONE ON DP LINE
office parameter set to N (dp digit collection allowed)	possible generation of fake calls, DP digit reception allowed.	possible generation of fake calls, DP digit reception allowed.	possible generation of fake calls
office parameter set to Y (dp digit collection disabled)	possible generation of offhook, flashes and DTMF tones only, not fake calls, DP digit reception not allowed.	not supported, DP digit reception not allowed.	possible generation of fake calls.

The new office parameter DISABLE_DP_RECEPTION_ON_DGT is not directly related to the OFCVAR parameter DEFAULT_SIGNALLING_TYPE. DEFAULT_SIGNALLING_TYPE parameter decides which option to be assigned to the line by default when no option is added to the line.If the DEFAULT_SIGNALLING_TYPE=DP and no option is assigned to the line, DP option is assigned automatically and the line is not affected by the new parameter DISABLE_DP_RECEPTION_ON_DGT. If the DEFAULT_SIGNALLING_TYPE=DT and no option is assigned to the line, DGT option is assigned automatically and the line is affected from the new parameter according to Table 1. If the DEFAULT_SIGNALLING_TYPE=DT and DP option is assigned to a line, the line is not affected from the new parameter, DP digit collection is allowed.

The new office parameter is downloaded to the targetted XPMs under following conditions:

- Static data download after XPM loading.
- Static data download during RTS of XPM.
- Change in the value of DISABLE_DP_RECEPTION_ON_DGT in table OFCENG.

One of the available locations of protected global data area in the XPM is reserved to store the new office parameter value.

Whenever a change occurs in the office parameter value, a msg is sent to all the targetted peripherals immediately, with the updated value.

Also, the XPMs are updated with the existing office parameter value whenever a loading or RTS of supported peripherals occur.

This does not cause any outage or static data mismatch in the peripherals.

There is no need for a reload, swact, etc on the peripherals for the parameter value update.

46.2.5 Supported Peripherals

The definitive line/XPM types that need to be covered under this activity are:

- GPP V5.2 IBN Lines.
- GPP MelCAS IBN Lines.
- IBN Lines on PLGC.
- IBN Lines in RCO2.

All DMS-100 customers that deploy line services are able to use this functionality.

46.2.6 Error Detection

A PM181 informational log is generated whenever a failure in updating the pre-defined global data location in the XPM is detected.

Refer to the Fault Management section for more details.

46.2.7 Activation

Feature activation is done by setting the office parameter DISABLE_DP_RECEPTION_ON_DGT to Y.

Changes to DISABLE_DP_RECEPTION_ON_DGT are immediately effective.

The targetted PM's are immediately updated with the new value, without causing any outage in the XPM, no action is needed in the peripherals for the parameter value update.

By default, the office parameter value is set to N.

46.3 Hardware Requirements or Dependencies

No changes due to this feature.

46.4 Software Requirements or Dependencies

The new functionality provided by this activity is being implemented using the existing interfaces. As such, no new software dependencies are being introduced.

This functionality requires release SN07 or higher loads.

46.5 Limitations and restrictions

The functionality that is provided by this feature restricts the use of Dial Pulse phones on lines assigned DGT option.

When the office parameter DISABLE_DP_RECEPTION_ON_DGT is set to Y, Dial Pulse phones on lines assigned DGT option are not supported.

46.6 Patch Availability

The activity is implemented in SN07 and patched back to SN04.

46.7 Interactions

There are no interactions with other features.

This feature has no effect on flash functionality and on features using flash functionality.

47: Functional Description (FN): A00003051

47.1 Feature name

CFGD (Call Forward Group Don't Answer) for BRI Hunt Groups.

47.2 Description

This activity A00003051 in MMP20, enhances the CFGD option (AD1164) for BRI Hunt Groups (AR2189) for Turk Telecom.

The CFGD option allows the user to assign call forwarding do not answer to separate hunt groups. The hunt groups are directory number hunt (DNH), distributed line hunt (DLH), and multiline hunt (MLH). With CFGD, calls to idle hunt group stations ring for a set amount of time before the system forwards the calls. The system can forward the calls to the next station in the hunt sequence and to an external directory number (DN).

Currently, the CFGD option is restricted if the hunt group contains a BRI agent (pilot or member). This activity removes this restriction.

47.3 Hardware Requirements or Dependencies

No new hardware requirements have been identified.

This will be supported on resident and remote BRI access including BRI access on V5.2.

47.4 Software Requirements or Dependencies

None.

47.5 Limitations and restrictions

- CFGD option can only be assigned to pilot.
- CFGD option will be ignored if the call has been terminated on a p-p BRI.
- Backward notification to the calling user is not applicable.
- Notification to Served user that a call has been forwarded is not applicable.

47.6 Interactions

Interactions introduced by this activity are considered.

47.6.1 CLIP

No impact

47.6.2 CLIR

No impact

47.6.3 CCBS / CCNR (on hunting DN/ member)

No impact

47.6.4 CCBS / CCNR (on calling subscriber which is not a member of huntgroup)

47.6.13 TP

No impact

47.6.14 COLP / COLR

No impact

47.6.15 UUS

No impact to be tested

47.6.16 ECT

ECT can be activated on the ringback from a hunt group agent with CFGD. If this event occurs the system forwards the call when the forwarding timer expires.

47.6.17 REV-C

No impact

47.6.18 CONF / 3PTY

No impact

47.6.19 CD

No impact

47.6.20 Hot Line / Warm Line

No impact

47.6.21 OCB-F

No impact

47.6.22 OCB-UC

No impact

47.6.23 WUC

Not applicable

47.6.24 MSN

Not applicable

47.6.25 CFB / CFNR

Not applicable

47.6.26 CFU

Precedence to Line Hunting

47.6.27 CFD

CFD can be assigned to an individual member of a DNH group.

- For calls to pilot DN, CFGD takes priority over CFD.
- For calls terminated on a DNH group member because of a direct call to that DN, CFD takes priority over CFGD.
- For calls terminated on a DNH group member because of hunting, CFGD takes priority over CFD.

47.6.28 CW

Not applicable

47.6.29 LOR / LOD

Overflowing occurs when all members are busy or not answered.

47.6.30 RMB

As with normal hunt, the system does not forward a call to a hunt group member that activates RMB. If these conditions occur the hunt group member that rings continues to ring.

47.6.31 SHU

As with normal hunt, the system does not forward a to a hunt group member that activates SHU. If these conditions occur the hunt group member that rings continues to ring.

48: Functional Description (FN): A00003227

48.1 Feature name

ISN07, IN support for User to User Service (UUS)

48.2 Description

48.2.1 Overview

This activity performs the followings for MMP:

- Introduction of the User-to-User information (UUI) parameter to the INAP InitDP operation as a Nortel defined InitDP parameter. This parameter is controlled via table SERVINFO datafill.
- Integration of the Continue opr XLA REENTRY function and the IN Auto-Continue functionality, i.e. the Auto-Continue functionality supports the XLA REENTRY option.
- Enhancement of the EINTRACE CI tool to display the UUI extension if it is sent within an InitDP operation.

48.2.2 UUI Parameter

The description in this section assumes the following:

- An incoming call triggers as an IN call (TDP2 or TDP3), i.e. an InitDP is sent to the SCP.

The UUI data, i.e. the real user information without the parameter header octets (i.e. without UUI element identifier, length and protocol discriminator octets), of an incoming BASE and GERMAN ETSI ISUP V2 IAM is read out and transferred within the InitDP operation to the SCP. UUI is only supported towards SCP. It can not be sent back.

If there is no UUI data contained in an incoming ETSI ISUP V2 IAM no UUI related data is sent within the InitDP operation to the SCP.

UUI functionality is only supported for ETSI ISUP V2 signalling.

When auto-continue is invoked, the UUI information is not removed and is passed on to the terminating agents which are ETSI BRI, ETSI PRI and ETSI ISUP.

The ASN.1 format of the UUI extension field of the InitDP looks as follows:

-- Definition of the Nortel UUI Extension

```
NortelUUIExtension EXTENSION
    EXTENSION-SYNTAX ExtUUIType
    CRITICALITY ignore

-- Assignment of value (integer identifier)
nortelUUIExtension NortelUUIExtension ::= 20

-- Type definition (format / possible values)
ExtUUIType ::= INExtUUI
INExtUUI ::= OCTET STRING (SIZE(1..128))
```

An SSP example datafill for UUI functionality is shown below ;

```
>TABLE SERVINFO

SERVIDX                                                    OPTION

-------------------------------------------------------------------------

   99    (INITDP_PARMS ( SERVKEY) (CDPA) (CLI) (EVENT_TYPE)
(UUI) $)

         (RESPONSE_INFO (CONTINUE_OPT (XLA_REENTRY (
UNIV_XLA PX NETXLA) $)$)$)

(TCAP_INFO ( INAP_OPT (AUTO_CONTINUE) $)$)$
```

48.2.3 Auto-Continue with translation reentry functionality

The requirement is to be able to re-translate a TDP-3 triggered failing SCP query using a pre-defined translator. This functionality is supported in by ‘merging’ the existing Auto-Continue operation and the existing REENTRY XLA option. For that, both options have to be provisioned within table SERVINFO for a service index.

Please note that the documented existing SSP functionality is as follows:

- Continue operation with REENTRY:
  In this call scenario the call is either translated using the REENTRY translator (if triggered at TDP-2), or re-translated using the REENTRY translator (if triggered at TDP-3). Armed and encountered EDPs are properly handled.
- Auto-Continue operation (alone):
  In this call scenarios the call is resumed either at TDP-2 (for TDP-2 triggered calls) or TDP-3 (for TDP-3 triggered calls) and behaves the same as a regular Continue operation. Any armed EDP is not handled as the IN feature is cleared as soon as the Auto-Continue opr finishes.

The merger of both above functionalities, i.e. Auto-Continue opr with REENTRY option, does properly work with TDP-2 and TDP-3 triggering but without consideration of EDP handling.

When Auto-continue is invoked , existing EIN301 log is generated.

An SSP example datafill for Auto-Continue with REENTRY functionality is shown below;

```
>TABLE SERVINFO
SERVIDX                                                    OPTION
-------------------------------------------------------------------------------1
(RESPONSE_INFO (CONTINUE_OPT (XLA_REENTRY (UNIV_XLA
PX NETXLA ) $)$)$)

    (TCAP_INFO (INAP_OPT (AUTO_CONTINUE) $)$)$

BOTTOM
```

48.2.4 UUI extension display by EINTRACE CI tool

The EINTRACE CI tool supports the UUI extension within an InitDP operation. If an InitDP operation contains an UUI extension field, then the EINTRACE CI tool decodes and displays the UUI data within the InitDP operation trace.

48.3 Hardware Requirements or Dependencies

None

48.4 Software Requirements or Dependencies

None

48.5 Limitations and restrictions

- The Auto-Continue with XLA reentry utilization is only supported on TDP-3 triggered IN calls without utilization of EDPs or IPs. The Auto-Continue with XLA reentry utilization on TDP-2 triggered IN call is not considered in this activity.
- This activity only supports Base and German ETSI ISUP V2.

48.6 Interactions

49: Functional Description (FN): A00003405

49.1 Feature name

ECAN Support for International Trunks

49.2 Description

Currently, the SPMECMON tool allows a craftsperson to query a resource module to obtain echo canceller performance data such as Echo Return Loss (ERL) and Echo Return Loss Enhancement (ERLE). This capability is available and limited to 24 channels per carrier on NA trunks off of SPMs. However, there are 32 channels per carrier on the international SPM (iSPM) and the capability of monitoring all channels is needed on the iSPM. Therefore, this feature enhances SPMECMON's functionality by increasing its capability to monitor all 32 channels on international trunks.

49.3 Software Requirements or Dependencies

This feature does not affect any hardware configurations or settings. The SPMECMON command is only valid when used for trunks that are set up for internal echo cancellation and assigned to an echo canceller equipped SPM.

49.4 Limitations and restrictions

No restrictions or limitations have been added to this tool.

49.5 Interactions

None.

iSPM International Spectrum Peripheral Module

50: Functional Description (FN): A00003410

50.1 Feature name

Honduras ETSI ISUP variant

50.2 Description

The purpose of this feature is to introduce a new ETSI ISUP variant for Honduras market in MMP20. This variant should be defined under ETSI ISUP Version 2 (White Book).

The reason to use the new variant is that Honduras market requirements may not be provided neither by the BASE ETSI ISUP nor by one of existing variants. The detailed description of Honduras market requirements may be found in the Product Spec “ETSI ISUP for Honduras (HONDUTEL)” , module **P008287PS.AA05** in FMDOC library.

The brief description of Honduras market requirements:

- Honduras ISUP variant should be supported in QDT and QCI loads.
- Prohibit specific ISUP messages and parameters.
- Support of INR/INF ISUP messages.
- Support of national Calling Party Categories (CPC) in interworking between Honduras ETSI ISUP and FDCP protocols.
- Support of TrunK Offering (TKO) feature.
- Support of Malicious Call Trace feature.

The detailed description of Honduras market requirements is below.

50.2.1 New Honduras variant

The type CCITT_ISUP_VARIANT_TYPE should be extended with HONDURAS variant (new decimal value 43 will be used), see figure 1 below. Trunk definition in the TRKSGRP table is shown on the figure 2.

Figure 1 Extention of CCITT_ISUP_VARIANT_TYPE

```
type CCITT_ISUP_VARIANT_TYPE

port2 / port1	ISUP	FDCP	IBN
ISUP	Y	Y	Y
FDCP	Y		
IBN	Y		

50.2.2 Alowed ISUP Messages and Optional Parameters

Messages that should be **supported** in Honduras market are shown in the Table 2 below. If any other message will be received in the trunk it should be responsed with ISUP_CNF (confusion).

Table 2 Supported messages

Message	Code
Address complete	0 0 0 0 0 1 1 0

Note: parameteres and indicators supported in INR/INF messages are described below in the section “50.2.3 Support of INR/INF”.

50.2.3 Support of INR/INF

Information request indicators under the INformation Request (INR) message and Information indicators under the INFormation (INF) message should support only calling party address.

Supported information indicators are shown in the “Table 4 INR / INF - Indicators support”.

Table 4 INR / INF - Indicators support

Message	Indicators	Bits	Value
INR	**calling party address request**	**A**	**Y**
	holding indicator	B	N
	calling party category request	D	N
	charge information request	E	N
	malicious call identification	H	N
INF	**calling party address response**	**BA**	**Y**
	hold provided	C	N
	calling party category response	F	N
	charge information response	G	N
	solicited information	H	N

Table 5 INR/INF Indicators supported

Message	Indicator supported	Not supported
INR	calling party address (bit A)	Bits B - P should be 0
INF	calling party address response (bits A - B)	Bits C - P should be 0

Optional parameters supported in INR/INF are shown in the “Table 6 INR / INF - Optional Parameters support”, see below.

Table 6 INR / INF - Optional Parameters support

Message	Indicators	Supported
INR	call reference	N
	network specific facility	N
	parameter compatibility information	N

Table 6 INR / INF - Optional Parameters support

Message	Indicators	Supported
INF	calling party category	N
	calling party number	**Y**
	call reference	N
	connection request	N
	parameter compatibility information	N
	network specific facility	N

Table 7 Message Type : INR and INF messages.

Message	Parameter	Type	Length
INR	Message Type	F	1
	Information request indicators	F	2
	End of optional parameters	O	1
INF	Message Type	F	1
	Information indicators	F	2
	calling party number	O	5-12
	End of optional parameters	O	1

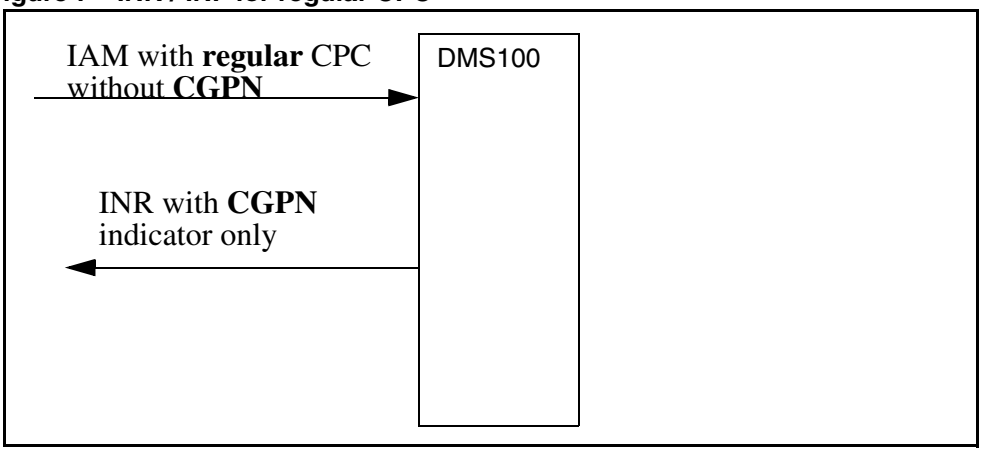
50.2.3.3 INR / INF in Terminating switch.

Figure 7 INR / INF for regular CPC



50.2.4 Calling Patry Categories: Values and Mapping.

The following calling party categories should be supported for Honduras variant (see table below).

Table 8 Calling Patry Categories

CPC	Value
Regular	#0A
Priority	#0B

Table 8 Calling Patry Categories

CPC	Value
Public phone	#0F
National Operator	#E1
Test	#0D

In the ISUP - FDCP and FDCP - ISUP crosses that should be supported by Honduras ETSI ISUP variant the mapping between ISUP CPC categories and MFC activities is following:

Table 9 CPC Mapping

ISUP CPC	Value	MFC Activity	Signal
ISUP_CPC_SUBSCRIBER_1	#0A	REG_SUB	1
ISUP_CPC_TOF_OPER	#E1	OPER	5
ISUP_CPC_PRIORITY	#0B	PR_SUB	2
ISUP_CPC_PAYPHONE	#0F	LOCAL_COIN	4
ISUP_CPC_TEST_CALL	#0D	MTC_EQ	3

In the mapping for ISUP to FDCP - Convert all ISUP_CPC categories except the above mentioned to REG_SUB MFC Activity.

In the mapping for FDCP to ISUP - Convert all MFC Activities categories except the above mentioned to ISUP_CPC_Subscriber_1.

50.2.5 Trunk Offering

The Honduras requirements for trunk offering are the same that for Costa-Rica market, detailed information on it may be found in the feature **A00002291.AA15** “Trunk Offering Expansion”, FMDOC library.

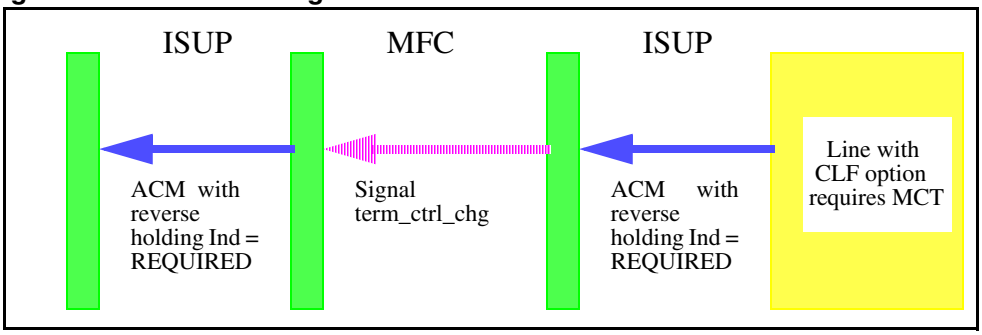
- The ISUP Operator signal should be #F9.
- The operator calling party category should be #E1 (see Table 8 above).

50.2.6 Malicious Call Trace

MCT support means that the field **Reverse_Holding_Ind** in the ACM message (that is set acording to the will of MCT terminator) should be transferred via net.

In the FDCP to ISUP tandem ACM with Reverse_Holding_Ind = REQUIRED should be transferred into activity TERM_CTRL_CHG, and into activity CONNECT_CALL_CHG otherwise.

Figure 8 Reverse holding indicator transfer



50.3 Hardware Requirements or Dependencies

N/A

50.4 Software Requirements or Dependencies

N/A

50.5 Limitations and restrictions

A. Messages that should be **supported** in Honduras market are shown in Table 2. If any other message will be received in the trunk, it should be responsed with ISUP_CNF (confusion) message.

B. Parameters that should be **supported** for Honduras variant are shown in Table 3. Parameters that are not suported should not be included in the ISUP messages taht are built in the switch, and being received from another switch should be discarded.

C. The definition of Honduras variant will be only for SX05 release.

51: Functional Description (FN): A00003411

51.1 Feature name

New TONESET for Honduras.

51.2 Description

This feature provides new loadable tones for the Honduras market on the base of existing NTMX76AB and NTMX76CA tone cards for the GPP and DTCO2 peripherals in the MMP20 stream.

The tone set includes:

- DTMF (Dual-Tone Multi-Frequency) tones
  - — The DTMF tones are added to support EBS (Electronic Business Set) and signalling to PABXs (Private Automatic Branch Exchanges). The following is the list the DTMF tones that should be defined for Honduras market: dtmf digit 1, dtmf digit 2, dtmf digit 3, dtmf digit 4, dtmf digit 5, dtmf digit 6, dtmf digit 7, dtmf digit 8, dtmf digit 9, dtmf digit 0, dtmf tone *, dtmf tone #, dtmf tone A, dtmf tone B, dtmf tone C, dtmf tone D.
- MFC (Forward Multi-Frequency Compelled) tones
  - — The MFC tones are added to support R2 protocol signalling. The following is the list the MFC tones that should be defined for Honduras market: MFC 1, MFC 2, MFC 3, MFC 4, MFC 5, MFC 6, MFC 7, MFC 8, MFC 9, MFC 10, MFC 11, MFC 12, MFC 13, MFC 14, MFC 15.
- B MFC (Backward Multi-Frequency Compelled) tones
  - — The following is the list the B MFC tones that should be defined for Honduras market: MFC B1, MFC B2, MFC B3, MFC B4, MFC B5, MFC B6, MFC B7, MFC B8, MFC B9, MFC B10, MFC B11, MFC B12, MFC B13, MFC B14, MFC B15.
- Supervisory Tones
  - — The supervisory tones consist of standard voice band supervisory tones generated by equipment connected to public exchanges. The following is the list the supervisory tones that should be defined for Honduras market: Dial Tone, Silent Tone, Milliwat Tone, Low Tone, High Tone, SF Loud tone, Audible Ringing Tone, Busy Tone, Congestion (Reorder), ROH (Howler), Call Waiting Tone, Confirmation Tone (PIT), Special Dial Tone, Vacant.

By specifying the appropriate TONESET field in table LTCINV, the tone-making process generates the tone samples required by Honduras market. The

TONESET field should be set to 'HONTONES'. These tone samples are sent to the tone memory (RAM).

51.2.1 Continuous tones

51.2.1.1 Continuous Tones definition

Table 1

Tone	Description
DIAL TONE	Is sent to the call originator after off-hook until the first digit is received by the exchange.
SILENT TONE	Is sent as a quiet termination for the tone-off periods to prevent noise.
MILLIWAT TONE	Is sent through an O/G or an I/C trunk at 0 dBm level (1 mW) so that the far end can measure losses of the trunk. The tone is used for trunk tests T902 and T904.
LOW TONE	The LOW Tone is for future use.
HIGH TONE	The HIGH Tone is for future use.
SF LOUD TONE	The SF LOUD tone is used for XPM tests.

51.2.2 Periodic Tones

51.2.2.1 Tones definition

Table 3

Tone	Description
CONGESTION TONE	Is sent in the backward direction to indicate to the calling party congestion on the O/G trunk, or blocking condition in the NET module
BUSY TONE	Is sent to the subscriber to indicate unavailable destination.

Table 3

Tone	Description
RING BACK TONE	Is sent to the originator during wait for answer state.
VACANT TONE	Is sent due to one of the following treatment conditions: FNAL - Feature Not Allowed. HNPI - Home NPA Intercept. VACT - Vacant Code.
ROH (HOWLER)	The Receiver Off Hook tone (ROH) is sent to the subscriber as a loud tone after it was left off-hook for more than a predefined time and no digits dialed. It is also sent when the terminator remains off-hook for more than a predefined time after originator disconnect. The ROH tone consists of 4 frequencies, 470Hz, 940Hz, 1410Hz and 1880Hz mixed together. Each frequency has a -2dBm level so that the total bursts ROH level is 4dBm.
SPECIAL DIAL TONE (SPDT)	Is given to a subscriber in various features to allow him continue with the dialling.
CALL WAITING TONE	Is given to a terminator (who subscribed to the CWT feature) as a warning signal that another call has entered and is waiting for an answer.
CONFIRMATION TONE	Is given to a subscriber that has activated a feature as a positive acknowledge that the feature has been received by the switch.
INTRUSION TONE	This Tone is used to provide the warning for a subscriber that is occupied in a call that an operator has just established a TPS/ ENQ as part of the Trunk Offering feature. We shall probably provide the intrusion tone for the operator trunk offering feature, directly from the CTM card. In which case the pattern will remain as it is provided in the CTM and will not be changed.

Note: The meaning of (+) is that it is in use, the meaning of (-) is that it is not currently in use.

52: Functional Description (FN): A00003465

52.1 Feature name

ETSI BRI Channel reservation override

52.2 Description

This feature provides the user to override the channel reservations for the calls on a loop. This enables the user to steal channel reserved for any other non-CW incoming alerting call for another call. Incoming alerting call is a call which ALERT is sent by the set to the switch.

Channel steal request is sent by SETUP, CONNECT or RETRIEVE messages with a proprietary facility information element.

This feature is required to enable subscribers to be able to freely answer incoming calls.

For DBArt, Stationary Train dispatchers use specially developed terminals for telecommunication purposes, called GeFo. The telecommunication I/F to the fixed network is based on ETSI BRI point to multipoint connections. When a call is presented to the user, the network always reserves a free B-channel. The user is not allowed to answer a waiting call, if both B-channels are reserved. To overcome this operational restriction, the terminal will be allowed to request allocation override on a reserved B-channel.

52.2.1 Requesting channel steal

To override the B-channel allocation for incoming alerting non-CW calls in case of incoming CW calls and outgoing calls, the mechanism for a user control of network-side channel reservation provided in ETS 300196-1 "Generic functional protocol for the support of supplementary services" in chapter 10.1.2 is used.

In order to minimize potential future implementations, the optional argument controlOption is extended by the proprietary value "reservationRequiredOverrideAllocations" with the value 128 (#80).The extended ASN.1 definition from table D.7 is outlined below.

```
ExplicitReservationCreationControl ::= OPERATION
   ARGUMENT controlOption ENUMERATED {
            noReservationRequired (0),
            reservationRequiredWithReservationIndicator (1),
            reservationRequiredWithoutReservationIndicator (2),
            reservationRequiredOverrideAllocations (128)} -- optional
   RESULT ReservationIndicator -- optional
   ERRORS { maximumNumberOfReservationsReached,
            notAvailable,
```

```
notSubscribed,
unwantedReservationCreated}
```

The reservation FAC IE can be sent in outgoing SETUP messages (to free up an allocated B-channel for an outgoing call) and in outgoing CONNECT or RETRIEVE messages (to free up an allocated B-channel for an incoming CW call).

Figure 1 Channel stealing with CONN message

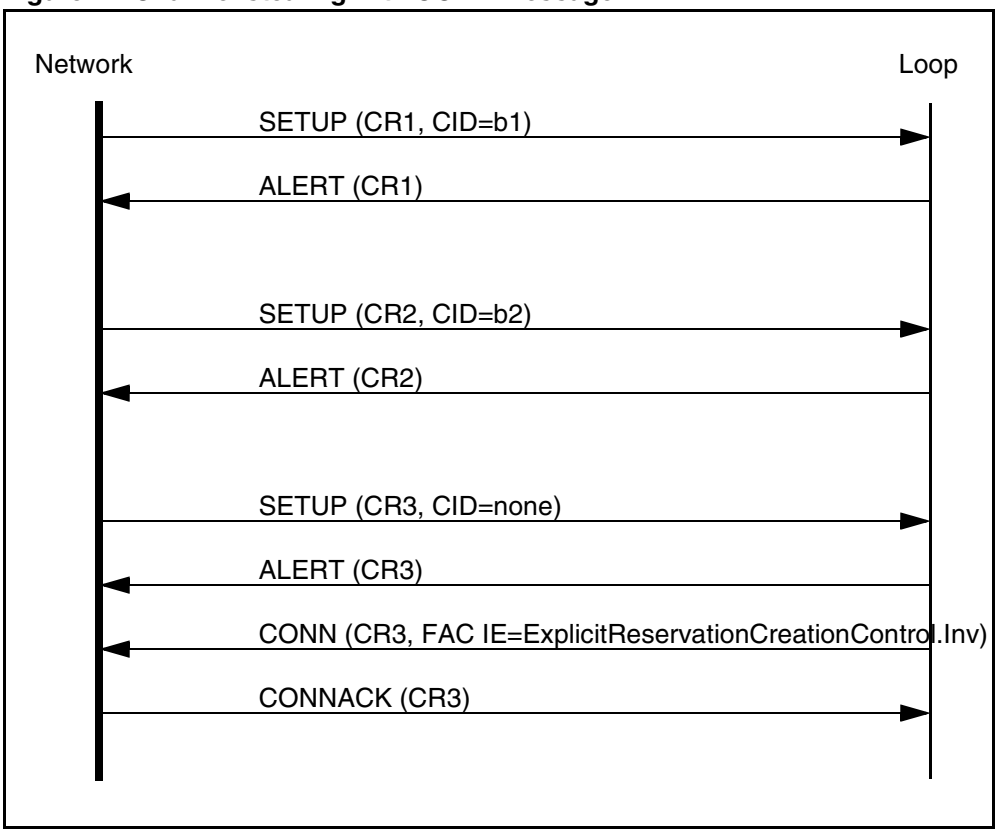

Figure 2 Channel stealing with SETUP message

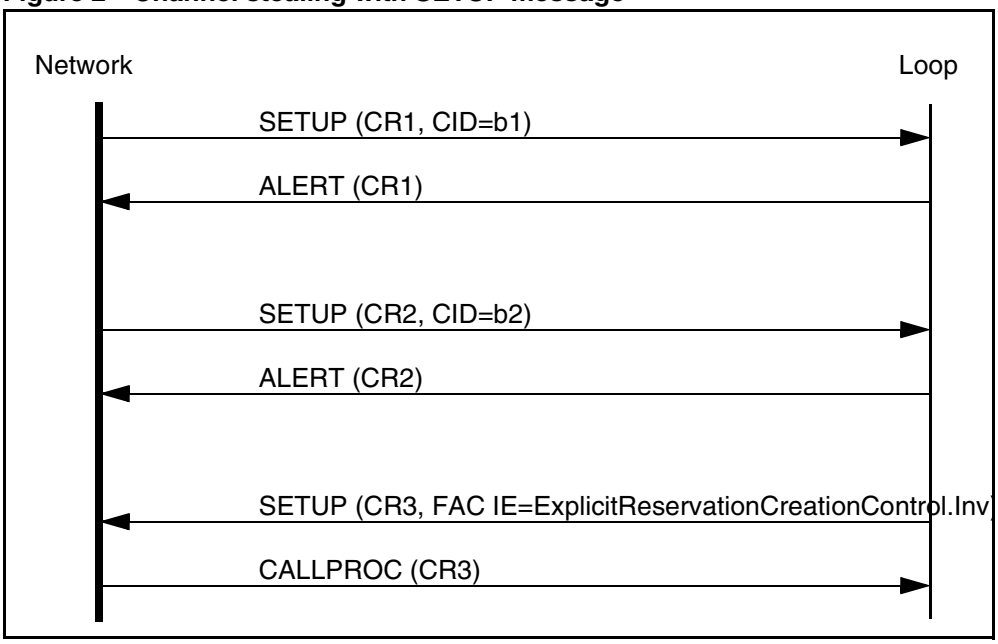

Figure 3 Channel stealing with RETR message

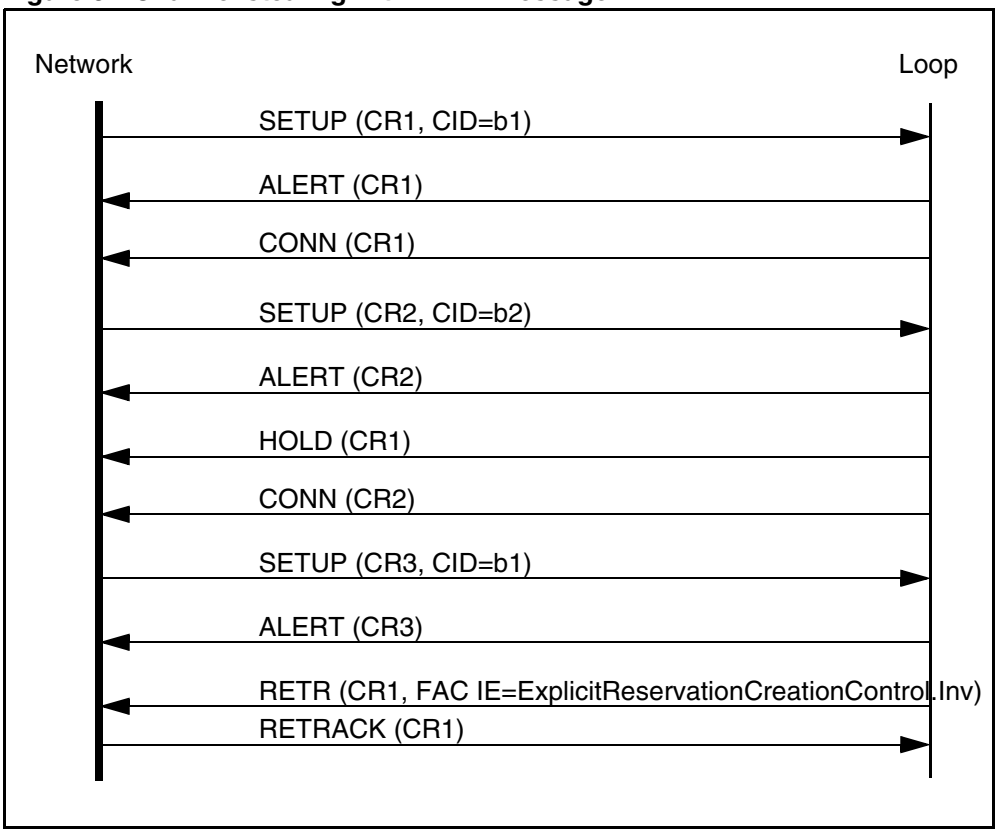

The terminal can pass the channel ID (CID) which it wants to reserve, but in case this preferred CID cannot be reserved (e.g. already stolen) the other b-channel will be returned in the next call control message.

During an attempt to setup an outgoing call while both B-channels are busy, the terminal is responsible to automatically hold or release one of its calls to free up a B-channel.

Table 1 ExplicitReservationCreationControl.Invoke

Hex Value	Description
1C	Facility
0C	Facility Length
91	Supplementary Service Spare
A1	Invoke Operation
09	Invoke Length
02 - Universal Integer	Invoke ID Tag
01	Invoke ID Length
A unique invoke Iidentifier	Invoke Identifier
02 - Universal Integer	Operation Tag
01	Operation Length
14 - ExplicitReservationCreationControl	Operation Identifier
02 - Universal Integer	controlOption Tag
01	controlOption Length
80 - reservationRequiredOverrideAllocations	controlOption

If an allocated B-channel will be provided (an allocated B-channel from another incoming alerting non-CW call) or if a B-channel is available the response from the XPM in the next call control message is a FAC Return Result.

Table 2 ExplicitReservationCreationControl.ReturnResult

Hex Value	Description
1C	Facility
06	Facility Length
91	Supplementary Service Spare
A2	ReturnResult Operation

03	ReturnResult Length
02 - Universal Integer	Invoke ID Tag
01	Invoke ID Length
InvokeID of the Invoke component, set sent	Invoke Identifier

In case the request can not be fulfilled (e.g. both B-channels are busy), the response from the XPM is a FAC return error component with the error "maximumNumberOfReservationsReached".

If the optional parameter in Invoke component is different than #80, the request can not be fulfilled. If no parameter is included, or the parameter has the value 0, 1 or 2 the request is valid and a FAC RE component with error code "notAvailable" will be sent (valid request, not supported).

If the value is between 2 and #80 or greater than #80 the request is invalid (coding error) and a FAC reject with the problem code "mistyped-argument" will be sent.

52.2.2 Software optionality control (SOC) option

The soc option SULN0028 “SULN BRI Call Queuing” which is created by the activity A00002377 “10 AFC Keys for BRI Directory Number” is also used for this activity. The functionality of this activity is depend on the SOC option SULN0028. When the SOC option is changed, static data of PLGCs and GPPs should be updated. A warning is printed when SOC is changed in CI level;

"*Static data update is required for related PLGCs and GPPs. Please BSY/RTS the inactive unit and perform swact*" .

52.3 Hardware Requirements or Dependencies

N/A

52.4 Software Requirements or Dependencies

N/A

52.5 Limitations and restrictions

1. Preemption services (MLPP): If a call selected to be pre-empted has had its b-channel stolen, the preemption does not successfully free up a b-channel and the pre-empting call will not complete. Therefore, the operator must disable MLPP network preemption in datafill by setting NONPREEMPT=YES, if B-channel stealing is to be used. Please note that, precedence calls are still allowed.
2. Busy determination services (CW, CF, CCBS, MLPP): A channel that has been made available after b-channel stealing is not available to CW, CF and CCBS. Specifically, if there is an alerting call that has had its b-channel stolen and there is also a free b-channel, CW, CF and CCBS consider that free channel as reserved against the call that had its b-channel stolen. A basic scenario could be as follows:
   - Consider, b1 and b2 are reserved for two different alerting calls and there is an additional waiting call on loop.
   - Assume b1 is stolen for the waiting call.
   - Let call holding b2 to terminate.
   - We have a free b-channel available on XPM and the set can originate a new call. However CM thinks that both channels are in use and no normal calls are terminated to the loop. Therefore CW, CF, CCBS, MLPP preemption or MLPP alternate party diversion may be tried.
3. Terminal Impact (1): A call that has had its b-channel stolen cannot be answered unless there is another channel available for stealing or one has been freed by the terminal. Therefore, the terminals used must be specially designed to first verify that a call can be answered under this new algorithm if b-channel stealing is to be used. A terminal can always send the stealing request, even there is no need for stealing since there are available b-channels.

4. Terminal Impact (2): Since the terminals used must have complete knowledge of all calls on the loop to make the determination of which calls can be answered (see previous point), the operator must ensure only one terminal may be active on the loop if b-channel stealing is used.
5. Terminal Impact (3): Since b-channel stealing may cause the b-channel specificied in the next call control message (RETR ACK, CONN ACK, CALL PROC) to the channel stealing request to be different that previous messages, the terminals must always use the b-channel specified in the CONNECT ACK and ignore b-channels specified in earlier messages.

52.6 Interactions

52.6.1 Pre-emption services (MLPP):

Preemption services (MLPP): If a call selected to be pre-empted has had its b-channel stolen, the preemption does not successfully free up a b-channel and the pre-empting call will not complete. Therefore, the operator must disable MLPP network preemption in datafill by setting NONPREEMPT=YES, if B-channel stealing is to be used. Please note that, precedence calls are still allowed.

52.6.2 Busy determination services (CW, CF, CCBS):

Busy determination services (CW, CF, CCBS, MLPP): A channel that has been made available after b-channel stealing is not available to CW, CF and CCBS. Specifically, if there is an alerting call that has had its b-channel stolen and there is also a free b-channel, CW, CF and CCBS consider that free channel as reserved against the call that had its b-channel stolen. A basic scenario could be as follows:

- — Consider, b1 and b2 are reserved for two different alerting calls and there is an additional waiting call on loop.
- — Assume b1 is stolen for the waiting call.
- — Let call holding b2 to terminate.
- — We have a free b-channel available on XPM and the set can originate a new call. However CM thinks that both channels are in use and no normal calls are terminated to the loop. Therefore CW, CF, CCBS, MLPP preemption or MLPP alternate party diversion may be tried.

53: Functional Description (FN): A00003466

53.1 Feature name

MLPP Default Precedence Level on Terminations

53.2 Description

This feature A00003466 MLPP Default Precedence Level on Terminations is an extension of the feature A00000154 Multi-Level Precedence and Preemption supplementary service that is implemented in MMP19/ISN06, for point-to-multipoint ETSI BRI.

In feature A00000154 Multi-Level Precedence and Preemption, calls from non-MLPP sources do not have a precedence when terminating to an MLPP BRI loop. They are not marked as MLPP call and treated as ordinary calls.

This feature is specified to meet Railway Dispatcher System requirements which are not compliant with specification Q955. The implementation for this activity will be done using Q955_COMPLIANT office parameter.

This feature provide assigning precedence level ROUTINE to calls originated from non-MLPP sources when terminating to an MLPP BRI loop if Q955_COMPLIANT is set to N. MLPP information (notifications, FAC data, causes) is not sent in the backwards direction to the non-MLPP originator.

Any MLPP related information is not included in IAM in the case of call forwarding or alternate party diversion over ISUP in which call is originated from non-MLPP resource.

53.3 Hardware Requirements or Dependencies

N/A

53.4 Software Requirements or Dependencies

N/A

53.5 Limitations and restrictions

1. This feature is in effect only if Q955_COMPLIANT office parameter is set to N.
2. Non_MLPP sources mentioned in function description are ETSI BRI, PRI, ETSI ISUP V2
3. Calls from non_MLPP sources cannot be preempted by network preemption.

53.6 Interactions

If an MLPP call originated from non-MLPP resource is taken into conference -3pty, addon, preset-it can be preempted by any other higher precedence MLPP call.

54.1 Feature name

REVERSE TRANSLATIONS ENHANCEMENTS VIA CUSTMOD OPTION

54.2 Description

54.2.1 Background Information

The purpose of this feature is to enhance Reverse Translations to co-exist with CS1R.

The current DMS100 MMP product has requirements to alter the default dialling on a per CLI basis, which is originally determined by the incoming trunk group (Customer Group and NCOS). This is done by assignment of the CUSTMOD option against the given CLI(s) (Calling Line Identity) and assigning a new customer group. In order to make use of the new customer group, in the routing phase (IBNRTxx), the routing option invoked is IBNRX. This allows a form of re-translations to occur, which is not exactly re-entering Universal Translations at the top of the digit analysis phase. The digits then are re-examined using the new Customer Group info and when entering Universal Translations, the call will then re-route according to this data.

The limitation is that CS1R and IBNRX are not integrated to be supported in the same call. This is due to the fact that the CS1R functions are ONLY designed to work within the digit translations phase of the call and IBNRX is invoked in the routing phase. Thus, the call will fail.

The primary enhancement is to allow Reverse Translations to be invoked within the digit analysis phase of the call. The preferred place to provide the enhancement is within the "Featinfo Validate".

54.2.2 Introduction

The functional diagram of this feature is shown in figure 2.

CUSTMOD, which is an option in refinement VALDATOP for XLASEL FEATINFO in universal translation tables, is enhanced by this feature; and the new field REV_XLA (Reverse_Translations_Trigger) and its refinement DELDIGS (Delete Prefix Digits) are added to the CUSTMOD option.

The entry in new field REV_XLA can be either Y or N.

When the CUSTMOD option is encountered in one of the translation tables (for ex in table PXCODE), and when these conditions are satisfied

i. The entry in field REV_XLA is “Y”

ii. The customer group or NCOS is changed in table DNSCRNx

the Reverse Translation starts within the "Featinfo Validate" option in Universal Translation tables, i.e. within the digit analysis phase of the call, and digit analysis stops and re-enters at the standard IBN translations block with the new Customer Group and NCOS.

So, based on the Access Code used to invoke CLI Screening, the customer can decide on a per CLI basis if they want to change the default Customer Group/ NCOS from the Trunk Group assigned or override the default with the one defined against the CLI. The new Customer Group/NCOS is used immediately during digit analysis without having to wait for the routing phase of call as per current implementation of IBNRX (an example for previous implementation of reverse translation is shown in Figure 3 on page 1178 and in Figure 4 on page 1179).

The new refinement DELDIGS allows the removal of prefix digits before retranslation (re-enter of IBNXLA) begins. DELDIGS is a mandatory field only if the entry in field REV_XLA is “Y”. The entry in new refinement DELDIGS can be an integer from 0 to 18, inclusive.

Sample datafill is shown in figure 1.

Figure 1 Sample Datafill

```
TABLE PXCODE

PTTXLA 888 888 FEATINFO VALIDATE ( SUBSCRN ( GENERAL Y Y Y
Y)$) ( CUSTMOD Y Y 6) $ 0 0 24 PX VALIDATE

PTTXLA 890 890 FEATINFO VALIDATE ( SUBSCRN ( GENERAL Y Y Y
Y)$) ( CUSTMOD Y N) $ 0 0 24 PX VALIDATE
```

REV_XLA option starts the reverse translation once per call.

Activation of the functionality is controlled by the SOC option XLAS0054 “XLAS Rev Trans Custmod”. If the SOC is turned OFF or ON, it is possible to datafill the new field REV_XLA but this option is ignored when the SOC is turned OFF.

Also,

- No changes are done in Table DNSCRN and the other DNSCRNx tables. This is to ensure integrity of the provisioning systems.

- If the entry in new field REV_XLA is Y or N, then if IBNRX is encountered in the routing phase, then IBNRX still functions as it always did. So, there is full transparency to this feature with existing capabilities.
- If the entry in 'new' field REV_XLA is Y, and the CLI does not have defined any Customer Group info, then any options in Featinfo selector will be completed and translation continues on universal translations.

If the call hits an AMAGRPID option in lineattr tables after the reverse translation starts, then this second AMAGRPID over-writes the previous one. And, the last AMAXLAID option (which can be datafilled in universal translation tables) over-writes the previous AMAXLAID option, too. An example for these options is shown in figure 5 and figure 6.

The translations verification (traver) tool is enhanced by this feature. It is now possible to trace the reverse translation via traver; after REV_XLA is hit, the traver shows the translation tables, the CS1R trigger points, the terminator, the outpulsed digits, and so on. Please refer to Figure 5, "New traver output - Part 1 / 2" on page 1180 and Figure 6, "New traver output - Part 2 / 2" on page 1181.

54.2.3 IN Interaction

The new functionality enables to support CS1R and the CUSTMOD option to be supported in the same call, as explained in the following paragraph.

The new functionality is to be able to trigger IN system after execution of the CUSTMOD option when the reverse translation is triggered; functional Behavior Diagram is shown in figure 2; and an example is shown in figure 9 and figure 10.

Also, the traver output shows the outpulsed digit result and the route choice(s) for both standard and CS1R triggered calls. Traver outputs of the previous implementation of CUSTMOD option is shown in figure 7 and figure 8; the new outputs are shown in figure 9 and figure 10.

Both TDP2 and TDP3 are supported by this feature. TDP2 occurs at the Info Collected point in the call (This can be seen in the traver - INAP Info Collected TDP). The reverse XLA occurs after this so we will do a TDP2 check, then reverse XLA.When this happens, the call will go back through the INFOCOL point in call. (Normally this occurs between DGCOL and IBNXLA. Reverse XLA does go back through these table so we will go back through another TDP2 trigger point. As shown in figure 9 and figure 10.

An another traver example is shown in figures 11, 12 and 13.

The working principle of CS1R is not effected.

AIN (Advanced Intelligent Networks; the North American standard of IN) and GIN (GSP IN) are not supported. Only EIN (ETSI INAP V8) is supported.

After the CONNECT message is received by the SSP, the original customer group and ncos of the originator trunk is used by the IN translation system. For ex: When the call triggers at TDP-3 on the SSP to provide an IN number translation service, after the IBNRX option, the translation system uses the customer group of the originating trunk, not the customer group and the ncos values defined in DNSCRN table.

54.3 Hardware Requirements or Dependencies

N/A

54.4 Software Requirements or Dependencies

Activation of the functionality is controlled by the SOC option XLAS0054 “XLAS Rev Trans Custmod”.

This feature is patched backed to SW000004. The patch ID is NAP43. NAP43 is a password activateble patch. For an ONP from (ISN04 - ISN06) to (ISN07 and beyond), the state of the SOC option XLAS0054 will automatically be set to ‘ON’, if NAP43 was activated before the ONP, and also all of the functionalities of this feature will be ON after the ONP, too. But for this ONP, a password for SOC option is still required to change the RTU field of the SOC option XLAS0054 in loads SW000007 and beyond. “SOC states and RTU values of the SOC optionXLAS0054 after ONPs” is described in table 3.

Table 1 SOC states and RTU values of the SOC option XLAS0054 after ONPs

ONP	State of SOC option after ONP		RTU of SOC option after ONP	
	IF State of SOC option in ISN07 (nodatafill load) before ONP is IDLE	IF State of SOC option in ISN07 (nodatafill load) before ONP is ON	IF RTU of SOC option in ISN07 (nodatafill load) before ONP is N	IF RTU of SOC option in ISN07 (nodatafill load) before ONP is Y
ISN04 (ISN04 or ISN06) to ISN07 (ISN07 or beyond) NAP43 is active on ISN04 (or ISN06)	ON	ON	N	Y
ISN04 (ISN04 or ISN06) to ISN07 (ISN07 or beyond) NAP43 is not active on ISN04 (or ISN06)	IDLE	ON	N	Y

54.5 Limitations and restrictions

REV_XLA option starts the reverse translation once per call.

AIN (Advanced Intelligent Networks; the North American standard of IN) and GIN (GSP IN) are not supported. Only EIN (ETSI INAP V8) is supported.

Only TDM trunks are supported by the REV_XLA option.

REV_XLA is functional for only the trunk originated calls. Supported Trunk types are:

- ETSI ISUP V1, V2, V3
- All National variants of ETSI ISUP (can be V1 or V2 based)
- BTUP V2, V2+
- SSUTR2
- SPIROU
- National variants of ETSI PRI
- QSIG
- Numeris VN4 PRI
- Numeris VN6 PRI
- DPNSS

54.6 Interactions

When a call is initiated by a feature, REV_XLA does not start the reverse translation after the featinfo selector; i.e. feature initiated calls are not supported by this activity. Some examples for the unsupported features are:

- Call diversion favors
- CFRA
- Attendant Console’s night service
- CCBS
- MONA
- IBN Auth code and Acct code features
- RSA
- DISA

Supported feature interworkings are:

- Calling Party Category Screening and Routing

- CDN
- BC, as exists plus Universal MMP15 feature.
- PN screen
- IN CS-1, CS-2, CS-3, CS-4
- All existing AMA functionality
- Forced overlap outgoing - Eire
- NETINFO
- All existing Validate CLI functionality
- IN Billing - all current IN billing to be supported (including FCI)
- French NAOC (AU3283) base feature support required along with the new NAOC features in ISN07

REV_XLA is supported only in the translation phase of the call. Therefore REV_XLA option is not supported after the other re-translation options in routing tables. But those other re-translation options in routing tables are supported by the REV_XLA option when the call hits the REV_XLA option before these options. For ex: REV_XLA option is not supported after

- RT, GBL options in universal routing tables
- RT, RX, GBL options in OVRx and OFRx tables
- RX, IBNRX, GBL options in IBNRTx tables
- VFGs

54.7 Applicable customer facing sections

55: Functional Description (FN): A00003624

55.1 Feature name

H.323 Out Of Band Interworking with APG

55.2 Description

This SN07 activity builds on the work done by activity A00001895 by enabling support for H.323 out-of-band DTMF signalling from and to a connection that has an Anchor Packet Gateway (APG) inserted. This activity covers out-of-band DTMF signalling between

- H.323 GW and **any** other Gateway when an APG has already been inserted by another service

55.2.1 Background

There are three different ways for an H.323 gateway to carry DTMF(Dual-Tone Multifrequency) digits:

- DTMF digits are carried as inband DTMF tones. But low bit-rate voice codecs such as G.729 cannot be guaranteed to reproduce these tone signals accurately enough for automatic recognition
- Out of band DTMF digits carried in an H.245 message
- Using RTP Payload to carry DTMF digits, Telephony Tones and Telephony Signals as specified in RFC2833.

As stated above, inband DTMF is not sufficient for certain codecs such as G.729. RFC 2833 solves the problem by carrying DTMF digits in the RTP Payload, but not all H.323 gateways support RFC 2833. SN06.1 activity A00001895 provided support of out of band DTMF signalling between:

- H.323 Gateway and H.323 Gateway
- PVG and H.323 Gateway

55.2.2 Out of Band DTMF Interworking with Anchor Packet Gateway (APG)

The APG may have been inserted at the terminating call server or at the originating call server.

The APG only supports G.711. This means that an H.323 GW in a call with an APG inserted will also have to use G.711. However the H.323 GW may still

send DTMF digits out of band using H.245 and this is the case covered by this activity.

If an APG has been inserted at the terminating Call Server and a terminating H.323 gateway sends a DTMF digit using H.245 User Input Indication, the APG applies the DTMF tone towards the originating GW, as shown in Figure 1.

If an APG has been inserted at the terminating Call Server and an originating H.323 gateway wishes to send digits to the terminating gateway, then SIP INFO is used to send the digits. At the terminating Call Server the DTMF tone is applied by the APG towards the terminating gateway, as shown in Figure 2.

Similar signalling occurs if the APG was inserted at the originating Call Server.

Figure 1 APG inserted at terminating Call Server.

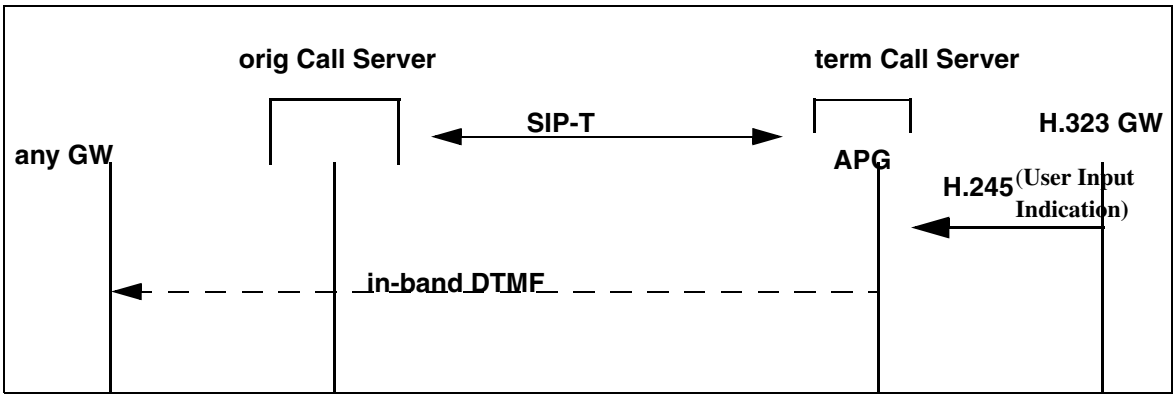

Figure 2 APG inserted at terminating Call Server.

56: Functional Description (FN): A00003495

56.1 Feature name

APG integration with MP for NAT traversal.

56.2 Description

This feature is an enhancement of the CS 2000 Media Proxy NAT (Network Address Translator) traversal solution. It adds support for the APG (Anchor Packet Gateway) to this solution.

The MP (Media Proxy) NAT traversal solution was developed in SN06 under activity 89007980. It involves proxying a media path through an MP if the calling agents are in different IP (Internet Protocol) address domains, in order to ensure that media can flow between both parties.

The APG is a network device needed to support certain SIP-T (Session Initiation Protocol for Telephony) features on the CS 2000, mainly those that require the SIP-T leg to collect digits or play tones. The APG is inserted into the media path whenever SIP-T control logic determines that it is needed. The APG was developed in SN04 under activity 59031163.

Previous to this feature, calls requiring both an MP and an APG were not supported.

56.3 Hardware Requirements or Dependencies

None, apart from the hardware requirements and dependencies inherited from the APG and NAT traversal features, on which this feature is based. Please refer to the functional descriptions of these features for more details.

56.4 Software Requirements or Dependencies

None, apart from the software requirements and dependencies inherited from the APG and NAT traversal features, on which this feature is based. Please refer to the functional descriptions of these features for more details.

56.5 Limitations and restrictions

None, apart from the limitations and restrictions inherited from the APG and NAT traversal features, on which this feature is based. Please refer to the functional descriptions of these features for more details.

56.6 Interactions

None.

57: Functional Description (FN): A00003624

57.1 Feature name

H.323 Out Of Band Interworking with APG

57.2 Description

This SN07 activity builds on the work done by activity A00001895 by enabling support for H.323 out-of-band DTMF signalling from and to a connection that has an Anchor Packet Gateway (APG) inserted. This activity covers out-of-band DTMF signalling between

- H.323 GW and **any** other Gateway when an APG has already been inserted by another service

57.2.1 Background

There are three different ways for an H.323 gateway to carry DTMF(Dual-Tone Multifrequency) digits:

- DTMF digits are carried as inband DTMF tones. But low bit-rate voice codecs such as G.729 cannot be guaranteed to reproduce these tone signals accurately enough for automatic recognition
- Out of band DTMF digits carried in an H.245 message
- Using RTP Payload to carry DTMF digits, Telephony Tones and Telephony Signals as specified in RFC2833.

As stated above, inband DTMF is not sufficient for certain codecs such as G.729. RFC 2833 solves the problem by carrying DTMF digits in the RTP Payload, but not all H.323 gateways support RFC 2833. SN06.1 activity A00001895 provided support of out of band DTMF signalling between:

- H.323 Gateway and H.323 Gateway
- PVG and H.323 Gateway

57.2.2 Out of Band DTMF Interworking with Anchor Packet Gateway (APG)

The APG may have been inserted at the terminating call server or at the originating call server.

The APG only supports G.711. This means that an H.323 GW in a call with an APG inserted will also have to use G.711. However the H.323 GW may still

send DTMF digits out of band using H.245 and this is the case covered by this activity.

If an APG has been inserted at the terminating Call Server and a terminating H.323 gateway sends a DTMF digit using H.245 User Input Indication, the APG applies the DTMF tone towards the originating GW, as shown in Figure 1.

If an APG has been inserted at the terminating Call Server and an originating H.323 gateway wishes to send digits to the terminating gateway, then SIP INFO is used to send the digits. At the terminating Call Server the DTMF tone is applied by the APG towards the terminating gateway, as shown in Figure 2.

Similar signalling occurs if the APG was inserted at the originating Call Server.

Figure 1 APG inserted at terminating Call Server.

57.8 Glossary

Term	Description
New term	Definition

58: Functional Description (FN): A00003627

58.1 Feature name

T.38 FAX Support for International H.323 (Actid A00003627, ISN07 Release)

58.2 Description

58.2.1 Overview

This activity provides “Call Server controlled switchover to T.38 (or G.711)” for Call Server routed H.323 calls. Fax interworking is supported on calls between H.323 GWs (e.g. Meridian, Cisco, BCM) and H.248 GWs (e.g. PVG) or MGCP GWs (e.g. Mediatrix). At least one involved agent must be H.323.

Fax interworking is provided over Session Initiation Protocol (SIP-T). All involved Call Servers must support the prerequisites given in chapter 58.2.8.

This feature provides “Call Server controlled switchover to T.38 (or G.711)” depending on T.38 network option:

- If **Netopt is set to “T.38”** and both GW support T.38, then upon fax detection, switchover is done from G.729 (or G.711) to T.38 codec.
- If **Netopt is not set to “T.38”**, or a GW does not support T.38, then switchover to T.38 does not apply. If the call was set up with G.729 codec, switching is done from G.729 to G.711 codec. If the call was set up with G.711, no switchover occurs.

This activity builds on top of the SN06.1 activity A00001895 “H.323 Base Application” that included development to support basic call capabilities for H.323 GWs connected to the CS2K.

This feature does not impact the capability of a GW to do autonomous switchover to T.38 in a call that does not involve an H.323 GW (e.g. PVG to PVG call).

Digital call control signaling (ISUP, ISDN, H.323) may request a Group 3 fax call within the first setup message (IAM, SETUP) by BC IE = “3.1 kHz audio” and HLC IE = “Facsimile Group 3”. Checking this teleservice “Fax Group 3” and opening a T.38 channel from beginning is not considered by this feature.

Testing is done on the international CS2K load only. Testing for NA load is captured by feature .... tbd. Testing T.38 fax interworking to MCS 5200 is not part of this feature, is captured by feature ... tbd.

58.2.2 ISN06 restrictions

The ISN06 CS2K solution does not provide interworking to Group 3 facsimile equipment (G3FE) connected to H.323 GW.

There are three different methods to do Group 3 fax over IP signalling:

1. Autonomous GW switching to fax transport mode via inband indication.
2. Call Server control of GW switching to fax transport mode.
3. GW switching to fax transport mode - peer-to-peer out of band indication.

The ISN06 CS2K solution provides autonomous switching to fax transport mode (G.711 codec or T.38 mode) if a fax tone (e.g. CNG, V.21 header) was received. The H.248 GW does not notify the H.248 GWC or far end GWC/GW about fax tone event or about autonomous switchover to T.38 mode.

H.323 generally supports method #2 for gatekeeper (GK) routed calls and method #3 for peer-to-peer calls. SIP GWs tend to support method #2 and #3.

To support fax interworking to H.323 GW, method #2 “Call Server controlled switchover to T.38 mode” is implemented on CS2K.

> ***Note:*** The peer-to-peer approach (#3) does not work for GK controlled calls and is therefore out of scope for this CS2K implementation.

58.2.3 VoIP Network Model

Figure 1 shows an example for T.38 fax data transmission over IP networks.

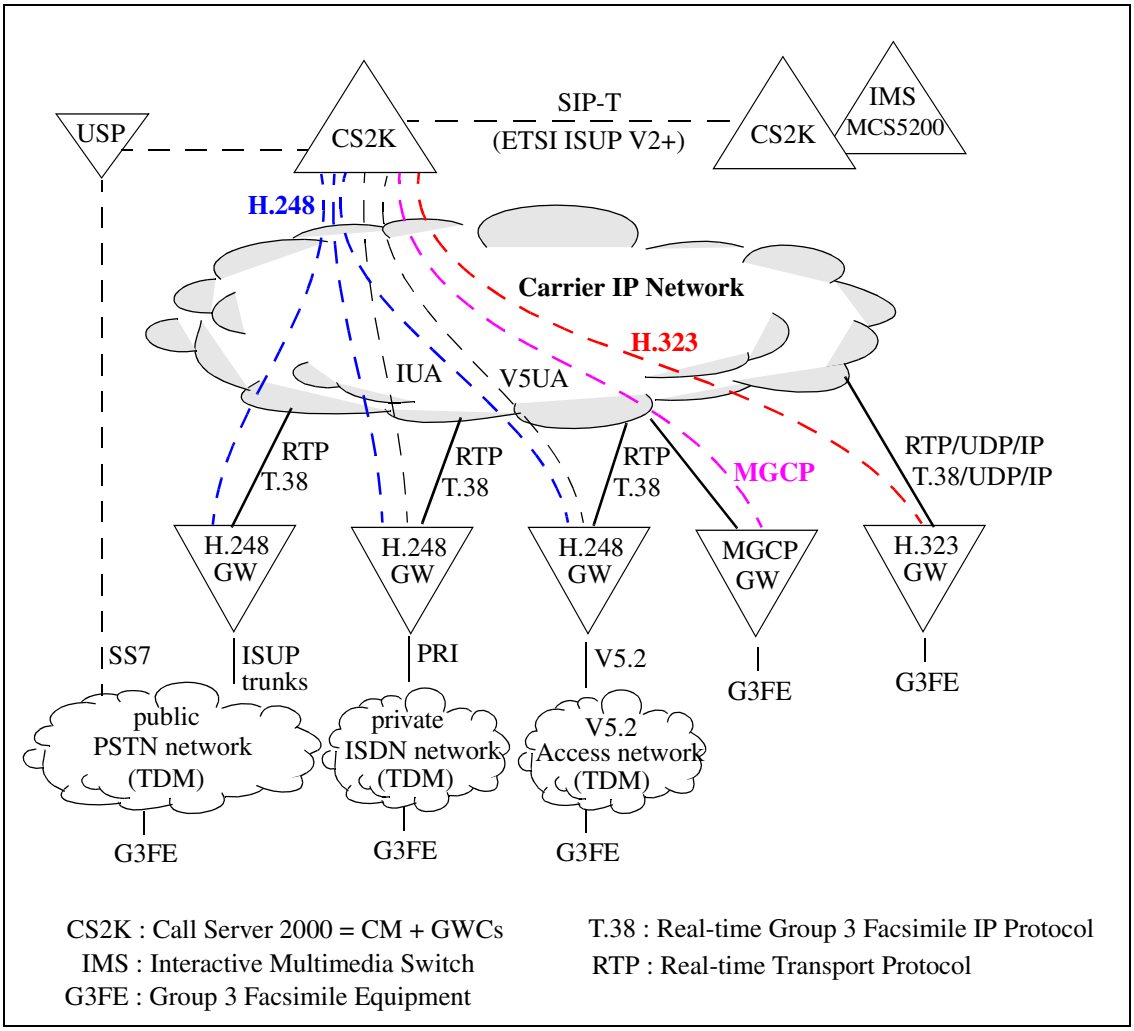
The H.323 GW is connected via H.323 protocol to the CS2K, which consist of H.225 protocol (Call control signaling) and H.245 protocol (Multimedia communication control). The G3FE devices are connected directly to the GW.

The H.248 GW supports voice trunking for public PSTN and private ISDN network. The GW is controlled via Media gateway control protocol H.248 from Call Server 2000 (CS2K). Call control signaling is relayed via IUA for ETSI PRI and via V5UA for V5.2 access between GW and CS2K.

The MGCP GW supports analog lines and is controlled by MGCP protocol only.

Media stream is transported via Real Time Protocol (RTP/UDP/IP) for voice calls and via Internet Facsimile Protocol (T.38/UDP/IP) for Group 3 fax calls.

Figure 1 Configuration example for facsimile transmission over IP networks



58.2.4 Applicable Standards

The ITU-T recommendations T.30 [1], T.38 [2] + [3], H.323 [4], T.225.0 [5], T.245 [6], H.248.1 [7], H.248.2 [8] applies for this feature They are listed in chapter 2.9 of this document with title and issue date.

58.2.5 H.323 Support for T.38 fax

Implementation of “Call Server controlled switchover to T.38 mode” is based on T.38 [2] Annex B, D and E, Draft Amendment to T.38 [3] Annex E and H.323 [4] Annex D.

The H.323 GWC requests the remote H.248 or MGCP side to detect fax tone and to notify the H.323 GWC about a fax event.

Upon receipt of fax event notification from remote H.248 or MGCP side, the H.323 GWC controls switching to T.38 mode. The logical voice channel is cleared and a T.38 fax channel is opened. The SDP(T.38) data is sent to the remote side, which is invited to switch over to T.38.

A remote H.248 or MGCP GW may send a SDP indicating simultaneous support of voice media stream via “m=audio ..” and T.38 media stream via “m=image ...” line. The “m=image 1 udptl t38” line in SDP means that T.38 codec is supported and “autonomous switchover to T.38” might be used lateron - see [3] Annex E.2.2.

> ***Note:*** A SDP coding sample for simultaneous voice and T.38 support is given in Figure 10, on page 1240 .

A H.323 GW which does not support voice media stream and T.38 media stream at the same time, removes/rejects the “m=image 1 udptl t38” line. This means that “autonomous switchover to T.38” is not used for this call.

> ***Note:*** To switch successfully to T.38, each side should know the T.38 capability of the other side. A GW indicates T.38 capability, by including a “a=cdsc: 1 image udptl t38” line in SDP. This means that “Call Server controlled switchover to T.38” is supported and might be used lateron.

58.2.6 H.248 Support for T.38 fax

Implementation of “Call Server controlled switchover to T.38 mode”, makes use of “Call Type Discriminator package” (ctyp) with event “Discriminating Tone detected” (dtone). See H.248.2 [8], chapter 7.

The GWC checks the GW capability to support T.38 via H.248 AuditValue command. If the H.248 GW replies with H.248 package “ctyp-1”, then “Call Server controlled switchover to T.38 mode” is supported - see Figure 2, on page 1236 .

> ***Note:*** If Netopt = “T.38”, the H.248 GWC add the ephemeral termination with voice and T.38 codec - see Figure 5, on page 1236 .

The H.248 GW does not switch over to T.38, before the remote SDP is received.

- If the remote SDP contains T.38 codec (m=image 1 udptl t38), then “autonomaous switchover to T.38” applies.
- If the remote SDP indicates T.38 capability (a=cdsc: 1 image udptl t38), then “Call Server controlled switchover to T.38 mode” applies.

The H.248 coding examples below display H.248 message as used in the call flow examples in chapter 58.2.10.

	m=image 2222 udptl t38
	a=T38Fax ...
	a=T38Fax...
	...
	}}}}}

Note 1: The ephemeral termination is added with T.38 codec, to support “autonomous switchover to T.38” for e.g. PVG to PVG calls. At this point the remote GW type is unknown. If the remote side is H.323, then the T.38 codec is removed by the H.323 GW (codec negotiation). Note 2: This example shows 2 media lines in one session descriptor, as implemented in ISN06.2. This example will be updated at end of this feature to display real used SDP syntax.	

58.2.7 MGCP Support for T.38 fax

Implementation of “Call Server controlled switchover to T.38 mode”, makes use of Fax tone (ft) defined in the Generic Media Package (G). See Basic MGCP Packages [9], chapter 2.1.

The MGCP GW does not switch over to T.38, before the remote SDP is received.

- If the remote SDP contains T.38 codec (m=image 1 udptl t38), then “autonomaous switchover to T.38” applies.
- If the remote SDP indicates T.38 capability (a=cdsc: 1 image udptl t38), then “Call Server controlled switchover to T.38 mode” applies.

  Note: According [9], the MGCP GW detect a fax call by detecting the V.21 fax preamble. The fax tone event SHOULD also be generated when the T.30 CNG tone is detected

58.2.8 SIP-T Support for T.38 fax

SIP-T/SDP support for T.38 fax call is implemented according ITU T.38 [2] Annex D, Draft Amendment to T.38 [3] Annex E and IETF SIP Support for Real-time Fax[13].

T.38 fax interworking is supported over SIP-T. Support via native SIP is not covered by this activity.

58.2.8.1 Fax call CS2K to CS2K

This feature provides and verifies T.38 fax calls for H.323 GW interworking to H.323 GWs, H.248 GWs and MGCP GWs over SIP-T (ETSI ISUP V2+).

The SIP messages SUBSCRIBE and NOTIFY are used, which are defined in IETF RFC 3265 [11].

- With SUBSCRIBE(reqFaxDet), the H.323 GWC requests the remote side to detect fax event and to notify the H.323 side about a fax event.
- With NOTIFY(FaxDet), the H.248 or MGCP GWC notifies the event “fax call detected” to the remote H.323 side.

The content of both messages is proprietary and is needed on interworking between H.323 GWs with H.248 or MGCP GWs. The coding is specified in chapter 58.2.8.3.

58.2.8.2 Fax call CS2K to other Call Server

Prerequisite: The other Call Server with connected GW must support the functionality chapter 58.2.8.4. Additionally option 1 or option 2 below must be supported:

Option 1: The SIP SUBSCRIBE(reqFaxDet) and SIP NOTIFY(FaxDet) message are supported and processed as defined in chapter 58.2.8.1.

Option 2: The SIP SUBSCRIBE(reqFaxDet) and SIP NOTIFY(FaxDet) message are not supported. In this case the other Call Server must support:

- Autonomous fax event detection.
- Upon detection of fax, a Re-INVITE (T.38) message is sent to the far end.
- Receipt of SUBSCRIBE(reqFaxDet) message is ignored or rejected.

Feature ... tbd ... verifies Fax interworking between H.323 GWs connected to CS2K and a SIP-GW connected to MCS 5200 over SIP-T. No design work is planned to support T.38 interworking with other Call Servers.

58.2.8.3 Coding of SIP-T messages SUBSCRIBE and NOTIFY

Figure 6 Sample message SUBSCRIBE

