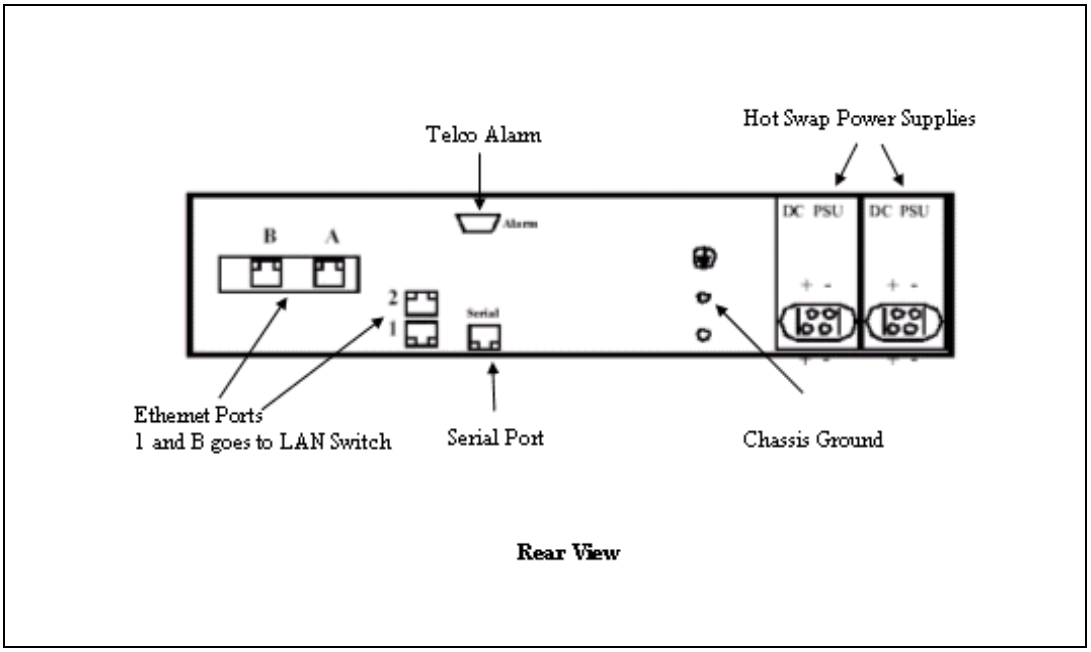
H	Disk 1 Activity/Fault LED (green or red)	Indicates disk 1 SCSI hard drive activity when green, or a disk 1 SCSI hard drive fault when red. When flashing green/red indicates that disk 1 is rebuilding disk array.
I	Main power LED (green)	When continuously lit, indicates the presence of DC power in the server. The LED goes out when the power is turned off or the power source is disrupted.
J	NIC0/NIC1 activity LED (green)	Indicates activity on either NIC0 or NIC1.
K	System ID LED (green)	Reserved for indicating any system SCSI hard drive activity. This Functionality is not implemented in SN07.

The connection ports on the rear view of the Session Server is shown in Figure 5, on page 1568.

Figure 5 Connection Ports



126.4 Software Requirements or Dependencies

The Session Server software has a layered architecture, which consists of the following:

- The base NCGL layer, running on Linux version 2.4 kernel.
- An application layer that includes a maintenance process for each application, which manages the associated processes.

The software running on this server has the following features:

- Linux operating system
- Maintenance applications for node maintenance, fault detection, and failover
- Apache Web server for provisioning and maintenance

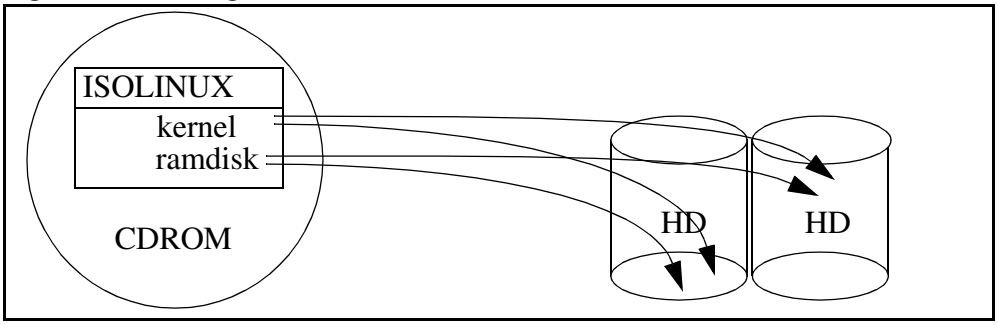
The Session Server has its own requirements in terms of software delivery and upgrade.

126.4.1 Software Delivery

The Session Server software load packages the kernel and ramdisk images using CDROM as the software delivery mechanism. The CDROM will be bootable, so that software installation and upgrades are as simple as inserting

the CD into the drive and rebooting. The software installation procedure is done separately on a per Session Server unit.

Figure 6 CD Image Installation to Hard Disks



126.4.2 Software Upgrade

This section addresses the upgrade of a simplex Session Server. The Session Server web interface contains a section under the admin panel to allow for upgrade to new load, as shown in Figure 19, on page 1596. The customer can select a default boot load as well as remove any older loads, which may no longer be needed. Space will be reserved on the hard drive to maintain approximately 3 or 4 Session Server loads in case fallback to a previous load is required. Further, it will allow for an upgrade of the Session Server load from either a CD inserted in the CDROM drive, from an ISO image located on the network, or from a Session Server CD mounted elsewhere in the network (via FTP). In summary the supported upgrade methods are:

- local cdrom
- local file (iso image, or load.tgz from CDROM)
- remote file via ftp (iso image, or load.tgz from CDROM)
- remote file via http (iso image, or load.tgz from CDROM)
- remote file via https (iso image, or load.tgz from CDROM)

126.5 Network Connectivity

Each Session Server (SS) is configured with two GigE interfaces directed to the LAN switch, as represented by link 0 and link 1 in Figure 7, on page 1570. In addition, two interfaces connect unit 0 to unit 1, as shown as the Point To Point (PTP) link.

Figure 7 Link Configuration of the Session Server

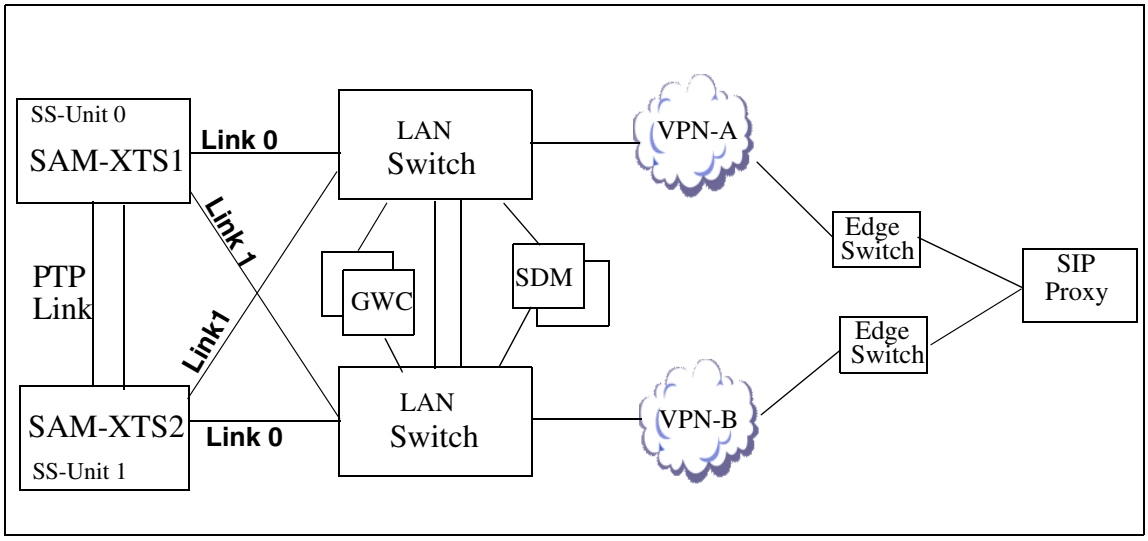


Figure 8, on page 1570 shows an example of the link configuration on the Session Server where “ethB” of each server is connected directly to the LAN switch, and “eth1” is connected to the alterative LAN switch.

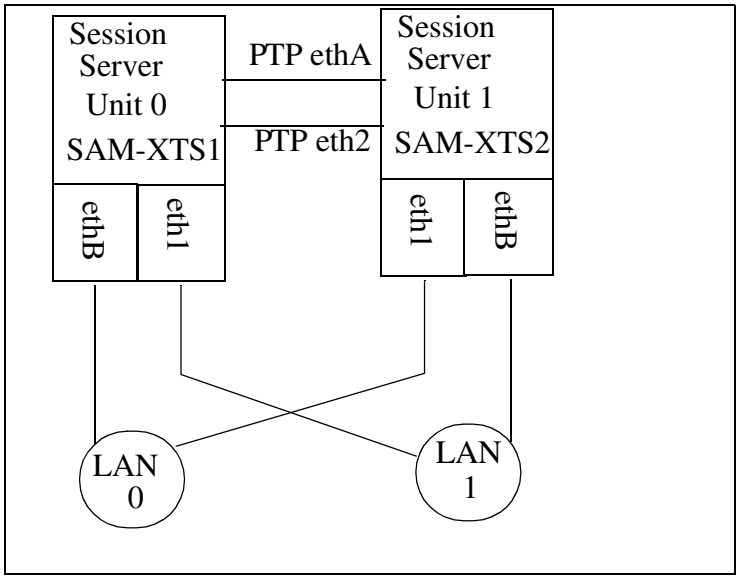
Figure 8 Link Configuration for Session Server



126.5.1 Network Monitor IP Address

Network Monitor IP address is the address of one of the reliable node within the network that co-exist with SAM-XTS node. The Network Monitor IP address is used by SAM-XTS as a primary node reference unit to make sure its network connectivity is good and unit is connected with in the network. In case of failure to get proper network connection with the Network Monitor IP

address, SAM-XTS uses NTP server IP address as secondary backup reference to verify its connectivity in the network.

126.5.2 Session Server IP addresses

The Session Server requires a block of eight consecutive IP addresses that have to be on the same subnet as the Call Server (CS) LAN. The customer determines the IP addresses. The last octet of the IP address must be divisible by 8. Please refer to “Table 2 Example of Session Server Configuration” on page 1571. It is worth indicating that the PTP IP addresses are internally set by the system to 192.168.1.1 and 192.168.1.2.

Table 2 Example of Session Server Configuration

Session Server IP addresses	Example Unit 0	Example Unit 1	Datafilled By user	Description
Active Node[a]	172.16.16.72	172.16.16.72	no	Logical application
Inactive Node	172.16.16.71	172.16.16.71	no	Logical application
Local unit	172.16.16.67	172.16.16.70	yes	Logical unit link
Local unit, Link 0	172.16.16.65	172.16.16.68	no	Physical unit link
Local unit, Link 1	172.16.16.66	172.16.16.69	no	Physical unit link
Mate unit	172.16.16.70	172.16.16.67	yes	Logical unit link
Mate unit, Link 0	172.16.16.68	172.16.16.65	no	Physical unit link
Mate unit, Link 1	172.16.16.69	172.16.16.66	no	Physical unit link
Local PTP link 0	**192.168.1.1**	**192.168.1.2**	no	Local point to point link[b]
Mate PTP link 1	**192.168.1.2**	**192.168.1.1**	no	Mate point to point link

a. Active node last set of digits must be divisible by 8

b. The IP addresses **192.168.1.1/192.168.1.2** are assigned to the local/mate Point to Point (PTP) links. To avoid conflict, make sure **not** to assign the same IP addresses for the Session Server.

126.6 Session Server OA&M

This section discusses Operations, Administration, and Maintenance (OA&M) topics for the new Session Server platform.

As mentioned earlier, the architecture for the Session Server will consist of a dual unit configuration similar to that of gateway controllers. The units consists of an active and inactive unit. Both units have the ability to raise alarms and generate logs. The alarms raised on the active and inactive units can be viewed from either unit. However, the logs can be viewed on the same unit that generated the log.

126.6.1 Web Based OAM

The Session Server runs its own Element Manager (EM). This means that the web server runs locally on the Session Server. Which in turn means that maintenance type activities for the Session Server also take place on the Session Server.

The crafts person uses a web-based interface to perform the maintenance activities. This interface consists of a web server running on the Session Server that provides maintenance and monitoring related web pages.

The web agent is the browsing application which will be used to display the Session Server EM. The supported browsers are:

- Internet Explorer 6
- Netscape Navigator 6.2 & 7.1

Netscape is supported on both PC (Windows) and Solaris clients, but not on Linux clients.

All Session Server web pages are divided into three areas:

- **Header**

  The area with the Nortel logo and the “Platform”, “Application”, and “Help” tags. All functions will be performed under the “Platform Tag”.

- **Menu Frame**

  The user uses the menu bar on the left to locate the proper function in the web page hierarchy.

- **Interaction Frame**

  This area is where a user fills in forms, performs maintenance actions, and obtains relevant information.

An example of the home page of the Session Server is shown in Figure 17, on page 1594.

Figure 9 Session Server home page

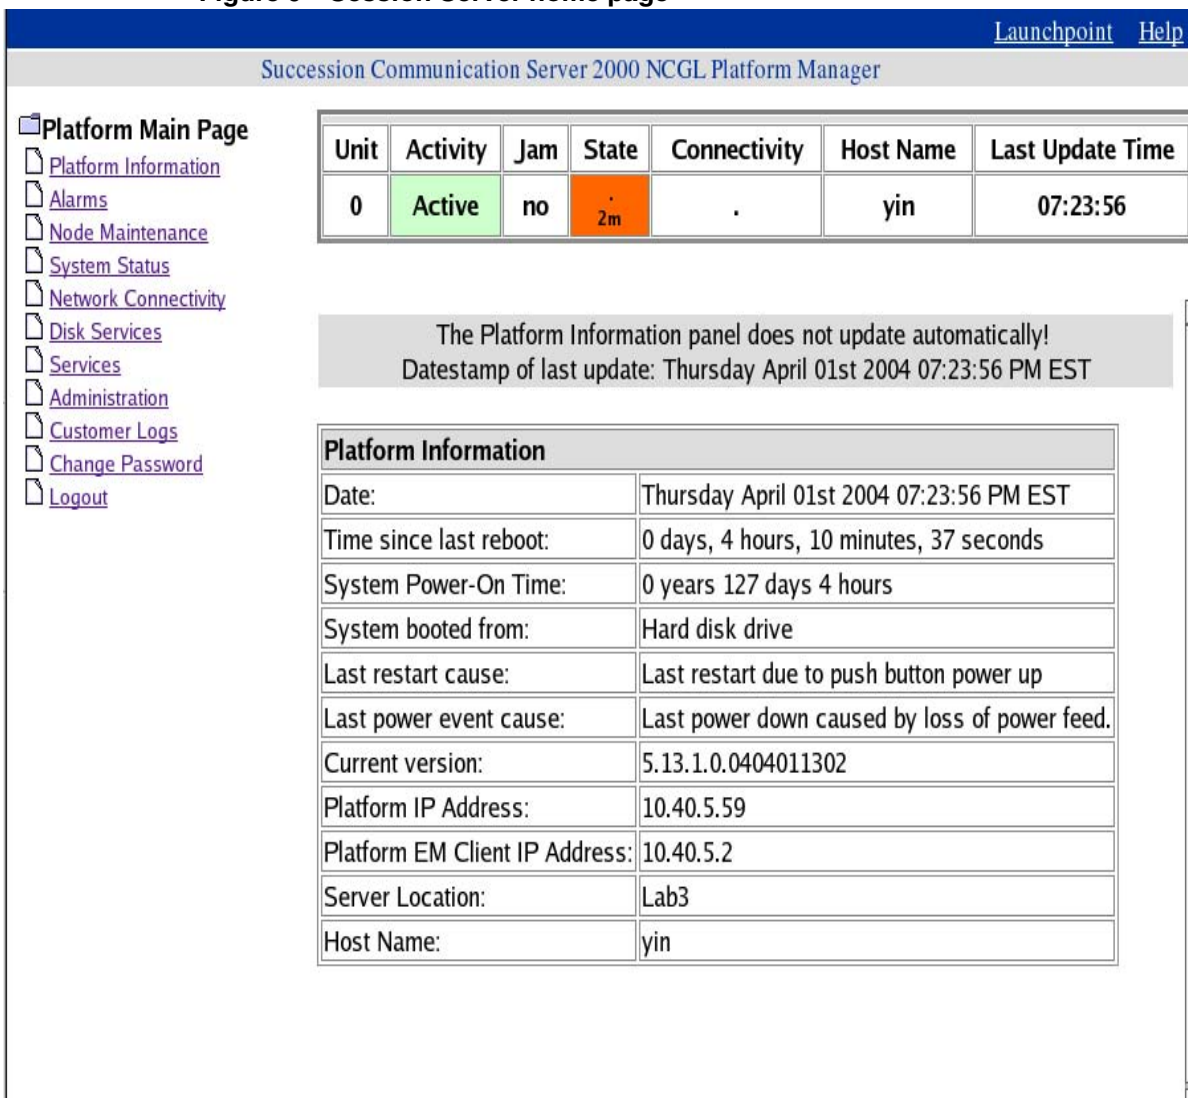


Table 3 Platform Main Page Links Description

Function	Description
System Information	Displays basic system information in an introductory screen.
Alarms	Provides the ability to view alarm information which consists of type, id, timestamp, severity, and description.
Node Maintenance	Provides the ability to perform the node maintenance actions like Swact/ Swact Force, Jam/Jam Force & UnJam.
System Status	Provides the ability to view chassis data, CPU Load, CPU Utilization, Process Information, and Memory Information.
Network Connectivity	Provides the connectivity status of local ethernet ports and network connectivity to the mate server and the ability to perform link maintenance actions such as lock/ unlock and swlnk.
Disk Services	Allows a view of file system data including partition specific data such as total space, used and available space. Also provides the ability to do Disk and Filesystem maintenance action.
Services	Provides the ability to view network active remote sessions and NTP information.
Administration	Allows the user to perform administrative tasks related to the system such as bootload management to setup the default load, software upgrade, reboot, reboot mate, halt and halt mate.
Customer Logs	Provides the ability to view customer logs.
Change Password	Provide the ability to change logged in user pass word
Logout	Provide the ability to log out of the session

126.6.2 System Status

The intention is to have the ability to view the status of both SS units at the same time when the user logs in. The status will be displayed as a frame on top of the interaction frame. Within the status frame the following information will be shown:

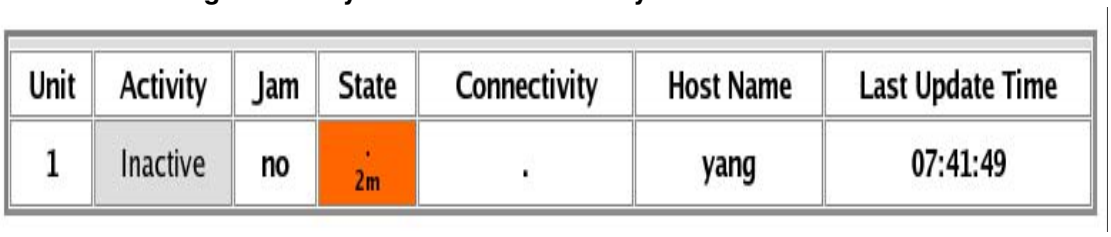
- unit number
- unit activity status (Active/Inactive) -- Active has green back ground -- Inactive has gray back ground
- unit jam status (yes/no)
- Overall system State - with number of alarms on both units
- session server host name
- last update time

In order to display the system status, a PHP script will be used to pool the required information to display within the frame. The status frame is refreshed approximately every 20 seconds. The valid link states mapping is captured in Table 4, “Mapping of link States,” on page 1575.

Table 4 Mapping of link States

Link State	Description
.	INSV - In SerVice
M	MANB - MAN Busy
S	SYSB - SYStem Busy
-	UNEQUIP -UNEQUipPed IP
NA	UNKNOWN

Figure 10 System Status Frame Layout



126.6.3 System Information

The home panel will display platform information for both Session Server units, which includes the following:

- Current date
- Time since last reboot
- System Power-On Time:
- System booted from
- Last restart cause
- Last power event cause
- Current version
- Platform IP Address
- Platform EM Client IP Address
- Server Location
- Host Name

126.6.4 Alarms

The Session Server has the capability to generate Alarms to report faults due to:

- network connectivity

- maintenance action failure
- mate communication
- disk usage
- memory usage
- disk mirroring failures

The alarms that are raised at this panel are the ones that are currently active on the system. The alarm panel is refreshed approximately every 54 seconds.

In addition, an application on the Session Server, such as the SIP Gateway application, has the ability to generate Alarms, Logs, and Operational Measurements (OM). The alarms that are raised on the Session Server are reported to the SNMP Trap destination server, if one is provisioned.

Alarms are formatted and displayed as defined in ITU-T Recommendation X.733(Systems management: Alarm reporting function), as follows:
`<Type> <ID> <Timestamp> <Host> <Serverity> <Description>`

126.6.4.1 Type

The alarm type specifies the alarm category for the given alarm. Valid alarm types are:

Table 5 Alarm Type (CCITT X.733)

1	Communications alarm
2	Quality of service alarm
3	Processing error alarm
4	Equipment alarm
5	Environmental alarm

126.6.4.2 ID

The alarm ID specifies, in general terms, why the given alarm was raised.

Examples of alarm IDs seen on Session Server are:

- Threshold Crossed
- Communications subsystem failure
- Loss of Signal

Please refer to section “126.19 Appendix B - Alarms” on page 1597 for a complete list of alarm IDs.

126.6.4.3 Timestamp

The alarm timestamp specifies when the alarm was raised. The date and time given were current on the Session Server system when the given alarm was raised.

126.6.4.4 Host

The session server host name from where alarm was raised.

126.6.4.5 Severity

The alarm severity specifies the seriousness of the given alarm.

Alarm severity can be one of the following:

— Warning

Indicates the detection of a potential or impending service affecting fault.

— Minor

Indicates the detection of a non-service affecting fault condition and that corrective action should be taken in order to prevent a more serious fault.

— Major

Indicates that a service affecting condition has developed and an urgent corrective action is required.

— Critical

Indicates that a service affecting condition has developed and immediate corrective action is required.

Note: 'cleared' is also a valid alarm severity, but will not be seen on the Alarms Panel, since the Alarms Panel only shows alarms that are currently raised.

126.6.4.6 Description

The alarm description provides specific details about the given alarm.

126.6.4.7 Alarms Panel Limitations

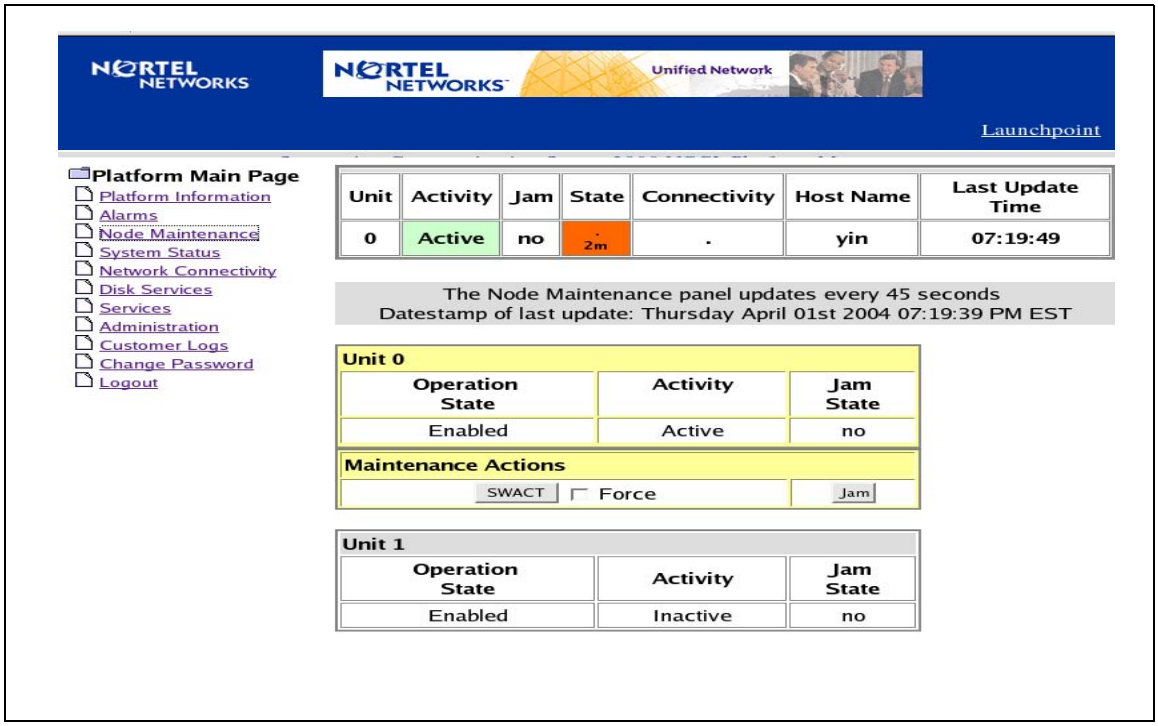
- The Alarms Panel sort order cannot be modified (it defaults to sorting by severity then by time), nor does the Alarms Panel support filtering of alarms.
- The Alarms Panel header will scroll out of sight if the browser client is not large enough to view all alarms and the user scrolls to the bottom of the window.
- If the SS system date/time are changed after an alarm is raised, the Alarms Panel does not update its timestamps. The timestamps shown at the Alarms Panel were those current at the time that the alarms were raised.

- The Alarms Panel refreshes automatically every 45 seconds. The refresh period is set by the system and is not configured
- If the system threshold values are changed after an alarm is raised, the Alarms Panel does not update its values in the *description* field. The threshold values shown at the Alarms Panel are still the values that were current at the time that the alarms were raised. In general, any of the text in an alarm is valid from the time the alarm was raised and is never updated.
- A critical alarm will not necessarily cause the system to SWACT. For a complete list of conditions that could cause the system to reset please refer to section 126.10 “Fault Handling” on page 1585.

126.6.5 Node Maintenance Actions

From the Session Server EM the user can perform node maintenance actions such as SWACT and JAM/UNJAM. This panel is refreshed approximately every 54 seconds. Figure 11, "Node MTC Frame Layout" shows the proposed layout for the node maintenance frame.

Figure 11 Node MTC Frame Layout



This frame is accessible from the menu list, namely “Node MTC”. The unit that the user is logged into will be highlighted. If that unit reboots, then the connectivity to that session will be lost. On the other hand, if the connection to the mate unit is lost, then all the fields for that unit will show unavailable status until the unit recovers.

126.6.6 System Status

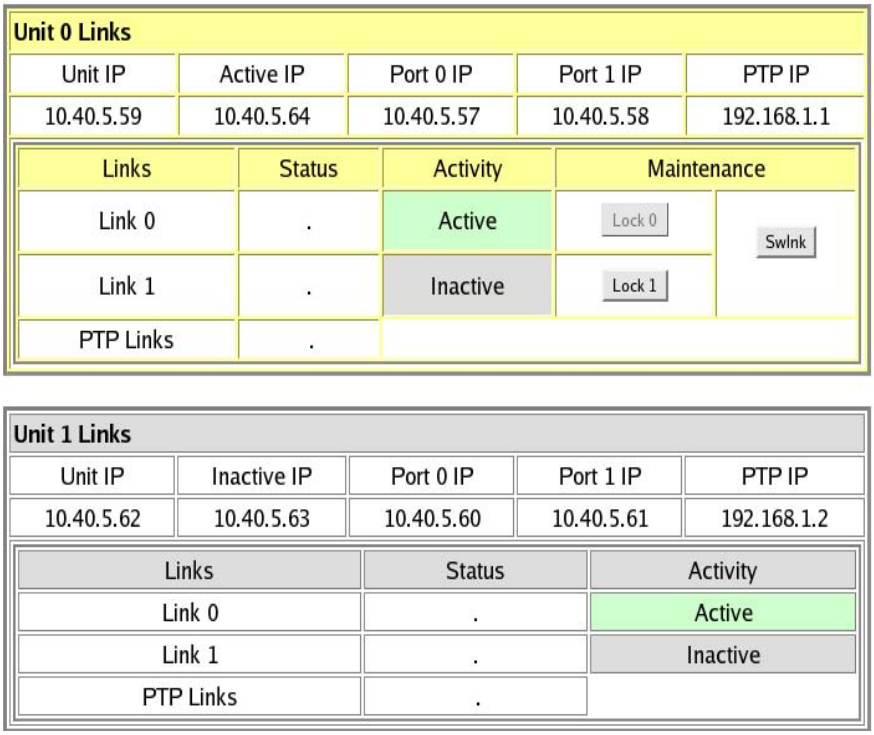
The system panel is used to view system parameters for Session Server unit. From the system panel the following parameters are available:

- view Chassis Information (system self test, chassis subsystem).
- view CPU usage (shows 1 min, 5 mins, and 15 mins load average/ threshold).
- view CPU Utilization (shows 5, 20 & 30 minsUtilization average and respective alarm thresholds)
- view the number of zombie processes on (shows minor, major, and critical alarm thresholds).
- view memory usage (shows minor, major, and critical alarm thresholds).

126.6.7 Network Connectivity / Link Maintenance

This section discusses the connectivity panel where link maintenance can be performed. When selecting this tab, the user can view both unit’s Ethernet connectivity status as well as perform link maintenance actions to lock/unlock and switch link activity. The Network Connectivity panel is refreshed approximately every 54 seconds. Figure 12, "Link MTC Frame Layout" shows the connectivity frame layout. The list of IP addresses will be shown when selecting the QueryIP button. For a complete list of valid link status please refer to Table 4, “Mapping of link States,” on page 1575.

Figure 12 Link MTC Frame Layout



Unit 0 Links

Unit IP	Active IP	Port 0 IP	Port 1 IP	PTP IP
10.40.5.59	10.40.5.64	10.40.5.57	10.40.5.58	192.168.1.1

Links	Status	Activity	Maintenance	
Link 0	.	Active	Lock 0	SwInk
Link 1	.	Inactive	Lock 1	
PTP Links	.			

Unit 1 Links

Unit IP	Inactive IP	Port 0 IP	Port 1 IP	PTP IP
10.40.5.62	10.40.5.63	10.40.5.60	10.40.5.61	192.168.1.2

Links	Status	Activity
Link 0	.	Active
Link 1	.	Inactive
PTP Links	.	

Note: In SN07 actions on mate links is not supported.
Hence the gray color for lock/unlock/SwLnk.

126.6.8 Disk Services

The Session Server EM has a storage panel which provides the following disk management functionality:

- view RAID array status
- disk maintenance
  - — remove disk
  - — insert disk
- view volume group information
- view filesystem information
- create a new filesystem
- remove a filesystem
- modify a filesystem

This panel displays information that is relevant to the local unit to which the browser is pointing.

126.6.9 Services

This panel is used to display the network active remote session status connected to the server and to view the NTP servers status.

This panel will display information specific to the Session Server unit the user is logged into. If the server local time is significantly out of sync with the NTP server, then the only way to resync the time is to reboot the inactive server, perform a swact, and reboot the newly inactive unit.

126.6.10 Admin

The admin panel is used to perform administrative tasks related to the Session Server unit. The actions supported from this panel are:

- Bootload Management (to set default bootload, or remove bootload)
- Software Upgrade, the user has the following options to upgrade the bootload:
  - — Anonymous FTP
  - — FTP
  - — HTTP
  - — HTTPS
  - — Local File
  - — Local CDROM
- Server Maintenance (reboot or halt)

126.6.11 Customer Logs

The Session Server provides the capability for the system or the application running to generate logs. The logs can be viewed on the Session Server's log view web page. Information shown about a particular log include fields shown in Table 6, "Example of Customer Logs Format," on page 1582. The Session Server generates different types of logs. This section, however, addresses the customer logs.

```
<time stamp> <hostname> <process name> <Name> <Number> <Severity> <Event Type>
<Label> <Description>

* Nov 12 15:54:56 loopback alarmd: NXTS802 MINOR INIT Array: '/dev/md0'
* |               |        |       |    |    |     |    |      |
* |               |        |       |    |    |     |    |      +--- description
* |               |        |       |    |    |     |    +---------- label
* |               |        |       |    |    |     +--------------- event type
* |               |        |       |    |    +--------------------- Severity
* |               |        |       |    +-------------------------- log number
* |               |        |       +------------------------------- log name
* |               |        +--------------------------------------- process name
* |               +------------------------------------------------ hostname
* +-------------------------------------------------------------- time stamp
```

```
Nov 11 16:20:43 loopback alarmd: XTS301 MINOR INIT Array: '/dev/md0' (/boot)
Status: The array is currently being rebuilt.
```

Table 6 Example of Customer Logs Format

Name	Number	Severity	Event Type	Label	Description
NXTS	301	CLEARED, MINOR, MAJOR, CRITICAL	Fault (FLT)	Array	Hard disk related alarm
NXTS	802	CLEARED, MINOR, MAJOR, CRITICAL, NONE	Fault (FLT) Trouble (TBL)	Error Status Threshold exceeded	Filesystem-related alarms

For screen shots of each panel on the platform main page, please refer to “126.18 Appendix A - Platform Main Web Page Interface” on page 1590.

126.7 Conditions for SWACT

There are three types of swact supported on the platform: manual, system initiated and application requested. Those types of Swacts will be performed on the node depending on the state of the system and failure conditions according to the following set of rules (except under extraordinary circumstances causing the swact to fail; the rules are listed in order of precedence):

1. A Session Server running cannot swact when running in a simplex configuration (!) or when the inactive side is completely isolated and unreachable (!!) or in “jammed” state.
2. Manual “forced” request always causes the system to swact
3. Critical failure conditions on the inactive side will prevent a swact to that inactive side.
4. Applications can reject swact requests
5. Critical failure conditions on the active side will cause a system-initiated swact.

These rules can also be summerized by the following table:

Unit status		Applications accept the SWACT		Application rejects SWACT	Manual "Force" SWACT
Active	**Inactive**	**Manual / Application requested SWACT**	**System Initiated SWACT**		
Not critical	Not critical	SWACT	(not applicable)	(no action)	SWACT
Not critical	critical	(no action)	(not applicable)	(no action)	SWACT
critical	Not critical	(not applicable)	SWACT	(no action)	SWACT
critical	critical	(no action)	(no action)	(no action)	SWACT

In the above set of rules, "critical failure conditions"are symmetrical in that the same conditions that would cause a swact from the active side would also prevent a swact to a failed inactive side. These correspond to the following cases:

- Unit not available: power loss, in the process of rebooting
- Sanity watchdog timeout, kernel panic or critical hardware failure.
- Critical netmon alarms, such as becoming isolated or otherwise no longer responding to its mate.
- Loss of one or both disks.

  Note: Manual Swact is allowed to a system which has single disk missing/fail alarm.

"Critical failure conditions" does NOT include the following, even though some alarms for those may be categorized as "critical":

- "major" or "minor" alarms for connectivity and most h/w faults
- Most H/W failures: power supply fault detection, voltage, temperature, fan, CPU, memory and other h/w failures (this is candidate content for sn08).
- OS status faults: cpu usage, memory usage, # zombie processes
- Disk usage

  Note: The OS status critical alarm is not symmetrical, It will prevent swact but does not cause system initiated swact.

126.8 Commissioning

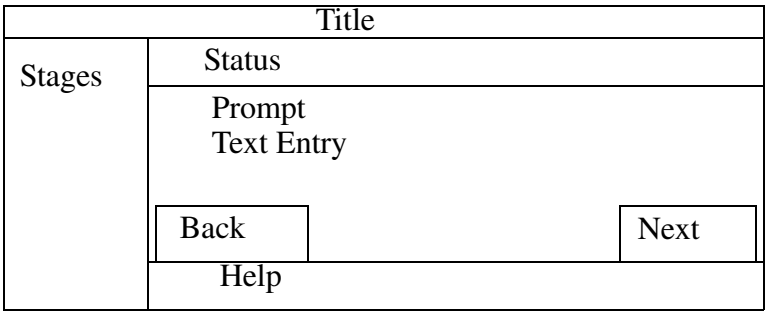
The Session Server is a standalone system. It is equipped with a commissioning tool called "commish" to allow the customer to configure the system as part of the initial setup of the server. This tool can be used at the

vt100 console port of the Session Server. The following values can be configured using the commish:

- hostname
- IP address
- Subnet Mask
- Gateway (default CS LAN router)
- Timezone
- One or more NTP servers
- Log server IP address
- NetNodes IP (Network Monitor, HTTPs proxy, and Core IP addresses)
- Server Location
- SNMP Trap destination

The user interface of the commish tool is broken up into the following sections as depicted in Figure 13, on page 1584 .

Figure 13 Commish user Interface Areas



The general philosophy is that for each screen:

- The title remains constant and indicates that this is the system setup
- The Stage bar along the left will highlight the stage on which the user is currently
- The Status will indicate in a longer form with what stage the user is interacting
- The help along the bottom indicates some useful piece of advice about what the user is being asked
- The prompt requests a piece of information from the user
- The text entry area is where the user types the requested information
- The back and next buttons are used to navigate between the screens

- The interface is navigated by using the ‘tab’ key to cycle between the text entry area and the ‘next’ and ‘back’ buttons. The ‘enter’ key is used to make a selection.

For some screenshots and details about the interface, please See “Appendix C - Commish Human Machine Interface” on page 1599.

126.9 SNMP Support

The Session Server supports SNMP V3 with “No Privacy” and “No Authentication” options. The user can use the commish tool, described in “126.8 Commissioning”, to configure two TRAP destinations and SNMPv3 user name. As part of SNMP support, the Session Server can raise the following traps to report alarms severity:

- nortelNMIalarmClearNotification
- nortelNMIwarningAlarmNotification
- nortelNMIminorAlarmNotification
- nortelNMImajorAlarmNotification
- nortelNMIcriticalAlarmNotification

126.10 Fault Handling

This section provides a summary of the fault handling behavior of the SAM-XTS node maintenance in reaction to various faults. The fault handling behaviour is based upon the compact Call Agent behavior for all but the disk cases.

Table 7 SAM-XTS Fault Handling

Fault Event	Simplex/ Duplex, Affected Unit	Action
Total Loss of LAN Connectivity	Duplex, Active	Failover to the inactive. Reset former active if condition persists for 20 seconds. After LAN connectivity is restored and reset completes, inactive unit comes back into sync.
Total Loss of LAN Connectivity	Simplex, Active	Wait about two minutes and reset active unit if persistent. (The wait handles SDM and router upgrade outage.)
Total Loss of LAN Connectivity	Duplex, Both	Wait about two minutes and reset if persistent; wait 60 seconds and reset inactive if persistent.
Single Ethernet Outage	Any, Any	Switch active ethernet if necessary. Monitor for ETH recovery.
Loss of Point to Point Connectivity	Duplex, Both	Alarm and log. Continue mate communication via LAN.
Sanity Time Out or Power Cycle	Duplex, Active	Inactive immediately takes over; former active resets.

Table 7 SAM-XTS Fault Handling

Fault Event	Simplex/ Duplex, Affected Unit	Action
Sanity Time Out or Power Cycle	Duplex, Inactive	Inactive resets
Sanity Time Out or Power Cycle	Simplex, Active	Active resets and determines mastership.
Total Disk Outage.	Duplex, Active	Failover to inactive.
Total Disk Outage	Simplex, Active	Alarm and log but wait for manual action.
Total Disk Outage	Duplex, Inactive	Alarm and log but wait for manual action.

126.11 Logs and Alarms

For a complete list of logs and alarms please refer to the FM section of ActId a00004005 book in PLS FMDOC.

126.12 Users Categories

The following is a list of groups that will be used on SAM-XTS platform. This list comes from Succession Element and Sub Element Manager (SESM), and is consistent with the existing Succession users.

Table 8 Authorization Groups

Group Name	Group Number	Description
mgcadm	1011	Can do anything. This is equivalent to being the root user
mgcmtc	1014	Can do any non-service impacting platform maintenance activities. Cannot change provisioning data.
mgcsprov	1013	Application provisioning user. Can modify provisioning data, but cannot take any platform maintenance actions
mgcrw/mgcro	1012/1015	Can view base or provisioning information but cannot initiate any changes.
succssn	104	required for login access to the Session Server

Note: The user group access permissions are not enforced on NCGL platform for SN07.

The following table describes the list of default users on the system, and their associated groups. At commissioning time, the customer will be able to remove any unneeded users, and will be forced to change the passwords on any of those which remain.

Table 9 Default Users

User Name	Groups	Removable	Description
root	mgcadm root system	no	System root user. Direct login will not be allowed - must login as another user, and can then su to the root user.
mtc	succssn users mtc mgcadm mgcrw mgcro mgcsprov mgcmtc	yes	NCGL-XTS maintenance user.

126.13 Limitations and restrictions

The Session Server does not support software alarming of the following failure situations:

- Over temperature
- CPU failure
- RAM failure
- Fan Failure
- Power supply failure (the power LED and relay contact will be raised)

There is no support for backup and restore in SN07 release.

In this release, to halt the Session Server from the admin panel is equivalent to the administrative state to lock the server.

The Session Server software does not support/include the STORM (STOrage Management) functionality.

The following process are not monitored. If any of these process die, a manual interact is required to start them.

- ssh
- syslogd

126.14 Interactions

The following external interfaces are supported on the Session Server to provide access to the server:

- SFTP or SCP (for secure file transfer)
- SSH (for secure login), which supports the following encryption algorithms:
  - 3DES 168 bits
  - Blowfish 128 bits
  - Twofish 128 bits
  - AES 128 bits

  The SSL encryption algorithms supported are:
  - RC4 - 128-bit keys
  - RC2 - 40 bit key
  - DES - 40 bit key
  - DES - 56 bit key
  - 3DES - 168 bit key
- HTTP (Session Server Web Interface)
- HTTPS (Secure HTTP)

All of the existing interfaces will be maintained, and since they are all standards based protocols, no compatibility issues are expected.

Note: The user will not be able to access the Session Server using the "telnet" command because it is not supported due to security issues.

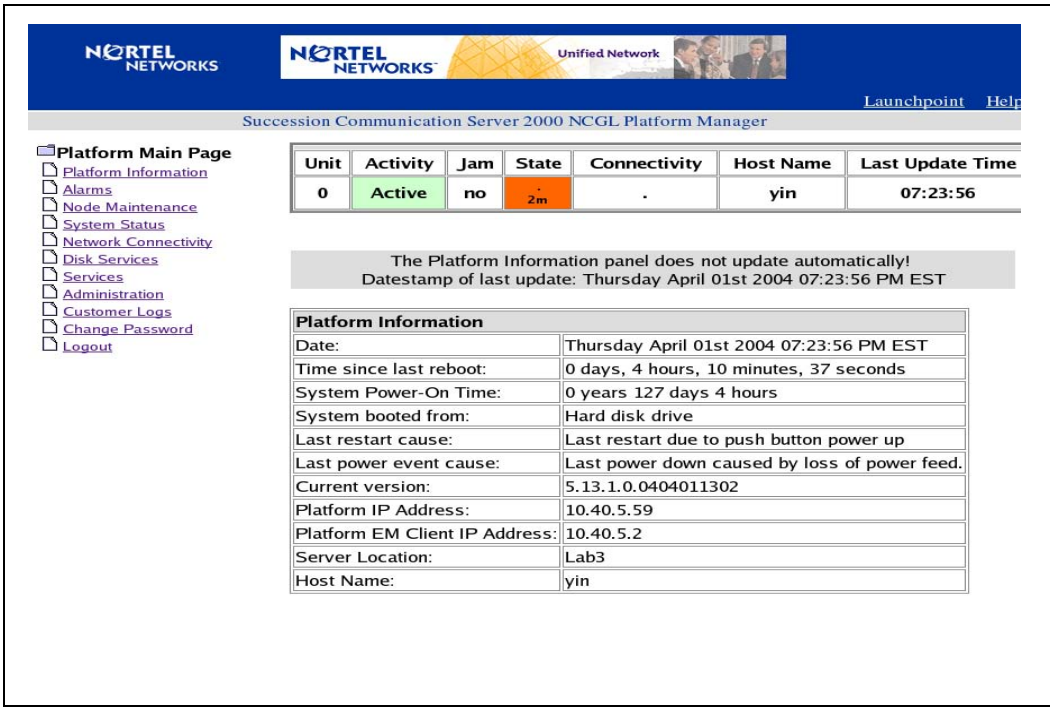
126.18 Appendix A - Platform Main Web Page Interface

This appendix contains the web page screenshots. Please note that screenshots captured here are for the Drop 1 deliverable, where the session server only supports simplex mode. This section will be updated when SN07session server full duplex functionality is completed.

126.18.0.1 Platform Home Panel

This panel will contain data for both Session Server units.

Figure 14 Home

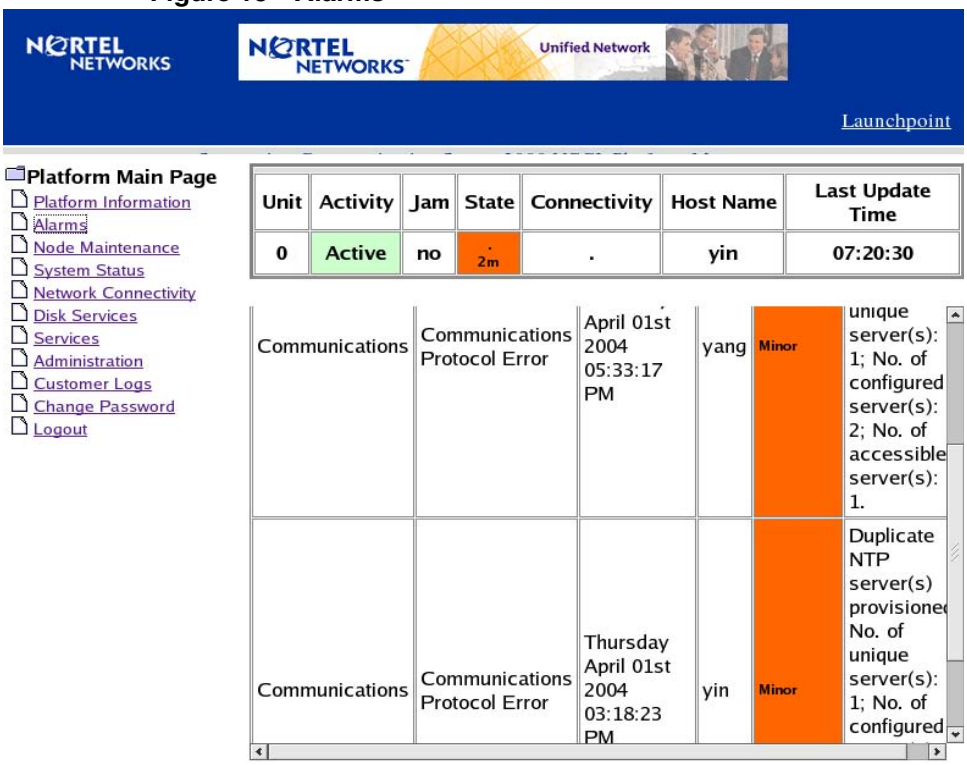


126.18.1 Alarms Panel

Like other Session Server EM panels, the Alarms panel will display the alarms on both the active and inactive units. The alarms are refreshed every 45 seconds.

Note: This screen shot is Drop1 functionality.

Figure 15 Alarms



126.18.2 System Panel

This panel contains data for the user's Session Server unit.

10.40.4.101 in sync	10.40.5.2 establishing sync	undefined	2	1	1

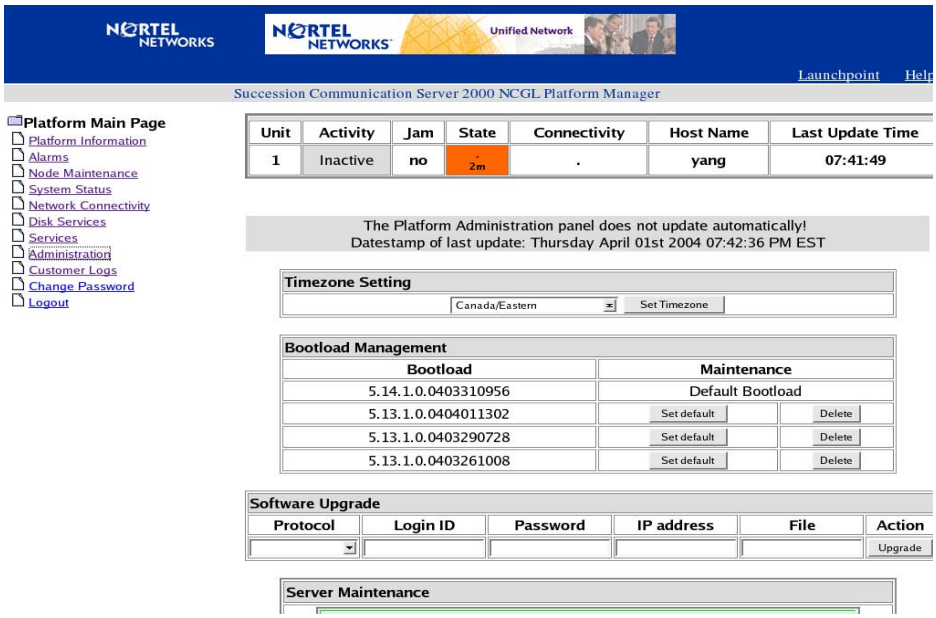
126.18.5 Admin Panel

The admin panel is used to perform administrative tasks related to the Session Server unit. The actions supported from this panel are:

- Bootload Management (to set default bootload, or remove bootload)
- S/W upgrade
- Server Maintenance (reboot or halt)

This panel contains data for the user's Session Server unit.

Figure 19 Admin

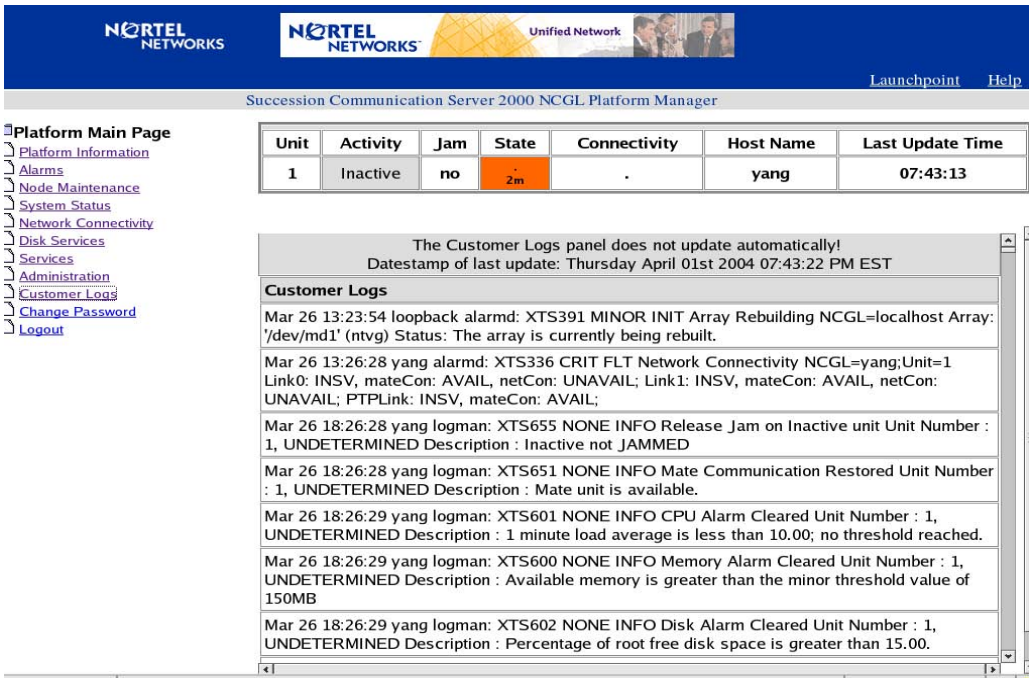


126.18.6 Customer Logs Panel

The customer logs panel displays a historical view of customer logs that have been generated on the Session Server unit. The most recent logs are displayed at the bottom of the log file.

Limitation of this panel is that the user can only view the logs that pertain to the user's specific unit.

Figure 20 Customer Logs



126.19 Appendix B - Alarms

Note that this appendix does not yet contain alarms relating to the hardware specific issues (e.g.: power supply failures, temperature, etc.).

Table 10 Alarm Id (ITU-T X.733)

ID	Type	ID	Type
1	Adapter error	30	Material supply exhausted
2	Application subsystem failure	31	Multiplexer problem
3	Bandwidth reduced	32	Out of memory
4	Call establishment error	33	Output device error
5	Communications protocol error	34	Performance degraded

127: Functional Description (FN): A00004020, USP Java GUI Introduction to Succession

127.1 Reference Architecture

The following figure may be used as a reference architecture throughout this feature description

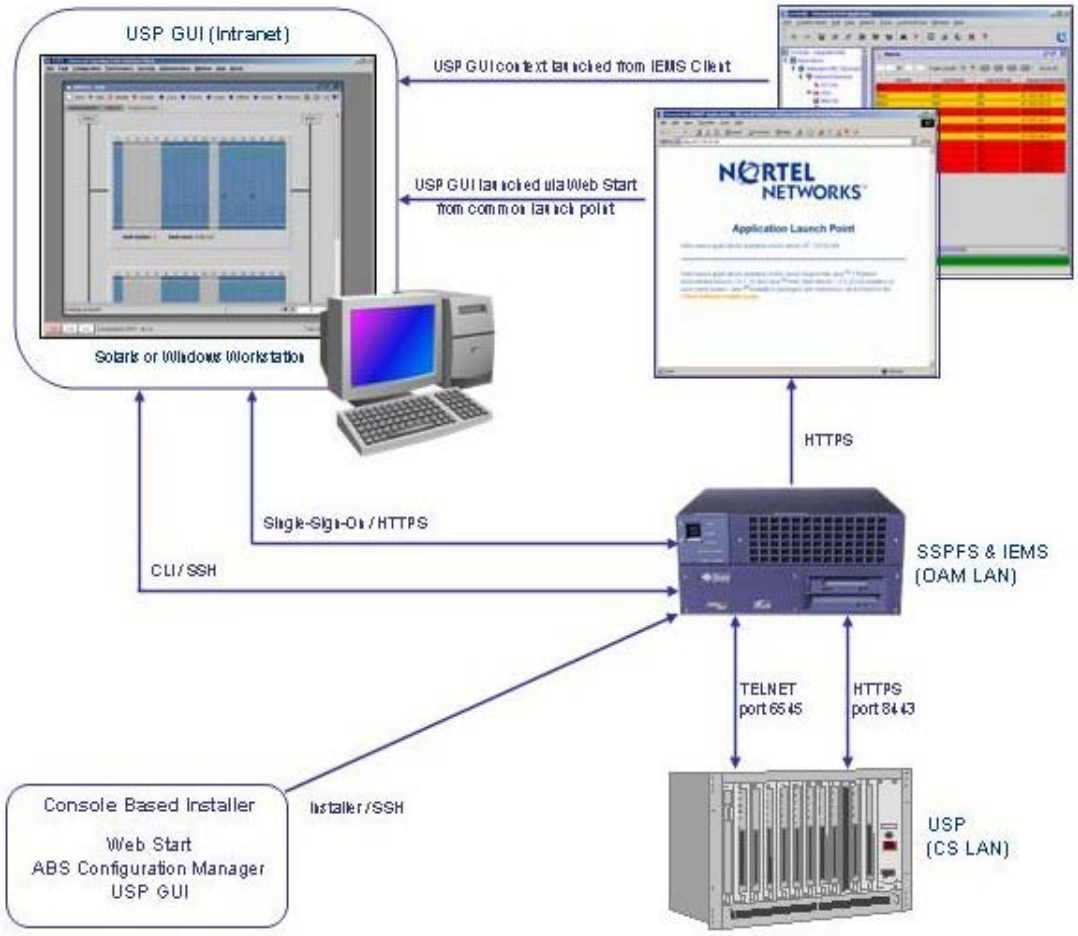

Figure 1 SN07 USP GUI Reference Architecture

127.2 Feature Descripion: GUI Enhancements

127.2.1 TELNET and SSH Proxy Support

Due to LAN security requirements, the USP GUI is not allowed to connect directly to the USP. In previous releases this was addressed by the use of a central PC running Citrix Metaframe. Users would connect to the PC via a Citrix client and then launch the USP GUI from the PC to connect to the USP. This function was referred to as “Reach Through.”

As of SN07 the GUI will be replaced with a thin Java compiled client GUI which will include the ability to connect to the USP via a TELNET or SSH proxy. For Succession solutions a SSH proxy function will be used on the SSPFS that will eliminate the need for the “Reach Through” PC in the solution.

The proxy function will actually be provided as a two-stage connection process between the GUI, the SSPFS and the USP (the complexity of this connection process will be hidden from the user by the GUI):

1. USP GUI establishes a SSH connection to SSPFS

2. USP GUI then establishes a TELNET from SSPFS to the USP

The configuration of the authentication and proxy function is captured in figures 2 and 3.

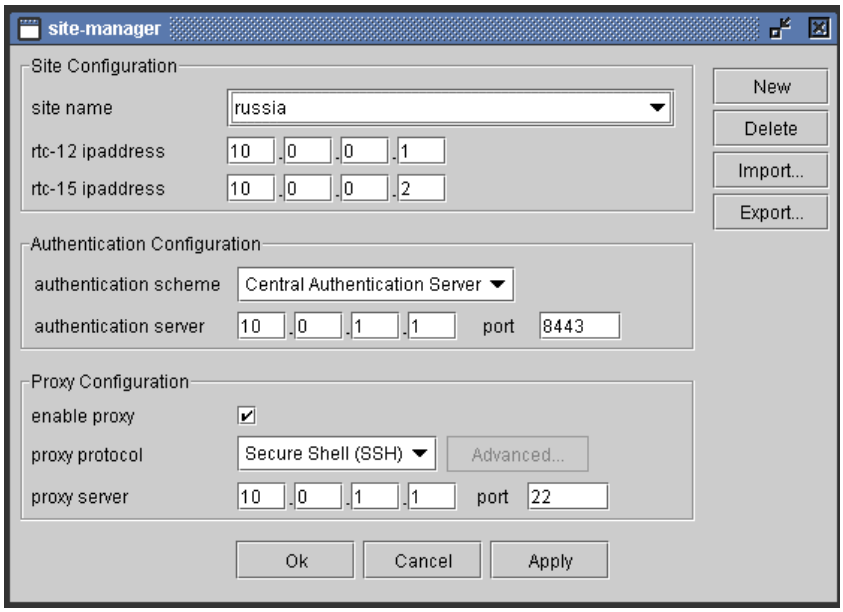

Figure 2 Site Manager Proxy Configuration - Basic

127.2.1.1 Site Configuration Export/Import

USP8.1 adds the ability to save a list of configured sites to a text file via the “Export” function. This file may then be distributed to all users and loaded via the “Import” function. This ability has been added due to the fact that we now have more data to configure for each site (authentication and proxy options). This will save the customer time and avoid configuration errors.

127.2.1.2 Authentication Scheme

User’s have the option of selecting “Standard Authentication” or “Central Authentication Server” authentication schemes. The standard authentication will use the supplied user name and password to perform authentication at the USP and proxy (if enabled). To perform advanced authentication the user may wish to use a central authentication server to perform a PAM + Proxy authentication using HTTPS. The standard authentication mechanism is the default authentication scheme for direct connections (no proxy) and the central authentication server mechanism is the default authentication scheme for proxy connections (proxy enabled). Refer to IEMS Single Sign-on Support for further details on using the PAM + Proxy authentication function.

127.2.1.3 Authentication IP Address and Port

If the authentication scheme is “Central Authentication Server” then an IP address and port must be supplied of the authentication server. The default port value is the HTTPS authentication port of 8443.

127.2.1.4 Proxy Protocol

User’s will have the option of selecting TELNET or SSH as the protocol to be used to connect to the proxy. For Succession solutions, SSH will be the required protocol (other customers and solutions may choose to use the TELNET option). If the proxy is enabled, SSH will be the default protocol.

127.2.1.5 Proxy IP Address and Port

If the proxy function is enabled, then an IP address and port must be supplied for the proxy server. The default port value is the well known Telnet or SSH port (dependent on the proxy protocol chosen).

127.2.1.6 Advanced Tokens

The advanced proxy token configuration allows the user to adapt the behavior of the proxy token matching when connecting through the proxy server. The default token values should be sufficient, but is provided for the ability to adjust the values to work with different Telnet proxy servers. Special keywords are available for the send value to eliminate the need to supply user name, password and/or IP addresses as part of the proxy token matching.

The following special send token values are available:

%u – resolves to the current user name

%p – resolves to the current password supplied (or special security token if using “central authentication server” authentication scheme)

%a – resolves to the IP address of the target end connection point (RTC)

%h – resolves to the fully qualified domain name of the target end connection point (RTC)

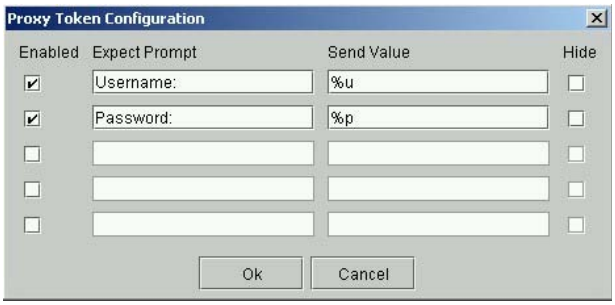

Figure 3 Site Manger Proxy Configuration - Advanced

127.2.2 Prompt for Password

During the log process or when the GUI is re-establishing a connection to the USP it is possible that the user's password may no longer be valid. For example, consider the case of a secure-id or another "time-to-live" security token. If the user has been logged in and an RTC is reboot the connection will need to be re-established and the user may need to re-authenticate (effort is being made to reduce the likelihood of this occurring). In this case we do not want the user to have to terminate the current simplex connection in order to re-establish the duplex connection. We will simply present the user with the session-login screen and prompt them to re-enter their password.

127.2.3 IEMS Single Sign-on Support & Context Launch

The IEMS provides a PAM + Proxy authentication mechanism for the central authentication server scheme. When "Central Authentication Server" authentication scheme is chosen, the GUI will use the supplied IP address and port to establish an HTTPS connection to the IEMS server. Using the supplied user name plus password or supplied security token (if context launched) to request a single time-to-live (TTL) security token from the IEMS. The TTL token will then be used to obtain single-use (SU) security tokens when establishing connections to any other end-points. This will ensure a secure authentication mechanism regardless of connection protocol.

The GUI can be context launched using either the user-name and password or a user-name and single-use security token. The user-name is supplied using the –u command line option and is used in conjunction with the –p (password) or –t (security token) options to perform the initial authentication with the IEMS server.

See figure 4 for a single sign-on walkthrough using the IEMS for central authentication.

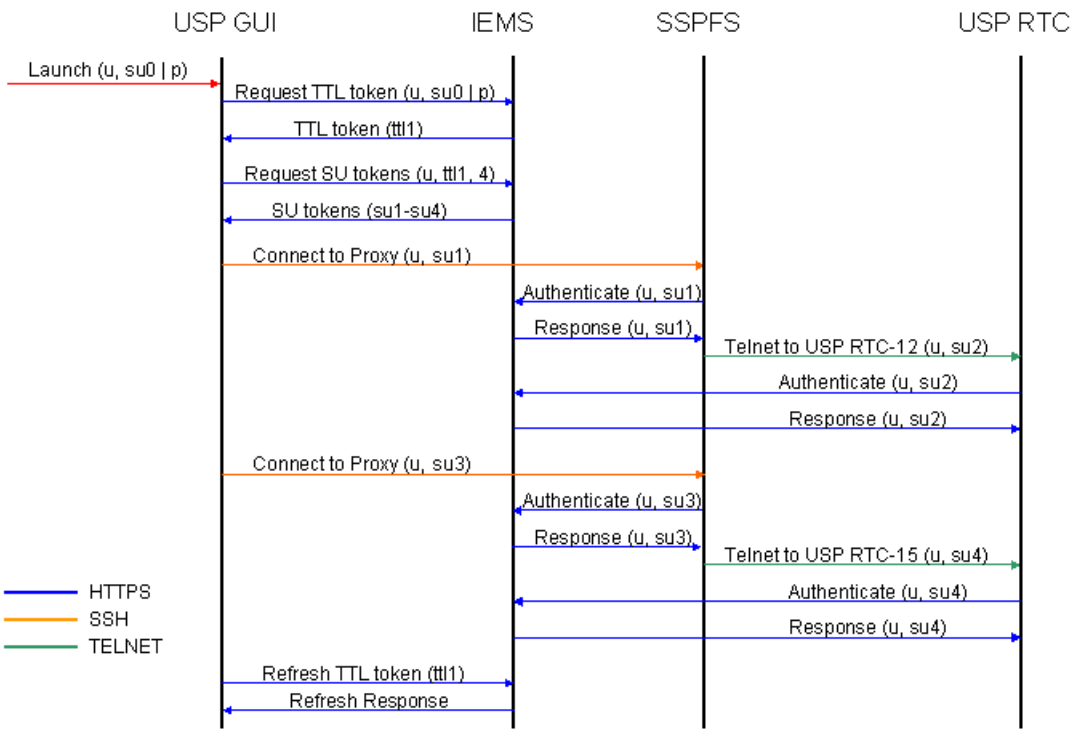

Figure 4 - single-sign-on Walk Through

127.3 Feature Descripion: Installer Enhancements

127.3.1 Web Start Support

In the past customers have always installed the GUI either on their local desktop or on the reach-through PC running Citrix Metaframe. As of USP9.0, users will still be able to install the GUI locally but will have the additional option of installing the GUI on a central web server and launching via Java Web Start. This is the option that will be used for Succession in SN07. The Web Server is provided by the SSPFS platform. Refer to Figure 1 as a reference.

127.3.2 Console Based Installer

The USP uses Install Anywhere™ to manage software installation. For a UNIX based installation (as used by Succession SN07) a console based install option is available. This eliminates the need to use the graphical version via remote display (i.e. Exceed). The installer provides the same functionality as the graphical version.

A user would simply insert the CD-ROM into the SSPFS platform (or FTP a copy of the CD image onto the SSPFS from a remote location), SSH (or TELNET) into the SSPFS and execute the installer with the `-i console` option.

A simulated trace of a console based install process is provided below:

```
$ ./install.bin -i console

Preparing CONSOLE Mode Installation...

===============================================================================
Universal Signaling Point v9.0.0      (created with InstallAnywhere by
Zero G)
-------------------------------------------------------------------------------

===============================================================================
Introduction
------------

InstallAnywhere will now guide you through the installation of the
Universal Signaling Point software components.

It is strongly recommended that you quit all programs before continuing
with this installation.

Respond to each prompt to proceed to the next step in the installation.
If you want to change something on a previous step, type 'back'.

You may cancel this installation at any time by typing 'quit'.

Press <ENTER> to continue:

===============================================================================
Component Selection
-------------------

Enter a comma separated list of numbers representing the software
components that you would like to install. To view a detailed
description of each software component enter '?<COMPONENT-NUMBER>'

    1- [X] USP Software Loads and ABS Manager
    2- [X] USP Graphical Interface Client
    3- [X] USP User Manuals and Documentation Suite
    4- [ ] USP GR-310 Mediation Application

Enter software component numbers and press <ENTER> to continue:

Installation...started. This may take a few minutes to complete.

Installation...completed.

The selected Universal Signaling Point software components have been
successfully installed.

Press <ENTER> to exit
```

127.4 Log & OM Information

No change to existing logs and operational measurements.

127.5 Feature Impact

127.5.1 Memory, Real-Time or Disk Space etc

no impact

127.5.2 Hardware

test labs will need access to a SSPFS platform and SN07 load running the IEMS software.

127.5.3 Documentation

127.5.3.1 User Manuals

> The user manuals will need to be updated with respect to the changed site-manager GUI screens.

> The use of a proxy for connection will need to be added to the security overview section

> upgrade procedure will need to be changed to reflect GUI install on SSPFS

127.5.3.2 Readme.txt & Release Notes

> A reference should be added to the release notes regarding new proxy and web-start functions as well as the console based installer option.

> upgrade procedure will need to be changed to reflect GUI install on SSPFS

127.5.3.3 OAM Interface Specifications

no impact

127.5.3.4 Installation Methods

> initial install procedure will need to be changed to reflect GUI install on SSPFS

> migration mop for moving the GUI to the SSPFS and removing the PC from the solution will need to be written.

127.5.4 Compliancy Impact

no impact

127.6 Restrictions & Limitations

none

128: Functional Description (FN): A00004036

118.1 Feature name

Off-Board Service Control

118.2 Description

This activity addresses the development associated with enabling in the DMS the update and/or query capabilities for the service listed in the Chapter 5 Section 5.7 of GR-1298 “Information Revision Messages”, which outlines specific groups as well as the services and/or functions relevant to each group.

Given that the appropriate network architecture is available, with the addition of this set of capabilities in the DMS, subscriber’s will have the ability to both query the status and/or programmed information (if applicable) as well as activate/deactivate and update their corresponding service.

While the first iterations will rely heavily on Advanced Intelligent Network (AIN) (the initial protocol support is Abstract Syntax Notation 1 (ASN.1) via Signaling System No. 7 (SS7)), it should be understood that the intention is for the individual update and/or query service event handlers ***not*** be protocol dependent nor coupled to AIN directly.

There is much to benefit, however, in abiding by GR-1298; primarily compliance but it also provides an initial set of requirements and capabilities that are already generally available. The following sections outline GR-1298’s Service Data Function (*SDF)* groups as well as their corresponding capabilities and relevant services.

This development allows end user to activate/deactivate the service as if he/she have done from their own phone. Based on the service provider’s interface for the end-user it take out the complexity to activate, deactivate, add, change, delete or edit service specific data faced by end-user using a phone. The query/ update messages that are sent between the SSP and the SCP are logged into AINT700 logs using AINTRACE tool.

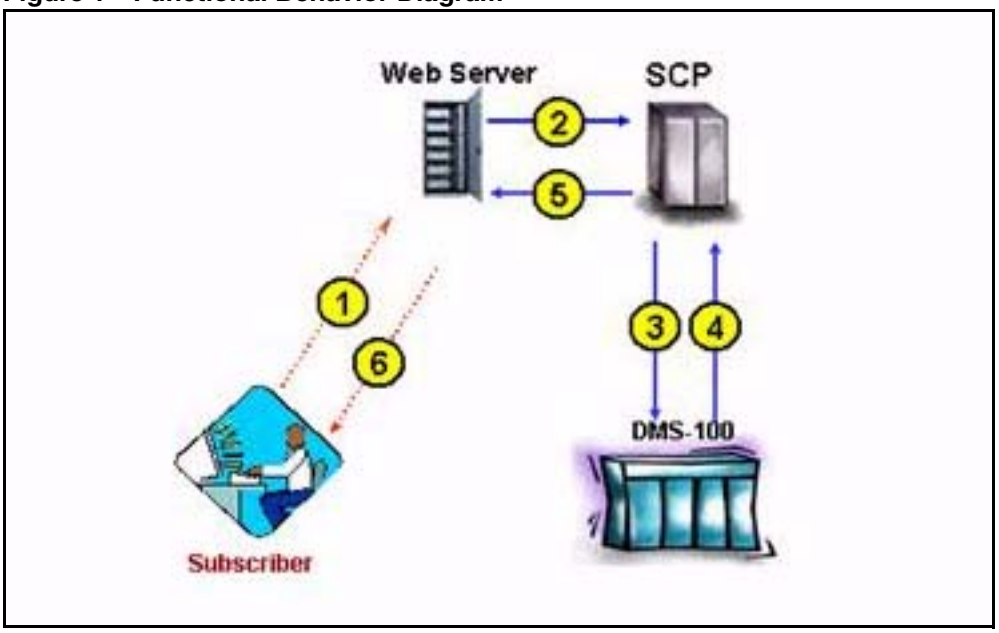
This development also allows the service providers to access the incoming / outgoing call memory of a particular DN.

118.2.1 Functional Behavior

Recognizing that the scope of this activity does not go beyond development in the Core, Figure 1, "Functional Behavior Diagram" below illustrates the basic control capabilities this activities intends to enable Off-board service control (given an AIN network solution). The following steps outline the basic tasks:

1. The subscriber logs into the Provider's network and, via Web or PC Client based application, gains access to his or her subscriber service control level. From here, the subscriber can generate a request for information about subscribed to services and/or an update to change, for example, the status of a service.
2. The subscriber's update/query request is delivered to the Provider's Network Server where a properly encoded message is created and dispatched to the SCP enabled in the Provider's network.
3. The update/query request is delivered to the SCP where a properly encoded message is created and dispatched via (SS7 or TCAP/IP) to the End-Office serving the subscriber.
4. The End-Office handles the request and replies with the appropriate response. A query response, for example, contains the information requested (e.g. status of a service).
5. The response is delivered to the Provider's Network Server where it is put into a format understood by the application serving the subscriber and, finally,
6. The formatted response makes gets delivered to the subscriber's application where the information is displayed.

Figure 1 Functional Behavior Diagram

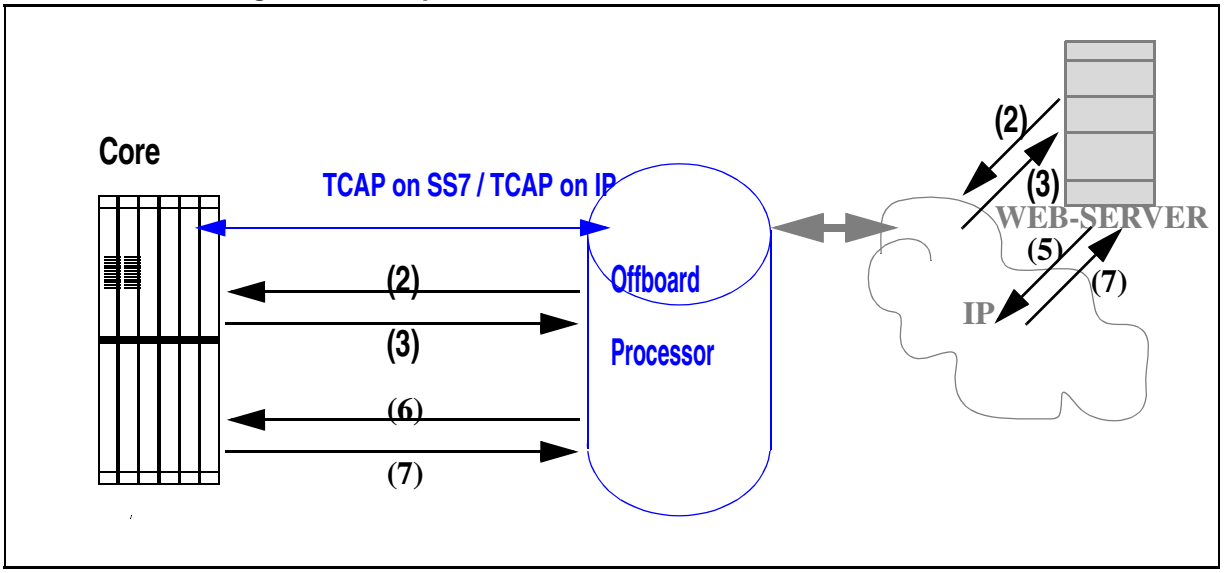


Note: It should be understood that the behavioral diagram outlined above represents only one of several possible network solutions and, while it represents the most plausible configuration in the short term, should not be considered the only alternative.

118.2.2 Sample Data Flow

The Figure 2, "Sample Data Flow" for the service management feature has been described below:

Figure 2 Sample Data Flow



1. The end-user browses the web-site, logs into the his / her account. E.g.: Myaccount@MyServiceProvider.com.
2. The Web client triggers a Query to the Off-board Processor, the Off-board Processor in turn generates a TCAP Query Request (NCR) to the Core.
3. The Core responds with the TCAP Query Response (NCR) message which return the users current profile, i.e. the current features assigned to the subscriber, their activation status and relevant attributes.
4. The end-user may decide to change certain services, for e.g.: SLE lists, call forward DN, or turn the call forward busy on the line. The user submits these changes.
5. This triggers the Offboard processor, which could be either of the SCP, IMS or an independent box.
6. The off-board processor in turn Builds TCAP Non Call Related Messages (e.g.: Update Message) and sends to the Core /Switch.
7. The Core / Switch will process the request and respond with the outcome of the request.
8. The Web-server could further use other Query Requests and Update Message to retrieve updated information for a user profile and change the feature attributes.

118.2.3 Query request for Incoming/ Outgoing call memory.

In order to obtain the incoming/ outgoing call memory of a DN, a query request is sent by the SCP. 'Provide Info' parameter of the query request contains parameter 'RequestMemorySlot' which contains subparameters 'incoming'and 'outgoing'. Once these parameters are received in the query request, the SSP sends back the following information in the 'MemorySlot' subparameter of the 'InfoProvided' parameter of the Response:

118.2.3.1 Incoming

The 'incoming' parameter contained within the 'MemorySlot' parameter contains the following subparameters.

- Calling Party number: This parameter displays the last number which had called the concerned DN.
  - — When the IncomingCall memory has OriginatingDN Presentation Indicator set to Suppressed, the Address Digits shall not be sent to the SCP in Query Response. The Presentation Indicator shall be set to Presentation Restricted.
  - — When the IncomingCall memory has Calling Party ID UNAVAILABLE, the SSP shall include the Empty parameter in the Query_Response Return Result with a value indicating the incoming memory slot is empty.

- Timestamp: This parameter defines the time at which the event has occured. It uses local time and gives the difference between the local time and GMT (Greenwich mean time). In this case it gives the time at which the calling party had made the call to the concerned DN.
- Empty: If the SSP, in processing the request finds the incoming or outgoing memory slot empty, or the list requested empty, the SSP shall include the Empty parameter in the Query_Response Return Result with a value indicating which requested data slots were found to be empty.

118.2.3.2 Outgoing

The ‘outgoing’ parameter contained within the ‘MemorySlot’ parameter contains the following subparameter.

- Called Party number: This parameter displays the last number called by the concerned DN.
- Empty: If the SSP, in processing the request finds the incoming or outgoing memory slot empty, or the list requested empty,, the SSP shall include the Empty parameter in the Query_Response Return Result with a value indicating which requested data slots were found to be empty.

118.2.4 DN Validation

The DN Validation requires TCAP query for certain services. GR-1298 is not clear on how to allow the DN validation for Non-CallP services. However, we are able to provide DN Validation using TCAP query. The following is the details for the DN Validation behavior for Non-CallP query and update request from the SCP:

118.2.5 SDF Group 1

Group1 services are those generally provided with the ability to

- activate and/or deactivate
- retrieve the status

The following is a list of services GR-1298-Core classifies as Group1.

- Message Waiting Indicator (MWT, CMWI, AINMWT etc.)
- Visual Message Waiting Indicator (MWL, CMWI, AINMWT etc.)
- Anonymous Call Rejection (ACRJ)
- Automatic Callback (deactivation or *cancellation* only) (ACB)
- Automatic Recall (deactivation or *cancellation* only) (AR)
- Call Screening (CSMI)
- Outside Calling Area Alerting (LDSA)

- Calling Identity Delivery and Suppression (activation -> *set the pps to public* and deactivation -> *set the pps to private*) (SUPPRESS)
- Call Waiting (CWTACT)

The following service is not classified by GR-1298-Core but supported by CM under Group 1:

- Make Set Busy (MSB)

Note: The Section 118.7.1 describes the encoding/decoding of MSB.

118.2.6 SDF Group 2

Group2 services are those generally provided with the ability to

- activate and/or deactivate
- update a corresponding delay interval value.
- retrieve the status and/or delay interval value.

The following is a list of services GR-1298-Core classifies as Group2.

- Audio Message Waiting Indicator (PRN)

118.2.7 SDF Group 3

Group3 services are those generally provided with the ability to

- activate and/or deactivate
- add/delete list entries corresponding to a specified Directory Number (DN), Speed Call Code or Incoming Memory Slot
- delete all list entries
- delete all private entries
- retrieve the status, list entries and/or list size

The following is a list of services GR-1298-Core classifies as Group3.

- Distinctive Ringing/Call Waiting
- Selective Call Rejection

The following service is not classified by GR-1298-Core but supported by CM under group 3:

- Simultaneous Ringing (SIMRING)

Note: The Section 118.7.2 describes the encoding/decoding of Simring.

118.2.8 SDF Group 4

Group4 services are those generally provided with the ability to

- activate and/or deactivate
- set or clear forwarding (remote) DN
- retrieve the status and/or forwarding DN

The following is a list of services GR-1298-Core classifies as Group4.

- Call Forwarding Variable
- Call Forwarding Don't Answer
- Call Forwarding Busy Line

Note: Please refer to section 118.7.3 for support of AINDigits Parm. This parm is not supported for Group4 in GR-1298 and GR-1299.

118.2.9 SDF Group 5

Group5 services are those generally provided with the ability to

- activate and/or deactivate
- add/delete list entries corresponding to a specified DN, Speed Call Code or Incoming Memory Slot
- delete all list entries
- delete all private entries
- set or clear forwarding (remote) DN
- retrieve the status, list entries, list size and/or forwarding DN

The following is a list of services GR-1298-Core classifies as Group5.

- Selective Call Forwarding
- Selective Call Acceptance

Note: Please refer to section 118.7.3 for support of AINDigits Parm. This parm is not supported for Group5 in GR-1298 and GR-1299.

118.2.10 SDF Group 6

Group6 services are those generally provided with the ability to

- update the relevant delay interval for number of rings prior to forwarding
- retrieve the delay interval value

The following is a list of services GR-1298-Core classifies as Group6.

- Ring Control

118.2.11 SDF Group 7

Group7 services are those generally provided with the ability to

- invoke the DMS-based CNDB or CNAB features

The following is a list of services GR-1298-Core classifies as Group7.

- Calling Number Delivery Blocking
- Calling Name Delivery Blocking

118.2.12 SDF Group 8

Group8 services are those generally provided with the ability to

- invoke a service

The following is a list of services GR-1298-Core classifies as Group8.

- Customer Originated Trace
- Cancel Call Waiting

118.2.13 SDF Group 9

Group9 services are those generally provided with the ability to

- change speed calling list entry to specified DN

The following is a list of services GR-1298-Core classifies as Group9.

- Speed Calling

For more information, please refer to GR-1298-Core, section 6.4.

Nortel has developed different variants of the GR's Speed Calling feature. For instance, Nortel's Speed Calling Short (SCS) allows an end user to store a maximum of ten (i.e., 0 to 9) often dialed DNs; therefore, SCS supports a single Speed Calling cell digit access. Nortel's Speed Calling Long (SCL) allows an end user to store up to seventy (i.e., 00 to 69) often dialed DNs; therefore, SCL supports two digits for Speed Calling Cell access.

> ***Note:*** for SCL (i.e., L30, L50 or L70), the end user must dial both digits of the two digit Speed Calling code, even if the first digit is zero.

This design intent makes the assumption that from the Speed Calling Cell digits provided (from the end user), a single Speed Calling (SC) digit indicates SCS, and two SC digits indicate SCL or Speed Calling User (SCU)[1].

GR-1298-Core allows for Group9 Update request(s); however, it does not provide for a Group9 Query message in order to retrieve/query the user's Speed Call data. However, Nortel will utilize the Extension Parm to retrieve/query a Block of 20 DNs (per Group9 Query Message). Each Query Block (of DNs) are labeled 0 to 5. For instance:

Nortel's Group9 Query Action $Block_X$: where x = 0 through 5:

- Query Action $Block_0$ contains DNs associated with Speed Call Codes 0 to 19
- Query Action $Block_1$ contains DNs associated with Speed Call Codes 00 to 19
- Query Action $Block_2$ contains DNs associated with Speed Call Codes 20 to 39
- Query Action $Block_3$ contains DNs associated with Speed Call Codes 40 to 59
- Query Action $Block_4$ contains DNs associated with Speed Call Codes 60 to 79
- Query Action $Block_5$ contains DNs associated with Speed Call Codes 80 to 99

Nortel's Group9 Query Action $Block_0$ is utilized for Speed Call Short only. Since Nortel's Speed Call Short list could contain up to a maximum of 10 DNs associated with a Speed Call Code, only the first 10 indexes (0 to 9) of Block0 will be utilized for a Speed Call query. The remaining indexes (10 to 19) will contain NIL DNs.

Nortel's Group9 Query Action Blocks 1-5 (i.e., Blocks1 through Blocks5) are utilized for Speed Call Long only.

Speed Calling directory number validation will be performed if the Speed Calling Validation (SCVAL) option is provisioned in Table CUSTSTN.

Please reference the appendix (Section 118.7.4 and Section 118.7.5) for Nortel's Group9 Query implementation, which utilizes the Extension Parm. Also, please refer to section 118.7.3 for support of AINDigits Parm. This parm is not supported for Group9 in GR-1298 and GR-1299.

[1]SCU - Speed Calling User: this user is allowed (if provisioned with the SCU Servord line option) to have access to a Speed Calling Long list. However, for this feature deployment, the SCU user is not allowed to add, change or query the Speed Calling list - only the SCL controller is allowed to modify or to query their SCL list.

118.3 AINTRACE support for UpdateRequest and QueryRequest

In order to obtain the logs for Update/Query Request and their responses, AINTRACE should be used to select these messages. These messages are sent by the SCP.

118.3.0.1 QueryRequest:

QueryRequest messages are subparameters of message 'Provide Info' .Each Query Request message contains the following subparameters: 'Service' and 'Request'. They are decoded and displayed on AINT700 logs using AINTRACE.

The 'Service' subparameter contained within the 'Requestgroup' parameter displays the name of the service for which the request is being made:

The 'Request ' subparameter contained within the 'Requestgroup' parameter contains the following subparameters:

- ActivationStatusCode: This parameter displays whether the service is presently active or not.
- DelayInterval: This parameter displays the delay that has been set to the service.
- EntireList: This parameter displays the enire list of DNs that were selected in the servord.
- ListSize: This parameter displays the size of the 'EntireList' parameter.
- ForwardingDn: This parameter displays the DN to which the call has been forwarded to.

118.3.0.2 UpdateRequest

Update messages are subparameters of SSP User Resource. Each update message contain the following subparameters: Service and Action.They are decoded and displayed on AINT700 logs using AINTRACE.

The 'Service' subparameter contained within the 'Updategroup' parameter displays the name of the service on which the 'Action' is to be performed.

The 'Action' subparameter contained within the 'Updategroup' parameter contains the following subparameters:

- ActivationStatusCode: This parameter displays whether the service is to be activated or not.
- DelayInterval: This parameter displays the new value to be set for the delay interval of the concerned service.
- EditSpecificEntry: This parameter contains further subparameters viz. (1)Entry: Displays DN,SpeedCalling Code and Memory Slot

(2)EditListType: Displays if the ‘Entry’ parameter has to be added or deleted.

- EditAllEntries: This parameter contains the following subparameters: (1)DeleteAllEntries (2)DeletePrivateEntries
- ForwardingDn: This parameter contains the following subparameters: (1)Set: This parameter displays the Dn and the SpeedCallingCode (2)Clear: This parameter is used to remove the service from the specified Dn.
- Toggle: Contains the parameter ‘PresentationStatusValue’
- Invoke: Contains the parameter ‘on’

118.4 Hardware Requirements or Dependencies

In order to enable this capability for affected subscribers, the following must be present in the provider’s network

- EO Switch providing the affected services must be enabled to handle the corresponding update and/or queries request via SS7.

118.5 Software Requirements or Dependencies

There are number of services are controlled via software optionality control (SOC). In order to use these services, appropriate SOC must be activated in the switch. Therefore, this development is depends on following SOC:

- AIN00002 - Essentials
- AIN00006 - Call Management
- AIN00210 - Service Enablers
- RES00008 - Long Distance Indicator
- RES00059 - LDA Enhancement
- RES00047 - Call Screening
- RES00053 - Enhanced CSMI
- RES00060 - Usage Sensitive Call Forwarding
- RES00073 - SLE/ACBAR NO TCAP
- RES00081 - Simultaneous Ring
- RES00085 - SimRing Virtual DN
- RES00102 - Enh Do Not Disturb

118.6 Limitations and restrictions

118.6.1 Limitations and restrictions for Incoming/ Outgoing Call memory.

Since the call memory is not captured for POTS lines, it will not be returned in the SSP 'Info Provided' message. When a query request for incoming/ outgoing parameter is made by SCP, the SSP sends back an 'EMPTY' bit string in the 'MemorySlot' parameter indicating that incoming/ outgoing information is not available.

118.6.2 Limitations and restrictions for each service

As discussed previously, the initial release of this capability is couple to AIN, specifically for signaling support and primary message (ASN.1) encoding/ decoding functions.

Because each group/service pair has its own unique set of limitations/ restrictions, a table is being provided to capture what, if any, limitations are present for each application.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
1	Message Waiting Indicator	To support MWI, MSRID is required to be sent by off-board processor and it has to be data filled in Table MSRTAB in the DMS. In the response of the query for MWI status, the ON/OFF status is sent back to the off-board system. The requestor DN which is stored against the agent will not be sent because GR-1298-Core does not support any additional data. The DMS supports following type of Message Waiting Indicator and Services: • Message Waiting Lamp - for Integrated Business Network (IBN) and Key Set (KSET) lines in business • Stutter Dial Tone (STD) - for Residential (RES) lines in residential and IBN lines in business environment. • Class Message Waiting Indicator (CMWI) for RES lines in form of STD. All existing Message Waiting (MWT) limitations and restrictions for activation and deactivation are the same and applicable to query and update messages for MWT. Also, please refer to AIN Service Implementation Guide (SIG) for more details. This service does not generate an AMA record.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
1	Visual Message Waiting Indicator	To support MWI, MSRID is required to be sent by off-board processor and it has to be data filled in Table MSRTAB in the DMS. In the response of the query for MWI status, the ON/OFF status is sent back to the off-board system. The requestor DN which is stored against the agent will not be sent because GR-1298-Core does not support any additional data. The DMS supports following type of Message Waiting Indicator and Services: • Message Waiting Lamp - for IBN and KSET lines in business • STD - for RES lines in residential and IBN lines in business environment. • CMWI for RES lines in form of STD. The DISPLAY TEXT is not supported. All existing MWT limitations and restrictions for activation and deactivation are the same and applicable to query and update messages for MWT. Also, please refer to AIN SIG for more details. This service does not generate an AMA record.
1	Anonymous Caller Rejection	All existing Anonymous Caller Rejection (ACRJ) limitations and restrictions for activation and deactivation are the same and applicable to query and update messages for ACRJ. If there's a call billing requirement, a AMASlpId is present and it's operating in a CEPT compliant market and only if the line was originally provisioned by the Telco. Then an item will be appended to the end of the AMA record. Otherwise, no AMA record will be generated.
1	Automatic Callback	The only portion is supported to deactivate the Automatic Callback (ACB) as per GR-1298-Core. The activation request for ACB is rejected. All existing Automatic Callback (ACB) limitations and restrictions for deactivation are the same and applicable to query and update messages for ACB. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
1	Automatic Recall	The only portion is supported to deactivate the Automatic Recall (AR) as per GR-1298-Core. The activation request for AR is rejected. All existing Automatic Recall (AR) limitations and restrictions for deactivation are the same and applicable to query and update messages for AR. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.
1	Call Screening	The Call Screening, Monitoring and Intercept (CSMI) is supported for both residential and business lines. All existing CSMI limitations and restrictions for activation and deactivation are the same and applicable to query and update messages for CSMI. This service does not generate an AMA record.
1	Outside Calling Area Alerting	The Outside Calling Area Alerting is known as long distance alerting (LDA) in DMS. The LDA service along with LDA Enhancement (LDAE) supports LDSV, LDSO, LDSA, LDSR and LDST options in DMS switch. Out of these options, the only option allows end user to activate/deactivate is LDSA using access code. The query and update messages are only applicable to LDSA state and activation/deactivation. If LDS_AUTO_PROV_ENABLED office parameter is set to "Y", the LDSA is automatically provisioned to line if the LDSV option is data filled in Table LINEATTR. User action to deactivate is ignored by the LDSA service. The update message for LDSA is ignored. All existing LDSA limitations and restrictions for activation and deactivation are the same and applicable to query and update messages for LDSA. This service does not generate an AMA record.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
1	Calling Identity Delivery and Suppression	The Calling Identity Delivery and Suppression (SUPPRESS) is only supported for the PUBLIC network. The query returns the current status of the line as public or private. The update request to activate change the status pps to public. The update request to deactivate change the status pps to private. If current status is public and deactivate request is received, no change made to the status. If current status is private and activate request is received, no change made to the status. All existing SUPPRESS limitations and restrictions for activation and deactivation are the same and applicable to query and update messages for SUPPRESS. This service does not generate an AMA record.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
1	Call Waiting	The call waiting (CWT) service is always active on all the lines when assigned in the switch. It is only deactivated when Cancel Call Waiting (CCW) access code is dialed. In the response to the query request following is sent for CWT: • If only CWT option is assigned to the line than the status of CWT is active. • If CWTACT is also assigned to the line than the status of CWTACT. In the response to the update request following activation/ deactivation are done: • If only CWT option is assigned to the line than activate/deactivate request are rejected because we can not change the status of CWT on the line. • If CWTACT is also assigned to the line than the activate request change the status to active and deactivate request change the status to inactive. Prior to this release CWTACT was only supported for the business lines. This feature also makes CWTACT available to RES lines as well. All existing CWT and CWTACT limitations and restrictions for activation and deactivation are the same and applicable to query and update messages for CWT and CWTACT. This service does not generate an AMA record.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
1	Make Set Busy	The Make Set Busy (MSB) is not required nor supported by GR-1298-Core and GR-1299-Core. This is a group 1 service supported by this activity as additional supported service. The activate request turns MSB “ON” and deactivate request turns MSB “OFF”. All existing MSB limitations and restrictions for activation and deactivation are the same and applicable to query and update messages for MSB. For encoding/decoding of MSB, please refer to Section 118.7.1. If there’s a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.
2	Audio Message Waiting Indicator	The GR-1298 defined Audio Message Waiting Indicator (AMWI) allows control of both MWT indication for the line in terms of ping ring at a programmable interval. This is the main difference between MWT in group1 and AMWI in grouyp2. The DMS service PRN falls under AMWI category while all other flavor of MWT in DMS are Group1 services. The delay interval is not supported. The CM feature Periodic Ringing Notification (PRN) can only be activated or deactivated because PRN does not allow to control the ring interval or delay interval. This service does not generate an AMA record.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
3	Distinctive Ringing/Call Waiting	• GR-219-Core provides the following guidance with respect to Distinctive Ringing/Call Waiting (DRCW) Traffic Measurements: *Hourly peg counts and usage counts with a usage scan rate of 1 per 10 seconds for SCRJ screen editing, for attempts to invoke control procedures as a result of dialing either SCF service access code (*61 or *81)* The end-office will peg any DRCW editing attempt as though the subscriber had instigated the editing session via service access code, therefore, the existing set of DRCW OMs will be used to reflect the measurements for both service access code and/or off-board service control attempts. For more information, please refer to the chapter discussing performance. • DRCW editing will be denied if DOR option present. In such instances, a result cause of *denied unsuccessful update (27)* will be provided in the update response. • DRCW editing will be denied if DENY DRCW option present. In such instances, a result cause of *denied unsuccessful update (27)* will be provided in the update response. • Attempts to add Extension DNs to an IBN subscriber's DRCW list is not supported.[a] • TCAP DN validation will not be performed for ADDs in which the source of the DN to be added is either incoming call memory or an existing SpeedCall cell entry. • The office parameter that controls the maximum number of SLE programmers allowed at any given time (SLE_MAX_PROGRAMMERS) will have no affect on SLE programming performed via the off-board service control interface. • A response of *confAllAnonymousEntriesRemoved* will be returned for *Delete All Anonymous Entries* update requests in which no private DNs are present in the subscriber's list. • When editing DRCW via Universal Access, the initial edit/query attempt will automatically add DRCW to the subscriber's line and take on the characteristics of DRCW as defined in table RESOFC. • Edit attempts with SOCOption AIN00322 IDLE will result in a SLE106 log being generated. • A response of *deniedUnsuccessfulUpdate* will be returned for ADD attempts in which DN validation fails. • For entire list queries in which the number of DNs in the list exceeds 32,only the first 32 entries will be reported in the query response and a SLE106 log will be generated. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
3	Selective Call Rejection	• GR-218-Core provides the following guidance with respect to Selective Call Rejection (SCRJ) Traffic Measurements: *Hourly peg counts and usage counts with a usage scan rate of 1 per 10 seconds for SCRJ screen editing, for attempts to invoke control procedures as a result of dialing either SCF service access code (*60 or *80)* The end-office will peg any SCRJ editing attempt as though the subscriber had instigated the editing session via service access code, therefore, the existing set of SCRJ OMs will be used to reflect the measurements for both service access code and/or off-board service control attempts. For more information, please refer to the chapter discussing performance. • SCRJ editing will be denied if DOR option present. In such instances, a result cause of *denied unsuccessful update (27)* will be provided in the update response. • SCRJ editing will be denied if DENY SCRJ option present. In such instances, a result cause of *denied unsuccessful update (27)* will be provided in the update response. • Attempts to add Extension DNs to an IBN subscriber's SCRJ list is not supported. • TCAP DN validation will not be performed for ADDs in which the source of the DN to be added is either incoming call memory or an existing SpeedCall cell entry. • The office parameter that controls the maximum number of SLE programmers allowed at any given time (SLE_MAX_PROGRAMMERS) will have no affect on SLE programming performed via the off-board service control interface. • A response of *confAllAnonymousEntriesRemoved* will be returned for *Delete All Anonymous Entries* update requests in which no private DNs are present in the subscriber's list. • When editing SCRJ via Universal Access, the initial edit/query attempt will automatically add SCRJ to the subscriber's line and take on the characteristics of SCRJ as defined in table RESOFC. • Edit attempts with SOCOption AIN00322 IDLE will result in a SLE106 log being generated. • A response of *deniedUnsuccessfulUpdate* will be returned for ADD attempts in which DN validation fails. • For entire list queries in which the number of DNs in the list exceeds 32,only the first 32 entries will be reported in the query response and a SLE106 log will be generated. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
3	Simultaneous Ringing	• The *EditSpecificEntry field* values of “add” or “delete” will be interpreted to add or delete only the NON-Pilot Member DN of a SIMRING group. • *EditAllEntries field* with a value of “deleteAllEntries “is interpreted as deleting only the Non-Pilot Member DNs in the SIMRING group. • *EditSpecificEntry field* with value of “delete” will result in SIMRING getting deactivated on the PILOT DN if no entries remain on the list. • *EditAllEntries field* with a value of “deleteAllEntries “will result in SIMRING getting deactivated on the PILOT DN. • *EditAllEntries field* with a value of “deleteAllPrivateEntries” is NOT valid for SIMRING. The update message with this action field will result in UnavailableResources result Cause being sent back as return error component. • The UPDATE message cannot edit the Non Pilot Member DN list during a SIMRING call (i.e. while all the member DNs are ringing). • Attempts to add NON-Pilot Member DNs via the ICM or given SpeedCall cell entry are not supported for SIMRING. • Edit attempts with SOCOption AIN00327 IDLE will result in a SLE106 log being generated. • A response of *deniedUnsuccessfulUpdate* will be returned for ADD attempts in which DN validation fails. This service does not generate an AMA record.
4	Call Forwarding Variable	Courtesy call during activation is not supported. No AIN triggers will be encountered during programing. ISDN agents are not supported. In a case involving updating the activation data for a call forward keylist, consistency will be retained between this feature and the present DMS call forwarding code as to what constitutes a successful updating. When the call forward service is deactivated, it will not clear the forwarding DN. This is to maintain consistency with the current DMS implementation. When the forwarded to DN is cleared, the call forwarding service will also be deactivated. The forwarded to DN may be up to 30 digits in length. CFU Per Key is not supported. If there’s a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
4	Call Forwarding Don't Answer	Courtesy call during activation is not supported. No AIN triggers will be encountered during programing. Integrated Services Digital Network (ISDN) agents are not supported. In a case involving updating the activation data for a call forward keylist, consistency will be retained between this feature and the present DMS call forwarding code as to what constitutes a successful updating. When the call forward service is deactivated, it will not clear the forwarding DN. This is to maintain consistency with the current DMS implementation. When the forwarded to DN is cleared, the call forwarding service will also be deactivated. The forwarded to DN may be up to 30 digits in length. CFB Per Key is not supported. This service does not generate an AMA record.
4	Call Forwarding Busy Line	Courtesy call during activation is not supported. No AIN triggers will be encountered during programing. ISDN agents are not supported. In a case involving updating the activation data for a call forward keylist, consistency will be retained between this feature and the present DMS call forwarding code as to what constitutes a successful updating. When the call forward service is deactivated, it will not clear the forwarding DN. This is to maintain consistency with the current DMS implementation. When the forwarded to DN is cleared, the call forwarding service will also be deactivated. The forwarded to DN may be up to 30 digits in length. CFD Per Key is not supported. This service does not generate a AMA record.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
5	Selective Call Forward	• GR-217-Core provides the following guidance with respect to Selective Call Forwarding (SCF) Traffic Measurements (section 3.5.4): *Hourly peg counts and usage counts with a usage scan rate of 1 per 10 seconds for SCF screen editing, for attempts to invoke control procedures as a result of dialing either SCF service access code (*63 or *83)* The end-office will peg any SCF editing attempt as though the subscriber had instigated the editing session via service access code, therefore, the existing set of SCF OMs will be used to reflect the measurements for both service access code and/or off-board service control attempts. For more information, please refer to the chapter discussing performance. • SCF editing will be denied if DOR option present. • SCF editing will be denied if DENY SCF option present. • If there are no entries in the list *and* no forwarding DN present, attempts to enable SCF will fail with a result cause of *denied invalid Forward DN*(17). • Attempts to add Extension DNs to an IBN subscriber's SCF list is not supported. • TCAP DN validation will not be performed for ADDs in which the source of the DN to be added is either incoming call memory or an existing SpeedCall cell entry. • The office parameter that controls the maximum number of SLE programmers allowed at any given time (SLE_MAX_PROGRAMMERS) will have no affect on SLE programming performed via the off-board service control interface. • A response of *confAllAnonymousEntriesRemoved* will be returned for *Delete All Anonymous Entries* update requests in which no private DNs are present in the subscriber's list. • When editing SCF via Universal Access, the initial edit/query attempt will automatically add SCF to the subscriber's line and take on the characteristics of SCF as defined in table RESOFC. • Edit attempts with SOCOption AIN00322 IDLE will result in a SLE106 log being generated. • A response of *deniedUnsuccessfulUpdate* will be returned for ADD attempts in which DN validation fails. • For entire list queries in which the number of DNs in the list exceeds 32,only the first 32 entries will be reported in the query response and a SLE106 log will be generated. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
5	Selective Call Acceptance	• GR-1298-Core provides for Selective Call Acceptance (SCA) to define the *no call acceptance treatment* as being a forwarding DN. Nortel Network's version of SCA does not allow for this capability. • The end-office will peg any SCA editing attempt as though the subscriber had instigated the editing session via service access code, therefore, the existing set of SCA OMs will be used to reflect the measurements for both service access code and/or off-board service control attempts. For more information, please refer to the chapter discussing performance. • SCA editing will be denied if DOR option present. • SCA editing will be denied if DENY SCA option present. • Attempts to add Extension DNs to an IBN subscriber's SCA list is not supported. • TCAP DN validation will not be performed for ADDs in which the source of the DN to be added is either incoming call memory or an existing SpeedCall cell entry. • The office parameter that controls the maximum number of SLE programmers allowed at any given time (SLE_MAX_PROGRAMMERS) will have no affect on SLE programming performed via the off-board service control interface. • A response of *confAllAnonymousEntriesRemoved* will be returned for *Delete All Anonymous Entries* update requests in which no private DNs are present in the subscriber's list. • When editing SCA via Universal Access, the initial edit/query attempt will automatically add SCA to the subscriber's line and take on the characteristics of SCA as defined in table RESOFC. • Edit attempts with SOCOption AIN00322 IDLE will result in a SLE106 log being generated. • A response of *deniedUnsuccessfulUpdate* will be returned for ADD attempts in which DN validation fails. • For entire list queries in which the number of DNs in the list exceeds 32,only the first 32 entries will be reported in the query response and a SLE106 log will be generated. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.
6	Ring Control	Only supported for a ring control type of PRGRING. One ring will last 8s for lines off of non-RDT peripherals and 6s for lines off of Remote Digital Terminal (RDT) peripherals. The number of rings can range between what the OFCENG parm RINGCTRL_MIN_VALUE is set to and 10. This service will not generate an AMA record.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
7	Calling Number Delivery Blocking	A DN's Permanent Presentation Status (PPS) is stored in table DNATTRS under the SUPPRESS option. The CNDB feature allows the caller to override the Number portion of the PPS on a per-call basis. The line must be subscribed to the CNDB line or customer group option or the CNDB Universal option. The agent must be off-hook and in the dialing state for the CNDB service to be invoked. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.
7	Calling Name Delivery Blocking	A DN's Permanent Presentation Status (PPS) is stored in table DNATTRS under the SUPPRESS option. The CNAB feature allows the caller to override the Name portion of the PPS on a per-call basis. The line must be subscribed to the CNAB line or customer group option or the CNAB Universal option. The agent must be off-hook and in the dialing state for the CNAB service to be invoked. This service does not generate a AMA record.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
8	Customer Originated Trace	• As per GR-216-Core and the CM implementation of the Customer Originated Trace (COT) feature, two activation levels (ACTLEVEL) are available for conventional users accessing the feature via an access code on telephone. The UPDATE message will allow invoking of the COT feature only for ACTLEVEL of ONELEVEL, which does NOT have any confirmation prompt announcements for the user accessing the feature. • The UPDATE message will not be supporting any announcements or any language related enhancements for the COT feature invocation. • If the COT has already been activated by the user via the access code from a telephone for the last incoming call then if an UPDATE message is used for the COT invocation, then it will be treated like a repeat attempt. The same will be valid in vice-versa scenario. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.
8	Cancel Call Waiting	• The user can use the UPDATE message to activate Cancel Call Waiting (CCW) only when the user is already off hook and getting a dial tone or is already on a call (single party or multiparty). • If the user invokes CCW through the UPDATE message while being off hook, then the user will not hear any audible confirmation tone for the invocation. If there's a call billing requirement and an AMASlpId is present. Then an item will be appended to the end of the AMA record. Please refer to the ACC document.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
9	Speed Calling	• GR-1299-Core provides numbers 2 through 9 (for Speed Call Short) or numbers 20 through 39 (for Speed Call Long) as the Speed Calling Code(s) for the Group9 Update Message. Nortel will support these GR required Speed Calling Code range. However, Nortel exceeds the GR-1299-Core standard by supporting the following Speed Call Code(s) (from NTP 297-8021-350, Standard 14.02, May 2001): - single digit Speed Call Cell range 0 to 9 for Speed Call Short (SCS), and - two digit Speed Call Cell range 00 to 69 for Speed Call Long (SCL) or Speed Call User (SCU) • GR-1299-Core does not provide for a Group9 Query message in order to retrieve/query the user's Speed Call data. However, Nortel will utilize the Extension Parm to retrieve/query a Block of 20 DNs (per Group9 Query Message). Each Query Block (of DNs) are labeled 0 to 5. For example: Nortel's Group9 Query Action $Block_X$: where X = 0-5: - Query Action $Block_0$ contains DNs associated with Speed Call Codes 0 to 19 - Query Action $Block_1$ contains DNs associated with Speed Call Codes 00 to 19 - Query Action $Block_2$ contains DNs associated with Speed Call Codes 20 to 39 - Query Action $Block_3$ contains DNs associated with Speed Call Codes 40 to 59 - Query Action $Block_4$ contains DNs associated with Speed Call Codes 60 to 79 - Query Action Block5 contains DNs associated with Speed Call Codes 80 to 99 • Nortel's Group9 Query Action $Block_0$ is utilized for Speed Call Short only. Since Nortel's Speed Call Short list could contain up to a maximum of 10 DNs associated with a Speed Call Code, only the first 10 indexes (0 to 9) of $Block_0$ will be utilized for query. The remaining indexes (10 to 19) will contain NIL DNs. • Nortel's Group9 Query Action Blocks 1-5 (i.e., $Blocks_1$ through $Blocks_5$) are utilized for Speed Call Long only.

Table 1 Limitations and Restrictions for each service

Group	Service	Limitations/Restrictions
9	Speed Calling	• GR-1299-Core provides that the Group9 Update Speed Call DN be a maximum of 10 digits per Speed Call Cell. **Note**: Nortel will support the GR-1299-Core requirement for a 10 digit Speed Call DN per Cell. In addition, Nortel will support an AINDigit DN which supports up to 30 digits for a Speed Call DN per Cell. • Nortel's Speed Call Design intent indicates that from the Speed Calling Cell digits provided (from the end user), a single Speed Calling Cell digit indicates Speed Calling Short, and two Speed Calling Cell digits indicate Speed Calling Long or Speed Calling User (SCU)[b]. • Only the Speed Call Controller is allowed to receive or query their Speed Calling List - not a Speed Calling User (SCU). • End to End Speed Call Signaling is not supported. • The Group9 Query Response Extension Parm contains the following fields: - **Count**: the total number of Speed Calling DNs within this $Block_X$ (up to 20). - **DN Bytes**: the number of bytes needed to represent the Speed Calling DN. Note: this range is 1 to 15, where 15 bytes represents 30 Digits. - **SC Cell**: the Speed Calling Cell associated with the Speed Calling DN. - **SC DN**: the Speed Calling DN. **NOTE: *if there's an odd number of Speed Calling Digits, the ending nibble will be hex F*.** • Please reference NTP 297-8021-350, Standard 14.02, May 2001 for all Nortel Speed Call limitations/restrictions. The Group9 Update/Query Event Handler will support the following: • Update Result Causes: - *deniedUnsuccessfulUpdate* - *confServiceActivated* • Update Return Result: - *UPD_UnavailableResources* - *UPD_OK* • Query Result: - *QR_Unavailable_Resources* - *QR_OK* This service does not generate a AMA record.

a. support EXTN DNs is possible given that EXTN is specified in the ADD DN update request - EXTN parm is currently not supported in the protocol but could be added as an extension parm of both group3 and group5 services.
b. SCU - Speed Calling User: this user is allowed (if provisioned with the SCU Servord line option) to have access to a Speed Calling Long list. However for this feature deployment, the SCU user is not allowed to add, change or query the Speed Calling list - only the SCL controller is allowed to modify or to query their SCL list.

118.7 Appendix A: Supplementary Details

This section contains additional details for the encoding and decoding services which are not supported by the GR-1298 and GR-1299. It also contains the details of Nortel's Extension Parameter(s) to support additional services and functionalities.

118.7.1 Make Set Busy Encoding and Decoding

The Make Set Busy service is not described in the GR-1299, Issue 7, Nov. 2001, ASN.1 encoding. The following extension to the GR-1299 ASN.1 encoding provides the Make Set Busy service accessible via update messages (Page 6-17, Section 6.4.2, GR-1299-Core, Issue 7, Nov. 2001):

Service1::=ENUMERATED {

118.7.2 Simring Encoding and Decoding

The Simring (simultaneousRinging) service is not described in the GR-1299, Issue 7, Nov. 2001, ASN.1 encoding. The following extension to the GR-1299 ASN.1 encoding provides the Simring service accessible via update messages (Page 6-18, Section 6.4.2, GR-1299-Core, Issue 7, Nov. 2001):

Service3::=ENUMERATED{

distinctiveRingingCallWaiting (0),

selectiveCallRejection (1),

simultaneousRinging (2)

}

The RequestGroup3 in Section 6.114, Page 6-110 of GR-1299-Core, Issue 7, Nov. 2001 refers to above Service3 for the Query request. The above change also apply to RequestGroup3, Service3 as well to provide the query request of the simring service.

The same changes also apply to Page C-59 and C-80, ASN.1 Modules to provide simring service under Service3 catagory.

The following is a hex and ASCII representation of the simring query and update requests:

118.7.3 Support of AINDigits Parameter in Call Forwarding and Speed Call

Call Forwarding and Speed Call are not described in GR-1299 Issue 7, Nov.2001, with having the capability to use up to thirty digit DNs (long DN). The following description captures how up to long DNs can now be used.

Service groups 3, 4, 5 and 9 have the ability to send a update request with long DNs. And service groups 3, 4 and 5 have the ability to receive a query request that contain long DNs.

Long DNs are not used to specify the UserResourceID. They're only permitted for example, when updating the ForwardingDN in a Call Forward Variable (CFU) request.

AdministrableObject Changes:

Service Group 3

Entry::=CHOICE {

[1] IMPLICIT Dn.

[2] IMPLICIT SpeedCallingCode,

[3] IMPLICIT MemorySlot,

[4] IMPLICIT AINDigits

}

-- AINDigits parameter supports up to 30 digits.

Service Group 4

Set::=CHOICE {

[1] IMPLICIT Dn,

[4] IMPLICIT SpeedCallingCode,

[5] IMPLICIT AINDigits

}

-- AINDigits parameter supports up to 30 digits.

Service Group 5

The above new definition, SET, is used indirectly by Service Group 5.

Service Group 9

ChangeList::=SEQUENCE {

[1] IMPLICIT Dn,

[2] IMPLICIT SpeedCallingCode,

[3] IMPLICIT AINDigits

}

-- AINDigits parameter supports up to 30 digits.

InfoProvided Changes:

All Service Groups will use this new query definition.

InfoProvided::=[100] IMPLICIT SEQUENCE {

[1] IMPLICIT ActivationStateCode OPTIONAL

[2] IMPLICIT EntireList OPTIONAL

[3] IMPLICIT MemorySlot OPTIONAL

[4] IMPLICIT ListSize OPTIONAL

[5] IMPLICIT ForwardToDn OPTIONAL

[6] IMPLICIT DelayInterval OPTIONAL

[7] IMPLICIT Empty OPTIONAL,

[8] IMPLICIT ListSizeVarDN OPTIONAL,

[9] IMPLICIT ForwardToVarDN OPTIONAL

}

ListSizeVarDN::=SEQUENCE {

AINDigits

}

-- ListSizeVarDN is a new field that uses type AINDigits, which supports up to 30 digits.

ForwardToVarDN::=SEQUENCE {

AINDigits

}

-- ForwardToVarDN is a new field that uses type AINDigits, which supports up to 30 digits.

118.7.4 Speed Call Query Request Extension Parameter

The Speed Calling Query Request Extension Parmeter contains the following fields:

- AssignmentAuthority: this field is utilized to identify if this particular Extension Parm is appropriate for this vendor's switch.
- NCRSpeedCallQueryRequest(x), where x = 0-5: the non-call response (NCR) parm identifies the Speed Calling Query Action Block request.

Note: the Speed Calling Query Action Block number (0 through 5) dictates which Speed Calling DN(s) will be retrieved:
- Query Action $Block_0$ contains DNs associated with Speed Call Codes 0 to 19
- Query Action $Block_1$ contains DNs associated with Speed Call Codes 00 to 19
- Query Action $Block_2$ contains DNs associated with Speed Call Codes 20 to 39
- Query Action $Block_3$ contains DNs associated with Speed Call Codes 40 to 59
- Query Action $Block_4$ contains DNs associated with Speed Call Codes 60 to 79
- Query Action $Block_5$ contains DNs associated with Speed Call Codes 80 to 99

Listed below are two Speed Calling Query Request examples: one for Speed Calling Short (SCS), and one for Speed Calling Long (SCL):

- Speed Calling Short (SCS) Query Request example:

Extension Parameter ASN.1 Details:- The following details are based on GR1299 Issue 7 requirements and definitions. They follow the ASN.1 notations for Extension Parameter, Assignement Authority and Special Routing Extension Parameter.

ExtensionParameter:-

The following shall be used for the ExtensionParameter (CR6-334 in GR1299 Issue 7, Page 6-77):

ExtensionParameter ::= [84] IMPLICIT SEQUENCE {

assignmentAuthority OBJECT IDENTIFIER,

parameters ANY DEFINED BY assignmentAuthority

}

-- The maximum length of the assignmentAuthority is 15 octets

The parameters field is to be defined by individual service providers. See ITU-T Recommendation X.209 for the encoding rules of OBJECT IDENTIFIERs.

assignmentAuthority:-

The following shall be used for the assignementAuthority (same as EnvelopeEncodingAuthority - R6-332 in GR1299 Issue 7, Page 6-76):

assignmentAuthority ::= [98] IMPLICIT OBJECT IDENTIFIER

-- Maximum of 15 octets

The following is bit encoding of the assignementAuthority:

Table 2 Bit and Octet Encoding of assignmentAuthority

TCAP INFORMATION		ENCODING	In Hex
		HGFEDCBA	
Parameter Identifier	assignmentAuthority (1st octet	10011111	9F
	assignementAuthority (2nd octet)	01100010	62
Parameter Length		00000111	07
Contents	1st sub-identifier	00101010	2A
	2nd sub-identifier	10000110	86
	3rd sub-identifier	01001000	48
	4th sub-identifier	10000110	86
	5th sub-identifier	11110110	F6
	6th sub-identifier	01111101	7D
	7th sub-identifier	00100100	24

NCRSpeedCallQuery Request:-

The following shall be used for the as NCRSpeedCallQueryRequest (As per ITU-T Recommendation X.209):

NCRSpeedCallQueryRequest::= [2] CHOICE {

[1] IMPLICIT ActionBlock

}

ActionBlock::=INTEGER (0 .. 5)

-- used to convey to the switch

-- association of Speed Call Codes.

-- 0 indicates that the Speed Call Codes for Speed Call short range from 0 to 9

-- 1 indicates that the Speed Call Codes for Speed Call long range from 00 to 19

-- 2 indicates that the Speed Call Codes for Speed Call long range from 20 to 39

-- 3 indicates that the Speed Call Codes for Speed Call long range from 40 to 59

-- 4 indicates that the Speed Call Codes for Speed Call long range from 60 to 79

-- 5 indicates that the Speed Call Codes for Speed Call long range from 80 to 99

118.7.5 Speed Call Query Response Extension Parameter

The Speed Calling Query Response Extension Parmeter contains the following fields:

- AssignmentAuthority: this field is utilized to identify if this particular Extension Parm is appropriate for this vendor's switch.
- NCRSpeedCallQueryResponse: the non-call response (NCR) parm contains the Speed Calling DN(s) associated with the Query Action Block request.

The NCRSpeedCallQueryResponse contains the following fields:

- **Count**: the total number of Speed Calling DNs within this Action Block$_X$ (up to 20).
- **DN Bytes**: the number of bytes needed to represent the Speed Calling DN. Note: range is 1 to 15, where

  1 byte - supports 1 or 2 Digits
  2 bytes - supports 3 or 4 Digits
  3 bytes - supports 5 or 6 Digits
  4 bytes - supports 7 or 8 Digits
  5 bytes - supports 9 or 10 Digits
  6 bytes - supports 11 or 12 Digits
  7 bytes - supports 13 or 14 Digits

8 bytes - supports 15 or 16 Digits
9 bytes - supports 17 or 18 Digits
10 bytes - supports 19 or 20 Digits
11 bytes - supports 21 or 22 Digits
12 bytes - supports 23 or 24 Digits
13 bytes - supports 25 or 26 Digits
14 bytes - supports 27 or 28 Digits
15 bytes - supports 29 or 30 Digits

- **SC Cell**: the Speed Calling Cell associated with the Speed Calling DN.
- **SC DN**: the Speed Calling DN.

  Note: if there's an odd number of Speed Calling Digits, the ending nibble will be hex F.

Please reference Figure 1, on page 1653 and Figure 2, on page 1655 for Speed Calling Query Response examples.

NCRSpeedCallQueryResponse:-

The following shall be used for the as NCRSpeedCallQueryRequest (As per ITU-T Recommendation X.209):

NCRSpeedCallQueryResponse::= [3] IMPLICIT HEX

-- Maximum of 361Octets.

129: Functional Description (FN): A00004037

129.1 Feature name

USNBD - FSK CDC Over Trunks

129.2 Description

129.2.1 Background Information

Currently there are three types of delivery mechanisms available for CDC messaging; X25, SCTP (supported only on CS2Kdelivery) or call data delivery via Frequency Shift Keying (FSK supported on DMS or in a CS2K hybrid configuration with TDM LTC/LGCs.) over a dedicated POTs line. X25 and SCTP mechanisms require Law Enforcement agencies to purchase additional hardware in order to receive the call data messages. Nortel has provided an inexpensive mechanism for the delivery of call data over a dedicated line. This feature will allow a mechanism for delivery of call data over a Switched Remote trunk.

129.2.2 Functional Description

Currently, FSK supports 2 access types, SL (switched local) and DE (Dedicated). This feature will add a third access type called SR (Switched Remote).

The DTC/SPM or other trunking peripheral does not support the CMR card. In order for the call data to be delivered over a trunk, an LGC/LTC peripheral containing the CMR will allocate a p-side loop around to the trunk. This will allow the data sent from the CM to be looped from the CMR peripheral to the trunk peripheral and out over the trunk.

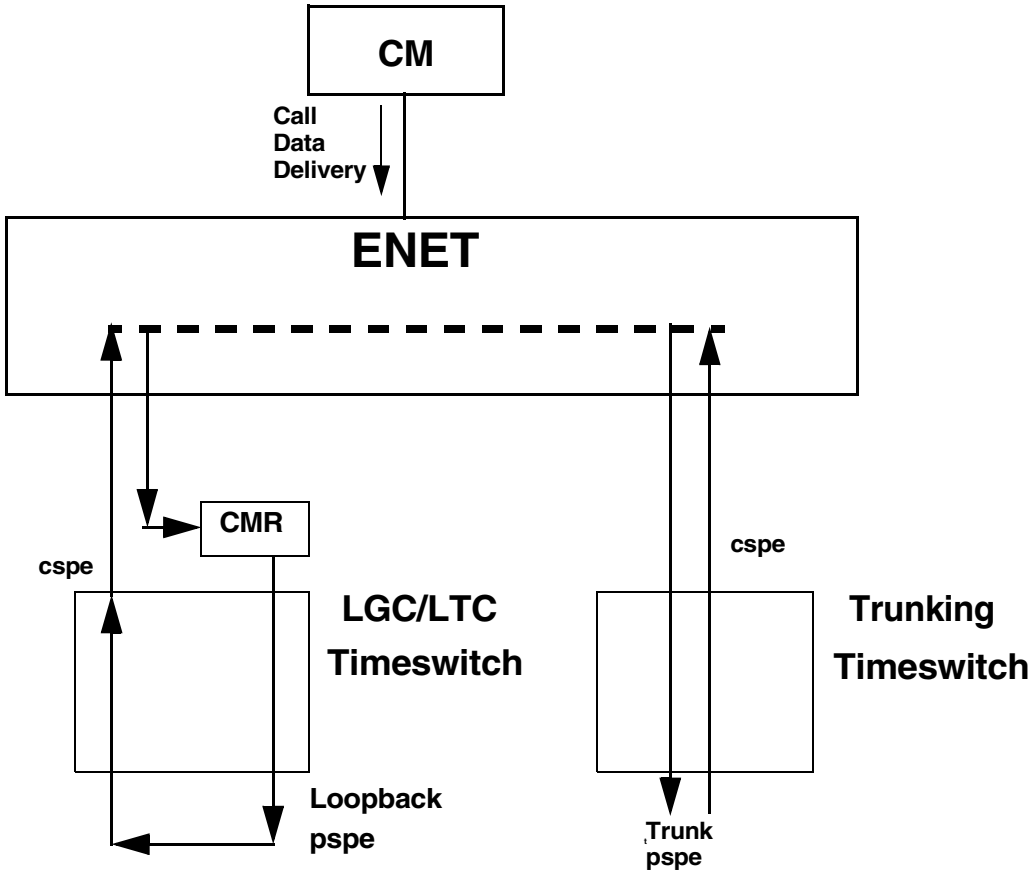
This feature will also support equal access dialing/routing for both Switched-Remote trunk CDCs and Switched CCRs (Note: Switched CCR or dial-out CCR functionality was initially provided in NA014 without equal access support).

To provide support of Equal Access, USNBD Agency command is modified to allow for the provisioning of a PIC and LATA which will be used for all equal access calls to Trunk CDCs and switched CCRs for that agency. If equal access dialing is not desired, the PIC and LATA fields should be set to NILCAR and NILLATA respectively.

Supported trunk types for equal access calls on SR CDCs and Switched CCRs are ISUP IT and ATC trunks with FGD signalling only.

Figure 1 below shows how the connections are made between the CMR card and the outgoing trunk.

Figure 1 CMR card to DTC connection



129.2.2.1 Modifications to USNBD CI commands

The USNBD CDC and AGENCY commands will be enhanced to allow a new type of transport protocol, SR (switched remote) for FSK CDC over trunks. Figure 2 illustrates the CDC list command with an SR CDC link added

Figure 2 Trunk

```
cdc list all
Index Type  Access CDC DN       Agency
    [Associated SINs]
-------------------------------------------------------------------------------
 1 FSK DE    6136211004          TEST
 2 FSK  SL   6136211005          TEST
 3 FSK SR    16136211006         FBI_WITH_EA
CDC LIST DONE
```

The Switched Remote CDC type will utilize Agency data just like the Switched CCRs, for billing information and digit translation.

The Agency command ADD and LIST will be enhanced to add the PIC and LATA fields. Figure 3 shows the agency list display.

Figure 3 Agency List Display

```
>agency list
AGENCY-NAME   STS   PRETRANSLATOR   LCANAME   BILLNO
                    PIC                       LATA
-------------------------------------------------------------------------------
FBI_NO_EA          613   P621                 L613          6135551000
                    NILCAR                    NILLATA
FBI_WITH_EA        613   P621                 L613          6135551001
                    ITT                       LATA1
AGENCY   LIST   DONE.
```

The Switched Remote CDC will utilize Agency data just like the existing Switched CCRs, for billing information and digit translation.

Figure 4 showis a calldump of the 110 and 119 billing records which are output for each CCR or CDC call utilizing EA translations.

129.2.2.2 CDC Link Establishment/Termination/Retries

The same rules which apply to Switched Local CDC lines, will be followed for Switched Remote trunks. A detailed list is in the DID section of this document.

129.3 Hardware Requirements or Dependencies

Availability of a CMR card in any LGC/LTC on the switch.

129.4 Software Requirements or Dependencies

Soc options NBD00003 and NBD00004 turned “ON” for USNBD functionality.

129.5 Limitations and restrictions

CM portion of this feature requires the XPM portion of this feature.

129.6 Interactions

The feature does not modify the way USNBD interacts with other features. It adds an additional CDC type.

129.7 Logs (LG)

129.7.1 New/modified logs

The existing UNB error and secret logs are enhanced to report the problems specific to Switched Remote CDCs during administration or audits. UNB306 logs will be output if the PIC or LATA fields are deleted.

129.8 Data schema (DS)

No new tables are created by this feature and none of the existing tables are modified by this feature.

129.9 Office parameters (OP)

No office parameter related changes are made by this feature.

129.10 Service orders (SO)

No Service order changes are made by this feature.

129.11 Alarms (AL)

No new alarms are added by this feature and none of the existing ones are modified by the feature.

129.12 Glossary

USNBD	United States Network Broadcast Delivery

130: Functional Description (FN): A00004045

130.1 Feature name

UCS20: A00004045 - Calling Line Identification Directory Number (CLIDN) for DMS-250

130.2 Description

The CLIDN call tracing capability captures call data based on the Called number. Called numbers that require tracing are entered into table CLIDN. Call data is captured during trunk termination and output in a TRK605 log. The TRK605 log contains the call origination number (e.g. Calling Party Number) and additional call information for tracing malicious, threatening or otherwise harassing calls.

Prior to this activity, the CLIDN table existed only in the DMS-100/200 product line as one option for providing CLI call tracing functionality. This feature implements similar DMS-100/200 CLIDN call tracing capability into the UCS DMS-250 product line and uses the same CLIDN table. The UCS DMS-250 functionality supports originations and terminations on the following DMS-250 trunk types: EANT (PTS and SS7), PRI, DAL, ONAL, ONAT and IMT (PTS and SS7). Availability of TRK605 log information is dependent on trunk and signaling type at the time the call information is captured.

Please refer to the following sections for additional information on this capability:

- Software Optionality Control (SOC): UTRS0012
- Table CLIDN
- TRK605 Log
- TRK605 Log Data Capture (Call Processing)

130.2.1 Software Optionality Control (SOC): UTRS0012

The new SOC code UTRS0012 ‘CLIDN for DMS-250’ is introduced by this feature. When UTRS0012 is ON, call attempts on a supported incoming trunk to a called number marked for tracing in table CLIDN will generate a TRK605 log. When UTRS0012 is IDLE, call attempts on a supported incoming trunk to a called number marked for tracing in table CLIDN will not generate a TRK605 log. Figure 1 shows an example of SOC UTRS0012 in the ON state.

Figure 1 UTRS0012 SOC option

```
>SOC
SOC:
>SELECT OPTION UTRS0012

GROUP:UTRS
OPTION   NAME              RTU STATE   USAGE   LIMIT    UNITS  LAST_CHG
------   ----              --- -----   -----   -----    -----  --------
UTRS0012  UCS CLIDN on DMS-250   Y    ON      -      -       -  03/08/28
```

If ACTPATCH KGL03 is active, then SOC UTRS0012 will be set to RTU "Y" and STATE "ON" on ONP to the sourced release.

130.2.2 Table CLIDN

This feature makes table CLIDN functionality available for the UCS DRU. Table CLIDN allows for a maximum of 67 ten-digit directory number (DN) (area code + office code + DN) tuples for which CLI call tracing is provided. For a service code (i.e., 411, 911, etc.) or a seven-digit DN, the letter N (internally translated to 0) must be prefixed to make the total digit count equal to 10.

Table CLIDN is not changed by this feature and is associated with the TRK605 log. When the called number is datafilled in table CLIDN, UTRS0012 SOC option is ON and the incoming trunk is a supported trunk type, the TRK605 log is generated. Figure 2 shows example datafill for table CLIDN.

Figure 2 Table CLIDN datafill

```

130.2.3 TRK605 Log

This feature makes TRK605 log functionality available for the UCS DRU. The existing TRK605 log was introduced in the DMS-100/200 by the Inter-Switch Call Trace (ICT) feature AN1658. The TRK605 log is used in a tandem switch to identify the origination number when the called number is being traced. The TRK605 log contains the fields: Incoming trunk, Outgoing trunk, Called number, Originating number, Source, Call ID and Time.

130.2.3.1 TRK605 Format

This feature does not change the format of the existing TRK605 log. The log report format for TRK605 is as follows:

* TRK605 mmmdd hh:mm:ss ssdd ALARM INFO ICT Calling Line Ident
INCOMING TRUNK = <CKT CLLI>

OUTGOING TRUNK = <CKT CLLI>

CALLED NUMBER = NXXNXXXXXX

SOURCE = CALLING NUMBER/CHARGE NUMBER/
UNAVAILABLE

CALLID = XXXXXX

TIME: MONTH: DAY HH:mm:ss

An example of log report TRK605 follows:

```
* TRK605 SEP27 14:23:29 5908 INFO ICT Calling Line Ident
    INCOMING TRUNK = CKT     DCEA20C7DR01    1
    OUTGOING TRUNK = CKT     DCEA21C7DR02    1
    CALLED NUMBER  = 2018212345
    ORIGINATION NUMBER = 8146119871
    SOURCE =           CALLING NUMBER
    CALLID =      852346
    TIME:    SEP27 14:23:29
```

130.2.3.2 TRK605 Log Field descriptions

Table 1 describes each field in the TRK605 log report.

Table 1 TRK605 Log Field descriptions

Field	Value	Description
*	Alarm	One asterik indicates that the generation of this log report represents a minor alarm condition.
INCOMING TRUNK	Trunk Group name and member number	This field identifies the CLLI name and member number of the incoming trunk.
OUTGOING TRUNK	Trunk Group name and member number	This field identifies the CLLI name and member number of the outgoing trunk.
CALLED NUMBER	Digits 0-9	This field identifies the called number that is being traced.
ORIGINATING NUMBER	Digits 0-9 or '$'	This field identifies either the calling number, charge number or billing number from the incoming trunk call information. The CLIDN for DMS-250 feature attempts to get the calling number first. If the calling number is not available, the charge number is used. If the charge number is not available, the billing number is used. If neither the calling, charge nor billing number is available, this field will display '$'.

Table 1 TRK605 Log Field descriptions

Field	Value	Description
SOURCE	Calling Number, Charge Number or Unavailable	This field identifies from what the originating number is derived. If the originating number cannot be derived, '$' will appear in the ORIGINATING NUMBER field and the SOURCE field will display "UNAVAILABLE".
CALLID	6 digit number; Digits 0-9 used	This field identifies the call process id number.
TIME	Month, Day, Hour, Minute and Second	This field identifies the date and time the call was logged.

130.2.4 TRK605 Log Data Capture (Call Processing)

When a supported incoming trunk with the called number datafilled in table CLIDN attempts to terminate on an outgoing trunk, a TRK605 log message is generated. The TRK605 log data is captured from the call information depending on the type of call and incoming trunk call data.

The following three call types may impact the Called number used to index table CLIDN on incoming DMS-250 calls:

- For typical calls, the Called number from the incoming trunk is used to index table CLIDN for DN tracing.
- Incoming calls in which a ported number Generic Address Parameter (GAP) is signaled in or returned from the database query, the ported number is used to index table CLIDN for DN tracing, otherwise the Called number is used.
- For all CAIN calls that receive a Called number from the database, the returned Called number from the database is used to index table CLIDN for DN tracing.

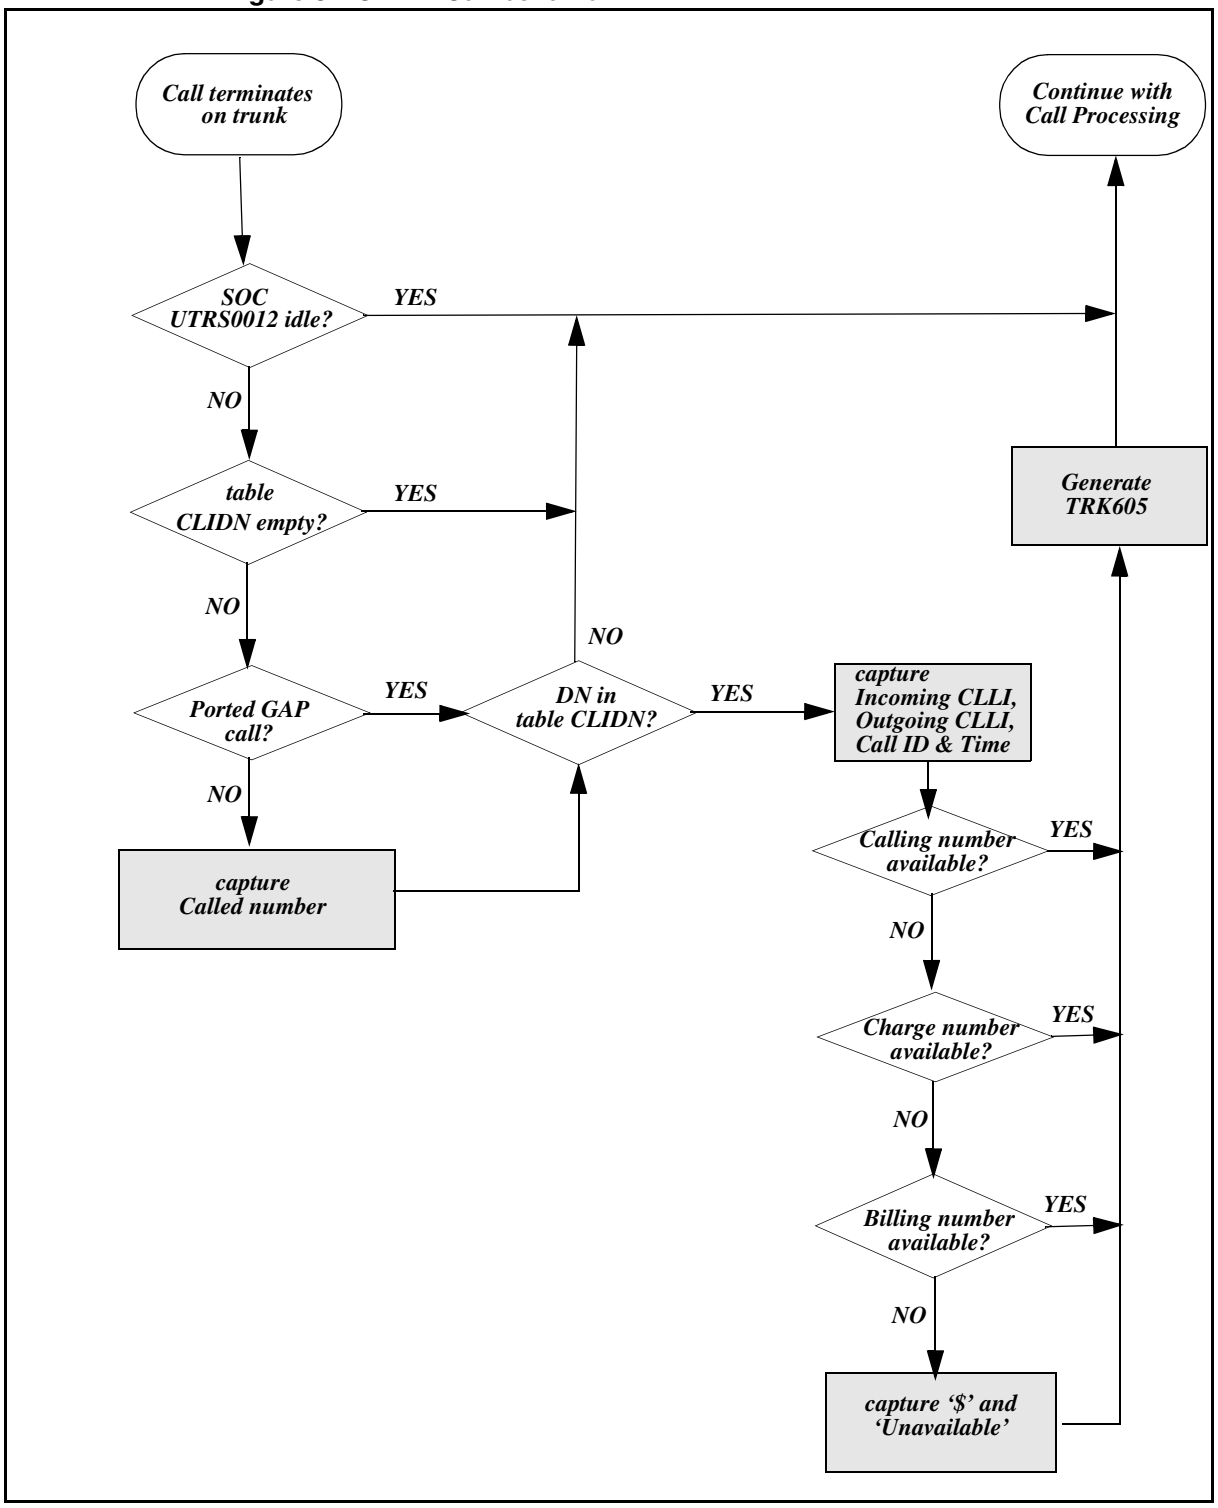
If the Called number is located in table CLIDN, the TRK605 log is generated with the incoming trunk captured call data. Table 2 gives a breakdown of how the TRK605 log data is derived. The flow chart in Figure 3 describes the call processing behavior of this feature.

Table 2 TRK605 log data

TRK605 log field	Information received from
Incoming Trunk	CLLI of incoming trunk

TRK605 log field	Information received from
Outgoing Trunk	CLLI of outgoing trunk
Called Number	Ported number GAP, if ported number is signaled in. The number returned from query, if CAIN alters called number. Called number present in the incoming trunk call data, if typical call.
Origination Number	Calling party number, charge number or billing number. If none of the above info is available, this field will be '$' (left blank).
Source	'CALLING NUMBER' if Origination number field is calling party number. 'CHARGE NUMBER' if Origination number field is charge number or billing number. 'UNAVAILABLE' if Origination number field is '$'.
Callid	Call data information
Time	Call data information time

Figure 3 CLIDN Call behavior



130.3 Hardware Requirements or Dependencies

None.

130.4 Software Requirements or Dependencies

SN07 (UCS20).

130.5 Limitations and restrictions

- This functionality will not support the following UCS trunk types: AXXESS.
- Only standard In-switch routed CAIN calls will be supported.
- This feature is patched in SN06 under ACTPATCH KGL03.

130.6 Interactions

None.

131: Functional description (FN): A00004046

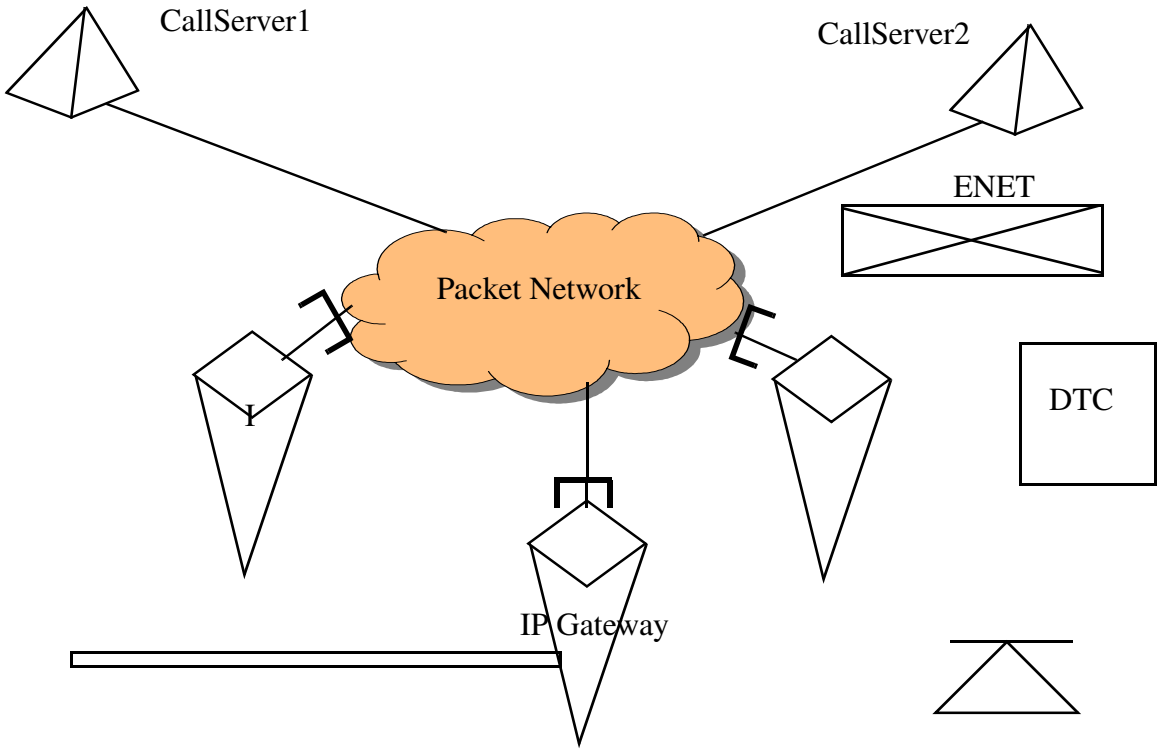
131.1 Feature name

This feature is titled Echo Cancellation Support for TriModal Call Server 2000.

131.2 Description

The TriModal call model allows for legacy, AAL1 and IP bearer fabrics to co-exist in the same Call Server VPN. This activity is responsible for ensuring that ECAN resources can and are allocated appropriately within the CallServer VPN. The goal is to ensure that ECAN resources are always applied in IP networks and are applied according to the selected strategy for AAL1 fabric. This entails implementation of an Edge Strategy for IP Networks and either an Edge or Region strategy for AAL1 networks. Edge Strategy requires that ECAN resources are always allocated at the point of entry into a packet network. Region strategy uses a provisioning model that allows the customer to dictate where ECAN resources should be deployed throughout the network.

Figure 1 Edge Strategy



The diagram above is an illustration of how an edge strategy could be employed. The salient point is that every point of entry into the network is covered by an ECAN resource.

Conversely, a region strategy is dictated by provisioning. The customer, using knowledge of network parameters, provisions the strategic locations within their network where ECAN resources should be applied. It is not assumed that a network device with a packet interface will automatically utilize ECAN resources.

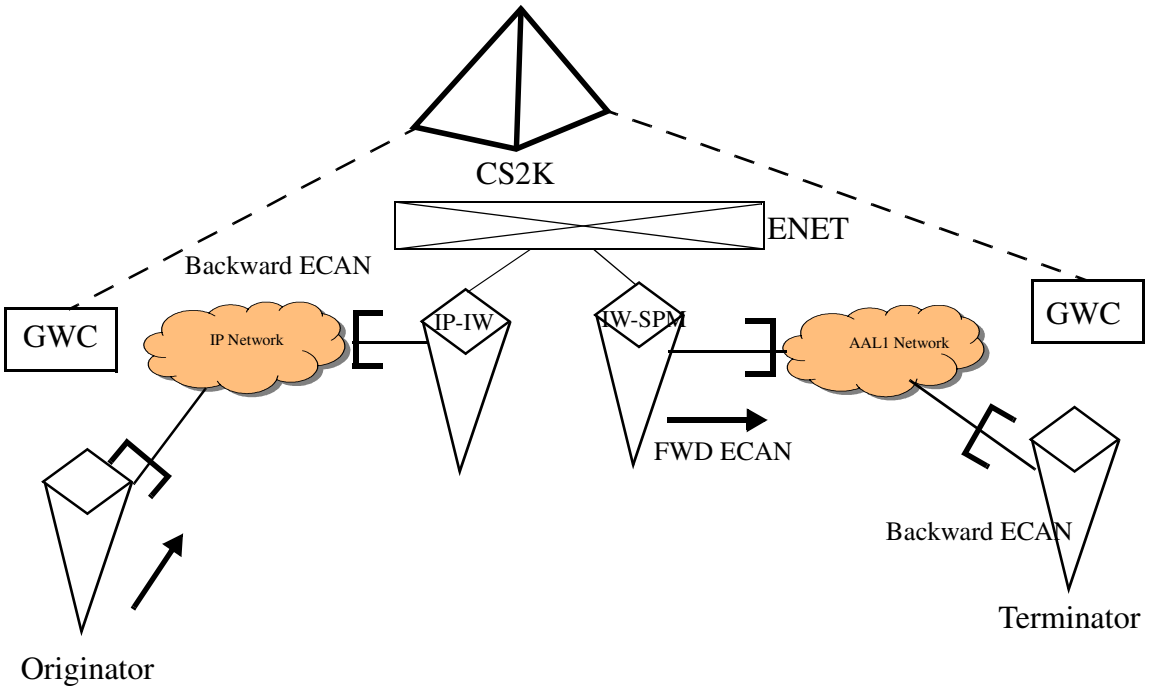
In SN06, feature A89007309, introduced support for an ECAN_EDGE_STRATEGY office parameter which would be used to differentiate between EDGE and REGION strategies on IP and AAL1 networks. A primary goal of activity A00004046 is to ensure that in the TriModal implementation, this strategy continues to be effective.

In SN07, IP, AAL1 and ENET bearer fabrics all co-exists on the same CS2K callserver. At a minimum, every call in this topology must have sufficient ECAN resources. These resources may be provided locally or optimized out of the call if it is subsequently determined that the resource is not required.

Fortunately, the SN06 strategy extends itself quite well to the TriModal architecture, ensuring that ECAN is applied consistent with this strategy.

The ECAN edge strategy will be assumed for all packet network types except AAL1. The ECAN strategy for AAL1 will be determined by the value of the EDGE_ECAN_STRATEGY office parameter. Currently, there are scenarios where ECAN resources in a TriModal switch will be duplicated.

Figure 2 TRI-MODAL IP-AAL1 Call



In the call scenario above, 4 ECAN resources will be allocated in the call, depending upon the ECAN_EDGE_STRATEGY value for the AAL1 side. The IP side of the call will always allocate both ECAN resources, however, if the REGION strategy is deployed, the ECAN resource on the AAL1 side of the call, utilizing the IW-SPM, will be deallocated. The manner in which ECAN resources are allocated in this TriModal topology is unchanged from the manner in which the resources would be allocated if both IP and AAL1 were not converged.

Therefore, in summary, the ECAN_EDGE_STRATEGY parameter will continue to be used in the CS2K to control ECAN allocation in the AAL1 bearer fabric. All other packet bearer fabrics will assume the edge strategy.

131.2.1 Trunk Provisioning

In summary, support for TriModal CS2K should be transparent to the customer. Support for this activity will be provided by the existing infrastructure, developed in the previous release for support of Next Generation Networks.

131.3 Hardware Requirements or Dependencies

There are no additional hardware requirements in support of this feature.

131.4 Software Requirements or Dependencies

There are no additional software requirements in support of this feature.

131.5 Limitations and restrictions

Trunk provisioning pertaining to ECAN is limited to provisioning ECAN resources against a specific trunk sub-group. There are 2 fields in TRKSGRP where this is done. On SPM peripherals, the SPMECIDX option is used to connect a specific ECAN provisioned value with a subgroup. For all other trunks, the ECSTAT field is used to determine whether or not ECAN resources are available, internally or externally.

This mode of operation is unchanged in this activity, however, customers should be aware of the following limitation (once MG4K-IP is available) when determining the ECAN characteristics of SPM based trunk members constituting a trunk group. TRKSGRP table only allows 2 subgroup tuples to be added per trunk group. There are currently 3 bearer fabrics that could potentially differ in their ECAN provisioning requirements in this table.

- Legacy Trunks i.e DMSCP SPM.
- AAL1 Trunks i.e. MG4K
- IP Trunks i.e. MG4K-IP (not available in SN07)

Since only 2 trunk subgroup tuples are allowed per trunkgroup, if the strategy for a trunkgroup contains all three component types, 2 of these types must share the same SPMECIDX value. This constraint should be considered during trunk datafill planning.

131.6 Interactions

There should be no visible effect in support of ECAN allocation in a TRI-MODAL call server. The extensibility of existing Next-Generation-Networks ECAN support makes the application of these resources transparent on a TRI-MODAL CS2K.

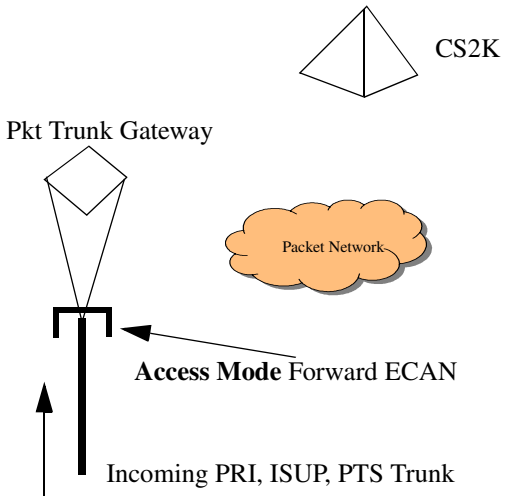
131.6.1 ECAN Terminal Type Cross Matrix

The allocation of resources are described in terms of Forward and Backward ECAN and Network vs. Access Mode allocation. In order to facilitate the understanding of table data, an explanation of these terms is in order.

Forward ECAN refers to ECAN resources that prevent echo from traversing in the forward direction of the call from originator to terminator. Backward ECAN refers to ECAN resources that prevent echo from traversing the call in a backwards direction from terminator to originator.

This concept in conjunction with Access vs. Network mode echo cancellation provides the exact direction and location in the CS2K that the echo cancellers are applied. Access mode ECAN refers to echo cancellers applied towards the facility i.e. The Line or the Trunk entity that is the source of the echo. Network mode ECAN applies echo cancellers toward the ENET. “Towards the ENET” or “Towards the Facility” applies to the “tail of the echo”. The “tail of the echo” can be thought of as the round-trip path from the echo canceller to the source of the echo. The echo cancellers are deployed in the direction of the tail. The following diagrams are provided to help the reader to understand how echo cancellers are applied in conjunction with these concepts.

Figure 3 Access Mode ECAN Example

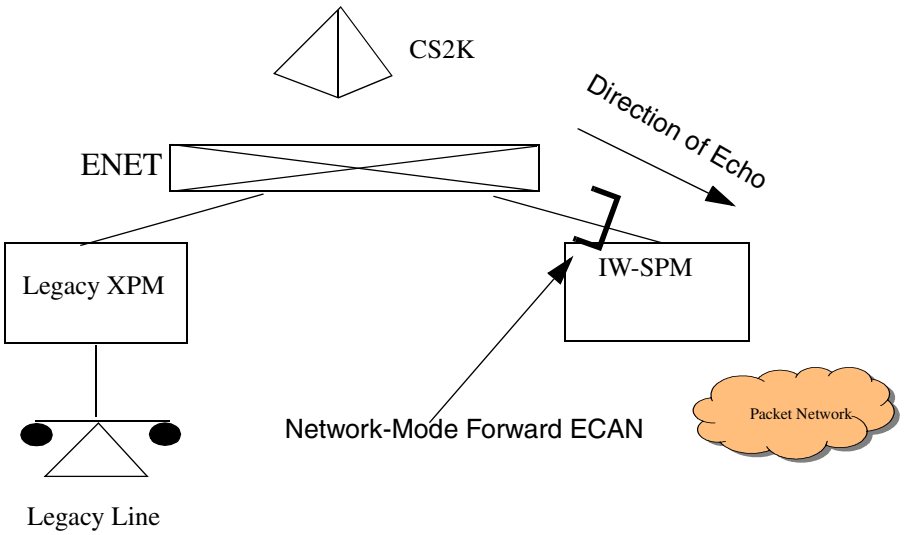


As Figure 3 illustrates, the echo canceller is applied to the incoming trunk, before packetization. It is Access Mode because it is applied to control echo

from the Facility. It is “forward” because it is blocking echo in the forward direction towards the terminating side of the call.

Network-Mode echo cancellers are applied toward the ENET. This is the defining characteristic of Network-Mode ECAN. Figure 4 below illustrates this concept.

Figure 4 Network Mode Forward ECAN

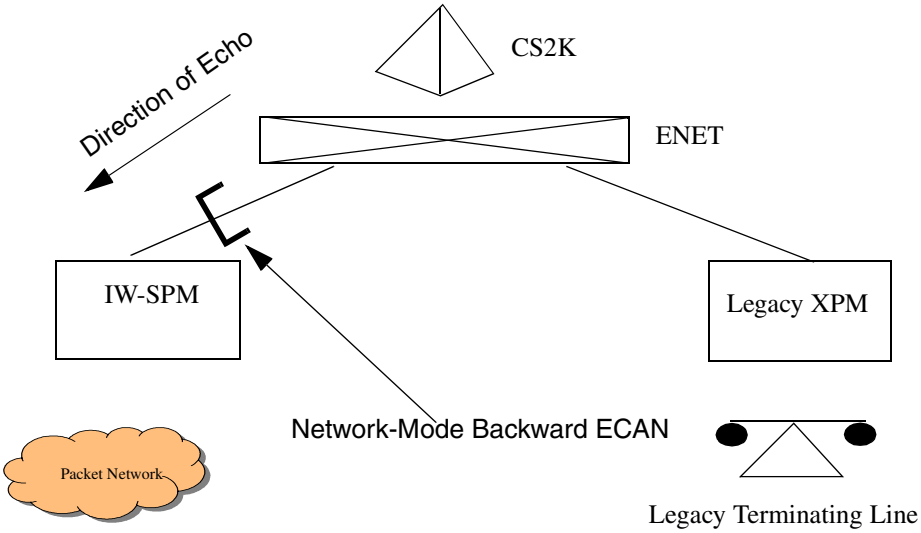


In Figure 4, the echo canceller is forward, due to the direction of the echo that is being cancelled. Echo cancellation is applied prior to packetization. However, the same ECAN resource applied in a different configuration can be Network-Mode **Backward** ECAN due to it’s position within the CS2K VLAN. This is the reason that Forward and Backward are not sufficient to determine the location of an echo canceller in the VLAN.

If the IW-SPM is positioned on the originating side of the CS2K VLAN, as opposed to the terminating side of the CS2K as it is shown in Figure 4, it is providing Backward ECAN.

Figure 5 below illustrates an IW-SPM providing ECAN resources in this capacity.

Figure 5 Network-Mode Backward ECAN



The following tables provides a high level view of ECAN allocation for different terminal types. Note that ABI lines and trunks have the same ECAN behavior as a packet line of the same network type. For example, an AAL1 ABI trunk would have the same ECAN behavior as listed in the following tables for an AAL1 line.

Table 1 ECAN Location for Legacy and IP Interworkings

Call Type	IP IW SPM	IP MG4K	IP Line GW	IP trunk GW
IP line to Legacy agent	Backward ECAN		Forward ECAN	
Legacy agent to IP line	Forward ECAN		Backward ECAN	
IP MG4K trunk to Legacy agent	Backward ECAN	Forward ECAN		
Legacy Agent to IP MG4K trunk	Forward ECAN	Backward ECAN		
IP GWC trunk to Legacy agent	Backward ECAN			Forward ECAN
Legacy Agent to IP GWC trunk	Forward ECAN			Backward ECAN
Legacy Agent to SIPT GWC trunk	Forward ECAN			
SIPT GWC trunk to Legacy Agent	Backward ECAN			
Note:	It is assumed that all packet trunks are datafilled with access mode ECAN.			

Table 2 ECAN Location for AAL1 agent Interworkings

Call Type	ECAN_EDGE_STRATEGY = N			ECAN_EDGE_STRATEGY = Y		
	AAL1 IW SPM	AAL1 MG4K	AAL1 line GW	AAL1 IW SPM	AAL1 MG4K	AAL1 line GW
AAL1 line to AAL1 line			Forward & Backward ECAN			Forward & Backward ECAN
AAL1 line to MG4K trunk		Forward & Backward ECAN**	Forward ECAN		Backward ECAN	Forward ECAN
AAL1 line to AAL1 BICC trunk			Forward ECAN			Forward ECAN

Term	Description
Forward ECAN	Echo Cancellers blocking echo from traversing from originator to terminator
Backward ECAN	Echo Cancellers blocking echo from traversing from terminator to originator

132: Functional description (FN): A00004096

132.1 Feature name

North America (NA) H.323 Support for Networked Meridian Customer Defined Network (MCDN) Services - ActId A00004096: SN07 Release, North American CS2K Load

132.2 Description

This feature allows interworking of MCDN based PBXs with certain hosted NA CS2K centrex lines for use within the Enterprise network.

Therefore, this feature activity A00004096 addresses the development associated with providing the NA CS2K switch the ability to support a specified set of MCDN services for its hosted centrex lines (i.e., CICM and Mediatrix 1104) within a carrier hosted H.323 network.

This feature activity A00004096 supports a specific set of MCDN services based upon the following Network Configurations:

- **interworking on a per nodal basis**
  These specific set of MCDN services are supported and interworked over a PRI_{H323} Trunk facility between either a Succession 1000M or BCM, and a hosted centrex line on a NA CS2K switch. Please reference Figure 2, on page 1695 .
- **interworking on a per inter-Call Server basis**
  These specific set of MCDN services are supported and interworked over a SIP-T[1] Trunk facility between either a Succession 1000M or BCM, and a hosted centrex line on a NA CS2K switch. Please reference Figure 3, on page 1697 .

MCDN is a Nortel proprietary PRI Q.931 protocol that allows Nortel PBXs to support a set of Networked Services between them within a Private Network. Within the H.323 IP network, the Enterprise PBX (i.e., Succession 1000M or BCM) tunnels this MCDN data in the nonStandardData field within the User-user Information Element (IE) of an H.225 message.

Currently, the CS2K Succession switch does not generate nor interpret this H.323 tunneled MCDN data.

[1]Within this document and/or activity A00004096, SIP-T is defined as an ANSI ISUP Trunk facility which contains Tunneled MCDN data.

In order to support these specific set of MCDN services on the CS2K Succession switch, design development maybe required to interpret or generate this tunneled MCDN service data within the H.323 packet.

> ***Note:*** if necessary, MCDN interpretation or generation is done within the Gateway Controller (GWC), not the CS2K Core.

This development allows the CS2K Succession switch to support (a limited set of) MCDN Services to Enterprise customers transparently. Therefore, if the Service Provider's Network contains more than one CS2K switch, an Enterprise customer can be spread across multiple CS2Ks.

132.3 $PRI_{H.323}$ Deployment

Throughout this FN document, a $PRI_{H.323}$ Trunk denotes a H.323 Nortel North American (NTNA) PRI Trunk which is utilized to connect a GWC with an H.323 profile to the CS2K on an NA CM load. This $PRI_{H.323}$ trunk type will be provisioned on the CS2K within the LTDATA table with the **PRI_IP_PROT** option, and **H323** VOIP_ PROTOCOL_TYPE. For example:

Figure 1 $PRI_{H.323}$ datafill trunk type example

```
TABLE: LTDATA
LTDKEY LTDRSLT
--------------
ISDN 867 SERV SERV Y Y ALWAYS ALWAYS (PRI_IP_PROT H323) $
```

Messaging on a $PRI_{H.323}$ trunk is formatted as per the H.323 NTNA PRI standard, and may carry tunneled MCDN private information pertaining to the H.323 endpoints. Currently, this tunneled MCDN data within the H.323 NTNA PRI Facility IE is transported transparently, without MCDN content verification/interpretation by either the GWC H.323 or GWC TPT tasks, up to the CS2K Core.

As indicated before, based upon this specific set of MCDN Services, development may be done within the GWC H.323 in order to interpret this tunneled MCDN data received from either a Succession 1000M or BCM Enterprise, and then pass this extracted interpreted MCDN data onto the GWC TPT.

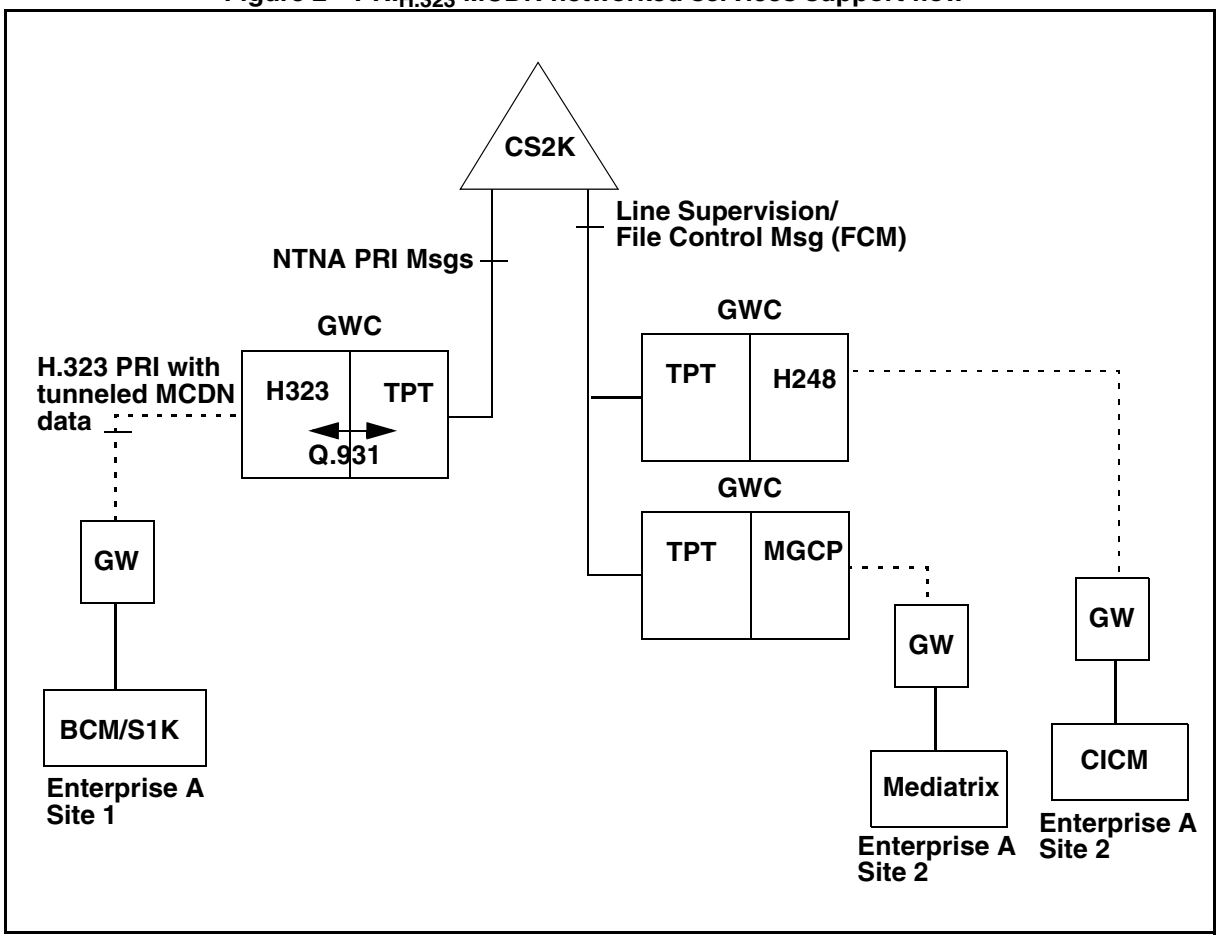
For example, at present, the Succession 1000M does not include Calling Name within the H.323 Setup message IEs, only Calling and Called Number in the H.323 IEs. The Succession 1000M Enterprise places the Calling Name IE within the tunneled MCDN data, not the H.323 IE. Therefore, development is required within the H.323 GWC to interpret this tunneled MCDN data in order to extract the Calling Name IE, and then pass this Calling Name text onto the GWC TPT. By doing this, the CS2K Core will receive Calling Name information from GWC TPT in order to provide Calling Name display.

In the CS2K to Succession 1000M call direction, the CS2K does provide Calling Name (as well as Calling and Called Number) within the H.323 Setup message IEs; however, the Succession 1000M displays only the Calling Number if tunneled MCDN data is not present (within an H.323 Setup Message). At present, the Succession 1000M expects the Calling Name to be contained within a tunneled MCDN H.323 packet. Therefore, the Succession 1000M does not display Calling Name from a CS2K switch. Hence, development is necessary within the GWC H.323 to build tunneled MCDN data which contains the Calling Name IE in order for the Succession 1000M to display Calling Name.

Note: for NTNA PRI name display, the Calling Name Presentation is linked to the Calling Number Presentation which requires the network to apply the Network Presentation Indicator (NPI) (“public” or “private”) value for the Calling Party Number to the Calling Name presentation status.

Figure 2, on page 1695 outlines the $PRI_{H.323}$ callserver topology in which this feature is being developed.

Figure 2 $PRI_{H.323}$ MCDN networked services support flow



132.3.1 SIP_$T_{H.323}$ (Tunneled ANSI ISUP) CS2K Deployment:

Throughout this document, a SIP_$T_{H.323}$ Trunk denotes tunneling of ANSI ISUP data via a SIP-T Trunk for support of the H.323 protocol on an NA CM load. This SIP_$T_{H.323}$ trunk type will be provisioned on the CS2K within the following existing CS2K Tables:

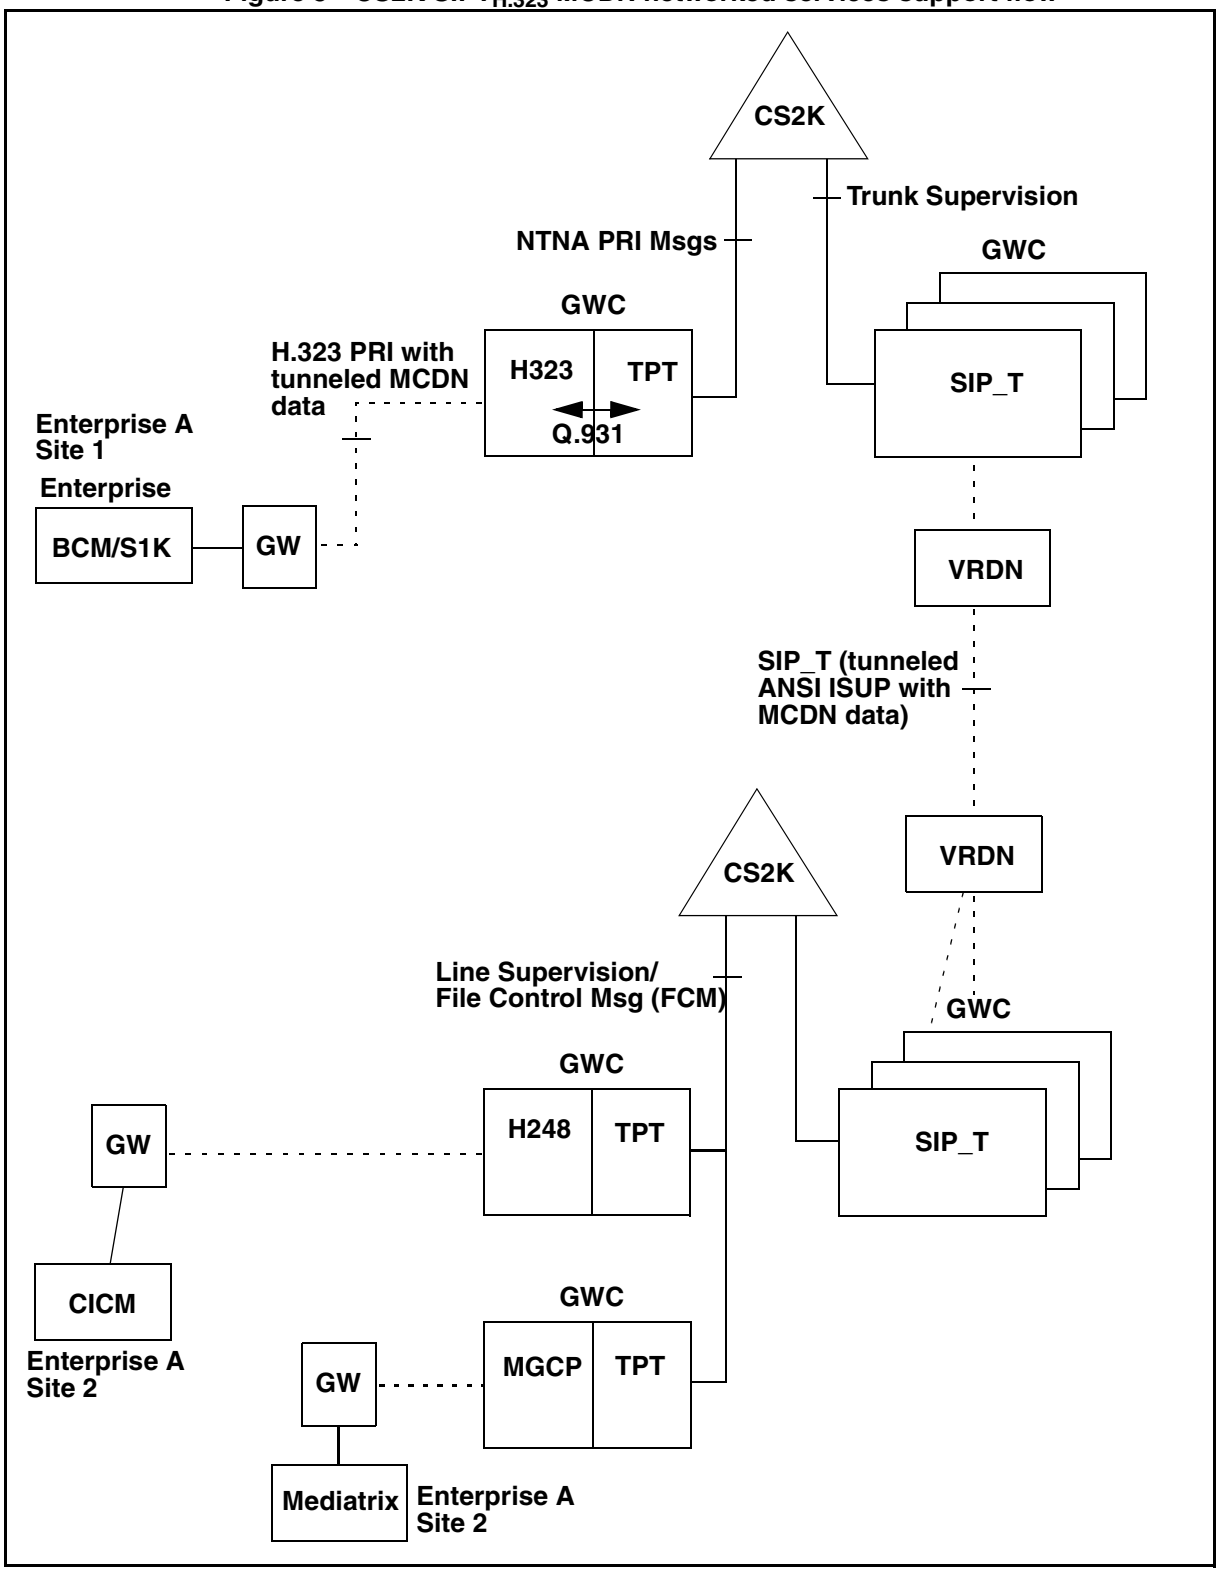
- CLLI
- TRKGRP
- TRKSGRP
- MGCINV
- TELEPROF
- VRINV
- TRKOPTS
- DPTRKMEM

MCDN private data will be mapped to ISUP Remote Operations Service Element (ROSE) Information Elements.

Like $PRI_{H.323}$, MCDN data contained with the ANSI ISUP ROSE parm(s) are transported transparently without verification of the MCDN content by the SIP_T GWC up to the CS2K Core.

Figure 3, on page 1697 outlines the SIP_$T_{H.323}$ callserver topology in which this feature is being developed.

Figure 3 CS2K SIPT$_{H.323}$ MCDN networked services support flow



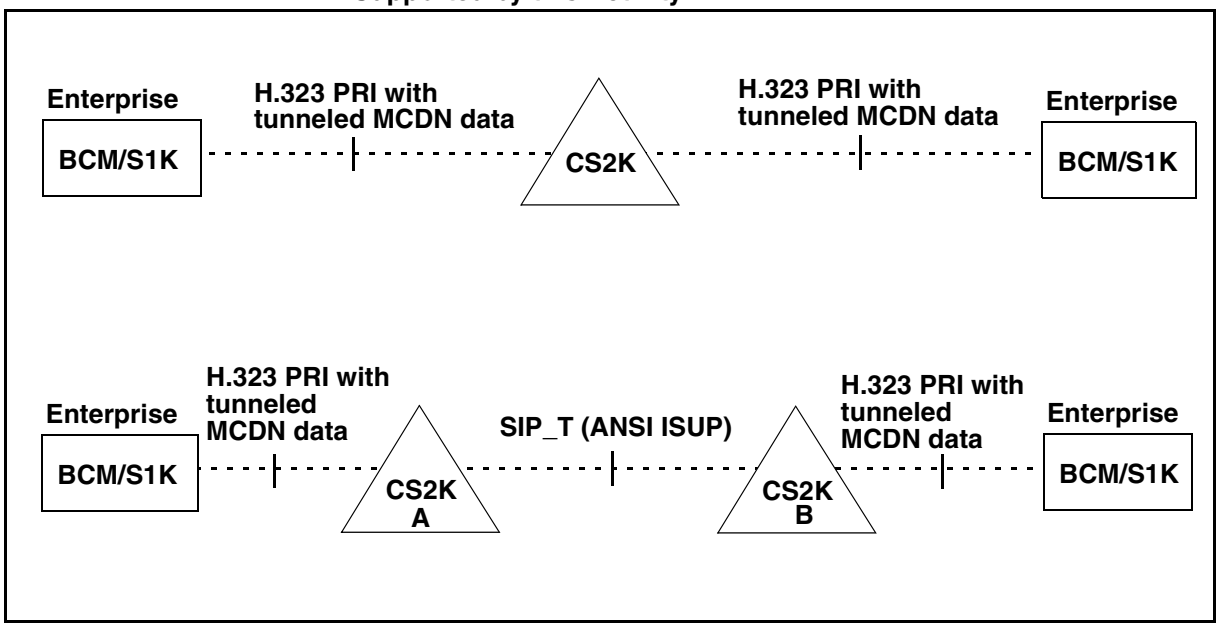
132.3.2 Supported MCDN Services

Only those MCDN services which are supported on either a P-Phone agent (via CICM) or an IBN line agent (via Mediatrix) are supported by this activity.

This feature supports a specific set of MCDN services on a per Enterprise nodal basis where the Originating and Terminating centrex line are connected to the same Call Service (i.e., CS2K). Also, these specific set of MCDN Services are supported across multiple Call Services via a SIP-T (ANSI ISUP).

Support of MCDN Services between different Enterprises (via a CS2K switch) is outside the scope of this feature (please reference Figure 4, on page 1698).

Figure 4 Enterprise to Enterprise MCDN Services via a CS2K is Not Supported by this Activity



Please reference the following activities for MCDN Tunneling through a CS2K:

- A00002206 *H.323 NTNA PRI Support*
- A00004568 *H.323 NA Network CAS SIP_T (Tunneling with MCDN)*

Following interworkings are supported:

- H.323 GW (BCM) <--> H.248 GW (CICM, P-phone)
- H.323 GW (BCM) <--> MGCP GW (Mediatrix, IBN lines)
- H.323 GW (Succession 1000M) <--> H.248 GW (CICM, P-phone)
- H.323 GW (Succession 1000M) <--> MGCP GW (Mediatrix, IBN lines)

Table 1 lists supported MCDN services for BCM interworking to CICM and Mediatrix for nodal calls and through SIP-T.

Table 2 lists supported MCDN services for Succession1000M interworking to CICM and Mediatrix GW for nodal calls and through SIP-T.

Each table should be read as following:

yes MCDN service interworking exists already and has been verified by other activities in SN06.

Yes MCDN service interworking is implemented and verified by this SN07 activity.

- low priority service (priority 2, 3, 4) not captured by this activity

Table 1 Supported MCDN Services

MCDN Services	BCM interworking to			
	CICM (nodal)	CICM (SIP-T)	Mediatrix (nodal)	Mediatrix (SIP-T)
Basic Call	yes	yes	yes	yes
Calling Line Identification (CLID)

Direct Inward System Access (DISA)	-	-	-	-

yes: service is already supported and tested by other SN06 activities
Yes: service is supported by this SN07 activity
- : low priority service, not captured by this activity
Note 1): Priority 1 service, not supported by this activity. Further investigations are needed.
Note 2): Priority 1 service, not supported by this activity, but according to Enterprise Architect, it is supported as a MCDN Service interworking between two H.323 GWs.
Note 3): Currently, CICM GWs are unavailable to test with; however, this is a supported Service.
Note 4): For this activity's CS2K to Succession-1000M direction, only private calls contain the MCDN private data (for displaying Calling Name). For CS2K to Succession-1000M direction, public calls do NOT contain private MCDN data. Therefore, for public CS2K to Succession-1000M direction calls, Calling Display is not applicable/displayed.
Note 5): Calling Name Delivery within the Core remains unchanged by this activity to either line agents or trunk agents; therefore, whatever existing functionalities, restrictions or limitations of Calling Name Delivery remain applicable.

Connected Number identifies the number in which the parties are connected to if the call had been changed (i.e., call redirection) during the lifetime of the call.

Even though Connected Number (CN) is a priority 1 service, it is not supported by this activity because the following:

- if the call has been redirected, CS2K expects that the Connected Number to be contained within a NOTIFY message. However, Nortel's *H.323 Interoperability Specification* does not support H.323 NOTIFY messaging.

  Succession 1000M/BCM expects this NOTIFY message, along with its Connected Number IE and other IEs, to be tunneled within the MCDN nonStandardData portion of a H.323 FACILITY message.
- in order to properly derive the Connected Number upon call redirection, multiple NOTIFY messages are required in order to request and provide

Connected Number bi-directionality (please reference Figure 5). The complexity of either tunneling the entire NOTIFY message and its IEs within the nonStandardData portion of an H.323 FACILITY message or extraction and interpretation of incoming MCDN data to a NOTIFY message to the CS2K Core requires sufficient time. According the an Enterprise Architect, for example, if the CS2K does not correctly build a tunneled MCDN Notify message within an H.323 FACILITY packet, it could cause call processing issues/problems for the Enterprise.

- because this activity came extremely late within the SN07 design cycle, this activity simply does not have a lot of design time (as well as testing time) in order to adequately provide high quality for this particular complicated messaging exchange.

Figure 5, on page 1702 , illustrates how the CS2K expects Connected Number to be contained within a NOTIFY message, but Nortel's H.323 Specifications do not support H.323 NOTIFY messaging. In addition, Figure 5 indicates the multiple messaging necessary to fully support/implement Connected Number.

Figure 5 CS2K Notify messaging Example for Connected Number

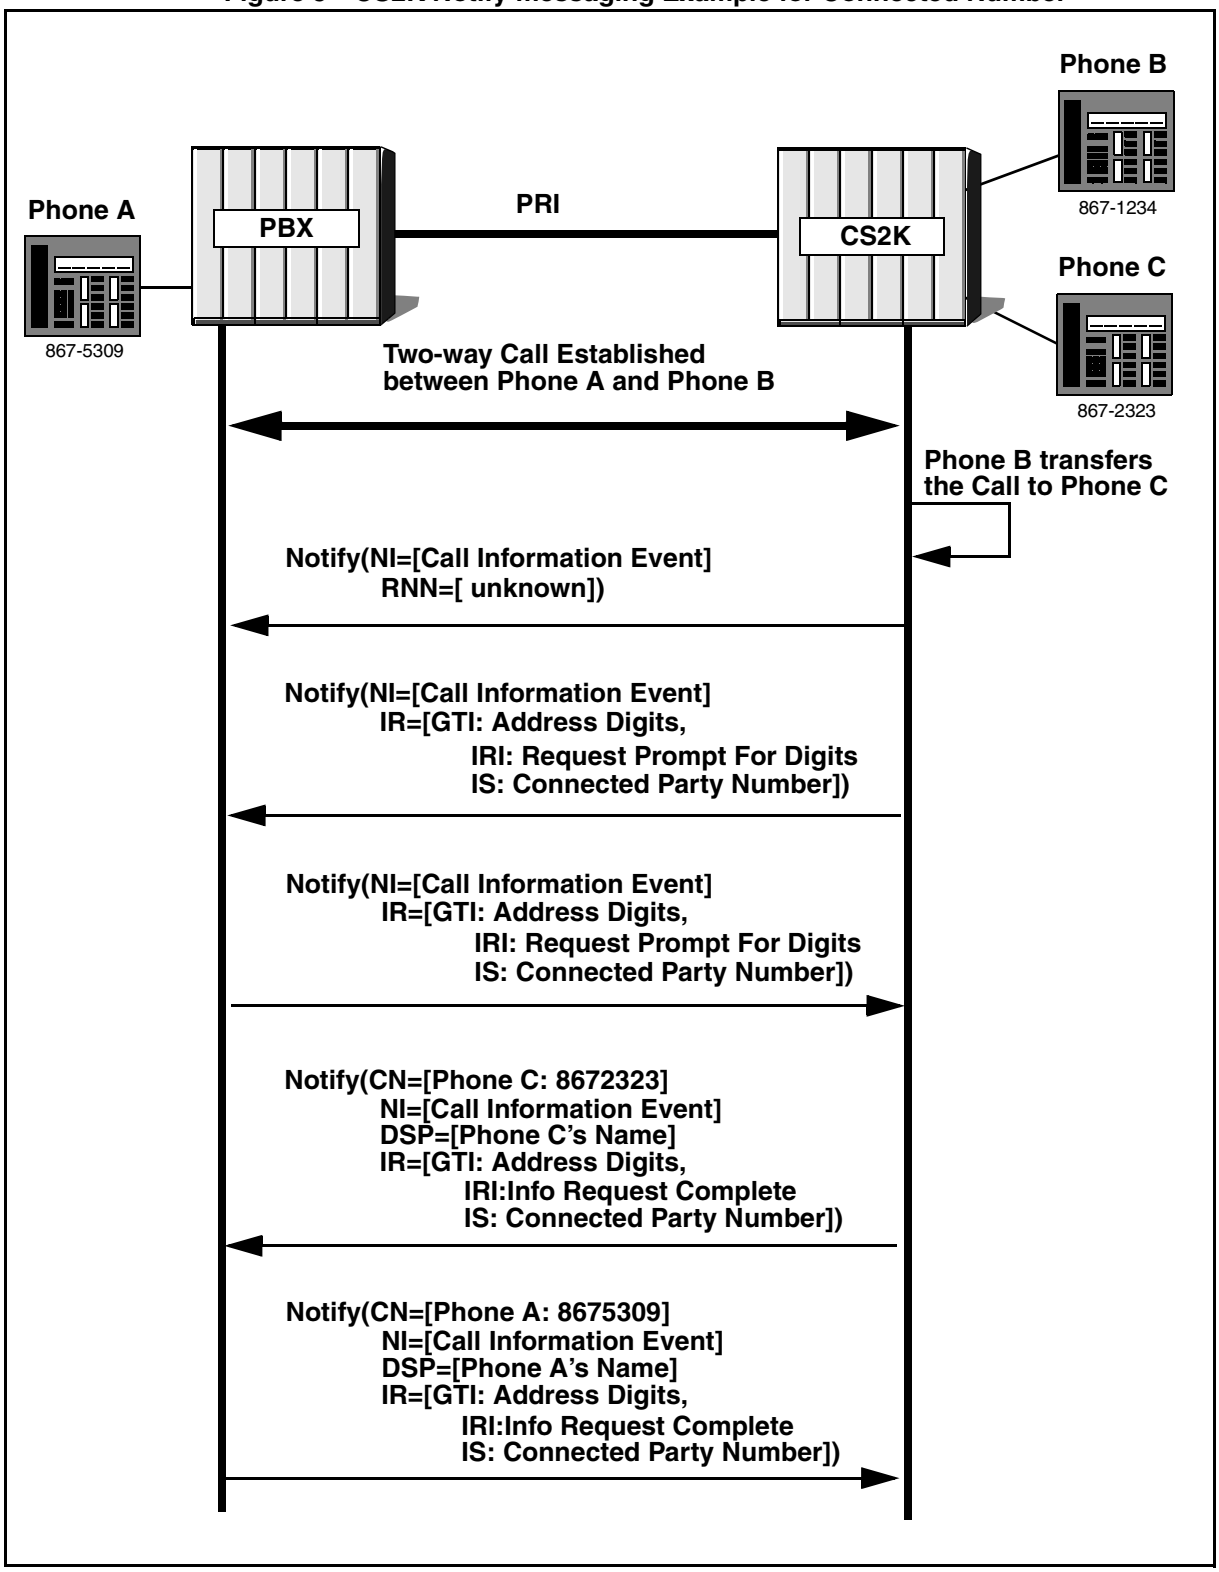

Table 2 lists supported MCDN services for Succession1000M interworking to CICM and Mediatrix GWs for nodal calls and through SIP-T.

The table should be read as following:

yes MCDN service interworking exists already and has been verified by other activities in SN06.

Yes MCDN service interworking is implemented and verified by this SN07 activity.

- low priority service (priority 2, 3, 4) not captured by this activity

Table 2 Supported MCDN Services

MCDN Services	Succession1000M interworking to			
	CICM (nodal)	CICM (SIP-T)	Mediatrix (nodal)	Mediatrix (SIP-T)

Table 2 Supported MCDN Services

yes: service is already supported and tested by other SN06 activities
Yes: service is supported by this SN07 activity
- : low priority service, not captured by this activity
Note 1): Priority 1 service, not supported by this activity. Further investigations are needed.
Note 2): Priority 1 service, not supported by this activity, but according to Enterprise Architect, it is supported as a MCDN Service interworking between two H.323 GWs (if tunneled through a CS2K).
Note 3): Currently, CICM GWs are unavailable to test with; however, this is a supported Service.
Note 4): Succession 1000M requires Calling Name to be tunneled within a H.323 Setup message (please reference See "PRIH.323 Deployment" on page 1693.) - hence, this design activity. In addition, for this activity's CS2K to Succession-1000M direction, only private calls contain the MCDN private data (for displaying Calling Name). For CS2K to Succession-1000M
direction, public calls do NOT contain private MCDN data. Therefore, for public CS2K to Succession-1000M direction calls, Calling Display is not applicable/displayed.
Note 5): Calling Name Delivery within the Core remains unchanged by this activity to either line agents or trunk agents; therefore, whatever existing functionalities, restrictions or limitations of Calling Name Delivery remain applicable.

132.4 Hardware Requirements or Dependencies

Please reference section “132.5 Software Requirements or Dependencies” on page 1707.

132.5 Software Requirements or Dependencies

- CM/GWC with SN07 load
- Business Communication Manager (BCM) with release 3.5
- Succession-1000M with release 4
- Centrex IP Client Manager (CICM) release 6.2
- Mediatrix 1104
- i2004 IP phone with release 1.5x
- Softclient M6350 with release 6.1

132.6 Limitations and restrictions

- A subset of MCDN services are supported by this feature. For supported services see chapter “132.3.2 Supported MCDN Services” on page 1698.
- Line side development (P-phone, IBN lines) is not part of this feature.
- Development on the H.323 agents (BCM, Succession1000M) is not part of this feature.
- MCDN Services which are not supported either by an H.323 agent or the line agent, will not be supported by this feature.
- Tunneling of MCDN data between Enterprises is outside of scope of this feature.
- Verification of MCDN services is done using Succession1000M. Omitting verification on Succession1000 GW is acceptable, because both GWs use the same software load.
- Testing is done on the North American CS2K load only.
- For Calling Name and Number delivery, the appropriate feature must be provisioned against the subscriber (i.e., CND - Calling Number Delivery, CNAMD - Calling Name Delivery, etc.)
- In the Mediatrix/CICM (CS2K) to Succession-1000M direction, only private Numbering Plan Indication (NPI) calls will contain this privately built MCDN tunneled data - public calls will not contain MCDN tunneled data.
- In the Mediatrix/CICM (CS2K) to Succession-1000M direction, private NPI with Local Type of Number (TON) is coded as an UIPE ESN CDP TON.

- CS2K Core Calling Name Delivery remains unchanged by this activity to either line agents or trunk agents; therefore, existing functionalities, restrictions or limitations of Calling Name Delivery remain applicable.

133: Functional Description (FN): A00004109

133.1 Feature name

A00004109: MG9K Hardware Upgrade and Call Processing Changes

133.2 Description

Note: This feature doesn't provide customer-facing changes. Any changes that will be visible to the customer will be done by feature A00003571.

This activity will implement call processing and resource management level software changes to support the new MG9000 ITP and ABI cards, which will be introduced in SN07.

Prior to this new ITP card, there were two separate ITP cards. One for the UA-IP product and one for the UA-AAL1 product. With the introduction of the new ITP, the same hardware will be used to support both IP and ATM applications. Previously, since the hardware was different for IP and ATM, the software could determine which application was to be run on the ITP. Since the new ITP supports IP and ATM, this is no longer the case. Customer interaction is necessary to provide the 'Bearer Type' of the VMG.

At VMG provisioning time, the end-user must select the 'Bearer Type' (UA-IP or UA-AAL1). This will be done via a GUI at the Element Manager. Feature A00003571 - "MG9000 MANAGER - NEW MG9000 CARD SUPPORT" will provide the functionality for the GUI and downloading the data to the MG9K. This feature will provide a new MIB which will hold the 'Bearer Type,' along with the VAD and CNG information.

Also, a 'Bearer IP Address' will be stored in this MIB. This address will be used for the bearer channels and will be used by ABI. The ABI handling of this address, along with ABI specific functionality will be provided by feature A00003729. This new MIB will be the 'Media Gateway Bearer Capabilities' MIB.

133.3 Hardware requirements

The functionality introduced by this feature doesn't have a requirement to explicitly run on the new ITP cards (NTNY30CA), but is being developed to support the new cards. The implementation of this feature will still execute on the 'old' ITP cards (NTNY30BA - UA-IP; NTNY30AB - UA-AAL1).

133.4 Limitations and restrictions

None.

133.5 Interactions

As described above, the customer will be required to provide a ‘Bearer Type’ and ‘Bearer IP Address’ at the time of VMG provisioning. For specific customer interactions please reference feature A00003751.

133.6 Logs & Alarms

There are no new logs or alarms being implemented with this feature.

134: Functional description (FN): A00004126

134.1 Feature name

A00004126 - SPM ECAN Control Enhancement

134.2 Description

134.2.1 Introduction

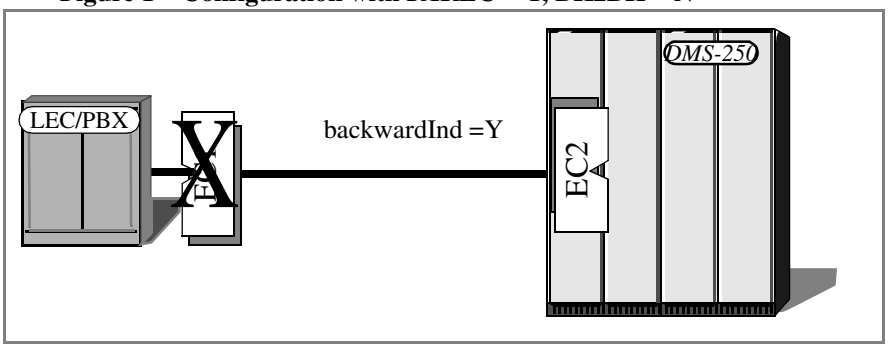
Currently, ECANs for ISUP trunks are allocated according to the ECAN control (EC) bits sent in the IAM and ACM/ANS message. If the far end switch incorrectly sets the EC bits then the near end will incorrectly allocate or not allocate an ECAN accordingly. This feature provides code changes in the CM and SPM that support backward and forward echo cancellation on an ISUP trunk regardless of the ECAN control bit setting of the far end by ignoring the echo bits sent in the IAM and ACM/ANS message.

This will offer the host SPM customer the flexibility of controlling the software decision making process to provide forward and backwards echo cancellation on a per trunk group basis. If the craftsman desires to control how ECANs are allocated the trunk option SPMECIDX in table SPMECAN can be datafilled to ignore the ISUP EC bits by setting a new bool IGNOREEC to TRUE. **However, ignoring the EC bits can cause more than two ECANS per call.**

Case : FAREC = Y, BK2BK = N

In this scenario, an external ECAN is expected at the distant end of the trunk. However, if the backward indicator indicates an ECAN is allocated when one is not allocated the DMS switch is provisioned with only one ECAN to cancel the backward echo. Therefore, a backward ECAN is needed to cancel the echo from the PBX/LEC. Please refer to figure 1.

Figure 1 Configuration with FAREC = Y, BK2BK = N



134.3 Hardware Requirements or Dependencies

There are no new hardware requirements for this feature.

134.4 Software Requirements or Dependencies

This feature requires the SPM and the CM to loaded simultaneously with SP20 and SN07, respectively, to activate this feature.

134.5 Limitations and restrictions

The following restrictions apply to the SPMECAN Table Control operations only:

- When changing the IGNOREEC bit from N to Y, it cannot be set Y if there are existing TRKSGRP tuples that use this SPMECAN index (tuple) and support any signaling type other than CCS7.
- When changed to Y, the new setting of the IGNOREEC bit will apply to all TRKSGRP CCS7 tuples that use the SPMECAN index.
- When changing the IGNOREEC bit from Y to N, it can be set N even if there are tuples in Table TRKSGRP that use this SPMEC index. The setting of the bit to N will be applied to all Trunk Subgroups that use this SPMECAN index.

135: Functional description (FN): A00004131

135.1 Feature name

UCS PRI B-Channel Negotiation

135.2 Description

This feature provides the ability for DMS 250 Universal Carrier Services (UCS) Primary Rate Interface (PRI) trunks to perform B-Channel negotiation. This functionality is implemented only for PRI trunks using either NTNA or N449PRI protocol. This feature is supported on both SPMs and GWCs.

135.2.1 B-Channel Negotiation Overview

The B-Channel Negotiation feature is provisioned on a PRI trunk group basis. With PRI B-Channel Negotiation active, the DMS-250 switch delivers an ISDN PRI Call SETUP message with the B-channel ID specified as "preferred" (see **Figure 1** below). The ISDN PRI customer premises equipment (CPE) user response to the Call SETUP message can include a request that the call be connected on a different B-channel from the one that was offered by the switch. If the CPE elects to change the B-channel to a different channel, the CPE's first response to the SETUP message must be a Call Proceeding, Alerting, or Connect message with the channel identification IE specified with the desired channel number. After receiving the message with the new channel, the switch completes the setup of the call using the B-channel that the CPE specified.

Figure 1 Preferred/Exclusive field of Channel Identification IE

The preferred/exclusive field is **Bit 4** of **Octet 3** of the **Channel Identification IE**
Values:

- **0 : preferred** - the indicated channel is preferred.
- **1 : exclusive** - only the indicated B-channel is acceptable.

135.2.2 B-Channel Negotiation Procedures

This section describes the B-Channel Negotiation procedures used by the DMS-250 to support delivery of a Call SETUP message to the terminating CPE with the B-Channel Negotiation feature active. **Note that the SOC option NPRI0003 - UCS B-Channel Negot must be enabled as specified in section 2.2.5 for B-Channel Negotiation to function properly as described in this section.**

If PRI B-Channel Negotiation is active for the B-Channel trunk group, the DMS-250 codes the preferred/exclusive bit of the channel identification IE of the SETUP message as "preferred". If the PRI B-Channel Negotiation is inactive, the switch marks the B-channel identification bit to its default value of “exclusive”.

If the called CPE responds with the same channel identification in the first CALL PROCeeding, ALERTing, or CONNect response to an incoming SETUP message as was indicated by the DMS-250 in the SETUP message, the DMS-250 continues with call processing to the terminating CPE as if the B-Channel Negotiation was not enabled.

If the first response to the outgoing SETUP message with channel identification specified as “preferred” is a Call Proceeding, Alerting, or Connect message containing a channel identification IE whose channel number differs from the offered channel ID, and if the received B-channel trunk group member is available for a call, B-Channel Negotiation is activated. DMS allocates the channel indicated by the CPE to the call and continues with call processing.

The DMS-250 does not distinguish whether the CPE specifies the channel as "preferred" or "exclusive" in the channel identification response of the first CPE Call PROCeeding, ALERTing, or CONNect message response to a terminating Call SETUP message.

There is no restriction on the direction or speech capability of the PRI trunks to which this feature can be assigned.

135.2.3 Errors Invoked by PRI B-Channel Negotiation

If the SETUP message from the DMS-250 specifies the channel identification as “exclusive” and the CPE first response message specifies a different B channel identification, the DMS-250 initiates call clearing by sending to the CPE a RELease message containing the cause: "channel unacceptable" (encoded 0000110)and location: “public network serving the local user” (encoded 0010).

If PRI B-channel Negotiation is active and the CPE's first response to a SETUP message with channel identification specified as "preferred" is a Call Proceeding, Alerting, or Connect message containing a channel identification IE whose channel number differs from the offered channel ID, but the received B-channel trunk group member is not available for a call, then the switch initiates call clearing by sending to the CPE a RELease message containing a cause: "channel unacceptable" (encoded 0000110)and location: "public network serving the local user" (encoded 0010).

If PRI B-channel Negotiation is active and the first response to the outgoing SETUP message with channel identification specified as "preferred" is a Call Proceeding, Alerting, or Connect message containing a channel identification IE whose channel number differs from the offered channel ID but does not exist or is not valid for the offered PRI Group, then the switch initiates call clearing by sending to the user a RELease message with cause: "channel unacceptable" (encoded 0000110)and location: "public network serving the local user" (encoded 0010).

If channel identification is not included in a CALL PROCeeding, ALERTing, or CONNect message received as the first response to the SETUP message, then B-Channel negotiation is not invoked and the treatment of the call is the same as the treatment of a basic call in the same scenario. Specifically, no state transition should occur and the DMS-250 should respond with a STATUS message containing the cause: "mandatory information element missing" (encoded 1100000) and location: "public network serving the local user" (encoded 0010).

135.2.4 B-Channel Negotiation Service Provisioning Options

NOTE : The SOC option NPRI0003 - UCS B-Channel Negot must be enabled as specified in section 2.2.5 before B-Channel Negotiation is provisioned. Otherwise, any call attempting to perform B-Channel Negotiation will fail.

B-Channel Negotiation is activated by setting BCHNEG field in table TRKSGRP to 'Y'. It activates B-channel Negotiation on a PRI trunk group basis. This functionality is turned off by default, as indicated by BCHNEG field setting of 'N'.

This is existing functionality for NTNA. This feature will add the ability to assign B-channel Negotiation to N449PRI by allowing the associated BCHNEG field to be set to 'Y' for trunks supporting the N449PRI protocol variant.

135.2.5 Software Optionality Control

The SOC code for this feature is: NPRI0003 - UCS B-Channel Negot.

When SOC is ‘IDLE’, B-Channel negotiation can be provisioned, but the call processing functionality is not available. Likewise, with the state set to ‘ON’, the functionality is available.

135.3 Hardware Requirements or Dependencies

No new hardware dependencies are introduced by this feature.

135.4 Software Requirements or Dependencies

No new customer software or firmware dependencies are introduced by this feature, but both Core and peripheral loads for SPMs and GWCs must be at SN07 or higher for this feature to work.

135.5 Limitations and restrictions

This functionality is implemented only for UCS PRI trunks using either NTNA or N449PRI protocol.

PRI B-channel Negotiation is limited to members of the same PRI trunk group.

Setting field ‘BCHNEG’ to ‘Y’ in Table TRKSGRP to activate this feature requires that field ‘BCHGLARE’ controlling glare is set to ‘STAND’.

The following originating agents are supported :

- EANT (MF & ISUP)
- DAL
- PRI
- ONAL
- ONAT

Setting field ‘BCHNEG’ to ‘Y’ in Table TRKSGRP to activate this feature causes the preferred/exclusive bit of channel identification field in the outgoing SETUP message to be set to ‘preferred’. However, the SOC option NPRI0003 - UCS B-Channel Negot controls the call processing functionality of this feature, thus must be enabled as specified in section 2.2.5 before B-Channel Negotiation is provisioned. Otherwise, any attempt to perform B-Channel Negotiation by far-end trying to use a different channel will cause the call to fail, even though the outgoing SETUP msg contained ‘preferred’.

135.6 Interactions

None known.

NTNA	DMS PRI
CPE	Customer Premises Equipment

136: Functional description (FN): A00004137

136.1 Feature name

A00004137 - ANI Billing

136.2 Synopsis

This feature introduces a new AMA module, Module Code 838 (MC838). MC838 is appended to a Structure Code 0220 (SC0220) record when the Calling Party Number (CPN) or the Billing Number (BN) is delivered to the terminating party on a PRI connection.

Additionally, the feature enhances the FAR message to indicate to the previous office that the CPN/BN was delivered to the terminating party when the terminating switch is different from the originating switch.

136.3 Description

This feature provides the following functionality:

- If the DMS switch is doing the billing for the call and the call terminates on a PRI trunk, and the PRI trunk is provisioned to deliver Calling Party Number (CPN) or Billing Number (BN), then Module Code 838 will be appended to the AMA record to indicate that the CPN or the BN was delivered to the terminating PRI party. This will only apply for Structure Code 0220. This is the case when the DMS switch is both the originating and terminating switch. Please refer to “Figure 1 - The DMS is both the originating and terminating switch” on page 1722.
- If the DMS switch is the originating switch, but not the terminating switch, then the DMS switch will generate a Module Code 838 based on the FAR message received from the terminating switch indicating that the CPN/BN was delivered to the terminating party. Please refer to “Figure 2 - The DMS is the originating switch, but not the terminating switch” on page 1722. This will be accomplished via a new Facility Indicator in the FAR message.
- If the DMS switch is the terminating switch, but not the originating switch, then the DMS will send a FAR in the backwards direction (to the originating switch) indicating that the CPN/BN was delivered to the terminating party. Please refer to “Figure 3 - The DMS is the terminating switch, but not the originating switch” on page 1723.
- If the DMS is neither the originating or the terminating switch, but an intermediate switch, then the DMS will just pass the FAR message received on the terminating trunk in the backward direction to the previous

switch. Please refer to "Figure 4 - The DMS is neither the terminating switch or the originating switch" on page 1723.

This ANI Billing functionality only applies to calls terminating on PRI trunks. Additionally, this functionality is controlled via SOC UTRS0014.

Figure 1 - The DMS is both the originating and terminating switch

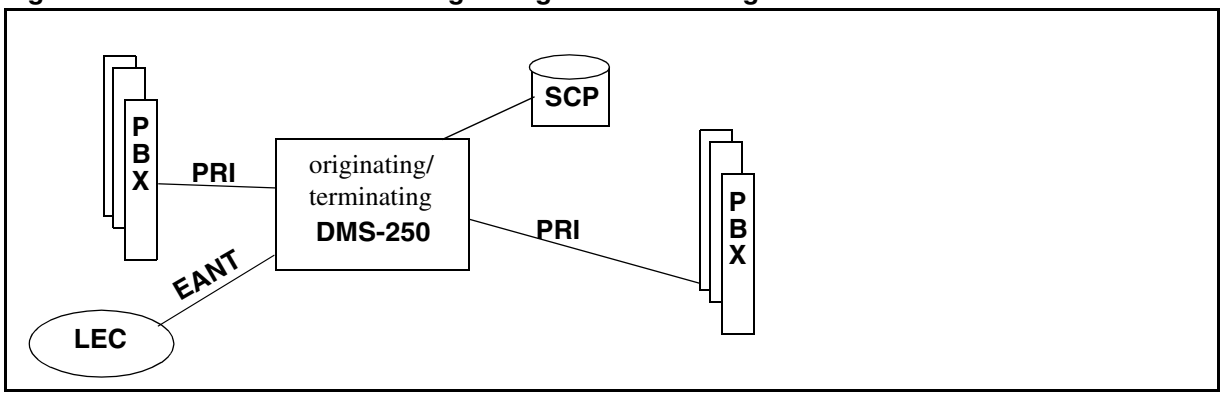

Figure 2 - The DMS is the originating switch, but not the terminating switch

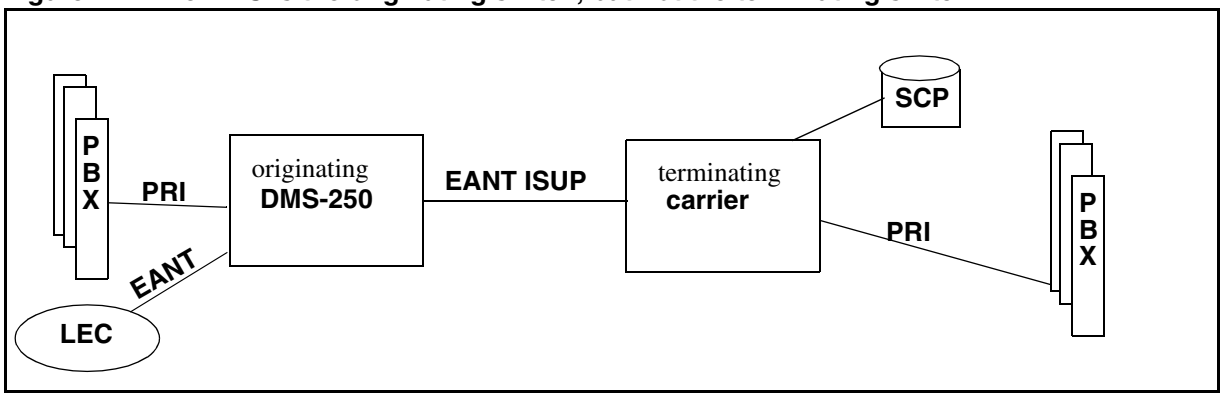

Figure 3 - The DMS is the terminating switch, but not the originating switch

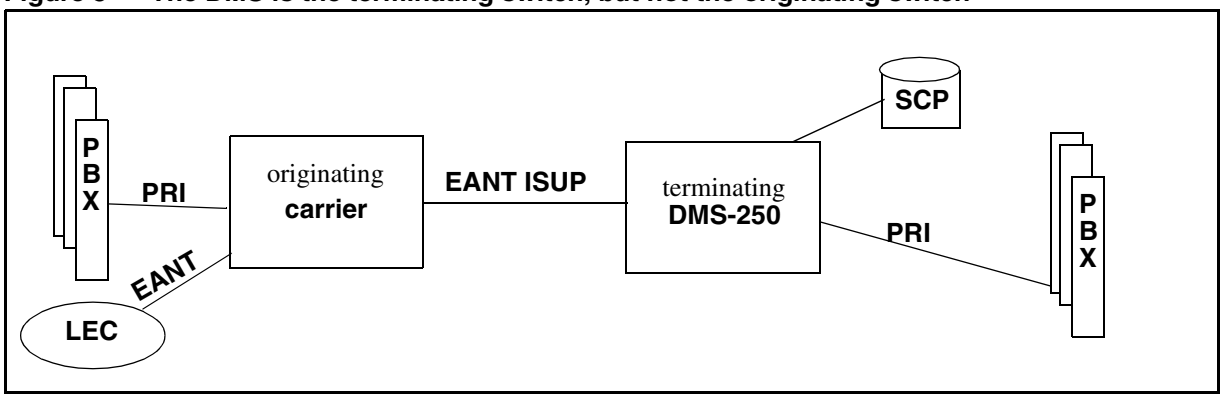

Figure 4 - The DMS is neither the terminating switch or the originating switch

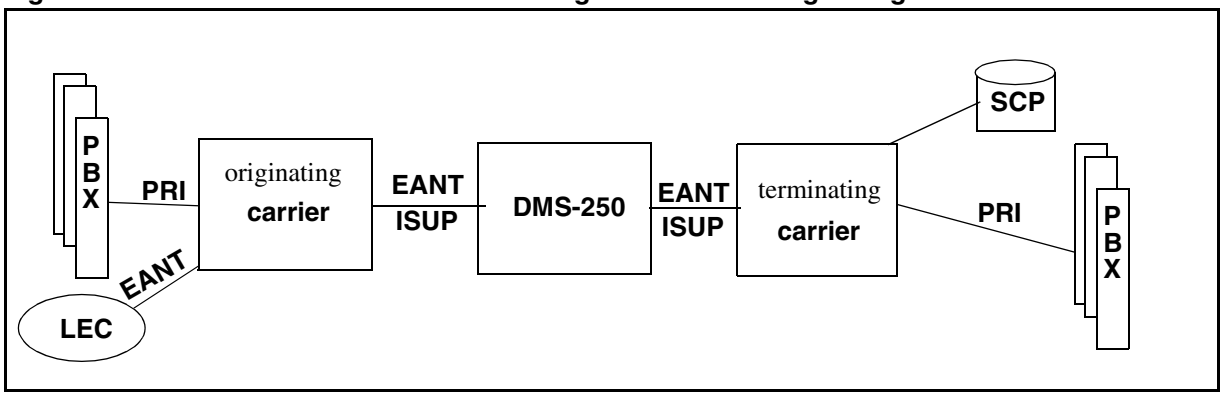

136.3.1 AMA Module

A new module is introduced by this activity, Module Code 838[1]. This module will only be appended to Structure Code 0220 (triggered by the AMASlpID in the Analyze_Route CAIN response) for calls terminating on PRI trunks for which CPN or BN as been delivered to the terminating party.

Table 1 Module Code 838 - Egress Data Module

Field Name	Table Number	Number of Characters
Module Code	88	4
Communications ISDN (ACI)/ISDN Features	344	4

[1]Module Code 838 is not a Bellcore defined module in GR-1100-CORE.

Table 2 Table (Field) 344 characters - values and meaning

Character	Value	Meaning
1-2	00	Constant
3	1	CPN/BN has been delivered to the terminating end.
	2-9	unassigned
4	C	SIGN character (HEX C)

136.3.2 UCP ISUP Protocol Changes

This activity defines a new Facility Indicator for the FAR message.

The Facility Indicator parameter is a mandatory, fixed-length parameter in the FAR message.

Table 3 Facility Indicator Parameter

8	7	6	5	4	3	2	1	
Facility Indicator								Octet 1

The value in bold (11111010) in the following table is added by this feature.

Table 4 Facility Indicator Field

Field	Codes and Description
Facility indicator	00010000=Release link for third-party interaction call (#10)
	00010001=Release link for redirect (#11)

	00011010=Context Block (#1A)
	00011011=Request Context Block (#1B)
	11111011 = ISDN Facility (#FB)
	11111010 = CPN/BN Delivered (#FA)

136.3.3 Call Flows

136.3.3.1 DMS is both originating and terminating switch

In the call flow below (also refer to Figure 5, on page 1726), the DMS-250 is both the originating switch and the terminating switch. In this scenario, the DMS-250 will be performing the billing for the call since it is the originating switch.

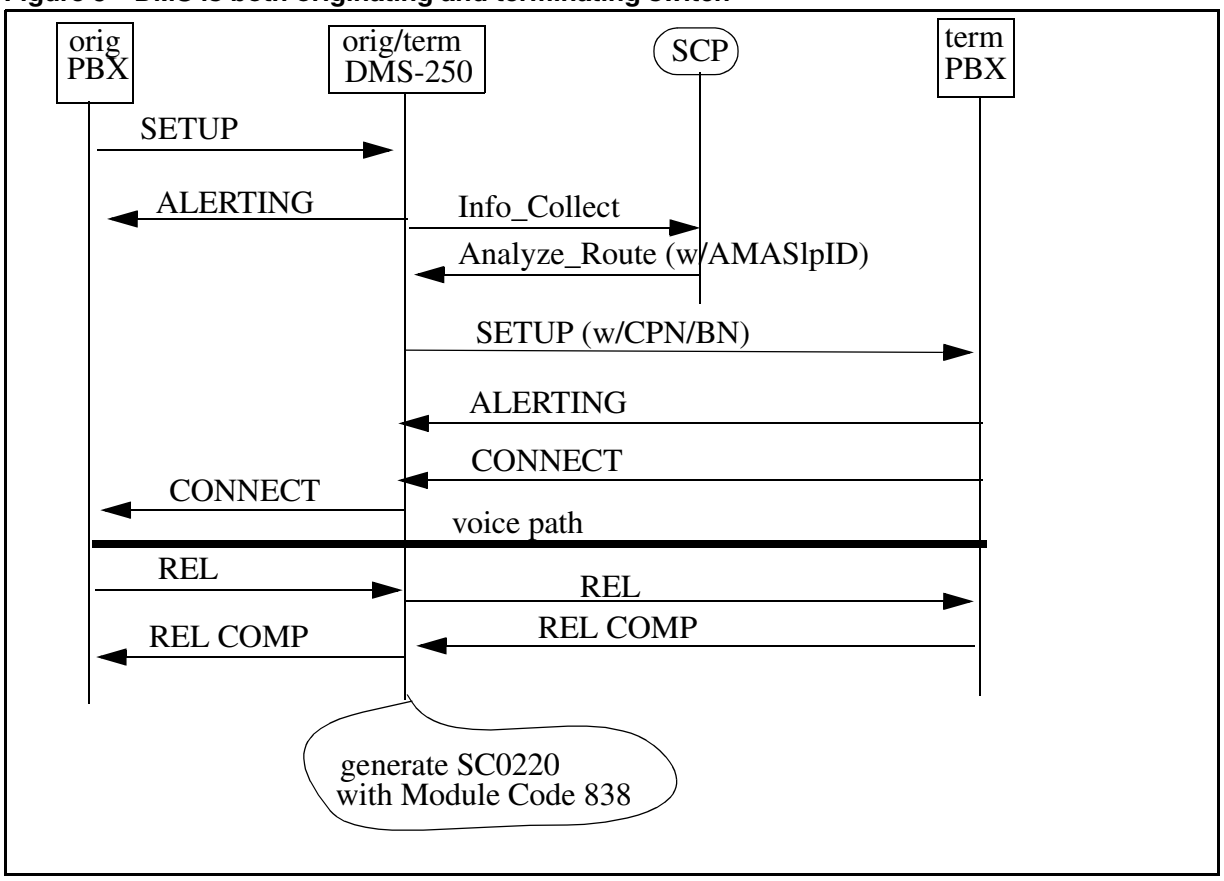
The scenario assumes the following:

- The incoming trunk is an NTNA PRI[1] Trunk
- The outgoing trunk is an NTNA PRI trunk provisioned to send CPN/BN information (via table CALLATTR, field ANIDELV[2])
- This feature is active (i.e., SOC UTRS0014 is ON).
- The Analyze_Route returned a AMASlpID, which causes a SC0220 to be generated for the call.

When the call completes, a SC0220 is generated and MC838 is appended to indicate that the CPN/BN was delivered to the terminating party.

[1]The call flow shows an incoming PRI trunk; however, it doesn't have to be incoming PRI.
[2]ANIDELV option can be set to any one of the following values: CPNPREF,CPNONLY,CGN-PREF,CGNONLY.

Figure 5 DMS is both originating and terminating switch



136.3.3.2 DMS is originating switch, but not terminating

In the call flow below (refer to Figure 6, on page 1727), the DMS-250 is the originating switch, but not the terminating switch. In this scenario, the DMS-250 will be performing the billing for the call since it is the originating switch; however, whether or not to append a MC838 will depend on the FAR message sent by the terminating switch.

The scenario assumes the following:

- The incoming trunk into the DMS-250 is an NTNA PRI[1] Trunk
- The outgoing trunk to the carrier is an EANT trunk and the ISUPIDX field is set to UCS2FE.
- This feature is active (i.e., SOC UTRS0014 is ON).
- The Analyze_Route returned a AMASlpID, which causes a SC0220 to be generated for the call.

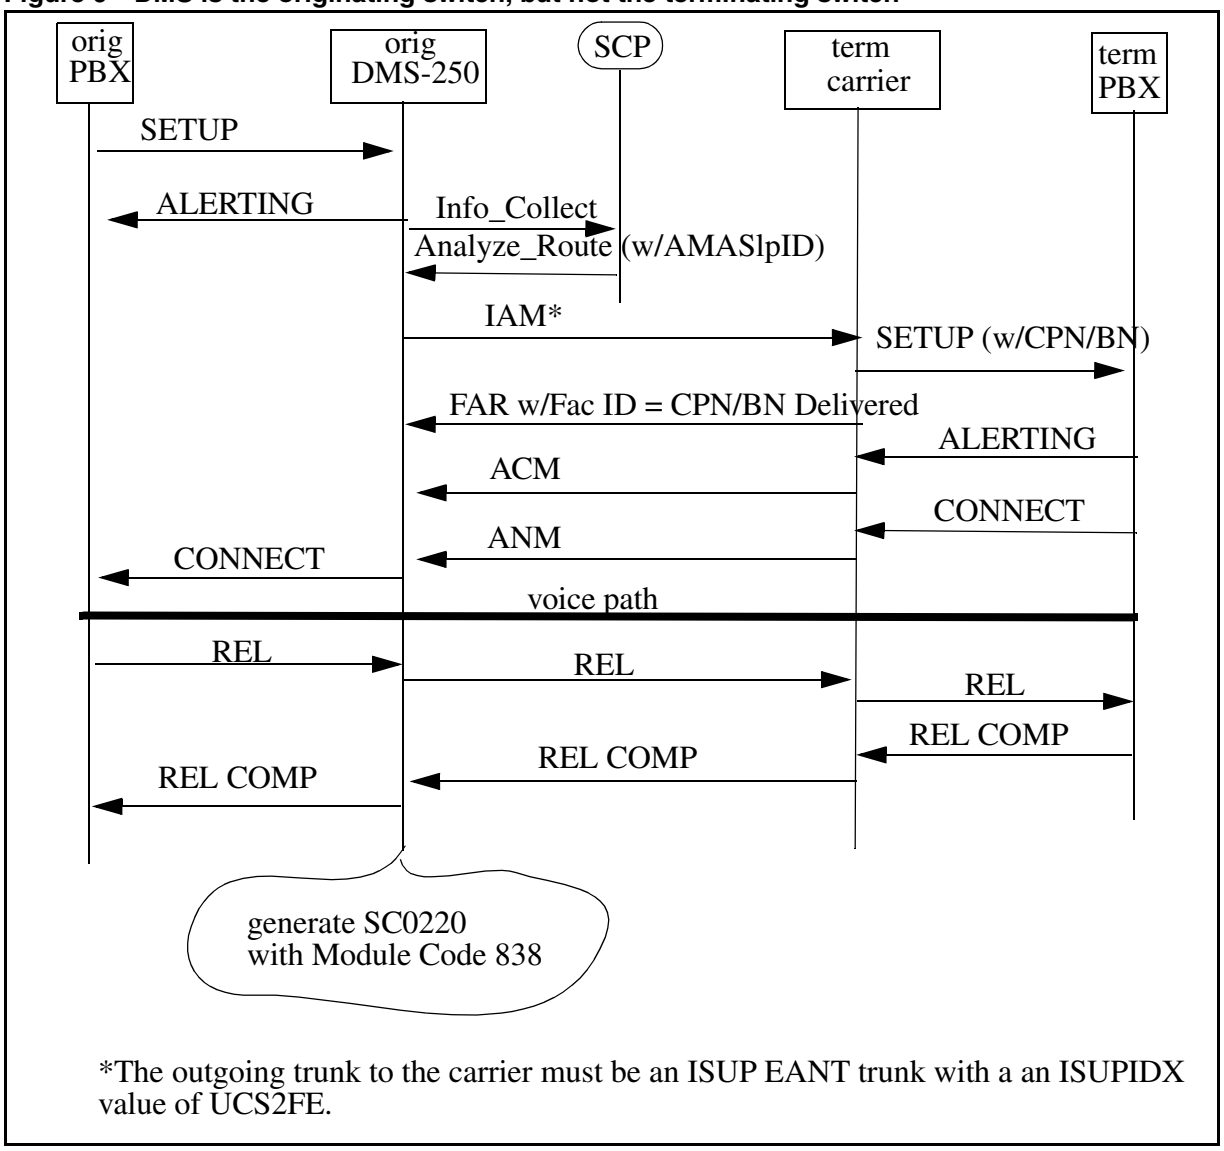
The call is routed to the carrier for completion. The carrier routes the call to the terminating party and sends CPN/BN in the SETUP message.

[1]The call flow shows an incoming PRI trunk; however, it doesn't have to be incoming PRI.

The carrier sends back a FAR message before an ACM to the DMS-250. The FAR message will contain a Facility Indicator value of #FA (CPN/BN Delivered). When the DMS-250 receives the FAR message, it will check to ensure that the trunk is datafilled with an ISUPIDX of UCS2FE and if so, it will append MC838 when the call ends.

If the EANT trunk group field ISUPIDX in table TRKGRP is set to anything other than UCS2FE, then the FAR message will be ignored. The call will complete successfully and a SC0220 AMA record will be generated; however, it will not contain an MC838 module.

Figure 6 DMS is the originating switch, but not the terminating switch



136.3.3.3 DMS is terminating switch, but not originating

In the call flow below (refer to Figure 7, on page 1729), the DMS-250 is the terminating switch, but not the originating switch. In this scenario, the DMS-250 will NOT be performing the billing for the call since it is not the originating switch. In this scenario, the DMS-250 will build a FAR message with a Facility Indicator of #FA and send it back on the originating trunk group back to the carrier.

The scenario assumes the following:

- The incoming trunk to the DMS-250 is an EANT trunk and the ISUPIDX field is set to UCS2FE.
- This feature is active (i.e., SOC UTRS0014 is ON).
- The outgoing trunk is an NTNA PRI trunk provisioned to send CPN/BN information (via table CALLATTR, field ANIDELV[1])

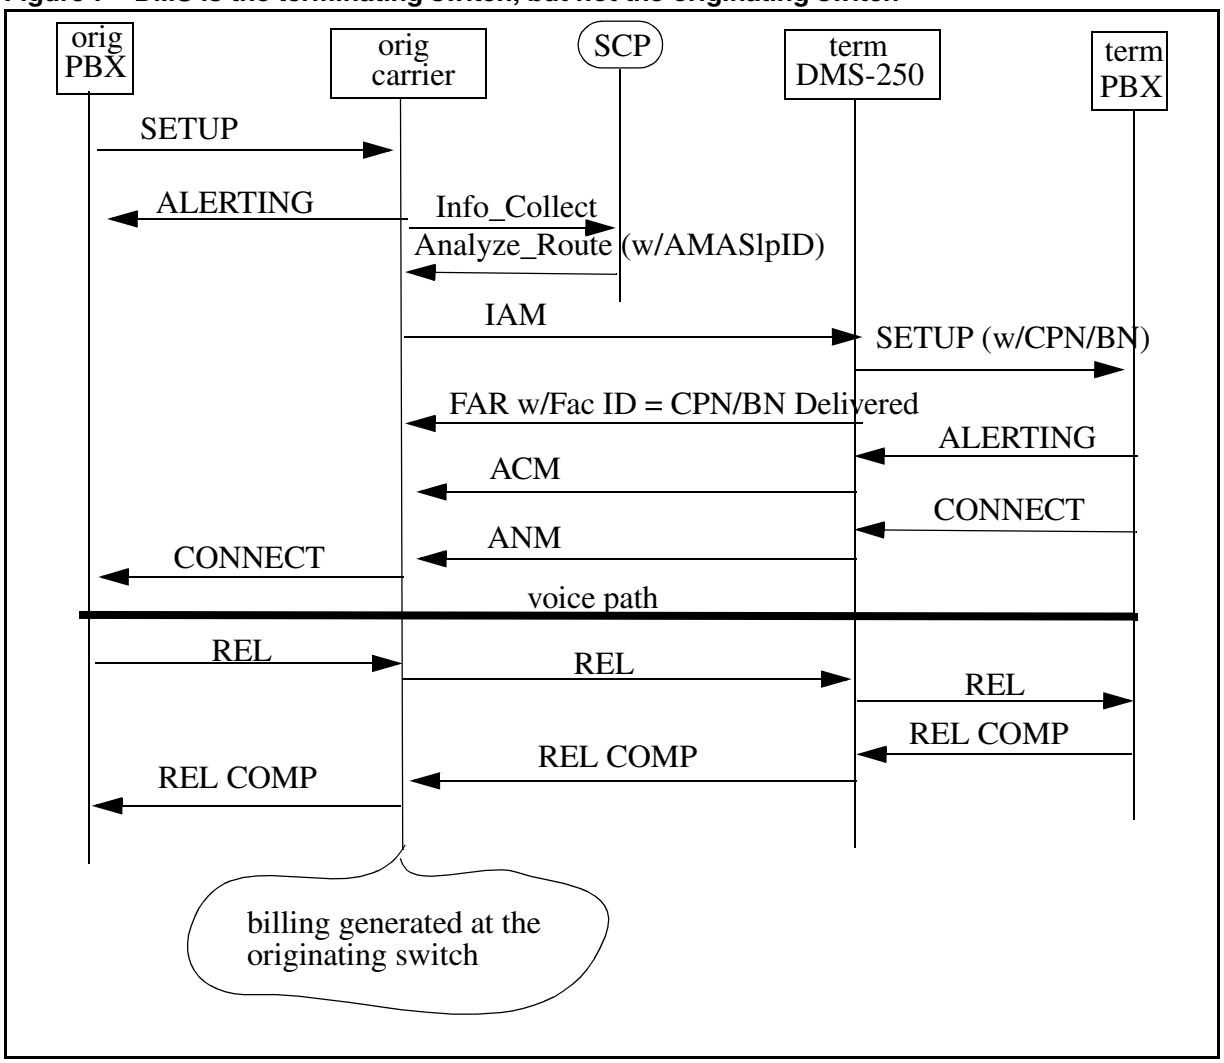
The call is routed to the DMS-250 for completion. The DMS-250 routes the call to the terminating party and sends CPN/BN in the SETUP message.

The DMS-250 check to ensure that the originating trunk is datafilled as a UCS2FE trunk and if so it will send back a FAR message **before sending an ACM** to the carrier. The FAR message will contain a Facility Indicator value of #FA (CPN/BN Delivered). In this scenario, the carrier is responsible for billing for the call.

If the EANT trunk group field ISUPIDX is set to anything other than UCS2FE, then the FAR message will not be sent. The call will complete successfully; however, there will be no indication sent back to the carrier to indicate that CPN/BN was delivered to the terminating party.

[1]ANIDELV option can be set to any one of the following values: CPNPREF,CPNONLY,CGN-PREF,CGNONLY.

Figure 7 DMS is the terminating switch, but not the originating switch



136.3.3.4 DMS is neither originating nor terminating

In the call flow below (refer to Figure 8, on page 1731), the DMS-250 is neither the terminating switch nor the originating switch. In this scenario, the DMS-250 will NOT be performing the billing for the call since it is not the originating switch. In this scenario, the DMS-250 merely passes the FAR message in the backwards direction if received.

The scenario assumes the following:

- The incoming trunk to the DMS-250 is an EANT trunk and the ISUPIDX field is set to UCS2FE.
- The outgoing trunk from the DMS-250 is an EANT trunk and the ISUPIDX field is set to UCS2FE.

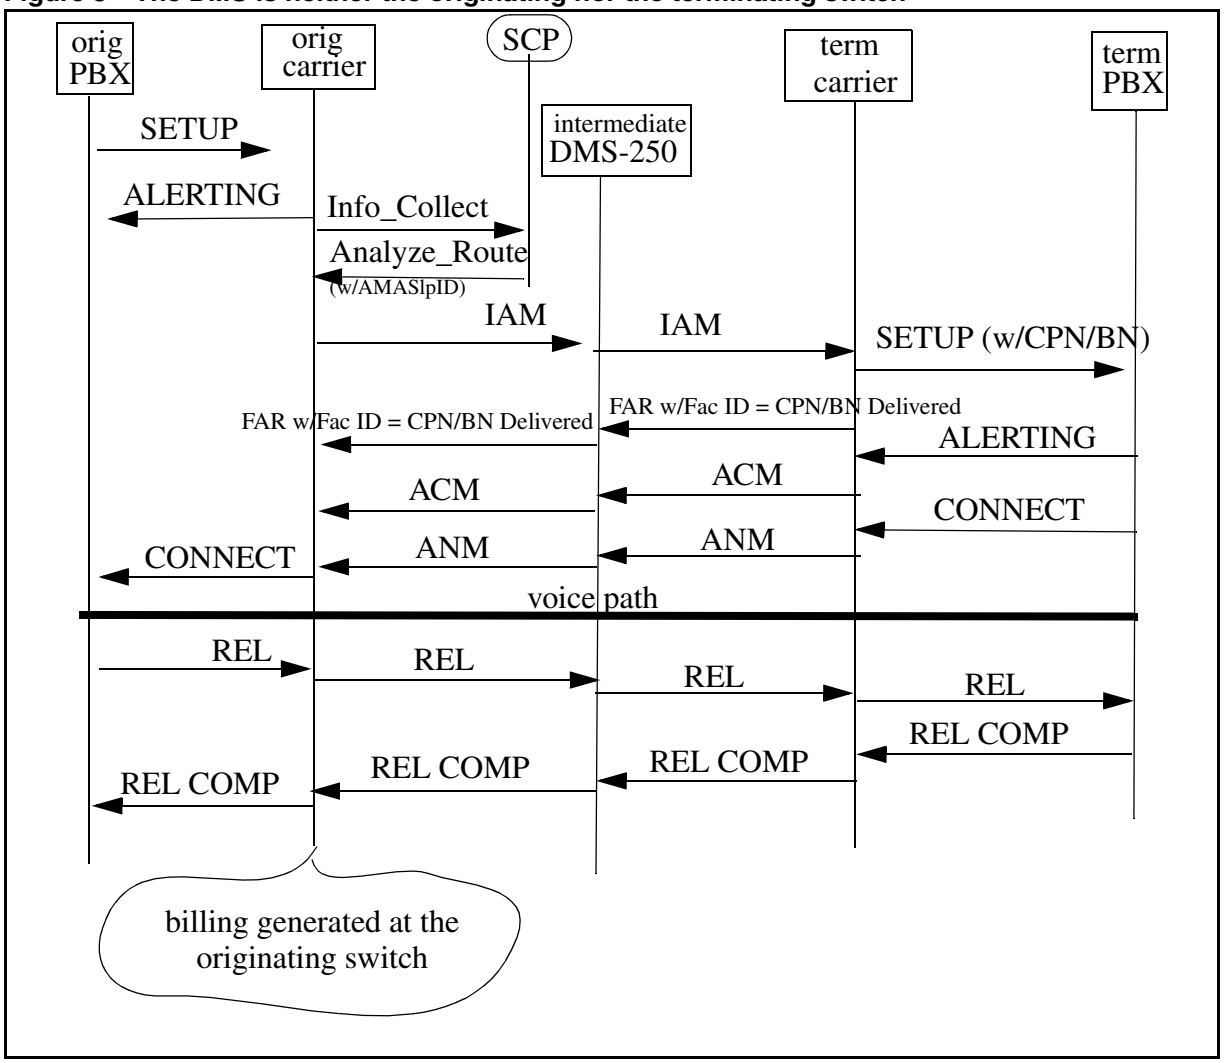
- This feature is active (i.e., SOC UTRS0014 is ON).

The call is routed to the DMS-250 for completion. The DMS-250 routes the call out on an EANT trunk to the carrier. The carrier terminates the call to the PBX and sends CPN/BN to the terminating party via the SETUP. The carrier then sends a FAR message in the backwards direction to the DMS-250 before it sends an ACM on the call.

The DMS-250 check to ensure that the terminating trunk is datafilled as a UCS2FE trunk and if so it will check to see if the incoming trunk group is also EANT with ISUPIDX set to UCS2FE. If so, it will pass the FAR message in the backward direction back to the originating carrier switch before it sends ACM.

If the EANT trunk group field ISUPIDX is set to anything other than UCS2FE, then the FAR message will be ignored and/or not sent. The call will complete successfully; however, there will be no indication sent back to the carrier to indicate that CPN/BN was delivered to the terminating party.

Figure 8 The DMS is neither the originating nor the terminating switch



136.3.4 Supported trunk group types

The FAR message with Facility Indicator set to “11111010 = CPN/BN Delivered (#FA)” is only supported on EANT trunk groups that are datafilled with an ISUPIDX value of UCS2FE.

When a FAR message is received on an EANT trunk group with an ISUPIDX other than UCS2FE, it will be ignored if the switch is the originating switch. If the switch is a terminating or an intermediate switch, it will not be passed in the backwards direction unless the ISUPIDX on the originating trunk is set to UCS2FE

136.3.5 Sending the FAR message

The FAR message will be sent in the backwards direction (on the originating trunk) before the ACM is sent. The one exception to this will be CGETS calls

that queue with announcement or queue without announcement, but are provisioned to send back ACM.

136.3.6 MC838 and trigger events

If a call sets trigger events such as ‘user busy’ and outpulses the CPN/BN on first terminating attempt, but encounters a user busy condition that results in another query/response (Analyze_Route) from the SCP and the second attempt terminates over a trunk group not provisioned to send CPN/BN, MC838 will still be included on the AMA record since it was sent on the first termination attempt.

A maximum of one MC838 will ever be appending to a SC0220 AMA record.

136.3.7 Generating MC838

Module Code 838 will not be generated for calls that terminate on PRI trunks with the following options:

- PRI trunks with the SNTRUNK option datafilled in table CALLATTR
- PRI trunks with the IPTRUNK option datafilled in table TRKGRP

Module Code 838 will not be generated for calls that terminate on DAL trunks.

136.3.8 Sending ISUP FAR in the backward direction

The ISUP FAR message will not be sent in the backwards direction if any of the following conditions occur:

- The terminating PRI trunk has the SNTRUNK option datafilled in table CALLATTR
- The terminating PRI trunk has the IPTRUNK option datafilled in table TRKGRP.
- The terminating trunk group in a non-PRI trunk (i.e., DAL)
- The originating trunk group is not an EANT trunk group.
- The originating EANT trunk group has an ISUPIDX value set to something other than UCS2FE.

136.4 Hardware Requirements or Dependencies

Not applicable.

136.5 Software Requirements or Dependencies

Not applicable.

136.6 Limitations and restrictions

This feature is only supported for the AMAREC template as defined in table CDRTMPLT. Additionally, the EDGE_SWITCH parameter in table OFCVAR must be set to Y.

This feature is not supported over SIP (Session Initiation Protocol) regarding usage of the FAR message.

136.7 Interactions

This feature does not do any work to actually deliver the CPN/BN. That is existing functionally and is controlled via the ANIDELV option in table CALLATTR.

137: Functional Description (FN): A00004260

137.1 Feature name

XPKT301 Alarm Banner for MG4K/IW/DPT

137.2 Description

This feature introduces a new MAP banner alarm that is generated when the number of XPKT301 logs crosses (i.e. meets or exceeds) thresholds controlled by the customer. XPKT301 logs are currently generated whenever a call fails SVC setup thru the ATM fabric. The new banner alarm will be displayed as “nn PKT” with major severity, where “nn” is the number of SMG4, IW, and DPT gateways (i.e. nodes) that have crossed the threshold for XPKT301XPKT301 logs. “PKT” is an abbreviation for Packet. The customer can modify the threshold parameters via Table OFCENG. A new XPKT806 log, with major alarm, is generated when a node crosses its threshold. A new XPKT807 log is generated when the node alarm clears. A new option allows suppressing further XPKT301 logs while the XPKT806 alarm is present for a SPM impacted by the XPKT301.

Note that “SMG4 node” refers to a SPM tuple in MNNODE with a CLASS of SMG4. “IW node” refers to a SPM tuple in MNNODE with a CLASS of IW and a DPT_INFO of BRDG_ONLY (Bridged). “DPT node” refers to a SPM tuple in MNNODE with a class of IW and a DPT_INFO of DPT_ONLY.

The new Map functions are documented in the OPTCN section. The new logs and alarms are documented in the OPTFM section. The office parameters that control the thresholds are documented in the OPTCN section.

Motivation for this feature is to allow the customer to respond quickly to ATM CallP failures (indicated by XPKT301 logs) by having a visual display at the MAP banner. There are cases where XPKT301 logs can occur due to problems in the ATM fabric that are not indicated elsewhere on the MAP (e.g. when there are no SMG4 equipment failures reported on the MAP).

137.3 Hardware Requirements or Dependencies

None.

137.4 Software Requirements or Dependencies

This feature will impact the MSH20 stream that is being delivered in SN07 loads. Feature will be patched to SN06. This feature does not impact any firmware or Local loads.

Here are the BLM and customer requirements for this feature:

1. Provide a new “nn PKT” MAP banner alarm for SVC failures on these ATM gateways: SMG4 (MG 4000), IW, and DPT-SPM. The SVC failures are indicated by the current XPKT301 log. The “nn PKT” will be displayed with major priority under the APPL MAP banner, where “nn” is the current number of nodes with the XPKT806 alarm.
2. A new XPKT806 log with major alarm will be **raised** on a per node basis when the number of XPKT301 logs for that node crosses (i.e. reaches or exceeds) RAISE_THRESHOLD number of XPKT301 logs within RAISE_CYCLE number of minutes, where RAISE_THRESHOLD and RAISE_CYCLE are office parameters provisionable on a per node class basis. The three supported Succession node classes will be SMG4, IW, and DPT. The XPKT806 log info will include node number (i.e. SPM number), node class type (i.e. SMG4, IW, DPT), number of SVC failures for that node, time interval, and threshold values.
3. Likewise, the alarm will be **cleared** on a per node basis via XPKT807 log when the number of XPKT301 logs for that node does not exceed CLEAR_THRESHOLD number of XPKT301 logs within CLEAR_CYCLE number of minutes, where CLEAR_THRESHOLD and CLEAR_CYCLE are office parameters provisionable on a per node class basis. There will be no severity for the XPKT807 log. The XPKT807 log will show the same type of info as the XPKT806 log.
4. The new alarm will be raised instantly once the raise threshold is crossed for a node (i.e. will not wait for the time interval to expire).
5. Provisioning changes to the feature’s office parameters that control raising and clearing the alarm will be activated immediately and not require a Restart. To immediately activate the changes, it will be necessary to reset the raise and clear cycles on the impacted node class type. For example, if a raise cycle is running on a SMG4 and any of the office parameters for the SMG4 are changed, then the raise cycle will be aborted by zeroing its XPKT301 hit counter and starting the raise cycle fresh with the updated threshold and cycle duration values.
6. Alarms and fault counts must persist over local node SWACTs and local S/W Upgrades, but not over ONPs. If the new alarm is present before an ONP, it will disappear after the NoRestartSWACT and will then be raised again if the fault condition persists.
7. An XPKT301 log for a failed **intra-office** gateway call (i.e. SMG4 to SMG4 call) will peg both gateways as long as the originating and terminating gateways are supported node classes (i.e. SMG4, IW, or DPT).
8. An XPKT301 log for a failed **inter-office** gateway call that terminates to a DPT will only peg the terminating node. Note that in this case, the originating node is not on the CS2K so the terminating info is all that is available to the CS2K.

9. New MAP commands will be provided to allow the craftsperson to query the status of any single node, or to query the status of all nodes in the CS2K office. The status information displayed will include node number, node class type, number of SVC failures, time interval, the threshold values, etc. MAP commands will also be provided to manually clear the alarm and to zero the failure counters.
10. The alarm status can be viewed at the APPL MAP level under a new PKT column (same place where all other APPL alarms can be viewed).
11. A new MAP level will dynamically display the alarm status for every supported node (SMG4, IW, DPT) in the CS2K office.
12. The feature will default to “off”. Customer must turn the feature on via the new office parameters to see the new XPKT806 alarms reported.
13. Introduce a new option to suppress further XPKT301 logs that impact a XPKT806-alarmed Succession node. This new option is “off” by default, meaning the customer must turn this option “on” before any XPKT301 logs will be suppressed. Once the XPKT806 alarm clears for a Succession node via an XPKT807 log, that node will no longer suppress any XPKT301 logs.

137.5 Limitations and restrictions

1. MG9K is not a supported node type for this feature.
2. While alarm raising is immediate per requirement #4 above, the clearing of the alarm can take an extra minute beyond the clear cycle completion. For example, consider a SMG4 that raised an XPKT806 alarm and is now running a 5 minute clear cycle; if the number of XPKT301 hits does not exceed the CLEAR_THRESHOLD, then the alarm will be cleared via XPKT807 between 5 and 6 minutes after the alarm was initially raised. This slower clearing of the alarm helps to minimize the real time impact of the new software.
3. This limitation is only applicable if XPKT301 suppression is “on” per requirement #13 above. If an XPKT301 log impacts two Succession nodes and only one of the nodes has the XPKT806 alarm raised, then the XPKT301 will still be suppressed even though one of the nodes does not have the XPKT806 alarm raised.
4. This feature will be dormant in MTXP/MSH20 Combo load since there is no room available for PKT in the dynamic alarm status of the MAPCI;MTC;APPL level.

137.6 Interactions

137.6.1 SPM Nodes Impacted by XPKT301 - Rules for Node Pegging

Feature A00004430 is being developed to deliver new OMs for XPKT301 logs. A0004430 is dependent on the A0004260 feature for the functionality of determining which SPM nodes are impacted by an XPKT301 log. To determine which SPM nodes are impacted, these fields from the XPKT301 log will be examined:

1. **Orig agent:** if this is a trunk hosted by a SMG4, then the XPKT301 log will be pegged against that SMG4 node.
2. **Term agent:** if this is a trunk hosted by a SMG4,, then the XPKT301 log will be pegged against that SMG4 node.
3. **Location:** if this SPM number is not the same as the SPM node hosting the originating or terminating agent, then the XPKT301 log will be pegged against the SPM in this Location field. .

In some cases, the SMG4 node will be the host for the originating or terminating agent and appear in the “Location” field; in these cases, following the above rules will avoid double-pegging the SMG4 node. Note that intra-switching at the SMG4 will prevent the same SMG4 node from hosting the originating and terminating agents (i.e. trunks).

For calls involving IW or DPT, those node types will never be the host of the originating or terminating agent since IW and DPT nodes do not provide trunks. When a IW of DPT node is involved with an XPKT301 failure, the node will only appear in the “Location” field.

137.6.2 Pegs during XPKT301 Suppression

While XPKT301 logs are being suppressed for any node with an XPKT806 alarm raised, all Succession nodes impacted by the XPKT301 will continue to be pegged for the purposes of OM (A00004430) and raising/clearing XPKT806/807 (A00004260).

137.8 Glossary

Term	Description
New term	Definition

138: Functional Description (FN): A00004271

138.1 Feature name

SIP App Server SOC

138.2 Description

This activity implements a mechanism to control the maximum number of SIPT calls that utilize the Next Generation Session Server (NGSS) platform when the far end is a non-CS2K, referred to here as an Application Server. A usage SOC, CS2B0009, is implemented to limit these types of calls (abreviated as CS2AS in this document).

Another activity, A00004414 SIP Call Server SOC, implements a similar mechanism to control the maximum number of SIPT calls that utilize the NGSS platform when the far end is another CS2K (CS2CS calls). SOC option CS2B0008 is the usage SOC for A00004414.

Both SOC features are part of a set of activities for delivering the Session Server - SIP Gateway application in SN07. The other features are:

- A00003270 SIP Open Interop Call Processing
- A00003271 Session Server Web Server Interface
- A00003272 Session Server Provisioning Framework
- A00003273 SIP Gateway Application Maintenance
- A00003277 Session Server OM Subsystem
- A00003279 SIP on Session Server Link Maintenance and Load Balancing
- A00003280 SIP on Session Server Tracing/Debug Framework
- A00003281 SIP on Session Server Call Audit
- A00003282 SIP on Session Server Datasync
- A00003933 SIP on Session Server Drop 1 ICAF
- A00003934 Session Server Project ICAF

138.2.1 SOC limiting

The usage-controlled CS2B0009 SOC added by this activity applies to calls that have the following characteristics:

— the incoming or outgoing trunk group has the DYNAMIC option with SIPT SIGNALING in table TRKOPTS,

— a match of the incoming or outgoing trunk group is found in the SIPTTRK field of one of the tuples in table SIPLINK[1],

— the CONNTYPE field of the tuple in table SIPLINK is set to CS2AS

A counter keeps track of the current number of calls matching the above criteria. For each new CS2AS call, the current value in the counter is checked against the limiting value in the CS2AS SOC. If the addition of a new call of this type would exeed the SOC limit, the call is sent to treatment; otherwise, the counter is incremented and the call is allowed to proceed. When the call is ended, the counter is decremented.

In the following example of table SIPLINK, incoming SIPT calls on trunk group NGSSINC and outgoing calls on trunk group NGSSOUT will increment the usage counter for the CS2AS SOC.