```
SUBSCRIBE sip:bob@biloxi.com SIP/2.0

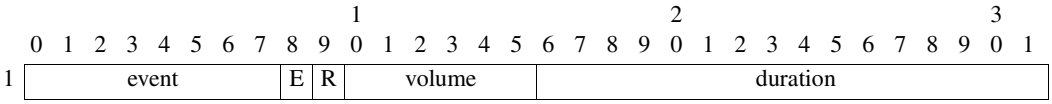
< four octets in network order, as coded in Figure 8 >
```

Figure 8 Coding of RFC 2833 Payload Format



With event = 32, E = 0, R = 0, volume = 0, duration = 0

58.2.8.4 Coding of Session Description Protocol (SDP)

To switch successfully from G.729/G.711 codec to T.38 codec (or from G.729 to G.711) the codec capability of the remote GW side must be well-known. To indicate T.38 or G.711 capability to the remote GW, the capability declaration mechanism of RFC 3047 [12] is used.

T.38 capability is indicated to the remote GW with “a=cdsc: 1 image udptl t38“ line in SDP data as shown in Figure 9.

With “a=cpar: a=T38 ..” additional T.38 parameters are defined, which applies in ISN07 release.

G.729 and G.711 capability is indicated to the remote GW with “a=cdsc: 2 audio RTP/AVP 18 8“ line in SDP data.

Figure 9 T.38 parameter in capability description

v=0
c=IN IP4 128.96.41.1
a=sqn: 0
a=cdsc: 1 image udptl t38 - indicates T.38 capability
a=cpar: a=T38FaxVersion: 1
a=cpar: a=T38FaxMaxBuffer:3341
a=cpar: a=T38FaxMaxDatagram:333
a=cpar: a=T38FaxMaxBitRate: 10000
m=audio 1111 RTP/AVP 18
a=ptime:20
a=cdsc: 2 audio RTP/AVP 18 8 - indicates G.729 and G.711 capability
a=cpar: a=ptime:20

Note: For clarity, T.38 parameters are omitted in the subsequent figures.

Figure 10 to Figure 14 show SDP coding examples for interworking H.248 to H.323.

Note: SDP coding for H.248 side applies also for non-H.323 e.g. MGCP.

Figure 10 and Figure 11 show SDP coding examples for interworking H.248 GW supporting “autonomous switching to T.38” and H.323 GW supporting “Call Server controlled T.38 switching”. Fast start (FS) applies on H.323 side.

Figure 10 SDP sample for H.248 -> H.323 (FS) interworking over SIP-T

H.248 -> H.323: INVITE (SDP)	**H.248 <- H.323: 200 OK (SDP)**
v=0 c=IN IP4 128.96.41.1 m=audio 1111 RTP/AVP 18 (Note 1) a=ptime:20 m=image 1112 udptl t38 (Note 2)	v=0 c=IN IP4 ... a=sqn: 0 a=cdsc: 1 image udptl t38 (Note 3) m=audio 2222 RTP/AVP 18 (Note 1) a=ptime:20 ~~m=image 0 udptl t38~~ (Note 4)

Note 1: Both sides supports G.729 codec. The voice call is set up with G.729 codec. Note 2: Originating H.248 side commits simultaneous support for T.38 and indicates usage of “autonomous T.38 switching”. Note 3: Terminating H.323 side indicates T.38 capability (not simultaneous to G.729). Note 4: Terminating H.323 does not support “autonomous T.38 switching”. Current ISN07 implementation does not sent “m=image 0 udptl t38” back. Omitting “m=image ...” indicates, that “autonomous T.38 switching” is not supported by terminating side. Note 5: Upon detection of fax call, “Call Server controlled T.38 switching” takes place.

Figure 11 SDP sample for H.323 (FS) -> H.248 interworking over SIP-T

H.323 -> H.248: INVITE (SDP)	**H.323 <- H.248: 200 OK (SDP)**

Note 1: Both sides indicates T.38 capability. Note 2: Both sides supports G.729 codec. The voice call is set up with G.729 codec. Note 3: Upon detection of fax call, “Call Server controlled T.38 switching” takes place.	

Figure 12 and Figure 13 show SDP coding example for interworking H.248 GW supporting “autonomous switching to T.38” and H.323 GW supporting “Call Server controlled T.38 switching”. Slow start (SS) applies on H.323 side.

Figure 12 SDP sample for H.248 -> H.323 (SS) interworking over SIP-T

H.248 -> H.323: INVITE (SDP)	**H.248 <- H.323: Ringing (SDP)**
v=0 c=IN IP4 128.96.41.1 m=audio 1111 RTP/AVP 18 (Note 1) a=ptime:20 m=image 1112 udptl t38 (Note 2)	v=0 c=IN IP4 ... a=sqn: 0 a=cdsc: 1 image udptl t38 (Note 3) m=audio 2222 RTP/AVP 18 (Note 1) a=ptime:20 ~~m=image 0 udptl t38~~ (Note 4)
H.248 -> H.323: ACK - 200 OK (SDP)	
v=0 c=IN IP4 ... a=sqn: 0 a=cdsc: 1 image udptl t38 (Note 5) m=audio 1111 RTP/AVP 18 (Note 1) a=ptime:20	

Note 1: Both sides supports G.729 codec. The voice call is set up with G.729 codec. Note 2: Originating H.248 side commits simultaneous support for T.38 and indicates usage of “autonomous T.38 switching”. Note 3: Terminating H.323 side indicates T.38 capability. Note 4: Terminating H.323 does not support “autonomous T.38 switching”. Current ISN07 implementation does not sent “m=image 0 udptl t38” back. Omitting “m=image ...” indicates, that “autonomous T.38 switching” is not supported by terminating side. Note 5: Originating H.248 side indicates T.38 capability. Note 5: Upon detection of fax call, “Call Server controlled T.38 switching” takes place.

Figure 13 SDP sample for H.323 (SS) -> H.248 interworking over SIP-T

H.323 -> H.248: INVITE (SDP = empty)	**H.323 <- H.248: RINGING (SDP)**
H.323 -> H.248: ACK (SDP)	v=0 c=IN IP4 ... a=sqn: 0 a=cdsc: 1 image udptl t38 (Note 1) m=audio 2222 RTP/AVP 18 (Note 2) a=ptime:20
v=0 c=IN IP4 ... a=sqn: 0 a=cdsc: 1 image udptl t38 (Note 1) m=audio 1111 RTP/AVP 18 (Note 2) a=ptime:20	
Note 1: Both sides indicates T.38 capability. Note 2: Both sides supports G.729 codec. The voice call is set up with G.729 codec. Note 3: Upon detection of fax call, “Call Server controlled T.38 switching” takes place.	

Figure 14 show SDP coding example for interworking H.248 GW supporting G.729 and G.711 codec with H.323 GW supporting G.729, G.711 and T.38 codec. Fast start (FS) applies on H.323 side.

Figure 14 SDP sample for H.248 -> H.323 (FS) interworking over SIP-T

H.248 -> H.323: INVITE (SDP)	**H.248 <- H.323: 200 OK (SDP)**
v=0 c=IN IP4 128.96.41.1 m=audio 1111 RTP/AVP 18 8 (Note 1, 2) a=ptime:20	v=0 c= IN IP4 ... a=sqn: 0 a=cdsc: 1 image udptl t38 (Note 3) m=audio 2222 RTP/AVP 18 (Note 1) a=ptime:20 a=cdsc: 2 audio RTP/AVP 18 8 (Note 4) a=cpar: a=ptime:20
Note 1: Both sides supports G.729 codec. The voice call is set up with G.729 codec. Note 2: Originating H.248 side supports additionally codec G.711 a-law. Note 3: Terminating H.323 side indicates T.38 capability.	

Note 4: Terminating H.248 side indicates additionally G.729, G.711 a-law capability
Note 5: Upon detection of fax call, “Call Server controlled G.729 -> G.711 switching” takes place, because originating side does not indicate/support T.38 capability.

58.2.9 Interworking

This feature supports “Call Server controlled switchover to T.38 (or to G.711)” for **nodal calls** and for **inter-Call Server calls** over SIP-T (ETSI ISUP V2+) when the originating or terminating agent is H.323.

This feature provides Call Server controlled switchover to T.38 (or G.711) codec depending on T.38 network option:

- If **Netopt is set to “T.38”** and both GW support T.38, then upon fax detection, switchover is done from G.729 (or G.711) to T.38 codec.
- If **Netopt is not set to “T.38”**, or a GW does not support T.38, then switchover to T.38 does not apply. If the call was set up with G.729 codec, switching is done from G.729 to G.711 codec. If the call was set up with G.711, no switchover occurs.

Table 1 Supported fax interworkings for nodal calls and for inter-Call Server calls via SIP-T

<table>
<tr><th>Terminating side:

Originating side:</th><th>H.323</th><th>H.248</th><th>MGCP</th><th>SIP-T</th></tr>
<tr><td>H.323</td><td>✓</td><td>✓</td><td>✓</td><td>✓</td></tr>
<tr><td>H.248</td><td>✓</td><td colspan="2" rowspan="2">Out of scope
for this activity
Note 3</td><td rowspan="2">✓
Note 2</td></tr>
<tr><td>MGCP</td><td>✓</td></tr>
<tr><td>SIP-T</td><td>✓</td><td colspan="2">✓
Note 1</td><td>Out of scope
for this activity</td></tr>
</table>

Note 1: Provided, if the originating side sends SUBSCRIBE(reqFaxDet) and processes NOTIFY(FaxDet) as defined in chapter 58.2.8.

Note 2: Provided, if the terminating side sends SUBSCRIBE(reqFaxDet) and processes NOTIFY(FaxDet) as defined in chapter 58.2.8.

Note 3: Calls where only H.248 GWs or MGCP GWs are involved, are out of scope for this feature. “Autonomous switching to T.38 (or to G.711)” may apply for these calls.

T.38 fax interworking to H.323 is provided for currently available protocol agents on H.248 GW: ETSI ISUP, ETSI PRI and ETSI V5.2.

In case of CS2K Hybrid, the interworking between TDM platform and IP platform is provided via ISUP-looparound.

58.2.10 Call Flows

Description of T.38 functionality is provided via annotated call flows. The description of the first call flow is given in detail and may be applied to other subsequent call flows.

> ***Note:*** Focus of the call flows is to show "Call Server controlled switchover to T.38 mode". Call control messages (e.g. H.225, IUA, SIP) and Media control messages (e.g. H.245, H.248, MGCP) are not complete. Furtheron TCS-Ack messages have been omitted for clarity.

Mapping between H.248 or H.323 messages and SIP-T messages can be obtained from the call flows. Coding of SIP-T messages SUBSCRIBE and NOTIFY is specified in chapter 58.2.8.3. Coding of SDP content is specified in chapter 58.2.8.4.

In the case that the originating and terminating GW are located on the same Call Server, the SIP-T part is not applicable and shall be neglected.

T.38 fax call flows are presented for:

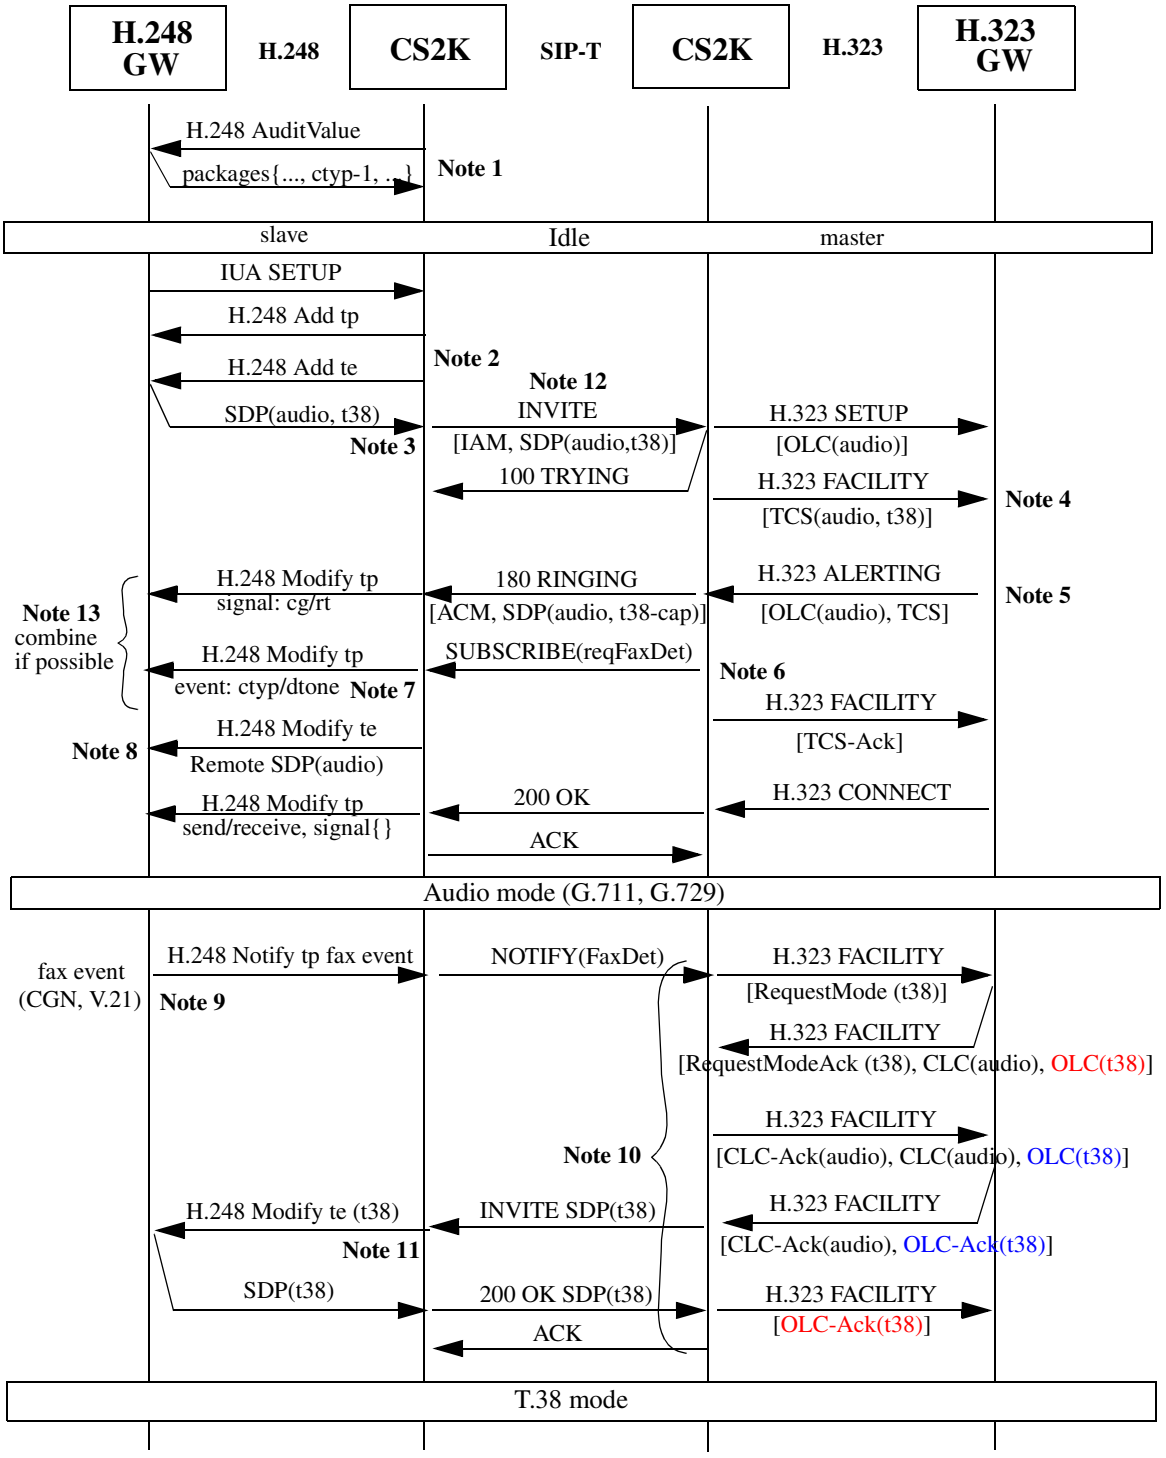
- fast start: H.248(FS) -> H.323(FS) - see chapter 58.2.10.1
- fast start: H.323(FS) -> H.248 (FS) - see chapter 58.2.10.2
- fast start: H.323(FS) -> H.323(FS) - see chapter 58.2.10.3
- slow start: H.248(FS) -> H.323(SS) - see chapter 58.2.10.4
- slow start: H.323(SS) -> H.248(FS) - see chapter 58.2.10.5

58.2.10.1 Call flow for H.248 to H.323 interworking (fast start)

Figure 15 displays a sample messaging of a successful fax call between PRI (H.248 controlled) and H.323. First a voice call is established. After a fax call was detected, "Call Server controlled switchover to T.38" occurs.

Selection: Fast start applies - the H.248 side is "slave", the H.323 side is "master". Both sides support "Call Server controlled switchover to T.38" and Netopt is set to "T.38"

Figure 15 Sample flow for H.248 to H.323 interworking



Note 1: The H.248 GWC checks GW T.38 capability via H.248 AuditValue command at GW registration. If GW replies to the AuditValue request with H.248.2 fax package “ctyp-1”, then “Call Server controlled switchover to T.38 mode” is supported by the H.248 GW.

Coding sample of H.248 AuditValue is shown in Figure 2, on page 1236

Note 2: After adding the physical TDM termination (Add tp), the ephemeral termination (te) is added for a voice call (e.g. G.711 or G.729 codec). If the Network Option is set to “T.38”, the GWC request “T.38 mode”, by including T.38 codec in Add te request command.

Note 3: The H.248 GW replies with local Session Description Protocol (SDP) containing the preferred voice codec and optional with T.38 codec.

Coding sample of H.248 Add te is shown in Figure 5, on page 1236

Note 4: The H.323 GWC sends a Terminal Capability Set (TCS) message to the H.323 GW, to indicate that “CS controlled switchover to T.38” is supported by the remote side.

Note 5: The H.323 GW supporting “CS controlled switchover to T.38” responds with the preferred audio codec and indicates T.38 capability.

SDP coding samples are available in section “58.2.8.4 Coding of Session Description Protocol (SDP)” on page 1239

Note 6: The H.323 GWC checks “CS controlled switchover to T.38” capability via H.323 GW profile. If supported, the remote H.248 side is requested to detect fax call.

Note 7: If H.248 GW supports “CS controlled switchover to T.38” i.e. AuditValue Reply included “ctyp-1” package, fax event detection (CNG tone, V.21 Preamble) is requested on the physical termination.

Coding sample of H.248 Modify tp event=ctyp/dtone is shown in Figure 3, on page 1236

Note 8: The ephemeral termination is modified with the remote SDP. If the remote SDP indicates T.38 capability via “a=cdsc: 1 image udptl t38”, then “CS controlled switchover to T.38” applies for this call. The H.248 GW does not switch over autonomously to T.38 or G.711.

Note 9: Upon detection of “fax call”, the H.248 GW notifies the H.248 GWC. The Notification is transferred to the remote H.323 GWC/GW side.

Coding sample of H.248 Notify tp fax call is shown in Figure 4, on page 1236

Note 10: Upon receipt of Notify fax detection, the H.323 GWC sends RequestMode (T.38) to the H.323 GW. The H.323 GWC handles the H.323 CLC and OLC messaging locally. Switchover to T.38 mode is always invoked by the H.323 GWC. The remote side is requested to switch over to T.38 by exchanging SDP(T.38) data.

Note 11: Upon receipt of SDP(T.38) data, a H.248 Modify command is sent, which request the ephemeral termination to switch over to T.38.

Note 12: The content of SDP uses following abbreviation:

— SDP(audio) for processing of audio media stream.

— SDP(t38) for processing of t38 media stream.

— SDP(audio, t38) for simultaneous processing of audio and t38 media streams.

— SDP(audio, t38-cap) for processing of audio media stream and for t38 capability indication.

Note 13: To reduce H.248 messaging, the “H.248 request detect fax tone” shall be sent within other available H.248 messages, if possible:

— combination of “Modify event = ctyp/dtone” and “Modify signal cg/rt” is possible, if ALERTING and SUBSCRIBE messages are sent coincidently.

— combination of “Add tp” and “Modify event = ctyp/dtone” is possible, if the H.248 GW is the terminator and runs in “master mode”.

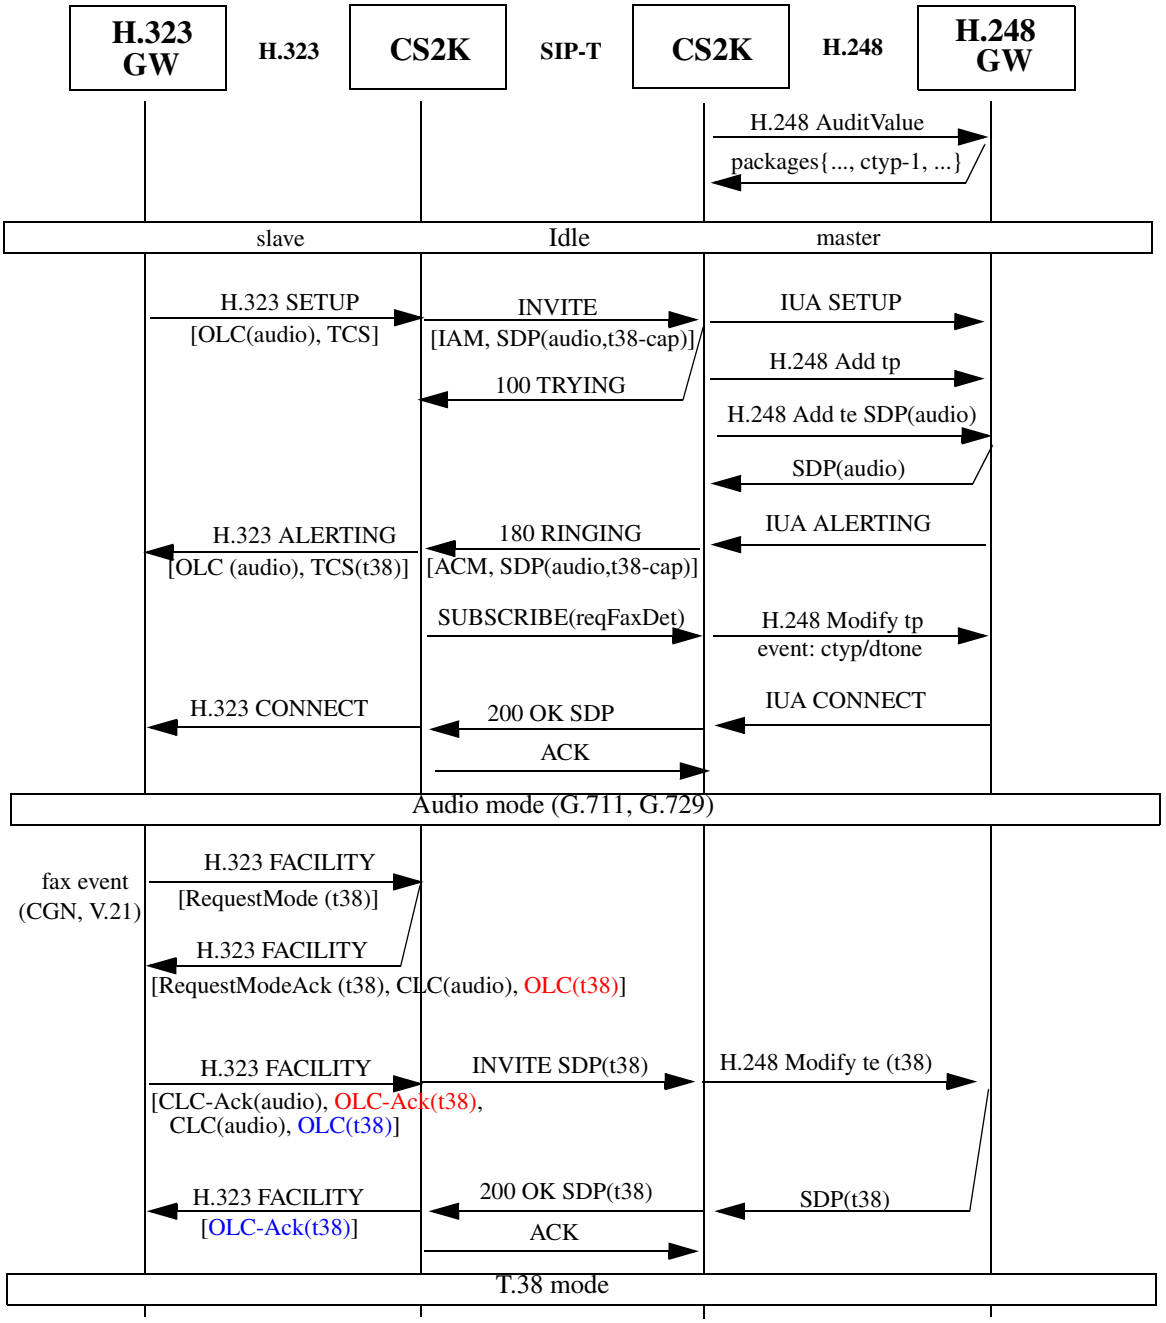
The “event = ctyp/dtone” is only requested, if the remote side is H.323, which request fax detection. On H.248 to H.248 interworking or H.248 to MGCP interworking, fax detection event is not requested.

58.2.10.2 Call flow for H.323 to H.248 interworking (fast start)

Figure 16 displays a sample messaging of a successful fax call between H.323 and PRI (H.248 controlled). First a voice call is established. Upon detection of fax call by originating H.323 side, “Call Server controlled switchover to T.38” applies.

Selection: Fast start applies - the H.323 side is “slave”, the H.248 side is “master”. Both sides supports “Call Server controlled switchover to T.38” and Netopt is set to “T.38”

Figure 16 Sample flow for H.323 to H.248 interworking

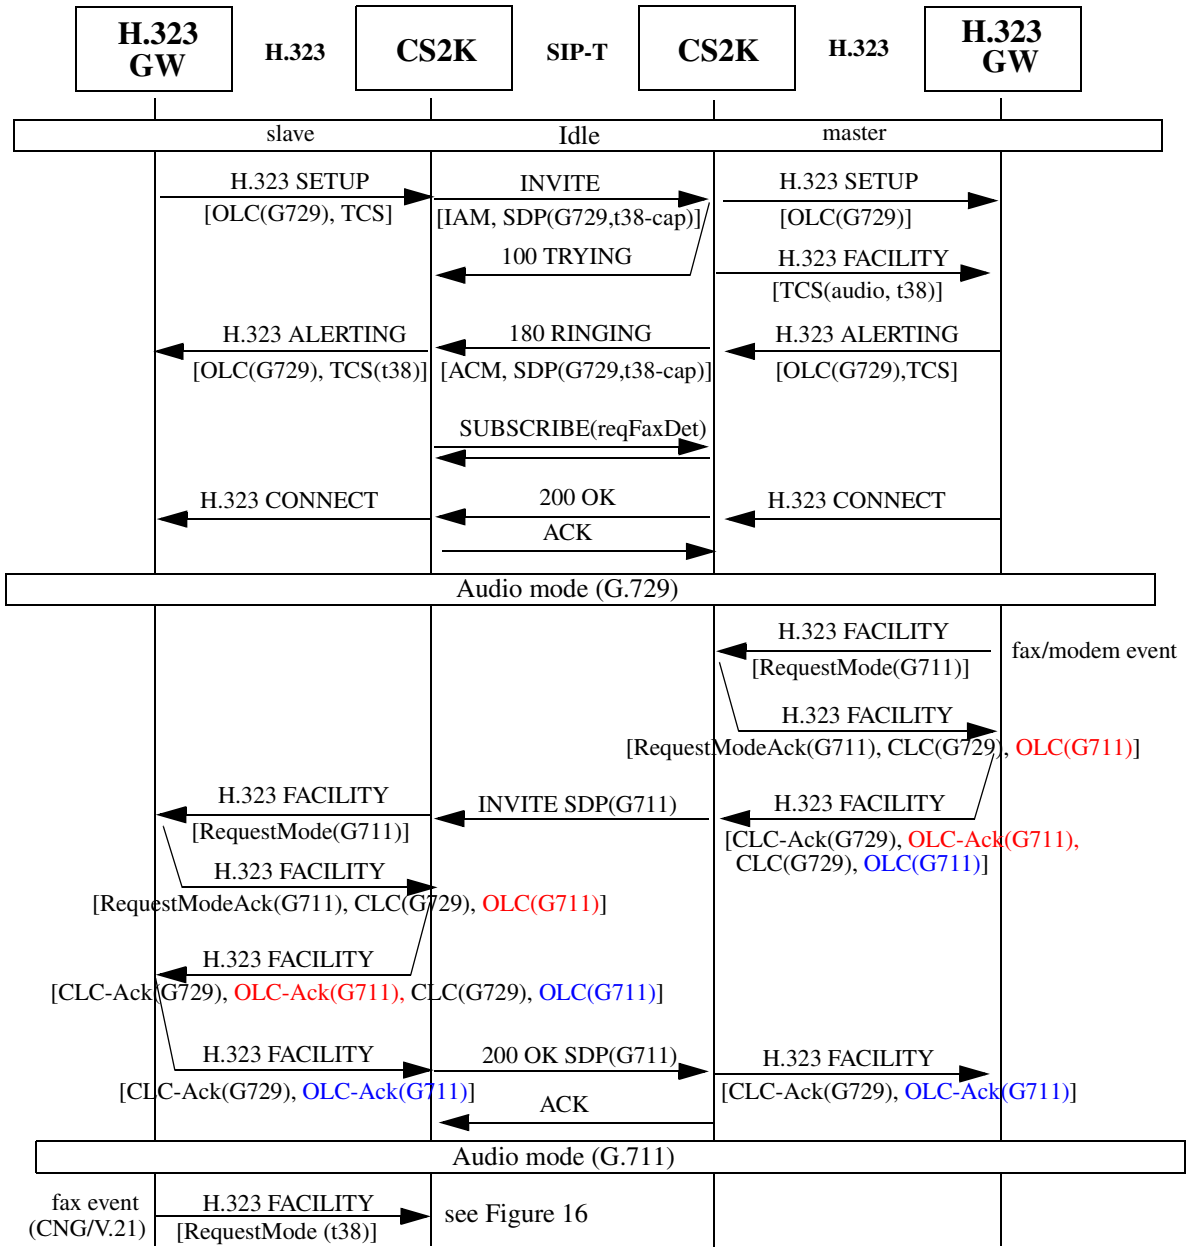


58.2.10.3 Call flow for H.323 to H.323 interworking (fast start)

Figure 17 displays a sample messaging for “Call Server controlled switchover to G.711” between two H.323 GWs, First a voice call with G.729 codec is established. Upon detection of CED tone, switching to G.711 codec is

requested by the terminating side in this example. Upon detection of CNG or V.21 preamble a further switching to T.38 codec may take place as displayed in previous Figure 16.

Figure 17 Sample flow for H.323 to H.323 interworking

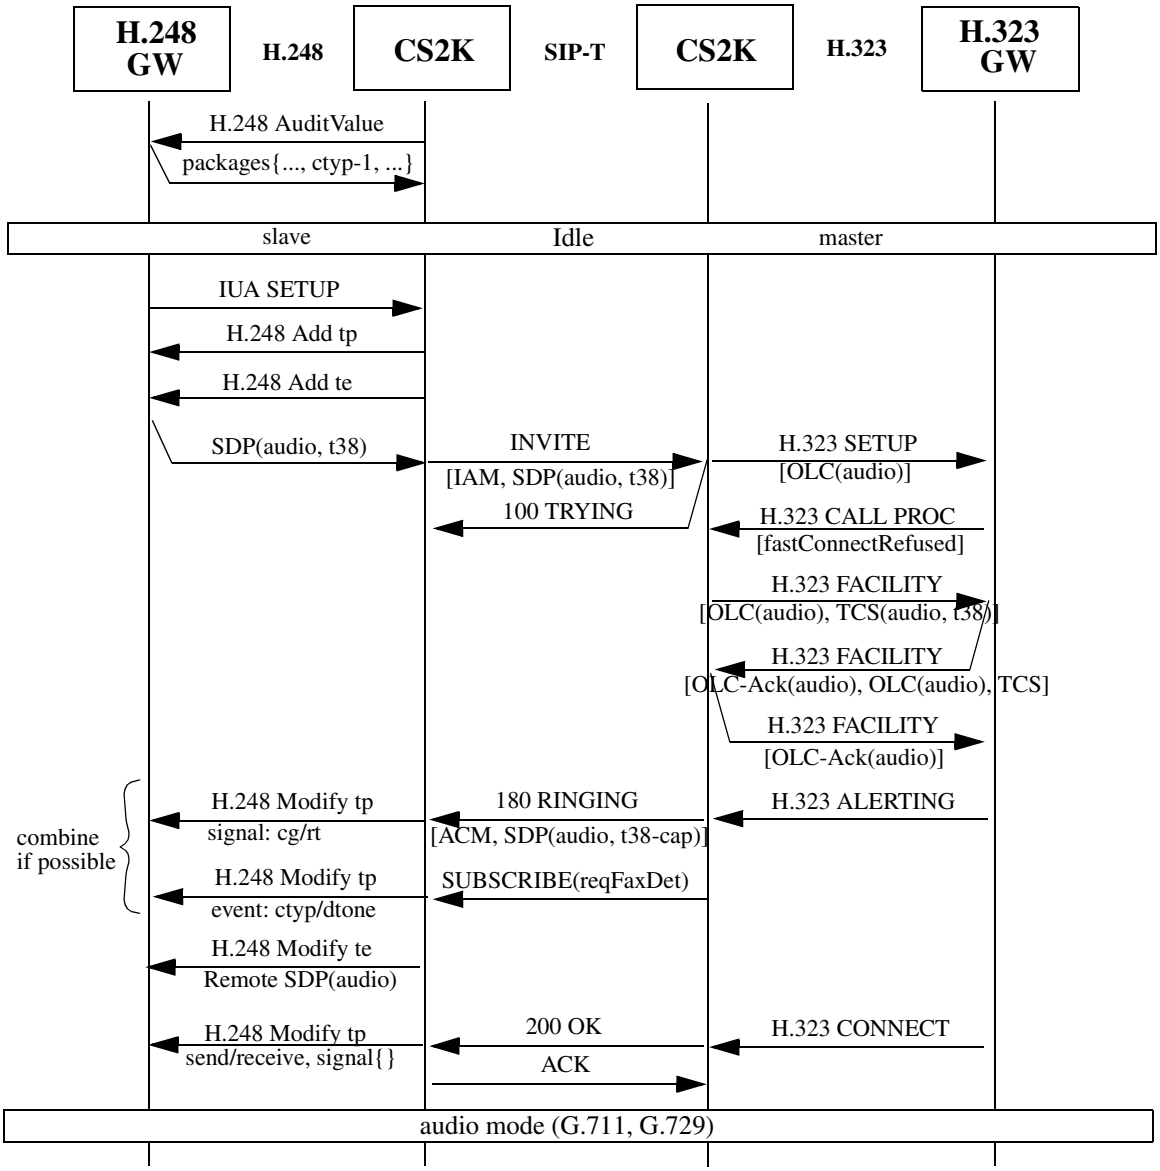


58.2.10.4 Call flow for H.248 to H.323 interworking (slow start)

Figure 18 displays a sample messaging of a voice call establishment between PRI (H.248 controlled) and H.323. In case of a fax event, the same sequence applies as displayed in Figure 15 or Figure 16.

Selection: Originating side (H.248) starts with fast connect, the terminating side (H.323) rejects fast connect. The H.323 side is “master”, the H.248 side is “slave”. Netopt is set to “T.38”

Figure 18 Sample flow for H.248 (FS) to H.323 (SS) interworking

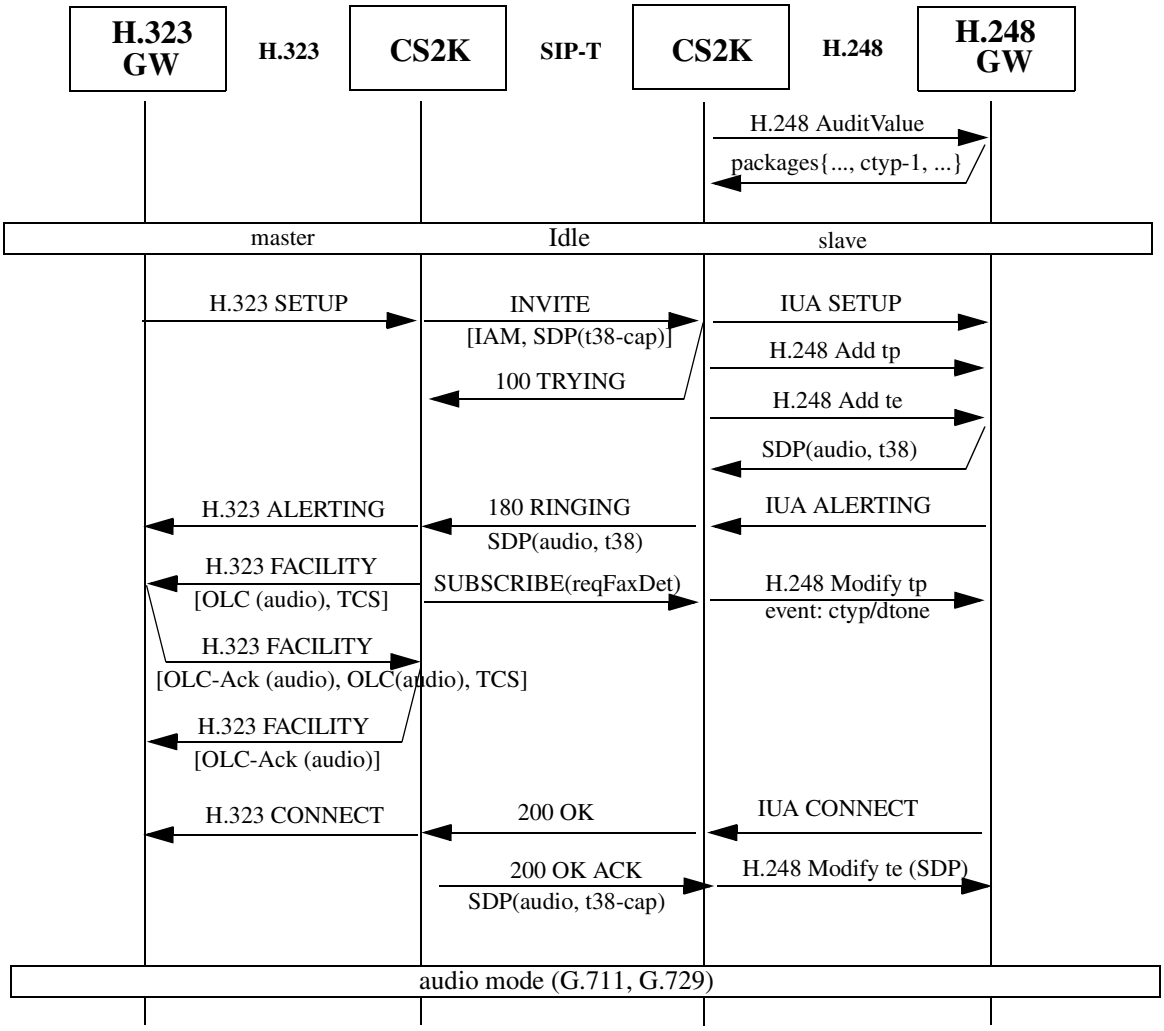


58.2.10.5 Call flow for H.323 to H.248 interworking (slow start)

Figure 18 displays a sample messaging of a voice call establishment between H.323 and PRI (H.248 controlled). Provisions are made to detect a fax call. In case of a fax event, the same sequence applies as displayed in Figure 15 or Figure 16.

Selection: Originating side (H.323) uses slow start. The H.323 side is “master”, the H.248 side is “slave”. Netopt is set to “T.38”

Figure 19 Sample flow for H.323 (SS) to H.248 interworking



58.2.11 G3FE operation modes

This feature supports fax operation modes specified in ITU-T T.30 [1]. The originating side can invoke a fax call manually or automatically. Same happens on terminating side, call acceptance can be manually or automatically.

Detection of a fax call and subsequent “Call Server controlled switchover to T.38 mode” is complicated by the following facts:

- Sending Calling tone (CNG tone) is mandatory for calling fax devices. However manual calling terminals conforming to 1993 or previous T.30 versions may not transmit this signal.
- Called terminal identification answer tone (CED tone) is mandatory for called fax devices using automatic mode. For manual operation mode the sending of CED is optional.
- Upon receipt of CED tone, it is not clear whether a fax call or a modem call will be established. Because of the time-critical nature of a modem call, it is recommended to switch from G.729 codec to G.711 codec. If a fax call is determined by detection of CGN tone or V.21 preamble, an additional switch to T.38 may occur.
- V.21 Preamble is sent by all G3FE devices except fax devices which use V.8 or V.34 operation mode. These devices may send CNG tone.
- Upon receipt of V.21 Preamble flag, the switchover to T.38 must occur quickly (within ca. 2 sec), otherwise the fax call will fail.

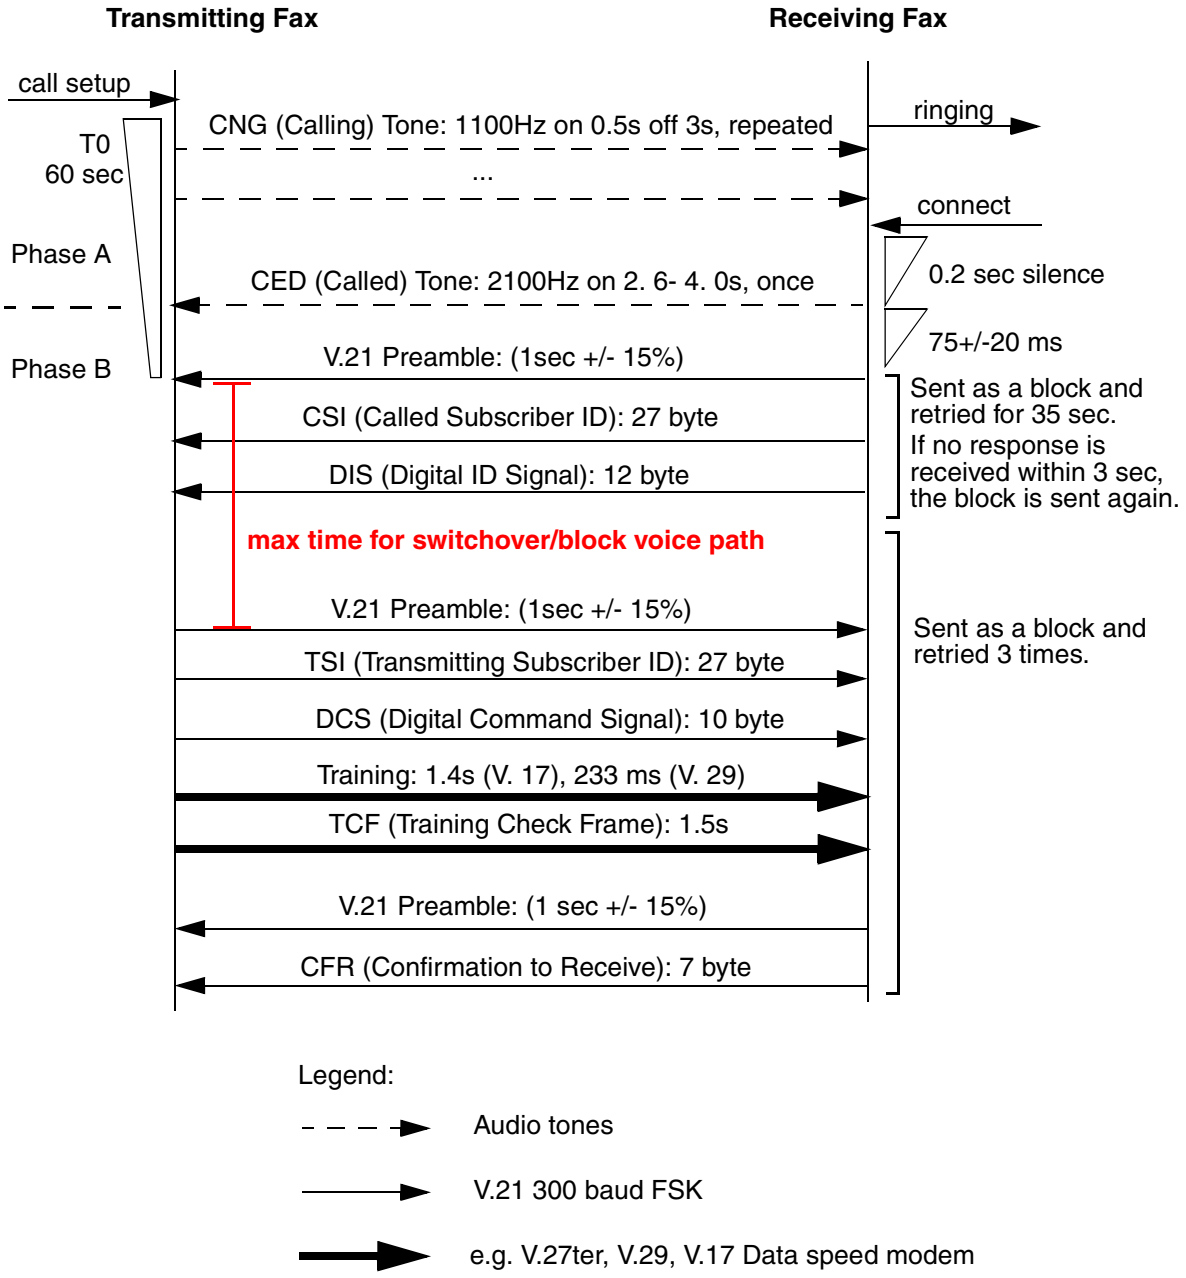
Note 1: A GW may identify a fax call by monitoring the physical termination (TDM bearer channel) for CNG tone and V.21 Preamble flags.

Note 2: Fax calls, without CNG tone and V.21 Preamble, will not be recognized by the GW.

Note 3: H.323 GWs seem to detect a fax call with CED and V.21 Preamble.

Figure 20 display an example of a T.30 fax call establishment. If switchover to T.38 mode is triggered by V.21 Preamble, the switchover must occur before Digital Command Signal (DCS) is transmitted. To prevent the exchange of DIS/DCS during switchover phase, the voice path should be blocked. If no DCS is received on terminating side, V.21/CSI/DIS is sent again after 3 sec.

Figure 20 Establishment of T.30 Fax call (automatic operation example)



58.3 Hardware Requirements or Dependencies

New hardware is not required.

58.4 Software Requirements or Dependencies

- CM/GWC: ISN07 load
- H.248 GW - supporting H.248.1, H.248.2 ctyp package, T.38 mode.
- H.323 GW - supporting H.323, H.225, H.245 protocol, T.38 mode
- MGCP GW - supporting Generic media package/fax tone (G/ft), T.38 mode

58.5 Limitations and restrictions

- T.38 fax interworking to non-Nortel Call Servers are out of scope for this feature and will not be tested. **(Note 1)**

  Note 1: Interworking to non-Nortel Call Servers may work, if the non-Nortel Call Server supports the prerequisites as defined in chapter 58.2.8.2.
- T.38 fax interworking is supported over SIP-T (ETSI ISUP V2+). Native SIP support for T.38 fax interworking is not covered by this feature.
- T.38 fax interworking with MCS 5200 (IMS) is not tested by this feature. It is tested by feature ... tbd.
- This feature verifies T.38 fax interworking for H.323 GW on one call leg and H.323 GW or H.248 GW or MGCP GW on the other call leg. Feature verification is done for:
  - H.323 GW: Succession1000M
  - H.323 GW: BCM
  - H.323 GW: Cisco IOS gateway 2600 **(Note 2)**
  - H.248 GW: PVG Passport 15k with VSP3 cards
  - MGCP GW: Mediatrix

  Note 2: This should also cover support for Cisco IOS gateway 36xx, although it isn't explicitly tested by this feature.

  T.38 interworking with other GWs are out of scope and will not be tested within this feature.
  - Testing Westell and SBC interoperability is tested by feature ... tbd.
- Interworking to Group 4 fax, Modem and Data Transmissions are out of scope for this feature.
- "Facsimile-only over IP environment" (T.38 Annex D.2.2.3) is out of scope for this feature. This feature addresses "Facsimile and voice over IP environment" (T.38 Annex D.2.2.4) in which first a voice call is established and then switchover to T.38 mode occurs.

- This feature does not support switching back to voice codec, when a fax call has ended.
- This feature uses the transport layer UDP/IP for T.38 packets (T.38 Annex D.2.3.2). Transport of T.38 packets via TCP/IP is not used by this feature.
- The optional transport of T.38 packets via one bidirectional reliable channel is not used. Instead two logical channels are used. (T.38 Annex B.3.3, D.2.3.2)
- Testing is done on the international CS2K load only. Testing for NA load is captured by feature .... tbd.
- Testing T.38 fax interworking to MCS 5200 is not part of this feature, is captured by feature ... tbd.
- T.38 fax interworking to Cable MTAs is out of scope for this feature.
- *Due to the DSP implementation on the BCM, currently BCM calls are not supported over a Media Portal (MP). BCM calls are only supported in the same network segment. A solution is currently estimated for the BCM 3.7 load which is post SN07 content which involves changes to the BCM software implementation.*
  The deployment of the T.38 functionality is currently only possible with the S1KM/S1K, if used behind a NAT / Firewall.
- *BCM and S1KM will not request G.711, if the codec is G.729 and a fax is detected, but T.38 is unavailable. Therefore no support for G.729 to G.711 switchover is possible between two H.323 GWs. Solution planned for post SN07 GW loads.*
- *Currently the only supported H.323 GWs are BCM and S1KM. Westell, Cisco and Mediatrix are not included in the IT content and will be tested in the ICAF A00005122 which is currently post SN07 content.*
- *The FN will be updated upon completion of A00005122 including the final restrictions for SN07.*

59: Functional Description (FN): A00003686

59.1 Feature name

Re-Routing Based on Release Cause Value.

59.2 Description

This feature provides re-routing of a call, when the release message (before ACM message) with ISUP cause value is received for terminating ETSI ISUP V1 and V2 agent (Base ETSI ISUP V1 and V2) and Belgian ISUP agent on a trunk route.

The activity provides re-routing on ETSI ISUP trunks for pre-datafilled release causes.

In current system ISUP Re-Routing on Congestion Cause value (No Circuit Available(34) or Switching Equipment Congestion(42)) is provided by Feature A59013395 called ISUP Re-routing on Congestion MMP13. It supports re-routing when congestion takes place for calls terminating to ETSI ISUP.

In current system, re-routing criteria depends on:

- CND NRR selector in the routing tuple
- Rel message received with congestion cause value

For this activity, Re-routing criteria will depend on:

- presence of CND NRR selector in routing tuple
- Rel message (before ACM message) received with ISUP cause value for which RTEADV field in table FLXCMAP was provisioned.
- optionality of feature

This feature has no affect on feature A59013395.

The activity is optional with a SOC option. When state of SOC is ON, feature becomes active, otherwise system behaves as it was before this functionality.

Through the fndocs of this activity, ‘ISUP cause value’ is used to address ISUP cause value except following cause values:

Normal Call Clearing (CI=16),

Normal Unspecified (CI=30),

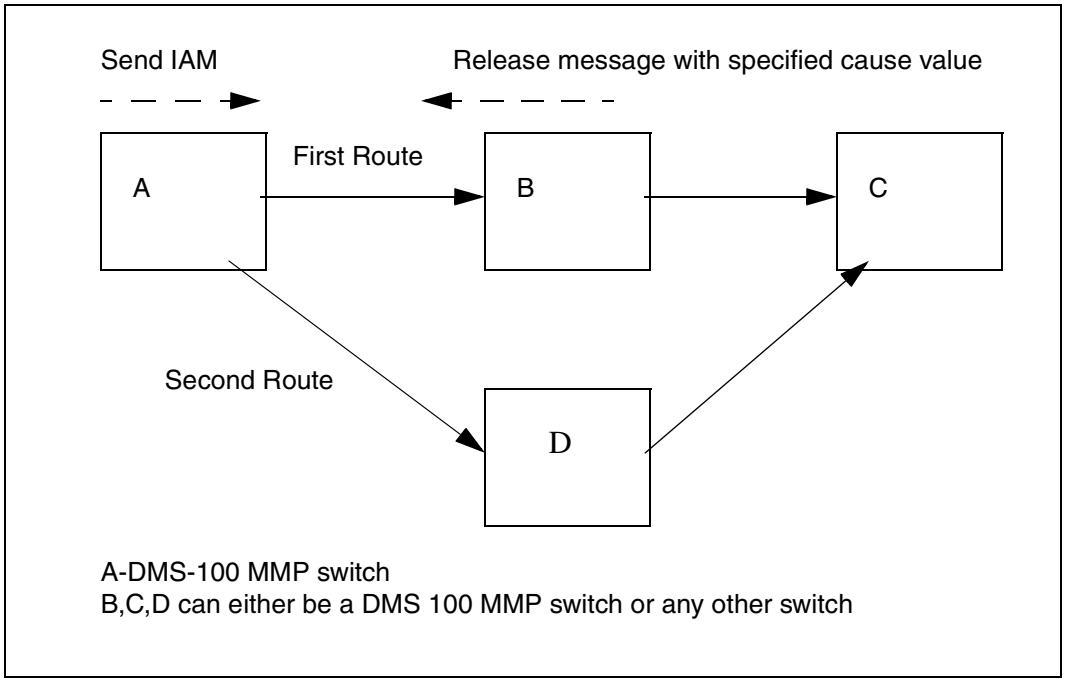
Interworking Unspecified (CI=127).

The feature is implemented in ISN07.

59.2.1 Functional Description

Figure 1 describes functional behavior of the feature.In this case, ISUP IAM is sent out on first route. When REL message with ISUP cause value is returned in response along the first route, second route is determined in route list in office A. If second route is present and required conditions are provided, IAM is sent on second route.

Figure 1 Functional Behavior of the Feature



The conditions mentioned above are shown in Figure 2 and can be listed as follows.

a. If ISUP cause value in REL message is congestion (No Circuit Available(34) or Switching Equipment Congestion(42)):

- It is directly checked CND NRR datafill as alternate route. If CND NRR selector is present in route list for terminating side (A office), call is routed to another trunk (second route). Otherwise, call goes to treatment.

b. If ISUP cause value in REL message is not congestion, following conditions are determined respectively:

- Checking whether REL message is received before ACM message. Re-routing is provided for REL message before ACM message.
- Checking of SOC option. It must be ON state for re-route.
- Determining of RTEADV field in FLXCMAP table. It must be Y for re-route
- Checking of CND NRR datafill as alternate route. CND NRR selector must be present in the route list for re-route.

  If these three conditions are provided, call is routed to another trunk (second route). Otherwise, call is terminated to treatment

59.2.2 Activation of Feature

Activation of feature is controlled by SOC XLAS0053.

XLAS Reroute Rel Cause is a state SOC and it has two states, ON and IDLE.Default state of XLAS Reroute Rel Cause is IDLE. When its state is ON, this feature becomes functional.

59.2.3 Provisioning Table FLXCMAP

Normally, there is a map in FLXCMAP table for ISUP cause value in release message. It should be mapped ISUP cause value to Network Re-Routing Capability for each ISUP cause value in REL message. For providing this, RTEADV field of table FLXCMAP is used. RTEADV field for ISUP cause value in FLXCMAP table must be provisioned to Yes so as to perform re-routing

SOC option ISP70008 must be ON state so as to be provisioned RTEADV field in FLXCMAP table. So this feature is dependent on activation of SOC option ISP70008.

Figure 3 shows an example for datafill of table FLXCMAP.

Figure 2 Design Flow of The Feature

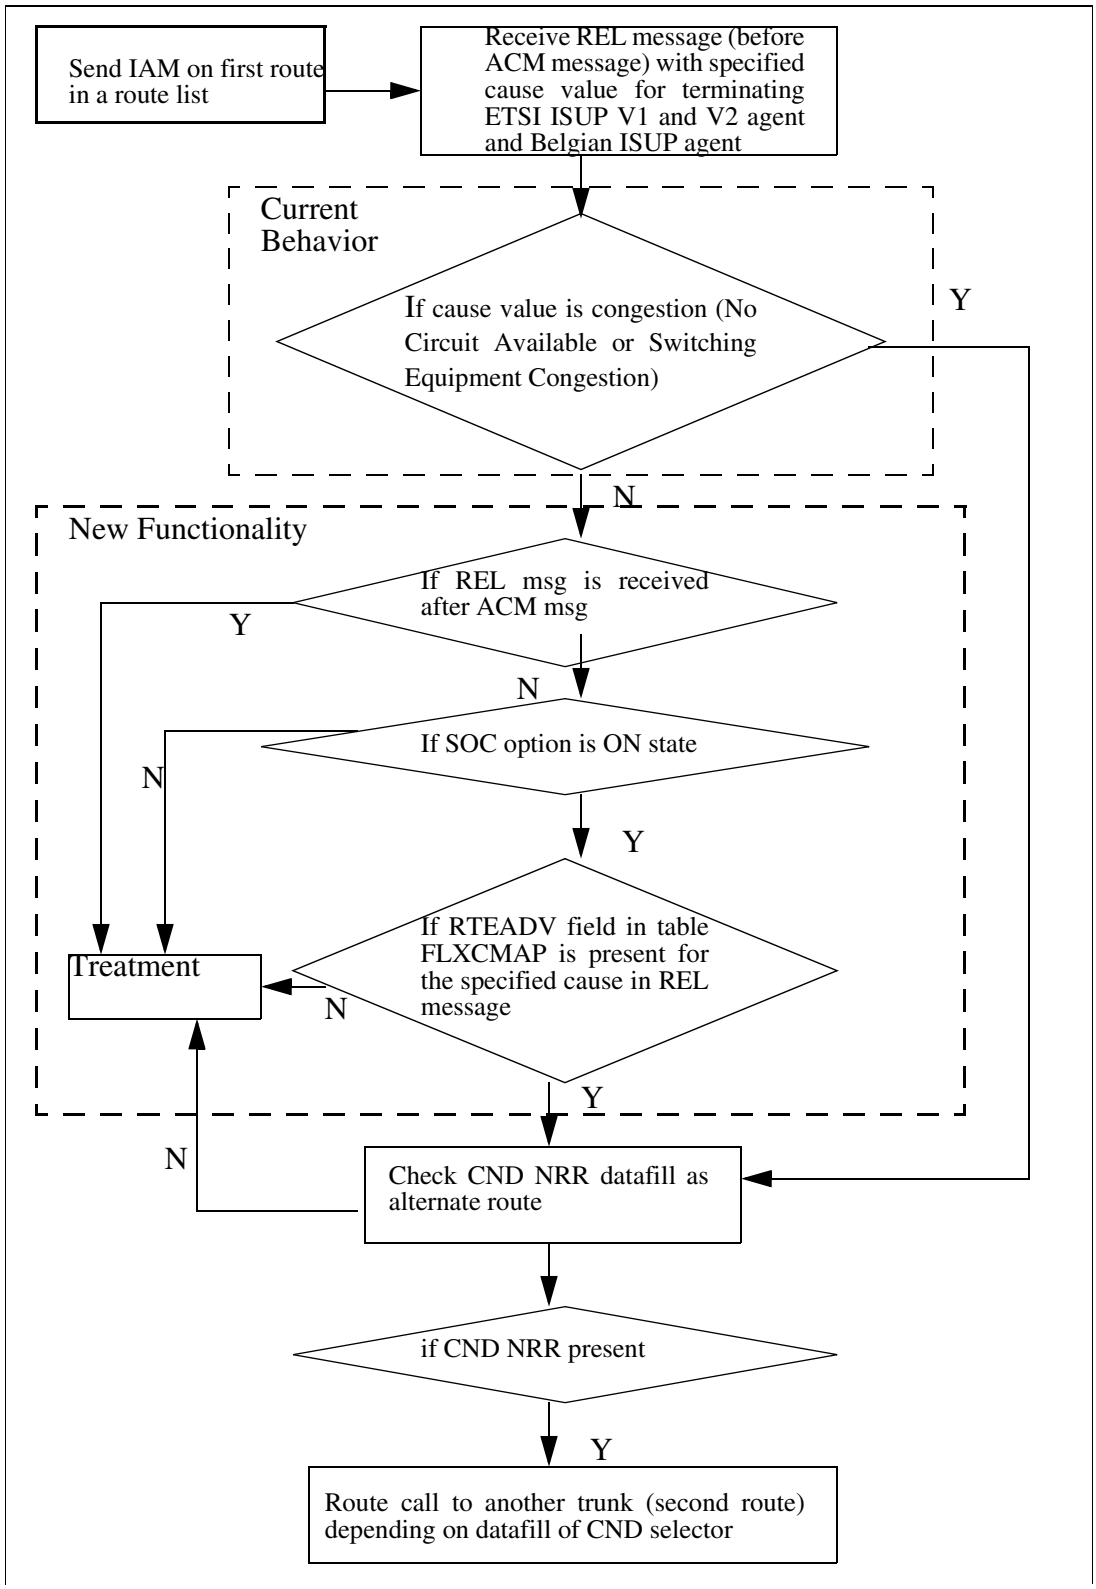


Figure 3 Example for FLXCMAP Table Datafill

```
CSEMPKEY                        TREAT          RTEADV
- - - - - - - - -              - - - - - -    - - - - - - -
USERBUSY   CCITT_STANDARD      BUSY           Y
NOCIRCAV   CCITT_STANDARD      NCRT           Y
```

59.2.4 Provisioning CND NRR selector

CND NRR selector must be provisioned in the route list at the terminating side for re-route. In figure 4, it is given an example for datafill of route table.

Figure 4 Example for Route Table Datafill

```
XLANAME        RTEREF      RTELIST
- - - - - - - - -  - - - - - - -  - - - - - - -
TEXTXLA        10          S TRUNK1
                           S TRUNK2

TEXTXLA1       12          S TRUNK3
                           S TRUNK4
                           CND NRR SK 0
                           S TRUNK5
```

Note: The routing tables that support the CND NRR selector include: XXRTE, OFRX, IBNRTX tables.

59.3 Hardware Requirements or Dependencies

None

59.4 Software Requirements or Dependencies

- Feature C59015296 must be active for re-route since SOC option ISP70008 is implemented by C59015296 feature.
- SOC option XLAS0053 must be on for activation of this feature
- This feature is patched backed to ISN04. The patch ID is NAP45. NAP45 is an password activateble patch. When NAP45 is active, for an ONP from ISN04 to ISN07 and beyond, the state of the SOC option XLAS0053 will automatically be set to 'ON'. And all of the functionalities of this feature will be ON. But after the ONP, a password for SOC option is still required to change the RTU field of the SOC option XLAS0053 in loads ISN07 and beyond.

59.5 Limitations and restrictions

Since this is enhancement in feature A59013395, it's limitations and restrictions are valid for this feature too. These are two items as follows:

- Rerouting will not be supported when REL message with ISUP cause value is received after an ACM (PostACM).
- It should be noted that re-routing will be limited to a specific number of route attempts(8 re-routing attempts). It is possible that the datafill may cause an infinite re-routing to occur, if the datafill is such that we are trying to select the already congested trunk.

Furthermore, following limitation and restriction will be valid for this feature.

- Whilst this functionality should work for terminating agents ETSI ISUP V1, ETSI ISUP V2 and all national ISUP variants based on ETSI V1 / V2, it is only being validated for use with terminating agents ETSI ISUP V1, ETSI ISUP V2 and Belgian ISUP.

59.6 Interactions

59.6.1 IN Functionality

In a call where IN is involved, current behavior is such that, if the received ISUP Release Cause Value is mapped in Table CSEDPMAP to an EDP for which IN has requested reporting, this ISUP Release Cause is passed to IN via the EDP value depending on this CSEDPMAP table. The EDP values involved for our purposes may be as follows:

- EDP-4 (Route _Select_Failure) RSF can be aimed to detect a failure to route a call to a final destination. In the current functionality, Congestion Cause Value is mapped to RSF.
- EDP-5 (o_Called_Party_Busy) For Called Party being Busy
- EDP-9(o-Disconnect) For Called Party Disconnecting

Currently, the IN behavior for Congestion Cause Value (No_Circuit_ Available_ or Switching Equipment Congestion) does not check CSEDPMAP table and reattempts translation with CND NRR selector. In other words, IN involvement is skipped. This behavior for Congestion Cause Value is kept as it is.

With this feature, the interaction of the IN functionality with the CND NRR selector for other ISUP Release Causes will be as follows:

1. If the related ISUP Release Cause has a mapping to an EDP in Table CSEDPMAP:
   - I*f the SCP has requested reporting of this EDP*: The handling will be left to IN, and the EDP will be reported to the SCP.
   - I*f IN has not requested the reporting of this EDP*: CND NRR selector will be functional.
2. If the related ISUP Release Cause does not have a mapping to an EDP in Table CSEDPMAP: CND NRR will be functional.

60: Functional Description (FN): A00003695

60.1 Feature name

AT.A00003695 - ANSI ISUP FGD on CS2K

60.2 Description

This activity provides ANSI ISUP FGD functionality on CS2K international load. This is done by porting the functionality of existing TDM MMP 17 feature with actid AT.59036475 into the ISN load.

The purpose is to enable CS2K with ISN load to directly interconnect to Inter Exchange Carriers (IEC) in North America.

This activity verifies the following agents interworkings only:

- ANSI ISUP FGD to/from ANSI ISUP FGD
- ANSI ISUP FGD to/from ETSI ISUP V1

60.3 Hardware Requirements or Dependencies

None

60.4 Software Requirements or Dependencies

None

60.5 Limitations and restrictions

Following interworkings are not verified with this activity:

ISUP V2 - ANSI ISUP FGD

ANSI ISUP FGD - ISUP V2

ANSI ISUP+ - ANSI ISUP FGD

ANSI ISUP FGD - ANSI ISUP+

ANSI ISUP FGD - ITU-R2

ITU-R2 - ANSI ISUP FGD

60.6 Interactions

Following interactions will be verified with this activity:

- ANSI ISUP FGD - ANSI ISUP FGD
- ANSI ISUP FGD - ETSI ISUP V1
- ETSI ISUP V1 - ANSI ISUP FGD

60.7 Applicable customer facing sections

61: Functional Description (FN): A00003696

61.1 Feature name

G-ISUP ROUTING ENHANCEMENTS

61.2 Description

This feature focuses on the routing enhancement for Deutsche Telecom G-ISUP, using the new national parameter UKK (#F5).

Additionally it also covers the

- Identification procedures for T-ISUP.
- Capturing of Originating ISC point Code.
- Blocking of Connected Number and Calling Party Number based on presentation indicator

These are described in the subsection below

61.2.1 Routing Enhancement for DTAG GISUP

DTAG Specifications introduces a new field Kundenkennung (KK) i.e Customer ID for the special routing.

KK is field in the national Parameter UKK, received in the IAM, from DTAG network.

The special routing is based on the following Criteria.

- Customer ID
- Destination
- IPI
- TMR

61.2.1.1 Routing based on Kundenkennung

To provide the ability to allow a different routing depending on the special routing criteria, the call control and universal screen framework is used (A59028780, A59033687). This frame work already provides the ability to route depending on BC and IPI.

Since TMR and BC are correlated, we use the BC screening, in place of the TMR screening,

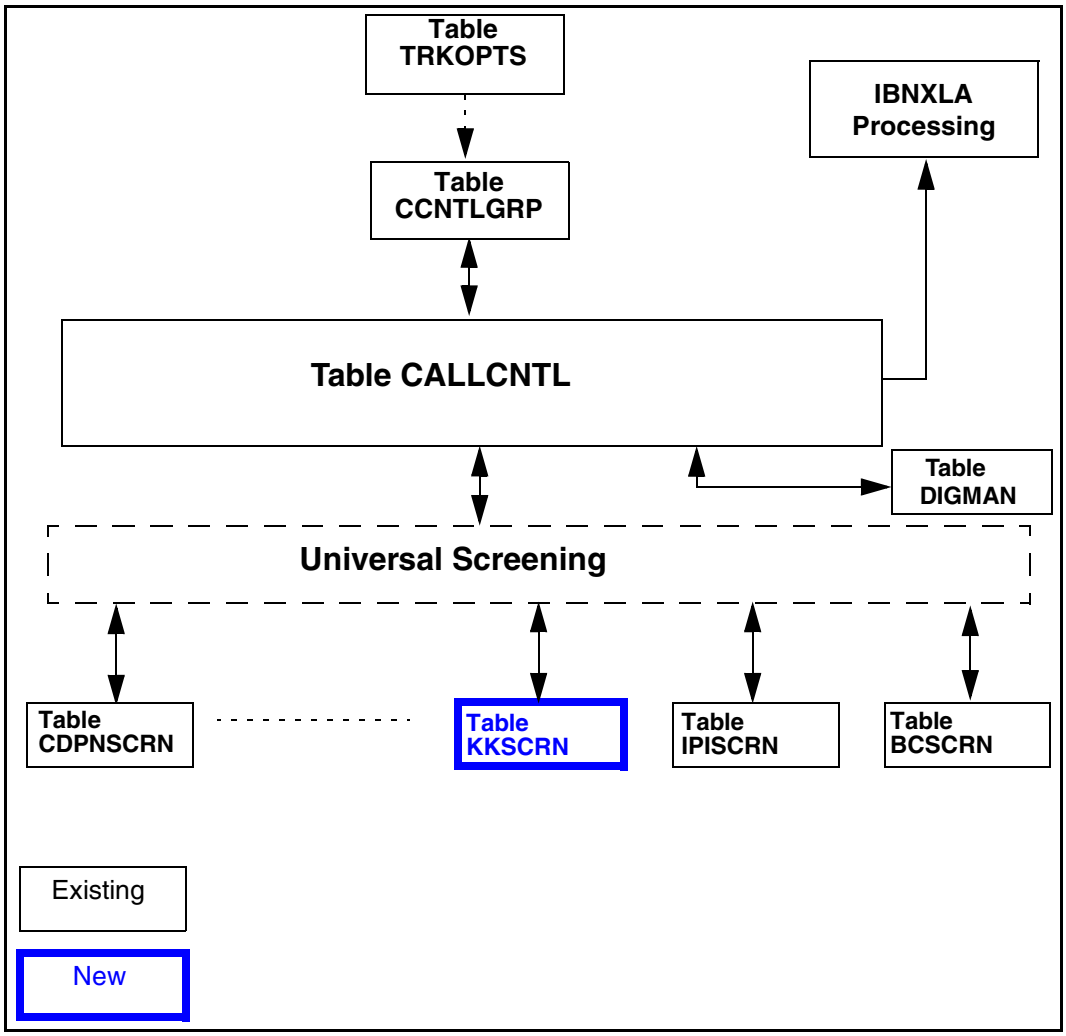
Table 1 TMR - BC correlation

TMR	BC
TMR_SPEECH	BC_SPEECH
TMR_64KB_UNRES	BC_64K_DATA
	BC_7_KHZ: ITC -GEN_ITC_DIG_TONES_ANNOUNC or GEN_ITC_7_KHZ_AUDIO
TMR_3_1KHZ_AUDIO	BC_3_1_KHZ
TMR_ALT_SPEECH_64KB_UNRES	BC_64K_DATA
TMR_ALT_64KB_UNRES_SPEECH	BC_64K_DATA
TMR_64KB_PREFERRED	BC_64K_RES

Table 1, “TMR - BC correlation,” on page 1271 captures the correlation of TMR and BC. The value TMR_64KB_UNRES, has different BC values based on ITC, hence TELCO will have to provision both these BC values for handling TMR_64KB_UNRES.

A new Table KKSCRN is created to store the KK values and the framework is extended to also allow routing dependent on KK. Please refer to “Figure 1 Call control and Universal screening Tables” on page 1272.

Figure 1 Call control and Universal screening Tables



The screening framework provides a flexible structure for modifying translations. For the purpose of DTAG, the recommended usage is as follows:

An entry screen index is datafilled against the trunk group and the table to screen against first (KKSCRN). The format of the table is as shown “Table 2 Format of Table KKSCRN” on page 1272

Table 2 Format of Table KKSCRN

Field	Range of Values	Description
SCRN_KEY	Any valid index from table CALLCTNL	Key Field: Index from table CALLCNTL
KK	KK value {0-16383}	Key Field: Kundenkennung.

Table 2 Format of Table KKSCRN

Field	Range of Values	Description
NEWSCRN_KEY	Any valid index in table CALLCNTL	Updated CALLCNTL Index
CALLCNTL_OPTIONS	Call Control Options: CUSTGRP, TREAT, POECNAME, DIGEDIT, CLICNTL.	Allows setting of call processing variables or treatment as performed in table CALLCNTL

1. The KK for the call is used along with this screen index to look up the entry in table KKSCRN. This entry can specify a customer group to use for translations (if no other BC or IPI specific routing is required), or a new screen index and the next screening table (IPISCRN).
2. The IPI for the call is used along with the current screen index to look up the entry in table IPISCRN. This entry can specify a customer group to use for translations (if no other IPI specific routing is required), or a new screen index and the next screening table (BCSCRN).
3. The BC for the call is used along with the current screen index to look up the entry in BCSCRN. This entry specifies the customer group to use for translations.

The datafill is as shown in Figure 2, "Sample datafill for KK/IPI/BC routing"

Figure 2 Sample datafill for KK/IPI/BC routing

```
TABLE TRKOPTS
STEP27ISUPV2 CCNTLIDX CCNTLIDX INDEX

TABLE CALLCNTL
INDEX (SCRN (KK) (IPI) (BC) $)$

TABLE KKSCRN
INDEX 5 KK5 $

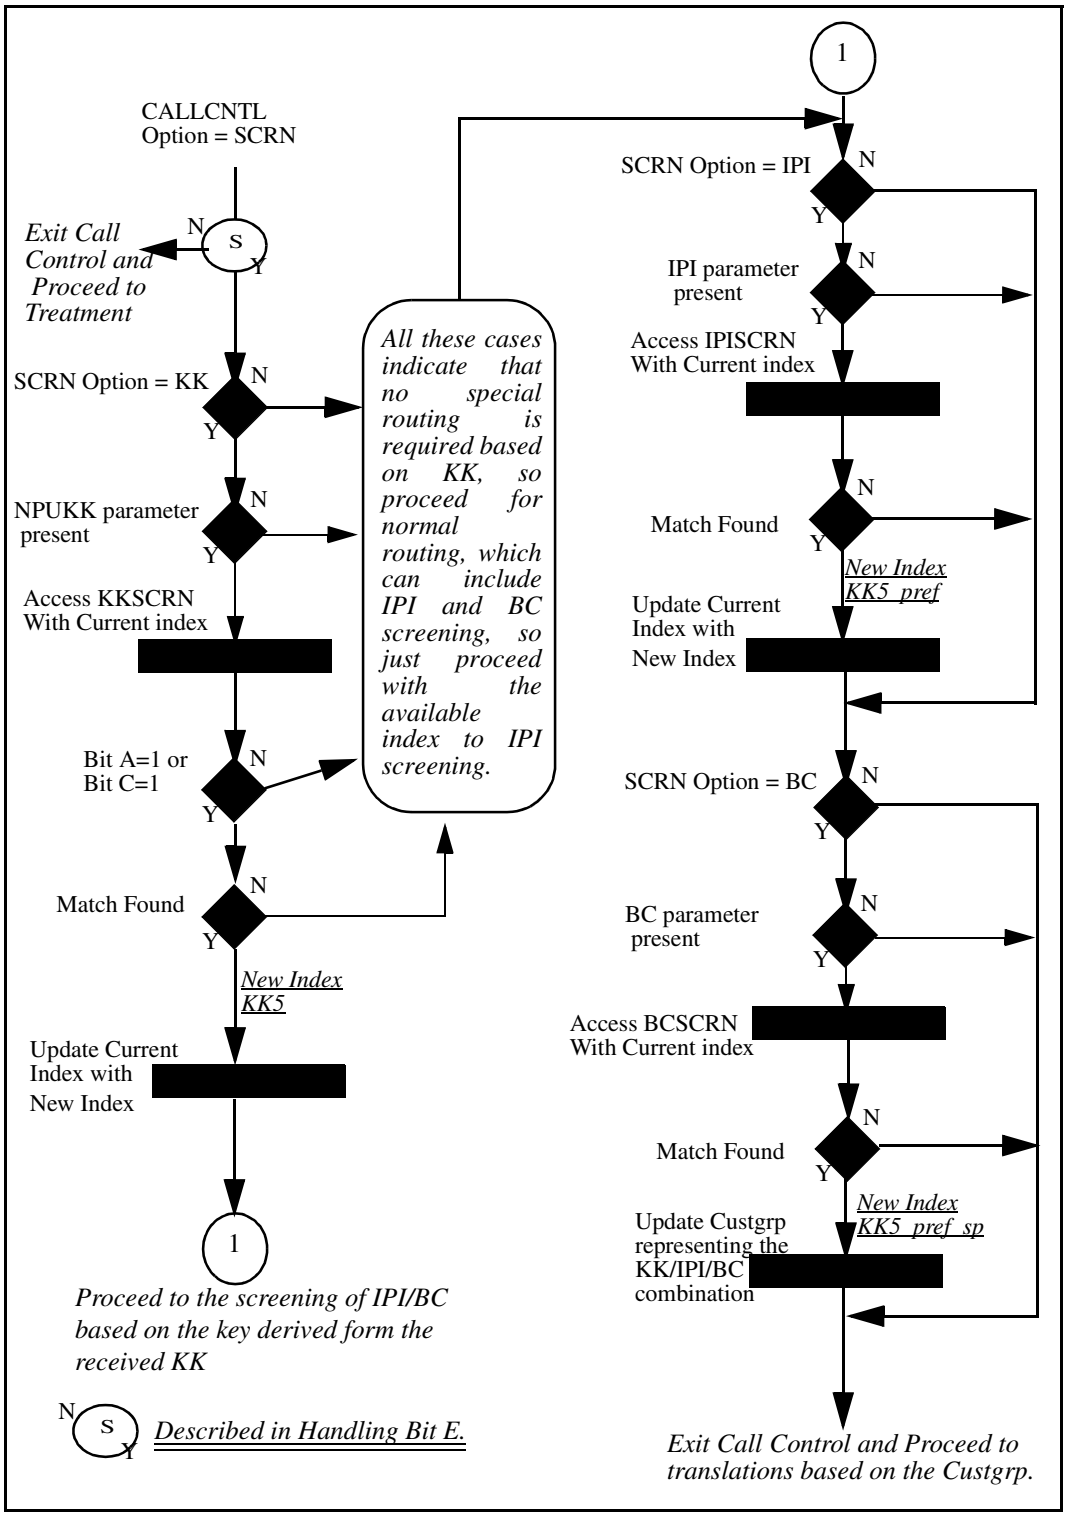
TABLE IPISCRN
KK5 PREFERRED KK5_PREF $

TABLE BCSCRN
KK5_PREF SPEECH KK5_PREF_SP (CUSTGRP
KK5_PREFERRED_SPEECH_CUSTGRP1) $
```

The end result is that the customer group for the call can be specified uniquely for each KK/IPI/BC combination. These customer groups can each have their own translations defined.

The special routing will be invoked based if either Bit A = 1 or Bit C = 1 is set in the message, else it proceeds for Normal routing.

Figure 3 Flow Diagram for KK screening.



The flow diagram as shown in Figure 3, "Flow Diagram for KK screening." captures the screening (routing) done based on the sample datafill for KK/IPI/BC combination.

The flow captures only a part of the screening framework, concentrating on the KK screening.

In cases where special routing is not required, the flow would proceed to normal routing. If the normal routing requires the IPI and BC to be screened, then IPISCRN tables and BCSCRN table should have provisioning to handle the index provisioned in Call Control table.

The translation for updated custgrp are set to route the call based on the called party number to a restricted routelist, as needed by the special routing KK/IPI/BC combination.

Interworking of Customer Id screening with other possible screening options may lead to incorrect result, if the index are not handled properly. This may even lead to have no KK screening done in spite of the UKK parameter available in the IAM.

61.2.1.2 Handling of failures for special routing

The routelist obtained after screening of KK/IPI/BC, restricts the available routes as compared to the default routes.

In cases where this special routing fails, the decision to fall back to the default routing is based on capabilities provided.

This is handled by adding all the default routes to routelist for the customer groups where the customer ID demands to fall back to the default Routing.

The example below details the handling.

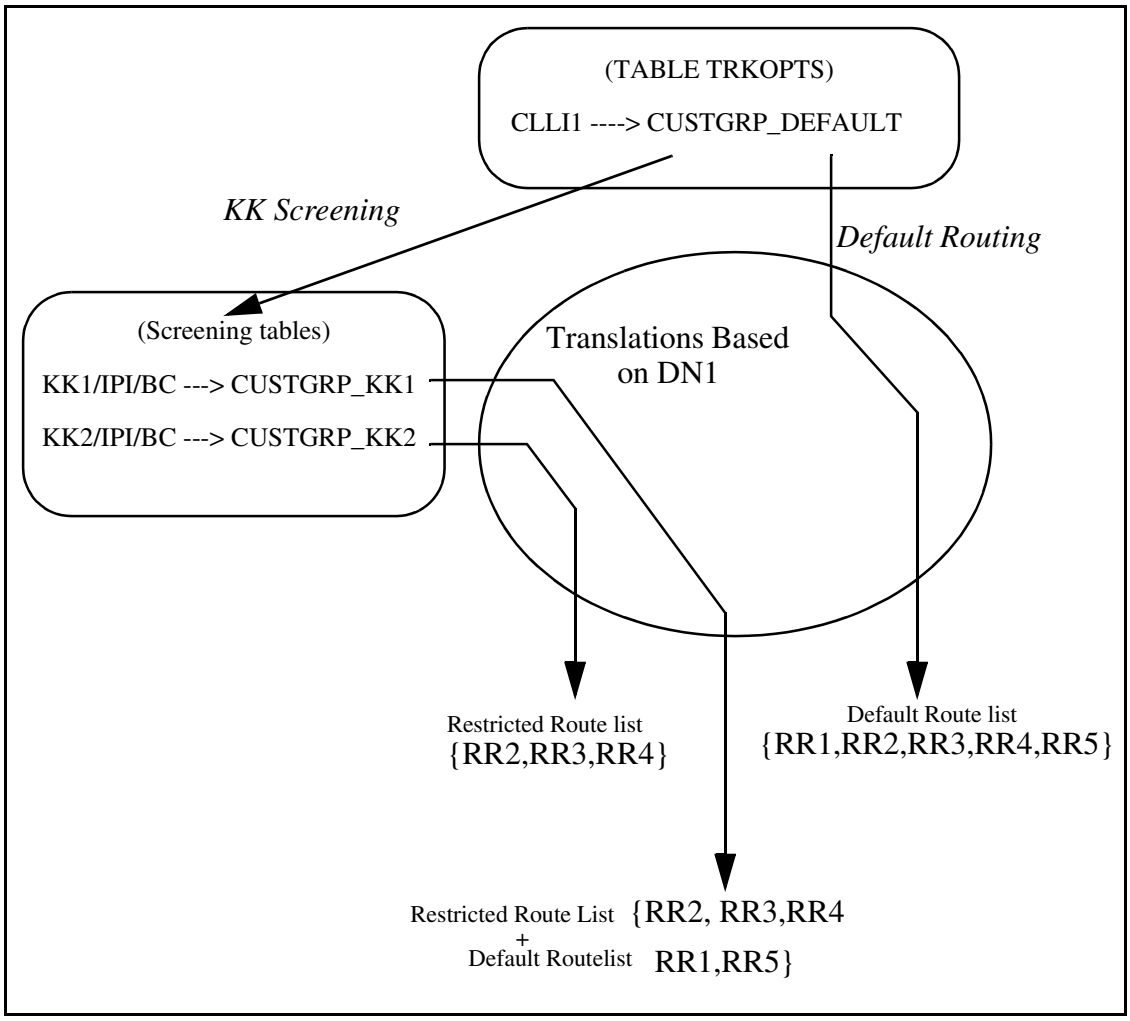
Scenario

- The default routelist for all customers with calls coming on Trunk CLLI1 for Called party number DN1 is {RR1, RR2, RR3, RR4, RR5}
- For the customers with Kundenkennung KK1 and KK2 the routes are restricted to {RR2,RR3,RR4}.
- But customer with KK1 have the facility to fallback back to the default routing when special routing to the restricted routelist fails.

Provisioning

The provisioning for the above scenario is as explained in the Figure 4 on page 1277.

Figure 4 Provisioning for special routing.



61.2.1.3 Capacity for provisioning of Kundenkennung

The Feature approach suggested derives the Customer group, based on the KK/ IPI/BC combinations. The Translations system completes the further routing based on the called number using Customer Group as index.

With the current provisioning capacity, total number of customer groups allowed is 4094.

In a completely unoptimized system, the resulting combinations can lead to 64000 KKs x 3 IPIs x 11 BCs = 2,112,000 different routing systems. This far exceeds the abilities of the CS2K XLA system.

But the realistic requirement specifics the International Gateway should support an average of 1000 Customer ID (KK), 80 destinations per customer group and an average of 2 IPI/BC combinations per destination. Since the screening of destination is done in translations, we do the IPI/BC screening before the destination. Thus the system will provide support for all 9 combinations of IPI/TMR. This results to 9000 customer group, which is beyond the current capacity of 4086.

But it is expected that there will be a significant number of combinations of KK/IPI/BC that result in the same routing. For example, two KK may share the same routing or one KK may have one routing for all IPI/BC combinations. Refer to the Appendix section “61.9.1 Example Datafill Setup” on page 1295 for examples of how this can be done.

61.2.1.4 Handling of the Bit E

In addition to special routing, the UKK parameter also provides information regarding bypassing the Black List numbers using Bit E (Blocking Indicator). If bit E = 1, then the black list will be ignored.

Screening for Bit E is handled by providing an additional screen option UKKCDPN in the table CALLCNTL. This option will use the existing CDPNSCRN table in conjunction with bit i.e it will not perform CDPN screening if the bit E is set to 1.

Figure 5 Table CALLCNTL(UKKCDPN option)

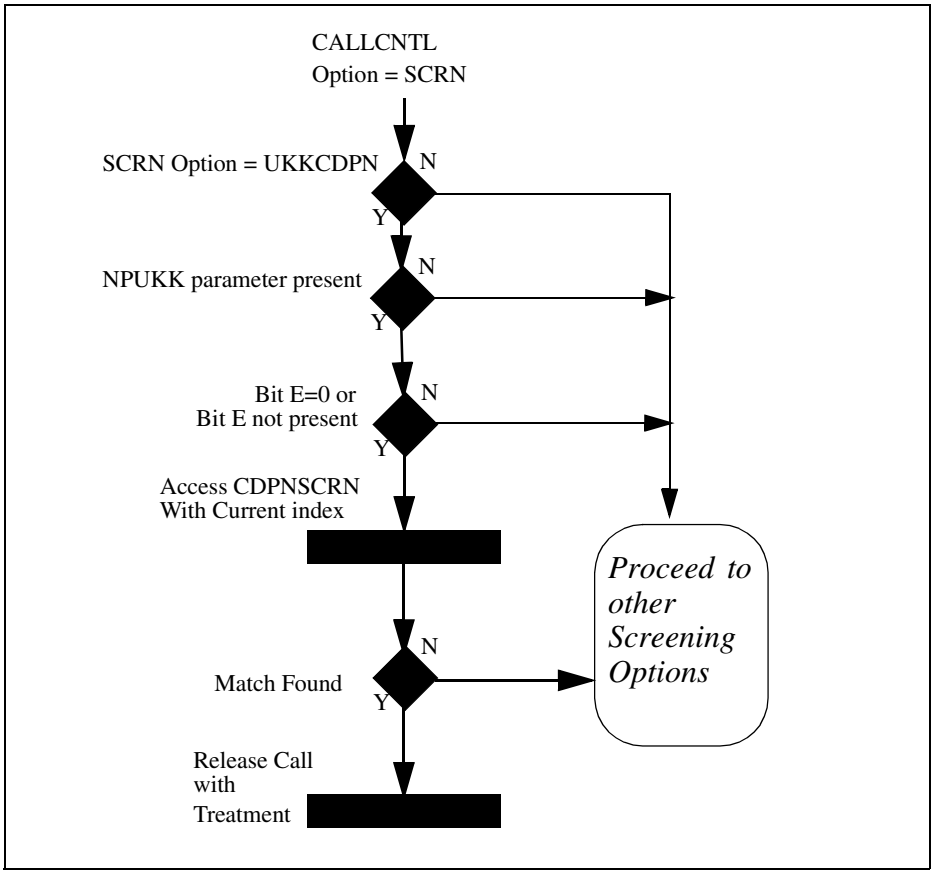
The flowchart for the above datafill is as shown in Figure 7 on page 1279

Figure 7 Handling of Bit E



61.2.1.5 Setup of UKK

The UKK parameter needs to be setup trunk based, for incoming International calls coming on GISUP/V1 trunks.

This capability is provided by providing a new option in table TRKOPTS.

The Option will allow the complete parameter to be provisioned, as per it's specification. Please refer to "Figure 8 NP.UKK parameter layout" on page 1280.

Figure 8 NP.UKK parameter layout

8	7	6	5	4	3	2	1	
Ext.i	G	F	E	D	C	B	A	
Ext.i	Kundenkennung (customer ID)							Kundenindikator (customer indicator)
Ext. i	Dienst-Typenkennung (type of service ID)							Registrierungsindicator (registration indicator)

The OPTINFO will contain, fields, representing from A to G, the Customer ID (Kundenkennung) and the Service ID.

Please refer to section 3.118 of TISUP Q.763 for :-

- **parameter NP.UKK and its fields.**
- **coding of Kundenkennung (customer ID)**

Figure 9 Table TRKOPTS (UKK option)

```
TABLE: TRKOPTS
OPTKEY                              OPTINFO
-----------------------------------------------
STEP27ISUPV2 UKK     UKK 1 0 0 0 0 0 0 100 0
```

The provisioned parameter will only be used to transit it in outgoing IAM on TISUP (National trunks) or GISUP (sipt) and not for routing.

The provisioning of the NPUKK on the trkopts is allowed on all ISUP trunk AGent. But interworking are currently supported only for GISUP,TISUP, ETSI V2 and ETSI V1 trunks.

Note: Bit A to E can take values '0' or '1' . Bit F and Bit G are spare bits and hence accept value '0' ONLY

The format of trunk option NPUKK is given below:

Table 3 Format of trunk option NPUKK

Field	Range of Values	Description
UKK_SPECIAL_ROUT_IND	{ 0 to 1}	Bit A of octate 1 (NP.UKK)
UKK_SPECIAL_ZONE_IND	{ 0 to 1}	Bit B of octate 1 (NP.UKK)
UKK_SPECIAL_INTL_CAR_IND	{ 0 to 1}	Bit C of octate 1 (NP.UKK)
UKK_SPECIAL_NTL_CAR_IND	{ 0 to 1}	Bit D of octate 1 (NP.UKK)
UKK_SPECIAL_BLOCK_IND	{ 0 to 1}	Bit E of octate 1 (NP.UKK)
BIT_F_SPARE	{ 0 to 1}	Bit F of octate 1 (NP.UKK)
BIT_G_SPARE	{ 0 to 1}	Bit F of octate 1 (NP.UKK)
KUNDENKENNUNG	{0 to 16383}	Octate 2 & 2a (NP.UKK)
REGISTRIERUNGS_INDICATOR	{0 to 127}	Octate 3 (NP.UKK)

61.2.1.6 Interworking for NP.UKK

The table below captures the Interworking for the NPUKK parameter.

Since the NPUKK parameter is only built for TISUP and GISUP-T. The interworking having these trunks as outgoing are considered.

Table 4 Interworking For NPUKK

Interworking	NPUKK on the outgoing end.
GISUP->TISUP	Built if provisioned on the GISUP
ETSI V1->TISUP	Built if provisioned on the ETSI V1
ETSI V2->TISUP	Built if provisioned on the ETSI V2
GISUP(sipt)->TISUP	If NPUKK is received in IAM, then it is transited, otherwise built if provisioned on GISUP(sipt)
TISUP -> TISUP	If NPUKK is received in IAM, then it is transited, otherwise built if provisioned on TISUP
TISUP -> GISUP(sipt)	If NPUKK is received in IAM, then it is transited, otherwise built if provisioned on TISUP
ETSI V1 -> GISUP(sipt)	Built if provisioned on the ETSI V1

Table 4 Interworking For NPUKK

Interworking	NPUKK on the outgoing end.
ETSI V2 -> GISUP(sipt)	Built if provisioned on the ETSI V2
GISUP(sipt) -> GISUP(sipt)	If NPUKK is received in IAM, then it is transited, otherwise built if provisioned on GISUP(sipt)
GISUP->GISUP(sipt)	Built if provisioned on the GISUP

61.2.1.7 Translation Verification Tool Support

The TRAVER tool is updated to support the new screening options, KK and UKKCDPN.

Figure 10 on page 1283 and Figure 11 on page 1284, shows the traver output involving KK and UKKCDPN screening, where Bit E is set to 1, hence the CDPN table is skipped.

61.2.2 Identification procedures for T-ISUP

DTAG specifications enhances the current IDR-IRS functionality for Gateway switch by

- Introducing additional timer T39A
- Additional Identification procedures.

The Timer T39A functionality is covered by the feature A00002908.

This feature covers the additional Identification procedures. DTAG enhances the Identification procedure by adding two new messages.

— NANA (#FF)

— EHZA (#FC)

The procedures are described as below.

61.2.2.1 Procedures for Incoming international Call, terminating on DTAG network (for G -> T and V1 -> T).

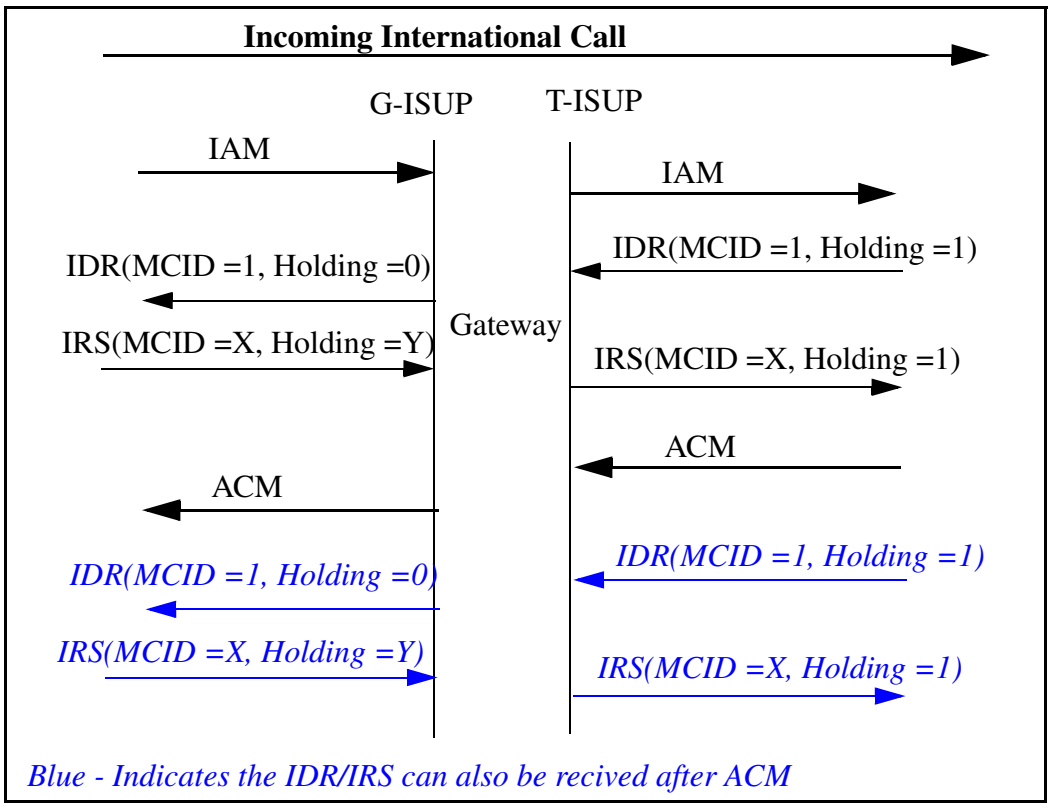
61.2.2.1.1 Activation The enhanced identification procedures are activated by receiving the IDR with Holding bit set to 1. DTAG requires the flexibility that the IDR can be received before or after ACM. The Outgoing IDR on the International gateway will always have the holding Indicator set to zero.

The IRS received from the International network, will be transited to the National network, with Holding Indicator as received in the in IDR. Please

refer to “Figure 13 Transit of IDR-IRS on International Gateway.” on page 1286.

Note: The Timer T39A and the procedures associated with it are not shown in the Figure, to make it simple.

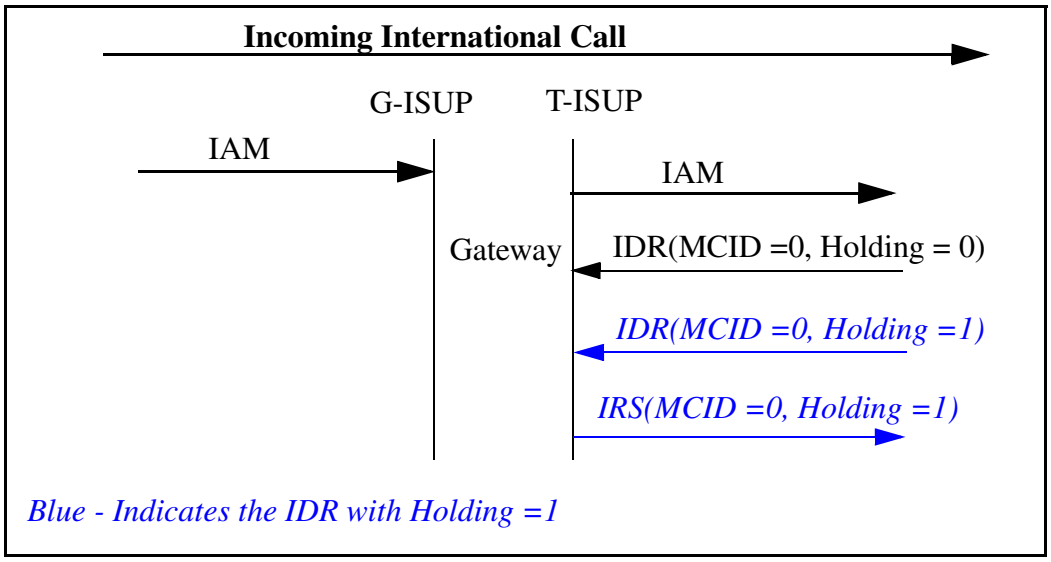
Figure 13 Transit of IDR-IRS on International Gateway.



If the received IDR has MCID indicator set to zero, i.e **MCID not requested** and Holding Indicator set to zero i.e. **Holding not requested** , **then the IDR is discarded and is NOT responded with a IRS.**

If the received IDR has MCID indicator set to zero, i.e **MCID not requested** and Holding Indicator set to one i.e. **Holding requested** , then the IDR is not transited to the International network. **Also the CS2K responds with a IRS message (MCID response Indicator bit set to zero and Holding Bit set to one) and holding procedures are activated on the Avst. Figure 14, "IDR-IRS behavior for MCID Indicator to 1" captures this behavior.**

Figure 14 IDR-IRS behavior for MCID Indicator to 1



In cases where the incoming International call is from ETSI ISUP V1. The IDR received will be responded with IRS, by TISUP and the holding procedures will be activated based on the holding indicator bit.

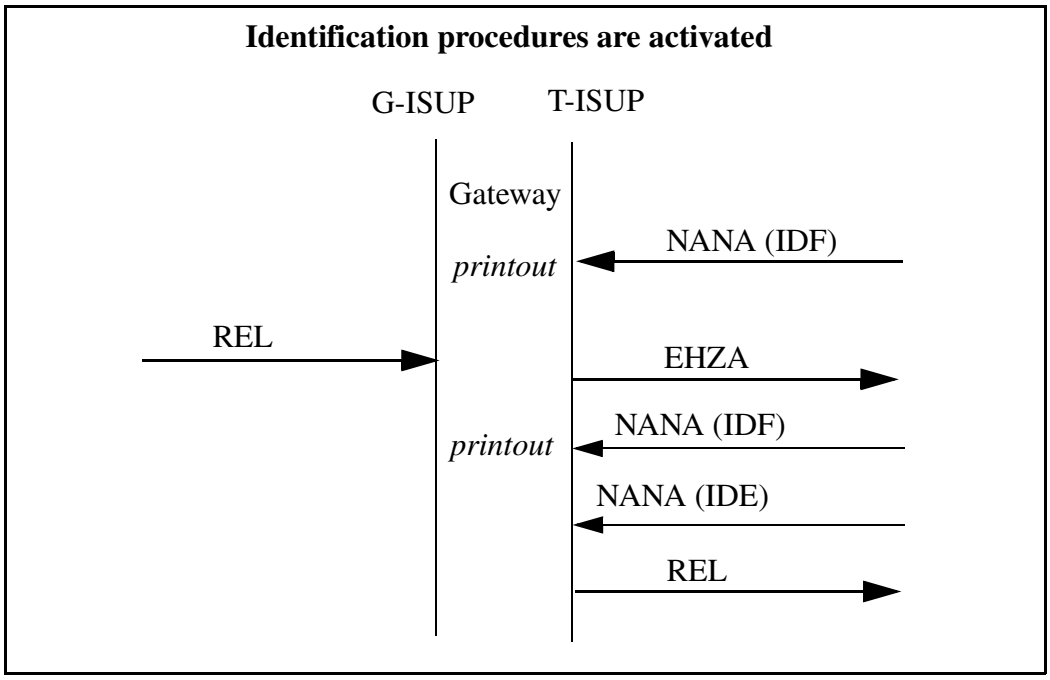
61.2.2.1.2 Behavior for Identification Once the procedure is activated, the NANA message is handled as below.

When a NANA message is received with Message Indicator field in NP.FF set to IDF, the identification data will be printed. The the content of the printout is analogous to the printout of the ETSI MCID service". Hence a new report MCID 600 is added to the MCID log. This log will be generated will be generated on the receipt of the NANA message. The content of the log is as shown in Figure 15, "MCID Log capturing printout for Identification"

Figure 15 MCID Log capturing printout for Identification

```
AVST1_LOG     MCID600 DEC09 18:12:57 5700 INFO IDENTIFICATION DATA
        Calling_Agent  : CKT     STEP36ISUPV2  628
        Called_Agent   : CKT     STEP39ISUPV2  632
        Calling_Number : 7848810036
        Called_Number  : 003349777799
        Date : 09.12.2003
        Time : 18:12:57
```

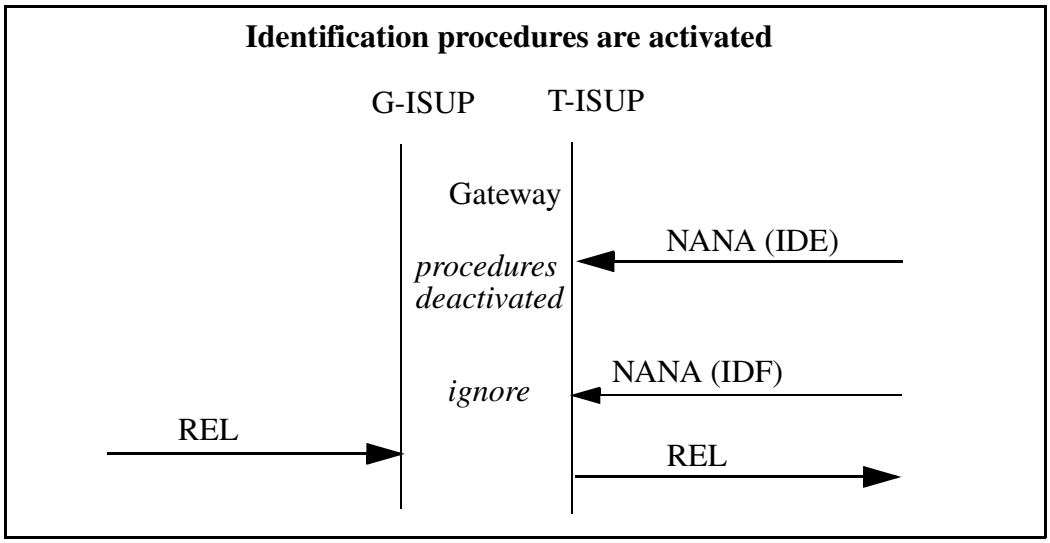
Figure 16 Behavior for Identification.



When Release is received from international side, it is not transmitted to national end. The new EHZA message is sent. The international call leg is disconnected while national leg remains active till NANA(IDE) is received. Any NANA(IDF) is received a printout will be generated as mentioned above. On receipt of NANA(IDE), a release message is sent if an EHZA message is already sent. Please refer to “Figure 16 Behavior for Identification.” on page 1288.

61.2.2.1.3 Deactivation The enhanced identification procedures are deactivated on the receipt of NANA message with the Message Indicator field in NP.FF set to IDE (Identification Ende). Any additional NANA (IDF) and NANA(IDE) message received is ignored.

Figure 17 Deactivation of Identification procedures

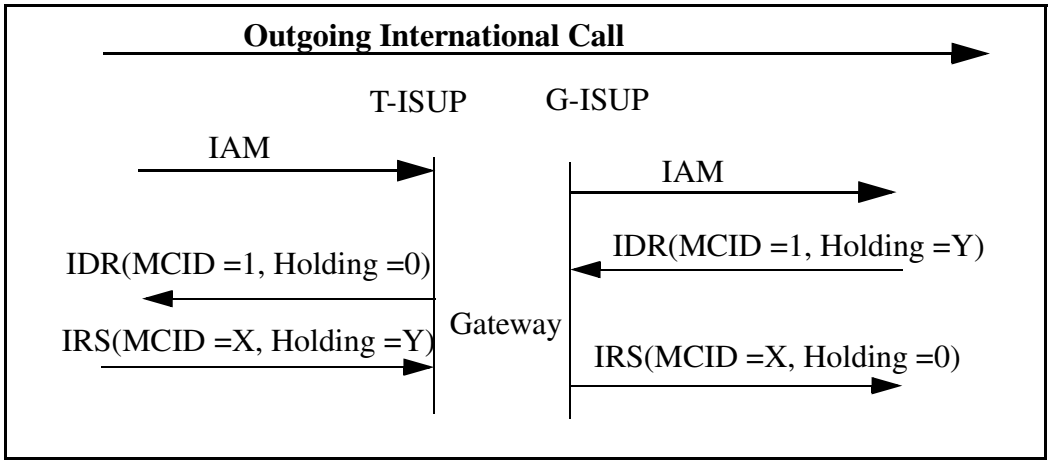


61.2.2.2 Procedures for Outgoing International Call from a DTAG network

For outgoing international calls from a DTAG network, the existing IDR-IRS functionality will be used for identification. no additional capability is being provided.

The holding indicator will be set to set zero when the IDR is transited to the national network and the response IRS will also have the holding bit set to zero, when it is sent on the International network. This is as shown in theFigure 18, "Procedures on outgoing International Gateway."

Figure 18 Procedures on outgoing International Gateway.



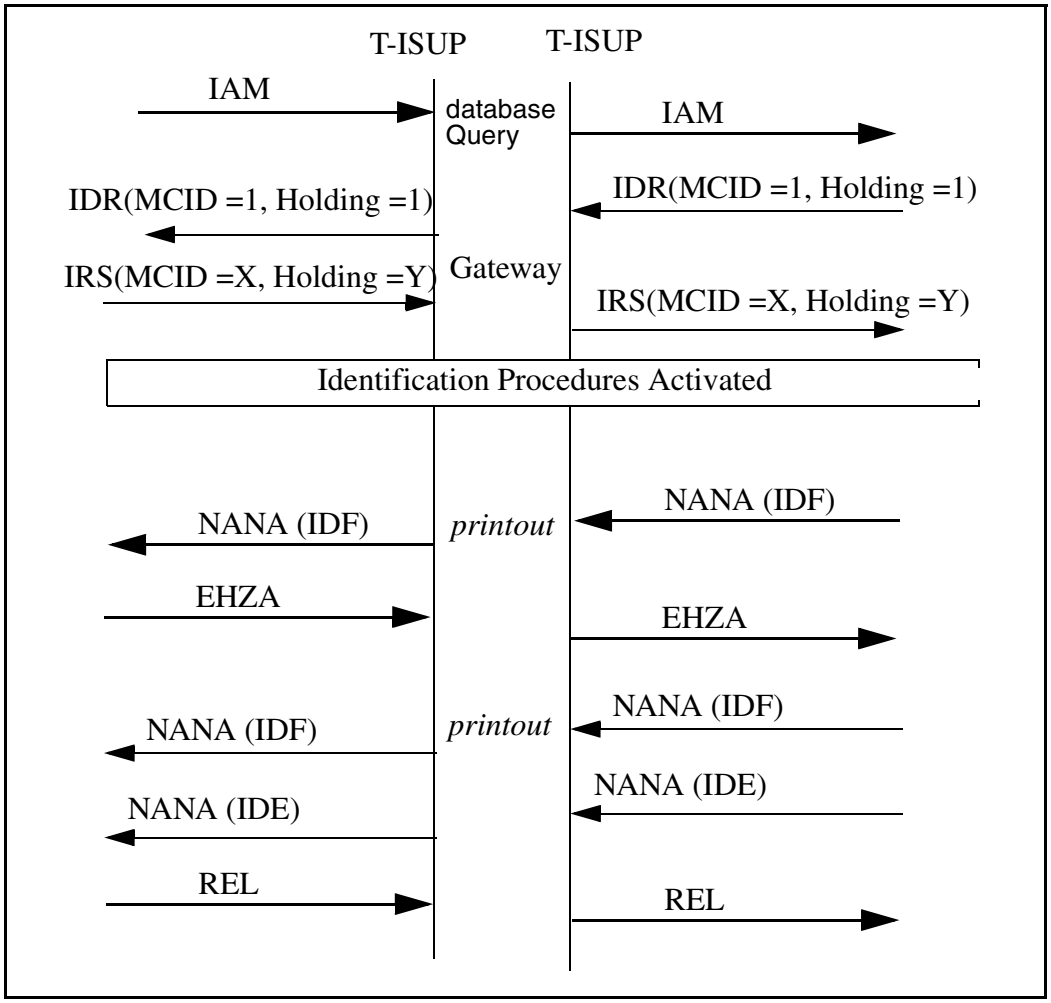
61.2.2.3 Procedures for TISUP - TISUP interworking.

For the procedures for the TISUP-TISUP scenario, Please refer to “Figure 19 .Behavior of TISUP-TISUP interworking.” on page 1290.

Note: The TISUP to TISUP interworking on the AVST is only possible, where the AVST acts as an SSP. Since MCID services are not directly related to the IN queries. Also the early ANM is currently not supported. The procedures described here are considering a normal TISUP -TISUP interworking.

All the messages NANA(IDE), NANA(IDF), EHZA will be transited. Identification procedures are also activated on the switch, NANA(IDF) will cause printout, NANA(IDE) will end the Holding. But these message will be transmitted. There is no release for EHZA.

Figure 19 .Behavior of TISUP-TISUP interworking.



61.2.3 Origination ISC Point Code

DTAG specifies that the origination ISC point code, for an international incoming call, to be captured for statistics purpose. This feature implements the capability to capture the point code and print in a log ISC600

The log is generally generated every 3hrs. It will print the first 480 point code and the count of calls received from that point code respectively.

Additionally, it will also provide a count of all the calls received on the point code. The output of the log based on the point code captured is as below

- For no Calls coming on GISUP to a national trunk

Figure 20 Log for ISC PC for no Calls

```
AVST1_LOG ISC600 NOV28 11:55:28 8900 INFO ISC log report

    100   5       150     1       230     1       250   1       300   1
    ..........................................

    2001  5       2608    1       3230    1       4250  1       9300  1
    16300 5       16301   1       16302   1       16303 1       16304 1
    ------------------------------------------------------------------------------------------
    PC not captured : 10
    ------------------------------------------------------------------------------------------
```

Note: The figures 18 and 19, shows the point codes and the their count to be left justified in their respective formatting space. In actual log these numbers are right justified.

This functionality is controlled via and Office parameter CAPTURE_ISC_OM, in table OFCENG.

61.2.4 Blocking of Connected Number and Calling Party Number

DTAG requires blocking of connected number and calling party number if the Address Presentation Restricted Indicator is set to “Presentation Restricted”. DTAG also requires the above functionality to be enabled / disabled via a trunk option.

This feature implements the above functionality by creating a new trunk option “BLK_CGPN_CONN” in table TRKOPTS. The option has to be set to “Y” for the functionality to be enabled.

An example of datafill for the option “BLK_CGPN_CONN” in table TRKOPTS is shown below:

Figure 23 datafill in table TRKOPTS

```
TABLE: TRKOPTS
STEP25ISUPV2    BLK_CGPN_CONN     BLK_CGPN_CONN     Y
```

61.3 Hardware Requirements or Dependencies

-NIL-

61.4 Software Requirements or Dependencies

-NIL-

61.5 Limitations and restrictions

61.5.1 Kundenkennung range

The screening frameworks allows up to 8191 indices.

- This implies that there can for each KK, there can be 8191 different routing paths specified. Similarly, for each BC or IPI, there can also be 8191 different routing paths specified.

The total number of customer groups allowed on a switch is 4094.

- This implies that there can only be a total of 4094 different routing systems to be shared between all KK/BC/IPI combinations.

This is not a limitation considering the current scope of the requirement, but would limit the system if the complete range of Kundenkennung is to provisioned.

61.5.2 Holding Indicator Bit

The Holding indicator bit for IRS from GISUP (SIPT) to TISUP, should be transmitted unchanged. This functionality would set it to the received value in IDR message, similar to GISUP (nonsipt) to TSIUP interworking.

61.5.3 SSP procedures

Procedures for Early ANM scenario are not covered.

61.5.4 Holding procedures for Network initiated SUSPEND timeout.

Currently the holding procedure for Network initiated SUSPEND timeout is not supported.

61.5.5 Calling party DN in IRS

The current design sends the Billing DN in the IRS , when we donot have a valid calling number available. This is incompliant with the MCID requirements of the Detusche Telecom.

To satisfy the requirement “It is recommended that the Billing DN is datafilled as $ and Table DEFNUM is NOT datafilled and trunk option DEFNUM is NOT used”

61.6 Interactions

This feature interacts with the screening of Number blocking features, where by the blocked numbers can be overridden with Bit E set to 1.

61.9 Appendix

61.9.1 Example Datafill Setup

The first table shows the No sharing of customer group (unoptimized) usage of the screening framework. The following tables provide some examples of the re-use that may occur because of common routing attributes for various IPI/KK/BC combinations. The final table shows the resulting datafill that would satisfy this example. Note that the in the worst-case scenario of this example, 18 customer groups would be required to specify the necessary translations. In the example optimization, only 3 are required because of re-use. Also note that only 2 screening indices were required for the optimized example, while in the unoptimized example, 9 would be required.

Table 5 No sharing of Customer Group

KK	IPI	BC	Resulting Customer Group
Default	Preferred	Speech	C01
		64K Data	C02
	Req	Speech	C03

62: Functional Description (FN): A00003951

This Functional Description (FN) covers the work required to support the i2001 Internet Telephone. The FN also covers the work required to support a common User Interface for the i2001, i2002and i2004.

62.1 Description

The i2001 is a reduced functionality sibling of the i2002 to reduce cost of manufacture it has a smaller screen, fewer buttons and a cheaper build

The i2001 is also a Phase II Unistim Terminal. Currently the CICM supports Phase I Terminals, as part of the scope of this feature, existing support for the i2002 and i2004 Phase I Terminals will be updated to support the new range of Phase II i2002 and i2004's.

Phase 1 terminals will be MD when the Phase II terminals become available so support for the whole range of Phase II terminals (i2001, i2002 and i2004) on the CICM will be required

62.1.1 Display

The following details apply to the i2001.

- i2001 will have a *32x143* pixel, fully bit-mapped, monochrome, non-grayscale display. This will display 2 lines of 24 5x9 characters.
- The number of Soft labelled feature keys on the i2001 is zero
- Dedicated icon area in the main display area has been removed.
- Dedicated Clock / Calendar area present.
- Dedicated number and context label are present.
- Dedicated down arrow removed.

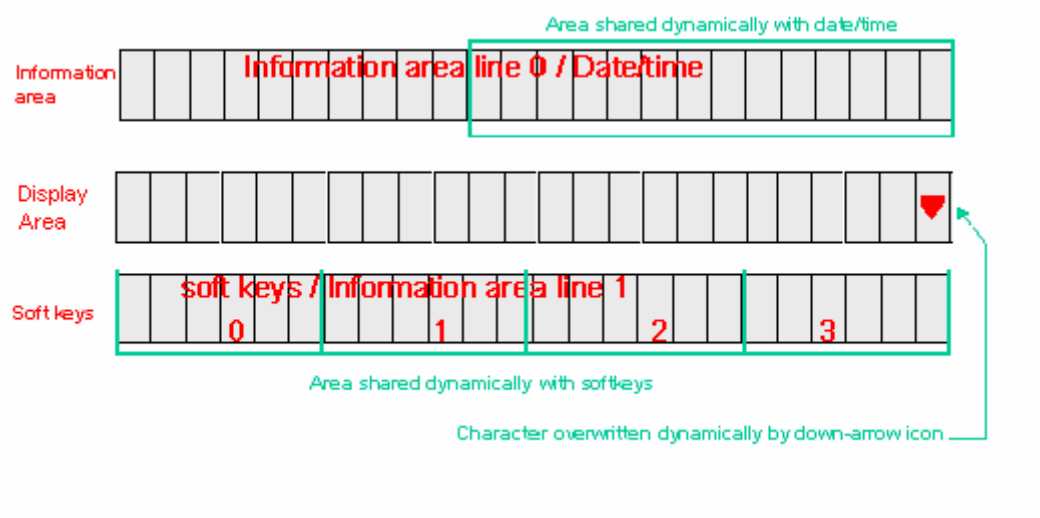

Figure 1 Display layout of i2001

62.1.2 Generic Display Rules

The following rules have been devised for the i200x terminals. These rules have been introduced to allow one common interface across both terminal types and to help avoid issues with Language Translations on soft key strings.

- All strings for menu options should be created with the following rules in mind
  a. Recommended length 12 characters – strings meeting this condition will always be shown in full (both on the information lines and in the context field)
  b. Maximum length 20 character – strings above 12 characters in length and equal to or below 20 characters will be fully displayable in the information line but not in the context field. Long strings in the context field will be cropped off to 11 characters and terminated with an ellipsis to indicate they have been cropped.
  c. Strings above 20 characters to be shown:
  — In the information lines will be cropped off to 19 characters and terminated with an ellipsis to indicate they have been cropped.
  — In the context field will be cropped off to 11 characters and terminated with an ellipsis to indicate they have been cropped.
- The Login Screen echoes entered digits to information line 0 rather than line 1 (please see Figure 2). The username and passwords entered may be up to a maximum of 15 digits. If the username/password entered is longer than the field space left on the screen (i.e. if the “Username” string is 14

characters and 12 username digits are to be entered), the digits will be scrolled to the left and an ellipsis will be inserted to the left of the username to indicate this (please see example below).

U	S	E	R	N	A	M	E		T	E	S	T	:	.	.	3	4	5	6	7	8	9	0	

- Bottom Soft key labels are set to a maximum of 5 characters with the exception of the last soft key on the screen which may use up to a maximum of 6 characters (please see Figure 2). This is due to a limitation of screen space on the i2001.

Figure 2 i2001 - Login Display

- Soft key labels are limited to a small generic subsection of the previously used soft keys (“Ok”, “Cancel”, “Clear”, “Bkspc”, “Menu”, “Help”, “Yes” and “No”).
- Menu options are selected via a scrollable list (instead of being assigned to a soft key). Scrolling may be carried out using the up and down navigation. This allows menu options to be displayed in strings which may be up to a maximum of 20 displayable characters (see rule 1). This is advantageous for the following reasons:
  - — A greater area makes language translations easier.
  - — A more informative string may be displayed.
- The position within a scrollable list is displayed to the far right hand side of the display. 1 character space is reserved to show scroll position.

- All Menu Options in the scrollable list are numerically indexed with the shortcut key number assigned to that option. The numerical indexes will go from 1 – 9. Options above 9 will have no shortcut assigned/displayed next to the menu option
- A menu option may be selected by either highlighting the option (i2004) or viewing the option (i2002, i2001) and selecting “Ok”. Alternatively the appropriate shortcut key assigned to an option may be selected using the key pad. This will cause the user to jump straight into the menu option required without scrolling.
- All Menu Options are set to a recommended length of 12 characters (so they may be displayed in the context field on the i2004). Please see rule number 1) for further details.
- The Logout option is presented as the first option in the Menu Options List. This will avoid language translation issues on when using a soft key for the same operation.
- All user prompts will be presented on Information line 0 on the display. The maximum length of a prompt is 23 characters. Prompts beyond 23 characters will be cropped down to 22 characters and an ellipsis will be presented as the 23rd character to indicate cropping has taken place. Further text to describe the prompt is viewable on a help screen which is accessed by selecting a “Help” soft key (Please see Figure 3). The help screen presents text to the user by using scrolling pages (Please see Figure 4). The help screen has a maximum number of 255 characters (due to the scrolling functionality). The recommended word size is 24 characters (words exceeding this limit will be word wrapped onto the next line of the display).

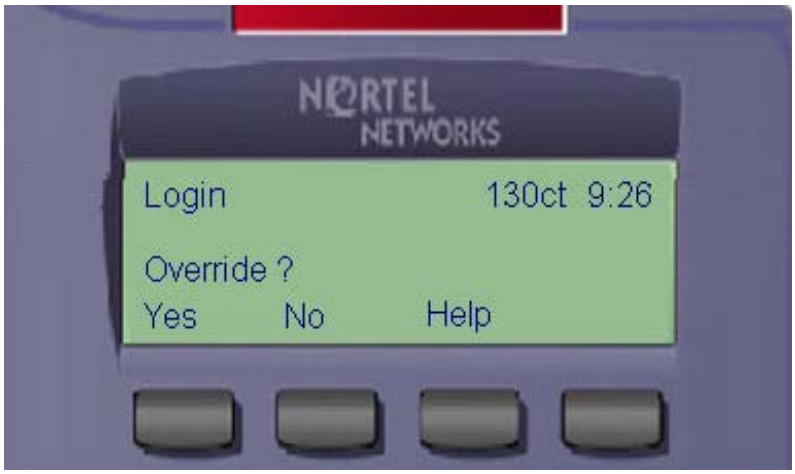

Figure 3 i2001- Override prompt

- User permissions disable

Figure 4 i2001 - Override Help screen

- The Menu system is accessible by either selecting the “Menu” softkey or by selecting the “service” physical key (please see at any time (idle or non-idle).

Figure 5 i2001 - Service key position (used to launch Menu system)

62.1.3 i2001 Display Rules

To show the information required to the user on such a restricted display, the following list of rules have been devised specifically for the i2001. The context-sensitive display that these rules entail are not as intuitive to use as that of the i2004, however there is no choice but to change the position and

visibility of information on the display depending upon context if that information is to be displayed at all.

- The Menu options are selected via a scrollable list.
- The relative position within the list is show to the far right of information line 0 via up and down arrows.

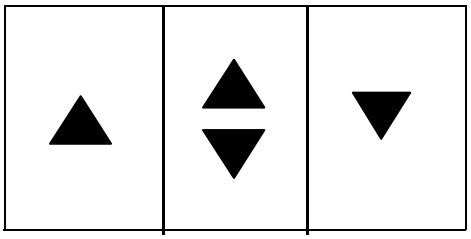

Figure 6 Example of navigation arrows

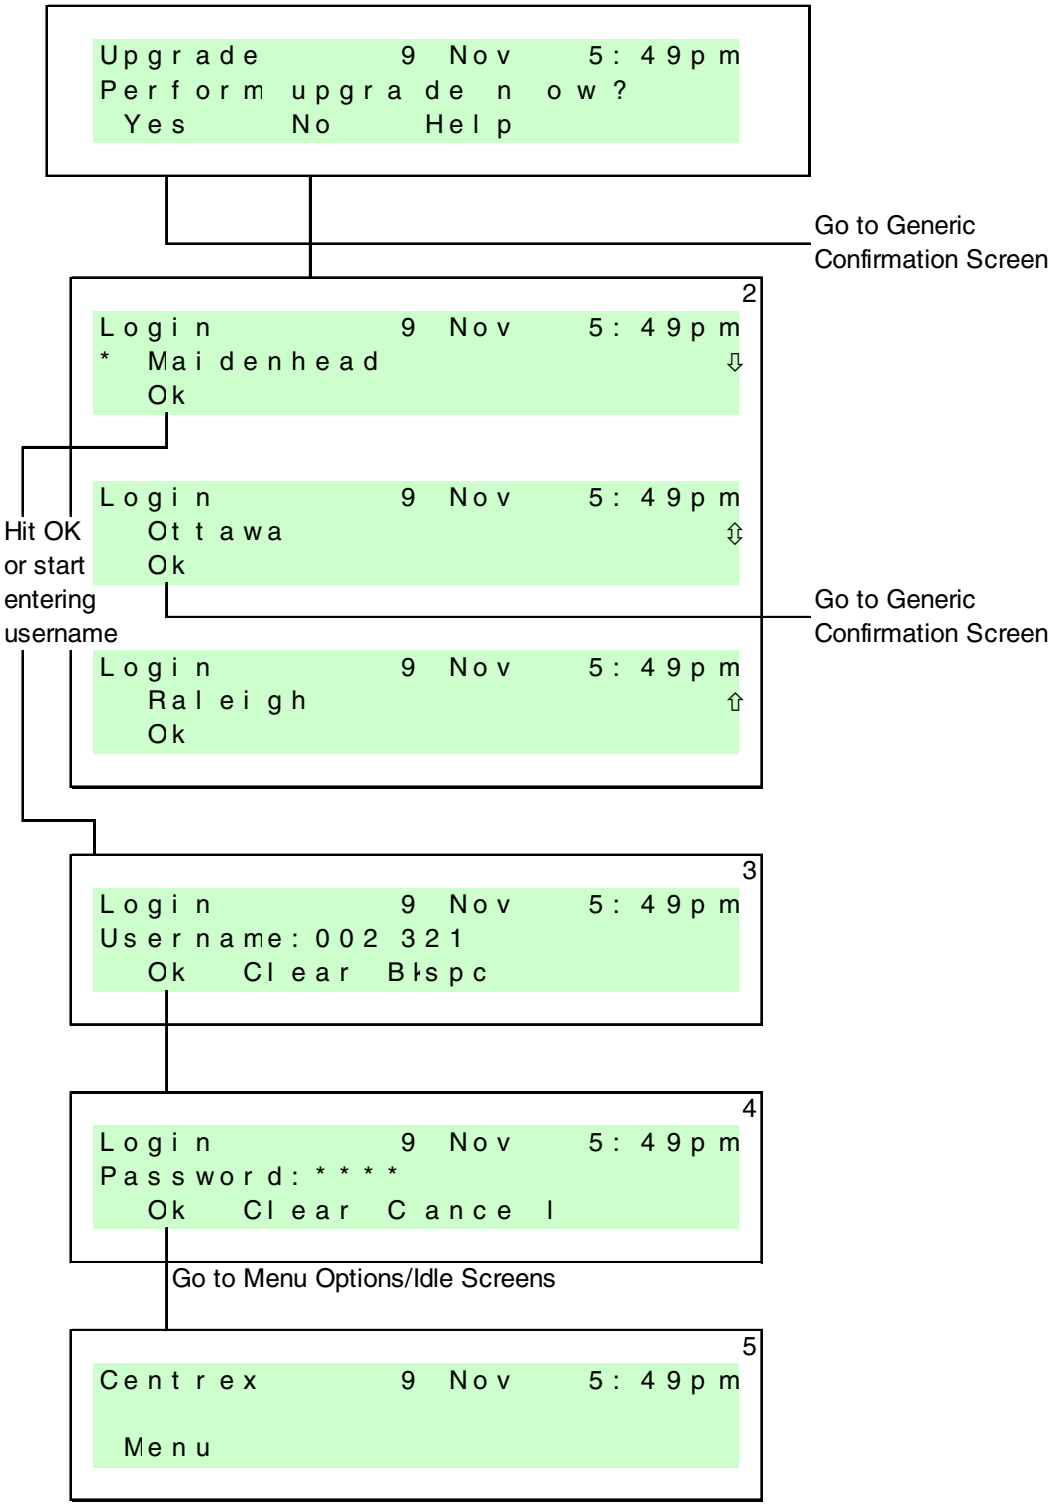
- Information line 1 is dedicated for the Soft keys.
- Time / Date displayed on context line.

62.1.4 i2001 Menu Map

The following screen representations show what will be presented to the user when logging on to a gateway, and navigating the menu options of the i2001.

62.1.4.1 Login Screens



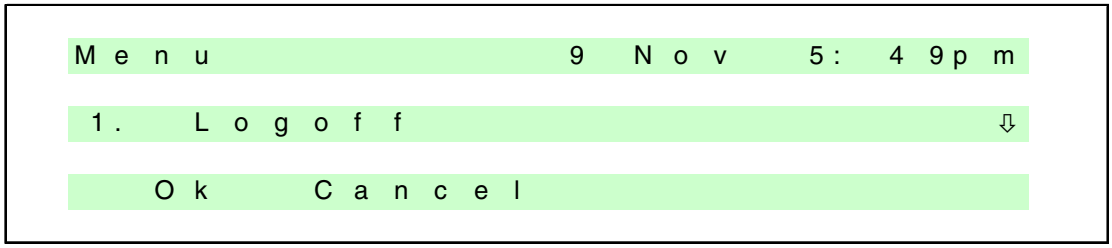
Screen 1 – Only shown if an upgrade is available / required.

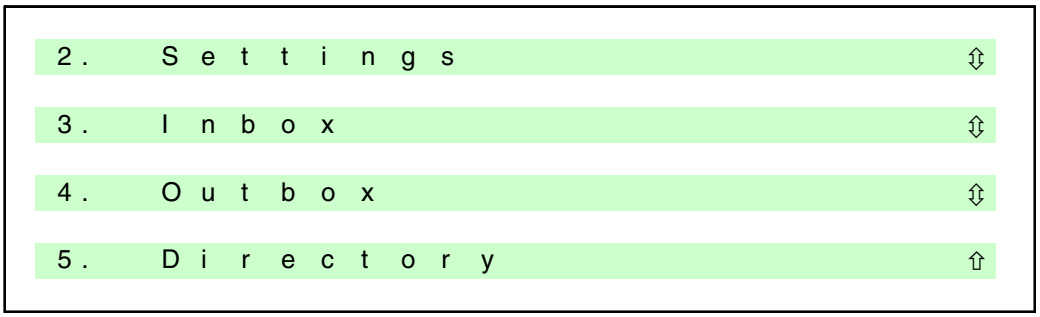
Screen 2 –Selective Gateway Login feature

Screen 2 – A user can either hit “Ok” to accept a gateway to login to, they will then be presented with Screen 3 to login. Alternatively the user may start entering their username digits and this will also accept the currently selected gateway, go to Screen 3 and insert the digit(s) already entered.

Screen 3 – If the username is too long for the display the digits entered will scroll to the left and an ellipsis will be shown to the left of the username to indicate this to the user.

62.1.4.2 Menu Option/Idle Screens



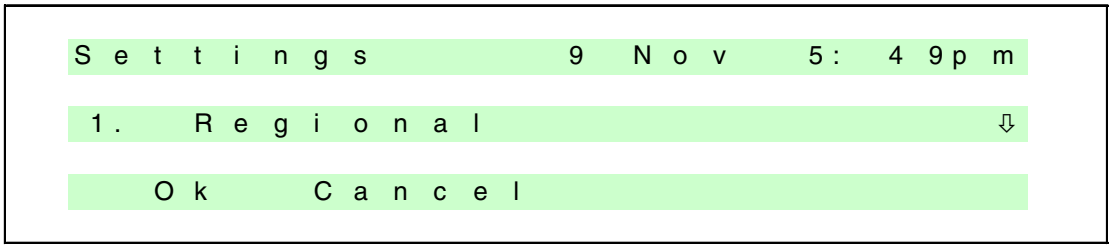


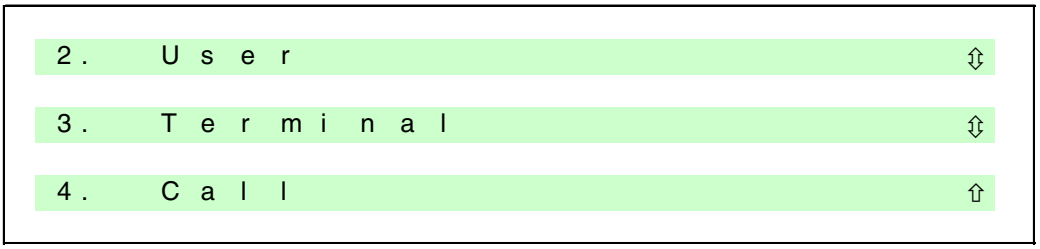
- Menu Option 1: Logoff – a Generic confirmation screen is displayed.
- Menu Option 2: Settings – launches the new i2001 settings menu.
- Menu Option 3: Inbox – Launches the inbox, Inbox is also available via dedicated Inbox key on terminal (i200x). The i2002 will be able to launch the inbox via both the menu and the dedicated key, the i2004 will only be able to access via its existing implementation of the dedicated key.
- Menu Option 4: Outbox – Launches the Outbox, the i2001 does not have a dedicated Outbox key and will only be able to access the Outbox via this

menu system, the i2002 and i2004 terminals will be able to launch the Outbox via the dedicated key. The i2002 will be able to access the Outbox via both the menu and the dedicated key. The i2004 will only access the outbox via the dedicated key.

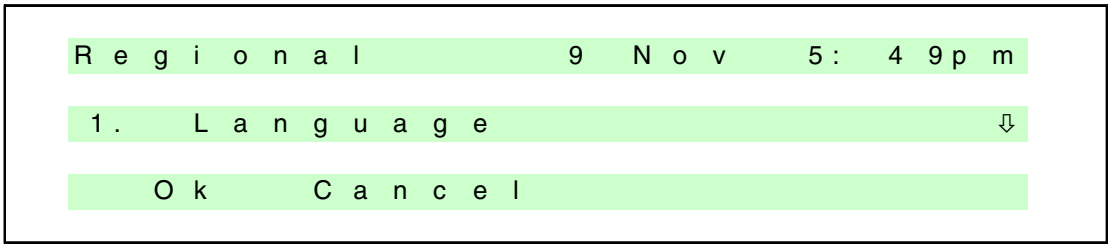
- Menu Option 5:Directory – Launches the directory contact list, the i2001 does not have a dedicated Directory key and will only be able to launch the directory via this menu system, the i2002 and i2004 have dedicated Directory keys to launch the directory

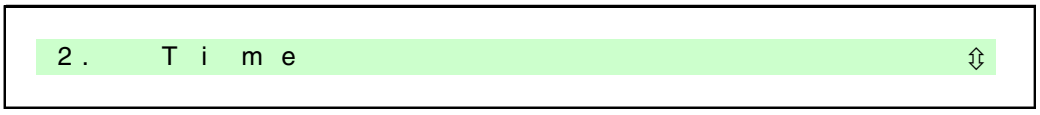
62.1.4.3 Menu Option: Settings



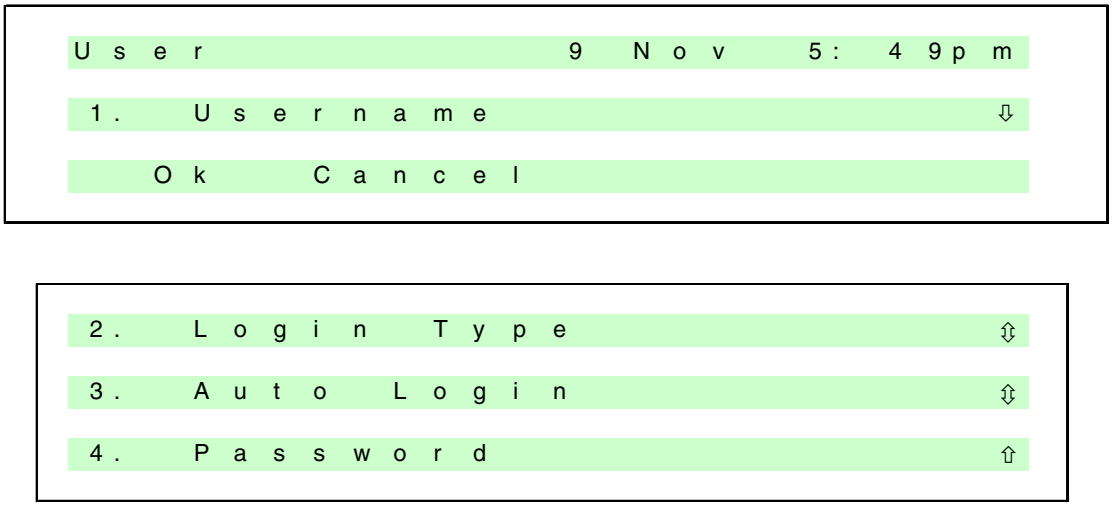


62.1.4.4 Menu Option: Regional Settings



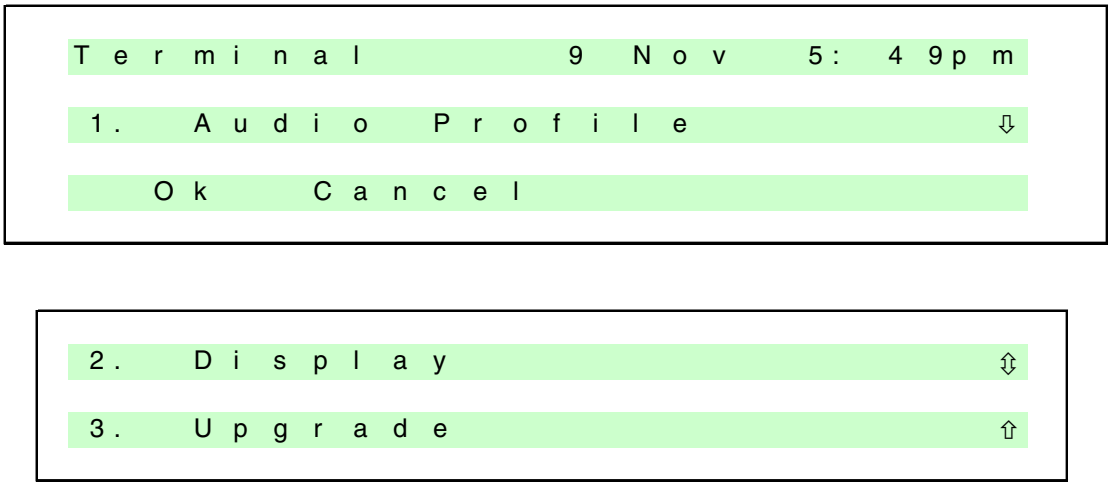


62.1.4.5 Menu Option: User Settings



See section 60.1.4.9 for details of user information screens.

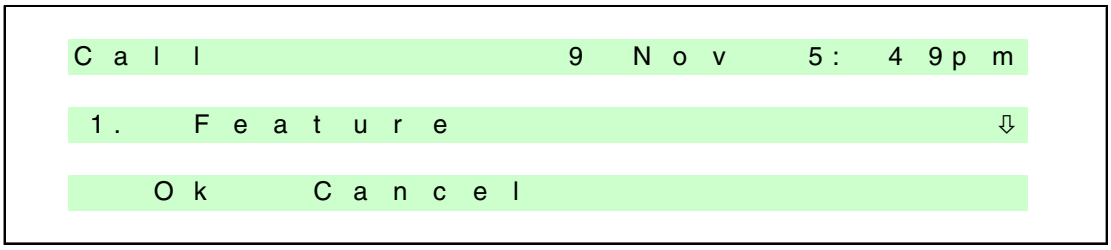
62.1.4.6 Menu Option: Terminal Settings

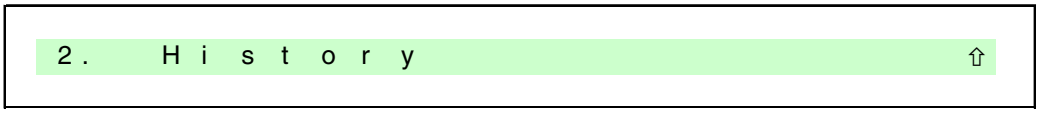


- Terminal Settings Option 1: Launches the Audio Profile menu.

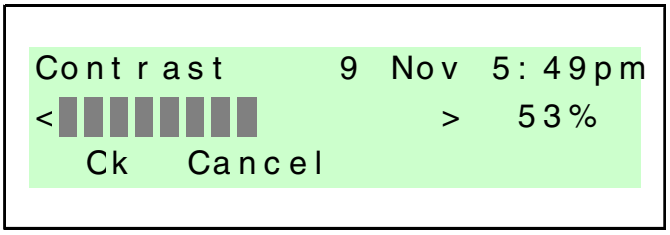
- Terminal Settings Option 2: Launches the display Contrast screen. (2.1.4.8)
- Terminal Settings Option 3: Launches the Upgrade confirmation menu, depending on if an upgrade is available or necessary.

62.1.4.7 Menu Option: Call Settings

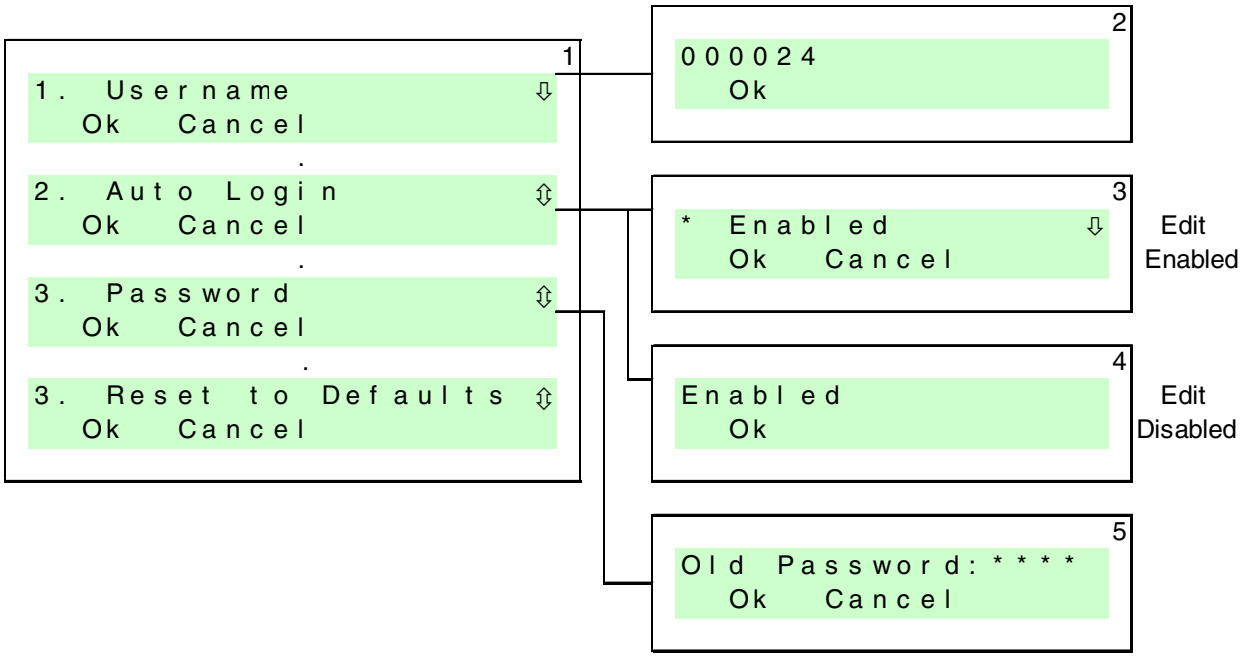




62.1.4.8 Display Contrast Screen



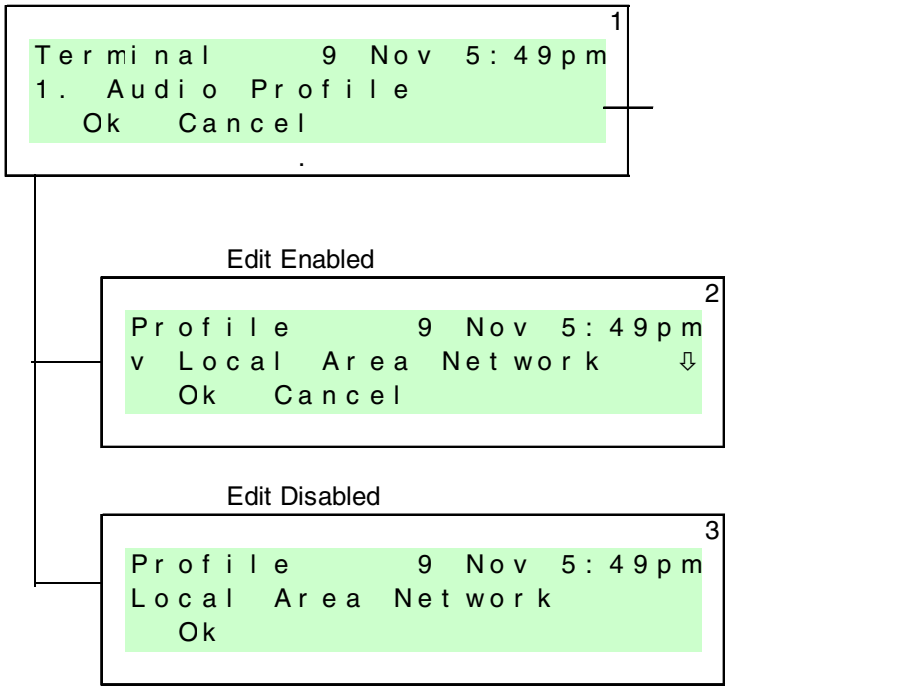
62.1.4.9 User Information Screens



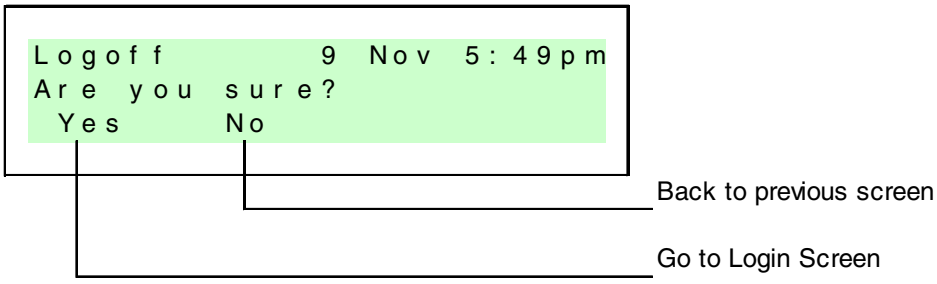
- Screen 3 – The user has permission to edit their Auto Login functionality. The user may enable/disable the feature from this screen.
- Screen 4 – The user has view permission to the Auto Login functionality. The user may only view what their current setting is.

  Note: NOTE: The permissions are configurable via the element manager in the user/user profile settings.

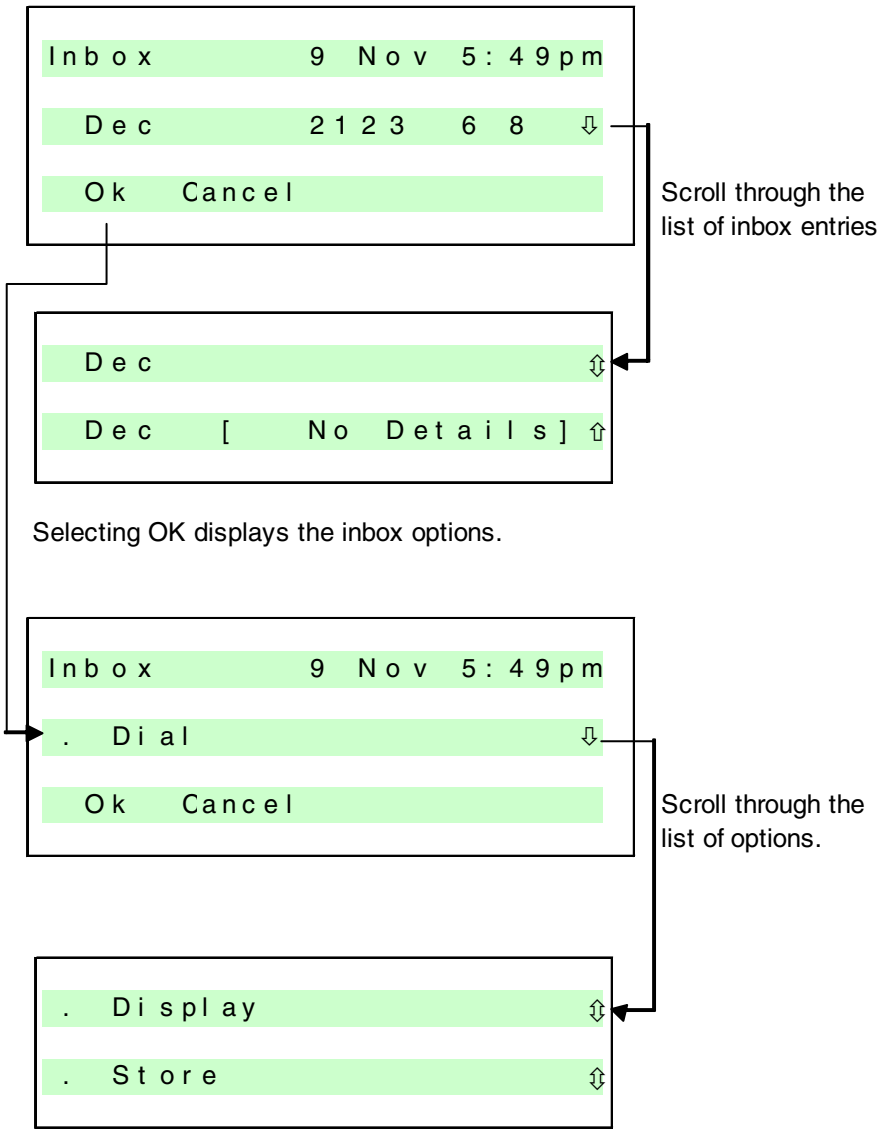
62.1.4.10 Audio Screens



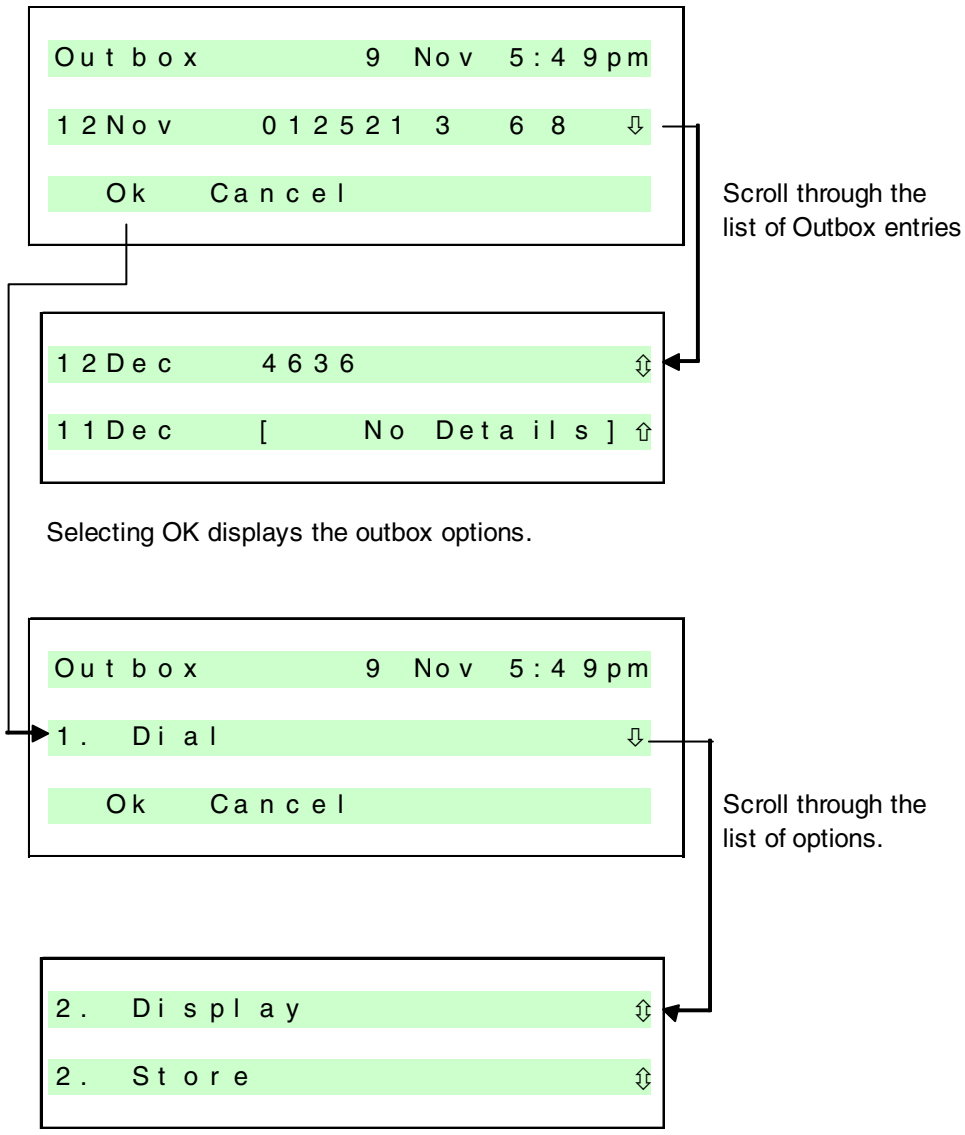
62.1.4.11 Generic Confirmation Screen



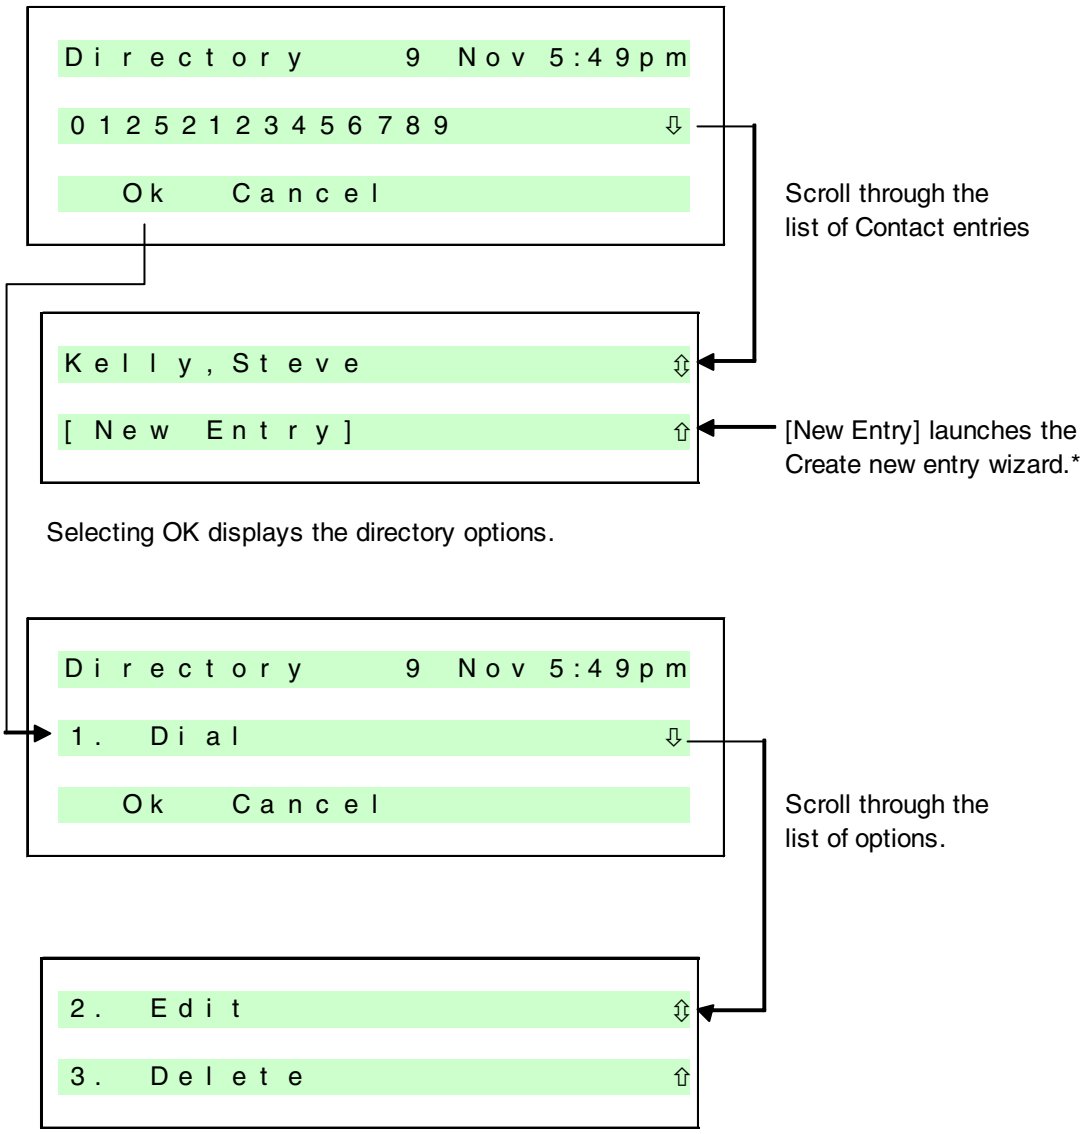
62.1.4.12 Inbox and submenu screens



62.1.4.13 Outbox and submenu screens

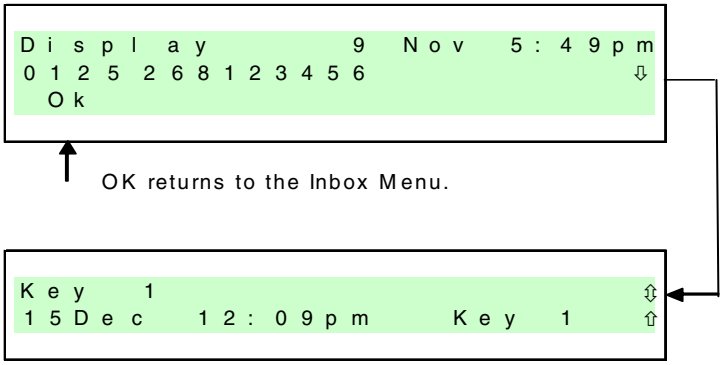


62.1.4.14 Directory display screens

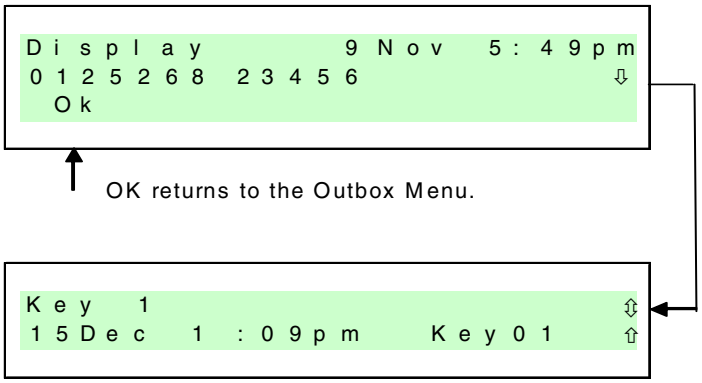


* The [New Entry] option may be ordered to feature at the top of the directory list, so upon entering th directory you will be presented with the first actual entry and press up to select [New Entry]

62.1.4.15 Inbox Display Screen

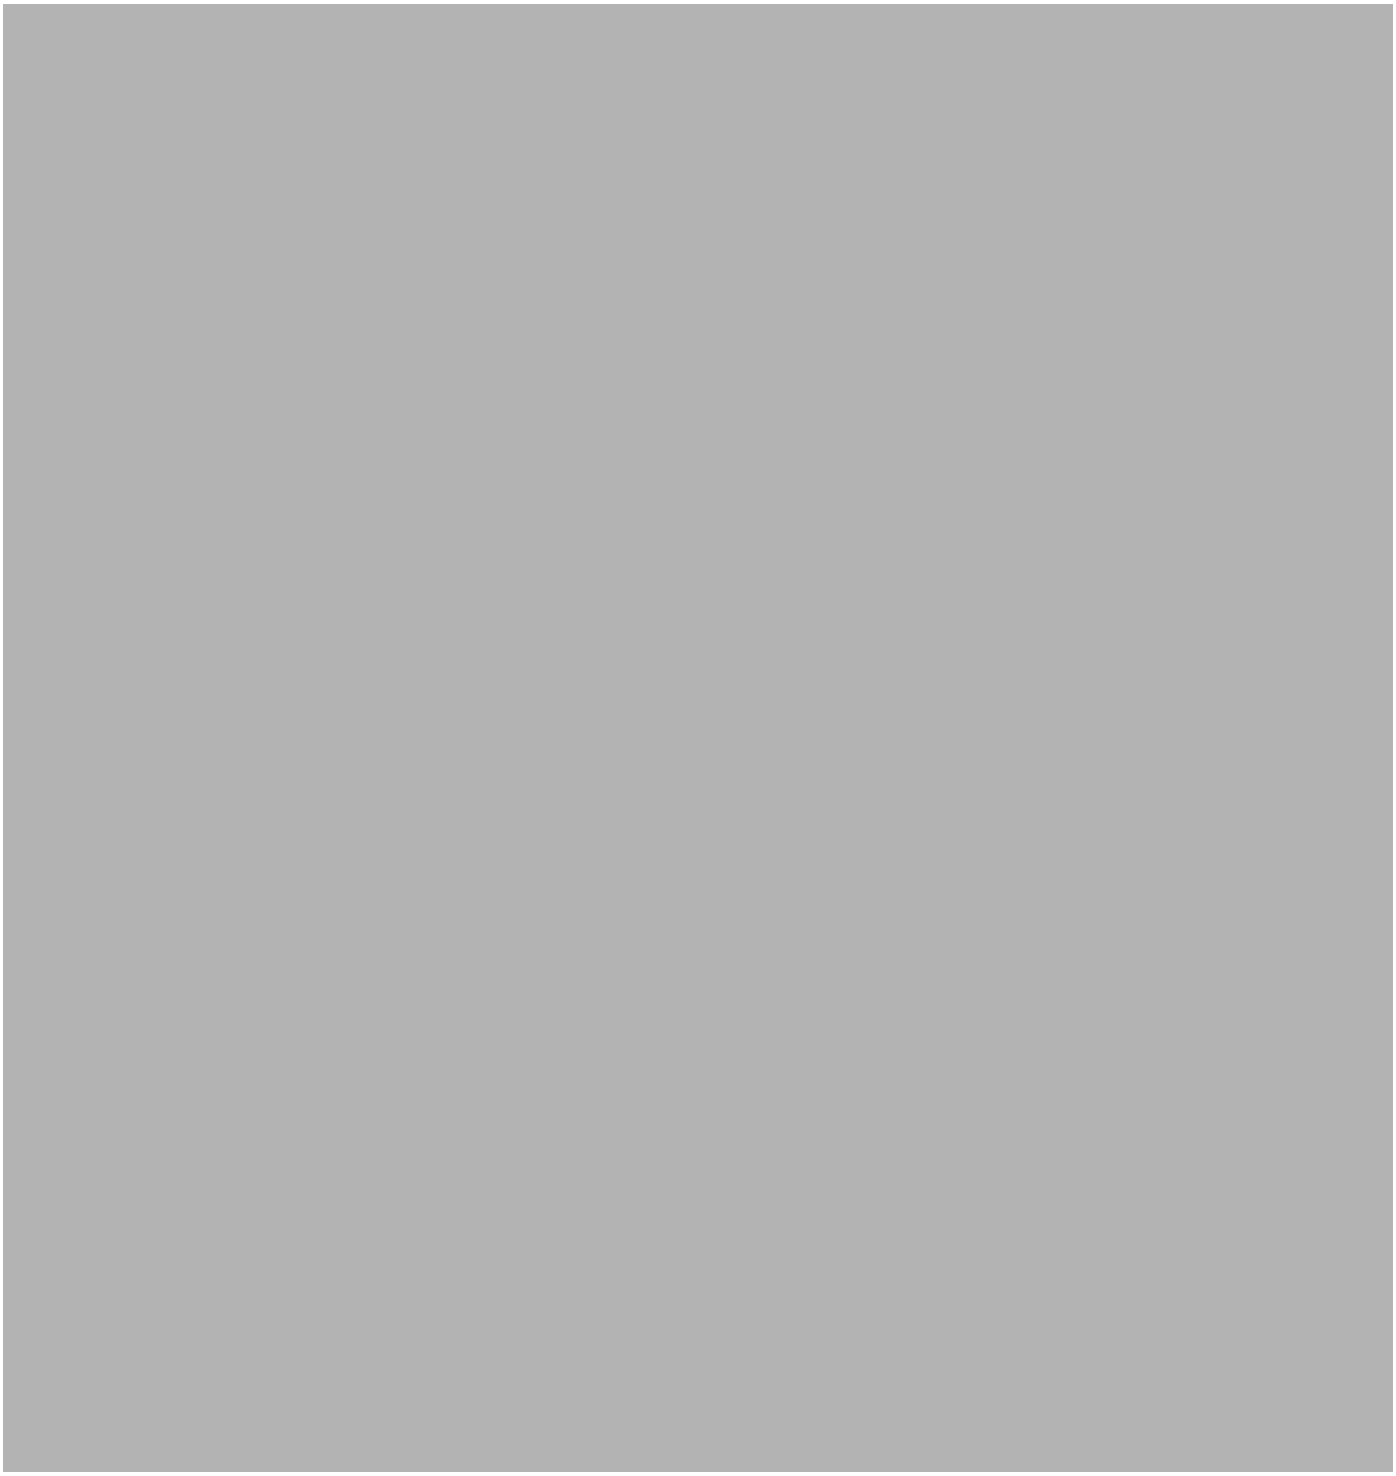


62.1.4.16 Outbox Display Screen



62.1.4.17 Directory Edit screens

62.1.4.18 Time display screens



62.1.4.19 Call History screens

62.1.5 Administration - Element Manager

Figure 7 Screen capture of terminal firmware upgrade page

The administration and configuration of the i2001 terminals will use the same pages which are already provided for the i2004 and i2002 terminals (See Figure 7).

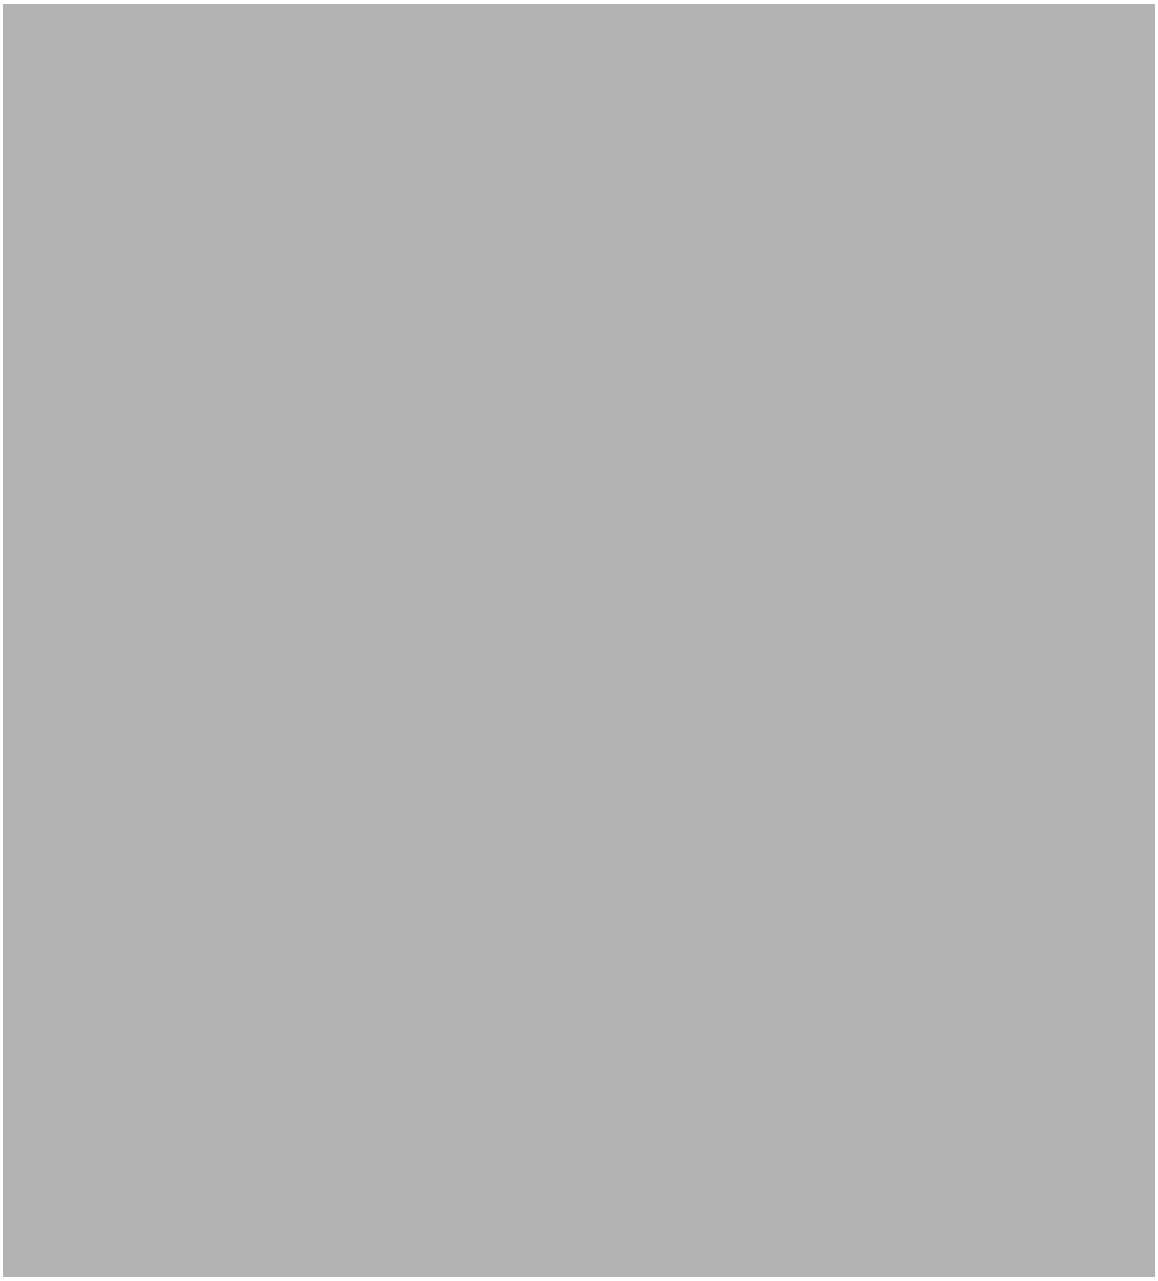


Figure 8 Screen capture of phase 2 terminal firmware upgrade page

User permissions will be editable via the user/user profile pages.

62.2 Interactions

62.2.1 Joint Sessions

The i2001 will only be able to have a joint session with the m6350 Softclient. In this scenario it will always adopt the master position in their master/slave

relationship. In this case, the i2001 will function in the same manner as the i2004.

There will be no support for the i2001 to have a joint session with another i200x.

62.3 Software Requirements or Dependencies

Firmware load *.bin will be used for the development of this feature on the i2001.

62.4 Interactions

This feature will change the existing menu system employed by the i2004 and i2002. Menu options previously displayed on the soft keys will be displayed in the main screen as a scrollable list (using the up and down navigation keys). The Soft keys will only be used for a small sub section of set functions.

The change is beneficial on the i2004 for the support of different languages as longer strings may be used for menu options. Problems had previously been encountered upon translating soft key options which were limited to only 7 characters i.e. a 7 character soft key in English may translate into a 9 character soft key in French which is not easily abbreviated.

62.5 References

63: Functional Description (FN): A00004205

63.1 Feature name

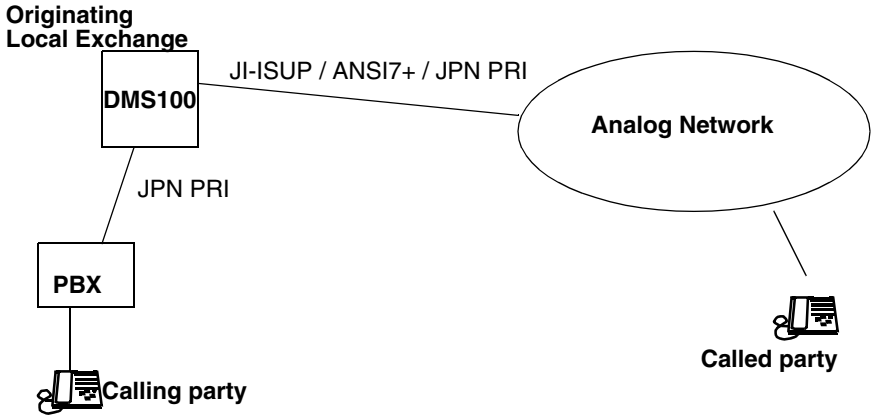
A00004205 - Japan PRI Backward Voice Path Solution

63.2 Description

63.2.1 Introduction

Some PBXs, upon receiving a PROGRESS or an ALERT message with PI#2 (Destination address is non-ISDN) on their Japan PRI interfaces do not open backward direction voice paths. As a result of this, although ring-back tone from destination side is available, PBX subscribers can not hear it. Currently, a PROGRESS message with PI#2 is sent back to the PBX when an ACM message with the pattern described in Section 63.2.2 is received in Japan PRI to Japan Interconnect ISUP(JI-ISUP)/ANSI7+ interworkings. Also currently, an ALERT message with PI#2 is sent back to the PBX when an ALERT message with PI#2 is received in Japan PRI to Japan PRI interworking (1).

Figure 1 Call scenario



The activity “Japan PRI Backward Voice Path Solution (A00004205)” implements in ISN07 the optional addition of a second progress indicator (PI#8: inband info available) to the PROGRESS/ALERT messages sent back to the call originating side like PBX.

Upon receiving the PI#8, the PBXs are expected to open their backward voice paths and resolve the ring-back tone problem described above.

The second PI is only added for the agents given in Figure 1, "Supported Agents and Directions"in the specified direction and it is added only if the switch-based option, that is introduced with activity, is enabled as described in Figure 63.2.3, "Activation of the PI#8 addition".

Table 1 Supported Agents and Directions

In the rest of this document, Japan PRI will refer to both Japan PRIv1 and Japan PRIv2, unless otherwise specified.

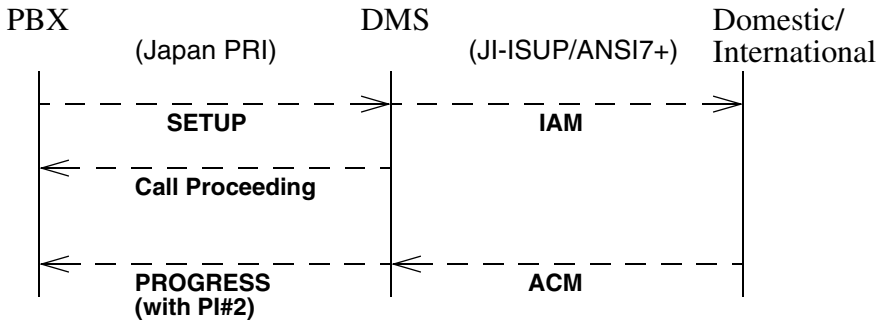
63.2.2 Background

A PROGRESS message with PI#2 is sent back to a JapanPRI trunk upon receiving an ACM message from Japan Interconnect ISUP (JI-ISUP) or ANSI7+ trunk with the following Backward Call Indicators (BCI):

Table 2 Current Backward Call Indicator to Progress Indicator mapping

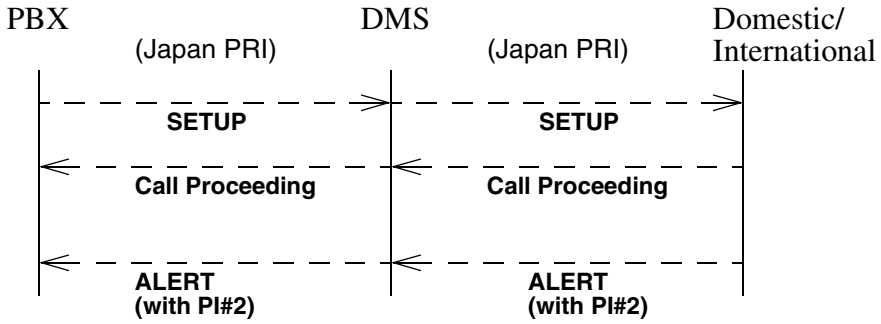
JI-ISUP	Japan PRI
Bit I=0 No interworking encountered Bit M=0 Terminating access is non-ISDN Bit DC=00 No indication	PI#2 (Destination address is non-ISDN)
ANSI7+ ISUP	**Japan PRI**
Bit I=0 No interworking encountered Bit M=0 Terminating access is non-ISDN Bit DC=00 No indication	PI#2 (Destination address is non-ISDN)

Figure 2 Current ACM to PROGRESS mapping



An ALERT message with PI#2 is sent back to a JapanPRI trunk upon receiving an ALERT message with PI#2 from JapanPRI trunk.

Figure 3 Current ALERT to ALERT mapping



63.2.3 Activation of the PI#8 addition

Activation and deactivation of this feature is only available per one DMS100 switch basis.

In order to activate the addition of the PI#8 back to the originating PBXs, ISERVOPT table should be datafilled as follows:

Table 3 ISERVOPT datafill example for JapanPRI option

SOPTSKEY SOPTSVAR
JAPANPRI JAPANPRI Y

The following table displays how datafilling the JapanPRI option will actually take place:

Table 4 Datafilling JapanPRI option in ISERVOPT table

```
>table iservopt
>add
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y

>y
TUPLE TO BE ADDED:
JAPANPRI JAPANPRI Y
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
JOURNAL FILE INACTIVE
```

63.2.4 Scenarios when PI#8 is not added

When JAPANPRI option in ISERVOPT table is not datafilled or when it is datafilled but ALLOW_BACKWARD_VOICE_PATH is set to ‘N’, the PI#8 will not be added to the PROGRESS/ALERT messages. Therefore in these conditions, ACM to PROGRESS mapping in Japan PRI to JI-ISUP/ANSI7+ interworkings and ALERT to ALERT mapping in Japan PRI to Japan PRI interworkings will be as described in section 63.2.2.

This will be the default behaviour of this feature, in order to prevent changing the existing behaviour after upgrades.

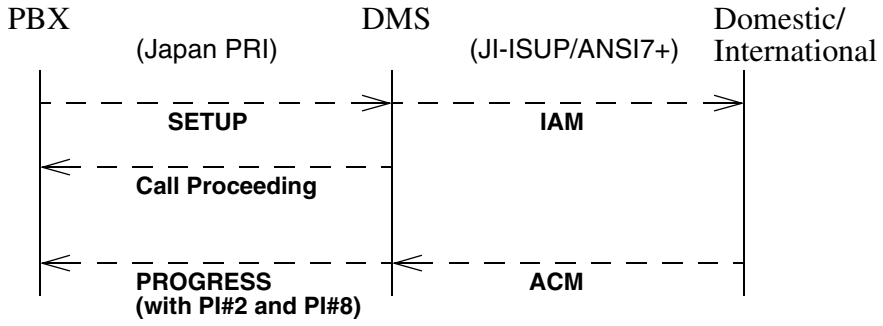
63.2.5 Scenarios when PI#8 is added

If the JAPANPRI option in ISERVOPT table is datafilled and ALLOW_BACKWARD_VOICE_PATH option is set to ‘Y’, then a PROGRESS message with a second PI#8 will be sent back to a JapanPRI trunk upon receiving an ACM message from JI-ISUP or ANSI7+ trunk with the following Backward Call Indicators (BCI):

Table 5 Desired Backward Call Indicator to Progress Indicator mapping

JI-ISUP	Japan PRI
Bit I=0 No interworking encountered Bit M=0 Terminating access is non-ISDN Bit DC=00 No indication	PI#2 (Destination address is non-ISDN) PI#8 (Inband Info Available)
ANSI7+ ISUP	**Japan PRI**
Bit I=0 No interworking encountered Bit M=0 Terminating access is non-ISDN Bit DC=00 No indication	PI#2 (Destination address is non-ISDN) PI#8 (Inband Info Available)

Figure 4 Desired ACM to PROGRESS mapping



If the JAPANPRI option in ISERVOPT table is datafilled and ALLOW_BACKWARD_VOICE_PATH option is set to ‘Y’ then an ALERT message with a second PI#8 will be sent back to a JapanPRI trunk upon receiving an ALERT message from JapanPRI trunk.

64: Functional Description (FN): A00004503

64.1 Feature name

Calling Party Number Serving Country Code(SCC)

64.2 Description

64.2.1 Notation

The following notations are used throughout the whole document.

Switch: DMS-GSP Switch

Outpulsing/Terminating CLI: Outgoing CGPN

Callp: Call Processing

EISUPV1: ETSI ISUP Version 1

EISUPV2: ETSI ISUP Version 2

64.2.2 Introduction

This document describes the feature ‘Calling Party Number Serving Country Code(SCC))’ which is implemented in GSPISN07 for GSP product(i.e. datafillable on Axxess trunks).

This feature enhances the feature AD9743 by introducing the ability to deactivate the terminating SCC processing for Calling Party Number (CGPN) for ANSI ISUP, ETSI ISUP V1, ETSI ISUP V2, RBTUP and BBTUP agencies.

Terminating SCC processing is controlled via the SCC field of the xxATTR tables (i.e. ISUPATTR, TUPATTR) and applies to both the CGPN and CDPN by removing the country code and changing the CGPN and CDPN Nature of Address (NOA) to National.

With this feature, terminating SCC functionality may be deactivated for the Calling Party Number parameter independent from Called Party Number (CDPN) on a per trunk basis.

64.2.2.1 The background for the requirement

According to the feature for SCC Processing (AD9743), SCC functionality’s aspect is that; when a global carrier switch such as the DMS-GSP is translating calls received from or destined for different countries, it can be difficult to

establish a database of calling numbers due to potential conflicts between each country's number formats. Additionally, when terminating international calls into a certain country, the national dialing plan might require conversion of the called and calling address from international to national formats. The Serving Country Code (SCC) functionality in feature AD9743 is designed to address these issues.

DMS takes off the country code (CC) (implemented in the existing feature AD9743) in the Calling Party Number Parameter in some case and consequently some organizations will delete the CLID when there is no CC or the NOA (nature of address) is set to National or in the worse case, they will reject the call.

This feature introduces the functionality where it is possible to disable the CGPN terminating SCC functionality inside the GSP.

64.2.3 Description of Feature

The feature "Calling Party Number SCC" is implemented in GSPISN07 for GSP product(i.e. datafillable on Axxess trunks).

With this feature, the country code may be always present on the CGPN even when the calls are terminating in country while at the same time have it stripped for the CDPN.

Feature introduces the ability to deactivate terminating SCC processing on the CGPN independently of the CDPN and this is done on a per trunk group basis. Following agencies are supported by this feature:

· ANSI ISUP

· ETSI ISUP V1

· ETSI ISUP V2

· RBTUP

· BBTUP

A new field is introduced in table TRKGRP to provide control for deactivation of terminating SCC processing for CGPN on a per trunk basis.

- the originating Calling Party Number(CG) SCC functionality remains unchanged

- the terminating SCC functionality for CDPN remains unchanged.

A new field in Table TRKGRP is defined to activate/deactivate terminating CGPN SCC processing in order to make terminating CGPN SCC processing independent from terminating CDPN SCC processing. While building up the CGPN in IAM/IAI/INF message this field is checked in order to decide if the terminating SCC processing will be active or not.

- If the field(CGSCCDEA) is set to 'Y' then terminating CGPN SCC processing is deactivated, that is, no SCC processing will be performed on the CGPN, CGPN remaining unchanged from the original received format.
- If the field is set to 'N' then terminating CGPN SCC processing is not deactivated, that is, the existing terminating SCC processing continues to work for CGPN.

This feature provides an optionality for terminating CGPN SCC processing by changing the new field in TRKGRP table. When this boolean field(CGSCCDEA) is set to 'N', the system behaves as it was before this functionality, that is, it performs SCC processing on that trunk (ref. AD9743FN, section 1.4.9.2).

64.2.3.1 Existing Behavior

Below is a background and only a quote for summary for the Feature AD9743. For details please refer to the FN section of that feature.

Feature for SCC processing AD9743 functions as below:

1. Call Origination to the GSP: Convert a received Calling Party Number (CLI) from national to international format before performing any CLI screening (in this way, CLIs can be datafilled for each country). This involves prefixing the SCC and changing the NOA/TON to "International".

2. Call Termination: Convert the Called Party Number from International to National format (thus, stripping the country code and changing the NOA/TON to "National").

3. Call Termination: Convert the CLI to national format by stripping the country code and changing the NOA/TON back to "National".

This feature only enhances the call termination functionality of feature AD9743 mentioned above as the thirs item.

In order to invoke the SCC feature AD9743, only the Serving Country Code(SCC) is datafilled according to trunk's protocol type. The SCC is assigned to a trunk in ISUPATTR, PRIATTR, TUPATTR or CASATTR (only for C5). Below table illustrates the tuples and datafills for the table ISUPATTR.

Figure 1 Terminating CGPN SCC Processing according to AD9743

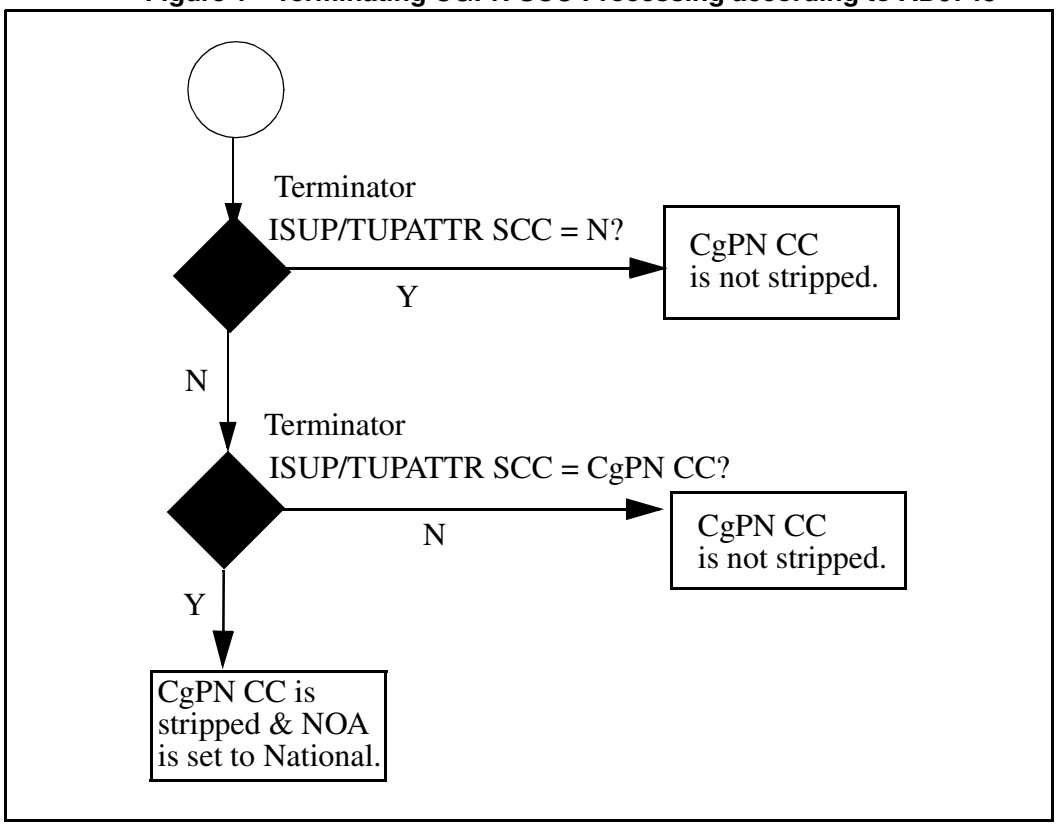

Figure 1 illustrates terminating CGPN SCC processing according to feature AD9743. During termination further processing is needed for an International ANI. If the call is terminating within the same country it originated, then the Country Code from the CGPN needs to be stripped off. To determine if the call is terminating in the same country, the Serving Country Code for the terminating agency in table xxxATTR is compared to the Country Code of the Calling Party Number. If the SCC and CC match then the CC is stripped off from the CGPN and the NOA of the CGPN is set to National. Stripping will not occur if SCC and CC mismatch or if SCC is datafilled as N in table xxxATTR.

In the feature AD9743, the Serving Country Code is a parameter in the tables ISUPATTR and TUPATTR. This field has a NIL option of N if no SCC is datafilled. The range for the SCC parameter is 1 to 3 digits. The SCC is used to create International ANIs out of the incoming Calling Party Number.

64.2.3.2 Functionality Introduced with this Feature

This feature enhances the feature AD9743 by providing an optionality that, for the terminating agents of the supported protocols (ANSI ISUP, ETSI ISUP V1, ETSI ISUP V2, RBTUP, BBTUP) SCC processing for CGPN may be

deactivated according to the new boolean field(CGSCCDEA) in table TRKGRP.

This feature functions for the default CLI being built inside the GSP switch as well.

Below is the TRKGRP table with the new field CGSCCDEA and some examples:

Table 2 Table TRKGRP

```
>table trkgrp
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: ISUPATTR
>format pack;lis
<line length>:   76 columns can be output per line.
<pack mode>:     Pack mode is ON.
<indent column>: Indented lines will begin in column 1.
<first column>:  The first column of output is column 1.

```

Figure 2 Terminating CGPN SCC Processing introduced by this feature

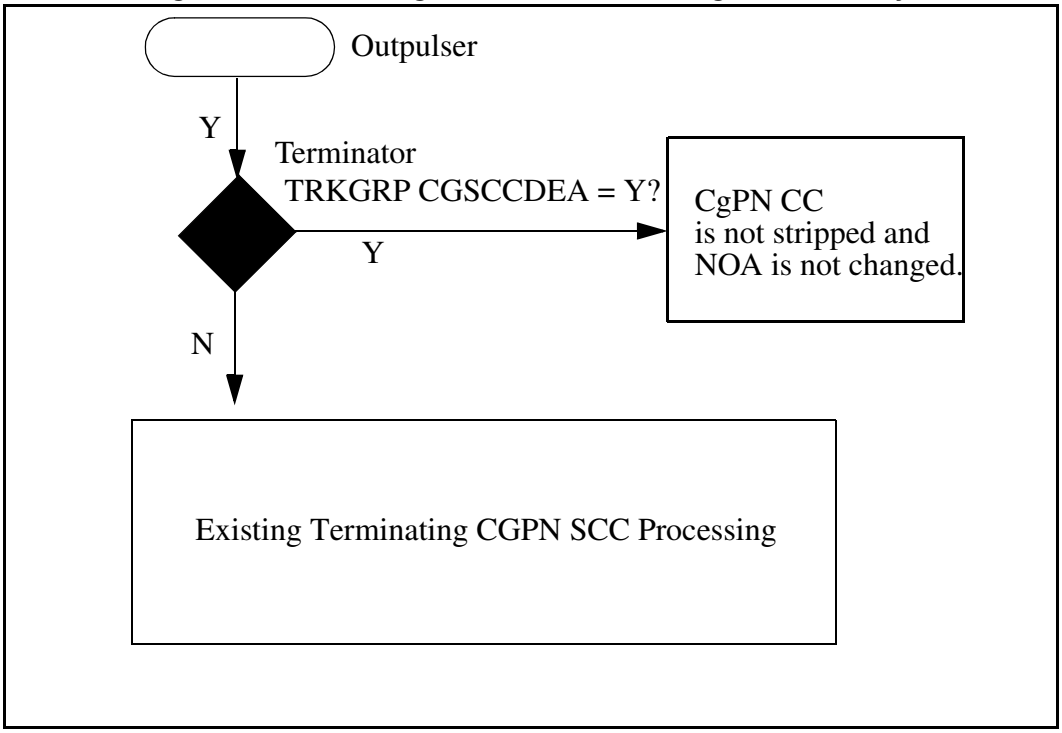

Figure 3 illustrates the terminating CGPN SCC processing introduced by this feature. The new field in table TRKGRP is checked to activate/deactivate terminating SCC processing in order to make terminating CGPN SCC processing independent from CDPN processing.

When building up the outgoing IAM / INF/IAI message this field is checked in order to determine whether the SCC will be stripped off or not.

- If the field is ‘Y’, then there will not be any SCC processing on CGPN and CGPN will be left as it is.
- If the field in table TRKGRP for the terminating trunk agent is ‘N’, then the existing SCC processing will continue to work for CGPN as in the functionality of feature AD9743.

64.2.4 Activation of Feature

This feature is functional for ANSI ISUP, ETSI ISUP V1, ETSI ISUP V2, RBTUP and BBTUP agencies. For the other protocols and variants, this feature is not functional.

The new field will be set to ‘N’ by default for all axxess trunks including incoming, outgoing and two-way trunks. But it will be functional for only outgoing and two-way trunks.

The default value for the newly introduced field ‘CGSCCDEA’ is ‘N’.

CGSCCDEA field can be set to ‘Y’ for only terminating ANSI ISUP, ETSI ISUP V1, ETSI ISUP V2, RBTUP and BBTUP trunks.Please refer to “Limitations/Restrictions“ section of this document for details.

64.2.4.1 New field CGSCCDEA in TRKGRP

To control the SCC processing on per trunk basis, a new boolean field CGSCCDEA is added to TRKGRP table for each trunk having the possible values ‘Y’ representing ‘YES’ and ‘N’ representing “NO’.

Figure 3 Activating/ Deactivating Terminating CGPN SCC Proces

```
>table trkgrp
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: TRKGRP
>pos GANSIE1STEP1
GANSIE1STEP1 AXXESS 0 NPDGP NCIT 2W ODP1 MIDL 16 7 16 16 4 5 4
ALERTING
NIL_COSGRP 0 901 NONE 0 0 NIL_CUST 1 Y Y NODEF NO_OVERRIDE
VOICE_DATA Y ALL
N 1 0 0 0 N N NIL NIL ISUP (NETINFO) $ 0 STD N Y NIL 0 N

>pos GANSIE1STEP2
GANSIE1STEP2 AXXESS 0 NPDGP NCIT 2W ODP2 MIDL 16 7 16 16 4 5 4
ALERTING
NIL_COSGRP 0 901 NONE 0 0 NIL_CUST 1 Y Y NODEF NO_OVERRIDE
VOICE_DATA Y ALL
N 1 0 0 0 N N NIL NIL ISUP (NETINFO) $ 0 STD N Y NIL 0 Y
```

As seen from the figure 3, CGSCCDEA field in TRKGRP table is represented as ‘Y’ or ‘N’ and for all axxess trunks it is set to ‘N’ by default.

64.2.4.2 TABLE CONTROL

A new field ’CGSCCDEA’ is introduced for AXXESS trunks in Table TRKGRP.

- The default value of the new field ’CGSCCDEA’ is ’N’ for all trunks
- For ETSI ISUP V1, ETSI ISUPV2, ANSI, RBTUP and BBTUP trunks CGCCDEA field can be set to ’Y’ to deactivate the terminating SCC processing for CGPN which means for the trunks that have this new field set to ’Y’, Country Code is not going to be stripped off and NOA is not going to be changed while outpulsing the CGPN on the terminating side.

The limitations and restrictions for setting and changing the CGSCCDEA field is mentioned in “Limitations and Restrictions“ section of this document.

64.2.4.3 SIGNALLING:

When a CPGN is received from incoming side with NOA: INTL and SCC code is prefixed in IAM message:

- If the CGSCCDEA is set to ’N’ in Table TRKGRP, ‘terminating CGPN SCC processing’ will work according to feature AD9743; if the SCC prefix in CGPN matches the SCC datafill in TUPATTR/ISUPATTR tables for the outgoing trunk SCC will be stripped off and the NOA will be set to NATL for CGPN in outpulsed IAM message.
- If the CGSCCDEA is set to ’Y’ in Table TRKGRP, CGPN will be outpulsed as received.

When an INR message is received from terminating switch; while outpulsing the CGPN in INF message (if the CGPN to be sent has the NOA INTL and SCC code prefix):

- If the CGSCCDEA is set to ’N’ in Table TRKGRP, terminating CGPN SCC processing will work according to feature AD9743; if the SCC prefix in CGPN matches the SCC datafill in TUPATTR/ISUPATTR tables for the outgoing trunk SCC will be stripped off and the NOA will be set to NATL for CGPN in outpulsed INF message.
- If the CGSCCDEA is set to ’Y’ in Table TRKGRP, CGPN will be outpulsed with NOA INTL and SCC code prefix in INF message.

This functionality is introduced for interworkings which have the terminating side protocols: ETSI ISUP V1, ETSI ISUP V2, ANSI ISUP, RBTUP/BBTUP.

64.3 Hardware Requirements or Dependencies

None.

64.4 Software Requirements or Dependencies

None.

64.5 Limitations and restrictions

This functionality is introduced for interworkings which have the terminating side protocols: ETSI ISUP V1, ETSI ISUP V2, ANSI ISUP, RBTUP/BBTUP.

The new field will be set to ‘N’ by default for all axxess trunks including incoming, outgoing and two-way trunks. But it will be functional for only outgoing and two-way trunks.

As for datafill changes there are some restrictions and limitations:

64.5.1 When attempting to change the value of CGSCCDEA field in table TRKGRP:

For axxess trunks other than ETSI ISUP V1, ETSI ISUPV2, ANSI, RBTUP and BBTUP, CGCCDEA field CAN NOT be changed to 'Y'.

If the field is attempted to be changed from 'N' to 'Y' for any AXXESS trunks other than ETSI ISUP V1, ETSI ISUPV2, ANSI, RBTUP and BBTUP, error messages are displayed and modification can not be realized:

- For trunks other than ISUP/TUP:

"CGSCCDEA can be set to Y for ISUP and TUP protocols."

- For ISUP trunks other than ETSI ISUP V1, V2 and ANSI ISUP:

"CGSCCDEA can be set to Y for ISUP trunks datafilled in Table ISUPATTR

as ETSI ISUP V1,ETSI ISUP V2 and ANSI ISUP."

- For TUP trunks other than RBTUP/BBTUP:

"CGSCCDEA can be set to Y for TUP trunks datafilled in Table TUPATTR as RBTUP/BBTUP."

64.5.2 When attempting to change the value of Protocol field in table TRKGRP:

For axxess trunks if the CGCCDEA field is 'Y', the 'Protocol' field in Table Trkgrp cannot be changed to any protocol other than ISUP and TUP.

If the Protocol field is attempted to be changed from ISUP or TUP to any other protocol, an error message is displayed and modification can not be realized.

- For an Axxess trunk with the CGSCCDEA field 'Y' and protocol field ISUP or TUP in table TRKGRP:

"CGSCCDEA can be set to Y for ISUP and TUP protocols."

64.5.3 When attempting to change the value of Protidx field in table TRKGRP:

For axxess trunks if the CGCCDEA field is 'Y', the 'Protidx' field in Table Trkgrp cannot be changed to any index other than the indexes representing the supported variants.

If the Protidx field is attempted to be changed from an index representing a supported variant to any other index of an unsupported variant, an error message is displayed and modification can not be realized.

- For an Axxess trunk with the CGSCCDEA field ‘Y’ and protidx field in table TRKGRP representing a supported variant of ISUP:

“CGSCCDEA can be set to Y for ISUP trunks datafilled

in Table ISUPATTR as ETSI ISUP V1,ETSI ISUP V2 and ANSI ISUP.”

- For an Axxess trunk with the CGSCCDEA field ‘Y’ and protidx field in table TRKGRP representing a supported variant of TUP:

“CGSCCDEA can be set to Y for TUP trunks datafilled in Table TUPATTR as RBTUP/BBTUP.”

64.5.4 While adding a new AXXESS trunk in Table TRKGRP:

Following error messages are displayed if the new trunk has the CGSCCDEA field as ’Y’ and the trunk is not a ETSI ISUP V1, ETSI ISUPV2, ANSI, RBTUP and BBTUP TRUNK.

- For trunks other than ISUP/TUP:

“CGSCCDEA can be set to Y for ISUP and TUP protocols.”

- For ISUP trunks other than ETSI ISUP V1, V2 and ANSI ISUP:

“CGSCCDEA can be set to Y for ISUP trunks datafilled in Table ISUPATTR

as ETSI ISUP V1,ETSI ISUP V2 and ANSI ISUP.”

- For TUP trunks other than RBTUP/BBTUP:

“CGSCCDEA can be set to Y for TUP trunks datafilled in Table TUPATTR as RBTUP/BBTUP.”

64.5.5 When CGSCCDEA field is set to ’Y’ :

For any of the trunks ETSI ISUP V1, ETSI ISUP V2 ,ANSI, RBTUP, BBTUP; an error message is displayed under the name of the trunk which has the CGSCCDEA field set to ’Y’ if there is an attempt to change the protocol in ISUPATTR/TUPATTR tables to a value other than ETSI V1, ETSI V2 , ANSI and RBTUP (protocols that do not support CGPN SCC deactivation) and it is not permitted to change the protocol variant in ISUPATTR/TUPATTR tables unless the CGSCCDEA field is changed to ‘N’ for all related trunks.

- “CGSCCDEA field is set to Y in Table TRKGRP”

64.6 Interactions

This feature is an enhancement of the SCC processing function in feature AD9743.

65: Functional Description (FN): A00004563

65.1 Feature name

Activity a00004563: Moroccan ISUP v2 on DMS100

65.2 Description

This activity addresses the following functionality:

1. Introduction of Moroccan ISUP version 2 as a new variant of ETSI ISUP version 2 signaling protocol
2. Support for Moroccan ISUP v2 - Moroccan ISUP v2 interworking
3. Tandem exchange functionality related to the following ISUP messages in a Moroccan ISUP v2 - Moroccan ISUP v2 interworking:
   - Charge (CRG)
   - Information Request (INR)
   - Information (INF)

The Moroccan ISUP v2 is built upon ETSI ISUP v2 BASE variant.

The requirements for Moroccan ISUP v2 are stated in Maroc Telecom Specific Requirements version 1.5.

65.2.1 Introduction of New Variant

The Moroccan ISUP v2 variant is introduced to the DMS. As a result, it is possible to perform calls over a trunkgroup that is datafilled as of Moroccan ISUP v2 variant.

The following is a sample datafill in table TRKSGRP for outgoing (OG), incoming (IC) and two-way (2W) Moroccan ISUP v2 trunks:

Figure 1 Sample TRKSGRP datafill for Moroccan ISUP v2 trunks

```
TABLE: TRKSGRP
SGRPKEY CARDCODE SGRPVAR SGRPVAR
-------------------------------
OGMRISUPV2 0 DS1SIG C7UP OG N N UNEQ NONE Q767 THRH 0 DMS N N
MOROCCO 100_WHITE $ OGN7

ICMRISUPV2 0 DS1SIG C7UP IC N N UNEQ NONE Q767 THRH DMS

2WMRISUPV2 0 DS1SIG C7UP 2W N N UNEQ NONE Q767 THRH 0 DMS N N
MOROCCO 100_WHITE $ 2WN7 CIC
```

Table C7UPTMR is used to datafill the signaling timers applying to a specific trunk subgroup in table TRKSGRP. Table C7UPTMR is not modified by this activity but an example is presented here for completeness.

Figure 2 Sample C7UPTMR datafill for Moroccan ISUP v2 timers

65.2.2 Interworking Support

This activity supports **only** Moroccan ISUP v2 - Moroccan ISUP v2 interworking.

For other interworkings supported by Moroccan ISUP v2, please refer to the following activity documentation:

- a00004563: Line to Moroccan ISUP V2 Interworking
- a00004560: Moroccan ISUP - ISDN Interworking
- a00004557: Moroccan R2 and Interworkings

65.2.3 Supported Messages and Parameters

65.2.3.1 Supported Messages

This activity supports the ISUP v2 messages presented in Table 1, “Supported Messages in Moroccan ISUP v2,” on page 1347”. Please note that the level of support is restricted to **tandem exchange functionality only**.

Table 1 Supported Messages in Moroccan ISUP v2

65.2.3.2 Supported Parameters

The set of parameters supported in Moroccan ISUP v2 messages is the same as in ETSI ISUP v2 BASE variant, unless otherwise stated.

The differences with respect to the ETSI ISUP v2 BASE variant are listed in the subsequent tables. Please note that the level of support is restricted to **tandem exchange functionality only** for all parameters.

- A parameter of type “F” is a mandatory parameter for the specified message and has a fixed length as specified in ITU-T Recommendation Q763.
- A parameter of type “V” is a mandatory parameter for the specified message and can have a variable length as specified in ITU-T Recommendation Q763.
- A parameter of type “O” is an optional parameter for the specified message and can have a variable length as specified in ITU-T Recommendation Q763.

Table 2 Supported Parameters in Initial Address Message

- The *Charge Message* is nationally defined for Moroccan ISUP v2. The structure of the message is presented in detail in Table 8, “Supported Parameters in Charge Message,” on page 1352. This activity is responsible **only** for the tandeming of the Charge Message in a Moroccan ISUP v2 - Moroccan ISUP v2 interworking.

Table 8 Supported Parameters in Charge Message

Parameter Name	Parameter Type	Parameter Code	Parameter Length
Message Type	F	N/A	1
Tariff Index	O	#FF	3
Pulse Number	O	#FE	3

End of Optional Parameters	O

65.2.4 Handling of Called Party Number Parameter in IAM

65.2.4.1 Numbering Plan Indicator (NPI) field in CdPn:

- The Moroccan ISUP supports **only** the "ISDN Telephony Numbering Plan" value for the NPI field in the CdPn parameter in an IAM.
- In order to support other values of NPI in the IAM CdPn, the incoming and/or outgoing Moroccan ISUP v2 trunk must be provisioned with the

ALL_NPI option via table *TRKSGRP*. An attempt to receive and/or transmit an IAM with an unsupported NPI value results in the **release** of the call.

65.2.4.2 Nature of Address (NOA) field in the CdPn:

- The Moroccan ISUP supports **only** the following values for the NOA field in the CdPn parameter in an IAM:
  - *Subscriber Number*
  - *National Significant Number*
  - *International Number*
- In order to support other values of NOA in the IAM CdPn, the incoming and/or outgoing Moroccan ISUP v2 trunk must be provisioned with the **ALL_NOA** option via table *TRKSGRP*. An attempt to receive and/or transmit an IAM with an unsupported NOA value results in the **release** of the call.
- In a Moroccan ISUP v2- Moroccan ISUP v2 interworking, the NOA of the CdPn in the outgoing IAM is determined accordking to the **translation class datafill:**

Table 11 Setting CdPn NOA via translation class

Translation Class Datafill	NOA of the Called Party Number in the outgoing IAM
No class datafill **($)**, Intragroup **(IAGRP)**	Same as the CdPn NOA in the incoming IAM
International **(INTL)**, Intercontinental **(ICNTL),** International Operator Assisted **(IOPRA)**	International Number (#04)
National **(NATL)**, Continental **(CNTL)**, Operator Assisted **(OPRA)**, Cellular **(CELL)**	National Significant Number (#03)
Local **(LCL)**	Subscriber Number (#01)
Other classes	Subscriber Number (#01)

65.2.5 Timers

The Moroccan ISUP v2 functionality supports the ISUP timers indicated in ITU-T Recommendation Q.764, “Signalling System No.7 - ISDN user part signaling procedures”.

The timers **not** supported by Moroccan ISUP v2 are listed in Table 12, "Timers not supported by Moroccan ISUP v2":

Table 12 Timers not supported by Moroccan ISUP v2

Timer Name	Associated Functionality	ITU-T Reference
T3	Temporary Trunk Blocking	Q.764, 2.9.9
T29, T30	Congestion Control	Q.764, 2.10.2
T31, T32	ISUP - SCCP signaling	Q.730 1.4.7.3, 1.4.7.4.1, 1.4.7.4.2, 1.4.7.5
T38	Suspend/Resume functionality in an incoming international gateway exchange	Q.764 2.4.1, 2.4.2, 2.4.3
T39	Malicious Call Identification (MCID)	Q.731.7

65.2.6 Supported Call Functionality & Services

This section outlines the functionality & services supported by Moroccan ISUP v2. The level of support is restricted to **tandem exchange functionality only**.

65.2.6.1 Basic Call Capabilities & Procedures

- Speech/3.1 kHz audio
- 64 kbit/s unrestricted
- Compatibility procedure
- Confusion procedure
- Tones and announcements
- MTP pause and resume
- Access delivery information
- Transportation of User teleservice information
- Generic number transfer
- Generic digit transfer
- Generic notification procedure
- Simple Segmentation procedure (IAM only)

65.2.6.2 Supplementary Services

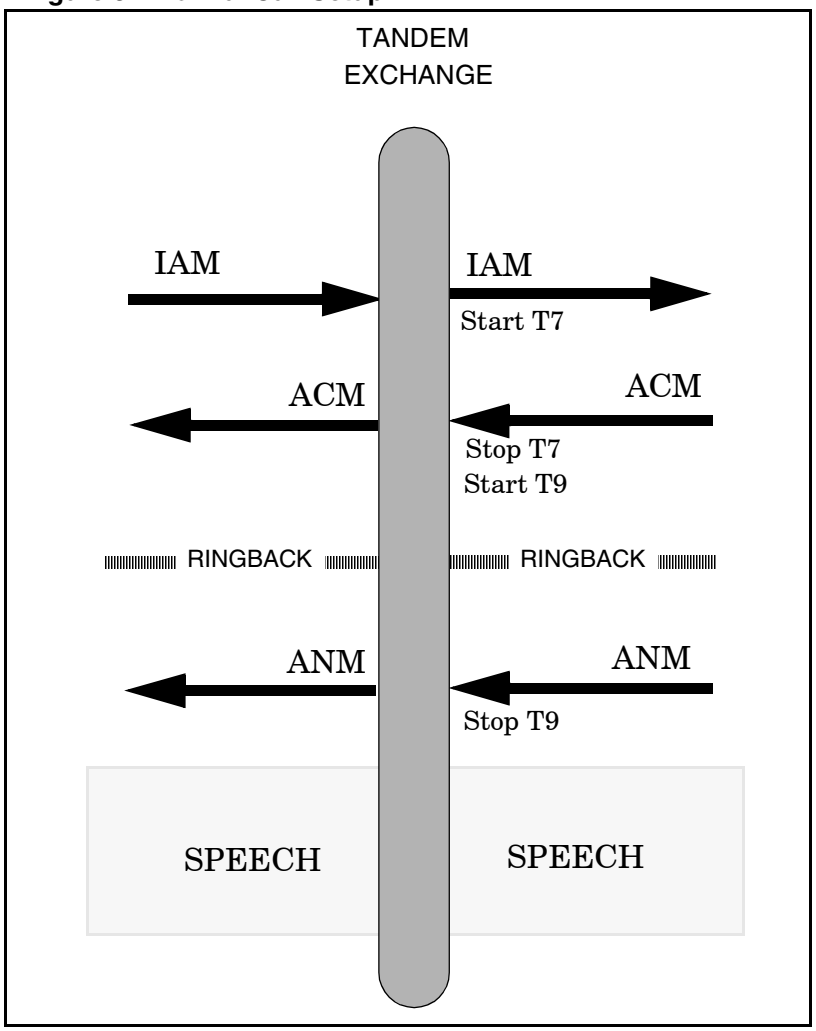
- CLIP/CLIR
- COLP/COLR
- SUB
- TP

- CFU/CFB/CFNR
- CD
- CW
- HOLD
- CONF
- 3PTY
- CUG
- UUS service 1 (implicit)/1 (explicit)/2/3
- ECT
- CCBS
- MCT (CLF)
- MCID

65.2.7 Typical Call Scenarios

65.2.7.1 Normal Call Setup

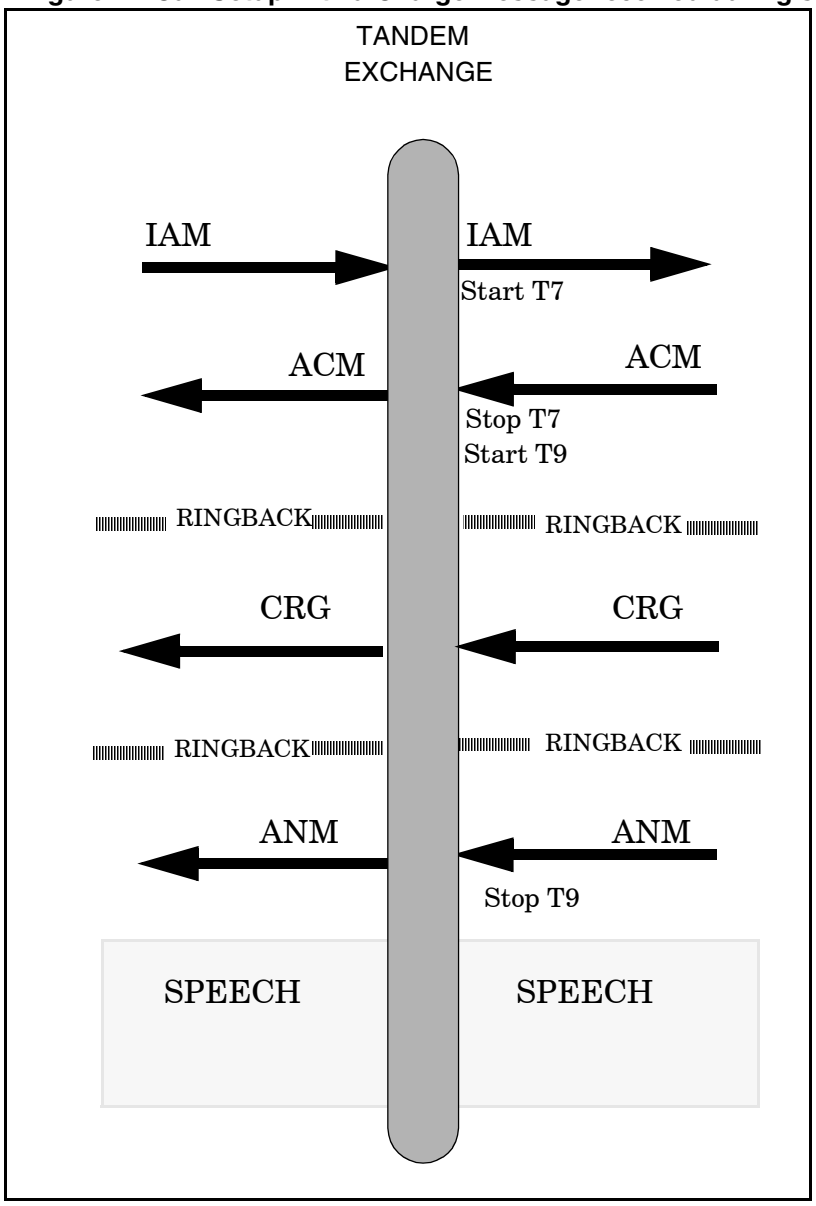
Figure 3 Normal Call Setup



- Timer T7 is started upon sending the IAM, and stopped upon receiving the first backward call setup message (ACM in this case).
- Timer T9 is started upon receiving the ACM, and stopped upon receiving the answer indication (ANM in this case).

65.2.7.2 Call with a Charge Message received during call setup

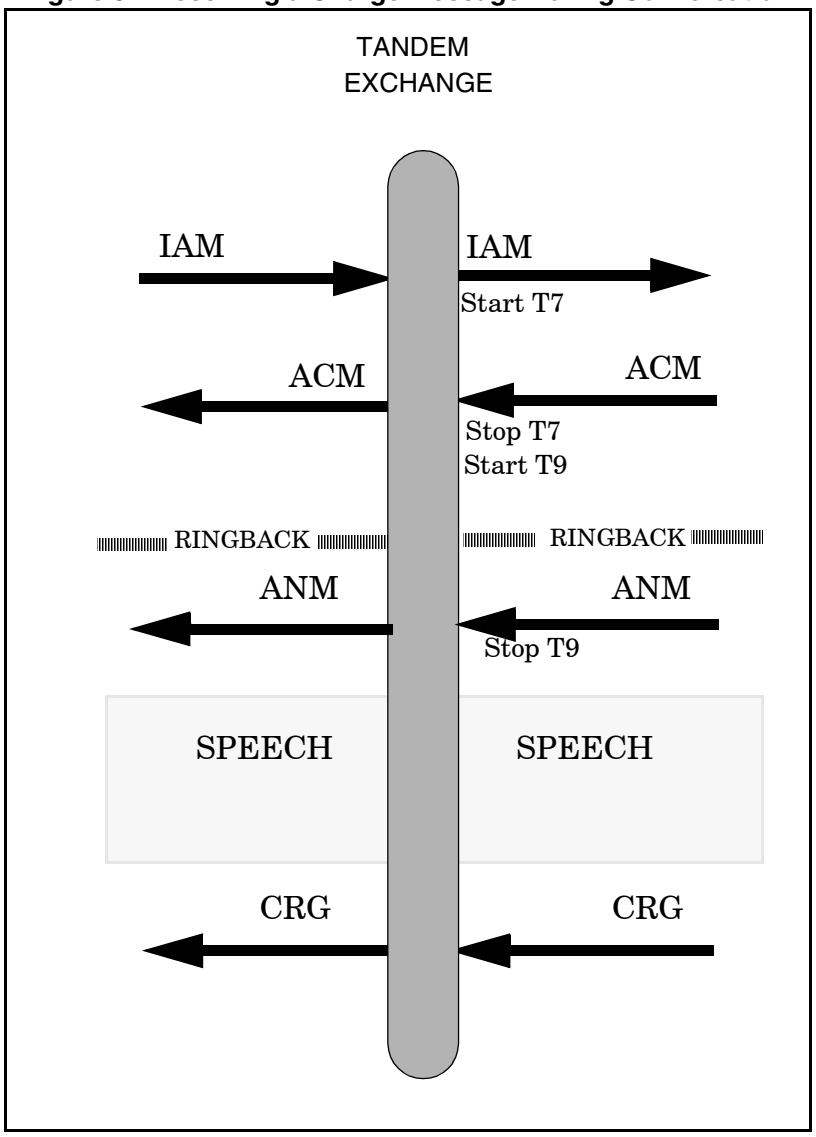
Figure 4 Call Setup with a Charge Message received during setup



- The DMS tandems the CRG message as is.
- No timers specific to CRG message are implemented in the tandem exchange.
- Timers T9 is not impacted by CRG message.

65.2.7.3 Call with a Charge Message received during conversation

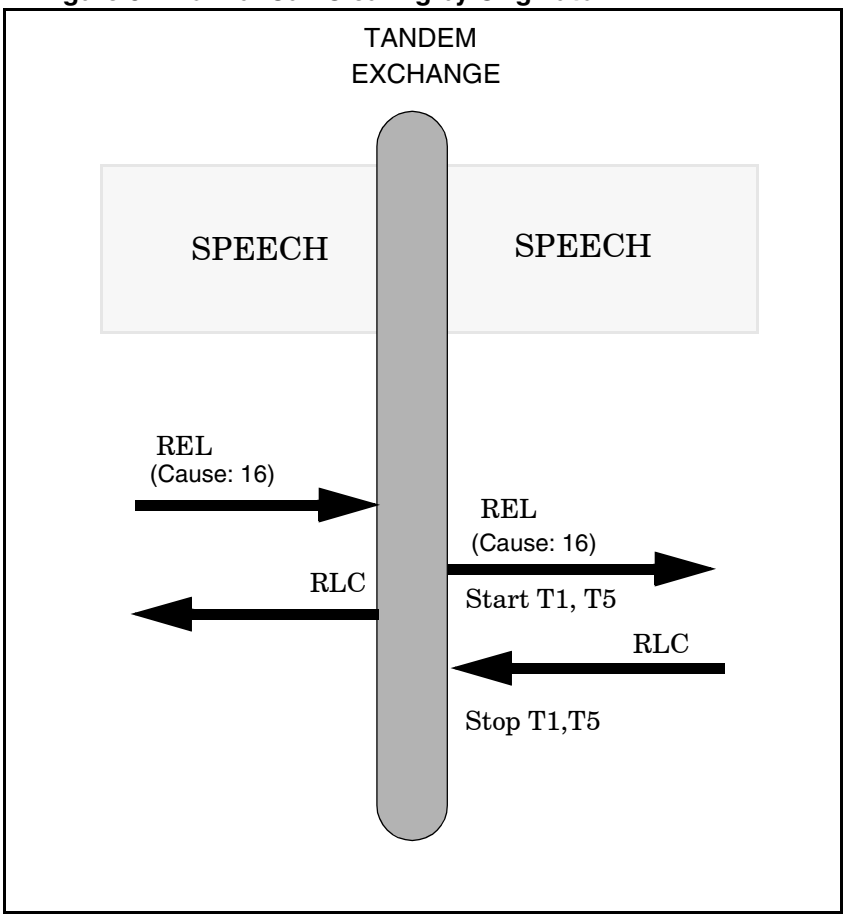
Figure 5 Receiving a Charge Message During Conversation



- The DMS tandems the CRG message as is.
- No timers specific to CRG message are implemented in the tandem exchange.

65.2.7.4 Normal Call Clearing by Originator

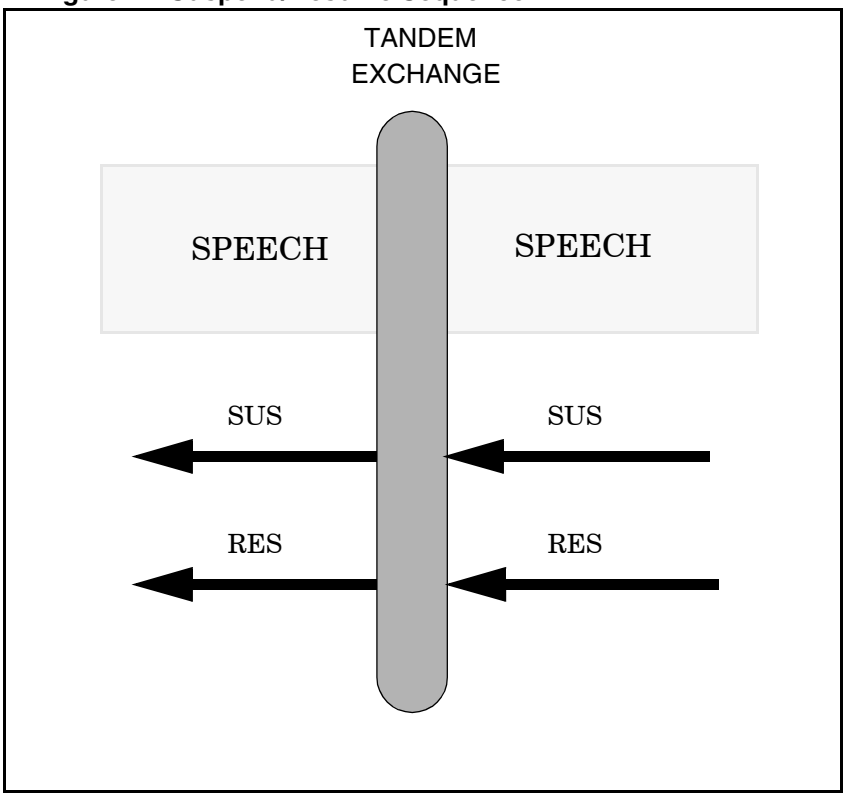
Figure 6 Normal Call Clearing by Originator



- Normal call clearing by the originator is performed using an ISUP REL message with cause 16, “normal call clearing”.
- Upon sending the REL message in an exchange, T1 and T5 timers are started.
- Upon receiving the release completion indication (RLC), the T1 and T5 are stopped in that exchange.

65.2.7.5 Suspend/Resume Sequence (Terminator's Exit)

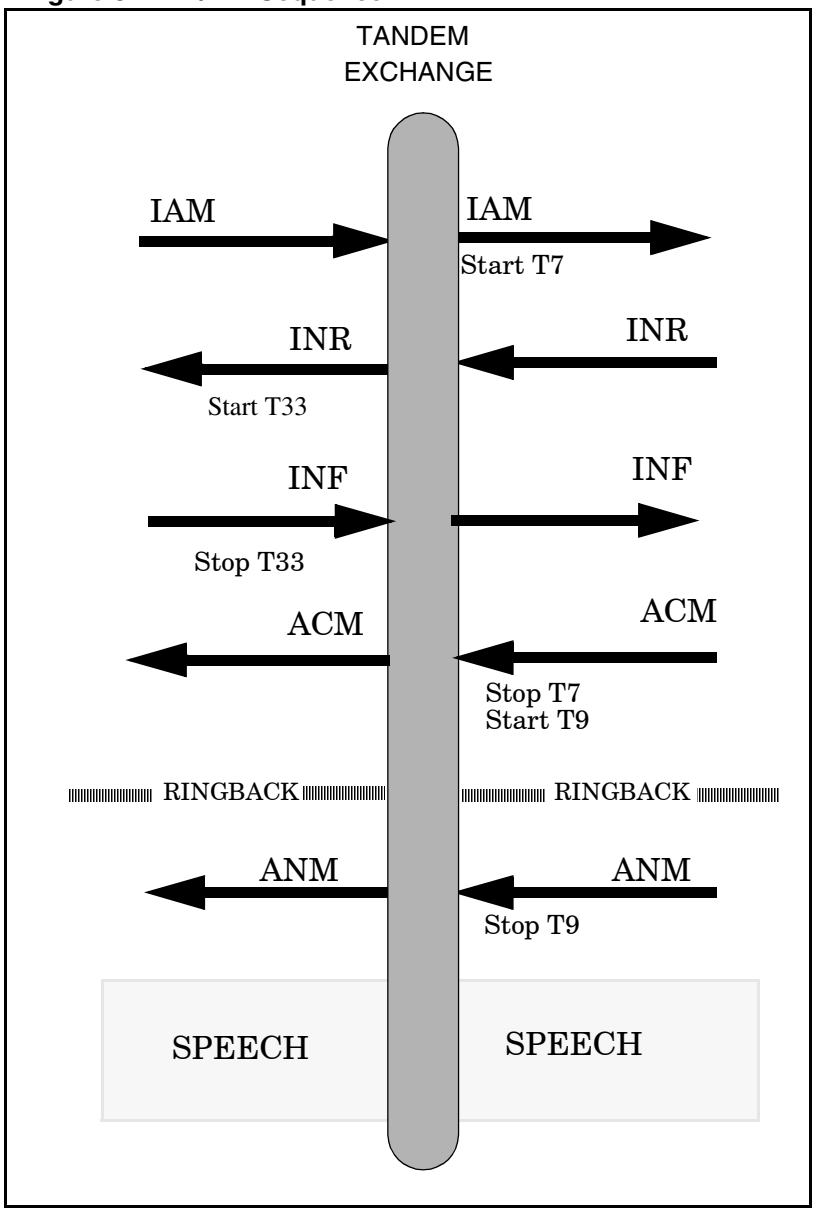
Figure 7 Suspend/Resume Sequence



- The Moroccan ISUP v2 Suspend/Resume functionality is limited to tandeming of SUS and RES messages **only**. **No timers are maintained in the tandem exchange.**

65.2.7.6 Information Request (INR/INF) Sequence

Figure 8 INR/INF Sequence



- The INR/INF sequence is invoked by the terminating exchange to request data from the preceding office(s) which are needed by the terminating exchange to complete the call setup.
- The INR/INF messages are **tandemed** transparently in a Moroccan ISUP v2 - Moroccan ISUP v2 interworking.
- In a Moroccan ISUP v2 - Moroccan ISUP v2 tandem, timer T33 is started upon sending the INR message to the preceding exchange and stopped upon receiving the INF message.

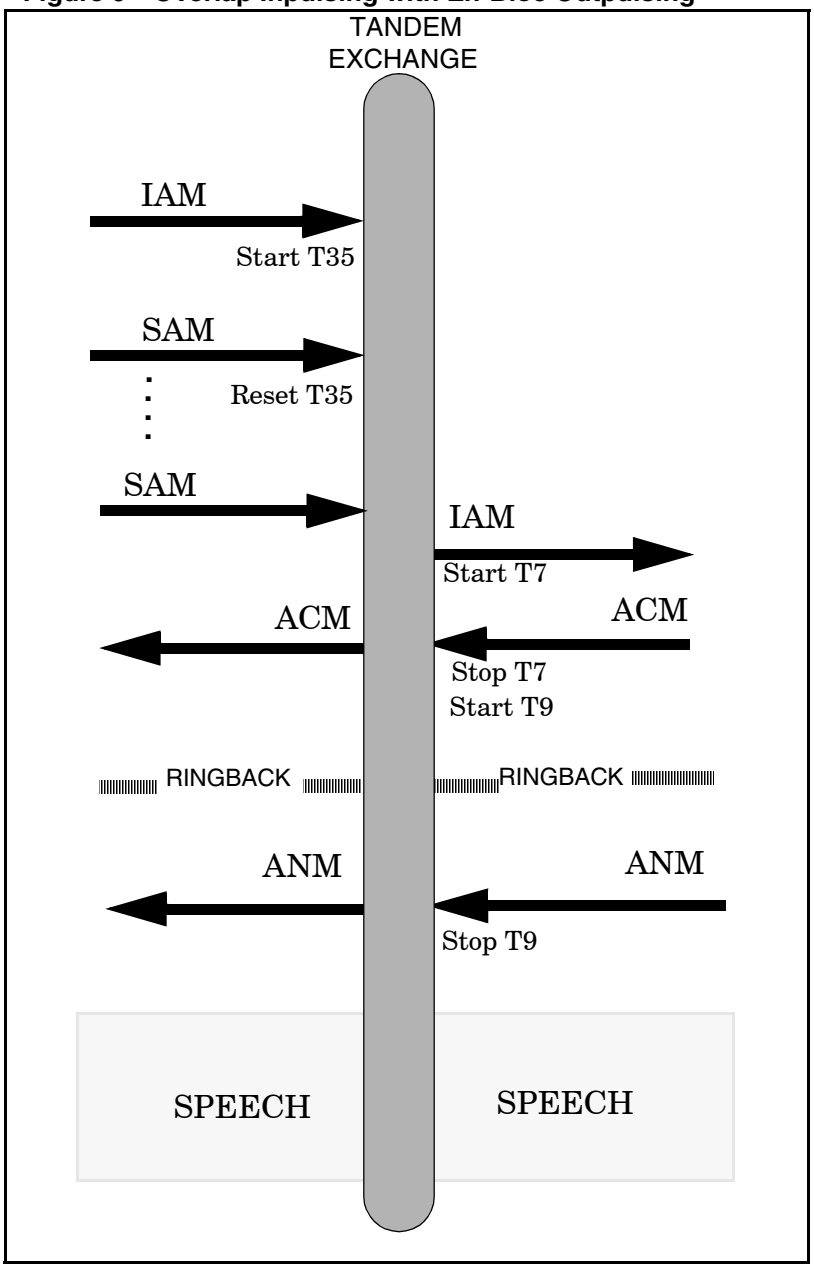
65.2.7.7 Overlap Signaling

- The Moroccan ISUP v2 supports the following overlap signaling procedures:
  - Overlap Inpulsing, en-bloc outpulsing
  - Overlap Inpulsing, overlap outpulsing
- On the inpulsing side, timer T35 is maintained during the receipt of multiple address messages.
- Upon obtaining the minimum address information (i.e. Called Party Number digits) to route the call, the DMS attempts to continue the call setup. The minimum address information needed for routing is determined by the translation datafill.

Note: *In case of overlap inpulsing and en-bloc outpulsing, the translation used for a specific call must ensure that the IAM is not sent too early, i.e. with insufficient CdPN digits, to the succeeding exchange. Otherwise, there is no possibility for tandeming the SAMs that are received after the IAM has been sent, and the call cannot be established due to incomplete address information.*

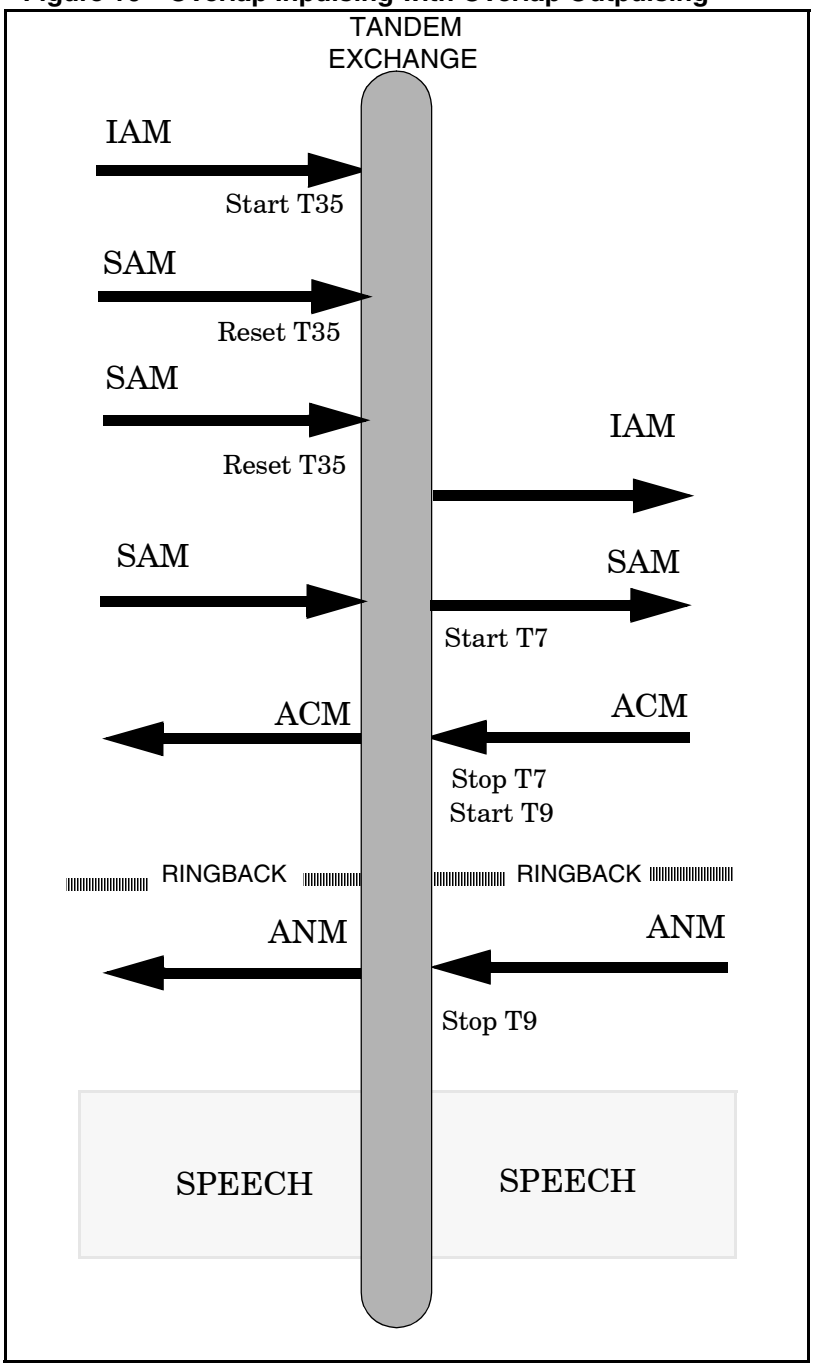
65.2.7.7.1 Overlap Inpulsing with En-Bloc Outpulsing

Figure 9 Overlap Inpulsing with En-Bloc Outpulsing



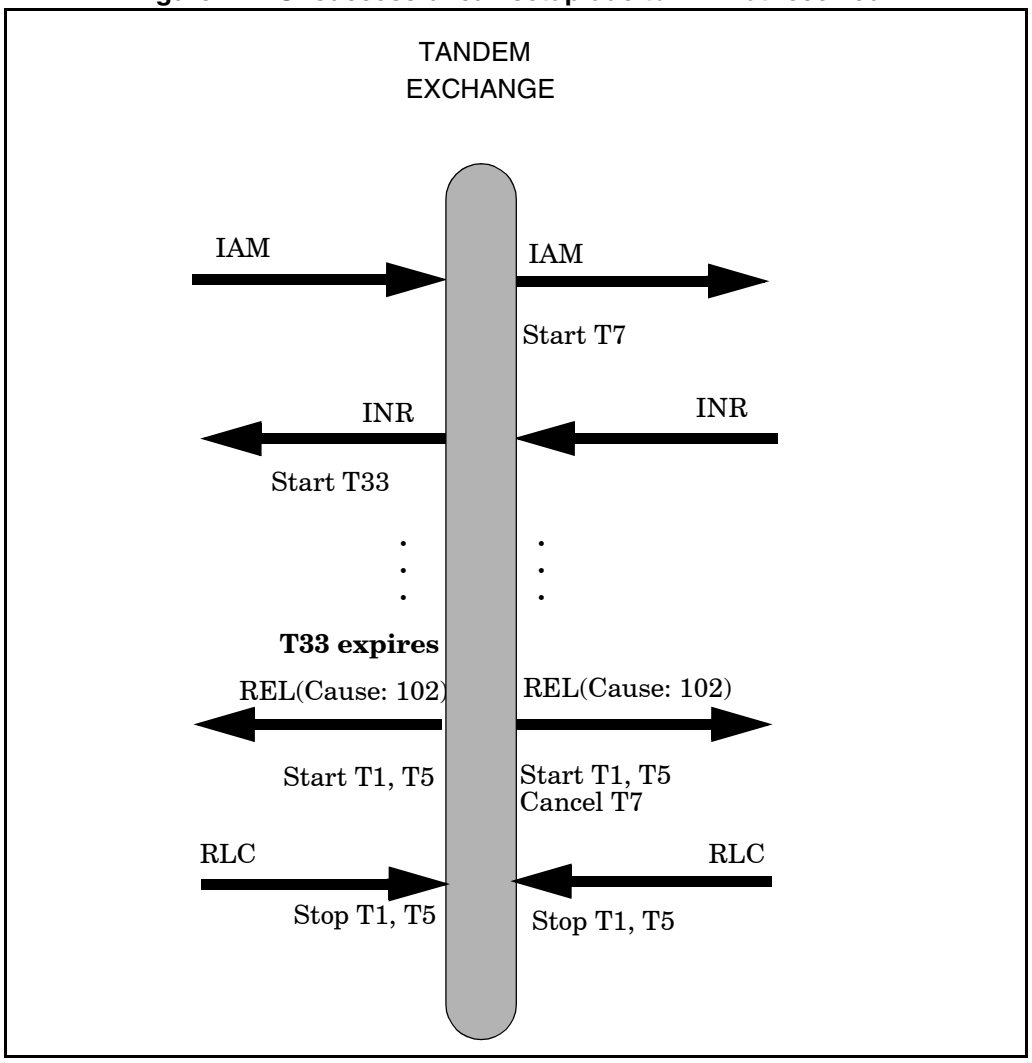
65.2.7.7.2 Overlap Inpulsing with Overlap Outpulsing

Figure 10 Overlap Inpulsing with Overlap Outpulsing



65.2.7.8 Unsuccessful call setup due to INF time-out

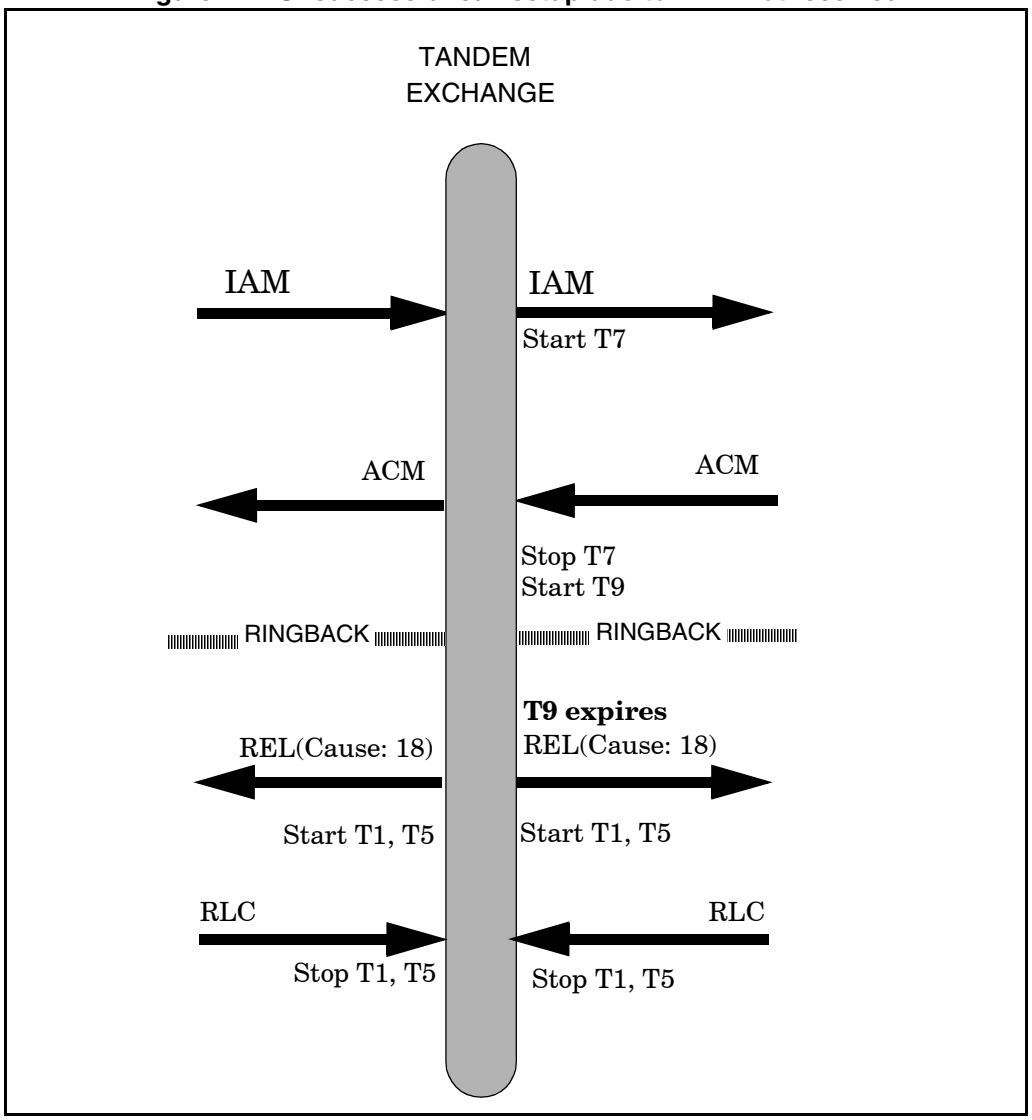
Figure 11 Unsuccessful call setup due to INF not received



- Upon tandeming of the INR message, timer T33 is started.
- If no INF message is received before T33 expiry, the tandem exchange releases the call by sending an ISUP REL message with cause 102, “Recovery on Timer Expiry” in both directions.
- Upon sending the REL message in the tandem exchange, T1 and T5 timers are started.
- Upon receiving the release completion indication (RLC), the T1 and T5 are stopped in that exchange.

65.2.7.9 Unsuccessful call setup due to ANM time-out

Figure 12 Unsuccessful call setup due to ANM not received



- Upon receiving the ACM, timer T9 is started in the tandem exchange.
- If no ISUP ANM is received before T9 expiry, the connection is released in both directions using an ISUP REL message with cause 18, “No user responding”.
- Upon sending the REL message in the tandem exchange, T1 and T5 timers are started.
- Upon receiving the release completion indication (RLC), the T1 and T5 are stopped in that exchange.

65.3 Hardware Requirements or Dependencies

The functionality provided by this activity is supported for **SX05** XPM processors **only**.

65.4 Software Requirements or Dependencies

N/A

65.5 Limitations and restrictions

1. Please refer to the appropriate section of the documentation for possible restrictions/limitations on a specific functional item.
2. Multirate connection types (2x64, 384, 1536 and 1920kbit/s) are **not** supported.
3. Signalling procedures for connection type allowing fallback capability are **not** supported.
4. **No** compatibility procedures are invoked in case of receiving recognized optional parameters with unsupported/unrecognized/spare/reserved values (ITU-T Q.764, 2.9.5.3.3.b).
5. Simple segmentation is supported for the segmentation of the IAM **only**..
6. User part availability control is **not** supported.
7. Propagation delay determination procedure is **not** supported.
8. Echo control procedure is **not** supported.
9. End-to-end signalling Pass along method is **not** supported.
10. End-to-end signalling SCCP Connection Orientated is **not** supported.
11. Simple service activation procedure is **not** supported.
12. Remote operations procedure is **not** supported.
13. Network specific facility procedures is **not** supported.

65.6 Billing

This activity does not implement or modify a functionality related to billing.

66: Functional Description (FN): A00004565

66.1 Feature name

A00004565 - Line to Moroccan ISUP V2 interworking

A00004551 - Backward Metering For Morocco

66.2 Description

66.2.1 Functional Overview

The activity A00004565 “Line to Moroccan ISUP V2 interworking ” provides line to Moroccan ISUP V2 and Moroccan ISUP V2 to line interworkings. Addition to the ISUP V2 messages, national use messages CRG, INR and INF are supported.

The activity A00004551 “Backward Metering For Morocco” provides backward metering functionality at the originating office for Moroccan ISUP calls. Received metering information in Moroccan ISUP V2 CRG message will be used to meter originating agent with MOG option.

IBN, BRI and V5.2 (IBN, BRI) lines are supported by these activities.

These activities are implemented in ISN07 for TDM.

66.2.2 Feature Description

This feature supports line to Moroccan ISUP V2 and Moroccan ISUP V2 to line interworkings. National use CRG, INR and INF messages are supported by this activity.

66.2.2.1 Line to Moroccan ISUP V2 and Moroccan ISUP V2 to line interworkings

Line to Moroccan ISUP V2 and Moroccan ISUP V2 to line interworking behaviours are same as line to Turkish ISUP V2 and Turkish ISUP V2 to line interworkings. So, for this interworkings please refer to FN section of A59018055.

Also, please refer to FN section of A59012394 (section 2.2.1.4.3. Supported Services for Turkish ISUP V2 and 2.2.1.4.4. Unsupported Services) for supported and unsupported services.

66.2.2.2 INR/INF sequence

During call setup in a Moroccan ISUP V2 - line interworking, the terminating exchange can initiate an INR/INF message sequence to request CPC and/or CLI information from the preceding exchange(s) if one or both of them are not received in the incoming IAM message.

The INR/INF sequence is initiated depending on the datafill in table ISUPSVC.

Default tuples for ISUP variants exist in table ISUPSVC. Default tuples in Moroccan ISUP V2 is shown in Figure 1, "Default Tuple in table ISUPSVC".

Figure 1 Default Tuple in table ISUPSVC

>
```