```
TABLE: SIPLINK
        LINKNAME CONNTYPE                  AGNTDATA
-------------------------------------------------
        NGSSOUTLK    CS2AS ISUPTRK          NGSSOUT
      NGSSINLINK    CS2AS ISUPTRK          NGSSINC
     LOOPAROUND1    CS2CS ISUPTRK         NGSSLOOP
```

Here is an example of the output of the SOC SELECT command for the new SOC:

```
>select option CS2B0009
GROUP:CS2B
OPTION    NAME                 RTU STATE   USAGE   LIMIT    UNITS  LAST_CHG
------    ----                 --- -----   -----   -----    -----  --------
CS2B0009 CS to AppS Calls         Y   -      127     500      1VC    04/01/19
```

138.2.2 OMs

A new OM group, NGSSOM is introduced for tracking the effects of the CS2B0009 SOC limit setting on CS2AS calls. OM fields in the new group relative to this feature are:

- CS2ASOVF - pegged when a CS2AS NGSS call is deflected because allowing the call would have caused the current CS2AS call count to exceed the SOC limit.
- CS2ASHWM - keeps track of the maximum value reached for the CS2AS call counter.

Two other registers are added for feature A00004414 to keep track of CS2CS calls (SOC CS2B0008):

[1]Table SIPLINK is a new table introduced in feature A00003279

- CS2CSOVF - pegged when a CS2CS NGSS call is deflected because allowing the call would have caused the current CS2CS call count to exceed the SOC limit.
- CS2CSHWM - keeps track of the maximum value reached for the CS2CS call counter.

Sample output for the NGSSOM group:

```
NGSSOM

CLASS: ACTIVE
START:2003/12/01 06:00:00 MON; STOP: 2003/12/01 06:09:10 MON;
SLOWSAMPLES:          6 ; FASTSAMPLES:          55 ;

          CS2CSHW   CS2CSHW2    CS2ASHW   CS2ASHW2
          CS2CSOV   CS2CSOV2    CS2ASOV   CS2ASOV2

    0
                0           0        125           0
                0           0          0           0
```

138.2.3 Logs

The NGSS701 log is a new log added for this feature. It is generated when a CS2AS call is rejected because it would exceed the LIMIT setting of the CS2B0009 SOC.

The NGSS700 log is added for feature A00004414 to be output when a CS2CS call is rejected because it would exceed the LIMIT setting of the CS2B0008 SOC.

138.3 Hardware Requirements or Dependencies

None

138.4 Software Requirements or Dependencies

None

138.5 Limitations and restrictions

None

138.6 Interactions

The usage SOC introduced by this feature does not take the place of Base DPT usage SOC CS2B0005. The latter is still needed to set the value of office parameter DPT_MAX_PORTS in table OFCVAR. DPT_MAX_PORTS limits the overall number of simultaneous DPT calls.

Calls that peg the new CS2B0009 count will always peg the CS2B0005 count as well.

If the SOC limit set for CS2B0009 exceeds the limit of the Base DPT SOC CS2B0005, the latter is the limiting factor in determining the maximum number of simultaneous CS2AS calls.

138.8 Glossary

Term	Description
CS2AS	CS2K Call Server-to-Agent Server
CS2CS	CS2K Call Server-to-CS2K Call Server

139: Functional Description (FN): A00004391

139.1 Feature name

ACD Agent Expansion from 9,999 to 30,000 Agents.

139.2 Description

Currently, the maximum number of ACD agents that can be provisioned in a single SL-100 or DMS-100 switch is 9,999. This feature extends that maximum to 30,000 agents.

This activity does not increase the number of ACD groups per switch nor the number of ACD agents per group. It only increases the switch-wide maximum number of total ACD agents.

This feature will be controlled via usage based SOC. The maximum number of ACD agents in the switch will be determined by the level of SOC which has been purchased but cannot exceed 30,000 agents.

139.2.1 Background

The maximum number of ACD agents that can be provisioned in a DMS-100 or SL-100 is currently determined by the value of an office parameter. The parameter MAX_NUM_ACD_AGENTS_PER_SWITCH is found in table OFCOPT and can be set to any value in the range of 0 to 9999.

When an attempt is made to create a new ACD agent, the current count of agents in the switch is compared to the value of the office parameter. If the limit has already been reached, the new agent cannot be created. For this activity, the range of the office parameter will be increased to 30000.

Other factors which contribute to the current maximum of 9,999 ACD agents per switch include the ACD agent position ID (POSID) and login ID (LOGINID). The POSID is defined via SERVORD when a new ACD agent is created, and LOGINIDs are defined via tables ACDLOGIN and ACDENLOG.

The POSID and LOGINID are both four digit values with a range of 0001 to 9999. Though neither POSID nor LOGINID is directly correlated to the number of agents in the switch, it would be impractical to have more than

9,999 agents if the POSID and LOGINID remain limited to 4 digits. Therefore, the range of POSID and LOGINID will be increased to 30000.

The external impact of making these changes is briefly described in the sections that follow. More detailed information can be found in the "Configuration" (CN) section of this document (chapter 13).

139.2.2 Office parameter MAX_NUM_ACD_AGENTS_PER_SWITCH

The office parameter MAX_NUM_ACD_AGENTS_PER_SWITCH currently has a maximum value of 9999. The range of this parameter will be increased to have a maximum value of 30000. The actual value of this parameter can no longer be changed by the end user. In order to change the value of the parameter, the SOC usage limit must be changed. The value in the office parameter will then be automatically updated to reflect the new SOC limit.

See section 13.3 (Office Parms) and 13.7 (SOC) for detailed information.

139.2.3 Table ACDLOGIN

Table ACDLOGIN currently supports a maximum of 9,999 tuples. LOGINIDs between 0001 and 9999 can be datafilled here for use by individual ACD agents. This table will be expanded to support up to 30,000 tuples.

Expansion to 30,000 LOGINIDs requires that the LOGINID field be expanded from a 4 digit value to a 5 digit value. Existing 4 digit LOGINIDs will be padded with a leading 0 during ONP.

See section 13.5 (Data Schema) for detailed information.

139.2.4 Table ACDENLOG

Table ACDENLOG currently supports up to 1024 partitions with a maximum of 9,999 tuples each. LOGINIDs between 0001 and 9999 can be datafilled in each partition for use by individual ACD agents. This table will be expanded to support up to 30,000 LOGINIDs in each partition.

Expansion to 30,000 LOGINIDs per partition requires that the LOGINID field be expanded from a 4 digit value to a 5 digit value. Existing 4 digit LOGINIDs will be padded with a leading 0 during ONP.

See section 13.5 (Data Schema) for detailed information and examples.

139.2.5 Table ACDGRP

This activity adds a new field in table ACDGRP. The new field will be called IDSIZE and will specify the number of login digits to be used by all agents in the group. IDSIZE can be set to a value of 4 or 5. The default value will be 4.

When IDSIZE equals ‘4’, all agents in the ACD group will login using 4 digit login IDs. When IDSIZE equals ‘5’, all agents in the ACD group will login using 5 digit login IDs.

During ONP from a load which does not include this feature to a load which does, IDSIZE will be defaulted to ‘4’ for all ACDGRP tuples.

All existing agents will continue to login using their existing 4 digit login IDs. The operating company can continue to add agents to these groups and/or create new groups with IDSIZE = 4 provided that there are available login IDs in the range of 00001 to 09999. Availability depends on datafill in table ACDLOGIN and/or ACDENLOG.

When login IDs 00001 through 09999 have been exhausted, the next agent added must use a 5 digit login ID. This means that the agent’s entire ACD group must be converted to 5 digit login.

139.2.5.1 Converting a group to 5 digit login

To convert an ACD group from 4 digit login to 5 digit login, field IDSIZE in table ACDGRP must be changed to ‘5’. No other switch based changes will be required. However, all agents in that ACD group must be notified to begin using 5 digit login. Existing agents can simply use their old 4 digit login ID but manually pad it with a leading 0. For example, an agent using a login ID of 1234 will begin using the login ID 01234. If they attempt to login without the leading 0, the login will fail.

New agents that are added to a group already using 5 digit login IDs can use any available login ID in the range of 00001 to 30000. Availability depends on existing datafill in table ACDLOGIN and/or ACDENLOG.

See section 13.5 (Data Schema) for detailed information and examples.

139.2.6 Table KSETLINE

Table KSETLINE defines the DN keys on all keysets. This activity makes a field change for KSETLINE tuples that meet the following criteria:

- FORMAT = ‘ACD’
- ACDKEY = ‘INCALLS’
- IDNUM = ‘Y’

For these tuples, field POSID (position ID) is required. This activity expands the POSID field from 4 digits to 5 digits. Existing 4 digit POSIDs will be padded with a leading 0 during ONP.

The maximum value for POSID will be 30000.

See section 13.5 (Data Schema) for detailed information and examples.

139.2.7 Table KSETFEAT

Table KSETFEAT defines the feature assignments on keysets. This activity makes a field change for KSETFEAT tuples that meet the following criteria:

- FEATURE = ‘SUPR’
- IDNUM = ‘Y’

For these tuples, field POSID (position ID) is required. This activity expands the POSID field from 4 digits to 5 digits. Existing 4 digit POSIDs will be padded with a leading 0 during ONP.

The maximum value for POSID will be 30000.

See section 13.5 (Data Schema) for detailed information and examples.

139.2.8 Table IBNFEAT

Table IBNFEAT defines the feature assignments on IBN sets. This activity makes a field change for IBNFEAT tuples that meet the following criteria:

- FEATURE = ‘ACD’ or ‘SUPR’
- IDNUM = ‘Y’

For these tuples, field POSID (position ID) is required. This activity expands the POSID field from 4 digits to 5 digits. Existing 4 digit POSIDs will be padded with a leading 0 during ONP.

The maximum value for POSID will be 30000.

See section 13.5 (Data Schema) for detailed information and examples.

139.2.9 SERVORD

Some Servord commands used by ACD offer a prompt for POSID. Currently, any value between 0000 and 9999 is accepted as valid input for the POSID. This activity will change the acceptable value of POSID to be a 5 digit value in the range of 00000 to 30000.

This change affects command prompting for NEW, ADO, NEWACD, and CHF commands.

See section 13.6 (Service Orders) for detailed information and examples.

139.2.10 Tools

ACDDEBUG and ACDSHOW are Command Interface (CI) tools that will require changes by this feature in order to handle a 5 digit position ID. ACDDEBUG is a CI tool created to display ACD data structures. Currently, a ACDDEBUG command uses a 4 digit position ID as an index in order to display ACD agent data. This activity will extend the command so that the data structures of an ACD agent with a 5 digit position will be displayed.

ACDSHOW is a CI tool that displays specific information concerning a current ACD configuration such as the list of agent positions in a ACD group and agent information for a given user login ID. Currently, ACDSHOW commands use a 4 digit position ID as an index in order to display information concerning an ACD configuration. This activity will extend the command so that the information of an ACD agent with a 5 digit position will be displayed.

For more information on ACDDEBUG and ACDSHOW, please refer to section 13.9 (Command Interface changes).

139.2.11 Intelligent Call Management (ICM)

ICM is a product that connects a host computer to a DMS-100 or MSL-100. ICM defines a switch to computer message set and a computer to switch message set that enables services to a telephone subscriber. Call event messages are sent from the switch to the host computer. Whereas call control messages, are sent from the host computer to the switch. Specific ICM call event messages or ICM call control message can contain a ‘positionID’ parameter and/or ‘loginID’ parameter. Currently, the ‘positionID’ parameter and the ‘loginID parameter in ICM messages handle only 4 digits.

This activity will allow the switch to send ICM call event messages to the host computer with a 5 digit ‘positionID’ parameter and/or a 5 digit ‘loginID’parameter’. This activity will also allow call control ICM messages sent from the host computer to the switch to have a 5 digit ‘positionID’ parameter or 5 digit ‘loginID’ parameter. Once the call control message is received on the switch, the 5 digit ‘positionID’ or 5 digit ‘loginID’ will be checked for validity.

139.2.12 ACD Management Information System (MIS)

ACD MIS is a hardware and software option which provides customer premise equipment (CPE) downstream processor (DSP) with information concerning ACD events occurring in an associated DMS-100 switch. The DSP can request and collect ACD information from the switch . There are two types of ACD MIS messages: messages sent from the switch to the DSP and message sent from the DSP to the switch.

The following are categories of messages sent from the switch to the DSP:

- Switch Control messages
- Initialization Data messages
- ACD VFG OM messages,
- ACD call/agent position event messages and
- Load Management Event messages.

Specific ACD MIS messages can contain a ‘positionID’ parameter and/or ‘loginID’ parameter. Currently, the ‘positionID’ parameter and the ‘loginID parameter in ACD MIS messages handle only 4 digits. This activity will allow ACD MIS messages sent from the switch to the DSP to have a 5 digit ‘positionID’ parameter or 5 digit ‘loginID’ parameter.

There following are categories of messages sent from the DSP to the switch:

- DSP Control Messages
- Inquire Switch Data Messages
- Remote Load Management Request messages.

This activity will allow ACD MIS message sent from the DSP to the switch to have a 5 digit ‘positionID’ parameter and/or a 5 digit ‘loginID’ parameter. The 5 digit ‘positionID’ will be checked for validity.

139.2.13 SOC Control

This feature will be controlled by a standard usage based SOC. The usage limit will define the maximum number of agents for the switch (i.e. the total number of lines that can have the ACD option assigned).

The default usage limit will be 0 ACD agents. During ONP from previous loads, the SOC usage limit will be set to match the value of office parameter MAX_NUM_ACD_AGENTS_PER_SWITCH. Thus there will be no impact to existing customers who do not purchase this SOC.

When the SOC is purchased, the usage limit can be increased by any number of agents up to a maximum value of 30,000 agents.

When the usage limit is changed via SOC, the value in office parameter MAX_NUM_ACD_AGENTS_PER_SWITCH will automatically be updated to reflect the SOC usage limit. The value in the office parameter can no longer be changed manually. The SOC usage limit must be changed first.

The SOC will not control the ability to use the optional 5 digit login IDs, nor will it control the ability to datafill extra login IDs for future use.

See section 13.7 (SOC) for detailed information.

139.3 Hardware Requirements or Dependencies

Not applicable

139.4 Software Requirements or Dependencies

Not applicable

139.5 Limitations and restrictions

- Once an ACD group is converted to 5 digit login (see section 2.2.5), all of the agents in that group will be required to login using 5 digits. Pre-existing 4 digit login IDs can be used by dialing a leading zero.
- Once an ACD group is converted to 5 digit login, it cannot be converted back to 4 digit login.

- Login IDs 00001 through 09999 can be used by any ACD agent in the switch. If the agent's group is using 4 digit login (as defined in table ACDGRP), the agent will dial the last 4 digits only. If the agent's group is using 5 digit login, the agent must dial all 5 digits.
- Login IDs 10000 through 30000 can only be used by agents in groups which use 5 digit login.
- Although 5 digit login is optional per ACD group, it should be noted that 5 digit login will be required as soon as the login IDs 00001 through 09999 are exhausted. At that point, the next agent added must use a 5 digit login ID. This means that the entire group to which this agent belongs must be converted to 5 digit login. The other agents in the group can continue to use their previous login IDs, but they must now include a leading zero when logging in.
- Individual ACD agents cannot be moved between two ACD groups which do not use the same number of login digits. Field IDSIZE in table ACDGRP must match for an agent to be moved from group to group by any means.

139.6 Interactions

139.6.1 Load Management / Remote Load Management

Load Management / Remote Load Management allows ACD agents to be moved from one ACD group to another. This activity restricts movement of agents between groups which do not use the same number of login digits. Field IDSIZE in table ACDGRP must match or the agent movement will not be allowed.

140: Functional Description (FN): A00004414

140.1 Feature name

SIP Call Server SOC

140.2 Description

This activity implements a mechanism to control the maximum number of SIPT calls that utilize the Next Generation Session Server (NGSS) platform when the far end is another CS2K. A usage SOC, CS2B0008, is implemented to limit these types of calls (abreviated as CS2CS in this document).

Another activity, A00004271 SIP App Server SOC, implements a similar mechanism to control the maximum number of SIPT calls that utilize the NGSS platform when the far end is non-CS2K, referred to here as an Application Server. SOC option CS2B0009 is the usage SOC for A00004271.

Both SOC features are part of a set of activities for delivering the Session Server - SIP Gateway application in SN07. The other features are:

- A00003270 SIP Open Interop Call Processing
- A00003271 Session Server Web Server Interface
- A00003272 Session Server Provisioning Framework
- A00003273 SIP Gateway Application Maintenance
- A00003277 Session Server OM Subsystem
- A00003279 SIP on Session Server Link Maintenance and Load Balancing
- A00003280 SIP on Session Server Tracing/Debug Framework
- A00003281 SIP on Session Server Call Audit
- A00003282 SIP on Session Server Datasync
- A00003933 SIP on Session Server Drop 1 ICAF
- A00003934 Session Server Project ICAF

140.2.1 SOC limiting

The usage-controlled CS2B0008 SOC added by this activity applies to calls that meet the following criteria:

— the incoming or outgoing trunk group has the DYNAMIC option with SIPT SIGNALING in table TRKOPTS,

— a match of the incoming or outgoing trunk group is found in the SIPTTRK field of one of the tuples in table SIPLINK[1],

— the CONNTYPE field of the tuple in table SIPLINK is set to CS2CS.

A counter keeps track of the current number of calls matching the above criteria. For each new CS2AS call, the current value in the counter is checked against the limiting value in the CS2AS SOC. If the addition of a new call of this type would exeed the SOC limit, the call is sent to treatment; otherwise, the counter is incremented and the call is allowed to proceed. When the call is ended, the counter is decremented.

In the following example of table SIPLINK, incoming and outgoing SIPT calls on trunk group NGSSLOOP will increment the usage counter for the CS2AS SOC.

```
TABLE: SIPLINK
        LINKNAME CONNTYPE                  AGNTDATA
-------------------------------------------------
        NGSSOUTLK    CS2AS ISUPTRK          NGSSOUT
      NGSSINLINK    CS2AS ISUPTRK          NGSSINC
     LOOPAROUND1    CS2CS ISUPTRK          NGSSLOOP
```

Here is an example of the output of the SOC SELECT command for the new SOC:

```
>select option CS2B0008
GROUP:CS2B
OPTION    NAME                 RTU STATE   USAGE   LIMIT    UNITS  LAST_CHG
------    ----                 --- -----   -----   -----    -----  --------
CS2B0008 CS to CS Calls           Y -         127     500      1VC  04/01/19
```

140.3 Hardware Requirements or Dependencies

None

140.4 Software Requirements or Dependencies

None

140.5 Limitations and restrictions

None

140.6 Interactions

The usage SOC introduced by this feature does not take the place of Base DPT usage SOC CS2B0005. The latter is still needed to set the value of office parameter DPT_MAX_PORTS in table OFCVAR. DPT_MAX_PORTS limits the overall number of simultaneous DPT calls.

Calls that peg the new CS2B0008 count will always peg the CS2B0005 count as well.

[1]Table SIPLINK is a new table introduced in feature A00003279

If the SOC limit set for CS2B0008 exceeds the limit of the Base DPT SOC CS2B0005, the latter is the limiting factor in determining the maximum number of simultaneous CS2AS calls.

Feature A00004271 SIP App Server SOC introduces new OM group NGSSOM for tracking the effects of the CS2B0008 SOC limit setting on CS2CS calls.

Feature A00004271 SIP App Server SOC adds a new NGSS700 log that is generated when a CS2CS call is rejected because it would exceed the LIMIT setting of the CS2B0008 SOC.

140.8 Glossary

Term	Description
New term	Definition

141: Functional Description (FN): A00004422

141.1 Feature name

ACT.00004422: Enhanced 911 Dynamic Packet Trunks Session Initiation Protocol-Telephony Call Trace.

141.2 Description

This feature provides the ability to trace established intra and inter office calls involving SIP-T DPT for Call Server 2000 (CS2K). Before the development of this feature, CS2K-Core had the ability to trace intra office line to line and inter office line to trunk/line and trunk to trunk/line calls for emergency situations (police, fire, hospital etc.) for only TDM trunks.

This feature enhances the trace abilities of CS2K to identify which SIP-T DPT (originating and/or terminating) is associated with an active call within the call server by means of SIP-T DPT callid.

This feature works for all calls and not just E911 calls.

The trunk information is provided through a new man-machine command interpreter (CI) command "SIPTRACE"[1]. The syntax and permissible input and output parameters of SIPTRACE are described below.

The input trunk information consists of:-

- trunk group and trunk member for TDM trunks.
- SIP-T DPT call-id for SIP-T DPT.

This command tool utility is limited to SIP-T DPT and TDM trunks as input to this command, while the output can be SIP-T DPT, TDM trunks or lines.

The new CI command "SIPTRACE" has the following syntax:-

SIPTRACE <Input trunk> {

{T <TDM trunk group> STRING

<TDM trunk member> {0 TO 9999}},

{D <DPT SIP-T call-id> STRING}}

Output on the CI prompt for the above command is of the following format:-

[1]Henceforth, in this document, all references to new CI command utility would refer to new CI command "SIPTRACE".

<input> is currently connected to ***<output>***

where

<input> is either

- "TDM trunk <trkgrp> <trkmem>" if a TDM trunk was entered or
- "SIP-T DPT <trkgrp> callid <SIP-T callid>" if a SIP-T callid was entered. The SIP-T callid entered on the command prompt during SIPTRACE command execution, is enclosed in single quotes.

<output> is one of the following:

- "TDM trunk <trkgrp> <trkmem>" if the connected party is a TDM trunk member
- "SIP-T DPT <trkgrp> callid <SIP-T callid>" if the connected party is a SIP-T DPT.
- "LINE <lineid>" DN is displayed, if the connected party is a line terminal.

For call scenarios in which the output TDM agent is found to be a C7ISL member, the tool automatically traverses the ISL and presents the final agent of the call. In such cases, multiple output lines are displayed on the CI.

Call scenarios involving SIP-T loop-arounds where SIP-T DPT looped around on the same or different GWC(s), are also supported by the new CI command SIPTRACE. In cases when the output agent for a SIPTRACE command execution is found to be SIP-T DPT, the output SIP-T call-id retrieved from the GWC is used to recursively trace the final output agent of the call and hence multi-line outputs are displayed on the CI.

Calls involving IW-SPM between legacy TDM agents connected to XPM (e.g. LTC in a North American lab. setup and PLGC in an International lab. setup) and succession agents in hybrid offices are also supported by SIPTRACE.

The new CI command utility is at the top level of CI and the user is able to invoke this new command, at any level built over CI (e.g. MAPCI, LOGUTIL etc.)

The following are the error/information messages to be displayed on the CI:-

Table 1 Error/Information messages displayed on the CI

Sr. No.	Error/Information messages displayed on the CI	Cause of the error/information message
1	<Input trunk>[a] is currently connected to a line whose DN is not available	The output end-point is found to be a line but its Tid is not mapped to a DN datafilled in tables on the Core

Sr. No.	Error/Information messages displayed on the CI	Cause of the error/information message
2	TDM trunk group not datafilled in table CLLI	Invalid TDM trunk group entered
3	TDM trunk group not datafilled in table TRKGRP	TDM Trunk group not datafilled in table TRKGRP
4	TDM trunk group not datafilled in table TRKSGRP	TDM Trunk group not datafilled in table TRKSGRP
5	SIP-T DPT <SIP-T DPT trkgrp> callid <SIP-T call-id> not associated with any active call	SIP-T callid does not exist within the GWC(s) and when the SIP-T DPT trunk group is available.
6	<Input trunk> is currently connected to an un-supported agent type <CP selector>	Output agent is not supported by this feature
7	TDM trunk <trkgrp> <trkmem> not associated with any active call	The input TDM trunk member information entered at the CI does not map to a live call
8	SIP-T DPT callid <SIP-T call-id> not associated with any active call	CS2K-Core is unable to send broadcast message to GWC(s) to retrieve associated DPT Tid(s) or when the GWC response messages have arrived in the Core but unable to determine the output agent details and the SIP-T DPT trunk group is not available.
9	Unable to identify far-end C7ISL member for TDM trunk (C7ISL) <trkgrp> <trkmem>	The output agent is found to be a TDM C7ISL agent but the far end TDM C7ISL trunk group and trunk member details datafilled in table C7ISL are not available.
10	Trunk group datafilled as DPT in Table DPTRKMEM	DPT trunk group entered using option T while SIPTRACE command execution
11	Number of SIP-T DPT loop-arounds exceeded allowed limit	For call scenarios in which the number of SIP-T to SIP-T loop-arounds in the same call server has exceeded 9 (highly unlikely)

a. <Input trunk> refers to: {T <Input TDM trunk group> <Input TDM trunk member>, D <SIP-T DPT trkgrp> callid <SIP-T call-id>}

The snap-shots of various combinations of call scenarios involving TDM and SIP-T DPT trunks is shown below; the SIPTRACE command execution is shown on the CI prompt for simplicity purpose but same can be executed on any level built over CI (e.g. MAPCI, LOGUTIL, etc.):-

Note: A brief description of the call scenario is provided only for some complex call scenarios.

1. TDM to line inter-working in CS2K

```
CI> SIPTRACE T ETSIV1LPA 2

TDM trunk ETSIV1LPA 2 is currently connected to LINE 1158206005
```

2. SIP-T DPT to line inter-working in CS2K

```
CI> SIPTRACE D '0026.4030-10-16-49-02.67@CS2K4_84'

SIP-T DPT K4SIP1LOOPFR3 callid 0026.4030-10-16-49-02.67@CS2K4_84
is currently connected to LINE 1158206007
```

3. TDM to TDM inter-working in CS2K

```
CI> SIPTRACE T ETSIV1LPB 2

TDM trunk ETSIV1LPB 2 is currently connected to TDM trunk
UKISUPLPA 10
```

4. TDM to SIP-T DPT inter-working in CS2K

```
Call Scenario: Line 1158206007 -> TDM ETSILPA 2
               TDM ETSILPB 2 -> SIP-T -> Line 1158206008v
```

```
CI> SIPTRACE T ETSIV1LPB 2

TDM trunk ETSIV1LPB 2 is currently connected to SIP-T DPT
K4SIP1LOOPFR3 callid 0026.4030-10-16-49-02.67@CS2K4_84
SIP-T DPT K4SIP1LOOPFR3 callid 0026.4030-10-16-49-02.67@CS2K4_84
is currently connected to LINE 1158206008
```

5. SIP-T DPT to TDM inter-working in CS2K

```
Call Scenario: Inter-Call Server posted SIP-T -> TDM ETSILPA 2
               TDM ETSILPB 2 -> Line 1158206008
```

Note: The SIPTRACE command will not be able to determine the other agent for an inter-call server SIP-T DPT as it involves another call server; hence the second line of output shows that SIPTRACE command execution in this call server could not determine the connected agent for the SIP-T DPT leg belonging to another call server domain.

In order to determine the complete path of the call, the SIPTRACE command has to be executed in successive call servers also.

```
CI> SIPTRACE D '0026.4030-10-16-49-02.67@CS2K4_84'

SIP-T DPT K1SIP1V1 callid 0026.4030-10-16-49-02.67@CS2K4_84 is
currently connected to TDM trunk ETSIV1LPA 2
SIP-T DPT K1SIP1V1 callid 0026.4030-10-16-49-02.67@CS2K4_84 not
associated with any active call
```

6. Output TDM identified as C7ISL member

```
CI> SIPTRACE T ETSIV1LPB 2

TDM trunk ETSIV1LPB 2 is currently connected to TDM trunk (C7ISL)
ETSIV1LPA 3
TDM trunk (C7ISL) UKISUPLPA 4 is currently connected to LINE
1158206005
```

7. Input TDM identified as C7ISL member

```
CI> SIPTRACE T ETSIV1LPB 2

TDM trunk (C7ISL) ETSIV1LPB 2 is currently connected to TDM trunk
UKISUPLPA 8
```

8. SIP-T DPT loop-arounds - Auto-traversal of SIP-T callid encountered as output of a SIPTRACE command execution

```
Call Scenario: Line 1158206005 -> SIP-T -> SIP-T (posted) -> Line 1158206007
```

Note: The order of displaying output agents for SIPTRACE command executions involving SIP-T DPT callid may not be in the same order as depicted in the snap-shot because this depends on the way in which the DPT Tid(s) are returned by the SIP-T GWC.

```
CI> SIPTRACE D '0026.4030-10-16-49-02.67@CS2K4_84'

SIP-T DPT K1SIP1UK3 callid 0026.4030-10-16-49-02.67@CS2K4_84 is
currently connected to SIP-T DPT K1SIP1V1 callid 0026.4030-10-16-
49-02.95@CS2K4_84

```

9. Invalid input option

```
CI> SIPTRACE abcd

Next par is: <Input trunk> {T <TDM trunk group> <TDM trunk
member>,
D <DPT SIP-T call-id>}

Enter: <Input trunk>
CI>
```

10. No option entered with new CI command

```
CI> SIPTRACE

Next par is: <Input trunk> {T <TDM trunk group> <TDM trunk
member>,
D <DPT SIP-T call-id>}

Enter: <Input trunk>
CI>
```

11. Incomplete input entered with option T

```
CI> SIPTRACE T ETSIV1LPA

Next par is: <TDM trunk member> {0 TO 9999}

Enter: <TDM trunk member>
CI>
```

12. Incomplete input entered with option D

```
CI> SIPTRACE D

Next par is: <DPT SIP-T call-id> {STRING}

Enter: <DPT SIP-T call-id>
CI>
```

13. Invalid input TDM trunk group name

```
CI> SIPTRACE T ABCD 2

TDM trunk group not datafilled in Table CLLI
```

14. TDM trunk group not datafilled in table TRKGRP

```
CI> SIPTRACE T UASBLDNANN 2

TDM trunk group not datafilled in Table TRKGRP
```

15. TDM trunk group not datafilled in table TRKSGRP

```
CI> SIPTRACE T ETSIV2LPB 2

TDM trunk group not datafilled in Table TRKSGRP
```

16. Invalid input TDM trunk member number

```
CI> SIPTRACE T ETSIV1LPA -2

Out of range: <TDM trunk member> {0 TO 9999}
Enter: <TDM trunk member>

CI>
```

17. SIP-T callid does not exist / does not map to any live call.

```
CI> SIPTRACE D '0026.4030-10-16-49-02.67@CS2K4_84'

SIP-T DPT K2SIP1CZ1 callid 0026.4030-10-16-49-02.67@CS2K4_84 not
associated with any active call
```

18. Input TDM parameters do not map to any live call.

```
CI> SIPTRACE T ETSIV1LPA 2

TDM trunk ETSIV1LPA 2 not associated with any active call
```

19. Output agent is not supported for TDM input

```
CI> SIPTRACE T ETSIV1LPA 2

TDM trunk ETSIV1LPA 2 is currently connected to an un-supported
agent type 10
```

20. Output agent is not supported for SIP-T DPT inputs

```
CI> SIPTRACE D '0026.4030-10-16-49-02.67@CS2K4_84'

SIP-T DPT K2SIP1CZ1 callid 0026.4030-10-16-49-02.67@CS2K4_84 is
currently connected to an un-supported agent type 12
```

21. Output line DN not identifiable for TDM inputs

```
CI> SIPTRACE T ETSIV1LPA 2

TDM trunk ETSIV1LPA 2 is currently connected to a line whose DN
is not available
```

22. Output line DN not identifiable for SIP-T DPT inputs

```
CI> SIPTRACE D '0026.4030-10-16-49-02.67@CS2K4_84'

SIP-T DPT K2SIP1CZ1 callid 0026.4030-10-16-49-02.67@CS2K4_84 is
currently connected to a line whose DN is not available
```

23. Output agent is TDM C7ISL but unable to find far-end C7ISL agent

```
CI> SIPTRACE T ETSILPB 2

TDM trunk ETSILPB 2 is currently connected to TDM trunk (C7ISL)
UKISUPLPA 3
Unable to identify far-end C7ISL member for TDM trunk (C7ISL)
UKISUPLPA 3
```

24. Input DPT trunk group entered with option T

```
CI> SIPTRACE T K2SIP1CZ1 2

Trunk group datafilled as DPT in Table DPTRKMEM
```

25. Unable to send GWC request message or unable to determine output agent for SIP-T DPT input

```
CI> SIPTRACE D ‘0026.4030-10-16-49-02.67@CS2K4_84’

```

141.3 Hardware Requirements or Dependencies

None.

141.4 Software Requirements or Dependencies

Software load from SN07 onwards.

141.5 Limitations and restrictions

— The new command interpreter (CI) command “SIPTRACE” is supported only for SIP-T DPT. It is not supported for networks using BICC protocol.

— TDM trunks and SIP-T DPT are the only input parameters allowed. Line is not allowed as input parameter.

— TDM trunks, SIP-T DPT and Line DNs are the only output parameters.

— If a line directly maps to a DN, the DN is displayed as <lineid> with area-code, office-code and station-number as datafilled in table DNINV.

— Lines, discovered as output agents, not mapped to DNs are not supported by the new CI command SIPTRACE.

— Feature interactions like 3WC or any other multi-linked calls with the new CI command SIPTRACE, are not supported by the new CI command SIPTRACE.

141.6 Interactions

Features supported by the new CI command SIPTRACE include, but not limited to, 3WC, CFB, CFU, CFDA, SDN, MLH.

VRDN	Virtual Routing Distribution Node

142: Functional Description (FN): A00004430 (AL1SVCOM)

142.1 Feature name

A00004430 - SVC Failure OMs

142.2 Description

This SN07 feature provides two main functional components:

- Introduces new OM group AL1SVCOM.
- Replaces the ATM606 log report with XPKT301 and XPKT302 logs.

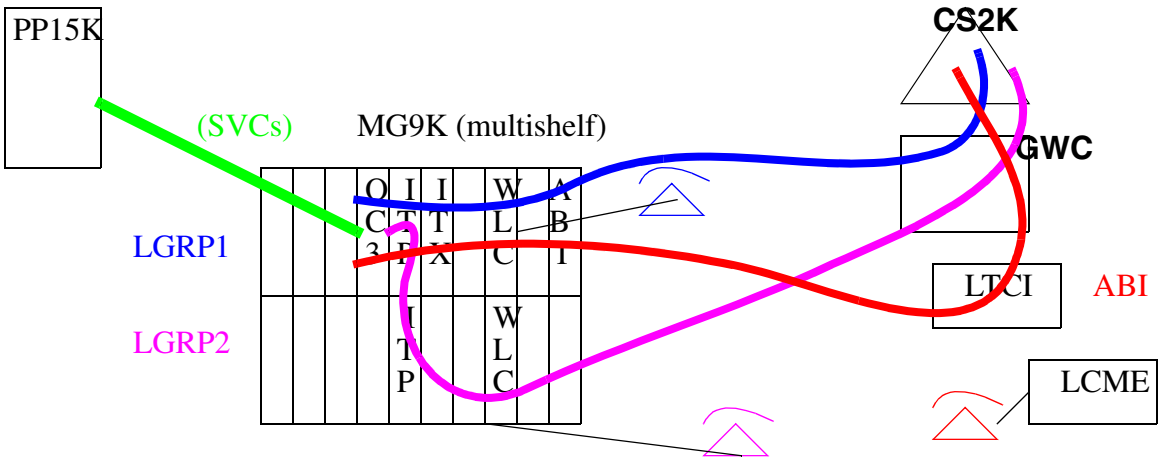
OM group - AL1SVCOM - is used to provide OM registers for ATM switched virtual circuits (SVC) external network connection bearer path call origination attempts and call failures. Prior to this feature, ATM external network bearer path connection failures were only captured with ATM606 log reports for (SPM IW, DPT SPM and SMG4)[1] nodes and also for MG9K[2] nodes.

Prior to SN07, an ATM606 log report was generated when either a node failed to get an SVC connection through the ATM network during initial call setup, or when an established call was taken down due to an ATM external network connection failure.

In SN07, when an ATM SVC failure occurs, this feature increments registers in OM group AL1SVCOM, on a nodal basis, for UA-AAL1 nodes: SMG4, IW SPM, DPT SPM, MG9K ABI (LTC, SMA1, LGC, RCC2, SMSR, SMS, RCC) and on a logical group basis for MG9K. An XPKT301 or XPKT302 log report is output for the SVC failure also. The XPKT301 log report is for UNI connection failures. The XPKT302 log report is for UNI Mid-call connection failures.

[1]SN05 feature A59035937 - ATM Failure Log
[2]SN06.2 feature A00001934 - ATM Troubleshooting Log Support for MG9K AAL1

Figure 1 CS2K identification of MG9K and ABI lines



MG9Ks are identified as ‘logical groups’ because the CS2K is not aware of MG9Ks on a nodal basis. SN06.2 feature A00002607 - ABI XPM SITE and MG9K Location support on the Core - provided the first step towards providing management on the CS2K of ABI XPM and MG9K lines in the Succession network, however, there is no distinction between an MG9K ‘master’ shelf (for multi-shelf MG9K configurations) and ‘subtending’ shelves.

Refering to figure 1 above, the physical ATM bearer path for a multi-shelf MG9K, (or a single-shelf MG9K) is between the ATM switch (which is a Passport 15000 in the example above) and the OC3 Supercore card on the MG9K master shelf. At the time of this writing, the CS2K has no concept of ‘master’ shelf for the MG9K. The ATM bearer path connection data is only maintained in the MG9K Element Manager. The CS2K maintains information in Table LGRPINV for each MG9K shelf. OM group AL1SVCOM will therefore output each MG9K shelf as a separate logical group, rather than identify one Master Shelf, where the actual physical ATM fiber connects the MG9K OC3 pack to the ATM network.

The MG9K logical group names displayed by OM group AL1SVCOM are the MG9K shelf names listed in Table LGRPINV.

Table 1 below lists the registers for OM group AL1SVCOM and a description of each register. External network origination connection attempts and connection failures are tracked by this OM group in SN07.

This feature increments OM group AL1SVCOM registers for both originating and terminating nodes, when the Core attempts to set up an external network connection.[1] Thus one ATM606 logged ATM SVC failure event will in most cases increment two OM AL1SVCFL registers - once for the SVC originating call agent node, and once for the SVC terminating agent node.

When an ATM external network connection failed prior to SN07, the Gateway node that requested the connection - the master of the ATM connection - reported an ATM SVC failure message to the Core which then generated an ATM606 log report.

With ths feature, an XPKT301 or XPKT302 log is generated for external network connection failures, depending upon if the connection failure occured during initial call setup, or after the call was established, and then OM group AL1SVCOM failure registers are also pegged.

Table 1 Registers for OM group AL1SVCOM

Register	Description
NOSVCAT	Number of SVC call attempts.
NOSVCAT2	Extension register for nosvcatt.
NOSVCFL	Number of SVC call failures.
ISSVCAT	Number of intraswitched (local) SVC call attempts
ISSVCAT2	Extension register for issvcsat.
ISSVCFL	Number of intraswitch (local) SVC call failures.
DPTSVCA	Number of interswitch (DPT) SVC call attempts.
DPTSVCA2	Extension register for dptsvca.
DPTSVCF	Number of interswitch (DPT) SVC call failures.
NRTEDEST	ATM cause code 3 - no route to destination - SVC call failures.
NOUSRRES	ATM cause code 18 - no user responding - SVC call failures.
VPCINAVL	ATM cause code 35 - requested VPI/VCI not available - SVC call failures.
BWTHNAVL	ATM cause code 37 - user cell rate not available - SVC call failures.
TEMPFAIL	ATM cause code 41 - temp failure - SVC call failure reference.
RESUNAVL	ATM cause code 47 - Resource unavailable SVC call failure reference
OTH_CC	All other ATM cause codes SVC call failures.

[1]Inter-office MG9K calls using BICC GWC, have only an originating node to report for the SVC call failure. The terminating side of the bearer path through the ATM network is located in another office. The local office is only aware of the originating agent on the ATM bearer path connection.

Figure 2 below shows the OM register peg flow chart for group AL1SVCOM..

1. (Originating registers): nosvcat, issvcat, dptsvca

All external network connection attempts peg register ***nosvcat*** (number of svc attempts)

If the external network connection attempt is an 'intra' switched call, register ***issvcat*** (interswitch svc attempt) is pegged along with the nosvcat register.

If the external network connection failure is an 'inter' switched call, register ***dptsvca*** is pegged along with the nosvcat register.

2. (Failure registers): dptsvcf, issvcfl, dptsvcf

All connection failures peg register ***nosvcfl*** (number of svc failures).

If the connection fails and the call is intra-switched, register ***issvcfl*** is pegged along with the nosvcfl register.

If the connection fails and the call is inter-switched, register ***dptsvcf*** is pegged along with the nosvcfl register.

3. (Failure registers):
nrtedest, ***nousrres***, ***vpcinavl***, ***bwthnavl***, ***tempfail***, ***resunavl***, ***oth_cc***

Depending upon what ATM cause code is reported to the Core from the Gateway, will determine which of the above registers are then pegged. Ony one of the above registers will be pegged to provide further categorization for connection failures. If the ATM cause code is not one of 3, 18, 35, 37, 41, or 47, register oth_cc (all other cause codes) is pegged.

```

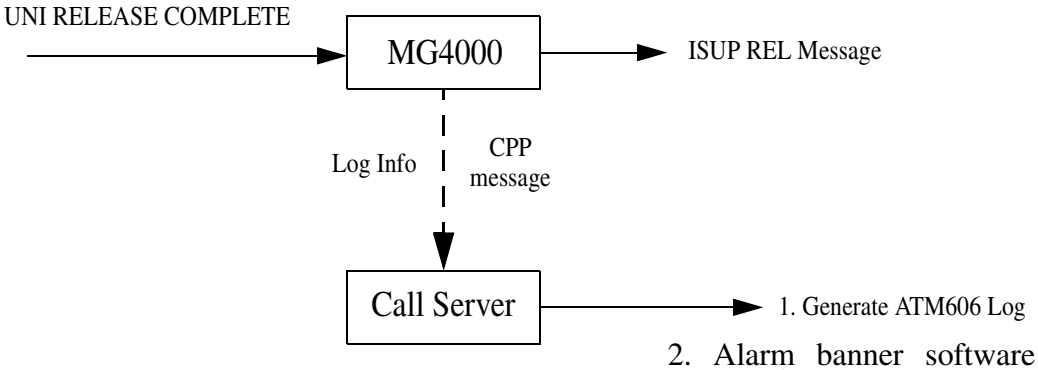
142.2.1 SPM based AAL1 SVC Failure OM generation Functionality

When the ATM606 log is generated for SPM IW, DPT SPM or an SMG4, new software introduced by this feature pegs the appropriate OM AL1SVCOM registers as shown in Figure 2.

SPM based AAL1 Functionality



[1]A00004260 - SN07

The operations relevant to an ATM bearer path failure scenario are as follows:

- During call setup time, the MG 4000 sends a UNI Setup message to the Passport ATM switch. Instead of receiving a UNI Connect, a UNI Release Complete is received with a cause value indicating some failure to set up the ATM SVC, or bearer path.
- When the MG 4000 receives the UNI Release Complete message, it gathers data needed for the new log and sends it to the Call Server.
- The Call Server receives the message from the MG 4000 and formats it into a new log, increment the appropriate alarm banner counter[1], and pegs the appropriate OM group AL1SVCOM register for the ATM failure cause code event.
- The Supernode Data Manager uses the existing log delivery capabilities to transfer the new log and OM to the OSS.
- The MG 4000 builds an ISUP RELease message and inserts the ISUP release cause value of 47. The ISUP RELease message is sent to the Ingress Succession Network in case of inter-working calls.

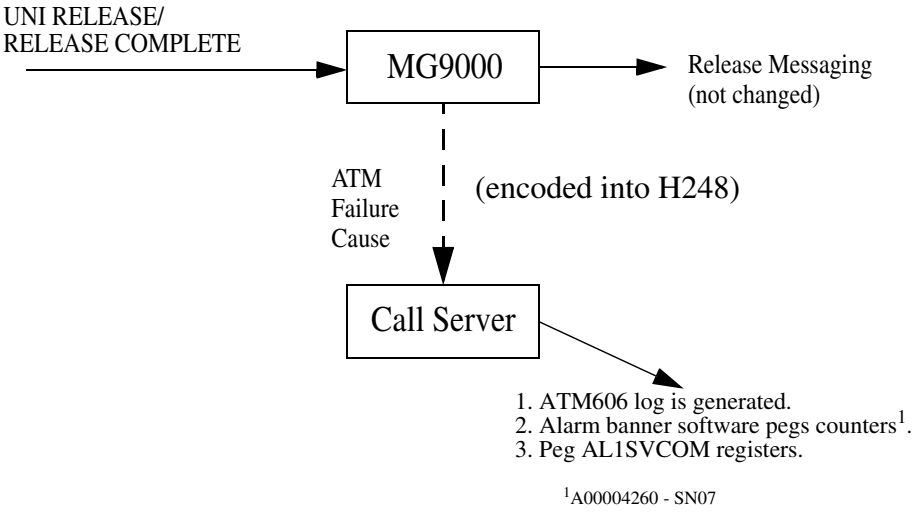
[1]SN07 - A00004260 - Alarm Banner.

142.2.2 MG9K AAL1 SVC Failure OM generation Functionality

The functionality shown in figure 2 shows the SN06.2 generation of ATM606[1] logs for MG9K gateways, and the OM pegging functionality introduced by this feature.

The functionality of this feature is depicted in Figure 1.

Figure 4 Functional Behavior Diagram



- During call setup time, the MG 9000 sends a UNI Setup message to the Passport ATM switch. Instead of receiving a UNI Connect, a UNI Release/ release Complete is received with a cause value indicating some failure to set up the ATM SVC, or bearer path.
- When the MG 9000 receives the UNI Release/release Complete message, it encodes the UNI release cause into an H248 message and sends same to the Call Server.
- The Call Server receives the message from the MG 9000 and formats it into an XPKT301 or XPKT302 log, and pegs the appropriate AL1SVCOM OM register for the ATM failure cause code[2].
- The Supernode Data Manager uses the existing log delivery capabilities to transfer the new log to the customer's OSS.
- For the affected call, the Call Server will detect integrity lost and process release messages to the other agent (line or trunk) in its usual way.

[1]ATM606 logs are replaced by the XPKT301 and XPKT302 log in SN07, see DSUM and FM sections.
[2]The alarm banner feature in SN07 is for SMG4/IW/DPTs only.

142.2.3 XPKT301 and XPKT302 logs

This feature eliminates the ATM606 log, replacing it with XPKT301 and XPKT302 logs. The XPKT301 and XPKT302 logs contain all the existing fields and formatting of the replaced ATM606 log, and also introduce three new fields:

- Orig Node field:
  This field lists the node name for the originating calling agent.
- Term Node field:
  This field lists the node name for the terminating calling agent.
- Debug field:
  This field introduces a debug area that provides space to capture Gateway application information that would be useful to help troubleshoot external network failure conditions. This information will be useful to Nortel Neworks engineers in a later release. The values in SN07 are NIL.

The XPKT301 log is generated for ATM external network connection failures that fail during initial call setup.

The XPKT302 log is generated for ATM external network connection failures that occur for established connections.

143.1 Feature name

ACT ID - A00004449 : OP_E911-TRUNK_SUPPORT.

143.2 Description

This feature supports the provisioning of OP and E911 MF trunks for DMSCP SPM for North American market.

E911 emergency service is a distinct product from the Basic 911 emergency service (B911). A DMS100 or DMS100/200 office with the E911 product, known as an E911 tandem, provides centralized emergency service that is capable of serving many end offices. An E911 tandem receives 911 calls from end offices and routes the calls to the appropriate PSAP (Public Safety Answering Point).

This feature enables the provisioning of E911 MF trunk for DMSCP SPM in table TRKMEM.

143.3 Hardware Requirements or Dependencies

None.

143.4 Software Requirements or Dependencies

None.

143.5 Limitations and restrictions

None.

143.6 Interactions

The intent of this activity is to support the provisioning of E911 MF trunks for DMSCP SPM. All the applicable interactions supported by this trunk group for DTC shall be supported on DMSCP SPM.

144: Functional Description (FN): A00004500

144.1 Feature name

A00004500 - IN TCAP Messaging on IP

144.2 Description

This document is a Functional Description for the support of the AIN TCAP (Transaction Capability Application Part) messaging in Open Standards Protocol. This activity is provided on the DMS / CS2K - CORE. It is intended to transport the IN messages via the IP fabric - using the Simple Control Transport Protocol[1] (SCTP). Control SOC INW0003 is used to control the IN Messaging over IP functionality.

With the converging of PSTN and IP networks, the existing transfer protocols (e.g.: TCP) has some major limitations. SCTP (Stream Control Transmission Protocol) is designed to overcome the limitations of TCP as well as supporting the extra requirements of PSTN signalling over IP networks.

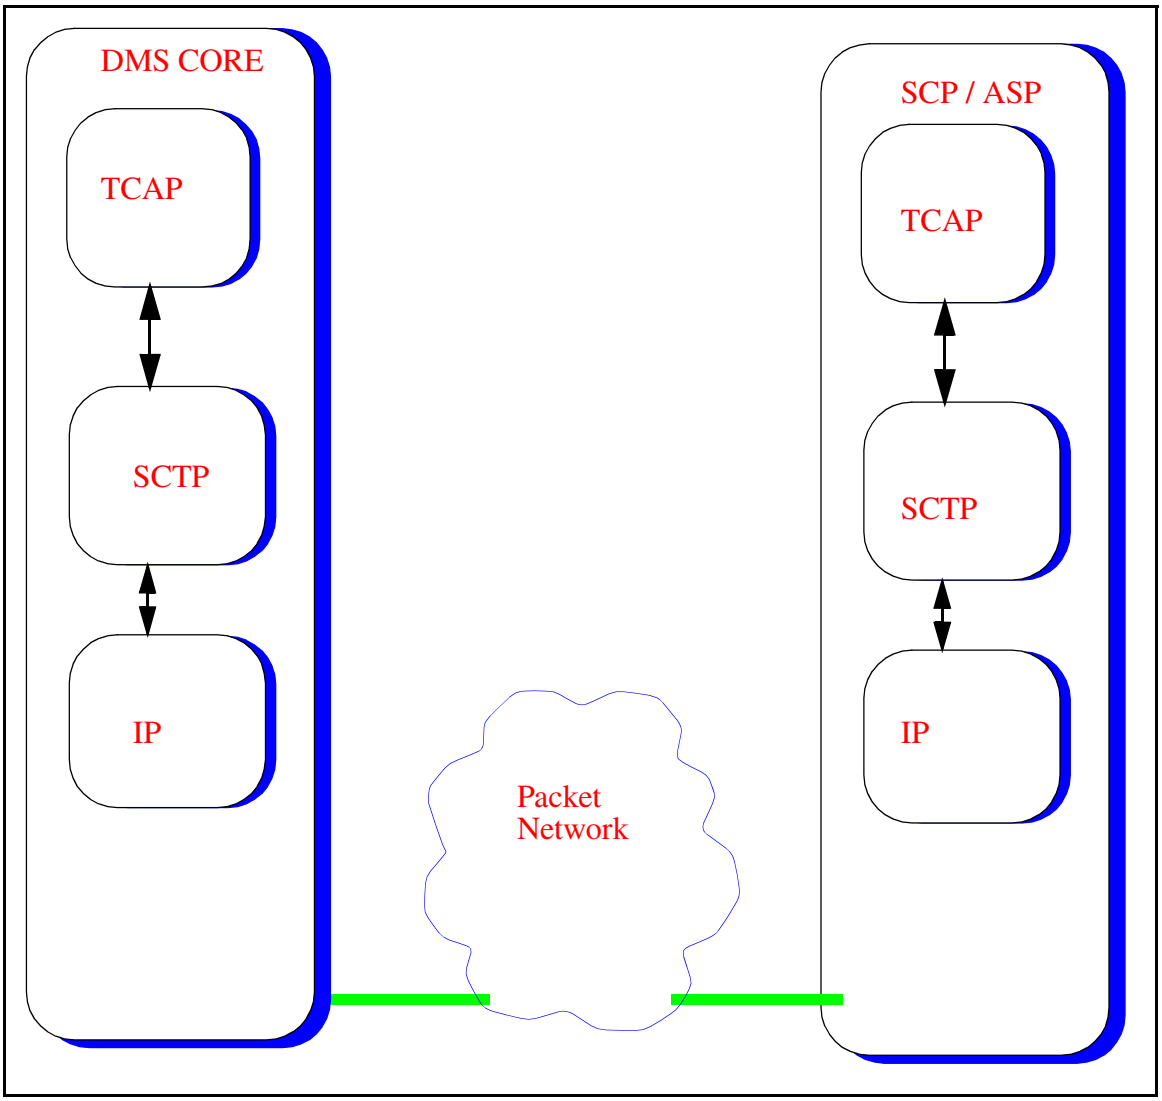
This activity provides the following functionality:

- Supporting AIN (IN) and LNP messages to / from the DMS / CS2K - CORE over SCTP / IP. Please note that the message sets supported for NA markets are only supported.

[1] It should be noted that version 5 RFC is titled “Simple Control Transmission Protocol” and the original RFC2690 is titled “Stream Control Transmission Protocol”. Throughout this document SCTP is “Stream Control Transmission Protocol”.

144.2.1 Functional Behavior

Figure 1 Functional Behavior



The IN TCAP messages will use the SCTP as a transport layer over IP networks. The hardware at the DMS-Core / CS2K may be either EIU or HIOP depending upon the required bandwidth.

Note: HIOP card is available only over XA-CORE platform for high bandwidth IP access.

This feature provides an Interface to the IP network via SCTP, which enables an Advanced Intelligent Network (AIN) Application to access services offered by an Application Service Provider (ASP) located on an Offboard Processor (OP) on an Ethernet / Local Area Network (LAN). The AIN Application uses the services of the Signalling System Number 7 (SS7) Transaction Capability Application Part (TCAP) Application Layer Protocol. This feature also provides the software to manage the SCTP association between the AIN Application in the Computing Module (CM) and the Application Service Provider in the Offboard Processor.

144.2.1.1 TCAP Background

Transaction Capability Application Part (TCAP) provides a common protocol for remote operations across the CCS7 network. The protocol consists of message formatting and contains rules and exchange procedures.

Transactions are functions which control non-circuit related information transfer between nodes in a CCS7 network. The TCAP protocol format is separated into two parts, the *Transaction and Component portions*.

The *Transaction Portion* provides a means of associating messages with a specific Application Process transaction. A transaction consists of one or more messages exchanged between Application Processes on the same or different Network Nodes.

The *Component Portion* ensures that Components are formatted an exchanged properly. A Component is a unit of information within a transaction. The Component Portion utilities provide all TCAP users with a common set of component encoding and decoding procedures. This eliminates the need for individual Applications that implement message formatting procedures thereby reducing development time and minimizing the risk of protocol errors.

A TCAP message consists of a Package containing a Transaction Portion plus one or more Components in any order.

TCAP enables the deployment of advanced intelligent network services by supporting non-circuit related information exchange between signaling points using the ***SCCP connectionless service***. An SSP uses TCAP to query an SCP to determine the routing number(s) associated with a dialed LNP, 800, 888, or 900 number. The SCP uses TCAP to return a response containing the routing number(s) (or an error or reject component) back to the SSP. Calling card calls are also validated using TCAP query and response messages.

In the CCS7 layered architecture, TCAP lies between the Application Processes using the CCS7 signalling network and the Signalling Connection Control Part (SCCP) which provides the message transfer capabilities.

Since IN TCAP messaging uses connectionless service, IN TCAP messages can be embedded in a transport layer function and transported across IP.

144.2.1.2 SCTP Background:

The limitations of TCP as a transport protocol for SS7 was the direct motivation for the using of SCTP as a new transport protocol. SCTP is a new IP transport protocol, which exists at an equivalent level with TCP and user datagram protocol (UDP) and which currently provides transport layer functions to many Internet-based applications. SCTP has been approved by the IETF as a proposed standard, and is specified in RFC 2960. Nortel Implementation of the SCTP transport protocol on the CORE was implemented by feature activity A59023997.

The SCTP transport service can be fragmented into several functionalities:

1. **Association Startup and Teardown** --An association is initiated by a request from the SCTP user. A cookie mechanism is employed during the initialization to provide protection against security attacks.
2. **Sequenced Delivery within Streams** --The SCTP user can specify at association startup time the number of streams to be supported by the association.
3. **User Data Fragmentation** --SCTP supports fragmentation and reassembly of user messages to ensure that the SCTP packet passed to the lower layer conforms to the path multiple-tenant unit (MTU).
4. **Acknowledgement and Congestion Avoidance** --SCTP assigns a transmission sequence number (TSN) to each user data message (fragment or unfragmented). The receiving end acknowledges all TSNs received, even if there are gaps in the sequence.
5. **Chunk Bundling** --The SCTP packet delivered to the lower layer consists of a common header followed by one or more chunks. The following table depicts the general structure of an SCTP packet:
6. **Packet Validation** --A mandatory verification tag field and a 32-bit checksum field are included in the SCTP common header.
7. **Path Management** --The SCTP path-management function chooses the destination transport address for each outgoing SCTP packet based on the SCTP user's instructions and the currently perceived reachability status of the eligible destination set.

The feature activity that implemented the SCTP stack on the core provides the above SCTP advantages and a framework for developing an Application Program Interface.

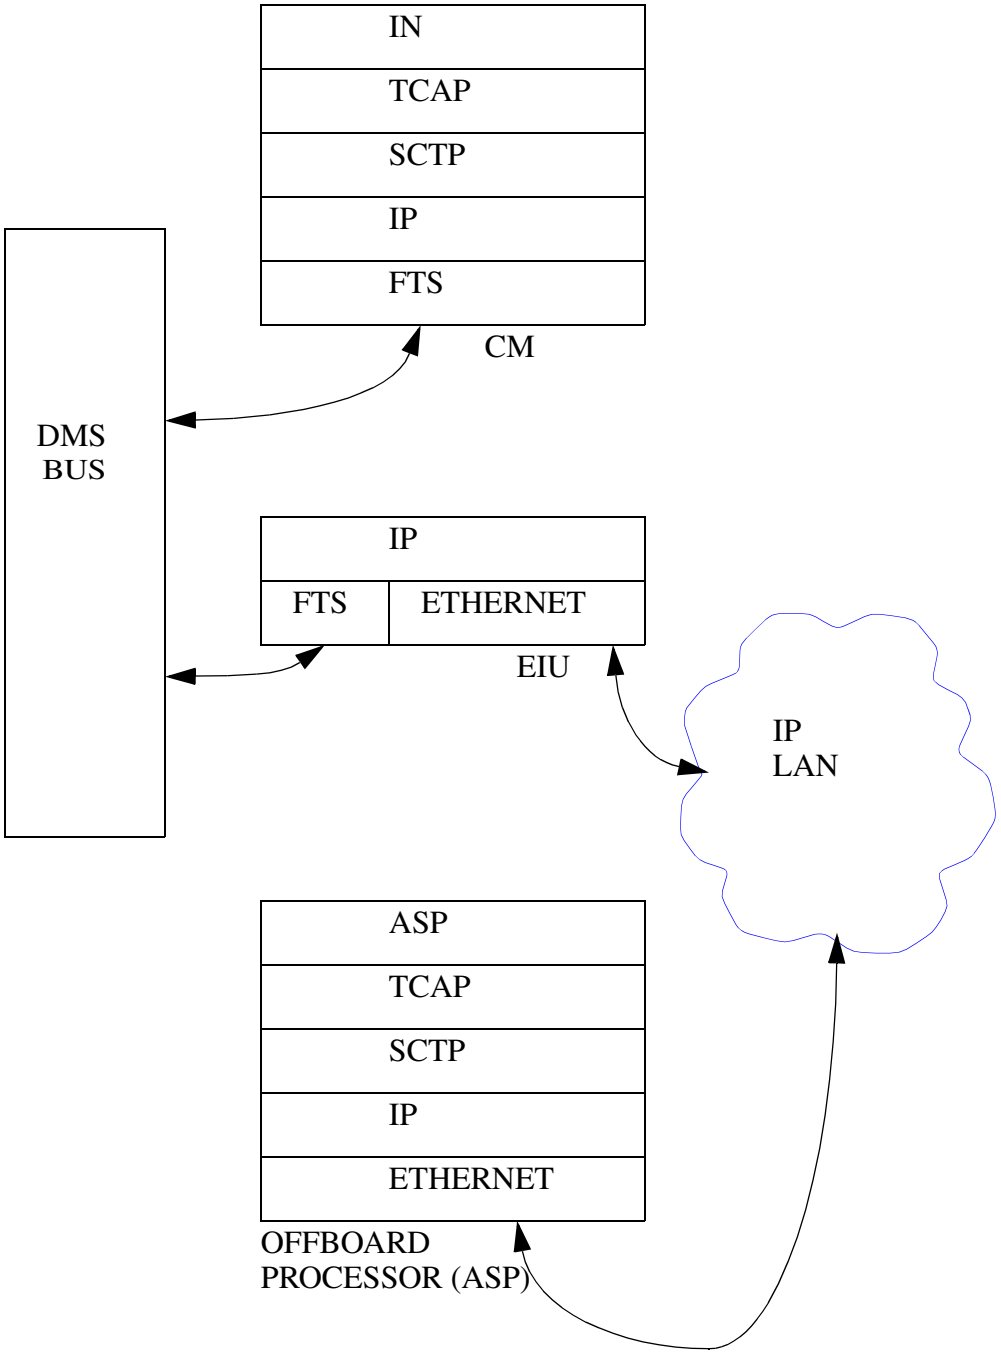
144.2.1.3 System Flow

Following Figure (Figure 2, on page 1786) shows the message flow between the AIN Application (located in the CM) and the ASP (connected on an Ethernet LAN). An IN/TCAP message is encoded and passed to SCTP for delivery to the ASP.

The SCTP transport hands over the TCAP Message to IP. IP forwards the Message to an Ethernet Interface Unit (EIU) through the Supernode Frame Transport System (FTS).In the EIU, the Message is received by FTS which passes it on to IP.

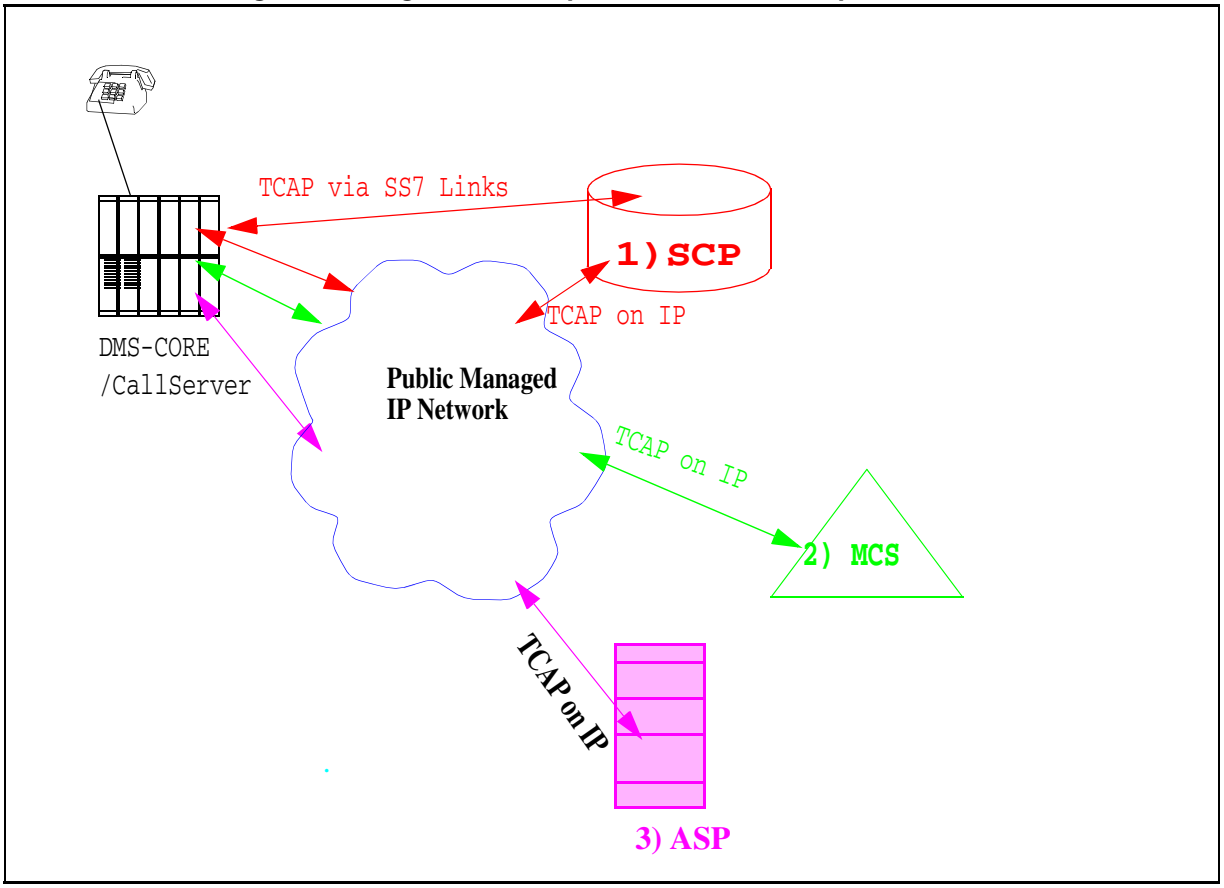
IP delivers the message to the Ethernet LAN which forwards it to the Appropriate Offboard Processor. On the ASP, the message is delivered to IP which passes it on SCTP transport which hands it over to the Application Service Provider. A Response Message from the ASP to the AIN Application follows the exact same path but in reverse order.

Figure 2 System Flow using EIU on DMS



Below is a diagrammatic representation of different nodes that could use the SCTP/IP interface. Figure 3, on page 1787

Figure 3 Diagrammatic representation of Examples

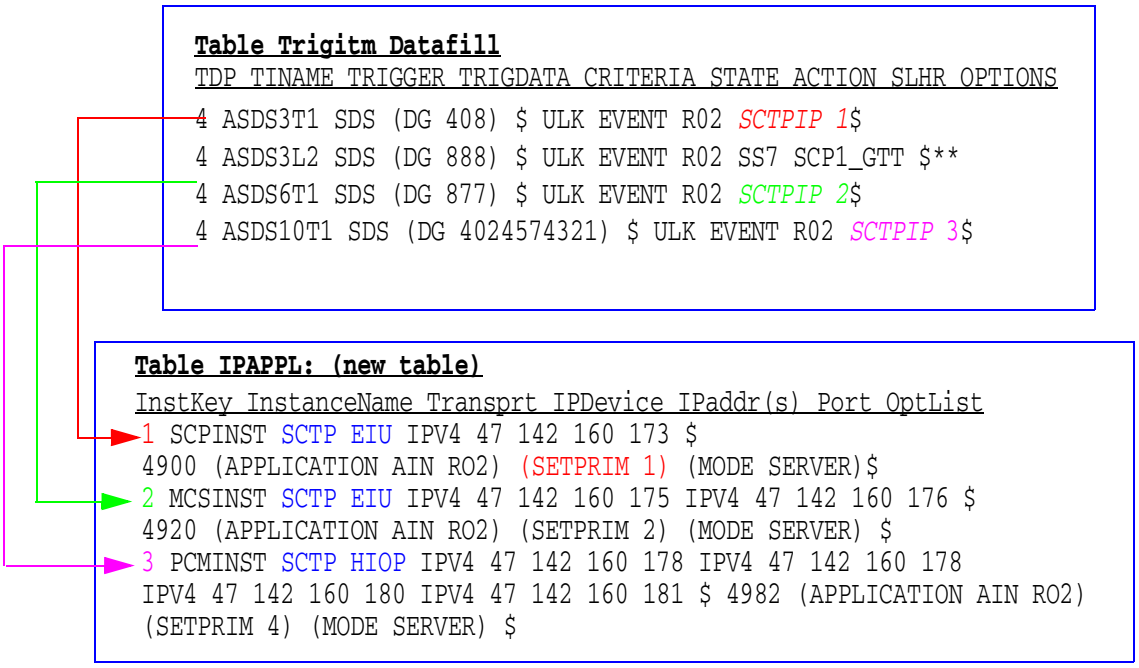


144.2.2 Provisioning

Only the TRIGITM model of subscription supports IN messaging over IP. The TRIGGRP model of subsrcription is not supported by this activity. Following datafill is required to allow IN messages over IP.

144.2.2.1 Table IPAPPL

Figure 4 Table Control Changes



** Note that SCP1_GTT points to the existing GTT for SS7 translations.

New **Table IPAPPL** datafill provides separation of various connections to the DMS. The use of SCTP transport requires that the application store the specific remote IP addresses and local Port number. Therefore table IPAPPL is datafilled in order to provide these details.

InstKey is datafilled in order to map this instance with an internally assigned instance number. This field is the unique key to the tuple. This field is used in the tuples in trigitm that uses SCTP as transport.

InstanceName is datafilled in order for the telco personnel to be able to distinguish one connection from the other.

Transprt is datafilled in order to classify the instance to which transport protocol be used. Currently the table will support SCTP functionality ONLY.

IPDevice is datafilled to indicate which IP interface hardware will be used. This table currently supports EIU and HIOP.

IP addresses (upto 4 addresses) are allowed in one instance tuple. This may be used to support multihoming. Please refer to Section “144.6.1 MultiHoming” on page 1792. The first IP address in the list will be used as the primary address. IPV4 type IP addresses are supported.

Port Number is the local port number at which the DMS-Core will expect to receive messages from this instance. (Note that the remote port is received during the INIT message from the far-end). Valid range of Source port allowed to be configured on the CORE is from **4900 to 4982**.

The IN Messaging application using SCTP allows for multiple associations to an ASP on the same IP address, but using a different port number. Care must be taken to datafill a different portnumber in the source port field on the DMS Core. This method may be used by service providers that use the GTT or SSN in SS7 for translating to different applications.

OptList field may be datafilled with "**SETPRIME**" to set any of the IP address in an instance to be used as to set the primary destination address. The field is designed so as to support any future enhanced options. The setprime option is mandatory for AIN on SCTP.

This option has been used along with the position of the ipaddress as in above examples,(Please refer to "Figure 4 Table Control Changes" on page 1788.), where in the SCTPINST the ipaddress "`47 142 160 173`" is set as the primary IP address.

Optlist sub-field "**APPLICATION**" can be datafilled to specify the application eg:AIN. This field is further augmented by **Msgset** eg: R01, R02. The application option is mandatory for AIN on SCTP.

Optlist sub-field "**mode**" is currently defaulted to the SERVER mode for AIN on SCTP. The IN TCAP messaging on IP requires the SCTP application runs in SERVER mode on the CORE.

Optlist sub-field "**multihoming"** is used to specify if the remote node supports multihoming. This option is currently only supported on the HIOP ipdevice.

144.2.2.2 Table Trigitim

In the trigitm model of AIN, the Trigitm table stores the trigger item definitions. Each trigger item also contains the Service Logic Host Route, which currently allows SS7 as transport and the datafill of a GTT per trigger item. The SLHR entry for each trigger specifies the ASP (Application Service Provider) destination (instance) to which this trigger query / messages will be sent.

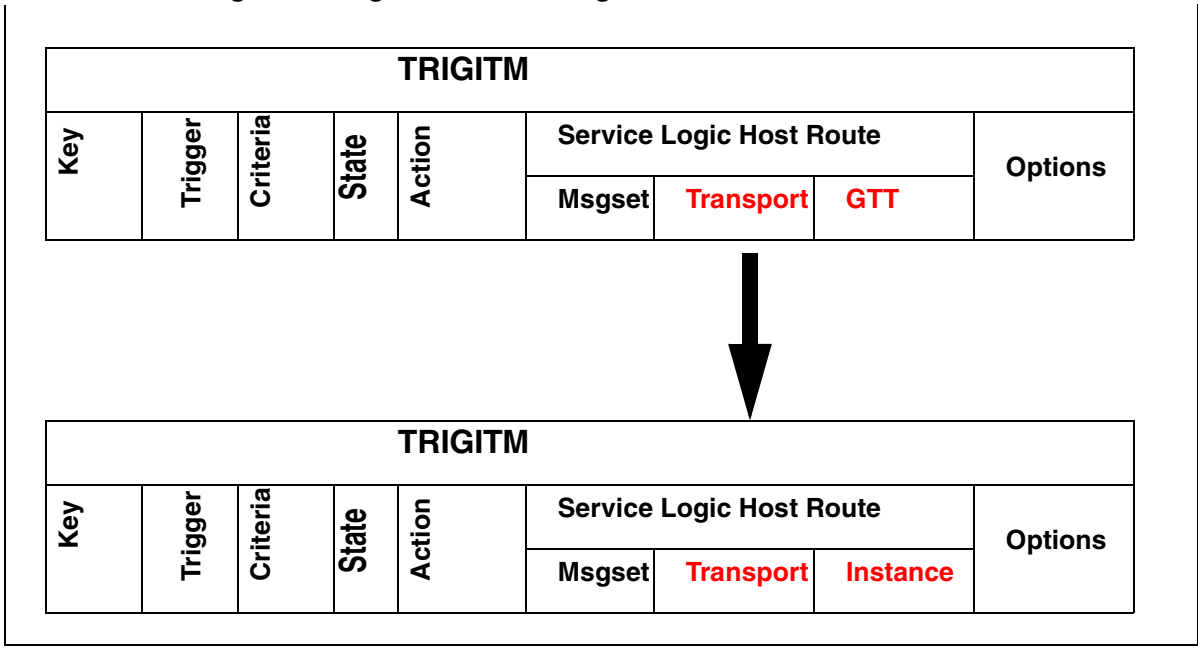
When the transport mechanism is changed to SCTP, this entry needs to be changed for transport and GTT fields for each trigger item. It should be replaced with the transport as SCTP with an instance number.

Field **SLHR's** sub-field transport in table trigitm is modified to allow the following transports:

- TCP (Lab-only)
- SCTP
- SS7

The Table trigitm changes are shown below.Please refer Figure 5, on page 1790

Figure 5 Trigitm Datafill Changes



144.3 Logs and OMs

New OMS are added by this activity. Please refer to the OMs section(optpf) of this document for new OMs introduced by this activity.

144.4 Hardware Requirements or Dependencies

The DMS core usually carries out most of the IP traffic over EIU. CS2K assumes XA-Core and may use EIU, but most CS2Ks are equipped with HIOP card for higher bandwidth IP traffic. This feature will support IN messages over IP for both EIU as well as HIOP. The bandwidth limitations posed by EIU in general will apply. For detail Engineering Information please refer to EI section(optei) of this document.

From the IN Messaging application perspective, it will serve different instances using HIOP and EIU simultaneously on the same switching core. However, Please refer to appropriate hardware procedures when operating with HIOP card as well as EIU peripheral on the CORE.

Note: The CORE platform can either be an XA-Core or Brisc.

144.5 Software Requirements or Dependencies

Limit SOC INW0003 will be used with this functionality. The limit in SOC must be set to atleast the number of tuples datafilled in the table IPAPPL. For more instances to be added in the table IPAPPL limit of this SOC must be increased by additional number of tuples.

Initial limit of this SOC will be zero. When limit is zero no tuples can be added to the IPAPPL table. Tuples can be added only when a non-zero limit is set. Maximum limit that can be set will be 32.

Adding, deleting and modifying do not impact the value of the SOC limit. The value of the current usage counter is however changed accordingly

If SOC limit is reduced after adding tuples, IN messaging on IP functionality will not be affected, but no further tuples will be allowed to be added to the table IPAPPL.

If the SOC limit set is less than or equal to the current number of tuples in table IPAPPL, no further tuples will be allowed to be added to the table IPAPPL. An attempt to add a tuple will result in the following message being displayed:

“SOC option INW0003: Usage limit exceeded”
“ERROR: Table IPAPPL is under SOC usage control.”
“ACTION: SOC Limit must be increased before adding further tuples.”

144.6 Limitations and restrictions

For Engineering Information on the

- bandwidth,
- Message Size,
- SCTP/IP Link Messaging Rate,
- Normal Throughput,
- Failure ThroughPut,
- Link Capacity as Call Attempts Per Hour, Messages Per Second and others,

Please refer to the EI section of this Document.

For EIU and HIOP being shared between various IP applications, For EIU configurations across subnets, etc. please refer to specific hardware guidelines

as well as the EI documentation referring to the bandwidth allotted to application sharing the hardware.

144.6.1 MultiHoming

Mutlihoming is not supported for IN Messaging using the SCTP on EIU configuration. Multihoming is supported by SCTP on the HIOP configuration.

144.6.2 Simultaneous HIOP and EIU

Please refer to appropriate hardware procedures when operating with HIOP card as well as EIU peripheral on the CORE.

144.7 Sample EIU Configurations

Please refer to NTP 297-8991-910, DMS-100 Family Ethernet Interface Unit User Guide TELECOM12 Standard 03.01 August 1999, EIU documentation(LANCOMM) for recommended EIU configurations.

144.8 Interactions

Tools such as AINTRACE and TRAVER will be supported to be able to refer to SCTP instances for the transactions using this transport.

145: Functional Description (FN): A00004554

145.1 Introduction

SDM FX System Backup Enhancements

This feature (A00004554) implements scheduling of the system image backup to both SDM tape drives and the capability to configure the "Backup Required Alarm".

145.2 Purpose

The following are the purposes of this activity.

- Automate the backup process and allow the user to schedule the backups for each drive (Dat 0 and Dat 1).
- Allow the user to Configure "Backup required "alarm, so that he can Enable/Disable the backup required alarm.

145.3 Subject Matter Experts Agreement List

Table 1 Table 1 Agreement List

Name	Role/Title	DRU,ArchID, Module, or Functional Area	Mandatory Reviewer (Y/N)
Reid,Bob	Manager/	SDM Evolution and Architecture	Y
Feijun Ma	FX Base Architect	SDM Base	Y

145.4 Problem Symptoms

In the existing SDM environment, if somebody wants to take the backup of the system, he has to go to the sdmmtc level and issue the backup command manually. There is no method avilable to take the backup automatically. So, the customer needs a method to schedule the backup.

Currently whenever a change happens to the SDM environment, like patch applying, logical volume changes, etc.. , a “Backup Required” alarm will be triggered. To clear this alarm the customer needs to issue "Backup clear" command or initiate a system backup. This constitute a heavy load for the cutomer.

145.5 Requirements

The existing backup code is designed only to support adhoc backup execution. No scheduling possible for backups. The Requirements for this activity are the Following

- A utility to schedule backup to write avilable tape drives on the SDM. This utility will provide a mechanism to automate the backup process in a scheduled interval.
- An option to configure the "Backup required" alarm. This will allow the user to Enable/ Disable the "Backup required" alarm.

145.6 Description of Code Churn

This will be a small tool for scheduling the backup and configure the "Backup Required" alarm. By implementing this tool, the customer will have an option to automate this backup process. The tool will allow the user to schedule each drive separately for taking the backups.

This tool will provide an option to configure the “Backup Required” alarm. It will have various options like, Disable (or) Enable this alarm, show only when backup fails, etc...

145.7 Scheduling Interface

This is the interface the user employs to add new schedules and disable or modify existing schedules.

The options provided by this interface are:

- Schedule Dat 0
- Schedule Dat 1

These two options allow the user to add new schedules and disable or modify an existing schedule.

- List Schedules

The List Schedule option will show all the schedule details for each drive.

145.8 Other features

The other features are:

- Incase of a failure it will raise a "Backup Failure "alarm.
- It won’t start the system image backup if a “Backup Failure” alarm exists.
- Necessary customer logs will be generated during the execution of the scheduled backup.
- It will support the existing way of taking the backup also.

145.9 Alarm Configure Interface

This is an interface for setting the “Backup Required” alarm status. The options provided by this interface are:

- Disable the “Backup Required” alarm
- Enable the “Backup Required” alarm
- List the Current status of “Backup Required” alarm

Note: The existing backup “InProgress” alarm will be there even if the “Backup Required” alarm status is Disabled.

146: Functional description (FN): A00004568

146.1 Feature name

H.323 NA Network CAS Tunneling - A00004568

146.2 Description

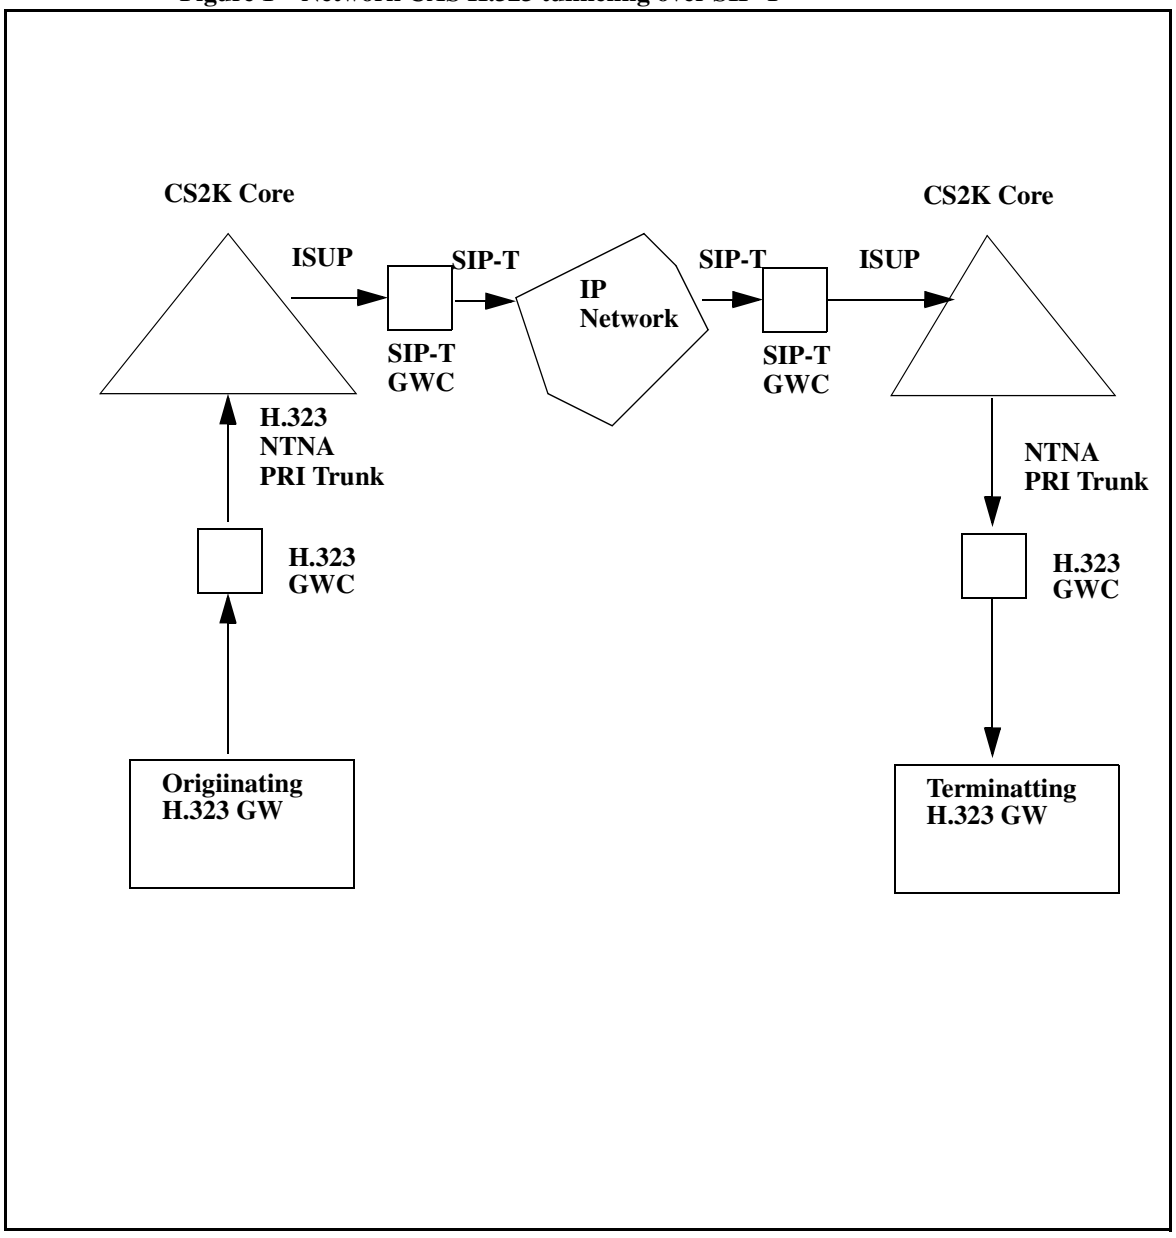
This activity provides the functionality to support the tunneling of ANSI Call Associated (CAS) messages between 2 CS2Ks via SIP-T, in support of the H.323 protocol.This activity provides the functionality to support the tunneling of ANSI Call Associated (CAS) messages between 2 CS2Ks via SIP-T, in support of the H.323 protocol.

Support is required both for North American ANSI and International ETSI message protocols, this activity covers the development required in the CS2K core for Network ANSI CAS, activity A00002358 covers ETSI.

The activity is part of a suite of features which support H.323 on the Succession CS200 Call Server. A00002206 provides the equivalent functionality for NA nodal CAS calls, and A00002261 the functionality for NA nodal and network NCAS (Non CAS) calls.

The following diagram shows the network configuration. A CAS message is routed from the Originating GW via a GWC to the core at the originating node. The message is then tunneled across the network via SIP-T to the Terminating Node where it is tunneled in a PRI Facility message to the terminating GW.

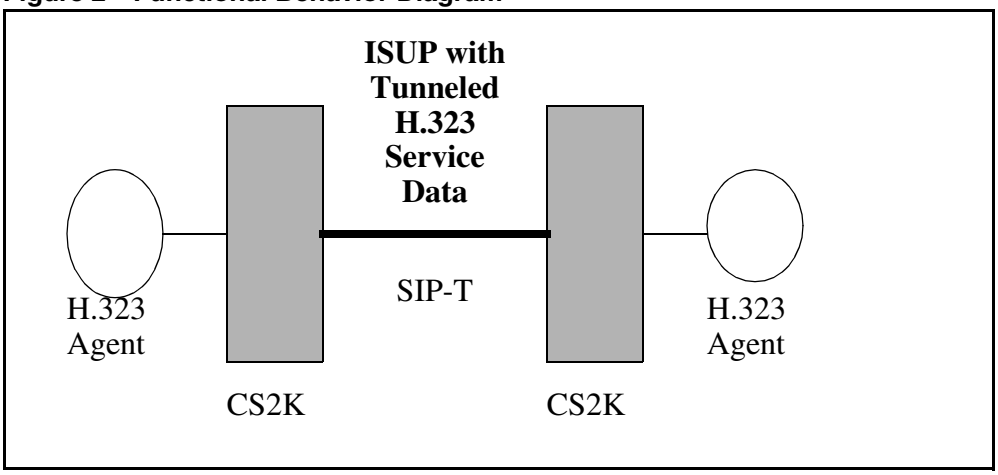
Figure 1 Network CAS H.323 tunneling over SIP-T



146.2.1 Call Processing Overview

This feature provides a mechanism to allow 2 H.323 agents to tunnel end to end service data to each other when they are interworked through the SIP-T protocol. The H.323 payload is tunneled within ISUP messages, which is in turn tunneled within the SIP-T messages, hence the references to ISUP, even though SIP-T is the only network protocol supported.

Figure 2 Functional Behavior Diagram



For ANSI, when a H.323 message is received from a H.323 gateway (GW) by the Gateway Controller (GWC) it is mapped to a NTNA PRI Q.931 message and sent via a H.323 NTNA PRI trunk signaling channel to the CS2K core for processing.

For CAS messages, the GWC will extract the tunneled payload from the UUIE in the H.323 message and include it in the Facility Information Element (FAC IE) of a corresponding NTNA PRI message. If the payload is destined for a local CS2K it is routed to the appropriate NTNA PRI trunk per feature A00002206. If the payload is destined for a gateway at a remote CS2K the payload is then extracted from the PRI message and tunneled within a ISUP message to the destination switch using the SIP-T protocol via the IP network

At the terminating switch the reverse occurs. The payload received within the ISUP message is tunneled within the FAC IE of a NTNA PRI message and sent to the GWC via a NTNA PRI H.323 trunk signaling channel, which then tunnels the payload within the UUIE of a H.323 message via the appropriate gateway.

This activity covers the development within the CS2K core to enhance the PRI/ISUP interworking to tunnel the H.323 payload within a appropriate ISUP parameter to the destination CS2K where the payload is extracted and presented in such a way that the existing PRI functionality developed by A00002206 will tunnel that payload and route it to the terminating GW.

146.2.2 Tunneling of H.323 Data

- The tunneling of H.323 data within an ISUP message can be divided into two components
  Mapping PRI Fac IE's to ISUP Parameters
- **The Segmentation of Large Payloads**

146.2.2.1 Mapping PRI Fac IEs to ISUP Parameters

This component covers determining that there is H.323 data to tunnel, creating the appropriate ISUP parameter and adding the H.323 data. At the terminating CS2K, determining there is H.323 data tunneled and ensuring that existing PRI functionality tunnels the data to the destination gateway. The following list shows the mapping of PRI to ISUP messages that can tunnel the data (the SC_X messages are sent from the GWC, SCP_C to the GWC):

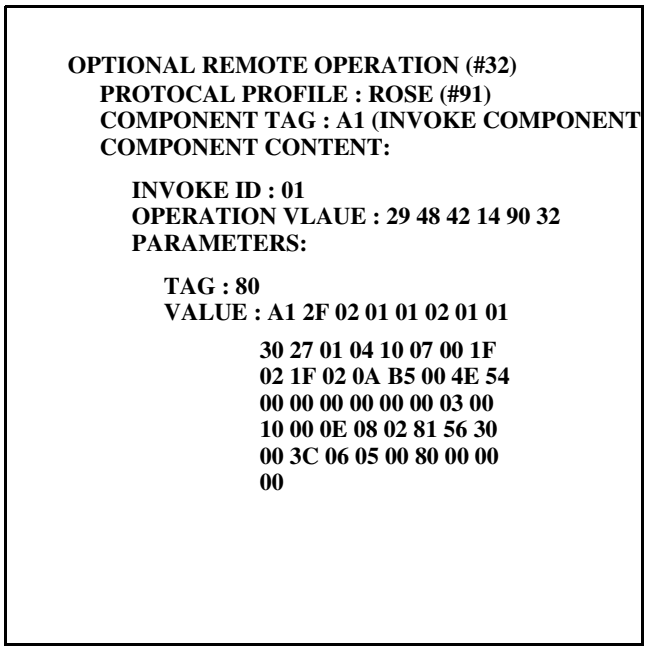
- Setup (maps to SCP_X_Origination/SCP_C_Origination) -> ISUP IAM
- Alerting (maps to SCP_X_Alerting/SCP_C_Alerting or SCP_X_Progress/ SCP_C_Progress) -> ISUP ACM
- FAC (maps to SCP_X_FAC/SCP_C_FAC) -> ISUP FAC
- Connect (maps to SCP_X_Progress ppi=Connect/SCP_C_Progress ppi=Connect) -> ISUP ANM
- Release (maps to SCP_X_Release/SCP_C_Release) -> ISUP REL

Note: for messages with large payloads the “long” version of the above SCP messages will be used.

In each of the listed ISUP messages the H.323 payload is tunneled in the ISUP Remote Operation (RO) parameter. The H.323 payload is tunneled within the Value field of the RO.

The following figure shows the structure of an RO parm containing a H.323 payload

Figure 3 Format of ISUP RO Parameter for H.323 Tunneling



146.2.2.2 The Segmentation of Large Payloads

The originating H.323 GWC will segment the payload based on a preset maximum, currently 180 bytes from the GW. The first 180 bytes is sent in the applicable PRI message. This data is then tunneled in the RO of the appropriate ISUP message. The remainder of the data is sent in a PRI FAC message. This data is tunneled in the RO of the ISUP FAC. For this case the GWC controls segmenting the payload and restoring it at the remote office.

The CS2K will segment the payload when it receives greater than 100 bytes. For the PRI SETUP message the first 100 bytes is tunneled in the RO of the ISUP IAM. The remainder of the data is tunneled in the RO of the ISUP FAC. This allows room for the other optional parameters of the ISUP IAM. For all other PRI messages with greater than 115 bytes the data is tunneled in multiple ROs of the applicable ISUP message. For both of these cases the CS2K controls segmenting the payload and restoring it at the terminating office.

146.3 Hardware requirements

There are no hardware requirements specifically for this feature. This feature applies to any H.323 North American GateWay currently supported.

146.4 Software Requirements or Dependencies

A00002206 - H.323 NTNA PRI

A00001895 - H.323 Base Application

146.5 Limitations and restrictions

None

147: Functional description (FN): A00004713

147.1 Feature name

1+1 Speedometer Support

147.2 Description

This feature updates the Speedometer to support 1+1 configuration in release CSP20. It provides capacity prediction for 1+1 configuration within the accuracy target of +/-10% when the utilization is above 15%. It allows the users to change the value of Rated Power to 1 through table OFCENG.

147.3 Hardware Requirements or Dependencies

N/A

147.4 Software Requirements or Dependencies

N/A

147.5 Limitations and restrictions

None

147.6 Interactions

In the releases without this feature, the smallest value of Rated Power allowed is 2. In this feature, the users are able to modify the value of Rated Power to the smallest of 1.

148: Functional description (FN): A00004772

148.1 Feature name

Destination ACD DN MIS Reporting

148.2 Description

This activity will allow reporting of the Dialed Digits of the Destination ACD Group in the ACDMIS CallOffered, CallAnswered, CallAbandoned, CallBlocked, RemoteOffered, RemoteAbandoned and CallNetworkAnswered messages on an office-wide basis. The Dialed Digits of the destination ACD Group that the call was CTI redirected to or immediate overflowed to, will replace the Original Dialed ACD DN in these messages.

Currently the original Dialed DN is reported in the CallOffered, CallAnswered, CallAbandoned, CallBlocked, RemoteOffered, RemoteAbandoned and CallNetworkAnswered ACDMIS messages. This is the DN that was dialed to enter the ACD environment. As long as the call remains in the ACD environment, this DN is preserved and reported in the ACDMIS messages. This DN is used by Call Center customers for generating various statistics.

This activity will provide new optional functionality (via SOC) for CTI redirected calls and Immediate overflowed calls that will report the Dialed Digits of the Destination ACD Group that the call was redirected to or immediately overflowed to. This information will be carried in the existing ACD DN field of the ACDMIS messages. There will be no change required to the ACDMIS Protocol.

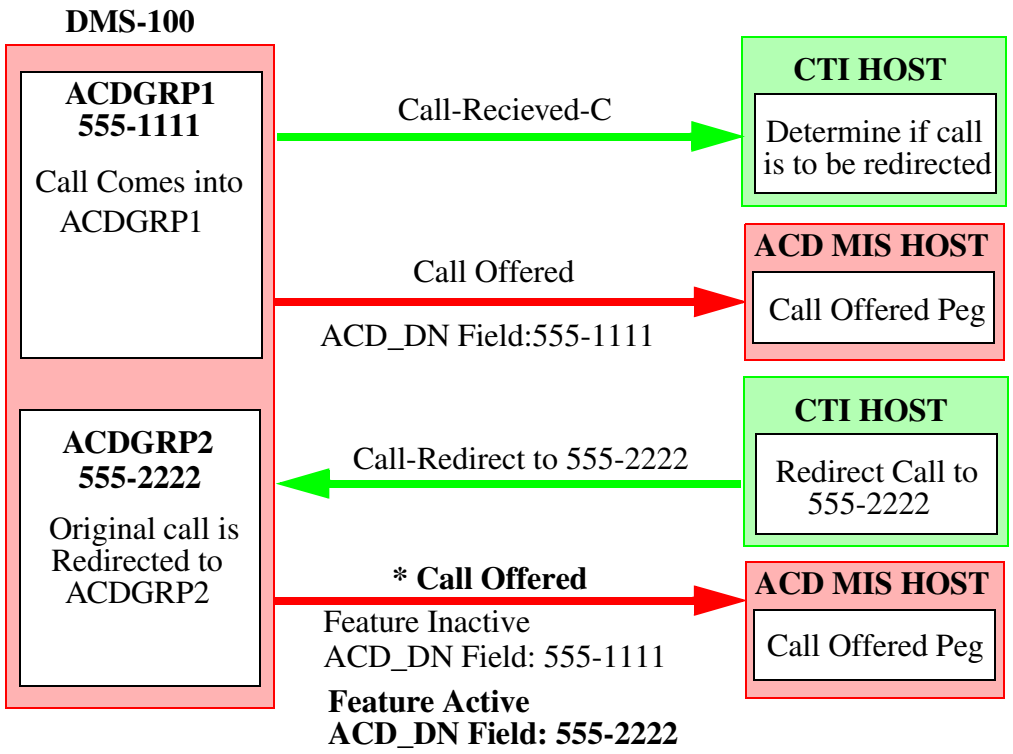
148.2.1 Supported ACD MIS Protocol Versions

Tuples in the ACDMISPL table on the DMS contain a field named PROTOCOL which uniquely identifies the version of ACD MIS messages that will be used for the session.

This activity will not require a new ACD MIS Protocol version. This activity will be supported by the existing ACD MIS Protocol versions BCS31 through BCS43 and newer.

148.2.2 Destination ACD DN MIS Reporting Functionality

As illustrated below, when activated via SOC, this activity will report the destination DN in the ACD_DN field of the CallOffered, CallAnswered, CallAbandoned, CallBlocked, RemoteOffered, RemoteAbandoned and CallNetworkAnswered ACD MIS messages for immediate overflowed and CTI redirected calls. If this functionality has not been activated via SOC, the Original Dialed DN will be populated in the ACD_DN field of the affected ACD messages.



** Diagram illustates CallOffered ACD MIS Message, however the same functionality will apply for the CallAnswered, CallAbandoned and CallBlocked etc. ACD MIS messages.*

148.2.3 ACD Call Offered Message Example

For this activity the ACD_DN fields of the CallOffered, CallAnswered, CallAbandoned CallBlocked, RemoteOffered, RemoteAbandoned and CallNetworkAnswered ACD MIS messages will be affected.

In this example the fields of ACDCallOffered message are shown with the affected ACD_DN field highlighted:

ACDCallOffered Message:

CALL_OFFERED_SGRP_DN
CALL_OFFERED_SGRP_DN_COUNT
CALL_OFFERED_DGRP_DN
CALL_OFFERED_DGRP_DN_COUNT
CALL_OFFERED_TOD
CALL_OFFERED_CSTATUS
CALL_OFFERED_NUMICQ_P
CALL_OFFERED_NUMICQ_L
CALL_OFFERED_ACD_DN
CALL_OFFERED_ACD_DN_COUNT
CURRENT_P_CALL_Q_WAIT_TIME
CURRENT_L_CALL_Q_WAIT_TIME
CALL_OFFERED_DGRP_AGPOSNID
CALL_TRANSFER_STATUS
CALL_TRANSFER_DIFF_CUST_GROUP
CALL_XFERING_PARKING_DN
CALL_XFERING_PARKING_DN_CNT
CALL_XFERING_PARKING_AGPOSNID
CALL_OFFERED_CALLING_NUMBER
CALL_OFFERED_CALLING_NUMBER_CNT
CALL_OFFERED_RECALL_DN
CALL_OFFERED_RECALL_DN_CNT

148.2.4 Software Optionality Control (SOC)

Order code ***ACD00102 - "Destination ACD DN MIS Reporting"*** provides Destination Dialed Digits reporting via the ACD_DN field of the CallOffered, CallAnswered, CallAbandoned and CallBlocked ACD MIS messages on a office-wide basis. When ACD00102 SOC is in the IDLE state, the ACD_DN field for the above stated ACD MIS messages will reflect the Orignal Dialed DN as it did prior to this activity.

148.3 Hardware Requirements or Dependencies

Not Applicable

148.4 Software Requirements or Dependencies

Not Applicable

148.5 Limitations and restrictions

- This activity will be supported by the existing ACD MIS Protocol versions BCS31 through BCS43 and newer.
- This activity only pertains to the CallOffered, CallAnswered, CallAbandoned, CallBlocked, RemoteOffered, RemoteAbandoned and CallNetworkAnswered ACD MIS messages.

148.6 Interactions

No new interactions are introduced by this activity. However it should be noted that when this new functionality is activated the Original Dialed DN will no longer be provided in the ACD_DN field of the affected ACDMIS messages on an office-wide basis for CTI redirected and immediate overflowed ACD calls. Conversely, when not activated the Original Dialed DN will be provided in the ACD_DN field of the affected ACDMIS messages.

149.1 Feature name

T1400 to N240 migration procedure

149.2 Description

The intent of this document is to describe the procedure to be used to migrate the CMT, MG9KEM and MG9KMT element managers from the existing T1400 platforms to the new COAM frame using Netra 240 High Availability servers.

This document contains all the necessary steps to accomplish the following:

- Migrate CMT SN07(T1400) to CMT-COAM SN07 (N240)
- Migrate MG9KEM SN07 (T1400) to MG9K-COAM SN07 (N240)
- Migrate MG9KMT SN07 (T1400) to MG9K-COAM SN07 (N240)

Refer to individual sections for the details. The user is referred to additional documentation when appropriate.

This procedure requires that the existing servers (T1400) have been upgraded to the SN07 software release.

.

149.3 Precautions

Contact GTAC if assistance is required with this section.

- Read this document in its entirety before attempting any individual procedure.
- The person(s) performing these procedures must be thoroughly familiar with the UA-AAL1 NA solution. The user is expected to have knowledge of the DMS MAP interface and be able to manipulate datafill and navigate the menu system.

- Certain procedures in this document are GTAC Interactive. Individual procedures will indicate this requirement. Use the 801 Scheduling procedures to obtain online GTAC support when required.
- Using the Core Management Tools, SAM21 Element Manager GUI, and MG9000 Element manager GUI, ensure the system is alarm free. Do not proceed until all alarms are either cleared or explained.
- Monitor logs in the XA Core and ensure the system is stable. Pay special attention to XAC logs.
- All procedures in this document require close coordination and prior approval from the customer. IP addressing changes must be clearly communicated to the customer.
- Obtain the latest copy of all referenced documentation the day of the actual activity. This will ensure the latest copy of each document is being used.
- Before performing any configuration changes on the Passport 8600 units, ensure direct physical connection to the console port is available. Locate a console port cable before the start of procedure.
- Ensure all REX tests are suspended when performing procedures in this document.
- Ensure Auto-patching is disabled when performing procedures in this document.
- Ensure no image dumps in XAC are scheduled when performing procedures in this document.
- No provisioning changes are allowed during this procedure.

149.4 Preparations

Contact GTAC if you require assistance with these preparation steps.

- Create backups for CMT, MG9KEM, MG9KMT
- Obtain and verify Userid/password information for all elements that will be accessed.
- Obtain and verify the IP addresses for all elements that will be accessed. These will include console port access.
- There are further preparation steps detailed in each procedure and/or the referenced documentation. Ensure those preparations are followed.
- The following tables are provided as a place to write down the information needed. Fill these out before continuing with the procedure.

149.5 Info Sheets

	Hostname	**IP addresses**	
CMT			
MG9KEM			
MG9KMT			

Table 1: Information to configure CMT-COAM

Hostname		This hostname is also called the original hostname later in this document	
3 IP Addresses	Cluster IP – new N240_0 IP – new N240_1 IP – new	Must be on same subnet as existing T1400 servers	
Subnet mask			
Default Router IP			
DNS Config			
Timezone	US/Central		
Server Installation Type “cs2kaps”, “cs2kmt”, “mg9kem”, or “csen”	cs2kaps

Timezone	US/Central		
Server Installation Type "cs2kaps", "cs2kmt", "mg9kem", or "csen"	mg9kem		
NTP Server (s)			
Syslog setup			

149.6 High Level Approach

The following approach will be used to make the transition from SN07 (T1400) to SN07 (N240).

1. Backup the CMT T1400 server
2. Install SSPFS and applications on the CMT-COAM server
3. Move data from the CMT T1400 server to the CMT-COAM server
4. Shutdown the CMT T1400 server
5. Reconfigure the CMT-COAM server with the IP address and host name of the CMT T1400
6. Reconfigure applications on the CMT-COAM server
7. Clone the CMT-COAM server to its mate server

The steps above will be repeated for the MG9K EM server if one exists in the office.

149.7 Detailed Steps

The following approach will be used to make the transition from T1400 to N240.

149.7.1 Migrate CMT from T1400 to N240

See Table 1 for CMT-COAM config settings.

The CMT-T1400 and the CMT-COAM will be configured with the same Hostname and IP address. Therefore, only one of these can be connected to the CS-LAN at any one time. The strategy is used so as to ensure that any other system referencing the CMT IP address will not be affected.

1. Follow the installation procedures for SSPFS installation defined in IM 241621.

2. Follow the installation procedures for CMT applications defined in IM 241623, **but don't perform the cloning step for this server. It will be done later.**

3. Ensure/Perform complete backup of required CMT oracle databases, patches, NPM, APS files etc. (must be backed up to file, not tape, since the N240 does not have a tape drive)

   Backup Oracle DB and critical data

   a) NN10281-600; Procedure-Performing a critical data backup;
   b) **Perform steps 2,3,4,5**
   c) Backup the CMT oracle database and critical data to a file using the following command: **/opt/nortel/sspfs/bks/bkdata –f /backup**

   Backup APS files if APS is running on same server with CMT

   d) NN10281-600; Procedure-Backing up APS application files; Instead of backup to tape, we modify the command to backup to file as follows:
      - Perform step 2
      - **Tar –cvf /aps_backup.tar /PROV_data /audio_files /user_audio_files / opt/uas/uas_conf_backup**

   Backup NPM patch files

   e) FTP all files in the **/data/npm/Au** from the CMT-T1400 to the CMT-COAM server
   f) FTP the **/backup** file from the CMT-T1400 to the CMT-COAM server
   g) FTP the **/aps_backup.tar** from the CMT-T1400 to the CMT-COAM server

4. Record any NPM customer specific configurations.
   a) NN10261-450v2; Procedure-**Saving user-defined NPM data using the NPM**; Perform steps 1-37 (Using the NPM GUI)

5. Shutdown the CMT-T1400 server

a) This is done by logging in as root, and issuing the **init 0** command.

At this point all commands are done on the CMT-COAM (N240) server

6. Change the virtual IP address of the CMT-COAM server
   a) Login as root
   b) Run the cli command
   c) Select option "Configure"
   d) Select option "IP Configuration"
   e) Select option "config_data"
   f) You will be prompted for the hostname and IP address to use. Enter the hostname of the CMT-T1400 and IP address of the CMT-T1400

7. Configure CS2M applications on the unit 0 N240

Configure Patching Server Element (PSE)

a) NN10276-500; Procedure- Configure Patching Server Element (PSE); **Perform steps 1-13.**

Configure APS

b) IM 24-9082 **(Need SN07 version);** Procedure 10 – **APS Configuration**; Perform steps 1-16. (Not required for this customer)

Configure SESM

c) IM 24-9082 **(Need SN07 version);** Procedure 11 – **SESM Configuration**; **Perform steps 1-17**. **(Skip steps 18-21) (Do not initialize or restore the database)**

Configure NPM (PFRS)

d) IM 24-9082 **(Need SN07 version);** Procedure 12 – **NPM Configuration**; Perform steps 1-14.

Configure SAM21

e) IM 24-9082 **(Need SN07 version);** Procedure 13 – **SAM21 Configuration**; Perform steps 1-24.

Configure SNMP Agent

f) NN10261-450v2; Procedure – **Configuring the SNMP Agent**; Perform steps 1-21.

g) Need Fred to provide the IM here

8. Ensure that no applications are running prior to restoring database
   a) Stop NPM with the command: servstop NPM
   b) Stop PTM with the command: servstop SESMservice
   c) Stop SAM21 with the command: servstop SAM21EM
   d) Stop APS with the command: servstop APS
   e) If QCA is configured on the server: Stop QCA with the command: servstop QCA

9. Restore all required CMT oracle databases, patches, NPM, APS files

   Restore Oracle DB and critical data

   a) NN10281-600; Procedure-Performing a data restore
      Perform steps 2,3,4,5
   b) Restore the CMT oracle database and critical data from a file using the following command: **/opt/nortel/sspfs/bks/rsdata -f /backup**
   c) NN10281-600; Procedure-Performing a data restore
      Perform steps 9,11

   Restore APS files

   a) **Tar –xvf aps_backup.tar (Will restore the files /PROV_data /audio_files / user_audio_files /opt/uas/uas_conf_backup)**

10. Start applications (SESM, SAM21, NPM)
    a) Start SESM with: serstart SESMserver
    b) Start NPM with: servstart NPM
    c) Start APS with: servstart APS
    d) Start SAM21 EM with: servstart SAM21EM
    e) If QCA is configured on this server: Start QCA with: servstart QCA

11. Restore any NPM customer specific configurations.
    a) NN10261-450v2; Procedure-Restoring the NPM patch files; **Perform steps 14-15**

12. Reboot the CMT-COAM
    a) sync;sync;init 6

13. Test all element Managers and equipment to ensure everything is operating correctly

NN10261-450v2; Procedure-Verifiying upgrade was successful; **Perform steps 1-9**

14. If there are problems at this point and a back-out is desired, execute the steps in the back-out procedure in the next section.

15. Clone Master N240 to Mate N240 (Approx 1 hour)
    IM 24-9082 **Perform steps 23-28**
    a) Copy MAC address into command into installed server
    b) Boot clone N240 from network with <ip address> of master
    c) Disk replication will occur
    d) Fred to provide new IM number and procedure number

16. Re-test all element Managers and equipment to ensure everything is still operating correctly
    a) NN10261-450v2; Procedure-Verifiying upgrade was successful; **Perform steps 1-9**

17. Remove CMT (T1400) physically from network

149.7.2 Back-out procedure for CMT from N240 to T1400

1. Change the virtual IP address of the CMT-COAM server
    a. Login as root
    b. Run the cli command
    c. Select option “Configure”
    d. Select option “IP Configuration”
    e. Select option “config_data”
    f. You will be prompted for the hostname and IP address to use. Enter the original hostname of the CMT-COAM and original IP address of the CMT-COAM. Leave the rest alone.
2. Take the CMT-COAM server down by doing the following as the root user:
    a. **init 0**

3. Reboot the CMT-T1400 server by issuing the following command from the console port of the CMT-T1400 server: **boot**
    a. The system will come up at this point

149.7.3 Migrate MG9KEM and MG9KMT from T1400 to N240

See Table 2 for MG9K-COAM config settings

1. Follow the installation procedures for SSPFS installation defined in IM 241621.

2. Follow the installation procedures for MG9KEM and MG9KMT applications defined in IM 240674, **but don't perform the cloning step for this server. It will be done later**.

3. Shutdown the MG9KEM-T1400
    a. This is done by logging in as root, and issuing the **init 0** command
4. Shutdown the MG9KMT-T1400
    a. This is done by logging in as root, and issuing the **init 0** command

At this point all commands are done on the MG9KEM-COAM (N240) server

5. Change the virtual IP address of the MG9KEM-COAM server
    a. Login as root
    b. Run the cli command
    c. Select option "Configure"
    d. Select option "IP Configuration"
    e. Select option "config_data"
    f. You will be prompted for the hostname and IP address to use. Enter the hostname of the MG9KEM-T1400 and IP address of the MG9KEM-T1400. Do NOT use the hostname and IP address of the MG9KMT-T1400 server.

6. Configure MG9K Server applications on master N240
    a. IM 24-0739 **(Need SN07 version)**; Procedure 8 – **EM Server Software Installation and Configuration**; Perform steps 8-10, 14-18.

7. Start MG9K server application
    a. IM 24-0739 **(Need SN07 version)**; Procedure 8 – **EM Server Software Installation and Configuration**; Perform steps 19-21.

8. Configure MG9K Midtier application on master N240

a. IM 24-0739 **(Need SN07 version)**; Procedure 9 – **Mid-Tier Software Installation and Configuration**; Perform steps 8-23.

9. Start MG9K Midtier application
    a. IM 24-0739 (Need SN07 version); Procedure 9 – Mid-Tier Software Installation **and Configuration**; Perform steps 8-23.
    b. NN10048-461; Procedure –Importing MG9000 Manager Data; Perform steps 1-4

10. Configure OM Collector
    a. Configure OM Collector. Follow the procedure to configure OM collector

11. Reboot the MG9K-COAM
    a. sync;sync;init 6

12. Test all MG9KEM/MT functions to ensure everything is operating correctly
    a. IM 24-0739 **(Need SN07 version)**; Section 4.13 – **Client Verification**; Perform procedure.

13. If there are problems at this point and a back-out is desired, execute the steps in the back-out procedure in the next section.

14. Clone Master N240 to Mate N240 (Approx 1 hour)
    IM 24-9082 **Perform steps 23-28**
    a. Copy MAC address into command into installed server
    b. Boot clone N240 from network with <ip address> of master
    c. Disk replication will occur
    d. Fred to provide new IM number and procedure number

15. Re-test all element Managers and equipment to ensure everything is operating correctly

16. Perform Failover Tests
    a. On master N240, issue “sync;sync;init 6”
    b. Check that the backup server takes over
    c.

17. Remove MG9KEM-T1400 and MG9KMT-T1400 physically from the network

149.7.4 Back-out procedure for MG9KEM and MG9KMT from N240 to T1400

4. Change the virtual IP address of the MG9KEM-COAM server
    a. Login as root
    b. Run the cli command
    c. Select option “Configure”
    d. Select option “IP Configuration”
    e. Select option “config_data”
    f. You will be prompted for the hostname and IP address to use. Enter the original hostname of the MG9KEM-COAM and original IP address of the MG9KEM-COAM. Leave the rest alone.
5. Take the MG9KEM-COAM server down by doing the following as the root user:
    a. **init 0**

6. Reboot the MG9KEM-T1400 server by issuing the following command from the console port of the MG9KEM-T1400 server: **boot**
    a. The system will come up at this point

7. Reboot the MG9KMT-T1400 server by issuing the following command from the console port of the MG9KMT-T1400 server: **boot**
    a. The system will come up at this point

149.9 Glossary

GTAC - Global Technical Assistance Center
SSPFS – Succession Server Platform Foundation Software

150: Corrective CAF, Functional Description (FN): A00004860

150.1 Title

SSPFSHA Cluster & Application Upgrade Procedures

150.2 Purpose

In Succession SN06.2 release, we have introduced two-node SSPFSHA cluster. As we moved to SN07, one of the direct requirements is to provide a SN06.2-SN07 cluster and application upgrade and migration strategy. Both SSPFS and SSPFS client applications have already done most preparatory work in SN06.2 in anticipation of this procedure.

150.3 Problem symptoms

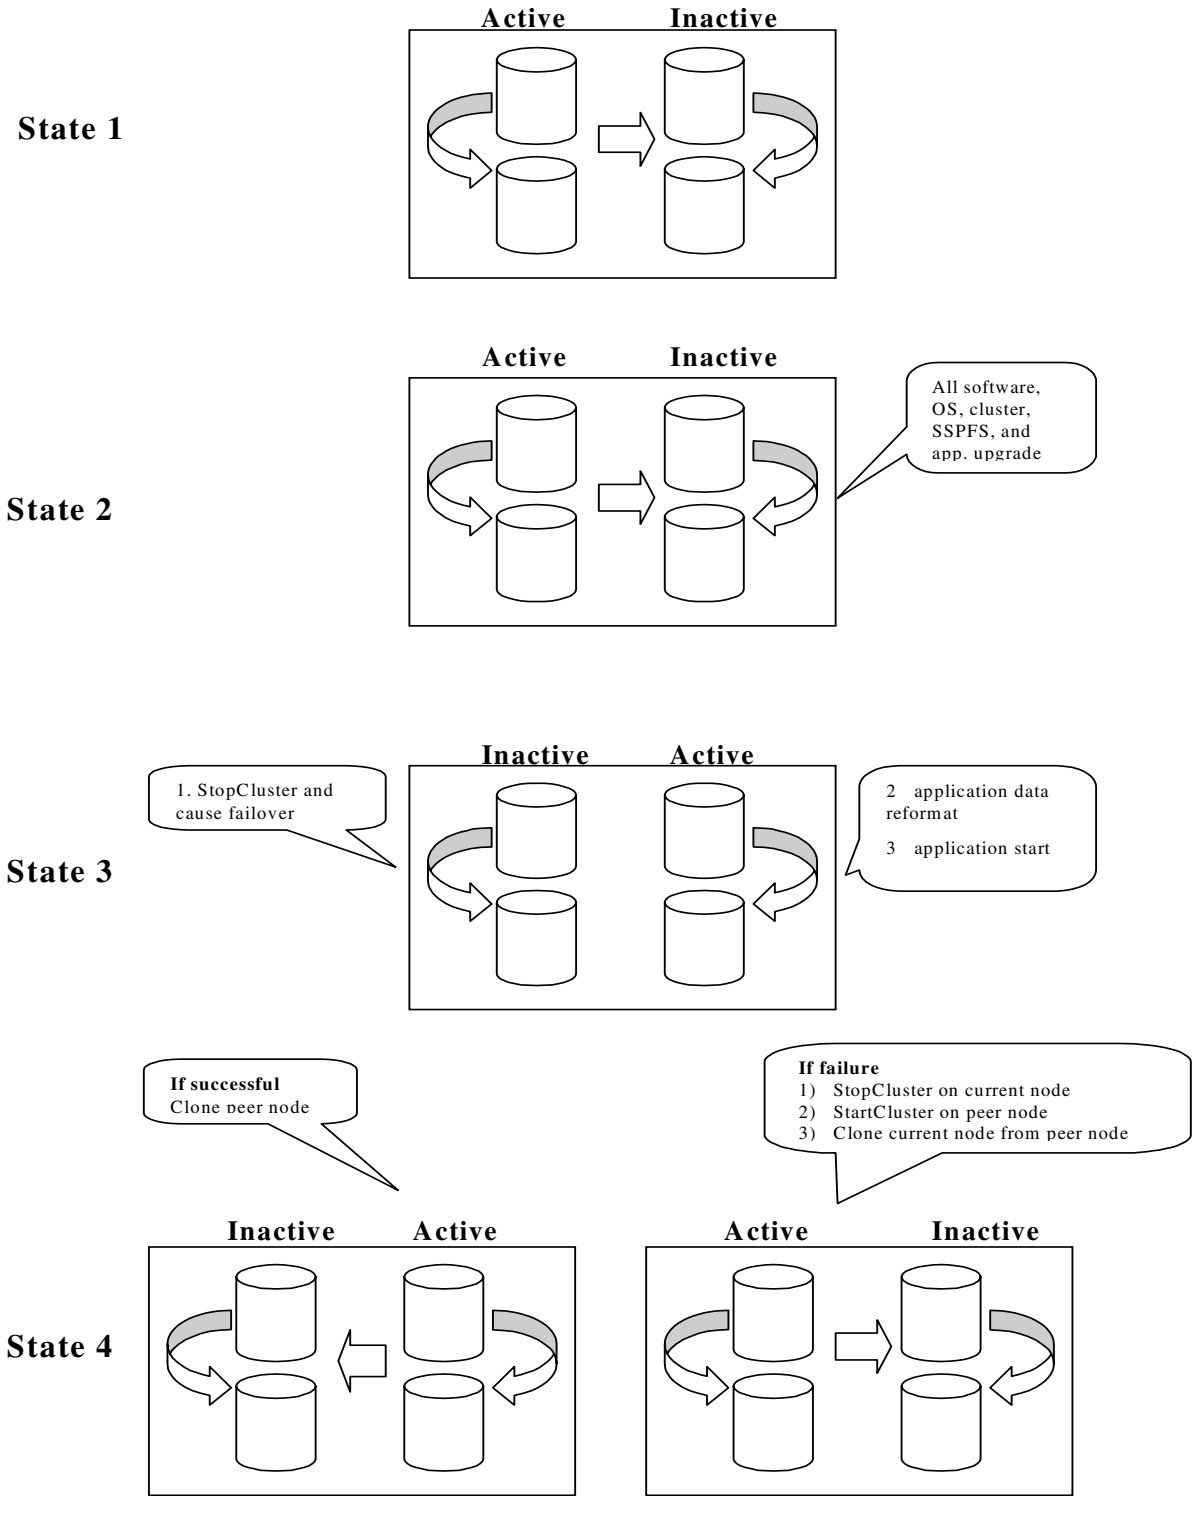
In SN07, none of the SSPFSHA clustered applications that have been running since SN06.2 have any explicit requirement on continuous network data replication between the cluster nodes during upgrade. Being able to quickly move back to previous SN06.2 running environment in case of upgrade failure is the only requirement.

150.4 Resolution

This procedure will concentrate on SSPFSHA SN06.2 cluster to SN07 cluster upgrade. There may be other issues relating to SSPFSHA simplex to cluster or dual-server profile configuration. They will be addressed separately.

For SSPFSHA Cluster SN06.2 to SN07 upgrade, we will separate the cluster in order to preserve the one of the cluster node in its previously, before-upgrade environment. If the upgrade is successful, a normal cloning procedure will create the secondary node and sync up the cluster. If the upgrade fails, we will quickly shutdown the newly upgraded node and restate the previous active cluster node.

Cluster upgrade takes place in four distinct stages:



State 1
Active
Inactive
State 2
Active
Inactive
All software, OS, cluster, SSPFS, and app. upgrade
State 3
Inactive
Active
1. StopCluster and cause failover
2 application data reformat
3 application start
If successful
Clone peer node
If failure
1) StopCluster on current node
2) StartCluster on peer node
3) Clone current node from peer node
State 4
Inactive
Active
Active
Inactive

Same upgrade procedure described in state tables:

	Active	*Inactive*
1		Upgrade software including OS, SSPFS middleware, upSuite, and OAM&P applications. See URLs below.
2	$StopCluster	
	Inactive	*Active*
3		Application reformat data Application start
4(successful)		$Clone
4(failure)		$StopCluster
	$StartCluster	
	$Clone	

Note: We will have a new command Clone, which when typed on the local machine, will go ahead and clone the peer node from the local machine image.

151: Design Description excerpts: A00004868

151.1 Feature name

FTP Proxy for SDM and DBM

151.2 Description

151.2.1 Purpose

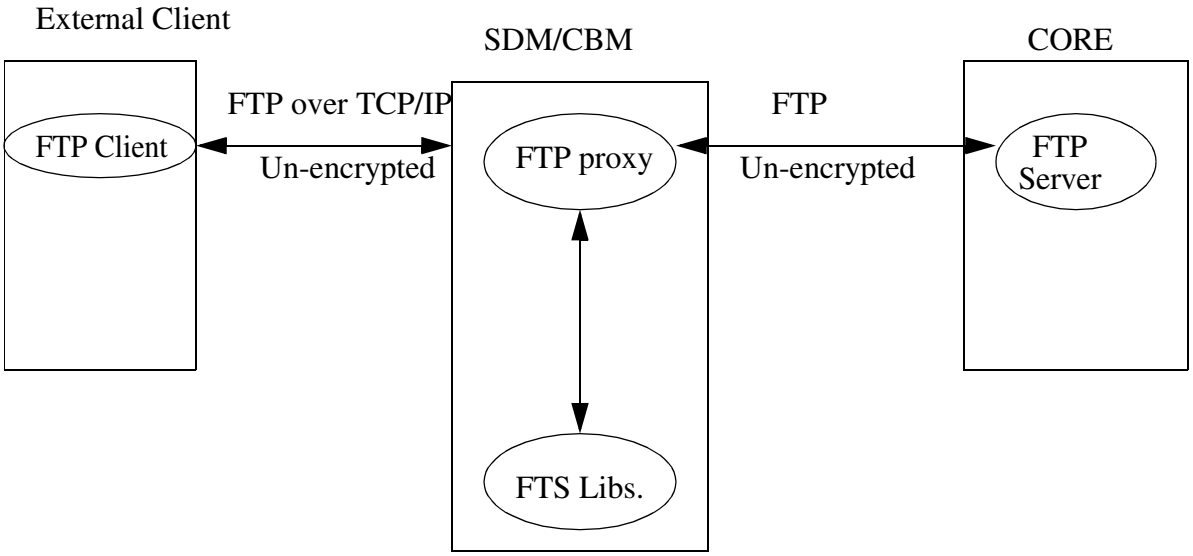
The purpose of this feature is to provide passthrough (file transfer) to the CM from the ftp client (downstream machine) via SDM/CBM in a Non-DCE environment.

FTPProxy will be used by an external ftp client for transferring files between client and CORE, client and SDM/CBM (In case of CORE it will be without the files ever residing on the SDM/CBM). Certain amount of security will be provided by giving the passthrough (file transfer) facility to the ftp users based on their unix groups. FTP Proxy will provide all of the facility provided by the current File transfer Service(SDM_BASE.fts) implementation on SDM19.

On SDM, SFT application provides the passthrough capability to the ftp users. So, the FTPProxy and SFT application will be mutually exclusive, at one point only either of them can reside on SDM. Whereas on CBM, SFT is not available, so the FTPProxy can reside independent of other CBM applications, but it will be mutually exclusive with SSPFS's ProFTPD service.

FTPProxy feature will be provided to the customer as an optional application on SDM and CBM. It will also include the functionalities such as creating ftp users dynamically and deleting them after the file transfer is over, and parallel sessions will also be supported.

Refer to the following figure for FTP functionality.



151.2.2 Logs

New customer logs will be generated to provide information regarding the file transfers between FTP Client and CORE, and who ftp-users are logged on to CORE.

151.2.2.1 Log format for file transfers

```
Feb 16 02:24:52 sspfs_server ftpd[20103]: SDM739 NONE
INFO FTS ftp-user request for file PML successful
```

151.2.2.2 Log format for login information

```
Feb 16 02:24:40 sspfs_server ftpd[20103]: SDM739 NONE
INFO FTS ftp-user hari logged on to CORE
successfully.
```

152: Functional Description (FN): A00004872

152.1 Feature name

SN07 Services Support for the Universal Access-Internet Protocol (UA-IP) Solution

152.2 Description

This SN07 activity provides support in both the North American and International markets for the following services:

- Automatic Call Distribution Observe (ACD OBS): allows an ACD supervisor to monitor the quality of service offered to callers. As an option, an observe warning tone may be provided to the agent prior to the observation. The tone is heard when the observation is invoked and at the start of each new call while an observation is in effect. This tone is heard by the ACD agent and not the caller.

  There are various types of observe:

  a. Basic - Basic observe allows the supervisor to monitor an agent within its group that is involved in an active call. To activate OBS, a supervisor presses the OBS key and enters the INCALLS DN of the agent to be monitored. The supervisor is provided with a one way listen path into a call between an ACD agent and caller. A two way speech path can be achieved by pressing the CAG key.

  b. Extended - Extended Observe enhances the observe functionality to allow a supervisor to observe any agent that has an INCALLS key in any ACD group within the same customer group.

  c. Enhanced - When the ACD observe agent enhanced feature is in effect, the supervisor can observe the INCALLS key and a datafilled SDN using the AGENT key. Once the supervisor enters the observe mode, pressing the AGENT key after dial tone is received allows the supervisor to switch back and forth between observing the INCALLS key and the SDN as the agent switches between talking on the two keys.

  d. Flexible Call Observing (FOBS) - FOBS enhances the current ACD feature by providing an ACD OBS means for ACD supervisors to begin monitoring service given to a call before an agent has answered the call. The basic OBS feature imposes the restriction that a call must be in the talking state in order for OBS to be used. FOBS allows observation of a call to begin from the time it is first queued in the ACD system. This gives the supervisor an opportunity to gain knowledge of the overall handling of the incoming call. The supervisor continues to

monitor the call if it is rerouted under enhanced overflow or NACD, if it is presented to an agent, and if the agent answers the call. Activation of FOBS instigates the monitoring of the next call to the ACD group, ACD subgroup or ACDDN. Monitoring ceases when the caller disconnects, or if the call is routed outside the ACD environment

NOTE: ASL functionality cannot be supported at this time. Although the provisioning of this functionality is not restricted, the behavior is not supported in solutions using an audio server. Solutions using an MTM to provide this observe conferencing should work with ASL. Furthermore, OBS and 3WC interactions are supported using the AMS for conferencing, but it is not supported on the UAS due to protocol restrictions on the UAS.

- Automatic Call Distribution Emergency Key, Emergency Key Backup (ACD EMK)- The EMK feature enables an ACD agent to immediately conference in a supervisor and/or an auxiliary device in the event of threatening or abusive calls. When the EMK key is pressed, the lamp flashes on the agent set if the supervisor is available. The supervisor set rings and the Answer Emergency Key (AEMK) lamp flashes. When the supervisor answers the AEMK key the supervisor is conferenced into the call. The EMK and AEMK lamps are steadily lit. If the call is not answered by the supervisor within 30 seconds the feature is taken down. The EMK key can only be activated while the agent is active on an ACD call. The agent who initiates the emergency call must remain on the call for the duration of the feature. Emergency Key Backup provides a method for redirecting EMK calls made from an ACD agent position to a supervisor set AEMK key when the supervisor set is already active on an AEMK call, or the supervisor set is unavailable (i.e. supervisor does not answer the EMK call.) Redirection is accomplished by placing ACD supervisor AEMK (Answer Emergency) DNs in a hunt group via tables HUNTGRP and HUNTMEM.
- Camp-on for MDC lines (MBSCAMP) - this feature allows a MBS set to “camp-on” to a busy group member. When the MBSCAMP subscriber receives a call and attempts to transfer to another member of the customer group, if that line is busy so that the call would normally receive busy treatment, the MBSCAMP feature provides a call-waiting type indication to the busy line and camps onto the busy line. The MBSCAMP line is provided ringback or audio as an indication of the camping.
- Music on Hold (LMOH, KSMOH, pre-recorded music announcement on hold for ACD) - this feature provides an audio source to a line placed on hold by a line with this option (either on the line or the customer group).
- Executive Busy Override/Executive Busy Override Exempt (EBO/EBX) - the EBO feature allows a member of a customer group to override a busy indication from a called line in the group and connect into the call in progress. The EBO line can be connected as a third party or can either flash

(on an IBN set) or press an EBO key again (on an MBS set) to drop the extra party and only be connected to the called party. Just prior to connecting the EBO party into the call, an EBO warning tone is provided to both parties of the current call. The EBX feature prevents a line with EBO from barging into a call. That is, when a subscriber with EBO attempts to override a call to another subscriber with EBX, the EBO feature is denied.

- Directed Call pick-up Barge In (DCBI) - this feature allows a member of a customer group to pickup an incoming call to a member of a customer group and also allows the member to barge-in to that call if it is answered prior to the completion of the pickup attempt. In that case, the DCBI line is connected as a third party to the call, and prior to the connection, an optional DCBITONE barge-in indication tone is provided to both parties of the initial call.

This activity requires mapping of EBO tone for the EBO, DCBI, and ACD OBS services. MBSCAMP actually sends an EBS opcode to physically buzz a pset and therefore does not send an actual tone signal.

These services should have the same basic functionality in Succession as in the Legacy environment, but it must be noted that in Succession the tones associated with the services are supplied by another device and therefore are a product of those elements.The following table describes the signals and associated GW tone mapping for these tones. For this activity, the tones are only required for the H.248 protocol although they are mapped to existing supported tones in other protocols in order to provide some sort of tone if ever required.

Table 1 Tones for services

Tone service	Tone is provided by	H.248 signal sent	GW signal and market supported with typical tone characteristics
EBO, DCBI	conferencing source (MTM or UAS/AMS)	(int/int) if package supported otherwise (cg/wt)	The UAS and AMS support cg/wt in North America and international packages. This is typically defined as a single 1400 hz tone for most markets but this is dependant upon the physical tone characteristics actually downloaded to the device.
ACD OBS	lines GW for packet agent; MTM for legacy agent	(int/int) if package supported otherwise (cg/wt)	MG9K North American V1 toneset supports int/int as 3 100msec on/100 msec off bursts of 440 hz at -13 db. CICM international int/int tone supported with same tone characteristics as above.

152.3 Hardware Requirements or Dependencies

No new hardware is introduced by these services. However, as noted above, in Succession the tones required for these services are requested of a gateway (GW), either a network audio server (i.e. Universal Audio Server (UAS) or Audiocodes Media Server (AMS)) or a local GW.

Note there is a limitation with respect to the UAS. See the limitations section for more information.

For hybrid testing, the MTM tone circuit is required along with table STN datafill for cases where EBO tone is played into an MTM conference or to a legacy ACD agent.

152.4 Software Requirements or Dependencies

The SN07 software loads are required of the Succession elements.

152.5 Limitations and restrictions

These services function in Succession as they do in Legacy; that is, any limitations existing in Legacy also exist in Succession. An exception is that ASL functionality cannot be supported at this time. Although the provisioning of this function is not restricted, the behavior is not supported in solutions using an audio server. Solutions using an MTM to provide this observe conferencing should work with ASL.

The UAS does not support some of the signalling used for the ACD OBS interactions with 3WC (a null events descriptor in the H.248 protocol). Therefore this interaction is not supported with the UAS. This functionality is supported on the AMS.

Tones for these services are dependant upon the GWs used. EBO and DCBI services play tones to a conference; therefore EBO tone is played by the conference server. For MTM based conferences, the table STN EBOT tone datafill is used to select the MTM for the tone (tone card is required); for the audio servers, the tone is provided by the audio server. For ACD, the tone is played to the agent; therefore for legacy agents the tone is provided by the MTM and for packet agents it is provided by the GW. Therefore the tones can differ based on legacy or succession and type of GW.

For Music On Hold, the music is a pre-recorded music announcement.

152.6 Interactions

There are no new interactions with these services in SN07.

153: Functional Description (FN): A00004873

153.1 Feature name and Feature ID

A00004873 - MS2000 CLUI Enhancements

153.2 Description

In SN06.2, the MS2000 (Media Server 2000) Series Node CLUI was introduced to configure the MS2010 device. The CLUI is delivered to the customer as part of the SESM load that is bundled as part of the CS2M load. The tool requires that the SESM server is in service.

The tool is launched with the command:
/opt/nortel/NTsesm/bin/ms2000.sh

The existing MS2000 Series Node CLUI will be enhanced in SN07 to handle configuration for the MS2020 ATM device. The tool will handle both SN06.2 MS2010 nodes as well as SN07 MS2010 and MS2020 nodes.

The following new functionality will be added to the MS2000 CLUI for SN07:

1) Ability to configure MS2020 device

2) Force Lock of a Device

3) Ability to change the SNMP Community Strings

4) Ability to change the MS2000 web interface user name and password.

5) Ability to configure the NTP (Network Time Protocol) settings for the MS2000 device.

6) Ability to set up trusted managers and trap destinations for MS2010 and MS2020 SN07 devices.

7) Ability to change the file transfer (web server) password on an SN07 MS2000 node from the CLUI.

153.2.1 MS2000 Main Menu

The layout of the menus has changed from SN06.2. The main menu that the tool launches into contains items that pertain to all MS2000 nodes. It allows the user to set up the automated ini file backup. Copy files to the SDM/CBM and list the MS2000 nodes datafilled in the SESM database (must be associated with GWCs).

```
wnc0s0jm:/var/tmp/ptm> /opt/nortel/NTsesm/bin/ms2000.sh
*********************************************************
**  Nortel Media Server 2000 Series Configuration Tool  **
**                    version 2.02                     **
*********************************************************
Enter user name > ptm
Enter password  >
ORBWrapper orb initialized

***** Media Server 2000 Series CLUI Main Menu *****
1) Display list of MS 2000 series nodes
2) Node Maintenance and Configuration
3) Backup INI file for all nodes
4) Copy a file to the SDM/CBM
5) Configure Automated INI file backup
x) EXIT CLUI
Enter Selection (1 - 5, x)
>
```

153.2.2 MS2010 SN06.2 Configuration

From here the “Node Maintenance and Configuration” can be launched for a specific node.The changes to that menu are outlined below.

153.2.2.1 MS2010 with a SN06.2 load

The SN06.2 load operates a little differently than the SN07 versions. In SN06.2

- the trap destination is setup in the general configuration
- the file download password can be set for the tool but CANNOT be changed on the MS2000 node.

Below is a look at the SN06.2 MS2010 maintenance and configuration menu. The maintenance menu is identical to the one used for an SN07 device.

```
***** Media Server 2000 Series CLUI Main Menu *****
1) Display list of MS 2000 series nodes
2) Node Maintenance and Configuration
3) Backup INI file for all nodes
4) Copy a file to the SDM/CBM
5) Configure Automated INI file backup
x) EXIT CLUI
Enter Selection (1 - 5, x)
> 2

Return to access this node or enter another IP address
>47.142.92.104

*** Main Menu for MS2010 at 47.142.92.104 ***
1) Maintenance Menu
```

```
2) Configuration Menu
x) EXIT
Enter Selection (1 - 2, x)
> 1

*** Maintenance Menu for MS2010 at 47.142.92.104 ***
1) Download load files to this node
2) Backup the INI file for this node
3) Perform a soft reset on this node
4) Lock or Unlock this node
x) EXIT
Enter Selection (1 - 4, x)
> x
```

Below is the configuration menu which does have different selections from the SN07 nodes.

```
***** Main Configuration Menu for MS2010 at 47.142.92.104 *****
1) Display this nodes current configuration
2) General node configuration
3) Change File Upload and Download user and password
x) EXIT
Enter Selection (1 - 2, x)
>
```

153.2.2.1.1 MS2010 SN06.2 File Download password

In SN06.2, the File transfer username and password was setup once and was used for every node. This made the assumption that each node would be setup with the same username and password. In SN07 the username and password is setup on a per node basis. The menu selection below allows for the SN06.2 functionality to remain the same when configuring an SN06.2 MS2010 node. A note is displayed to explain the functionality.

```
***** Main Configuration Menu for MS2010 at 47.142.92.104 *****
1) Display this nodes current configuration
2) General node configuration
3) Change File Upload and Download user and password
x) EXIT
Enter Selection (1 - 2, x)
> 3

This menu selection will allow you to setup the file transfer username and password
for ALL SN06.2 MS2010 nodes. The CLUI will allow you to setup the SN06.2 username
and password in two ways. First, you can setup the CLUI to use the factory default
username and password for all of the SN06.2 MS2010 nodes or second, you can specify
a different username and password for the tool to use when communicating with
SN06.2
MS2010 devices.

This menu selection will NOT actually change the username and password on the node.
In order to change the username and password on an MS2010 SN06.2 node, the MS2010
web interface must be used.

Would you like to change the file transfer username and password that the CLUI uses
when communicating with all SN06.2 MS2010 nodes? (y/n)
```

```
>
```

153.2.3 MS2010 and MS2020 SN07 Configuration

The MS2010 and MS2020 share some common behavior for SN07.

153.2.3.1 Forced Lock Menu change

Below is an example of logging into the device issuing a force lock command.

```
***** Media Server 2000 Series CLUI Main Menu *****
1) Display list of MS 2000 series nodes
2) Node Maintenance and Configuration
3) Backup INI file for all nodes

to the SDM/CBM now? (y/n)
> y
File copied to the SDM successfully.
Press <enter> to continue
```

153.2.3.3 Setting SNMP Community String

SNMP has a password type of security for versions v1 and v2 called the Community String. The CLUI allows you to change the Community String that will be used by the box when communicating via SNMP. This will actually change the Community String on the MS2000 node and then the CLUI will store that password for later use. Any other device that must communicate via SNMP with the MS2000 node will also need to change the community string it uses.

```

                          *** WARNING ***
This password will be written to the MS2020 and is the only password
that can be used for either reading from or writing to the node via
SNMP. If there are other managers that must communicate to this MS2020
node then you will need to go to that manager and reconfigure the
community strings it uses to communicate with this MS2020 node. The
password you are entering here will be used for both the read and write SNMP
community strings.

Press <enter> to continue

Enter the SNMP password for the CLUI to use when communicating with
the 47.142.92.107 MS2020 node. Return to exit.

>
Re-enter the Password
>
Save the SNMP password change? (y/n)
> y
```

153.2.3.4 Configuring Trusted SNMP Managers

The definition of a Trusted Manger is defined below in the CLUI help text. An example of adding a trusted manager is defined. Of special note is the proplem that can be created when someone adds the first trusted manager and it is not the IP address of the CLUI. This can cause the MS2000 node to stop responding to the CLUI. A special warning is put into the CLUI to help warn of this problem.

```
*** SNMP Configuration and Password Management Menu for MS2020 at 47.142.92.107

2) Add a trusted manager
3) Delete a trusted manager
```

```
?) Help
x) EXIT
Enter Selection (1 - 3, ?, x)
> ?

A trusted manager is an Element Manager (EM) from which the MS2020
accepts SNMP requests. By default, if there are no trusted managers
defined then the MS2020 accepts requests from any manager that provides
a valid community string. Up to 5 trusted managers can be placed in
the table. After adding a trusted manager, a soft reset will need to
be issued.
                        *** WARNING ***
Once a single trusted manager is configured, requests from any IP
address not in the trusted managers table will be rejected. Since
the MS2000 CLUI acts as the EM for the MS2000 devices, it should be
entered into the table BEFORE adding any other entries. The IP address
entered for the CLUI should be the IP address of the server that the
MS2000 CLUI is running on.

as this trusted manager is added to the node, the node will ONLY accept SNMP
requests from the 1.1.1.1 address. Other trusted managers can be added from the
CLUI (up to 5) but in order to add more trusted managers, the CLUI server's IP
address must be the first trusted manager in the table in order to communicate
with the node.

The CLUI sees the server IP address as 47.142.94.81 and if this is correct
then if you proceed with adding the 1.1.1.1 address as the first trusted manager,
the CLUI will NO LONGER BE ABLE TO COMMUNICATE WITH THE DEVICE!
```

```
It is STRONGLY recommended that you NOT proceed with adding 1.1.1.1 as
the first trusted manager until you are positive that it is the IP address that
the MS2020 will recognize as the CLUI.

Continue with add of trusted manager? (y/n)

List of Trusted Managers
========================
  IP = 47.142.94.81

Press <enter> to continue
```

NOTE : At this point the ONLY way that the MS2000 node configured above will responde to an SNMP request is if it comes from the IP address configured

in the Trusted Managers list (in our case it is 47.142.94.81) AND it provides the correct community string.

NOTE: If the situation arises where the CLUI cannot communicate with the node because a trusted manager is defined and it is NOT the IP address of the CLUI then the MS2000 node will need to reboot via bootp and loaded with an INI file that clears out the trusted managers.

153.2.3.5 SNMP Trap Destinations

The trap destinations menu will allow the customer to configure up to 5 trap destinations. This will allow for multiple logging locations for traps generated by the box.

154: Functional description (FN): A00004922

154.1 Feature name

A00004922 DMS-250 N449 PRI Enhancements - GWC

A00004923 DMS-250 N449 PRI Enhancements - SPM

154.2 Synopsis

This FN documents the functionalities provided by features A00004922 (DMS-250 N449 PRI Enhancements - GWC) and A00004923 (DMS-250 N449 PRI Enhancements - SPM) in Succession environment.

A00004922 covers the functionalities required to support the following N449 Primary Rate Interface (PRI) enhancements:

- Support of CodeSet 0 (CS0) parameterized Network Specific Facilities Information Element (NSF IE) with Out-Of-Band (OOB) data in Facility message.
- Support of CS6 Facility IE, Billing IE, and Item IE in Facility message.
- Support of CS0 and CS7 User-to-User Information (UUI) if present in PRI Disconnect message.

A00004923 covers the functionalities required to support the following N449 PRI enhancements:

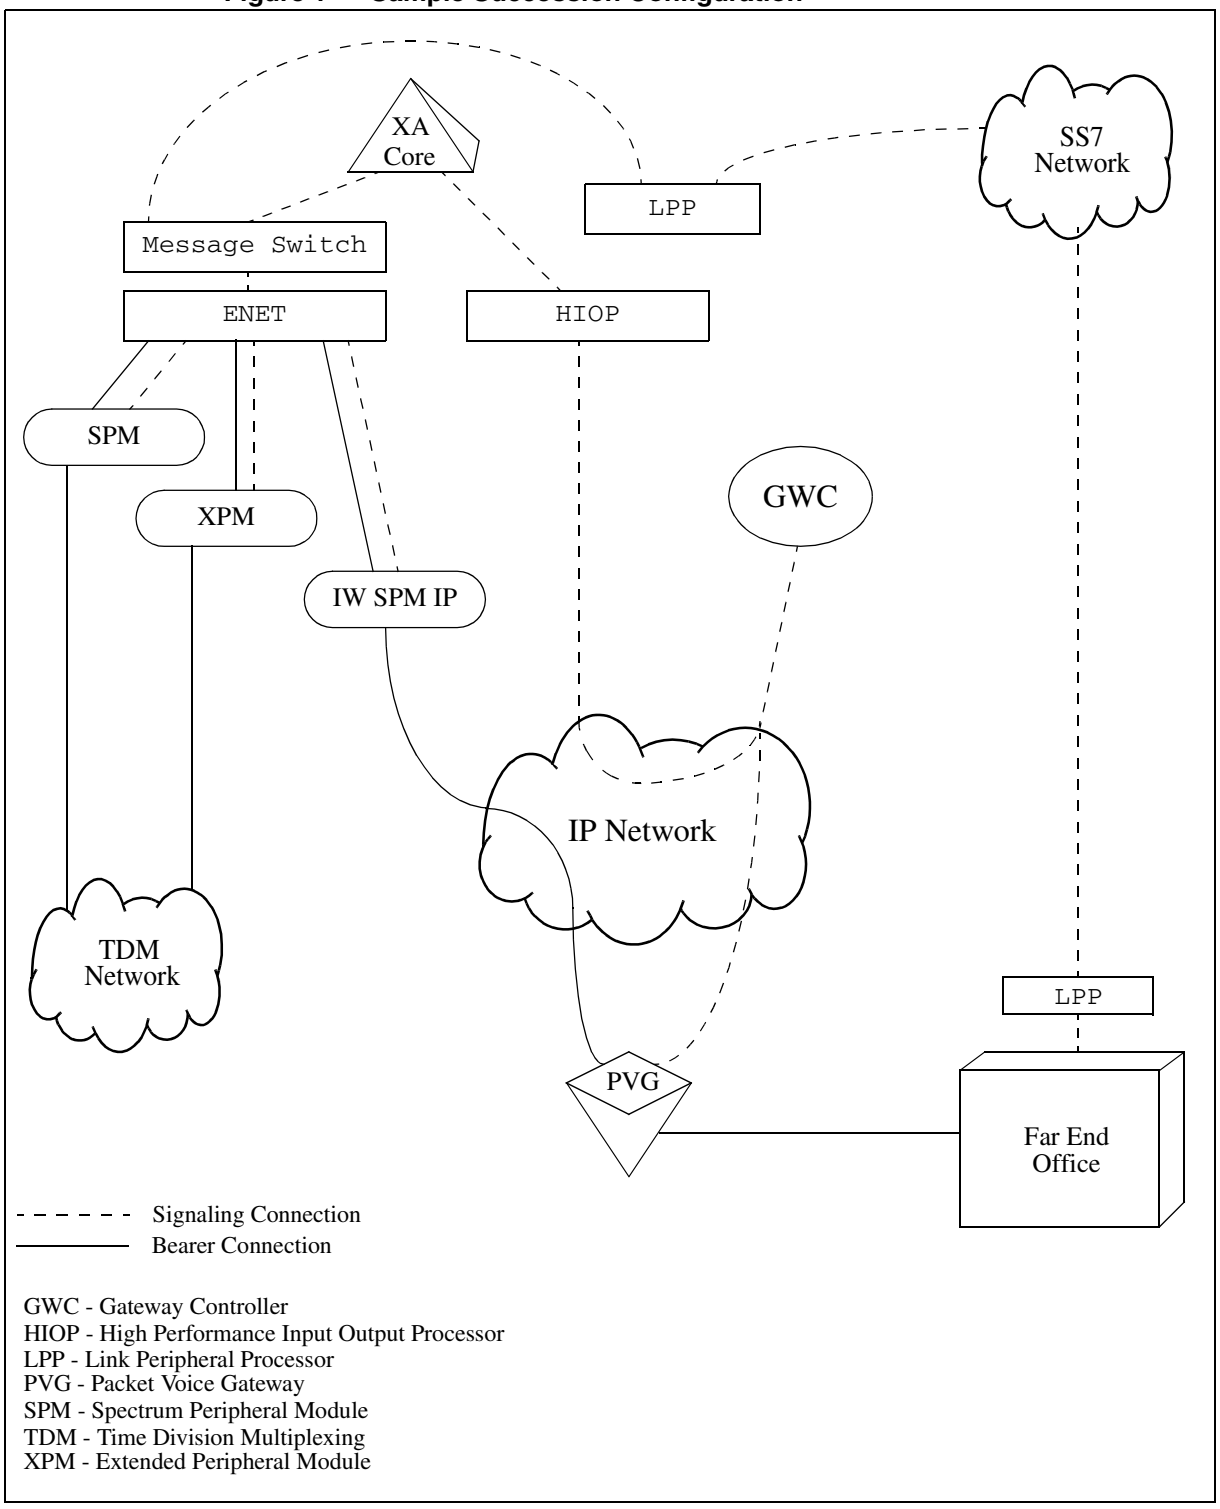
- Support of CS0 parameterized NSF IE with OOB data in SETUP and Facility messages.
- Support of CS6 Facility IE in Facility message.

154.3 Background

A brief description of Succession environment and its components is presented in this section as the background information.

Figure 1 - Sample Succession Configuration on page 23, shows a switch that is capable of Time Division Multiplexing (TDM) as well as Succession environment.

Figure 1 - Sample Succession Configuration



A description of the IP components are presented in “Table 1 - IP Components” on page 1855:

Table 1 - IP Components

IP Component	Explanation
XA-Core	Performs the call processing functions for a TDM and/or IP based solution. Also known as the computing module (CM).
Gateway Controller	Functions as the interface between the XA-Core and gateways such as the PVG. The GWC handles signaling from the core that was previously handled by the TDM SPM/XPM. Examples of this include Integrated Services Digital Network User Part (ISUP) and PRI. To communicate with gateways; the GWC also supports protocols such as ASPEN, ISDN User Adaptation Protocol (IUAP), and H.248.
Interworking SPM IP	Provides trunking capability from a TDM network to the IP network. TDM voice flows in the IW SPM IP from the ENET and is sent to the PVG in the form of IP packets. The reverse function is also performed. It is important to note that trunks do not hang off the IW SPM IP as they do with TDM SPMs.
Packet Voice Gateway	Functions as a gateway to the network for the bearer (i.e. speech) path. Bearer voice over IP packets are received from peripherals such as the IW SPM IP and sent to the outside network in the form of IP packets or TDM voice.
Link Peripheral Processor	This SS7 entity is the switch’s link to the SS7 network. It functions in the IP world exactly as it does in the TDM world. In a TDM environment, the SPM/XPM sends an ISUP Initial Address Message (IAM) to the destination switch by bouncing the IAM through the core to the LPP to the SS7 Network. In an IP environment, the GWC sends an ISUP IAM to the destination switch in exactly the same way.
High Performance Input Output Processor	Provides the XA-Core a 100 Base ethernet access to the IP network. This allows communication between the core and the gateway controller.

154.4 Feature Description

154.4.1 A00004922 DMS-250 N449 PRI Enhancements - GWC

The functionalities provided by GWC for N449 PRI are documented in the following subsections.

154.4.1.1 Support of CS0 Parameterized NSF IE with OOB data in Facility Message

This feature supports three new NSF service identifiers in CS0 for the N449 PRI. The service identifier is sent in the Service Parameter field of the NSF IE in a Facility message. The new service identifiers are:

- OOB triggers and data allowed (0001100)
- Only OOB triggers allowed (0001101)
- Network Managed Data (NMD) (0001110)

The GWC supports the receipt of the following parameterized values in a Facility message.

Table 2 - Parameterized Network Specific Facilities Information Element.

Octet	Values
Octet 1	00100000 (NSF IE identifier)
Octet 2	Length of NSF IE
Octet 3:	00000000 (Length of network identification)
Octet 4: Bit 8	**0 (Parameterized)**
Octet 4: Bit 7	1 (Extension)
Octet 4: Bit 6	**0 (Feature)**
Octet 4: Bit 5-1	01001 (Available Feature Indicator)
Octet 5: Bit 8	0 (Spare)
Octet 5:Bits 7-1	Service Parameter Field
	0001100 OOB Triggers Allowed - Data Allowed **0001101 OOB Triggers allowed - Data Not Allowed** **0001110 Network Managed Data (NMD)**

154.4.1.2 Support of CS6 Facility IE in Facility Message

This feature supports a CS6 Facility IE length of up to 200 octets in an N449 PRI Facility message. A sample format of CS6 Facility IE supported is shown below. The highlighted operation values are the new values supported.

Table 3 - Parameterized Network CS6 Facility IE

Octet	Values
Octet 1	Service Discriminator = 10001
Octet 2	Component Type Tag = 10100001 (Invoke)

Octet	Values
Octet 3:	Component Length
Octet 4: Bit 8	Invoke ID Tag = 00000010 (Invoke ID tag)
Octet 4: Bit 7	Invoke ID Length
Octet 4: Bit 6	Invoke ID
Octet 4: Bit 5-1	Operation Value Tag = 00000010 (Operation Value Tag)
Octet 5: Bit 8	Operation Value Length
Octet 5:Bits 7-1	**Operation Value**
	11001110 (Redirect Call)
	11001111 (Put Calling Party on Hold)
	11010000 (Retrieve Calling Party From Hold)
	11010001 (Drop TP)
	11010011 (User Data Transfer)
	11001100 (Billing Operation)
	11010010 (Application Specific Call Status)
	10001111 (Request Feature)
	Q.931 IE tag = 01000000

154.4.1.3 Support of CS6 Billing IE, and Item IE in Facility Message

This feature provides the capability to receive and transmit an N449 PRI Facility message containing CS6 Billing Service Data IE, and/or CS6 Item IE.

The Billing Service Data IE can be received in a Facility message on a call after a Call Proceeding message has been received or sent.

The content of the Billing Service Data IE is presented in “Table 4 - Billing Service Data Information Element” on page 1857. Up to 100 octets of billing service data is supported. The Billing Service Data IE may appear in a Facility message as long as the total number of octets within the message does not exceed the maximum.

Table 4 - Billing Service Data Information Element

Octet	Values
Octet 1	01011000 (Billing Service Data IE identifier)
Octet 2	Length of Billing Service Data IE
Octet 3: Bit 8	1 (Extension)
Octet 3: Bits 7-5	000 (spare)

Octet	Values
Octet 3: Bits 4-1	Type of Billing Service Data 0011 Append To Record: Non-Mutilated Data 0100 Append To Record: Mutilated Data
Octet 4 - 103	Billing Service Data

The content of the Item IE is presented in “Table 5 - Item Information Element” on page 1858.

Table 5 - Item Information Element

Octet	Values
Octet 1:bit 8	0 Set value
Octet 1:bits 7-1	1001101 (Item IE Identifier)
Octet 2	Length of Item IE
Octet 3: Bit 8	1 (Extension)
Octet 3:Bits 7-1	Item 0100001 Billing Closure 0101001 Send Close Message

154.4.1.4 Support of CS0 and CS7 UUI IE

This feature provides the capability to receive and transmit CS0 and/or CS7 UUI IE if present in an N449 PRI Disconnect message.

The content of UUI IE is presented in “Table 6 - User-to-User Information Element” on page 1858.

Table 6 - User-to-User Information Element

Octet	Values
Octet 1:bit 8	0 Set value
Octet 1:bits 7-1	1111110 (UUI IE Identifier)
Octet 2	Length of UUI IE
Octet 3+	User Information (See notes)

Notes: The contents of user information are structured according to the user application.

154.4.2 A00004923 DMS-250 N449 PRI Enhancements - SPM

The functionalities provided by SPM for N449 PRI are documented in the following subsections.

154.4.2.1 Support of CS0 Parameterized NSF IE with OOB data in SETUP and Facility Message

This feature supports three new NSF service identifiers in CS0. The service identifier is sent in the Service Parameter field of the NSF IE in a SETUP and Facility message.

Refer to “154.4.1.1 Support of CS0 Parameterized NSF IE with OOB data in Facility Message” on page 1856 for more information.

154.4.2.2 Support of CS6 Facility IE in Facility Message

This feature supports a CS6 Facility IE length of up to 200 bytes in a Facility message.

Refer to “154.4.1.2 Support of CS6 Facility IE in Facility Message” on page 1856 for more information.

155.8 Glossary

Term	Description
New term	Definition

156: Functional Description (FN): A00005007

156.1 Feature name

Cause Indicators parameter support for DTAG AMA Enhancement.

156.2 Description

This feature addresses the specific requirements defined by Deutsche Telekom AG (DTAG) for reporting the cause indicator parameter in the AMA records for an Avst (International Gateway Switch).

This feature is in continuation with feature A00003007 AMA Enhancements for DTAG International Gateway.

156.2.1 Functional Overview.

The DTAG specifications states that the cause indicator of the release message be captured in AMA records.

This feature captures the Cause Indicator for ETSI ISUP to ETSI ISUP non-INAP tandem call for the following scenarios.

- GWC sends a Clear Forward Message.
- GWC sends a Clear Back Message.
- GWC reports the Release message to the CM.

In a Tandem (or Gateway) switch, for most of the cases, the release message is bounced on the GWC and not sent to the CM. Upon receiving a release message, the GWC sends a CLEAR_FORWARD or CLEAR_BACKWARD message to the CM to tear down the call.

This feature introduces a mechanism to transport CI parameter from GWC to CM in CLEAR_FORWARD or CLEAR_BACKWARD message. Figure2 explains the mechanism.

A new office parameter REPORT_ISUP_CI_TO_CM will be created in table OFCENG, which will govern the functionality.

- If the office-parameter is set to ‘Y’, functionality is enabled
- If the office-parameter is set to ‘N’, functionality is disabled.

Figure 1 Example datafill of REPORT_ISUP_CI_TO_CM

```
Table OFCENG
REPORT_ISUP_CI_TO_CM    N
```

The Extraction of Cause Indicator will be fully invoked if

- The Office Parameter CAPTURE_TMR_ST_CI of TABLE AMAOPTS is ON.
- The Office Parameter REPORT_ISUP_CI_TO_CM of TABLE OFCENG is set to YES.

While data filling CAPTURE_TMR_ST_CI in table AMAOPTS, this feature introduces additional **warning** to data fill REPORT_ISUP_CI_TO_CM to YES to ensure complete functionality.

Figure 2 Warning while data filling CAPTURE_TMR_ST_CI.

```

157: Functional Description (FN): A00005016

157.1 Feature name and Feature ID

A00005016: VMG Out of Service Alarms

157.2 Description

This document provides the functional description for support of additional VMG alarms on the MG 9000 and Media Gateway 9000 Manager.

In SN06.2, there is only one alarm that is raised if a VMG has been provisioned that is in an Out of Service state. Unfortunately, the state of VMG Out of Service is symptomatic of many problems that could be occurring:

missed steps in LCI commissioning

bad IP address input during VMG provisioning

mismatch provisioning between MG 9000 Mgr and the core during ABI provisioning

network router issues

ITP/ABI is locked or disabled

GWC locked

card is still initializing

This feature addresses the problem that resolution of a single VMG OOSV alarm is too complex, especially at VMG provisioning time. Instead of the single fault raised in SN06.2 - VMG300 - VMG OOS, there will instead be a number of faults, each describing a different root cause for why the MG9K is not in service. Raising different alarms helps the user to narrow their resolution /debugging efforts to what is specifically broken.

In addition, because these different alarm reasons are logged, there will now be extra information in the logs when the VMG goes out of service as to why it did so (manually set to out of service vs. GWC unreachable vs. GWC not responding).

As a result of this feature, when a VMG goes out of service, the Alarm Browser will show the VMG300 alarm only in very unusual circumstances - instead, one or more of the following faults will be raised:

rootTermStatusChange (1), -- generic reason

vMGAdminStatusOutOfService (2), - VMG was administratively set to out of service

cardLocked (3), -- card is locked
cardDisabled (4), -- card is disabled
cardInitializing (5), -- card is initializing
lineMtceOnPairNotReady (8), -- Line maintenance is not ready
megacoMtceOnPairNotReady (8), -- Megaco maintenance is not ready
gWCUnreachable (53), -- pings to reach GWC failed
noGWCReply (54), -- GWC didn't reply to ServiceChange
aal1BearerSubsystemOnPairNotReady (56),
ipBearerSubsystemOnPairNotReady (57),

All faults are cleared when a VMG goes to an In Service state.

While the VMG300 alarm was always critical in SN06.2, the following faults will be raised at a severity level of warning instead of critical to indicate that there was a (likely) user-initiated reason the VMG is out of service:

Initializing - this fault will be raised during the initial period after an ITP/ABI card pair has been restarted or when the ITP/ABI is waiting for an initial registration response from the GWC, after which the VMG will either be in service (all faults cleared) or a different alarm will be raised

Card Locked - if the active ITP or ABI has been locked

VMG Admin Status Out Of Service - if the VMG has been set to out of service in the Gateway Status Config tab of the Switched Lines Services GUI

All of the other faults will have a severity of critical.

The Switched Lines Services GUI will show what VMG alarms are currently raised against the VMG in a new field in the GW Status Config screen.

More information on the purpose and clearing procedures of the new faults is in the Fault Management section of this DDOC.

VMG	Virtual Media Gateway

158: Functional Description (FN): A00005073

158.1 Feature name

SBA Outbound Connection Security

158.2 Description

This feature provides optional secure outbound file transfer using OpenSSH sftp client. The sftp client protects all data including sensitive user s' password by encrypting the data before it leaves SDM/CBM and decrypting the data after it arrives the downstream OSS. The sftp also provides data integrity check to ensure that no one has tampered the data during the transfer.

The SBA user can configure the secure file transfer by adding or changing an existing schedule tuple in billmtc. For SN07, the user has to manually accept the downstream host key for each destintation before configuring secure outbound file transfer to the destintation. The actual configuration details are documented in the configuration section.

This feature also enhances SBA password protection scheme by using SDM/CBM private data manager (documented in A00005074) to store all the passwords for OSS access. The private data manager is responsible for storing the data in an encrypted form.

158.3 Hardware Requirements or Dependencies

No new hardware requirements or dependencies are introduced by this feature.

158.4 Software Requirements or Dependencies

158.4.1 Software requirements for downstream system

A SSH sftp-server[1] which is compatible with OpenSSH sftp client must be running on the downstream Operations Support System (OSS) in order for SBA to transfer data with OpenSSH sftp client.

158.4.2 Software requirements for SDM.

The OpenSSH and its dependencis should be installed on the SDM/CBM. If this software is unavailable, SBA user will not be able to uses the SFTPW protocol for outbound file transfer. There is no explicity check done by the SBA software to determine if this package/fileset is installed during SFTPW configuration time. If the SBA SFTPW application fail to find the sftp

[1]SFTP server subsystem

program, it raised a SFTPW alarm and terminates the transfer event immediately.

For CBM, this feature depends on the OpenSSH packages as well as NTutil

For SDM, this feature depends on SDM_OpenSSH.base and SDM_BASE.util fileset must be installed manually.

158.5 Limitations and restrictions

- As described in Section “158.4 Software Requirements or Dependencies”, that the SFTPW is only available if OpenSSH and the SDM base util software is iinstalled. SBA uses OpenSSH software verion 3.7.1p2 or later for secure file transfer.
- Public keys authentication is not supported in this release. All users are authenticated with userid/password to the dowstream OSS.
- The overall billing data traffic rate is lower than that of a FTPW with a given SBA CPU usage. For more information, please refer to the SDM EI section.
- The initial host key acceptance of the downstream processor should be done manually before it can use the SFTPW[1] to transfer files from SDM/CBM. Figure 1 shows how to accept a host key manually. The .ssh/known_hosts file in maint’s home directory will be edited by SSH software to include the host key. After that SBA can use sftp to send file to the downstream OSS as maint/root. This procedure must be done for each downstream destintation. This step must be done prior to schedule tuple configuration for SFTPW.
- The SSH-2 server running on the downstream OSS must be compatbile with OpenSSH sftp client.
- Due to governement restrictions on export/import of encryption software, secure file transfer will not be available on SDM/CBM loads that shipped to some countries with restrictions on the strength of encryption.
- Does not secure data transfer for AFT, RTB and sendtape applications

[1]SFTPW - Secure File Transfer Protocol Wrapper which controls sftp client to send files using SSH protocol

159: Functional Description (FN): A00005074

159.1 Feature name

OMDD: Outbound Connection Security

159.2 Description

The OM Data Delivery (OMDD) application on the SDM/CBM collectes OM reports from the core, processes them in to CSV files and sends the CSV files to downstream destinations (OSS). Prior to this activity, the outbound transfer of CSV files from SDM/CBM to downstream was always insecure because it used only the standard ftp protocol to do the transfer. The standard ftp protocol sends out user password as well as data in cleartext, making them vulnerable to reading by a thirdparty by interceptiing them in the network.

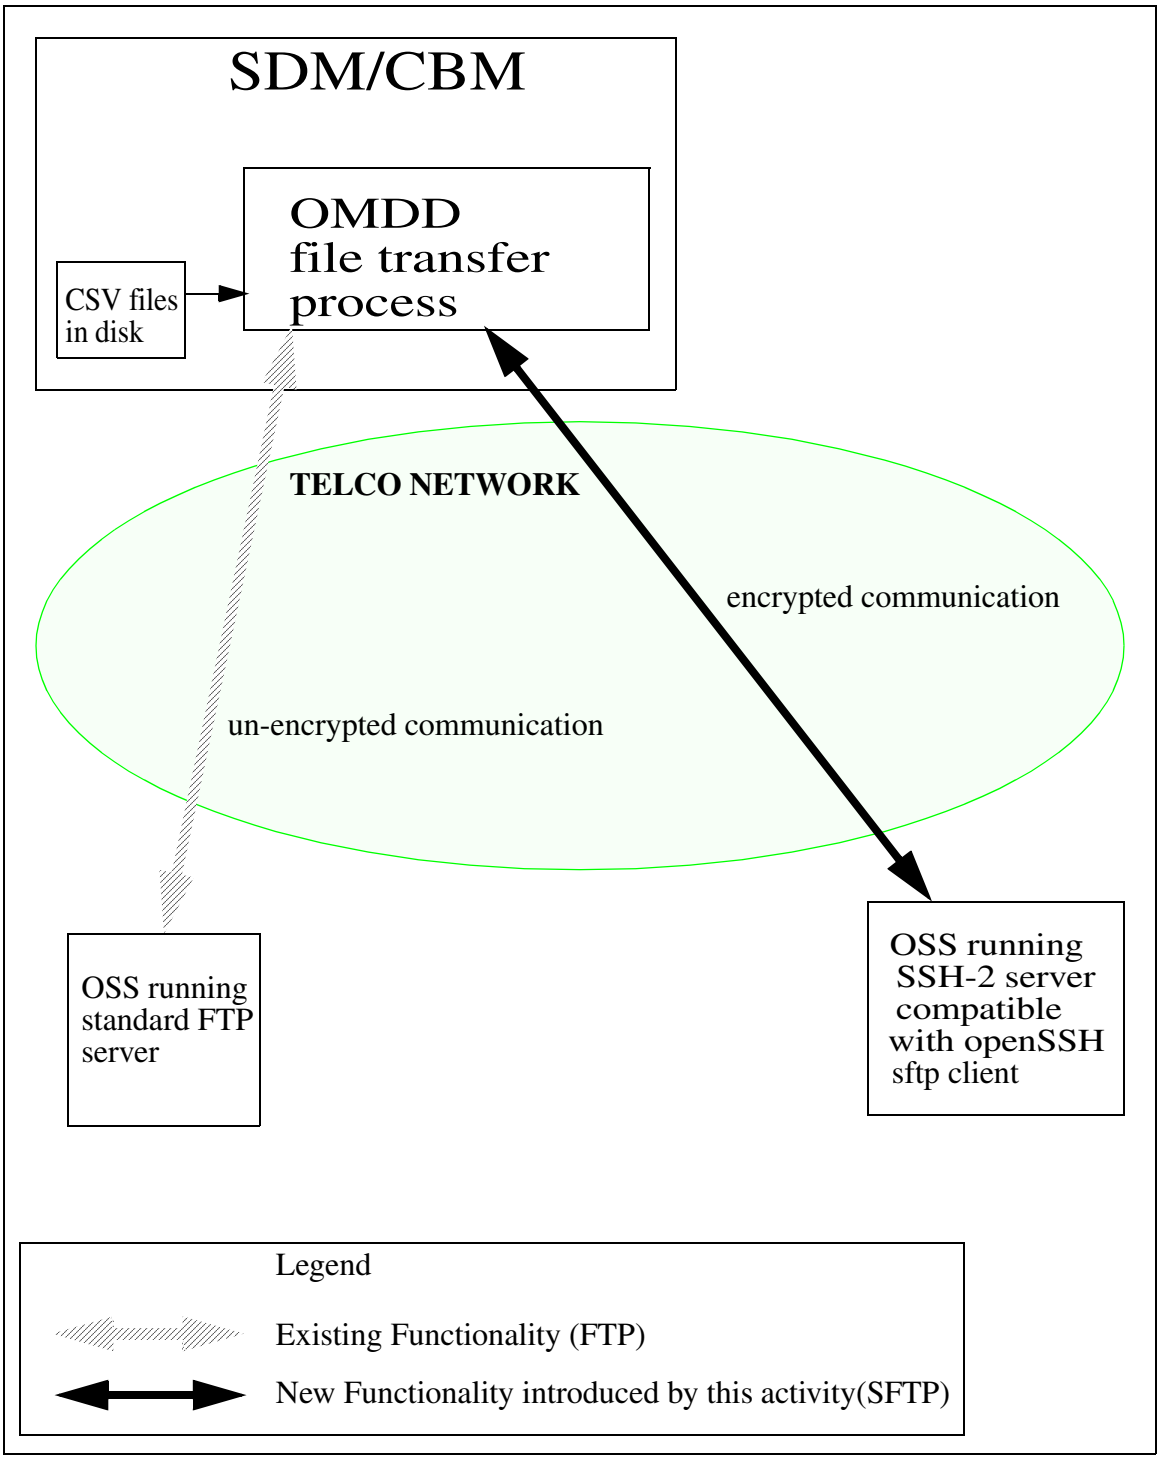
This activity provides an optional mechanism to prevent OMDD outbound transfers from sending out clear text passwords and data in the network. The mechanism uses the OpenSSH secure ftp client for doing outbound filetransfers from SDM/CBM to the downstream destination. OpenSSH encrpyts all data (including passwords) exchanged between the SDM/CBM and downstream, thus making them resistant to reading bya thirdpary by intercepting them in the network.

Figure 1 shows the OMDD outbound file transfer functionality after this activity. It should be noted that secure file transfer is only an optional mechanism and the user can still choose standard ftp for file transfers. This choice can be done while configuring or modifying file transfer destinations.

The user configures file transfer destinations on the SDM/CBM using the OMDD User Interface program (OMUI). It is the configuration tool for OMDD. This activity modifies the Add and Modify File Transfer Destination menus of OMUI. From now on, when a user adds or modifies a file transfer destination, he/she will be asked to select the type of file transfer for the destination in addition to the already existing parameters. The choices for the type of file transfer will be “Standard” and “Secure” . The default choice will be “Standard”.

While doing the actual file transfer, OMDD will invoke either the standard FTP client or the secure FTP client by looking at the choice made by the user at the time of configuration. A customer log SDMO375 will be generated if the OM file transfer fails.

Figure 1 OMDD File Transfer view



Additionally, this feature develops a Private Data Manager on the SDM./CBM for encrypting data by all applications. OMDD will contact the Private Data Manager for storing downstream destination passwords in encrypted format.

159.3 Hardware Requirements or Dependencies

No hardware requirements or dependencies are introduced by this feature.

159.4 Software Requirements or Dependencies

The customer's downstream machine (the OSS) should be running a SSH-2 server compatible with SFTP client of OpenSSH.The OpenSSH fileset should be installed on the SDM/CBM too.

159.5 Limitations and restrictions

- The additional overhead of encrypting/decrypting all data will affect the capacity of OMDD if secure ftp is used.
- Public keys authentication is NOT supported in this release. All users are authenticated with userid/password with the downstream OSS.
- The initial host key acceptance of the downstream processor should be done manually before it can use the SSH protocol to transfer file from SDM/CBM. Figure 2 shows an example how to accept a host key. The /home/maint/.ssh/known_hosts file will be edited by ssh to include the host key. After that user can use SSH for OMDD file transfer. OMDD will use the /home/maint/.ssh/known_hosts file when invoking the sftp client.
- The SSH-2 server running on the downstream OSS should be compatible with the OpenSSH sftp client.
- Due to government restrictions on export/import of encryption software, this feature will not be available on SDM/CBM loads shipped to some countires.

Figure 2 Example of adding the host key of downstream processor to the known_hosts file

160: Functional Description (FN): A00005089

160.1 Feature name and Feature ID

A00005089: NOA Routing for IC Agency - TRAVER Enhancement

160.2 Description

Feature A00004192 enhances NOA routing to support CAP and INAP protocols, TRAVER tool is also enhanced to verify NOA routing for CAP and INAP protocols.

TRAVER is enhanced to display the result of a search for a match in table CDNCHAR for CAP and INAP protocol. Only TRACE option B for MS selector is supported.

Additional enhancement makes users can replace LAC, CID/SAC option with a new XLAENTRY option, so that they can directly specify the XLAENTRY INDEX they want without datafilling and looking up table LAC to find it. It's useful when users just want an entry point of UXLA to verify the NOA routing without caring about mobile's LAC and CELL.

The enhancement only works with MS selector. For other selector, TRAVER's behavior is not affected.

For details, please refer to FN and MM document of A00004192 in GSMDOC library.

Term	Description
CAP	CAMEL Application Part
INAP	Intelligent Network Application Part
NOA	Nature of Address
TRAVER	Translation Verify

161: Functional Description (FN): A00005123

161.1 Purpose

In SN07, changes to the SESM upgrade scripts will enhance how the SESM s/w handles upgrades, in particular Database upgrades. These changes will prevent a number of issues frequently observed in labs, and will also be required to correctly handle database upgrades with the introduction of CI and HA.

161.2 Description of Fix

There are several different enhancements as described below:

- Restructured CS2M load
  The CS2M load is being restructured to allow s/w packages to be easily added or removed from the CS2M combo load. The CS2M installer script will be made dynamic so it looks into the packages directory and installs only the loads it finds there. The installation code is being made generic to handle any normal Sun package.
- SESM Data Versioning and DB upgrade enhancements
  SESM database upgrades are being divorced from the s/w installation. During SESM startup, the Database is checked for the current version. If it is not current, a DB upgrade is initiated. The DB upgrade code is being changed so that it no longer relies on s/w versions, but only on internal DB versions.
- SESM Configuration enhancements
  SESM configuration is now being linked into the CLI tool.

161.3 Possible Design Side Effects

SESM s/w upgrades will now occur faster as a result of the DB upgrades being decoupled from s/w upgrades. SESM startup time will be increased slightly due to the check of DB versions and the SESM could take significantly longer to start up if the system determines that the DB needs to be upgraded.

161.4 Customer Facing Document Changes

There will be minor impacts to Installation and Upgrade documents. The area most significantly impacted will be the upgrade process when going from one h/w platform to another.

161.5 Test Instructions

1. Verify CS2M application installation
   a. Download and untar the CS2M Combo load.

b. **cd** to the **bin** directory and run the **appl_mgr.ksh** script and verify that all the applications install.

2. Verify ability to add and remove apps from the CS2M application installation script

a. Download and untar the CS2M Combo load.

b. **cd** to the **pkg** directory and move the NTsesm package to the **/tmp** directory.

c. **cd** to the **bin** directory of the CS2M Combo load and run the **appl_mgr.ksh** script and verify that the SESM application isn't listed.\

d. **cd** to the **/tmp** directory and move the NTsesm package to the **pkg** directory of the CS2M Combo load package.

e. **cd** to the **bin** directory of the CS2M Combo load and run the **appl_mgr.ksh** script and verify that the SESM application is listed.

3. Verify CS2M Upgrade from SN06.2

a. Install the SN06.2 FC SESM load, configure and enter some provisioning data.

b. Using CS2M, upgrade to SN07 load.

c. Verify the SESM installs cleanly and configuration settings survived the upgrade using the **configure** tool.

d. Start the SESM using the **ptmctl –f start** command

e. Verify that SESM detects that the DB needs upgrading.

f. After prompting the system to upgrade the DB, verify that the DB is upgraded successfully with no errors.

g. Verify SESM starts up with no errors.

4. Verify CS2M Upgrade from SN06

a. Install the SN06 FC SESM load, configure and enter some provisioning data.

b. Using CS2M, upgrade to SN07 load.

c. Verify the SESM installs cleanly and configuration settings survived the upgrade using the **configure** tool.

d. Run the **ptmctl diag** command

e. Verify that SESM detects that the DB needs upgrading.

f. After prompting the system not to upgrade the DB, run the **configure** tool. Select Option 2 (SESM database tools). Then select Option 4 (Upgrade SESM database).

g. Verify that the DB is upgraded successfully with no errors

h. Start SESM using the **ptmctl –f** start command.

i. Verify SESM starts up with no errors.

5. Verify CS2M Upgrade from SN05

a. Install the SN05 FC SESM load, configure and enter some provisioning data.

b. Using CS2M, upgrade to SN07 load.

c. Verify the SESM installs cleanly and configuration settings survived the upgrade using the **configure** tool.

d. Start the SESM using the **servman** utility

e. Verify that SESM detects that the DB needs upgrading and upgrades it automatically.

f. Verify that the DB is upgraded successfully with no errors.

g. Verify SESM starts up with no errors.

6. Verify **configure** script binds into **cli**

a. Install the SN07 SESM load.

b. Type **cli** to start the cli tool

c. Select Option 2 (Configuration).

d. Select Option 3 (Succession Element configuration).

e. Verify an option for “SESM Application configuration” exists.

f. Select “SESM Application configuration” and verify that it launches **configure** tool

162.8 Glossary

Term	Description
New term	Definition

163: Functional Description (FN): A00005160

163.1 Feature name

OSSAIN XA-Core Data Messaging Capacity Enhancements.

OSSAIN: Operator Services System Advanced Intelligent Network.
XA-Core: Extended Architecture Core.

163.2 Description

This activity makes it possible for OSSAIN data messaging to use XA-Core Ethernet interfaces such as the HIOP and the new HCMIC card. Prior to this activity, all OSSAIN messaging used the EIU (Ethernet Interface Unit). The EIU has insufficient capacity to support some service providers' requirements for OSSAIN.

163.2.1 Background

This section includes background material on both OSSAIN and XA-Core Ethernet interfaces.

163.2.1.1 OSSAIN background

The OSSAIN product uses a messaging protocol between TOPS (Traffic Office Position System) switches and external service nodes (SNs), allowing the SNs to provide services for and control switch functionality associated with directory and operator services calls. In an OSAC (OSSAIN centralization) configuration, one or more centralized SNs provide services for multiple TOPS switches. These TOPS switches are referred to as OSAC hosts and OSAC remotes, and they exchange messages with each other as well as with SNs. All of this messaging uses the UDP protocol at the transport level.

Until recently, OSSAIN was used mainly for toll and assistance (TA) calls. Now service providers are beginning to use OSSAIN for directory assistance automation (DAA) as well. Since most TOPS switches handle many more DA than TA calls, and since DAA calls may use OSSAIN for both front end and back end automation, service providers are requiring more OSSAIN messaging capacity than EIUs can provide. Throughput of an EIU is between roughly 10 and 40 KBytes/second in each direction, depending on how heavily the LPP or FLIS is used for other applications besides OSSAIN. And because of the way EIU selection is done, adding more EIUs for OSSAIN may not increase the messaging capacity. For more information about EIU capacity, refer to *OSSAIN User's Guide* (297-8403-901) and *Ethernet Interface Unit User Guide* (297-8991-910).

163.2.1.2 XA-Core Ethernet interface background

In the XA-Core architecture, I/O processor cards in the core can be used to provide Ethernet LAN connectivity. These cards communicate directly with the PEs (processing elements) using a shared memory system. The first-generation card was the IOP, a host card that accommodates specialized packlets for different interfaces. An IOP with Ethernet packlet(s) is called an EIOP. The second-generation card is the HIOP. HIOP cards do not host packlets. Three versions of HIOP have been developed—one with only an Ethernet interface, and two with both Ethernet and AMDI (for ATM). Next-generation HCMIC cards with CMIC, RTIF, and Ethernet interfaces are under test at the time of this writing.

XA-Core Ethernet interface cards are datafilled in switch table CMIPADDR. The datafill includes two active host CM IP addresses, which the switch dynamically associates with physical links. As long as at least two links are in-service, the two IP addresses are always associated with different links. If a link fails while another is in-service, the IP address that was associated with the failed link is automatically reassigned to a different one. Unsolicited ARP (Address Resolution Protocol) replies are used to inform the network of the association between IP addresses and physical interfaces.

XA-Core I/O cards are maintained from the switch at MAP level MAPCI;MTC;XAC;IO. Their functional components, including Ethernet ports and links, are maintained at level MAPCI;MTC;XAC;ETHR. *Port* refers to a hardware interface on the card, and *link* represents the transmission medium connecting the XA-Core to other nodes. For more information, refer to documentation for the following features:

A59019176	XA-Core ethernet packlet - OA&M
A59029980	HIOP Maintenance Software
A00002012	XA-Core CMIC/RTIF HIOP Maintenance Software

163.2.2 New functionality

This feature adds new fields to switch table OANODINV, the inventory table for OSSAIN SNs and OSAC nodes, to allow the service provider to specify the data path to be used for messaging with each node. Thus it is possible for a TOPS switch to use EIU for messaging with some OSSAIN nodes and XA-Core Ethernet interface cards for messaging with others. This enables a gradual transition, on a node-by-node basis, to using XA-Core Ethernet interface cards.

Which data path the switch uses is transparent to the far-end node, except that the far-end node must be configured to use a different IP address for the switch depending on which data path the switch uses when messaging with that node.

For the EIU data path, far-end nodes are configured to send messages to the IP address in the CMIPADDR tuple of table IPNETWRK. This is existing functionality, and is unchanged.

For the XA-Core Ethernet interface data path, each far-end node is configured to send messages to one of the two active CM host IP addresses datafilled in table CMIPADDR. That address is also datafilled against the node in table OANODINV, and is used as the source IP address when the switch sends messages to the node.

Under normal conditions of no failure, traffic should be balanced over the physical links. This is accomplished by configuring half of the far-end nodes to use one of the active CM host IP addresses, and the other half to use the other active CM host IP address.

TOPS does not restrict which XA-Core Ethernet interface cards can be used. However, some of the earlier XA-Core I/O cards have been or will soon be manufacture discontinued, and the product platform on which TOPS runs may have restrictions on which cards are supported. Contact your Nortel Networks representative for more information.

This activity also adds a new OM group, TDGTHRU (TOPS Datagram Throughput), which counts the number of UDP messages sent and received in each of several "buckets" or message size ranges. The OM group has tuples for several TOPS applications, and it has separate tuples for OSSAIN using EIU and OSSAIN using XA-Core Ethernet interface. The pegs are meant to help in studies of messaging bandwidth utilization of TOPS applications.

163.2.3 Capacity engineering considerations

Paper studies suggest that if the LPP or FLIS that houses the EIU is used primarily for OSSAIN messaging, an OSAC remote can process roughly 100,000 DA busy hour calls/hour, with DA front and back end automation using Nortel Networks service nodes, before it approaches EIU messaging capacity limits. If the LPP or FLIS is also used heavily for ISUP signaling or other applications, the OSSAIN traffic limit may be closer to 25,000 calls/hour. Capacity decreases if the SNs send a significant number of SMS (Short Message Service) requests to the switch. Other features may also decrease capacity.

Similar studies suggest that a pure OSAC host can process roughly a million busy hour OAP sessions for its remotes if the EIU in the host is used primarily for OSSAIN traffic. Using Nortel Networks service nodes, separate OAP sessions are used for DA front end and back end automation, so this translates to 500,000 DA calls/hour. If the LPP or FLIS housing the EIU in the OSAC host is also used heavily for ISUP signaling or other applications, the OSAC host's limit is closer to 125,000 DA calls/hour from its OSAC remotes. The host's capacity decreases if it is also processing standalone OSSAIN calls.

Note: Messaging patterns may be different if service nodes from other vendors are used. Nortel Networks does not have message flows for calls that are serviced by other vendors' SNs, and does not do capacity engineering for these SNs.

Ethernet throughput capacity of XA-Core interface cards depends on factors such as the extent to which other interfaces on the card are used and the sizes of the individual messages. Committed throughput numbers for NTLX04CA (HIOP) and NTLX17AA (HCMIC) were not available at the time of this writing, but both cards will have Ethernet throughput capacity much higher than the EIU, even if other interfaces on the card are used.

It is anticipated that in offices that are not using XA-Core interfaces for Succession packet call signaling, a pair of NTLX04CA or NTLX17AA cards (for redundancy) can easily accommodate both CBM (Core and Billing Manager, the next-generation Supernode Data Manager replacement) and all existing DA traffic, using OSSAIN for both front and back end automation, with no capacity concerns.

In TOPS CS2000 switches in which OSSAIN messaging is sharing the available Ethernet interface bandwidth with high-runner Succession call signaling, the CS2000 capacity for handling non-TOPS calls is decreased. At the time of this writing, Succession CS2000 capacity numbers published by Nortel Networks were based on office models that did not include OSSAIN. Contact your Nortel Networks representative for the status of capacity engineering work for CS2000 switches that use Ethernet interface cards for both OSSAIN and Succession packet call signaling.

163.3 Hardware Requirements or Dependencies

This functionality is available only on XA-Core equipped with Ethernet interface cards such as HIOP (NTLX04CA) or HCMIC (NTLX17AA).

163.4 Software Requirements or Dependencies

This functionality is first available in the SN07 and ISN07 core software loads.

163.5 Limitations and restrictions

From an end user's perspective, this activity introduces no limitations or restrictions that were not present in OSSAIN using EIU.

From a service provider's perspective, the following limitations and restrictions apply:

- Use of XA-Core Ethernet interface cards is supported only for OSSAIN applications that use the UDP protocol. It is not supported for OSSAIN QMS MIS, which uses TCP.

- Unlike EIUs, XA-Core Ethernet interface cards do not provide screening capabilities. (EIUs can be configured to protect the core by screening out incoming messages from unwanted IP addresses, including addresses that do not match datafilled nodes and addresses of nodes that are off-line or have been declared babblers.)

  Since call processing can be adversely affected if the core is flooded with unwanted messages, it is especially important that the network be properly configured with firewalls and router filters when XA-Core Ethernet interfaces are used.

- In TOPS CS2000 switches in which OSSAIN is sharing the Ethernet interface cards with high-runner Succession calls, OSSAIN decreases the capacity of the CS2000 for non-TOPS calls. CS2000 capacity numbers published by Nortel Networks engineering groups do not apply in this case, unless the office model has specifically included OSSAIN calls.

- The XA-Core does not provide a way to reserve portions of its total Ethernet interface bandwidth for specific applications. All applications compete for the same bandwidth.

- An SN cannot be on the same subnet as a core Ethernet interface if an EIU router is to be used for messaging with the SN. Refer to the Configuration section of this feature for more information.

- This limitation applies when (a) an OSAC remote switch is being changed to use XA-Core Ethernet interface to communicate with a centralized SN, and (b) either the OSAC host is below SN07/ISN07, the centralized SN is at an OAP release below 9, or both. In this situation, if the service node is incorrectly configured (in the service node) to use the wrong IP address for the OSAC remote, the mismatch is not detected when the links to the centralized SN are returned to service in the OSAC remote. The OSAC remote will present calls to the centralized SN. The incorrectly configured SN will probably not attempt to send the switch any messages regarding these calls. Depending on datafill for OSSAIN time-outs and on how quickly callers abandon these calls, there may be no logs in the OSAC remote indicating any problem. However, the incorrectly configured SN should be raising alarms using its own event reporting system if this happens.

  This is not a new problem with XA-Core Ethernet interface; however, the configuration mismatch may be more likely to be introduced with this feature, since the service provider now has to be aware of more than one IP address for any particular switch.

  The OSAC and OAP protocols are enhanced in SN07 and OAP Release 9 to eliminate this limitation. If the SN is at OAP 9 or higher, and both the OSAC remote and host are at SN07 or higher, then the OSAC remote cannot RTS its links to the centralized SN if the SN has incorrect datafill for the OSAC remote's IP address.

163.6 Interactions

Existing OSSAIN services are not affected by the choice of which data path the switch uses for Ethernet connectivity.

164: Functional Description (FN): A00005190

164.1 Feature name

CBM 800 OC3 Core Node and Link Maintenance

164.2 Description

A market was identified to replace the aging billing storage device known as the DPP (Distributed Processing Peripheral). The function of the DPP is to receive billing records from the core through an IOC interface and store them on redundant hard disks. A modem link is used to poll the DPP for billing records and transfer them downstream to an OSS.

The chosen platform for DPP replacement was the next generation SDM or Core and Billing Manager (CBM) on the SSPFS platform. However core connectivity became a problem since DPP's are connected to BRISC cores via IOC connectivity but the CBM only provided IP connectivity.

A prototype was built to prove that OC3 could be used to connect a CBM 800 to an MS in a similar manner to the SDM FX which is connected through DS512 links to the MS.

The OC3 connectivity resolves several issues including security and capacity.

This solution builds on the existing infrastructure that is used for the SDM FX platform and the Node maintenance infrastructure that was developed for the Ethernet connected SDM and the CBM 850.

This activity provides the modifications in node maintenance on the core to support the OC3 connected CBM 800.

164.8 Glossary

Term	Description
CBM	Core and Billing Manager

165: Functional Description (FN): A00005192

165.1 Feature name

CBM 800 OC3 BRISC connectivity and OC3 node and link maintenance.

165.2 Description

This feature provides OC3 connectivity between a CBM 800 and the MS of a BRISC or XA-Core. Physical connectivity consists of two OC3 fibers connected between two ATM interface cards on the Solaris Netra-240 and two NTL9X63 paddleboards, one on each MS.

This feature provides the following software components:

- CBM 800 MTS/IP/FTS driver
- CBM 800 link maintenance
- CBM 800 node maintenance

The MTS/IP/FTS driver provides an MTS socket and IP socket interface to allow CBM 800 software components to send and receive MTS and IP messages to and from core software components.

CBM 800 link maintenance sets the conditions of the two OC3 links displayed at the Core level (figure 2) of the cbmmtc UI. Link conditions are set in response to node state change commands invoked from the SDM level of MAPCI (figure 1) and port / card state changes invoked from the MS Card level of MAPCI. Table 1 gives the MAPCI node state and the cbmmtc link conditions for various mtce actions.

Figure 1 MAPCI SDM Level

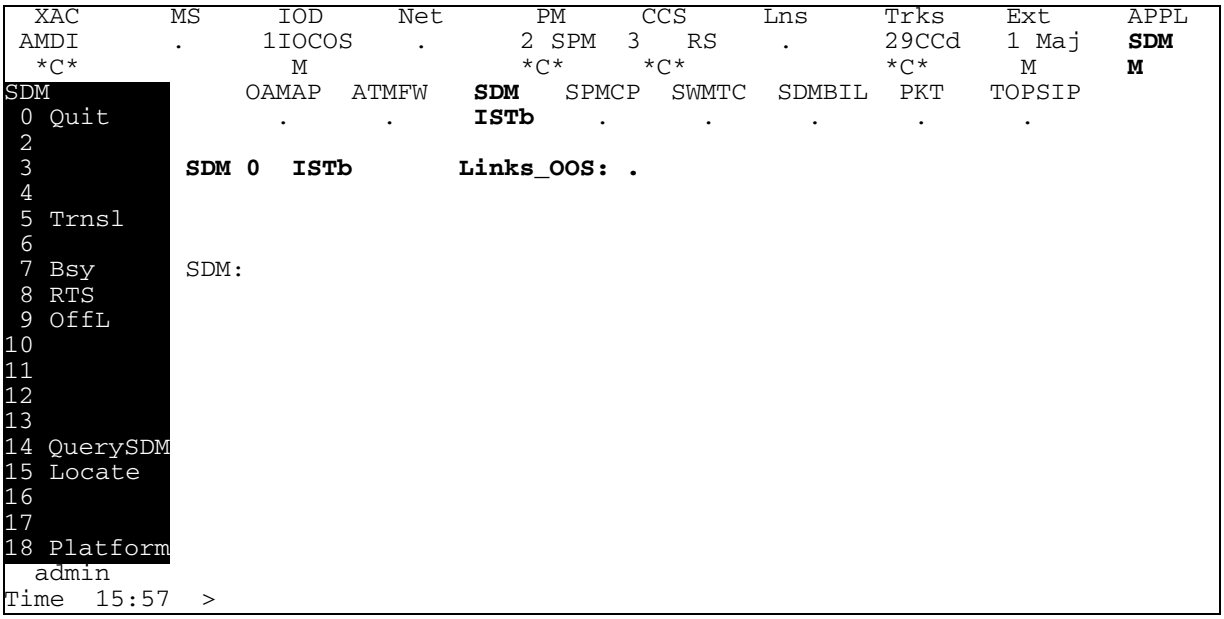

Figure 2 cbmmtc Core Level

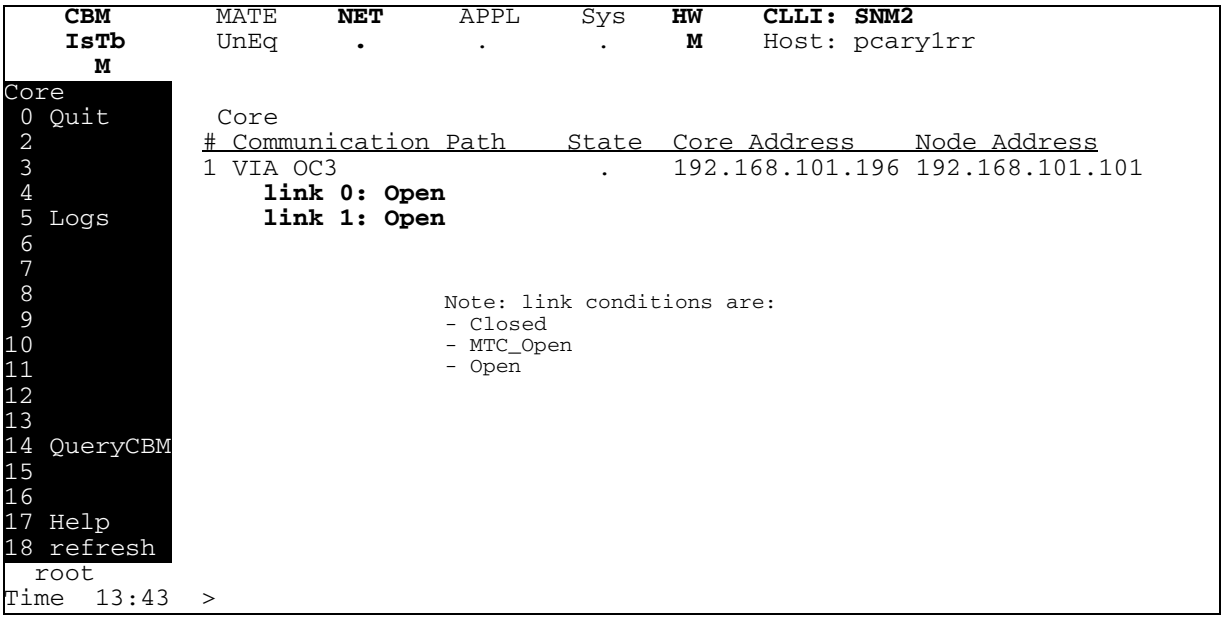

Table 1 Node State and Link Conditions

Mtce Action	Node State	Link 0 Condition	Link 1 Condition
Offline node	Offl	Closed	Closed
Busy node	ManB	Mtc-open	Mtc-open
RTS node	InSv / ISTb	Open	Open
Busy link 0	InSv / ISTb	Closed	Open
Busy link 1	InSv / ISTb	Open	Closed
Busy all links when node state InSv	SysB (NA)	Closed	Closed
Busy all links when node state ManB	ManB (NA)	Closed	Closed
Faults on both links	SysB (NA)	Closed	Closed

The CBM node state in the banner of figure 2 may **not** be the same as the SDM node state in figure 1 due to the fact that the two node states are different data points. The CBM alarm state in the banner of figure 2 will match the SDM alarm state in figure 1 when the CBM 800 is in-service.

CBM 800 node maintenance sets the Core Heartbeat State at the Net level of the cbmmtc UI (figure 3). The heartbeat state will be InSv if at least one of the OC3 links is in a mtc-open or open condition. If faults are raised on both links, the link conditions will change to closed and the heartbeat state will change to SysB. The NET alarm in the banner will also change to SysB.

If an ATM card alarm is raised, the HW alarm in the banner will indicate a HW problem. The ATM HW alarm can be queried from the HW level of the cbmmtc UI.

CBM 800 link mtce generates cust logs for link condition changes and crossed links.

Figure 3 CBM Net Connectivity Level

167: Functional description (FN): A00005268

167.1 Feature name

A00005268: SBA: MULTI-VOLUME SUPPORT FOR CORE BACKUP .

167.2 Description

167.2.1 Architectural Description.

Currently 2 volumes can be assigned on a per stream for SBA on the CM as backup storage.These volumes are used to store the billing records whenever the stream goes to backup mode on the CM.This configuration deos not meet the backup storage requirement for some of the markets.

This feature will focus on increasing the backup storage capacity available for SBA on the CM from current 2 volumes allotted per stream to 69 volumes or the maximum supported by the underlying hardware whichever is less per stream.

167.2.2 High Level Description.

As part of this feature new MAPCI commands will be introduced. The new CI commands will allow user to add / remove more than one volume at a time per stream .

This feature is core only scope and affect TL layer.

167.3 Hardware requirements

Under investigation.

167.4 Limitations and restrictions

168: Functional Description (FN): A00005317

168.1 Feature name

WanBuilder Heartbeat Ping

168.2 Description

This feature adds robustness to the WanBuilder inband messaging links by allowing the subsystem to perform corrective actions when communication fails. WanBuilder Heartbeat Ping monitors the inband messaging links (OAM, CallControl and DS512) and reacts to failure by raising an alarm, swapping SVCs or causing a SWACT, for example.

168.3 Problem Correction

In some cases, the UEMG's primary SVC is to the inactive Shelf Controller but the SAM21 is unaware of the mix-up. In this case, the SVCs are up and “green” on the SAM21 GUI, but inband messaging fails. WanBuilder Heartbeat Ping will correct the situation by swapping the SVCs.

The DCC takes its provisioning for the IP address to ping for each connection type from the LCI. It sends a message to each ITP or ABI telling it to start heartbeat. If heartbeat fails on one ITP or ABI, the DCC heartbeat controller requests a status update from all ITPs or ABIs. After collecting the status updates, the controller decides upon a course of action.

If all heartbeats for a given connection type (OAM, Call Control or DS512) are failing, there are two actions that can be taken. The first step is to swap the SVCs, while the second, more drastic step is to raise an alarm which may result in a SWACT of the DCCs. The SWACT decision is left to node maintenance's service evaluation.

If heartbeat is failing for one or more VMGs within a connection type, but not for all of them, an alarm can be raised on ITPs/ABIs that are failing heartbeat. Again, this may result in a SWACT of the ITP or ABI.

168.4 Provisioning

The heartbeat address is an newly added field on each Connection page. It is an optional field and if not provisioned, heartbeat is not enabled.

169: Functional Description (FN): A00005322

169.1 Feature name

Spectrum Common Equipment Module (CEM) Overload Enhancement: Asynchronous Transfer Mode Resource Module (ATMRM) Status

169.2 Description

This feature introduces several changes into the reporting of ATMRM resource exhaustion and CEM overload conditions. Since the ATMRM resources are integral to call processing on the MG4K/IW variants of the SPM peripheral node, attempts are made to make ATMRM resource exhaustion conditions very visible. To this end, depending upon the severity of the ATMRM resource exhaustion:

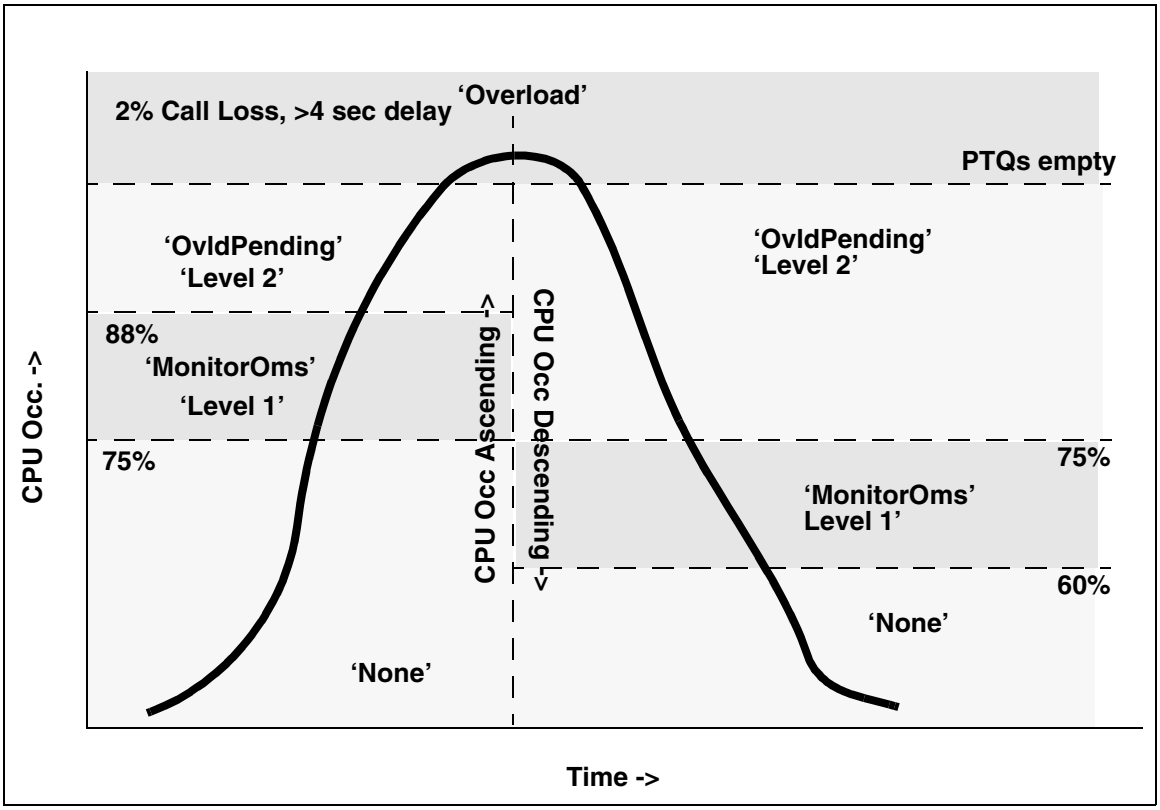
- CEM CALLP can go into Overload which results in SPM399 Overload logs, Minor alarm, CEM state change to ISTb, Node state change to Istb (NODE500, NODE602), MAPCI MIP strings indicating Overload and "querypm flt reason" indicating an overload condition being generated.
- On the ATMRM, a minor alarm will be raised, RM state change to ISTb (SPM500 state change and SPM300 fault reason logs), MAPCI MIP strings indicating Overload and "querypm flt reason" indicating an overload condition will be generated.

The severity of ATMRM resource exhaustion is reported via predefined utilization levels. Each level has a different onset and abatement value to prevent quick entry/exit (jitter) from a single level at a boundary value. The ATMRM resource utilization levels (NONE, LEVEL1 and LEVEL2) are transferred to the CEM and are applied to CEM resources. As a result, the ATMRM and CEM share resource utilization levels. For the case of CPU occupancy/CALLP flow control, these levels are as follows:

- None: Exit: 75 % (Level 1 Onset), Onset: 0% (system initialization) or 60% (Level 1 abatement) - The monitored resource is below 75% utilization since last being in "Level 1" or since system initialization.
- Level 1: Onset: 75%, Exit: 88% (Level 2 onset), Abatement: 60% (Level 1 onset) - The CPU resource utilization was initially above its engineering level of 75% and has not dropped below 60% utilization since the initial 75% level was encountered.
- Level 2: Onset: 88%, Exit: Overload triggered, Abatement: 75% - The CPU resource is dangerously overused. CALLP flow control has been triggered to delay call originations in order to lessen CPU occupancy.

- Overload: Onset: Any call delayed by flowcontrol for more than 4 seconds or more than 2% of the calls have been discarded. Abatement: No calls are being delayed. Overload determination is not resource based, it is determined by the characteristics of the states of the calls in flow control.

Figure 1 CPU Occupancy and Resource Utilization Level



The following table shows the maintenance interaction mapped to CPU resource levels. The shaded entries are the new interactions introduced by this feature. Please note, with introduction of this feature, the ATMRM CPU resource level will effect existing maintenance interactions for the CEM.

.

Table 1 Maintenance Interactions for each ATMRM Resource Utilization Level

Mtc Interaction	No Overload	Level 1 Resource Utilization	Level 2 Resource Utilization	CALLP Overload (call state based)
CEM Flowcontrol	Off	Off	On	On
CEM Alarms	None	None	Minor	Minor
ATMRM Alarms	None	Minor	Minor	Minor

Changing Existing Interaction

New Interaction

Table 1 Maintenance Interactions for each ATMRM Resource Utilization Level

Mtc Interaction	No Overload	Level 1 Resource Utilization	Level 2 Resource Utilization	CALLP Overload (call state based)
CEM State	InSv	InSv	ISTb	ISTb
ATMRM State	InSv	ISTb	ISTb	ISTb
Node State	InSv	InSv	ISTb	ISTb
CEM MIP	None	“Monitor OMs”	“Overload Pending”	“Overload”
ATMRM MIP	None	“Monitor OMs”	“Overload Pending”	“Overload Pending”
CEM Logs				
SPM399	None	“Monitor OMs”	“Overload Pending”	“Overload”
NODE500	None	None	ISTb State Change	None
NODE602	None	None	“Reached or Nearing Overload”	None
ATMRM Logs				
SPM300	None	“Monitor OMs”	“Overload Pending”	None
SPM500	None	ISTb State Change	None	None

Please note, the above table indicates the interactions visible when entering or being in high resource utilization levels. When abating the “Level 1” state and returning to the “No Overload” state, alarms are extinguished, MIP strings are cleared, module states are returned to InSv and the logs indicate overload states have cleared, resources utilization levels have returned to normal, and module states are back to InSv.

169.3 Hardware Requirements or Dependencies

None.

169.4 Software Requirements or Dependencies

- A00002431 - SP20 “LX82BA Capacity Delivery” required for the new CALLP overflow infrastructure.
- A00002432 - SP20 “SPM Enhanced Overload OMs and Logs” needed for the overload reporting infrastructure.

169.5 Limitations and restrictions

SP20 CORE load required for full reporting infrastructure to function.

169.6 Interactions

This feature depends upon the reporting infrastructure introduced into the Spectrum by A00002432 - SP20 “SPM Enhanced Overload OMs and Logs” for overload reporting.

The feature also uses the new CALLP flow control infrastructure introduced by A00002431 - SP20 “LX82BA Capacity Delivery”.

170: Functional Description (FN): A00005337

170.1 Feature name

CBM 800 OC3 BRISC Connectivity

BRISC - BNR Reduced Instruction Set Computer (DMS Core)

CBM - Core Billing Manager

OC3 - Optical Carrier- Level 3 (transmission interface)

170.2 Description

170.2.1 General Description

The purpose of this feature is to allow the usage of OC3 paddleboards on the MS for communication between the CBM (running on a SUN Netra server) and the message switch (MS), connected to the computing module (CM) or core.

The changes introduced in the software can be broken up into two separate components, where one portion resides on the message switch (MS) and the other on the computing module (CM). The CM portion will basically allow the datafill of table MSCDINV (Message Switch CarD INVentory) so that the NT9X63AB OC3 paddleboard can be shown on the user MAP. From this, maintenance (mtc) actions can be issued on it (eg - bsy/tst/rts). The local MS software component is what allows the OC3 paddleboard to be recognized and allow the actual mtc actions to be performed on it.

170.2.2 System Behaviour/Feature Operation

To allow the NT9X63AB OC3 paddleboard to be used for communication between the MS and a CBM server, the following steps should be used as a guideline to get the paddleboard into service.

a. ensure that both the CM and MS images have the software code changes introduced in this feature

   - If only one portion is present the user will either not be able to datafill the MSCDINV table or not be able to bring the card into service

b. make sure that there are two NT9X63AB OC3 paddleboards and two NT9X17AD circuit packs available for insertion

   - one set will be inserted into each MS

The next set of instructions are from the Nortel Networks MS card replacement procedure. Please refer to DMS-100 Card Replacement Procedures document (297-9051-547).

c. go to the MS level of the MAP, bsy out MS1 (change it to the slave MS if it is not)

   >mapci;mtc;ms

   >swmast % if MS1 is not the slave MS

   >bsy 1

d. power down the busied MS

e. insert the NT9X63AB paddleboard as well as the corresponding NT9X17AD into the MS for the chosen slot location[1]

f. powerup the busied MS

g. load the MS software image onto the busied MS

   >loadms <ms_number>

   Note that if the MS software image does not contain the changes introduced in this feature, the paddleboard rts may fail.

h. issue an out of service test on the MS

   >tst <ms_number>

i. rts the busied MS, this will trigger a restart of the local MS code, which enables the software to find the OC3 paddleboard[2]

   >rts <ms_number>

j. add the datafill into the MS card inventory table, MSCDINV

   >table mscdinv

   >ove

   >format pack

   >add <ms_#> <shelf_#> <card_#> DS512 NT9X17AD NT9X63AB

   >yes

k. bring the OC3 paddleboard into service

   >mapci;mtc;ms;shelf

   >bsy <ms_#> <card_#>

   >rts <ms_#> <card_#>

l. repeat steps (c) to (k) for MS0

[1]Refer to “170.5 Limitations and restrictions” on page 1917

[2]If not seen or the PEC read fails, the user will be unable to rts with a pec mismatch error given.

170.3 Hardware Requirements or Dependencies

The OC3 paddleboard inserted on the MS to be used for the CBM communication is identified with the PEC (Product Equipment Code) of NT9X63AB. The front circuit pack card on the MS should be the NT9X17AD card.

170.4 Software Requirements or Dependencies

n/a

170.5 Limitations and restrictions

A restriction for using the NT9X63AB OC3 paddleboards is the card location on the MS shelf that the paddleboard may be inserted into. Allowable card locations are listed in Table 1 : Provisionable paddleboard locations.

Table 1 Provisionable paddleboard locations

MS Configuration	Provisionable Slots	Card Location Equivalent
SuperNode (SN)	12R up to 27R	cards #6 up to #21
Super Node System Enhanced (SNSE) MS0	11R up to 15 R	cards #5 up to #9
Super Node System Enhanced (SNSE) MS1	24R up to 28R	cards #5 up to #9

There is no particular card/slot location that is recommended by Nortel. The easiest method for choosing a slot to use is to start from the lowest card number[1] and use the first available location. The OC3 inserted in each MS shelf should have matching card locations (eg - if inserted in card 5 for MS0, it should also be in card 5 of MS1).

170.5.1 Examples

The following shows table MSCDINV before and after the datafill is added for a NT9X63AB OC3 paddleboard in card #8.