66.2.2.3 Backward Metering Activation and Behaviour

Backward metering information is sent to originating office by a central office with ISUP CRG message to perform metering locally in the originating office.

Two types of CRG message are used by Moroccan ISUP V2 to send backward metering information.

- CRG message which includes tariff index
- CRG message which includes pulse count

There are two types of backward metering provided within this feature according to the used CRG message type:

- ***Local type backward metering:***
  Tariff index is received as backward metering information inside Morocco ISUP V2 CRG message before ISUP ANM/CON message. This tariff index is used for calculating meter counts and updating software meter register of the call locally. Also for hardware metered

lines, pulses are generated according to the MTRTARIFF datafill of received tariff index .

- ***Distance type backward metering:***
  Pulse count is received as backward metering information inside Morocco ISUP V2 CRG messages after ISUP ANM/CON message. This pulse count is accumulated and used for updating software meter register of the call locally. Also for hardware metered lines, received amount of pulse is generated.

The type of backward metering to be performed depends on the reception sequence of the Moroccan ISUP V2 CRG Message

Morocco ISUP calls that will be charged using backward metering is determined via a newly introduced translation option BCKWMTR at the originating office.

BCKWMTR option is added to the OSEL (option selector) field of HEAD and CODE translation tables. BCKWMTR option does not have any subfields. See sample datafill below for PXCODE table.

Figure 2 Sample Datafill in Table PXCODE

```
TABLE: PXCODE
>lis
 XLANAME        FROMD           TOD
                                                              XLADATA
------------------------------------------------------------------
  NETXLA          783           783
CONT (PF 3) (MM 7 7) (CLASS LCL) (XLT OFC OFC783) (LNET INTL)
(MZONE 4) (BCKWMTR) $
>
```

Please note that software metering using local metering datafills is not applied when BCKWMTR is used in translation.

For the calls with BCKWMTR translation option, originating line software and hardware metering is performed using received backward metering information.

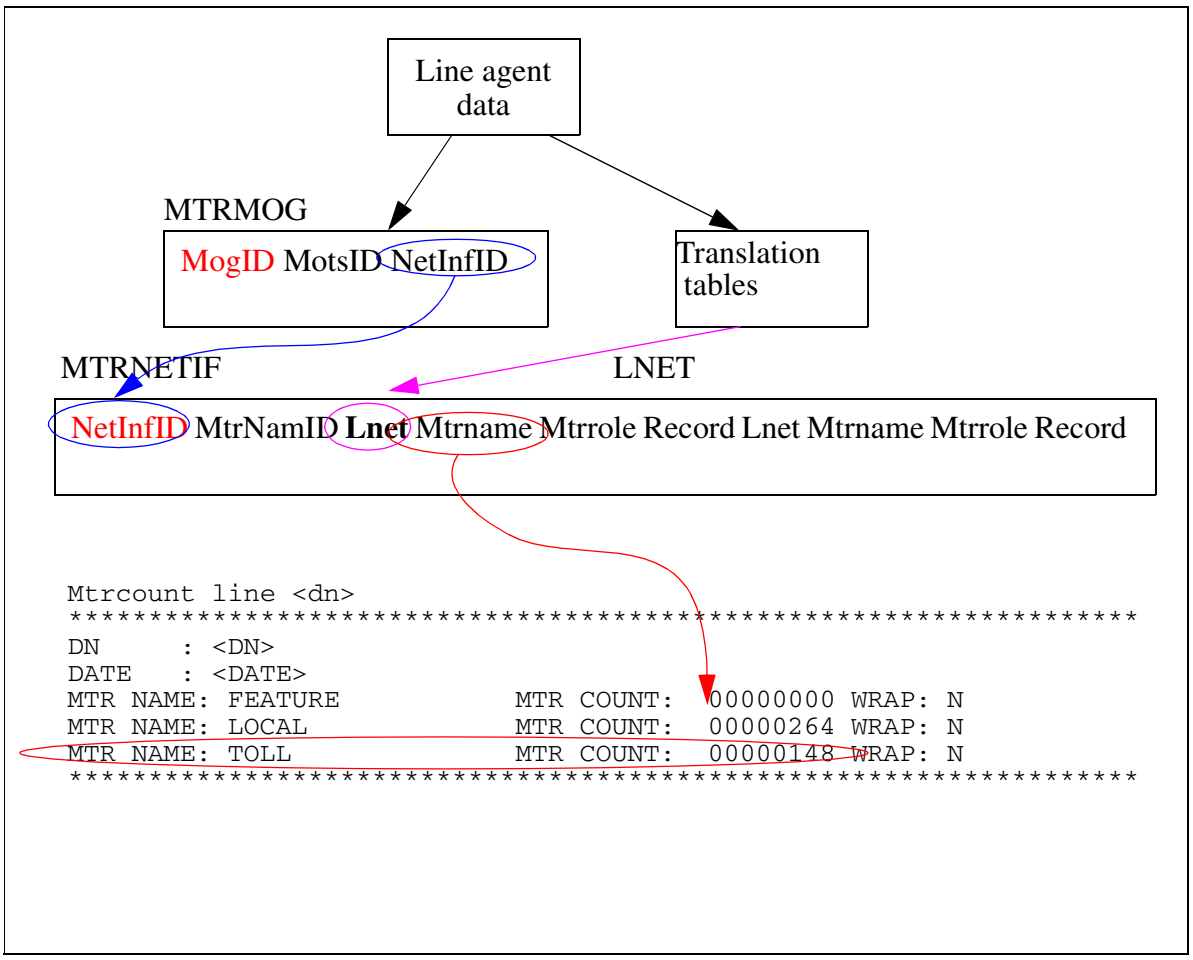
If the below conditions are not met, the call will not be metered by received backward metering information although BCKWMTR option is datafilled:

- Line must have MOG option for line metering
- Line must have SPM/COIN option for line hardware metering
- LNET value must be datafilled in translation tables for both type backward metered call.
- CRG timer must be datafilled in table C7UPTMR.

- Received tariff index must be datafilled in table MTRTARIF for local type backward metered calls.
- A meter name must be datafilled in table MTRNETIF with GENERATE meter role for used LNET.

LNET and MOGID values are used to index the meter name that will be incremented for backward metering call.

Figure 3 Indexing of meter name using LNET and MOGID values



If LNET value is not datafilled in backward metering translation, this missing datafill is reported with an MTR113 log and backward metering is not performed. If MFP parameter in table MTRSYSPM is set to FAIL, the call is sent to treatment otherwise call is not metered for this case.

New MTR logs MTR161 and MTR162 are defined to report backward metering specific failures.

MTR161 log is generated if a matching MTRTARIF tuple could not be found for a received tariff index within Moroccan ISUP V2 CRG message.

If a Moroccan ISUP V2 CRG tariff message with 0 tariff index is received then the call is not charged. Note that, despite 0 tariff index cannot be datafilled in MTRTARIF, it's used as free tariff index by metering system and MTR161 log is not generated for this case.

MTR162 log is generated for two cases:

- When a mismatch occurs between calculated software meter count and reported hardware metering pulse count for local type backward metering
- When a mismatch occurs between received meter count and reported hardware metering pulse count for distance type backward metering

Tariff change over in local office does not take affect for backward metered calls.

If the call is not line to Morocco ISUP V2 interworking then BCKWMTR option in translation is not taken into consideration.

If an ANM,ACM,CON or CPG message with no charge in BCI parameter is received, then the call will not be charged.

Note that, if an ISUP message with no charge in BCI parameter is received during the message sequence, the charge indicator in the following ISUP messages is not taken into consideration by the metering system and the call is not charged. (Examples of this case is ANM/CON/CPG messages with charge in BCI recevied after ACM/ANM/CON message with no charge in BCI parameter).

If AMA record generation with MC 612 is enabled, then pulse count field in ICR records will be updated according to accumulated or calculated backward meter count in software meter register. (originated from s/w metered lines or SPM/COIN lines).

ICR record for a call with BCKWMTR translation will be generated if the originating line has MOG option, LNET is datafilled in translation and a meter name for the used LNET is datafilled in table MTRNETIF with Y in record field.

Note that pulse count value in trunk metering related ICAMA and IAA records will not be updated for backward metering.

66.2.2.4 CRG message

Incoming Morocco specific ISUP V2 CRG message in the originating DMS100 office is handled to support Backward Metering. In backward

metering, central office sends CRG message with meter tariff index or pulse count to local DMS100 office over Moroccan ISUP V2 trunks. Local DMS100 office performs metering procedures according to information in CRG message.

Central office is responsible for CRG message generation. This activity doesn't deal with generation of CRG message. Only handling of incoming CRG message in originating office is covered by this activity.

A new translation option BCKWMTR is introduced by activity A00004551 to mark backward metered calls. Hitting BCKWMTR tuple during translation means that the call needs **backward charging**.

This activity is going to check the existence of the new translation option to decide whether the call needs backward charging in local type backward metering and distance type backward metering.

The metering of originating line is done according to CRG messages coming over Moroccan ISUP V2. There are two types of backward metering: local and distance. In local type backward metering, tariff index is carried in CRG message. In distance type backward metering, pulse count is carried in CRG message.

66.2.2.4.1 CRG message format

This section covers CRG message format on Moroccan ISUP V2 protocol.

The received CRG message should contain one of the following information:

- The metering tariff index during the call establishment phase
- The number of metering pulses during the call

Table 1 CRG message format

Parameter	Type	Code	Length
Message type	M	0011 0001	1
Tariff index	O	1111 1111	3
Pulse number	O	1111 1110	3
Compatibility information	O	0011 1001	4
End of optional parameters	O	0000 0000	1

M : Mandatory

O : Optional

The value range of Parameters:

- Tariff index

0000 0000	No charge
0000 0001	
to	Represents the number of tariff index
1111 1111	

- Pulse number

0000 0000	In use
0000 0001	
to	Represents the incremented pulse count
1111 1111	

- Compatibility information

  Refer to Q.763 for compatibility information

66.2.2.4.2 Local Type Backward Metering

The metering information is sent from distance office (metering exchange, international exchange) and the metering is performed locally in the originating office. This information is received by Moroccan ISUP V2 CRG message which includes tariff index during call set up for local type backward metering.

The status of CRG message for local type backward metering is indicated in the following table.

Table 2 Status of CRG message for local type backward metering

Pulse number	Tariff index	Status
Present	Non present	Invalid

Present	Present	Incorrect
Non present	Non present	Incorrect
Non present	Present	Correct

Actions of the local office for local type backward metering

1. CRG message is received before ANM/CON message (Requirement 1).
2. If the call needs backward charging, and CRG timer is provisioned in table C7UPTMR, all correct CRG messages are reported to CM (Requirement 2).
3. The circuit is reset and the reattempt is performed in case an invalid (CRG message with pulse number) or incorrect CRG message is received as a first backward message after IAM message (Requirement 3).
4. After the first backward message reception during call setup (ACM or correct CRG), if an invalid (CRG message with pulse number) or incorrect CRG message is received, it is ignored (Requirement 4).
5. The CRG message which is received after CPG message is handled and reported to CM (Requirement 5).
6. When ACM, ANM, CON or CPG message is received with “no charge” value for charge indicator in backward call indicator parameter, the received CRG message is ignored.
7. ISUP INFO log (PM189) is generated in XPM to inform the maintenance about the cases numbered 3, and 4 (Requirement 6).

Successful calls for local type backward metering

Refer to Table 2 for the status of CRG message in this subsection. For free calls, central office has the responsibility to send an appropriate CRG message (with index 0) to local DMS. Correct datafill with this index is required on DMS for free charging of the call.

Figure 4 CRG message received before ANM (Req.1)

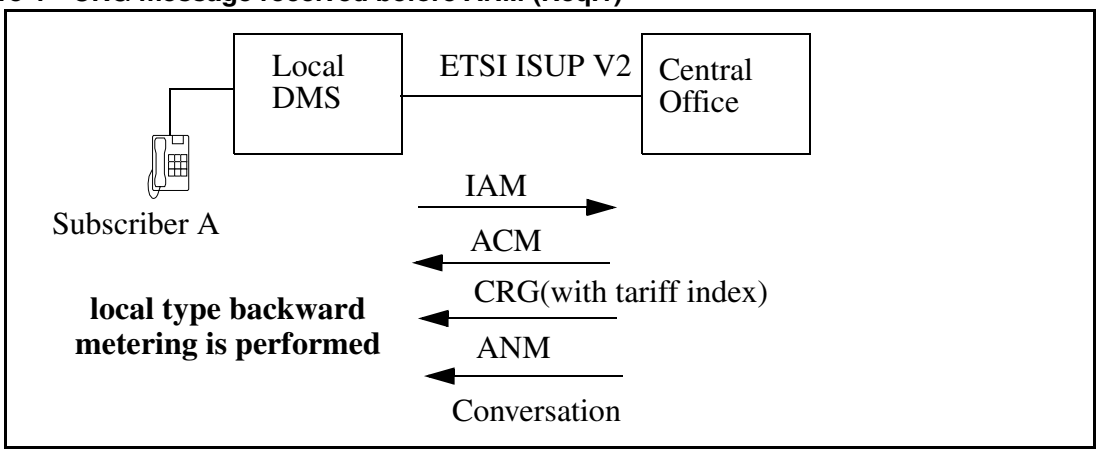


Figure 5 CRG message received before CON (Req.1)

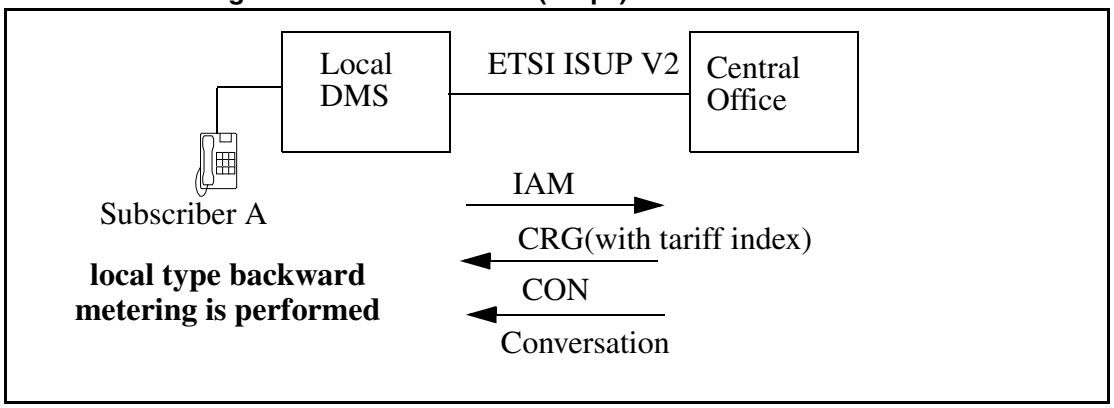

Figure 6 More than one correct CRG message received before ANM (Req. 2)

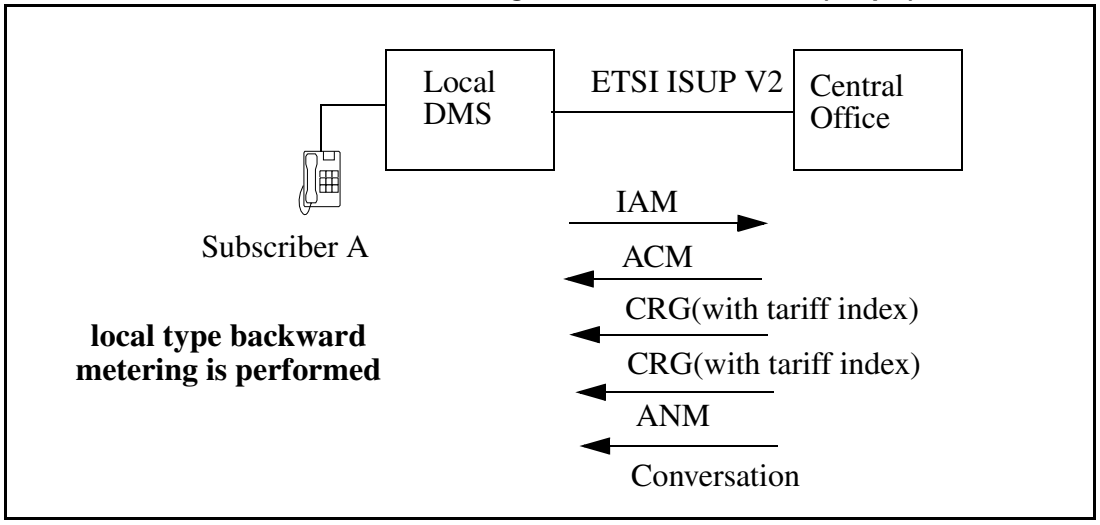

Figure 7 More than one correct CRG message received before CON (Req. 2)

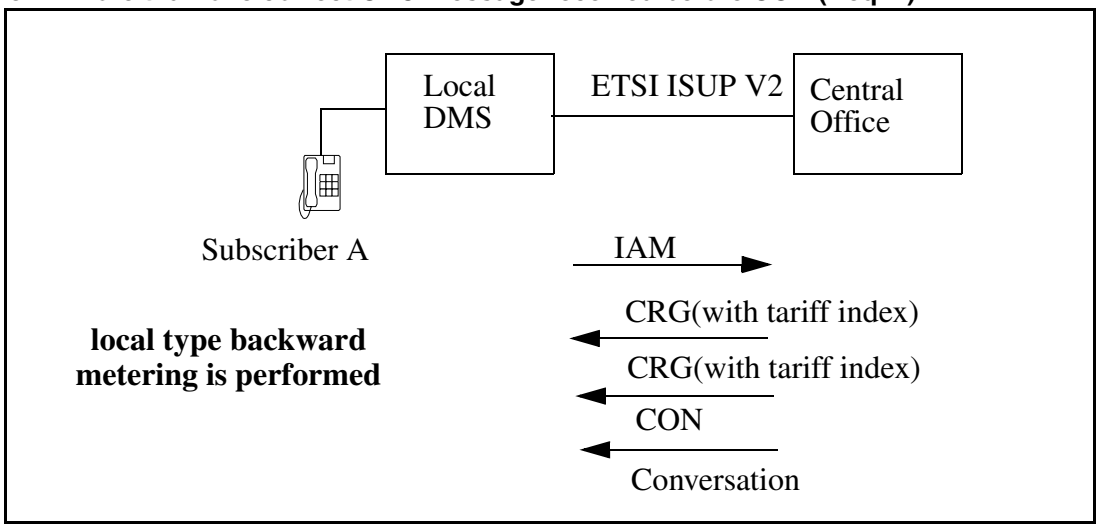

Figure 8 Invalid/Incorrect CRG message after ACM message(Req.4)

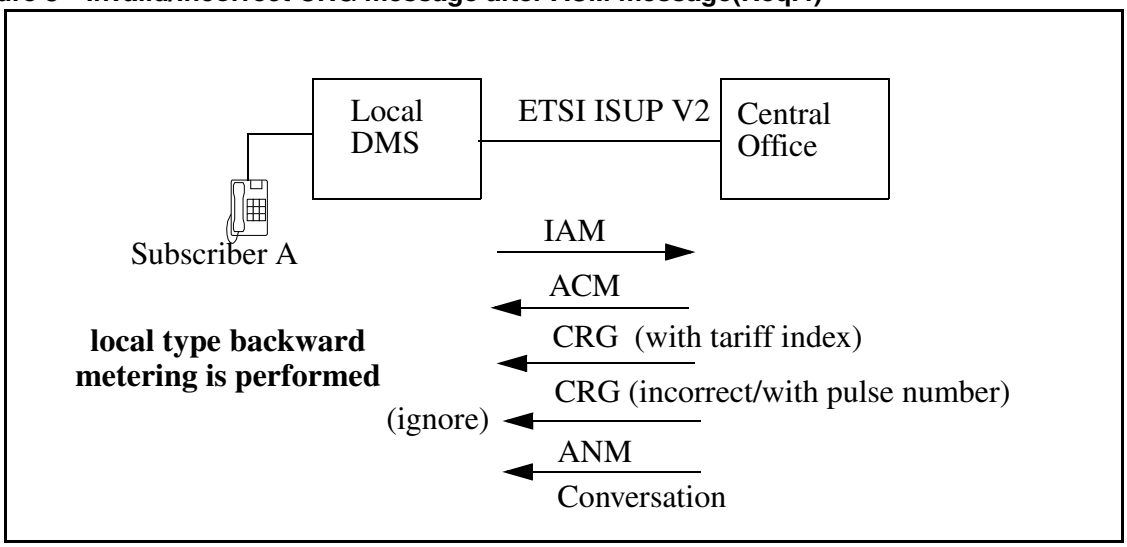

Figure 9 Invalid/Incorrect CRG message after ACM message (Req.4)

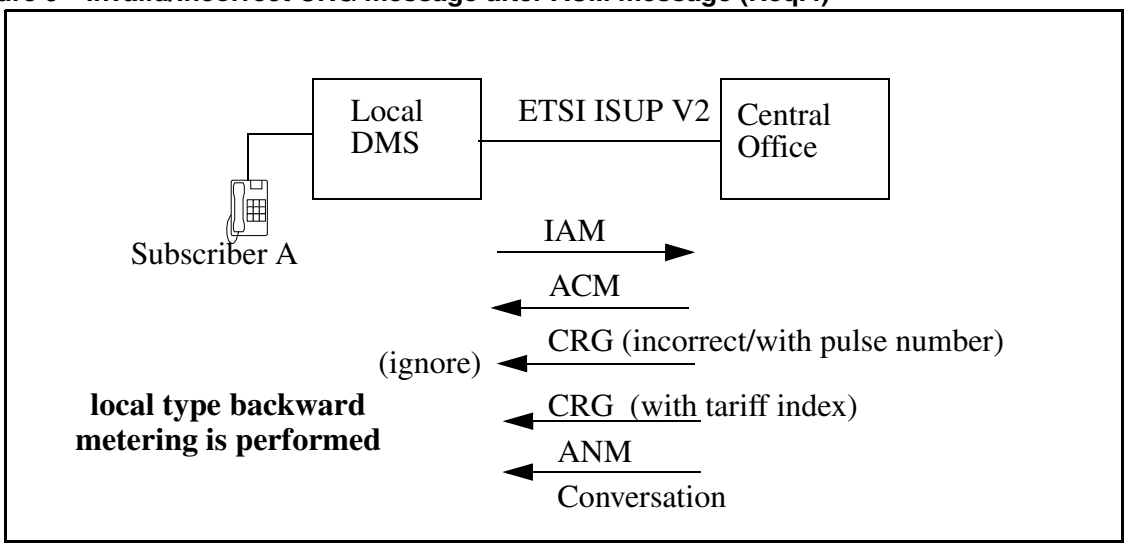

Figure 10 Invalid/Incorrect CRG message after correct CRG message (Req.4)

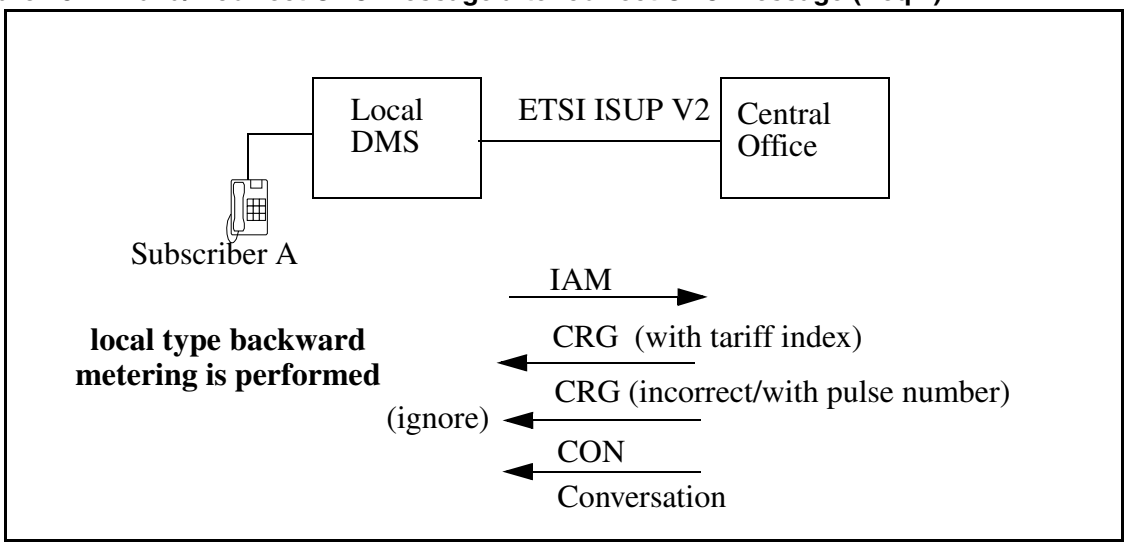

Figure 11 CRG message received after CPG (Req.5)

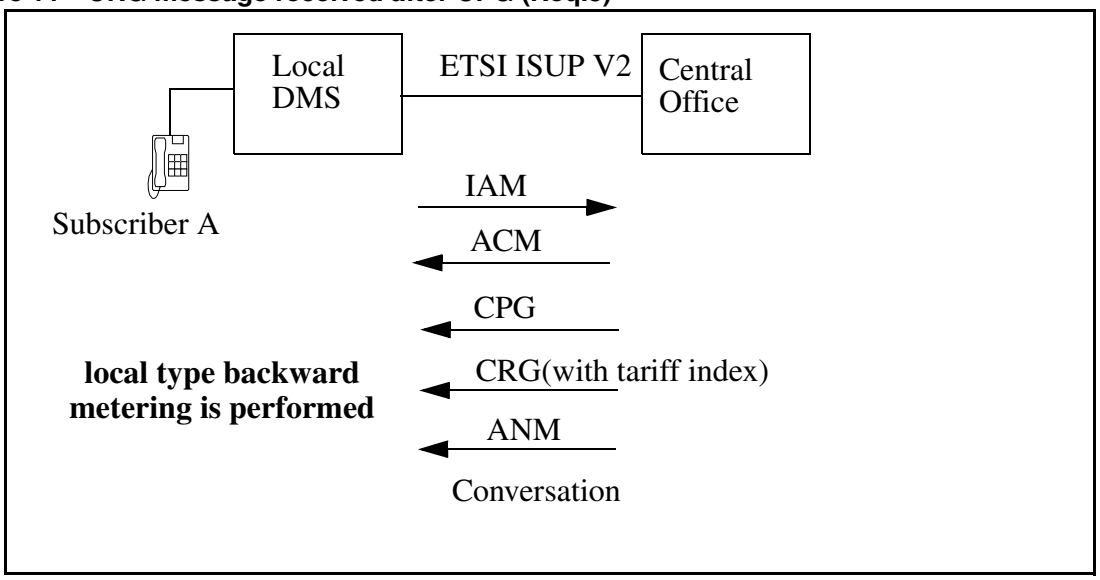
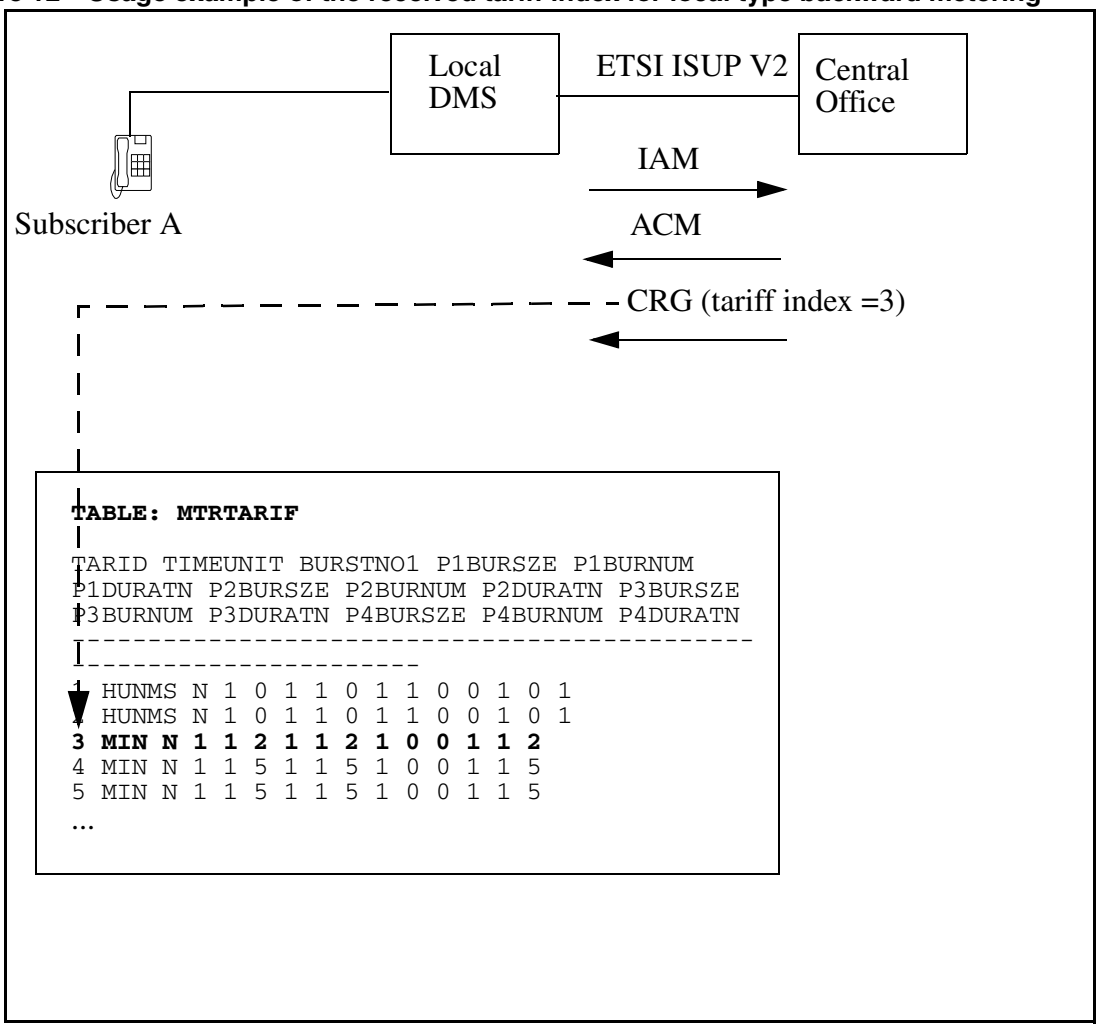


Metering behavior for successful local type backward metering calls:

If the CRG message with a valid tariff index is received, then this index is evaluated by metering system to verify that a corresponding tariff tuple exists in table MTRTARIF. In case more than one CRG message with tariff index is received, the last received tariff index is used by local type backward metering Figure 6, "More than one correct CRG message received before ANM (Req. 2)".

If a related MTRTARIF tuple is found, then this tariff tuple is used for charging the call. Note that tariff index range that can be received within CRG message is 0 to 255 which means MTRTARIF tuples within 256-511 index range cannot be used for local type backward metering.

Figure 12 Usage example of the received tariff index for local type backward metering



For plain subscribers with MOG option, software meters are increased according to the found MTRTARIF tuple.

For SPM/COIN subscribers, pulse generation to the originator is done using the found MTRTARIF tuple.

For MOG subscribers without SPM/COIN, software meters are increased according to the found MTRTARIF tuple.

At the end of the call, an MTR162 log is generated if there is a mismatch between calculated software meter count and reported hardware metering pulse count. In this case calculated software meter counts are used to update software meter registers.

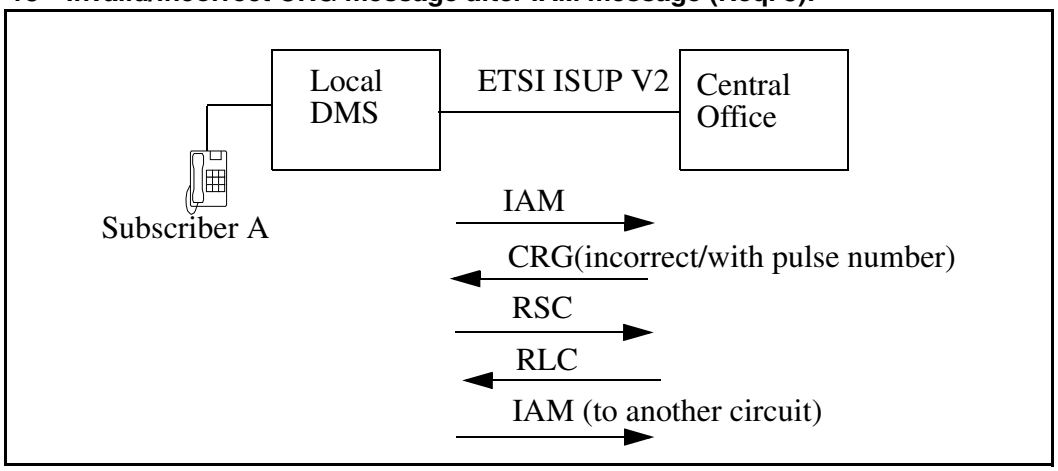
The amount of meter count mismatch which causes MTR162 log generation is determined by the PULMISTH parameter in table MTRSYSPM.

If a corresponding MTRTARIF tuple is not found then an MTR161 log including the received tariff index is generated and the call is not metered. Also the call is sent to treatment and dropped for this case if the MFP parameter in table MTRSYSPM is set to 'FAIL'. If MFP parameter is set to SUCCEED MTR161 log is generated, call is not dropped but not metered.

Unsuccessful calls for local type backward metering

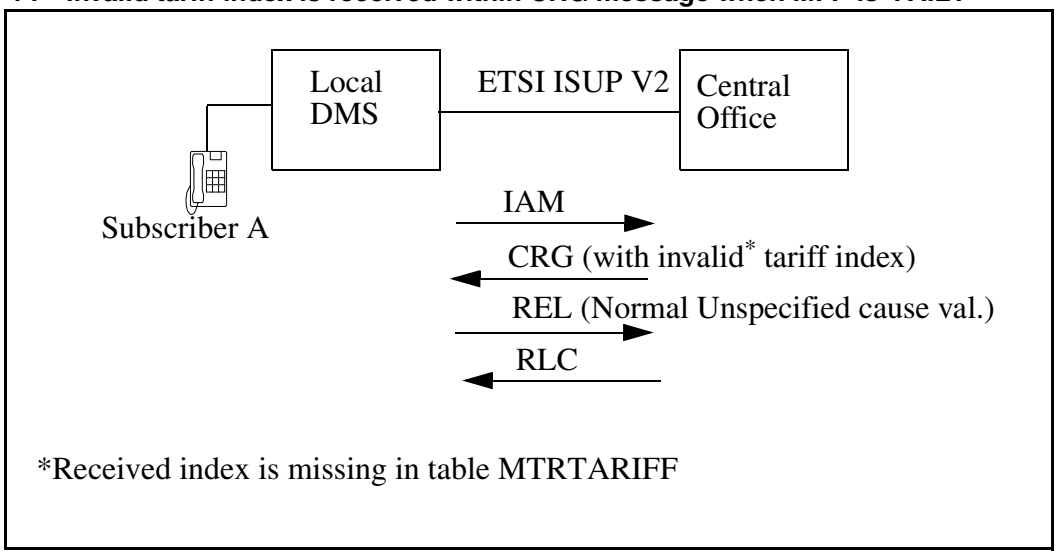
Refer to Table 2 for the status of CRG message in this subsection.

Figure 13 Invalid/incorrect CRG message after IAM message (Req. 3):



Another unsuccessful call scenario for local type backward metering is reception of an invalid tariff index which does not correspond to any MTRTARIF tuple in the local office. If MFP parameter in table MTRSYSPM is set to FAIL, then the call is sent to treatment for this case. Otherwise call is continue but not metered.

Figure 14 Invalid tariff index is received within CRG message when MFP is 'FAIL':



66.2.2.4.3 Distance Type Backward Metering

Central office identifies the charging count and sends this information by CRG message to the local offices during the conversation phase.

The new charge timer is started after receiving of ANM/CON messages to wait for a CRG message at local exchange for the calls that need backward charging. If the new timer is not provisioned in the table C7UPTMR, CRG timer is not started, incoming CRG messages are ignored and not reported to CM.

Table 3 CRG timer values

Minimum value	Maximum Value	Default value
0.5 seconds	4 minutes	20 seconds

The status of CRG message for distance type backward metering is indicated in the following table.

Table 4 Status of CRG message for distance type backward metering

Pulse number	Tariff index	Status
Present	Non present	Correct
Present	Present	Incorrect

Non present	Non present	Incorrect
Non present	Present	Invalid

Actions of the local office for distance type backward metering

1. When ANM/CON message is received, the CRG timer is started for the calls that needs backward charging (Requirement 7).
2. CRG message is ignored and not reported to CM, if CRG timer is not provisioned in table C7UPTMR.
3. CRG timer is stopped when the first correct CRG message is received during conversation (Requirement 8).
4. CRG message is received after ANM/CON message (Requirement 9).
5. All correct CRG messages are reported to CM, if the call needs backward charging, and CRG timer is provisioned in table C7UPTMR (Requirement 10).
6. The circuit is reset and reattempted in case reception of correct (CRG message with pulse number) or incorrect CRG message as a first backward message after IAM message (Requirement 3).
7. The correct (CRG message with pulse number) or incorrect CRG message is ignored if it is received after first backward message (ACM or CRG message with tariff index) during call setup (Requirement 4).
8. Local office ignores the incorrect or invalid (CRG message with tariff index) messages which is received during the conversation (Requirement 11).
9. If local type backward metering is performed for a call, the CRG timer is not started in ANM/CON message. Also received CRG messages during conversation, are ignored (Requirement 12).
10. If no CRG message is received till CRG timer expire, the circuit is released with the cause value timer expiry (Requirement 13).
11. If ACM, ANM, CON, or CPG message is received with "no charge" value for charge indicator in backward call indicator parameter, CRG timer is not started and the received correct CRG messages are not reported to CM (Requirement 14).
12. ISUP INFO log (PM189) is generated in XPM to inform the maintenance about the actions numbered from 6, 7, 8, 9 and 11.

For free calls, ACM,ANM,CON and CPG messages are received with "no charge" value for charge indicator in backward call indicator parameter. In this case received CRG message is not reported to CM.

If charge indicator in backward call indicator parameter is “charge” and a CRG message is received with zero pulse number during conversation, the call is dropped with the cause value Service or option not available. But, if charge indicator is “no charge” then, this CRG message with zero pulse number is ignored.

Successful calls for distance type backward metering

Refer to Table 4 for the status of CRG message in this subsection.

Figure 15 CRG received after ANM (Req. 7,8, and 9)

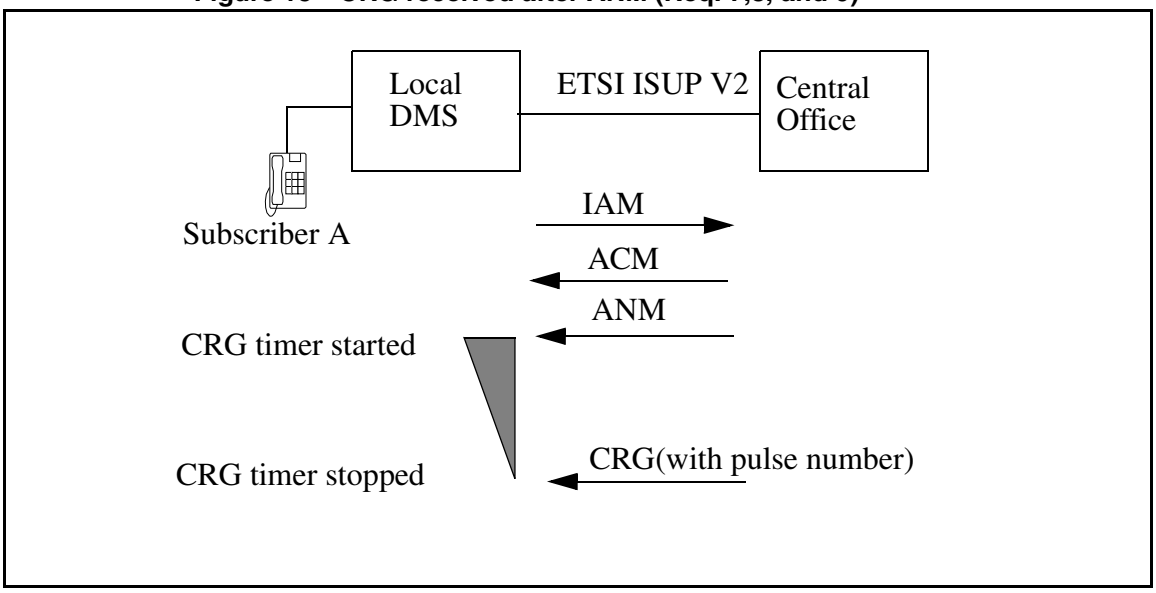


Figure 16 CRG received after CON (Req. 7,8, and 9)

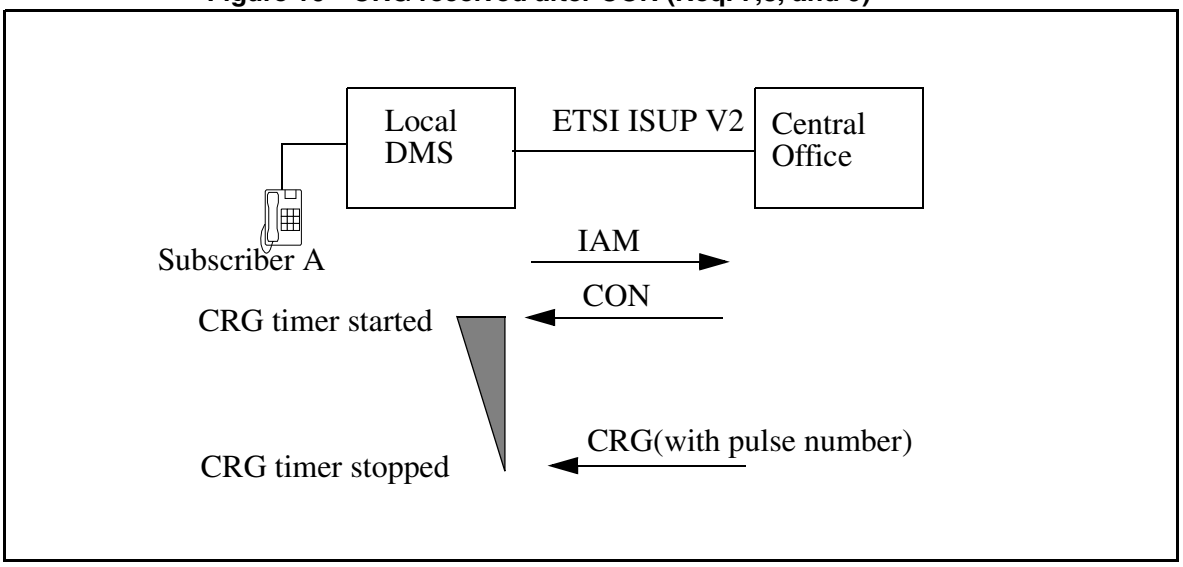

Figure 17 More than one correct CRG received after ANM message (Req.10)

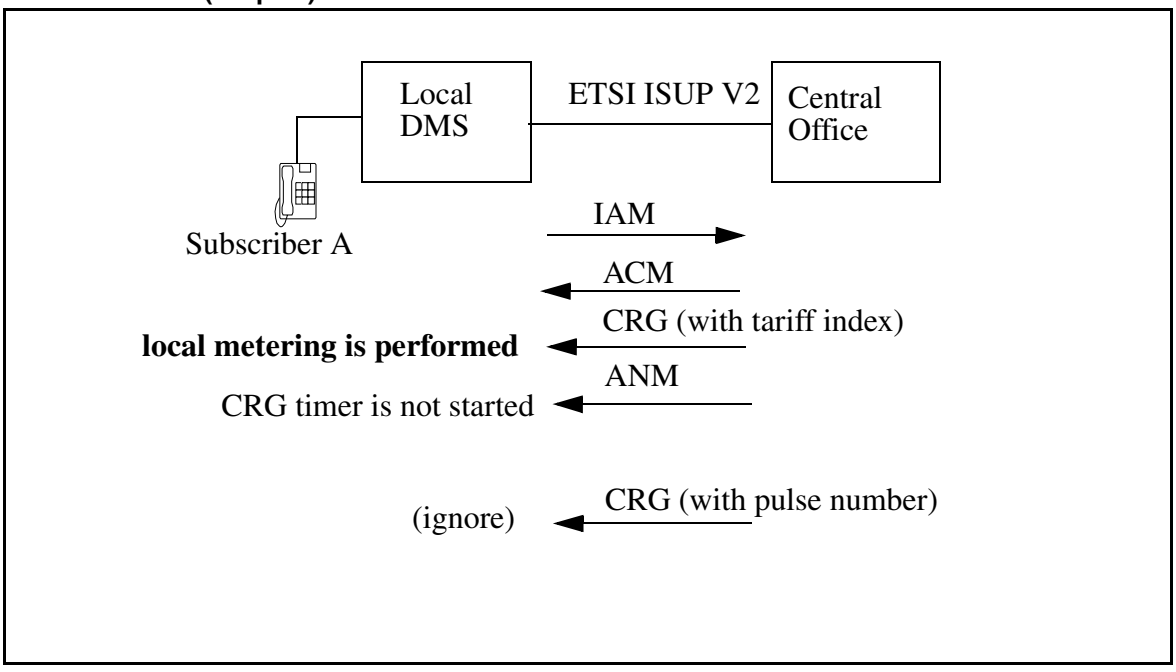

Figure 26 CRG timer according to charge indicator in ACM and ANM (Req. 14)

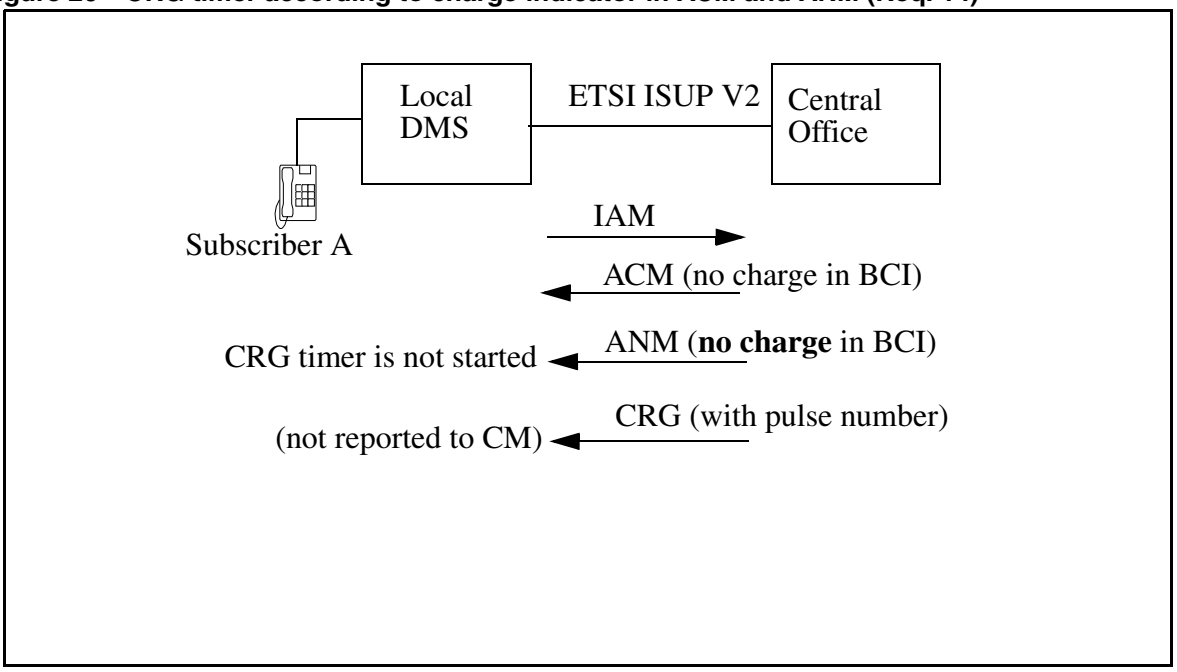

Figure 27 CRG timer according to charge indicator in ACM and ANM (Req. 14)

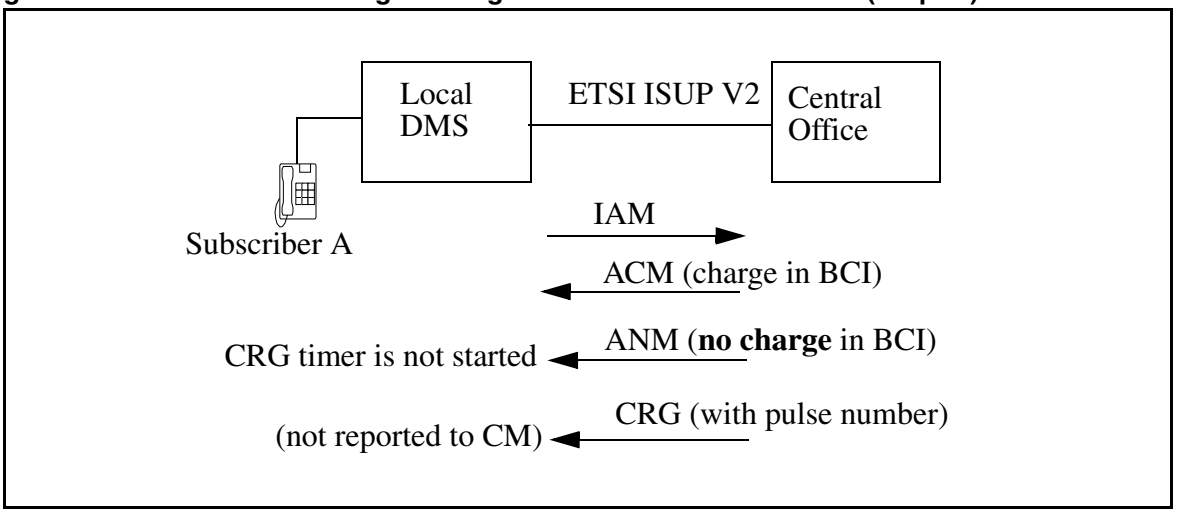

Figure 28 CRG timer according to charge indicator in ACM and ANM (Req. 14)

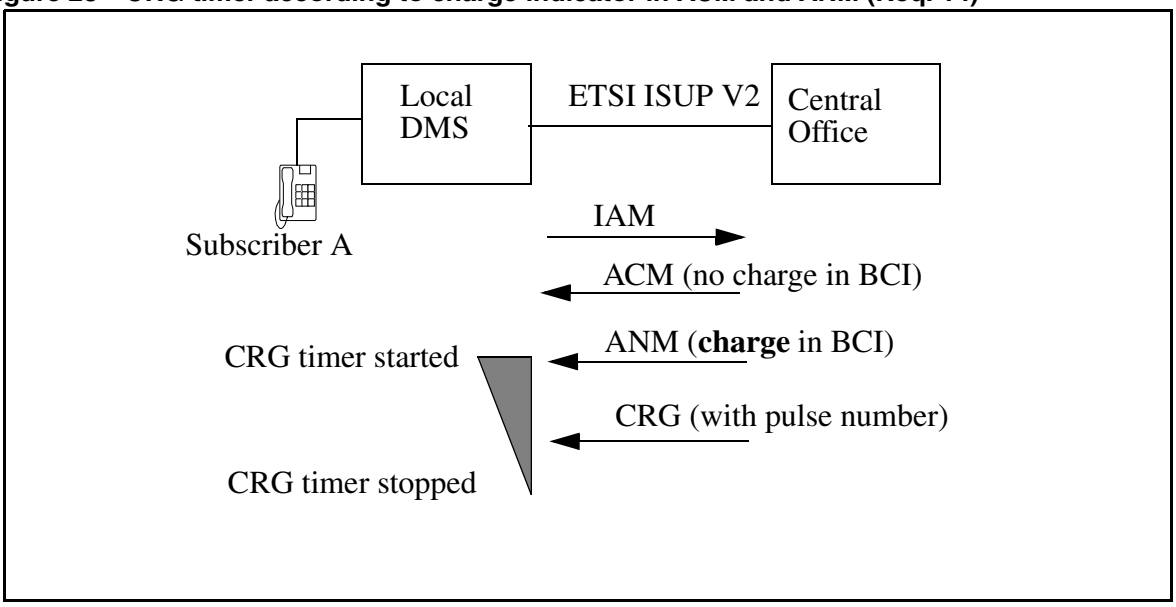

Figure 29 CRG timer according to charge indicator in ACM and ANM (Req. 14)

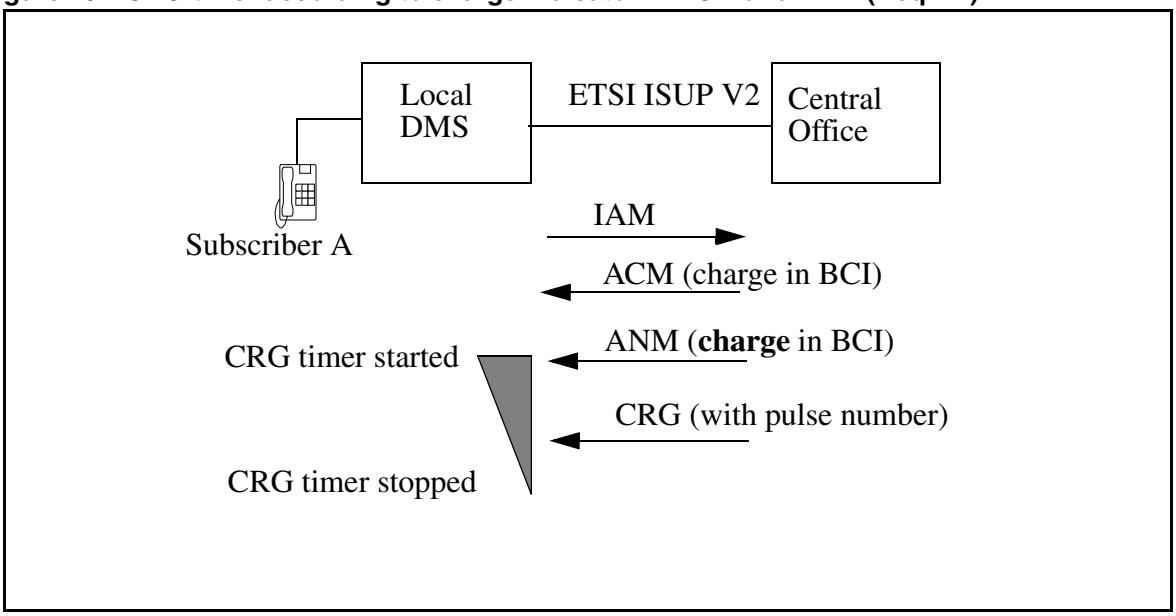

Figure 30 CRG timer according to charge indicator in ACM and ANM (Req. 14)

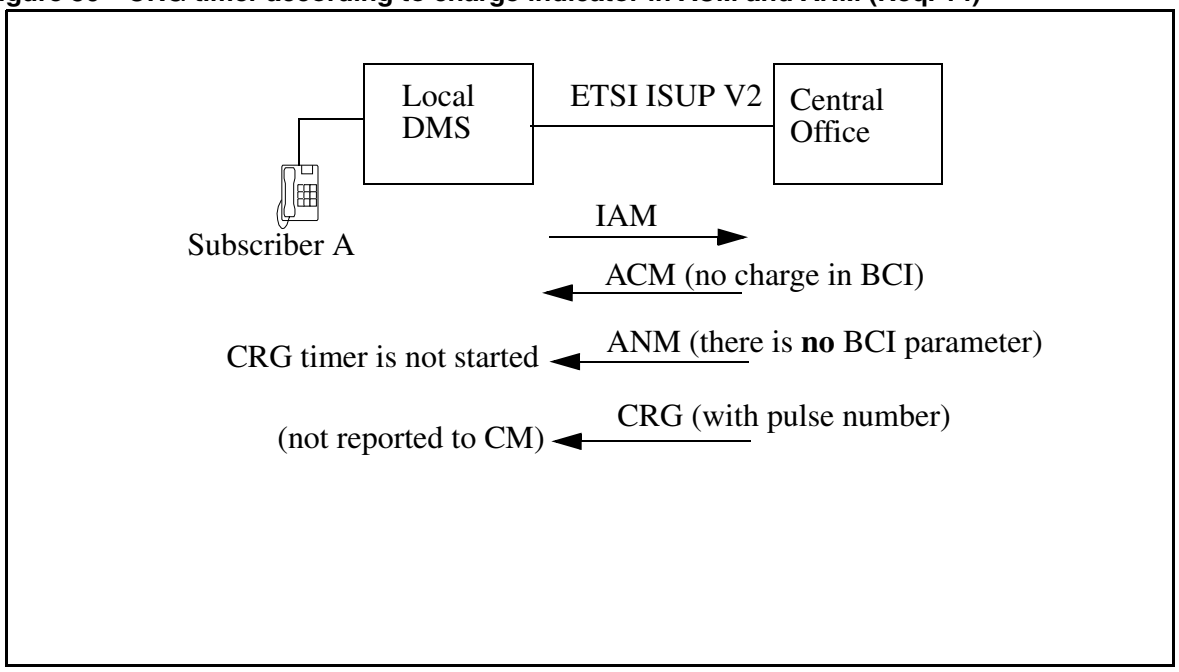

Figure 31 CRG timer according to charge indicator in ACM and ANM (Req. 14)

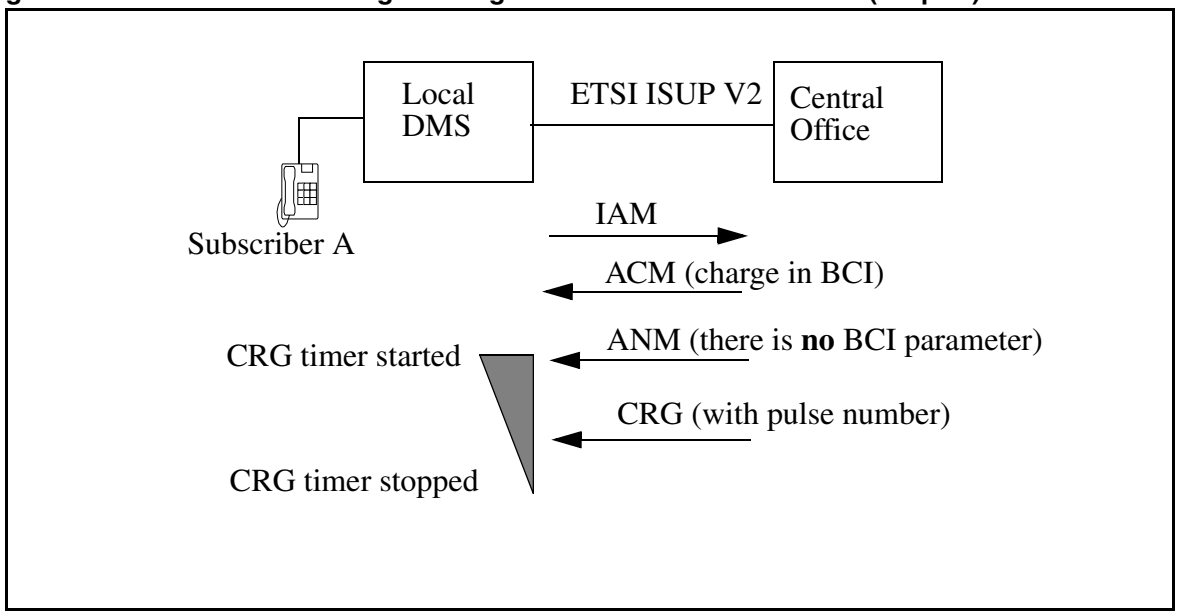


Metering behavior for successful distance type backward metering calls:

For successful distance type backward metering calls, charging of the originating agent will be done using the total of the received CRG pulse counts up to disconnect stage.

If an ANM, ACM, CON or CPG message with no charge in BCI parameter is received, then the call will not be charged.

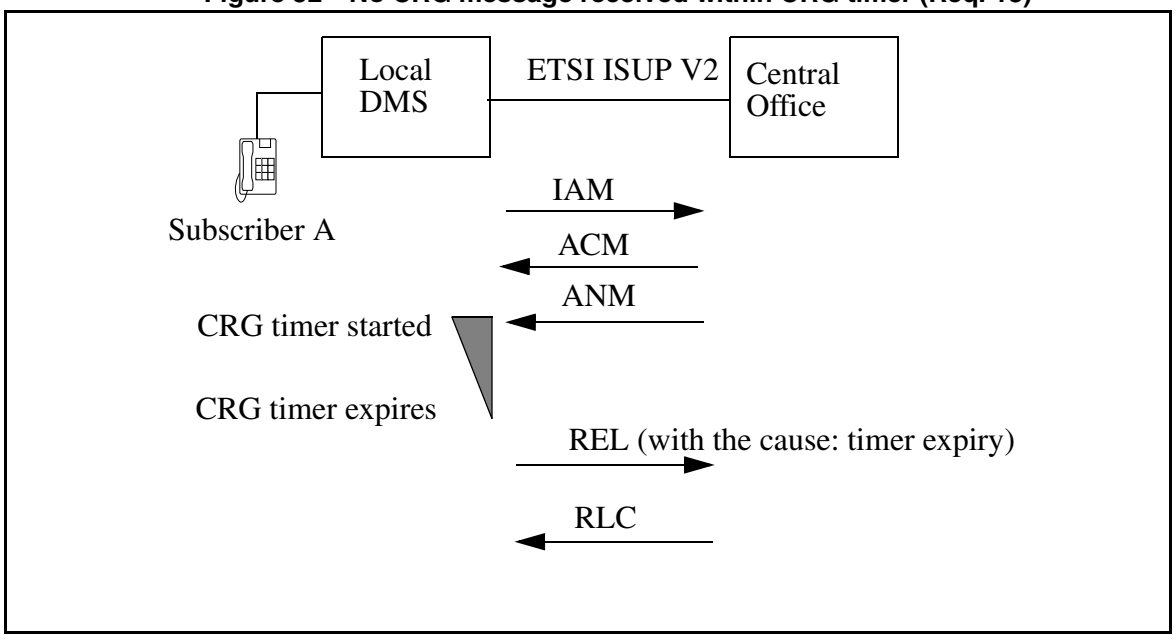
For SPM/COIN subscribers, hardware pulses will be generated for the originating agent using the CRG pulse count received. CRG pulses will be transmitted to originating SPM/COIN line as soon as the CRG message is received.

At the end of the call, if a mismatch occurs between received meter count and reported hardware metering pulse count for the originating line, then an MTR162 log is generated.

Unsuccessful calls for distance type backward metering

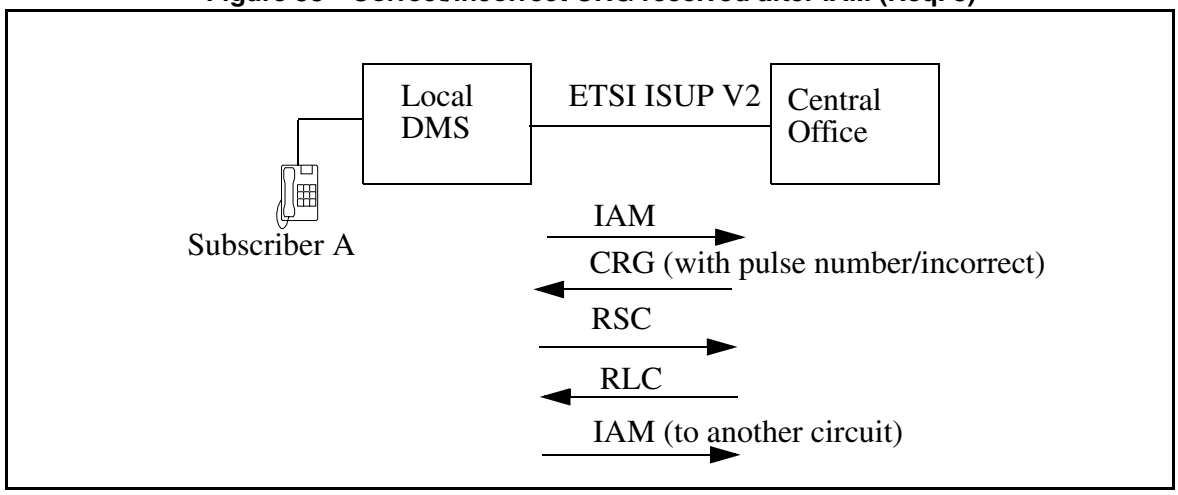
Refer to Table 4 for the status of CRG message in this subsection.

Figure 32 No CRG message received within CRG timer (Req. 13)



If CRG timer is expired after ANM/CON message for distance type backward metered call, call is not metered.

Figure 33 Correct/incorrect CRG received after IAM (Req. 3)



66.2.2.4.4 Charge Timer

The new CRG timer is provisioned in table C7UPTMR. This timer only applies at a local office for line to ISUP interworking. This timer is only started for the calls that need backward charging.

The CRG timer is started after receiving of ANM/CON messages to wait for a CRG message. If ACM and ANM messages are received with "no charge" value for charge indicator in backward call indicator parameter, CRG timer is not started and CRG message is reported to CM.

It is stopped when the first correct CRG message (with pulse number) is received during conversation.

If the new timer is not provisioned in table C7UPTMR, CRG timer is not started, incoming CRG messages are ignored and not reported to CM.

Table 5 CRG timer values

Minimum value	Maximum Value	Default value
0.5 seconds	4 minutes	20 seconds

66.2.2.5 Long Duration Call Interactions with Backward Metering

A call which is active longer than a pre-determined time is identified as a long duration call. For ordinary metered long duration calls, charge count is calculated each time the long duration audit is invoked and software meters of the originator are updated.
Long duration support is available for both local and distance type Morocco backward metering calls.

- For local type backward metering calls, long duration behavior is similar with ordinary metering. Each time the long duration audit is invoked, charge value for the audit period is calculated for the received tariff index, and then software meter of the originator is updated.
- For distance type backward metering calls, pulses are received inside CRG messages. Each time the long duration audit is invoked, received backward metering pulses are accumulated and software meters of the originator are updated with that value.

66.2.2.6 Backward Metering Line Feature Interactions

Backward metering is not supported in complex call scenarios. Feature activations are restricted when it is decided that some part[1] of call is being backward metered.

Controlling FLASH usage defines the behaviour of backward metering in most of IBN CEPT feature interaction scenarios which involves more than one leg (e.g. Call Switching, Three/Six Way Conference, Call Transfer, Call Diversion, Call Waiting, etc).

In ETSI BRI lines, usage of HOLD functionality is allowed with some limitations. Activation of ECT, 3PTY and 6PTY are not allowed if one of call legs is being backward metered.

Call Diversion features are restricted for both IBN and ETSI BRI lines, when 2nd leg is a backward metered call.

Feature interactions of COIN lines are not discussed, since COIN is not compatible with CEPT services (i.e Features that COIN is incompatible with are CWT, CXR, ENQ, CT, CWT, I3WC, I6WC, MDN, MTR, SCR, SPM, 3WC, and VOWDN).

Please note that IGNR_FLSH parameter in table ISERVOPT must be N, in order to enable flash usage of SPM agents.

[1]Any leg in complex call scenarios

IBN and ETSI BRI features, whose existing functionality is changed/limited by this activity are discussed below. Functionality of other features, which are not mentioned in this document, remins tha same.

66.2.2.6.1 Interaction with IBN CEPT Services

Restricting FLASH Usage

Flash usage is not allowed in backward metered calls. So any feature activated by flash (i.e.Call Transfer, 3WC, 6WC, Hold) is not allowed in backward metered calls.

FLASH Activation When Active Call is Backward Metered

Flash usage is not allowed when active call is Backward metered.

Consider the following scenario:

- A (IBN Agent) calls B (A - B Call Backward metered).
- A flashes and takes A-B call on hold (in order to make a new call, or activate a feature, etc.)

Flash is ignored in this case, and A-B call continues.

Backward Metered Call Initiation after FLASH

Initiation of a backward metered call, via flashing during a local type backward metered call, is not allowed. Such calls are routed to treatment when it is decided that call will be backward metered.

Consider the following scenario:

- A (either IBN agent) calls B (A-B Call is not backward metered).
- A flashes (A-B call on hold now), and calls C (A - C call Backward metered).

A - C call is sent to treatment from routing, and A-B call continues when A flashes again. A is given FNAL (LINE138 Log) treatment.

Call Diversion Services (CFU, CFD, CFF, CFU)

Call Diversion feature is not allowed if call is being diverted to a backward metered call. Please note that feature meter count of agent B is incremented for the usage of CFW feature (amount to be incremented is datafilled in MTRFEAT table, by ‘usage’ field), since this scenario is successful in terms of CFW operation, but is blocked by the terminating trunk.

Backward Metering Option on the second (Diverted) Leg

Consider the following scenario:

- B is programmed for being diverted to C (B - C Call Backward metered).
- A calls B.

In this case call diversion is not allowed, and a treatment is applied to A.

Treatment given in this case varies depending on the trunk/line treatment mappings on the first leg (A-B above).

In case

a. A - B is a line to line call, FNAL (LINE 138 Log) treatment is applied to orig agent (A).

b. a trunk (May be either ISUP, R2, PRI etc.) is involved in A - B call, type of treatment being applied to A depends on the treatment and release cause mapping datafills of related trunk. Hence treatment applied here may not be necessarily FNAL treatment. You can find teatment/release cause mappings in related signalling protocol documentation.

Please note that, if type of diversion applied is CFD(Call Forward Do Not Answer), if subscriber B does not answer the call in predefined amount of time (specified by CFDATIM option in table CUSTSTN), call is attempted to be divered to C. This diversion is not allowed since B-C call is backward metered, and B continues ringing[1], since diversion is rejected (general behavior of CFD). In CFD cases, an FNAL(LINE138) LOG might be reported, depending on the signalling protocol (i.e A-B call is line to line, R2, ISUP, PRI, etc).

Backward Metering Option on the first Leg

Consider the following scenario:

- B is diverted to C.
- A calls B (A - B Call Backward metered).

This scenario is not possible since backward metering generation is not supported in current office, only tandeming is supported.

ICWT/CWT (CEPT Call Waiting)

Call Waiting will be restricted since usage of FLASH in backward metered calls has been restricted already, and agent with ICWT/CWT option will not be able to take the call.

Consider the following scenario:

- A has ICWT/CWT option

[1]If B is an ETSIBRI agent, A-B call is taken down too.

- A calls B.
- A - B Call Active (Backward Metered)
- C calls A.

C gets busy tone, and A is not informed about second call request.

The following scenario is not possible since meter pulse generation is not supported in DMS100 MMP Office:

- A and/or B has ICWT/CWT option
- A Calls B.
- A - B Call Active.
- C calls either A or B (A-C Call backward metered).

66.2.2.6.2 Interaction with ETSI BRI Services

ETSI HOLD

The existing functionality of ETSI HOLD service is not affected, except that **silent tone**[1] is given to the held party if a backward metered call is taken hold.

Consider the following scenario for ETSI BRI agents:

- A (ETSI BRI Agent) calls B (A - B Call Backward metered).
- A holds A-B call.

A - B call is held, and B is applied silent tone. Now a new call can be initiated from A, and subscriber can turn back to A - B call via HOLDing the active call.

ECT (Explicit Call Transfer)

Call Transfer is not allowed if any of legs is a backward metered call.

Consider the following scenario for ETSI BRI agents:

- A(ETSI BRI Agent with ECT option) - B call is active (A - B call backward metered, and A is the originator).
- A - C call (any call) is on hold.

A attemts to transfer B - C, and call transfer is not allowed.

Call Transfer is rejected again, if backward metered call was on HOLD and call transfer was requested from the other leg.

3PTY (Three Way Conference)

[1] instead of HOLD announcement/tone

3PTY is not allowed, if ETSI BRI agent (who is the controller of conference) is the originator of a backward metered call on any leg (might be either HELD or IDLE leg).

Consider the following scenario:

- A (ETSI BRI agent with 3PTY option).
- A - B call is on HOLD. (A-B call backward metered and A is the originator).
- A - C call is active, and A requests 3PTY.

3PTY is not allowed, and conference is not established. Calls on both legs are preserved, and A might switch between calls via HOLD.

3PTY is again rejected if 3PTY is requested from the backward metered leg in the above scenario.

6PTY (Six Way Conference)

Initiation of 6PTY is not allowed if the controller is the originator of current backward metered call.

- A (ETSI BRI Agent with ECONF option).
- A - B call is active and backward metered.
- A attemts to initiate a 6 way conference, and conference request is rejected.

Also, addition of a backward metered call to an existing conference is not allowed.

A (ETSI BRI Agent with ECONF option), and is the controller of the ongoing conference.

- A takes the conference on HOLD, and initiates A-B call (backward metered).
- When B answers the call, A attempts to add A-B leg to the conference.
- Request of A for addon leg is rejected.

Call Diversion Services

Behavior of call diversion services for ETSI BRI lines in backward metered calls are as described in the Call Diversion Section for IBN lines.

66.3 Hardware Requirements or Dependencies

These activities are supported

- only for SX05 PDTC

- only for SX05 GPP and QPO load
- MX77 (development will be done) PLGC and OLG load
- SX05 (only for basic sanity tests will be done) PLGC, QGI loads.

66.4 Software Requirements or Dependencies

None

66.5 Limitations and restrictions

- If more than one pulse count is received in CRG message, generation of all received pulses to SPM/COIN lines is not guaranteed for distance type backward line hardware metering.
- Maximum supported CRG message rate is 1 message per 0.52 seconds for distance type backward line hardware metering.
- In case CRG timer is not datafilled in C7UPTMR local software metering is done instead of backward metering.
- Trunk software metering is not supported for Morocco ISUP V2.
- Retranslation scenarios are not supported in Morocco ISUP V2 backward metered calls, similar to existing metering functionality.

67.1 Feature name

Activity ID: A00004743

Title: Line originations CLI modification through CALLCNTL in ISN07

67.2 Description

67.2.1 Background

Customers wants the ability to send a different CLI dependent on the dialed digits and calling digits for their ONE NUMBER service.

All ONE NUMBER VoIP lines have a real DN (original DN) that is datafilled on the call server and a virtual DN (new CLI), where the original DN is changed into the new CLI when the called number is in a special range.

Features A59028780 and A59033687 (from MMP15 and tested in Succession ISN loads) provide a capability through table CALLCNTL and related tables to perform CLI modification based on the called number and calling number. These features work well in a trunk to trunk scenario.

The translations can also be applied in line originated calls (line to trunk and line to line) correctly. However, the CLI presented at the terminating display or in the outgoing message of the trunk terminating call, is not modified, and remains as the original CLI, but the Orig Open Digs in AMA log is the modified CLI.

This feature enhances the capability in ISN07 to modify the CLI based on called number and calling number (through table CALLCNTL) for IBN line originating calls. And this feature also provides a datafillable ability to control whether the modified CLI or original CLI is put into the Orig Open Digits field of AMA record.

67.2.2 Detail description

67.2.2.1 CLI for display

Following scenarios are supported by this feature.

- For IBN line -> IBN line calls, the modified CLI is presented at the CLASS display if the CLI needs to be changed to the virtual DN.

  Note: In order to active this function, CND tuple for ETSI variant must be added in table ISERVOPT (please refer to Figure 1), and the called party must be with CND/DDN option.

Figure 1 Datafill example in table ISERVOPT

```
TABLE: ISERVOPT
>lis
SOPTSKEY SOPTSVAR
-----------------
CND CND ETSI RS15 N N DEFAULT
```

- For IBN line -> ETSI V2 BASE ISUP trunk calls, the modified CLI is sent in the outgoing IAM if the CLI needs to be changed to the virtual DN.
- For IBN line -> ETSI PRI trunk calls, the modified CLI is sent in the outgoing SETUP message if the CLI needs to be changed to the virtual DN.

As to how to datafill the CLI modification through table CALLCNTL, please refer to features A59028780 and A59033687 for detail.

67.2.2.2 CLI in Orig Open Digs field of AMA log

BILLCLI, a new option in subtable CGPNDATA of table CGPNSCRN and subtable CDPNDATA of table CDPNSCRN, is introduced by this feature to control which CLI is put into the Orig Open Digs field of AMA log.

The modified structure of subtable CGPNDATA of table CGPNSCRN is as below:

Figure 2 Structure of subtable CGPNDATA of table CGPNSCRN

```
TABLE: CGPNSCRN CGPNSCRN: CGPNDATA
>ran
 1 FROMDIGS          EDIG_DIG_REG
 2 TODIGS            EDIG_DIG_REG
 3 CGPNINDX          THIRTY_TWO_CHAR_VECTOR
 4 CCOPTION          CALLCNTL_OPTION_VECTOR
 5 CGPNOPT           CDGPNSCRN_OPTION_VECTOR
LOGICAL TUPLE TYPE: CGPNDATA_LOG_TUPLE
>ran 5
 5 CGPNOPT           CDGPNSCRN_OPTION_VECTOR
TYPE IS CDGPNSCRN_OPTION_VECTOR VECTOR OF UP TO 2 MULTIPLES WITH
       CDGPNSCRN_OPTIONS      {CONTINUE, BILLING_CLI} REFINEMENTS:
        {CONTINUE}              MULTIPLE WITH
             CONSUME            {0 TO 31}
        {BILLCLI}              MULTIPLE WITH
             CLI                {ORIG, MODIF}
```

The modified structure of subtable CDPNDATA of table CDPNSCRN is as below:

Figure 3 Structure of subtable CDPNDATA of table CDPNSCRN

```
TABLE: CDPNSCRN SCRN_PROVIDER12: CDPNDATA
>ran
 1 FROMDIGS          EDIG_DIG_REG
 2 TODIGS            EDIG_DIG_REG
 3 CDPNINDX          THIRTY_TWO_CHAR_VECTOR
 4 CCOPTION          CALLCNTL_OPTION_VECTOR
 5 CDPNOPT           CDGPNSCRN_OPTION_VECTOR
LOGICAL TUPLE TYPE: CDPNDATA_LOG_TUPLE
>ran 5
 5 CDPNOPT           CDGPNSCRN_OPTION_VECTOR
TYPE IS CDGPNSCRN_OPTION_VECTOR VECTOR OF UP TO 2 MULTIPLES WITH
        CDGPNSCRN_OPTIONS       {CONTINUE,BILLCLI} REFINEMENTS:
        {CONTINUE}              MULTIPLE WITH
             CONSUME            {0 TO 31}
        {BILLCLI}              MULTIPLE WITH
             CLI                {ORIG, MODIF}
```

A datafill example in subtable CGPNDATA of table CGPNSCRN is as below:

Figure 4 Datafill example in table CGPNSCRN

```
TABLE: CGPNSCRN CLISCRN: CGPNDATA
>lis
FROMDIGS TODIGS CGPNINDX CCOPTION CGPNOPT
----------------------------------------
106602 106602 RETURN (DIGMAN CGPN 2) $ (BILLCLI ORIG) $
```

A datafill example in subtable CDPNDATA of table CDPNSCRN is as below:

Figure 5 Datafill example in table CDPNSCRN

```
TABLE: CDPNSCRN CLISCRN: CDPNDATA
>lis
TOP
FROMDIGS TODIGS CDPNINDX CCOPTION CDPNOPT
----------------------------------------
106602 106602 RETURN (DIGMAN CGPN 0) $ (BILLCLI MODIF) $
```

When BILLCLI is *ORIG*, the Orig Open Digs in AMA log is the original CLI if the CLI has been modified through table CALLCNTL; When BILLCLI is *MODIF*, it is the modified CLI.

Note: This function is applied to line and trunk originating calls.

For line originating calls with the CFW service on the called party, if BILLCLI is *ORIG*, the Orig Open Digs field in the first AMA log is set to original calling number whereas the filed in the other AMA logs are set to original called number.

If the option is not datafilled, AMA log is not impacted by this feature.

67.3 Hardware Requirements or Dependencies

N/A

67.4 Software Requirements or Dependencies

N/A

67.5 Limitations and restrictions

N/A

67.6 Interactions

67.6.1 IBN line to IBN line calls

- The CLI from SCP overrides the modified CLI through table CALLCNTL, i.e. the SCP CLI is displayed on the phone.
- The modified CLI is not manipulated through DN reverse translation.

67.6.2 IBN line to ETSI V2 ISUP trunk calls

- The CLI from SCP overrides the modified CLI through table CALLCNTL, i.e. the CLI from SCP is sent in the outgoing IAM.
- The IN DEFNUM overrides the modified CLI through table CALLCNTL, i.e. the IN DEFNUM is sent in the outgoing IAM.
- The manipulation of CLI through CLIOUTP or CLGDMI option on the outgoing trunk overrides this feature's functionality, i.e. the CLI manipulated by those options is sent in the outgoing IAM.

67.6.3 IBN line to ETSI PRI trunk calls

- The CLI from SCP overrides the modified CLI through table CALLCNTL, i.e. the CLI from SCP is sent in the outgoing SETUP message.
- The manipulation of CLI through CLIOUTP or CLGDMI option on the outgoing trunk overrides this feature's functionality, i.e. the CLI manipulated by those options is sent in the outgoing SETUP message.

68: Functional Description (FN): A00004750

68.1 Feature name

Even Bit Inversion(EBI) Support on DTCO2.

68.2 Description

The intent of this activity is to download even bit inversion feature to DTCO2s Downloading is enabled/disabled by means of a datafillable entity.

We would normally do not require this feature for DTCO2s. This feature is only needed for some specific scenarios described in the following sections:

68.2.1 Background Information

Currently, EBI for PLGC and PDTC (DTCO) is defined by features AE0385 ’EBI - CC SUPPORT’ and AE0334 ‘EVEN BIT INVERSION’. GSP/GMP customers were complaining about bringing the CCS7 links on the DTCO2s into service while they are making changes in BIT_INVERSION field of table LIUINV to make the bit inversion compatible with the far-end datafill.