```
-> MSCDINV before datafilling the OC3 paddleboards:

>table mscdinv
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: MSCDINV
```

[1]Please refer to Table 1 : Provisionable paddleboard location for the card numbers to use.

171: Functional Description (FN): A00005363

171.1 Feature name

A00005363 - CAIN FlexCDR Enhancements

171.2 Description

Additional information is needed that is not currently collected and presented in CDR records. This information will be made available in new CDR fields, that are used by the Flexible CDR capability. Some of this information comes from new CAIN message processing. The Flexible CDR capability is controlled by the existing SOC UBFR0001.

The processing of this new information is controlled by a new SOC CAIN0202 - CAIN FlexCDR Enhancements.

The new processing consists of:

1. Support for a new CAIN parameter, AMABusinessCustomerId in some incoming messages.
2. Support for a new digits id (300) for an existing CAIN parameter, AMADigitsDialedWC.
3. Support for recording all the digits for a currently supported digits id (301) for the existing CAIN parameter AMADigitsDialedWC.
4. Support for retaining the first occurrence of an existing CAIN parameter, AMASlpID. Currently, only the last occurrence of this parameter is retained.
5. Support for 4 new parameters in the CDRTMPLT table: SLPID1ST, BUSCSTID, DGI300 and DGI301. This feature does not create a new predefined template. The customer must either modify their existing template or create a new template which includes the 4 new parameters.

171.3 Functional Overview

171.3.1 CAIN: AMABusinessCustomerId

Prior to this feature, the AMABusinessCustomerId parameter was not supported by the DMS-250. This feature provides support for this parameter, including enhancements to the CAIN simulator to generate this parameter in the messages listed below. The size of this parameter is 11 digits.

The call processing support consists of parsing the incoming parameter, and making the data available for use by the billing component - it will not affect call processing (either by its value, presence or absence) in any other way. Only the last occurrence of this parameter will be retained for use by the billing component. This parameter will be supported in the DMS-250 being received in the following messages from an SCP:

- Analyze_Route
- Disconnect
- Send_To_Resource

This includes display of this parameter in the VAMP log.

171.3.2 CAIN: AMADigitsDialedWC - 300

Prior to this feature, the AMADigitsDialedWC was not supported for a digits id of 300. This feature adds this support, which consists of parsing the incoming parameter for this digits id, and making the data available for use by the billing component. Only the last occurrence of a AMADigitsDialedWC with a digits id of 300 will be retained for use by the billing component (as is the case today with other such AMADigitsDialedWC digits id). The maximum supported length for the value of this digits id is 24 digits (with the three digits of the digits id makes a maximum total length of 27 digits).

The AMADigitsDialedWC parameter is currently supported by the DMS-250 for various incoming messages from the SCP, and this activity does not alter that support - that is to say that the DMS-250 will support receiving a AMADigitsDialedWC parameter with a digits id of 300 in all cases that reception of a AMADigitsDialedWC parameter is valid. However, the functionality added by this feature (recording the value received in a AMADigitsDialedWC parameter with digits id = 300) will only be supported for the following messages:

- Analyze_Route
- Disconnect
- Send_To_Resource

This includes display of this new digits id in the VAMP log.

171.3.3 CAIN: AMADigitsDialedWC - 301

Prior to this feature, only the first four digits in the AMADigitsDialedWC parameter with digits id = 301 were recorded (in field PINDIGS). This feature records the entire parameter (the 3 digits of the digits id plus 24 digits) in the new field DGI301. When this feature is active, the AMADigitsDialedWC parameter with digits id = 301 is no longer recorded in field PINDIGS, but only in field DGI301.

171.3.4 CAIN: AMASlpId

Prior to this feature, only the last AMASlpId parameter for a call received in a message from the SCP was retained for use by the billing component. This feature adds support for also retaining the first AMASlpId parameter for a call received in a message. This support applies to all messages from the SCP that contain an AMASlpId parameter. Note that in the case that there is only one such AMASlpId parameter received during a call, the first and last AMASlpId values will be the same. The AMASlpId parameter is currently supported by the DMS-250 for various incoming messages from the SCP, and this activity does not alter that support. The functionality added by this feature (retaining the first AMASlpId) will however only be supported for the following messages:

- Analyze_Route
- Disconnect
- Send_To_Resource

171.3.5 CAIN: Simulator changes

To support the changes to the CAIN simulator for the new parameter and AMADigitsDialedWC digits, the following CAIN simulator tables are changed. Table Control Changes

Table	Desc
CAINRESP	A new parameter, AMABusinessCustomerId, with a value of 11 digits, is supported in the following operation types: • Analyze_Route • Disconnect • Send_To_Resource This new parameter is also supported in the “non-restricted” message (as are all parameters). For the existing parameter AMADIGS, a new digits type, 300, is supported.
CAINREXT	For the existing parameter AMADIGS, a new digits type, 300, is supported.

171.3.6 CDR: Table changes

To allow the recording of Dialed digits, Customerid and the first received Amaslpid, the following changes are made to the CDRTMPLT table.

Table	Desc
CDRTMPLT	4 new parameters for the FIELDS and REORIGCP subfields of table CDRTMPLT are added to record the data collected for the AMADigitsDialedWC, AMABusinessCustomerId, and AMASlpID CAIN parameters.

Sample datafill for table **CDRTMPLT** (new fields in bold):

NAME ACTIVE PRIMARY FIELDS REORIGCP

171.3.7 CDR: New Field Description

The new data captured by this activity will be formatted into the CDR record using the following layout:

Field Name	Chars	CDR Field Description
DGI300	27	Contains the Digit ID “300” followed by the dialed digits which are contained in the SCP message whenever the digits id = 300. This will be performed as described in section 2.3.2.
DGI301	27	Contains the Digit ID “301” followed by the dialed digits which are contained in the SCP message whenever the digits id = 301. This will be performed as described in section 2.3.3.
BUSCSTID	11	Contains the customer id which is received in the SCP message. This field is populated based on the description in section 2.3.1.
SLPID1ST	9	Contains the first AMASLPID received. This field is populated as described in section 2.3.4.

Sample CDR Log (new fields in bold):

172: Functional Description (FN): A00005375

172.1 Feature name

A00005375: New Shelf Discovery Alarms.

172.2 Description

Note: This feature does not add any extra functionality. The only addition is the extra faults to indicate shelf discovery failure due to a particular card or card incompatibility. Refer to the Fault Management (FM) A00005375 for further details.

173: Functional Description (FN): A00005391

173.1 Feature name

SBA: Support for Verizon GNS personal Toll Free Service : A00005391.

173.2 Description

New CDR fields are required by Verizon to support introduction of their Personal Toll Free Service. This activity will ensure that new records can be handled by SBA and recognized by SDM AMADUMP. There is corrresponding activity on the core side also with the activity id A00005363.

173.3 Hardware Requirements or Dependencies

Requires no additional hardware resources to implement the activities in this feature.

173.4 Software Requirements or Dependencies

Requires no additional software resources to implement the activities in this feature.

173.5 Limitations and restrictions

No new limitations/restrictions as a result of this feature. The only limitation relates to the time-lag in the interpretation of changed templates on the core. During this time-lag, the new templates are downloaded from the core to SDM side.

173.6 Applicable customer facing sections

The customer will be able to see the the new records in the correct format at the amadump display output.

173.7 Glossary

Term	Description
SBA	SuperNode Billing Application is a distributed, high capacity, scalable billing system that enhances the functionality of the DMS family switch. The primary purpose of the SBA is to receive records from the Computing Module (CM), perform processing, and route the records to files. The SBA can also be configured to send billing files to the operating company's downstream processor(s).
SDM	The term Supernode Data Manager (SDM) refers to the SDM peripheral as a whole. In other words, it includes SDM hardware, AIX operating system, SDM software, SBA base software and other applications.
AMADUMP	Amadump is a tool that allows you to view billing records from the standard billing files. You can display all the records using amadump or you can create filters that allow you to display only records matching a specific search criteria. Amadump can be used to view records in multiple files by specifying a time period or by entering the filename(s).

174: Functional Description (FN): A00005485

174.1 Feature name

SAM21 Platform Installation on SSPFS

174.2 Purpose

To allow the installation of the SAM21 Platform Package from CDROM on to the SSPFS box.

In SN07, the new SSPFS box does not contain a DAT Tape Drive but only a CD/DVD ROM drive. Therefore, the Platform Installation tool will be further enhanced to allow the user to extract the SAM21 Platform Package from CD where it is stored in a “RPM” format.

What this means is that this tool will now be used in ALL Solutions to allow the user to install the SAM21 Platform Loads using a DAT tape, to be backward compatible, and CDROM moving forward. The CDROM will be of ISO format containing the following files:

- SAM21 Platform Fileset (This is used for installation on the AIX SDM)
- SAM21 Platform TAR file
- SAM21 Platform RPM file

If the solution contains an AIX SDM, the user will be prompted for a roo passwd for the SDM so that the fileset will be Secure Copied onto the SDM.

Note: The implementation of this activity will also satisfy the problem described by CR.Q00808578 -

This tool will be further expanded to allow the user to install the Call Agent and Message Controller Linux loads from CDROM. It must be noted that the SOS images will not be extracted from CD using this tool.

175: Functional Description (FN): A00005538

175.1 Feature name

Preset Conference on Succession

175.2 Description

This feature addresses the functionality of Preset Conference in Succession..

For a detailed description of the Preset Conference please refer to the NTP 297-8001-350 DMS 100 Family NA100 Translations Guide Volume 13 of 20. However, in the Succession domain, there are further limitations to the Preset Conference functionality which are described in this document.

This activity provides support for the following types of lines on both North American and International markets.

- CICM lines - i2002, i2004 and m6350 softclients
- MG9K Pphones and IBN lines

175.3 Hardware Requirements or Dependencies

There is no special hardware dependency for this service. It is assumed that the lines types as described in Section 175.2 are available. UAS is also needed in order to provide this functionality. Please refer to the configuration section of activity A59036149 in FMDOC for provisioning details of the AudioServer.

175.4 Software Requirements or Dependencies

The SN07 software loads (both North American and International) are required of the Succession elements.

175.5 Limitations and restrictions

175.5.1 Maximum conferees in Preset Conference

The maximum supported conferees for Preset conference is 25. Larger conference sizes are not supported.

175.5.2 Hybrid Solution Limitation

This activity seeks to implement Preset conference in non-hybrid scenarios only. On Hybrid environment, the support remains unchanged.

175.5.3 Add ON

The ADDON functionality for Preset Conference is not supported on Succession. The subfield ADDON in Table PRECONF should be set to N.

Figure 1 Table PRECONF, ADDON subfield

```
0 0 9192461888 D IBN POTSDATA 0 N N N N Y $
```

175.5.4 Audio Tone Detector

The Audio Tone Detector is a MTM component and the functionality is not available through UAS. Hence, this activity does not support the ATD functionality of the Preset Conference. The ATD subfield in Table PRECONF should be set to N.

Figure 2 Table PRECONF, ATD subfield

```
0 0 9192461888 D IBN POTSDATA 0 N N N N N Y $
```

175.5.5 Immediate Start

Support of Tones or Announcements for Preset Conference on Succession is not implemented through this activity. This would imply that the IMMSTART subfield in Table PRECONF should be set to Y.

Figure 3 Table PRECONF, IMMSTART subfield

```
0 0 9192461888 D IBN POTSDATA 0 N N N N N Y $
```

175.5.6 Conferee Class

The Conferee class ‘P’ and ‘D’ are supported. The other conferee classes (ie., ‘A’ and ‘C’) are not supported in this activity.

175.5.7 Preset Conference Options

The Preset Conference options MADNOPT and NARS is not supported through this activity and should not be datafilled.

Figure 4 Table PRECONF, Options

```
0 0 9192461888 D IBN POTSDATA 0 N N N N N Y $
```

175.5.8 Tones

This feature will make use of conference tones like conference entry tone, and conference exit tone. The Preconference tones PCNOR (Preset Conference Notification Tone) and PCALR (Preset Conference Precedence Notification Tone) is not supported through this activity.

175.5.9 Preset Conference on warm swact of Audio GWC

An alerting preset call will not be torn immediately after a warm swact of the audio controller GWC. It will continue ringing until expiration of Preset Conference timer, which is datafilled in table PRECONF. However, it is not possible to answer the call. (Note that the timer runs for two cycles).

175.6 Interactions

The existing feature interactions are described below:

If any of the conferees are connected to the CS2000 switch where the preset conference is being originated and has any of the following features,

- Call forwarding don’t answer
- Call forwarding busy
- Call forwarding intragroup

These features will remain active for the incoming preset conference call (if the primary address does not answer call forwarding will be attempted if it is activated).

Interaction of Preset Conference with any other feature other than the above listed ones is not supported and may result in undefined behaviour.

Note: *The fields described in Section 175.5.3 through 175.5.8 must be datafilled as described. It is to be noted that there exists no interface to restrict the office from provisioning the above mentioned ones , the*

maximum conferees in a Preset Conference and the feature interactions (described in Section 2.6). Any inconsistencies or failures that may result from such a provisioning violation should be considered beyond Nortel Networks CallServer2000's control and corresponding problems reported will be subject to immediate closure without further investigation.

176: Functional Description (FN): A00005734

176.1 Feature name

Multiple Time Zone (MTZ) support for CICM lines.

176.2 Description

CICM lines can exist in multiple time zones as there is no geographical limitation that the call server and the agents should co-exist in the same time zone.

With the existing implementation line features, billing, logs etc. work on the switch time for all users irrespective of their local times.

This activty provides Multiple Time Zone (will be called by abbreviation MTZ henceforth) by providing the ability to store the local time of the user on the switch so that the features can be activated in terms of the local time of the user.

Activity A59038784 provided the same functionality for subscriber visible services for IBN and RES sets.

This activity extends the support to CICM KSET lines.

The services addressed by this feature are

a. WUCR (Wakeup Call Request)

b. ARDDN (Automatic Recall Directory Number)

c. QTD (Query Time and Date)

No changes are made to Logs and Billing records.

This new functionality reuses existing table MULTITM which can be datafilled with different time zones along with Day Light Savings if any. The items that can be entered in table MULTITM are shown in Figure 1.

Figure 1 : Items in table MULTITM (Range of MULTITM)

ENTRY NAME	ENTRY TYPE
MTZNAME	MULTITM_KEY
TMSENSE	MODIFY
MINUTES	MTZMINSTYPE
DST	YES_NO
DSTSENSE	MODIFY
DSTMINS	DSTMINSTYPE
STRTYEAR	MTZYEARTYPE
STRTMON	MONTHS
STRTDAY	DAYS
STRTHOUR	HOURS
STRTMIN	MINUTES
ENDYEAR	MTZYEARTYPE
ENDMON	MONTHS
ENDDAY	DAYS
ENDHOUR	HOURS
ENDMIN	MINUTES

Figure 2 shows a sample entry for table MULTITM. It shows that the timezone BERL is offset from the standard by 60 minutes, and that DST of plus 60 minutes begins on March 31st at 0200, and ends on October 27th at 0300.Similarly AZOR is offset with a nagative 60 (behind by 60 mins).

There is one pre-registered key in table MULTITM: 'LOC'. This key is used to show when the time local to the CM is applying DST. This is to cover situations such as the USA and the UK, whose DST start times are often one week apart.

Figure 2: Sample entries in Table MULTITM

```
MTZName TMSense Minutes DST DSTSense DSTmins STRTYear STRTMon STRTDay
STRTHour STRTMin ENDYear ENDMon ENDDay ENDHour ENDMin

LOC POS 0 N POS 0 2002 JAN 1 0 0 2002 JAN 1 0 0

BERL POS 60 Y POS 60 2002 MAR 31 2 0 2002 OCT 27 3 0

AZOR NEG 60 N POS 0 2002 JAN 1 0 0 2002 JAN 1 0 0
```

This activty introduces a new option ‘MTZ’ for KSET lines ,details about this option are:

- This option is a Set option ,can be assigned to any key .(DN key(key 1)or any other vacant key) .

- It is ‘data feature’ option , has one parameter, which is any key in table MULTITM.Table MULTITM is datafilled with different possible timezones.A KSET agent ‘s timezone if different from the switch timezone is configured by associating the corresponding entry in MULTITM through MTZ option

- MTZ option if applied to a Set affects the specified features(QTD.WUCR and ARDDN) on all DN appearances of the set.

- It is ‘Code access ‘ feature , does not require a key press to activate the feature.Also there is no explicit activation required,effective once assigned .

-No Lamp be lit by this option

-MTZ option is applicable to only M5216 LCC (It is the only supported KSET LCC on CICM currently)

Figure 3 shows how to datafill a line with the MTZ option. Figure 4 shows the qdn and qlen output .

Figure 3 : Assigning MTZ option

```

In this example the Set is configured to belong to BERL timezone .This timezone is 60 mins ahead of the switch time (see figure 2 - BERL tuple).

With above datafills if the CM clock is as below,

Date is THU. 26/FEB/2004 16:45:58 ,

Invoking QTD(Query Time and Date) on the KSET set will display

“Date is THU. 26/FEB/2004 **17:45:58**”

176.3 Hardware Requirements or Dependencies

N/A

176.4 Software Requirements or Dependencies

SN07 or equivalent CM load.

176.5 Limitations and restrictions

The information in table MULTITM, including time offsets and start and end points for daylight savings time, will have to be entered manually each year. Since it is up to each country or region to set their own DST dates, any routine to automatically generate these dates is in danger of becoming obsolete very quickly. An effort has been made to make the table as human readable as possible, to make the task of entering the data as easy as it can be.

When adding a tuple to table MULTITM, the starting and ending dates of the DST entries can be at most switch year+1. Any entry with a year greater than that value are rejected.

This activty tests MTZ feature only on CICM KSET line though the implementation is in the switch which does not differentiate a CICM line from other lines like MG9K etc...The feature is not restricted to other lines but as a part of this activity the functionality is tested only on CICM and testing on other lines like lines on MG9K are out of scope.

M5216 is the only LCC supported on CICM currently and is the only affected LCC by this activity.

MTZ assigned on a CICM line affects the date and time on the 3 specified features only viz. ARDDN,QTD and WUCR and does not affect the time provided by the CICM gateway for the Inbox,Outbox etc... on the CICM line.

No changes to billing records or logs for the affected features are included in this activty.

There is no restriction on the number of lines that can have this feature.

176.6 Interactions

This feature alters any customer activated feature where the time of day is a factor. Wake Up Call Request is an obvious example, where the user enters the time at which they wish to receive a call to wake them.The full list is:

1. WUCR (Wake Up Call Request)

2.ARDDN (Automatic Recall Dialable Directory Number)

3.QTD (Query Time and date) - pphone only

177: Functional Description (FN): A00005758

177.1 Feature name

ESUP OVER TELNET SUPPORT

177.2 Description

ESUP, Enhanced SDM Upgrade Procedure, is the recommended upgrade procedure for the SuperNode Data Manager from/to SDM20/CS2E00070.

The Major limitation of ESUP was its restriction on the usage of the Active System console to perform the upgrade. This feature provides the support for performing the ESUP upgrade over remote login sessions (telnet) as well.

This is achieved by the usage of the Open Source third party software 'SCREEN', a full-screen window manager that multiplexes a physical terminal between several processes.

ESUP process is launched with 'SCREEN' support. The usage of 'SCREEN' is transparent to the user.

The framework for a semi-automatic recovery in case of an ESUP failure is also introduced as part of this feature. Semi-automatic recovery here refers to the user initiated recovery procedure to recover the system from upgrade failures.

177.3 Hardware Requirements or Dependencies

No new hardware requirements or dependencies are introduced by this feature.

177.4 Software Requirements or Dependencies

177.4.1 Software requirements for downstream system

No new hardware requirements or dependencies are introduced by this feature.

177.4.2 Software requirements for SDM.

Open Source software 'SCREEN' is to be installed on the system.

177.5 Limitations and restrictions

- 'Telnet' is the only remote login supported.

177.6 Interactions

No

178: Functional Description (FN): A00005986

178.1 Feature name

EM integration with PAM+ proxy

178.2 Description

Succession user authentication services are migrating to a single centralized 3rd party server, which provide authentication services to succession management systems via a Pluggable Authentication Module (PAM) on the SSPSFS platform. By using PAM, Succession management systems can interact with any pluggable authentication technology of a customers choosing, without having to make any changes to succession management applications. The use of a centralized authorization database via PAM also provides the advantage of having a single account management interface for use by all succession management tools.

This feature integrates the CICM-EM into this wider strategy for user authentication on Succession.

The CICM-EM now interfaces to PAM via the HTTPS PAM+ proxy on SSPFS.

The CICM-EM User Interface requires a username/password login. Prior to this feature, only a single user level was supported – which provided full access to all the provisioning, maintenance and admin functions of the CICM-EM. With the introduction of this feature, the CICM-EM can be configured to access the HTTPS PAM+ proxy, passing it the username and password, and the SSPFS then returns a user authentication level to the CICM-EM, or rejects the username and password if they are not a valid combination. This user authentication level is then used by the CICM-EM to restrict access to functions that are not appropriate for particular user groups.

178.2.1 Detail

Prior to this feature, the username and password supplied when logging into the element manager corresponded to local user accounts on the CICM-EM. For SN07 Succession deployments, username and password can be configured to be a global Succession account managed on a centralized authentication database, which interfaces to Succession management tools via the PAM+ proxy located on the SSPFS.

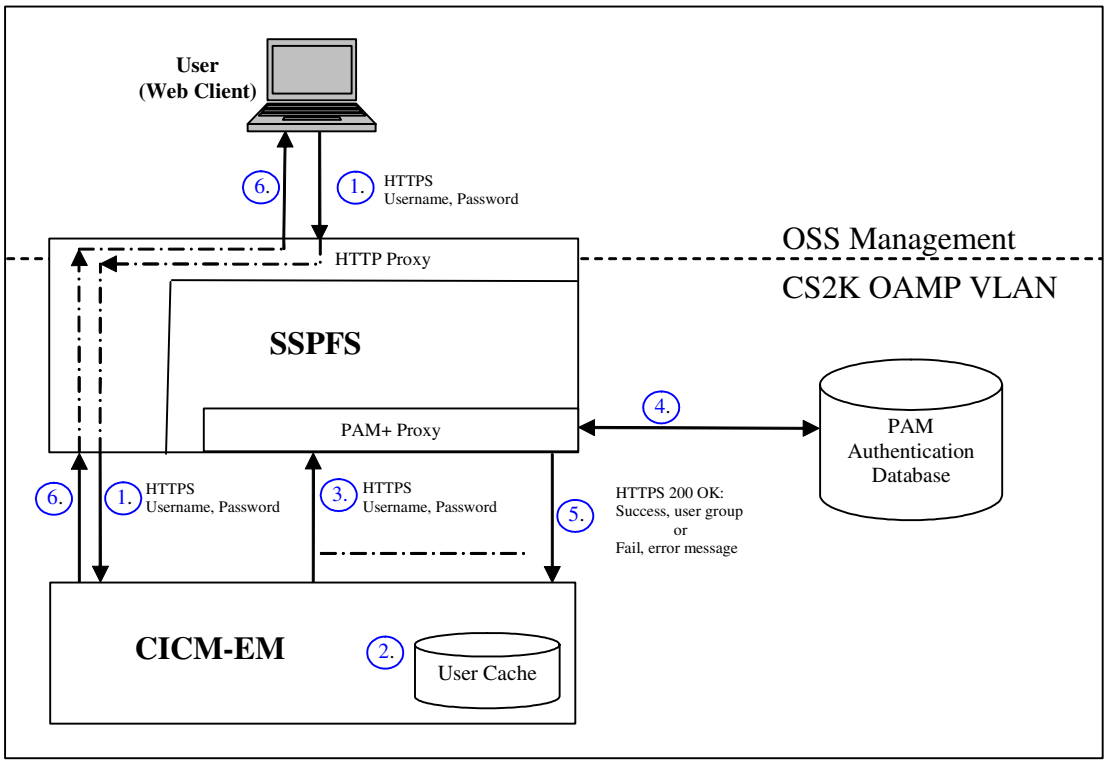
Local user account management and user authentication on the CICM-EM is preserved for TDM deployments, where the SSPFS platform is not used. For

Succession deployments, a method of local user authentication is also provided for use when connectivity is lost to the SSPFS platform.

178.2.2 User authentication via SSPFS PAM Proxy

The behavior provided by CICM-EM user authentication via the PAM proxy running on the SSPFS, is outlined in the functional behavior diagram below.

Functional Behaviour Diagram: HTTPS PAM+ proxy and CICM-EM integration



1 Using a web client, the user attempts to log into the CICM-EM through the HTTP proxy located on the SSPFS. The supplied username and password are for a global Succession user account which is managed on a centralised authentication database. The Web Client sends an HTTPS request to the CICM-EM with the username and password built into the HTTP authentication header.

2 The CICM-EM uses the supplied username and password as a key to search a cache of recently authenticated users. Each user entry in the cache contains a corresponding username and password for a temporary local user account assigned to that user. If the user is present in the cache, the mapped local username and password is passed back to the PAM authenticator and we go directly to step 5 (with successful authentication).

3 The CICM-EM sends an authentication request to the HTTPS PAM+ proxy located on the SSPFS.

4 The PAM+ proxy authenticates the user on a centralised authentication database via PAM.

5 If the authentication is successful, the PAM+ proxy responds with a list of succession user groups to which the user belongs. The CICM-EM has a list of pre-defined local user groups that are equivalent to the user groups returned by the PAM proxy. The CICM-EM creates a temporary local user account on the CICM-EM when a response to a user authentication request is successful. The temporary local user account is added to the pre-defined local user groups that are equivalent to the Succession user groups returned by the PAM proxy.

   Additionally, the CICM-EM adds the authenticated username/password and the corresponding temporary local username/password to the user cache. This entry is held in the local cache for a pre-determined amount of time. Whilst this entry is present in the cache, subsequent authorisation requests for this user do not need to be processed through the PAM proxy. This reduces the processing load on both the CICM-EM and PAM proxy.

   The CICM-EM also replaces the global Succession username/password in the HTTPS authentication request with the username/password of the temporary local user account. The temporary local username and password combination is then authenticated locally by standard user authentication. If the authentication is unsuccessful, then the CICM-EM rejects the user's attempt to log in.

6 If the authentication is successful, then the CICM-EM provides the user with the required webpage. If the authentication is unsuccessful, then the CICM-EM denies access to the requested webpage.

Succession User authentication levels on the PAM+ proxy are organised into five separate domains, with each domain containing 5 separate levels of user authentication. This provides a total of 25 user authentication levels, as shown below:

Access level	**User Domain**				
	Trunks	**Lines**	**MGC**	**MG**	**EMS**
Administrator	trkadm	lnadm	mgcadm	mgadm	emsadm
Read-Write	trkrw	lnrw	mgcrw	mgrw	emsrw
Provisioning	trkprov	lnsprov	mgcprov	mgprov	emsprov
Maintenance	trkmtc	lnmtc	mgcmtc	mgmtc	emsmtc
Read-Only	trkro	lnro	mgcro	mgro	emsro

The PAM proxy returns a list of groups against which the user has been successfully authentication. The user domains relevant to the CICM Element Manager are Lines, MG and EMS.

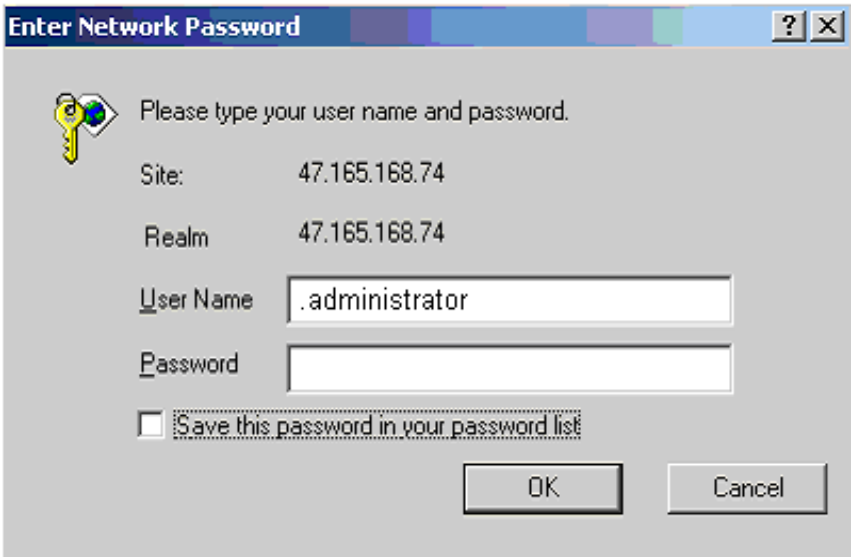
All CICM-EM web pages are configured with access control levels that are appropriate to their functionality.

178.2.3 Local User authentication

Centralised user authentication via the SSPFS PAM proxy is not available to TDM deployments of CICM. In addition, if connectivity is lost between the CICM EM and the SSPFS, it is important to provide the ability to access the CICM-EM to provide continued access to the functionality that it offers.

The CICM-EM will check if it is running in a TDM or Succession CICM deployment before it attempts to process the authentication via the PAM proxy. For TDM deployments, the authentication functionality will immediately pass control of the authentication back to the standard mechanism used for CICM.

For Succession deployments, users will be able to select local authentication by prefixing their username with a period (“.”). This will allow users to access the CICM-EM when the PAM proxy is out of service (provided they have a local user account on the CICM-EM). Therefore, to access the CICM-EM when the SSPFS is not accessible, the user can log in as shown below:



178.3 Configuration

The configuration of the IP address to use for the SSPFS PAM+ proxy is configured during p the EM preboot stage as follows:

Screen capture of initial configuration of the EM

```
+----------------------------------------------------------------
| STEP n  : Configure the SSPFS PAM Proxy
+----------------------------------------------------------------

This CICM Element Manager can use Pluggable Authentication Module (PAM)
on the Succession Server Platform Foundation Software (SSPFS) platform
(if available).

Will this Element Manager use the PAM on the SSPFS to authenticate users?
[Y|N, default=N]:
Y

Will this EM connect to the PAM server using HTTPS [Y|N, default = N]
N

Please enter the IP address of the SSPFS PAM proxy:
1.2.3.4

You have entered the IP address of the SSPFS PAM proxy as 1.2.3.4
Is this correct [Y|N, default=N]
Y
```

The user can select to use HTTP or HTTPS (secure HTTP) to communicate with the PAM proxy. If HTTPS is selected, the user will be prompted to enter the Fully Qualified Domain Name (FQDN) of the PAM server. HTTPS requires that a certificate from a valid signing authority is installed on the SSPFS.

178.4 Hardware Requirements or Dependencies

N/A

178.5 Software Requirements or Dependencies

N/A

178.6 Limitations and restrictions

Authentication using the SSPFS will only occur when the user is accessing the CICM-EM via the web interface. This feature will not change the method used for authenticating users who are logging in using a Telnet session.

178.7 Logs (LG)

This feature interacts with A00003718 “CICM Osmine readiness – Faults, alarms and performance monitoring”, to log the following events on the IEMS:

- User successfully authenticated through PAM.
- User authentication through PAM failed.
- Request Timeout on PAM proxy.

The CICM-EM will also raise an alarm on the IEMS when a request to the PAM proxy times out. This alarm is cleared the next time an authentication request is successfully processed through the PAM server.

179: Functional Description (FN): A00006032

179.1 Feature name

Loop Reversal On Answer (LROA), Loop Reversal on Seizure (LRS) and Insert Tone on Coin Phone Termination (NOCOLL) SN07 Support for Cable & Wireless Caribbean

179.2 Description

This feature will allow the use of the following features in ISN07 (International Call Server) with a North American Toneset on the Passport Packet Voice Gateway (PVG) and on the MG9K:

- Loop Reversal On Answer (LROA)
- Loop Reversal on Seizure (LRS)
- Insert Tone on Coin Phone Termination (NOCOLL) on interworkings with trunks on a PVG

179.2.1 Loop Reversal On Answer (LROA)

Loop Reversal On Answer as detailed in AR0502 “Line option for Line Reversal On Answer” will be supported on IBN line types on the MG9K 32 port Global Line Card (GLC-32).

179.2.2 Loop Reversal on Seizure (LRS)

Loop Reversal on Seizure as detailed in A59008303 “Line option for Line Reversal on Seizure” will be supported on IBN line types on the MG9K GLC-32.

179.2.3 Insert Tone on Coin Phone Termination (NOCOLL) on interworkings with PVG trunks

NOCOLL functionality as detailed in A59008313 “Insert Tone on Coin Telephone Termination” will be supported on interworkings with the following PVG trunks types:

- ETSI ISUP
- ANSI ISUP

The pay phone recognition tone will be played on the trunk when terminating to a IBN line with the NOCOLL option. The characteristics of the tone such as frequency, cadence, level, and repetition are defined by the toneset of the PVG.

179.3 Hardware Requirements or Dependencies

179.3.1 Loop Reversal On Answer (LROA)

The MG9K 32 port Global Line Card is required.

179.3.2 Loop Reversal on Seizure (LRS)

The MG9K 32 port Global Line Card is required.

179.3.3 Insert Tone on Coin Phone Termination (NOCOLL) on interworkings with PVG trunks

A VSP3 or VSP3-o card is required on the PVG.

179.4 Software Requirements or Dependencies

None.

179.5 Limitations and restrictions

All limitations and restrictions for the original LROA, LRS, and NOCOLL are still applicable with the exception of the supported hardware configurations as stated in this FN.

LRS and LROA are only supported on the MG9K GLC-32 card for IBN line types.

Playback of the pay phone recognition tone is only supported on the PVG for ANSI ISUP and ETSI ISUP trunk types. Originations from other trunk types on a PVG terminating to IBN lines with the NOCOLL option will not result in the playback of the pay phone recognition tone.

A VSP3 or VSP3-o card is required on the PVG in order for speech to be heard during the playback of the pay phone recognition tone. The use of VSP2 or older card will cause the calling party to only hear the tone playback for the first 13 seconds of the call. During this time, voice from the called party will not be transmitted.

The use of features such as call waiting, call hold, conference calling are not supported on lines with the LROA option. The use of these features may result in the normalization of the polarity reversal.

LRS and LROA are not supported on lines with the CEPT option.

179.6 Interactions

A line with a service which uses flash can also have the NOCOLL option provisioned. If the line flashes while the tone is being applied, the playback of the tone will be halted.

180: Functional Description (FN): A00006483

180.1 Feature name

Audio Server Node Announcement Capacity Increase to 1280

180.2 Description

This activity provides the capability to increase the number of simultaneous announcement calls which can be supported in the CS2K for an Audio Server Node from 300 to 1280.

180.3 Hardware Requirements or Dependencies

The audio server gateways subtending the Gateway Controller (GWC) that is datafilled as an Audio Server node must have the apppropriate configuration to support 1280 ports.

180.4 Software Requirements or Dependencies

This functionality requires both the Core and GWC to be at the SN07 releases or later.

180.5 Limitations and restrictions

With the ANNC option set to 1280, this reduces the number of conference resources available on for the Audio Server node. Please refer to A89009843 "UAS Announcement Traffic Distribution" for how to calculate conference and announcement availabilty.

Prior to SN06, the ANNC option did not exist. When the Core is upgraded to SN06, the reformat procedure for table SERVSINV assigns by default the ANNC option. The default value specified for the ANNTERMS field is 300 if no other options (i.e. 3PORT or 6PORT) are datafilled. The default value will not change in SN07. If 3PORT or 6PORT is datafilled, the ANNC ANNTERMS value is adjusted accordingly against the value in NUMTERMS. For upgrades from SN06 to SN07, the ANNC option ANNTERMS value is simply transferred.

180.6 Interactions

Not applicable.

180.8 Glossary

Term	Description
GWC	Gateway Controller

181: Design Description excerpts: A00006495

181.1 Feature name

H.323 Flexible Carriers

181.2 Purpose

This SN07 activity enables the addition of H.323 virtual carriers with a size within the range of 4 to 672. The current implementation allocates H.323 virtual carriers in blocks of 24 or 32, based on the market. The new capability will only affect carriers that are defined as the type H.323.

The H.323 Flexible Carrier feature enables customers to allocate small and large groups of endpoints for H.323 gateways. By allowing variable size blocks of endpoints/TIDs (Terminal Identifiers), customers can manage the TID range of a H.323 GWC (Gateway Controller) more efficiently.

The new capability is targeted to customers who don't have OSS (Operations Support System) requirements to provision blocks of endpoints in (24 or 32) increments and support small H.323 systems.

> ***Note:*** If a craftperson adds a H.323 virtual carrier and does not specify a size, the default number of endpoints/TIDs will be allocated (24 North American/32 International).

181.3 H.323 Capacities

The maximum number of gateways that will be supported on a H.323 GWC in SN07 is 254. The PRI data structures on the GWC currently support 168 D channels. Thus, the current maximum number of H.323 gateways is 168. This feature changes the PRI data structures on the GWC to support 254 D channels.

A craftperson can allocate (provision via SESM) 258 H.323 gateways (in the North American market) and virtual carriers with a minimum size of 4. A SN07 H.323 GWC in the North American market can be provisioned with 1032 endpoints/TIDs. A SN07 H.323 GWC in the International market can be provisioned with 1024 endpoints/TIDs. Regardless of the number of gateways provisioned on a GWC, only 254 D channels can be defined on a H.323 GWC after this feature is delivered. D channel provisioning is executed on the core. If an attempt is made to provision a 255th D channel on a H.323 GWC, an error is generated stating that the maximum number of D channels has been exceeded.

The smallest H.323 virtual carrier that can be allocated is 4 endpoints/TIDs. The largest H.323 virtual carrier that can be allocated is 672 endpoints/TIDs. The maximum size of a H.323 virtual carrier was based on the number of B channels that can be mapped to a PRI trunk group on the core in table TRKMEM (671 B channels maximum for a PRI trunk group). A H.323 virtual carrier can be any size within the range of 4 - 672.

H.323 GWC capacities

H.323 GWC Profile	Endpoint Capacity (maximum number of endpoints/TIDs per GWC)	Gateway Capacity (maximum number of gateways per GWC)
H.323_INTL	1024	1024/4 = 256
H.323_NA	1032	1032/4 = 258

181.4 H.323 Gateway Profile Changes

This feature delivers changes to the H.323 gateway profiles:

H.323 gateway maximum reserved terminations

H.323 Gateway Profile	SN06.2 Maximum Terminations	SN07 Maximum Terminations
NORTEL_BCM	64	consult the vendor documentation
SUCCESSION_1000	480	consult the vendor documentation
CISCO_2600	96	consult the vendor documentation
CISCO_3600	384	consult the vendor documentation

WESTELL	64	consult the vendor documentation
CISCO_H323_IOS	N/A	consult the vendor documentation
H323_PROXY	N/A	consult the vendor documentation

181.5 Limitations and restrictions

The limitations of this activity include the following:

- The maximum number of gateways that will be supported on a H.323 GWC in SN07 is 254. A craftperson can allocate 258 H.323 gateways and virtual carriers with a minimum size of 4 but only 254 D channels can be defined on a H.323 GWC after this feature is delivered.
- The smallest H.323 virtual carrier that can be allocated is 4 endpoints/TIDs. The largest H.323 virtual carrier that can be allocated is 672 endpoints/TIDs.
- If H.323 virtual carriers are attempted to be provisioned on a pre-SN07 GWC load, an error is generated detailing that this functionality is not supported in previous releases.

182: Functional Description (FN): A00006496

182.1 Feature name

H.323 Multiple D Channels

182.2 Purpose

This SN07 activity will enable the support of mapping multiple D channels to a single H.323 gateway. The current H.323 implementation on the GWC makes the assumption that there is only ***one*** D channel mapped to a single H.323 gateway. The new capability will only affect H.323 gateways.

The multiple D channel feature provides the support to map more than one trunk group on the core to the allocated TIDs on the GWC. The current maximum number of endpoints supported on a single H.323 gateway by the CS2K is 672.

The new capability enables support of large H.323 systems such as the Succession 1000 H.323 gateway. Once this feature is delivered, a single H.323 gateway can be mapped to the full capacity of a SN07 H.323 GWC (1024 for International/1032 for North American).

182.3 H.323 Capacities

The maximum number of gateways that will be supported on a H.323 GWC in SN07 is 254. The PRI data structures on the GWC currently support 168 D channels. Thus, the current maximum number of H.323 gateways is 168. This feature changes the PRI data structures on the GWC to support 254 D channels.

A craftperson can allocate (provision via SESM) 258 H.323 gateways (in the North American market) and virtual carriers with a minimum size of 4. A SN07 H.323 GWC in the North American market can be provisioned with 1032 endpoints/TIDs. A SN07 H.323 GWC in the International market can be provisioned with 1024 endpoints/TIDs. Regardless of the number of gateways provisioned on a GWC, only 254 D channels can be defined on a H.323 GWC after this feature is delivered. Thus the maximum number of H.323 gateways that can provide call processing is 254**.** D channel provisioning is executed on the core. If an attempt is made to provision a 255th D channel on a H.323 GWC, an error is generated stating that the maximum number of D channels has been exceeded.

The smallest H.323 virtual carrier that can be allocated is 4 endpoints/TIDs. The largest H.323 virtual carrier that can be allocated is 672 endpoints/TIDs. The maximum size of a H.323 virtual carrier was based on the number of B

channels that can be mapped to a PRI trunk group on the core in table TRKMEM (671 B channels maximum for a PRI trunk group). A H.323 virtual carrier can be any size within the range of 4 - 672.

H.323 GWC capacities

H.323 GWC Profile	Endpoint Capacity (maximum number of endpoints/TIDs per GWC)	Gateway Capacity (maximum number of gateways per GWC)
H.323_INTL	1024	1024/4 = 256
H.323_NA	1032	1032/4 = 258

182.4 H.323 Gateway Profiles

H.323 gateway maximum reserved terminations

H.323 Gateway Profile	SN06.2 Maximum Terminations	SN07 Maximum Terminations
NORTEL_BCM	64	consult the vendor documentation
SUCCESSION_1000	480	consult the vendor documentation

CISCO_AS5300	384	consult the vendor documentation
WESTELL	64	consult the vendor documentation
CISCO_H323_IOS	N/A	consult the vendor documentation
H323_PROXY	N/A	consult the vendor documentation

182.4.1 H.323. Maintenance Model

The H.323 maintenance model will be changed by this feature. A H.323 D channel will come into service once a H.323 gateway successfully registers

with a H.323 GWC. If a H.323 gateway has multiple D channels, all the D channels will be brought into service once a H.323 gateway successfully registers. If at least one D channel comes into service the registration process will be successful.

A craftperson must take all the D channels out of service to successfully "de-register" the H.323 gateway. If at least one D channel remains in service the gateway will not be "de-registered".

182.5 Trunk Group Configuration

To support the mapping of multiple D channels or trunk groups to a single H.323 the configuration of the trunk groups must be identical. The translations, customer group, services, etc. must be provisioned on the core to be the same so there isn't any difference in services or terminations. Services and call routing via one trunk group or a different one mapped to the same H.323 gateway must be transparent to a user.

A H.323 gateway and the associated trunk group(s) must be mapped to only one GWC. A H.323 gateway can't be associated with two GWCs.

182.6 GWC Changes

The GWC software must be updated to support the Multiple D Channel feature. The changes focus on changing the D channel TID selection algorithm within the H.323 GWC application and the H.323 maintenance code on the GWC.

- Update the H.323 GWC maintenance application. The current H.323 GWC maintenance implementation assumes that there is only ***one*** D channel per H.323 gateway. The assigned TID range of the H.323 gateway must be traversed to capture all the mapped D channels.

The support of mapping multiple D channels to a single H.323 gateway changes the maintenance model. The changes include:

- Only ***one*** D channel is required to come into service for a H.323 gateway to successfully register.
- A H.323 gateway will be "unregistered" if ***all*** D channels are manually taken out of service. If a craftperson successfully executes the maintenance commands "BSY; BSY INB;" for all of the mapped D channels, the gateway will be unregistered. If any of mapped D channels do not reach an "INB" state, the gateway will not be unregistered.

182.7 Limitations and restrictions

The limitations of this activity include the following:

- The maximum number of gateways that will be supported on a H.323 GWC in SN07 is 254. A craftperson can allocate 258 H.323 gateways and virtual carriers with a minimum size of 4 but only 254 D channels can be defined on a H.323 GWC after this feature is delivered.
- A craftperson must post **all** the D channels when manually “unregistering” H.323 gateways with multiple D channels.
- Multiple commands must be executed to manually “unregister” a H.323 gateway with multiple D channels. A utility does not exist to BSY INB all D channels mapped to a single H.323 gateway.
- A craftperson must “keep track” or capture all the mapped D channels of a H.323 gateway to manually “unregister” the respective gateway. A craftperson can capture the D channel mappings by traversing table TRKSGRP on the core to determine the D channel(s) of a H.323 gateway. The TMM (Trunk Maintenance Manager) application can be used to provide the D channel mappings of a H.323 gateway and to “unregister” the gateway by executing the proper maintenance commands. The D channels are not explicitly listed when querying the endpoint data via TMM but the information is listed.

183: Functional Description (FN): A00006639

183.1 Feature name

MG9K Overload OM pegs

183.2 Description

When a Media Gateway 9000 (MG9K) begins to reach an overload threshold call connections request are denied. This condition can occur on an ITP, ABI or at the nodal level (DCC). A llog is currently generated corresponding to the line or trunk which requested the connection.

Overload condition occurs when the MG9K has reached a threshold where subsequent calls with the exception of calls marked ‘essential or emergency’ must be denied to prevent further catastrophic degration of the MG9K node.

In SN07 an Operational Measurement (OM) register will be incremented for every connection which is denied. A new OM group GWOVLOM will be defined and the register OVERLOAD will be incremented upon connection denial.

In SN07 feature ‘A00004430 - SVC Failure OMs’ introduced the ability to peg OMs for ATM switched virtual circuits call failures. It pegs the logical group of the MG9K for calls which involve lines hosted off the ITP boards and it pegs the hosting legacy XPM peripherals directly connected to the ABI DS512 pack for calls involving lines subtending the ABI board.

To be consistent in pegging OMs this feature will follow the same model.

When a connection is denied for a call originated or terminated on an ITP board, i.e. a native MG9K call, the register associated with the logical group will be pegged. MG9Ks are indentified as ‘logical groups’ because the CS2K is not aware on the MG9Ks on a nodal basis. In SN06.2 the feature ‘A00002607 ABI XPMSITE and MG9K Location support on the Core’ provided the first step towards recognizing ABI XPM and MG9K on a nodal basis. However currently only ABI ‘nodes’ are recognized in the CS2K.

If the connection is denied for a call which originates or terminates on an agent which is subtending an ABI board, the OM peg will occurr on the hosting XPM which is directly connected to the DS512 pack on the ABI board. Currently the hosting XPMs which can be pegged are LTCs, SMA2s, LGCs.

For ABI connection failures line or RCC trunk could be rejected and pegging will be done for either one on the hosting XPM node.

Figure-1 shows how the level where the OM register will be pegged.

184: Functional Description (FN): A00006693

184.1 Feature name

XA-Core IO Capacity Monitoring Toolset

184.2 Description

The IO Capacity monitoring toolset (IOCAP) provide the customer telemetry for messaging over HIOP and HCMIC.

XA-Core counts messages and bytes for each service. Software on the XA-Core accesses the measurements, calculates the messaging occupancy level, and displays the results on the IOCAP MAPCI level and the IOCAP OM group.

This feature will cause no more than 3% capacity degradation to IO capacity.

184.2.1 IOCAP MAPCI display

Following is a prototype of the IOCAP MAPCI display, which will subtend from the CAPACITY level. The display will be updated once per minute.

```
CATMP/HR   SMS/HR VLR_UPD/HR  CAP ENGBHCA CCOVRLD CMICOVRLD PESC
  303001      180     398700  128  233643    OFF       OFF    NO

Service IOUTIL%  TxMsg/s  TxSize RxMsg/s  RxSize
   ETHR      64    15324     107   13234      91
   CMIC      17     4102     202    1254     102
   AMDI       0        0       0       0       0
```

The Service column identifies the type of IO service (Ethernet, CMIC, or AMDI). IOUTIL is the calculated percentage utilization of the available system messaging capacity, based on the known IO system capacity, the average rate through other services on the same card, and the throughput on other cards. TxMsg/s, TxSize, RxMsg/s and RxSize report average transmit and receive message rates and sizes through that service. Because the MAPCI display is updated once per minute, high water mark information will not be displayed.

184.2.2 IOCAPCI tool

The information in the MAP display is also available through the IOCAPCI tool, in addition to the following tools:

- one month's history of hourly high water mark percent utilization for each service (Ethernet, CMIC, and AMDI), similar to DMSMON HIGHCAP.
- one month's history of hourly average percent utilization for each service.
- current hour and last hour utilization and throughput for each service

An example of the CMIC high water mark data follows. A similar output will be available for each service.

```
> iomax cmic
Maximum CMIC Utilization
                                                    Hour

               0          0           0       0
               0          0           0
```

The IOCAP OM provides measurements of messaging rates and sizes for each service. The IO_SERVICE_TYPE indicates the service provided. IOUTIL refers to percentage utilization of the services on the switch. IOHWM refers to the highest level that the corresponding utilization has reached in the sample period. TxMSG/S, TxSIZE, RxMSG/S and RxSIZE report the average transmit and receive message rates and sizes through the service. The IOTHRESH register is pegged every time the service average utilization for one minute exceeds the value of new OFCENG office parameter IO_WARNING_THRESHOLD. This register is intended to give the customer a flexible warning that they are approaching the need to upgrade their IO system.

184.2.4 Office parameter

A new office parameter in table OFCENG, IO_WARNING_THRESHOLD, indicates the minimum IO service utilization at which the IOTHRESH register in the IOCAP OM will be pegged.

184.3 Hardware Requirements or Dependencies

This feature is unavailable for CMIC, Ethernet and AMDI packlets (NTLX05AB, NTLX09AA, NTLX05BA respectively).

This feature is supported on all versions of NTLX04 HIOP cards and NTLX17 HCMIC cards.

184.4 Software Requirements or Dependencies

None.

184.5 Limitations and restrictions

This feature will be submitted into CSP21 and patched back to CSP20.

When the system is in transition from IOP to HIOP, the utilization of all IO services are not be available.

184.6 Interactions

The MAPCI level display will subtend from the CAPACITY MAP level. It will be shown as an option from that level.

Term	Description
New term	Definition

185: Functional Description (FN): A00006741

185.1 Feature name and Feature ID

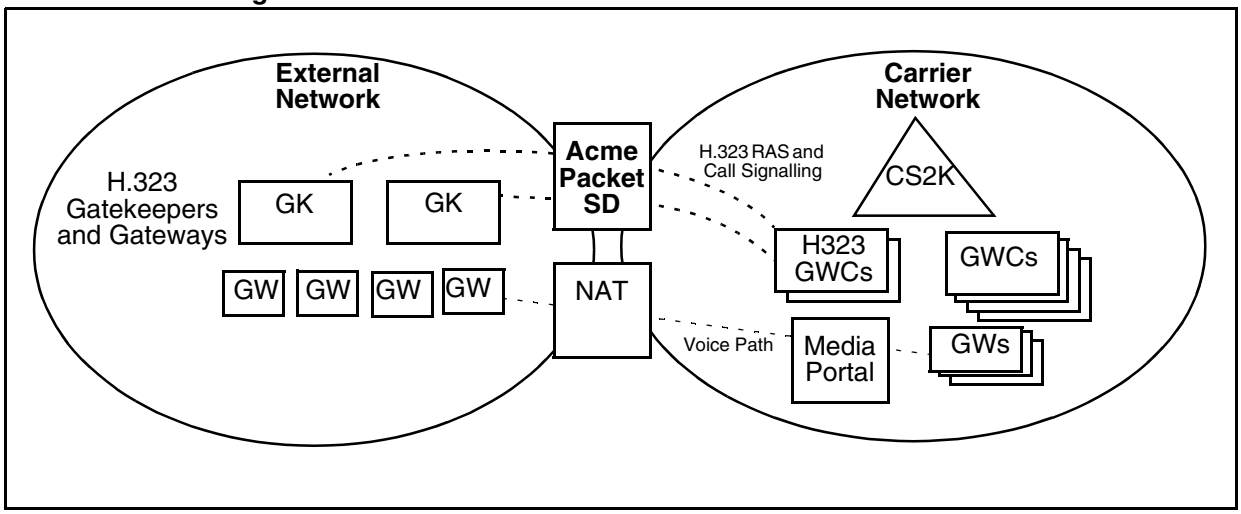
A00006741: H.323 Gatekeeper to CS2K Gatekeeper Interworking

185.2 Description

This feature supports interworking (call routing) between H.323 Gatekeepers in an external network and a CS2K H.323 Gatekeeper (GWC) on a carrier network. The external network could be an enterprise network, another carrier's network, or any other private or public network.

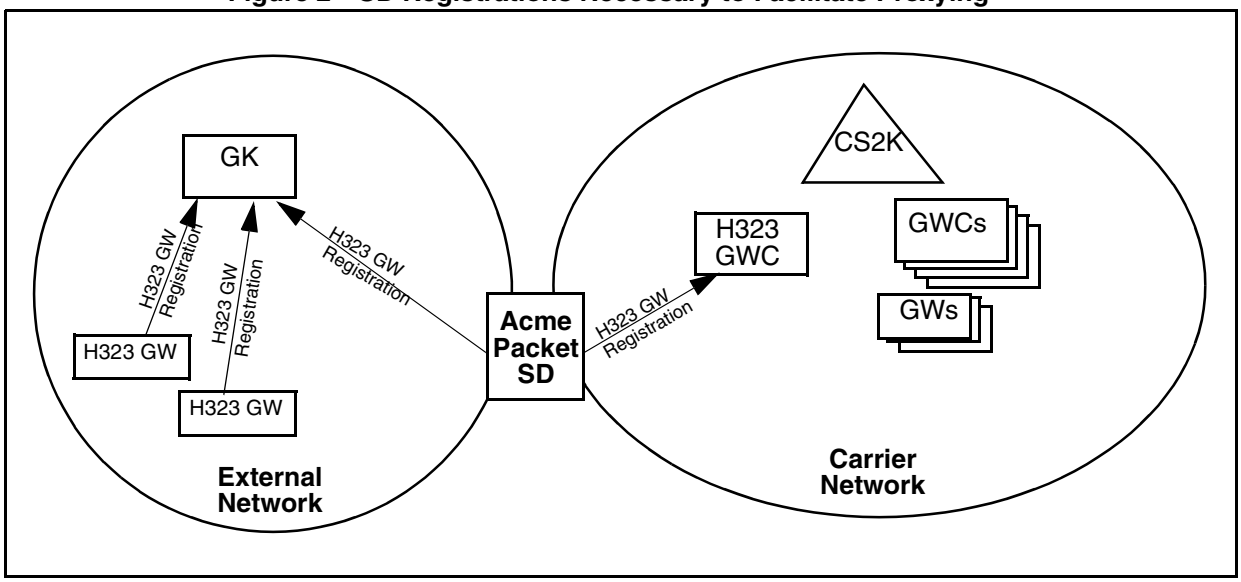
The solution uses an Acme Packet Session Director (**SD**) to proxy H.323 messaging between Gatekeepers in an external network and an H.323 GWC on the Carrier network. Voice is not routed through the SD as part of this solution, therefore, a NAT (middlebox) is required to route voice between the two networks. Figure 1 shows a very high level overview what is supported.

Figure 1 Feature Overview



As shown in Figure 1, this activity allows calls from Gateways (GWs) that are registered with External Gatekeepers (GKs) to route calls via the Gatekeeper and Acme Packet SD to the CS2K using H.323. To facilitate this, the Acme SD registers as an H.323 Gateway with both an external Gatekeeper and with the CS2K H.323 GWC as shown in Figure 2. In this way, the SD acts as a back-to-back H.323 gateway, routing calls from one gatekeeper to the other. Both gatekeepers (external and H.323 GWC) view the SD as a registered H.323 gateway that can originate and terminate calls.

Figure 2 SD Registrations Necessary to Facilitate Proxying



185.2.1 Example Call Flows

With the SD registered as an H.323 Gateway with both gatekeepers, a call would be routed from an external gateway to the CS2K as follows:

- An external H.323 gateway (H323 GW) originates a call, sends H.323 signalling to the external Gatekeeper (GK).
- The GK routes the call to the SD, basically treating the SD as a terminating H.323 gateway. Neither the GK, nor the originating H323 GW, is aware that the SD actually proxies the call to a CS2K on the carrier network.
- When the SD receives the incoming H.323 call from the originating H323 GW (or GK), it immediately originates a call on the carrier network by sending H.323 signalling to the H.323 GWC. From the H.323 GWC's perspective, this appears as a new call originating from an H.323 gateway (the SD). The fact that the call actually originated on the external network from another H.323 gateway, via an external GK, is transparent to the CS2K.
- The call is translated through the CS2K to a terminating GWC/GW and the call is set up end to end from the external H.323 GW (originator) to the terminating agent on the CS2K (with voice routing through a NAT and media portal, not the SD). A list of supported terminating agents (gateways) off the CS2K is in Section 2.6.3.

A call from the CS2K to an external H.323 gateway registered with an external gatekeeper would be the opposite:

- A CS2K-hosted gateway makes a call and CS2K routes the call to the SD H.323 PRI trunk via call translations which results in H.323

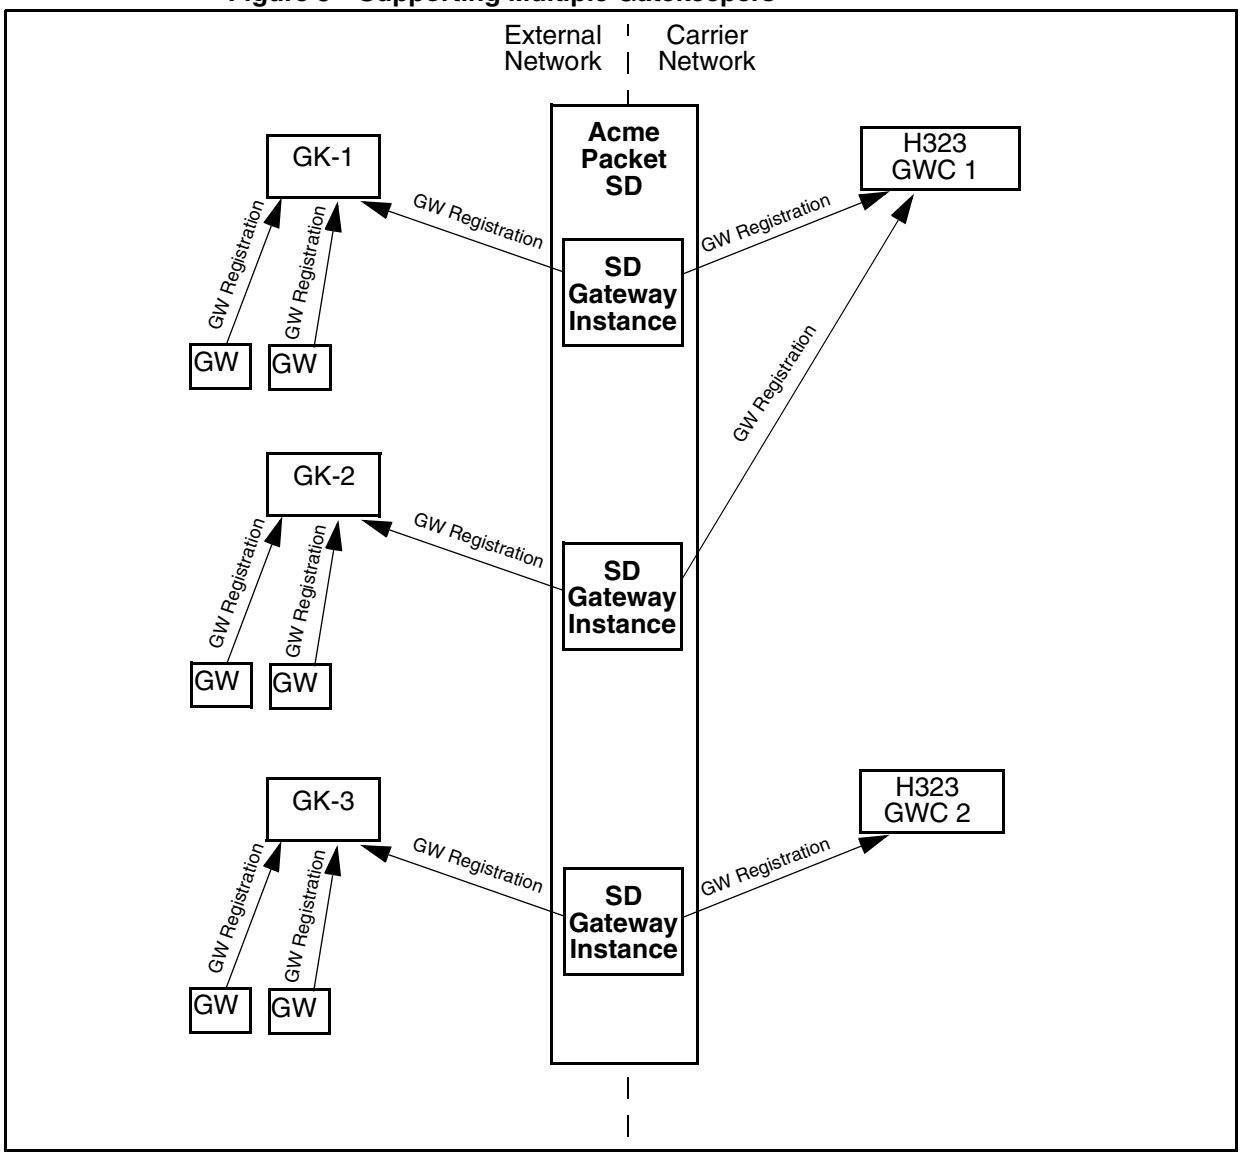
messaging sent to the SD. Again, the CS2K views the SD as a terminating H.323 gateway.

- The SD initiates a call on the external network by sending H.323 signalling to the external gatekeeper (GK). From the GK's perspective, this is a new call originating from an H.323 gateway (the SD).
- The GK routes the call to the appropriate registered H323 GW and the call is set up end to end from the CS2K originating gateway to the external H.323 gateway.

185.2.2 Interworking with Multiple External Gatekeepers

The SD supports interworking between multiple external gatekeepers and GWCs. This is done by configuring multiple back-to-back gateway instances in the SD as shown in Figure 3.

Figure 3 Supporting Multiple Gatekeepers



This is a logical view only, intended to show how the SD can support multiple gatekeepers - it does not show all the nodes that must be provisioned in the SD in order to support this (provisioning is discussed in Section 2.5).

Each external gatekeeper (GK-1, GK-2, and GK-3) is represented to the CS2K by a unique SD Gateway Instance. Each of these will register with one external gatekeeper, and one GWC. Multiple SD Gateway instances can register with a single GWC, as indicated in the figure - two are registered with GWC 1.

The key concept here is that each SD Gateway Instance that registers with an H.323 GWC is basically a gateway that represents an external gatekeeper and

all gateways that are registered with that external gatekeeper. The GWC has no direct knowledge of the external gatekeeper or any of its subtending gateways. Instead it views each SD Gateway Instance simply as an H.323 Gateway that can originate and terminate calls. Also of importance is that multiple SD gateway instances can be registered with a single GWC.

185.3 Hardware Requirements or Dependencies

- Acme Packet Session Director (SD)
- NAT Router (for media between external network and Carrier Network or DMZ)
- Media Portal
- Succession Call Server

185.4 Summary of Customer Impacting Changes

185.4.1 CS2K Provisioning Changes

The CS2K has no knowledge of the gatekeepers or gateways on the external networks. Therefore, provisioning on the CS2K is limited to simply provisioning the Acme Packet SD Gateway Instances as H.323 gateways, both in SESM and core trunk datafill. Because of specific behaviors of the SD, there are two customer facing changes when provisioning a SD in SESM:

1. A new gateway profile has been added
2. Multiple gateways can be provisioned, all sharing a single IP address

185.4.1.1 New Gateway Profile: H323_PROXY

All SD gateway instances are provisioned in SESM with the new profile `H323_PROXY`.

185.4.1.2 Multiple Gateways with Single IP Address

The SD can register multiple gateway instances with one GWC, all using a single IP address. This requires new functionality in SESM, although from a customer perspective, it is functionality provided by removing some existing error checking. Specifically, prior to SN07, a gateway could not be associated in SESM if its IP address was already in use by another provisioned gateway. This restriction is removed in SN07 to support GK-GK Interworking. Two conditions must be met, however, in order to add multiple gateways with a single IP address:

- Each gateway must be provisioned with **Protocol type** H.323 (6)
- Each gateway must be provisioned with **Protocol port** 0.

There are some configuration related considerations for various fields when adding SD gateway instances in SESM (detailed discussed in Section “185.5 Configuration and Provisioning” on page 1979), but the new profile and ability

to provision multiple gateways with a single address are the only actual SESM changes in terms of customer visibility.

185.4.1.3 Implications of Provisioning an H.323 Gateway with Port 0

Provisioning a gateway with **Protocol port** 0 in SESM has three effects:

1. It indicates that the gateway requires **automatic port discovery**. This means the gateway's protocol port is not known at provisioning time, so the port must be discovered (by the GWC) when the gateway registers (the initial registration message from the gateway to the GWC contains the port). All Acme SD and Cisco IOS gateways require auto port discovery. Other gateways can be provisioned as auto port discovery as well.

   Prior to SN07, we only supported Cisco gateways as auto port discovery gateways, and this was done based on the gateway profile name. Although port 1719 was the supported (and default) port to use when provisioning Cisco gateways, in reality it didn't matter what port was provisioned since Cisco gateways were always treated as auto port discovery gateways. No other gateway types could be provisioned as auto port discovery.

   Beginning in SN07, any gateway, regardless of its profile, can be treated as auto port discovery by setting the Protocol port as 0. This means that all Cisco and Acme SD gateways must be provisioned with port 0, since they are all auto port discovery gateways.

2. For gateways behind a NAT, it indicates that the gateway has a 1:1 NAT mapping, as opposed to N:1 NAT mapping. The GWC assigns the gateway's H.323 signalling port based on whether the gateway is mapped 1:1 or N:1 by the NAT. Gateways provisioned as 1:1 (port = 0) will be assigned call signalling port of 1720. Gateways provisioned as N:1 (port = anything other than 0) will be assigned a call signalling port of provisioned port + 1.

3. It is a necessary condition in order to add a gateway with the same IP address as another provisioned gateway.

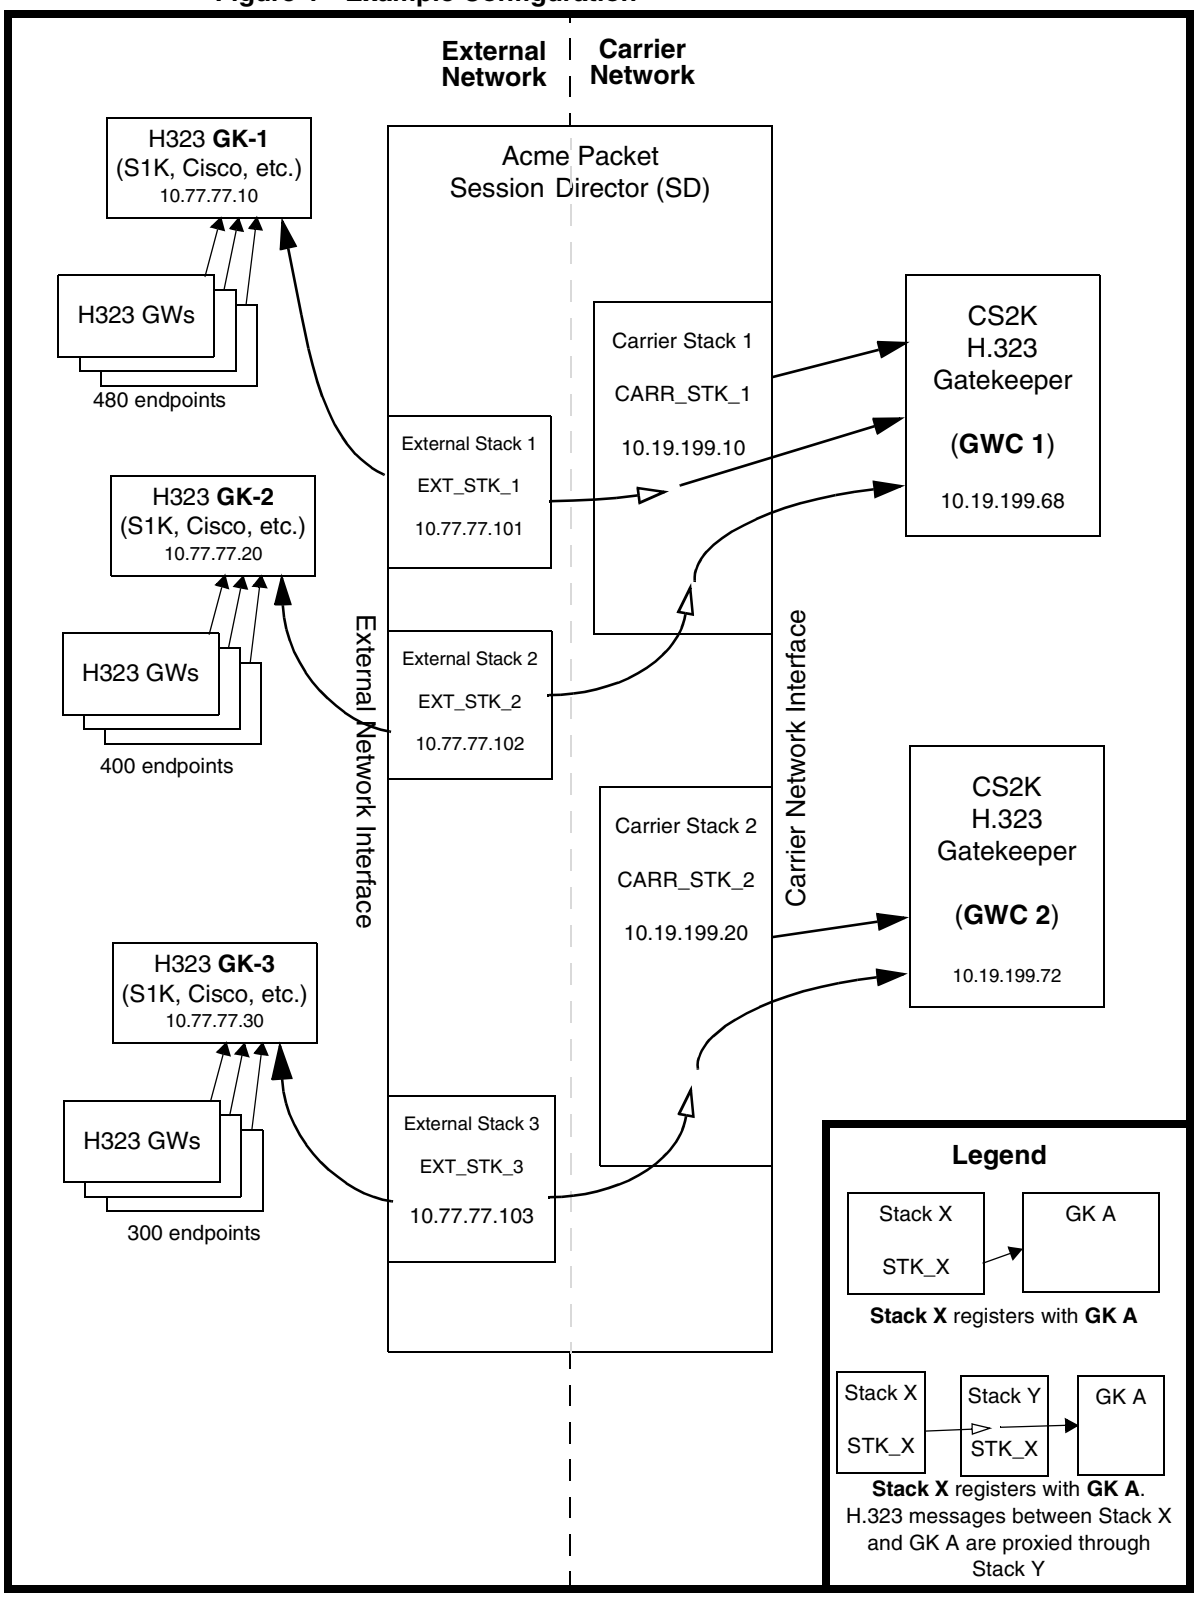
185.4.2 Acme Packet Session Director (SD) Configuration and Provisioning

The Acme SD is a required node in this solution. As such, it requires installation and "ground-up" provisioning which will likely be new to the customer. This document provides detailed SD configuration and provisioning requirements that are pertinent to supporting Gatekeeper to Gatekeeper Interworking. It does not, however, cover basic SD provisioning and configuration. It is expected that the customer will have access to documentation and/or other product support mechanisms provided by Acme Packet.

185.5 Configuration and Provisioning

This section discusses GK-GK Interworking configuration and provisioning, referring to the example configuration shown in Figure 4.

Figure 4 Example Configuration



185.5.1 Configuration Overview

The example in Figure 4 shows how one might configure interworking between three Gatekeepers (GK-1, GK-2, and GK-3) on an *external network* (or networks) and two GWCs subtended off a CS2K on the *carrier network*. The external gatekeepers may be on the same external network, or on different external networks.

185.5.1.1 Session Director Properties

To configure an SD to support Gatekeeper to Gatekeeper Interworking, there are some important SD characteristics to understand:

1. **The SD has two physical network interfaces that route all media including H.323 messaging.** These can be ethernet or optical ports depending on the hardware. The SD is capable of routing voice and other real-time media on these two physical interfaces; but in this solution, voice will not be routed through the SD (it will route through a NAT and media portal). So in general, these two physical interfaces will handle all H.323 signalling into and out of the SD.

   - One of these two physical interfaces should be connected to the Carrier Network.
   - The other should be connected to one or more External Networks. Connecting a SD physical interface to multiple External Networks is done through advanced IP network configuration and is beyond the scope of this FN, but it is supported by the SD.

   In Figure 4, the carrier network interface is logically shown as the right edge of the SD. The external network interface is logically shown as the left edge of the SD.

   The SD has additional physical interfaces including a serial console port, and three ethernet (wancom) ports that can be configured for maintenance access, including telnet and ftp, or as direct links to a redundant SD to support data sync. These are not shown in the example and provisioning these is beyond the scope of this FN - refer to Acme Packet documentation and/or product support.

2. **Multiple H.323 *Gateway instances* (stacks) can be configured on a single SD device.** The objects we have been referring to as “gateway instances” or “back-to-back gateway instances” up until now are provisioned as **stacks** in the Acme SD. In Figure 3, we have five stacks configured - each basically has properties of a unique H.323 gateway.

3. **Each SD stack can be associated to one, and only one, network interface.** When a stack is configured on the SD, it can be mapped to use either one of the two physical interfaces described in (1) above, but not both. For example, in Figure 3, *External Stack 1* is associated with the external network interface, and the IP address assigned to it must be an external network address. As such, it will be unable to directly send messages out to, or receive messages from, the carrier network.
4. **Each SD stack must have one unique IP address.** This is a requirement on the SD and ports are not considered part of the IP address for this rule - when provisioning the SD, each stack must be assigned a unique IP address. Again, this must be a reachable address on the network this stack is associated with.

185.5.1.2 SD Stack Proxying

The last two characteristics above (3 and 4) present obstacles when configuring the SD to register a stack with GKs on both networks. Specifically, we cannot simply provision a single stack to register directly with both an external gatekeeper and a GWC because each stack can have only one IP address, and can be mapped to only one physical network interface.

To get around this, the SD allows a stack to access a physical network, other than the one it is directly associated with, by proxying messages through another stack. For example: External Stack 1, being associated with the external network interface, is unable to send/receive messages on the physical interface. So we will provision Carrier Stack 1 as an associated stack (**assoc-stack**) against External Stack 1. When External Stack 1 needs to send a message to the carrier network, for example a registration request to the GWC, it will send the message to Carrier Stack 1. Carrier Stack 1 will proxy the message to the GWC on the carrier network.

One side effect of this proxying is that the IP address in messages being proxied through the carrier stack will be changed from External Gateway 1's address (10.77.77.101) to Carrier Stack 1's address (10.19.199.10). This is important because it means that when provisioning External Stack 1 in SESM, we will assign it Carrier Stack 1's IP address. In fact, all of the external stacks registering with a GWC via a carrier stack will be provisioned in SESM with the carrier stack's address. When they register with the GWC, they will each have a unique RAS port, and they have unique H323_IDs. Since we won't know at provisioning time what RAS port each stack will have, the port should be provisioned as 0. Provisioning an H.323 gateway in SESM with port 0 can be considered a flag that indicates that the port will be auto-discovered at registration time (see xxx).

When the GWC sends messages to External Stack 1, for example, it sends them to Carrier Stack 1's IP address. Carrier Stack 1 will proxy the message to the appropriate external stack based on the RAS port, H323_ID, or both.

185.5.1.3 Determining the number of stacks provisioned against a GWC

To support the proxying described in the previous section, it is clear that exactly one *carrier stack* must be provisioned against, and registered with, each H.323 GWC.

The number of *external stacks* provisioned against a GWC will be determined based on the number of endpoints required by each external GK.

So, the total number of provisioned stacks on each GWC will be:

Number of external stacks + 1 carrier stack

Again, all of the stacks provisioned in SESM against a single GWC, carrier and external, will have the same IP address - the carrier stack's local IP address.

The example in Figure 4 shows that External GK-1 has four H.323 gateways registered with it in the external network, and a total of 480 endpoints off those gateways. We can assume, perhaps, that there are 4 gateways with 120 endpoints each. So the maximum number of simultaneous calls between External GK 1 and the GWC is:

4 GWs **x** 120 endpoints = **480**

This means External Stack 1 will need 480 reserved terminations (endpoints) provisioned against it in both the CS2K and the SD.

Similarly, External Stack 2 requires an additional 400 terminations to support the gateways registered with External GK 2, and External Stack 3 requires 300 reserved terminations to support External GK 3. These are just arbitrary numbers used in the example.

Thus, the total number of reserved endpoints required by all three external gatekeepers is:

480 (GK 1) + 400 (GK 2) + 300 (GK 3) = **1180**

This exceeds the capability of a single GWC, which can only support 1032 (North American) or 1024 (International) H.323 endpoints. Thus two GWCs are required, as shown in the example.

185.5.1.4 Provisioning Sequence

This section provides the sequence for provisioning the example shown in Figure 4. Detailed provisioning instructions are provided in Sections 2.5.3 (carrier stacks) and 2.5.4 (external stacks).

The general sequence for configuring the example shown is:

1. Provision both carrier stacks in SESM (See Section "185.5.3.1 Carrier Gateway SESM Provisioning" on page 1986)
   a. Add the stacks in SESM by associating each one as a gateway against an H.323 GWC. Exactly one carrier stack per GWC is required. CARR_STK_1 should be associated with GWC 1 and CARR_STK_2 should be associated with GWC 2.
   b. Add four carrier ports for each stack in SESM. Although only one is actually needed, for the d-channel, 4 is the minimum number that can be added in SESM. B-channels are not needed for the carrier stacks, since these stacks are only used to proxy messages to/from the external stacks. It is the external stacks that actually originate and terminate calls, so they will require b-channels.
2. Add trunk datafill in the core for each carrier stack. No trunk members are required for carrier stacks. (See Section "185.5.3.2 Carrier Gateway Core Provisioning" on page 1988)
3. Add each carrier stack in the SD with the following properties (see Section "185.5.3.3 Carrier Gateway Session Director Provisioning" on page 1988). SD provisioning is done via a command line interface in the SD itself (that is, there is no element manager). How to access and use this interface is beyond the scope of this FN - refer to Acme documentation and/or product support.
   a. Associate both stacks with the carrier network interface. This is a multi-layer association: A **stack** is associated with a **realm**; a realm is associated with a **network-interface**, a network interface is associated with a **physical interface**.
   b. Assign each stack carrier network local IP (**local-ip**) addresses (10.19.199.10 and 10.19.199.20 in the example).
   c. Add the IP address of each stack to the **hip-ip-list** in each stack's associated **network interface**. This step is critical and often overlooked since the hip-ip-list field is not part of the stack provisioning tuple, but rather is under network-interface provisioning. Without this step, the stacks will not be able to send messages via the carrier network.
   d. Assign each stack a **gatekeeper** address - this will be the stack's respective GWC address (10.19.199.68 and 10.19.199.72 in the example).
   e. Assign the **maintenanceProxy** option to each stack

After completing these three steps, the carrier stacks will begin sending registration attempts to the GWCs, the GWCs will confirm these requests, and the stacks will be successfully registered with the GWCs.

4. Provision each of the three external stacks in SESM (see Section "185.5.4.1 External Gateway SESM Provisioning" on page 1990).
    a. Add the stacks in SESM by associating each it as a gateway against an H.323 GWC. It must be the same GWC that carrier stack that will proxy H323 messages is provisioned against. Assign the gateway the same IP address as its associated carrier stack's local IP address.
    b. Add sufficient carrier ports in SESM to support the maximum number of endpoints each stack will need, based on the number of endpoints registered with the external GK the stack represents. (See Section "185.5.3.1 Carrier Gateway SESM Provisioning" on page 1986)
5. Add trunk datafill in the core for the stack, including one TRKMEM per carrier port provisioned in SESM in step 4b (see Section "185.5.4.2 External Gateway Core Provisioning" on page 1991).
6. Add the stacks in the SD (see Section "185.5.4.3 External Gateway Session Director Provisioning" on page 1992) with the following properties:
    a. All three stacks are associated with the *external network interface*
    b. All three stacks are assigned external network addresses (10.77.77.101, 10.77.77.102, 10.77.77.103)
    c. Each stack is provisioned with its respective external GK address (10.77.77.10, 10.77.77.20, and 10.77.77.30)
    d. Stacks External Stack 1 and External Stack 2 are associated with Carrier Stack 1.
    e. Stack External Stack 3 is associated with Carrier Stack 2
7. Provision each stack in its respective external GK, if necessary. This step is optional on Cisco GKs but required on S1000 GKs.

After completing steps 4 through 7, the external stacks will begin sending registration attempts to their respective external GKs; the GKs will confirm these requests; and the stacks will be successfully registered.

Next, the stacks will begin sending registration attempts to their respective GWCs on the carrier network, *proxying these requests through the carrier stacks*. The GWCs will confirm these requests (*also proxied through the carrier stacks*), and the stacks will be successfully registered with the GWCs, as well as with the external GKs.

At this point, calls can be routed between the external GKs and the GWCs based on routing in the GKs and core translations (neither of which is addressed in this FN).

Note: External stacks will not be able to proxy messages to the carrier network if its associated carrier stack is not successfully registered. This is important to consider when debugging configuration/provisioning/registration issues.

185.5.2 Maintenance Proxying

Maintenance proxying is a functionality on the SD that is specific to gatekeeper to gatekeeper interworking. Understanding the role of maintenance proxying will be useful in debugging configuration/provisioning/registration issues.

Some brief background: when an H.323 Gateway (any profile) successfully registers with a GWC, the gateway's PRI trunk d-channels and b-channels transition to "in service" state (INS) in the core. The trunk being in service should imply that we should be able to now terminate calls to this trunk and the call should complete, at least to the far end of the trunk. In the case of H.323 Gateways, the implication is that the gateway is in service and is capable of originating/terminating calls - otherwise it would not be registered.

This model breaks down somewhat when external stacks on a SD are registering with the GWC. The reason is that, an external stack could successfully register with a GWC, even if it is not successfully registered with an enterprise GK. The result in this case would be that the stack's trunk in the core would go INS, when in reality, there are no agents on the external side of the SD to terminate a call to, since the stack is not even registered with an external GK.

To solve this, the SD practices maintenance proxying. Basically, an external stack will attempt to register with a GK on the carrier network (GWC) **only** if it is successfully registered with an external gatekeeper. Similarly, once it is successfully registered with both a GK and GWC; if the stack, for any reason, unregisters with the external GK, then it will immediately unregister from the GWC. This behavior results in a trunk state on the core that is more reflective of the stack's readiness to process calls. When a stack's trunk is INS, this always implies that the stack is registered with an external GK and, in theory, is able to process calls.

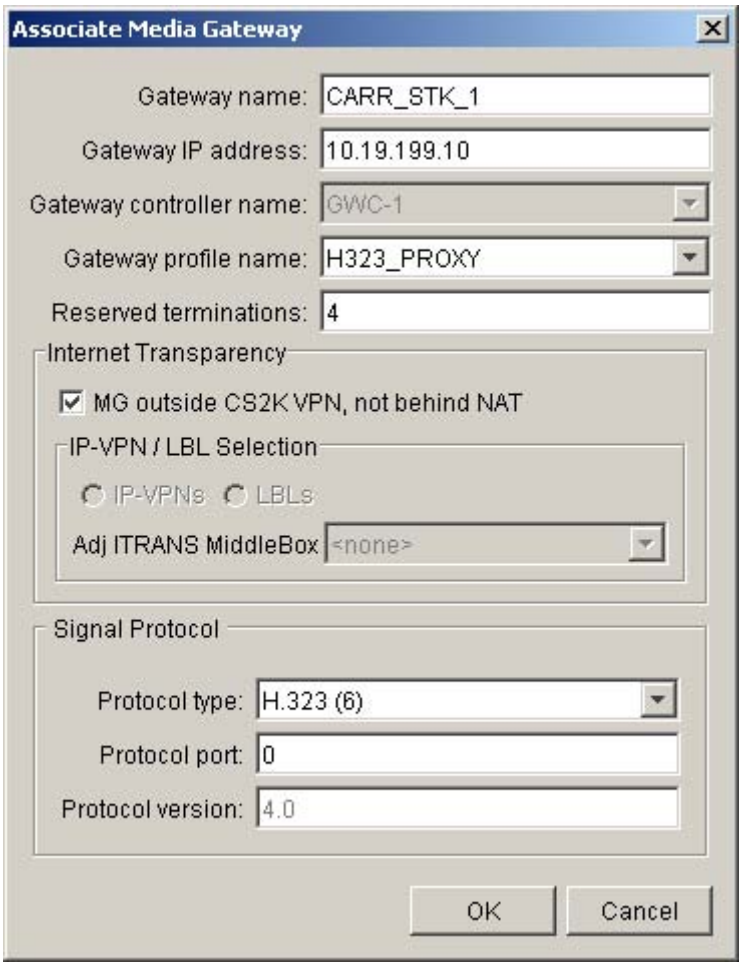
185.5.3 Configuring Acme SD *Carrier Stacks*

This section discusses details on provisioning carrier stacks.

185.5.3.1 Carrier Gateway SESM Provisioning

Figure 5 shows example SESM provisioning for Carrier Stack 1. (CARR_STK_1). The gateway will be associated against GWC 1. Carrier Stack 2 would be similarly provisioned against GWC 2.

Figure 5 Example SESM Provisioning - Carrier Stack 1

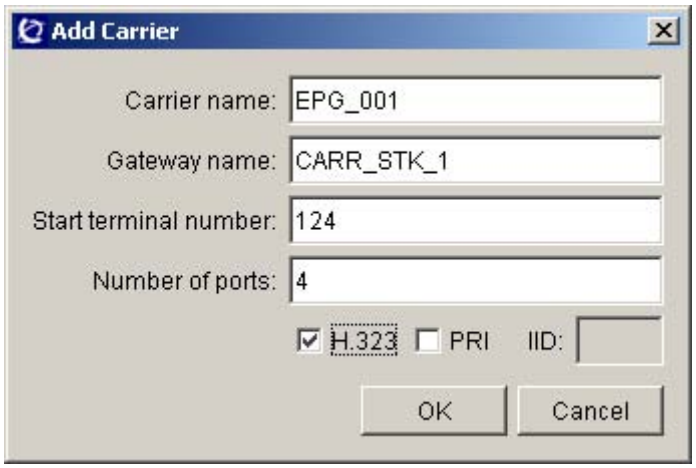


Fields that are significant to GK-GK interworking include:

- **Gateway Profile name: H323_PROXY**
  This **new profile** should be used for all Acme Packet SD Gateways (stacks).
- **Reserved terminations: 4**
  This gateway (stack) should be provisioned with the minimum reserved terminations (4). We actually only need one, for the d-channel, but four is the minimum number that can be added.
- **MG outside CS2K VPN, not behind NAT**
  It is not necessary to associate a NAT for this gateway (stack). This field can be checked or left blank. An **Adj ITRANS MiddleBox** should not be selected in either case.
- **Protocol port: 0**
  H323_PROXY gateways should always be provisioned with a signalling protocol port of 0.

After the gateway is associated, a carrier must be added for this gateway in SESM. Provision the carrier just like any other H323 gateway - there are no carrier group changes specific to GK-GK interworking.

Figure 6 Example SESM Provisioning - Add Carrier for Carrier Stack 1



Fields that are significant to GK-GK interworking:

- **Reserved terminations: 4**
  Only one port is required for this gateway (the d-channel). However, 4 is the minimum number SESM currently allows.

185.5.3.2 Carrier Gateway Core Provisioning

An H323 trunk group should be added to core datafill that maps to the gateway provisioned in SESM in section "185.5.3.1 Carrier Gateway SESM Provisioning" on page 1986. There are no core datafill changes specific to this feature - the trunk should be datafilled just like any H323 trunk group. It is not necessary to provision any b-channels for carrier stacks.

185.5.3.3 Carrier Gateway Session Director Provisioning

Example configuration for Carrier Stack 1 on the Acme SD is shown below:

```
h323-stack
        name                            CARR_STK_1
        state                           enabled
        isgateway                       enabled
        realm-id                        carrier_ntwk
        assoc-stack
        local-ip                        10.19.199.10
        max-calls                       1
        max-channels                    2
        registration-ttl                50
        terminal-alias
                                        h323-ID=CARR_STK_1
        prefixes
        ras-port                        1719
```

```
 auto-gk-discovery             disabled
 multicast                     0.0.0.0:0
 gatekeeper                    10.19.199.68:1719
gk-identifier
 q931-port                     1720
 alternate-transport
 q931-max-calls                880
 h245-tunneling                enabled
 fs-in-first-msg               disabled
 call-start-fast               disabled
 call-start-slow               disabled
 media-profiles
 process-registration          disabled
 options                       maintenanceProxy
 anonymous-connection          enabled
 proxy-mode                    H245
 filename
 last-modified-date            2004-05-06 09:38:59
```

The **name** field has been assigned the value **CARR_STK_1** in the example, although this could be named anything and is only used as an identifier for this stack. The field in which the name is important is **terminal-alias** which needs to include the h323-ID that was provisioned in SESM. In this case, **h323-ID=CARR_STK_1**.

The **realm-id** field points to a provisioned realm on the SD that is associated with the carrier network interface. Provisioning realms, network interfaces, and physical interfaces on the SD is beyond the scope of this FN - refer to Acme Packet documentation or product support.

The **assoc-stack** (associated stack) field should be left blank for this stack.

The **local-ip** (local IP address) is assigned an available address on the carrier network (10.19.199.10).

The **q931-max-calls** field indicates the maximum number of calls supported by this stack. It should be assigned the number of resources necessary to support all endpoints off the external stacks that will use this carrier stack to proxy messages to a GWC. In our example, we have determined that External Stack 1 requires 480 max calls, and External Stack 2 requires 400. Therefore, Carrier Stack 1 must support **880** calls.

The **gatekeeper** field is assigned the GWC address and port 1719 (standard RAS port).

The **maintenanceProxy** option indicates that these stacks will be used to proxy H.323 maintenance and call processing messaging to the GWCs from other SD stacks.

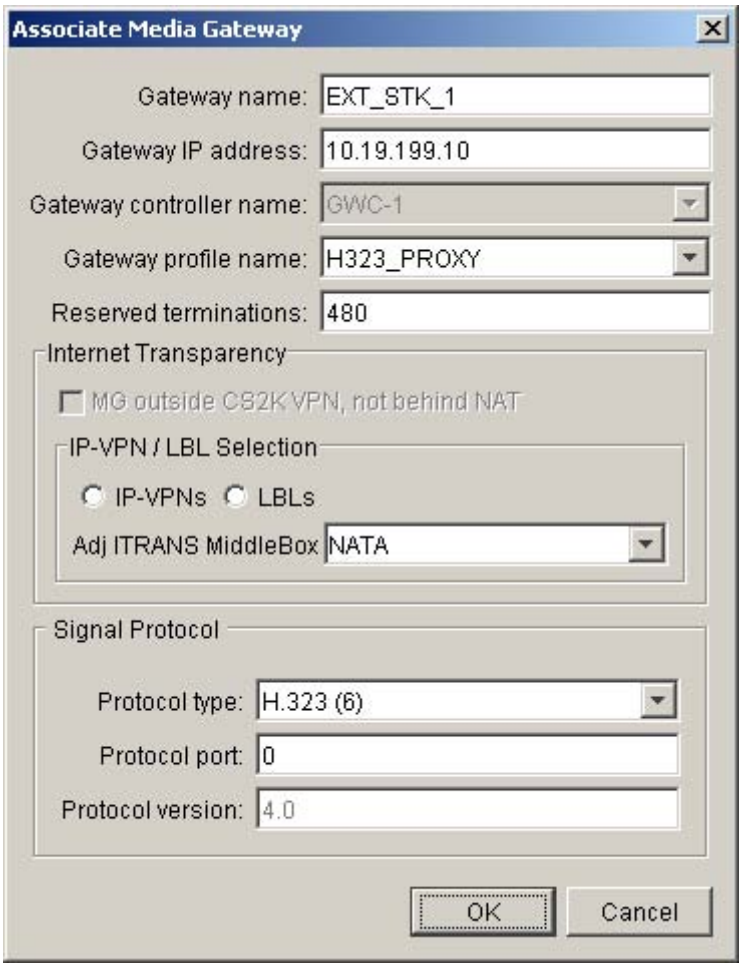
185.5.4 Configuring Acme SD *External Stacks*

External Stacks 1, 2, and 3 (EXT_STK_1, EXT_STK_2, and EXT_STK_2) will register with GK-1, GK-2, and GK-3, respectively, on the external network(s), as well as with GWC-1 and GWC-2 on the carrier network. These gateways will proxy H.323 calls through the SD. This section walks through provisioning for External Stack 1.

185.5.4.1 External Gateway SESM Provisioning

Figure 7 shows example SESM provisioning for External Stack 1. The gateway will be associated against GWC 1. External Stack 2 would also be provisioned against GWC 1, and External Stack 3 would be provisioned against GWC 2.

Figure 7 Example SESM Provisioning - External Stack 1



Fields that are significant to GK-GK interworking include:

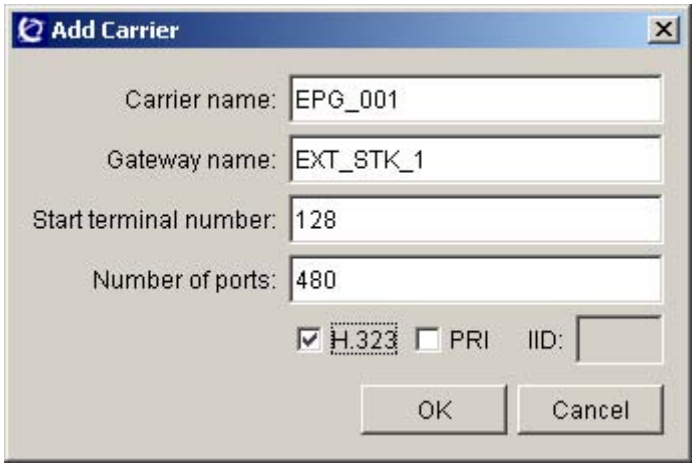
- **Gateway IP address: 10.19.199.10**

Messaging from the External Gateway to the GWC will be proxied via the Carrier Stack - thus we provision Carrier Stack 1's IP address here.

- **Gateway Profile name: H323_PROXY**
  This **new profile** should be used for all Acme Packet SD Gateways (stacks).
- **Reserved terminations: 480**
  Reserved terminations should be populated with the total number of calls supported between the CS2K and the external GK represented by this stack (480 in our example).
- **Adj ITRANS MiddleBox: NATA**
  A NAT should be added for the external network that GK-1 resides in.
- **Protocol port: 0**
  H323_PROXY gateways should always be provisioned with a signalling protocol port of 0.

After the gateway is associated, a carrier must be added for this gateway in SESM. Provision the carrier just like any other H323 gateway. Refer to Figure 8.

Figure 8 Example SESM Provisioning - Add Carrier for External Stack 1



The **number of ports** represents the supported calls between the CS2K and the gatekeeper represented by the external stack (480 in our example).

185.5.4.2 External Gateway Core Provisioning

An H323 trunk group should be added to core datafill that maps to the gateway provisioned in SESM in section "185.5.4.1 External Gateway SESM Provisioning" on page 1990. There are no core datafill changes specific to GK-GK Interworking - the trunk should be datafilled just like any H323 trunk group. In this example, 480 trunk members (b-channels) should be added for EXT_STK_1.

185.5.4.3 External Gateway Session Director Provisioning

Example configuration for External Stack 1 on the Acme SD is shown below:

```
h323-stack
        name                            EXT_STK_1
        state                           enabled
        isgateway                       enabled
        realm-id                        enterprise_z
        assoc-stack                     CARR_STK_1
        local-ip                        10.77.77.30
        max-calls                       480
        max-channels                    4
        registration-ttl                50
        terminal-alias
                                        h323-ID=EXT_STK_1
        prefixes
        ras-port
        auto-gk-discovery               disabled
        multicast                       0.0.0.0:0
        gatekeeper                      10.77.77.10:1719
        gk-identifier
        q931-port                       1720
        alternate-transport
        q931-max-calls                  480
        h245-tunneling                  enabled
        fs-in-first-msg                 disabled
        call-start-fast                 disabled
        call-start-slow                 disabled
        media-profiles
        process-registration            disabled
        anonymous-connection            enabled
        proxy-mode                      H245
        filename
        last-modified-date              2004-05-06 09:38:59
```

The **realm-id** field points to a provisioned realm on the SD that is associated with the external network interface. Provisioning realms, network interfaces, and physical interfaces on the SD is beyond the scope of this FN - refer to Acme Packet documentation or product support.

The **assoc-stack** (associated stack) field points to the carrier stack that will proxy messaging for this stack to/from the GWC. EXT_STK_1's associated stack is CARR_STK_1.

The **local-ip** (local IP address) is assigned an available address on the external network.

The **q931-max-calls** field indicates the maximum number of calls supported by this stack. It should be assigned the number of resources necessary to support all endpoints off the external GK (480 in our example).

The **maintenanceProxy** option is *not* added to this gateway.

185.6 Hardware Requirements or Dependencies

185.7 Software Requirements or Dependencies

185.8 Limitations and restrictions

185.8.1 Supported GK Devices

GK-GK interworking is supported between the CS2K GK and the following GKs

- Cisco 36xx (IOS 12.2.24)
- Cisco 72xx (IOS 12.2.24)
- Nortel S1000 (Succession Rls 3)

185.8.2 Supported H323 Gateways

GK-GK interworking is supported between the CS2K GK and the following GWs. That is, these Gateways can be registered with the Gatekeepers listed in section 2.6.1.

- Cisco 26xx (IOS 12.2.24)
- Cisco 36xx (IOS 12.2.24)
- Cisco 37xx (IOS 12.2.TBD)
- Nortel S1000 (Succession Rls 3)
- Nortel S1000M (Succession Rls 3)
- Nortel BCM (Version 3.6)

185.8.3 Supported CS2K Interworking

Interworking is supported between any combination of gateway and gatekeeper pairs listed in sections 2.6.1 and 2.6.2, and the following:

- Cisco 26xx (IOS 12.2.24)
- Cisco 36xx (IOS 12.2.24)
- Cisco 37xx (IOS 12.2.TBD)
- Nortel S1000 (Succession Rls 3)
- Nortel S1000M (Succession Rls 3)
- Nortel BCM (Version 3.6)

Non-H323 Gateways

- PVG

- Mediatrix
- CICM
- UAS
- MG9000
- SIP-T (VRDN)
- SIP-T (NGSS)
- MCS

185.8.4 GWC Limitations

The same H.323 GWC capacity requirements apply to SD stacks as to any other H.323 gateways - specifically, only 1032 (NA) or 1024 (international) endpoints are supported off a single GWC. The engineering decision of how many external stacks can be provisioned against a single GWC should be based on how many endpoints are represented by each external stack. Each stack represents the combined number of endpoints on all the external gateways registered with the external gatekeeper the stack is registered with.

185.8.5 Acme Session Director Limitations

- Maximum BHCA: currently unknown/uncharacterized
- Maximum simultaneous calls: Tiered based on license
- Maximum number of provisionable stacks: approximately 100-200
- Maximum number of provisionable endpoints per stack: this is manually engineered based on the licensed number of simultaneous calls and the number of provisioned stacks. For example, if 100 stacks are configured and a license allows for 8,000 simultaneous calls, then the maximum number of endpoints per stack would be 8000/100 = 80 (on average).
- Failover speed: depends on the outage type but anywhere from 40 ms to 300 ms should be expected

185.9 Interactions

185.10 Glossary

Term	Description
New term	Definition

186: Functional Description (FN): A00007063

186.1 Feature name

A00007063 SN07 Corrective CAF H.323 Gateway Profile Changes

186.2 Description

The current design to limit the number of endpoints that can be assigned to a specific gateway via the CS2M (CS2K Management Tools) is to set a maximum reserved terminations value in the respective gateway profile. The maximum reserved terminations value is set in the GWC EM (Gateway Controller Element Manager) database during initial installation and upgrades. The values are set per release and cannot be changed dynamically by a craftperson.

A better solution has been adopted to manage the number of endpoints a single H.323 gateway can have allocated towards it.

A single gateway cannot be assigned more endpoints/TIDs than the maximum reserved terminations value of the assigned gateway profile.

H.323 gateways are different than most supported Succession gateways from a capacity perspective. A number of H.323 gateways do not have physical limitations. H.323 gateways have many variables that determine the maximum number of simultaneous calls:

- What is the hardware platform the H.323 gateway application is running on?
- How much memory does it have?
- Which hardware version?
- Which software version?

Determining the proper maximum capacity for a H.323 gateway from release to release is inaccurate. Nortel's H.323 gateways' maximum reserved termination values are difficult to properly set during a given release. H.323 third party gateways are even more difficult.

The solution is to set the maximum reserved termination values for all the H.323 gateway profiles to the maximum capacity of a H.323 GWC. The maximum reserved terminations value for a H.323 gateway is now restricted by the GWC not the gateway profile maximum reserved termination setting. Instead of the design team trying to manage the capacities of Nortel and third party H.323 gateways, our customers will configure the number of desired

endpoints against H.323 gateways. Nortel will no longer dictate the maximum capacity of a third party H.323 gateway supported by the CS2K.

Nortel documentation will direct our customers to the respective gateway vendor documentation for the maximum capacities of the supported H.323 gateways.

The maximum number of endpoints that can be assigned to a single H.323 gateway in SN07 will now be the capacity of a H.323 GWC. If an attempt is made to associate more endpoints/TIDs to a H.323 gateway than the capacity of a H.323 GWC, the request is rejected and an error message is generated.

186.2.1 H.323 Capacities

A SN07 H.323 GWC in the North American market can be provisioned with 1032 endpoints/TIDs. A SN07 H.323 GWC in the International market can be provisioned with 1024 endpoints/TIDs.

Note: The SN07 H.323 GWC capacities have not changed from SN06.2.

A H.323 virtual carrier can be any size within the range of 4 - 672.

Table 1 H.323 SN07 GWC capacities

H.323 GWC Profile	Endpoint Capacity (maximum number of endpoints/TIDs per GWC)
H.323_INTL	1024
H.323_NA	1032

The H.323 gateway profiles have been consolidated and updated by setting the maximum reserved terminations values to the capacity of the H.323 GWC.

The updated SN07 H.323 gateway profiles are listed in Table 2, “H.323 gateway maximum reserved terminations,” on page 1997.

Note: The H.323 gateway profiles that are being removed are designated by the “***~~strike through~~***”.

Table 2 H.323 gateway maximum reserved terminations

H.323 Gateway Profile	SN06.2 Maximum Terminations	SN07 Maximum Terminations
NORTEL_BCM	64	1032 for NA 1024 for INTL (please consult the vendor documentation for the recommended maximum)
~~NORTEL_BCM_NA~~	~~48~~	~~48~~
SUCCESSION_1000	480	1032 for NA 1024 for INTL (please consult the vendor documentation for the recommended maximum)
CISCO_2600	96	1032 for NA 1024 for INTL (please consult the vendor documentation for the recommended maximum)
CISCO_3600	384	1032 for NA 1024 for INTL (please consult the vendor documentation for the recommended maximum)

TID	Terminal Identifier
TMM	Trunk Maintenance Manager
TN	Terminal Number

187: Functional Description (FN): A00007211

187.1 Feature name

H.323 GWC600 Log Changes

187.2 Purpose

Log report GWC600 indicates an Info Log for a H.323 failure with a failure reason that indicates specifically what happened.

The current GWC600 log does not adhere to the log formatting standards as described in IEMPG.AF01. Not adhering to the requirements often makes the log in question unsupportable or difficult to support in the OSS.

This SN07 activity will modify the existing H.323 GWC600 log format to follow a generic OSS log framework. These changes will impact both the NA and international versions of H.323.

187.2.1 GWC Changes

The H323 application will generate formatted GWC600 logs to adhere to the OSS requirements. The formatted logs are sent to the syslog customer log interface. The fields in the log body are defined and populated in the H323 application.

The header is changed from "H323 LOG MESSAGE" to something not H323 specific, but more function-indicating, like "Protocol Event". So we won't have to define GWC601 as "SCTP Event" and GWC602 as "TCP event", and etc. The log body is modified as well.

After the changes, for H323 the GWC600 log will look like:

RTPG GWC11 GWC600 MAY21 14:54:47 0895 INFO GWC Protocol Event
Category: Communication
Component Id: GWC=GWC-11-UNIT-0;LINK=BCM_RTPG
Specific Problem: H323 keepAlive RRQ rejected
Description: D-Channel Out Of Service

Logs for other applications will follow the same framework, and will look something like:

RTPG GWC11 GWC600 MAY21 14:54:47 0895 INFO GWC Protocol Event
Category: Communication
Component Id: GWC=GWC-11-UNIT-0;LINK=ABI_1_2_3
Specific Problem: SCTP packet NACK
Description: SCTP association re-established

and

RTPG GWC11 GWC600 MAY21 14:54:47 0895 INFO GWC Protocol Event
Category: Communication
Component Id: GWC=GWC-11-UNIT-0;LINK=CS2M_IP_ADDR
Specific Problem: SNMP ASN.1 format error
Description: Message from 47.142.108.100 dropped

188: CR: Q00681924

188.1 Name

AIN Response Simplification

188.1.1 Problem

In some instances, the application of SOC code AIN00026 (Translation Simplification Phase II) creates a situation in which the CDP query and AR response repeat in a loop until the value of AIN_MAX_SERIAL_TRIGGERS is exceeded in table OFCENG.

188.1.2 Resolution

Every second time the PUB_NET_ACC code matches the CDP trigger code, the CDP trigger does not happen, so no loop occurs.

For example, the first match allows the CDP trigger to occur, and the second match prevents the CDP trigger.

If the call flow hit this scenario a third time, the CDP trigger would occur, then the fourth time the CDP trigger would not occur. However, it is highly unlikely that multiple hits would occur.

Fault Management (FM)

Introduction

This chapter describes impacts to fault management, such as logs and alarms, for the features planned for this release. Only those features with fault-management impacts are listed.

Featid	Title
A00001893	MG9K Imaging
A00002012.AA13	XA-Core CMIC/RTIF HIOP Maintenance Software
A00002013.AA06	Intelligent Network T1 Timer Expiry Message Suppression
A00002020.AB10	ESA Translation Download
A00002146.AA09	MAPCI ABI Link Test & Legacy Comparison

A00005375	New Shelf Discovery Alarms

2008

1: Fault Management (FM): A00001893

This feature, MG9K Imaging, introduces two new logs; a new node type customer log and a new MG9K Audit log. Both logs are new numbers in an existing series for each type.

Document Name:

MG9K_Image_FM.fm; A00001893/A00001894

Document Version:

/main/pnmdoc/3

1.1 Fault management strategy

No additional tools are implemented by this feature. Customer and Audit logs for this feature are generated via the existing log software in the MG9K Element Manager.

1.2 Fault management tools and utilities

This feature utilizes the fault management tools provided by the MG9K Element Manager application.

Customer logs are generated by the Element Manager application and are based on the processing of node logs received from the MG9K gateway.

Audit logs are generated by the Element Manager and are based on maintenance actions performed by the craft person only at the Element Manager console.

1.3 Logs

1.3.1 New MGEM 714 Audit Log

This log is generated whenever a user attempts to image an MG9K device.

1.3.1.1 Format

The following table is an example of the new MGEM 714:

Oct 2 14:37:14 wnc0s00v MGEM:joeuser 714 Software Image Requested MG9K: U16 [16]

Table 1 Field Description for the MGEM log

Field	Description	Example
Date/Time	Date and Time stamp of the log	Oct 2 14:37:14
Host Name	Host machine name	wnc0s00v
Application Name	Specifies the application producing the log	MGEM
User Name	User name attempting the action	joeuser
Log Number	The log number	714
Log Text	Specifies the action attempted and any associated details.	Software Image Requested MG9K: U16[16]

1.3.1.2 Action

No action is required.

1.3.1.3 Associated Operational Measurements or Performance Measurements

None.

1.3.1.4 Additional Information

None.

1.3.2 New NE609 Software Image Log

This new log is generated whenever a user executes an image request.

1.3.2.1 Format

The following is an example of what the new log might look like:

NE609 OCT6 11:06:14 0029 INFO MG9K Software Image Event

Imaging: NE Number: 7 NE Name: PL7 Card Type: DS1

Image Type: Card Type

Image Action: Image

Image Status: Image Completed

Time: Thu Oct 02 18:17:11 EDT 2003

1.3.2.2 Action

If the Image Status field indicates a failure, the user may want to attempt to image the device again.

1.3.2.3 Associated Operational Measurements or Performance Measurements

None.

1.3.2.4 Additional Information

None.

1.4 Related documentation

SN06.2 MG9K Logs

2: Fault Management (FM): A00002012

2.1 Fault management strategy

This feature does not change the fault management strategy of the XA-Core.

2.2 Fault management tools and utilities

This feature does not change the fault management tools and utilities of the XA-Core.

2.3 Logs

2.3.1 CMIC XAC log changes

Since this feature introduces port/link separation for the CMIC functionality on HIOP, the XAC information and action logs will now show the new CMIC port device, in addition to the CMIC packlets and CMIC links. The feature does not change the format of either the information or action logs.

- CMIC packlets and CMIC links on packlet are going to be shown the same way as before (no port/link separation for CMIC packlets),
- CMIC ports and links on HIOP will have the packlet field left blank.

The XAC610 log is chosen to show the difference.

Current XAC610 Log for CMIC packlet:

```
XA506AX     XAC610 JAN29 06:37:35 8000 RTS  Returned To Service
        DESCRIPTION: State has changed from SYSB to INSV by RECOVERY action
        CARD:   Type State Site FL Row Bay    Shf/Slt/Pk    EqPEC/Serial
                CMIC INSV  HOST 01 A00 DPCC:00 00 15R L  NTLX05AB/NNTM171VY7C0
```

Current XAC610 Log for CMIC link on packlet:

```
XA506AX     XAC610 JAN29 06:37:35 8000 RTS  Returned To Service
        DESCRIPTION: State has changed from SYSB to INSV by MS-MTCE action
        LINK:   Type State Site FL Row Bay    Shf/Slt/Pk/Lk    EqPEC/Serial
              CMIC INSV  HOST 01 A00 DPCC:00 00 15R L  1  NTLX05AB/NNTM171VY7C0
```

New XAC610 Log for CMIC port on HIOP (packlet field blank):

```
XA506ax XAC610 MAR05 17:54:47 1200 RTS  Returned To Service
        DESCRIPTION: State has changed from SYSB to INSV by RECOVERY action
        PORT: Type State Site FL Row Bay    Shf/Slt/Pk/Pt EqPEC/Serial
              CMIC INSV  HOST 01 A00 DPCC:00 00 15R    1 NTLX17AA/NNTM64422MWV
```

New XAC610 Log for CMIC link on HIOP (packlet field blank):

```
XA506ax XAC610 MAR05 17:54:47 1200 RTS  Returned To Service
        DESCRIPTION: State has changed from SYSB to INSV by MS-MTCE action
        LINK: Type State Site FL Row Bay    Shf/Slt/Pk/Lk EqPEC/Serial
              CMIC INSV  HOST 01 A00 DPCC:00 00 15R    1 NTLX17AA/NNTM64422MWV
```

2.3.2 RTIF XAC log changes

Since this feature introduces port/link separation for the RTIF functionality on HIOP, the XAC information and action logs will now show the new RTIF link device, in addition to the RTIF packlets and RTIF ports. This feature does not change the format of either the information or action logs.

- RTIF packlets are going to be shown the same way as before,
- RTIF port representation on packlets will be changed to RTIF links: Llink0 and Link1,
- RTIF ports and links on HIOP will have the packlet field left blank.

The XAC610 log is chosen to show the difference.

Current XAC610 Log for RTIF packlet:

```
XA506BH      XAC605 MAR05 10:11:02 6800 INFO RTIF Alarm Cleared
        DESCRIPTION: State has changed from MBSY to INSV by MANUAL action
        CARD: Type State Site FL Row Bay    Shf/Slt/Pk   EqPEC/Serial
              RTIF INSV  HOST 01 A00 DPCC:00 00 04R U NTLX08AA/NNTM171P3G37
```

Current XAC610 Log for RTIF port on packlet (port will be obsoleted):

```
XA506BH      XAC605 MAR05 10:11:02 6800 INFO RTIF Alarm Cleared
        DESCRIPTION: State has changed from MBSY to INSV by MANUAL action
        PORT: Type State Site FL Row Bay    Shf/Slt/Pk/Pt   EqPEC/Serial
              RTIF INSV  HOST 01 A00 DPCC:00 00 04R U  0 NTLX08AA/NNTM171P3G37
```

New XAC610 Log for RTIF link on packlet (no port field on packlet):

```
XA506BH      XAC605 MAR05 10:11:02 6800 INFO RTIF Alarm Cleared
        DESCRIPTION: State has changed from MBSY to INSV by MANUAL action
        LINK: Type State Site FL Row Bay    Shf/Slt/Pk/Lk EqPEC/Serial
              RTIF INSV  HOST 01 A00 DPCC:00 00 04R U  0 NTLX08AA/NNTM171P3G37
```

New XAC610 Log for RTIF port on HIOP (packlet field blank):

```
XA506BH      XAC605 MAR05 10:11:02 6800 INFO RTIF Alarm Cleared
        DESCRIPTION: State has changed from MBSY to INSV by MANUAL action
        PORT: Type State Site FL Row Bay    Shf/Slt/Pk/Pt EqPEC/Serial
              RTIF INSV  HOST 01 A00 DPCC:00 00 04R    0 NTLX17AA/  NNTM171P3G37
```

New XAC610 Log for RTIF link (packlet field blank):

```
XA506BH      XAC605 MAR05 10:11:02 6800 INFO RTIF Alarm Cleared
        DESCRIPTION: State has changed from MBSY to INSV by MANUAL action
        LINK: Type State Site FL Row Bay    Shf/Slt/Pk/Lk    EqPEC/Serial
              RTIF INSV  HOST 01 A00 DPCC:00 00 04R    0  NTLX17AA/NNTM171P3G37
```

2.3.3 IO XAC log changes

Since this feature introduces the new CMIC/RTIF HIOP card, minor modifications are needed to the impact statement of the existing XAC logs for this new resource. There is no other change for any information or action logs.

Current XAC312 Log for AMDI/RTIF/ETHR HIOP:

```
S106BI   *  XAC312 MAR11 10:24:19 6700 FLT  IOP (Input Output Processor Fault)
        IMPACT: AMDI, Ethernet and RTIF services are unavailable on this IO
        DESCRIPTION: State has changed from INSV to MBSY by MANUAL action
        CARD: Type State Site FL Row Bay    Shf/Slt         EqPEC/Serial
              HIOP MBSY  HOST 01 A00 DPCC:00 00 05R      NTLX04BA/  NNTM64422MWV
```

XAC312 Log for new CMIC/RTIF HIOP (different impact statement):

```
S106BI   *  XAC312 MAR11 10:24:19 6700 FLT  IOP (Input Output Processor Fault)
        IMPACT: CMIC, Ethernet and RTIF services are unavailable on this IO
        DESCRIPTION: State has changed from INSV to MBSY by MANUAL action
        CARD: Type State Site FL Row Bay    Shf/Slt         EqPEC/Serial
              HIOP MBSY  HOST 01 A00 DPCC:00 00 05R      NTLX17AA/  NNTM64422MWV
```

2.4 Alarms

This feature does not add or remove any existing XA-Core system alarms which are displayed under the XAC title in the alarm banner. It only adds to the scenarios by which the MSComm XAC Alarm is raised.

2.4.1 MScomm alarm

The MScomm alarm is raised if there is a communication problem between the XA-Core and the Message Switch (MS).

2.4.1.1 Current MScomm alarm and CMIC link RTS behavior

Currently, the MScomm alarm is raised only if a hardware component used for the communication between the XA-Core and the Message Switch (MS) goes out of service, on either the XA-Core or MS side. The following severities can be observed:

- CRITICAL: no communication,
- MAJOR: no communication link redundancy,
- MINOR: communication link redundancy is partially lost.

Configuration problems with the CMIC links between the XA-Core and the Message Switch (MS) do *not* directly raise the MScomm alarm. The alarm is raised indirectly by the fact that the system will not bring the misconfigured CMIC link in-service.

Following steps show how the current system behavior handles CMIC link misconfiguration on a packlet:

- the CMIC link on the packlet gets misconfigured,
- the CMIC link will *not* come in-service,

- the XAC326 ‘MS link Configuration Mismatch’ log is generated,
- the XAC303 ‘MScomm’ log is generated, and
- as a consequence of the CMIC link will being out of service, the MScomm XAC alarm is raised.

Once the correct configuration is established, the following will occur:

- the CMIC link on the packlet will come in-service,
- the XAC626 ‘MS Link Configuration Restored’ log is generated,
- the XAC603 ‘MScomm Alarm Cleared’ log is generated,
- the MScomm XAC alarm is cleared.

Recommended XA-Core to MS configuration

Currently, the only supported configuration between the XA-Core and the Message Switch (MS) requires four CMIC links to be cross-connected between the XA-Core and the Message Switch (MS), with specific mappings between the MS CMIC paddle board ports and the XA-Core CMIC links. This setup provides the maximum CMIC link redundancy, and node and component isolation protection.

Note: This feature does *not* change the currently recommended XA-Core to MS configuration.

Please refer to “Figure 1 Recommended XA-Core - MS configuration (SuperNode)” on page 2017.

Please refer to “Figure 2 Recommended XA-Core - MS configuration (SuperNode SE)” on page 2017.

Figure 1 Recommended XA-Core - MS configuration (SuperNode)

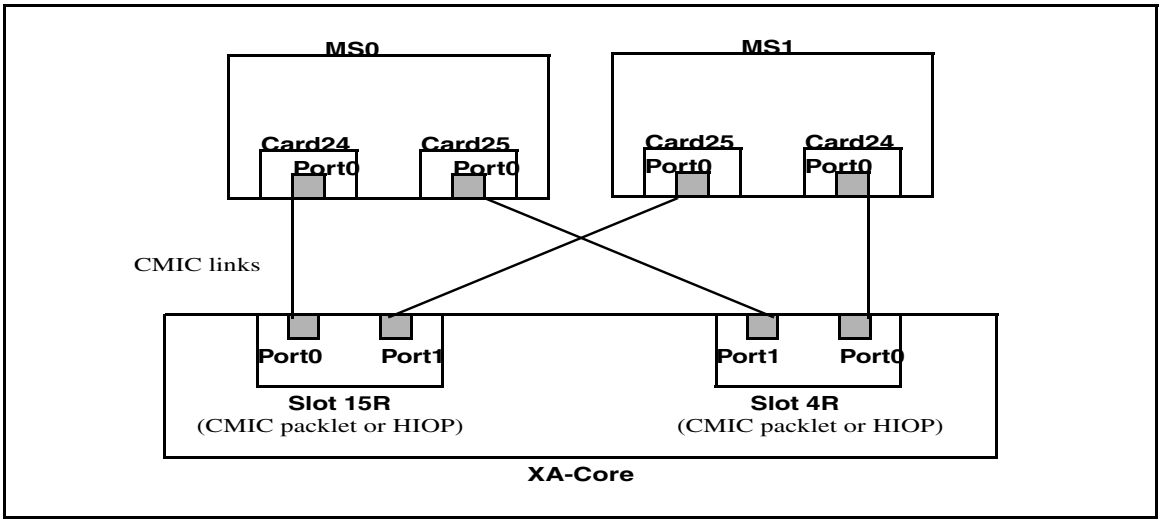

Figure 2 Recommended XA-Core - MS configuration (SuperNode SE)

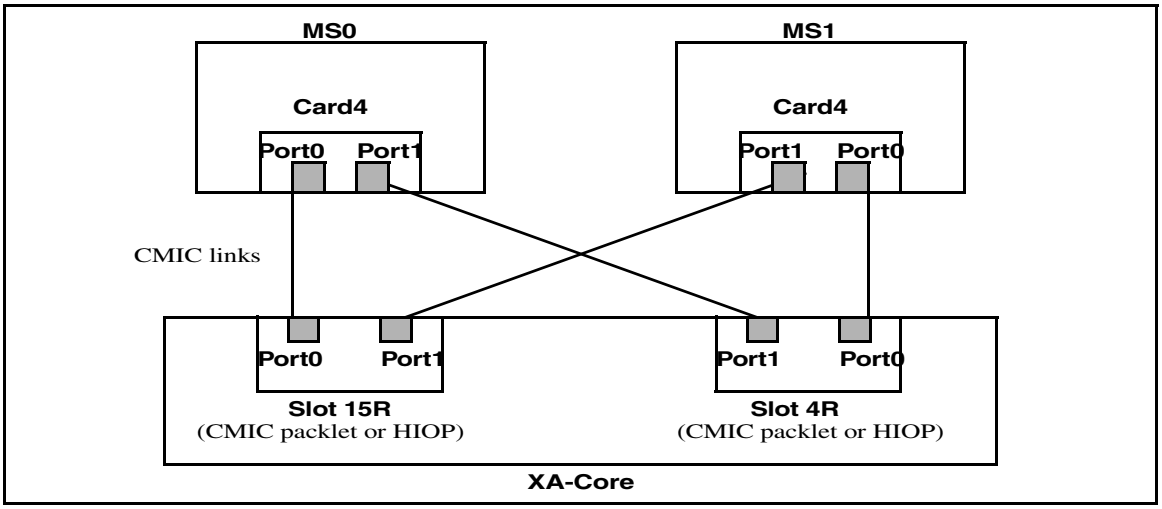

2.4.1.2 New MScomm alarm and CMIC link RTS behavior

This feature adds to the scenarios that raise the MSComm XAC Alarm.

Presently, the MScomm alarm is raised only if a hardware component used for the communication between the XA-Core and the Message Switch (MS) goes out of service, on either the XA-Core or MS side.

In addition to these scenarios, from now on, an MScomm MAJOR alarm will also be raised if a CMIC link between the XA-Core and the Message Switch (MS) is in-service but not configured properly.

Support for new XA-Core to MS configuration

This feature does *not* change the currently recommended XA-Core to MS configuration.

Please refer to “Figure 1 Recommended XA-Core - MS configuration (SuperNode)” on page 2017.

Please refer to “Figure 2 Recommended XA-Core - MS configuration (SuperNode SE)” on page 2017.

However, with the introduction of flexible provisioning of CMIC components, the system will be able to support new XA-Core to MS configurations. CMIC packlets or CMIC/RTIF HIOPs can possibly be provisioned in any empty (unequipped) element slots. The same redundancy and isolation protection rules are going to be applied as before.

This new approach will help the system to adapt more gracefully to CMIC link misconfigurations. For example, this will avoid a possible boot loop during commissioning of a new XA-Core office when all CMIC links are misconfigured with respect to the recommended setup (still satisfying all redundancy and isolation protection rules). Instead of failing the boot, the system will successfully boot and bring the CMIC links in-service. Once the system is up and running, craft personnel can rectify the CMIC link misconfiguration.

The system behavior with respect to bringing a misconfigured CMIC link in-service is different depending on the following scenarios:

- a misconfigured CMIC link is being newly provisioned by the system (e.g. boot, restart, provisioning): the system will bring the misconfigured CMIC link in-service and raise the MScomm MAJOR alarm. Please refer to Section “2.4.1.2.1 Misconfigured CMIC link provisioning” on page 2018.

- an already provisioned CMIC link is improperly connected into a different port (e.g. card replacement): the system will *not* bring the misconfigured CMIC link in-service. Please refer to Section “2.4.1.2.2 Provisioned CMIC link is misconfigured” on page 2020.

2.4.1.2.1 Misconfigured CMIC link provisioning

This scenario can happen during boot, restart, and provisioning.

Please refer to “Figure 3 CMIC links not cross-connected (SuperNode)” on page 2019.

Please refer to “Figure 4 CMIC links not cross-connected (SuperNode SE)” on page 2019.

Figure 3 CMIC links not cross-connected (SuperNode)

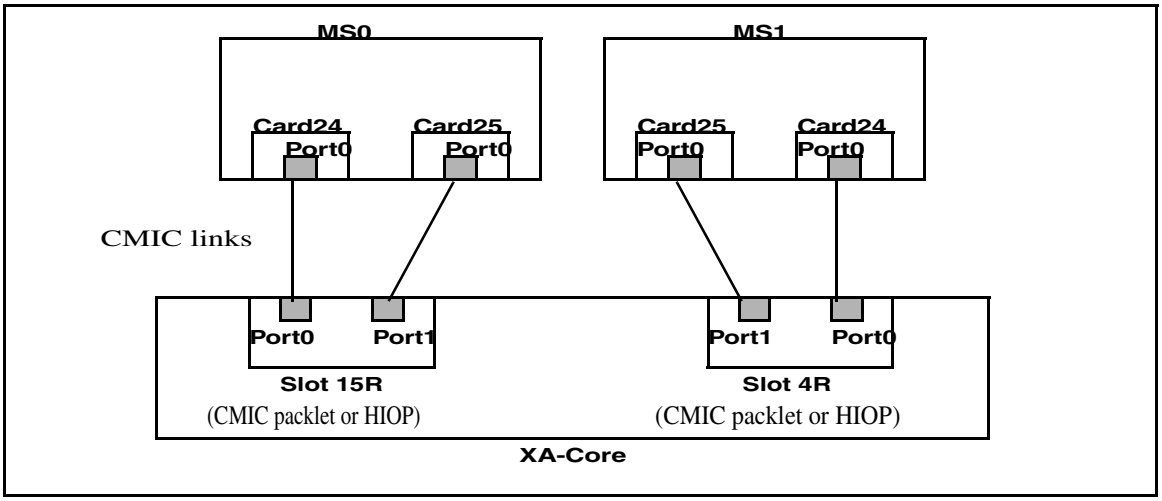

Figure 4 CMIC links not cross-connected (SuperNode SE)

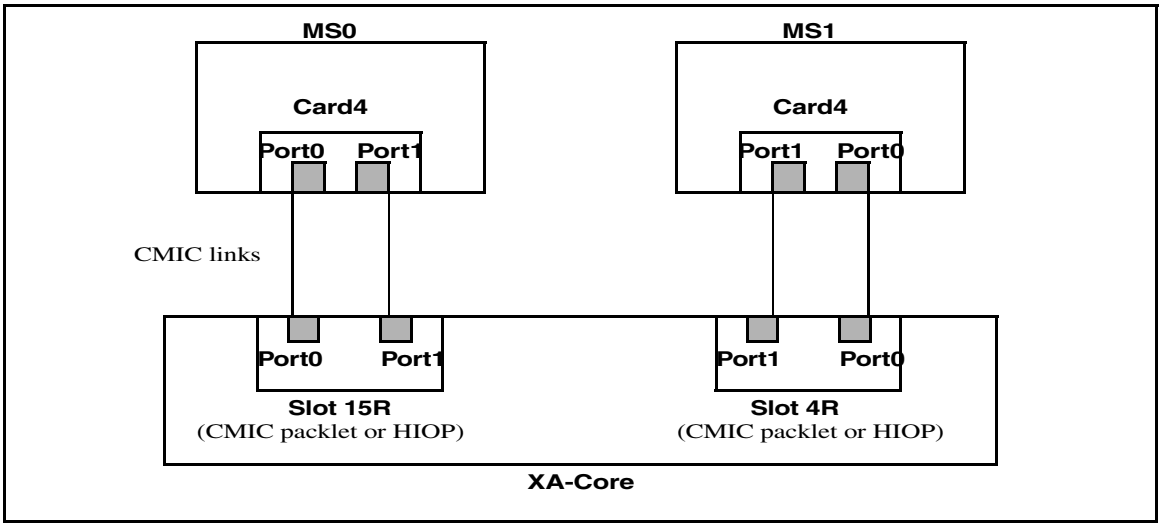

Following steps show how the new system behavior handles CMIC link misconfiguration during boot, restart, and provisioning:

- the CMIC links get misconfigured (e.g. during commissioning of a new XA-Core office),
- the system will bring the CMIC links in-service,
- the XAC326 MS link Configuration Mismatch log is generated,
- although all CMIC components are in-service, the MScomm XAC MAJOR alarm is raised because of the configuration error.

Once the correct configuration is established, the following will occur:

- the XAC626 ‘MS Link Configuration Restored’ log is generated,
- the MScomm XAC alarm is cleared,

2.4.1.2.2 Provisioned CMIC link is misconfigured

This scenario can happen during a card replacement procedure. That is, two existing (provisioned) CMIC links on the same FRU are interchanged and incorrectly connected into the other port.

Please refer to “Figure 5 Interchanged CMIC links on same FRU (4R) (SuperNode)” on page 2020.

Please refer to “Figure 6 Interchanged CMIC links on same FRU (4R) (SuperNode SE)” on page 2021.

Figure 5 Interchanged CMIC links on same FRU (4R) (SuperNode)

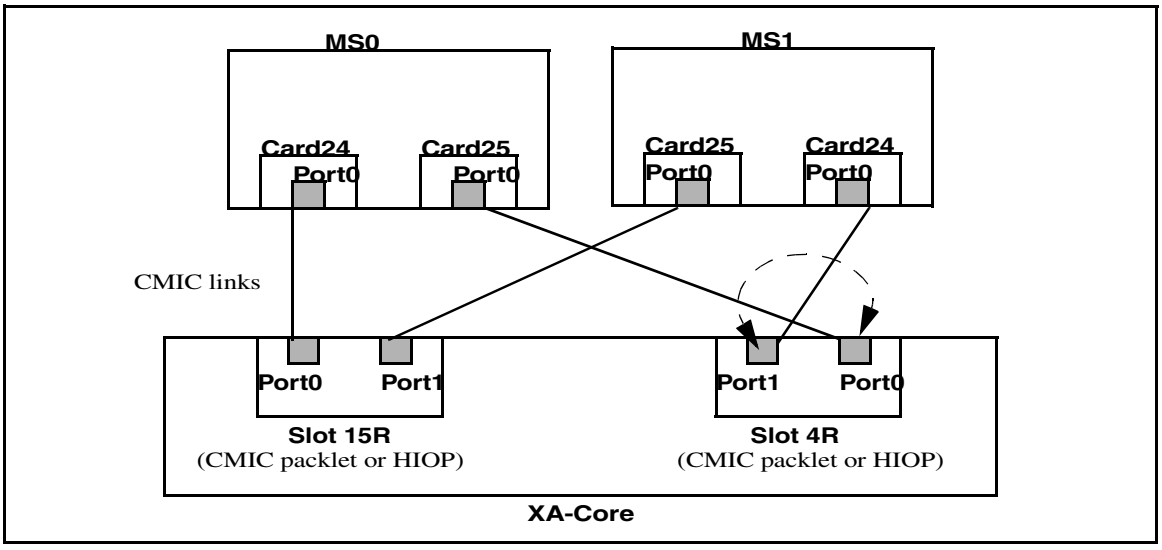

Figure 6 Interchanged CMIC links on same FRU (4R) (SuperNode SE)

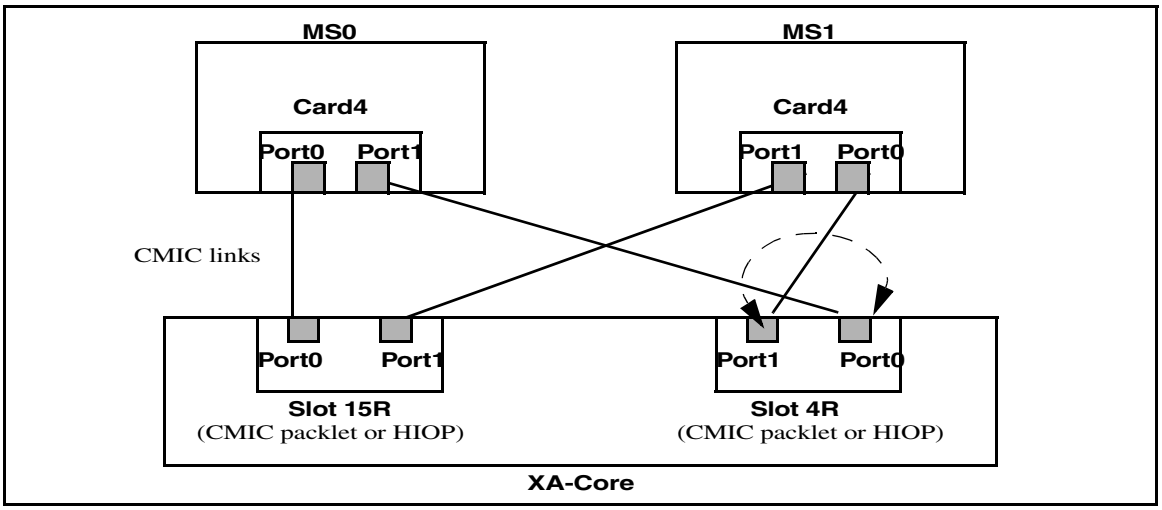

Following steps show how the new system behavior handles CMIC link misconfiguration during card replacement:

- during a card replacement procedure, the CMIC links on a given FRU get misconfigured,
- the system will *not* bring the CMIC links in-service,
- the XAC326 MS link Configuration Mismatch log is generated,
- the MScomm XAC MAJOR alarm is raised because of the out of service CMIC links.

Once the correct configuration is established, the following will occur:

- the XAC626 ‘MS Link Configuration Restored’ log is generated,
- the MScomm XAC alarm is cleared,
- the system will attempt to bring the OOS CMIC links in-service.

3: Fault Management (FM): A00002013

3.1 Fault management strategy

None.

3.2 Fault management tools and utilities

None.

3.3 Logs

3.3.1 Log GAME101

3.3.1.1 Explanation

A GAME101 log will be created if the RSPTMOUT OM count is greater than zero. The log will be created during the RSPTMOUT OM transfer period and will record the RSPTMOUT OM count value.

3.3.1.2 Format

The log report format follows:

```
office * GAME101 mmmdd hh:mm:ss seqno INFO GAME_ERR_REPORT
REASON = reason_field
COUNT  = count_field
```

3.3.1.3 Example

An example of the log report follows:

```
S3_500_17BL CM GAME101 APR04 05:10:16 0504 INFO GAME_ERR_REPORT
REASON    = Suppressed T1 Timer Expiry Message
COUNT     = 25
```

3.3.1.4 Field descriptions

Table 1 Field descriptions

Field	Value	Description
reason_field	CONSTANT	A string describing the reason the log was created. In this case, it is due to suppressing a 'T1 Timer Expiry' message.
count_field	UNSIGNED INTEGER	A copy of the RSPTMOUT OM count value. It will be a number in the range from 1 to 32,767.

3.3.1.5 Action

If a high number of GAME101 logs are output it could be an indication that there is a problem with the SCP. The SCP should be checked to verify that it is operating normally.

If a low number of GAME101 logs show occasionally, it could be related to a network congestion.

Any number of GAME101 logs are highlighting a problem that needs to be addressed by your SCP first level support.

3.3.1.6 Associated Operational Measurements or Performance Measurements

This feature monitors the RSPTMOUT OM count, found in the AIN OM group, checking to see if it increments past zero. The count is incremented everytime the T1 timer expires and the SSP, as a consequence, attempts to generate a 'T1 Timer Expiry' message.

3.3.1.7 Additional information

N/A

3.3.2 Log GAME102

3.3.2.1 Explanation

A GAME102 log will be created if RSPTMOUT OM count becomes equal to the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS threshold value. The log will be created when this feature suppresses a 'T1 Timer Expiry' message.

When a GAME102 log is created it will raise an external minor alarm. The alarm will need to be cleared before another log entry will be created through

the situation described earlier. The alarm will be cleared either by an operator or by this feature. The feature will clear the alarm during the second transfer period to pass after initially creating the log entry. The reason for doing this, will be to expose the alarm for long enough to get noticed by an operator. If the problem persists after clearing the alarm, then a new log will be created, as described earlier and as a consequence, a new external minor alarm will be raised.

3.3.2.2 Format

The log report format follows:

```
office * GAME102 mmmdd hh:mm:ss seqno INFO GAME_ERR_REPORT
REASON = reason_field
COUNT  = count_field
```

3.3.2.3 Example

An example of the log report follows:

```
S3_500_17BL CM GAME102 APR04 05:10:16 0504 INFO GAME_ERR_REPORT
REASON = Threshold reached for suppressing T1 Timer Expiry Messages
COUNT  = 100
```

3.3.2.4 Field descriptions

Table 2 Field descriptions

Field	Value	Description
reason_field	CONSTANT	A string describing that the number of times a 'T1 Timer Expiry' message was suppressed has reached the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS threshold value.
count_field	UNSIGNED INTEGER	A copy of the RSPTMOUT OM count value. It will be a number in the range from 1 to 32,767.

3.3.2.5 Action

If you frequently find a high number of GAME102 logs, it could be that you have the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS threshold value set too low. If this is the case, the threshold value should be modified according to the configuration recommendations.

If the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS threshold value is not too low, it could be a problem with the SCP.

If the T1_TIMER_EXPIRY_MSG_SUPPRESS threshold value has been set accordingly, it could be a problem with the application T1 Timer value being set too low.

You should have your SCP first level support look into any of these problems.

3.3.2.6 Associated Operational Measurements or Performance Measurements

This feature monitors the RSPTMOUT OM count, found in the AIN OM group, checking to see if it increments to value equal to the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS threshold. The count is incremented everytime the T1 timer expires and the SSP, as a consequence, attempts to generate a 'T1 Timer Expiry' message.

3.3.2.7 Additional information

N/A

3.4 Alarms

3.4.1 Alarm GAME102

This is a minor external alarm, that is associated with GAME102 log ("3.3.2 Log GAME102" on page 2024). This alarm indicates that Service Control Point (SCP) is not responding to each query and the T1 timers associated with each query is expiring.

1. 297-5161-022, Vol 1-3, AIN Service Enablers: Service Implementation Guides.

4: Fault Management (FM): A00002020

4.1 Fault management strategy

New ESA logs are generated whenever an attempt to generate an ESA data file succeeds or fails.

Existing ESA logs are generated when internal ESA data structures overflow.

4.2 Fault management tools and utilities

LOGUTIL

4.3 Logs

4.3.1 ESA 120 - ESA Data Generation

4.3.1.1 Explanation

Log Title: ESA120

Name: ESA Data Generation

Description:

An ESA120 is generated if the CS2000 successfully generates an MG9000 ESA data file in SFDEV. The file generation is initiated every 24 hours or from a manual command.

Event type: informational

4.3.1.2 Format

```
ESA120 mmmdd hh:mm:ss ssdd INFO ESA DATA GENERATION

ESA120 MAY20 01:00:40 2400 INFO ESA DATA GENERATION
```

4.3.1.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
ESA DATA GENERATION	constant	Successfully generation of file with MG9000 ESA data.

4.3.1.4 Action

Informational log only. Note that the MG9000 EM must download the ESA data to the MG9000 for it to be used during an emergency stand alone event.

4.3.1.5 Associated Operational Measurements or Performance Measurements

None.

4.3.1.6 Additional information

None.

4.3.2 ESA 121 - ESA Data Generation Fail

4.3.2.1 Explanation

Log Title: ESA121

Name: ESA Data Generation Fail

Description:

An ESA121 is generated if the CS2000 fails to generate an MG9000 ESA data file in SFDEV. The file generation is initiated every 24 hours or from a manual command. If the MG9000 goes into emergency stand alone then the last ESA data file successfully downloaded will be used.

Event type: non-critical failure.

4.3.2.2 Format

```
ESA121 mmmdd hh:mm:ss ssdd INFO ESA DATA GENERATION FAIL
MG9000 ESA WILL USE PREVIOUS DATA FILE

ESA121 MAY20 01:00:48 3500 INFO ESA DATA GENERATION FAIL
MG9000 ESA WILL USE PREVIOUS DATA FILE
```

4.3.2.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
ESA DATA GENERATION FAIL	constant	Failed to generate file with MG9000 ESA data.

Table 2 Field descriptions

Field	Value	Description
MG9000 ESA WILL USE PREVIOUS DATA FILE	constant	Last file successfully downloaded to the MG9000 EM and MG9000 will be used if an ESA event occurs.

4.3.2.4 Action

The MG9000 ESA data file ESA_SYSTEM_SD$XML failed to generate on the device specified by OFCENG parameter ESA_GWDATA_DEVICE.

The craftsperson should ensure there is enough room on the device and consider using a disk device instead of SFDEV.

4.3.2.5 Associated Operational Measurements or Performance Measurements

None.

4.3.2.6 Additional information

The MG9000 EM will continue to use the last valid ESA data file successfully downloaded.

Table DSLIMIT specifies the maximum allowed size of SFDEV in the STOREFS entry. This entry can not be set above 5 million words (10 million bytes).

5: Fault Management (FM): A00002146

5.1 Fault management strategy

The cside links of an ABI-hosted XPM will be managed from the new ABILink map level after posting an LGC-type XPM. (See Configuration section for more details of the map level and commands.) When a fault occurs on the cside links of an ABI-hosted XPM, an alarm will be raised on the XPM and will be visible under the PM heading of the alarm banner. This behavior will be the same as for existing ENET-hosted XPMs. When a cside link of an ABI-hosted XPM goes into or out of service, a new PM log will be generated.

5.2 Fault management tools and utilities

The alarm system and LOGUTIL are used to trouble shoot problems on the ABI XPM just as for other types of XPMs. The logs to look for are PM logs. Also, the MG9000 Element Manager should be used to manage the ABI cards which host the XPM.

5.3 Logs

A new PM log is defined for state changes on the cside links of an ABI-hosted XPM.

5.3.1 PM 610

5.3.1.1 Explanation

Log Title: PM 610

Name: State change log for ABI-XPM cside links

Event type: INFO

Description: A cside link of an ABI-hosted XPM has changed state. The log has no alarm level.

5.3.1.2 Examples

```
PM610 APR14 15:25:52 8700 INFO ABI XPM C-side Link State Change
       Node: LGC 3   Link: 1   Plane: 1   Port: 0
       From: InSv   To: ManB
       Reason: Manual action by user
```

```
PM610 APR14 15:26:23 8800 INFO ABI XPM C-side Link State Change
       Node: LGC 3   Link: 1   Plane: 1   Port: 0
       From: ManB   To: InSv
       Reason: Manual action by user
```

```
PM610 APR14 15:27:04 8900 INFO ABI XPM C-side Link State Change
       Node: LGC 3   Link: 1   Plane: 1   Port: 0
       From: InSv   To: SysB
       Reason: Port error detected by XPM
```

```
PM610 APR14 15:28:44 9000 INFO ABI XPM C-side Link State Change
       Node: LGC 3   Link: 1   Plane: 1   Port: 0
       From: SysB   To: InSv
       Reason: Link opened by MG9K/ABI
```

5.3.1.3 Format

```
PM610 <date> <time> <log_no> INFO ABI XPM C-side Link State Change
  Node: <pm_type> <pm_no>  Link: <link_no>  Plane: <plane_no>  Port: <port_no>
   From: <state>   To: <state>
   Reason: <reason_text>
```

5.3.1.4 Field descriptions

Table 1 Field descriptions

Field	Value	Description
date	mmmdd	month and day
time	hh:mm:ss	hour:minute:second
log_no	dddd	standard log number
pm_type	LGC, LTC, etc.	the pm_type of the host XPM
pm_no	integer	the external pm number of the host XPM
link_no	integer {0 to 31}	the cside link number
plane_no	integer {0 to 1}	the plane of the link -- corresponds to ABI card

Table 1 Field descriptions

Field	Value	Description
port_no	integer {0 to 15}	the port of the link
state	{INSV, CBSY, PBSY, SYSB, MANB}	the state of the link just prior to or just after the state change
reason_text	string	some additional information about the state change

5.3.1.5 Action

Depends on the state of the link:

- If the To state is InSv, the indicated link has returned to service. No further action is necessary.
- If the To state is ManB, a craftsperson has manually busied a link. No further action is necessary.
- If the To state is SysB, investigate why the link went SysB.
- If the To state is CBsy, the cside node (i.e. the GWC) has gone OOS. No communication with the link is possible.
- If the To state is PBsy, the pside node (i.e. the XPM) has gone OOS.

5.3.1.6 Associated Operational Measurements or Performance Measurements

none

5.3.1.7 Additional information

none

5.4 Alarms

In the area of CSide link maintenance, an ABI-hosted XPM will exhibit the same alarm behavior as an ENET-based XPM.

5.5 Related documentation

6: Fault Management (FM): A00002380

6.1 Fault management strategy

Exiting ESA for the ABI board will be controlled by the CM. Whenever an attempt to exit ESA, a new MAP indicator will be displayed on the posted ABI-hosted XPM (See Configuration section for more details of the new map indicator). In addition, PM181 informational logs are output whenever an attempt to exit ESA occurs.

6.2 Fault management tools and utilities

LOGUTIL is used to inform the craftsperson of the ABI board exiting esa. The logs to look for when the ABI board is exiting ESA are PM181 logs.

6.3 Logs

Existing PM181 logs are generated with new strings.

An ESA120 or ESA121 is output when an attempt is made to generate MG9000 ESA data. This is an existing capability of Activity A00002020 - ESA Translation Download. The format of these logs has not changed.

6.3.1 Explanation

Log Title: PM181

Name: Informational log for PMs (peripheral modules)

Description: The PM181 logs are generated when the ABI of an ABI-hosted XPM is attempting to exit esa, cannot exit, or successfully exit(s) esa. The log has no alarm level.

Event type: INFO

6.3.2 Format

This format of the PM181 is not documented in the NTP 297-9051-840, “DMS-100 Family MMP Log Report Reference Manual Volume 6 of 7 MMP15 and up”.

Field descriptions

Table 1 Field descriptions

Field	Value	Description
date	mmmdd	month and day
time	hh:mm:ss	hour:minute:second
log_no	dddd	standard log number
pmid	LGC 0	pm name and external pm number
statxt	{InSv, SysB, ManB, Cbsy}	state of XPM node
actxt	Act, InAct	activity of the XPM unit
statxt1	{InSv, SysB, ManB, Cbsy}	state of XPM unit
string1	ABI discovered in ESA	ABI ESA information
string2	ABI ESA Warm Entry/ Cold Exit	ABI ESA information which is optional

6.3.3.1 Action

- ***ABI discovered in esa*** log does not require any action.
- ***Cold ABI esa attempt*** log does not require any action.
- ***ABI ESA Failed*** log requires the craftsperson to inform their first-level support that there was a communication failure between the CM and the ABI.
- ***ABI board cannot exit ESA*** log requires the craftsperson to inform their first-level support that the ABI board is having problems exitting esa - check the element manager.
- ***ABI ESA Cold Exit*** log does not require any action.

6.4 Alarms

No alarms are generated by PM 181 logs.

6.4.1 ESA Failed to Exit

Alarm Format		
	Fault Type	“Failed to exit ESA“

Associated Alarm Message	“Failed to exit ESA”
Severity	MAJOR. Call functional will not be establish if this card is brought out of ESA
Cause or Condition	The messaging is down on the card.
Duration	Alarm will remain set until card restarts.
Cause / Prevent a SWACT	This alarm does go through Node Maintenance; it will cause a SWACT of any card; it will prevent a SWACT of any card.
Action / Clearing Procedure	none.
Association	There are no related Core logs, other alarms, or performance measurements.

6.4.2 New fault type for the ESA alarm

New fault type, failed to enter ESA, will be added to the MG9000 ESA alarm for the ABI ESA. This alarm will be displayed at MG9000 Eelemet Manager and MG9000 LCI..

Alarm Format	**Log Id**	“ESA302”
	Fault Type	“Failed to enter ESA“
Associated Alarm Message	“Failed to enter ESA”	
Severity	Critical. ESA call processing will not function at all, and there is no dial tone provided.	
Cause or Condition	The links between MG9000 and XPM are down.	
Duration	Alarm will remain set until the links between MG9000 and XPM recover.	
Cause / Prevent a SWACT	This alarm does not go through Node Maintenance; it will not cause a SWACT of any card; it will not prevent a SWACT of any card.	
Action / Clearing Procedure	Establish the links between MG9000 and XPM by manually restart both active and inactive ABI cards by the craftperson..	
Association	There are no related Core logs, other alarms, or performance measurements.	
Interfaces	MG9000 Element Manager and MG9000 LCI	

6.5 Related documentation

7: Fault Management (FM): A00002433

7.1 Fault management strategy

7.1.1 Baseln Alarm

System alarm “Baseln” is raised whenever any XA-Core Field Replaceable Unit (FRU) installed in the shelf is not at Hardware (HW) or Firmware (FW) baseline. Only the Major level is used.
“ALARM Baseln” command will list the non-baseline components from MAPCI;MTC;XAC level, or its sub-levels.

1. Baseln alarm is raised due to HW issue when:
   a. Product Equipment Code (PEC) is missing from table PECINV
   b. Actual PEC HW release is less than PECINV baseline release
   c. Actual PEC HW release equals one of the PECINV exception releases
2. Baseln alarm is raised due to FW issue when:
   a. PEC is missing from table FWINV, and associated FRU has FW
   b. Actual PEC FW version is less than FWINV baseline version
   c. Actual PEC FW version equals one of the FWINV exception releases

7.1.2 Logs

1. New XAC337 FLT log is produced when:
   a. Baseln alarm is first raised
   b. Baseln alarm still raised, and non-baseline component list changes. The log lists all of the non-baseline components known.
2. New XAC637 INFO log is produced when Baseln alarm is cleared, due to an empty list of non-baseline components.
3. Existing XAC415 log adds “not at baseline” reason for not running the SREx test.

7.2 Fault management tools and utilities

7.2.1 MAPCI;MTC;XAC; ALARM BASELN

Returns a list of field replaceable unit (FRU) which are not at HW or FW baseline.

7.2.2 MAPCI;MTC;XAC; QUERY SHELF

Returns a list of FRU installed in the XA-Core shelf. Those FRU which are not at HW or FW baseline are indicated with a "*" in the OK column[s] - see CN section for more info.

7.2.3 LOGUTIL; OPEN XAC 337/637/415

XAC337 - list of components not at baseline
XAC637 - all components now at baseline
XAC415 - system state at time SREx test was bypassed, due to HW or FW not being at baseline.

7.2.4 Update HW

BSY, remove, and replace with correct PEC/release.

7.2.5 Update FW

FW is updated from MAPCI;MTC;XAC; <level> as per MTC manual steps, summarized briefly here:

a. update table XAFWLOAD PEC/NEW tuple to baseline FW (and HIOP DLL) version found in table FWINV

b. BSY <pos>; LOADFW <pos> FILE NEW; RTS <pos>
(Note that RTS downloads HIOP DLL during OOS TST)

c. update table XAFWLOAD by changing current to old, new to current

7.3 Logs

3 logs are detailed below: XAC415, XAC337, XAC637.

7.3.1 Explanation

Log Title: XAC415

Name: INFO Routine Exercise (REx) Report

Description:
Generated when SREx is bypassed, due to:

1 or more non-baseline PE|SM card being found in the XA-Core shelf. SREx is not impacted by FW being BELOW baseline on the PE, since FW is updated AFTER the ONP; however, SREx is not run if the PE/SM's entry is absent from FWINV, or it uses an exception version.

Event type: Log severity = MAJOR

7.3.2 Format

Figure 1 XAC415 Format and Example

```
<switch>      XAC415 <mmmdd hh:mm:ss ssd> INFO Routine Exercise (REx) Report
        INITIATOR      CLASS      RESULT
          System       <class>    Not Run
        Reason:<reason>
```

```
     **  XAC415 JAN08 19:47:22 5201 INFO Routine Exercise (REx) Report
            INITIATOR      CLASS      RESULT
             System        Full       Not Run
            Reason: XA-Core HW (PECINV) or FW (FWINV) is not at baseline
```

7.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
<class>	Existing list: "BASE", "ALL", "FULL", "IO", "PE", "SM"	SREx class requested.
<reason>	"XA-Core HW (PECINV) or FW (FWINV) is not at baseline" <other existing reasons>	Self-explanatory

7.3.4 Action

Investigate non-baseline components using:

1. LOGUTIL; OPEN XAC337 or
2. MAPCI;MTC;XAC;ALARM BASELN.

Update HW or FW/DLL as required.

7.3.5 Associated Operational Measurements or Performance Measurements

None.

7.3.6 Explanation

Log Title: XAC337

Name: FLT Baseln Alarm Raised

Description:
Log is produced when:

a. Baseln alarm is first raised

b. Baseln alarm still raised, and non-baseline component list changes. The log lists the non-baseline components known at generation time.

Event type: Log severity = MAJOR

7.3.7 Format

```

7.3.8 Field descriptions

Table 2 Field descriptions

Field	Value	Description
fru	Valid fru names: cards: pe, iop, hiop, **sm** pklts: cmic, amdi, ethr, **disk, tape, rtif**	FRU (field replaceable unit) names. **Bolded** FRU have no FW.
pos	Slot number: 1-30 front/rear: F or R upper/lower: U or L	Position of FRU in XA-Core shelf.
pec	8 character alphanumeric. NTLXnnaa: n=0-9, a=A-Z	Product Equipment Code (PEC)

Table 2 Field descriptions

Field	Value	Description
rel	2 character alphanumeric. "00" through "ZZ"	HW rel
OK	2 chars: "Y " = Yes - at baseline "N*" = Non-baseline	Indicates if HW and/or FW is baseline compatible.
fw_dll	FW or DLL	Indicates if following fw_name field is for FirmWare or DLL.
fw_name	8 character alphanumeric.	Firmware load name.

7.3.9 Action

See *"7.3.4 Action" on page 2043*

7.3.10 Associated Operational Measurements or Performance Measurements

None.

7.3.11 Explanation

Log Title: XAC637

Name: INFO Baseln Alarm Cleared

Description:
Log is produced when alarm was raised, but now lowered, since no longer any non-baseline components.

Event type: Log severity = NONE

7.3.12 Format

Figure 3 XAC637 Format and Example

```
<switch>      XAC637 <mmmdd hh:mm:ss ssd> INFO Baseln Alarm Cleared
                <string>
```

```
XAC637 JAN15 23:13:26 4432 INFO Baseln Alarm Cleared
  All XAC HW at PECINV baseline. All XAC FW/DLL at FWINV baseline.
```

7.3.13 Field descriptions

Table 3 Field descriptions

Field	Value	Description
string	`All XAC HW at PECINV baseline. All XAC FW/DLL at FWINV baseline.`	XA-Core now at baseline.

7.3.14 Action

See *"7.3.4 Action" on page 2043*

7.3.15 Associated Operational Measurements or Performance Measurements

None.

7.4 Alarms

System alarm Baseln is added.
See *"Fault management strategy" on page 2041*, for alarm behaviour, and associated logs. The components listed should be investigated, and likely replaced. ALARM Baseln output simply lists the problem FRU and locations. More useful information appears in XAC337 log/QUERY SHELF outputs.

The alarm is cleared when no XA-Core components are non-baseline.

The output format for MAPCI; MTC; XAC; ALARM BASELN lists those components which are non-baseline.

Figure 4 ALARM BASELN Format

```
Alarm       Severity       Status
SysBTh      <sev     >     <Enabled/Disabled>
Cause                             Resource      State Slot/Pk/Dev
<cause>                           <res>         <st>  <slot > <dev>
....
<cause>                           <res>         <st>  <slot > <dev>

Where:
<sev>   = Cleared, Minor, Major, Critical
<cause> = HW or FW is non-baseline.
<res>   = NIL, PE, SM, IOP, HIOP, Tape, Disk, RTIF, CMIC,
          AMDI, ETHR, RTIFp, RTIFp, AMDIp, CMICp,
          AMDIl, CMICl, ETHRp, ETHRl, TOD};
<st>    = '     ', INSV, ISTB, SYSB, CBSY, MBSY, SPLT, UNEQ
<slot>  = <slot number> +  <' ' | F | R> +  <' ' | L | U>
<dev>   = ' ' | 0 | 1
```

8: Fault Management (FM): A00002499

8.1 Fault management strategy

Three new logs are introduced by this feature to flag the detection of faults by the XA-Core Store Audit. There are existing STOR logs already defined for use by the audit which the new logs will augment.

8.2 Fault management tools and utilities

N/A.

8.3 Logs - STOR605

8.3.1 Explanation

Log Title: STOR605

Name: Store Bstree Corruption

Description: This log is output when the Store Audit has detected a corruption in the Bstree structures containing the information about the data address space STOR is responsible for.

Event type: Critical.

8.3.2 Format

Figure 1 STOR605 Format

```
HHHHHHH STOR605 mmmdd hh:mm:ss ssdd INFO Store Bstree Corruption
      Bstree nodes corrupt= XXXX
      Check SOSB Footprint data - STORE FP EVENT generated.
```

8.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
Bstree nodes corrupt	1 - 9999	Number of problems detected by a single pass of the audit.

8.3.4 Action

The log text indicates to the support personnel that footprints should be collected. This log is only notification that a problem was detected; the detailed fault information is dumped in the SOSB footprints (with the title text

"STORE FP EVENT"). Once the details of the corruption(s) is analyzed further recovery action may be required. The corruption may be an invalid pointer or a bad state in the data, and may affect any store type. If DSTEMP is affected the corruption may be cleared by a core restart. If DSPROT is affected the core image may no longer be viable and a reboot or system SWACT may be needed to recover.

8.3.5 Associated Operational Measurements or Performance Measurements

None.

8.3.6 Additional information

None.

8.4 Logs - STOR606

8.4.1 Explanation

Log Title: STOR606

Name: Dump Data Corruption

Description: This log indicates that the Store Audit has found a corruption in the allocation information for data store which is dumped (such as DSPROT) and it is very likely that a attempt to perform a dump while in this state would fail.

Event type: Critical.

8.4.2 Format

Figure 2 STOR606 Format

```
HHHHHHH STOR606 mmmdd hh:mm:ss ssdd INFO Store Dump Data Corruption
      ADDR= XXXXXXXX STORTYPE= YYYYYYYY BLOCKSIZE= ZZZZZZZZ
```

8.4.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
ADDR	00000000 - FFFFFFFF (hexidecimal)	Address of the block of store flagged as corrupt.
STORTYPE	STORTYPE2 (module STOR)	Storetype of the corrupted block.

Table 2 Field descriptions

Field	Value	Description
BLOCKSIZE	00000000 - FFFFFFFF (hexidecimal)	Size in bytes of the corrupted block.

8.4.4 Action

Should these logs be generated the state of the system's allocation information for protected store is such that a valid image dump cannot be performed. Nortel Networks support personnel should be contacted immediately to further investigate the problem. If a valid image file exists then the system may need to be rebooted or otherwise restored to the valid image using a SWACT.

8.4.5 Associated Operational Measurements or Performance Measurements

None.

8.4.6 Additional information

None.

8.5 Logs - STOR607

8.5.1 Explanation

Log Title: STOR607

Name: Store Attribute Corruption

Description: This log is generated when the Store Audit detects a mismatch between the Store Allocator's internal setting of an address' blocking attribute and the actual setting of the attribute in memory hardware. The attribute is either blocking or write-blocking. An incorrect value could mislead the Store Allocator's initialization routines and cause traps.

Event type: Major.

8.5.2 Format

Figure 3 STOR607 Format

```
HHHHHHH STOR607 mmmdd hh:mm:ss ssdd INFO Store Attribute Corruption
      ADDR= XXXXXXXX ST2ATTR= YYYY HW_ATTR= ZZZZ
```

8.5.3 Field descriptions

Table 3 Field descriptions

Field	Value	Description
ADDR	00000000 - FFFFFFFF (hexidecimal)	Address of the block of store flagged as having mismatching attributes.
ST2ATTR	0 - blocking memory 1 - write-blocking memory 2 - attribute read error	Blocking attribute of the memory recorded internally by the Store Allocator.
HW_ATTR	0 - blocking memory 1 - write-blocking memory 2 - attribute read error	Blocking attribute of the memory as reported by hardware.

8.5.4 Action

In the event of blocking attribute mismatches being detected support personnel will have to investigate further. Footprints and logs should be collected, as well as FQT (Fault Query Tool) data to determine if any memory hardware failures have occurred.

If blocking attribute mismatches exist in the system, it is possible that there will be no other immediate symptoms as long as there is no Store Allocator activity related to the affected memory. However if a restart occurs the Store Allocator may be unable to correctly access this memory, and in the worst case a restart progression may lead to a system reboot. Thus, manual restarts should be avoided until technical support can determine exactly what memory is affected.

8.5.5 Associated Operational Measurements or Performance Measurements

None.

8.5.6 Additional information

None.

8.6 Related documentation

10.3 Logs

10.3.1 Explanation

Log Title: AUDmmm & XAUDnnn (where mmm & nnn are numeric values)

Name: Call Processing Resource Dump

Description: XAUD logs are generated whenever a call processing resource is recovered by the audit process running on the XA-Core platform. AUD logs are generated/used by all other non-audit processes.

The numeric values for the XAUD logs used to cover the range from 600 to 610 for standard resources (ie. XAUD600, XAUD601, XAUD602, and XAUD609) and 700 to 955 for extension block resources. The numeric values for the XAUD logs are being extended and changed to match those for the AUD logs for simplicity. The new numeric values for the XAUD logs will now be 395, 397, 432, 434 and ranges from 400 to 431 and 500 to 982. A table is being included below (in the 'Additional Information' section 12.3.6) to illustrate the new numbering system for the XAUD logs.

Please note, the total number of AUD and XAUD logs will vary from load to load. This feature is not adding more AUD or XAUD logs to the load, it is only setting the framework so that applications will be able to add more in the future.

The size, format and contents for the AUD and XAUD logs of standard resources is not being changed. However, the location and number of bits used to represent the extension block's format code in the header (within the hex dump of the log) has changed for all extension block logs. **The only noticeable difference to the cutomer will be the number following the XAUD string in the log title**.

Event type: INFO

10.3.2 Format

No change to the format of the AUD or XAUD log (originally defined by feature ACT.A19011742). A sample format is being included for reference.

General format of all XAUD logs:

```
XAUD<nnn> <date> <time> <sequence> INFO <resource> Recovery
  REMARK: <remark>
  PTR: <item> INDEX: <prim> <sec> CURRENT AUDIT GENERATION: <gen>
  STATE: <state> PROBLEM: <problem>
  <hex dump>
```

Sample of an encapsulator recovery log (standard resource):

```
XAUD397 APR29 10:34:37 2900 INFO Encapsulator Recovery
  REMARK: Associated CCB queue is empty
  PTR: 4B1EF920  INDEX: 0001 000F  CURRENT AUDIT GENERATION: 00BD
  STATE: UNAVAILABLE_ENC  PROBLEM:   ERROR_LINKS
  444B B9D4 0000 0001 0001 FDCF 7BCD FDFD FDFD FDFD
  FDFD FDFD FDFD FDFD FDFD FDFD FD72 0001 0000 FDFD
  FDFD FDFD FDFD FDFD FDFD FDFD FDFD FDFD FDFD FDFD
  FDFD FDFD FFFF 0000 FD02 FFFF 0000 FFFF 0000 0000
  FDFC FFFF 0000 FDFD FDFD FDFD FDFD FDFD
```

The total size of the extension block header has not been increased and hence the total size of the hex dump has not been increased. However, the location and number of bits used to represent the extension block format code in the header portion of the hex dump has changed for all extension block logs.

Sample hex dump portion of an extension block recovery log:

```
<XAUD or AUD log title>
<hex_dump>:
   FFFF 0000 7340 FCF5 FDFD FDFD FDFD FDFD FDFD FDFD
   FDFD FDFD FDFD FDFD FDFD FDFD
```

The extension format code will now be 9-bits starting at offset 6 (ie. 14th hex digit) in the hex dump. As illustrated in the above, the format code will be 9-bits of CF5.

```
ie. CF5 hex = 1100 1111 0101 bin ==> FORMAT CODE = 245
only the right most 9-bits of the 14th, 15th and 16th hex digits in
the hex dump will be used to represent the format code. In this case
the format code is 245. The remaining three bits of the 14th hex
digit are unused at present.
```

10.3.3 Field descriptions

No change. The field descriptions are being provided here for reference.

Table 1 Field descriptions

Field	Value	Description
nnn	numeric	Value from ranges outlined in description above
date	date	System supplied, when the recovery happened
time	time	System supplied, when the recovery happened
sequence	numeric	System supplied, sequence within log system
resource	text	Name of the resource recovered

Table 1 Field descriptions

Field	Value	Description
remark	text	Further clarification as to why it was recovered
item	hex numeric	Memory address of item
prim	hex numeric	Primary index into item's resource pool
sec	hex numeric	Secondary index into item's resource pool
gen	hex numeric	Audit generation when recovered
state	text	State of item at the time of recovery
problem	text	Description of problem that resulted in the log
hex dump	hex numeric	Multi line dump of the contents of the resource

10.3.4 Action

No immediate action required.

10.4 Related documentation

XAUD logs were originally introduced by the Call Processing Resource Audit Robustness Feature (ACT.A19011742). Additional information can be found in the PLS FMDOC library if required.

11: Fault Management (FM): A00002607

11.1 Fault management strategy

This feature does not expect to modify existing logs or create new logs. This feature will, as a positive side effect, correct existing logs SITE data for XPMs involved in ABI Configurations.

The ABI XPM Location component of this feature, which allows for the provisioning of ABI XPMs Site and hosting MG9K information, will have a beneficial impact on some existing logs. These logs are the ones mainly associated with XPM peripherals, PM logs. The impact will take the form of the log containing the correct SITE name for these ABI XPMs. As mentioned in the DID, XPMs generally had “HOST” as their Site name.

11.2 Fault management tools and utilities

N/A

11.3 Related documentation

12: Fault Management (FM): A00002757

12.1 Fault management strategy

This feature provides functionality to a SSPFS Platform for the aggregation of Alarms into one database. Logs will be generated by the reporting entity when using the *Reporting API* to enter/update/clear alarms in the database.

12.2 Fault management tools and utilities

Two command line tools will be available to report and query faults contained in the *Alarm Database*.

The tools are called *queryflt*, and *reportflt*.

12.3 Logs

12.3.1 Explanation

Log Title: Report Alarm

Name: Report Alarm Log

Description:

This log is sent when requested by the entity that is reporting an alarm.

Event type: Customer Log

12.3.2 Format

```
_V2_~I=CBM~H=<hostname>~A=<application>~S=<seqNum>~~
<reportName><reportNum> <alarmLevel> <eventType> <description>
      TimeStamp: <timeStamp>
      ComponentID: <componentID>
      Category: <categoryString>
      Probable Cause: <probableCauseStr>
      Specific Problem: <specificProblemStr>
```

Note: The *I=CBM* will be changed to reflect the currently defined network element name.

12.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
hostname	variable	Hostname of the cluster on which the log is being generated.

Table 1 Field descriptions

Field	Value	Description
application	variable	Name of the application for which the alarm is raised.
seqNum	variable	Sequence number of the log being generated.
reportName	variable	The Customer Log report name (e.g.: CBM)
reportNum	variable	The Customer Log report number (e.g.: 300).
alarmLevel	variable	The alarm level for this alarm, one of: Cleared, Warning, Minor, Major, Critical, or Indeterminate.
eventType	variable	The Customer Log event type. This is eAlarmEventType.
description	variable	Description for this particular alarm. Not describing the problem that happened, but describing what the alarm relates to or represents.
timeStamp	variable	This is the time at which the alarm was raised.
componentID	variable	This field is specified by the application to include the name of the component being alarmed (see definitions in section “1.7.4 Use of component name” on page 33 for details of how to specify this field).

Table 1 Field descriptions

Field	Value	Description
categoryString	variable	The alarm category for this alarm. This is eAlarmProblemCategory.
probableCauseStr	variable	This is eAlarmProbableCause
specificProblemStr	variable	Further qualifies the probable cause for this alarm.

12.3.4 Action

The action required is dependent on what the particular alarm report is. Any specific action will be described in the *description* field above.

12.4 Related documentation

13: Fault Management (FM): A00002823

13.1 Fault management strategy

An Ethernet connected SDM or CBM will report it's alarms independantly of the core. However, logs will be generated on the core to indicate connection status as seen by the core to assist in correlation of application alarms.

While a loss of connectivity log will contain an alarm level, no alarms are raised on the MAPCI alarm banner by this activity.

13.2 Fault management tools and utilities

Current connectivity status is available with the CI tool OAMPPCI.

Core connectivity logs are available via LOGUTIL.

13.3 Logs

13.3.1 Explanation

Log ID: OAMN600

Description: Generated when heartbeats are established between the SDM or CBM process oammtce and the Core process oampnmpp.

Event type: INFO

Event label: OAMP Node Status

13.3.2 Format

```
header
        Cluster number: 1 Node: <A or B>
        Core address:               <IRM IP address>
        Cluster address:            <CBM floating address>
        Cluster Heartbeat Status:   <heartbeat status>
        Cluster Application Status: <application started or stopped>
        Node A address:             <CBM/SDM fixed address>
        Node A heartbeat Status:    <heartbeat status>
        Node A Application Status:  <application started or stopped>
        Node B address:             <CBM/SDM fixed address>
        Node B heartbeat Status:    <heartbeat status>
        Node B Application Status:  <application started or stopped>
```

13.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
Cluster number:	1	The number of the cluster connected to the Core. Only 1 is currently supported.
Node:	A or B	The node, within a cluster, which is reporting a change. For CBM HA this can be either A or B. For CBM simplex and SDM this will always be A. Note that there is no relationship between A and B and CBM units 0 and 1. A corresponds to the first node to connect to the core.
Core address:	nnn.nnn.nnn.nnn	The Core side IP address which is being used by the SDM or CBM.
Cluster address:	nnn.nnn.nnn.nnn	The floating address of the CBM cluster or the node address of an SDM.
Cluster Heartbeat Status:	Unequipped	Resetipaddress command has been executed from oamppci to delete a non-heartbeating ip address.
	No heartbeat	The SDM or CBM has stopped heartbeating to the Core from this Node.
	heartbeat received	This SDM or CBM node is currently heartbeating with the Core
Cluster Application Status:	unknown	The SDM or CBM has not supplied an application status on any connected nodes.
	applications stopped	All the SDM or CBM applications have been stopped on all connected nodes.
	Applications started	The SDM or CBM applications have been started with the exception of those which have been individually selected and stopped on one of the connected nodes.
	Switch Activity	Both Nodes are currently reporting applications started. This can happen on some CBM failure scenarios.

Table 1 Field descriptions

Field	Value	Description
Node A address:	nnn.nnn.nnn.nnn	The node address of an CBM or SDM
Node A Heartbeat Status:	Unequipped	Resetipaddress command has been executed from oamppci to delete a non-heartbeating ip address.
	No heartbeat	The SDM or CBM has stopped heartbeating to the Core from this Node.
	heartbeat received	This SDM or CBM node is currently heartbeating with the Core
Node A Application Status:	unknown	Either the SDM or CBM node has not supplied an application status or it has stopped heartbeating.
	applications stopped	All the SDM or CBM applications have been stopped on this node.
	Applications started	The SDM or CBM applications have been started with the exception of those which have been individually selected and stopped on this node.
Node B address:	nnn.nnn.nnn.nnn	The node address of an CBM or SDM
Node B Heartbeat Status:	Unequipped	Either Node B has never contacted the Core OR the resetipaddress command has been executed from oamppci to delete a non-heartbeating ip address.
	No heartbeat	The SDM or CBM has stopped heartbeating to the Core from this Node.
	heartbeat received	This SDM or CBM node is currently heartbeating with the Core
Node B Application Status:	unknown	Either the SDM or CBM node has not supplied an application status or it has stopped heartbeating
	applications stopped	All the SDM or CBM applications have been stopped on this node.
	Applications started	The SDM or CBM applications have been started with the exception of those which have been individually selected and stopped on this node.

13.3.4 Action

This is an information log which may not require action. The SDM or CBM generates its own alarms and logs.

13.3.5 Associated Operational Measurements or Performance Measurements

None

13.3.6 Additional information

Example:

```
XA1_PPC07BR     OAMN600 JAN15 02:28:32 5000 INFO OAMP Node Status
        Cluster number: 1 Node: A
        Core address:               10.40.14.200
        Cluster address:            10.40.14.241
        Cluster Heartbeat Status:   Heartbeat Active
        Cluster Application Status: Applications started
        Node A address:             10.40.14.242
        Node A Heartbeat Status:    Heartbeat Active
        Node A Application Status:  Applications stopped
        Node B address:             10.40.14.243
        Node B Heartbeat Status:    Heartbeat Active
        Node B Application Status:  Applications started
```

13.4 Related documentation

None

14: Fault Management (FM): A00002858

14.1 Fault management strategy

The purpose of the “SPM Node ISTb for Carrier Outage” feature is to mark an SPM as ISTb so an indicator appears under the PM Map banner whenever one of these carrier faults appear:

1. Any of the SPMs carriers goes SysB.
2. Any of the SPM’s line carriers (STS3L or STM1M) has an RFI (Remote Failure Indicator) alarm.

The new steps for resolving these faults will be integrated into the existing Succesion fault management documentation for troubleshooting SPM ISTb faults.

Note that the OPTFN section of this A00002858 feature document provides an easier to follow format for troubleshooting these faults. The OPTCN section documents the changes to the QUERYPM FLT REASON command. This OPTFM section documents changes to the impacted logs.

14.2 Fault management tools and utilities

No new tools. Existing tools used are MAPCI and LOGUTIL.

14.3 Logs

There are no new logs introduced by this feature, but some existing logs will act as triggers to cause the SPM node to go ISTb on the MAP, and there will be some modifications to existing logs.

14.3.1 CARR511 for SPM carrier going SysB

The CARR511 log is the first of the two new triggers than can cause the SPM node to get ISTb under the PM banner of the MAP display.

14.3.1.1 Explanation

Log Title: CARR511

Name: SYSB CARRIER SPM

Description: Generated when an SPM carrier changes state to SysB.

Event type: minor

14.3.1.2 Format

Existing log with no changes, so just showing an example:

```
MSH706BM   * CARR511 JUN04 05:46:03 6200 SYSB CARRIER SPM  34
                CKT: 13  CarrName: SPM34_STS1P_1_VT15P_3_DS1P_3
                Carrier: STS1P  1 VT15P 15 DS1P   1
                Previous State: INSV
```

14.3.1.3 Action

Follow the standard procedures for maintenance of a SysB SPM carrier.

14.3.1.4 Associated Operational Measurements or Performance Measurements

None

14.3.1.5 Additional information

CARR511 is generated when one of the OC3's carriers goes SysB, which corresponds to a Bellcore state of OOS-AU-FAF (which is same as OC3 carrier state of IS-UPS-FAF). FAF is FAcility Failure. While the carrier is SysB, any of its trunks will be in the CFL condition and not able to bear traffic.

For STM-1 international product, this log will occur when a STM-1 carrier goes SysB.

14.3.2 CARR310 for SPM line carrier raising RFI alarm

The CARR310 log is the second of the two new triggers than can cause the SPM node to get ISTb under the PM banner of the MAP display.

14.3.2.1 Explanation

Log Title: CARR310

Name: FLT CARRIER SPM

Description: Generated when an SPM line carrier (STS3L or STM1M) raises an RFI (Remote Fault Indicator) alarm.

Event type: minor

14.3.2.2 Format

Existing log with no changes, so just showing an example:

```
MSH8_03BM   * CARR310 APR18 10:27:41 3204 FLT  CARRIER SPM  41
                CKT: 178  CarrName: ATM_STS3L_SPM_41_CKT_178
                Carrier: RM     2 OC3S   0 STS3L  0
                Failure: RFI     Set
```

14.3.2.3 Action

Follow the standard procedures for maintenance of a SPM carrier fault.

14.3.2.4 Associated Operational Measurements or Performance Measurements

None

14.3.2.5 Additional information

The CARR310 log above is generated when one of the OC3'sInSv STS3L carriers has a RFI (Remote Failure Indication) alarm. Such an alarm can be caused by cutting the TX fiber on the OC3. Note that this trigger corresponds to "R" (for Remote alarm) in the A59036987 feature. Since OC3 sparing will not be allowed while the remote alarm condition is present on the line carrier, the OC3 is effectively in an E2 outage condition due to the loss of redundancy.

If the RFI alarm is set as NRPT (non-reportable) for the carrier in Table MNHSCARR, then the log will not be seen but the trigger will still occur. Note that the CI command:

MAPCI;MTC;TRKS;CARRIER;POST {carrier};LISTALM

will always show the presence of the alarm, independent of whether MNHSCARR sets the alarm as RPT or NRPT for the carrier.

This trigger/log clears when the RFI alarm clears (as reported by a CARR310 "RFI Clear" log).

For STM-1 international product, trigger will occur when a InSv STM1M carrier has a RFI alarm.

14.3.3 SPM300 for SPM carrier going SysB

The existing SPM300 log will occur for a new reason: a OC3 carrier going SysB. The SPM300 log shows why a OC3 RM went ISTb.

14.3.3.1 Explanation

Log Title: SPM300

Name: Device Fault Report / Check SysB Carrier

Description: generated when an OC3 has no SysB carriers and one of its carriers goes SysB.

Event type: minor

14.3.3.2 Format

Existing log that now has a new text reason beside the “7A” row:

```
STEC207AM   *  SPM300 MAY30 15:57:33 4093 TBL  Device Fault Report
      Location   : SPM : 26   OC3 : 0
      Status     : Alarm Raised
      Problem Description: Non Critical
       7A: Check SysB Carrier
      Action     : Refer to NTPs for Alarm Clearing Procedures.
      Cardlist   :
       No Cardlist Available.
```

14.3.3.3 Action

See troubleshooting chapter of OPTFN section for how to determine which carrier caused this log to occur.

14.3.3.4 Associated Operational Measurements or Performance Measurements

None

14.3.3.5 Additional information

None

14.3.4 SPM300 for RFI Alarm on STS3L Carrier

The existing SPM300 log will occur for a new reason: RFI alarm occuring on a STS3L carrier. The SPM300 log shows why a OC3 RM went ISTb.

14.3.4.1 Explanation

Log Title: SPM300

Name: Device Fault Report / Check RFI Alarm on STS3L Carrier

Description: generated when a STS3L carrier experiences an RFI alarm.

Event type: minor

14.3.4.2 Format

Existing log that now has a new text reason beside the “7A” row:

```
STEC207AM   *  SPM300 MAY30 15:57:33 4093 TBL  Device Fault Report
       Location   : SPM : 26   OC3 : 0
       Status     : Alarm Raised
       Problem Description: Non Critical
        7A: Check RFI Alarm on STS3L Carrier
       Action     : Refer to NTPs for Alarm Clearing Procedures.
       Cardlist   :
```

14.3.4.3 Action

See troubleshooting chapter of OPTFN section for how to determine which carrier caused this log to occur.

14.3.4.4 Associated Operational Measurements or Performance Measurements

None

14.3.4.5 Additional information

None

14.4 Alarms

There are no new or changed alarms for this feature.

14.5 Related documentation

None

15: Fault Management (FM): A00002970

15.1 Fault management strategy

This feature introduces a new field, ‘SITE’, in Table MNNODE for SMG4 variant of SPMs.

Hence the logs displaying site name will now show the site name data that is present in Table MNNODE and not ‘HOST’, as it showed prior to this feature.

15.2 Fault management tools and utilities

None.

15.3 SPM 300 Log

15.3.1 Explanation

Log Title: SPM300

Name : Device Fault Report

Description: This is an existing Log. The only changes occuring as a result of this feature are that the log will now show the ‘*site*’ name as the one that is datafilled in Table MNNODE.

Event type: IDM related logs that are transferred from the local.

15.3.2 Format

Not impacted.

Example 1

```
MG4K106BT   *  SPM300 JUN18 06:21:55 2700 TBL  Device Fault Report
          Location   : SPM : 62   SRM : 0
          Status     : Alarm Raised
          Problem Description: Non Critical
            Sync RM non critical fault(s) still present
          Action     : Refer to NTPs for Alarm Clearing Procedures.
          Cardlist   :
            Site    Flr  Row   FrPos    ShfPos    ShfPec       Slot

            REM1    1    B     13       40        NTLX72BA     1
```

Example 2

```
MG4K106BB   ***  SPM300   JAN28   22:58:01   6900  TBL  Device Fault Report
           Location   :     SPM  :  61    DLC : 0
           Status      : Alarm Raised
           Problem Description: Critical
           8I          : Cfg Failure, Intended Recovery Ac
           Action       : Replace the following cards in the order listed.
           Cardlist     :
           Site    Flr  Row   FrPos    ShfPos    ShfPec     Slot
           REM1    1     B      13        40       NTLX72BA     1
```

15.3.3 Field descriptions

Table 1 shows the fields in Log ‘SPM 300’ impacted as a result of this feature, ACT.A00002970.

Table 1 Field Descriptions

Field	Value	Description
SITE	This field will show the site name present in Table MNNODE, for that SPM.	In SN06 and previous releases, Log ‘SPM 300’ always showed the value, ‘HOST’ under field ‘site’. From Release SN07 onwards it will show the ‘site’ value present in Table MNNODE.

15.3.4 Action

None.

15.3.5 Associated Operational Measurements or Performance Measurements

None.

15.3.6 Additional information

None.
None.

1. A00002970 in PLS FMDOC.

16: Fault Management (FM): A00003371

16.1 Fault management strategy

The Common Inventory and Data Consolidation A00003371 feature is focused on the CMT network element data and database access. As such new customer logs will be generated to notify the system operators of note worthy database access events as per the Nortel standard document:

Log reporting Rules and guidelines

DIS Ref: IEMPG DIS No: AF01 Release: Standard

All Logs created apply the principles and comply with the formats specified in the standard. Also nomenclature or identifiers already in use will be used where possible.

Note that none of the logs created initiate operator actions. The event being logged are failures to obtain a database connection. These can occur when a resource limit has been exceeded, when a database password is changed or when the database server has stopped or restarted.

The following identifies the general format of the CS2M database access Logs created by this activity.

The general format for all logs is given in the next subsection. Specific Logs are defined further on in this document.

16.1.1 Log Header Formats

The SCC2 log header is organized as follows:

<severity> <minute> <LogName/Num> <sequence number> <logtype> <device type> <Event Label>

For Nortel Standard format, the header is organized as follows:

<CM CLLI> <severity> <logname/num> <mmmdd hh:mm:ss> <sequence number> <logtype> <device id> <Event Label>

Where:

Severity is NOA

Minute or mmmdd hh:mm:ss is minutes of the day or month, day, hour, minute

LogName/Num is CMTxxx where xxx is in the range 600 - 799

Sequence Number is number internally generated

LogType is INFO

Device Type is SESM

Event Label describes the event that occurred

16.1.2 Log Body Format

The body of logs will be the same for both Nortel and SSC2 formats:

Location: SSPFS=hostname
Information: <Detected problem>
Time: <MMM dd hh:mm:ss YYYY>
Component Id: Database
Specific Problem: <Specific problem>
Description: <short text description

16.2 Fault management tools and utilities

Not applicable

16.2.1 Faults, Alarms and Logs

16.3 Logs

16.3.1 Database Stopped Log

Log Title:DB600

16.3.1.1 Formats

NTSTD log format:

RTP2 DB600 SEP23 17:25:00 0401 INFO DB Connection Error

Location: SSPFS=wnc0s0jd
Information: I/O error, the database did not respond
Time: SEP23 17:25:00 2003
Component Id: Database, GWCEM User
Specific Problem: I/O error was detected when attempting to get a database connection.
Description: Transient error detected. The database maybe stopped for administrative actions. Investigate when this log occurs repeatedly.

Table 1 Log Field descriptions

Field	Value
Category	Information
Severity	NOA
LogName	DB
LogNumber	600
Day Time	mmmdd hh:mm:ss
Sequence Number	sequential log number
EventType	INFO
Device ID	DB
EventLabel	Connection Error
Location	SSPFS=hostname
Information	I/O error, the database did not respond
Day Time Year	MMMdd hh:mm:ss YYYY
Component Id	Database, user id
SpecificProblem	I/O error was detected when attempting to get database connection.
Description	Transient error detected. The database maybe stopped for administrative actions. Investigate when this log occurs repeatedly.

16.3.1.2 Explanation

This Log is generated when an attempt to allocate a database connection encounters an I/O error. These errors can occur when the database has been stopped momentarily for administrative purposes. A few occurrances of this

log is informational. Continuous occurances within a 15 minutes or a half hour should be investigated to insure these errors are attributable to specific authorized administrative actions.

16.3.1.3 Action

Monitor for multiple occurances within a 15 minutes or a half hour for the same “Component Id”.(Note: It is expected that a Log will be generated for multiple different “Component Ids”.) If this is detected investigate to insure these errors are attributable to specific authorized administrative actions. If these are occurring and are not caused by administrative activity then verify the database on the SSPFS machine identified is functioning normally.

16.3.2 Database Connection Closed Log

Log Title:DB601

16.3.2.1 Formats

NTSTD log format:

RTP2 DB601 SEP23 17:25:00 0401 INFO DB Connection Error
Location: SSPFS=wnc0s0jd
Information: Database connection closed, stale connections will refresh.
Time: SEP23 17:25:00 2003
Component Id: Database, GWCEM User
Specific Problem: A closed or stale database connection was detected, all stale connections will be refreshed..
Description: Transient error detected. Investigate when a threshold is exceeded in a short time.

Table 2 Log Field descriptions

Field	Value
Category	Information
Severity	NOA
LogName	DB
LogNumber	601
Day Time	mmmdd hh:mm:ss

Table 2 Log Field descriptions

Field	Value
Location	SSPFS=hostname
Information	Database started, stale connections were refreshed
Day Time Year	MMMdd hh:mm:ss YYYY
Component Id	Database, user id
SpecificProblem	A closed or stale database connection was detected, all stale connections were refreshed.
Description	Transient error detected. Investigate when a threshold is exceeded in a short time

16.3.2.2 Explanation

This Log is generated when an attempt to allocate a database connection encounters detects that the connection is already closed. These errors can occur when the database has been stopped momentarily and then again started. A single occurrance of this log is informational. Multiple occurances within a 15 minutes or a half hour for the same “Component Id” should be investigated to insure these errors are attributable to specific authorized administrative actions.

16.3.2.3 Action

Monitor for multiple occurances within a 15 minutes or a half hour for the same “Component Id”.(Note: It is expected that a Log will be generated for multiple different “Component Ids”.) If this is detected investigate to insure these errors are attributable to specific authorized administrative actions. If these are occurring and are not caused by administrative activity then verify the SSPFS machine identified is functioning normally.

16.3.3 Database Password Changed Log

Log Title:DB602

16.3.3.1 Formats

NTSTD log format:

RTP2 DB602 SEP23 18:25:00 0402 INFO DB Connection Error
Location: SSPFS=wnc0s0jd
Information: User password has changed
Time: SEP23 17:25:00 2003
Component Id: Database, GWCEM User
Specific Problem: Invalid password was detected on a database connection, the new password is now in use for this database user.
Description: Transient error detected. When a threshold is exceeded in a short time, investigate to insure security violations or unauthorized access are not the cause.

Table 3 Log Field descriptions

Field	Value
Category	Information
Severity	NOA
LogName	DB
LogNumber	602
Day Time	mmmdd hh:mm:ss
Sequence Number	sequential log number
EventType	INFO
Device ID	DB
EventLabel	Connection Error
Location	SSPFS=hostname
Information	I/O error, stale connections were refreshed
Day Time Year	MMMdd hh:mm:ss YYYY
Component Id	Database, user id
SpecificProblem	Invalid password was detected on a database connection, the new password is now in use for this database user.

Table 3 Log Field descriptions

Field	Value
Description	Transient error detected. When a threshold is exceeded in a short time, investigate to insure security violations or unauthorized access are not the cause.

16.3.3.2 Explanation

This Log is generated when an attempt to allocate a database connection encounters an invalid password error. These errors can occur when the database log in password for a database user is changed. A single occurrance of this log is informational. Multiple occurances within a 15 minutes or a half hour should be investigated..

16.3.3.3 Action

Monitor for multiple occurances within a 15 minutes or a half hour. If this is detected investigate to insure these errors are attributable to authorized security actions to change the database password and not due to security violations or unauthorized system access.

16.3.4 Database Maximum Sessions Log

Log Title:DB603

16.3.4.1 Formats

NTSTD log format:

RTP2 DB603 SEP23 18:45:00 0403 INFO DB Connection Error
Location: SSPFS=wnc0s0jd
Information: Maximum database sessions limit reached
Time: SEP23 17:25:00 2003
Component Id: Database, GWCEM User
Specific Problem: Maximum database sessions active was detected on an attempt to create a database connection.
Description: Transient error detected. When a threshold is exceeded in a short time, reconfiguration of the database's limits maybe required.

Table 4 Log Field descriptions

Field	Value
Category	Information

Table 4 Log Field descriptions

Field	Value
Severity	NOA
LogName	DB
LogNumber	603
Day Time	mmmdd hh:mm:ss
Sequence Number	sequential log number
EventType	INFO
Device ID	DB
EventLabel	Connection Error
Location	SSPFS=hostname
Information	Maximum database sessions limit reached
Day Time Year	MMMdd hh:mm:ss YYYY
Component Id	Database, user id
SpecificProblem	Maximum database sessions active was detected on an attempt to create a database connection.
Description	Transient error detected. When a threshold is exceeded in a short time, reconfiguration of the database's limits maybe required.

16.3.4.2 Explanation

This Log is generated when an attempt to allocate a database connection encounters maximum database sessions exceeded error. These errors can occur when an unusual event has occurred that caused sustained high levels of system activity. A single occurrance of this log is informational indicating that database resources may need reconfiguration. Multiple occurances within a 15 minutes or a half hour should be investigated.

16.3.4.3 Action

Monitor for multiple occurances within a half hour or an hour. If this is detected notify the database or system administrator. A possible solution is increase the value of the SESSIONS initialization parameter.

16.3.5 Database Maximum Processes Log

Log Title:DB604

16.3.5.1 Formats

NTSTD log format:

RTP2 DB604 SEP23 18:45:00 0403 INFO DB Connection Error
Location: SSPFS=wnc0s0jd
Information: Maximum database processes limit reached
Time: SEP23 17:25:00 2003
Component Id: Database, GWCEM User
Specific Problem: Maximum database processes was detected on an attempt to create a database connection.
Description: Transient error detected. When a threshold is exceeded in a short time, reconfiguration of the database's processes limit maybe required.

Table 5 Log Field descriptions

Field	Value
Category	Information
Severity	NOA
LogName	DB
LogNumber	604
Day Time	mmmdd hh:mm:ss
Sequence Number	sequential log number
EventType	INFO
Device ID	DB
EventLabel	Connection Error
Location	SSPFS=hostname
Information	Maximum database processes limit reached
Day Time Year	MMMdd hh:mm:ss YYYY
Component Id	Database, user id
SpecificProblem	Maximum database processes limit reached

Table 5 Log Field descriptions

Field	Value
Description	Transient error detected. When a threshold is exceeded in a short time, reconfiguration of the database's processes limit maybe required.

16.3.5.2 Explanation

This Log is generated when an attempt to allocate a database connection encounters maximum database processes exceeded error. These errors can occur when an unusual event has occurred that caused sustained high levels of system activity. A single occurrance of this log is informational indicating that database resources may need reconfiguration. Multiple occurances within a 15 minutes or a half hour should be investigated.

16.3.5.3 Action

Monitor for multiple occurances within a half hour or an hour. If this is detected notify the database or system administrator. A possible solution is increase the value of the PROCESSES initialization parameter.

17.3 Logs IWBM 800

17.3.1 Explanation

Log Title: IWBM 800

Name: Interworking Bridge Manager Pool Logs

Description: Log report IWBM800 indicates that the number of available IW bridges exceeds the first threshold (70%) when attempting to retrieve an IW-bridge ID from the IW bridge manager.

Event type: Unchanged

17.3.2 Format

Since it is possible to have multiple IW bridge pools in a single call server, a new line of information is included in the IWBM800 log. This new information is only visible when the Office Parameter MULTINET_DISPLAY_ACTIVE is set to 'Y'. This thresholding log will be monitored and generated for each bridge pool defined in Table NETBRDGE.

Figure 1 Enhanced IWBM 800 Log

```
RTP7  **  IWBM800 SEP17  12:16:55  6600  1st Threshold Exceeded
          The number of interworking bridges in use has
          exceeded 70 percent of all bridges in the pool.
           Total number of IW bridges:  2016
           Number of available IW bridges: <NN>
           Bridge Pool: <bridge pool CLLI from Table NETBRDGE>
```

Log Title: IWBM 802

Name: Interworking Bridge Manager Pool Logs

Description: Log report IWBM802 indicates that the number of available IW bridges exceeds the second threshold (90%) when attempting to retrieve an IW-bridge ID from the IW bridge manager.

Event type: Unchanged

17.5.2 Format

Since it is possible to have multiple IW bridge pools in a single call server, a new line of information is included in the IWBM802 log. This new information is only visible when the Office Parameter MULTINET_DISPLAY_ACTIVE is set to 'Y'. This thresholding log will be monitored and generated for each bridge pool defined in Table NETBRDGE.

Figure 3 Enhanced IWBM 802 Log

```
RTP7 ** IWBM802 SEP17 12:16:55 6600 2nd Threshold Exceeded
    The number of interworking bridges in use has
    exceeded 90percent of all bridges in the pool.
        Total number of IW bridges: 2016
        Number of available IW bridges: <NN>
        Bridge Pool: <bridge pool CLLI from Table NETBRDGE>
```

17.5.3 Field descriptions

Table 3 Field descriptions

Field	Value	Description
Number of available IW bridges	unchanged	unchanged
Bridge Pool	CLLI	Bridge pool name as datafilled in Tale NETBRDGE

17.5.4 Action

This log report requires no action.

17.5.5 Associated Operational Measurements or Performance Measurements

New OM group IWBMNODE can be used to determine individual IW bridge node usage. To determine bridge pool usage, the per-node usage counts would have to be summed.

17.5.6 Additional information

This log report requires no additional information.

17.6 Logs IWBM 803

17.6.1 Explanation

Log Title: IWBM 803

Name: Interworking Bridge Manager Pool Logs

Description: Log report IWBM803 indicates that the number of available IW bridges falls to less than 85% of bridges in the pool in use. This log always occurs after IWBM802.

Event type: Unchanged

17.6.2 Format

Since it is possible to have multiple IW bridge pools in a single call server, a new line of information is included in the IWBM803 log. This new information is only visible when the Office Parameter MULTINET_DISPLAY_ACTIVE is set to 'Y'. This thresholding log will be monitored and generated for each bridge pool defined in Table NETBRDGE.

Figure 4 Enhanced IWBM 803 Log

```
RTP7  **  IWBM803 SEP17  12:16:55  6600 2nd Threshold Cleared
      The number of interworking bridges in use has
      fallen below 85 percent of all bridges in the pool.
            Total number of IW bridges:  2016
            Number of available IW bridges: <NN>
            Bridge Pool: <bridge pool CLLI from Table NETBRDGE>
```

17.6.3 Field descriptions

Table 4 Field descriptions

Field	Value	Description
Number of available IW bridges	unchanged	unchanged
Bridge Pool	CLLI	Bridge pool name as datafilled in Tale NETBRDGE

17.6.4 Action

This log report requires no action.

17.6.5 Associated Operational Measurements or Performance Measurements

New OM group IWBMNODE can be used to determine individual IW bridge node usage. To determine bridge pool usage, the per-node usage counts would have to be summed.

17.6.6 Additional information

This log report requires no additional information.

17.7 XNET 600 Series logs (new)

The XNET 600 series logs provide information on external packet network bearer connection problems. Three new logs are created:

17.7.1 XNET605

17.7.1.1 Explanation

Bearer Networks Cannot connect

This log indicates that the bearer networks of the two parties in a connection attempt are not permitted to inter-connect, based on datafill in table NET2NET.

- or an “Unavailable” indication when the conection source was an ENET hosted party, but that party can no longer be determined.

The ‘From Bearer Network’ line indicates the bearer network name, as datafilled in table BEARNETS, of the source party . The ‘To Bearer Network’ line indicates the bearer network name, as datafilled in table BEARNETS, of the connection destination party.

17.7.1.2 Format

Figure 5 XNET605 Log Example

```
RTP7   XNET605  MAY17  12:16:55  9600 INFO Bearer Networks Cannot Connect
       From Agent              : VOIP 42 2 04 00      DN 6137204200
       From Bearer Network:  IP_PRIMARY
       To     Bearer Network: AAL1_SECONDARY
       Bearer Network Translations resulted in no interconnect
       Check Table NET2NET, NETPATH and NETBRDGE
```

17.7.1.3 Field descriptions

The ‘From Agent’ line indicates the source party of the connection request. This can be in many forms:

- a LEN and DN,
- a Trunk Group name and member number
- a PM type and PM number,
- a Node number and TID (terminal id) when an appropriate device type and device id cannot be determined

17.7.1.4 Action

The telco should determine whether the identified bearer networks are permitted to interconnect. If so, the appropriate datafill should be added to tables NET2NET, and if necessary NETPATH and NETBRDGE. If the bearer networks are not permitted to connect, the telco can:

a. if possible, change DN translations so that the originator can no longer dial the terminator, but will receive a treatment of some type,

b. use the EXTLOGCI command to disable the XNET605 log (see section 17.8)

c. use LOGUTIL to SUPPRESS the XNET 605 log

d. do nothing, the log will continue to print when two parties on the specified bearer networks attempt to dial one another.

17.7.1.5 Associated Operational Measurements or Performance Measurements

17.7.1.6 Additional Information

17.7.2 XNET606

17.7.2.1 Explanation

XNET606 - PKT Pathend Has NIL Bearer Net ID

This log indicates a software or provisioning problem in the switch, in that an appropriate bearer network could not be determined through provisioned data for a particular party in a connection attempt.

17.7.2.2 Format

Figure 6 XNET 606 Log Example

```
RTP7   XNET606  MAY17  12:16:55  9600 INFO PKT Pathend Has NIL Bearer Net ID
       Path   - Node: LGRP   07   Tid:  124
       Agent - VOIP 42 2 04 00     DN 6137204200
       Contact Product Support
```

17.7.2.3 Field descriptions

- The ‘Path’ line indicates the node at the network connection point, this can be in two forms:
- a PM name and number, and a channel or TID id,
- a node number, and a channel or TID id, when the PM name and number cannot be determined from the node number

The ‘Agent’ line identifies the suspect party, this can be in several forms:

- a LEN and DN,
- a Trunk Group name and member number
- or a Node number and TID (terminal id) when an appropriate device type and device id cannot be determined

17.7.2.4 Action

The telco should report this log to appropriate Nortel Product Support.

17.7.2.5 Associated Operational Measurements or Performance Measurements

17.7.2.6 Additional Information

The telco can:

- use the EXTLOGCI command to disable the XNET606 log (see section 17.8)
- use LOGUTIL to SUPPRESS the XNET 605 log
- do nothing, the log will continue to print when the suspect party attempts to place calls

17.7.3 XNET607

17.7.3.1 Explanation

XNET607 - IW Bridge Not Available

This log indicates that an IW SPM interworking bridge was not available for the connection request, either because

- of a bridge exhaust condition on one of the bridge pools involved in the connection request,
- bridges are not inservice, or provisioned for one of the bridge pools involved with the connection request

17.7.3.2 Format

Figure 7 XNET 607 Log Example

```
RTP7    XNET607  MAY17  12:16:55  9600 INFO IW Bridge Not Available
        Bridge Pool       : ENET_TO_IP
        From Agent        : VOIP 42 2 04 00      DN 6137204200
        From Bearer Network:  IP_PRIMARY
        To      Bearer Network: AAL1_SECONDARY
```

17.7.3.3 Field descriptions

The ‘Bridge Pool’ line indicates the name of the bridge pool, as specified in table NETBRDGE, that has the ‘trouble’ condition. The ‘From Agent’ line indicates the source party of the connection request. This can be in many forms:

- a LEN and DN,
- a Trunk Group name and member number
- a PM type and PM number,
- a Node number and TID (terminal id) when an appropriate device type and device id cannot be determined
- or an “Unavailable” indication when the conection source was an ENET hosted party, but that party can no longer be determined.

The ‘From Bearer Network’ line indicates the bearer network name, as datafilled in table BEARNETS, of the source party. The ‘To Bearer Network’ line indicates the bearer network name, as datafilled in table BEARNETS, of the connection destination party.

17.7.3.4 Action

The telco can:

- check for IWBM602 logs indicating a bridge exhaust condition,
- verify that the bridge pool identified in the log is provisioned on an SPM in table MNNODE,
- verify that the bridges in the bridge pool identified in the log are in-service.
- use the EXTLOGCI command to disable the XNET607 log (see section 17.8)
- use LOGUTIL to SUPPRESS the XNET 607 log

17.7.3.5 Associated Operational Measurements or Performance Measurements

17.7.3.6 Additional Information

17.8 EXTLOGCI Tool

The EXTLOGCI tool is an existing CI command that controls the XNET series of logs. By using the ENABLE and DISABLE commands, the user can control the production of XNET logs. The XNET 605, 606 and 607 logs are automatically enabled on all restarts.

17.9 Related documentation

18: Fault Management (FM): A00003567

18.1 Fault management strategy

This feature uses existing MG9KEM fault management structure.

18.2 Fault management tools and utilities

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

18.3 Logs and Alarms

A new alarm (nnESADownloadFault) will be added to indicate a failure to download ESA data to given VMG. This alarm will only be generated for autonomous download attempts. This was indicated by a log in previous releases. This alarm is EM generated and will be problems such as failure to setup the FTP connection to gateway or failure to login. It is different than the inconsistent data (nnESAFault) alarm generated by the hardware while the file transfer is in progress.

The alarm will be cleared by the EM when a successful download takes place.

The new alarm will be displayed at the Alarm Browser at the subnet as well as the well as the alarm browser for each corresponding network element. A log is also generated.

In addition, all the alarms and logs generated for the ITP ESA also apply to ABI ESA.

18.3.1 Explanation

18.3.1.1 nnESADownloadFault

Title: nnESADownloadFault

Name: ESA

Description: This log is generated when the EM is unable to download ESA data to a VMG.

Severity: Critical

Event type: ESA data download failure

18.3.2 Format

The Log Delivery application for this feature generates logs in the Number 2 Switch Control Center (SCC2) format and the NT standard (STD) format explained in the PLOA_SLOA_LOG_ALARMS DID.

18.3.2.1 nnESADownloadFault

***ESA302 Tue Jul 09 14:50:26 EDT 2003 TBL
NnESADOWNLOADFAULT
NE Number: 8 NE Name: co8
State: not acknowledged
Type: Equipment
Cause: Failed to set up FTP connection: login failure!!

Time: Jul 09 14:50:26:616 2003
Severity: critical
Mo: Card.f0.s2.l13.ITP
Description: EM failed to push ESA to VMG

18.3.3 Field descriptions

18.3.3.1 nnESADownloadFault

Table 1 Field descriptions ESA302

Field	Value	Description
office identification	String	Identifies the switch that generates the log. This field is optional. The maximum length of this field is 12 characters.

Table 1 Field descriptions ESA302

Field	Value	Description
alarm	***,**,*, or blank	Indicates the alarm type of the log report. ***=critical, **=major, *=minor, blank = no alarms/warning
threshold	+ or blank	Indicates if a threshold is set for the log report. Plus (+) sign indicates that a threshold was set; if a blank, a threshold was not set.
report identification	AAAA nnn	Identifies the log subsystem that generates the report. This field uses 2-4 alphabetical characters and the number 100-999 of the log report in this subsystem. For this log AAAA= MGC and nnn=600.
day	String	Identifies the day of the week.
mmmmdd	January-December (01-31)	Identifies the month and date the report generates.
hh:mm:ss	00-23 00-59 00-59	Identifies the hour, the minute, and the second the report generates.
zone	PST, EST, MST, CST, AST	Identifies the time zone.
yyyy	0000-9999	Year
ssdd	0000-9999	Defines a different sequence number for each log report generated.
event type	TBL, INFO, etc	Trouble, Service Summary, State Change, Information, Threshold and Expert. TBL for this log.

Table 1 Field descriptions ESA302

Field	Value	Description
event id	String	The Log Title.
NE Number	integer	Number of the NE
NE Name	string	Name of the NE
nnESA Fault Type	string	The type of the fault: ESA data download failed
nnUemgEventTime	DateandTime	The Date and Time the event occurred in the following format: day mmmmdd hh:mm:ss zone yyyy
nnUemgAlarmSeverity	String	Warning
MediaGatewayName	string	The name of the Media Gateway control group which found ESA data inconsistent
Description	string	ESA data download failed

18.3.4 Action

nnESADownloadFault:

Check failure cause in alarm or log text and perform manual downloading actions from the corresponding VMG view . The alarm will be cleared by the EM when the download is succesful.

18.3.5 Associated Operational Measurements or Performance Measurements

None.

18.4 Related documentation

1. NORTEL-UEMG-BASE-MIB - MG9000's Enterprise MIB, contains the Alarm Log Table.

2. PLOA and SLOA Logs and Alarms for UE9kMG EM (DID) - MG9000s design documentation for logs and alarms on the MG9000 Element Manager.

3. Logs and Alarms Strategy for WUA Components - MG9000 Alarm strategy guide - version 1.4

3. Reliable Alarms and Alarm Robustness Design Intent Document (DID) - MG9000 Element Manager design document.

4. PLOA and SLOA Alarm Forwarding to OSS(DSUM) - MG9000 Alarm forwarding feature.

19: Fault Management (FM): A00003591

19.1 Fault management strategy

The standard MG9K EM Fault Management strategy will apply to the new faults raised by this feature. Alarms will be displayed by the MG9K EM Alarm Browser, logged in NT standard format to the SSPFS CUST logs and forwarded to northbound OSS.

For the “A00003591 - OC3 Channelization ” feature there will be new faults added when the payload selected DS3

19.2 Fault management tools and utilities

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

The DS3 alarms will be displayed here..

19.2.1 Faults, Alarms and Logs

There will be new faults generated and cleared by MG9000 when the carrier is channelized and payload selected on the STS1 path is DS3CC or DS3PLCP.

The alarms that can be generated for DS3 will be AIS, LOF and RAI. These faults will be generated when there is a Loss of Frame or some problem at the remote end.

19.3 Alarms

19.3.1 Explanation

19.3.1.1 AlarmIndicationSignal

Title: AlarmIndicatinSignal

Name: ds3ais

Description: This log is generated when a AlarmIndicationSignal fault is received from the Gateway.

19.3.1.2 LossOfFrame

Title: Loss Of Frame

Name: ds3lof

Description: This log is generated when a LossOfFrame fault is received from the Gateway.

19.3.1.3 RemoteAlarmIndication

Title: RemoteAlarmIndication

Name: ds3rai

Description: This log is generated when a RemoteAlarmIndication fault is received from the Gateway

19.3.2 Format

The Log Delivery application for this feature generates logs in the Number 2 Switch Control Center (SCC2) format and the NT standard (STD) format explained in the PLOA_SLOA_LOG_ALARMS DID.

19.3.2.1 STD Format

19.3.3 Action

19.3.3.1 AlarmIndicationSignal

This alarm will be cleared when an AlarmIndicationSignal with faultdefinition - clear is received.

19.3.3.2 LossOfFrame

This alarm will be cleared when an AlarmIndicationSignal with faultdefinition - clear is received..

19.3.3.3 RemoteAlarmIndication

This alarm will be cleared when an RemoteAlarmIndication with faultdefinition - clear is received..

19.3.4 Associated Operational Measurements or Performance Measurements

None.

19.4 Related documentation

20: Fault Management (FM): A00003650

20.1 Fault management strategy

This feature provides logs for the MG4K-IP product in SN07. The log series MG4I is introduced by this activity. The following logs are supported:

- MG4I 501 - Stream Control Transmission Protocol (SCTP) IP Control Connection Maintenance (CCMT) Core connection state change
- MG4I 502 - SCTP IPCCM Peer connection state change
- MG4I 300 - Media Integrity Failure

These logs provide the craft with the capability to detect fault conditions and configuration issues.

20.2 Fault management tools and utilities

The logs can be viewed and reporting can be controlled using the existing LOGUTIL CI.

20.3 MG4I 501 Log

Log Title/Log ID: SCTP Core Conn State Change - MG4I 501

20.3.1 Formats

The format for MG4I 501 log report is as follows:

<Alarm Sev.> MG4I501 <date> INFO SCTP Core Conn State Change
State Change From: <SCTP From State> To: <SCTP To State>
Reason : <State Change Reason>
From Node : CORE (<Core IP addr>:<port>; Associd: <SCTP assoc id>)
To Node : SMG4 <SPM no:> (<MG4K IP addr>:<port>)
Location: SPM <SPM no:> Type: <DMSCP, IW, SMG4, DPT > Fabric: <IP, ATM, UNK>

Example:

```
*** MG4I501 MAY02 22:04:48 800 INFO SCTP Core Conn State Change
        State Change From: ESTABLISHED To: CLOSED
        Reason : FAR END DISCONNECTED
        From Node : CORE (47.108.11.3:5050; Associd: 10)
            To Node : SMG4 6 (47.142.211.1:5050)
        Location: SPM 6 Type: SMG4 Fabric: IP
```

20.3.2 Explanation

Description: This INFO log is generated when the SCTP IPCCM Core Connection state changes for an MG4K-IP node. IPCCM maintains the SCTP connection for reliable messaging between the call server and the MG4K-IP

node. The state change log from ‘CLOSED’ to ‘ESTABLISHED’ indicates that the connection is up. The state change log from ‘ESTABLISHED’ to ‘CLOSED’ indicates that the connection is down. The trunks will go down and no call processing is possible when the connection is down. This is indicated by log alarm severity of Critical.

20.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
From SCTP State	string of 12 char length {CLOSED, ESTABLISHED}	Indicates the old SCTP connection state.
To SCTP State	string of 12 char length {CLOSED, ESTABLISHED}	Indicates the new SCTP connection state.
State Change Reason	1 line of variable text of 60 characters	Indicates the reason for the SCTP connection state change
From Node	CORE (<Call Server IP addr in dotted decimal format>: <Port>; Associd: <Association id>	Indicates the call server SCTP connection end point IP address, port and SCTP association id.
To Node	SMG4 <SPM no: (0 to 85)> (<MG4K IP addr in dotted decimal format>:<Port>)	Indicates the MG4K IP node, SCTP connection end point IP address, port
Location	SPM <SPM no: (0 to 85)>, Type: {DMSCP, IW, SMG4, DPT}, Fabric: {IP, ATM, UNK}	Indicates the SPM node location. It can only be an MG4K node with IP Fabric. The SPM node number is the same as that in ‘To Node’ field.

20.3.4 Action

If the SCTP state change is from ‘ESTABLISHED’ to ‘CLOSED’, check the state change reason and corresponding NODE and SPM logs to determine possible causes of SCTP connection failure and attempt to recover the SCTP connection.

20.3.5 Associated Operational Measurements or Performance Measurements

Not Applicable.

20.3.6 Additional information

Not Applicable.

20.4 MG4I 502 Log

Log Title/Log ID: SCTP Peer Conn State Change - MG4I 502

20.4.1 Formats

The format for MG4I 502 log report is as follows:

MG4I502 <date> INFO SCTP Peer Conn State Change
State Change From: <SCTP From State> To: <SCTP To State>
Reason : <State Change Reason>
From Node : SMG4 <SPM no:> (<MG4K IP addr>:<port>; Associd: <SCTP assoc id>)
To Node(s) : <SMG4, IW, GWC> <Node no:> (<Node IP addr>:<port>)
<SMG4, IW, GWC> <Node no:> (<Node IP addr>:<port>)
....
<list of upto 4 peer IP nodes>
Location: SPM <SPM no:> Type: <DMSCP, IW, SMG4, DPT > Fabric: <IP, ATM, UNK>

Examples:

MG4I502 MAY02 22:04:48 800 INFO SCTP Peer Conn State Change
State Change From: ESTABLISHED To: CLOSED
Reason : FAR END DISCONNECTED
From Node : SMG4 6 (47.108.11.3:5050; Associd: 10)
To Node : SMG4 5 (47.142.211.1:5050)
Location: SPM 6 Type: SMG4 Fabric: IP

MG4I502 MAY02 22:04:48 0800 INFO SCTP Peer Conn State Change
State Change From: ESTABLISHED To: CLOSED
Reason : REPORTED BY PERIPHERAL
From Node : SMG4 6 (47.108.11.3:*; Associd: *)
To Nodes : SMG4 5 (47.142.211.1:5050)
SMG4 7 (47.142.211.2:5050)
SMG4 10 (47.142.211.23:5050)
SMG4 22 (47.142.211.24:5050)
Location : SPM 6 Type: SMG4 Fabric: IP

20.4.2 Explanation

Description: This INFO log is generated when the SCTP IPCCM Peer Connection from an MG4K-IP node to a peer MG4K-IP node changes state.

IPCCM maintains the SCTP connections for reliable messaging between the MG4K-IP node and all its peer MG4K-IP nodes for peer-peer signalling during call processing. The state change log from ‘CLOSED’ to ‘ESTABLISHED’ indicates that the connection is up. The state change log from ‘ESTABLISHED’ to ‘CLOSED’ indicates that the connection is down. The messages are bounced off the call server when the peer connection is down.

20.4.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
From SCTP State	string of 12 char length {CLOSED, ESTABLISHED}	Indicates the old SCTP connection state.
To SCTP State	string of 12 char length {CLOSED, ESTABLISHED}	Indicates the new SCTP connection state.
State Change Reason	1 line of variable text of 60 characters	Indicates the reason for the SCTP connection state change
From Node	SMG4 <SPM no:(0 to 85)> (<MG4K IP addr in dotted decimal format>: <Port>; Associd: <Association id>	Indicates the MG4K IP node, SCTP connection end point IP address, port and SCTP association id.
To Node list	Upto 4 nodes SMG4 <SPM no: (0 to 85)> (<MG4K IP addr in dotted decimal format>:<Port>)	Indicates the peer MG4K IP node, SCTP connection end point IP address and port for upto 4 peer SCTP connections undergoing state changes.
Location	SPM <SPM no: (0 to 85)>, Type: {DMSCP, IW, SMG4, DPT}, Fabric: {IP, ATM, UNK}	Indicates the SPM node location. It can only be an MG4K node with IP Fabric. The SPM node number is the same as that in 'From Node' field.

20.4.4 Action

These logs do not indicate a service affecting change. If the SCTP state change is from 'ESTABLISHED' to 'CLOSED', check the state change reason and corresponding NODE and SPM logs to determine possible causes of SCTP connection failure.

20.4.5 Associated Operational Measurements or Performance Measurements

Not Applicable.

20.4.6 Additional information

In SN07, the peer IP nodes are only MG4K-IP nodes managed by the same call server. The peer nodes may include GWC in a future release.

20.5 MG4I 300 Log

Log Title/Log ID: Media Integrity Failure - MG4I 300

20.5.1 Formats

The format for MG4I 300 log report is as follows:

MG4I300 <date> TBL Media Integrity Failure
Call Type: <Call type string>
Src IP: <Src IP addr>:<port> Dest IP: <Dest IP addr>:<port>
Description : <Media Integrity Failure Reason>
Location: SPM <SPM no:> Type: <DMSCP, IW, SMG4, DPT > Fabric: <IP, ATM, UNK>

Example:

MG4I300 SEP04 03:41:44 2801 TBL Media Integrity Failure
Call Type: G711
Src IP: 47.108.11.3:5050 Dest IP:47.142.211.1:5050
Description: RTCP Media Integrity Timer Expired
Location: SPM 1 Type: SMG4 Fabric: IP

20.5.2 Explanation

Description: This TBL log is generated when a media integrity failure has been detected during a call. The corresponding call is taken down.

20.5.3 Field descriptions

Table 3 Field descriptions

Field	Value	Description
Call Type	8 character string	Indicates the call type codec (G711, G729)
Src IP	<Src IP addr in dotted decimal format>:<Port>	Source IP address and port
Dest IP	<Dest IP addr in dotted decimal format>:<Port>	Destination IP address and port
Description	1 line of variable text of 50 characters	Indicates the reason for the media integrity failure
Location	SPM <SPM no: (0 to 85)>, Type: {DMSCP, IW, SMG4, DPT}, Fabric: {IP, ATM, UNK}	Indicates the SPM node location which reported this failure. It can only be an MG4K node with IP Fabric.

20.5.4 Action

Check the description and investigate the cause of integrity failure.

20.5.5 Associated Operational Measurements or Performance Measurements

Not Applicable.

20.5.6 Additional information

Not Applicable.

20.6 Alarms

Not Applicable.

20.7 Related documentation

Not Applicable.

21: Fault Management (FM): A00003667

21.1 Fault management strategy

There are three changes to the existing SESM fault management structure.

One is the elimination of the SESM alarm acknowledgement function. This is removed because the alarm acknowledgements are being handled at the IEMS level of alarm management. This change will apply to the SESM alarm GUI clients. It is discussed briefly below and more fully in the configuration section.

The second is the update of the SESM communications alarm previously "owned" by the device. The alarm was raised as an alarm from the device that SESM could not communicate with. This was an inaccurate representation of the source of the alarm as the device itself may not have any alarm condition. The alarm was also a critical and this was inaccurate as it did not necessarily mean an outage was occuring or imminent. The alarm has been changed to a major to reflect that the current condition could cause an outage.

The third is the generation of logs on SESM. One each is generated upon startup and shutdown and one when SESM cannot generate alarm notification events. These logs will be sent via the syslog to the SDM.

21.2 Fault management tools and utilities

There are two SESM alarm GUI's. One shows active alarms on the managed devices and the other shows the alarm history. On the active alarm GUI, the ability to acknowledge an alarm will be removed. This function is handled by the IEMS alarm GUI. By removing it, there is no confusion whether an alarm is acknoweldged or not.

The only change to the alarm GUI's will be the removal of the acknowledge options in the active alarm manager and the removal of the "show acknowledged" check box on the alarm history window.

21.3 Logs

21.3.1 Explanation

This log is generated by the SESM alarm system to indicate the system is initializing.

21.3.2 Format

```
COMPACT2 CMT500 JUN30 11:01:55 0580 INFO CMT INFO Init

        CS2K Management Tools Alarm Manager Initialization.
```

Cause – SESM server is restarting.

Action – None.

Interfaces – this is generated by the SESM alarm system via syslog.

21.3.3 Field descriptions

N/A

Table 1 Field descriptions

Field	Value	Description

21.3.4 Action

N/A

21.3.5 Associated Operational Measurements or Performance Measurements

N/A

21.3.6 Additional information

N/A

21.3.7 .Explanation

This log is generated by the SESM alarm system upon shutdown.

21.3.8 Format

```
COMPACT2 CMT501 JUN30 11:01:55 0580 INFO CMT INFO Shutdown
        CS2K Management Tools Alarm Manager Shutting Down.
```

Cause – SESM Server has been shutdown.

Action – A SESM administrator should ensure that the server was intentionally shutdown and that it is being restarted.

Interfaces – this is generated by the SESM alarm system via syslog.

21.3.9 Field descriptions

N/A

Table 2 Field descriptions

Field	Value	Description

21.3.10 Action

A SESM administrator should ensure that the server was intentionally shutdown and that it is being restarted.

21.3.11 Associated Operational Measurements or Performance Measurements

N/A

21.3.12 Additional information

N/A

21.3.13 Explanation

This log is generated by the SESM alarm system to inform northbound alarm clients that alarm notifications cannot be generated. This log will be sent via the SSPFS syslog feed to the customer log.

21.3.14 Format

```
COMPACT2 CMT502 JUN30 11:01:55 0580 INFO CMT INFO

        CS2K Management Tools Alarm Manager failed to raise alarm

        notification due to CORBA failure.  Please check CORBA status on

        CS2K Management Tools server.
```

The is just a sample of how the log might look. The final format will be provided prior to IT.

Cause – CORBA communications on the SESM server or within SESM are failing.

Action – A SESM administrator should check the communications on the SESM server.

Interfaces – this is generated by the SESM alarm system via syslog.

21.3.15 Field descriptions

N/A

Table 3 Field descriptions

Field	Value	Description

21.3.16 Action

The SESM administrator should determine the status of the CORBA communications on the SESM server and the network connectivitiy of that machine.

21.3.17 Associated Operational Measurements or Performance Measurements

N/A

21.3.18 Additional information

This log is intended for users of the SESM CORBA alarm notifications to inform the user that events cannot be generated.

21.4 Alarms

There is one change to an existing alarm. The alarm was previously a device owned alarm represented as GWC398 or UAS398 and was a critical alarm. It has been changed to be owned by the CMT and will be a major alarm now.

For a description of the alarm log formats and fields, please see:

http://ptm -> Documentation -> SN06 -> AlarmLoggingDSUM.doc -> Section 11.

This is the new format of the communication error log. Changed fields in bold.

```
COMPACT2 ** CMT302 JUN30 11:01:55 0580 TBL CMT Fault
        Location: SNMP_NE_Poller
        NotificationID: 0
        State: Raise
        Category: Communications
        Cause: Communications subsystem failure
        Time: Jun 30 11:01:55 2003
```

```
Component Id: SNMP Device Poller;Device=rtpsUASa;DeviceID=0x0000006
3000000a12f8e5952
Specific Problem: SNMP Timeout
Description: CMT Unable to communicate with managed device
```

Severity – Major, as it may indicate a network issue or an issue with the device itself, and it could lead to an outage.

Cause – SNMP poller cannot communicate to the network device

Duration – will remain active until communications are reestablished to the device being polled

Action – have a network administrator determine the cause of the SNMP timeout to the device

Interfaces – this is generated by the SNMP poller on SESM

21.5 Related documentation

http://ptm -> Documentation -> SN06 -> AlarmLoggingDSUM.doc -> Section 11.

22: Fault Management (FM): A00003687

22.1 Fault management strategy

The TOPS131 log was added in SN06 by feature A00000816: "TOPS Wireless ADACC with Release." TOPS generates this log in failure situations when interacting with a cell phone caller and a Mobile Switching Center (MSC).

This SN07 feature updates the text title string in the log. The log was formerly titled "TOPS IS-41 Trouble." To make it more general, it is now titled "TOPS Wireless Trouble." An additional line of text is added to identify whether the trouble occurred on an IS-41 or GSM call.

This feature also adds some new reasons to the Reason field.

22.2 Fault management tools and utilities

LOGUTIL and related log tables (LOGCLASS, LOGDEV) can be used to view and collect logs relating to TOPS wireless applications.

22.3 Logs

22.3.1 Explanation

Log Title: TOPS131

Name: TOPS Wireless Trouble (changed from TOPS IS-41 Trouble)

Description: This log is generated in the TOPS switch when problems occur on a wireless ADACC with release call, or when problems occurs when TOPS tries to send a short text message using Short Message Service (SMS).

In the ADACC case, the log indicates TOPS attempted to provide ADACC with Release Link Trunking (RLT) to a wireless customer, but an unexpected problem prevented this.

This log is not generated when the call is disconnected prior to call completion due to normal reasons (e.g. calling party abandons, or operator can't locate DA listing and ends call).

In the SMS case, this log indicates an SMS did not reach the cell phone user. The log text gives an indication of the problem.

Event type: Major. Each log can represent the loss of one call, or that requested information could not be provided. On RLT calls, the wireless customer is disconnected prior to call completion to the requested number.

22.3.2 Format

TOPS131 <mmmdd hh:mm:ss ssdd> TBL TOPS Wireless Trouble
CKT <CPID>
MSC route set: <serving MSC route set from Table C7RTESET>
Called digits: <digits>
Reason: <reason text>
Wireless type: <IS-41 or GSM>

Example:

```
TOPS131 OCT01 15:07:54 7100 TBL TOPS Wireless Trouble
MSC route set:     RTP8_STPA_N_RS
Called digits:     201-220-1234 (TLDN)
Reason:            Failure at MSC
Wireless type:     IS-41
```

Example:

```
TOPS131 OCT01 15:07:54 7100 TBL TOPS Wireless Trouble
CKT  RTPC_RTP8_ISUP    2
MSC route set:     RTP8_STPA_N_RS
Called digits:     619-322-1234 (Destination number)
Reason:            SMS failure: Network problem (2)
Wireless type:     IS-41
```

22.3.3 Field descriptions

This feature does not change TOPS131 fields CKT, MSC route set, or Called digits. This feature adds additional text reasons to the Reason field as indicated in the table in this section. This feature also adds a new field, Wireless type, which indicates whether the log was generated on an IS-41 or GSM call.

The Reason field describes the category of the error. When the log is generated due to a negative acknowledgment from the message center, the exact byte value of the cause code is included in parentheses at the end of the Reason field. The meaning of the byte value can be found in the specifications as follows:

- IS-41-D: Chapter 5, section 6.5.2.125 (SMS Cause Code), table 171
- GSM: 3GPP TS 29.002 V4.12.0 (2003-06), sections 7.6.1 and 12.2.3.

Table 1 Field descriptions

Field	Value	Description
Reason	SMS failure: Network problem <nn>	The message center encountered a network problem and could not process the TOPS SMS.

Table 1 Field descriptions

Field	Value	Description
Reason	SMS failure: Terminal problem <nn>	The message center could not process the TOPS SMS due to problems with the terminal (cell phone) specified by the destination number.
Reason	SMS failure: Radio interface problem <nn>	The message center could not process the TOPS SMS due to problems with the radio interface to the cell phone.
Reason	SMS failure: Miscellaneous problem <nn>	The message center could not process the TOPS SMS for a reason other than the above three. One example is if the format of the TOPS SMS was not understood by the message center.
Reason	SMS failure: Time-out	A response was not received to the TOPS SMS within the time period defined in Table TOPSPARM parameter SMS_TIMEOUT.
Reason	SMS failure: Global title translation	Tables C7GTTYPE and C7GTT cannot accommodate the destination number listed in the log.
Reason	No transaction IDs	No transaction ID could be obtained when TOPS attempted to send an INVOKE, whether for IS-41 WIN, GSM CAMEL, or SMS. This means the message could not be sent.

Table 1 Field descriptions

Field	Value	Description
Reason	WIN: Wireless protocol mismatch	The wireless network protocol established by the IS-41 ANLYZD or GSM InitialDP message did not match the trunk group datafill (RLT_IS41 or RLT_GSM) in Table ISUPTRK when the call arrived. The call cannot proceed because the version of IS-41 or GSM RLT is unknown.
Wireless type	IS-41	The log was generated on a TOPS IS-41 call.
Wireless type	GSM	The log was generated on a TOPS GSM call.

22.3.4 Action

The action taken depends on the contents of the reason field as follows.

Table 2 Reason to action mapping

Reason text	Action
SMS failure: *(any SMS failure except GTT)*	Examine SS7 and TCAP logs on the TOPS switch and at the message center. Use an operator position to send SMS messages and verify the messages arrive at the message center. Use message center tools to verify SMS can be forwarded to the cell phone. If time-outs are occurring, investigate whether the SMS_TIMEOUT parameter in Table TOPSPARM needs to be increased.
SMS failure: Global title translation	Check datafill in Tables C7GTTYPE and C7GTT for the destination number listed in the log. Look for tuples containing MDNMCGT (mobile directory number to message center global title).
No transaction IDs	Contact Nortel Networks. TOPS automatically allocates transaction IDs when needed.
WIN: Wireless protocol mismatch	Correct the datafill mismatch in Table ISUPTRK. The MSC specified in the log is sending one kind of protocol to TOPS, but is datafilled in Table ISUPTRK as another kind.

22.3.5 Associated Operational Measurements or Performance Measurements

Table 3 Reason to OM mapping

TOPS131 reason text	OM
SMS failure: Network problem	Group SMSTOPS, register SMSNETWK
SMS failure: Terminal problem	Group SMSTOPS, register SMSTERM
SMS failure: Radio interface problem	Group SMSTOPS, register SMSRADIO
SMS failure: Miscellaneous problem	Group SMSTOPS, register SMSMISC
SMS failure: Time-out	Group SMSTOPS, register SMSTIME
SMS failure: Global title translation	Group TC7WRLSS, register GTTFAIL
No transaction IDs	Group TC7WRLSS, register NOTRIDS
WIN: Wireless protocol mismatch	None

22.3.6 Additional information

Since short messaging can fail in many expected situations (such as wireless phone powered off, destination number not subscribed to SMS, etc.), the TOPS131 logs can be throttled. A new parameter in Table TOPSPARM, `SMS_LOG_MC_FAILURE`, determines when TOPS131 logs are generated as a result of SMS failure. TOPS131 to be generated in some SMS failure scenarios but not others. See the Configuration chapter for more information.

22.4 Alarms

No new or changed alarms.

22.5 Related documentation

Not applicable.

23: Fault Management (FM): A00003767

23.1 Fault management strategy

Three new alarms are introduced by this activity. These alarms are associated with ABI host XPMs and allow the customer to quickly isolate network messaging issues from other causes of XPM c-side busy.

As with other XPM faults, these alarms affect the DMS alarm banner, show up as an InService TrouBle (ISTB) reason for the applicable ABI XPM, and generate a log message.

23.2 Fault management tools and utilities

No new tools are introduced. These alarms look like other ISTB reasons on any XPM.

23.3 Logs

23.3.1 Explanation

Log Title: PM181

Name: PM181

Description: PM181 logs are existing DMS logs and are used extensively by the GWC in a Succession configuration. This activity extends the use of the PM181 log for Succession. When an ABI messaging alarm (described later) is set or cleared, a PM181 log is reported.

Event type: critical, major or minor depending on the alarm that is generating the log.

23.3.2 Format

Format of the PM181 log has not been changed beyond the formats already in used by the GWC. Information on the GWC use of PM181 can be found in NN10090-911. The following new strings are used. Strings 1, 2 & 3 are concatenated together to form the complete string:

Table 1 New PM181 Log strings

String 1	String 2	String 3
ABI external messaging alarm	Links Down - Severely degraded - Degraded -	Alarm set Alarm cleared

23.3.3 Field descriptions

Unchanged.

23.3.4 Action

An associated alarm is also raised. Please refer to the alarm descriptions below for operating company actions.

23.3.5 Associated Operational Measurements or Performance Measurements

Not applicable

23.3.6 Additional information

Alarm set **Associated alarm message: ABI external messaging alarm Links Down - Alarm Set (or Alarm cleared)**

Severity: Critical; Service Outage

Cause: The messaging links between the ABI card associated with the XPM and the GWC which the XPM subtends have gone down. This causes a service outage of the XPM and all its subtending peripherals (ESA may be in affect).

The problem is somewhere between the ABI cards hosting the XPM and the GWC which the XPM subtends.

Action: Need to isolate the network component experiencing the problem. If the problem lies as a transitory problem in a network component, the messaging links may recover autonomously.

Any network component used in the messaging path could cause a messaging disruption. The GWC and XPMs are very probably fine. The following are some likely causes (but not all) of the messaging disruptions and the operator should check to ensure that components are operating normally:

- MG9K ABI card failed or was pulled and not taken out service first
- MG9K OC3 cards taken out of service
- MG9K active OC3 card failed or was pulled and not taken out service first
- Fiber links on MG9K ABI or active OC3 card pulled or failed
- Shelf controller for associated GWC failed, or taken out of service
- Network router failed or taken out of service with no alternative path for packets
- Configuration of router(s) changed so packets can’t get through
- Cables to router(s) failed.

- No Single point of failure, but network message loss is so high that a messaging link can not be sustained (would probably have seen the minor and major alarms earlier).

The alarm is cleared when the message link is re-established, or by MANBSY'ing the XPM, or a DMS core reload restart.

Interfaces: DMS Core Alarm

Associated alarm message: ABI external messaging alarm Severely Degraded - Alarm Set (or Alarm cleared)

Severity: Major, service affecting

Cause: Message loss in the network has reached a point where calls may be sporadically starting to fail, loading and RTS'ing peripheral may fail.

The problem is somewhere between the ABI cards hosting the XPM and the GWC which the XPM subtends.

Action: Need to isolate the network component experiencing the problem. If the problem lies as a transitory problem in a network component, the messaging links may recover autonomously.

Any network component used in the messaging path could cause a messaging disruption. The GWC and XPMs are very probably fine. The following are some likely causes (but not all) of the messaging disruptions and the operator should check to ensure that components are operating normally:

- MG9K ABI cards in overload
- MG9K OC3 cards in overload
- Shelf controller for associated GWC in overload
- Network router(s) in overload
- Configuration of router(s) changed so there is not sufficient bandwidth

The potential for call failures is high in this state, to the network operator should recover the immediate cause. Additionally, the customer's network operations may want to closely monitor the system and decide if further network capacity is required.

The alarm is cleared when the message link message loss decreases, the critical alarms is raised or by MANBSY'ing the XPM, or a DMS core reload restart.

Interfaces: DMS Core Alarm

Associated alarm message: ABI external messaging alarm Degraded - Alarm Set (or Alarm cleared)

Severity: Minor - potential to affect service

Cause: Message retransmission in the network has reached a point where the occasional call fails due to increased latency.

The problem is somewhere between the ABI cards hosting the XPM and the GWC which the XPM subtends. Messages are being lost, but the system is able to recover with message retransmissions. However, if this situation continues to escalate, eventually unrecoverable message loss will occur.

Action: Need to isolate the network component experiencing the problem. If the problem lies as a transitory problem in a network component, the messaging links may recover automonously. The network engineering group should be given the collected information to determine if further network build-out or tweaking of network parameters is required.

Any network component used in the messaging path could cause a messaging disruption. The GWC and XPMs are very probably fine. The following are some likely causes (but not all)of the messaging disruptions and the operator should check to ensure that components are operating normally:

- MG9K ABI cards in overload
- MG9K OC3 cards in overload
- Shelf controller for associated GWC in overload
- Network router(s) in overload
- Configuration of router(s) changed so there is not sufficient bandwidth

The alarm is cleared when the message link message loss decreases, the critical or major alarm is raised or by MANBSY'ing the XPM, or a DMS core reload restart.

Interfaces: DMS Core Alarm

23.4 Related documentation

The MG9K ABI cards will also being generating similar alarms. The information the for the new alarms at the MG9K element manager can be found in activity A0003571 documentation.

24: Fault Management (FM): A00003933

This section provides information on logs and alarms for the features under the SIP Gateway application umbrella. Separate sections are provided for the Call Processing, Application Maintenance, and Provisioning logs and alarms.

24.1 SIP Gateway application Call Processing Logs and Alarms

The following is a description of logs and alarms generated by the SIP Gateway application Call Processing. Note that these logs and alarms are only generated and reported on the SIP Gateway application.

They can be viewed via the SIP Gateway Maintenance web browser interface on the Session Server Manager - SIP Gateway application web page.

Note 1: The body of log formats shown in this document are the formats for Session Server logs if viewed from the IEMS (Integrated Element Manager System). Log formats may differ if logs are viewed from the Session Server Web Interface. However the content of the logs will not differ, only the formatting.

Note 2: When viewing logs from an IEMS, log headers may differ slightly from what is shown in this document.

24.1.1 SIP Gateway application Call Processing Logs

The SIP Gateway application Call Processing software produces the following logs:

- SIPC310 - SIP CallP No Database Connection
- SIPC310 (related log) - SIP CallP Database Connection Established
- SIPC 650 - SIP CallP No Data Found
- SIPC301 - All SIP Incoming Msgs Blocked
- SIPC750 - Incoming SIP messages dropped
- STGW700 - SIP Call Processing Application Logs

24.1.1.1 SIPC310 SIP CallP No Database Connection Log

Log SIPC310 "SIP CallP No Database Connection" is associated with the generation of the Critical alarm due to a loss of connectivity between the database and the CallP application, a Critical alarm is generated.

Log Title: SIP CallP

Name: SIPC310

Description: No Database Connection

Event type: Trouble

24.1.1.1.1 Format

For the SIPC 310 log, the following are values/explanations of the variable values:

- alarmLevel = CRIT- Indicates it is a critical alarm
- componentID = SIPC
- category = Communications - Indicates communication failure between CallP and the database
- description = No Database Connection
- probableCause = outOfService
- specificProblem = Communication failure with Database
- correlationIdList = None
- neVendorSpecificInfo = None
- technologySpecificInfo = None
- reportName = SIPC
- reportNum = 310
- eventType = TBL
- label = SIP CallP

The following is a sample log:

```
May 19 14:02:54 ngss4 alarmd: SIPC310 CRIT TBL SIP CallP
NCGL=ngss4;Unit=0;SIPC No Database Connection
```

24.1.1.1.2 Action

Establish connectivity between CallP and the Database.

24.1.1.1.3 Associated Operational Measurements or Performance Measurements

None

24.1.1.2 SIPC310 SIP CallP Database Connection Established Log

A second associated SIPC310 log is generated "SIP CallP Database Connection Established" when the connection that caused the first SIPC310 log is re-established and the alarm is cleared.

Log Title: SIP CallP

Name: SIPC3100

Description: Database Connection Established

Event type: Trouble

24.1.1.2.1 Format

For the SIPC 310 alarm and related log, the following are values/explanations of the variable values:

- alarmLevel = None - Indicates that the alarm is cleared
- componentID = SIPC
- category = Communications - Indicates communication failure between CallP and the database has been established
- description = Database Connection Established
- probableCause = outOfService
- specificProblem = Communication Established with Database
- correlationIdList = None
- neVendorSpecificInfo = None
- technologySpecificInfo = None
- reportNum = 310
- eventType = TRBL
- label = SIP CallP

The following is a sample log:

```
May 19 14:03:34 ngss4 alarmd: SIPC310 NONE TBL SIP CallP
NCGL=ngss4;Unit=0;SIPC Automatically cleared due to alarm generator
process death
```

24.1.1.2.2 Action

None

24.1.1.2.3 Associated Operational Measurements or Performance Measurements

None

24.1.1.3 SIPC 650

The SIPC 650 log is an informational log that is generated when the CallP application goes to get data from the database for a particular table and no data is found.

Log Title: IP CallP

Name: SIPC 650

Description: No Data Found

Event type: Info

24.1.1.3.1 Format

For the SIPC 650 log, the following are values/explanations of the variable values:

- Report Name = SIPC
- Report Number = 650
- Alarm Value = NONE
- Event Type = INFO
- label = "No Data Found:" <data type>

The following is a sample log:

```
May 13 13:32:17 JOEBOB sipgwyappln: SIPC650 NONE INFO SIP CallP No
Data Found: ACCESS LINK MAP
```

24.1.1.3.2 Action

None

24.1.1.3.3 Associated Operational Measurements or Performance Measurements

None

24.1.1.4 SIPC301

The SIPC301 log is a critical log that is generated when the SIP Gateway Call Processing Application will not receive any incoming SIP messages due to Access Control List being enabled and no valid entries in the Remote SIP server or ACL list.

Log Title: All Incoming SIP Msgs Blocked

Name: SIPC301

Description: ACL enabled without valid entries

Event type: Trouble

24.1.1.4.1 Format

For the SIPC301 log, the following are values/explanations of the variable values:

- Report Name = SIPC
- Report Number = 301
- Alarm Value = CRIT
- Event Type = TBL
- label = “All SIP Incoming Msgs Blocked" <data type>

The following is a sample log:

```
Nov 12 21:32:08 loopback sipgwyappln: SIPC301 CRIT TBL All SIP
Incoming Msgs Blocked
```

24.1.1.4.2 Action

None

24.1.1.4.3 Associated Operational Measurements or Performance Measurements

None

24.1.1.5 SIPC750

The SIPC750 log is generated when the SIP Gateway Call Processing Application drops incoming SIP messages due to Access Control List restrictions.

A Minor, Major or Critical log is generated based on the number of SIP messages dropped in last 15 minutes:

- Minor Threshold: 25
- Major Threshold: 100
- Critical Threshold: 500

Log Title: SIP Access Control List

Name: SIPC750

Description: Incoming SIP messages dropped

Event type: Trouble

24.1.1.5.1 Format

For the SIPC301 log, the following are values/explanations of the variable values:

- Report Name = SIPC
- Report Number = 750
- Alarm Value = MIN/MAJ/CRIT
- Event Type = TBL
- label = "SIP Access Control List" <data type>

The following is a sample log:

```

24.1.1.6 STGW700 - SIP Call Processing Application Logs

The following is a description of the customer logs generated by SIP call processing application. SIP Call Processing Application Logs are INFO logs which can be viewed via the SIP Gateway Maintenance web browser interface on the Session Server.

Following is the format of the log:

```
<Date> <Time> <DeviceName> sipgwyappln: STGW700 NONE INFO SIPCALLP <LogMessage>
```

Following are values/explanations of variable values listed above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <LogMessage>:
  - PostGainNotifyCallp Called on INACTIVE side
  - Sync call to the standby unit failed with callid *callId*
  - GCP NewCall received for Unsupported Agent : *agentType*
  - No more CallDataBlocks to process CallID: *callId*
  - Failed to add ISUP payload for call *callId*
  - Remote SIP server not mapped for SIP LINK Index *SipLinkIdx*
  - No Active Server for SIP Link *SipLinkIdx*
  - HandleNewCall::Failed to Set MDB for callid *callId*
  - No GCP Nodes to process call with callid *callId*
  - Unauthorized Call attempt from MGC *DestMgc*
  - HandleSipUPDATERequest::MDB Parsing for UPDATE failed for callid *callId*
  - HandleACK::MDB Parsing for ACK failed for callid *callId*
  - Handle200OKINVITERecvd::MDB Parsing for 200 OK INVITE failed for callid *callId*
  - Incompatible media format received in 200 OK response to INVITE.
  - Handle200OKINVITERecvd::Failed to send ACK for callid *callId*
  - Handle200OKINVITERecvd::Failed to get Outbound Message for callid *callId*
  - Handle200OKINVITERecvd::Failed to add 305 warning header for callid *callId*

- HandleReINVITE::MDB Parsing for Re INVITE failed for callid *callId*
- HandleSipINFORequest::MDB Parsing for INFO failed for callid *callId*
- HandleACKReINVITE::MDB Parsing for ACK failed for callid *callId*
- new message received with bad syntax start-line. *msgDestName*
- new message received with bad syntax. *msgDestName*
- Unable to Get Received Message (ACK) for callid *callId*
- *Module*:*Procedure* Null App Call Context
- *Module*:*Procedure* Unable to Get Received Message
- Media Error: CALLID: *callId* - 488 Not Acceptable Here Received
- Media Error: CALLID: *callId* - 606 Not Acceptable Received
- Incompatible media format, call rejected.
- Media type not available, call rejected.
- GCP Socket Open Failed
- Failed to get Active IP Address
- Bind for GCP Socket Failed
- supportedExtensionList was Null defaulted to 100rel
- NGSS Profile Data Creation Failed for Server *sipServerName*

Following is a sample STGW700 log:

```
May 11 15:09:33 sp2k-1 sipgwyappln: STGW700 NONE INFO SIPCALLP
supportedExtensionList was Null defaulted to 100rel
```

24.1.2 SIP Gateway application Call Processing Alarms

24.1.2.1 SIP Gateway CallP ACL Trouble Alarm

This alarm is raised when incoming SIP messages are dropped due to Access Control List enforcements. The alarm handler polls for dropped messages every 15 minutes. The severity of the alarm is based on the number of packets dropped in last 15 minute time interval. The severities include

- Minor Threshold: A minor alarm is raised if 25 or more messages (but less than 100) are dropped.
- Major Threshold: A major alarm is raised if 100 or more messages (but less than500) are dropped.
- Critical Threshold: A major alarm is raised if 500 or more messages are dropped.

If no messages are dropped in the next 15 minutes, the raised alarmed is cleared.

SIPC 750 logs are generated for each of the alarms as described in logs section.

24.2 SIP Gateway Application Maintenance Logs and Alarms

The following is a description of logs and alarms generated by the SIP Gateway Application Maintenance software. Note that these logs and alarms are only generated and reported on the SIP Gateway application, and are not resident on the DMS core for example.

They can be viewed via the SIP Gateway Maintenance web browser interface on the Session Server Manager - SIP Gateway application web page.

The following information corresponds to the content delivered in the SN07 release, and may be updated for following releases.

24.2.1 SIP Gateway Application Maintenance Logs

The SIP Gateway Application Maintenance software produces the following logs:

- SIPM500 - SIP Gateway Maintenance State Change Log
- SIPM300 - SIP Gateway Maintenance Trouble Log
- SIPM301 - SIP Gateway Maintenance Trouble Alarm Log
- SIPM302 - SIP Gateway Maintenance Sync Trouble Alarm Log

24.2.1.1 SIPM500 - SIP Gateway Maintenance State Change Log

This is an INFO log which is generated any time the SIP Gateway Application maintenance state changes.

Following is the format of this log:

```
<Date> <Time> <DeviceName> sipgwymtc: SIPM500 NONE INFO SIP Gateway Maintenance State Change
        [Administrative : <AdminFrom> -> <AdminTo>]
        [Operational    : <OperFrom>  -> <OperTo>]
        [Control        : <CtrlFrom>  -> <CtrlTo>]
        [Procedural     : <ProcFrom>  -> <ProcTo>]
        [User Requested : <Yes|No>]
        [Reason         : <StateChangeReason>]
        [Web User ID    : <webuserid>]
```

Following are values/explanations of variable values listed above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <AdminFrom> and <AdminTo>:
  - — Locked
  - — Unlocked
  - — Shutting Down

- <OperFrom> and <OperTo>:
  - — Enabled
  - — Disabled
- <CtrlFrom> and <CtrlTo>:
  - — Suspended
  - — Not Suspended
- <ProcFrom> and <ProcTo>:
  - — Terminating
  - — Not Terminating
- <StateChangeReason>:
  - — Unsuspend command issued
  - — Suspend command issued
  - — Lock command issued
  - — Lock command in progress
  - — Lock operation complete
  - — Unlock command issued
  - — Shut Down command issued
  - — Shut Down operation complete
  - — System originated change of state
  - — Timeout waiting to terminate call processing
  - — Audit Failure
  - — Timer Problem
  - — Data corruption detected
- <webuserid>: If applicable, this is the web interface login ID of the user performing the maintenance that caused the state transition. If not applicable, this value is left blank.

Following is a sample SIPM500 log:

```
Apr 12 10:45:06 RTPF-SIP0 sipgwymtc: SIPM500 NONE INFO SIP Gateway Maintenance State Change
        [Administrative : Locked          -> Unlocked]
        [Operational    : Enabled         -> Enabled]
        [Control        : Not Suspended   -> Not Suspended]
        [Procedural     : Not Terminating -> Not Terminating]
        [User Requested : Yes]
        [Reason         : Unlock command issued]
        [Web User ID    : mtc]
```

24.2.1.2 SIPM300 - SIP Gateway Maintenance Trouble Log

This is a TBL (Trouble) log which is generated any time the SIP Gateway Application Maintenance software encounters an unexpected condition.

Following is the format of this log:

```
<Date> <Time> <DeviceName> sipgwymtc: SIPM300 NONE TBL  SIP Gateway Maintenance Trouble
        [Reason Text : <TroubleReason>]
        [Error Code  : <ErrorCode>]
```

Following are values/explanations of variable values listed above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <TroubleReason>:
  - — SAM to Web Server message send failure
  - — SAM to SIP CallP message send failure
  - — Been Terminating too long. Timer Expired.
  - — SAM Wait Timer Messaging Timeout
  - — SAM/SIP CallP Audit Messaging Timeout
  - — Failed to set the SIP Gateway Application state
  - — SIP Gateway Application process death
  - — Failed to start the SIP Gateway Application process
  - — Failed to set a timer
  - — SIP CallP created, but not in the requested state
  - — SIP CallP created, but failed to reply to SAM
  - — SIP CallP on the Inactive failed to respond to a request
  - — SIP CallP on the Inactive failed to get to the requested state
  - — SAM failed to send a reply to a platform swact request
  - — SAM failed a Swact Request due to an invalid Swact Request
  - — SAM failed a Graceful Swact Request due to being marked to do a COLD Swact
  - — SAM failed a Swact Precheck Request due to option = FORCE
  - — SAM failed a Swact Precheck or PreSwact request due to option = NOW
  - — SAM failed a Swact Request due to an invalid option
  - — SAM failed a Swact Request due to an unacceptable platform status

- SAM failed a Swact Request due to not being In-Sync
- Swact Precheck Failed due to failure received in SIP CallP response
- Swact Precheck Failed due to failure to notify SIP CallP
- Swact Precheck Failed due to timeout waiting on SIP CallP response
- Swact PreSwact Failed due to failure received in SIP CallP response
- Swact PreSwact Failed due to failure to notify SIP CallP
- Swact PreSwact Failed due to timeout waiting on SIP CallP response
- Swact AbortSwact Failed due to failure received in SIP CallP response
- Swact AbortSwact Failed due to failure to notify SIP CallP
- Swact AbortSwact Failed due to timeout waiting on SIP CallP response
- Swact PostSwact Failed due to failure received in SIP CallP response
- Swact PostSwact Failed due to failure to notify SIP CallP
- Swact PostSwact Failed due to timeout waiting on SIP CallP response
- Disable PreCheck Failed due to failure received in SIP CallP response
- Disable PreCheck Failed due to timeout waiting on SIP CallP response
- Disable PreDisable Failed due to failure received in SIP CallP response
- Disable PreDisable Failed due to timeout waiting on SIP CallP response
- Disable AbortDisable Failed due to failure received in SIP CallP response
- Disable AbortDisable Failed due to timeout waiting on SIP CallP response
- Swact PreSwact Failed due to failure to notify SIP CallP
- Disable PreDisable Failed due to failure received from the mate SAM
- Disable PreDisable Failed due to failure to notify SIP CallP
- Disable PreDisable Failed due to timeout waiting on mate SAM response
- Disable AbortDisable Failed due to failure received from the mate SAM
- Disable AbortDisable Failed due to failure to notify SIP CallP
- Disable AbortDisable Failed due to timeout waiting on mate SAM response
- Disable Request Failed due to Callback called with existing disable request outstanding

- — Disable Request Failed due to Callback called when platform not active and enabled
- — Disable Inactive Failed due to Callback called when platform not in duplex
- — Disable Inactive PreCheck Failed due to Callback called when SAM had a conflicting wait state
- — Disable Inactive PreDisable Failed due to Callback called when SAM had a conflicting wait state
- — Disable Inactive AbortDisable Failed due to Callback called when SAM had a conflicting wait state
- — Disable PreCheck Failed due to failure to notify SIP CallP
- — Disable PreDisable Failed due to failure to notify the Mate SAM
- — Disable AbortDisable Failed due to failure to notify the Mate SAM
- — Disable Active Failed due to Callback called when platform was in duplex
- — Disable Active Graceful Failed due to Callback called when SIP State was not suspended
- — Disable Callback called with invalid request
- — SAM received a response to a Swact request that contained an invalid request
- — SAM received a response to a Swact request that contained an invalid option
- — SAM received a response to a Swact request that contained an invalid result
- — Mate SAM failed a Prepare For COLD Swact request, reverting to a WARM swact
- — Failed to notify the Mate SAM to Prepare For COLD Swact request, reverting to a WARM swact
- — Timed out waiting on the Mate SAM to respond to a Prepare For COLD Swact request, reverting to a WARM swact
- — SAM failed to register with DataSync

- <ErrorCode>: This is an integer code used for debugging. -1 is the default value.

Following is a sample SIPM300 log:

```
Apr  6 13:24:47 RTPF-SIP0 sipgwymtc: SIPM300 NONE TBL  SIP Gateway Maintenance Trouble
        [Reason Text : SIP Gateway Application process death]
        [Error Code  : -1]
```

24.2.1.3 SIPM301 - SIP Gateway Maintenance Trouble Alarm Log

This is a TBL (Trouble) log which is generated any time the SIP Gateway Maintenance Trouble Alarm is raised or lowered.

Following is the format of this log:

```
<Date> <Time> <DeviceName> alarmd: SIPM301 <AlarmSeverity> TBL  SIP Gateway Maintenance Trouble
Alarm : <DeviceInfo> <AlarmRaiseLowerText>
```

Following are values/explanations of variable values listed above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <AlarmSeverity>: The current severity of the alarm:
  - CRIT
  - NONE
- <DeviceInfo>: Info that specifies the device to which the alarm pertains
- <AlarmRaiseLowerText>:
  - SIP Gateway Application System Busy
  - SIP Gateway Application System Busy - Alarm Cleared

Following are sample SIPM301 logs:

```
Apr  6 14:39:00 RTPF-SIP0 alarmd: SIPM301 CRIT TBL  SIP Gateway Maintenance Trouble Alarm :
NCGL=RTPF-SIP0;Unit=0; SIP Gateway Application System Busy

Apr  6 14:39:01 RTPF-SIP0 alarmd: SIPM301 NONE TBL  SIP Gateway Maintenance Trouble Alarm :
NCGL=RTPF-SIP0;Unit=0; SIP Gateway Application System Busy - Alarm Cleared
```

24.2.1.4 SIPM302 - SIP Gateway Maintenance Sync Trouble Alarm Log

This is a TBL (Trouble) log which is generated any time the SIP Gateway Maintenance Sync Trouble Alarm is raised or lowered. This occurs when the SIP Gateway application state gets out of sync, or gets back in sync in a duplex Session Server configuration.

Following is the format of this log:

```
<Date> <Time> <DeviceName> alarmd: SIPM302 <AlarmSeverity> TBL  SIP Gateway Maintenance Sync
Trouble Alarm : <DeviceInfo> <AlarmRaiseLowerText>
```

Following are values/explanations of variable values listed above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <AlarmSeverity>: The current severity of the alarm:
  - — MAJOR
  - — NONE
- <DeviceInfo>: Info that specifies the device to which the alarm pertains
- <AlarmRaiseLowerText>:
  - — SIP Gateway Application Mtc Out Of Sync
  - — SIP Gateway Application Mtc Out Of Sync - Alarm Cleared

Following are sample SIPM302 logs:

```
Apr 13 09:13:15 RTPF-SIP0 alarmd: SIPM302 MAJOR TBL  SIP Gateway Maintenance Sync Trouble Alarm
: NCGL=RTPF-SIP0;Unit=0; SIP Gateway Application Mtc Out Of Sync

Apr 13 09:13:45 RTPF-SIP0 alarmd: SIPM302 NONE TBL  SIP Gateway Maintenance Sync Trouble Alarm :
NCGL=RTPF-SIP0;Unit=0; SIP Gateway Application Mtc Out Of Sync - Alarm Cleared
```

24.2.2 SIP Gateway Application Maintenance Alarms

Following are the two alarms the SIP Gateway Application Maintenance software may produce:

- SIP Gateway Maintenance Trouble Alarm
- SIP Gateway Maintenance Sync Trouble Alarm

24.2.2.1 SIP Gateway Maintenance Trouble Alarm

This is a critical alarm that is raised when the SIP Gateway Application transitions to a state that indicates it should be in-service, but is not, and the Session Server unit the application is running on is in an enabled operational state. This “system busied” state is represented by state values as follows:

- Administrative State = Unlocked
- Operational State = Disabled
- Procedural Status = “-” or Not Terminating
- Control Status = “-” or Not Suspended

Call processing cannot occur while in this state.

When the SIP Gateway Application transitions out of this state (automatically or manually) this alarm is lowered. It is also lowered if the Session Server unit the application is running on leaves the enabled operational state.

When this alarm is raised, the system will attempt recovery immediately. If immediate recovery is not successful, reattempts are made automatically every 30 seconds.

A manual method to attempt recovery from this state would entail issuing the following commands from the SIP Gateway Maintenance web browser interface:

- Lock command
- Unsuspend command
- Unlock command

Refer to the SIPM301 logs described above which are generated when this alarm is raised or lowered.

24.2.2.2 SIP Gateway Maintenance Sync Trouble Alarm

This is a major alarm that is raised when the Session Server the SIP Gateway Application is running on is in a duplex configurations with both units in an

enabled operational state, and the SIP Gateway application state becomes out of sync between the two Session Server units.

This alarm is lowered if the Session Server leaves the duplex configuration with both units in an enabled operational state, or if the SIP Gateway application state becomes synchronized between the two Session Server units.

The SIP Gateway application should attempt to sync itself automatically every 30 seconds. If there repeated failures, a manual method to attempt recovery from this condition would entail issuing the following commands from the SIP Gateway Maintenance web browser interface:

- Lock command
- Suspend command
- Unsuspend command
- Unlock command

Refer to the SIPM302 logs described above which are generated when this alarm is raised or lowered.

24.3 Session Server Provisioning Logs and Alarms

The following is a description of logs and alarms generated by the Session Server Provisioning software. The alarms and logs are generated in response to database connectivity changes of state detected by the provisioning watchdog program.

They can be viewed via the CS 2000 Session Server Manager Platform Main web browser page via the ‘Alarms’ and ‘Customer Logs’ buttons.

24.3.1 Session Server Provisioning Logs

The Session Server provisioning software produces the following logs:

- DBSE300 - Database Connectivity Change Log

24.3.1.1 DBSE300 - Solid Database connectivity change Log

This is a Trouble (TBL) log which is generated any time a change in database connectivity is detected. It reports ‘**No Solid DB Connection**’ when database connectivity is lost. It reports ‘**Solid DB Connection Restored**’ when database connectivity is reestablished.

Log Title: No Solid DB Connection

Name: DBSE300

Description: No Database Connection

Event type: Trouble

The DBSE300 "No Database Connection" log is generated in tandem with a Critical alarm due to a loss of connectivity between the Session Server provisioning watchdog program and the Solid database.

Following is the format of this log:

- reportName = DBSE
- reportNum = 300
- eventType = TBL
- alarmValue =
  - CRIT
  - None

- label = **No Solid DB Connection** ~ when database connectivity is lost.
- label = **Solid DB Connection Restored** ~ when database connectivity is restored.

24.3.2 Example Logs

The following is a sample log when the database connection is lost.:

```
Mar 22 21:27:48 vm0 alarmd:DBSE300 CRIT TBL No Solid DB Connection No
Database Connection
```

The following is a sample log when the database connectivity is restored:

```
Mar 22 21:27:48 vm0 alarmd:DBSE300 CRIT TBL Solid DB Connection
Restored No Database Connection
```

24.3.3 Action

Take corrective action to restore the unresponsive database.

24.3.4 Associated OMs

None.

24.3.5 Associated Alarms

Critical No Database Connection Alarm

24.4 Session Server Provisioning Alarms

The Session Server Provisioning software produces a critical alarm when it detects a loss of connectivity to the database. An example of this alarm follow:

```
Communications   Out of Service   Monday March 22nd 2004 09:34:54 AM
Critical   No Database Connection
```

When this alarm is raised the provisioning watchdog software will attempt to switch activity to the mate copy of the Session Server platform only if connectivity to the mate's database can be verified.

24.4.1 Action

Take corrective action to restore the unresponsive database.

24.4.2 Associated Logs

26: Fault Management (FM): A00003971

26.1 Fault management strategy

As a part of this activity the following enhancements are done.

- Some of the existing logs generated for SPMs shall be modified to provide additional data.
- Two new SPM logs, SPM 682 and SPM 683 shall be implemented to report on conditions related to manual reset of CEM/RM and CEM swact trigger respectively.
- A new NODE log, NODE602 shall be implemented to report on the CEM state transition reasons. This log is generated only when the CEM state transitions from Insv to Istb or Insv to Sysb. This log provides the reason for the state transition.

Figure 3 shows an format and example of the SPM 650 log after completion of this activity.

Figure 3 Format and example of SPM 650 log

Format of SPM 650 log

```
RTPY07AW      SPM650 <mmmdd hh:mm:ss ssdd> PASS
                 SPM Device Loader Success
        Report:          <report seq. num> OF <total num. of report>
        Device:          SPM <spm num> <device type> <device unit no> Activity : <A or I>
        Result:          Passed
        Load File:       <load file name>
        Elapsed Time:    <elapsed hour>:<elapsed min>:<elapsed sec>
        KiloByte Loaded: <kiloByte downloaded>
```

Example of SPM 650 log

```
RTPY07AW      SPM650 AUG28 02:46:52 8400 PASS
                 SPM Device Loader Success
        Report:          1 OF 1
        Device:          SPM 10 VSP 2 Activity : I
        Result:          Passed
        Load File:       DSP20AM_010012
        Elapsed Time:    00:03:49
        KiloByte Loaded: 2926
```

26.3.3.3 Field descriptions

The newly added field ‘Activity’ indicates the activity status of the device. The following table gives details of the newly added field.

Table 3 SPM 650 field details

Field	Modified/ Added	Value	Description
Activity	Added	A or I	This indicates activity status of the device. A - Active I - Inactive

26.3.3.4 Action
Not applicable.

26.3.3.5 Associated Operational Measurements or Performance Measurements
None.

26.3.3.6 Additional information
None.

26.3.4 SPM651

26.3.4.1 Explanation
Log Title: SPM Bootloader log (loading Failed)

Name: SPM 651

Description:

This log is generated when a SPM bootloader fails to transfer load.

Event type: Not applicable

26.3.4.2 Format
Figure 4 shows the format and an example of the SPM 651 log after completion of this activity.

Figure 4 Format and example of SPM 651 log

Format of SPM 651 log

```
RTPY07AW   *  SPM651 <mmmdd hh:mm:ss ssdd> FAIL
                 SPM Device Loader Failure
        Report:          <report seq. num> OF <total num. of report>
        Device:          SPM <spm num> <device type> <device unit no> Activity : <A or I>
        Result:          Failed
        Load File:       <load file name>
        Elapsed Time:    <elapsed hour>:<elapsed min>:<elapsed sec>
        Failure Reason:  <kiloByte downloaded>
```

Example of SPM 651 log

```
RTPY07AW   *  SPM651 AUG28 02:11:03 3800 FAIL
                 SPM Device Loader Failure
         Report:          1 OF 1
         Device:          SPM 10 VSP 2 Activity : I
         Result:          Failed
         Load File:       DSP20AM_010012
         Elapsed Time:    00:00:46
         Failure Reason:  Loading Aborted
```

26.3.4.3 Field descriptions

The newly added field ‘Activity’ indicates the activity status of the device. The following table gives details of the new field added.

Table 4 SPM 651 new field details

Field	Modified/ Added	Value	Description
Activity	Added	A I	This indicates activity status of the device. A - Active I - Inactive

26.3.4.4 Action

Not applicable.

26.3.4.5 Associated Operational Measurements or Performance Measurements

None.

26.3.4.6 Additional information

None.

26.3.5 SPM684

26.3.5.1 Explanation

Log Title: Erase Flash log

Name: SPM 684

Description:

This log is generated when a EraseFl command is executed on a CEM MAP.

Event type: INFO

26.3.5.2 Format

Figure 5 shows the format and an example of the SPM 684 log after completion of this activity.

Figure 5 Format and example of SPM 684 log

```
Format of SPM684 log

<Office id> SPM684 <mmmdd hh:mm:ss ssdd>INFO ERASE FLASH
Location: SPM : <spm no> CEM : <unit no> Activity : <A or I>
Userid : <userid>
Description:<one of the 4 strings given below>
Location   : <SPM node_no> Type: <spm_type> Fabric: <fabric_type>

string1 : ERASE FLASH INITIATED
string2 : ERASE FLASH COMPLETED
string3 : ERASE FLASH FAILED
string4 : ERASE FLASH REJECTED

Example of SPM log

RTPY07AW      SPM684 AUG28 03:04:25 4800 INFO ERASE FLASH
        Location    : SPM :  10   CEM : 0 Activity : I
        Userid      : USER1
        Description : ERASE FLASH COMPLETED
```

26.3.5.3 Field descriptions

The newly added field ‘Activity’ indicates the activity status of the device. The following table gives details about the new field.

Table 5 SPM 651 new field details

Field	Modified/Added	Value	Description
Activity	Added	A I	This indicates activity status of the device. A -Active I -Inactive

26.3.5.4 Action

Not applicable.

26.3.5.5 Associated Operational Measurements or Performance Measurements

None.

26.3.5.6 Additional information

None.

26.3.6 SPM301

26.3.6.1 Explanation

Log Title: Device Patching Report

Name: SPM 301

Description:

This log is generated when patching fails on a SPM device.

Event type: TBL

26.3.6.2 Format

Figure 6 shows the format and an example of the SPM 301 log after completion of this activity.

Figure 6 Format and example of SPM 301 log

Format of SPM301 log

```
<office_id> <alarm> SPM301 <mmmdd hh:mm:ss: ssdd> TBL  Device Patching Report
         Location   : SPM : <spm_number> <cpk_type> : <cpk_number> Activity:<A or I>
         Status     : <one of the 2 strings given below>
         Location: <SPM node_no> Type: <spm_type> Fabric: <fabric_type>
```

string 1 : Patching operation failure set
string 2 : Patching operation failure cleared

Example of SPM301 log

```
INTL7006CD  **  SPM301 JAN01 09:50:33 1600 TBL  Device Patching Report
          Location   : SPM : 2   CEM : 1 Activity: I
          Status     : Patching operation failure set
```

26.3.6.3 Field descriptions

The newly added field 'Activity' indicates the activity status of the device. The following table gives details about the new field.

Table 6 SPM 301 new field details

Field	Modified/ Added	Value	Description
Activity	Added	A I	This indicates activity status of the device. A -Active I -Inactive

26.3.6.4 Action

Not applicable.

26.3.6.5 Associated Operational Measurements or Performance Measurements

None.

26.3.6.6 Additional information

None.

26.3.7 SPM311

26.3.7.1 Explanation

Log Title: SW exception Report

Name: SPM 311

Description:

This log is generated when software error (SWERR) occurs on a SPM device.

Event type: TBL

26.3.7.2 Format

Figure 7 shows the format and an example of the SPM 311 log after completion of this activity.

Figure 7 Format and example of SPM 311 log

Format of SPM311 log

```
<office_id> <alarm> SPM311 <mmmdd hh:mm:ss ssdd> TBL SW Exception Report
      SPM <node number> <circuit pack> <circuitpackno> : <activity>              Time: <timestamp>
        Filename: <filename>              LineNumber: <linenumber>
        TaskID: <task id>      Index: <index number>          Reason: <reason>
        TaskName: <taskname string>
        ErrStr:    <error string>
        ErrData: <error data>
        Traceback: <traceback>
```

Example of SPM311 log

```
MSH306BB      SPM311 FEB24 03:10:47 5519 TBL  SW Exception Report
           SPM  12 CEM   1 : I                      Time: 03:10:47.145
           Filename: isupSgrpDDMData.cpp      LineNumber: 489
           TaskID: 000000DF      Index:           Reason:
           TaskName: processMipArbitrati
           ErrStr:
           ErrData:   00376230 026B6D24 026B6D1C 026B6D40 00D1FA58
           Traceback: 00D1FD14 00CEA1A4 00D2D044 00D2F598 00D2F894 00D2E87C
```

26.3.7.3 Field descriptions

The newly added field ‘TaskName’ gives the task name for the task Id. The following table gives details about the new field.

Table 7 SPM 311 field details

Field	Modified/ Added	Value	Description
TaskName	Added	String	This indicates taskname corresponding to the taskID field.

26.3.7.4 Action

Not applicable.

26.3.7.5 Associated Operational Measurements or Performance Measurements

None.

26.3.7.6 Additional information

None.

26.3.8 SPM312

26.3.8.1 Explanation

Log Title: Trap log

Name: SPM 312

Description:

This log is generated when a trap occurs in a SPM device.

Event type: TBL

26.3.8.2 Format

Figure 8 shows the format and an example of the SPM 312 log after completion of this activity.

Figure 8 Format and example of SPM 312 log

Format of SPM312 log

```
<office_id> <alarm> SPM312 <mmmdd hh:mm:ss ssdd> TBL Trap
          SPM <node number> <circuit pack> <circuitpackno> : <activity>          Time: <timestamp>
             TaskID: <task id>  TrapNo: <trap number>
             TaskName: <taskname string>
             Instr:   <instruction>      Flt: <fault>     Vector: <vector>
             Traceback: <traceback>
```

Example of SPM312 log

```
MG4K106BG ***  SPM312 MAR03 03:37:59 8963 TBL  Trap
               SPM  64 CEM   0 : A                       Time: 03:37:59.155
               TaskID: 000000D3  TrapNo: 00000001
               TaskName: OmSubsystemStart
               Instr:  009CFB00     Flt: 00000000     Vector: 00000300
              Traceback: 009CF44C 00774B44 01608508 FDFDFDFD FDFDFDFD FDFDFDFD
                         FDFDFDFD FDFDFDFD FDFDFDFD FDFDFDFD
```

26.3.8.3 Field descriptions

The newly added field ‘TaskName’ gives the task name corresponding to the the task Id displayed in the log. The new field is described in the following table.

Table 8 SPM 312 field details

Field	Modified/ Added	Value	Description
TaskName	Added	String	This indicates taskname corresponding to the taskID field.

26.3.8.4 Action

Not applicable.

26.3.8.5 Associated Operational Measurements or Performance Measurements

None.

26.3.8.6 Additional information

None.

26.3.9 SPM331

26.3.9.1 Explanation

Log Title: Failed Device Protection Switch

Name: SPM 331

Description:

This log is generated when sparing fails/is rejected or when PROTFAIL alarm is cleared on a SPM device.

Event type: TBL

26.3.9.2 Format

Figure 9 shows the format and an example of the SPM 331 log after completion of this activity.

Figure 9 Format of SPM 331 log

Format of SPM 331 log

```
<office_id> <alarm> SPM331 <mmmdd hh:mm:ss ssdd> TBL Failed Device Protection Switch
                    Location:  SPM : <spm_number> <cpk_type> : <cpk_number>
                    Status  : <one of the strings given below>
                    Description: <Description string>
                    Reason  : <Failure Reason string>
                    Location   : <SPM node_no> Type: <spm_type> Fabric: <fabric_type>
```

Example of SPM 331 log

```
MSH207BL ***  SPM331 NOV27 02:32:27 1100 TBL  Failed Device Protection Switch
                  Location: SPM : 25   VSP : 0
                  Status  : Alarm Raised
                  Description: Manual spare from VSP 1 to VSP 0 failed.
                  Reason  :  dest Config failed!
```

26.3.9.3 Field descriptions

The newly added field ‘Reason’ indicates the Reason for the protection switch failure/refusal. The following table gives details of the new and modified fields.

Table 9 SPM 331 field details

Field	Modified/ Added	Value	Description
Reason	Added	string	This indicates reason for failure/rejection of protection switching for the device.

26.3.9.4 Action
Not applicable.

26.3.9.5 Associated Operational Measurements or Performance Measurements
None.

26.3.9.6 Additional information
None.

26.3.10 SPM682

26.3.10.1 Explanation
Log Title: Resetmod

Name: SPM 682

Description:

This log is generated when CEM/RM is manually reset on the MAP. This log is generated in the following conditions

1> When resetmod command is initiated from the MAP
2> When resetmod command is completed
3> When resetmod command fails
4> When resetmod command is aborted
5> When reset via mate is initiated (on CEM) from the MAP
6> When reset firmware is initiated from the MAP

Event type: INFO

26.3.10.2 Format
Figure 10 shows the format and examples of the SPM 682 log .

Figure 10 Format of SPM 682 log

Format of SPM682 log

```
<Office id> SPM682 <mmmdd hh:mm:ss ssdd> INFO RESETMOD
Location: SPM : <spm no>  <cpk_type> : <cpk_number>
Userid : <userid>
Description:<one of the 7 strings given below>
Location   : <SPM node_no> Type: <spm_type> Fabric: <fabric_type>
```

Description strings:

```
Resetmod Initiated
Resetmod Completed
Resetmod Firmware Initiated
Resetmod ViaMate Initiated
Resetmod Rejected
Resetmod Failed
Resetmod Aborted
```

Example of SPM 682 log

```
STEC207AS      SPM682 JUL16 07:31:58 7311 INFO RESETMOD
                Location    : SPM :  25   CEM : 0
                Userid      : USER1
                Description : Resetmod initiated

STEC207AS      SPM682 JUL16 07:31:58 7311 INFO RESETMOD

```

26.3.10.3 Field descriptions

The following table describes each field in detail.

Table 10 SPM 682 field details

Field	Value	Description
INFO RESETMOD	Constant	Indicates that the log is a info log and related to resetmod
spm number	Numeric	Indicates the spm number on which resetmod was initiated
cpk_type	String	This is the circuitpack type on which the manual reset was issued.
cpk_number	Numeric	This is the circuit pack number on which manual reset was issued.
UserId	string	Gives the login ID of the user who issued the reset command.
Description	Resetmod Initiated Resetmod Completed Resetmod Aborted Resetmod Failed Resetmod Firmware Initiated Resetmod ViaMate Initiated Resetmod Rejected	This is a description of the resetmod status.

26.3.10.4 Action

Not applicable.

26.3.10.5 Associated Operational Measurements or Performance Measurements

None.

26.3.10.6 Additional information

None.

26.3.11 SPM683

26.3.11.1 Explanation

Log Title: CEM swact trigger

Name: SPM 683

Description:

This log is generated when CEM swact occurs.

Event type: INFO

26.3.11.2 Format

Figure 11 shows the format of the SPM 683 log .

Figure 11 Format of SPM 683 log

Format of SPM 683 log

```

Figure 15 shows the format of the NODE 303 log .

Figure 15 Format of NODE 303 log

Format and example of NODE log

NODE 303 <mmmdd hh:mm:ss> <ssdd> TBL Wrong Application Data
Location: <NODE>
Trouble: <Trouble_Type>
Action: <User_Action>
Activity:<Activity status A or I>
Integrated Node Maintenance Detailed Information
Trouble Reason: <Trouble_Reason>
Trouble Detail: CEM in Slot <slot_number(7or 8)> has Application Data of CEM <cem_number(0 or 1)>

```
NODE303 FEB15 01:57:54 2112 TBL Wrong Application Data
Location: SPM 0 Unit 1
Trouble:  CEM has Application Data of Mate CEM
Action:   Check LINK300 Logs & reconnect DS512 Links correctly
Activity: I
Integrated Node Maintenance Detailed Information
Trouble Reason:  DS-512 Link/Links may be misconnected.
Trouble Detail:  CEM in Slot 8 has Application Data of CEM 0.
```

26.3.15.3 Field descriptions

The newly added field ‘Activity’ indicates the activity status of the unit.

Table 15 NODE 303 field details

Field	Added/Modified	Value	Description
Activity	Added	A I	This indicates activity status of the unit. A- Active I-Inactive

26.3.15.4 Action
Not applicable.

26.3.15.5 Associated Operational Measurements or Performance Measurements
None.

26.3.15.6 Additional information
None.

26.3.16 NODE326

26.3.16.1 Explanation
Log Title: Hardware Fault

Name: NODE 326

Description:

This log is generated when a hardware fault occurs.

Event type: TBL

26.3.16.2 Format
Figure 16 shows the format of the NODE 326 log .

Figure 16 Format of NODE 326 log

NODE326 <mmmdd hh:mm:ss ssdd> TBL Hardware Fault
Location: <node> <unit number>
Status: <Alarm status>
Trouble: <trouble_code>
Action: <user_action>
Activity: <activity status A or I>
Integrated Node Maintenance Detailed Information
Trouble Reason: <INM trouble condition reason>
Trouble Detail: <trouble detail>

Example of NODE326 log

```
RSN07AOINDY1  ** NODE326 OCT02 14:55:30 3300 TBL  Hardware Fault
        Location: SPM 3 Unit 0
        Status:   Alarm raised
        Trouble:  Card fault
        Action:   Restore communication with the Resource Processor
         Activity: I
         Integrated Node Maintenance Detailed Information
         Trouble Reason:  Link isolation condition
         Trouble Detail:  Link/Messaging hardware
```

26.3.16.3 Field descriptions

The newly added field ‘Activity’ indicates the activity status of the unit.

Table 16 NODE 326 field details

Field	Added/ Modified	Value	Description
Activity	Added	A I	This indicates activity status of the unit. A-Active I-Inactive

26.3.16.4 Action

Not applicable.

None.

26.3.16.6 Additional information

None.

26.3.17 NODE602

26.3.17.1 Explanation

Log Title: CEM State Change Reason Report

Name: NODE 602

Description:

This log is generated when a CEM unit of an SPM transitions from Insv to Sysb or Insv to Istb.

Event type: INFO

26.3.17.2 Format

Figure 17 shows the format of the NODE 602 log .

Figure 17 Format of NODE 602 log

```
<office_id> <alarm> NODE602 <mmmdd hh:mm:ss ssdd> INFO CEM State Change Reason Report
        Location:  SPM : <spm_number> CEM : <Unit number>
        Reason  : <Description string>
        Location   : <SPM node_no> Type: <spm_type> Fabric: <fabric_type>
```

Example of NODE602 log

```
MSH207BL     NODE602 DEC01 00:38:58 1500 TBL  CEM State Change Reason Report
        Location: SPM:  10   CEM :  0
        Reason  : /RmmMgr/CfltSet
        Location: SPM  10  Type: SMG4      Fabric: ATM
```

26.3.17.3 Field descriptions

The fields in the NODE 602 log are explained below in Table 17, “NODE 602 field details,” on page 2188.

Table 17 NODE 602 field details

Field	Value	Description
INFO CEM State Change Reason Report	Constant	This indicates that the log is a information log related to CEM state change reason.
spm number	Numeric	Indicates the SPM number on which CEM state transition occurred.

Field	Value	Description
CEM unit number	Numeric	This gives the unit number of the CEM which underwent a state transition.
Reason	String	This gives the description of the reason for CEM state transition.

26.3.17.4 Action

Not applicable.

26.3.17.5 Associated Operational Measurements or Performance Measurements

None.

26.3.17.6 Additional information

None.

26.4 Related documentation

None.

27: Fault Management (FM): A00004045

This section provides information on logs and alarms for the features under the Session Server platform.

27.1 Session Server Platform Logs and Alarms

This section describes the logs and alarms generated by the Nortel Carrier Grade Link (NCGL) session server. The logs and alarms can be viewed via the web browser interface on the Succession Communication Server 2000 NCGL Platform Manager - via Alarms panel and Customer Logs panel.

Session Server Alarms/Logs

The NCGL session server platform generate the following logs categories::

- Raid Alarms/Logs
  - — XTS391
  - — XTS691
- Chassis Hardware Alarms/Logs
  - — XTS392
  - — XTS692
- File system Alarms/Logs
  - — XTS395
  - — XTS695
- Platform Maintenance.
  - — XTS300
  - — XTS600
  - — XTS301
  - — XTS601
  - — XTS302
  - — XTS602
  - — XTS303
  - — XTS603
  - — XTS305
  - — XTS605
  - — XTS306

  - XTS606
- Application Maintenance.
  - XTS315
  - XTS615
  - XTS316
  - XTS616
- Network Connectivity Maintenance.
  - XTS331
  - XTS631
  - XTS335
  - XTS635
  - XTS336
  - XTS636
  - XTS351
  - XTS651
- Node Maintenance.
  - XTS355
  - XTS655
  - XTS670
  - XTS671

Field Description

The NCGL alarm/logs are made of the following fields shown in the table given below.

Field	Value	Description
Time and Date Stamp	Alphanumeric	The time and date the log was generated
Hostname or Host ID	Alphanumeric	The hostname or host id of the unit that generated the log
Process Name	Alphanumeric	Identifies the NCGL or application process unit that generates the report
Log Number	Alphanumeric	The component prefix and number of the log

Severity	Alphanumeric	The log severity (may be related to alarm severity)
Event Type	Alphanumeric	The type of trouble recorded
Label	Alphanumeric	Title label for the log
Description	Alphanumeric	Detailed description of the trouble

Few example of alarms are given below

Apr 29 10:33:05 yang alarmd: XTS391 MINOR INIT Array Rebuilding NCGL=yang; Array: '/dev/md1' (ntvg) Status: The array is currently being rebuilt.

May 10 13:48:12 yin alarmd: XTS391 MAJOR UNEQ Disk Missing NCGL=yin;Unit=0; Array: '/dev/md1' (ntvg) Status: A physical disk has been removed from the array.

May 6 14:30:09 yin alarmd: XTS691 NONE INIT Array Rebuilt NCGL=yin;Unit=0; Array: '/dev/md1' (ntvg) The array has been rebuilt.

May 10 13:48:37 yin alarmd: XTS691 NONE UNEQ Array Rebuilding NCGL=yin;Unit=0; Array: '/dev/md1' (ntvg) Disk inserted

27.1.1 Raider Alarms/Logs

The Raider software produces the following logs:

27.1.1.1 XTS391

27.1.1.1.1 Explanation

In the event of a disk failure, the fault is reported as an alarm to the SAM XTS and an XTS391 log report is generated. LEDs on the face of the SAM-XTS platform also indicate the failure. Alarm is raised at the STORM Manager and a log report is generated.

The SAM-XTS platform uses two 68.37 GB drives mirrored in a RAID-1 configuration. The SAM-XTS platform mirrors its own load locally, in addition to exported file systems, so that the unit can boot even in the event of one disk failure.

Disk Array Rebuilding alarm indicates that the disk array is being rebuilt after a disk replacement or an uncontrolled shutdown.

27.1.1.1.2 Format

- **When Disk Failure occurs**
  - Alarm/Log: Disk Failure
  - Type: Equipment
  - ID: inputOutputDeviceError
  - Event: FAIL
  - Label: Disk Failure
  - Severity: Major (1 disk fail) or Critical (2 disk fail or removed)
- **When Disk is missing**
  - Alarm/Log: Disk Missing
  - Type: Equipment
  - ID: underlyingResourceUnavailable
  - Event: UNEQ
  - Label: Disk Missing
  - Severity: Major (1 disk removed)
- **When Disk array is rebuilding**
  - Alarm/Log: Disk Rebuilding
  - Type: Equipment
  - ID: performanceDegraded
  - Event: INIT
  - Label: Array Rebuilding
  - Severity: Minor (array rebuilding)

27.1.1.1.3 Field descriptions

See section 12.1

27.1.1.1.4 Action

Check the application status and performance on disk outages.

Click on the Disk services panel tab.

Review the RAID Array Status table.

Under Disk Service Frame, Disk Maintenance window has Disk Insert option if one of the disk is removed it can be inserted if disk is error free.

Monitor the rebuild by periodically clicking the web browser reload button until the rebuild completes.

When the rebuild completes, the alarm clears and an information only XTS691 log report is generated.

27.1.1.1.5 Associated Operational Measurements or Performance Measurements

None

27.1.1.1.6 Additional information

None

27.1.1.2 XTS691

27.1.1.2.1 Explanation

When XTS391 alarm is cleared. XTS391 alarm are due to

Array Rebuilt or Disk Failure or Disk Missing or Array Rebuilding

27.1.1.2.2 Format

- **When Disk Alarms are cleared**
  - Alarm/Log: Disk Rebuilding Clear
  - Event: None
  - Label: "Array Rebuilt" or "Disk Failure" or "Disk Missing" or "Array Rebuilding"
  - Severity: None
  - Log ID: 691

27.1.1.2.3 Field descriptions

See section 12.1

27.1.1.2.4 Action

None

27.1.1.2.5 Associated Operational Measurements or Performance Measurements

None

27.1.1.2.6 Additional information

None

27.1.2 Chassis Hardware Alarms/Logs

The Chassis Hardware related alarms/logs are as follows:

27.1.2.1 XTS392

27.1.2.1.1 Explanation

When there is platform hardware failure an XTS392 alarm is raised on the Alarms panel of the NCGL Session server unit.

27.1.2.1.2 Format

- **Alarm/Log: Magneto Hardware Chassis Fault Alarms / Logs**
  - Type: eAPC_Equipment
  - ID: equipmentMalfunction
  - Event: Fail
  - Label: Chassis Fault
  - Severity: Major
- **Alarm/Log: Self Test Unavailable**
  - Type: eAPC_Equipment
  - ID: underlyingResourceUnavailable
  - Event: UNEQ
  - Label: Self Test
  - Severity: Minor
- **Alarm/Log: Self Test Hardware Error**
  - Type: eAPC_Equipment
  - ID: equipmentMalfunction
  - Event: FLT
  - Label: Self Test
  - Severity: Critical
- **Alarm/Log: Self Test Query Error**
  - Type: eAPC_Equipment
  - ID: communicationsSubsystemFailure
  - Event: FLT

- Label: Self Test
- Severity: Major

- **Alarm/Log: Self Test Corrupted Error**
  - Type: eAPC_Equipment
  - ID: equipmentMalfunction;
  - Event: FLT
  - Label: Self Test
  - Severity: Major
- **Alarm/Log: Self Test Device Failure**
  - Type: eAPC_Equipment
  - ID: equipmentMalfunction;
  - Event: FLT
  - Label: Self Test
  - Severity: Major

27.1.2.1.3 Field descriptions

See section 12.1

27.1.2.1.4 Action

Click on the System Status panel tab.

Review the Chassis Information table.

Record the error message, gather XTS log reports, and contact Nortel Networks support personnel for assistance.

27.1.2.1.5 Associated Operational Measurements or Performance Measurements

None

27.1.2.1.6 Additional information

None

27.1.2.2 XTS692

27.1.2.2.1 Explanation

When XTS392 alarm is cleared this log is generated.

27.1.2.2.2 Format

- Alarm/Log: Self Test Device Clear
  - — Event: None
  - — Label: "Self Test" or "Chassis OK"
  - — Severity: None
  - — Log ID: 692

27.1.2.2.3 Field descriptions

See section 12.1

27.1.2.2.4 Action

None

27.1.2.2.5 Associated Operational Measurements or Performance Measurements

None

27.1.2.2.6 Additional information

None

27.1.3 File System Alarms/Logs

The Magnum software produces the following logs:

27.1.3.1 XTS395

27.1.3.1.1 Explanation

An alarm is raised on the Alarms panel of the SAM XTS when the filesystem Threshold Crossed or when there is an error in Filesystem.

Minor severity alarms indicate that the filesystem is full and a request to write data to the filesystem by the system test process failed.

Critical severity alarms indicate that the system encountered an error with at least one of the following sequential operations:

- — create a directory on the filesystem
- — create a file on the filesystem
- — write to the file (if only this test fails because the filesystem is too full, the alarm is minor)

- read from the file
- delete the file
- delete the directory

27.1.3.1.2 Format

- **Alarm/Log: Self Test Device Filesystem Threshold Exceeded**
  - Type: QualityOfService
  - ID: thresholdCrossed;
  - Event: THR
  - Label: Threshold exceeded
  - Severity: Minor or Major or Critical
- **Alarm/Log: Filesystem Test Failure**
  - Type: Equipment
  - ID: inputOutputDeviceError;
  - Event: FLT
  - Label: Filesystem Error
  - Severity: Minor (low disk space) or Critical (filesystem test fail)

27.1.3.1.3 Field descriptions

See section 12.1

27.1.3.1.4 Action

Click on the Disk service panel tab.

Review the Filesystem Information table.

If the alarm is minor, determine if the filesystem size is engineered too low.If so, increase the size of the filesystem, and the alarm will clear. Determine how the space is being used.

If the alarm is Critical, contact Nortel Networks support personnel for assistance.

27.1.3.1.5 Associated Operational Measurements or Performance Measurements

None

27.1.3.1.6 Additional information

May 4 13:02:58 fred alarmd: XTS395 MINOR FLT Filesystem Error NCGL=fred;Unit=0 Status: Alarm raised. Filesystem is < /boot >. Test results: Stat(Success) CreateDir(Success) CreateFile(Success) WriteFile(No space left on device) ReadFile(Success) RemoveFile(Success) RemoveDir(Success)

27.1.3.2 XTS695

27.1.3.2.1 Explanation

When XTS395 alarm is cleared his log is generated.

27.1.3.2.2 Format

- **Alarm/Log: Clear Logs**
  - — Event: None
  - — Label: "Threshold exceeded" or "Filesystem Error"
  - — Severity: None
  - — Log ID: 695

27.1.3.2.3 Field descriptions

See section 12.1

27.1.3.2.4 Action

None

27.1.3.2.5 Associated Operational Measurements or Performance Measurements

None

27.1.3.2.6 Additional information

None

27.1.4 Platform Maintenance Alarms/Logs

The Madman & Swmon software produces the following logs:

27.1.4.1 XTS300

27.1.4.1.1 Explanation

An alarm is raised on the Alarms panel of the NCGL session server. An XTS300 log report is generated and is available for viewing from the Customer Logs panel of the NCGL session server.

This alarm is raised when Memory usage on the NCGL session server unit is excessive.

27.1.4.1.2 Format

- **Alarm/Log: OutofMemory**
  - Type: QualityOfService
  - ID: outOfMemory
  - Event: FLT
  - Label: Memory
  - Severity:Minor,Major or Critical

27.1.4.1.3 Field descriptions

27.1.4.1.4 Action

Click on the System Status panel tab.

Review the Memory Information table.

For minor or major : Monitor the alarm and contact Nortel Networks support personnel.

For critical : Check the unit activity status and swact if the unit is Active. Then do rebootmate the failure NCGL Session server unit from the Admin panel of Active unit. Contact Nortel Networks support personnel for additional support if the alarm persist.

27.1.4.1.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.1.6 Additional information

None

27.1.4.2 XTS600

27.1.4.2.1 Explanation

When XTS300 minor, major or critical alarm is cleared, a INFO alarm/log XTS600 is generated.

27.1.4.2.2 Format

- **Alarm/Log: Application Memory**
  - — Type: QualityOfService
  - — ID: outOfMemory
  - — Event: INFO
  - — Label: Application Memory Alarm Cleared
  - — Severity:NONE

27.1.4.2.3 Field descriptions

See section 12.1

27.1.4.2.4 Action

None

27.1.4.2.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.2.6 Additional information

None

27.1.4.3 XTS301

27.1.4.3.1 Explanation

When too many processes are waiting in the process queue an alarm is raised on the Alarms panel of the NCGL session server. An XTS300 log report is generated and is available for viewing from the Customer Logs panel of the NCGL session server.

27.1.4.3.2 Format

- Alarm/Log: CPU Load
  - — Type: QualityOfService
  - — ID: cpuCyclesLimitExceeded

— Event: FLT

— Label: CPU Load

— Severity:Minor,Major or Critical

27.1.4.3.3 Field descriptions

See section 12.1

27.1.4.3.4 Action

Click on the System Status panel tab.

Review the current load average from the CPU Information table and the number of zombie processes from the Process Information table.

If zombie processes are present the CPU alarm is minor or major :

Zombie processes could be causing the CPU high load. Wait for a period of low office traffic, and reboot the NCGL session server unit from the Admin panel.

If the CPU alarm is minor or major and no zombie processes are present:

The unit is in a period of heavy load. Monitor the CPU load by clicking the reload button. Also look into Additional information given below for any cause and related diagnosing.

The CPU alarm is critical but the 1 minute and 5 minute loads are less than the 15 minute load

The unit endured a prolonged period of heavy load but the load is diminishing. Monitor the CPU load by clicking on the reload button. If the CPU load is falling, continue to monitor the load and refer to Additional information given below for information about diagnosing this alarm.

The CPU alarm is critical and the load for all time periods is rising

The load exceeds the capacity of the unit. reboot the unit from the Admin panel.

27.1.4.3.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.3.6 Additional information

Consider the following factors that could cause a temporary rise in CPU load:

Rebuilding a disk array while under heavy load

A SIP call processing application image dump while under heavy load

Lack of free space on the "/" filesystem. This mount point is a ramdisk and cannot be increased. An alarm report indicate a lack of storage.

Excessive network traffic on the Communications Server LAN (CS LAN).

27.1.4.4 XTS601

27.1.4.4.1 Explanation

This alarm is reported when XTS301 minor/major/critical alarm is cleared

27.1.4.4.2 Format

- **Alarm/Log: CPU Alarm Cleared**
  - Type: QualityOfService
  - ID: cpuCyclesLimitExceeded
  - Event: INFO
  - Label: CPU Alarm Cleared
  - Severity:NONE

27.1.4.4.3 Field descriptions

See section 12.1

27.1.4.4.4 Action

None

27.1.4.4.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.4.6 Additional information

None

27.1.4.5 XTS302

27.1.4.5.1 Explanation

When Not enough space is available to meet storage needs.an alarm is raised on the Alarms panel of the NCGL session server. An XTS302 log report is generated and is available for viewing from the Customer Logs panel of the NCGL session server.

27.1.4.5.2 Format

- **Alarm/Log: Disk/Storage FLT**
  - Type: ProcessingError
  - ID: storageCapacityProblem
  - Event: FLT
  - Label: Disk
  - Severity:Minor,Major or Critical

27.1.4.5.3 Field descriptions

See section 12.1

27.1.4.5.4 Action

Click on the Disk Service panel tab.

Review the Filesystem Information table.

If the alarm is raised against the “/” filesystem Contact Nortel Networks support personnel.

If the alarm is raised against the /boot filesystem Remove previous software loads from the Admin panel.

Else increase the size of the filesystem. Refer to Increasing filesystem size in Configuration management document.

27.1.4.5.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.5.6 Additional information

None

27.1.4.6 XTS602

27.1.4.6.1 Explanation

This alarm is reported when XTS302 minor/major/critical alarm is cleared.

27.1.4.6.2 Format

- **Alarm/Log: Disk Alarm Cleared**
  - Type: ProcessingError
  - ID: storageCapacityProblem
  - Event: INFO
  - Label: Disk Alarm Cleared
  - Severity: NONE

27.1.4.6.3 Field descriptions

See section 12.1

27.1.4.6.4 Action

None

27.1.4.6.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.6.6 Additional information

None

27.1.4.7 XTS303

27.1.4.7.1 Explanation

When the number of zombie processes has exceeded the threshold specified on the System panel an alarm is raised on the Alarms panel of the NCGL session server. An XTS303 log report is generated and is available for viewing from the Customer Logs panel of the NCGL session server.

27.1.4.7.2 Format

- **Alarm/Log: Zombie Process**

- Type: QualityOfService
- ID: thresholdCrossed
- Event: FLT
- Label: Zombie Process
- Severity: Minor,Major or Critical

27.1.4.7.3 Field descriptions

See section 12.1

27.1.4.7.4 Action

Click on the System Status panel tab.

Review the number of zombie processes.

If the alarm is minor or major and no CPU threshold crossing alarms are present

Wait for a period of low office traffic, reboot the unit from the Admin panel.

The alarm is minor or major and CPU threshold crossing alarms are present or the alarm is critical

Reboot the unit from the Admin panel.

27.1.4.7.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.7.6 Additional information

None

27.1.4.8 XTS603

27.1.4.8.1 Explanation

This alarm is reported when XTS303 minor/major/critical alarm is cleared.

27.1.4.8.2 Format

- **Alarm/Log: Zombie Process Alarm Cleared**
  - Type: QualityOfService
  - ID: thresholdCrossed

— Event: INFO

— Label: Zombie Process Alarm Cleared

— Severity:NONE

27.1.4.8.3 Field descriptions

See section 12.1

27.1.4.8.4 Action

None

27.1.4.8.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.8.6 Additional information

None

27.1.4.9 XTS305

27.1.4.9.1 Explanation

The platformsoftware lost time synchronization to one or more Network Time Protocol (NTP) servers or the drift is excessive.

27.1.4.9.2 Format

- **Alarm/Log: NTP Related**
  - — Type: Communications
  - — ID: communicationsProtocolError
  - — Event: FLT
  - — Label: NTP Error
  - — Severity:Minor, Major or Critical

27.1.4.9.3 Field descriptions

See section 12.1

27.1.4.9.4 Action

Click on the Services panel tab.

Review the NTP related information.

The provisioned NTP information is displayed. Ensure that the IP addresses in the remote column match the NTP servers provisioned at the NCGL session server unit. If provision data is right, refer to NTP product document or Contact Nortel Networks support personnel.

27.1.4.9.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.9.6 Additional information

None

27.1.4.10 XTS605

27.1.4.10.1 Explanation

This alarm is reported when XTS305 minor/major/critical alarm is cleared.

27.1.4.10.2 Format

- **Alarm/Log:NTP Alarm Cleared**
  - Type: Communications
  - ID: communicationsProtocolError
  - Event: INFO
  - Label: NTP Alarm Cleared
  - Severity: NONE

27.1.4.10.3 Field descriptions

See section 12.1

27.1.4.10.4 Action

None

27.1.4.10.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.10.6 Additional information

None

27.1.4.11 XTS306

27.1.4.11.1 Explanation

The CPU utilization for one or more time segments has exceeded the threshold.

27.1.4.11.2 Format

- **Alarm/Log: CPU Utilization**
  - Type: QualityOfService
  - ID: cpuCyclesLimitExceeded
  - Event: FLT
  - Label: CPU Utilization
  - Severity:Minor, Major or Critical

27.1.4.11.3 Field descriptions

See section 12.1

27.1.4.11.4 Action

Click on the System Status panel tab.

Review the of CPU Utilization.

If the alarm is critical monitor the status and performance of the application.

27.1.4.11.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.11.6 Additional information

None

27.1.4.12 XTS606

27.1.4.12.1 Explanation

This alarm is reported when XTS306 minor/major/critical alarm is cleared.

27.1.4.12.2 Format

- **Alarm/Log:CPU Utilization Cleared**
  - Type: QualityOfService
  - ID: cpuCyclesLimitExceeded,
  - Event: INFO
  - Label: CPU Utilization Cleared
  - Severity:NONE

27.1.4.12.3 Field descriptions

See section 12.1

27.1.4.12.4 Action

None

27.1.4.12.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.12.6 Additional information

None

27.1.4.13 XTS309

27.1.4.13.1 Explanation

The unit has a bus fault, Error Checking and Correction (ECC) memory fault, or a parity error or any hardware component failure.

27.1.4.13.2 Format

- **Alarm/Log: Hardware FLT**
  - Type: Equipment
  - ID: equipmentMalfunction
  - Event: FLT
  - Label: Hardware Fault
  - Severity:Minor, Major or Critical

27.1.4.13.3 Field descriptions

See section 12.1

27.1.4.13.4 Action

Click on the Alarm panel tab.

Review the Hardware fault alarms.

If the severity is minor & unit is Inactive, Jam the unit from active unit. Perform a reboot on the faulty unit and Unjam it from active unit when its back to service.

If the severity is critical reboot the unit. In case of failure even after reboot, Contact Nortel Networks support personnel.

27.1.4.13.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.13.6 Additional information

None

27.1.4.14 XTS609

27.1.4.14.1 Explanation

This alarm is reported when XTS309 minor/major/critical alarm is cleared.

27.1.4.14.2 Format

- **Alarm/Log:Hardware Fault Cleared**
  - Type: Equipment
  - ID: equipmentMalfunction
  - Event: INFO
  - Label: Hardware Fault Cleared
  - Severity: NONE

27.1.4.14.3 Field descriptions

See section 12.1

27.1.4.14.4 Action

None

27.1.4.14.5 Associated Operational Measurements or Performance Measurements

None

27.1.4.14.6 Additional information

None

27.1.5 Application Alarms/Logs

The Application software produces the following logs:

27.1.5.1 XTS315

27.1.5.1.1 Explanation

This alarm is reported during swact operation when the unit State has changed from Standby Enabled to Standby Disabled."

27.1.5.1.2 Format

- **Alarm/Log: Application Out-of-Sync**
  - Type: ProcessingError
  - ID: applicationSubsystemFailure
  - Event: FLT
  - Label: Application Out-of-Sync (simplex)
  - Severity:Minor, Major or Critical

27.1.5.1.3 Field descriptions

See section 12.1

27.1.5.1.4 Action

Click on the Alarm panel tab.

Review the Application fault alarms.

This alarm is raised during a transition state. No action is required.

27.1.5.1.5 Associated Operational Measurements or Performance Measurements

None

27.1.5.1.6 Additional information

None

27.1.5.2 XTS615

27.1.5.2.1 Explanation

This alarm is reported after successful swact operation when unit State has changed from Standby Disabled to Standby Enabled.

27.1.5.2.2 Format

- **Alarm/Log:Application In-Sync**
  - Type: ProcessingError
  - ID: applicationSubsystemFailure
  - Event: INFO
  - Label: Application In-Sync
  - Severity:NONE

27.1.5.2.3 Field descriptions

See section 12.1

27.1.5.2.4 Action

None

27.1.5.2.5 Associated Operational Measurements or Performance Measurements

None

27.1.5.2.6 Additional information

None

27.1.5.3 XTS316

27.1.5.3.1 Explanation

The alarm has minor severity if the alarm is raised against the inactive application. The alarm has critical severity if the alarm is raised against the active application.

27.1.5.3.2 Format

- **Alarm/Log: Application Out-of-Service**

- Type: ProcessingError
- ID: outOfService
- Event: FLT
- Label: Application Out-of-Service
- Severity:Minor, Major or Critical

27.1.5.3.3 Field descriptions

See section 12.1

27.1.5.3.4 Action

Click on the Alarm panel tab.

Review the Application fault alarms.

This alarm is raised during a transition state. No action is required.

27.1.5.3.5 Associated Operational Measurements or Performance Measurements

None

27.1.5.3.6 Additional information

None

27.1.5.4 XTS616

27.1.5.4.1 Explanation

This alarm is reported when XTS316 minor/major/critical alarm is cleared.

27.1.5.4.2 Format

- **Alarm/Log:Application In-Service**
  - Type: ProcessingError
  - ID: outOfService
  - Event: INFO
  - Label: Application In-Service
  - Severity: NONE

27.1.5.4.3 Field descriptions

See section 12.1

27.1.5.4.4 Action

None

27.1.5.4.5 Associated Operational Measurements or Performance Measurements

None

27.1.5.4.6 Additional information

None

27.1.6 Network Maintenance Alarms/Logs

The Netmon software produces the following logs:

27.1.6.1 XTS331

27.1.6.1.1 Explanation

A remote host monitor has failed. This failure indicates a loss of connectivity to the monitored unit.

27.1.6.1.2 Format

- **Alarm/Log: Mate Connectivity**
  - Type: Communications
  - ID: communicationsSubsystemFailure
  - Event: FLT
  - Label: Mate Connectivity
  - Severity:Minor, Major or Critical

27.1.6.1.3 Field descriptions

See section 12.1

27.1.6.1.4 Action

Click on the Network Connectivity panel tab.

Review the Network connectivity Information.

Use the following list of possible causes to clear the alarm:

- The unit is offline due to maintenance or an uncontrolled failure
- Communication to the unit is unavailable due to a router failure or misconfiguration
- Cable failure at the remote unit

27.1.6.1.5 Associated Operational Measurements or Performance Measurements

None

27.1.6.1.6 Additional information

None

27.1.6.2 XTS631

27.1.6.2.1 Explanation

This alarm is reported when XTS331 minor/major/critical alarm is cleared.

27.1.6.2.2 Format

- **Alarm/Log : Mate Connectivity Restored**
  - Type: Communications
  - ID: communicationsSubsystemFailure
  - Event: INFO
  - Label: Mate Connectivity Restored
  - Severity: NONE

27.1.6.2.3 Field descriptions

See section 12.1

27.1.6.2.4 Action

None

27.1.6.2.5 Associated Operational Measurements or Performance Measurements

None

27.1.6.2.6 Additional information

None

27.1.6.3 XTS335

27.1.6.3.1 Explanation

A major severity alarm indicates that one of the Ethernet links is unavailable. A critical severity alarm indicates that both of the Ethernet links are unavailable. If both Ethernet links are unavailable, the Call Agent reboots.

27.1.6.3.2 Format

- **Alarm/Log: Link Connectivity**
  - Type: Communications
  - ID: communicationsSubsystemFailure
  - Event: FLT
  - Label: Link Connectivity
  - Severity:Minor, Major or Critical

27.1.6.3.3 Field descriptions

See section 12.1

27.1.6.3.4 Action

Click on the Network Connectivity panel tab.

Review the Network connectivity Information.

Follow Action suggested in Mate Connectivity section XTS331.

If Link0, Link1 in-service (INSV) and the alarm persists, contact Nortel Networks support personnel. 4 This procedure is complete.

27.1.6.3.5 Associated Operational Measurements or Performance Measurements

None

27.1.6.3.6 Additional information

None

27.1.6.4 XTS635

27.1.6.4.1 Explanation

This alarm is reported when XTS335 minor/major/critical alarm is cleared.

27.1.6.4.2 Format

- **Alarm/Log : Link Connectivity Restored**
  - Type: Communications
  - ID: communicationsSubsystemFailure
  - Event: INFO
  - Label: Link Connectivity Restored
  - Severity: NONE

27.1.6.4.3 Field descriptions

See section 12.1

27.1.6.4.4 Action

None

27.1.6.4.5 Associated Operational Measurements or Performance Measurements

None

27.1.6.4.6 Additional information

None

27.1.6.5 XTS336

27.1.6.5.1 Explanation

A major severity alarm indicates that one Ethernet link does not have network connectivity. A critical severity alarm indicates that both Ethernet links do not have network connectivity.

27.1.6.5.2 Format

- **Alarm/Log: Network Connectivity**
  - Type: Communications
  - ID: communicationsSubsystemFailure

— Event: FLT

— Label: Network Connectivity

— Severity:Minor, Major or Critical

27.1.6.5.3 Field descriptions

See section 12.1

27.1.6.5.4 Action

Click on the Network Connectivity panel tab.

Review the Network connectivity Information .

Follow Action suggested for Mate Connectivity log XTS331.

If link connectivity is restored and the alarm persists, contact Nortel Networks support personnel.

27.1.6.5.5 Associated Operational Measurements or Performance Measurements

None

27.1.6.5.6 Additional information

None

27.1.6.6 XTS636

27.1.6.6.1 Explanation

This alarm is reported when XTS336 minor/major/critical alarm is cleared.

27.1.6.6.2 Format

- **Alarm/Log : Network Connectivity Restored**
  — Type: Communications
  — ID: communicationsSubsystemFailure
  — Event: INFO
  — Label: Network Connectivity Restored
  — Severity: NONE

27.1.6.6.3 Field descriptions

See section 12.1

27.1.6.6.4 Action

None

27.1.6.6.5 Associated Operational Measurements or Performance Measurements

None

27.1.6.6.6 Additional information

None

27.1.6.7 XTS351

27.1.6.7.1 Explanation

A major severity alarm indicates that one Ethernet link does not have network connectivity. A critical severity alarm indicates that both Ethernet links do not have network connectivity

27.1.6.7.2 Format

- **Alarm/Log: No Mate Communication (simplex)**
  - Type: ProcessingError
  - ID: underlyingResourceUnavailable
  - Event: FLT
  - Label: No Mate Communication (simplex)
  - Severity:Minor, Major or Critical

27.1.6.7.3 Field descriptions

See section 12.1

27.1.6.7.4 Action

Click on the Network Connectivity panel tab.

Review the Network connectivity Information .

Follow Action suggested for Mate Connectivity log XTS331.

If link connectivity is restored and the alarm persists, contact Nortel Networks support personnel.

27.1.6.7.5 Associated Operational Measurements or Performance Measurements

None

27.1.6.7.6 Additional information

None

27.1.6.8 XTS651

27.1.6.8.1 Explanation

This alarm is reported when XTS351 minor/major/critical alarm is cleared.

27.1.6.8.2 Format

- **Alarm/Log : Mate Communication Restored**
  - Type: ProcessingError
  - ID: underlyingResourceUnavailable
  - Event: INFO
  - Label: Mate Communication Restored
  - Severity: NONE

27.1.6.8.3 Field descriptions

27.1.6.8.4 Action

None

27.1.6.8.5 Associated Operational Measurements or Performance Measurements

None

27.1.6.8.6 Additional information

None

27.1.7 Node Maintenance

When Node maintenance action is performed, the following alarm/logs are generated.

27.1.7.1 XTS355

27.1.7.1.1 Explanation

The inactive unit is jammed to prevent a Switch of Activity (SWACT).

27.1.7.1.2 Format

- **Alarm/Log: Jam Inactive Unit**
  - Type: ProcessingError
  - ID: underlyingResourceUnavailabe
  - Event: FLT
  - Label: Jam Inactive Unit
  - Severity: Major or Critical

27.1.7.1.3 Field descriptions

See section 12.1

27.1.7.1.4 Action

This alarm is expected during an upgrade or unit replacement. No action is required.

27.1.7.1.5 Associated Operational Measurements or Performance Measurements

None

27.1.7.1.6 Additional information

None

27.1.7.2 XTS655

27.1.7.2.1 Explanation

This alarm is reported when XTS355 minor/major/critical alarm is cleared.

27.1.7.2.2 Format

- **Alarm/Log : Release Jam on Inactive unit**

- Type: ProcessingError
- ID: underlyingResourceUnavailable
- Event: INFO
- Label: Release Jam on Inactive unit
- Severity: NONE

27.1.7.2.3 Field descriptions

See section 12.1

27.1.7.2.4 Action

None

27.1.7.2.5 Associated Operational Measurements or Performance Measurements

None

27.1.7.2.6 Additional information

None

27.1.7.3 XTS670

27.1.7.3.1 Explanation

This alarm is reported when a swact is initiated on the system

27.1.7.3.2 Format

- **Alarm/Log : SWACT Failover Started**
  - Type: No_Problem_Category
  - ID: noProbableCause
  - Event: INFO
  - Label: SWACT Failover Started
  - Severity: NONE

27.1.7.3.3 Field descriptions

See seaction 12.1

27.1.7.3.4 Action

None

27.1.7.3.5 Associated Operational Measurements or Performance Measurements

None

27.1.7.3.6 Additional information

None

27.1.7.4 XTS671

27.1.7.4.1 Explanation

This alarm is reported when swact is finished on the unit.

27.1.7.4.2 Format

- **Alarm/Log : SWACT Failover Finished**
  - Type: No_Problem_Category
  - ID: noProbableCause
  - Event: INFO
  - Label: SWACT Failover Finished
  - Severity: NONE

27.1.7.4.3 Field descriptions

See section 12.1

27.1.7.4.4 Action

None

27.1.7.4.5 Associated Operational Measurements or Performance Measurements

None

27.1.7.4.6 Additional information

None

28: Fault Management (FM): A00004045

28.1 Fault management strategy

The CLIDN for DMS-250 feature provides the same CLIDN call tracing capability using the TRK605 log as the existing DMS-100/200 CLIDN functionality.

28.2 Fault management tools and utilities

N/A.

28.3 Logs

28.3.1 Explanation

Log Title: TRK605

Name: ICT Calling Line Identification

Description: This log is generated when the SOC UTRS0012 is ON and the called number is data filled in table CLIDN in a DMS-250 toll switch. The TRK605 log is used in a toll switch to identify the origination number when the called number is being traced.

Event type: Minor alarm condition.

28.3.2 Format

The log report format for TRK605 is as follows:

* TRK605 mmmdd hh:mm:ss ssdd ALARM INFO ICT Calling Line Ident

INCOMING TRUNK = <CKT CLLI>

OUTGOING TRUNK = <CKT CLLI>

CALLED NUMBER = NXXNXXXXXX

SOURCE = CALLING NUMBER/CHARGE NUMBER/ UNAVAILABLE

CALLID = XXXXXX

TIME: MONTH: DAY HH:mm:ss

An example of log report TRK605 follows:

* TRK605 SEP27 14:23:29 5908 INFO ICT Calling Line Ident

INCOMING TRUNK = CKT DCEA20C7DR01 1

OUTGOING TRUNK = CKT DCEA21C7DR02 1

CALLED NUMBER = 2018212345

ORIGINATION NUMBER = 8146119871

SOURCE = CALLING NUMBER

CALLID = 852346

TIME: SEP27 14:23:29

28.3.3 Field descriptions

The following table describes each field in the log report:

Table 1 Field descriptions

Field	Value	Description
*	Alarm	One asterik indicates that the generation of this log report represents a minor alarm condition.
INCOMING TRUNK	Trunk Group name and member number	This field identifies the CLLI name and member number of the incoming trunk.
OUTGOING TRUNK	Trunk Group name and member number	This field identifies the CLLI name and member number of the outgoing trunk.
CALLED NUMBER	Digits 0-9	This field identifies the called number that is being traced.
ORIGINATING NUMBER	Digits 0-9 or '$'	This field identifies either the calling number, charge number or billing number from the incoming trunk call information. The CLIDN for DMS-250 feature attempts to get the calling number first. If the calling number is not available, the charge number is used. If the charge number is not available, the billing number is used. If neither the calling, charge nor billing number is available, this field will display '$'.

Table 1 Field descriptions

Field	Value	Description
SOURCE	Calling Number, Charge Number or Unavailable	This field identifies from what the originating number is derived. If the originating number cannot be derived, '$' will appear in the ORIGINATING NUMBER field and the SOURCE field will display "UNAVAILABLE".
CALLID	6 digit number; Digits 0-9 used	This field identifies the call process id number.
TIME	Month, Day, Hour, Minute and Second	This field identifies the date and time the call was logged.

28.3.4 Action

Action to be taken is determined by the local telephone company.

28.3.5 Associated Operational Measurements or Performance Measurements

There are no associated OM registers.

28.3.6 Additional information

On the DMS-250, the TRK605 log is generated for EANT, PRI, DAL, ONAL, ONAT and IMT trunk types.

The TRK605 log was introduced to the DMS-100/200 by feature AN1658.

28.4 Alarms

The TRK605 log is a minor alarm condition.

28.5 Related documentation

AN1658 - Inter-Switch Call Trace (ICT) Feature

29: Fault Management (FM): A00004260

29.1 Fault management strategy

This section describes troubleshooting for the new XPKT806 and XPKT807 logs, which assist with current strategy of troubleshooting XPKT301 logs.

29.2 Fault management tools and utilities

Tools used are LOGUTIL, for the new logs described below, and MAPCI, which has the new APPL;PKT;SPM_ATM Map levels to assist with troubleshooting the new XPKT806 and XPKT807 logs.

29.3 XPKT806 Logs

29.3.1 Explanation

Log Title: XPKT806

Name: TBL ATM PACKET ALARM

Description: Reported when the number of XPKT301 logs against a SPM node crosses (i.e. meets or exceeds) the threshold. The threshold value and duration of the collection interval (called a “raise cycle”) are defined in the OPTCN section.

The “nn PKT” major alarm is raised under the APPL banner in MAPCI;MTC whenever one or more nodes have the XPKT806 alarm raised. See OPTCN section on MAPCI;MTC level for more details.

Event type: Major

29.3.2 Format

```
MG4K107BH  **  XPKT806  <mmmdd hh:mmm:ss seq#> TBL  ATM Packet Alarm
         Status  : Alarm Raised
         Problem : Node reached threshold of <hits> XPKT301 failures
                   at <CycleDur> minutes into a <CycleMax> minute raise cycle.
         Troubleshooting : MAPCI;MTC;APPL;PKT;SPM_ATM or refer to NTPs.
         Location: SPM  <SPMNUM>  Type: <SPM Class>      Fabric: <Fabric>

MG4K107BH  **  XPKT806 OCT31 11:55:30 7100 TBL  ATM Packet Alarm
         Status  : Alarm Raised
         Problem : Node reached threshold of 2 XPKT301 failures
                   at 3 minutes into a 15 minute raise cycle.
         Troubleshooting : MAPCI;MTC;APPL;PKT;SPM_ATM or refer to NTPs.
         Location: SPM  60  Type: SMG4      Fabric: ATM
```

29.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
<mmmdd hh:mmm:ss seq#>	numeric	Date, Time, and Log Sequence number
<hits>	1..32767	Number of XPKT301 logs that impacted this SPM node during the cycle. This number will match the RAISE_THRESHOLD value since alarm is raised as soon as threshold is crossed.
<CycleDur>	1..1440	Number of minutes that elapsed (i.e. duration) in the current cycle when the alarm was raised.
<CycleMax>	1..1440	Maximum minutes in the cycle - same as RAISE_CYCLE in the office parameter that controls the threshold.
<SPMNUM>	0..85	Number of SPM that raised this alarm
<SPM Class>	SMG4, IW, or DPT	SPM Class of the node where IW is IW with BRDG_ONLY, and DPT is IW with DPT_ONLY.

29.3.4 Action

Alarm will clear automatically if the number of XPKT301 failures diminishes. The MAPCI;MTC;APPL;PKT;SPM_ATM Map level provides helpful commands for troubleshooting XPKT806 alarms. Also refer to the existing NTP troubleshooting procedures for XPKT301 logs.

29.3.5 Associated Operational Measurements or Performance Measurements

Feature A00004430 is creating new OMs in SN07 to track the XPKT301 hits on a per node basis.

29.3.6 Additional information

None

29.4 XPKT807 Logs

29.4.1 Explanation

Log Title: XPKT807

Name: INFO ATM PACKET ALARM

Description: Reported when the XPKT806 alarm clears for a SPM node. The clearing is done when the number of XPKT301 logs against the node does not exceed the threshold. The threshold value and duration of the collection interval (called a “clear cycle”) are defined in the OPTCN section.

Event type: None

29.4.2 Format

There are four different formats for the XPKT807 log, where the difference between the formats is the text in the “Reason:” field, which will indicate the four different ways the alarm can be cleared.

29.4.2.1 XPKT807 for Automatic Clearing when Threshold Met

This format is used when the XPKT806 alarm is automatically cleared by the system after the threshold is not exceeded when the clear cycle expires. This is the most common way of clearing the alarm.

```
RSN07BD     XPKT807 <mmmdd hh:mmm:ss seq#> INFO ATM Packet Alarm
        Status: Alarm Cleared Automatically
        Reason: Node had <hits> XPKT301 failures in a <CycleMax> minute clear
                cycle with a threshold of <Thresh> XPKT301 failures.
        Location: SPM <SPMNUM>  Type: <SPM Class>  Fabric: <Fabric>

RSN07BD     XPKT807 SEP30 12:58:04 1100 INFO ATM PACKET ALARM
        Status: Alarm Cleared Automatically
        Reason: Node had 0 XPKT301 failures in a 15 minute clear
                cycle with a threshold of 0 XPKT301 failures.
        Location: SPM 39  Type: SMG4  Fabric: ATM
```

29.4.2.2 XPKT807 for Manual Clearing by Map Command

This format is used when the XPKT806 alarm is manually cleared via the CLEAR command at the MAPCI;MTC;APPL;PKT;SPM_ATM level:

```
RSN07BD     XPKT807 <mmmdd hh:mmm:ss seq#> INFO ATM Packet Alarm
```

```
        Status: Alarm Cleared Manually by User <user>
        Reason: Cleared by MAPCI;MTC;APPL;PKT;SPM_ATM;CLEAR command.
                Node had <hits> XPKT301 failures before clear cycle aborted.
        Location: SPM <SPMNUM>  Type: <SPM Class>  Fabric: <Fabric>

RSN07BD     XPKT807 SEP30 12:58:04 1100 INFO ATM PACKET ALARM
        Status: Alarm Cleared Manually by User ADMIN
        Reason: Cleared by MAPCI;MTC;APPL;PKT;SPM_ATM;CLEAR command.
                Node had 0 XPKT301 failures before clear cycle aborted
        Location: SPM 39  Type: SMG4  Fabric: ATM
```

29.4.2.3 XPKT807 for Manual Clearing by Disabling Feature

This format is used when the XPKT806 alarm is manually cleared via Table OFCENG by setting the sub-parameter RAISE_THRESHOLD to zero for one of these tuples:

1. XPKT806_SMG4_RAISE_CLEAR
2. XPKT806_IW_RAISE_CLEAR
3. XPKT806_DPT_RAISE_CLEAR

Setting the RAISE_THRESHOLD to zero will disable XPKT806 reporting for the supported SPM type. See the OPTCN section for more details on the above office parameters.

```
RSN07BD     XPKT807 <mmmdd hh:mmm:ss seq#> INFO ATM Packet Alarm
        Status: Alarm Cleared Manually by User <user>
        Reason: Cleared by disabling feature in Table OFCENG.
                Node had <hits> XPKT301 failures before clear cycle aborted.
        Location: SPM <SPMNUM>  Type: <SPM Class>  Fabric: <Fabric>

RSN07BD     XPKT807 SEP30 12:58:04 1100 INFO ATM PACKET ALARM
        Status: Alarm Cleared Manually by User ADMIN
        Reason: Cleared by disabling feature in Table OFCENG.
                Node had 0 XPKT301 failures before clear cycle aborted
        Location: SPM 39  Type: SMG4  Fabric: ATM
```

29.4.2.4 XPKT807 for Automatic Clearing when Node Deleted

This format is used when the XPKT806 alarm is automatically cleared for a node that has XPKT806 alarm present and is then deleted.

```
RSN07BD     XPKT807 <mmmdd hh:mmm:ss seq#> INFO ATM Packet Alarm
        Status: Alarm Cleared Automatically
        Reason: Cleared since node has been deleted.
                Node had <hits> XPKT301 failures before clear cycle aborted.
        Location: SPM <SPMNUM>  Type: <SPM Class>  Fabric: <Fabric>

RSN07BD     XPKT807 SEP30 12:58:04 1100 INFO ATM PACKET ALARM
        Status: Alarm Cleared Automatically
        Reason: Cleared since node has been deleted.
                Node had 0 XPKT301 failures before clear cycle aborted
```

```
Location: SPM 39  Type: SMG4  Fabric: ATM
```

29.4.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
<mmmdd hh:mmm:ss seq#>	numeric	Date, Time, and Log Sequence number
<user>	string	Login ID of user that executed command that caused manual clearing of the alarm.
<hits>	1..32767	Number of XPKT301 logs that impacted this SPM node during the cycle.
<CycleMax>	1..1440	Number of minutes in a clear cycle - same as CLEAR_CYCLE in the office parameter that controls the threshold.
<Thresh>	1..32767	Number of XPKT301 hits allowed against the node for alarm to clear. Same as CLEAR_THRESHOLD in the office parameter that controls the threshold.
<SPMNUM>	0..85	Number of SPM that cleared the XPKT806 alarm.
<SPM Class>	SMG4, IW, or DPT	SPM Class of the node where IW is IW with BRDG_ONLY, and DPT is IW with DPT_ONLY.

29.4.4 Action

None - just a notification that the previous XPKT806 major alarm has now cleared for this SPM node. The MAPCI;MTC;APPL;PKT;SPM_ATM Map level provides helpful commands for troubleshooting XPKT806 alarms.

29.4.5 Associated Operational Measurements or Performance Measurements

Feature A00004430 is creating new OMs in SN07 to track the XPKT301 hits on a per node basis.

29.4.6 Additional information

None

29.5 Alarms

A new “nn PKT” major alarm is introduced under the APPL banner for the MAPCI;MTC level. See the OPTCN section for details.

A new XPKT806 log with major alarm is introduced. See details above in the section for “XPKT806 Logs”.

30: Fault Management (FM): A00004271

30.1 Fault management strategy

A log is needed to provide real-time indication when a SIPT call is not allowed to proceed due to the SOC LIMIT setting of either CS2B0008 or CS2B0009.

30.2 Fault management tools and utilities

DMS logutil system.

30.3 Logs

30.3.1 Explanation

Log Title: NGSS 700

Name: CS2CS CALL REJECTED

Description: This log is generated when a SIPT CS2CS call is rejected because it would exceed the LIMIT setting of the CS2B0008 SOC. The SIPT call is not allowed to complete through the NGSS.

Event type: Call setup failure.

30.3.2 Format

```
NGSS700 <mmmdd hh:mmm:ss ssdd> INFO CS2CS CALL REJECTED
 NGSS CS2CS call limit has been reached
 A new LIMIT for SOC CS2B0008 may be needed.
```

30.3.3 Field descriptions

There are no fields associated with this log, only text indicating SOC CS2B0008's LIMIT setting is being exceeded.

30.3.4 Action

The SOC LIMIT setting for the SIP Call Server SOC CS2B0008 option may need to be increased.

30.3.5 Associated Operational Measurements or Performance Measurements

The CS2CSOV register in OM group NGSSOM is pegged.

30.3.6 Additional information

None.

30.3.7 Explanation

Log Title: NGSS 701

Name: CS2AS CALL REJECTED

Description: This log is generated when a CS2AS call is rejected because it would exceed the LIMIT setting of the CS2B0009 SOC. The SIPT call is not allowed to complete through the NGSS.

Event type: Call setup failure.

30.3.8 Format

```
NGSS701 <mmmdd hh:mmm:ss ssdd> INFO CS2AS CALL REJECTED
 NGSS CS2AS call limit has been reached
 A new LIMIT for SOC CS2B0009 may be needed.
```

30.3.9 Field descriptions

There are no fields associated with this log, only text indicating SOC CS2B0009's LIMIT setting is being exceeded.

30.3.10 Action

The SOC LIMIT setting for the SIP Call Server SOC CS2B0009 option may need to be increased.

30.3.11 Associated Operational Measurements or Performance Measurements

The CS2ASOV register in OM group NGSSOM is pegged.

30.3.12 Additional information

None.

30.4 Related documentation

31: Fault Management (FM): A00004391

31.1 Fault management strategy

There are 3 existing logs which are slightly modified for this feature. The modified logs are E911212, E911213, and E911214.

The modification is very minor. Each of these logs prints out a position ID and login ID when the 911 PSAP is using ACD. The fields used to display these IDs are increasing from 4 digits to 5 digits.

31.2 Fault management tools and utilities

Not Applicable

31.3 E911 212 Logs

31.3.1 Explanation

Log Title: E911 212

Name: E911 Call Event Record

Description: All E911 calls produce this log when either party disconnects.

31.3.2 Format

This is an existing log. Its function and basic format is unchanged by this activity.

If the E911 PSAP is using an ACD group for its agents, this log will print a position ID (POSID) and a login ID (LOGINID) associated with the agent who took the call. This feature expands these ID fields from 4 digits to 5 digits and extends their range to a maximum of 30000.

31.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
POSID	00001 to 30000	This feature increases the size of this field to 5 digits and its range to a maximum of 30000.

Table 1 Field descriptions

Field	Value	Description
LOGINID	00001 to 30000	This feature increases the size of this field to 5 digits and its range to a maximum of 30000.

31.3.4 Action

No new action is required beyond the standard procedures for E911 212 logs.

31.3.5 Associated Operational Measurements or Performance Measurements

Not Applicable.

31.3.6 Additional information

None.

31.4 E911 213 Logs

31.4.1 Explanation

Log Title: E911 213

Name: ACD PSAP Agent Login

Description: This log is produced when an ACD PSAP Agent logs in.

31.4.2 Format

This is an existing log. Its function and basic format is unchanged by this activity.

When an ACD PSAP agent logs in, this log is produced. It contains an AGENT POSITION ID and an AGENT LOGIN ID associated with the agent logging in. This feature expands these ID fields from 4 digits to 5 digits and extends their range to a maximum of 30000.

31.4.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
AGENT POSITION ID	00001 to 30000	This feature increases the size of this field to 5 digits and its range to a maximum of 30000.
AGENT LOGIN ID	00001 to 30000	This feature increases the size of this field to 5 digits and its range to a maximum of 30000.

31.4.4 Action

No new action is required beyond the standard procedures for E911 213 logs.

31.4.5 Associated Operational Measurements or Performance Measurements

Not Applicable.

31.4.6 Additional information

None.

31.5 E911 214 Logs

31.5.1 Explanation

Log Title: E911 214

Name: ACD PSAP Agent Logout

Description: This log is produced when an ACD PSAP agent logs out.

31.5.2 Format

This is an existing log. Its function and basic format is unchanged by this activity.

When an ACD PSAP agent logs out, this log is produced. It contains an AGENT POSITION ID and an AGENT LOGIN ID associated with the agent logging out. This feature expands these ID fields from 4 digits to 5 digits and extends their range to a maximum of 30000

31.5.3 Field descriptions

Table 3 Field descriptions

Field	Value	Description
AGENT POSITION ID	00001 to 30000	This feature increases the size of this field to 5 digits and its range to a maximum of 30000.
AGENT LOGIN ID	00001 to 30000	This feature increases the size of this field to 5 digits and its range to a maximum of 30000.

31.5.4 Action

No new action is required beyond the standard procedures for E911 214 logs.

31.5.5 Associated Operational Measurements or Performance Measurements

Not Applicable.

31.5.6 Additional information

None.

32: Fault Management (FM): A00004430

32.1 Fault management strategy

32.2 Fault management tools and utilities

32.3 Logs

32.3.1 XPKT301 and XPKT302

Log Title: ***XPKT301***

Name: UNI Connection Failure

The XPKT301 log replaces the ATM606 log in SN07. The ATM606 log was introduced on the SMG4 in SN05, and was expanded to include MG9K and MG9K ABI nodes in SN06.

The XPKT301 log is generated when a UNI Release/Release Complete message is received by a Succession line or trunk peripheral where the release cause in the message indicates a failure, i.e. not normal clearing. The Core is sent an ATM SVC failure message from either an SPM based AAL1 node (SMG4, IW SPM, or DPT SPM), or from an MG9K Gateway, through a Gateway Controller (GWC). The log can be used to troubleshoot system configuration and setup problems.

In SN07 the XPKT301 is the only log generated by SPM based AAL1 nodes, and represents both ATM SVC setup call failures, and ATM SVC mid-call failures.

NOTE In SN07, for MG9K and MG9K ABI nodes, the XPKT301 log represents ATM SVC call setup failures. (The XPKT302 log is generated for MG9K and MG9K ABI established calls).

Event type: INFO

Log Title: ***XPKT302***

Name: UNI Mid-call Failure

Description: This log is generated when a UNI Release/Release Complete message is received by a Succession line or trunk peripheral and the release

cause in the message indicates a failure, i.e. not normal clearing, for established MG9K or MG9K ABI node calls.

The log can be used to troubleshoot system configuration and setup problems.

The XPKT302 log is introduced in SN07 and is generated by MG9K Gateway or MG9K ABI nodes for established calls.

Event type: INFO

32.3.2 Format

The format of the XPKT301 and XPKT302 logs are almost identical to the ATM606 log, except for three new fields. New fields are introduced for the originating and terminating nodes (Orig Node, Term Node). A new DEBUG field is also introduced for future use by Gateways to send information back to the Core for Field Support trouble shooting.

32.3.2.1 SPM originated logs

The first example is for SPM originated logs, logs pertaining to ATM connections made by an SPM. This example also illustrates an optional last line applicable to **all** SPM ATM-related logs that is present when SPM_ENHANCED_OUTPUT in table OFCVAR is set to ON.

32.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
Location	SPM <nn> or <site, frame, unit/shelf> or <trunk PM name, PM #>	Identifies the node or subnode hosting the line/trunk whose bearer connection received the UNI Release/ Release Complete with failure cause. This is the master node that requested the ATM connection.
Type	SMG4 or IW or MG9K or MG9K-ABI	Identifies the type of the node associated with the location.

Table 1 Field descriptions

Field	Value	Description
Orig. Agent	CKT/DPT, CLLI, CIC or LEN, DN	Identification and properties of the originating agent in the affected call
Orig. Node	- SPM <nn> or - MG9K <lgrp - name> - MG9K-ABI (pm name)	- SPM and number - MG9K Lgrp name from table lgrpinv - the name of the ABI peripheral that has its DS-512 fiber connected to the MG9K Gateway,
Term. Agent	CKT/DPT, CLLI, CIC or LEN, DN	Identification and properties of the terminating agent in the affected call
Term. Node	- SPM <nn> or - MG9K <lgrp - name> - MG9K-ABI (pm name)	- SPM and number - MG9K Lgrp name from table lgrpinv - the name of the ABI peripheral that has its DS-512 fiber connected to the MG9K Gateway,
Called Number	<digit string>	The called number of the affected call
CallID	<digits>	The DMS Core Call Identifier for the affected call
Cause	digits, text	The UNI release/ release complete cause value and associated text as defined in the Q2931 standard.

Table 1 Field descriptions

Field	Value	Description
Debug	Nil values in SN07	Future use for Gateways to send information back to the Core to allow Nortel Network engineers to trouble shoot External Network problems.

32.3.4 Action

No immediate action is required. These logs are informational and intended to help with diagnosing call completion problems.

32.3.5 Associated Operational Measurements or Performance Measurements

Whenever this log is generated a subsequent integrity lost event will occur and this latter event will cause the ISCONBAD OM to be pegged if the agent attempting the ATM connection is an ISUP agent.

32.3.5.1 OM group AL1SVCOM register pegs in SN07

At the time the XPKT301 or XPKT302 logs are generated, corresponding nodal tuples in new OM group AL1SVCOM are also pegged.

32.3.6 Additional information

NA

32.4 Related documentation

33: Fault Management (FM): A00005016

33.1 Fault management strategy

The standard MG9K EM Fault Management strategy will apply to the new faults raised by this feature. Alarms will be displayed by the MG9K EM Alarm Browser, logged in NT standard format to the SSPFS CUST logs and forwarded to northbound OSS.

For the “New VMG Out of Service Alarms” feature there will be new faults added to provide the reason why a VMG is out of service.

33.2 Fault management tools and utilities

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

Gateway Status Config in Switched Lines Services GUI - the current list of Megaco faults will also be displayed here.

33.2.1 Faults, Alarms and Logs

There will be new VMG Out Of Service faults raised and cleared by the MG9000 to indicate the specific reason the VMG is out of service.

Some of these faults will have a severity of WARNING. These faults will be raised for issues that are most likely caused by user intervention: locking cards, setting VMG administrative state to Out of Service and restarting cards.

All of the other faults raised must assume that there is a problem that is preventing the VMG from going into service and have a severity of CRITICAL, same as the existing VMG300 fault.

33.3 Alarms

33.3.1 Explanation

33.3.1.1 vmgAdminStatusOutOfService

LogID: VMG322

Title: vmgAdminStatusOutOfService

Name: VMG Admin State is OOS

33.3.3 Action

33.3.3.1 vmgAdminStatusOutOfService

To clear this, change the Admin status in the Gateway Status Config tab of the Switched Lines Services GUI to In Service

33.3.3.2 vmgInitializing

This alarm is raised at initial VMG creation, while waiting for a reply form the GWC when the VMG Admin status is changed to InService or as the active ABI/ITP is coming up out of a restart. There is no clearing procedure for this alarm. During a restart, this is raised as long as 15 minutes. During the first 15 minutes after a restart of an ITP pair, no other out of service VMG alarms are raised against the VMG, except the Card Locked and Admin State Out of Service faults. If the VMG is still Out of Service 15 minutes after the restart, the alarm will be cleared and replaced by the appropriate VMG fault indicating the fault condition at that time.

33.3.3.3 vmgOOSCardLocked

To clear this, unlock the active ITP or ABI.

33.3.3.4 vmgOOSCardDisabled

This alarm indicates the ITP or ABI card's status is disabled. The ITP or ABI card view or Alarm Browser will provide more information about what is preventing the card from going enabled. When the card's status goes to enabled, this alarm will be cleared.

33.3.3.5 vmgOOSLineMtcOnPairNotReady

This alarm indicates Line Maintenance on the ITP or ABI is not ready for call processing support. If this is raised when the card is enabled, then this is most likely a software error condition. If the ITP or ABI is disabled, the Line Maintenance fault is usually raised as well. Locking and unlocking the card might cause this condition to clear.

33.3.3.6 vmgOOSMegacoMtcOnPairNotReady

This fault would be raised because of a software error condition. Locking and unlocking the card might cause this condition to clear.

33.3.3.7 vmgOOSGWCUnreachable

This alarm indicates the GWC is not responding to pings from the ITP or ABI and either the VMG has never reached an Enabled state or ESA capability is not turned on for this VMG.

It could mean a number of things:

- If this VMG has never been in service, it could be because an invalid VMG IP address was provisioned. If the address is incorrect, then delete and re-add the VMG with the correct IP address
- It could be an issue with the network interface or edge router - most likely there will also be a Wanbuilder Heartbeat alarm - resolve the issue with that alarm
- If there is not a Wanbuilder Heartbeat alarm and Wanbuilder Heartbeat was turned on for the Call Control subnet (ITPs) or ABI subnet (ABIs) then this is likely a network issue - do pings/traceroutes to isolate the issue further
- Also verify that the pair of GWC cards is unlocked. If the active GWC is locked, it will not respond to pings.

33.3.3.8 vmgOOSNoReplyFromGWC

This alarm indicates the GWC is not responding to Megaco messages for this VMG and either the VMG has never reached an Enabled state or ESA capability is not turned on for this VMG.

It could mean a number of things, including:

- The LGRP for this VMG is not in a ready state. Check the LGRP state using MAPCI ; PM on the core.
- If this is a VMG for an ABI pair that has never been in service, it could mean that the core or MG9K EM is provisioned with the incorrect address for this VMG. Correct the VMG IP address in the datafill in the core or re-provision the VMG with the correct address in the MG9K EM.
- GWC pair has been set to man busy or has issues - check the GWC status in CS2M.

33.3.3.9 vmgOOSAAL1BearerOnPairNotReady

This usually indicates a software error situation on either the DCC or ITP. Lock and unlocking the ITP, ABI or DCC card(s) involved might clear this.

33.3.3.10 vmgOOSIPBearerOnPairNotReady

This is usually because the Call Control Subnet was not provisioned on the DCC. Go to LCI and provision the Call Control Subnet. As such, this fault is usually card to see if that clears the issue. If the Call Control Subnet has been provisioned and this fault does not clear, then this is likely a software error - lock and unlock the ITP/ABI card to see if that clears the issue.

33.3.3.11 VMG300

Most of the time, this alarm will be raised only for transient situations, and should either be cleared or replaced by a different alarm within 15 seconds. The two exceptions to this are:

- if the active card is at SN07 or greater, but the inactive card is on a pre-SN07 software release.
- the ITP or ABI pair is on SN07, but the DCC is on a pre-SN07 release

Until the inactive card and DCC are upgraded to SN07 or greater, the active card will raise only the VMG300 fault when the VMG is out of service. To clear this, follow the instructions for the various faults in this section until the alarm is cleared.

33.3.4 Associated Operational Measurements or Performance Measurements

None.

33.4 Related documentation

34: Fault Management (FM): A00005073

34.1 Fault management strategy

In case of file transfer error , SDMB375 is generated on the Core with the proper information. The SDMB375 is not a new log.It is also raises a major or critical alarm on certain error conditions. .

34.2 Fault management tools and utilities

34.3 Logs

34.3.1 Explanation

The SDMB375 log is generated whenever SFTP or the base file transfer systems encounters a problem. Where appropriate, it raises a major or critical alarm. The TEXT portion of the log provides an explanation of the problem. SDMB375 logs is generated to indicate the trouble condition.

Log Title:. SDMB375

Name: SDM BILLING FILE TRANSFER

Description: To indicate an error occur in SBA secure file transfer

Event type: Trouble (TBL)

34.3.2 Format

Figure 1 SDMB375 log format

**SDMB375 <date> <time> <seq#> <event type> SDM BILLING FILE TRANSFER STREAM=<stream>: <destination>: <specific resolution>

***SDMB375 <date> <time> <seq#> <event type> SDM BILLING FILE TRANSFER STREAM=<stream>: <destination>: <specific error>

Note : The ** in the log indicates the major event and *** in the log indicates the critical event

Example:

** SDMB375 MAR12 00:33:16 9921 TBL SDM BILLING FILE TRANSFER

STREAM= AMA: TEST: Not logged in or login incorrect.

34.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
Stream	string SIZE(4)	stream name
destination	string SIZE(15)	The name of the destination
specific error (variable field)	string SIZE varies	sftp specific error message and the possible action should be taken

34.3.4 Action

Follow the recommended action in the specific error field.
next line of support should be contacted.

34.3.4.1 Additional information

The SDMB375 log is generated whenever SFTP or the base file transfer systems encounters a problem. Where appropriate, it raises a major or critical alarm. The TEXT portion of the log provides an explanation of the problem.

Example:

** SDMB375 MAR12 01:59:48 5404 TBL SDM BILLING FILE TRANSFER

STREAM= AMA: TEST: Not logged in or login incorrect

*** SDMB375 MAR12 01:59:48 5505 TBL SDM BILLING FILE TRANSFER

STREAM= AMA: TEST: SFTP session failed. Max retries encountered

34.3.5 SDMB675

34.3.5.1 Explanation:

The SDMB675 log is generated whenever SFTP or the base file transfer system displays an informative message. The <destination>: <specific resolution> portion of the log provides an explanation of the information. SDMB675 logs is generated to indicate the cleared trouble condition.

Log Title: SDMB675

Name: SDM BILLING FILE TRANSFER

Description: To indicate the cleared error condition.

Event type: Info(INFO)

34.3.5.2 Format

Figure 2 SDMB 675 log format

SDMB675 <date> <time> <seq#> <event type> SDM BILLING FILE TRANSFER
STREAM=<stream>: <destination>: <specific resolution>

Example:

SDMB675 MAR13 01:46:43 5836 INFO SDM BILLING FILE TRANSFER

STREAM= AMA: TEST: Retrying one more time

34.3.5.3 Field descriptions

Field	Value	Description
Stream	string SIZE(4)	stream name
destination	string SIZE(15)	The name of the destination
specific resolution (variable field)	string SIZE varies	An explanation of the information.

34.3.5.4 Additional information

The SDMB675 log is generated whenever SFTP or the base file transfer system displays an informative message. The <destination>: <specific resolution> portion of the log provides an explanation of the information.

Example:

SDMB675 MAR13 01:46:43 5836 INFO SDM BILLING FILE TRANSFER

STREAM= AMA: TEST: Retrying one more time

34.4 Alarms

On error conditions, Major or critical alarm is raised on SDMBIL alarm slot on the core. The “major” alarm is raised if SFTPW will attempt re-try or “critical” alarm is raised if SFTP does not re-try due to exceeded re-try limit

Alarm format: SFTW

C

The corresponding log for the alarm detail will also be generated to indicate the error.

Example:

critical: AMA: SFTPW: TEST: SFTP session failed. Max retries encounter.

34.4.1 Major Alarm:

Alarm format: **SFTPW**

M

The corresponding log for alarm detail will also be generated to indicate the error.

Example:

Major:AMA:SFTPW: TEST: Not logged in or login incorrect

34.4.2 Associated Operational Measurements or Performance Measurements

34.5 Related documentation

35: Fault Management (FM): A00005074

35.1 Fault management strategy

Prior to this activity, OMDD used only the standard file transfer protocol for performing file transfers. This activity introduces an optional secure outbound file transfer mechanism for OMDD. Now OMDD can perform outbound file transfers in two ways: standard or secure. This activity does not modify the existing mechanism for fault management in OMDD file transfers. If a file transfer (either secure or standard) fails, a customer log (SDMO375) will be generated. The text of the log will indicate the reason for failure of file transfer.

35.2 Fault management tools and utilities

The existing OM file transfer log SDMO375 will be used by this activity to indicate failures in secure file transfer. The text of SDMO35 will indicate the actual reason for file transfer failure.

35.3 Logs

35.3.1 Explanation

Log Title: SDMO375

Name:SDM OM FILE TRANSFERDescription: This log indicates that OMDD outbound file transfer from the SDM to the OSS has failed. This is an already existing log.

Event type:MAJOR

35.3.2 Format

<mm dd hh:mmm:ss> <sdm/cbm name> syslog: SDMO375 MAJOR TBL SDM OM FILE TRANSFER ODM FTP:<reason for ftp failure>

35.3.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
<mm dd hh:mmm:ss>	date and time	Date and time when the log is generated

Table 1 Field descriptions

Field	Value	Description
<sdmname>	sdm/cbm name	The hostname of the SDM/CBM where the log is generated
SDMO375	SDMO375	Log name
<reason for ftp failure>	Text String	The actual reason for ftp failure.

35.3.4 Action

From the reason text, identify the reason for failure of file transfer and follow the standard procedures to rectify it.

35.3.5 Associated Operational Measurements or Performance Measurements

None

35.3.6 Additional information

No alarms are created or modified by this activity.

35.4 Related documentation

SDM product documentation: Fault Management.

36: Fault Management (FM): A00005160

36.1 Fault management strategy

This feature does not change the fault management strategy for XA-Core Ethernet interface cards or for the OSSAIN product. It does modify the reason texts that can appear in two OSSAIN log reports.

36.2 Fault management tools and utilities

Unchanged.

36.3 Logs

This activity modifies the values that can appear in the existing OAIN606 and OAIN607 logs. It does not add any new logs or change the format of any existing logs.

36.3.1 Explanation

Log Title: OAIN606

Name: UNDELIVERABLE MESSAGE

Description: This log is generated when OSSAIN data communication software cannot route an incoming message to the appropriate software to process it. The reason text in the log indicates why the message could not be routed.

Event type: INFO

36.3.2 Format

The format is unchanged. Following is an example.

```
RTPC07BZ  OAIN606 MAR12 13:56:45 8500 INFO UNDELIVERABLE MESSAGE
        MESSAGE PROTOCOL RELEASE:   5
        MESSAGE PROTOCOL INCREMENT: 0
        SENDERS PROTOCOL RELEASE:   5
        SENDERS PROTOCOL INCREMENT: 0
        NODE NAME: TO_RTPV                          NODE ID: 70
        SESSION POOL NAME:                          SESSION POOL ID: 0
        SESSION ID: 0
        MESSAGE CLASS: OSAC NODE CLASS              MESSAGE CLASS ID: 22
        NETWORK ADDRESS : 47 245 9 1 : 5290
        REASON: MSG RECEIVED AT UNEXPECTED DESTINATION ADDRESS
        MESSAGE:
        160000003600120000050005460064 00FF0082A1
        26000202640102020B0282041A0005E016002000
        000300FFF52F0109FFFFFFFFFFFFFFFFFFFFFFFF
        00FF00FF00FF00FF00FF00FF00FF00FF00FF00FF
        00FF00FF00FF00FF00FF00FF00FF00FF00FF00FF
```

36.3.3 Field descriptions

The overall field descriptions are unchanged. The values that can appear in the REASON field are changed as follows:

- INVALID NETWORK ADDRESS

  This value, which could appear in earlier releases, no longer appears as of SN07/ISN07. It is replaced by MSG RECEIVED WITH UNEXPECTED SOURCE ADDRESS

- MSG RECEIVED WITH UNEXPECTED SOURCE ADDRESS

  This new reason indicates that the source IP address, port, or both in the incoming message do not match switch datafill for the node whose node name and ID are shown in the log. The NETWORK ADDRESS field shows the actual source address. The most likely explanation is incorrect datafill for the node's IP address at the switch at which the log is generated. Another possibility is that the security of the service provider's network may have been compromised, and a rogue node may be sending OAP messages to the switch.

- MSG RECEIVED AT UNEXPECTED DESTINATION ADDRESS

  This new reason indicates that a message incoming from the node whose name and ID are shown in the log was delivered to a core IP address other than the one datafilled in the switch for the far-end node. The NETWORK ADDRESS in the log is the actual destination address at which the message was received.

  The most likely explanation is that the node that sent the message is configured to have the wrong one of the core's IP addresses. If the switch where the log was generated is datafilled to use an EIU for messaging with the far-end node, the IP address in table IPNETWRK at the switch should be configured in the far-end node as the switch address. If the switch is datafilled to use XA-Core Ethernet interface for messaging with the node, the CM IP address datafilled against the node in table OANODINV in the switch should be configured in the node as the switch IP address.

  Another possibility is that the security of the service provider's network may have been compromised in a way that causes messages to be misrouted.

Note the REASON field can also have other values, which are unchanged by this feature.

36.3.4 Action

Check parallel datafill between the node that sent the message and the switch at which the log was generated. Check for logs or alarms at the node that sent the message. If the problem is not resolved, contact the next level of support.

36.3.5 Associated Operational Measurements or Performance Measurements

Unchanged.

36.3.6 Explanation

Log Title: OAIN607

Name: TRANSPORT INTERFACE ERROR

Description: This log indicates that OSSAIN software encountered an error when interfacing with lower-layer transport software in the switch.

Event type: INFO

36.3.7 Format

The format is unchanged. Following is an example.

```
RTPC07BZ  OAIN607 FEB29 13:03:30 7499 INFO TRANSPORT INTERFACE ERROR
        NODE NAME: TEST_NODE1                    NODE ID: 185
        SESSION POOL NAME:                       SESSION POOL ID: 0
        MESSAGE CLASS:                           MESSAGE CLASS ID: 256
        NETWORK ADDRESS : 47 142 224 185 : 7000
        REASON: XAETHR TRANSMIT FAILURE
        MESSAGE:
        0001000000260012080009000020000008300FF
        00FF00FF00FF00FF00FF00FF00FF00FF00FF00FF
        00FF00FF00FF00FF00FF00FF00FF00FF00FF00FF
        00FF00FF00FF00FF00FF00FF00FF00FF00FF00FF
        00FF00FF00FF00FF00FF00FF00FF00FF00FF00FF
```

36.3.8 Field descriptions

The overall field descriptions are unchanged. This activity adds one new value that can appear in the REASON field:

- XAETHR TRANSMIT FAILURE

  This value indicates that the OSSAIN attempted to send a message using the XA-Core Ethernet interface, but the lower-layer transport software reported back to OSSAIN that the message could not be sent. The cause of the problem is more likely to be in lower-layer software or hardware than in OSSAIN code.

36.3.9 Action

Investigate the underlying transport facilities. Check logs for any that might suggest the root cause of the transport failure. Investigate at MAP levels MAPCI;MTC;XAC;IO and MAPCI;MTC;XAC;ETHR. The peg counts in CI XAIPTOOL may be useful.

36.3.10 Associated Operational Measurements or Performance Measurements

Unchanged.

36.3.11 Additional information

OSSAIN does not generate an OAIN607 log if the reason for failure to send an OAP message via XA-Core Ethernet interface is that no route exists for the source IP address. In this case, the problem is definitely with the underlying transport, and OAIN logs would only clutter up the reporting and possibly make it more difficult to troubleshoot the underlying problem. The underlying transport always raises an XAC alarm when there is no route for messages from a CM host IP address.

36.4 Related documentation

Refer to 297-8403-901, OSSAIN User's Guide, for information about OSSAIN fault management.

37: Fault Management (FM): A00005192

37.1 Fault management strategy

37.2 Fault management tools and utilities

37.3 Link Condition Change Log

37.3.1 Explanation

Log Title: SDM633

Name: SDM LINK CONDITION CHANGE

Description: CBM custlog log to indicate a change in the condition of a CBM link.

Event type: Info

37.3.2 Format

```
SDM633 NONE INFO SDM LINK CONDITION CHANGE
        Link: domain <domain num> port <port num>
        From: <previous link condition>
          To: <new link condition>

Probable Cause: noProbableCause
Specific Problem:

Associated alarm message: Link Fault: <fault description> on link <num> (domain <num> port <num>)

Severity: Minor

Condition: diagnostics indicate minor link fault

Action: Report the full text of the alarm to the support group.

Log Title: SDM335 MINOR, SDM635 NONE

Examples:

Alarm Raised Log:

SDM335 MINOR Alarm raised or updated.
Minor Link Fault: Bad Incoming CRCs on link 0 (domain 0 port 0)
TimeStamp: Mon Mar 29 19:47:06 2004
ComponentID: CLASS=HW;HWTYPE=LINK_FAULT_0
Category: Communications
Probable Cause: equipmentMalfunction
Specific Problem:

Alarm Cleared Log:

SDM635 NONE Alarm raised or updated.
Cleared Link Fault: Bad Incoming CRCs on link 0 (domain 0 port 0)
TimeStamp: Mon Mar 29 19:47:06 2004
ComponentID: CLASS=HW;HWTYPE=LINK_FAULT_0
Category: Communications
Probable Cause: noProbableCause
Specific Problem:

38: Fault Management (FM): A00005322

38.1 Fault management strategy

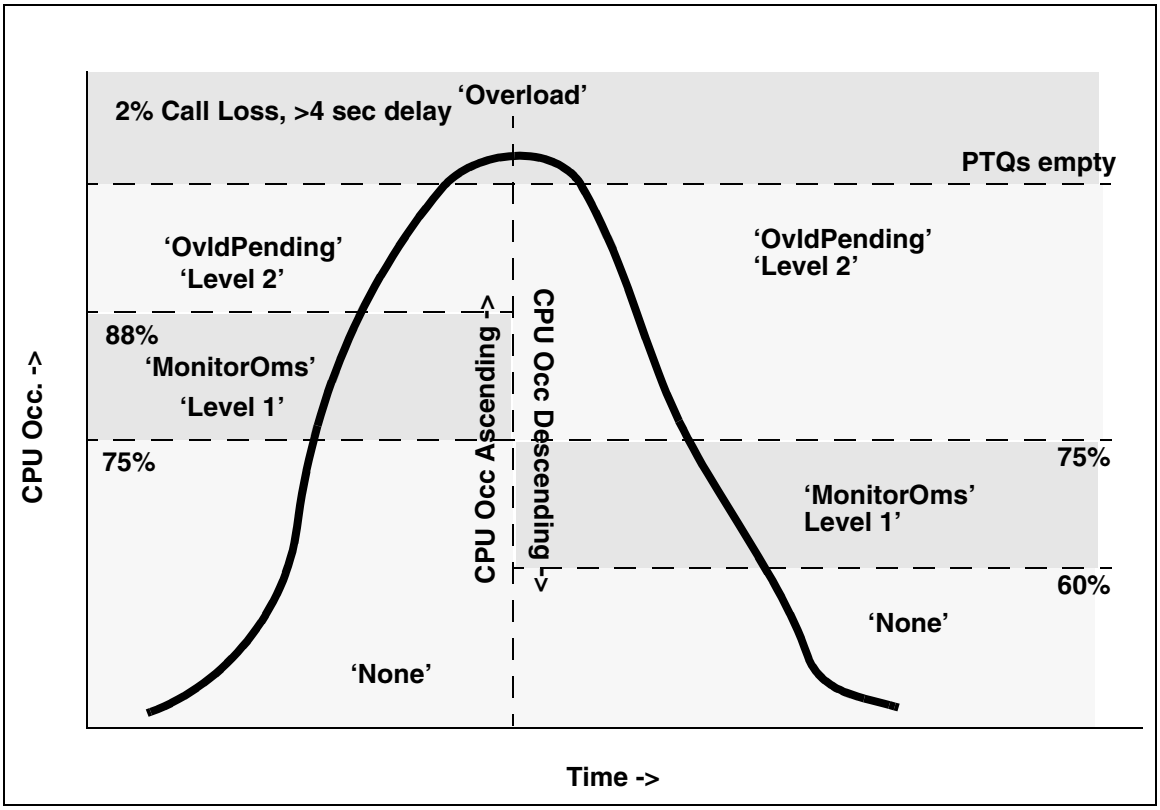
This feature introduces several changes into the reporting of ATMRM resource exhaustion and CEM overload conditions. Since the ATMRM resources are integral to call processing on the MG4K/IW variants of the SPM peripheral node, attempts are made to make ATMRM resource exhaustion conditions very visible. To this end, depending upon the severity of the ATMRM resource exhaustion:

- CEM CALLP can go into Overload which results in SPM399 Overload logs, Minor alarm, CEM state change to ISTb, Node state change to Istb (NODE500, NODE602), MAPCI MIP strings indicating Overload and "querypm flt reason" indicating an overload condition being generated.
- On the ATMRM, a minor alarm will be raised, RM state change to ISTb (SPM500 state change and SPM300 fault reason logs), MAPCI MIP strings indicating Overload and "querypm flt reason" indicating an overload condition will be generated.

The severity of ATMRM resource exhaustion is reported via predefined utilization levels. Each level has a different onset and abatement value to prevent quick entry/exit (jitter) from a single level at a boundary value. The ATMRM resource utilization levels (NONE, LEVEL1 and LEVEL2) are transferred to the CEM and are applied to CEM resources. As a result, the ATMRM and CEM share resource utilization levels. For the case of CPU occupancy/CALLP flow control, these levels are as follows:

- None: Exit: 75% (Level 1 Onset), Onset: 0% (system initialization) or 60% (Level 1 abatement) - The monitored resource is below 75% utilization since last being in "Level 1" or since system initialization.
- Level 1: Onset: 75%, Exit: 88% (Level 2 onset), Abatement: 60% (Level 1 onset) - The CPU resource utilization was initially above its engineering level of 75% and has not dropped below 60% utilization since the initial 75% level was encountered.
- Level 2: Onset: 88%, Exit: Overload triggered, Abatement: 75% - The CPU resource is dangerously overused. CALLP flow control has been triggered to delay call originations in order to lessen CPU occupancy.
- Overload: Onset: Any call delayed by flowcontrol for more than 4 seconds or more than 2% of the calls have been discarded. Abatement: No calls are being delayed. Overload determination is not resource based, it is determined by the characteristics of the states of the calls in flow control.

Figure 1 CPU Occupancy and Resource Utilization Level



The following table shows the maintenance interaction mapped to CPU resource levels. The shaded entries are the new interactions introduced by this feature. Please note, with introduction of this feature, the ATMRM CPU resource level will effect existing maintenance interactions for the CEM.

.

Table 1 Maintenance Interactions for each ATMRM Resource Utilization Level

Mtc Interaction	No Overload	Level 1 Resource Utilization	Level 2 Resource Utilization	CALLP Overload (call state based)
CEM Flowcontrol	Off	Off	On	On
CEM Alarms	None	None	Minor	Minor
ATMRM Alarms	None	Minor	Minor	Minor
CEM State	InSv	InSv	ISTb	ISTb
ATMRM State	InSv	ISTb	ISTb	ISTb
Node State	InSv	InSv	ISTb	ISTb

Changing Existing Interaction

New Interaction

Table 1 Maintenance Interactions for each ATMRM Resource Utilization Level

Mtc Interaction	No Overload	Level 1 Resource Utilization	Level 2 Resource Utilization	CALLP Overload (call state based)
CEM MIP	None	"Monitor OMs"	"Overload Pending"	"Overload"
ATMRM MIP	None	"Monitor OMs"	"Overload Pending"	"Overload Pending"
CEM Logs				
SPM399	None	"Monitor OMs"	"Overload Pending"	"Overload"
NODE500	None	None	ISTb State Change	None
NODE602	None	None	"Reached or Nearing Overload"	None
ATMRM Logs				
SPM300	None	"Monitor OMs"	"Overload Pending"	None
SPM500	None	ISTb State Change	None	None

Please note, the above table indicates the interactions visible when entering or being in high resource utilization levels. When abating the "Level 1" state and returning to the "No Overload" state, alarms are extinguished, MIP strings are cleared, module states are returned to InSv and the logs indicate overload states have cleared, resources utilization levels have returned to normal, and module states are back to InSv.

38.2 Fault management tools and utilities

This feature is not introducing new mechanisms for fault reporting. Existing CORE based tools/mechanisms are being utilized.

38.2.1 Logs

The CORE base **LOGUTIL** command can be used to view the following logs. These logs are existing log classes, but now are being triggered via resource exhaustion/overload conditions on the ATMRM with new fault text.

- NODE500 "Node State Change",
- NODE602 "CEM State Change Reason Report"
- SPM399 "SPM Overload Report",
- SPM300 "Device Fault Report"
- SPM500 "Device State Change".

Depending upon the state of the CEM/ATM RM experiencing the resource exhaustion condition, a minimum of 2 of the above logs types will be generated and possibly, all 5 types of logs will be generated. At the very least, the 2 report logs (SPM399 “SPM Overload Report” and SPM300 “Device Fault Report”) will be generated. These two “Report” logs contain the detailed information needed to identify the “Resource Exhaustion” event.

38.2.2 Alarms

This feature introduces new conditions in which Spectrum device alarms are generated. A minor alarm is raised against an ATMRM when it experiences resource exhaustion. When the CEM’s CALLP performance degrades sufficiently, the CEM will raise a minor alarm. When the active CEM raises an alarm, the NODE will raise a similar alarm. To view which node is alarmed:

MAPCI;MTC;PM;POST SPM <Alarm Type: {Minor, Major, Crit}>

To see details of the alarm:

MAPCI;MTC;PM;POST SPM <SPM Number>; querypm flt

A useful mechanism to determine the current alarm state of all devices within a single node, is the “querypm flt reason” MAPCI command. It will elaborate on the reasons behind a device being alarmed. To view the peripheral faults:

MAPCI;MTC;PM;POST SPM <SPM Number>;querypm flt reason

38.2.3 State Changes

To indicate a device’s resource exhaustion/overload state, a device’s maintenance state can be degraded from “InSv” to “Istb”. If the device is the active CEM, a degraded device state will also degrade the node state in a similar manner. To view the degraded nodes:

MAPCI;MTC;PM;POST SPM <State: {SysB, ManB, OffL, CBsy, ISTb, InSv}>

The above command only posts the node by state, not the individual devices. Once the node is posted, the “querypm flt reason” can be used to indicate the device degradation reasons.

38.2.4 Maintenance Operation Strings

To view the current resource exhaustion/overload state of a Spectrum device, the device must be selected.

MAPCI;MTC;PM;POST SPM <SPM Number>;SELECT <Device Type: {CEM, ATM}> <Device Number {0,1}>

On the maintenance status line, the device's resource exhaustion/overload state will be visible if said condition exists. These status indicators are:

- "Monitor OMs",
- "Ovld Pending",
- "Overload".

38.3 Logs

38.3.1 ATM605

This feature removes the generation of the ATM605 log. The ATM605 is replaced with the SPM300 "Device Fault Report" log.

38.3.1.1 Explanation

Log Title: ATM 605

Name: ATM Overload Event

Description: This log is generated on the DMS CORE whenever an Spectrum ATMRM enters/leaves pre-defined resource utilization levels. Resource utilization levels are commonly referred to as overload levels.

Event type: Threshold

38.3.1.2 Format

```
<LABCLLI> ATM605 <MMMdd hh:mm:ss SSSS> INFO  ATM Overload Event
           Location: SPM <xx> ATM RM
           Description: <Description String>
```

38.3.1.3 Examples

38.3.1.3.1 Exiting Level 1 Resource Utilization

```
MSH207BW      ATM605 FEB25 12:58:22 5209 INFO ATM Overload Event
               Location: SPM 4 ATM RM
               Description: ATM RM Not in Overload
```

38.3.1.3.2 Entering Level 1 Resource Utilization/Exiting Level 2 Resource Utilization

```
MSH207BW      ATM605 FEB25 14:14:00 5236 INFO ATM Overload Event
               Location: SPM 4 ATM RM
               Description: ATM RM Near Overload
```

38.3.1.3.3 Entering Level 2 Resource Utilization

```
MSH207BW       ATM605 FEB25 14:40:09 5009 INFO ATM Overload Event
                Location: SPM 4 ATM RM
                Description: ATM RM In Overload
```

38.3.1.4 Field descriptions

The following table describes the variable fields (fields within "<>" "38.3.1.2 Format" on page 2277):

Table 2 Field descriptions

Field	Value	Description
LABCLLI	The CLLI of the office where the log is getting generated	
MMMdd hh:mm:ss	MMM - JAN to DEC dd - 01 to 31 hh - 00 to 23 mm - 00 to 59 ss - 00 to 59	Date and Time when the log was generated in the core.
XX	00 to 85	CEM number of the SPM for which the log is generated.
Description String	1) ATM RM Not in Overload 2) ATM RM Near Overload 3) ATM RM in Overload 4) Invalid ATM Overload Level Received from ATM	The set of possible strings for the ATMRM when traversing various resource utilization levels. String "1" is an error clearing event. The subsequent strings are for error notification events.

The 3 "Description Strings" indicate the 3 following events respectfully:

1. Active ATMRM's CPU occupancy has dropped below 60%.
2. Active ATMRM's CPU occupancy initially exceeds 75% and subsequently exceeds 60%.
3. Active ATMRM's CPU occupancy initially exceeds 88% and subsequently exceeds 75%.
4. Unknown error has been encountered - contact Nortel support personnel.

38.3.1.5 Action

None. Log is being replaced with SPM300 "Device Fault Report".

38.3.1.6 Associated Operational Measurements or Performance Measurements

None. Log is being replaced with SPM300 “Device Fault Report”.

38.3.1.7 Additional information

None. Log is being replaced with SPM300 “Device Fault Report”.

38.3.2 SPM399

38.3.2.1 Explanation

Log Title: SPM 399

Name: SPM Overload Report

Description: This log is generated whenever a Spectrum CEM enters/leaves pre-defined overload conditions.

This feature augments the conditions in which this log is generated. With this feature, the CEM overload states are effected by the ATM RM resource utilization levels. As a result, the ATM RM resource utilization levels can trigger the generation of this log.

Event type: Trouble

38.3.2.2 Format

Format has not changed

```
<LABCLLI> <*> SPM399 <MMMdd hh:mm:ss SSSS> TBL  SPM Overload Report

        Location: SPM   4  Type: SMG4      Fabric: ATM
```

38.3.2.4 Field descriptions

Field contents have not changed.

Table 3 Field descriptions

Field	Value	Description
LABCLLI	The CLLI of the office where the log is getting generated	
*	Priority of Alarm - Two asterisks (**), one asterisk (*) or empty space	Two asterisks (**) appear for a log of 'Major' severity, one asterisk (*) appears for a log of severity 'Minor' and empty space appears for a log of severity 'No Alarm'.
MMMdd hh:mm:ss	MMM - JAN to DEC dd - 01 to 31 hh - 00 to 23 mm - 00 to 59 ss - 00 to 59	Date and Time when the log was generated in the core.
SSSS	0000 to 9999	Log serial number.
xx	00 to 85	SPM number for which the log is generated.
y	0,1	CEM number of the SPM for which the log is generated.
Activity	A,I	Activity of the CEM. 'A' for Active and 'I' for Inactive.
State	INSV,ISTB,MANB,SYSB	State of the CEM.
hh:mm:ss.SSS	hh - 00 to 23 mm - 00 to 59 ss - 00 to 59 SSS - 000 to 999	Time when the error/ error-clearing event happened in the SPM. This time will be earlier than the time that appears on the first line because the event happens in the SPM first and then the core generates the log.

Table 3 Field descriptions

Field	Value	Description
Reason	1) “Overload OMs initiated” 2) “CEM in Overload Pending state” 3) “CEM experiencing Overload” 4) “Overload Pending cleared” 5) “Overload cleared”	These are the five possible strings that can appear in the ‘Reason’ field of the log. The first three reasons are for error scenarios and the fourth one is for the error-clearing scenario.
Prev	1)”None” 2) “MonitorOMs” 3)”OvldPending” 4)”Overload”	This field gives the overload condition of the SPM before the error/error-clearing event happened.
Curr	1)”None” 2) “MonitorOMs” 3)”OvldPending” 4)”Overload”	This field gives the current overload condition of the SPM.
Diagnostics	“#0000” to “#FFFF”	This field is for the designers who are doing the trouble-shooting. The craft need not look in to this field.
Action	1)”Check SPMACT and SPMOVLD OMs.” 2) “Contact your next level of support.” 3)”None.”	This field gives the craft information on the action that needs to be taken. The string 1) is for logs generated for “Check OMs” and “Overload Pending”. String 2) is generated in addition to String 1) when an “Overload” event occurs. The last string is for logs generated for an error-clearing scenario.
SPM no	00 to 85	SPM number
Type	DMSCP,SMG4,IW	Variant of the SPM
Fabric	ATM,IP,ENET	The switching fabric

The CEM now incorporates the ATM RM's resource utilization level into the generation of the SPM399. As a result, the ATM RM resource levels can trigger the SPM399 logs under the following condition:

1. Overload OMs initiated - ATM RM's CPU occupancy initially exceeds 75%, then subsequently exceeds 60%.
2. CEM in Overload Pending state - ATM RM's CPU occupancy initially exceeds 88%, then subsequently exceeds 75%. The overload pending state can also be entered when the CEM has exited overload conditions.
3. CEM experiencing Overload - The ATM RM ***cannot*** trigger this transition. The ATM RM can influence/contribute to this state, but it cannot be the trigger. This transition is triggered when CEM CALLP has delayed calls for more than 4 seconds, or when over 2% of calls have been tossed. Overload is exited only when there are no more delayed/tossed calls on the CEM.
4. Overload Pending cleared - ATM RM's CPU occupancy initially exceeds 88%, then subsequently drops below 75%.
5. Overload cleared - ATM RM's CPU occupancy has dropped below 60%

38.3.2.5 Action

The 'Action' field of the log contains the action that is needed to be taken by the craft. For the situations when the SPM is leaving an overload condition, the 'Action' field will have 'None' and no action need be taken.

1. Check SPMACT and SPMOVLD OMs - Consult these OM groups on the DMS CORE. Consultation should indicate that the amount of traffic being presented to the Spectrum exceeds the engineering guidelines. The craft should re-engineer traffic sources to bring traffic levels presented to the Spectrum to within published guidelines.
2. Contact your next level of support - Contact Nortel support personnel.
3. None - For the situations when the SPM is leaving an overload condition, no action is required.

38.3.2.6 Associated Operational Measurements or Performance Measurements

In the OM group SPMOVLD, the OVLDNUM register is pegged when the SPM enters the 'Overload' condition and register OVLDUSG maintains the number of seconds the SPM was in the 'Overload' condition in the present OM collection interval. Similarly, the register OVLDPNUM is pegged when the SPM enters the 'Overload Pending' condition and register OVLDPUSG maintains the number of seconds the SPM was in the 'Overload Pending' condition in the present OM collection interval.

Looking at the “TRK” OM group for the trunk groups terminating on the overloaded Spectrum should indicate the source of the overload. The “CONNECT” OM indicates the number of calls successfully connected by this Spectrum for this trunk group. The “INCATOT” OM indicates the number total incoming connect requests for this trunk group for this Spectrum. If these two OMs are not equal, then call failures have occurred and need to be further investigated. Depending upon office configuration/traffic scenarios, all trunk groups terminating on this Spectrum may have to have these OM added together for the analysis to be meaningful.

38.3.2.7 Additional information

a. A00002431 - SP20 “LX82BA Capacity Delivery” - Enhances CALLP Flowcontrol interaction

b. A00002432 - SP20 “SPM Enhanced Overload OMs and Logs”- Enhances overload reporting.

38.3.3 SPM300

38.3.3.1 Explanation

Log Title: SPM300

Name: SPM300 Device Fault Report

Description: This feature adds new conditions for the generation of this existing log class.

With this feature, when ATM RM resource utilization crosses several pre-defined thresholds, instances of this log will be generated indicating resource utilization levels.

This log replaces the ATM605 log.

Event type: Trouble

38.3.3.2 Format

The format of this log has not changed. New descriptive strings have been added to describe the ATM RM’s resource utilization levels.

```
<LABCLLI> <*> SPM300 <MMMdd hh:mm:ss SSSS TBL  Device Fault Report
          Location    : SPM :<XX> ATM : <Y> Activity : <Activity1>
          Status      : <Status String>
          Problem Description: <Problem Description String>
          <Slot Number><Activity2>: <Problem Refinement String>
          Action      : <Action String>
          Cardlist    :
            No Cardlist Available.
```

38.3.3.3 Examples

38.3.3.3.1 Clearing ATMRM Resource Utilization Issues

```
MSH207BW      SPM300 FEB25 14:40:19 5900 TBL  Device Fault Report
          Location   : SPM : 4   ATM : 0 Activity : A
          Status     : Info Only
          Problem Description: No Problem
            8A: Resources OK
          Action     : No Action Required.
          Cardlist   :
            No Cardlist Available.
```

38.3.3.3.2 Entering Monitor OMs

```
MSH207BW   *  SPM300 FEB25 14:13:59 5000 TBL  Device Fault Report
          Location   : SPM : 4   ATM : 0 Activity : A
          Status     : Fault Raised
          Problem Description: Non Critical
            8A: Monitor OMs - Check SPMACT and SPMOVLD OMs
          Action     : Refer to NTPs for Alarm Clearing Procedures.
          Cardlist   :
            No Cardlist Available.
```

38.3.3.3.3 Entering Overload Pending

```
MSH207BW   *  SPM300 FEB25 14:14:08 3100 TBL  Device Fault Report
          Location   : SPM : 4   ATM : 0 Activity : A
          Status     : Fault Raised
          Problem Description: Non Critical
            8A: Ovld Pending
          Action     : Refer to NTPs for Alarm Clearing Procedures.
          Cardlist   :
            No Cardlist Available.
```

38.3.3.4 Field descriptions

Table 4 Field descriptions

Field	Value	Description
LABCLLI	The CLLI of the office where the log is getting generated	
*	Priority of Alarm - One asterisk (*) or empty space	One asterisk (*) appears for a log of severity ‘Minor’ and empty space appears for a log of severity ‘No Alarm’.

Table 4 Field descriptions

Field	Value	Description
MMMdd hh:mm:ss	MMM - JAN to DEC dd - 01 to 31 hh - 00 to 23 mm - 00 to 59 ss - 00 to 59	Date and Time when the log was generated in the core.
SSSS	0000 to 9999	Log serial number.
xx	00 to 85	SPM number for which the log is generated.
y	0,1	ATM RM number of the SPM for which the log is generated.
Activity1	A,I	Activity of the ATM RM. ‘A’ for Active and ‘I’ for Inactive.
Status String	1) “Info Only”, 2) “Fault Raised”	Log reason indication - The first string indicates no issues exists. The second string indicates an error condition.
Problem Description String	1) “No Problem”, 2) “Non Critical”	Severity of the fault - The first string indicates no issues exists. The second string indicates an error condition.
Slot Number	7,8	Slot Number of CEM which maintains the ATMRM
Activity2	A,I	Activity of the CEM. ‘A’ for Active and ‘I’ for Inactive.
Problem Refinement String	1) “Resources OK”, 2) “Monitor OMs - Check SPMACT and SPMOVLD OMs”, 3) “Ovld Pending”	ATM RM Resource Utilization level. First refinement indicates the condition has cleared. The subsequent 2 refinements indicate an error condition.
Action String	1) “Refer to NTPs for Alarm Clearing Procedures.”, 2) “No Action Required.”	Action the craft can preform.

38.3.3.5 Action

Same actions are to be preformed as when similar SPM399 logs are generated.
For more details, see“38.3.2.5 Action” on page 2283.

38.3.3.6 Associated Operational Measurements or Performance Measurements

Same analysis is to be preformed as when similar SPM399 logs are generated. For more details, see “38.3.2.6 Associated Operational Measurements or Performance Measurements” on page 2283.

38.3.3.7 Additional information

Please consult the same information as when the SPM399 logs are generated. For more details, see “38.3.2.7 Additional information” on page 2284.

38.3.4 NODE500

38.3.4.1 Explanation

Log Title: Node 500

Name: Node State Change

Description: This log is generated whenever a Spectrum node or Spectrum CEM changes state.

This feature adds new triggers for the generation of this log. The ATM RM resource levels are factored into the generation of this log in the same manner as the CEM resources are currently factored.

In the case of ATMRM resource exhaustion, when this log is triggered the following logs will also be generated. These other logs provide the reason behind the NODE/CEM state change.

- SPM399 SPM Overload Report
- SPM300 Device Fault Report

Event type: Information

38.3.4.2 Format

This feature is not changing the format of this log type. There are two formats for this log class: 1) Node State change, 2) CEM state change.

38.3.4.2.1 Node State Change

```
<LABCLLI> <*> NODE500 <MMMdd hh:mm:ss SSSS> INFO Node State Change
        Location: SPM  <xx>
        From:     <Node State>  ( <Connectivity State> )
        To        <Node State>  ( <Connectivity State> )
```

38.3.4.2.2 CEM State Change

```
<LABCLLI> <*> NODE500 <MMMdd hh:mm:ss SSSS> INFO Node State Change
        Location: SPM  <xx> Unit <y>
        From:     <Node State>  ( <Connectivity State>, <Activity State> )
        To        <Node State>  ( <Connectivity State>, <Activity State> )
```

38.3.4.3 Examples

38.3.4.3.1 Node ISTb State Change

```
MSH207BW   * NODE500 MAR04 09:21:26 7500 INFO Node State Change
        Location: SPM 10
        From:     InSv ( Connected )
          To:     ISTb ( Connected )
```

38.3.4.3.2 Node InSv State Change

```
MSH207BW     NODE500 MAR04 09:21:14 7200 INFO Node State Change
        Location: SPM 10
        From:     ISTb ( Connected )
          To:     InSv ( Connected )
```

38.3.4.3.3 CEM ISTb State Change

```
MSH207BW   * NODE500 MAR04 09:49:40 0000 INFO Node State Change
        Location: SPM 10 Unit 1
        From:     InSv ( Connected, Active )
          To:     ISTb ( Connected, Active )
```

38.3.4.3.4 CEM InSv State Change

```
MSH207BW     NODE500 MAR04 09:21:14 7100 INFO Node State Change
        Location: SPM 10 Unit 1
        From:     ISTb ( Connected, Active )
          To:     InSv ( Connected, Active )
```

38.3.4.4 Field descriptions

This feature is not changing the format of this log type.

Table 5 Field descriptions

Field	Value	Description
LABCLLI	The CLLI of the office where the log is getting generated	
*	Priority of Alarm - One asterisk (*) or empty space	One asterisk (*) appears for a log of severity ‘Minor’ and empty space appears for a log of severity ‘No Alarm’.

Table 5 Field descriptions

Field	Value	Description
MMMdd hh:mm:ss	MMM - JAN to DEC dd - 01 to 31 hh - 00 to 23 mm - 00 to 59 ss - 00 to 59	Date and Time when the log was generated in the core.
SSSS	0000 to 9999	Log serial number.
xx	00 to 85	SPM number for which the log is generated.
y	0,1	CEM number of the SPM for which the log is generated.
Node State	InSv, ISTb	The ISTb condition indicates the NODE/ CEM is experiencing ATMRM resource exhaustion. The InSv condition indicates no such condition exists.
Connectivity State	Connected, Isolated	CORE Connectivity Indicator - Nodes/CEM experiencing resource exhaustion should always be ”Connected”
Activity State	Active, Inactive	CEM’s Activity State - Only Active CEMs should experience resource exhaustion.

38.3.4.5 Action

In the case of ATMRM resource exhaustion, the following 3 log types will also be generated:

- NODE602 “CEM State Change Reason Report”,
- SPM300 “Device Fault Report” and a
- SPM399 “SPM Overload Report”.

See the “Action” sections associated with the above 3 log types for corrective action.

38.3.4.6 Associated Operational Measurements or Performance Measurements

See “38.3.2.6 Associated Operational Measurements or Performance Measurements” on page 2283 for details

38.3.4.7 Additional information

Please consult the same information as when the SPM399 logs are generated. For more details, see “12.3.3.7 Additional information” on page 99.

38.3.5 NODE602

38.3.5.1 Explanation

Log Title: Node 602

Name: CEM State Change Reason Report

Description: This log is generated whenever a Spectrum CEM changes state. The fault string “Unit reached or nearing OVERLOAD” is generated only when the active CEM enters the Level 2 overload state. There is no abatement log.

This feature adds new triggers for the generation of this log. The ATM RM resource levels are factored into the generation of this log in the same manner as the CEM resources are currently factored.

In the case of ATMRM resource exhaustion, when this log is triggered, the following logs will also be generated. These other logs provide the reason behind the NODE/CEM state change.

- NODE500 Node State Change
- SPM399 SPM Overload Report
- SPM300 Device Fault Report

Event type: Trouble

38.3.5.2 Format

This feature is not changing the format of this log type. A new reason string has been added.

```
<LABCLLI> NODE602 <MMMdd hh:mm:ss SSSS> TBL  CEM State Change Reason Report
        Location: SPM  <xx>   CEM :  <y>
        Reason  : CPU: Unit reached or nearing OVERLOAD.
        Location: SPM  <xx>  Type: SMG4      Fabric: ATM
```

38.3.5.3 Example

```
MSH207BW     NODE602 MAR16 13:31:15 7757 TBL  CEM State Change Reason Report
        Location: SPM:  10   CEM :  0
        Reason  : CPU: Unit reached or nearing OVERLOAD.
        Location: SPM  10  Type: SMG4      Fabric: ATM
```

38.3.5.4 Field descriptions

This feature is not changing the format of this log type.

Table 6 Field descriptions

Field	Value	Description
LABCLLI	The CLLI of the office where the log is getting generated	
MMMdd hh:mm:ss	MMM - JAN to DEC dd - 01 to 31 hh - 00 to 23 mm - 00 to 59 ss - 00 to 59	Date and Time when the log was generated in the core.
SSSS	0000 to 9999	Log serial number.
xx	00 to 85	SPM number for which the log is generated.
y	0,1	CEM number of the SPM for which the log is generated.

38.3.5.5 Action

In the case of ATMRM resource exhaustion, the following 3 log types will also be generated:

- NODE500 “Node State Change”,
- SPM300 “Device Fault Report” and a
- SPM399 “SPM Overload Report”.

See the “Action” sections associated with the above 3 log types for corrective action.

38.3.5.6 Associated Operational Measurements or Performance Measurements

See “38.3.2.6 Associated Operational Measurements or Performance Measurements” on page 2283 for details

38.3.5.7 Additional information

Please consult the same information as when the SPM399 logs are generated. For more details, see “12.3.3.7 Additional information” on page 99.

38.3.6 SPM500

38.3.6.1 Explanation

Log Title: SPM 500

Name: Device State Change

Description: This class of logs are generated when a Spectrum Resource Module changes state.

This feature does not change the information contained in this log class. This feature adds a new trigger for the generation of this type of log.

When the ATM RM experiences initial resource exhaustion, or recovers from resource exhaustion, this log will be triggered. Please note, in the case of ATM RM resource exhaustion, when this log is generated, it will be accompanied by a SPM300 “Device Fault Report” and a SPM399 “SPM Overload Report”.

Event type: Information

38.3.6.2 Format

This feature does not change the format or contents of this log class.

```
<LABCLLI> <*> SPM500 <MMMdd hh:mm:ss SSSS> INFO Device State Change
         Location: SPM : <xx>   ATM : <y>
         From    : <State String>  (<Activity String>)
         To      : <State String>  (<Activity String>)
```

38.3.6.3 Examples

38.3.6.3.1 Istb Device State Change

```
MSH207BW *  SPM500 FEB25 14:13:59 5135 INFO Device State Change
        Location: SPM : 4   ATM : 0
        From    : InSv (Active  )
        To      : ISTb (Active  )
```

38.3.6.3.2 Insv Device State Change

```
MSH207BW    SPM500 FEB25 14:40:19 5817 INFO Device State Change
        Location: SPM : 4   ATM : 0
        From    : ISTb (Active  )
        To      : InSv (Active  )
```

38.3.6.4 Field descriptions

Field descriptions are not changes by this feature.

Table 7 Field descriptions

Field	Value	Description
LABCLLI	The CLLI of the office where the log is getting generated	
Priority of Alarm	One asterisk (*) or empty space	One asterisk (*) appears for a log of severity ‘Minor’ and empty space appears for a log of severity ‘No Alarm’.

Table 7 Field descriptions

Field	Value	Description
MMMdd hh:mm:ss	MMM - JAN to DEC dd - 01 to 31 hh - 00 to 23 mm - 00 to 59 ss - 00 to 59	Date and Time when the log was generated in the core.
SSSS	0000 to 9999	Log serial number.
xx	00 to 85	SPM number for which the log is generated.
y	0,1	CEM number of the SPM for which the log is generated.
State String	InSv, ISTb	Device State - An ATMRM should be InSv when there is no resource exhaustion, else ISTb.
Activity String	Active, Inactive	Identifies the sparing state of the ATM RM. Only the “Active” ATMRM should experience resource exhaustion.

38.3.6.5 Action

In the case of ATMRM resource exhaustion, the following 2 log types will also be generated:

- SPM300 “Device Fault Report” and a
- SPM399 “SPM Overload Report”.

See the “Action” sections associated with the above 2 log types for corrective action.

38.3.6.6 Associated Operational Measurements or Performance Measurements

In the case of ATMRM resource exhaustion, the following 2 log types will also be generated:

- SPM300 “Device Fault Report” and a
- SPM399 “SPM Overload Report”.

See “38.3.2.6 Associated Operational Measurements or Performance Measurements” on page 2283 for details

38.3.6.7 Additional information

Please consult the same information as when the SPM399 logs are generated. For more details, see “12.3.3.7 Additional information” on page 99.

38.4 Alarms

This feature does not introduce any new alarms. It provides new conditions for the triggering the existing ISTb alarm on both the ATMRM and the CEM.

The resource exhaustion based ISTb alarm for the ATMRM is triggered before the similar alarm for the CEM. The CEM ISTb alarm will only be triggered for ATMRM resource utilization level of Level 2 and/or the CEM reaching a similar resource utilization level.

38.4.1 Format

This feature does not change the format of this existing alarm. The following output is from the "**MAPCI;MTC;PM;POST SPM <xx>;QUERYPM FLT**" command.

```
ATM  <Active ATMRM #> ISTb Act   Alarm: ISTB     Severity: Minor    Action: RPT
```

Field descriptions are not changed by this feature.

Table 8 Field descriptions

Field	Value	Description
`ATM`	All valid RM types.	Indicates the RM type generating the alarm.
`<Active ATMRM #>`	0,1	RM number of the active unit.
`ISTb`	ISTb	RM device state. Only the "ISTb" state is allowed for the "ISTb" alarm.
`Act`	Act	Activity of the ATMRM generating the alarm. Only the active ATMRM can generate this log for an overload condition.
`Alarm: ISTB`	ISTb	Alarm type. Only "ISTb" is allowed.
`Severity: Minor`	Minor	Alarm severity. Only "Minor" is allowed for an overload condition.
`Action: RPT`	RPT, NORPT	Indicates whether a log is to be generated for this alarm type. In table MNNODE a tuple for this node exists that indicates for an ISTb alarm, a SPM300 "Node State Change" and/or a SPM500 "Device State Change" log will be generated.

38.4.2 Associated Alarm Message

To look at other output to refine the "ISTb" alarm conditions, use the "**MAPCI;MTC;PM;POST SPM <xx>; QUERYPM FLT REASON**" command.

For a Level 1 ATMRM resource exhaustion condition, the output will be:

```
ATM <Active ATMRM #> ISTb NonCritical faults:
ApplicationFlt: Monitor OMs - Check SPMACT and SPMOVLD OMs
```

For a Level 2 ATMRM resource exhaustion condition, the output will be:

```
ATM <Active ATMRM #> ISTb NonCritical faults:
  ApplicationFlt: Ovld Pending
CEM <Active CEM #> ISTb NonCritical faults:
  CPU: Unit reached or nearing OVERLOAD
```

For a CEM CALLP Overload condition, the output will be:

```
ATM <Active ATMRM #> ISTb NonCritical faults:
  ApplicationFlt: Overload
CEM <Active CEM #> ISTb NonCritical faults:
  CPU: Unit reached or nearing OVERLOAD
```

38.4.3 Severity

Minor

38.4.4 Cause or Condition

The ATMRM resource exhaustion triggered ISTb alarm is triggered by any form of resource exhaustion (i.e. high rates of traffic) in the ATMRM. The CEM alarm is raised when the ATMRM enters Level 2 resource exhaustion (i.e. ATMRM CPU occupancy is initially greater than 88%, then greater than 75%).

38.4.5 Duration

The ATMRM resource exhaustion triggered alarm will exist as long as the ATMRM is experiencing any form of resource exhaustion. The CEM alarm is raised when the ATMRM enters Level 2 resource exhaustion.

38.4.6 Action

As specified in the SPM399 “Overload Report” log.

38.4.7 Association

For full association, see Table 1, “Maintenance Interactions for each ATMRM Resource Utilization Level,” on page 2274.

38.5 Maintenance Operation Strings

The Maintenance Operation strings (also known as MIP Strings (Maintenance In Progress)) displays the current maintenance status of the posted device.

This feature extends the current CEM overload MIP strings functionality to the ATMRM.

38.5.1 Format

This feature adds the overload status MIP string to the ATMRM.

To view the current resource exhaustion/overload state of an ATMRM module, the module must be selected.

MAPCI;MTC;PM;POST SPM <SPM Number>;SELECT ATM <Module Number {0,1}>

```
 XAC       MS      IOD      Net       PM      CCS      Lns      Trks     Ext      APPL
  .        .        .        .        .        .        .        .        .        .

Table 9 Field descriptions

Field	Value	Description
MIP String	“”, “/Monitor OMs”, “/Ovld Pending”.	Indicates the current maintenance operations of the posted device.

- “” (no string): Device is not experiencing resource exhaustion.
- “/Monitor OMs”: Resource utilization is at Level 1 (See “Fault management strategy” on page 2273. for resource level description,
- “/Ovld Pending”: Resource utilization is at Level 2.
- Please note, the “/Overload” MIP string does not exist for the ATMRM. Only CEMs can be in this state as it indicates that CEM CALLP is experiencing overload.

38.5.2 Cause or Condition

The ATMRM resource exhaustion triggered MIP strings is triggered by any form of resource exhaustion (i.e. high rates of traffic) in the ATMRM. The CEM MIP string can be raised when the ATMRM enters any level of resource exhaustion.

38.5.3 Duration

The ATMRM resource exhaustion triggered MIP string will exist as long as the ATMRM is experiencing any form of resource exhaustion The CEM MIP string is raised when the ATMRM enters any level of resource exhaustion.

38.5.4 Action

As specified in the SPM399 “Overload Report” log.

38.5.5 Association

For full association, see Table 1, “Maintenance Interactions for each ATMRM Resource Utilization Level,” on page 2274.

On the maintenance status line, the module’s resource exhaustion/overload state will be visible if said condition exists. These status indicators are:

39: Fault Management (FM): A00005363

39.1 Fault management strategy

Logs are used for fault management.

39.2 Fault management tools and utilities

The VPTRACE tool is used to turn on VAMP logs.

39.3 Logs

39.3.1 VAMP901

The VAMP901 log is enhanced for the following two purposes:

- to display the new Business Customer ID parameter, and
- the AMA Digits parameter has an additional value possible in the Digits Type subfield (300)

39.3.1.1 Explanation

Log Title: VAMP901

Name: Variable AIN Message Platform 901 Log

Description: The VAMP901 log report is generated when a message is received via the VAMP framework. The VAMP framework captures the messages only when message logging has been enabled with the VPTRACE tool. For more detailed information, refer to NTP 297-2621-370--UCS DMS-250 NetworkBuilder Application Guide. This log is intended for lab use only and is not suitable for live switches due to the number and size of reports.

Event type: Info

39.3.1.2 Format

The new Business Customer ID parameter appears in the VAMP901 log with the other parameters. Its display format is shown below.

```
AMABUSCSTID: <string of digits>
```

39.3.1.3 Field descriptions

The new field AMABUSCSTID consists of a string of digits

Table 1 Field descriptions

Field	Value	Description
AMABUSCSTID	Vector of 11 digits	Digits

Field name: AMABUSCSTID
Field optionality: optional, variable
Type: Alphanumeric
Size: 7 bytes
Value(s): See field descriptions above
Descriptions: See field descriptions above
NTP table reference: N/A

None

39.3.1.5 Associated Operational Measurements or Performance Measurements

None

39.3.1.6 Additional information

None

39.4 Related documentation

None

40: Fault Management (FM): A00005375

40.1 Fault management strategy

The standard MG9K EM Fault Management strategy will apply to the new faults raised by this feature. Alarms will be displayed by the MG9K EM Alarm Browser, logged in NT standard format to the SSPFS CUST logs and forwarded to northbound OSS.

For the “New Shelf Discovery Alarms” feature there will be new faults added to provide the reason when shelf discovery failed due to a particular card or due to an incompatible card.

40.2 Fault management tools and utilities

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

40.2.1 Faults, Alarms and Logs

There will be new Shelf faults raised and cleared by the MG9000 to indicate the specific reason the shelf discovery failed.

40.3 Alarms

40.3.1 Explanation

40.3.1.1 SHELFCOMPATIBILITY

Title: shelfCompatibility

Name: Incompatible Shelf

Description: This log is generated when a shelfCompatibility fault is received from the MG9kEM server.

40.3.1.2 CARDDISCOVERY

Title: cardDiscovery

Name: Card Discovery failure

Description: This log is generated when a cardDiscovery fault is received from the MG9kEM server.

40.3.1.3 CARDDISCPOWIO

Title: cardDiscPowIo

Name: Discovery failure for IO card

Description: This log is generated when a cardDiscPowIo fault is received from the MG9kEM server.

40.3.1.4 CARDDISPOWSIC

Title: cardDiscPowSic

Name: Discovery failure for SIC card

Description: This log is generated when a cardDiscPowSic fault is received from the MG9kEM server.

40.3.1.5 CARDDISCSLOT2

Title: cardDiscSlot2

Name: Discovery failure for card in Slot 2

Description: This log is generated when a cardDiscSlot2 fault is received from the MG9kEM server.

40.3.1.6 CARDDISCSLOT3

Title: cardDiscSlot2

Name: Discovery failure for card in Slot 3

Description: This log is generated when a cardDiscSlot3 fault is received from the MG9kEM server.

40.3.1.7 CARDDISCSLOT4

Title: cardDiscSlot4

Name: Discovery failure for card in Slot 4

Description: This log is generated when a cardDiscSlot4 fault is received from the MG9kEM server.

40.3.1.8 CARDDISCSLOT5

Title: cardDiscSlot5

Name: Discovery failure for card in Slot 5

Description: This log is generated when a cardDiscSlot5 fault is received from the MG9kEM server.

40.3.1.9 CARDDISCSLOT6

Title: cardDiscSlot6

Name: Discovery failure for card in Slot 6

Description: This log is generated when a cardDiscSlot6 fault is received from the MG9kEM server.

40.3.1.10 CARDDISCSLOT7

Title: cardDiscSlot7

Name: Discovery failure for card in Slot 7

Description: This log is generated when a cardDiscSlot7 fault is received from the MG9kEM server.

40.3.1.11 CARDDISCSLOT8

Title: cardDiscSlot8

Name: Discovery failure for card in Slot 8

Description: This log is generated when a cardDiscSlot8 fault is received from the MG9kEM server.

40.3.1.12 CARDDISCSLOT9

Title: cardDiscSlot9

Name: Discovery failure for card in Slot 9

Description: This log is generated when a cardDiscSlot9 fault is received from the MG9kEM server.

40.3.1.13 CARDDISCSLOT10

Title: cardDiscSlot10

Name: Discovery failure for card in Slot 10

Description: This log is generated when a cardDiscSlot10 fault is received from the MG9kEM server.

40.3.1.14 CARDDISCSLOT11

Title: cardDiscSlot11

Name: Discovery failure for card in Slot 11

Description: This log is generated when a cardDiscSlot11 fault is received from the MG9kEM server.

40.3.1.15 CARDDISCSLOT12

Title: cardDiscSlot12

Name: Discovery failure for card in Slot 12

Description: This log is generated when a cardDiscSlot12 fault is received from the MG9kEM server.

40.3.1.16 CARDDISCSLOT13

Title: cardDiscSlot13

Name: Discovery failure for card in Slot 13

Description: This log is generated when a cardDiscSlot13 fault is received from the MG9kEM server.

40.3.1.17 CARDDISCSLOT14

Title: cardDiscSlot14

Name: Discovery failure for card in Slot 14

Description: This log is generated when a cardDiscSlot14 fault is received from the MG9kEM server.

40.3.1.18 CARDDISCSLOT15

Title: cardDiscSlot15

Name: Discovery failure for card in Slot 15

Description: This log is generated when a cardDiscSlot15 fault is received from the MG9kEM server.

40.3.1.19 CARDDISCSLOT16

Title: cardDiscSlot16

Name: Discovery failure for card in Slot 16

Description: This log is generated when a cardDiscSlot16 fault is received from the MG9kEM server.

40.3.1.20 CARDDISCSLOT17

Title: cardDiscSlot17

Name: Discovery failure for card in Slot 17

Description: This log is generated when a cardDiscSlot17 fault is received from the MG9kEM server.

40.3.1.21 CARDDISCSLOT18

Title: cardDiscSlot18

Name: Discovery failure for card in Slot 18

Description: This log is generated when a cardDiscSlot18 fault is received from the MG9kEM server.

40.3.1.22 CARDDISCSLOT19

Title: cardDiscSlot19

Name: Discovery failure for card in Slot 19

Description: This log is generated when a cardDiscSlot19 fault is received from the MG9kEM server.

40.3.1.23 CARDDISCSLOT20

Title: cardDiscSlot20

Name: Discovery failure for card in Slot 20

Description: This log is generated when a cardDiscSlot20 fault is received from the MG9kEM server.

40.3.1.24 CARDDISCSLOT21

Title: cardDiscSlot21

Name: Discovery failure for card in Slot 21

Description: This log is generated when a cardDiscSlot21 fault is received from the MG9kEM server.

40.3.2 Format

The Log Delivery application for this feature generates logs in the Number 2 Switch Control Center (SCC2) format and the NT standard (STD) format explained in the PLOA_SLOA_LOG_ALARMS DID.

40.3.2.1 SHELFCOMPATIBILITY

- **STD Format:**

40.3.3 Action

40.3.3.1 SHELFCOMPATIBILITY

To clear this, insert a compatible card in the slot. for example put a NY30AA card if the active mate card is a NY30AA

40.3.3.2 CARDDOSCOVERY

Insert a good card

40.3.3.3 CARDDISCPOWIO

Insert a good IO card

40.3.3.4 CARDDISCPOWSIC

Insert a good SIC card.

40.3.3.5 CARDDISCSLOT2

Insert a good card in the slot.

40.3.3.6 CARDDISCSLOT3

Insert a good card in the slot.

40.3.3.7 CARDDISCSLOT4

Insert a good card in the slot.

40.3.3.8 CARDDISCSLOT5

Insert a good card in the slot.

40.3.3.9 CARDDISCSLOT6
Insert a good card in the slot.

40.3.3.10 CARDDISCSLOT7
Insert a good card in the slot.

40.3.3.11 CARDDISCSLOT8
Insert a good card in the slot.

40.3.3.12 CARDDISCSLOT9
Insert a good card in the slot.

40.3.3.13 CARDDISCSLOT10
Insert a good card in the slot.

Configuration Management (CN)

Introduction

This chapter describes impacts to configuration management, such as hardware/software requirements, data schemas, and service orders for the features planned for this release. Only those features with configuration-management impacts are listed.

1: Configuration (CN): A00001847

This chapter documents the changes in the Data Schema introduced by activity A00001847. Specifically there are changes to the behavior of table LTCINV that are documented.

Note: The FN/CN sections for activity A00001847 include the related information for a number of activities due to the close association of all these activities. The activities that are included in this group are:

- A00001847 - ABI Expansion Datafill
- A00001909 - ABI Trunk Support for RCC
- A00001936 - MG9K ABI Expansion - Node and Link Mtc

1.1 Hardware and Software Requirements

Not Required

1.2 Initial Configuration

Not Required

1.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Required

1.4 Upgrade Impact

Not Required

1.5 Data schema (DS) (CM, MIBS, RDB)

1.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
LTCINV	CHANGED	UNCHANGED (NEW)

1.5.2 Table/MIB/Remote Database Schema information

1.5.2.1 Name: LTCINV

Full Table Name: Line/Trunk Controller Inventory Table

1.5.2.1.1 Functional description

Table LTCINV lists all the line and trunk controlling peripherals that were historically directly connected to the ENET (although this is no longer the case as of SN05 with the additional of the EXTDS512 optional field). Tuples are added to this table for the following peripheral types (this is not an exhaustive list and only includes those which are relevant to this activity):

1. LGC/LGCI (although no distinction is made in the table itself)
2. LTC/LTCI (although no distinction is made in the table itself)
3. SMA2

Prior to this activity the EXTDS512 optional attribute was only allowed to be provisioned on the LGCI and SMA2 types of peripherals. After this activity the entire peripheral list shown above will be allowed to have the EXTDS512 optional attribute assigned to them.

There is no change in the format of the table or in the format of the optional field, all that has been changed is the types of peripherals that are allowed to have the field provisioned. All other types of peripherals that can be added in table LTCINV will continue to receive an error message if the EXTDS512 field is provisioned.

Note: Please refer to the documentation for SN05 activity A59038361 for more detailed information of the initial EXTDS512 design.

1.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged (SERVRINV must be datafilled prior to adding EXTDS512 peripherals in LTCINV).

1.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LTCINV	Unchanged by this activity.	Unchanged by this activity.	All existing tuples, regardless of whether the EXTDS512 attribute is provisioned or not, have the physical space allocated for the information contained in this field; therefore, there is no memory impact from this activity as the memory is already allocated for all tuples in this table.

1.5.2.1.4 Fields/OIDs

The following table lists fields for LTCINV.

CSLNKTAB = “$”

OPT_ATTR = EXTDS512

When provisioning an external (non-ENET hosted) peripheral in LTCINV the EXTDS512 OPT_ATTR must be added. This optional attribute includes the IP Address of the DS512 (ABI) card in the MG9000 and Gateway Controller host name (as provisioned in table SERVRINV).

It should be noted that the CSLNKTAB portion of the tuple is not datafilled when adding external XPMs. The content of the CSLNKTAB field is automatically generated by the LTCINV code and no longer refers to real C-side links to the ENET. A “$” should be entered when prompted for the CSLNKTAB entry (this is unchanged from SN05 behavior).

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CSLNKTAB	Changed	Unchanged from SN05	None	For External XPMs this field no longer contains real C-side ENET links. Instead, "$" should be entered when prompted for this field. With this activity you should now enter "$" when provisioning External LTC/LTCI/ LGC tuples in LTCINV.
OPT_ATTR (EXTDS512)	Changed	Unchanged from SN05	Unchanged from SN05	When datafilling external LTC/LTCI/ LGC peripherals you should add this field and enter the IP address of the DS512 card in the MG9000 and the name of the host GWC (from table SERVRINV).

1.5.2.1.5 Datafill example

The following example shows sample datafill for table LTCINV. The changes from standard ENET-based peripheral datafill is highlighted with **bold** characters.

>
```

1.5.2.1.6 Table release history update

The following changes were made:

1. EXTDS512 OPT_ATTR is now allowed for LTC/LTCI/LGC peripheral types.
2. "$" should be entered in the CSLNKTAB field for external XPMs (the C-side link information will be generated automatically).

1.5.2.1.7 Supplementary information

Limitations:

- The CSLNKTAB and EXTDS512 optional attribute must align in each tuple in LTCINV. This means that if EXTDS512 exists then a "$" must have been entered in the CSLNKTAB field. A tuple must be either ENET based on External but not a combination of both.
- Multiple tuples of each type (ENET and External) can exist in the table at the same time.
- The EXTDS512 optional attribute can be provisioned only against LTC, LGC, LTCI, LGCI, and SMA2 peripheral types. Attempting to add the optional attribute to other peripheral types will result in the tuple failing verification and an error will be displayed.

- The derived CSLNKTAB entries for External XPMs cannot be changed by the user.
- The ability to change the Host Gateway Controller for External XPMs is not allowed.
- The EXTDS512 optional attribute cannot be added to an existing tuple using the change command in table control, nor can it be removed using change.

1.5.2.1.8 Translation verification other tools

Output from the check all table control command and tabaudit will be included at a later date, but no issues are expected with these commands as the changes to LTCINV are minor.

1.6 Service Orders (SO) (CM & SESM)

Not Required

1.7 Software optionality control (SOC)

Not Required

1.8 Element Management

Not Required

1.9 Command interface changes

1.9.1 Directory: MAPCI;MTC;PM

1.9.1.1 Directory description

No new commands or paramenters have been introduced, however due to the ABI supported host XPMs in this feature, certain maintenance functions and states will be supported for the ABI host XPMs. When an ABI peripheral (LTC, LTCI, LGC, LGCI, or SMA2) subtending a GWC is posted the display looks just like it did for the same peripheral posted as a direct HOST peripheral (legacy).

1.9.1.2 Accessing directory: PM

1.9.1.2.1 Access to directory or MAP level and return to CI

The updated displays are accessed through the PM (peripherals) level of the maintenance (MTC) level of the DMS core command interface (MAPCI).

1.9.2 Command: TRNSL C

1.9.2.1 Command type: Listed MENU

1.9.2.2 Command target: All

But will only appear for Succession ABI peripherals.

1.9.2.3 Command availability: RES

1.9.2.4 Command description

TRNSL C (translate c-side links) is not a new command, however when an LTC, LTCI, LGC, LGCI, or SMA2 subtends a GWC (gateway controller), the TRNSL C will display the c-side links of the peripheral as connecting to a GWC.

Each c-side link will simply reflect the name of the gateway controller to which it subtends. Link 0, 1, 4 and 5 (the message links) reflect the actual status of the c-side links. Currently, the speech links have the following string hardcoded as their status “**;Cap S;Status:OK”.

It is important to note that TRNSL C indicates only which GWC supertends the ABI peripheral, it does not display the MG9K or ABI card that is in use for the messaging path.

1.9.2.5 Command syntax

Table 4 TRNSL C command parameters and variables

Command	Parameters and variables
TRNSL C	unchanged
Parameters and variables	unchanged

1.9.2.6 Qualifications and warnings

The TRNSL C command will provide the user with the following additional information when a GWC is involved:

“Please refer to the DS512 Interface EM for all link maintenance commands.”

It should be noted that maintenance actions on the c-side links (e.g. bsy link 0, rts link 1, etc.) can only be performed on the c-side message links for ABI peripherals.

1.9.2.7 Example

Usage example for **“MAPCI;MTC;PM; POST <XPM>;TRNSL C “ command**

```
XAC      MS     IOD     Net      PM     CCS     Lns     Trks    Ext     APPL

  6 Tst_       Unit1:    Act   InSv
  7 Bsy_        Trnsl   c
  8 RTS_        Link  0: GWC 0              8;Cap MS;Status:OK
;MsgCond:OPN,
  9 OffL        Restrict
 10 LoadPM_     Link  1: GWC 0              9;Cap MS;Status:OK
;MsgCond:OPN,
 11 Disp_       Restrict
 12 Next        Link  2: GWC 0             **;Cap  S;Status:OK
 13 SwAct       Link  3: GWC 0             **;Cap  S;Status:OK
 14 QueryPM     Link  4: GWC 0             10;Cap MS;Status:OK
;MsgCond:OPN,
 15 DCH         Unrestrict
 16             Link  5: GWC 0             11;Cap MS;Status:OK
;MsgCond:OPN,
 17 PERFORM     Unrestrict
 18 ISG         Link  6: GWC 0             **;Cap  S;Status:OK
```

Message link status is reflected accurately

Speech link state is hardcoded.

Shows which GWC is used to control packet c-side connections for this ABI peripheral.

PM can be SMA2, LTC, LTCI, LGC, or LGCI

1.10 Security

Not Required

1.11 Configuration Walkthrough

Not Required

2: Configuration (CN): A00001890

2.1 Hardware and Software Requirements

The following activities provide support for MG9000 line testing through the CS2000 in the SN06.2 release:

- A00001890
- A00001888

The following sections describe the hardware and software required to support the functionality delivered under the above listed activities.

2.1.1 Hardware Requirements

2.1.1.1 CS2000 Hardware

The following hardware is required to provide the CS2000 line test support:

2.1.1.1.1 Trunk Modules

The CS2000 supports an array of test heads and supporting hardware. These circuit packs are contained in trunk modules. Examples of the supported trunk modules are the TM8, ISM, MTM and RMM.

2.1.1.1.2 Test Circuits

The following CS2000 test heads and supporting hardware are required to support MG9000 line testing:

- NT4X45AA EDTU (or NT1x90/NT2x96 TTT, NT2x47/NT2x56 TTU, NT4x23 DTU)
- NT2X10/NT2X11 MTU
- NT2X90AD MONTALK Circuit
- NT5X30AA 101 Communication Test Line (HSET)
- NT1X54AA Jack Ended Trunk (JACK)
- NT2X90AD INC/OC Test Trunk (Analog Test Trunk Interface)

The CS2000 also requires the following supporting equipment for MLT test trunks:

- NT2X57 SD Card

Additional details on the circuit packs listed above are provided in TAM-1001-018 DMS-100 Family Quick Reference Guide. This is available through Helmsman.

The information on the quantities required for each circuit pack is provided in the EI section of this activity.

2.1.1.1.3 MTA Matrix

The CS2000 supports two types of test heads: transmission test heads and metallic test heads. The transmission test heads connect to the line under test through the bear network. The metallic test heads connect to the line under test through a metallic test access matrix.

The metallic test access matrix is a matrix with the metallic test heads connected to the horizontal leads on the matrix and the line concentrating devices connected to the vertical leads on the matrix. This matrix allows any test head to be cross connected to any line, thus allowing the test heads to be shared across all line access devices.

The CS2000 supports the following cards for implementing the MTA matrix:

- NT3X09BA 8x8 Matrix Card

The trunk modules also contain the MTA matrix cards.

2.1.1.1.4 Horizontal Connectivity

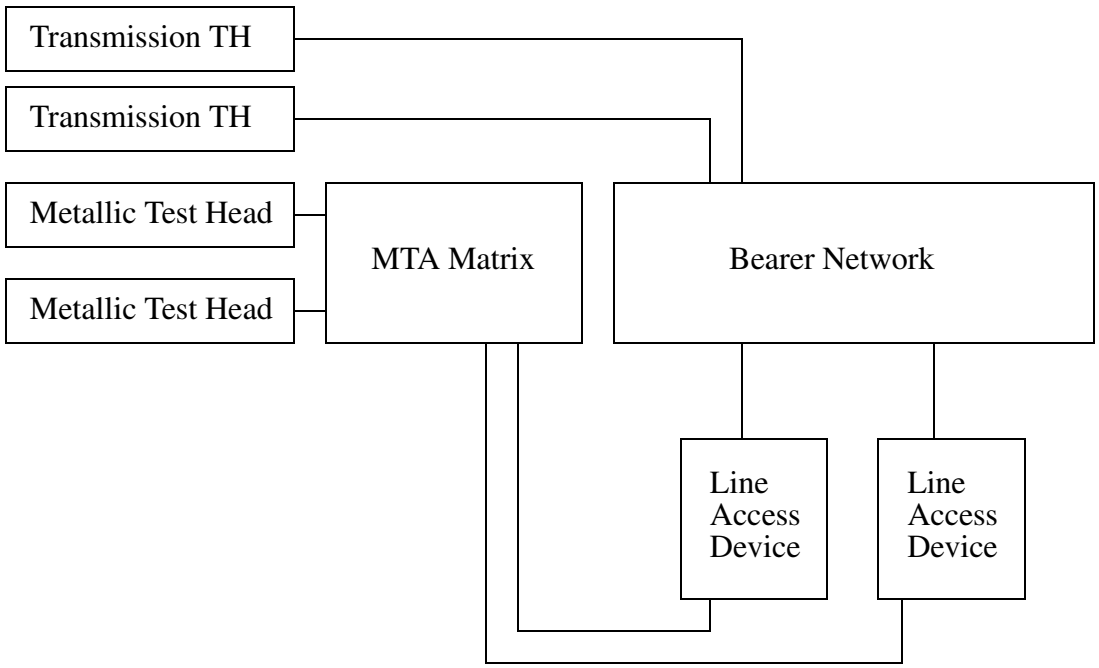
As noted above, the metallic test heads must be wired to the horizontal leads on the MTA matrix.

2.1.1.1.5 Vertical Connectivity

As notes above, the test access ports on the line concentrating devices must be wired to the vertical leads on the MTA matrix.

2.1.1.1.6 Test Configuration Diagram

The following diagrams illustrate the hardware configuration required to support CS2000 based line testing for MG9000 lines.



The above diagram is a logical view of the test equipment.

- The transmission test heads have access to the bearer network. These test heads are connected to the line access devices through the bearer network.
- The metallic test heads are connected to the horizontal leads on the MTA matrix. The line access devices are connected to the vertical leads on the MTA matrix. In this configuration, any metallic test head can be cross connected to any line on any line access device.

The following figure gives are more detailed view of the physical implementation.

NTP 50041.08 DMS-100/200 Hardware Planning Guide

2.1.1.2 MG9000 Hardware

The MG9000 requires the following hardware to support the SN06.2 line test content provided by activities A00001888 and A00001890:

- MTA-TRC pack per node per frame
- SIC card per shelf.

2.1.1.3 3rd Party Gateways

The CS2000 line test functionality will support any 3rd party gateway that supports the H.248 extension added by activities A00001890 and A00001888. However, this document does not provide specific information on the hardware requirements for 3rd party gateways.

2.1.2 Software Requirements

There are 5 types of equipment/connectivity datafilled required to support the CS2000 line test functionality provided by activities: A00001888 and A00001890.

- First the trunk modules that will contain the CS2000 test equipment are provisioned.
- Second, the CS2000 test heads and supporting hardware are provisioned.
- Third, the MTA (Metallic Test Access) matrix for the CS2000 is provisioned.
- Fouth, the metallic test head connectivity to the horizontals on the MTA matrix are provisioned.
- Fifth, the line concentrating device connectivity to the verticals on the MTA matrix are provisioned.

Note that additional datafill is required for individual line test applications. For example, the subscriber premise tests are supported for MG9000 lines in the SN06.2 release (DSCKT, SSMAN, Station Ringer). The subscriber premise tests require translations in the CS2000 to function correctly.

This document does not provide details on the provisoining and translations required for the individual line test applications. The provisioning and translations for individual line test applications are already documented in NTP 297-1001-594 DMS-100 Family Line Maintenance Guide, and the existing provisioning and translations methods apply to LGRP lines on the CS2000.

2.1.2.1 Trunk Module Provisioning

The trunk modules are provisioned in table TMINV and RMMINV. The CS2000 uses the same trunk module provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provide details on trunk module provisioning for the CS2000.

2.1.2.2 Test Head and Supporting Hardware Provisioning

The test heads and supporting hardware are provisioned in tables TRKGRP and TRKMEM. The CS2000 uses the same test head provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on test head provisoning for the CS2000.

2.1.2.3 MTA Matrix Provisioning

The MTA matrix is provisioned in table MTAMDRVE. The CS2000 uses the same MTA matrix provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on MTA matrix provisioning for the CS2000.

2.1.2.4 Horizontal Connectivity Provisioning

The horizontal connectivity is provisioned in table MTAHORIZ. The CS2000 uses the same horizontal connectivity provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on the horizontal connectivity provisioning for the CS2000.

2.1.2.5 Vertical Connectivity Provisioning

Vertical connectivity provisioning for LGRPs differs from the vertical connectivity provisoning for existing DMS-100 peripherals. Additional details on LGRP vertical connectivity are provided below.

Table LGRPINV and MTAVERT are used to provision the metallic connections from MG9000 shelves to verticals on the MTA matrix. The following figure shows examples of provisioning these tables for MG9000 to MTA matrix connectivity.

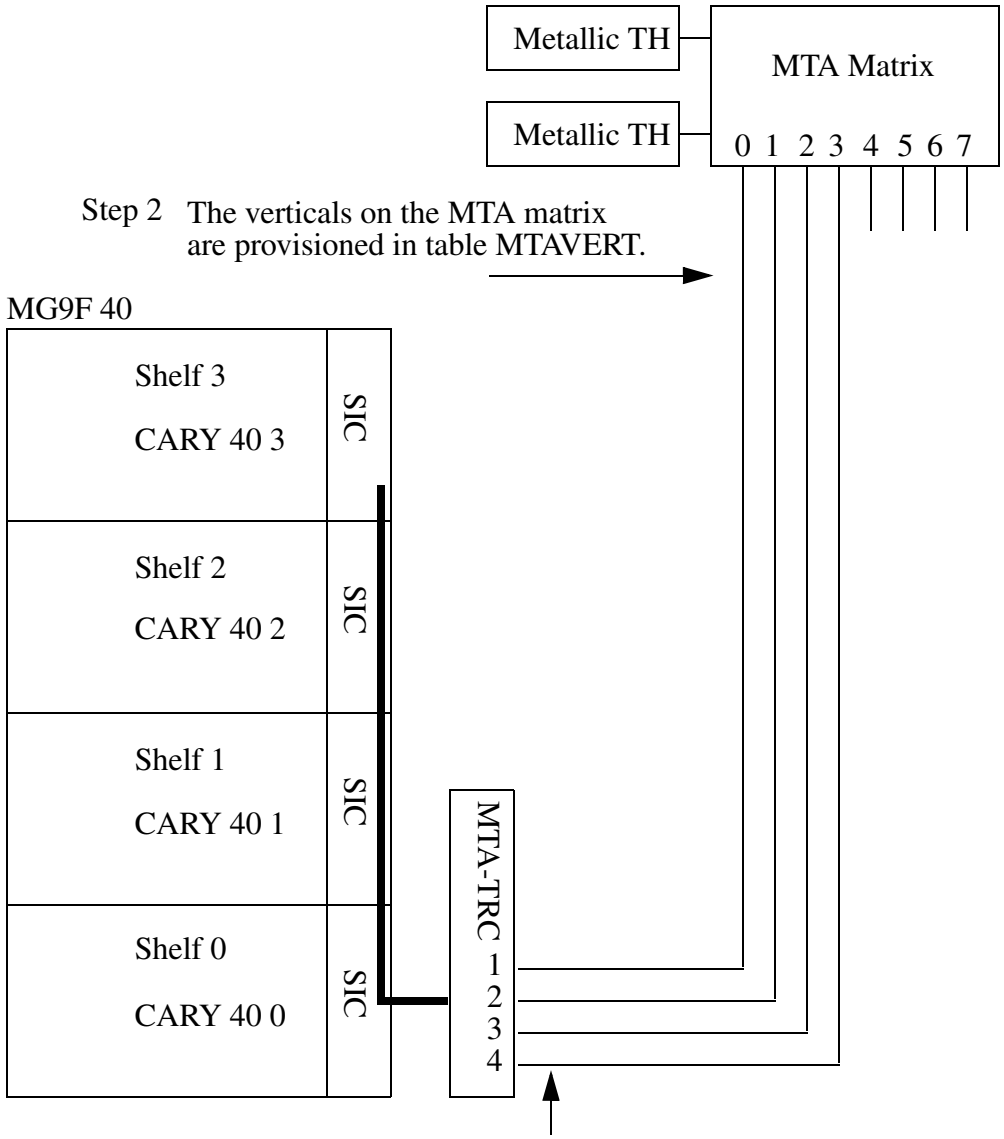

Table LGRPINV

```
CARY 40 0  GWC 0  S  MTSTAPT  CARY  (0  1) $
CARY 40 1  GWC 0  S  MTSTAPT  CARY  (1  2) $
CARY 40 2  GWC 0  S  MTSTAPT  CARY  (2  3) $
CARY 40 3  GWC 0  S  MTSTAPT  CARY  (3  4) $
```

Table MTAVERT

```
0  G  (O  CARY  40  0) $
1  G  (O  CARY  40  1) $
2  G  (O  CARY  40  2) $
3  G  (O  CARY  40  3) $
```

Vertical
Metallic Test Access Point

Provisioning Rules for MG9000 Verticals

1. The metallic test access connections for the MG9000s are provisioned in table LGRPINV first, and then in table MTAVERT.
2. Table LGRPINV allows up to 8 metallic test access points (with verticals) to be provisioned per LGRP. This is for future flexibility to increase the number of simultaneous tests per MG9000. **At this time, the user should only provision a single metallic test access point per LGRP in table LGRPINV (each LGRP being a single MG9000 shelf**).
3. LGRPs are assigned to verticals in table MTAVERT. Before an LGRP is assigned to a vertical in table MTAVERT, the tuple for the LGRP in table LGRPINV must have a metallic test access point associated to the vertical.