For example, the customers would like to set the BIT_INVERSION field in LIUINV to Even Bit Inversion (EBI) to make it compatible with the far-end setting. When the customer brings the CCS7 link into service, the link drops into SYStem Busy (SYSB) state and never recovers unless they change the bit inversion to a suitable setting (e.g: No Bit Inversion (NBI)).

Basically, the customer has two offices, one with DTCO and the other with DTCO2 carrying a CCS7 link in between but the link cannot be bring into service when they made an equivalent bit inversion setting in LIUINV.

Customer indicated that they do not have this problem when they move the CCS7 link to a DTCO from DTCO2.

68.2.2 Root-Cause

Basically, the problem is due to bit conversions done on the network side due to the setting of TYPE_OF_NETWORK parameter in table OFCENG.

The two offices in question have different TYPE_OF_NETWORK settings. Namely, one office containing MMP load has the setting of INTERNATNL and the other containing GSP/GMP load has the setting of NORTH_AMERICA.

The TYPE_OF_NETWORK parameter is introduced to DMS by the activity AE0385 - EBI CC Support. Based on the network type selection, it does a

conversion on the network side. For example for a PCM30 voice carrier where no conversion is done on the P-side, the bit stream is converted to “CCITT A-Law + EBI A-Law companding” for a setting of INTERNATNL in the network side. However, for a NORTH_AMERICA setting, this conversion is “True data + ABI Inverted Data” in the network side.

The reader is referred to FN section of activity AE0385 for a detailed explanations of the bit conversions based on the TYPE_OF NETWORK.

The reader is also referred to DS section of the same document for the datafill details of this activity.

Neverthless, the GSP/GMP office in question is configured as NORTH_AMERICA type_of_network. This parameter should only be datafilled during the office setup and should not be changed thereafter.

On the other hand, the DTCOs can be added an NT6X44EA optional card in the LTCINV datafill to download the EBI support onto it. Hence the DTCOs can work with the far-end as expected.

The reader is referred to activity AE0385 for a detailed description of NT6X44EA usage.

Unlike the DTCOs, the DTCO2s cannot be datafilled NT6X44EA optional card and therefore the EBI information cannot be downloaded to DTOC2s.

68.2.3 The Solution

In order to overcome this problem, the EBI support should be downloaded to DTCO2s.

A fix has been submitted into TL20 stream to download EBI support to DTCO2s, however, this update may bring new problems as stated in the following section.

68.2.4 Potential Problems of the TL20 fix

Consider an office which has CCS7 links on some of DTCO2 and their associated bit inversion fields in LIUINV are not compatible with the far-end (as in our case, the near-end is NBI and far-end is EBI). Right after an ISN07 upgrade, the DTCO2s may be re-started to download the static data (performing and kind of PM WARM or COLD swact, or a PM REX swact or BSY/RTS of whole PM or a RELOAD RESTART of CM).

As there is no control of the fix submitted into TL20, the EBI feature is downloaded to DTCOs which ultimately impacts the bit inversion and hence causes CCS7 link outages.

To prevent such outages, the customers are expected to change their LIUINV bit inversion datafills and make it compatible with the far-end.

68.2.5 The Ultimate Solution

Ultimately, the fix in TL20 has no control on the downloading of EBI support feature to DTCO2s. Therefore, adatafillable switch should be defined on CM to enable/disable the functionality provided by the fix.

68.3 Feature Descripton

EBI is defined by features AE0334 and AE0385. AE0334, Even Bit Inversion feature enables the time switch card (NT6X44EA) the ability to provide PCM conversions(A-Law, Mu Law, EBI conversion) on per channel basis. This feature uses AE0385, EBI-CC Support Feature which provides Central Control Software in the International DMS-100F Switches. Within an International Network all data is EBI'd and all voice is A-law companding. The conversions required between PCM at the lines or trunks, and PCM within the network is done by peripheral's timeswitch card NT6X44EA.

The reader is referred to activities AE0334 and AE0385 for a wider understanding of how bit inversion is handled within the internal network for different type of networks.

The type of network is determined by the office parameter TYPE_OF_NETWORK in table OFCENG. Please refer to activity AE0385 for a description of this parameter.

Unlike the DTCOs where the even bit functionality is downloaded by adding NT6X44EA in LTCINV, the DTCO2's are not allowed to datafill NT6X44EA, hence does not have the ability to download even bit support feature.This activity, as in NT6X44EA, downloads the EBI support feature into DTCO2s by adding a new optional attribute to table LTCINV.

The following table is clone from AE0385 and it shows how bit inversions are done for voice and data in the internal network for different values of TYPE_OF_NETWORK setting.

In the table below the following symbols are used

A : CCITT A-Law

Ai : A + ABI Inverted CCITT A-Law

Ae : A + EBI A-Law Companding (EBI'd CCITT A-Law)

U : CCITT U-Law

Ui : U + ABI Inverted CCITT U-Law

Ue : U + EBI EBI'd CCITT U-Law

OBI : Odd Bit Inversion

Table 1 Network/Carrier Type/Voice Law/Conversion Matrice for a defined link.

Network Type	Carrier Type	Voice Law	Voice Conversion	Data Conversion
INTERNATIONAL	PCM30	A-LAW	NO CONVERSION	NO CONVERSION

NORTH AMERICA	DS1	A-LAW	Ui<-->Ae	NO CONVERSION
NORTH AMERICA	DS1	MU-LAW	NO CONVERSION	NO CONVERSION

68.3.1 New Optional Attribute Definition in LTCINV Table for EBI Activation

This activity adds a new optional attribute, namely, "EBI" in table LTCINV.

When it is added into a DTCO2 tuple in LTCINV, it downloads EBI support feature to DTCO2 during static data download. LIUINV table should be compatible with the far end setting.

The reader is referred to Data Schema section of this activity to have a sample datafill.

68.4 Hardware Requirements or Dependencies

This feature is designed for DTCO2s.

68.5 Software Requirements or Dependencies

None.

68.6 ONP Requirements

This activity is a follow-up activity for a fix (which uncontrollably downloads EBI support to DTCO2s) made in TL20 timeframe and is intended to eliminate possible CCS7 link failures during/after an ISN07 upgrade.

Without this activity being deployed in TL20, the EBI support feature is downloaded to DTCO2 during a static data download due to PM REX or PM SWACT or CM RELOAD RESTARTs right after an ISN07 upgrade and ultimately, bit inversion in the internal network is changed and hence cause a CCS7 link outage if the bit inversion field in the associated LIUINV tables are not made compatible with the far-end bit inversion settings (for example, near-end is set to NBI and far-end is set to EBI). In these circumstances, the customer may require to set the LIUINV bit inversions correctly.

However, this activity addresses this issue to overcome such problem that may occur right after an ISN07 upgrade.

68.7 Limitations and restrictions

None.

68.8 Interactions

None.

69: Functional Description (FN): A00004931

69.1 Feature name

Indian ISUP Act A00004931

69.2 Description

This activity addresses the ability to support Indian ISUP. Indian ISUP is on the CS2K IP solution. It is available on the International Succession Product.

The Indian ISUP is based on following international standards:

ETSI standard ETS 300 356-1 to -12 and -14 to -19 (February 1995): ISDN User Part (ISUP) Version 2 for the international interface

ETSI standard ES 201 296, V1.1.2 (1998-09) (ISUP Signalling aspects of charging)

The primary difference between Indian ISUP and ETSI ISUP V2 baseline is the modification of some of the existing additional parameters within the supported message set of ETSI ISUP base and additional parameters with Indian ISUP specific format.

Following interworkings will be covered by this activity:

to ETSI ISUP V2

to ANSI ISUP

to Indian ISUP

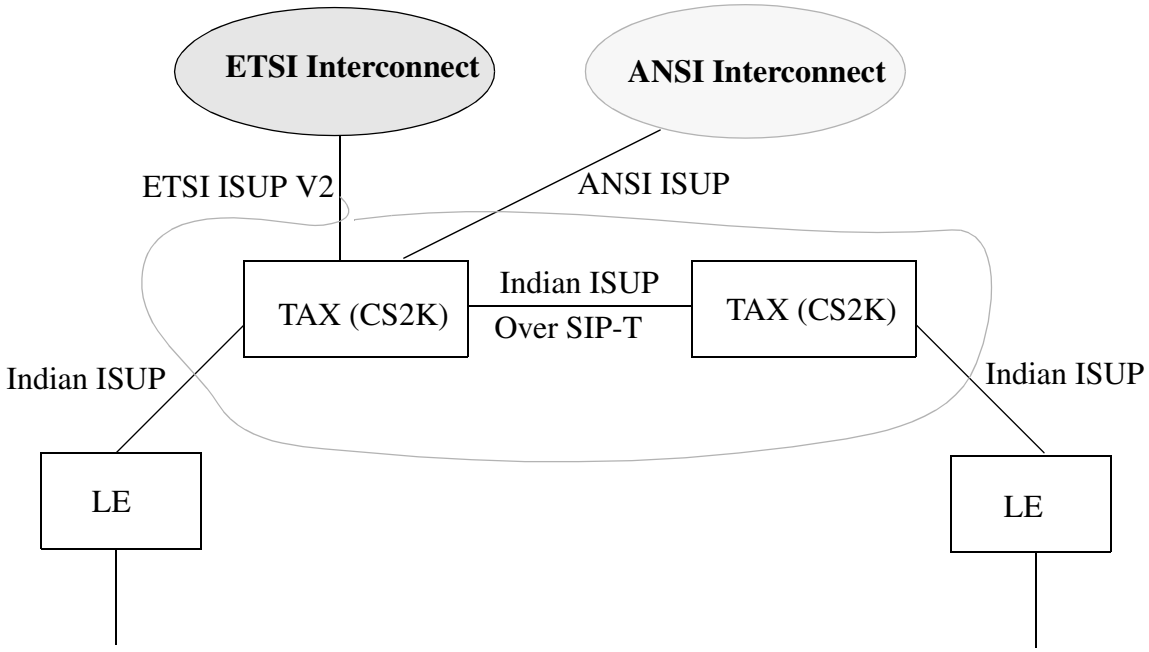
The following table indicates which protocols will be tested using SIP-T

Table 1 SIP-T Usage

Protocol	SIP-T	non-SIP-T
ISUP V2	X	X
Indian ISUP	X	X

The following figure illustrates the planned CS2K configuration for Indian ISUP.

Figure 1 CS2K Configuration for Indian ISUP



The following additional timers shall be provided as detailed by the specification for Indian ISUP, rest of timers shall be used as defined for ETSI ISUP V2.

UI SUS Control timer - Initiated when controlling exchange receives SUS (user) message and terminated upon receipt of resume message. At expiry the release procedure is initiated.

Congestion handling short - Initiated when congestion indication is received. At expiry the new congestion indication will be taken into account.

Congestion handling long - Initiated when congestion indication is received. At expiry the traffic is restored by one step.

Response to Call Reference release - Initiated when response to request of end to end connection establishment is sent and terminated at the receipt of the first end to end message from remote end. At expiry end to end message is allowed to be sent.

69.2.1 Indian ISUP datafill

This activity provides the ability to datafill Indian ISUP variant in table TRKSGRP. An example of this datafill in TABLE TRKSGRP is as shown below:

Table TRKSGRP

99ATMC42IT2 0 DS1SIG C7UP 2W N N EXTERNAL NONE Q767 THRH 0 DMSETSI N Y **INDIA 100_WHITE** $ ETSI2W CIC

'100_WHITE' indicates that the variant is based on ETSI ISUP V2.**'INDIA'** marks the specific variant based on 100_WHITE.

69.2.2 Indian ISUP signalling

69.2.2.1 General

This section describes the supported messages and parameters. The description within this section is based on ETSI ISUP V2 specification and Indian ISUP specification.

69.2.2.2 Messages

The following set of tables describes the messages and the parameters that these messages will/will not supported in Indian ISUP.

Table 2 ISUP Address Complete Message

69.2.2.3 Parameter that are getting effected for INDIAN ISUP

The following sections describes the existing ETSI ISUP message parameters that will be enhanced/restricted or if the parameter is new in the existing message.

69.2.2.3.1 IAM parameters

CPC (Calling Party Category):

The format of Calling Party Category is as shown below:

8	7	6	5	4	3	2	1
Calling Party's Category							

In addition to all the Calling Party Categories defined in ITU-T recommendation Q.763 the following categories will be supported over Indian ISUP:

00001001 - National Operator with Trunk offer

11100001 - Operator with trunk offer

11100000 - CCB Subscriber

11100010 - Interception Operator

11100011 - Subscriber with Home meter

11100100 - PABX

11100101 - PABX with priority

11100110 - Line test desk

TMR (Transmission Medium Required):

The format of Transmission Medium Required is as shown below:

8	7	6	5	4	3	2	1
Transmission Medium Required							

In the TMR parameter defined in ITU-T Q.763, The following values will not be used for Indian ISUP:

00000100 to 00000101

00000111 to 00001010

00010000 to 00101010

USI (User Service Information):

The format of User Service Information is as shown below:

	8	7	6	5	4	3	2	1
1	ext.	Coding standard		Information transfer capability				
2	ext.	Transfer mode		Information transfer rate				
2a	Rate multiplier							
3	ext.	Layer ident.		User information layer 1 protocol				
4	ext.	Layer ident.		User information layer 2 protocol				
5	ext.	Layer ident.		User information layer 3 protocol				

NOTE 1 – Octet 2a is required if octet 2 indicates multirate (64 kbit/s base rate); otherwise, it shall not be present.

NOTE 2 – Octets 3, 4, 5 or any combination of these octets may be omitted. Octet 3 may be extended as described in Recommendation Q.931.

The codes listed below are reserved and are not provided:

01 to 11 - Coding Standard

10001 and 11000 - Information Transfer Capability

10001 to 10111 and 11000 - Information Transfer Rate

00010, 00100, 00101, 00110 and 00111 - User information Layer-1 protocol identification

69.2.2.3.2 ACM, ANM, CPG parameters

BCI (Backward Call Indicators):

The format of Backward Call Indicator is as shown below:

	8	7	6	5	4	3	2	1
1	H	G	F	E	D	C	B	A
2	P	O	N	M	L	K	J	I

The parameter ‘Backward Call Indicator’ is defined in ITU-T Recommendation Q.763, The following bit fields are reserved and will not be used:

Bit DC - 10 (Binary Value)

69.2.2.3.3 INF parameters

Information Indicators:

The format of Information Indicators is as shown below:

	8	7	6	5	4	3	2	1
1	H	G	F	E	D	C	B	A
2	P	O	N	M	L	K	J	I

The parameter ‘Information Indicators’ is defined in ITU-T recommendation Q.763, The following bit value is fixed:

Bit H - Always set to 0

69.2.2.3.4 REL, CPG, ACM parameter

Cause Indicator:

The format of Cause Indicator is as shown below:

	8	7	6	5	4	3	2	1
1	ext.	Coding standard		Spare	Location			
2	ext.	Cause value						
3								
.	Diagnostic(s) (if any)							
.								
n								

NOTE – Octet 3 to 3n may be omitted or repeated, e.g. 3' to 3'n.

The parameter ‘Cause Indicator’ is defined in ITU-T recommendation Q.763, The following bit value is fixed:

Coding Standard - 01 to 11

Location - 0001, 0101 and 0111

69.2.2.3.5 CRG parameter

Charge Band:

Please refer FN for Act A00004933.

69.2.3 Supplementary services supported by Indian ISUP

The ETSI V2 supplementary services will be directly inherited by Indian ISUP. The following will be the list of supplementary services that will be supported over Indian ISUP.

Direct Dialing-In (DDI)

Multiple Subscriber Number (MSN)

Calling Line Identification Presentation (CLIP)

Calling Line Identification Restriction (CLIR)

Connected Line Identification Presentation (COLP)

Connected Line Identification Restriction (COLR)

Malicious Call Identification (MCID)

Call Forwarding Busy (CFB)

Call Forwarding No Reply (CFNR)

Call Forwarding Un-conditional (CFU)

Call Waiting (CW)

Call Hold (HOLD)

Three Party Service (3PTY).

69.2.4 Interworking

The interworking of Indian ISUP with ETSI ISUP V2 and ANSI ISUP has been supported. The section below describes the message mapping and parameter mapping between Indian ISUP and ETSI ISUP, and Indian ISUP and ANSI ISUP respectively.

69.2.4.1 Message mapping

69.2.4.1.1 Indian ISUP to ETSI ISUP interworking

All messages except national specific messages of Indian ISUP will be supported by ETSI ISUP.

69.2.4.1.2 Indian ISUP to ANSI ISUP interworking

Received ANSI7+ Message	Indian ISUP (Gen/Rx)	Generated ANSI7+ Message
Forward Set-Up Messages		
IAM	IAM	IAM
	SAM	
Backward Set-Up Messages		
ACM	ACM	ACM
CPG	CPG	CPG
ANM	CON	ANM
Call Supervision Messages		
ANM	ANM	ANM

REL	REL	REL

69.2.4.2 Parameter mapping

All the parameter mapping from Indian ISUP to ETSI ISUP, and Indian ISUP to ANSI ISUP follows the same framework as ETSI ISUP to ETSI ISUP interworking except the ones listed below

Table 32 Indian ISUP to ETSI ISUP (V2) Interworking

69.3 Hardware Requirements or Dependencies

Not Applicable

69.4 Software Requirements or Dependencies

Not Applicable

69.5 Limitations and restrictions

- Only Indian ISUP to Indian ISUP/ETSIV2/ANSI trunk interworkings will be supported.
- With respect to Lines, only Indian ISUP to IBN line interworking will be supported.
- Transit Network Selection parameter is supported only for transit call scenarios.
- Diagnostics of Cause Indicator parameter in REL message will be removed only when there are no optional parameters in the REL message
- Call Reference Parameter shall only be supported for IAM
- Display Information Parameter will not be supported

69.6 Interactions

Since Indian ISUP is based on ETSI ISUP V2 this feature interacts with the base implementation of ETSI ISUP V2.

70: Functional Description (FN): A00004933

70.1 Feature name

A00004933- Indian ISUP Charging

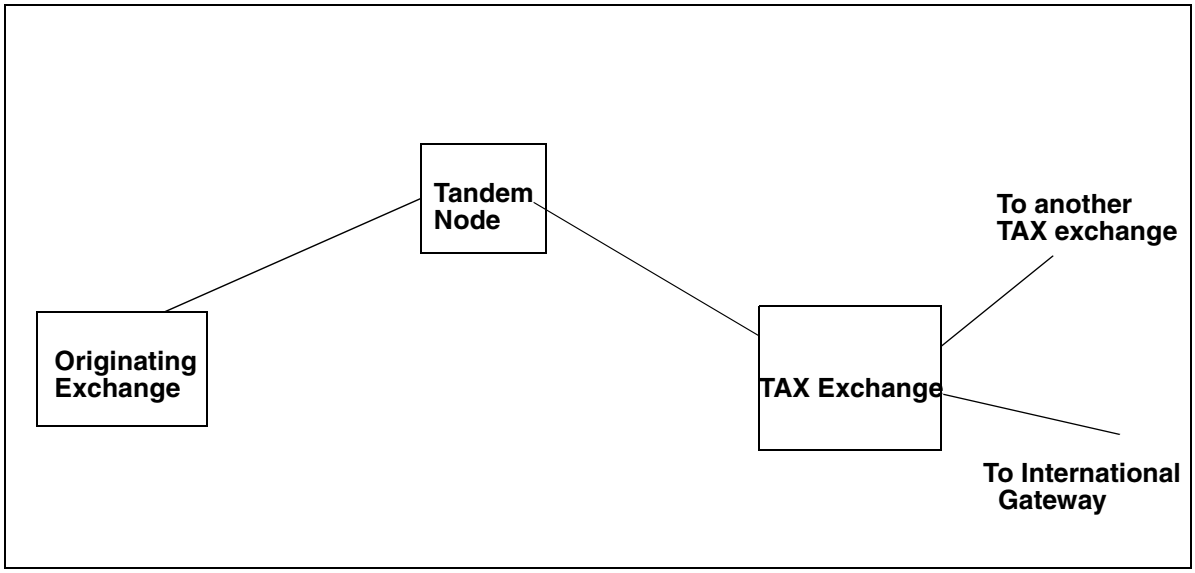
70.2 Introduction

70.2.1 Overview:

In this feature we are dealing with following points

- Charge Band Table.
- CDP node functionality.
- CGP node functionality.
- Exception condition on receipt of Charging message.
- Tandem/interworking node functionality.
- Generation of AMA record.

Figure 1 Network Diagram in Indian scenario



70.2.1.1 Charge Band Table:

Charge Band Tables are used to calculate the pulses for charging in Indian Market. These tables have relationship between the CBN and pulse duration. For Indian Market, CDP is the TAX exchange and CGP is the Local exchange.

70.2.1.1.1 Charge Band Parameter:

CBN parameter is national parameter for Indian ISUP which has following structure

Parameter	Type	Length(octets)	Code(hex)
Message Type	F	1	31
charge band	O	3	
parameter code			FF
parameter length			01
Charge band number			
message compatibility information	O	3	38
end of optional parameter	O	1	00

Message compatibility information need to be supported in the CRG message. The format of the message compatibility information parameter field is shown in table below

8	7	6	5	4	3	2	1
Instruction Indicator							

The instruction indicator has following subfields:

bit

A Transit at intermediate exchange indicator.

According to the Indian ISUP Charging specification it should have the value 0 for transit interpretation.

B Release call indicator.

According to the BSNL specification it should have value 1 which means release call, 0 value is used for do not release call.

C Send notification indicator.

Should have the value 0 which means do not send notification according to the specification.

D Discard message indicator.

According to the BSNL specification it should have value 0 which means do not discard the message (pass on).

E Pass on not possible indicator.

It has value 0 which means release call. Value 1 means discard information.

F/G Broadband/narrowband interworking indicator.

00 value to be used, meaning spare. The extension indicator defines if information continues through the next octet or not. It has a value 1 which means Last octet.

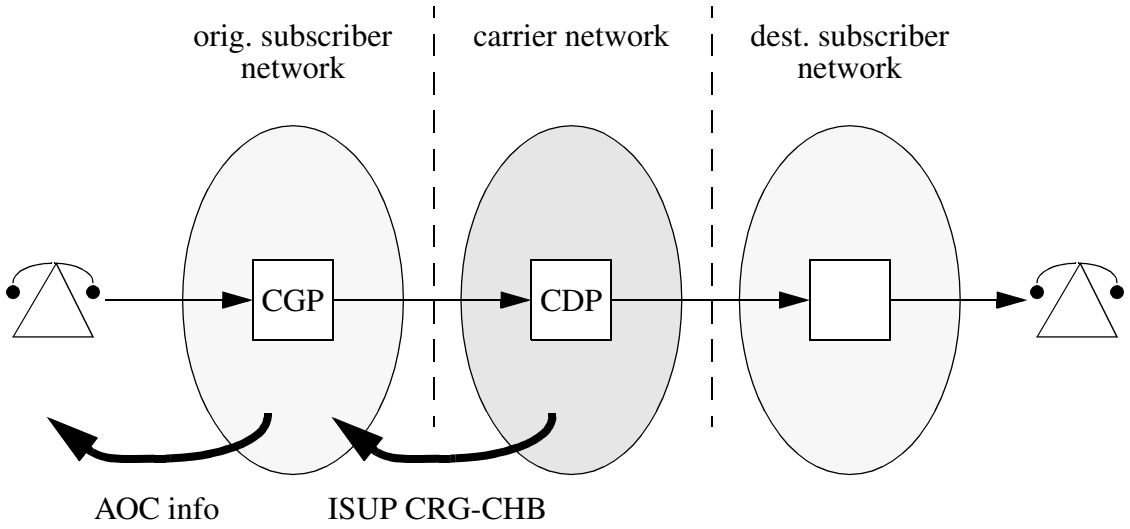
70.2.1.2 Charge Determination point functionality:

This feature provides the capabilities for the determination of charging related information between a charge determination point (CDP) and a charge generation point (CGP) which all may be located in multiple networks or on same network.

Main function of CDP is to determine charge Band number and generation of CRG message. The charge generation point is an exchange where the charging information received from the network is converted into a format that is delivered to the actual subscriber.

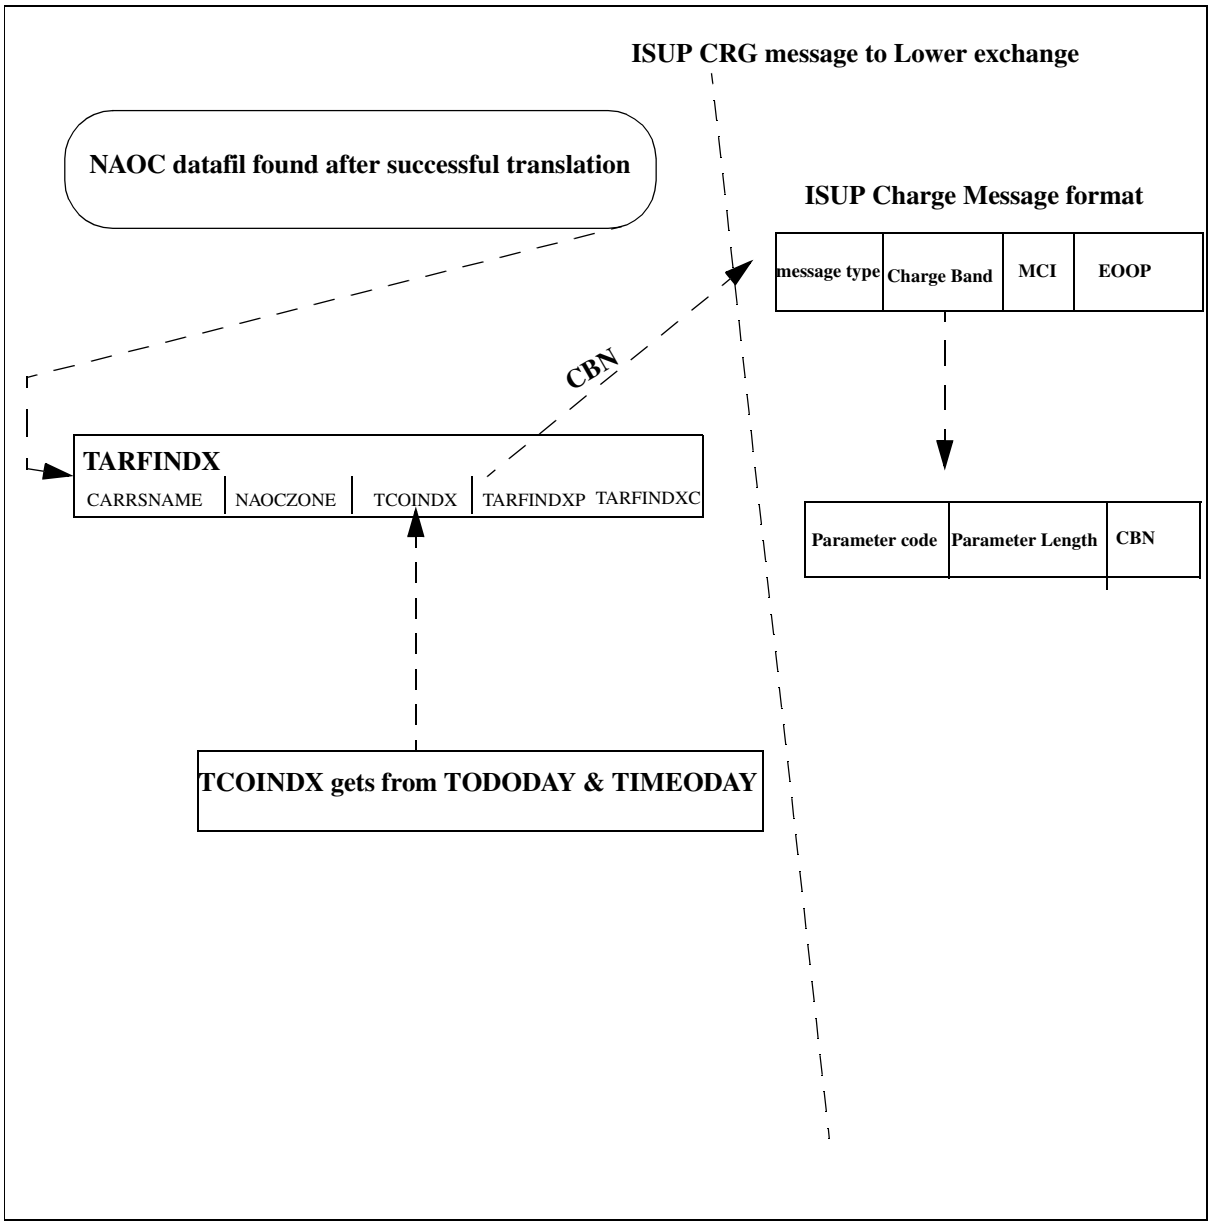
The following diagram shows a simple scenario where this functionality is needed and the location where the CDP (exchange to determine the tariff, send it over ETSI ISUP trunks) and CGP (receiving and processing OLE) reside during the call.

Figure 2 Network AOC support for Indian ISUP Charging



For this NAOC call, the charge determination point (CDP) is located in the carrier network and the charge generation point (CGP) is located in the originating subscriber network. At CDP the charge band number is calculated and send in ISUP CRG message to CGP which uses this information to get the tariff information with the existing charge band table. ISUP charge message is generated for all calls pre ACM at the TAX node. CRG message contains the national specific Charge Band Parameter. Charge Band Parameter contains CBN. The calculation of CBN at the TAX node is done according to the Time of the Day, Type of the call and day of the week. At the outgoing trunk, if NAOC datafill is found after successful translation, then the TARFINDXP indices in the table TARFINDX is taken and is treated as CBN. This CBN number is put in the filled of CRG message along with message compatibility and sent to the CGP. More details are provided later in the datafill section.

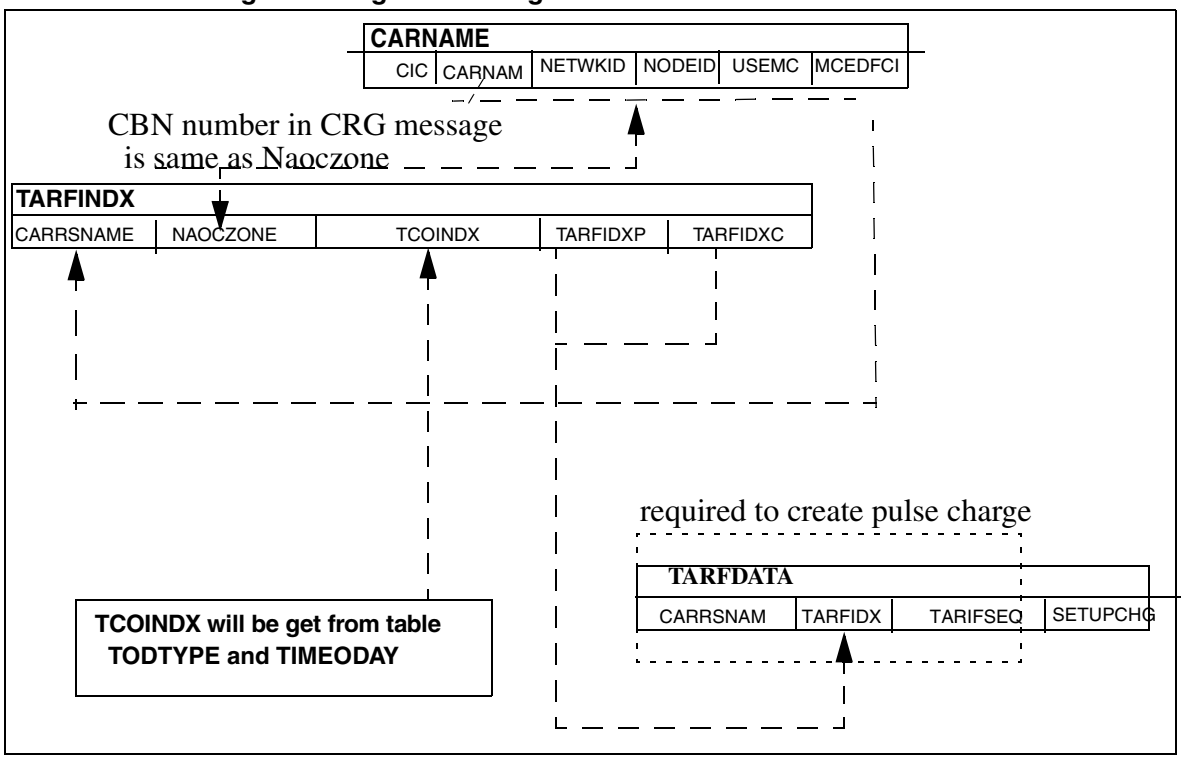
Figure 3 Figure showing table used in CDP and ISUP CRG-CHB format



70.2.1.3 Charge generation point functionality :

On CGP, Charge Band Number received in the CRG message will be used to determine tariff. Table SERVZONE has two keys SERVDN and NAOCZONE. SERVDN can be interpreted by the originating DN whereas the NAOCZONE is same as the CBN received in CRG message. The output of the table will be the CARRSNAM. In the table TARFINDX the keys are CARRSNAM, NAOCZONE, and TCOINDX. TCOINDX is interpreted from TIMEODAY and TODHEAD. The output of the table will be TARFIDXP (for preselect call) or TARFIDXC (for per call). TARFINDX output (tarfindxp and tarfindxc) is used in table TARFDATA to get the charge rate. Table CARRSNAME should be datafilled with charges of one pulse.

Figure 4 Figure showing Tables used at CGP



70.2.1.4 Exception condition on receipt of CRG message:

CS2K will release the call if any of the following cases will occur. These are the exception cases and only in certain scenario when it will occur the call will be released with proper cause value.

70.2.1.4.1 The charge band number received is not in the charge band table: The IAM message will be sent from the LE to the TAX. The tandem (or intermediate) exchange will pass the IAM message to the TAX exchange. ISUP CRG message will be sent to the LE. If the LE find the CBN number in the charge message as corrupted or not in the datafil the call will be released with the cause value 111. Fig 6 gives the diagramatic view of the scenario.

70.2.1.4.2 CRG is not received before ANM/ CON : IAM message for a call is sent to the TAX. If there is any intermediate exchange in between which will pass the IAM message to TAX. If for any reason or for any error condition the CRG nessage is not sent befor the ANM or CON message to LE, the LE will release the call with cause value 111. The diagramatic view of the scenario is shown below.

70.2.1.4.3 When the originating or interworking exchange receives an incorrect CRG message.

Figure 5 Figure showing CRG-CHB received is corrupted

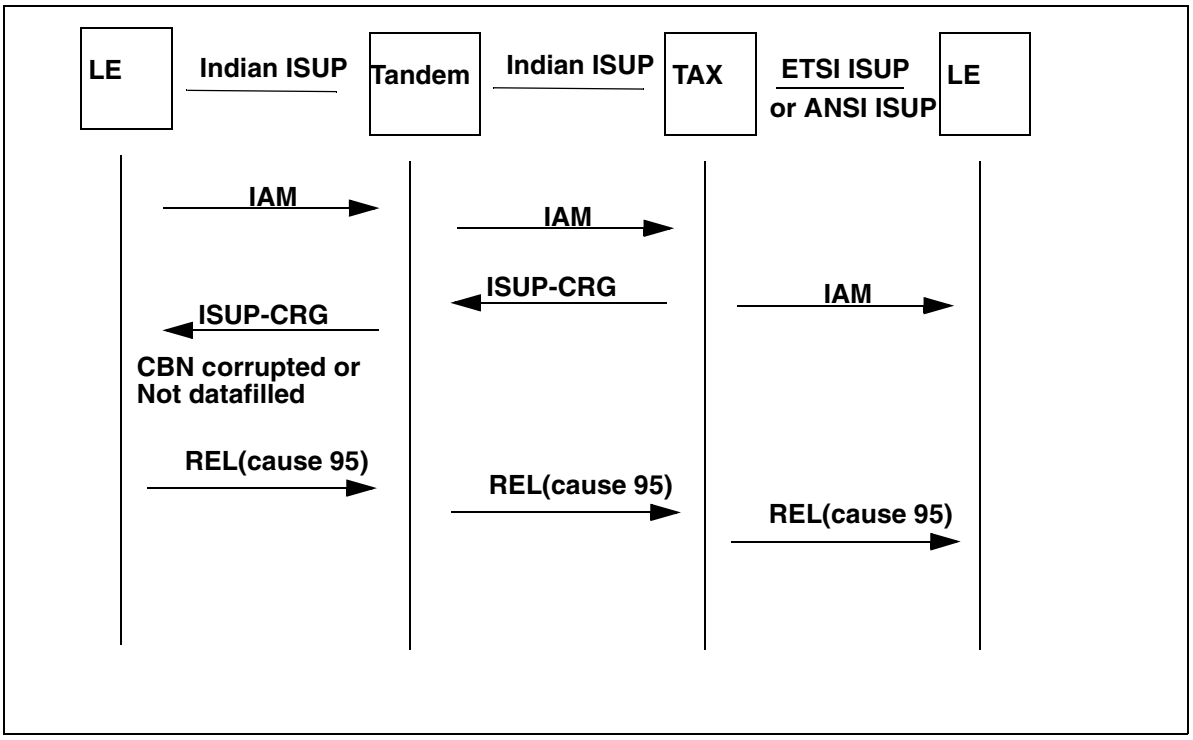


Figure 6 Figure showing no CRG-CHB received

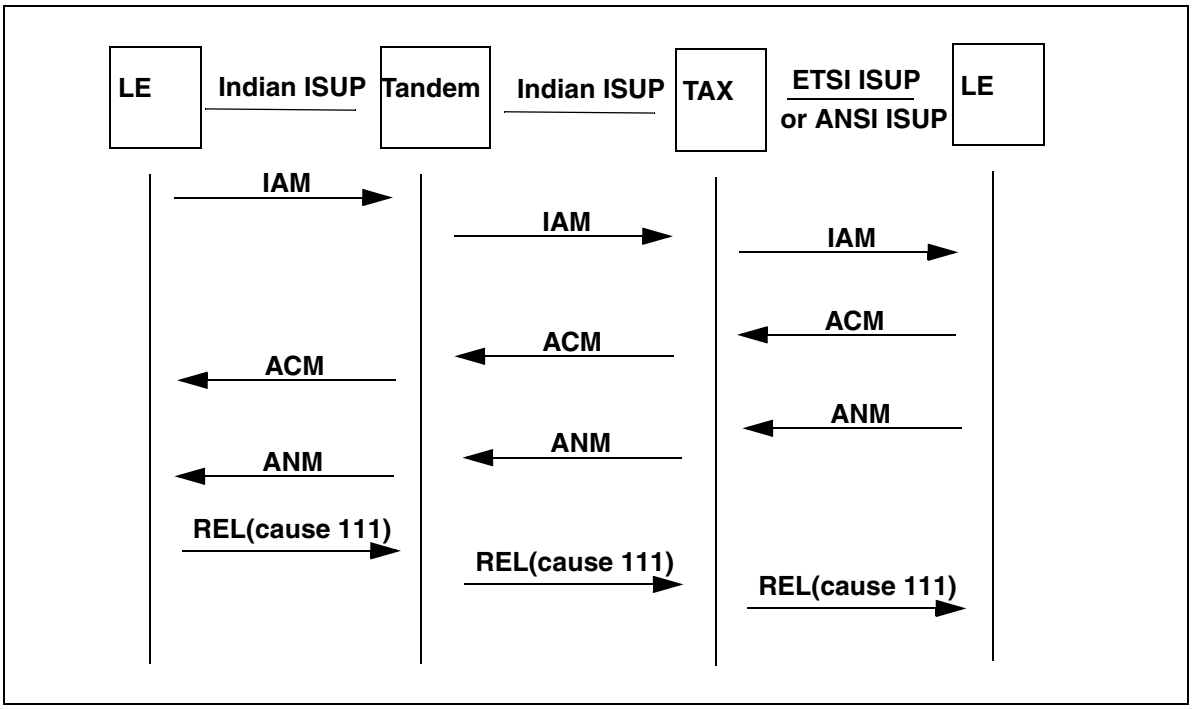

Figure 7 Figure showing CRG-CHB received after call established

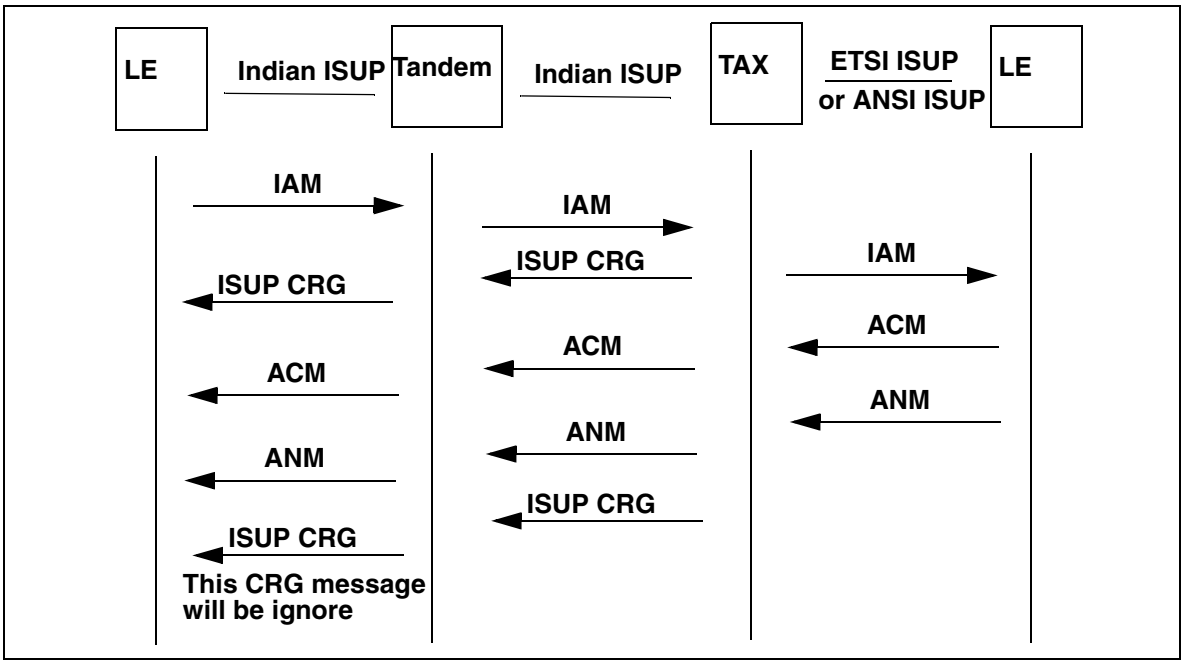

70.2.1.5 Internetworking node functionality:

In case when Indian ISUP CRG message has to pass to Indian ISUP internetworking, the TAX exchange will generate the CBN and send the CRG message.

In case when Indian ISUP to ETSI ISUP the tax will send the CRG message to the originating exchange.

In case of ETSI ISUP to Indian ISUP the internetworking node need not send any CRG message. Same applies for ANSI ISUP and Indian ISUP internetworking.

Figure 8 Indian ISUP <-> ETSIISUP

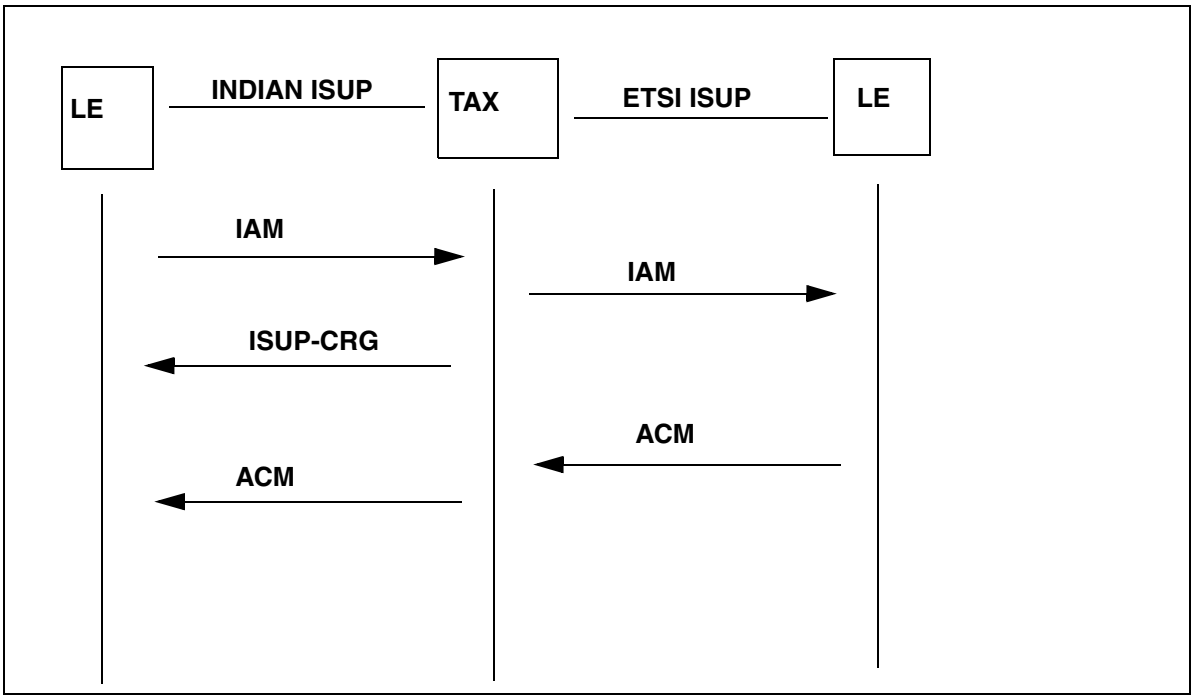

Figure 9 Indian ISUP <-> ANSI ISUP

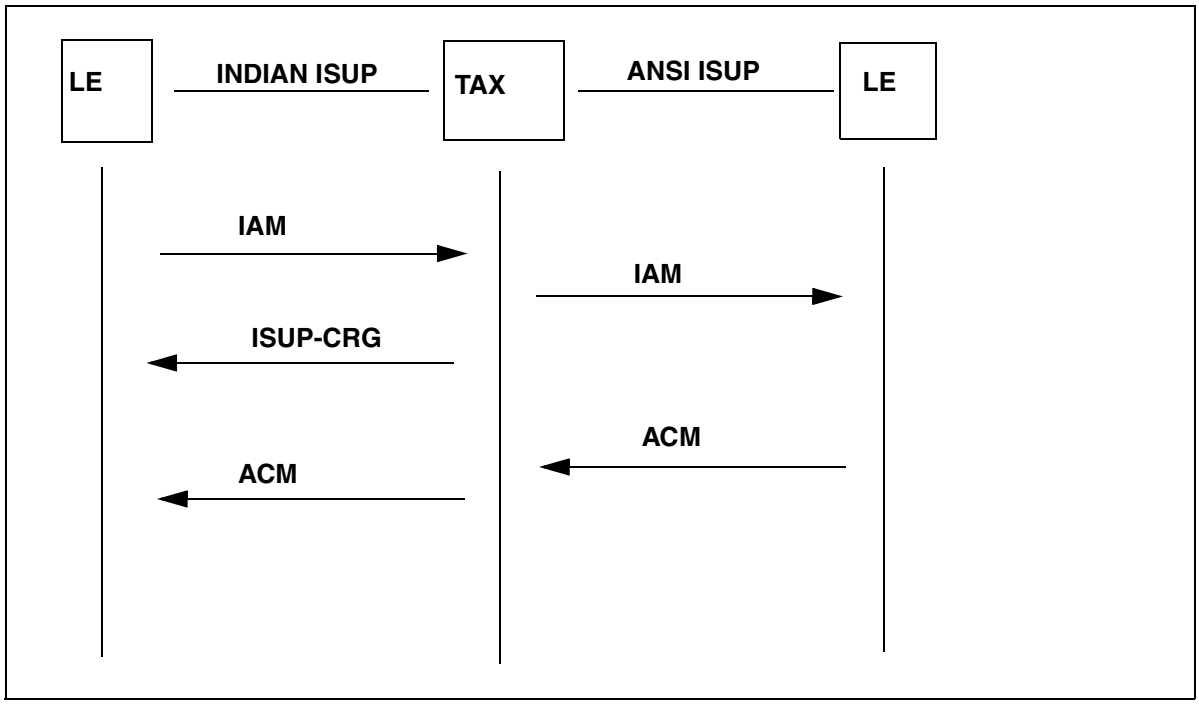

Figure 10 ETSI ISUP <-> Indian ISUP

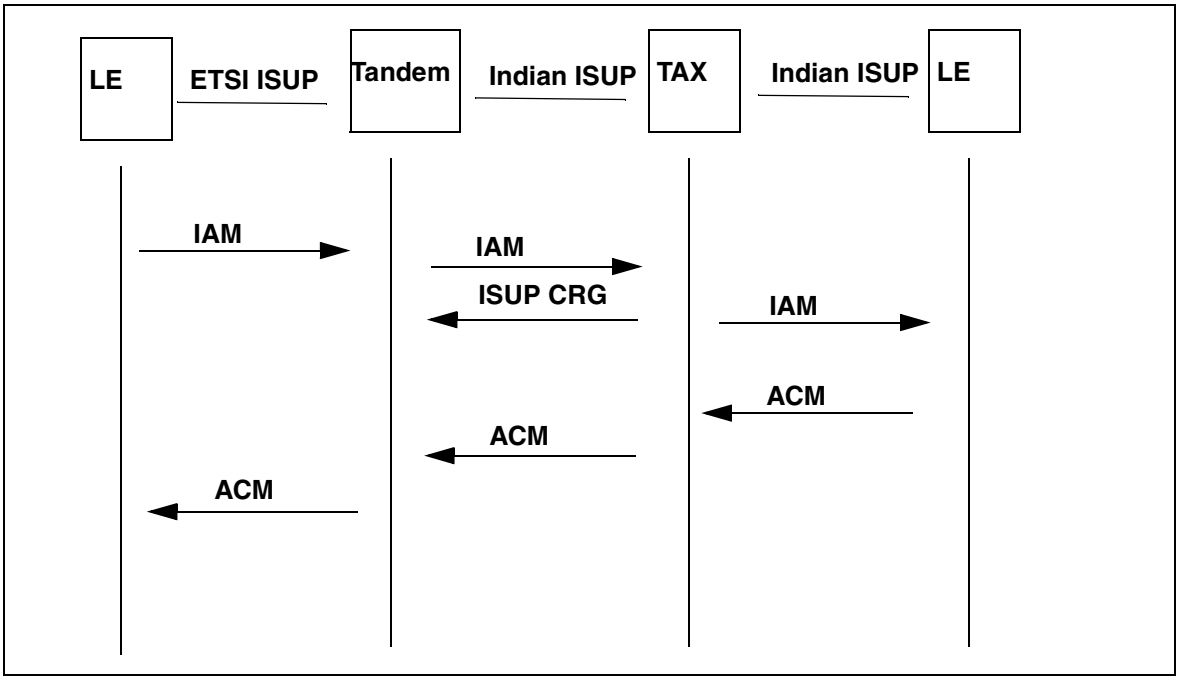

Figure 11 ANSI ISUP <-> Indian ISUP

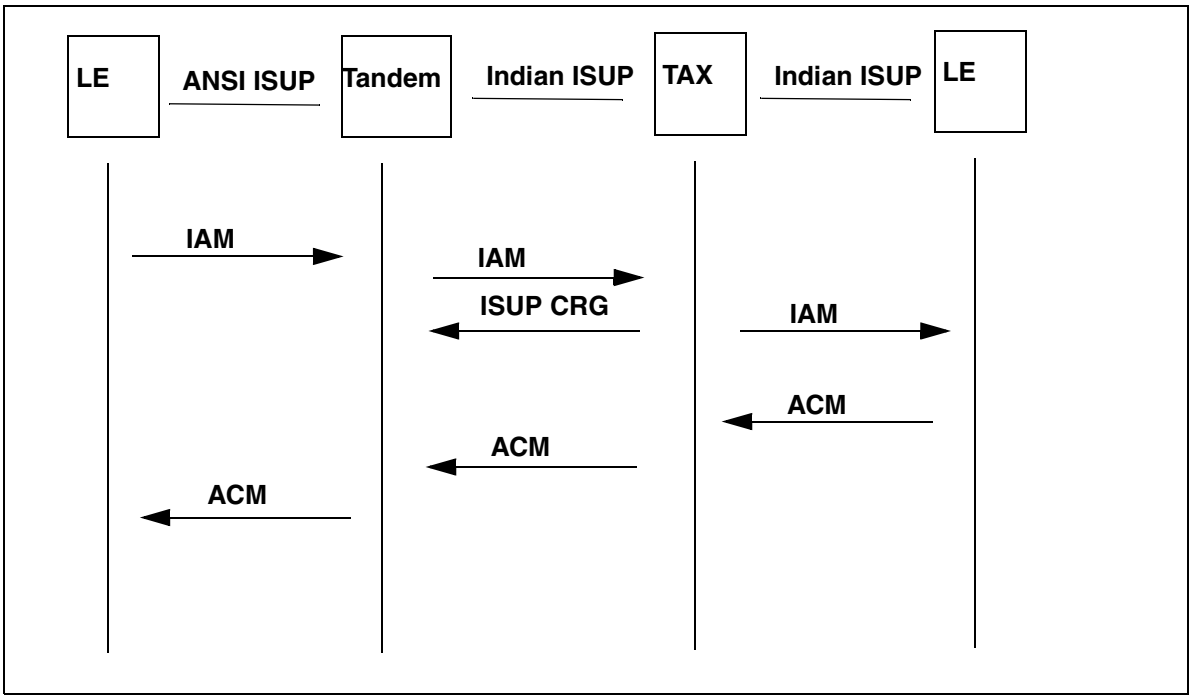

70.2.1.6 Generation of AMA record:

Indian ISUP has requirement to generate the AMA record for the call. AMA record is generated according to the Time of day, Day of week and Holiday.

In the Local exchange (i.e CGP) a new option **Capt_Charge_Band_Number** should be selected and AMASEL should be made ON to generate AMA record.

```
>table amaopts
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: AMAOPTS
>format pack; lis all;.
TOP
OPTION                          SCHEDULE
-------------------------------------------------------------------
Capt_Charge_Band_Number         ON
```

For the CDP the option Capt_Charge_Band_Number is set to OFF condition.

70.3 Background

70.3.1 NAOC

Network **A**dvice **O**f **C**harge (NAOC) implements the tariffing of calls between different exchanges. It can operate

- in a single carrier environment, where tariffs are sent between different nodes within the same carrier's network. This is the case addressed by the current activity.

For more information Refer act id A00002637 page 36, 37

70.4 Datafill

Datafill is done by entering the keyword NAOC following by one of the zoning classes **NATL, SERV** in the **PXHEAD/PXCODE** tables as listed below. This activity provide changes to the way how NAOC has to be provisioned.

70.4.1 The Translation Option:

After an ISUP IAM message is received and all the parameters inside it are decoded (Calling Party Number and Called Party Number) the translation tables are traversed.

This option has many possible sub-options: **natl**, **serv** are two of them. Each of the two sub-options are discussed separately.

The naoc translation option should only be datafilled if you want to configure the exchange as CDP. Datafilling this option on the wrong node may result in more than one CDP for the call, which can cause undesirable results at the CGP. At the CGP the NAOC option is not to be filled.

a) NAOC sub-option: NATL

If this translation selector/sub-option is encountered during the translation of the call, the call is assumed to be a National call. This means the call does not cross any international boundaries, and is a regular subscriber to subscriber call. In order to define which calls are National calls, they must be datafilled in the translation tables with the **naoc** selector, with the **natl** sub-option. The zone class is then set to **national,** and the NAOC Indian ISUP process begin to access the zoning/tariff database.

```
table natlzone;
>format pack; lis all;
<line length>: 76 columns can be output per line.
<pack mode>: Pack mode is ON.
<indent column>: Indented lines will begin in column 1.
<first column>: The first column of output is column 1.

```

b) Indian ISUP NAOC sub-option: SERV

If this translation selector/sub-option is encountered during the translation of the call, the call is assumed to be an International call. This means the destination number is outside the originators international boundary, and it is a regular subscriber to subscriber call. In order to define which calls are international calls, they must be datafilled in the translation tables with the **naoc** selector, with the **serv** sub-option.

70.5 Hardware Requirements or Dependencies

This feature does not add any additional hardware requirements and dependencies on top of those one used for NAOC and PCA or for the features that NAOC/PCA do interact with.

70.6 Software Requirements or Dependencies

This feature requires the following features do be activated by SOC:

- ***NETK0019*** Network AOC
- ***NETK0024*** Network AOC Tariff
- ***NETK0028*** CGP Network AOC

SOC option name:	NETK NETWORK AOC Tariff
SOC option title:	NETK NETWORK AOC Tariff
SOC option control type:	code/state

New SOC option?	Yes
SOC option order code	NETK0024
Option defined in DRU:	WT
Affected products:	-

NAOC tariff information is required, since this activity reuses the ***NAOC*** functionality. NAOC datafill including the NAOC tables and translation options have to be set up in a appropriate way.

71: Functional Description (FN): A00004981

71.1 Feature name

GWC-EM Internet Transparency VCAC provisioning support for CentrexIP gateways - Activity ID A00004981

71.2 Description

Activity A00002512 introduces VCAC in the SN07 timeframe. VCAC introduces Limited Bandwidth Links(LBLs) to the SESM (network panel) AND a topological hierarchy that links LBLs and NATs to form a tree of 'internet transparency middleboxes'. These devices are sent to the small lines GWCs via the

GWC-MIDDLE-BOX-MIB and
GWC-MIDDLEBOX-RSRCUSAGE-MIB (the resource usage of the LBL)

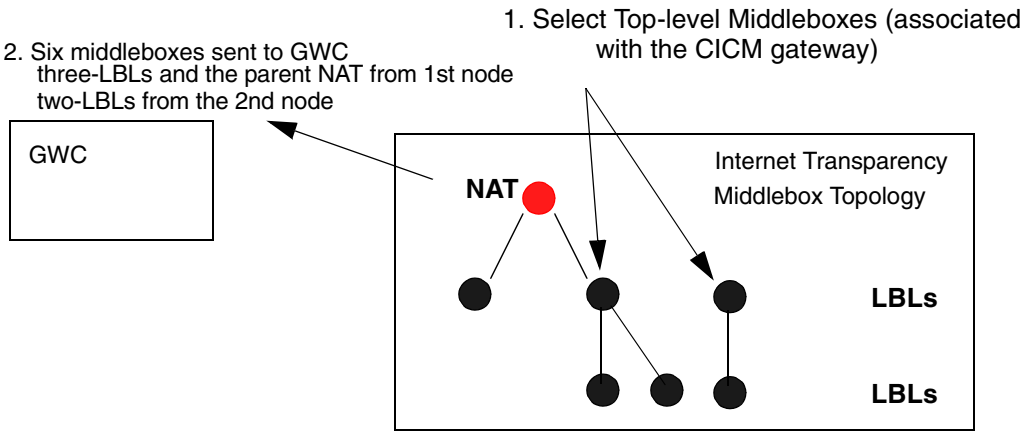
The model for this download of data has been designed for the "fixed-lines" IAD deployment, and occurs when the gateway is associated to an adjacent-middlebox.

This solution is to allow VCAC to function correctly for CICM gateways because unlike the small-lines IAD solution the CICM gateways resides in the TSP (succession) domain. The CICM **gateway** does not "fit" the concept of an "adjacent middlebox". The Adjacent middlebox will always be = 0 (<none>).

CICM users login to the CICM terminals, this sends a message to the GWC. In SN07 this message will contain the "discovered" adjacent middlebox of the terminal/endpoint. The CallP ITA function will then "look-up" this middlebox in the GWC static tables. For a more comprehensive problem definition please refer to the DID for this activity.

This solution allows the user to provision a set of root (top-level) middleboxes, allowing the GWCEM to send all the underlying middleboxes to the GWC. Ensuring that when a CICM user logs in, the middlebox will be available on the GWC, see figure 1.

Figure 1 CICM gateway : Multiple root middlebox provisioning



This feature provides the following functionality (from the OSS and GWCEM - GUI):

- Provision a set of root middleboxes (a maximum of 5) per CICM gateway.
- Change the current provisioning of root middleboxes against provisioned CICM gateways.
- Display/Query the root middleboxes that are provisioned against a CICM gateway.

71.3 Hardware Requirements or Dependencies

No new hardware is required or introduced by this feature. The application components provided by this feature execute as part of the SESM.

71.4 Software Requirements or Dependencies

Dependencies:

- A00002512 VCAC provisioning for the GWCEM
- A00003568 E911 support will allow the CICM endpoints adjacent middlebox to be sent to the GWC when the user logs into the gatway.
- A00002739 GWC Call-P for the VCAC functionality.

71.5 Limitations and restrictions

- The GWC has a limit of 2000 middleboxes.

- Internal counting limits the provisioning of gateways onto the same GWC as the associated chain of LBLs (they must be provisioned onto one GWC). This needs to be made clear in the engineering guidlines, and will be blocked by code to stop the user from completing such provisioning steps.
- A limit of 5 Root Middleboxes can be provisioned against a gatway.
- The CentrexIP users cannot roam outside of their provisioned “enterprise” area, and expect VCAC to function.

71.6 Interactions

The following existing GUIs have been modifed (refer to the Configuration section of this feature):

- Associate Media Gateway Dialog
- Change Gateway Dialog
- Gateway Provisioning Panel

The following existing XML commands have been modified:

- AssocMG
- ChangeRootMiddleBoxes
- QueryMG

The on-line help facility will be updated with information on the use, syntax and valid values for all the above modifications/additions.

71.7 Applicable customer facing sections

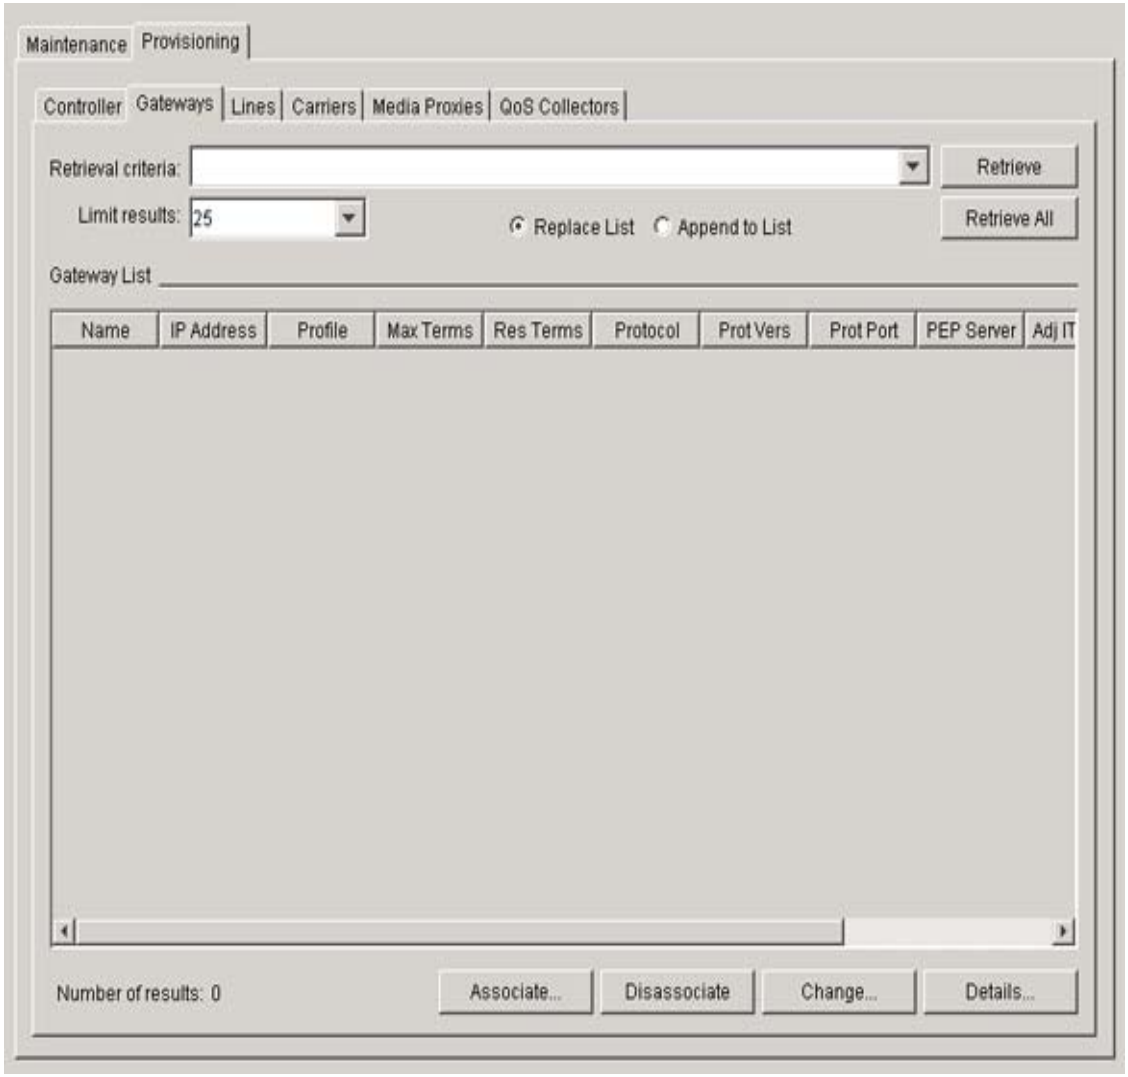
71.8 GWC-EM GWC Provisioning

The GWC-EM has been modified to display the rootMiddleboxes that are provisioned against the CICM gateways.

71.8.1 GUI Client : The Gateways panel

Figure 2 The GWC-EM Gateways Panel



71.9 Gateway Provisioning changes

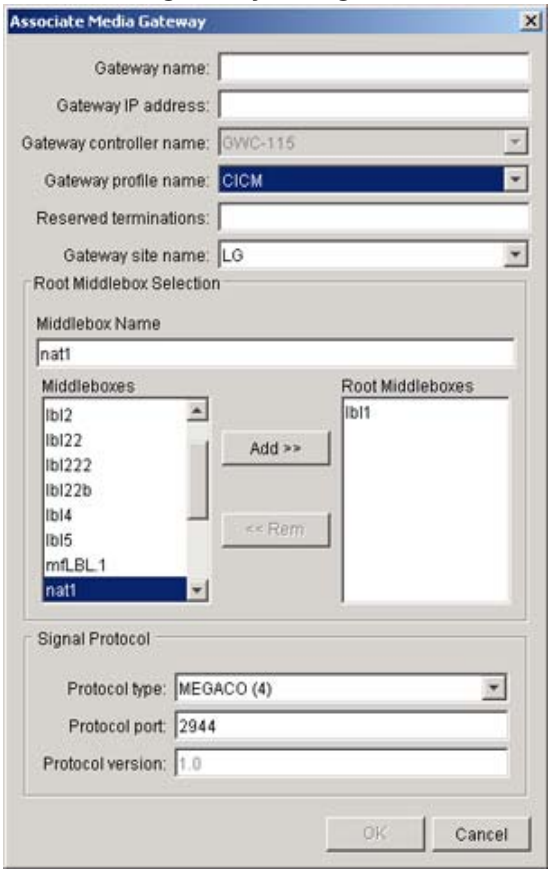
The association of a CICM gateway(or other future Roaming user style gateways) to a GWC has been modified to allow the user to provision a set of root middleboxes (0..5 only). Already provisioned gateways can also be changed to have a different set of (or none) root middleboxes.

71.9.1 GUI Client

71.9.1.1 Associate gateway GUI

The Associate gateway dialogue has been modified to display a new internet transparency panel, this occours when a CICM gateway has been selected. The user may optionally select upto 5 root middleboxes to associate with the CICM gateway, these are selected to define the roaming area where VCAC will function for the CICM users/endpoints. The root middlebox selection process is controlled from within the Root middlebox selection area, this is the same for either the Associate gateway or the Change gateway commands.

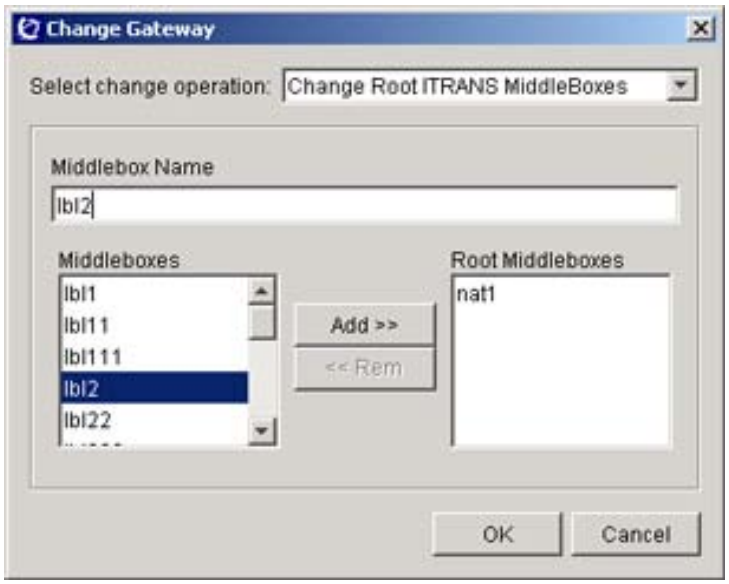
Figure 3 Associate gateway dialogue



71.9.1.2 Change Gateway GUI

The change gateway Root Middleboxes dialogue has been created to allow the user to modify (or remove) the Root Middleboxes associated with an already provisioned CICM gateway.

Figure 4 Change gateway RootMiddleboxes dialogue



71.9.1.3 Root Middleboxes Details

Figure 5 Root Middlebox details can be displayed by selecting the details button.

71.9.2 XML Interface

The AssocMG and QueryMG interface has been modified to allow/display (0..5) root middleboxes. A new interface ChangeRootMiddleboxes has been added to the ItransIf code .If any request is unsuccessful, an error message is returned as described in Appendix B.

71.9.2.1 AssocMG command

<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <changeRootMiddleboxes usn="1" version="1.0">
      <Parameters>
          <MGname>bobcicm.1</MGname>
          <rootMiddleboxName1>NAT1</rootMiddleboxName1>
          <rootMiddleboxName2>NAT2</rootMiddleboxName2>
      </Parameters>
     </changeRootMiddleboxes>
    </Methods>
  </Command>
 </CommandList>
```

71.10 Authorization for Commands

The security for the GUI Client and OSSgate interface includes support for permission or ‘Authorization’ levels for commands. Each command is assoicated with one or more user groups. In order to execute a command, a user must belong to at least one of the assoicated user groups. The user groups assoicated with the new commands associated with this feature are specified in the table below.

Table 1 NEW Internet Transparency Commands Authorization

Command	User Group				
	mgcadm	mgcrw	mgcmtc	mgcsprov	mgcro
ChangeRootMiddleboxes	X	X			
Display Gateway Root Middlebox details	X	X	X	X	X

71.11 Upgrade

When upgrading the GWCEM to SN07 when CICM gateways are present in the Network:

It is necessary to (i) set the Call Agent ID and then (ii) update the IDs for all enterprises (NATs) on a CICM to new IDs **prior** to upgrading the CICM Gateway.

Hence the recommended order for upgrade is as described below:

Upgrade Procedure

1. Upgrade GWCEM to SN07.
2. Set Call Agent ID in GWCEM. This causes all existing middlebox ids to be upgraded to the SN07 format.
3. Upgrade the GWC to SN07 (this may also be done after step 5).
4. Upgrade CICM EM to SN07
5. On the CICM EM, using the provided interface, retrieve the middlebox IDs for all NATs from GWCEM. This will update the NAT information stored in the CICM EM with the new SN07 format middlebox ids.
6. Upgrade CICMs to SN07. CICM upgrade from SN06.2 to SN07 will be done by adding SN07 CICM to GWC and migrating users across to new CICM. The SN07 CICM will have the new format middlebox IDs. All terminals will re-login as part of this upgrade, hence all get new format IDs associated with them in the CICM.

71.12 Glossary

Term	Description
GUI	Graphical User Interface
GWC	Gateway Controller
GWCEM	Gateway Controller Element Manager
NAT	Network Address Translation
LBL	Limited Bandwidth Link
VCAC	Virtual Connections Admission Control

71.14 Appendix B: Error codes and messages

Table 2 Return codes when command is unsuccessful

Cause of error	Return code	Example return messages
The Media Gateway hasn't got a ITransRoam service type in its profile	16	The use of Root Middle Box name(s) is invalid. The Gateway does not support this internet transparency service.
The GWCEM has failed the provisioning method.	21	GWCEM failed to associate the MG with the GWC, Reason the number of distinct Middleboxes used gwc *[gwc id]* exceeds the limit of 2000 per GWC

Cause of error	Return code	Example return messages
Incorrect command version in query	301	Unsupported version
Platform applications internal error: OSS Interface applications cannot connect to required server application	302	Interfacing error
Unable to change RootmiddleboxNames because of a database error occurred	303	Database error occurred during setting of Root MiddleboxNames
Unable to add/change RootmiddleboxNames because of invalid input data	304	Cannot set RootMiddleboxName because VCAC internal counting constraint hit. LBLs must be on one GWC.
User is not a member of any of the user groups allowed to perform this action	501	Insufficient permissions to perform this operation
General SAX parser exceptions	None	caught ParserEx,Reason: Caught SAXException trying to parse xml-Details:org.xml.sax.SAXParseException: Element type "rootMiddleboxName6" must be declared.>

71.14.1 Example Return Messages

Error message example:

```
<?xml version="1.0" encoding="UTF-8"  ?>
 <CommandList>

</Methods>
</Response></CommandList>
```

71.15 Appendix C: XML Commands: description of method parameters

71.15.1 Parameter definitions

- **encoding??**
- **version** - The version refers to the version of the method or operation - e.g., the changeRootMiddleboxNames operation may have version 1.0 and 2.0, where version 1.0 takes parameters X and Y and version 2.0 takes parms X, Y, and Z. TYPE *decimal*.
- **usn** - Unique Sequence Number. This parameter is introduced to facilitate sending multiple XML commands in one file. This parameter value will be used to match the responses with the requests. TYPE *integer*.
- **ReturnCode value**- A numeric value indicating the result of the attempted operation (see Table 3, for range and definitions of each possible value). TYPE *string*.
- **Return code text**- Appropriate text that describes the result of the operation. TYPE *string*.

- **rootMiddleboxName1(1..5)** - The Middlebox name(s) of the root node middlebox(es) that encompasses the enterprise network that the CICM gateway operates with.. TYPE *NoSpaceNameType* .(32 character token without spaces, see xsd definitions in Appendix A.)

71.15.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **AssocMG** - Method to associate a gateway to the CS2K. This method has the following NEW parameters: (only NEW ones described, see standard documentation for the other definitions).

- Input data:

– usn

– version

– rootMiddleboxName1 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 1st RootMiddlebox for this gateway.

– rootMiddleboxName2 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 2nd RootMiddlebox for this gateway.

– rootMiddleboxName3 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 3rd RootMiddlebox for this gateway.

– rootMiddleboxName4 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 4th RootMiddlebox for this gateway.

– rootMiddleboxName5 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 5th RootMiddlebox for this gateway.

- Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

2. **QueryMG** - Method that gets the gateway information from a CS2K. This method has the following NEW Output parameters: (only NEW ones described, see standard documentation for the other definitions) :

- Output data:

– rootMiddleboxName1 - defines the 1st RootMiddlebox for this gateway.

– rootMiddleboxName2 - defines the 2nd RootMiddlebox for this gateway.

– rootMiddleboxName3 - defines the 3rd RootMiddlebox for this gateway.

– rootMiddleboxName4 - defines the 4th RootMiddlebox for this gateway.

– rootMiddleboxName5 - defines the 5th RootMiddlebox for this gateway.

–

3. **changeRootMiddleboxes** - Method that changes the rootMiddleboxes for a given gateway. This method has the following parameters:

- Input data:

– usn

– version

– MGname indicates the gateway that this change command is for.

– rootMiddleboxName1 - defines the 1st RootMiddlebox.

– rootMiddleboxName2 - (Optional) defines the 2nd Root Middlebox.

– rootMiddleboxName3 - (Optional) defines the 3rd Root Middlebox.

– rootMiddleboxName4 - (Optional) defines the 4th Root Middlebox.

– rootMiddleboxName5 - (Optional) defines the 5th Root Middlebox.

- Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

72: Functional Description (FN): A00005164

72.1 Feature name

ACT.A00005164 - Russia ISUP V2+ on CS2K .

72.2 Description

This activity provides the capability to support Russia ISUP V2+ introduced by the activity ACT.A00000937 on succession product line. This is done by porting the functionality of existing TDM MMP19 feature with actid ACT.A00000937 into the ISN07 load.

The purpose is to enable CS2K with ISN load to directly interconnect to existing Russia network.

In this activity, the interworkings of only the following agents are verified:

- Russia ISUP V2+ to/from Russia ISUP V2+
- Russia ISUP V2+ to/from IBN/V5.2 lines
- Russia ISUP V2+ to/from ETSI PRI
- Russia ISUP V2+ to/from Russia ISUP V2+ over SIP-T

ACT.A00000937 addresses only the ability to support IBN to/from Russia ISUP V2+, and Russia ISUP V2+ to/from Russia ISUP V2+ interworkings. Other Russia specific functionalities, such as ISDN interworkings, new subscriber categories, subscriber category based authentication, etc., are implemented in MMP20 time frame with the following features:

- ACT.A00001923 - “CIS Subscriber Categories”
- ACT.A00001929 - “Russian ISUP - ISDN Interworkings”
- ACT.A00002100 - “ISUP-R-2000 Operator Call on Busy Subscriber (Toll Break In) Support”.

This activity verifies the functionality provided with these activities (for supported interworkings).

Russia requires a distinct ringing when a call request is received from toll exchange over Russia ISUP V2+ trunks. This functionality is out of the scope of this activity.

For the differences between Russia ISUP V2+ vs. ETSI ISUP V2 BASE variant, please refer to **ISUPR2000** in FMDOC library. Additionally, “ISDN

User Part (ISUP) Technical Specifications For the National Network of Russia" includes the Russia requirements for ETSI PRI interworkings.

72.3 Hardware Requirements or Dependencies

None.

72.4 Software Requirements or Dependencies

None.

72.5 Limitations and restrictions

Following interworkings are not verified with this activity:

— ETSI ISUP V2 BASE to/from Russia ISUP V2+

— BRI to/from Russia ISUP V2+

All limitations and restrictions indicated in the FN documents of ACT.A00000937, ACT.A00001923, ACT.A00001929, and ACT.A00002100 are also applicable in this activity.

In ACT.A00002100, Russia specific call waiting tone was applied to the operator, when an operator calls a busy subscriber over Russia ISUP V2+ trunks.

On TDM, in order to be able to apply the Call Waiting Tone to the operator over Russia ISUP V2+ trunk, a special CWT trunk was defined on MTM device which has 3X68AB/ 3X68AC card on it. However, this hardware is not available on CS2K, therefore, standard ring-back tone is applied to the operator in TBI.

Russia requires a distinct ringing when a call request is received from toll exchange over Russia ISUP V2+ trunks. This functionality is out of the scope of this activity.

72.6 Interactions

All interactions provided in the FN documents of ACT.A00000937, ACT.A00001923, ACT.A00001929, and ACT.A00002100 are also applicable, and are verified in this activity.

73: Functional Description (FN): A00005802

73.1 Feature name

A00005802, *SPM COMPANDING LAW PROVISIONING.*

73.2 Description

This feature allows an OC3-SPM p-side companding to be a provisionable option to either Mu-law or A-law, instead of the current architecture which always assumes that the p-side companding to be Mu-Law. This feature also provides for a provisionable Bit Inversion Option to either EBI or ABI, instead of basing it from the OFCENG parameter TYPE_OF_NETWORK

SPM p-side voice companding and bit inversion option is controlled by datafill. This datafill is done in table MNNODE, and is downloaded to the SPM through DDM framework. The c-side companding law will remain unchanged and will be determined from TYPE_OF_NETWORK parameter.

This feature supports OC3-SPM of the DMSCP class. No other variants of SPMs are currently supported.

The p-side companding law and bit inversion option introduced in table MNNODE will have default values such that the current system behavior can be maintained. The default values are determined as follows -

- Over an upgrade from a load without this feature, the default values for p-side companding in table MNNODE will be determined by type of DMSCP SPM (OC3 or STM). The default value of companding for OC3-SPM will be Mu-Law and for STM-SPM it will be A-law in this case.
- For a new SPM that is to be added, if it is desired that the SPM maintain the current system configuration, the field in MNNODE must contain '**$**'. If the craftsperson enters the companding law and bit inversion option in table MNNODE, it is assumed that the set defines the required configuration.. Also in addition, while the craftsperson datafills MNCKTPAK, a warning message will be displayed if the p-side companding in MNNODE is different from current system behavior for that RM type, and if this is not desired, p-side companding in table MNNODE has to be changed before proceeding. If the craftsperson wishes to continue it is assumed that this is desired, and if the craftsperson does not wish to continue, tuple addition in table MNCKTPAK is aborted and p-side companding must be changed by craftsperson in table MNNODE before proceeding.

For examples refer to “Supplementary Information” in the Configuration section of this feature.

Changes to Companding Law and Bit inversion Option in MNNODE are allowed only on an OOS SPM that is in MANB or OFFL state. This is to allow the transfer to data to the local through bulk DDM download.

73.3 Hardware Requirements or Dependencies

None.

73.4 Software Requirements or Dependencies

None.

73.5 Limitations and restrictions

- If TYPE_OF_NETWORK is changed over a restart, the companding law and bit inversion option present in MNNODE must be verified if they are in desired configuration. The craftsperson has to manually change the companding and Bit Inversion values of the SPM nodes if necessary. There will be no report or warning to indicate this.
- This feature allows SPM_OC3 to have all possible combinations of Companding Law and Bit-Inversion options. In table MNNODE, default value of COMPOPT ($) is suggested unless a specific combination of Companding Law and Bit-Inversion values are required. This feature is mainly targeted at CDMA network with SBS connected to SPM-OC3.
- To ensure good voice quality of the call, all components in the voice path of the call should have compatible Companding Law and/or Bit-Inversion values. Voice quality may be seriously affected if the Companding Law and/or Bit-Inversion values are not compatible.
- Forcustomer using SBS, the desired and supported configurations are:
  - **Default:** OC3-SPM: $ SBS: mu_law (it is equivalent to OC3-SPM: A_law+EBI: a_law for International type_of_network; and equivalent to OC3-SPM: Mu_law+ABI, SBS: mu_law for NA type_of_network)
  - OC3-SPM: A_law + ABI, SBS: a_law

73.6 Interactions

None.

74: Functional Description (FN): A00006001

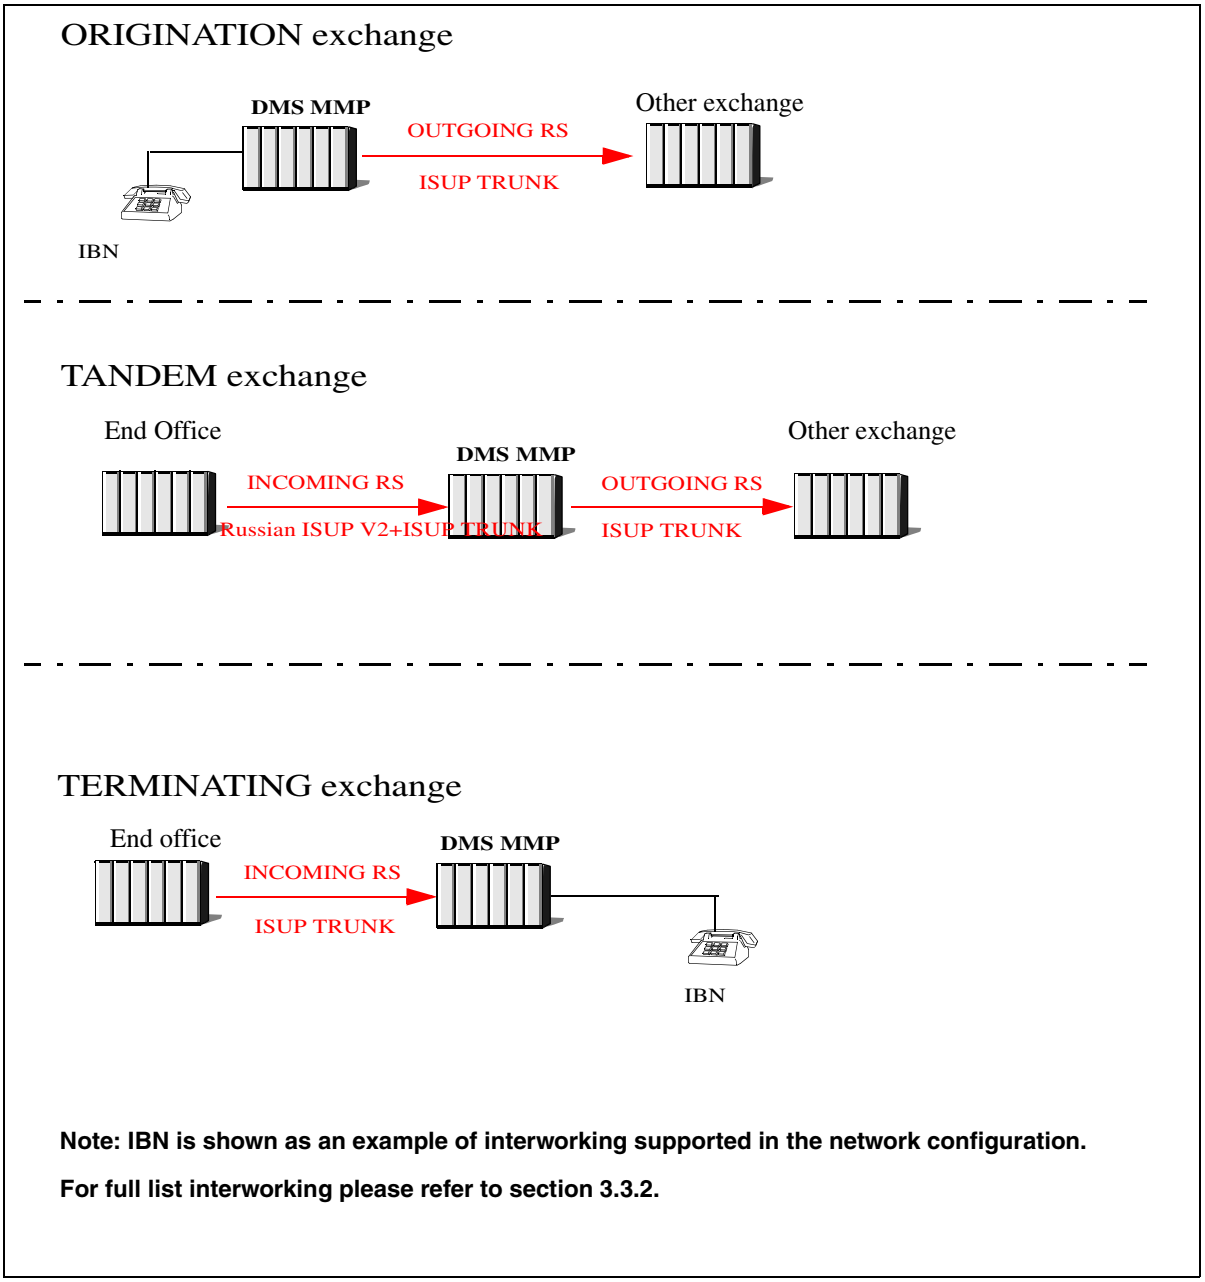
74.1 Feature name

AT.A00006001 - RUSSIAN ISUP AND TONES FOR INTERNATIONAL SPM

74.2 Overview

Figure 1 below shows the basic network configuration for Russian ISUP V2+ on DMS-MMP.

Figure 1 Russian ISUP V2+ Network Configuration



Note: IBN is shown as an example of interworking supported in the network configuration.

For full list interworking please refer to section 3.3.2.

This activity will mainly concentrate on what needs to be done to support Russian Isup V2+ on SPMs along with the interworking with other supported lines and trunks. After studying the different activities (as listed below) done to support Russian ISUP V2+ on PDTCs with DMS-MMP switch the following functional areas are needed to support Russian ISUP V2+ on SPMs.

74.3 Description

This activity introduces functionality to enable the DMS MMP to support the Russian V2+ variant using the SPM STM-1 peripheral. Russian ISUP V2+ is a variant of the ETSI ISUP V2 protocol and is dependent on the ETSI ISUP implementation within the SPM. The ETSI ISUP V1 and V2 protocol is provided in the SPM by activity A59012154: ETSI ISUP V1/V2 Base support for STM-1 access on the DMS MMP, in the MMP13/SP13 release.

This activity addresses the ability to support basic calls:

i. Line(IBN)-Russian ISUP V2+n ISUP on DMS MMP originating exchange

ii. Russia ISUP-Russia ISUP on DMS MMP tandem exchange

iii. Russia ISUP-Line(IBN) on DMS MMP terminating exchange

Note: Listed above are the basic call scenarios. There are a set of interworking supported by this activity. For full details, please refer to section 3.3.2.

The functionality currently available on the DMS MMP for Russian ISUP V2+, provided by PDTCs remain unchanged by this activity. Unless explicitly stated, the SPM implementation is equivalent to that of the PDTC in the XPM implemented by the activities

- ACT.A00000937 - Russian ISUP V2+ - Phase.1.
- ACT.A00000945 - CIS Tones and Cadences
- ACT. A00000943 - CIS Subscriber Line Parameters
- ACT.A00002033 - Russian ISUP-IBN Line Interworking
- ACT.A00002034 - Russian ISUP-V5.2 Interworking
- ACT.A00001929 - Russian ISUP-ISDN Interworking
- ACT.A00001923 - CIS Subscriber Categories
- ACT.A00002100 - ISUP_R_2000 Operator Calls on Busy Subscribers(TBI)
- ACT.A00001921 - CIS Toll Call Ringing
- ACT.A00002172 - SOSM: PROVISIONING
- ACT.A00002173 - SOSM: X.25 MESSAGING & CONNECTION
- ACT.A00002178 - SOSM : CALLP & SERVICE INTERACTIONS
- ACT. A59033579 - Downloadable Tones for SPMs

Russian ISUP V2+, defined in Russian 2000 requirements document, is based on ETSI ISUP V2. ISUPR2000.AB01 version document in FMDOC will be the requirements used to develop this activity.

This activity on STM1 SPM implements the following Russian ISUP V2+ requirements on DMS MMP switches for call processing :

- Definition of Russian ISUP V2+
- Basic Russian ISUP V2+ call scenarios
- Basic Russian ISUP V2+ call termination
- Russian specific ISUP messages (CCL, RNG)
- Handling of ISUP messages (FAC, CRG)
- Modifications in mandatory and optional signalling parameters such as
    iv. Called Party Number - Nature of Address Ind.,
    v. Nature of Connection Ind.- Satellite Ind.,
    vi. Backward Call Ind. - Called Party's Category Ind. and
    vii. Backward Call Ind. - Echo Control Device Ind.
- Handling calling party categories (CPC) for Russian ISUP V2+
- Handling IDR/IRS-INR/INF messages
- Enhancement of ISUP timers: T5, T13, T15, T17, T19, T21, T23
- Support for trunk offering (TBI) procedures at tandem exchanges for backward compatibility.
- Russian Tones and Cadences support

A summary of the activities that are required in SPM STM1 are given in table below.

Table 1 Activities Requirement for A00006001

Activities	Title	SPM	Core	DT	PV
ACT.A00000937	Russia ISUP V2+ - Phase.1	**Y**	**Y**	**Y**	**Y**
ACT.A00000945	CIS Tones and Cadences	N	N	N	Y
ACT.A00000943	CIS Subscriber Line Parameters	N	N	N	Y
ACT.A00002033	Russian ISUP-IBN Line Interworking	N	N	N	Y
ACT.A00002034	Russian ISUP-V5.2 Interworking	N	N	N	Y
ACT.A00001929	Russian ISUP-ISDN Interworking	N	N	N	Y
ACT.A00001923	CIS Subscriber Categories	N	N	N	Y

Table 1 Activities Requirement for A00006001

Activities	Title	SPM	Core	DT	PV
ACT.A00000937	Russia ISUP V2+ - Phase.1	**Y**	**Y**	**Y**	**Y**
ACT.A00002100	ISUP_R_2000 Operator Calls on Busy Subscribers(TBI)	N	N	N	Y
ACT.A00001921	CIS Toll Call Ringing	N	N	N	Y
ACT.A00002172	SOSM: PROVISIONING	N	N	N	Y
ACT.A00002173	OSM: X.25 MESSAGING & CONNECTION	N	N	N	Y
ACT.A00002178	SOSM : CALLP & SERVICE INTERACTIONS	N	N	N	Y
ACT. A59033579	Downloadable Tones for SPMs	N	Y	Y	Y

Notes: SPM, Core: Yes/No implies that this activity does/does not have any core or Local SPM-STM1 changes to support the activities listed in the table.

Notes: DT, PV: Yes/No implies that this activity does/does not have testing efforts to support the activities listed in the table.

Notes: DT testing Y or N is determined based on the software chagnes required as part of this activity in Core or SPM. For eg., there are no core or local SPM changes required to support the activity A00002100. Hence there is no DT/IT required for this activity to test the feature A00002100 supported in MMP20 (iSN07).

74.3.1 New ISUP Variant

This activity defines a new ISUP V2 variant in SPM STM1. This variant is based on the architecture of ETSI ISUP V1 and ETSI SUP V2 on SPM-STM1.

74.3.2 Basic and Interworking Call Scenarios

This activity addresses the ability to support basic calls:

1. Line(IBN) - Russian ISUP - Line(IBN)
2. Line (IBN) - Russia ISUP - Russia ISUP - Line (IBN)

Other Interworking supported are:

3. V5.2-on GPP -> Russian ISUP V2-on SPM -> V5.2-on GPP
4. ISDN BRI Line -> Russian ISUP V2-on SPM -> ISDN BRI Line
5. Line -> ETSI PRI -> Russian ISUP V2-on SPM -> ETSI PRI on SPM -> Line
6. Operator calls on Busy subscriber (Toll Break In)

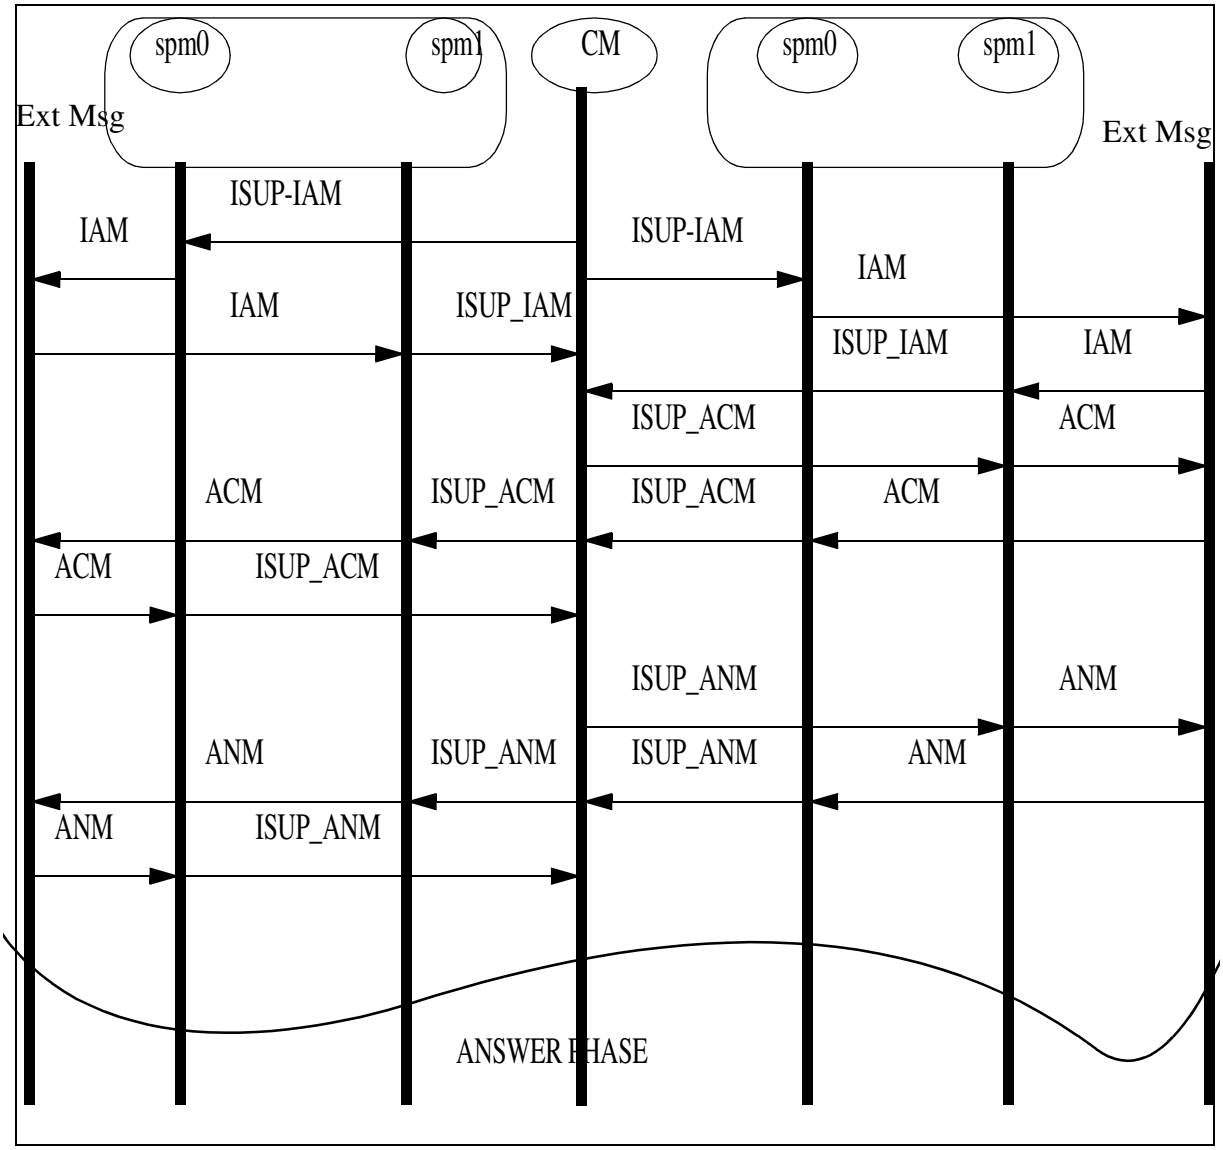
Russian ISUP variants will be configured on SPM STM1(orginal actid - A00000937). This interworking will be developed and design tested to support on SPM-STM1.

Note: **There are two activities identified as part of TBI service. The first original activity is A00000937. This will be supported in SPM-STM1 with necessary software changes. The second activity is A00002100. There were no software changes required in PDTC to support A00002100 activity (ISUP_R_2000 Operators calls on Busy Subscribers). Hence this SPM activity (A00006001) will not introduce any software changes to support too. Therefore A00006001 will not perform any DT/IT testing for A00002100.**

74.3.3 Basic Call

A basic call flow diagram with the ISUP messages on the set-up phase of the call for the scenario (Line -> Russian ISUP V2+ -> Line) is shown in Figure 2, "Basic Call Scenario : Message flow Diagram".

Figure 2 Basic Call Scenario : Message flow Diagram



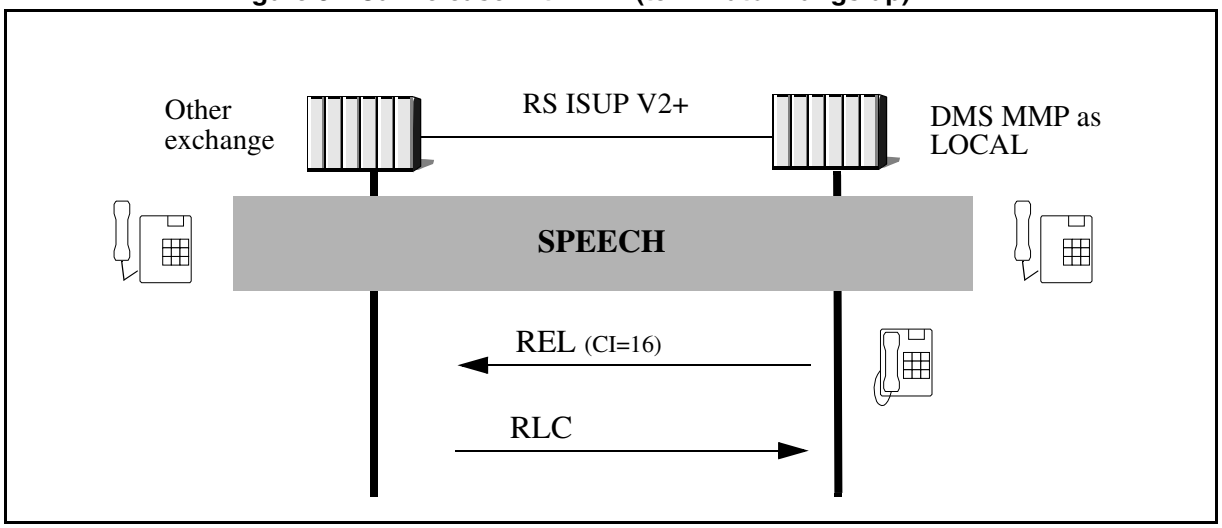
74.3.3.1 Call Termination

When called subscriber on-hooks, REL message will be sent instead of SUS message as required by interworking specifications. Additionally, re-answer is not supported in Russia network, thus, when network initiated SUS message is received over Russia ISUP V2+ trunks at an originating exchange, DMS MMP will release the call immediately with REL (CI=16).

User initiated SUS messages will be ignored by both originating and terminating exchanges, but they will be transmitted at tandem.

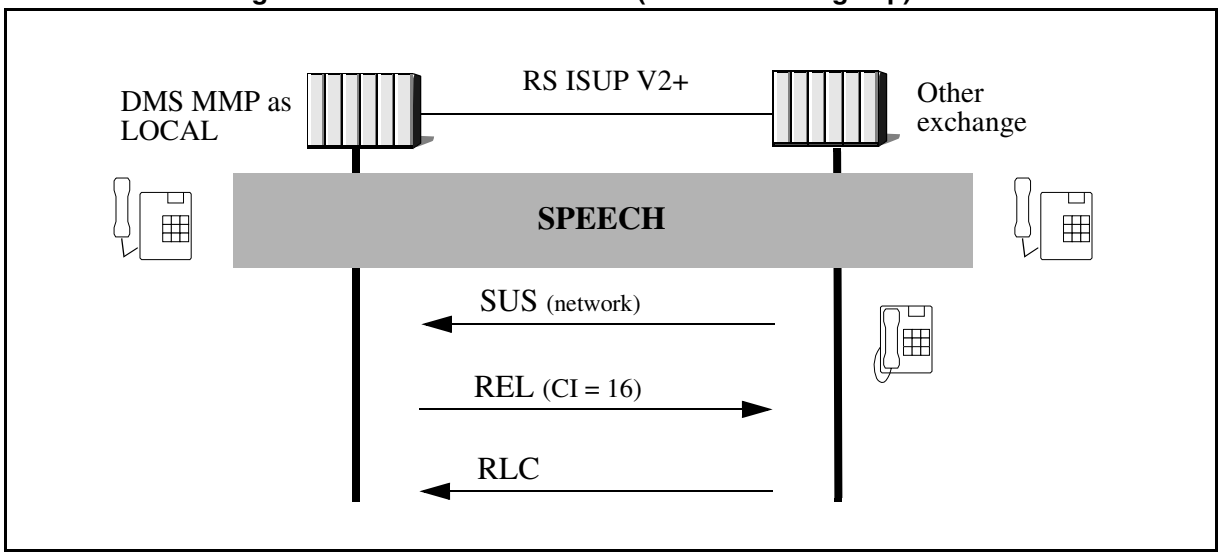
When a called subscriber on-hooks, REL message is sent instead of SUS message as required by interworking specifications. Please refer to Figure 3.

Figure 3 Call release with REL (terminator hangs up)



If network initiated SUS message is received at an originating DMS MMP exchange, REL with "Normal Call Clearing" cause is sent back (instead of starting T6 timer), as given in Figure 4, since Russia ISUP V2+ trunks does not support re-answer in automatic calls.

Figure 4 Call release with SUS (terminator hangs up)



Additionally, T6 timer is not started at DMS MMP tandem exchanges when network initiated SUS message is received.

Originating and terminating DMS MMP exchanges ignore user initiated SUS messages received over Russia ISUP V2+ trunks instead of starting T2 timer.

When REL message is received over Russia ISUP V2+ trunks at terminating DMS MMP exchange, a datafillable treatment can be applied to the terminating subscriber. This functionality can be achieved by datafilling Y for the office parameter FLEXIBLE_FAIL_CAUSE_TO_TRMT_MAP in table OFCENG.

The disconnect treatment, which will be applied to the terminating agent, should be datafilled in table FAILMSG where FLEXIBLE_FAIL_CAUSE_TO_TRMT_MAP is datafilled as "Y". Example datafill of FAILMSG table (for CI=16 (normal call clearing) - Russia ISUP V2+ to line interworking) is given in Figure 5.

Figure 5 Example FAILMSG datafill

```
INPUTMSG MAPTO LOG RESULT
------------------------------------------------------------
Q767 NORMCLR OTHERWISE N TREAT RODR
```

If FLEXIBLE_FAIL_CAUSE_TO_TRMT_MAP parameter in table OFCENG is datafilled as N, DMS MMP applies disconnect timeout treatment (DISC), by default, to the terminating subscriber for all release causes.

Upon reception of REL message over the incoming Russia ISUP V2+ trunk, DMS MMP applies the specified treatment (DISC or datafilled treatment) to the terminating subscriber after a certain time interval. This time interval can be determined by datafilling the office parameter FLEXIBLE_DISCONNECT_TIMER in table OFCENG. The duration of the interval (in seconds) is 2,5 times the parameter value. FLEXIBLE_DISCONNECT_TIMER should be datafilled as "0", if it is required to apply disconnect treatment immediately after REL message is received.

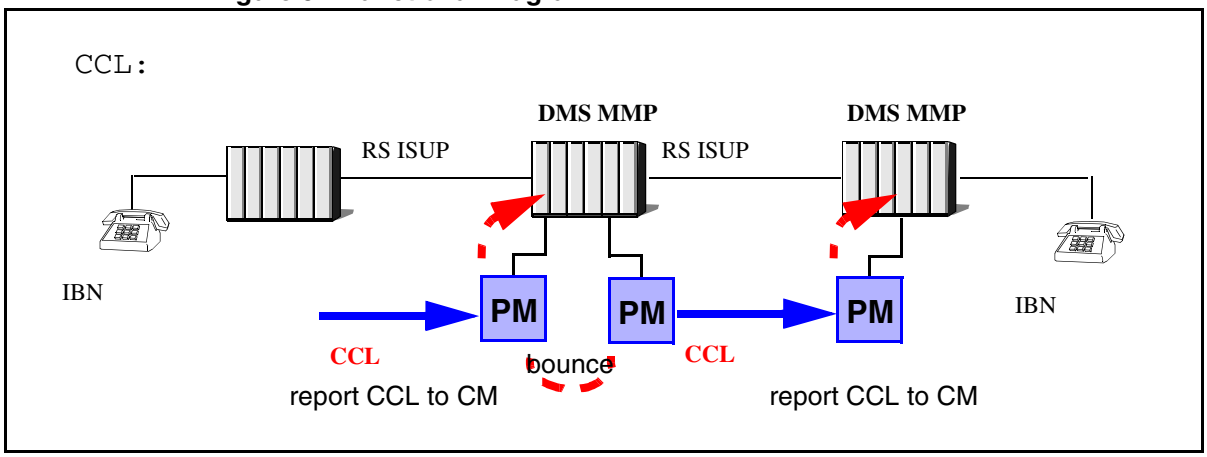
74.3.4 New Russia Specific ISUP Messages on SPM STM1

As part of this activity there are two new message types supported in SPM which are required by Russia specifications: CCL and RNG.

Other required messages are all existing ISUP messages, and are supported by DMS MMP and SPM-STM1. The list of required messages and parameters for Russia ISUP V2+ is available in ISUPR2000 in FMDOC library.

74.3.4.1 Calling Line Clear (CCL)

Figure 6 Functional Diagram



In this activity, following items will be implemented for CCL message:

- Definition of the CCL message.
- Formatting of the CCL message.
- Handling CCL message in SPM (Originating, Tandem and Terminating exchanges)

Note: CCL requirement for this activity is based on ISUPR2000.AB01

74.3.4.1.1 Definition of CCL Message

Calling line clear message (CCL) is a forward message sent instead of RELease signal in malicious call hold (MCH). It is used to provide 'called control disconnection type'. Hold indicator is not supported by the Russia ISUP V2+, instead CCL message is used.

Figure 7 The CCL message template

*NEW	MESSAGE TYPE	1111 1100

Mandatory fixed parameter

74.3.4.1.2 DMS MMP as Originating Exchange

Generation:

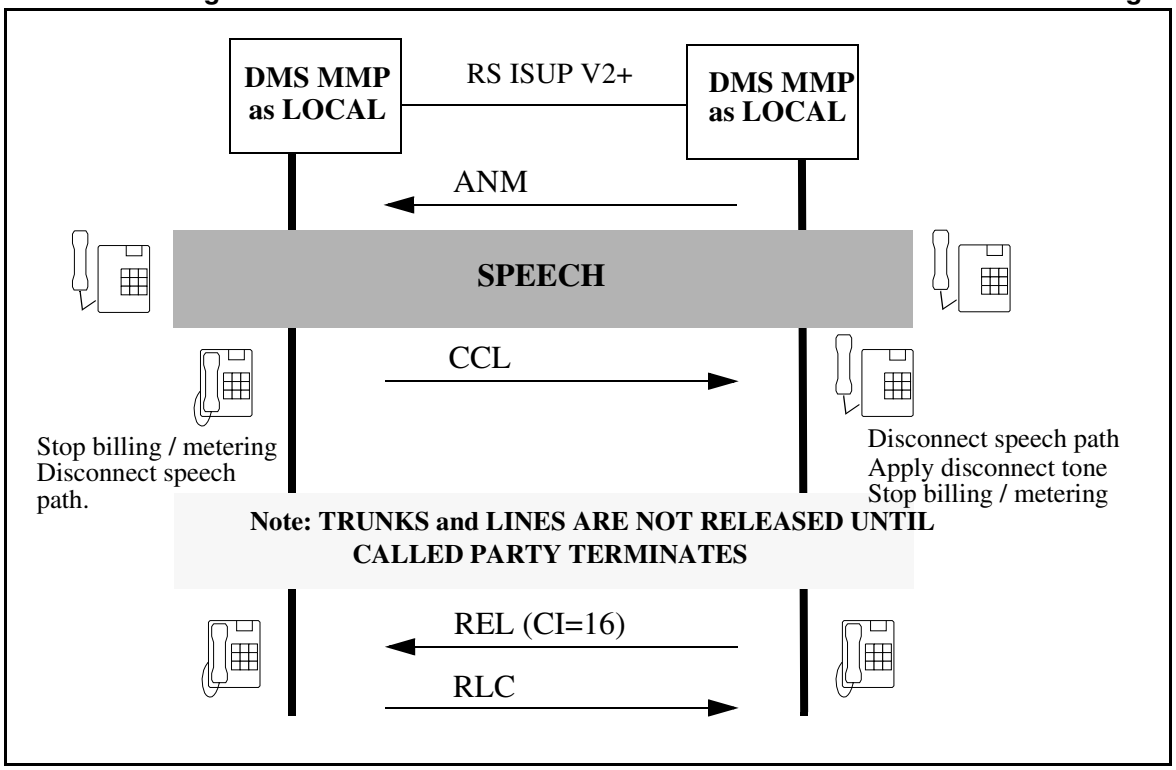
Upon calling subscriber's on-hook during a conversation, DMS MMP sends CCL message **if CALLCTRL option is datafilled within corresponding tuples of translation tables (XXHEAD / XXCODE) with CALLED value**. Otherwise REL is sent. **In called controlled calls,**

billing and metering of the call stops when originator terminates the call.

There are 4 possible scenarios for the originating DMS-MMP Generation:

Scenario 1: CCL Generation at Originating Exchange
Call releases with CCL at Originating DMS MMP Exchange upon calling subscriber's on-hook. Refer to Figure 8. If not datafilled with CALLCTRL option, REL will be sent. This will be a normal Call release scenario.

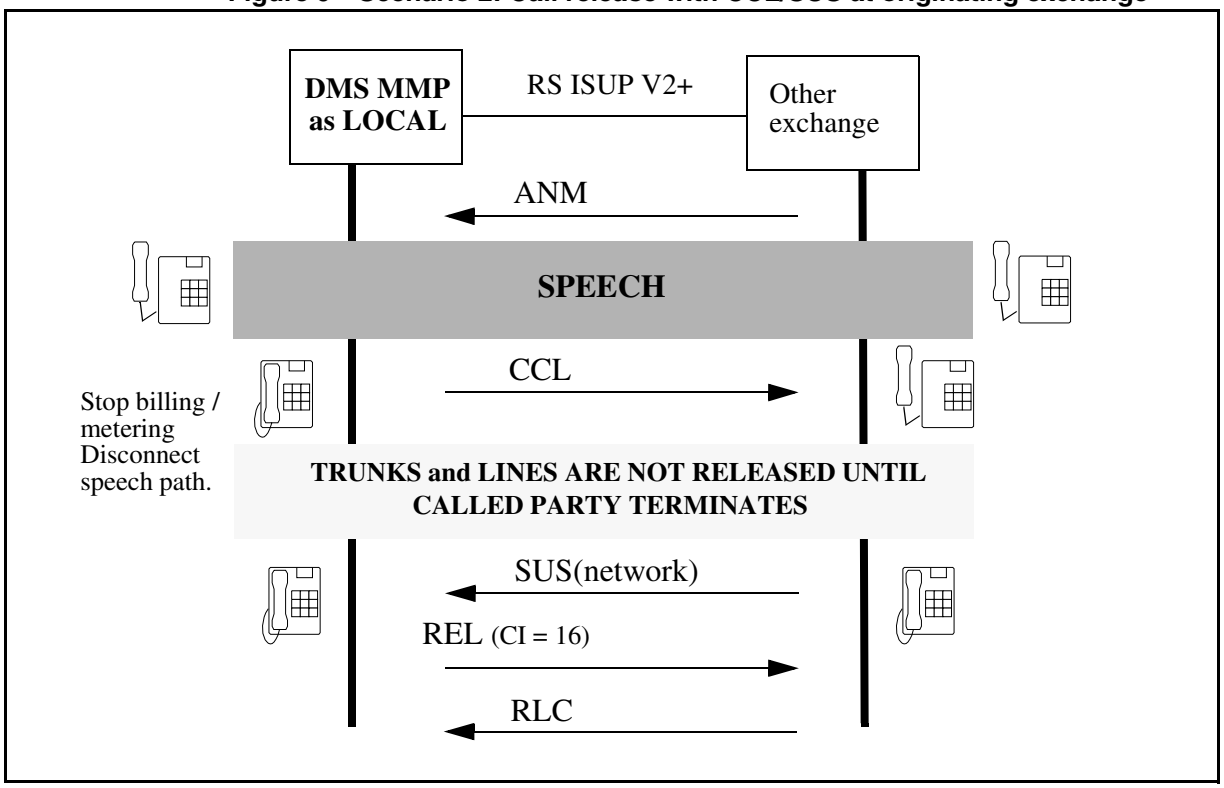
Figure 8 Scenario 1: Call release with CCL/REL at ORIG and TERM exchanges



Scenario 2: CCL Generation at Originating Exchange, Other Exchange Sending SUS

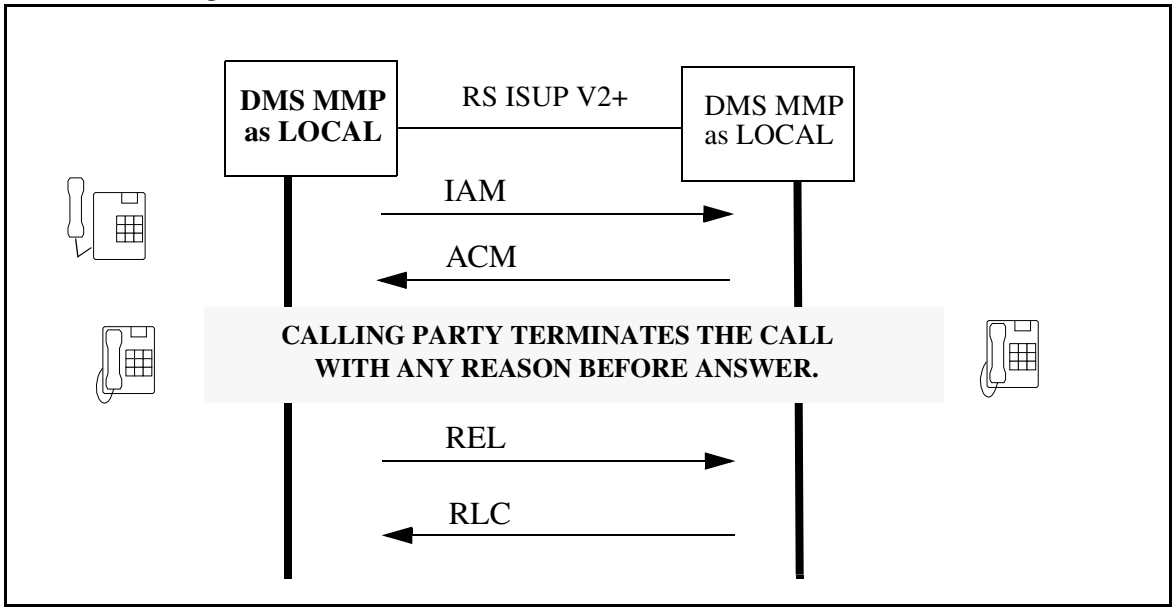
Call release with generating CCL and receiving SUS at Originating DMS-MMP exchange.

Figure 9 Scenario 2: Call release with CCL/SUS at originating exchange



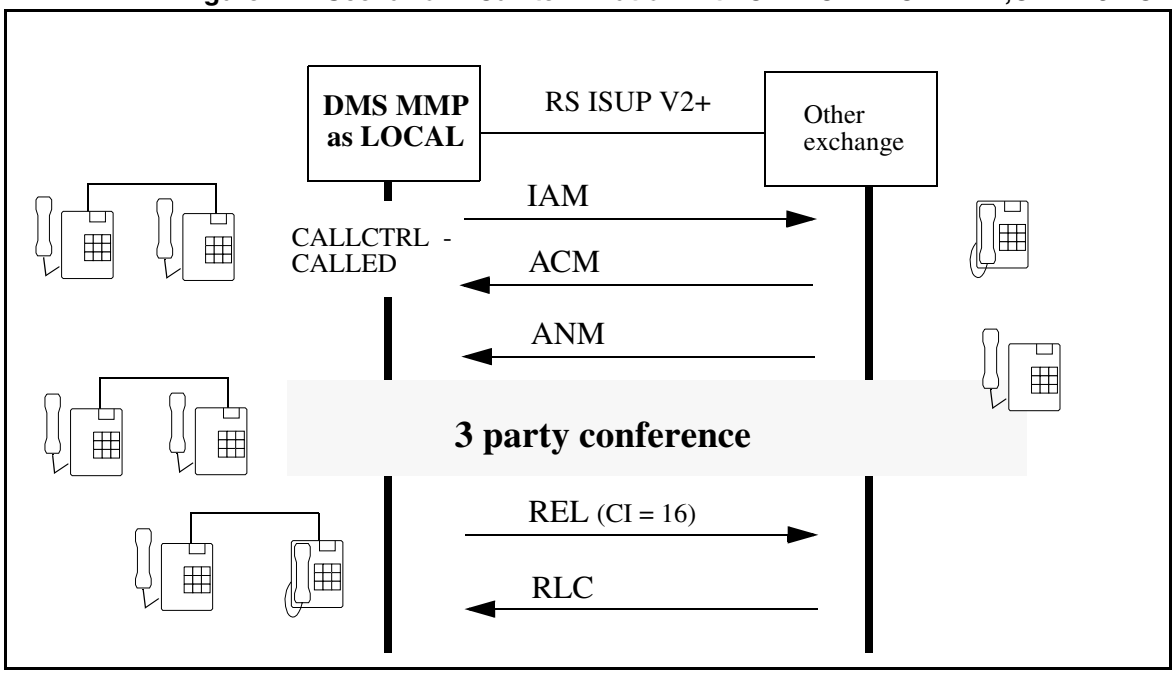
Scenario 3 : Call release with REL from Originating DMS MMP Exchange

Figure 10 Scenario 3:Call release with REL.



Scenario 4: Call termination on Originating DMS MMP Exchange with CALLCTRL-CALLED and CEPT-I3WC.

Figure 11 Scenario 4: Call termination with CALLCTRL-CALLED,CEPT-I3WC

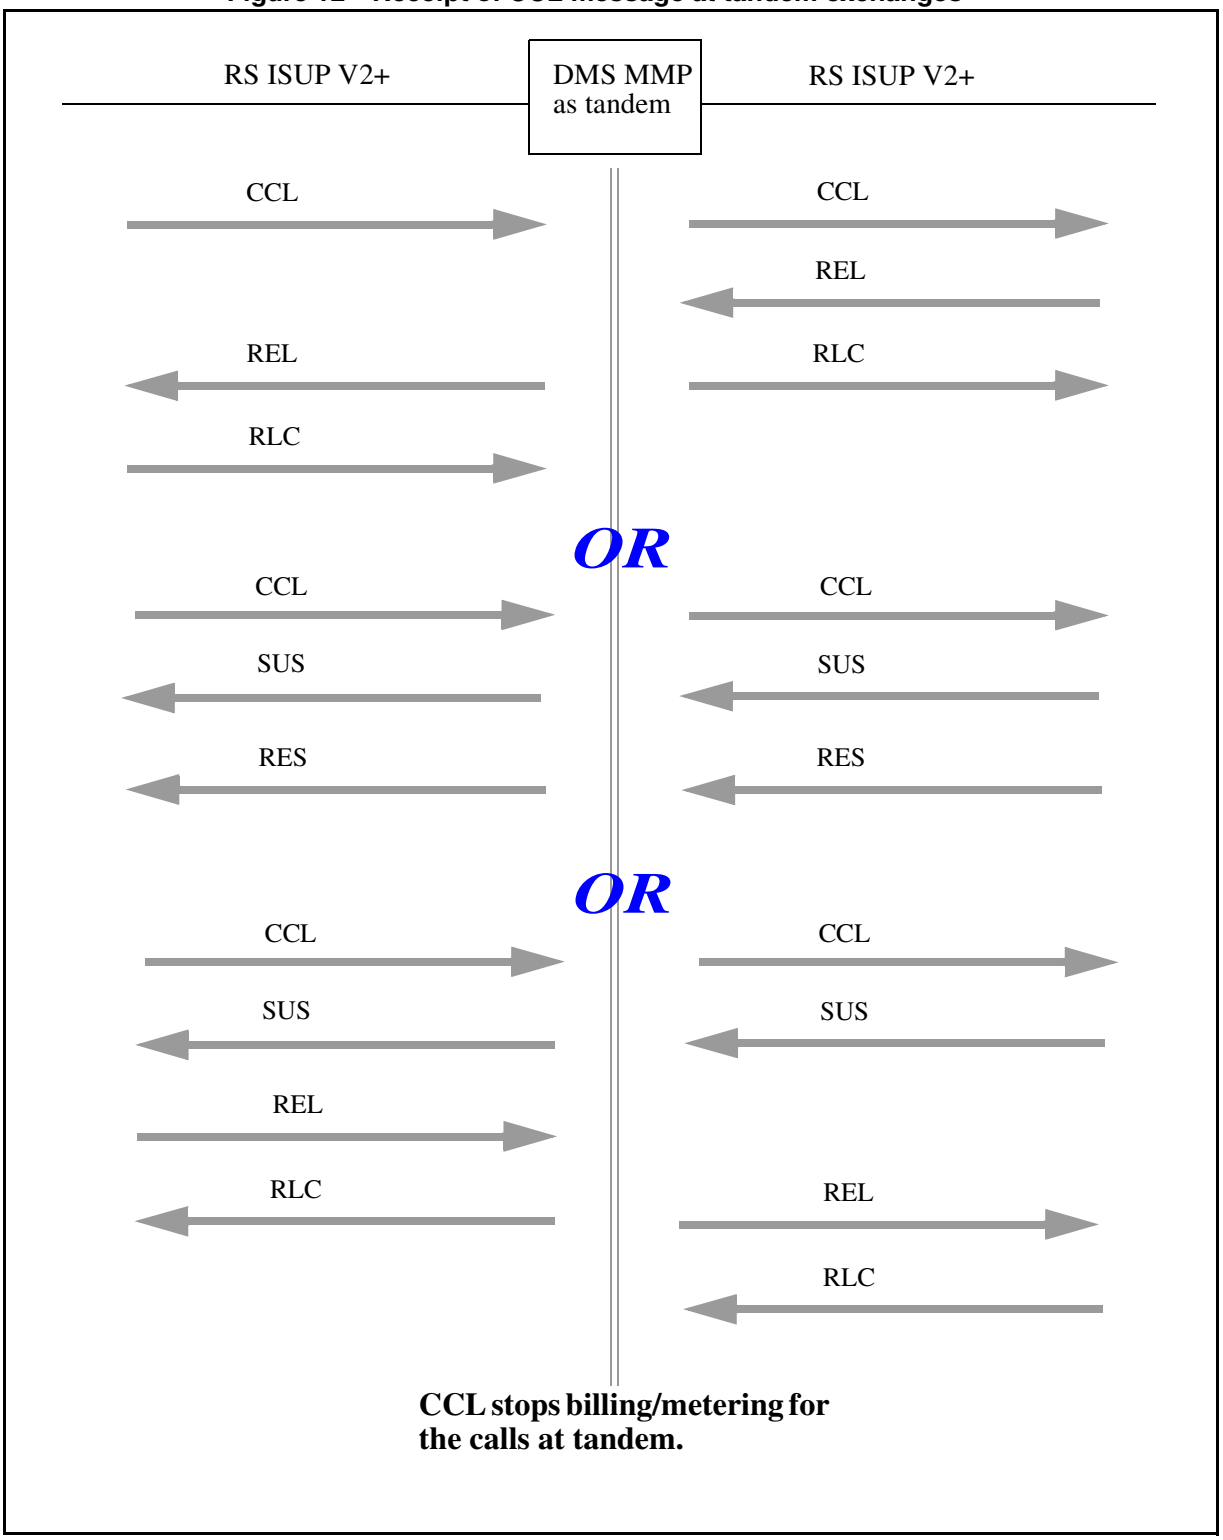


74.3.4.1.3 DMS MMP as a Tandem Exchange

DMS MMP transmits CCL message without changing any of its parameters. **CCL message stops billing and metering of the call at tandem exchanges.** There are 3 possible scenarios on a tandem exchange. These 3 scenarios will be supported on DMS-MMP with SPM-STM1 peripheral. (Figure 12)

SUS and RES messages, which are received at tandem after CCL, are transmitted without modification.

Figure 12 Receipt of CCL message at tandem exchanges



74.3.4.1.4 Reception

DMS MMP stops billing/metering, disconnects speech path, and applies reorder (RODR) treatment to the terminating IBN agent, after CCL message is received, as given in Figure 13. Clearing the call depends on the called subscriber's action after receiving CCL message.

With the use of CCL message, this activity supports called party control functionality, as given in Russia requirements, **only for IBN** subscribers which are routed to Russia ISUP V2+ trunks. **Called party control is not supported for line-to-line calls, and other Russia ISUP V2+ interworkings.**

CCL message, and called party control applies only in basic calls. Calls subject to called-party control shall have the following call transfer related services denied:

— Call Hold

— Call Transfer

— Call Waiting

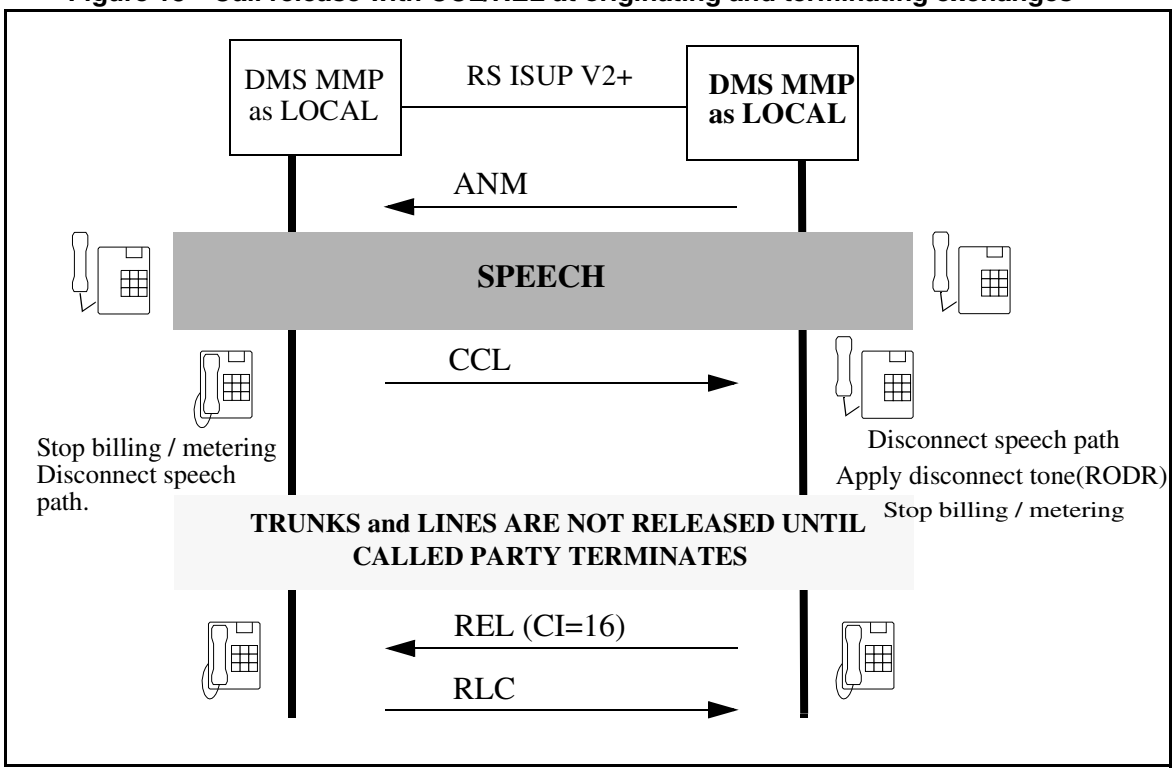
— 3-Way Calling

— 6-Way Calling

Originating subscribers are not allowed to FLASH within called party controlled calls, after the call is answered.

Additionally, called-party control is not supported within multi party calls. In multi party calls, where CALLCTRL-CALLED translation option is introduced after the first call is established, the call transfer related feature shall override called party control as given in Figure 13.

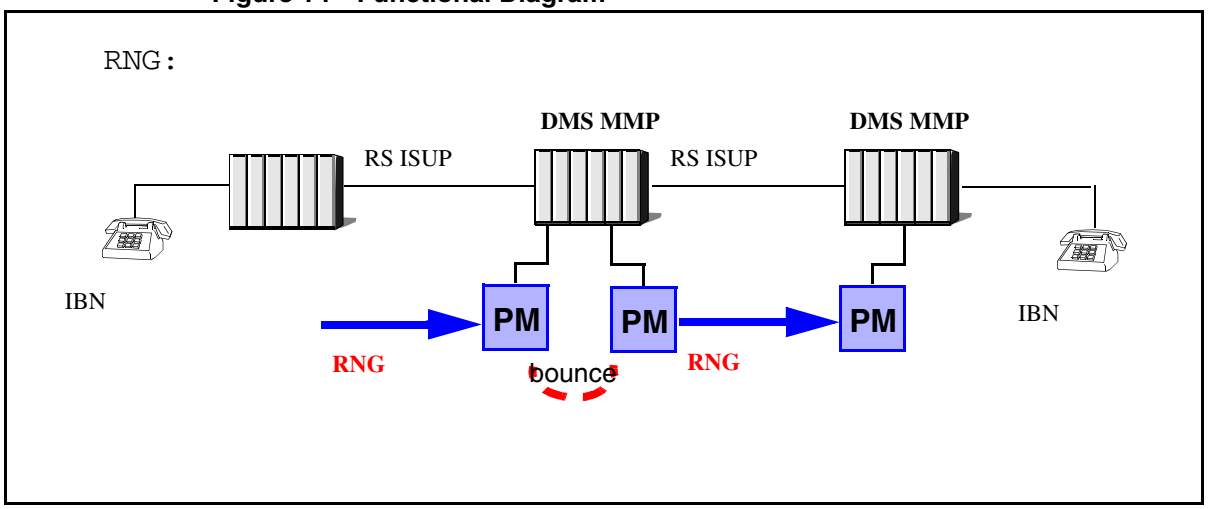
Figure 13 Call release with CCL/REL at originating and terminating exchanges



The scenarios, where called subscribers - of called-party controlled calls - involve in complex calls (I3WC, I6WC, ICT, CFX ...etc), are not supported by this feature.

74.3.4.2 Ring (RNG) Message

Figure 14 Functional Diagram



In this activity, following items will be implemented for RNG message on SPM:

- Definition of the RNG message.
- Formatting of the RNG message.
- Handling RNG message in SPM (Originating, Tandem and Terminating exchanges)

  Note: RNG is used for Backward Compatibility.

74.3.4.2.1 Definition of RNG Message

Ring message (RNG) is a forward signal sent from an operator-connected exchange towards the line-connected exchange.

Figure 15 RNG Message Template.

*NEW	MESSAGE TYPE	1111 1111
*	POINTER TO START OF OPTIONAL PART	0000 0000

Mandatory fixed parameter

- *Generation:*

  In Russia network, RNG message is generated only during a semi automatic call in case of operator's re-ring. Since DMS MMP does not support operator positions, this message will not be generated.

- *Tandem:*

  DMS MMP forwards RNG message without changing any of its parameters.

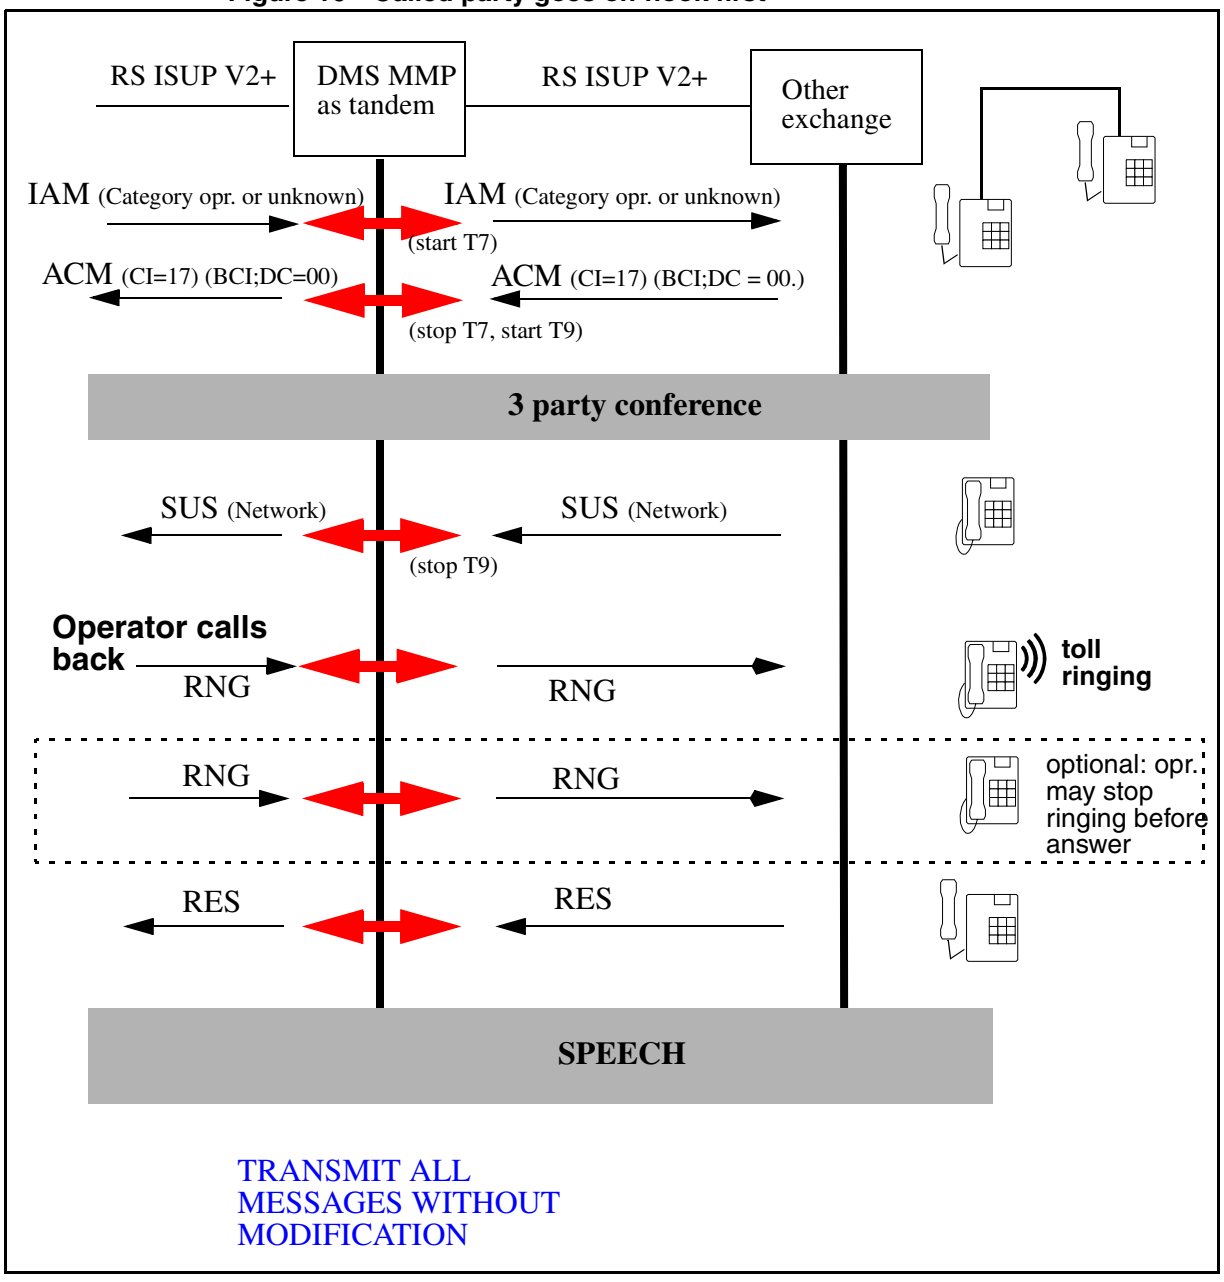
- *Reception:*

  This message was previously being used in Russia network for TBI service (Old TBI). However, within ISUPR2000.AB01 specifications, it is indicated that CWT will be used instead of TBI, thus it is not required to process RNG message. DMS MMP ignores RNG message when it is received at terminating exchange.

  Note: Please note, Old TBI refers to Backward Compatibility for TBI service. Wherever necessary the document will refer the Backward compatibility TBI service to Old TBI

As indicated above, DMS MMP can only receive RNG message within TBI scenarios. TBI scenario at tandem -where RNG message is received- is given in Figure 16 below.

Figure 16 Called party goes on-hook first



RNG message is supported only for the scenarios similar to Figure 16, at tandem switches. If RNG message is received after ACM and ANM at an originating or terminating DMS MMP switch, it will be ignored.

If ISUP_RNG is received in forward direction in operator calls after ACM or ANM at tandem nodes, it will be transmitted unchanged, but it will not be processed. If RNG is received in a non-operator call after ACM or ANM, it will be ignored even at tandem.

In other scenarios (i.e. RNG received after IAM) DMS MMP behaves as described in Q764.2.9.5.1-”Handling of Unexpected Messages”.

For more details on the possible RNG messages on tandem, please refer to section 3.3.5 on Toll Break In (TBI).

74.3.5 Toll Break In (old TBI) Support in SPM STM1

In Russia network, toll operators can establish calls to busy subscribers using TBI feature with ISUP-R-1994 signalling.

DMS MMP does not support TBI feature as an originating or terminating exchange.

Operator calls are distinguished from other calls via CPC parameter in IAM. Possible CPC can be:

- Unknown (#00)
- National Operator (#09)
- Semiautomatic call, categoryI - OCCI (#F1)
- Semiautomatic call, categoryII - OCCII (#F3)
- Semiautomatic call, categoryIII- OCCIII (#F5)
- Semiautomatic call, categoryIV- OCCIV (#F7)

There are 4 possible scenarios in order to support TBI.

RNG message is supported only for the scenarios similar to Figure 17 at tandem switches. If RNG message is received after ACM and ANM at an originating or terminating DMS MMP switch, it will be ignored.

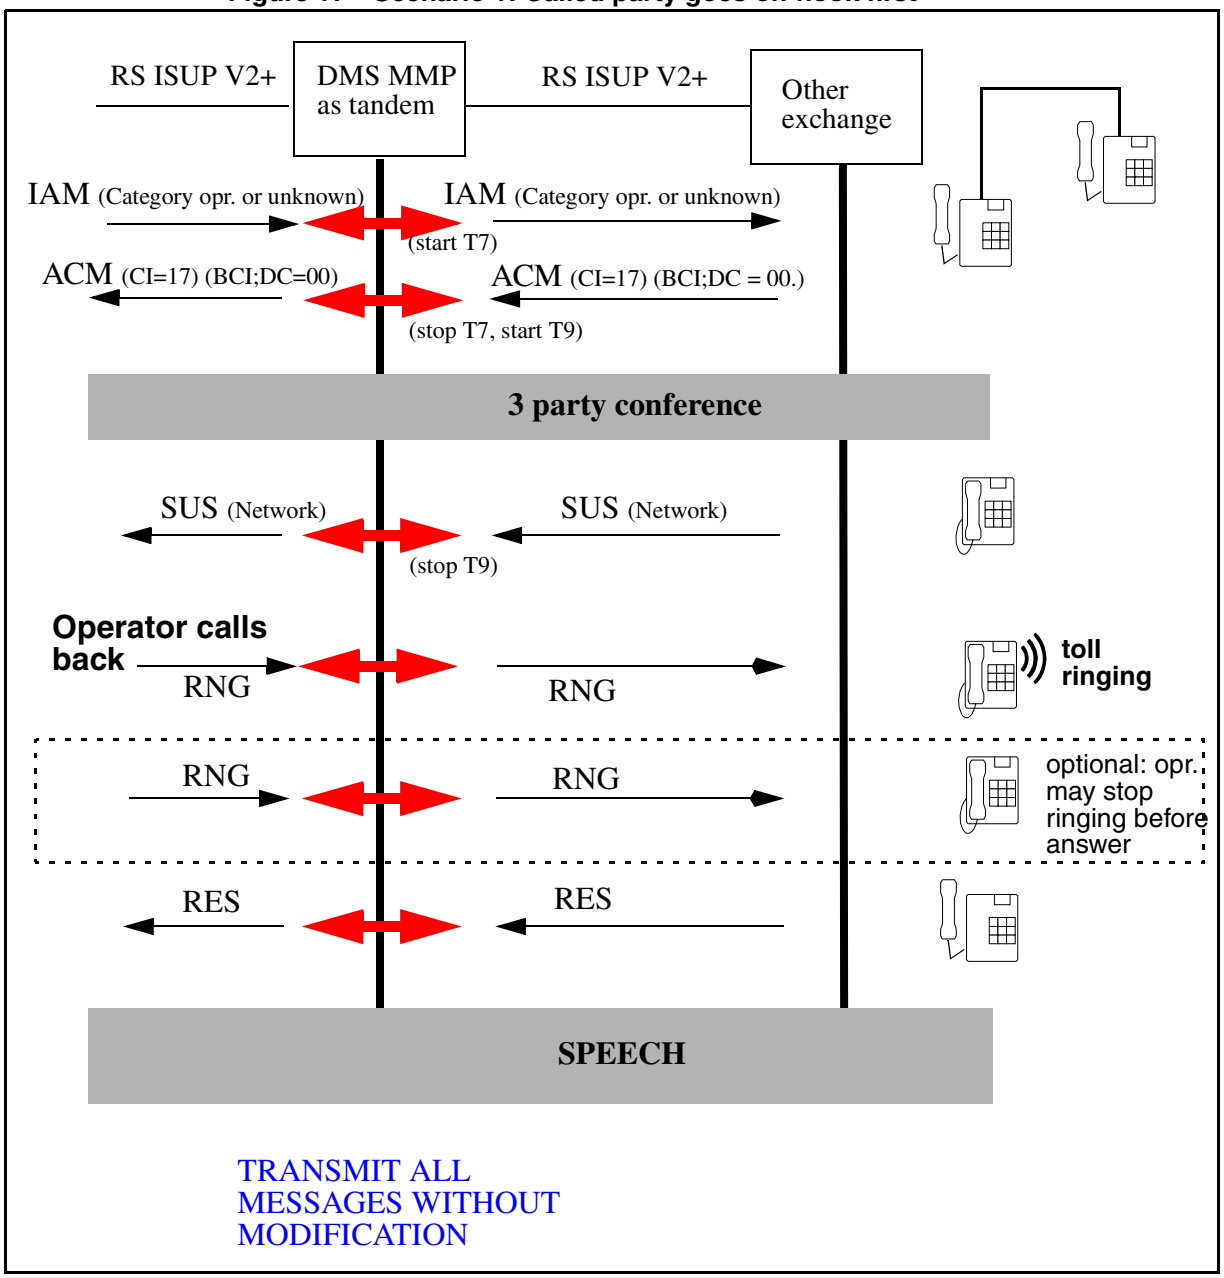
If ISUP_RNG is received in forward direction in operator calls after ACM or ANM at tandem nodes, it will be transmitted unchanged, but it will not be processed.

If RNG is received in a non-operator call after ACM or ANM, it will be ignored even at tandem.

In other scenarios (i.e. RNG received after IAM) DMS MMP behaves as described in Q764.2.9.5.1-”Handling of Unexpected Messages”.

Scenario 1: Line -> Russian ISUP V2+ -> Russian ISUP V2+ -> Line: Called Subscriber busy in TBI - called party goes on-hook (hangs up) first

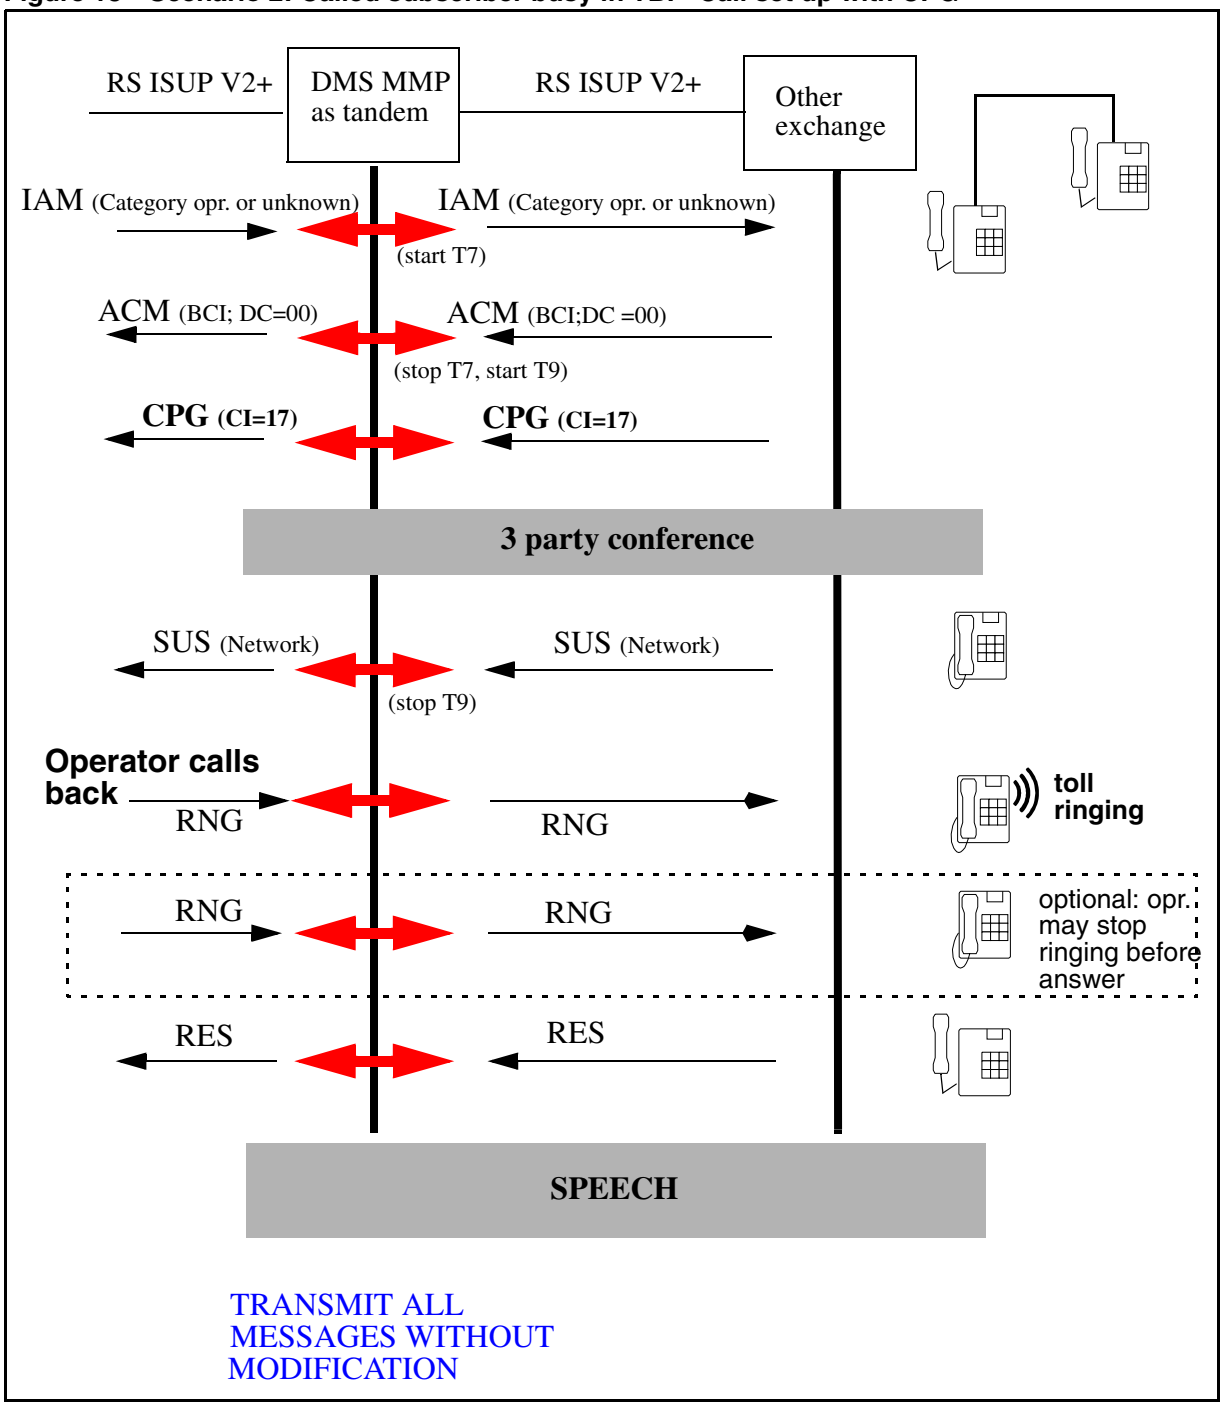
Figure 17 Scenario 1: Called party goes on-hook first



Scenario: 2 Line -> Russian ISUP V2+ -> Russian ISUP V2+ -> Line

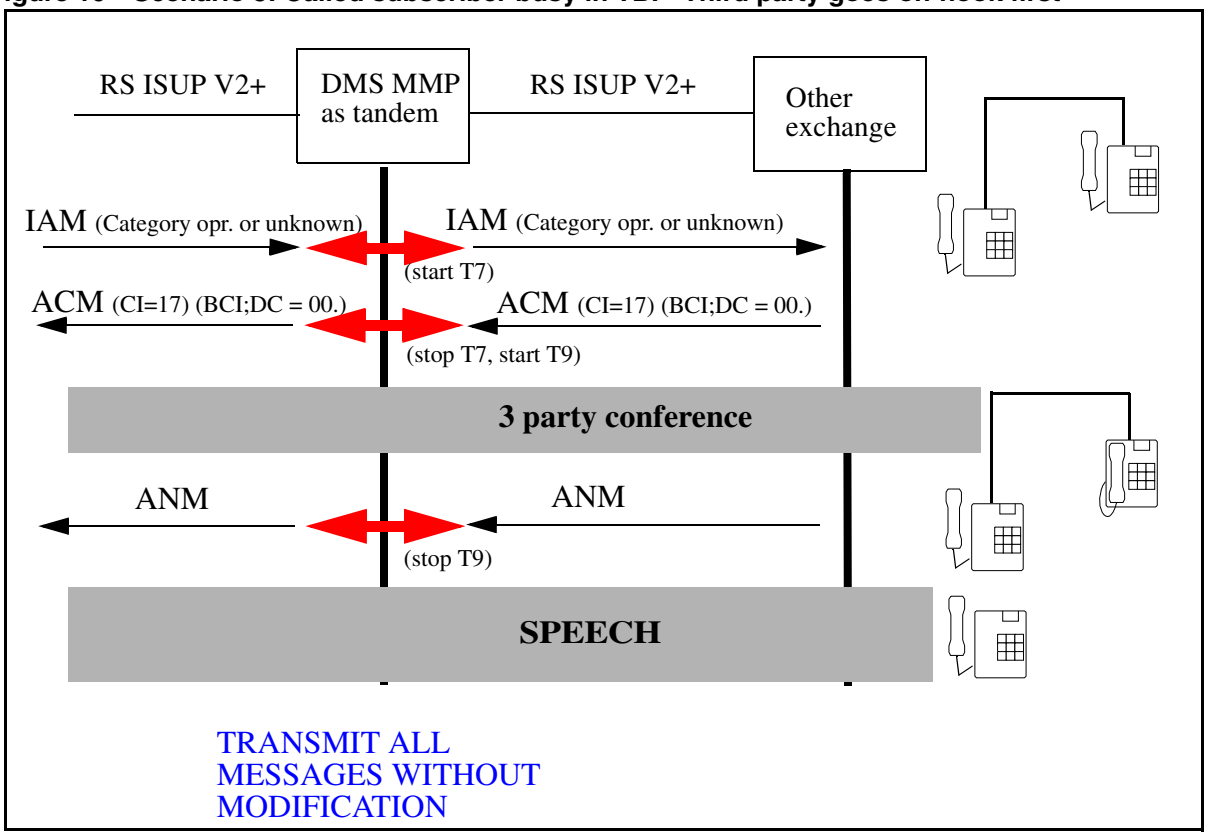
Called Subscriber busy in TBI - call setup with CPG (similar to 1 except the called party is busy)

Figure 18 Scenario 2: Called subscriber busy in TBI - Call set up with CPG



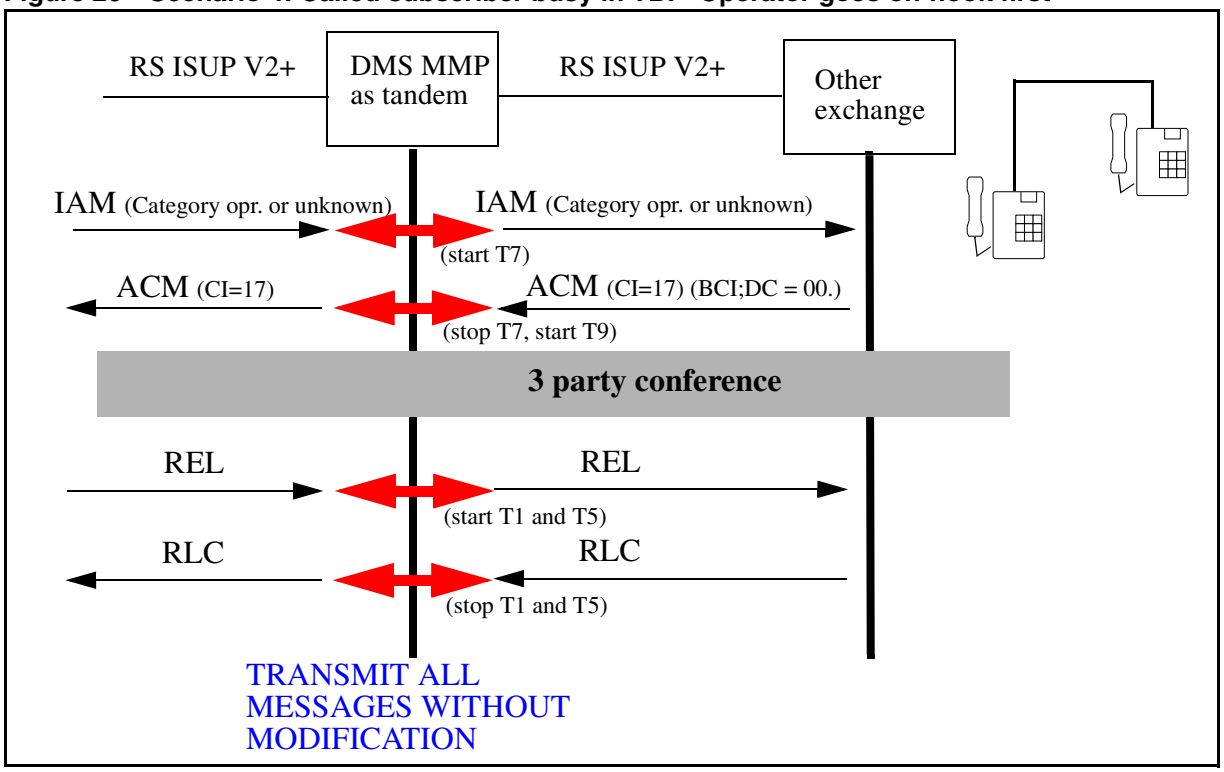
Scenario: 3 Line -> Russian ISUP V2+ -> Russian ISUP V2+ -> Line: Called subscriber busy in TBI - Third party goes on hook (hangs up) first

Figure 19 Scenario 3: Called subscriber busy in TBI - Third party goes on-hook first



Scenario: 4 Line -> Russian ISUP V2+ -> Russian ISUP V2+ -> Line
Up to this part, the scenarios in which the called party accepts the operator call are given. In some scenarios, operator gives up. DMS MMP is also capable of tandeming these scenarios. An example to these scenarios is given Figure 20 in . IAM with Category : Operator or unknown

Figure 20 Scenario 4: Called subscriber busy in TBI - Operator goes on-hook first



74.3.5.1 SWACT Interaction

If warm swact is applied to the peripherals which are connected to Russia ISUP V2+ trunks -involved in the scenarios in Figure 17 (scenario 1 in TBI) and Figure 18 (scenario 2 in TBI) - before ISUP_RES message is received, the call will be dropped.

Note: Operator goes on hook first based on the called party is busy

74.3.5.2 Restriction:

- DMS MMP does not support TBI feature as an originating or terminating exchange. Only on tandem exchanges
- Do not support the feature on warm swact for scenarios 1, 2. But supported on scenario 3.

74.3.6 ISUP Messages CRG and FAC

- CRG: Russia specifications require CRG message to be considered as correct, but ignored. Therefore, it will be recognized as a valid message (i.e. no CFN will be sent), but it will not be processed or originated.

- FAC: FAC message is used for ECT(Explicit Call Transfer) and REV (Reverse Charging) services. ECT is an optional service in Russia specifications and partly supported by DMS MMP.

  Note: This activity supports ISUPR2000.AB01 FAC requirement.

74.3.6.1 Originating Exchange Behavior:

1. CRG: Discards when received CRG at Originating MMP Exchange
2. FAC: No FAC on Originating MMP Exchange.

74.3.6.2 Tandem Exchange Behavior:

1. CRG: DMS MMP transmits CRG message if it is received at tandem exchange over Russia ISUP V2+ trunks.
2. FAC: DMS MMP transmits FAC messages -which are received at tandem node over Russia ISUP V2+ trunks- without changing any parameters, without processing this message, and without sending CFN.

74.3.6.3 Terminating Exchange Behavior:

1. If CRG is received at terminating exchange, message will be discarded without notification.
2. FAC message is not supported at terminating switches. CFN message will be sent if FAC is received from an Russia ISUP V2+ trunk at terminating exchange.

Figure 21 Functional diagram

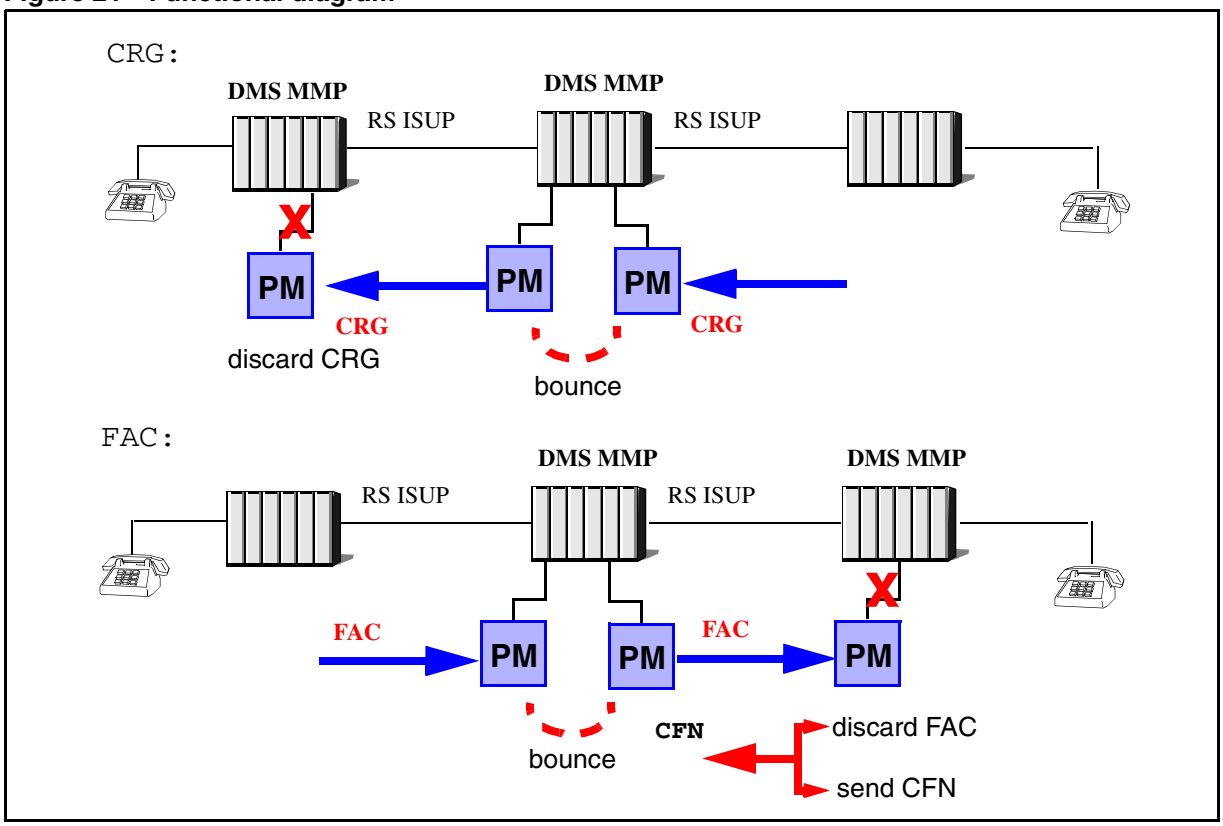


Figure 22 Provided functionality

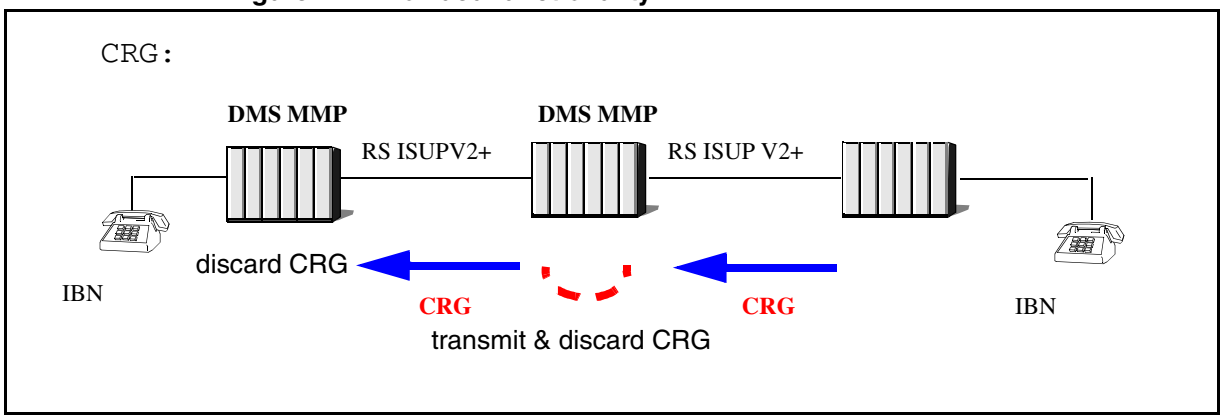
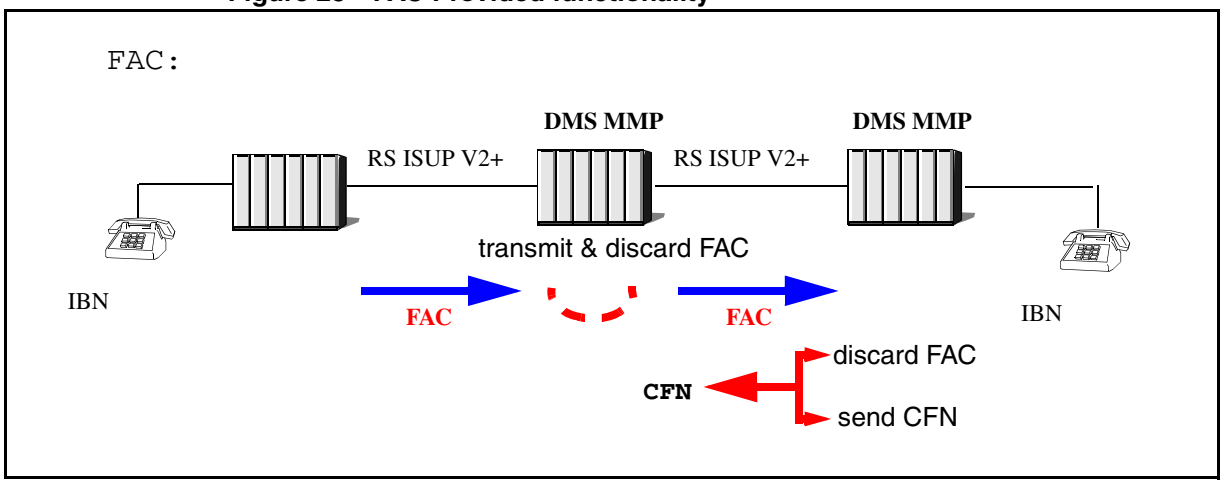


74.3.6.4 Processing CRG message

The behavior of the CRG message is as follows

- If the CRG is a CC message, we send the message to the facility
- If the CRG is a facility message at a tandem, we will bounce the message
- If the CRG is a facility message at an end-office, the message is discarded.

Figure 23 FAC Provided functionality



74.3.7 Russian ISUP Message Parameter Compatibility

Russia specification identify variances in the set of supported optional parameters for ISUP messages. The following table identifies the supported mandatory and optional parameters for each message in SPM STM1.

Table 2 Supported Russia ISUP Messages and Parameters

Mes sage	Mandatory Parms	Optional Parms	Currenly supported by ETSI V2?
ACM	Backward Call Indicator	Access Delivery Information Access Transport Application Transport Call Diversion Information End of Optional Parameters Generic Notification Optional Backward Call Indicators Parameter Compatibility Information Redirection Number Redirection Number Restriction User-To-User Indicators User-To-User information	ETSI V2 supports Cause Indicator and Service Activation Parms. **New formatter required.**
APM		Application transport End of Optional Parameters Message Compatibility Information Parameter Compatibility Information	Same supported set of parms as ETSI V2.

Table 2 Supported Russia ISUP Messages and Parameters

Mes sage	Mandatory Parms	Optional Parms	Currenly supported by ETSI V2?
ANM		Access delivery information Access transport Application transport Backward Call Indicator Call History Information Connect Number End of Optional Parameters Generic Notification Generic Number Optional Backward Call Indicators Parameter Compatibility Information Redirection Number Redirection Number Restriction User-To-User Indicators User-To-User information	ETSI V2 supports Service Activation Parm, but does not support Access transport, BCI, Connect Number or User-To-User information. **New formatter required.**
BLO			Same as ETSI V2
BLA			Same as ETSI V2
CCR			Same as ETSI V2
CCL			**New Message, formatter already being developed**
CFN	Cause Indicators	End of Optional Parms	Same as ETSI V2
CGB	Circuit Group Supervision Message Type Range And Status		Same as ETSI V2
CGBA	Circuit Group Supervision Message Type Range And Status		Same as ETSI V2
CGU	Circuit Group Supervision Message Type Range And Status		Same as ETSI V2
CGUA	Circuit Group Supervision Message Type Range And Status		Same as ETSI V2

Table 2 Supported Russia ISUP Messages and Parameters

Mes sage	Mandatory Parms	Optional Parms	Currenly supported by ETSI V2?
CON	Backward Call Indicator	Access delivery information Access transport Application transport Call History Information Connect Number End of Optional Parameters Generic Notification Generic Number Optional Backward Call Indicators Parameter Compatibility Information Redirection Number Redirection Number Restriction User-To-User Indicators User-To-User information	ETSI V2 supports Service Indicator parm. **New Formatter required.**
COT	Continuity Indicators		Same as ETSI V2
CPG	Event Information	Access delivery information Access transport Application transport Parameter Compatibility Information Backward Call Indicator Call Diversion Information Call History Information End of Optional Parameters Generic Notification Generic Number Optional Backward Call Indicators Redirection Number Redirection Number Restriction User-To-User Indicators User-To-User information	ETSI V2 supports Cause Indicator and Service Activation parms. Also ETSI V2 does not support the Generic Number Parameter. **New Formatter required.**
CRG			Same as ETSI V2.
FAA		End of Optional Parameters Parameter Compatibility Information User-To-User Indicators	Same as ETSI V2
FAC			Same as ETSI V2
FAR	Facility Indicator	End of Optional Parameters Parameter Compatibility Information User-To-User Indicators	Same as ETSI V2
FRJ	Cause Indicators Facility Indicators	End of Optional Parameters User-To-User Indicators	Same as ETSI V2.
GRA			Same as ETSI V2
GRS	Range and Status		Same as ETSI V2

Table 2 Supported Russia ISUP Messages and Parameters

Mes sage	Mandatory Parms	Optional Parms	Currenly supported by ETSI V2?
IAM	Called Party Number Calling Party's Category Forward Call Indicators Nature of Connection Indicators Transmission Medium Requirement **Please refer to 74.3.8 for more details.**	Access transport Application transport Calling Party Number Closed user group interlock code End of Optional Parameters Generic Notification Generic Number Hop Counter Location Number Optional Forward Call Indicators Original Called Number Parameter Compatibility Information Propagation Delay Counter Redirecting Number Redirection Information User Service Information User Teleservice Information User-To-User Indicators User-To-User information **Please refer to 74.3.8 for more details.**	**Already writing new formatter for IAM message to support new CPC values.** Checking of optional parms is not required in the SPM.
IDR		End of Optional Parameters MCID Request Indicator Message Compatibility Information Parameter Compatibility Information	Same as ETSI V2.
INF	Information Indicators	Calling Party Number Calling Party's Category End of Optional Parameters Parameter Compatibility Information	ETSI V2 supports all optional parms except DmsPartyInfo. This messge is processed per leg basis and not on ball basis. **New formatter required.**
INR	Information Request Indicators	End of Optional Parameters Parameter Compatibility Information	ETSI V2 supports all optional parms except DmsPartyInfo. This messge is processed per leg basis and not on ball basis **New formatter required.**

Table 2 Supported Russia ISUP Messages and Parameters

Mes sage	Mandatory Parms	Optional Parms	Currenly supported by ETSI V2?
IRS		Access transport Calling Party Number End of Optional Parameters Generic Number MCID Response Indicator Message Compatibility Information Parameter Compatibility Information	Same as ETSI V2.
REL	Cause Indicaotrs	Access delivery information Access transport End of Optional Parameters Parameter Compatibility Information Redirection Number Restriction User-To-User Indicators User-To-User information ACG (Automatic Congestion Control)	ETSI V2 supports automatic congestion level parameter. **New formatter required.**
RES	Suspend/Resume Indicators	End of Optional Parameters	Same as ETSI V2.
RLC		Cause Indicators End of Optional Parameters	Same as ETSI V2.
RNG			**New Message, formatter already being developed**
RSC			Same as ETSI V2.
SAM			Same as ETSI V2.
SGM		Access transport End of Optional Parameters Generic Notification Generic Number Message Compatibility Information User-To-User information	ETSI V2 supports Generic Digits parameter. **New formatter required**.
SUS	Suspend/Resume Indicators	End of Optional Parameters	Same as ETSI V2.
UBL			Same as ETSI V2.
UBA			Same as ETSI V2.
UPA			Same as ETSI V2.
UPT			Same as ETSI V2.
USR		Access Transport End of Optional Parameters User-To-User Information	ETSI V2 does not support User-To-User information parameter. **New formatter required.**

74.3.7.1 Message Formatter for Optional Parameters

In order to support all of the necessary parms, specific Russia message formatters will have to be created for the following messages:

- ACM
- ANM
- CCL
- CON
- CPG
- IAM
- INF
- INR
- REL
- RNG
- SGM
- USR/UUI

74.3.8 Modification of Mandatory/Optional Parameters in Russia ISUP V2+

Russia specifications require four mandatory parameter fields to be enhanced:

a. Called Party Number-Nature of Address Indicator,

b. Nature of Connection Indicator-Satellite Indicator,

c. Backward Call Indicator - Called Party's Category Indicator and

d. Backward Call Indicator - Echo Control Device Indicator.

Original activity A00000937 addresses these requirements in the core. This activity will ensure that SPM STM1 handles these mandatory and optional paramters correctly when received. For more details, please refer to A00000937.

74.3.8.1 Called Party Number - Nature Of Address Indicator

In Russia network, different contents of IAM has been observed. IAM's observed in Russia network don't cause any problem in DMS MMP. Russia ISUP V2+ meets the market requirements (except NOA and address signals) for IAM.

Table 3, “NOA values for different call types,” on page 1518 shows the call types and the corresponding ‘Nature of Address Indicator’ (NOA) values.

Table 3 NOA values for different call types

Call Types	Nature of Address Indicator
Local Calls	Subscriber Number
National Calls	National (significant) Number
International Calls	International Number

“01-Subscriber Number” is the default value for Called Party Number-NOA.

74.3.8.2 Nature Of Connection Indicators-Satellite Indicator

In Russia specifications, “00-ISUP No Satellite”, “01- ISUP 1 Satellite”, and “02-ISUP 2 Satellite” values for “Nature Of Connection Indicators-Satellite Indicator” are required. These values of “Satellite Indicator” are already supported by the existing ETSI ISUP V2 base variant.

In order to set Satellite Indicator, SAT field of the TRKSGRP table tuple should be set for a trunk group. However, this datafill is not enough to allow 02-ISUP 2 Satellite value at tandem exchanges.

Table SATOVER is used to determine the routes that will allow double satellite hops. In Figure 24, "Datafilling TRKSGRP and SATOVER tables" a sample datafill for SATOVER table is given.

Figure 24 Datafilling TRKSGRP and SATOVER tables

```
TABLE TRKSGRP

- Outgoing RS ISUP V2+ Trunk -

- Incoming RS ISUP V2+ Trunk -
ICRSISUPBA 0 DS1SIG C7UP IC N Y UNEQ NONE Q767 THRH 0 DMS N N RUSSIA
100_WHITE $ 2WN7 CIC

- 2-Way RS ISUP V2+ Trunk -
2WRSISUPBA 0 DS1SIG C7UP 2W N Y UNEQ NONE Q767 THRH 0 DMS N N RUSSIA
100_WHITE $ 2WN7 CIC

TABLE SATOVER

FROM              TO          OVERRIDE
-----------------------------------------------------------
ICRSISUPBA        OGRSISUPBC      Y
```

74.3.8.3 Backward Call Indicator - Called Party's Category Indicator

DMS MMP sends CPC_PAYPHONE within Backward Call Indicator-Called Party's Category field of ACM message, when a call -over Russia ISUP V2+ trunk- terminates to an IBN-COIN line.

74.3.8.4 Backward Call Indicator - Echo Control Device Indicator

DMS MMP sends ECHO_CONTROL_DEVICE_INCLUDED within Backward Call Indicator-Echo Control Device Indicator field of ACM message, if ESUPR field of TRKSGRP table is datafilled as "H" for the incoming Russia ISUP V2+ trunk, at terminating DMS MMP exchange.

74.3.9 New Calling Party Categories (CPC)

New calling party category (CPC) values required by Russia network are given in Table 4, "New CPC values," on page 1519.

Table 4 New CPC values

Category	Meaning
0000 1001	National Operator
0000 1110	Spare
0000 1111	Toll Payphone
0001 0000 - 1101 1111	Spare
1110 0000	Spare. Subscriber category 0
1110 0001	Hotel Subscriber. Subscriber category 2

Table 4 New CPC values

Category	Meaning
1110 0010	Subscriber free of charge. Subscriber category 5
1110 0011	Subscriber with access to special services. Subscriber category 7
1110 0100	Local network subscriber. Subscriber category 3
1110 0101	Local payphone. Subscriber category 9
1110 0110 - 1110 1111	Spare. For national use.
1111 0000	Automatic call , category I- ACCI
1111 0001	Semiautomatic call, categoryI - OCCI
1111 0010	Automatic call , category II- ACCII
1111 0011	Semiautomatic call, categoryII - OCCII
1111 0100	Automatic call , category III- ACCIII
1111 0101	Semiautomatic call, categoryIII - OCCIII
1111 0110	Automatic call , category IV- ACCIV
1111 0111	Semiautomatic call, categoryIV - OCCIV
1111 1000 - 1111 1110	Spare. For national use
1111 1111	Spare

Required Calling Party Category (CPC) values are defined in this activity.

74.3.10 Handling INR and INF Message

Two new message formatters will be required for Russian ISUP V2+ to support INR and INF messages on SPM STM1.

Please refer to the original activity A00000937 for the details on the core configuration/datafill to support INR and INF messages.

74.3.11 Russia Tones and Cadences

The tone parameters (which are calculated according to frequencies, levels and cadences of tones) for each market are kept in the software modules separately and downloaded from the CM to the SPM. The Russia tones has been made as a downloadable tone.Downloadable tones provides one generic tone player application in the DSP RM and downloading the details of each markets toneset from the Core when needed. The Downloadable Tone feature was provided in the SPM by activity A59033579 in SPSH17.

In SPMs the tone parameters which will be downloaded is based on the entry for TONETYPE in table MNCKTPAK.The Russia toneset is selected by setting the TONETYPE field to "**RUSSIA**". To select the TONETYPE the RSRINFO has to be datafilled with INTTONE. The Figure 25 below shows the datafill procedure.

Figure 25 Sample Datafill for RUSSIA tone (CHA)

74.3.12 C7 Timers (Table C7UPTMR)

In Russia specifications, it is required to enlarge ranges of timers T5 and T17 from 320 seconds to 15 minutes(900 secs). Additionally, ranges of timers T13,

T15, T19, T21 and T23 should be enlarged from 640 seconds to 15 minutes. C7 timer values are datafillable in table C7UPTMR based on direction and protocol.

A00000937 activity enhanced the max integer value to 900 secs in core and XPM with PDTC hardware restriction. Please refer to Restriction and Limitation section of the A00000937 FN for PDTC.

In SPMs, the C7 timers will be downloaded with the correct datafilled timers.

74.4 Hardware Requirements or Dependencies

N/A

74.5 Software Requirements or Dependencies

Will be tested on core MMP20 non combo release load lineup. Patch or merge will be requested in SPM for this activity.

74.6 Limitations and restrictions

- As the development is on SPM STM1, any Line related features or services are not required to be supported by this activity
- This feature only defines and transmits Russia specific CPC values. Assigning and processing of these CPC values is not handled by this activity.
- Trunk metering Russia ISUP V2+ is not supported by this activity.
- Enhancements in CCITT timers apply to all CCITT versions/variants. However, enlarged ranges for T5 and T17 timers will be effective only on PDTC's when their both units are equipped with SX05. In other cases (i.e. the PDTC is equipped with MX77 or PM type is different), although it will be allowed to datafill all values between 1-900, highest effective value for T5 and T17 timers will be limited to 320, which is the current maximum for T5 and T17.
- If warm swact is applied to the peripherals which are connected to Russia ISUP V2+ trunks -involved in the TBI scenarios given in section 3.3.5.2 before RES/ANM message is received, the call will be dropped.

74.7 Interactions

74.7.1 Feature Interactions

Generation and reception of CCL message has interactions with call transfer related CEPT services.

- Subscribers are not allowed to FLASH within called controlled calls after the call is answered. CCL message, and called party control applies only

in basic calls. Calls subject to called-party control shall have the following call transfer related services denied:

— Call Hold

— Call Transfer

— Call Waiting

— 3-Way Calling

— 6-Way Calling

- If the originator of a called controlled call is involved in multi-party calls, called-party control will not be activated as given in Figure 11.
- CCL message is not supported in the scenarios where called subscribers - of called controlled calls - involve in complex calls (I3WC, I6WC, ICT, CFX ...etc).
- This activity does not support the interactions between called party control / CCL and CENTREX features.

74.7.2 Billing Interactions

Please refer to the original activity A00000937 for any billing interactions.

74.7.3 Interworking

This activity addresses the ability to support basic calls:

1. Line(IBN) - Russian ISUP - Line(IBN)

2. Line (IBN) - Russia ISUP - Russia ISUP - Line (IBN)

Other Interworking supported are:

3. V5.2-on GPP -> Russian ISUP V2-on SPM -> V5.2-on GPP

4. ISDN BRI Line -> Russian ISUP V2-on SPM -> ISDN BRI Line

5. Line -> ETSI PRI -> Russian ISUP V2-on SPM -> PRI -> Line

6. Operator calls on Busy subscriber (Toll Break In)

Russian ISUP variants will be configured on SPM STM1.

75: Functional Description (FN): A0006032

75.1 Feature name

Loop Reversal On Answer (LROA), Loop Reversal on Seizure (LRS) and Insert Tone on Coin Phone Termination (NOCOLL) SN07 Support for Cable & Wireless Caribbean

75.2 Description

This feature will allow the use of the following features in ISN07 (International Call Server) with a North American Toneset on the Passport Packet Voice Gateway (PVG) and on the MG9K:

- Loop Reversal On Answer (LROA)
- Loop Reversal on Seizure (LRS)
- Insert Tone on Coin Phone Termination (NOCOLL) on interworkings with trunks on a PVG

75.2.1 Loop Reversal On Answer (LROA)

Loop Reversal On Answer as detailed in AR0502 “Line option for Line Reversal On Answer” will be supported on IBN line types on the MG9K 32 port Global Line Card (GLC-32).

75.2.2 Loop Reversal on Seizure (LRS)

Loop Reversal on Seizure as detailed in A59008303 “Line option for Line Reversal on Seizure” will be supported on IBN line types on the MG9K GLC-32.

75.2.3 Insert Tone on Coin Phone Termination (NOCOLL) on interworkings with PVG trunks

NOCOLL functionality as detailed in A59008313 “Insert Tone on Coin Telephone Termination” will be supported on interworkings with the following PVG trunks types:

- ETSI ISUP
- ANSI ISUP

The pay phone recognition tone will be played on the trunk when terminating to a IBN line with the NOCOLL option. The characteristics of the tone such as frequency, cadence, level, and repetition are defined by the toneset of the PVG.

75.3 Hardware Requirements or Dependencies

75.3.1 Loop Reversal On Answer (LROA)

The MG9K 32 port Global Line Card is required.

75.3.2 Loop Reversal on Seizure (LRS)

The MG9K 32 port Global Line Card is required.

75.3.3 Insert Tone on Coin Phone Termination (NOCOLL) on interworkings with PVG trunks

A VSP3 or VSP3-o card is required on the PVG.

75.4 Software Requirements or Dependencies

None.

75.5 Limitations and restrictions

All limitations and restrictions for the original LROA, LRS, and NOCOLL are still applicable with the exception of the supported hardware configurations as stated in this FN.

LRS and LROA are only supported on the MG9K GLC-32 card for IBN line types.

Playback of the pay phone recognition tone is only supported on the PVG for ANSI ISUP and ETSI ISUP trunk types. Originations from other trunk types on a PVG terminating to IBN lines with the NOCOLL option will not result in the playback of the pay phone recognition tone.

A VSP3 or VSP3-o card is required on the PVG in order for speech to be heard during the playback of the pay phone recognition tone. The use of VSP2 or older card will cause the calling party to only hear the tone playback for the first 13 seconds of the call. During this time, voice from the called party will not be transmitted.

The use of features such as call waiting, call hold, conference calling are not supported on lines with the LROA option. The use of these features may result in the normalization of the polarity reversal.

LRS and LROA are not supported on lines with the CEPT option.

75.6 Interactions

A line with a service which uses flash can also have the NOCOLL option provisioned. If the line flashes while the tone is being applied, the playback of the tone will be halted.

75.8 Glossary

Term	Description
ANSI	American National Standards Institute
ETSI	European Telecommunications Standards Institute
IBN	Integrated Business Network
ISUP	ISDN User Part
LROA	Loop Reversal On Answer
LRS	Loop Reversal on Seizure
NOCOLL	NO COLLect - a servord option associated with the Insert Tone on Coin Phone Termination feature
PVG	Passport Packet Voice Gateway
VSP	Voice Services Processor

Fault Management (FM)

Introduction

This chapter describes impacts to fault management, such as logs and alarms, for the features planned for this release. Only those features with fault-management impacts are listed.

Featid	Title
A00001919.AA09	CEPT Services Password Enhancement
A00001920.AA09	Metering OOS Enhancements
A00002252.AA04	MG9K Lines Preprovisioning
A00002364.AA08	CLI/RDN/OCN capture in Billing Record (CDR) for ANSI ISUP and HK ISUP on DRU GSP20
A00002702.AA15	No Line Origination Without Charging
A00002844.AA09	Excessive Metering Detection (EMD) Support for Metered Trunks
A00003147.AA09	DP Digit Reception Control
A00003696.AA15	G-ISUP Routing Enhancements
A00004565.AA15	Line to Moroccan ISUP V2 interworking

1.1 Fault management strategy

1.2 Fault management tools and utilities

1.3 CEPT100 Logs

1.3.1 Explanation

Log Title: CEPT100

Name: CEPTPW IS LOCKED REMOTELY

Description: CEPT100 log is generated when CEPT Features' Password (CEPTPW) is locked remotely usage of CEPT features which means subscriber exceeds the maximum wrong PIN entry for CEPTPW feature.

Event type:

1.3.2 Format

The following is the format for log report CEPT 100.

Figure 1 Formats of log reports

```
CEPT100 mmmdd hh:mm:ss ssdd INFO CEPTPW IS LOCKED REMOTELY

BASE DN: <base_dn>

ORIGINATING DN: <orig_dn>

ORIGINATING TRUNK: <orig_cpid>
```

The sample log report is as shown below.

Figure 2 Sample log report (CLI is available)

```
CEPT100 APR28 09:33:57 2909 INFO CEPTPW IS LOCKED REMOTELY

BASE DN: 1027835411

ORIGINATING DN: 1027835475

ORIGINATING TRUNK: CKT       ICISP2BA    0
```

In case of the calling DN unavailability such as, incoming trunk is NTLS01 R1 Trunk, ORIGINATING DN field is printed as empty.

Figure 3 .Sample log report (CLI is not available)

```
CEPT100 APR28 09:33:57 2909 INFO CEPTPW IS LOCKED REMOTELY

BASE DN: 1027835411

ORIGINATING DN:

ORIGINATING TRUNK: CKT      ICNTLS01BA    0
```

If the originating agent is in the same switch that means line to line call (basic call) performed while dialing DISA DN, the ORIGINATING TRUNK field is printed as empty.

Figure 4 .Sample log report (Line to Line call)

```
CEPT100 APR28 09:33:57 2909 INFO CEPTPW IS LOCKED REMOTELY

BASE DN: 1027835411

ORIGINATING DN: 1027835475

ORIGINATING TRUNK:
```

1.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
INFO CEPTPW IS LOCKED REMOTELY	Constant	Indicates a report of CEPT information
BASE DN	Digits (18 digits)	Identifies the SNPA + DN of the base agent.
ORIGINATING DN	Digits (18 digits)	Identifies the SNPA + DN of the originator.

Field	Value	Description
ORIGINATING TRUNK	CPID	Identifies the originator trunk (incoming trunk).

1.3.4 Action

No immediate action is taken.

1.3.5 Associated Operational Measurements or Performance Measurements

CPTRAFAL register in CEPTRA OM group, PWUSG and PWLOCK registers in CEPTPW OM group are pegged. Note that these OMs are pegged for another cases also not only for this scenario.

1.3.6 Additional information

N/A

1.4 CEPT101 Logs

1.4.1 Explanation

Log Title: CEPT101

Name: CEPTRA USAGE ATTEMPT

Description: CEPT101 log is generated when subscriber attempts to use supported CEPT features (ILR, IWUC, CEPTPW, CFD, CFU and CFB) from remote agents via CEPTRA.

Event type:

1.4.2 Format

The following is the format for log report CEPT 101.

Figure 5 Formats of log reports

```
CEPT101 mmmdd hh:mm:ss ssdd INFO CEPTRA USAGE ATTEMPT

BASE DN: <base_dn>

ORIGINATING DN: <orig_dn>

ORIGINATING TRUNK: <orig_cpid>

FEATURE: <requsted_ftr>

ACTION: <ftr_action>
```

Originating DN or Originating Trunk fields could be empty due to unavailable CLI or performing remote access in same switch (line to line call) respectively.

The sample log report is as shown below.

Figure 6 Sample log report (CLI is available)

```
CEPT101 APR28 09:33:57 2909 INFO CEPTRA USAGE ATTEMPT

BASE DN: 1027835411

ORIGINATING DN: 1027835475

ORIGINATING TRUNK: CKT       ICISP2BA    0

FEATURE: ILR

ACTION: INTER
```

In case of the calling DN unavailability such as, incoming trunk is NTLS01 R1 Trunk, ORIGINATING DN field is printed as empty.

Figure 7 .Sample log report (CLI is not available)

```
CEPT101 APR28 09:33:57 2909 INFO CEPTRA USAGE ATTEMPT

BASE DN: 1027835411

ORIGINATING DN:

ORIGINATING TRUNK: CKT      ICNTLS01BA    0

FEATURE: ILR

ACTION: INTER
```

If the originating agent is in the same switch that means line to line call (basic call) performed while dialing DISA DN, the ORIGINATING TRUNK field is printed as empty.

Figure 8 .Sample log report (Line to Line call)

```
CEPT101 APR28 09:33:57 2909 INFO CEPTRA USAGE ATTEMPT

BASE DN: 1027835411

ORIGINATING DN: 1027835475

ORIGINATING TRUNK:

FEATURE: ILR

ACTION: INTER
```

1.4.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
CEPTRA USAGE ATTEMPT	Constant	Indicates a report of CEPT information
BASE DN	Digits (18 digits)	Identifies the SNPA + DN of the base agent.
ORIGINATING DN	Digits (18 digits)	Identifies the SNPA + DN of the originator.
ORIGINATING TRUNK	CPID	Identifies the originator trunk (incoming trunk).
FEATURE	line_option	Identifies the which CEPT feature is requested.
ACTION	xla_ftr_function (ACT, DEACT, INTER, USAGE, PROG, DELETE)	Indicates the subscriber action on requested CEPT feature.

1.4.4 Action

No immediate action is taken.

1.4.5 Associated Operational Measurements or Performance Measurements

CPTRAATT register in CEPTRA OM group is pegged, and if subscriber is unsuccessful to program one of supported CEPT feature, CPTRAFAL register is pegged; otherwise in case of successful programming CPTRASUC register is pegged. Additionally, requested CEPT feature OM register is pegged according to success of result.Note that these OMs are pegged for another cases also not only for this scenario.

2.3 Logs

2.3.1 Explanation

Log Title: MTRDEASS DATA LOST

Name: MTR 150

Description: This log is generated when there is no space available in MTRDEASS table for a new entry.

MTRDEASS table is used to keep deassigned meters of subscribers. Adding a new tuple to MTRDEASS table is performed when MOG deletion is done. If there is no space for new entry, MTR 150 log is generated for each deassigned meter of subscriber.

Event type: Information

2.3.2 Format

MTR150 <mmmdd hh:mm:ss ssdd> INFO MTRDEASS DATA LOST

DN: <Directory Number> METER NAME: <Meter Name>

METER COUNT: <Meter Count> WRAP: <Wrap>

NO SPACE IS AVAILABLE IN MTRDEASS TABLE

Example:

MTR150 APR1 12:00:13 1234 INFO MTRDEASS DATA LOST

DN:7835401 METER NAME: LOCAL

METER COUNT: 00000012 WRAP:N

NO FREE SPACE IS AVAILABLE IN MTRDEASS TABLE

2.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
DN	Directory Number	Directory Number of subscriber
Meter Name	character set	Meter names that are defined in table MTRNAMES
Meter Count	Numeric	Meter count of deassigned meter which may be up to 99999999
Wrap	Y/N	Boolean to indicate whether meter counts has exceeded 99999999.

2.3.4 Action

MTR 150 log is an information log. It requires no immediate action.

2.3.5 Associated Operational Measurements or Performance Measurements

2.4 Related documentation

3: Fault Management (FM): A00002252

3.1 Fault management strategy

ActID 89009298 changes the format of MG9K LENs. Prior to SN06 (CCM19), an MG9K LEN had the following format.

<SITE> <0 to 511> <0 to 9> <subgroup, 0 to 10> <circuit, 0 to 99>

Because of the formula used to calculate terminal ids (TermID) in the core, the MG9K LEN reflects the TermID/terminal number and not the physical location of the MG9K line. For example, the following shows a QLEN on an SN05 MG9K LEN:

```
>QLEN CO10 00 0 01 67
------------------------------------------------------------------------------
LEN:     CO10  00 0 01 67
TYPE: SINGLE PARTY LINE
SNPA: 619
DIRECTORY NUMBER:     5210621
LINE CLASS CODE:      1FR
SIGNALLING TYPE:  DIGITONE
LINE TREATMENT GROUP:     0
LINE ATTRIBUTE INDEX:     0
CARDCODE:  RDTLSG    GND: N  PADGRP: NPDGP  BNV: NL MNO: N
PM NODE NUMBER     :    103
PM TERMINAL NUMBER :    168
OPTIONS:
DGT
------------------------------------------------------------------------------
```

Note that the terminal number is the LEN slot/circuit + 1.

The new MG9K LEN format reflects the physical location of the line.

<SITE> <frame, 0 to 511> <shelf, 0 to 9> <slot, 2 to 9, 14 to 21> <circuit, 0 to 47>

3.2 Fault management tools and utilities

As stated above ActID 89009298 changes the format of an MG9K LEN. Any OAM&P utility that uses LENs will require the new MG9K LEN format for MG9K lines, and any OAM&P utility that displays LENs will display MG9K LENs in the new format. A sampling of OAM&P that will require or reflect the new MG9K LEN follows. The complete list of changed utilities is essentially everything that uses LENs. Reference the Logs section below for MG9K LEN values and ranges.

- MAPCI: Posting MG9K lines via LEN at the LTP level will require the new format.
- LINE logs in logutil will use the new format.
- SERVORD will require the new format for MG9K lines (SESM).

3.3 Logs

3.3.1 Explanation

All LINE logs generated for MG9K lines will utilize the new LEN format.

3.3.2 Field descriptions

The new MG9K LEN contains the following fields.

Table 1 Field descriptions

Field	Value	Description
<site>	character vector	name of the site from table site
<frame or cf>	0 to 511	frame number in the office
<shelf or rs>	0 to 9	shelf number in the frame
<slot or ss>	2 to 9, 14 to 21	card slot number
<circuit or cc>	0 to 47	circuit on card

3.3.3 Action

Persons responsible for maintenance must realize the MG9K LEN format has changed. The crafts person can now use the log to pinpoint the physical location of the reported MG9K circuit.

8.3.3 Field descriptions

The Fields in the log format are displayed as per format below.

Table 1 Field descriptions

Field	Value	Description
from_time	Date and time	The time when the ISC point Code where captured for the current Log
to_time	Date and time	The time till the ISC point Code were captured for the give log.
pc	0 -16383	Originating ISC point Code received.
count	Integer range	Counter displaying the count of the respective point Code

Table 1 Field descriptions

Field	Value	Description
overflow	Integer range	Counts the number point codes from which the calls were received but are not printed in the log.

8.3.4 Action

Nil

8.3.5 Associated Operational Measurements or Performance Measurements

Nil

8.3.6 Additional information

This data collected form this log will be used for Statistical purpose. The printing of the log is controlled via office parameter CAPTUE_ISC_PC.

8.4 Logs : MCID600

8.4.1 Explanation

Log Title: MCID600

Name: Identification Data

Description: This log is an extension of the MCID logs, introduced for DTAG holding service. It provides information about the Called agent, calling number, called number and the date and time of the call.

Event type: When Holding is activated on the Telco and NANA message is received.

8.4.2 Format

8.4.2.1 Format

Below is the format for the MCID log.