As noted in the rules, only a one metallic test access point and vertical should be assigned to an LGRP in the SN06.2 release. A single physical MG9000 can support up to 16 shelves; however, a single physical MG9000 can only support 8 metallic test access points. When an MG9000 grows beyond 8 shelves, verticals must be shared across multiple shelves. The provisioning recommendations for SN06.2 are as follows:

a. For MG9000 nodes that have 8 or less shelves, each shelf on the MG9000 should be assigned to a unique metallic test access point and vertical.

b. As an MG9000 grows beyond 8 shelves, the metallic test access points and verticals used on shelves 0-7 should be reused on shelves 8-15 in sequential fashion.

c. If wideband testing is required on the MG9000 to support DSL lines, then one (or more) of the metallic test access points should be reserved for the wideband test head.

Example 1 : All 8 metallic test access points assigned to verticals.

The following shows example provisioning for table LGRPINV and MTAVERT for a 16 shelf MG9000. In the example given, the MG9000 node is in the CARY site and it occupies frame 40 41 42 and 42. This examples hows all 8 metallic test access points wired to verticals on the MTA matrix.

TABLE: LGRPINV

```
GRPNO SRVRNAME GRPTYPE  LGRPOPTS

CARY 40 0	CARY 41 0	CARY 42 0	CARY 43 0

2.1.2.6 Provisioning Example

2.1.2.6.1 Trunk Module Provisioning

First, the trunk modules must be provisioned. This includes shelves such as the TM8, MTMs and RMMs. In the example given, RMMs are not shown. However, RMMs can be used in the remote sites for MG9000 line testing. The sample datafill given shows a single MTM and TM8 shelf for this CS2000.

Note: all tables are shown in packeted format.

2.1.2.6.2 Test Head and Supporting Hardware Provisioning

The test heads and supporting hardware are provisioned next. These circuits are provsioned thru tables TRKGRP and TRKMEM. The following test heads and inteface circuits are required to support MG9000 line testing:

- NT4X45AA EDTU (or NT1x90/NT2x96 TTT, NT2x47/NT2x56 TTU, NT4x23 DTU)
- NT2X10/NT2X11 MTU
- NT2X90AD MONTALK Circuit
- NT5X30AA 101 Communication Test Line (HSET)
- NT1X54AA Jack Ended Trunk (JACK)
- NT2X90AD INC/OC Test Trunk (Analog Test Trunk Interface)

2.1.2.6.3 MTA Matrix Provisioning

After the test heads and supporting circuits are provisioned, the MTA (Metallic Test Access) matrix is provisioned for the CS2000. The MTA matrix is provisioned through table MTAMDRVE. This examples shows an MTA matrix with a single MTA matrix card. The CS2000 supports an MTA matrix

that is significantly larger. The MTA matrix for a CS2000 is created by linking together multiple MTA cards in both the vertical and horizontal directions.

TABLE: MTAMDRVE

```
MTAMEM VERT HORIZ TMTYPE TMNO TMCKTNO MTACARD
-------------------------------------------
0 0 0 MTM 0 6 3X09BA
```

2.1.2.6.4 Horizontal Connectivity Provisioning

After provisioning the MTA matrix for the office, the test heads are assigned to horizontals on the MTA matrix. The example shows a pair ofMTU (Metallic Test Units) connected to the first two horizontals on theMTA matrix along with a single analog test trunk for supporting external test systems such as: Access Care, 4TEL and Loop Care.

TABLE: MTAHORIZ

```
HORIZ HORIZGRP HORIZAGT MTAGRP
-----------------------------
0 0 L MTU 0 Y (0 0) $
1 0 L MTU 1 N (0 1) $
3 0 T LTDESK 0 (0 3) $
```

2.1.2.6.5 Vertical Connectivity Provisioning

After provisioning the test head connectivity to the horizontals on the MTA matrix, the line concentrating devices are assigned to verticals on the MTA matrix. For LGRPs, verticals are assigned to specific MG9000 metallic test access points and shelves through tables LGRPINV and MTAVERT.

The following example shows two separate LGRPs. For CARY 77 1, the entry in LGRPINV associates vertical 0 with metallic test access point 1 on the gateway. For CARY 40 2, the entry in LGRPINV associates vertical 1 with metallic test access point 1 on the gateway.

2.9.2.7.1 New CM LGRP messages to support MAP-Based Line Test for MG9000

Other messages than the ones listed below are output but they are not unique to Succession. The ones listed below are unique to Succession.

Table 2 MAP outputs with associated meanings and actions

Responses
For unsupported commands: “This command is not valid for Call Server LGRP lines.” **Meaning:** Self-explanatory **System or user actions:** None
For all commands: “This command is not valid for non-MG9000 lines.” **Meaning:** Self-explanatory **System or user actions:** None

Table 2 MAP outputs with associated meanings and actions

Responses
For VDC, VAC: “Failed to determine the split capabilities for this Call Server LGRP line.” **Meaning:** Could not get the test session for this LGRP. **System or user actions:** Check logs.
For VDC, VAC,LTA: “LTA IN requires split-in metallic access which is not supported for this Call Server LGRP line.” **Meaning:** Split capability is not right. **System or user actions:** None
For RES: “LTA IN command is not valid for RES on Call Server LGRP lines.” **Meaning:** Self-explanatory **System or user actions:** None
For CAP: “LTA IN command is not valid for CAP on Call Server LGRP lines.” **Meaning:** Self-explanatory **System or user actions:** None
For LNTST: “LTA IN command is not valid for LNTST on Call Server LGRP lines.” **Meaning:** Self-explanatory **System or user actions:** None
For metallic tests: “Unable to determine metallic test equipment provisioned” “Verify the MTSTAPT option exists for the entry in table LGRPINV” **Meaning:** Could not retrieve MTSTAPT from LGRPINV provisioned data **System or user actions:** Check table LGRPINV, option MTSTAPT.
For metallic tests: “Unable to get the test point index from LGRPINV” “Test cannot be performed” **Meaning:** Could not find available vertical type test point. **System or user actions:** Check table LGRPINV.

Table 2 MAP outputs with associated meanings and actions

Responses
For metallic tests: “Vertical is not datafilled in MTAVERT” “Test cannot be performed” **Meaning:** Self-explanatory. **System or user actions:** Check table MTAVERT.
For metallic tests: “TAN vertical is not assigned” “Test canot be performed” **Meaning:** Self-explanatory. **System or user actions:** Check table MTAVERT.
For MONLTA or TALKLTA: “Cannot get line state” **Meaning:** Self-explanatory. **System or user actions:**
For LTA: “Talk connected” “LTA operations not valid on Call Server LGRP lines” **Meaning:** Do not allow the LTA IN or LTA OUT commands for LGRP lines if either monlta or talklta is in progress. LGRP line maintenance performs a true split-in when the LTA IN command is performed and a split-out when the LTA OUT command is performed. The monlta and talklta commands use bridge mode by design. For LGRP lines, once the bridge is lost by a LTA IN or LTA OUT, it can not be re-established using the LTA command. **System or user actions:** Wait until TALKLTA is complete.
For LTA: “Monitor connected: “LTA operations not valid on Call Server LGRP lines” **Meaning:** Do not allow the LTA IN or LTA OUT commands for LGRP lines if either monlta or talklta is in progress. LGRP line maintenance performs a true split-in when the LTA IN command is performed and a split-out when the LTA OUT command is performed. The monlta and talklta commands use bridge mode by design. For LGRP lines, once the bridge is lost by a LTA IN or LTA OUT, it can not be re-established using the LTA command. **System or user actions:** Wait until MONLTA is complete.

Table 2 MAP outputs with associated meanings and actions

Responses
For LTA: “Failed to determine the split capabilities of the LGRP.” “Test not performed.” **Meaning:** Could not get the test session for this LGRP. **System or user actions:** Check logs.
For TSTRING: “To test the ringing function for Call Server LGRP lines, please run the DIAG command.” **Meaning:** self-explanaory **System or user actions:** Execute the DIAG command.
For DIAG, “This Call Server LGRP line has no serving metallic test equipment.” “”*** WARNING *** This command will cause the EBS set to lose” “ power and its previous volume setting” **Meaning:** self-explanaory **System or user actions:** None.
“Failed to determine the termination state” **Meaning:** Could not determine the state of the line to be tested. So, line test cannot be performed on this line. **System or user actions:** Check the termination status at the gateway.
“Failed to put the termination in the test state” and/or “Check the termination status at the gateway” **Meaning:** Could not put the state of the line to be tested in the termination state. So, line test cannot be performed on this line. **System or user actions:** Check the termination status at the gateway.
The line is an ESA call” **Meaning:** self-explanaory **System or user actions:** None.

Table 2 MAP outputs with associated meanings and actions

Responses
The line is out of service at the gateway” **Meaning:** The gateway has explicitly stated that this line is Out of Service. So, line test cannot be performed on this line. **System or user actions:** Check the Circuit State at the MG9000 Element Manager.

3: Configuration (CN): A00001893

3.1 Hardware and Software Requirements

This feature requires the SN07 Media Gateway 9000 Element Manager, the Network Patch Manager and Media Gateway 9000 Device Software as well as the SSPFS platform software.

3.2 Document Name and Version

Document Name:
MG9K_Imaging_CN.fm

Version:

/main/pnmdoc/1

3.3 Upgrade Impact

This feature impacts MG9K Device upgrades by allowing the craft person to upgrade an MG9K Device with a new load, patch the load with all available patches for the load and execute an image.

The execution of the image will create a device load with a ".tar" file extension (ex. SCOA07AA_GZ.tar). This image load will contain the software load *and* the patches.

The user will then have the ability to upgrade the remaining devices in the office with the newly imaged load.

The availability of the image command could potentially reduce the amount of time an upgrade takes significantly

3.3.1 Dump and Restore

N/A

3.3.2 Element Management Upgrade

This feature will create a ".tar" load file during the imaging process that can be used to upgrade MG9K Devices of the same load type.

3.4 Element Management

This feature adds new commands to the Media Gateway 9000 Element Manager Graphical User Interface and the Network Patch Manager Graphical User and Command Line User Interface.

3.4.1 Media Gateway 9000 Element Manager

This feature adds new commands to the Media Gateway 9000 Element Manager Graphical User Interface and the Network Patch Manager Graphical User and Command Line User Interface.

3.4.2 Initial MG9K Element Manager Configuration

This feature will change/update two configuration scripts for the MG9K EM Server; *mg9kconfig.sh* and *mg9kserver config*.

3.4.2.0.1 mg9kconfig.sh

Today, the mg9kconfig.sh script must be executed before the MG9K EM Server can be started. Therefore, this script will be modified to ask the user for the following information:

- Image Server - the load server where the load images will be stored
- Image Server User ID - the user id for the load server that has ftp access. **NOTE: the ftp user must have over write privileges on the server**.
- Image Server password - the password for the load server user id
- Supercore IMA Image Directory - directory where the image for this load type will be stored.
- SuperCore OC2 Image Directory - directory where the image for this load type will be stored.
- ITP Image Directory - directory where the image for this load type will be stored.
- ITX Image Directory - directory where the image for this load type will be stored.
- DS1 Image Directory - directory where the image for this load type will be stored.
- ABI Image Directory -directory where the image for this load type will be stored.

The mg9kconfig.sh script will provide a default Image Directory for the user that will be located at: /swd/mg9k.

The following figure shows the final output from the mg9kconfig.sh script that the user will see and verify before starting the MG9K EM Server.

Figure 1 Script output of the mg9kconfig.sh verification

```
************************************************************
      Setup Server As                    : MASTER
     Master Server IP Address            : wnc0s00v
      SESM IP Address                    : 47.142.164.250
      Security Authentication Host       : 47.142.164.250
      Oracle IP Address                  : 47.142.164.250
      Initialize Database                : YES
      Maintenance Release Upgrade        : NO
      Image Server                       : 47.142.164.250
      Image Server User ID               : maint

      ITX Image Directory                : /swd/mg9k/itx
      ABI Image Directory                : /swd/mg9k/abi
      DS1 Image Directory                : /swd/mg9k/ds1

************************************************************
```

3.4.2.0.2 mg9kimpl

The mg9kimpl script exists today and is available so that the user can change information the MG9K EM Server utilizes. This script is accessed by typing **./ mg9kserver config**. This feature will provide a "*Change Imaging Server Settings*" Menu in this script so that the default software imaging parameters can be changed without executing the entire mg9kconfig.sh script again. The following figures show how the menu is displayed.

Figure 2 Main Configuration Menu for the MG9K EM Server

```
Main Configuration Menu

1) Change Distribution Policy
2) Change SESM IP Address
3) Change Oracle IP Address
4) Change Debug Level for logs
5) Change Persistence settings
6) Change ESA data download settings
7) Change Imaging Server settings
8) Display current settings
9) Exit from Main Menu
Please make a selection =>
```

  Image Configuration Menu

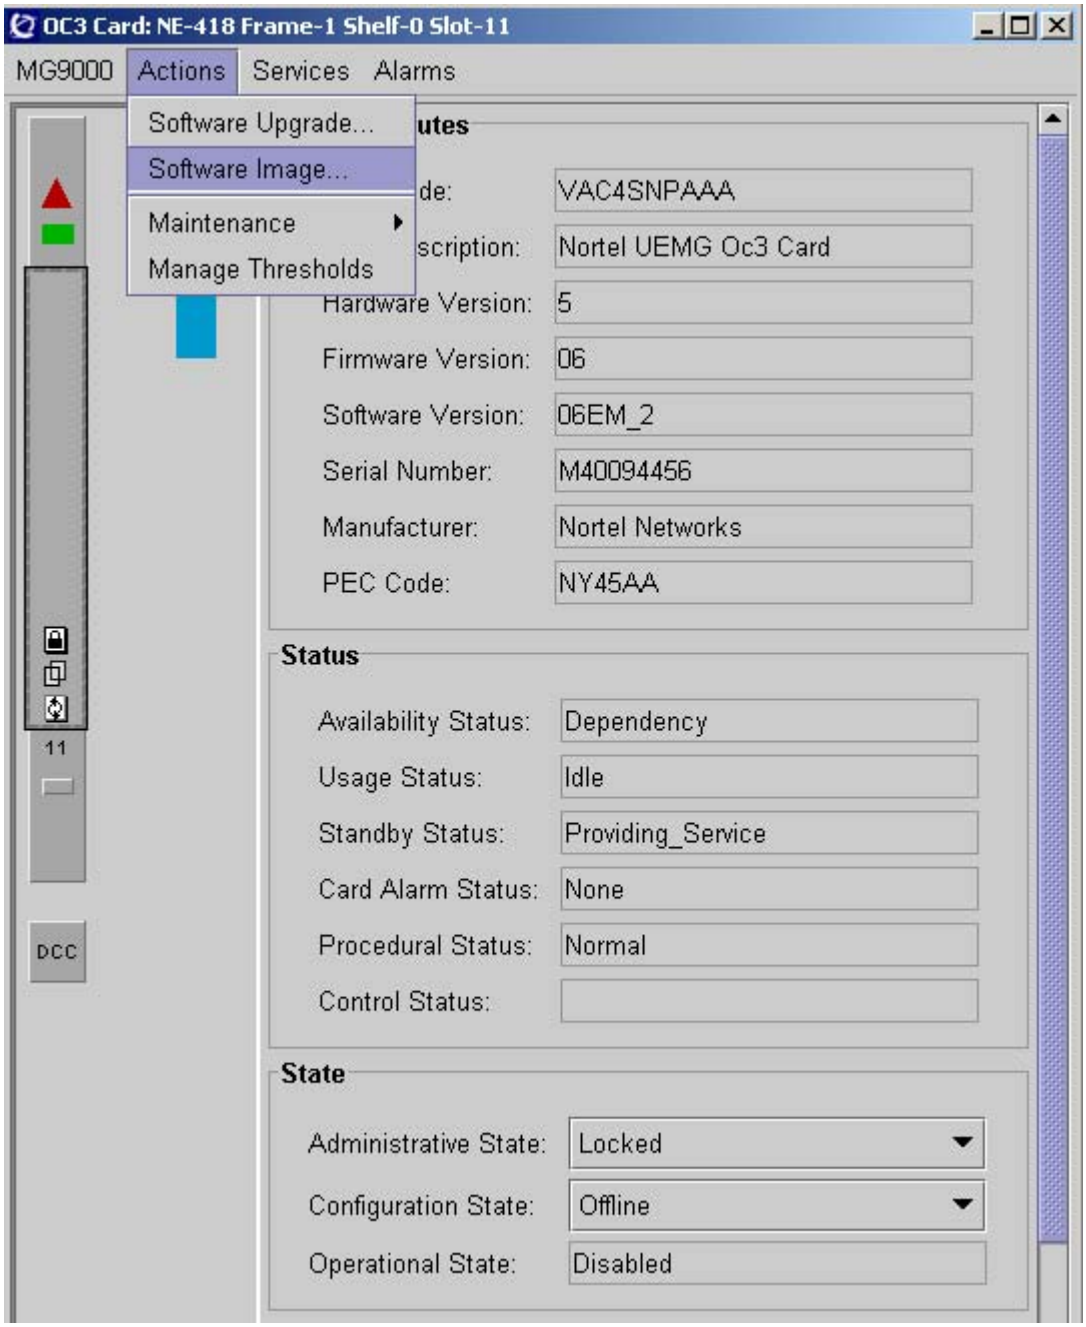
1) Change Image Server IP
2) Change Image Server User ID and password
3) Change Image Server default directories
4) Exit to Main Menu
Please make a selection =>
```

3.4.2.1 MG9K EM GUI

This feature changes the MG9K EM GUI at the card level only. An additional item named *Software Image* will be added to the *Actions* menu. The Software Image function is performed on a **per card basis** and is only available for the SuperCore OC3, SuperCore IMA, ITP, ITX, DS1 and ABI cards.

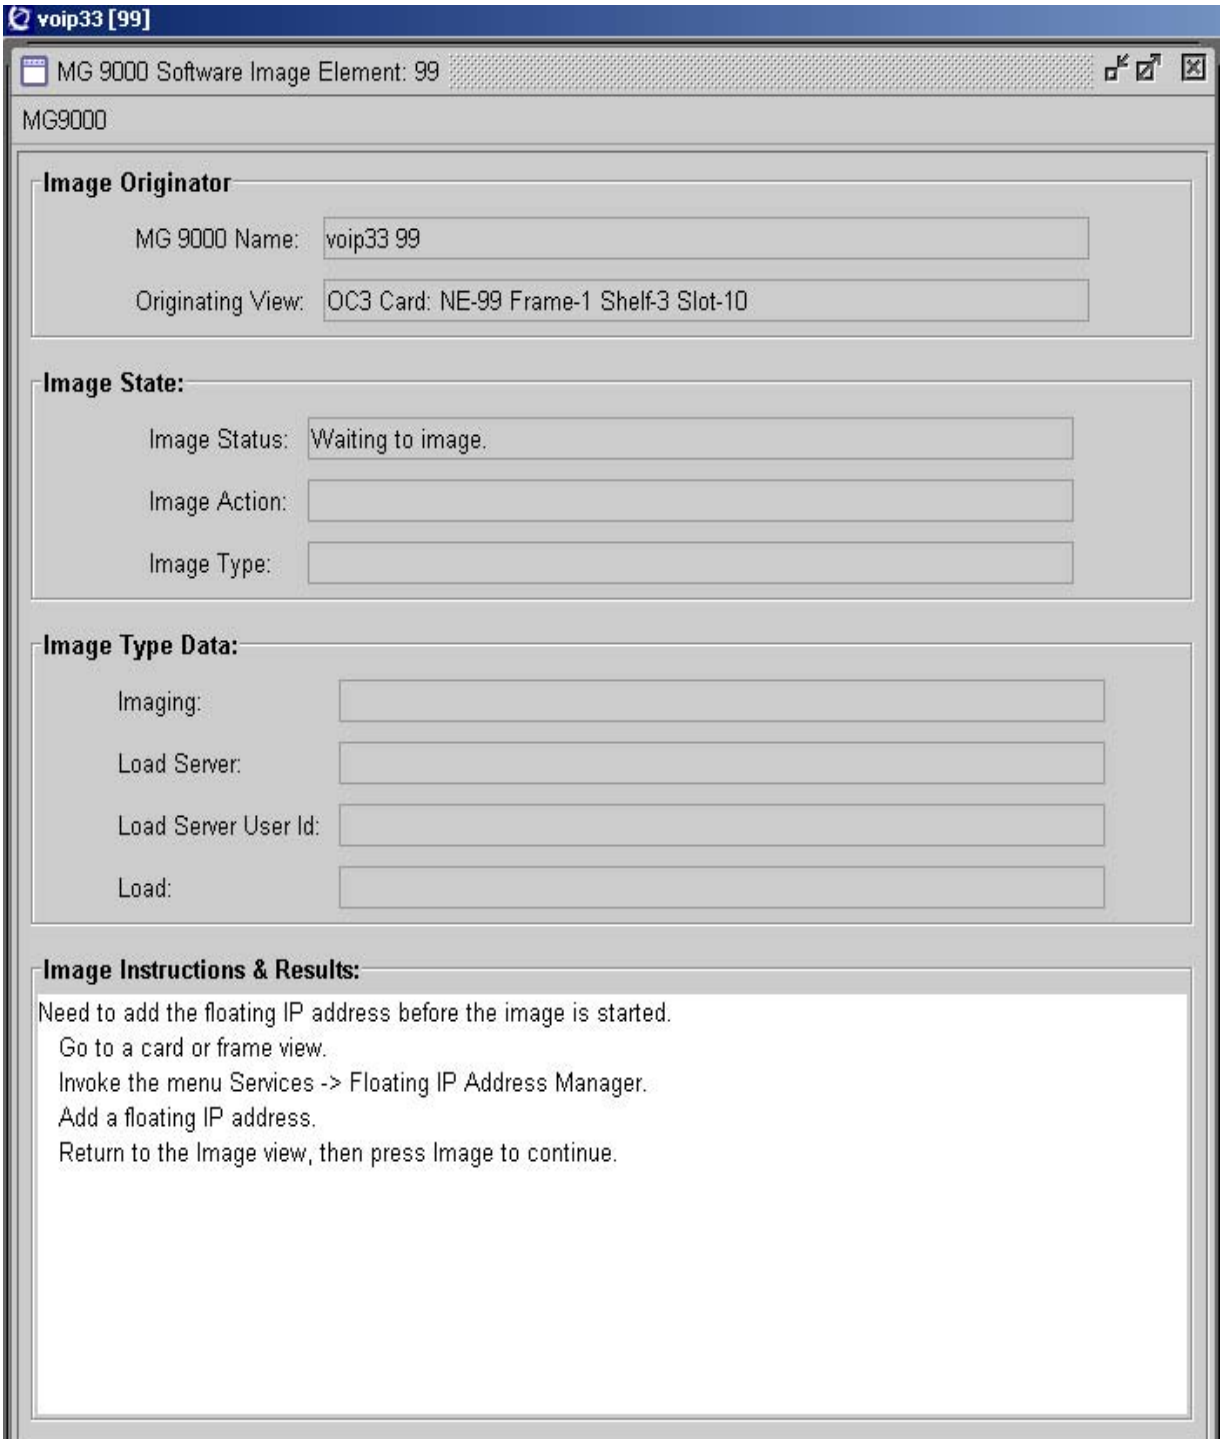
The following figures show the Software Imaging GUI interface for the MG9K EM.

Figure 4 MG9K EM GUI Card View



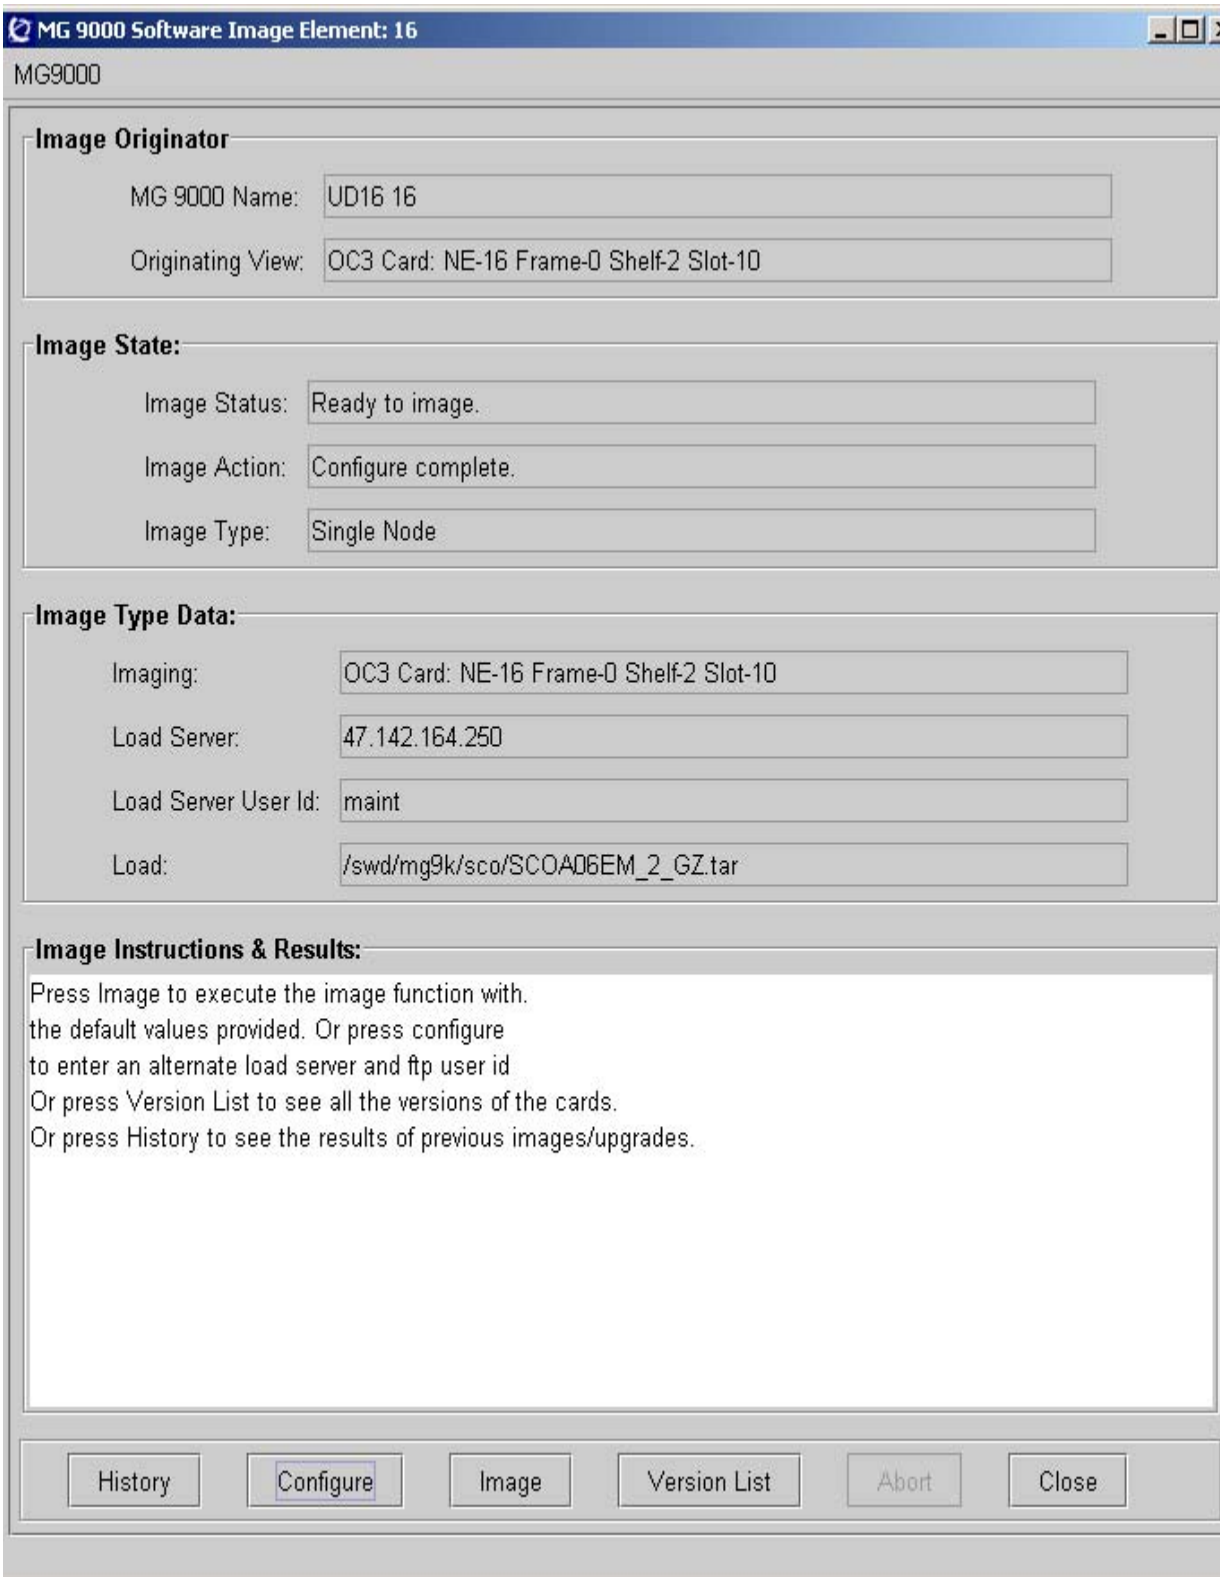
After selecting the Software Image tab, the MG9K Image GUI appears. The next figure shows the message if the Floating IP has not been configured.

Figure 5 Floating IP Not configured



After the floating IP has been configured, the MG9K Image GUI can be re-entered and should look as follows:

Figure 6 MG9K EM Image GUI



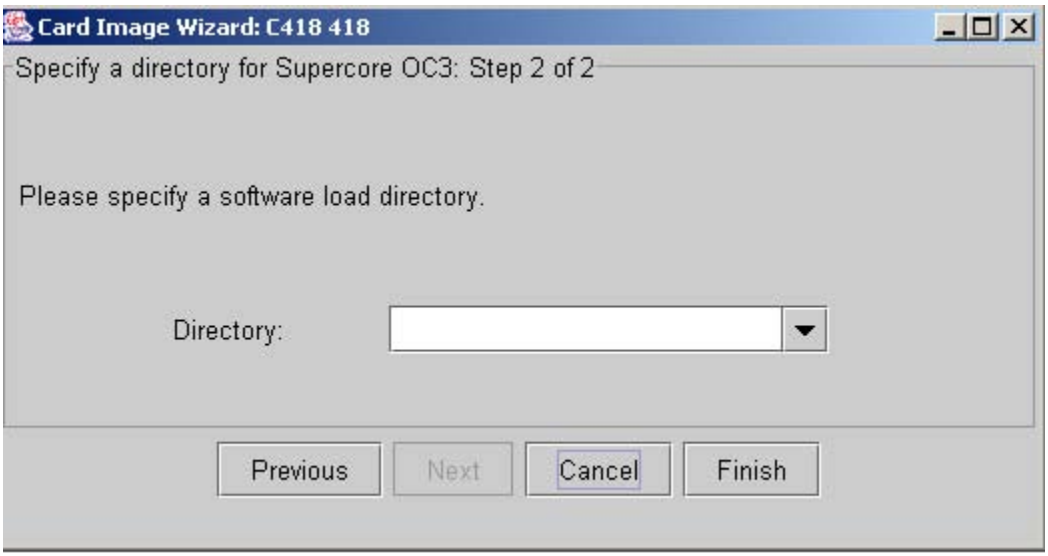
From figure 6, notice that there is a *Configure* button. If the user wishes to change the default server IP, server user ID, server password or directory, they can do so by clicking on the *Configure* button. **Note**: *Configure* only changes these values for this session. It does not change the default values permanently.

The following two figures show the *Configure* menus.

Figure 7 Server Configure Menu

The Server User Identifer *must* be an FTP user that has overwrite access on the load server.

Figure 8 Server Directory Menu



As part of manual imaging, the MG9K EM will obtain patch information from the Network Patch Manager. This information will help the user to determine if there is any reason the device load should not be imaged. If the NPM determines any of the following conditions, a *Warning* message will be sent to the user:

- the device load contains obsolete patches
- the device load contains patches that are on hold
- the device itself is on hold
- the device load is at a lower patch level then the previously image load.

A *Failure* message will be sent to the user if communication with the NPM cannot be obtained. However, in all of these instances, the user will have the ability to override these conditions and continue with the image.

3.4.2.2 FTP User Configuration

This feature requires that the FTP server that is used for images have an FTP user configured that has read AND overwrite access to the server. After an image file is created once, every subsequent image of that load will be overwritten. NOTE: only the image file will be overwritten, not the original load file.

3.4.2.3 Image File

The imaged file name is pre-determined and **CANNOT** be configured. The imaged file name will be based on the name of the load file with a ".tar" extension. For example, if the file name of the load is SCOA07AA_GZ, the imaged load file name will be SCOA07AA_GZ.tar. This is the name of the load file that should be used when the user is ready to upgrade or re-load devices from disk.

The imaged load will be placed in the directory that the user specified during initial configuration of the MG9K EM Server or in the configuration entered via the Image Configuration Panels shown in figures 6 and 7.

3.4.3 Network Patch Manager

The NPM will offer the ability to image an MG9K Device via a new maintenance command; *SmartImage*. This new maintenance command will "look and feel" like the other maintenance commands in the NPM.

Unlike manual imaging from the MG9K EM, the *SmartImage* command utilizes a patching criteria that will determine if the devices that the user wishes to image *should* be imaged. The following sections discuss the patching criteria, NPM GUI and NPM CLUI changes as well as other changes to the NPM that will be necessary for the this feature.

3.4.3.1 Security

This feature requires the user to have a security level of emsadm in order to execute the *SmartImage* command.

3.4.3.2 Logs

This feature will not add new log numbers for the SmartImage command. This feature will utilized the NPM maintenance log numbers that are currently available for maintenance commands.

3.4.3.3 NPM PreDefined Device Sets

This feature will introduce two new predefined device sets to the NPM:

- MG9KDevices
- GWCDevices

Each of these sets will include all of the devices of the device type they reference. For example, MG9K Devices will include all of the MG9K type devices; OC3, ITP, ITX, DS1, and ABI. It will be recommended that the user utilize these sets when executing the *SmartImage* command.

3.4.3.4 NPM Patching Criteria

Basically, the criteria for the SmartImage command boils down to which device(s) contains the highest patch content.

Because this is the “focus” of the criteria, it is essential that the user be aware of what they are doing when they image a device from the NPM. It is **highly** recommended that the user only use the “device sets” that will be provided as part of this feature. Otherwise, an image of a device could be taken that does not contain the highest patch content.

The tables below show an example of how the patching criteria will work for the SmartImage Command.

Table 1 shows a list of all the MG9K Devices, registered in the NPM, sorted by loadname.

Table 1 Sorted devices and loads

Loadname	Device
SCOA07AB	UD16_16_62_OC3_0_2_10
	UD16_16_62_OC3_0_2_11
	UD17_17_72_OC3_0_2_10
	UD17_17_72_OC3_0_2_11
ITPA07AB	UD16_16_62_ITP_0_2_12
	UD16_16_62_ITP_0_2_13
	UD16_16_62_ITP_1_2_12
ITPA07AA	UD16_16_62_ITP_1_2_13
ITXA07AB	UD16_16_62_ITX_0_2_14
	UD16_16_62_ITX_0_2_15
	UD17_17_72_ITX_0_2_14
	UD17_17_72_ITX_0_2_15

Once all of the devices are sorted, the NPM looks at specific fields to determine if each device is a candidate for imaging. The following table shows the fields used and what impact they have on each device as it is evaluated.

Table 2 Patching Criteria

Field	Description	Impact on Imaging
AppLevel	Contains an integer value to indicate the number of patches applied to the device.	If zero patches are applied, the device is not a candidate for imaging.

Table 2 Patching Criteria

Field	Description	Impact on Imaging
ActLevel	Contains an integer value to indicate the number of patches activated in the device.	If all the devices for a particular load are at the same applevel, this field is used as a “tie breaker” to determine if a device should be imaged.
Hold	Contains Y or N to indicate whether the device is on hold.	If the device is on hold (Y), the device is not a candidate for imaging.
Patches on Hold	Contains an integer to indicate how many patches are on hold.	If the device contains any patches that are on hold, the device is not a candidate for imaging.
Obsolete Patches	Contains an integer value to indicate how many obsolete patches.	If the device contains any patches that are obsolete, the device is not a candidate for imaging.

Table 3 shows an example the patching criteria field values for each device.

Table 3 Patching Criteria Fields

Loadname	Device	App-Level	Act-Level	Patches on Hold	Obsolete Patches	Hold	Include
SCOA07AB	UD16_16_62_OC3_0_2_10	5	0	0	0	N	Y
	UD16_16_62_OC3_0_2_11	5	0	0	0	N	Y
	UD17_17_72_OC3_0_2_10	5	0	0	0	N	Y
	UD17_17_72_OC3_0_2_11	5	0	0	0	N	Y
ITPA07AB	UD16_16_62_ITP_0_2_12	3	0	0	0	N	Y
	UD16_16_62_ITP_0_2_13	2	0	0	0	N	Y
	UD16_16_62_ITP_1_2_12	5	0	0	0	Y	N
ITPA07AA	UD16_16_62_ITP_1_2_13	5	0	0	1	N	N
ITXA07AB	UD16_16_62_ITX_0_2_14	0	0	0	0	N	N
	UD16_16_62_ITX_0_2_15	0	0	0	0	N	N
	UD17_17_72_ITX_0_2_14	0	0	0	0	N	N
	UD17_17_72_ITX_0_2_15	0	0	0	0	N	N

From Table 3, let's evaluate which devices were chosen as candidates for imaging. We will look at the devices that were not chosen for imaging later in this section.

Table 4 Candidates Devices for Imaging

Candidate Devices	
Group 1	UD16_16_62_OC3_0_2_10
	UD16_16_62_OC3_0_2_11
	UD17_17_72_OC3_0_2_10
	UD17_17_72_OC3_0_2_11
Group 2	UD16_16_62_ITP_0_2_12

The five devices from Table 4 were chosen because they were not on hold and they had the highest level of patches applied to their load without any of the patches being obsolete or on hold.

Once the candidate device list is determined, the NPM then looks at the previously imaged AppLevel and ActLevel fields for each load.

If the AppLevel for the devices in a group are at a higher or lower level then the previously imaged levels, a device from the group will be chosen for imaging.

If the AppLevel is the same as the Previously Imaged AppLevel, the ActLevel will be used as a "tie breaker" to determine if an image should occur. If the ActLevel is the same, none of the devices will be imaged because the levels are the same level as the previous image.

NOTE: MG9K Devices do not currently support activation type patches, however, this patching criteria will continue to utilize this field as part to the criteria to determine the candidate device list, so that the patching criteria can be keep generic.

Table 5 Chosen Devices for Imaging

Candidate Devices		Current AppLevel	Current Actlevel	Previous Imaged AppLevel	Previous Imaged ActLevel
Group 1	UD16_16_62_OC3_0_2_10	5	0	4	0
	UD16_16_62_OC3_0_2_11	5	0	4	0
	UD17_17_72_OC3_0_2_10	5	0	4	0
	UD17_17_72_OC3_0_2_11	5	0	4	0
Group 2	UD16_16_62_ITP_0_2_12	3	0	4	0

Once the NPM determines that a group of devices should be imaged, from this point on, the NPM views the devices in each group as “equals” and simply chooses the first device in the group to be imaged; as shown in Table 6.

Table 6 Chosen Devices for Imaging

Chosen Devices	
1	UD16_16_62_OC3_0_2_10
2	UD16_16_62_ITP_0_2_12

Now that we know which devices will be chosen for imaging, let’s take a closer look at why some of the devices were not chosen for imaging.

Table 7 Devices NOT chosen for imaging

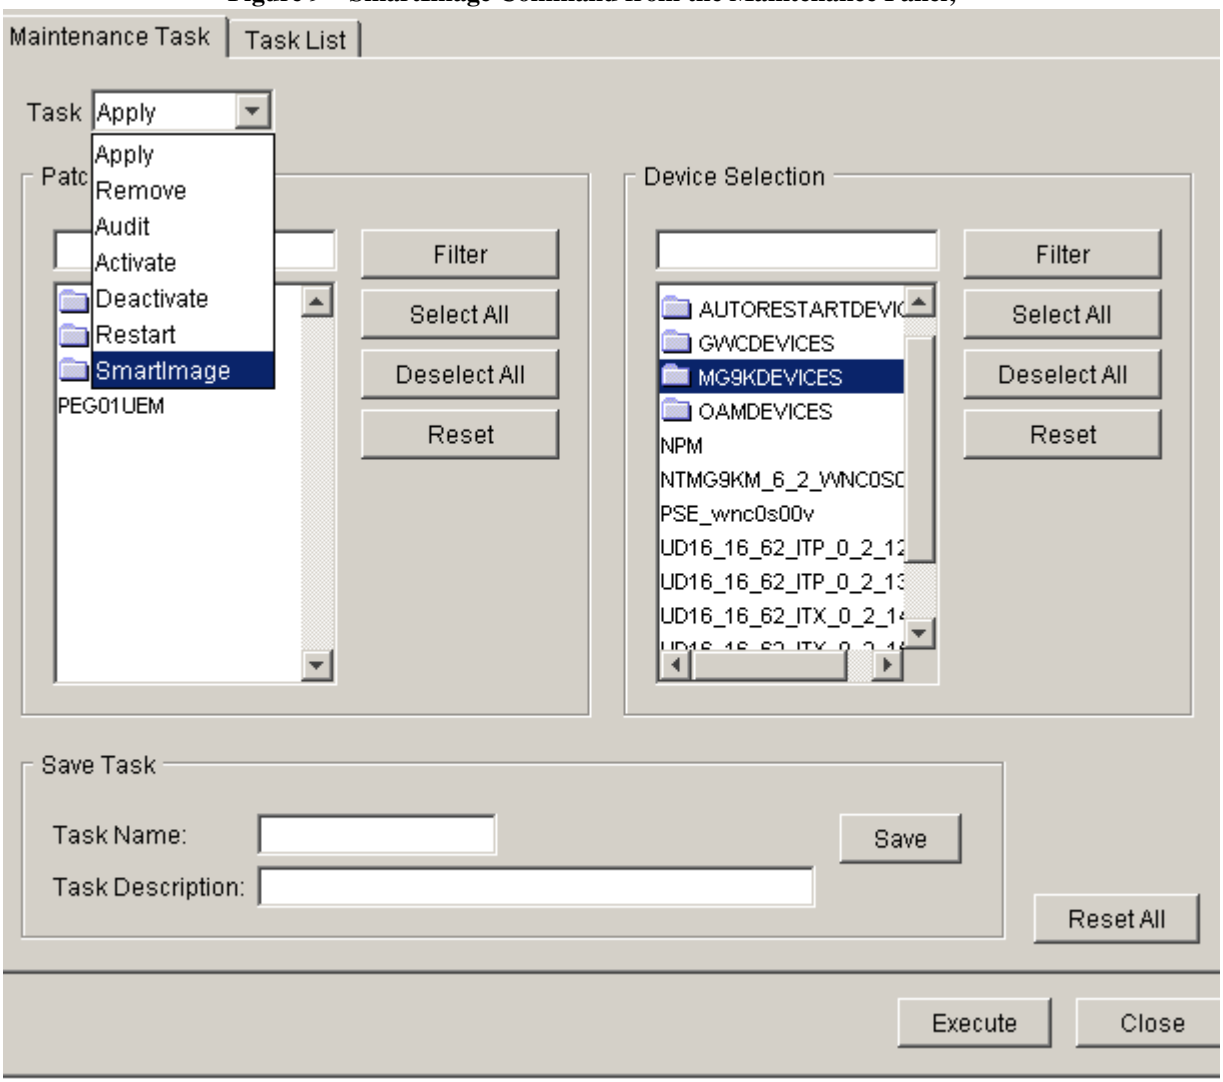
Loadname	Device	AppLevel	ActLevel	Patches on Hold	Obsolete Patches	Hold
ITPA07AB	UD16_16_62_ITP_0_2_13	2	0	0	0	N
	UD16_16_62_ITP_1_2_12	5	0	0	0	Y
ITPA07AA	UD16_16_62_ITP_1_2_13	5	0	0	1	N
ITXA07AB	UD16_16_62_ITX_0_2_14	0	0	0	0	N
	UD16_16_62_ITX_0_2_15	0	0	0	0	N
	UD17_17_72_ITX_0_2_14	0	0	0	0	N
	UD17_17_72_ITX_0_2_15	0	0	0	0	N

- Device UD16_16_62_ITP_0_2_13, was not chosen for imaging because it does not contain as high of a patch content as UD16_16_62_ITP_0_2_12.
- Device UD16_16_62_ITP_1_2_12, was not chosen for imaging because the device is on hold.
- Device UD16_16_62_ITP_1_2_13, was not chosen for imaging because the device load contains an obsolete patch.
- Device UD16_16_62_ITX_0_2_14, UD16_16_62_ITX_0_2_15, UD17_17_72_ITX_0_2_15 and UD17_17_72_ITX_0_2_15 were not chosen for imaging because there are not patches currently applied to either device.

3.4.3.5 NPM GUI

The following figures show example output of the *SmartImage* command and results (Note the example output here, is not the example that is shown in the table example shown in section 2.2.2.4):

Figure 9 SmartImage Command from the Maintenance Panel;



After choosing the *SmartImage* Command and the selected devices, the user can click the *Execute* button. Once this button is clicked a warning message is displayed to the user to ensure that they agree that the devices chosen are the ones that they want evaluated.

Figure 10 Warning message for the SmartImage Command

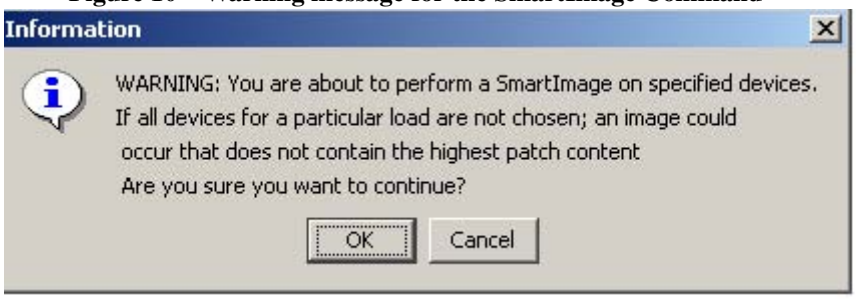


Figure 11 Pre-results for the SmartImage Command

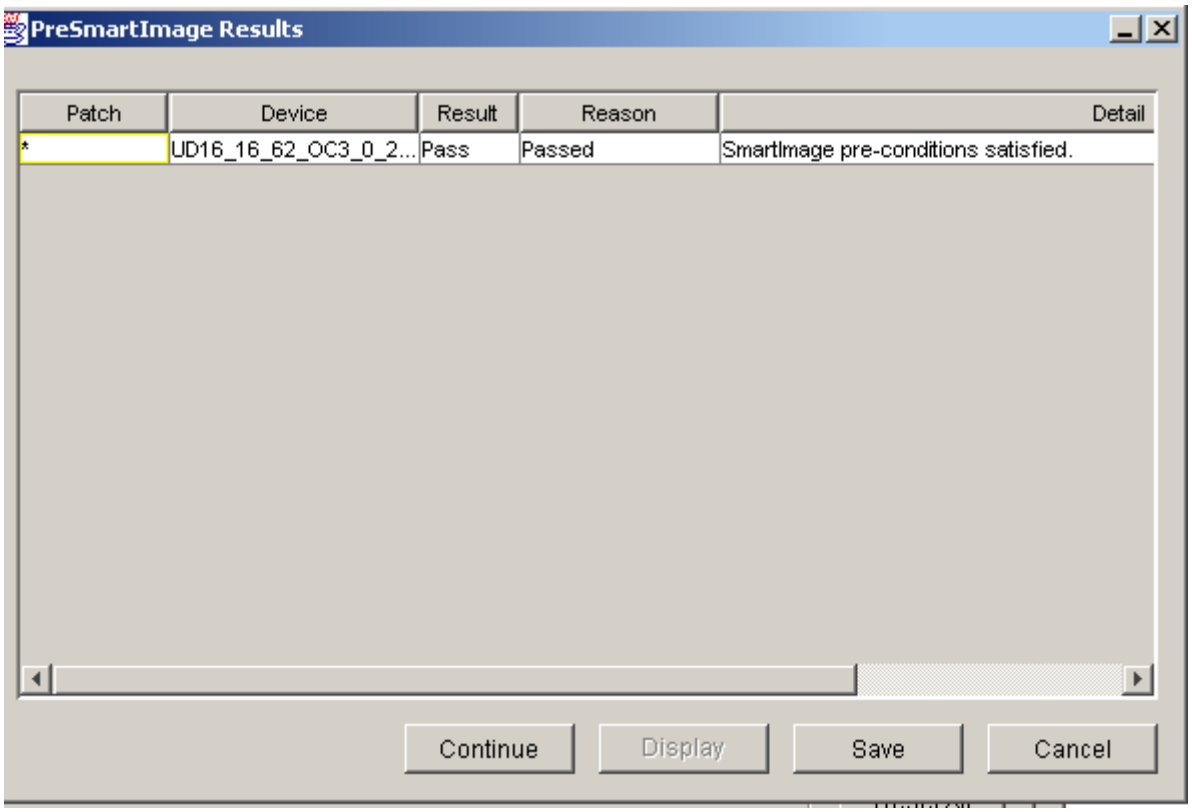

Figure 12 Final results from the SmartImage Command

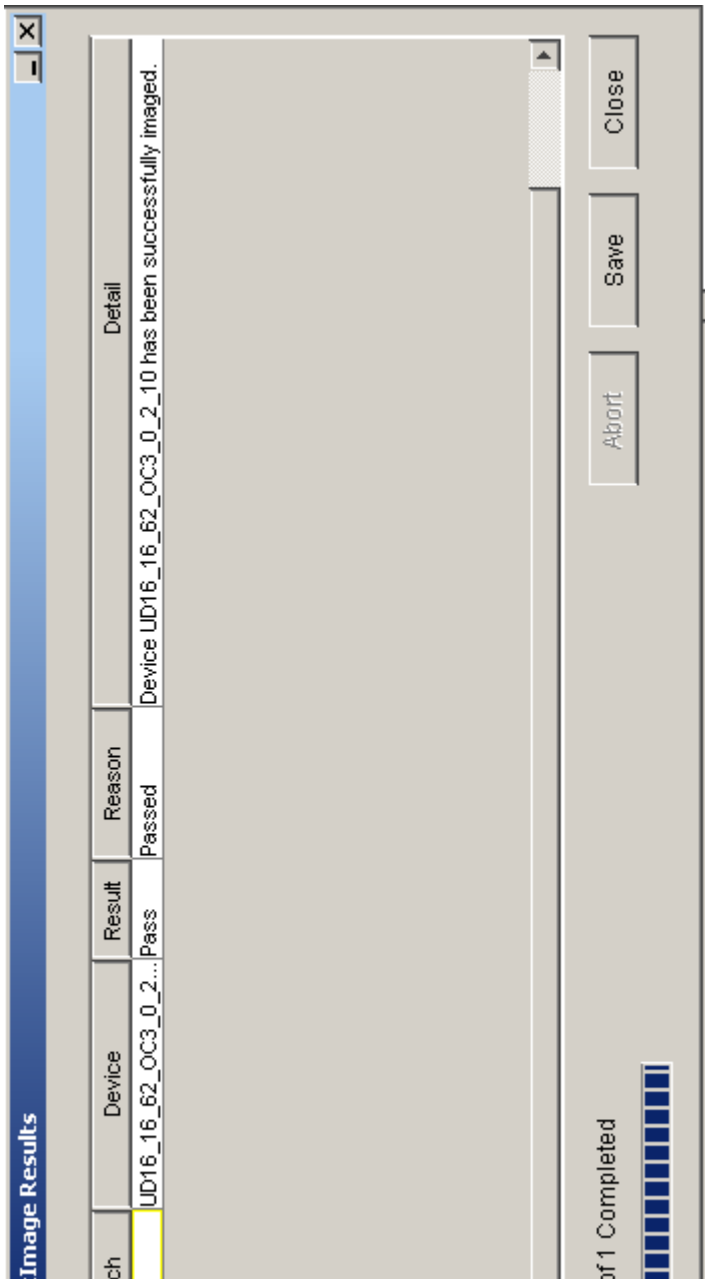

3.4.3.6 NPM CLUI

This feature changes the NPM CLUI by adding the new SmartImage command. The command will execute just as it does in the NPM GUI. The following is an example of the command and output.

NPM CLUI SmartImage Command Output

```
npm>smartimage SET MG9KDEVICES
WARNING: You are about to perform a smartimage on the specified devices.
Note that if all devices for a particular load are not chosen
for imaging. A device may be chosen that does not contain the
the highest patch content.
If you wish to continue with this maintenance request enter Yes (Y or y).
Otherwise, just enter return.
#y

Patch: *
Device: UD16_16_62_OC3_0_2_10
Result: true
Reason: Passed
Details: SmartImage pre-conditions satisfied.

If you wish to continue with this maintenance request enter Yes (Y or y).
Otherwise, just enter return.
#y

npm>
Patch: *
Device: UD16_16_62_OC3_0_2_10
Reason: Passed
Detail: Device UD16_16_62_OC3_0_2_10 has been successfully imaged.
```

3.4.3.7 Scheduling SmartImage

The SmartImage command can be scheduled in the NPM via the NPM GUI or NPM CLUI and executed nightly, weekly or monthly. It is recommended that if SmartImage is scheduled on a nightly basis, that autoapply is also scheduled and executed before the SmartImage task is executed.

The following figures show some of the steps involed to schedule the SmartImage task.

3.4.3.7.1 Scheduling a SmartImage from the NPM GUI

Figure 13 Saving the SmartImage Task

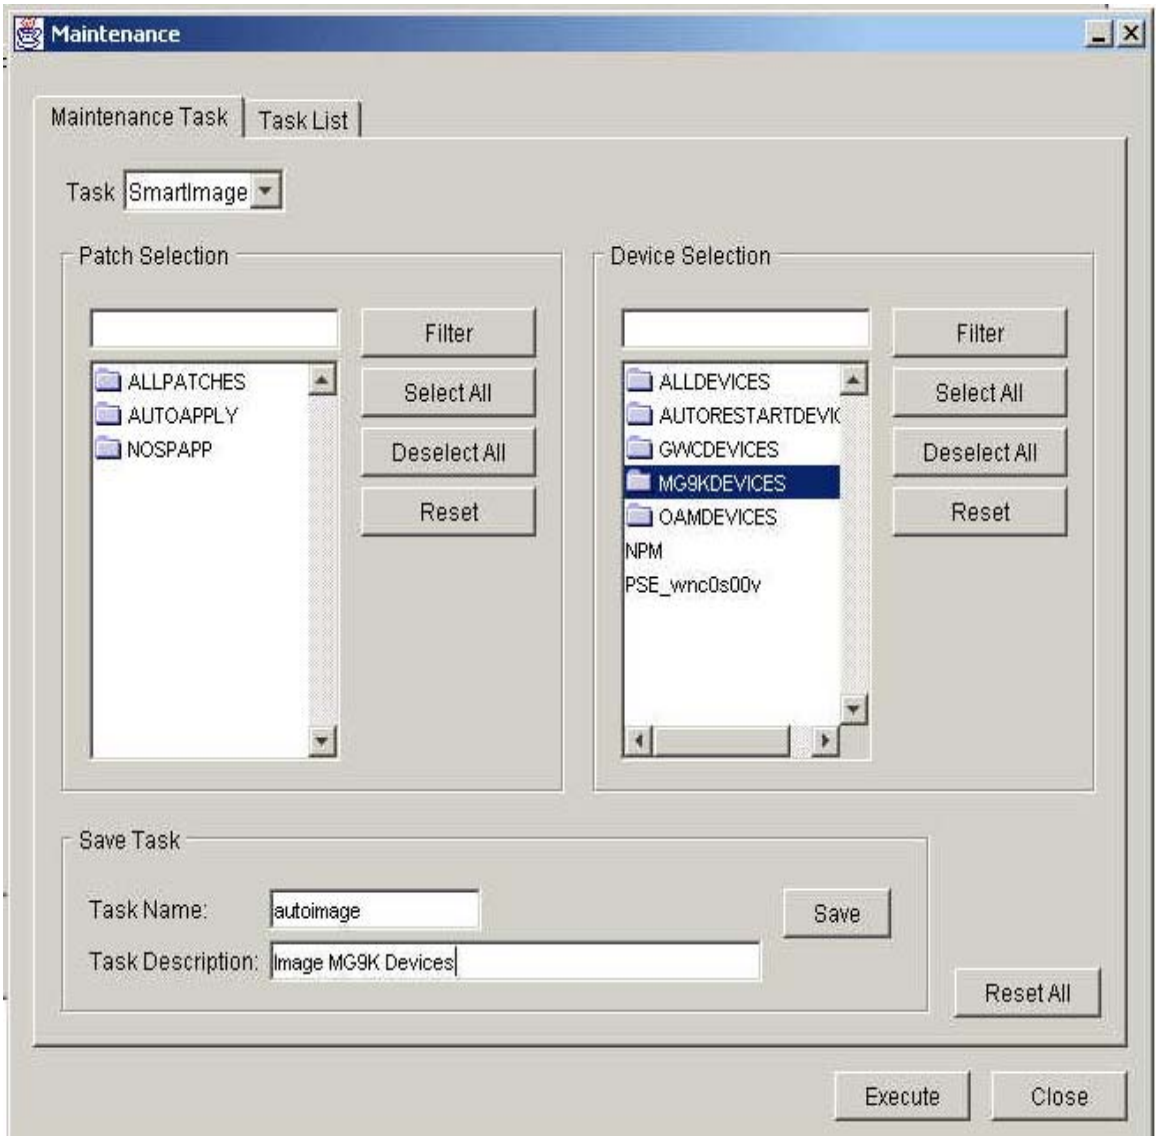

Figure 13 shows the SmartImage Task being saved and called *autoimage*.

After the task is saved it will show up as an available task to be scheduled in the NPM System Scheduler. The following figures show how to get to the NPM System plan and how to edit the plan to include the *autoimage* task.

Figure 14 Selection of the System Plans menu

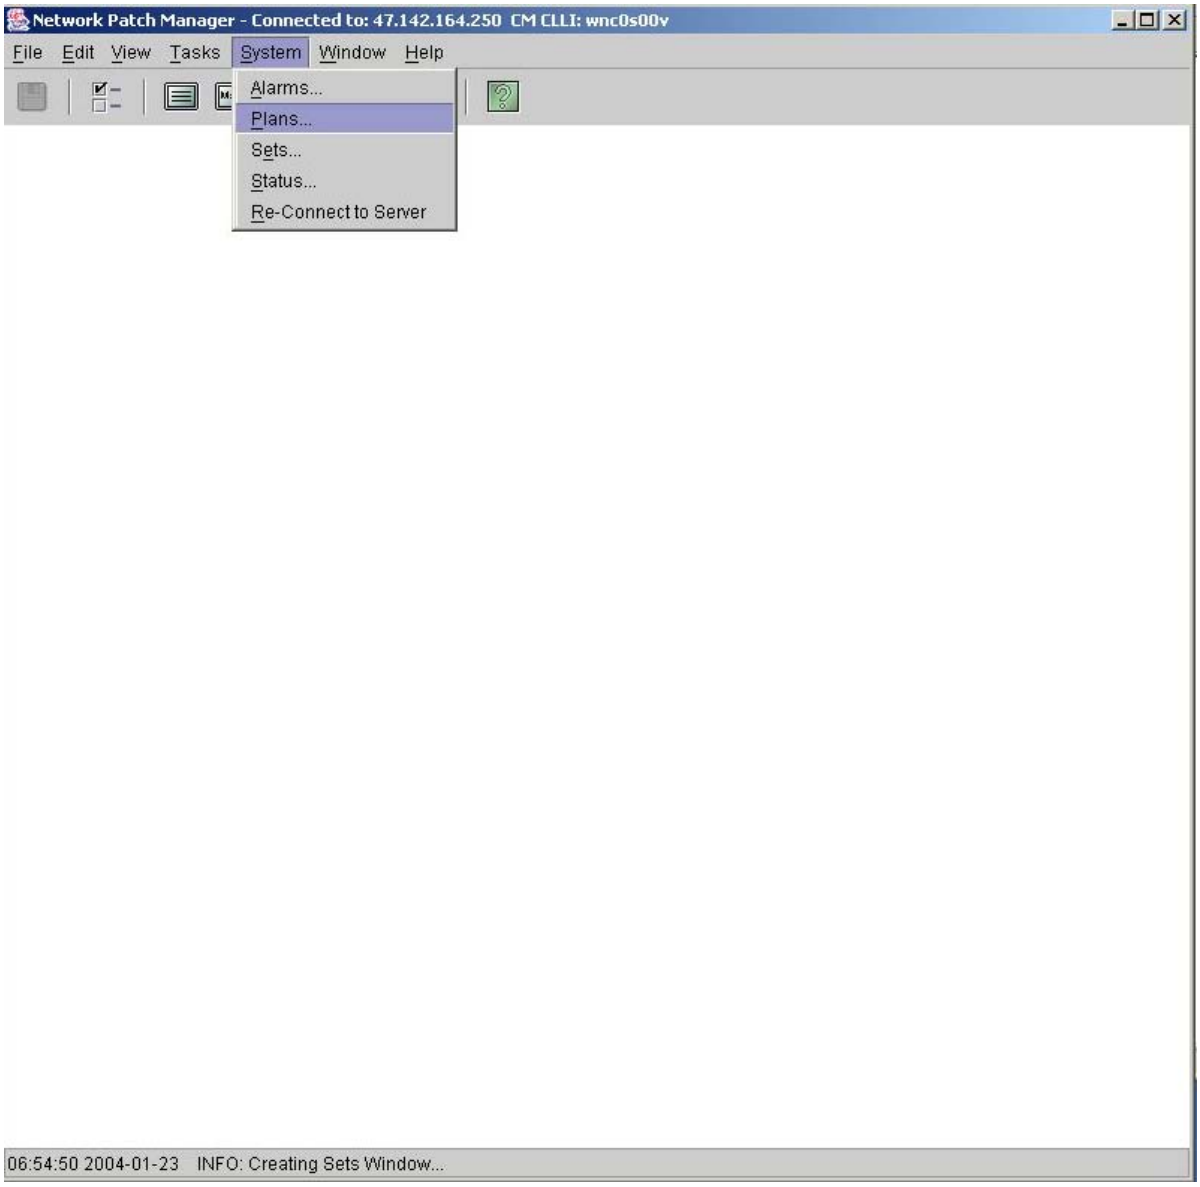

Figure 15 Selection of the System Plan for editing

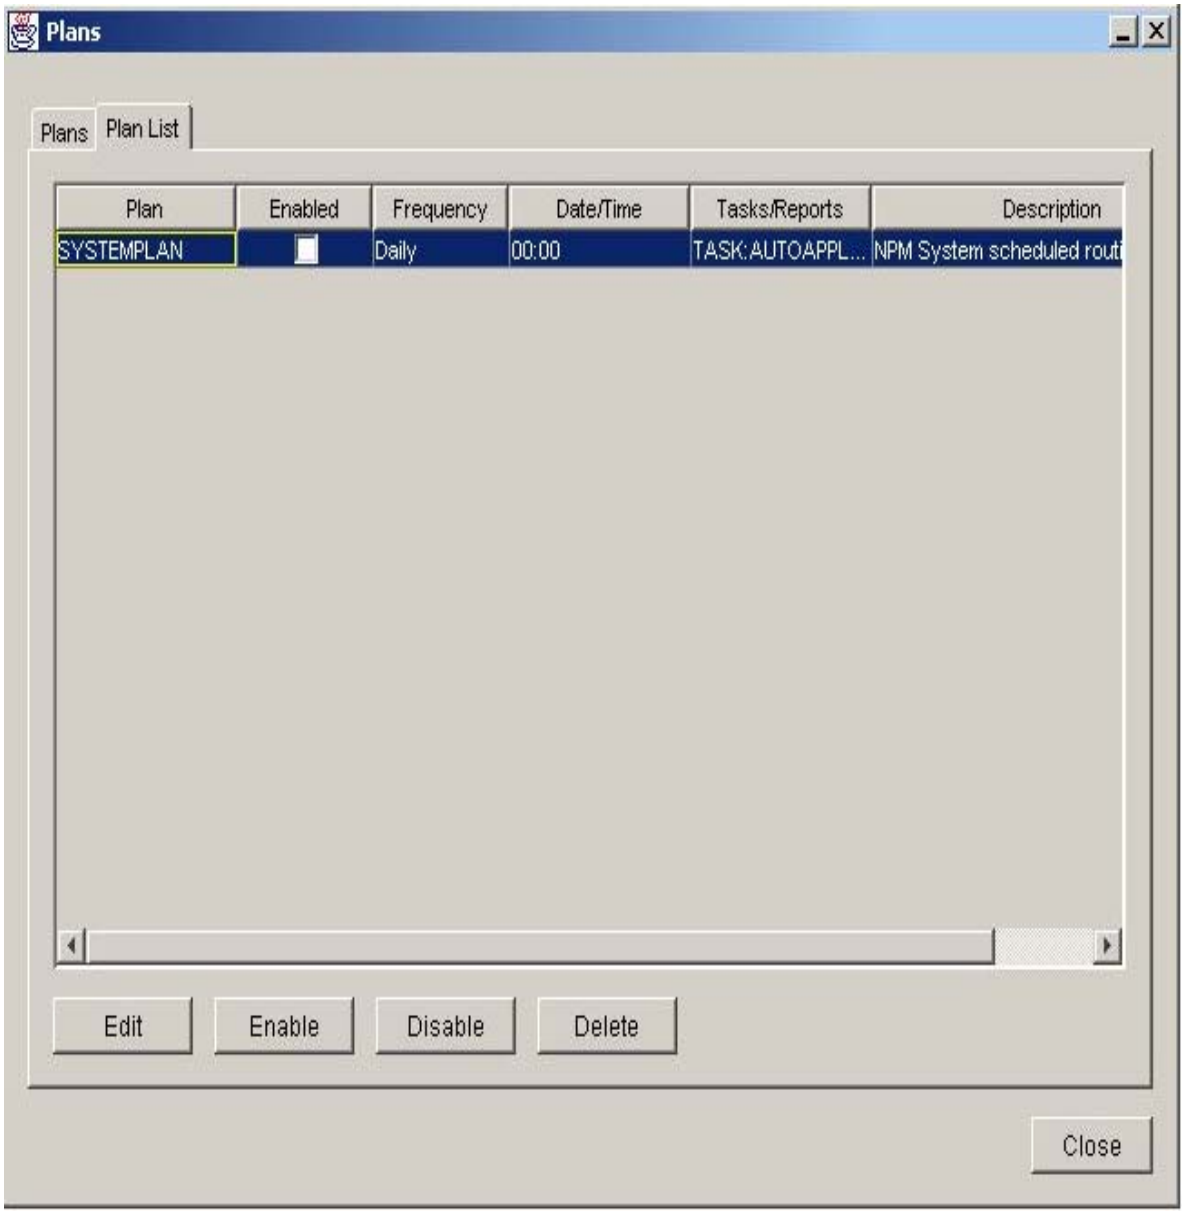

Figure 16 List of Available Tasks

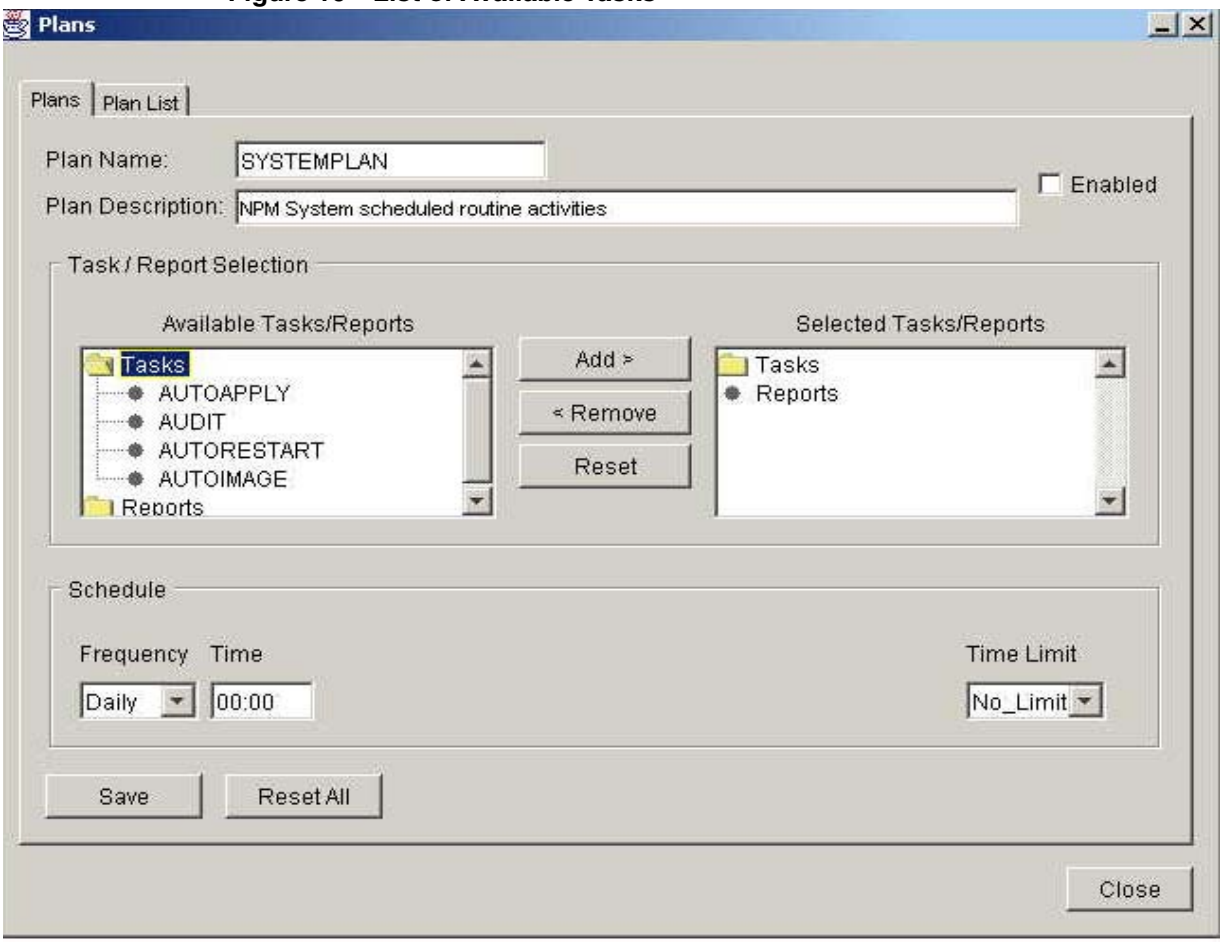
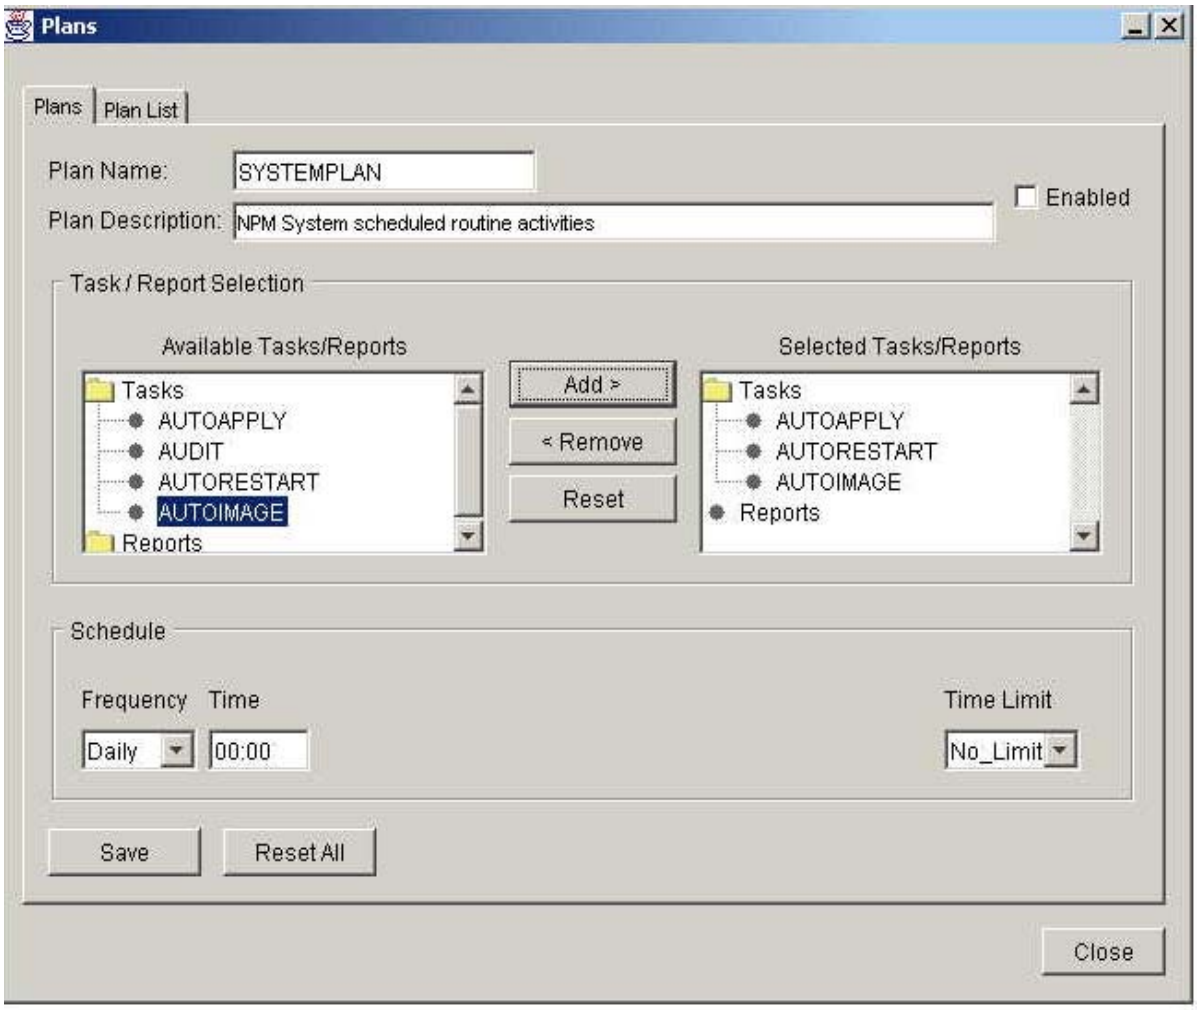


The newly added *AUTOIMAGE* task can be added to the selected number of tasks to execute, as shown in figure 15.

Figure 17 Imaging added to the System Plan



3.4.3.7.2 Scheduling a SmartImage task from the NPM CLUI

The following figures shows how to save, add and schedule a *SmartImage* task from the NPM CLUI.

Figure 18 Scheduling SmartImage Task from NPM CLUI

```
npm>newtask MG9K_IMAGE_TASK SMARTIMAGETASK"MG9K AUTO IMAGING
" MG9KDEVICES
Task created successfully.

npm>sched SYSTEMPLAN TASK MG9K_IMAGE_TASK Add
Done.

npm>updplan SYSTEMPLAN Daily"1-24-04 00:00 " No_Limit"Nightly Maintenance"
Plan updated successfully.

npm>enableplan SYSTEMPLAN ON
Done.
```

3.5 Hardware Requirements or Dependencies

None

3.6 Software Requirements or Dependencies

This feature requires the SN07 MG9K EM, NPM and MG9K Device Software.

3.7 Limitations and restrictions

The following items are listed here as limitations from this feature:

- **SmartImage is dependant on the default information that is input at configuration time of the MG9K EM Server. If this information is not available, the user will not be able to SmartImage or auto image.**
- **SmartImage or auto imaging for the customer who does not *specialize* his office. It is for the customer who patches all devices with the same patches.**
- **The patching criteria looks at the levels of patches in a device load. Therefore is a user patches a device with 4 patches, images the device, then removes the patches and then applies 4 different patches; the level of patches since the last image has not changed and the device will not be imaged.**

- **Due to the fact that two MG9K EM Servers execute on the same SSPFS box at one time during upgrades; the customer must be aware that when the mg9kconfig.sh script asks for the image user id and image server password, they must be the same for both MG9K EM Servers executing. This is due to the fact that there will only be one secure password file for the imaging server per SSPFS platform. However, the additional information the user provides via the mg9kconfig.sh script can be different, including the image server IP and load image directories.**
- **The load server used must have FTP read/overwrite access.**

3.8 Interactions

None

3.9 Glossary

MG9K EM - Media Gateway 9000 Element Manager

NPM - Network Patch Manager

GUI - Graphical User Interface

CLUI - Command Line User Interface

4: Configuration (CN): A00001898

This chapter documents the configuration related changes for activity A00001898. Specifically there are changes in the provisioning system (as captured in the Data Schema Section) as well as changes in the maintenance system (as captured in the Command Interface Section). All sections that are not relevant for this activity are tagged as Not Applicable.

4.1 Hardware and Software Requirements

- The RMM has been installed
- A DS30A card has been inserted into the host peripheral (LTC, LGC, or SMA2) in the appropriate slot
- The host XPM and the RMM are connected via a DS30A cable
- The software for this activity is installed in the XACore
- The required SMA2 load (if the RMM is connected to an SMA2) is installed in the XPM

4.2 Initial Configuration

Not Applicable

4.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable

4.4 Upgrade Impact

The RMM load is unchanged by this activity and therefore is not required to be upgraded from the currently available load. All other loads are upgraded in the standard fashion and the upgrade procedure is not impacted by this activity.

The feature impacts Core, GWC, and XPM software. The standard DMS processes for upgrade order applies to ABI XPMs. With regard to GWCs and XPMs, the XPMs are upgraded first, followed by the GWCs.

4.5 Data schema (DS) (CM, MIBS, RDB)

4.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TABLE LTCPSINV	Changed	Unchanged

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TABLE RMMINV	Changed	Unchanged
TABLE LTCINV	Changed	Unchanged

4.5.2 Table/MIB/Remote Database Schema information

4.5.2.1 Name: TABLE LTCPSINV

Long Table Name: Line Trunk Controller P-Side Inventory

4.5.2.1.1 Functional description

Table LTCPSINV lists all the P-Side links for each of the XPMs datafilled in table LTCINV. A tuple in this table is automatically created when a tuple is added in LTCINV, and is only modified (tuples are not manually added or deleted in this table) by the craftsperson to indicate what types of links are available on the P-Side of the XPM.

This activity modifies the handling of the P-Side links for the SMA2 peripheral type. All other peripheral types are unaffected by this activity.

Prior to this activity the SMA2 was only allowed to have DS-1 or DCH type P-Side devices. With the implementation of this activity support is provided for a single DS30A P-Side link on the SMA2. This is specifically being added to allow the SMA2 to have an RMM subtending it. The RMM is connected to it's host peripheral via a single DS30A link.

The format of LTCPSINV in not changed, all that is done is to allow the provisioning of a DS30A type link on the SMA2.

4.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

4.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LTCPSINV	Unchanged by this activity	Unchanged by this activity	Unchanged by this activity.

4.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for LTCPSINV.

EXP_TAB = "<LINK NUMBER (0-53)> DS30A"

When modifying the LTCPSINV entry for the SMA2 the EXP_TAB entry is changed to be a P-Side type of DS30A from NILTYPE.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
EXP_TAB	Changed	Unchanged from the existing set of P-side types.	DS30A	EXP_TAB refers to the expanded table of P-side links that is available for CPM-based peripherals (of which the SMA2 is one). The EXP_TAB allows the entry of up to 54 P-side links on the XPM, which is what is available when the SMA2 is setup with an extension shelf. This activity adds the capability to add a DS30A link on the P-side of the SMA2 XPM, specifically on link 52 only.

4.5.2.1.5 Datafill example

The following example shows sample datafill for table LTCPSINV. The changes from the prior allowed SMA2 peripheral datafill is highlighted with **bold** characters. This example is for an SMA2 without at extension shelf, but the DS30A provisioning is identical (ie: link 52 is always used) for a single shelf system.

4.5.2.1.6 Table release history update

The following changes have been made to table LTCPSINV in this release:

1. A single DS30A type P-side link can be added to SMA2 peripherals on link 52.

4.5.2.1.7 Supplementary information

There are a number of restrictions on how the provisioning of the DS30A link on the SMA2 can be done. The following list defines the set of restrictions.

Note: DS30A provisioning, and any associated restrictions, for LTCs and LGCs have not been changed and are not impacted by the restrictions listed here. These restrictions apply to the SMA2 only.

Limitations:

- There can be a maximum of 1 P-side DS30A link on an SMA2, and hence a maximum of 1 RMM subtending an SMA2.
- The DS30A uses link 52 regardless of whether this is a single or extension shelf system. Prior to this activity link 52 was not used by the SMA2 and therefore using this link does not impact any existing configurations. Any attempt to add the DS30A on a link other than 52 will result in an error.
- The DS30A cards can only be located in slots 13 and 15 of the main shelf of an SMA2 system (regardless of whether the system has an extension shelf or not). Due to a backplane restriction the cards will not fit into any other slot in the main shelf. The DS30A cards cannot be placed into any slot in the extension shelf.

  Note: Slots 13 and 15 of existing SMA2 systems will have a 0X50AA filler cards in them prior to this activity. These slots were previously unused by the SMA2 as there was no supported card that fit into these slots. To add

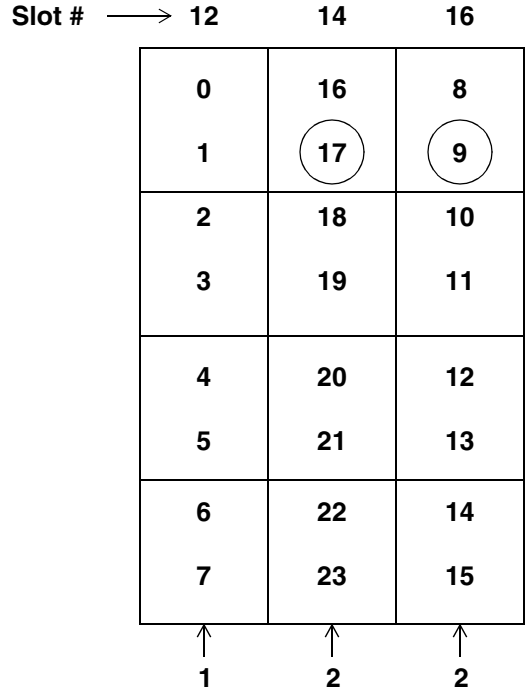
the MX74 DS30A cards to an SMA2 these filler cards will need to be removed to allow installation.

Note: Two DS30A cards need to be installed into the SMA2 to ensure that the DS30A link is kept in service at all times as one card serves each unit of the XPM. Port 52 only terminates on the back of slot 15 in the SMA2 due to the hardware design of the shelf, but the two DS30A cards are linked on the backplane of the shelf to allow either card to communicate on port 52 depending on which card is active.

- There are no restrictions on the provisioning of DS-1s/DCHs and the DS30A link in an SMA2 as the DS30A uses a link number that is not used by any of the other type of p-side links.

Figure 1, "SMA2 Existing Slot and Link Usage Restrictions - Main Shelf" and Figure 2, "SMA2 Existing Slot and Link Usage Restrictions - Extension Shelf" show the existing slot and link restrictions for the SMA2. These diagrams are duplicates of those found in the existing SMA2 (ESMA) Maintenance NTP (297-8263-550) in the “SMA2 Hardware” Chapter. They are provided here for reference only. The NTP diagrams are the master copies of these and take presidence over these versions.

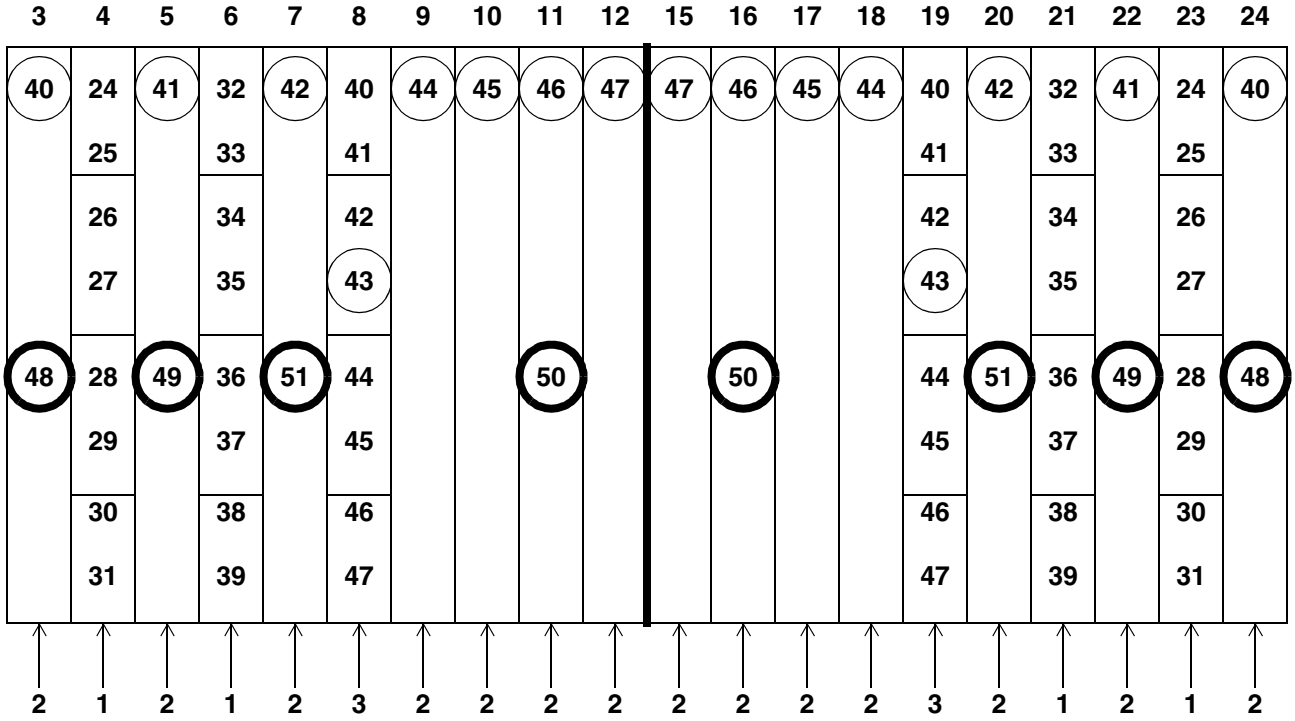
Figure 1 SMA2 Existing Slot and Link Usage Restrictions - Main Shelf



The bottom numbers indicate the type of cards that can be contained in the slot:
1 = DS-1
2 = DS-1 or DCH

NOTE: The allowed link numbers for DCH are circled.

Figure 2 SMA2 Existing Slot and Link Usage Restrictions - Extension Shelf



The bottom numbers indicate the type of cards that can be contained in the slot:
1 = DS-1 Only
2 = DCH Only
3 = DS-1 or DCH

NOTE: The allowed link numbers for DCH are circled, with the normal bold circles being those for the DCH links in the special initial configuration (48 DS-1s and 4 DCHs). The non-bold circles indicate the possible locations for the DCHs when not in the special initial configuration. The link numbers that are not circled are those used by the DS-1 cards with the exception of 43, which can be a DS-1 link or a DCH link depending on which type of card is in slot 8/19.

4.5.2.1.8 Translation verification other tools

Output from the check all table control command and tabaudit will be included at a later date, but no issues are expected with these commands as the changes to LTCINV are minor.

4.5.2.2 Name: TABLE RMMINV

Long Table Name: Remote Maintenance Module Inventory

4.5.2.2.1 Functional description

Table RMMINV contains the inventory list for all the RMMs provisioned in the office. Each tuple contains the RMM's site, the PEC code for the hardware,

information about the RMM load, the EXEC lineup for the RMM, and finally, a pointer to the C-side peripheral upon which the RMM is hosted.

This activity has altered this table to allow the C-side PM to include a new set of allowable XPM types, including LGC, LTC, and SMA2.

Note: Although official support of the LTC is added with this activity there are no code changes needed for this as the table already allowed an LTC to be the host peripheral for an RMM prior to this release.

Note: It should also be noted that LGCI and LTCIs are also supported as host peripherals for the RMM; however, the distinction between the LTC/LGC and their ISDN counterparts (LTCI/LGCI) is strictly done based on where ISDN subtending devices are provisioned on the host. There is no actual LTCI or LGCI XPM type defined in the DMS, they are known only as LTCs or LGCs.

4.5.2.2.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

4.5.2.2.3 Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
RMMINV	Unchanged by this activity	Unchanged by this activity	Unchanged by this activity.

4.5.2.2.4 Fields/OIDs

The following table lists fields/OIDs for RMMINV.

CSPMINFO = “<RMMSMA2 or RMMLTC> <XPM Key from LTCINV> <Port Number of DS30A Link from LTCPSINV>”

For Example:

CSPMINFO = “RMMSMA2 SMA2 0 52”

where “SMA2 0” is the XPM key from LTCINV and “52” is the port number in LTCPSINV of a DS30A link on SMA2 0.

Note: It should be noted that the RMM Selector for the LTC and LGC peripherals is the same (RMMLTC). This is due to the fact that these two

peripherals are simply variations of the same hardware, and are also treated identically in the software.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CSPMINFO	Changed	New RMM Selector of RMMSMA2 has been defined for adding RMMs to SMA2 ABI XPMs.	RMMSMA2	When RMMSMA2 is entered as the RMM Selector for the CSPMINFO field the user is then prompted for the SMA name/number and the DS30A port to use. The DS30A port number must match that provisioned in table LTCPSINV for the SMA2 (52 is the only allowed link number for a DS30A on an SMA2).
CSPMINFO	Changed	The handling of the CSIDEPM has been modified such that when an RMM Selector of RMMLTC is entered the allowed C-side PM types now includes LTC and LGC.	CSIDEPM	When RMMLTC is entered as the RMM Selector for the CSPMINFO field the user is then prompted for the name/number of the LTC/LGC and the DS30A port to use (fields CSIDEPM and CSIDPORT). The DS30A port number must match that provisioned in table LTCPSINV for the XPM.

4.5.2.2.5 Datafill example

The following 3 examples show sample datafill for table RMMINV. The first example shows the provisioning of an RMM hosted on an SMA2, the second shows the provisioning of an RMM on an LTC, and the third shows the provisioning of an RMM on an LGC. The changes from the prior allowed datafill is highlighted with **bold** characters.

4.5.2.2.6 Table release history update

The following changes have been made to table RMMINV in this release:

1. New RMMSELECTOR of RMMSMA2 has been added.
2. CSIDEPM of SMA2 is now allowed when the RMMSELECTOR is RMMSMA2.
3. The CSIDPORT for SMA2 type CSIDEPM must be between 0 and 53, and must match that provisioned in table LTCPSINV for the SMA2 (port 52, although there is no specific error checking for this in RMMINV, it is enforced through table LTCPSINV).
4. For RMMSELECTOR of RMMLTC the following peripheral types are now supported for the CSIDEPM field:
   — LTC
   — LGC
5. The CSIDPORT for peripherals with a RMMSELECTOR of RMMLTC must be between 0 and 19.

4.5.2.2.7 Supplementary information

Limitations:

- The RMM is only supported on the LGC, LTC, and SMA2 ABI XPMs. It should also be noted that the RMM is not supported on the legacy (ENET-based) versions of these peripheral types.
- The CHANGE operation cannot alter the content of the C-side Port portion of the tuple. Any attempt to alter this value will result in an error and the tuple will be rejected by table control. If the C-side port information needs to be altered then the RMM must be deleted and re-added to the table. Note

that this is not new behavior, it simply reflects the existing restriction for RMMs.

4.5.2.2.8 Translation verification other tools

Output from the check all table control command and tabaudit will be included at a later date, but no issues are expected with these commands as the changes to LTCINV are minor.

4.5.2.3 Name: TABLE LTCINV

Long Table Name: Line Trunk Controller Inventory

4.5.2.3.1 Functional description

Table LTCINV contains a list of all the provisioned LTC-type peripherals in the system. ABI-based XPMs are datafilled in this table and are distinguished by the addition of the EXTDS512 optional attribute to their tuples.

This activity alters the functionality of LTCINV to allow the provisioning of a new type of EXEC for the SMA2 peripherals. To support the functionality of the RMM on the SMA2 the RSMEX EXECs need to be downloaded to the SMA2 when the SMA2 is RTSed. Prior to this activity this set of EXECs were not allowed to be provisioned against an SMA2. This is an existing set of EXECs that just needs to be sent to the SMA2.

Note: These EXECs need to be provisioned against the host peripheral for the RMM, which also can now include the LTC and LGC. Although we did not officially support the LTC and LGC prior to this release they were allowed to have the RSMEX EXECs provisioned against them already, so no work was done by this activity to support this.

4.5.2.3.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

4.5.2.3.3 Size

Table 6 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LTCINV	Unchanged by this activity	Unchanged by this activity	Unchanged by this activity.

4.5.2.3.4 Fields/OIDs

The following table lists fields/OIDs for LTCINV.

EXECTAB = “RMM_TERM RSMEX”

When adding a subtending RMM on an LTC, LGC, or SMA2 the EXECTAB field needs to include RMM_TERM RSMEX. This can be done either at the time the XPM is first provisioned or can be added at a later date using the CHANGE command.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
EXECTAB	Changed	Unchanged from the existing set of EXECs.	RMM_TERM RSMEX	RSMEX EXECs need to be downloaded to the host peripheral for the RMM. The LTC/ LGC already supported this set of EXECs but the SMA2 did not.

4.5.2.3.5 Datafill example

The following example shows sample datafill for table LTCINV. The example shown below demonstrates the addition of RSMEX EXECs to an SMA2 using the CHANGE command. The changes from the prior allowed SMA2 peripheral datafill is highlighted with **bold** characters.

4.5.2.3.6 Table release history update

The following changes have been made to table LTCINV in this release:

1. EXECTAB field for SMA2, LGC, and LTC can now include "RMM_TERM RSMEX"

4.5.2.3.7 Supplementary information

Limitations:

- The RMM is only supported on the LGC, LTC, and SMA2 ABI XPMs, not on the SMS.

4.5.2.3.8 Translation verification other tools

Output from the check all table control command and tabaudit will be included at a later date, but no issues are expected with these commands as the changes to LTCINV are minor.

4.6 Service Orders (SO) (CM & SESM)

Not Applicable

4.7 Software optionality control (SOC)

Not Applicable

4.8 Element Management

Not Applicable

4.9 Command interface changes

4.9.1 Directory: MAPCI;MTC;PM

4.9.1.1 Directory description

No new commands or parameters have been introduced. However an RMM has been introduced as a subtending peripheral of an LTC, LGC, and SMA2. Existing maintenance actions through the MAP are supported for an RMM subtending these peripherals.

4.9.1.2 Accessing directory: PM

4.9.1.2.1 Access to directory or MAP level and return to CI

The updated displays are accessed through the PM (peripherals) level of the maintenance (MTC) level of the DMS core command interface (MAPCI). The RMM must be posted to perform maintenance actions on the RMM.

4.9.2 Command: TRNSL C

4.9.2.1 Command type: Listed MENU

4.9.2.2 Command target: All

This functionality will only be used in Succession ABI loads, but the software exists in all loads.

4.9.2.3 Command availability: RES

4.9.2.4 Command description

TRNSL C (translate c-side links) is not a new command, however when an RMM subtends an LTC, LGC, or SMA2, a TRNSL C of the RMM will display its c-side link.

Note that the supertending[1] peripheral is an ABI peripheral, and a TRNSL C of that peripheral will provide additional ABI information.

4.9.2.5 Command syntax

Table 8 TRNSL C

Command	Parameters and variables
TRNSL C	unchanged
Parameters and variables	unchanged

4.9.2.6 Example

Usage example for "MAPCI;MTC;PM; POST RMM <X>;TRNSL C" command

[1]The phrase "supertend peripheral" defines the peripheral which is immediately to the Cside of the peripheral being described. The phrase is meant to distinguish it from "host" peripheral, which sometimes implies the peripheral connected to the Network.

```

RMM is displayed on appropriate link.

4.10 Security

Not Applicable

4.11 Configuration Walkthrough

The following lists the steps to provision and RMM hosted on an existing SMA2 ABI XPM:

1. Upgrade all Succession components (Core, GWC, MG9K, etc.) to SN06.2.
2. Install RMM and Power up.
3. Install DS30A boards (MX74) in slot 13 and 15 of an SMA2 shelf following existing procedure for MX74 installation for RCC2 shelf. One place this procedure is defined is in "DMS-100 Family NA100 Card Replacement Procedure Vol 7 of 7 LEC0015 and up". There is a section within this document entitled "NTMX74 in an RSC-S (DS-1) Model A RCC2".
4. Install the DS30A cable from the SMA2 (port 52) to the RMM.
5. Provision LTCINV for the SMA2 which supertends the RMM with EXECTAB set to "RMM_TERM RSMEX".
6. Table LTCPSINV - Change the new SMA2 tuple to include a DS30A link on the SMA2 in P-side port 52 for the RMM (note the restrictions on where this link may exist are documented earlier in this chapter).

7. Table RMMINV - Add a new RMM to point to the SMA2 as it's CSIDEPM with the CSIDPORT set to the same port number as the DS30A datafilled in step #6 (52).
8. Once this is complete the new SMA2 can be RTSed and brought into service and it should download the RSMEX EXECs..
9. Test the DS30A cable by running a DS30A test from the map with SMA2 XPM posted.
10. RTS the DS30A link.
11. Load and RTS the RMM.

5: Configuration (CN): A00002009

5.1 Data schema (DS)

- Table KSETFEAT: The name up to 24 characters provided by this feature will be stored in this table.
- Table LCCOPTS: The list of compatible LCCs of this feature will be specified here.

5.2 Service Orders (SO)

5.2.1 Summary of service order impact

NAME24 must be added to a set via SERVORD.

5.2.2 Service order change details

- IDENTIFY any NEW LCC introduced by this feature:

  None.
- IDENTIFY any NEW OPTIONS introduced by this feature:

  NAME24.
- FOR EACH OPTION, list other options that must be assigned:

  NAME option must be assigned for NAME24 option to work.

5.2.3 Line class code compatibility

Compatible LCCs in the CCM layer:

- PSET
- P_Phone
- M5008
- M5009
- M5208
- M5209
- M5112
- M5212
- M5312

- M5216
- M5316

Compatible LCCs in the MSL layer

- P_Phone
- PSET
- M5008
- M5009
- M5208
- M5209
- M5112
- M5212
- M5312

SOC option control type:	state
New SOC option?	Yes
SOC option order code	MDC00075
Option defined in DRU:	CCM
Affected products:	CCM

6: Configuration (CN): A00002012

6.1 Command interface changes

Currently on XA-Core, the CMIC functionality on packlet is provided by a CMIC link. The RTIF functionality on packlet is provided by an RTIF port. With the introduction of the CMIC/RTIF HIOP card, port/link separation will be implemented for the CMIC and RTIF functionalities on HIOP. That is, both services will be maintained by a port and a link. Hence, the CMIC and RTIF MAP levels have to change to reflect the new port/link separation.

> **Note:** this feature does not implement port/link separation on CMIC and RTIF packlets.

Port/link separation has already been done for the ETHR and AMDI functionality on the HIOP card by the Ethernet Maintenance feature (A59019176) and the HIOP ATM Maintenance software feature (A59035251). In order to have consistent MAP representation of ports and links in the XA-Core system, this feature will reuse the OAM design decisions applied for those features.

6.1.1 IO MAP level

Currently on the IO MAP level, the CMIC and RTIF functionality are only represented on packlets in lower and upper positions. No ‘middle’ packlets exist. Please refer to “Figure 1 IO MAP with CMIC and RTIF packlets on IOPs in slots 4R and 15R” on page 2421. With the introduction of the CMIC/RTIF HIOP, these functionalities can be hosted on either packlets or HIOP cards. Please refer to “Figure 2 IO MAP with CMIC/RTIF HIOPs in slots 4R and 15R” on page 2421.

Figure 1 IO MAP with CMIC and RTIF packlets on IOPs in slots 4R and 15R

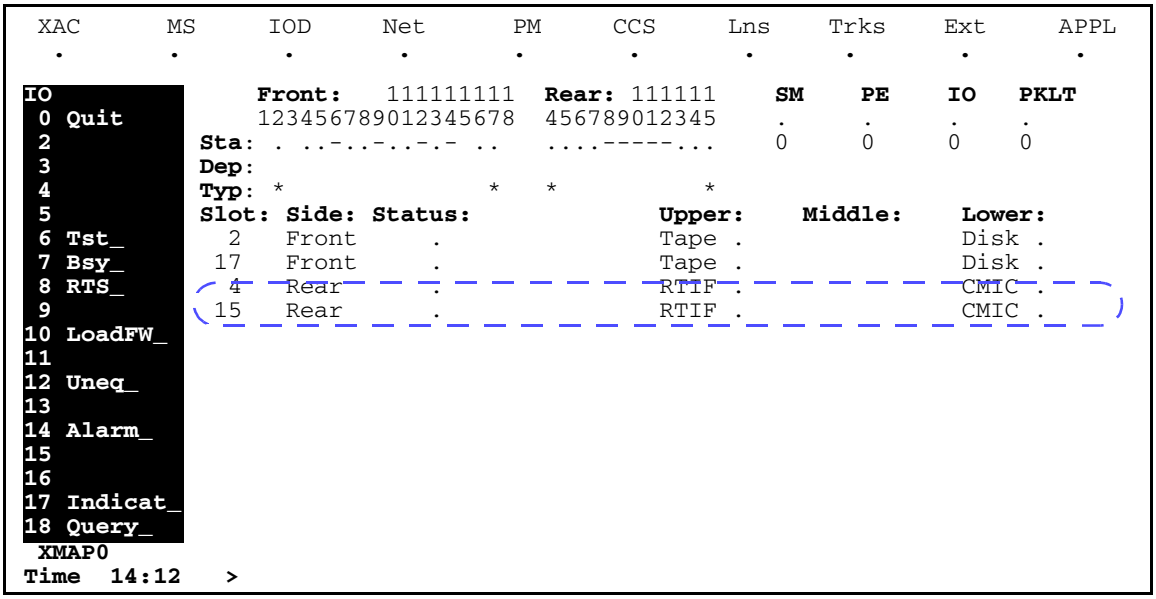

Figure 2 IO MAP with CMIC/RTIF HIOPs in slots 4R and 15R

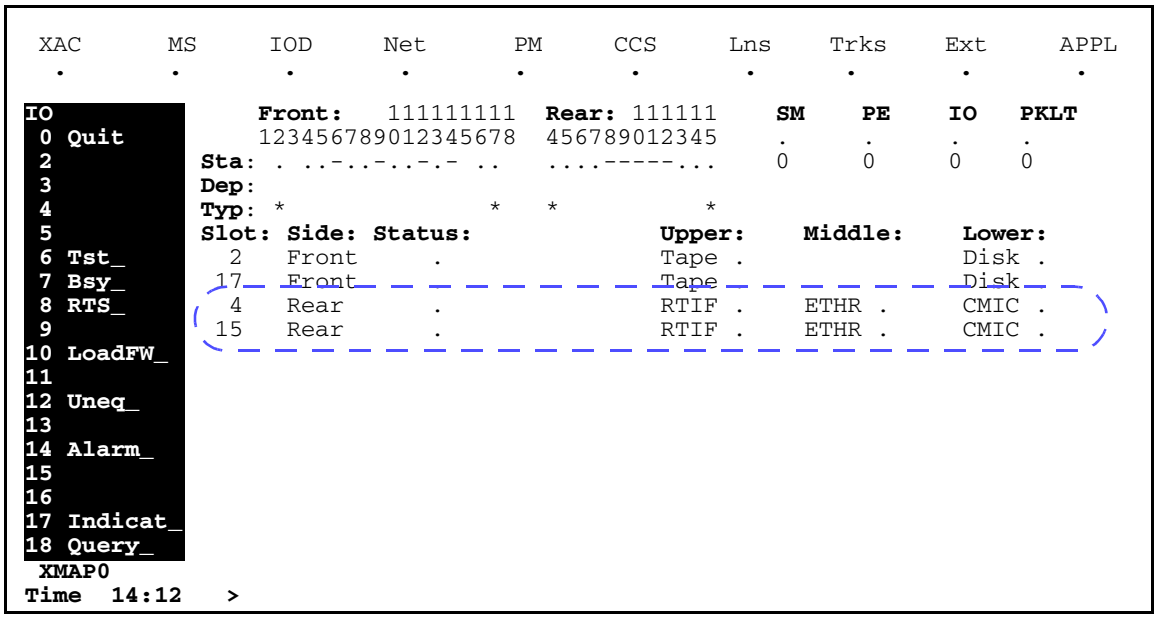
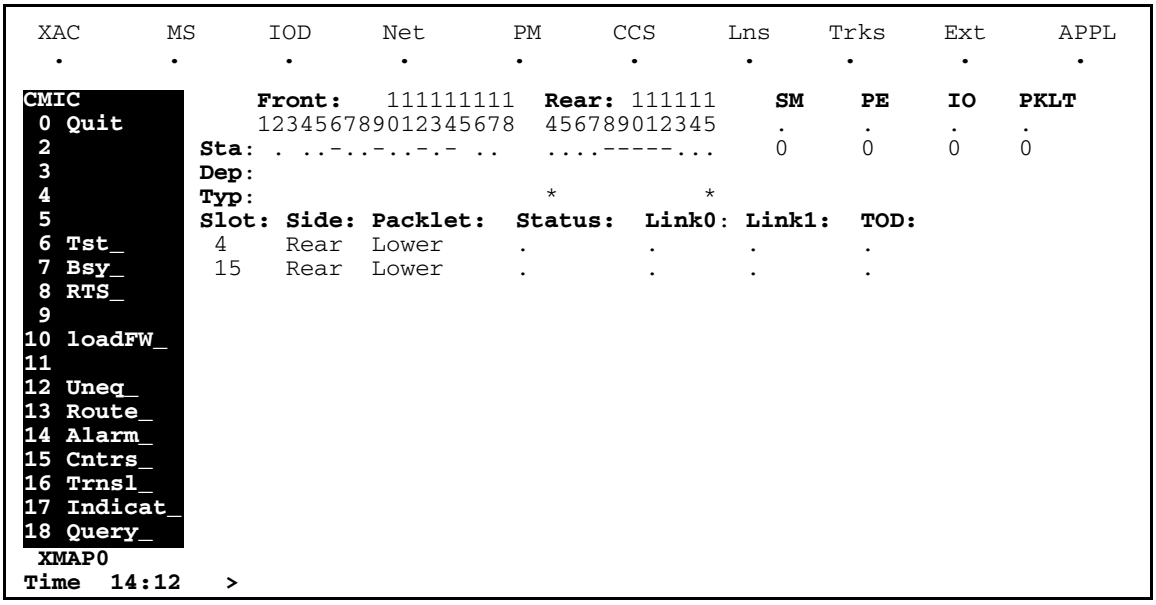


6.1.2 CMIC MAP level

Currently, the CMIC functionality can only be hosted by a CMIC packlet on an IOP card. Please refer to “Figure 3 Current CMIC MAP level with CMIC packlets in slots 4R and 15R” on page 2422.

Figure 3 Current CMIC MAP level with CMIC packlets in slots 4R and 15R



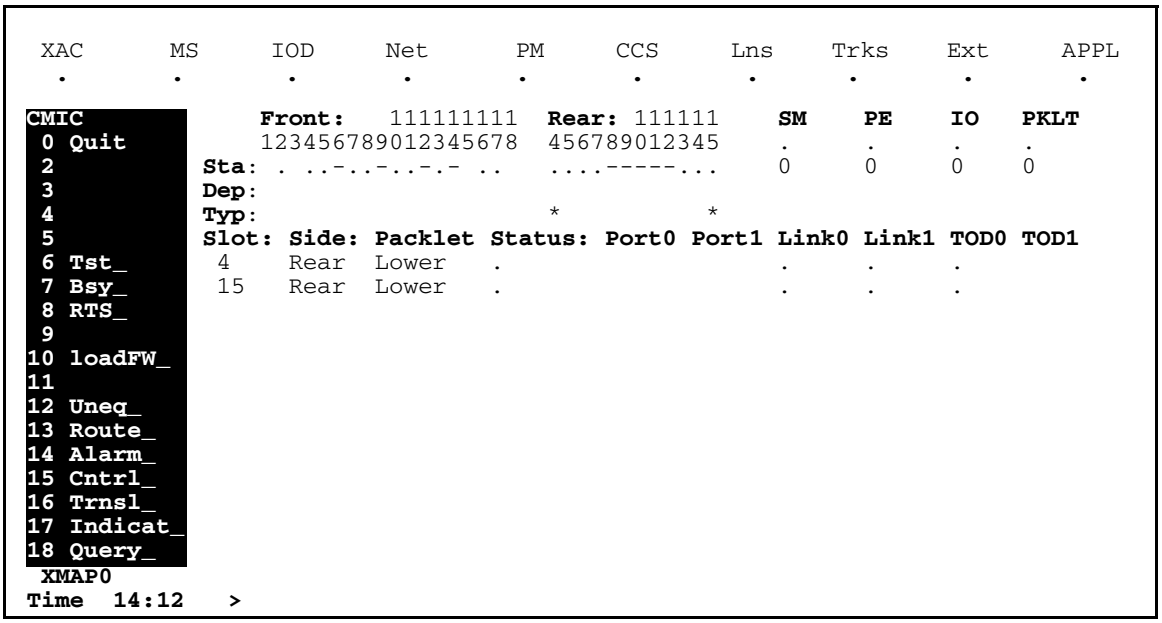
With the introduction of the CMIC/RTIF HIOP, the new CMIC MAP will show the functionality hosted by either a CMIC packlet on an IOP card, or by a CMIC/RTIF HIOP. Also, with CMIC port/link separation on CMIC/RTIF HIOP, new CMIC port0 and CMIC port1 components will be shown on the CMIC MAP level. Furthermore, instead of showing one TOD device component per CMIC packlet, two TOD devices will be shown for each CMIC/RTIF HIOP card: TOD0 and TOD1.

Table 1 Summary of CMIC MAP field changes

Component	Current MAP field	New MAP field	New/Deleted/ Changed
CMIC Port 0	n/a	‘Port0’	new
CMIC Port 1	n/a	‘Port1’	new
CMIC Link TOD	‘TOD’	‘TOD0’	changed
CMIC Link1 TOD	n/a	‘TOD1’	new

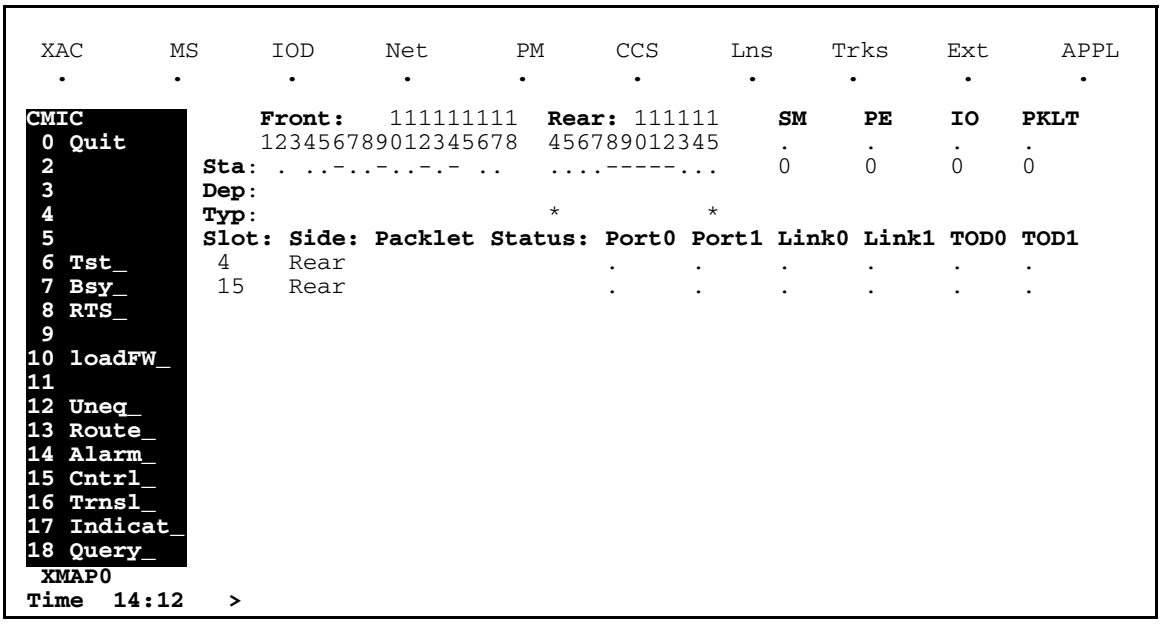
For CMIC packlets represented on the new CMIC MAP level, the following components will be shown as before: Slot, Side, Packlet, Status, link0, and link1. Port0 and port1 components will be left blank. The TOD component will be represented by the new TOD0 component. The TOD1 component will be left blank. Please refer to “Figure 4 New CMIC MAP level with CMIC packlets in slots 4R and 15R” on page 2423.

Figure 4 New CMIC MAP level with CMIC packlets in slots 4R and 15R



For CMIC functionality on CMIC/RTIF HIOP represented on the new CMIC MAP level, since the card does not have packlets, the ‘Packlet’ location field, and the packlet ‘Status’ field will be left blank. Also, in addition to the two CMIC links, there are going to be two new CMIC ports shown (Port0 and Port1), as well as two TOD devices for each CMIC/RTIF HIOP card (TOD0 and TOD1). Please refer to “Figure 5 New CMIC MAP level with CMIC/ RTIF HIOPs in slot 4R and 15R” on page 2424.

Figure 5 New CMIC MAP level with CMIC/RTIF HIOPs in slot 4R and 15R



The new CMIC MAP level will be able to show both, packlet and HIOP, configurations during the migration from one configuration to the other (e.g. CMIC packlet to CMIC/RTIF HIOP).

6.1.2.1 Command: uneq

With the introduction of the new CMIC/RTIF HIOP card, the CMIC packlets will have to be migrated to the new card. Hence, from now on, the XA-Core system will support the provisioning and deprovisioning of CMIC components. The ‘uneq’ command will be used for deprovisioning a CMIC packlet on an IOP card or a CMIC link on a CMIC/RTIF HIOP card. Currently CMIC packlet deprovisioning is not supported.

Table 2 New or modified CMIC MAP commands

Command Name	NEW, CHANGED or DELETED	Directory/MAP level name	MENU/NON-MENU/ HIDDEN
uneq	New	MAPCI;MTC;XAC;CMIC	Menu
trnsl	Changed	MAPCI;MTC;XAC;CMIC	Menu

6.1.2.1.1 Command description

The ‘uneq’ MAP command is used to deprovision a component from the XA-Core system. On the CMIC MAP level, the ‘uneq’ command will be used to deprovision a CMIC packlet residing on an IOP card, or to deprovision a

CMIC link residing on a CMIC/RTIF HIOP card. Until now, deprovisioning of CMIC packlets was not supported since they were part of the ‘fixed’ XA-Core configuration (slots 4R and 15R). From now on, deprovisioning of CMIC components is needed for the migration of CMIC packlets to CMIC/RTIF HIOP cards and back.

Table 3 Summary of the new ‘uneq’ CMIC MAP level command

Command	Menu#	Type	Options	Function
uneq	12	Operational	None	- Deprovision a CMIC packlet on an IOP card - Deprovision a CMIC link on an HIOP card

6.1.2.1.2 Command syntax

The ‘uneq’ command requires parameters. If you do not enter any parameters or you enter invalid parameters, the MAP terminal displays an error message. The MAP terminal prompts you to enter a correct parameter value.

Table 4 ‘uneq’ command parameters and variables

Command	Parameters and variables
uneq	- slot number (0 to 17), - side (front, f or rear, r), - packlet position (upper, u, or lower, l), - link number (link0 or link1).
Parameters and variables	**Description**
slot number	Use the ‘slot number’ parameter value to indicate the number of the physical shelf slot: 0 to 17
side	Use the ‘side’ parameter value to indicate the component location in the physical shelf: front, f or rear, r
packlet position	Use the ‘packlet position’ parameter value to indicate the CMIC packlet location on an IOP card: upper, u or lower, l. This is used only for CMIC packlet deprovisioning and is not used for CMIC link.
link number	Use the ‘link number’ parameter value to indicate the CMIC link position on a CMIC/RTIF HIOP card: link0 or link1. This is used only for CMIC link deprovisioning and is not used for CMIC packlets.

Note: The ‘slot number’ parameter value will usually be ‘4’ or ‘15’. The ‘side’ parameter value will usually be ‘rear’ or ‘r’. The ‘packlet position’ parameter value will usually be ‘lower’ or ‘l’.

6.1.2.1.3 Qualifications and warnings

The ‘uneq’ command should be used with great care since it deprovisions a component from the XA-Core system. There are some general requirements for the successful completion of the ‘uneq’ command. They are (in order):

- first, the component must be brought into a ‘ManB’ state,
- then, the component must be pulled from the shelf,
- finally, the ‘uneq’ command can be issued for the component.

Since the ‘uneq’ command on the CMIC MAP level can be issued for the CMIC packlet residing on an IOP card or for a CMIC link residing on an HIOP card, the command usage will be different depending on the component being deprovisioned. Please refer to Section “6.1.2.1.5 Example” on page 2428.

Note: Deprovisioning of CMIC links on packlets is not supported.

6.1.2.1.4 MAP Responses

Table 5 MAP outputs with associated meanings and actions

Command
RESPONSE: Command submitted. Uneq 4 Rear Lower completed. **Meaning:** This response indicates that the ‘uneq’ command has completed successfully. **System or user actions:** none
RESPONSE: Command submitted. Improper state for required action, no action take **Meaning:** this response indicates that the ‘uneq’ command has been issued without bringing the component into the ‘ManB’ state first. **System or user actions:** the craft person has to ‘ManB’ the component

Table 5 MAP outputs with associated meanings and actions

Command
RESPONSE: Command submitted H/W must be removed from shelf, no action taken **Meaning:** this response indicates that the ‘uneq’ command has been issued without removing the component from the shelf, or without waiting long enough for the system to recognize the component’s loss of clock. **System or user actions:** the craft person has to remove the component from the shelf. If the component is already removed, the craft person has to wait long enough (e.g. one minute) for the system to recognize the component’s loss of clock.
RESPONSE: Card/device is unadressable...no action taken. **Meaning:** this response indicates that there is no provisioned component in the given location. **System or user actions:** the craft person has to check the FRU location
RESPONSE: Either incorrect optional parameter(s) OR too many parameters **Meaning:** this response indicates that the ‘uneq’ command was issued without following the correct syntax. For example, the ‘link0’ or ‘link1’ parameter values were entered while deprovisioning a CMIC packlet on an IOP card (CMIC link deprovisioning not supported on packlets). **System or user actions:**
RESPONSE: <slot> <side> is an IOP. Packlet location must be specified **Meaning:** this response indicates that the ‘uneq’ command was issue for a CMIC packlet slot, but the packlet location parameter value (lower, l or upper, u) was not specified. **System or user actions:** re-enter the ‘uneq’ command with correct syntax.
RESPONSE: <slot> <side> is an HIOP. Packlet location does not apply. **Meaning:** this response indicates that the ‘uneq’ command was issued for a CMIC link on an HIOP card, but a packlet location parameter value was entered. **System or user actions:** re-enter the ‘uneq’ command with correct syntax.

6.1.2.1.5 Example

Table 6 Usage examples for 'uneq' command on the CMIC MAP level

Description of task: Command: MAP response:	Deprovision a CMIC packlet on an IOP card Example: uneq 4 rear lower Example: Command submitted. Uneq 4 Rear Lower completed
Description of task: Command: MAP response:	Deprovision a CMIC link 0 on an HIOP card Example: uneq 4 rear link0 Example: Command submitted. Uneq 4 Rear Link0 completed.

6.1.2.2 Command: trnsl

With the introduction of the new CMIC/RTIF HIOP card, the CMIC packlets will have to be migrated to the new card. Hence, from now on, the 'trnsl' command has to support the new HIOP card. This feature does not change the functionality of the command.

6.1.2.2.1 Command description

The 'trnsl' MAP command is used on the MAPCI;MTC;XAC;CMIC MAP level to find out the identity of the MS CMIC paddle board ports connected to a given CMIC link on the XA-Core. Until now, the 'trnsl' command was only used on CMIC packlets. From now on, it can be issued for either a CMIC packlet or CMIC component on the HIOP card.

6.1.2.2.2 Command syntax

This feature does not change the parameter values expected by the 'trnsl' command, its menu number on the CMIC MAP level. It only makes changes to the usage of the command. That is, for CMIC/RTIF HIOP cards, the packlet location parameter value should not be entered. For CMIC packlets, the 'trnsl' command should be issued as before.

6.1.2.2.3 MAP Responses

Table 7 MAP outputs with associated meanings and actions

Command
RESPONSE: Command submitted. Trnsl 4 Rear completed. **Meaning:** This response indicates that the 'trnsl' command has completed successfully. **System or user actions:** none

Table 7 MAP outputs with associated meanings and actions

Command
RESPONSE: Card/device is unadressable...no action taken. **Meaning:** this response indicates that there is no provisioned component in the given location. **System or user actions:** the craft person has to check the FRU location
RESPONSE: Either incorrect optional parameter(s) OR too many parameters **Meaning:** this response indicates that the ‘trsnl’ command was issued without following the correct syntax. For example, the packlet location parameter value was entered for an HIOP. **System or user actions:** re-enter the ‘trnsl’ command with correct syntax.
RESPONSE: <slot> <side> is an IOP. Packlet location must be specified **Meaning:** this response indicates that the ‘trnsl’ command was issued for a CMIC packlet slot, but the packlet location parameter value (lower, l or upper, u) was not specified. **System or user actions:** re-enter the ‘uneq’ command with correct syntax.
RESPONSE: <slot> <side> is an HIOP. Packlet location does not apply. **Meaning:** this response indicates that the ‘trnsl’ command was issued for a CMIC component on an HIOP card, but a packlet location parameter value was entered. **System or user actions:** re-enter the ‘trnsl’ command with correct syntax.

6.1.2.2.4 Example

For CMIC packlets, the ‘trnsl’ command usage will be the same. For CMIC components on an HIOP card, the ‘trnsl’ command will have to be entered without specifying the packlet location (lower or upper). Next table shows some examples.

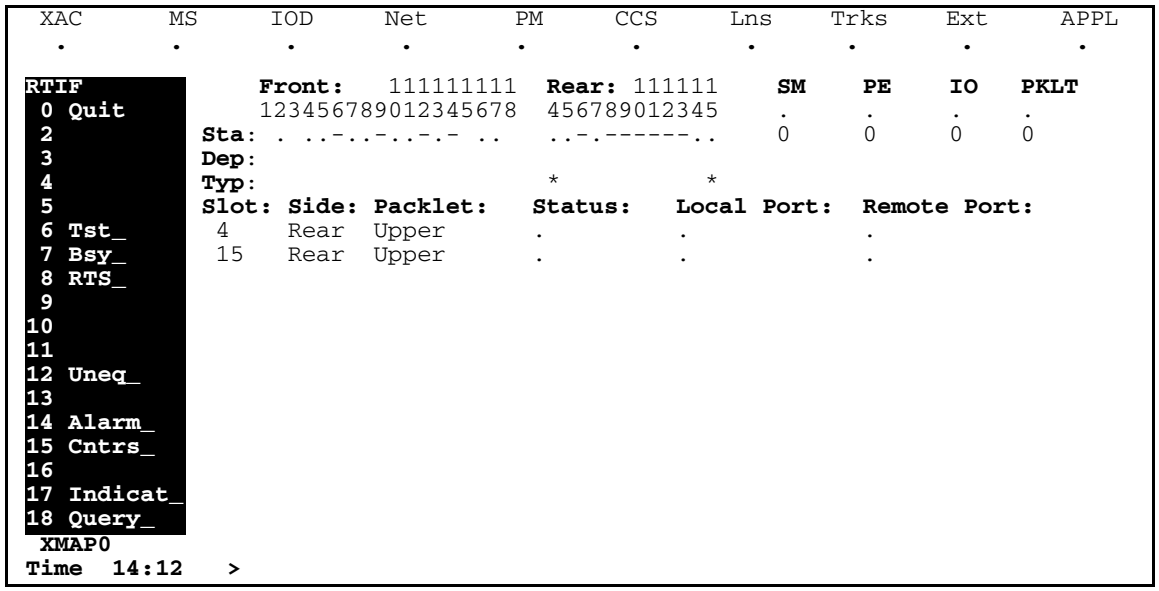
Table 8 Usage examples for ‘trnsl’ command on the CMIC MAP level

Description of task: Command: MAP response:	Trnsl a CMIC packlet on an IOP card Example: trnsl 4 rear lower Example: Command submitted. Trnsl 4 Rear Lower completed
Description of task: Command: MAP response:	Trnsl CMIC on an HIOP card Example: trnsl 4 rear Example: Command submitted. Trnsl 4 Rear completed.

6.1.3 RTIF MAP level

Currently, the RTIF functionality can only be hosted by an RTIF packlet on an IOP card. Please refer to “Figure 6 Current RTIF MAP level with RTIF packlets on IOPs in slots 4R and 15R” on page 2430.

Figure 6 Current RTIF MAP level with RTIF packlets on IOPs in slots 4R and 15R



With the introduction of the new CMIC/RTIF HIOP, the new RTIF MAP will show the functionality hosted by either an RTIF packlet on an IOP card or an CMIC/RTIF HIOP card. Also, with RTIF port/link separation on CMIC/RTIF

HIOP, new RTIF link0 and RTIF link1 components will be shown on the RTIF MAP level.

Table 9 Summary of RTIF MAP field changes

Component	Current MAP Field	New MAP Field	New/Deleted/ Changed
RTIF Local Port on Packlet	'Local Port'	'n/a'	Deleted
RTIF Remote Port on Packlet	'Remote Port'	'n/a'	Deleted
RTIF Local Link on Packlet	n/a	'Link0'	New
RTIF Remote Link on Packlet	n/a	'Link1'	New
RTIF Local Port on HIOP	n/a	'Port0'	New
RTIF Remote Port on HIOP	n/a	'Port1'	New
RTIF Local Link on HIOP	n/a	'Link0'	New
RTIF Remote Link on HIOP	n/a	'Link1'	New

For RTIF packlets on the new RTIF MAP level, the following components will be shown as before: Slot, Side, Packlet, Status. The RTIF local port will be changed to Link0. The RTIF remote port will be changed to Link1. Port0 and Port1 will be left blank. Hence, the RTIF MAP level will be consistent with other packlet MAP levels that have no port/link separation. Please refer to "Figure 7 New RTIF MAP level with RTIF packlets on IOPs in slots 4R and 15R" on page 2431.

Figure 7 New RTIF MAP level with RTIF packlets on IOPs in slots 4R and 15R

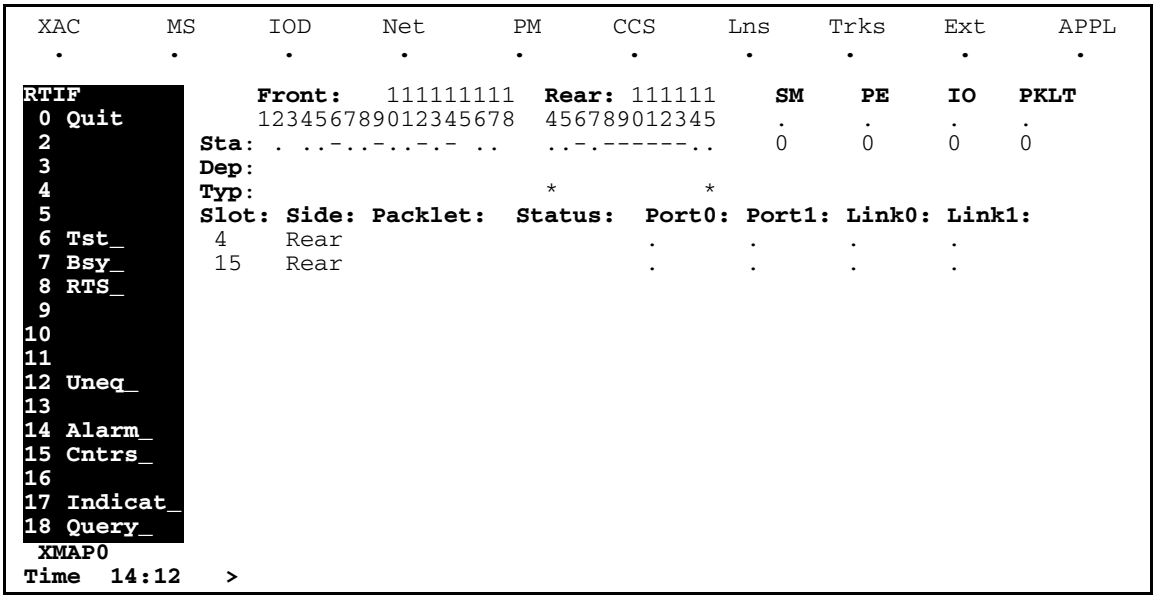
For RTIF functionality on CMIC/RTIF HIOP represented on the new RTIF MAP, since the card does not have packlets, the ‘Packlet’ location field, and the packlet ‘Status’ field will be left blank. Also, in addition to the local and remote RTIF ports, there are going to be two new RTIF links shown (link0 and link1). Please refer to “Figure 8 New RTIF MAP level with CMIC/RTIF HIOP cards in slots 4R and 15R” on page 2432.

Figure 8 New RTIF MAP level with CMIC/RTIF HIOP cards in slots 4R and 15R



The new RTIF MAP level will be able to show both, packlet and HIOP, configurations during the migration from one configuration to the other (e.g. RTIF packlet to CMIC/RTIF HIOP).

6.1.3.1 Command: uneq

With the introduction of the new CMIC/RTIF HIOP card, the RTIF packlets will have to be migrated to the new card. Hence, from now on, the XA-Core system will support the provisioning and deprovisioning of RTIF components. The ‘uneq’ command will be used for deprovisioning a RTIF packlet on an IOP card or an RTIF link on a CMIC/RTIF HIOP card. Currently, RTIF packlet deprovisioning is not supported.

Table 10 New or modified CMIC MAP commands

Command Name	NEW, CHANGED or DELETED	Directory/MAP level name	MENU/NON-MENU/ HIDDEN
uneq	changed	MAPCI;MTC;XAC;RTIF	Menu

6.1.3.1.1 Command description

The ‘uneq’ MAP command is used to deprovision a component from the XA-Core system. On the RTIF MAP level, the ‘uneq’ command will be used to deprovision a RTIF packlet residing on an IOP card, or to deprovision a RTIF link residing on a CMIC/RTIF HIOP card. Until now, deprovisioning of RTIF packlets was not supported since they were part of the ‘fixed’ XA-Core configuration (slots 4R and 15R). From now on, deprovisioning of RTIT components is needed for the migration of RTIF packlets to CMIC/RTIF HIOP cards and back.

Table 11 Summary of the new ‘uneq’ CMIC MAP level command

Command	Menu#	Type	Options	Function
uneq	12	Operational	None	- Deprovision a RTIF packlet on an IOP card - Deprovision a RTIF link on an HIOP card

6.1.3.1.2 Command syntax

The ‘uneq’ command requires parameters. If you do not enter any parameters or you enter invalid parameters, the MAP terminal displays an error message. The MAP terminal prompts you to enter a correct parameter value.

Table 12 <’uneq’> command parameters and variables

Command	Parameters and variables
uneq	- slot number (0 to 17), - side (front, f or rear, r), - packlet position (upper, u, or lower, l), - link number (link0 or link1).
Parameters and variables	**Description**
slot number	Use the ‘slot number’ parameter value to indicate the number of the physical shelf slot: 0 to 17
side	Use the ‘side’ parameter value to indicate the component location in the physical shelf: front, f or rear, r
packlet position	Use the ‘packlet position’ parameter value to indicate the RTIF packlet location on an IOP card: upper, u or lower, l. This is used only for RTIF packlet deprovisioning and is not used for RTIF link.

Table 12 <'uneq'> command parameters and variables

Command	Parameters and variables
link number	Use the 'link number' parameter value to indicate the RTIF link position on a CMIC/RTIF HIOP card: link0 or link1. This is used only for RTIF link deprovisioning and is not used for RTIF packlets.

Note: The 'slot number' parameter value will usually be '4' or '15'. The 'side' parameter value will usually be 'upper' or 'u'. The 'packlet position' parameter value will usually be 'upper' or 'u'.

6.1.3.1.3 Qualifications and warnings

The 'uneq' command should be used with great care since it deprovisions a component from the XA-Core system. There are some general requirements for the successful completion of the 'uneq' command. They are (in order):

- first, the component must be brought into a 'ManB' state,
- then, the component must be pulled from the shelf,
- finally, the 'uneq' command can be issued for the component.

Since the 'uneq' command on the RTIF MAP level can be issued for the RTIF packlet residing on an IOP card or for an RTIF link residing on an HIOP card, the command usage will be different depending on the component being deprovisioned. Please refer to Section "6.1.3.1.5 Example" on page 2436.

Note: Deprovisioning of RTIF links on packlets is not supported.

6.1.3.1.4 MAP Responses

Table 13 MAP outputs with associated meanings and actions

Command
RESPONSE: Command submitted. Uneq 4 Rear Upper completed. **Meaning:** This response indicates that the 'uneq' command has completed successfully. **System or user actions:** none
RESPONSE: Command submitted. Improper state for required action, no action take **Meaning:** this response indicates that the 'uneq' command has been issued without bringing the component into the 'ManB' state first. **System or user actions:** the craft person has to 'ManB' the component

Table 13 MAP outputs with associated meanings and actions

Command
RESPONSE: Command submitted H/W must be removed from shelf, no action taken **Meaning:** this response indicates that the ‘uneq’ command has been issued without removing the component from the shelf, or without waiting long enough for the system to recognize the component’s loss of clock. **System or user actions:** the craft person has to remove the component from the shelf. If the component is already removed, the craft person has to wait long enough (e.g. one minute) for the system to recognize the component’s loss of clock.
RESPONSE: Card/device is unadressable...no action taken. **Meaning:** this response indicates that there is no provisioned component in the given location. **System or user actions:** the craft person has to check the FRU location
RESPONSE: Either incorrect optional parameter(s) OR too many parameters **Meaning:** this response indicates that the ‘uneq’ command was issued without following the correct syntax. For example, the ‘link0’ or ‘link1’ parameter values were entered while deprovisioning an RTIF packlet on an IOP card (RTIF link deprovisioning not supported on packlets). **System or user actions:**
RESPONSE: <slot> <side> is an IOP. Packlet location must be specified **Meaning:** this response indicates that the ‘uneq’ command was issue for an RTIF packlet, but the packlet location parameter value (lower, l or upper, u) was not specified. **System or user actions:** re-enter the ‘uneq’ command with correct syntax.
RESPONSE: <slot> <side> is an HIOP. Packlet location does not apply. **Meaning:** this response indicates that the ‘uneq’ command was issued for an RTIF link on an HIOP card, but a packlet location parameter value was entered. **System or user actions:** re-enter the ‘uneq’ command with correct syntax.

6.1.3.1.5 Example

Table 14 Usage examples for 'uneq' command on the RTIF MAP level

Description of task: Command: MAP response:	Deprovision a RTIF packlet on an IOP card Example: uneq 4 rear upper Example: Command submitted. Uneq 4 Rear Upper completed
Description of task: Command: MAP response:	Deprovision a RTIF link 0 on an HIOP card Example: uneq 4 rear link0 Example: Command submitted. Uneq 4 Rear Link0 completed.

6.2 Configuration Walkthrough

6.2.1 Provisioning and Deprovisioning

For provisioning and deprovisioning the CMIC, RTIF, IOP, and HIOP components, this feature makes use of the XA-Core provisioning feature. For a more detailed explanation of the provisioning feature please refer to FN-A59009527.

6.2.1.1 CMIC packlet deprovisioning on IOP

Deprovisioning a CMIC packlet on an IOP card follows the general guidelines for deprovisioning any component in XA-Core. In addition, deprovisioning of CMIC packlets also have some particular characteristics:

- first, the CMIC links have to be manually busied from the MS side (links will go 'CBsy'),
- then the CMIC packlet must be brought into a 'ManB' state,
- once the CMIC links are 'CBsy' and the CMIC packlet is 'ManB', the craft person should remove the CMIC packlet from the IOP card,
- once the CMIC packlet is removed from the IOP card, the craft person should issue the 'uneq' command for the CMIC packlet. This deprovisions the CMIC packlet and the CMIC links.

6.2.1.2 CMIC link deprovisioning on HIOP

Deprovisioning a CMIC link on an HIOP card follows the general guidelines for deprovisioning any component in XA-Core. In addition, deprovisioning of CMIC links also have some particular characteristics:

- first, the CMIC link has to be manually busied from the MS side (link will go ‘CBsy’),
- once the CMIC link is ‘CBsy’, the craft person should remove the CMIC link from the HIOP card,
- once the CMIC link is ‘CBsy’ and removed from the HIOP card, the craft person should issue the ‘uneq’ command for the CMIC link. This deprovisions the CMIC link.

6.2.1.3 CMIC packlet provisioning on IOP

Provisioning of CMIC packlets is done as follows:

- have the host IOP card provisioned and in-service, with an empty (unprovisioned) packlet location,
- on the MS side, the craft person must manually busy both MS ports for the CMIC packlet we want to provision,
- after both MS ports are ‘ManB’, the craft person should plug in the CMIC packlet with no links attached,

  Note: when the system provisions the CMIC packlet, the CMIC links are automatically added to the system inventory. They will be ‘CBsy’.
- once the CMIC packlet is provisioned, the craft person should bring the CMIC packlet in-service,
- after the CMIC packlet is in-service, with the CMIC link ‘CBsy’, the craft person should plug the CMIC links into the CMIC packlet,
- on the MS side, once the CMIC links are provisioned and ‘CBsy’, the craft person must test both MS ports connected to the CMIC links,
- after the MS port tests pass, the craft person should bring the MS ports in-service. This will also bring the CMIC links in-service.

6.2.1.4 CMIC link provisioning on HIOP

Provisioning of CMIC links on HIOP is done as follows:

- have the host HIOP card provisioned and in-service, with an empty (unprovisioned) OC3 link location,
- on the MS side, the craft person must manually busy the MS port for the CMIC link we want to provision,

- after the MS port is ‘ManB’, the craft person should plug the CMIC link into the OC3 port of the HIOP card (the CMIC link will be ‘CBsy’),
- on the MS side, once the CMIC link is provisioned and ‘CBsy’, the craft person must test the MS port connected to the CMIC link,
- after the MS port test passes, the craft person should bring the MS port in-service. This will also bring the CMIC link in-service.

6.2.2 Migration procedures

With the introduction of the new CMIC/RTIF HIOP card, the CMIC and RTIF functionality presently hosted by packlets on IOP cards will have to be migrated to the new HIOP card. Also, a ‘back-out’ migration procedure has to be available so that the office can go from the CMIC/RTIF HIOP cards back to packlets.

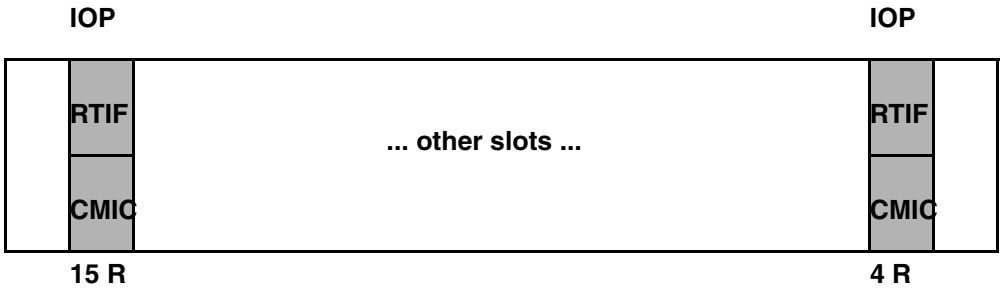
6.2.2.1 Migration from CMIC and RTIF packlets to CMIC/RTIF HIOP for SuperNode (SN)

This section describes the migration procedure from an XA-Core system with CMIC and RTIF functionality provided by packlets on IOP cards to a system with CMIC and RTIF functionality provided by CMIC/RTIF HIOP cards. The recommended approach will provision the new HIOP cards in the *same* slots (4R and 15R) as the deprovisioned IOP cards with packlets. Because of lost redundancy during the migration, there are two E2 conditions during this procedure.

The following sequence of events shows the steps:

- Start with a CMIC and RTIF packlet configuration on IOP cards in slots 4R and 15R (no CMIC/RTIF HIOP cards in the shelf). Please refer to “Figure 9 Initial CMIC and RTIF packlet configuration - XA-Core rear view” on page 2438.

Figure 9 Initial CMIC and RTIF packlet configuration - XA-Core rear view



- set the ‘xa_component_install_state’ office parameter in table OFCENG to ‘manbusy’,

- verify that table XAFWLOAD is datafilled with valid FW (ROM) and DLL (RAM) loads for the new CMIC/RTIF HIOP card,
- issue the ‘trnsl’ command for the CMIC packlet in 4 rear lower: ‘trnsl 4 rear lower’. The MAP response should look like this:

```
trnsl 4 rear lower
Command Submitted.
Trnsl  4 Rear   Lower    completed

Link 0 is connected to MS1 Shelf 0 Card 24 Port 0
Link 1 is connected to MS0 Shelf 0 Card 25 Port 0
```

- record the MS port numbers returned by the ‘trnsl’ command for the CMIC packlet in 4 rear lower,
- on the MS MAP level, manually busy the MS ports returned by the ‘trnsl’ command for CMIC packlet in slot 4 rear lower (Port 0 on MS 1, Shelf 0, Card 24 and Port 0 on MS 0, Shelf 0, Card 25). The CMIC links will go ‘CBsy’.
- on the CMIC MAP level, manually busy the CMIC packlet in slot 4 rear lower,
- on the RTIF MAP level, manually busy the RTIF packlet in slot 4 rear upper,
- on the IO MAP level, manually busy the IOP card in slot 4 rear,
- pull the CMIC packlet in slot 4 rear lower with links attached,
- pull the RTIF packlet in slot 4 rear upper,
- pull the IOP card in slot 4 rear,
- wait one minute for the system to recognize the loss of clock,
- on the CMIC MAP level, issue the ‘uneq’ command for the CMIC packlet: ‘uneq 4 rear lower’.
- on the RTIF MAP level, issue the ‘uneq’ command for the RTIF packlet: ‘uneq 4 rear upper’.
- on the IO MAP level, issue the ‘uneq’ command for the IOP card: ‘uneq 4 rear’. The following logs should be generated:

```
XAC628 MAR19 14:16:20 5600 INFO XA-Core Provisioning Report
        DESCRIPTION: Resource has been deprovisioned
        CARD: Type State Site FL Row Bay    Shf/Slt/Pk    EqPEC/Serial
              CMIC MBSY  HOST 01 A00 DPCC:00 00 04R L  NTLX05AB/NNTM64422MWV

XAC628 MAR19 14:17:20 5700 INFO XA-Core Provisioning Report
        DESCRIPTION: Resource has been deprovisioned
        CARD: Type State Site FL Row Bay    Shf/Slt/Pk    EqPEC/Serial
              RTIF MBSY  HOST 01 A00 DPCC:00 00 04R U  NTLX08AA/NNTM64422MWV

XAC628 MAR19 14:18:20 5800 INFO XA-Core Provisioning Report
        DESCRIPTION: Resource has been deprovisioned
        CARD: Type State Site FL Row Bay    Shf/Slt    EqPEC/Serial
              IO   MBSY  HOST 01 A00 DPCC:00 00 04R NTLX03AB/NNTM64422MWV
```

- at this stage, the CMIC and RTIF functionality is provided only by the packlets in slot 15 rear. Please refer to “Figure 10 Reduced CMIC and RTIF redundancy (service on packlets) - XA-Core rear view” on page 2440.

Figure 10 Reduced CMIC and RTIF redundancy (service on packlets) - XA-Core rear view

- plug the CMIC/RTIF HIOP card into slot 4 rear with no links attached. The following log should be generated:

  Note: Once the HIOP card is provisioned, all its associated ports will be provisioned as well.

```
XAC628 MAR19 14:20:20 6800 INFO XA-Core Provisioning Report
        DESCRIPTION: New resource has been provisioned
        CARD: Type State Site FL Row Bay    Shf/Slt    EqPEC/Serial
              HIOP MBSY  HOST 01 A00 DPCC:00 00 04R NTLX04BA/NNTM64422MWV
```

- the craft person should verify the success of the system-initiated provisioning test of the HIOP card in slot 4 rear by checking the XAC log 640 in logutil:

```
XAC640 MAR19 14:20:40 6900 INFO Test Report
        Type Link_Num Slot Side Packlet  Test_Type Result
        HIOP          4    R             OOS       Passed
        Initiator: Action initiated by the system
```

- once the integrity of the HIOP card in slot 4 rear has been verified, the craft person should manually RTS the card,

  Note: Once the HIOP card is in-service, all its associated ports are automatically brought in-service by the system, provided their OOS test passes.

- plug the CMIC links into the OC3 ports of the HIOP card in slot 4 rear. The system will automatically provision the CMIC links, perform an OOS test on them, and bring them into a ‘CBsy’ state.

  Note: use the same configuration as recorded for the ‘trnsl’ command issued for the CMIC packlet in slot 4 rear lower. The following log should be generated:

```
XAC628 MAR19 14:22:20 7000 INFO XA-Core Provisioning Report
        DESCRIPTION: New resource has been provisioned
        LINK: Type State Site FL Row Bay    Shf/Slt/Lk    EqPEC/Serial
              CMIC CBSY  HOST 01 A00 DPCC:00 00 04R 0  NTLX04BA/NNTM64422MWV
```

```
XAC628 MAR19 14:22:20 7100 INFO XA-Core Provisioning Report
        DESCRIPTION: New resource has been provisioned
        LINK: Type State Site FL Row Bay    Shf/Slt/Lk    EqPEC/Serial
              CMIC CBSY  HOST 01 A00 DPCC:00 00 04R 1  NTLX04BA/NNTM64422MWV
```

- on the MS MAP level, test the MS ports returned by the ‘trnsl’ command for the CMIC packlet in slot 4 rear lower (Port 0 on MS 1, Shelf 0, Card 24 and Port 0 on MS 0, Shelf 0, Card 25).

- on the MS MAP level, if the previous MS port tests passed, bring them in-service (Port 0 on MS 1, Shelf 0, Card 24 and Port 0 on MS 0, Shelf 0, Card 25). On the MS MAP level the MS ports will go from ‘M’ to ‘.’, while on the XAC CMIC MAP level the CMIC links will go from ‘CBsy’ to ‘.’.

- once the CMIC links are in-service, issue the ‘trnsl’ command for the CMIC links on HIOP in 4 rear: ‘trnsl 4 rear’. The MAP response should look like this:

```
trnsl 4 rear
Command Submitted.
Trnsl  4 Rear completed

Link 0 is connected to MS1 Shelf 0 Card 24 Port 0
Link 1 is connected to MS0 Shelf 0 Card 25 Port 0
```

- record the MS port numbers returned by the ‘trnsl’ command for the CMIC links on HIOP card in 4 rear. Verify that they are the same as the MS port numbers recorded before deprovisioning the CMIC packlet in 4 rear lower,

- plug the RTIF local link into the HIOP card’s local RTIF port in slot 4 rear. The system will automatically provision and attempt to bring the local RTIF link in-service. The following log should be generated:

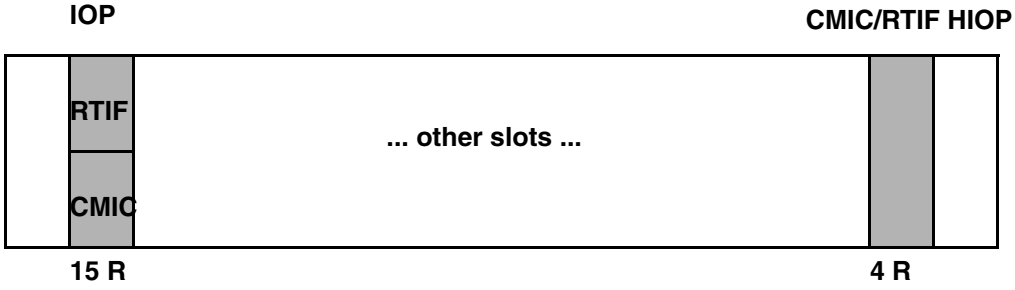
```
XAC628 MAR19 14:23:20 7200 INFO XA-Core Provisioning Report
        DESCRIPTION: New resource has been provisioned
        LINK: Type State Site FL Row Bay    Shf/Slt/Lk    EqPEC/Serial
              RTIF CBSY  HOST 01 A00 DPCC:00 00 04R 0  NTLX04BA/NNTM64422MWV
```

- plug the RTIF remote link into the HIOP card’s remote RTIF port in slot 4 rear. The system will automatically provision and attempt to bring the remote RTIF link in-service. The following log should be generated:

```
XAC628 MAR19 14:23:20 7200 INFO XA-Core Provisioning Report
        DESCRIPTION: New resource has been provisioned
        LINK: Type State Site FL Row Bay    Shf/Slt/Lk    EqPEC/Serial
              RTIF CBSY  HOST 01 A00 DPCC:00 00 04R 1  NTLX04BA/NNTM64422MWV
```

- at this point, we have a hybrid CMIC and RTIF system: the CMIC and RTIF functionality in slot 15R is still provided by packlets on IOP cards, while the CMIC and RTIF functionality in slot 4R is provided by the new CMIC/RTIF HIOP. Please refer to “Figure 11 Intermediate (hybrid) CMIC and RTIF configuration - XA-Core rear view” on page 2442.

Figure 11 Intermediate (hybrid) CMIC and RTIF configuration - XA-Core rear view



- issue the ‘trnsl’ command for the CMIC packlet in 15 rear lower: ‘trnsl 15 rear lower’. The MAP response should look like this:

```
trnsl 15 rear lower
Command Submitted.
Trnsl 15 Rear   Lower    completed

Link 0 is connected to MS0 Shelf 0 Card 24 Port 0
Link 1 is connected to MS1 Shelf 0 Card 25 Port 0
```

- record the MS port numbers returned by the ‘trnsl’ command for the CMIC packlet in 15 rear lower,
- on the MS MAP level, manually busy the MS ports returned by the ‘trnsl’ command issued for the CMIC packlet in slot 15 rear lower (Port 0 on MS 0, Shelf 0, Card 24 and Port 0 on MS 1, Shelf 0, Card 25). The CMIC links will go ‘CBsy’.
- on the CMIC MAP level, manually busy the CMIC packlet in slot 15 rear lower,
- on the RTIF MAP level, manually busy the RTIF packlet in slot 15 rear upper,
- on the IO MAP level, manually busy the IOP card in slot 15 rear,
- pull the CMIC packlet in slot 15 rear lower, with links attached,
- pull the RTIF packlet in slot 15 rear upper,
- pull the IOP card in slot 15 rear,
- wait one minute for the system to recognize the loss of clock,
- on the CMIC MAP level, issue the ‘uneq’ command for the CMIC packlet: ‘uneq 15 rear lower’,
- on the RTIF MAP level, issue the ‘uneq’ command for the RTIF packlet: ‘uneq 15 rear upper’,
- on the IO MAP level, issue the ‘uneq’ command for the IOP card: ‘uneq 15 rear’. The following logs should be generated:

```
XAC628 MAR19 14:25:20 7300 INFO XA-Core Provisioning Report
        DESCRIPTION: Resource has been deprovisioned

```

- Please refer to “Figure 12 Reduced CMIC and RTIF redundancy (service on HIOP) - XA-Core rear view” on page 2443.

Figure 12 Reduced CMIC and RTIF redundancy (service on HIOP) - XA-Core rear view

- plug the CMIC/RTIF HIOP card into slot 15 rear with no links attached. The following log should be generated:

```
XAC628 MAR19 14:28:20 7600 INFO XA-Core Provisioning Report
        DESCRIPTION: New resource has been provisioned
        CARD: Type State Site FL Row Bay    Shf/Slt    EqPEC/Serial
              HIOP MBSY  HOST 01 A00 DPCC:00 00 15R NTLX04BA/NNTM64422MWV
```

- the craft person should verify the success of the system-initiated provisioning test of the HIOP card in slot 15 rear by checking the XAC log 640 in logutil:

```
XAC640 MAR19 14:29:40 7700 INFO Test Report
        Type Link_Num Slot Side Packlet  Test_Type Result
        HIOP          15   R             OOS       Passed
        Initiator: Action initiated by the system
```

- once the integrity of the HIOP card in slot 15 rear has been verified, the craft person should manually RTS the card,

  Note: Once the HIOP card is in-service, all its associated ports are automatically brought in-service by the system, provided their OOS test passes.

- plug the CMIC links into the OC3 ports of the HIOP card in slot 15 rear. The system will automatically provision the CMIC links, perform an OOS test on them, and bring them into a ‘CBsy’ state.

  Note: use the same configuration as recorded for the ‘trnsl’ command issued for the CMIC packlet in slot 15 rear lower.

```

```

- on the MS MAP level, test the MS ports previously returned by the 'trnsl' command for CMIC packlet in slot 15 rear lower (Port 0 on MS 0, Shelf 0, Card 24 and Port 0 on MS 1, Shelf 0, Card 25).

- on the MS MAP level, if the previous MS port tests passed, bring them in-service (Port 0 on MS 0, Shelf 0, Card 24 and Port 0 on MS 1, Shelf 0, Card 25). On the MS MAP level the MS ports will go from 'M' to '.', while on the XAC CMIC MAP level the CMIC links will go from 'CBsy' to '.'.

- once the CMIC links are in-service, issue the 'trnsl' command for the CMIC links on HIOP 14 rear: 'trnsl 14 rear'. The MAP response should look like this:

```
trnsl 15 rear
Command Submitted.
Trnsl 15 Rear completed

Link 0 is connected to MS0 Shelf 0 Card 24 Port 0
Link 1 is connected to MS1 Shelf 0 Card 25 Port 0
```

- record the MS port numbers returned by the 'trnsl' command for the CMIC links on HIOP card in 4 rear. Verify that they are the same as the MS port numbers recorded before deprovisioning the CMIC packlet in 15 rear lower,

- plug the RTIF local link into the HIOP card's local RTIF port in slot 15 rear. The system will automatically provision and attempt to bring the local RTIF link in-service.

```

```

- set the 'xa_component_install_state' office parameter in table OFCENG back to 'inservice',

- at this point, the CMIC/RTIF HIOP cards in slots 4R and 15R are all in-service, along with their associated CMIC and RTIF links. No CMIC or RTIF packlets on IOP cards are provisioned in the shelf. This constitutes the end of the migration procedure from CMIC and RTIF packlets to

CMIC/RTIF HIOP. Please refer to “Figure 13 Final CMIC/RTIF HIOP configuration - XA-Core rear view” on page 2445.

Figure 13 Final CMIC/RTIF HIOP configuration - XA-Core rear view

6.2.2.2 Migration from CMIC and RTIF packlets to CMIC/RTIF HIOP for SuperNode SE (SNSE)

The migration procedure from CMIC and RTIF packlets to CMIC/RTIF HIOP cards for SuperNode Shelf Extension (SNSE) is similar to the SuperNode (SN) case. The only exception is the MS port numbers that have to be busied, tested, and enabled during the migration procedure. The ‘trnsl’ command should be used on the CMIC MAP level to get the specific MS port numbers to be busied. Please refer to “Table 15 SN to SNSE port mapping” on page 2445.

Table 15 SN to SNSE port mapping

SN MS port	SNSE MS port	XA-Core CMIC link
MS 0, Card 24, Port 0	MS 0, Card 4, Port 0	Slot 15 rear, link 0
MS 1, Card 25, Port 0	MS 1, Card 4, Port 1	Slot 15 rear, link 1
MS 1, Card 24, Port 0	MS 1, Card 4, Port 0	Slot 4 rear, link 0
MS 0, Card 25, Port 0	MS 0, Card 4, Port 1	Slot 4 rear, link 1

6.2.2.3 Migration from CMIC/RTIF HIOP back to CMIC and RTIF packlets on IOP for SuperNode (SN)

This section describes the migration procedure from an XA-Core system with CMIC and RTIF functionality provided by CMIC/RTIF HIOP cards to a system with CMIC and RTIF funcitionality provided by packlets on IOP cards. The recommended approach will provision the new IOP cards and CMIC and RTIF packlets in the *same* slots (4R and 15R) as the deprovisioned HIOP cards. Hence, because of lost redundancy during the migration, there are two E2 conditions during this procedure.

The following sequence of events shows the steps:

- start with a CMIC/RTIF HIOP configuration in slots 4R and 15R (no IOP cards with CMIC or RTIF packlets provisioned in the shelf). Please refer to “Figure 14 Initial CMIC/RTIF HIOP locations - XA-Core rear view” on page 2446.

Figure 14 Initial CMIC/RTIF HIOP locations - XA-Core rear view

- set the ‘xa_component_install_state’ office parameter in table OFCENG to ‘manbusy’,
- issue the ‘trnsl’ command for the CMIC links on the HIOP card in slot 4 rear: ‘trnsl 4 rear’. The MAP response should look like this:

```
trnsl 4 rear
Command Submitted.
Trnsl  4 Rear completed

Link 0 is connected to MS1 Shelf 0 Card 24 Port 0
Link 1 is connected to MS0 Shelf 0 Card 25 Port 0
```

- record the MS port numbers returned by the ‘trnsl’ command for the CMIC links on the HIOP card in slot 4 rear,
- on the MS MAP level, manually busy the MS ports returned by the ‘trnsl’ command for CMIC links on the HIOP card in slot 4 rear (Port 0 on MS 1, Shelf 0, Card 24 and Port 0 on MS 0, Shelf 0, Card 25). The CMIC links will go ‘CBsy’.
- pull the CMIC links on the HIOP in slot 4 rear,
- wait one minute for the system to recognize the loss of clock,
- on the CMIC MAP level, issue the ‘uneq’ command for the CMIC links on the HIOP in slot 4 rear: ‘uneq 4 rear link0’ and ‘uneq 4 rear link1’. The following logs should be generated:

```
XAC628 MAR19 14:16:20 5600 INFO XA-Core Provisioning Report

        Type Link_Num Slot Side Packlet  Test_Type Result
        IOP           15   R             OOS       Passed
        Initiator: Action initiated by the system
```

- once the integrity of the IOP card in slot 15 rear has been verified, the craft person should manually RTS the card,

- plug the CMIC packlet into the in-service IOP card in slot 15 rear lower with the CMIC links attached. The system will automatically provision the CMIC packlet, perform an OOS test on it, and bring it into a ‘ManB’ state.

  Note: Once the CMIC packlet is provisioned, both CMIC links will be automatically provisioned as well. They will be ‘CBsy’.

  Note: when plugging the CMIC links into the CMIC packlet, use the same configuration as recorded for the ‘trnsl’ command issued for the CMIC links on the HIOP card in slot 15 rear.

```
XAC628 MAR19 14:22:20 7000 INFO XA-Core Provisioning Report
        DESCRIPTION: New resource has been provisioned
        CARD: Type State Site FL Row Bay    Shf/Slt/Pk    EqPEC/Serial
              CMIC MBSY  HOST 01 A00 DPCC:00 00 15R L  NTLX05AB/NNTM64422MWV
```

- the craft person should verify the success of the system-initiated provisioning test of the CMIC packlet in slot 15 rear lower by checking the XAC log 640 in logutil:

```
XAC640 MAR19 14:20:40 6900 INFO Test Report
        Type Link_Num Slot Side Packlet  Test_Type Result
```

```
        CMIC          15   R    L        OOS       Passed
        Initiator: Action initiated by the system
```

- once the integrity of the CMIC packlet in slot 15 rear lower has been verified, the craft person should manually RTS the CMIC packlet,
- on the MS MAP level, test the MS ports returned by the 'trnsl' command for the CMIC links on the HIOP in slot 15 rear (Port 0 on MS 0, Shelf 0, Card 24 and Port 0 on MS 1, Shelf 0, Card 25).
- on the MS MAP level, if the previous MS port tests passed, bring them in-service (Port 0 on MS 0, Shelf 0, Card 24 and Port 0 on MS 1, Shelf 0, Card 25). On the MS MAP level the MS ports will go from 'M' to '.', while on the XAC CMIC MAP level the CMIC links will go from 'CBsy' to '.'.
- once the CMIC links are in-service, issue the 'trnsl' command for the CMIC links on the CMIC packlet in slot 15 rear lower: 'trnsl 15 rear lower'. The MAP response should look like this:

```
trnsl 15 rear lower
Command Submitted.
Trnsl  15 Rear lower completed

Link 0 is connected to MS0 Shelf 0 Card 24 Port 0
Link 1 is connected to MS1 Shelf 0 Card 25 Port 0
```

- record the MS port numbers returned by the 'trnsl' command for the CMIC links on the CMIC packlet in 15 rear lower. Verify that they are the same as the MS port numbers recorded before deprovisioning the CMIC/RTIF HIOP card in 15 rear,
- plug the RTIF packlet into the IOP card in 15 rear upper, with links attached.
- the system will automatically provision the RTIF packlet, perform an OOS test on it, and bring it into a 'ManB' state.

  Note: Once the RTIF packlet is provisioned, the system will automatically provision the local and remote RTIF links.

```
XAC628 MAR19 14:23:20 7200 INFO XA-Core Provisioning Report
        DESCRIPTION: New resource has been provisioned
        CARD: Type State Site FL Row Bay    Shf/Slt/Pk    EqPEC/Serial
              RTIF CBSY  HOST 01 A00 DPCC:00 00 15R U  NTLX08AA/NNTM64422MWV
```

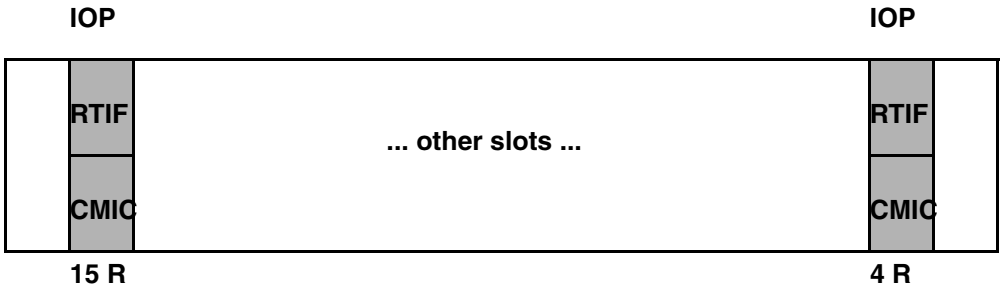
- the craft person should verify the success of the system-initiated provisioning test of the RTIF packlet in slot 15 rear upper by checking the XAC log 640 in logutil:

```
XAC640 MAR19 14:20:40 6900 INFO Test Report
        Type Link_Num Slot Side Packlet  Test_Type Result
        RTIF          15    R    U        OOS       Passed
        Initiator: Action initiated by the system
```

- once the integrity of the RTIF packlet in slot 15 rear upper has been verified, the craft person should manually RTS the packlet,

- once the RTIF packlet is in-service, the system will automatically attempt to bring the local and remote RTIF links in-service.
- set the ‘xa_component_install_state’ office parameter in table OFCENG back to ‘inservice’,
- at this point, the CMIC and RTIF packlets on IOP cards in slots 4R and 15R are all in-service, along with their associated CMIC and RTIF links. No CMIC/RTIF HIOP cards are provisioned in the shelf. This constitutes the end of the migration procedure from CMIC/RTIF HIOP to CMIC and RTIF packlets. Please refer to “Figure 18 Final CMIC and RTIF packlet locations - XA-Core rear view” on page 2453.

Figure 18 Final CMIC and RTIF packlet locations - XA-Core rear view



6.2.2.4 Migration from CMIC/RTIF HIOP back to CMIC and RTIF packlets on IOP for SuperNode Shelf Extension (SNSE)

The migration procedure from CMIC/RTIF HIOP cards to CMIC and RTIF packlets on IOP cards for SuperNode Shelf Extension (SNSE) is similar to the SuperNode (SN) case. The only exception is the MS port numbers that have to be busied, tested, and enabled during the migration procedure. The ‘trnsl’ command should be used on the CMIC MAP level to get the specific MS port numbers to be busied. Please refer to “Table 15 SN to SNSE port mapping” on page 2445.

7: Configuration (CN): A00002013

7.1 Hardware and Software Requirements

There are no hardware or software requirements.

7.2 Initial Configuration

During the ONP, if the patch TBF56 is found active on the switch, SOC INW00001 will be switched ON and the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS will be initialized to indicate that all 'T1 Timer Expiry' messages should be suppressed.

If the patch TBF56 is found and not active on the switch during ONP, then SOC INW00001 will be switched ON and the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS will be initialized to indicate that no 'T1 Timer Expiry' messages should be suppressed.

If the patch TBF56 is not found, then the SOC INW00001 will be switched OFF and the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS will be initialized to indicate that no 'T1 Timer Expiry' messages should be suppressed.

7.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable.

7.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCVAR	T1_TIMER_EXPIRY_MSG_SUPPRESS	NEW	CM

7.3.2 Parameter information

7.3.2.1 T1_TIMER_EXPIRY_MSG_SUPPRESS

T1_TIMER_EXPIRY_MSG_SUPPRESS

7.3.2.1.1 Functional description

This office parm will be used to provide optionality control for the feature.

7.3.2.1.2 Provisioning rules

There will be four fields in office parm T1_TIMER_EXPIRY_MSG_SUPPRESSION, to switch ‘T1 Timer Expiry’ message suppression ON/OFF, log ON/OFF, alarm ON/OFF and a threshold value.

If SOC INW00001 is switched OFF, the user will not be permitted to provision the office parm T1_TIMER_EXPIRY_MSG_SUPPRESSION.

The user will be able to switch the log or alarm ON/OFF, if the SOC INW00001 is ON and the office parm T1_TIMER_EXPIRY_MSG_SUPPRESSION field suppression is switched ON. Additionally, they can only specify a threshold value grater than zero if the alarm creation is ON. If they try to provision incorrectly, then a suitable message will be displayed to indicate the reason for failing the change in SERVORD.

The threshold value is used to determine when to create a GAME102 log entry, which in turn raises an external minor alarm. In order to calculate the value of the threshold, the user should take the highest RSPTMOUT OM count value found within a 24 hour period and multiply this number by 1.25. Calculating the threshold in this way, provides a small amount of padding against the worst situation.

Incidentally, the user will only be permitted to enter a threshold value greater than zero when the alarm option is ON. The threshold value of zero is invalid when the alarm option is ON and if the user attempts to provision it in this way, it will be denied. If denied, a suitable message will be displayed to indicate the problem.

7.3.2.1.3 Range information

The table below provides information about all four fields, as described in 13.3.2.1.2 Provisioning Rules. Fields 1 to 3 are of type BOOLEAN and will only have a value of ‘TRUE’ or ‘FALSE’. It is interpreted that ‘TRUE’ is equivalent to ‘ON’ and ‘FALSE’ is ‘OFF’. Field 4 is an UNSIGNED INTEGER with a value range of 0 to 32,767.

Table 2 Range Information

Field	Minimum	Maximum	Default
1	OFF	ON	OFF
2	OFF	ON	OFF
3	OFF	ON	OFF
4	0	32,767	0

7.3.2.1.4 Activation

In order to suppress ‘T1 Timer Expiry’ messages from being generated, the user will need to switch the SOC INW00001 to ON and the office parm T1_TIMER_EXPIRY_MSG_SUPPRESS field suppression to ON. Once these are ON, the user has the option to activate log or alarm generation when a ‘T1 Timer Expiry’ message is suppressed.

7.3.2.1.5 Dependencies

None.

7.3.2.1.6 Consequences

The following fields, as briefly explained above in section 13.3.2.1.3 Provisioning Rules, represent:

SOC INW00001 needs to be switches ON, before any provisioning of office parm T1_TIMER_EXPIRY_MSG_SUPPRESSION is permitted.

Field 1: Suppression (ON/OFF). When ‘ON’ all ‘T1 Timer Expiry’ messages will be suppressed and permits provisioning of fields 2 to 4.

Field 2: Log (ON/OFF). When ‘ON’, creates an entry in GAME101 during the RSPTMOUT OM transfer period, if the RSPTMOUT OM count is greater than zero.

Field 3: Alarm (ON/OFF): When ‘ON’, creates an entry in GAME102 if the RSPTMOUT OM count equals the office parm T1_TIMER_EXPIRY_MSG_SUPPRESSION threshold value. In turn, when an entry is created, an external minor alarm will be raised.

Field 4: Threshold (0 - 32,767). Used when determining if a entry in the GAME102 log should be created.

For more information on the behavior of these fields, please refer to the relevant customer documentation.

7.3.2.1.7 Verification

During the verification of the four fields the following checks will be done:

Field 1: This can only be equal to ON or OFF. In order for this to be equal to ON, SOC INW00001 should be switched ON.

Field 2: This can only equal to ON or OFF. This can only be set to ON, if field 1 is set to ON.

Field 3: This can only equal to ON or OFF. This can only be set to ON, if field 1 is set to ON.

Field 4: This can only be a number in the range 1 to 32,767. It can only change from a value of 0 if field 3 is set to ON. If field 3 is set to OFF, then the only valid value in this field is 0.

7.3.2.1.8 Memory requirements

Need memory to store data:

Units per memory block = 1

Words per memory block = 3

If the parameter value = 1

words required = (((parameter value - 1)/units per block) + 1) *words per block = 3

7.3.2.1.9 Parameter release history update

New in SN07.

7.11 Configuration Walkthrough

8: Configuration (CN): A00002020

8.1 Hardware and Software Requirements

Office has converted to using deterministic LENs for MG9000 as described in SN06 activity “A89009298 - MG9000 Lines Preprovisioning”.

8.2 Initial Configuration

This section describes only the configuration necessary for the core to make ESA data available to the MG9000 EM. It does not describe MG9000 EM or MG9000 operation. Please refer to section “Related Activities” of the FN for this feature for further information.

Table LGRPINV should contain a number of logical groups of lines added by the MG9000 EM. LGRPs with a GRPTYPE of “S” are in one to one correspondence with MG9000 VMGs.

Table ESAPXLA should be provisioned with special dialing codes needed while in ESA. Pretranslator datafill is required for every customer group and LGRP combination. A special entry called ESAPOTS is provided for non-IBN lines

OFCENG parameter ESA_GWDATA_DEVICE specifies the device on the core where the ESA data is generated. The default value is SFDEV but the telco should consider using a disk device for offices with large numbers of MG9000 lines.

Collection of ESA data for LGRPs with GRPTYPE “S” is automatically triggered at 1:00 AM every night.

8.3 Office/Subnet parameters (OP/SP) (CM & SESM)

8.3.1 New/Modified Office parameters

Table 1 New or modified parameters

Parm Table	Parameter Name	New/ Changed/ Deleted/ Relocated	Domain (CM or Subnet Management
OFCENG	ESA_GWDATA_DEVICE	New	CM

8.3.2 Parameter Information

8.3.2.1 ESA_GWDATA_DEVICE

Emergency Stand Alone Gateway Data Device

8.3.2.1.1 Functional Description

Every night at 1:00 AM the CM generates a data file containing ESA data for all MG9000 gateways in the office. The file is called ESA_SYSTEM_SD$XML and is stored on the device indicated by parameter ESA_GWDATA_DEVICE. The file is later retrieved by the MG9000 Element Manager which will erase its existing ESA data only if a valid file is received.

It is highly recommended that a disk device be used even though the default device is SFDEV. Any change to ESA_GWDATA_DEVICE must be also be made on the MG9000 EM.

The file should not be manually modified since it is system generated. It is not normally viewed by the telco but may be transferred to UNIX or PC using FTP and viewed with a text editor. FTP should be used in binary mode.

The DMS PRINT and EDIT/TYPE commands will only partially display the file.

8.3.2.1.2 Provisioning Rules

This parameter can be set to SFDEV or any valid disk volume name.

SFDEV is not recommended due to its limited size and usage by many other applications. The ESA_SYSTEM_SD$XML file can be rather large - approximately 86 KB per 1000 gateway lines. The maximum size of SFDEV (as provisioned in table DSLIMIT) is 5 million words (10 million bytes) and there is no guarantee that all of this will be available for the ESA file.

8.3.2.1.3 Range Information

Table 2 Range Information

Minimum	Maximum	Default
1 character	28 characters	SFDEV

8.3.2.1.4 Activation

If office parameter ESA_GWDATA_DEVICE is changed the following steps are recommended. The data device name property on the MG9000 EM must be updated or the MG9000 will continue to use the ESA data last successfully downloaded from the CM.

1. Change the ESA_GWDATA_DEVICE parameter to its new value.
2. Execute the ESACOLL command in the ESATOOLS CI increment.
3. Verify that an ESA120 log has been generated. This indicates the ESA data file has been successfully generated. It may take several minutes.
4. Verify that file ESA_SYSTEM_SD$XML exists on the new device.

5. ***Important:*** Using the MG9000 EM, Change the ESA.DataDeviceName property to the same device as used in the core. See documentation for activity A00002019.
6. Using the MG9000 EM graphical user interface, manually initiate a download of ESA data. See documentation for activity A00002019.
7. Erase the ESA_SYSTEM_SD$XML file from the OLD device to ensure the MG9000 will not use this file at a later date.

8.3.2.1.5 Dependencies

The MG9000 EM must be manually configured to look for the ESA_SYSTEM_SD$XML file on the new device by using the ESA.DataDeviceName property. Please refer to activity A0002019.

If this parameter is left at its default value of SFDEV, then there is a dependency on table DSLIMIT, where memory is allocated for SFDEV under entry STOREFS. Example:

```
>table dslimit
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: DSLIMIT
>list all
TOP
                          DSOWNER   DSMAX  DSUSED
-----------------------------------------------
                          STOREFS 5000000  146592
                          NPOFIMP   45000    3040
                           NTDEVS 3000000  237472
BOTTOM
```

For STOREFS, DSMAX - DSUSED = memory available for the ESA data file

8.3.2.1.6 Consequences

If data collection does not complete successfully using this device, an ESA121 log is output, and the data file will be unusable by the MG9000 EM. The MG9000 will continue to use the ESA data last successfully downloaded.

8.3.2.1.7 Verification

Please refer to section “8.3.2.1.4 Activation” for complete activation and verification instructions.

8.3.2.1.8 Memory Requirements

No memory impact for the parameter itself. See EI section for data file store impact.

8.3.2.1.9 Parameter release history update

This parameter is new for this release.

8.4 Upgrade Impact

8.4.1 Dump and Restore

No additional impact.

8.4.2 Element Management Upgrade

Please refer to A00002019 MG9000 EM Enhancements.

8.5 Data schema (DS) (CM, MIBS, RDB)

8.5.1 New/modified tables, MIBs, or Database Schema

Table 3 New or modified tables

Table name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ESAPXLA	CHANGED	UNCHANGED

8.5.2 Table Database Schema information

8.5.2.1 Name: ESAPXLA

Emergency Stand Alone Pretranslation Table

8.5.2.1.1 Functional description

Table ESAPXLA lists special dialing codes to be used during emergency stand alone operation and the translation result for these codes. Provisioning is allowed for every IBN customer group and LGRP combination with translator name ESAPOTS being used for non-IBN lines.

Note that 911 lines must be available on each LGRP since individual VMGs can enter ESA without other VMGs on the MG9000. Translations for each LGRP must be provided in table ESAPXLA so 911 will terminate properly.

8.5.2.1.2 Usage sequence and implications (CM Only)

A new table dependency has been added. LGRPINV is a read only table that is filled as the result of MG9000 EM provisioning. It must be provisioned before table ESAPXLA.

Table provisioning order:

- HUNTMEM
- LGRPINV (Read Only table under control of MG9000 EM)
- ESAPXLA

8.5.2.1.3 Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ESAPXLA	0	32 x N x M[a]	No Change. Each new XLANAME/LGRP combination uses 16 bytes for a header. Each tuple uses an additional 16 bytes.

a. N is the number of LGRPs and M is the number of XLANAME entries used including ESAPOTS for POTS lines.

8.5.2.1.4 Fields

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PXLAKEY	CHANGED	NODE	PMTYPE	LGRP selection added. Similar to existing LCM and DLM selectors.

8.5.2.1.5 Datafill example

```
TABLE ESAPXLA
LIST ALL
TOP
                                    PXLAKEY                    RESULT
-------------------------------------------------------------------------
 ESAPOTS  LGRP REM1 00 0              411               T REORDER
 ESAPOTS  LGRP REM1 00 0              611               H 55 1 N
 ESAPOTS  LGRP REM1 00 0              911               L REM1 0 0 2 5 N 0
 IBNXLA   LGRP REM1 00 0              9                 A ESAPOTS Y
```

8.5.2.1.6 Table release history update

Add support for LGRP PMTYPE for MG9000.

8.5.2.1.7 Supplementary information

MG9000 LGRPs do not currently have the capability to support trunks so references to table ESARTE or ESAHNPA are not allowed.

The “L” selector allows terminations to a line with a given line equipment number (LEN). The LEN must be on an MG9000 at the same site as the LGRP in the tuple key.

The “H” selector allows terminations to hunt members given the hunt group number specified in table HUNTGRP and the hunt member number specified in table HUNTMEM. The hunt member must be on the same LGRP as used in the tuple key.

8.5.2.1.8 Translation verification other tools

Please refer to section “8.9.2 Command: ESATRAVER”.

8.6 Service Orders (SO) (CM & SESM)

No change.

8.7 Software optionality control (SOC)

MG9000 ESA supports use of the duplicate office code support SOC (Y78520DO).

8.8 Element Management

Please refer to feature A00002019.

8.9 Command interface changes

8.9.1 Directory: ESATOOLSDIR

8.9.1.1 Directory description

The ESATOOLS CI increment provides a number of customer tools to verify and operate on CS2000 ESA data. This activity will

1. Enhance the ESATRAVER command to work with MG9000 lines.
2. Create a command that will generate an ESA data file for MG9000 lines.

Note that any ESA data must be downloaded to the MG9000 EM and MG9000 before it will affect ESA operation.

8.9.1.2 Accessing directory: ESATOOLSDIR

8.9.1.2.1 Access to directory or MAP level and return to CI

To access the ESATOOLS CI increment, type ESATOOLS from the command prompt. To exit ESATOOLS back to the CI environment, type QUIT.

8.9.2 Command: ESATRAVER

Note: Activity "A00002380 - MG9K ABI ESA" is implemented in CCM20 and enhances MG9K ESA to support ABI as well as non native lines. The ability to support ESATRAVER for ABI has changed some of the messages printed by that command.

8.9.2.1 Command type: NON-MENU

8.9.2.2 Command target: All

8.9.2.3 Command availability: RES

8.9.2.4 Command description

ESATRAVER is a command in the ESATOOLS CI increment which is used to verify ESA translations data in the Call Server.

8.9.2.5 Command syntax

Table 6 ESATRAVER command parameters and variables

Command	Parameters and variables
ESATRAVER	<ORIG> {TR <CLLI> STRING, L <LINE> STRING} <DIGITS> STRING <TRACE> {T, NT, B}
Parameters and variables	**Description**
ORIG	TR <CLLI> : For trunk originations, enter TR and the CLLI name of the trunk group L <LINE> : For line originations, enter L and the 7-digit directory number of the line

Table 6 ESATRAVER command parameters and variables

Command	Parameters and variables
DIGITS	Enter the dialled digits to be verified.
TRACE	T = Trace NT = NoTrace B = Both

8.9.2.6 Qualifications and warnings

The ESATRAVER command syntax has not changed. The software has been enhanced to allow verification of lines originating and terminating on an MG9000 gateway.

Since the MG9000 does not support trunks, the TR <CLLI> parameter does not apply.

8.9.2.6.1 SETRCC command interactions.

SETRCC is an existing command in ESATOOLS that is used to collect trunk group data on an RCC. The SETRCC command must be run for an RCC before the ESATRAVER command can be used on a line or trunk on that RCC.

Since an LGRP does not have trunks, the SETRCC command is not required prior to issuing the ESATRAVER command on a line on an LGRP.

If SETRCC is done on a particular RCC, ESATRAVER on an LGRP line will not use the collected trunk group data and will not affect the data in any way. ESATRAVER on an LGRP line can be followed by ESATRAVER on a line or trunk on that RCC without reissuing the SETRCC command.

8.9.2.7 Responses

8.9.2.7.1 Warning: Cannot verify term LGRP accessible from orig LGRP.

Command: ESATRAVER
Output: Warning: Cannot verify term LGRP accessible from orig LGRP. **Meaning:** The ESATRAVER command has determined that both the originating and terminating lines are in LGRPs with the same site names, but cannot determine which Gateway controls these lines. Both LGRPs must belong to the same Gateway for this call to complete while the Gateway is in ESA mode. It is also possible for one LGRP to be in ESA mode while another on the same MG9000 is not. In this case, the call would not complete. **User actions:** The user must verify at the Element Manager that both LGRPs are controlled by the same Media Gateway.

8.9.2.7.2 Originator and destination are not on the same remote site

Command: ESATRAVER
Output: Originator and destination are not on the same remote site **Meaning:** For an LGRP line originator, this response means that both the originating and terminating line are on LGRPs, but the site names are different, so the termination is not valid**.** **User Actions:** If the user wishes these dialled digits to terminate to a valid LGRP line, then an entry must be made in table ESAPXLA to direct this call to a valid line**.**

8.9.2.7.3 NO MATCH

Command: ESATRAVER
Output: NO MATCH **Meaning**: This is a generic error message that indicates that the digits dialled do not translate to a valid terminator from this originator. For an LGRP line originator, this response indicates that the terminator is not an LGRP line. **User Actions**: If the user wishes these dialled digits to terminate to a valid LGRP line, then an entry must be made in table ESAPXLA to direct this call to a valid line.

8.9.3 Command: ESACOLL

8.9.3.1 Command type: Listed NON-MENU

8.9.3.2 Command target: All

8.9.3.3 Command availability: RES

8.9.3.4 Command description

The ESACOLL command will cause ESA data to be generated for all MG9000 lines in the office. The command will create or replace file ESA_SYSTEM_SD$XML on the device specified by OFCENG parameter ESA_GWDATA_DEVICE.

The file is generated asynchronously and the command prompt will return once file generation has been initiated.

An ESA120 log is output if file generation is initiated successfully and the actual generation is successful. An ESA121 log is output if file generation is initiated but then fails.

8.9.3.5 Command syntax

No command arguments are required.

8.9.3.6 Qualifications and warnings

A failure message will be output if the ESACOLL command was unable to initiate building of the ESA data file.

"ESA static data generation failed to initiate."
"Possible conflict with system or user request."

8.9.3.7 Responses

8.9.3.7.1 ESA Data Generation Initiated

This response is generated if generation of the ESA data file was initiated.

"ESA static data generation initiated."
"See file ESA_SYSTEM_SD$XML on device SFDEV."

8.9.3.8 Example

```
>ESATOOLS
>ESACOLL
Warning: All MG9000 ESA data will be rebuilt.
Please confirm ("YES", "Y", "NO", or "N"):
>Y
ESA static data generation initiated.
See file ESA_SYSTEM_SD$XML on device SFDEV.
```

8.10 Security

The MG9000 EM will have to FTP the ESA data file from the core. Please refer to feature A00002019 for security considerations.

8.11 Configuration Walkthrough

Please refer to feature A00002019 for MG9000 EM operation.

1. Verify tuples with GRPTYPE of "S" have been provisioned in table LGRPINV by the MG9000 EM. Verify that the shelf number (the "0" in "REM1 00 0") for all "S" type LGRPs are 3 or under. If this is not the case the office has not converted to deterministic LENs for MG9000.

```
>table lgrpinv
>lis 2

TOP
      GRPNO          SRVRNAME GRPTYPE                                  LGRPOPTS
-------------------------------------------------------------------------------
REM1  00 0            GWC 110       S                                        $
REM1  00 1            GWC 110       S                                        $
```

2. Provision special dialing codes in table ESAPXLA for POTS (XLANAME = ESAPOTS) as well as for XLANAMEs used by IBN customer groups with members in the LGRP.

```
>table ESAPXLA
>lis all

TOP
                                    PXLAKEY                  RESULT
-----------------------------------------------------------------
 ESAPOTS LGRP REM1  00 0              411               T REORDER
 ESAPOTS LGRP REM1  00 0              911 L REM1  00 2 03 01 N 0
```

3. Set ESA_GWDATA_DEVICE

```
This step is not necessary if SFDEV is being used to hold MG9000 ESA data.

It is recommended that a disk device be used so that SFDEV is available for other
uses. Please refer to "8.3.2.1.4 Activation" for details on how to change the
office parameter.
```

4. Generate ESA data file using ESATOOLS.

```
>ESATOOLS
>ESACOLL
Warning: All MG9000 ESA data will be rebuilt.
Please confirm ("YES", "Y", "NO", or "N"):
>Y
ESA static data generation initiated.
See file ESA_SYSTEM_SD$XML on device D000ESA.

... have prompt back - wait for ESA120/ESA121 log

5. ESA data file will be automatically generated every day at 1:00 AM.

9: Configuration (CN): A00002146

9.1 Hardware and Software Requirements

The commands in this section apply to a fully configured and commissioned XPM with cside connectivity to the ABI cards on an MG9K. The MG9K and Core must contain at least SN06.2 loads.

9.2 Initial Configuration

When moving an existing XPM from the ENET to an MG9K, use the procedures found in Installation Method IM 72-1682: XPM to MG9000 DS512 Rehome.

9.3 Upgrade Impact

9.3.1 Dump and Restore

Not applicable

9.3.2 Element Management Upgrade

Not applicable

9.4 Command interface changes

9.4.1 LGCDIR Directory (changed)

9.4.1.1 Directory description

The LGCDIR directory is associated with the LGC map level. It is available whenever an XPM of node_type LGC is posted. The LGC node_type encompasses a number of pm_types including DTC, LTC, LGC, and SMA2. From this directory/map level, maintenance on the posted XPM can be performed.

The only change to this directory is the addition of the ABILink command to access the ABILink sublevel for performing maintenance on the Cside links of an ABI-hosted XPM. The ABILink command is only available when an ABI-hosted XPM is posted.[1]

9.4.1.2 Accessing directory: LGCDIR

To enter this directory from the CI environment, type:

```
MAPCI;MTC;PM;POST <pm_type> <pm_number>
```

To quit, type:

```
QUIT
```

[1]Due to patching considerations, the ABILink command may not be visible in the MAP menu although the command will still be available.

9.4.1.3 MAP display

9.4.2 ABILink Command (new)

- **Command type**: Listed MENU (at location 4)
- **Command target**: ALL
- **Command availability**: RES (in Succession loads only)

9.4.2.1 Command description

The ABILink command takes the user to the ABILink sublevel where maintenance can be performed on the CSide links of an ABI-hosted XPM.

9.4.2.2 Command syntax

Table 1 ABILink command parameters and variables

Command	Parameters and variables
ABILink	none

9.4.2.3 Qualifications and warnings

The ABILink command is only available when an ABI-hosted XPM is posted.

9.4.2.4 Examples

```
>ABILink
```

Enters the ABILink level of the MAP.

9.4.3 Trnsl Command (changed)

- **Command type**: Listed MENU (at location 5)
- **Command target**: ALL
- **Command availability**: RES

9.4.3.1 Command description

The Trnsl command translates CSide and PSide link information.

On ABI XPMs, a note appears at the end of the command display when translating CSide links. That note is being changed.

9.4.3.2 Command syntax

Table 2 Trnsl command parameters and variables

Command	Parameters and variables
Trnsl	<FUNCTION> { C [<CSIDE LINK>], P [<PSIDE LINK>], MSG <MESSAGE LINK>, EMSG <EXTENDED MESSAGE LINK> }
Parameters and variables	**Description**
FUNCTION = {C, P, MSG, EMSG}	What kind of link information to display
C	Display C Side link information. The default is to display all CSide links.
CSIDE LINK = {0 TO 31}	Optional parameter to specify a single CSide link
P	Display P Side link information. The default is to display all PSide links.
PSIDE LINK = {0 TO 53}	Optional parameter to specify a single PSide link
MSG	Display only message links
MESSAGE LINK = {C, P}	Specify either CSide or PSide message links
EMSG	Display only Extended Message links
EXTENDED MESSAGE LINK = {C}	Display the CSide Extended message links (required)

9.4.3.3 Qualifications and warnings

The only change to existing behavior is to modify the note at the end of the TRNSL C and TRNSL MSG C commands when issued on an ABI XPM.

9.4.3.4 Examples

```
>trnsl c
Link  0: GWC 16              0;Cap MS;Status:OK      ;MsgCond:OPN,Unrestrict
Link  1: GWC 16              1;Cap MS;Status:OK      ;MsgCond:OPN,Unrestrict
Link  2: GWC 16             **;Cap  S;Status:OK
Link  3: GWC 16             **;Cap  S;Status:OK
. . .
Link 31: GWC 16             **;Cap  S;Status:OK
Please go to the ABILink level for CSide Link Mtc.

>trnsl msg c
Link  0: GWC 16              0;Cap MS;Status:OK      ;MsgCond:OPN,Unrestrict
Link  1: GWC 16              1;Cap MS;Status:OK      ;MsgCond:OPN,Unrestrict
Link  4: GWC 16              2;Cap MS;Status:OK      ;MsgCond:OPN,Restrict
Link  5: GWC 16              3;Cap MS;Status:OK      ;MsgCond:OPN,Restrict
Please go to the ABILink level for CSide Link Mtc.
```

9.4.4 ABILINKDIR Directory (new)

9.4.4.1 Directory description

The ABILINKDIR directory is associated with the ABILINK map level. This directory/map level provides a place for link mtc. on the cside links of an ABI-hosted XPM.

The ABILink level is only available on ABI-hosted XPMs.

9.4.4.2 Accessing directory: ABILINKDIR

To enter this directory from the CI environment, type:

```
MAPCI;MTC;PM;POST <pm_type> <pm_number>;ABILINK
```

To quit, type:

```
QUIT
```

9.4.4.3 MAP display

In the MAP screenshot below, the portions of the MAP which are specific to the ABILink level are shown in boldface type. Dynamic map fields are shown in blue and are described below.

```

Table 3 ABILink MAP display - dynamic fields

Field	Values	Description
CSide host:	<pm_type> <pm_no>	The CSide node which logically hosts the links to the ABI XPM (as datafilled in table LTCINV).
ABI IP Address:	aaa.bbb.ccc.ddd	The IP address of the Master ABI card to which the XPM's DS512 links are attached (as datafilled in table LTCINV). The same IP address follows Mastership of the ABI card pair.
ABI Status	{Master, Slave}	Each ABI card models a network plane. One card is always the Master while the other is Slave.
Link Status fields	'.' = InService 'S' = SysB 'M' = ManB 'C' = CBsy 'P' = PBsy '-' = Unequipped	The current status of each individual link.

9.4.5 Tst Command (new)

- **Command type**: Listed MENU (at location 6)
- **Command target**: ALL
- **Command availability**: RES

9.4.5.1 Command description

The TST command is used to test a CSide link of an ABI XPM. The nature of the test depends on the state of the link and whether the link has message or speech capability. The ALL parameter will test the whole DS512 link. The conversion between link number and plane/port is as follows:

link = 2*port + plane

9.4.5.2 Command syntax

Table 4 Tst command parameters and variables

Command	**Parameters and variables**
TST	<plane> <scope> {ALL, PORT <port_no>} [<type>]
Parameters and variables	**Description**
plane = {0 to 1}	The plane to test. Plane corresponds to ABI card.
scope = {ALL, PORT}	ALL = test the whole DS512 link on the given plane. PORT = test only a single DS30 link on the given port.
port_no = {0 to 15}	The specific DS30 port to test.
type = {MSG, SPC}	MSG = force msg tests and only msg tests to be run SPC = force speech tests and only speech tests to be run

9.4.5.3 Qualifications and warnings

The link must be either InSv or ManB to be tested. If a single link is specified, non-destructive diagnostics are run on the link. If the ALL parameter is given to test the whole plane, all the msg links on that plane which can be tested will be. The Type parameter can be used to force MSG-only or SPC-only diagnostics on links in any state.

Tests on individual speech links are not supported at this time.

9.4.5.4 Examples

1. Port 0 on plane 0 is a message link and is InSv.

```
>tst 0 port 0
Request Passed
```

2. Port 1 on plane 1 is a speech link and is ManB.

```
>tst 1 port 1
Request Invalid - Speech-only links are not supported.
```

3. The entire DS512 on plane 0 is ManB. There is a problem on 1 link.

```
>tst 0 all
```

```
Request Failed
 port 0 on plane 0 - Test Passed
 port 2 on plane 0 - MG9K reports HAL Alarms.
```

4. Port 0 on plane 0 is a message link and is ManB. The ABI card is InSv, but there is a problem with the XPM.

```
>tst 0 port 0
Request Failed - The XPM did not respond to Msg test.
```

5. Port 0 on plane 0 is a message link and is ManB. The ABI card is locked.

```
>tst 0 port 0
Request Failed - The ABI did not respond to Msg test.
```

6. Port 0 on plane 0 is a message link and is CBsy. The hosting GWC is not InSv.

```
>tst 0 port 0
Request Invalid - Link is C-side busy.
```

7. Port 0 on plane 0 is a message link and is CBsy. The hosting GWC is not InSv.

```
>tst 0 port 0 msg
Only MSG tests will be executed.
Request Failed - The GWC did not respond to Msg test.
```

9.4.6 Bsy Command (new)

- **Command type**: Listed MENU (at location 7)
- **Command target**: ALL
- **Command availability**: RES

9.4.6.1 Command description

The BSY command will take the given CSide link of an ABI XPM out of service and mark it as ManB. The ALL parameter will busy the whole DS512 link, i.e. the whole plane. The conversion between link number and plane/port is as follows:

link = 2*port + plane

9.4.6.2 Command syntax

Table 5 Bsy command parameters and variables

Command	Parameters and variables
BSY	<plane> <scope> {ALL, PORT <port_no>}

Table 5 Bsy command parameters and variables

Parameters and variables	Description
plane = {0 to 1}	The plane to busy. Plane corresponds to ABI card.
scope = {ALL, PORT}	ALL = busy the whole DS512 link on the given plane. PORT = busy only a single DS30 link on the given port.
port_no = {0 to 15}	The specific DS30 port to busy.

9.4.6.3 Qualifications and warnings

A link can be manually busied from any state except ManB.

A warning will be output if busying the given link will isolate the XPM unit or take the ABI plane out of service.

Bsying a link may cause call setup failures.

Individual speech links are not supported at this time.

9.4.6.4 Examples

1. Port 0 on plane 0 is a message link and is InSv.

```
>bsy 0 port 0
Request Passed
```

2. Port 0 on plane 1 is a message link and is InSv. Port 0 on plane 0 is already OOS.

```
>bsy 1 port 0
WARNING: Unit 0 of LTC 0 will become isolated.
Please confirm ("YES", "Y", "NO", or "N"):
>y
Request Passed
```

3. Port 1 on plane 0 is a speech link and is InSv.

```
>bsy 0 port 1
Request Invalid - Speech-only links are not supported.
```

4. Port 2 on plane 0 is a message link and is already ManB.

```
>bsy 0 port 2
Request Invalid - link is ManB.
```

5. Port 2 on plane 1 is a message link and is SysB.

```
>bsy 1 port 2
Request Passed
```

6. The entire DS512 on plane 0 is InSv. Plane 0 is the active plane.

```
>bsy 0 all
WARNING: Some calls may be dropped.
WARNING: Bsying the Master plane will cause a Swact of
         the ABI cards.
```

```
Please confirm ("YES", "Y", "NO", or "N"):
>Y
Request Passed
```

9.4.7 RTS Command (new)

- **Command type**: Listed MENU (at location 8)
- **Command target**: ALL
- **Command availability**: RES

9.4.7.1 Command description

The RTS command will return to service the given CSide link of an ABI XPM. The ALL parameter will return to service the whole DS512 link, i.e. the whole plane. The FORCE parameter will skip diagnostics. The conversion between link number and plane/port is as follows:

link = 2*port + plane

9.4.7.2 Command syntax

Table 6 RTS command parameters and variables

Command	Parameters and variables
RTS	<plane> <scope> {ALL, PORT <port_no>} [FORCE]
Parameters and variables	**Description**
plane = {0 to 1}	The plane to RTS. Plane corresponds to ABI card.
scope = {ALL, PORT}	ALL = RTS the whole DS512 link on the given plane. PORT = RTS only a single DS30 link on the given port.
port_no = {0 to 15}	The specific DS30 port to RTS.
FORCE	Skip diagnostics when RTSing the link.

9.4.7.3 Qualifications and warnings

A link must be ManB before it can be RTSed.

Individual speech links are not supported at this time.

9.4.7.4 Examples

1. Port 0 on plane 0 is a message link and is ManB.

```
>rts 0 port 0
Request Passed
```

2. Port 0 on plane 1 is a message link and is SysB.

```
>rts 1 port 0
Request Invalid - SysB link is not ManB.
```

3. Port 1 on plane 0 is a speech link and is ManB.

```
>rts 0 port 1
Request Invalid - Speech-only links are not supported.
```

4. Port 2 on plane 0 is a message link and is ManB.

```
>rts 0 port 2
Request Failed
```

5. Port 2 on plane 0 is a message link and is ManB. Try again without diagnostics.

```
>rts 0 port 2 force
Using the FORCE option will attempt to RTS the link without
running the Speech Tests.
Please confirm ("YES", "Y", "NO", or "N"):
>y
Request Passed
```

6. The entire DS512 on plane 0 is ManB.

```
>rts 0 all
Request Passed
```

9.4.8 ABIREHOME Directory (changed)

9.4.8.1 Directory description

The ABIREHOME directory is the home of the ABI REHOME CI tool. This tool set is intended for use during a controlled rehome of an XPM's c-side from the ENET/JNET to an ABI card on an MG9000 via installation method IM 72-1682: XPM to MG9000 DS512 Rehome. The user must use the TASTOOLCI command SET_ABI_REHOME_STATUS to turn functionality of invasive commands on.

Note: For use by trained and experienced personnel only.

A new command, ADJUST_FRAME_SYNC (or AFS), is being added to the ABIREHOME directory.

9.4.8.2 Accessing directory: ABIREHOME

To enter this directory from the CI environment, type:

```
ABIREHOME
```

To quit, type:

```
QUIT
```

9.4.9 ADJUST_FRAME_SYNC Command (new)

- **Command type**: NON-MENU (part of ABIREHOME directory)
- **Command target**: ALL
- **Command availability**: RES

9.4.9.1 Command description

The Adjust_Frame_Sync command (or AFS for short) is used to tell the ABI interface on an MG9K to adjust its frame sync reference to sync to the inactive XPM unit. This allows the ABI and XPM to achieve proper frame sync when the XPM is connected to both the ENET and ABI during the ABI Rehome installation method.

Note: Because this is an invasive command, the user must first SET_ABI_REHOME_STATUS to ON from within TASTOOLCI.

9.4.9.2 Command syntax

Table 7 AFS command parameters and variables

Command	Parameters and variables
ADJUST_FRAME_SYNC (AFS)	<xpm_node>
Parameters and variables	**Description**
xpm_node = {0 to 4095}	The node number of the XPM

9.4.9.3 Qualifications and warnings

This command should only be used during the process of rehoming an XPM from the ENET to an MG9K. See installation method IM 72-1682: XPM to MG9000 DS512 Rehome

This command is only valid when ABI XPM Rehome Control has been enabled via the SET_ABI_REHOME_STATUS command from within TASTOOLCI.

If the user wishes to reset the frame sync between the ABI and the inactive XPM unit back to its original values, a reset of the Master ABI card is required.

9.4.9.4 Examples

```
>adjust_frame_sync 101
Request Passed

>afs 67
This command must be enabled by TAS via
the TASTOOLCI SET_ABI_REHOME_STATUS command.
Please refer to the installation method.
```

10: Configuration (CN): A00002196

10.1 Hardware and Software Requirements

All hardware and software installation complete and all commissioning activities successful.

10.2 Initial Configuration

N/A

10.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

10.4 Upgrade Impact

10.4.1 Dump and Restore

Lines with the SCA option appear in Table RESFEAT. During the ONP process SCA lines will be restored with the new field DND_ONLY set to its default value of "N."

Lines with DND active as a result of dialing the DNDACT code in table IBNXLA will appear in Table DNDMSB with a status of DNDGA. This ensures that the DND status is preserved over an ONP.

10.4.2 Element Management Upgrade

N/A

10.5 Data schema (DS) (CM, MIBS, RDB)

10.5.1 New/modified tables, MIBs, or Database Schema

IBNXLA, RESFEAT

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
IBNXLA	Changed	Unchanged
RESFEAT	Changed	Unchanged

10.5.2 Table Schema information

10.5.2.1 Name: IBNXLA

IBN Translation

10.5.2.1.1 Functional description

Table IBNXLA specifies data for the translation of digits. These digits originate from both an IBN station and a RES station.

10.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

Current datafill order unchanged.

10.5.2.1.3 Size

Unchanged

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
IBNXLA	Unchanged	Unchanged	Unchanged

10.5.2.1.4 Fields/OIDs

The following table lists fields for Table IBNXLA.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
Key	Unchanged	XLANAME	Vector up to 8 Chars	Translator Name
Key	Unchanged	DGLIDX	Vector up to 18 digits	Digilator Index
Result	Unchanged	TRSEL	FEAT	Translator Selector
Result	Unchanged	ACR	Y/N	Account Code Entry
Result	Unchanged	SMDR	Y/N	Station Message Detail Recording
Result	New	FEATURE	**DNDACT**	DND Activation
Result	New	FEATURE	**DNDDEACT**	DND Deactivation

10.5.2.1.5 Datafill example

The following example shows sample datafill for table IBNXLA.

Figure 1 Table IBNXLA example datafill

```
TABLE: IBNXLA

        KEY                 RESULT
-------------------------------------------------
RXCFN  77    FEAT  N  N  DNDACT
RXCFN  78    FEAT  N  N  DNDDEACT
```

10.5.2.1.6 Table release history update

DNDACT (DND Activation) and DNDDEACT (DND Deactivation) added as new FEATURE options (type IBN_LOG_FEATURE).

10.5.2.1.7 Supplementary information

A subscriber dials the DNDACT feature access code to activate Do Not Disturb and the DNDDEACT feature access code to deactivate Do Not Disturb.

10.5.2.1.8 Translation verification

The following example shows the output from Traver when it is used to verify Table IBNXLA datafill.

10.5.2.2 Name: RESFEAT

RESidential line FEATures

10.5.2.2.1 Functional description

Table RESFEAT contains the assignment of custom local area signaling services (CLASS) for residential lines.

10.5.2.2.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

Current datafill order unchanged.

10.5.2.2.3 Size

Unchanged

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
RESFEAT	Unchanged	Unchanged	Unchanged

10.5.2.2.4 Fields/OIDs

The following table lists fields for Table RESFEAT .

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
LINE	Unchanged	N/A	EXT_LEN	Line Equipment Number
KEY	Unchanged	N/A	RESFEAT_ KEY_RANGE	0 to 76
FEAT	Unchanged	N/A	SCA	Selective Call Acceptance feature
VAR	Unchanged	DF Subfield	SCA	SCA Data Feature
VAR	Unchanged	AMA Subfield	{AMA, NOAMA}	Automatic Message Accounting
VAR	Unchanged	STATUS Subfield	{INACT, ACT, UNIVI, UNIVA}	Status
DND_ONLY	**NEW**	DF Refinement (DF=SCA)	**{Y, N}**	**Y** if SCA applies only when DND is active **N** for standard SCA

10.5.2.2.5 Datafill example

The following example shows sample datafill for table RESFEAT.

Figure 4 Table RESFEAT example datafill

```
TABLE: RESFEAT

            LINE     KEY     FEAT
                                                    VAR
-----------------------------------------------------------------
HOST 00 1 08 05          0      SCA
                                SCA NOAMA ACT Y
```

10.5.2.2.6 Table release history update

DND_ONLY field added to SCA data feature.

10.5.2.2.7 Supplementary information

None

10.5.2.2.8 Translation verification

Table RESFEAT is not included in TRAVER output.

10.6 Service Orders (SO) (CM & SESM)

This activity does not introduce a new LCC, a new option, or change any existing compatibilities. It does introduce a new field for the SCA option.

10.6.1 Service order change details

A new field DND_ONLY is added to the existing SCA (Selective Call Acceptance) option. Its default value is "N." When DND_ONLY is set to "Y" then this instance of SCA only applies if DND is active. If DND is not active, then SCA screening does not apply to any incoming calls.

10.6.1.1 LCC and options

Unchanged

Table 6 Meridian digital centrex feature assignment requirements

Feature	500/2500	MDC SET	ISDN SET
DND	Y	Y	Y
SCA	Y	Y	Y

10.6.2 New commands

None

10.6.2.1 How service order options are presented

10.6.2.1.1 Description

A new field will be added to the SCA feature. The new field is DND_ONLY (Y/N). When DND_ONLY is set to “Y” it indicates that this instance of SCA should only apply when DND is active on the line. If DND is not active, then this instance of SCA will not screen any incoming calls. If DND_ONLY is set to “N” then the interaction documented prior to this activity between DND & SCA applies.

10.6.2.1.2 ADO Example

The following example shows the SCA option added to a line. The field DND_ONLY is set to Y (Note its default value is N).

Figure 5 Example of the SCA option in prompt mode

```
>ADO $
DN_OR_LEN:
>6210040
OPTION:
>SCA
BILLING_OPTION: NOAMA
>NOAMA
STATUS:

10.9 Command interface changes

10.9.1 Directory: N/A

10.9.1.1 Directory description

10.9.1.2 Accessing directory:

10.9.1.2.1 Access to directory or MAP level and return to CI

10.9.2 Command: QSL

10.9.2.1 Command type: NON-MENU

10.9.2.2 Command target: All

10.9.2.3 Command availability: RES

10.9.2.4 Command description

Query Screen List is available from the CI prompt by typing “QSL” and provides the screening lists associated with a line. Command input is not changing as a result of this activity, but the output will be changed to reflect when SCA DND_ONLY is applicable.

10.9.2.5 Command syntax

Table 11 <CommandName> command parameters and variables

Command	Parameters and variables	Description
QSL	DN_OR LEN	7- TO 10-DIGIT DN or LEN
	OPTKEY	1 to 76
	FEATURE	SLE feature name SCA, SCF, or SCRJ , or ALL
	FORMAT	F (Full) or H (Hex)

10.9.2.6 Qualifications and warnings

None

10.9.2.7 Responses

10.9.2.7.1 <response>

Table 12 MAP outputs with associated meanings and actions

Command: QSL 6210040 SCA F
<RESPONSE>: --- DN: 6136210040 LEN: HOST 00 0 00 21 SCA feature is ACTIVE and will not generate AMA records. Do Not Disturb Only: Yes. Contents of SCA list are: 6136210042 --- **Meaning:** 6136210042 is on 6136210040 SCA screening list. The output Do Not Disturb Only indicates the value of the SCA field DND_ONLY. In this example the field DND_ONLY is set to Y. When DND_ONLY is Y then SCA screening applies when DND (Do Not Disturb) is active (provided SCA is active & RES00102 is ON). If DND is active, then caller(s) on the SCA screening list (in this example, 6136210042) will bypass DND and terminate. Callers not on the SCA screening list will receive SCA treatment. If DND is not active, then all callers terminate without going through SCA screening as this iteration of SCA (DND_ONLY = Y) only applies screening when DND is active. **System or user actions:** None.

Table 12 MAP outputs with associated meanings and actions

Command: QSL 6210040 SCA F
<RESPONSE>: --- DN: 6136210042 LEN: HOST 00 0 00 21 SCA feature is ACTIVE and will not generate AMA records. Do Not Disturb Only: No. Contents of SCA list are: 6136210040 --- **Meaning:** 6136210040 is on 6136210042 SCA screening list. The output Do Not Disturb Only indicates the value of the SCA field DND_ONLY. In this example the field DND_ONLY is set to N. When DND_ONLY is N then SCA screening applies to all incoming calls (provided SCA is active) . If DND is active, then caller(s) on the SCA screening list (in this example, 6136210042) will receive DND treatment and not terminate. Callers not on the SCA screening list will receive SCA treatment. If DND is not active or not provisioned, then callers on the SCA screening list will terminate and callers not on the SCA screening list will receive SCA treatment. **System or user actions:** None

10.10 Security

None

10.11 Configuration Walkthrough

11: Configuration (CN): A00002380

11.1 Hardware and Software Requirements

North American office with MG9000 ABI.

11.2 Initial Configuration

MG9000 ABI configured.

11.3 Office/Subnet parameters (OP/SP) (CM & SESM)

11.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	ESA_GWDATA UPD_HOUR	New	CM
OFCENG	ESA_GWDATA UPD_BOOL	New	CM

11.3.2 Parameter Information

11.3.2.1 ESA_GWDATAUPD_HOUR

Emergency Stand Alone Gateway Data Update Hour.

11.3.2.1.1 Functional Description

A file called ESA_SYSTEM_SD$XML is generated every 24 hours for use during MG9000 ESA. ESA_GWDATAUPD_HOUR specifies the time the file should be generated. The time is given in one hour increments using a 24 hour clock.

11.3.2.1.2 Provisioning rules

It is recommended that ESA_GWDATAUPD_HOUR is set in the early morning after bulk provisioning has been applied but several hours before office traffic picks up.

11.3.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
0	23	6

11.3.2.1.4 Activation

Immediate with the condition that MG9000 ESA data has not already been collected in the same calendar day. Collection is allowed only once per calendar day except when done manually by the ESACOLL command in the ESATOOLS CI increment.

11.3.2.1.5 Dependencies

File ESA_SYSTEM_SD$XML will not be generated if no MG9000 ABI or ITP (LGRP) lines exist in the office or if table OFCENG parameter ESA_GWDATAUPD_BOOL is set to “N”.

File ESA_SYSTEM_SD$XML will be generated on the device specified by OFCENG parameter ESA_GWDATA_DEVICE.

11.3.2.1.6 Consequences

The MG9000 element manager pulls the ESA data every 24 hours. It is desirable for this to happen shortly after the data has been generated in the CM. Please refer to activity A00002019 - ESA EM Enhancements.

11.3.2.1.7 Verification

An ESA120 log is output upon success generation of the XML data file used during MG9000 ESA. Wait until the time specified in the office parameter either in this calendar day or if ESA data collection has already occurred, the next calendar day. Verify an ESA120 log is generated within 10 minutes of this time.

11.3.2.1.8 Memory requirements

No memory impact.

11.3.2.1.9 Parameter release history update

Initial creation. Default collection time of 6:00 AM ensures release upgrade from the SN06.2 patched version of “A00002020 - ITP ESA” will not change the ESA data collection time.

11.3.2.2 ESA_GWDATAUPD_BOOL

Emergency Stand Alone Gateway Data Update Boolean.

11.3.2.2.1 Functional description

Office parameter ESA_GWDATAUPD_BOOL controls the generation of file ESA_SYSTEM_SD$XML. This file is used during MG9000 ESA for ABI and

ITP (LGRP) lines. Note that the file will not be generated if no MG9000 based lines are present regardless of the setting of this parameter.

11.3.2.2.2 Provisioning rules

This parameter is normally set to "Y" in North American Offices with MG9000 based lines. It is not necessary to set it to "N" if no MG9000 based lines are present.

11.3.2.2.3 Range information

Table 3 Range Information

Values	Default
{Y/N}	Y

11.3.2.2.4 Activation

Immediate. MG9000 ESA data will be generated at the time specified by OFCENG parameter ESA_GWDATAUPD_HOUR.

Follow the steps in "11.11 Configuration Walkthrough" when the parameter is changed to "Y".

11.3.2.2.5 Consequences

ESA_SYSTEM_SD$XML can contain many megabytes of data. Please refer to the engineering information section of A00002020 - ESA Translation download and verify that space is available on the device specified by OFCENG parameter ESA_GWDATA_DEVICE.

The MG9000 EM will attempt to pull the ESA_SYSTEM_SD$XML file if any MG9000s use "enhanced ESA". Stale data may be used if the CM is no longer generating this data. An EM alarm may be generated if the file can not be found on the CM. The craftsperson should ensure that the MG9000 EM has all VMGs using "basic ESA" if this office parm is set to "N".

11.3.2.2.6 Verification

Erase file ESA_SYSTEM_SD$XML from the device specified by ESA_GWDATA_DEVICE and wait until the time specified by ESA_GWDATAUPD_HOUR. Ensure that the file has been generated and an ESA120 log output.

11.3.2.2.7 Memory requirements

Please refer to the EI section of A00002020 - ESA Translation Download.

11.3.2.2.8 Parameter release history update

Initial creation.

11.4 Upgrade Impact

11.4.1 Dump and Restore

ESA_GWDATAUPD_HOUR is new in this release. If a patched version of the ITP ESA activity is used this parameter will be updated automatically during an ONP.

11.4.2 Element Management Upgrade

Addressed in activity A00003567: MG 9000 Element Mgr Support for ABI ESA.

11.5 Data schema (DS) (CM, MIBS, RDB)

11.5.1 New/modified tables, MIBs, or Database Schema

Table 4 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ESAPXLA	Changed	Unchanged

11.5.2 Table/MIB/Remote Database Schema Information

11.5.2.1 Name: ESAPXLA (CM table)

Emergency Stand Alone Pretranslation Table

11.5.2.1.1 Functional description

Table ESAPXLA lists special dialing codes to be used during emergency stand alone operation and the translation results for these codes. Provisioning is allowed for every IBN customer group and ABI XPM combination with translator name ESAPOTS being used for non-IBN lines.

Note that 911 lines must be available for each ABI since individual ABIs can enter ESA while other ABIs and LGRPs on the MG9000 do not. Translations for each ABI must be provided in table ESAPXLA so that 911 will terminate properly.

11.5.2.1.2 Usage sequence and implications (CM Only)

Usage of the “L” selector requires that tables LENLINES, IBNLINEs, and KSETLINES be provisioned before table ESAPXLA. Usage of the “H” selector requires that table HUNTMEM be provisioned before table ESAPXLA. These are existing requirements.

Prior to this activity only RCC and RLCM type peripherals could be used in table ESAPXLA. This activity allows LGC/LTC and SMA type peripherals to be used. These peripherals are provisioned in table LTCINV. This is not

expected to add a new dependency since LENLINES also depends on LTCINV and is already required.

11.5.2.1.3 Size

Table 5 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ESAPXLA	0	32 x N x M[a]	No Change. Each new XLANAME/LGRP combination uses 16 bytes for a header. Each tuple uses an additional 16 bytes.

a. N is the number of LGRPs and M is the number of XLANAME entries used including ESAPOTS for POTS lines.

11.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for table ESAPXLA.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PXLAKEY	CHANGED	NODE	PMTYPE	ABI selection added. Allows any XPM supported by ABI ESA as part of an ESAPXLA tuple key. ABI XPMs have the EXTDS512 option in table LTCINV.

11.5.2.1.5 Datafill example

```
ESAPOTS  ABI        LGC   0            201 L REM1  00 0 02 08 N 0
ESAPOTS  ABI        LGC   0            400             T REORDER
ESAPOTS  ABI        LGC   0            402           A ESAPOTS Y
REM1XLA  ABI        LGC   0            202             T SRPDXLA
REM2XLA  ABI        LGC   0            800             T REORDER
REM2XLA  ABI        LGC   0            801         H     3   9 N
```

11.5.2.1.6 Table release history update

Add ESA support for MG9000 ABI XPMs.

11.5.2.1.7 Supplementary information

MG9000 ABIs do not support trunks in ESA so references to table ESARTE or ESAHNPA are not allowed.

The “L” selector allows terminations to a line with a given line equipment number (LEN). The LEN will be screened to ensure it has MG9000 ESA support.

The “H” selector allows terminations to hunt members given the hunt group number specified in table HUNTGRP and the hunt member number specified in table HUNTMEM. The hunt member will be screened to ensure it has MG9000 ESA support.and is served by the same ABI XPM as used in the tuple key.

11.5.2.1.8 Translation verification other tools

Please refer to section “8.9.2 Command: ESATRAVER”.

11.6 Service Orders (SO) (CM & SESM)

No change.

11.7 Software optionality control (SOC)

No change.