```
AVST1_LOG MCID600 DEC04 <mmmdd hh:mm:dd> INFO IDENTIFICATION DATA
         Calling_Agent  : <originating agent>
         Called_Agent   : <terminating agent>
         Calling_Number : <calling number>
         Called_Number  : <called number>
         Date : <date>
         Time : <time>
```

8.4.2.2 Examples

```
AVST1_LOG MCID600 DEC04 22:23:01 0800 INFO IDENTIFICATION DATA
         Calling_Agent  : CKT     INTGATEISUP 628
```

```
Called_Agent    : CKT     TELKOMIUSP 632
Calling_Number : 033461111
Called_Number  : 033461112
Date : 05.12.2003
Time : 22:23:01
```

8.4.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
Originating Agent	-	CLLI name for the originating agent.
Terminating Agent	-	CLLI name for the terminating agent.
calling_number	digits	Calling party number
called number	digits	Called party number
Date	date	Date on which the call was made
time	time	time on which the call was made

8.4.4 Action

Nil

8.4.5 Associated Operational Measurements or Performance Measurements

Nil

8.4.6 Additional information

This log is currently a temporary place holder for the information to be displayed on the AVST, after receipt of NANA message. It can be further enhanced once the specifications are clear.

9.3 Logs

9.3.1 MTR161

9.3.1.1 Explanation

Log Title: MTR161

Name: BCKMTR DATAFILL

Description: The metering (MTR) subsystem generates this report if a corresponding MTRTARIF tuple could not be found for a received tariff index within ISUP CRG message.

Event type: Failure

9.3.1.2 Format

MTR161 mmmdd hh:mm:ss ssdd FAIL BCKMTR DATAFILL

LEN <len> DN <dn>

CALLED DR <dn>

NO TARIFF DATAFILL AVAILABLE

FOR THE RECEIVED TARIFF INDEX : <taridx>

LNET = <lnetval> MZONE = <mzoneval>

Example:

XXXX MTR161 DEC12 10:49:18 4900 FAIL BCKMTR DATAFILL

HOST 00 0 00 10 DN 1027835405

CALLED DR 7835406

NO TARIFF DATAFILL AVAILABLE

FOR THE RECEIVED TARIFF INDEX : 3

LNET = LOC MZONE = 0

9.3.1.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
FAIL BCKMTR DATAFILL	Constant	Indicates that backward metering failed because data was missing from the table MTRTARIF
len	Alphanumeric (up to 12 characters)	Gives the line equipment number (LEN) of affected equipment
dn	Numeric(up to 15 digits)	Provides the directory number (DN) associated with the LEN
dn	Numeric(up to 15 digits)	Identifies the contents of the digit register (the called number)
NO TARIFF DATAFILL AVAILABLE FOR THE RECEIVED INDEX	Constant	-
taridx	0 - 255	This field gives the received tariff index within CRG message
lnetval	Symbolic text	This field provides the identifier of the logical network of the call. The entry in the LNETWORK field is in table LNETWORK and specified in translation
mzoneval	0 - 63	This field provides the metering zone value of the call specified in translation

9.3.1.4 Action

This log indicates that the MTRTARIF tuple corresponding to the received tariff index in CRG message is missing. An MTRTARIF tuple using the received index value should be datafilled for charging the call.

9.3.1.5 Associated Operational Measurements or Performance Measurements

N/A

9.3.1.6 Additional information

N/A

9.3.2 MTR162

9.3.2.1 Explanation

Log Title: MTR162

Name: BCKMTR RATE MISMATCH

Description: The Metering (MTR) subsystem generates log report MTR162 for two cases:

- When a mismatch occurs between calculated software meter count and reported hardware metering pulse count for local type backward metering
- When a mismatch occurs between received meter count and reported hardware metering pulse count for distance type backward metering

Event type: Information

9.3.2.2 Format

MTR162 <mmmdd hh:mm:ss ssdd> INFO BCKMTR RATE MISMATCH

<cpid of origination> <DN of origination>

PULSE COUNT MISMATCH - NODE <node no> REPORTED INACCURATE CHARGE

BACKWARD METERING TYPE : <bcktmtr type>

LNETWORK: <LNET value> <tariff index>

<pulse info> PULSE COUNT: <CM meter count>

REPORTED PULSE COUNT: <Pulse count from PM>

Examples:

XXX MTR162 DEC13 19:05:44 5000 INFO BCKMTR RATE MISMATCH

HOST 01 1 15 11 DN 3923652407

PULSE COUNT MISMATCH - NODE 31 REPORTED INACCURATE CHARGE

BACKWARD METERING TYPE :LOCAL

LNETWORK: NATL TARIFF INDEX: 3

CALCULATED PULSE COUNT: 10

REPORTED PULSE COUNT: 16

XXX MTR162 DEC13 19:05:44 5000 INFO BCKMTR RATE MISMATCH

HOST 01 1 15 11 DN 3923652407

PULSE COUNT MISMATCH - NODE 31 REPORTED INACCURATE CHARGE

BACKWARD METERING TYPE : DISTANCE

LNETWORK: NATL

RECEIVED PULSE COUNT: 10

REPORTED PULSE COUNT: 16

9.3.2.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
BCKMTR RATE MISMATCH	Constant	Reports a meter count mismatch between the reported hardware meter pulse and the meter count calculated or accumulated at CM
CPID of origination	Host number	Identifies the line CP_ID of the originator
DN of origination	Numeric(up to 15 digits)	Identifies the DN number of the originator
PULSE COUNT MISMATCH	Constant	
node no	Numeric	PM node number
REPORTED INACCURATE CHARGE	Constant	
REPORTED INACCURATE CHARGE	Constant	

Table 2 Field descriptions

Field	Value	Description
BACKWARD METERING TYPE :	Constant	
bcktmtr type	local/distance	
LNET value	Symbolic text	This field provides the identifier of the logical network of the call. This field is specified in translation.
tariff index	0 to 255	Received tariff index within CRG message for local backward metering.
pulse info	CALCULATED/ RECEIVED	This field is set to 'CALCULATED' for local backward metering and to 'RECEIVED' for distance bacward metering
PULSE COUNT:	Constant	
CM meter count	Numeric	Calculated or accumulated meter count in CM
REPORTED PULSE COUNT:	Constant	
Pulse count from PM	Numeric	Reported pulse count generated for the call

9.3.2.4 Action

For local backward metering, check the metering tables and the static data for differences.

For distance backward metering, no action is necessary. The log is generated only for information.

9.3.2.5 Associated Operational Measurements or Performance Measurements

N/A

9.3.2.6 Additional information

The amount of meter count mismatch which causes MTR162 log generation is determined by the PULMISTH parameter in MTRSYSPM.

For distance metering, meter count mismatch can occur in case the originator line on hooks before all the received pulses are generated.

9.3.3 MTR113

9.3.3.1 Explanation

Log Title: METER DATAFILL

Name: MTR113

Description: The metering (MTR) subsystem generates this report when the system attempts to meter a call and one of the following tables has invalid or missing data:

- universal translations
- metering

Event type: Failure

9.3.3.2 Format

MTR113 mmmdd hh:mm:ss ssdd FAIL METER DATAFILL
LEN <len> DN <dn> CALLED DR <dn>
METERING DATAFILL ERROR
<rsntxt>
LNETWORK = <infotxt>

Example:
MTR113 MAY04 14:11:16 1886 FAIL METER DATAFILL
HOST 05 1 00 20 DN 9096210001
CALLED DR 9096210002
METERING DATAFILL ERROR.
NO MZONE DATAFILLED IN XLA
LNETWORK = LOCAL MZONE 63 0 0

9.3.3.3 Field descriptions

Table 3 Field descriptions

Field	Value	Description
LEN	Alphanumeric(up to 12 characters)	Gives the line equipment number (LEN) of affected equipment

Table 3 Field descriptions

Field	Value	Description
DN	Numeric(up to 15 digits)	Provides the directory number (DN) associated with the LEN
CALLED DR	Numeric(up to 15 digits)	Identifies the contents of the digit register (the called number)
rsntxt	Alphanumeric	Provides information on the condition that caused metering to fail
infotxt	Symbolic and numeric	The LNET and MZONE value for the call obtained from translation

9.3.3.4 Action

When this log is generated, the missing table datafill for the call stated in the rsntxt field should be completed in order to meter the call. Either translation or metering table datafills can be missing.

9.3.3.5 Associated Operational Measurements or Performance Measurements

N/A

9.3.3.6 Additional information

Only change for the existing log is a new rsntxt added for backward metering. The new rsntxt is as below:

BACKWARD METERING: NO LNET IN XLA

Figure 1 Example output for the new log text

```
MTR113 MAY04 14:11:16 1886 FAIL METER DATAFILL
HOST 05 1 00 20 DN 9096210001
CALLED DR 9096210002
METERING DATAFILL ERROR
BACKWARD METERING: NO LNET IN XLA
LNETWORK =      MZONE    63          0          0
```

An mtr 113 log with the new rsntxt is generated if no LNET datafill is found for a translation with BCKWMTR option.

1.1 Hardware and Software Requirements

1.2 Initial Configuration

1.3 Office/Subnet parameters (OP/SP) (CM & SESM)

1.4 Upgrade Impact

1.5 Data schema (DS) (CM, MIBS, RDB)

1.5.1 New/modified tables, MIBs, or Database Schema

ISERVOPT, XXCODE AND XXHEAD tables are modified.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ISERVOPT	CHANGED	UNCHANGED
ACCODE	CHANGED	UNCHANGED

1.5.2 Table/MIB/Remote Database Schema information

1.5.2.1 Name: ISERVOPT

This table is used to configure switch wide information for service related feature.

1.5.2.1.1 Functional description

This activity extends the ILRCLS tuple of the table ISERVOPT. A new subfield is added named SDT.

The extended part at ILRCLS tuple:

SDT: This field determines if special dial tone will be given to subscriber on offhook when he has ILR feature active. It can be datafilled as Y or N. Y indicates that SDT will be given and N indicates that ordinary dial tone will be given to subscriber on offhook. The default value for the field is N.

Figure 1 Example Datafill for ILRCLS tuple of ISERVOPT table

```
>table iservopt
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: ISERVOPT
>pos ilrcls
ILRCLS ILRCLS   Y  Y  N  $
```

1.5.2.1.2 Usage sequence and implications (CM Only)

1.5.2.1.3 There is no requirement to datafill tables in a specific order for ILR tuples.**Size**

1.5.2.1.4 Fields/OIDs

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ISERVOPT	0	1	

The following table lists fields/OIDs for ISERVOPT.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SDT	NEW		Y, N	Determines weather Special Dial Tone should be applied to costumer on offhook when he has ILR feature active or not.

1.5.2.1.5 Datafill example

1.5.2.3 Name: ILRCLASS

International Line Restriction Class

1.5.2.3.1 Functional description

This is the new table defined by activity A00002641. It contains the barring programs for the ILR line option.

1.5.2.3.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

1.5.2.3.3 Size

Table 5 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ILRCLASS	0	100	Memory is statically allocated

1.5.2.3.4 Fields

The following table lists fields for ILRCLASS.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Data dictionary type	Entry	Explanation and action
KEY	New	NIL	ILRCLASS_KEY	VECTOR OF UP TO 16 CHAR'S	ILR_CLASS is the name of the barring program. It is used by the ILR line option
RCODE	NEW	NIL	TWO_DIGIT_CODE	VECTOR OF UP TO 2 DIGITS	The RCODE identifies the barring program to the subscriber. It is unique in the table or empty.
IXLAOPT	NEW	NIL	ILRCLASS_IXLA_VECTOR	VECTOR OF UP TO 32 IXLA_CLAS'S	Contains a list of international translation classes to be barred by this program

Field	New or Changed	Subfield or refinement	Data dictionary type	Entry	Explanation and action
DNOPT	NEW	NIL	ILRCLASS_DN_VECTOR	VECTOR OF UP TO 10 VECTORS OF UP TO 15 DIGITS	Contains a list of DNs which are barred additionally to the international translation classes

1.5.2.3.5 Datafill example

The following example shows sample datafill for table ILRCLASS.

Figure 5 Example entry in table ILRCLASS

```
TABLE ILRCLASS
DIDD 02 (CNTL) (ICNTL) (INTL) $(09000) (09001)$
```

1.5.2.3.6 Table release history update

ISN07: Table was created

1.5.2.3.7 Supplementary information

Barring classes in this table can only be deleted if there is no line with ILR in the office referencing this tuple.

If during an ONP from a release before this activity there are no R-codes assigned in the ILRCLS tuple in table ISERVOPT the R-Code in table ILRCLASS is left empty.

1.5.2.3.8 Translation verification other tools

ILRCLASS does not use translation verification tools.

1.6 Service Orders (SO) (CM & SESM)

1.6.1 Service order change details

1.6.2 New commands

1.6.2.1 How service order commands are presented

None

1.6.2.2 How service order options are presented

1.6.2.2.1 Description

ILR line option has been defined with activity A59019295 CEPT International Line Restriction. This ILR line option enables a subscriber to control the origination line by identifying one of the restriction classes that restrict certain dialled numbers.

For detailed information about ILR line option, please refer to the activity A59019295 CEPT International Line Restriction.

Two new restriction classes are added with this activity. These are:

- **DNATL (Deny only NATional):** In this restriction class, only outgoing national calls will be restricted while other call classes are not.
- **DLCL (Deny only LoCaL):** In this restriction class, only outgoing local calls will be restricted while other call classes are not.

1.6.2.2.2 Example

1.6.2.2.3 Option prompts

Two new restriction classes have been added. Other parameters are not changed.

Table 7 System prompts for the ILR option

Prompt	Valid input	Description	Areas affected by prompts
OPTION	ILR	ILR Line Option	OPTION
ILRCLASS	NIL, DIDD, DAI, DNI, DNID, DABE, DSSV, DANID, DABLE, DNIC, DAIC, DANI, **DNATL, DLCL**	Line Restriction Classes	OPTION
ILRPW	NNNN	Pass Code (including 4 digits)	OPTION
ILRACTIVE	Y, N	Status Flag of ILR Line Option	OPTION

1.6.2.2.4 Line class code compatibility

Table 8 ILR compatibility to LCC

Line class code	Compatible?
IBN	YES

1.6.2.2.5 Assignability

The following functionalities apply to this option:

- set functionality: <yes or no>
- subset functionality: <yes or no>
- DN functionality: <yes or no>
- key functionality: <yes or no>

1.6.2.2.6 Option prerequisites

ILR has the following prerequisites:

CEPT line option must be assigned to IBN line before the assignment of ILR line option to this line.

2.5.2 Table/MIB/Remote Database Schema information

2.5.2.1 Name:ISERVOPT

This table is used to configure switch wide information for service related feature.

2.5.2.1.1 Functional description

This activity introduces a new tuple named as CEPT_ANN in ISERVOPT table and a new field SPECIAL_DIAL_TONE for the existing tuple CEPT_CFX.

Fields of the **CEPT_ANN** tuple ;

ANN_STATE: This field can be datafilled with one of the following;

- **DIAL_TONE** : For providing dial tone until the announcement returns to the beginning
- **SPECIAL_DIAL_TONE** : For providing special dial tone until the announcement returns to the beginning
- **IMMEDIATELY** : For providing the announcement immediately

CEPTANNS : This field consists of the following options

- **CFU :** For providing CFU warning announcement,
- **CFB :** For providing CFB warning announcement,
- **CFD :** For providing CFD warning announcement,
- **CDND :** For providing CDND warning announcement,
- **CDTA :** For providing CDTA warning announcement,
- **CDTO :** For providing CDTO warning announcement,
- **IWUC :** For providing WAKEUP warning announcement,

New field for the existing **CEPT_CFX** tuple ;

SPECIAL_DIAL_TONE : This field can be datafilled with one of the following;

- **Y** : The subscriber gets special dial tone when he goes off hook.
- **N** : The subscriber gets dial tone when he goes off hook.

2.5.2.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

2.5.2.1.3 Size

Table 2 Table size

2.5.2.1.6 Table release history update

This feature adds a new tuple named as **CEPT_ANN** in **ISERVOPT** table. The fields of this new tuple is used for providing the CEPT warning announcement when the subscriber goes off hook.

ANN_STATE field indicates the status of the announcement to be given and can be datafilled with one of **DIAL_TONE, SPECIAL_DIAL_TONE** or **IMMEDIATELY.**

CEPTANNS field is datafilled with the feature options which have warning announcements. These options are;

CFU, CFB, CFD, CDND, CDTA, **CDTO** and **IWUC**

Also a new field **SPECIAL_DIAL_TONE** is implemented for the existing tuple **CEPT_CFX**. This field is datafilled as **Y** or **N**. According to this datafill the user hears special dial tone or only normal dial tone when he goes off hook.

3.4 Upgrade Impact

3.5 Data schema (DS) (CM, MIBS, RDB)

3.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ISERVOPT	CHANGED	UNCHANGED

3.5.2 Table/MIB/Remote Database Schema information

3.5.2.1 Name: ISERVOPT

This table is used to configure switch wide information for service related feature.

3.5.2.1.1 Functional description

This activity introduces a new tuple named as CEPTPW in ISERVOPT table.

Fields of the **CEPTPW** tuple:

MAX_PIN_RETRY: indicates that how many times that subscriber can enter wrong pin sequentally while doing password related issues.

DEFAULT_PIN: indicates that the initial pin when administrator assigns this feature (CEPTPW) to the subscriber.

PIN_VALIDATION {BOOLEAN}: indicates that changing of unique password of which all digits are same as each other such as ‘2222 or 3333’ is disallowed or allowed. If it is set as ‘Y’, PIN validity is on and such PIN

programming is not allowed and subsciber will get NACK tone or related announcement; otherwise, tones are applied instead of announcements.

ANNOUNCE: indicates the announcements are used instead of tones (SDT, SIT) while subscriber actions to control password related CEPT features. Announcements will be applied to the subscriber if it is set as 'Y'; otherwise tones are used instead of announcements.

ANNOUNCE_STATE {SILENCE, AUD_ RNG}: indicates that the subscriber hears only silence or audible ringing until the announcement retuns to the beginning, then he listens related announcement. **This field is visible only if ANNOUNCE field is set as 'Y'; otherwise it is unvisible because there is no need to define announcement state since tones are used instead of them.**

CEPT_ANNCS {CEPT_ANNC_VECTOR}: indicates the used announcements in CEPTRA and CEPTPW features and the corresponding announcement trunk which is connected for the entered announcement name.

- The entered CLLIs should be an announcement trunk CLLI, otherwise an error message is occured "**DATAFILL FOR** *ENTERED_CLLI* **MISSING IN TABLE ANNS**" where ENTERED_CLLI is the provisioned CLLI.
- The announcement name should not be entered more than once, otherwise an error message is occured "**ANNOUNCEMENT TYPE (***announcement_ID***) IS DUPLICATED**", where announcement_ID (CHGPIN, LOCKED, VLDPIN, DNPIN, SCODE) is provisioned more than once.
- In case of non-existance of the announcement trunks in table ANNMEMS, there is a warning message "**Warning: DATAFILL FOR** *ENTERED_CLLI* **MISSING IN TABLE ANNMEMS**.", where ENTERED_CLLI is the provisioned CLLI.
- This feature supports only STANDART announcements, so in case of CUSTOM announcement provisioning, there occurs an error message "**ANNC CLLI** *ENTERED_CLLI* **MUST BE A STANDARD ANNOUNCEMENT**", where ENTERED_CLLI is the provisioned CLLI of which announcement type is CUSTOM.

3.5.2.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

3.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ISERVOPT	0	1	

3.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for ISERVOPT.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SOPTSKEY	NEW		CEPTPW	This is the key in ISERVOPT
OPTION	NEW		CEPTPW	This is the option name
MAX_PIN_RETRY	NEW		0 TO 9	If ‘0’ is entered, there is no limit for wrong pin entry.
DEFAULT_PIN	NEW		0000 TO 9999	Default PIN of CEPTPW
PIN_VALIDATION	NEW		Y, N	to control programming of a unique password of which digits are same as each other
ANNOUNCE	NEW		Y, N	for selecting announcements or tones are used
ANNC_STATE	NEW		SILENCE, AUD_ RNG	for selecting what subscriber hears (audible_ring or silence) while announcement returns to beginning.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action

CEPT_ANNC	NEW		{
			{
			CHGPIN,
			LOCKED,
			VLDPIN,
			DNPIN,
			SCODE
			},
			CLLI
			}
				Related announcements
				
				The announcements used by the CEPTRA & CEPTPW and corresponding announce CLLI can be entered for each ANNAME field. To terminate $ should be entered for this field.

3.5.2.1.5 Datafill example

- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
CEPTPW  CEPTPW                                   3 1111 Y N$
```

There is no restriction to remove this tuple, however since CEPTPW feature is working according the values in this tuple, CEPTPW can not activated/ programmed even if it is already on agent in case of this tuple removal.

Because of this reason, during CEPTPW tuple deletion there is a warning message displayed to warn the operator as:

"**WARNING: CEPTPW can be on any agent or default CEPT feature. WARNING: CEPTPW does not work without this tuple.**"

3.5.2.1.6 Table release history update

3.5.2.1.7 Supplementary information

3.5.2.1.8 Translation verification other tools.

3.6 Service Orders (SO) (CM & SESM)

3.6.1 Service order change details

3.6.1.1 LCC and options

CEPTPW line option is created with this activity and can be assigned to each IBN and ETSI ISDN BRI line via service order session.

3.6.1.1.1 Incompatible options

AUL is incompatible with CEPTPW option

Table 4 Meridian digital centrex feature assignment requirements

Feature	500 2500	IBN	MDC SET	ISDN SET	MDC Set ISDN Set Relationship							
					SET	SUBSET	KEY	DN	DEDKEY	LAMP	CODE	DISPLAY
CEPTPW	N	Y	N	Y				X				

This feature must be assigned to any key on which DN is defined.

3.6.2 New commands

3.6.2.1 How service order commands are presented

None

3.6.2.2 How service order options are presented

3.6.2.2.1 Description

CEPTPW option is introduced with this activity. CEPTPW option provides password enhancement for CEPT features by introducing a unique password for the subscriber. This password is valid for the features which are ILR (International Line Restriction) and OCB (Outgoing Call Barring).

Subscriber can use this unique password to control these features, and this password can be activated, changed and interrogated by subscriber. This unique password is used for existing password controlled features ILR, OCB and new feature CEPT Features Remote Access which is also introduced with this activity.

3.6.2.2.2 Example

CEPTPW could be assigned both IBN and ETSI ISDN BRI lines.

The administrator is authorized to assign, deassign, activate or deactivate CEPTPW to IBN and ETSI ISDN BRI lines via service order.

If CEPTPW line option is to be assigned to a subscriber not having CEPT option for IBN lines, a message "**Can not add CEPTPW option if line does not have CEPT option, firstly add CEPT line option**" is printed on screen.

The administrator should enter the status of the CEPTPW while performing servord actions.

The administrator can apply the following operations via Service Order:

Assignment: STATUS field should be entered as 'DEACTIVE'. This means subscriber should activate password by using password changing sequence.

'LOCKED' or 'ACTIVE' as STATUS can not be entered by administrator during assignment via Service Order. An error message ' **STATUS should be datafilled as DEACTIVE**'.

An example of CEPTPW assignment is shown in figure 5 and figure 6for IBN lines, figure 7 and 8 for BRI lines.

Deassignment: The CEPTPW option is deassigned form a line by using DEO (Delete Option) command via Service Order.

An example of CEPTPW deassignment is shown in figure 9 and figure 10 for IBN lines, figure 11 and 12 for BRI lines.

Administrator Activation: The administrator can activate the CEPTPW if and only if CEPTPW is in "LOCKED" state which means subscriber is prohibited to control password related CEPT features due to maximum wrong

pin entry. Otherwise, CEPTPW is not in 'LOCKED' state, an error message '**CEPTPW should be in LOCKED state**' is printed.

This action is performed when subscriber remembers the old PIN and wants to continue using this PIN as CEPT password.

An example of CEPTPW activation is shown in figure 13 and figure 14 for IBN lines, figure 15 and figure 16 for BRI lines.

Administrator Deactivation: The administrator may deactivate the CEPTPW on a subscriber line by using the CHF (Change Feature) command, this action can be performed if and only if CEPTPW is already in "ACTIVE" or "LOCKED" states. "LOCKED" state means subscriber is prohibited to control password related CEPT features due to maximum wrong pin entry. Otherwise, CEPTPW is not in "ACTIVE" or 'LOCKED' state, an error message '**CEPTPW should be in LOCKED or ACTIVE state**' is printed.

This action is performed when subscriber does not remember the old PIN and wants to use default password as CEPT password. However, subscriber should have activate the CEPTPW after this function because it is now in DEACTIVE state.

An example of CEPTPW activation is shown in figure 17 and figure 18 for IBN lines, figure 19 and figure 20 for BRI lines.

3.6.2.2.3 Option prompts

The system prompts for CEPTPW are shown in order of their appearance.

Table 5 System prompts for CEPTPW option

Prompt	Valid input	Description	Areas affected by prompt
OPTION	CEPTPW	CEPTPW line option	OPTION
STATUS	DEACTIVE, ACTIVE, LOCKED	state of the CEPTPW feature	OPTION

3.6.2.2.4 Line class code compatibility

Table 6 CEPTPW compatibility to LCC

Line class code	Compatible?
IBN	Yes
BRI	Yes

3.6.2.2.5 Assignability

The following functionalities apply to this option to ETSI ISDN BRI:

- set functionality: No
- subset functionality: No
- DN functionality: Yes
- key functionality: No

3.6.2.2.6 Option prerequisites

CEPTPW has the following prerequisites:

CEPT line option must be assigned to IBN line before the assignment of CEPTPW line option to this line.

3.6.2.2.7 Notes

None

3.6.2.2.8 Feature identification

Functionality: None

Feature number: A00001919

4.5 Data schema (DS) (CM, MIBS, RDB)

4.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
MTRDEASS	NEW	NEW

4.5.2 Table/MIB/Remote Database Schema information

4.5.2.1 Name: MTRDEASS

Deassigned meters table.

4.5.2.1.1 Functional description

MTRDEASS table is used to keep deassigned meters of subscriber to be able to restore them when a MOG reprovisioning is done.

A new tuple is added to this table when a MOG deletion is performed and tuple is deleted when agent is assigned with same MOG option.

4.5.2.1.2 Usage sequence and implications (CM Only)

User has no chance to datafill MTRDEASS table. Entries are added into this table internally. But in order to be able add a tuple into MTRDEASS table internally, world metering tables are needed to be available in office.

4.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MTRDEASS	0	65536	Memory is allocated automatically for each new tuple.

4.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for MTRDEASS table.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
DEAKEY	New	None	Up to 18 digits	Directory Number of subscriber
METER1	New	None	00000000 - 99999999	Meter Counts of deassigned meter
WRAP1	New	None	Y/N/-	Indicates whether counts are wrapped or not.
METER2	New	None	00000000 - 99999999	Meter Counts of deassigned meter
WRAP2	New	None	Y/N/-	Indicates whether counts are wrapped or not.
METER3	New	None	00000000 - 99999999	Meter Counts of deassigned meter
WRAP3	New	None	Y/N/-	Indicates whether counts are wrapped or not.
METER4	New	None	00000000 - 99999999	Meter Counts of deassigned meter
WRAP4	New	None	Y/N/-	Indicates whether counts are wrapped or not.
OUTDATE	New	None	YYYY/MM/DD HH:MM:SS	Date of deassigning meters

4.5.2.1.5 Datafill example

The following example shows sample datafill for table MTRDEASS.

```
TABLE MTRDEASS
TOP

DEAKEY      METER1 WRAP1 METER2 WRAP2 METER3 WRAP3 METER4 WRAP4 OUTDATE
-------------------------------------------------------------------------------------------------------------------------------
1027835401  00000012    N   00000015    N   00000020    N   --------    -   2003/03/31 16:03:56

BOTTOM
```

4.5.2.1.6 Table release history update

MTRDEASS table is introduced in ISN07. Maximum table size of 65536 tuples for deassigned meters.

4.5.2.1.7 Supplementary information

- Tuples of MTRDEASS table can not be changed or deleted.
- New tuples can not be added manually.
- When maximum number of tuples is reached, MTR150 log is generated.

4.5.2.1.8 Translation verification other tools

MTRDEASS table does not use translation verification tools.

4.6 Service Orders (SO) (CM & SESM)

N/A

4.7 Software optionality control (SOC)

There are two new SOC options that are introduced with this feature; *METR_Deassigned_Support* and *METR_Prevent_Sent_OOS*.

METR_Deassigned_Support is defined under METR SOC group. Functionality of feature is controlled with this SOC option. It is a state SOC, whose states can be ON or IDLE. When state of *METR_Deassigned_Support* is ON, feature becomes functional.

Table 4 METR_Deassigned_Support SOC

SOC option name:	METRxxxx
SOC option title:	METR_Deassigned_Support
SOC option control type:	state
New SOC option?	Yes
SOC option order code	METRxxxx

Table 4 METR_Deassigned_Support SOC

Option defined in DRU:	WT
Affected products:	ISN07

The second SOC, *METR_Prevent_Sent_OOS*, is defined under METR SOC group and it is used to decide sending recycled meters to OOS or not. For Bangladesh, recycled meters should not be sent to OOS. So when this SOC is ON, sending recycled meters to OOS is prevented.

Table 5 METR_Prevent_Sent_OOS SOC

SOC option name:	METRxxxx
SOC option title:	METR_Prevent_Sent_OOS
SOC option control type:	state
New SOC option?	Yes
SOC option order code	METRxxxx
Option defined in DRU:	WT
Affected products:	ISN07

There is a dependency between these two SOC options. *METR_Deassigned_Support* can not be made IDLE when *METR_Prevent_Sent_OOS* is ON. Furthermore, *METR_Prevent_Sent_OOS* can be made ON only when *METR_Deassigned_Support* is ON.

4.9 Command interface changes

4.9.1 Directory: <directory name/MAP level>

4.9.2 Command: DEASSCLR

Clear Deassigned Meters

4.9.2.1 Command type: NON-MENU

4.9.2.2 Command target: BRISC, XACORE

4.9.2.3 Command availability: NONRES

4.9.2.4 Command description

This command is used to clear all content of MTRDEASS table.

4.9.2.5 Command syntax

There is no parameter for DEASSCLR command.

Table 6 DEASSCLR command parameters and variables

Command	Parameters and variables
DEASSCLR	N/A

4.9.2.6 Qualifications and warnings

A warning message is displayed to inform user about loss of deassigned meter data.

4.9.2.7 Responses

After displaying warning message, user is asked to confirm his/her request since executing command results with loss of deassigned meter data.

4.9.2.7.1 Confirmation Message

Y: content of MTRDEASS table is cleared

N: user gives up clearing the content of MTRDEASS table.

Table 7 MAP outputs with associated meanings and actions

Command: DEASSCLR
WARNING: All deassigned meters data will be lost. Do you wish to continue? Please confirm (“Yes”, “Y’, “No”, “N”). **Meaning:** This response warns user that all tuples in MTRDEASS table are cleared and this result with loosing meter counts of deassigned meters. **System or user actions:** User should select Yes/Y to continue or No/N to give up.

4.9.2.8 Example

Table 8 Usage examples for DEASSCLR command

Description of task:	
Description of task	Clear all content of MTRDEASS table

4.11 Configuration Walkthrough

N/A

5: Configuration (CN): A00001921

5.1 Data schema (DS) (CM, MIBS, RDB)

5.1.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TRKOPTS	CHANGED	UNCHANGED
ISERVOPT	CHANGED	UNCHANGED

5.1.2 Table/MIB/Remote Database Schema information

5.1.2.1 Name: TRKOPTS

Trunk options

5.1.2.1.1 Functional description

Table TRKOPTS is used to give trunk group specific options to trunk groups. LDA trunk group option gives ability of toll call ringing to the terminating exchange office.

If CLI is not available then the toll call recognition is done depending on the value of ALERT_NO_CLID of the new tuple LDA in table ISERVOPT.

If it's value is Y, then distinctive alerting is provided to the terminating line.

If it's value is N, feature processing will continue to check table TRKOPTS for an alerting indication. Incoming trunk CLLI with LDA option is searched in the table TRKOPTS for toll call determination. If found incoming trunk CLLI with LDA option in table TRKOPTS is ETSI ISUP V2+,the value of CHECK_NOA field is seen. If this field is datafilled as Y, local terminating exchange checks the Nature of Address (NOA) indicator of called party number parameter in received ISUP_IAM message and applies toll call ringing patterns to terminating line if NOA is equal to:

- National Number
- International Number

If this CHECK_NOA field is datafilled as N, toll call ringing pattern is applied to the terminating line.

5.1.2.1.2 Usage sequence and implications (CM Only)

The current datafill sequence will be changed to datafill LDA option to the trunk group. TRKGRP and TRKSGRP datafill of this trunk group must be done before LDA option is datafilled to the table TRKOPTS.

5.1.2.1.3 Size

Unchanged.

5.1.2.1.4 Fields/OIDs

The following table lists fields/OIDs for table TRKOPTS

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTKEY	Changed	CLLI TRKOPTS_OPTION	CLLI name of any incoming or 2-way trunks. LDA	Trunk group name datafilled in table CLLI and LDA trunk group option.
OPTINFO	Changed	OPTION CHECK_NOA	LDA BOOLEAN	LDA trunk group option and CHECK_NOA field with boolean entry.

5.1.2.1.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

Figure 1 Example of datafilling of the LDA tuple in TRKOPTS table

```
> table trkopts
>add
SOPTSKEY:
>icrsisupba    lda
OPTION:
>lda
CHECK_NOA:
>y
```

Figure 2 The View of LDATuples in TRKOPTS Table

```
>table trkopts

 OPTKEY                                                    OPTINFO
-------------------------------------------------------------------------
 ICRSISUPBA      LDA                                  LDA        Y
```

5.1.2.1.6 Table release history update

ISN07 ACT.A00001921 “CIS Toll Call Ringing”

5.1.2.1.7 Supplementary information

A new field “CHECK_NOA” is added to the existing tuple related with “LDA” feature in table TRKOPTS.

CHECK_NOA : If CLLI is a ETSI ISUP V2+ trunk group, this field is checked to apply toll ringing to the terminating line. If this field is Y, local terminating exchange checks the Nature of Address (NOA) indicator of called party number parameter in received ISUP_IAM message and applies toll call ringing patterns to terminating line if NOA is equal to:

- National Number
- International Number

If this CHECK_NOA field is datafilled as N, toll call ringing pattern is applied to the terminating line.

The default value of CHECK_NOA field will be N.

LDA option can be given to only incoming trunks. If the administrator tries to give this option to outgoing trunks, the following error is displayed.

“ LDA option can only be assigned to incoming and 2W trunks”

To datafill LDA option in TRKOPTS, table TRKSGRP must be datafilled for the CLLI before. If this condition is not satisfied, the following error is generated.

“ Trunk not datafilled in Table TRKSGRP.

Datafill Table TRKSGRP with the CLLI first.”

5.1.2.1.8 Translation verification other tools

N/A.

5.1.2.2 Name: ISERVOPT

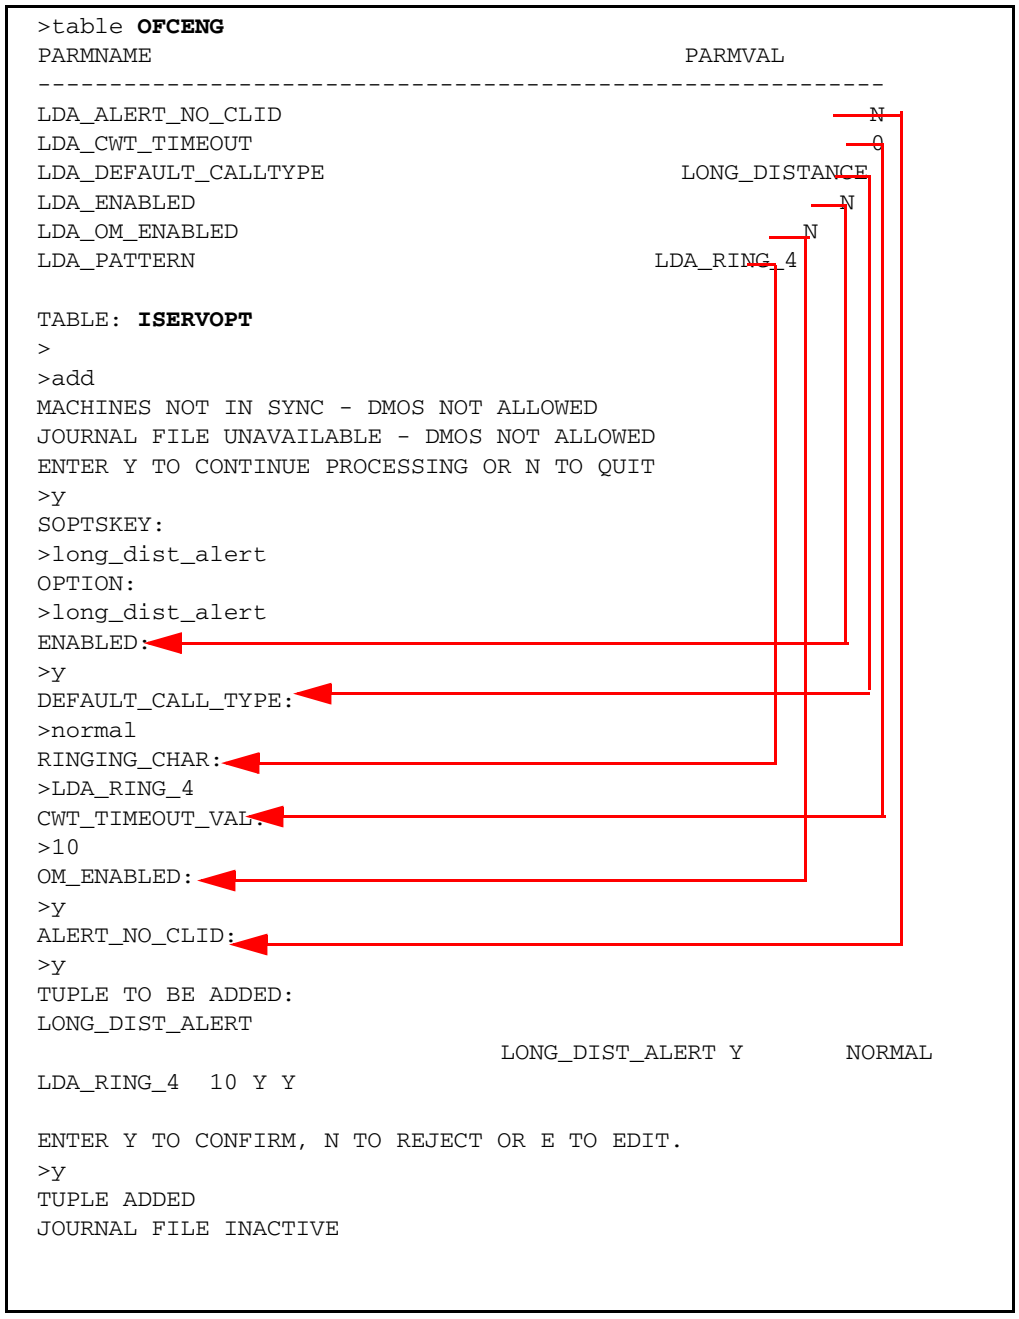
This table is used to configure switch wide information for service related feature.

5.1.2.2.1 Functional description

This activity introduces a new tuple named as LONG_DIST_ALERT in ISERVOPT table.

Existing office parameters LDA_ENABLED, LDA_DEFAULT_CALLTYPE, LDA_OM_ENABLED, LDA_ALERT_NO_CLID, LDA_CWT_TIMEOUT, LDA_PATTERN in table OFCENG are moved to the new tuple "LONG_DIST_ALERT" in table ISERVOPT.

Table 3 Remove from table OFCENG to table ISERVOPT



```
>table OFCENG

```

5.1.2.2.6 Table release history update

ISN07 ACT.A00001921 “CIS Toll Call Ringing”

5.1.2.2.7 Supplementary information

A new tuple with a symbol “LONG_DIST_ALERT” is added to the table ISERVOPT to provide CIS market requirement related with “Toll Call Ringing” feature. The sub fields of this new tuple will be “ENABLED”, “DEFAULT_CALL_TYPE”, “RINGING_CHAR”, “CWT_TIME_OUT_VAL”, “OM_ENABLED” and “ALERT_NO_CLID”.

ENABLED : This is moved from table OFCENG-LDA_ENABLED parameter to table ISERVOPT under new ENABLED field of new tuple. This field is used to activate or deactivate LDA functionality office-wide. If it is set

to N, LDA functionality is available to none of the lines in the switch. Its default value will be N.

DEFAULT_CALL_TYPE : This is moved from table OFCENG-LDA_DEFAULT_CALL_TYPE parameter to table ISERVOPT under new DEFAULT_CALL_TYPE field of new tuple. This field is used to determine the call type if it is not able to identify the type of the call by screening through the table LDASCRN. It takes the value of NORMAL or LONG_DISTANCE. Its default value will be LONG_DISTANCE.

RINGING_CHAR : This is moved from table OFCENG-LDA_PATTERN parameter to table ISERVOPT under new RINGING_CHAR field of new tuple. This field is used to determine which toll ringing pattern is applied to the terminating line.

CWT_TIME_OUT_VAL : This is moved from table OFCENG-LDA_CWT_TIMEOUT parameter to table ISERVOPT under new CWT_TIME_OUT_VAL field of new tuple. This field gives the operating company the ability to force a toll call that is call waited for more than a specified duration to be routed to the NTRS treatment. The parameter allows the operating company to specify the length of this duration. Its default value will be 0.

OM_ENABLED : This is moved from table OFCENG-LDA_OM_ENABLED parameter to table ISERVOPT under new OM_ENABLED field of new tuple.This field turns OM pegging ON or OFF. Its default value will be N.

ALERT_NO_CLID : This is moved from table OFCENG-LDA_ALERT_NO_CLID parameter to table ISERVOPT under new ALERT_NO_CLID field of new tuple.This field allows the operating company to specify whether distinctive alerting should be provided to the terminating line when the CLID is not delivered along with the incoming call. If ALERT_NO_CLID is set to ‘N’, the feature will not provide distinctive alerting by default, and will continue feature processing by checking table TRKOPTS for an alerting indication. Its default value will be N.

6.5.2 Table/MIB/Remote Database Schema information

6.5.2.1 Name: ISERVOPT

A new tuple to table ISERVOPT will be added: zonetoll_scrn. An example datafill is as: zonetoll_scrn zonetoll_scrn Y Y.

6.5.2.1.1 Functional description

It is used to activate zone toll screening for the office in CIS network. Hence, zone toll office is also defined. It is accessed with the Table Control operations. Tuple can be added, deleted or changed.

Zone toll screening active field determines whether office is a zone toll office or not.

Line screening active field determines whether office makes screening for lines connected to itself or not.

When this tuple does not exist, it is accepted to have values NO (not a zone toll office).

6.5.2.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

6.5.2.1.7 Supplementary information

NONE

6.5.2.1.8 Translation verification other tools

NONE

6.5.2.2 Name: CISCPCPR

A new table CISCPCPR (Commonwealth of Independent States Calling Party Category PRivileges) is defined. Table is not initialized to default values. This table is only used at CIS network.

6.5.2.2.1 Functional description

Table is used to define network and service access privileges in terms of CPC value and call translation class. It is accessed with the Table Control operations. Add, delete and changing a tuple is possible.

When a tuple for a CPC type does not exist, no restrictions are applied to calls having that CPC type.

When a tuple for a CPC type exists, call translation classes it has are allowed to for calls.

6.5.2.2.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

6.5.2.2.3 Size

Table 4 Table size

6.5.2.3 Name: CUSTSTN

A new field to table CUSTSTN is added: CPC. Tuple can be added, deleted or changed. An example datafill is as: CUST783 CPC CPC **ORD.**

6.5.2.3.1 Functional description

It is used to assign CPC value to customer groups. It is accessed with the Table Control operations.

6.5.2.3.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

6.5.2.3.3 Size

Table 7 Table size

6.5.2.4 Name: CPCOPMAP

CPCOPMAP is a table of CPC line options feature (A59032371.AA07).

6.5.2.4.1 Functional description

Table CPCOPMAP translates CPC values to ISUP CPC and R2 categories (CP activity). Table datafill can be changed with change (CHA) table control command.

In this feature, a new CPC value (RSRVD) is added to range of CPC values. And this value is also used in CPCOPMAP table. However, table CPCOPMAP is not used in CIS network.

Default values loaded at IPL for RSRVD are shown in datafill example section below.

6.5.2.4.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

6.5.2.4.3 Size

Table 10 Table size

```

7.6 Service Orders (SO) (CM & SESM)

7.6.1 Service order change details

7.6.1.1 LCC and options

Two new line options, LCMI and TCMI, are introduced by this feature. LCMI and TCMI line options are not DN based.

7.6.1.1.1 LCMI and TCMI Line Options

Two new line options TCMI and LCMI are introduced. CMI line options are boolean options, which means it has no subfields. For ETSI BRI lines, they are compatible with point to point and point to multi point mode.

CMI line options can be assigned/deassigned to subscriber via SERVORD software. When TCMI/LCMI line options are assigned to a line, datafill will be added into one of tables IBNLINES (for IBN lines) or KSETLINE (for ETSI BRI lines) depending on the line type.

- **Administrator Assignment**

CMI line options can be assigned to IBN lines and ETSI BRI lines through SERVORD software via ADO (Add Option) and NEW commands. TCMI and LCMI line options can be assigned to IBN and ETSI BRI subscribers only. In order to assign TCMI or LCMI option to a line, line should have a MOG or FPS option. Please note that FPS option is supported for IBN lines only.

```
ado $ <DN> TCMI $

ado $ <DN> LCMI $
```

If line has none of MOG or FPS options, new CMI otion can not be assigned to the subscriber. In this case system will reply with one of the following error messages.

```
"Cannot add LCMI since line does not have MOG or FPS option"

"Cannot add TCMI since line does not have MOG or FPS option"
```

If MOG and CMI options are intended to be assigned at the same time, MOG option should be given first so that the feature metering of administrative assignment is done correctly. Please refer to section 2.2.5 Feature Metering for more information on feature metering.

- **Administrator Deassignment**

The administrator may deassign CMI option by using the DEO (Delete Option) and OUT commands through SERVORD software.

```
deo $ <DN> TCMI $

deo $ <DN> LCMI $
```

- **Deassignment of MOG Option**

If both MOG and CMI options are intended to be deassigned from a line at the same time, CMI option must be deassigned first, so that feature metering of administrator deassignment is done correctly. Please refer to section 2.2.5 Feature Metering for more information on feature metering.

```
deo $ <DN> LCMI MOG $
```

```
deo $ <DN> TCMI MOG $
```

MOG option deletion is prohibited if line has TCMI and/or LCMI option. The following error message is generated:

```
"Error: Cannot delete MOG since TCMI requires MOG option."

"Error: Cannot delete MOG since LCMI requires MOG option."
```

- **Deassignment of FPS Option**

FPS option deletion is prohibited if line has LCMI and/or TCMI line options. The following error message is generated FPS option is attempted to be deassigned from a line which has LCMI/TCMI line option.

```
"Error: Cannot delete FPS since TCMI requires FPS option."

"Error: Cannot delete FPS since LCMI requires FPS option."
```

- **Example**

7.6.1.1.2 Line class code compatibility

LCMI and TCMI Line options are compatible with IBN and ISDNKSET LCCs.

7.6.1.1.3 Option prerequisites

LCMI and TCMI line options require MOG or FPS option on the subscriber.

7.6.1.1.4 Interaction with EST command

LCMI and TCMI line options cannot be added via EST (Establih hunt group) command, since addition of MOG and FPS by EST is not allowed and LCMI and TCMI line options require MOG or FPS previously assigned (Sec. 13.6.1.1.3).

7.6.1.1.5 Interaction with SWAP and CLN Commands

Last call and last feature meter counts of FPS and MOG agents are preserved during SWAP and CLN operations. In other words, last call and last feature meter counts of old len will be moved to new len during SWAP and CLN.

Behavior of SWAP and CLN commands were not like this before this activity, since idea of keeping last call and last feature meter counts was being introduced by this activity. But please note that this enhancement does not change the general behavior of CLN and SWAP commands when SVBI0033 SOC in IDLE, or appiled to agents that does not have MOG or FPS assigned when SVBI0033 SOC is ON.

The following example shows the behavior of CMI service when SWAP command is applied to FPS agent (Behavior of MOG agent is the same). Please note that CMI SOC is ON.

Figure 17 SWAP Example (FPS Subscriber)

7.6.2 New commands

N/A

7.7 Software optionality control (SOC)

A new state SOC, SVBI0033 SOC, is introduced by this feature.

7.7.1 SVBI0033 SOC

In order to control the officewide functionality of the TCMI and LCMI services, one state SOC is designed, which is given the name SVBI0033 SOC. SVBI0033 SOC has two states: SOC_ON and SOC_IDLE. In the SOC_ON

state, SVBI0033 SOC is fully functional. In the IDLE state, the LCMI and TCMI features can be provisioned, but the usage of the service is not enabled.

Table 6 SVBI0033 SOC

SOC Group	SVBI
SOC Option Name	SVBI0033
SOC Option Title	Call Meter Inquiry
SOC Option Control Type	State
New SOC Option?	Yes
Option defined in DRU	WT20
Affected Products	DMS100 - MMP

Default state of SOC is IDLE.

Activation/Deactivation of SOC is done by password control. The password is unique for each office.

However, datafilling tables (i.e IBNXLA, IBNLINES, CUSTSTN, etc.) does not depend on the state of the SOC. This means that datafills could be done even if SVBI0033 SOC is not ON. But note that CMI services can not be activated if SVBI0033 SOC is not ON.

For all MOG and FPS subscribers, last call and last feature meter counts are initialized when state of SVBI0033 SOC is changed to IDLE.

State of SVBI0033 SOC can not be changed from ON to IDLE while one of DUMP, METERING RESTORE, or METERING LINE RECOVERY processes. One of following error messages are displayed:

“DUMP is in progress“

“METER LINE RECOVERY process is in progress“

“METER RESTORE is in progress“

and change state is aborted.

7.8 Element Management

N/A

7.9 Command interface changes

7.9.1 Directory: <directory name/MAP level>

N/A

7.9.2 Command: MTRCOUNT

MTRCOUNT command, which displays the software meter counts of the subscriber having MOG, is enhanced in order to display the last call meter count, last feature meter count, and the total of all meter counts assigned to the subscriber when SVBI0033 SOC is ON.

When MTRCOUNT command is used with TRUNK/LMG (Line Meter Group) option, when SVBI0033 SOC is ON, TOTAL of assigned meter counts of trunk/lmg is displayed.

But general structure and operation of the command remains the same.

7.9.2.1 Command type: NON-MENU

7.9.2.2 Command target:

BRISC, XACORE.

7.9.2.3 Command availability:

RES

7.10 Security
N/A

7.11 Configuration Walkthrough
N/A

8: Configuration (CN): A00001935

8.1 Hardware and Software Requirements

Not applicable.

8.2 Initial Configuration

Not applicable.

8.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable. This feature leverages a previously defined gateway profile for CICM gateways.

8.4 Upgrade Impact

8.4.1 Dump and Restore

Not applicable.

8.4.2 Element Management Upgrade

Not applicable.

Upgrade of CICM data to SN07 is not supported. SN06.1 and SN06.2 data must be removed and then re-added in SN07 in order to leverage any flow through capabilities delivered by this feature. Both new and old format CICM data will be allowed to co-exist in SN07, however the SN06 format CICM will be managed generically (same as in SN06).

8.5 Data schema (DS) (CM, MIBS, RDB)

8.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
LGRPINV	CHANGED	UNCHANGED
LNINV	CHANGED	UNCHANGED

8.5.2 Table/MIB/Remote Database Schema information

8.5.2.1 Name: LGRPINV

Logical Group Inventory

8.5.2.1.1 Functional description
In SN06, the field GRPTYPE of the table LGRPINV is set to “C” for non-MG9K logical groups and to “S” for MG9K logical groups. In SN07, the unused value “M” will be used in this field to indicate that the logical group is assigned to a CICM gateway.

8.5.2.1.2 Usage sequence and implications (CM Only)
The table LGRPINV is provisioned by the SESM. No manual datafill or change is allowed. Manual changes to this table will cause data corruption.

8.5.2.1.3 Size
Not applicable.

8.5.2.1.4 Fields/OIDs
Not applicable. This feature will use an already defined and supported field.

8.5.2.1.5 Datafill example
The following example shows sample datafill for table LGRPINV.

Preprovisioned MG(e.g MG9K) : SLOA 00 0 GWC 3 S $

Preprovisioned CICM gateways : CICM 00 0 GWC 3 M $

Non preprovisioned MG(e.g. Cable MG) : LG 01 0 GWC 3 C $

8.5.2.1.6 Table release history update
Not applicable.

8.5.2.1.7 Supplementary information
Not applicable.

8.5.2.1.8 Translation verification other tools
Not applicable.

8.5.2.2 Name: LNINV
Line Inventory

8.5.2.2.1 Functional description
In SN07, the field SUBGROUP and CIRCUIT fields of the table LNINV are refined based on their associated LGRPINV GRPTYPE field.

The SUBGROUP/SLOT and CIRCUIT fields are defined as follows:

```
(GRPTYPE C) LINE SUBGROUP {0 TO 10}

(GRPTYPE M) LINE SUBGROUP {0 TO 10}

(GRPTYPE S) SLOT          {2-9, 14-21}
```

```
(GRPTYPE C) CIRCUIT   {0 TO 99}

(GRPTYPE M) CIRCUIT   {0 TO 99} FOR SUBGROUP {0 TO 10}

(GRPTYPE S) CIRCUIT   {0 TO 47}
```

8.5.2.2.2 Usage sequence and implications (CM Only)

Entries will be automatically configured by SESM at CICM gateway provisioning time.

8.5.2.2.3 Size

Not applicable.

8.5.2.2.4 Fields

The following table lists fields for LNINV.

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SUBGROUP	Changed	M	{0 to 10}	
CIRCUIT	Changed	M	{0 to 99}	

8.5.2.2.5 Datafill example

The following example shows sample datafill for table LNINV.

Preprovisioned MG(e.g MG9K) line:

SLOA 00 0 21 31 RDTLSG PKLNL HASU N NL N NIL

Preprovisioned CICM gateway line:

International - HOST 00 0 10 22 **GWLEBS** NPDGP HASU N NL N NIL

North America - HOST 00 0 10 22 **RDTEBS** NPDGP HASU N NL N NIL

Non preprovisioned MG(e.g. Cable MG) line:

LG 01 0 00 00 RDTLSG PKLNL WORKING N NL N NIL

8.5.2.2.6 Table release history update

Not applicable.

8.5.2.2.7 Supplementary information

Not applicable.

8.5.2.2.8 Translation verification other tools

Not applicable.

8.5.2.3 Gateway and Termination Name Mapping to Logical Group and Line Equipment Number (LEN)

8.5.2.3.1 Functional description

The definitions of the various portions of the logical group, LEN, GW and termination names are defined to provide a visual correlation between their respective values.

8.5.2.3.2 GW

<GWNAME>-<NNN>, e.g. "CICM-142"
where:

<GWNAME> = String
CICM Identifier (configurable)

<NNN> = 000-511
The CICM gateway identifier.

8.5.2.3.3 Logical Group

<SITE> <NNN> <G>, e.g. "HOST 142 0", “CICM 142 0”, etc.
where:

<SITE> = SITE name chosen at gateway provisioning time. Matching gateway name to SITE name is not an enforced rule, however it is suggested that a “CICM” SITE name be defined in the XACore and that all CICM gateway provisioning utilize the “CICM” SITE name. “HOST” is used in this example simply to show the flexibility of the provisioning system (any SITE name may be chosen at CICM gateway provisioning time). Actual utilization of the “HOST” SITE name is NOT recommended as it may collide with legacy LCM definitions in the XACore.

<NNN> defined as in GW name.

<G> = 0-2
The group number. Each gateway will span 3 logical groups.

8.5.2.3.4 Termination/Endpoint

tp/<G>/<TTtt>, eg. "tp/0/1013"
where:

<G> defined as in the logical group.

<TT> = 00-10
<tt> = 00-99, except where <TT> = 10 in which case <tt> = 00-22.

8.5.2.3.5 LEN Format

<SITE> <NNN> <G> <TT> <tt>, eg “CICM 142 0 10 13"
where:

<SITE>, <NNN>, <G>, <TT>, and <tt>, defined as in gateway and logical group.

8.5.2.3.6 Logical Group and LEN to GW and Termination Correlation for a CICM Processor Pair

- One CICM "GW" mapped to Three logical groups in the XACore.
- 3069 CICM terminations mapped to the three logical group's LENs in the XACore.
- 3 terminal numbers are reserved in the XACore (one for each logical group) for maintenance/messaging.

Table 3 LEN to GW, Termination and Terminal Number Mapping

LEN	GW	Termination	Terminal Number
CICM 142 0 00 00	CICM-142	tp/0/0000	1 **
CICM 142 0 00 01	CICM-142	tp/0/0001	2
:	:	:	:
CICM 142 0 10 22	CICM-142	tp/0/1022	1023
CICM 142 1 00 00	CICM-142	tp/1/0000	1 **
CICM 142 1 00 01	CICM-142	tp/1/0001	2
:	:	:	:
CICM 142 1 10 22	CICM-142	tp/1/1022	1023
CICM 142 2 00 00	CICM-142	tp/2/0000	1 **
CICM 142 2 00 01	CICM-142	tp/2/0001	2
:	:	:	:
CICM 142 2 10 22	CICM-142	tp/2/1022	1023

** Terminal number 0 is reserved in the XACore for the maintenance/ messaging terminal on the node. The formula currently used by the XACore to convert non-MG9K LEN to terminal number is as follows:

terminal number = ((100 * TT) + tt + 1)

8.6 Service Orders (SO) (CM & SESM)

8.6.1 Service order change details

No new service orders are introduced by this feature. CICM client specific SERVORD+ commands (NEW, EST, OUT, etc.) may contain USERID and PASSWD option flags which will be stripped from the command by SESM before being processed by the CM.

8.6.1.1 How service order options are presented

8.6.1.1.1 Description

The USERID and PASSWD options are used to specify CICM client information in the various SERVORD+ commands which create or modify lines. These options may be provisioning using any valid key number on the CICM client, however they are not key specific options (they affect the entire set).

8.6.1.1.2 Example

Figure 1 Example of the USERID option in no-prompt mode for SERVORD+

```
NEW $ 6137210992 M5216 PRADEFAULT 0 0 1 N LATA1 9 CICM 142 0 10 13 1 7 USERID 12345(
```

8.6.1.1.3 Line class code compatibility

USERID to LCC compatibility

Table 4 <abbreviated option name> compatibility to LCC

Line class code	Compatible?
M5216	Yes
All others	No (but not functionally enforced)

8.6.1.1.4 SERVORD+ Exceptions

No SERVORD+ command exclusions although some servord commands will not be integrated with CICM provisioning. The non-integrated commands will still function normally from a SERVORD+ and XACore perspective.

8.7 Software optionality control (SOC)

Not applicable.

8.8 Element Management

8.8.1 New/modified GUIs

The CS2000 Management Tools GUI is modified by this feature. Specifically the Associate Media Gateway dialog box will be altered.

The profile name “CICM” which was added in SN06 to the list of profiles that appears in the Gateway profile name drop down list, will be unmodified in SN07. The Reserved terminations for this profile will be 3069.

CICM gateways provisioned prior to SN07, will have their profile names changed to an obsolete value (eg. “OBSOLETE_CICM”) to allow them to continue to function within the various provisioning systems as they did in SN06.

8.9 Command interface changes

Not applicable.

8.10 Security

Not delivered under this feature.

8.11 Configuration Walkthrough

The general order of provisioning is as follows:

- Provision table SITE in XACore. SITE values for CICM should be retricted from use for other logical group types..
- Provision table PADDATA in XACore (PKLNL and PKNIL entries).
- Provision CICM gateway in SESM (autocreates LGRPINV and LNINV entries).
- Configure CICM gateway at the CICM-EM (some data is retrieved from SESM via OSSGate)
- Execute SERVORD+ commands via OSSGate (service is assigned to LENs in LNINV).
- USERNAME and PASSWD data is configured (via OSSGate SERVORD+) on the CICM client to enable service.

9: Configuration (CN): A00002053

9.1 Hardware and Software Requirements

None.

9.2 Initial Configuration

For the software initialization, the datafills given in the section 2.2.4 of the FN document are required for this feature.

9.3 Office/Subnet parameters (OP/SP) (CM & SESM)

9.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management)
OFCVAR	FTR_RECORD_FOR_ICR_OPT	NEW	CM

9.3.2 Parameter information

9.3.2.1 FTR_RECORD_FOR_ICR_OPT

Feature Record for ICR Option

9.3.2.1.1 Functional description

The parameter FTR_RECORD_FOR_ICR_OPT is newly created by this activity to make the FTR record generation optional for metered actions of ICR feature option. When the subscriber having ICR option is charged for the ICR operations (assignment / deassignment / usage), the FTR record is generated only if the FTR_RECORD_FOR_ICR_OPT is Y in table OFCVAR.

9.3.2.1.2 Provisioning rules

The parameter FTR_RECORD_FOR_ICR_OPT is set to Y to generate FTR record for the charged ICR operations of subscribers (as shown in Figure 1). But, beside of this parameter setting, all required datafill should exist for the generation of the FTR record. Please refer to the Section 2.2.4 in the FN document for the FTR record provisioning.

Figure 1 The new OFCVAR parameter

```
> Table OFCVAR

PARMNAME PARMVAL
-----------------------------
FTR_RECORD_FOR_ICR_OPT      Y
```

When the parameter FTR_RECORD_FOR_ICR_OPT is changed from “N” to “Y”, the following message is displayed;

“WARNING: FTR record generation for ICR feature is activated”

Opposite when FTR_RECORD_FOR_ICR_OPT is changed from “Y” to “N” the following message is displayed;

“WARNING: FTR record generation for ICR feature is deactivated”

9.3.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
TRUE (Y)	FALSE (N)	FALSE (N)

9.3.2.1.4 Activation
Change activation is immediate. No additional action is necessary.

9.3.2.1.5 Dependencies
None.

9.3.2.1.6 Verification
After changing this parameter, it is enough to check it by ‘pos’ command in the table OFCVAR.

9.3.2.1.7 Memory requirements
No memory impact.

9.3.2.1.8 Parameter release history update
A new parameter addition.

10: Configuration (CN): A00002101

10.1 Hardware and Software Requirements

This feature is supported only on SX05 DTCO/DTCO2 processor.

10.2 Initial Configuration

N/A

10.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

10.4 Upgrade Impact

N/A

10.5 Data schema (DS) (CM, MIBS, RDB)

10.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TABLE TRKOPTS	CHANGED	UNCHANGED

10.5.2 Table/MIB/Remote Database Schema information

10.5.2.1 Name: TRKOPTS

Trunk Options Table

10.5.2.1.1 Functional description

Table TRKOPTS is used to assign a trunk option which is supported for a certain trunk type.

10.5.2.1.2 Usage sequence and implications (CM Only)

No change due to this feature.

10.5.2.1.3 Size

No change due to this feature.

10.5.2.1.4 Fields/OIDs

Below you can find the field information related to the new option, TELETAXE_ITX_SIG, in the table TRKOPTS.

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTKEY	Changed	Multiple with CLLI and OPTION	CLLI and TELETAXE_ITX_SIG	TELETAXE_ITX_SIG is datafilled with CLLI to which assigned this option at OPTKEY field.
OPTINFO	Changed	OPTION	TELETAXE_ITX_SIG	TELETAXE_ITX_SIG is datafilled at OPTION field after entry of the OPTKEY field.

10.5.2.1.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

TABLE: TRKOPTS

TOP

OPTKEY OPTINFO

2WFTUPAB TELETAXE_ITX_SIG TELETAXE_ITX_SIG

10.5.2.1.6 New Error Messages

Below you can find the error messages generated during making datafill verification related to the option TELETAXE_ITX_SIG.

Figure 1

"TELETAXE option not supported for the ISUP variant assigned to this trunk group in table TRKSGRP.
Error reported by option TELETAXE_ITX_SIG with VPROC operation defined in module FTUPDEF."

Generated when the operator tries to assign TELETAXE_ITX_SIG option to an ETSI ISUP trunk of which variant is other than France.

Figure 2

**"TELETAXE option not supported for the signalling data selector assigned to this trunk group in table TRKSGRP.
Error reported by option TELETAXE_ITX_SIG with VPROC operation defined in module FTUPDEF."**

Generated when the operator tries to assign TELETAXE_ITX_SIG option to a CAS trunk.

Figure 3

**"TELETAXE option is supported only on IBN incoming and two-way trunk types.
Error reported by option TELETAXE_ITX_SIG with VPROC operation defined in module FTUPDEF."**

Generated when the operator tries to assign TELETAXE_ITX_SIG option to an OG SSUTR2 trunk or a PRI trunk.

Figure 4

"OPTIONS are not the same in key and optinfo fields”

Generated when the operator tries to assign an option other than TELETAXE_ITX_SIG to a trunk datafilled with TELETAXE_ITX_SIG at OPTKEY field of the table TRKOPTS.

Figure 5

"TELETAXE_NOSIG option previously assigned to this trunk."

Generated when the operator tries to assign TELETAXE_ITX_SIG option to an IC/2W SSUTR2 trunk to which previosly TELETAXE_NOSIG assigned.

Figure 6

"TELETAXE_ITX_SIG option previously assigned to this trunk."

Generated when the operator tries to assign TELETAXE_NOSIG option to an IC/2W SSUTR2 trunk to which previosly TELETAXE_ITX_SIG assigned.

Figure 7

"SSUTR2_TAX_GEN option previously assigned to this trunk."

Generated when the operator tries to assign TELETAXE_ITX_SIG option to an IC/2W SSUTR2 trunk to which previosly SSUTR2_TAX_GEN assigned.

Figure 8

"TELETAXE_ITX_SIG option previously assigned to this trunk."

Generated when the operator tries to assign SSUTR2_TAX_GEN option to an IC/2W SSUTR2 trunk to which previosly TELETAXE_ITX_SIG assigned.

Figure 9

"WARNING - the peripheral must be equipped with an SX05 processor for this parameter to be functional"'

Generated when the operator tries to assign TELETAXE_ITX_SIG option to an IC/2W SSUTR2 trunk which is datafilled on peripheral is not equipped with an SX05 processor.

10.10 Security

N/A.

10.11 Configuration Walkthrough

N/A.

11: Configuration (CN): A00002173

11.1 Hardware and Software Requirements

Software requirements in order to work with this activity are as follows:

- SOC SOSM0001 must be activated.
- Tables MPCLINK, TRKGRP, SOSMMPC, SOSMTRK and SOSMPARM must have been datafilled before receiving START SOSM command from CP.

Hardware Requirements are as follows:

- SOSM system uses conference ports from a common pool in the DMS MMP. If all ports are used by SOSM, normal 3-way or 6-way calls will be denied. Similarly, if all ports are used by 3-way or 6-way calls, SOSM monitored calls will be unable to obtain an MCL connection.
- For X25 Messaging Interface, MPC cards must have been installed in DMS office (IOC (NT1x89) or IOM).
- Maximum 224 SPC trunks are needed for transmission of call content.

11.2 Initial Configuration

- Turn on SOC SOSM0001.
- Install MPC cards to the DMS MMP office.
- Datafill SPC trunks and SPC lines.
- If X25 messages will be sent over trunk, make the hardware connection of MPC links to the SPC trunks over modems and datafill the table SPCCON based on hardware connection that is used for SOSM.
- Datafill table SOSMMPC.
- Datafill table SOSMTRK appropriately.
- Modify parameters in SOSMPARM table if required.

11.3 Office/Subnet parameters (OP/SP) (CM & SESM)

None

11.4 Upgrade Impact

11.4.1 Dump and Restore

When a software upgrade is taking place via a One Night Process (ONP), all static SOSM data (data in tables SOSMTRK, SOSMMPC, MPCLINK, MPC, SOSMPARM and TRKGRP) is transferred to the new software load

automatically. Dynamic tables are not transferred. After SWACT, appropriate message is sent to CP and SOSM is stopped.

11.4.2 Element Management Upgrade

NA.

11.5 Data schema (DS) (CM, MIBS, RDB)

11.5.1 New tables Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SOSMMPC	NEW	NEW
SOSMTRK	NEW	NEW
SOSMPARM	NEW	NEW

11.5.2 Table Schema information

11.5.2.1 Name: SOSMMPC

System of Operative Searching Measures (SOSM) MPC table

11.5.2.1.1 Functional description

This table provides the mechanism to allocate MPC cards for the DMS-Control Point X.25 Interface of SOSM feature. For each pair of channels, a tuple is added to this table.

11.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

Table MPC

Table MPCLINK

Table SOSMMPC

11.5.2.1.3 Size

11.5.2.1.4 Fields

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SOSMMPC	0	8	This table is dynamically sized at tuple add time.Memory is automatically allocated for 8 SOSMMPC entry.

Table 3 Table SOSMMPC field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
Key (SOSMLINK)	New	None	0 to 7	The name of the key field is SOSMLINK. None default value. This field is used to index the table by the SOSM X.25 application. Up to eight pairs of channels may be datafilled
DATACH1	New	None	MPCNO (0 to 255) LNKNO (0 to 3)	None default value. Specifies the MPC card and Link number to be used for DMS to CP Data Channel 1 (CP Command Interface)
DATACH2	New	None	MPCNO (0 to 255) LNKNO (0 to 3)	None default value. Specifies the MPC card and Link number to be used for DMS to CP Data Channel 2 (Call Information Channel)

11.5.2.1.5 Datafill example

The following example shows sample datafill for table SOSMMPC. Accessable only via SOSMCONF CI increment with a valid password

Table 4 Table SOSMMPC example datafill

RNBDLINK	CHNL1	CHNL2
0	3 2	3 3
1	4 2	4 3

SOSMMPC table entries can be edited only if the following criteria are met:

- SOSM0001 is ON,
- SOSMCONF CI increment is accessed with a valid password, and
- SOSM system is inactive (not activated by a CP command).

11.5.2.1.6 Table release history update
This table is added to the system by activity A00002173 in ISN07 context.

11.5.2.1.7 Supplementary information
NA.

11.5.2.1.8 Translation verification other tools
SOSMMPC does not use translation verification tools.

11.5.2.2 Name: SOSMTRK
System of Operative Searching Measures (SOSM) Trunk table

11.5.2.2.1 Functional description
This table is used by the SOSM system for mapping generic trunk groups into dedicated SOSM trunks. Each entry identifies a trunk group to be used for the PCM-30 group of MCLs.

11.5.2.2.2 Usage sequence and implications (CM Only)
Tables must be datafilled in the following sequence :

Table CLLI

Table TRKGRP

Table TRKSGRP

Table TRKMEM

Table SOSMTRK

11.5.2.2.3 Size

Table 5 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SOSMTRK	0	8	Memory is statistically allocated for 8 SOSMMPC entry. This table consumes 16 bytes in protected memory.

11.5.2.2.4 Fields

Table 6 Table SOSMTRK field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
Key : SOSMGRP	New	None	0 to 7	This field identifies the PCM-30 group number.
CLLI	New	None	Common Language Name (CLLI)	This field identifies the trunk group to be used by SOSM. The CLLI entered here must correspond to a valid trunk datafilled in tables CLLI, TRKGRP, TRKSGRP and TRKMEM.

11.5.2.2.5 Datafill Example

The following example shows sample datafill for table SOSMTRK. SOSMTRK table is accessable only via SOSMCONF CI increment with a valid password.

Table 7 Table SOSMTRK example datafill

SOSMGRP	CLLI
0	SOSMGRP0
1	SOSMGRP1

SOSMTRK table entries can be edited only if the following criteria are met:

- SOSM0001 is ON,
- SOSMCONF CI increment is accessed with a valid password, and
- SOSM system is inactive (not activated by a CP command).

11.5.2.2.6 Table release history update
This table is added to the system by activity A00002172 in ISN07 context.

11.5.2.2.7 Supplementary information
NA.

11.5.2.2.8 Translation verification other tools
The following example shows the output from FINDREF when it is used to verify SOSMTRK.

11.5.2.3 Name: SOSMPARM
System of Operative Searching Measures (SOSM) Parameters

11.5.2.3.1 Functional description
Table SOSMPARM is used by SOSM system for saving SOSM specific parameters.

11.5.2.3.2 Usage sequence and implications (CM Only)
SOSMPARM is not referenced by any other tables.

SOSMPARM does not use any other tables.

11.5.2.3.3 Size
Table 8 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SOSMPARM	3	3	This table currently contains three tuples, and its memory is allocated statistically.

11.5.2.3.4 Fields

Table 9 Table SOSMPARM field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PARMNAME (Key)	New	None	TOLL_EXIT_CODE INTRAZONAL_CODE or INTERNTNL_CODE	This is the name of the SOSM specific parameter.
PARMVAL	New	PARMSEL	TOLL, INTRAZONAL, INTERNTNL	This subfield is the selector which determines the refinement used for the corresponding SOSM parameter. TOLL is valid only for TOLL_EXIT_CODE. INTRAZONAL is valid only for INTRAZONAL_CODE INTERNTNL is valid only for INTERNTNL_CODE parameters.
		PARMSEL : TOLL EXIT_CODE	Digit {0 to 9}	Toll exit code consists of a single digit between 0-9.
		PARMSEL : INTRAZONAL EXIT_CODE	Digit {0 to 9}	Zonal exit code consists of a single digit between 0-9.
		PARMSEL : INTERNTNL EXIT_CODE	2 digits of each {0 to 9}	International exit code consists of two digits, each between 0-9.

11.5.2.3.5 Datafill example

The following table shows default datafill for table SOSMPARM. This table is accessible only via SOSMCONF CI increment with a valid password.

Table 10 Default SOSMPARM tuples

PARMNAME	PARMVAL	
	PARMSEL	EXIT_CODE
TOLL_EXIT_CODE	TOLL	8 (1 digit is allowed for this parameter)
INTRAZONAL_CODE	INTRAZONAL	2 (1 digit is allowed for this parameter)
INTERNTNL_CODE	INTERNTNL	10 (1-2 digit(s) are allowed for this parameter)

Data in SOSMPARM table can not be deleted. Furthermore, addition of new tuples with table editing commands is prevented by SOSM software.

It is not permitted to change PARMSEL for the default parameters (TOLL_EXIT_CODE, INTRAZONAL_CODE and INTERNTNL_CODE) by table editing commands.

SOSMPARM table entries can be edited only if the following criteria are met:

- SOSM0001 is ON,
- SOSMCONF CI increment is accessed with a valid password, and
- SOSM system is inactive (not activated by a CP command).

11.5.2.3.6 Table release history update

This table is added to the system by activity A00002172 in ISN07 context.

11.5.2.3.7 Supplementary information

NA.

11.5.2.3.8 Translation verification other tools

NA.

11.6 Service Orders (SO) (CM & SESM)

NA.

11.7 Software optionality control (SOC)

Table 11 SOC

SOC option name:	SOSM - System of Operative-Searching Measures
SOC option title:	System of Operative-Searching Measures
SOC option control type:	STATE
New SOC option?	YES
SOC option order code	SOSM0001
Option defined in DRU:	WT
Affected products:	MMP

Software Optionality Control is provided for SOSM feature. SOC order code is SOSM0001.

While SOSM0001 is OFF:

- Any message received from CP are ignored. (DMS MMP neither executes the command nor sends response to the control point at this state.)
- Access to SOSM configuration CI level is not permitted even if the valid password is entered.
- SOSM configuration tables SOSMMPC, SOSMTRK and SOSMPARM can be reached only within SOSMCONF CI level. Since access to SOSMCONF CI level is not permitted at this state, access to SOSM configuration tables is not possible while SOSM0001 is OFF.

Activation of SOSM0001:

- It is not allowed to turn SOSM0001 to ON state, while there is any other active NBD flavor (DNBD, etc...) on the switch.

While SOSM0001 is ON:

- Activation of any other Network Broadcast Delivery (NBD) application is not allowed after turning SOSM0001 to ON state.
- Access to SOSM configuration tables via SOSMCONF CI level is possible.
- Commands received from CP are processed as described in the previous sections.

Deactivation of SOSM0001:

- Turning SOSM0001 OFF deactivates all SOSM applications on the exchange. SOSM is stopped, and all dynamic data within MCL and monitoring order databases are cleared.
- SOSM system password is reset with the initial password.
- Data in SOSMMPC, SOSMTRK and SOSMPARM tables remains unchanged. However, access to these tables are prevented as indicated above.

11.8 Element Management

None.

11.9 Command Interface changes

11.9.1 Directory: SOSMCONF

System of Operative Searching Measures (SOSM) Configuration

11.9.1.1 Directory description

Access to SOSM configuration tables, namely, SOSMMPC, SOSMTRK and SOSMPARM is restricted. The only way to reach these tables is with this new CI level called SOSMCONF (SOSM Configuration).

11.9.1.2 Accessing directory: CI

11.9.1.2.1 Command Interface**Access to directory or MAP level and return to CI**

To access SOSMCONF from CI level, enter SOSMCONF.

While accessing to SOSMCONF, the user is asked for the access password. Appropriate access password should be provided when it is requested..

To return to the CI environment, enter quit.

12: Configuration (CN): A00002252

12.1 Hardware and Software Requirements

Act ID 89009298 functionality is resident in the CCM19 and CNA19 software layers in the core. While this functionality may be resident, it is dormant unless features 89008782 and 89008025 are present. These features reside in MG9K EM and SESM respectively. Feature 89008025 specifically provisions MG9K lines with the new LEN format.

Initial Configuration This specific feature does not require changes to initial configuration.

12.2 Office/Subnet parameters (OP/SP) (CM & SESM)

The functionality of office parm RDT_SUCC_AUTOCREATE_LNINV is altered with this feature for MG9K lines. For MG9K lines the value of ACTIVE is ignored, and no autoprovisioning of table LNINV is allowed. DEFAULT_MNO is used for MG9K lines.

12.3 Upgrade Impact

This feature does not directly impact a system upgrade. However, upgrading a Succession MG9K GW network from SN05 to SN06 does require special handling. Essentially, existing MG9K LENs and terminal ids will be migrated to use the new LEN format. All of this will be driven by MG9K EM and will be completely transparent for a core SN05 to SN06 upgrade. Please refer to 89008025 documentation for more info.

12.3.1 Dump and Restore

This feature does not impact dump and restore on upgrades.

12.3.2 Element Management Upgrade

This feature does not impact EMs.

12.4 Data schema (DS) (CM, MIBS, RDB)

12.4.1 New/modified tables, MIBs, or Database Schema

The previously unused field GRPTYPE in Table LGRPINV is used in this feature to denote a specific type of LGRP. The values for GRPTYPE are S, M, and C. This feature disables SERVORD autoprovisioning for GRPTYPE S for groups on shelves 0 to 3; refer to the FN section for more info. Currently,

GRPTYPE S will denote a set of LGRPs that for now will only include MG9K LGRPs.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
LGRPINV	CHANGED	UNCHANGED
PADDATA	CHANGED	UNCHANGED

Table PADDATA will have two new pad groups which will be used by gateway lines. Pad group PKLNL will be used by gateways lines with LGRP GRPTYPE set to S. PKNIL will be used by gateway lines with LGRP GRPTYPE set to C.

12.4.2 Table/MIB/Remote Database Schema information

12.4.2.1 Name: LGRPINV

Logical Group Inventory Table

12.4.2.1.1 Functional description

Table LGRPINV contains logical group information for gateway lines.

12.4.2.1.2 Usage sequence and implications (CM Only)

SESM will provision table LGRPINV for LGRPs with GRPTYPE S.

12.4.2.1.3 Size

Table size is not changed via this feature.

12.4.2.1.4 Fields

The following table details the GRPTYPE field in table LGRPINV.

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GRPTYPE	Changed	None	S C M	S denotes a specific set of LGRPs that includes MG9K LGRPs. C denotes all other LGRPs M is currently not used.

12.4.2.1.5 Datafill example

The following example shows sample datafill for table LGRPINV.

```
    GRPNO       SRVRNAME GRPTYPE                    LGRPOPTS
------------------------------------------------------------------------
CO10  00 0        GWC   1              S                        $
```

12.4.2.1.6 Table release history update
A GRPTYPE value of S denotes a specific set of LGRPs that include MG9K LGRPs. A GRPTYPE value of C is used for all other gateway LGRPs. GRPTYPE M is currently not used.

12.4.2.1.7 Supplementary information
None.

12.4.2.1.8 Translation verification other tools
Table LGRPINV is not displayed for TRAVER.

12.4.2.2 Name: PADDATA
Pad Data Table

12.4.2.2.1 Functional description
Table PADDATA contains attenuation and boost settings for different device interactions. Pads are applied to devices in order to balance volume levels.

12.4.2.2.2 Usage sequence and implications (CM Only)
Pad groups PKLNL and PKNIL will be defined and will appear in table PADDATA in the nodatafill base load.

12.4.2.2.3 Size
Pad value settings will be created for the two new pad groups. New table size will be within the allocated size.

12.4.2.2.4 Fields
Fields will not change with these changes.

12.4.2.2.5 Datafill example
The following example would apply a 3db attenuation to a line with pad group PKLNL and a 3db gain to a line with pad group STDLN whenever the lines are connected:

```
PKTLN   STDLN   3L   3G
```

12.4.2.2.6 Table release history update
Pad group PKLNL is to be used only by gateway lines that have LGRP GRPTYPE set to S. Pad group PKNIL is to be used only by gateway lines that have LGRP GRPTYPE set to C. Gateway lines will automatically have the appropriate pad group assigned when they are provisioned.

12.4.2.2.7 Supplementary information
None.

12.4.2.2.8 Translation verification other tools
Table PADDATA is not used in TRAVER.

12.5 Service Orders (SO) (CM & SESM)

12.5.1 Service order change details
Act ID 89009298 disables SERVORD autoprovisioning for gateway lines that have an LGRP type of S (table LGRPINV field GRPTYPE) that reside on shelves 0 to 3. Autoprovisioning provisions or deletes datafill to table LNINV for specific SERVORD+ commands received from SESM. SESM will preprovision table LNINV at the time of node provisioning; reference documentation for Act ID 89008025. This functionality supercedes the setting of office parm RDT_SUCC_AUTOCREATE_LNINV which is applicable to ther types of line gateways. Previously, office parm RDT_SO_AUTOCREATE_LNINV was used for setting autoprovisioning for gateway lines (SN05). RDT_SUCC_AUTOCREATE_LNINV was introduced in SN06 specifically for gateway line autoprovisioning. Neither office parm is applicable for MG9K gateway lines.

Pad group PKLNL will be assigned to gateway lines that have LGRP GRPTYPE set to S via SERVORD. Pad group PKNIL will be assigned to gateway lines that have LGRP GRPTYPE set to C via SERVORD. Attempts to change the pad group via SESM or SERVORD will not be successful. The appropriate gateway pad group will be assigned. However, the pad group can be changed in table LNINV via table control if need be.

12.6 Software optionality control (SOC)
This feature has no effect on SOC.

12.7 Element Management
This feature has no effect on EM. However, Act ID 89008782 does.

12.8 Command interface changes
Act ID 89009298 changes the format for gateway LENs that have GRPTYPE set to S in table LGRPINV. Please refer to the FN for detailed information on the change. Consequently, any CI command that requires a LEN for input must use the new format for a gateway line with GRPTYPE set to S in table LGRPINV. Likewise, any gateway LEN with GRPTYPE set to S in table LGRPINV display via a CI command (or MAPCI) will be displayed in the new format.

12.9 Security
None.

12.10 Configuration Walkthrough

Please reference Act ID 89008782 documentation.

13: Configuration (CN): A00002291

14.3 Data schema (DS) (CM, MIBS, RDB)

14.3.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ISERVOPT	CHANGED	UNCHANGED

14.3.2 Table/MIB/Remote Database Schema information

14.3.2.1 Name: ISERVOPT

International Service Option

14.3.2.1.1 Functional description

Operating company personnel uses table ISERVOPT to configure switch information for service-related features. This table groups multiple related pieces of data in single entry.

Each service that uses this table provides a subfield related to that service. Each subfield asks for information in a format relevant to the service. This table accepts an entry if operating company personnel enter a service that is in the load.

14.3.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

14.3.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ISERVOPT	0	100	Static memory allocation

14.3.2.1.4 Fields/OIDs

The following table lists fields/OIDs for ISERVOPT:.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SOPTSKEY	New		RGC	
SOPTSVAR	Changed	OPTION	RGC	Registered Call
	New	AUTO_DEACT _TIMEOUT	5 to 30 minutes	AUTO_DEACT_TIME OUT determines the maximum timeout between RGC activation and automatic feature deactivation. The default value is **10**

14.3.2.1.5 Datafill example

The following example shows sample datafill for table ISERVOPT.

SOPTSKEY SOPTSVAR

RGC RGC 10

Note: *This datafill indicates that DMS supports RGC feature and that RGC feature can be automatically deactivated in 10 minutes.*

14.3.2.1.6 Table release history update

The following information was added:

— entry RGC added to field SOPTSKEY

— entry of selector RGC with subfield AUTO_DEACT_TIMEOUT added to field SOPTSVAR

14.3.2.1.7 Supplementary information

NONE.

14.3.2.1.8 Translation verification other tools

ISERVOPT does not use translation verification tools.

14.4 Service Orders (SO) (CM & SESM)

14.4.1 Service order change details

14.4.1.1 LCC and options

- New line option RGC is applied to the following line class code (LCC): IBN and ISDNKSET and is added to table LCCOPT.

Figure 3 Example of RGC tuples in table LCCOPT

```
 IBN  (ACB) (AR) ..... (VMI) (WML) (WUCR) (RGC) $

ISDNKSET (AFC) (AUL) (CFB)..... (VMI) (WML) (WUCR) (RGC) $
```

- LIST options NOT compatible with new RGC option is added to OPTOPT table:

Figure 4 Example of RGC tuple in table OPTOPT

```
RGC (ACB) (AR) (AUL) (DLH) (DNH) (GIC) (MAN) (MLH) (MPB) (WML)$
```

14.4.2 Servord commands for RGC line option

14.4.2.1 How service order options are presented

14.4.2.1.1 Description

A new RGC (Registered Call) line option is added.

RGC option enables the subscriber on the assigned line automatic redialing to the last valid call (that passed translation and routing in the switch).

For ISDN set, the RGC option is assigned on a per-key.

14.4.2.1.2 Option prompts

Table 4 System prompts for RGC option

Prompt	Valid input	Description	Areas affected by prompt
OPTION	RGC	Specifies the option to assign to the line	
TIMEOUT	{1 TO 20} seconds	Specifies the timeout in seconds between off-hook and starting dialing after feature activation	

14.4.2.1.3 Example of service order prompt

3651804 *— last dialed number that was stored after activation was done.*
5 *— timeout between off-hook and starting dialing*

14.4.2.1.6 Notes

The following notes apply to RGC option:

Field ACTIVE in tables IBNFEAT and KSETFEAT can not be changed via Servord and is updated after feature activation/deactivation is done ONLY.

14.5 Configuration Walkthrough

Following are the provisioning steps for the RGC performance:

- Datafill RGC tuple in table ISERVOPT (“14.3.2.1.5 Datafill example”).
- Datafill table IBNXLA for feature/activation (“14.2.1 RGC Datafill for Activation / Deactivation”)

- Servord:
  - — Add RGC option to the line (“14.4.2 Servord commands for RGC line option”)

Next steps are needed to establish RGC successful call:

- Perform successful call from the RGC line to line/trunk
- Off hook a phone and dial the RGC activation code (*66)
- Verify that the confirmation tone is heard
- On hook the phone
- Off hook, wait for timeout defined in table IBNFEAT / KSETFEAT to establish call to the last dialed destination number

15: Configuration (CN): A00002319

15.1 Hardware and Software Requirements

- MMP20.
- PDTC (with the ETSI ISUP Hardware configuration) or Shrink CPM are required.

15.2 Initial Configuration

The following initial definitions should be supported:

15.2.1 Datafill for IBN and BRI subscribers.

Figure 1 Datafill for IBN subscriber without LAMP.

15.3 Upgrade Impact

15.3.1 Dump and Restore

No DUMP and Restore reformat algorithm is required for this feature.

15.3.2 Element Management Upgrade

N/A

15.4 Data schema (DS) (CM, MIBS, RDB)

15.4.1 New/modified tables, MIBs, or Database Schema

The PXRTE table will be modified. The CNDSEL of the CND route selector will be enhanced with VMI CND route condition.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
PXRTE	CHANGED	UNCHANGED

15.4.2 Table/MIB/Remote Database Schema information

15.4.2.1 Name: PXRTE

Prefix code Route.

15.4.2.1.1 Functional description

Table PXRTE is a member of the universal translation tables. The universal translation tables are organized to translate the incoming digit string in

segments. Table PXRTE translates the prefix code digit segment, together with tables PXHEAD and PXCODE.

15.4.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

15.4.2.1.3 Size

The table size is not changed.

Memory is allocated dynamically. When the first tuple for a given XLANAME is added, table size is allocated to accommodate the given route reference. As tuples are added, the table increases to accommodate the largest route reference index.

15.4.2.1.4 Fields/OIDs

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CNDSEL	Changed	refinement	VMI	The CND_RTE_CONDITION type is extended with VMI value.

15.4.2.1.5 Datafill example

Figure 8 The PXRTE datafill example.

```
XLANAME RTEREF RTELIST
-----------------------------------------
ISDN 100 (CND VMI T OFRT 88) $
```

Where RTELIST includes the following selectors and subfields:

RTESEL - the type is route_selector {S, N, T, **CND**, RT, SO, NOT, DCRT, NODE, SG}

CNDSEL - the type is cnd_rte_condition {ALWAYS, RND, SNPA, EA, TOD, NARS, COSMAP, NRR, SITE, CALLCHR, **VMI**}

RTETYPE - the type is cnd_rte_type {ST,T,SK}

TABNAME - the type is rter_id {OFRT, OFR2, OFR3, OFR4, IRTE, RRTE, IBNRTE, IBNRT2, IBNRT3, IBNRT4, TOPS}

INDEX - type is extended_route_ref_index {0 TO 1023}

15.4.2.1.6 Supplementary information

None.

15.4.2.1.7 Translation verification other tools

- The following examples shows the output from TRAVER when it is used to verify the PXRTE table (**CND VMI tuple is defined).**

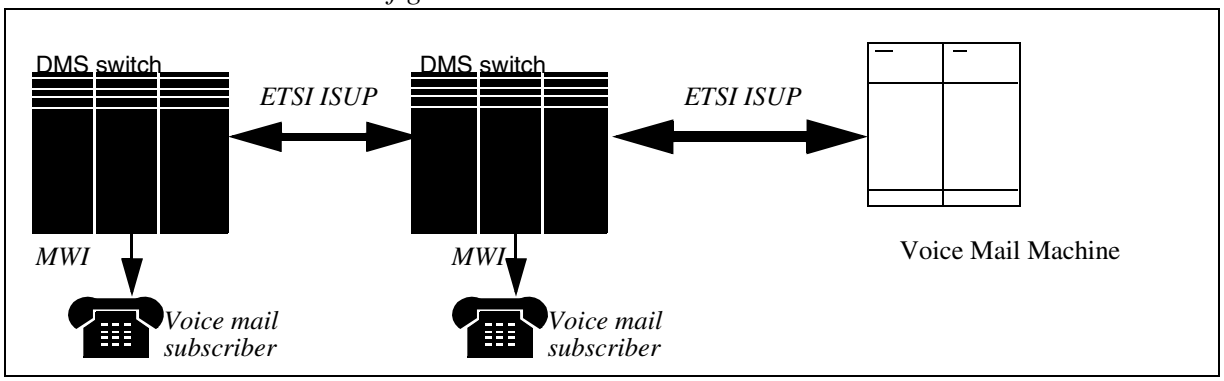
15.5 Configuration Walkthrough

There are the provisioning steps for the “MWI control via ISUP” performance:

1. The following network configuration must be supported:

Network configuration.



2. Use Service Order tool to define the MWT line option for IBN Voice Mail subscribers (Figure 1, "Datafill for IBN subscriber without LAMP.", Figure 2, "Datafill for IBN subscriber with LAMP.").

3. Use Service Order tool to define the VMI line option for BRI Voice Mail subscribers (Figure 3, "Datafill for BRI subscriber").

4. Use Service Order tool to define the appropriate Call Forward line option for subscribers that have MWT or VMI line option.

5. Datafill tables (Figure 5, "Datafill example for setting SDT on / turning LAMP on.", Figure 6, "Datafill example for setting SDT off / turning LAMP off.", Figure 7, "Additional datafill for MWI feature.").

6. Perform a successful call to a VM subscriber. Leave a voice message.

7. Off hook the subscriber.

8. Verify that SDT is heard/Lamp is turned on.

9. Clear the voice message.

10. On hook the subscriber.

11. Off hook the subscriber.

12. Verify that SDT is not heard/Lamp is turned off.

16: Configuration (CN): A00002364

16.1 Hardware and Software Requirements

None.

16.2 Initial Configuration

None.

16.3 Office/Subnet parameters (OP/SP) (CM & SESM)

16.3.1 New/modified office/subnet parameters

None.

16.3.2 Parameter information

None.

16.4 Upgrade Impact

16.4.1 Dump and Restore

None.

16.4.2 Element Management Upgrade

None.

16.5 Data schema (DS) (CM, MIBS, RDB)

16.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
CLICNTL	CHANGED	UNCHANGED

16.5.2 Table/MIB/Remote Database Schema information

16.5.2.1 Name: CLICNTL

16.5.2.1.1 Functional description

A new BILLING_OPTION named OCN is introduced by this feature to capture OCN in CDR. The new option is only created as a BILLING_OPTION, so it can be only added to the CLICTKEY which direction is incoming.

16.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

16.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
CLICNTL	unchanged	unchanged	unchanged

16.5.2.1.4 Fields/OIDs

The following table lists fields changed by this feature for CLICNTL.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BILLING_OPTIONS	changed	None	{RDN,CLI, SCRN_NUM..... **OCN**	OCN is added by this feature to provide the capability to capture OCN in CDR

16.5.2.1.5 Datafill example

Figure 1 Datafill example for new option OCN

```
TABLE: CLICNTL

CLICTKEY DIRECTN
---------------
NONE IC $ (RDN) (CLI) $ Y

CLI_ONLY IC (CLI) $ (CLI) $ Y

RDN_ONLY IC (RDN) $ (RDN) $ Y

CLI_THEN_RDN IC (CLI) (RDN) $ (SCRN_NUM) $ Y

RDN_THEN_CLI IC (RDN) (CLI) $ (SCRN_NUM) $ Y

RDN_OCN_CLI IC $ (RDN) (OCN) (CLI) $ Y
```

16.5.2.1.6 Table release history update

Entry OCN is added to field BILLING_OPTIONS

16.5.2.1.7 Supplementary information

The entry OCN can not be added to a CLICTKEY which direction is ongoing, otherwise, an error will occur and related error message is displayed.

17.1.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ISERVOPT	changed	unchanged
TRKOPTS	changed	unchanged

17.1.2 Table information

17.1.2.1 Name: ISERVOPT

International Service Option

17.1.2.1.1 Functional description

N/A

17.1.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

There is no requirement to datafill tables in a specific order.

17.1.2.1.3 Size

N/A

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
N/A	N/A	N/A	N/A

17.1.2.1.4 Fields/OIDs

The following table lists fields/OIDs for ISERVOPT.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SOPTSKEY	Changed	-	CWR_ON_TRUNK	The new option CWR_ON_TRUNK is added to table ISERVOPT.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SOPTSVAR	New	Option	CWR_ON_TRUNK	The option CWR_ON_TRUNK contains trunk types ETSI_ISUP, IBN7 and R2 that can be enabled or disabled for CWR over trunk.
SOPTSVAR	New	ETSI_ISUP	Y, N	The subfield ETSI_ISUP can be set to Y or N. Y enables and N disables CWR on trunk.
SOPTSVAR	New	IBN7	Y, N	The subfield IBN7 can be set to Y or N. Y enables and N disables CWR on trunk.
SOPTSVAR	New	R2	Y, N	The subfield R2 can be set to Y or N. Y enables and N disables CWR on trunk.

The following Figure 1 shows the list of table ISERVOPT including the new option CWR_ON_TRUNK.

18.6 Service Orders (SO) (CM & SESM)

This activity does not add a new service order (SO), it just increases the upper limit of the provisionable number of AFC Keys.

The old code allowed provisioning up to 4 AFC Keys on one DN. This activity increases the provisioning number of AFC Keys to 10 per DN for the DMS ETSI BRI implementation.

The master DN, known as SFC (Single Functional Call) key is able to have up to 10 AFC Keys associated with it. This can be specified through servord by using the AFC line option. If the AFC line option is added to a DN on a BRI set, the user is prompted for NUMCALLS indicating the number of call references permitted to be associated with that DN.

18.6.1 Service order change details

Increasing the upper limit of the provisionable number of AFC Keys just affects the DMS ETSI BRI variant. Other DRUs (such as NA) and other BRI variants (such as VN4 and AUSTEL) is not affected from the SO change.

18.6.2 New commands

ISERVOPT	CHANGED	UNCHANGED

19.5.2 Table/MIB/Remote Database Schema information

19.5.2.1 Name: ISERVOPT

19.5.2.1.1 Functional description

A new tuple ICWT is introduced by this activity in table ISERVOPT. This tuple specifies whether CWT announcements to be applied to the Call Waiting Party. If the booleans ICWT_ANN_ACTIVE and ICWT_TMO_ANN_ACTIVE are set to 'Y', the "Caller Call Waiting" and "Called Party Ignores Waiting Call" announcements are applied to the Call Waiting Party. ICWT_TIMEOUT_TREATMENT sub field controls ffter 30 secs timer expiry (and after the Called Party Ignores Waiting Call announcment, if being applied), a treatment (busy, answer, no_service_circuit timeout etc.) is applied to the Call Waiting Line. The treatment is defined by datafill

For the functional details, please refer to the FN section of this activity.

19.5.2.1.2 Usage sequence and implications (CM Only)

Not applicable.

19.5.2.1.3 Size
Unchanged.

19.5.2.1.4 Fields/OIDs
The following table lists fields/OIDs for ISERVOPT.

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SOPTSKEY	Changed	-	ICWT	New entry ICWT defined.
SOPTSVAR	Changed	option	ICWT	New entry ICWT defined.
SOPTSVAR	New	icwt_ann_active	{Y, N}	icwt_ann_active: Whether “Caller Call Waiting” announcement should be applied ore not.
SOPTSVAR	New	icwt_tmo_ann_active	{Y, N}	icwt_tmo_ann_active: Whether “Called Party Ignores Waiting Call” announcement should be applied ore not.
SOPTSVAR	New	icwt_timeout_treatment	one of the *extended_treatment*	icwt_timeout_treatment:After 30 secs timer expiry a treatment (busy, answer, no_service_circuit timeout etc.) is applied to the Call Waiting Line

19.5.2.1.5 Datafill example
The following examples shows sample datafill for table ISERVOPT.

- If CWT announcements to the Waiting Party should be turned ON:
  ICWT ICWT Y Y UNDT
- If CWT announcements to the Waiting Party should be turned OFF:
  ICWT ICWT N N UNDT
- To set a timeout treatment to BUSY ICWT_TIMEOUT_TREATMENT field should be changed:
  ICWT ICWT N N BUSY

19.5.2.1.6 Table release history update
The following information was added:

Entry ICWT added to field SOPTSKEY and SOPTSVAR/OPTION.

New fields ICWT_ANN_ACTIVE, ICWT_TMO_ANN_ACTIVE and ICWT_TIMEOUT_TREATMENT are added to entry ICWT in field SOPTSKEY and SOPTSVAR/OPTION.

19.5.2.1.7 Supplementary information

None.

19.5.2.1.8 Translation verification other tools

ISERVOPT does not use translation verification tools.

19.6 Service Orders (SO) (CM & SESM)

Not applicable.

19.7 Software optionality control (SOC)

19.10 Security

Not applicable.

19.11 Configuration Walkthrough

In order to have CWT announcements to be applied to the Waiting Party, the following configuration is required:

- The Called Party has ICWT line option datafilled and activated,
- The CWT announcements datafilled and brought in service, and
- The ISERVOPT option ICWT is datafilled and its booleans ICWT_ANN_ACTIVE and ICWT_TMO_ANN_ACTIVE are activated.
- In order to change timeout treatment, the initial value should be selected via ICWT_TIMEOUT_TREATMENT field in ICWT tuple.

19.11.1 Datafilling ICWT Line Option

The following figure shows the steps for adding the ICWT line option to the Called Party:

Figure 1 Steps for adding ICWT line option to the Called Party

```
>servord
SO:
>ado $ 8888587771001
OPTION:
>CEPT
OPTION:
>ICWT

>y
```

19.11.2 Datafilling CWT Announcements

The “Call Waiting” and “Called User Ignores Waiting Call” announcements are datafilled using the existing CS2K announcement capabilities. Please, note that the CLLIs used for “Call Waiting” and “Called User Ignores Waiting Call” announcements are **hardcoded** to **ICWTANN** and **ICWTTMOANN**, respectively.

The following figure shows the steps for datafilling the CWT announcements:

Figure 2 Example for datafilling CWT Announcements

```
table clli
ove; ver off;
add ICWTANN 70 10 ICWT_ANNOUNCEMENT y y
add ICWTTMOANN 71 10 ICWT_ANNOUNCEMENT y y
quit

22.5.2 Table/MIB/Remote Database Schema information

22.5.2.1 Name: NAOCFEAT

Network Advice of Charge Feature Charging Table

22.5.2.1.1 Functional description

Table NAOCFEAT contains Network Advice of Charge charging information for features when one or more of the following feature actions occur:

Feature Action	Description
Administration Assignment	Operating company personnel add a feature to a line.
Administration Deassignment	Operating company personnel remove a feature from a line.
Administration Activation	Operating company personnel change the state of a feature from inactive to active.
Administration Deactivation	Operating company personnel change the state of a feature from active to inactive.
Administration Programming	Operating company personnel change feature data.
Subscriber Activation	A subscriber causes the state of a feature to change from inactive to active.
Subscriber Deactivation	A subscriber causes the state of a feature to change from active to inactive.
Subscriber Programming	A subscriber causes a change to feature data.
Subscriber Usage	A subscriber uses a feature.
Subscriber Interrogation	A subscriber queries a feature, to determine whether it is active, and/or to display the data programmed for the feature.