11.8 Element Management

Please refer to documentation for activity A00003567: MG 9000 Element Mgr Support for ABI ESA.

11.9 Command Interface Changes

11.9.1 Directory: ESATOOLSDIR

11.9.1.1 Directory description

The ESATOOLS CI increment provides a number of customer tools to verify and operate on CS2000 ESA data. This activity will enhance the ESATRAVER command to work with MG9000 ABI lines.

11.9.1.2 Accessing directory: ESATOOLSDIR

11.9.1.2.1 Access to directory or MAP level and return to CI

To access the ESATOOLS CI increment, type ESATOOLS from the command prompt. To exit ESATOOLS back to the CI environment, type QUIT.

11.9.2 Command: ESATRAVER

Please note that this section includes changes for ESATRAVER related to MG9000 LGRPs and ABI XPMs. It supersedes any prior ESATRAVER

documentation for MG9000. In particular, the ESATRAVER description in activity “A00002020 - ESA Translation Download” is no longer accurate.

11.9.2.1 Command type: NON-MENU

11.9.2.2 Command target: All

11.9.2.3 Command availability: RES

11.9.2.4 Command description

ESATRAVER is a command in the ESATOOLS CI increment which is used to verify ESA translations data in the Call Server.

11.9.2.5 Command syntax

Table 7 ESATRAVER command parameters and variables

Command	Parameters and variables
ESATRAVER	<ORIG> {TR <CLLI> STRING, L <LINE> STRING} <DIGITS> STRING <TRACE> {T, NT, B}
Parameters and variables	**Description**
ORIG	TR <CLLI> : For trunk originations, enter TR and the CLLI name of the trunk group L <LINE> : For line originations, enter L and the 7-digit directory number of the line
DIGITS	Enter the dialled digits to be verified.
TRACE	T = Trace NT = NoTrace B = Both

11.9.2.6 Qualifications and warnings

The ESATRAVER command syntax has not changed. The software has been enhanced to allow verification of lines originating and terminating on MG9000 ABI XPMs. It is already capable of handling MG9000 LGRPs.

Since the MG9000 does not support trunks, the TR <CLLI> parameter does not apply.

11.9.2.6.1 SETRCC command interactions.

SETRCC is an existing command in ESATOOLS that is used to collect trunk group data on an RCC. The SETRCC command must be run for an RCC before the ESATRAVER command can be used on a line or trunk on that RCC.

Since MG9000 does not support trunks in ESA, the SETRCC command is not required prior to issuing the ESATRAVER command on a line on an MG9000.

If SETRCC is done on a particular RCC, an MG9000 ESATRAVER will not use the collected trunk group data and will not affect the data in any way. An MG9000 ESATRAVER can be followed by ESATRAVER on a line or trunk on that RCC without reissuing the SETRCC command.

11.9.2.7 Responses

11.9.2.7.1 Warning: Cannot verify MG9000 Terminator accessible from Originator.

Command: ESATRAVER
Output: Warning: Cannot verify MG9000 Terminator accessible from Originator. **Meaning:** The ESATRAVER command has determined that both the originating and terminating lines are MG9000 based but can not verify that they can call each other during ESA. The main reason for this is that the lines are served by different MG9000s. LGRP to LGRP calls are necessarily on the same site but there is no such restriction with calls involving an ABI line. ESATRAVER between LGRP lines at different sites will not show as completing and will not receive this warning message. **User actions:** The user must verify at the Element Manager that both lines are controlled by the same MG9000.

11.9.2.7.2 NO MATCH

Command: ESATRAVER
Output: NO MATCH **Meaning**: This is a generic error message that indicates that the digits dialled do not translate to a valid terminator from this originator. For an MG9000 line originator this response indicates that the terminator is not on an MG9000. For MG9000 LGRP to LGRP calls it can also mean the two LGRPs are on different sites. **User Actions**: ESATRAVER should be used with originating and terminating lines that can call each other during ESA.

11.9.3 Directory: LGCDIR

11.9.3.1 Directory description

The LGCDIR directory is associated with the LGC level of the MAP. It is available whenever an XPM of node_type LGC is posted. The LGC node_type encompasses a number of PM types including LTC, SMS, SMSR, DTC, SMA2 ... From this directory/map level, maintenance on the posted XPM can be performed.

This activity renames the ABILink directory to ABI. The QUERYPM command is enhanced to query the ABI board for esa capability. This new information of esa enabled/disabled will ONLY exist on ABI-hosted XPMs which not only support ABI ESA funtionality but are capable of esa. The PM types which support ABI ESA functionality are: LGC, LGC with ISP card, or SMA2.

In addition, the maintenance commands (TST, PMRESET, LOADPM, RECOVER, RTS) are enhanced to disallow the maintenance action if the ABI board is in ESA. However the craftsperson is prompted to continue the maintenance action by exitting esa. This new functionality will ONLY exist on ABI-hosted XPMs which support ABI ESA functionality: LGC, LGC with ISP card datafilled, and SMA2.

11.9.3.2 Accessing directory: LGCDIR

11.9.3.2.1 Access to directory or MAP level and return to CI

To enter this directory from the CI evironment, type:

MAPCI;MTC;PM;POST <pm type> <pm number>

To quit, enter:

> QUIT ALL

11.9.3.3 MAP display

The ABILink directory renamed to ABI.

Figure 1 ABILink directory renamed to ABI

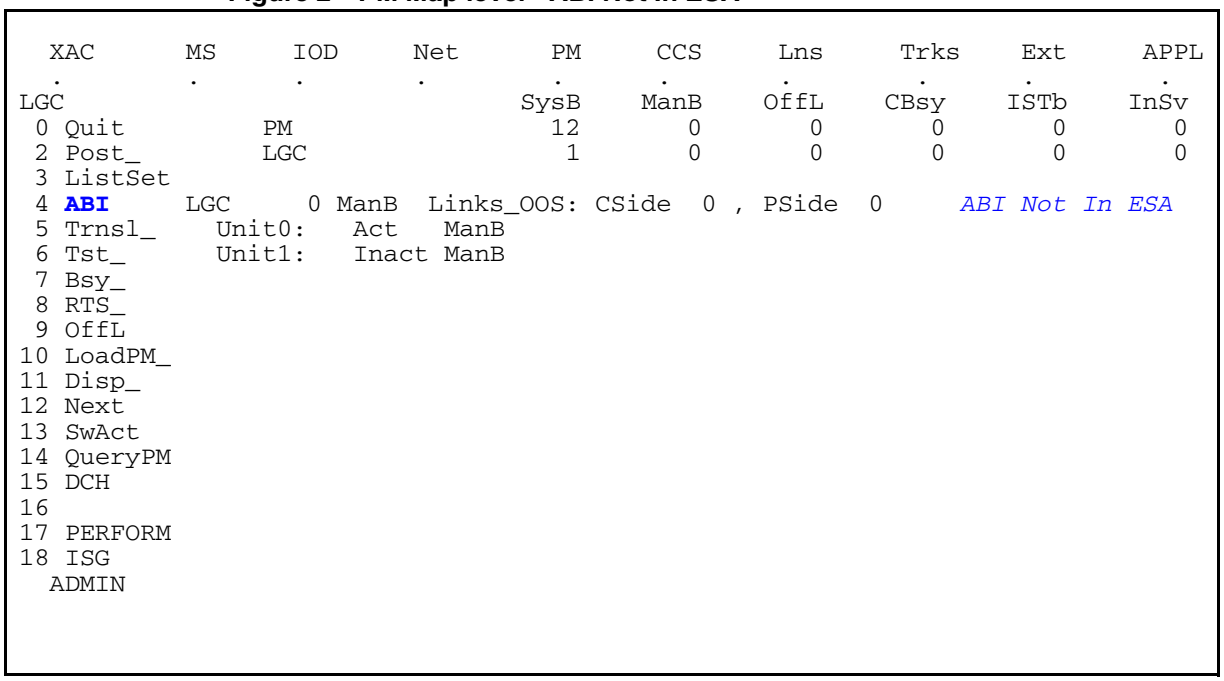
11.9.3.4 ABI ESA MAP status indicator

The new ABI ESA map status indicator is displayed whenever the ABI-hosted XPM has the the following manual maintenance commands initiated (TST, PMRESET, LOADPM, RECOVER, RTS, BSY).

11.9.3.4.1 ABI ESA status MAP indicator - ABI Not in ESA (new)

The ABI ESA status of *ABI Not in ESA* is displayed whenever the ABI board is cabable of ESA and is NOT in ESA.

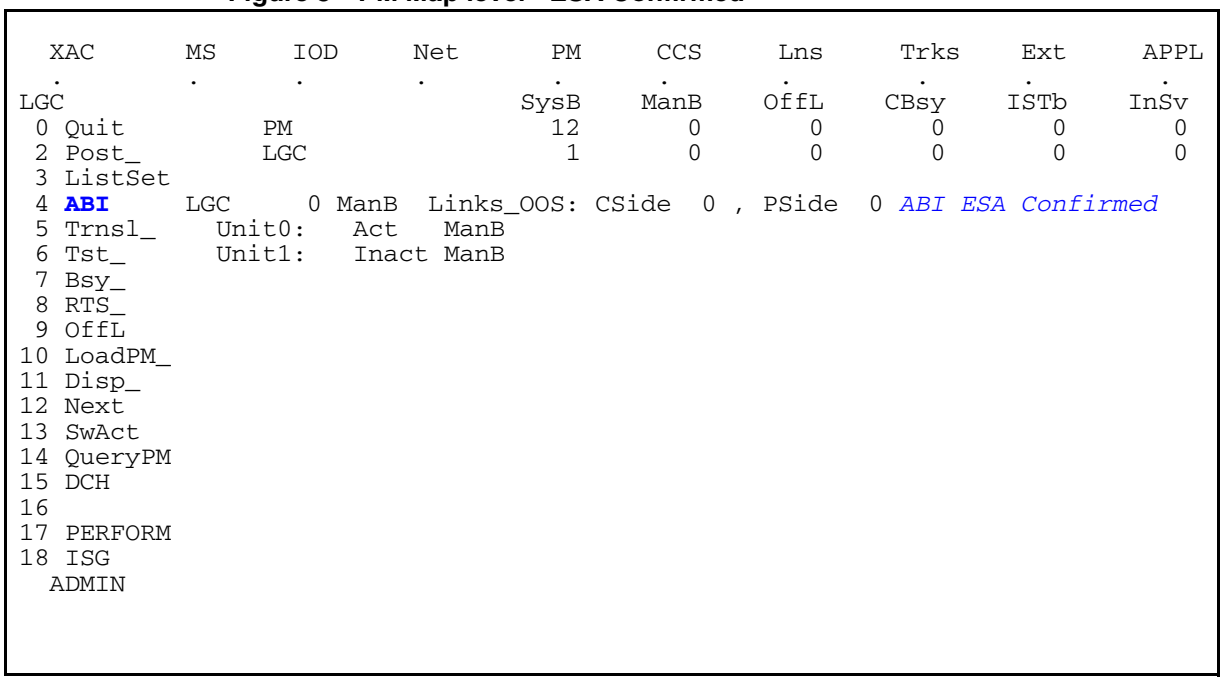
Figure 2 PM Map level - ABI Not In ESA



11.9.3.4.2 ABI ESA status MAP indicator - ABI ESA confirmed (new)

The ABI ESA status of *ABI ESA confirmed* is displayed whenever the ABI board is cabable of ESA and is IN ESA.

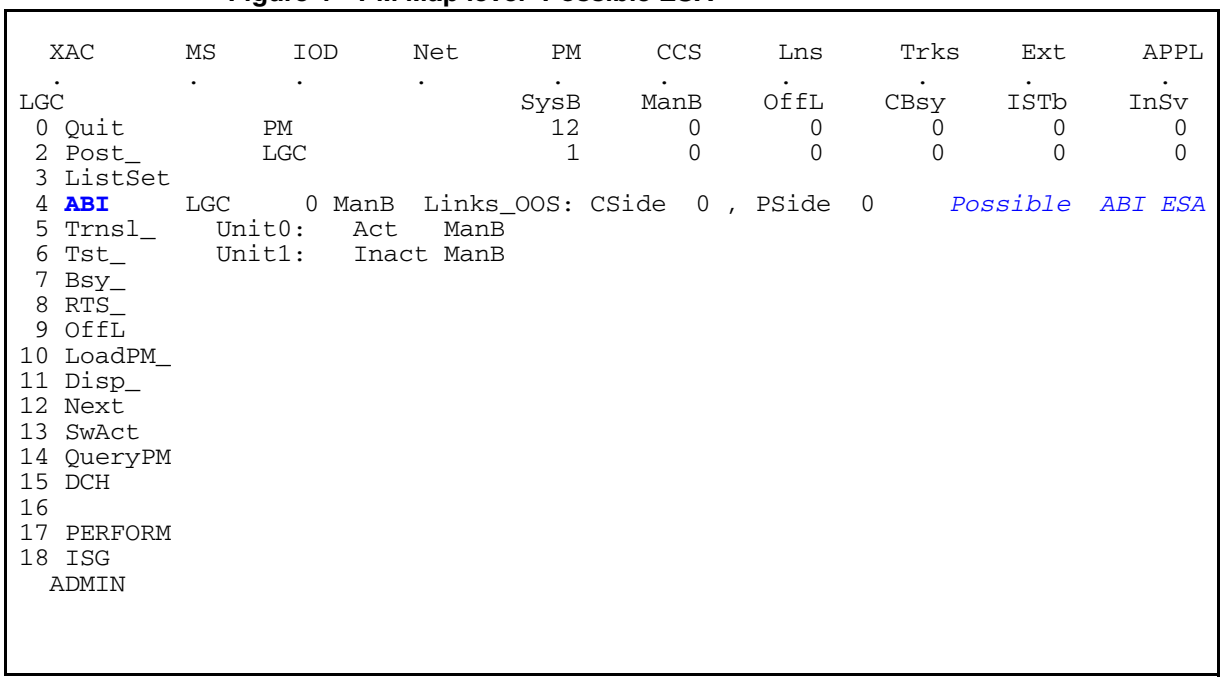
Figure 3 PM Map level - ESA Confirmed



11.9.3.4.3 ABI ESA status MAP indicator - ABI Possible ESA (new)

Possible ABI ESA will be displayed whenever the ABI board is cabable of ESA and communication between the CM and the ABI is down. For example, whenever an InSv ABI-hosted XPM which in capable of ESA goes Cside Busy (CBsy), the ABI ESA map status of Possible ABI ESA will be displayed.

Figure 4 PM Map level -Possible ESA



11.9.4 Command: QUERYPM (existing)

Please note that this section includes additional information for the QUERYPM command for ABI-hosted XPMs which are capable of ESA.

11.9.4.1 Command type: MENU

11.9.4.2 Command target: All

11.9.4.3 Command availability: RES

11.9.4.4 Command description

QUERYPM is a command in the LGCDIR CI increment which is used to query the PM for data. New ABI ESA information is displayed if the ABI board is capable of ESA.

11.9.4.5 Command syntax

Not changed.

11.9.4.6 Qualifications and warnings

none.

11.9.4.7 Responses

11.9.4.7.1 ABI Enhanced ESA enabled - check Element Manager

Command: QUERYPM
Output: ABI Enhanced ESA enabled - check Element Manager **Meaning:** The QUERYPM command queried the ABI board which is capable of ESA and has ESA functionality enabled. The craftsperson can check the Element Manager to verify it's viewpoint of enhanced esa. **User actions:** None. Informational purposes only

11.9.4.7.2 ABI Enhanced ESA disabled - check Element Manager

Command: QUERYPM
Output: ABI Enhanced ESA disabled - check Element Manager **Meaning**: The QUERYPM command queried the ABI board which is capable of ESA and has ESA functionality disabled. The craftsperson can check the Element Manager to verify it's viewpoint of enhanced esa. **User Actions**: None. Informational purposes only

11.9.4.7.3 ABI ESA information not available - no response

Command: QUERYPM
Output: ABI ESA information not available - check Element Manager **Meaning**: The QUERYPM command queried the ABI board and the ABI board did not respond. The craftsperson can check the Element Manager to verify it's viewpoint of enhanced esa. **User Actions**: None. Informational purposes only

11.9.4.7.4 ABI ESA information not available - GWC out of service

Command: QUERYPM
Output: ABI ESA information not available - GWC is out of service **Meaning**: The QUERYPM command attempted to query the ABI board but the host GWC node was out of service. **User Actions**: None. Informational purposes only

11.9.5 Command: TST, PMRESET, LOADPM (existing)

Please note that this section includes changes for TST, PMRESET, and LOADPM only for ABI-hosted XPMs which are capable of ESA. Before performing the initiated maintenance command, the ABI board is queried to determine if it is in ESA. If the ABI board is in ESA or communication is not established between the CM and the ABI board, then the maintenance

command will be rejected. The craftsperson has the option of requesting the ABI board to exit esa and continuing with the maintenance action.

11.9.5.1 Command type: MENU

11.9.5.2 Command target: All

11.9.5.3 Command availability: RES

11.9.5.4 Command description

TST is a command in the LGCDIR CI increment which is used to perform InSv and out-of-service (OOS) diagnostics on the PM. OOS diagnostics occur on a ManB PM/unit. The PM/unit is dropped to ROM at the beginning of the TST command to run ROM diagnostics. PMRESET is a command in the LGCDIR CI increment which is used to drop the ABI-hosted XPM to ROM-level.

LOADPM is a command in the LGCDIR CI increment which is used to load an XPM load into the ABI-hosted XPM. Loading of the XPM is performed only at ROM-level.

Berfore allowing the XPM to be dropped to ROM-level the ABI board is verified if it is in ESA. If so, the craftsperson is informed that the ABI board is in ESA and maybe processing calls. The craftsperson can chose to continue and exit ESA and if exit fails, to force exit the ABI board out of ESA.

11.9.5.5 Command syntax (existing)

The command syntax for the TST, PMRESET, LOADPM, and BSY commands did not change.

11.9.5.6 Qualifications and warnings

The only change to existing behavior is to allow the craftsperson to initiate an ABI esa exit and continue the XPM maintenance command. MAPCI responses are displayed at the MAP for ABI-hosted XPMs which are capable of ESA.

11.9.5.7 Responses (new)

11.9.5.7.1 A COLD ABI ESA Exit will be attempted.

Command: TST
Output: <pmtype> <xpm number> Unit <unit number> A COLD ABI ESA Exit will be attempted **ALL active ESA calls will be ABORTED** **Please confirm ('YES', 'Y', 'NO', or 'N');** **Meaning:** The TST command queried the ABI and determined that the ABI board has esa enabled and is in ESA and out-of-service diagnostics are not permitted. **User actions:** Craftsperson has the option of leaving the ABI in ESA or continuing by exitting abi esa.

Command: PMRESET
Output: <pmtype> <xpm number> Unit <unit number> A COLD ABI ESA Exit will be attemped **ALL active ESA calls will be ABORTED** **Please confirm ('YES', 'Y', 'NO', or 'N');** **Meaning:** The PMRESET command queried the ABI and determined that the ABI board has esa enabled and is in ESA and a PMRESET is not permitted. **User actions:** Craftsperson has the option of leaving the ABI in ESA or continuing by exitting abi esa.

Command: LOADPM
Output: <pmtype> <xpm number> Unit <unit number> A COLD ABI ESA Exit will be attempted **ALL active ESA calls will be ABORTED** **Please confirm ('YES', 'Y', 'NO', or 'N');** **Meaning:** The LOADPM command queried the ABI and determined that the ABI board has esa enabled and is in ESA and a LOADPM is not permitted. **User actions:** Craftsperson has the option of leaving the ABI in ESA or continuing by exitting abi esa.

11.9.5.7.2 A Force will allow maintenance actions

Command: TST
Output: <pmtype> <xpm number> Unit <unit number> A Force will allow maintenance actions **This action will result in a CALL PROCESSING OUTAGE** **Please confirm ('YES', 'Y', 'NO', or 'N');** **Meaning:** The TST command queried the ABI and determined that the ABI board has esa enabled and is in ESA and the craftsperson attempted to exit esa, but the abi board can only partially exit esa. **User actions:** Craftsperson has the option of leaving the ABI in ESA or continuing by exit forcing esa.

Command: PMRESET
Output: <pmtype> <xpm number> Unit <unit number> A Force will allow maintenance actions **This action will result in a CALL PROCESSING OUTAGE** **Please confirm ('YES', 'Y', 'NO', or 'N');** **Meaning:** The PMRESET command queried the ABI and determined that the ABI board has esa enabled and is in ESA and the craftsperson attempted to exit esa, but the abi board can only partially exit esa. **User actions:** Craftsperson has the option of leaving the ABI in ESA or continuing by exit forcing esa.

Command: LOADPM

Output: <pmtype> <xpm number> Unit <unit number> A Force will allow maintenance actions

This action will result in a CALL PROCESSING OUTAGE

Please confirm ('YES', 'Y', 'NO', or 'N');

Meaning: The LOADPM command queried the ABI and determined that the ABI board has esa enabled and is in ESA and the craftsperson attempted to exit esa, but the abi board can only partially exit esa.

User actions: Craftsperson has the option of leaving the ABI in ESA or continuing by exit forcing esa.

11.9.6 Command: RTS, RECOVER (existing)

Please note that this section includes changes for RTS and RECOVER related to ABI-hosted XPMs. These commands will drop the ABI-hosted XPM to ROM before performing the initiated maintenance command. If the ABI is in ESA the craftsperson can chose to continue and exit the ABI board out of ESA but the craftsperson is not allowed to force exit the ABI board out of ESA.

11.9.6.1 Command type: MENU

11.9.6.2 Command target: All

11.9.6.3 Command availability: RES

11.9.6.4 Command description

RTS is a command in the LGCDIR CI increment which is used to recover the ABI-hosted XPM unit(s) from a ManB to an InSv state. RTS can only occur on a ManB PM/unit. If the ABI is in ESA or communication is not established between the CM and the ABI, the RTS command will be rejected. If the ABI is in ESA, then the craftsperson will be prompted to initiate exit esa causing ALL active calls to be aborted.

RECOVER is a command in the LGCDIR CI increment which is used to recover the ABI-hosted XPM from a ManB or SysB to an InSv state.

RECOVER will reload the units if necessary and recover the units to an InSv state.

11.9.6.5 Command syntax (existing)

The command syntax for the RTS and RECOVER commands did not change.

11.9.6.6 Qualifications and warnings

The only change to existing behavior is to display failure responses at the MAP for ABI-hosted XPMs and to initiate ABI esa exit.

11.9.6.7 Responses (new)

11.9.6.7.1 ABI callp is NOT possible.

Command: RTS
Output: <pmtype> <xpm number> Unit <unit number> ABI callp is NOT possible **Perform ABI maintenance from the Element Manager** **Meaning:** The RTS command queried the ABI and determined that the ABI board has esa enabled and is in partially in ESA and the RTS is not permitted. **User actions:** Craftsperson has the option of performing ABI maintenance from the Element Manager.

Command: RECOVER
Output: <pmtype> <xpm number> Unit <unit number> ABI callp is NOT possible **Perform ABI maintenance from the Element Manager** **Meaning:** The RECOVER command queried the ABI and determined that the ABI and ABI board has esa enabled and is in partially in ESA and the RECOVER is not permitted. **User actions:** Craftsperson has the option of performing ABI maintenance from the Element Manager.

11.9.6.7.2 ABI communication is NOT possible.

Command: RTS
Output: <pmtype> <xpm number> Unit <unit number> ABI communication is NOT possible **ABI maintenance may be performed from the Element Manager.** **Meaning:** The RTS command tried to query the ABI and received no response, RTS is not permitted. **User actions:** Craftsperson has the option of performing ABI maintenance from the Element Manager.

Command: RECOVER
Output: <pmtype> <xpm number> Unit <unit number> ABI communication is NOT possible **ABI maintenance may be performed from the Element Manager.** **Meaning:** The RECOVER command tried to query the ABI and received no response, RECOVER is not permitted. **User actions:** Craftsperson has the option of performing ABI maintenance from the Element Manager.

11.9.6.7.3 A Cold ABI ESA Exit will be attempted.

Command: RTS
Output: <pmtype> <xpm number> Unit <unit number> A Cold ABI ESA Exit will be attempted **This will cause ALL active calls to be ABORTED** **Please confirm (“YES”, “Y”, “NO”, “N”):** **Meaning:** The RTS command queried the ABI and determined that the ABI board has esa enabled and is in ESA and a RTS is not permitted. **User actions:** Craftsperson has the option of leaving the ABI in ESA or continuing by exitting abi esa.

Command: RECOVER
Output: <pmtype> <xpm number> Unit <unit number> A Cold ABI ESA Exit will be attempted **This will cause ALL active calls to be ABORTED** **Please confirm ("YES", "Y", "NO", "N"):** **Meaning:** The RECOVER command queried the ABI and determined that the ABI board has esa enabled and is in ESA and a RECOVER is not permitted. **User actions:** Craftsperson has the option of leaving the ABI in ESA or continuing by exitting abi esa.

11.9.7 Directory: ABIDIR

11.9.7.1 Directory description

The ABIDIR directory is associated with the ABI level of the MAP. It is available whenever an ABI-hosted XPM is posted. The LGC node_type encompasses a number of pm_types including LTC, SMS, SMSR, DTC, SMA2 ... From this directory/map level, maintenance on the posted ABI-hosted XPM can be performed.

11.9.8 Command: QUERYABI (new)

11.9.8.1 Command type: MENU

11.9.8.2 Command target: All

11.9.8.3 Command availability: RES

11.9.8.4 Command description

QUERYABI is a command in the ABIDIR CI increment which is used to display table GATWYINV information and display the ABI board's esa capability of enabled/disabled if the ABI board has esa functionality.

11.9.8.5 Command syntax

Table 8 ABIEXITESA command parameters and variables

Command	Parameters and variables
QUERYABI	none

11.9.8.6 Qualifications and warnings

The QUERYABI command is only available when an ABI-hosted XPM is posted.

11.9.8.7 Responses

11.9.8.7.1 ABI Enhanced ESA enabled.

Command: QUERYABI
Output: ABI ESA enabled. **Meaning:** The QUERYABI command queried the ABI board for it's ESA capability. The information displayed informs the craftsperson that the abi board has esa enabled. **User actions:** None. Informational purposes only

11.9.8.7.2 ABI Enhanced ESA disabled

Command: QUERYABI
Output: ABI ESA disabled **Meaning**: The QUERYABI command queried the ABI board for it's ESA capability. The information displayed informs the craftsperson that the abi board has esa disabled. **User Actions**: None. Informational purposed only.

11.9.8.7.3 ABI ESA information not available - GWC is out of service

Command: QUERYABI
Output: ABI ESA information not available - GWC is out of service **Meaning**: The QUERYABI command attempted to query the ABI board for it's ESA capability. The information displayed informs the craftsperson that the cside host node (GWC) of the ABI-hosted XPM is out-of-service. **User Actions**: None. Informational purposed only.

11.9.8.7.4 ABI ESA information not available - check Element Manager

Command: QUERYABI
Output: ABI ESA information not available - check Element Manager **Meaning**: The QUERYABI command attempted to query the ABI board for it's ESA capability. The information displayed informs the craftsperson that the ABI board did not respond to the esa query. **User Actions**: None. Informational purposed only.

11.10 Security

The security issue of the FTP transfer of file ESA_SYSTEM_SD$XML from the CM to the MG9000 EM is considered in activity A00002019 - ESA EM Enhancements.

11.11 Configuration Walkthrough

Please refer to activityA00002019 ESA EM Enhancements for information on configuring the MG9000 EM.

1. Verify tuples exist in table LTCINV with the EXTDS512 option. This indicates the XPM has ABI capability.

```
TABLE: LTCINV
>top
       LGC    0
```

```
             10    LTEI    0     4      1    C    31 6X02NA  QLI20AZ
 (          POTS   POTSEX) (       KEYSET   KSETEX) (     RMM_TERM    RSMEX)$
                (         4  0) (         4  1) (         4  2) (         4  3)$
                                (     UTR15 ) (   MSG6X69 ) (       ISP 16)$
     NORTHAM     SX05AA $ SX05AA $
                                                        0
                            SXFWAJ01
                            (EXTDS512 HOST 1 2 192 2 7 65 GWC 3) $
     6X40FB                                             N
```

2. Provision special dialing codes in table ESAPXLA for POTS (XLANAME = ESAPOTS) as well as for XLANAMEs used by IBN customer groups with member lines on the ABI XPM.

```
>table ESAPXLA
>lis all

TOP
                                  PXLAKEY                  RESULT
-----------------------------------------------------------------
 ESAPOTS ABI LGC 0              411 T REORDER
 ESAPOTS ABI LGC 0              911 L HOST 00 2 03 01 N 0
```

3. Set OFCENG parameter ESA_GWDATA_DEVICE

```
This step is not necessary if SFDEV is being used to hold MG9000 ESA data.

It is recommended that a disk device be used so that SFDEV is available for other
uses.
```

4. Set OFCENG parameter ESA_GWDATAUPD_HOUR

```
This step is not necessary if the default generation time of 6:00 AM is acceptable.
```

5. Verify OFCENG parameter ESA_GWDATAUPD_BOOL is set to “Y”.

6. Generate ESA data file using ESATOOLS.

```
>ESATOOLS
>ESACOLL
Warning: All MG9000 ESA data will be rebuilt.
Please confirm ("YES", "Y", "NO", or "N"):
>Y
ESA static data generation initiated.
ESA 120 log will be output upon successful generation of
file ESA_SYSTEM_SD$XML on device D000ESA.

... have prompt back - wait for ESA120/ESA121 log

LOGUTIL ESA
Done.
RTP207BT      ESA120 NOV20 11:12:21 8500 INFO ESA DATA GENERATION

>DISKUT
>LISTFL D000ESA
ESA_SYSTEM_SD$XML

QUIT ALL
```

7. ESA data file will be automatically generated every 24 hours at the time specified by ESA_GWDATAUPD_HOUR. An ESA120 log is output when the data is successfully generated.

12: Configuration (CN): A00002431

12.1 Hardware and Software Requirements

None.

12.2 Initial Configuration

None.

MNCKTPAK	CHANGED	NEW

12.5.2 Table information

12.5.2.1 Name: MNNODE

12.5.2.1.1 Functional description

A new field ‘capindx’ is added in table MNNODE for DMSCP class of SPMs only. This new field can take the values ‘Standard’, ‘Enhanced’ or ‘Premium’ where ‘Standard’ is the default value.

During tuple addition in table MNNODE, for using ‘Enhanced’ or ‘Premium’ values, the respective SOC options must have its RTU set to Y and the Usage count must be less than its Limit. Also for using ‘Enhanced’ capacity, number of DMSCP SPMs provisioned with Enhanced capacity must be less than the limit of SPMS0020 SOC option and for using ‘Premium’ capacity, number of DMSCP SPMs provisioned with Premium capacity must be less than the limit of SPMS0028 SOC option.

While changing the capindx field to ‘Enhanced’ or ‘Premium’ values, the PEC codes of the CEM units provisioned in table MNCKTPAK for this node are also verified for NTLX82BA, in addition to the SOC check. If all the check passes, the appropriate SOC usage value is incremented. For capindx field changes from ‘Enhanced’ or ‘Premium’ values to ‘Standard’, appropriate SOC usage counts are decremented if both the CEM tuples are present in table MNCKTPAK.

Tuple change with No change to the ‘capindx’ field is not validated. For tuple deletion, there are no restrictions enforced on this field. Refer table 2, table 3 and table 4 for the various Error, Warning and Success messages that are introduced in table MNNODE as part of this activity.

Note: All the table control operations in table 2 shall be failed with appropriate error messages and all the table control operation in table 3 and table 4 shall be passed with appropriate messages.

Table 2 New Error Messages

No.	Table Control operations	Pre - conditions
	Error Messages	
1	a. Tuple addition in MNNODE with 'Enhanced' capacity. b. Tuple change in MNNODE from 'Standard' to 'Enhanced' capacity. c. Tuple change in MNNODE from 'Premium' to 'Enhanced' capacity.	SPMS0020 SOC option's RTU set to 'N'
	RTU value not set for SPM Enhanced capacity SOC option SPMS0020.	
2	a. Tuple addition in MNNODE with 'Premium' capacity. b. Tuple change in MNNODE from 'Standard' to 'Premium' capacity. c. Tuple change in MNNODE from 'Enhanced' to 'Premium' capacity.	SPMS0028 SOC option's RTU set to 'N'
	RTU value not set for SPM Premium capacity SOC option SPMS0028.	
3	a. Tuple addition in MNNODE with 'Enhanced' capacity. b. Tuple change in MNNODE from 'Standard' to 'Enhanced' capacity. c. Tuple change in MNNODE from 'Premium' to 'Enhanced' capacity.	SPMS0020 SOC option's Limit is equal to the No. of SPMs provisioned with 'Enhanced' capacity.
	Capindx cannot be provisioned as Enhanced capacity for more SPMs than the limit of SOC option SPMS0020. Check existing tuples using SPMCPCAP tool.	

Table 2 New Error Messages

No.	Table Control operations	Pre - conditions
	Error Messages	
4	a. Tuple addition in MNNODE with ‘Premium’ capacity. b. Tuple change in MNNODE from ‘Standard’ to ‘Premium’ capacity. c. Tuple change in MNNODE from ‘Enhanced’ to ‘Premium’ capacity.	SPMS0028 SOC option's Limit is equal to the No. of SPMs provisioned with ‘Premium’ capacity.
	Capindx cannot be provisioned as Premium capacity for more SPMs than the limit of SOC option SPMS0028. Check existing tuples using SPMCPCAP tool.	
5	a. Tuple change in MNNODE from ‘Standard’ to ‘Enhanced’ capacity.	a. No. of SPMs provisioned with Enhanced capacity is less than the Limit and b. One or Both the CEM PEC is/are not NTLX82BA.
	Both CEM PEC codes must be NTLX82BA for Enhanced capacity. **Verify MNCKTPAK datafill.**	
6	a. Tuple change in MNNODE from ‘Standard’ to ‘Premium’ capacity.	a. No. of SPMs provisioned with Premium capacity is less than the Limit and b. One or Both the CEM PEC is/are not NTLX82BA.
	Both CEM PEC codes must be NTLX82BA for Premium capacity. **Verify MNCKTPAK datafill.**	

Table 3 New Warning Messages

No.	Table Control operations	Pre - conditions
	Warning Messages	
1	a. Tuple addition in MNNODE with 'Enhanced' capacity. b. Tuple change in MNNODE from 'Standard' to 'Enhanced' capacity. c. Tuple change in MNNODE from 'Premium' to 'Enhanced' capacity	a. SPMS0020 SOC option's RTU set to Y, No. of SPMs provisioned with Enhanced capacity is less than the Limit and b. One or both the CEM tuples in table MNCKTPAK is/are not provisioned.
	WARNING: Capindx provisioned as Enhanced capacity. **Both CEMs must be provisioned as NTLX82BA.**	
2	a. Tuple addition in MNNODE with 'Premium' capacity. b. Tuple change in MNNODE from 'Standard' to 'Premium' capacity. c. Tuple change in MNNODE from 'Enhanced' to 'Premium' capacity.	a. SPMS0028 SOC option's RTU set to Y, No. of SPMs provisioned with Enhanced capacity is less than the Limit and b. One or both the CEM tuples in table MNCKTPAK is/are not provisioned.
	WARNING: Capindx provisioned as Premium capacity. **Both CEMs must be provisioned as NTLX82BA.**	

Table 4 New Success Messages

No.	Table Control operations	Pre - conditions
	Success Messages	
1	a. Tuple change in MNNODE from 'Enhanced' to 'Standard' capacity.	Both the CEM tuples are present in table MNCKTPAK.
	Datafill conditions met for de-activation of **SPM Enhanced capacity SOC option SPMS0020.**	
2	a. Tuple change in MNNODE from 'Premium' to 'Standard' capacity.	Both the CEM tuples are present in table MNCKTPAK.
	Datafill conditions met for de-activation of **SPM Premium capacity SOC option SPMS0028.**	

Table 4 New Success Messages

No.	Table Control operations	Pre - conditions
	Success Messages	
3	a. Tuple change in MNNODE from 'Standard' to 'Enhanced'. b. Tuple change in MNNODE from 'Premium' to 'Enhanced'.	a. No. of SPMs provisioned with Enhanced capacity is less than the Limit and b. Both the CEM tuples are present in table MNCKTPAK and both the CEM PEC are NTLX82BA.
	Datafill conditions met for activation of SPM Enhanced capacity SOC option SPMS0020.	
4	a. Tuple change in MNNODE from 'Standard' to 'Premium'. b. Tuple change in MNNODE from 'Enhanced' to 'Premium'.	a. No. of SPMs provisioned with Premium capacity is less than the Limit and b. Both the CEM tuples are present in table MNCKTPAK and both the CEM PEC are NTLX82BA.
	Datafill conditions met for activation of SPM Premium capacity SOC option SPMS0028.	

12.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

12.5.2.1.3 Size

Not impacted.

12.5.2.1.4 Fields/OIDs

The following table lists fields for table MNNODE which are changed as part of this activity.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CAPINDX	New	Not Applicable		This field is introduced for DMSCP class of SPMs only in table MNNODE.

12.5.2.1.5 Datafill example

Datafill examples for each capacity datafilled in table MNNODE are shown below.

Figure 1 Datafill example

```
SPM 1 SPM_1 DMSCP 1 SYNC LOOP 15 (COT 60) (DTMF 60) (ECAN 60) (TONESYN 60)

12.5.2.2 Name: MNCKTPAK

12.5.2.2.1 Functional description

The CEM tuples of DMSCP variant of SPM are allowed to be provisioned only with the PECs - NTLX82AA, NTLX82AB and NTLX82BA in table MNCKTPAK. With the introduction of the new field ‘CAPINDX’ in table MNNODE, the provisioning of the PEC is dependent on the capindx value. The capindx can be provisioned with ‘Standard’, ‘Enhanced’ or ‘Premium’.

Incase the capindx in table MNNODE is ‘Standard’, the PEC shall be allowed to be datafilled as NTLX82AA, NTLX82AB or NTLX82BA. In case of ‘Enhanced’ or ‘Premium’ capindx, the PEC must be datafilled as NTLX82BA.

For Non-DMSCP class of SPMs, no validations for CEM PEC are introduced by this activity. The PEC that is datafilled for both the CEMs in table MNCKTPAK automatically determines the capacity for that SPM. If both the CEMs are datafilled with NTLX82BA PEC cards, then capacity is ‘Premium’ and for any other combinations of PEC cards, the capacity is ‘Standard’. Refer table 7 and table 8 for the various Error and Success messages that are introduced in table MNCKTPAK as part of this activity.

Table 6 New Error Messages

No.	Table Control operations	Pre - conditions
	Error Messages	
1	a. Addition of a CEM tuple in table MNCKTPAK with NTLX82AA. b. Updation of a CEM PEC from NTLX82BA to NTLX82AA.	a. The capindx field in table MNNODE is Enhanced or Premium and b. The other CEM tuple may or may not be present.
	Cannot allocate NTLX82AA card for an SPM that has been datafilled with Enhanced or Premium capacity. Check MNNODE datafill.	
2	a. Addition of a CEM tuple in table MNCKTPAK with NTLX82AB. b. Updation of a CEM PEC from NTLX82BA to NTLX82AB.	a. The capindx field in table MNNODE is Enhanced or Premium and b. The other CEM tuple may or may not be present.
	Cannot allocate NTLX82AB card for an SPM that has been datafilled with Enhanced or Premium capacity. Check MNNODE datafill.	

Table 7 New Success Messages

No.	Table Control operations	Pre - conditions
	Success Messages	
1	a. Addition of a CEM tuple in table MNCKTPAK with NTLX82BA.	a. The capindx field in table MNNODE is Enhanced and b. The other CEM tuple is already present.
	Datafill conditions met for activation of SPM Enhanced capacity SOC option SPMS0020.	
2	a. Addition of a CEM tuple in table MNCKTPAK with NTLX82BA.	a. The capindx field in table MNNODE is Premium and b. The other CEM tuple is already present.
	Datafill conditions met for activation of SPM Premium capacity SOC option SPMS0028.	
3	a. Deletion of a CEM tuple in table MNCKTPAK with NTLX82BA.	a. The capindx field in table MNNODE is Enhanced and b. The other CEM tuple is already present.
	Datafill conditions met for de-activation of SPM Enhanced capacity SOC option SPMS0020.	
4	a. Deletion of a CEM tuple in table MNCKTPAK with NTLX82BA.	a. The capindx field in table MNNODE is Premium and b. The other CEM tuple is already present.
	Datafill conditions met for de-activation of SPM Premium capacity SOC option SPMS0028.	

12.5.2.2.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

12.5.2.2.3 Size

Not impacted.

Not Applicable

12.7 Software optionality control (SOC)

Two new USAGE SOCs are created under a new group called CAP. These SOCs are used only by DMSCP class of SPMs. The SOC option SPMS0020 corresponds to the SPMs with Enhanced capacity and the SOC option SPMS0028 corresponds to the SPMs with Premium capacity.

The hard limit value of SPMS0020 denotes the maximum number of DMSCP class of SPMs in the office that can be provisioned with Enhanced capacity and the hard limit value of SPMS0028 denotes the maximum number of DMSCP

class of SPMs in the office that can be provisioned with Premium capacity. The threshold value of these SOC options are set to 100%.

The value of the USAGE of SPMS0020 and SPMS0028 denotes the number of DMSCP class of SPMs currently running with the Enhanced and Premium capacity respectively from Core's perspective. Refer Appendix A in Section 13.12 for the syntax of some of the SOC commands.

12.9.2.4 Command description

Command SPMCPCAP is used to display CallP capacity information for SPMs.

12.9.2.5 Command syntax

The command syntax is as shown in Figure 2.

Figure 2 Syntax of SPMCPCAP command

```
>help spmcpcap
SPM Callp Capacity information tool.
SPMCPCAP - Displays Callp Capacity information for SPMs.
           Remarks field displays if CEM(s) are not
           datafilled for the SPM.

Parms: <OPTION> {Class <Class type> {DMSCP,
                                     IW,
                                     MG4K,
                                     ALL},
                Capacity <Capacity type> {Standard,
                                          Enhanced,
                                          Premium,
                                          ALL},
                SPM <SPM Number> {0 TO 85}}
```

```
Syntax  : spmcpcap
Parameter Description:

  CLASS DMSCP      : List CallP capacities of all the DMSCP SPMs provisioned
                     in the office.

  CLASS MG4K       : List CallP capacities of all the MG4K SPMs provisioned in
                     the office.

  CLASS IW         : List CallP capacities of all the IW SPMs provisioned in
                     the office.

  CLASS ALL        : List CallP capacities of all the classes of SPMs
                     provisioned in the office.

  CAPACITY Standard: List all the SPMs in an office that have 'Standard' CallP
                     capacity.

  CAPACITY Enhanced: List all the SPMs in an office that have 'Enhanced' CallP
                     capacity.

  CAPACITY Premium : List all the SPMs in an office that have 'Premium' CallP
                     capacity.

  CAPACITY ALL     : List all the SPMs in an office and their corresponding
                     CallP capacity.

  SPM <SPM NO>     : List CallP capacity for a given SPM node number.
```

12.9.2.6 Qualifications and warnings

If either or both the CEM tuple are not present in table MNCKTPAK for an SPM, then the remarks field against that SPM displays that the CEM datafill is incomplete. If the both the CEM tuples are datafilled, remarks field displays 'None' against that SPM.

CallP capacity information is taken from table MNNODE datafill for DMSCP class of SPMs. Supported capacities for this class are ‘Standard’, ‘Enhanced’ and ‘Premium’.

For other classes (MG4K and IW) this capacity is derived from CEM PEC datafill in table MNCKTPAK. Supported capacities for these classes are ‘Standard’ and ‘Premium’. If the CEM(s) are not datafilled in table MNCKTPAK, then the tool displays ‘Standard’ capacity for MG4Ks and IWs.

12.9.2.7 Responses

12.9.2.7.1 Listing SPMs with Enhanced CallP capacity

Listing of SPMs with Enhanced capacity will not display information of MG4K and IW SPMs as this capacity is invalid for these classes. This option is valid for DMSCP class of SPMs only.

12.9.2.8 Example

Table 13 lists various usage examples for SPMCPCAP command.

12.12 Appendix A: SOC commands

Appendix A lists the syntax for various SOC commands.

- To display information about SOC group and options.

  SOC:

  >SELECT GROUP CAP

  >SELECT OPTION SPMS0020

  >SELECT OPTION SPMS0028

- To assign a limit to the new SOC options, SPMS0020 and SPMS0028.

  SOC:

  >ASSIGN LIMIT <value of limit> <key code> TO SPMS0020

  >ASSIGN LIMIT <value of limit> <key code> TO SPMS0028

- To assign the threshold value(percentage and absolute).

  SOC:

  >ASSIGN THRESHOLD <percentage value> PERCENT TO SPMS0020

  >ASSIGN THRESHOLD <absolute value> ABSOLUTE TO SPMS0020

13: Configuration (CN): A00002433

13.1 Hardware and Software Requirements

This feature is intended to verify that an XA-Core meets baseline HW and FW requirements, that may vary from one SW release to another.

13.2 Initial Configuration

No configuration steps are required to enable this feature in CSP20.
For CSP17/18/19, a patch must be developed which does a “precheck” to alert the user that they are not at HW baseline for CSP20, and that these components will not come into service if they were to continue with the unsplit. Documentation will also indicate the required HW PEC and HW releases required.

13.3 Office parameters

No new or modified office parameters.

13.4 Upgrade Impact

13.4.1 Dump and Restore

No dump and restore impact, as existing table PECINV, and new table FWINV are NOT restored over an ONP.

13.4.2 CSP20 XA-Core Baselines

HW baselines and optoinal exception releases are listed in table PECINV.
FW baselines and optional exception versions are listed in table FWINV.
XA-Core baselines are shown below - these should be added to customer ONP documentation. Used in ONP prechecks weeks prior to ONP, while unsplit: (a) ONPREADY, b) SWUPGRADE READY; START, c) BCSUPDATE; PRECHECK) as well as during ONP pre-swact checks, while split (BCSUPDATE; SWACTCI; PRESWACT):

13.4.3 Pre-ONP checks (while usnplit)

Existing steps have been enhanced for XA-Core, and to check for non-baseline XA-Core HW/FW/DLL.

1. ONPREADY % Step "DISPLAY_PEC_INFO"
   Step saves MAP output to file, then scans it for baseline failures.
2. BCSUPDATE; PRECHECK % Step "DISPLAY_PEC_INFO"
   Step display MAP output to screen ONLY.
   Step always “fails”, so that user wil manually scan for non-baseline indicators.
   Override the step to continue, once all resources are at baseline.
3. SWUPGRADE READY; START % Step “VERIFY_SN_PECS_INFO”
   Step saves MAP output to file, then scans it for baseline failures.

13.4.4 PRESWACT checks (while split)

A new preswact check is added, and run while the XA-Core is split. Active side queries are sent to inactive side for comparison against NEW PECINV baselines. Incompatible cards/packlets are sent back to active side for display. If list is nil, step passes, else preswact step fails.

Figure 3 PRESWACT - Baseline Check Behaviour

```
ACTIVE SIDE                                          INACTIVE SIDE
-----------                                          --------------
1- Card/pklt query list -> Buf
                                     Buf
2- preswact_transfer(PSEND, INITIAL) --->
   Invokes
                                       3- Compare card/pklts vs NEW PECINV baseli
                                                Non-baseline items->Buf

                                     Buf
4- preswact_transfer(PRECEIVE)       <---
   Pass: Display OK OR
   Fail: list problem card/pklts
```

Sample output, when HW is NOT compatible with NEW side baselines:

Figure 4 Sample PRESWACT output - step XACORE_BASELN_CHECK

```
>BCSUPDATE; SWACTCI; PRESWACT
XACORE_BASELN_CHECK              executing
      16 of 23 cards+packlets compatible with NEW SIDE baselines.

13.5 Data schema (DS)

13.5.1 New/modified tables

Table 1 New or modified tables

Table name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
PECINV	CHANGED	UNCHANGED (NEW)
FWINV	NEW	NEW

13.5.2 Table Data Schema information

13.5.2.1 Name: PECINV

PECINV is changed in the following ways:

1. Maximum number of tuples is increased from 200 to 256.
2. Default datafill (added at loadbuild time using PLS DMSPL module EXTPECHWSUB) is updated:
   a. Added new PECs and their correct baseline releases.
   b. Corrected baseline release on some existing PECs.

13.5.2.1.1 Functional description

PECINV is intended to mainatin the HW baseline PEC, release and exception releases for various subsystems.

Its data is accessed by:

1. CHECKMS CI - MSHW and STDHW subsystems only.
2. CHECKREL CI - all supported subsystems.
3. SREX - through run_hardware_monitor() check.
   Only MSHW subsystem. has a target procedure bound curretnly.

13.5.2.1.2 Usage sequence and implications

No table dependencies. Current datafill order unchanged.

13.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
PECINV	0	256	Store for 256 tuples is pre-allocated in DSPROT. Each tuple approx 20 bytes

13.5.2.1.4 Datafill example

The following example shows sample datafill for table FWINV:

Figure 5 PECINV examples

```
PEC SSYSBASE
------------
1. NTLX02CA (XACHW 01 $) $
```

13.5.2.1.5 Table release history update

1. Extended maximum tuple range from 200 to 256.

2. Added missing PEC/releases to default datafill: (now 211 entries at IPL)
NTLX02DA XACHW 01 % ATLAS PE
NTLX03AB XACHW 03 % single width IOP card
NTLX03BB XACHW 03 % double width IOP card
NTLX04AA XACHW 01 % HIOP card - ETHR
NTLX04BA XACHW 01 % HIOP card - ETHR/AMDI
NTLX04CA XACHW 01 % HIOP card - ETHR/CMIC
NTLX05AB XACHW 01 % CMIC packlet
NTLX05BA XACHW 01 % AMDI packlet
NTLX06AC XACHW 01 % Disk packlet - 34.2 GB
NTLX07BA XACHW 01 % Tape packlet - 20 GB DDS4
NTLX08AB XACHW 01 % RTIF Packlet
NTLX09AA XACHW 01 % ETHR Packlet
NTLX14FA XACHW 01 % 512MB SM Card
NTLX17AA XACHW 01 % HIOP Card - CMIC/RTIF .

3. Corrected baseline releases on existing PECs:
NT9X13DE LIMHW 01 --> 03
NT9X63AA MSHW 01 --> 10
NT9X71AB LIMHW 00 --> 01
NT9X72BA LISHW 00 --> 01
NTLX02AA XACHW 04 --> 01
NTLX03AA XACHW 04 --> 28
NTLX03BA XACHW 04 --> 28
NTLX05AA XACHW 02 --> 01

NTLX06AA XACHW 02 --> 01
NTLX07AA XACHW 02 --> 01
NTLX12AA XACHW 02 --> 04
NTLX14CA XACHW 02 --> 01
NTLX22AA XACHW 02 --> 07
NTLX27AA XACHW 02 --> 01

4. Removed XA-Core PECs - no longer supported
NTLX02AA XACHW % HIPPO based PE
NTLX05AA XACHW % CMIC packlet

13.5.2.1.6 Supplementary information
NONE

13.5.2.1.7 Translation verification other tools

PECINV does not use translation verification tools.

13.5.2.2 Name: FWINV
FWINV is a NEW table.

13.5.2.2.1 Functional description
FWINV is intended to mainatin the FW baseline for a PEC, and allows from 0 up to 4 exception versions.

Its data is accessed by:

1. MAPCI;MTC;XAC;QUERY SHELF/CARD
2. Periodic internal queries
3. SREx
4. Card/Packlet RTS
5. ONP prechecks, prior to ONP
6. ONP preswact, while split, during ONP

13.5.2.2.2 Usage sequence and implications

No table dependencies. Current datafill order unchanged.

13.5.2.2.3 Size

Table 3 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
FWINV	0	64	Store for 64 tuples is pre-allocated in DSPROT. Each tuple is 90 bytes.

13.5.2.2.4 Fields/OIDs

The following table lists fields for table FWINV. Only 2 fields are shown by the RANGE command: PEC (key) and FWBASE. FWBASE is further broken down into FWTYPE/FWBASE/EXCEPTIONS

Table 4 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PEC	NEW	Subfield	8 chars	Must begin with NTLX
FWBASE	NEW	Subfield	Sum of 3 below	
FWTYPE	NEW	Subfield	FW or DLL	FW for ROM baseline. DLL for DLL baseline.
VERSION	NEW	Subfield	8 chars	ASCII A-Z, 0-9, beginning with: PE: XAPE IOP: XAIO HIOP: XHIO CMIC: PKdd, d=0-9 AMDI: PKdd, d=0-9 ETHR: EPdd, d=0-9 NO FW for: SM, DISK, TAPE, RTIF
EXCEPTIONS	NEW	Subfield	8 chars	Same restrictions as above. This FW/DLL version is bad, and will be alarmed if used.

13.5.2.2.5 Datafill example

The following example shows sample datafill for table FWINV.

Figure 6 FWINV examples

```
PEC FWBASE
------------
1. NTLX02CA (FW XAPE01AG $) $
2. NTLX04CA (FW XHIO02AH $) (DLL XHIO02AI $)

%% Eg. ONLY, to show exception format.
3. NTLX05AB (FW PK12CE12 (PK12CE13) $) $
```

13.5.2.2.6 Table release history update

1. Initial release.

13.5.2.2.7 Supplementary information

NONE

13.5.2.2.8 Translation verification other tools

FWINV does not use translation verification tools.

13.6 Service Orders (SO)

No impact to Service Orders.

13.7 Software optionality control (SOC)

Feature is not SOC controlled.

13.8 Command interface changes

QUERY CARD and QUERY SHELF commands are enhanced to show if FRU is HW and FW/DLL baseline compatible.

13.8.1 Directory: MAPCI; MTC; XAC

13.8.1.1 Directory description

Existing levels are still used - only the display is changed for QUERY SHELF.
QUERY SHELF is available from XAC and its sublevels:
XACMTC, SM, PE, IO, CMIC, RTIF, DISK, TAPE, AMDI, ETHR

13.8.1.2 Accessing directory: XACDIR

13.8.1.2.1 Access to directory or MAP level and return to CI

enter XAC level from CI:
    MAPCI;MTC;XAC
exit to CI:
    QUIT ALL

13.8.2 Command: QUERY SHELF

13.8.2.1 Command type: Listed MENU

13.8.2.2 Command target: XA-Core

13.8.2.3 Command availability: RES

13.8.2.4 Command description

QUERY SHELF lists:

1. Last REX data: time, type, result
2. Information per FRU installed in the shelf.

13.8.2.5 Command syntax

Table 5 QUERY SHELFcommand parameters and variables

Command	Parameters and variables
QUERY SHELF	No additional parameters available.

13.8.2.6 Qualifications and warnings

13.8.2.7 Example

See Figure 7, on page 2551

Figure 7 Query SHELF Example

13.10 Configuration Walkthrough

14: Configuration (CN): A00002510

14.1 Hardware and Software Requirements

14.2 Initial Configuration

14.3 Office/Subnet parameters (OP/SP) (CM & SESM)

14.4 Upgrade Impact

14.5 Data schema (DS) (CM, MIBS, RDB)

14.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
IPNETWRK	changed	old

14.5.2 Table/MIB/Remote Database Schema information

Table schema for IPNETWRK has been modified as follow.

Field name PARM in table IPNETWRK has been refined, a new value IRM_INTERFACE is introduced, to replace existing IOP_INTERFACE.

As well a new dependency is introduced which has an impact to the dump and restore table transfer order. Table CMIPADDR need to be transferred before IPNETWRK.

14.5.2.1 Name:

IP Network Table

14.5.2.1.1 Functional description

A new value under PARM, called IRM_INTERFACE, has been introduced in CSP20 to replace an existing IOP_INTERFACE.

The IP address specified under the IRM_INTERFACE must conform with one of the CMHOST IP addresses assigned for the XA-Core IOP (IRM) or the Ethernet interface for the XA-Core, and this IP address must have been datafilled in table CMIPADDR.

14.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

Transfer order must be changed such that CMIPADDR is transferred before IPNETWRK.

CMIPADDR

IPNETWRK

14.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
DDPACDEV	0	8 000 000	Memory is automatically allocated for 16 DPC devices.

14.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for IPNETWRK.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action

14.5.2.1.5 Datafill example

The following example shows sample datafill for table IPNETWRK using parm IRM_INTERFACE:

```
TABLE: IPNETWRK

KEYREF CMIPADDR SUBNET OPTION PARMAREA
-------------------------------------
1 10 101 8 100 16 $ (IRM_INTERFACE )$
```

and note that the CMIPADDR value used above must already been assigned as one of the CMHOST IP addresses, such as shown in the following example of CMIPADDR table:

```
TABLE: CMIPADDR:
KEY DATA
--------
GATEWAY 0 GW (10 101 8 1) 0
CMHOST 0 HOST (10 101 8 100) 24 0
CMHOST 1 HOST (10 101 8 101) 24 0
ETHRLNK 0 ETHR 5 REAR NONE (10 101 8 102) 24 (10 101 8 103) 24 (10 101 8 10) 0
ETHRLNK 1 ETHR 14 REAR NONE (10 101 8 104) 24 (10 101 8 105) 24
(10 101 8 10) 0
```

14.5.2.1.6 Table release history update

14.5.2.1.7 Supplementary information

14.5.2.1.8 Translation verification other tools

IPNETWRK does not use translation verification tools.

14.6 Service Orders (SO) (CM & SESM)

14.7 Software optionality control (SOC)

14.8 Element Management

14.9 Command interface changes

14.10 Security

14.11 Configuration Walkthrough

15: Configuration (CN): A00002555

This feature allows the ADO, DEO and CLN Servord commands to manipulate the GND Bool in table LNINV for certain adaptive line cards. See the Servord section, starting at paragraph 13.6

15.1 Hardware and Software Requirements

SN07

15.2 Initial Configuration

n/a

15.3 Office/Subnet parameters (OP/SP) (CM & SESM)

15.4 Upgrade Impact

15.5 Data schema (DS) (CM, MIBS, RDB)

15.6 Service Orders (SO) (CM & SESM)

This feature allows the ADO, DEO and CLN Servord commands to manipulate the GND Bool in table LNINV for the below list of the supported line cards.

- 3A06BA
- 7A25AA
- SCD271
- RDTCON
- RDTLSG

The above line cards are refered in this document as the supported line cards.

There are other line cards that support GND but they are not supported by this feature. Other Servord commands are not effected. Commands that establish new service such as NEW and EST will function as before.

If table OFCVAR parm SO_ALLOW_REDUNDANT_FEATURE is set to Y, then the redundant feature is turned on. Redundant feautre is now supported for GND for the ADO, DEO and CLN commands. This means for example, if the ADO of GND is attempted to a line that already has the GND option, the command will not be rejected and no journal file update will occur.

15.6.1 Service order change details

15.6.1.1 LCC and options

There are no new options introduced by this feature. The behavior of the ADO, DEO and CLN Servord commands is changed for the GND option for the supported line cards only. The GND option is not applicable to key sets or ISDNSETs. The option pretains mostly to COIN and PBX lines.

15.6.2 New commands

There are no new commands introduced by this feature.

15.6.2.0.1 Command prompts

There are no additional or changes to prompts for this feature.

15.6.2.1 How service order options are presented

15.6.2.1.1 Description

The GND option is used to specify that the line will be a GROUND START line. It is determined by the value of GND in table LNINV for the tuple assoicated with the line. Only certain line cards can be ground start lines and only the supported line cards apply to this feature. Prior to this feature, the ADO, DEO and CLN Servord commands could not change the GND Bool for any line.. This value was set when the tuple was datafulled in table LNINV. This feature doesn't add the GND option or additional prompts as the option already exists. It allows the Servord commands ADO, DEO and CLN to change the value fo GND for the supported line cards. Prior to this feature, an error message was given when GND was attempted to be ADO-ed or DEO-ed.. The error message is still given for lines that do not have a supported line card. Use QLEN or QDN to determine the line card and GND value. Positioning on the LEN in table LNINV can also be used

Perhaps the biggest enhancement of this feature is with the CLN command. If the NEW_LEN has a supported line card, the value of GND will be set to that of the OLD_LEN. If the value will change, a warning message is output. If the NEW_LEN does not have a supported line card, the value of GND on the NEW_LEN will be the same as it was prior to execution of the CLN command. If the value of GND is different between the OLD_LEN and the NEW_LEN, a warning message will be output.

QLEN or QDN can be used to determine the line card and the value of GND. GND will also appear in the option list if it set to Y in table LNINV. The below example shows a line with a RDTLSG line card with GND set to Y.

```
>qlen rdt0 1 0 1 2
------------------------------------------------------------------------------
LEN:     RDT0  01 0 01 02
TYPE: SINGLE PARTY LINE
SNPA: 908
DIRECTORY NUMBER:     9451104
LINE CLASS CODE:      1FR
SIGNALLING TYPE:  DIGITONE
LINE TREATMENT GROUP:     0
LINE ATTRIBUTE INDEX:     400
CARDCODE:  RDTLSG    GND: Y  PADGRP: STDLN  BNV: NL MNO: N
PM NODE NUMBER     :    221
PM TERMINAL NUMBER :    2
OPTIONS:
DGT GND NAME PUBLIC C1FR1RGB
OFFICE OPTIONS:
AIN TIID
------------------------------------------------------------------------------
>
```

15.6.2.1.2 Example

Figure 1 Example of ADO of GND in NO PROMPT mode

Example of ADO of the GND option in prompt mode

```
>ado
SONUMBER:      NOW    3    12   1 PM
>
DN_OR_LEN:
>RDT0 1 0 1 2
OPTION:
>GND
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 12 1 PM RDT0 1 0 1 2 ( GND ) $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT
>y
```

Figure 2 Example of DEO of GND in No Prompt mode

```
>deo
SONUMBER:       NOW    3    12   1 PM
>
DN_OR_LEN:
>RDT0 1 0 1 2
OPTION:
>GND
OPTION:
>$
COMMAND AS ENTERED:
DEO  NOW 3 12 1 PM RDT0 1 0 1 2 ( GND ) $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT
>y
```

The below example shows a CLN from a OLD_LEN that has GND set to a NEW_LEN that has a supported line card. NOTE: The warning is output only if the GND values are different between the OLD_LEN and NEW_LEN prior to the execution of the command.

Figure 3 Example of CLN command to a NEW_LEN with Supported Line Card

```
>CLN
SONUMBER:       NOW    3    12   1 PM
>
OLD_LEN:
>RSC0 0 0 3 0
NEW_LEN:
>RSC0 0 0 0 7
COMMAND AS ENTERED:
CLN NOW 3 12 1 PM RSC0 00 0 03 00 RSC0 00 0 00 07
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT
y
WARNING: GND will be changed to TRUE in table LNNIV
              on the NEW_LEN, same setting as the OLD_LEN
```

The below example shows a CLN from a OLD_LEN that has GND set to a NEW_LEN that doesn't have a supported line card. NOTE: The warning is output only if the GND values are different between the OLD_LEN and NEW_LEN prior to the execution of the command.

Figure 4 Example of CLN, NEWLEN is not a Supported Line Card

```
>CLN
SCLNUMBER:       NOW    3    12   1 PM
>
OLD_LEN:
>RSC0 0 0 3 0
NEW_LEN:
>0 0 0 3
COMMAND AS ENTERED:
CLN NOW 3 12 1 PM RSC0 00 0 03 00 HOST 00 0 00 03
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT
y
WARNING: GND is FALSE in table LNNIV on the NEW_LEN
              The setting was TRUE on the OLD_LEN
```

Figure 5 Example of ADO and DEO of the GND option in no-prompt mode for SERVORD+

```
ADO $ RDT0 1 0 1 2 GND $ Y Y

DEO $ RDT0 1 0 1 2 GND $ Y Y
```

15.6.2.1.3 Option prompts

There are no changes to prompts. The GND option already exists.

15.6.2.1.4 Line class code compatibility

There are no changes to LCC compatibilty for GND

15.6.2.1.5 Assignability

The following functionalities apply to this option:

- set functionality: NO
- subset functionality: NO
- DN functionality: NO
- key functionality: NO

The GND option is not a typical line option in that it gives added functions to the line or set. It determines how the line card detects when the subscriber goes off hook. It is a hardware function of the line card, transparent to the subscriber.

15.6.2.1.6 Option prerequisites

GND has the following prerequisites:

None

15.6.2.1.7 Notes

The following notes apply to GND:

This feature applies only to the supported line cards. It may be necessary to post the line at the MAP and BSY and RTS the line in order for the change to take effect

15.6.2.1.8 Feature identification

Feature number: A00002555

15.6.2.1.9 SERVORD+ Exceptions

none known.

15.7 Software optionality control (SOC)

15.8 Element Management

15.9 Command interface changes

15.10 Security

15.11 Configuration Walkthrough

16: Configuration (CN): A00002558

16.1 Hardware and Software Requirements

None

16.2 Initial Configuration

None

16.3 Office/Subnet parameters (OP/SP) (CM & SESM)

None

16.4 Upgrade Impact

None

16.5 Data schema (DS) (CM, MIBS, RDB)

16.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TOLLTRKS	NEW	NEW

16.5.2 Table/MIB/Remote Database Schema information

16.5.2.1 Name: <TOLLTRKS>

16.5.2.1.1 Functional description

Table TOLLTRKS stores the common language location identifiers (CLLI) of all trunk groups carrying incoming toll completing traffic, and LDI evaluates the CLLI name to determine the long distance status.

16.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

TRKGRP

TOLLTRKS

16.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TOLLTRKS	0	8192	Memory is automatically allocated.

16.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for TOLLTRKS.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CLLI	New	N/A	alphanumeric (1 to 16 characters)	Common language location identifier. This field specifies the trunk over which long distance calls can come into an office. Enter a CLLI from table TRKGRP (1 to 16 characters)

16.5.2.1.5 Datafill example

The following example shows sample datafill for table TOLLTRKS:

```
CLLI
-----------------------------------

ANSIISUP
ETSIISUP
HKISUP
CTUP
```

16.5.2.1.6 Table release history update
Table TOLLTRKS is created for trunks.

17: Configuration (CN): A00002585

Purpose:

XML Commands Responses and Errors for Feature A00002585 - TMM Support For PTS Trunk, POST by Carrier.

This document described the examples about commands responses and errors with XML format. These new commands responses and errors are introduced by the A00002585 “TMM Support for PTS trunk, Post ByCarrier”.

Reference: None.

17.1 Introduction

This document describes the changes being made to the interface via OSSGate by activity A00002585 in SN07. This section is not meant to be a complete description of the interface via OSSGate.

17.2 Mtc By Carrier

The example input from OSSGate are as following:

17.2.1 Get Carriers

```
**************** INPUT XML STRING ******************

   </Options>
</CommandList>
```

17.3 Show trunk types in post result set

If the command “PostByGatewayName” with the option “ShowDetails” to be set from OSSGate, the corresponding response is as following:

```
*************** OUTPUT XML STRING ******************
<CommandList>
   <Response>
      <Interface>TrunkMtc</Interface>
      <Methods>
        <PostByGatewayName>
          <Header
            GatewayName="ZLYGW"
            EndpointRange="0-2"
            NodeNumber="68"
            FilterState="ALL"
          >
            <Summary>
              <State Value="INB " Count="2"/>
            </Summary>
          </Header>
        <Members>
         <Member
            TerminalNumber="1"
            State="INB "
            ConnectedTo="                    "
            TrunkDirection="2W"
            TrunkSignaling="ISD ISD "
            PMType="GWC_NODE"
            PMNumber="6"
            EndpointName="DS3_20.0.1"
            TrunkCLLI="T0              "
            TrunkMember="1"
            TrunkType="PRI"
            PMCarrier="0"
            PMTimeSlot="1"
          />
          <Member
            TerminalNumber="2"
            State="INB "
            ConnectedTo="                    "
            TrunkDirection="2W"
            TrunkSignaling="ISD ISD "
            PMType="GWC_NODE"
            PMNumber="6"
            EndpointName="DS3_20.0.2"
            TrunkCLLI="T0              "
            TrunkMember="2"
```

```
            TrunkType="PRI"
            PMCarrier="0"
            PMTimeSlot="1"
          />
        </Members>
      </PostByGatewayName>
    </Methods>
   </Response>
   <Options>
      <UseStyleSheet>true</UseStyleSheet>
      <Stylesheet>tmm/MtcByGatewayNameResults.xsl</Stylesheet>
   </Options>
</CommandList>
```

17.4 Keep Return Codes Compliance

New return codes are as following:

```
<?xml version="1.0"?>

18: Configuration (CN): A00002607

18.1 Hardware and Software Requirements

The changes provided by this feature will allow the customer to physically identify ABI configured hardware components as well as MG9K frames/ shelves hosting only native lines when trouble shooting their network therefore allowing for quick problem resolutions. These Core changes provide:

- ABI XPM Site information and MG9K hosting data
- limited MG9K Frame/Shelf location data for MG9Ks hosting only native lines
- changes to the Mapci, Logs and OM applications to make use of this data

Therefore the following hardware needs to be in place prior to exercising the software provided by this feature. The software is exercised by provisioning the physical location data of these hardware components:

- A typical ABI configuration
- A typical MG9K Gateway configuration

Software Requirements:

- SN06 Succession Core load with this feature patched back

-OR-

- SN07 Succession Core load or later

18.2 Initial Configuration

As a provisioning component of the Succession program, much of this functionality performs as designed without the hardware being in place. However, to provision actual physical location data, the provisioning of the configurations mentioned in “18.1 Hardware and Software Requirements” should be installed.

Once the hardware is installed and the software is available, provisioning of the physical location data can begin. The ABI location data is provisioned in table LTCINV. The MG9K Frame/Shelf location data for MG9Ks hosting native lines only is provisioned in table LGRPINV. The steps to perform the provisioning are described in section “18.5 Data schema (DS) (CM, MIBS, RDB)” on page 2580.

18.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable.

18.4 Upgrade Impact

18.4.1 Dump and Restore

No impact to Dump and Restore mechanisms. This data is preserved via the existing TabXfr mechanism available to all Table Control tables.

18.4.2 Element Management Upgrade

Not applicable.

18.5 Data schema (DS) (CM, MIBS, RDB)

18.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
LTCINV	Changed	Unchanged
LGRPINV	Changed	Unchanged

18.5.2 Table LTCINV Database Schema information

18.5.2.1 Name: LTCINV

Long Table Name: Line Trunk Controller INVentory

18.5.2.1.1 Functional description

Table LTCINV contains the inventory data, except P-side link assignments, for various host peripheral module (XPM) types. This feature will only impact ABI XPM tuples. The impact does not change existing datafilled but extends the optional data associated with the ABI (EXTDS512) option. This new optional data will allow the provisioning of the physical XPM location data. Please refer to “Table 3 Table LTCINV changed field descriptions” on page 2581.

18.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

- No change to current datafill order.

18.5.2.1.3 Size

No change in the maximum number of tuples for table LTCINV.

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LTCINV	0	210	Memory is automatically allocated in increments of 10 XPMs at a time up to 210

18.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for Table LTCINV.

Table 3 Table LTCINV changed field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTATTR	Changed	Modified the EXTDS512 refinement, add 3 new subfields	SITE - 4 alpha numerics	SITE_NAME - This is the Site name as datafilled in table Site. There is an existing data dictionary type for SITE. Valid values are verified against entries in table SITE. Example data fill CARY.
			NE_NBR - 0 TO 999	NETWORK_ELEMENT_NO - This is the network element number assigned when the MG9K gateway is added via the MG9K-EM. This requires a new dictionary type. Value of 0 is the NIL value.
			ABI_SLOT - 1 TO 21	SLOT_NO - new dictionary type. Valid values are 2-9 and 14-21, even numbers only. Because the range is 1 TO 21, verification of this value is enforced outside the data dictionary via format aspects.

18.5.2.1.5 Datafill example

The following example illustrates the prompting sequence for the new Location data associated with the EXTDS512 option in table LTCINV.

Figure 1 Prompting sequence for new Location fields for option EXTDS512

18.5.2.1.6 Table release history update

SN07 Feature A00002607:

Modified field: OPTATTR:

— adding 3 new subfields for the EXTDS512 refinement. For more information see “Table LTCINV changed field descriptions” on page 2581.

18.5.2.1.7 Supplementary information

Limitations:

- LTCINV - since these new fields apply to the EXTDS512 option, they can only be datafilled on tuples with the EXTDS512 option.

18.5.2.1.8 Translation verification other tools

Table LTCINV does not impact translations. Therefore TABAUDIT is the tool used to verify the contents of table LTCINV. The following Figure 4 on page 2584 shows the output from TABAUDIT when it is used to verify LTCINV.

Figure 4 Sample Tabaudit output for Verifying Table LTCINV Datafill

```
>tabaudit
TABAUDIT:
>include ltcinv

>execute
-------------------------------------------------------------------------------
|            TABAUDIT STATUS
-------------------------------------------------------------------------------

The following tables are included:
      table LTCINV (91)

The following tables are excluded:
  From table VERSIONS (0)              to table SERVRINV (90).
  From table MGCINV (92)               to table IPINV (299).
  From table X75INFO (301)             to table INWATNPA (1426).

Please confirm ("YES", "Y", "NO", or "N"):

Data verification is completed.
```

18.5.3 Table LGRPINV Database Scheme information

18.5.3.1 Name: LGRPINV

Long Table Name: Logical GRouP INVentory

18.5.3.1.1 Functional description

Table LGRPINV is where Logical Groups (Lgrps) are provisioned. Generally speaking Logical Groups (one or more) are the Cores representation of Gateways. Specifically, for MG9K Gateways, one Lgrp represents one shelf in a specific MG9K Frame. MG9K Lgrps are Logical Groups with a GroupType of “S”.

This feature will only impact MG9K Lgrps. The impact is to provide a new optional field called LGRPLOC. The optional Location field will contain the physical location of a specific MG9K shelf. Please refer to “Table 5 Table LGRPINV Changed field descriptions” on page 2585.

18.5.3.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

- No change to current datafill order.

18.5.3.1.3 Size

No change in the maximum number of tuples for table LGRPINV.

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LGRPINV	0	1000	Memory is automatically allocated in increments of 20 LCDs at a time up to 1000.

18.5.3.1.4 Fields/OIDs

The following table lists fields/OIDs for Table LGRPINV.

Table 5 Table LGRPINV Changed field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
LGRPOPTS	Changed	Added new refinement, LGRPLOC with 6 fields.	FRAME_TYPE	FRAME_NAME - existing data dictionary type. The unique frame type. MG9Ks have a frame type of 'MG9F'.
			FLOOR_POSITION {0 TO 99}	FLOOR_POS - existing data dictionary type. The unique floor with a unique Site (generally a building).
			ROW_POSITION {A,B,C...X,Y,Z,AA, BB,CC...XX,YY,ZZ}	ROW_POS - existing data dictionary type. The unique row within a floor.
			FRAME_POSITION {0 TO 99}	FRAME_POS - existing data dictionary type. The unique frame position within a row.
			SHELF_POSITION {0 TO 77}	SHELF_POS - existing data dictionary type. Traditionally, this is the bolt hole position as measured in inches from the floor up. For MG9K shelves, it will be equal to the Shelf Number as specified in the Lgrp Key. The unique shelf position within a specific frame.

18.5.3.1.5 Datafill example

18.5.3.1.6 Table release history update

SN07 Feature A00002607:

Modified field: LGRPOPTS

— adding a new LGRPLOC refinement. For more information see “Table LGRPINV Changed field descriptions” on page 2585.

18.5.3.1.7 Supplementary information

Limitations:

- LGRPINV - the new LGRPLOC optional data should be datafilled against MG9K LGRPs, LGRPs with a GRPTYPE of S and shelf number < 4. This requirement will be enforced by the table control software and if not provided a warning will be issued. For other LGRP types, datafilling of this data is optional.

18.5.3.1.8 Translation verification other tools

Table LGRPINV does not impact translations. Therefore TABAUDIT is the tool used to verify the contents of table LGRPINV. The following Figure 4 on page 2584 shows the output from TABAUDIT when it is used to verify Table LGRPINV.

Figure 8 Sample Tabaudit output for Verifying LGRPINV Table Datafill

```
>tabaudit
TABAUDIT:
>include lgrpinv

>execute
-------------------------------------------------------------------------------
|             TABAUDIT STATUS
-------------------------------------------------------------------------------

The following tables are included:
table LGRPINV (300)

The following tables are excluded:
  From table VERSIONS (0)              to table SERVRINV (90).
  From table MGCINV (92)               to table IPINV (299).
  From table X75INFO (301)             to table INWATNPA (1426).

Please confirm ("YES", "Y", "NO", or "N"):

18.11 Configuration Walkthrough

As indicated earlier, there is no change to the provisioning sequence of the tables. There are changes to the prompting sequence within the LTCINV and LGRPINV tables for the new data. Examples of these prompting sequences for each table are provided in “18.5 Data schema (DS) (CM, MIBS, RDB)” on page 2580.

19: Configuration (CN): A00002858

19.1 Hardware and Software Requirements

The spectrum load tape should contain an EXT file with correct information about all the spectrum load releases which is used to datafill the table SPMLDVAL.

19.2 Initial Configuration

None.

19.3 Office/Subnet parameters (OP/SP) (CM & SESM)

None.

19.4 Upgrade Impact

19.4.1 Dump and Restore

In SN06, table SPMLDVAL contains both the INTL and NA DMSCP loads in the same tuple. i.e. One tuple contains CST, CEM, STM and OC3 loads. Here, CEM and OC3 loads are specific to DMSCP NA product whereas CST and STM loads are specific to DMSCP INTL product of SPM.

In SN07, since a new field is introduced to identify the product type of each tuple, such a combination of loads becomes invalid.

During the dump and restore of table SPMLDVAL from release SN06 to SN07, a single tuple with both DMSCP NA and INTL loads is splitted up into two tuples. The product type of the first tuple is written as SPMNA and contains CEM and OC3 loads. On the other hand, the product type of the second tuple is written as SPMIN and contains CST and STM loads.

19.5 Data schema (DS) (CM, MIBS, RDB)

19.5.1 Modified table

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SPMLDVAL	CHANGED	NEW

19.5.2 Table/MIB/Remote Database Schema information

19.5.2.1 Name: SPMLDVAL

Spectrum Load Name Validation.

19.5.2.1.1 Functional description

Table SPMLDVAL is enhanced to store the device load lineups for both TDM and Succession spectrum load releases.

Table SPMLDVAL has a 5 part key. The 5 parts of the key are

- Spectrum family load type indicator.
- General release number.
- Maintenance release number.
- Emergency release number.
- Spectrum family product line type indicator.

Figure 1 shows some example tuples in table SPMLDVAL.

Figure 1 : Example tuples in table SPMLDVAL

```
SP 17 0 0 SPMNA (CEM17BU) (DLC17BV) (DL217BT) (DSP17BU) $
SP 17 0 0 SPMIN (CST17BS) (DLC17BV) (DL217BT) (DSP17BU) $
SN 06 0 0 MG4AT (MG419BR) (ATC19BO) (IED19BO) (OC419BN) $
SN 06 0 0 MG4IP (MG419BR) (GEM19BN) $
SN 06 0 0 IWSAT (IWS19BP) (ATC19BO) (SYN19BN) $
SN 06 0 0 IWSIP (IWS19BP) (GEM19BN) $
SN 06 0 1 DPTAT (IWS19BP) (ATC19BO) (DSP19BN (COH0019) $
SN 07 0 1 DPTIP (IWS20BA) $
```

For a general release, the key subfields ‘maintenance release’ and ‘emergency release’ are datafilled as 0. Similarly for a maintenance release, the key subfield ‘emergency release’ is datafilled as 0.

Note 1: The PPSL loads are considered under the current maintenance release name only. No new tuple is added in the table whenever a PPSL load is released.

Note 2: Whenever a coherant load changes the version in a release the first seven characters remains same and so this change will not be reflected in the table SPMLDVAL. However, a new tuple shall be added in the table with the same coherant load name.

Table SPMLDVAL can be datafilled in the following ways.

- During panther execution, filecopy command copies the EXT file from the tape to the disk volume and run the EXT file to get the table datafilled.

- If tuples need to be added manually, then ADMIN can use RWOK ON option and get write permission for the table.

The following applications retrieve data from table SPMLDVAL.

- CI tool SPMLDINFO gets the load lineup information for different spectrum load releases from table SPMLDVAL.
- QueryPM files command compares the device loads in a SPM with the load lineup of different spectrum load releases datafilled in table SPMLDVAL to find out the running release load for that SPM.

19.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

19.5.2.1.3 Size

The Size of this table is increased from 255 to 2048.

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SPMLDVAL	0	2048	Protected Memory

19.5.2.1.4 Fields/OIDs

The following table lists fields for SPMLDVAL.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PRODUCT_TYPE	New	T_SPMLDVAL_KEY	SPMNA, SPMIN, MG4AT, MG4IP, IWSAT, IWSIP, DPTAT, DPTIP	A new subfield is introduced which defines the product line of the SPM.
LOAD_TYPE	Changed	T_SPMLDVAL_KEY	SP, SN	This subfield supports both SP and SN.

19.5.2.1.5 Datafill example

The following example shows sample datafill for table SPMLDVAL.

BOTTOM

19.5.2.1.6 Table release history update

Table SPMLDVAL was introduced in CSP release 19.

19.5.2.1.7 Supplementary information

The protection level of the table is SYSPROT which prevents the user from add / delete / modify tuples in this table directly. The user needs to enter 'RWOK ON' to get write permission to the table.

19.5.2.1.8 Translation verification other tools

Table SPMLDVAL does not use translation verification tools.

19.9 Command interface changes

19.9.1 Directory: SPMLDINFO

19.9.1.1 Directory description

- The CI directory was used to display the spectrum load release information for DMSCP class of SPMs only. It is enhanced to enable the craftsperson to display the load release information for all the following product lines of SPMs:
  - — DMSCP - NA
  - — DMSCP - INTL
  - — SMG4 - ATM
  - — SMG4 - IP
  - — IW - ATM
  - — IW - IP
  - — DPT - ATM and
  - — DPT - IP

19.9.1.2 Accessing directory: SPMLDINFO

19.9.1.2.1 Access to directory or MAP level and return to CI

To access SPMLDINFO from the CI environment, enter **SPMLDINFO**.

To return to the CI environment, enter **quit**.

19.9.2 Command: LISTLOAD

19.9.2.1 Command type: Non-Menu

19.9.2.2 Command target: All

19.9.2.3 Command availability: Res

19.9.2.4 Command description

This command **listload** was used for displaying the load lineup information for a given spectrum load release name. Now, it can be used for displaying the load lineup information for a given SN load release name also. In case of many tuples(many product lineup) with the same release present in the table, then all the load lineups are displayed along with the product line information. See Table 4 for more information.

19.9.2.5 Command syntax

The command syntax is as shown in Figure 2.

Figure 2 : LISTLOAD command syntax

```
SYNTAX : LISTLOAD <load_type> <general_release> <maintenance_release>
                        <emergency_release>
Parms: <load_type> { SP, SN}
       <general_release> {1 TO 99}
       <maintenance_release> {0 TO 9}
       <emergency_release> {0 TO 9}

Parameter Description:
```

load_type :
Enter the type of load. It can take values - SP or SN

general_release :
Enter the milestone release number. It takes values in the range 1 to 99.

maintenance_release :
Enter the maintenance release number. Enter 0 if it is a milestone release. It takes values in the range 0 to 9.

emergency_release :
Enter the emergency release number. Enter 0 if it is a milestone release or maintenance release. It takes values in the range 0 to 9.

19.9.2.6 Qualifications and warnings

None.

19.9.2.7 Responses

If the load release name entered is not datafilled in table SPMLDVAL, then the following message is displayed.
This load release is not datafilled in table SPMLDVAL.

19.9.2.8 Example

Table 4 shows the output of listload command.

Table 4 Usage examples for listload command

Description of task:	Display the list of device loads belonging to a particular spectrum load release.
Command: MAP response:	SPMLDINFO; listload SN 07 3 1 CI: >**SPMLDINFO** SPMLDINFO: >**listload SN 07 3 1** Circuit Pack Load Lineup for MG4K ATM Load Release SN07.3.1: CEM Load : MG420AL DSP Load : DSP20AL DLC Load : DLC20AL ..... Circuit Pack Load Lineup for MG4K IP Load Release SN07.3.1: CEM Load : MG420AL DSP Load : DSP20AL DLC Load : DLC20AL ..... Circuit Pack Load Lineup for IW ATM Load Release SN07.3.1: IWS Load : IWS20AL DSP Load : DSP20AL DLC Load : DLC20AL .....
Command: MAP response:	SPMLDINFO; listload SN 03 1 1 CI: >**SPMLDINFO** SPMLDINFO: >**listload SN 03 1 1** This load release is not datafilled in table SPMLDVAL.

Note: It uses the first 3 characters of the loadname to identify a load type. For example, OC3 for OC315DF, DL2 for DL215AH etc..

19.9.3 Command: LISTRELEASE

19.9.3.1 Command type: Non-Menu

19.9.3.2 Command target: All

19.9.3.3 Command availability: Res

19.9.3.4 Command description

This command **listrelease** was used only for displaying the spectrum(SP) load releases in which a given device load is included. Now, it is used for displaying the SN load releases also.

19.9.3.5 Command syntax

The command syntax is as shown in Figure 3.

Figure 3 : LISTRELEASE command syntax

```
SYNTAX : listrelease <loadname> STRING
Parms: <load_name>

Parameter Description:

    load_name :
                Enter the device load name. It is a string which can take up to 7 characters.
                Ex: MG420CQ, DSP20DO
```

19.9.3.6 Qualifications and warnings

None.

19.9.3.7 Responses

If the circuit pack loadname entered is not 7 character long, then the following warning message is displayed.

***** Warning : Loadname must be 7 characters in length.**

If the circuit pack loadname entered is not datafilled in table SPMLDVAL, then the following message is displayed.
Circuit pack load <load name> is not datafilled in table SPMLDVAL.

19.9.3.8 Example

Table 5 shows the output of listrelease command.

Table 5 Usage examples for listrelease command

Description of task:	Display the list of spectrum load releases in which the given device load is included.
Command: MAP response:	SPMLDINFO; listrelease DLC20AB CI: **>SPMLDINFO** SPMLDINFO: **>listrelease DLC20AB** Circuit pack load DLC20AB is valid in the following load releases. MG4K ATM Load Release SN07.2.1
Command: MAP response:	SPMLDINFO; listrelease MG420 CI: **>SPMLDINFO** SPMLDINFO: **>listrelease MG420** *** Warning : Loadname must be 7 characters in length.
Command: MAP response:	SPMLDINFO; listrelease IWS15CZ CI: **>SPMLDINFO** SPMLDINFO: **>listrelease IWS15CZ** Circuit pack load IWS15CZ is not datafilled in table SPMLDVAL.

19.9.4 Command: LISTSPMLOAD

19.9.4.1 Command type: Non-Menu

19.9.4.2 Command target: All

19.9.4.3 Command availability: Res

19.9.4.4 Command description

This command **listspmload** is used for displaying the running release load name for all the SPMs in the office. This command has 3 options. Option ‘all’ can be used to list the load release names for all SPMs. In the second option, the user can specify a range, say SPM 1 4, in which case, the load release

names of all SPMs in the given range is displayed. In the third option, the user can specify one SPM, in which case, the load release names of that SPM is displayed.

19.9.4.5 Command syntax

The command syntax is as shown in Figure 4.

Figure 4 LISTSPMLOAD command syntax

```
SYNTAX : listspmload
Parms: { All }
        { spm <spm no> <spm no>}

Parameter Description:
```

All:

This option lists the running release loads for all the SPMs.

SPM <spm no> <spm no>:

Specify the range of SPM numbers for which the running load release information is required.

19.9.4.6 Qualifications and warnings

None.

19.9.4.7 Responses

If the running device loads in an SPM do not match with any of the load release lineups datafilled in table SPMLDVAL, then a warning is displayed as follows.

SPM <spm no> : Load lineup does not match with any of the load releases datafilled in table SPMLDVAL.

If the CEMs/RMs in the SPM are out of service, then the tool will not be able to get the running loads in the SPM's devices. In that case, the following warning message is displayed.

SPM <spm no> : Unable to contact the devices. The requested data cannot be retrieved.

When option 'all' is specified, then it will check whether at least 1 SPM is datafilled. If not, then it will give the following message and stop execution.

No SPMs are datafilled in the office.

When spm number range is specified, if one of the spm numbers within the range is not datafilled in table MNNODE, then the following warning message is displayed.

SPM <spm no> is not datafilled.

Non-datafilled SPMs will not be displayed in the case of '**all**' option.

19.9.4.8 Example

Table 6 shows the output of listspmload command.

Table 6 Usage examples for listspmload command

Description of task:	Display the list of spectrum load releases running in each of the SPMs in the office.
Command: MAP response:	SPMLDINFO; listspmload all CI: >**SPMLDINFO** SPMLDINFO: >**listspmload all** SPM 1 : MG4K ATM Load Release SN07.3.1 SPM 3 : DMSCP NA Load Release SP20.3.1 SPM 5 : IW ATM Load Release SN07.3.1 SPM 6 : Unable to contact the devices. The requested data cannot be retrieved. SPM 7 : Load lineup does not match with any of the load releases datafilled in table SPMLDVAL
Command: MAP response:	SPMLDINFO; listspmload spm 1 4 >**SPMLDINFO** SPMLDINFO: >**listspmload spm 1 4** SPM 1 : MG4K ATM Load Release SN07.3.1 SPM 2 is not datafilled. SPM 3 : DMSCP NA Load Release SN07.3.1 SPM 4 is not datafilled.
Command: MAP response:	SPMLDINFO; listspmload spm 1 >**SPMLDINFO** SPMLDINFO: >**listspmload spm 1** SPM 1 : MG4K ATM Load Release SN07.3.1

Table 7 shows the output of listspmload all command, when no SPMs are datafilled in the office.

Table 7 : Usage Examples for listspmload command.

Description of task:	Display the list of spectrum load releases running in each of the SPMs in the office.
Command: MAP response:	SPMLDINFO; listspmload all CI: **>SPMLDINFO** SPMLDINFO: **>listspmload all** No SPMs are datafilled in the office.

19.9.5 Command: QUIT

19.9.5.1 Command type: Non-Menu

19.9.5.2 Command target: All

19.9.5.3 Command availability: Res

19.9.5.4 Command description

QUIT command is used to quit from SPMLDINFO directory**.**

19.9.5.5 Command syntax

The command syntax is as shown in Figure 5.

Figure 5 : QUIT command syntax

```
SYNTAX : QUIT (from within SPMLDINFO directory)
Parms: None.

Parameter Description:

               : Not Applicable.
```

19.9.5.6 Qualifications and warnings

None.

19.9.5.7 Responses

When quit command is issued, SPMLDINFO directory is being exited. No warnings or messages are displayed.

19.9.5.8 Example

Table 8 shows the output of quit command.

Table 8 Usage examples for quit command

Description of task:	Quit from SPMLDINFO directory
Command: MAP response:	quit **>SPMLDINFO** SPMLDINFO: **>quit** CI: >

19.9.6 Command: mapci;mtc;pm;post spm <n>; querypm <option>

19.9.6.1 Command type: Menu

19.9.6.2 Command target: All

19.9.6.3 Command availability: Res

19.9.6.4 Command description

The command **querypm** is used to list information about loads running in the devices of a SPM and to list the faults present in the devices. It has 2 optional parameters ‘files’ and ‘flt’ to list different information as mentioned above. Querypm files displays the spectrum load release running on DMSCP class of SPMs only. This feature enhances ‘**querypm files**’ to display the spectrum load release running on a any class of SPM.

19.9.6.5 Command syntax

The command syntax is as shown in Figure 6.

Figure 6 : QueryPM files command syntax

```
SYNTAX : mapci;mtc;pm;post spm <n>;querypm {<files> or <flt>}
Parms: <files> or <flt>

Parameter Description:

              : Enter <files> to get information about the load files
                running on the SPM.
                Enter <flt> to get the faults in the devices.
```

The following sections explain only the ‘files’ option of querypm since this feature does not change ‘flt’ option.

19.9.6.6 Qualifications and warnings

No new warnings or qualifications.

19.9.6.7 Responses

With the new enhancement, ‘querypm files’ command displays the running spectrum load release name for the posted SPM irrespective of the variant type. If the posted SPM is MG4K ATM product and the device loads of that SPM do not match with any of the load release lineups datafilled for which the product type is MG4AT in table SPMLDVAL, then the following message is displayed.

Running MG4K ATM Load Release : Load Lineup of this SPM does not match with any of the load releases datafilled in table SPMLDVAL.

If the CEMs/RMs of an SPM are out of service such that the running loads in each of the devices cannot be determined, then it will display the following warning message.

Running MG4K ATM Load Release : Unable to contact the devices. The requested data cannot be retrieved.

19.9.6.8 Example

Table 9 shows the changed output of querypm files command.

Table 9 Usage examples for querypm files command

Description of task:	Display the spectrum load release name running in the SPM in context.

Table 9 Usage examples for querypm files command

Command: MAP response:	mapci; mtc; pm; post spm 1; querypm files **>mapci nodisp; mtc; pm; post spm 1** SPM: SPM 1 ISTb ATM 0 InSv Act Default Loadname: ATC20AJ Default Filename: ATC20AJ_010009 Running Load: ATC20AJ_010009 Load in Flash: ATC20AJ_010009 ... ... DSP 3 InSv Act Default Loadname: DSP20AJ Default Filename: DSP20AJ_010009 Running Load: DSP20AJ_010009 Load in Flash: DSP20AJ_010009 Running MG4K ATM Load Release : SN07.3.1
Command: MAP response:	mapci;mtc;pm;post spm 4;querypm files **>mapci nodisp; mtc; pm; post spm 4** SPM: **>querypm files** SPM 4 ISTb ATM 0 InSv Act Default Loadname: ATC20AJ Default Filename: ATC20AJ_010009 Running Load: ATC20AJ_010009 Load in Flash: ATC20AJ_010009 ... ... 19.10 Security

Not Applicable.

19.11 Configuration Walkthrough

Not Applicable.

20: Configuration (CN): A00002858

20.1 Hardware and Software Requirements

This feature requires the following features to function:

- A00002607 - ABI XPM SITE and MG9K Location support.
- A00002146 - MAPCI ABI Link Test & Legacy Comparison.

20.2 Initial Configuration

An ABI XPM must be datafilled to observe the new functionality provided via the QUERYPM command at the PM level(s) of the MAP.

20.3 Command interface changes

20.3.1 QUERYPM MAPCI command

The QUERYPM command is used to query miscellaneous information about the currently posted XPM at the PM level of the MAP. This feature modifies the legacy QUERYPM command as follows:

1. Add additional screen output to the default QUERYPM command (without arguments) which reflects SITE, ABI slot, and network element number information. New output only occurs if the posted XPM is an ABI XPM.
2. Add an additional option to the QUERYPM command, ABICONN, which is used to trigger a looparound message at the ABI XPM for verifying connectivity between the CM and XPM.

20.3.1.1 Legacy QUERYPM

Figure 1 on page 2607 displays the legacy version of the QUERYPM command and options.

Figure 2 on page 2607 displays the legacy output of the QUERYPM command without arguments.

Figure 1 Legacy MAPCI help QUERYPM command.

```

20.3.1.2.4 QUERYPM with ABICONN option - INPUT

Entering “QUERYPM ABICONN” at the MAP will attempt a looparound test at the ABI XPM. Information regarding the results will be displayed at the MAP. Please refer to “20.3.1.2.5 QUERYPM with ABICONN option - OUTPUT” on page 2609 for an overview of the possible results which are output at the MAP.

20.3.1.2.5 QUERYPM with ABICONN option - OUTPUT

There are a number of nodes in the path between the CM and ABI XPM which are necessary to perform the link looparound. If a failure occurs, the link looparound test will attempt to isolate the issue. Based on success or the point of failure, various messages will be output informing the end user of the status.

Table 1, “QUERYPM with ABICONN MAP outputs,” on page 2609 lists the possible messages output at the MAP when the QUERYPM command using the ABICONN option is input at the MAP. There should be a separate output for each of the messaging paths to the XPM.

Table 1 QUERYPM with ABICONN MAP outputs

QUERYPM ABICONN
Response: “Connectivity to XPM has been confirmed.” **Meaning:** A successful link looparound test was completed. The CM is communicating with the XPM. **System or user actions:** No actions are required.
Response: “Connectivity check via link # PASSED.” **Meaning:** Connectivity was verified over the specified link. **System or user actions:** None.

Table 1 QUERYPM with ABICONN MAP outputs

QUERYPM ABICONN
Response: “Connectivity check via link # FAILED.” **Meaning:** Connectivity over the specified link could not be verified, or the verification failed. **System or user actions:** Refer to the extra output when this occurs for troubleshooting steps if any.
Response: “Invalid link state for test.” **Meaning:** The connectivity tests were not run because of the state of the link. **System or user actions:** Retry the test when the links are in a valid state for test.
Response: “Querypm ABICONN has been aborted by higher priority mtc.” **Meaning:** The connectivity test was aborted because the resources were needed by higher priority maintenance. **System or user actions:** Retry the command later.
Response: ’Failed to maintenance open link.’ **Meaning:** The Mtc system was unable to open the link for test purposes. **System or user actions:** Retry the command later.

Table 1 QUERYPM with ABICONN MAP outputs

QUERYPM ABICONN
Response: 'Failed XPM messaging test.' **Meaning:** The XPM is not messaging properly. **System or user actions:** Troubleshoot the XPM for resolution of the issue.
Response: 'Check connectivity between the ABI and XPM.' **Meaning:** Communication between the ABI and XPM could not be verified. **System or user actions:** Troubleshoot communications between the ABI and XPM.
Response: 'Check connectivity between the GWC and ABI.' **Meaning:** Communication between the GWC and ABI could not be verified. **System or user actions:** Troubleshoot communications between the GWC and ABI.
Response: 'Check connectivity between the CM and GWC. ' **Meaning:** Communication between the CM and GWC could not be verified. **System or user actions:** Troubleshoot communications between the CM and GWC.
Response: 'Invalid response - spch #' **Meaning:** This is an invalid response to this test. **System or user actions:** Contact next level of support.

Table 1 QUERYPM with ABICONN MAP outputs

QUERYPM ABICONN
Response: 'MG9K reports VMG is OOS.' **Meaning:** The ABI is reporting the VMG is not INSV. **System or user actions:** Verify VMG status at the Element Manager.
Response: 'MG9K reports Node Mtc is not ready.' **Meaning:** The MG9K is not in a proper state to support the connectivity test. **System or user actions:** Verify the MG9K and ABI status at the Element Manager.
Response: 'MG9K reports HAL Alarms.' **Meaning:** The test is failing because of faults which are alarmed. **System or user actions:** Verify the ABI status at the Element Manager and clear any critical alarms.
Response: 'MG9K reports no Sync with XPM.' **Meaning:** Clock sync between the XPM and ABI has not been achieved. **System or user actions:** Verify physical connectivity between the ABI and XPM.

21: Configuration (CN): A00002858

21.1 Hardware and Software Requirements

Just need SN07/20 release or later in the Core and SPMs.

21.2 Initial Configuration

At the CI prompt:

ENGWRITE ON

TABLE OFCENG

POS SPM_NODE_ISTB_FOR_CARRIER_OUTAGE

21.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Introducing OFCENG office parameter SPM_NODE_ISTB_FOR_CARRIER_OUTAGE in the CM.

21.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	SPM_NODE_ISTB_FOR_CARRIER_OUTAGE	NEW	CM

21.3.2 Parameter information

21.3.2.1 SPM_NODE_ISTB_FOR_CARRIER_OUTAGE

SPM Node ISTb under PM Map banner for carrier outage

21.3.2.1.1 Functional description

This parameter controls taking a SPM or STM-1 node ISTb under the PM Map banner whenever one of its carriers has an outage. The carrier outage can be 1) whenever any of the SPM's carriers goes SysB, or 2) whenever one of the SPM's line carriers (STS3L or STM1M) has a RFI (Remote Failure Indicator) alarm.

When the parameter is enabled (“Y”), any SPM carrier outage will cause an indicator under the PM banner that a SPM node has gone ISTb. When the parameter is disabled (“N”), carrier outages will never cause a SPM node to go ISTb.

The parameter is only supported on TDM Legacy nodes (SPM and STM-1), and has no impact on Succession nodes (MG4K, LSA, IW, STS-1).

21.3.2.1.2 Provisioning rules

21.3.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
N	Y	N It is strongly recommended that this parameter be enabled (“Y”) so the telco craftperson will be alerted at the Map to any carrier outages that can disrupt service.

21.3.2.1.4 Activation

Activation is immediate; no restart or manual action is required.

When the parameter is changed to “Y” to enable the feature, these warning messages will be seen:

WARNING: If pre-20 Local loads are running on Legacy SPM/STM

while this parm is YES, then carrier outages may occur.

WARNING: Activation takes up to 45 minutes to complete.

The first warning insures that user does not enable the feature when the local software to support it is not available. For the feature to work when enabled, the Core and Local must be running version 20 or later. If the Local is running 19 or earlier, then carrier outages can occur when the feature is enabled.

The second warning indicates that it can take up to 45 minutes for the change to be propagated to every SPM node, and the current SPM carrier outage status reflected under the Map PM banner.

21.3.2.1.5 Dependencies

None

21.3.2.1.6 Consequences

N/A

21.3.2.1.7 Verification

The only way to test this parameter is working is to turn it on, cause an outage, and confirm the Map reflects the outage. Since service would be disrupted, this is not recommended.

21.3.2.1.8 Memory requirements

No memory impact.

21.3.2.1.9 Parameter release history update

Added SPM_NODE_ISTB_FOR_CARRIER_OUTAGE parameter to Table OFCENG to control taking SPM node ISTb in the MAP whenever one of the SPM carriers has an outage.

21.4 Upgrade Impact

21.4.1 Dump and Restore

No impact.

21.4.2 Element Management Upgrade

No impact.

21.5 Data schema (DS) (CM, MIBS, RDB)

No impact.

21.6 Service Orders (SO) (CM & SESM)

No impact.

21.7 Element Management

No impact.

21.8 Command interface changes

Two new ISTb reasons were added to the output of the existing QUERYPM FLT REASON command.

See the OPTFN section of this feature for good examples of how this command is used.

21.8.1 Directory: MAPCI;MTC;PM;POST SPM [spm#]

21.8.1.1 Directory description

PM is an existing MAP level.

21.8.1.2 Accessing directory: MAPCI;MTC;PM;POST SPM [spm#]

21.8.1.2.1 Access to directory or MAP level and return to CI

Example of how to access and quit the PM Map level for SPM 10:

mapci;mtc;pm;post spm 10

quit mapci

21.8.2 Command: QUERYPM FLT REASON

21.8.2.1 Command type: Listed MENU

21.8.2.2 Command target: All

21.8.2.3 Command availability: RES

21.8.2.4 Command description

The QUERYPM FLT REASON will show the reason an SPM is in the ISTb or SysB state. This feature adds the following new ISTb reasons:

Check SysB Carrier - non-critical fault that indicates the OC3 (or STM) RM has a carrier in the SysB state.

Check RFI Alarm on STS3L Carrier - non-critical fault that indicates the STS3L carrier on the OC3 (which OC3 specified below) has a RFI alarm.

Check Carrier on OC3 RM - non-critical fault that indicates a carrier on this OC3 has one of the two faults listed above.

21.8.2.5 Command syntax

Table 3 QUERYPM command parameters and variables

Command	Parameters and variables
QUERYPM	existing
Parameters and variables	Description
FLT REASON	existing

21.8.2.6 Qualifications and warnings

None

21.8.2.7 Responses

There are two possible new responses for the QUERYPM FLT REASON command. Each is a status message visible on “All” systems.

21.8.2.7.1 Check SysB Carrier

>querypm flt reason
OC3 0 ISTb NonCritical faults:
Check SysB Carrier
CEM 0 ISTb NonCritical faults:
Check Carrier on OC3 RM

If this is the international STM-1 product, substitute “OC3” above with “STM”.

This ISTb status output indicates that one of the carriers on the OC3 (or STM) is in a SysB state.

21.8.2.7.2 Check RFI Alarm on STS3L Carrier

>querypm flt reason
OC3 0 ISTb NonCritical faults:
Check RFI Alarm on STS3L Carrier
CEM 0 ISTb NonCritical faults:
Check Carrier on OC3 RM

If this is the international STM-1 product, substitute “OC3” above with “STM” and “STS3L” with “STM1M”.

This ISTb status output indicates that one of the STS3L (or STM1M) carriers on the OC3 (or STM) has an RFI (Remote Fault Indicator) alarm.

Table 4 MAP outputs with associated meanings and actions

Command: QUERYPM FLT REASON
RESPONSE: Check SysB Carrier **Meaning:** one of the carriers on the OC3 has gone SysB. **System or user actions:** see Troubleshooting chapter of the OPTFN section.
RESPONSE: Check RFI Alarm on STS3L Carrier **Meaning:** one of the STS3L carriers on the OC3 has an RFI alarm. **System or user actions:** see Troubleshooting chapter of the OPTFN section.

21.8.2.8 Example

See OPTFN section of this feature for examples of each scenario when these new responses can occur, and what the telco response should be in each case.

21.9 Security

No impact.

21.10 Configuration Walkthrough

Other than upgrading to the new SN07/20 release, no further action is required to provision this feature. The new SPM_NODE_ISTB_FOR_CARRIER_OUTAGE office parameter will be “on” by default, so this feature will start working right away.

22: Configuration (CN): A00002900

22.1 Hardware and Software Requirements

N/A.

22.2 Initial Configuration

22.5 Data schema (DS) (CM, MIBS, RDB)

22.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SERVINFO	CHANGED	Unchanged

22.5.2 Table/MIB/Remote Database Schema information

22.5.2.1 Name: SERVINFO

22.5.2.1.1 Functional description

Option INITDP_PARMS of table SERVINFO is extended to add two new fields **IP_AVA** and **IPSSP_CAP** to indicate whether parameters IPAvailable and IPSSPCapabilities will be carried in IDP. These two fields should be datafilled at the same time.

Meanwhile, option SRF_INFO is extended to add new filed **IP_INFO** to provide detailed information of the IP capability within SSP.

If IP_AVA and IPSSP_CAP are datafilled and IP_INFO is not datafilled, parameters iPAvailable and iPSSPCapabilities are set to default value according to China INAP, the default value of iPAvailable is ‘01’H (which indicates that the IP is available), the default value of iPSSPCapabilities is ‘#0C00’ (which indicates that DTMF digit collection and tone & announcement is supported). If IP_INFO is datafilled, then iPAvailable and iPSSPCapabilities are set according to this datafill. That means IP_INFO will take effect only if IP_AVA and IPSSP_CAP are datafilled, otherwise, the information of this datafill will not be carried in IDP.

IP_INFO contains two subfields: **IP_AVA** and **IP_SSP_CAPABILITIES**, which are for parameter IPAvailable and IPSSPCapabilities respectively.

22.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

22.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVINFO	no change	no change	N/A

22.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for SERVINFO.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
INITDP_PARMS	Changed	refinement	Boolean Value	Add new selections: IP_AVA and IPSSP_CAP.
SRF_INFO	Changed	refinement	Boolean Value	Add new sub-option: IP_INFO
IP_INFO	New	Subfield	Boolean Value	Add new sub-options: IP_AVA and IP_SSP_CAPABILITIES
IP_AVA	New	Subfield	Boolean Value	Indicate whether the IP is available.
IP_SSP_CAPABILITIES	New	Subfiled	Boolean	Provide the detailed information of IP capabilities. (See table 4 for details)

According to China INAP, there are 14 kinds of IP capabilities which are indicated by parameter iPSSPCapabilities. These capabilities can be datafilled in IP_SSP_CAPABILITIES as shown in table 4:

Table 4 IP Capabilities defined in China INAP

IPSSPCapabilites parameter	Value	Meaning	IPSSP_CAPABILITIES selections
1st byte, bit 0	0/1	Not support/Support IPRoutingAddress	IPRA
1st byte, bit 1	0/1	Not support/Support VoiceBack	VOICE_BACK
1st byte, bit 2	0/1	Not support/Support VoiceInformation, recognize through voice, speech.	VOICE_INFO_SPEECH
1st byte, bit 3	0/1	Not support/Support VoiceInformation, recognize through voice, voice.	VOICE_INFO_VOICE
1st byte, bit 4	0/1	Not support /SupportText to Voice conversion.	TEXT_TO_VOICE
1st byte, bit 5	0/1	Not support/Support fax.	FAX
1st byte, bit 6	0/1	Not support/Support recorder.	RECORDER
1st byte, bit 7	0/1	Not support/Support script.	SCRIPT
2nd byte, bit 0	0/1	Not support/Support manual operator.	MAN_OPERATOR
2nd byte, bit 1	0/1	Not support/Support conference.	CONFERENCE
2nd byte, bit 2	0/1	Not support/Support tone & announcement.	TONE_ANNC
2nd byte, bit 3	0/1	Not support/Support DTMF digit collection.	DTMF_DIGCOL
2nd byte, bit 4	0/1	Not support/Support sending DTMF signal.	SEND_DTMF_SIG
2nd byte, bit 5	0/1	Not support/Support sending FSK signal.	SEND_FSK_SIG
2nd byte, bit 6,7	To be defined.		
3rd, 4th bytes	To be defined.		

22.5.2.1.5 Datafill example

The following example shows sample datafill for table SERVINFO:

Example of datafill:
TABLE SERVINFO
200 (INITDP_PARMS (SERVKEY) (CDPA)(**IP_AVA**) (**IPSSP_CAP**) $)
(SRF_INFO (EARLY_ANS ANS_ON_ANNS)
(**IP_INFO Y** (**IPRA**) (**VOICE_INFO_SPEECH**)
(**TONE_ANNC**)(**DTMF_DIGCOL**)$)$)$

22.5.2.1.6 Table release history update

New sub-option IP_AVA, IPSSP_CAP are added to option INITDP_PARMS. New sub-option IP_INFO is added to SRF_INFO and new option IP_INFO has 2 sub-options: IP_AVA and IP_SSP_CAPABILITIES.

23.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for EMMCDATA.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
LKEY	New		see subfields	EMMC table Key, this field consists of subfields SNPA, OFCCODE and STNCODE
		SNPA	serving_numbering_plan_area	area code of a DN
		OFCCODE	ofccode_digit_register	office code of a DN
		STNCODE	stncode_digit_register	station code of a DN
RESERVE	New		see subfields	The reservation type of the conference: timeless or schedule.
		RESERVED	SCHEDULE or TIMELESS	Selector. If the conference is reserved for the user to have a conference at any time, then enter TIMELESS and datafill no refinement is this field. If the conference is reserved for the user to have conference only at specific time, then enter SCHEDULE and datafill refinements SCHEDULE, STARTDAT, STARTTIM and ELAPSED.
SIZE	New	N/A.	numeric {3 TO 30}	Conference size. Specify the maximum allowed conferees in this confernece.
CHAIPSWD	New	N/A.	6 digits code	Chair-person's password. Enter the 6 digit length password.
PARTPSWD	New	N/A.	6 digits code	Invited Participant's password. Enter the 6 digit length password. This password can not be the same as the one of chair-person's.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
QUICKST	New	N/A.	Y or N (boolean)	Quick Start option. If the conference can start without the chair-person, enter Y. With this datafill, all participants enter before the chair-person will be placed on hold. If the conference must start with the chair-person entering, then enter N.
GREETING	New	N/A.	alphanumeric {a maximum of 16 characters}	Enter the CLLI name of the announcement defined for the greeting of this conference.
AUDIOGRP	New	N/A.	audio group	Enter the audio group name of the music which will be played while an invited participant is to be held.
ENDALARM	New	N/A.	{1 TO 10}	numeric range
CONTINUE	New	N/A.	Y or N (boolean)	Continue option. Enter Y if the confernece can continue after the chair-person leaves. If the conference should drop after the chair-person leaves, Enter N.
BILLING	New	N/A.	Y or N (boolean)	Billing option. Enter Y for generating conference specific AMA log. Enter N for no specific AMA log generation.

RESERVED = SCHEDULE

If the entry in subfield is SCHEDULE, datafill refinement as described below.

Table 4 Table field descriptionswhen RESERVED = SCHEDULE

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
		SCHEDULE	DAILY, WEEKLY, MONTHLY or NONPERIOD	Scheduled type of the conference. This field denotes the scheduled type of the conference being reserved. If the conference is reserved to be used during a specific time for each day, enter DAILY. If the conference is reserved to be used during a specific time and is able to be used on one day of each week, enter WEEKLY. If the conference is reserved to be used during a specific time and and is able to be used on one day of each month, enter MONTHLY. If the conference is reserved to be used during a specific time and is only for once, enter NONPERIOD.
		STARTDAT	yyyymmdd	Conference start date. Enter the start date of this conference (year, month and day).
		STARTTIM	hhmm	Conference start time. Enter the start time of this conference (hours and minutes).
		ELAPSED	1 to 9999	Conference elasped time. Enter the predefined elasped time of this conference (in minutes).

23.5.2.1.5 Datafill example

The following example shows sample datafill for table EMMCDATA.

```
TABLE: EMMCDATA

```

23.5.2.1.6 Table release history update

New table EMMCDATA is added.

23.5.2.1.7 Supplementary information

N/A.

23.5.2.1.8 Translation verification other tools

N/A.

24: Configuration (CN): A00002960

24.1 Hardware and Software Requirements

In order to perform originator identification screening SOC UTRS0011 must be ON and the terminating ISUP EANT trunk must have ORIGIDSCR assigned in Table TRKOPTS.

24.2 Initial Configuration

This feature only impacts calls that terminate on ISUP EANT trunk.

24.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

24.4 Upgrade Impact

24.4.1 Dump and Restore

No special steps are required.

24.4.2 Element Management Upgrade

N/A

24.5 Data schema (DS) (CM, MIBS, RDB)

24.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TRKOPTS	Changed	New

24.5.2 Table/MIB/Remote Database Schema information

24.5.2.1 Name: TRKOPTS

TRunK OPTionS

24.5.2.1.1 Functional description

A new trunk group option, ORIGIDSCR, is introduced in Table TRKOPTS for ISUP EANT trunks only. This allows the customer to specify which ISUP EANT trunks perform originator identification screening introduced by this feature.

24.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

Current datafill order unchanged.

24.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TRKOPTS	0	131072	Dynamically Allocated

24.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for TRKOPTS impacted by this feature.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTION	Changed	Refinement	ORIGIDSCR refinement is added	New option is ORIGinator IDentificaton SCreening.

24.5.2.1.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

Figure 1 Table TRKOPTS Examples

TABLE: TRKOPTS

TRK1 ORIGIDSCR ORIGIDSCR

When an attempt to add ORIGIDSCR to a trunk other than EANT type or an MF EANT trunk the following error message is generated by table control:
TABLE: TRKOPTS

*** ERROR - ORIGIDSCR can only be assigned to EANT ISUP trunks.

When an attempt to add ORIGIDSCR to an incoming trunk the following error message is generated by table control:
TABLE: TRKOPTS

*** ERROR - ORIGIDSCR can not be assigned to Incoming trunks.

24.5.2.1.6 Table release history update

Added option ORIIDSCR option for ISUP EANT trunks. This allows the customer to specify which ISUP EANT trunks perform originator identification screening.

24.5.2.1.7 Supplementary information

None

24.5.2.1.8 Translation verification other tools

Table TRKOPTS is not diplayed in TRAVER.

24.11 Configuration Walkthrough

In order to perform originator identification screening SOC UTRS0011 must be ON and the terminating ISUP EANT trunk must have ORIGIDSCR assigned in Table TRKOPTS.

25: Configuration (CN): A00002970

25.1 Hardware and Software Requirements

25.1.1 Hardware Requirements

None.

25.1.2 Software Requirements

None.

25.2 Initial Configuration

None.

25.3 Office/Subnet parameters (OP/SP) (CM & SESM)

None.

25.4 Upgrade Impact

25.4.1 Dump and Restore

Over ONP from SN06 and previous releases, the new field ‘SITE’ in Table MNNODE(for SMG4s only), is defaulted to 'HOST'.

25.4.2 Element Management Upgrade

Not Applicable.

25.5 Data schema (DS) (CM, MIBS, RDB)

25.5.1 New/modified tables, MIBs, or Database Schema

Table 1 lists the Tables being modified as a result of this feature:

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
Table MNNODE	CHANGED	UNCHANGED

25.5.2 Table Information

25.5.2.1 Name: MNNODE

25.5.2.1.1 Functional description

The Table control changes in the Table ‘MNNODE’ would consist of introducing a new inservice editable field, ‘*site’*.

25.5.2.1.2 Fields

Table 2 lists the fields for table MNNODE which are added/changed as part of this activity:

Table 2 Table field description

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SITE	New	Not Applicable	Not Applicable	This field is used to indicate the site location where the SMG4 is located. This is introduced only for SMG4 class of SPM nodes and can be datafilled only by the site names that are provisioned in Table SITE.

25.5.2.1.3 Datafill example

Figure 1 shows the sample datafill for table MNNODE, depicting that the ‘site’ field has been referenced from Table SITE :

Figure 1 Table MNNODE tuple - Existing and Desired.

MNNODE Tuple prior to this feature:-

```
SPM 4 SPM_4 SMG4 0  SYNC LINE 50 (COT 60) (DTMF 60) (ECAN 60) (TONESYN 60) (MF
60) $ (SYSB CR RPT) (MANB MJ RPT) (ISTB MN RPT) (SYSBNA CR RPT)  (MANBNA MJ

REM2   2      0          RMMVER90   $
REM3   3      0          RMMVER90   $
REM4   4      0          RMMVER90   $
```

25.5.2.1.4 New Error Messages

As a result of the feature enhancements, some new error messages are introduced which are described in Table 3.

Table 3 New Error Messages

No.	Table Control operations	Pre - conditions
	Error Messages	
1.	a. Tuple addition in Table MNNODE. b.Tuple modification('SITE' field) in Table MNNODE.	'SITE' field value not present in Table SITE. (Note : This is an error message already present in Table Control Command Interface.)
	TYPE OF SITE IS SITE_INDEX. **TYPE IS SITE_INDEX {<SITE VALUE 1>,<SITE VALUE2>,<SITE VALUE3>,...}**	

No.	Table Control operations	Pre - conditions
	Error Messages	
2	a. Change SITE name value for a particular tuple.	An SMG4 already provisioned at the changed site location and at the same floor, row, frame position and shelf position.
	The specified site, floor and shelf is already occupied. **See tuple SPM <no.>.**	
3	a. Deleting tuple from Table SITE.	The corresponding site is being referred to in Table MNNODE. (Note : This error message already exists in the Table Control Command Interface.)
	Error : Table MNNODE still references this tuple.	

25.5.2.1.5 Usage sequence and implications (CM Only)

The datafill order remains unchanged.

However, the addition of an SMG4 in a new site requires the data to be provisioned in Table SITE first (See FN-Section 2.9 for more details.)

25.8 Element Management

Not Applicable.

25.9 Command interface changes

Prior to this feature, the value for site was hardcoded to 'HOST' in the MAPs that displayed site name. This feature now picks up the site value from the corresponding data in Table MNNODE and displays it in the existing MAPs.

A snapshot of all the affected MAPs is shown in this section with modified displays. Also shown in Figure 2 is the related SMG4 tuple from the Table MNNODE.

Figure 2 An MNNODE tuple with SITE data

26.9.2.1 Command type: NON-MENU

26.9.2.2 Command target: All

26.9.2.3 Command availability: RES

26.9.2.4 Command description

The LOADDISTRIB and PATCHDISTRIB options of the SET command are extended to support electronic software delivery via FTP as described below.

A complete description of the SET command can be found in the "Commands" subsection of the "Overview of automated update process" section of the following NTP:

North American DMS-100 Peripheral Module Software Release Document, NTP 297-2663-599

26.9.2.5 Command syntax

Table 1 SET command parameters and variables

Command	**Parameters and variables**
SET	<Set options> <new values>
Parameters and variables	**Description**
<Set options>	LOADDISTRIB: The source of the load files to be copied. PATCHDISTRIB: The source of the patch files to be copied.
<new values>	ftp://<SDM_IP_address><directory_location>

26.9.2.6 Qualifications and warnings

None.

26.9.2.7 Responses

The LOADDISTRIB and PATCHDISTRIB options of the SET command will allow the crafts person to specify remote FTP volumes as PM load and patch distribution volumes.

The name of a **remote FTP volume** looks like:

```
ftp://<SDM_IP_address><directory_location>
```

where **<SDM_IP_address>** designates the IP address of the SDM containing the PM upgrade files to be copied, and **<directory_location>** designates where on the SDM the PM upgrade files are stored.

26.9.2.7.1 SET LOADDISTRIB and PATCHDISTRIB

Table 2 MAP outputs with associated meanings and actions

Command
>SET LOADDISTRIB 'ftp://<SDM_IP_address_1><directory_location_1>' The current PMUPGRADE settings are: **Load File Distribution: ftp://<SDM_IP_address_1><directory_location_1>** Load File Destination: S00DPMLOADS **Patch File Distribution: S00T** ISN Patch Destination: SFDEV XPM Patch Destination: SFDEV Confirmation: ON IncludeLoads: ExcludeLoads: **>SET PATCHDISTRIB 'ftp://<SDM_IP_address_2><directory_location_2>'** The current PMUPGRADE settings are: **Load File Distribution: ftp://<SDM_IP_address_1><directory_location_1>** Load File Destination: S00DPMLOADS **Patch File Distribution: ftp://<SDM_IP_address_2><directory_location_2>** ISN Patch Destination: SFDEV XPM Patch Destination: SFDEV Confirmation: ON IncludeLoads: ExcludeLoads: **Meaning:** The crafts person has requested PMUPGRADE to set the load distribution volume and patch distribution volume to be remote FTP volumes. **System or user actions:** PMUPGRADE sets the load distribution volume and patch distribution volume as requested, and displays the new settings. **Note**: Because of DMS command interpreter restrictions, the remote FTP volumes must be enclosed in single quotes as shown in the example above.

26.9.2.8 Example

Table 3 Usage examples for SET command

Description of task	The crafts person request PMUPGRADE to set the load distribution volume and patch distribution volume to be remote FTP volumes.

Table 3 Usage examples for SET command

Command: MAP response:	>**SET LOADDISTRIB 'ftp://10.1.2.3/NA08/pm-loads'** The current PMUPGRADE settings are: **Load File Distribution: ftp://10.1.2.3/NA08/pm-loads** Load File Destination: S00DPMLOADS **Patch File Distribution: S00T** ISN Patch Destination: SFDEV XPM Patch Destination: SFDEV Confirmation: ON IncludeLoads: ExcludeLoads: >**SET PATCHDISTRIB 'ftp://10.1.2.3/NA08/pm-patches'** The current PMUPGRADE settings are: **Load File Distribution: ftp://10.1.2.3/NA08/pm-loads** Load File Destination: S00DPMLOADS **Patch File Distribution: ftp://10.1.2.3/NA08/pm-patches** ISN Patch Destination: SFDEV XPM Patch Destination: SFDEV Confirmation: ON IncludeLoads: ExcludeLoads

26.9.3 Command: START

26.9.3.1 Command type: NON-MENU

26.9.3.2 Command target: All

26.9.3.3 Command availability: RES

26.9.3.4 Command description

The FILECOPY phase of the START command is extended to support electronic software delivery via FTP as described below.

A complete description of the START command can be found in the "Commands" subsection of the "Overview of automated update process" section of the following NTP:
North American DMS-100 Peripheral Module Software Release Document, NTP 297-2663-599

26.9.3.5 Command syntax

Table 4 START command parameters and variables

Command	Parameters and variables
START	<Start phases>
Parameters and variables	**Description**
<Start phases>	FILECOPY: Will copy load files and patches required to upgrade the peripherals on the switch.

26.9.3.6 Qualifications and warnings

None.

26.9.3.7 Responses

26.9.3.7.1 Remote FTP volume login

Table 5 MAP outputs with associated meanings and actions

Command
>START FILECOPY **Please enter the username and password for the remote FTP volume:** **ftp://<IP_address_1><directory_location_1>** **Username? <username_1>** **Password? <password_1>** **Please enter the username and password for the remote FTP volume:** **ftp://<IP_address_2><directory_location_2>** **Username? <username_2>** **Password? <password_2>** **Meaning:** The crafts person has requested PMUPGRADE to begin the FILECOPY phase of the PM upgrade process. The FILECOPY phase of the START command will allow the crafts person to copy PM load and patch files from remote FTP volumes to the destination volumes on the DMS switch. **System or user actions:** Because the load distribution volume and patch distribution volume are remote FTP volumes, PMUPGRADE prompts the crafts person to supply usernames and passwords. The crafts person enters the usernames and passwords for the remote FTP volumes. **Notes:** Up to two retries will be provided by PMUPGRADE for the username and password prompts in case the original supplied values are not valid.

26.11 Configuration Walkthrough

N/A

27: Configuration (CN): A00003073

27.1 Hardware and Software Requirements

SimRing Deny Redirection feature requires Redirection Framework.

No new hardware is required.

27.2 Initial Configuration

Set existing redirection_framework office parm to Y.

```
TABLE: OFCVAR
PARMNAME PARMVAL
----------------
REDIRECTION_FRAMEWORK Y
```

27.3 Office/Subnet parameters (OP/SP) (CM & SESM)

No office parameter is added or modified by this feature.

27.4 Upgrade Impact

27.4.1 Dump and Restore

Reformat Procs will be written to deal with table KSETFEAT and IBNFEAT changes during ONP. The new added field (REDIRECTION) will have the default value of “ALLOWED”. This will ensure that the existing SimRing feature in the switch will work the same as before.

27.4.2 Element Management Upgrade

N/A

27.5 Data schema (DS) (CM, MIBS, RDB)

27.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
IBNFEAT	changed	unchanged
KSETFEAT	changed	unchanged

27.5.2 Table/MIB/Remote Database Schema information

27.5.2.1 Name: IBNFEAT

27.5.2.1.1 Functional description

This feature adds a Redirection subfield to the SimRing line option datafilled in table IBNFEAT. When this option has a value of Not_allowed on a SimRing pilot DN then the resultant NPMDN legs are not allowed to call forward.

27.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

27.5.2.1.3 Size

Current table size is unchanged.

27.5.2.1.4 Fields/OIDs

The following table lists the new subfield for SimRing line option in IBNFEAT.

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
Redirection	NEW	none	allowed / not_allowed	SimRing Deny Redirection Allowed assigned to this subfield of simring group option indicates that NPMDN terminators with active call forwarding are allowed to redirect calls. Not_Allowed assigned to this subfield of simring group option indicates that NPMDN terminators are not allowed to call forward.

27.5.2.1.5 Datafill example

The following example shows sample datafill for table IBNFEAT line option SimRing.

```
TABLE: IBNFEAT
>
>list
LEN DNNO DF FEATURE DATA
------------------------
HOST 01 0 00 00 0 SIMRING SIMRING 0 ACT FALSE $
>cha

PIN: $
>
TUPLE TO BE CHANGED:
HOST 01 0 00 00 0 SIMRING SIMRING 0 ACT NOT_ALLOWED $
```

27.5.2.1.6 Table release history update

A subfield, Redirection, added to the SimRing group option.

27.5.2.1.7 Supplementary information

None.

27.5.2.1.8 Translation verification other tools

Not applicable.

27.5.2.2 Name: KSETFEAT

27.5.2.2.1 Functional description

This feature adds an Redirection subfield to the SimRing line option datafilled in table KSETFEAT. When this option has a value of Not_allowed on a

SimRing pilot DN then the resultant NPMDN legs are not allowed to call forward.

27.5.2.2.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

27.5.2.2.3 Size

There is no change to the table size.

27.5.2.2.4 Fields/OIDs

The following table lists fields/OIDs for KSETFEAT.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
Redirection	NEW	none	allowed / not_allowed	SimRing Deny Redirection Allowed assigned to this subfield of simring group option indicates that NPMDN terminators with active call forwarding are allowed to redirect calls. Not_Allowed assigned to this subfield of simring group option indicates that NPMDN terminators are not allowed to call forward.

27.5.2.2.5 Datafill example

The following example shows sample datafill for table KSETFEAT line option SimRing.

```
TABLE: KSETFEAT

```

27.5.2.2.6 Table release history update

A subfield, SRDR, added to the SimRing group option.

27.5.2.2.7 Supplementary information

None.

27.5.2.2.8 Translation verification other tools

Not applicable.

27.6 Service Orders (SO) (CM & SESM)

27.6.1 Service order change details

27.6.1.1 LCC and options

27.6.2 New commands

This activity adds a new option “REDIRECTION” to the existing SimRing group commands. The commands that can be used to datafill SimRing the standard ADO, DEO, CHF, EST, ADD, and DEL commands. The following table describes what the new prompt is for each of the ServOrd commands.

Command	Prompting
ADO	• **Redirection** • PIN
DEO	• No new prompt
CHF	• state • **Redirection** • PIN
EST	• NPMDNs • State • **Redirection** • PIN
ADD	• No new prompt
DEL	• No new prompt

27.6.2.1 How service order commands are presented

No new commands added

27.6.2.1.1 Command prompts

The system prompts for EST and CHF commands are shown in order of their appearance.

27.6.2.2 How service order options are presented

27.6.2.2.1 Description

For SimRing, EST and CHF commands are changed in order to have the new "REDIRECTION" option. Other than that crafts person will not see any other changes.

27.6.2.2.2 Example

Figure 1 Example of the EST command in prompt mode

```

27.6.2.2.3 Option prompts

Table 4 System prompts for Redirection field of SimRing option

Prompt	Valid input	Description	Areas affected by prompt
REDIRECTION	ALLOWED	NPMDN with active call forwarding are allowed to redirect calls.	This change only affect NPMDNs with active call forwarding (CFA, CFD, CFB)
	NOT_ALLOWED	NPMDN with active call forwarding are not allowed to forward calls.	

27.6.2.2.4 Line class code compatibility

No change to SimRing option / LCC compatibility.

Table 5 Redirection compatibility to LCC

Line class code	Compatible?
N/A	
1FR-1MR	Yes/No

27.6.2.2.5 Assignability

Redirection option is SimRing group option.

27.6.2.2.6 Option prerequisites

Redirection option is part of the SimRing group option and can not be added to any lines.

27.6.2.2.7 Notes

n/a

27.6.2.2.8 Feature identification

n/a

27.6.2.2.9 SERVORD+ Exceptions

27.7 Software optionality control (SOC)

No new SOC is introduced by this feature.

27.8 Element Management

Not applicable.

27.9 Command interface changes

27.9.1 Command: QSIMR

This feature modifies the display of QSIMR. It adds an indication that Redirection is allowed/not allowed on the SimRing group.

27.10 Security

This feature does not impact security.

27.11 Configuration Walkthrough

See “27.6 Service Orders (SO) (CM & SESM)” on page 2654 for configuration details.

28: Configuration (CN): A00003074

28.1 Hardware and Software Requirements

Not Required

28.2 Initial Configuration

Not Required

28.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Required

28.4 Upgrade Impact

28.4.1 Upgrade Impact

28.4.1.1 Dump and Restore

In order to upgrade to SN07.0, the customer must currently be running the SN06.2 release.

In order to bring the data from SN06.2 to SN07 during an SN06.2 to SN07 upgrade, the customer must export the SN06.2 data in the SN06.2 Subnet View for the individual gateway node and then import the gateway node into SN07. The export files from SN06.2 must be saved on another device if rollback of a gateway is anticipated. The SN06.2 export data is used to repopulate the node in the SN07 Mg9k Element Manager.

Prior to performing a maintenance release (MR) upgrade (i.e. SN07 to SN07MR), the customer should backup the Oracle database on the CS2M machine. This is a normal backup of the oracle database on the CS2M machine.

28.4.1.2 Element Management Major Release Upgrade

Changes to the SN06.2 to SN07 upgrade are

- After upgrading to SN07, new hardware for SCO, SCI, ITX, ITP, and ABI can be upgraded.
- If attempting to rollback to SN06.2, the new SN07 boards have to be removed and replaced with the old hardware boards prior to downgrading the loads on the cards. Failure to do so could damage the hardware.
- During the time when the DCC cards have been upgraded to SN07 but the NE resides in the SN06.X Subnet View, the SN06.X OM Collector will not collect any OMs due to security features added in the SN07 MG9k card software. The NE should be removed from the SN06.X OM Collector collection list.

- When the user installs the MG9000 Master server software, the “pkgadd” command now performs an additional check. If two releases of the MG9000 server software are already installed, the installation fails and the user sees the following message:

  The package cannot be installed. The following releases of the MG9000 EM Master server are already installed:

  NTmg9ks_6_45.pkg

  NTmg9ks_6_221_0.pkg

  At most two releases of the MG9K EM Master server software should be installed on a given SSPFS at any time. Before installing the new package, you must remove one of the packages listed above. Please remove the package that is no longer being used. To remove a package, use the “pkgadd” command.

- When the user installs the MG9000 mid-tier server software, the “pkgadd” command now performs the same check. If two releases of the MG9000 mid-tier software are already installed, the installation fails and the user sees the following message:

  The package cannot be installed. The following releases of the MG9000 EM mid-tier server are already installed:

  NTmg9km_6_45.pkg

  NTmg9km_6_221_0.pkg

  At most two releases of the MG9K EM mid-tier server software should be installed on a given SSPFS at any time. Before installing the new package, you must remove one of the packages listed above. Please remove the package that is no longer being used. To remove a package, use the “pkgadd” command.

28.4.1.3 Element Management Maintenance Release (MR) Upgrade

Compared to previous releases, the SN07 maintenance release (MR) upgrade process has the following differences:

- Prior to the MR upgrade, the user should backup the entire Oracle database.
- The user does not export each NE prior to the upgrade.

The SN06.2 MR upgrade process is documented in section “Upgrading the MG 9000 Manager software to a maintenance release” of document NN10048-461 entitled “Upgrading the MG9000” (version SN07). Below is a summary of the MR upgrade process for SN07.

- Backup the entire Oracle database.
- Upgrade the hardware, if necessary. Ensure the connection from the MG 9000 Manager to the MG 9000 is up.

- Stop the GUI clients.
- Stop the mid-tier server.
- Stop the Performance Collector and Formatter (PCF) OM collection application.
- Stop the master server.
- Remove the old master server package.
- If required, perform an MR upgrade on the SSPFS software.
- Install, configure, and start the MR release master server. When you configure the master server, typically you should use the same settings from the previous installation of the master server. You will NOT be prompted with the questions “Is this an MR upgrade?” and “Do you want to initialize the database?”. The software knows the correct actions to take.
- Remove the old midtier server package.
- Install, configure, and start the MR release midtier server. When you configure the midtier server, typically you should use the same settings from the previous installation of the midtier server.
- Launch the new client. The client will display any NEs that were provisioned prior to the MR upgrade.
- Reconnect any third party application that retrieves alarms for delivery to Operations Support System (OSS) fault management systems.
- Install and start the MR release OM collection application.

28.4.2 OSS Changes

28.4.2.1 Prefix Changes

With SN07 the northbound interfaces need to change the prefix for event channel, and fault manager entries. In SN06.2, the prefix was Subnet_62. With the SN07 release the prefix for applicable CORBA Naming Service entries should be changed to Subnet_7.

Example ORB entry changes:

SN06.2

EventChannel = “Subnet_62.ec.Oss”

FaultServiceManager = “Subnet_62.Services.FaultServiceManager”

SN07

EventChannel = “Subnet_7.ec.Oss”

FaultServiceManager = “Subnet_7.Services.FaultServiceManager”

28.4.2.2 Customer Log Changes

New customer logs are added to inform users when data has not been saved in the database. These are cases where the data is provisioned successfully in all appropriate places except for the database. The logs indicate when this situation occurs for termination data, when an attempt to correct the database fails, and when the database is corrected. The MGEM logs apply to all components on the MG9K EM except for terminations and the VMG logs apply to termination data. The logs and examples are below:

- MGEM 704 - An attempt to correct the database has failed.

```
MGEM 704 Warning INFO

Database unavailable, correction failed

Failed database correction on VMG.  The database will
be corrected when it is available.  Check the
database for problems.
```

```
MGEM 704 Warning INFO

Database unavailable, correction failed

Failed database correction to MODIFY TERM ESA DATA on
VMG LCE023-0-3, termination tp/04/01 with DN
9192234567.  The database will be corrected when it
is available.  Check the database for problems.
```

- MGEM 705 - An attempt to correct the database has passed.

```
MGEM 705 Warning INFO

Database corrected

Data is corrected on VMG.
```

- VMG 600 - Termination data was successfully provisioned in all appropriate areas except for the database.

```
VMG 600 Warning INFO

Database unavailable, update failure
```

```
Failed database update to MODIFY TERM DN on VMG
LCE023-0-3, termination tp/04/01 with DN 9192234567
and gateway ESA flag value of 0. The database will be
corrected when it is available.  Check the database
for problems.
```

- VMG 601 - An attempt to correct termination data in the database has passed.

```
VMG 601 Warning INFO

Database corrected

Data is corrected for MODIFY TERM DN on VMG LCE023-
0-3, termination tp/04/01 with DN 9192234567.
```

28.4.3 External Interface Changes

With SN07 the TL1 Adaptor for SN07 connects to 2363 port. Thus third party equipment should connect to port 2363 for SN07.

In SN07, the EM's SNMP listening port is 8002.

28.5 Element Management

28.5.1 New/modified GUIs

28.5.1.1 MG9000 Menu changes

In SN06.2 and earlier releases, the MG9000 menu tab in the subnet view has a menu item for ExportNE. However, as of SN07, the menu item for ExportNE no longer exists. When upgrading from SN07 to a later release, the user no longer exports the NE data.

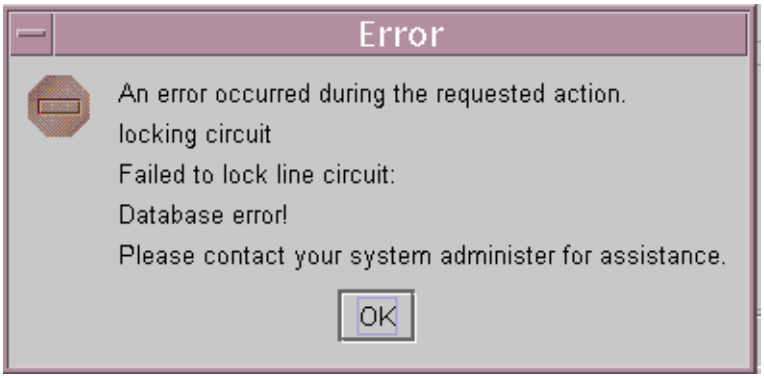
28.5.1.2 New Status Icon

Consider a scenario in which an MG9K is upgraded from an EM running version SN06.2 to an EM running version SN07. After the upgrade, the SN06.2 version of the EM notices that the MG9K is reporting its traps to an IP address and port that is different from its own SNMP listening port. Essentially, the SN06.2 EM is no longer managing that MG9K.

When an EM has an MG9K provisioned but is no longer managing that MG9K, the EM's GUI should provide an indication to the user regrading the status of that MG9K. More specifically, in the GUI's subnet view, the following status icon will appear on top of the NE icon:

28.5.1.3 New database error

With this feature, some data that used to reside in memory will now be persisted in the database. If a database error is encountered during MG9000 EM GUI actions, an error message will be displayed to inform the user that the operation has failed due to a database error. The following GUI is an example of such an error message:



29: Configuration (CN): A00003454

29.1 Hardware and Software Requirements

There are no special hardware or software requirements.

29.2 Configuration

The initial configuration of this package is completed as part of the installation.

Following is an example of getting to the SOCKS configuration using *cli*. All following examples will presume the SOCKS configuration was successfully navigated to.

29.2.0.1 Starting the SOCKS configuration

```
>/opt/nortel/NTsocks/cli

 2 - list_socks (List Socks Security Service)

 X - exit

select - 1
```

The changes of the server side port is a disruptive action. If the server side port is changed, the SOCKS server and all dependant applications must be restarted.

SOCKS ports in all offices must be configured the same. Misconfiguration will cause EMS clients to not function.

Proceed with caution.

29.2.0.2 Successful configuration of the SOCKS ports using default values.

```
Enter the port the Server side SOCKS Proxy will
listen on. Value must be
within [1025 - 65535]. default value 10080.
Current value 10080[?,q]

Is port 10080 acceptable? [y] [y,n,?,q] y

Enter the port the Client side SOCKS Proxy will
listen on. Value must be
```

```
within [1025 - 65535]. Current Value - 10090 [?,q]
Leaving CLIENT port at 10090.
Leaving both ports at configured values:
           Server side SOCKS Proxy port: 10080
           Client side SOCKS Proxy port: 10090

=== "config_socks" completed successfully
```

29.2.0.3 Entering a non-default value for both the server and client ports.

WARNING: Configuring the SOCKS server side port requires a restart of the SOCKS server and all dependent applications, are you sure you want to change the configuration? [y] [y,n,?,q] y

Enter the port the Client side SOCKS Proxy will listen on. Value must be within [1025 - 65535]. Current Value - 10090 [?,q] 3445

Warning: Clients already running Succession GUI's must be restarted to use this new port, are you sure you want to change the configuration?
[y] [y,n,?,q] y
Configuring ports:
Server side SOCKS Proxy port to 2334
Client side SOCKS Proxy port to 3445

WARNING: Configuring the Server Side socks port. This will cause disruption of
service. Do you want to continue? [y] [y,n,?,q] y
Stopping NTSocks on Thu Jan 29 05:32:41 EST 2004

30: Configuration (CN): A00003487

30.1 Hardware and Software Requirements

30.1.1 Hardware

No additional hardware is required in order to upgrade to a load capable of supporting multiple packet networks (support limited to IP interworking with AAL2 for SN07). All exisiting TDM/Packet configurations will continue to be supported, including:

- UA-AAL1
- PT-AAL1
- Ultralite AAL1
- UA-IP
- PT-IP
- PT-IP Compact (includes AAL2 via the PVG)
- AAL2 Wireless

In addition, the following new office configuration are supported:

- UA-AAL1/IP
- New hardware will be required for the addition of the second packet network.

30.1.2 Software

The software reconfiguration to use the new networking tables (BEARNETS, NETBRDGE, NETPATH, NET2NET) will occur automatically to include default datafill dictated by the value of a new office parameter. This parameter, PRE_SN07_DUMPSIDE_PACKET_FABRIC, must be set by the engineering team and applied to the office prior to the table transfer.

SESM will align with the standard SESM requirements.

In order to provision a second packet network, the customer will have to provision the new network, any bridging resources for that network, and the connectivity supported between the networks via the bridging resource paths.

30.2 Initial Configuration.

30.2.1 Office parameters

30.2.1.1 NETWORK_ACTIVE

The network_active office parameter will be set to EXTENET when upgraded to the SN07 Succession load, even if it had been previously set to ENET.

If it had been set to JNET, the value will remain as JNET. In these offices, there will be no default network datafill in the new network tables.

> ***Note:*** If the value of the network_active office parameter is set to JNET, the packet connectivity function is not available.

30.2.1.2 PRE_SN07_DUMPSIDE_PACKET_FABRIC

Will be set to one of {UNDEF[1], NONE, AAL1, AAL2, IP}. Once the ONP is complete, there is no need to change this office parameter.

30.2.1.3 MULTINET_DISPLAY_ACTIVE = 'N'

The display control for the new OMs and Logs introduced by this activity is initially off.

30.2.2 New Network Tables - initial datafill

The examples that follow are the default tuples that will be in the new network tables after the ONP is complete. Note that the initial value of the NET 1 FABRIC field will be determined by the new office parameter PRE_SN07_DUMPSIDE_PACKET_FABRIC.

The following examples show the post TABXFER views of the new table data for the various "from" office network configurations.

[1]Should be set to something other than UNDEF by the engineering team prior to table transfer. UNDEF will be an error condition if the network_active = EXTENET.

30.2.3 New fields in existing tables

30.2.3.1 MNNODE

- IW SPM: will include new field BRDGCLLI set to key of only entry in table NETBRDGE.
- IW DPT: will include a new field BEARNETS set to (<name of NET 1> Y) $.
- MG4K: will include a new field BEARNETS set to (NET_AAL1 Y) $

30.2.3.2 TRKOPTS

- DPT tuples will be pulled out of the DYNAMIC option as an application type and moved into it's own option area.
- DPT tuples will contain a new BEARNETS field, that will contain (<name of NET 1> Y) $
- SIPT DPT tuples contain a new selector named NGSS. This selector indicates if the trunk group uses the new Next Generaion Session Server (NGSS) for SIP architecture implemented by activities A00003933. The values of this field is either 'Y' or 'N'.

30.2.3.3 SERVRINV

- Will contain a new BEARNETS field, which will be set to:

— (<name of NET 1> Y) $ if GWC is not a DPT GWC

— $ if a DPT GWC

30.2.3.4 Routing tables: CND PKT selector

The existing CND PKT routing selector will be converted to CND FABRIC in all of the applicable routing tables.

30.2.4 SESM

Each non DPT GWC provisioned will have a network codec profile associated with it, using the existing network codec profile that is configured for the office.

DPT GWC's will not have a network codec profile associated with them.

30.3 Office/Subnet parameters (OP/SP) (CM & SESM)

30.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCOPT	network_active	Unchanged	CM
OFCVAR	multinet_display_active	New	CM
OFCSTD	pre_sn07_dumpside_packet_fabric	New	CM

30.3.2 Parameter information

30.3.2.1 OFCOPT::NETWORK_ACTIVE

- The parameter itself is not really changing in SN07. It will simply be used to aid in the detection of an upgrade to a Succession call server capable of supporting multiple packet networks.
- As of SN04, any ENET offices upgrading to a packet capable Succession load will have this office parameter converted to EXTENET automatically during the upgrade.
- The value EXTENET is now expanded to include the ability to support mutiple packet networks.

- The use of the network tables (BEARNETS, NETBRDGE, NETPATH, and NET2NET) is enforced in connectivity for interworking the various networks, even when only a single packet network exists.

30.3.2.1.1 Functional description
This parameter controls various aspects of call processing, most importantly the network connectivity capabilities that are supported by the system.

30.3.2.1.2 Provisioning rules
For JNET call processing, set the value of this parameter to JNET.

For Succession (single or multiple packet networks), the value should be set to EXTENET. “Succession” includes all cases where the load is packet capable, such that it includes the MSH DRU. This includes offices that currently only have an ENET provisioned.

30.3.2.1.3 Range information
Unchanged.

30.3.2.1.4 Activation
Unchanged.

30.3.2.1.5 Dependencies
No additional dependencies.

30.3.2.1.6 Consequences
Unchanged.

Note: The update mentioned under activation was put in place because this office parameter requires a restart for activation, and packet network connectivity is not available unless the office parm is set to EXTENET for Succession loads.

30.3.2.1.7 Verification
Not applicable.

30.3.2.1.8 Memory requirements
No memory impact.

30.3.2.1.9 Parameter release history update
Office parm value EXTENET now implies that the software can support multiple packet networks.

Note: The current SN06 NTP documentation does not reflect that this parameter will be changed on an ONP to EXTENET, if the from side is currently set at “ENET” and the to load contains the MSH DRU. The update that does this was submitted in TL16.

30.3.2.2 OFCVAR::MULTINET_DISPLAY_ACTIVE

Multiple Networks Display Active

30.3.2.2.1 Functional description

This is a new office parameter associated with Succession Call Server that activates the new and changed OMs and logs. This allows the customer the flexibility of enabling multiple packet networks (likely for testing purposes only) prior to having the back-office system (i.e., OSS systems) ready to support the new OMs and log fields. This is an Y/N type parameter. This parameter would be part of OFCVAR table. The default would be set to 'N'.

This parameter does not control the display of the IWBM per bridge pool OMs.

30.3.2.2.2 Provisioning rules

This office parameter cannot be turned on unless NETWORK_ACTIVE = EXTENET.

There are no restrictions for setting it to 'N'.

30.3.2.2.2.1 Behavior when the parameter is set to 'Y'

- Change from 'N' to 'Y' using table control.
  - — The tuples in the new OM groups TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP are created/ (if non-existant) displayed.
  - — Pegging of the OM group registers in TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP is started.
  - — The signaling type for the DPT node tuple in the DPTNODE OM group is displayed. The bearer network is also displayed for DPTNODE OMs if the DPT node is SPM based. The bearer network will not be displayed for GWC hosted DPT.
  - — The display of the bridge pool in IWBM 800 series of LOGS is enabled.

30.3.2.2.2.2 Behavior when the parameter is set to 'N'

- Change from 'Y' to 'N' using table control
  - — A warning message would be displayed "All OM and LOGs data pertaining to multiple bearer networks on this call server will be lost.".
  - — The tuples in the new OM groups would not be displayed.
  - — The signaling type and bearer network for the DPT node tuple in the DPTNODE OM group would not be displayed.
  - — All the counters for the registers of the new OM groups would be set to zero.

— The counters of the registers of the new OM groups would not be pegged.

— The display of bridge pool in IWBM 800 series of LOGS would be disabled.

— The OMSHOW command would display the OM groups TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP and its fields. However the tuples of these OM groups is not be displayed.

30.3.2.2.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
Y/N	Y/N	N

30.3.2.2.4 Activation
Immediate

30.3.2.2.5 Dependencies

This parameter cannot be set to Y unless NETWORK_ACTIVE = EXTENET.

30.3.2.2.6 Consequences

Setting this parameter to Y will result in new OM tuples and log fields to be displayed. This could adversely affect downsteam OOS systems that have not yet been upgraded to handle this additional data.

30.3.2.2.7 Verification
To verify that the MULTINET Display is active and OM groups are created, use the CI command OMSHOW DPTOFCP. This command should display the OM group files and its tuples.

30.3.2.2.8 Memory requirements
Refer to the EI section for final details.

The new OM groups will be created at IPL time, but the tuples will not be created/displayed until the office parameter is set to Y.

- For the OM groups DPTOFCP, OFZ2NET1 and OFZ2NET2 the tuples would be created but not displayed.
- For the OM TRK2NET1 and TRK2NET2, the tuples would not be created and would be created when the office parameter "MULTINET_DISPLAY_ACTIVE" is set to Y for the first time.

30.3.2.2.9 Parameter release history update

New in SN07.

30.3.2.3 OFCSTD::PRE_SN07_DUMPSIDE_PACKET_FABRIC

SN07 Dumpside Packet Fabric prior to Succession MULTINET upgrade.

30.3.2.3.1 Functional description

This office parameter is set by the Nortel engineering team in an office parm changes flat file prior to the night of ONP. It is to be applied after the transfer of the office parameters and prior to the TABXFER.

The purpose of the parameter is to identify the FABRIC type of the single packet fabric supported on the from side prior to the upgrade, in order for the proper network tuples to be created in tables BEARNETS, CLLI, NETBRDGE, NETPATH, and NET2NET, as well as allow the new network related fields in tables MNNODE, TRKOPTS, and SERVRINV to be assigned the proper default values.

It is very important that this parameter be set correctly.

30.3.2.3.2 Provisioning rules

This parameter has the following range: {UNDEF, NONE, AAL1, AAL2, IP}. It will be defaulted to UNDEF at IPL in a Succession load, and NONE if in a non-Succession load. It should be set to one of the other values (not UNDEF) on all upgrades to Succession loads. Although present in non Succession loads, it does not need to be set for these loads. Once an office is already on an SN07 or later load, it does not need to be set again.

A warning will be output on all changes except “UNDEF” to one of the other values that this parameter impacts the automatic creation of the network data on ONP, and should be changed with care.

Once a packet tuple is provisioned in table BEARNETS, changes will not be allowed.

In order to properly set the value, datafill will be required from the dump side from the following tables: MNNODE, MNCKTPAK, SERVRINV, TRKOPTS, LGRPINV.

Explanation of parameter values:

- UNDEF: Default value at IPL. Indicates that the engineering team has not looked at the data.
- NONE: The engineering team has analyzed the from side data and detected that no packet nodes are provisioned. Indications that a packet node existed would include:

— MNNODE: IW SPM, DPM SPM, or MG4K SPMs are provisioned.

— SERVRINV: any tuple provisioned.

— Although one could argue that datafill in tables SERVSINV or LGRPINV also indicates a packet node, it cannot be added without a GWC first.

- AAL1: The from side packet datafill contained one of the following:
  — MNNODE contained an SMG4 (MG4K). Prior to SN07.1, MG4K IP did not exist.
  — MNNODE IW or DPT SPM whose circuit card in table MNCKTPAK is ATM RM.
- AAL2:
  — Cannot be detected based on table datafill. Hopefully the engineering team knows if the PVG is using AAL2 or IP/AAL5.
- IP:
  — MNNODE IW or DPT SPM whose circuit card in table MNCKTPAK is GEM RM.
  — Table LGRPINV contains tuples whose GRPTYPE field is ‘M’ or ‘C’. indicating IAD devices or CICM.
  — The parm should also be set to IP if dumpside was using IP/AAL5. This will not be distinguished as a seperate bearer network.

30.3.2.3.3 Range information

Table 3 Range Information

Minimum	Maximum	Default
{UNDEF, NONE, AAL1, AAL2, IP}	{UNDEF, NONE, AAL1, AAL2, IP}	ENET - if load does not contain the MSH DRU UNDEF - if load contains MSH DRU.

30.3.2.3.4 Activation

Not applicable. This office parameter is only used during the TABXFER of data to a new load. It should be set to the correct fabric PRIOR to the night of ONP, and not changed thereafter. It is not used by call processing.

30.3.2.3.5 Dependencies

The following tables rely on the proper provisioning of this parameter:

- BEARNETS
- NETBRDGE

- NETPATH
- NET2NET
- MNNODE
- TRKOPTS
- SERVRINV

30.3.2.3.6 Consequences

- There are no consequences of incorrect provisioning if there are no packet nodes currently supported at the site. If the parameter is set to a packet fabric in a site that does not have a packet network, then network tuples will automatically be created in tables BEARNETS, NETBRDGE, NETPATH, NET2NET.
- If a packet network was supported, and the parameter is provisioned incorrectly, tuple transfer errors could occur in the following tables:
  - TABXFER data errors in MNNODE, TRKOPTS, SERVRINV.
- For an SN07 to SN07 lab upgrade, where the new tables suddenly appear in the load:
  - The ONP will not detect this scenario as a multinet upgrade. Instead, the network tables will appear in the load first, and the lab primes will be notified of the change. They will be required to go to a website and download/apply a DMOPRO file for the type of lab they are working in that contains the default data. In a following load, the dependent fields will be added to the existing tables, and type reformats will pick up the default datafill.

30.3.2.3.7 Verification

Not applicable.

30.3.2.3.8 Memory requirements

Minimal. Just need to store the fabric type in a protected variable. Does not control the allocation of any additional memory.

30.3.2.3.9 Parameter release history update

New in SN07.

30.4 Upgrade Impact

30.4.1 Dump and Restore

Callp functionality should not be affected over an upgrade from pre-SN07 to post-SN07. In order to maintain this, the new/changed tables need to be datafilled over the ONP. It is required that this upgrade has minimum impact to the customer. Aside from the traditional issues with type specific reformats,

we have the additional issue of determining what the FABRIC type was on the from side, in order to properly create default tuples in the new network tables. Since call processing will start depending on this data to make inter-network connections, it is vital that this data is correct after the transfer is ONP.

Given the importance of a proper transfer, the need for user input, and the complexity of the data involved, the design team held a meeting with the upgrade team. This chosen alternative was suggested during this meeting, and was unanimously agreed upon by all who were present.

Once the data transfer is complete, the goal is to have the correct network representation for the currently configured networks, such that only new network information is required for when the customer wishes to add additional networks.

The ONP strategy must handle the following information:

30.4.1.1 Office Parameters

- OFCOPT::NETWORK_ACTIVE - If ENET, convert to EXTENET, and ensure that appropriate datafill is created to handle the existing networks.
- OFCVAR::MULTINET_DISPLAY_ACTIVE - Ensure the new office parameter is defaulted to ‘N’.
- OFCSTD::PRE_SN07_DUMPSIDE_PACKET_FABRIC: the new office parameter *must be set by the upgrade engineering team* to indicate the default packet fabric on the from side network. This is set in a flat file that is applied after the office parameters have been transferred and before the tables are transferred. The engineering team is responsible for setting the correct values, and the application team is responsible for applying the changes at the proper point. Note that this is simply a new parameter included in the existing office parameter process. No changes are required to the process. This parameter applies only to alternative 1.

30.4.1.2 ONP Creation of Default Network Tuples

Tuples will be created automatically during the TABXFER via post data move procedures for the following tables. For more information see “New Network Tables - initial datafill” on page 2769.

- BEARNETS
  - — Create a NET 0 tuple representing the ENET if ENET is present.
  - — Create an appropriate NET 1 tuple representing the existing packet network. The FABRIC should be set to either AAL1, AAL2, or IP as appropriate.
- CLLI
  - — Create the appropriate CLLI used as the index to table NETBRDGE.

- NETBRDGE
  - — If there is both an ENET and a packet network defined, a bridge pool will be automatically created in table NETBRDGE for it.
- NETPATH
  - — Path 0 will be created as $. This is the nilpath, indicating that 2 networks can be interconnected without a bridge.
  - — If there are two networks defined, create a path using the bridge pool from NETBRDGE, assuming that bridges exist and that the bridgepool can connect them.
- NET2NET
  - — For each network in table BEARNETS, create a tuple in NET2NET.
  - — If there are multiple networks (both an ENET and a packet network), assume that both the ENET and the packet network can be connected to the other using the path index containing the bridge pool defined in table NETPATH.
  - — Ensure that the NET 1 packet network detected is assigned the PACKET_NETWORK_DEFAULT option.

  Note: It is possible that an upgrade can occur in offices that have both an ENET and a packet network, but no interworking bridge nodes defined. In this case, the default datafill will still be created, but there will be no IW SPM nodes assigned to the bridge pool, so the interconnections defined in table NET2NET will not work. It is assumed that since this is an upgrade from a working office, that translations would prevent such attempts from occuring.

30.4.1.3 Initialization of new fields in existing tables

- MNNODE:
  - — IW SPM: Initialize the new BRDGCLLI field to the single bridge group defined in table NETBRDGE.
  - — DPT SPM: Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the node.
  - — MG4K: Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the node.
- TRKOPTS:
  - — Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the DPT trunk group.
  - — Initialize the new NGSS field, on SIPT trunks, to ‘N’.
- SERVRINV:

— If not a DPT GWC, initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the GWC.

— If this is a DPT GWC, initialize the new BEARNETS field to $.

30.4.1.4 Type reformats on existing tables

- TRKOPTS: Remove DPT trunk groups as an application under the DYNAMIC trunk option, and create a DPT trunk option.
- OFRn, IBNRTn, HNPACONT::RTEREF, FNPACONT::RTEREF:
  — Convert the CND PKT conditional selector to CND FABRIC in all of the applicable routing tables.

30.4.2 Element Management Upgrade

30.5 Data schema (DS) (CM, MIBS, RDB)

30.5.1 New/modified tables, MIBs, or Database Schema

Table 4 New or modified tables

Table/MIB name	NEW/ CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
Core Tables:		
BEARNETS	NEW	NEW
NETBRDGE	NEW	NEW
NETPATH	NEW	NEW
NET2NET	NEW	NEW
MNNODE	Changed	Unchanged
SERVRINV	Changed	Unchanged
SERVSINV	Changed	Unchanged.
TRKOPTS	Changed	Unchanged
MNCKTPAK	n/a	Unchanged
OFRn	Changed	Unchanged
IBNRTn	Changed	Unchanged
HNPACONT:RTEREF	Changed	Unchanged
FNPACONT:RTEREF	Changed	Unchanged

Table 4 New or modified tables

Table/MIB name	NEW/ CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)

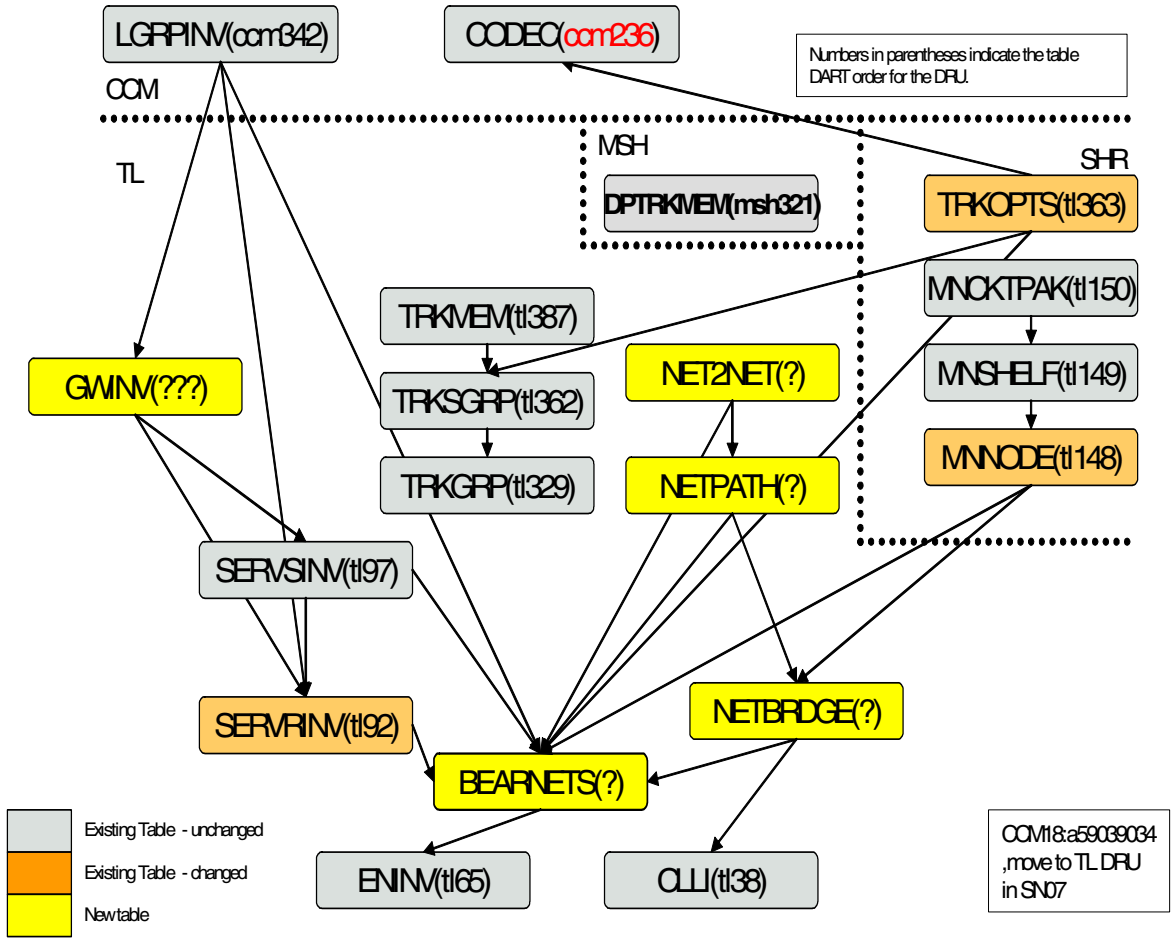
GWCNode	Changed	New
GATEWAYPROFILE	Changed	Old

30.5.2 Table/MIB/Remote Database Schema information

30.5.2.1 Core Table Dependencies



30.5.2.2 Core Table BEARNETS

Bearer networks

30.5.2.2.1 Functional description

On a Succession Call Server, this table identifies the bearer networks supported by the server and the network options that apply to the packet networks.

The overall default packet network for the office is determined by the assignment of the packet_network_default option to a single tuple in the table. If no packet network is detected in the provisioning hierarchy for a packet agent, this default packet network will be used.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

30.5.2.2.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

ENINV

BEARNETS

NETBRDGE, NET2NET, MNNODE, SERVRINV, TRKOPTS

30.5.2.2.3 Size

Table 5 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
BEARNETS	0	8	Memory not allocated unless tuples are provisoned. (Required if NETWORK_ACTIVE = EXTENET).

30.5.2.2.4 Fields/OIDs

The following table lists fields for BEARNETS.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NETIDX	New	No	0-7	Key to the table. Will be displayed as “NET 0” - “NET 7”.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BNETNAME	New	No	Vector of up to 32 characters.	Identifies the name of the bearer network.This will be used in other tables to reference the associated bearer network and its characteristics. Making the name a field of the tuple rather than the index allows the customer to make name changes to the networks defined. The 32 character name of the network must be unique across the table.
DISPLAY	New	No	Vector of up to 4 characters.	Identifies the a 4 character string that will be used to display the bearer network on the MAP screens. We recommend that this be a unique string across the bearer networks, but this will not be implemented in the table control.
FABRIC	New	No	ENET, AAL1, AAL2, IP	Identifies the bearer network fabric type.
OPTIONS	New	Refinements	Vector of {pkt_network_default}	Vector of options against the bearer network.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
pkt_network_default	New	OPTIONS refinement (not a field)	n/a	Indicates that this tuple is the packet bearer network default for the office. Primarily used in initializing dependant tables during an ONP. Restrictions: Only one tuple in the table can have this option.

30.5.2.2.5 Datafill example

The following example shows sample datafill for table BEARNETS.

```
TABLE: BEARNETS
NETIDX NETNAME      DISPLAY FABRIC OPTIONS
-----------------------------------------
NET 0  TDM_ENET     ENET    ENET   $
NET 1  NET_AAL1     ATM     AAL1   (PKT_NETWORK_DEFAULT)$
NET 2  NET_IP       IP      IP     $
NET 3  NET_AAL2     AAL2    AAL2   $
```

30.5.2.2.6 Table release history update

New in SN07.

30.5.2.2.7 Supplementary information

Table BEARNETS, along with tables NETBRDGE, NETPATH, and NET2NET) is required to be provisioned in all Succession sites supporting bridged calls from a TDM network to a packet network.

When using the FINDREF tool on table BEARNETS, it is necessary to encapsulate the key field within single parentheses. For example:

FINDREF BEARNETS ‘NET 1’

On an ONP, this table will be automatically provisioned with both TDM and packet networks tuples where they exist.

— If the from side datafill contained an ENET, the NET 0 tuple from the datafill example will be automatically provisioned.

— If the from side supported packet nodes (as indicated by the setting of the PRE_SN07_DUMPSIDE_NETWORK_FABRIC), the NET 1 tuple will be provisioned and marked as the PKT_NETWORK_DEFAULT.

Table 7 BEARNETS Provisioning Restrctions

Field	Provisioning Restrictions
NETIDX	• Additions of packet networks to the table will not be allowed unless the NETWORK_ACTIVE = EXTENET. • Adding a tuple in table BEARNETS will automatically create a tuple in table NET2NET with $. • Cannot delete a BEARNETS tuple unless the NET2NET entry contains a $ and that tuple is the only reference. It is a counted tuple type.
BNETNAME	• Must be unique in table. • Changes to the BNETNAME will be reflected immediately in logs, OMs, etc. • Should only contain alphanumeric and underscore characters.
DISPLAY	• No restrictions, but recommend that this field be unique in the table.
FABRIC	• Only 1 ENET tuple is allowed. • ENET tuple can only be added if ENET exists. • ENET tuple cannot be deleted if ENET exists. • Adds of UNDEF tuples are not allowed. • Changes are not allowed.
OPTION pkt_network_default	• The first packet network added must be the default. • Only one tuple may have this option assigned. If the option is added to another tuple, it will be removed from the first. • Cannot be added if FABRIC = ENET. • Cannot be deleted from a tuple, except by adding to another tuple. • Can only delete the network default tuple if it is the only remaining packet network tuple.

Refer to the supplementary information for table NET2NET for additional information.

30.5.2.2.8 Translation verification other tools

BEARNETS does not use translation verification tools.

30.5.2.3 Core Table NETBRDGE

Network bridging resources.

30.5.2.3.1 Functional description

This table defines the network bridging resources for interconnecting networks. Bridges provide the ability to connect one network to another without regard to the call type. Bridges typically have two connectivity endpoints, one for each of the networks that it inter-connects.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

30.5.2.3.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

CLLI, BEARNETS

NETBRDGE

NETPATH, NET2NET, MNNODE

30.5.2.3.3 Size

Table 8 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NETBRDGE	0	64	Refer to the EI section after DSUM.

30.5.2.3.4 Fields/OIDs

The following table lists fields/OIDs for NETBRDGE.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BRDGCLLI	New	No	CLLI common_language_name	Identifies the name of the bridge resource group.
BRDGTYPE	New	No	CORE_BRDG	The type of the bridging resource. For SN07, this is limited to core bridges, but could be expanded in the future.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
DISPLAY	New	No	Vector of up to 4 characters	Identifies the a 4 character string that will be used to display the bearer network on the MAP screens. We recommend that this be a unique string across the bearer networks, but this will not be implemented in the table control.
BEARNETS	New	Structure	BNETNAME, BNETNAME	Identifies the two networks that can be bridged with this bridging resource group.

30.5.2.3.5 Datafill example

The following example shows sample datafill for table NETBRDGE.

```
TABLE: NETBRDGE
BRDGCLLI      TYPE         DISPLAY BEARNETS
-----------------------------------------
ENET_TO_AAL1  CORE_BRDG   E-A1    TDM_ENET NET_AAL1
ENET_TO_IP    CORE_BRDG   E-IP    TDM_ENET NET_IP
```

30.5.2.3.6 Table release history update

New in SN07.

30.5.2.3.7 Supplementary information

Table 10 NETBRDGE Provisioning Restrctions

Field	Provisioning Restrictions
BRDGCLLI	• Common_language_name provisioned in table CLLI. • Counted tuple type. Deletions are not allowed if referenced by another table.
BRDGTYPE	• Only allowable value in SN07 is {CORE_BRDG}. • Cannot change.

Table 10 NETBRDGE Provisioning Restrctions

Field	Provisioning Restrictions
DISPLAY	• Recommended, but not enforced, to be unique. • No change restrictions.
BEARNETS	• The two network names provided must be provisioned in table BEARNETS. • The two network names must be different. • Changes to the BEARNETS field is allowed only if the tuple is not referenced by another table.

Since the BRDGCLLI is the key to this table, it cannot be changed through the table control interfaces. BRDGCLLI names can be changed for this table using the CI command RENAMECLLI. The name change will then be reflected in all tables, OM, and logs that reference the particular bridge CLLI.

30.5.2.3.8 Translation verification other tools

NETBRDGE does not use translation verification tools.

30.5.2.4 Core Table NETPATH

Interconnecting network path.

30.5.2.4.1 Functional description

Tuples in this table identify the list of bridging resource groups (the bridge path) that can be used to interconnect two networks. In SN07, two bridges are required to connect an AAL1 agent and an IP agent, so the path consists of a bridge resource from each of those NETBRDGE's.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

30.5.2.4.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

NETBRDGE

NETPATH

NET2NET

30.5.2.4.3 Size

Table 11 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NETPATH	0	256	Refer to the EI section of this document following the DSUM.

30.5.2.4.4 Fields/OIDs

The following table lists fields/OIDs for NETPATH.

Table 12 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PATHIDX	New	New	0 to 255	The key to the table.
NETBRDGE	New	New	Vector of BRDGCLLI	A list of the bridge pools that are required to go from one network to another. Bridge CLLIs must be listed in the order of the traversal required, without regard to the direction of the traversal (forward or backward).

30.5.2.4.5 Datafill example

The following example shows sample datafill for table NETPATH

```
TABLE: NETPATH
PATHIDX       NETBRDGE
----------------------------------------
0              $
1            (ENET_TO_AAL1)  $
2            (ENET_TO_IP)    $
3            (ENET_TO_AAL1), (ENET_TO_IP)$
4            (AAL1_TO_IP)    $

NOTE: PATHIDX 4 is not supported in SN07.
```

30.5.2.4.6 Table release history update

New table in SN07.

30.5.2.4.7 Supplementary information

The following tuple will be created automatically for all Succession offices:

0 $

This will indicate the “nil path” that can be used in table NET2NET to indicate that two networks can be directed connected without the use of bridging resources.

Table 13 NETPATH Provisioning Restrctions

Field	Provisioning Restrictions
PATHIDX	• Counted tuple. Deletions not allowed if refenced by another table.
NETBRDGE	• The same bridge pool should not be in the list more than once. • Limit of 2 bridge pools in SN07. • Order of the bridge pools should be maintained. • Changes are allowed, and take effect immediately for all NET2NET tuples provisioned with this path. • The bridge pools must be listed in the order they will be traversed to go from one network to the other. The pools can be listed in either the forward or reverse direction.

Note: Allowing the NETBRDGE field to be changed allows this user to deload a particular IW SPM by creating another PATH with another NETBRDGE pool of the same type and assigning the desired SPMs to it. The CI tool IWBMCI:DBL can be used to validate when the deloaded SPM is no longer in use.

30.5.2.4.8 Translation verification other tools

NETPATH does not use translation verification tools.

30.5.2.5 Core Table NET2NET

Network interconnection.

30.5.2.5.1 Functional description

Tuples in this table define the allowable interconnections between networks, and the network path used to interconnect them.

Call processing will assume that any agents on the same network can be connected with one another.

Once the normal translations have occurred, a request will be made to connectivity to connect the agents.

- If the agents are on the same network, the connection request will proceed.
- If the agents are provisioned on seperate networks, connectivity will check table NET2NET to see if the connection is allowed.
  - — If the two networks are provisioned as connecting in the table, the NETPATH and associated bridge resources will be retrieved and the connection request will continue. If there are no idle members in the bridge groups, the connection request will then fail.
  - — If the two networks are not provisioned as connecting in the table, the connection request will fail immediately.
- In SN07, no mechansim is provided for choosing an alternate bridging path if the bridging resources are unavailable in the provisioned path.

30.5.2.5.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS, NETPATH

NET2NET

30.5.2.5.3 Size

Table 14 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NET2NET	0	7	Allocated upon first tuple entry.

30.5.2.5.4 Fields/OIDs

The following table lists fields/OIDs for NET2NET.

Each CONNNETS vector entry consists of:

- NET2NET - the interconnecting network
- NETPATH - reference to tuple in table NETPATH definining the path by which the two networks interconnect.

Table 15 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BNETNAME	New	No	BNETNAME defined in table BEARNETS	Identifies the name of the bearer network. Must be datafilled in Table BEARNETS first.
CONNNETS	New	No	Vector of connecting_network	Identifies a list of other bearer networks that are allowed to interconnect to this bearer network.
NET2NET	New	Field of connecting_network	BNETNAME provisioned in table BEARNETS	The interworking bearer network. Must be provisioned in Table BEARNETS first.
NETPATH	New	Field of connecting_network	Key to table NETPATH 0 - 255	Index into Table NETPATH.

30.5.2.5.5 Datafill example

The following example shows sample datafill for table NET2NET.

Figure 7 ENET/AAL1/IP NET2NET DatafillI

```
TABLE BEARNETS

NET_IPE         (NET_IP 0) $
```

To interconnect two different networks on the same fabric, define a NETPATH that requires no bridges, and put entries in NET2NET using that path.

30.5.2.5.6 Table release history update

New in SN07.

30.5.2.5.7 Supplementary information

- NET2NET tuples will automatically be created with CONNNETS = $ whenever new networks are added to table BEARNETS.
- On an ONP, the interconnecting networks should be provisioned with the appropriate bridges automatically.

Table 16 NET2NET Provisioning Restrctions

Field	Provisioning Restrictions
BNETNAME	• Deletions are not allowed from this table. • User may change the tuple to the point that CONNNETS = $. Tuple deletions will be handled via table BEARNETS, and allowed only if CONNNETS = $.
CONNNETS	• Networks that connect only with themselves will have CONNNETS = $. All provisioned networks in table BEARNETS will be represented in this table. • The order of the entries is used during trunk member selection as the network preference order for trunk members when a member that is on the originating agent's network is not avaiable. The most efficient path is recommended to be provisioned first. • Adding a connecting network to a tuple should also add the connection to the tuple for the other network. This addition will be added to the end of the CONNNETS list of that tuple. • Deleting a connecting network from a tuple will also delete the interconnection from the connecting network's tuple. • Changes to NET2NET tuples will take effect immediately upon the change for all new connection requests. Used should be warned when removing an existing interconnection ability.
CONNNETS: NET2NET	• Valid BNETNAME from table BEARNETS. • Should not be the same as the key for the tuple. It is understood that a network can connect to itself. • A given network should appear in the connecting network list only once. • Changing the order will change the order of trunk member selection based on the network of the originating agent.
CONNNETS: NETPATH	• A valid PATHIDX from table NETPATH. • Path changes take effect immediately for new connection requests. Existing connections will continue with the old path until the connection has been released. • If NETPATH = 0 is specified, verify that the network FABRIC for both the BNETNAME network and the NET2NET network are on the same fabric. • Verify that once the starting end of the path is chosen based on the BNETNAME network, the path can then be traced in the appropriate direction to reach the CONNNETS network.

30.5.2.5.8 Translation verification other tools

NET2NET does not use translation verification tools.

30.5.2.6 Core Table MNNODE

Maintenance node table used to provision Spectrum nodes.

30.5.2.6.1 Functional description

Unchanged.

30.5.2.6.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

All existing dependencies, plus BEARNETS, NETBRDGE

MNNODE

All existing dependant tables.

30.5.2.6.3 Size

Table 17 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNNODE	Unchanged	Unchanged	Refer to the EI section of this document after DSUM complete.

30.5.2.6.4 Fields/OIDs

The following table lists fields/OIDs for MNNODE.

The following nodes provisioned in table MNNODE are impacted by these changes:

- Interworking bridges (NODEKEY=IW, DPT_INFO = BRDG_ONLY)
- DPT SPM (NODEKEY = IW, DPT_INFO = DPT_ONLY)
- MG4K (NODEKEY = SMG4)

Each of the applicable node type change is broken into it's own table below.

Table 18 Table field descriptions for IW Bridges

```

30.5.2.6.6 Table release history update

In SN07, The following mandatory fields were added:

- BEARNETS field added to IW DPT_ONLY and SMG4 nodes to indicate the bearer network associated with the node.
- BRDGCLLI field added to IW BRDG_ONLY nodes to indicate the list of bridge groups the particular SPM node contributes to.

30.5.2.6.7 Supplementary information

- As of SN07, in order for interworking bridges to be utilized, the BRDGCLLI for the IW must be included in a NETPATH used to interconnect two networks in table BEARNETS.
- Terminations to DPT will dynamically match the network of the DPT SPM to the network provsioned against the terminating trunk group in table TRKOPTS to properly select a DPT "terminal" on the correct network.

Table 21 MNNODE IW bridg_only Provisioning Restrctions

Field	Provisioning Restrictions
BRDGCLLI	• Must be provisioned as a single entry in SN07. Cannot have either a nil vector or more than one provisioned. • Ensure the CLLI entered is a bridge clli. • Do not allow BRDGCLLI's where the NETBRDGE packet network fabric is not IP or AAL1. AAL2 is currently not supported by SPM nodes. • Changes are allowed only if the IW is OOS (MANB or OFFL). • On changes, compare the packet fabrics for the networks bridged by the BRDGCLLI. If the fabrics are different, then this means the network cards must be changed as well. Network cards should be removed prior to changing the BRDGCLLI, so a check is made that no network cards are provisioned if the packet fabrics that are bridged are different.

Table 22 MNNODE IW dpt_only Provisioning Restrctions

Field	Provisioning Restrictions
BEARNETS - vector of {BNETNAME, DEFAULT}	• Must have a single entry and it must be marked as the default. • The network entered must be provisioned in table BEARNETS. • The network entered must be a packet network with an IP or AAL1 fabric. • For changes, the SPM must be OFFL and all DPT carriers must be INB. (from DPTTRM, pos spm no, bsy, bsy inb). • If the network fabric is changing, then the network cards must be removed before the change is allowed.

Table 23 MNNODE SMG4 Provisioning Restrctions

Field	Provisioning Restrictions
BEARNETS	• Must have a single entry and it must be marked as the default. • The network entered must be provisioned in table BEARNETS. • The network entered must be a packet network. • For changes, the SPM must be OFFL and all carriers must be INB. If DPT, then from DPTTRM, post spm no, bsy, bsy inb. If not DPT, then from TTP, post d <pm no>, bsy all, bsy inb all. • If the network fabric is changing, then the network cards must be removed before the change is allowed.

Generally, if the packet fabric for the IW is changing (whether a bridge or trunk members), then the following process must be followed to change the BEARNETS or BRDGCLLI provisioned:

- OFFL the SPM and bsy INB all carriers.
- Remove the network cards via table MNCKTPAK.
- Change the MNNODE BEARNETS or BRDGCLLI information.
- Add the correct circuit packs to MNCKTPAK (will be verified against the MNNODE datafill).
- RTS the SPM node.

30.5.2.6.8 Translation verification other tools

MNNODE does not use translation verification tools.

30.5.2.7 Core Table MNCKTPAK

Management Network Node Table

No sematice changes have been made to this table.

Additional validation checking has been added for when the GWM RM and ATM RM card provisioning, to ensure that the network implies by the card agrees with the bearer network provisioned against the node.

30.5.2.7.1 Supplementary information

Table 24 MNCKTPAK Provisioning Restrctions

Field	Provisioning Restrictions
CPKINFO - GEM card	• If SPM is IW brdg_only, ensure that at least one IP network is supported by the BRDGCLLI assigned. • If the SPM is either IW dpt_only or SMG4 (MG4K), ensure that the BEARNETS fabric provisioned in table MNNODE is IP.
CPKINFO - ATM card	• If SPM is IW brdg_only, ensure that at least one AAL1 network is supported by the BRDGCLLI assigned. • If the SPM is either IW dpt_only or SMG4 (MG4K), ensure that the BEARNETS fabric provisioned in table MNNODE is AAL1.

30.5.2.8 Core Table SERVRINV

Server Inventory

30.5.2.8.1 Functional description

A new field, BEARNETS is added to the SERVRINV table to indicate the bearer networks of the packet nodes it controls. For SN07, there will be a limit of one bearer network per gateway controller, and it will be the default.

In addition, DPT GWCs should not be provisioned with a bearer network, as it is a signalling only network element.

30.5.2.8.2 Usage sequence and implications (CM Only)

The following provisioning dependencies is added :

BEARNETS

SERVRINV

30.5.2.8.3 Size

Table 25 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVRINV	Unchanged	Unchanged	tbd

30.5.2.8.4 Fields/OIDs

The following table lists fields/OIDs for SERVRINV.

Table 26 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SERVRNAME	Unchanged	Unchanged	Unchanged	Unchanged
SERVRADDR	Unchanged	Unchanged	Unchanged	Unchanged

SERVROPTS	Unchanged	Unchanged	Unchanged	Unchanged

30.5.2.8.5 Datafill example

The following example shows sample datafill for table SERVRINV.

Figure 13 Example Datafill

```
TABLE: MNNODE
SERVRNAME SERVRADDR SERVREXEC SERVRTONE BEARNETS SERVROPTS
-----------------------------------------------------------
GWC 0     IP  47 192 48 24 (POTS POTSEX)  (KEYSET  KSETEX)  $
NORTHAA (PACKET_DEFAULT Y) $ $
```

30.5.2.8.6 Table release history update

Added BEARNETS field in SN07.

30.5.2.8.7 Supplementary information

- SERVRINV is the bearer network provisioning point for the following nodes, if the BEARNETS field contains a default network. If the GWC does not have a BEARNETS entry, the office default (the tuple in table BEARNETS with the default_packet_network option assigned) will be taken as the bearer network for the following agents.
  - — IP trunking gateways (PVG, Audiocodes)
  - — Logical groups
  - — ABI lines and trunks
  - — H.323 & Media Call Server 5200
  - — UAS (for CALEA)
- DPT GWCs do not have a bearer network provisioning against them, as the DPT TIDs against the GWC do not have associated hardware. If a network is provisioned against DPT GWC, it will have no effect on call processing. DPT trunk groups get their bearer network from table TRKOPTS.
- It is assumed that SERVRINV will be provisioned via SESM, which will ensure that a default bearer network is added for non-DPT GWCs, and that no bearer network will be added to DPT GWCs. A warning message is output to the user when provisioning changes are made to SERVRINV warning of potential data corruption. This warning message already exists.

Table 27 SERVRINV Provisioning Restrctions

Field	Provisioning Restrictions
BEARNETS - vector of {BNETNAME, DEFAULT{	• BEARNETS does not apply if the GWC is a DPT GWC. • If a nil entry is added for a non-DPT GWC, the bearere network will be taken from the office default provisoned in table BEARNETS as the pkt_default_network. • Entry must either be assigned a “$” or a single BNETNAME marked as the default. • Changes require that the GWC be OOS (MANB or OFFL). • Non-DPT trunks must be BSY INB prior to change. • Allow changes to a non-nil BEARNETS field only if not DPT in SERVSINV. Allow deletion of BEARNETS entry only if DPT.

30.5.2.8.8 Translation verification other tools

SERVRINV does not use translation verification tools.

30.5.2.9 Core Table SERVSINV

Server Subtending Inventory

Table unchanged by this activity. Only additional provsioning consistency checks are added for use during an ONP.

30.5.2.9.1 Supplementary information

DPT terminal groups are signalling only, and do not have any physical hardware associated. The DPT trunk group, via provisioning in table TRKOPTS, contains the bearer network information, and DPT “terminals” can be associated with any bearer network provisioned against the trunk group, as long as the signalling type matches.

When transferring table data during an ONP for table SERVRINV, it is not known if the GWC is a DPT GWC, so the BEARNETS will be automatically set to the bearer network default. Therefore, the write procedure for table SERVSINV will be hooked to check whether or not a multinet upgrade is in progress for DPT GWCs (SIPT or BICC) and if it is, it will delete the BEARNETS entry for it’s host GWC.

30.5.2.10 Core Table TRKOPTS

Trunk Options.

30.5.2.10.1 Functional description

Unchanged.

30.5.2.10.2 Usage sequence and implications (CM Only)

The following dependency is added to the existing provisioning order:

BEARNETS

TRKOPTS

30.5.2.10.3 Size

Table 28 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TRKOPTS	Unchanged	Unchanged	Refer to EI section after DSUM.

30.5.2.10.4 Fields/OIDs

The following table lists fields/OIDs for TRKOPTS.

```

NGSS	**NEW**	**Subfield of SIPT protocol**	**{N,Y}**	**Identifies if the new NGSS SIP architecture is being used**
INTER_DOMAIN	**New**	**Subfield of NGSS 'Y' selector**	**N, Y**	**Refer to activity a89007980.** **Indicates if the SIP-T trunks are inter-domain or intra-domain (between Nortel Networks equipment in the same addressable range).**
DEST_MGCNAME	**New**	**Subfield of NGSS 'N' selector**	**MGCINV_KEY**	**Enter the Media Gateway Controller (MGC) name from table MGCINV.**

Table 29 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
TPROFILE	New	Subfield of NGSS 'N' selector	TPROFILE _NAME	Enter the telephony profile name from table TELEPROF.
ALT_HOST_MGCNAME	New	Subfield of NGSS 'N' selector	Vector of up to 32 chars.	Enter an alternative Media Gateway Controller (MGC) name.
INTER_DOMAIN	New	Subfield of NGSS 'N' selector	N, Y	Refer to activity a89007980. Indicates if the SIP-T trunks are inter-domain or intra-domain (between Nortel Networks equipment in the same addressable range).
PROTOCOL	New	Subfiled of DPT option	BICC	Subfields when protocol = BICC (old ISUPPLUS)
CAPABILITY_SET	New	Subfield of BICC protocol	{1 to 2}	This represents the BICC capability set (CS). If the remote switch (other side of the DPT trunk) is unable to supoort CS2 then datafill the CAPABILITY_SET as 1. If the remote switch can support CS2 then datafill CAPABILITY_SET as 2.

30.5.2.10.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

Figure 14 Example Datafill

```
TABLE: TRKOPTS
OPTKEY          OPTINFO
----------------------------------------
DPTTRK DPT      DPT BICC NET_AAL1 1 (100 200) (300 400) $ 200
SIPTRK DPT      DPT SIPT NET_IP N MGC2 PROF MGCTWO Y
OCTRK  DYNAMIC  DYNAMIC ISUP IP IP OC $
```

30.5.2.10.6 Table release history update

- DPT is removed from APPLICATION field under the DYNAMIC option.
- DPT is added as a new OPTION.
- NGSS is added as a new selector field under the SIPT protocol

30.5.2.10.7 Supplementary information

The signaling network field is not required for DPT. The signaling protocol implies the signaling network: BICC implies SS7, and SIPT implies IP.

The bearer_fabric provisioned for DPT in table TRKOPTS indicates the bearer fabric for a specific DPT trunk group, and a given DPT trunk group can only have one bearer fabric.

GWC DPT trunk “agents” (provisioned in table SERVSINV) will be associated with the DPT trunk group during call processing based on the signaling protocol only. Bearer fabric is not provisioned against DPT GWCs in table SERVRINV.

SPM DPT trunk “agents” (provisioned in table MNNODE) will be associated with the DPT trunk group during call processing based on both the signaling protocol and the bearer network provisioned in table MNNODE.

The new NGSS (New Generation Session Server) selector identifies the SIP architecture used by the trunk group. When the new NGSS architecture is selected only INTER_DOMAIN data is necessary. However, when NGSS is not selected, the fields previously under the Dynamic tuple are required.

Table 30 TRKOPTS Provisioning Restrctions

Field	Provisioning Restrictions
BEARNETS	• BNETNAME must be provisioned in table BEARNETS. • Ensure compatibility of the signalling type with the fabric type of the bearer network. • Changes are allowed without restriction and will take effect immediately. Trunk members that are currently call processing will retain their existing network until the call is terminated.

Table 30 TRKOPTS Provisioning Restrctions

Field	Provisioning Restrictions
PROTOCOL	• Changes to the protocol field are not allowed for DPT.

30.5.2.10.8 Translation verification other tools

The following example shows the output from <ToolName> when it is used to verify <abbreviated name of table>.

<abbreviated name of table> does not use translation verification tools.

30.5.2.11 Core Tables OFRT, OFR2, OFR3, OFR4

Office Routing Tables

Same change applies to each

30.5.2.11.1 Functional description

Unchanged.

New CND/NOT selector condition of BEARNET, to allow conditional routing based on the originator's bearer network.

Changed the name of the PKT conditional selector to FABRIC, and increased the allowable FABRIC range from {ENET} to {ENET, AAL1, AAL2, IP}.

30.5.2.11.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

OFRT

30.5.2.11.3 Size

Not Changed

Table 31 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
OFRT	unchanged	unchanged	unchanged
OFR2	unchanged	unchanged	unchanged
OFR3	unchanged	unchanged	unchanged
OFR4	unchanged	unchanged	unchanged

30.5.2.11.4 Fields/OIDs

The following table lists fields/OIDs for OFRT, OFR2, OFR3, OFR4.

If CND/NOT condition is FABRIC, will be prompted for FABSEL.

If CND/NOT condition is BEARNET, will be prompted for NETSEL.

Table 32 OFRn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RTE	Unchanged			
RTESEL	Unchanged			
CNDSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,~~**PKT**~~, TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	Conditional Selector based on Bearer FABRIC and Network.
NOTSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,~~**PKT**~~, TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	NOT Selector based on Bearer FABRIC and Network
FABSEL	Changed.	No	ENET, AAL1, AAL2, IP	Fabrics defined in table BEARNETS

Table 32 OFRn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NETSEL	NEW	No	Network Name	NTWKNAME values provisioned in Table BEARNETS

30.5.2.11.5 Datafill example

The following examples shows sample datafill for table OFRT.

Figure 15 CND BEARNET

```
TABLE OFRT
POS 99
100 (CND BEARNET DFLTTDM ST 901)
(CND BEARNET DFLTIP ST 902)
(CND BEARNET DFLTATM ST 903) $ $
```

Figure 16 CND FABRIC Selector Criteria ENET, IP and ATM

```
TABLE OFRT
POS 100
100 (CND FABRIC ENET ST 901)
   (CND FABRIC IP ST 902)
   (CND FABRIC AAL1 ST 903)
   (CND FABRIC AAL2 ST 904) $ $
```

30.5.2.11.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

30.5.2.11.7 Supplementary information

The above mentioned changes are applicable to all the routing tables OFR2, OFR3, OFR4, IBNRTE, IBNRT2, IBNRT3, IBNRT4 and HNPACONT$RTEREF that have CND and NOT bound in as the route selector.

The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

30.5.2.11.8 Translation verification other tools

The following example shows the output from Traver when it is used to verify OFRT.

30.5.2.12 Core Tables IBNRTn (IBNRTE, IBNRT2, IBNRT3, IBNRT4)

IBN Routing Table

30.5.2.12.1 Functional description

Unchanged

30.5.2.12.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

IBNRTE, IBNRT2, IBNRT3, IBNRT4

30.5.2.12.3 Size

Table 33 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
IBNRTE	Unchanged	Unchanged	Unchanged
IBNRT2	Unchanged	Unchanged	Unchanged
IBNRT3	Unchanged	Unchanged	Unchanged
IBNRT4	Unchanged	Unchanged	Unchanged

30.5.2.12.4 Fields/OIDs

The following table lists fields/OIDs for OFRT, OFR2, OFR3, OFR4.

If CND/NOT condition is FABRIC, will be prompted for PKTSEL.

If CND/NOT condition is BEARNET, will be prompted for NETSEL.

Table 34 IBNRTn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RTE	Unchanged			
RTESEL	Unchanged			

Table 34 IBNRTn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CNDSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,**~~PKT~~,** TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	Conditional Selector based on Bearer FABRIC and Network.
NOTSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,**~~PKT~~**, TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	NOT Selector based on Bearer FABRIC and Network
PKTSEL	Changed.	No	ENET, AAL1, AAL2, IP	Fabrics defined in table BEARNETS
NETSEL	NEW	No	Network Name	NTWKNAME values provisioned in Table BEARNETS

30.5.2.12.5 Datafill example

Similar to the above examples.

30.5.2.12.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

30.5.2.12.7 Supplementary information

The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

30.5.2.12.8 Translation verification other tools

Refer to TRAVER information under table OFRT.

30.5.2.13 Core Tables HNPACONT::RTEREF and FNPACONT::RTEREF

Subtable Route Reference from the Home Numbering Plan Area

Subtable Route Reference from the Foreign Numbering Plan Area

Changes are the same as for OFRn and IBNRTn.

30.5.2.13.1 Functional description

Refer to OFRn.

30.5.2.13.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

HNPACONT::RTEREF & FNPACONT::RTEREF (order between these is unchanged)

30.5.2.13.3 Size

Table 35 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
HNPACONT::RTEREF	Unchanged	Unchanged	Unchanged
FNPACONT::RTEREF	Unchanged	Unchanged	Unchanged

30.5.2.13.4 Fields/OIDs

Same changes as table OFRn.

30.5.2.13.5 Datafill example

Refer to table OFRn.

30.5.2.13.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

30.5.2.13.7 Supplementary information

The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

30.5.2.13.8 Translation verification other tools

Refer to OFRn.

30.5.2.14 GWC_NETWORK_CODEC_PROFILE

30.5.2.14.1 Functional description

This new table is used to store network codec profiles that created by customer. The profiles will be used when customer add GWC node. Please refer to DID document for details.

30.5.2.14.2 Fields

The following table lists fields of this table.

Table 36 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
profilename	New	VARCHAR2 (32)	The name of the profile. It is not allow to be NULL. This field is the primary key of this table.
bearerpath	New	NUMBER	Indicates the bearer network fabric type. Refer to table “BEARERPATH_MAP“. The default value is “0”.
defaultcodec	New	NUMBER	Indicate the default codec. Refer to table “CODEC_MAP“. The default value is “0”.
preferredcodec	New	NUMBER	Indicate the preferred codec. Refer to table “CODEC_MAP“. The default value is “0”.
alternativecodec	New	NUMBER	Indicate the alternative codec. Refer to table “CODEC_MAP“. The default value is “0”.
packetizationinteger	New	NUMBER	Indicate the packetization rate. Refer to table “PACKETIZATION_MAP“. The default value is “0”.
t38	New	NUMBER(1)	Indicate whether the T38 setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.

Field	New/ Changed	Entry	Explanation and action
rfc2833	New	NUMBER(1)	Indicate whether the RFC2833 setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.
comfortnoise	New	NUMBER(1)	Indicate whether the comfort noise setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.
bearertypedefault	New	CHAR(1)	Indicate whether this profile is a default profile. Available values are “Y” and “N”. Char “Y” indicates this profile is default profile for this bearer network type, char “N” indicates this profile is not the default one. This field can not be NULL. The default value is “N”. Please note that there will be up to 1 default profile every bearer network fabric type.
networkdefault	New	CHAR(1)	Indicate whether this profile is network default profile. Available values are “Y” and “N”. Char “Y” indicates this profile is the default profile in network, char “N” indicates this profile is not the default one. This field can not be NULL. The default value is “N”. Please note that there will be up to 1 network default profile totally.

30.5.2.15 GWCPROFILE

30.5.2.15.1 Functional description

This table is used to store attributes of Gateway Controller profile. One new field will be added into this table, which is used to indicate whether network instance is needed to be associated to this GWC or not.

30.5.2.15.2 Fields

The following table lists the new field of this table.

Table 37 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
BEARER_INSTANCE_REQUIRED	New	CHAR(1)	Indicate whether network instance is needed to be associated to this GWC or not. Available values are “Y” and “N”. Char “Y” indicates need, char “N” indicates not need. The default value is “Y”. This field can not be NULL.

30.5.2.16 GATEWAYPROFILE

30.5.2.16.1 Functional description

This table is used to store attributes of Gateway profile. One new field will be added into this table, which is used to enhance the fabric type check when customer associate gateway to GWC node. Please refer to DID document for details.

30.5.2.16.2 Fields

The following table lists fields of this table.

Table 38 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
BEARER_FABRIC_RESTRICTION_LIST	New	Embedded table of "RestrictList_NT" type	The Name of this field is: Bearer fabric restriction list. This field can be NULL. This field would list the bearer fabrics to which the gateway is restricted. In most cases, this list will be empty and there will be no restriction. But for some special gateway (e.g. MG9000IP and ATM versions), the values would be provided.

30.6 Service Orders (SO) (CM & SESM)

Not applicable.

30.7 Software optionality control (SOC)

Not applicable.

30.8 Element Management

Prior to SN07, the SESM server could support only one bearer network fabric type (IP/AAL1/AAL2) at one time. As of SN07, each GWC will be associated with a beaer network instance, which defines the associated bearer network fabric type. This information will be provided by the customer as they add the GWC through the GWC-EM. In addition to the beaer fabric instance, GWC-EM will allow the cutomer to define multiple network codec "profiles" in the system and will allow the customer to select the desired profile as they add the GWC to the network.

30.8.1 New/modified GUIs

Table 39 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
GWC-EM	Changed

30.8.2 GUI information

30.8.2.1 GWC-EM GUI

Gateway Controller Element Manager Graphical User Interface

30.8.2.1.1 Functional description

The GWC-EM database will be changed to include a new MIB table: GET_NETWORK_CODEC_PROFILE.

The following functionality is added to the GWC-EM:

1. Support the provisioning of multiple network codec profiles.
   - — Display network codec profile on GWC-EM GUI.
   - — Add network codec profile from GWC-EM GUI.
   - — Delete network codec profile from GWC-EM GUI.
   - — Change network codec profile from GWC-EM GUI.
2. Support the specification of a bearer network fabric instance and a network codec profile for each GWC.
   - — Display bearer network fabric instance and network codec profile of each GWC on GWC-EM GUI.
   - — Associate bearer network fabric instance and network codec profile with one GWC when adding GWC node from GWC-EM GUI.
   - — Change the associated network codec profile of one GWC node from GWC-EM GUI.

30.8.2.1.2 GUI usage and implications

GUIs must be used in the following sequence:

Current datafill order unchanged.

30.8.2.1.3 GUI size

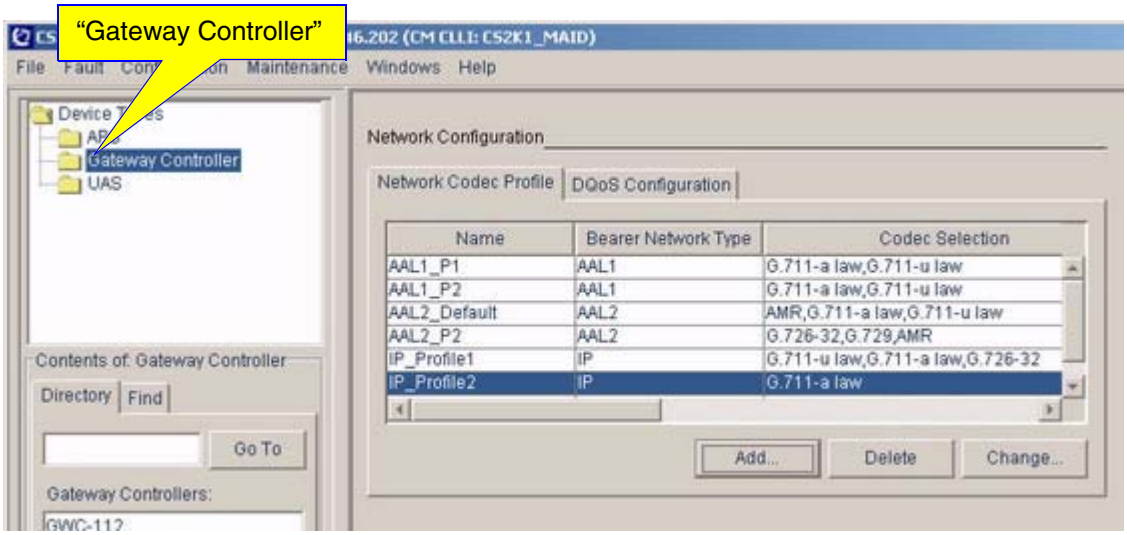
Table 40 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
GWC-EM	Unchanged	Unchanged	Unchanged

30.8.2.1.4 Usage Example: Display network codec profile

When customer click the “Gateway Controller” type from the device type tree at the left side, all network codec profiles will be displayed on the right side. (Please refer to “Figure 13 Network codec profile display panel”)

Figure 1 Network codec profile display panel



All existing codec profiles will be displayed in a table, each profile includes following parameters:

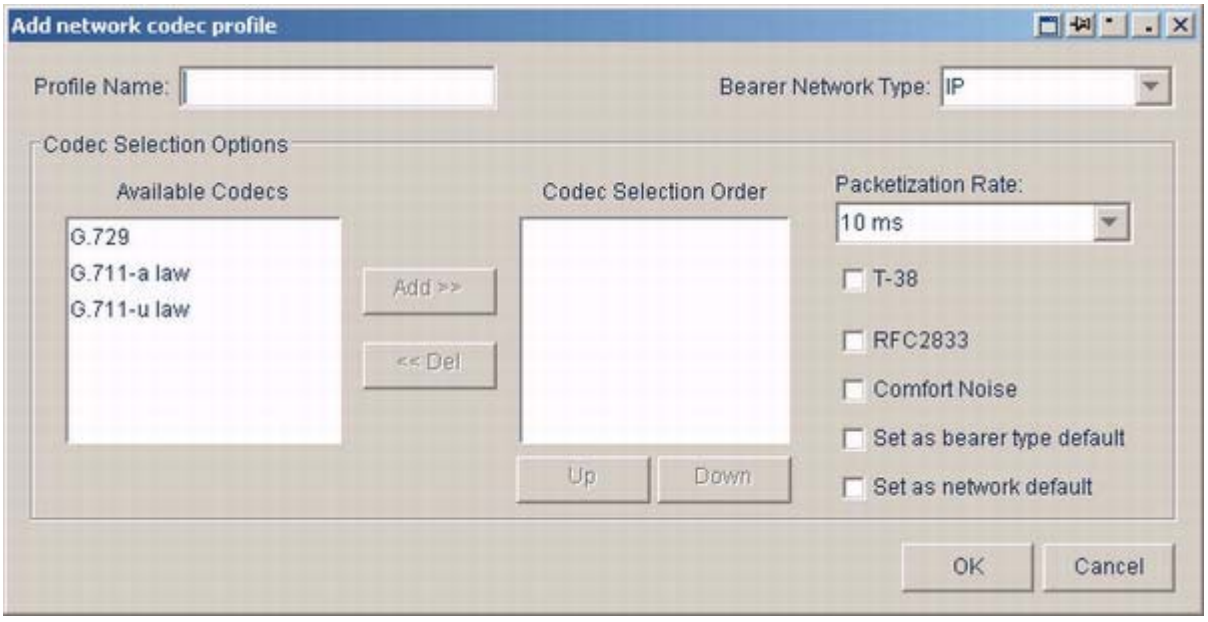
Table 1 Parameters of network codec profile

Parameter name	Description	Notes
Name	The name of the profile.	
Bearer Network Type	Indicates the bearer network fabric type.	
Codec Selection	Indicate the codecs used in this profile.	
Packetization rate	Indicate the packetization rate.	For IP bearer type only.
T-38	Indicate whether the T38 setting is enabled.	For IP bearer type only.
RFC2833	Indicate whether the RFC2833 setting is enabled.	For IP bearer type only.
Comfort noise	Indicate whether the comfort noise setting is enabled.	For IP bearer type only.
Default Profile	Indicate whether this profile is a default profile. Please note that there will be up to 1 default profile every bear network fabric type.	

30.8.2.1.5 Usage Example: Add network codec profile

Customer will be able to add one new network codec profile just by clicking the “Add” button, then a dialog “Add network codec profile” will be popped up. (Please refer to “Figure 14 Add network codec profile dialog”)

Figure 2 Add network codec profile dialog

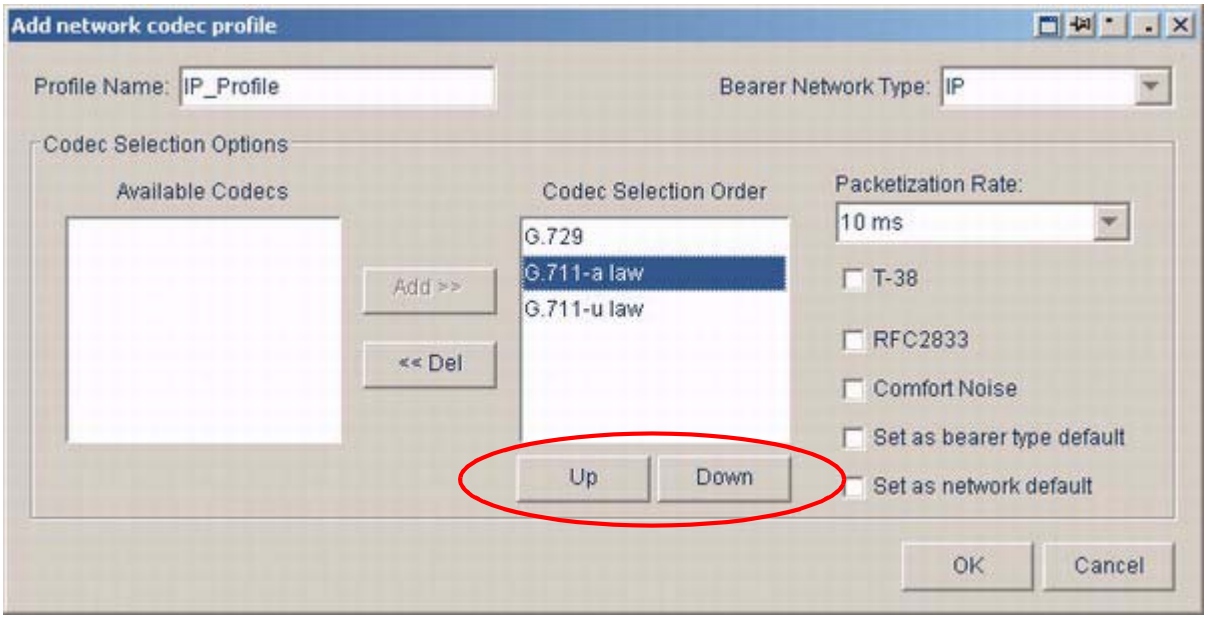


When customer select a bearer network type from the droplist box, the corresponding available codecs will be displayed below in the left list box. The available codec list may be different for different bearer network type.

Please note that the codec selecting is different from SN06 version. Customer won't select different codec for “Compression codec”, “Default codec” and “Alternative Codec” one by one. The available codecs will be listed at left side, customer should be able to select them just by highlighting codec item and clicking the “Add >>” button. Then the selected codec will be added into codec selection. Contrarily, customer could delete some codec from the selection by highlighting the codec item and clicking the button “<< Del”.

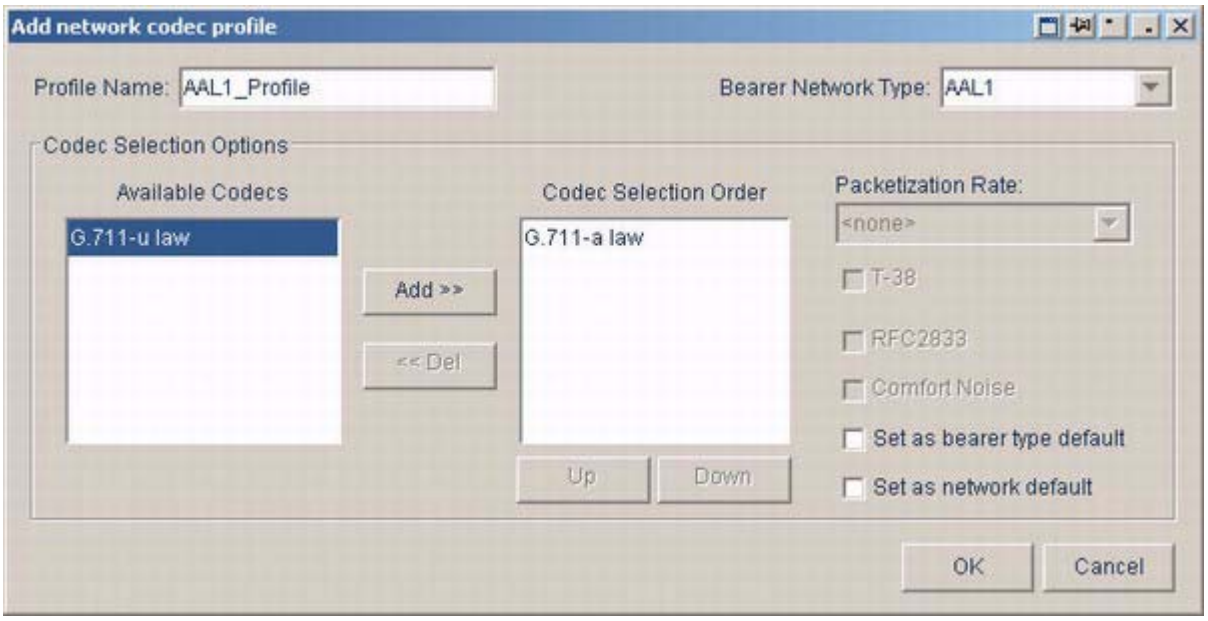
In the codec selection, the order of the codec determines how the device will treat them. For example, the first one will be mapped to “Compression codec”, the second one will be mapped to “Default Codec”, and the last one will be mapped to “Alternative Codec”. Additional, customer could change the order of codecs by highlighting the codec item and clicking the “Up” and “Down” buttons.

Figure 3 Change the order of codecs in the selection



Please note that parameters “Packetization Rate” and LCO options (T38, RFC2833, and Comfort Noise) are settings for IP bearer type only. If customer select “AAL1” or “AAL2” as the bearer network fabric type, these settings will be disabled.

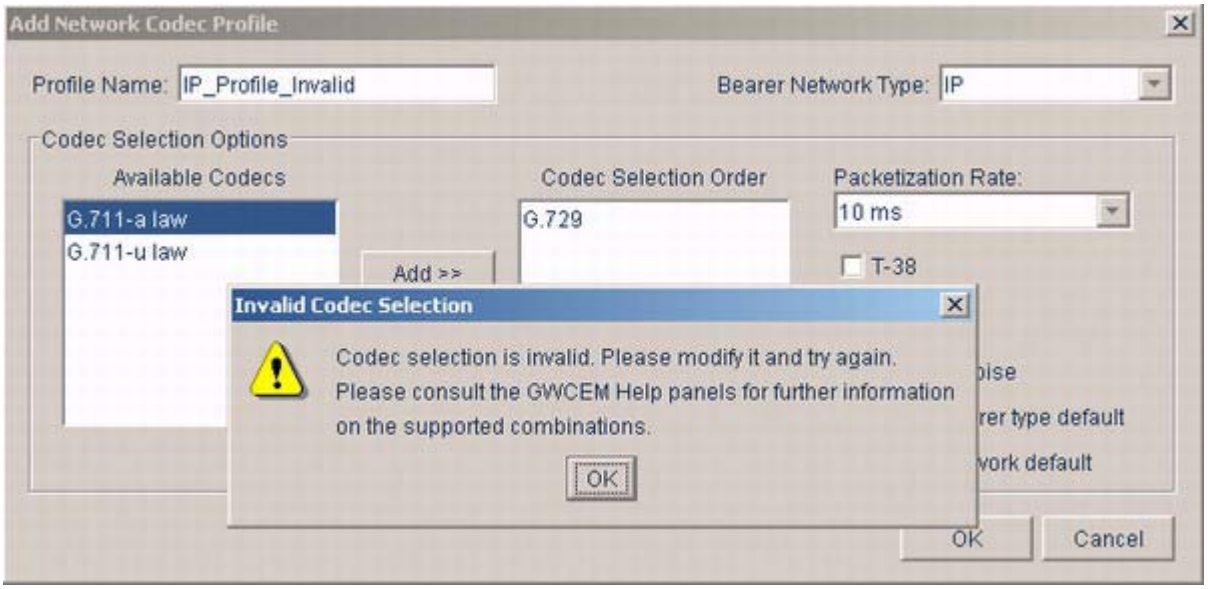
Figure 4 Select “AAL1” as the bearer network fabric type



Customer will be able to use the recommended codec setting by clicking the button “Recommended Codec Setting”, then the recommended setting will be restored into the dialog. Note that the recommended codec setting will be different for different bearer network type.

If customer select an invalid codec selection, alert dialog will be popped up. (Please refer to “Figure 17 Alert dialog for invalid codec selection”)

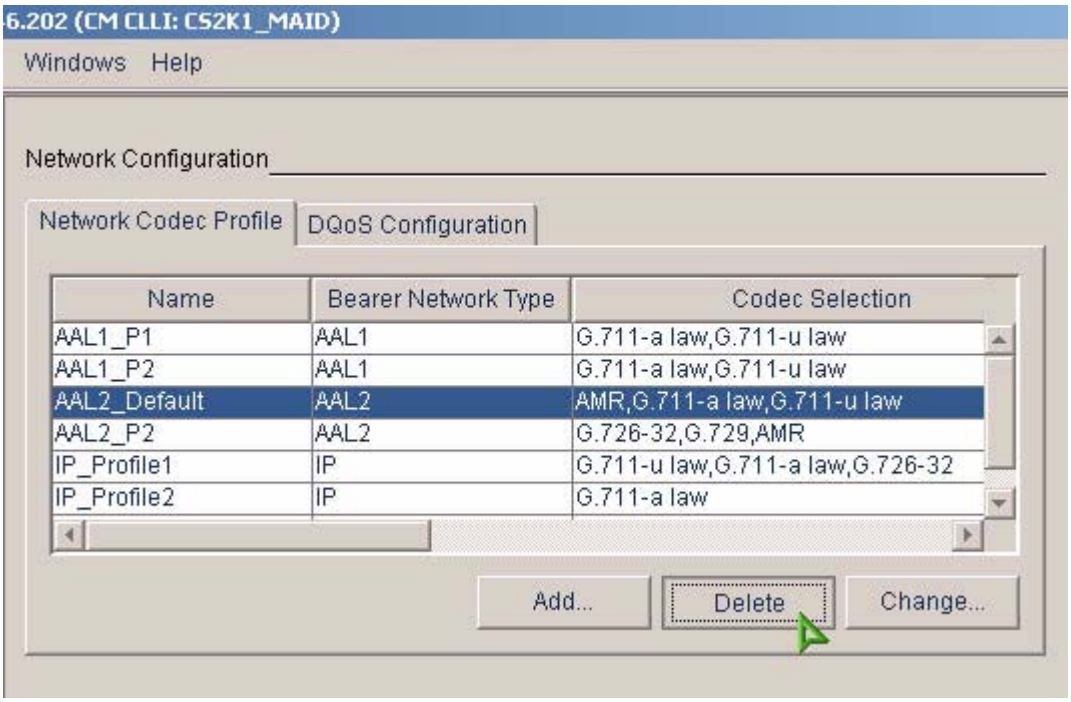
Figure 5 Alert dialog for invalid codec selection



30.8.2.1.6 Usage Example: Delete network codec profile

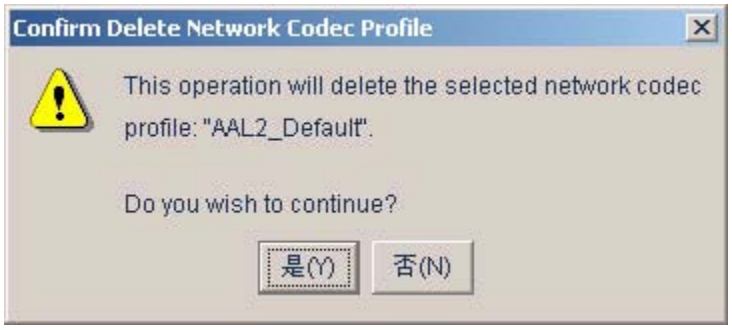
Customer will be able to delete one existing network codec profile just by highlighting the profile row from the table, and click the “Delete” button. (Please refer to “Figure 18 Delete existing network codec profile”)

Figure 6 Delete existing network codec profile



Once customer click the “Delete” button, one confirmation dialog will be popped up.

Figure 7 Delete network codec profile confirmation dialog

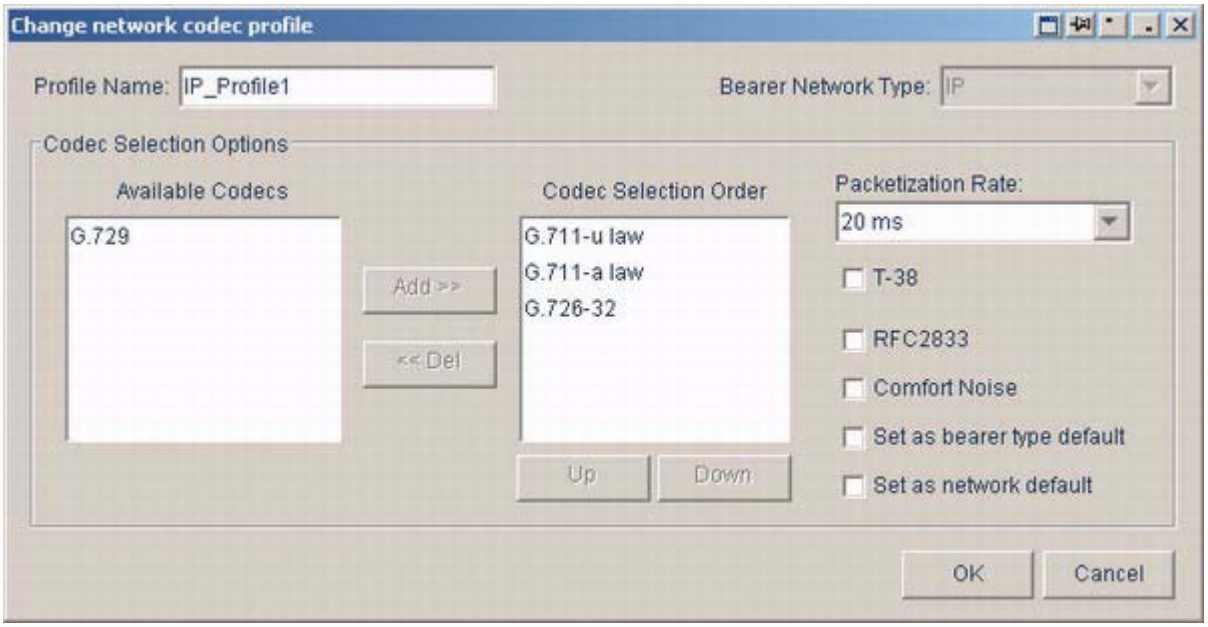


The operation result will be displayed in a pop-up dialog, and the codec profile table will be updated according to the result. Please note that if any GWC using this profile, the delete operation will be failed.

30.8.2.1.7 Usage Example: Change network codec profile

Customer will be able to change one existing network codec profile just by highlighting the profile row from the table, and click the “Change” button. Then the dialog “Change network codec profile” will be popped up. All parameters of the profile will be filled in the dialog. (Please refer to “Figure 20 Change existing network codec profile”)

Figure 8 Change existing network codec profile

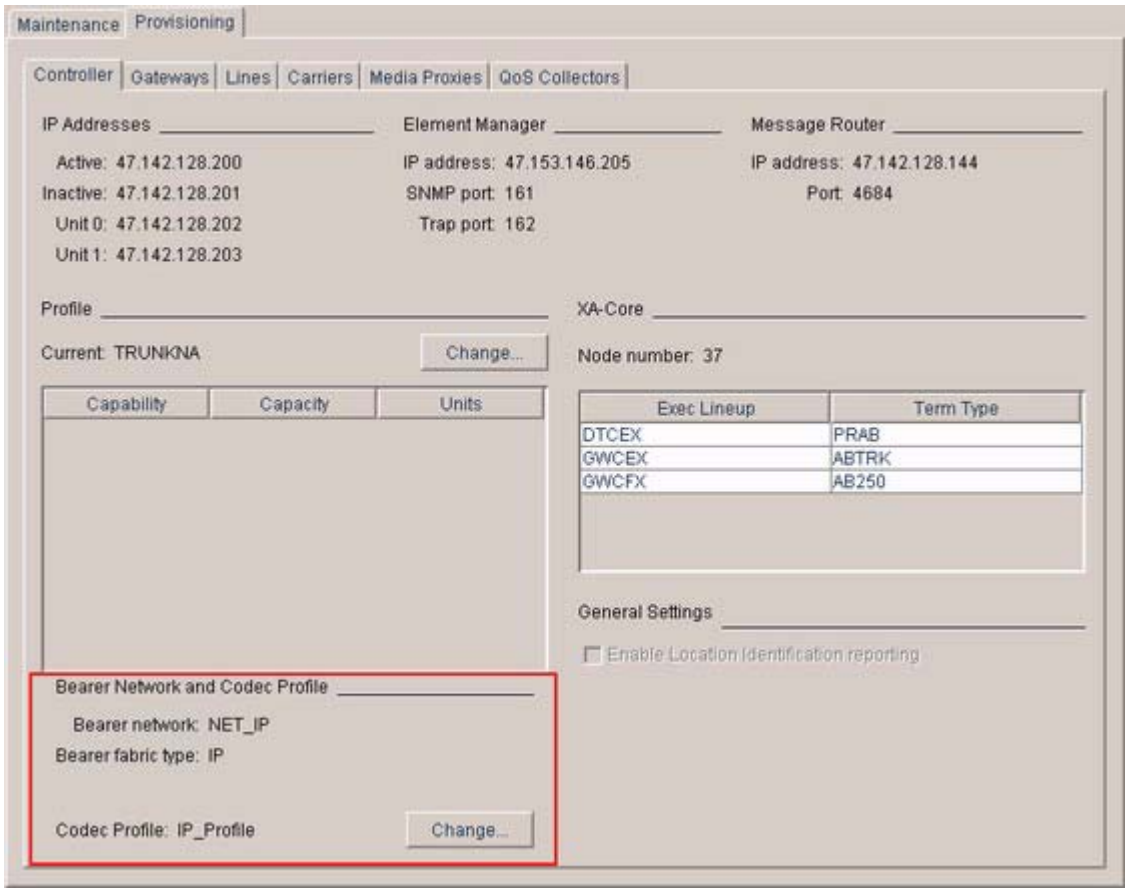


Note that the bearer network type of the profile is not allowed to be changed. Please refer to "32.8.2.1.5 Usage Example: Add network codec profile" section for how to change other parameters. Once the profile was updated successfully, these parameters will be updated into all GWCs using this profile.

30.8.2.1.8 Usage Example: Display GWC node

A new section will be added to the GWC provisioning panel to indicate the bearer network and codec profile configuration for the selected GWC.

Figure 9 Display GWC node



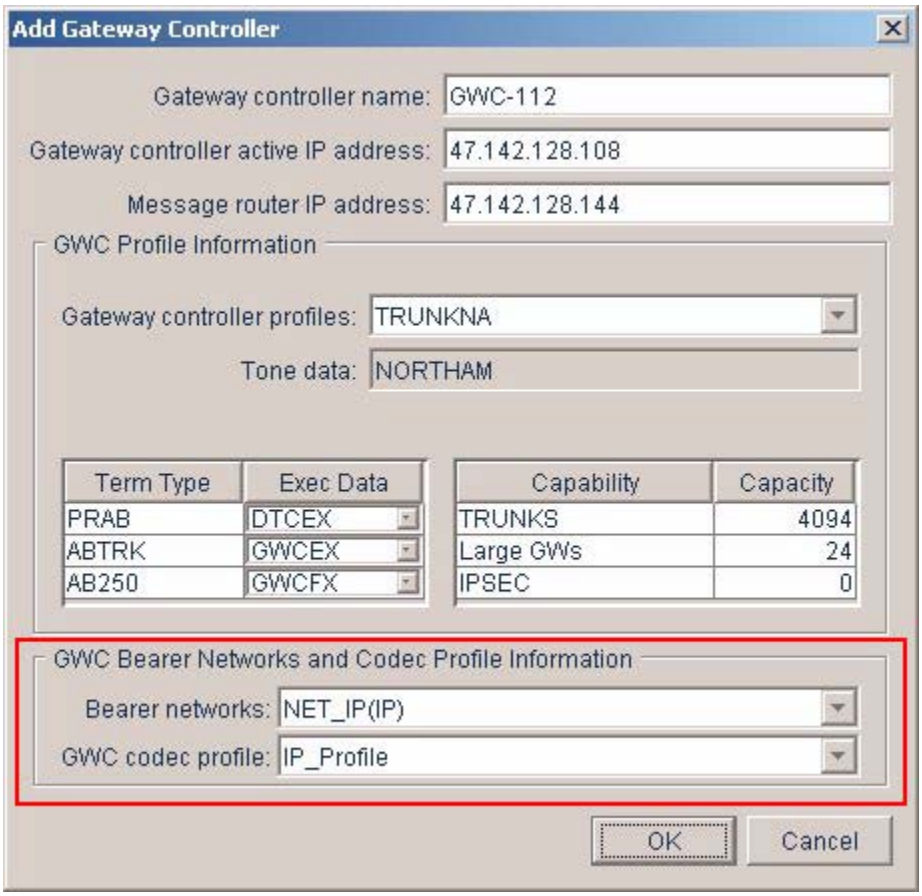
The new section includes two part, one is bearer network area and another is codec profile area. A “Change...” button will be added to the right of the codec profile fields to allow customer to change the codec configuration for the GWC.

This information will be displayed on the GUI with other GWC’s informations together while customer select a GWC from the GWC device list tree.

30.8.2.1.9 Usage Example: Add GWC node

Two new list boxes will be added to the “Add GWC Node” dialog to allow customers to select a specific bearer network instance and codec profile while a GWC is adding to the system.

Figure 10 Add GWC node



One of these two new box contains the bearer network list, another contains the codec profile list. The codec profile list must match the bearer network, that means, if customers select a bearer network instance belonging to “IP” bearer type, then the codec profile box will only contain the names of “IP” codec profiles; if customer select a “AAL1” bearer network instance, the codec profile box will be changed to only contain the “AAL1” codec profile names.

And if customers leave the codec profile box not selected, a default codec profile based on the bearer network type will be selected automatically.

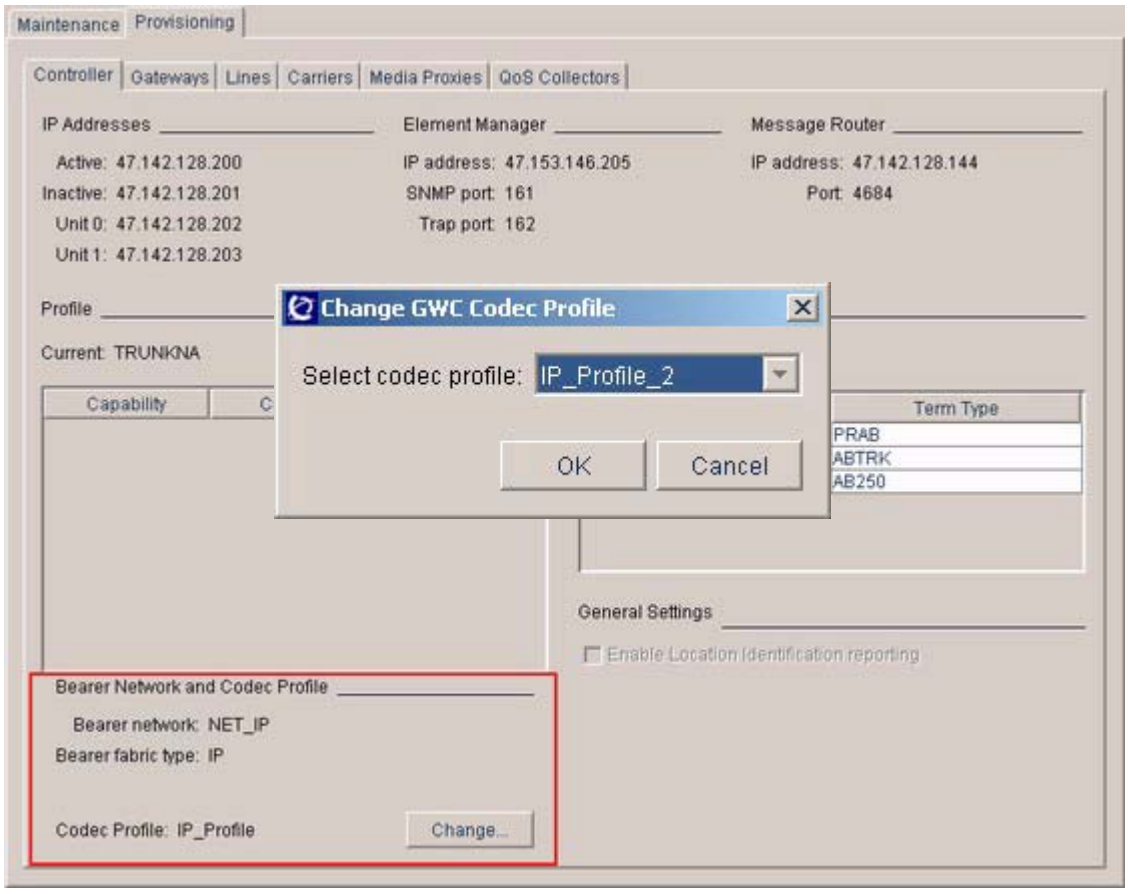
Once the addition operation has been performed successfully, a dialog like following will be pushed to the customer to indicate that the GWC was added to the system without errors.

Figure 11 Add GWC node result dialog

30.8.2.1.10 Usage Example: Change GWC network codec profile

When customers click the “Change...” button on the right of the codec profile fields on the GWC provisioning panel, a “Change Codec Configuration” dialog will be created like the following figure.

Figure 12 Change GWC's network codec profile



From this dialog, customers can select a different codec profile for the specific GWC even after the GWC has been provisioned already and a dialog with successful information will be displayed for customers if the operation has been performed without errors. Otherwise, a error message will be returned to the customers.

30.8.2.1.11 GUI release history update

1. Support the provisioning of multiple network codec profiles.
   - — Display network codec profile on GWC-EM GUI.
   - — Add network codec profile from GWC-EM GUI.
   - — Delete network codec profile from GWC-EM GUI.
   - — Change network codec profile from GWC-EM GUI.

2. Support the specification of a bearer network fabric instance and a network codec profile for each GWC.
   - — Display bearer network fabric instance and network codec profile of each GWC on GWC-EM GUI.
   - — Associate bearer network fabric instance and network codec profile with one GWC when adding GWC node from GWC-EM GUI.
   - — Change the associated network codec profile of one GWC node from GWC-EM GUI.

30.8.2.1.12 Supplementary information

30.9 Command interface changes

30.9.1 Directory: TRAVER

30.9.1.1 Directory description

TRAnslations VERification.

30.9.1.2 Accessing directory: TRAVER

30.9.1.2.1 Access to directory or MAP level and return to CI

CI> TRAVER <traver options>

Traver is a single command interface rather than an envirnment that is entered. You are automatically returned to the CI level after execution of the command.

30.9.2 Command: TRAVER TR

30.9.2.1 Command type: unchanged

30.9.2.2 Command target: unchanged

30.9.2.3 Command availability: unchanged

30.9.2.4 Command description

Traver an originating trunk based with the digits provided. The originating trunk (TRAVER TR) command is changed as follows:

When encountering a CND FABRIC or CND BEARNET selector in the translations route, three options are created for determining the originator's bearer fabric or network in order to determine how to interprete the CND route selection.

- TRKMEM option: The fabric or network of the member specified will be used.
- NEW BEARNET option: Allows the user to specify the bearer network (32 char vector identifying a BNETNAME provisioned in table BEARNETS) of the specifified trunk group.
- If none of the above options is specified, the TDM network will be assumed for the specified trunk group for non-DPT trunk groups.
- For DPT trunk groups, where none of the above options is specified, the bearer fabric or network will be obtained from table TRKOPTS.

30.9.2.5 Command syntax

Table 41 <CommandName> command parameters and variables

Command	Parameters and variables
TRAVER **TR**	Next par is: <CLLI> STRING Enter: <CLLI> [<CLLIOPT>] [<MBGOPTS>] [<TRIGOPT>] **[<TRKMEM>] [<BEARNET>]** <DIGITS OR N FOR NO DIGITS> [<CDNIE>] [<NSF>] [<TNSIE>] [<OSAIE>] [<BC>] [<SR>] [<PI>] [<TRI>] [<NETINFO>] [<FINFO>] [<RPOAP>] [<RPOAS>] [<NOA>] [<AIN_OPTIONS>] [<AIN_INFO>] [<SCAIIN>]
Parameters and variables	Description
[<TRKMEM>}	Existing option. Input is unchanged. Will now be used to obtain the bearer network and bearer fabric to be used when making conditional translations decisions CND FABRIC or CND BEARNET.
[<BEARNET>]	New option. Allows user to specify the bearer network (up to 32 character BNETNAME provisioned in table BEARNETS) to use as the originating bearer network. This will also imply the FABRIC, since the FABRIC is a field in table BEARNETS. Both of these will be used when making conditional routing decsions based on FABRIC or BEARNET (CND selectors). The network specified will be used, even if the trunk group does not have members on that network.

30.9.2.6 Qualifications and warnings

- Non-DPT trunk groups can have members that are spread across the varioius networks. During call processing, an effort will be made to match the originator’s network to a trunk member of a like network. Traver will not be enhanced to show this selection process.

- Line group originations (eg: HUNT, MDN, ACD) will use the network fabric of the originating member of the group to determine the network fabric.
- If the FABRIC or BEARNET option is used to specify the bearer network information of a trunk group, this information will be used in TRAVER to determine the routing, even if the trunk group does not have members in that network. This allows users to test the translations before adding members, but also allows for verification to pass when during call processing it could actually fail.

30.9.2.7 Responses

30.9.2.7.1 Undefined BEARNET specified

Since the user will be prompted for a 32 character string rather than a list of tuples provisioned in table BEARNET, an invalid entry should be met with a response indicating where to look for the valid information.

Table 42 MAP outputs with associated meanings and actions

Command TRAVER TR <trunk group CLLI> <digits> BEARNET <BNETNAME>
<RESPONSE>: <description> **Meaning:** The BEARNET name entered does not exist in table BEARNETS. **System or user actions:** Choose a BNETNAME of out table BEARNETS.
<RESPONSE>: <description> **Meaning:** **System or user actions:**

30.10 Security

30.11 Configuration Walkthrough

31: Configuration (CN): A00003486

31.1 Hardware and Software Requirements

The changes provided by this feature will allow the customer to physically identify ABI configured hardware components hosting ABI lines from the Core when trouble shooting their network. This enables quick problem resolutions. These Core changes provide:

- MG9K Frame/Shelf physical location data for MG9Ks hosting ABI lines
- Changes to the Mapci QueryPM application to make use of this data

Therefore the following hardware needs to be in place prior to exercising the software provided by this feature. The software is exercised by provisioning the physical location data of these hardware components:

- A typical ABI configuration

Software Requirements:

- SN07 Succession Core load or later

31.2 Initial Configuration

As a provisioning component of the Succession program, much of this functionality performs as designed without the hardware being in place. However, to provision actual physical location data, the provisioning of the configurations mentioned in “31.1 Hardware and Software Requirements” on page 2752 should be installed.

Once the hardware is installed and the software is available, provisioning of the physical location data can begin. The ABI Gateway and its location data is provisioned in table GATWYINV. This is a new table as of SN07. The steps to perform the provisioning are described in section “31.5 Data schema (DS) (CM, MIBS, RDB)” on page 2753.

31.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable.

31.4 Upgrade Impact

31.4.1 Dump and Restore

Table GATWYINV will use the existing data transfer “TabXfr” mechanism available to all Table Control tables to preserve its data during an upgrade. Because this is a new table as of SN07, there will be no data to preserve.

Due to the changes to table LTCINV for the ABI XPM tuples, data preservation for these tuples will occur when upgrading from any prior release which could contain ABI XPM datafill (SN05 or later) to the SN07 release. This means entries will be created in table GATWYINV when processing table LTCINV to preserve the ABI XPM datafill. Because the new GATWYINV table has much more configuration information available than what is provisioned against the ABI XPMs, much of the data will be defaulted. Therefore, once the upgrade is complete, the customer is expected to modify the newly created data in table GATWYINV to provide more accurate information than could possibly be provided during the upgrade.

31.4.2 Element Management Upgrade

Not applicable.

31.5 Data schema (DS) (CM, MIBS, RDB)

31.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
LTCINV	Changed	Unchanged
GATWYINV	New	New Table Control

31.5.2 Table LTCINV Database Schema information

31.5.2.1 Name: LTCINV

Long Table Name: Line Trunk Controller INVentory

31.5.2.1.1 Functional description

Table LTCINV contains the inventory data, except P-side link assignments, for various host peripheral module (XPM) types. This feature will only impact ABI XPM tuples. The change impacts the datafill associated with the ABI (EXTDS512) option. The change is to move most of the option datafill to table GATWYINV and replace the data with a key to the ABI gateway. Please refer to “Table 3 Table LTCINV changed field descriptions” on page 2755.

31.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

1. Table SERVRINV - GWC datafill, no change

2. Table SERVSINV - AUD datafill, no change
3. Table GATWYINV - New table, Gateway datafill. Dependencies on both SERVRINV and SERVSINV.
4. Table LTCINV - Dependency on GATWYINV for ABI XPM tuples
5. Table SERVCONN - ATM server connection datafill, no change

31.5.2.1.3 Size

No change in the maximum number of tuples for table LTCINV.

Table 2 Table LTCINV size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LTCINV	0	210	Memory is automatically allocated in increments of 10 XPMs at a time up to a maximum of 210 tuples.

31.5.2.1.4 Fields

The following table lists impacted fields for Table LTCINV.

Table 3 Table LTCINV changed field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTATTR	Changed	Modified the EXTDS512 refinement, add 1 new subfield and deleted 4 existing subfields	GTWY_HOST (added)	New field, This field contains the data which points to an entry in the new GATWYINV table. Made up of two sub-fields: GWTYPE GW_TYPE GWNO {0 TO 1023}
			NE_NBR (deleted)	GW_NETWORK_ELEMENT _NUMBER_RANGE - This field is deleted. The data is now available in table GATWYINV.
			ABI_SLOT_NBR (deleted)	ABI_SLOT_RANGE - This field is deleted. The data is now available in table GATWYINV.
			IPADDR (deleted)	TABLE OF 4 {0 TO 255}'s - This field is deleted. The data is now available in table GATWYINV.
			GWC_HOST (deleted)	Made up of two sub-fields: PMTYPE PM_TYPE PMNO {0 TO 255} - This field is deleted. The data is now available in table GATWYINV.

31.5.2.1.5 Datafill example

The following example illustrates the changed prompting sequence for the EXTDS512 option in table LTCINV.

```

31.5.2.1.6 Table release history update

- SN07 Feature A00003486: Available in the Core with the SN07 or later release.

Modified field: OPTATTR:

— add 1 new subfield for the EXTDS512 refinement and deleted 4 existing subfields for the EXTDS512 refinement. For more information see “Table LTCINV changed field descriptions” on page 2755.

31.5.2.1.7 Supplementary information

Limitations:

- LTCINV - since the impacted fields apply to ABI XPMs, they can only be datafilled on tuples with the EXTDS512 option.

ONP Upgrade to SN07:

— During the upgrade to SN07, tuples will be auto populated in table GWCINV. This is required to preserved any existing datafill in table LTCINV for tuples with the EXTDS512 option. There will be new fields which will be assigned a nil value, refer to GW 0006 Figure 5 on page 2762. It is expected that the user will correct this to more accurate data after the ONP is completed.

31.5.2.1.8 Translation verification other tools

Table LTCINV does not impact translations. Therefore TABAUDIT is the tool used to verify the contents of table LTCINV. The following Figure 4 on page 2584 shows the output from TABAUDIT when it is used to verify LTCINV.

Figure 4 Sample Tabaudit output for Verifying Table LTCINV Datafill

```
>tabaudit
TABAUDIT:
>include ltcinv

>execute
-------------------------------------------------------------------------------
|            TABAUDIT STATUS
-------------------------------------------------------------------------------

The following tables are included:
      table LTCINV (91)

The following tables are excluded:
  From table VERSIONS (0)              to table SERVRINV (90).
  From table MGCINV (92)               to table IPINV (299).
  From table X75INFO (301)             to table INWATNPA (1426).

Please confirm ("YES", "Y", "NO", or "N"):
>yes

Data verification is completed.
```

31.5.3 Table GATWYINV Database Schema Information

31.5.3.1 Name: GATWYINV

Long Table Name: Gateway Inventory

31.5.3.1.1 Functional Description

Table GATWYINV is where gateway configuration information is provisioned. Provisioning gateways in this table does not allocate IOUI nodes of any kind. For this release, this table contains configuration information only (no nodes) involving gateways. The term “gateway” could either mean a physical gateway or logical gateway, it depends on the actual “gateway” in question.

31.5.3.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

1. Table SERVRINV - GWC datafill, no change
2. Table SERVSINV - AUD datafill, no change
3. Table GATWYINV - New table, Gateway datafill. Dependencies on both SERVRINV and SERVSINV.
4. Table LTCINV - Dependency on GATWYINV for ABI XPM tuples

31.5.3.1.3 Size

The maximum number of tuples is 32767 for this table GATWYINV. Currently limited to 1024 (0-1023) for only ABI gateways for SN07.

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
GATWYINV	0	32767	Memory is automatically allocated in increments of 32 tuples at a time up to 32767. The multiple of 32 allows for an exact allocation of store to accommodate the maximum number of tuples.

31.5.3.1.4 Fields

Table 5 Table GATWYINV new field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GTWYPMNO	New	2 Subfields:		Two part Key:
		GWTYPE	GW_TYPE - only valid SN07 value is “ABI”.	GW_TYPE - This is the type of the gateway as defined on the Core.
		GWNO	GW_NO - {0 - 1023} - any valid number in this range.	GW_NO - This is the unique external number of the gateway.
GTWYPRFL	New	n/a	An enumerated list of gateway profiles consisting of Alpha-numeric Characters. Examples:MG9KITP, MG9KABI, PVG. only valid SN07 value is MG9KABI.	The name of the profile for the gateway. The profile provides a way to assign a finer level of grandularity (as opposed to GW_TYPE) to specify specific gateway behaviors.
GTWYNAME	New	n/a	32 Alphanumeric characters.	The name of the gateway, could be upper and lower characters with special characters.
GTWYADDR	New	n/a	IPADDR Table of 4 {0 TO 255}	The IP address of the gateway. For this release this could be either the Callp address or Mtce address.(aka CIPOA address)
GTWYCSPM	New	3 Subfields: SITE_ID	4 Alphanumerics	SITE_ID: The physical Site of the Hosting Gateway Controller. Site name must be defined in table SITE. The only valid value for SN07 is HOST.
		PMT	PM_TYPE - any valid PM type.	PM_TYPE - This is a valid PM type of the cside host XPM. This could be any valid PM type but generally will be a GWC.
		EXT_PMNO	{0 TO 255} - any valid number in this range.	PMNO - The unique external number of the cside host Gateway Controller.

Table 5 Table GATWYINV new field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GTWYOPTS	New	Refinement GTWYLOC with 8 fields.	GTWY_SITE (4 alpha numerics)	SITE_NAME: The physical site of the gateway. Valid values are verified against entries in table SITE. Example datafill 'CARY'.
			FRAME_TYPE	FRAME_NAME - existing data dictionary type. The unique frame type. Example datafill, MG9Ks have a frame type of 'MG9F'.
			FRAME_NUMBER {0 - 511}	FRAME - existing data dictionary type. The unique number given to a frame within an Office.
			FLOOR_POSITION {0 TO 99}	FLOOR_POS - existing data dictionary type. The unique floor with a unique Site (generally a building).
			ROW_POSITION {A,B,C...X,Y,Z,AA, BB,CC...XX,YY,ZZ}	ROW_POS - existing data dictionary type. The unique row within a floor.
			FRAME_POSITION {0 TO 99}	FRAME_POS - existing data dictionary type. The unique frame position within a row.
			SHELF_POSITION {0 TO 77}	SHELF_POS - existing data dictionary type. Traditionally, this is the bolt hole position as measured in inches from the floor up. For MG9K shelves, it should be equal to the Shelf Number as specified in the Lgrp Key. The unique shelf position within a specific frame.
			GW_CARD_SLOT_NB R {0-50}	SLOT_NO - existing data dictionary type. This is the slot number for a card. The SN07 use if for the ABI card slot.

Table 5 Table GATWYINV new field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GTWYOPTS (continued...)	New	ELMGR with 1 field.	GTWY_NE_NBR {0-999}	GW_NETWORK_ELEMENT_NUMBER_RANGE - existing data dictionary type. This is the network element number assigned when the gateway is added via the MG9K-EM. 0 is the NIL value.

31.5.3.1.5 Datafill Example

Figure 5 on page 2762 provides a view of a successfully added tuples with the location and element manager options. Note that other gateway types other than ABI are shown, this is just example data. Only ABI gateways are supported in SN07.

Figure 5 Sample GATWYINV Tuples with Options

```

31.5.3.1.6 Table release history update

Release SN07, feature A00003486: Initial release of this new table GATWYINV.

31.5.3.1.7 Supplementary information

ONP Upgrade to SN07:

— During the upgrade to SN07, tuples will be auto populated in table GWCINV. This is required to preserved any existing datafill in table LTCINV for tuples with the EXTDS512 option. There will be new fields which will be assigned a nil value, refer to GW 0006 Figure 5 on page 2762. It is expected that the user will correct this to more accurate data after the ONP is completed.

31.5.3.1.8 Translation verification other tools

Table GATWYINV does not impact translations. TABAUDIT is the tool used to verify the contents of table GATWYINV. Examples will be provided once the new table is functioning.

31.6 Service Orders (SO) (CM & SESM)

Not Applicable.

31.7 Software optionality control (SOC)

Not Applicable.

31.8 Element Management

Not Applicable.

31.9 Command interface changes

31.9.1 Map Level: QUERYPM MAPCI command

The QUERYPM command is used to query miscellaneous information about the currently posted XPM at the PM level of the MAP. This feature modifies the legacy QUERYPM command by displaying an additional screen to the default QUERYPM command (without arguments) which reflects the following ABI MG9K:

- Site
- Floor
- Row Position
- Frame Position
- Frame Type
- Frame Number

- Shelf Number
- ABI Slots
- Network Element Number
- ABI card IP address

  Note: New output only occurs if the posted XPM is an ABI XPM.

31.9.1.1 Current QUERYPM for ABI XPM

.

Figure 6 Current QueryPM Display for ABI XPMs

Not Applicable.

31.11 Configuration Walkthrough

32: Configuration (CN): A00003487

32.1 Hardware and Software Requirements

32.1.1 Hardware

No additional hardware is required in order to upgrade to a load capable of supporting multiple packet networks (support limited to IP interworking with AAL1 for SN07). All exisiting TDM/Packet configurations will continue to be supported, including:

- UA-AAL1
- PT-AAL1
- Ultralite AAL1
- UA-IP
- PT-IP
- PT-IP Compact (includes AAL2 via the PVG)
- AAL2 Wireless

In addition, the following new office configuration is supported:

- UA-AAL1/IP

New hardware will be required for the addition of the second packet network.

32.1.2 Software

The software reconfiguration to use the new networking tables (BEARNETS, NETBRDGE, NETPATH, NET2NET) will occur automatically to include default datafill dictated by the value of a new office parameter. This parameter, PRE_SN07_DUMPSIDE_PACKET_FABRIC, must be set by the engineering team and applied to the office prior to the table transfer.

SESM will align with the standard SESM requirements.

In order to provision a second packet network, the customer will have to provision the new network, any bridging resources for that network, and the connectivity supported between the networks via the bridging resource paths.

32.2 Initial Configuration.

32.2.1 Office parameters

32.2.1.1 NETWORK_ACTIVE

The network_active office parameter will be set to EXTENET when upgraded to the SN07 Succession load, even if it had been previously set to ENET.

If it had been set to JNET, the value will remain as JNET. In these offices, there will be no default network datafill in the new network tables.

> ***Note:*** If the value of the network_active office parameter is set to JNET, the packet connectivity function is not available.

32.2.1.2 PRE_SN07_DUMPSIDE_PACKET_FABRIC

Will be set to one of {UNDEF[1], NONE, AAL1, AAL2, IP}. Once the ONP is complete, there is no need to change this office parameter.

32.2.1.3 MULTINET_DISPLAY_ACTIVE = 'N'

The display control for the new OMs and Logs introduced by this activity is initially off.

32.2.2 New Network Tables - initial datafill

The examples that follow are the default tuples that will be in the new network tables after the ONP is complete. Note that the initial value of the NET 1 FABRIC field will be determined by the new office parameter PRE_SN07_DUMPSIDE_PACKET_FABRIC.

The following examples show the post TABXFER views of the new table data for the various "from" office network configurations.

[1]Should be set to something other than UNDEF by the engineering team prior to table transfer. UNDEF will be an error condition if the network_active = EXTENET.

32.2.3 New fields in existing tables

32.2.3.1 MNNODE

- IW SPM: will include new field BRDGCLLI set to key of only entry in table NETBRDGE.
- IW DPT: will include a new field BEARNETS set to (<name of NET 1> Y) $.
- MG4K: will include a new field BEARNETS set to (NET_AAL1 Y) $

  Note: NET 1 reflects the previously existing packet network as datafilled in table BEARNETS.

32.2.3.2 TRKOPTS

- DPT tuples will be pulled out of the DYNAMIC option as an application type and moved into it's own option area.
- DPT tuples will contain a new BEARNETS field, that will contain (<name of NET 1> Y) $
- SIPT DPT tuples contain a new selector named NGSS. This selector indicates if the trunk group uses the new Next Generaion Session Server (NGSS) for SIP architecture implemented by activities A00003933. The values of this field is either 'Y' or 'N'.

Note: NET 1 reflects the previously existing packet network as datafilled in table BEARNETS.

32.2.3.3 SERVRINV

- Will contain a new BEARNETS field, which will be set to:
  - (<name of NET 1> Y) $ if GWC is not a DPT GWC
  - $ if a DPT GWC

  Note: NET 1 reflects the previously existing packet network as datafilled in table BEARNETS.

32.2.3.4 Routing tables: CND PKT selector

The existing CND PKT routing selector will be converted to CND FABRIC in all of the applicable routing tables.

32.2.4 SESM

Each non DPT GWC provisioned will have a network codec profile associated with it, using the existing network codec profile that is configured for the office.

DPT GWC's will not have a network codec profile associated with them.

32.3 Office/Subnet parameters (OP/SP) (CM & SESM)

32.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCOPT	network_active	Unchanged	CM
OFCVAR	multinet_display_active	New	CM
OFCSTD	pre_sn07_dumpside_packet_fabric	New	CM

32.3.2 Parameter information

32.3.2.1 OFCOPT::NETWORK_ACTIVE

- The parameter itself is not really changing in SN07. It will simply be used to aid in the detection of an upgrade to a Succession call server capable of supporting multiple packet networks.

- As of SN04, any ENET offices upgrading to a packet capable Succession load will have this office parameter converted to EXTENET automatically during the upgrade.
- The value EXTENET is now expanded to include the ability to support mutiple packet networks.
- The use of the network tables (BEARNETS, NETBRDGE, NETPATH, and NET2NET) is enforced in connectivity for interworking the various networks, even when only a single packet network exists.

32.3.2.1.1 Functional description
This parameter controls various aspects of call processing, most importantly the network connectivity capabilities that are supported by the system.

32.3.2.1.2 Provisioning rules
For JNET call processing, set the value of this parameter to JNET.

For Succession (single or multiple packet networks), the value should be set to EXTENET. “Succession” includes all cases where the load is packet capable, such that it includes the MSH DRU. This includes offices that currently only have an ENET provisioned.

32.3.2.1.3 Range information
Unchanged.

32.3.2.1.4 Activation
Unchanged.

32.3.2.1.5 Dependencies
No additional dependencies.

32.3.2.1.6 Consequences
Unchanged.

32.3.2.1.7 Verification
Not applicable.

32.3.2.1.8 Memory requirements
No memory impact.

32.3.2.1.9 Parameter release history update
Office parm value EXTENET now implies that the software can support multiple packet networks.

Note: The current SN06 NTP documentation does not reflect that this parameter will be changed on an ONP to EXTENET, if the from side is currently set at “ENET” and the to load contains the MSH DRU. The update that does this was submitted in TL16.

32.3.2.2 OFCVAR::MULTINET_DISPLAY_ACTIVE

Multiple Networks Display Active

32.3.2.2.1 Functional description

This is a new office parameter associated with Succession Call Server that activates the new and changed OMs and logs. This allows the customer the flexibility of enabling multiple packet networks (likely for testing purposes only) prior to having the back-office system (i.e., OSS systems) ready to support the new OMs and log fields. This is an Y/N type parameter. This parameter would be part of OFCVAR table. The default would be set to 'N'.

This parameter does not control the display of the IWBM per bridge pool OMs.

32.3.2.2.2 Provisioning rules

This office parameter cannot be turned on unless NETWORK_ACTIVE = EXTENET.

There are no restrictions for setting it to 'N'.

32.3.2.2.2.1 Behavior when the parameter is set to 'Y'

- Change from 'N' to 'Y' using table control.
  - — The tuples in the new OM groups TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP are created/ (if non-existant) displayed.
  - — Pegging of the OM group registers in TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP is started.
  - — The signaling type for the DPT node tuple in the DPTNODE OM group is displayed. The bearer network is also displayed for DPTNODE OMs if the DPT node is SPM based. The bearer network will not be displayed for GWC hosted DPT.
  - — The display of the bridge pool in IWBM 800 series of LOGS is enabled.

32.3.2.2.2.2 Behavior when the parameter is set to 'N'

- Change from 'Y' to 'N' using table control
  - — A warning message would be displayed "All OM and LOGs data pertaining to multiple bearer networks on this call server will be lost.".
  - — The tuples in the new OM groups would not be displayed.
  - — The signaling type and bearer network for the DPT node tuple in the DPTNODE OM group would not be displayed.
  - — All the counters for the registers of the new OM groups would be set to zero.

— The counters of the registers of the new OM groups would not be pegged.

— The display of bridge pool in IWBM 800 series of LOGS would be disabled.

— The OMSHOW command would display the OM groups TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP and its fields. However the tuples of these OM groups is not be displayed.

32.3.2.2.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
Y/N	Y/N	N

32.3.2.2.4 Activation
Immediate

32.3.2.2.5 Dependencies

This parameter cannot be set to Y unless NETWORK_ACTIVE = EXTENET.

32.3.2.2.6 Consequences

Setting this parameter to Y will result in new OM tuples and log fields to be displayed. This could adversely affect downsteam OOS systems that have not yet been upgraded to handle this additional data.

32.3.2.2.7 Verification
To verify that the MULTINET Display is active and OM groups are created, use the CI command OMSHOW DPTOFCP. This command should display the OM group files and its tuples.

32.3.2.2.8 Memory requirements
Refer to the EI section for final details.

The new OM groups will be created at IPL time, but the tuples will not be created/displayed until the office parameter is set to Y.

- For the OM groups DPTOFCP, OFZ2NET1 and OFZ2NET2 the tuples would be created but not displayed.
- For the OM TRK2NET1 and TRK2NET2, the tuples would not be created and would be created when the office parameter “MULTINET_DISPLAY_ACTIVE” is set to Y for the first time.

32.3.2.2.9 Parameter release history update
New in SN07.

32.3.2.3 OFCSTD::PRE_SN07_DUMPSIDE_PACKET_FABRIC
SN07 Dumpside Packet Fabric prior to Succession MULTINET upgrade.

32.3.2.3.1 Functional description

This office parameter is set by the Nortel engineering team in an office parm changes flat file prior to the night of ONP. It is to be applied after the transfer of the office parameters and prior to the TABXFER.

The purpose of the parameter is to identify the FABRIC type of the single packet fabric supported on the from side prior to the upgrade, in order for the proper network tuples to be created in tables BEARNETS, CLLI, NETBRDGE, NETPATH, and NET2NET, as well as allow the new network related fields in tables MNNODE, TRKOPTS, and SERVRINV to be assigned the proper default values.

It is very important that this parameter be set correctly.

32.3.2.3.2 Provisioning rules
This parameter has the following range: {UNDEF, NONE, AAL1, AAL2, IP}. It will be defaulted to UNDEF at IPL in a Succession load, and NONE if in a non-Succession load. It should be set to one of the other values (not UNDEF) on all upgrades to Succession loads. Although present in non Succession loads, it does not need to be set for these loads. Once an office is already on an SN07 or later load, it does not need to be set again.

A warning will be output on all changes except “UNDEF” to one of the other values that this parameter impacts the automatic creation of the network data on ONP, and should be changed with care.

Once a packet tuple is provisioned in table BEARNETS, changes will not be allowed.

In order to properly set the value, datafill will be required from the dump side from the following tables: MNNODE, MNCKTPAK, SERVRINV, TRKOPTS, LGRPINV.

Explanation of parameter values:

- UNDEF: Default value at IPL. Indicates that the engineering team has not looked at the data.
- NONE: The engineering team has analyzed the from side data and detected that no packet nodes are provisioned. Indications that a packet node existed would include:

— MNNODE: IW SPM, DPM SPM, or MG4K SPMs are provisioned.

— SERVRINV: any tuple provisioned.

— Although one could argue that datafill in tables SERVSINV or LGRPINV also indicates a packet node, it cannot be added without a GWC first.

- AAL1: The from side packet datafill contained one of the following:
  — MNNODE contained an SMG4 (MG4K).
  — MNNODE IW or DPT SPM whose circuit card in table MNCKTPAK is ATM RM.
- AAL2:
  — Cannot be detected based on table datafill. Hopefully the engineering team knows if the PVG is using AAL2 or IP/AAL5.
- IP:
  — MNNODE IW or DPT SPM whose circuit card in table MNCKTPAK is GEM RM.
  — Table LGRPINV contains tuples whose GRPTYPE field is ‘M’ or ‘C’. indicating IAD devices or CICM.
  — The parm should also be set to IP if dumpside was using IP/AAL5. This will not be distinguished as a seperate bearer network.

32.3.2.3.3 Range information

Table 3 Range Information

Minimum	Maximum	Default
{UNDEF, NONE, AAL1, AAL2, IP}	{UNDEF, NONE, AAL1, AAL2, IP}	ENET - if load does not contain the MSH DRU UNDEF - if load contains MSH DRU.

32.3.2.3.4 Activation

Not applicable. This office parameter is only used during the TABXFER of data to a new load. It should be set to the correct fabric PRIOR to the night of ONP, and not changed thereafter. It is not used by call processing.

32.3.2.3.5 Dependencies

The following tables rely on the proper provisioning of this parameter:

- BEARNETS
- NETBRDGE

- NETPATH
- NET2NET
- MNNODE
- TRKOPTS
- SERVRINV

32.3.2.3.6 Consequences

- There are no consequences of incorrect provisioning if there are no packet nodes currently supported at the site. If the parameter is set to a packet fabric in a site that does not have a packet network, then network tuples will automatically be created in tables BEARNETS, NETBRDGE, NETPATH, NET2NET.
- If a packet network was supported, and the parameter is provisioned incorrectly, tuple transfer errors could occur in the following tables:
  — TABXFER data errors in MNNODE, TRKOPTS, SERVRINV.
- For an SN07 to SN07 lab upgrade, where the new tables suddenly appear in the load:
  — The ONP will not detect this scenario as a multinet upgrade. Instead, the network tables will appear in the load first, and the lab primes will be notified of the change. They will be required to go to a website and download/apply a DMOPRO file for the type of lab they are working in that contains the default data. In a following load, the dependent fields will be added to the existing tables, and type reformats will pick up the default datafill.

32.3.2.3.7 Verification

Not applicable.

32.3.2.3.8 Memory requirements

Minimal. Just need to store the fabric type in a protected variable. Does not control the allocation of any additional memory.

32.3.2.3.9 Parameter release history update

New in SN07.

32.4 Upgrade Impact

32.4.1 Dump and Restore

Callp functionality should not be affected over an upgrade from pre-SN07 to post-SN07. In order to maintain this, the new/changed tables need to be datafilled over the ONP. It is required that this upgrade has minimum impact to the customer. Aside from the traditional issues with type specific reformats,

we have the additional issue of determining what the FABRIC type was on the from side, in order to properly create default tuples in the new network tables. Since call processing will start depending on this data to make inter-network connections, it is vital that this data is correct after the transfer is ONP.

Once the data transfer is complete, the goal is to have the correct network representation for the currently configured networks, such that only new network information is required for when the customer wishes to add additional networks.

The ONP strategy must handle the following information:

32.4.1.1 Office Parameters

- OFCOPT::NETWORK_ACTIVE - If ENET, convert to EXTENET, and ensure that appropriate datafill is created to handle the existing networks.
- OFCVAR::MULTINET_DISPLAY_ACTIVE - Ensure the new office parameter is defaulted to 'N'.
- OFCSTD::PRE_SN07_DUMPSIDE_PACKET_FABRIC: the new office parameter *must be set by the upgrade engineering team* to indicate the default packet fabric on the from side network. This is set in a flat file that is applied after the office parameters have been transferred and before the tables are transferred. The engineering team is responsible for setting the correct values, and the application team is responsible for applying the changes at the proper point. Note that this is simply a new parameter included in the existing office parameter process. No changes are required to the process. This parameter applies only to alternative 1.

32.4.1.2 ONP Creation of Default Network Tuples

Tuples will be created automatically during the TABXFER via post data move procedures for the following tables. For more information see "New Network Tables - initial datafill" on page 2769.

- BEARNETS
  - — Create a NET 0 tuple representing the ENET if ENET is present.
  - — Create an appropriate NET 1 tuple representing the existing packet network. The FABRIC should be set to either AAL1, AAL2, or IP as appropriate.
- CLLI
  - — Create the appropriate CLLI used as the index to table NETBRDGE.
- NETBRDGE
  - — If there is both an ENET and a packet network defined, a bridge pool will be automatically created in table NETBRDGE for it.
- NETPATH

- Path 0 will be created as $. This is the nilpath, indicating that 2 networks can be interconnected without a bridge.
- If there are two networks defined, create a path using the bridge pool from NETBRDGE, assuming that bridges exist and that the bridgepool can connect them.

- NET2NET
  - For each network in table BEARNETS, create a tuple in NET2NET.
  - If there are multiple networks (both an ENET and a packet network), assume that both the ENET and the packet network can be connected to the other using the path index containing the bridge pool defined in table NETPATH.
  - Ensure that the NET 1 packet network detected is assigned the PACKET_NETWORK_DEFAULT option.

  Note: It is possible that an upgrade can occur in offices that have both an ENET and a packet network, but no interworking bridge nodes defined. In this case, the default datafill will still be created, but there will be no IW SPM nodes assigned to the bridge pool, so the interconnections defined in table NET2NET will not work. It is assumed that since this is an upgrade from a working office, that translations would prevent such attempts from occuring.

32.4.1.3 Initialization of new fields in existing tables

- MNNODE:
  - IW SPM: Initialize the new BRDGCLLI field to the single bridge group defined in table NETBRDGE.
  - DPT SPM: Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the node.
  - MG4K: Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the node.
- TRKOPTS:
  - Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the DPT trunk group.
  - Initialize the new NGSS field, on SIPT trunks, to ‘N’.
- SERVRINV:
  - If not a DPT GWC, initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the GWC.
  - If this is a DPT GWC, initialize the new BEARNETS field to $.

32.4.1.4 Type reformats on existing tables

- TRKOPTS: Remove DPT trunk groups as an application under the DYNAMIC trunk option, and create a DPT trunk option.
- OFRn, IBNRTn, HNPACONT::RTEREF, FNPACONT::RTEREF:
  - — Convert the CND PKT conditional selector to CND FABRIC in all of the applicable routing tables.

32.4.2 Element Management Upgrade

32.5 Data schema (DS) (CM, MIBS, RDB)

32.5.1 New/modified tables, MIBs, or Database Schema

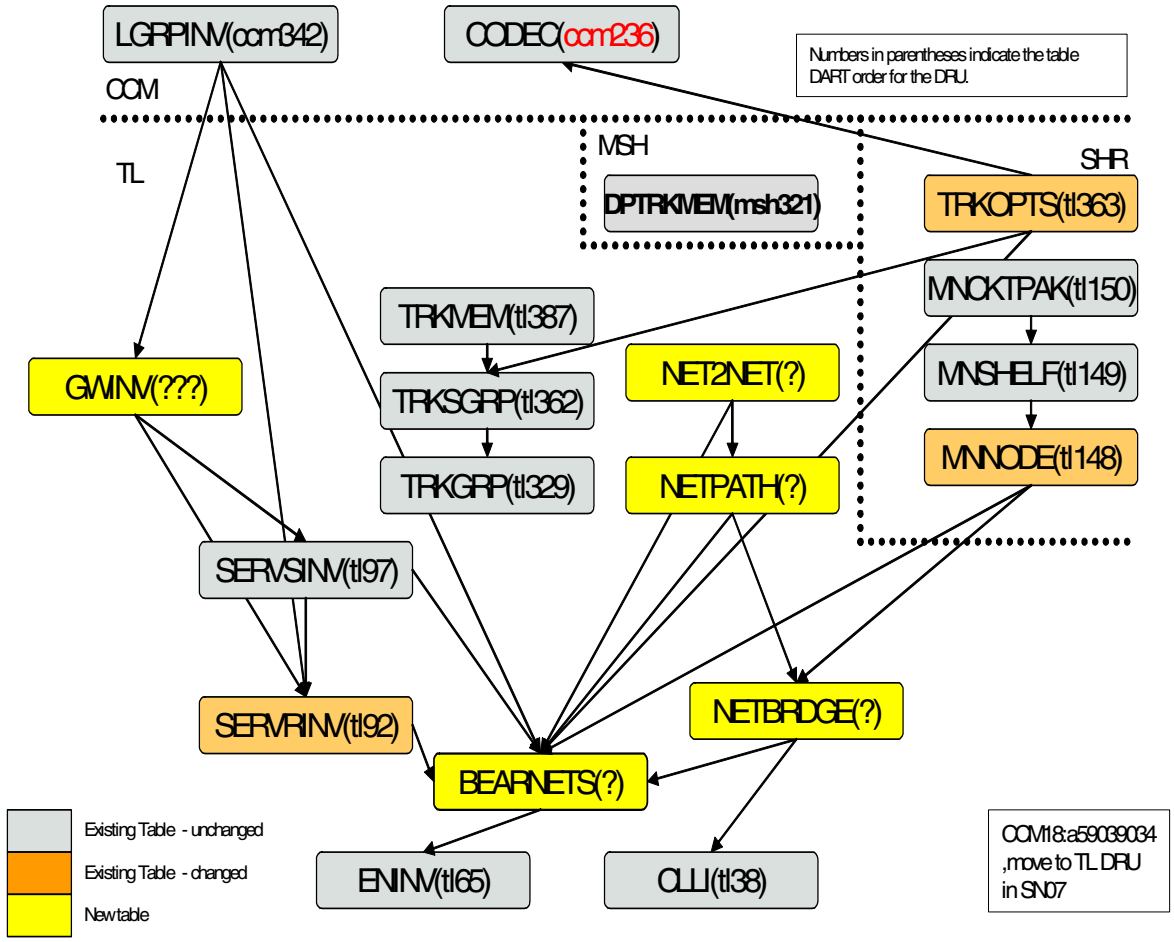
32.5.2 Table/MIB/Remote Database Schema information

32.5.2.1 Core Table Dependencies



32.5.2.2 Core Table BEARNETS

Bearer networks

32.5.2.2.1 Functional description

On a Succession Call Server, this table identifies the bearer networks supported by the server and the network options that apply to the packet networks.

The overall default packet network for the office is determined by the assignment of the packet_network_default option to a single tuple in the table. If no packet network is detected in the provisioning hierarchy for a packet agent, this default packet network will be used.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

32.5.2.2.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

ENINV

BEARNETS

NETBRDGE, NET2NET, MNNODE, SERVRINV, TRKOPTS

32.5.2.2.3 Size

Table 5 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
BEARNETS	0	8	Memory not allocated unless tuples are provisoned. (Required if NETWORK_ACTIVE = EXTENET).

32.5.2.2.4 Fields/OIDs

The following table lists fields for BEARNETS.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NETIDX	New	No	0-7	Key to the table. Will be displayed as “NET 0” - “NET 7”.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BNETNAME	New	No	Vector of up to 32 characters.	Identifies the name of the bearer network.This will be used in other tables to reference the associated bearer network and its characteristics. Making the name a field of the tuple rather than the index allows the customer to make name changes to the networks defined. The 32 character name of the network must be unique across the table.
DISPLAY	New	No	Vector of up to 4 characters.	Identifies the a 4 character string that will be used to display the bearer network on the MAP screens. We recommend that this be a unique string across the bearer networks, but this will not be implemented in the table control. Use of non-unique names will diminish the usefulness of MAPCI displays which use this field.
FABRIC	New	No	ENET, AAL1, AAL2, IP	Identifies the bearer network fabric type.
OPTIONS	New	Refinements	Vector of {pkt_network_default}	Vector of options against the bearer network.
pkt_network_default	New	OPTIONS refinement (not a field)	n/a	Indicates that this tuple is the packet bearer network default for the office. Primarily used in initializing dependant tables during an ONP. Restrictions: Only one tuple in the table can have this option.

32.5.2.2.5 Datafill example

The following example shows sample datafill for table BEARNETS.

```
TABLE: BEARNETS
NETIDX NETNAME      DISPLAY FABRIC OPTIONS
----------------------------------------
NET 0  TDM_ENET     ENET    ENET   $
NET 1  NET_AAL1     ATM     AAL1   (PKT_NETWORK_DEFAULT)$
NET 2  NET_IP       IP      IP     $
NET 3  NET_AAL2     AAL2    AAL2   $
```

32.5.2.2.6 Table release history update

New in SN07.

32.5.2.2.7 Supplementary information

Table BEARNETS, along with tables NETBRDGE, NETPATH, and NET2NET) is required to be provisioned in all Succession sites supporting bridged calls from a TDM network to a packet network.

When using the FINDREF tool on table BEARNETS, it is necessary to encapsulate the key field within single parentheses. For example:

FINDREF BEARNETS ‘NET 1’

On an ONP, this table will be automatically provisioned with both TDM and packet networks tuples where they exist.

— If the from side datafill contained an ENET, the NET 0 tuple from the datafill example will be automatically provisioned.

— If the from side supported packet nodes (as indicated by the setting of the PRE_SN07_DUMPSIDE_NETWORK_FABRIC), the NET 1 tuple will be provisioned and marked as the PKT_NETWORK_DEFAULT.

Table 7 BEARNETS Provisioning Restrctions

Field	Provisioning Restrictions
NETIDX	• Additions of packet networks to the table will not be allowed unless the NETWORK_ACTIVE = EXTENET. • Adding a tuple in table BEARNETS will automatically create a tuple in table NET2NET with $. • Cannot delete a BEARNETS tuple unless the NET2NET entry contains a $ and that tuple is the only reference. It is a counted tuple type.
BNETNAME	• Must be unique in table. • Changes to the BNETNAME will be reflected immediately in logs, OMs, etc. • Should only contain alphanumeric and underscore characters.

Table 7 BEARNETS Provisioning Restrctions

Field	Provisioning Restrictions
DISPLAY	• No restrictions, but recommend that this field be unique in the table. • Use of non-unique names will diminish the usefulness of MAPCI displays which use this field.
FABRIC	• Only 1 ENET tuple is allowed. • ENET tuple can only be added if ENET exists. • ENET tuple cannot be deleted if ENET exists. • Adds of UNDEF tuples are not allowed. • Changes are not allowed.
OPTION pkt_network_default	• The first packet network added must be the default. • Only one tuple may have this option assigned. If the option is added to another tuple, it will be removed from the first. • Cannot be added if FABRIC = ENET. • Cannot be deleted from a tuple, except by adding to another tuple. • Can only delete the network default tuple if it is the only remaining packet network tuple.

Refer to the supplementary information for table NET2NET for additional information.

32.5.2.2.8 Translation verification other tools

BEARNETS does not use translation verification tools. The Bearer Network (BNETNAME field) and Bearer Fabric (FABRIC field) are used to perform translation verification for Trunk Groups in the Trimodal configuration.

32.5.2.3 Core Table NETBRDGE

Network bridging resources.

32.5.2.3.1 Functional description

This table defines the network bridging resources for interconnecting networks. Bridges provide the ability to connect one network to another without regard to the call type. Bridges typically have two connectivity endpoints, one for each of the networks that it inter-connects.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

32.5.2.3.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

CLLI, BEARNETS

NETBRDGE

NETPATH, NET2NET, MNNODE

32.5.2.3.3 Size

Table 8 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NETBRDGE	0	64	Refer to the EI section.

32.5.2.3.4 Fields/OIDs

The following table lists fields/OIDs for NETBRDGE.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BRDGCLLI	New	No	CLLI common_language_name	Identifies the name of the bridge resource group.
BRDGTYPE	New	No	CORE_BRDG	The type of the bridging resource. For SN07, this is limited to core bridges, but could be expanded in the future.
DISPLAY	New	No	Vector of up to 4 characters	Identifies the a 4 character string that will be used to display the bearer network on the MAP screens. It is recommended that this be a unique string across the bearer networks, but this will not be implemented in the table control. Use of non-unique names will diminish the usefulness of MAPCI displays which use this field.
BEARNETS	New	Structure	BNETNAME, BNETNAME	Identifies the two networks that can be bridged with this bridging resource group.

32.5.2.3.5 Datafill example

The following example shows sample datafill for table NETBRDGE.

```
TABLE: NETBRDGE
BRDGCLLI      TYPE        DISPLAY BEARNETS
-----------------------------------------
ENET_TO_AAL1  CORE_BRDG   E-A1    TDM_ENET NET_AAL1
ENET_TO_IP    CORE_BRDG   E-IP    TDM_ENET NET_IP
```

32.5.2.3.6 Table release history update

New in SN07.

32.5.2.3.7 Supplementary information

Table 10 NETBRDGE Provisioning Restrctions

Field	Provisioning Restrictions
BRDGCLLI	• Common_language_name provisioned in table CLLI. • Counted tuple type. Deletions are not allowed if referenced by another table.
BRDGTYPE	• Only allowable value in SN07 is {CORE_BRDG}. • Cannot change.
DISPLAY	• Recommended, but not enforced, to be unique. Use of non-unique names will diminish the usefulness of MAPCI displays which use this field. • No change restrictions.
BEARNETS	• The two network names provided must be provisioned in table BEARNETS. • The two network names must be different. • Changes to the BEARNETS field is allowed only if the tuple is not referenced by another table.

Since the BRDGCLLI is the key to this table, it cannot be changed through the table control interfaces. BRDGCLLI names can be changed for this table using the CI command RENAMECLLI. The name change will then be reflected in all tables, OM, and logs that reference the particular bridge CLLI.

32.5.2.3.8 Translation verification other tools

NETBRDGE does not use translation verification tools.

32.5.2.4 Core Table NETPATH

Interconnecting network path.

32.5.2.4.1 Functional description

Tuples in this table identify the list of bridging resource groups (the bridge path) that can be used to interconnect two networks. In SN07, two bridges are required to connect an AAL1 agent and an IP agent, so the path consists of a bridge resource from each of those NETBRDGE's.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

32.5.2.4.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

NETBRDGE

NETPATH

NET2NET

32.5.2.4.3 Size

Table 11 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NETPATH	0	256	Refer to the EI section of this document.

32.5.2.4.4 Fields/OIDs

The following table lists fields/OIDs for NETPATH.

Table 12 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PATHIDX	New	New	0 to 255	The key to the table.
NETBRDGE	New	New	Vector of BRDGCLLI	A list of the bridge pools that are required to go from one network to another. Bridge CLLIs must be listed in the order of the traversal required, without regard to the direction of the traversal (forward or backward).

32.5.2.4.5 Datafill example

The following example shows sample datafill for table NETPATH

```
TABLE: NETPATH
PATHIDX       NETBRDGE
-----------------------------------------
0              $
1            (ENET_TO_AAL1)  $
2            (ENET_TO_IP)    $
3            (ENET_TO_AAL1) (ENET_TO_IP)$
```

32.5.2.4.6 Table release history update

New table in SN07.

32.5.2.4.7 Supplementary information

The following tuple will be created automatically for all Succession offices:

0 $

This will indicate the “nil path” that can be used in table NET2NET to indicate that two networks can be directed connected without the use of bridging resources.

Table 13 NETPATH Provisioning Restrctions

Field	Provisioning Restrictions
PATHIDX	• Counted tuple. Deletions not allowed if refenced by another table. • PATHIDX = 0 is reserved for connections between packet networks of the same fabric which do not require an IW bridge for connectivity.
NETBRDGE	• The same bridge pool should not be in the list more than once. • Limit of 2 bridge pools in SN07. • Order of the bridge pools should be maintained. • Changes are allowed, and take effect immediately for all NET2NET tuples provisioned with this path. • The bridge pools must be listed in the order they will be traversed to go from one network to the other. The pools can be listed in either the forward or reverse direction.

Note: Allowing the NETBRDGE field to be changed allows this user to deload a particular IW SPM by creating another PATH with another NETBRDGE pool of the same type and assigning the desired SPMs to it. The CI tool IWBMCI:DBL can be used to validate when the deloaded SPM is no longer in use.

32.5.2.4.8 Translation verification other tools

NETPATH does not use translation verification tools.

32.5.2.5 Core Table NET2NET

Network interconnection.

32.5.2.5.1 Functional description

Tuples in this table define the allowable interconnections between networks, and the network path used to interconnect them.

Call processing will assume that any agents on the same network can be connected with one another.

Once the normal translations have occurred, a request will be made to connectivity to connect the agents.

- If the agents are on the same network, the connection request will proceed.
- If the agents are provisioned on seperate networks, connectivity will check table NET2NET to see if the connection is allowed.
  - — If the two networks are provisioned as connecting in the table, the NETPATH and associated bridge resources will be retrieved and the connection request will continue. If there are no idle members in the bridge groups, the connection request will then fail.
  - — If the two networks are not provisioned as connecting in the table, the connection request will fail immediately.
- In SN07, no mechansim is provided for choosing an alternate bridging path if the bridging resources are unavailable in the provisioned path.

32.5.2.5.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS, NETPATH

NET2NET

32.5.2.5.3 Size

Table 14 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NET2NET	0	7	Allocated upon first tuple entry.

32.5.2.5.4 Fields/OIDs

The following table lists fields/OIDs for NET2NET.

Each CONNNETS vector entry consists of:

- NET2NET - the interconnecting network
- NETPATH - reference to tuple in table NETPATH definining the path by which the two networks interconnect.

Table 15 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BNETNAME	New	No	BNETNAME defined in table BEARNETS	Identifies the name of the bearer network. Must be datafilled in Table BEARNETS first.
CONNNETS	New	No	Vector of connecting_network	Identifies a list of other bearer networks that are allowed to interconnect to this bearer network.
NET2NET	New	Field of connecting_network	BNETNAME provisioned in table BEARNETS	The interworking bearer network. Must be provisioned in Table BEARNETS first.
NETPATH	New	Field of connecting_network	Key to table NETPATH 0 - 255	Index into Table NETPATH.

32.5.2.5.5 Datafill example

The following example shows sample datafill for table NET2NET.

Figure 7 ENET/AAL1/IP NET2NET Datafilll

```
TABLE BEARNETS
NETIDX  NETNAME    DISPLAY     FABRIC    OPTIONS
-----------------------------------------------
NET 0   TDM_ENET   ENET        ENET      $

NET_IPE         (NET_IP 0) $
```

To interconnect two different networks on the same fabric, define a NETPATH that requires no bridges, and put entries in NET2NET using that path.

32.5.2.5.6 Table release history update

New in SN07.

32.5.2.5.7 Supplementary information

- NET2NET tuples will automatically be created with CONNNETS = $ whenever new networks are added to table BEARNETS.
- On an ONP, the interconnecting networks should be provisioned with the appropriate bridges automatically.

Table 16 NET2NET Provisioning Restrctions

Field	Provisioning Restrictions
BNETNAME	• Deletions are not allowed from this table. • User may change the tuple to the point that CONNNETS = $. Tuple deletions will be handled via table BEARNETS, and allowed only if CONNNETS = $.
CONNNETS	• Networks that connect only with themselves will have CONNNETS = $. All provisioned networks in table BEARNETS will be represented in this table. • The order of the entries is used during trunk member selection as the network preference order for trunk members when a member that is on the originating agent's network is not avaiable. The most efficient path is recommended to be provisioned first. • Adding a connecting network to a tuple should also add the connection to the tuple for the other network. This addition will be added to the end of the CONNNETS list of that tuple. • Deleting a connecting network from a tuple will also delete the interconnection from the connecting network's tuple. • Changes to NET2NET tuples will take effect immediately upon the change for all new connection requests. Used should be warned when removing an existing interconnection ability.
CONNNETS: NET2NET	• Valid BNETNAME from table BEARNETS. • Should not be the same as the key for the tuple. It is understood that a network can connect to itself. • A given network should appear in the connecting network list only once. • Changing the order will change the order of trunk member selection based on the network of the originating agent.
CONNNETS: NETPATH	• A valid PATHIDX from table NETPATH. • Path changes take effect immediately for new connection requests. Existing connections will continue with the old path until the connection has been released. • If NETPATH = 0 is specified, verify that the network FABRIC for both the BNETNAME network and the NET2NET network are on the same fabric. • Verify that once the starting end of the path is chosen based on the BNETNAME network, the path can then be traced in the appropriate direction to reach the CONNNETS network.

32.5.2.5.8 Translation verification other tools

NET2NET does not use translation verification tools.

32.5.2.6 Core Table MNNODE

Maintenance node table used to provision Spectrum nodes.

32.5.2.6.1 Functional description

Unchanged.

32.5.2.6.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

All existing dependencies, plus BEARNETS, NETBRDGE

MNNODE

All existing dependant tables.

32.5.2.6.3 Size

Table 17 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNNODE	Unchanged	Unchanged	Refer to the EI section of this document .

32.5.2.6.4 Fields/OIDs

The following table lists fields/OIDs for MNNODE.

The following nodes provisioned in table MNNODE are impacted by these changes:

- Interworking bridges (NODEKEY=IW, DPT_INFO = BRDG_ONLY)
- DPT SPM (NODEKEY = IW, DPT_INFO = DPT_ONLY)
- MG4K (NODEKEY = SMG4)

Each of the applicable node type change is broken into it's own table below.

Table 18 Table field descriptions for IW Bridges

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NODEKEY	Unchanged	Unchanged	Unchanged	Unchanged
ALIAS	Unchanged	Unchanged	Unchanged	Unchanged

Table 18 Table field descriptions for IW Bridges

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NODEINFO	Changed	IW refinement		Changes below impact the IW refinement of CLASS.
CLASS	Unchanged	IW refinement	Unchanged	The IW refinement is changed.

```

32.5.2.6.6 Table release history update

In SN07, The following mandatory fields were added:

- BEARNETS field added to IW DPT_ONLY and SMG4 nodes to indicate the bearer network associated with the node.
- BRDGCLLI field added to IW BRDG_ONLY nodes to indicate the list of bridge groups the particular SPM node contributes to.

32.5.2.6.7 Supplementary information

- As of SN07, in order for interworking bridges to be utilized, the BRDGCLLI for the IW must be included in a NETPATH used to interconnect two networks in table BEARNETS.
- Terminations to DPT will dynamically match the network of the DPT SPM to the network provsioned against the terminating trunk group in table TRKOPTS to properly select a DPT “terminal” on the correct network.

Table 21 MNNODE IW bridg_only Provisioning Restrctions

Field	Provisioning Restrictions
BRDGCLLI	• Must be provisioned as a single entry in SN07. Cannot have either a nil vector or more than one provisioned. • Ensure the CLLI entered is a bridge clli. • Do not allow BRDGCLLI's where the NETBRDGE packet network fabric is not IP or AAL1. AAL2 is currently not supported by SPM nodes. • Changes are allowed only if the IW is OOS (MANB or OFFL). • On changes, compare the packet fabrics for the networks bridged by the BRDGCLLI. If the fabrics are different, then this means the network cards must be changed as well. Network cards should be removed prior to changing the BRDGCLLI, so a check is made that no network cards are provisioned if the packet fabrics that are bridged are different.

Table 22 MNNODE IW dpt_only Provisioning Restrctions

Field	Provisioning Restrictions
BEARNETS - vector of {BNETNAME, DEFAULT}	• Must have a single entry and it must be marked as the default. • The network entered must be provisioned in table BEARNETS. • The network entered must be a packet network with an IP or AAL1 fabric. • For changes, the SPM must be OFFL and all DPT carriers must be INB. (from DPTTRM, post spm <spm no>, bsy, bsy inb). • If the network fabric is changing, then the network cards must be removed before the change is allowed.

Table 23 MNNODE SMG4 Provisioning Restrctions

Field	Provisioning Restrictions
BEARNETS	• Must have a single entry and it must be marked as the default. • The network entered must be provisioned in table BEARNETS. • The network entered must be a packet network. • For changes, the SPM must be OFFL and all carriers must be INB. If DPT, then from DPTTRM, post <spm no>, bsy, bsy inb. If not DPT, then from TTP, post d spm <spm no>, bsy all, bsy inb all. • If the network fabric is changing, then the network cards must be removed before the change is allowed.

Generally, if the packet fabric for the IW is changing (whether a bridge or trunk members), then the following process must be followed to change the BEARNETS or BRDGCLLI provisioned:

- OFFL the SPM and bsy INB all carriers.
- Remove the network cards via table MNCKTPAK.
- Change the MNNODE BEARNETS or BRDGCLLI information.
- Add the correct circuit packs to MNCKTPAK (will be verified against the MNNODE datafill).
- RTS the SPM node.

32.5.2.6.8 Translation verification other tools

MNNODE does not use translation verification tools.

32.5.2.7 Core Table MNCKTPAK

Management Network Node Table

No sematice changes have been made to this table.

Additional validation checking has been added for when the GWM RM and ATM RM card provisioning, to ensure that the network implies by the card agrees with the bearer network provisioned against the node.

32.5.2.7.1 Supplementary information

Table 24 MNCKTPAK Provisioning Restrctions

Field	Provisioning Restrictions
CPKINFO - GEM card	• If SPM is IW brdg_only, ensure that at least one IP network is supported by the BRDGCLLI assigned. • If the SPM is either IW dpt_only or SMG4 (MG4K), ensure that the BEARNETS fabric provisioned in table MNNODE is IP.
CPKINFO - ATM card	• If SPM is IW brdg_only, ensure that at least one AAL1 network is supported by the BRDGCLLI assigned. • If the SPM is either IW dpt_only or SMG4 (MG4K), ensure that the BEARNETS fabric provisioned in table MNNODE is AAL1.

32.5.2.8 Core Table SERVRINV

Server Inventory

32.5.2.8.1 Functional description

A new field, BEARNETS is added to the SERVRINV table to indicate the bearer networks of the packet nodes it controls. For SN07, there will be a limit of one bearer network per gateway controller, and it will be the default.

In addition, DPT GWCs should not be provisioned with a bearer network, as it is a signalling only network element.

32.5.2.8.2 Usage sequence and implications (CM Only)

The following provisioning dependencies is added :

BEARNETS

SERVRINV

32.5.2.8.3 Size

Table 25 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVRINV	Unchanged	Unchanged	tbd

32.5.2.8.4 Fields/OIDs

The following table lists fields/OIDs for SERVRINV.

Table 26 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SERVRNAME	Unchanged	Unchanged	Unchanged	Unchanged

Enter $.**
BNETNAME	**New**	**Subfield of BEARNETS.**	**BNETNAME provisioned in table BEARNETS.**	**Name of the bearer network from table BEARNETS.**
DEFAULT	**New**	**Subfield of BEARNETS**	**{Y, N}**	**Indicates whether the particular bearer network is the default network**
SERVROPTS	Unchanged	Unchanged	Unchanged	Unchanged

32.5.2.8.5 Datafill example

The following example shows sample datafill for table SERVRINV.

Figure 13 Example Datafill

```
TABLE: SERVRINV
SERVRNAME SERVRADDR SERVREXEC SERVRTONE BEARNETS SERVROPTS
-----------------------------------------------------------
GWC 0     IP  47 192 48 24 (POTS POTSEX)  (KEYSET  KSETEX)  $
NORTHAA (NET_IP Y) $ $
```

32.5.2.8.6 Table release history update

Added BEARNETS field in SN07.

32.5.2.8.7 Supplementary information

- SERVRINV is the bearer network provisioning point for the following nodes, if the BEARNETS field contains a default network. If the GWC does not have a BEARNETS entry, the office default (the tuple in table BEARNETS with the default_packet_network option assigned) will be taken as the bearer network for the following agents.
  - — IP trunking gateways (PVG, Audiocodes)
  - — Logical groups
  - — ABI lines and trunks
  - — H.323 & Media Call Server 5200
  - — UAS (for CALEA)
- DPT GWCs do not have a bearer network provisioning against them, as the DPT TIDs against the GWC do not have associated hardware. If a network is provisioned against DPT GWC, it will have no effect on call processing. DPT trunk groups get their bearer network from table TRKOPTS.
- It is assumed that SERVRINV will be provisioned via SESM, which will ensure that a default bearer network is added for non-DPT GWCs, and that no bearer network will be added to DPT GWCs. A warning message is output to the user when provisioning changes are made to SERVRINV warning of potential data corruption. This warning message already exists.

Table 27 SERVRINV Provisioning Restrctions

Field	Provisioning Restrictions
BEARNETS - vector of {BNETNAME, DEFAULT{	• BEARNETS does not apply if the GWC is a DPT GWC. • If a nil entry is added for a non-DPT GWC, the bearere network will be taken from the office default provisoned in table BEARNETS as the pkt_default_network. • Entry must either be assigned a “$” or a single BNETNAME marked as the default. • Changes require that the GWC be OOS (MANB or OFFL). • Non-DPT trunks must be BSY INB prior to change. • Allow changes to a non-nil BEARNETS field only if not DPT in SERVSINV. Allow deletion of BEARNETS entry only if DPT.

32.5.2.8.8 Translation verification other tools

SERVRINV does not use translation verification tools.

32.5.2.9 Core Table SERVSINV

Server Subtending Inventory

Table unchanged by this activity. Only additional provsioning consistency checks are added for use during an ONP.

32.5.2.9.1 Supplementary information

DPT terminal groups are signalling only, and do not have any physical hardware associated. The DPT trunk group, via provisioning in table TRKOPTS, contains the bearer network information, and DPT “terminals” can be associated with any bearer network provisioned against the trunk group, as long as the signalling type matches.

When transferring table data during an ONP for table SERVRINV, it is not known if the GWC is a DPT GWC, so the BEARNETS will be automatically set to the bearer network default. Therefore, the write procedure for table SERVSINV will be hooked to check whether or not a multinet upgrade is in progress for DPT GWCs (SIPT or BICC) and if it is, it will delete the BEARNETS entry for it’s host GWC.

32.5.2.10 Core Table TRKOPTS

Trunk Options.

32.5.2.10.1 Functional description

Unchanged.

32.5.2.10.2 Usage sequence and implications (CM Only)

The following dependency is added to the existing provisioning order:

BEARNETS

TRKOPTS

32.5.2.10.3 Size

Table 28 Table size

NGSS	**NEW**	**Subfield of SIPT protocol**	**{N,Y}**	**Identifies if the new NGSS SIP architecture is being used**

Table 29 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
DEST_MGCNAME	New	Subfield of NGSS 'N' selector	MGCINV_ KEY	Enter the Media Gateway Controller (MGC) name from table MGCINV.
TPROFILE	New	Subfield of NGSS 'N' selector	TPROFILE _NAME	Enter the telephony profile name from table TELEPROF.
ALT_HOST_MGCNAME	New	Subfield of NGSS 'N' selector	Vector of up to 32 chars.	Enter an alternative Media Gateway Controller (MGC) name.
INTER_DOMAIN	New	Subfield of NGSS 'N' and NGSS 'Y' selector	N, Y	Refer to activity a89007980. Indicates if the SIP-T trunks are inter-domain or intra-domain (between Nortel Networks equipment in the same addressable range).
PROTOCOL	New	Subfiled of DPT option	BICC	Subfields when protocol = BICC (old ISUPPLUS)
CAPABILITY_SET	New	Subfield of BICC protocol	{1 to 2}	This represents the BICC capability set (CS). If the remote switch (other side of the DPT trunk) is unable to supoort CS2 then datafill the CAPABILITY_SET as 1. If the remote switch can support CS2 then datafill CAPABILITY_SET as 2.

32.5.2.10.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

Figure 14 Example Datafill

```
TABLE: TRKOPTS
OPTKEY          OPTINFO
----------------------------------------
DPTTRK DPT      DPT BICC NET_AAL1 1
SIPTRK DPT      DPT SIPT NET_IP N MGC2 PROF MGCTWO Y
OCTRK  DYNAMIC  DYNAMIC ISUP IP IP OC $
```

32.5.2.10.6 Table release history update

- DPT is removed from APPLICATION field under the DYNAMIC option.
- DPT is added as a new OPTION.
- NGSS is added as a new selector field under the SIPT protocol

32.5.2.10.7 Supplementary information

The signaling network field is not required for DPT. The signaling protocol implies the signaling network: BICC implies SS7, and SIPT implies IP.

The bearer_fabric provisioned for DPT in table TRKOPTS indicates the bearer fabric for a specific DPT trunk group, and a given DPT trunk group can only have one bearer fabric.

GWC DPT trunk “agents” (provisioned in table SERVSINV) will be associated with the DPT trunk group during call processing based on the signaling protocol only. Bearer fabric is not provisioned against DPT GWCs in table SERVRINV.

SPM DPT trunk “agents” (provisioned in table MNNODE) will be associated with the DPT trunk group during call processing based on both the signaling protocol and the bearer network provisioned in table MNNODE.

The new NGSS (New Generation Session Server) selector identifies the SIP architecture used by the trunk group. When the new NGSS architecture is selected no additional data is necessary. However, when NGSS is not selected, the fields previously under the Dynamic tuple are required.

Table 30 TRKOPTS Provisioning Restrctions

Field	Provisioning Restrictions
BEARNETS	• BNETNAME must be provisioned in table BEARNETS. • Ensure compatibility of the signalling type with the fabric type of the bearer network. • Changes are allowed without restriction and will take effect immediately. Trunk members that are currently call processing will retain their existing network until the call is terminated.

Table 30 TRKOPTS Provisioning Restrctions

Field	Provisioning Restrictions
PROTOCOL	• Changes to the protocol field are not allowed for DPT.

32.5.2.10.8 Translation verification other tools
N/A

32.5.2.11 Core Tables OFRT, OFR2, OFR3, OFR4
Office Routing Tables

Same change applies to each

32.5.2.11.1 Functional description
Unchanged.

New CND/NOT selector condition of BEARNET, to allow conditional routing based on the originator's bearer network.

Changed the name of the PKT conditional selector to FABRIC, and increased the allowable FABRIC range from {ENET} to {ENET, AAL1, AAL2, IP}.

32.5.2.11.2 Usage sequence and implications (CM Only)
Tables must be datafilled in the following sequence:

BEARNETS

OFRT

32.5.2.11.3 Size
Not Changed

Table 31 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
OFRT	unchanged	unchanged	unchanged
OFR2	unchanged	unchanged	unchanged
OFR3	unchanged	unchanged	unchanged
OFR4	unchanged	unchanged	unchanged

32.5.2.11.4 Fields/OIDs
The following table lists fields/OIDs for OFRT, OFR2, OFR3, OFR4.

If CND/NOT condition is FABRIC, will be prompted for FABSEL.

If CND/NOT condition is BEARNET, will be prompted for BEARNETSEL.

Table 32 OFRn Table field descriptions

100 (CND FABRIC ENET ST 901)
   (CND FABRIC IP ST 902)
   (CND FABRIC AAL1 ST 903)
   (CND FABRIC AAL2 ST 904) $ $
```

32.5.2.11.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

32.5.2.11.7 Supplementary information

The above mentioned changes are applicable to all the routing tables OFR2, OFR3, OFR4, IBNRTE, IBNRT2, IBNRT3, IBNRT4 and HNPACONT$RTEREF that have CND and NOT bound in as the route selector.
The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

32.5.2.11.8 Translation verification other tools

The following example shows the output from Traver when it is used to verify OFRT.

32.5.2.12 Core Tables IBNRTn (IBNRTE, IBNRT2, IBNRT3, IBNRT4)

IBN Routing Table

32.5.2.12.1 Functional description

Unchanged

32.5.2.12.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

IBNRTE, IBNRT2, IBNRT3, IBNRT4

32.5.2.12.3 Size

Table 33 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
IBNRTE	Unchanged	Unchanged	Unchanged
IBNRT2	Unchanged	Unchanged	Unchanged
IBNRT3	Unchanged	Unchanged	Unchanged
IBNRT4	Unchanged	Unchanged	Unchanged

32.5.2.12.4 Fields/OIDs

The following table lists fields/OIDs for OFRT, OFR2, OFR3, OFR4.

If CND/NOT condition is FABRIC, will be prompted for PKTSEL.

If CND/NOT condition is BEARNET, will be prompted for BEARNETSEL.

Table 34 IBNRTn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RTE	Unchanged			
RTESEL	Unchanged			

Table 34 IBNRTn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CNDSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,**~~PKT~~,** TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	Conditional Selector based on Bearer FABRIC and Network.
NOTSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,**~~PKT~~**, TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	NOT Selector based on Bearer FABRIC and Network
PKTSEL	Changed.	No	ENET, AAL1, AAL2, IP	Fabrics defined in table BEARNETS
BEARNETSEL	NEW	No	Network Name	NTWKNAME values provisioned in Table BEARNETS

32.5.2.12.5 Datafill example

Similar to the above examples.

32.5.2.12.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

32.5.2.12.7 Supplementary information

The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

32.5.2.12.8 Translation verification other tools

Refer to TRAVER information under table OFRT.

32.5.2.13 Core Tables HNPACONT::RTEREF and FNPACONT::RTEREF

Subtable Route Reference from the Home Numbering Plan Area

Subtable Route Reference from the Foreign Numbering Plan Area

Changes are the same as for OFRn and IBNRTn.

32.5.2.13.1 Functional description

Refer to OFRn.

32.5.2.13.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

HNPACONT::RTEREF & FNPACONT::RTEREF (order between these is unchanged)

32.5.2.13.3 Size

Table 35 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
HNPACONT::RTEREF	Unchanged	Unchanged	Unchanged
FNPACONT::RTEREF	Unchanged	Unchanged	Unchanged

32.5.2.13.4 Fields/OIDs

Same changes as table OFRn.

32.5.2.13.5 Datafill example

Refer to table OFRn.

32.5.2.13.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

32.5.2.13.7 Supplementary information

The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

32.5.2.13.8 Translation verification other tools

Refer to OFRn.

32.5.2.14 GWC_NETWORK_CODEC_PROFILE

32.5.2.14.1 Functional description

This new table is used to store network codec profiles that created by customer. The profiles will be used when customer add GWC node. Please refer to DID document for details.

32.5.2.14.2 Fields

The following table lists fields of this table.

Table 36 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
profilename	New	VARCHAR2 (32)	The name of the profile. It is not allow to be NULL. This field is the primary key of this table.
bearerpath	New	NUMBER	Indicates the bearer network fabric type. Refer to table “BEARERPATH_MAP“. The default value is “0”.
defaultcodec	New	NUMBER	Indicate the default codec. Refer to table “CODEC_MAP“. The default value is “0”.
preferredcodec	New	NUMBER	Indicate the preferred codec. Refer to table “CODEC_MAP“. The default value is “0”.
alternativecodec	New	NUMBER	Indicate the alternative codec. Refer to table “CODEC_MAP“. The default value is “0”.
packetizationinteger	New	NUMBER	Indicate the packetization rate. Refer to table “PACKETIZATION_MAP“. The default value is “0”.
t38	New	NUMBER(1)	Indicate whether the T38 setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.

Field	New/ Changed	Entry	Explanation and action
rfc2833	New	NUMBER(1)	Indicate whether the RFC2833 setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.
comfortnoise	New	NUMBER(1)	Indicate whether the comfort noise setting is enabled. Available values are “0” and “1”. Number “0” indicates disabled, number “1” indicates enabled. The default value is “0”.
bearertypedefault	New	CHAR(1)	Indicate whether this profile is a default profile. Available values are “Y” and “N”. Char “Y” indicates this profile is default profile for this bearer network type, char “N” indicates this profile is not the default one. This field can not be NULL. The default value is “N”. Please note that there will be up to 1 default profile every bearer network fabric type.
networkdefault	New	CHAR(1)	Indicate whether this profile is network default profile. Available values are “Y” and “N”. Char “Y” indicates this profile is the default profile in network, char “N” indicates this profile is not the default one. This field can not be NULL. The default value is “N”. Please note that there will be up to 1 network default profile totally.

32.5.2.15 GWCPROFILE

32.5.2.15.1 Functional description

This table is used to store attributes of Gateway Controller profile. One new field will be added into this table, which is used to indicate whether network instance is needed to be associated to this GWC or not.

32.5.2.15.2 Fields

The following table lists the new field of this table.

Table 37 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
BEARER_INSTANCE_REQUIRED	New	CHAR(1)	Indicate whether network instance is needed to be associated to this GWC or not. Available values are “Y” and “N”. Char “Y” indicates need, char “N” indicates not need. The default value is “Y”. This field can not be NULL.

32.5.2.16 GATEWAYPROFILE

32.5.2.16.1 Functional description

This table is used to store attributes of Gateway profile. One new field will be added into this table, which is used to enhance the fabric type check when customer associate gateway to GWC node. Please refer to DID document for details.

32.5.2.16.2 Fields

The following table lists fields of this table.

Table 38 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
BEARER_FABRIC_RESTRICTION_LIST	New	Embedded table of "RestrictList_NT" type	The Name of this field is: Bearer fabric restriction list. This field can be NULL. This field would list the bearer fabrics to which the gateway is restricted. In most cases, this list will be empty and there will be no restriction. But for some special gateway (e.g. MG9000IP and ATM versions), the values would be provided.

32.6 Service Orders (SO) (CM & SESM)

Not applicable.

32.7 Software optionality control (SOC)

Not applicable.

32.8 Element Management

Prior to SN07, the SESM server could support only one bearer network fabric type (IP/AAL1/AAL2) at one time. As of SN07, each GWC will be associated with a beaer network instance, which defines the associated bearer network fabric type. This information will be provided by the customer as they add the GWC through the GWC-EM. In addition to the beaer fabric instance, GWC-EM will allow the cutomer to define multiple network codec "profiles" in the system and will allow the customer to select the desired profile as they add the GWC to the network.

32.8.1 New/modified GUIs

Table 39 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
GWC-EM	Changed

32.8.2 GUI information

32.8.2.1 GWC-EM GUI

Gateway Controller Element Manager Graphical User Interface

32.8.2.1.1 Functional description

The GWC-EM database will be changed to include a new MIB table: GET_NETWORK_CODEC_PROFILE.

The following functionality is added to the GWC-EM:

1. Support the provisioning of multiple network codec profiles.
   - — Display network codec profile on GWC-EM GUI.
   - — Add network codec profile from GWC-EM GUI.
   - — Delete network codec profile from GWC-EM GUI.
   - — Change network codec profile from GWC-EM GUI.
2. Support the specification of a bearer network fabric instance and a network codec profile for each GWC.
   - — Display bearer network fabric instance and network codec profile of each GWC on GWC-EM GUI.
   - — Associate bearer network fabric instance and network codec profile with one GWC when adding GWC node from GWC-EM GUI.
   - — Change the associated network codec profile of one GWC node from GWC-EM GUI.

32.8.2.1.2 GUI usage and implications

GUIs must be used in the following sequence:

Current datafill order unchanged.

32.8.2.1.3 GUI size

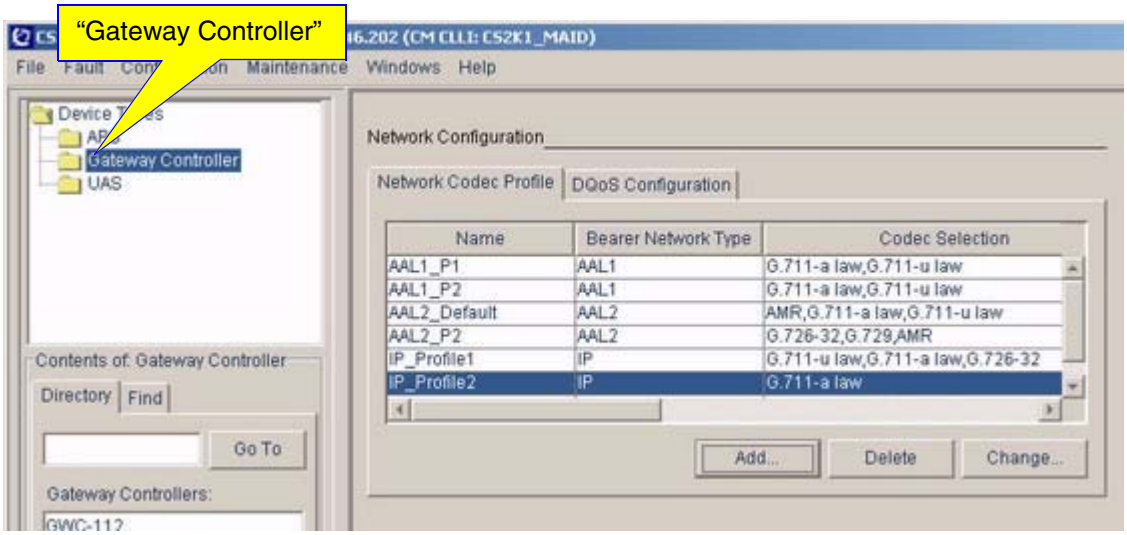
Table 40 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
GWC-EM	Unchanged	Unchanged	Unchanged

32.8.2.1.4 Usage Example: Display network codec profile

When customer click the “Gateway Controller” type from the device type tree at the left side, all network codec profiles will be displayed on the right side. (Please refer to “Figure 13 Network codec profile display panel”)

Figure 13 Network codec profile display panel



All existing codec profiles will be displayed in a table, each profile includes following parameters:

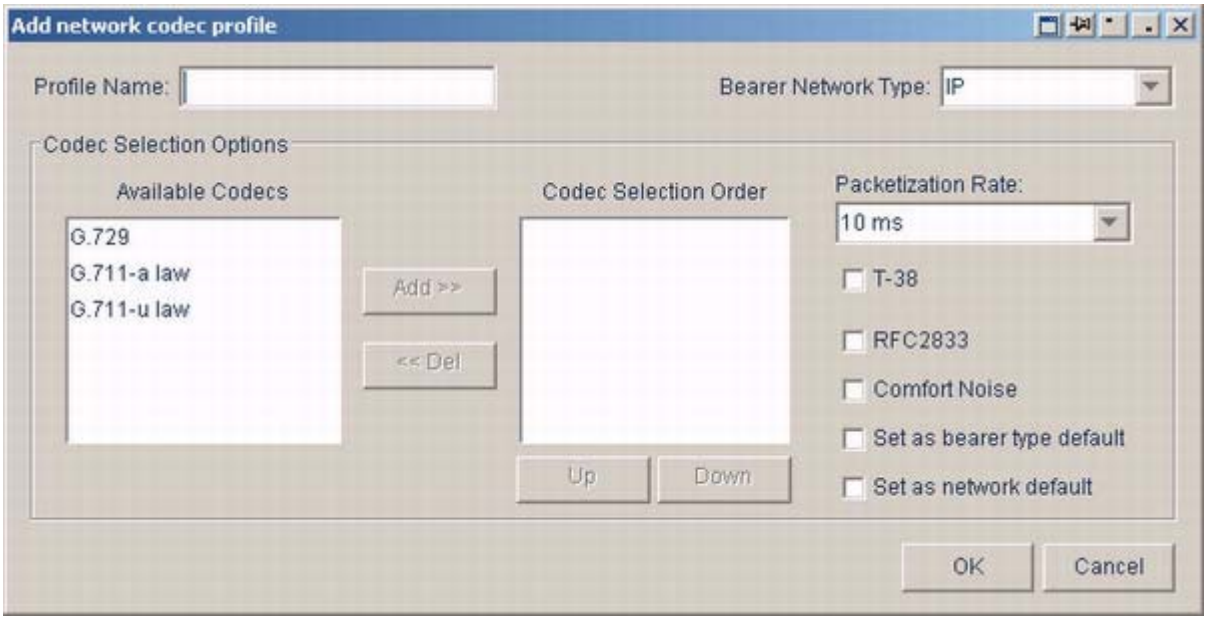
Table 2 Parameters of network codec profile

Parameter name	Description	Notes
Name	The name of the profile.	
Bearer Network Type	Indicates the bearer network fabric type.	
Codec Selection	Indicate the codecs used in this profile.	
Packetization rate	Indicate the packetization rate.	For IP bearer type only.
T-38	Indicate whether the T38 setting is enabled.	For IP bearer type only.
RFC2833	Indicate whether the RFC2833 setting is enabled.	For IP bearer type only.
Comfort noise	Indicate whether the comfort noise setting is enabled.	For IP bearer type only.
Default Profile	Indicate whether this profile is a default profile. Please note that there will be up to 1 default profile every bear network fabric type.	

32.8.2.1.5 Usage Example: Add network codec profile

Customer will be able to add one new network codec profile just by clicking the “Add” button, then a dialog “Add network codec profile” will be popped up. (Please refer to “Figure 14 Add network codec profile dialog”)

Figure 14 Add network codec profile dialog

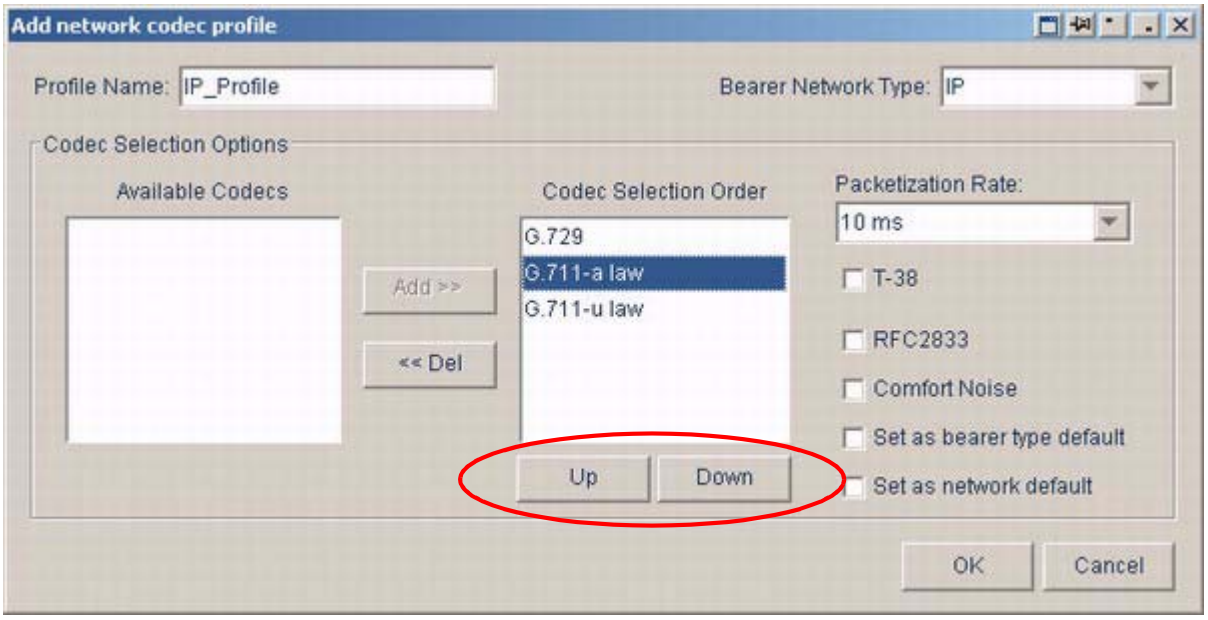


When customer select a bearer network type from the droplist box, the corresponding available codecs will be displayed below in the left list box. The available codec list may be different for different bearer network type.

Please note that the codec selecting is different from SN06 version. Customer won't select different codec for “Compression codec”, “Default codec” and “Alternative Codec” one by one. The available codecs will be listed at left side, customer should be able to select them just by highlighting codec item and clicking the “Add >>” button. Then the selected codec will be added into codec selection. Contrarily, customer could delete some codec from the selection by highlighting the codec item and clicking the button “<< Del”.

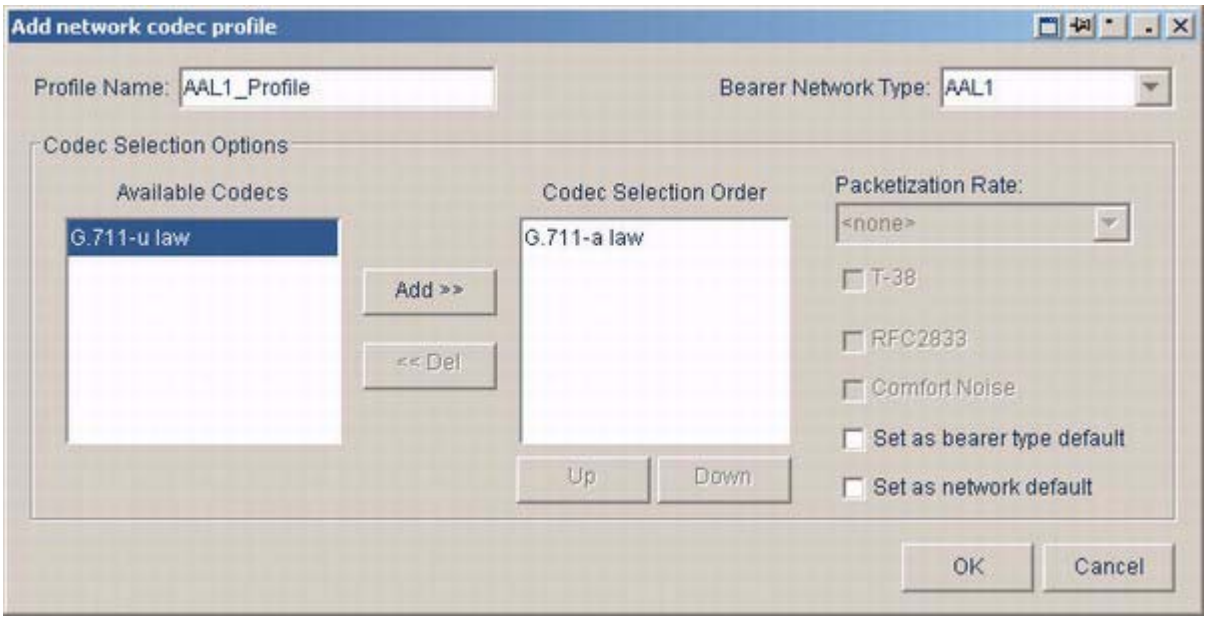
In the codec selection, the order of the codec determines how the device will treat them. For example, the first one will be mapped to “Compression codec”, the second one will be mapped to “Default Codec”, and the last one will be mapped to “Alternative Codec”. Additional, customer could change the order of codecs by highlighting the codec item and clicking the “Up” and “Down” buttons.

Figure 15 Change the order of codecs in the selection



Please note that parameters “Packetization Rate” and LCO options (T38, RFC2833, and Comfort Noise) are settings for IP bearer type only. If customer select “AAL1” or “AAL2” as the bearer network fabric type, these settings will be disabled.

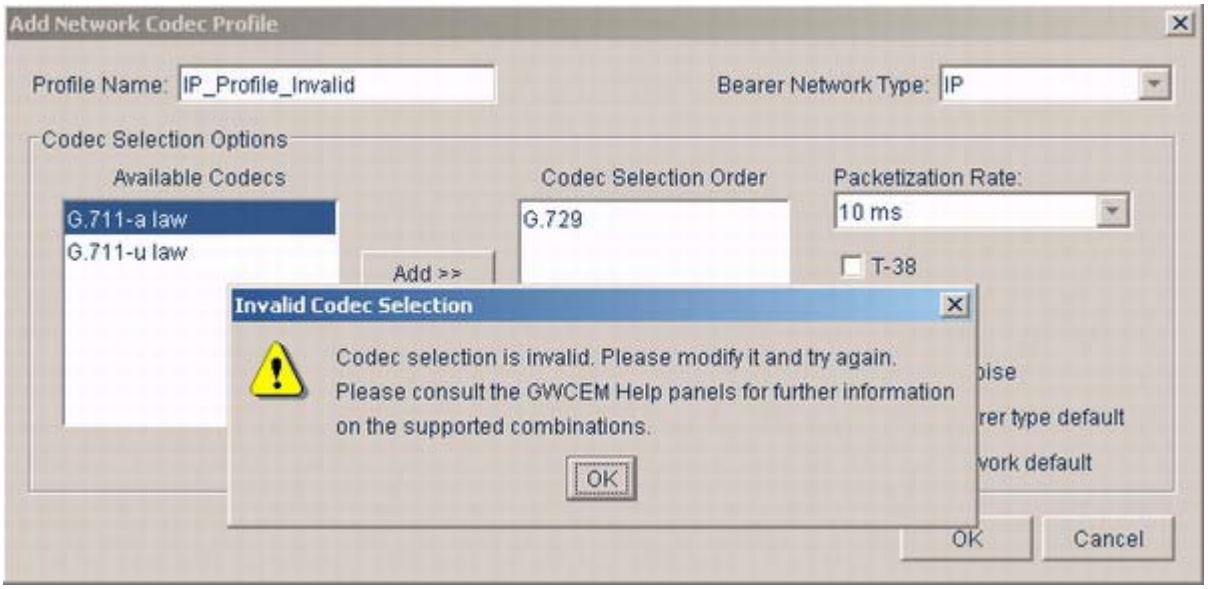
Figure 16 Select “AAL1” as the bearer network fabric type



Customer will be able to use the recommended codec setting by clicking the button “Recommended Codec Setting”, then the recommended setting will be restored into the dialog. Note that the recommended codec setting will be different for different bearer network type.

If customer select an invalid codec selection, alert dialog will be popped up. (Please refer to “Figure 17 Alert dialog for invalid codec selection”)

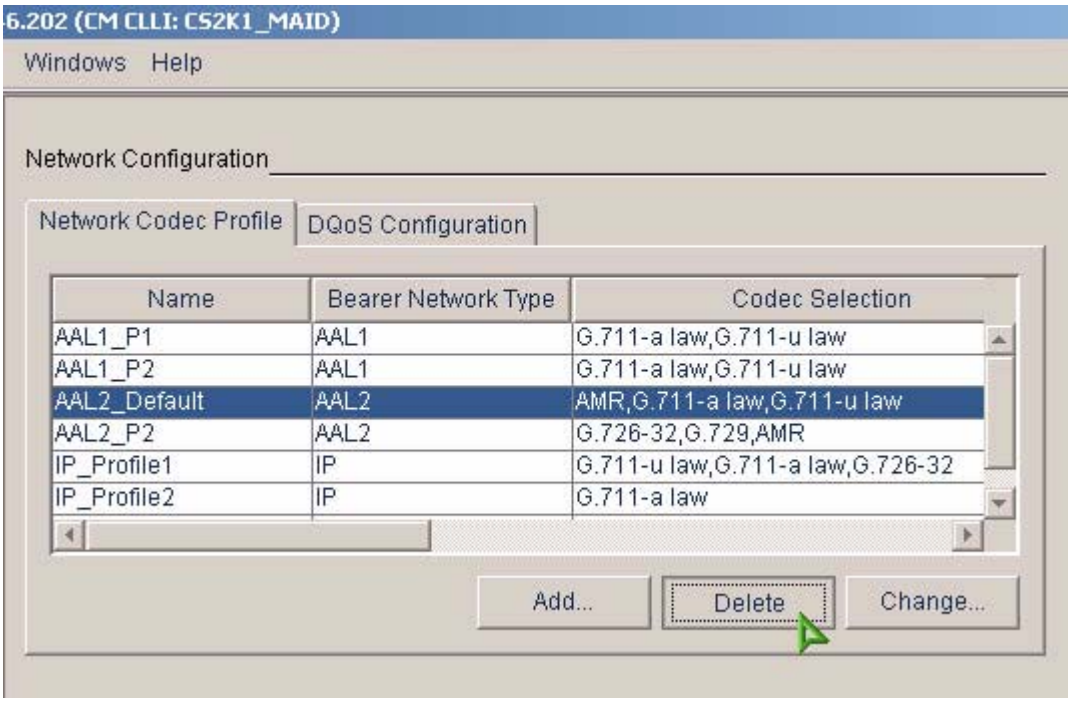
Figure 17 Alert dialog for invalid codec selection



32.8.2.1.6 Usage Example: Delete network codec profile

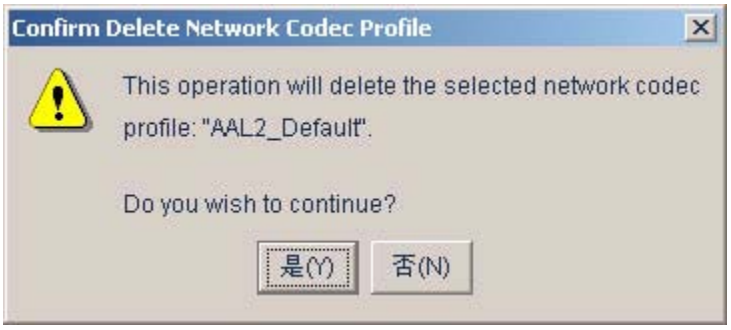
Customer will be able to delete one existing network codec profile just by highlighting the profile row from the table, and click the “Delete” button. (Please refer to “Figure 18 Delete existing network codec profile”)

Figure 18 Delete existing network codec profile



Once customer click the “Delete” button, one confirmation dialog will be popped up.

Figure 19 Delete network codec profile confirmation dialog

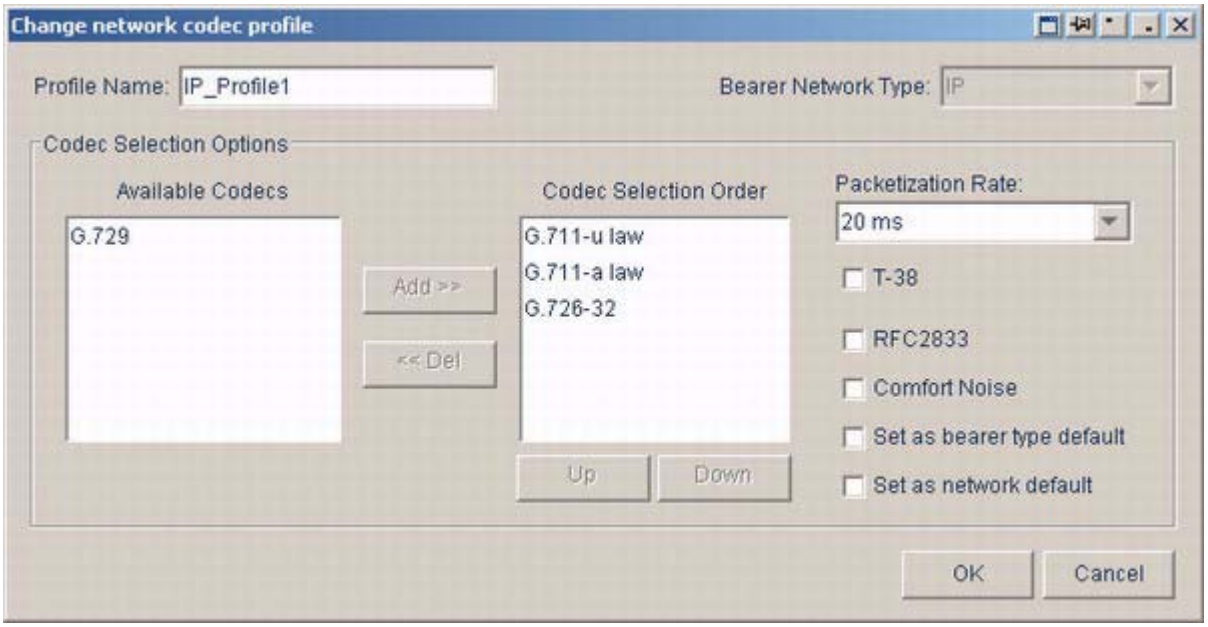


The operation result will be displayed in a pop-up dialog, and the codec profile table will be updated according to the result. Please note that if any GWC using this profile, the delete operation will be failed.

32.8.2.1.7 Usage Example: Change network codec profile

Customer will be able to change one existing network codec profile just by highlighting the profile row from the table, and click the “Change” button. Then the dialog “Change network codec profile” will be popped up. All parameters of the profile will be filled in the dialog. (Please refer to “Figure 20 Change existing network codec profile”)

Figure 20 Change existing network codec profile

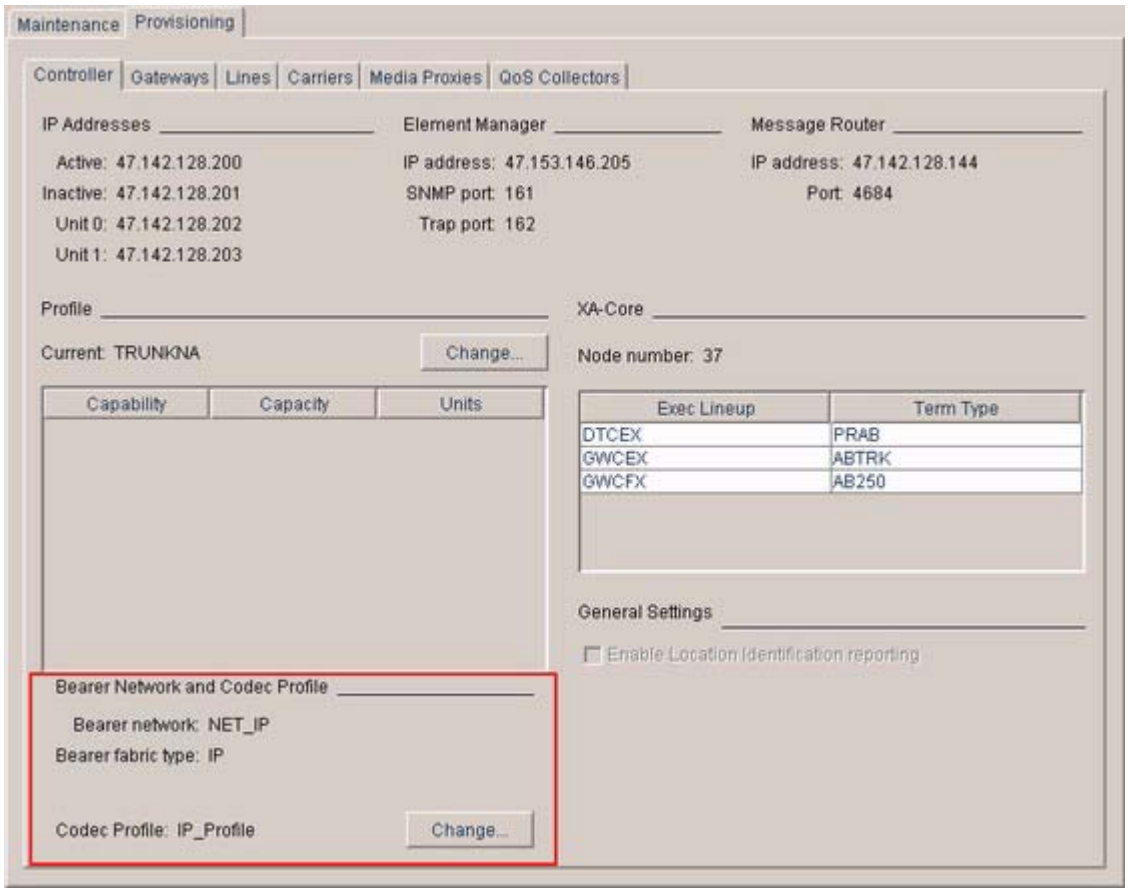


Note that the bearer network type of the profile is not allowed to be changed. Please refer to "32.8.2.1.5 Usage Example: Add network codec profile" section for how to change other parameters. Once the profile was updated successfully, these parameters will be updated into all GWCs using this profile.

32.8.2.1.8 Usage Example: Display GWC node

A new section will be added to the GWC provisioning panel to indicate the bearer network and codec profile configuration for the selected GWC.

Figure 21 Display GWC node



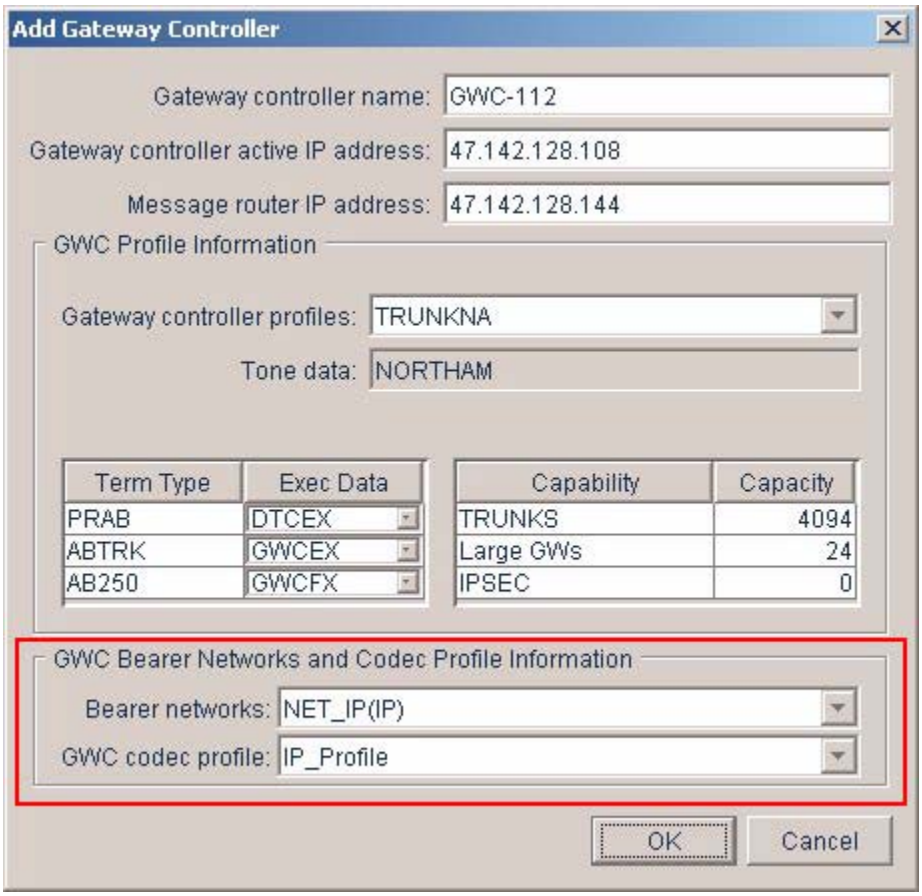
The new section includes two parts, one is bearer network area and another is codec profile area. A “Change...” button will be added to the right of the codec profile fields to allow customer to change the codec configuration for the GWC.

This information will be displayed on the GUI with other GWC’s informations together while customer select a GWC from the GWC device list tree.

32.8.2.1.9 Usage Example: Add GWC node

Two new list boxes will be added to the “Add GWC Node” dialog to allow customers to select a specific bearer network instance and codec profile while a GWC is adding to the system.

Figure 22 Add GWC node



One of these two new box contains the bearer network list, another contains the codec profile list. The codec profile list must match the bearer network, that means, if customers select a bearer network instance belonging to “IP” bearer type, then the codec profile box will only contain the names of “IP” codec profiles; if customer select a “AAL1” bearer network instance, the codec profile box will be changed to only contain the “AAL1” codec profile names.

And if customers leave the codec profile box not selected, a default codec profile based on the bearer network type will be selected automatically.

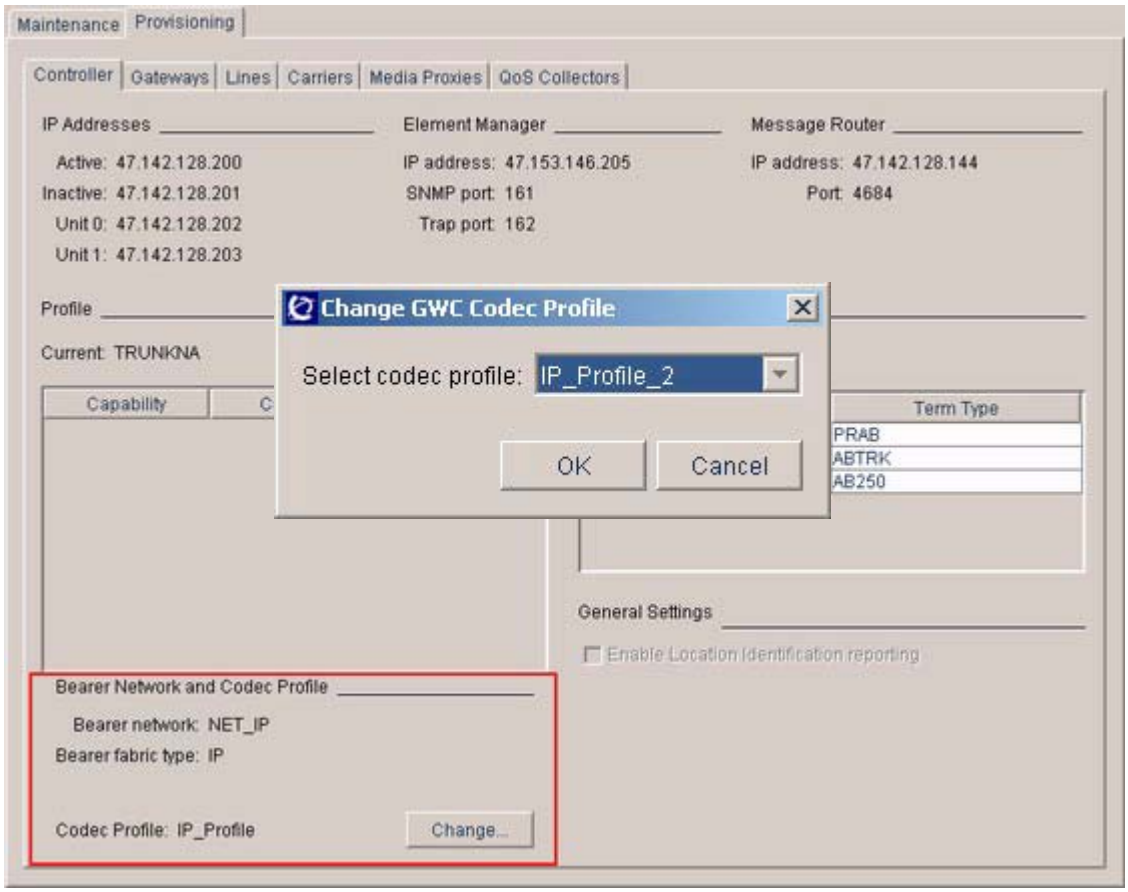
Once the addition operation has been performed successfully, a dialog like following will be pushed to the customer to indicate that the GWC was added to the system without errors.

Figure 23 Add GWC node result dialog

32.8.2.1.10 Usage Example: Change GWC network codec profile

When customers click the “Change...” button on the right of the codec profile fields on the GWC provisioning panel, a “Change Codec Configuration” dialog will be created like the following figure.

Figure 24 Change GWC's network codec profile



From this dialog, customers can select a different codec profile for the specific GWC even after the GWC has been provisioned already and a dialog with successful information will be displayed for customers if the operation has been performed without errors. Otherwise, a error message will be returned to the customers.

32.8.2.1.11 GUI release history update

1. Support the provisioning of multiple network codec profiles.
   - — Display network codec profile on GWC-EM GUI.
   - — Add network codec profile from GWC-EM GUI.
   - — Delete network codec profile from GWC-EM GUI.
   - — Change network codec profile from GWC-EM GUI.

2. Support the specification of a bearer network fabric instance and a network codec profile for each GWC.
   - — Display bearer network fabric instance and network codec profile of each GWC on GWC-EM GUI.
   - — Associate bearer network fabric instance and network codec profile with one GWC when adding GWC node from GWC-EM GUI.
   - — Change the associated network codec profile of one GWC node from GWC-EM GUI.

32.8.2.1.12 Supplementary information

32.9 Command interface changes

32.9.1 Directory: TRAVER

32.9.1.1 Directory description

TRAnslations VERification.

32.9.1.2 Accessing directory: TRAVER

32.9.1.2.1 Access to directory or MAP level and return to CI

CI> TRAVER <traver options>

Traver is a single command interface rather than an envirnment that is entered. You are automatically returned to the CI level after execution of the command.

32.9.2 Command: TRAVER TR

32.9.2.1 Command type: unchanged

32.9.2.2 Command target: unchanged

32.9.2.3 Command availability: unchanged

32.9.2.4 Command description

Traver an originating trunk based with the digits provided. The originating trunk (TRAVER TR) command is changed as follows:

When encountering a CND FABRIC or CND BEARNET selector in the translations route, three options are created for determining the originator's bearer fabric or network in order to determine how to interprete the CND route selection.

- TRKMEM option: The fabric or network of the member specified will be used.
- NEW BEARNET option: Allows the user to specify the bearer network (32 char vector identifying a BNETNAME provisioned in table BEARNETS) of the specifified trunk group.
- If none of the above options is specified, the TDM network will be assumed for the specified trunk group for non-DPT trunk groups.
- For DPT trunk groups, where none of the above options is specified, the bearer fabric or network will be obtained from table TRKOPTS.

32.9.2.5 Command syntax

Table 41 <CommandName> command parameters and variables

Command	Parameters and variables
TRAVER **TR**	Next par is: <CLLI> STRING Enter: <CLLI> [<CLLIOPT>] [<MBGOPTS>] [<TRIGOPT>] **[<TRKMEM>] [<BEARNET>]** <DIGITS OR N FOR NO DIGITS> [<CDNIE>] [<NSF>] [<TNSIE>] [<OSAIE>] [<BC>] [<SR>] [<PI>] [<TRI>] [<NETINFO>] [<FINFO>] [<RPOAP>] [<RPOAS>] [<NOA>] [<AIN_OPTIONS>] [<AIN_INFO>] [<SCAIIN>]
Parameters and variables	Description
[<TRKMEM>}	Existing option. Input is unchanged. Will now be used to obtain the bearer network and bearer fabric to be used when making conditional translations decisions CND FABRIC or CND BEARNET.
[<BEARNET>]	New option. Allows user to specify the bearer network (up to 32 character BNETNAME provisioned in table BEARNETS) to use as the originating bearer network. This will also imply the FABRIC, since the FABRIC is a field in table BEARNETS. Both of these will be used when making conditional routing decsions based on FABRIC or BEARNET (CND selectors). The network specified will be used, even if the trunk group does not have members on that network.

32.9.2.6 Qualifications and warnings

- Non-DPT trunk groups can have members that are spread across the varioius networks. During call processing, an effort will be made to match the originator's network to a trunk member of a like network. Traver will not be enhanced to show this selection process.

- Line group originations (eg: HUNT, MDN, ACD) will use the network fabric of the originating member of the group to determine the network fabric.
- If the FABRIC or BEARNET option is used to specify the bearer network information of a trunk group, this information will be used in TRAVER to determine the routing, even if the trunk group does not have members in that network. This allows users to test the translations before adding members, but also allows for verification to pass when during call processing it could actually fail.

32.9.2.7 Responses

32.9.2.7.1 Undefined BEARNET specified

Since the user will be prompted for a 32 character string rather than a list of tuples provisioned in table BEARNET, an invalid entry should be met with a response indicating where to look for the valid information.

Table 42 MAP outputs with associated meanings and actions

Command TRAVER TR <trunk group CLLI> <digits> BEARNET <BNETNAME>
<RESPONSE>: <description> **Meaning:** The BEARNET name entered does not exist in table BEARNETS. **System or user actions:** Choose a BNETNAME of out table BEARNETS.
<RESPONSE>: <description> **Meaning:** **System or user actions:**

Not applicable.

32.11 Configuration Walkthrough

33: Configuration (CN): A00003489

This chapter documents the changes to the Data Schema introduced by activity A0003489. Specifically it documents the changes to the behavior of table LTCINV for the SMS Peripeheral Type.

33.1 Hardware and Software Requirements

Not required.

33.2 Initial Configuration

Not required.

33.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not required.

33.4 Upgrade Impact

Not required.

33.5 Data schema (DS) (CM, MIBS, RDB)

New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
LTCINV	Changed	Unchanged

33.5.1 Table/MIB/Remote Database Schema information

33.5.1.1 Name: LTCINV

Table LTCINV lists all the line and trunk controlling peripherals in the office. Historically they all were connected to the ENET and this table was used (among other things) to datafill the details of this connection. With the ABI program some XPM types were now allowed to subtend the packet network. To support this architectural change the EXTDS512 optional field was added to this table in SN06. Only those XPM types that were allowed to subtend the packet network were allowed to use this new optional field. This feature adds SMS to the list of XPM types that can be datafilled as subtending the packet network using this optional field.

There is no change in the format of the table or in the format of the optional field, all that has been changed is the types of peripherals that are allowed to have the field provisioned. All other types of peripherals that can be added in table LTCINV will continue to receive an error message if the EXTDS512 field is provisioned.

Note: Please refer to the documentation for SN05 activity A59038361 for more detailed information of the initial EXTDS512 design.

33.5.1.1.1 Usage sequence and implications (CM Only)

Current datafill order unchanged (SERVRINV must be datafilled prior to adding EXTDS512 peripherals in LTCINV).

33.5.1.1.2 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LTCINV	Unchanged by this activity.	Unchanged by this activity.	All existing tuples, regardless of whether the EXTDS512 attribute is provisioned or not, have the physical space allocated for the information contained in this field; therefore, there is no memory impact from this activity as the memory is already allocated for all tuples in this table.

33.5.1.1.3 Fields/OIDs

The following table lists fields for LTCINV.

CSLNKTAB = “$”

OPT_ATTR = EXTDS512

When provisioning an external (non-ENET hosted) peripheral in LTCINV the EXTDS512 OPT_ATTR must be added. This optional attribute includes the IP Address of the DS512 (ABI) card in the MG9000 and Gateway Controller host name (as provisioned in table SERVRINV).

It should be noted that the CSLNKTAB portion of the tuple is not datafilled when adding external XPMs. The content of the CSLNKTAB field is automatically generated by the LTCINV code and no longer refers to real C-

side links to the ENET. A “$” should be entered when prompted for the CSLNKTAB entry (this is unchanged from SN05 behavior).

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CSLNKTAB	Changed	Unchanged from SN05	None	For External XPMs this field no longer contains real C-side ENET links. Instead, “$” should be entered when prompted for this field. With this activity you should now enter “$” when provisioning External SMS tuples in LTCINV.
OPT_ATTR (EXTDS512)	Changed	Unchanged from SN05	Unchanged from SN05	When datafilling external SMS peripherals you should add this field and enter the IP address of the DS512 card in the MG9000 and the name of the host GWC (from table SERVRINV).

33.5.1.1.4 Datafill example

The following example shows sample datafill for table LTCINV. The changes from standard ENET-based peripheral datafill is highlighted with **bold** characters.

```

>
```

33.5.1.1.5 Table release history update

following changes were made:

1. EXTDS512 OPT_ATTR is now allowed for the SMS peripheral type.
2. "$" should be entered in the CSLNKTAB field for external XPMs (the C-side link information will be generated automatically).

33.5.1.1.6 Supplementary information

- The CSLNKTAB and EXTDS512 optional attribute must align in each tuple in LTCINV. This means that if EXTDS512 exists then a "$" must have been entered in the CSLNKTAB field. A tuple must be either ENET based on External but not a combination of both.
- Multiple tuples of each type (ENET and External) can exist in the table at the same time.
- The EXTDS512 optional attribute can be provisioned only against LTC, LGC, LTCI, LGCI, SMA2, and SMS peripheral types. Attempting to add the optional attribute to other peripheral types will result in the tuple failing verification and an error will be displayed.
- The derived CSLNKTAB entries for External XPMs cannot be changed by the user.
- The ability to change the Host Gateway Controller for External XPMs is not allowed.

- The EXTDS512 optional attribute cannot be added to an existing tuple using the change command in table control, nor can it be removed using change.

33.5.1.1.7 Translation verification other tools

Output from the check all table control command and tabaudit will be included at a later date, but no issues are expected with these commands as the changes to LTCINV are minor.

33.5.1.1.8 Table Changes

As part of feature A00003486 ‘Gateway location information’ the format of the LTCINV tuple will be changing. This will impact how an External SMS will be datafilled in the CM. There will be no changes to this table unique to SMS. For details on the changes consult the documentation for that feature.

33.6 Service Orders (SO) (CM & SESM)

Not Required.

33.7 Software optionality control (SOC)

Not Required.

33.8 Element Management

Not Required.

33.9 Command interface changes

33.9.1 Directory: MAPCI;MTC;PM

33.9.1.1 Directory description

No new commands or parameters have been introduced, however due to the ABI supported host XPMs in this feature, certain maintenance functions and states will be supported for the ABI host XPMs. When an ABI peripheral (LTC, LTCI, LGC, LGCI, SMA2, or SMS) subtending a GWC is posted the display looks just like it did for the same peripheral posted as a direct HOST peripheral (legacy).

33.9.1.2 Accessing directory: PM

33.9.1.2.1 Access to directory or MAP level and return to CI

The updated displays are accessed through the PM (peripherals) level of the maintenance (MTC) level of the DMS core command interface (MAPCI).

33.9.1.3 SN07 Enhancements

Features A00003486 ‘Gateway location information’ and A00002137 ‘DS512 Link Mtc Robustness - CM’ will be adding additional information and commands to the PM level for External XPMs. This will provide more information on the nodes on the C-Side of the XPM. The SMS will get full advantage of those changes and there is no SMS specific information being added. See the documentation for those two features for more details.

33.9.2 Command: TRNSL C

33.9.2.1 Command type: Listed MENU

33.9.2.2 Command target: All

But will only appear for Succession ABI peripherals.

33.9.2.3 Command availability: RES

33.9.2.4 Command description

TRNSL C (translate c-side links) is not a new command, however when an LTC, LTCI, LGC, LGCI, SMA2, or SMS subtends a GWC (gateway controller), the TRNSL C will display the c-side links of the peripheral as connecting to a GWC.

Each c-side link will simply reflect the name of the gateway controller to which it subtends. Link 0, 1, 4 and 5 (the message links) reflect the actual status of the c-side links. Currently, the speech links have the following string hardcoded as their status “**;Cap S;Status:OK”.

It is important to note that TRNSL C indicates only which GWC supertends the ABI peripheral, it does not display the MG9K or ABI card that is in use for the messaging path.

33.9.2.5 Command syntax

Table 4 TRNSL C command parameters and variables

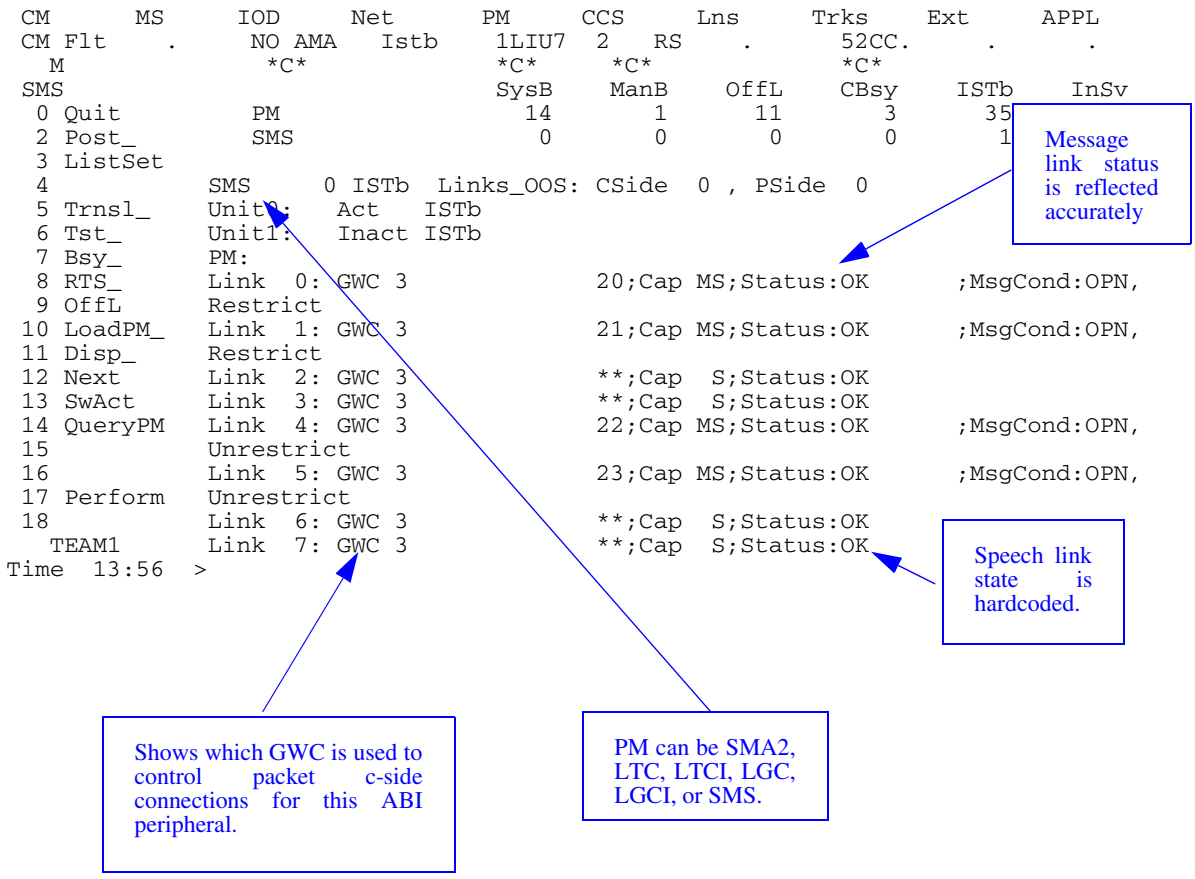
Command	Parameters and variables
TRNSL C	unchanged
Parameters and variables	unchanged

33.9.2.6 Qualifications and warnings

The TRNSL C command will provide the user with the following additional information when a GWC is involved:

“Please refer to the DS512 Interface EM for all link maintenance commands.”

It should be noted that maintenance actions on the c-side links (e.g. bsy link 0, rts link 1, etc.) can only be performed on the c-side message links for ABI peripherals.
Usage example for **“MAPCI;MTC;PM; POST <XPM>;TRNSL C “command**



33.10 Security

Not Required.

33.11 Configuration Walkthrough

Not Required.

34: Configuration (CN): A00003490

34.1 Hardware and Software Requirements

The purpose of this feature is to rehome existing ENET/JNET XPMs to the ABI DS-512 interface off MG 9000.

Therefore the following hardware is required:

- An available LGCI , SMA2, LGC, LTC, LTCI, SMS
- GWCs that will be hosting XPMs need to be configured and datafilled in table SERVRINV
- DS-512 Interface cards should be installed in the appropriate MG 9000 Gateways and their base IP address known.

Because this feature is a part of the larger installation method to rehome XPMs to the ABI configuration, please refer to the Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" for a complete list of required hardware to perform the rehome.

Software requirements:

- SN07 or later Succession Core load

34.2 Initial Configuration

This feature, when enabled, provides the ability to rehome an existing ENET/JNET XPM by changing its data in table LTCINV. The ability to rehome XPMs involves turning on the rehome capability via the ABIREHOME tool and splitting the Core. This is but one step of an overall process to rehome the ENET/JNET based XPMs. For the complete process, please refer to Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome."

34.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable.

34.4 Upgrade Impact

No Impact.

34.5 Data schema (DS) (CM, MIBS, RDB)

This feature does not introduce any new tables, fields, or field values in any table. It permits, when enabled, the ability to rehome an existing ENET/JNET XPM by *changing* its data in table LTCINV (rather than having to delete and re-add the tuple).

In order to provide this *change* capability, some limitations and restrictions have been modified. Please refer to"Limitations and Restrictions" in the Functional description (FN) section for a complete list of limitations and restrictions.

34.6 Service Orders (SO) (CM & SESM)

Not Applicable.

34.7 Software optionality control (SOC)

Not Applicable.

34.8 Element Management

Not Applicable.

34.9 Command interface changes

34.9.1 Directory: TASTOOLCI (changed)

Two commands removed:

- SET_ABI_REHOME_STATUS
- QUERY_ABI_REHOME_STATUS

34.9.1.1 Directory description

This CI command directory is password protected and exists for use by TAS (Technical Assistance) personnel in various upgrade scenarios which involve splitting the switch and using the SWACT functionality to enable behavior.

The above commands are reomved from TASTOOLCI, and are accessible only from the ABIREHOME tool, described below.

34.9.1.2 Accessing directory: TASTOOLCI

34.9.1.2.1 Access to directory or MAP level and return to CI

Not changed.

34.9.2 Directory: ABIREHOME (new)

Commands:

- QUERY_ABI_REHOME_STATUS / QRS
- QUERY_IMPACTED_NODES / QIN
- FIND_AFFECTED_NODES / FAN
- SHOW_NODE_STATUS / SHOWNS
- DISP_LINK_CHANNEL_MAP / DLC
- DISP_LINK_INFO / DLI
- DISP_IOUI_ROUTE_DATA / DRD
- SET_ABI_REHOME_STATUS
- ADJUST_FRAME_SYNC / AFS
- MARK_NODE_DS512_RESULT / VER512
- SEND_GWC_STATIC_DATA / GWCSD
- ABORT_GWC_STATIC_DATA / ABORT_GWCSD
- LINE_STATUS_CHG

Hidden Commands:

The following commands are HIDDEN and are used for debugging / correcting errors encountered as a part of Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" to enable the ability to rehome an XPM from ENET/JNET C-side links to an ABI DS-512 off of an MG 9000.

These HIDDEN commands should not be executed in the field, except by qualified Nortel person.

- SLC (set link channel map)
- SAN (set affected node)
- CAN (clear affected node)
- CLEAR_GWC_SD_TABLE
- SHOW_GWCSD

34.9.2.1 Directory description

This CI command directory is used for ABI rehome specific commands once the functionality has been enabled via TOOLSUP password control. Invasive commands within this directory require the execution of the

SET_ABI_REHOME_STATUS ON command before their functionality is enabled.

There are numerous commands which do not appear in the HELP documentation, and therefore are generally hidden from the average user. It is the intent that these commands are not to be executed except by TAS / GNPS in an error recovery and/or data collection mode.

34.9.2.2 Accessing directory: ABIREHOME

34.9.2.2.1 Access to directory or MAP level and return to CI

Prior to an attempt to access the ABIREHOME directory at the map, the tool must be enabled by executing the TOOLSUP command “access on abirehome,” and entering the proper daily password.

To access ABIREHOME from the CI environment, enter “abirehome” from the command interface.

To return to the CI environment, enter “quit”.

34.9.3 Command: ABIREHOME: QUERY_ABI_REHOME_STATUS / QRS

34.9.3.1 Command type: NON-MENU

34.9.3.2 Command target: All

34.9.3.3 Command availability: RES

34.9.3.4 Command description

This command is used to display the current state of the ABI Rehome.

34.9.3.5 Command syntax

Table 1 <CommandName> command parameters and variables

Command	Parameters and variables
QUERY_ABI_REHOME_STATUS or QRS	n/a
Parameters and variables	Description
n/a	

34.9.3.6 Qualifications and warnings

None.

34.9.3.7 Responses

34.9.3.7.1 QUERY_ABI_REHOME_STATUS responses

Table 2 MAP outputs with associated meanings and actions

QUERY_ABI_REHOME_STATUS
`Displays the status of the ABI Migration control structures.` **Meaning:** Help associated with command. **System or user actions:** Informational purposes only.
`Current ABI Rehome State is: {ON, OFF, SUSPENDED}` **Meaning:** Output regardless of status entered. If ON, the rehome process has been enabled. If OFF, the rehome process has been disabled, and all node rehome data is currently at default values. If SUSPENDED, a rehome was begun, and interrupted by the user. In this state, the control bool is FALSE, but there could be node rehome data that is not at default values. **System or user actions:** None. This is for informational purposes.
`ABI XPM Rehome Control Enabled: {Y, N}` **Meaning:** Displays the state of the control bool that enables the table control and ABIREHOME CI tool functionality. **System or user actions:** None. This is for informational purposes.

`There are nodes which have been marked as rehomed.`
`Please use QUERY_IMPACTED_NODES/QIN for more information.`
 	
Meaning: There are nodes which have been marked as impacted by Rehome. All node rehome data is cleared if SET_ABI_REHOME_STATE with ON or OFF is executed. Individual nodes can be cleared by utilizing the VER512 <node> FAIL command.
 	
System or user actions: None. This is for informational purposes.

`There are no nodes marked as impacted.` **Meaning:** There are no nodes which have rehome data associated with them. The rehome state can be turned ON or OFF without impacting any existing data. **System or user actions:** None. This is for informational purposes.

34.9.3.8 Example

Table 3 Usage examples for QUERY_ABI_REHOME_STATUS command

Description of task:	
QRS	Current ABI Rehome State is: ON ABI XPM Rehome Control Enabled: Y There are nodes which have been marked as rehomed. Please use QUERY_IMPACTED_NODES/QIN for more information.

34.9.4 Command: ABIREHOME: QUERY_IMPACTED_NODES / QIN

34.9.4.1 Command type: NON-MENU

34.9.4.2 Command target: All

34.9.4.3 Command availability: RES

34.9.4.4 Command description

This command is used as a part of Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" to enable the ability to rehome an XPM from ENET/ JNET C-side links to an ABI DS-512 off of an MG 9000.

Query impacted nodes will display all nodes that have been marked as impacted by the rehome.

34.9.4.5 Command syntax

Table 4 QUERY_IMPACTED_NODES command parameters and variables

Command	Parameters and variables
QUERY_IMPACTED_NODES or QIN	n/a
Parameters and variables	Description
n/a	

34.9.4.6 Qualifications and w arnings

None.

34.9.4.7 Responses

34.9.4.7.1 QUERY_IMPACTED_NODES responses

Table 5 MAP outputs with associated meanings and actions

QUERY_IMPACTED_NODES
`There are no nodes marked as impacted.` **Meaning:** No nodes have been marked as impacted. **System or user actions:** Informational purposes only.
`Displays all nodes currently marked as impacted in the rehome node data.` **Meaning:** Help associated with command. **System or user actions:** Informational purposes only.

`Impacted Nodes`
`--------------`
`Node 68: LTC_NODE SMA2 1`
`Node 77: IDT_NODE IDT 99`
 	
Meaning: Node numbers 68 and 77 have been marked as impacted, and will be treated as rehomed during a NRS (norestartswact).
 	
System or user actions: Informational purposes.

34.9.4.8 Example

Table 6 Usage examples for command QUERY_IMPACTED_NODES

Description of task:	

QIN	`Impacted Nodes`
	`--------------`
	`Node 68: LTC_NODE SMA2 1`
	`Node 77: IDT_NODE IDT 99`

34.9.5 Command: FIND_AFFECTED_NODES / FAN

34.9.5.1 Command type: NON-MENU

34.9.5.2 Command target: All

34.9.5.3 Command availability: RES

34.9.5.4 Command description

This command is used as a part of Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" to enable the ability to rehome an XPM from ENET/ JNET C-side links to an ABI DS-512 off of an MG 9000.

Given a node number of an XPM, this command will show all nodes that would be impacted by a rehome of that XPM, by recursively searching its p-side links.

34.9.5.5 Command syntax

Table 7 command parameters and variables

Command	Parameters and variables
FIND_AFFECTED_NODES or FAN	<NODE NUMBER> {0 to 4095}
Parameters and variables	Description
node	Node number of the XPM. Node number can be found by performing QueryPM while the XPM is POSTed at the map. <NODE NUMBER> {0 to 4095}

34.9.5.6 Qualifications and warnings

None.

34.9.5.7 Responses

34.9.5.7.1 FIND_AFFECTED_NODES / FAN responses

Table 8 MAP outputs with associated meanings and actions

FIND_AFFECTED_NODES/FAN
FIND_AFFECTED_NODES: Displays the affected nodes for given XPM node --- Syntax: FIND_AFFECTED_NODES node or FAN node Parms: <NODE NUMBER> {0 TO 4095} **Meaning:** Help associated with command. **System or user actions:** Informational purposes only.
Node number is not a supported XPM. **Meaning:** The node number provided is not an XPM that can be supported from an ABI interface. The command will work whether the XPM is currently on an ENET/JNET interface or off of an ABI interface, but the XPM type must be able to be supported on either interface. **System or user actions:** Informational purposes.
Given node: --- Node 69: LTC_NODE SMA2 1 Subtending nodes: --- Node 77: IDT_NODE IDT 5 **Meaning:** For the given XPM number, display the node type and device information for each subtending nodes. Nodes which subtend a node are shown indented under that node. **System or user actions:** Informational purposes only.

34.9.5.8 Example

Table 9 Usage examples for command FIND_AFFECTED_NODES/FAN

Description of task:	
FIND_AFFECTED_NODES or FAN	Given node: --- Node 69: LTC_NODE SMA2 1 Subtending nodes: --- Node 77: IDT_NODE IDT 5

34.9.6 Command: ABIREHOME: SHOW_NODE_STATUS / SHOWNS

34.9.6.1 Command type: NON-MENU

34.9.6.2 Command target: All

34.9.6.3 Command availability: RES

34.9.6.4 Command description

This command is used as a part of Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" to Display the rehome status of a given node,or all Affected Nodes.

34.9.6.5 Command syntax

Table 10 <CommandName> command parameters and variables

Command	Parameters and variables
SHOW_NODE_STATUS or SHOWNS	<NODE NUMBER or ALL>
Parameters and variables	Description
NODE NUMBER	The Node number of the xpm.
ALL	Display the status of all the nodes.

34.9.6.6 Qualifications and warnings

None

34.9.6.7 Responses

34.9.6.7.1 SHOW_NODE_STATUS responses

Table 11 MAP outputs with associated meanings and actions

SHOW_NODE_STATUS

```
SHOW_NODE_STATUS:  Displays the status of XPM nodes which are marked as
'Impacted' by the rehome. It does not display the subtending nodes.
------------------------------------------------------------
Syntax: SHOW_NODE_STATUS node/ALL
        or
        SHOWNS node/ALL

Parms: <NODE NUMBER or ALL> {0 TO 4095,
                             ALL}
```

Meaning: Help associated with command.

System or user actions: Informational purposes only.

```
  DS512 link verification result is: UNEXECUTED
  Provisioning state is             : PASS
  NoRestartSwact state is           : UNEXECUTED
  GWC Static Data Download state is: UNEXECUTED
```

Meaning: Output of the SHOW_NODE_STATUS on a node.

System or user actions: None - informational only.

```
DS512 link Verification result is: {PASS, FAIL, UNEXECUTED}
```

Meaning: The SHOWNS command displays four key data points for a rehoming XPM. The DS512 link verification result is changed via the ABIREHOME VER512 command. The ABIREHOME VER512 command is executed as one of the steps in the Installation Method 72-1639 "XPM - ABI Link Verification." PASS indicates that the Installation Method has been executed successfully for the specified node. FAIL indicates that the Installation Method has been executed, but failed, for the specified node; the Installation Method should be referenced for appropriate action. UNEXECUTED indicates that the Installation Method has not been executed for the specified node.

System or user actions: If FAIL is encountered reference the Installation Method for appropriate action.

Table 11 MAP outputs with associated meanings and actions

SHOW_NODE_STATUS
`provisioning state is : {PASS, FAIL, UNEXECUTED}` **Meaning:** The SHOWNS command displays four key data points for a rehoming XPM. The Provisioning State indicates the status of the LTCINV and/or GATWYINV data manipulation while ABI Rehome is in progress on the Inactive XACore. This Provisioning State is only tracked for XPMs which are compatible with ABI C-side links. PASS indicates that the XPM's LTCINV and/or GATWYINV tuples have been successfully manipulated on the Inactive XACore while ABI Rehome is in progress. FAIL indicates that the XPM's LTCINV and/or GATWYINV tuples have failed manipulation on the Inactive XACore while ABI Rehome is in progress; the Installation Method should be referenced if this is unexpected. UNEXECUTED indicates that neither LTCINV nor GATWYINV tuple manipulation has been attempted for the XPM on the Inactive XACore while ABI Rehome is in progress. **System or user actions:** If FAIL is encountered reference the Installation Method for appropriate action.
`NoRestartSwact state is : {PASS, FAIL, UNEXECUTED}` **Meaning**: The SHOWNS command displays four key data points for a rehoming XPM. The NoRestartSwact state provides an indicator that the ABI Rehome functions associated with the NoRestartSwact have occurred. PASS indicates that the rehomed XPM has properly passed the NoRestartSwact step. FAIL indicates that the rehomed XPM has failed the NoRestartSwact step; the Installation Method should be referenced for appropriate action. UNEXECUTED indicates that the NoRestartSwact step has not yet been executed for the rehoming XPM. **System or user actions**: If FAIL is encountered reference the Installation Method for appropriate action.
`GWC Static Data Download state is : {PASS, FAIL, UNEXECUTED}` **Meaning:** The SHOWNS command displays four key data points for a rehoming XPM. The GWC Static Data Download state indicates the status of the static data download to the rehoming XPM's GWC. PASS indicates that the rehomed XPM's hosting GWC has received a static data update. FAIL indicates that the rehomed XPM's hosting GWC has not received a static data update, or the update was rejected. The GWC must properly receive a static data update following the ABI Rehome XACore SWACT. If the GWC does not properly receive the static data update, the rehomed XPM will not come in-service. If FAIL is encountered, reference the Installation Method for immediate corrective action. UNEXECUTED indicates that the GWC Static Data Download step has not yet been executed for the rehoming XPM. **System or user actions:** If FAIL is encountered reference the Installation Method for appropriate action.

Table 11 MAP outputs with associated meanings and actions

SHOW_NODE_STATUS
`Node number is not a supported ABI XPM` **Meaning:** The node number provided is not an XPM that can be supported from an ABI interface. The command will work whether the XPM is currently on an ENET/JNET interface or off of an ABI interface, but the XPM type must be able to be supported on either interface. **System or user actions:** None - informational only.

34.9.6.8 Example

Table 12 Usage examples for SHOW_NODE_STATUS command

Description of task:	

SHOW_NODE_STATUS 72	`Current ABI Rehome State is: ON`
	
	`Node 72: LTC_NODE LTC 1`
	`DS512 link verification result is: UNEXECUTED`

34.9.10 Command: ABIREHOME: SET_ABI_REHOME_STATUS

34.9.10.1 Command type: NON-MENU

34.9.10.2 Command target: All

34.9.10.3 Command availability: RES

34.9.10.4 Command description

This command is used as a part of Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" to enable the ability to rehome an XPM from ENET/ JNET C-side links to an ABI DS-512 off of an MG 9000.

This command allows TAS personnel the ability to control the rehome status in an office. If affects both an overall control boolean and the initialization of per node rehome status data. In addition, this command enables the ability to position on the XPM's tuple in table LTCINV and execute a CHA, as opposed to deleting and re-adding the tuple.

34.9.10.5 Command syntax

Table 22 <CommandName> command parameters and variables

Command	**Parameters and variables**
SET_ABI_REHOME_STATUS	<STATUS> {ON, OFF, SUSPEND, RESUME}
Parameters and variables	Description
ON	Sets the control bool to TRUE and initializes all node rehome data to default values.
OFF	Sets the control bool to FALSE and initializes all node rehome data to default values.
SUSPEND	Sets the control bool to FALSE, leaving the per node rehome data as is.
RESUME	Sets the control bool to TRUE, leaving the per node rehome data as is.

34.9.10.6 Qualifications and warnings

In all cases, a warning message will be output to user that this command enables highly dangerous functionality and should be used by experienced personnel only, giving the user the option to quit.

In all cases, the current status of the rehome (ON, OFF, SUSPENDED) will be displayed prior to any parameter specific messages.

34.9.10.7 Responses

34.9.10.7.1 SET_ABI_REHOME_STATUS responses

Table 23 MAP outputs with associated meanings and actions

SET_ABI_REHOME_STATUS
SET_ABI_REHOME_STATUS: Turns on the main ABI Rehome status ---------- Syntax: SET_ABI_REHOME_STATUS Parms: <STATUS> Parms: <STATUS> {ON, OFF, SUSPEND, RESUME} **Meaning:** Help associated with command. **System or user actions:** Informational purposes only.
This command is intended for use during the rehoming of XPMs to an ABI interface on an MG9000. It enables highly dangerous functionality that should only be executed as directed by the installation method. This command should be used by qualified and experienced personnel ONLY in conjunction with the IM. Do you wish to continue? Please confirm ("YES", "Y", "NO", or "N"): **Meaning:** Output regardless of status entered. This response warns the user that this command could result in an outage and that it should be executed by experienced personnel only. **System or user actions:** If the user is not qualified to proceed, he should enter NO and the command will exit at this point.

Table 23 MAP outputs with associated meanings and actions

SET_ABI_REHOME_STATUS
`Current ABI Rehome State is: {ON, OFF, SUSPENDED}` **Meaning:** Output regardless of status entered. If ON, the rehome process has been enabled. If OFF, the rehome process has been disabled, and all node rehome data is currently at default values. If SUSPENDED, a rehome was begun, and interrupted by the user. In this state, the control bool is FALSE, but there could be node rehome data that is not at default values. **System or user actions:** None. This is for informational purposes.
`ABI Rehome state is already ON. Rehome data not impacted..` **Meaning:** The user is attempting to turn ON the rehome status when it is already ON. **System or user actions:** None. This is for informational purposes.
`Continuing with this command will cause all existing node rehome data to be lost. Consider using RESUME instead. Do you wish to continue?` continue=no ‘SET_REHOME_STATUS command aborted by user.’ **Meaning:** The user is attempting to turn ON the rehome status when it is currently SUSPENDED. If there is an per node rehome data, it will be re initialized to default values. **System or user actions:** The user has an opportunity to abort the command, at which point they will receive the continue=no response.
`Command Successful. ABI Rehome has been turned ON.` **Meaning:** The ABI Rehome status has been turned ON and all per node rehome data has been initialized to default values. **System or user actions:** None.
`Failed to enable ABI Rehome. Please check for swerrs.` **Meaning:** The command to enable the ABI rehome has failed for some reason. **System or user actions:** Use the QUERY_ABI_REHOME_STATUS to determine current status and if any part is ON, use the SET_ABI_REHOME_STATUS to turn OFF.
`ABI Rehome state is already OFF. Rehome data not impacted.` **Meaning:** The user is attempting to turn OFF the ABI rehome status when it is already OFF. **System or user actions:** None.

Table 23 MAP outputs with associated meanings and actions

SET_ABI_REHOME_STATUS
`Continuing with this command will cause all existing node rehome data to be lost. Do you wish to continue?` continue=no ‘SET_REHOME_STATUS command aborted by user. **Meaning:** The user is attempting to turn OFF the ABI tool when it is currently ON or SUSPENDED. This could cause a loss of the per node rehome data. **System or user actions:** Opportunity to abort, in which case user gets the continue = no output.
`ABI Rehome has been turned OFF.` **Meaning:** The control bool has been turned OFF, and per node rehome data initialized to default values. **System or user actions:** None - informational only.
`Failed to disable the ABI Rehome. Please check for swerrs.` **Meaning:** The attempt to turn OFF the ABI rehome state has failed. **System or user actions:** Should not occur. Indicates a problem.
`Cannot SUSPEND - ABI Rehome is not ON.` **Meaning:** The user is attempting to SUSPEND the rehome status when it is not ON. **System or user actions:** None - informational only.
`ABI Rehome has been SUSPENDED.` **Meaning:** The control bool has been turned OFF, and per node rehome data was left intact. **System or user actions:** None - informational only.
`Failed to suspend ABI Rehome. Please check for swerrs.` **Meaning:** The attempt to suspend the ABI rehome state has failed. **System or user actions:** Should not occur. Indicates a problem.
`Cannot RESUME - ABI Rehome is not SUSPENDED.` **Meaning:** RESUME only makes sense when the rehome state was suspended. No data has been impacted. **System or user actions:** None - informational only.

Table 23 MAP outputs with associated meanings and actions

SET_ABI_REHOME_STATUS
`ABI Rehome has been RESUMED.` **Meaning:** The control bool has been turned ON, and per node rehome data was left intact. **System or user actions:** None - informational only.
`Failed to resume ABI Rehome. Please check for swerrs.` **Meaning:** The attempt to resume the ABI rehome state has failed. **System or user actions:** Should not occur. Indicates a problem.

34.9.10.8 Example

Table 24 Usage examples for SET_ABI_REHOME_STATUS command

Description of task:	
SET_ABI_REHOME_STATUS ON	`This command is intended for use during the rehoming of XPMs to an ABI interface on an MG 9000. It enables highly dangerous functionality that should only be executed as directed by the installation method. This command should be used by qualified and experienced personnel ONLY in conjunction with IM. Do you wish to proceed?` `Current ABI Rehome State is: SUSPENDED` `Continuing with this command will cause all existing node rehome data to be lost. Consider using RESUME instead. Do you wish to continue?` `>N` `SET_REHOME_STATUS command aborted by user.`
SET_ABI_REHOME_STATUS OFF	`This command is intended for use during the rehoming of XPMs to an ABI interface on an MG 9000. It enables highly dangerous functionality that should only be executed as directed by the installation method. This command should be used by qualified and experienced personnel ONLY in conjunction with IM. Do you wish to proceed?` `Current ABI Rehome State is: ON` `Continuing with this command will cause all existing node rehome data to be lost. Do you wish to continue?` `Y` `'ABI Rehome has been turned OFF.`
SET_ABI_REHOME_STATUS SUSPEND	`This command is intended for use during the rehoming of XPMs to an ABI interface on an MG 9000. It enables highly dangerous functionality that should only be executed as directed by the installation method. This command should be used by qualified and experienced personnel ONLY in conjunction with IM. Do you wish to proceed?` `Current ABI Rehome State is: ON` `ABI Rehome has been SUSPENDED.`

Table 24 Usage examples for SET_ABI_REHOME_STATUS command

SET_ABI_REHOME_STATUS RESUME	This command is intended for use during the rehoming of XPMs to an ABI interface on an MG 9000. It enables highly dangerous functionality that should only be executed as directed by the installation method. This command should be used by qualified and experienced personnel ONLY in conjunction with IM. Do you wish to proceed? Current ABI Rehome State is: SUSPENDED ABI migration has been RESUMED.

34.9.11 Command: ABIREHOME: ADJUST_FRAME_SYNC / AFS

34.9.11.1 Command type: NON-MENU

34.9.11.2 Command target: All

34.9.11.3 Command availability: RES

34.9.11.4 Command description

This command is used as a part of Installation Method 72-1639 “XPM - ABI Link Verification” to enable the ability to rehome an XPM from ENET/JNET C-side links to an ABI DS-512 off of an MG 9000.

Given the node number of the XPM to be rehomed, this command will cause the ABI cards to adjust their frame sync to that of the inactive XPM unit. This is one step in the process of verifying the DS-512 fiber connection of the XPM before the actual rehome occurs.

34.9.11.5 Command syntax

Table 25 command parameters and variables

Command	**Parameters and variables**
ADJUST_FRAME_SYNC or AFS	<NODE NUMBER> {0 to 4095}
Parameters and variables	Description
node	Node number of the XPM. Node number can be found by performing QueryPM while the XPM is POSTed at the map. <XPM_NODE> {0 to 4095}

34.9.11.6 Qualifications and warnings

None.

34.9.11.7 Responses

34.9.11.7.1 ADJUST_FRAME_SYNC responses

Table 26 MAP outputs with associated meanings and actions

ADJUST_FRAME_SYNC
ADJUST_FRAME_SYNC: Adjust the frame sync on the ABI cards to sync to the inactive XPM unit. --- Syntax: ADJUST_FRAME_SYNC node or AFS node Parms: <NODE NUMBER> {0 TO 4095} **Meaning:** Help associated with command. **System or user actions:** Informational purposes only.
This command must be enabled via the SET_ABI_REHOME_STATUS command. Please refer to the installation method. **Meaning:** The ABI REHOME installation method has not been enabled. SET_ABI_REHOME_STATUS (ON or RESUME) commands must be enabled via ABIREHOME tool before proceeding. **System or user actions:** If user wishes to proceed with the command, ABIREHOME will have to enable the tool.
This command will RESET the frame sync on the ABI cards.Both ABI cards must be locked and unlocked to recover from this condition. Do you wish to continue? **Meaning:** Adjust the frame sync on the ABI cards to sync to the inactive XPM unit. **System or user actions:** Enter the correct response.
AFS command aborted by user. **Meaning:** Command was aborted by the user and no action has been taken. **System or user actions:** Informational purposes only.

Table 26 MAP outputs with associated meanings and actions

ADJUST_FRAME_SYNC
`No reply received from ABI. Adjust Frame Sync FAILED. Check for swerrs and traps.` **Meaning:**Indicates a problem with the software. Contact Nortel for support. **System or user actions:** Use the FAN command to see what nodes were likely impacted and compare to the QIN (impacted nodes) output. User should refer to the installation method to determine how to proceed.

34.9.11.8 Example

Table 27 Usage examples for command

Description of task:	

AFS 69	`>afs 103`
	`Node 103: LTC_NODE SMA2 7 ( SMA2 7 )`
	
	`This command will RESET the frame sync on the ABI cards.`
	`Both ABI cards must be locked and unlocked to recover from`
	`this condition.`
	`Do you wish to continue?`
	
	`Please confirm ("YES", "Y", "NO", or "N"):`
	`>y`

34.9.12 Command: ABIREHOME:MARK_NODE_DS512_RESULT /VER512

34.9.12.1 Command type: NON-MENU

34.9.12.2 Command target: All

34.9.12.3 Command availability: RES

34.9.12.4 Command description

This command is used as a part of Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" to set the DS512 verification result for a node.

34.9.12.5 Command syntax

Table 28 MARK_NODE_DS512_RESULT command parameters and variables

Command	Parameters and variables
MARK_NODE_DS512_RESULT or VER512	<NODE NUMBER> < FAIL or PASS>
Parameters and variables	Description
NODE NUMBER	The Node number of the xpm.
PASS	Sets the DS512 link verification result of the node to PASS.
FAIL	Sets the DS512 link verification result of the node to FAIL.

34.9.12.6 Qualifications and warnings

In all cases, a warning message will be output to user wether he wants to continue with the operation. It has options YES and NO.

In all cases, the current status of the DS512 is displayed(UNEXECUTED, PASS, FAIL).

34.9.12.7 Responses

34.9.12.7.1 MARK_NODE_DS512_RESULT responses

Table 29 MAP outputs with associated meanings and actions

MARK_NODE_DS512_RESULT

```
MARK_NODE_DS512_RESULT: Marks the PASS/FAIL result of the
                        specified node.
-------------------------------------------------------
Syntax: MARK_NODE_DS512_RESULT node PASS/FAIL
        or
        VER512 node PASS/FAIL

Parms: <NODE NUMBER> {0 TO 4095}
       <FAIL or PASS> {FAIL,
                       PASS}
```

Meaning: Help associated with command.

System or user actions: Informational purposes only.

Table 29 MAP outputs with associated meanings and actions

MARK_NODE_DS512_RESULT
Do you wish to continue? Please confirm ("YES", "Y", "NO", or "N"): **Meaning:** This response warns the user wether he wants to continue with the setting of DS512 Result for the node. **System or user actions:** If the user is not qualified to proceed, he should enter NO and the command will exit at this point.
Current MARK_NODE_DS512_RESULT State is: {UNEXECUTED, PASS, FAIL} **Meaning:** Displays the current status of the DS512 Result of the node. **System or user actions:** None. This is for informational purposes.

34.9.12.8 Example

Table 30 Usage examples for MARK_NODE_DS512_RESULT command

Description of task:	
MARK_NODE_DS512_RESULT 72 PASS	Current DS512 result for this node is: UNEXECUTED Current ABI Rehome State is: SUSPENDED Do you wish to continue? Please confirm ("YES", "Y", "NO", or "N"): >N VER512 command aborted by user.

Command	Parameters and variables
SLC	node
Parameters and variables	Description
node	Node number of the XPM. Node number can be found by performing QueryPM while the XPM is POSTed at the map. <NODE NUMBER> {0 to 4095}

34.9.16.5.1 Qualifications and warnings

None.

34.9.16.6 Responses

34.9.16.6.1 SET_LINK_CHANNEL_MAP responses

Table 41 MAP outputs with associated meanings and actions

SET_LINK_CHANNEL_MAP

`SET_LINK_CHANNELS_IDLE:  Sets the link/channel map for a node to idle.`
`----------`
`Syntax:  SLC node`
 	
`Parms: <NODE NUMBER> {0 TO 4095}`
 	
Meaning: Help associated with command.
 	
System or user actions: Informational purposes only.

`This command must be enabled by TAS. Please refer to IM 72-1682.` **Meaning:** The control bool to enable the command has not been turned on. **System or user actions:** Go into ABIREHOME tool and use command SET_REHOME_STATUS ON to turn on the tool. Password required.

Table 41 MAP outputs with associated meanings and actions

SET_LINK_CHANNEL_MAP
`Node number is not a supported XPM.` **Meaning:** The command is ended because the node number entered is not a node number of a valid XPM that can exist off of an ABI interface. The node number can be either ABI connected or ENET/ JNET connected, but must be ABLE to be ABI connected. **System or user actions:** Get the right node number and reenter the command. The PMIST NODENO command can be used to get the correct node number.
`Current IO format is: External` **Meaning:** The node is currently provisioned as a packet node off of an ABI interface. **System or user actions:** None. Informational purposes.
`Current IO format is: Internal` **Meaning:** The node is currently provisioned as a tdm node off of an ENET/JNET. **System or user actions:** None. Informational purposes.

`This command can be service impacting. Do you wish to continue?`
`If continue=no: SLC command aborted by user.`
 	
Meaning: Resetting the link channel map is dangerous if used improperly. This is the last chance to change your mind.
 	
System or user actions: Enter desire to continue.

`Links/Channels have been reset for node <node number>.` **Meaning:** The command was successful. **System or user actions:** None, but user can choose to use DLC to verify results.
`Trouble resetting links/channels on node <node number>.` **Meaning:** Something was wrong and the link channel map could not be reset. **System or user actions:** Look for swerrs and report problem. Use DLC to display current values.

34.9.16.7 Example

Table 42 Usage examples for SET_LINK_CHANNEL_MAP command

Description of task:	

SLC 68	`Current IO format is: External`
	`This command can be service impacting. Do you wish to continue?`
	`Yes`
	`Links/Channels have been reset for node 68.`

34.9.17 Hidden Command: ABIREHOME: SAN (SET AFFECTED NODES)

34.9.17.1 Command type: NON-MENU

34.9.17.2 Command target: All

34.9.17.3 Command availability: RES

34.9.17.4 Command description

This HIDDEN command is used as a part of Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" to enable the ability to rehome an XPM from ENET/JNET C-side links to an ABI DS-512 off of an MG 9000.

Given the node number of the rehomed XPM, sets the impacted node table bits for the XPM and all of its subtending nodes, found by recursively searching its p-side links.

This command should not be executed manually during the rehome process. All nodes being rehomed will be properly marked as 'affected' by table control operations or by NDS personnel. This command is available only for trouble recovery by qualified personnel.

34.9.17.5 Command syntax

Table 43 command parameters and variables

Command	Parameters and variables
SAN	<NODE NUMBER> {0 to 4095}
Parameters and variables	Description
node	Node number of the XPM. Node number can be found by performing QueryPM while the XPM is POSTed at the map. <XPM_NODE> {0 to 4095}

34.9.17.6 Qualifications and warnings

None.

34.9.17.7 Responses

34.9.17.7.1 responses

Table 44 MAP outputs with associated meanings and actions

SET_AFFECTED_NODES/SAN
SAN (SET_AFFECTED_NODES) Protected command for ABI Rehomes. Sets the rehome node bits for all nodes that are impacted by rehoming the given XPM, including its subtending nodes. Nodes must be marked as impacted on the INACTIVE processor. ---------- Syntax: SAN node Parms: <NODE NUMBER> {0 TO 4095} **Meaning:** Help associated with command. **System or user actions:** Informational purposes only.
Node number is not a supported XPM. **Meaning:** The node number entered cannot be homed off of an ABI interface, and is therefore not a valid XPM for this command. **System or user actions:** Enter the correct node number of the rehomed XPM.
This command will SET the impacted node table bools for this XPM and all of its subtending nodes. Do you wish to continue? **Meaning:** Warning that using this command will set triggers that will impact the behavior of a NRS. **System or user actions:** Enter the correct response.
SAN command aborted by user. **Meaning:** Response indicating the command was aborted by the user and no action was taken. **System or user actions:** Informational purposes only.
Node 69: LTC_NODE SMA2 1 Set affected nodes PASSED. Use FIND_AFFECTED_NODES/FAN to see the nodes impacted. **Meaning:** Displays the XPM node provided, shows that the command passed, and suggests using the FAN command to see what nodes were impacted. **System or user actions:**

34.9.17.8 Example

Table 45 Usage examples for command SET_AFFECTED_NODES

Description of task:	

Table 45 Usage examples for command SET_AFFECTED_NODES

SAN 69	This command will SET the impacted node table bools for this XPM and all of its subtending nodes. Do you wish to continue? Please confirm ("YES", "Y", "NO", or "N"): >Y Node 69: LTC_NODE SMA2 1 Set affected nodes PASSED. Use FIND_AFFECTED_NODES/FAN to see the nodes impacted.

34.9.18 Hidden Command: ABIREHOME: CAN (CLEAR AFFECTED NODE)

34.9.18.1 Command type: NON-MENU

34.9.18.2 Command target: All

34.9.18.3 Command availability: RES

34.9.18.4 Command description

This HIDDEN command is used as a part of Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome" to enable the ability to rehome an XPM from ENET/JNET C-side links to an ABI DS-512 off of an MG 9000.

Given the node number of the rehomed XPM, clears the impacted node table bits for the XPM and all of its subtending nodes, found by recursively searching its p-side links.

This command should not be executed manually during the rehome process. Nodes which have been marked as 'affected' during table control operations, or by NDS personnel, should not be cleared by this command. This command is available only for trouble recovery by qualified personnel.

34.9.18.5 Command syntax

Command	Parameters and variables
CAN	<NODE NUMBER> {0 to 4095}
Parameters and variables	Description

Table 46 command parameters and variables

Command	Parameters and variables
node	Node number of the XPM. Node number can be found by performing QueryPM while the XPM is POSTed at the map. <XPM_NODE> {0 to 4095}

34.9.18.6 Qualifications and warnings

None.

34.9.18.7 Responses

34.9.18.7.1 CLEAR_AFFECTED_NODES responses

Table 47 MAP outputs with associated meanings and actions

CLEAR_AFFECTED_NODES

`CAN (CLEAR_AFFECTED_NODES) Protected command for ABI Rehomes.`
`Clear the rehome node bits for all nodes that are impacted by`
`rehoming the given XPM, including its subtending nodes.`
`----------`
`Syntax: CAN node`
 	
`Parms: <NODE NUMBER> {0 TO 4095}`
 	
Meaning: Help associated with command.
 	
System or user actions: Informational purposes only.

`This command will CLEAR the impacted node table bools for this XPM and all of its subtending nodes. Do you wish to continue?` **Meaning:** Warning that using this command will set triggers that will impact the behavior of a NRS. **System or user actions:** Enter the correct response.
`CAN command aborted by user.` **Meaning:** Command was aborted by the user and no action has been taken. **System or user actions:** Informational purposes only.

Table 47 MAP outputs with associated meanings and actions

CLEAR_AFFECTED_NODES

`Node 69: LTC_NODE SMA2 1`
`Clear affected nodes PASSED.`
`Use FIND_AFFECTED_NODES to see the nodes impacted.`
 	
Meaning: The impacted node bools have been cleared for this XPM and all of its subtending nodes. To see the nodes affected, use the FAN command. To see the current list of impacted nodes, use the QIN command. This command can be used to clear the impacted node table if it was inadventantly set via the SAN command.
 	
System or user actions: Informational purposes.

`Clear affected nodes FAILED. Check for swerrs and traps.` **Meaning:**Indicates a problem with the software. Contact Nortel for support. **System or user actions:** Use the FAN command to see what nodes were likely impacted and compare to the QIN (impacted nodes) output. User should refer to the installation method to determine how to proceed.

34.9.18.8 Example

Table 48 Usage examples for command

Description of task:	

CAN 69	`>can 69`
	
	`This command will CLEAR the impacted node table bools for this XPM and all of its subtending nodes.`
	`Do you wish to continue?`
	
	`Please confirm ("YES", "Y", "NO", or "N"):`
	`>y`
	`Node 69: LTC_NODE SMA2 1`
	
	`Clear affected nodes PASSED.`
	`Use FIND_AFFECTED_NODES to see the nodes impacted.`

34.9.19 Hidden Command: ABIREHOME: CLEAR_GWC_SD_TABLE

34.9.19.1 Command type: NON-MENU

34.11 Configuration Walkthrough

34.11.1 Walkthrough XPM Rehome to ABI Networks

This feature is a step in the overall Installation Method 72-1682 "XPM to MG 9000 DS-512 Rehome." This feature provides the functionality to change an XPM from ENET C-side links to DS-512 ABI links. The use of this feature is restricted and must be activated by appropriate Nortel personnel. A general sequence of events follow however, for full details please refer to the Installation method mentioned above.

1. Enter the ABIREHOME tool and use command ‘set_abi_rehome_status on’ to enable the table control functionality.
2. Add a ABI tuple in the Table GATWYINV which will be used in while adding a tuple in the table LTCINV for the option EXTDS512

Figure 1 View of ABI tuple in Table GATWYINV

```
GTWYPMNO GTWYPRFL GTWYNAME GTWYADDR GTWYCSPM GTWYOPTS
-----------------------------------------------------
ABI 0 MG9KABI TEST (1 2 3 4) $ HOST GWC 3
(GTWYLOC HOST MG9F 2 3 D 4 4 4) (ELMGR 44) $
```

3. Split the Core
4. On Inactive Core, Busy and Offline the XPM to be rehomed
5. On Inactive Core, position on the XPM to be rehomed via Table LTCINV

6. Change the tuple by removing the C-side links ($) and adding the optional parameter EXTDS512. Please refer to "Figure 2 Before and After rehome view of the XPM in table LTCINV" on page 2905
7. Repeat steps 4 and 5 for each XPM to be rehomed
8. Provision/create the VMG on the ABI board via the MG9K-EM
9. Enable the VMG via the MG9K-EM
10. On Active Core, Busy and Offline the rehomed XPM

    Note: Call-P Outage Starts
11. Move fibers and following the steps in the installation method, perform the NoRestartSwact to activate the table control changes.
12. On newly Active Core, Busy and RTS the XPM(s)

Figure 2 Before and After rehome view of the XPM in table LTCINV

Before view of the LGC tuple with ENET links and no EXTDS512 option.

```
TABLE: LTCINV
LTCNAME ADNUM FRTYPE FRNO SHPOS FLOOR ROW FRPOS EQPEC LOAD EXECTAB CSLNKTAB
OPTCARD TONESET PROCPEC EXTLINKS E2LOAD OPTATTR PEC6X40 EXTINFO
----------------------------------------------------------------------------------------------------------------------------
LGC 1 1001 LTEI 2 18 1 CC 2 6X02NA QLI19AZ (POTS POTSEX) (KEYSET KSETEX) $ (0 12 1 0)
(0 12 1 1) (0 12 1 2) (0 12 1 3) (0 12 1 4)(0 12 1 5) (0 12 1 6) (0 12 1 7) (0 12 1 8) (0 12 1 9) (0 12 1 10)
(0 12 1 11) (0 12 1 12) (0 12 1 13) (0 12 1 14) (0 12 1 15) $ (UTR15 ) (MSG6X69 ) (CMR13 CMR10A)
(ISP 16) $ NORTHAM SX05AA $ SX05AA $ 0 SXFWAE08 $ 6X40FB N
```

After view of the LGC tuple after the change operation has rehomed the XPM to the ABI DS-512 interface. The XPM now has ABI links (derived by the system, user entered a "$") and the EXTDS512 options.

```
TABLE: LTCINV
LTCNAME ADNUM FRTYPE FRNO SHPOS FLOOR ROW FRPOS EQPEC LOAD EXECTAB CSLNKTAB
OPTCARD TONESET PROCPEC EXTLINKS E2LOAD OPTATTR PEC6X40 EXTINFO

```

35: Configuration (CN): A00003506

35.1 Hardware and Software Requirements

It is assumed the hardware and software installation of the CS2K is complete. Additionally, the SESM GWC EM is initialized and available for provisioning data related to this activity.

This activity has the following software dependencies:

- CS2K North American load - SNNCSH07
- GWC load - GC070
- SN07.1 PVG load - availability TBD
- SN07 CS2M load - CSM0007

In summary, the SN07 release load lineup is required.

35.2 Initial Configuration

Refer to section “35.11 Configuration Walkthrough” on page 2930

35.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Some office parameters are no longer applicable to PTS trunks provisioned on a GWC. Their values are now provisioned on the PVG through the use of PVG Profiles. Please refer to Section “35.12 PVG Profiles” on page 2931. The chart below shows which key PTS office parameters are and are not applicable to GWC PTS trunks.

Office Parameter	Still applicable to GWC PTS trunks?	Notes

PRE_SND_WK_DD_TIME (OFCSTD)	Yes	On originating wink start or delay dial trunks, this is the amount of time that the switch waits (minimum) before sending the leading edge of the start signal (either wink or DD) after origination has been detected. This parameter is in 10 millisecond granularity. This timing is not started until after the origination has been filtered (see ORIGFLTR in TRKGRP datafill).
REC_MAX_DD_TIME (OFCSTD)	No	Maximum duration Delay Dial recognized. On terminating DD trunks, any start signal with an offhook duration of greater than this value will be considered glare. This is in 160 millisecond granularity.
REC_MAX_WK_TIME (OFCSTD)	No	Same as above except for terminating wink start trunks.
REC_MIN_DD_TIME (OFCSTD)	No	Minimum duration Delay Dial recognized. On terminating DD trunks, any start signal with an offhook duration of less than this value will be ignored (probably resulting in a 'no start dial' condition with a route advance). This parameter is in 10 millisecond granularity.
REC_MIN_WK_TIME (OFCSTD)	No	Same as above except for terminating wink start trunks.
REC_PRE_DD_TIME (OFCSTD)	No	Timeout for receiving Delay Dial signal leading edge. On terminating DD trunks, the leading edge of the start signal must be received within this time or a "no start dial" condition will be experienced. This parameter is in 150 millisecond granularity. A value of 10 is recommended for legacy and GWC based trunks inter-connection.
REC_PRE_WK_TIME (OFCSTD)	No	Same as above except for terminating wink start trunks.

SND_DD_TIME (OFCSTD)	No	For DP trunks, this is the start signal duration (i.e. time between leading and trailing edges). This parameter is in 10 millisecond granularity.
SND_MF_WK_TIME (OFCSTD)	No	For non-DP trunks (MF trunks), this is the start signal wink duration (i.e. time between leading and trailing edges). This parameter is in 10 millisecond granularity.
SND_DP_WK_TIME (OFCSTD)	No	Same as above except for DP originators.
WK_DD_PRE_DIAL_ DELAY (OFCSTD)	Yes	On terminating wink and delay dial trunks, this is the time delay after the trailing edge of the start signal before outpulsing begins.
EA_REC_MAX_WK_ TIME (OFCSTD)	Yes	Equal Access Receive Maximum Wink Time - This parameter specifies the maximum time for recognition of wink for ATC type trunk groups, in 10-ms intervals.
EA_REC_SUB_PRE_ WK_TIME (OFCSTD)	Yes	Equal Access Receive Subsequent Pre-wink - This parameter specifies the timeout for receiving the leading edge of next wink signals for ATC type trunk groups, in 160ms intervals.
EA_REC_1ST_PRE_ WK_TIME (OFCSTD)	Yes	Equal Access Receive First Pre-wink Time - This parameter specifies the timeout for receiving the leading edge of the first wink signal for ATC type trunk groups, in 160-ms intervals.
EAEO_REC_1ST_PRE _WK_TIME (OFCSTD)	Yes	Equal Access End Office Receive First Pre-wink Time - This parameter specifies the time of the first pre-wink delay associated with outpulsing from an equal access end office (EAEO), in 160 ms intervals.
EAEO_REC_2ND_PR E_WK_TIME (OFCSTD)	Yes	Equal Access End Office Receive Second Pre-wink Time - This parameter specifies the time of the second pre-wink delay associated with outpulsing from an Equal Access End Office (EAEO), in 160-ms intervals.

IMMED_PRE_DIAL_DELAY (OFCSTD)	No, GWC PTS trunks will use a value of 1 second.	Two-way Immediate Start Trunks Pre-dial Delay - This parameter only applies to two-way immediate start and outgoing trunks. This parameter specifies the delay between seizure and outpulsing of digits, in 10-ms intervals.
MIN_REC_DP_PULSE_WD (OFCSTD)	No	Minimum Received Dial Pulse Width - This parameter allows variable settings for the minimum received dial pulse (DP) width.
PRE_ANI_SPILL_DELAY (OFCSTD)	Yes	Pre-automatic Number Identification Spill Delay - Switching units with outgoing trunks that perform wink and reversal signal calling number outpulsing require this parameter. This parameter specifies the delay between receiving the calling number request signal (wink), and outpulsing the calling number.
DPREC_INTER_DGT_TIMING (OFCSTD)	No	Interdigit timing in DP reception. This parameter specifies the end of digit timing value between two consecutive digits.
SHORT_TIMED_RELEASE_DISC_TIME (OFCSTD)	Yes	Disconnect timing performed on terminator disconnect. The Short TRD is typically used for unbilled calls.
LONG_TIMED_RELEASE_DISC_TIME (OFCENG)	Yes	Disconnect timing performed on terminator disconnect. The Long TRD is typically used for billed calls.
MF_LAST_DIGIT_DELAY (OFCENG)	No	This is a special interdigit delay between the second-to-last and last digit of an MF outpulsing stream. A value of 0 means the delay is no different than between other digits. This parameter is in 10 millisecond granularity.
ACK_WINK_DELAY_TIME (OFCVAR)	Yes	For FGD originations, this is the delay between the end of the address stream and the leading edge of the acknowledgment wink. This parameter is in 10 millisecond granularity.

ANS_DELAY_TIME (OFCVAR)	Yes	For FGD originations, this is the minimum delay between the trailing edge of the acknowl-edgment wink and offhook indicating answer. This parameter is in 10 millisecond granularity. 500 milliseconds seems large; however, in many cases the in-switch delay to route the call may be greater than 1/2 second.

35.4 Upgrade Impact

35.4.1 Dump and Restore

None

35.4.2 Element Management Upgrade

None

35.5 Data schema (DS) (CM, MIBS, RDB)

35.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)

TRKMEM	changed	unchanged

35.5.2 Table/MIB/Remote Database Schema information

35.5.2.1 Name: SERVRINV

Server Inventory Table

35.5.2.1.1 Functional description

This activity adds three new exec line-up, GWCEX , GWCFX, and GWC250 for GWC node types. The new exec line-ups are specific to Per Trunk Signaling (PTS) trunk types that are configured on a GWC node type.

The following table provides a mapping of which exec line-up and termtype combinations can be used to support the various PTS trunk group types since not all supported PTS trunks can be supported by one GWC at the same time..

Table 2 Supported PTS Exec Lineup/Term Type Combinations

PTS Exec Lineup with ABTRK TermType	PTS Exec Lineup with AB250 TermType	GWC PTS Trunks Supported
GWCEX	GWC250	All GWC PTS trunk groups except for PX trunk groups using FXS signalling.
GWCEX	GWCFX	All GWC PTS trunk groups including PX with FXS signalling except for EANT, ONAT, and DAL trunk groups.
GWCEX	<none>	All GWC PTS trunk groups except for PX trunk groups using FXS signalling and EANT, ONAT, and DAL trunk groups.

35.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged by this activity.

35.5.2.1.3 Size

The size of this table is unchanged.

35.5.2.1.4 Fields/OIDs

The following table lists fields for SERVRINV that are changed by this activity. The configuration information for all other fields in table SERVRINV are unchanged.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SRVREXEC	changed	TRMTYPE	ABTRK unchanged	The TRMTYPE subfield is unchanged. This activity adds 1 new EXEC entry for TRMTYPE ABTRK and 2 new EXEC entries for TRMTYPE AB250
		EXEC	GWCEX	ABTRK / GWCEX supports GWC PTS trunks OP, ES, PX, IBN, ATC, IT, SC & CELL, but does not support PX trunks using FXS signalling.
		TRMTYPE	AB250	
		EXEC	GWCFX	ABTRK / GWCFX supports PX trunks using FXS signalling only.
		EXEC	GWC250	AB250 / GWCAB250 supports DMS250 GWC PTS trunks EANT, DAL, and ONAT. Also supports DAL with FXS signalling.

35.5.2.1.5 Datafill example

The following example shows sample datafill for table SERVRINV.

```
SRVRNAME        SRVRADDR
                SRVREXEC                SRVRTONE    SRVROPTS
-------------------------------------------------------------------------------
GWC  0      IP  47  174  66  4
            (ABTRK   GWCEX) (AB250   GWC250)$  NORTHAM  $
GWC  1      IP  47  174  66  8
            (ABTRK   GWCEX) (AB250   GWCFX)$  NORTHAM  $
GWC  2      IP  47  174  66  12
            (ABTRK   GWCEX) $                 NORTHAM  $
```

35.5.2.1.6 Table release history update

The following information was added to table SERVRINV:

exec line-up GWCEX is added to field SRVREXEC

exec line-up GWCFX is added to field SRVREXEC

exec line-up GWC250 is added to field SRVREXEC

35.5.2.1.7 Supplementary information

Tuples in table SERVRINV should not be added or changed via manual table control commands. Provisioning of this table should be performed using SESM node provisioning.

35.5.2.1.8 Translation verification other tools

35.5.2.2.2 Usage sequence and implications (CM Only)

When provisioning PTS trunk group members on a GWC, the following sequence of table provisioning is required (NOTE: Table TRKSGRP is permitted to be provisioned before table TRKOPTS)

1. table CLLI
2. table TRKGRP
3. table TRKOPTS, option GWCPTSTK
4. table TRKSGRP
5. table TRKMEM

35.5.2.2.3 Size

The size of this table is unchanged by this activity.

35.5.2.2.4 Fields/OIDs

Field	New or Changed	Subfield or refinement	Entry	Explanation and action

35.5.2.2.5 Datafill example

Not Applicable

35.5.2.2.6 Table release history update

The following information was added to table TRKGRP:

Restrictions are added for GWC PTS trunk groups

35.5.2.2.7 Supplementary information

When PTS trunk group data is changed in table TRKGRP, table control determines if option GWCPTSTK is provisioned in table TRKOPTS. GWCPTSTK identifies PTS trunk groups configured on a GWC that provide connectivity between the CS2K's packet network and the Public Switched Telephone Network (PSTN). If option GWCPTSTK is provisioned, table control performs error checking to ensure the TRKGRP data is provisioned correctly. Table 6, "TRKGRP Restrictions," on page 2916 lists the new error messages that may be generated by table control.

Table 6 TRKGRP Restrictions

Trunk Type	Error Messages
ALL support GWC PTS groups	Trunk Members exist in table TRKMEM
	Non-GWC trunk members are disallowed
	CCONT in table TRKSGRP must be set to NO
	ESUPR in table TRKSGRP must be set to N
	Table Control Operation not allowed
	PRELOADANI must be set to N for this trunk type
	CCONT in table TRKSGRP must be set to NO or MW for this trunk type
Non-Supported trunk groups	It is not supported with this trunk group type
OP	ANITYPE in table TRKGRP must be set to WK or REV
	EAOSS in table TRKGRP must be set to N when EA is Y
	OPULSTYP in TRKSGRP must be set to MF for this trunk type
	OSTARTSG in TRKSGRP must be set to WK for this trunk type
	IPULSTYP in TRKSGRP must be set to MF for this trunk type
	ISTARTSG in TRKSGRP must be set to WK for this trunk type
	ANITYPE in table TRKGRP must be set to REV for this trunk type
	ANITYPE in table TRKGRP must be set to NO for this trunk type
ES	Only OG direction is supported with this trunk type
	FDISCTIM in table TRKGRP must be set to 0
	SWST in table TRKGRP must be set to DC
	ANI in table TRKGRP must be set to ANISPILL
	OPULSTYP in TRKSGRP must be set to MF for this trunk type
	OSTARTSG in TRKSGRP must be set to WK for this trunk type
PX	PRELOADANI must be set to N for this trunk group type

Table 6 TRKGRP Restrictions

Trunk Type	Error Messages
IBNTO	PRELOADANI must be set to N for this trunk group type
	ANITYPE in table TRKGRP must be set to WK or REV
	FLASH in table TRKGRP must be set to N for this trunk type.
	DNIS option disallowed for this trunk type.
	CLID option disallowed for this trunk type.
	OUTSCHM option disallowed for this trunk type.
	PROPANS option disallowed for this trunk type.
	ANISEND option disallowed for this trunk type.
IBNTI	PRELOADANI must be set to N for this trunk group type
	DTI in table TRKGRP must be set to N for this trunk type.
	TRKDSR in table TRKGRP must be set to N for this trunk type.
	REORIG in table TRKGRP must be set to N for this trunk type.
IBNT2	PRELOADANI must be set to N for this trunk group type
	ANITYPE in table TRKGRP must be set to WK or REV
	DTI in table TRKGRP must be set to N for this trunk type.
	TRKDSR in table TRKGRP must be set to N for this trunk type.
	REORIG in table TRKGRP must be set to N for this trunk type.
	FLASH in table TRKGRP must be set to N for this trunk type.
	DNIS option disallowed for this trunk type.
	CLID option disallowed for this trunk type.
	OUTSCHM option disallowed for this trunk type.
	PROPANS option disallowed for this trunk type.
	ANISEND option disallowed for this trunk type.
ATC	PRELOADANI must be set to N for this trunk group type
IT	PRELOADANI must be set to N for this trunk group type
SC	PRELOADANI must be set to N for this trunk group type.
	ANITYPE in table TRKGRP must be set to WK or REV
	NOUTR option is disallowed.
CELL	PRELOADANI must be set to N for this trunk group type
DAL	PRELOADANI must be set to N for this trunk group type
	DETDIAL option is disallowed.
	ATDANS option is disallowed.

Table 6 TRKGRP Restrictions

35.5.2.3 Name: TRKSGRP
Trunk Subgroup Table

35.5.2.3.1 Functional description
This activity introduces new provisioning restrictions in table TRKSGRP for PTS trunks groups configured on a GWC. The restrictions apply when the trunk group is assigned the GWCPTSTK option in table TRKOPTS and when adding or changing the GWC PTS trunk subgroup tuples in table TRKSGRP.

35.5.2.3.2 Usage sequence and implications (CM Only)
When provisioning PTS trunk group members on a GWC, the following sequence of table provisioning is required.(NOTE: Table TRKSGRP is permitted to be provisioned before table TRKOPTS)

1. table CLLI
2. table TRKGRP
3. table TRKOPTS, option GWCPTSTK
4. table TRKSGRP
5. table TRKMEM

35.5.2.3.3 Size
The size of this table is unchanged by this activity.

35.5.2.4 Name: TRKOPTS
Trunk Options Table

35.5.2.4.1 Functional description
This activity adds the new trunk group option, GWCPTSTK, to table TRKOPTS. GWCPTSTK identifies PTS trunk groups configured on a GWC that provide connectivity between the CS2K's packet network and the Public Switched Telephone Network (PSTN). In the SN07 release, GWCPTSTK is supported with all GWC PTS supported trunk group types that are configured on a GWC. Please refer to "Table 4 Supported GWC PTS Trunk Group Types" on page 2914. This option must be provisioned prior to configuring trunk members in table TRKMEM.

35.5.2.4.2 Usage sequence and implications (CM Only)
When provisioning PTS trunk group members on a GWC, the following sequence of table provisioning is required. (NOTE: Table TRKSGRP is permitted to be provisioned before table TRKOPTS)

1. table CLLI
2. table TRKGRP
3. table TRKOPTS, option GWCPTSTK
4. table TRKSGRP
5. table TRKMEM

Table TRKOPTS may be provisioned following table TRKSGRP. Table control restrictions will enforce table TRKOPTS be provisioned after table TRKGRP and before table TRKMEM.

35.5.2.4.3 Size

The size of this table is unchanged by this activity.

35.5.2.4.4 Fields/OIDs

The following table lists fields for TRKOPTS that are changed by this activity.

Table 8 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTKEY	changed	CLLI	unchanged	The CLLI subfield is unchanged.
		OPTION	GWCPTSTK	The option GWCPTSTK enables a PTS trunk group to be configured on a GWC..
OPTION	changed	OPTION	GWCPTSTK	The option GWCPTSTK enables a PTS trunk group to be configured on a GWC.
		PRELOAD ANI	Y or N	The sub-option PRELOADANI is for GWC PTS trunks which support a call model that allows the ANI digits to be sent from the Core prior to receiving an ANI request. To enable this capability, set the field to “Y”.

35.5.2.4.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

```

-------------------------------------------------------------------------
```

PTSCLLI GWCPTSTK GWCPTSTK N

35.5.2.4.6 Table release history update

The following information was added to table TRKOPTS:

Option GWCPTSTK is added for GWC PTS trunk groups

35.5.2.4.7 Supplementary information

Option GWCPTSTK is used to identify PTS trunk groups to be configured on a GWC that can provide connectivity between the CS2K's packet network and the PSTN. This option applies only to all GWC PTS supported trunk group types in the SN07 release. Table control in table TRKOPTS will block the addition of this option to a non-supported trunk type. Please refer to "Table 4 Supported GWC PTS Trunk Group Types" on page 2914.. The following error message will result:

"GWCPTSTK cannot be assigned for the following reasons:"
"It is not supported with this trunk type."

This option can not be added if existing datafill in either table TRKGRP or table TRKSGRP that is incompatible with GWC PTS trunks. If an error message occurs when provisioning GWCPTSTK in table TRKOPTS, the tuple entry in table TRKGRP and/or table TRKSGRP must be changed. Please refer to "Table 6 TRKGRP Restrictions" on page 2916. and Table 7, "TRKSGRP Restrictions," on page 2919.

This option can not be added if the PTS trunk group already has members provisioned in table TRKMEM. This can occur if the members were provisioned on a peripheral type other than a GWC. Note that trunks members can not be assigned to a GWC in table TRKMEM if the GWCPTSTK option is not present in table TRKOPTS. Hybrid PTS trunk groups that consist of members distributed across a GWC and a different peripheral type, such as a DTC, are ***not*** supported. If trunk members exist while provisioning the GWCPTSTK option, the following error will result:

"GWCPTSTK cannot be assigned for the following reasons:"
"Trunk Members exist in table TRKMEM"

This option can not be deleted from table TRKOPTS until all members on the trunk group have been deleted from table TRKMEM. The following error will result:
"GWCPTSTK cannot be deleted for the following reasons:"
"Trunk Members exist in table TRKMEM"

35.11 Configuration Walkthrough

Following is a high-level walkthrough of the steps required to provision supported PTS trunk groups on a GWC.

- Provision the GWC node using the CS2M. The CS2M will provision table SERVRINV on the CS2K core. A new Gateway Controller Profile must be selected when provisioning the GWC node. Select "TRUNKNA" and choose exec lineups as specified in the following table:

PTS Exec Lineup with ABTRK TermType	PTS Exec Lineup with AB250 TermType	GWC PTS Trunks Supported
GWCEX	GWC250	All GWC PTS trunk groups except for PX trunk groups using FXS signalling.
GWCEX	GWCFX	All GWC PTS trunk groups including PX with FXS signalling except for EANT, ONAT, and DAL trunk groups.
GWCEX	<none>	All GWC PTS trunk groups except for PX trunk groups using FXS signalling and EANT, ONAT, and DAL trunk groups.

- Provision the PTS MG(s) using the CS2M. Use the PVG gateway profile which corresponds to gateway profile number 58. Additionally, Megaco protocol must be specified.
- When provisioning the PTS MGs, the GWC name must be entered. The GWC name must be entered to prevent the GWC EM from discovering an incorrect GWC.
- Provision the PTS MG endpoints on the GWC using the CS2M. The endpoint names and terminal numbers returned by the CS2M should be noted. The terminal numbers are required when provisioning table TRKMEM on the CS2K core.
- Provision table CLLI with the PTS group clli.
- Provision table TRKGRP with the PTS trunk group data. Please refer to “Table 6 TRKGRP Restrictions” on page 2916..
- Provision the GWCPTSTK option for the PTS trunk group CLLI in table TRKOPTS.

- Provision table TRKSGRP with the PTS trunk subgroup data. Please refer to “Table 7 TRKSGRP Restrictions” on page 2919..
- Provision table TRKMEM with the PTS trunk group members. The terminal number information provided by the CS2M is required when entering tuples in table TRKMEM.

35.12 PVG Profiles

For the PVG, a profile is provisioned on a DS1 carrier basis during installation of the PVG by Nortel Networks. Currently there are four profiles which support PTS trunks and are dependent on the supported cardcode and pulse types provisioned in table TRKSGRP. A PVG profile table mapping is shown below in Table 12, “PVG DS1 Profile Mapping,” on page 2931.

Table 12 PVG DS1 Profile Mapping

PVG Profile Name	TRKSGRP Cardcode	TRKSGRP InComing Pulsetype	TRKSGRP OutGoing Pulsetype	Trunk Group Restrictions
ds1sig_mfr1.prof	DS1SIG	MF,DT, DP	MF,DP	None
ds1SigMwMfr1.prof *	DS1SIG	MF,DT,DP	MF,DP	None *.
ds1sig_dtmf.prof	DS1SIG	DT,DP	DT,DP	Not Supported for OP, SC, ES, ATC, IT, ONAT, and EANT.
fxsls.prof	FXSLS	DT,DP	DT,DP	Supported for DAL and PX groups only
fxsgs.prof	FXSGS	DT,DP	DT,DP	Supported for DAL and PX groups only

36.4 Upgrade Impact

36.4.1 Element Management Upgrade

While upgrading MG9K Manager software from SN06.2 to SN07, follow the steps given below.

1. Start SN07 MG9KEM
2. Start SN07 OM Collector
3. NE is deleted from SN06.2 MG9KEM manually
4. NE is deleted from SN06.2 OMC (should happen during the MG upgrade window)
5. NE is upgraded to SN07 software
6. NE is added (manually or automatically) to SN07 MG9KEM. If device was previously being polled for OMs, operator will check 'yes' in the checkbox "NE OMCollection" in MG9KEM either while adding the NE or after adding the NE.
7. NE is deleted from SN06.2 MG9KEM manually (This does not happen until NE is successfully upgraded to SN07 EM).

36.5 Data schema (DS) (CM, MIBS, RDB)

A new column OMCSTATUS is introduced in the database table NODE_ATTRIBUTES. No existing external interfaces are changed.

36.6 Service Orders (SO) (CM & SESM)

MG9K-EM Alarm browser GUI	Changed
MG9000 Provisioning GUI	Changed
MG9K-EM NE Properties GUI	Changed
MG9K-EM NE Discovery GUI	Changed

36.8.2 GUI information

36.8.2.1 GUI name: MG9K-EM Frame-view

36.8.2.1.1 Functional description

Following changes will be done in this GUI;

1. In MG9K-EM Frameview, frames are displayed without gap. However, any gap present between shelves will continue to be displayed.

   With this change, MG9K-EM Frame view is displayed in a cleaner way. Some of the examples for this cleaner display are;

   - MG9K-EM Craft-person can see Master frame as and when he/she opens the Frame view, even when Master frame has two or more empty frames to its left side.
   - MG9K-EM Craft-person can see adjacent frames, without scrolling to right in Frameview, even when there is gap between the frames.

2. In MG9K-EM Frameview, Master frame is shown far left and all subtending frames are shown to the right of Master frame going by following logic.

- Show Master frame far left.
- Show other frames, whose frame number is higher than that of Master frame on right of Master frame, in increasing order of their Internal frame number (IFN).
-And then, show other frames, whose IFN is lower than that of Master frame, in increasing order of their IFNs.

As a result of these changes, Frameview may not be a mirror reflection of actual line-up of frames in MG9K.

Note that, as in SN6.2, in MG9K-EM Frame view, Internal frame number is shown at the bottom of each frame and Office frame number is shown at the top of each frame. With this, Craft-person can map the MG9K-EM Frame view to actual line-up of frames in MG9K.

36.8.2.1.2 GUI Usage and implications

NA

36.8.2.1.3 GUI size

No changes in SN07.

36.8.2.1.4 GUI fields

No changes in SN07.

36.8.2.1.5 Usage example

Let us consider two scenarios.

Scenario 1:

Let us consider a scenario wherein frames are lined-up from left to right as follows;

- First frame is numbered as 1 and is Master frame
- Second frame is numbered as 3 and is subtending frame

For this scenario, in SN06.2, craft-person need to use horizontal scroll bar to see the non-empty frames (frame #1 and frame #3) and MG9K-EM Frame view would looks like figure #1 and figure #2.

For this scenario, in SN07, craft-person see the non-empty frames as and when he/she opens the Frameview and MG9K-EM Frame view would looks like figure #3.

Even when frames are lined-up from right to left, in both SN06.2 and SN07, Frame view will look the same way as in left to right lineup.

Scenario 2:

Let us consider a scenario wherein frames are numbered as follows;

- First frame is numbered as 5 and is Master frame
- Subsequent three subtending frames are numbered as 7, 0 and 2 .

For this scenario, in SN06.2, frames would be shown in increasing order of their Internal frame numbers. i.e, as [frame #0][frame #2][frame #5][frame #7]).

For this scenario, in SN07, frames would be shown as [frame #5][frame #7][frame #0][frame #2]); refer to the logic given in section 12.8.2.1.1 point #2.

Figure 1 MG9K-EM Frame view in SN06.2 and prior when Frame view comes up

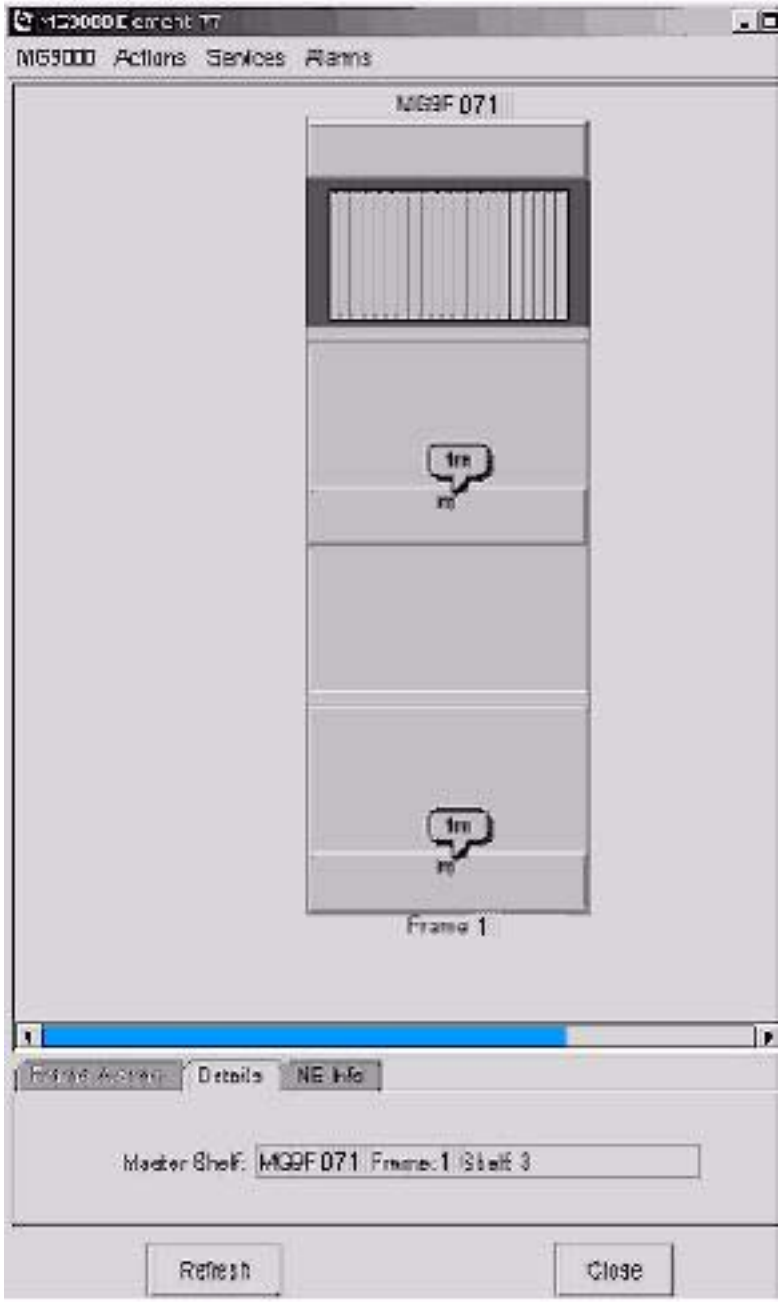

Figure 2 MG9K-EM Frame view in SN06.2 and prior when horizontally scrolled far right

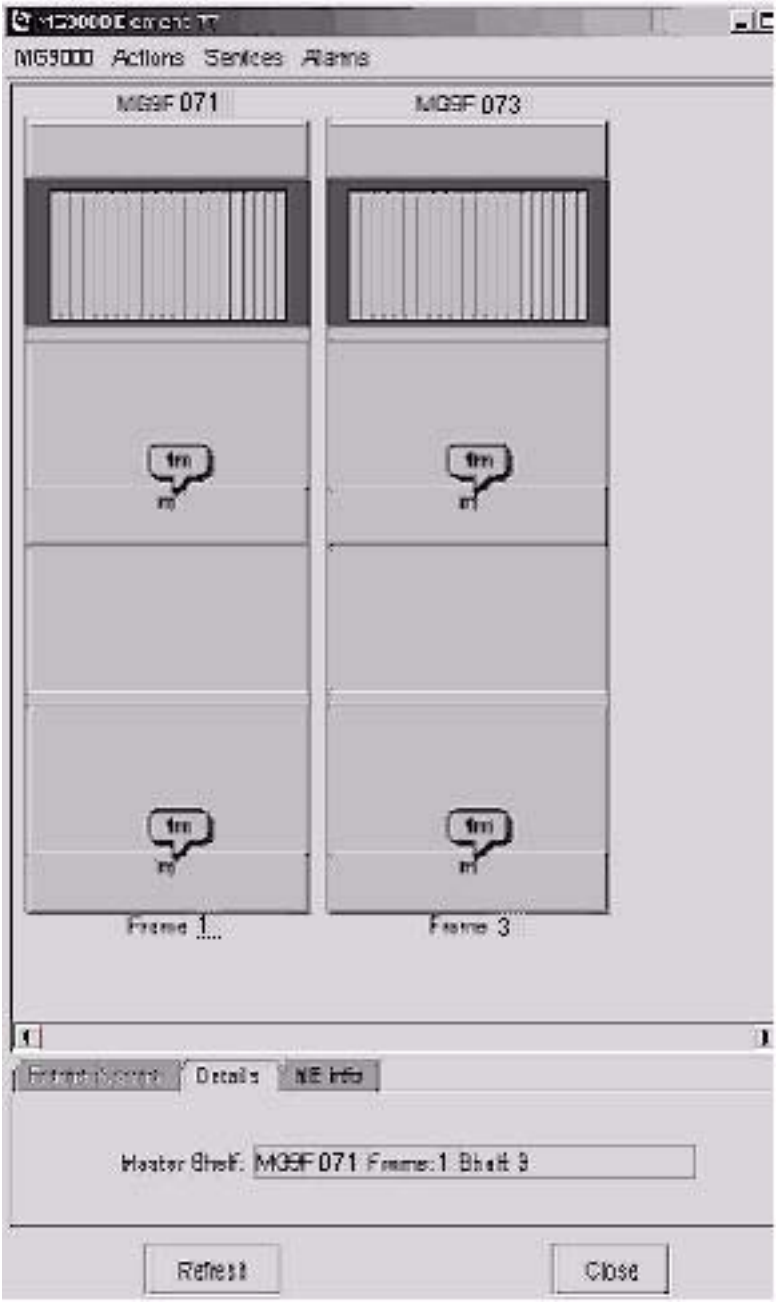
Figure 3 MG9K-EM Frame view in SN07



36.8.2.1.6 GUI release history update

SN07, following changes will be done to MG9K-EM Frameview GUI;

a. frames are displayed without gap.

c. In MG9K-EM Frameview, Master frame is shown far left and all sub-

tending frames are shown to the right of Master frame going by following logic.

- Show Master frame far left.
- Show other frames, whose frame number is higher than that of Master frame on right of Master frame, in increasing order of their Internal frame number (IFN).
- And then, show other frames, whose IFN is lower than that of Master frame, in increasing order of their IFNs.

36.8.2.1.7 Supplementary information

None

36.8.2.1.8 CLUI Interface

NA

36.8.2.2 GUI name: MG9K-EM "Provision a Virtual Media Gateway" GUI

36.8.2.2.1 Functional description

Following changes will be done in this GUI;

Internal frame number is hard-coded to zero in VMG name, while provisioning VMG. So, VMG name of a VMG which is provisioned in SN07, will be as follows;

<SITE_name><Office frame number><Internal frame number = 0><Shelf number>

An example VMG name is 'SLOA007-0-1'.

36.8.2.2.2 GUI Usage and implications

No changes in SN07.

36.8.2.2.3 GUI size

No changes in SN07.

36.8.2.2.4 GUI fields

Following table describes fields of this GUI.

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Virtual Media Gateway Name	Changed	NA	No change in SN07	Internal frame number is hard-coded to zero in VMG name, while provisioning VMG.	No change in SN07

There is no change in SN07 for other GUI fields.

36.8.2.2.5 Usage example

The field “Virtual Media Gateway” is not configurable by MG9K-EM Craft-person. This field is populated based on value of the fields “Virtual Media Gateway type” and “Virtual Media Gateway physical location”. Note that, in figure-4, Internal frame number of 1 is used to construct VMG name and in figure-5, Internal frame number is hardcoded to zero while constructing VMG name.

Figure 4 MG9K-EM “Provision a Virtual Media Gateway” GUI in SN06.2 and prior

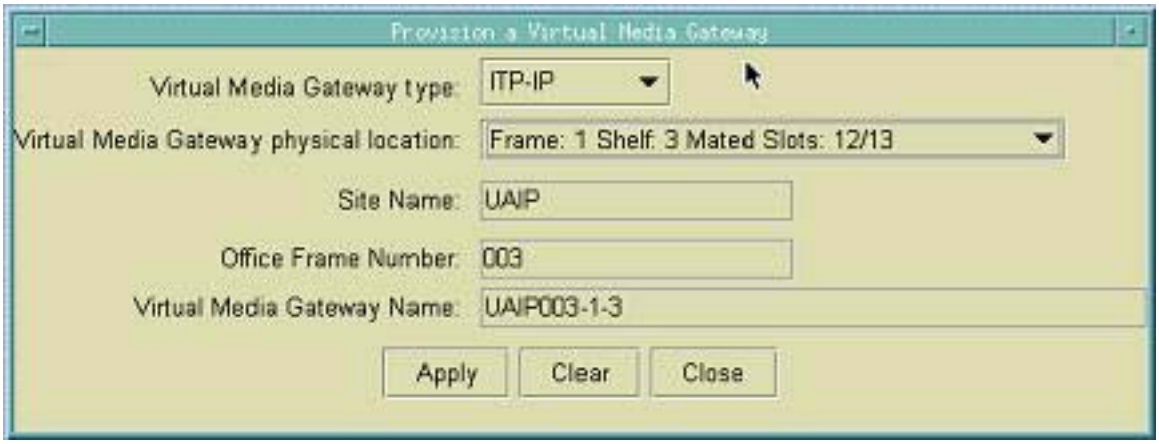


Figure 5 MG9K-EM "Provision a Virtual Media Gateway" GUI in SN07

36.8.2.2.6 GUI release history update

SN07, following changes will be done to MG9K-EM GUI;

- Internal frame number is hard-coded to zero in VMG name

36.8.2.2.7 Supplementary information

VMGs which are provisioned in SN05/SN06+ with non-zero Internal frame number, continue to exist as they are. i.e., they continue to exist with non-zero Internal frame number.

36.8.2.2.8 CLUI Interface

NA

36.8.2.3 GUI name: MG9K-EM Alarm browser GUI

36.8.2.3.1 Functional description

In SN07, following changes will be done in "Description" field of this GUI;

- Until Frame location information is not provisioned, default filler F's are appended in following format to the data which is shown in this field in SN06.2.

  ```
  Site Flr RPos Bay_id
  FFFF   FF FFFF  MG9F FFF
  i.e., <Site=FFFF><3 blank space><Flr=FF><2 blank space><RPos=FFFF><3 blank space><Bay-id>
  <Bay-id> = MG9F<One blank space><FFF>
  ```

- When Frame location information is (re)provisioned for a Master frame, all alarms (both Gateway alarms and EM alarms) reported on components in the frame are updated with latest frame location information.
- When Frame location information is (re)provisioned for a subtending frame, only Gateway alarms reported on components in the frame are updated with latest frame location information.

36.8.2.3.2 GUI Usage and implications

As explained in 12.8.2.3.1, data shown in "Description" field of this GUI depends on whether Frame location information is provisioned or not.

36.8.2.3.3 GUI size

No changes in SN07.

36.8.2.3.4 GUI fields

Following table describes the fields of this GUI.

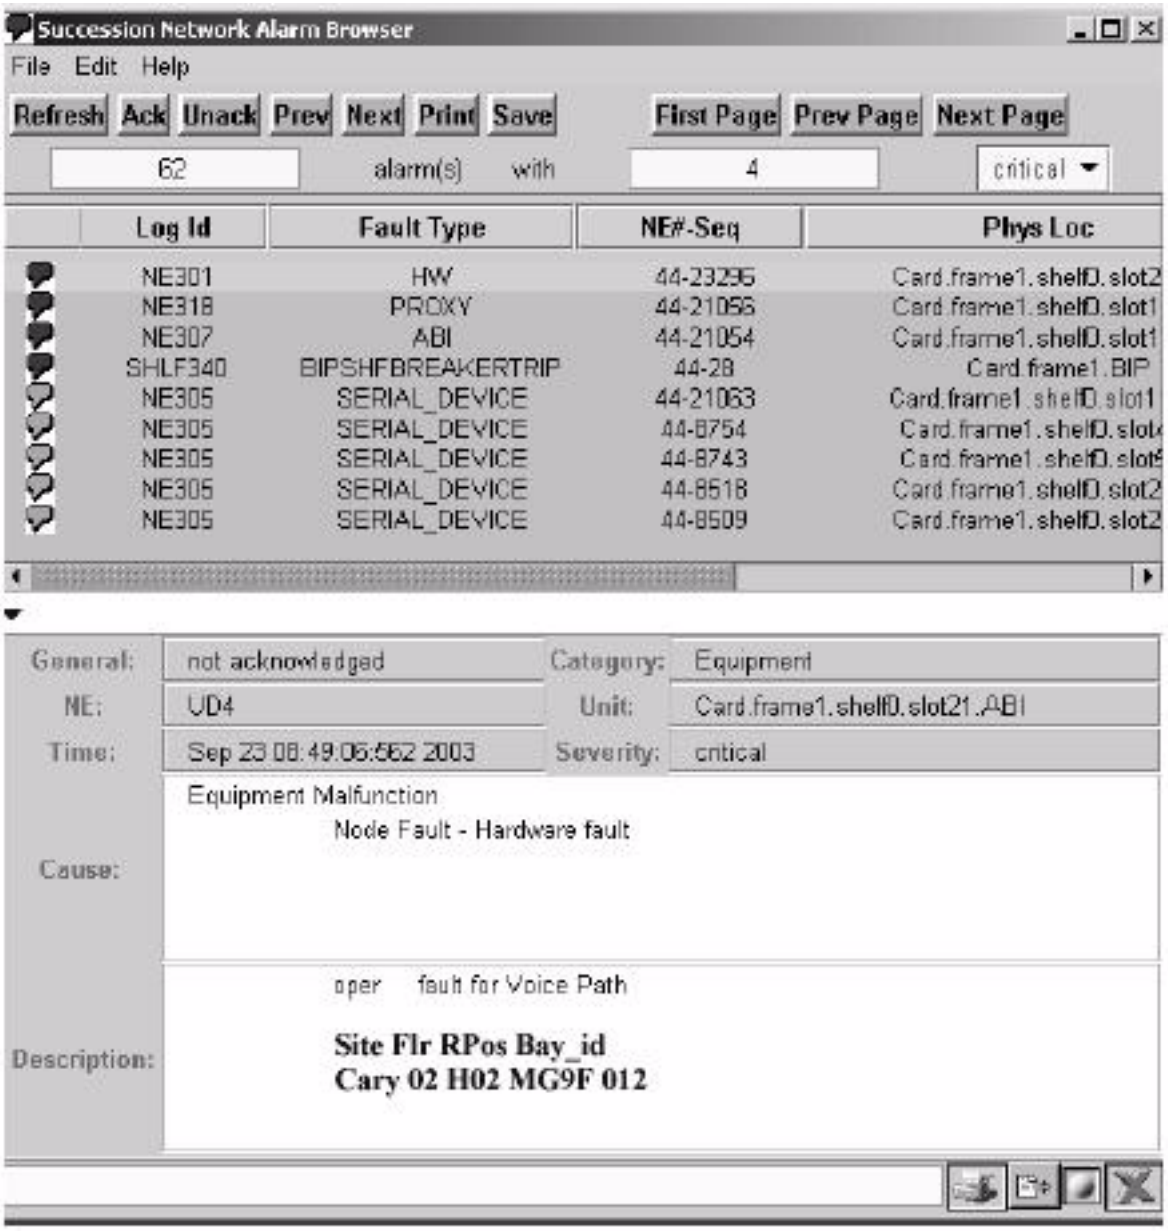
Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Description	Changed	NA	No change in SN07	Refer to 12.8.2.3.1	No change in SN07

There is no change in SN07 for other GUI fields.