Table NAOCFEAT has a two-part key, containing

- a Carrier or Reseller Name (from tables CARNAME or RESNAME)
- an MMP line option name or an enquiry action

Current enquiry actions are:

- Register Recall (RR) - a subscriber flashes and switches between the parties involved in the call
- Register recall Target Number (RTN) - a subscriber flashes and dials a number for another subscriber

Associated with each key are an assigned feature code and a list of chargeable feature actions and their assigned charge.

Note: The presence of datafill in table NAOCFEAT for line options and/or enquiry actions does not necessarily mean that these features are being charged or should be charged. Table NAOCFEAT, like table MTRFEAT for World Metering, provides the flexibility for the telco to supply datafill for each

subscriber feature with one or more chargeable activities, even though Network Advice of Charge is not currently active for the feature. The user must refer to the individual service documents to verify whether a particular feature is chargeable.

22.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

- CARNAME
- RESNAME
- NAOCFEAT

22.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NAOCFEAT	0	32766	Memory is automatically allocated as the tuples are datafilled.

22.5.2.1.4 Fields/OIDs

The following table lists the new fields for table NAOCFEAT

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
Key	New		see subfields	This field contains two subfields: CARRSNAM and FEATNAME
	New	CARRSNAM	8 character vector	Carrier or Reseller name. Enter a carrier or carrier reseller name as it was entered in either table CARNAME or table RESNAME..

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action

	New	FEATNAME	<line option>, RR, RTN	Feature Name.
				
				Enter a line option (as listed in the SERVORD Reference Manual) or an enquiry action.
				
				Enquiry actions are:
				`RR - Register Recall`
				`RTN - Register recall Target Number`

FEATCODE	New		00-99	Feature Code. Enter a two-digit number to be used to identify the feature in a charge record.
ACTIONS	New		see subfields	This field is a vector of up to 10 entries where each entry consists of two subfields, FEATACTN and CHARGE.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
	New	FEATACTN	ASSIGN, DEASSIGN, ADMACT, ADMDEACT, ADMPROG, , SUBACT, SUBDEACT, SUBPROG, USAGE, INTERROG, $	Feature Action. ASSIGN - Administration Assignment DEASSIGN - Administration Deassignment ADMACT - Administration Activation ADMDEACT - Administration Deactivation ADMPROG - Administration Programming SUBACT - Subscriber Activation SUBDEACT - Subscriber Deactivation SUBPROG Subscriber Programming USAGE - Subscriber Usage INTERROG - Subscriber Interrogation
	New	CHARGE	0-255	Feature Action Charge. Enter the charge value to be charged for the action.

22.5.2.1.5 Datafill example

The following example shows sample datafill for table NAOCFEAT:

```
KEY     FEATCODE
                                                                ACTIONS
-------------------------------------------------------------------------------
```

CAR01 ACRJ 01
(ASSIGN 4) (DEASSIGN 3) (USAGE 5)$

22.5.2.1.6 Table release history update
Added to WT20 by feature A00002654.

22.5.2.1.7 Supplementary information
None.

22.5.2.1.8 Translation verification other tools
NAOCFEAT does not use translation verification tools.

22.5.2.2 Name: IBNFEAT
IBN Features Table

22.5.2.2.1 Functional description
IBNFEAT displays data associated with various IBN features.

22.5.2.2.2 Usage sequence and implications (CM Only)
Current datafill order unchanged.

22.5.2.2.3 Size
The size of the table is not changed.

22.5.2.2.4 Fields/OIDs
This activity allows AR and ACRJ to appear in the FEATURES list of the SEC (Security Code option) as shown below:

TYPE FEATURES_LIST_TYPE STRING RANGE

'DCPK' 0

'AR' 1

'ACRJ' 2

END STRING RANGE

(0, 4, 0, 4)

Table 4 Table field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action
DATA	changed	FEATURES	DCPK, AR, ACRJ	Enter DCPK, AR, and/or ACRJ. These are the line options associated with feature SEC.

22.5.2.2.5 Datafill example

The following example shows sample datafill for table IBNFEAT.

```
HOST 00 1 10 05 0 SEC SEC (AR) $ 0000
```

22.5.2.2.6 Table release history update

The SEC feature option is modified to include the AR and ACRJ options in its Features List.

22.5.2.2.7 Supplementary information

None

22.5.2.2.8 Translation verification other tools

None

22.5.2.3 Name: ACCODE

Access Code Table

22.5.2.3.1 Functional description

Access Code Table, and other code tables, work in conjunction with the universal translations head tables (for example, table ACHEAD) to provide the digit path through universal translations.

The access code table translates the access code digit segment of the incoming digit string. The access code is used for access to another networks, an attendant, or a feature.

22.5.2.3.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

22.5.2.3.3 Size

The size of the table is not changed.

22.5.2.3.4 Fields/OIDs

The feature option selector (i.e., FTR) of the XLA feature selector (i.e., FEAT) of the XLA CODE table will be modified to add the additional features AR and ACRJ.

Table 5 Table field descriptions

Field XLASEL	New or Changed	Subfield OSEL	Entry	Explanation and action
FEAT	changed	FTR	<XLA_FEATURE_NAME> {ILR, ICWT, SC, SCR, CCBS, WML, CFU, CFF, CFBF, CFBP, CFDF, CFDP, CDND, CDTA, CDTO, IWUC, VMWI, CNDB, SUPP, CND, VALIDATE, PATH_REPLACEMENT, CALLCHAR, TLC, CLCTDIGS, CALLBACK, REV, FRB, FOC, FDT, NTC, **AR**, **ACRJ** }	Feature name. If the entry in subfield OSEL is FTR, enter an international line feature name. New feature names for AR and ACRJ have been added.

22.5.2.3.5 Datafill example

The following example shows sample datafill for table ACCODE.

```
starcept 921 921 FEAT (FTR AR) (PF 3) (MM 3 15) (FUNC ACT) $

starcept 934 934 FEAT (FTR ACRJ) (PF 3) (MM 3 15) (FUNC ACT) $
```

22.5.2.3.6 Table release history update

The feature option selector (i.e., FTR) of the XLA feature selector (i.e., FEAT) of the XLA CODE table will be modified to add the additional features AR and ACRJ.

22.5.2.3.7 Supplementary information

None.

22.5.2.3.8 Translation verification other tools

The example in Figure 1, "Example Traver for AR activation" shows the output from **traver** when it is used to verify Table ACCODE.

Figure 1 Example Traver for AR activation

22.6 Service Orders (SO) (CM & SESM)

22.6.1 Service order change details

This feature will expand the existing SEC (Security Code) option to accept two more additional values (AR and ACRJ) when it is prompted for its feature list. The feature list contains a list of features for which the Security Code PIN applies.

As well, this feature will expand the provisioning for AR (for CEPT lines **only**) by adding an additional sub-option to define the initial status of the AR feature.

22.6.1.1 LCC and options

The LCC compatibility of SEC is not being changed by this activity.

Table 6 Meridian digital centrex feature assignment requirements

Feature	500 2500	MDC SET	ISDN SET	MDC Set ISDN Set Relationship							
				SET	SUBSET	KEY	DN	DEDKEY	LAMP	CODE	DISPLAY

22.6.2 New commands

NA- No new Servord commands are being introduced by this activity.

22.6.2.1 How SEC service order options are presented

22.6.2.1.1 Description

With this activity, the FEATURES prompt of the SEC option will allow two new values, AR and ACRJ. Previously, only DCPK was a valid option.

22.6.2.1.2 Example

Figure 2 Example of Servord sequence in prompt mode

```
SO:
>ado
SONUMBER:      NOW    3   6 16 PM
>
DN_OR_LEN:
>0 1 10 5
OPTION:
>sec
FEATURES:
>ar  (or acrj) <---------- The new features to which the SEC PIN applies
FEATURES:
>$
SEC_CODE:
>0000
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 6 16 PM HOST 00 1 10 05 ( SEC ( AR) $ 0000 ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
```

Figure 3 Example of Servord sequence in no-prompt mode

SO:
ado $ 0 0 18 5 sec **acrj** $ 0000 $ y y

22.6.2.1.3 Option prompts

The new SEC FEATURES values are shown in **bold** below.

Table 7 Change to SEC FEATURES sub-option prompt

Prompt	Valid input	Description
FEATURES	DCPK, **AR**, **ACRJ**	The FEATURES field indicate the line features using the SEC PIN.

22.6.2.1.4 Line class code compatibility

The LCC compatibility of SEC is not being changed by this activity.

22.6.2.1.5 Assignability

The SEC option is assignable to a line.

22.6.2.1.6 Option prerequisites

For the SEC PIN to apply to AR and ACRJ, the CEPT option needs to be present on the line. The SEC PIN will not apply to non-CEPT AR and ACRJ.

22.6.2.1.7 Notes

None.

22.6.2.1.8 Feature identification

Feature number: A00002654 (CEPT AR), A00002655 (CEPT ACRJ)

22.6.2.1.9 SERVORD+ Exceptions

None.

22.6.2.2 How CEPT AR service order options are presented

22.6.2.2.1 Description

With this activity, the CEPT **AR** option will require two sub-options in addition to the feature option name, they are:

- **billing_option**

  This sub-option is **not** a new sub-option with respect to AR.

- **cnd_status**

  This sub-option pertains to CEPT AR only. This defines the initial state of the CEPT AR option, i.e., active or inactive.

  Note: This feature state can be toggled via the feature access codes as defined in the FN section of this design document. As well, the current CEPT AR feature state can be viewed via the QDN or QLEN commands.

22.6.2.2.2 Example

Figure 4 Example of Servord sequence in prompt mode - CEPT AR

```
>ado
SONUMBER:      NOW    4 10 18 PM
>
DN_OR_LEN:
>6320401
OPTION:
>ar
BILLING_OPTION: NOAMA
>noama
CND_STATUS:  <---------- new for CEPT AR only!!
>inact
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 4 10 18 PM 6320401 ( AR NOAMA INACT ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
JOURNAL FILE IS INACTIVE, SERVICE ORDERS NOT ALLOWED
SHOULD ORDER BE DONE ANYWAY? (Y OR N)
>y
```

Figure 5 Example of Servord sequence in no-prompt mode - CEPT AR

```
SO:
ado $ 6320401 ar noama inact $ y y
```

22.6.2.2.3 Option prompts

The new CEPT AR sub-option prompts are shown below.

Table 8 CEPT AR sub-option prompts

Prompt	Valid input	Description
BILLING_OPTION	NOAMA AMA (not allowed for CEPT AR) <CLASS_AMA_STATUS>	Indicates whether an AMA billing record should or should not be created. If the line is provisioned with the CEPT option then input of AMA will be rejected by SERVORD.

Table 8 CEPT AR sub-option prompts

Prompt	Valid input	Description
CND_STATUS	INACT ACT UNIVI (not allowed for CEPT AR) UNIVA (not allowed for CEPT AR) <CLASS_ACTIVITY_STATUS>	This defines the initial state of the CEPT AR option, i.e., inactive or active. If the line is provisioned with the CEPT option then input of UNIVI or UNIVA will be rejected by SERVORD. If the line is **not** provisioned with the CEPT option then input of INACT will be rejected by SERVORD.

22.6.2.2.4 Line class code compatibility

The LCC compatibility of CEPT AR is not being changed by this activity.

22.6.2.2.5 Assignability

The CEPT AR option is assignable to a line.

22.6.2.2.6 Option prerequisites

The prompt for the CEPT AR **cnd_status** will only appear if the customer group, that the line is a member of, has the CEPT option assigned (in Table CUSTSTN).

It is **highly recommended** that the line also be provisioned with the CEPT option prior to adding the CEPT AR option (although this is not enforced by SERVORD).

22.6.2.2.7 Notes

None.

22.6.2.2.8 Feature identification

Feature number: A00002654 (CEPT AR)

22.6.2.2.9 SERVORD+ Exceptions

None.

23: Configuration (CN): A00002678

23.1 Hardware and Software Requirements

No non-standard hardware or software requirements.

23.2 Initial Configuration

Not applicable.

23.3 Office/Subnet parameters (OP/SP) (CM & SESM)

23.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	WTIN_TDP4_ACTIVE	NEW	CM
OFCENG	INAP_ASF_FILTERING_TIMEOUT_DUR	NEW	CM
OFCENG	INAP_VARIANT	Changed	CM

23.3.2 Parameter information

23.3.2.1 WTIN_TDP4_ACTIVE

Intelligent Networks Trigger Detection Point 4 Active

23.3.2.1.1 Functional description

TDP4 Query on Release (QoR) Triggering is being introduced by this activity. TDP4 occurs when a release indication is received from the network or internally within the switch. The feature partially implements TDP4, it only allows IN to be trigger on receipt of an ISUP REL message (from ETSI ISUP).The criteria for triggering TDP-4 is based on the cause value received in the ISUP message. The release cause value required to trigger TDP-4 is specified in a new criteria type CAUSE in table TRIGGRP.

Checking for a matching CAUSE criteria introduces a real-time hit for during release message processing. To reduce this a new office parm, WTIN_TDP4_ACTIVE has been introduced. If TDP-4 triggering is required in the office this office parm can be set to TRUE. If the office parm is set to FALSE TDP-4 triggering will be disabled regardless of datafil in table TRIGGRP.

23.3.2.1.2 Provisioning rules

The value should be set to TRUE if TDP-4 triggering is required in this office, and FALSE if it is not required.

23.3.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
FALSE	TRUE	FALSE

23.3.2.1.4 Activation

Any changes are activated immediately

23.3.2.1.5 Dependencies

None

23.3.2.1.6 Consequences

If TDP-4 triggering is not required and this office parm is set to TRUE, there will be an unnecessary real time hit for all calls, during backward release.

23.3.2.1.7 Verification

Make a call which will trigger at TDP-4, if the office is parm is set to TRUE to call will result in the trigger being generated, if set to FALSE the trigger will not occur.

23.3.2.1.8 Memory requirements

No memory impact.

23.3.2.1.9 Parameter release history update

Created WTIN_TDP4_ACTIVE office parameter in table OFCENG.

23.3.2.2 INAP_ASF_FILTERING_TIMEOUT_DUR

Intelligent Network Application Part ActivateService Filtering Timeout Duration

23.3.2.2.1 Functional description

This activity provides the ability to specify a network default ASF duration. If the SSP receives an ASF operation with a duration of -2, this indicates the value is network specific and the network default duration should be used.

A new office parm has been created called INAP_ASF_FILTERING_TIMEOUT_DUR in table OFCENG to specify the network specific ASF duration.

23.3.2.2.2 Provisioning rules
This office parm is only applicable to networks which require a network specific ASF duration. The value of this office parm should match the network specific ASF duration or if not required should be entered as 0

23.3.2.2.3 Range information
The range accepted by this office parm is -1 - 86,400 seconds. A value of -1 represents an infinite duration

Table 3 Range Information

Minimum	Maximum	Default
-1	86,400	0

23.3.2.2.4 Activation
Any changes are activated immediately but will only affect new ASF operations and not any that may currently be processing.

23.3.2.2.5 Dependencies
None

23.3.2.2.6 Consequences
If there is a network specific ASF duration and the value of this parameter does not match it, an incorrect duration will be used if the network specific duration is requested by the SCP. If there isn't a network specific ASF duration, and this office parm is not datafilled as 0, should an ASF operation be received with a duration of -2, it will not be treated as an error and instead the value of the office parm will be used for the duration of the ASF operation.

23.3.2.2.7 Verification
Send an ASF operation to the SSP with a duration of -2 and use the ASF MAP CI tool to display the ASF entries and check the duration parameter is set as expected.

23.3.2.2.8 Memory requirements
No memory impact.

23.3.2.2.9 Parameter release history update
Created INAP_ASF_FILTERING_TIMEOUT_DUR office parameter in table OFCENG

23.3.2.3 INAP_VARIANT
Intelligent Network Application Part Variant

23.3.2.3.1 Functional description
Unchanged

23.3.2.3.2 Provisioning rules
For the Spanish National Market this office parm should be set to TELEFONICA

23.3.2.3.3 Range information
A new value of TELEFONICA has been added for the Spanish national market

23.3.2.3.4 Activation
Unchanged

23.3.2.3.5 Dependencies
None

23.3.2.3.6 Consequences
If this office parameter is not set correctly INAP operations may be encoded/ decoded incorrectly

23.3.2.3.7 Verification
Unchanged

23.3.2.3.8 Memory requirements
Unchanged

23.3.2.3.9 Parameter release history update
Added a new variant TELEFONICA

The following table lists fields/OIDs for SERVINFO.

Table 8 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
FCI_OPT	Changed	refinement	{..., **TELFONICA**,...}	
TELFONICA	New		FORMAT_IDENTIFIER	Specifies that Telefonica FCI handling should be used
FORMAT_IDENTIFIER	New	Subfield	numeric (in the range 127 to 255)	Denotes a vendor-specificFCIBCC format or IN service
INITDP_PARMS	Changed	refinement	{..., **CAUSE**, ...}	
CAUSE	New		none	Specifies that the release CAUSE value should be included in the InitDP.

23.5.2.2.5 Datafill example

The following example shows sample datafill for table SERVINFO.

Figure 3 Example datafill SERVINFO

```
SERVIDX                                                              OPTION
-------------------------------------------------------------------------------

4441    (INITDP_PARMS ( SERVKEY) (CDPA) (CPC) (EVENT_TYPE) (CAUSE)$)
           (BILL_INFO (FCI_OPT TELEFONICA 127) $)
           (DIGIT_COLLECTION_INFO ( FULL_CDPA ) $)
           (EDPS_INFO ( EXPLICIT ) $) (CS1R (CONTINUE) (CWA) $)$
```

23.5.2.2.6 Table release history update

Added new FCI_OPT option TELEFONICA and INITDP_PARMS option CAUSE.

23.5.2.2.7 Supplementary information

None

23.5.2.2.8 Translation verification other tools

The following example shows the output from TRAVER when it is used to verify SERVINFO.

23.6 Configuration Walkthrough

Please refer to the FN for ACT.00002678 for details on configuring this functionality.

24: Configuration (CN): A00002680

24.1 Hardware and Software Requirements

24.2 Initial Configuration

24.3 Office/Subnet parameters (OP/SP) (CM & SESM)

24.4 Upgrade Impact

24.5 Data schema (DS) (CM, MIBS, RDB)

This activity does not introduce new tables, however, it does make use of three existing tables that were previously introduced via activity BV1522. These tables are PAUSPATT, ISCASSGN, and AISDBS. Investigation reveals no reference to these tables in the existing NTP documentation. These tables need to be added to the NTP documentation based on the description given in BV1522.

24.6 Service Orders (SO) (CM & SESM)

24.7 Software optionality control (SOC)

24.8 Element Management

24.9 Command interface changes

24.10 Security

24.11 Configuration Walkthrough

25: Configuration (CN): A00002702

25.1 Data schema (DS) (CM, MIBS, RDB)

25.1.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
MTRSYSPM	CHANGED	UNCHANGED
MTRSYSPM	CHANGED	UNCHANGED

25.1.2 Table/MIB/Remote Database Schema information

25.1.2.1 Name: MTRSYSPM

25.1.2.1.1 Functional description

NCW_MOG field of the table is renamed to NCW_CHG.

25.1.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

25.1.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MTRSYSPM	10	10	One tuple is added to this table. That means 1 bit memory is allocated from the memory conception.

25.1.2.1.4 Fields/OIDs

The following table lists fields/OIDs for MTRSYSPM.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NCW_CHG	Changed	-	Allowed or Disallowed	Field name is renamed from NCW_MOG

...................
BOTTOM
```

25.1.2.2.6 Table release history update

- New field NO_TRK_ORIG_WITHOUT_CHG and new tuple NTOW_CHG is added.
- The tuple size of the table is increased to 12.

25.1.2.2.7 Supplementary information

A reload restart is required to activate the functionality bound to NTOW_CHG tuple, so the operator is warned with a message when this tuple is changed.

Figure 5 Example of activating the function.

```
>cha
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
MTRSEL: NTOW_CHG
>NTOW_CHG
NO_TRK_ORIG_WITHOUT_CHG: ALLOWED
>DISALLOWED
TUPLE TO BE CHANGED
NTOW_CHG NTOW_CHG DISALLOWED
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
*** WARNING: ALL ETSI PRI TRUNK ORIGINATED CALLS
WILL BE AFFECTED

NOTE:
A RELOAD RESTART is necessary to activate new value. When
NTOW_CHG is DISALLOWED, calls which are originated by
ETSI PRI trunks having no ICMOG datafill, will NOT be allowed.
TUPLE CHANGED
JOURNAL FILE INACTIVE
```

When NTOW_CHG value is changed from ALLOWED to DISALLOWED, if user attempts to list the tuples in MTRSYSPM table, user is informed about the mismatch between the active used value and the value in table.

Figure 6 Mismatch Warning Message in DISALLOWED case

```
WARNING: NTOW_CHG - DISALLOWED value is not active yet
A RELOAD restart is required to activate
```

Figure 7 Example to deactivating the function

```
>cha
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
MTRSEL: NTOW_CHG
>NTOW_CHG
NO_TRK_ORIG_WITHOUT_CHG: ALLOWED
>ALLOWED
TUPLE TO BE CHANGED
NTOW_CHG NTOW_CHG ALLOWED
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
*** WARNING: ALL LINE ORIGINATED CALL WILL BE AFFECTED

NOTE:
A RELOAD RESTART is necessary to activate new value. When
NTOW_CHG is DISALLOWED, calls which are originated by
ETSI PRI trunks having no ICMOG datafill, will NOT be allowed.
TUPLE CHANGED
JOURNAL FILE INACTIVE
```

In this case, when NTOW_CHG value is changed from DISALLOWED to ALLOWED, mismatch warning message occurs as following;

Figure 8 Mismatch Warning Message in ALLOWED case

```
WARNING: NTOW_CHG - ALLOWED value is not active yet
A RELOAD restart is required to activate
```

Since changed value in table will be active after a reload restart, mismatch message will be displayed each time the tuple is listed until the restart reload is performed.

Also, this mismatch warning message occurs in every attempt to enter MTRSYSPM table.

25.1.2.2.8 Translation verification other tools

MTRSYSPM does not use translation verification tools.

27.6 Service Orders (SO) (CM & SESM)

27.6.1 Service order change details

27.6.1.1 LCC and options

27.6.2 New commands

27.6.2.1 How service order commands are presented

27.6.2.2 How service order options are presented

27.6.2.2.1 Description

A new line option CWACT is introduced to provide Call Waiting Activation/ Deactivation(CWACT) function. The function allows the subscriber to activate and deactivate call waiting via feature access codes (i.e. *74, #74).

The function is provided by assigning CWACT line option to subscriber by means of SERVORD command. It works with CW service. The CWACT can only be assigned to a BRI DN that already has CW (Call Waiting), therefore the removal of CW from the DN with CWACT will not be allowed.

27.6.2.2.2 Example

Figure 1 Example of the assignment example of CWACT option

```
>SERVORD
SO:
>ado
SONUMBER MAY 95 6 46 PM
>[Enter]
DN_OR_LEN
>ISDN 400
OPTKEY
>1
OPTION:
>CWACT
CW_ACTIVE:
>Y
OPTKEY
>$
COMMAND AS ENTERED:
ADO MAY 95 6 46 PM ISDN 400(1 CWACT Y) $
Enter Y to confirm, N to reject or E to edit
>Y
```

Figure 2 Example of the CWACT option in no-prompt mode

```
> servord
SO:
> ado $ 6020400 1 CWACT Y $
```

27.6.2.2.3 Option prompts

Table 3 System prompts for <abbreviated option name> option

Prompt	Valid input	Description	Areas affected by prompt
OPTION	CWACT	The name of the new option	N/A
CW_ACTIVE	Y or N	Indicate if the CW service can be active.	N/A

27.6.2.2.4 Line class code compatibility

Table 4 CWACT compatibility to LCC

Line class code	Compatible?
ISDNKSET	YES

27.6.2.2.5 Assignability

The following functionalities apply to this option:

- set functionality: <yes or no>
- subset functionality: <yes or no>
- DN functionality: <yes or no>
- key functionality: <yes or no>

27.6.2.2.6 Option prerequisites

To assign the option to a BRI DN, the CW option must exist on this DN.

27.6.2.2.7 Notes

To delete CW option, CWACT option must be deleted firstly.

27.6.2.2.8 Feature identification

Feature number: A00002751

27.6.2.2.9 SERVORD+ Exceptions

International Services options

29.5.2.1.1 Functional description - Tuple CEPTONCNETREX

A new field MARKET into the tuple CEPTONCENTREX in table ISERVOPT. The field MARKET is used to identify in which market the line services are working. Now, two value are available for this field. One is DEFAULT and another is CHINA. For the chinese office, this field must be set to CHINA.

In order to allow all CEPT line services mentioned above on the IBN line without CEPT option, the corresponding service options must be present in tuple CEPTONCENTREX in table ISERVOPT. Table 2 below shows the available options in tuple CEPTONCENTREX, and the associated CEPT line services:

***Note**: The CEPTONCENTREX options with **bold** font are introduced by this activity.*

Table 2 CEPTONCENTREX Options and CEPT Line Services

CEPTONCENTREX OPTION	Associated CEPT Line Service
SC	SCL, SCS
WML	WML
ILR	ILR
CDIV	CDND, CFU, CFB, CFD, CFF, CDTA, CDTO, CFRA
ICT	ICT
ICWT	ICWT
IWUC	IWUC
ICWT	ICWT
CCBS	CCBS
I3WC	I3WC
I6WC	I6WC
CEPTPW	CEPTPW
CEPTRA	CEPTRA

29.5.2.1.33 Functional description - Tuple CEPTPW

A new field COLLECT_DNPIN_IN_DIFF_STAGES and two announcement IDs COLLECT_DN_ONLY and COLLECT_PIN_ONLY are introduced into tuple CEPTPW.

If the field COLLECT_DNPIN_IN_DIFF_STAGES is set to Y in tuple CEPTPW, a new DN and PIN dialing sequence is adopted by CEPTRA, that is, the subscriber should input DN firstly, and receive announcement, then input PIN.

When the subscriber dials the DISA DN in order to use CEPTRA service, if the field COLLECT_DNPIN_IN_DIFF_STAGES and ANNOUNCE are set to Y in tuple CEPTPW and the announcements are provisioned correctly, the subscriber will hear the announcement associated by announcement ID COLLECT_DN_ONLY to prompt to input DN, after the subscriber inputs the

valid DN, he/she will hear the announcement associated by announcement ID COLLECT_PIN_ONLY to prompt to input password.

29.5.2.1.34 Usage sequence and implications (CM Only)

Current datafill order unchanged.

29.5.2.1.35 Size

Current table size unchanged.

29.5.2.1.36 Fields/OIDs

The following table lists fields for table ISERVOPT;

Table 7 Table field descriptions for tuple CEPTONCENTREX

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
COLLE CT_DNPIN_IN_ DIFF_STAGES	New		{N,Y}	This field indicates if the new DN and PIN dialing sequence is adopted for CEPTRA service. If this field is set to Y, the subscriber should input DN firstly, and receive announcement, then input PIN. If the field is set to N, the subscriber should input DN and PIN as “DN*PIN” at once dialing.
CEPTANNID	Changed		{DNPIN,CHGPI N,SCODE ,VLDPIN,LOCK, **COLLE CT_DN_ONLY, COLLE CT_PIN_ONLY**}	New announcement IDs for the new DN and PIN dialing sequence.

29.5.2.1.37 Datafill example

30.3.2.1 Name: MTRSYSPM

Metering System Parameters

30.3.2.1.1 Functional description

A new parameter “trunk_threshold” is added into EMD tuple in MTRSYSPM table.

Also, existing “threshold” field of EMD tuple is renamed as “line_threshold”.

30.3.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

30.3.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MTRSYSPM	11	11	EMD tuple is changed. A new parameter has been added, so there is not a fundamental change on memory consumption.

30.3.2.1.4 Fields/OIDs

The following table lists changed fields/OIDs for MTRSYSPM.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
EMD	Changed	TRUNK THRESHOLD	0 to 2,100,000,000	It identifies maximum delta value between current and previous trunk meter counts.

30.3.2.1.5 Datafill example

The following example shows sample datafill for table MTRSYSPM.

Table 4 Datafill example of EMD tuple in table MTRSYSPM

Field name	Default Value
ACTIVATION	NO
HOUR	4
MINUTE	15
PERIOD	1
LINE_THRESHOLD	20.000
TRUNK_THRESHOLD	200.000

There are some properties related to table MTRSYSPM as follows:

- New tuples cannot be added manually.
- Tuples can not be deleted.
- MTRSEL selector value must be identical to key value.
- Only changing is allowed.

30.3.2.1.6 Table release history update

Definition of EMD tuple has been made in MMP15. With this activity in SN07, parameters of EMD tuples is changed to include threshold value for trunks.

30.3.2.1.7 Supplementary information

None.

30.3.2.1.8 Translation verification other tools

MTRSYSPM does not use translation verification tools.

31.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SERVINFO	CHANGED	Unchanged

31.5.2 Table/MIB/Remote Database Schema information

31.5.2.1 Name: SERVINFO

31.5.2.1.1 Functional description

Option INITDP_PARMS of table SERVINFO is extended to add two new fields **IP_AVA** and **IPSSP_CAP** to indicate whether parameters IPAvailable and IPSSPCapabilities will be carried in IDP. These two fields should be datafilled at the same time.

Meanwhile, option SRF_INFO is extended to add new filed **IP_INFO** to provide detailed information of the IP capability within SSP.

If IP_AVA and IPSSP_CAP are datafilled and IP_INFO is not datafilled, parameters iPAvailable and iPSSPCapabilities are set to default value according to China INAP, the default value of iPAvailable is ‘01’H (which indicates that the IP is available), the default value of iPSSPCapabilities is ‘#0C00’ (which indicates that DTMF digit collection and tone & announcement is supported). If IP_INFO is datafilled, then iPAvailable and iPSSPCapabilities are set according to this datafill. That means IP_INFO will take effect only if IP_AVA and IPSSP_CAP are datafilled, otherwise, the information of this datafill will not be carried in IDP.

IP_INFO contains two subfields: **IP_AVA** and **IP_SSP_CAPABILITIES**, which are for parameter IPAvailable and IPSSPCapabilities respectively.

31.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

31.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVINFO	no change	no change	N/A

31.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for SERVINFO.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
INITDP_PARMS	Changed	refinement	Boolean Value	Add new selections: IP_AVA and IPSSP_CAP.
SRF_INFO	Changed	refinement	Boolean Value	Add new sub-option: IP_INFO
IP_INFO	New	Subfield	Boolean Value	Add new sub-options: IP_AVA and IP_SSP_CAPABILITIES
IP_AVA	New	Subfield	Boolean Value	Indicate whether the IP is available.
IP_SSP_CAPABILITIES	New	Subfiled	Boolean	Provide the detailed information of IP capabilities. (See table 4 for details)

According to China INAP, there are 14 kinds of IP capabilities which are indicated by parameter iPSSPCapabilities. These capabilities can be datafilled in IP_SSP_CAPABILITIES as shown in table 4:

Table 4 IP Capabilities defined in China INAP

IPSSPCapabilites parameter	Value	Meaning	IPSSP_CAPABILITIES selections
1st byte, bit 0	0/1	Not support/Support IPRoutingAddress	IPRA
1st byte, bit 1	0/1	Not support/Support VoiceBack	VOICE_BACK
1st byte, bit 2	0/1	Not support/Support VoiceInformation, recognize through voice, speech.	VOICE_INFO_SPEECH
1st byte, bit 3	0/1	Not support/Support VoiceInformation, recognize through voice, voice.	VOICE_INFO_VOICE
1st byte, bit 4	0/1	Not support /SupportText to Voice conversion.	TEXT_TO_VOICE
1st byte, bit 5	0/1	Not support/Support fax.	FAX
1st byte, bit 6	0/1	Not support/Support recorder.	RECORDER
1st byte, bit 7	0/1	Not support/Support script.	SCRIPT
2nd byte, bit 0	0/1	Not support/Support manual operator.	MAN_OPERATOR
2nd byte, bit 1	0/1	Not support/Support conference.	CONFERENCE
2nd byte, bit 2	0/1	Not support/Support tone & announcement.	TONE_ANNC
2nd byte, bit 3	0/1	Not support/Support DTMF digit collection.	DTMF_DIGCOL
2nd byte, bit 4	0/1	Not support/Support sending DTMF signal.	SEND_DTMF_SIG
2nd byte, bit 5	0/1	Not support/Support sending FSK signal.	SEND_FSK_SIG
2nd byte, bit 6,7	To be defined.		
3rd, 4th bytes	To be defined.		

31.5.2.1.5 Datafill example

The following example shows sample datafill for table SERVINFO:

Example of datafill:
TABLE SERVINFO
200 (INITDP_PARMS (SERVKEY) (CDPA)(**IP_AVA**) (**IPSSP_CAP**) $)
(SRF_INFO (EARLY_ANS ANS_ON_ANNS)
(**IP_INFO Y** (**IPRA**) (**VOICE_INFO_SPEECH**)
(**TONE_ANNC**)(**DTMF_DIGCOL**)$)$)$

31.5.2.1.6 Table release history update

New sub-option IP_AVA, IPSSP_CAP are added to option INITDP_PARMS. New sub-option IP_INFO is added to SRF_INFO and new option IP_INFO has 2 sub-options: IP_AVA and IP_SSP_CAPABILITIES.

32.5.2.4 Translation verification tools

SCAISSRV does not use translation verification tools.

32.6 Service Orders (SO) (CM & SESM)

N/A

32.7 Software optionality control (SOC)

Order code ICM00079, CTI Toggle Transfer optionalized the functionality of the dv_Toggle_Call message. When ICM00079 SOC is in the IDLE state, the invoke of the above message will be rejected by the DMS.

SOC-ON_TO-IDLE warning messages

The following warning message is displayed when the CTI Toggle Transfer SOC ICM00079 is toggled from ON to IDLE state. The warning message indicates that state transition disables the associated dv_Toggle_Call functionality.

SERVICE AFFECTING: This transition will disable the dv_Toggle_Call functionality for all current and future subscribers.

The table below summarizes the SOC option ICM00079 for CTI Toggle Transfer

Table 3 SOC

SOC option name:	ICM
SOC option title:	Toggle Transfer
SOC option control type:	STATE
New SOC option?	Yes
SOC option order code	ICM00079
Option defined in DRU:	CCM
Affected products:	LEC00020, LET00020, LLT00020, SN07, ISN07

33: Configuration (CN): A00002907

33.1 Hardware and Software Requirements

ISN07 software load on CS2K DMS.

33.2 Initial Configuration

Not applicable.

33.3 Office/Subnet parameters (OP/SP) (CM & SESM)

33.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	INAP_VARIANT	CHANGED	CM

33.3.2 Parameter information

33.3.2.1 INAP_VARIANT

Intelligent Network Application Protocol Variant.

33.3.2.1.1 Functional description

The value of the INAP_VARIANT office parameter determines whether INAP variant specific requirements are considered when handling INAP operations.

33.3.2.1.2 Provisioning rules

The value should be set to TINAP, if T-INAP support is required.

33.3.2.1.3 Range information

Table 2 Range Information

Valid Values	Maximum	Default
DFLTINAP, CHINESE, TINAP		DFLTINAP

33.3.2.1.4 Activation

Any changes are activated immediately.

33.3.2.1.5 Dependencies

None.

33.3.2.1.6 Consequences

When setting INAP_VARIANT to TINAP, Deutsche Telekom (DTAG) specific INAP extensions are activated.

33.3.2.1.7 Verification

Enable T-INAP support and verify, whether Deutsche Telekom specific INAP extensions are activated.

The following functionality is supported with the INAP_VARIANT office parameter set to TINAP:

- When ActivityTest operation fails, send an U-ABORT with activityTestFailed error code to the SCP.
- Encode userUser parameter in the ERB operation for DP9.
- Decode the DTAG private parameters in the Connect operation.

33.3.2.1.8 Memory requirements

No memory impact.

33.3.2.1.9 Parameter release history update

New TINAP option is implemented for the INAP_VARIANT office parameter.

33.4 Upgrade Impact

33.4.1 Dump and Restore

No impact.

33.4.2 Element Management Upgrade

No impact.

33.5 Data schema (DS) (CM, MIBS, RDB)

33.5.1 New/modified tables, MIBs, or Database Schema

Table 3 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SERVINFO	CHANGED	UNCHANGED

33.5.2 Table/MIB/Remote Database Schema information

33.5.2.1 Name: SERVINFO

Intelligent Network Service Information Table.

33.5.2.1.1 Functional description
Unchanged.

33.5.2.1.2 Usage sequence and implications (CM Only)
Current datafill order unchanged.

33.5.2.1.3 Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVINFO	unchanged	unchanged	unchanged

33.5.2.1.4 Fields/OIDs
The following table lists fields/OIDs for SERVINFO.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
INITDP_PARMS	Changed	refinement	{..., **ACPN, HLC**,...}	Parameters included when building an InitDP operation.
ACLI	New			Additional Calling Line Identity.
HLC	New			High Layer Compatibility.
INITDP_EXTENSIONS	Changed	refinement	{..., **SF_ENC, GAP_INT, NCPC, IN_CONT**, ...}	Additional Parameters included when building an InitDP operation.
SF_ENC	New			SF Encountered.
GAP_INT	New			GAP Interval.
NCPC	New			National Calling Partys Category.
IN_CONT	New			IN Container.

33.5.2.1.5 Datafill example
The following example shows sample datafill for table SERVINFO.

Figure 1 Example datafill SERVINFO

```
SERVIDX                                                              OPTION
-------------------------------------------------------------------------------

1234    ( INITDP_PARMS ( CDPA) ( ACLI) ( HLC) $)

34.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
RCO2MAP	New	New

34.5.2 Table/MIB/Remote Database Schema information

34.5.2.1 Name: RCO2MAP

RCO2 Mapping Table

34.5.2.1.1 Functional description

The new Table RCO2MAP has been created to map the RCO2 C-side links to PRI terminals. Datafilling a RCO2 hosted off a GWC in table RCCINV auto-datafills a NIL tuple in table RCO2MAP. This tuple can then be modified by the craftsperson by datafilling the PRI trunks. This results in static data download to the GWC, of the mapping information of the RCO2 c-side links to PRI trunks.

34.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

- SERVRINV
- CLLI
- SITE
- RCCINV

- TRKSGRP
- TRKMEM
- RCO2MAP

34.5.2.1.3 <Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
RCO2MAP	0	255	

34.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for <abbreviated name of table/MIB>.

<conditional information>

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RMGNAME	New	S_PMT RCCNO	4 CHARS 0 TO 255	This is the key for the table and is autodatafilled in table RCO2MAP when table RCCINV is datafilled.
HOSTGWC	New	XPMTYPE XPMNO	GWC 0 TO 255	C-Side PM-This field must be datafilled with the RCO2's c-side PM as datafilled in Table RCCINV. The XPMTYPE must be GWC.
GWCPRITB	New	TAB COUNT	0 TO max_clli 0 TO 20	PRI CLLI datafill. Refer Figure 34.5.2.1.5, "Datafill example"for details.

34.5.2.1.5 Datafill example

The following example shows sample datafill for table <abbreviated name of table>

Datafilling an RCO2 hosted off a GWC in table RCCINV results in table RCO2MAP being datafilled with a nil tuple as follows :

Figure 1 Table RCO2MAP- sample tuple auto-datafilled

```
TABLE RCO2MAP

RCCNAME CSPM GWCPRITAB
-------------------------------------------------------------------------
RM02 RCO2 0 GWC 205 NIL 0
```

This tuple can then be modified by the craftsperson by datafilling the PRI trunk. The PRI CLLI datafilled in RCO2MAP will be a PRI variant that supports NFAS (Non-Facility Associated Signalling) functionality, on which one D-channel supports B-channels from a number of PRI trunks. A sample tuple in table RCO2MAP is as per following figure.

Figure 2 Table RCO2MAP- PRI NFAS Variant

```
TABLE RCO2MAP
RCCNAME CSPM GWCPRITAB
-------------------------------------------------------------------------
RM02 RCO2 0 GWC 205 (PRICLLITST1 1) (PRICLLITST2 1) (PRICLLITST1 31)
```

The first and second PRI starting terminal number will correspond to the D-channel for RCO2 unit 0 and unit 1 respectively. Hence, the first and second starting CLLI must be unique. Also, for these CLLI's Table TRKSGRP must be datafilled with the D-channel information. The subsequent PRI starting terminal numbers correspond to the messaging links. For each of these messaging links table TRKMEM must have the next consecutive 31 time slots datafilled.

The above sample tuple has 3 PRI trunk starting CLLI's - (PRICLLITST1 1) (PRICLLITST2 1) and (PRICLLITST1 31). Each PRI trunk starting terminal number corresponds to an E1 on the RCO2's c-side. Hence, it is imperative that the number of PRI trunk starting terminal numbers keyed in by the user in table RCO2MAP, must be equal to the number of RCO2 c-side links provisioned in the CSLNKTAB field in table RCCINV.

34.5.2.1.6 Table release history update

34.5.2.1.7 Supplementary information

Restrictions/Warnings:

- A Tuple in table RCO2MAP is deleted when the corresponding tuple in table RCCINV is deleted.
- Tuples in table TRKMEM that are referenced in table RCO2MAP cannot be deleted. First delete the tuple in table RCCINV, this will auto-delete the tuples in table RCO2MAP, then delete the table TRKMEM datafill.

34.5.2.1.8 Translation verification other tools

The following example shows the output from <ToolName> when it is used to verify <abbreviated name of table>.

RCO2MAP does not used translation verification tools.

<abbreviated name of table> does not use translation verification tools.

34.5.2.2 Name: RCCINV

Remote Cluster Controller Inventory

34.5.2.2.1 Functional description

Changes are implemented in table RCCINV to enable provisioning of a CSPM type of GWC for a RCO2. Datafilling a RCO2 subtending a GWC in table RCCINV will result in an auto-datafill of a NIL tuple in table RCO2MAP.Deleting a RCO2 subtending a GWC in table RCCINV will delete the corresponding tuple in table RCO2MAP.

34.5.2.2.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

- SERVRINV
- CLLI
- SITE
- RCCINV

34.5.2.2.3 <Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
RCCINV	0	255	

The Table RCCINV size is unchanged.

34.5.2.2.4 Fields/OIDs

The following table lists fields/OIDs for <abbreviated name of table/MIB>.

<conditional information>

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RCCNAME		SITENM	alphanumeric	Site name. Enter the site name assigned to the remote location.
		PMTYPE	RCO2	Peripheral Module type.
		RCCNO	0-255	Remote cluster controller number. Enter the PM number
ADNUM			0 to 4095	Administration number.
FRTYPE			CRSC,MCRM,MCRMS,RCE, RCEI	Frame type. Enter the frame type on which the PM equipment is mounted.
FRNO			0 to 511	Frame number. Enter the number of the frame on which the PM is mounted.
SHPOS			0 to 77	Shelf position.Enter the position of the llower of the two shelves on the frame unit.
FLOOR			0 to 99	Floor. Enter the number of the floor on which the PM frame is located.
ROW			A to Z and AA to ZZ	Row. Enter the row in which the PM equipment frame is located.
FRPOS			0 to 99	Frame position. Enter the bay position of the PM equipment frame.
EQPEC			MX85AA	Equipment product engineering code.Enter MX85AA for the RCO2.
LOAD			alphanumeric (vector of upto eight characters)	Load. Enter the name given to the issue of PM software. Table PMLOADS must be datafilled first with the load used.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
EXECTAB		TRMTYPE EXEC	KEYSET, POTS, RMM_TERM KSETEX, POTSEX, RSMEX	Terminal type. Enter the type of PM terminals used Executive programs. Enter the set of executive programs required for the PM specified in field TRMTYPE. Enter KSETEX if TRMTYPE is KEYSET. Enter POTSEX if TRMTYPE is POTS. Enter RSMEX if TRMTYPE is RMM_TERM.
CSPM	Changed	XPMTYPE	GWC	Peripheral module type. Enter the type of PM to which the RCO2 C-side is attached
		XPMNO	(0 to 255)	Peripheral module number. Enter the number of the PM to which the RCC C-side is attached.
CSLNKTAB				C-side link table. This field is a vector of up to 16 entries.Enter the RCO2's C-side links that are connected to the PVG.
ESA			N	ESA is not supported in a RCO2.
INTRASW			N	Intraswitching is not supported in a RCO2.
ADDLMSGL			N	Additional message link. Additional message links are not supported.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTCARD				Optional card. This field is a vector of up to 10 entries.
TONESET				Tone set. Enter the tone set appropriate for RCO2.
PROCPEC				Processor equipment product engineering code.
E2LOAD			alphanumeric (vector of upto eight characters)	EEPROM load name. Enter the erasable electronic programming read only memory (EEPROM) load name.
EXTINFO		EXTSHELF	Y/N	Extension shelf.Enter Y if the CPM has an extension shelf and continue datafill for the subfields. Otherwise, enter N.
		EXTFRTYP	CEXT,MCRMS, RCEI	Extension frame type. Enter the type of frame in which the extension shelf is located.
		EXTFRNO	0 to 511	Extension frame number. Enter the frame number of the frame type in which the extension shelf is placed.
		EXTSHPOS	0 to 77	Extension shelf position. Enter the shelf position in inches above the floor.
		EXTFLOOR	0 to 99	Extension shelf floor location. Enter the floor on which the extension shelf is located.
		EXTROW	A to Z (except I and O)	Extension shelf row location. Enter the row in which the extension shelf is located.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
		EXTFRPOS	0 to 99	Extension shelf frame position. Enter the extension shelf position within the frame.
OPTATTR			METER	Assign/Remove the METER option to enable/disable AOC for RCO2s.

34.5.2.2.5 Datafill example

The following example shows sample datafill for table RCCINV that provisions a RCO2 subtending a GWC.

Figure 3 Table RCCINV- Sample Datafill

```
RCCNAME ADNUM FRTYPE FRNO SHPOS FLOOR ROW FRPOS EQPEC LOAD
 EXECTAB CSPM CSLNKTAB ESA INTRASW ADDLMSGL OPTCARD TONESET

(RMM_TERM RSMEX) (ESALINES ESAEX) $
GWC 205 (1) (2) (3) $Y Y N (UTR6 )(RAM6X69 ) (ISP 16) $ UK100
AX74AA AX74AA UPFWNU01 Y CEXT 1 6 1 C 5 MX86AA L$
```

34.5.2.2.6 Table release history update

The following information was added :

In CSPM subfield XPMTYPE - added GWC.

CSLNKTAB field for a RCO2 subtending GWC indicates the C-side links on the RCO2.

34.5.2.2.7 Supplementary information

Restrictions/Warnings:

- Datafilling a RCO2 subtending a GWC in table RCCINV, autodatafills a NIL tuple in table RCO2MAP.
- Deleting a RCO2 subtending a GWC in table RCCINV, deletes the corresponding tuple in table RCO2MAP.

- GWC Tuples in table SERVRINV, that are datafilled in table RCCINV cannot be deleted. First delete the tuple in table RCCINV and then delete the GWC from table SERVRINV.

34.5.2.2.8 Translation verification other tools

The following example shows the output from <ToolName> when it is used to verify <abbreviated name of table>.

RCCINV does not used translation verification tools.

<abbreviated name of table> does not use translation verification tools.

36.3 Office/Subnet parameters (OP/SP) (CM & SESM)

36.3.1 New/modified office/subnet parameters

Table 1 New of modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	DISABLE_DP_RECEPTION_ON_DGT	NEW	CM

36.3.2 Parameter information

36.3.2.1 DISABLE_DP_RECEPTION_ON_DGT

Disable DP Reception on lines assigned DGT option

36.3.2.1.1 Functional description

A new parameter named DISABLE_DP_RECEPTION_ON_DGT in table OFCENG is used to control(enable/disable) DP digit reception for lines assigned DGT option.

DP Digit Reception Disabled (DISABLE_DP_RECEPTION_ON_DGT=Y)
With this selection, DP Digit Reception is disabled officewide for lines assigned DGT option. This eliminates the generation of fake calls and unwanted billing records by line faults.

DP Digit Reception Enabled (DISABLE_DP_RECEPTION_ON_DGT=N)
With this selection, DP digit functionality remains unchanged.

36.3.2.1.2 Provisioning rules

If generation of fake calls and unwanted billing records occur on lines assigned DGT option by line faults, DISABLE_DP_RECEPTION_ON_DGT should be set to Y.

Otherwise, set DISABLE_DP_RECEPTION_ON_DGT to N.

36.3.2.1.3 Range information

Not applicable. The parameter can be set to Y or N, and will default to a value of N.

36.3.2.1.4 Activation

Changes to DISABLE_DP_RECEPTION_ON_DGT are immediately effective.

36.3.2.1.5 Dependencies

None.

36.3.2.1.6 Consequences

The following summary describes the effects of the DP digit control office parameter.

If DISABLE_DP_RECEPTION_ON_DGT is Y:

- DP digit reception is disabled on lines assigned DGT option.
- DP digit reception is unchanged on lines assigned DP option.
- Dial pulse phones on lines with DGT option are not supported.
- Generation of phantom calls on lines assigned DGT option is prevented.

If DISABLE_DP_RECEPTION_ON_DGT is N:

- DP digit functionality is unchanged.

36.3.2.1.7 Verification

Not applicable.

36.3.2.1.8 Memory requirements

No memory impact.

36.3.2.1.9 Parameter release history update

DISABLE_DP_RECEPTION_ON_DGT is added to table OFCENG in SN07 to control DP digit reception on lines assigned DGT option.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TRKSGRP	CHANGED	UNCHANGED

38.5.2 Table/MIB/Remote Database Schema information

38.5.2.1 Table Name: TRKSGRP.

38.5.2.1.1 Functional description

DMS100 switches are all based on ETSI V2 White book specification. Each market which its requirements are different from the base, can implement it by using the ability to declare its own VARIANT. Each market can use the VARIANT that already has been declared by the ISUP Platform.

For example: The Honduras national variant is identified by datafilling of the VARIANT field as ‘HONDURAS’ in table TRKSGRP for the Honduras ETSI ISUP trunks.

The VERSION field in table TRKSGRP is datafilled when the PROTOCOL field in table TRKSGRP indicates Q767 (ETSI ISUP). The 100_WHITE is available whenever the PROTOCOL is datafilled as Q767. The datafilled Version 100_WHITE together with the Variants define whether ETSI ISUP V2 or another market of ETSI ISUP V2 is used for that particular trunk group.

38.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

38.5.2.1.3 Size

38.11 Configuration Walkthrough
N/A.

39: Configuration (CN): A00003411

39.1 Hardware and Software Requirements

The NTMX76AB card must be equipped on GPP line peripherals with SX05 processor.
The NTMX76CA card must be equipped on DTCO2 trunk peripherals SX05 processor.
The QPO20xx or QCI20xx load files should be supported for SX05 processor.

39.2 Initial Configuration

GPP should be loaded with QPO20xx load file.

DTCO2 should be loaded with QCI20xx load file.

NTMX76AB tone cards must be equipped on GPP peripherals.

NTMX76CA tone cards must be equipped on DTCO2 peripherals.

The LTCINV table should be datafilled with the new 'HONTONES' toneset.

The GPP/DTCO2 static data should be downloaded

39.3 Office/Subnet parameters (OP/SP) (CM & SESM)

FEATURE_TONE_SET office parameter.

39.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	FEATURE_TONE_SET	CHANGED	CM

39.3.2 Parameter information

39.3.2.1 <abbreviated parameter name>

<Feature Tone Set>

39.3.2.1.1 Functional description

The FEATURE_TONE_SET office parameter is responsible for providing market specific feature treatment definitions instead of default hardcoded definitions.

This office parameter will be expanded so as to include the new HONTONES toneset that is required for the Honduras market.

39.3.2.1.2 Provisioning rules

For the Honduras market the FEATURE_TONE_SET office parameter must be set to HONTONES value.

39.3.2.1.3 Activation

For activation of the office parameter the Restart Reload must be performed.

39.3.2.1.4 Dependencies

None

39.3.2.1.5 Consequences

If this office parameter is not set to HONTONES, the CWT tone will not be connected during CWT feature usage for Honduras market.

39.3.2.1.6 Memory requirements

No memory impact.

39.4 Upgrade Impact

N/A

39.5 Data schema (DS) (CM, MIBS, RDB)

39.5.1 New/modified tables, MIBs, or Database Schema

The LTCINV table will be modified. The TONESET field will be enhanced with HONTONES tones set.

Table 2 New or modified tables

40.6 Service Orders (SO) (CM & SESM)

40.7 Software optionality control (SOC)

Table 3 SOC

SOC option name:	XLAS Rev Trans Custmod
SOC option title:	Yes
SOC option control type:	state
New SOC option?	Yes
SOC option order code	XLAS0054
Option defined in DRU:	WT
Affected products:	ISN07

This feature is patched backed to SW000004. The patch ID is NAP43. NAP43 is a password activateble patch. For an ONP from (ISN04 - ISN06) to (ISN07 and beyond), the state of the SOC option XLAS0054 will automatically be set to 'ON', if NAP43 was activated before the ONP, and also all of the functionalities of this feature will be ON after the ONP, too. But for this ONP, a password for SOC option is still required to change the RTU field of the SOC option XLAS0054 in loads SW000007 and beyond. "SOC states and RTU values of the SOC optionXLAS0054 after ONPs" is described in table 14.

Table 41 SOC states and RTU values of the SOC option XLAS0054 after ONPs

ONP	State of SOC option after ONP		RTU of SOC option after ONP	
	IF State of SOC option in ISN07 (nodatafill load) before ONP is IDLE	**IF State of SOC option in ISN07 (nodatafill load) before ONP is ON**	**IF RTU of SOC option in ISN07 (nodatafill load) before ONP is N**	**IF RTU of SOC option in ISN07 (nodatafill load) before ONP is Y**
ISN04 (ISN04 or ISN06) to ISN07 (ISN07 or beyond) NAP43 is active on ISN04 (or ISN06)	ON	ON	N	Y

Table 41 SOC states and RTU values of the SOC option XLAS0054 after ONPs

ONP	State of SOC option after ONP		RTU of SOC option after ONP	
	IF State of SOC option in ISN07 (nodatafill load) before ONP is IDLE	IF State of SOC option in ISN07 (nodatafill load) before ONP is ON	IF RTU of SOC option in ISN07 (nodatafill load) before ONP is N	IF RTU of SOC option in ISN07 (nodatafill load) before ONP is Y
ISN04 (ISN04 or ISN06) to ISN07 (ISN07 or beyond) NAP43 is not active on ISN04 (or ISN06)	IDLE	ON	N	Y

42.6 Service Orders (SO) (CM & SESM)

42.7 Software optionality control (SOC)

There is one new SOC option that is introduced with this feature,XLAS Reroute Rel Cause.

XLAS Reroute Rel Cause is defined under XLAS SOC group.Functionality of feature is controlled with this SOC option.It is a state SOC, whose can be ON or IDLE.When state of XLAS Reroute Rel Cause is ON, feature becomes functional.

Table 1 XLAS Reroute Rel Cause SOC

SOC option name:	XLASxxxx
SOC option title:	XLAS Reroute Rel Cause
SOC option control type:	state
New SOC option?	Yes
SOC option order code	XLASxxxx
Option defined in DRU:	WT
Affected products:	ISN07

This feature is patched backed to ISN04. The patch ID is NAP45. NAP45 is an password activateble patch. For an ONP from ISN04 to ISN07 and beyond, the

state of the SOC option XLAS0053 will automatically be set to ‘ON’. And all of the functionalities of this feature will be ON. But after the ONP, a password for SOC option is still required to change the RTU field of the SOC option XLAS0053 in loads ISN07 and beyond.

43.5.1 New/modified tables, MIBs, or Database Schema

Table 3 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
KKSCRN	NEW	OLD

43.5.2 Table/MIB/Remote Database Schema information

43.5.2.1 Name: KKSCRN
KundenKennung Screening

43.5.2.1.1 Functional description
A mechanism to facilitate KK, IPI and TMR based screening and routing has to be provided as a part of this activity. To organize the data required to fulfill the above requirement, a new table KKSCRN has been created.

Access to this table from call processing and TRAVER starts with table TRKOPTS which then moves to CALLCNTL. After this, all other tables would be accessed depending on the particular datafill in CALLCNTL.

A screening index is datafilled against the trunk group (TRKOPTS) and the same screening index is also datafilled in the table (KKSCRN) which will be screened first.

The KK for the call is used along with this screen index to look up the entry in table KKSCRN. This entry can specify a customer group to use for translations (if no other BC or IPI specific routing is required), or a new screen index and the next screening table (IPISCRN)

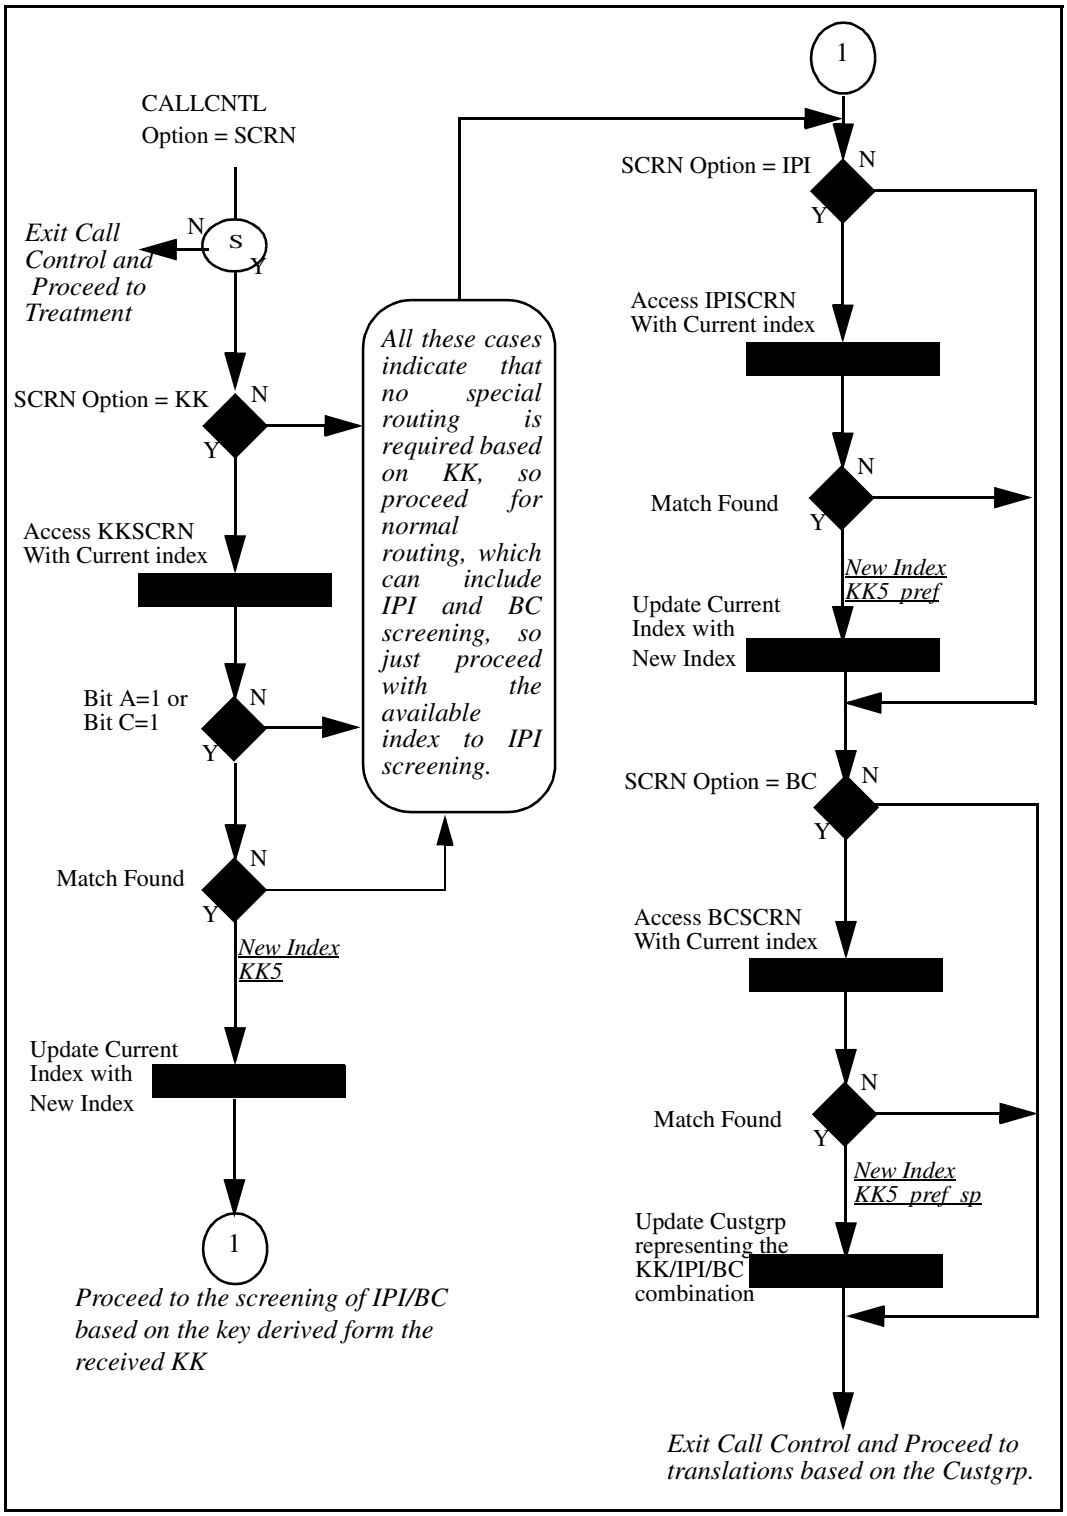
The IPI for the call is used along with the current screen index to look up the entry in table IPISCRN. This entry can specify a customer group to use for translations (if no other IPI specific routing is required), or a new screen index and the next screening table (BCSCRN).

The BC for the call is used along with the current screen index to loop up the entry in BCSCRN. This entry specifies the customer group to use for translations.

The end result is that the customer group for the call can be specified uniquely for each KK/IPI/BC combination.

The special routing will be invoked based Bit A and Bit C of national parameter NP.UKK. if either Bit A = 1 or Bit C = 1 is set in the message, else it proceeds for Normal routing.

Figure 1 Flow Diagram for KK screening



43.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

TABLE TRKOPTS

TABLE CALLCNTL

TABLE CDPNSCRN

SUBTABLE CDPNDATA

TABLE KKSCRN

TABLE IPISCRN

TABLE BCSCRN

43.5.2.1.3 Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
KKSCRN	0	8191	Memory is automatically allocated for 16 DPC devices.

43.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for KKSCRN.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
KKKEY	NEW	SCRNKEY	Any valid index in table CALLCNTL	KundenKennung Key. Subfield KundenKennung Screening Key has to be datafilled first in table TRKOPTS and then table CALLCNTL before datafilling into this table
	NEW	KK	0-16383	KundenKennung.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NEWSCKEY	NEW		Any valid index in table CALLCNTL	New Screening Index. This index has must exist in table CALLCNTL. This filed is of type THIRTY_TWO_CHAR_VECTOR
CCOPTION	NEW		Call Control Option	Call Control Option. This filed is of type THIRTY_TWO_CHAR_VECTOR

43.5.2.1.5 Datafill example

Table 2 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ISERVOPT	CHANGED	UNCHANGED

44.5.2 Table/MIB/Remote Database Schema information

44.5.2.1 Name: ISERVOPT

44.5.2.1.1 Functional description

The new tuple JAPANPRI will be introduced by this activity in table ISERVOPT. This tuple holds entries for every Japan PRI related enhancement which is intended to be switched on and off by datafill. At the moment table ISERVOPT will allow an entry for opening backward voice path on the Japan PRI PBXs by sending a second PI#8 in the PROGRESS/ALERT messages.

Value Yes ‘Y’ implies that this service should be supported, value No ‘N’ or absence of JAPANPRI tuple in the iservopt table means the service is not supported.

44.5.2.1.2 Usage sequence and implications (CM Only)
There is no requirement to datafill tables in a specific order.

44.5.2.1.3 Size
Unchanged.

44.5.2.1.4 Fields/OIDs
The following table lists fields/OIDs for ISERVOPT.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SOPTSKEY	Changed	-	JAPANPRI	New entry JAPANPRI defined.
SOPTSVAR	Changed	option	JAPANPRI	New entry JAPANPRI defined.
SOPTSVAR	New	allow_backward_voice_path	{Y, N}	Whether second PI#8 should be added or not to the PROGRESS/ ALERT messages.

44.5.2.1.5 Datafill example
The following examples shows sample datafill for table ISERVOPT.

- Addition of the second PI#8 should be turned on:
  JAPANPRI JAPANPRI Y
- Addition of the second PI#8 should be turned off:
  JAPANPRI JAPANPRI N

44.5.2.1.6 Table release history update
The following information was added:

New entry JAPANPRI added to fields SOPTSKEY and SOPTSVAR.

New option ALLOW_BACKWARD_VOICE_PATH added to the JAPANPRI.

44.5.2.1.7 Supplementary information
None.

44.5.2.1.8 Translation verification other tools
ISERVOPT does not use translation verification tools.

45.4 Upgrade Impact

45.4.1 Dump and Restore

If the boolean field CGSCCDEA exists in the prior releases, it is transferred unchanged; if it does not exist, it is moved in ONPs by ‘N’ as default.

45.4.2 Element Management Upgrade

45.5 Data schema (DS) (CM, MIBS, RDB)

45.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TRKGRP	CHANGED	CHANGED

45.5.2 Table/MIB/Remote Database Schema information

45.5.2.1 Name: TRKGRP

Trunk group table

45.5.2.1.1 Functional description

TRKGRP table is used to store agent basis information about trunks to be able to define and change variable options about trunks including group type, trunk direction, class of service,....etc.

A new field is added to this table to provide a new control mechanism in order to activate/deactivate terminating SCC processing for CGPN.

45.5.2.1.2 Usage sequence and implications (CM Only)

In order to be able to add a new tuple into table TRKGRP, current datafill order is unchanged.

45.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TRKGRP	0	912	

45.5.2.1.4 Fields/OIDs

The following table lists new field added into TRKGRP table.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CGSCCDEA	NEW	None	Y/N	Terminating CGPN SCC processing deactivation/ activation

45.5.2.1.5 Datafill example

The following example shows sample datafill for table TRKGRP:

```
>table trkgrp
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: TRKGRP
>pos GANSIE1STEP1
GANSIE1STEP1 AXXESS 0 NPDGP NCIT 2W ODP1 MIDL 16 7 16 16 4 5 4
ALERTING

>y
```

When the CGSCCDEA field is set to ‘Y’ in Table TRKGRP, there are some restrictions for changing the ‘Protocol’ and ‘Protidx’ fields of TRKGRP table as follows:

For axxess trunks if the CGCCDEA field is ’Y’, the ‘Protocol’ field in Table Trkgrp can not be changed to any protocol other than ISUP and TUP.

If the Protocol field is attempted to be changed from ISUP or TUP to any other protocol, an error message is displayed and modification can not be realized.

- For an Axxess trunk with the CGSCCDEA field ‘Y’ and protocol field ISUP or TUP in table TRKGRP:

“CGSCCDEA can be set to Y for ISUP and TUP protocols.“

Figure 6 Changing Protocol field in TRKGRP if CGSCCDEA is 'Y'

For axxess trunks if the CGCCDEA field is ’Y’, the ‘Protidx’ field in Table Trkgrp cannot be changed to any index other than the indexes representing the supported variants.

If the Protidx field is attempted to be changed from an index representing a supported variant to any other index of an unsupported variant, an error message is displayed and modification can not be realized.

- For an Axxess trunk with the CGSCCDEA field ‘Y’ and protidx field in table TRKGRP representing a supported variant of ISUP:

“CGSCCDEA can be set to Y for ISUP trunks datafilled

in Table ISUPATTR as ETSI ISUP V1,ETSI ISUP V2 and ANSI ISUP.”

- For an Axxess trunk with the CGSCCDEA field ‘Y’ and protidx field in table TRKGRP representing a supported variant of TUP:

“CGSCCDEA can be set to Y for TUP trunks datafilled in Table TUPATTR as RBTUP/BBTUP.”

47.5 Data schema (DS) (CM, MIBS, RDB)

47.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
C7UPTMR	CHANGED	UNCHANGED
ISUPSVC	UNCHANGED	UNCHANGED
xxHEAD (PXHEAD, OFCHEAD, CTHEAD, ACHEAD, FAHEAD, AMHEAD, FTHEAD)	CHANGED	UNCHANGED

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
xxCODE (PXCODE, OFCCODE, CTCODE, ACCODE, FACODE, FTCODE, AMCODE)	CHANGED	UNCHANGED

47.5.2 Table/MIB/Remote Database Schema information

47.5.2.1 Table C7UPTMR

Common Channel Signalling No.7 ISUP Timers

47.5.2.1.1 Functional description

Table C7UPTMR contains call processing and maintenance timers. The timers are datafilled according to trunk subgroup. A new ISUP timer "CRG" is datafilled in table C7UPTMR. CRG timer is started to wait CRG messages after ANM/CON messages in backward metered ISUP calls. This timer is provisioned only for OG and 2W trunks.

47.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

47.5.2.1.3 Size

The minimum and maximum number of tuples allowed in the table C7UPTMR is not changed by this activity.

47.5.2.1.4 Fields/OIDs

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CRG	new	no	{5 TO 2400}	Charge timer in 100 miliseconds.

47.5.2.1.5 Datafill example

The following example shows sample datafill for table C7UPTMR.

Figure 1 Sample C7UPTMR datafill

```
TABLE: C7UPTMR

TMRKEY C7UPDIR TMRS OPTIONS
-------------------------
OGN7 OG Q767 15 180 326 60 90 20 180 10 60 10 60 1000 10 120
40 10 (CRG 400) $
ICN7 IC Q767 15 180 326 60 90 15 5 15 10 60 10 60 10 60 10 60
60 10 60 10120 240 10 20 4 $
```

In this datafill example CRG timer is datafilled as 400 (40 seconds) in C7UPTMR for the tuple OGN7. That "OGN7" is datafilled in TMRNAME field of TRKSGRP table. So the trunk subgroups whose tmrname is OGN7 has a charge timer with the value 40 seconds.

CCS7 Signalling ISUP Timers Table

50.5.2.1.1 Functional description

N/A.

50.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

50.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
C7UPTMR	0	31	The maximum number of tuples that can be datafilled is 31 with one tuple assigned the value NIL.

50.5.2.1.4 Fields/OIDs

The ranges of timers T5, T13, T15, T17, T19, T21, and T23 which are datafillable through C7UPTMR table were enlarged to 15 minutes by the activity ACT.A00000937 in MMP19 (ISN06) time frame.

Since enlarged timer ranges were supported only on PDTC's equipped with SX05, the following warning was displayed by ACT.A00000937 while datafilling values greater than 320 for NQ764T5 and NQ764T17 fields within BW, IC and OG refinements in C7UPTMR table.

"T5 and T17 timer values greater than 320 are affective only at PDTC's when both units are equipped with SX05."

This activity enhances GWC implementation to support enlarged CCITT timer ranges, therefore, the warning message is modified as follows:

"T5 and T17 timer values greater than 320 are affective only for the following peripherals:

- PDTC (when both units are equipped with SX05)

- GWC"

50.5.2.1.5 Datafill example

50.5.2.1.6 Table release history update

ACT.A00005164 enhanced GWC implementation to support enlarged CCITT timer ranges. The warning message which is displayed while datafilling NQ764T5 and NQ764T17 timers is modified to indicate that the enlarged timer ranges are supported also on GWC's.

50.5.2.1.7 Supplementary information

51.4 Upgrade Impact

51.4.1 Dump and Restore

The feature introduces two new fields in form of a vector in table MNNODE. During the Restore, the type reformat proc for MNNODE will fill this vector set with **$** to indicate current system behavior on the SPM. The current system behavior is MuLaw for OC3-SPMs and Alaw for STM-SPMs.

For upgrades to later releases, the existing companding law and bit inversion option if datafilled in table MNNODE will be retained.

51.4.2 Element Management Upgrade

None

51.5 Data schema (DS) (CM, MIBS, RDB)

51.5.1 Modified tables

table MNNODE.

table MNCKTPAK

table OFCENG

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
MNNODE	CHANGED. Two new fields **complaw** and **bitinv** are added for DMSCP class SPM	UNCHANGED

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
MNCKTPAK	UNCHANGED	UNCHANGED, Supplementary information added
OFCENG	UNCHANGED	UNCHANGED, Supplementary information added.

51.5.2 Table Schema information

51.5.2.1 Name:

51.5.2.1.1 Managed Network Node table**Functional description**

Table MNNODE stores SPM node specific information. This information includes:

- Class/Variant of SPM.
- Clock reference details of the SPM.
- Resource information that a particular SPM can provide.
- Alarm information for different failures for the SPM.
- EXEC information for CallP.
- Capacity index for the DMSCP SPM

This feature adds two new fields **complaw** and **bitinv** of enum type to DMCSP class of SPM as a vector **compopt**. The craft shall be able to change the p-side companding law and bit inversion option for a OC3-SPM of DMSCP class.

51.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

51.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNNODE	0	86	The memory is allocated dynamically upon the addition of the tuple from the OAMDB pool.

Fields

Table 3 Table field descriptions for MNNODE

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NODEKEY	Unchanged	NODETYPE NODEID	ENUM {0 to 256} BYTE {0 to 85}	This represents the Node type (e.g. SPM). This represents a unique SPM number.
ALIAS	Unchanged		Alphanumeric 1 to 12 characters	This field represents a unique Alias name for the SPM.
NODEINFO	Unchanged	CLASS T_SPMNDV_DMSCP_DATA	{0 to 10}	Represents class of SPM (like SMG4, DMSCP etc.) (refinement for DMSCP with fields as below in Subfield)
	Unchanged	FLOOR	{0 to 99}	This field gives the floor position details.
	Unchanged	CLKMODE	{SYNC}	This represents CLOCK synchronization mode for the MG4K.
	Unchanged	CLKREF	{0 to 5} {*Internal*, *External*, *Line*, *Loop*}	This represents the source and reference for the clock sync. A newly added SPM should be datafilled as LINE. *Internal*:SYNC to MS *External*:SYNC to SRM *Line*:SYNC to OC3 RM. *Loop*:SYNC to active OC3 RM.

Table 3 Table field descriptions for MNNODE

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
	Unchanged	LEDTIMER	{0 to 1440}	This type designates time in minutes. If no critical fault has been detected on an SPM for the specified length of time, then LEDs on the SPM will be turned off to extend their life. Value of 0 means that the LEDs will never be turned off.
	Unchanged	RSRUTLIM	1. (table {0 to 27} of *{0 to 27}, {10 to 100}})* 2. 0 to 6	This field represents the resources that shall be provided by the SPM. This also gives the threshold limit for each of the resources.
	Unchanged	ALRMCTRL	1. (table {0 to 21} of *{o to 20}, {{0 to 4}, 0 to 1}))* *2. (0 to 21)*	This field represents the Alarm that should be triggered when the SPM goes to a particular state or any failure occurs. This also gives the severity of the failure and the information about reporting on to the MAP.
	Unchanged	EXECTAB	1. (table {7} of *{o to 63}, {0 to 119})* *2. (0 to 8)*	This field represents the EXEC lineup information which is useful for call processing.
	Unchanged	CAPINDX	{STANDARD,ENHANCED,PREMIUM}	This field represents the SPM Call Processing Capacity type

Table 3 Table field descriptions for MNNODE

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
COMPOPT	**New**		see subfields	COMPANDING OPTION. This field consists of a vector of up to 1 entry in subfields complaw and bitinv. Enter **$** to select current system behavior (MuLaw for OC3-SPMs and ALaw for STM-SPMs). This vector is supported only for OC3-SPM.
	New	**complaw**	ALaw, MuLaw	COMPANDING LAW. This contains the p-side companding law for SPM.
	New	**bitinv**	NBI, OBI, EBI, ABI	BIT INVERSION OPTION. This field contains the bit inversion option for the SPM. Currently only EBI and ABI are supported.

51.5.2.1.4 Datafill example

Figure 1, "Datafill example" shows sample datafill for table MNNODE.

Figure 1 Datafill example

```
Datafill with compopt datafilled -

(SMCHLD MJ RPT) (SMCHLD24 CR RPT) (SPMREXBYP MN RPT) $ (ABTRK SPMEX)
(AB250 SPM250) (PRAB SPMEX) (PRAB500 SPM250) $ STANDARD $
```

51.5.2.1.5 Table release history update

SN07:

New vector **compopt** is added to table MNNODE for DMSCP variant of the SPM. This vector consists of two fields - **complaw,** which contains the p-side companding information of that SPM whose values are {Alaw, MuLaw}, and **bitinv,** which contains the bit inversion option of the SPM whose values are {NBI, OBI, EBI, ABI}. The default value of the vector is **$** which indicates that SPM confirms to current system behavior of OC3-SPM having MuLaw and STM-SPM having ALaw.

51.5.2.1.6 Supplementary information

The value for **compopt** can be changed only when the SPM node is in either MANB or OFFL state. Otherwise the following error condition will occur -

ERROR: Both CEMs must be in MANB or OFFL state with no maintenance for COMPOPT change.

By default compopt field will take $ as value over upgrade. If craft datafills value other than $ then following warning will be displayed -

Warning: Datafilling companding law and bit inversion is recommended for non-standard configurations. Use of incorrect values will severely affect voice quality of the SPM.

A warning message will be displayed when **compopt** fields are changed -

Warning: Changing companding law or bit inversion option may severely affect voice quality of the SPM and must be done with care. Perform the following steps to activate the changes in SPM X:

1. BSY the CEMs if not in MANB state.

2. Issue RESETMOD command on both the CEMs.

3. RTS the CEMs.

While changing companding law to MULAW from either $ or ALAW, check is done for STM RM datafill. If STM datafill is found then COMPOPT change will not be allowed. Following error message is displayed.

ERROR: STM RM is datafilled in table MNCKTPAK. MULAW is not appropriate law for the STM-SPM.

51.5.2.1.7 Translation verification other tools

None.

51.5.3 Table Schema information

51.5.3.1 Name:

Managed Network Circuit Pack

51.5.3.2 Supplementary information

Table MNCKTPAK is not changed and no new fields are added to this table by this feature. Only new warning messages are introduced as follows -

While adding an OC3-SPM in table MNCKTPAK, if the p-side companding law in table MNNODE is A-law the following message is displayed -

WARNING: This OC3-SPM has a non-standard companding law datafilled in MNNODE. If this is not desired, please change companding law in MNNODE to the appropriate value before proceeding. If this is desired, please continue.

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT

Actions: If ‘Y’ is entered, tuple addition of OC3 in table MNCKTPAK will be allowed assuming that OC3-SPM with A-Law is the desired configuration.

If ‘N’ is entered, tuple addition will be aborted, the craftsperson has to manually change companding law for that SPM in table MNNODE before proceeding.

While adding a STM-SPM in table MNCKTPAK, if the p-side companding law in table MNNODE is MuLaw, the following error message is displayed -

ERROR: STM-SPM with MuLaw companding is not a supported configuration. Please change companding law in MNNODE before proceeding.

Actions: Tuple addition of STM in table MNCKTPAK is aborted. The craftsperson had to manually change companding law of that SPM in table MNNODE before proceeding.

51.5.4 Table Schema information

51.5.4.1 Name:

OFCENG - Office Engineering Parameter table

51.5.4.2 Supplementary information

Table OFCENG is not changed and no new fields are added to this table by this feature. This section mentions the limitation while changing TYPE_OF_NETWORK parameter.

If TYPE_OF_NETWORK field is changed, all DMSCP SPM tuples in table MNNODE must be verified that the **compopt** field is in the desired configuration for the new TYPE_OF_NETWORK. If they are found otherwise, the craftsperson must manually change **compopt** field for those SPMs to the desired configuration.

Performance Management (PF)

Introduction

This chapter describes impacts to performance management, such as operational measurements and performance measurements, for the features planned for this release. Only those features with performance-management impacts are listed.

Featid	Title
A00001914.AA11	CEPT International Line Restriction Enhancements
A00001930.AA14	Last and Total Call Meter Inquiry Services
A00002904.AA12	CTI Toggle

1: Performance (PF): A00001914

1.1 Performance management strategy

N/A

1.2 Performance management tools and utilities

1.3 Performance Measurements (PM), Operational Measurements (OM), and stats

The ILR OM are adopted to support the flexible definition of the barring programs in table ILRCLASS. The ILR OM provides per OM group the number of activations, deactivations, usages and unsuccessful deactivations:

Figure 1 Flexible ILR OM group

```
TACLASS:   ACTIVE
START:2003/05/10 18: 30:00 SAT; STOP: 2003/05/10 18:47:12 SAT;
SLOWSAMPLES:      11 ; FASTSAMPLES:       103 ;
    KEY (RCODE)
     INFO (OMILRINFO)
       ACT              DACT    USGE    UDACT

  02 DIDD
                       10 1 25 5
```

The ILR1 OM group is deleted, because all information is stored in the flexible ILR OM group.

The example above shows an OMSHOW output for the new ILR OM group. It shows for the OM group with R-Code 2 called DIDD 10 activations, 1 deactivation, 25 times a call was barred due to this program and 5 times the deactivation failed. These are stored under ILRCLASS OM group.

Two new OM registers are defined for successful deactivation and unsuccessful temporary deactivation under ILR OM group which includes ILRCERR, ILRUINT, ILRINTG OM registers. These are:

- TEMPDAC
- TEMPUDAC

Figure 2 OMSHOW output for ILR OM group

```

1.3.1 PM, OM, and stats format

1.3.2 OM Group template (applies only to DMS)

1.3.2.1 OM description

OM group ILRCLASS provides information about the usage and performance of the International Line Restriction feature (ILR). This OM group stores the counts of usage, activation, successful and unsuccessful attempts of deactivation of ILR feature for related restriction classes.

OM group ILR provides information about successful and unsuccessful temporary deactivation, interrogation of ILR feature and also customer error.

1.3.2.2 Release history update

OM group ILRCLASS has a flexible body and includes registers according to the ILRCLASSes datafilled in table ILRCLASS.

OM group ILR includes registers of the successful and unsuccessful temporary deactivation, interrogation of ILR feature and also customer error.

TEMPDAC: Number of successful attempts fo temporary deactivations of ILR feature.

TEMPUDAC: Number of unsuccessful attempts for temporary deactivations of ILR feature.

1.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

Figure 4 OM Group ILR Display

1.3.3 Register (applies only to DMS)

1.3.3.1 Register description

Register **TEMPDAC**

Temporary Deactivation of ILR feature.

TEMPDAC is a peg register. It counts the number of Temporary deactivations of ILR feature.

Register **TEMPUDAC**

Unsuccessful Attempts for Temporary Deactivation of ILR feature

TEMPUDAC is a peg register. It counts the number of unsuccessful attempts for temporary deactivations of ILR feature.

1.3.3.2 Register release history update

1.3.3.3 Associated Registers

Existing ILR OMs became more flexible in this activity.

ILR and ILRCLASS OM groups are defined. For detailed information, please refer to the above sections.

1.3.3.4 Associated registers

None

1.3.3.5 Associated logs

None

2: Performance (PF): A00001930

2.1 Performance management strategy

2.2 Performance management tools and utilities

2.3 Performance Measurements (PM), Operational Measurements (OM), and stats

2.3.1 PM, OM, and stats format

2.3.2 CMI OM GROUP

2.3.2.1 CMI OM description

CMI OM Group provides information about the successful and unsuccessful usage and performance of CMI features (SVBI0033 SOC must be ON). CMI OM group has four registers with names CMIATT, CMIUSG, CMIOVFL, and CMICERR. These OM registers are pegged by LCMI and TCMI features. CMI OM group is multi-tuple, which includes LCMI and TCMI tuples.

2.3.2.2 Release history update

The CMI OM group is being introduced by this feature, and implemented in ISN07.

2.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

```
>omformat CMI
CMI
KEY (CMI_OPTION)

          CMIATT  CMIUSG  CMIOVFL CMICERR
```

2.3.2.4 Group structure

OM group provides one tuple for each CMI functionality.

Key field: CMI_OPTION {TCMI, LCMI}

Info field: None

```
>omshow CMI active
CMI

CLASS:   ACTIVE
START:2003/05/25 12:00:00 SUN; STOP: 2003/05/25 12:01:47 SUN;
SLOWSAMPLES:          2 ; FASTSAMPLES:          11 ;
         KEY (CMI_OPTION)

                 CMIATT CMIUSG   CMIOVFL          CMICERR
         TCMI    4       2       1                1
         LCMI    10      9       1                0
```

2.3.2.5 Associated OM groups

None

2.3.2.6 Associated functional groups

None

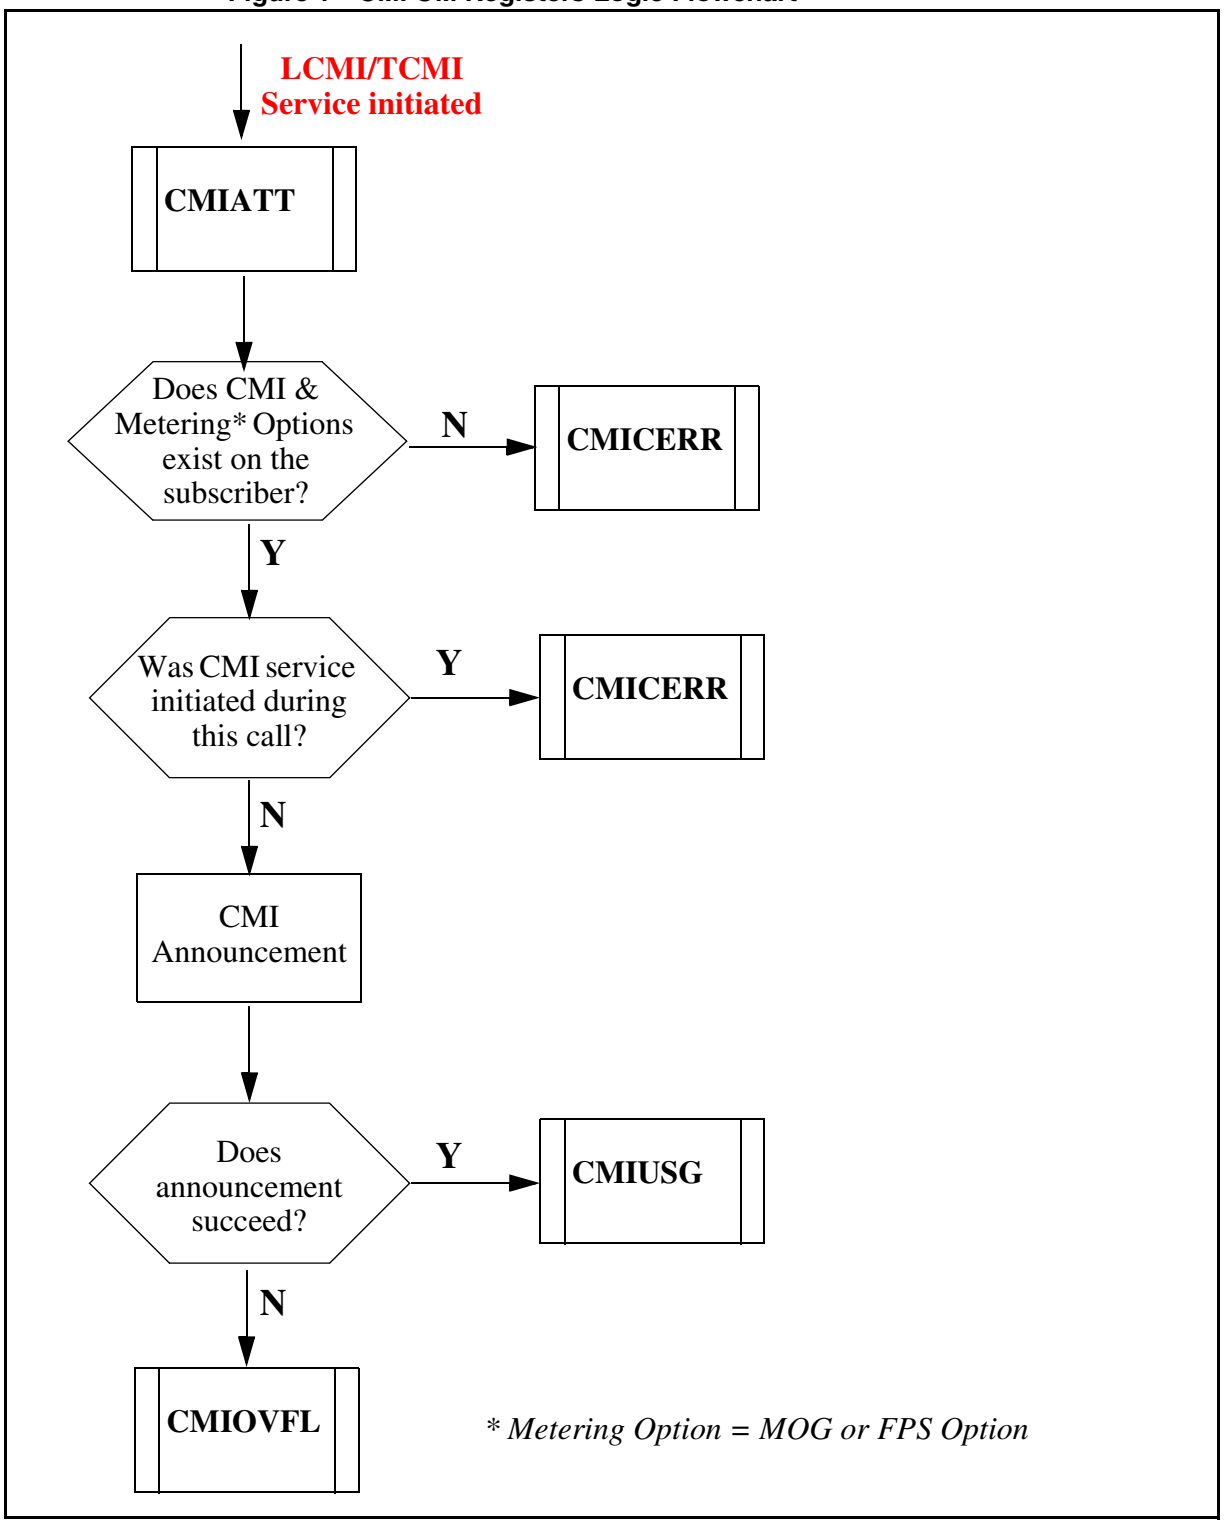
2.3.2.7 Associated functionality codes

Table 1 Functionality codes associated with OM group

Functionality	Code
Total Call Meter Inquiry	
Last Call Meter Inquiry	

2.3.2.8 OM group registers logic flow chart

Figure 1 CMI OM Registers Logic Flowchart



2.3.3 Register CMIATT

2.3.3.1 Register description

This register counts the number of attempts for TCMI/LCMI service to be invoked. Generally this register is incremented each time LCMI or TCMI service is initiated. This means, LCMI/TCMI service is successfully translated through translation table IBNXLA and successfully activated.

2.3.3.2 Register release history update

None

2.3.3.3 Associated registers

None

2.3.3.4 Associated logs

None

2.3.4 Register CMIUSG

2.3.4.1 Register description

This register counts the number of times LCMI/TCMI service is successfully completed. This register is incremented just after the announcement is successfully played

2.3.4.2 .Register release history update

None

2.3.4.3 Associated registers

None

2.3.4.4 Associated logs

None

2.3.5 Register CMIOVFL

2.3.5.1 Register description

This register counts the number of times LCMI/TCMI service can not be successfully completed due to insufficient system resources. It is incremented when the announcement can not be provided to the subscriber.

2.3.5.2 Register release history update

None

2.3.5.3 Associated registers

None

2.3.5.4 Associated logs

None

2.3.6 Register CMICERR

2.3.6.1 Register description

his register counts the number of times CMI service is not provided to the subscriber, due to illegal initiation of the service (i.e. initiation of the CMI service during active call) or subscriber is not allowed to use the service.

2.3.6.2 Register release history update

None

2.3.6.3 Associated registers

None

2.3.6.4 Associated logs

                2            1            2
```

3.3.5 Group structure

OM group SCAISRV4 provides tuples for each SCAIGRP

Key field: SCAI_GROUP

Info field: None

Number of tuples: One per SCAI group

The key field identifies the SCAI group name which is a unique character string with a maximum length of 16 characters. The SCAI group is defined in table SCAIGRP.

3.3.6 Associated OM groups

SCAISERV, SCAISRV2, SCAISRV3 are related.All these groups provide OM data on SCAI service usage.

3.3.7 Associated functional groups

None

3.3.8 Associated functionality codes

Accounting (ACC)

Introduction

This chapter describes new and changed features that are planned for this release.

Featid	Title
A00002053.AA14	AMA Records for Metered Features
A00002364.AA08	CLI/RDN/OCN capture in Billing Record (CDR) for ANSI ISUP and HK ISUP on DRU GSP20

1: Accounting (ACC): A00002053

1.1 Accounting strategy

This feature uses the existing AMA/Billing framework based on the Bellcore AMA Format. The existing structure code SCI_00514 (with call code CCI_006) and the existing module code MCI_612 (with context_id 80040) are used to generate the new AMA record FTR.

The FTR record is generated when a feature metering is done successfully due to usage of the feature actions such as assign, usage, deassign, activation, deactivation or interrogation etc...This record is generated for IBN lines if the SOC option RBIL0014 is ON and the all required datafills are done as given in the Section 2.2.4 of the FN document. The FTR record contains the following information:

- Record Code
- Calling number
- Date
- Time
- Feature code
- Action type
- Feature Metering Count

Additional to this record an AMA log is generated with the name AMAB156 which has the same information as FTR record. If the parameter LOGAMA is ON in table AMAOPTS, the AMAB156 log is printed whenever the FTR record is generated.

The generation of the FTR record for the metered actions of ICR feature option depends on the new office parameter FTR_RECORD_FOR_ICR_OPT in table OFCVAR.

1.2 CM billing changes

1.2.1 Structure codes

No new structure code is created by this feature.

1.2.2 Structure code nnn

Table 1 Structure code

Information	Field number
Structure code	nn
	nn

1.2.3 Module code

No new module code or context identifier is created by this feature.

1.2.4 Module code nnn

Table 2 Module code

Information	Field number	Number of characters
Module code	nn	nn
	nn	nn

1.2.5 Fields

In this feature, some fields of the existing structure code SCI_00514 and the existing module code MCI_612 (context_id 80040) are used for the new FTR AMA Record when the SOC option RBIL0014 is ON.

Calling number, Date and Time information for metered feature action are put in the SCI_00514 fields Originating Open Digits 1, Date and Connect Time respectively, as shown in below:

Calling Number -> ORIGINATING OPEN DIGITS 1

Date -> DATE

Time -> CONNECT TIME

ORIGINATING OPEN DIGITS 1 field in SCI_00514 contains 11 digits. But the Calling Number data of the IBN agent metered for feature actions has 10 digits. So, this data is put in this field as right-justified and the first digit filled by 0.

DATE field of SCI_00514 is filled by the Date data of the metered feature action as in the Table 3.

Table 3 Date field explanation in SCI_00514

BCD Char	Meaning
1	Last Digit of Year
2-3	Month
4-5	Day
8	Sign (hex C)

CONNECT TIME field of SCI_00514 is used to place the Time at which the feature action is metered, as in Table 4.

Table 4 Connect Time field explanation in SCI_00514

BCD Char	Meaning
1-2	Hours
3-4	Minutes
5-6	Seconds
7	Tenths of Seconds
8	Sign (hex C)

Note: Date and Time information are also displayed in the Generic Digits String 2 fields of the appended module code MCI_612 (80040). Please refer to Table 6.

In this feature, EXT TERM OPEN DIGITS 1 field of the SCI_00514 is filled by zeros for the Called DN.

Then the remaining information which are Record Code, Feature Code, Action Code and Feature Meter Count, are put in the Generic Digits String 1 fields of the MCI_612 (80040) as in the following Table 5. In this table, the usage changes are given in the bold format.

Table 5 Generic Digits String 1 usage for new FTR record

BCD Char	Content
1-2	Record Code **is filled as 03 for the new FTR record**.
3-4	Call Class **is not used and filled as 00 in the new FTR record.**
5-6	Call Info **is not used and filled as 00 in the new FTR record.**
7	Unused field (0).

BCD Char	Content
8-15	Pulse Count **is used to hold the following information:** **8-9 Feature Code** **10-11 Action Code** **12-13 Unused (00)** **14-15 Meter Count**
16	Sign (hex C)

The Record Code field contains 2 digits Record Code data which uniquely identifies the type of the record to distinguish it from the other record types generated when SOC option RBIL0014 is ON. It is set to '03' for the new FTR record since the existing record codes are '00' for Turkish CAMA, '01' for IAA and '02' for ICR.

The Call Class (2 digits, from 3 to 4) and Call Info (2 digits, from 5 to 6) fields are not used in the new FTR record. So, these are filled by zero. Also the seventh digit is already unused and 0.

The Pulse Count field has 8 digits from 8 to 15, and for FTR record it is filled by the Feature Code, Action Code and Feature Meter Count information in the following order:

Feature Code (2 digits) -> Pulse Count (the first 2 digits)

Action Code (2 digits) -> Pulse Count (3 and 4th digits)

Space, 00 -> Pulse Count (5 and 6th digits)

Feature Meter Count (2 digits) -> Pulse Count (7 and 8th digits)

In the fields of the Generic Digits String 2 of 80040, the Date and Time values have already existed and they are continued to display in this FTR record with the same format as before (additional to Date and Time information put in the SCI_00514 fields DATE and CONNECT TIME). The explanations for the existing fields of the Generic Digits String 2 are given in Table 6.

Table 6 Existing Generic Digits String 2 fields

BCD Char	Meaning
1-6	Date
7-13	Time
14-15	Unused
16	Sign (hex C)

The example views of this record can be given as in Figure 1 for ‘calldump’ command and Figure 2 for ‘calldump full’ command.

Figure 1 The example view of the FTR Record.

MODULE CODE:                 000C      FINAL MODULE
```

In these Figures, Generic Digits String 1 fields are interpreted as in below:

0300000**21**4500**02**C

03: Record Code is FTR (first 2 digits)

00000: Unused space (5 digits after record code)

21: Feature Code (2 digits as 8th and 9th)

45: Action Code (2 digits as 10th and 11th)

00: Two space between Action Code and Meter Count (12th and 13th digits)

02: Meter Count (last 2 digits)

Feature Meter Count information is displayed by 2 digits in the FTR record and AMAB156 log. The data shown in this field reflects the value datafilled in the CHARGE field of table MTRFEAT and the range for the charge value has been defined as 0 to 255 in this table. Although 3 digits data is datafilled in the charge field of MTRFEAT table, the last 2 digits will be displayed in the FTR record and AMAB156 log, as in MTR156 log.

AMAB156 log contains FTR record data (i.e, old MTR 156 data) and it is optionally generated depending on the existing AMA option LOGAMA in table AMAOPTS. If the LOGAMA option is ON , then the AMAB156 log is printed whenever the FTR record is generated. If the LOGAMA option is OFF, then the AMAB156 log is not printed although the FTR record is generated.

Record Code is ‘BE’ in AMAB156 in spite of ‘03’ in FTR Record. Because the Record Code values BB, B8, BD are currently used in the AMA logs of the ICR, ICAMA, IAA records.

Please refer to Figure 3 for the example view of AMAB156 log.

Figure 3 AMAB156 LOG Format Example

```
RSNW4E06BK     AMAB156 MAR26 09:23:36 7216 INFO AMA RECORD DATA
           RECORD CODE = BE
           CALLING NUMBER = 1027835406   FEATURE CODE = 21
           ACTION = 45                   COUNT = 02
           TIME = 0923355                DATE = 030326
```