36.8.2.3.5 Usage example

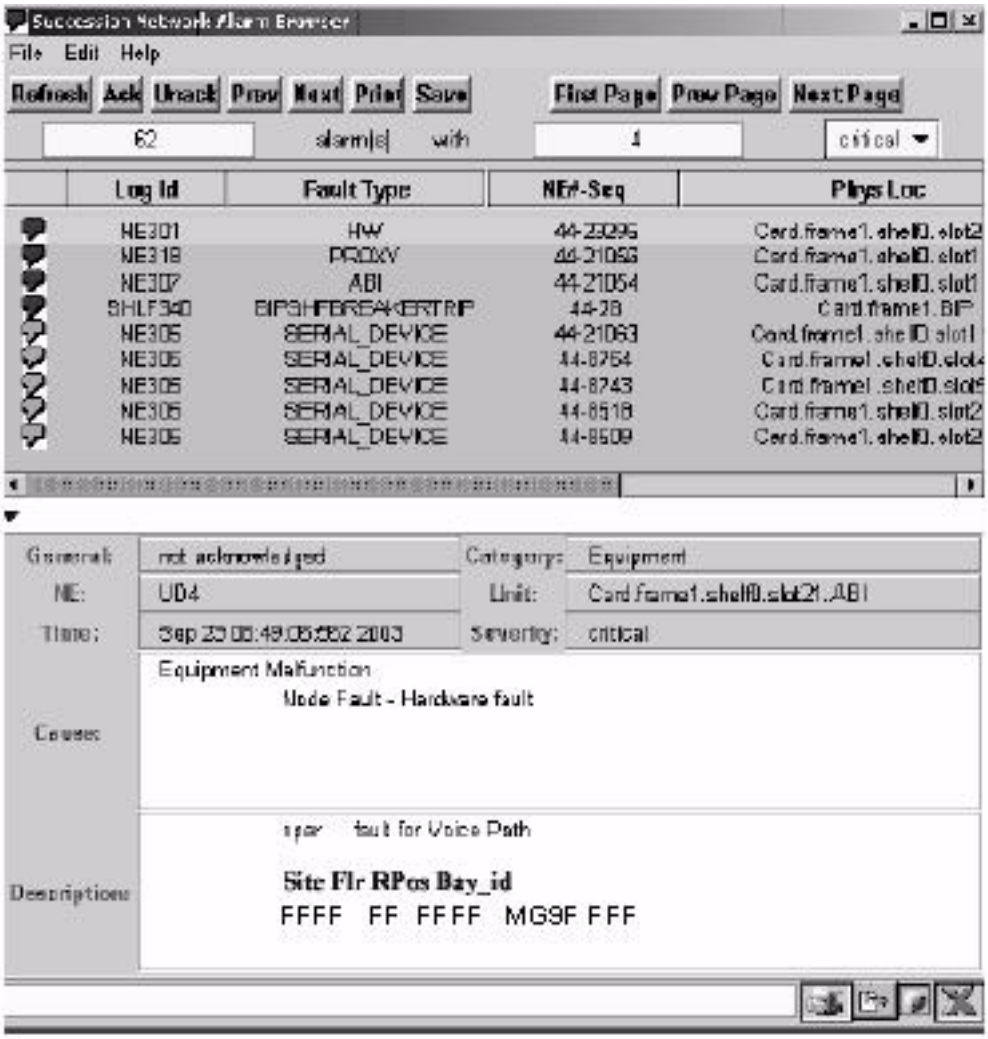
After Frame location information is provisioned for frame 1, if an alarm is raised on an entity say card, which is present in frame 1, then in SN07, it will look as in figure-6.

Figure 6 MG9K-EM Alarm browser GUI in SN07 when Frame location information is provisioned for frame 1



If an alarm is raised on an entity say card, which is present in frame 1, for which Frame location information is not provisioned, then in SN07, it will look as in figure-7.

Figure 7 MG9K-EM Alarm browser GUI in SN07 when Frame location information is not provisioned for frame



36.8.2.3.6 GUI release history update

SN07, following changes will be done in Description field of this GUI;

- Until Frame location information is not provisioned, default filler F's are shown
- When Frame location information is (re)provisioned for a Master frame, all alarms (both Gateway alarms and EM alarms) reported on components in the frame are updated with latest frame location information.
- When Frame location information is (re)provisioned for a subtending frame, only Gateway alarms reported on components in the frame are updated with latest frame location information.

36.8.2.3.7 Supplementary information

If Frame location is (re)provisioned when Alarm audit is underway, Frame location information for Gateway alarm may not be updated immediately on Alarm browser.

36.8.2.3.8 CLUI Interface

NA

36.8.2.4 GUI name: MG9K-EM MG9000 Provisioning GUI

36.8.2.4.1 Functional description

In SN07, a new checkbox “NE OMCollection” is introduced in MG000 Provisioning GUI. Operator can check or uncheck this checkbox. If it is checked, OM Collector will collect OM data starting from its next collection cycle. If it is unchecked, OM Collector will stop collecting OM data starting from its next collection cycle.

36.8.2.4.2 GUI Usage and implications

NA

36.8.2.4.3 GUI size

No changes in SN07.

36.8.2.4.4 GUI fields

Following table describes the fields of this GUI.

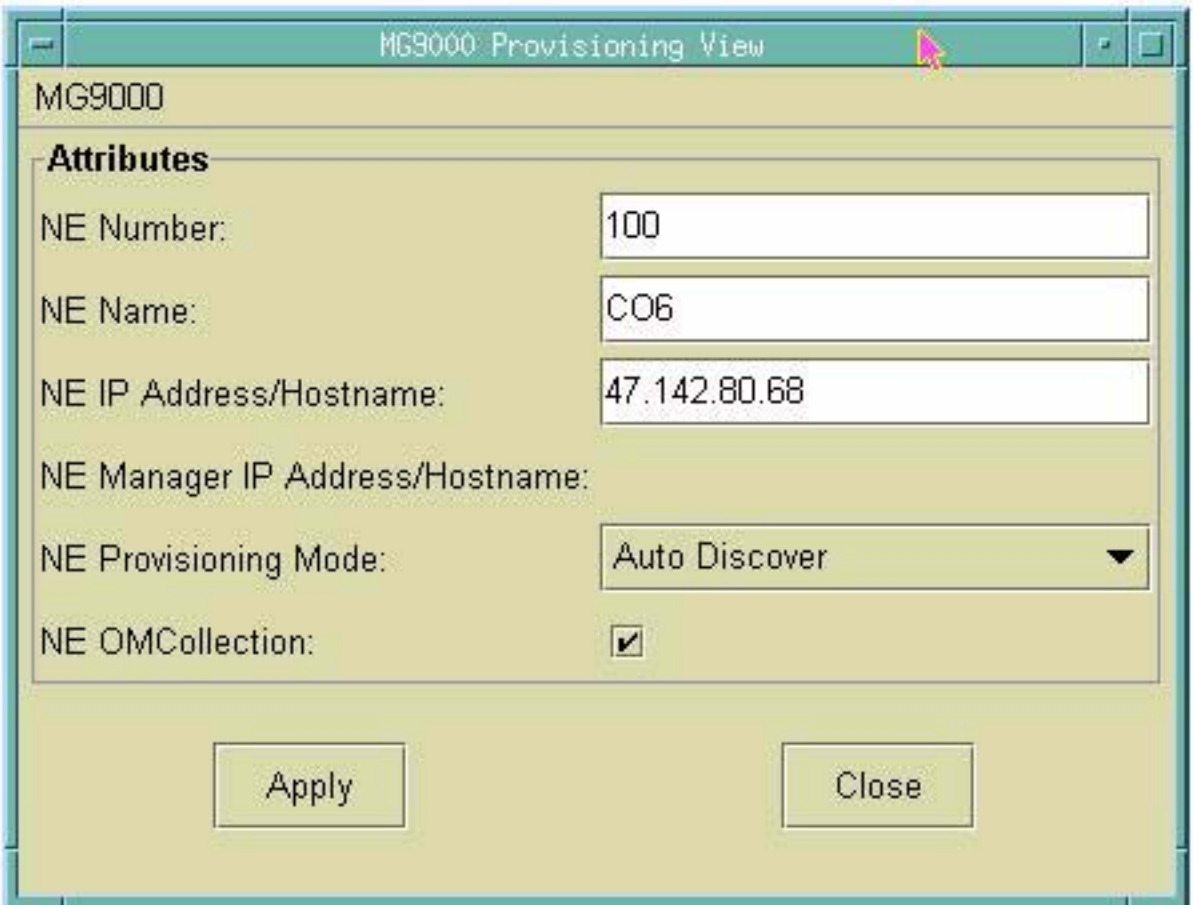
Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
NE OMCollection	New	NA	checked/ unchecked	Refer to 12.8.2.4.1	None

There is no change in SN07 for other GUI fields.

36.8.2.4.5 Usage example

Operator can either check or uncheck the “NE OMCollection” checkbox.

Figure 8 MG9K-EM “MG9000 Provisioning” GUI when “NE OMCollection“is checked



36.8.2.4.6 GUI release history update

In SN07, a new checkbox “NE OMCollection” is introduced in “MG9000 Provisioning” GUI. Operator can check or uncheck this checkbox. If it is checked, OM Collector will collect OM data starting from its next collection cycle. If it is unchecked, OM Collector will stop collecting OM data starting from its next collection cycle.

36.8.2.4.7 Supplementary information

None

36.8.2.4.8 CLUI Interface

NA

36.8.2.5 GUI name: MG9K-EM NE Properties GUI

36.8.2.5.1 Functional description

In SN07, a new checkbox “NE OMCollection” is introduced in NE Properties GUI. Operator can check or uncheck this checkbox. If it is checked, OM Collector will collect OM data starting from its next collection cycle. If it is unchecked, OM Collector will stop collecting OM data starting from its next collection cycle.

36.8.2.5.2 GUI Usage and implications

NA

36.8.2.5.3 GUI size

No changes in SN07.

36.8.2.5.4 GUI fields

Following table describes the fields of this GUI.

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
NE OMCollection	New	NA	checked/ unchecked	Refer to 12.8.2.3.1	None

There is no change in SN07 for other GUI fields.

36.8.2.5.5 Usage example

Operator can either check or uncheck the “NE OMCollection” checkbox.

36.10 Security

36.10.1 Authentication.

- MG9K OM Collector access MG9K EM Oracle database tables, namely NODE_ATTRIBUTES, DEM_APPS and FRAME_LOC. It gets database password from the SSFPS password file “/opt/nortel/sspfs/db/pfsora.pwd”
- MG9K OM Collector open FTP/SFTP session with MG9K periodically. It get password for this FTP/SFTP session by querying a database table, maintained by MG9K EM.

36.11 Configuration Walkthrough

36.12 Glossary

Term	Description
EM alarm	Alarm generated internally by MG9K EM. Ex; When communication from MG9K EM to MG9K goes down, MG9K-EM generates an alarm with specific problem “Comm Channel Down - Communication Lost to the NE”.
Frame location information	It consists of frame type, floor position, row position, frame position, shelf position
Internal (logical) frame number	Frame number, which is unique within a MG9K
Gateway alarm	Alarm reported from gateway.
MG9K frame line-up	MG9K frames are lined-up either left to right or right to left. When frames are lined-up left to right, new frames are positioned/added to right of existing frames, as MG9K grows and frames are numbered from left to right. That means, Master frame will be the left-most frame in the NE. When frames are lined-up right to left, new frames are positioned/added to left of existing frames, as MG9K grows and frames are numbered from right to left. That means, Master frame will be the right-most frame in the NE.
NE	Network Element. Each NE has a Master shelf and zero or more subtending shelves/s, whose ITP cards are connected to the ITX card present in Master shelf.
Office (External) frame number	Frame number, which is unique within an office
Subtending frame	It has the subtending shelves of a MG9K

37: Configuration (CN): A00003567

37.1 Hardware and Software Requirements

This functionality is for MG9000 EM that has SN07 or higher software version.

37.2 Initial Configuration

No changes to the initial configuration.

37.3 Upgrade Impact

37.3.1 Dump and Restore

N/A

37.3.2 Element Management Upgrade

ABI ESA functionality is only applicable if the MG9000 is at a software release of SN07 or higher.

37.4 Element Management

37.4.1 GUI information

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
ESA Configuration View	Changed
Subnet View	Changed

37.4.1.1 ESA Configuration View

37.4.1.1.1 Functional description

In release SN07, this view will be enabled for ABI as well as ITP VMGs.For the ABI VMGs only enhanced ESA capability will be supported.

37.4.1.1.2 GUI usage and implications

From MG9kEMS software UE9000 MG Element Manager View, when you click Services submenu ‘Switched Line Services Manager’, this action invokes

Switched Line Services for MG9000 Element View. The ESA Config Panel View which is displayed when the “ESA Config” tab is selected.

37.4.1.1.3 GUI size

Not Applicable

37.4.1.1.4 GUI fields

The following table lists the new fields in the ESA Config View:

Table 2 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
ESA Mode	Changed	N/A	“Enhanced (North American)” or “Basic”	The “Enhanced” will use the ESA data provided by the Core. This will be used by both ABI and ITP VMGs The “Basic” will work in the same manner that ESA is configured in SN06 using the MG9000 EM for ITP VMGs but will not be supported for ABI VMGs.	None
ESA Capability	Not Changed	N/A	“Yes” or “No”	“Yes” means that the selected VMG is capable of going into ESA. “No” means that the VMG is not capable of going into ESA.	nnEsaConfigAdminStatus
ESA Dialing Plan	Not Changed	N/A	add “7 and 10 Digit Dialing”	7 and 10 digit dialing is supported in SN06.2. It is supported only for “Enhanced” ESA mode. It will be disabled.	nnEsaConfigDialingPlan

Table 2 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
ESA Notify Tone	Not Changed	N/A	“Yes” or “No”	“Yes” means that a notify tone is given to alert user that in ESA mode. “No” means that there is no indication to the user that in ESA mode. It will be disabled if “Enhanced” is selected.	nnEsaConfigNotifyTone
Default Pretranslator Name	Not Changed	N/A	Default Pretranslator name which is from Core	This field is the Default Pretranslator name that is associated with the selected VMG.It will be disabled if “Enhanced” is selected.	nnEsaConfigDefPretranslationId
ESA Operational Status	Not Changed	N/A	“Not in ESA” or “In ESA”	“Not in ESA” means that the VMG is not in ESA mode. “In ESA” means that the VMG is in ESA mode.	nnEsaConfigOperStatus
Download	Not Changed	N/A	N/A	When user clicks on this button, it will perform a manual downloading the EM ESA data to Gateway in order to resync the MG9000 with EM latest Core data for selected VMG.The button will be disabled if “Basic” is selected.	None
Customer Group	Not Changed	N/A	N/A	Click on this button, “ESA Customer Group List” View will be displayed. It will be disabled if “Basic” is selected.	None

Table 2 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Hunt Group	Not Changed	N/A	N/A	Click on this button, “ESA Hunt Group List” View will be displayed. It will be disabled if “Basic” is selected.	None
Translations	Not changeds	N/A	N/A	Click on this button, “ESA Translation List” View will be displayed. It will be disabled if “Basic” is selected.	None

37.6 Configuration Walkthrough

37.6.1 SDM Configuration:

Please ensure that the SDM has the latest available fileset as part of the CS2E06 SDM load, for the package SDM_BASE.fts for the application ‘File Transfer Service”.

37.6.2 MG9K EM Configuration:

37.6.2.1 Set up the SSH authentication

This feature requires a key exchange between the MG9K EM server and the SDM for downloading the ESA data.

37.6.2.1.1 Procedure

1. Configure the SDM IP and SDM USER for this system. Log in to the MG9K EM server as ‘root’ and run the command:

   $ *cli*

   Select "Configuration", then select "OAMP Application Configuration", then select "Configure SDM IP and User" and set the SDM IP to the correct IP address of the SDM.

   Set the SDM user name to be “*esauser*”

2. For the user, ‘mgems’ on the MG9K EM server, generate the ssh key pair needed for data transmission between the MG9K EM and the SDM. As the ‘root’ user, execute the following commands:

   # *su - mgems*

   $ *ssh-keygen -t rsa*

   Accept the default location and enter an empty passphrase. This will create the following key file:

   /export/home/mgems/.ssh/id_rsa.pub

3. The key information contained in the file /export/home/mgems/.ssh/id_rsa.pub must be placed in the following file on the SDM:

   /home/esauser/.ssh/authorized_keys2

   — Secure copy the id_rsa.pub file to the SDM, using the command

$ *scp /export/home/mgems/.ssh/id_rsa.pub root@$SDM_IP:/home/esauser/tempkey*

Answer "yes" to the prompt "Are you sure you want to continue connecting (yes/no)?", then enter the password of the ‘root’ SDM user.

— Secure append the public key to the authorized keys list on the SDM, using the command

$ *ssh root@$SDM_IP ’cat /home/esauser/tempkey >> /home/esauser/.ssh/authorized_keys2’*

Enter the password of the ‘root’ SDM user when prompted for it.

Once completed, the MG9K EM will have the required access to the SDM for downloading the ESA data.

37.6.2.2 Set up ESA data download properties

ESA properties must be set up appropriately to download the right ESA data file from the Core at the right time. The Core will have an office parm configured to a specific time to start the collection of ESA data on the Core daily. The download of the ESA data is a nightly process and the corresponding time on the EM must be configured such that there is atleast half an hour delay between this time and the Core configured time.

There are 3 ESA data download properties that need to be properly configured. These include the time that will be used for nightly downloads, the name of the device on the Core where the ESA data file will be stored and the name of the ESA data file itself. These properties have the following default values:

ESA.DataDownloadTime=1:30 AM

ESA.DataDeviceName=/SFDEV

ESA.DataFileName=ESA_SYSTEM_SD$XML

ESA.DataFileNameUnix=ESA_SYSTEM_SD.XML

Notes:

- The ESA.DataFileNameUnix property is not editable. This is dynamically derived from the ESA.DataFileName property by the MG9K EM software.
- The ESA.DataFileName on the core should adhere to the following naming conventions:
  a. There can only be one ‘$’ sign in the name separating the ‘name’ part from the ‘extension’ part. (Please see the default value for an example).
  b. No spaces are allowed in the file name.

Use the following procedure only if you need to change the default values of the ESA properties.

37.6.2.2.1 Procedure

Telnet into the MG9K EM server and launch the ‘mg9kserver’ script, located under the “bin” directory under the server where it is installed. The menu walk through is described as follows only to be used as an example:

./mg9kserver config

Main Configuration Menu

1) Change Distribution Policy

2) Change SESM IP Address

3) Change Oracle IP Address

4) Change Debug Level for logs

5) Change Persistence settings

6) Change ESA data download settings

7) Display current settings

8) Exit from Main Menu

Please make a selection => 6

ESA Configuration Menu

1) Change ESA data download time

2) Change ESA data device name

3) Change ESA data file name

4) Exit to Main Menu

Please make a selection => 1

Please enter the new ESA data nightly download time ?

Default: [1:30 AM] => 5:30 PM

ESA Configuration Menu

1) Change ESA data download time

2) Change ESA data device name

3) Change ESA data file name

4) Exit to Main Menu

Please make a selection => 2

Please enter the new ESA data device name on the core ?

Default: [/SFDEV] => /ESADEV

ESA Configuration Menu

1) Change ESA data download time

2) Change ESA data device name

3) Change ESA data file name

4) Exit to Main Menu

Please make a selection => 3

Please enter the new ESA data file name on the core ?

Default: [ESA_SYSTEM_SD$XML] => ESADATA$XML

Name of the ESA data file on the EM: ESADATA.XML

ESA Configuration Menu

1) Change ESA data download time

2) Change ESA data device name

3) Change ESA data file name

4) Exit to Main Menu

Please make a selection => 4

Once completed, the new ESA data download properties will become effective on the future downloading of the ESA data.

37.6.3 Core Configuration:

37.6.3.1 Overview

ESA data file will be downloaded from the core using FTP. Hence, it is important to ensure that enough TCP connections are configured on the core for the FTP Server sessions.

The maximum number of FTP sessions is controlled by the “CM” tuple in TABLE IPHOST in the “CM”. The “CM” tuple is usually the first tuple in the table. This tuple contains the following fields:

NODENAME: Node name = CM.

CMINDEX: Index = 0.

TCPCONN: The total number of TCP connections allowed. This number must be greater than or equal to (*FTPCLCON* + *FTPSVCON*) * 2.

FTPCLCON:The maximum number of FTP client sessions allowed. SFT is not impacted by this value.

FTPSVCON:The maximum number of FTP server sessions allowed. SFT shares this resource with other CM FTP users.

Care must be taken when determining the value of *FTPSVCON*. Other telnet applications may have been configured and the value of *FTPSVCON* should be incremented taking this into account.

If *FTPSVCON* is incremented, ensure that *TCPCONN* is large enough to support the total of *FTPCLCON* and *FTPSVCON*. Each FTP session will consume 2 TCP connections. This will be enforced by the *IPHOST* table control.

38: Configuration (CN): A00003571

38.1 Hardware and Software Requirements

The Software requirement is MG9KEM SN07 release and MG9K sn07 release.

This feature supports the following new card release:

- Internet Telephony Processor (ITP): NTNY30CA (IP & AAL1 modes)
- Access Bridging Interface (ABI): NTNY43BA (IP & AAL1 modes)

38.2 Initial Configuration

The ITP and/or ABI must be discovered.

38.3 Office/Subnet parameters (OP/SP) (CM & SESM)

None.

38.4 Upgrade Impact

38.4.1 Dump and Restore

N/A

38.4.2 Element Management Upgrade

These new releases of ITP and ABI are supported only in SN07 and higher.

The MG9kEM must upgrade first to SN07 and then New ITP and ABI cards can be upgraded.

The Downgrade process MUST:

FIRST downgrade the hardware (ITP and/or ABI) before downgrade the MG9KEM software.

38.5 Data schema (DS) (CM, MIBS, RDB)

N/A

38.6 Service Orders (SO) (CM & SESM)

Not Applicable.

38.7 Software optionality control (SOC)

Not Applicable.

38.8 Element Management

38.8.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
Siwtched Line Services manager - GW config Tab	Changed
Provision a Virtual Media Gateway	Changed

38.8.2 GUI information

38.8.2.1 GUI name: Switched Line Services manager

<Switched Line Services for MG9000 Element #>

38.8.2.1.1 Functional description

This GUI provisions the Configuration for VMGs.

38.8.2.1.2 GUI usage and implications

Current datafill order unchanged.

38.8.2.1.3 GUI size

Table 2 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
Switched Line Services for MG9000 Element ##	1	60	extra memory required by JAVA swing library to display one text field and its label

39.4 Upgrade Impact

NA

39.5 Data schema (DS) (CM, MIBS, RDB)

39.5.1 New/modified tables, MIBs, or Database Schema

This feature uses new MIBs - channelized carrier configuraton details introduced by a Gateway feature A00003604

39.6 Service Orders (SO) (CM & SESM)

NA

39.7 Software optionality control (SOC)

NA

39.8 Element Management

The Element manager will display channelization carrier configuration details from SN07 release.

39.8.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
OC3STS1PortView	New
Performance browser	changed

39.8.2 GUI information

39.8.2.1 GUI name: Carrier configuration display

OC3STS1PortView

39.8.2.1.1 Functional description

If the carrier is channelized, the port view will display OC3 Section/Line and three STS1 path information. When the user clicks on the OC3 port on the OC3CardView, if the carrier is channelized, three ilog graphics will be displayed on the graphical panel in the portview for STS1 path information. The OC3Section/Line information is displayed by default in a tab. Double clicking on the ilogs will display STS1 path information in a separate tab.

The OC3 Section/Line details is unchanged for channelized carrier details. The STS1 path information displayed will be Circuit identifier, Description, speed, NETWORK field and status of the STS1 path. The status includes administrative, operational and configuration status. The user can lock/unlock or online/offline the OC3 Section/Line and three STS1 path separately. To lock OC3 Section/Line, all the three STS1 paths should be locked first. . To unlock nertwork carrier the OC3 Section/Line should be unlocked. . In the release SN07 traffic will be sent on only one STS1 path and that path is the network carrier. The STS1 path description will mention DS3 payload if the DS3 is opted on the STS1. For the network carrier, the destination will be NETWORK. For other STS1 paths the destination will be NONE. The STS1 path label will mention if DS3(plcp or clearchannel) payload is supported on STS1.

The carrier can be changed from OC3c to OC3 and viceversa dynamically from LCI. But a coldstart has to be sent to EM from Gateway after changing the carrier to EM know that the carrier has been modified

39.8.2.2 GUI size

Table 2 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
channelized OC3 carrier	3	3 per MG9000	NA

39.8.2.2.1 GUI fields

39.8.2.2.2 GUI release history update

None

39.8.2.2.3 Supplementary information

The carrier can be provisioned (concatenated/channelized) from LCI.The EM will display the carrier details. The EM user will be able to change only the administrative(lock/unlock) and configuration state. The user will not be able to provision the carrier from EM.

39.8.2.2.4 CLUI Interface

NA

39.8.2.3 Performance parameters for channelized carrier

39.8.2.3.1 GUI name: channelized carrier performance parameter

Performance browser

39.8.2.3.2 Functional Description

If the carrier is in channelized mode, the performance browser will display the OC3 Section/Line, STS1 path performance parameters and DS3 path information(if DS3 payload is selected) The information remains unchanged for OC3c.

In the performance browser, if the carrier is channelized, clicking on OC3 port will just display OC3 Section/Line performance parameters. Three nodes will be displayed under OC3 port for 3 STS1 paths information.Clicking on each of STS1 path will display STS1 path and DS3 performance parameters statistics. If DS3 payload is selected on the STS1 paths, the DS3 performance parameters will be displayed.

39.8.3 New Alarms

The STS1 and DS3 alarms will be handled at EM. The new alarms will be

LOP, UNEQ, PLM, AIS and RDI for STS1 and LOF, RAI and AIS for DS3.

39.8.4 Upgrade and Downgrade

To support channelization in SN07, the DCC card uses new hardware. So, SN06.2 and below , GW load should not be loaded on this card.A SN06.2 MG9K should have new hardware to has to be loaded with SN07 load.

39.10 Security

NA

39.11 Configuration Walkthrough

NA

40: Configuration (CN): A00003615

40.1 Hardware and Software Requirements

For the reduction of upgrade downtime, the user must have fieldgrade Netra t1400s or N240s.

40.2 Initial Configuration

The only initial configuration required would be the registration of SSPFS into PSE/NPM. This will be automatically handled via the SSPFS installation/ upgrade scripts.

40.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

40.4 Upgrade Considerations

The only impact to upgrade will be the required new step in the process which will re-attach the mirrors. This new step will replace the “boot -s” step in the current documentation. The new step will ask the user to run the command link_mirrors as root to get the mirrors reattached. Please refer to the DSUM for A00003615 for details on the internals of this script.

40.5 Data schema (DS) (CM, MIBS, RDB)

N/A

40.6 Service Orders (SO) (CM & SESM)

N/A

40.7 Software optionality control (SOC)

N/A

40.8 Element Management

New interface additions into cli will be described in the User Interface section of this document.

40.9 User interface changes

40.9.1 Directory: View

40.9.1.1 Directory Description

This existing menu level contains commands to view various informational items on the SSPFS unit.

40.9.1.2 Accessing directory: View

40.9.1.2.1 Access to directory or MAP level and return to CI

As with all menus in the “cli” tool, the user enters “x” or “X” to exit to the higher level menu

40.9.2 Command: sspfs_patch

40.9.2.1 Command type: MENU

40.9.2.2 Command target: Other, SSPFS System

40.9.2.3 Command availability: RES

40.9.2.4 Command description

The command will allow the user to view the status of the patches for SSPFS.

40.9.2.5 Command syntax

The command take no options or user input.

40.9.2.6 Qualifications and warnings

N/A

40.9.2.7 Responses

40.9.2.7.1 Example

The option will provide a table listing of the patch information in a fashion such as:

SSPFS Patch	Installed	Active
SSPFS07MA	Yes	Yes
SSPFS07MB	Yes	

40.9.3 Directory: Other

40.9.3.1 Directory Description

This existing menu level contains miscellaneous commands to manage items on the SSPFS unit.

40.9.3.2 Accessing directory: Other

40.9.3.2.1 Access to directory or MAP level and return to CI

As with all menus in the “cli” tool, the user enters “x” or “X” to exit to the higher level menu

40.9.4 Command: sun_explorer

40.9.4.1 Command type: MENU

40.9.4.2 Command target: Other, SSPFS System

40.9.4.3 Command availability: RES

40.9.4.4 Command description

The command will allow the user to execute the Sun Explorer software.

40.9.4.5 Command syntax

The command take no options or user input.

40.9.4.6 Qualifications and warnings

N/A

40.9.4.7 Responses

40.9.4.7.1 Example

=== Executing “sun_explorer” ===
=== “sun_explorer” completed successfully.

When this command is finished, the sun “dump” will reside in the directory /tmp.

40.9.5 Command: mount_image

40.9.5.1 Command type: MENU

40.9.5.2 Command target: Other, SSPFS System

40.9.5.3 Command availability: RES

40.9.5.4 Command description

The command will allow the user to mount a generic iso image to the SSPFS unit

40.9.5.5 Command syntax

This command only takes one parameter which must be a full path string to the iso image.

40.9.5.6 Qualifications and warnings

The user must be the root user to run this command

40.9.5.7 Responses

40.9.5.7.1 Example

=== Executing “mount_image” ===

Enter the full path to the iso image: /tmp/junk.iso
Mounting /tmp/junk.iso to /mnt
=== “mount_image” completed successfully.

40.10 Security

N/A

40.11 Configuration Walkthrough

All “cli” additions are purely optional, however, their use should be encouraged. This is especially true in the event of a field issue where the debugging options would be helpful.

41: Configuration (CN): A00003630

41.1 Hardware and Software Requirements

It is assumed the hardware and software installation of the CS2K is complete with the SN07 load lineup for the CS2K core, GWC, and CS2M. The MG is provided by a third party gateway vendor supporting TGCP as described in the PKT-SP-TGCP-I05-030728 TGCP Specification. Additionally, CS2M and OSSGate is initialized and available for provisioning data related to this activity.

41.2 Initial Configuration

Refer to section “41.11 Configuration Walkthrough” on page 2999.

41.3 Office/Subnet parameters (OP/SP) (CM & SESM)

No new office parameter or subnet parameter is introduced by this activity.

41.4 Upgrade Impact

41.4.1 Dump and Restore

None

41.4.2 Element Management Upgrade

Since TGCP profile is a new gateway profile introduced in SN07, there is no upgrade work required to upgrade existing TGCP gateways to the ones with the new profile.

However, through this feature, all the 5 existing PVG profiles are collapsed into one profile -- PVG.

PVG15K
PVG15K_1000
PVG15K_PARTIAL
PVG7K
PVG_VSP3

All existing PVG gateway profiles share the same information other than the maximum reserved endpoints. The new PVG profile is defined to have the maximum reserved endpoints to be the maximum of all the ones defined in the existing PVG profiles..

Similarly, all the following “Motorola” profiles are collapsed into one profile -- “MOTOROLA.

MOTOROLAMTA_1

MOTOROLAMTA_2
MOTOROLAMTA_4

All the following four “TouchTone” profiles are collapsed into one profile -- “TOUCHTONE”.

TOUCHTONE_NN01_1
TOUCHTONE_NN01_2
TOUCHTONE_NN01_3
TOUCHTONE_NN01_4

All the following “MediaTrix” profiles are collapsed into one profile -- “MEDIATRIX”.

MEDIATRIX_LINE_GW_24
MEDIATRIX_LINE_GW_4

All the following “ASKEY” profiles are collapsed into one profile -- ”ASKEY”.

ASKEY_LINE_GW_12
ASKEY_LINE_GW_30
ASKEY_LINE_GW_4

All the following “CVX” profiles are collapsed into one profile -- “CVX”.

CVX1800_2688
CVX600_612

All the following “ARRIS” profiles are collapsed into one profile -- “ARRIS”.

ARRIS_TOUCHTONE_NN01_4
ARRIS_TOUCHTONE_NN02_4

All the following “PVG” profiles are collapsed into one profile -- “PVG_APG”.

PVG_APG
PVG_APG_VSP3

Because of the collapse activity, upgrade plug-ins are written to upgrade all the existing gateways to reference their new respective gateway profile.

41.5 Data schema (DS) (CM, MIBS, RDB)

41.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
NORTEL-GWC-COMMON-TC	changed	unchanged

TRKGRP	changed	unchanged
TRKSGRP	changed	unchanged
TRKOPTS	changed	unchanged
TRKMEM	changed	unchanged

41.5.2 Table/MIB/Remote Database Schema information

41.5.2.1 Name: NORTEL-GWC-COMMON-TC

Nortel GWC Common attributes MIB

41.5.2.1.1 Functional description

This MIB is used for defining all the supported gateway protocols.

In this MIB, a new protocol “TGCPPROTOCOL” is added in the supported protocol list for the field “GWCDeviceProtocol” as shown below. The rest of the MIB stays the same.

```
GWCDeviceProtocol ::= TEXTUAL-CONVENTION
   STATUS       current
   DESCRIPTION
         "Represents device protocol type defined in gwcdtype.h and
          callpdefs.h on the Gateway Controller. The module gwcdtype.h,
        enum gw_protocols { NIL_PROTOCOL, NCS_PROTOCOL, ASPEN,
DSMCC, MEGACO, MGCP, TGCPPROTOCOL,
FILLER3_PROTOCOL,GWCRESERVED, DQOSPROTOCOL,
MGCP_PLUS, H323}."
   SYNTAX       INTEGER { nilprotocol     (0),
                          ncsprotocol      (1),
                          aspen            (2),
                          dsmcc            (3),
                          megaco           (4),
```

```
mgcp                (5),
tgcpprotocol        (6),
filler3protocol     (7),
gwcreserved         (8),  -- GWC internal use only
dqosprotocol        (9),
mgcpplus            (10),
h323                (11)}
```

41.5.2.1.2 Usage sequence and implications (CM Only)

Not Applicable

41.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NORTEL-GWC-COMMON-TC	0	115000	

41.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for **NORTEL-GWC-COMMON-TC**.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GWCDevice Protocol	Changed	N/A	TGCPPROTOCOL	When provisioning a TGCP gateway, TGCP protocol information needs to be sent down to the GWC device from SESM.

41.5.2.1.5 Datafill example

When sending SNMP set to the GWC device, GWCDeviceProtocol should be set to 12 for provisioning TGCP gateways.

GWCDeviceProtocol = 6;

41.5.2.1.6 Table release history update

41.5.2.1.7 Supplementary information

41.5.2.1.8 Translation verification other tools
Not Applicable

41.5.2.2 Name: SERVRINV
Server Inventory table

41.5.2.2.1 Functional description
This activity adds a new exec line-up, GWCABEX, for GWC node types. The new exec line-up is specific to Succession End Office and Tandem Per Trunk Signaling (PTS) trunk types configured on a GWC node type. For GWCs configured with MF OP and/or ES trunk group members, GWCABEX must be provisioned with the **ABTRK** TERMTYPE in table SERVRINV.

41.5.2.2.2 Usage sequence and implications (CM Only)
Current datafill order unchanged by this activity.

41.5.2.2.3 Size
The size of this table is unchanged by this activity.

41.5.2.2.4 Fields/OIDs
The following table lists fields for table SERVRINV changed by this activity. The configuration information for all other fields in table SERVRINV are unchanged.

Table 4 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SRVREXEC	changed	TRMTYPE	unchanged	The TRMTYPE subfield is unchanged. This activity adds a new EXEC entry for the existing TRMTYPE of **ABTRK**.
		EXEC	GWCABEX	The new exec line-up, GWCABEX, is added. For GWCs configured with either OP or ES trunk group members, GWCABEX must be provisioned with a TRMTYPE **ABTRK.**

41.5.2.2.5 Datafill example

The following example shows sample datafill for table SERVRINV.

```
SRVRNAME        SRVRADDR
                                                    SRVREXEC
SRVRTONE    SRVROPTS
-------------------------------------------------------------------------
            GWC         0       IP  47  174  66  4
            (                   ABTRK   GWCABEX)
NORTHAM             $
```

41.5.2.2.6 Table release history update

The following information is added to table SERVRINV:

exec line-up GWCABEX added to field SRVREXEC

41.5.2.2.7 Supplementary information

Tuples in table SERVRINV should not be added or changed via manual table control commands. Provisioning of this table should be performed using CS2M GWC node provisioning.

The modifications to table SERVRINV is a shared requirement with activity A00003506. See activity A00003506 for further details.

41.5.2.2.8 Translation verification other tools

Not applicable.

41.5.2.3 Name: TRKGRP

Trunk Group Table Table

41.5.2.3.1 Functional description

This activity introduces new provisioning restrictions in table TRKGRP for MF OP and ES trunks groups configured on a GWC. The restrictions apply when the trunk group is assigned the GWCPTSTK option in table TRKOPTS and the trunk group tuple is changed in table TRKGRP.

Table 5 Supported GWC MF Trunk Group Types for TGCP MG

Trunk Group Type	Supported Services
OP	Operator Services
ES	Emergency Services

41.5.2.3.2 Usage sequence and implications (CM Only)

When provisioning MF OP and ES trunk group members on a GWC, the following sequence of table provisioning is required.

1. table CLLI
2. table TRKGRP
3. table TRKOPTS, option GWCPTSTK
4. table TRKSGRP
5. table TRKMEM

41.5.2.3.3 Size

The size of this table is unchanged by this activity.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action

41.5.2.3.5 Datafill example

Not Applicable

41.5.2.3.6 Table release history update

The following information is added to table TRKGRP:

restrictions added for GWC MF OP and ES trunk groups

41.5.2.3.7 Supplementary information

When MF OP or ES trunk group data is changed in table TRKGRP, table control determines if option GWCPTSTK is provisioned in table TRKOPTS. GWCPTSTK identifies PTS packet trunk groups that provide connectivity between the packet network and the PSTN. If option GWCPTSTK is provisioned, table control performs error checking to ensure the TRKGRP data is provisioned correctly. Table 6, "TRKGRP Restrictions," on page 2916 lists the new error messages that may be generated by table control.

Table 7 TRKGRP Restrictions

Trunk Type	Error Messages
OP	"GWCPTSTK option exists in table TRKOPTS. DIR must be IC or OG." "GWCPTSTK option exists in table TRKOPTS. ANITYPE must be REV." "GWCPTSTK option exists in table TRKOPTS. EAOSS must be N."
ES	"GWCPTSTK option exists in table TRKOPTS. DIR must be OG." "GWCPTSTK option exists in table TRKOPTS. ANI must be ANISPILL." "GWCPTSTK option exists in table TRKOPTS. SWST must be DC." "GWCPTSTK option exists in table TRKOPTS. FDISCTIM must be 0."

The modifications to table TRKGRP is a shared requirement with activity A00003506. See activity A00003506 for further details.

41.5.2.3.8 Translation verification other tools

Not Applicable

41.5.2.4 Name: TRKSGRP

Trunk Subgroup Table

41.5.2.4.1 Functional description

This activity introduces new provisioning restrictions in table TRKSGRP for MF OP and ES trunks groups configured on a GWC. The restrictions apply when the trunk group is assigned the GWCPTSTK option in table TRKOPTS and adding or changing the trunk subgroup tuples in table TRKSGRP.

41.5.2.4.2 Usage sequence and implications (CM Only)

When provisioning MF OP and ES trunk group members on a GWC, the following sequence of table provisioning is required.

1. table CLLI
2. table TRKGRP
3. table TRKOPTS, option GWCPTSTK
4. table TRKSGRP

5. table TRKMEM

41.5.2.4.3 Size
The size of this table is unchanged by this activity.

41.5.2.4.4 Fields/OIDs
Not Applicable

Table 8 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action

41.5.2.4.5 Datafill example
Not Applicable

41.5.2.4.6 Table release history update
The following information is added to table TRKSGRP:

restrictions added for GWC MF OP and ES trunk groups

41.5.2.4.7 Supplementary information
When MF OP or ES trunk groups are provisioned or tuples are changed in table TRKSGRP, table control determines if option GWCPTSTK is provisioned in table TRKOPTS. GWCPTSTK identifies PTS packet trunk groups that provide connectivity between the packet network and the PSTN. If option GWCPTSTK is provisioned, table control performs error checking to ensure the TRKSGRP data is provisioned correctly. Table 7, "TRKSGRP Restrictions," on page 2919 lists the new error messages that may be generated by table control.

Table 9 TRKSGRP Restrictions

TRKSGRP Field	Error Messages
OP, ES	"GWCPTSTK option exists in table TRKOPTS. CCONT must be NO." "GWCPTSTK option exists in table TRKOPTS. OPULSTYPin table TRKSGRP must be MF for this trunk type." "GWCPTSTK option exists in table TRKOPTS.OSTARTSG in table TRKSGRP must be WK for this trunk type.." "GWCPTSTK option exists in table TRKOPTS. SGRPVAR must be STD." "GWCPTSTK option exists in table TRKOPTS. RNGBCK must be MW." "GWCPTSTK option exists in table TRKOPTS. ESUPR must be N." "GWCPTSTK option exists in table TRKOPTS. ECSTAT must be INTERNAL or EXTERNAL."

Provisioning of this table may also be performed using OSSGate. The error checking described above is performed on TRKSGRP data enter through OSSGate.

The modifications to table TRKSGRP is a shared requirement with activity A00003506. See activity A00003506 for further details.

41.5.2.4.8 Translation verification other tools
Not Applicable

41.5.2.5 Name: TRKOPTS
Trunk Options Table

41.5.2.5.1 Functional description
A new trunk group option, GWCPTSTK, is added to table TRKOPTS. GWCPTSTK identifies PTS packet trunk groups that provide connectivity between the packet network and the PSTN. In the SN07 release, GWCPTSTK is supported with all GWC PTS supported trunk group types configured on a GWC. This option must be provisioned prior to configuring MF OP and/or ES trunk group members in table TRKMEM.

Additionally, this activity adds a sub-option , PRELOADANI, to the GWCPTSTK trunk group option. PRELOADANI sub-option identifies PTS packet trunks which support a call model that allows the ANI digits to be sent from the Core to the GWC prior to receiving any ANI request from the far-end.

41.5.2.5.2 Usage sequence and implications (CM Only)
When provisioning MF OP and ES trunk group members on a GWC, the following sequence of table provisioning is required.

1. table CLLI

2. table TRKGRP

3. table TRKOPTS, option GWCPTSTK

4. table TRKSGRP

5. table TRKMEM

Table TRKOPTS may be provisioned following table TRKSGRP. Table control restrictions enforce table TRKOPTS be provisioned after table TRKGRP and before table TRKMEM.

41.5.2.5.3 Size
The size of this table is unchanged by this activity.

41.5.2.5.4 Fields/OIDs

The following table lists fields for TRKOPTS that are changed by this activity.

Table 10 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTKEY	changed	CLLI	unchanged	The CLLI subfield is unchanged. Provision the OP or ES trunk group CLLI.
		OPTION	GWCPTSTK	The new option GWCPTSTK is added. For MF OP and ES trunks configured on a GWC, this option must be provisioned.
OPTION	changed	OPTION	GWCPTSTK	The new option GWCPTSTK is added. For PTS trunks configured on a GWC, this option must be provisioned.
		PRELOADANI	Y/N	The new sub-option PRELOADANI is added. For GWC PTS trunks which support a call model that allows the ANI digits to be sent from the Core prior to receiving an ANI request, the field must be to Y.

41.5.2.5.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

```
                OPTKEY                  OPTINFO

-------------------------------------------------------------------------

     PTSCLLI    GWCPTSTK            GWCPTSTK N
```

41.5.2.5.6 Table release history update

The following information is added to table TRKOPTS:

option GWCPTSTK added for GWC PTS trunk groups

41.5.2.5.7 Supplementary information

Option GWCPTSTK identifies PTS packet trunk groups that provide connectivity between the packet network and the PSTN. This option applies to all GWC PTS trunk group types supported in the SN07 release. Table control in table TRKOPTS blocks the addition of this option to a non-supported trunk type (see Table 4, "Supported GWC PTS Trunk Group Types," on page 2914 and activity A00003506 for the list of supported PTS trunk types on a GWC). The following error message will result:

"GWCPTSTK cannot be assigned for the following reasons:"
"It is not supported with this trunk type."

This option cannot be added for PTS trunk groups if there is existing datafill in either table TRKGRP or table TRKSGRP not supported on the GWC. If this error occurs when provisioning GWCPTSTK in table TRKOPTS, the tuple entry in table TRKGRP and/or table TRKSGRP must be changed. See Table 6, "TRKGRP Restrictions," on page 2916 and Table 7, "TRKSGRP Restrictions," on page 2919 for the list of restrictions.

This option cannot be added to a supported PTS trunk group that contains members on a peripheral type other than a GWC. PTS trunk groups on a GWC can not consist of members on different peripheral types, such as a GWC and DTC (hybrid PTS trunk groups are not supported). A check is made of other trunk members already present in table TRKMEM prior to assigning the GWCPTSTK option. If members are present it is assumed they do not have a PMTYPE of GWC, since the option isn't assigned yet. The following error will result:

"GWCPTSTK cannot be assigned for the following reasons:"
"Trunk Members exist in table TRKMEM"

This option cannot be deleted from table TRKOPTS until all members on the trunk group have been deleted from table TRKMEM. The following error will result:

"GWCPTSTK cannot be deleted for the following reasons:"
"Trunk Members exist in table TRKMEM"

The PRELOADANI sub-option applies only to GWC PTS trunk group types of OP and ES. The PRELOADANI sub-option cannot be set to "Y" for other GWC PTS trunk group types (see activity A00003506 for the list of supported PTS trunk types on a GWC).

restrictions added for GWC MF OP and ES trunk groups

41.5.2.6.7 Supplementary information
Table control for table TRKMEM determines if the option GWCPTSTK is provisioned in table TRKOPTS. If option GWCPTSTK is provisioned, table control performs error checking to ensure the TRKMEM data is provisioned correctly (see Table 10, “TRKMEM Restrictions,” on page 2924).

Table 12 TRKMEM Restrictions

TRKMEM Action	Error Messages
Attempt to ADD member with GWC PMTYPE to PTS group without GWCPTSTK option.	TBD
Attempt to ADD member with non-GWC PMTYPE to PTS group with GWCPTSTK option	TBD
Attempt to Change PMTYPE from GWC to non-GWC.	TBD
Attempt to CHANGE PMTYPE from Non-GWC to GWC	TBD

Provisioning of this table may also be performed using OSSGate. The error checking described above is performed on TRKMEM data enter through OSSGate.

The modifications to table TRKMEM is a shared requirement with activity A00003506. See activity A00003506 for further details.

41.5.2.6.8 Translation verification other tools

Not Applicable

41.6 Service Orders (SO) (CM & SESM)

Service Order unchanged by this activity.

41.7 Software optionality control (SOC)

Not Applicable. There is no SOC control for this activity

41.8 Element Management

41.8.1 New/modified GUIs

Table 13 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
Associate Gateway	Changed
Add GWC	Changed

41.8.2 GUI information

41.8.2.1 GUI name: Add GW

Associate Gateway Dialog

41.8.2.1.1 Functional description

Associate Gateway Dialog is a graphic tool that provides the crafts person with the ability to associate a gateway. For this activity, a TGCP gateway can be associated via the Associated Gateway Dialog from CS2M GUI.

41.8.2.1.2 GUI usage and implications

There is no requirement to datafill the Associate Gateway Dialog in a specific order.

41.8.2.1.3 GUI size

Table 14 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
Add GW	0	10	64k

41.8.2.1.4 GUI fields

The following table lists fields for the Associate Gateway Dialog.

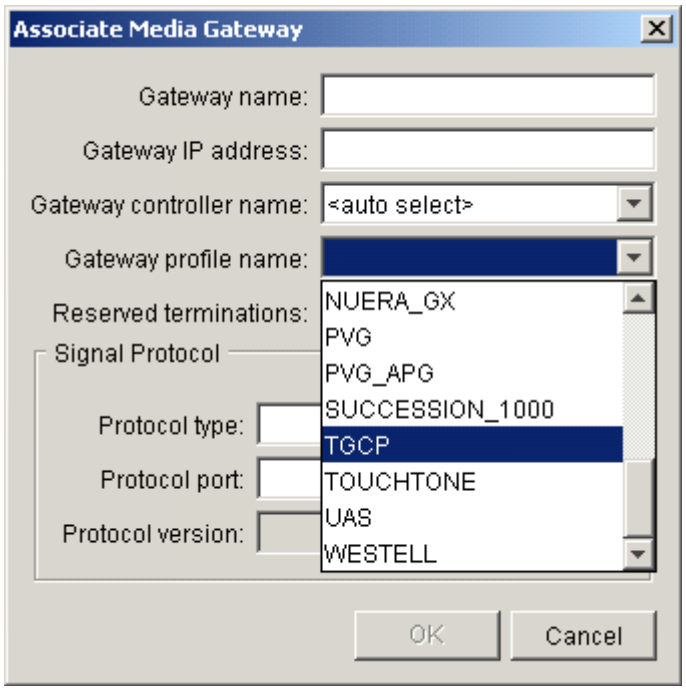
- Gateway Name
- Gateway IP Address
- Gateway Controller Name
- Gateway Profile Name
- Reserved Terminations
- Protocol Type
- Protocol Port
- Protocol Version

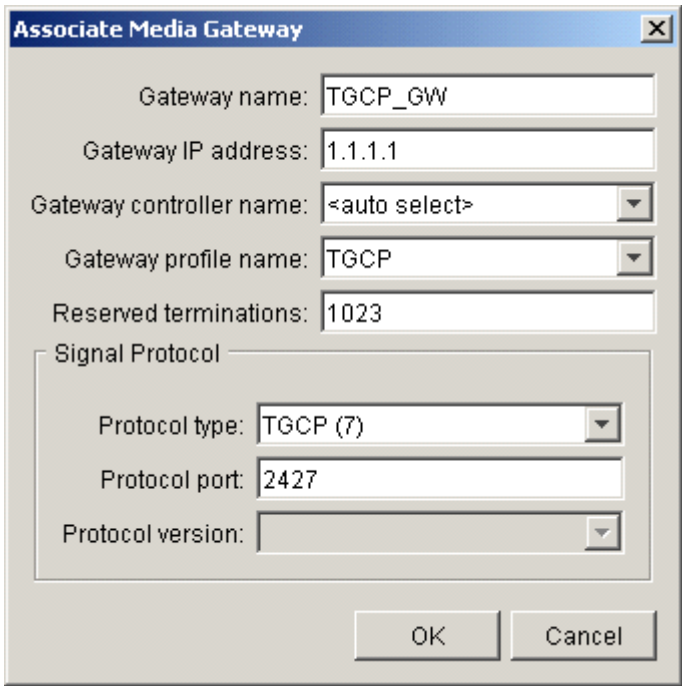
Table 15 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Gateway Profile Name	Changed	N/A	TGCP	When adding a TGCP gateway, the TGCP gateway profile should be selected from the provided profile list.	GWC-GW-MIB

41.8.2.1.5 Usage example

The following example shows sample datafill or menu selection for GUI Associate Gateway Dialog:





41.8.2.1.6 GUI release history update

41.8.2.1.7 Supplementary information

41.8.2.1.8 CLUI Interface

41.8.2.1.9 OSSGate Interface

The following is an example of an XML input file when using OSSGate interface to datafill a TGCP gateway.

```
<?xml version="1.0" encoding="UTF-8"  ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
    <assocMG usn="1" version="1.0">
     <Parameters>
       <mgUIName>mg1.nortel.net</mgUIName>
       <mgProfileName>TGCP_GW</mgProfileName>
       <mgIpAddr>47.49.23.43</mgIpAddr>
       <mgProtocolType>12</mgProtocolType>
       <mgProtocolVersion>1.0</mgProtocolVersion>
       <mgProtocolPort>2427</mgProtocolPort>
       <gwcUIName>GWC-0</gwcUIName>
     </Parameters>
    </assocMG>
  </Methods>
 </Command>
</CommandList>
```

41.8.2.2 GUI name: Add GWC

Add Gateway Controller Dialog

41.8.2.2.1 Functional description

Add Gateway Controller Dialog is a graphic tool that provides the crafts person with the ability to add a gateway controller.

When PTS functionality is provided, a different TRUNK profile needs to be selected to provision different EXEC types in the XACore.

41.8.2.2.2 GUI usage and implications

There is no requirement to datafill the Add Gateway Controller Dialog in a specific order.

41.8.2.2.3 GUI size

Table 16 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
Add GWC	0	10	64k

41.8.2.2.4 GUI fields

The following table lists fields for the Add Gateway Controller Dialog.

- Gateway Controller Name
- Gateway Controller Active IP Address
- Message Router IP Address
- Gateway Controller Profiles

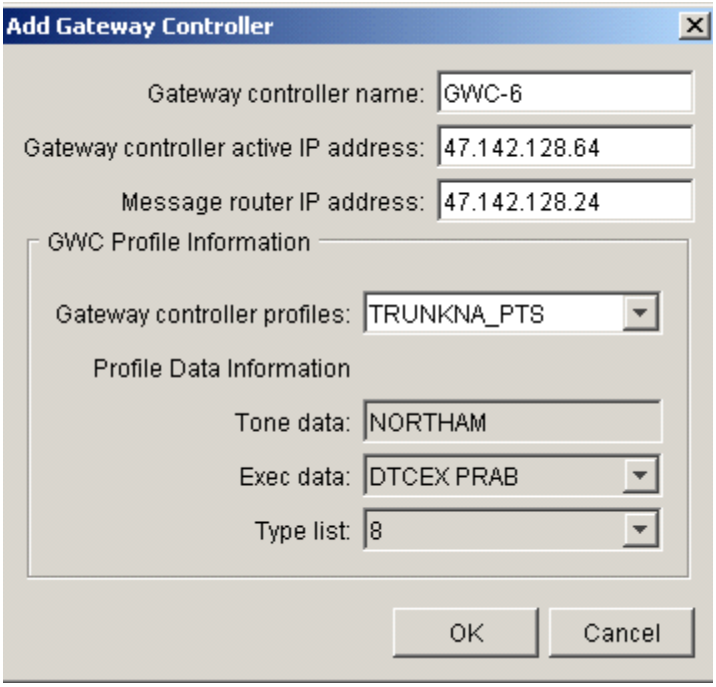
- Tone Data
- Exec Data
- Type List

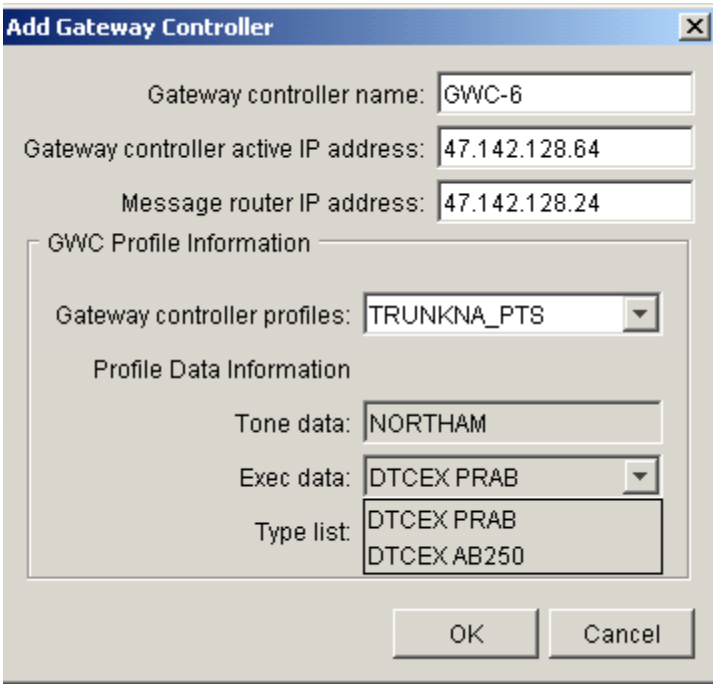
Table 17 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Gateway Controller Profile Name	Changed	N/A	TRUNKNA	When PTS functionality is provided, TRUNKNA needs to be selected when adding a GWC	GWC-GWC-MIB
EXEC Type	Changed	N/A	(DTCEX, PRAB) (GWCABEX, ABTRK)	When PTS functionality is provided, EXEC type needs to include ABTRK	

41.8.2.2.5 Usage example

The following example shows sample datafill or menu selection for GUI Add Gateway Controller Dialog:





41.8.2.2.6 GUI release history update

41.8.2.2.7 Supplementary information

41.8.2.2.8 CLUI Interface

41.8.2.2.9 OSSGate Interface

The only method of adding a gateway controller is through GUI. There is no XML interface for it.

41.9 Command interface changes

41.9.1 Directory: TTP

41.9.1.1 Directory description

Trunk Test Position (TTP) is changed. New restrictions are added at this MAP level for MF OP and ES trunk groups provisioned on a GWC.

41.9.1.2 Accessing directory: TRKS

41.9.1.2.1 Access to directory or MAP level and return to CI

To access TTP for the CI environment enter “mapci;mtc;trks;ttp”

To return to the CI environment enter “quit all”.

41.9.1.3 Supplementary information

New restrictions are added to the TTP level of the MAP for MF OP and ES trunks configured on a GWC.

The "Seize" and "Cktinfo" commands are not supported for MF OP and ES trunks configured on a GWC. The following error message is displayed if an attempt is made to execute these commands:

"Action not supported on GWC trunks."

The "TST" and "Ckt" commands require certain Succession components to support MF OP and ES trunks configured on a GWC. The following error message is displayed if an attempt is made to execute these commands without the available components:

"Action not supported on GWC trunks." or
"No IW SPM IP Bridges Available to Perform Action."

41.9.2 Directory: MONITOR

41.9.2.1 Directory description

MONITOR is changed. New restrictions are added at this MAP level for MF OP and ES trunk groups provisioned on a GWC.

41.9.2.2 Accessing directory: TTP

41.9.2.2.1 Access to directory or MAP level and return to CI

To access MONITOR for the CI environment enter "mapci;mtc;trks;ttp;level monitor"

To return to the CI environment enter "quit all".

41.9.2.3 Supplementary information

New restrictions are added to the MONITOR level of the MAP for MF OP and ES trunks configured on a GWC.

The "CktMon", "CPos_", and "RLS" commands are not supported for MF OP and ES trunks configured on a GWC. The following error message is displayed if an attempt is made to execute these commands:

"Action not supported on GWC trunks."

The "TST" and "MonTalk" commands require certain Succession components to support MF OP and ES trunks configured on a GWC. The following error message is displayed if an attempt is made to execute these commands without the available components:

"Action not supported on GWC trunks." or
"No IW SPM IP Bridges Available to Perform Action."

MONITOR level is not accessible for posted MF OP and ES trunks configured on a GWC if Succession IW bridges are not available. The following error message is displayed if an attempt is made to enter the MONITOR map level without the available components:

"No IW SPM IP Bridges Available to Perform Action."

41.9.3 Directory: MANUAL

41.9.3.1 Directory description

MANUAL is changed. New restrictions are added at this MAP level for MF OP and ES trunk groups provisioned on a GWC.

41.9.3.2 Accessing directory: TTP

41.9.3.2.1 Access to directory or MAP level and return to CI

To access MANUAL for the CI environment enter "mapci;mtc;trks;ttp;level manual"

To return to the CI environment enter "quit all".

41.9.3.3 Supplementary information

New restrictions are added to the MANUAL level of the MAP for MF OP and ES trunks configured on a GWC.

The "OP_", "SGNL", and "RLS" commands are not supported for MF OP and ES trunks configured on a GWC. The following error message is displayed if an attempt is made to execute these commands:

"Action not supported on GWC trunks."

The "Loss", "TGEN", "TST", "Noise", "TDET", and "HSET" commands require certain Succession components to support MF OP and ES trunks configured on a GWC. The following error message is displayed if an attempt is made to execute these commands without the available components:

"Action not supported on GWC trunks." or
"No IW SPM IP Bridges Available to Perform Action."

41.9.4 Directory: DATA

41.9.4.1 Directory description

DATA is changed. New restrictions are added at this MAP level for MF OP and ES trunk groups provisioned on a GWC.

41.9.4.2 Accessing directory: TTP

41.9.4.2.1 Access to directory or MAP level and return to CI

To access DATA for the CI environment enter “mapci;mtc;trks;ttp;level datattp”

To return to the CI environment enter “quit all”.

41.9.4.3 Supplementary information

New restrictions are added to the DATA level of the MAP for MF OP and ES trunks configured on a GWC.

The “Seize”, “BTerm_”, and “RLS” commands are not supported for MF OP and ES trunks configured on a GWC. The following error message is displayed if an attempt is made to execute these commands:

“Action not supported on GWC trunks.”

The “BERT_” command require certain Succession components to support MF OP and ES trunks configured on a GWC. The following error message is displayed if an attempt is made to execute this command without the available components:

“Action not supported on GWC trunks.” or
“No IW SPM IP Bridges Available to Perform Action.”

41.10 Security

Not covered by this activity. See activity A00003576.

41.11 Configuration Walkthrough

Following is a high-level walkthrough of the steps required to provision MF OP and ES trunk groups on a GWC.

1. Add the GWC node using the CS2M GWC EM. The CS2M GWC EM will provision table SERVRINV on the CS2K core. The new exec line-up, **GWCABEX**, must be selected when provisioning the GWC node.
2. Provision the TGCP MG(s) using the CS2M GWC EM. The gateway profile name that should be provisioned for a TGCP MG is “**tbd**[1]”. Additionally, TGCP protocol must be specified.

   When provisioning the TGCP MGs, the GWC name must be entered. In the SN07 release, MF OP and ES trunks must be configured on a GWC reserved for PTS trunks only. The GWC name must be entered to prevent the GWC EM from discovering an incorrect GWC.

[1]The profile name can not be confirmed at this time, but will be updated when the activity is completed.

3. Provision the TGCP MG endpoints on the GWC using the CS2M GWC EM. The endpoint names and terminal numbers returned by the GWC EM should be noted. The terminal numbers are required for provisioning table TRKMEM on the CS2K core.
4. Provision table CLLI with the OP and/or ES trunk group clli.
5. Provision table TRKGRP with the OP and/or ES trunk group data. Note the table control restrictions described in Table 6, "TRKGRP Restrictions," on page 2916.
6. Provision the GWCPTSTK option for MF OP and/or ES trunk group clli in table TRKOPTS.
7. Provision table TRKSGRP with the OP and/or ES trunk subgroup data. Note the table control restrictions described in Table 7, "TRKSGRP Restrictions," on page 2919.
8. Provision table TRKMEM with the OP and/or ES trunk group members. The terminal number information provided by the CS2M GWC EM is required when entering tuples in table TRKMEM. Note the table control restrictions described in section "41.5.2.6 Name: TRKMEM" on page 2989.

Following is a high-level walkthrough of the steps required to provision TGCP ISUP IT and/or ATC trunk groups on a GWC.

1. Add the GWC node using the CS2M GWC EM. The CS2M GWC EM will provision table SERVRINV on the CS2K core.
2. Provision the TGCP MG(s) using the CS2M GWC EM. The gateway profile name that should be provisioned for a TGCP MG is "**tbd**[1]". Additionally, TGCP protocol must be specified.

   When provisioning the TGCP MGs, the GWC name must be entered. The GWC name must be entered to prevent the GWC EM from discovering an incorrect GWC.
3. Provision the TGCP MG endpoints on the GWC using the CS2M GWC EM. The endpoint names and terminal numbers returned by the GWC EM should be noted. The terminal numbers are required for provisioning table TRKMEM on the CS2K core.
4. Provision table CLLI with the ISUP IT and/or ATC trunk group clli.
5. Provision table TRKGRP with the ISUP IT and/or ATC trunk group data.
6. Provision table TRKSGRP with the ISUP IT and/or ATC trunk subgroup data.
7. Provision table TRKMEM with the ISUP IT and/or ATC trunk group members. The terminal number information provided by the CS2M GWC EM is required when entering tuples in table TRKMEM.

[1]The profile name can not be confirmed at this time, but will be updated when the activity is completed.

8. Provision table ISUPDEST with the C7 routeset for the ISUP IT and/or ATC trunk subgroups.
9. Provision table C7TRKMEM with the C7 circuit ID code (CIC) for the ISUP IT and/or ATC trunk group members.

42: Configuration (CN): A00003667

42.1 Hardware and Software Requirements

No change due to this feature.

42.2 Initial Configuration

No change due to this feature.

42.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

42.4 Upgrade Impact

42.4.1 Dump and Restore

N/A

42.4.2 Element Management Upgrade

This feature introduces a new mechanism for sending SESM alarm logs northbound. Previously this was handled via syslog to the SDM. In this release, it can be handled by CORBA notifications to the IEMS.

For customers that use IEMS in SN07, the syslog generation should be turned off to avoid duplication of the alarm logs. This cannot be turned off over the upgrade because some customers will not have IEMS in SN07. So this should be a manual step post-insallation.

To turn the SESM syslog generation off:

1) As root on the SESM server: > cd /opt/nortel/NTsesm/admin/bin/

2) Run: ./configure

3) Select option 5: SESM logging configuration (syslog, sesm debug log)

4) Select option 3: SESM Alarm Logging configuration

5) Enter n

6) Exit the configuration tool

7) Restart the SESM application: ./ptmctl restart

In the case of new installations, this northbound syslog generation will still be turned on by default. To turn this off for customers with IEMS, the same commands listed above should be run post installation.

42.5 Data schema (DS) (CM, MIBS, RDB)

42.8.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
SESM Alarm Manager	Changed
SESM Alarm History	Changed

42.8.2 GUI information

42.8.2.1 GUI name: SESM Alarm Manager and Alarm History

42.8.2.1.1 Functional description

The Alarm Manager is the SESM GUI used to monitor active alarms in on devices it manages. It receives CORBA notifications when new alarms occur or when existing alarms are cleared. Because of the addition of IEMS and its alarm manager, the alarm acknowledgment feature is no longer required at this level. Alarms should be acknowledged at the network management level.

Alarm History is the SESM GUI used to view all alarms received by the system (to save disk space, old alarms are cleared after some preconfigured time period, usually 1 week). This GUI shows both active and cleared alarms.

42.8.2.1.2 GUI usage and implications

Because of the addition of IEMS and its alarm manager, the alarm acknowledgment feature is no longer required at this level. Alarms should be acknowledged at the network management level.

In the Alarm Manager, the ability to acknowledge and de-acknowledge the alarms will be removed. In the Alarm History, the check box to filter on acknowledged alarms will be removed so as to not be confusing.

Not Applicable.

43.4 Upgrade Impact

Not Applicable.

43.5 Data schema (DS) (CM, MIBS, RDB)

43.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
MNNODE	changed-New field SGFABRIC is added for SMG4 (MG4K) class SPM.	new
MNMGPIP	changed- New fields GEMSIGIP, SIGSUBMASK, BEARERVLAN, SIGVLAN, SIGIPENABLED are added	new
MNIPPARM	changed - new fields DIFFSERV and MEDIA_INTEG are added	new

43.5.2 Table/MIB/Remote Database Schema information

43.5.2.1 Name: MNNODE

Management Network Node Table

43.5.2.1.1 Functional description

This feature adds a new ***SGFABRIC*** field to the MG4K class of SPM in table MNNODE. T. For ATM MG4K nodes, this new field, ***SGFABRIC*** , is set to 'ATM' and for IP MG4K nodes, it is set to 'IP'.

43.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

43.5.2.1.3 Size

It does not change.

43.5.2.1.4 Fields/OIDs

Table 3, gives the information about the new fields introduced in table MNNODE.

Table 2 MNNODE Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SGFABRIC	New		ATM or IP	If the value is set to 'ATM', it indicates that the particular MG4K is of ATM framework. The value of 'IP' indicates that the MG4K node is of IP framework. The default value is set to 'ATM' after TABXFR from previous releases to release having this change.

43.5.2.1.5 Datafill example

Figure 1 MAP display for table MNNODE

```
NODEKEY ALIAS NODEINFO
----------------------
SPM 4 SPM_4 SMG4 0 SYNC LINE 50 (COT 60) (DTMF 60) (ECAN 60) (TONESYN 60)
(MF 60) $(SYSB CR RPT) (MANB MJ RPT) (ISTB MN RPT) (SYSBNA CR RPT)
(MANBNA MJ RPT) (COTLOW MN RPT) (DTMFLOW MN RPT) (ECANLOW MN RPT)
(TONESLOW MN RPT) (MFLOW MN RPT) (CMRLOW MN RPT) (SMG4CN MN RPT)
(PATCHFAIL MJ RPT) (ATMBCN CR RPT) (ST3EHLD MJ RPT) (ST3EHLD24 CR RPT)
(SMCHLD MJ RPT) (SMCHLD24 CR RPT) (SPMSRMNTD MN RPT) (LOCUR MJ RPT)
(TSRCFAIL CR RPT) $ $ N 0 $ N N ATM
```

43.5.2.1.6 Table release history update

SN07:

New field ***SGFABRIC*** is added to the table for SMG4 variant of SPM. This field is defined as a signalling FABRIC type. If this field is set to 'ATM', then only ATM RMs can be datafilled in MNCKTPAK.If the field is set to IP then only GEM RMs can be datafilled in MNCKTPAK.

43.5.2.1.7 Supplementary information

The field ***SGFABRIC*** can be changed for a datafilled MG4K node.Node must be in OFFL state for SGFABRIC field change operation. Steps to be followed during MG4K-ATM to MG4K-IP are listed below.

- BSY/OFFL the RM and CEM on the MG4K-ATM
- Delete all the tuple entries in table ATMCONN for the desired node.
- Delete All entries for MG4K-ATM from table MNATMIF.
- BSY/OFFL all ATM carriers.
- Delete ATM Carriers from table MNHSCARR
- Delete ATM RM datafill from the table MNCKTPAK.
- Delete ATM_GRP from table MNPRTGRP
- Add GEM_GRP in table MNPRTGRP
- Add load info in table PMLOADS.
- Change SGFABRIC field value from ATM to IP in table MNNODE
- Datafill GEM RM in the table MNCKTPAK for the desired node.
- Datafill table MNMGPIP, with entries for newly added GEM RMs.
- Change entries in table MNIPPARM for fine tuning of IP parameters.
- BSY/RTS MG4K-IP CEM and RMs.

For MG4K-IP to MG4K-ATM similar steps are followed with little changes.

43.5.2.1.8 Error messages for MNNODE :

- Trying a SGFABRIC change when the node is MANB/INSV/ISTb state.

```
For ATM to IP change:
Error: Failed to change SGFABRIC from ATM to IP.
       Please OFFL the node before attempting SGFABRIC change.

For IP to ATM change:
Error: Failed to change SGFABRIC from IP to ATM.
       Please OFFL the node before attempting SGFABRIC change.
```

- SGFABRIC change fails to verify node update tuple due to internal error.

```
Error: Failed to change SGFABRIC due to internal error.
```

- SGFABRIC change from ATM to IP fails because table ATMCONN datafill related to node undergoing change is not deleted.

```
Error: Failed to change SGFABRIC from ATM to IP.
       Delete all the tuples corresponding to
       SPM 10 from table ATMCONN
```

- SGFABRIC change from IP to ATM fails because table MNMGPIP datafill related to node undergoing change is not deleted.

```
Error: Failed to change SGFABRIC from IP to ATM.
       Delete all the tuples corresponding to
       SPM 10 from table MNMGPIP
```

- SGFABRIC change verification passes for ATM to IP operation.

```
Warning: Verification passed for SGFABRIC change from ATM to IP.
         Please ensure that MNMGPIP is datafilled.
```

- SGFABRIC change verification passes for IP to ATM operation.

```
Warning: Verification passed for SGFABRIC change from IP to ATM.
         Please ensure that ATMCONN is datafilled.
```

43.5.2.2 Name: MNCKTPAK

Management Network Circuit Pack

43.5.2.2.1 Functional description

This feature adds datafill restrictions for slot 1, 2, 9 & 10 of shelf 1 for RMs.

43.5.2.2.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

43.5.2.2.3 Size

It does not change.

43.5.2.2.4 Fields/OIDs

No Change.

43.5.2.2.5 Datafill example

No Change.

43.5.2.2.6 Table release history update

SN07:

New datafill restrictions are applicable only if the GEM RM is provisioned in the SPM.

43.5.2.2.7 Supplementary information

None.

43.5.2.2.8 Error messages in MNCKTPAK

- Block ATM RM addition in table MNCKTPAK if the sgfabric of the node is IP.

```
Error: ATM RM cannot be datafilled because the SGFABRIC field in
       table MNNODE is set to IP. Only GEM RM can be datafilled.
```

- Block GEM RM addition in table MNCKTPAK if the fabric of the node is ATM.

```
Error: GEM RM cannot be datafilled because the SGFABRIC field in
       table MNNODE is set to ATM. Only ATM RM can be datafilled.
```

- No CPKs are allowed to be datafilled in slots 1, 2, 9 & 10 of shelf 1 if GEM RM is datafilled in any of these slots of shelf 0 because of thermal dissipation.

```
Error: No CPKs are allowed to be datafilled in slots 1/2/9/10
       of shelf 1 while GEM RM is already datafilled in the
       same slot on shelf 0 since thermal restrictions dictate
       that we leave the slot empty over a GEM RM.
```

- GEM RM is not allowed to be datafilled in slot 1, 2, 9 & 10 of shelf 0 if any other RM is already datafilled in any of these slots of shelf 1.

```
Error: GEM RM is not allowed to be datafilled in slots 1/2/9/10
       of shelf 0 while any other RM is already datafilled in the
       same slot on shelf 1 since thermal restrictions dictate
       that we leave the slot empty over a GEM RM.
```

43.5.2.3 Name: MNMGPIP

Management Network Media Gateway Processor Internet Protocol

43.5.2.3.1 Functional description

This feature adds 5 fields to the MNMGPIP table: the signalling IP address, the signalling mask, the signalling enabled status, the VLAN TCI for the signalling interface, and VLAN TCI for the bearer interface.

43.5.2.3.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

Restrictions on VLAN TCI values:

- Upon ONP to SN07, the default value showing a 0 N 0 will be used
- For the Bearer VLAN TCI, changes to this field will not be allowed without BSYing or OFFLing the GEM RMs. For signalling VLAN TCI, the change can be made on the fly for the FIRST CHANGE ONLY - once the TCI has been set, then the GEMs will have to be BSY in order to change the value. This is because the IP interface is active when the GEM is INSV - changing these values requires re-provisioning the far-end switch for VLAN as well and this would cause an INSV GEM to go SYSB.
- If the default value of'0 N 0' is present for a VlanTCI in the table, that GEM interface will not perform VLAN tagging of outgoing packets but will instead fill that word with the NULL VLAN tag.

Restrictions on Signalling address:

- GEMSIGIP and SIGSUBMASK default to 0.0.0.0 for an IW-SPM during an ONP to SN07; this ensures the signalling interface starts out disabled on the new load.
- SIGIPENABLED field defaults to N during an ONP to SN07. It can be changed to Y only after a valid address has been entered in SIGIPADDR and SIGSUBMASK. It can be changed back to N at any time to disable IP signalling on the GEM.
- On an IW-SPM, GEMSIGIP and SIGSUBMASK are allowed to change from 0.0.0.0 to any valid value and back to 0.0.0.0 while the GEM is INSV and the SIGIPENABLED boolean is FALSE. All other changes are blocked.
- In the future, an MG4K-IP SPM will be provisioned; for these nodes, the SIGIP fields must all contain valid values and are not allowed to change while the GEM is INSV.

43.5.2.3.3 Size

Table tuple limits unchanged.

43.5.2.3.4 Fields/OIDs

The following table lists fields/OIDs for MNMGPIP.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GEMSIGIP	new	none	0 0 0 0 to 255 255 255 255	The usual DMS-format IP Address range (no “dots” in the field) used as the address for signalling interface
SIGSUBMASK	new	none	0 0 0 0 to 255 255 255 255	The usual DMS-format IP Address range (no “dots” in the field) used as the mask for signalling interface
SIGIPENABLED	new	none	Y or N	Is
BEARVLAN	new	PRIORITY	0-7	User Priority
BEARVLAN	new	CFI	Y or N	Canonical Format Indicator - only N is supported
BEARVLAN	new	VID	0-4095 (*255 for Calisto-based GEM RMs)	VLAN ID - a unique number to identify the VLAN (* NTLZ20AA, BA, and CA boards are restricted to 255 due to Broadcom Calisto DSP implementation), and 1& 4095 are reserved by spec and are not allowed to be entered.
SIGVLAN	new	PRIORITY	0-7	User Priority
SIGVLAN	new	CFI	Y or N	Canonical Format Indicator - only N is supported
SIGVLAN	new	VID	0-4095	VLAN ID - a unique number to identify the VLAN - 1and 4095 are reserved by the spec and are not allowed to be entered.

43.5.2.3.5 Datafill example

The following example shows sample datafill for table MNMGPIP.

Figure 2 MAP display for table MNMGPIP

```
>table mnmgpip
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: MNMGPIP
>list
            MGPKEY         GEMMGMIP         SUBNMASK          BCASTIP

           Y    253 N 6 2032 N 5
```

43.5.2.3.6 Table release history update

SN07:

New fields are present and datafilled “benignly” so that their features are not enabled over an ONP. They must be manually enabled at the customers need.

43.5.2.3.7 Supplementary information

The “range” command from the switch, just in case anyone is interested:

```
11 BEARERVLAN         T_VLAN_TCI
12 SIGVLAN            T_VLAN_TCI
LOGICAL TUPLE TYPE: T_SMGPCT_LT
Mate>range 11
11 BEARERVLAN         T_VLAN_TCI
TYPE IS T_VLAN_TCI MULTIPLE WITH
        VID         {0 TO 4095}
        CFI         {N,Y}
        PRIORITY    {0 TO 7}
Mate>range 12
12 SIGVLAN            T_VLAN_TCI
TYPE IS T_VLAN_TCI MULTIPLE WITH
        VID         {0 TO 4095}
        CFI         {N,Y}
        PRIORITY    {0 TO 7}
```

43.5.2.3.8 Translation verification other tools

None

43.5.2.4 Name: MNIPPARM

Management Network Internet Protocol PARaMeters

43.5.2.4.1 Functional description

This feature adds 2 fields to the MNIPPARM table: the DIFFSERV codepoints and the Media Integrity Indicator.

43.5.2.4.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

43.5.2.4.3 Size

Table tuple limits unchanged.

43.5.2.4.4 Fields/OIDs

The following table lists fields/OIDs for MNIPPARM.

Table 4 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
DIFFSERV	new	EF_CODEPOINT	6-bits as ASCII, prefixed by “CP” for CodePoint, ie: CP101110	The codepoint for voice band defaults to CP101110
DIFFSERV	new	EF_PRIORITY	0-7	The priority for voice defaults to 6
DIFFSERV	new	CS5_CODEPOINT	6-bits as ASCII, prefixed by “CP” for CodePoint,, ie: CP101000	The codepoint for signalling data defaults to CP101000
DIFFSERV	new	CS5_PRIORITY	0-7	The priority for signalling defaults to 6
MEDIA_INTEG	new	MI_STATUS	ENABLE or DISABLE	Indicates the state of Media Integrity on this GEM card, defaults to DISABLE

Table 4 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
MEDIA_INTEG	new	MI_ACTION	NONE, LOGONLY, TEARDOWN	Indicates the action to be taken when MI fails.
MEDIA_INTEG	new	MI_INTEGER	0 to 32767	Today, this is unused but will be required when MI functionality is fully defined.

43.5.2.4.5 Datafill example

The following example shows sample datafill for table MNIPPARM.

         NTLX83AA,NTLX92AA,NTLX74AA,NTLX76AA,
         NTLX44AA,NTLX82EA,NTLZ20BA,NTLZ20CA}

         Non-NORTEL Product Identification Code:
          TABLE OF 8 CHARs
```

44.4 Configuration Walkthrough

NA

45: Configuration (CN): A00003687

45.1 Hardware and Software Requirements

The Mobile Switching Centers (MSCs) and the TOPS switches must have SS7 connectivity. ISUP voice trunk connectivity is necessary for Wireless ADACC with Release.

The customer's SS7 network must have global title translations set up such that short messages from the TOPS node can route to the correct message centers.

The MSCs must have MSC and network translations set up such that the TOPS TLDN routes the call to the TOPS node for service processing.

45.2 Initial Configuration

Not applicable.

45.3 Office parameters (OP)

Existing Table OFCENG parameter `NUM_OF_IS41TOPS_EXT_BLKS` is replaced with new Table OFCAUT parameter `NUM_OF_WIN_TOPS_EXT_BLKS`. This parameter provisions the WIN TOPS extension block (formerly `IS41TOPS_EXT_BLK`; now `WIN_TOPS_EXT_BLK`). The extension block serves both IS-41 and GSM TOPS calls, so it has been renamed to be more general. Since it has been moved to Table OFCAUT, it is now allocated automatically.

45.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCAUT	NUM_OF_WIN_TOPS_EXT_BLKS	New	CM
OFCENG	NUM_OF_IS41TOPS_EXT_BLKS	Deleted	CM

45.3.2 Parameter information

45.3.2.1 NUM_OF_WIN_TOPS_EXT_BLKS

Number of Wireless Intelligent Network TOPS Extension Blocks

45.3.2.1.1 Functional description

This parameter controls how many extension blocks are allocated for use by Wireless Intelligent Network (WIN) TOPS calls.

WIN TOPS extension blocks are used for TOPS calls originating from IS-41 wireless networks as well as calls originating from GSM wireless networks. Each extension block stores data about a wireless call while TOPS is waiting for the MSC to outpulse to TOPS on a voice trunk.

45.3.2.1.2 Provisioning rules

This parameter is located in Table OFCAUT, so additional EXT blocks are allocated automatically when needed. Attributes of the parameter can be modified in Table OFCAUT.

By default, WIN TOPS extension blocks are allocated in groups of 100 using the capabilities of Table OFCAUT.

45.3.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
0	32767	By default, 10 WIN TOPS extension blocks are allocated, at 128 words per block. Whenever the number available drops to 9, a new block of 100 is allocated.

45.3.2.1.4 Activation

The parameter is allocated automatically. No restarts are necessary.

45.3.2.1.5 Dependencies

None.

45.3.2.1.6 Consequences

Since the parameter is under the control of Table OFCAUT, it should not be underprovisioned. If there are not enough extension blocks, TOPS131 logs will appear, and wireless calls will be routed to treatment in the MSCs.

By default, WIN TOPS extension blocks are allocated in blocks of 100, so the extension blocks should normally be overprovisioned, using slightly more memory than is required during peak periods.

45.3.2.1.7 Verification

To verify that the WIN TOPS extension blocks are allocated, use the CI command OMSHOW EXT ACTIVE WIN_TOPS_EXT_BLK.

45.3.2.1.8 Memory requirements

Each WIN TOPS extension block requires 128 words. So the total memory used by the EXT blocks is (NUM_OF_WIN_TOPS_EXT_BLKS * 128 words).

45.3.2.1.9 Parameter release history update

SN06: Parameter NUM_OF_IS41TOPS_EXT_BLKS created.

SN07: Parameter NUM_OF_IS41TOPS_EXT_BLKS removed and parameter NUM_OF_WIN_TOPS_EXT_BLKS added to accommodate IS-41 and GSM.

45.4 Upgrade Impact

45.4.1 Dump and Restore

Not applicable. NUM_OF_WIN_TOPS_EXT_BLKS starts with a default value of10 and is increased automatically as needed.

45.4.2 Element Management Upgrade

Not applicable.

45.5 Data schema (DS)

45.5.1 New/modified tables

Table 3 New or modified tables

Table name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ISUPTRK	Changed	Unchanged
MSCIDMAP	New	New
TOPSFTR	Changed	Unchanged
TOPSMCDB	New	New
TOPSPARM	Changed	Unchanged
TOPSTLDN	Changed	Unchanged
TOPSTOPT	Changed	Unchanged

45.5.2 Table information

45.5.2.1 Name: ISUPTRK

ISUP Trunk

45.5.2.1.1 Functional description

Table ISUPTRK is a TOPS table which associates TOPS options and features with ISUP trunk groups. TOPS ISUP calls use standard ISUP trunk group datafill in Table TRKGRP, and Table ISUPTRK was created to allow datafill of TOPS options and features without affecting standard ISUP trunk group datafill.

45.5.2.1.2 Usage sequence and implications (CM Only)

A trunk group must be datafilled in Table TRKGRP and Table TRKSGRP before it can be datafilled in Table ISUPTRK. This sequence is unchanged.

45.5.2.1.3 Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ISUPTRK	Unchanged	Unchanged	Unchanged

45.5.2.1.4 Fields

The following table lists changed fields for Table ISUPTRK.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RLT	Changed	Unchanged	NONE, RLT_REL, RLT_FAR, RLT_IS41, RLT_GSM	Release link trunking: Value RLT_GSM is added by this feature. When the user selects RLT_GSM, they are presented with the existing subfields added in SN06 for value RLT_IS41: RLT_VERSION, RESETTIMER, and TIMERVAL

45.5.2.1.5 Datafill example

The following example shows sample datafill for Table ISUPTRK. The RLT type is set to GSM, the RLT version is set to 1, and the reset timer is enabled and set to 20 seconds.

RLT_GSM is for future use and cannot be datafilled at this time.

```
TABLE: ISUPTRK
          GRPKEY              CONNTYPE  LCANAME          BILLCD CALLSRC
ANI2CLI             RLT SNTPDRST DNLKUP DISPLAY ININTWRK BRANDCHC
-------------------------------------------------------------------------
       MSC_DACC1     CELL_MOBILE  IEC     NLCA      TOPSBC   0    ORIG
      Y RLT_GSM  1 Y 20        N      N       0     NONE        N
```

45.5.2.1.6 Table release history update

SN06: Value RLT_IS41 plus subfields RLT_VERSION, RESETTIMER, and TIMERVAL added to RLT field to accommodate WIN TOPS calls using IS-41.

SN07: Value RLT_GSM added to RLT field to accommodate WIN TOPS calls using GSM. The same subfields are used.

45.5.2.1.7 Supplementary information

No dump and restore necessary, since value RLT_GSM did not exist in SN06.

45.5.2.1.8 Translation verification other tools

Not applicable.

45.5.3 Table information

45.5.3.1 Name: MSCIDMAP

Mobile Switching Center Identifier Mapping

45.5.3.1.1 Functional description

This table maps Mobile Switching Center Identifiers (MSCIDs) to TLDN pool identifiers from Table TOPSTLDN. This allows the customer to control TLDN allocation on a per-MSC basis.

An MSCID consists of a Market ID (16 bit value) and a Switch ID (8 bit value). Less than 1,000 market IDs are in use today in the United States, so the datafill of Table MSCIDMAP is held to a maximum of 4,096 different market IDs to limit data store usage.

MSCIDs are IS-41-specific, so **this table is used on TOPS IS-41 calls only**. New table MSCINMAP (section 45.5.4) is used on GSM calls.

The switch ID can be any number from 0 to 255. The total number of tuples which can be datafilled is 32,767 (the DMS maximum for any table).

Wildcarding can be used to limit datafill in this table. The market ID and switch ID can be wildcarded as follows:

Market ID	Switch number	Meaning
$	$	Match all MSCIDs not otherwise found in table. This combination, when datafilled, serves as the default.
<0 to 65535>	$	Match exact market ID and any switch number, providing exact MSCID and exact switch number is not datafilled.
<0 to 65535>	<0 to 255>	Match exact market ID and switch number
$	<0 to 255>	Not allowed. A wildcard market ID cannot be datafilled with a specific switch number.

45.5.3.1.2 TLDN selection

The list of pools for a given MSCID indicates the order in which the pools are searched for an idle TLDN. If no idle TLDNs are found in the first pool, the DMS examines the next pool in the list.

This allows the customer to set aside groups of TLDNs for certain groups of MSCs. Such datafill reduces shared store contention (that is, XA-Core blocking) during periods of heavy traffic.

The holding time for a TLDN is very short (under once second), so if a pool of 100 or 200 TLDNs is datafilled first in the pool list, it is possible that TLDNs in later pools in the list will only be used in periods of extremely heavy traffic.

45.5.3.1.3 Usage sequence and implications (CM Only)

Table TOPSTLDN must be datafilled before Table MSCIDMAP.

45.5.3.1.4 Size

Table 6 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MSCIDMAP	0	32767	The store is allocated and deallocated dynamically. When the first tuple is entered, 20K words are allocated. Subsequent tuples cause store allocation as follows: -150 words when a **new** market ID is added with a specific switch number - 32 words when a **new** market ID is added with a wildcard switch number. These estimates include an allocation of one word for each pool ID in each tuple. An addition of an **existing** market ID with a specific switch number results in allocation of one word per pool ID in the tuple. Store is deallocated when tuples are deleted. All store is deallocated when the last remaining tuple is deleted.

45.5.3.1.5 Fields

The following table lists fields for Table MSCIDMAP.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
MSCIDKEY	New	MARKETID	{0 to 65535}, or '$'	Market Identifier (vector). First part of two-part key MSCIDKEY.
		SWITCHNO	{0 to 255}, or '$'	Switch Number (vector). Second part of two-part key MSCIDKEY.
POOLLIST	New	None	Vector of up to 255 TLDN pool identifiers from Table TOPSTLDN	Temporary local directory number pool list. Pointer to TLDN pool IDs in Table TOPSTLDN. The order of the pool list in this field indicates the order in which TLDN pools are searched for an idle TLDN. If the first pool in the list contains 100-200 TLDNs, it is likely that the remaining pools in the tuple will never be needed by the MSCs associated with the tuple. This is because the holding time of a TLDN is very short (normally under one second).

45.5.3.1.6 Datafill example

The following example shows sample datafill for Table MSCIDMAP.

```
TABLE: MSCIDMAP
MSCIDKEY        POOLLIST
------------------------
$ $    (0) (1) (2) (3) $
64 $           (0) (2) $
64 5           (0) (1) $
312 444    (0) (1) (2) $

```

45.5.3.1.7 Table release history update

Created in SN07

45.5.3.1.8 Supplementary information

During dump and restore from SN06 to a later load, Table TOPSTLDN is checked. If it has any entries, they are restored using sequential pool IDs beginning with pool ID 0. Then a single tuple with the key {$, $} is added to Table MSCIDMAP. This is a wildcard tuple which matches all MSCIDs and which contains all pool IDs from restored Table TOPSTLDN.

45.5.3.1.9 Translation verification other tools

Not applicable.

45.5.4 Table information

45.5.4.1 Name: MSCINMAP

Mobile Switching Center Identifier Number Mapping

45.5.4.1.1 Functional description

This table maps Mobile Switching Center Identification Numbers (MSCINs) to TLDN pool identifiers from Table TOPSTLDN. This allows the customer to control TLDN allocation on a per-MSC basis.

An MSC Identification Number is a directory number of up to 18 digits. It is also called an MSC Address. MSCINs are GSM-specific, so **this table is used on TOPS GSM calls only**. New table MSCIDMAP is used on IS-41 calls.

This table is a digilator table, meaning the first few digits of an MSCIN can be datafilled, and the tuple will match all MSCINs beginning with those digits. So a single tuple can provide a TLDN pool ID list for hundreds or thousands of MSCs.

This table allows the datafill of up to 4,096 unique TLDN pool ID lists. Note that two lists containing the same pool IDs but in a different order are considered different lists.

The following table shows how digilator matching works.

MSCINMAP key	MSCIN matches
6	Matches all MSCINs (up to 18 digits) beginning with the digit 6.
919	Matches all MSCINs (up to 18 digits) beginning with the digits 919.
704991	Matches all MSCINs (up to 18 digits) beginning with the digits 704991.
2022201111	Matches all MSCINs (up to 18 digits) beginning with the digits 2022201111.

45.5.4.1.2 TLDN selection

The list of pools for a given MSCIN indicates the order in which the pools are searched for an idle TLDN. If no idle TLDNs are found in the first pool, the DMS examines the next pool in the list.

This allows the customer to set aside groups of TLDNs for certain groups of MSCs. Such datafill reduces shared store contention (that is, XA-Core blocking) during periods of heavy traffic.

The holding time for a TLDN is very short (under once second), so if a pool of 100 or 200 TLDNs is datafilled first in the pool list, it is possible that TLDNs in later pools in the list will only be used in periods of extremely heavy traffic.

45.5.4.1.3 Usage sequence and implications (CM Only)

Table TOPSTLDN must be datafilled before Table MSCINMAP.

45.5.4.1.4 Size

Table 8 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MSCINMAP	0	32767	The store is allocated and deallocated dynamically. When the first tuple is entered, 16K words are allocated. Subsequent tuples cause store allocation as follows: - One word per pool ID when a new TLDN pool ID list is added or a tuple change results in a new list - No store increase when a tuple is added with a TLDN pool ID list identical to one already in the table. To be identical, two lists must contain the same pool IDs in the same order. Store is deallocated when tuples are deleted. All store is deallocated when the last remaining tuple is deleted.

45.5.4.1.5 Fields

The following table lists fields for Table MSCINMAP.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
MSCINKEY	New	None	Digilator table key	A digilator key is a vector of up to 18 digits.
POOLLIST	New	None	Vector of up to 255 TLDN pool identifiers from Table TOPSTLDN	Temporary local directory number pool list. Pointer to TLDN pool IDs in Table TOPSTLDN. The order of the pool list in this field indicates the order in which TLDN pools are searched for an idle TLDN. If the first pool in the list contains 100-200 TLDNs, it is likely that the remaining pools in the tuple will never be needed by the MSCs associated with the tuple. This is because the holding time of a TLDN is very short (normally under one second).

45.5.4.1.6 Datafill example

The following example shows sample datafill for Table MSCINMAP.

```
TABLE: MSCINMAP
MSCINKEY             POOLLIST
----------------------------
619         (0)(1)(1000)(10)$
919320            (1)(1000)$
2022201111              (0)$
2032201111        (10)(1)(0)$
2042201111              (0)$
```

45.5.5 Table information

45.5.5.1 Name: TOPSFTR
TOPS Feature

45.5.5.1.1 Functional description
Table TOPSFTR is a TOPS table which allows optional TOPS functions to be activated and deactivated easily. Once the SOC option has been turned on for a TOPS feature, the customer can use Table TOPSFTR to turn the function on and off.

This feature adds tuple `RLT_FOR_GSM`, which controls GSM ADACC with Release.

45.5.5.1.2 Usage sequence and implications (CM Only)
Tuple `RLT_FOR_GSM` must be set to `Y` in order for TOPS to process wireless calls using GSM CAMEL.

45.5.5.1.3 Size

Table 10 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TOPSFTR	Unchanged	Increased by 1	Unchanged

45.5.5.1.4 Fields
The following table lists fields for Table TOPSFTR.

Table 11 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
FTRNAME	Changed	None	RLT_FOR_GSM	Feature name: This tuple allows the customer to enable GSM TOPS ADACC with release. In order to activate the feature, the SOC option OSEA0104 must be on, and this tuple must be set to Y.
FTRENABL	Unchanged	None	Y/N	Feature enable: Activates or deactivates an optional TOPS feature. The tuple's default value is N.

45.5.5.1.5 Datafill example

The following example shows sample datafill for Table TOPSFTR. The TOPS WIN and TOPS SMS features have been activated.

```
TABLE: TOPSFTR
               FTRNAME FTRENABL

45.5.6 Table information

45.5.6.1 Name: TOPSMCDB

TOPS Message Center Database

45.5.6.1.1 Functional description

This table provides datafill for a TOPS SMS SS7-based message center simulator. An operator position or automated node can send SMS messages using either IS-41 TCAP or GSM TCAP. When the simulator receives the SMS, it looks up the data stored against the SMS destination number to determine the disposition of the SMS. The simulator can successfully acknowledge the SMS, send back a failure message, or ignore the SMS so the TOPS SMS time-out code executes.

45.5.6.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

45.5.6.1.3 Size

Table 12 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TOPSMCDB	0	64	2 words per tuple

45.5.6.1.4 Fields

45.5.7 Table information

45.5.7.1 Name: TOPSPARM

TOPS Parameter

45.5.7.1.1 Functional description

Table TOPSPARM is a TOPS-specific version of the office parameter tables. This feature adds two new parameters, SMS_MC_LOG_FAILURE and SMS_TIMEOUT. These parameters apply to SS7-based TOPS Short Message Service (SMS). They do not apply to position-based Internet Protocol (IP) SMS.

SMS_MC_LOG_FAILURE

The telco can use the first parameter, SMS_LOG_MC_FAILURE, to limit the number of TOPS131 logs generated in SMS failure situations. There are many normal situations in which the message center (MC) will return an error code. These might include wireless phone powered off, or destination number not subscribed to SMS. The telco might not wish to have TOPS131 logs generated for these situations. Note that OMs in group SMSTOPS are pegged for these situations.

SMS_LOG_MC_FAILURE is a set field consisting of the following values. These values are related to the cause code returned by the MC when an SMS fails. This parameter only controls the TOPS131 log upon receipt of a negative acknowledgment from the MC. The TOPS131 is always generated as a result of global title translation failure or SS7 routing failure.

- NONE: Do not generate the TOPS131 for any of the following reasons.
- NETWK: Generate the TOPS131 when a negative acknowledgment is received from the MC with the Cause Code set to a network problem value.
- TERM: Generate the TOPS131 when a negative acknowledgment is received from the MC with the Cause Code set to a terminal problem value.
- RADIO: Generate the TOPS131 when a negative acknowledgment is received from the MC with the Cause Code set to a radio interface problem value.
- MISC: Generate the TOPS131 when a negative acknowledgment is received from the MC with the Cause Code set to a general problem value.
- TIMEOUT: Generate the TOPS131 when no response is received from the MC.
- ALL: Generate the TOPS131 for all of the above reasons.

SMS_LOG_MC_FAILURE can be set to NONE, ALL, or any combination of NETWK, TERM, RADIO, and MISC.

The default value of SMS_LOG_MC_FAILURE is ALL.

SMS_TIMEOUT

The second parameter, SMS_TIMEOUT, controls how long TOPS waits before marking an SMS attempt as timed out. The time-out period is datafilled in seconds. The default value of SMS_TIMEOUT is 10 seconds, since operators and automated nodes do not wait while the SMS attempt is in progress, and the SMS acknowledgment can be received after the call is ended.

The time-out value is required since the position or service node cannot send a second SMS while the first SMS transaction is in progress. Also, the time-out ensures DMS resources are cleaned up if the SMS is lost in the network.

45.5.7.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

45.5.7.1.3 Size

Table 14 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TOPSPARM	Increased by 2	Increased by 2	Unchanged

45.5.7.1.4 Fields

The following table lists fields for Table TOPSPARM.

Table 15 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PARMNAME	Changed	None	SMS_LOG_MC_FAILURE is added to the range of TOPS parameters.	This parameter controls when the TOPS131 log is generated in certain SMS failure situations.

Table 15 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PARMVAL	Unchanged	None	Set of {NONE, NETWK, TERM, RADIO, MISC, TIMEOUT ALL}	This parameter can be set to NONE, ALL, or any combination of the four remaining values. Its default value is ALL, meaning generated the TOPS131 in all failure situations.
PARMNAME	Changed	None	SMS_TIMEOUT is added to the range of TOPS parameters.	This parameter controls the amount of time in seconds before TOPS marks an SMS attempt as timed out.
PARMVAL	Unchanged	None	0 to 255	Parameter SMS_TIMEOUT can be set to values 0 to 255. Its default value is 10.

45.5.7.1.5 Datafill example

The following example shows sample datafill for Table TOPSPARM.

```
TABLE: TOPSPARM
PARMNAME PARMVAL
-------------------------
SMS_LOG_MC_FAILURE   ALL $
SMS_TIMEOUT             30
```

45.5.7.1.6 Table release history update

Table initially added in BCS31.

45.5.7.1.7 Supplementary information

When performing a dump and restore from an SN06 load to an SN07 or later load, SMS_LOG_MC_FAILURE will be restored with a value of ALL, and SMS_TIMEOUT will be restored with a value of 10.

45.5.7.1.8 Translation verification other tools

Not applicable.

45.5.8 Table information

45.5.8.1 Name: TOPSTLDN

TOPS Temporary Local Directory Numbers

45.5.8.1.1 Functional description

Table TOPSTLDN provides all TLDNs which can be used by TOPS when providing a Wireless Intelligent Network (WIN) service such as ADACC with release. When a cell phone caller initiates a wireless directory assistance (DA) call and TOPS receives an IS-41 AnalyzedInformation or a GSM InitialDP, TOPS selects an idle TLDN from Table TOPSTLDN and sends it back to the originating mobile switching center (MSC).

Tuples in Table TOPSTLDN define pools of TLDNs from a low TLDN to a high TLDN. Each pool has a numerical index, the pool ID. Two new tables, MSCIDMAP and MSCINMAP, map MSC identifiers to one or more pool IDs. When an MSC sends an AnalyzedInformation or InitialDP, the MSC identifier in the message is used to index Table MSCIDMAP (IS-41) or Table MSCINMAP (GSM) to determine a pool ID. Then an idle TLDN is selected from the pool in Table TOPSTLDN and sent back to the MSC.

A maximum of 2,000 TOPS TLDNs can be defined. The holding time of a TOPS TLDN is very short (around one second), so this number of TLDNs should be able to accommodate heavy TOPS WIN traffic.

45.5.8.1.2 Usage sequence and implications (CM Only)

Table TOPSTLDN must be datafilled before Table MSCIDMAP and Table MSCINMAP.

45.5.8.1.3 Size

Table 16 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TOPSTLDN	0	2000	Memory for all 2000 tuples (10 words each) is allocated when the first tuple is added. Memory is deallocated when the last tuple is deleted.

45.5.8.1.4 Fields

The following table lists fields for Table TOPSTLDN.

Table 17 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
POOLID	New	None	0-1999	Pool Identifier: an integer field identifying the pool of TLDNs.
FROMDIGS	Changed	None	Up to 18 digits	From Digits: the start of the TLDN range for this tuple.
TODIGS	Changed	None	Up to 18 digits	To Digits: the end of the TLDN digit range for this tuple.

45.5.8.1.5 Datafill example

The following example shows sample datafill for Table TOPSTLDN.

```
TABLE: TOPSTLDN
POOLID   FROMDIGS     TODIGS
----------------------------
0      2012201234 2012201234
1      2013364400 2013364899
2      2018591400 2018591489
```

45.5.8.1.6 Table release history update

SN06: Added by Feature A00000816

SN07: Modified to use a pool ID as the key field.

45.5.8.1.7 Supplementary information

During dump and restore from SN06 to a later release, if Table TOPSTLDN contains datafill on the SN06 side, it is restored into Table TOPSTLDN on the restore side with sequential pool IDs beginning with 0.

See the Functional Description chapter for illustrations of Table TOPSTLDN before and after a dump and restore.

45.5.8.1.8 Translation verification other tools

Not applicable.

45.5.9 Table information

45.5.9.1 Name: TOPSTOPT

TOPS Trunk Options

45.5.9.1.1 Functional description

This table contains various options datafilled against trunk groups used by TOPS.

45.5.9.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

45.5.9.1.3 Size

Table 18 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TOPSTOPT	Unchanged	Unchanged	Negligible (additional 4 bits per tuple)

45.5.9.1.4 Fields

The following table lists fields for Table TOPSTOPT.

Table 19 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
WIRELESS	New	None	NIL, IS41, or GSM	Wireless: Indicates if the trunk group carries wireless (cellular) traffic. This field controls whether TOPS can use wireless functions on a non-WIN (non-CAMEL) call. If the field is set to IS41 or GSM, all traffic is assumed to be from a wireless phone. A trunk group can only support one network type, so all traffic is assumed to be either IS-41 or GSM.

45.5.9.1.5 Datafill example

The following example shows sample datafill for Table TOPSTOPT.

```
TABLE: TOPSTOPT
GRPKEY ORGAREA DISPCLG ADASERV ADASANS ANITOCLI OLNSQRY DCIBIDX LNPCLGAM
XLASCHEM SPIDPRC TRKSPID BILLSCRN ANIFSPL MAXCONNS DISPSPID WIRELESS
-------------------------------------------------------------------------
TEAOSSIC N Y NONE NA Y N NONE 0 N N N N N N 0 N N
TOSSIC N Y NONE NA Y N NONE 0 N N N N N N 0 N Y IS41
TBELLBIC N Y NONE NA N NONE 0 N N N N N N 0 N Y GSM
```

45.5.9.1.6 Table release history update

SN07 - Added field WIRELESS.

45.5.9.1.7 Supplementary information

The default value of WIRELESS on a dump and restore is NIL. Currently this field is only used when sending a TOPS SMS on a non-WIN (non-CAMEL) call. On an IS-41 WIN or GSM CAMEL call, the originating wireless network type is already known through signaling.

45.5.9.1.8 Translation verification other tools

Not applicable.

45.6 Service Orders (SO)

Not applicable.

45.7 Software optionality control (SOC)

No new SOCs are added by this feature. Regarding the two main components of this feature:

- GSM ADACC with Release is under the control of an existing SOC (OSEA0104, which also controls IS-41 ADACC with Release).
- TOPS SMS is not under the control of SOC.

45.8 Element Management

Not applicable.

45.9 Command interface changes

Not applicable.

45.10 Security

Not applicable.

45.11 Configuration Walkthrough

Tables C7GTTYPE and C7GTT must be datafilled before TOPS can send short messages into the SS7 network. These must use a global title translation number for MDN to Message Center (MDNMCGT) routing such that when the TOPS-sent SMS arrives at the STPs, it is routed to the calling party's message center.

Since SMS has been supported over SS7 for some time, much of the necessary SMS global title translation datafill is probably already present. TOPS might require large amounts of MDNMCGT datafill, but a more likely scenario is that large blocks of MDNMCGT global title translations can be off-loaded to existing STPs using a small number of MDNMCGT tuples in the TOPS switch.

46: Configuration (CN): A00003767

NORTEL-UEMG-RELMSGING-MIB	NEW	

46.5.2 Table/MIB/Remote Database Schema information

46.5.2.1 Name: NORTEL-UEMG-RELMSGING-MIB

Nortel-UEMG-Reliable Messaging- MIB

46.5.2.1.1 Functional description

The MIB has four sections

- Association general info - This contains basic information for an association, most of it will only ever be read, but it contains some thresholds for the alarms which in the future functionality could be added to change these values.
- Current OMs - Counts for the sample of OM data which is currently being collected. These OMs will give information to current health of the association and can be used to diagnose problems as they occur.
- Interval OMs - Historical samples of the OMs that have been collected. Each sample is for a 15 minute period and will retain the last 96 of these

samples. These OMs can be used to help diagnose problems that occurred in the past.

- Alarms - If a threshold is crossed or the association fails/recovers an alarm will be raised or cleared. The MIB contains the data which will be contained in the alarm.

46.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

<abbreviated names of tables before the current table if applicable>

<abbreviated name of the current table>

<abbreviated names of tables after the current table if applicable>

OR

There is no requirement to datafill tables in a specific order.

OR

Current datafill order unchanged.

46.5.2.1.3 Size

One instance of the MIB will exist for each SCTP association on an ABI card.

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory

46.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for <abbreviated name of table/MIB>.

<conditional information>

Table 3 MIB definitions

MIB Table	Entry	Subfield or refinement	values	Explanation and action
nnRelMsgSctpAssocTable The association information table which contains an entry for each association	NnRelMsgSctpAssocEntry An individual entry into the nnRelMsgSctpAssocTable	nnRelMsgSctpAssocId	Unsigned 32 bit	A numerical representation of an association
		nnRelMsgSctpAssocRemHostName	Octet String	The IP address of the farend of the SCTP association.
		nnRelMsgSctpAssocRemHostPort	Unsigned 32 bit	The IP port number of the farend for which the association was setup to.
		nnRelMsgSctpAssocLocalPort	Unsigned 32 bit	The IP port number on the ABI for the association
		nnRelMsgSctpAssocEntPhysIndex	Unsigned 32 bit	The numerical representation for the frame, shelf, and slot of the ABI which the association exists on
		nnRelMsgSctpAssocState	Integer closed (1), cookieWait (2), cookieEchoed (3), established (4), shutdownPending (5), shutdownSent (6), shutdownReceived(7), shutdownAckSent (8), deleteTCB (9)	The state of the association
		nnRelMsgSctpAssocMsgLoss	Unsigned32 (1..1000000000)	Error rate...expressed as an integer, with 10 digits, the decimal point is in the 1st place. A value of 10**-5, 0.00001 is expressed 0000100000 or 100,000. A value of 0.05 is 0500000000 or 500,000,000 and so forth.
		nnRelMsgSctpAssocRetrans	Unsigned32 (1..1000000000)	Error rate...expressed as an integer, with 10 digits, the decimal point is in the 1st place. A value of 10**-5, 0.00001 is expressed 0000100000 or 100,000. A value of 0.05 is 0500000000 or 500,000,000 and so forth.

Table 3 MIB definitions

MIB Table	Entry	Subfield or refinement	values	Explanation and action
nnRelMsgSctpAssocOmCurr Table The table which contains an entry for the OMs currently being collected for each association	NnRelMsgSctpAssocEntry An individual entry into the nnRelMsgSctpAssocOmCurr Table.	nnRelMsgSctpAscCurrClosed	Unsigned 32 bit	Number of times an association has been closed
		nnRelMsgSctpAscCurrAbort	Unsigned 32 bit	Number of times an association has been aborted
		nnRelMsgSctpAscCurrOutPacks	Unsigned 32 bit	Number of packets which have been sent using the association
		nnRelMsgSctpAscCurrInPacks	Unsigned 32 bit	Number of packets which have been received from the association
		nnRelMsgSctpAscCurrDiscPacks	Unsigned 32 bit	Number of packets which have been discarded
		nnRelMsgSctpAscCurrRetranPacks	Unsigned 32 bit	The number of packets which have been retransmitted
		nnRelMsgSctpAscCurrT1expires	Unsigned32	Number of times the T1 timer has expired.
		nnRelMsgSctpAscCurrT2expires	Unsigned 32 bit	Number of times the T2 timer has expired.
		nnRelMsgSctpAscCurrT3expires	Unsigned 32 bit	Number of times the T3 timer has expired.
		nnRelMsgSctpAscCurrCongCount	Unsigned32	The number of times the association has become congested
		nnRelMsgSctpAscCurrCongCleared	Unsigned32	The number of times the association has cleared up from being congested

Table 3 MIB definitions

MIB Table	Entry	Subfield or refinement	values	Explanation and action
nnRelMsgSctpAssocOmIntervTable The table which contains an entry for the historical OMs that have been collected for each association	NnRelMsgSctpAssocOmIntervEntry An individual entry into the nnRelMsgSctpAssocOmIntervTable.	nnRelMsgSctpAsclnterval	Integer (1-96)	Number of times an association has been closed
		nnRelMsgSctpAsclntervClosed	Unsigned 32 bit	Number of times an association has been closed
		nnRelMsgSctpAsclntervAbort	Unsigned 32 bit	Number of times an association has been aborted
		nnRelMsgSctpAsclntervOutPacks	Unsigned 32 bit	Number of packets which have been sent using the association
		nnRelMsgSctpAsclntervInPacks	Unsigned 32 bit	Number of packets which have been received from the association
		nnRelMsgSctpAsclntervDiscPacks	Unsigned 32 bit	Number of packets which have been discarded
		nnRelMsgSctpAsclntervRetranPacks	Unsigned 32 bit	The number of packets which have been retransmitted
		nnRelMsgSctpAsclntervT1expires	Unsigned32	Number of times the T1 timer has expired.
		nnRelMsgSctpAsclntervT2expires	Unsigned 32 bit	Number of times the T2 timer has expired.
		nnRelMsgSctpAsclntervT3expires	Unsigned 32 bit	Number of times the T3 timer has expired.
		nnRelMsgSctpAsclntervCongCount	Unsigned32	The number of times the association has become congested
		nnRelMsgSctpAsclntervCongCleared	Unsigned32	The number of times the association has cleared up from being congested

Table 3 MIB definitions

MIB Table	Entry	Subfield or refinement	values	Explanation and action
nnRelMsgNotifications Contains the data collected for each alarm as it is raised or cleared	nnRelMsgFault	nnRelMsgFaultType	INTEGER relMsgLinkFail (1), relMsgLinkSevDegraded (2), -- msgLoss Thresh exceeded relMsgLinkDegraded (3)	Gives the type of the fault being raised or cleared.
		nnUemgAlarmSeverity	INTEGER indeterminate (1), warning (2), minor (3), major (4), critical (5)	Tells how much the system will be affected when the alarm is raised.
		nnUemgAlarmDescrip	String	Brief description of the alarm being raised or cleared
		nnRelMsgSctpAssocState	Integer closed (1), cookieWait (2), cookieEchoed (3), established (4), shutdownPending (5), shutdownSent (6), shutdownReceived(7), shutdownAckSent (8), deleteTCB (9)	The state of the association when the alarm is raised
		nnUemgAlarmDefinition	INTEGER set (1), -- Alarm is Set clear (2), -- Alarm is Cleared notAlarmed(3) -- Fault is NOT Alarmed (event only)	If the alarm is raised or cleared
		nnUemgAlarmEventTime	DateAndTime,	The time when the alarm is raised or cleared.

46.5.2.1.5 Datafill example

This MIB currently can not be set or changed.

46.5.2.1.6 Table release history update

46.5.2.1.7 Supplementary information

46.5.2.1.8 Translation verification other tools

46.6 Service Orders (SO) (CM & SESM)

46.7 Software optionality control (SOC)

46.8 Element Management

46.9 Command interface changes

46.9.1 Directory: mapci;mtc;pm;<pm name & number>;querypm flts

Three new messaging faults may appear for HOST ABI XPMs. The following new text strings are added to QUERYPM FLTS:

- External Pkt Ntwk Msg Link(s) Problems - CRITICAL links down
- External Pkt Ntwk Msg Link(s) Problems - Major severe message loss
- External Pkt Ntwk Msg Link(s) Problems - Minor degraded

46.9.1.1 Directory description

46.10 Dshell command changes

46.10.1 Directory: SctpAppIf

46.10.1.1 Directory description

This Dshell directory on the ABI contains commands to obtain information about any SCTP associations that exist on that ABI card. The information that can be obtained will be OM data and basic data on the health of the association.

46.10.1.2 Accessing directory: SctpAppI

46.10.1.2.1 Access to directory or MAP level and return to CI

To access the /SctpAppl command, first telnet to the desired ABI. This will take the user to the root directory of the Dshell which will look like: ABI[0 1 15] dSH>

Now type the following command to enter the SctpAppI directory: cd / SctpAppI

To return to the root directory the user can enter either of the following commands: cd.. or cd

46.10.2 Command: ListAssociations

46.10.2.1 Command type: ABI Dshell Command

46.10.2.2 Command target: MG9K ABI card

46.10.2.3 Command availability: Other

In house tool

46.10.2.4 Command description

The listAssociations command will list the SCTP associations on the ABI card and provide a status of each association. The command will provide the SCTP association number which will be used to view the OM data in the other commands in the SctpAppIf directory.

46.10.4 Command: HistoryOMs

46.10.4.1 Command type: ABI Dshell Command

46.10.4.2 Command target: MG9K ABI card

46.10.4.3 Command availability: Other

In house tool

46.10.4.4 Command description

The historyOMs command will print one or more sets of OMs that had been previously collected. The users will be able to specify which set 1-96 with 1 being the latest set collected and 96 being the oldest set collected. If a range is specified it will print out the sets in the range from latest to oldest.

46.10.4.5 Command syntax

Table 9 historyOMs command parameters and variables

Command	Parameters and variables
historyOMs	[-h] <Association#> [lower bound (1-96)] [upper bound (1-96)]
Parameters and variables	Description
-h	Prints a basic help statement for the command
Association #	The number of the SCTP association that the OM data is being requested for. This can be obtained from the listAssociations command.
lower bound	This parameter has a range from 1 to 96, with 1 being the latest and 96 being the oldest set of OMs collected. If this is not supplied it will default to 1, which will cause the latest set of OMs to be printed out.
upper bound	This parameter has a range of 1 to 96, with one being the newest and 96 being the oldest set of OMs being collected. If the parameter is supplied it has to be equal or greater than the lower bound parameter. This parameter will cause multiple sets of OMs to be printed out between the range of the lower and upper bound. If this parameter is not supplied it will be defaulted to the lower bound parameter and cause only one set of OMs to be printed.

46.10.4.6 Qualifications and warnings

None

46.10.4.7 Responses

46.10.4.7.1 Bad parameter entered for the command

Table 10 Outputs with associated meanings and actions

Command	
	Association not defined or Usage: historyOMs <Association#> [lower bound (1-96)] [upper bound (1-96)] Will print the OM history for the specific association requested. The association numbers can be obtained using the listAssociation command If no lower bound is entered it will print out the last saved interval of OMs for the specified one association number. If one bound parameter is supplied it will print that OM set. If both bound parameters are supplied it will print the sets between the two numbers. The upper bound has to be larger or equal to the lower bound.
Meaning: Either a valid association number was entered but that association was not create or a bad association number was entered, or the upper or lower bounds were out of range [1 - 96] or the upper bound was smaller than the lower bound	
System or user actions: Use the command listAssociations to determine a valid association number to use as the parameter for this command. Also check to make sure the upper bound (if one was entered) is not smaller than the lower bound and that both lower and upper bounds (if supplied) are in the range of 1 through 96.	

46.10.4.8 Example

46.11 Security

46.12 Configuration Walkthrough

47: Configuration (CN): A00003773

47.1 Hardware and Software Requirements

This functionality requires SN07 load in the Call Server, and SN07.1 or higher load in the MG4K-IP CEM and GEM RM.

47.2 Initial Configuration

Not Applicable

47.3 Office/Subnet parameters (OP/SP) (CM & SESM)

47.3.1 New/modified office/subnet parameters

Table 1 Office parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCVAR	PACKET_QOS_OM_THRESHOLDS	UNCHANGED	CM

This office parameter is introduced by feature A89007725 in SN06. This is being reused by this activity and explained for better understanding.

47.3.2 Parameter information

47.3.2.1 PACKET_QOS_OM_THRESHOLDS

Packet Quality of Service Operational Measurement Thresholds

47.3.2.1.1 Functional description

In SN06 the activity A89007725 - '*Trunk Group based QoS OM'* introduced a new office parameter PACKET_QOS_OM_THRESHOLDS to define QOS OM threshold values for GWC.

This parameter defines the QOS thresholds values used for pegging QOS issues on GWC based trunk groups. In addition, it allows the QOS reporting threshold feature to be enabled or disabled.

The same QOS OM threshold values (PACKET_QOS_OM_THRESHOLDS) defined in table OFCVAR will be applied to all MG4K-IP nodes datafilled on the Call Server. These QOS thresholds values will be used for pegging QOS issues on MG4K-IP based TDM trunk groups.

The values may be changed at any time without the need for Call Server/ MG4K-IP/GWC restart.

47.3.2.1.2 Provisioning rules

To activate the QOS OM pegging feature for GWC and MG4K-IP based TDM trunk groups, set the enabled value to Y and specify the desired thresholds for jitter, packet loss, and delay.

47.3.2.1.3 Range information

Table 2 Range information

Parameter	Field		Range	Units
PACKET_QOS_OM_THRESHOLDS	Enabled		Y/N	
	Jitter		0 TO 100	Milliseconds (ms)
	Delay		0 TO 500	Milliseconds (ms)
	Loss	Whole	0 TO 9	% packet loss range from 0 TO 9.999999%
		Fraction	0 TO 999999	

47.3.2.1.4 Activation

Changes take effect immediately.

47.3.2.1.5 Dependencies

A new log - *MG4K-IP OM Failure log,* shall be introduced by feature *A00003650 - 'MG4K-IP ECAN, SCTP and OM Failure logs'*. The QOS measurements shall be pegged on the GEM card per CLLI basis. The pegs are stored in 16 bit integers. If these overflow, then the MG4K-IP OM Failure log shall be generated with a reason. The reason code description for the log are Jitter peg overflow, Delay Peg Overflow, Packet Loss Peg Overflow. The pegs in the GEM shall be reset to 0 when this log is generated.

47.3.2.1.6 Consequences

None.

47.3.2.1.7 Verification

None.

47.3.2.1.8 Parameter release history update

In SN06, this parameter is created and used by GWC to peg the trunk group based QoS OMs. From SN07.1 the MG4K-IP nodes also uses these threshold to peg trunk group based QoS OMs.

47.4 Upgrade Impact

47.4.1 Dump and Restore

No Impact.

Minimum	Maximum	Default
{N,Y}	{N,Y}	N

48.3.2.1.4 Activation

Immediate.

48.3.2.1.5 Dependencies

SOC NSER0005 must be set to ON and the INTRACSE option in table TRKOPTS must be present in order to enable the functionality of this parameter.

48.3.2.1.6 Consequences

None

48.3.2.1.7 Verification
None

48.3.2.1.8 Memory requirements
No memory impact.

48.3.2.1.9 Parameter release history update
Office parm RTE_ADVANCE_FOR_INTRA_IMT_NCRT is a new parm added in table OFCVAR.

48.4 Upgrade Impact

48.4.1 Dump and Restore
No customer interaction is required.

- Patch SBB41 status is checked during ONP and if patch is active the SOC status for NSER0005 is set to ON.
- Patch SBB59 status is checked during ONP and if the patch is active the office parm RTE_ADVANCE_FOR_INTRA_IMT_NCRT is set to “Y”. Otherwise the parm is set to “N”.

48.4.2 Element Management Upgrade
N/A

48.5 Data schema (DS) (CM, MIBS, RDB)

48.5.1 New/modified tables, MIBs, or Database Schema
New option is added to existing table TRKOPTS

Table 4 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
TRKOPTS	Changed	Unchanged

48.5.2 Table/MIB/Remote Database Schema information

48.5.2.1 Name: TRKOPTS
TRunK OPTionS

48.5.2.1.1 Functional description
A new Trunk option, INTRACSE is introduced to Table TRKOPTS. The INTRACSE option contains a subfield called RTE_ADV_CHOICE that must be datafilled to Y or N to determine route advance behavior for specific CAUSE values. The CAUSE Enhancement capability is dependant on the the originating trunk and therefore The INTRACSE option can only be assigned to IC or 2W INTRA IMT trunks. The option can be assigned to both SS7 and

PTS INTRA IMT signaling trunks. The option allows the customer to activate the CAUSE enhancements capability on a per trunk group basis. INTRA IMT originators with this option assigned must terminate to an SS7 terminating trunk to enable the CAUSE Enhancement capability.

Only CAUSE values 34 (NOCIRCAV), 42 (SWEQCONG), 47 (RESUNAV) and 51 (CSE_51) are impacted by this option. CAUSE values 42, 47 and 51 will always route advance if the RTE_ADV_CHOICE field is set to Y.

If the office parameter RTE_ADVANCE_FOR_INTRA_IMT_NCRT is set to Y, CAUSE value 34 will route advance according to the RTE_ADV_CHOICE and table CSEMAP. If the office paramter is set to N, CAUSE value 34 will NOT route advancing regardless of the Y/N value of the RTE_ADV_CHOICE field.

48.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

Current datafill order unchanged.

48.5.2.1.3 Size

Table 5 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TRKOPTS	0	131072	Dynamically Allocated

48.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for TRKOPTS.

Table 6 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTION	Changed	refinement	Option: INTRACSE subfield: RTE_ADV_CHOICE - Y/N	INTRA IMT CAUSE Enhancements Enables route advance capabilities for CAUSE values 34, 42, 47 and 51. Subfield RTE_ADV_CHOICE is a Y/N prompt. When datafilled to Y CAUSE 34, 42, 47 and 51 will route advance. When datafilled to N CAUSE values 34, 42, 47 and 51 will go to thier respective default treatments.

48.5.2.1.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

```
TABLE: TRKOPTS
 -------------------------
TRKCLLI   INTRACSE   INTRACSE  RTE_ADV_CHOICE  Y
```

INTRACSE data fill incompatibilties result in the following Error Messages

Attempts to datafill the INTRACSE option on a trunk type other than IMT results in the following error message:

'INTRACSE option is supported only for IMT trunk types'

Attempts to datafill the INTRACSE option on an IMT trunk with a NETWKSPC value other than INTRA, results in following error message

'INTRACSE option requires NETWKSPC to be INTRA'

Attempts to datafill the INTRACSE option on an outgoing (OG) trunk result in the following error message:

'INTRACSE option supports IC and 2W direction only.'

48.5.2.1.6 Table release history update

INTRACSE with subfield RTE_ADV_CHOICE is added as an additional OPTION in table TRKOPTS.

48.9 Command interface changes

N/A

48.10 Security

N/A

48.11 Configuration Walkthrough

N/A

49: Configuration (CN): A00003905

49.1 Hardware and Software Requirements

Feature A00003905 allows 72 disk volumes to be provisioned per DIRP pool in table DIRPPOOL. Previously, only 24 volumes could be allocated per pool.

Feature A00002186 expands DDU capacity from 1G to 4G. IOM load XXXYYYZZZ is required by feature A00002186.

In order for full 4G DDU capacity to be available for DIRP, feature A00002186 must be at SOC state ON. IOM load XXXYYYZZZ must be used. Feature A00003905 must also be at SOC state ON.

The SOC name for this functionality is BASE DIRP enh to 72 vol, and the ORDCODE is BASE0014.

49.2 Initial Configuration

Feature A00003905 SOC state defaults to IDLE.

72 possible volumes are displayed in table DIRPPOOL. Access to provisioning more than 24 volumes is SOC controlled.

49.3 Upgrade Impact

49.3.1 Dump and Restore

Feature A00003905 sources the functionalities provided by software bridge SBB28. SBB28 created a new table DIRPOOL2 which linked together three 24 volume pools in table DIRPPOOL in order to achieve 72 volumes of storage per DIRP subsystem.

Over an ONP when bridge SBB28 is active and table DIRPOOL2 contains linked pools, feature A00003905 will consolidate all of the pools' volumes under the main pool that is provisioned against the subsystem in table DIRPSSYS. The emptied unused pools will be deleted from table DIRPPOOL.

Any files present in table DIRPHOLD from the volumes being consolidated will be deleted as part of the consolidation process. Files in table DIRPHOLD should be processed prior to an ONP. The following warning is displayed during POSTSWACT:

```
WARNING - ALL DIRPHOLD FILES FOR VOLUME <volume name> DELETED
FROM TABLE DIRPHOLD, AND ARE THE USERS' RESPONSIBILITY
```

Table DIRPOOL2 is present active on the new load only during the ONP and is only used for consolidation. The table is rendered inert in the system at the end of the ONP.

SOC state is not considered during an ONP. Feature A00003905 will always transfer and consolidate if needed. SOC state IDLE will prevent any future provisioning of volumes in a pool that has more than 24 volumes.

49.4 Data schema (DS) (CM, MIBS, RDB)

49.4.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
DIRPPOOL	CHANGED	UNCHANGED
DIRPOOL2	NEW	NEW

49.4.2 Table/MIB/Remote Database Schema information

49.4.2.1 Name: DIRPPOOL

49.4.2.1.1 Functional description

Table DIRPPOOL contains information regarding the pool of available devices to be used by a DIRP subsystem for recording.

49.4.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

49.4.2.1.3 Size

Increasing the number of volumes per pool to 72 from 24 increases the memory requirements of table DIRPPOOL. Essentially, volume related store now requires 3x as much memory (72/24=3). Modules DIRPGI and DIRPDSON carry the bulk of the increase in storage. The following information shows the increase:

```

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
DIRPPOOL	SAME	SAME	Volume memory requirements increase by 3x. See above.

49.4.2.1.4 Fields

The following table lists changed fields for DIRPPOOL.

Every individual volume field, i.e. VOLUME12, is changed to a TABLE of three volume names.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
VOLUME0	Changed	None	eight_char_vector	New Field Name: VOL00X02 The field will be provisioned with 3 volume names for volumes 00 to 02. Default: $ $ $
VOLUME1	Changed	None	eight_char_vector	New Field Name: VOL03X05 The field will be provisioned with 3 eight_char_vector for volumes 03 to 05. Default: $ $ $
VOLUME2	Changed	None	eight_char_vector	New Field Name: VOL06X08 The field will be provisioned with 3 eight_char_vector for volumes 06 to 08. Default: $ $ $
VOLUME3	Changed	None	eight_char_vector	New Field Name: VOL09X11 The field will be provisioned with 3 eight_char_vector for volumes 09 to 11. Default: $ $ $

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
VOLUME4	Changed	None	eight_char _vector	New Field Name: VOL12X14 The field will be provisioned with 3 eight_char_vector for volumes 12 to 14. Default: $ $ $
VOLUME5	Changed	None	eight_char _vector	New Field Name: VOL15X17 The field will be provisioned with 3 eight_char_vector for volumes 15 to 17. Default: $ $ $
VOLUME6	Changed	None	eight_char _vector	New Field Name: VOL18X20 The field will be provisioned with 3 eight_char_vector for volumes 18 to 20. Default: $ $ $
VOLUME7	Changed	None	eight_char _vector	New Field Name: VOL21X23 The field will be provisioned with 3 eight_char_vector for volumes 21 to 23. Default: $ $ $
VOLUME8	Changed	None	eight_char _vector	New Field Name: VOL24X26 The field will be provisioned with 3 eight_char_vector for volumes 24 to 26. Default: $ $ $

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
VOLUME9	Changed	None	eight_char _vector	New Field Name: VOL27X29 The field will be provisioned with 3 eight_char_vector for volumes 27 to 29. Default: $ $ $
VOLUME10	Changed	None	eight_char _vector	New Field Name: VOL30X32 The field will be provisioned with 3 eight_char_vector for volumes 30 to 32. Default: $ $ $
VOLUME11	Changed	None	eight_char _vector	New Field Name: VOL33X35 The field will be provisioned with 3 eight_char_vector for volumes 33 to 35. Default: $ $ $
VOLUME12	Changed	None	eight_char _vector	New Field Name: VOL36X38 The field will be provisioned with 3 eight_char_vector for volumes 36 to 38. Default: $ $ $
VOLUME13	Changed	None	eight_char _vector	New Field Name: VOL39X41 The field will be provisioned with 3 eight_char_vector for volumes 39 to 41. Default: $ $ $

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
VOLUME14	Changed	None	eight_char _vector	New Field Name: VOL42X44 The field will be provisioned with 3 eight_char_vector for volumes 42 to 44. Default: $ $ $
VOLUME15	Changed	None	eight_char _vector	New Field Name: VOL45X47 The field will be provisioned with 3 eight_char_vector for volumes 45 to 47. Default: $ $ $
VOLUME16	Changed	None	eight_char _vector	New Field Name: VOL48X50 The field will be provisioned with 3 eight_char_vector for volumes 48 to 50. Default: $ $ $
VOLUME17	Changed	None	eight_char _vector	New Field Name: VOL51X53 The field will be provisioned with 3 eight_char_vector for volumes 51 to 53. Default: $ $ $
VOLUME18	Changed	None	eight_char _vector	New Field Name: VOL54X56 The field will be provisioned with 3 eight_char_vector for volumes 54 to 56. Default: $ $ $

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
VOLUME19	Changed	None	eight_char _vector	New Field Name: VOL57X59 The field will be provisioned with 3 eight_char_vector for volumes 57 to 59. Default: $ $ $
VOLUME20	Changed	None	eight_char _vector	New Field Name: VOL60X62 The field will be provisioned with 3 eight_char_vector for volumes 60 to 62. Default: $ $ $
VOLUME21	Changed	None	eight_char _vector	New Field Name: VOL63X65 The field will be provisioned with 3 eight_char_vector for volumes 63 to 65. Default: $ $ $
VOLUME22	Changed	None	eight_char _vector	New Field Name: VOL66X68 The field will be provisioned with 3 eight_char_vector for volumes 66 to 68. Default: $ $ $
VOLUME23	Changed	None	eight_char _vector	New Field Name: VOL69X71 The field will be provisioned with 3 eight_char_vector for volumes 69 to 71. Default: $ $ $

49.4.2.1.5 Datafill example

The following example shows sample datafill and how volumes would now be added and deleted for table DIRPPOOL.

Changing the volumes with a one line command is not recommended. Table control does not recognize NIL volume names, and unexpected provisioning may result. Always verify table changes before confirming. Changing individual volumes is possible, but the approach taken in the example below and in the sample datafill is recommended. An example of a one line volume name change is below.

> CHA VOL00X02 $ $ D000VOL2

Preferred method:

> CHA VOL00X02

> VOL00X02: $ $ $

> $ $ D000VOL2

49.4.2.1.6 Table release history update

Each individual volume field in table DIRPPOOL is now replaced with a field that contains three volume names. The new field name represents the 3 volume names. For example, VOL24X26 represent volumes 24, 25, and 26. Table control will require 3 volume names be entered for each new volume range field. “$” is still used for no volume name. Changing volume names with a one line command is not recommended. In order to change a specific range of volumes perform a change on the range and be prompted for the new volumes.

SOC is used to limit provisioning of more than 24 volumes per pool in table DIRPPOOL. If more than 24 volumes are attempted to be provisioned in table DIRPPOOL and the SOC state is IDLE, an error message is produced indicating the SOC limitation, and the volumes are not provisioned. The SOC name for this functionality is BASE DIRP enh to 72 vol, and the ORDCODE is BASE0014.

49.4.2.1.7 Supplementary information

Volumes can be provisioned via table control or through the use of the MNT and DMNT commands at the MAPCI DIRP level. MNT and DMNT usage to provision volumes remains unchanged with this feature.

49.4.2.1.8 Translation verification other tools

The following example shows the output from MAPCI DIRP QUERY when it is used to verify the provisioned volumes in table DIRPPOOL for a specific subsystem.

49.4.2.2 Name: DIRPOOL2

49.4.2.2.1 Functional description

Feature Bridge SBB28 introduced table DIRPOOL2 in SNNCSH04. Table DIRPOOL2 links three DIRP pools in table DIRPPOOL for a subsystem listed in table DIRPSSYS. The three pools provide 72 volumes of storage capacity per subsystem.

Table DIRPOOL2 is created in feature A00003905 solely for the purpose of providing information needed to consolidate linked pools when moving to a load that now has 72 volumes per pool in table DIRPPOOL. The table is created at IPL. Its data is transferred during DART (if applicable). The table data is used during POSTSWACT to consolidate volumes in DIRPPOOL. At the end of POSTSWACT, table DIRPOOL2 is rendered inert in the switch.

Basic table functionality is provided during the duration of the ONP, but no data verification is done. Valid data is assumed from the old load (pre-SNNCSH07).

49.4.2.2.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

DIRPPOOL

DIRPSSYS

DIRPOOL2

49.4.2.3 Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
DIRPOOL2	0	24	Memory is allocated only during ONP and is freed afterwards.

49.4.2.3.1 Fields/OIDs

The following table lists fields for DIRPOOL2.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
ssysname	new	none	ssnamesr	DIRP subsystem name
poolnam1	new	none	poolname sr	DIRP pool name
poolnam2	new	none	poolname sr	DIRP pool name
poolnam3	new	none	poolname sr	DIRP pool name

49.4.2.3.2 Datafill example

The following example shows sample datafill for table DIRPOOL2 which was transferred from feature bridge SBB28 data in SNNCSH04.

```
Mate>table dirpool2
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: DIRPOOL2
Mate>lis all
TOP
SSYSNAME POOLNAM1 POOLNAM2 POOLNAM3
---------------------------------
     AMA  AMAPOOL MEGAPOOL MCKYPOOL
BOTTOM
```

49.4.2.3.3 Table release history update

Table DIRPOOL2 is introduced by feature A00003905 solely for consolidating pool volumes linked via feature bridge SBB28. SBB28 introduced table DIRPOOL2 to link up to three DIRP pools to one DIRP subsystem allowing for a maximum of 72 recording volumes. Table DIRPOOL2 is used during ONP to consolidate the linked pool volumes under the main pool that is datafilled against the subsystem in table DIRPSSYS. Post-ONP, table DIRPOOL2 is rendered inert in the system, and SOC for

feature A00003905 is used to provision more than 24 and up to 72 volumes per pool in table DIRPPOOL.

49.4.2.3.4 Supplementary information

None.

49.4.2.3.5 Translation verification other tools

Table DIRPOOL2 data can be verified post-RESTORE by listing the table on the inactive side during an ONP.

Consolidation can be verified by checking table DIRPPOOL after POSTSWACT to ensure that all linked pool volumes were moved under the main pool provisioned against the subsystem in table DIRPSSYS.

49.5 Software optionality control (SOC)

Table 6 SOC

SOC option name:	BASE DIRP enh to 72 vol
SOC option title:	Yes
SOC option control type:	State
New SOC option?	Yes
SOC option order code	BASE0014
Option defined in DRU:	BASE
Affected products:	DIRP

SOC state IDLE limits the number of provisionable volumes per pool in table DIRPPOOL to 24. SOC state ON increases the total number of volumes per pool to 72.

49.6 Command interface changes

49.6.1 Directory: MAPCI;MTC;IOD;DIRP

49.6.1.1 Directory description

DIRP provides the ability to perform a variety of commands against DIRP subsystems.

QUIT ALL

49.6.2 Command: MNT

49.6.2.1 Command type: MENU

49.6.2.2 Command target: All

49.6.2.3 Command availability: RES

49.6.2.4 Command description

MNT mounts a specific volume to a specific DIRP subsystem.

49.6.2.5 Command syntax

MNT <DIRP subsystem> <volume name>

49.6.2.6 Qualifications and warnings

Feature A00003905 SOC limits the number of volumes provisionable per DIRP subsystem if the SOC state is IDLE. If the state is IDLE, only 24 volumes can be provisioned per DIRP pool in table DIRPPOOL. If more than 24 volumes are attempted to be provisioned with SOC state IDLE, an error message is produced, and the volume is not mounted against the subsystem.

The SOC name for this functionality is BASE DIRP enh to 72 vol, and the ORDCODE is BASE0014.

49.6.2.7 Responses

49.6.2.7.1 DIRP Volume Expansion SOC is not ON. Cannot mount more than 24 VOLUMES per POOL.

The user is trying to allocate more than 24 volumes per pool with the SOC state for feature A00003905 IDLE.

Table 7 MAP outputs with associated meanings and actions

Command: DIRP MNT
DIRP Volume Expansion SOC is not ON. Cannot mount more than 24 VOLUMES per POOL. **Meaning:** Cannot mount more than 24 volumes per pool in table DIRPPOOL **System or user actions:** The user needs to purchase functionality under feature A00003905 if they want to provision more that 24 volumes per pool in table DIRPPOOL.

50: Configuration (CN): A00003923

50.1 Hardware and Software Requirements

There is no specific hardware requirement for this feature. The basic ICM software package is needed to use this feature.

50.2 Initial Configuration

The required configuration for this feature is detailed in the DS section of this document.

50.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

50.4 Upgrade Impact

50.4.1 Dump and Restore

No manual action is required. A reformat Procedure will be used as the software solution.

50.4.2 Element Management Upgrade

N/A

50.5 Data schema (DS) (CM, MIBS, RDB)

50.5.1 New/modified tables, MIBs, or Database Schema

Impacted tables are listed below in Table 1

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
IBNFEAT	Changed	Unchanged
KSETFEAT	Changed	Unchanged

50.5.2 Table/MIB/Remote Database Schema information

50.5.2.1 Name: IBNFEAT

Integrated Business Network Features Table

50.5.2.1.1 Functional description

N/A

50.5.2.1.2 Usage sequence and implications (CM Only)

50.5.2.1.3 Current datafill order unchanged.
Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
IBNFEAT	0	N/A	Dynamically Allocated

50.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for IBNFEAT.

The IBNFEAT fields are being shown for informational purposes only, functionality for this actvity is only assignable via SERVORD.

The new sub-option SCAIRDIR is identified on the line via a Y or N entry under the ECM option. If the sub-option SCAIRDIR is 'Y' then the MSGTO subfield is presented.

For this activity, if field 3 (DF) is ECM and field 4 (FEATURE) is ECM, then the sub-option SCAIRDIR will be presented as one of the field 5 (DATA) Area Refinements. If SCAIRDIR is set to 'Y' then a further refinement of MSGTO (Message Timeout) will be presented which will have a range of 1 to 60 seconds. (See **BOLD** in tuple example below).

Table IBNFEAT fields:

```
1   LEN         EXT_LEN
2   DNN         DNNO_RANGE
3   DF          DATA_FEATURE
4   FEATURE     DATA_FEATURE
5   DATA        AREA REFINEMENTS
```

Table IBNFEAT Tuple example:

```
LEN
            DNNO        DF    FEATURE
                                                DATA
-------------------------------------------------------------------------------
HOST  05 0 00 05
                0       ECM       ECM Y Y Y Y Y Y Y Y 60
```

50.5.2.1.5 Datafill example
Datafill for this activity is performed via SERVORD only.

50.5.2.1.6 Table release history update
Added a sub-option named SCAIRDIR to the ECM option. If SCAIRDIR is set to ‘Y’ a sub-field named MSGTO is also presented.

50.5.2.2 Name: KSETFEAT

Key Set Features Table

50.5.2.2.1 Functional description
N/A

50.5.2.2.2 Usage sequence and implications (CM Only)

50.5.2.2.3 Current datafill order unchanged.
Size

Table 3 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
KSETFEAT	0	N/A	Dynamically Allocated

50.5.2.2.4 Fields/OIDs
The following table lists fields/OIDs for KSETFEAT.

The KSETFEAT fields are being shown for informational purposes only, functionality for this actvity is only assignable via SERVORD.

The new sub-option SCAIRDIR is identified on the line via a Y or N entry under the ECM option. If the sub-option SCAIRDIR is ‘Y’ then the MSGTO subfield is presented.

For this activity, if field 2 (FEATURE) is ECM, then the sub-option SCAIRDIR will be presented as one of the field 3 (KVAR) Area Refinements. If SCAIRDIR is set to ‘Y’ then a further refinement of MSGTO (Message Timeout) will be presented which will have a range of 1 to 60 seconds. (See **BOLD** in tuple example below).

TableKSETFEAT fields:

```
1   FEATKEY     KSETFEAT_KEY
2   FEATURE     KEY_SET_FEATURE
3   KVAR        AREA REFINEMENTS
```

TableKSETFEAT Tuple example:

```
FEATKEY     FEATURE
                                                    KVAR
-------------------------------------------------------------------------------
HOST  00 0 19 16  1     ECM         ECM Y Y Y Y Y Y Y Y 60
```

50.5.2.2.5 Datafill example

Datafill for this activity is performed via SERVORD only.

50.5.2.2.6 Table release history update

Added a sub-option named SCAIRDIR to the ECM option. If SCAIRDIR is set to 'Y' a sub-field named MSGTO is also presented.

50.6 Service Orders (SO) (CM & SESM)

This activity is adding a new sub-option named SCAIRDIR to the existing ECM line option. The SCAIRDIR sub-option will also have a sub-field named MSGTO which will be available when the SCAIRDIR sub-option is set to 'Y'.

50.6.1 Service order change details

50.6.1.1 LCC and options

The new sub-option SCAIRDIR will be applicable to the same sets as the ECM Line Option (reference AR0046 - ECM / SCAI Support for Non-ACD). This includes sets that are Meridian Business Set (MBS), 500/2500 IBN and Meridian Feature Transparency (MFT) sets, including EtherSets.

Only single DN apperance per line will be supported by this activity. Lines with features such as Multiple Appearance Directory Number (MADN), Hunt Groups, UCD etc. are not supported

50.6.2 New commands

No new SERVORD commands are introduced by this activity.

50.6.2.1 How service order commands are presented - IBN

50.6.2.1.1 Description

The existing SERVORD ADO (Add Option) command will be used to assign the sub-option SCAIRDIR (via the ECM option) to an existing IBN line.

50.6.2.1.2 Example

Example of the SCAIRDIR sub-option in prompt mode

```
CI:
>servord

ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
```

50.6.3 Option prerequisites

50.6.3.1 Notes

SCAIRDIR is a sub-option of the ECM line option. The ECM is therefore required on the line in order for the SCAIRDIR sub-option to be presented.

50.6.3.2 Feature identification

This activity A00003923 - CTX / RES SCAI Redirection is activatable via SOC ICM00080 which requires ICM00001, PCID 00037570

50.7 Software optionality control (SOC)

Order code ICM00080, CTX / RES SCAI Redirection provides SCAI Redirection support for CENTREX and Residental lines that have the ECM option assigned. When ICM00080 SOC is in the IDLE state, calls to the affected line will not generate a ICM Call-Received-C message.

The following warning message is displayed when the CTX / RES SCAI Redirection SOC ICM00080 is toggled from ON to IDLE state (the warning message indicates that state transition disables the associated Call-Received-C messaging and CTX/RES SCAI Redirection functionality).

SERVICE AFFECTING: This transition will disable the CTX / RES SCAI Redirection functionality for all current and future subscribers.

Table 4 SOC

SOC option name:	ICM
SOC option title:	CTX / RES SCAIRDIR
SOC option control type:	STATE
New SOC option?	Yes
SOC option order code	ICM00080
Option defined in DRU:	CCM
Affected products:	LEC00020, LET00020, LLT00020, SN07, ISN07

51: Configuration (CN): A00003933

51.1 Hardware and Software Requirements

The Gateway Controller's (GWC's) software load must be upgraded to receive SIPLINK before CM SIPLINK is datafilled.

51.2 Initial Configuration

There is no initial configuration.

51.3 Office/Subnet parameters (OP/SP) (CM & CS2M)

Not Applicable

51.4 Upgrade Impact

SIPLINK is a new table.

51.5 Data schema (DS) (CM, MIBS, RDB)

51.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SIPLINK	NEW	NEW

51.5.2Table/MIB/Remote Database Schema information

51.5.2.1 SIPLINK

Session Internet Protocol Communication Link

51.5.2.1.1 Functional description

New table SIPLINK creates an association between CS 2000 agents (e.g., ISUP trunks) and a SIP link name.

The SIPLINK table is downloaded to GWCs datafilled as DPT SIPT in table SERVSINV.

51.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

TRKOPTS with SIPT

DPTRKMEM with DPTRKKEY.CLLI and SIPT signaling

SIPLINK with SIPTTRK already datafilled in TRKOPTS:OPTKEY.CLLI and in DPTRKMEM.

51.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SIPLINK	0	400	Memory allocated in increments for 64 tuples (each 6 bytes)

51.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for SIPLINK.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
LINKNAME	new	key	VECTOR OF UP TO 16 CHARS	alpha numerical name of the siplink
CONNTYPE	new		CS2CS or CS2AS	a connection type indicates CallServer to CallServer or CallServer to ApplicationServer

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
AGNTDATA	new	selector	ISUPTRK	currently only ISUPTRK is implemented
SIPTTRK	new	refinement	VECTOR OF UP TO 16 CHARS	alpha numerical name of the trunk (CLLI)

51.5.2.1.5 Datafill example

The following example shows a sample datafill for tables TRKOPTS, DPTRKMEM and SIPLINK.

- **TABLE TRKOPTS (after Trimodal restructuring - SN07)**

OPTKEY OPTINFO

SIP_LOOP_1 DPT DPT SIPT NET_IP Y

- **TABLE DPTRKMEM**

DPTRKKEY RANGEINF MAXCALLS

SIP_LOOP_1 SIPT 100

- **TABLE SIPLINK**

LINKNAME CONNTYPE AGNTDATA

ACCESS_LINK_2 CS2CS ISUPTRK **SIP_LOOP_1**

51.5.2.1.6 Table release history update

This is new table for SN07 (patchable into SN06.0)

51.5.2.1.7 Supplementary information

None

51.5.2.1.8 Translation verification other tools

None

51.6 Service Orders (SO) (CM & CS2M)

Not Applicable.

51.7 Software optionality control (SOC)

There are two new core usage SOC options that are used to limit the maximum number of simultaneous calls that are allowed through the Session Server Manager at any given time. Without one or both of the new SOC options, no call processing can take place using the Session Server Manager.

These usage SOCs do not take the place of Base DPT usage SOC CS2B0005. The latter is still needed to set the value of office parameter DPT_MAX_PORTS in table OFCVAR. DPT_MAX_PORTS limits the overall number of simultaneous DPT calls.

51.7.1SOC CS2B0008

Table 4 SOC CS2B0008

SOC option name:	CS to CS calls
SOC option title:	Yes/No
SOC option control type:	usage
New SOC option?	Yes
SOC option order code	CS2B0008
Option defined in DRU:	MSH
Affected products:	SN07

51.7.1.1 SOC limitations

The usage-controlled CS2B0008 SOC added by this activity applies to calls that meet the following criteria:

— the incoming or outgoing trunk group has the DYNAMIC option with SIPT SIGNALING in table TRKOPTS,

— a match of the incoming or outgoing trunk group is found in the SIPTTRK field of one of the tuples in table SIPLINK,

— the CONNTYPE field of the tuple in table SIPLINK is set to CS2CS.

A counter keeps track of the current number of calls matching the above criteria. For each new CS2AS call, the current value in the counter is checked against the limiting value in the CS2AS SOC. If the addition of a new call of this type would exceed the SOC limit, the call is sent to treatment; otherwise, the counter is incremented and the call is allowed to proceed. When the call is ended, the counter is decremented.

In the following example of table SIPLINK, incoming and outgoing SIPT calls on trunk group NGSSLOOP will increment the usage counter for the CS2AS SOC.

```
TABLE: SIPLINK
        LINKNAME CONNTYPE                  AGNTDATA
-------------------------------------------------
        NGSSOUTLK    CS2AS ISUPTRK          NGSSOUT
      NGSSINLINK    CS2AS ISUPTRK          NGSSINC
     LOOPAROUND1    CS2CS ISUPTRK          NGSSLOOP
```

Here is an example of the output of the SOC SELECT command for the new SOC:

```
>select option CS2B0008
GROUP:CS2B
OPTION    NAME                 RTU STATE   USAGE   LIMIT    UNITS  LAST_CHG
------    ----                 --- -----   -----   -----    -----  --------
CS2B0008 CS to CS Calls           N     -     127     500      1VC  04/01/19
```

51.7.1.2 SOC CS2B0008 interactions:

- Calls that peg the new CS2B0008 count will always peg the CS2B0005 count as well.
- If the SOC limit set for CS2B0008 exceeds the limit of the Base DPT SOC CS2B0005, the latter is the limiting factor in determining the maximum number of simultaneous CS2AS calls.
- Feature A00004271 SIP App Server SOC introduces new OM group NGSSOM for tracking the effects of the CS2B0008 SOC limit setting on CS2CS calls.

51.7.2SOC CS2B0009

Table 5 SOC CS2B0009

SOC option name:	CS to AppS calls
SOC option title:	Yes/No
SOC option control type:	usage
New SOC option?	Yes
SOC option order code	CS2B0009
Option defined in DRU:	MSH
Affected products:	SN07

51.7.2.1 SOC limiting

The usage-controlled CS2B0009 SOC added by this activity applies to calls that have the following characteristics:

— the incoming or outgoing trunk group has the DYNAMIC option with SIPT SIGNALING in table TRKOPTS,

— a match of the incoming or outgoing trunk group is found in the SIPTTRK field of one of the tuples in table SIPLINK,

— the CONNTYPE field of the tuple in table SIPLINK is set to CS2AS

A counter keeps track of the current number of calls matching the above criteria. For each new CS2AS call, the current value in the counter is checked against the limiting value in the CS2AS SOC. If the addition of a new call of this type would exceed the SOC limit, the call is sent to treatment; otherwise, the counter is incremented and the call is allowed to proceed. When the call is ended, the counter is decremented.

In the following example of table SIPLINK, incoming SIPT calls on trunk group NGSSINC and outgoing calls on trunk group NGSSOUT will increment the usage counter for the CS2AS SOC.

```
TABLE: SIPLINK
        LINKNAME CONNTYPE                  AGNTDATA
-------------------------------------------------
         NGSSOUTLK    CS2AS ISUPTRK          NGSSOUT
       NGSSINLINK    CS2AS ISUPTRK          NGSSINC
     LOOPAROUND1    CS2CS ISUPTRK         NGSSLOOP
```

Here is an example of the output of the SOC SELECT command for the new SOC:

```
>select option CS2B0009
GROUP:CS2B
OPTION    NAME                 RTU STATE   USAGE   LIMIT    UNITS  LAST_CHG
------    ----                 --- -----   -----   -----    -----  --------
CS2B0009 CS to AppS Calls          N     -    127     500      1VC  04/01/19
```

51.7.2.2 SOC limitations

- Calls that peg the new CS2B0009 count will always peg the CS2B0005 count as well.
- If the SOC limit set for CS2B0009 exceeds the limit of the Base DPT SOC CS2B0005, the latter is the limiting factor in determining the maximum number of simultaneous CS2AS calls.

51.8 Element Management

Not Applicable.

51.9 Security

Not Applicable.

51.10 Configuration Information

This feature allows the craftsperson to provision a number of fields on a remote-server basis, as per customer requirements. The following section captures the provisioning information for specific configurations. The different configurations discussed include:

- NGSS - NGSS
- NGSS - SN07 VRDN
- NGSS - SN06.2 VRDN
- NGSS - SN06 VRDN
- NGSS - MCS

Please refer to the FN section for detailed information on provisionable fields.

Table 6 Default Provisioning Information Various Configurations

Field	NGSS - MCS	NGSS - SN07 VRDN	NGSS-NGSS

Agent	ISUP	ISUP	ISUP
Unknown Header	any string	any string	anystring
Anonymous Header	any string	any string	any string

a. The port can be configured to a number of choice. Ensure the port number is consistent across the communicating NGSSs.

b. Either all the nodes in a call should support UPDATE, or none of them should. Otherwise, undesired behavior may occur.

c. A custom ISUP - SIP cause map can be added by clicking on "*ISUP and SIP Mappings*" tab and adding a new mapping under "*ISUP to SIP Map*".

d. A custom SIP - ISUP cause map can be added by clicking on "*SIP and ISUP Mappings*" tab and adding a new mapping under "*SIP to ISUP Map*".

e. A custom SIP Redirection Map can be added by clicking on "*ISUP and SIP Mappings*" tab and a new mapping under *"SIP Redirection"*.

f. This maps ISUP *Protocol/Version/Variant* <--> *SIP base and Version* fields. See FN section for instructions on how to add a new mapping. Also, See Appendix for base/version for different protocol variants that are required for communicating with VRDN configurations. For all other configurations, base/version entries are configurable.

g. When interworking with VRDN, add an entry with base/version of gr394/gr394 for any external protocol (Q764 NULL NULL gr394 gr394)

h. Nature Of Address/Numbering Plan Identifier <--> Phone-Context Mapping table. For incoming SIP calls, this table is used to determine the NOA/NPI values to be used in the ISUP message. Similarly, for outgoing calls, this table is used to determine the 'phone-context' parameter to be added to Request-URI. The button "**Phone-Context**" (under URI-Parameters) must be turned ON for this functionality to take effect. New mapping entries can be added by following the procedure described in FN section.

i. This is used to setup handling of Action Point Number (APN), Private Numbering Plan type calls. There are three different types this can be configured as shown in the pull-down menu. **1.** *Use Prefix* ---> requires datafill of Prefix field. **2.** *Use Prefix and Phone Context* --> requires datafill of both Prefix and Phone-Context fields. **3.** *Phone Context Only* --> requires datafill of Phone Context Field.

j. Marking this field 'Y' requires datafill of Country Code Supported to be set to 'Y' and entry of valid Country Code in the provided field.

k. Marking this field 'Y' requires datafill of Country Code Supported to be set to 'Y' and entry of valid Country Code in the provided field.

l. Marking this field 'Y' requires selection of at least one applicable codec in the 'Config Data' section.

m. Marking this field 'Y' requires selection of at least one applicable codec in the 'Config Data' section.

n. Marking this field "N" requires marking "Accepts Early SDP" to "N". Marking both of these field "N" means supporting SIP (without ISUP payload) between session server and session server.

o. Must be marked 'Y' and valid Country code datafilled, if '*e.164 supported*' is set to 'Y'.

p. This value should be configured based on the MCS configuration. Please check the MCS's Initial Maximum Hop Value, and then set the Hop-Counter according to the formula as explained in the FN section of this document.

Table 7 Default Provisioning Information Various Configuration

Field	NGSS - SN06.2 VRDN	NGSS - SN06 VRDN
IP Address	x.x.x.x	x.x.x.x
Port	5060	5060
Protocol	UDP	UDP
Optional IP (1-7)	none	none
Methods:	INVITE, CANCEL, BYE, OPTIONS, SUBSCRIBE, NOTIFY, PRACK, INFO	INVITE, CANCEL, BYE, OPTIONS, PRACK, INFO
URI Parameters Supported	cic	none
SIP Headers supported	One of Remote-Party-ID or P-Asserted-ID/Privacy, Diversion	Remote-Party-ID
ISUP to SIP Cause Map[a]	Default	Default

Field	NGSS - SN06.2 VRDN	NGSS - SN06 VRDN
SIP to ISUP Cause Map[b]	Default	Default
SIP Redirection Map[c]	Default	Default
ISUP Variant to SIP Version Map[d]	Default[e]	Default[f]
NOA/NPI to Phone Context Map	None	None
SIP Cause Precedence Priority[g]	Default	Default
APN Information	Not Applicable	Not Applicable
Backward Call Indicator (BCI) Data	(I) Inetworking Encountered (K) ISUP Not used All the Way (M) Terminating Access is not ISDN	(I) Inetworking Encountered (K) ISUP Not used All the Way (M) Terminating Access is not ISDN
Forward Call Indicator (FCI) Data	Treat as National Call (D) Interworking Encountered (F) ISUP Not Used All the Way (HG) ISUP Not required (I) Originating Access nonISDN	Treat as National Call (D) Interworking Encountered (F) ISUP Not Used All the Way (HG) ISUP Not required (I) Originating Access nonISDN
SIP Header format	Compact or Long	Compact or Long
Options for Heartbeat	yes	yes
Telephony Profile	yes	yes
Use Info for Long Call Audit	yes	yes

Field	NGSS - SN06.2 VRDN	NGSS - SN06 VRDN
Map non-screened RPI to Calling#	yes	yes
Accepts Early SDP	yes	yes
Accept Invite without SDP	yes	yes
E.164 Format Allowed[h]	no	no
Enforce Code-Compatibility[i]	no	no
Accepts Encap-sulated ISUP	yes	yes
CountryCode[j] Support	no	no
Hop-Counter	7	7
Out of Band DTMF	telephone-event	Not Applicable
Agent	ISUP	ISUP
Unknown Header	any string	any string
Anonymous Header	any string	any string

a. A custom ISUP - SIP cause map can be added by clicking on "*ISUP and SIP Mappings*" tab and adding a new mapping under "*ISUP to SIP Map*".

b. A custom SIP - ISUP cause map can be added by clicking on "*SIP and ISUP Mappings*" tab and adding a new mapping under "*SIP to ISUP Map*".

c. A custom SIP Redirection Map can be added by clicking on "*ISUP and SIP Mappings*" tab and a new mapping under *"SIP Redirection"*.

d. This maps ISUP *Protocol/Version/Variant <--> SIP base and Version* fields. See FN section for instructions on how to add a new mapping. Also, See Appendix for base/version for different protocol variants that are required for communicating with VRDN configurations. For all other configurations, base/version entries are configurable.

e. When interworking with VRDN, add an entry with base/version of gr394/gr394 for any external protocol (Q764 NULL NULL gr394 gr394)

f. When interworking with VRDN, add an entry with base/version of gr394/gr394 for any external protocol (Q764 NULL NULL gr394 gr394)
g. You can change the precedence setting for testing purposes and select different precedence for different interworkings
h. Marking this field 'Y' requires datafill of Country Code Supported to be set to 'Y' and entry of valid Country Code in the provided field.
i. Marking this field 'Y' requires selection of at least one applicable codec in the 'Config Data' section.
j. Must be marked 'Y' and valid Country Code datafilled, if 'e.164 Supported' is set to 'Y'

Table 8 Default Configuration Data Settings

Field	Default Value
general Linger Timer	5000
Invite Linger Timer	5000
local TCP Port	5060[a]
local UDP Port	5060[b]
maxCallLegs	1000[c]
maxSipMsgSize	1536
maxSubscriptions	1000
provisionalTimer	180000
retransmission T1	2000
retransmission T2	4000
retransmission T4	5000
retry Count	6
codec G729 Allowed	N[d]
codecPCMUAllowed	N[e]
codecPCMAAllowed	N[f]
enableOnBoardBilling	N[g]
enableAccessControl[h] List	N

Table 8 Default Configuration Data Settings

Field	Default Value
mgcHostName	Must Correspond to table ofceng ‘mgc_hostname’ parameter in the core
susAutoRefresh	N
supportedExtensionList	100rel

a. This can be configured for NGSS-NGSS calls
b. This can be configured for NGSS-NGSS calls
c. Max value of 40000
d. Must be set if ‘codec-enforcement’ is turned on for the server
e. Must be set if ‘codec-enforcement’ is turned on for the server
f. Must be set if ‘codec-enforcement’ is turned on for the server
g. Billing is MCI specific
h. If this turned ON, please ensure ALL the IP Addresses the NGSS box communicates with are part of the Access Control List. (IP Addresses that are datafilled in Remote Server Page area automatically part of the list.) For example, when communicating with VRDN implementation, ensure the IP Addresses of all the communicating SIP GWCs are part of the list. Otherwise, call processing will not work.

51.11 Appendix

The following mapping will be used for NGSS to communicate with VRDN configuration.

52: Configuration (CN): A00003947

52.1 Hardware and Software Requirements

None

52.2 Initial Configuration

52.3 Office/Subnet parameters (OP/SP) (CM & SESM)

CM

52.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCVAR	MULTINET_DISPLAY_ACTIVE	NEW	CM

52.3.2 Parameter information

52.3.2.1 MULTINET_DISPLAY_ACTIVE

Multiple Networks Display Active

52.3.2.1.1 Functional description

This is a new office parameter associated with Trimodal Call Server that activates the new and changed OMs/Logs and MAP screens. This allows the customer the flexibility of enabling multiple packet networks (likely for testing purposes only) prior to having the back-office system (i.e., OSS systems) ready to support the new OMs/Logs/MAP screens. This is an YES-NO type parameter. This parameter would be part of OFCVAR table. The default would be set to 'NO'.

52.3.2.1.2 Provisioning rules

52.3.2.1.2.1 Behavior when the parameter is set to ‘YES’

- First time change from ‘NO’ to ‘YES’ using table control or using Table transfer.
  - — The tuples in the new OM groups IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP are displayed.
  - — Pegging of the OM group registers in IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP is started.
  - — The signaling type for the DPT node tuple in the DPTNODE OM group is displayed.
  - — The display of bridge pool in IWBM 800 series of LOGS is enabled.
- Second time change from ‘NO’ to ‘YES’ using table control
  - — The tuples in the new OM groups IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP are displayed.
  - — Pegging of the OM group registers in IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP is started.
  - — The signaling type for the DPT node tuple in the DPTNODE OM group would be displayed.
  - — The display of bridge pool in IWBM 800 series of LOGS is enabled.

52.3.2.1.2.2 Behavior when the parameter is set to ‘NO’

- Change from ‘YES’ to ‘NO’ using table control
  - — A warning message would be displayed “All OM and LOGs data pertaining to Trimodal call server will be lost.”.
  - — The tuples in the new OM groups would not be displayed.
  - — The signaling type for the DPT node tuple in the DPTNODE OM group would not be displayed.
  - — All the counters for the registers of the new OM groups would be set to zero.
  - — The counters of the registers of the new OM groups would not be pegged.
  - — The display of bridge pool in IWBM 800 series of LOGS would be disabled.
  - — The OMSHOW command would display the OM groupsIWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP and its fields. However the tuples of these OM groups is not be displayed.

52.3.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default

52.3.2.1.4 Activation
Immediate

52.3.2.1.5 Dependencies

None
None

52.3.2.1.6 Consequences

None

52.3.2.1.7 Verification
To verify that the MULTINET Display is active and OM groups are created, use the CI command OMSHOW DPTOFCP. This command should display the OM group files and its tuples

52.3.2.1.8 Memory requirements
No memory impact.

Units per memory block = <10>

Words per memory block = <510>

If the parameter value = <25>

words required = (((parameter value - 1)/units per block) + 1) *words per block = <>

52.3.2.1.9 Parameter release history update
N/A

52.4 Upgrade Impact

52.5 Data schema (DS) (CM, MIBS, RDB)

52.5.1 New/modified tables, MIBs, or Database Schema

Table 3 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
OFRT	CHANGED	NEW
OFR2	CHANGED	NEW
OFR3	CHANGED	NEW
OFR4	CHANGED	NEW
IBNRTE	CHANGED	NEW
IBNRT2	CHANGED	NEW
IBNRT3	CHANGED	NEW
IBNRT4	CHANGED	NEW
HNPACONT$RTEREF	CHANGED	NEW

52.5.2 Table/MIB/Remote Database Schema information

52.5.2.1 Name: OFRT

Office Routing Table

52.5.2.1.1 Functional description

52.5.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

OFRT

52.5.2.1.3 Size

Not Changed

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
DDPACDEV	0	8 000 000	Memory is automatically allocated for 16 DPC devices.

52.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for OFRT.

<conditional information>

Table 5 OFRT Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RTE	Unchanged			
RTESEL	Unchanged			
CNDSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,PKT, TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	Conditional Selector based on Bearer FABRIC and Network.

Table 5 OFRT Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NOTSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,PKT, TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	NOT Selector based on Bearer FABRIC and Network
PKTSEL	Changed.	No	UNDEF[a], ENET, AAL1, AAL2, IP	Fabrics defined in table BEARNETS
NETSEL	NEW	No	Network Name	NTWKNAME values provisioned in Table BEARNETS

a. No trunk and line agent can belong to an network with fabric as “UNDEF”. Hence “UNDEF” fabric selector is blocked form being datafilled.

52.5.2.1.5 Datafill example

The following examples shows sample datafill for table OFRT.

Figure 1 CND BEARNET

```
TABLE OFRT
POS 99
100 (CND BEARNET DFLTTDM ST 901)
(CND BEARNET DFLTIP ST 902)
(CND BEARNET DFLTATM ST 903) $ $
```

Figure 2 CND FABRIC Selector Criteria ENET, IP and ATM

```
TABLE OFRT
POS 100
100 (CND FABRIC ENET ST 901)
   (CND FABRIC IP ST 902)
   (CND FABRIC AAL1 ST 903)
   (CND FABRIC AAL2 ST 904) $ $
```

52.5.2.1.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support ATM and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name.

52.5.2.1.7 Supplementary information

The above mentioned changes are applicable to all the routing tables OFR2, OFR3, OFR4, IBNRTE, IBNRT2, IBNRT3, IBNRT4 and HNPACONT$RTEREF that have CND and NOT bound in as the route selector.

52.5.2.1.8 Translation verification other tools

The following example shows the output from Traver when it is used to verify OFRT.

<abbreviated name of table> does not use translation verification tools.

Figure 3 Traver example: with BEARNET Option

52.9.1.4 Command description

Traver is a Translations Verification Tool.

- Traver enhancements
  - — New Traver option BEARNET to input the network name of the incoming trunk agent to support FABRIC and BEARNET conditional selector routing
  - — Traver TRKMEM option is enhanced to derive the originating trunk bearer network/fabric. The bearer network/fabric is used to support FABRIC and BEARNET conditional selector routing

52.10 Security

52.11 Configuration Walkthrough

53: Configuration (CN): A00003948

53.1 Hardware and Software Requirements

53.1.1 Hardware

No additional hardware is required in order to upgrade to a load capable of supporting multiple packet networks (support limited to IP interworking with AAL2 for SN07). All exisiting TDM/Packet configurations will continue to be supported, including:

- UA-AAL1
- PT-AAL1
- Ultralite AAL1
- UA-IP
- PT-IP
- PT-IP Compact (includes AAL2 via the PVG)
- AAL2 Wireless

In addition, the following new office configuration are supported:

- UA-AAL1/IP
- PT-AAL2/IP
- New hardware will be required for the addition of the second packet network.

53.1.2 Software

The software reconfiguration to use the new networking tables (BEARNETS, NETBRDGE, NETPATH, NET2NET) will occur automatically to include default datafill dictated by the value of a new office parameter. This parameter, PRE_SN07_DUMPSIDE_PACKET_FABRIC, must be set by the engineering team and applied to the office prior to the table transfer.

SESM will align with the standard SESM requirements.

In order to provision a second packet network, the customer will have to provision the new network, any bridging resources for that network, and the connectivity supported between the networks via the bridging resource paths.

53.2 Initial Configuration.

53.2.1 Office parameters

53.2.1.1 NETWORK_ACTIVE

The network_active office parameter will be set to EXTENET when upgraded to the SN07 Succession load, even if it had been previously set to ENET.

If it had been set to JNET, the value will remain as JNET. In these offices, there will be no default network datafill in the new network tables.

Note: If the value of the network_active office parameter is set to JNET, the packet connectivity function is not available.

53.2.1.2 PRE_SN07_DUMPSIDE_PACKET_FABRIC

Will be set to one of {NONE, AAL1, AAL2, IP}. Once the ONP is complete, there is no need to change this office parameter.

53.2.1.3 MULTINET_DISPLAY_ACTIVE = 'N'

The display control for the new OMs and Logs introduced by this activity is initially off.

53.2.1.4 ECAN_EDGE_STRATEGY

The existing ECAN_EDGE_STRATEGY office parameter will be deleted following the ONP. By default, the ECAN strategy will be EDGE for the office and applies to all IP and AAL2 networks. AAL1 networks will have the ECAN_REGION_STRATEGY option added to them during the ONP if the office parm ECAN_EDGE_STRATEGY was FALSE on the from side.

53.2.2 New Network Tables - initial datafill

The examples that follow are the default tuples that will be in the new network tables after the ONP is complete. Note that the initial value of the NET 1 FABRIC field will be determined by the new office parameter PRE_SN07_DUMPSIDE_PACKET_FABRIC.

53.2.3 New fields in existing tables

53.2.3.1 MNNODE

- IW SPM: will include new field BRDGCLLI set to key of only entry in table NETBRDGE.
- IW DPT: will include a new field BEARNETS set to (<name of NET 1> Y) $.
- MG4K: will include a new field BEARNETS set to (NET_AAL1 Y) $

53.2.3.2 TRKOPTS

- DPT tuples will be pulled out of the DYNAMIC option as an application type and moved into it's own option area.
- DPT tuples will contain a new BEARNETS field, that will contain (<name of NET 1> Y) $

53.2.3.3 SERVRINV

- Will contain a new BEARNETS field, which will be set to:
  - (<name of NET 1> Y) $ if GWC is not a DPT GWC
  - $ if a DPT GWC

53.2.3.4 Routing tables: CND PKT selector

The existing CND PKT routing selector will be converted to CND FABRIC in all of the applicable routing tables.

53.2.4 SESM

Each non DPT GWC provisioned will have a network codec profile associated with it, using the existing network codec profile that is configured for the office.

DPT GWC's will not have a network codec profile associated with them.

53.3 Office/Subnet parameters (OP/SP) (CM & SESM)

53.3.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCOPT	network_active	Unchanged	CM
OFCENG	ecan_edge_strategy	Deleted	CM
OFCVAR	multinet_display_active	New	CM
OFCENG	pre_sn07_dumpside_packet_fabric	New	CM

53.3.2 Parameter information

53.3.2.1 OFCOPT::NETWORK_ACTIVE

- The parameter itself is not really changing in SN07. It will simply be used to aid in the detection of an upgrade to a Succession call server capable of supporting multiple packet networks.
- As of SN04, any ENET offices upgrading to a packet capable Succession load will have this office parameter converted to EXTENET automatically during the upgrade.
- The value EXTENET is now expanded to include the ability to support mutiple packet networks.
- The use of the network tables (BEARNETS, NETBRDGE, NETPATH, and NET2NET) is enforced in connectivity for interworking the various networks, even when only a single packet network exists.

53.3.2.1.1 Functional description
This parameter controls various aspects of call processing, most importantly the network connectivity capabilities that are supported by the system.

53.3.2.1.2 Provisioning rules
For JNET call processing, set the value of this parameter to JNET.

For ENET call processing, set the value of this parameter to ENET (non-Succession loads only).

For Succession (single or multiple packet networks), the value should be set to EXTENET. “Succession” includes all cases where the load is packet capable, such that it includes the MSH DRU. This includes offices that currently only have an ENET provisioned.

53.3.2.1.3 Range information
Unchanged.

53.3.2.1.4 Activation
Unchanged.

53.3.2.1.5 Dependencies
No additional dependencies.

53.3.2.1.6 Consequences
Unchanged.

Note: The update mentioned under activation was put in place because this office parameter requires a restart for activation, and packet network connectivity is not available unless the office parm is set to EXTENET for Succession loads.

53.3.2.1.7 Verification
Not applicable.

53.3.2.1.8 Memory requirements
No memory impact.

53.3.2.1.9 Parameter release history update
Office parm value EXTENET also applies to the Trimodal Succession Call Server.

Note: The current SN06 NTP documentation does not reflect that this parameter will be changed on an ONP to EXTENET, if the from side is currently set at “ENET” and the to load contains the MSH DRU. The update that does this was submitted in TL16.

53.3.2.2 OFCENG::ECAN_EDGE_STRATEGY

Echo cancellation provisioning strategy on a packet network.

Potential issue: This office parm still needs to transfer in order to properly set the BEARNETS ECAN_REGION_STRATEGY option. It should be deleted from the system only after the table transfer of BEARNETS.

53.3.2.2.1 Functional description

This is a Succession related parameter that indicates whether a given load is using an edge or region strategy to control echo cancellation.

This parameter will be deleted in SN07.

53.3.2.2.2 Provisioning rules

Not applicble.

53.3.2.2.3 Range information

Unchanged.

Table 2 Range Information

Minimum	Maximum	Default
Y/N	Y/N	N

53.3.2.2.4 Activation

Not applicable.

53.3.2.2.5 Dependencies

Not applicable.

53.3.2.2.6 Consequences

Not applicable.

53.3.2.2.7 Verification

Not applicable.

53.3.2.2.8 Memory requirements

No additional memory required.

53.3.2.2.9 Parameter release history update

As of SN07, the ECAN strategy is moved to the individual packet network tuples in table BEARNETS, as option ECAN_REGION_STRATEGY. When this option is not present in the tuple, the ECAN strategy will default to the edge strategy for that network. Refer to the FN section for more information.

On an ONP, the AAL1 packet network tuples in the new table BEARNETS will automatically have the ECAN_REGION_STRATEGY added to them if the ECAN_EDGE_STRATEGY was F (false).

53.3.2.3 OFCOPT::MULTINET_DISPLAY_ACTIVE

Multiple Networks Display Active

53.3.2.3.1 Functional description

This is a new office parameter associated with Trimodal Call Server that activates the new and changed OMs and logs. This allows the customer the flexibility of enabling multiple packet networks (likely for testing purposes only) prior to having the back-office system (i.e., OSS systems) ready to support the new OMs and log fields. This is an Y/N type parameter. This parameter would be part of OFCVAR table. The default would be set to 'N'.

53.3.2.3.2 Provisioning rules

This office parameter cannot be turned on unless NETWORK_ACTIVE = EXTENET.

There are no restrictions for setting it to 'N'.

53.3.2.3.2.1 Behavior when the parameter is set to 'Y'

- Change from 'N' to 'Y' using table control.
  - — The tuples in the new OM groups IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP are created (if non-existing) and displayed.
  - — Pegging of the OM group registers in IWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP is started.
  - — The signaling type for the DPT node tuple in the DPTNODE OM group is displayed. The bearer network is also displayed for DPTNODE OMs if the DPT node is SPM based. The bearer network will not be displayed for GWC hosted DPT.
  - — The display of the bridge pool in IWBM 800 series of LOGS is enabled.
  - — Automatic creation of additional tuples via the table provisioning interfaces is turned on.

53.3.2.3.2.2 Behavior when the parameter is set to 'N'

- Change from 'Y' to 'N' using table control
  - — A warning message would be displayed "All OM and LOGs data pertaining to Trimodal call server will be lost.".
  - — The tuples in the new OM groups would not be displayed.

— The signaling type and bearer network for the DPT node tuple in the DPTNODE OM group would not be displayed.

— All the counters for the registers of the new OM groups would be set to zero.

— The counters of the registers of the new OM groups would not be pegged.

— The display of bridge pool in IWBM 800 series of LOGS would be disabled.

— The OMSHOW command would display the OM groupsIWBMNODE, TRK2NET1, TRK2NET2, OFZ2NET1, OFZ2NET2 and DPTOFCP and its fields. However the tuples of these OM groups is not be displayed.

— Automatic creation of addtional tuples via the table provisioning interfaces is turned off.

53.3.2.3.3 Range information

Table 3 Range Information

Minimum	Maximum	Default
Y/N	Y/N	N

53.3.2.3.4 Activation

Immediate

53.3.2.3.5 Dependencies

This parameter cannot be set to Y unless NETWORK_ACTIVE = EXTENET.

53.3.2.3.6 Consequences

None

53.3.2.3.7 Verification

To verify that the MULTINET Display is active and OM groups are created, use the CI command OMSHOW DPTOFCP. This command should display the OM group files and its tuples.

53.3.2.3.8 Memory requirements

Refer to the EI section for final details.

Enabling this office parameter will create store allocation for the following OM groups:

IWBMNODE OM group: Protected store of 10.5K bytes.

TRK2NET1 and TRK2NET2 combined:

— 48Kbytes of protected store, assuming only one network provisioned in table BEARNETS.

— Each additional tuple requires an additional 8Kbytes of store, for a maximum of 160Kbytes.

53.3.2.3.9 Parameter release history update

New in SN07.

53.3.2.4 OFCENG::PRE_SN07_DUMPSIDE_PACKET_FABRIC

SN07 Dumpside Packet Fabric prior to Trimodal upgrade.

53.3.2.4.1 Functional description

This office parameter is set by the Nortel engineering team in an office parm changes flat file prior to the night of ONP. It is to be applied after the transfer of the office parameters and prior to the TABXFER.

The purpose of the parameter is to identify the FABRIC type of the single packet fabric supported on the from side prior to the upgrade, in order for the proper network tuples to be created in tables BEARNETS, CLLI, NETBRDGE, NETPATH, and NET2NET, as well as allow the new network related fields in tables MNNODE, TRKOPTS, and SERVRINV to be assigned the proper default values.

It is very important that this parameter be set correctly.

Note: Let's talk about what to call this office parameter. The current name is a placeholder.

53.3.2.4.2 Provisioning rules

This parameter has the following range: {UNDEF, NONE, AAL1, AAL2, IP}. It will be defaulted to UNDEF at IPL, and should be set to one of the other values on all upgrades to Succession loads. Although present in non Succession loads, it does not need to be set for these loads. Once an office is already on an SN07 or later load, it does not need to be set again.

A warning will be output on all changes except "UNDEF" to one of the other values that this parameter impacts the automatic creation of the network data on ONP, and should be changed with care.

Once a packet tuple is provisioned in table BEARNETS, changes will not be allowed.

In order to properly set the value, datafill will be required from the dump side from the following tables: MNNODE, MNCKTPAK, TRKOPTS, LGRPINV.

Explanation of parameter values:

- UNDEF: Default value at IPL. Indicates that the engineering team has not looked at the data.
- NONE: The engineering team has analyzed the from side data and detected that no packet nodes are provisioned. Indications that a packet node existed would include:
  - — MNNODE: IW SPM, DPM SPM, or MG4K SPMs are provisioned.
  - — SERVRINV: any tuple provisioned.
  - — Although one could argue that datafill in tables SERVSINV or LGRPINV also indicates a packet node, it cannot be added without a GWC first.
- AAL1: The from side packet datafill contained one of the following:
  - — MNNODE contained an SMG4 (MG4K). Prior to SN07.1, MG4K IP did not exist.
  - — MNNODE IW or DPT SPM whose circuit card in table MNCKTPAK is ATM RM.
- AAL2:
  - — Cannot be detected based on table datafill. Hopefully the engineering team knows if the PVG is using AAL2 or IP/AAL5.
- IP:
  - — MNNODE IW or DPT SPM whose circuit card in table MNCKTPAK is GEM RM.
  - — Table LGRPINV contains tuples whose GRPTYPE field is ‘M’ or ‘C’. indicating IAD devices or CICM.
  - — The parm should also be set to IP if dumpside was using IP/AAL5. This will not be distinguished as a seperate bearer network.

53.3.2.4.3 Range information

Office parm is deleted.

Table 4 Range Information

Minimum	Maximum	Default
{UNDEF, NONE, AAL1, AAL2, IP}	{UNDEF, NONE, AAL1, AAL2, IP}	UNDEF

53.3.2.4.4 Activation

Not applicable. This office parameter is only used during the TABXFER of data to a new load. It should be set to the correct fabric PRIOR to the night of ONP, and not changed thereafter. It is not used by call processing.

53.3.2.4.5 Dependencies

The following tables rely on the proper provisioning of this parameter:

- BEARNETS
- NETBRDGE
- NETPATH
- NET2NET
- MNNODE
- TRKOPTS
- SERVRINV

53.3.2.4.6 Consequences

- There are no consequences of incorrect provisioning if there are no packet nodes currently supported at the site. If the parameter is set to a packet fabric in a site that does not have a packet network, then network tuples will automatically be created in tables BEARNETS, NETBRDGE, NETPATH, NET2NET.
- If a packet network was supported, and the parameter is provisioned incorrectly, tuple transfer errors could occur in the following tables:

  — TABXFER data errors in MNCKTPAK, TRKOPTS, LGRPINV.

53.3.2.4.7 Verification

Not applicable.

53.3.2.4.8 Memory requirements

Minimal. Just need to store the fabric type in a protected variable. Does not control the allocation of any additional memory.

53.3.2.4.9 Parameter release history update

New in SN07.

53.4 Upgrade Impact

53.4.1 Dump and Restore

Callp functionality should not be affected over an upgrade from pre-SN07 to post-SN07. In order to maintain this, the new/changed tables need to be datafilled over the ONP. It is required that this upgrade has minimum impact

to the customer. Aside from the traditional issues with type specific reformats, we have the additional issue of determining what the FABRIC type was on the from side, in order to properly create default tuples in the new network tables. Since call processing will start depending on this data to make inter-network connections, it is vital that this data is correct after the transfer is ONP.

Given the importance of a proper transfer, the need for user input, and the complexity of the data involved, the design team held a meeting with the upgrade team. This chosen alternative was suggested during this meeting, and was unanimously agreed upon by all who were present.

Once the data transfer is complete, the goal is to have the correct network representation for the currently configured networks, such that only new network information is required for when the customer wishes to add additional networks.

The ONP strategy must handle the following information:

53.4.1.1 Office Parameters

- OFCOPT::NETWORK_ACTIVE - If ENET, convert to EXTENET, and ensure that appropriate datafill is created to handle the existing networks.
- OFCOPT::MULTINET_DISPLAY_ACTIVE - Ensure the new office parameter is defaulted to ‘N’.
- OFCENG::ECAN_EDGE_STRATEGY - Move the information currently provided on an office-wide level via the office parameter into the individual packet network tuples in table BEARNETS as the option ECAN_REGION_STRATEGY. Obsolete the office parameter.
- OFCENG::PRE_SN07_DUMPSIDE_PACKET_FABRIC: the new office parameter *must be set by the upgrade engineering team* to indicate the default packet fabric on the from side network. This is set in a flat file that is applied after the office parameters have been transferred and before the tables are transferred. The engineering team is responsible for setting the correct values, and the application team is responsible for applying the changes at the proper point. Note that this is simply a new parameter included in the existing office parameter process. No changes are required to the process. This parameter applies only to alternative 1.

53.4.1.2 ONP Creation of Default Network Tuples

Tuples will be created automatically during the TABXFER for the following tables. For more information see “New Network Tables - initial datafill” on page 3128.

- BEARNETS
  - — Create a NET 0 tuple representing the ENET if ENET is present.

— Create an appropriate NET 2 tuple representing the existing packet network. The FABRIC should be set to either AAL1, AAL2, or IP as appropriate.

- CLLI
  - — Create the appropriate CLLI used as the index to table NETBRDGE.
- NETBRDGE
  - — If there is currently an IW SPM provisioned in the office, create a default bridge group representing it.
- NETPATH
  - — If there is currently an IW SPM provisioned in the office, create a path from the NET 0 ENET to the NET 1 packet network using the bridge group available in table NETBRDGE.
- NET2NET
  - — For each network in table BEARNETS, create a tuple in NET2NET.
  - — If there is an IW SPM, assume that both the ENET and the packet network can be connected to the other using the single path index defined in table NETPATH.
  - — Ensure that the NET 1 packet network detected is assigned the PACKET_NETWORK_DEFAULT option.
  - — If the packet network has an AAL1 fabric, and the office parameter ECAN_EDGE_STRATEGY = F, then assign the ECAN_REGION_STRATEGY to the NET 1 packet tuple.

53.4.1.3 Initialization of new fields in existing tables

- MNNODE:
  - — IW SPM: Initialize the new BRDGCLLI field to the single bridge group defined in table NETBRDGE.
  - — DPT SPM: Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the node.
  - — MG4K: Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the node.
- TRKOPTS:
  - — Initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the DPT trunk group.
- SERVRINV:
  - — If not a DPT GWC, initialize the new BEARNETS field to the NET 1 BNETNAME, and mark is as the default network for the GWC.
  - — If this is a DPT GWC, initialize the new BEARNETS field to $.

53.4.1.4 Type reformats on existing tables

- TRKOPTS: Remove DPT trunk groups as an application under the DYNAMIC trunk option, and create a DPT trunk option.
- OFRn, IBNRTn, HNPACONT::RTEREF, FNPACONT::RTEREF:
  - Convert the CND PKT conditional selector to CND FABRIC in all of the applicable routing tables.

53.4.2 Element Management Upgrade

53.5 Data schema (DS) (CM, MIBS, RDB)

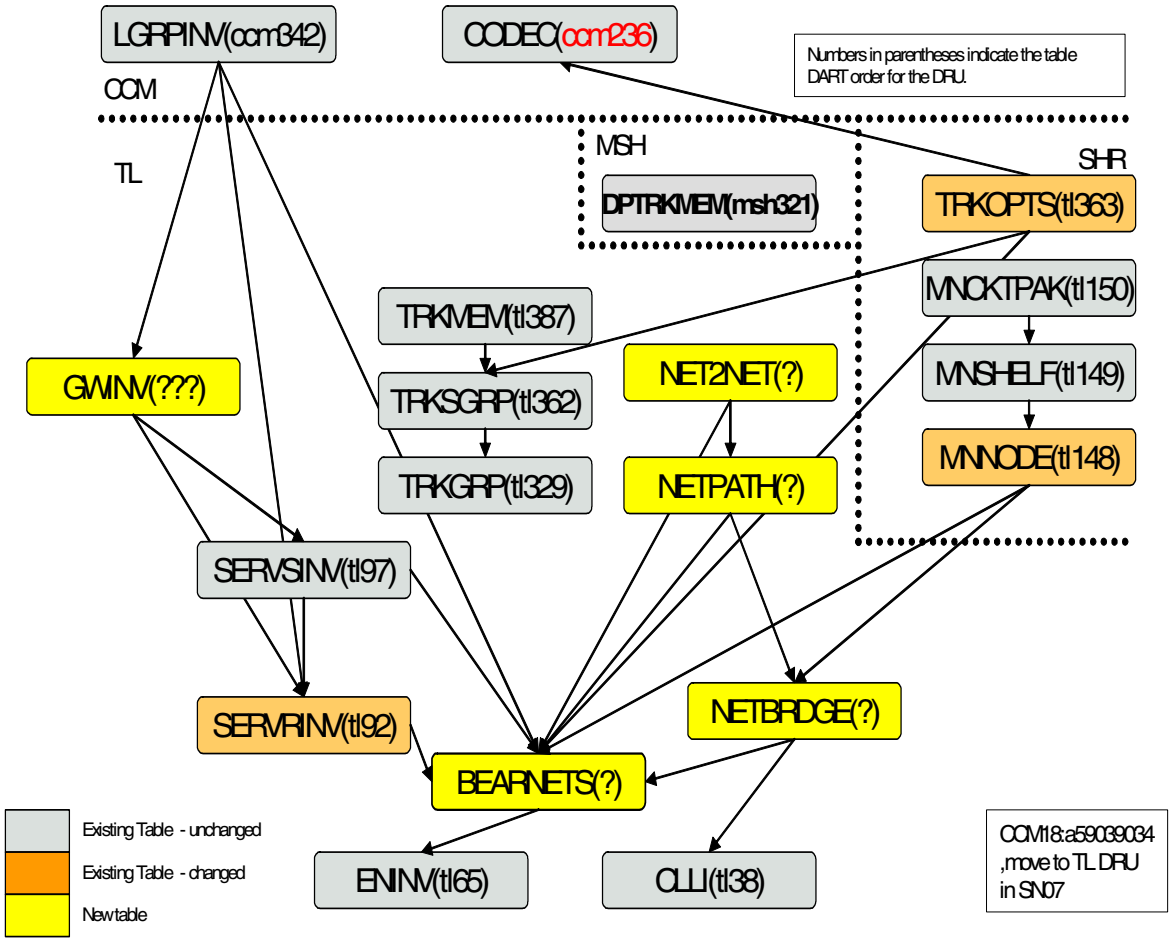
53.5.2 Table/MIB/Remote Database Schema information

53.5.2.1 Core Table Dependencies



53.5.2.2 Core Table BEARNETS

Bearer networks

53.5.2.2.1 Functional description

On a Succession Call Server, this table identifies the bearer networks supported by the server and the network options that apply to the packet networks.

The overall default packet network for the office is determined by the assignment of the packet_network_default option to a single tuple in the table. If no packet network is detected in the provisioning hierarchy for a packet agent, this default packet network will be used.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

53.5.2.2.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

ENINV

BEARNETS

NETBRDGE, NET2NET, MNNODE, SERVRINV, TRKOPTS

53.5.2.2.3 Size

Table 6 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
BEARNETS	0	8	Memory not allocated unless tuples are provisoned. (Required if NETWORK_ACTIVE = EXTENET).

53.5.2.2.4 Fields/OIDs

The following table lists fields for BEARNETS.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NETIDX	New	No	0-7	Key to the table. Will be displayed as “NET 0” - “NET 7”.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BNETNAME	New	No	Vector of up to 32 characters.	Identifies the name of the bearer network.This will be used in other tables to reference the associated bearer network and its characteristics. Making the name a field of the tuple rather than the index allows the customer to make name changes to the networks defined. The 32 character name of the network must be unique across the table.
DISPLAY	New	No	Vector of up to 4 characters.	Identifies the a 4 character string that will be used to display the bearer network on the MAP screens. We recommend that this be a unique string across the bearer networks, but this will not be implemented in the table control.
FABRIC	New	No	UNDEF, ENET, AAL1, AAL2, IP	Identifies the bearer network fabric type.
OPTIONS	New	Refinements	Vector of {pkt_network_default, ecan_region_strategy}	Vector of options against the bearer network.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
pkt_network_default	New	OPTIONS refinement (not a field)	n/a	Indicates that this tuple is the packet bearer network default for the office. Primarily used in initializing dependant tables during an ONP. Restrictions: Only one tuple in the table can have this option. Cannot be added to tuples where the FABRIC is UNDEF or ENET.
ecan_region_strategy	New	OPTIONS refinement (not a field)	n/a	Indicates that calls on this network will use the region strategy to govern their echo cancellation. Restrictions: Can only be added to AAL1 networks.

53.5.2.2.5 Datafill example

The following example shows sample datafill for table BEARNETS.

```
TABLE: BEARNETS
NETIDX NETNAME      DISPLAY FABRIC OPTIONS
----------------------------------------
NET 0  TDM_ENET     ENET    ENET   $
NET 1  NET_AAL1     ATM     AAL1   (PKT_NETWORK_DEFAULT)$
NET 2  NET_IP       IP      IP     $
NET 3  NET_AAL2     AAL2    AAL2   $
```

53.5.2.2.6 Table release history update

New in SN07.

53.5.2.2.7 Supplementary information

Table BEARNETS, along with tables NETBRDGE, NETPATH, and NET2NET) is required to be provisioned in all Succession sites supporting bridged calls from a TDM network to a packet network.

On an ONP, this table will be automatically provisioned with both TDM and packet networks tuples where they exist.

— If the from side datafill contained an ENET, the NET 0 tuple from the datafill example will be automatically provisioned.

— If the from side supported packet nodes (as indicated by the setting of the PRE_SN07_DUMPSIDE_NETWORK_FABRIC), the NET 1 tuple will be provisioned and marked as the PKT_NETWORK_DEFAULT.

Datafill restrictions and limitations:

- Additions of packet networks to the table will not be allowed unless the Office Parm NETWORK_ACTIVE is EXTENET.
- Table BEARNETS is a counted table. Tuple deletes are not be allowed when other tables reference it.
- Only one packet network can have the packet_network_default option. If this option is added to another network tuple, the option will be removed from the existing network tuple. Determine the restrictions for doing this.
  — Do not change unless all GWCs (except DPT) have a default network provisioned?
  — Allow changes, but first search for and assign all GWCs the existing default network?
- The FABRIC field cannot be changed.

Refer to the supplementary information for table NET2NET for additional information.

53.5.2.2.8 Translation verification other tools

BEARNETS does not use translation verification tools.

53.5.2.3 Core Table NETBRDGE

Network bridging resources.

53.5.2.3.1 Functional description

This table defines the network bridging resources for interconnecting networks. Bridges provide the ability to connect one network to another without regard to the call type. Bridges typically have two connectivity endpoints, one for each of the networks that it inter-connects.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

53.5.2.3.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

CLLI, BEARNETS

NETBRDGE

NETPATH, NET2NET, MNNODE

53.5.2.3.3 Size

Table 8 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NETBRDGE	0	64	Refer to the EI section after DSUM.

53.5.2.3.4 Fields/OIDs

The following table lists fields/OIDs for NETBRDGE.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BRDGCLLI	New	No	CLLI common_language_name	Identifies the name of the bridge resource group.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
TYPE OR BRDGTYPE?	New	No	CORE_BRDG	The type of the bridging resource. For SN07, this is limited to core bridges, but could be expanded in the future.
DISPLAY	New	No	Vector of up to 4 characters	Identifies the a 4 character string that will be used to display the bearer network on the MAP screens. We recommend that this be a unique string across the bearer networks, but this will not be implemented in the table control.
BEARNETS	New	Structure	BNETNAME, BNETNAME	Identifies the two networks that can be bridged with this bridging resource group.

53.5.2.3.5 Datafill example

The following example shows sample datafill for table NETBRDGE.

```
TABLE: NETBRDGE
BRDGCLLI       TYPE         DISPLAY BEARNETS
-----------------x-------------------------
ENET_TO_AAL1   CORE_BRDG    E-A1     (TDM_ENET NET_AAL1) $
ENET_TO_IP     CORE_BRDG    E-IP     (TDM_ENET NET_IP)   $
```

53.5.2.3.6 Table release history update

New in SN07.

53.5.2.3.7 Supplementary information

- In SN07, the only TYPE supported is CORE_BRDG. It is possible that other bridge types may be added in the future.
- Table NETBRDGE shall be a counted table. Tuple deletes shall not be allowed when other tables reference it.

- The following tuple fields cannot be changed unless the tuple is not referenced by any other tables:
  - — TYPE
  - — BEARNETS

53.5.2.3.8 Translation verification other tools

NETBRDGE does not use translation verification tools.

53.5.2.4 Core Table NETPATH

Interconnecting network path.

53.5.2.4.1 Functional description

Tuples in this table identify the list of bridging resource groups (the bridge path) that can be used to interconnect two networks. In SN07, two bridges are required to connect an AAL1 agent and an IP agent, so the path consists of a bridge resource from each of those NETBRDGE's.

Refer to the functional description section for table NET2NET for a full description of how the new network tables are used.

53.5.2.4.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

NETBRDGE

NETPATH

NET2NET

53.5.2.4.3 Size

Table 10 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NETPATH	0	256	Refer to the EI section of this document following the DSUM.

53.5.2.4.4 Fields/OIDs

The following table lists fields/OIDs for NETPATH.

Table 11 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PATHIDX	New	New	0 to 255	The key to the table.
NETBRDGE	New	New	Vector of BRDGCLLI	A list of the bridge pools that are required to go from one network to another.

53.5.2.4.5 Datafill example

The following example shows sample datafill for table NETPATH

```
TABLE: NETPATH
PATHIDX       NETBRDGE
----------------------------------------
  0           (ENET_TO_AAL1)  $
  1           (ENET_TO_IP)    $
  2           (ENET_TO_AAL1), (ENET_TO_IP)$
  3           (AAL1_TO_IP)    $

NOTE: PATHIDX 3 is not supported in SN07.
```

53.5.2.4.6 Table release history update

New table in SN07.

53.5.2.4.7 Supplementary information

Network paths are used dynamically during call processing. If a user changes a network path currently in use via table NET2NET, new connection requests between the 2 networks will begin using the new path.

Restored connections will continue to use the old path.

53.5.2.4.8 Translation verification other tools

NETPATH does not use translation verification tools.

53.5.2.5 Core Table NET2NET

Network interconnection.

53.5.2.5.1 Functional description

Tuples in this table define the allowable interconnections between networks, and the network path used to interconnect them.

Call processing will assume that any agents on the same network can be connected with one another.

Once the normal translations have occurred, a request will be made to connectivity to connect the agents.

- If the agents are on the same network, the connection request will proceed.
- If the agents are provisioned on seperate networks, connectivity will check table NET2NET to see if the connection is allowed.
  - — If the two networks are provisioned as connecting in the table, the NETPATH and associated bridge resources will be retrieved and the connection request will continue. If there are no idle members in the bridge groups, the connection request will then fail.
  - — If the two networks are not provisioned as connecting in the table, the connection request will fail immediately.
- In SN07, no mechansim is provided for choosing an alternate bridging path if the bridging resources are unavailable in the provisioned path.

53.5.2.5.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS, NETPATH

NET2NET

53.5.2.5.3 Size

Table 12 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NET2NET	0	7	Allocated upon first tuple entry.

53.5.2.5.4 Fields/OIDs

The following table lists fields/OIDs for NET2NET.

Each CONNNETS vector entry consists of:

- NET2NET - the interconnecting network
- NETPATH - reference to tuple in table NETPATH definining the path by which the two networks interconnect.

Table 13 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BNETNAME	New	No	BNETNAME defined in table BEARNETS	Identifies the name of the bearer network. Must be datafilled in Table BEARNETS first.
CONNNETS	New	No	Vector of connecting_network	Identifies a list of other bearer networks that are allowed to interconnect to this bearer network.
NET2NET	New	Field of connecting_network	BNETNAME provisioned in table BEARNETS	The interworking bearer network. Must be provisioned in Table BEARNETS first.
NETPATH	New	Field of connecting_network	Key to table NETPATH 0 - 255	Index into Table NETPATH.

53.5.2.5.5 Datafill example

The following example shows sample datafill for table NET2NET.

Figure 6 ENET/AAL1/IP NET2NET DatafillI

```
TABLE BEARNETS
NETIDX  NETNAME    DISPLAY     FABRIC    OPTIONS
-----------------------------------------------
NET 0   TDM_ENET   ENET        ENET      $
NET 1   NET_ATM    ATM         AAL1      $
NET 2   NET_IP     IP          IP        $

NET_IPE         (NET_IP 3) $
```

To interconnect two different networks on the same fabric, define a NETPATH that requires no bridges, and put entries in NET2NET using that path.

53.5.2.5.6 Table release history update

New in SN07.

53.5.2.5.7 Supplementary information

- When a new interconnection is made from one network to another using a given NETPATH index, the reverse network connection tuple will also be updated to add the connectivity in the other direction using the same NETPATH index. Conversely, if a network connection path is removed from a tuple, it will also be removed in the reverse direction.
- It is recommended that if a network can connect only with itself, that a tuple is still provisioned with a '$' in the CONNNETS field. During the ONP, this will be the standard default datafill. However, if a tuple is deleted

that has a “$” for the CONNNETS field, connections will still be allowed among agents on the same network.

- Changes to NET2NET tuples take effect immediatly upon the change for all new connection requests. They do not impact the path of restored connections. Note that this can impact some active service interworking, if the service moves agents around in new connection configurations, such as Call Hold (CHD).
- A given network may only appear once is the CONNNETS list against another network. It is not permissable to provision network connectivity using two different NETPATH entries.

53.5.2.5.8 Translation verification other tools

NET2NET does not use translation verification tools.

53.5.2.6 Core Table MNNODE

Maintenance node table used to provision Spectrum nodes.

53.5.2.6.1 Functional description

Unchanged.

53.5.2.6.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

All existing dependencies, plus BEARNETS, NETBRDGE

MNNODE

All existing dependant tables.

53.5.2.6.3 Size

Table 14 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNNODE	Unchanged	Unchanged	Refer to the EI section of this document after DSUM complete.

53.5.2.6.4 Fields/OIDs

The following table lists fields/OIDs for MNNODE.

The following nodes provisioned in table MNNODE are impacted by these changes:

- Interworking bridges (NODEKEY=IW, DPT_INFO = BRDG_ONLY)

- DPT SPM (NODEKEY = IW, DPT_INFO = DPT_ONLY)
- MG4K (NODEKEY = SMG4)

Each of the applicable node type change is broken into it's own table below.

Table 15 Table field descriptions for IW Bridges

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NODEKEY	Unchanged	Unchanged	Unchanged	Unchanged
ALIAS	Unchanged	Unchanged	Unchanged	Unchanged
NODEINFO	Changed	IW refinement	**IW**	Changes below impact the IW refinement of CLASS.

53.5.2.6.6 Table release history update

In SN07, The following mandatory fields were added:

- BEARNETS field added to IW DPT_ONLY and SMG4 nodes to indicate the bearer network associated with the node.
- BRDGCLLI field added to IW BRDG_ONLY nodes to indicate the list of bridge groups the particular SPM node contributes to.

53.5.2.6.7 Supplementary information

- MNNODE is the bearer network provisioning point for the following SN07 nodes:
  - IW SPM
  - DPT SPM
  - MG4K
- As of SN07, in order for interworking bridges to be utilized, the BRDGCLLI for the IW must be included in a NETPATH used to interconnect two networks in table BEARNETS.
- Terminations to DPT will dynamically match the network of the DPT SPM to the network provsioned against the terminating trunk group in table TRKOPTS to properly select a DPT “terminal” on the correct network.
- In order to change the BEARNETS field of a DPM SPM node or a MG4K DPT, the node must be “Installtion Busy.” Additional restrictions/checks are being investigated.
- Checks for changing the BRDGCLLI are being investigated.
- IW SPM must be OOS (MANB, OFFL, SYSB) before changing the
  - MNNODE first, must either crosscheck that correct card is provisioned in MNCKTPAK or put something in the RTS code to block RTS unless the other data agrees.
  - MNCKTPAK change

— Datafill must be complete before the IW SPM can be RTS'd.

53.5.2.6.8 Translation verification other tools

MNNODE does not use translation verification tools.

53.5.2.7 Core Table SERVRINV

Server Inventory

53.5.2.7.1 Functional description

A new field, BEARNETS is added to the SERVRINV table to indicate the bearer networks of the packet nodes it controls. For SN07, there will be a limit of one bearer network per gateway controller, and it will be the default.

In addition, DPT GWCs should not be provisioned with a bearer network, as it is a signalling only network element.

53.5.2.7.2 Usage sequence and implications (CM Only)

The following provisioning dependencies is added :

BEARNETS

SERVRINV

53.5.2.7.3 Size

Table 18 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVRINV	Unchanged	Unchanged	tbd

53.5.2.7.4 Fields/OIDs

The following table lists fields/OIDs for SERVRINV.

Table 19 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SERVRNAME	Unchanged	Unchanged	Unchanged	Unchanged
SERVRADDR	Unchanged	Unchanged	Unchanged	Unchanged
SERVREXEC	Unchanged	Unchanged	Unchanged	Unchanged
SERVRTONE	Unchanged	Unchanged	Unchanged	Unchanged

Table 19 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BEARNETS	**New**	**New subfield when DPT_INFO = DPT_ONLY**	**Vector of (BNETNAME and DEFAULT)**	**List of the networks to which the DPT TIDs belong and whether or not the network should be considered the default network for the node.** **In SN07, only 1 network can be added, and it will be the default.** **DPT GWC's should not be provisioned with a bearer network.**
BNETNAME	**New**	**Subfield of BEARNETS.**	**BNETNAME provisioned in table BEARNETS.**	**Name of the bearer network from table BEARNETS.**
DEFAULT	**New**	**Subfield of BEARNETS**	**{Y, N}**	**Indicates whether the particular bearer network is the default network**
SERVROPTS	Unchanged	Unchanged	Unchanged	Unchanged

53.5.2.7.5 Datafill example

The following example shows sample datafill for table SERVRINV.

Figure 12 Example Datafill

```
TABLE: MNNODE
SERVRNAME SERVRADDR SERVREXEC SERVRTONE BEARNETS SERVROPTS
---------------------------------------------------------
GWC 0     IP  47 192 48 24 (POTS POTSEX)  (KEYSET  KSETEX)  $
NORTHAA (PACKET_DEFAULT Y) $ $
```

53.5.2.7.6 Table release history update

Added BEARNETS field in SN07.

53.5.2.7.7 Supplementary information

- SERVRINV is the bearer network provisioning point for the following nodes, if the BEARNETS field contains a default network. If the GWC does not have a BEARNETS entry, the office default (the tuple in table BEARNETS with the default_packet_network option assigned) will be taken as the bearer network for the following agents.
  - IP trunking gateways (PVG, Audiocodes)
  - Logical groups
  - ABI lines and trunks
  - H.323 & Media Call Server 5200
  - UAS (for CALEA)
- DPT GWCs do not have a bearer network provisioning against them, as the DPT TIDs against the GWC do not have associated hardware. If a network is provisioned against DPT GWC, it will have no effect on call processing. DPT trunk groups get their bearer network from table TRKOPTS.
- Changes to the BEARNETS field in table SERVRINV should be made only via the GWC-EM GUI, although this will not be enforced in table control. Instead, the usual warning will be output from the table control interface when changes are attempted in this table: ‘Warning: Changes must be done via SESM node provisioning to avoid data corruption.”. The GWC itself has knowledge of the bearer fabric and the codecs supported on the fabric, so changing the bearer network through table control can have unpredictable results.
- Restrictions for changing the bearer network, where the FABRIC remains the same:
  - Impacts trunking queues only.
  - Take GWC OOS or make change and swact?
- Restrictions for changing the bearer network, where the FABRIC also changes:
  - Impacts trunks and lines that are already allocated.
  - Not allowed.
- In order for the BEARNETS field to be changed, all p-side nodes must be in an OOS state:
  - GWC trunk members.
  - Logical line groups - pathends associated dynamically.
  - ABI lines - pathends associated dynamically
  - ABI trunks - pathends associated dynamically

53.5.2.7.8 Translation verification other tools

SERVRINV does not use translation verification tools.

53.5.2.8 Core Table SERVSINV

Subtending Server Inventory

53.5.2.8.1 Functional description

A hook is added to the table control write code so that during an upgrade, if a DPT terminal group is added, the code will go into SERVRINV physical data and remove the default BEARNET that was added during the initial provisioning.

Under normal conditions, table SERVRINV is provisioned via the SESM or OSSDI interface, and is not provisioned via the MAP for a customer, so the BEARNETS information in SERVRINV will be correct the first time. On an ONP, we will assign all GWCs the default network, and then remove it for DPT groups, since the GWC cannot host both DPT and actual gateways, and the data does not apply to DPT GWCs.

53.5.2.8.2 Usage sequence and implications (CM Only)

The datafill order for table SERVSINV is unchanged

53.5.2.8.3 Size

Table 20 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVSINV	Unchanged	Unchanged	Unchanged

53.5.2.8.4 Fields/OIDs

The fields and field values for table SERVSINV are unchanged..

53.5.2.8.5 Datafill example

Unchanged.

53.5.2.8.6 Table release history update

Added ONP checks such that during TABXFER on a Trimodal upgrade, when a DPT group is added, the BEARNETS will be removed from the host GWC.

This check will not be enforced during normal provisioning sequence.

53.5.2.8.7 Supplementary information

DPT terminal groups are signalling only, and do not have any physical hardware associated. The DPT trunk group, via provisioning in table TRKOPTS, contains the bearer network information, and DPT "terminals" can be associated with any bearer network provisioned against the trunk group, as long as the signalling type matches.

53.5.2.8.8 Translation verification other tools

SERVSINV does not use translation verification tools.

53.5.2.9 Core Table TRKOPTS

Trunk Options.

53.5.2.9.1 Functional description

Unchanged.

53.5.2.9.2 Usage sequence and implications (CM Only)

The following dependency is added to the existing provisioning order:

BEARNETS

TRKOPTS

53.5.2.9.3 Size

Table 21 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
TRKOPTS	Unchanged	Unchanged	Refer to EI section after DSUM.

53.5.2.9.4 Fields/OIDs

The following table lists fields/OIDs for TRKOPTS.

```
>range
 1 OPTKEY            TRKOPTS_KEY

SIGNALING	Unchanged	Subfiled of DYNAMIC option	OTHERWISE	Unchanged

Table 22 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTION	Changed	Selector subfield of OPTINFO	DPT	Remove DPT from list of valid APPLICATIONs
PROTOCOL	New	Subfiled of DPT option	{BICC, SIPT}	The DPT signalling protocol.
BEARER_NETWORK	New	Subfiled of DPT option	BNETNAME from table BEARNETS	The BNETNAME of a bearer network provisioned in table BEARNETS.
PROTOCOL	New	Subfiled of DPT option	SIPT	Subfields when protocol = SIPT.
DEST_MGCNAME	New	Subfield of SIPT protocol	MGCINV_KEY	Same as under the dynamic option.
TPROFILE	New	Subfield of SIPT protocol	TPROFILE_NAME	Same as under the dynamic option.
ALT_HOST_MGCNAME	New	Subfield of SIPT protocol	Vector of up to 32 chars.	Same as under the dynamic option.
INTER_DOMAIN	New	Subfield of SIPT protocol	N, Y	Same as under the dynamic option.
PROTOCOL	New	Subfiled of DPT option	BICC	Subfields when protocol = BICC (old ISUPPLUS)
CAPABILITY_SET	New	Subfield of ISUPPLUS protocol	{1 to 2}	Same as under the dynamic option.

53.5.2.9.5 Datafill example

The following example shows sample datafill for table TRKOPTS.

Figure 13 Example Datafill

```
TABLE: TRKOPTS
OPTKEY          OPTINFO
----------------------------------------
DPTTRK DPT      DPT BICC NET_AAL1 1 (100 200) (300 400) $ 200
SIPTRK DPT      DPT SIPT NET_IP $ 200
OCTRK  DYNAMIC  DYNAMIC ISUP IP IP OC $
```

53.5.2.9.6 Table release history update

- DPT is removed from APPLICATION field under the DYNAMIC option.
- DPT is added as a new OPTION.

53.5.2.9.7 Supplementary information

The signaling network field is not required for DPT. The signaling protocol implies the signaling network: BICC implies SS7, and SIPT implies IP.

The bearer_fabric provisioned for DPT in table TRKOPTS indicates the bearer fabric for a specific DPT trunk group, and a given DPT trunk group can only have one bearer fabric.

GWC DPT trunk “agents” (provisioned in table SERVSINV) will be associated with the DPT trunk group during call processing based on the signaling protocol only. Bearer fabric is not provisioned against DPT GWCs in table SERVRINV.

SPM DPT trunk “agents” (proavisioned in table MNNODE) will be associated with the DPT trunk group during call processing based on both the signaling protcol and the bearer network provisioned in table MNNODE.

53.5.2.9.8 Translation verification other tools

The following example shows the output from <ToolName> when it is used to verify <abbreviated name of table>.

<abbreviated name of table> does not use translation verification tools.

53.5.2.10 Core Table MNCKTPAK

Management Network Node Table

No sematice changes have been made to this table.

Additional validation checking has been added for when the GWM RM and ATM RM card provisioning, to ensure that the network implies by the card agrees with the bearer network provisioned against the node.

53.5.2.10.1 Functional description

Unchanged.

53.5.2.10.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

53.5.2.10.3 Size

Table 23 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNCKTPAK	Unchanged	Unchanged	Unchanged

53.5.2.10.4 Fields/OIDs

The following table lists fields/OIDs for MNCKTPAK.

Table 24 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CPKKEY	Unchanged	Unchanged	Unchanged	Unchanged
CPKINFO	Changed	CPKTYPE	GEM or ATM	Additional checking added to compare to the bearer network in table MNNODE.
PEC	Unchanged	Unchanged	Unchanged	Unchanged
RELEASE	Unchanged	Unchanged	Unchanged	Unchanged
LOAD	Unchanged	Unchanged	Unchanged	Unchanged

53.5.2.10.5 Datafill example

The following example shows sample datafill for table MNCKTPAK.

Figure 14 Example Datafill

```
SPM 0 0 9 ATM 0 1 WORKING (SYSB CR RPT) (MANB MJ RPT) (ISTB MN RPT)
(PROTFAIL CR RPT) (PATCHFAIL MJ RPT) $ NTLX73BA 01 ATC20AW
```

53.5.2.10.6 Table release history update

Additional network card validation checks added in SN07.

53.5.2.10.7 Supplementary information
When adding a network card, ensure that if a GEM card is being added, the SPM supports either a BEARNETS with FABRIC = IP or a BRDGCLLI that bridges a network with an IP FABRIC. Similarly, if adding an ATM RM, the network should be AAL1.

53.5.2.10.8 Translation verification other tools

MNCKTPAK does not use translation verification tools.

53.5.2.11 Core Tables OFRT, OFR2, OFR3, OFR4
Office Routing Tables

Same change applies to each

53.5.2.11.1 Functional description
Unchanged.

New CND/NOT selector condition of BEARNET, to allow conditional routing based on the originator's bearer network.

Changed the name of the PKT conditional selector to FABRIC, and increased the allowable FABRIC range from {ENET} to {ENET, AAL1, AAL2, IP}.

53.5.2.11.2 Usage sequence and implications (CM Only)
Tables must be datafilled in the following sequence:

BEARNETS

OFRT

53.5.2.11.3 Size
Not Changed

Table 25 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
OFRT	unchanged	unchanged	unchanged
OFR2	unchanged	unchanged	unchanged
OFR3	unchanged	unchanged	unchanged
OFR4	unchanged	unchanged	unchanged

53.5.2.11.4 Fields/OIDs
The following table lists fields/OIDs for OFRT, OFR2, OFR3, OFR4.

If CND/NOT condition is FABRIC, will be prompted for PKTSEL.

If CND/NOT condition is BEARNET, will be prompted for NETSEL.

Table 26 OFRn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RTE	Unchanged			
RTESEL	Unchanged			
CNDSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,~~**PKT,**~~ TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	Conditional Selector based on Bearer FABRIC and Network.
NOTSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,~~**PKT**~~, TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	NOT Selector based on Bearer FABRIC and Network
PKTSEL	Changed.	No	UNDEF[a], ENET, AAL1, AAL2, IP	Fabrics defined in table BEARNETS

Table 26 OFRn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
NETSEL	NEW	No	Network Name	NTWKNAME values provisioned in Table BEARNETS

a. No trunk and line agent can belong to an network with fabric as “UNDEF”. Hence “UNDEF” fabric selector is blocked form being datafilled.

53.5.2.11.5 Datafill example

The following examples shows sample datafill for table OFRT.

Figure 15 CND BEARNET

```
TABLE OFRT
POS 99
100 (CND BEARNET DFLTTDM ST 901)
(CND BEARNET DFLTIP ST 902)
(CND BEARNET DFLTATM ST 903) $ $
```

Figure 16 CND FABRIC Selector Criteria ENET, IP and ATM

```
TABLE OFRT
POS 100
100 (CND FABRIC ENET ST 901)
   (CND FABRIC IP ST 902)
   (CND FABRIC AAL1 ST 903)
   (CND FABRIC AAL2 ST 904) $ $
```

53.5.2.11.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

53.5.2.11.7 Supplementary information

The above mentioned changes are applicable to all the routing tables OFR2, OFR3, OFR4, IBNRTE, IBNRT2, IBNRT3, IBNRT4 and

HNPACONT$RTEREF that have CND and NOT bound in as the route selector.
The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

53.5.2.11.8 Translation verification other tools

The following example shows the output from Traver when it is used to verify OFRT.

53.5.2.12 Core Tables IBNRTn (IBNRTE, IBNRT2, IBNRT3, IBNRT4)

IBN Routing Table

53.5.2.12.1 Functional description

Unchanged

53.5.2.12.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

IBNRTE, IBNRT2, IBNRT3, IBNRT4

53.5.2.12.3 Size

Table 27 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
IBNRTE	Unchanged	Unchanged	Unchanged
IBNRT2	Unchanged	Unchanged	Unchanged
IBNRT3	Unchanged	Unchanged	Unchanged
IBNRT4	Unchanged	Unchanged	Unchanged

53.5.2.12.4 Fields/OIDs

The following table lists fields/OIDs for OFRT, OFR2, OFR3, OFR4.

If CND/NOT condition is FABRIC, will be prompted for PKTSEL.

If CND/NOT condition is BEARNET, will be prompted for NETSEL.

Table 28 IBNRTn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RTE	Unchanged			
RTESEL	Unchanged			

Table 28 IBNRTn Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CNDSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,~~**PKT,**~~ TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	Conditional Selector based on Bearer FABRIC and Network.
NOTSEL	Changed	Yes	ALWAYS, RND,SNPA,EA,TOD,MIGRATE,NARS, COSMAP, NRR,SITE,CALLCHR,INTERLATA,~~**PKT**~~, TOPEAALT,TOPEAXFR,TOPEACLS,STS,**FABRIC,BEARNET**	NOT Selector based on Bearer FABRIC and Network
PKTSEL	Changed.	No	UNDEF[a], ENET, AAL1, AAL2, IP	Fabrics defined in table BEARNETS
NETSEL	NEW	No	Network Name	NTWKNAME values provisioned in Table BEARNETS

a. No trunk and line agent can belong to an network with fabric as “UNDEF”. Hence “UNDEF” fabric selector is blocked form being datafilled.

53.5.2.12.5 Datafill example

Similar to the above examples.

53.5.2.12.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

53.5.2.12.7 Supplementary information

The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

53.5.2.12.8 Translation verification other tools

Refer to TRAVER information under table OFRT.

53.5.2.13 Core Tables HNPACONT::RTEREF and FNPACONT::RTEREF

Subtable Route Reference from the Home Numbering Plan Area

Subtable Route Reference from the Foreign Numbering Plan Area

Changes are the same as for OFRn and IBNRTn.

53.5.2.13.1 Functional description

Refer to OFRn.

53.5.2.13.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

HNPACONT::RTEREF & FNPACONT::RTEREF (order between these is unchanged)

53.5.2.13.3 Size

Table 29 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
HNPACONT::RTEREF	Unchanged	Unchanged	Unchanged
FNPACONT::RTEREF	Unchanged	Unchanged	Unchanged

53.5.2.13.4 Fields/OIDs

Same changes as table OFRn.

53.5.2.13.5 Datafill example

Refer to table OFRn.

53.5.2.13.6 Table release history update

— CND/NOT PKT selector renamed to “FABRIC” and enhanced to support AAL1, AAL2 and IP fabrics.

— New BEARNET CND/NOT selector to support criteria checking based on network name of the originating agent.

53.5.2.13.7 Supplementary information

The bearer network of the originiator can be provisioned in one of the following tables: MNNODE, SERVRINV, or TRKOPTS (for DPT).

53.5.2.13.8 Translation verification other tools

Refer to OFRn.

53.5.2.14 GWC_NETWORK_CODEC_PROFILE

53.5.2.14.1 Functional description

This new table is used to store network codec profiles that created by customer. The profiles will be used when customer add GWC node. Please refer to DID document for details.

53.5.2.14.2 Fields

The following table lists fields of this table.

Table 30 Table field descriptions

Field	New/ Changed	Entry	Explanation and action
~~Profile_Id~~	~~New~~	~~VARCHAR~~	~~This field is the primary key of this table. It is not allow to be NULL.~~
profilename	New	VARCHAR2 (32)	The name of the profile. It is not allow to be NULL. This field is the primary key of this table.
bearerpath	New	NUMBER	Indicates the bearer network fabric type. Refer to table “BEARERPATH_MAP“. The default value is “0”.
defaultcodec	New	NUMBER	Indicate the default codec. Refer to table “CODEC_MAP“. The default value is “0”.
preferredcodec	New	NUMBER	Indicate the preferred codec. Refer to table “CODEC_MAP“. The default value is “0”.
alternativecodec	New	NUMBER	Indicate the alternative codec. Refer to table “CODEC_MAP“. The default value is “0”.
